FIGURE 1.—Sales of building lime compared with total new construction and sales of refractory and chemical lime compared with industrial production, 1925–50. Units are reduced to percentages of the 1935–39 average. Statistics on value of construction from the Bureau of Foreign and Domestic Commerce (Survey of Current Business, March 1951) and on industrial production from the Federal Reserve Board.

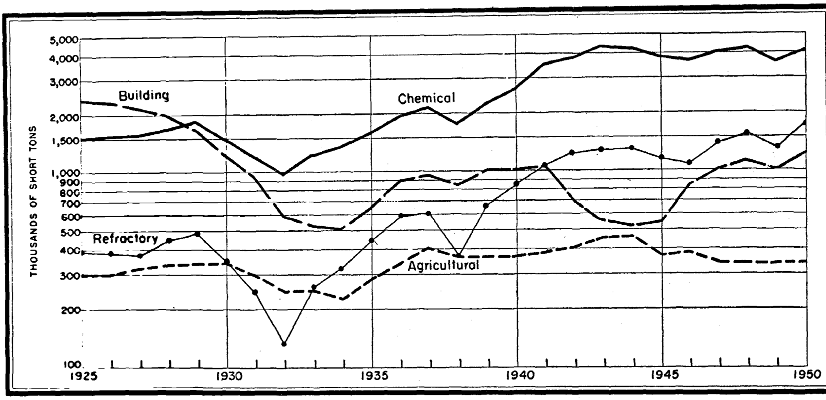

FIGURE 2.—Trends in major uses of lime, 1925–50.

DOMESTIC PRODUCTION

Total production of open-market lime (as indicated by sales) increased 18 percent in quantity and 20 percent in value from 1949 to 1950. The major gains were in refractory lime (dead-burned dolomite), 33 percent, and in building lime, 19 percent. Chemical and industrial lime sales gained 14 percent. As lime stocks are relatively small and constant the quantities sold or used as recorded herein are virtually equivalent to production.

Captive Tonnage.—The statistics included in this chapter pertain primarily to open-market lime, but in some instances relatively small quantities of captive tonnage are included where it is particularly desirable to show complete figures for consumption by use. Specifically, in the figures for lime sold or used in the United States in 1950, there was included a total of 456,191 short tons of captive tonnage, distributed as follows: 47,723 tons for building, 294,521 tons for metallurgical uses, 74,493 tons for miscellaneous chemical uses, and 39,454 tons of refractory lime (dead-burned dolomite). A more complete figure for total lime production can be obtained by adding to the total given herein the quantity calculated from the limestone tonnages (shown in the chapter on Stone in this volume) consumed in the uses in which limestone is generally calcined.

TABLE 2.—Lime sold by producers in the United States, 1949–50, by types and major uses

	1949				1950					
	Quantity		Value [1]		Quantity		Value [1]		Percent change from 1949 in—

[1] Selling value, f. o. b. plant, excluding cost of container.
[2] Includes lime used by producers (captive tonnage) as follows—1949: 355,367 tons, $3,171,392; 1950: 456,191 tons, $3,977,905.
[3] Less than ±0.5 percent.

Size of Plants.—The trend toward fewer and larger plants that has characterized recent years was strikingly evident during 1950. Although the total number of plants reporting declined by 12, the number of plants producing 100,000 tons a year or more increased from 15 to 21. These 21 plants produced 56 percent of the total lime tonnage. The 43 plants having individual production rates greater than 50,000 tons a year contributed 76 percent of the total compared with 71 percent in 1949 for 38 plants in this size group.

TABLE 3.—Distribution of open-market lime (including refractory) plants, 1948–50, according to size of production

Size group (short tons)	1948			1949			1950		
	Plants	Production		Plants	Production		Plants	Production	
		Short tons	Percent of total		Short tons	Percent of total		Short tons	Percent of total
Less than 1,000	23	7,816	(1)	21	6,991	(1)	17	6,199	(1)
1,000 to less than 5,000	33	84,142	1	38	106,799	2	29	77,098	1

[1] Less than 0.5 percent.

PRODUCTION BY STATES

In 1950 open-market lime was produced in 32 States and 2 Territories. As in 1949, Ohio was far in the lead as the chief producer, followed by Pennsylvania and Missouri. These three States together contributed 57 percent of the United States output.

TABLE 4.—Lime (quick and hydrated) sold by producers in the United States, 1949–50, by States

[1] Figures that may not be shown separately are combined as "Undistributed."

Hydrated Lime.—About three-fourths of the lime sold is in the form of quicklime and the balance as hydrated lime. In 1950, 25 percent of the total lime output was in hydrated form compared with 27 percent in 1949.

[1] Includes the following States and number of plants in 1950 (1949 same as 1950, unless shown differently in parentheses): Arizona 2, Arkansas 1, Colorado 0 (1), Connecticut 1, Florida 1, Indiana 1, Maine 1 (2), Michigan 1, Minnesota 1, Montana 1, Nevada 2 (1), New Jersey 3, New York 2, Oklahoma 1, Oregon 2 (0), Puerto Rico 3 (4), Utah 2 (3), Washington 1, and Wisconsin 6.

CONSUMPTION AND USES

Table 6, showing sales of lime by States and uses, provides geographic data that may be of interest. Although many figures are concealed to avoid revealing confidential information, the table shows, in general, the more important uses to which the lime of each State is applied and the relative importance of each State as a lime producer.

Table 7, on sales of lime according to use, indicates the great variety of uses to which lime is applied and its importance in agriculture, building construction, and industry in general. The chemical and industrial uses of lime have attained great importance during recent years; in 1950, 55 percent of the total output was applied to such uses. In that year 14 percent more lime was assigned to these categories than in 1949, but there was considerable fluctuation in the relative quantities applied to individual uses. Of the principal uses shown in table 7, the quantities employed in calcium carbide manufacture, insecticides, sewage and trade-waste treatment, and sugar refining were virtually unchanged from 1949. Reflecting the high level of metal production, metallurgical lime increased 25 percent and refractory lime 33 percent over 1949. Lime for glass works increased 23 percent, for paper manufacture 7 percent, and for water purification 14 percent. A small increase was recorded for agricultural lime, and the quantity of lime applied to building uses advanced 19 percent.

The sales distribution of hydrated lime by use is indicated in table 8.

[1] Included with "Undistributed," to avoid disclosure of individual operations.
[2] Bleach used in paper mills excluded from "Bleach" and included with "Paper mills."
[3] Includes citrates, tartrates, and miscellaneous food products.
[4] Includes flotation, cyanidation, bauxite purification, and magnesium manufacture.
[5] Includes barium and vanadium processing, cupola, gold recovery, and unspecified metallurgical uses.
[6] Includes alcohol, alkalies (1950 only), explosives (1949 only), oil drilling, petrochemicals (glycol), plastics, polishing compounds, retarder, sulfur, tobacco, and miscellaneous industrial uses.
[7] Includes lime used by producers (captive tonnage) as follows—1949: 355,367 tons, valued at $3,171,392 1950: 456,191 tons, $3,977,905.

TABLE 8.—Hydrated lime sold by producers in the United States, 1949–50, by uses

Use	1949 Short tons	1949 Value Total	1949 Value Average	1950 Short tons	1950 Value Total	1950 Value Average
Agricultural	216,715	$2,481,195	$11.45	228,864	$2,567,149	$11.22
Building	828,564	10,794,161	13.03	967,065	13,296,618	13.75

Paper mills	44,424	499,630	11.25	52,251	636,442	12.18
Petroleum	26,558	310,894	11.71	26,503	316,100	11.93
Sewage and trade-waste treatment	48,285	559,870	11.60	52,855	630,145	11.92
Sugar refining	26,347	427,864	16.24	24,635	400,802	16.27
Tanneries	42,604	492,578	11.56	47,556	565,178	11.88
Water purification	230,819	2,532,456	10.97	225,638	2,540,915	11.26
Undistributed [1]	24,162	267,475	11.07	37,504	462,692	12.34
Unspecified	58,054	675,559	11.64	74,911	864,313	11.54
Total	648,667	7,579,187	11.68	689,172	8,257,796	11.98
Grand total, hydrated lime	1,693,946	20,854,543	12.31	1,885,101	24,121,563	12.80

[1] Includes cement products, glass, glue, grease (lubricating) 85-percent magnesia (1949 only), medicines and drugs, oil-well drilling, rubber, wood distillation, and miscellaneous industrial uses.

To furnish a more comprehensive picture of the various materials used for liming land table 9 shows, in addition to agricultural lime, the quantities of oystershell, limestone, and calcareous marl that are applied to soil amendment.

TABLE 9.—Agricultural lime and other liming materials sold by producers in the United States, 1949–50, by kinds

Kind	1949 Short tons Gross weight	1949 Short tons Effective lime content [1]	1949 Value Total	1949 Value Average	1950 Short tons Gross weight	1950 Short tons Effective lime content [1]	1950 Value Total	1950 Value Average
Lime:								
Quicklime	111,813	95,040	$1,063,125	$9.51	103,823	88,250	$1,037,222	$9.99
Hydrated lime	216,715	151,700	2,481,195	11.45	228,864	160,200	2,567,149	11.22
Oystershells (crushed) [2]	38,366	18,030	268,458	7.00	55,075	25,890	320,557	5.82
Limestone	21,482,910	10,096,970	33,251,141	1.55	19,348,820	9,093,950	30,393,075	1.57
Calcareous marl [3]	166,800	70,060	231,975	1.39	347,843	146,090	246,451	.71
Total		10,431,800	37,295,894			9,514,380	34,564,454	

[1] Calculated upon basis of average percentages used by the National Lime Association, as follows: Quicklime (including lime from oystershells), 85 percent; hydrated lime, 70 percent; pulverized uncalcined limestone and oystershells, 47 percent; calcareous marl, 42 percent.
[2] Figures compiled by Fish and Wildlife Service.
[3] The great increase in calcareous marl in 1950 compared with 1949 was due in part to more complete coverage of marl producers in Michigan.

Apparent Consumption by States.—Lime plants are widely distributed, and most of the lime manufactured is used in local market areas. However, as some States produce a surplus and others are deficient in production, considerable quantities enter interstate trade as indicated in table 10. Furthermore, limes vary considerably in physical and chemical properties, and the peculiar needs of consuming industries commonly demand shipments from distant points. The principal States that exported lime beyond their borders in 1950 were Ohio, Missouri, Pennsylvania, West Virginia, and Virginia. Data on origin and destination of lime shipments, by States and groups of States, are given in tables 11 and 12.

TABLE 10.—Apparent consumption of open-market lime in continental United States in 1950, by States, in short tons

State	Sales by producers	Shipments from State [1]	Shipments into State	Apparent consumption

[1] Data not available.

PRICES

The uptrend in prices continued in 1950; the average selling price, f. o. b. plant, was $11.13 per short ton compared with $10.97 in 1949. The average selling price of quicklime in 1950 was $10.57 ($10.48 in 1949), and of hydrated lime $12.80 ($12.31 in 1949).

FOREIGN TRADE [2]

Imports.—Imports of lime into the United States which are relatively small originate chiefly in Canada to satisfy local needs in border areas, particularly in the State of Washington. Imports during recent years are indicated in tables 14 and 15.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

NEW DEVELOPMENTS

Committee C–7 on Lime of the American Society for Testing Materials is making progress toward establishing specifications for hydrated lime for grease manufacture, quicklime for calcium carbide manufacture, and lime used for treating leather. The committee is working in cooperation with Committee C–14 on Glass in perfecting methods for determining the iron content of lime. It is also sponsoring research on popping and pitting. The framing of a specification for agricultural liming materials is not favored by the committee.[3]

The Armour Research Foundation claims to have developed a procedure for preparing completely hydrated dolomitic lime without employing the autoclave treatment now used in the manufacture of finishing lime. The method can also be used to prepare high-calcium finishing limes of any desired plasticity. Details of the new method have not yet appeared.[4]

Technical problems in lime burning have been discussed in some detail by Gibbs. The elements of sensible heat, latent heat, and time are described in their relation to the calcination process. Heat losses, fuel efficiency, and kiln design are other subjects covered.[5]

Instrument control is becoming increasingly important as a means of promoting efficiency in lime burning. Helpful suggestions on the subject have been supplied by Warner.[6]

A new quick process for production of the so-called aged lime putty has been developed by the Miller-Komline Co., Peapack, N. J.[7]

Azbe has proposed a new design for rotary kilns to conserve heat and promote general efficiency.[8]

The city of Miami, Fla., now operates a rotary-kiln lime plant to calcine sludge that accumulates from treatment of the municipal water supply. The plant not only supplies all the lime needed for water treatment but produces surplus lime for sale, because the sludge consists of both the lime added to the water and the precipitated lime originally dissolved in the water.[9]

Magnesium

By H. B. Comstock

GENERAL SUMMARY

CONSUMPTION of magnesium, which has been increasing progressively since 1947, continued to rise at a greater rate in 1950. The rising demand stimulated a marked rise in production to 15,726 tons, 36 percent more than in 1949. The production rate at the end of the year was about 4 million pounds per month compared with an estimated demand of 5 million pounds. The total output of primary magnesium for the year was from the Dow Chemical Co. plant at Freeport, Tex. Recovery of magnesium from secondary sources in 1950 increased 30 percent over 1949 and totaled 7,740 short tons. Consumption exceeded production by more than 4,000 tons, the excess being drawn from producers' stocks.

The price of domestic primary magnesium, which had remained stable at 20.5 cents per pound from 1943 to 1950, increased three times during 1950. In June the price increased to 21.5 cents, in July to 22.5 cents, and in September to 24.5 cents per pound.

The world production of magnesium for 1950 is estimated at 40,000 metric tons (44,000 short tons), a 14-percent increase over 1949. More than a third was produced by United States; the remainder was produced chiefly by the U. S. S. R., United Kingdom, Canada, and France.

The outstanding influence in the industry has been the increasing demand for structural products by the armed forces and purchases for the National Strategic Stockpile. A sum of $9 million was appropriated by Congress for reactivating six of the seven Government-owned magnesium plants to supplement production from the Freeport plant.

TABLE 1.—Salient statistics of the magnesium metal industry in the United States, 1941–45 (average) and 1946–50

PRODUCTION

Primary.—The output of the only domestic producer of primary magnesium, the Freeport, Tex., plant of the Dow Chemical Co., was 15,726 short tons for 1950 or 36 percent above 1949. The annual capacity of this plant was increased to 24,000 tons. Plans were under way for the further increase of primary magnesium production by reactivation of the Government-owned magnesium plants to supply Government requirements for the metal in the defense program, as provided in the Critical Materials Stockpiling Act (Pub., 520, 79th Cong., 2d sess., as amended), the National Reserve Act of 1948 (Pub., 883, 80th Cong., 2d sess.), and the Defense Production Act (Pub., 774, 81st Cong.). Six of these plants were expected to start production by July 1951. The seventh, at Luckey, Ohio, has been operated by the Brush-Beryllium Co. since May 1949 for production of beryllium, and it had not yet been determined whether it would be converted to the production of magnesium. The total production capacity after the reactivation program was completed was to be about 127,000 tons per year.

TABLE 2.—Production of primary magnesium in the United States, 1949–50, by months, in short tons

Month	1949	1950	Month	1949	1950
January	988	1,002	August	970	1,400
February	884	913	September	974	1,635
March	988	948	October	941	1,690
April	958	957	November	969	1,760
May	987	972	December	1,004	1,942
June	950	1,175			
July	985	1,332	Total	11,598	15,726

The Government-owned plants are as follows:

	Capacity (tons)
Electrolytic process:	
Painesville, Ohio	18,000
Velasco, Tex	36,000
Ferrosilicon process:	
Luckey, Ohio	5,000
Spokane, Wash	24,000
Manteca, Calif	10,000
Wingdale, N. Y	5,000
Canaan, Conn	5,000

The Painesville, Ohio, plant was operated during World War II by the Diamond Magnesium Co., a wholly owned subsidiary of Diamond Alkali Co. It produced 42,162 tons of magnesium ingot before it was closed in September 1945.

The Velasco, Tex., plant, operated by Dow Chemical Co. during World War II, produced 83,500 tons of magnesium ingot before it was closed September 19, 1945. This plant probably can produce at 130 percent of its rated capacity of 36,000 tons per year if necessary.[1] It is considered the most economical of the Government-owned plants.

[1] Surplus Property Administration, Magnesium Plants and Facilities: Report to the Congress, Dec. 7 1945, p. 37.

The Spokane, Wash., plant did not get into full operation during World War II owing to the late date of its completion and labor problems in the Northwest at that time. It did, however, produce 12,000 tons of primary magnesium and 12,000 tons of ferrosilicon before it was closed in November 1944. This plant is an entirely complete production unit; it has its own dolomite quarry and calcining equipment and its own facilities to produce ferrosilicon.

The Manteca, Calif., plant, operated by Permanente Metals Co., was closed June 1, 1944, after it had produced 12,795 tons of magnesium. The ferrosilicon furnaces are at Permanente, Calif., and the dolomite quarry and calcining facilities at Natividad, Calif.

The two smallest defense plants, at Wingdale, N. Y. and Canaan, Conn., are similar in design and in most other respects and are approximately 35 miles apart. The Wingdale magnesium plant produced 2,227 tons of ingot before it was closed on June 1, 1944, but it never operated at capacity. The Canaan plant served as a pilot plant for the other ferrosilicon reduction plants during World War II; it produced 9,000 tons of magnesium and 500 tons of metallic calcium before it was closed September 19, 1947.

It is estimated that the fabrication capacity of magnesium doubled during the 2 years, 1949–50. Present rolling-mill capacity for sheet is 200 tons monthly. Rolling-mill facilities were augmented in 1950 by the establishment of a rolling mill in New Kensington, Pa., and will be further increased when the former Standard Steel Spring plant at Madison, Ill., is put into operation. Plans were under way for the installation in the Madison plant of the first modern continuous rolling mill for magnesium. During 1950 about 65 firms were regularly producing magnesium castings. Production of wrought products exceeded that of castings for the first time in the history of the magnesium industry. Many improvements, resulting in decreased labor costs, have been made in producing wrought products.

Secondary.—Recovery of secondary magnesium, including alloying ingredients and secondary magnesium incorporated in primary ingot, totaled 7,740 short tons in 1950 compared with 5,962 short tons in 1949. Of this quantity, 7,568 tons was recovered from 8,367 tons of magnesium-base scrap in 1950. Old scrap constituted about 62 percent of the scrap consumed compared with 48 percent in 1949. Of the 1950 recovery, 3,682 tons was in ingot form, 2,504 tons in castings, 281 tons in magnesium-alloy shapes, 810 tons in aluminum-base alloys, 57 tons in zinc-base alloys, 311 tons in anodes and strip for cathodic protection, and 95 tons in chemicals and other nonrecoverable forms. Additional information on secondary magnesium may be found in the Secondary Metals—Nonferrous chapter of this volume.

CONSUMPTION AND USES

Total consumption of primary magnesium in 1950 amounted to 18,051 tons, an increase of 6,104 tons above 1949 consumption and 2,325 tons higher than 1950 production. The excess represents withdrawals from inventories.

Transportation equipment continued to consume the largest amount of magnesium. Perhaps the most significant increase in the use of magnesium was in die castings for automotive parts. The production

TABLE 3.—Production, sales, exports, and apparent consumption of primary magnesium in the United States, 1946–50, in short tons

Year	Production		Sales	Exports [1]	Apparent consumption [2]
	Raw, crude, and pure ingot	Ingot equivalent			
1946	5,317	5,317	8,916	207	8,709
1947	12,344	12,344	5,264	315	4,949
1948	10,003	10,003	8,489	274	8,215
1949	11,598	11,598	12,977	432	12,545
1950	15,726	15,726	20,370	586	19,784

[1] Primary metal only.
[2] Does not consider fluctuations in consumers' stocks and metal derived from scrap. Net withdrawals from producers' stocks were 3,599 tons in 1946, 1,379 in 1949, and 4,464 in 1950. Net additions to producers' stocks were 7,080 tons in 1947 and 1,514 tons in 1948.

of permanent mold castings showed the first major increase since 1945, rising from 44 tons in 1949 to 573 tons in 1950. The principal use of the metal in the aircraft industry was for structural parts of the engines and wheels. The amount of magnesium sheet used for stressed skin applications in aircraft also increased. There were other increases in use of magnesium in fabricating such equipment as paper-mill rolls, portable tools, ladders, dockboards, grain shovels, gangplanks, and hand trucks, where weight saving is very important. Magnesium die castings are well-established in calculators and business machines.

Although the most important use for magnesium is as a structural metal, it is also finding increased application for other purposes. The use of magnesium for cathodic protection, which had consumed less than 500 tons in previous years, increased to 1,937 tons in 1950. The protection of steel ground pipe from corrosion by using sacrificial magnesium anodes is now an established practice. Its use as a constituent

TABLE 4.—Actual domestic consumption of primary magnesium (ingot equivalent and magnesium content of magnesium-base alloys) by uses, 1946–50, in short tons

in producing aluminum alloys increased more than 100 percent over 1949. Substantial quantities of magnesium are being consumed in the reduction of titanium and zirconium. Small amounts of magnesium are added to gray cast iron before pouring to produce a so-called nodular cast iron with improved strength and ductility. Other applications that are consuming increased amounts of magnesium are zinc and nickel alloys and photoengraving printing processes involving direct printing from magnesium plates.

STOCKS

Inventories of primary magnesium ingot at Freeport, Tex., the only plant producing in 1950, declined to about 20 percent of annual production by December 31. Total consumers' stocks of primary metal dropped to about 1,650 tons. Thus, total stocks decreased in 1950 to less than 2 months' supply at the year-end rate of consumption. Government agencies continued to hold large quantities of surplus magnesium left from stocks accumulated during World War II. In September magnesium was placed on the list of materials to be purchased for the National Stockpile.

PRICES

The base price of primary magnesium, which had remained at 20.5 cents per pound since January 1943, was increased in June to 21.5 cents; in July the price advanced to 22.5 cents and in September to 24.5 cents per pound. These increases were part of the increase that occurred in prices of metals generally.

FOREIGN TRADE [2]

Imports.—Total imports of magnesium during 1950 decreased to 868 tons, only 34 percent of those for 1949. Of the 843 tons of metal and scrap imported, 333 were from France, 203 from Germany, 91 from United Kingdom, 74 from Belgium and Luxembourg, 65 from Italy, 40 from India, 23 from French Morocco, 10 from Canada, 3 from the Netherlands, and 1 from the Bahamas. Tariff rates on magnesium in 1950 were as follows: Metallic, 20 cents per pound; alloys, powder, sheets, tubing, wire, manufactures, etc., 20 cents per pound on magnesium content plus 10 percent ad valorem; and metallic scrap, 20 cents per pound until October 1, 1950 when the duty was suspended.

Exports.—Total exports of magnesium were 908 tons in 1950, an increase of 28 percent over the 708 tons shipped in 1949. Of the metal exported in primary form during 1950, 470 tons went to Mexico, 110 to Argentina, and the remaining 6 to three other countries. The United Kingdom received 146 tons of the metal exported as powder, ribbons, and other forms; Colombia received 100 tons; Canada, 40 tons; Saudi Arabia, 17 tons; Venezuela, 11 tons; and other countries, 8 tons.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TABLE 5.—Magnesium imported for consumption and exported from the United States, 1946–50

[U. S. Department of Commerce]

Year	Imports						Exports			
	Metallic and scrap		Alloys (magnesium content)		Sheets, tubing, ribbons, wire, and other forms (magnesium content)		Metal in primary form		Powder, ribbons, and metal in other forms

TECHNOLOGY

Magnesium has two advantages over other metals that are likely to have an increasing effect in extending its use as a structural metal. It is the lightest of the metals available for structural uses, and the raw materials for its production are virtually unlimited. Weight saving is becoming increasingly important in transportation, military equipment, and reducing inertial stresses created by rapid acceleration and deceleration of moving parts in machines. Likewise, the rising costs of labor are placing increased values on lightness in tools and equipment to be moved by hand. The unique position of magnesium alloys as a lightweight structural metal is stimulating more and more interest in development of alloys and techniques for fabrication. The abundance of sea water, carnallite, and dolomite as raw materials for production of magnesium, at a time when depletion of ores of other structural metals is becoming critical, is another reason for increased attention to the technology of magnesium to extend its field of application.

All production of primary magnesium for 1950 came from the Dow Chemical Co. plant at Freeport, Tex., which extracts magnesium from sea water. The essential steps of the process are summarized as follows: [3]

Sea water, which contains 0.13 percent magnesium, is mixed with a slurry of calcium hydroxide or milk of lime. The magnesium in solution in the sea water is precipitated as magnesium hydroxide because of its greater insolubility. The precipitated magnesium hydroxide settles out of the sea water in large settling tanks or Dorr thickeners and is pumped from the bottom of the tank as a thin slurry containing about 17 percent magnesium hydroxide by weight. Precipitation of the magnesium permits elimination of about 98 percent of the volume of sea water in the first step of the process.

[3] Shigley, C. M., Minerals from the Sea: Am. Inst. Min. and Met. Eng., Jour. Metals, vol. 191, No. 1, January 1951, pp. 25–29.

The magnesium hydroxide slurry is filtered and neutralized with hydrochloric acid to form a 15-percent solution of magnesium chloride. The magnesium chloride solution is evaporated and dehydrated to a composition having the approximate composition $MgCl_2 \cdot 1\frac{1}{2}\ H_2O$, the material fed to the electrolytic cells for reduction to metallic magnesium.

Important developments in magnesium alloys were made during the year in the use of rare-earth metals and zirconium as alloying constituents; there was also further investigation of magnesium-lithium alloys. Zirconium was added to magnesium-zinc alloys for grain refining. The alloy ZK 61, containing 5.5–6.5 percent Zn and 0.7–0.9 percent Zr, is reported to have the highest strength : weight ratio of any commercial casting alloy.[4] Rare earths in amounts up to 3 percent are added to magnesium alloys to improve the mechanical properties at elevated temperatures (creep strength).

A good deal of attention has been given by research metallurgists to the study of magnesium-lithium alloys.[5] The hexagonal alpha structure of magnesium is changed to the more ductile and workable body-centered-cubic beta structure by adding 10 percent lithium, but these alloys are subject to overaging and loss of strength at temperatures of 150°–200° C. The ductility of such alloys is destroyed by even small traces of sodium, so sodium-free metals must be used. Sodium may be removed by using a LiCl–LiF flux, bubbling nitrogen into the melt, or by absorption of the sodium by an immersed graphite rod.

Magnesium alloys containing lithium absorb oxygen and nitrogen from the air; therefore special equipment and techniques were devised in Bureau of Mines laboratories for preparing and melting such alloys. This procedure involved vacuum treatment of the charge to eliminate absorbed gases and maintaining an atmosphere of helium around the metal during melting and casting. This technique has permitted the casting and rolling of alloys containing as much as 40 percent lithium.

A technique was developed in the laboratory whereby magnesium powder was extruded directly to form rods ⅜ inch in diameter or strips having a cross section of ¾ by 1/16 inch.[6]

WORLD REVIEW

The estimated world production of primary magnesium in 1950 was 40,000 metric tons, or about 14 percent above the 1949 total. World markets reflected an appreciable gain in military consumption. Strongest increases in civilian consumption were noted in the United States.

[2] Data not available; estimate by author of chapter included in total.
[3] Estimated figure.
[4] British and American zones only.
[5] Includes secondary metal.
[6] 1944–49 figures revised.

Canada.—The ferrosilicon plant of Dominion Magnesium, Ltd., at Haley, Ontario, resumed production in July 1950, at the annual rate of 5,000 metric tons and was the only plant to produce primary magnesium in Canada during the year. It had been shut down since 1946. No plans are being made to expand production facilities. About 80 percent of the magnesium produced is exported. Most of the exports are destined for the United Kingdom. Of the 20 percent consumed in the country, 10 percent is used in making aluminum alloys, and the other 10 percent is used in the Dominion Magnesium, Ltd., extrusion plant and casting foundry.[7]

U. S. S. R.—It was reported that magnesium is produced in the plant near Solikamsk in the Ural Mountains, using carnallite from the local potash deposits, and that present production of this plant has probably risen to 5,000 tons or more.[8] Postwar production in Russia may have been further increased by transfer to that country of the Aachen, Germany, plant with an estimated annual capacity of 12,000 tons and transfer of the 20,000-ton plant from the Soviet zone of Austria.[9]

United Kingdom.—Two privately owned plants produced over 4,000 metric tons of magnesium in 1950, part of which was secondary metal. Three Government-owned magnesium plants ceased operations in 1950, and one of them was dismantled.[10] Annual production of magnesium in Britain was expanded, under Government control, after 1940 until it reached a figure of 20,000 to 30,000 tons for all makers.

[9] Mining World, vol. 13, No. 4, April, 1951, p. 15.
[10] However, one of the remaining plants, the Clifton Junction works near Manchester was scheduled for reactivation early in 1951. (Ball, Maj. C. J. P., Magnesium, Lightest of the Light Alloys: Light Metals, vol. 14, No. 159, June 1951, pp. 329–334.)

Magnesium Compounds

By Joseph C. Arundale and F. M. Barsigian

GENERAL SUMMARY

DOMESTIC production of crude magnesite, as well as refractory magnesia and dead-burned dolomite, was greatly increased during 1950 as a result of expansions in the steel industry. Further expansions were being planned as a result of anticipated increases in steel-making capacity. Industrial activity, accelerated by the defense program, resulted in increased production of other magnesium compounds, such as the high-grade magnesias and magnesium chloride.

The assets of an important Austrian magnesite and refractories firm were acquired by a domestic concern.

TABLE 1.—Salient statistics of magnesite, magnesia, and dead-burned dolomite in the United States, 1946–50

	1946	1947	1948	1949	1950

[1] Figure withheld to avoid disclosure of individual company operation.
[2] Partly estimated; most of crude is processed by mining companies, and very little enters open market.
[3] Average receipts f. o. b. mine shipping point.

DOMESTIC PRODUCTION

Magnesite.—Domestic production of 429,392 short tons of crude magnesite during 1950 was nearly 50 percent greater than the previous year and represented the largest tonnage since the war years 1943 and 1944. Refractory magnesia was produced at an all-time high. This greatly increased output was attributable mainly to the record production of basic steel, wherein the bulk of refractory magnesia is consumed, and to the construction of new basic open-hearth furnaces. The domestic steel industry consumed a record 106,610,273 long tons of iron ore during the year. Many firms producing refractory magnesia were making plans for greatly increased production in view of the steel industry's decision to increase steel-making capacity to 118,000,000 tons by 1953.

TABLE 2.—Magnesia sold or used by producers in the United States, 1949–50, by kinds and sources

Magnesia	From magnesite, brucite, and dolomite [1]		From well brines, raw sea water, and sea-water bitterns [1]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1949						
Caustic-calcined	8,992	$831,674	23,513	$2,277,707	32,505	$3,109,381
Refractory	175,364	6,763,294	75,025	3,714,562	250,389	10,477,856
Total	184,356	7,594,968	98,538	5,992,269	282,894	13,587,237
1950						
Caustic-calcined	6,418	740,369	35,029	3,396,529	41,447	4,136,898
Refractory	232,283	9,358,483	103,157	5,557,371	335,440	14,915,854
Total	238,701	10,098,852	138,186	8,953,900	376,887	19,052,752

[1] Magnesia made from a combination of dolomite and sea water is included with that from sea water.

Dolomite.—The intense activity in the steel industry was also reflected in increased sales of dead-burned dolomite and accounted for the bulk of the more than 1,750,000 tons sold in the United States during 1950. As in the case of magnesia, many firms producing dead-burned dolomite were implementing plans to greatly increase capacity. In view of the shortage of both magnesia and dead-burned dolomite, these expansion programs were stimulated and aided by the provisions of the Defense Production Act of 1950, particularly by accelerated tax-amortization provisions.

In a period when steel furnaces are being pushed to capacity and new hearths are being built, both refractory magnesia and dolomite are consumed at a greater rate per ton than normally. In addition, there is an over-all trend toward greater consumption of these basic refractories per ton of steel.

Additional information on dolomite may be found in the Stone and Lime chapters of this volume.

TABLE 3.—Dead-burned dolomite sold in and imported into the United States, 1945–50

Year	Sales of domestic		Imports [1]		Year	Sales of domestic		Imports [1]	
	Short tons	Value	Short tons [2]	Value		Short tons	Value	Short tons [2]	Value
1945	1,187,334	$10,613,711	(3)	$7	1948	1,544,755	$17,847,182	2,427	$91,613

1947	1,395,203	14,295,359	53	2,194	1950	1,759,443	21,725,560	2,127	86,425

[1] "Dead-burned" basic refractory material consisting chiefly of magnesia and lime.
[2] Includes weight of immediate container.
[3] Less than 0.5 ton.

Other Magnesium Compounds.—The high level of industrial activity was reflected in both production and sales of the light and heavy high-grade magnesias. A substantial increase in production of magnesium chloride was necessary to supply increased demand from the magnesium-metal industry.

TABLE 4.—Specified magnesium compounds produced, sold, and used by producers in the United States, 1949–50 [1]

Product [1]	Plants	Produced (short tons)	Sold [2]		Used (short tons)
			Short tons	Value	
1949					
Specified magnesias (basis 100 percent MgO), U. S. P. and technical:

[1] In addition to the compounds shown, magnesium chloride, hydroxide, nitrate, phosphate (1950 only), and sulfate were produced. Figures for these items are withheld to avoid disclosure of individual company operations.
[2] Sales by a producer to an affiliated consumer for immediate use are not included with "Sold" but are with "Used."
[3] Figure withheld to avoid disclosure of individual company operations.
[4] A plant producing more than 1 grade is counted but once in arriving at total.

REVIEW BY STATES

California.—Johns-Manville Products Corp., 22 East Fortieth Street, New York 16, N. Y., produced magnesium carbonate from purchased magnesium hydroxide at Redwood City, Calif., for use in 85-percent magnesia insulation. Kaiser Aluminum & Chemical Corp., Kaiser Building, Oakland, Calif., operated its magnesia-from-sea-water plant at Moss Landing, producing refractory and caustic-calcined magnesias. Marine Magnesium Products Corp., South San Francisco, Calif., recovered precipitated magnesium carbonate, magnesium hydroxide, and specialty magnesias, using lime, dolomite, sea-water bitterns, and water from San Francisco Bay as raw materials. Pabco Products, Inc. (formerly The Paraffin Cos., Inc.), 1550 Powell Street, Emeryville 8, Calif., produced magnesium carbonate from purchased magnesium hydroxide for use in 85-percent magnesia insulation. Westvaco Chemical Division, Food Machinery & Chemical Corp., 405 Lexington Avenue, New York 17, N. Y., produced a small quantity of magnesite from its Western mine near Livermore, Calif., and reported that its calcining plant was idle during 1950. This firm also produced at its Newark plant refractory and caustic-calcined magnesia from sea-water bitterns and dolomite and caustic-calcined magnesia from magnesite. At its Chula Vista plant it recovered magnesium chloride from sea-water bitterns.

Illinois.—Johns-Manville Products Corp., 22 East Fortieth Street, New York 16, N. Y., produced precipitated magnesium carbonate by the Pattinson process at its Waukegan, Ill., plant for use in 85-percent magnesia insulation.

Michigan.—The Dow Chemical Co., Midland, Mich., produced magnesium chloride and epsom salt from well brines, dolomite, and lime. Michigan Chemical Corp., St. Louis, Mich., produced magnesium carbonate and magnesia from well brines and dolomite. The Morton Salt Co., 120 South LaSalle Street, Chicago 4, Ill., produced precipitated magnesium carbonate from well brines at its Manistee, Mich., plant. Standard Lime & Stone Co., 2000 First National Bank Building, Baltimore 3, Md., produced refractory-grade magnesia from well brines and lime at its plant at Manistee.

Nevada.—Basic Refractories, Inc., 845 Hanna Building, Cleveland, Ohio, produced magnesite and brucite at its operation near Gabbs, Nev. This material is processed into a line of refractories at its Maple Grove, Ohio, plant.

Sierra Magnesite Co., Box 8–A, Newark, Calif., produced magnesite from its Segerstrom mine near Gabbs, Nev. The Standard Slag Co., 1200 Wick Building, Youngstown, Ohio, produced magnesite from its mine near Gabbs, Nev., and reported for the first time sales of calcined material. Previously, this firm shipped only raw magnesite.

New Jersey.—The J. T. Baker Chemical Co., Phillipsburg, N. J., produced a line of magnesium compounds from purchased magnesium carbonate. Johns-Manville Corp., at its Manville plant, produced precipitated magnesium carbonate by the Pattinson process for use in 85-percent magnesia insulation. Northwest Magnesite Co., 1922 Farmers Bank Building, Pittsburgh 22, Pa., continued to recover refractory-grade magnesia from sea water and dolomite at its Cape May, N. J., plant.

Ohio.—The Diamond Alkali Co., Union Commerce Building, Cleveland, Ohio, produced refractory magnesia from dolomite at Fairport.

Pennsylvania.—Both Keasbey & Mattison Co., Ambler, Pa., and the Philip Carey Manufacturing Co., Cincinnati 15, Ohio (plant at Plymouth Meeting, Pa.), produced magnesia and magnesium carbonate. The Ehret Magnesia Manufacturing Co., Valley Forge, Pa., produced precipitated magnesium carbonate. All three firms used the Pattinson process, and the magnesium carbonate produced was for use in 85-percent magnesia insulation.

Texas.—The Dow Chemical Co., at Freeport, Tex., recovered magnesium chloride from raw sea water as an intermediate in the production of magnesium metal. It also produced some magnesia.

Washington.—The Laucks Chemical Co., 1008 Western Ave., Seattle 4, Wash., produced epsom salt from a natural deposit near Tonasket. Northwest Magnesite Co., 1922 Farmers Bank Building, Pittsburgh 22, Pa., the largest producer of natural magnesite in the United States, produced refractory magnesia near Chewelah.

West Virginia.—The Standard Lime & Stone Co., 2000 First National Bank Building, Baltimore 3, Md., produced a refractory magnesia from dolomite at its Millville, W. Va., plant.

PRICES

According to E&MJ Metal and Mineral Markets, the price of dead-burned grain magnesite per ton, f. o. b. Chewelah, Wash., rose in May to $33.00 in bulk and $38.00 in bags, increasing in October to $36.30 in bulk and $41.80 in bags, from $30.50 to $31.00 in bulk and $35.00 to $35.50 in bags, respectively, in 1949. The Westvaco Chemical Division of Food Machinery & Chemical Corp. quoted prices of its magnesias (carlots, f. o. b. California), late in the year as follows: Powdered caustic-calcined magnesite, in bags, $75; kiln-run 90-percent sea-water periclase remained at $50.50 per ton in bulk throughout the year.

According to the Oil, Paint and Drug Reporter, magnesium hydroxide, medicinal grade, was quoted at 29 to 30 cents per pound throughout the year. As for the past few years, magnesium carbonate, technical grade, bags, carlots, freight equalized, was quoted at 9 to 9½ cents per pound and magnesium carbonate, U. S. P. grade, at 10¾ to 11¼ cents. Magnesium carbonate is quoted freight allowed to New Jersey (except to Atlantic, Burlington, Cape May, Cumberland, Gloucester, Ocean, and Salem Counties) and to Philadelphia County, Pa. Freight was equalized with New York City on all other destinations. Magnesium chloride, flake, barrels, carlots, works, was increased to $45.00 per ton in July. Epsom salt, technical, bags, carlots, was quoted at $2.15 per 100 pounds throughout the year. Technical-grade calcined magnesia, cartons, works, was quoted at 32 to 34¾ cents per pound; synthetic, rubber grade, cartons, works, was 29 to 31 cents per pound; U. S. P. light, cartons, at 34 to 36 cents per pound; and U. S. P. heavy, barrels, at 36 to 38 cents per pound.

FOREIGN TRADE [1]

The domestic shortage of refractory magnesia accounted for sizable imports from Austria—the only important shipment from this country since before World War II. The small imports of magnesia from India and Canada shown in table 5 are principally high-grade periclase or electrical-grade magnesia.

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TECHNOLOGY

European all-basic open-hearth furnace designs and general practices were investigated to determine if they suggest improvements in similar-type hearths in the United States. The results of this investigation were presented in considerable detail. It was concluded that improvement of some domestic practices, particularly in design of furnace port ends, may result from use of European techniques. In other instances, American techniques may improve results in European all-basic open hearth furnaces. Many of the designs and techniques on the other hand, are similar.[2]

Progress reports on all-basic furnaces in the United States and Canada were presented. Experience during the year indicated that the all-basic furnace had not as yet proved economically advantageous over the conventional silica-roof furnaces which is probably due to the cost of basic construction and high rate of fuel consumption.[3]

The performance of high-magnesia ramming mixes, a controversial subject during the past few years, was reviewed for one open-hearth shop.[4]

WORLD REVIEW

Austria.—The accompanying table shows that the Austrian magnesite industry is continuing to recover from the postwar slump and is increasing its output of magnesite. Increases will also be noted in Greece, Southern Rhodesia, Union of South Africa, and others.

The General Refractories Co. of Philadelphia, Pa., purchased all of the outstanding capital stock of the American-Austrian Magnesite Corp., which owns all of the stock of Austro-American Magnesite Co., which in turn owns and operates magnesite deposits and a refractory brick plant near Radenthein, Austria. Production from this operation is expected to be increased by the application of "American patents, processes, and know-how."[5]

In an agreement signed February 25, 1950, and effective March 1, 1950, valid for 1 year, magnesite bricks and other refractory products valued at $40,000 are given in list B, Austrian export goods for Greece.[6]

Magnesite and magnesite brick valued at 300,000 Swedish kronor are listed under Austrian export goods in a supplemental protocol to the Austro-Swedish agreement of April 2, 1948, made effective in Vienna December 19, 1949, extending the formal trade agreement between the two countries to December 31, 1950.[7]

[1] Unless otherwise stated, quantities in this table represent crude magnesite mined. In addition to countries listed, magnesite is also produced in Anglo-Egyptian Sudan, Canada, China, Cuba, U. S. S. R., and Yugoslavia, but data on tonnage of output are not available; estimates by senior author of chapter included in total.

The Canadian production was actually magnesitic dolomite and brucite, valued as follows: 1944: C$1,139,281; 1945: C$1,278,596; 1946: C$1,225,593; 1947: C$1,167,584; 1948: C$1,587,709; beginning in 1949 value includes magnesium metal: 1949: C$1,536,200; 1950: C$1,473,377.

[2] Data not available; estimate by senior author of chapter included in total.

[3] Excluding New South Wales and South Australia.

[4] Estimate.

[5] January to June, inclusive.

[6] Exports.

[7] Bureau of Mines not at liberty to publish figure; included in total.

France.—A decree dated December 10, 1949, authorizes the National Industrial Nitrogen Office (Office National Industriel de l'Azote) to increase its financial participation in the potash and magnesia mines of Boudigot.[8]

Greece.—As of July 10, 1950, barter premiums on "Groupe 1" ore exports included raw magnesite and listed premiums of 13,400 drachmas to the dollar and 27,100 drachmas to the pound sterling; premiums on "Groupe 2" ores, which include caustic and dead-burned magnesite, were 9,200 drachmas to the dollar and 18,850 drachmas to the pound sterling.[9]

Venezuela.—Although from the standpoint of exploitable reserves magnesite deposits in Venezuela have long been considered promising, production costs have made Venezuelan magnesite uncompetitive in world markets; and, with a relatively small domestic market, the industry has received little impetus in recent years. Indications are that output, all of which was from the Island of Margarita, State of

[8] Bureau of Mines, Mineral Trade Notes: Vol. 30, No. 1, January 1950, p. 41.

[9] Bureau of Mines, Mineral Trade Notes: Vol. 31, No. 5, November 1950, p. 50.

Nueva Esparta, was negligible. Domestic outlets for magnesite are largely reported by requirements from the pharmaceutical industry.[10]

No systematic exploration of magnesite resources in Venezuela has ever been undertaken. Magnesite production, which began early in the 1900's, has been hampered continually by poor market demand locally as well as abroad. The total output of crude magnesite, from the beginning of operations until about 1923 when the workings were abandoned, approximates only 40,000 metric tons. Production was not resumed until 1943, when it was undertaken in deposits near Porlamar.[11]

Manganese

By Norwood B. Melcher

GENERAL SUMMARY

DEALERS and consumers of manganese ore in the United States in 1950 experienced a record year in both imports and consumption. Receipts rose for the second consecutive year and even exceeded those in 1946, when Russia was the main supplier, although less than 4 percent of the 1950 total was supplied by the Soviet Union. This record was made possible by expanding shipments from several of the usual suppliers of recent years, and only very small tonnages originating from new sources.

India established an all-time record high in shipments to the United States during the year. Receipts from India, most of which were metallurgical-grade ore, comprised 34 percent of the import total. This Indian ore averaged 47.5 percent Mn but contained rather high iron. Ore from Central Provinces was more suited for blending with the high-iron ores of South Africa than was the material from the other Provinces.

The Union of South Africa was the second-largest supplier in 1950, furnishing 26 percent of the United States import total. Reserves of manganese in the Union of South Africa are sufficient to permit large expansion in the shipments from that country; however, movement to the United States, as well as other countries, is hindered by shortage of transportation facilities, particularly railroad cars in the Union. Also, in 1950 some limitations were felt because of a shortage of ocean bottoms late in the year as a result of transportation demands of United Nations forces in the Far East.

Gold Coast provided some of the most desirable grades of metallurgical ore, being high in manganese and low in iron. Thus, this material is in demand for blending with the higher iron ores from South Africa and India. Gold Coast also provided the bulk of the total United States receipts of battery- and chemical-grade ores during the year. The oxide ore from Gold Coast is suitable as a natural ore in the manufacture of dry-cell batteries and is also used for many chemical purposes, including the production of hydroquinone, permanganates, fluxes, and dyes.

Receipts of ore from Cuba (general imports) increased 59 percent over 1949. Increased mining activity in Cuba, resulting from higher prices, caused a 26-percent increase in that country's production, which, at the end of the year, was at a rate of virtually 100,000 tons annually. Indications were that this rate would be expanded somewhat further in the future.

Mexican shipments dropped sharply during the year, owing to abandonment of certain operations as a result of high costs and the uncertainty of adequate rail-shipment facilities in Mexico.

TABLE 1.—Salient statistics of the manganese industry in the United States, 1946–50, gross weight in short tons

[1] A small quantity of miscellaneous ore is included with battery ore.
[2] Revised figure.

As the 1950 rate of imports was believed to be about the maximum that could be obtained from present facilities, the need for developing new deposits and sources of manganese became more and more pressing. The Interdepartmental Manganese Coordination Committee, mentioned in Manganese chapters for previous years, dissolved its activities during the summer, when it appeared that the need for this coordinated effort between industry and various interested Government agencies had accomplished the goals for which it had been created and that expanded production would now have to await the execution of the various long-term development programs. Belgian Congo and Brazil were expected to become increasingly important as foreign suppliers of manganese ore in the future as a result of these programs.

Expansion of mineral production in the United States was one of the purposes of the Defense Production Act of 1950, Public Law 774, 81st Congress, second session, approved September 8, 1950. This law provided for Government assistance in developing domestic mineral deposits through contracts for Government purchases at above-market prices, if necessary; provided for direct loans to finance new capacity when other means of financing were not available; and provided loans on a Government-industry-participation basis for exploration of areas geologically favorable for the discovery of new reserves. In the last program, later administrative determination resulted in Government participation, with regard to manganese, of 75 percent.

The only contract concerning manganese to be completed in 1950 was a purchase contract with Manganese, Inc., for production of high-grade sintered concentrates from the deposits of ore at the Three Kids Mine in Clark County, Nev. This contract, which was signed with the Emergency Procurement Service (General Services Administration), called for production to begin in the middle of 1952. By the end of 1950 several other applications had also been received by the Defense Minerals Administration, the agency set up to handle applications that affected minerals. These applications covered various types of possible Federal assistance, but none except the Manganese, Inc., application were finally acted upon in 1950. A fourth means of Government assistance, which, although ineffectual in 1950, became available after passage of the Defense Production Act, was a provision in the Internal Revenue Act of 1950, section 124A. This provided that companies engaged in defense production could, under certain circumstances, amortize new facilities as rapidly as in 5 years. Administrative determinations were made as to the extent of the investment that could be amortized on this basis according to individual circumstances.

Research on manganese took on a new impetus in 1950, much of the work being carried out by the Bureau of Mines. The most important projects were the planned construction of a 50-ton-per-day pilot plant at Boulder City, Nev., to treat and beneficiate low-grade ores from Artillery Peak, Ariz., and other low-grade ores, and the construction of an experimental blast furnace and pilot plant in Pittsburgh, Pa., to experiment with recovery of manganese from basic open-hearth slag. This latter project has fascinating possibilities for commercial production, inasmuch as the raw material used has previously been largely discarded, and as much as one-half of our domestic requirements for manganese could be satisfied through full-scale plants of this type. Both pilot-plant projects were made possible by the appropriation of $850,000 by the Congress late in the year.

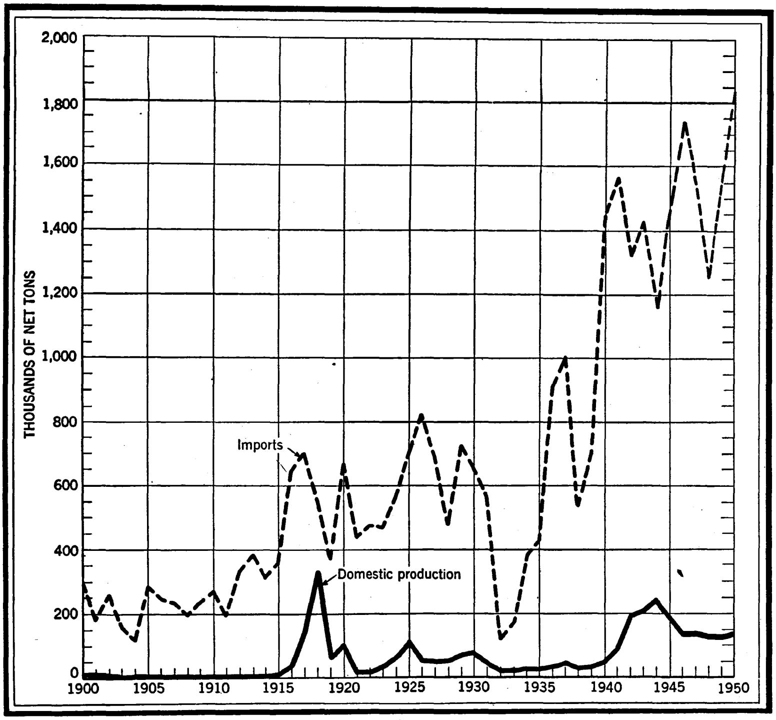

FIGURE 1.—General imports and domestic production (mine shipments) of manganese ore, 1900–50.

DOMESTIC PRODUCTION

Table 2 shows the various types of manganiferous materials shipped by domestic producers from 1946 to 1950.

TABLE 2.—Manganiferous raw materials shipped by producers in the United States, 1946–50, in short tons

Year	Metallurgical ore				Battery ore (25 percent or more Mn)	Miscellaneous ore	
	Manganese ore (35 percent or more Mn)	Ferruginous manganese ore (10 to 35 percent Mn)	Manganiferous iron ore (5 to 10 percent Mn)	Manganiferous zinc residuum		35 percent or more Mn	10 to 35 percent Mn
1946	134,381	100,402	1,070,694	205,786	[1] 8,295	[1] 959	87

MINING BY STATES

Alabama.—Two operators in Cherokee and Calhoun Counties shipped manganese ore averaging (natural) 40 percent manganese.

Arizona.—The Denison Manganese Co. shipped manganese ore containing (natural) 43 percent manganese from the Long Valley mine in Coconino County, and the U. S. Manganese Corp. shipped a (natural) 47 percent ore from Gila County. The Federal Bureau of Mines continued the development project on the Artillery Peak manganese deposit. This work consists of driving underground workings and core drilling, along with sampling.

Arkansas.—Shipments of ore from Independence County were made by Denison Manganese Co. at (natural) 37 percent manganese, and the Westmoreland Manganese Co. shipped hand-sorted ore averaging (natural) 56 percent manganese. These companies also shipped ferruginous ore of (natural) 27 percent manganese.

California.—Four operators shipped (1) a small tonnage of manganese ore containing (natural) 49 percent manganese, and (2) ferruginous ore averaging (natural) 20 percent manganese from Humboldt, Riverside, and Siskiyou Counties.

Michigan.—Shipments of manganiferous iron containing (natural) 5 to 6 percent manganese were made from Iron County.

Minnesota.—The Hanna Coal & Ore Corp., Oliver Iron Mining Co., and Pickands, Mather & Co. shipped manganiferous iron ore from Crow Wing and St. Louis Counties averaging (natural) 6.2 percent manganese. Hanna also shipped 16,206 net tons of ferruginous ore containing (natural) 11 percent manganese.

Montana.—Montana continued to hold its position as the major producing State for manganese ore. Anaconda Copper Mining Co. produced crude ore from the Emma and Butte Hill mines in Silver Bow County and processed it into nodules containing (dry) 58.9 percent manganese, easily maintaining the position of the largest single producer of manganese ore in the United States. In Granite County of the Philipsburg district, the Trout Mining Division of the American Machine & Metals, Inc., shipped middlings averaging (natural) 22.7 percent manganese. Trout Mining Division and Taylor-Knapp Co. shipped 11,507 tons of battery-grade manganese ore averaging (natural) 42 percent manganese, or 66 percent MnO_2.

Nevada.—Eleven operators produced ferruginous ores averaging (natural) 27.4 percent manganese. The largest operator in Nevada was the Charleston Hill National Mines Co., which operated in Humboldt County. All ore was shipped to blast furnaces in Utah for consumption.

[1] Containing 35 percent or more manganese (natural).
[2] Not available; estimate included in total.
[3] Estimate.
[4] Containing 10 to 35 percent manganese (natural).
[5] Containing 5 to 10 percent manganese (natural).
[6] Figure withheld in order to avoid disclosure of individual company operations.

New Mexico.—The Luck Mining & Construction Co. produced ferruginous ore from the Boston Hill mine in Grant County averaging (natural) 11.3 percent contained manganese. The Rock Products Co. produced manganese ore containing (natural) 42 percent manganese.

Tennessee.—The Hambright mine in Bradley County shipped concentrates averaging (natural) 55.4 percent manganese.

Utah.—Thirteen operators in Utah shipped manganese ore containing (natural) 35.5 percent manganese, ferruginous ore averaging (natural) 23.5 percent manganese, and manganiferous iron ore averaging (natural) 9.5 percent manganese.

Virginia.—The Glade Mountain mine in Smyth County shipped a small tonnage of manganese ore containing 44 percent manganese.

CONSUMPTION AND STOCKS

With expanding steel production during 1950 requiring more manganese ore, total consumption during the year exceeded that of the previous year by 21 percent. Domestic mines supplied 7 percent and foreign sources 93 percent, compared with 10 percent and 90 percent, respectively, in 1949. Two and one-half percent was consumed in the manufacture of dry cells, 1.5 percent went into chemicals, and 96 percent was used in the metals industry. Industrial stocks decreased from 928,349 tons on December 31, 1949, to 826,757 tons at the end of 1950, a decrease of 11 percent. A maldistribution of inventories, particularly in the lower iron grades, was apparent in 1949 and became more noticeable by the close of 1950.

TABLE 7.—Apparent consumption of manganiferous raw materials in the United States in 1950

[1] Excluding Government stocks.
[2] Data not available.
[3] Includes only that part of castings made by companies that also produce steel ingots.
[4] Excludes companies that produce both steel castings and steel ingots.
[5] Data for 1950 not available; 1949 figures carried over to show approximate magnitude of consumption and stocks.
[6] The greater part of the consumption of ore was used in the manufacture of ferromanganese and silicomanganese. Combining consumption of ore with that of ferromanganese and silicomanganese would result in duplication.
[7] Excludes small tonnages of producers' stocks.

The consumption of manganese (both in ferroalloy and directly charged ore) in 1950 per short ton of steel manufactured was 13.6 pounds compared to 13.2 pounds in 1949. This increase was in spite of efforts toward conservation and reflected particularly the expanded use of manganese in steels for defense uses. High-manganese steels used for defense purposes, such as armor plate, increase the consumption ratio of manganese considerably. Of the manganese used per ton of steel in 1950, 12.2 pounds was in the form of ferromanganese, 1.0 pound silicomanganese, 0.3 pound spiegeleisen, and 0.1 pound ore. These data apply to consumption of manganese in the manufacture of steel ingots and that part of steel castings manufactured by companies that also produce steel ingots. The companies reporting in this part of the survey are the same as those reporting production of ingots and castings to the American Iron and Steel Institute.

Electrolytic Manganese.—The Electro Manganese Corp., Knoxville, Tenn., was the only producer of electrolytic manganese during 1950.

[1] None produced from foreign ore.
[2] Estimated.

Ferromanganese.—Output of ferromanganese in the United States increased 25 percent to 719,680 short tons in 1950 compared with 577,345 tons in 1949. The following plants were active producers during the year: Bethlehem Steel Co., Johnstown, Pa.; Anaconda Copper Mining Co., Black Eagle and Anaconda, Mont.; the Electro Metallurgical Division of the Union Carbide & Carbon Corp., Ashtabula, Ohio, Alloy, W. Va., and Niagara Falls, N. Y.; E. J. Lavino & Co., Reusens, Va., and Sheridan, Pa.; Tennessee Coal, Iron & Railroad Co., Ensley, Ala; Carnegie-Illinois Steel Corp., Clairton, Duquesne, and Etna, Pa.; Tennessee Products & Chemical Corp., Chattanooga, Tenn.; and Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala. Manganese ore consumed in the manufacture of ferromanganese totaled 1,416,803 short tons in 1950. Of this quantity, 7 percent was of domestic origin and 93 percent foreign. The domestic contribution in 1949 was 10 percent, and in 1948, 6 percent. The recovery of manganese from ore in making ferromanganese was 83.6 percent in 1950 compared with 83.3 percent in 1949 and 84.6 percent in 1948. Shipments of ferromanganese from producing furnaces in 1950 increased 31 percent in quantity and 34 percent in value from 1949. Table 12 gives shipments for 1945–50.

TABLE 10.—Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1946–50

1947	614, 647	79, 972, 673	1950	731, 421	116, 043, 055

Spiegeleisen.—Production of spiegeleisen in the United States continued to decline in 1950 to 42,375 short tons from 78,167 tons in 1949 and 112,610 tons in 1948. Shipments, however, rose 21 percent in quantity, and the value increased 30 percent.

Three companies produced spiegeleisen in four plants in 1950: New Jersey Zinc Co., Palmerton, Pa., Carnegie-Illinois Steel Corp., Clairton and Etna, Pa., and The Tennessee Coal, Iron & Railroad Co., Ensley, Ala. No foreign materials were reported used in the manufacture of spiegeleisen in 1950.

TABLE 13.—Spiegeleisen produced and shipped in the United States, 1945–50

Year	Produced (short tons)	Shipped from furnaces		Year	Produced (short tons)	Shipped from furnaces	
		Short tons	Value			Short tons	Value
1945	139, 039	157, 774	$5, 108, 144	1948	112, 610	108, 960	$5, 261, 650
1946	111, 696	114, 982	3, 793, 673	1949	78, 167	53, 888	2, 972, 653
1947	134, 329	124, 517	4, 980, 030	1950	42, 375	65, 163	3, 875, 823

Manganiferous Pig Iron.—Pig-iron furnaces used 902,110 tons of manganese-bearing ores containing (natural) over 5 percent manganese in 1950. Of the ore used, 708,401 tons was of domestic and 193,709 tons of foreign origin. Of the domestic material used, 622,864 tons contained (natural) 5 to 10 percent manganese, 83,488 tons contained 10 to 35 percent manganese, and 2,049 tons contained over 35 percent manganese. Of the foreign material used, 43,725 tons contained less than 10 percent manganese, 92,905 tons contained 10 to 35 percent manganese, and 57,079 tons contained over 35 percent manganese.

Battery and Miscellaneous Industries.—Manufacturers of dry cells used 41,319 short tons of manganese ore during 1950; of this total, 3,369 tons were of domestic and 37,950 tons of foreign origin. Chemical plants used 25,276 tons, of which 8,603 tons were domestic and 16,673 tons imported. All of the ore used contained (natural) over 35 percent manganese. The principal use of chemical ore is in the manufacture of manganese sulfate fertilizer and of hydroquinone for photographic use. Manganese ore for battery use should have a high content of available oxygen with minimum iron and be relatively free from such metals as arsenic, nickel, copper, and cobalt, which are electronegative to zinc. Preferably, battery manganese ore should be poorly crystallized and consist of the gamma oxide known as cryptomelane. Ore for chemical use, on the other hand, is usually predominantly pyrolusite.

TABLE 14.—Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1947–50, in short tons

PRICES

Manganese Ore.—Prices of manganese ore containing 48 percent manganese, as quoted by E&MJ Metal and Mineral Markets, ranged at the beginning of 1950 from 81.8 to 83.8 cents per long-ton unit, including duty c. i. f. eastern and southern ports. At the end of the year, prices ranged from 92 to 96 cents per unit, with duty to the account of the buyer. The long-ton unit upon which the price of manganese ore is based is 1 percent of a long ton (22.4 pounds) of contained manganese. Prices of chemical ore are given on a per ton basis, with a minimum requirement of manganese dioxide. A duty of one-fourth cent per pound of contained manganese was imposed on all ores imported in 1950, except those from Cuba and the Republic of the Philippines, which entered duty free.

Manganese Alloys.—The average value, f. o. b. producers' furnaces, for ferromanganese shipped during 1950 was $158.65 per short ton, compared with $154.35 in 1949. According to Iron Age, the selling price of ferromanganese in carlots at eastern centers rose from $173.40 per gross ton at the end of 1949 to $181.20 in December 1950; the average for the year was $174.48. The average value of spiegeleisen, f. o. b. domestic furnaces, was $59.48 per short ton compared with $55.16 in 1949; and the quoted price on a gross-ton basis, as given by Iron Age, rose from $65 at the end of 1949 to $70 at the close of the year. The average quoted price per gross ton was $63.13 in 1950.

FOREIGN TRADE [1]

Imports of all grades of manganese ore (battery, chemical, and metallurgical) are shown by countries in table 15. The data include imports of battery-grade ore totaling 85,311 short tons in 1950. Of this quantity, 63,464 tons came from Gold Coast, 8,705 tons from Cuba, 6,535 tons from French Morocco, 5,928 tons from Union of South Africa, 554 tons from Chile, and 125 tons from Mexico. It is known that these imports include some receipts of chemical ore, particularly those from Gold Coast. This ore averaged 53.9 percent manganese, or 85.2 percent MnO^{2}. Imports for consumption of battery ore totaled 67,832 short tons valued at $2,000,771 or $29.50 per short ton f. o. b. foreign ports. Of the total, Gold Coast supplied 44,016 tons valued at $1,293,831; Cuba (chemical), 8,705 tons, $276,984; French Morocco,

WORLD REVIEW

Table 19 shows, insofar as statistics are available, the world production of manganese ores from 1945 to 1950 and their average manganese content. Official statistics of the countries are used, supplemented by data from semiofficial and other sources.

TABLE 19.—World production of manganese ore, by countries, 1945–50, in metric tons

[1] In addition to countries listed, Belgium, Bolivia, Bulgaria, Costa Rica, Eritrea, Germany, Indochina, Iran, and Korea have produced manganese ore; estimates for them are included in the totals. Czechoslovakia and Northern Rhodesia report production of manganese ore; but, as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in this table.
[2] Data not available; estimate by author of chapter included in total.
[3] Exports.
[4] Estimate.
[5] Shipments by rail and river.
[6] June to December, inclusive.
[7] Incomplete data.
[8] Fiscal year ended March 31 of year following that stated.
[9] Dry weight.
[10] Excluding South Australia.
[11] Fiscal year ended June 30 of year stated.

Angola.—It was reported during the year that United States investors would raise the capital of Cie. du Manganese de l'Angola from 20 to 100 million escudos to make possible an increase in production to 5,000 tons monthly.[2] The total production of manganese ore in Angola during 1950 was 9,308 metric tons.

Australia.—Manganese ores were placed under Commonwealth export control in 1950 under provisions of the Customs Act.[3]

Belgian Congo.—A new company was formed in Brussels to develop the manganese-ore deposits of the Société Minière du Beceka. The new company is titled Minière Beceka—Manganese. Plans called for first exports by the close of 1951.[4]

Brazil.—The Bethlehem Steel Corp. continued development work on its properties in Amapa Territory with main efforts in surveying the location of the necessary railroad to the Amazon port of Macapa during 1950. Bethlehem is working under an agreement with a Brazilian firm, Industria e Commercio de Minerios (Icomi). A new firm is planned for the development and operation of the deposits; and of this firm, Bethlehem will own 49 percent and Icomi, 51 percent. Preliminary negotiations were carried on between Icomi and the International Bank for Reconstruction and Development, from which the company was seeking a $35,000,000 loan to be guaranteed by the Brazilian Government. Under the terms of the concession, production and shipment of material are to begin by the end of 1953; and, by contract, Icomi is required to build a 136-mile railroad from the mines to the port, provided 10,000,000 tons of ore are proved. This railroad will absorb the bulk of the capital investment.[5]

India.—At the forty-second annual general meeting of the Central Provinces Manganese Ore Co., Ltd., on June 1, 1950, H. R. Holmes, chairman, emphasized the need for mechanization in the manganese mines. He pointed to the South Tirodi mine, where most of the machinery had been installed so far and where production had been increased and costs were reported to be less than hand labor. He mentioned further that two holes have been drilled at the Balaghat mine, both of which intersected manganese ore. One of these holes cut the bed at a depth of 550 feet below the surface, with the high grade continuing to this depth. Mr. Holmes stated that, in view of the substantial tonnage that the Balaghat bed alone yields for each 100-foot depth, the quantity of ore remaining in the Balaghat district and in other deposits in the Central Provinces may well be assumed to be very large.[6]

New Caledonia.—Discovery of several new manganese deposits was reported in 1950.[7]

Norway.—A discovery of manganese in an inaccessible area in western Norway at Sauda near Stavanger was reported during the year.[8]

Quebec-Labrador.—The existence of commercial grades of manganese ore in the iron-ore concession areas in Quebec-Labrador was announced during 1950.[9] These manganese occurrences have been discussed briefly.[10]

Mercury

By Helena M. Meyer and Alethea W. Mitchell

GENERAL SUMMARY

THE mercury industry was featured in 1950 by near-record imports, by the highest consumption since the peak established in 1945, by the smallest domestic production by a substantial margin in the 100 years covered by the statistical record, and by a sharp reversal after midyear of the long-time downtrend in prices.

Import entries in 1950 were 46 percent below the high for 1949 and 18 percent less than in 1945 but were larger than any other year. The quantity brought into the United States in 1949 was largely for the National Stockpile, a factor that did not influence 1950 receipts. Spain and Italy supplied most of the imports in 1950--51 and 27 percent, respectively—whereas Italy alone dominated 1949 receipts, with 82 percent of the total. Yugoslavia and Mexico shipped important quantities to the United States in both years. Sweden, Netherlands, and Denmark are listed as sources of significant quantities in 1950; but these are not mercury-producing countries, and the metal involved, therefore, must represent reexports. Japan, which produces mercury but is normally a net importer, has shipped to the United States in the postwar period chiefly from stocks of imported metal; in 1950 only one-fourth as much mercury came into the United States from Japan as entered annually in the period 1947–49.

The expanded consumption of mercury in 1950 established a new peacetime high—23 percent above 1949 and 6 percent above the previous peacetime record for 1948. Construction of mercury boiler plants and of chlorine and caustic soda plants using mercury cells contributed to the high consumption rates indicated for 1948 and 1949, although strictly speaking, the metal so used is not dissipated and may readily be reclaimed and put to other use. Such nondissipative uses did not characterize consumption in 1950, and a larger part of the total for that year therefore will not be available for recovery. Uses accounting for most of the increased consumption in 1950 were electrical apparatus (including the mercury cell), 65 percent over 1949; antifouling paint, 86 percent; and pharmaceuticals, 74 percent, with smaller gains for most other items. Agricultural use was an exception to the general trend, dropping 3 percent.

Mercury was accumulated in 1950 for a new large chlorine and caustic soda plant at Saltville, Va., and the noteworthy increase in industrial stocks during 1950 is explained chiefly by provision for the new installation. Three additional, smaller, chlorine and caustic soda plants to use mercury were in the planning stage at the end of 1950.

Domestic production dropped to 46 percent of the small quantity for 1949 and was only 10 percent of the annual average for 1941–45. One large producer, the Mount Jackson mine, Sonoma County, Calif., was active throughout 1950, and a second, the Cordero mine, Humboldt County, Nev., closed on February 15. Ranking third in output was the Juniper mine, San Benito County, Calif. These three properties accounted for 90 percent of the total for the United States, and about 13 other properties contributed the remaining 10 percent.

TABLE 1.—Salient statistics of the mercury industry in the United States, 1941–45 (average) and 1946–50

[Flasks of 76 pounds]

	1941–45 (average)	1946	1947	1948	1949	1950
Production	43,229	25,348	23,244	14,388	9,930	4,535
Number of producing mines	139	51	37	20	23	16
Average price per flask: New York	$165.97	$98.24	$83.74	$76.49	$79.46	$81.26
Imports for consumption	36,531	13,894	13,008	31,951	103,141	56,080
Exports	1,022	907	884	526	577	447
Consumption	50,866	31,552	35,581	46,253	39,857	49,215

The expectation of increased consumption of mercury in the United States because of the outbreak of war in Korea, followed by the speeding up of defense mobilization in the United States; the low level of domestic mining in the United States; and the sharp acceleration of exports by the two chief mercury-producing countries to the United Kingdom, ranking second in the world in consumption, caused a drastic reversal of the downward trend of mercury prices after June.

By June 1950 the average quoted price per flask for mercury at New York had sunk to \$70–\$72, the lowest level since September 1935, in contrast to the general wholesale-price index of the Bureau of Labor Statistics which had more than doubled during the same period. The price rose 25 percent to \$87–\$90 by the end of the third quarter, continued upward at an accelerated pace in the fourth quarter to reach \$138–\$141 by the year end, and the uptrend was unchecked at that time. The domestic price advances followed the establishment of higher Spanish quotations.

Following the Korean incident it became evident that the accomplishment of mobilization objectives would create many supply-requirement problems with regard to strategic minerals, as well as other products. Mercury is classed as a strategic mineral, but because from a world standpoint supplies of this metal in the postwar period have been more than ample for all needs, the Government strategic stockpile objective for mercury became more nearly filled than that for almost any other mineral in this class. As a consequence of this relatively satisfactory defense position, mercury was low on the list of minerals likely to receive Government production-stimulation aid under provisions of the Defense Production Act of 1950, but also less likely to be subject to Government consumption limitation orders, such as were immediately required for metals like cobalt, copper, and others.

An outstanding feature of the international situation was the great expansion in the movement of mercury from Spain and Italy to the United Kingdom. Total imports into the United Kingdom were

54,199 flasks in 1950 compared with 18,823 in 1949 and with an annual average of 35,478 in 1935–38. In 1950, 14,317 flasks were reexported by the United Kingdom, compared with 3,904 in 1949, leaving 39,882 and 14,919 flasks, respectively, as new supply available for consumption. Britain's consumption has expanded because of defense mobilization, but speculation and stockpiling may have been additional factors in the noteworthy gain in mercury receipts from abroad.

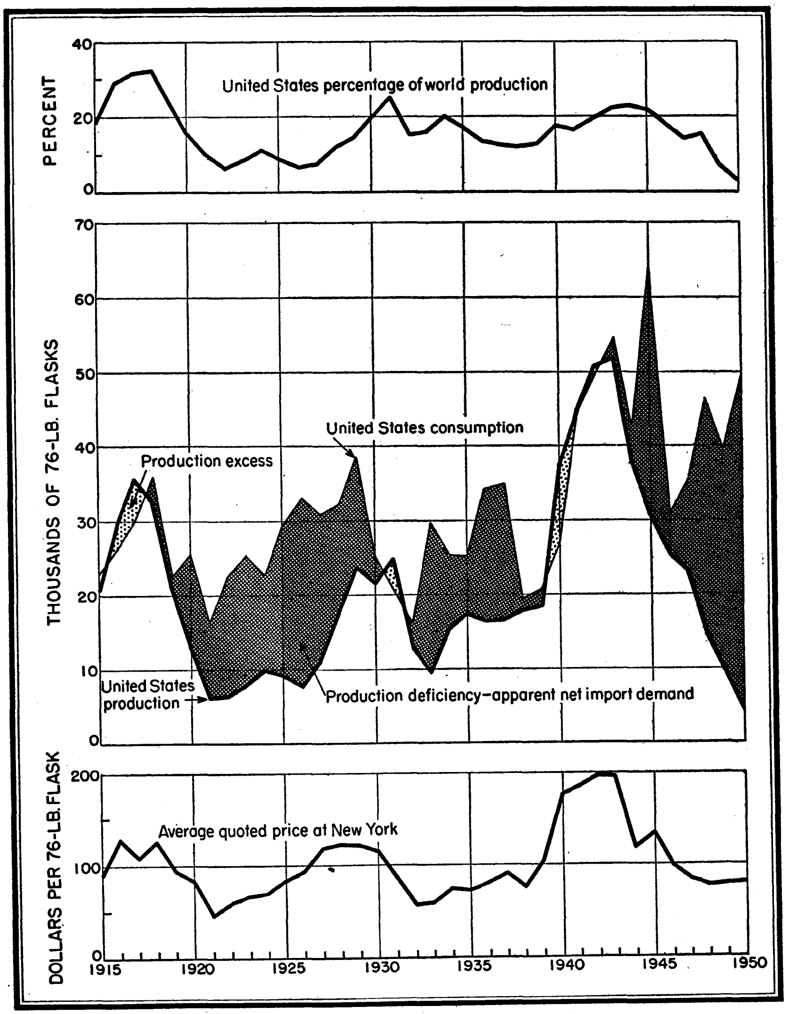

FIGURE 1.—Trends in production, consumption, and price of mercury, 1915–50.

Mercurio Europeo, the Spanish-Italian mercury cartel, was reported dissolved at the beginning of 1950 and to have been inoperative throughout the year. Consumers, however, were subjected to sales limitations and to violent price mark-ups and thus could note little, if any, benefit under the supposed free-market conditions.

DOMESTIC PRODUCTION

Only one large mercury mine, the Mount Jackson in Sonoma County, Calif., was productive throughout 1950, and total production for the United States was at the lowest level by far in the 100 years covered by production records. The Cordero mine, Humboldt County, Nev., which ranked first in output in 1949, closed February 15, 1950, and continued inactive for the remainder of the year. Although the rapidly advancing mercury price that followed the outbreak of war in Korea seemed to make possible the revival of sizeable domestic production, few properties, none large, resumed operations in the latter part of the year. Because of the adverse price movements of World War II, former operators took the position that assurances of the maintenance of a relatively favorable price were required to induce them to resume activity. According to spokesmen for the industry, the mines that contributed most of the mercury produced in World War II, other than the Mount Jackson, were in badly run-down condition. The reopening of inactive mines would require the expenditure of considerable funds, recruitment of technical and other help, the blocking out of ore reserves, and acquisition of the necessary equipment and supplies. Until confidence in the persistence of prices at profitable levels was reestablished, a major expansion in output was not to be expected.

Chief mercury-producing mines in 1950 were as follows:

California—San Benito County, Juniper, North Star, New Idria, and Aurora mines; Santa Clara County, New Almaden, Guadalupe, and New Almaden dumps; Sonoma County, Dewey-Geyser, Culver-Baer, and Mount Jackson (including Great Eastern) mines.

Nevada—Humboldt County, Cordero mine.

These 11 mines accounted for 99 percent of the United States total in 1950; in 1949, 7 mines produced 98 percent, but in 1942 it took 34 mines to furnish 89 percent.

TABLE 2.—Mercury produced in the United States, 1947–50, by States

Year and State	Producing mines	Flasks of 76 pounds	Value [1]	Year and State	Producing mines	Flasks of 76 pounds	Value [1]

The long-time downtrend in grade of mercury ore treated in the United States was reversed in 1944–47, but subsequently has been resumed; in 1950 the average grade was 1 pound per ton lower than in 1949, which, in turn, averaged 2.2 pounds under that for 1947.

TABLE 4.—Mercury ore treated and mercury produced therefrom in the United States, 1927–50 [1]

[That material from old dumps which is not separable is included with ore]

Year	Ore treated (short tons)	Mercury produced: Flasks of 76 pounds	Mercury produced: Pounds per ton of ore	Year	Ore treated (short tons)	Mercury produced: Flasks of 76 pounds	Mercury produced: Pounds per ton of ore

[1] Excludes mercury produced from placer operations and from clean-up activity at furnaces and other plants.

In addition to the mercury produced at the mines in 1950, at least 2,000 flasks were reported as produced from old battery plates and other scrap, compared with 1,385 flasks in 1949 and 2,170 in 1948. Additional unreported quantities doubtless were recovered.

REVIEW BY STATES

Alaska.—No production of mercury was reported in 1950. The Decoursey Mountain mine, 24 miles from Crooked Creek, was the only producer from 1947 to 1949, inclusive.

The Bureau of Mines investigated the mercury deposits in the Cinnabar Creek area, Georgetown and Akiak districts, Kuskokwim region of southwestern Alaska, in 1947 and recently issued a report [1] on the subject.

[1] Rutledge, F. A., Investigation of Mercury Deposits, Cinnabar Creek Area, Georgetown and Akiak Districts, Kuskokwim Region, Southwestern Alaska: Bureau of Mines Rept. of Investigations 4719, 1950, 9 pp.

Arkansas.—No production has been reported since 1946. In 1944 the Bureau of Mines investigated 57 mine dumps, the calcine dumps of 13 furnaces, and 4 retorts to ascertain the possibility of recovering mercury from them. The measured mine dumps contained 144,000 tons of rock, of which 21,250 tons were estimated to contain 36,000 pounds or nearly 457 flasks. A report [2] on the investigation and results of the work carried on in the field by the Bureau in 1941 was recently issued.

California.—California resumed its normal position in 1950 by producing substantially more than all other areas in the United States together, as contrasted with the unusual situation in 1949 when for the first time in many years California accounted for less than half of the country's total. California produced 85 percent of the total in 1950, 45 percent in 1949, and 78 percent in 1948. Output of the Mount Jackson (including Great Eastern) mine, Sonoma County, dominated by a wide margin production in the State and in the United States. Thirteen other properties in California had some production in 1950, or a total of 14 compared with 15 in 1949. Production of six of the properties listed for 1950 was from clean-up or dump operations only. Output came from six counties as follows: Lake, Napa, San Benito, Santa Clara, Sonoma, and Yolo Counties.

A small quantity of mercury was recovered from clean-up operations at the Great Western mine, Lake County.

Mercury was reported to have been purchased from the Oat Hill mine, Napa County, and probably represented some clean-up or dump operation.

The Juniper mine, San Benito County, operated by Berg and Sciochetti, was the third largest producer in the United States, recovering 500 flasks of mercury in retorts. Clean-up operations at the New Idria mine resulted in production, and the North Star and Aurora mines also were productive. The North Star ore was handled in one of the furnaces at the New Idria mine, and that from Aurora was treated in its own retorts.

Small quantities of mercury were produced from dump ore at the New Almaden mine, Santa Clara County, from ore mined and retorted at the Guadalupe mine, and from one other property in the county. The Bureau of Mines released a report [3] on the Guadalupe mine and another [4] on the New Almaden mine during the year, and the Federal Geological Survey released one on exploration possibilities in the New Almaden mine.

The Mount Jackson (including Great Eastern), Sonoma County was by far the outstanding producer in California and in the United States. Two other properties in the county, the Culver-Baer and the Dewey-Geyser, also produced in 1950. At the Culver-Baer mine 25 flasks were recovered from 95 tons of ore treated in a 20-ton rotary furnace. A report [5] was published on the Skaggs Springs mine, idle since 1944.

The Altoona mine, Trinity County, which has been closed since 1945, was described.[6]

A small quantity of mercury was produced from soot at the Reed mine, Yolo County.

Nevada.—The Cordero mine, Humboldt County, was the second largest producer in the United States in 1950, having fallen from first place in 1949. Production in 1950 was up to February 15 only, when the mine was closed for the remainder of the year. No production was reported for any other property in Nevada in 1950.

Oregon.—The Amity mine, Crook County, was the source of a small quantity of mercury in 1950 and was the only property for which production in that year was reported.

Texas.—A *preliminary* report on the structural geology of the Terlingua quicksilver district was put on public file by the Federal Geological Survey in 1950.

CONSUMPTION AND USES

Consumption of mercury in 1950 was at a new peacetime peak rate, 23 percent above 1949 and 6 percent over the previous top in 1948; it was 21 percent below the all-time record established in 1945. Virtually all classifications, except agriculture, shared in the increased use in 1950. Agricultural consumption dropped 3 percent, following a 34-percent decrease in 1949, but this use had substantially more than doubled in the 2 years 1946 to 1948. The high rates of consumption in 1948 and 1949 were caused in part by chlorine and caustic soda and mercury-boiler installations, but no such construction contributed to the high total for 1950.

Electrical apparatus, including the mercury cell, was again by far the principal use, taking 65 percent more than in 1949. Other important classifications that made substantial gains in 1950 were pharmaceuticals, with an increase of 74 percent, and antifouling paint, with 86 percent.

TABLE 5.—Mercury consumed in the United States, 1946–50, in flasks of 76 pounds

Use	1946	1947	1948	1949	1950
Pharmaceuticals	4,095	3,047	3,382	3,443	5,996
Dental preparations	[1] 1,133	[1] 785	[1] 994	[1] 963	[1] 1,458
Fulminate for munitions and blasting caps	682	523	441	149	289
Agriculture	3,134	5,617	7,048	4,667	4,504
Antifouling paint	994	760	996	1,683	3,133
Electrolytic preparation of chlorine and caustic soda	550	693	806	755	1,309
Catalysts	3,310	5,078	3,262	2,520	2,743
Electrical apparatus	[1] 3,889	[1] 6,763	[1] 6,471	[1] 7,323	[1] 12,049
Industrial and control instruments	[1] 4,609	[1] 5,394	[1] 5,653	[1] 5,016	[1] 5,385
Amalgamation	99	138	143	165	192
General laboratory	269	333	442	345	646
Redistilled	[1] 5,574	[1] 4,689	[1] 6,499	[1] 6,642	[1] 7,600
Other	3,214	1,761	10,116	6,186	3,911
Total	31,552	35,581	46,253	39,857	49,215

[1] A partial breakdown of the "redistilled" classification showed 53 percent was for instruments, 14 percent for dental preparations, and 21 percent for electrical apparatus in 1950, compared with a range of 53 to 47, 22 to 10, and 22 to 10, respectively, in the 4-year period 1946–49.

Final			62,429	31,552	35,581	46,253	39,857	49,215

Mercury was accumulated in 1950 by the Mathieson Hydrocarbon Co. for a new large chlorine and caustic soda plant at Saltville, Va., which, according to a recent report,[7] was to begin operation in 1951 and have a daily capacity of 220 tons of caustic soda.

An article [8] describing a new 10-kw. short-arc mercury lamp, which may become a valuable asset in motion-picture studios and elsewhere, and another,[9] discussing mercury lamps for daylight signaling, were published. Compact-source lamps are said to have efficiencies of 50 to 60 lumens per watt available in powers up to 10 kw. By short-circuiting parts of the series ballast resistors the lamps may be flashed for brief periods at powers much greater than their normal ratings, and extremely high light outputs can then be produced. Color-corrected lamps for motion-picture studio lighting was the subject of another article.[10] In the new lamps color correction is obtained by means of metallic vapors in the discharge at considerably higher efficiency than heretofore—of the order of 50 lumens per watt for the 5,000-watt size. A water-cooled, high-pressure, mercury-discharge lamp, which has been used for motion-picture projection, was the subject of still another article.[11]

A summarized statement showing progress in mercury boiler-plant construction from 1928 when the first plant, the South Meadow Station, of the Hartford Electric Light Co., was installed, to 1949 when the plant, Schiller Station, of the Public Service Co. of New Hampshire, was completed, was released in 1950.[12] Other articles in the same magazine describe the newest installations in detail.

Organic mercury compounds generally have been accepted as the most efficient therapeutic agents for stimulating urine production,

according to an article published in the American Chemical Society Journal.[13]

The mercury cathode and its applications were described in a report published in 1950.[14] In summarizing, the authors state:

The mercury cathode cell is in use in several industrial and university laboratories where it is regarded as a valuable analytical tool, but it is by no means used as widely as it could be or should be. This rapid method is especially useful in the analysis of alloys and minerals wherein it is often necessary to remove large concentrations of one element in order to make possible the determination of a trace concentration of another by polarographic or other methods. In the field of rock analysis its use as a rapid method for the determination of the alkali and alkaline earth elements and for the separation of these elements one from another—always a troublesome problem—should be studied further. And there are interesting possible applications in the separation of elements such as copper, nickel, and chromium from the more abundant elements of rocks. Much ground must yet be tilled before an end to the applications of the mercury cathode cell is in sight, but the instrument is established as an integral part of the analytical laboratory.

STOCKS

Stocks of mercury in consumers' hands were at abnormally high levels in 1950, total industry inventories being 70 percent above those on hand at the beginning of the year. The accumulation of a large quantity of metal for use in a new chlorine and caustic soda plant was chiefly the cause of the sharp increase in 1950. If the new plant goes into operation in 1951, as anticipated, inventories should recede to more nearly normal levels. Noteworthy quantities of mercury are held in the National Stockpile, but data on such quantities may not be disclosed.

TABLE 7.—Stocks of mercury in hands of producers, consumers and dealers, and Office of Metals Reserve, 1946–50, in flasks of 76 pounds

End of year	Producers [1]	Consumers and dealers	Office of Metals Reserve	Total
1946	2,599	16,400	20,884	39,900
1947	3,084	16,200		19,284
1948	5,165	25,000		30,165
1949	5,354	15,600		20,954
1950	2,719	32,900		35,619

[1] Operators that account for roughly 95 percent of output.

PRICES

The price for mercury generally was downtrending from May 1945 through the second quarter of 1950, the chief exception being a $14-a-flask advance in December 1948 by the mercury cartel, Mercurio Europeo, which provided a temporary reversal. In June 1950 the price was at the lowest level since September 1935, an interim during which the Bureau of Labor Statistics general wholesale-price index had more than doubled. In July the price began to rise and moved forward thereafter without interruption to the end of the

FOREIGN TRADE [15]

Receipts of mercury for consumption in the United States in 1950 dropped 46 percent below 1949, but except for that year and 1945 were the highest on record. The peak quantity in 1949 was influenced sharply by metal purchased for the National Stockpile (included in "imports for consumption" and "general imports") by the ECA with counterpart funds, and heavy imports in 1945 were in response to demand stimulated by World War II. The sharp rise in imports in the second half of 1950 was partly in response to increased needs for the defense mobilization program and partly speculative in character. Still greater defense demand was anticipated, and sources of supply were known to be limited.

Exports of mercury continued to be small in 1950, amounting to less than 1 percent of imports for consumption. Reexports again were larger than exports but were equivalent to only between 1 and 2 percent of total imports.

Imports.—Of the 56,080 flasks of mercury imported for consumption in 1950 (comparison with 1949 in parentheses), 28,462 (9,264) came from Spain, 14,973 (84,894) from Italy, 5,529 (3,176) from Yugoslavia, 3,480 (3,091) from Mexico, and 3,636 (2,716) from other countries. Of the other countries in 1950, only Japan (with 793 flasks) produced any mercury. Japan is not an exporter of mercury under usual conditions and in recent years has shipped heavily from

[15] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

stocks of imported metal. Normally importing countries such as Sweden, the United Kingdom, Netherlands, and Denmark appeared as sources of mercury imported into the United States in 1950; these shipments must have actually originated elsewhere. National and international conditions existing in the latter part of 1950 favored speculation, and doubtless this factor was present in some of the transactions in mercury that took place.

General imports are a better measure of goods actually arriving in the country in a given period than are imports for consumption, which cover material entered for immediate consumption plus material withdrawn from warehouses for consumption. General imports were 60,564 flasks in 1950 (96,918 in 1949). Of the 1950 total 29,439 (2,225 in 1949) flasks came from Spain, 18,073 (84,628) from Italy, 5,980 (3,753) from Yugoslavia, 3,986 (3,506) from Mexico, and the remainder from Japan (793 in 1950 compared with 2,777 in 1949) and other countries that are normally mercury-importing countries.

Imports of mercury compounds generally are insignificant—those of mercuric chloride in 1950 were 1,102 pounds from Spain; of mercurous chloride, 5 pounds from the United Kingdom; of oxide (red precipitate), 150 pounds from the United Kingdom; and of mercury preparations not specifically provided for, 24,766 pounds, of which 24,557 were from Sweden and 209 from Belgium and Luxembourg.

Exports.—Of the exports of 447 flasks, 215 (64 in 1949) went to Canada, 70 (25) to Colombia, 43 (18) to Venezuela, 28 (32) to Brazil, 19 (10) to Mexico, 15 (24) to Cuba, and smaller quantities to 16 other countries.

TABLE 10.—Mercury exported from the United States, 1946–50

[U. S. Department of Commerce]

Year	Pounds	Flasks of 76 pounds	Value	Year	Pounds	Flasks of 76 pounds	Value
1946	68,932	907	$113,817	1949	43,860	577	$54,413

1948	40,013	526	42,620				

Reexports totaled 886 flasks (828 in 1949). Of the total, 578 (535) flasks went to Canada, 221 (108) to Brazil, 46 (73) to Colombia, and the remainder in quantities of 12 flasks or less to 8 other countries.

WORLD REVIEW

World production of mercury is estimated to have increased about 18 percent in 1950, chiefly because of 55- and 20-percent gains in Spain and Italy; all other countries for which data are available had smaller outputs than in 1949. The year 1950 was characterized by noteworthy expansion in foreign trade between principal producing and consuming countries. Spanish exports were almost double production in that country; United Kingdom imports virtually trebled, and United States imports were the third highest on record. Spain withdrew from the Spanish-Italian cartel, Mercurio Europeo, at the beginning of 1950, and the cartel was reported to be inoperative throughout the year.

Mexico.—Following the establishment of an all-time peak output, 32,443 flasks, in 1942, production in Mexico has trended downward without interruption except in 1949. In 1950 only 11 percent as much metal was produced as in the record year. Exports of 4,960 flasks in 1950 and 6,469 in 1949 were above production in both years.

[1] Mercury is also produced in Korea, Yugoslavia, and U. S. S. R., but production data are not available; estimates by authors of chapter included in total.
[2] Data not yet available; estimates by authors of chapter included in totals.
[3] Less than 1 flask.
[4] Included with Germany.
[5] Byproduct of pyrites production in Slovakia only.
[6] Includes Austria.
[7] Estimate.
[8] Output of Idria mine (Yugoslavia) included with Italy through 1945.

Spain.—Mercury production was estimated as 50,000 flasks [16] in 1950 compared with 32,289 in 1949. Exports were 99,400 flasks in 1950, or about double production, and stocks thus were reduced sharply; at the end of 1950 stocks approximated 40,000 flasks. Spain withdrew from the Spanish-Italian mercury cartel, Mercurio Europeo, and the cartel was dissolved at the beginning of 1950. Thereafter the Spanish export price for mercury dropped from $70 to about $45 a flask. After the end of June the Spanish export price was advanced, on the average, every 2 or 3 weeks and was $130 a flask, f. o. b. Spanish port, at the year end when sales were restricted to small lots, not exceeding 250 flasks. Of the exports of 99,400 flasks in 1950 (27,620 flasks in 1949), the United Kingdom took 47 percent and the United States 35 percent.

No plant expansion took place in 1950, but plans were underway to make new installations in 1951.

[16] Data are taken from Annual Economic Report 1950, Counselor of Embassy for Economic Affairs, Madrid, Spain, Mar. 30, 1951, and Quarterly Mineral Reports.

United Kingdom.—The sharp advance in imports into the United Kingdom in 1950 was a dominant feature of the international mercury situation. Entries of 54,199 flasks in 1950 were virtually three times the 18,823 flasks for 1949, and about one and one-half times the prewar average for 1935–38. Reexports were 14,317 flasks in 1950 and 3,904 in 1949; the quantities available for consumption were 39,882 and 14,919 flasks, respectively, in the 2 years. Roura and Forgas of London was reported [17] to have been named sole selling agent in the sterling area for Italian quicksilver producers. This concern was to be represented in India and Ceylon by Khandelwals, Ltd., also of London.

Mica

By Joseph C. Arundale and Nan C. Jensen

GENERAL SUMMARY

DOMESTIC production of sheet mica continued to supply only a small percentage of requirements. Production of ground mica increased sharply. There was a shortage of block and film mica, but supplies of both muscovite and phlogopite splittings were adequate, with the exception of book-form splittings. Prices of imported mica increased rapidly, and quality deteriorated.

The economic importance of pegmatites, from which all commercial sheet mica is derived, was discussed comprehensively in a publication issued by the Bureau of Mines.[1] In this publication it was pointed out that new knowledge regarding the internal structure of pegmatites has eliminated some of the guesswork in estimating reserves and forecasting costs of operation. Expanding markets for some of the major pegmatite products and greatly improved recovery methods also tend to reduce the hazards and uncertainties of soundly planned pegmatite operations.

A report was issued on an investigation of several pegmatites in the Black Hills district of South Dakota.[2] Over 2,000 feet of diamond-drill holes were completed, and much valuable information on these properties was acquired.

TABLE 1.—Salient statistics of the mica industry in the United States, 1946–50

DOMESTIC PRODUCTION

Sheet Mica.—Domestic production of sheet mica increased slightly; but, as in the past, it represented only a small percentage of total sheet mica consumed. The great bulk of domestic sheet-mica production was in the punch and circle sizes. Mica is produced in the United States by a large number of small producers, many of which cannot be reached by the Bureau of Mines canvass of the industry. Therefore, it is necessary to depend largely on the reports by purchasers in compiling the statistics on domestic production. The principal reason for the small domestic production is the high cost of production rather than lack of deposits or reserves. The production, processing, and preparation of sheet mica require an unusual amount of hand labor, and in this respect domestic production cannot compete with mica produced in certain foreign countries with low-cost labor.

Despite the foregoing, there was a shortage of good-quality sheet mica in 1950, as well as of some of the other pegmatite minerals, and increased interest on the part of domestic producers and potential producers was noted.

Scrap Mica.—Sales of scrap mica to grinders in 1950 increased sharply to a new high of 69,360 short tons valued at $1,742,616, an 111-percent increase in tonnage and 119-percent in value over 1949. New production was reported from New Mexico, Arizona, Colorado, Georgia, and North Carolina, and many more projects were being considered.

[1] Includes small quantities of splittings in certain years.
[2] Includes Arizona (1949–50), Colorado (1948–50), Connecticut (1948 and 1950), Georgia, Maine, New Hampshire (1948–50), New Mexico (1948 and 1950), New York (1950), Pennsylvania (1949–50), and Virginia (1949–50).

Ground Mica.—Sales of ground mica were the largest on record as this material gained increasing acceptance as a component of paints and for other uses. Producers were vigorously searching for new and expanded markets. The Wet Ground Mica Association, Inc., 420 Lexington Avenue, New York 17, N. Y., issued several pamphlets on the use of ground mica in paints.

TABLE 3.—*Scrap and reclaimed mica sold or used by producers in the United States, 1935–39 (average) and 1946–50*

CONSUMPTION

Sheet, Punch, and Film Mica.—No accurate statistics on consumption of sheet, film, and punch mica are available; however, incomplete reports indicate that consumption increased substantially during 1950. Considerable difficulty was experienced in acquiring adequate quantities of both block and condenser film for the National Stockpile.

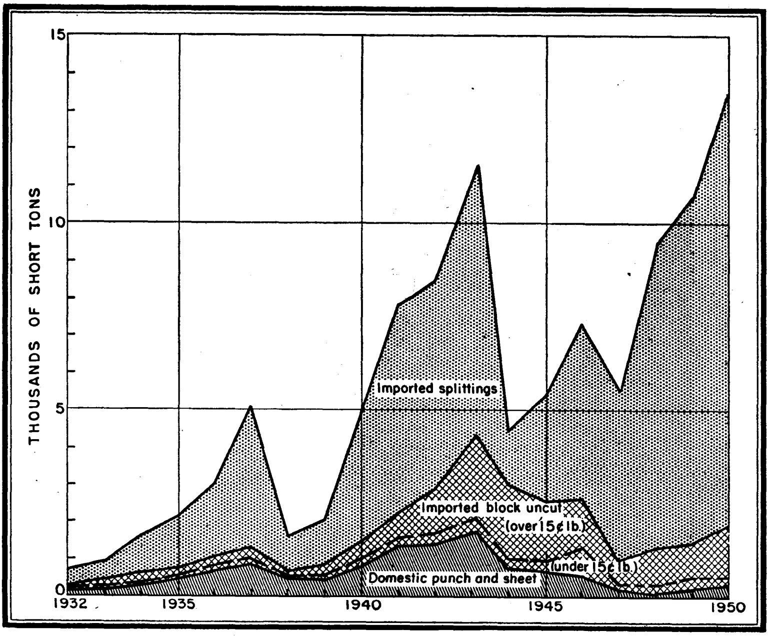

FIGURE 2.—Block mica and splittings imported for consumption in the United States and sales of domestic sheet and punch mica, 1932–50.

TABLE 5.—Production of sheet and punch mica and apparent consumption of sheet and punch mica and mica splittings in the United States, 1941–50, in pounds

[1] Revised figure.

Mica Splittings.—Consumption of mica splittings, as reported by consumers, reached an all-time high of nearly 11,000,000 pounds. Consumer stocks were near a normal and adequate level. Both muscovite and phlogopite splittings were acquired for the National Stockpile at an adequate rate, and the objective for both these items was nearing completion.

Built-Up Mica.—The production of more than 8,000,000 pounds of built-up mica in 1950 was the greatest output ever reported in a single year.

An important development affecting the built-up-mica industry was the reported plan of two domestic firms to make built-up-mica products from scrap mica, which in many instances would substitute for imported splittings.

TABLE 7.—Built-up mica produced in the United States, 1948–50, by kind of product

Product	1948		1949		1950

Ground Mica.—The market for ground mica during 1950 was good. The roofing industry took nearly half of the total output. The material used by this industry is usually the poorer quality and larger-mesh sizes. The paint industry consumed an increased percentage of the total, taking principally the better quality and finer-mesh sizes.

TABLE 8.—Ground mica (including mica from kaolin and schist) sold by producers in the United States to various industries, 1949–50

Industry	1949			1950		
	Short tons	Percent of total	Value	Short tons	Percent of total	Value
Roofing	29,481	52	$939,587	32,594	45	$1,083,584

Total	56,393	100	2,860,956	72,250	100	3,935,697

[1] Includes mica used for molded electric insulation, house insulation, Christmas-tree snow, manufacture of axle greases and oil, annealing, pipeline enamel, oil-well drilling, welding, and other purposes.

PRICES

Prices of domestic sheet mica increased during the year, but they still were not high enough to allow domestic producers in most instances to compete with the low-cost output from foreign sources. Quoted prices for domestic mica are nominal, vary greatly, and generally are determined by direct negotiation between buyer and seller after agreement as to the quality of particular lots. The following quotations from E&MJ Metal & Mineral Markets serve only as a general guide and represent a range of prices during 1950: North Carolina district, clear sheet, punch, 12 to 22 cents per pound, according to size and quality; sheet, 1½ by 2 inches, 70 to 75 cents per pound; 2 by 2 inches, $1.00 to $1.10; 2 by 3 inches, $1.40 to $1.50; 3 by 3 inches, $1.70 to $1.80; 3 by 4 inches, $2.10 to $2.20; 3 by 5 inches, $2.40 to $2.50; 4 by 6 inches, $3.15 to $3.25; 6 by 8 inches, $4.00 to $4.50; stained or electric mica was sold at approximately the same prices as clear sheet.

North Carolina wet-ground mica ranged from $120 to $135 per ton during 1950, depending on fineness and quantity; dry-ground, from $32.50 to $70; scrap, $30 to $35, depending on quality.

FOREIGN TRADE[3]

Imports.—In 1950 imports of mica of all types totaled 18,510 tons, compared with 12,738 tons in 1949. This was the largest tonnage of imports on record, and much of the increase was attributable to large tonnages of splittings acquired for the National Stockpile.

TABLE 9.—Mica imported into and exported from the United States in 1946–50

[1] Changes in Minerals Yearbook, 1946, p. 793, should read as follows: Unmanufactured (other), valued above 15 cents per pound—Argentina, 452,872 pounds ($285,882) and India, 873,201 pounds ($802,576). Manufactured (films and splittings): Not cut or stamped to dimensions and not above 12/10,000 inch in thickness—India, 8,891,367 pounds ($3,669,226); cut or stamped to dimensions—India, 8,498 pounds ($23,089). total—India, 9,273,176 pounds ($4,200,630).

[2] Changes in Minerals Yearbook, 1949, p. 780, should read as follows: Unmanufactured (other), valued not above 15 cents per pound—Brazil, 126,179 pounds ($40,386). Manufactured (films and splittings): Not cut or stamped to dimensions and not above 12/10,000 of an inch in thickness—India, 17,539,492 pounds ($15,715,840) and United Kingdom, 25,881 pounds ($13,203); total—India, 17,749,715 pounds ($16,278,767) and United Kingdom, 29,484 pounds ($85,480).

Exports.—Total exports of mica and mica products in 1950 increased by 40 percent in quantity and 27 percent in value over 1949. The greatest increases in the quantity of exports were in shipments of unmanufactured mica to Canada, and Belgium-Luxembourg; ground or pulverized mica to the same countries and Germany; and mica products other than ground or pulverized mica to Canada and Mexico.

TECHNOLOGY

Research continued on the synthesis of mica, and some progress was reported; however, sheets of mica with physical characteristics comparable with the natural mica have not yet been produced.

WORLD REVIEW

India.—One of the most significant aspects of the mica situation during 1950 was the reduced export of splittings to the United States in the latter part of the year, which was due principally to decreased requirements for the National Stockpile. This condition and the possibility of substitutes for built-up mica made from splittings are expected to have an unstabilizing influence on the Indian mica industry.

In January the International Standards Organization met at New Delhi to discuss proposed new mica standards. It was reported that an agreement had been reached.[4]

Discovery of an extensive new mica deposit near Bhuvaneshwar was reported.[5]

Austria.—Austria is the only country in Europe that has produced substantial quantities of mica, all of which came from the St. Leonhard mine in Carinthia in the British Zone. The mine was last operated in August 1948. In the past, it has produced phlogopite at the rate of a few hundred tons a year. Although the property, developed by the Berlin office of the Philips Co. during the war, is under British Property Control jurisdiction, the British have announced that it will be restituted to the Netherlands. Philips Co. also has prospecting rights to a considerable area in the vicinity of the mine. Total production of crude mica from this mine from 1942 to 1948 was 549 metric tons.[6]

Molybdenum

By Robert W. Geehan

GENERAL SUMMARY

PRODUCTION, shipments, exports, and consumption of molybdenum concentrates were higher in 1950 than in any of the preceding 4 years. Production increased in each quarter-year period, starting with the last quarter of 1949, the major increase being in the third quarter of 1950. Consumption of concentrates reversed the steady downward trend of 1949 and increased from 3,758,000 pounds in the last quarter of 1949 to 8,408,000 pounds in the last quarter of 1950. The major increase took place in the last 3 months of 1950. Shipments for export of molybdic oxide, calcium molybdate, and ferromolybdenum were up 49 percent; production increased 29 percent. As a consequence of the increased demand for molybdenum products in 1950, the quantity of concentrates converted to oxide was 30 percent greater than in 1949.

Production and shipments of molybdenum concentrates were higher by 26 and 91 percent, respectively, in 1950 than in 1949. Utah advanced from second to first place as a molybdenum-producing State, and replaced Colorado, which dropped to second.

Industry stocks of molybdenum concentrates were 79 percent less at the end of 1950 than at the close of 1949, and stocks of molybdenum products held by producers were 86 percent less.

Effective December 1, 1950, the quoted price of molybdenum in concentrates advanced 10 cents a pound, and the prices of products advanced at the same time.

TABLE 1.—Salient statistics of molybdenum concentrates in the United States, 1946–50

	Molybdenum contained, thousands of pounds				
	1946	1947	1948	1949	1950

[2] Excludes imports for conversion and reexport as follows: 1946, 276,465 pounds; 1947–50, none.
[3] 10 pounds.
[4] At mines and at plants making molybdenum products.

DOMESTIC PRODUCTION

The year 1950 was marked by expansion of production to the limit of existing facilities and by construction and development programs designed further to expand production rates. Production of molybdenum concentrates totaled 28,480,000 pounds (contained molybdenum) in 1950, an increase of 26 percent over 1949. The chief mineral of molybdenum is molybdenite (MoS_2), which comprised virtually the entire output in 1950; powellite [$Ca(Mo,W)O_4$] contributed a relatively small quantity. Wulfenite ($PbMoO_4$), once mined from several deposits in southwestern United States, has not been produced since 1944.

Molybdenum was produced in six States in 1950; Utah led, followed in order by Colorado, New Mexico, Arizona, Nevada, and California. Output of concentrates at mines operated solely or almost solely for molybdenum was 12,082,000 pounds in 1950, an increase of 10 percent from 1949, whereas byproduct concentrates from copper and tungsten operations totaled 16,398,000 pounds, an increase of 42 percent. Byproduct molybdenum represented 58 percent of the total concentrates produced in 1950 compared with 51 percent in 1949.

Shipments of molybdenum concentrates were 44,544,000 pounds (contained molybdenum) in 1950, an increase of 91 percent over 1949. Shipments in 1950 comprised 39,158,000 pounds to domestic consumers and 5,386,000 pounds for export.

A historical review of the molybdenum industry in the United States and a table showing its spectacular growth were presented in the Molybdenum chapter of Minerals Yearkbook 1948 (pp. 816–819).

TABLE 2.—Molybdenum in ore and concentrates produced and shipped from mines in the United States, 1941–50

Year	Production (thousands of pounds)	Shipped from mines		Year	Production (thousands of pounds)	Shipped from mines	
		Weight (thousands of pounds)[1]	Value (thousands of dollars)[2]			Weight (thousands of pounds)[1]	Value (thousands of dollars)[2]
1941	40,363	38,377	25,996	1946	18,218	16,787	11,529
1942	56,942	66,437	47,275	1947	27,047	22,190	15,178
1943	61,667	53,955	38,500	1948	26,706	29,669	20,418
1944	38,679	39,423	27,999	1949	22,530	23,280	19,332
1945	30,802	33,683	23,976	1950	28,480	44,544	37,729

[1] Figures for 1941–44 represent shipments from mines, plus concentrates converted to oxide by producer at Miami, Ariz.; those for 1945–50 represent shipments to domestic and foreign customers, plus concentrates converted to oxide at Miami, Ariz., and Langeloth, Pa.
[2] Largely estimated by Bureau of Mines.

Arizona.—The Miami Copper Co. has been a regular producer of molybdenum concentrates since 1938. Molybdenite concentrates are recovered as a byproduct of its copper operations at Miami, Ariz., where they are converted to molybdic oxide. Output in 1950 was 25 percent greater than in 1949. Arizona remained in fourth place as a producer of molybdenum in 1950.

California.—California dropped from fifth to sixth place as a producer of molybdenum in 1950. The only producer in California was the United States Vanadium Corp. at Bishop, where the mineral is recovered as a byproduct of tungsten production. Recovery of molybdenum was 26 percent less than in 1949. Molybdenum is present in the tungsten ore as molybdenite and powellite.

Colorado.—Colorado dropped from first to second place in 1950, but the output of molybdenum was 11 percent more than in 1949.

The Climax Molybdenum Co., operating the world-famous deposit at Climax, Colo., was the sole producer of molybdenum concentrates in 1950. Before 1948 the Climax deposit was exploited solely for molybdenum, but since that time tungsten and tin have been recovered as byproducts. Although the tungsten content of the ore is very low, the total byproduct-tungsten production was adequate to raise the Climax mine to fifth place as a tungsten producer.

During the first half of 1950 operations at Climax were curtailed because of the low demand for molybdenum products, but during the second half production was increased to the limit of mine and mill capacity. The main production is from underground workings, using a caving system of mining, but it is reported that in 1950 some ore was again obtained from the open-cut. A long tunnel has been driven to develop the ore body below the present operating level, but actual production will not be obtained from this portion of the mine until extensive development workings are completed. The expansion program at Climax also includes additional mill and camp facilities.

Nevada.—Since 1941 the Nevada Mines Division of the Kennecott Copper Corp. has been the only producer of molybdenite concentrates in Nevada. The concentrates are recovered as a byproduct of the McGill concentrator, where copper ores from the company Ruth and Copper Flat operations and from the Emma Nevada group of Consolidated Coppermines Corp. are milled. Output of concentrates was 176 percent more than in 1949.

New Mexico.—The Chino Mines Division of the Kennecott Copper Corp., Hurley, and the Molybdenum Corp. of America, Questa, continued to be the only producers of molybdenite in New Mexico in 1950. At Hurley, molybdenite has been recovered as a byproduct of copper operations since 1937. The copper ore mined in 1950 contained slightly less molybdenum than in 1949, and production of molybdenum declined 4 percent. The Questa mine, operated for molybdenum only, was opened in 1919 and since 1923 has been a regular producer. In 1950 a portion of the output was obtained from tailings produced in prior years, and the output of molybdenum declined 14 percent. The concentrates produced at Questa are shipped to the processing plant of the Molybdenum Corp. of America at Washington, Pa., where the company produces ferromolybdenum, calcium molybdate, molybdic oxide, and other molybdenum products.

Utah.—Utah was the largest molybdenum-producing State. The sole producer in Utah is the Utah Copper Division of the Kennecott Copper Corp., which since 1936 has been recovering molybdenite as a byproduct of copper at its Arthur and Magna concentrators. Output of molybdenite concentrates in Utah was 46 percent more than in 1949.

CONSUMPTION AND USES

Consumption (as measured by shipments to domestic consumers) of molybdenum products in the United States was 118 percent more in 1950 than in 1949. The largest single use for molybdenum is as an alloying element in the manufacture of steels, to which it is added as molybdic oxide, calcium molybdate, or ferromolybdenum. In general, when an entire open-hearth heat is to be alloyed to a degree not exceeding 0.8 percent molybdenum, the addition is in the form of molybdic oxide or calcium molybdate; ferromolybdenum is used when higher percentages of molybdenum are desired. Of the total molybdenum used in the United States, it is estimated that about 70 percent is in steels. Molybdenum is finding an expanding market in the high-temperature alloys developed for various components of gas turbines, as well as in jet aircraft engines and turbosuperchargers.

Much smaller quantities (about 20 percent of the total) of molybdenum, chiefly in the form of ferromolybdenum and molybdic oxide, are employed in gray iron and malleable castings. Molybdenum in various forms finds limited employment in the chemical, electrical, and ceramic industries, which comprise about 10 percent of the total. A relatively small quantity of concentrates (50,000 to 75,000 pounds of contained molybdenum annually) is used by a few steel companies as an addition to molten metal in the ladle to raise the sulfur content and improve machinability, in addition to gaining the benefit of the contained molybdenum.

Experiments regarding the use of molybdenum as a fertilizer are continuing, and favorable results are indicated.[1]

Interest in the possibility of using molybdenum metal in a temperature range above that filled by present-day high-temperature alloys has led to the development by Climax Molybdenum Co. of Michigan (a research subsidiary of Climax Molybdenum Co.) of a vacuum furnace capable of producing ingots 9 inches in diameter weighing up to 1,000 pounds.[2] The ability of molybdenum to plate itself on friction surfaces and withstand high temperatures and pressures has resulted in commercial development of a molybdenum lubricant for this purpose.[3]

TABLE 3.—Production and shipments of molybdenum products [1] in the United States, 1946–50, in pounds of contained molybdenum

Year	Production	Shipments		
		To domestic consumers	Exports [2]	Total
1946	15,039,100	16,501,700	442,400	16,944,100
1947	20,659,700	19,878,500	866,400	20,744,900
1948	24,445,300	23,808,900	1,215,800	25,024,700
1949	19,624,200	15,019,000	1,314,100	16,333,100
1950	25,347,800	32,735,700	1,955,100	34,690,800

[1] Comprises ferromolybdenum, molybdic oxide, and molybdenum salts and metal.
[2] Reported by producers to the Bureau of Mines.

STOCKS

The accompanying table shows industry stocks of molybdenum concentrates and products, 1946–50. Drastic reductions in the industry stocks of both types are noteworthy; this reduction was partly caused by the increase in demand for products containing molybdenum and partly by purchases by the Government.

[1] Science News Letter, vol. 57, No. 15, April 15, 1950, p. 236.
[2] Steel, vol. 126, No. 14, April 3, 1950, p. 64.
[3] Engineering and Mining Journal, vol. 151, No. 3, March 1950, p. 108.

TABLE 4.—Industry stocks of molybdenum concentrates and products, Dec. 31, 1946–50, in thousands of pounds of contained molybdenum

Year	Concentrates [1]	Products [2]		Total
		Producers	Consumers	
1946	19,275	8,211	2,582	30,068
1947	23,661	8,126	2,695	34,482
1948	21,206	7,547	(3)	[4] 28,753
1949	19,159	10,838	(3)	[4] 29,997
1950	4,090	1,495	(3)	[4] 5,585

[1] At mines and at plants making molybdenum products.
[2] Comprises ferromolybdenum, molybdic oxide, and molybdenum salts and metal.
[3] Figure not available.
[4] Excludes stocks of molybdenum products at consumers' plants.

PRICES

Effective December 1, 1950, the published price, f. o. b. mines, of molybdenite in concentrates containing 90 percent MoS_2 was increased to 60 cents a pound (equivalent to $1 a pound of molybdenum contained). The former price of 54 cents a pound of MoS_2 had been in effect since January 1949, and a price of 45 cents a pound of MoS_2 had been in effect from 1938 to 1949. Molybdenum concentrates are shipped, largely to processing plants, for conversion to molybdic oxide, ferromolybdenum, and calcium molybdate, all of which are used in manufacturing iron and steel. The prices of the principal molybdenum products are based on a pound of contained molybdenum, f. o. b. producer's plant. Effective December 1, 1950, the price of molybdic oxide was raised to $1.14, calcium molybdate to $1.15, and ferromolybdenum to $1.32; the former prices were $0.95, $0.95, and $1.10, respectively.

FOREIGN TRADE [4]

Imports of molybdenum ore and concentrates into the United States are normally small; 2,784 pounds (contained molybdenum) were received in 1950, all from Japan, compared with total imports of 48,148 pounds in 1949. Some molybdenum ore and concentrates are occasionally imported for conversion to molybdenum products for export; none has been so imported since 1946.

Exports of molybdenum concentrates (including roasted concentrates) were 6,234,521 pounds (contained molybdenum) in 1950 compared with 5,319,780 pounds in 1949. United Kingdom and Germany were the chief foreign markets in 1950, taking 61 and 18 percent, respectively.

Exports of ferromolybdenum were 1,178,604 pounds (gross weight) in 1950 compared with 955,103 pounds in 1949, and those of molybdenum metal and alloys were 146,075 pounds compared with 86,139 pounds (revised figure) in 1949.

Tariff.—The duty on molybdenum ore and concentrates was increased from 17½ cents to 35 cents a pound on the metallic molybde-

[4] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

num contained effective after December 31, 1950, as a result of cancellation of the Reciprocal Trade Agreement with Mexico. The duty on ferromolybdenum, molybdenum metal and powder, calcium molybdate, and other compounds and alloys of molybdenum continued to be 50 cents a pound of molybdenum contained plus 15 percent ad valorem.

TABLE 5.—Molybdenum ore and concentrates (including roasted concentrates) exported from the United States, 1948–50, by countries of destination.

WORLD REVIEW

United States production of molybdenum in 1950 was 90 percent of estimated world production. The balance of the reported output came from Chile, Norway, Canada, and Australia, although many other countries produce molybdenum in small quantities. Very little in the way of new developments abroad was reported, but some progress was made on existing projects.

Canada.—Production of molybdenum in Canada was resumed in 1950 after a complete cessation of activity in 1949; 28 metric tons were produced as compared with 509 tons in 1944, the peak war year.

Chile.—Based on estimated exports, production of molybdenum in Chile increased from 558 metric tons in 1949 to 800 tons in 1950.

Finland.—The Matasvaara molybdenum mine shut down in 1947, was dismantled and part of the equipment sold to Outokumpu Oy for the Aijala mine.[5]

Norway.—Production of molybdenum in Norway continued to decline in 1950, totaling 62 metric tons compared with 71 tons in 1949.

Yugoslavia.—Progress was reported at the new molybdenum mine near Mackatica in Serbia, which was expected to begin operations in 1951. A 3-mile tunnel was driven, which is connected to the mine face by a 1,300-foot shaft. It is reported that the shaft will be used to transport water to a hydroelectric plant to be built at the bottom of the shaft.[6]

[1] Molybdenum is also produced in Greece, Rumania, Spain, Turkey, U. S. S. R., and Yugoslavia, but production data are not available. Estimates by author of chapter are included in total.
[2] Less than 1 ton.
[3] Data not yet available; estimate by author of chapter included in total.
[4] Estimated exports.
[5] Exports to Japan proper.
[6] Data represent areas designated as Free China during the period of Japanese occupation.
[7] Preliminary data for fiscal year ended Mar. 31 of year following that stated.

Natural Gas

By D. S. Colby, H. J. Barton and B. E. Oppegard

GENERAL SUMMARY

MARKETED production of natural gas is estimated to have increased 16 percent to 6,281 billion cubic feet in 1950, the largest annual increase, both in quantity and percentage, of the past decade. The average annual increase of marketed production from 1940 to 1950 was 8 percent.

Consumption of natural gas advanced 21, 12, and 15 percent for domestic, commercial, and industrial customers respectively. This compares with gains in 1949 of 11, 8, and 3 percent. Industrial uses (other than carbon black, petroleum refineries, etc.) grew most rapidly in 1950, rising 23 percent above 1949.

The average value of natural gas at the well increased 0.3 cent to 6.6 cents per thousand cubic feet in 1950. The total value at the wellhead of marketed production on this basis would be 416 million dollars, 72 million dollars more than in 1949.

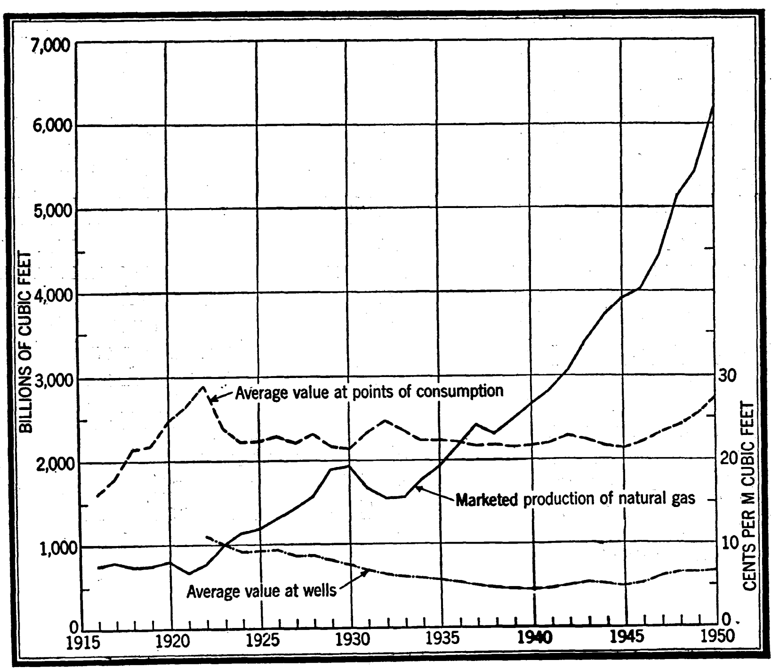

FIGURE 1.—Production and value of natural gas in the United States, 1916–50.

The average value at point of consumption of natural gas in 1950, according to preliminary data, was 71.3 cents per thousand cubic feet for residential consumers, 48.3 cents for commercial, 13.7 cents for industrial, and 27.4 cents for all types. The corresponding prices in 1949 were 67.1, 45.5, 12.9, and 25.4 cents per thousand cubic feet.

TABLE 1.—Salient statistics of natural gas in the United States, 1946–50

	1946	1947	1948	1949	1950 [1]
MILLION CUBIC FEET					
Supply:					
Marketed production [2]	4,030,605	4,582,173	5,148,020	5,419,736	6,281,048
Withdrawn from storage	56,138	86,643	79,035	106,368	175,260

VALUE					
Production (at wells)...thousand dollars	212,251	274,709	333,173	344,034	416,224
Average per M cubic feet...cents	5.3	6.0	6.5	6.3	6.6

[1] Preliminary figures.
[2] For 1946, equivalent to consumption plus exports. For subsequent years, comprises gas either sold or consumed by producers, including losses in transmission, amounts added to storage, and increases in gas in pipelines.
[3] Figure not available.

SPECIAL PROBLEMS

Further growth of the natural-gas industry, at the end of 1950, appeared to be limited not by any lack of demand but by the quantity of well casing and line pipe it was able to acquire. With few exceptions, growth was taking place by expansion of deliveries to localities already being served by natural gas. It seemed certain that New England, one of the few remaining areas not already being served with natural gas, would become a consumer by 1952. A proposal to supply natural gas to the Pacific Northwest from Canada was delayed because proved reserves in Alberta Province were not considered adequate to satisfy both export and local requirements.

The decision of the United States Supreme Court on December 11, 1950,[1] which upheld the right of a State regulatory agency to set a minimum wellhead price for natural gas, raised the possibility of diminished Federal Power Commission control over the field price of gas and subsequent increases in the field price of gas. Gas, however, remained one of the country's primary sources of cheap power. Several of the new aluminum-reduction plants necessitated by the national defense program and requiring large quantities of low-cost electricity were among the prospective new large-scale users.

[1] *See* Government Regulation.

The expansion of residential loads in cities far removed from the source of gas made some method of storage near the point of consumption very desirable. To facilitate acquisition of underground storage reservoirs by natural-gas companies, Senator Douglas of Illinois introduced a bill in the United States Senate providing for utility and pipeline companies to exercise eminent domain to obtain natural-gas storage fields.[2]

GOVERNMENT REGULATION

On January 9, 1950, the United States Supreme Court upheld the Federal Power Commission claim to authority over the East Ohio Gas Co., a company operating wholly within the State of Ohio,[3] and thereby confirmed that the Commission's authority was not restricted to companies operating in more than one State.

On April 16, 1950, President Truman vetoed the Kerr bill, which sought to exclude from Federal Power Commission jurisdiction natural-gas exploration, drilling, production, or gathering, sale "at arm's length," sale "before arm's length," sale to interstate facilities, local distribution, and local distribution facilities.

In conformity with this veto, the Federal Power Commission rescinded its Order 139, which stated that the Commission would not assert jurisdiction over independent producers and gatherers of natural gas who might be subject to jurisdiction solely because of "arm's length" sales of natural gas.

On December 11, 1950, the United States Supreme Court upheld the Oklahoma Supreme Court decision that a State, to prevent physical and economic waste, has the right to set a minimum wellhead price on natural gas and also has the power to require a gatherer to take gas ratably from various producers in the reservoir.[4] Under authority of this decision, the wellhead price of gas in the Guyman Hugoton field was set at 7 cents per thousand cubic feet.

The Petroleum Administration for Defense was established in 1950 under the United States Department of the Interior to carry out various functions under the Defense Production Act with regard to the oil and gas industry. This agency has authority over natural- and manufactured-gas production, transmission, and distribution.

RESERVES

The committee on natural-gas reserves of the American Gas Association reported estimated proved recoverable reserves of natural gas in the United States to be 185,592,699 million cubic feet on December 31, 1950, an increase of 3 percent over 1949. New discoveries in 1950 made a gross addition to proved reserves of 2.9 trillion cubic feet, and extensions of old fields added 9.2 trillion.

[1] Volumes are reported at a pressure base of 14.65 pounds per square inch absolute and at a standard temperature of 60° F.
[2] Excludes gas loss due to natural-gas liquids recovery.
[3] The net difference between gas stored in and gas withdrawn from underground storage reservoirs.
[4] Net production equals gross withdrawals less gas injected into underground reservoirs; changes in underground storage are excluded. December production partly estimated.
[5] Includes off-shore reserves.
[6] Includes Alabama, Florida, Maryland, Missouri, Nebraska, and Virginia.
[7] Nonassociated gas is free gas not in contact with crude oil in the reservoir.
[8] Associated gas is free gas in contact with crude oil in the reservoir.
[9] Dissolved gas is gas in solution with crude oil in the reservoir.
[10] Gas held in underground reservoirs for storage purposes only.

PRODUCTION

GROSS PRODUCTION

Estimated gross production of natural gas in the United States in 1949 was 7,546,825 million cubic feet, 5 percent over 1948 production. In general the increases occurred in the prolific producing States of the Southwest (Oklahoma excepted) and in the newer production of the Rocky Mountain States. Gross production declined in all Appalachian producing States and in Illinois and Michigan.

TABLE 3.—Gross withdrawals and disposition of natural gas in the United States, 1948–49, by States, in million cubic feet

[1] Marketed production plus quantities used in repressuring, vented and wasted.
[2] Gas sold or consumed by producers (*see* table 1).
[3] Includes gas (mostly-residue) blown to the air, but does not include direct waste on producing properties, except where data are available.
[4] Florida, Missouri (1949 only), North Dakota, South Dakota, Tennessee, and Virginia.

Repressuring continued its steady growth, increasing in all major producing States except Louisiana and West Virginia. The quantity of gas used in repressuring or recycling in 1949 totaled 1,273,205 million cubic feet, 52,626 million more than in 1948.

The use of underground reservoirs for storing natural gas is becoming progressively more important, as markets at great distances from the source of production expand. Net gas placed in underground storage increased from 57,371 million cubic feet in 1948 to 65,683 million in 1949. A better indicator of the use being made of this type of storage is the gross amount stored, which rose from 136,406 million cubic feet in 1948 to 172,051 million in 1949. The States showing the largest advances in total gas stored were, in descending order, Michigan, West Virginia, Ohio, California, Pennsylvania, Oklahoma, and Kansas.

TABLE 4.—Natural gas stored underground in and withdrawn from storage fields, by States of location, 1948–49, in million cubic feet

State	1948			1949

MARKETED PRODUCTION

Marketed production of natural gas in 1949 rose 5 percent to 5,419,736 million cubic feet. Of the four largest producing States, marketed production increased in Texas and Louisiana but decreased in California and Oklahoma. The only other States showing an advance in marketed production were Kansas, Mississippi, and New Mexico. The marketed production of Texas continued to grow as a percentage of the total marketed production, reaching 48 percent in 1949, but this was still less than its proportion of proved reserves.

TABLE 5.—Marketed production of natural gas in the United States, by States, 1945–49

State	Quantity: Million cubic feet 1945	1946	1947[1]	1948[1]	1949[1]	Percent of total 1949	Estimated value at wells (thousand dollars) 1949

NUMBER OF WELLS

In 1950, 2,844 new gas wells were drilled in the United States compared with 2,887 in 1949. The number completed in Texas declined by 99; the number completed in West Virginia increased by 40. This reverses the record for the last several years, when completions were increasing in Texas and decreasing in West Virginia. The number of gas wells completed in New Mexico rose sharply to 90 in 1950 from 53 in 1949. Ten wells were reported completed in Nebraska, considerable activity for this State.

The total number of producing wells at the end of 1949 was 64,146, slightly lower than the previous year. The indicated number of wells abandoned, shut in, or reclassified during 1949 is 2,953.

TABLE 6.—Gas wells in the United States, 1948–50, by States

State	Producing Dec. 31, 1948	Drilled during 1949 [1]	Producing Dec. 31, 1949	Drilled during 1950 [1]
Arkansas	165	3	168	2

DEVELOPMENT AND PRODUCTION BY STATES [5]

Arkansas.—J. W. Sanders, chief engineer, Arkansas Oil and Gas Commission, reports that gas production from oil and condensate wells in south Arkansas rose in 1950 to 64,791 million cubic feet from 58,880 million in 1949. This increase was partly due to rescinding a cut in "allowables" placed on the controlled fields in 1949.

Production of dry gas from wells in northwest Arkansas increased from 6,901 million cubic feet in 1949 to 8,017 million in 1950. Of seven wildcat wells drilled in northwest Arkansas in 1950, one, the Arkansas Western No. 1, Franklin County, discovered a new reservoir.

California.—R. M. Bauer, Southern California Gas Co., reports that net dry-gas withdrawals from formation in 1950 totaled 533,809 million cubic feet compared with 546,026 million in 1949. In addition, 36,052 million cubic feet of gas were recovered as liquids in 1950 compared with 35,118 million in 1949. Receipts of natural gas in California via interstate pipeline increased from 94,099 million cubic feet in 1949 to 148,039 million in 1950.

Additions to reserves in 1950 again did not equal production, and proved reserves were estimated to have declined 231,249 million cubic feet to 9,760,386 million cubic feet.

Colorado.—J. R. Schwabrow, U. S. Geological Survey, reports that 12 gas wells were completed in 1950 with a total open flow of 72 million cubic feet, the greatest number of gas wells completed in Colorado in any year to date. New discoveries were made at Armstrong, Lee, and Loveland in the Julesburg Basin and at Ignacio in the San Juan Basin. Development wells were drilled at Barker Creek, Lee, Loveland, Powder Wash, and Piceance Creek. The pro-

[5] Based on latest available trade publications and reports from Federal and State agencies.

ductive area and proved reserves of this last-named field were increased considerably by these successful outpost wells. Three other wells here were dry holes.

Gas was marketed from Berthoyd, Craig, East Hiawatha, West Hiawatha, Powder Wash, and Thornburg fields. Marketing prospects were being investigated for Barker Creek, Douglas Creek, Piceance Creek, and the newly discovered fields. The casinghead gas from the Rangely field is employed only for recovery of liquids and lease use.

Net production increased from 13,529 million cubic feet in 1949 to 15,258 million in 1950. The advance was accounted for mainly by augmented field use at Rangely and larger sales from gas fields.

Illinois.—A. H. Bell and D. H. Swann, Illinois State Geological Survey, reported that 19 wells were completed as gas wells in 1950. Only three of these wells are being utilized, two in the Cottonwood pool and one in the Herald pool. The others have been shut in for lack of market or abandoned.

The two gas fields that have produced most of the Illinois natural gas marketed during the past decade—Ayers and Russellville—were both abandoned during 1950. About 60 billion cubic feet of solution gas were produced from oil wells and about one-half billion cubic feet from gas wells in oil fields during the year. Most of the 373 million cubic feet of Illinois gas marketed away from the field came from dry-gas wells within oil fields. About 13.7 billion cubic feet of solution gas from oil wells (a small amount of which originated in Indiana) was treated at Illinois natural-gasoline plants during 1950. Two and one-half billion cubic feet of the residue gas from these plants was used for repressuring, the rest being consumed as plant or lease fuel.

Indiana.—Six wildcat wells and 45 development gas wells were completed in Indiana in 1950. Twenty-two of these were in the Trenton field. The American Gas Association committee on natural-gas reserves reports a net production of 6,400 million cubic feet of natural gas in 1950 compared with 6,250 million in 1949.

Kansas.—Earl K. Nixon, Kansas State Geological Survey, reports that four new gas pools and two revivals—one each in Butler, Ford, Harper, Meade, Pawnee, and Rice Counties—were discovered in Kansas during 1950.

Three developments high lighted natural-gas operations in the State during the year: Addition in Seward County of about 200 square miles of gas-producing area as a southeast extension of the Hugoton field; opening of a new pool with strong production from the Mississippian in Meade County; and revival of the Pleasant Valley pool in eastern Ford County with large gas production, also from the Mississippian.

Roughly 220,000 acres were added to the Hugoton field, making the total producing area approximately 2.225,000 acres.

Of the 389 Kansas gas-well completions in 1950, 366 were in the Hugoton field, which had 2,216 producers at year end. Production from the Kansas part of the Hugoton gas field in 1950 was about 320 billion cubic feet, an increase of 29 percent over 1949. Roughly 85 percent of Kansas gas production during the year came from the Hugoton field.

Kentucky.—C. D. Hunter, chief geologist, Kentucky West Virginia Gas Co., reports that 193 producing gas wells, with an initial daily open flow capacity of 141 million cubic feet, were completed in Kentucky in 1950. Of these wells, 144 were in the Big Sandy gas field.

A new gas field was discovered in northern Scott County. Five wells starting in upper Ordovician encountered gas at depths of 320 to 375 feet in the Trenton limestone and developed a total daily open flow of 1.6 million cubic feet.

A careful check of gas production was made in 1950 by Hunter and other Kentucky geologists. Production was found to be 70 billion cubic feet in 1950, of which 95 percent came from the Big Sandy gas field.

Louisiana.—The Louisiana Department of Conservation Petroleum Activity Report for 1950 states that the production of natural gas was 1,496,817 million cubic feet, 47 percent above 1949. In all, 394 gas wells and condensate wells were completed, including 8 wildcat wells. The fields thus discovered and their location by parishes, were: Esterwood and Maxie in Acadia; Eugene Island Block 58 and Kent Bayou in Terrebonne; Opelousas in St. Mary; Sherburne in Pointe Coupee; Stonewall in DeSoto; and Unionville in Lincoln.

Michigan.—G. E. Eddy and W. L. Daoust of the Michigan Department of Conservation report that the most impressive dry natural-gas development of 1950 was the discovery and development of the Cannon Creek field in Tps. 24 and 25 N. and RS. 5 and 6 W., Missaukee and Kalkaska Counties. This was the first instance of discovery of gas in important quantities in the Traverse formation. Seventeen producing wells were completed with a combined daily open flow of more than 150 million cubic feet. In addition to the Cannon Creek discovery there were 6 other gas discoveries, but only 14 producing wells were drilled in these fields at the end of the year.

Seventy-five gas wells were drilled, of which 44 were facility wells drilled in gas-storage fields. Dry-gas production for the year totaled 12.5 billion cubic feet compared with 14.5 billion for the preceding year. Gas consumption, however, increased 15 billion cubic feet over 1949.

Mississippi.—In 1950 nine gas wells were completed in Mississippi, none of them wildcat wells. These completions included two in the Baxterville field, two in the Gwinville field, and four in the Sharon field.

According to the Monthly Petroleum Activity Report of the Mississippi State Oil and Gas Board, gross production of natural gas increased to 161,086 million cubic feet in 1950 compared with 108,978 million in 1949. Most of the increase came from the Baxterville and Gwinville fields. Sharon field, which had been shut in in 1949, was connected and started producing in July.

Missouri.—Frank C. Greene, district geologist, Missouri Division of Geological Survey and Water Resources, reports that 13 gas wells were completed in Missouri in 1950. Three wells were drilled in a new area south of Linkville, Platte County. In Cass County three wells were completed near Lisle and three near Harrisonville. Redrilling the old Smithville pool in Clay County yielded four producers. Total gas production in 1950 was reported as 81.6 million cubic feet from 14 wells.

Montana.—J. R. Schwabrow, U. S. Geological Survey, reports that 39 gas wells were completed with a total daily open flow of 118 million cubic feet. This is a smaller number of completions than during any year since 1939. Small exploratory wells at Bannatyne and Dunkirk were turned over to landowners for local use. The balance were field wells, Cub Bank having 13, Kevin-Sunburst 8, and the 101 Ranch-Plevna area 12. Only two wells were completed at Bowdoin and none at Cedar Creek, which accounts for the decline. The 101 Ranch-Plevna area is apparently a separate pool west of the southern part of the Cedar Creek anticline.

The small commercial production of the Havre field was suspended in June, and the Kicking Horse field ceased production in August owing to low well pressure.

On October 1 the Montana-Dakota Utilities Co. began transporting desulfurized Embar gas and sweet Frontier gas from the Worland field, Wyoming, through a new 340-mile line to Cabin Creek on the Bowdoin–Cedar Creek system. This gas will augment the supply from these two old fields, and some of it will be stored at Cedar Creek.

Net production of natural gas increased from 41,245 million cubic feet in 1949 to 42,745 million in 1950. Losses were cut to one-third of the 1949 volume.

Nebraska.—J. R. Schwabrow, U. S. Geological Survey, reports that in Nebraska during 1950, 11 gas wells were completed with a total initial production of 88 million cubic feet per day and located as follows: 7 with 69 million cubic feet per day in Huntsman field, 2 with 13 million in Southwest Sidney field, 1 with 5 million in Sunol field, all Cheyenne County, and 1 with 5 million in Big Springs field, Deuel County. At the end of the year only 1 of these 11 wells had been connected to a pipeline and put on production—the Ohio Oil Co. No. 1 Ruehman, Huntsman field. This well was supplying gas for the nearby town of Sidney. The Ohio Oil Co. also completed a gasoline plant in the Huntsman field to process all free and associated gas produced in the field and to supply dry gas to the North Central Gas Co. trunk line along the North Platte River.

New Mexico.—Foster Morrell, U. S. Geological Survey, reports that gas-development operations were accelerated in the San Juan Basin by the approval of the Federal Power Commission on July 14, 1950, of the El Paso Natural Gas Co. application to construct a pipeline from the San Juan Basin to Toprock, Ariz. During 1950, 5 new gas pools were discovered, and 88 gas wells were completed in the New Mexico portion of the San Juan Basin. Of these 33 were in the Fulcher Basin-Kutz Canyon pool and 31 in the Blanco and La Plata pools. No major gas fields were discovered in central or southeastern New Mexico in 1950; 32 gas wells were completed in Lea County.

The estimated production of gas in southeast New Mexico rose from 202,687 million cubic feet in 1949 to 207,787 million in 1950. Natural-gas deliveries in northwest New Mexico increased from 11,544 million cubic feet in 1949 to 14,410 million in 1950.

New York.—W. L. Kreidler, senior geologist, New York Geological Survey, reported natural-gas production in 1950 to have been 4,050 million cubic feet—2,800 million from the Medina horizon and 1,250 million from the Oriskany horizon. Forty wells were drilled into the Medina, of which 22 were facility wells in gas-storage fields. Four wells were completed into the Oriskany, but none resulted in commercial production.

North Dakota.—Wilson M. Laird, State geologist of the North Dakota Geological Survey, reported that 28 wells were producing gas in the State in 1950 and that no permits had been issued for gas-well drilling during the year. Production for 1950 was 608 million cubic feet. Some gas has been encountered in deep tests drilled for oil, but no commercial production has resulted.

Ohio.—R. L. Alkire of the Ohio Geological Survey reports that 284 gas wells were completed in 1950 compared with 292 in 1949. The average initial production of these wells was 414 thousand cubic feet per day compared with 676 thousand cubic feet in 1949. Of the total gas completions, 106 were in the Berea sand and 101 in the Clinton. Eight exploratory gas wells were completed as small gas producers. Acreage added by new pool discoveries in 1950 was negligible, totaling 1,100 acres; 500 acres in the Oriskany sand in section 25, Granger Township, Medina County, and 600 acres in the Newburg sand in section 24, Congress Township, Wayne County. Approximately 4,200 acres were added by extensions. The largest well reported during the year was completed on the L. S. Starr farm, lot 5, Litchfield Township, Medina County. Its initial daily production was 5,740 thousand cubic feet from the Clinton sand at 2611–2,623 feet.

Oklahoma.—Elmer Capshaw, Oklahoma Corporation Commission, reports that in 1950 the Oklahoma portion of the Hugoton field produced 125,890 million cubic feet of dry gas, over 40 percent of the total production from gas wells in the State. Three-quarters of this field has been developed and has 948 producing wells. The remaining quarter of the field is being developed.

The rising field price of dry gas in Oklahoma has led to the development of storage facilities and increased processing and utilization of casinghead gas.

The American Gas Association Reserves Committee reports that the net production of natural gas in Oklahoma in 1950 was 607,918 million cubic feet compared to 567,335 million in 1949. The number of gas wells completed increased from 213 in 1949 to 249 in 1950.

Pennsylvania.—J. G. Montgomery, Jr., vice president, United Natural Gas Co., reports that the most important natural-gas development in Pennsylvania in 1950 was the discovery of gas in Oriskany sands underlying the Leidy dome on the Wellsboro anticline in Clinton County. The discovery well had an initial daily open flow of 10 to 15 million cubic feet and an initial rock pressure of 4,200 pounds per square inch. By the end of the year, 12 wells with an average initial daily open flow of 17 million cubic feet had been completed, and 47 wells were being drilled. The pool was producing 150 million cubic feet per day.

In all, 410 gas wells were drilled during the year, of which 391 were in shallow sand fields. Two wells testing Cambro-Ordovician formations were being drilled in Bedford and Lycoming Counties at the end of 1950.

Tennessee.—H. C. Milhous, geologist, Tennessee Division of Geology, reports that three wildcat test wells drilled in 1950 showed gas and probably would be commercial producers except for the remoteness of their location. These were in Robertson, Sumner, and

Pickett Counties. Total gas production in 1950 was estimated at 88.5 million cubic feet, 88 percent being produced in Morgan and Scott Counties.

Texas.—The total production of natural gas in Texas, according to the Railroad Commission of Texas, increased 14 percent in 1950 to 4,024,177 million cubic feet, of which 889,850 million cubic feet were returned to formation. Production from gas wells totaled 3,099,606 million cubic feet, 77 percent of the total production. According to the Oil and Gas Journal, gas-well completions for the year totaled 647,534 development wells and 113 wildcat wells.

The Bulletin of the American Association of Petroleum Geologists, June 1951, reports that drilling in the Panhandle district resulted entirely in extending and developing known fields. Gas production declined to 860,066 million cubic feet. In South Texas production from gas wells was 725,400 million cubic feet. In this region the percentage of oil wells connected with casinghead-gas processing plants increased from 15 to 49 percent over a 4-year period.

In East Texas none of the new discoveries were expected to have major geological significance. The most productive discovery was the Sanders No. 1 in the North Jacksonville field in Cherokee County. This well had a calculated daily open-flow potential of 105 million cubic feet of gas and 1,144 barrels of condensate.

No gas discoveries in the Upper Gulf Coast region appeared to have major importance. Gas production increased to 750,674 million cubic feet in 1950, and virtually all large gas reserves in the area have been committed.

Utah.—J. R. Schwabrow, U. S. Geological Survey, reports that the only gas well drilled in Utah in 1950 was a field-use well at Ashley Creek, with a reported daily open flow of 5 million cubic feet. The Utah Natural Gas Co. filed a petition before the Utah Public Service Commission to build an intrastate natural-gas pipeline from southeastern Utah, but no decision was rendered during 1950.

Marketed production was limited to Clay Basin, as in the past. Clay Basin production was 3,950 million cubic feet compared with 6,126 million in 1949. Some gas was produced from Ashley Creek and Roosevelt fields and used in the field.

Virginia.—William M. McGill, State geologist, Virginia Geological Survey, reports that tests for natural gas in Virginia in 1950 were confined mainly to the Appalachian Plateaus section and were in Buchanan, Dickenson, Tazewell, and Wise Counties. Eleven test wells were completed as potential producers and capped; 12 were abandoned as dry holes. The potential daily production from this region is estimated at 85 million cubic feet. Production of natural gas in 1950 came entirely from the Early Grove field in Scott and Washington Counties and was reported as 82 million cubic feet for the year.

West Virginia.—Paul H. Price, State geologist of West Virginia, reports 417 gas wells as completed in 1950 compared with 427 in 1949. The initial daily open-flow gas production of these wells was 468 million cubic feet. The counties with the greatest activity in 1950 were Calhoun, Jackson, Lincoln, Mingo, Putnam, Ritchie, and Wayne.

The American Gas Association reserves committee reports that net production of natural gas in 1950 was 205,000 million cubic feet compared with 180,000 million in 1949.

Wyoming.—J. R. Schwabrow, U. S. Geological Survey, states that 20 gas wells were completed in 1950, with a total daily open flow of 160 million cubic feet. Three of these were recompletions in the Frontier at Worland, and one was recompletion in the Embar at Garland. Four deep wells were completed at Church Buttes, and two were being drilled there at the end of 1950. New fields discovered were at Deep Creek, with a total daily open flow of 3,728 thousand cubic feet from the Mesaverde and at Long's Creek with a daily open flow of 6,470 thousand cubic feet from the Phosphoria. Other completions were scattered among nine old fields.

Net production in 1950 was 78 billion cubic feet compared with 72 billion in 1949. Waste gas has been eliminated at Elk Basin, and the pipeline described in the review for Montana will eliminate most of the waste at Worland.

INTERSTATE SHIPMENTS AND EXPORTS

Interstate shipments and exports of natural gas in 1949 increased 14 percent to 2,007,878 million cubic feet. The largest producer of gas shipped interstate was Texas, whose shipments also expanded at a higher rate in 1949 than those of other major producing States. Interstate shipments increased from the major gas-producing States of the Southwest except Oklahoma; shipments declined from all the producing States in the Appalachian district. The West South Central region produced 74 percent of all gas moving interstate.

The gas from the West South Central region was consumed mainly in the East North Central (31 percent) and the West North Central regions (17 percent). The Pacific, Middle Atlantic, and South Atlantic regions showed the highest rate of increase of consumption of gas from the West South Central region.

Exports to Mexico increased from 18,511 million cubic feet in 1948 to 19,828 million in 1949. Exports to Canada increased from 193 million cubic feet in 1948 to 226 million in 1949.

TABLE 7.—Interstate shipments and exports of natural gas in 1949 by sources of shipments and State or country of final destination [1]

Producing region	Quantity shipped (million cubic feet)	Consuming State or country	Quantity received [2] (million cubic feet)

[1] Includes exports of 20,054 million cubic feet, of which Mexico received 19,828 million and Canada 226 million.
[2] Includes amounts consumed, stored, and lost in transmission.

PIPELINES

In 1950, $954,000,000 was spent on the construction of natural-gas transmission and distribution pipelines. During the year the Federal Power Commission approved construction of 5,750 miles of natural-gas transmission lines, which when completed will raise the total mileage of the natural-gas transmission system to more than 265,000 miles. Still pending before the Federal Power Commission at the beginning of 1951 were applications for constructing 12,400 miles of pipeline.

The world's longest gas pipeline—the 1,840 mile line of Transcontinental Gas Pipeline Corp. from Texas to New York City—was completed in 1950. Also completed was the largest-diameter line yet constructed, the 34-inch line of Pacific Gas & Electric Co. from Toprock, Ariz., to the San Francisco, Calif. area.

The Federal Power Commission in 1950 arrived at a decision on supplying natural gas to the New England States. The market was divided between Algonquin Gas Transmission Co. and Northeastern Gas Transmission Co. Distribution to New England may begin before the end of 1951.

Gas-gathering lines are to be laid under the Gulf of Mexico to collect gas produced by wells off the coast of Louisiana.

CONSUMPTION

Consumption of natural gas in the United States in 1949 was 5,195,484 million cubic feet compared with 4,945,149 million in 1948. Residential consumption increased 11 percent, commercial 8 percent, and total industrial 3 percent.

Treated for Natural Gasoline.—The quantity of natural gas processed at natural-gasoline and cycle plants increased 6 percent in 1949 to 4,656,000 million cubic feet. The pattern of previous years continued, with the volumes treated in the Southwestern States, except New Mexico, increasing and the volumes in the Appalachian and North Central States decreasing.

Residential and Commercial.—Residential consumption of natural gas increased from 896,000 million cubic feet in 1948 to 993,000 million in 1949. The number of consumers increased by about 1,200,000 to 14,690,000. A consumer of natural gas is considered as one who receives natural gas either straight, reformed, or mixed with other gases.

Texas	2,039,983	2,012,357	2,235,185	2,382,804	2,526,885
West Virginia	166,037	181,903	193,044	193,086	170,831
Wyoming	21,907	22,590	22,261	29,998	32,333
Total	3,653,870	3,663,760	4,070,150	4,393,500	4,656,142

The largest increases in residential consumption took place in California (17,000 million cubic feet) and Pennsylvania (16,000 million cubic feet). This increase in Pennsylvania, which is now a larger consumer of natural gas for residential use than Texas, was due mainly to the initiation in 1948 of natural-gas deliveries to Philadelphia. The rise in the number of residential consumers of natural gas was general throughout the consuming States. Largest gains were made in Pennsylvania, Wisconsin, and California. The initiation of deliveries to Wisconsin utilities by the Michigan-Wisconsin Pipeline Co. explains the large increase in the number of consumers in that State.

Commercial consumption of natural gas increased by 25,000 million cubic feet to 347,818 million in 1949. The number of consumers increased in the same proportion to 1,231,000.

Field.—Field use of natural gas increased 4 percent to 1,059,628 million cubic feet in 1949. Field use, in the individual States, tended to vary in the same direction as marketed production, except in Kentucky, Pennsylvania, and West Virginia. Here field use was greater, though marketed production declined.

Carbon-Black Manufacture.—The consumption of natural gas in the manufacture of carbon black declined 11 percent to 428,000 million cubic feet in 1949 compared with 1948. At the same time, the production of carbon black declined only 6 percent owing to the increasing quantities being produced from oil. Again in 1949 New Mexico was the only State to show an increase in the use of gas for carbon-black manufacture. The average value of gas for carbon-black production in New Mexico was well below the national average.

Petroleum Refineries.—The consumption of natural gas as fuel at petroleum refineries decreased from 441,000 million cubic feet in 1948 to 422,000 million in 1949. This reduction is not directly related to the quantity of crude oil run to stills, the largest reduction occurring in California, where crude runs increased in 1949. Smaller reductions took place in Kansas and Oklahoma. Louisiana showed an increase of 10,000 million cubic feet.

232294—53——53

[1] Federal Power Commission. These figures include some manufactured gas and are therefore shown separately. The natural gas component in these figures is included with "Other industrial."

[2] Gas used in portland-cement plants included under "Unclassified by States" for United States total and under "Other industrial" for State totals to avoid disclosing figures of individual operators.

[3] Gas used in carbon-black manufacture included under "Unclassified by States" for United States total and under "Other industrial" for State totals to avoid disclosing figures of individual operators.

[4] North Dakota, South Dakota, Utah, and Wisconsin.

[5] Less than 500 M cubic feet.

Electric Utility Plants.—Gas consumption by public-utility electric power plants in 1949, as reported by the Federal Power Commission, increased 15 percent over 1948 to 550,000 million cubic feet. A small amount of manufactured gas is included in this figure. The largest gain in consumption was reported for Illinois. New Jersey and Delaware used natural gas in electric utility power generation for the first time. All consuming States gained in consumption except Tennessee and West Virginia and the group of "Other States," which includes North Dakota, South Dakota, Utah, and Wisconsin.

Portland-Cement Plants.—The consumption of natural gas as fuel at portland-cement plants rose 17 percent in 1949 to 85,000 million cubic feet. At the same time, the production of portland cement increased by only 2 percent. Alabama reported the largest increase in consumption. No State showed a decline.

Other Industrial.—The consumption of natural gas by industries other than petroleum refining and cement manufacture increased 9 percent to 1,861,000 million cubic feet. Largest gains were made by Texas, increasing 62,000 million cubic feet, and Illinois, increasing 27,000 million. New Mexico was the only State that showed a substantial loss of "Other industrial" sales, which declined 16 percent. New Jersey and Delaware reported industrial consumption for the first time. Michigan and New York lost industrial sales in 1948 but regained them in 1949.

Mixed Gas.—Both the quantity of natural gas used with manufactured gas and the number of consumers of mixed gas in 1949 increased over 1948. Conversions to straight natural gas have eliminated all mixed-gas sales in Minnesota, most of them in Ohio, and a substantial quantity in New York. In Delaware and New Jersey natural gas, available for the first time in 1949, is distributed mixed.

TABLE 12.—Consumption of natural gas used with manufactured gas in the United States in 1949, by States

State	Residential		Commercial		Industrial (million cubic feet)	Total	
	Number of consumers	Million cubic feet	Number of consumers	Million cubic feet		Million cubic feet	Value at point of consumption (thousand dollars)
Illinois	1,210,677	27,005	60,323	8,293	15,243	50,541	35,199

PRICES

The average value at wells for natural gas in the United States declined 0.2 cent in 1949 to 6.3 cents per thousand cubic feet. The decline resulted from an increased proportion of total marketed production being produced in the low-value, larger producing States and from price declines in a number of the smaller producing States. The average value, however, increased in five of the seven States with largest marketed production.

The average value of natural gas at point of consumption in 1949 increased 1.3 cents per thousand cubic feet to 25.4 cents per thousand. The percentage gain in unit value on a United States total basis was about 3 percent for each class of consumer—residential, commercial, and industrial.

WORLD REVIEW

Canada.—Gross production of natural gas in the Province of Alberta in 1950 was 75.6 billion cubic feet, an increase of 13 percent over 1949. The first development of the Jumping Pound field took place in 1950. Discovered in 1944, it had been shut in for lack of market. A natural-gasoline plant is under construction here, and another was completed at Devon to operate on casinghead gas from the Leduc field.

The Petroleum and Natural Gas Conservation Board of Alberta issued an interim report on the question of exporting gas from the Province. It estimated reserves for Alberta at 4.4 trillion cubic feet of gas economically recoverable and available for use away from the field. These reserves were thought to be sufficient only to meet the expected needs of the Province of Alberta, and the Board therefore declined to issue export permits until further reserves had been proved.

Italy.—The production of natural gas in Italy in 1950 approximated 16 billion cubic feet, more than a 100-percent increase over 1949.

[1] Preliminary or estimated figures.
[2] Data not available.
[3] American and British Zones.
[4] April–December.
[5] January–June.
[6] Beginning 1945, industries under control of the National Resources Commission.
[7] Less than 500,000 cubic meters.
[8] Excluding U. S. S. R, where natural-gas consumption was last reported as 1,400 million cubic meters in 1936.

Completion of pipeline construction to be started in 1951 will give Azienda Generale Italiana Petroli, the Government-controlled oil company, 840 miles of line with a daily capacity of 353 million cubic feet. This company and its subsidiaries in 1950 produced over half of the natural gas in Italy.

Mexico.—The completed 20-inch pipeline from Veracruz to Mexico City delivered 30 million cubic feet per day to Mexico City for industrial use in 1950. Proved reserves of natural gas at the end of 1949 were reported to be 1.2 trillion cubic feet. Daily production of gas at the end of 1950 was 400 million cubic feet compared with 164 million at the end of 1949.

Venezuela.—A natural-gas pipeline was started in October 1950 from the producing region around Las Mercedes and Tucupido to Caracas. Production of natural gas in 1949 approximated 500 billion cubic feet.

Natural Gasoline
and Liquefied Petroleum Gases[1]

By D. S. Colby, E. M. Seeley, A. T. Coumbe, and I. F. Avery

GENERAL SUMMARY

PRODUCTION of natural-gas liquids increased to 7,625 million gallons in 1950, an all-time high and 16 percent above 1949. LP-gases[2] showed the largest growth, with an increase of 24 percent for the year.

The average yield of all light products rose from 1.42 gallons per thousand cubic feet in 1949 to 1.44 gallons in 1950. The gain was due almost entirely to increased recovery of propane; the yield of natural gasoline declined.

In 1950, 5,283 billion cubic feet of gas were treated at natural-gasoline and cycle plants compared with 4,656 billion in 1949. Operable plants on January 1, 1950 (latest biennial survey), had a production capacity of 27 million gallons of natural-gas liquids daily.

Total demand for natural-gas liquids in 1950 was 7,690,041 thousand gallons, an increase of 14 percent. Shipments to refineries totaled 4,143,693 thousand gallons. The proportion of these products blended into refinery gasoline increased from 9.1 percent in 1949 to 9.5 percent in 1950. The primary market for LP-gases—direct sale for fuel use—took 2,051 million gallons in 1950, a 26-percent increase.

[1] Preliminary figures.
[2] Differs from previously published figures by amount of stock change.
[3] "Other products" not used as motor fuel.
[4] Liquefied refinery gases.

Stocks of all natural-gas liquids at plants, terminals, and refineries on December 31, 1950, totaled 309 million gallons, an increase of 22 million gallons during the year, mostly of LP-gas stocks.

The total value at plants of all natural-gas liquids produced in 1950 was $417,700,000, an increase in overall value despite the decline in average value to 5.5 cents per gallon from 6.1 cents in 1949. Market prices for both natural gasoline and LP-gas in 1950 averaged below 1949 prices despite the rising trend in the latter part of 1950.

Exports totaled 110 million gallons compared with 237 million in 1949. The decline took place entirely in exports of natural gasoline. Exports of LP-gases increased.

RESERVES

The American Petroleum Institute and the American Gas Association reserves committee estimated proved recoverable reserves of natural-gas liquids in the United States at the end of 1950 to be 4,267,663,000 barrels, an increase of 538,651,000 barrels over 1949.

New discoveries were lower than in 1949, while extensions and revisions of estimates of old fields added more reserves in 1950 than at any time since these estimates were initiated in 1947. Over half of the total addition to reserves was due to extensions and revisions of the reserves of Texas. Extensions to reserves in California and Kansas were unusually high in 1950. The downward revision of estimates of Colorado reserves caused the largest indicated decline of reserves in any State.

[1] Comprises natural gasoline, LP-gases, and condensate.
[2] Not allocated by types, but occurring principally in column shown.

PRODUCTION

The production of natural gasoline and allied products in 1950 again exceeded all previous outputs. Total liquid production was 7,625,466 thousand gallons, 16 percent above 1949. Production of liquids at cycle plants increased only 9 percent to 1,877,392 thousand gallons in 1950. Production of natural-gas liquids in the last half of 1950 exceeded 1949 production by a greater margin than in the first half.

By type of product, the increases in production compared to 1949 were 10 percent for natural gasoline, 24 percent for LP-gases, 14 percent for finished gasoline and naphtha, and 9 percent for other products. LP-gases in 1950 constituted 40 percent of the total production of natural-gas liquids, whereas in 1941 they constituted just over 20 percent.

1 Includes condensate, kerosine, distillate fuel, etc.
2 A producer operating in more than 1 State is counted but once in arriving at total for United States.
3 Preliminary figures.
4 Less than $500.

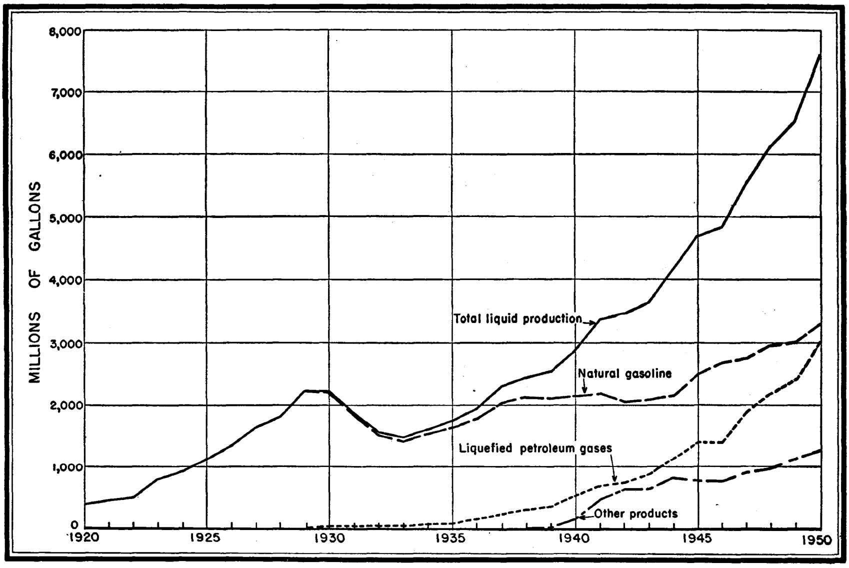

FIGURE 1.—Production of the natural-gasoline industry, 1920–50.

REVIEW BY STATES

California.—The production of all natural-gas liquids in 1950 totaled 1,184,479 thousand gallons, a 4-percent increase over 1949 but below the national average gain.

Louisiana.—The production of natural-gas liquids in the Gulf area of Louisiana declined 2 percent in 1950. Output in this district has been declining since 1947. The Inland area produced 12 percent more natural-gas liquids than in 1950. Total production in Louisiana for 1950 was 860,863 thousand gallons. There was virtually no change in the volume of natural gasoline and "other products" produced compared with 1949; production of LP-gases and "finished gasoline and naphtha" increased 12 and 19 percent, respectively.

Oklahoma.—The production of natural-gas liquids in Oklahoma increased 18 percent in 1950 to 616,823 thousand gallons. Natural-gasoline output increased 14 percent compared with a 4-percent increase in 1949. The production of LP-gases and "finished gasoline and naphtha" increased 20 and 5 percent, respectively.

Texas.—The output of all natural-gas liquids in Texas in 1950 increased 21 percent to 3,930,347 thousand gallons. The largest gain was made in the production of LP-gases, which increased 33 percent to 1,655,998 thousand gallons. Texas in 1950 produced 52 percent of all natural-gas liquids and 55 percent of all LP-gases in the country.

Other States.—The States showing above-average gains in the production of natural-gas liquids in 1950 were Kansas, New Mexico, West Virginia, and Wyoming. In all these States the predominant increases percentagewise were in the production of LP-gases. States reporting decreases in output were Illinois, Michigan, New York, and Ohio.

[1] West New York and West Pennsylvania separated from east part of States to allow grouping either according to Bureau of Mines refinery districts or according to Petroleum Administration for War districts. Districts shown for Texas and Louisiana are Bureau of Mines production districts.

[2] Preliminary figures.

YIELDS, PROCESSES, AND NUMBER OF PLANTS

Cycle Plants.—The yield of natural-gas liquids recovered at cycle plants declined for the second consecutive year in 1950 to 1.49 gallons per thousand cubic feet. In the two preceding years the yield had been 1.54 and 1.60 gallons per thousand cubic feet. In 1950, 1,263,714 thousand cubic feet of gas were treated at cycle plants, from which 1,877,392 thousand gallons of liquids were recovered.

Yields.—The average yield of all light products continued its slow rise in 1950. This rise in over-all yield was due entirely to the increased yield of LP-gases, which in 1950 averaged 0.57 gallon per thousand cubic feet compared with 0.52 in 1949; propane alone accounted for 0.04 of this 0.05-gallon-per-thousand-cubic-feet increase. The yield of all products averaged 1.44 gallons per thousand cubic feet, up from 1.42 in 1949, while the average yield of all products except

1948	131	376	41	548	257,458	4,315,774	1,589,055	6,162,287

[1] Figures for 1950 not yet available.
[2] Includes 21 plants manufacturing LP-gases.
[3] Includes combination of absorption process with compression and charcoal processes. Includes 236 plants manufacturing LP-gases; and 3 charcoal plants in West Virginia and Ohio with 932,000 gallons produced in 1949 and 3 charcoal plants with 1,664,000 gallons produced in 1948.
[4] Includes 36 plants manufacturing LP-gases.
[5] Includes 38,346,000 gallons of field condensate.
[6] Drip gasoline.

LP-gases declined from 0.89 gallon to 0.87 gallon per thousand cubic feet.

The average value of liquids recovered per thousand cubic feet of natural gas treated declined from 8.6 cents in 1949 to 7.9 cents in 1950. The decline in value of natural gasoline recovered per thousand cubic feet—from 4.5 cents in 1949 to 4.2 in 1950—was due both to price decline and lowered recovery. The decline in value of LP-gases recovered per thousand cubic feet—from 2.1 cents to 1.8—was due entirely to a price decline.

Production, by Processes.—The total number of plants, natural-gasoline and cycle, operating in 1949 was 550, a net increase of 2 over 1948. The number of operating compression-type plants continued to decline, most of the shut-downs occurring in Pennsylvania and West Virginia. The number of operating absorption plants increased by 12 to 388, and the number of cycle plants increased by 5 to 46.

MARKET DEMAND—SHIPMENTS

Total demand at plants and terminals for natural-gas liquids was 7,690,041 thousand gallons in 1950, a 14-percent increase. Sizable gains were made in the demand for all classes of products. Natural gasoline increased 11 percent, condensate 10 percent, finished gasoline and naphtha 21 percent and LP-gases 22 percent.

Shipments to Refineries.—Shipments of natural-gas liquids to refineries increased 10 percent in 1950 to 4,143,693 thousand gallons. Natural-gasoline shipments increased 10 percent, normal butane shipments 13 percent, and "other LP-gases" 39 percent, while isobutane and isopentane shipments decreased 4 and 23 percent, respectively. Indicated shipments of finished gasoline and naphtha increased 30 percent. This figure is substantially influenced by the sales methods of companies operating both gasoline plants and refineries, and a change in the figure does not necessarily indicate an operational change.

[1] Preliminary figures.

The quantity of natural gasoline and allied products utilized at refineries in the United States in 1950 was 3,974,838 thousand gallons. This represents an 11-percent increase in the refinery use of these products and an increase in the percentage of natural gasoline and allied products in refinery gasoline from 9.1 percent in 1949 to 9.5 percent in 1950. The largest percentage increases in consumption of these products at refineries were in the East Coast and Arkansas-Louisiana Inland regions.

TABLE 8.—Percentage of natural gasoline and allied products in refinery gasoline in the United States 1946–50 by Bureau of Mines refinery districts

Year	East Coast	Appalachian	Indiana, Illinois, Kentucky	Oklahoma, Kansas, Missouri	Texas Inland	Texas Gulf Coast	Louisiana Gulf Coast	Arkansas, Louisiana Inland	Rocky Mountain	California	Total
1946	1.2	1.9	5.0	7.9	22.7	8.8	5.1	16.6	4.7	15.4	8.4
1947	.8	2.0	5.5	7.7	22.6	8.8	5.3	10.3	3.9	17.4	8.7
1948	.8	2.4	5.0	8.9	25.0	8.3	4.8	7.1	3.8	17.2	8.5
1949	1.5	2.0	5.3	9.5	27.6	8.5	6.0	7.5	4.5	18.4	9.1
1950 [1]	3.5	1.7	5.0	8.3	26.0	10.7	5.9	13.8	4.1	19.0	9.5

[1] Preliminary figures.

"Direct" Sales.—The largest market for LP-gases is direct fuel use. Shipments to jobbers and trade outlets for this use increased 26 percent in 1950 to 2,051,277 thousand gallons. The use of LP-gases for chemical manufacture was rising throughout the year and averaged 27 percent higher than in 1949.

Shipments of natural gasoline to jobbers, while still relatively small, increased 34 percent in 1950 to 246,842 thousand gallons.

The relative importance of various modes of transport carrying gasoline and cycle-plant products from the producing plants remained constant in 1949 compared to 1948. Pipelines carried 50 percent of the total shipments; tank cars, 24 percent; tank trucks, 21 percent; barges, 2 percent; and miscellaneous (which includes direct retail sales and company use), 3 percent.

SALES OF LP-GASES[3]

Sales of LP-gas, which showed only a nominal increase in 1949 compared with 1948, turned sharply upward in 1950, when deliveries of 3,482,567,000 gallons were nearly a quarter (23 percent) above the 1949 total of 2,836,599,000. Illustrating the rapid growth in the market for LP-gas is the fact that 1950 sales about tripled the demand in 1945 and doubled the 1946 quantity. Exports of LP-gas increased from 53,383,000 gallons in 1949 to 67,763,000 in 1950, a 27-percent gain, according to figures published by the Bureau of the Census, United States Department of Commerce.

Sales of LP-gas were shown only by marketing districts [4] in 1948 and 1949; a State breakdown of the market is available for the first

[3] LP-gases, as used in this section, includes LR- (liquid refinery) gases as well. The survey covering sales of LP-gases in the Pacific Coast marketing area (district 5) was made by E. T. Knudsen, chief, Petroleum Statistics Branch, Bureau of Mines, Los Angeles, Calif.

[4] Petroleum Administration for War districts. For a list of the States in each district, *see* footnote to table 11.

time in 1950. Gains in requirements for LP-gas in 1950 were reported for all areas of the country, except district 5, where there was a 4-percent decline in the quantity compared with 1949. Outstanding increases in sales in 1950 were reported for district 1, where deliveries were 57 percent over the 1949 total, and also for districts 2 and 4, where requirements were up 21 and 39 percent, respectively, over 1949 demands.

TABLE 9.—Sales of LP-gases [1] in the United States 1946–50 by type of gas

Year	Butane		Propane		Butane-propane mixture		Total	
	Thousand gallons	Percent of total	Thousand gallons	Percent of total	Thousand gallons	Percent of total	Thousand gallons	Increase over previous year, percent

1949	1,627,550	544,886	177,850	162,197	239,210	77,981	6,925	2,836,599
1950	2,034,464	612,468	228,485	217,078	251,694	129,818	8,560	3,482,567

[1] Data include LR-gases.

Distributors reported sales of 1,938,301,000 gallons of propane in 1950, a gain of 38 percent over the 1949 total of 1,403,359,000 gallons. The proportion of propane in the LP-gas total, because of its expanding supply, continued the upward trend of recent years and represented about 56 percent of all deliveries in 1950 compared with a 50-percent share in 1949. Butane covered in the survey increased from 488,-801,000 gallons in 1949 to 568,038,000 in 1950, a gain of 16 percent; however, the butane proportion in the total sales declined from 17 percent in 1949 to 16 in 1950. Sales of butane-propane mixtures rose by 3 percent, or from 944,439,000 gallons in 1949 to 976,228,000 in 1950, while the relative share of these mixtures in the LP-gas total declined from 33 percent in 1949 to 28 percent in 1950.

A greater demand for propane was indicated for all principal uses in 1950 compared with 1949. The quantities of butane reported for gas-company distribution, industrial fuel, and internal-combustion-engine fuel in 1950 were below those for 1949, while sales of butane for domestic (household) and commercial uses and to synthetic rubber and chemical plants were above comparative items for 1949. Domestic and commercial establishments, chemical plants, and internal-combustion engines used more butane-propane mixtures in 1950 than in 1949, while quantities reported for other principal uses were below the 1949 level.

1 Data include LR gases.
2 The States in each district are as follows:
District 1.—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida.
District 2.—North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Wisconsin, Illinois, Indiana, Michigan, Ohio, Kentucky, Tennessee, Missouri, Kansas, Oklahoma.
District 3.—New Mexico, Texas, Arkansas, Louisiana, Mississippi, Alabama.
District 4.—Idaho, Montana, Wyoming, Utah, Colorado.
District 5.—California, Oregon, Washington, Arizona, Nevada.
3 Not available by type of gas.

Domestic (Household) and Commercial Uses.—Distributors reported sales of 2,034,464,000 gallons of LP-gas for domestic and commercial uses in 1950, a 25-percent gain over the 1949 quantity of 1,627,550,000 gallons, which in turn exceeded 1948 requirements by 10 percent. Most of the LP-gas sold for domestic and commercial fuel is propane (60 percent of the total in 1950 and 53 percent in 1949); the quantity increased from 854,456,000 gallons in 1949 to 1,217,760,000 in 1950—a gain of 43 percent. Butane and propane mixtures for domestic and commercial use in 1950—638,061,000 gallons—were only slightly above the 1949 total of 618,495,000 gallons, and the proportionate share declined from 38 percent in 1949 to 31 percent in 1950. Butane delivered for household fuel increased from 154,599,000 gallons in 1949 to 178,643,000 in 1950—a 16-percent gain—and represented about 9 percent of total requirements in both years.

Important gains in sales of LP-gas for domestic and commercial fuel in 1950 were reported for districts 1, 2, and 4 (*see* table 12). In district 1 the increase was outstanding—57 percent—and the proportionate share for the area increased from about 17 percent of the national total in 1949 to 22 percent in 1950. The quantity of liquefied gas delivered for domestic fuel in district 2 was larger by 36 percent in 1950 over 1949, even though a growing use of natural gas was a competitive factor in the area. Sales in this district increased from 33 percent of the total domestic demand in 1949 to 35 percent in 1950. Deliveries of LP-gas for household use in district 4 are not relatively important (about 3 percent of the national total); however, they showed a 30-percent gain in 1950 over 1949. The largest share (35 percent in 1949 and 31 percent in 1950) of the LP-gas delivered for domestic fuel was reported for district 3; however, there was a gain of only 10 percent in sales in that area in 1950 over 1949, probably because it has used LP-gas for a longer time and is possibly near the saturation point for this type of domestic fuel. A wide distribution of natural gas in the area is also a factor. The Pacific Coast marketing area (district 5) was the only section of the country to show lower sales—down 6 percent—of LP-gas for domestic use in 1950. This loss was partly attributed to competitive natural gas piped in from Texas and to milder weather. LP-gas sold in district 5 for household fuel represented 12 percent of the national total in 1949 and 9 percent in 1950.

Gas-Company Use.—LP-gas sold to gas companies for enriching manufactured gas and for direct distribution through mains increased from 239,210,000 gallons in 1949 to 251,694,000 in 1950—a 5-percent gain, which compares with a 1-percent expansion in 1949 over 1948. Most of the LP-gas delivered to gas companies is propane (76 percent of the total in 1950 and 61 in 1949), and the quantity increased by a third from 144,883,000 gallons in 1949 to 192,347,000 in 1950. Butane sold to gas companies declined by a third from 61,501,000 gallons in 1949 to 40,924,000 in 1950, while mixtures were lower by 44 percent, dropping from 32,826,000 gallons in 1949 to 18,423,000 in 1950.

Sales of LP-gas to gas companies in 1950 showed gains in districts 1, 3, and 4 and declines in the other areas of the country. In district 1 the liquid gas delivered to gas companies in 1950 was 31 percent above the 1949 demand, and the proportion for the area rose from 30 percent of the national total in 1949 to 37 percent in 1950. Quantities credited to gas companies in districts 3 and 4 are not relatively important; however, their purchases of LP-gas in these areas expanded greatly in 1950 over 1949. Although over half (about 54 percent) of the LP-gas going to gas companies in 1949 was credited to district 2, the demand declined by 12 percent in 1950—probably due to competition with natural gas—and the relative share for the area dropped to 45 percent of the national total. Gas companies operating in district 5 bought 6 percent less LP-gas in 1950 than in 1949, and their requirements declined from 12 percent of the national total in 1949 to 11 percent in 1950.

The American Gas Association has reviewed the distribution of LP-gas by gas companies in 1950 as follows:

> As of June 1, 1951, liquefied petroleum gas was being delivered through mains in 402 communities in 39 States by 185 utilities. Butane air gas and propane air gas with heating values ranging from 525 to 1,600 B. t. u. per cubic foot were supplied in 338 of these communities in 36 States. Undiluted butane vapors or mixtures of butane and propane vapors were distributed in 10 communities in Arizona, California and New Mexico. Undiluted propane gas was supplied in 54 communities in Connecticut, Iowa, Maryland, Massachusetts, Minnesota, Missouri, Nebraska, Nevada, New Jersey, New Mexico, North Carolina, South Carolina, Virginia and Wisconsin. An average of 326,800 customers, of which 298,400 were residential, received liquefied petroleum gas from utilities during 1950 * * *.

Industrial-Plant Use.—Industrial plants purchased 217,078,000 gallons of LP-gas in 1950, a third more than the 1949 total (162,197,000 gallons). Propane sold to industrial establishments increased by 62 percent, or from 99,736,000 gallons in 1949 to 161,057,000 in 1950. The 1950 totals for butane (40,998,000 gallons) and butane-propane (15,023,000) were below the 1949 levels (43,343,000 and 19,118,000 gallons, respectively).

Plants in districts 1 and 2 use most of the LP-gas sold for industrial fuel; quantities reported for these areas were up by 66 and 16 percent, respectively, in 1950 over 1949. Relatively small amounts of LP-gas are delivered to industrial plants in other parts of the country; there was a substantial gain in the quantity for district 3 in 1950 and declines for districts 4 and 5.

Synthetic Rubber Components.—A stepped-up synthetic rubber-manufacturing program, ordered by the Government after the start of hostilities in Korea in June 1950, was reflected in expanded sales of LP-gas for synthetic-rubber components. Distributors reported the delivery of 228,485,000 gallons of LP-gas to synthetic-rubber plants in 1950, a gain of 28 percent over the 1949 total of 177,850,000 gallons. Virtually all (95 percent in 1950 and 88 percent in 1949) of the LP-gas used for making synthetic rubber was butane, and the quantity increased from 156,607,000 gallons in 1949 to 216,299,000 in 1950—a 38-percent gain. A small amount of propane is also shipped to synthetic-rubber plants; this rose from 1,380,000 gallons in 1949 to 12,186,000 in 1950. There were 19,863,000 gallons of butane-propane mixtures sold for synthetic rubber manufacture in 1949, but no sales were reported in 1950.

Virtually all of the LP-gas sold for the manufacture of synthetic rubber is reported for district 3, and sales in that area increased by nearly a half from 144,351,000 gallons in 1949 to 215,219,000 in 1950. Quantities sold in other areas for synthetic-rubber components are relatively unimportant.

Raw Material and Solvents for Chemical Manufactures.—Suppliers reported sales of 612,468,000 gallons of LP-gas to chemical-manufacturing plants in 1950, or 12 percent over the 1949 total of 544,886,000 gallons. About half of this chemical raw material (51 percent in 1949 and 47 percent in 1950) was propane, and the quantity increased by 5 percent from 277,045,000 gallons in 1949 to 290,459,000 in 1950. Butane-propane mixtures, which made up about 40 percent of the chemical-plant total for both 1949 and 1950, rose in volume from 211,365,000 gallons in 1949 to 251,514,000 in 1950, a 19-percent gain.

Most of the LP-gas credited to chemical plants (68 percent of the total in 1949 and 61 percent in 1950) was reported for district 3, and the quantity for that area increased from 370,575,000 gallons in 1949 to 375,661,000 in 1950. Greatly increased activity in chemical plants operating in district 1 is indicated in their purchases of LP-gas for raw material, which rose from 86,767,000 gallons in 1949 to 153,783,000 in 1950. Less-important quantities were credited to district 2, where requirements for chemical plants also gained in 1950 over 1949, and district 5, where the demand declined in 1950.

Internal-Combustion-Engine Fuel.—The use of LP-gas for motor fuel, especially for farm and other heavy equipment, has recently been vigorously advocated to find a summer market for propane. The fact that this campaign is expanding the market for LP-gas is indicated in the quantities reported sold for motor fuel in 1950—129,818,000 gallons, a total well above 1949 sales of 77,981,000 gallons. However, before 1950 only producers of LP-gas reported the distribution of their sales, but for 1950 dealers were also asked to cooperate in the survey; the numerous distributors who sold direct

[1] Data include LR-gases.

to consumers were evidently better able to determine the quantities of this fuel used for farm equipment in rural areas, and this factor has evidently helped to swell the 1950 total.

Sales of propane for internal-combustion-engine fuel increased from 20,264,000 gallons in 1949 to 63,825,000 in 1950—a reflection of the recent effort to find a market for the oversupply of this gas in summer. Deliveries of butane-propane mixtures also showed an important gain from 42,724,000 gallons in 1949 to 51,099,000 in 1950, while for butane (for which there is a year-round demand as a component for the manufacture of gasoline and synthetic rubber) there was little change—14,894,000 gallons in 1950 compared with 14,993,000 in 1949.

The more-important quantities of LP-gas sold for motor fuel are reported from districts 2, 3, and 5. The increase in sales in district 3—43,742,000 gallons in 1950 compared with 15,372,000 in 1949—and in district 5—43,388,000 gallons in 1950 against 22,531,000 in 1949—were outstanding, while there was little change for district 2—37,577,000 gallons in 1950 and 38,295,000 in 1949.

STOCKS

Stocks of natural-gas liquids at plants, terminals, and refineries on December 31, 1950, totaled 308,900,000 gallons. This 8-percent increase over December 31, 1949, is far below the increase for the previous 2 years. Large reductions in stock during the last half of the year, especially of natural gasoline, explained the small over-all increase. Compared with December 31, 1949, stocks of natural gasoline increased 2 percent, LP-gases increased 42 percent, and other products decreased 3 percent. Even with the 42-percent increase, stocks of LP-gases are turning over at more than twice the rate of stocks of natural gasoline.

PRICES

The price of grade 26–70 natural gasoline f. o. b. group 3 (Oklahoma) declined seasonally from 5.88 cents per gallon to 4.00 cents during the first quarter of 1950 and then rose steadily during the remainder of the year to 6.88 cents per gallon at the end of the year. Compared with 1949, the first-quarter decline was not as severe, and there was greater recovery in the last three quarters of 1950. The average price for 1950 was 5.56 cents per gallon, 0.33 cent below the 1949 average.

The average price of Regular-grade gasoline f. o. b. group 3 in 1950 was 10.12 cents per gallon, almost unchanged from 1949. The seasonal price variation of about 0.8 cent was somewhat greater than in 1949.

The only LP-gas for which Platt's Oil Price Handbook continues to carry monthly prices is commercial propane f. o. b. refineries at New York Harbor. The average price there in 1950 was 6.34 cents per gallon compared with 6.49 cents in 1949. After dropping sharply on April 1, 1949, the price remained in the neighborhood of 6 cents per gallon until September 6, 1950. At that time it started to rise and was at 8 cents by the end of the year.

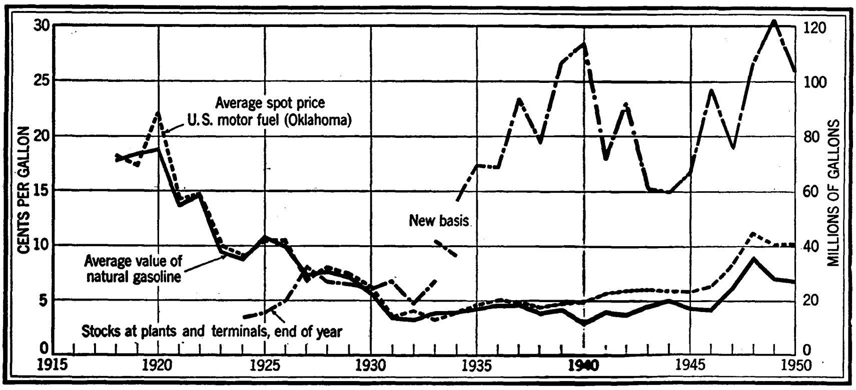

FIGURE 2.—Trends in average value of natural gasoline, spot price of gasoline, and stocks of natural gasoline, 1918–50.

TECHNOLOGY

An innovation in natural-gasoline plants placed on the market in 1950 was a small plant capable of handling 500,000 to 4,000,000 cubic feet of gas daily. The units are easily transported, operation is almost entirely automatic, and the plants are intended for use at one or more isolated wells.

The seasonal demand pattern for LP-gases, especially propane, and the high cost of high-pressure above-ground storage have stimulated experimentation in the use of underground reservoirs for storage. Storage has been attempted in oil and gas reservoirs, in which case reprocessing is necessary on removal. In the Carthage field of Texas, propane has been injected into a reservoir that contained only salt water. When withdrawn, the propane needed only drying before sale. Reservoirs have also been made in underground salt strata by circulating water to dissolve the salt.

FOREIGN TRADE [5]

The exports of natural gasoline in 1950 declined to 41,940 thousand gallons from 183,267 thousand in 1949. Canada, taking 35,513 thousand gallons, was the only remaining sizable customer. The total value of natural gasoline exported in 1950 was $3,581,214 or 8.5 cents per gallon compared with 9.5 cents in 1949.

Exports of LP-gases in 1950 totaled 67,763 thousand gallons valued at $5,747,671, an increase of 27 percent in the volume exported compared with 1949, while the average value declined from 10.8 cents per gallon in 1949 to 8.5 cents in 1950. Canada and Mexico remained the largest export customers, and both took greater quantities in 1950 than in 1949.

Nickel

By Hubert W. Davis

GENERAL SUMMARY

A SUBSTANTIAL upward surge in nickel requirements, which were well above production, resulted in an acute shortage in 1950. Before midyear it became apparent that the demand for nickel would exceed the available supply. Accordingly, both the International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd., established voluntary rationing programs for equitable distribution of the metal. Because of the shortage, some steel companies reverted to the National Emergency steels of World War II, some automobile companies reduced the thickness of plating, and foundries produced leaner nickel alloys. Total consumption of nickel in the United States established a peacetime record in 1950 and was 45 percent greater than in 1949. Deliveries to the National Stockpile were smaller. Stocks of nickel held by consumers in the United States declined 34 percent to 11,813,000 pounds on December 31, 1950, and were equivalent to slightly more than 3 weeks' requirements at the 1950 rate of consumption. Chiefly because of the transition in progress from open-pit operations to underground mining by the International Nickel Co. of Canada, Ltd., output in Canada in 1950 was 4 percent smaller than in 1949. Imports of nickel from Canada were about the same in both 1950 and 1949, but receipts from Norway declined moderately. France supplied 540,127 pounds of refined nickel in 1950. Production of nickel ore in New Caledonia gained 68 percent over 1949, but the combined output of matte and ferronickel was only 17 percent greater. Domestic output was, as heretofore, small in 1950. To aid in alleviating the shortage of nickel, the Government-owned idle nickel facilities in Oriente Province, Cuba, were scheduled to be rehabilitated.

[1] Excludes "All other manufactures of nickel", weight of which not recorded.
[2] Excludes "Manufactures," weight of which not recorded.
[3] Revised figure.
[4] Price quoted to United States buyers by International Nickel Co., Inc., for electrolytic nickel in carlots f. o. b. Port Colborne, Ontario; price includes duty of 2½ cents a pound, 1946–47, and 1¼ cents, 1948–50.

The steel industry continued to be the chief consumer of nickel in the United States. Seventy-six percent more nickel was used in stainless steels in 1950 than in 1949, but use for other steels was only 32 percent larger. Consumption of nickel in high-temperature and electrical-resistance alloys was up 41 percent, and that for anodes gained 26 percent. The use of nickel in cast iron increased 44 percent. Most of the nickel consumed in 1950 was in the form of metal, but the proportion of oxide and oxide sinter used was slightly more in 1950 than in 1949.

Effective June 1, 1950, the contract price to United States buyers for electrolytic nickel in carlots f. o. b. Port Colborne, Ontario, was advanced to 48 cents a pound, including duty of 1¼ cents a pound; and for nickel oxide sinter (on which there is no duty) it was increased to 44¼ cents a pound (nickel content) f. o. b. Copper Cliff, Ontario. The former prices (40 and 36¼ cents, respectively) had been in effect since July 22, 1948. On December 13, 1950, the prices were raised to 50½ and 46¾ cents, respectively.

A paper by Caron gave brief statements on investigations of various fundamental and practical factors of the ammonia leaching process for nickel and cobalt ores and also many hitherto unpublished data on various phases of the method, including conditions for ore reduction, leaching, and distillation.[1] Caron also contributed a paper on the separation of nickel and cobalt.[2]

A patent was issued for a method of recovering nickel values from ore too low in grade to be treated economically by present known processes.[3]

PRODUCTION

Domestic production of nickel (other than from imported matte and oxide) is small and comprises metals recovered from scrap—nickel anodes and nickel-silver and copper-nickel alloys (including Monel metal)—and primary nickel recovered in copper refining. There has been no output of nickel from ore or as a byproduct of talc production since 1945.

A total of 1,825,000 pounds of nickel, in the form of both crude and refined nickel sulfate, was recovered as a byproduct of copper refining at Baltimore, Md.; Carteret and Perth Amboy, N. J.; Laurel Hill, N. Y.; and Tacoma, Wash. Shipments were 1,823,000 pounds, the bulk of which was crude nickel sulfate sold to refiners for use as an intermediate in the manufacture of refined nickel salts. Although all the nickel recovered as a byproduct of copper refining is credited to domestic production, some is actually recovered from imported blister copper.

[3] Poole, H. G., and Ravitz, S. F. (assigned to the United States of America), Nickel Recovery: United States Patent 2,520,958, Sept. 5, 1950.

In addition to the nickel recovered as a byproduct of copper refining in 1950, 3,852,000 pounds (nickel content) of refined salts (chiefly sulfate) were produced in the United States from Canadian nickel residues, from domestic crude nickel sulfate, and from nickel shot and nickel scrap.

The total production of refined nickel salts in the United States was 4,517,000 pounds (nickel content) in 1950; shipments to consumers for electroplating, catalysts, and ceramics totaled 4,646,000 pounds.

CONSUMPTION AND CONSUMERS' STOCKS

Tables 3 and 4 give data on consumption and consumers' stocks of nickel. The data cover all known consumers of nickel in the form of metal, oxide, and matte. The figures for nickel salts, however, fall short of the total and probably represent only 70 and 51 percent, respectively, of the totals in 1950 and 1949.

TABLE 3.—Nickel (exclusive of scrap) consumed and in stock in the United States, 1949–50, by forms, in pounds of nickel

Form	1949			1950		
	Consumption	Stocks at consumers' plants Dec. 31	In transit to consumers' plants Dec. 31	Consumption	Stocks at consumers' plants Dec. 31	In transit to consumers' plants Dec. 31

Total	160,210,774	161,513,859	187,116,518	136,652,228	197,807,699

[1] Comprises copper-nickel alloys, nickel-silver, brass, bronze, beryllium alloys, magnesium and aluminum alloys, Monel, Inconel, and malleable nickel.
[2] The figures for solutions and ceramics for 1946–50 and for catalysts for 1946–49 fall short of the totals.

FOREIGN TRADE [4]

The quantity of nickel imported into the United States in 1950 was virtually the same as in 1949. Imports comprised chiefly metal, matte, and oxide. As heretofore, Canada was the chief source of the imports. At the plant of the International Nickel Co., Inc., at Huntington, W. Va., the roasted and sintered matte was refined to Monel metal and other products, and some sintered oxide was refined to nickel pig.

TABLE 5.—Nickel products imported for consumption in the United States in 1950, by countries, gross weight in pounds

[U. S. Department of Commerce]

Country	Metal [1]	Matte	Oxide and oxide sinter	Nickel bars, rods, etc.	Nickel scrap	Nickel-silver	Nickel residues [2]
Belgium-Luxembourg	2,494			11,076	13,225		
Canada [3]	130,426,076	22,261,814	32,612,122	36,659	337,965	15,485	356,561
Denmark	49,890				33,600		
France	540,127			4,415	50,228		
Japan	5,937						
Netherlands				7,160	6,013		
Norway	7,216,093				82,622		
Sweden						23,331	
Switzerland						23,148	
United Kingdom	23,568	9,072		14,597	727,010		
Total	138,264,185	22,270,886	32,612,122	73,907	1,250,663	61,964	356,561

[1] Adjusted by Bureau of Mines to exclude scrap.
[2] Reported to Bureau of Mines by importers.
[3] According to reports by importers to the Bureau of Mines, the roasted and sintered matte averages about 69 percent nickel, the oxide and oxide sinter about 75 percent nickel, and the nickel residues about 28 percent nickel.

The nickel content of the unmanufactured nickel products imported into the United States is estimated at 183,106,000 pounds in 1950 compared with 182,942,000 pounds in 1949.

Since January 1, 1948, the rate of duty on refined nickel imported

[4] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

into the United States has been 1¼ cents a pound. Nickel ore, matte, and oxide entered the United States duty free.

Exports of nickel comprise largely products manufactured from imported raw materials. Exports of alloy and scrap in 1950 were 2 percent more than in 1949, but those of metal, nickel-silver, and nickel-chrome electric resistance wire were smaller by 58, 52, and 38 percent, respectively.

The United Kingdom (2,887,721 pounds), Canada (2,466,108 pounds), France (209,019 pounds), India (160,910 pounds), and Italy (147,260 pounds) were the chief markets for nickel, Monel metal, alloys, and scrap.

TABLE 6.—Nickel products (excluding residues) imported for consumption in the United States, 1948–50, by classes

[U. S. Department of Commerce]

Class	1948		1949		1950	
	Pounds	Value	Pounds	Value	Pounds	Value

WORLD REVIEW

Table 8 shows world production of nickel by countries, 1943–50, insofar as statistics are available. Despite the fact that nickel is produced in many countries, one country—Canada—has supplied about 77 percent of the world output since 1943.

TABLE 8.—World mine production of nickel, by countries, 1943–50, in metric tons of contained metal

[Compiled by Berenice B. Mitchell]

Country	1943	1944	1945	1946	1947	1948	1949	1950

[1] Data not available; estimate by author of chapter included in total.
[2] Estimate.
[3] Preliminary data for year ended Mar. 31 of year following that stated.
[4] Less than 1 ton.
[5] Byproduct in electrolytic refining of copper. In 1944 and 1945 includes also production from ore.

Canada.—Virtually all the Canadian output is derived from copper-nickel ores of the Sudbury district, Ontario. Some nickel is also recovered as a byproduct from silver-cobalt ores of Cobalt, Ontario. Two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Nickel production in Canada was 123,057 short tons in 1950 compared with 128,690 tons in 1949. Exports of nickel from Canada were 121,651 short tons in 1950 compared with 127,141 tons in 1949.

Sales of nickel in all forms by the International Nickel Co. of Canada, Ltd., were 256,410,543 pounds in 1950 compared with 209,292,257 pounds in 1949.[5] As a consequence of the heavy demands from civilian users and for national defense, more nickel in all forms was supplied the "free world" than in any previous peacetime year.

During 1950 underground mining was expanded to compensate for the progressive exhaustion of ore that can be mined by open-pit surface methods. Underground ore mined was 5,733,269 short tons in 1950 compared with 5,015,318 tons in 1949 and 5,128,964 tons in 1948. Open-pit ore mined was 4,115,755 short tons in 1950 compared with 4,969,573 tons in 1949 and 5,737,898 tons in 1948. Accordingly, total ore mined was 9,849,024 tons in 1950 compared with 9,984,891 tons in 1949 and 10,866,862 tons in 1948. According to the company, proved ore reserves at the end of 1950 were 252,860,000 short tons containing 7,669,000 tons of nickel-copper compared with 251,805,000

[5] International Nickel Co. of Canada, Ltd., Annual Report: 1950, 28 pp.

tons containing 7,630,000 tons of nickel-copper at the end of 1949. Underground development in the operating mines advanced 87,963 feet (16⅔ miles) in 1950, bringing the total footage to 1,496,277 or over 283 miles.

Concerning developments in 1950, the company reported as follows:

Progress was made during the year on our major program of replacing open pit tonnage by obtaining and treating annually, beginning in 1953, more than twice as much ore as ever before from our underground mines.

The Murray Mine which has been under long and active development was brought to a regular production basis. At the year-end it was producing approximately 4,500 tons daily compared with 500 tons at the beginning of the period.

The main shafts at our Garson, Murray, and Levack Mines are being deepened a combined total of 3,700 feet. Simultaneously, we are in the course of sinking three entirely new shafts at Creighton Mine, Levack Mine, and the Stobie section of the Frood-Stobie Mine. The combined depth of these three new shafts will total 5,000 feet. We have also completed major alterations in the Frood section which permit the abandonment of an old shaft and make possible the recovery of several million tons of ore by low-cost surface mining.

Along with the new shaft sinkings and the deepenings, representing together nearly one and two-thirds miles of additional depth, the hoisting capacity of the Frood shaft at the Frood-Stobie Mine is being enlarged. Also, a new hoist building including a new cage hoist and other facilities at Garson Mine has been put into service. The speed of the ore hoist at Garson has been increased to provide capacity for regular operations at lower levels.

Large scale mine development for future mining is proceeding simultaneously at five distinct locations: at Garson Mine in the area of the existing main shaft; at the Stobie section of the Frood-Stobie Mine where a main ore-pass system, including large crushers at three horizons, along with ore pockets, is being installed to serve the area from the 400 foot to the 1,400 foot level; at the Frood section where the levels immediately below the bottom of the open pit are being prepared for underground mining by low-cost, blasthole methods; at the deep levels of the Creighton Mine; and at the lower-grade areas of the Creighton Mine.

In the lower areas of the Frood, water-borne sand filling operations continued, permitting more economical mining and higher production from individual working places. In order to exploit these favorable results more fully, the capacity of the tailings sand plant at Copper Cliff has been increased by fifty per cent and the use of sand for regular mine filling will be expanded to include all square-set operations.

A large portion of our open pit to underground mine transition program is the preparation at Creighton Mine for mining the lower-grade ores which have now become economical through the development of low-cost block-caving methods of mining. The sinking of the new shaft for hoisting these ores directly to the new crushing plant and concentrator was carried to a depth of 1,130 feet, where it met a raise which we had been driving upwards 700 feet from our 30 level. The shaft and the ore bins excavated below the 30 level are now being concreted.

Construction proceeded throughout the year on the permanent Creighton hoist house on the surface, the mill buildings and the pipelines for transporting the bulk concentrate seven and one-half miles to Copper Cliff. The original planned capacity of the concentrator was enlarged substantially during the year. The first unit consisting of two mills already has come into preliminary operation. A total of four units will be completed by the year-end, which will provide a rated capacity of upwards of 10,000 tons daily.

Development was continued on the main ore-pass system servicing the block caving area at Creighton. Extension of the air intake system to provide air to the lower reaches of the mine, free from contaminating effects of the caving operations, was virtually completed and construction started on a ventilation system for the initial Creighton caving blocks. Development was continued also in the area of our deep, internal Creighton shaft where the new ore handling system was completed and put into service. A rock pocket was constructed more than one mile underground to handle the material from an extensive and deep exploration program.

The higher-grade ores at Creighton will continue to be mined and will be hoisted in the existing main shaft which reaches from the surface to a depth of 4,074 feet and the internal shaft which extends to the 5,562 foot level Extensive alterations are proceeding so that any lower-grade ores obtained through the existing shafts may be conveyed to the Creighton crushing plant and concentrator for treatment along with the lower-grade output from the new shaft.

In intensifying its effort to provide expanded supplies of nickel, the company brought into production in May 1950 an additional blast furnace at the Coniston smelter, followed by an additional reverberatory furnace at the Copper Cliff smelter.

Falconbridge Nickel Mines, Ltd., operated its two blast furnaces throughout 1950, except for necessary short shutdowns. Production lost during the scheduled repair shutdown was not completely regained during the remainder of year; consequently, the total tonnage of ore hoisted and treated, as well as matte produced, was somewhat lower in 1950 than in 1949. Ore treated was 928,650 short tons in 1950 (941,929 tons in 1949). At the Falconbridge mine, where 881,838 tons of ore were hoisted in 1950, the internal shaft sunk for deeper development was stopped at 4,147 feet and completed with stations, spillage pocket, and equipment. Development and exploration therefrom was confined to the 2,975-, 3,150-, and 4,025-foot levels. At the McKim mine, which produced 46,997 tons of ore in 1950, the quantity of ore being developed exceeded that originally indicated by diamond drilling. Beginning in 1951 it will be a moderate but regular supplier of ore to the Falconbridge smelter. The ore body has been opened on six levels, and stope preparation was under way on four of these levels.[6]

In the latter months of 1950 Falconbridge Nickel Mines, Ltd., started a further expansion program designed to increase maximum production to a rate of 40 million pounds of nickel annually. It will require a minimum of 3 years to raise ore production to this rate. Some additional increases in mill and smelter capacity, over those now under way, will be required. In accordance with this program, development was begun at one of the ore bodies in the Levack area, a surface plant was under construction, and shaft sinking had been started. The property, which has been named the Hardy mine, will have a daily productive capacity of 1,000 tons of ore. Work was also commenced on the sinking of a small shaft to open an ore body for mining on the norite contact east of the Falconbridge mine.

According to Falconbridge Nickel Mines, Ltd., ore reserves totaled 15,147,500 short tons on December 31, 1950, and comprised 9,369,000 tons of developed ore averaging 1.60 percent nickel and 0.86 percent copper in the Falconbridge and McKim mines and 5,778,500 tons of indicated ore averaging 1.86 percent nickel and 1.03 percent copper in Sudbury district holdings.

The Sherritt Gordon Mines, Ltd., continued its program of exploration and development of nickel-copper ores in the Lynn Lake area of northern Manitoba in 1950. Substantial additions were made to the ore reserves; at the end of 1950 they were calculated at 14,055,000 short tons averaging 1.223 percent nickel and 0.618 percent copper. As this ore reserve was considered to be adequate for the time being, all exploratory development work was suspended, thus bringing the preliminary development stage of operation to an end. The next stage, which has now been reached, is preparation for production. After thorough study, the company decided to proceed with develop-

[6] Falconbridge Nickel Mines, Ltd., 22d Annual Report: 1950, 20 pp.

ment of a completely integrated operation to produce annually about 17,000,000 pounds of refined nickel. An annual output of 9,000,000 pounds of copper, 300,000 pounds of cobalt, and 70,000 tons of ammonium sulfate fertilizer was also anticipated. To attain it, in the initial operation, 2,000 tons of ore daily from the two highest-grade ore bodies will be treated. The "A" and "EL" ore bodies will be prepared for mining to supply the ore for the initial 2,000-ton-per-day operation. The nickel concentrate produced at Lynn Lake will be shipped to Alberta, where the company proposes to build a refinery, which will use its ammonia leaching process. Completion of the refinery was planned for the third quarter of 1953. The Canadian National Railways began a survey of a railway line to Lynn Lake.[7]

The pilot mill at Lynn Lake resumed operation in June 1950 on ore from "A", "B", and "C" ore bodies. In all, 2,687 tons of feed were put through the mill, and 160 tons of nickel concentrate and 40 tons of copper concentrate resulted. About 75 tons of nickel concentrate were shipped to Ottawa for refining in the company pilot leaching plant. Operation of the pilot leaching plant resulted in many improvements being made in the ammonia leach process, and information was acquired for the design of a permanent treatment plant. A limited amount of laboratory work was done on outside concentrates to determine their amenability to treatment by leaching processes. During November the plant and equipment were moved to a new location in Ottawa and when completed will be fully equipped to carry out pilot-plant operations using the company ammonia leach process, the Chemical Construction Co. acid leach process, or any combination of the two.

Cuba.—Agreements for the rehabilitation and operation of the United States Government-owned Nicaro nickel plant were announced by the Administrator of General Services on January 16, 1951. The Frederick A. Snare Corp., the construction contractors that built the extensive mining and metallurgical facilities in 1942, will put them in shape for new operations. Mining Equipment Corp., a wholly owned American subsidiary of N. V. Billiton Maatschappij of The Hague, Netherlands, will operate the plant and act as engineering consultants for the rehabilitation project. The facilities are expected to be producing nickel oxide at a rate of 32,000,000 pounds (nickel content) annually within 10 to 12 months. The output will be taken by the Government for stockpiling and other purposes. The Nicaro property occupies 1,133 acres on Lengua de Pajaro Peninsula, Lavista Bay, Oriente Province. It consists of rail and port terminals, mining facilities, and a metallurgical plant of some 30 industrial structures.

Netherlands.—According to the Mining World:[8]

> Mining activity in the Celebes has been confined to further exploratory work in the nickel areas. However, a report indicates that some deposits of fairly good ore have been discovered recently which could be worked by the installation of a special plant to treat garnieritic nickel ore. Exploration also has located several deposits of magnesite which will be worked if they are found to be sufficiently large. Recently East-Borneo Company started exploration in the southern sections of the island.

[7] Sherritt Gordon Mines, Ltd., Annual Report: 1950, 16 pp
[8] Mining World, vol. 12, No. 7, June 1950, p. 57.

It was reported that, because of the uncertain situation politically in Celebes, the Billiton Co. had abandoned its work in its nickel concessions and withdrawn the staff and laborers.[9]

New Caledonia.—The Thio Group at Thio, on the east coast, belonging to La Société le Nickel, was the only nickel property in production in 1950. Output of ore was 157,645 metric tons containing 3.20 to 5.26 percent nickel.

Production of matte in 1950 was 5,790 metric tons averaging 77 percent nickel (3,950 tons in 1949).

Production of ferronickel was 1,119 metric tons, averaging about 37.5 percent nickel (1,936 tons in 1949).

On May 20, 1950, the Economic Cooperation Administration announced conclusion of an agreement with the French Government whereby $965,000 worth of American mining equipment would be provided for modernization and development of nickel production in New Caledonia by La Société le Nickel. The expansion program is expected to increase the production of nickel to 10,000 to 12,000 tons annually.

Norway.—Operating conditions in 1950 at the Falconbridge nickel refinery at Kristiansand were influenced unfavorably by both a shortage of labor, particularly during the summer months, and by construction and alteration work related to the modernization program. Nevertheless, refinery production in 1950 somewhat exceeded the 1949 output of both refined nickel and copper. The new smelting and roasting unit was satisfactorily placed in operation, reducing the strain on some of the old equipment and also resulting in metallurgical improvements. During the last quarter of 1950 production was at a materially higher level than ever before achieved.[10]

Union of South Africa.—A small quantity (843 metric tons in 1950) of nickel in the form of matte is produced annually in the Rustenburg district, Union of South Africa, by Rustenburg Platinum Mines, Ltd. The matte is exported to England for refining.

According to the Mining World, Nickel Corp. of Africa, Ltd., has been organized to exploit the Insizwa nickel deposit in East Griqualand, Cape Province. The ore, chiefly copper-nickel sulfides, occurs in a differentiated zone 10 to 12 feet thick at the contact between basinlike intrusive masses resting on Karroo sediments in mountainous country.[11]

At the annual general meeting of shareholders in Nickel Corp. of Africa, Ltd., it was reported that some very high-grade ore had been exposed in Brook's Adit as well as in a development rise which is being made between Morley's and Honnold's Adit. The company was erecting a plant for crushing high-grade material recovered from development and proposes to export the ore to different refineries in Europe.[12]

United Kingdom.—Nickel production by the Mond Nickel Co. at the refinery at Clydach, Wales, was 48,000,000 pounds in 1950 compared with 49,400,000 pounds in 1949.

Nitrogen Compounds

By Bertrand L. Johnson

GENERAL SUMMARY

BY THE beginning of 1950, the supply of nitrogen in the United States—the largest producer and consumer of nitrogen in the world—had come into balance with the requirements of that commodity. Total domestic productive capacity even exceeded somewhat the normal peacetime demand, for agricultural, industrial, and military needs.

The rising trend of agricultural and industrial demand, stepped-up military demand, and the need to be prepared against the eventuality of full-scale war, pointed to the need at the end of 1950, for additional nitrogen production capacity in the near future.

In 1950 there were no Government controls over the distribution of nitrogenous fertilizers by private producers for use in domestic agriculture. Such controls as had existed in the export field were eliminated in May 1950, when the Office of International Trade announced deletion from the positive list of nitrogenous fertilizer materials (except those containing ammonium nitrate) and prepared fertilizer mixtures. Thereafter, with the exceptions noted, those commodities could be exported in any quantity to any destination without export license.

The principal part of our domestic production of nitrogen compounds consists of ammonia solutions (including liquid anhydrous ammonia), ammonium sulfate, ammonium nitrate, and synthetic sodium nitrate. Little industrial chemical nitrogen is imported, but large quantities of nitrogenous fertilizer materials enter the United States each year. Export fertilizer nitrogen is mostly in the form of ammonium sulfate and ammonium nitrate, large quantities of which are shipped abroad. Much smaller tonnages of anhydrous ammonia and ammonium nitrate are exported as industrial chemicals.

DOMESTIC PRODUCTION

Ammonium Compounds.—Domestic production of synthetic anhydrous ammonia in 1950 attained another new high—1,565,569 short tons. The domestic areas where the major nitrogen compounds are produced are indicated in figure 1.

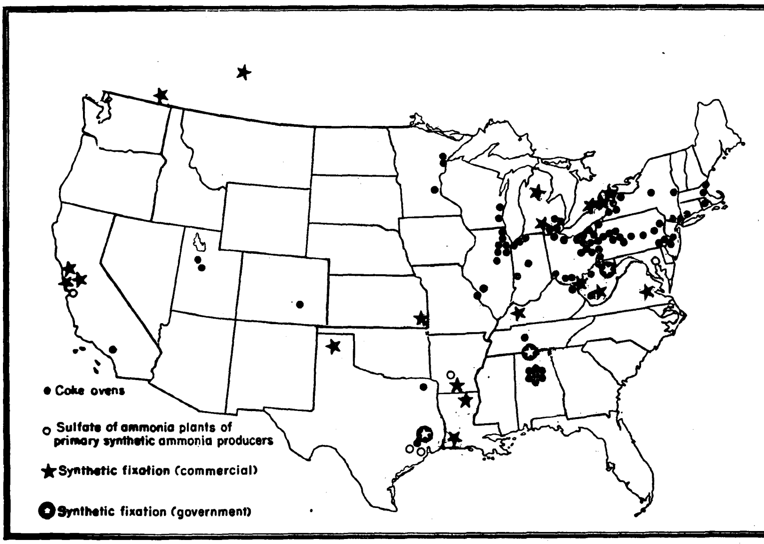

FIGURE 1.—Locations of domestic nitrogen production. (Based on diagram in National Fertilizer Association, Fertilizer Review, October–December 1950, p. 3.)

TABLE 1.—Principal nitrogen compounds produced in the United States, 1947–50, in short tons

Commodity	1947	1948	1949	1950
Ammonia (NH_3):				
Synthetic plants: Anhydrous ammonia [1]	[2] 1,114,000	1,089,786	1,294,057	1,565,569
Byproduct coking plants (NH_3 content):				
Aqua ammonia	25,718	24,753	22,750	23,387
Ammonium sulfate	202,360	207,671	189,202	207,754
Subtotal	228,078	232,424	211,952	231,141
Grand total	1,342,078	1,322,210	1,506,009	1,796,710
Principal ammonium compounds:				
Ammonium sulfate:				
Synthetic plants [1]	[2] 195,848	[2] 264,476	846,195	1,137,721
Byproduct coking plants [3]	809,440	830,683	756,807	831,016
Total	[2] 1,005,288	[2] 1,095,159	1,603,002	1,968,737
Ammonium nitrate, basis solution, 100 percent NH_4NO_3 [1]	[2] 1,086,869	988,342	1,018,706	1,213,911

[1] Data from Bureau of Census monthly Facts for Industry series.
[2] Revised figure.
[3] Does not include ammonium sulfate produced at byproduct coking plants from purchased anhydrous ammonia as follows: 1947—11,070 short tons; 1948—30,749 short tons; 1949—58,826 short tons; 1950—14,699 short tons.

On January 1, 1950, the Army had in its possession three operating anhydrous ammonia plants—the Morgantown Ordnance Works, Morgantown, W. Va.; the Ohio River Ordnance Works, West Henderson, Ky.; and the San Jacinto Ordnance Works, near Houston, Tex. These were offered for sale or lease on January 5, 1950. On May 3, 1950, the Ohio River Ordnance Works was sold by the Government to the Spencer Chemical Co. This plant ceased operations while it was being converted from coke to natural gas as a source of hydrogen but resumed the production of ammonia on November 5, 1950. The San Jacinto works was leased in August 1950 to R. F. Mueller Co., Baltimore, Md. The lease was assigned to the San Jacinto Chemical Corp—a new company—which was to operate the plant. The Morgantown Ordnance Works, the second-largest ammonia plant in America, closed in May 1950 and had not been sold or leased by the end of that year.

The total production of ammonium sulfate from both synthetic and byproduct sources increased from 1,603,002 tons in 1949 to 1,968,737 tons in 1950. Production of this commodity has nearly doubled since 1947, owing almost entirely to the rapidly expanding production of synthetic ammonium sulfate, now nearly a million tons a year greater than in 1947, and accounting for the big bulk of total production.

Ammonium nitrate production reached a new high in 1950, with a considerable increase over 1949. By far the greater part of it went into agriculture.

The Government-owned alumina-from-clay plant at Salem, Oreg., was acquired in 1950 by the Continental Chemical Co. of Salem, Oreg., which redesigned the equipment to produce battery-grade manganese dioxide with ammonium sulfate as a byproduct. This company has been reported sold to the Ray-O-Vac Battery Co. of Madison, Wis., which will continue operating the plant.

Sodium Nitrate.—The synthetic nitrate of soda consumed in the United States in 1950 was produced domestically; none was imported. Only two companies were in production—Solvay Process Division, Allied Chemical & Dye Corp., Hopewell, Va., and Mathieson Chemical Corp., Lake Charles, La.

Deposits of soluble nitrate minerals, none of present economic importance, occur in various parts of the United States. (See Minerals Yearbook 1942, p. 1522.)

CONSUMPTION AND USES

Nitrogen plays important parts in both agriculture and industry. A small amount of elemental nitrogen is used for industrial purposes, but most nitrogen enters both agriculture and industry in various chemical compounds. In agriculture, which in the fiscal year ended June 30, 1950, consumed more than a million tons of nitrogen, the principal chemical nitrogen materials, in order of importance, were ammonium nitrate, ammonium nitrate solutions, and ammonium nitrate-limestone mixtures, sodium nitrate, ammonium sulfate, anhydrous ammonia and solutions, calcium cyanamide, calcium nitrate, urea, and divers nitrogen chemicals. A considerable tonnage of nitrogen is included in natural organic materials.

According to the United States Department of Agriculture, shipments of ammonium nitrate increased from 347,223 tons in 1948–49 to 577,562 tons in 1949–50. In addition, in the latter year there were shipments of 102,205 tons of ammonium nitrate-limestone mixtures and 11,108 tons of ammonium nitrate solutions. Consumption of sodium nitrate totaled 627,424 tons and ammonium sulfate 234,664 tons. The use of anhydrous ammonia in agriculture continued to increase. In 1949–50, 85,516 tons were consumed compared with 65,596 tons in 1948–49.[1]

Industrial nitrogen sources are principally synthetic ammonia, byproduct ammonia from coking, cyanamide and cyanides, and Chilean sodium nitrate. Ammonia is one of the major basic chemicals, and the synthetic ammonia industry is by far the largest source of ammonia and its derivatives for increasingly widespread diverse uses.

PRICES

Changes in price quotations of several of the nitrogen compounds—ammonium nitrate, ammonium sulfate, and anhydrous ammonia—were reported in 1950. Eastern Canadian ammonium nitrate was advanced in price on September 15, 1950, from $57.50 a ton (the price prevailing during the earlier months of the year) to $63. On December 15, 1951, a further increase to $69.50 was announced. The quotation on western domestic ammonium nitrate was also raised late in the year from $58 a ton to $63. The established price quotations of ammonium sulfate at the beginning of 1950 were $45 to $50 a ton. In May the price of coke oven ammonium sulfate was slashed $13 a ton by the steel producers, one of the deepest cuts ever made for this type of nitrogen fertilizer; this brought the range down to $32 to $37 a ton, according to the producing point. In September 1950 several western and southern producers advanced their price $3 a ton, and in December 1950 other producers raised their prices $8 a ton, reportedly because of increased costs of sulfuric acid, freight, and labor. At the end of the year the price range was $32 to $45 a ton. The price quotations of various nitrogen compounds on January 2, 1950, and December 25, 1950, from the Oil, Paint and Drug Reporter of those dates, are shown in table 2.

TABLE 2.—Prices of major nitrogen compounds in 1950, per short ton [1]

Commodity	Jan. 2, 1950	Dec. 25, 1950
Chilean nitrate, port warehouse, bulk	$48.00	$48.00
Sodium nitrate, synthetic domestic, c. l. works, crude bulk	45.00	45.00
Ammonium sulfate, coke ovens, bulk	45.00–50.00	32.00–45.00
Cyanamide, fertilizer-mixing grade, 20.6% N, granular, Niagara Falls, Ont., bulk	46.50	46.50
Ammonium nitrate, fertilizer grade, Canadian eastern, 32.5% N, c. l. shipping point, bags	57.50	63.00
Western, domestic, works, bags	58.00	58.00–63.00
Anhydrous ammonia, fertilizer, tanks, works	74.00–75.00	74.00–80.00
Ammonium-nitrate-dolomite compound, 20.5% N, Hopewell, Va., bags	46.00	46.00

[1] Quotations from Oil, Paint and Drug Reporter of the dates listed.

FOREIGN TRADE [2]

Large amounts of natural sodium nitrate from Chile enter the United States each year, the quantity greatly exceeding the import tonnage of any other nitrogenous material. Domestic demand for

[1] Scholl, Walter, and Wallace, H. M., Commercial Fertilizers. Consumption in the United States, 1949–50: U. S. Dept. of Agriculture, Beltsville, Md., 1951, 13 pp.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Chilean sodium nitrate, as indicated by the imports, has declined since 1948 but has not yet reached the levels of 1946 and 1947. The quantity imported fell from 675,543 short tons in 1949 to 615,674 tons in 1950. The value of the imports also dropped in 1950 to $22,301,880.

Chilean sodium-potassium nitrate has been imported into the United States recently in small quantities, reaching 20,409 tons in 1950, the highest amount in recent years. The value of these imports was $882,582.

TABLE 3.—Major nitrogen compounds imported into and exported from the United States, 1947–50, in short tons [1]

[U. S. Department of Commerce]

[1] All from Chile except sodium nitrate from Canada as follows: 1947: 42 tons, $2,542; 1948: 199 tons, $11,057; 1949: 8 tons, $416; 1950: Canada, 14 tons; Germany, 11 tons.

WORLD REVIEW

World-wide demand for nitrogen continues to increase. In the 1950–51 fertilizer year new records were made in both production and consumption of nitrogen, large increases occurring in both categories.

Estimates by leading authorities, however, differ as to the adequacy of the increased production to meet new demands for agricultural use. United Nations Food and Agriculture Organization estimates show an excess of production, while those of the Aikman (London), Ltd., suggest that there was an inadequate supply of nitrogen in 1950–51, world consumption exceeding production by about 150,000 metric tons. On the other hand, production and consumption of industrial nitrogen in 1950–51 were in balance, according to the Aikman company, the deficit occurring in the agricultural supply. Details are shown in tables 5 and 6.

Peat

By J. A. Corgan and Golden V. Chiriaco

GENERAL SUMMARY

PRODUCTION of peat in the United States in 1950 increased 1 percent in tonnage and 11 percent in unit value over 1949. The output is used entirely within the United States, none being exported. Imports increased 32 percent over 1949 and accounted for half of the quarter million tons consumed in this country in 1950.

TABLE 1.—Salient statistics of the peat industry in the United States, 1946–50

	1946	1947	1948	1949	1950
SHORT TONS					
Production	140,707	136,232	129,581	129,532	130,723

VALUE					
Production	$1,006,231	$868,979	$929,560	$1,020,014	$1,142,566
Average per ton	7.15	6.38	7.17	7.87	8.74

RESERVES

Minnesota, Wisconsin, and Michigan combined contain 75 percent of the total reserves of peat in the United States, Florida contains 14 percent of the country's total, and the rest is distributed through the New England and Pacific Coast States. Total reserves were calculated in 1922 at 13,827,000,000 short tons in terms of air-dried peat.[1] It is estimated that about 2,000,000 tons of peat have been recovered from these reserves since 1922.

PRODUCTION

Forty-eight producers operating in 17 States accounted for the 1950 production of 130,723 tons reported to the Bureau of Mines, as compared with 48 producers operating in 19 States in 1949. Although six plants that produced peat in 1949 were inactive in 1950, a like number of plants that did not produce peat in 1949 reported production for 1950. Value of the peat produced in 1950 was $1,142,566.

TABLE 2.—Peat produced in the United States, 1946–50

Year	Short tons	Value	
		Total	Per ton
1946	140,707	$1,006,231	$7.15
1947	136,232	868,979	6.38
1948	129,581	929,560	7.17
1949	129,532	1,020,014	7.87
1950	130,723	1,142,566	8.74

[1] Soper, E. K., and Osbon, C. C., The Occurrence and Uses of Peat in the United States: U. S. Geol. Survey Bull. 728, 1922, p. 92.

More peat was produced in New Jersey in 1950 than in any other State. The output of New Jersey together with that of the next three leading States—Florida, Ohio, and Michigan—accounted for nearly two-thirds of the United States total.

Peat humus, produced in 13 States, comprised about 65 percent of the total production in 1950; reed or sedge, produced in 7 States, about 27 percent; and moss peat and other, produced in 8 States, about 8 percent.

Total	129,532	1,020,014	7.87	130,723	1,142,566	8.74

USES

In 1950, as in preceding years, peat was used in this country primarily for soil improvement. Of the total sales of domestic peat reported for 1950, 67 percent was for soil improvement, 28 percent *for mixed fertilizers*, and 5 percent for other purposes.

United States Government Specifications.—The Federal Government purchases a certain amount of peat principally for horticultural purposes, provided the peat meets required specifications. These specifications may be obtained from the Federal Supply Service, General Services Administration, Washington 25, D. C.

TABLE 5.—Peat sold in the United States, 1946–50, by uses

Year	Soil improvement		Mixed fertilizers		Other uses		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	99,733	$664,565	32,471	$263,542	6,684	$66,286	138,888	$994,393

IMPORTS [2]

The quantity of moss peat imported into the United States in 1950 reached an all-time high of 124,864 short tons, an increase of 32 percent over the 94,747 tons imported in 1949 and 59 percent over the 1939 prewar figure of 78,611 tons. In 1950, as in past years, no exports of peat were reported.

WORLD REVIEW

Although peat has not been used generally in this country as fuel because supplies of higher-grade fuels at competitive prices have been ample, some European countries have utilized peat for fuel and power purposes for many years. With the rising demand for other fuels in Europe in the last several years, considerable attention has been focused on the possibilities for expanding the use of peat. A report published by the British Government [3] contains the following interesting facts on peat utilization in certain countries:

In Eire, the shortage of coal, especially during the war years, has stimulated the production of peat to about 5 million tons annually. The use of peat as a domestic fuel has been investigated in tests carried out at the Fuel Research Station and by the Industrial Research Council of Eire. Special domestic appliances for the efficient and economical combustion of peat fuel have been produced.

The use of peat as a fuel for steam generation has been investigated in many countries, notably Germany, Russia, and Eire. The methods adopted included direct combustion of peat under boilers either in the form of air-dried blocks, a coarse powder (milled peat), or a dried, pulverized fuel and the complete gasification of peat in producers followed by combustion of the gas in gas-fired steam boilers.

Peat has been carbonized on a moderate scale on the Continent of Europe and in Russia, mainly for the production of peat coke, which was used in gas producers and for metallurgical purposes. Although a number of processes have been devised for the carbonization of peat, whereby valuable byproducts are claimed to be produced, no such processes have been exploited commercially with success in Great Britain.

The report further states that, apart from its use as a fuel and for horticultural and agricultural purposes, peat has been used as a packing and insulating material, in the production of building materials and textiles, in gas purification, as an absorbent in surgical dressings, in water purification for the production of alcohol, etc. These uses, however, are on a very limited scale and are not likely to be extended for economic and other reasons. By the treatment of certain types of peat with solvents, ester waxes can be extracted, which, after suitable processing, may prove satisfactory as a substitute for montan wax. Further investigations, however, would be necessary to determine whether an economically successful process could be developed. From the information available it would appear that the possibility of extraction of waxes from peat deserves careful study.

Petroleum and Petroleum Products

By A. G. White, A. T. Coumbe, A. L. Clapp, and K. F. Hartman

GENERAL SUMMARY

OUTSTANDING features of the petroleum situation in 1950 were a much higher total demand [1] for all oils than was anticipated and the erratic seasonal supply and operation situation that resulted. Most of the abnormal accumulation of stocks of refined products in 1948 was still on hand at the beginning of 1950, and refinery operations were kept at a low level in the first half of the year, with an unusual reduction of 34.4 million barrels in refined stocks. With product stocks close to workable levels on June 30 and indications of increasing demand, crude runs set a new record in July and continued at well over 6 million barrels daily for the rest of the year. Daily average crude runs in the first half of 1950 were only 2 percent greater than in 1949 but almost 14 percent larger in the last half.

The total demand for all oils in 1950 amounted to 2,483 million barrels or a daily average of 6,803,000, an 11-percent gain compared with 1949. Total exports in 1950 were 111 million barrels or 304,000 barrels daily, a decline of 7 percent. Domestic demand in continental United States totaled 2,372 million barrels in 1950 or 6,499,000 barrels daily, a 12-percent increase compared with 1949.

Continuation of the downward trend in exports was due to further expansion in crude production and refinery capacity abroad, as well as the problem of dollar exchange. The large gain in domestic demand, compared with the low demand in 1949, reflected more normal weather, the increased number of oil-heating installations and of motor vehicles in use, expansion in the volume of industrial operations, and increased military requirements in the last half of the year.

Initiation of a major rearmament program after hostilities broke out in Korea in June resulted in a maximum output of civilian goods, combined with increasing military production. This involved a corresponding increase in fuel consumption, but supplies of oil proved ample to meet all needs.

---

[1] Certain terms, as utilized in this chapter, are more or less unique to the petroleum industry. Principal terms, and their meaning, are as follows:

Total demand.—A derived figure representing total new supply plus decreases or minus increases in reported stocks. Because there are substantial secondary and consumers' stocks that are not reported to the Bureau of Mines, this figure varies considerably from consumption.

Domestic demand.—Total demand less exports.

New supply of all oils.—The sum of crude oil production, plus production of natural gas liquids, plus benzol (coke-oven) used for motor fuel, plus imports of crude oil and products.

Transfers.—Crude oil conveyed to fuel oil stocks without processing, or reclassification of products from one product category to another.

All oils.—Crude petroleum, natural gas liquids, and their derivatives.

Principal products.—Gasoline, kerosine, distillate fuel oil, and residual fuel oil.

Exports.—Total shipments from continental United States, including shipments to United States Territories and possessions.

[8] Figure on new basis and comparable with succeeding years. Figure for 1949 on old basis and comparable with preceding years—342,704,000 barrels.
[9] American Petroleum Institute.

The most immediate problem was to increase the output of aviation fuels. Net production of aviation gasoline was increased from 17.6 million barrels in the first half of 1950 to 28.7 million in the last half of the year.

Fears of the possibility of oil rationing proved unfounded. Rationing in 1942 had been due primarily to the need to conserve rubber and to diversion of tankers from the Gulf-East Coast movement to carry oil to Europe. Neither of these factors was important in 1950.

The steps taken to reduce the stocks of refined products during the first half of 1950 were reversed in the last half of the year, when it became apparent that larger product stocks might be desirable.

The new supply of all oils in 1950 totaled 2,463 million barrels, an average of 6,747,000 barrels daily and a 10-percent gain compared with 1949. Daily production of crude petroleum averaged 5,402,000 barrels, a gain of 7 percent, but still 118,000 barrels daily below the record level of 1948. Production of light oils from natural gas set a new daily record of 497,000 barrels, a 15.6-percent increase over 1949. Imports of all oils averaged 847,000 barrels daily—a gain of about 31 percent from 1949, including an increase of about 16 percent in receipts of crude oil and 61 percent in receipts of petroleum products.

Total stocks of oils declined 20.4 million barrels in 1950, including a decrease of 4.9 million in crude-oil stocks, a gain of 0.5 million in natural-gasoline stocks, and a decline of 16.0 million in product stocks. The reduction in product stocks represented a decline of 21.2 million barrels in the California district and a gain of 5.2 million in other districts. The principal decline was in stocks of residual fuel oil and was related to liquidation of surplus stocks in California, in connection with large tanker shipments to the East Coast district, and to expansion in imports of residual fuel oil.

[2] Preliminary figures.

DEMAND

The total demand for all oils [2] increased from 2,238 million barrels in 1949 to 2,483 million in 1950; the gain of 245 million barrels included a decline of 8.5 million barrels in total exports and a gain of 254 million in domestic demand. The principal changes in exports were a decrease of 14.8 million barrels for gasoline and gains of 3.6 million for residual fuel oil and 1.3 million for lubricants. The major changes in domestic demand were gains of 80.8 million barrels for motor fuel, 65.4 million for distillate, 56.9 million for residual fuel oil, and 15.2 million for kerosine. The gain for all other products was 35.6 million barrels, including gains of 16.9 million barrels for liquefied gases, 9.3 million for asphalt, and 5.8 million for lubricants. A brief review of the trends in demand for the major oil products follows.

Motor Fuel.—The total demand for motor fuel rose from 953 million barrels in 1949 to 1,019 million in 1950, or about 7 percent. Exports declined from 39.3 million in 1949 to 24.5 million in 1950—nearly 38 percent. Domestic demand increased almost 9 percent—from 914 million in 1949 to 994 million in 1950. The decrease in exports reflects the rapid increase in refinery capacity abroad, particularly in western Europe. The steady upward trend in domestic demand indicates the increasing importance of motor transport and the fact that motor-fuel demand is less affected by fluctuation in weather or the volume of industrial operations than that of any other major product. A substantial part of the gain in 1950 was due to the sharp rise in military requirements for both aviation fuels and motor gasoline.

Residual Fuel Oil.—The total demand for residual fuel oil increased almost 12 percent—from 509 million barrels in 1949 to 569 million in 1950. Exports rose from 12.6 million barrels in 1949 to 16.2 million in 1950. Domestic demand increased 11.5 percent—from 496 million barrels in 1949 to 553 million in 1950. The domestic demand for residual fuel oil is affected materially by the volume of

[2] For definition, *see* footnote 1 at beginning of this chapter.

industrial operations and the relative cost of residual fuel oil compared with other fuels. The large gain in demand in 1950 was due to peak industrial activity, more normal weather, increased military requirements, and favorable factors in supply and competitive position.

The outstanding factor in the supply of residual fuel oil in 1950 was an increase in imports to 119 million barrels from 75 million in 1949, a gain of nearly 59 percent; the supply was further augmented by a decrease of 19.4 million barrels in stocks. The increase in imports and the decline in stocks provided for all the increase in demand; refinery output of residual fuel oil was almost static, the decline in yield from 21.7 percent in 1949 to 20.2 percent in 1950 offsetting the increase in crude runs.

Distillate Fuel Oil.—The total demand for distillate fuel oil increased from 342 million barrels in 1949 to 407 million in 1950, or about 19 percent. Exports showed a minor gain from 12.3 million barrels to 12.6 million. Domestic demand rose from 329 million barrels in 1949 to 395 million in 1950, or almost 20 percent.

The apparent high demand for distillate fuel oil is a result in part of comparison with the low demand of 1949, which was 3 percent below the domestic demand in 1948. Colder weather in 1950, compared with the abnormally mild weather in 1949, was a major factor in the increase in heating-oil requirements. Also important in increasing demand was the substantial increase in the number of new oil-heating installations.

Kerosine.—The total demand for kerosine rose from 105 million barrels in 1949 to 120 million in 1950—about 14 percent. Exports of kerosine declined from 2.5 million barrels to 2.0 million. Domestic demand increased from 103 million barrels in 1949 to 118 million in 1950—almost 15 percent compared with the 8.5-percent decline in 1949 from 1948. Demand for kerosine varies both with the over-all use of small space heaters and range-oil burners and with the relative substitution of No. 1 distillate fuel oil for kerosine in such apparatus.

Other Products.—The domestic demand for all other products rose almost 13 percent—from 277 million barrels in 1949 to 312 million in 1950. The domestic demand for liquefied gases for fuel and chemical uses increased from 68 million barrels to 85 million, a gain of almost 25 percent in 1950 compared with gains of 4.2 percent in 1949 and about 24 percent in 1948. The domestic demand for asphalt rose from 49 million barrels in 1949 to 59 million in 1950, or about 19 percent. The domestic demand for lubricants increased from 33 million barrels in 1949 to 39 million in 1950, or over 17 percent, compared with a decline of about 8 percent in 1949.

Demand by Calendar Quarters.—The high demand in the first half of 1950 compared with low demand in the same period of 1949 and the acceleration in demand in the last half of the year make a brief analysis by quarters of special interest.

In the first quarter of 1950 crude production averaged 4,921,000 barrels daily and refinery runs 5,380,000 barrels daily; both were at the lowest level of the year and materially under the rates in the first quarter of 1949. With total demand for all oils 8.6 percent above 1949, heavy liquidation of stocks resulted, amounting to a total decline of 52 million barrels, including about 12 million barrels in crude stocks and 40 million in other stocks.

In the second quarter, crude production averaged 5,163,000 barrels daily and crude runs 5,462,000 barrels daily, respectively about 4 and 6 percent above the rates in the second quarter of 1949. With the total demand for all oils gaining 10.9 percent above the second quarter of 1949, stocks of all oils increased only 7.9 million barrels—a gain of 1 million for crude and about 7 million for other oils. Even with this increase, however, stocks were not much above working levels at the end of the first half of 1950.

The start of Korean hostilities late in June and initiation of a major rearmament program resulted in increased oil demand and, as a consequence, in more desirable levels of oil in storage. In the third quarter, daily crude-oil output increased to 5,677,000 barrels and crude runs to 6,002,000 barrels, gains of about 18 and 14 percent, respectively, compared with the third quarter of 1949. The total demand for all oils was 11.6 percent over the same period of 1949. Stocks of all oils increased about 26 million barrels, all of the increase being in products rather than crude.

In the fourth quarter of 1950, total demand gained 12.6 percent compared with 1949, and crude production and runs to stills were record-breaking. Crude production averaged 5,836,000 barrels daily, a gain of about 15 percent compared with 1949; and crude runs averaged 6,102,000 barrels daily, or almost 14 percent above the last quarter of 1949. Total stocks of all oils declined 2.4 million barrels during the quarter, including an increase of 6.2 million in crude stocks and a decrease of 8.6 million in stocks of other oils.

With prospects of a further major increase in total oil demand of possibly 10 percent for 1951, consideration was being given to increasing the total supply of crude oil and to material expansion in refinery capacity.

Demand in United States Territories.—In computing domestic demand in continental United States, shipments from the United States to the Territories (and possessions) are included with exports, and any imports from foreign countries to the Territories are deleted from total imports. The major part of such shipments from the United States goes to Hawaii, Alaska, and Puerto Rico. Normally, Puerto Rico is the chief Territorial importer of foreign oils.

Table 4, in addition to giving imports and exports of continental United States, shows the supply of oil received by the Territories from the United States and from foreign sources. This supply, minus minor reexports, indicates their total demand. The indicated total supply of all oils in the Territories rose from 16,268,000 barrels in 1949 to 16,828,000 in 1950. Reexports to foreign countries amounted to 258,000 barrels in 1949 and 326,000 barrels in 1950, indicating a total net demand for petroleum products in the Territories of about 16.5 million barrels in 1950 compared with 16.0 million in 1949.

WORLD OIL SUPPLY

World production of crude petroleum in 1950 amounted to 3,797 million barrels compared with 3,404 million in 1949. The total gain of 393 million barrels comprises an increase of 130 million barrels for the United States and a gain of 263 million for the rest of the world. The largest gains in foreign production were: Venezuela, 64.5 million barrels; Iran, 37.8 million; Kuwait, 35.7 million; U. S. S. R., 28.5 million (estimated); Saudi Arabia, 25.5 million; Iraq, 19.0 million; Mexico, 11.5 million; Qatar, 11.5 million; and Canada, 7.8 million.

The United States produced 61.4 percent of the world's crude oil in 1947, 58.8 percent in 1948, 54.1 percent in 1949, and 51.9 percent in 1950. The excess of crude imports into the United States over crude exports has steadily increased from 51.2 million barrels in 1947 to 89.4 million in 1948, 120.6 million in 1949, and 142.9 million in 1950.

RESERVES

The Committee on Petroleum Reserves, American Petroleum Institute, estimated proved reserves of crude in the United States on December 31, 1950, at 25,268 million barrels. These estimates include only oil recoverable under existing economic and operating conditions.

The increase in net crude reserves in 1950 was 619 million barrels. Estimated new reserves added in 1950 were 2,563 million barrels, of which 1,998 million were an upward revision of reserves due to extensions of old pools and revisions of previous estimates, and 565 million were new reserves discovered in 1950 in new fields and in new pools in old fields. Deduction of an estimated production of 1,944 million barrels of crude during 1950 (exclusive of condensate) results in the indicated net gain.

TABLE 5.—Estimates of proved oil reserves in the United States, on Dec. 31, 1944–50, by States [1]

[1] From reports of Committee on Petroleum Reserves, American Petroleum Institute, of the amount of crude oil that may be extracted by present methods from fields completely developed or sufficiently explored to permit reasonably accurate calculations. The change in reserves during any year represents total new discoveries, extensions, and revisions, minus production.

[2] New basis; excludes condensate.

The principal changes in net reserves of crude in 1950 were gains of 275 million barrels for Louisiana, 149 million for Wyoming, 96 million for Illinois, 72 million for Texas, 67 million for Oklahoma, 45 million for Arkansas, and 13 million for Michigan. The principal declines were 89 million barrels for California, 17 million for Mississippi, and 6 million each for Kansas and Colorado.

As of December 31, 1950, Texas had 53.8 percent of total estimated reserves, California 14.8 percent, Louisiana 8.6 percent, and Oklahoma 5.5 percent—82.7 percent for the four States combined.

The total proved reserves of natural-gas liquids, not included in the crude reserves, were 4,268 million barrels on December 31, 1950, a gain of 539 million during the year. Proved reserves for crude-oil and natural-gas liquids combined were 29,536 million barrels on December 31, 1950, compared with 28,378 million on December 31, 1949.

CRUDE PETROLEUM

SUPPLY AND DEMAND

The new supply of crude petroleum in 1950 included a domestic production of 1,971.8 million barrels, or 5,402,000 daily, and imports of 177.7 million barrels, or 487,000 daily. Compared with 1949, crude production increased 7.1 and imports 15.7 percent. Production, however, was still 118,000 barrels daily below the 1948 record. Total stocks of crude petroleum decreased 13,000 barrels daily in 1950 compared with a decline of 9,000 barrels daily in 1949 and a gain of 71,000 barrels daily in 1948.

The total demand [3] for crude in 1950 set a new record of 2,154.5 million barrels, or a daily average of 5,903,000 barrels, a gain of 427,000 barrels or 7.8 percent over 1949. The demand for domestic crude rose from 5,052,000 barrels daily in 1949 to 5,419,000 in 1950, an increase of 367,000 barrels or 7.3 percent. The demand for foreign crude rose from 424,000 barrels daily in 1949 to 483,000 in 1950, an increase of 59,000 barrels daily or 13.9 percent. The demand for domestic crude was 41,000 barrels daily below the record level of 1948, while the demand for foreign crude continued to expand.

Although the indicated demand for crude oil was inflated in 1948 by the addition of 79.8 million barrels to stocks of refined products, it was reduced by declines in product stocks of 0.8 million barrels in 1949 and 16.1 million in 1950. In an effort to reduce product stocks to what were considered more normal levels, refining operations were kept at a relatively low rate in the first half of 1950, with the result that these stocks decreased 40.8 million barrels in the first quarter and increased only 6.4 million in the second. With opening of the Korean hostilities and indication of a much larger total demand for all oils than had been anticipated for 1950, refinery operations were accelerated to record rates in the last half of the year, and stocks of refined products were increased 25.7 million barrels in the third quarter and reduced only 7.3 million barrels in the last quarter.

Total runs of crude oil to stills rose from 1,944.2 million barrels in 1949 to 2,094.9 million in 1950, crude exports increased from 33.1 million barrels to 34.8 million, transfers of crude to residual and distillate fuel-oil uses increased from 7.5 million barrels to 7.9 million, and crude losses increased from 14.2 million barrels to 16.9 million.

[3] For definition, *see* footnote 1 at beginning of this chapter.

PRODUCTION

GENERAL

Production of crude petroleum in the United States reached a peak of 2,020.2 million barrels in 1948, declined to 1,841.9 million in 1949, and rose to 1,971.8 million in 1950.

The increase of 129.9 million barrels in crude production in 1950 compared with 1949 represented gains in most of the important producing States. The principal increases were 84.4 million barrels for Texas, 18.3 million for Louisiana, 13.2 million for Oklahoma, 12.6 million for Wyoming, and 5.7 million barrels for Kansas. The most important declines were 5.3 million barrels for California and 2.6 million for Illinois.

Fourteen States produced over 10 million barrels of crude in 1950, with Kentucky added to the list. These States produced 98.3 percent of the total. Seven States produced over 50 million barrels of oil in 1950; these States combined produced 89.3 percent of the total in 1950 compared with 88.7 percent in 1949. Texas ranked first with 42.0 percent of the total national output in 1950, California second with 16.6 percent, Louisiana third with 10.6 percent, Oklahoma fourth with 8.4 percent, Kansas fifth with 5.5 percent, Illinois sixth with 3.1 percent, and Wyoming seventh with 3.1 percent. California and Illinois were the only States in this group to show declines in the percentage of total output compared with 1949.

The relative positions of the various oil-producing States from 1941 to 1950 are shown in table 11.

TABLE 7.—Petroleum produced in the United States, 1946–50, and total, 1859–1950, by States[1]

[3] Slaughter includes Levelland for 1949.

CRUDE PRODUCTION BY STATES

Alabama.—Crude production in Alabama in 1950 increased 59.1 percent compared with 1949 and totaled 735,000 barrels, or 273,000 barrels more than the 1949 output (462,000 barrels). The first quarter of the year showed a slight gain over the last quarter of the previous year; the second quarter indicated a definite increase (27 percent), and this upward trend held throughout the remainder of the year.

Continued expansion of both the Selma chalk and Eutaw sand (Upper Cretaceous) producing areas in Gilbertown contributed to the increased production in 1950. Ninety-eight percent of the year's total output for Alabama was from the Gilbertown field; the remainder came from the newly discovered South Carlton field.

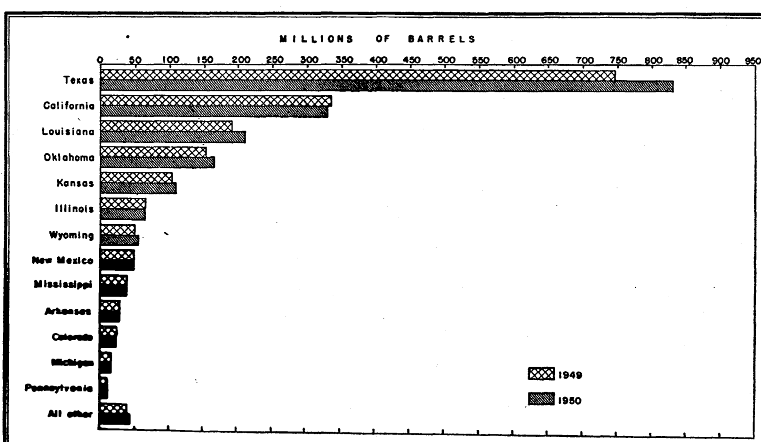

FIGURE 3.—Production of crude petroleum in the United States, 1949–50, by States.

Arkansas.—Crude production totaled 31,108 thousand barrels in 1950 compared with 29,986 thousand in 1949 and represented a gain of 1,122 thousand barrels or 3.7 percent for the year. With a slight rise in output for the first quarter compared with the previous one, a gradual upward trend developed in the second and third quarters, with a leveling off in the fourth period.

The Magnolia field, Columbia County, continued to lead all others, with the output for 1950 at 4,547 thousand barrels. The Smackover field was second, with 3,991 thousand barrels; the Wesson field gained third place, with 3,452 thousand barrels; and Schuler field dropped to fourth place, with 2,854 thousand barrels.

In all, 397 wells were drilled, a moderate gain over the previous year. A slight decline was noted in percentage of dry wells, with a distinct increase in the percentage of oil wells completed. Of the 104 exploratory wells, 84 were new-field wildcats, a slight decrease from the 88 new-field wildcats drilled in 1949.

Discoveries in Arkansas in 1950 consisted of eight new oil fields, four extensions, and three producing zones. Of the eight new oil fields discovered, only three were developed to any extent during the year—the Tubal and Catesville fields in Union County and the Bodcaw field in Nevada County. The first two may develop into large fields and add appreciably to reserves, while the third appears to be small and is expected to add very little.

There has been little activity in the Fort Lynn field since discovery owing to bad weather and unfavorable terrain. Indications in this fault-line discovery point to development of a good field and may result in increased exploration along the fault trend.

TABLE 13.—Production of crude petroleum in Arkansas, 1946–50, by fields

Wesson	622	1,793	3,084	3,053	3,452
Other fields [2]	3,195	3,744	4,412	4,566	5,174
Total Arkansas	28,375	29,948	31,682	29,986	31,108

[1] Preliminary figures.
[2] Includes oil consumed on leases and net change in stocks held on leases for entire State.

California.—Petroleum production in California declined 5,315 thousand barrels from 332,942 thousand barrels in 1949 to 327,627 thousand barrels in 1950, a decrease of 1.6 percent. Adhering to the general trend in the industry for 1950, California crude-oil production decreased moderately during the first quarter of the year, recovered during the second period, and continued upward during the last half with the greatest quarterly percentage increase (6.1 percent) in the fourth quarter.

Although total crude production for 1950 decreased from the 1949 total, with corresponding decreases in the majority of producing areas, notable increases were made in some fields. These included the Raisin City and Russell Ranch-South Cuyama fields in the San Joaquin Valley district, the Aliso Canyon, San Miguelito, and Ventura-Newhall fields in the Coastal district, and the Long Beach and Wilmington fields in the Los Angeles Basin district. Of these, the greatest percentage increases were in the Russell Ranch-South Cuyama field, with 104.6 percent, and the Wilmington field, with 6.3 percent.

The 1,828 wells drilled in 1950 compared with 2,512 wells in 1949 represented a considerable decline in exploratory activity—27.2

[1] Preliminary figures. [2] Includes Tupman. [3] Includes Athens.

percent. Adverse price and demand factors carried over from the latter part of 1949 into the first half of 1950. The Korean situation, however, caused a rapid rise in demand for Pacific coast crude oil. The increased price of crude also stimulated exploration. This effect of increased demand and price became apparent in the latter part of the year, when exploratory activity trended upward.

Colorado.—Total crude production for 1950 in Colorado decreased 1 percent to 23,353 thousand barrels from the 23,587 thousand barrels produced in the all-time record year 1949. In line with the general trend of the industry during the first three quarters of the year, production dropped moderately during the first quarter, gained slightly during the second period, increased appreciably in the third quarter, and reached an all-time quarterly high in the fourth period with an increment of 19.3 percent over the preceding quarter. The principal declines for the year were for the Rangely and Iles fields.

Highlight of exploration in 1950 was the rapid and successful development of the eastern flank of the Denver-Cheyenne Basin in northeastern Colorado and western Nebraska. Thirteen Cretaceous new-field discoveries were made in this basin. Announced plans for constructing a crude-oil line linking Wyoming, eastern Colorado, and western Nebraska areas with north midcontinent markets is expected to provide impetus for increased development activity in 1951.

[1] Includes crude oil consumed on leases and net change in stocks held on leases for entire State.
[2] Preliminary figures.

Florida.—Crude production for 1950 in Florida increased substantially (10.4 percent)—from 441 thousand barrels in 1949 to 487 thousand. Opening the year with a slight increase for the first quarter compared with the preceding period, distinct gains were made in the second and third quarters, with a leveling off in the fourth period.

Only 9 wildcats were drilled in 1950, compared with 19 in 1949 and 24 in 1948. All but one of the 1950 wildcats were drilled in north Florida, the south Florida well being in Monroe County in the Florida Keys. Three field wells were drilled in the State's only field, Sunniland. One produced from the Glen Rose (Lower Cretaceous) at 11,535–11,567 feet, and the other two were dry. At the end of 1950 the Sunniland field had 11 pumping wells and one flowing well.

Illinois.—Crude production for Illinois in 1950 decreased 4.0 percent from the 1949 total of 64,501 thousand barrels (Bureau of Mines data) to 61,922 thousand barrels. The quarterly trend for the State corresponded generally with the trend for the industry as a whole, except for a marked decline of 2.8 percent during the last quarter.

Although total crude output for 1950 dropped below 1949, exploratory activity increased approximately 3.8 percent; 1,280 oil wells were drilled, 17 gas wells reported, and 1,511 dry holes recorded. Wildcat wells drilled in 1950 were 11 percent more numerous than in 1949, with those over 2 miles from production—"wildcats far"—4.3 percent successful. In 1949, 7 percent of the "wildcats far" were successful. Drilling activity was greatest in the deep-basin area of southeastern Illinois.

Indiana.—Production of 9,942 thousand barrels of crude during 1950 reflected an increase of 2.5 percent over the 1949 total of 9,696 thousand barrels. Although a marked decline of approximately 17 percent occurred during the first quarter compared with the preceding period, a substantial recovery was made in the second quarter, with a leveling off in the third period and a slight decline in the fourth.

Exploratory activity increased substantially—approximately 20 percent over 1949—tests drilled totaling 1,533. However, drilling activity was more or less confined to the frontiers established in 1949, and geophysical work progressed on leases acquired during the previous year.

[1] Preliminary figures.

Kansas.—A substantial gain in crude production in 1950 for Kansas was reported; output increased 5,718 thousand barrels or 5.6 percent over the 1949 total of 101,868 thousand barrels (Bureau of Mines data). The quarterly trend for the year coincided approximately with that for the industry as a whole, but with peak output in July.

Development and exploration drilling in Kansas attained its highest volume since 1918. Completions for 1950 totaled 3,950 compared with 3,356 for 1949 and increased approximately 17.7 percent. With this marked rise in exploratory drilling, the percentage of successes in 1950 varied only slightly from that in 1949.

The most notable advances in production by fields were made in Big Creek, Bloomer, Fairport, Kraft-Prusa, Ray, and Silica-Raymond. The most active counties with respect to drilling included Barton, with 527 completions; Russell, 374; Butler, 361; and Stafford, 316. Allowable oil production for prorated wells during the year was increased over the allowables set for 1949. In 1950 the allocation was set at 270,000 barrels per day for January, February, and March; it was increased to 275,000 for April, 285,000 for May, 295,000 for June, and 300,000 for July through December.

Kentucky.—Accelerated drilling activity in Kentucky during 1950 caused a substantial gain in crude production. Output increased 1,498 thousand barrels to reach 10,301 thousand barrels in 1950, representing an advance of approximately 17.0 percent over the 1949 figure of 8,803 thousand barrels. Opening the year with a considerable decline during the first quarter compared with the preceding period, a gain of approximately 18.3 percent was made in the following quarter, with a continued upward trend for the last half of 1950.

Drilling activity in 1950 increased approximately 10 percent over the previous year, resulting in 516 oil wells, 157 gas wells, and 474 dry holes and giving 673 successful completions compared with 641 in 1949.

[1] Preliminary figures.

Louisiana.—Production of crude reached an all-time high for Louisiana in 1950, when output exceeded the previous annual record set in 1949. The State realized an increase of 18,290 thousand barrels in 1950 for a total of 209,116 thousand barrels, or a 9.6-percent increment over 1949. Production figures for 1950 indicated a moderate decline during the first quarter, followed by a slight decrease in the second. A marked increase occurred in the third quarter and an additional gain in the fourth. Gulf Coast area production increased 12.6 percent, while output for the rest of the State dropped less than 1 percent.

Fields in northern Louisiana showing increases in production during 1950 were Caddo, Haynesville, and Lisbon, whereas those showing considerable losses were Big Creek, Delhi, Lake St. John, and Ora. In the Louisiana Gulf Coast area, the fields making the greatest gains were Caillou Island, Golden Meadows, Venice, and Weeks Island.

For the Gulf Coast area, the success percentage of the total new-field wildcats was not as high as in 1949. The discovery rate of offshore wildcats was just slightly above the average for inland wildcats. At this time, the major discoveries appear to be Cox Bay, Eugene Island, Block 126, Glenmora, Phoenix, and Romere Pass.

Michigan.—Crude production for 1950 in Michigan declined 4.3 percent, or 706 thousand barrels, from the 1949 total of 16,517 thousand barrels. Except for a slight gain in the second quarter over the preceding period in 1950, quarterly declines were noted for the remainder of the year.

Although a general increase in activity had been noted for the past several years, decreased exploratory and development drilling was evident in 1950. In all, 837 wells were drilled compared with 925 wells in the previous year, a decline of 9.5 percent. In general, there was a moderate decline in oil and gas production in 1950, a curtailment of development drilling, a slight increase in exploratory drilling, and a great increase in geological testing.

Mississippi.—Petroleum production for 1950 increased 0.8 percent above the 1949 output of 37,966 thousand barrels to 38,258 thousand barrels. There was a moderate decline in the first quarter of 1950 compared with the last quarter of 1949 but a notable increase of approximately 6.0 percent in the second period, followed by a like increment in the third quarter and a moderate decrease in the fourth.

Exploratory activity declined in 1950, with 313 wells drilled contrasted with 333 in 1949. Of these 124 were oil producers, 9 gas producers, and 180 dry holes.

Montana.—Crude production for Montana declined considerably in 1950, with total output dropping approximately 11 percent from 9,118 thousand barrels in 1949 to 8,112 thousand. The quarterly trend for the State in 1950 coincided generally with that for the industry as a whole.

Two new-field wildcats were successful in the West and Northwest Sumatra area. Little exploratory activity was evident in Montana during 1950, as outpost and field drilling highlighted the year's activity.

[2] Preliminary figures.

Nebraska.—The year 1950 marked the debut of Nebraska as a substantial full-scale oil-producing area, with output increasing 369 percent, or 1,217 thousand barrels, over the 1949 production of 330 thousand barrels to reach an all-time record. Production increased in each quarter of the year.

Principal exploration activity in the State occurred in the Denver-Cheyenne Basin of western Nebraska, in which six Cretaceous new-field discoveries were made. With five successful outpost wells in 1950, the Huntsman field promises to develop into a comparatively large reserve.

New Mexico.—Crude production in New Mexico attained an all-time record in 1950, when output, according to Bureau of Mines data, passed the 48-million-barrel mark. There were successive increases in each quarter of the year, except for a moderate decline in the first quarter compared with the last quarter of 1949.

As in the previous year, the major producing fields were as follows: Drinkard, Monument, Vacuum, Eunice, Hobbs, Brunson, and Maljamar. Drilling was most active in the San Juan Basin in San Juan and Rio Arriba Counties of northwestern New Mexico and in Chaves and Lea Counties of the southeastern area of the State.

New York.—Crude production in New York declined moderately in 1950, output dropping 282 thousand barrels, or 6.4 percent, below the 1949 total to 4,143 thousand barrels.

Development activity was minor and limited to work in small areas by local companies. There was little geological and no geophysical work with respect to oil and gas during the year. New York State is likely to be dormant as an exploratory area until the large Pennsylvania play and the drilling of untested Pennsylvania structures have diminished.

Ohio.—Production of crude in Ohio decreased moderately during 1950, by 150 thousand barrels, or 4.3 percent from the 1949 output of 3,483 thousand barrels. Adhering to the over-all trend for the industry in 1950, successive quarterly figures showed a moderate decline for the first period, followed by an appreciable gain in the second, an additional increment in the third, and a leveling off in the fourth.

No important oil or gas fields were discovered in 1950, although drilling activity in the oil-producing counties increased as a result of advances in crude prices and a considerable lack of gas discoveries.

[1] Preliminary figures.

Oklahoma.—Crude production in Oklahoma during 1950 scored a substantial increase of approximately 8.7 percent over 1949 with output for the year reaching 164,899 thousand barrels (Bureau of Mines data) contrasted with 151,660 thousand barrels in the previous year. Although a considerable decline was noted for the first period of 1950 compared with the closing 3 months of 1949, consistent and substantial gains were made in each of the succeeding quarters.

Wildcat drilling increased during 1950, with a resulting rise in discoveries. One major discovery, North Milroy in Stephens County, added significantly to crude reserves, while increased development drilling provided numerous revisions and extensions of older fields.

Important additions to reserves in Oklahoma may be expected from development on a major scale in 1950 of secondary-recovery techniques, such as water flooding and gas repressuring of old fields. The majority of such operations were in the northeast quarter of the State, although other like projects were established in Caddo, Carter, Cotton, and Garvin Counties.

Much of Oklahoma has reached the saturation point of coverage by ordinary exploratory methods, and greater use of new seismic methods, such as air shooting, is expected in 1951.

Pennsylvania.—A moderate increase in output of crude was attained in 1950 by Pennsylvania, with a differential of 438 thousand barrels, or 3.9 percent, above the 1949 total of 11,374 thousand barrels. Consecutive quarterly figures for 1950 indicate a gradual upward trend for the first 9 months and a leveling off in the closing period. A postwar monthly low in production was noted in February 1950.

The Bradford-Allegany field supplied 79 percent of Pennsylvania's oil production during 1950. Exploratory drilling in the shallow-sand territory of western Pennsylvania led to discovery of only one small new gas field. No new oil pool was discovered.

[1] Preliminary figures.

Tennessee.—Oil production for 1950 in Tennessee showed a moderate gain of 2 thousand barrels above the previous year's output of 18 thousand barrels; over 80 percent came from Morgan and Scott Counties in the northern part of the Cumberland Plateau. Production there is from middle and upper Mississippian limestones, which lie 700 to 1,500 feet below the surface. The remaining production was from Clay, Fentress, and Pickett Counties.

Although activity was high in the early and closing quarters of 1950, a midyear lull in exploration resulted in an unusually small number of completions and a low figure for footage drilled.

Texas.—Production of crude in 1950 in Texas increased 84 million barrels above that in 1949 to reach a total of 829 million barrels, an increment of approximately 11.3 percent. All districts except the Panhandle reported substantial gains in crude production over the previous year's output. The magnitude of the decrease in the Panhandle district was negligible in itself but significant in relation to the increases in other districts of the State. Percentage gains in 1950 over 1949 were: Gulf Coast 4.5 percent, West Texas 25.5 percent, East Texas 2.0 percent, and rest of the State 6.6 percent. These may be compared with a Nation-wide gain of 7.1 percent. Since Texas produced 42 percent of the Nation's crude oil, both annual and quarterly trends in Texas were reflected strongly in the figures for the industry as a whole. Despite the high crude output for the State in 1950, a postwar monthly low was noted for February.

Drilling activity increased and was maintained at a high rate during 1950, 16,509 wells being drilled in contrast with 13,619 in 1949, an increment of 21.2 percent. The percentage of successes varied only slightly from that of 1949.

Gulf Coast.—A gain of about 9 million barrels in crude production was reported for the Gulf Coast district in 1950, or 4.5 percent above the previous year. Fields reporting large increases were Chocolate Bayou, Dickinson-Gillock, High Island, Hull, Markham, Old Ocean, and Sour Lake. The district reported 2,303 wells drilled during the year compared with 1,980 wells the previous year, a 16.3-percent increase. The percentage of successes in 1950 was slightly higher than for the previous year. Of the 1950 discoveries, none were of major importance, and several appeared to be marginal.

East Texas.—Crude production increased 2.0 percent in East Texas proper during 1950 compared with the previous year; output exceeded 144 million barrels. Drilling activity increased slightly during the year compared with 1949; 1,152 wells were drilled, of which 801 were oil producers, 51 gas producers, and 300 dry holes. Although several new moderate-size fields were discovered, none can be considered a major discovery.

Central Texas.—Crude production in Central Texas totaled 9,719 thousand barrels during 1950 compared with 8,892 thousand barrels for 1949, an increase of 9.3 percent. The principal producing fields were Charlotte, Darst Creek, and Luling; gains were reported for each during 1950.

North Texas.—Production of crude in North Texas increased over 10 million barrels, or 15 percent, to reach almost 80 million barrels for 1950. Exploratory activity continued high; leasing activity was greatest in the extreme western and eastern sections of this district. The total number of wells drilled exceeded any previous year and was expected to remain high as long as favorable conditions continued, that is, improvement of drilling techniques, and increased demand and higher price for crude.

Panhandle.—Crude production remained almost the same as in 1949, decreasing only slightly during 1950 compared with the previous year. A little over 33 million barrels of crude was produced in 1949 and 1950, although demand for Texas oil was considerably higher in the latter year.

Drilling activities in the Texas Panhandle continued to increase over preceding years, and leasing activity remained high, with major attention given the Palo Duro Basin.

South Texas.—A moderate gain in crude production, 4.6 percent, was reported for South Texas in 1950. Output totaled 76,916 thousand barrels, or more than 3 million above 1949. Development activity increased slightly compared with like operations during the preceding year. A decline in the rate of exploratory drilling was offset by the increased development in proved areas. Of continuing importance are the intensive development and utilization of casinghead gas and free gas in the production of light hydrocarbons.

West Texas.—Production of crude soared to more than 286 million barrels during 1950 as West Texas scored the greatest percentage annual gain in output of any district in the State. The most notable increase was attained in Scurry County, where production rose to 36.5 million barrels from approximately 6 million in 1949. Exploratory activity increased tremendously, including significant new-field wildcat successes. Development activity likewise rose considerably, providing continual extension of proved fields. It was anticipated that these development and exploratory trends would continue during 1951.

[1] The breakdown of Texas districts, 1946–50, has been changed to agree with the Texas Railroad Commission divisions.
[2] Preliminary figures.
[3] Includes crude oil consumed on leases and net change in stocks held on leases for entire district.
[4] Includes the fields in and between Hardeman, Wilbarger, Wichita, Clay, Montague, and Cook Counties on the north and San Saba, Lampasas, and Coryell on the south.
[5] Includes crude oil consumed on leases and net change in stocks held on leases for East (exclusive of East Texas proper), Central, North, and South Texas.
[6] Carson, Gray, Hutchinson, Moore, Sherman, and Wheeler Counties.
[7] Includes the part of Jordan pool in Crane County.

Utah.—The production of 1,208 thousand barrels of crude in 1950 was an increase of 90 percent above the 637 thousand barrels produced in 1949. Quarterly figures for the year evidenced a trend in general conformity with that for the industry as a whole, that of consistently rising crude production.

During the year 1950, Carter and Stanolind confirmed their 1949 Uinta Basin strike with a half-mile step-out success. Accelerated interest in this area was expected in 1951.

Virginia.—Crude production for 1950 in Virginia declined 23 thousand barrels from the 1949 total of 43 thousand barrels, and represented a decrease of 53.5 percent. The quarterly trend in 1950 indicated a generally declining level of oil production despite increased development activity, particularly in the western portion of the State.

West Virginia.—Production of crude decreased 1.8 percent during 1950 in West Virginia; output dropped 51 thousand barrels below the 1949 total to 2,788 thousand barrels. Quarterly figures for 1950 indicate a downward trend, except for a moderate gain in the second quarter.

Development activity in general increased moderately during 1950 compared with 1949. Total completions were 652 as against 518 in 1949. Jackson County, with 81 completions, topped the list of completions by counties, followed by Pleasants with 75, Ritchie with

52, Wood with 49, Calhoun with 47, Wayne with 43, and Lincoln and Putnam with 34 each. These eight counties represented 57 percent of the completions.

TABLE 31.—Production of crude petroleum in West Virginia, 1946–50, by months

[Thousands of barrels]

Year	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total

1949	212	209	233	226	235	238	236	254	247	260	247	242	2,839
1950 [1]	240	220	246	234	245	238	230	249	232	248	194	212	2,788

[1] Preliminary figures.

Wyoming.—An all-time crude-production record was established during 1950 in Wyoming; output increased 12.6 million barrels above 1949 to reach a high exceeding 60 million barrels, representing an increment of 26.2 percent. Successive gains were made in each quarter of the year. This development contrasted sharply with the downward trend in the early part of 1949 and was due to increased demand for black oil and rapid development of new reserves, particularly in the Sussex-Meadow Creek area.

WELLS

The number of wells drilled in the United States, including oil and gas wells and dry holes, set a new record, increasing from 37,656 in 1949 to 42,030 in 1950. The 4,374-well gain, compared with the small increase of 148 from 1948 to 1949, reflects the substantial increase in the demand for domestic crude oil in 1950 compared with the sharp decline in demand in 1949.

Oil-well completions increased from 22,042 in 1949 to 24,430 in 1950, and the number of gas wells declined from 2,887 to 2,843. The number of dry holes rose from 12,727 in 1949 to 14,757 in 1950, increasing from 33.8 percent of the total wells drilled in 1949 to 35.1 percent in 1950.

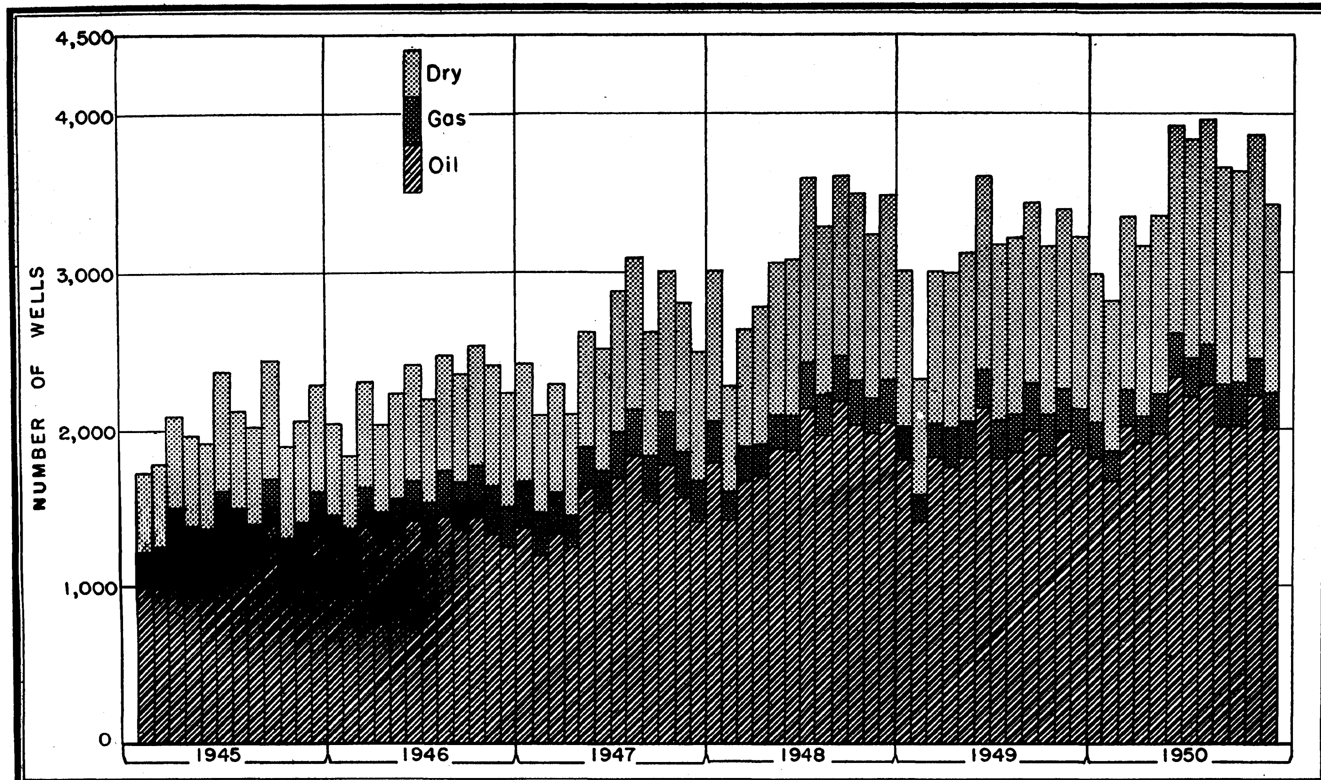

FIGURE 4.—Wells drilled in the United States, 1945–50, by months.

Principal gains from 1949 to 1950 in the total number of wells drilled were 2,890 in Texas, 1,057 in Oklahoma, 594 in Kansas, and 257 in Indiana. The largest declines were 684 in California, 237 in the Appalachian States, and 88 in Michigan.

The total number of producing oil wells in the United States rose from 437,880 at the end of 1948 to 448,680 at the end of 1949, while the average production per well declined from 12.8 to 11.4 barrels per day. The average daily production per well in 1949 ranged from a peak of 89.1 barrels in Colorado to 0.4 barrel in Pennsylvania.

[3] Alabama, Florida, Missouri, Tennessee, Utah, and Virginia.

CONSUMPTION AND DISTRIBUTION

The indicated total demand[4] for crude was 2,154.5 million barrels in 1950, an average of 5,903,000 barrels daily and an increase of 427,000 barrels daily, or 7.8 percent, compared with 1949. This record demand for crude was 102,000 barrels daily above the previous record in 1948.

Of the total indicated demand, domestic crude supplied 1,844.2 million barrels in 1949 and 1,978.0 million in 1950, a gain of 7.3 percent. Production amounted to 1,971.8 million barrels, while stocks declined 6.2 million barrels. The demand for foreign crude was 176.4 million barrels in 1950, a gain of 13.9 percent. Imports were 177.7 million barrels, and stocks increased 1.3 million. Foreign crude met 5.9 percent of the total demand for crude in 1948, 7.7 percent in 1949, and 8.2 percent in 1950.

Runs to Stills.—Total runs of crude at refineries amounted to 2,094.9 million barrels in 1950 or 5,739,000 barrels daily—a gain of 7.7 percent compared with 1949 and 142,000 barrels daily over the previous record of 1948. The total advance of 150.7 million barrels over 1949 comprised an increase of 129.1 million in runs of domestic crude and 21.6 million in runs of foreign crude. The runs of foreign crude amounted to 6.1 percent of total runs in 1948, 7.9 percent in 1949, and 8.4 percent in 1950. Runs to stills in districts east of California rose from 83.5 percent of the United States total in 1949 to 84.7 percent in 1950, while runs in the California district dropped from 16.5 percent to 15.3. Changes in total runs, by districts, in 1950 compared with 1949 included gains of 51.0 million barrels for the East Coast district, 45.2 million for Indiana-Illinois, 22.1 million for Oklahoma-Kansas, 13.6 million for the Louisiana Gulf district, 11.0 million for the Texas Gulf district, 7.9 million for the Mountain district, 3.8 million for the Appalachian district, and 0.4 million for California. Decreases in total runs were 3.0 million barrels in the Texas Inland district and 1.3 million for Inland Louisiana-Arkansas.

[4] For definition, *see* footnote 1 at beginning of this chapter.

TABLE 36.—Runs to stills of crude petroleum in the United States in 1950, by districts and months [1]

[1] Preliminary figures.
[2] Where no breakdown is shown, runs were all of domestic crude.

Distribution.—The increased consumption of domestic crude in 1950 was primarily a result of the 11.0-percent increase in the total demand for all oils compared with 1949, but was proportionately less than this because other components of total petroleum supply increased at a greater rate. The domestic production of light liquids from natural gas gained 15.6 percent, and total imports increased 31.2 percent. Furthermore, stocks of refined products were reduced 16.0 million barrels in 1950 compared with a reduction of only 0.8 million in 1949 and a gain of 79.8 million in 1948. The demand for domestic crude in 1950 was met by an output of 1,971.8 million barrels and a reduction of 6.2 million barrels in stocks of domestic crude.

The Bureau of Mines collects data relating to the receipts of domestic and foreign crude petroleum at refineries in the United States. These receipts provide the crude for total runs to stills at refineries, for small amounts of crude used as refinery fuel, and for any increase in crude stocks at refineries. Classification of the receipts by States of origin shows the amount received from local production (intrastate), the receipts from other States (interstate), and receipts of imported crude. The classification of receipts by method of transportation indicates the mode of final delivery—boat, pipeline, or tank car–truck. The receipts of domestic crude by boat were, in most instances, originally moved by pipeline from the point of production to the point of shipment by boat.

Receipts of domestic and foreign crude at refineries amounted to 2,100.4 million barrels in 1950 and, allowing for an increase of 2.9 million barrels in crude stocks at refineries, indicated a refinery consumption of 2,097.5 million barrels of crude, including total crude runs of 2,094.9 million barrels and 2.6 million barrels for crude used as fuel and losses. Receipts of foreign crude amounted to 177.7 million barrels or 8.5 percent of the total, interstate receipts of domestic crude oil were 779.2 million barrels or 37.1 percent of the total, and intrastate receipts of 1,143.5 million represented 54.4 percent of the total.

Of total refinery receipts of crude in 1950, 73.4 percent was delivered by pipeline, 25.1 percent by boat, and 1.5 percent by tank car and truck.

[1] Preliminary figures.
[2] Missouri, Tennessee, and Virginia.

Deliveries to refineries by boat totaled 527.5 million barrels in 1950. Deliveries of foreign crude totaled 177.7 million barrels, of which 168.8 million barrels went to the East Coast district, 7.5 million to the Texas Gulf Coast district, and 1.4 million to the Lousiana Gulf Coast district. The interstate movement of domestic crude by boat amounted to 221.2 million barrels, including 160.4 million shipped from the Gulf Coast to the East Coast district, 45.8 million of exchanges by boat between the Texas Gulf and Lousiana Gulf districts, and 15.0 million barrels representing river shipments to Kentucky refineries. The intrastate deliveries by boat amounted to 128.6 million barrels in 1950, including 48.3 million in California, 40.0 million in the Louisiana Gulf district, 35.3 million in the Texas Gulf district, and 5.0 million in Kentucky.

Deliveries to refineries by tank cars and trucks in 1950 totaled 31.6 million barrels, including 15.4 million intrastate and 16.2 interstate. The largest intrastate movements were 5.8 million barrels in California, 2.0 million in the Texas Gulf, 1.3 million in Michigan, 1.1 million in Wyoming, 1.1 million in Kansas, and 1.0 million in Colorado. The principal interstate movements were 3.9 million barrels to the Louisiana Gulf district, 2.9 million to Illinois, 1.5 million to Washington, 1.3 million to Inland Louisiana, 1.1 million to Kentucky, and 0.9 million to Colorado.

Total by tank car and truck	37.9	46.0	56.8	32.8	31.6
Grand total	1,737.2	1,855.6	2,046.6	1,945.5	2,100.4

[1] Preliminary figures.

The East Coast refinery district is a major market for crude brought in from outside sources. Receipts of crude in 1950 totaled 333.4 million barrels compared with 280.2 million in 1949. Receipts of foreign crude by boat increased from 136.5 million barrels in 1949 to 168.8 million in 1950. Interstate receipts of domestic crude increased from 143.7 million barrels in 1949 to 164.6 million in 1950. The receipts of domestic crude in 1950 included 160.3 million by interstate boats, 4.1 million by pipeline from the Appalachian district, and 0.2 million by tank cars and trucks. The total increase in receipts of all crudes in 1950 compared with 1949 was 53.2 million barrels, including gains of 32.3 million in foreign crude and 20.9 million in domestic. The principal changes in the receipts of domestic crude were gains of 10.1 million barrels from Louisiana, 8.6 million from Texas, and 2.2 million from Mississippi.

The demand for domestic crude in 1950 totaled 1,978.0 million barrels compared with 1,844.2 million in 1949, a gain of 133.8 million or 7.3 percent. Twenty-one States had an annual demand of over 1 million barrels in 1950, with Nebraska and Utah added to the list. Of these States, 14 showed increases in demand in 1950 compared with 1949, and 7 reported declines. The principal gains were 69.3 million barrels for Texas, 20.2 million for Louisiana, 15.1 million for Wyoming, 14.3 million for Oklahoma, 5.7 million for California, 3.2 million for Kansas, 2.2 million for Kentucky, 2.0 million for New Mexico, 1.9 million for Arkansas, 1.2 million for Nebraska, and 1.1 million barrels for Pennsylvania. The principal declines in demand were 1.0 million barrels for Montana, 0.7 million for Mississippi, 0.6 million for Illinois, 0.4 million for Michigan, 0.3 million for New York, and 0.2 for Ohio. Considering the substantial gain in the demand for crude, the small gains or declines were primarily in States with static or decreasing production.

The demand for Texas crude rose from 752.9 million barrels in 1949 to 822.2 million in 1950, a gain of 9.2 percent. Stocks of Texas crude increased 7.0 million barrels during the year. The relative contribution of Texas to meeting the total demand for domestic crude declined from 45.0 percent in 1948 to 40.8 percent in 1949 and increased to 41.6 percent in 1950. Its contribution, however, was still 76.0 million barrels below the peak of 1948. The deliveries of Texas crude to refineries in the United States increased from 746.1 million barrels in 1949 to 812.5 million in 1950—a gain of 66.4 million, including increases of 30.4 million barrels in deliveries to Texas refineries and of 36.0 million in deliveries to refineries in other States. Deliveries to the Indiana-Illinois refinery district increased 22.9 million barrels, to the East Coast district 8.5 million, to the Oklahoma-Kansas district 7.6 million, and to the Appalachian district 0.1 million, while deliveries to Louisiana refineries declined 3.1 million.

California ranked second as a source of domestic crude, supplying 334.3 million barrels in 1950, a gain of 5.7 million or 1.7 percent. California supplied 16.8 percent of the total demand for domestic crude in 1948, 17.8 percent in 1949, and 16.9 percent in 1950. Stocks of California crude were reduced 6.7 million barrels in 1950. California shipped 23.5 million barrels of oil products to the East Coast in 1950 compared to 7.6 million in 1949. This movement was a primary reason for the reduction of total product stocks in the California district by 21.2 million barrels in 1950 compared with an increase in such stocks of 13.5 million in 1949.

Louisiana was the third largest source of domestic crude, supplying 9.0 percent of the total market demand in 1948, 10.3 percent in 1949, and 10.6 percent in 1950. The market demand for Louisiana crude rose from 189.5 million barrels in 1949 to 209.7 million in 1950, a gain of 10.7 percent. Stocks of Louisiana crude decreased 0.6 million barrels during 1950. Deliveries of Louisiana crude to refineries totaled 202.6 million barrels in 1950, including 106.5 million to refineries within the State and 96.1 million to refineries in other States. Of the total increase of 20.5 million barrels in deliveries of crude to refineries, 17.2 million was in deliveries to Louisiana refineries and only 3.3 million to those in other States. While deliveries to the East Coast district increased 10.1 million barrels and to the Indiana-Illinois district 1.0 million, shipments to the Texas Gulf district declined 6.3 million, to Arkansas 0.9 million, and to the Appalachian district 0.6 million barrels.

Oklahoma ranked fourth in supplying the demand for domestic crude in 1950, furnishing 8.3 percent of the total compared to 8.2 percent in 1949 and 7.7 percent in 1948. The total demand for Oklahoma crude rose from 150.6 million barrels in 1949 to 164.8 million in 1950, a gain of 9.5 percent. Stocks of Oklahoma crude increased 0.1 million barrels in 1950. Deliveries of crude to refineries in 1950 amounted to 141.4 million barrels, including 64.4 million to refineries in Oklahoma and 77.0 million to other States. Interstate deliveries included 58.3 million barrels to the Indiana-Illinois refinery district, 11.4 million to Kansas and Missouri, 5.2 million to the Appalachian districts, and 2.1 million to Texas refineries.

Kansas ranked fifth as a source of domestic crude in 1950 and supplied 5.4 percent of the total compared with 5.6 percent in 1949. The market demand for Kansas crude increased from 102.9 million barrels in 1949 to 106.1 million in 1950, a gain of 3.1 percent. Stocks

Daily average	3,133	97	263	211	961	603	2,135	5,268	8	5,739	7

[1] Preliminary. [2] Includes Washington. [3] Includes South Carolina. [4] Includes Minnesota and Wisconsin. [5] Includes Nebraska. [6] Includes Tennessee. [7] Includes Alabama and Mississippi. [8] Includes Rhode Island. [9] Includes Florida. [10] Includes Idaho. [11] Includes foreign crude.

of Kansas crude increased 1.5 million barrels in 1950. Total deliveries of crude to refineries amounted to 106.2 million barrels in 1950, including 59.3 million to refineries in the State and 46.9 million to refineries in other districts. Deliveries to the Indiana-Illinois district amounted to 35.4 million barrels, 10.9 million went to refineries in Oklahoma and Missouri, and 0.6 million went to the Appalachian district.

Illinois ranked sixth in importance in supplying the market demand for domestic crude in 1950, with 3.3 percent of the total in 1950 compared with 3.5 percent in 1949. The total market demand for Illinois crude declined from 65.3 million barrels in 1949 to 64.6 million in 1950, or 1.0 percent. Stocks of Illinois crude decreased 2.8 million barrels in 1950. Total deliveries of Illinois crude to refineries amounted to 62.1 million barrels in 1950, including 26.8 million to refineries in the State and 35.3 million to those in other States. Deliveries to other States included in the Indiana-Illinois refinery district totaled 17.4 million barrels, and deliveries to the Appalachian refineries amounted to 17.9 million.

Wyoming ranked seventh in 1950 as a source of domestic crude, supplying 3.2 percent of the total market demand compared with 2.6 percent in 1949. The market demand for Wyoming crude rose from 47.4 million barrels in 1949 to 62.4 million in 1950, a gain of 31.8 percent. Deliveries of crude to refineries in 1950 amounted to 61.3 million barrels, including 25.4 million to refineries in the State and 35.9 million to other States. Deliveries to other States in the Mountain district were 15.5 million barrels, to the Indiana-Illinois district 16.7 million, to the Oklahoma-Kansas district 2.5 million, and to Washington 1.2 million.

New Mexico ranked eighth in the demand for domestic crude in 1950, furnishing 2.5 percent of the total in 1950 compared with 2.6 percent in 1949. The market demand for New Mexico crude increased from 47.1 million barrels in 1949 to 49.1 million in 1950, a gain of 4.3 percent. Stocks of New Mexico crude decreased 1.1 million barrels in 1950. Deliveries of New Mexico crude to refineries totaled 48.6 million barrels in 1950, including 4.0 million to refineries in the State and 44.6 million to other States. Deliveries to other States included 28.6 million barrels to Texas, 13.5 million to the Indiana-Illinois district, 1.3 million to the East Coast district, and 1.2 million to Oklahoma.

STOCKS

The most significant factor in the stocks of all oils in the past 3 years relates to product stocks. The abnormal increase of almost 80 million barrels in product stocks in 1948 and the decline of less than 1 million barrels in these stocks in 1949 left a total on hand at the start of 1950 that led to a curtailment of refinery operations and an unusually heavy liquidation of product stocks during the first half of the year. With total civilian demand for all oils much higher than had been anticipated and increasing military requirements, every effort was made to increase refinery operations and raise the level of product stocks in the last half of 1950.

Total stocks of all oils declined from 603.1 million barrels at the beginning of 1950 to 582.7 million at the end of the year. The decrease of 20.4 million barrels included a decline of 4.9 million in crude stocks, an increase of 0.5 million in natural-gasoline stocks, and a decline of 16.0 million in product stocks, representing primarily a decrease in residual fuel stocks in California.

The decline in crude stocks in 1950 included a decline of 6.2 million in stocks of domestic crude and an increase of 1.3 million barrels in stocks of foreign crude. The principal changes in domestic crude stocks by States of origin were declines of 6.7 million barrels for California, 2.8 million for Illinois, 2.0 million for Wyoming, and 1.1 million for New Mexico. The largest increases were 7.0 million barrels for Texas and 1.5 million for Kansas.

TABLE 42.—Stocks of crude petroleum, natural gasoline, and refined products in continental United States at end of year, 1946–50

[Thousands of barrels]

Product	1946	1947	1948	1949 [1]	1950 [1]
Crude petroleum (refinable):					
At refineries	53,113	52,864	60,969	60,405	63,328

[1] Preliminary figures.

PRICES AND VALUE

The average value of crude petroleum at the well, as reported in the annual survey of the Bureau of Mines, rose from $1.41 per barrel in 1946 to $1.93 in 1947 and to $2.60 in 1948. The results of the 1949 survey show a decline in average value to $2.54 per barrel. The figures for 1950 indicate an average value of $2.51 per barrel.

The value of crude at wells totaled $5,245 million in 1948 and declined to $4,675 million in 1949, as a result of an 8.8-percent decrease in volume and a 6-cent-per-barrel decrease in average value at the well. With an increase of 7.1 percent in the volume of production, the total value in 1950 was $4,959 million.

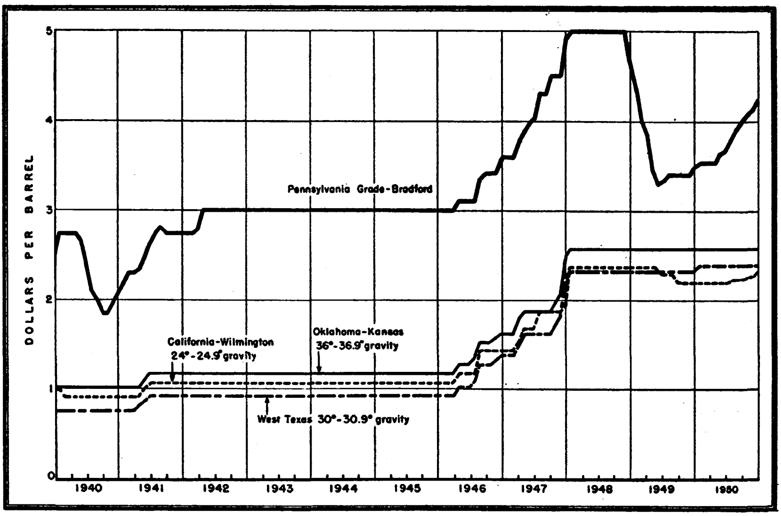

FIGURE 5.—Posted prices of selected grades of crude petroleum in the United States, 1940–50, by months.

The average value of crude at the well varies considerably with the quality of the oil and the distance from the market. The highest-value crudes, due to their high content of lubricating oils, are those in the Appalachian district. The value of crude from the Illinois Basin is well above the national average because of quality and nearness to refinery and product markets. The value of Oklahoma and Kansas crude generally closely approximates the national average, good quality being somewhat offset by longer distances to market. The average value of Texas crude approximates the national average but includes a wide range of values owing to variations in quality and location.

The posted prices for the Bradford and Alleghany districts illustrate the trend for Pennsylvania Grade crudes. The improved demand for lubricating oils in 1950 resulted in a steady upward trend in the posted prices for crude in these districts that more than offset the average decline in 1949. The posted prices for this grade were $4.50 per barrel on January 1, 1949, declined to a low of $3.27 on May 11, rose to $3.54 on December 12, and remained there until May 1, 1950, when they rose to $3.65. Subsequent increases were to $3.75 per barrel on June 21, $3.89 on July 19, $4.00 on August 25, $4.10 on October 9, and $4.25 on December 9, 1950.

There were no changes during 1950 in the representative posted prices shown for all other districts except California, where the posted price for Coalinga crude rose from $2.58 per barrel on January 1 to $2.61 on December 12, Kettleman crude rose from $2.77 on January 1 to $2.80 on December 12, Midway-Sunset crude increased progressively from $1.65 per barrel on January 1 to $2.00 on December 12, and Wilmington crude rose from $2.20 on January 1 to $2.33 by December 12.

REFINED PRODUCTS

GENERAL REVIEW

The total demand for all oils[5] in 1950 averaged 6,803,000 barrels daily, an 11-percent gain over 1949. A considerable part of this relative increase is a consequence of the lagging demand in 1949, which was 0.5 percent below that of 1948. It is due, moreover, to the defense-mobilization activity of latter 1950 and to the more normal weather compared to the abnormally mild weather in 1949.

The supply of products was augmented in 1950 by an increase of 150.7 million barrels in crude runs (a gain of 7.7 percent), by an increase in the import of refined products of 49.6 million barrels (61 percent), and by a reduction of 16.0 million barrels in stocks of refined products, compared with a decline of 0.8 million during 1949.

[5] For definition, see footnote 1 at beginning of this chapter.

[1] Includes California data on a new basis to compare with 1949.
[2] Preliminary figures.
[3] Conversion factors: 280 pounds of wax to the barrel; 5.0 barrels of coke to the short ton; 5.5 barrels of asphalt to the short ton; 3,600 cubic feet of still gas to the barrel.
[4] Negative quantity; represents net excess of unfinished oils rerun over unfinished oils produced.
[5] Includes losses or gains in volume during processing.

The 11-percent increase in the total demand for all oils (from 2,237.6 million barrels in 1949 to 2,483.1 million in 1950) included gains of about 7 percent for motor fuel, 12 percent for residual fuel oil, 19 percent for distillate fuel oil, 14 percent for kerosine, and 12 percent for all other products.

Exports of refined products declined from 86.3 million barrels in 1949 to 76.1 million in 1950, or about 12 percent. The principal changes in exports included a decrease of 14.8 million for motor fuel and gains of 3.6 million for residual fuel oil and 1.3 million barrels for lubricants. The continued drop in exports reflected expansion in refinery capacity abroad and the problem of dollar exchange.

The domestic demand for all products increased from 2,118.3 million barrels in 1949 to 2,372.2 million in 1950, or 12 percent. The demand for motor fuel was almost 9 percent higher, for residual fuel about 11.5 percent higher, for distillate fuel oil about 20 percent higher, for kerosine about 15 percent higher, and for other products about 13 percent higher.

The new supply of refined products is composed of refinery output from crude, the production of light products from natural gas, and imports of refined products.

The output of light products at natural-gasoline and cycle plants increased from 157.1 million barrels in 1949 to 181.6 million in 1950, a gain of about 16 percent. The amount of motor benzol from coke-oven operations that was blended with motor fuel was less than 0.2 million barrels in both years. The total amount of these liquid fuels from sources other than crude oil that was marketed or blended in

1950 was 181.2 million barrels, after allowance for a small increase in stocks. About 66.5 percent of the total in 1950 was used for motor fuel; about 31.9 percent, in the form of liquefied petroleum gases, went into other fuel and into chemical uses; and about 1.6 percent went into miscellaneous products.

Imports of refined products rose from 81.9 million barrels in 1949 to 131.4 million in 1950, a gain of about 60 percent. The principal change was the increase in imports of residual fuel oil from 75.2 million barrels in 1949 to 119.2 million in 1950, or almost 59 percent.

TABLE 49.—Salient statistics of the major refined petroleum products in continental United States, 1946–50

Stocks, end of year	41,491	43,847	[2] 61,885	58,037	61,786
Shortage	1,695	4,222	2,768	585	−712

[1] Preliminary figures.
[2] Figure on new basis due to transfers in California of stock formerly reported as distillate and residual fuel oils to "Other unfinished oils," and excludes the following quantities from distributors' stocks: Kerosine, 115; distillate fuel oil, 1,469; residual fuel oil, 529. Figures for 1948 on the old basis and comparable with preceding years are as follows: Kerosine, 24,056; distillate fuel oil, 76,001; residual fuel oil, 76,970; other unfinished oils, 46,362.
[3] Figure on new basis due to additional terminal storage reported in the East Coast. Figure on old basis, 75,207.
[4] Beginning with January 1948, exports of grease were transferred from "Miscellaneous" to "Lubricants."
[5] Figure on new basis that excludes distributors' stocks in California and is comparable with subsequent years. Figures for 1947 on the old basis and comparable with preceding years are as follows: Lubricants, 8,624; asphalt, 4,021; miscellaneous, 584.
[6] Negative quantity; represents net excess of unfinished oils produced over unfinished oils rerun.
[7] Products from natural gasoline plants added to unfinished oil stocks.

Imports of unfinished oils for further refining rose from 3.7 million barrels in 1949 to 7.7 million in 1950. Imports of residual fuel oil represented about 92 percent of total refined imports in 1949 and 91 percent in 1950.

Total crude run to stills set a new record in 1950, increasing from 1,944.2 million barrels in 1949 to 2,094.9 million in 1950, a gain of 7.7 percent. The average for 1950 was 5,739,000 barrels daily, including a sharp rise from 5,422,000 barrels daily in the first half of the year to 6,052,000 barrels daily in the last half.

The yields of the principal refined products from crude, compared with 1949, showed a decline in gasoline yield from 43.7 percent to 43.0, a sharp decline in residual yield from 21.7 percent to 20.2, an increase in distillate yield from 17.5 percent to 19.0, and a gain in kerosine yield from 5.2 percent to 5.6. The relative gains in the yields of light fuels reflected the stronger market for these products, while the decline in residual yield was due to the fact that the increased demand was met by larger imports and a heavy reduction in stocks.

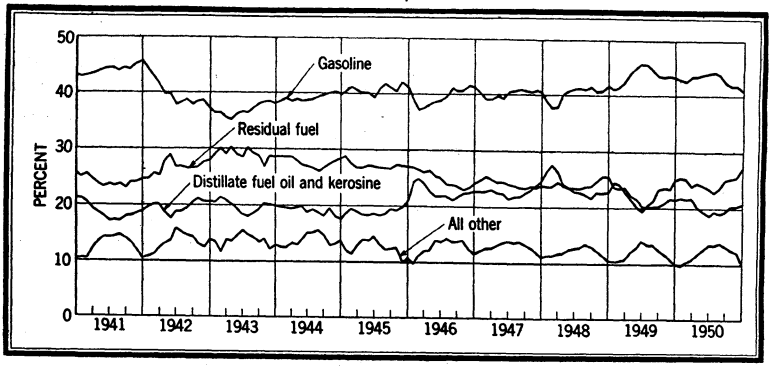

FIGURE 6.—Yields of principal products from crude run to stills in the United States, 1941–50, by months.

TABLE 50.—Percentage yields of refined petroleum products in the United States, 1941–50

[1] Yields computed on the new basis for California to compare with 1949.
[2] Preliminary figures.
[3] Not separated after 1946.
[4] Less than 0.1 percent.
[5] Negative percentage; represents excess rerun over produced.
[6] Added to finished gasoline production in computing yields after 1946.
[7] Added to crude in computing yields after 1946.

Total stocks of refined products amounted to 342.9 million barrels on January 1, 1950, and 326.9 million on December 31, 1950—a decline of 16.0 million barrels, including a decline of 21.2 million in the California district and a gain of 5.2 million in other districts. The changes in total refined stocks, by quarters, were a decline of 40.8 million barrels in the first quarter, gains of 6.4 million in the second quarter and 25.7 million in the third quarter, and a decline of 7.3 million barrels in the fourth quarter.

The major change in refined stocks during 1950 was the decrease of 19.4 million barrels in residual-fuel-oil stocks, including a decline of 17.4 million in the California district and a decline of 2.0 million in other districts. Stocks of finished gasoline increased 5.1 million barrels, including a decline of 2.6 million in the California district and a gain of 7.7 million in other districts. Stocks of distillate fuel oil decreased 3.5 million barrels, with a decline of 1.9 million in the California district and of 1.6 million in other districts. Stocks of kerosine were reduced 1.2 million barrels, including a decline of 0.2 million in California and of 1.0 million in other districts. Stocks of all other products increased 3.0 million barrels, with gains of 0.5 million in California and 2.4 million in other districts.

The prices of certain representative products in specified markets have been shown in the Minerals Yearbook over a series of years as a general indication of price trends. Prices vary in different districts, depending on the distance the crude moves to the refinery and the subsequent movements of products to market by boat, tank car, or pipeline.

The average price per gallon of Regular Grade gasoline at Oklahoma refineries was 11.9 cents in 1948, declined to 10.15 cents in 1949, and rose to 10.32 cents in 1950. The average tank-wagon price per gallon of kerosine at Chicago was 15.85 cents in 1948, declined to 15.33 cents in 1949, and rose to 15.36 cents in 1950. The average value per gallon of a selected bright stock at Oklahoma refineries was 31.67 cents in 1948, declined to 19.43 cents in 1949, and rose to 21.21 cents in 1950.

The average price of Bunker "C" oil at New York Harbor was $3.00 per barrel in 1948, declined to $1.90 in 1949, and rose to $2.09 in 1950.

The price per gallon of No. 2 distillate heating oil at New York was 9.71 cents in 1948, declined to 8.17 cents in 1949, and rose to 8.35 cents in 1950.

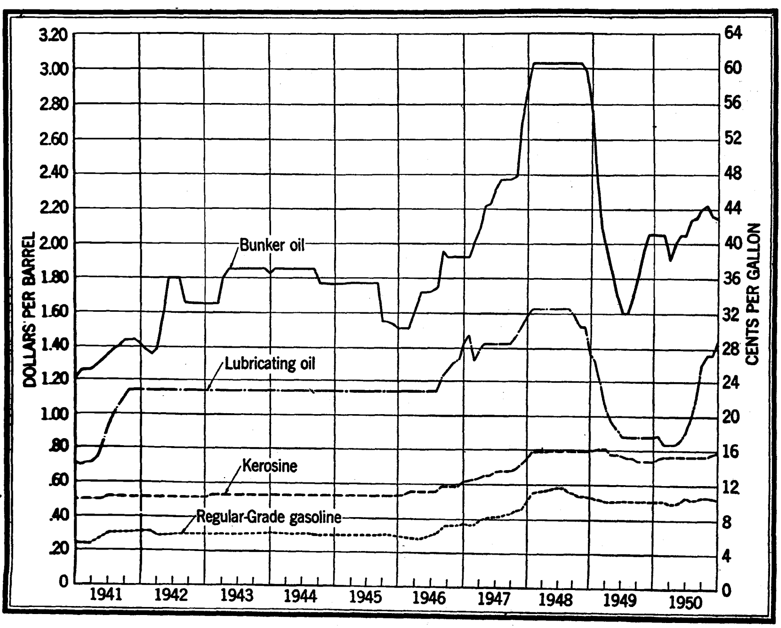

FIGURE 7.—Prices of Bunker "C" oil at New York Harbor, bright stock at Oklahoma refineries, tank-wagon prices of kerosine at Chicago, and Regular Grade gasoline at refineries in Oklahoma, 1941–50, by months.

REFINERY CAPACITY

The total reported crude capacity of refineries in the United States increased from 6,696,300 barrels daily on January 1, 1950, to 6,963,644 barrels daily at the end of the year—a gain of 267,344 barrels daily. The total capacity in operation increased from 6,222,998 barrels daily on January 1, 1950, to 6,701,815 at the end of the year, while the total capacity of all shut-down units declined from 473,302 barrels daily on January 1, 1950, to 261,829. The total capacity under construction increased from 145,600 barrels daily on January 1, 1950, to 160,100 daily on January 1, 1951.

The total crude capacity of refineries increased, in the 3 years from January 1, 1948, to January 1, 1951, about 929,000 barrels daily or over 15 percent. The principal changes in capacity by refinery districts during this period were gains of 276,000 barrels daily for the Indiana-Illinois district, 191,000 for the Texas Gulf, 173,000 for the East Coast, 113,000 for the Louisiana Gulf, 92,000 for the Oklahoma-Kansas, 76,000 for the Mountain, and 72,000 for the California. Declines included 35,000 barrels daily for the Texas Inland district, 26,000 for the Arkansas-Inland Louisiana, and 3,000 barrels daily for the Appalachian.

Assuming that refineries could run annually at 95 percent of reported capacity, potential crude runs on January 1, 1950, were 6,361,000 barrels and on January 1, 1951, 6,615,000 barrels daily compared with actual crude runs averaging 5,739,000 barrels daily in 1950.

TABLE 54.—Petroleum-refinery capacity in the United States, Jan. 1, 1946–51

Year	Number of refineries				Capacity (barrels per day)			
	Operating	Shut down	Total	Building	Operating	Shut down	Total	Building
1946	364	29	393	1	5,086,165	229,691	5,315,856	53,100
1947	361	38	399		5,336,399	233,083	5,569,482	162,200
1948	352	38	390	2	5,825,566	208,686	6,034,252	367,250
1949	336	39	375	3	6,230,505	208,490	6,438,995	341,500
1950	320	47	367	2	6,222,998	473,302	6,696,300	145,600
1951	325	32	357	1	6,701,815	261,829	6,963,644	160,100

AVIATION GASOLINE

The total demand for aviation gasoline rose from 15.2 million barrels in 1946 to 43.0 million in 1948, declined to 42.8 million in 1949, and rose to 46.6 million in 1950. Exports of aviation gasoline increased from 2.3 million barrels in 1946 to 6.2 million in 1948, rose to 8.8 million in 1949, and declined to 7.0 million in 1950. The domestic demand for aviation gasoline in continental United States amounted to 12.9 million barrels in 1946, rose to 36.7 million in 1948, declined to 34.0 million in 1949, and increased to 39.6 million in 1950. This domestic demand included reported deliveries to all military agencies of 17.6 million barrels in 1948, 16.8 million in 1949, and 19.9 million in 1950.

The total demand for aviation grades of 100 octane and above amounted to 33.2 million barrels in 1948, 33.8 million in 1949, and 37.6 million in 1950. The total demand for lower grades and components was 9.8 million barrels in 1948, 9.0 million in 1949, and 9.0 million in 1950. Changes in the indicated total demand by districts in 1950, compared with 1949, were increases of 1.2 million barrels for district 1 and 0.5 million for district 2, a decline of 1.2 million for district 3, and increases of 0.2 million for district 4 and 3.1 million for district 5.

Jet fuels are not included under aviation gasoline as they are primarily blends of low-grade gasoline with either light distillate fuel oil or kerosine.

Aviation gasoline is discussed separately because of the special interest in this type of fuel, but all aviation-gasoline figures are also included in the total figures for motor fuel and gasoline in this chapter. The figures for aviation gasoline represent the amounts so identified and reported by producing companies but do not include the aviation consumption of regular automotive types of gasoline that are used by many small planes. It should be noted that, in the production figures for aviation gasoline, the item "transfers out" represents rejected material returned for use as automotive gasoline; this item is subtracted from the gross production figure of aviation gasoline to determine the net production of marketable grades.

MOTOR FUEL

The total demand for motor fuel set another new record, increasing from 953.1 million barrels in 1949 to 1,019.0 million in 1950, a gain of 6.9 percent. Exports declined sharply from 39.4 million barrels in 1949 to 24.5 million in 1950. Domestic demand in continental United States increased from 913.7 million barrels in 1949 to 994.5 million in 1950, a gain of 8.8 percent. The domestic demand for aviation gasoline, included in the total, rose from 34.0 million barrels in 1949 to 39.6 million in 1950. There were no imports of motor fuel in 1949 and only 0.2 million barrels in 1950.

[1] Preliminary figures.
[2] LP-gases and other natural-gas liquids used for other than motor fuel.

Production.—The total production of motor fuel rose from 962.4 million barrels in 1949 to 1,024.4 million in 1950. Production in 1950 included an output of 903.4 million barrels of gasoline and naphtha from crude oil at refineries at a yield of 43.0 percent and an output of motor fuel from other light oils amounting to 121.0 million barrels. The latter figure was obtained by adding the total production of light oils from natural gas to the small amount of motor benzol derived from coke ovens and subtracting from this total the amount of these oils that does not eventually end up as motor fuel. The production of these light oils totaled 181.7 million barrels in 1950, and the amounts used as other than motor fuel totaled 60.7 million barrels, leaving a net production of all types of motor fuel of 121.0 million barrels. If the small import of 0.2 million barrels of gasoline is added to the production of 1,024.4 million barrels it amounts to a new supply of 1,024.6 million barrels in 1950, from which the increase of 5.6 million barrels in the combined stocks of finished gasoline and natural gasoline is deducted to arrive at a total demand for motor fuel of 1,019.0 million barrels.

Yields.—The average refinery yield of gasoline and naphtha from crude oil declined from 43.7 percent in 1949 to 43.0 in 1950. The reduction in yield reflected the relatively greater increase in the demand for other products, as well as the gain in the amount of natural gasoline blended at refineries from 9.1 percent of the total refinery output of gasoline in 1949 to 9.5 percent in 1950.

Exports.—Exports of motor fuel from continental United States, including shipments to the Territories, declined sharply from 39.4 million barrels in 1949 to 24.5 million in 1950. Shipments to the Territories rose from 5.6 million barrels in 1949 to 5.9 million in 1950, while exports to foreign countries declined from 33.8 million in 1949 to 18.6 million in 1950, a loss of about 45 percent.

[1] Preliminary figures.
[2] Based on crude runs to stills adjusted for net change in stocks of unfinished oils.

Domestic Demand.—The domestic demand for motor fuel set another new record, increasing from 913.7 million barrels in 1949 to 994.5 million in 1950. Average demand rose from 2,503,000 barrels daily in 1949 to 2,725,000 daily in 1950. Domestic demand in the first quarter of 1950 averaged 2,322,000 barrels daily, a gain of 7.5 percent compared with the first quarter of 1949; demand in the second quarter averaged 2,852,000 barrels daily, a gain of 8.0 percent; demand in the third quarter averaged 2,968,000 barrels daily, a gain of 10.3 percent; and demand in the fourth quarter was 2,749,000 barrels daily, or 9.3 percent above that in the last quarter of 1949.

The annual survey of the Bureau of Public Roads includes an analysis of civilian motor-fuel consumption based on tax returns of the various States. The total given in this survey is considerably smaller than the domestic demand shown by the Bureau of Mines. The difference represents deliveries to the armed forces, any losses in production and transportation before the point of tax incidence and any commercial or industrial uses of gasoline or naphtha not recorded in the exemptions from State taxes. On the other hand, the survey includes, in addition to gasoline, Diesel and other fuels for highway use.

In 1949 the total use of motor fuel shown by the Bureau of Public Roads was 877.0 million barrels, including 772.2 million for highway use, 95.4 million for nonhighway use, and 9.4 million allowed for losses. Highway use included 8.6 million barrels of fuels other than gasoline, primarily Diesel oil and liquefied gases. This figure was incomplete, as two States did not tax these fuels, and six other States taxed them but did not separate the data from gasoline use. In 1950, the total use of motor fuel amounted to 959.0 million barrels, including 848.9 million for highway use, 99.4 million for nonhighway use, and 10.7 million allowed for losses.

Production and Consumption, by States.—Table 60, showing the production and consumption of gasoline by States, is designed to indicate roughly the areas of surplus production and deficit supply. The refinery-production figures are compiled from reports to the Bureau of Mines and do not include the natural gasoline which does not pass through refineries. The consumption figures used are compiled from State tax reports by the American Petroleum Institute. They include deliveries to the armed forces for use in continental United States but exclude shipments to the armed forces abroad. Some losses and at least part of the naphthas not subject to taxation are excluded.

In 1950, refinery production amounted to 998.1 million barrels and consumption, as defined above, to 967.0 million barrels. The production figure includes a large part of the gasoline for export and also part of the additions to storage in 1950. The consumption figure of 967.0 million barrels in 1950 was 27.5 million less than the domestic demand figure of 994.5 million barrels shown by the Bureau of Mines.

Comparison of production and consumption by broad districts indicates the major problems of distribution between surplus and deficit areas. The Gulf Coast district (including Texas, Louisiana, Mississippi, and Alabama) showed a refinery production of 358.5 million barrels of gasoline in 1950 compared with a consumption of 107.5 million—a surplus of 251.0 million. Known movements out

[1] Preliminary figures.
[2] American Petroleum Institute.
[3] Alabama and Mississippi included with Louisiana.
[4] Washington included with California.
[5] Maryland and South Carolina included with Georgia.
[6] Idaho included with Wyoming.
[7] Minnesota and Wisconsin included with Illinois.
[8] Missouri and Nebraska included with Kansas.
[9] Tennessee included with Kentucky.
[10] Rhode Island included with Massachusetts.

of this district in 1950 include shipments to the Atlantic States of 166.7 million barrels by boat and pipeline deliveries of 14.1 million barrels to the Atlantic States, 22.2 million to the Central States, and 1.7 million to the Mountain States. In addition, there were some barge and tank-car shipments to other States, and a considerable part of United States exports originated in this area.

The Atlantic Coast States produced 148.8 million barrels of gasoline in 1950 and consumed 309.3 million—a deficit of 160.5 million. The principal receipts from other districts in 1950 included 166.7 million by boat from the Gulf Coast district, 5.9 million from California, 3.2 million by barge from the Central and Gulf States, and 14.1 million by pipeline from the Gulf States. The movements out of the Atlantic Coast States included 4.8 million barrels by pipeline to the Central States and a considerable volume of export and overseas military deliveries.

The Pacific Coast district (California, Oregon, Washington, Nevada, and Arizona) produced 139.9 million barrels of gasoline in 1950 and consumed 129.1 million. With a decrease of 2.3 million barrels of finished gasoline stocks, there was a surplus of 13.1 million barrels for export or delivery to other States. Of this amount, 5.9 million barrels represented deliveries by boat to the Atlantic Coast States.

The Rocky Mountain States (Idaho, Montana, Wyoming, Colorado, Utah, and New Mexico) produced 33.6 million barrels in 1950 and consumed 34.5 million—a deficit of 0.9 million barrels, which was the balance of receipts from and shipments to the Pacific Coast district and States to the east. Pipeline receipts from the Gulf States amounted to 1.7 million barrels in 1950.

The remaining Central States produced 317.4 million barrels of gasoline in 1950 and consumed 386.6 million—a deficit of 69.2 million barrels supplied by receipts by pipeline, tank car, and barge from adjacent districts. The principal known movements in 1950 were receipts by pipeline of 22.2 million barrels from the Gulf States and 4.8 million barrels from the Atlantic States.

While by no means complete, the foregoing review gives a fair idea of the general domestic distribution of motor fuels and the trends of consumption in different areas.

Methods of Distribution.—The total deliveries of gasoline by pipeline rose from 278.0 million barrels in 1949 to 306.4 million in 1950. The major part of this movement was within the main districts. Inter-district movements recorded in 1950 comprised a movement of 14.1 million barrels from district 3 to district 1, of 22.2 million to district 2, and 1.7 million barrels to district 4. The pipeline movement from district 1 to district 2 amounted to 4.8 million barrels.

The boat movement of gasoline from the Gulf Coast to the East Coast district rose from 155.6 million barrels in 1949 to 166.7 million in 1950. Receipts by boat on the east coast from California increased from 0.7 million barrels in 1949 to 5.9 million in 1950.

[1] The quantities "Turned into lines" and "Delivered from lines" are on a net basis, eliminating intersystem transfers, and are not comparable with data published for previous years.

[2] Figures in parentheses represent overage.

Stocks.—Stocks of gasoline, as reported, include stocks held at refineries and bulk terminals and by pipelines but not stocks in secondary distribution tanks, in consumers' hands, or in military custody.

Stocks of finished gasoline increased 5.1 million barrels in 1950 from 103.6 million on January 1, 1950, to 108.7 million on December 31. Stocks of natural gasoline and other natural-gas liquids increased from 6.8 million barrels at the beginning of the year to over 7.3 million at the end of 1950—a gain of 0.5 million barrels. Stocks of unfinished gasoline increased from 7.9 million barrels to 8.1 million during the year

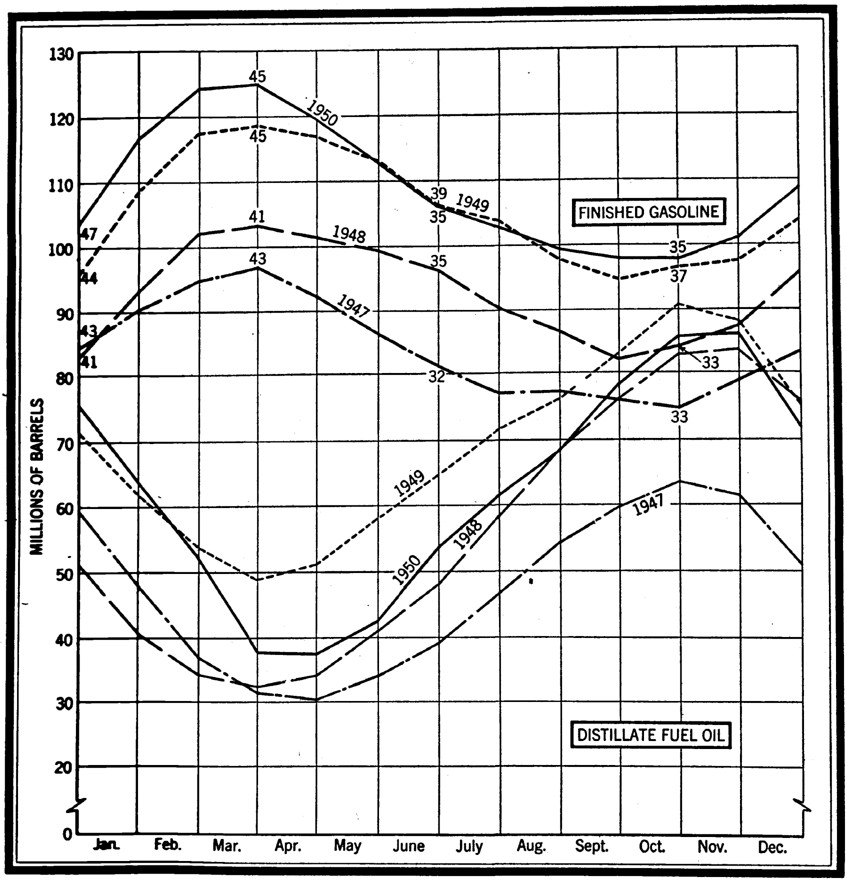

FIGURE 9.—Stocks of finished gasoline in the United States, 1947–50, by months, with figures representing day's supply at certain periods, also stocks of distillate fuel oil 1947–50, by months.

[1] Includes stocks of finished gasoline at refineries and bulk terminals, and in pipelines.

The change in finished gasoline stocks, by quarters, in 1950 included a gain of 21.3 million barrels in the first quarter, an unusually large decline of 18.9 million in the second, a further decrease of 8.1 million in the third, and a substantial gain of 10.8 million barrels in the last.

Stocks of finished and unfinished gasoline combined increased from almost 111.5 million barrels on January 1, 1950, to 116.8 million on December 31. The principal changes, by refinery districts, were a decrease of 2.3 million barrels in the California district and gains of 1.8 million for Indiana-Illinois, 1.5 million for the East Coast, 1.3 million for Oklahoma-Kansas, 1.2 million for the Louisiana Gulf, and 1.1 million barrels for the Texas Gulf.

Stocks of finished gasoline and natural gasoline, used in computing the total demand for motor fuel, represented 43.7 days' supply at the end of 1950 compared with 50.0 days' supply at the end of 1949.

[1] Stocks divided by the daily average total demand (domestic demand plus exports) for succeeding month.
[2] Preliminary figures.

Prices.—The average dealer's net price for Regular Grade gasoline (exclusive of tax) in 50 representative cities in the United States provides an index of gasoline prices at the wholesale level. This average price, according to the American Petroleum Institute, rose from 12.33 cents per gallon in 1947 to 14.55 cents in 1948, 15.05 cents in 1949, and 15.10 cents in 1950. The average service-station price, also reported by the American Petroleum Institute and including State and local taxes but not Federal tax, rose from 21.61 cents per gallon in 1947 to 24.38 cents in 1948 and 25.29 cents in 1949 and declined to 25.26 cents in 1950. Including the Federal tax of 1.50 cents per gallon, the total average price to the consumer for Regular Grade gasoline rose from 23.11 cents per gallon in 1947 to 25.88 cents in 1948 and 26.79 cents in 1949 and declined to 26.76 cents in 1950. There was no change in the Federal tax during these years, but the average State taxes rose from 4.61 cents per gallon in 1947 to 4.75 cents in 1948, 4.92 cents in 1949, and 5.09 cents in 1950. The average local (municipal and county) tax per gallon rose from 0.07 cent in 1947 to 0.09 cent in 1948 and 0.10 cent in 1949 and declined to 0.09 cent in 1950.

OTHER REFINED PRODUCTS

KEROSINE

The domestic demand for kerosine increased noticeably in 1950 over 1949; however, greater production plus a slight draft on stocks and minor imports were adequate to meet this expanded market. Exports, of small volume in 1950, continued the decline evident since 1946. These salient factors for kerosine in 1950 differed from those of 1949, when both production and domestic demand were down sharply. Detailed statistics for kerosine in the 2 years are shown in table 66.

Kerosine production of 118,512,000 barrels in 1950 exceeded the 1949 total of 102,152,000 barrels by 16 percent. This increased output was due mainly to an 8-percent gain in crude runs at refineries, as the percentage yield for this fuel changed only slightly—from 5.2 percent in 1949 to 5.6 percent in 1950.

Substantial gains in production of kerosine were reported for most of the refinery districts in 1950. The increase in the Texas Gulf Coast, where about a third of the kerosine is made, was 23 percent, while in the Indiana-Illinois area, source of about a fifth of the total, the gain was 21 percent. The expansion in output for the East Coast was outstanding in 1950—27 percent over 1949. Production of kerosine in 1950 in three refinery districts—Oklahoma-Kansas, Texas Inland, and California—was below 1949.

TABLE 66.—Salient statistics of kerosine in the United States, 1949–50, by months and districts

[1] Preliminary figures.
[2] Figures not available.

The domestic demand for kerosine in 1950—117,879,000 barrels—was 15 percent over 1949 requirements—102,672,000 barrels. This expanded market for kerosine in 1950 was due largely to colder weather and the greater need for range oil. In 1949 the domestic demand for kerosine declined from the preceding year in the first three quarters and made only a nominal gain in the final months of the year, while in 1950 a higher demand than in 1949 was evident throughout the year. Domestic demand in the opening quarters of 1950 was 14 and 19 percent, respectively, above comparative demand in 1949; however, it was below the corresponding 1948 figures. The domestic demand for kerosine in the third quarter of 1950 was 16 percent above the similar period of 1949, while the gain for the closing 3 months of the year was 13 percent. The rate of expansion in the domestic demand for kerosine evident in 1950 did not, however, continue into the first quarter of 1951, when the gain was only 10 percent over the corresponding period of 1950.

Exports of kerosine have declined from a peak of 8,637,000 barrels in 1946 to 2,533,000 in 1949 and 2,043,000 in 1950. Canada (477,000 barrels) and the United Kingdom (339,000 barrels) received the larger shares of the 1950 exports of kerosine. Exports to the various foreign countries are shown in table 88.

Stocks of kerosine reported for the year end have declined somewhat in recent years from 23,941,000 barrels in 1948 to 20,888,000 in 1949 and 19,723,000 at the close of 1950. Kerosine stored at petroleum refineries, representing about 60 percent of the total, has declined from 14,110,000 barrels in 1948 to 12,030,000 in 1949 and 11,315,000 in the final month of 1950, while bulk terminal and pipeline supplies have also dropped from 9,831,000 barrels in 1948 to 8,858,000 in 1949 and down to 8,408,000 at the 1950 year end. Kerosine in storage on December 31, 1950, was equivalent to a 39-day domestic supply at the January 1951 rate of consumption, which compares with a 47-day reserve at the end of 1949 and a 57-day supply for 1948.

Over 41 percent of the kerosine stocks are reported from the East Coast area, and there the quantity declined by 12 percent in 1950, while about a fifth of the volume is carried in the Indiana-Illinois refinery district, where there was a gain of about 3 percent. The only other section with an important kerosine inventory—15 percent of the national total—is the Texas Gulf Coast, and that area showed a 3-percent shrinkage in these stocks in 1950.

The annual survey conducted by the Bureau of Mines showed a 15-percent increase in the market for kerosine in 1950 over 1949 requirements. The quantity reported was not only of record volume but was also in contrast to a 9-percent decline in 1949 compared with 1948 sales to consumers. Kerosine sold for range oil in 1950 was up by a fifth over the 1949 total and represented about 68 percent of the market compared to a 65-percent share in 1949. Deliveries of kerosine for tractor fuel in 1950 continued the downward trend of recent years, owing largely to a pronounced shift to gasoline and liquefied petroleum gas for this farm use. The 1950 quantity was lower by 15 percent compared with 1949 requirements, and the relative volume dropped from 5 percent of the kerosine total in 1949 to 4 percent in 1950. Kerosine reported as sold for all other uses, such as lamp fuel, orchard heating, weed burning, dust control, jet fuel, etc., increased by 9 percent in 1950 over the 1949 total.

Kerosine prices, which dropped noticeably in 1949, changed very little in 1950. The quotation for 41°–43° gravity, water-white kerosine at refineries in Oklahoma rose gradually throughout 1950 from 8.52 cents a gallon in January to 9.23 cents in December, averaging 8.84 cents for the year compared with 8.58 cents for 1949. Kerosine, including No. 1 fuel oil, at New York Harbor rose from a low of 9 cents a gallon in May 1950 to 10.15 cents in the final 2 months of the year, and the average price for 1950 was 9.46 cents a gallon against 9.12 cents for 1949.

The average tank-wagon prices for kerosine at Chicago and New York changed only fractionally in 1950 compared with 1949. The average price for 1950 at Chicago was 15.36 cents a gallon compared with 15.33 cents in 1949 and at New York 12.94 cents in 1950 and 12.93 cents in 1949.

California oil companies shipped 25,000 barrels of kerosine by rail and truck to other parts of the country in 1950, a gain over the 1949 total of 19,000 barrels. There were no tanker shipments of kerosine from California to the east coast in either 1949 or 1950. The Pacific Coast area received 1,000 barrels of kerosine in 1950 by rail and truck but none in 1949.

Barge shipments of kerosine from the Gulf coast to points on the Mississippi River and its tributaries increased from 5,783,000 barrels in 1949 to 8,587,000 in 1950, according to monthly reports published by the Oil and Gas Division, United States Department of the Interior. Quantities originating in Texas totaled 2,051,000 barrels in 1950 compared with 912,000 in 1949; in Louisiana, 5,457,000 barrels in 1950 and 3,634,000 in 1949; and in Arkansas and Mississippi, 1,079,000 barrels in 1950 and 1,237,000 in 1949. Most of the kerosine handled in this river traffic is unloaded at terminals in district 2, and quantities terminated in that area increased from 5,270,000 barrels in 1949 to 7,941,000 in 1950. District 3 received 513,000 barrels in 1949 and 629,000 in 1950, while 17,000 barrels of kerosine reached district 1 over these inland waters in 1950 compared with none in 1949.

Kerosine shipped by tanker and barge from the Gulf coast to ports on the east coast increased from 35,045,000 barrels in 1949 to 41,756,000 in 1950. Quantities loaded in Texas expanded from 24,862,000 barrels in 1949 to 30,784,000 in 1950, while there was little change in the amounts credited to Louisiana—10,183,000 barrels in 1949 and 10,962,000 in 1950.

[1] Manhattan and Queens.

In 1950, as in 1949, there were numerous changes in the tanker rates for kerosine and other petroleum products transported from the Gulf Coast area to New York. A freight rate of 36.1 cents a barrel for kerosine carried over this route as of December 31, 1949, dropped to a low of 18.1 cents a barrel on February 13, 1950. The charge fluctuated somewhat thereafter; but a sharp upward trend, especially after the midyear, brought this transportation cost to 88.2 cents a barrel on December 26, 1950, and an average of 37.8 cents a barrel for all of 1950 compared with 25.6 cents in 1949.

DISTILLATE FUEL OIL

Although production and imports of distillate fuel oil, including Diesel fuel, in 1950 were well above comparative quantities in 1949, it was necessary to draw on stocks to satisfy a greatly increased domestic demand and slightly higher exports. This was the first draft on distillate-fuel-oil stocks since 1947. The supply and demand situation for distillate fuel oils was entirely different in 1949, when—with slightly lower domestic requirements and a greatly contracted export market compared with 1948—fuel-oil stocks were increased, even though the over-all supply from production, imports, and transfers was considerably less. Salient statistics for distillate fuel oil by months and by refinery districts in 1949 and 1950 are shown in table 70.

The domestic demand for distillate grades of fuel oil, which declined 3 percent in 1949 compared with 1948, increased to 394,715,000 barrels in 1950—a 20 percent gain over the 1949 total of 329,278,000 barrels. This expanded domestic market for light fuel oils was evident throughout 1950. A 15-percent gain over 1949 in the first quarter of 1950 was followed by a 30-percent increase in the April–June period. These higher quarterly demands for distillate in 1950 are in contrast to pronounced declines—5 and 18 percent, respectively—in the opening quarters of 1949 compared with 1948. There was a 17-percent increase in the domestic demand for light fuel oils in the third quarter of 1950, which compares with a 10 percent gain over the preceding year in the same period of 1949, while in the closing 3 months of 1950 consumption was 22 percent above the corresponding 1949 figure, which in turn was only 1 percent over the 1948 total. This active domestic market for distillate fuel oils continued into 1951, with the total for the first quarter about 22 percent over the 1950 demand.

According to the annual survey made by the Bureau of Mines, sales of light fuel oils for all principal uses showed important gains in 1950 over 1949, except the quantity sold to vessels, which was lower by 2 percent. The railroads, with their revenue-paying freight up by 12 percent, bought 26 percent more light fuel oils, mostly Diesel grades, in 1950 than in 1949, while heavy industries—smelters, mines, and manufacturing plants—with a big expansion in their activities, increased their distillate requirements by 40 percent in the same period. With more degree days in 1950 and a 15-percent increase in domestic burner installations, the sales of heating oils were up by 16 percent over the 1949 total, and the quantity of No. 1 fuel oil delivered for range burners was a fifth larger in reported volume in 1950. Gas and electric power utilities purchased 5 percent more distillate fuel oils in 1950 then in 1949 and the military services required a 7-percent greater quantity. Light fuel oils sold for various miscellaneous uses

[1] Includes Diesel fuel.

such as fuel for heavy equipment, dust and insect control, weed burning, orchard heating, etc., showed a 39-percent increase. Oil companies use only comparatively small amounts of distillates in their various operations; however with their expanded activities in 1950, the consumption of these light oils was greater by 37 percent than reported in 1949.

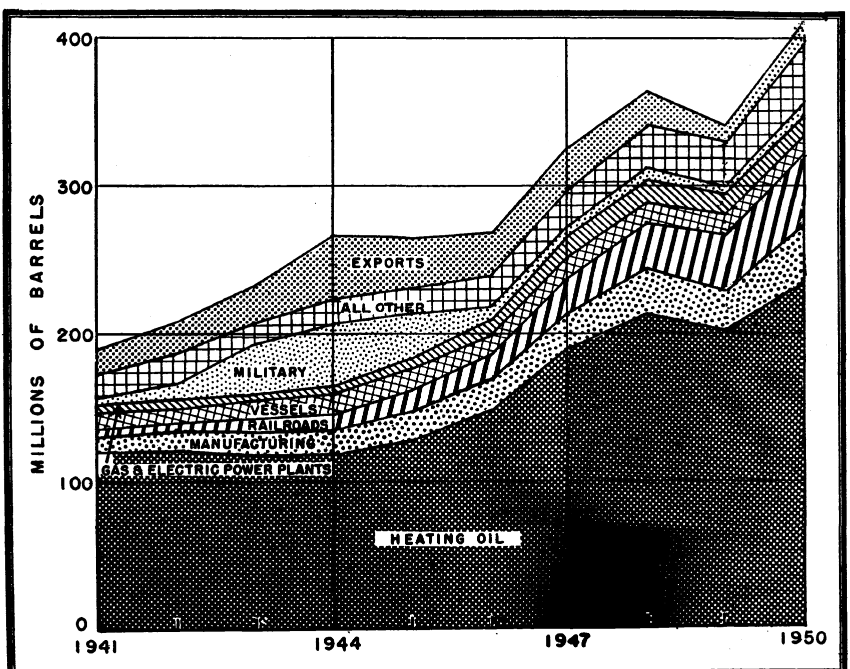

FIGURE 10.—Sales of distillate fuel oil, including Diesel oil and range oil, in the United States, 1941–50, by uses.

Total United States	239,550	298,014	341,973	329,196	395,306

[1] Includes Diesel fuel oil.
[2] States are grouped according to petroleum-marketing districts rather than to conventional geographic regions.

Exports plus shipments to United States Territories of distillate fuel oil in 1950 (12,561,000 barrels) differed little from the 1949 total (12,295,000 barrels). Quantities credited to Canada were 2,746,000 barrels in 1949 and 5,401,000 in 1950; the United Kingdom, 2,314,000 in 1949, and 1,167,000 in 1950; France, 352,000 in 1949 and 750,000 in 1950; Sweden, 675,000 in 1949 and 590,000 in 1950; and Denmark, 587,000 in 1949 and 219,000 in 1950. Exports and shipments of distillate fuel oil to the Territories in 1950 are given, by destination, in table 88.

The production of distillate fuel oil increased from 340,825,000 barrels in 1949 to 398,912,000 in 1950—a 17-percent gain. This greater output of light fuel oils at refineries resulted from larger runs of crude in 1950—8 percent over 1949—and a greater yield—19 percent in 1950 compared with 17.5 percent in 1949. Distillate fuel oil produced at refineries in 1950 represented 98 percent of the total supply, compared with 99 percent in 1949.

All refinery districts produced a greater volume of distillate fuel oil in 1950 than in 1949, except the California area, where there was a 3-percent decline. In the Texas Gulf district, source of a quarter of the light fuel oils, the output increased 16 percent. The production in other important source areas—the East Coast and the Indiana-Illinois-Kentucky refinery districts—rose 24 and 29 percent, respectively. Gains in distillate production in other parts of the country ranged from 5 percent in the Louisiana Gulf to 30 percent in the Arkansas-Louisiana Inland district.

Some light crude oils are used by pipeline companies as fuel, and such quantities are entered into the fuel-oil account as "transfers." The volume of these transfers has declined somewhat from 3,543,000 barrels in 1948 to 2,701,000 in 1949 and to 2,537,000 in 1950 and at present represents less than 1 percent of the available light-fuel-oil supply. The larger share of the transfers is reported from the Middle Western areas, while none is credited to the East Coast, Appalachian, and California districts.

Only a small portion—less than 1 percent of the distillate-fuel-oil market—is supplied from imports; these have varied from 2,546,000 barrels in 1948 to 1,825,000 in 1949 and 2,340,000 in 1950. The more important quantities were received from Netherlands Antilles (926,000 barrels in 1949 and 1,068,000 in 1950); Saudi Arabia (352,000 barrels in 1949 and 695,000 in 1950); and the State of Bahrein (308,000 barrels in 1949 and 774,000 in 1950).

Year-end distillate-fuel-oil stocks of 71,948,000 barrels for 1950 and 75,207,000 for 1949 are not comparable; however, an upward revision of 228,000 barrels in the 1949 total brings it onto the same basis as the 1950 figure. The light-fuel-oil stocks at the close of 1950 were reported as 41,632,000 barrels held in storage at refineries and 30,316,000 at bulk terminals and in pipelines. The distillate fuel oil on hand at the end of 1950 was equivalent to a 39-day domestic supply at the January 1951 rate of daily demand.

The tanker movement of distillate fuel oil from California to the East coast has fluctuated widely in recent years—from 1,177,000 barrels in 1948 down to 66,000 in 1949 and then sharply upward to 1,554,000 barrels in 1950. Virtually all the light fuel oil shipped over this route in 1950 was moved during the second half of the year and possibly was an effort at the time to find a new market for this product. The traffic did not continue into 1951, as the total was only 17,000 barrels for the opening quarter of the year. There are also some overland movements of distillate fuel oil by rail and truck from the California area to other Western States, totaling 849,000 barrels in 1949 and 606,000 in 1950. The Pacific coast market in turn received 1,095,000 barrels of light fuel oil by overland routes from other States in 1950 compared with receipts of 1,413,000 barrels in 1949.

Shipments of distillate fuel oil by tanker and barge from the Gulf coast to terminals on the Atlantic coast increased from 102,147,000 barrels in 1949 to 115,328,000 in 1950, according to published records of the Oil and Gas Division, United States Department of the Interior. Most of the increase in this traffic shows up in the quantities originating in Texas—93,600,000 barrels in 1950 compared with 80,748,000 in 1949—while there was little change in the Louisiana portion—21,728,000 barrels in 1950 against 21,399,000 in 1949.

Official records covering the barge movement of distillate fuel oil from the Gulf Coast area up the Mississippi River and its tributaries to markets in districts 1, 2, and 3 show that the quantity doubled from 4,796,000 barrels in 1949 to 9,593,000 in 1950. The light fuel oil in these shipments credited to Texas about tripled from 1,209,000 barrels in 1949 to 3,332,000 in 1950, while there was also a large gain in the Louisiana total—5,425,000 barrels in 1950 compared with 2,961,000 in 1949. Only a relatively small share came from Arkansas and Mississippi—626,000 barrels in 1949 and 836,000 in 1950. Most of this distillate fuel oil was unloaded in district 2, where the quantity increased from 4,421,000 barrels in 1949 to 9,122,000 in 1950. Relatively small amounts were terminated in district 3—306,000 barrels in 1949 and 304,000 in 1950—and in district 1—69,000 barrels in 1949 and 167,000 in 1950.

The tanker rate for No. 2 distillate fuel oil carried on the Gulf coast–New York route has been changed frequently in recent years. A freight charge of 37.8 cents a barrel quoted at the close of 1949 gave way to 18.9 cents a barrel by February 13, 1950—the low for the year. There was a sharp upward trend during the following months until the charge reached a high of 93.2 cents a barrel on December 26, 1950. The weighted average tanker rate for this run was 39.5 cents for 1950 compared with 27.3 cents for 1949.

Prices of distillate, which declined somewhat in 1949, trended upward slightly in 1950. The quotation for No. 2 straw fuel oil at refineries in Oklahoma was lowered slightly in the early summer season but after the midyear rose gradually to 8.46 cents a gallon in December 1950 and averaged 8.13 cents for the year compared with 7.73 cents in 1949. The price of No. 2 at New York Harbor declined to a low of 7.75 cents a gallon in April 1950 and then was slowly pushed up to 9.15 cents in the final 2 months, averaging 8.35 cents for the year compared with 8.17 cents for 1949.

Diesel oil at shore plants around New York Harbor, quoted at 8.97 cents a gallon in January 1950, dipped to 8.15 cents in April. The trend thereafter was steadily upward to 9.55 cents in the final months of the year, with 8.80 cents a gallon the 1950 average compared with 8.76 cents in 1949. Diesel oil sold for ships' bunkers varied less in

TABLE 73.—Monthly average prices of distillate fuel oil and Diesel fuel in the United States, 1949–50

price in 1950 compared with 1949 than did other distillate-fuel-oil grades; the average quotation at New York Harbor for 1950—$3.60 a barrel—was down slightly from the 1949 average—$3.65 a barrel. Ships' Diesel oil at New Orleans averaged $3.36 a barrel in 1950 compared with an average price of $3.33 in 1949, while the average price at San Pedro was $3.37 a barrel in 1950 and $3.35 in 1949.

The Bureau of Labor Statistics, United States Department of Labor, publishes average monthly retail prices of various fuels for a number of cities. The 1950 average price of No. 2 distillate in New York—11.72 cents a gallon—was only slightly above the 1949 average—11.36 cents. The 1950 price, starting at 12.02 cents a gallon in January, reached a low of 11 cents in the late spring and then gradually increased to a December quotation of 12.63 cents a gallon. The price of No. 2 grade at Chicago rose steadily from 12.24 cents a gallon in January 1950 to 13.06 cents in the final quarter of the year—an annual average of 12.64 cents compared with 12.51 cents for 1949.

RESIDUAL FUEL OIL

The demand for residual grades of fuel oil both for domestic use and for export rose sharply in 1950 compared with 1949. As there was no corresponding increase in production, it was necessary to make a heavy draft on stocks and to greatly increase imports and transfers to supply these expanded markets. Comparatively, the lower production of residual fuel oil in 1949 resulted in only a nominal withdrawal from stocks, since domestic and export demand was also lower and there was a considerable increase in imports. Detailed statistics for residual fuel oil in 1949 and 1950, by months and by refinery districts, are shown in table 74.

The domestic demand for heavy fuel oils reached a record in 1950; requirements of 552,944,000 barrels for the year were about 12 percent over the 1949 total (496,021,000 barrels). This important expansion in the domestic market for residual grades is in contrast to small annual declines in 1948 and 1949. The gains in the first and second quarters of 1950—11 and 14 percent, respectively, compared with the preceding year—are in contrast to losses in the opening quarters of 1949. A 13-percent increase over 1949 in the indicated demand for the third quarter of 1950 compares with a 1-percent gain for the similar period between 1948 and 1949, while in the final 3 months the expansion was only 8 percent against a 10-percent gain over the preceding year for the final period of 1949. This improved domestic market for heavy fuel oils showed a slight leveling off in the initial quarter of 1951—7 percent up from 1950 in contrast to a 11-percent gain in the same period of 1950 compared with 1949.

A review of the sales of residual fuel oils in 1950, as reported in a survey made by the Bureau of Mines, shows substantial increases for all important uses except the railroads, which, with their rapidly growing consumption of light Diesel grades, bought 4 percent less heavy fuel oils in 1950 than in 1949. Heavy bunker-oil sales, which have dropped in recent years, turned upward again in 1950, with a 4-percent gain over the 1949 total. In spite of a slightly lower price for bituminous coal at the mines and generally higher prices for heavy fuel oils, both the public utilities and the manufacturing

[1] Includes Navy grade and crude oil burned as fuel.
[2] Revised.

industries bought greatly increased quantities of liquid fuel in 1950 compared with 1949. The gain in sales of residual fuel oil to gas and electric power plants in 1950 was 16 percent over 1949, while deliveries to smelters, mines, and manufacturing plants were greater by 21 percent. With a colder season and a 7-percent increase in commercial burner installations, 20 percent more heavy fuel oil was sold for heating buildings in 1950 than in 1949. Greater military activities due to the country's quickly expanding preparedness program and hostilities in Korea caused purchases of heavy grades of fuel oil by the armed forces to increase by a quarter. The oil companies, in producing and refining more crude petroleum in 1950 and in drilling a greater number of wells, consumed 3 percent more heavy fuel oil in 1950 than in 1949. Residual fuel oil sold for various miscellaneous uses was up by 7 percent in 1950 compared with 1949.

Sales of residual fuel oils in recent years are shown graphically in figure 11. All grades of heavy fuel oil and crude petroleum and acid sludge used as fuel are included.

[1] Includes some crude oil burned as fuel.
[2] States are grouped according to petroleum-marketing districts rather than to conventional geographic regions.
[3] Revised.

Exports (including shipments to the Territories) of 12,641,000 barrels of residual fuel oil in 1949 were slightly below the 1948 total; however there was an upturn to 16,227,000 barrels—a 28-percent gain—in 1950, according to published records of the Bureau of the Census, United States Department of Commerce. The countries that received the more important quantities in 1950 were as follows: Canada, 4,498,000 barrels; Mexico, 2,171,000; Cuba, 980,000; Canal Zone, 793,000; and Guatemala, 573,000.

Although crude runs to stills in 1950 were 8 percent above the 1949 total, production of residual fuel oil—425,217,000 barrels—differed little from the 1949 output of 424,909,000 barrels, as the percentage yield for these heavy grades of fuel oil was down from 21.7 percent in 1949 to 20.2 percent in 1950. All important refinery areas gained in output except the California district, which is credited with about 30 percent of the national total; there the production for 1950 was 7 percent below the comparative item for 1949. Quantities credited to the Texas Gulf Coast area, source of about a fifth of the production, were virtually the same for both 1949 and 1950, while petroleum refineries in the east coast area stepped up their output 11 percent in 1950. Still another important source of residual fuel oil, the Indiana-Illinois-Kentucky refinery district, reported an 8-percent gain in production in 1950 over the previous year. In the remaining refinery districts the 1950 production of heavy fuel oil exceeded the 1949 total for the Appalachian, Louisiana Gulf, and Rocky Mountain areas and was lower in the Oklahoma-Kansas, Texas Inland, and Arkansas-Louisiana Inland refinery areas.

Some heavy crude petroleum is burned as fuel on oil-company leases and at some industrial plants. These quantities are added to the available fuel oil as "transfers" and represent about 1 percent of the total supply from all sources. These transfers rose from 4,750,000 barrels in 1949 to 5,325,000 in 1950— a gain of 12 percent. Quantities reported for refinery districts east of California were 3,033,000 barrels in 1949 and 3,649,000 in 1950, while the total for the California area declined from 1,717,000 barrels in 1949 to 1,676,000 in 1950.

Residual fuel oil imported from foreign countries rose sharply from 75,175,000 barrels in 1949 to 119,186,000 in 1950—a gain of 59 percent. This imported heavy fuel oil represented about 21 percent of the available supply in 1950 compared with a 15-percent proportion in 1949. Most of the residual fuel imported in 1950 came from the Netherlands Antilles (96,666,000 barrels) and Venezuela (22,191,000 barrels). Trinidad and Tobago and Mexico also supplied comparatively small quantities.

The 40,750,000 barrels of residual fuel oil held in storage at the end of 1950 was a third below the comparative total for 1949 (60,193,000 barrels). This heavy draft on stocks in 1950 was necessary, as production of these heavy grades in 1950 remained at the 1949 rate, while both export and domestic demand was up considerably. Normally over half (about 57 percent in 1949) of the residual-fuel stocks is held in the California marketing area; however, there was a big shrinkage (51 percent) there in 1950 to a 41-percent share of the national total, partly because the west coast made unusually heavy shipments of heavy fuel oil to the eastern seaboard in 1950. Fairly important amounts of residual fuel oils are also stored in the East Coast and Texas Gulf Coast refinery districts, and these quantities were also reduced considerably (8 and 19 percent, respectively). The only areas to gain in inventory in 1950 over 1949 were the Appalachian, Louisiana Gulf Coast, and the Rocky Mountain districts; however, the quantities involved are relatively unimportant.

Heavy grades of fuel oil stored at petroleum refineries declined by 38 percent from 49,668,000 barrels at the close of 1949 to 31,003,000 at the end of 1950. The 1949 quantity represented about 83 percent of all heavy fuel-oil stocks and the 1950 quantity about 76 percent. Bulk terminals reported 10,525,000 barrels of residual grades at the end of 1949 and 9,747,000 at the end of 1950, a shrinkage of 7 percent in volume.

Quantities of residual fuel oil in storage at the end of 1949 represented a 36-day domestic supply at the January 1950 rate of demand; this was down to a 23-day supply at the January 1951 rate by the end of December 1950.

Oil companies operating in the Pacific Coast marketing area shipped 362,000 barrels of residual fuel oil by rail and truck to other Western States in 1950 compared with a total of 104,000 in 1949 and received in return over overland routes 370,000 barrels of heavy fuel oils in 1950 compared with 543,000 in 1949.

Tanker shipments of residual fuel from California to the east coast "skyrocketed" from 97,000 barrels in 1948 to 6,419,000 in 1949 and to 15,429,000 barrels in 1950. This accelerated movement of heavy fuel from the west to the east coast began in the third quarter of 1949 and reached a peak of 7,895,000 barrels in the first 3 months of 1950; it then dwindled to only 140,000 barrels in the closing quarter of that year and to 79,000 in the initial quarter of 1951. This eastward tanker movement of heavy fuel oil was an effort to get rid of excessive stocks in California and to take advantage of an 80-cent price differential prevailing at New York while the movement was at its greatest height.

There has been a slight downward trend in tanker and barge shipments of residual fuel oil from the Gulf coast to the east coast in recent years—from 68,662,000 barrels in 1948 to 67,425,000 in 1949 and down to 59,292,000 in 1950, according to information compiled by the Oil and Gas Division, United States Department of the Interior. Shipments from Texas fluctuated from 55,325,000 barrels in 1948 to 56,996,000 in 1949 and then down to 53,102,000 in 1950, while quantities originating in Louisiana were 12,907,000 barrels in 1948, 10,429,000 in 1949, and 6,190,000 in 1950, and in Alabama 430,000 barrels in 1948 only.

The barging of heavy fuel up the Mississippi River and its tributaries from the Gulf coast, Arkansas, and Mississippi increased noticeably from 1,057,000 barrels in 1948 and 1,111,000 in 1949 to 5,465,000 barrels in 1950. Quantities originating in Texas have varied from 105,000 barrels in 1948 to 46,000 in 1949 and 980,000 in 1950; from Louisiana, 896,000 barrels in 1948 to 972,000 in 1949 and 4,464,000 in 1950; and from Arkansas and Mississippi, 56,000 barrels in 1948, to 93,000 in 1949 and 21,000 in 1950. Residual fuel oil transported by river barges was terminated as follows: District 1, 224,000 barrels in 1948, 117,000 in 1949, and 2,717,000 in 1950; district 2, 659,000 barrels in 1948, 865,000 in 1949 and 2,740,000 in 1950; and district 3, 174,000 barrels in 1948, 129,000 in 1949, and 8,000 in 1950.

The tanker rate for Bunker "C" fuel oil on the Gulf coast–New York run was 37.2 cents a barrel for vessels of over 14,000 tons deadweight at the end of December 1949, according to Platt's Oil Price Handbook for 1950. There were numerous new postings for this freight rate throughout 1950, ranging from a low of 23.1 cents a barrel on February 15 to a high of $1.052 a barrel on December 28. The average rate for all of 1950 was 41.1 cents a barrel compared with 28 cents for 1949.

The general level of the average prices of representative grades of residual fuel oils was higher in 1950 than in 1949. The price of No. 6 fuel oil at refineries in Oklahoma, which was selling at an average monthly price of $1.34 a barrel in January 1950, increased gradually during the year to $1.79 a barrel for December 1950. The average price for this grade was $1.64 a barrel for all of 1950 compared with $1.08 in 1949. No. 5 Grade at New York Harbor averaged $2.75 a barrel during January 1950 and then fluctuated downward during the spring and summer, reaching a low of $2.55 a barrel during March, after which it gradually increased to $3.10 for November and December 1950. The average quotation for this grade for 1950 was $2.79 a barrel compared with $2.69 a barrel for 1949. The price of Bunker "C" to vessels bunkering in New York Harbor followed a pattern similar to No. 5, starting at $2.05 a barrel in January 1950, reaching its low point of $1.91 also in March, and increasing gradually to the high of the year of $2.22 for October. The average price of this grade for 1950 was $2.09 a barrel compared with $1.90 for 1949. Bunker "C" at New Orleans fluctuated from $1.75 a barrel for January and February 1950 to a low for the year of $1.60 a barrel in March, after which it gradually increased to a high of $1.85, which price prevailed from August through December 1950. The average quotation of this grade for 1950 was $1.78 a barrel compared with $1.57 for 1949. The San Pedro price for Bunker "C" remained constant at $1.25 a barrel from January through May 1950 and fluctuated upward to a high for the year of $1.71 a barrel in December 1950. The average price for this grade was lower during 1950 than in 1949, averaging $1.41 as against $1.64.

Retail prices of heavy fuel oils also were generally higher in 1950 than in 1949, according to records published monthly by the Bureau of Labor Statistics, United States Department of Labor. The average price of No. 6 Grade in New York in 1950 was 5.93 cents a gallon compared with 5.59 cents in 1949. The price of this grade was 5.91 cents a gallon in January 1950, after which it declined to a low of 5.61 cents in March and then gradually increased to a high for the year of 6.14 cents during the final quarter of 1950. The average price of No. 5 heavy fuel oil at Chicago was 9.27 cents a gallon during 1950 compared with 8.66 cents during 1949. The quotation for this grade was 8.62 cents a gallon during January 1950, after which it gradually increased to 9.69 cents, where it held during the September-November period, then reached its high point of the year at 9.84 cents in December 1950.

LUBRICANTS

The refinery production of lubricants increased from 45.4 million barrels in 1949 to 51.7 million in 1950—a gain of 14.0 percent that brought output back to a little above that in 1948. The increase of 6.3 million barrels in production in 1950 included gains of 2.3 million barrels in the Louisiana Gulf district, 1.6 million in the East Coast, 1.5 million in the Texas Gulf, and 0.5 million in the Indiana-Illinois and Inland Louisiana-Arkansas. The only declines were 0.6 million barrels in the California district and 0.1 million in the Texas Inland district. Production in the Texas Gulf district represented 32.1 percent of the total compared with 19.7 percent in the East Coast district, 10.4 percent in the Appalachian district, 9.3 percent in the Indiana-Illinois district, 8.7 percent in the Louisiana Gulf district, 8.1 percent in the Oklahoma-Kansas district, 8.0 percent in the California district, and 3.7 percent in other districts. Production in 1949 was supplemented by a decline of 0.6 million barrels in stocks and in 1950 by a decline of 1.4 million in stocks.

TABLE 78.—Salient statistics of lubricants in the United States, 1949–50, by months and districts

Month and district	Production (thousand barrels)		Yield (percent)		Domestic demand (thousand barrels)		Stocks, end of period (thousand barrels)

[1] Preliminary figures.
[2] Figures not available.

The total demand for lubricants increased from 46.0 million barrels in 1949 to 53.1 million in 1950—a gain of 7.1 million barrels or over 15 percent. Exports increased from 12.9 million barrels to 14.2 million, while domestic demand rose from 33.1 million to 38.9 million or over 17 percent.

The sharp gain in domestic demand can be attributed to greater industrial activity and increased automotive use. No current figures are available on the relative demand for industrial and automotive use. The growth in automotive requirements has been affected by the reclamation of lubricants for reuse and the improved quality that has cut down the frequency of change required.

Table 79 shows the prices of representative lubricating oils for 1949 and 1950.

TABLE 79.—Average monthly refinery prices of five selected grades of lubricating oil in the United States, 1949–50, in cents per gallon

LIQUEFIED GASES

The demand for liquefied gases for fuel and chemical uses has expanded rapidly in the last few years and now ranks after kerosine in volume.

The supply of liquefied gases includes both that part of the output of natural-gasoline and cycle plants sold for fuel and chemical uses and the output of liquefied refinery gases sold for the same uses. Similar materials used for blending with motor fuel are accounted for as part of the output of that product. Direct use of natural-gas liquids increased from 46.0 million barrels in 1949 to 57.8 million barrels in 1950, while liquefied-refinery-gas production rose from 23.5 million to 29.1 million barrels.

The total demand for liquefied gases increased from 66.6 million barrels in 1948 to 69.5 million in 1949 and 86.7 million in 1950. Exports increased from 1.1 million in 1948 to 1.3 million in 1949 and 1.6 million in 1950. Domestic demand rose from 65.5 million in 1948 to 68.2 million in 1949 and 85.1 million in 1950. The relative gain over the preceding year was about 24 percent in 1948, 4 percent in 1949, and 25 percent in 1950. Details on the sales of liquefied gases by types and uses may be found in the Natural Gasoline chapter of this volume.

OTHER PRODUCTS

Wax.—The refinery production of wax increased from 3,208,000 barrels in 1949 to 4,462,000 in 1950, converted from pounds at the rate of 280 to the barrel. The total increase in production amounted to 1,254,000 barrels, with increases in all districts, except for a decline of 42,000 barrels in the Appalachian district. The principal gains were 404,000 barrels in the Louisiana Gulf district, 377,000 barrels in the East Coast district, 240,000 barrels in the Texas Gulf district, 119,000 in California, and 96,000 barrels in the Oklahoma-Kansas district. Production in the East Coast district represented 38.2 percent of the total in 1948, 34.3 percent in 1949, and 33.1 percent in 1950.

Stocks declined 78,000 barrels in 1949 and increased 31,000 barrels in 1950. Total demand increased from 3,286,000 barrels in 1949 to 4,431,000 in 1950. Exports rose from 1,031,000 barrels to 1,195,000, while domestic demand increased from 2,255,000 barrels to 3,236,000. The average refinery price of white crude scale wax at Pennsylvania refineries declined from 4.85 cents per pound in 1949 to 4.24 cents in 1950.

Coke.—The production of petroleum coke increased from 17.0 million barrels in 1949 to 17.2 million in 1950 (converted at the rate of 5 barrels to the short ton). The principal changes, by refinery districts, were increases of 0.7 million barrels in the East Coast district and 0.2 million in the Inland Louisiana-Arkansas district, and declines of 0.3 million in the Texas Inland district and 0.2 million each in the Texas Gulf and Indiana-Illinois districts. The Indiana-Illinois district is the largest producer, representing 49.6 percent of the total output in 1948, 47.6 percent in 1949, and 45.8 percent in 1950.

The total demand for petroleum coke rose from 16.9 million barrels in 1949 to 17.5 million in 1950. Exports were static at 2.5 million barrels, while domestic demand rose from 14.4 million to 15.0 million.

[2] Preliminary figures.
[3] Figures not available.

Asphalt and Road Oil.—The total demand for petroleum asphalt rose from 50.9 million barrels in 1949 to 59.7 million in 1950—a gain of 8.8 million or about 17 percent (asphalt is converted at the rate of 5.5 barrels to the short ton). Exports declined from 1.6 million barrels in 1949 to 1.0 million in 1950, while domestic demand rose from 49.4 million barrels to 58.7 million. The domestic demand for road oil declined from 7.8 million barrels in 1949 to 6.9 million in 1950. Details on sales of asphalt and types of products will be found in the Asphalt chapter of this volume.

Still Gas.—The production of still gas increased from 82.6 million barrels equivalent in 1949 to 83.7 million in 1950. Expressed in cubic feet, the rise was from 297.4 billion in 1949 to 301.5 billion in 1950. The major use of still gas is for refinery fuel. The conversion to barrels is on the basis of crude-oil equivalent rather than heating value.

TABLE 83.—Production of still gas in the United States, 1948–50, by districts

[1] Preliminary figures.

Miscellaneous Finished Products.—The production of miscellaneous finished products at refineries in the United States amounted to 4,236,000 barrels in 1949 and 4,717,000 barrels in 1950. The character of these products is indicated in table 84.

TABLE 84.—Production of miscellaneous finished oils in the United States in 1950, by districts and classes

INTERCOASTAL SHIPMENTS

Total shipments of mineral oils, crude and refined, from Gulf coast ports to east coast ports amounted to 566.0 million barrels in 1948, declined to 514.9 million in 1949, and rose to 559.6 million in 1950. The growth of this movement has been affected by the relatively larger increase in imports of crude and products and by a material gain in product receipts from California. The shipments of crude amounted to 196.8 million barrels in 1948, declined to 143.0 million in 1949, and rose to 163.7 million in 1950. Shipments of gasoline gained steadily from 145.8 million barrels in 1948 to 155.6 million in 1949 and 166.7 million in 1950. Shipments of residual fuel oil, subject to the greatest competition from foreign sources and California, declined from 68.7 million barrels in 1948 to 67.4 million in 1949 and 59.3 million in 1950.

The total movement of surplus products from California to the east coast rose from 2.1 million barrels in 1948 to 7.6 million in 1949 and 23.5 million in 1950. The principal changes in 1950, compared with 1949, were the increase for residual fuel from 6.4 million barrels to 15.4 million and the gain in gasoline shipments from 0.7 million barrels to 5.9 million. Almost two thirds of the total movement occurred in the first half of 1950, the subsequent expansion in military requirements tending to limit the flow.

FOREIGN TRADE [6]

> Foreign trade statistics in this section are as reported by the United States Department of Commerce and may differ slightly from those in other sections of this chapter. Bureau of Mines petroleum import data pertain to continental United States only, while its export statistics include not only foreign countries, but also shipments to the Territories. Crude-petroleum imports shown elsewhere are obtained by the Bureau of Mines from petroleum companies in order to balance refinery reports and do not provide a country of origin and country of destination breakdown, as do Department of Commerce statistics.

Imports.—Total imports of crude petroleum and petroleum products into continental United States increased 28.5 percent from 1949 to 1950. In 1949 total imports of mineral oils exceeded total exports (including shipments to the Territories) by 108 percent, and in 1950 imports exceeded exports by 188 percent. Imported mineral oils constituted 12.6 percent of the total new supply in continental United States in 1950, compared with 10.5 percent in 1949.

Crude-petroleum imports represented 65 percent of the total imports in 1949 and 57 percent in 1950. Venezuela supplied 66 percent of the crude petroleum imported into the United States in 1949 and 62 percent in 1950. Colombia and Mexico both increased their shipments of crude petroleum to the United States in 1950. Middle East countries furnished 24 percent in 1949 and 23 percent in 1950.

Residual-fuel-oil imports into continental United States and the Territories increased from 32 percent of the total imports in 1949 to 40 percent in 1950. The Netherlands Antilles, which shipped 93 percent of the residual fuel oil imported into continental United States and the Territories in 1949, supplied 79 percent in 1950, while Venezuela, where refining capacity was tripled during 1950, increased its share from 5 percent in 1949 to 18 percent in 1950.

Caribbean countries and Mexico, the principal suppliers of the comparatively small quantities of distillate fuel oil imported into continental United States and the Territories in 1948 and 1949, supplied only 48 percent of such imports in 1950. Middle Eastern countries increased their share from 28 percent in 1949 to 52 percent in 1950.

Imports of unfinished oil increased 70 percent from 1949 to 1950, with Mexico the principal supplier in both years.

[6] By F. X. Jordan, Petroleum and Natural Gas Branch, Bureau of Mines.

[1] Imports of crude as reported to Bureau of Mines; imports of refined products compiled from records of U. S. Department of Commerce; figures may differ slightly from those used in other sections of this chapter.
[2] Preliminary figures.

Exports.—Exports and shipments to Territories of mineral oils, crude and refined, decreased 7 percent from 1949 to 1950. Continental United States continued to be a net importer of mineral oils, as the excess of all petroleum imports over all petroleum exports rose from 122.6 million barrels in 1949 to 197.8 million in 1950. The excess of crude-petroleum imports increased from 122 million barrels in 1949 to 138 million in 1950, and the excess of residual-fuel-oil imports over exports rose from 63 million barrels in 1949 to 104 million in 1950. Although exports of the other refined products (excluding residual fuel oil) decreased considerably owing to the competition of the new and enlarged European and Middle East refineries and to increased domestic demand, they still exceeded imports by 43 million barrels in 1950 compared with 62 million barrels in 1949.

Exports of crude petroleum increased 5 percent from 1949 to 1950. Canada continued to be the principal country of destination, receiving 91 percent of the total in 1949 and 88 percent in 1950. Cuba received 5 percent in both years, but shipments to Argentina almost tripled those of 1949. European countries took 3 percent of the total in 1949 and 4 percent in 1950. Japan was the only country in Asia receiving any appreciable amount of United States crude in 1950. None was shipped to the Territories.

Exports and Territorial shipments of all refined mineral oils were 12 percent lower than in 1949. Motor-fuel exports decreased 37 percent and kerosine 18 percent from 1949. Outgoing shipments of the other refined products increased over 1949; the largest increase was in shipments of residual fuel oil, which were 28 percent higher than in 1949.

Motor-fuel exports and Territorial shipments decreased 14.6 million barrels from 1949. The decreases were general, but greatest in shipments to Europe and to countries of North America. Shipments to Mexico, Colombia, Mozambique, Union of South Africa, and the Territories were, however, an exception to the general decline. Motor-fuel exports to Europe decreased 9.4 million barrels from 1949. Notable decreases from 1949, by country, were: United Kingdom, 76 percent; France, 76 percent; and Sweden, 72 percent. Motor-fuel shipments to Canada declined 39 percent; to Netherlands Antilles, over 48 percent; and to Cuba, 20 percent.

Outgoing shipments of kerosine also decreased from 1949, except for shipments to El Salvador, United Kingdom, Philippine Islands, Mozambique, the Union of South Africa, and the Territories.

Exports and Territorial shipments of distillate fuel oil increased 3 percent from 1949 to 1950. Gains were confined mostly to North American countries, especially Canada, whereas exports to Europe decreased 38 percent from 1949, with shipments to the United Kingdom only half of the 1949 total.

Increased shipments of residual fuel oil to Canada, Central America, Mexico, Chile, Alaska and Hawaii more than offset smaller shipments to Europe and Eastern Asia.

Exports and Territorial shipments of lubricating oil were 10.5 percent higher in 1950 than in 1949. Increased shipments to Europe, especially to the United Kingdom, accounted for most of the increase.

[1] Compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce. Changes for 1948 in Mineral Yearbook, 1948, pp. 1018–1020, are as follows, in thousands of barrels: Fuel oil exported to Canada, 9,380; total North America, 15,791; grand total, 27,920. Motor fuel—New Zealand, 408; total Oceania, 1,286; grand total, 32,700. Lubricating oils—Australia, 599; New Zealand, 174; total Oceania, 778; grand total, 12,855. Shipments from continental United States to the Territories, in thousands of barrels: Alaska and Hawaii (figures represent shipments from refining companies for export to Alaska and Hawaii through Pacific ports, as reported to Bureau of Mines by shippers)—motor fuel, 2,919; kerosine, 172; fuel oil, 6,261; and lubricating oil, 90. Total shipments from continental United States to the Territories—motor fuel, 4,697; kerosine, 606; fuel oil, 6,500; and lubricating oil, 140. Total net shipments from continental United States—motor fuel, 37,337; kerosine, 3,529; fuel oil, 34,250; and lubricating oil, 12,994.

Changes in table 88, Minerals Yearbook, 1949, p. 989, are as follows, thousands of barrels: Lubricating oil—India, 1,052; total Asia, 2,310; grand total, 12,318. Total all products—India, 1,336; Asia, 4,942; grand total, 100,672. Shipments from continental United States to the Territories, in thousands of barrels: Alaska and Hawaii (figures represent shipments from refining companies for export to Alaska and Hawaii through Pacific coast ports, as reported to Bureau of Mines by shippers)—motor fuel, 3,523; kerosine, 175; distillate oil, 2,241; residual oil, 4,001; lubricating oil, 114; and total, 10,144. Total shipments from continental United States to the Territories—motor fuel, 5,603; kerosine, 713; distillate oil, 2,452; residual oil, 4,094; lubricating oil, 176; and total, 13,038. Total net shipments from continental United States—motor fuel, 39,388; kerosine, 2,534; distillate oil, 12,297; residual oil, 12,642; lubricating oil, 12,492; and total, 113,452.

[2] Country and continent totals exclude but grand totals include, 2,902 thousand barrels of motor fuel and 2,710 thousand barrels of lubricating oils, for which country breakdown may not be published for security reasons.

[3] Includes natural gasoline, naphtha, benzol, and antiknock compounds of petroleum origin.

[4] Less than 500 barrels.

[5] Figures represent shipments from refining companies for export to Alaska and Hawaii through Pacific coast ports, as reported to Bureau of Mines by shippers.

[6] Not separately recorded.

TABLE 89.—Mineral oils, crude and refined, shipped from continental United States, including shipments to the Territories, 1949–50, by classes and months [1]

[2] Includes benzol, natural gasoline, and antiknock compounds.
[3] Preliminary figures.

WORLD PRODUCTION

World production of crude petroleum in 1950 resumed its long-range upward trend, being 11.5 percent larger than in 1949. Except for Rumania, all major producing countries of the world increased production over 1949.

The Western Hemisphere's proportion of world crude-petroleum production declined from 73.4 percent in 1949 to 71.6 percent in 1950. The United States furnished 54 percent of the world output in 1949 and 52 percent in 1950. Venezuela maintained its position as the second largest producing country, furnishing 14 percent of the total in both 1949 and 1950. The Middle East (Bahrein Island, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, Turkey, and Egypt) increased its share from 15 percent in 1949 to 17 percent in 1950, surpassing for the first time the Caribbean area in crude-petroleum production.

Crude production in the United States increased 7 percent from 1949 to 1950. Owing to much larger output in Alberta, Canada increased its output nearly 37 percent; and late in the year crude began moving through the Interprovincial Pipeline to Lake Superior. Mexico's production continued its steady climb, being 19 percent larger in 1950 than in the previous year. Colombia's production gained nearly 15 percent with the installation of new pumping facilities on the Andian pipeline which carries crude from interior fields to Mamonal on the Caribbean Sea. Brazil more than doubled 1949 production from the Bahia fields. Chile, with development of the Cerro Manatiales field, was able to export about two-thirds of its production.

[1] Preliminary figures.
[2] Less than 500 barrels.
[3] Natural naphtha and gas oil.
[4] Estimate.
[5] Data represent Trianon Hungary after October 1944.
[6] Data revised in accordance with recent information stating 6.948 barrels per metric ton.
[7] Beginning in 1945, postwar borders.
[8] U. S. S. R. in Asia (except Sakhalin) included with U. S. S. R. in Europe.
[9] Includes New Guinea, whose production amounted to 1,725,500 barrels in 1949 and 1,748,000 barrels in 1950.
[10] Included with India.

In Western Europe, Germany increased production 33 percent from 1949 to 1950, and Netherlands output was almost 14 percent larger than in 1949. France more than doubled 1949 production with development of the Lacq field in the Aquitanian Basin.

For Eastern Europe, reliable statistics are generally lacking. The U. S. S. R. (including Sakhalin) apparently increased its production from 1949 to 1950, as did Albania, Hungary, and Yugoslavia. Rumania, however, is estimated to have had lower production in 1950 than in 1949.

The largest gains in petroleum production were in the Middle East. Iraq, with completion of the new 16-inch-diameter pipeline to Tripoli, Lebanon, produced 61 percent more petroleum in 1950 than in 1949. Kuwait produced from its Burghan field 40 percent more petroleum than in 1949. Iran, the largest producer of the Middle East, increased its output 18 percent from 1949 to 1950, while Saudi Arabia's production was up nearly 15 percent. The Trans-Arabian pipeline from Qaisumah in north central Arabia to Sidon, Lebanon, was placed in operation during December 1950, with a daily delivery capacity exceeding 500,000 barrels. Qatar completed its first full year as a commercial producer and exporter of crude petroleum in 1950. In Egypt, greater output from the Asl field more than offset declines in the older producing fields.

In the Far East, Japanese crude-petroleum production showed a notable increase in 1950; and, although the United States of Indonesia increased output 12 percent from 1949 to 1950, it had not regained prewar levels. In British Borneo, production increased 23 percent from 1949 to 1950.

Phosphate Rock

By Bertrand L. Johnson and Nan C. Jensen

GENERAL SUMMARY

MINED production of phosphate rock in the United States in 1950 reached a record high of 11,114,159 long tons, thus exceeding the previous record (9,388,160 tons in 1948) by nearly 1¾ million tons, according to reports submitted by producers to the Bureau of Mines. Increases were shown in Florida, Tennessee, and most of the Western States. Supplies of phosphate rock were plentiful and large quantities were added to the stocks in producers' hands.

Sales likewise increased, rising from 8,986,933 long tons in 1949 to 10,253,552 tons in 1950. (See fig. 1.) Increased sales in Florida and Tennessee counterbalanced the decline in sales in the Western States. The total value of the phosphate rock sold or used in 1950 rose to $59,027,848, or about $7,600,000 over 1949. The P_2O_5 content of the rock sold or used in 1950 increased to a new record high of 3,336,112 long tons from 2,913,796 tons in 1949. Imports in 1950 increased both in quantity and value. Exports in 1950 were likewise above those in 1949 in both quantity and value. Apparent domestic consumption rose considerably to 8,580,925 long tons. Stocks at the end of 1950 had increased greatly in all the producing areas.

[1] Data not available.
[2] Includes a small quantity from Virginia in 1949.
[3] Includes Utah in 1950.
[4] As reported to the Bureau of Mines by domestic producers.
[5] Revised figure.

Several general papers relating to the phosphate-rock industry have appeared recently.[1]

DOMESTIC PRODUCTION

Mined production of phosphate rock in the United States in 1950 (11,114,159 long tons) was much larger than that of 1949 (8,877,474 tons) and even exceeded the former record high (9,388,160 tons) of 1948 by about 1,726,000 tons.

SALES

An increase of over a million tons in the quantity of phosphate rock sold or used by domestic producers brought the total for the United States in 1950 to a record high of 10,253,552 long tons with a record value of $59,027,848.

REVIEW BY STATES

SOUTHERN STATES

Florida.—The upward trend in the marketed production of Florida phosphate rock continued in 1950; a new high of 8,085,870 long tons valued at $45,377,842 was attained. By far the greater part of the production came from the land-pebble field. Relatively small quantities of hard rock and soft rock (waste-pond phosphates from the hard-rock field) were produced. The output of soft rock was somewhat larger than of hard rock.

The following companies mined and shipped phosphate rock in 1950:

Land pebble:

American Agricultural Chemical Corp., 50 Church St., New York, N. Y. (Pierce, Fla.)
American Cyanamid Co., 30 Rockefeller Plaza, New York, N. Y. (Brewster, Fla.)
Coronet Phosphate Co., 19 Rector St., New York, N. Y. (Plant City, Fla.)
Davison Chemical Corp., Baltimore, Md. (Bartow, Fla.)
International Minerals & Chemical Corp., 20 N. Wacker Drive, Chicago 6, Ill. (Mulberry and Bartow, Fla.)
Swift & Co., R. F. D. 1, Box 200, Bartow, Fla.
Virginia-Carolina Chemical Corp., P. O. Drawer 1797, Richmond 14, Va. (Nichols, Fla.)

Hard rock:

Kibler-Camp Phosphate Enterprise, P. O. Box 608, Ocala, Fla.

Soft rock:

Colloidal Phosphate Co., P. O. Box 1588, Tampa, Fla.
Kellogg Co., Hernando, Fla.
Loncala Phosphate Co., Box 338, High Springs, Fla.
Sea Board Phosphate Co., Dunnellon, Fla.
Soil Builders, Inc., Dunnellon, Fla. (Hernando, Fla.)
Superior Phosphate Co., Box 476, Dunnellon, Fla.

TABLE 5.—Florida phosphate rock sold or used by producers, 1946–50, by kinds

Year	Hard rock			Soft rock [1]

[1] Includes material from waste-pond operations.

The American Agricultural Chemical Corp. operated its No. 3 and No. 12 mines and washers, its recovery and reclaim units, and its drier at Pierce. It is reported to have installed an elemental-phosphorus electric furnace of 8,000- to 10,000-kw. capacity at Pierce. The American Cyanamid Co. reports that it operated both its Saddle Creek and Sydney mines and washers and dried the phosphate rock produced at its Brewster drier.

The Sydney property of the American Cyanamid Co. is in Hillsborough County, 15 miles east of Tampa, on State Highway 60. In December 1949, a plant was put in operation there to be served by the Seaboard Airline Railroad. A description of the plant has been published. According to a published description, the plant includes the world's largest settling basin served by a single mechanical unit for reclaiming water from process flows. This is a 300-foot-diameter special Dorr thickener mechanism, incorporating a flocculating feed well and picket arms, installed in a 750-foot-diameter earthen basin with sloped bottom, yielding an underflow with 14-percent solids and a clear-water overflow.[2] At Brewster the company installed a new type of wet storage ahead of the drying plant to lower the moisture content of the wet pebble and concentrates. A belt stacker will take feed from incoming hopper cars and deposit it on a radial pile. The phosphate will be reclaimed by belt conveyors in tunnels underneath, which elevate and convey it to the drying plant.

The Armour Fertilizer Works (350 Hurt Bldg., Atlanta, Ga.) states that there were no mining operations at its Florida plant near Bartow. The Coronet Phosphate Co. operated its Eleanor mine, washer, and flotation plant in 1950, drying the phosphate rock produced in its Coronet drier. A considerable tonnage of defluorinated phosphate rock was produced and shipped by this company. The Coronet Phosphate Co. is moving its mining operations from Hillsborough County to a site in Polk County about 6 miles northeast of Lakeland. Actual mining operations are to begin there in 1951. The Davison Chemical Corp. operated its Bonny Lake and Pauway No. 4 mines and washers and dried the washed phosphate rock at its Ridgewood drying plant.

The International Minerals & Chemical Corp. operated its Achan, Noralyn, and Peace Valley mines and washers and its Noralyn and Prairie driers in 1950. During the year the company installed Humphreys spirals to re-treat flotation table tails at the Peace Valley plant. In 1950 the Federal Communications Commission granted a permit for installing a radio-communications system at the company open-pit phosphate mines in Florida. A two-way conversational set is reported to operate on a 60-watt base station near the main shop. Of 16 mobile units, 14 will be in automobiles used by maintenance personnel, and 2 will be placed on draglines. The system will operate on the 152- to 162-mc. band, using frequency modulation.[3] All International's Florida office and service centers are being moved to the Bartow area. The company is planning to produce uranium for the Atomic Energy Commission from Florida phosphate deposits.

The Pembroke Chemical Corp. (Pembroke, Fla.) reports that it made no production of land-pebble phosphate rock in 1950 and that it had no stocks at the end of that year. Swift & Co. operated its Swift No. 5 and Swift No. 6 mines and washers, drying the phosphate rock at its Agricola drying plant. The Virginia-Carolina Chemical Corp. operated its Homine and Clear Springs mines and washers and mined feed from the Phosmico debris dumps. The Phosmico and Nichols drying plants were in operation. Some phosphate rock was calcined. A large dragline recently installed at the Florida mines of this company has been described in its house organ.[4]

In the hard-rock phosphate field the Kibler-Camp Phosphate Enterprise (P. O. Box 608, Ocala, Fla., and P. O. Box 67, Lakeland, Fla.) operated the Section 12 mine. This property was formerly worked under the names of C. & J. Camp, Inc., and J. Buttgenbach & Co., with D. B. Kibler, Jr., as manager. The latter has acquired the interest formerly held by the Belgian partner. The company drying plant at Fernandina was moved some time ago to the mine, where both wet and dry storage facilities are now available. A Bucyrus-Erie 6 W Diesel-driven dragline is said to have been bought to handle the hard overburden, which cannot be hydraulicked effectively. Shipments were made in 1950 for domestic consumption in the manufacture of elemental phosphorus, ferrophosphorus, phosphoric acid, and various phosphate chemicals, and for export.

The Bureau of Land Management, United States Department of the of the Interior, requested bids in 1950 on the leasing of 130 acres of phosphate land in Florida. Two tracts, one of 80 acres in Citrus County, 4 miles southwest of Inverness, and one in Hernando County, 1 mile west of South Catherine, were offered, at a minimum bid of $25 on each tract, to qualified bidders of the highest cash amount per acre as a bonus for the privilege of leasing.[5]

Several soft-rock phosphate mining companies were in operation in 1950, mining the fine-grained phosphatic residues in the old waste-pond dumps near Dunnellon, Hernando, and High Springs in the hard-rock phosphate field. Part of this material was sold for use as a phosphate fertilizer for direct application to the soil, some for use as a filler in commercial mixed or complete fertilizers, and a portion for stock and poultry feed.

It has been known for some time that uranium occurs as a minor component in certain of the phosphate rock deposits of Florida. The land-pebble phosphate rock is the only type that contains uranium. In the high-grade part of the land-pebble district, in Polk and Hillsborough Counties, the uranium occurs principally in the Bone Valley formation. The fresh, unweathered Hawthorn formation contains little or no uranium, but leached Hawthorn, rich in P_2O_5, contains a small amount of uranium. The Pleistocene sands have no uranium, except where they contain reworked phosphatic material from the Bone Valley formation. South of the high-grade district these formations contain only minor amounts of uranium. The uranium seems to be associated with the phosphate.[6]

The Atomic Energy Commission has announced that it has de-

[4] V-C News, She's a Queen: Vol. 3, No. 6, June-July 1950, pp. 4-9.

[6] Engineering and Mining Journal, Uranium Found in Florida Phosphate Limited to Certain Deposits: Vol. 151, No. 8, August 1950, p. 93.

veloped a process (secret) for economic extraction of the uranium of phosphate rocks during the production of triple superphosphate. The International Minerals & Chemical Corp. plans to erect a large plant in Florida to produce defluorinated phosphate for the animal-feed-manufacturing industry and multiple superphosphate for the fertilizer industry. The recovery of uranium compounds will be an additional step in these processes.

Submarine deposits of rock phosphate have been found along the Gulf coast of peninsular Florida over a 25-mile area in the vicinity of Tampa, possibly extending as far south as Fort Myers. Little is known about them, and the possibility that they could be exploited commercially is considered "remote." [7]

The results of a study to determine the age and the relationships of the land-pebble phosphate-rock deposits to the Pleistocene terraces appeared in 1950. It was concluded that no relationship exists and that, instead of the presence of several phosphate-bearing terrace deposits, as postulated by Vernon, the phosphate gravels appeared to be a continuous beach placer deposit resting unconformably on a very irregular limestone surface.[8] A more general study of the land-pebble deposits was also published during the year.[9]

South Carolina.—In March 1950 the new elemental-phosphorus 12,000-kv-a. electric furnace of the Virginia-Carolina Chemical Corp. at Charleston, S. C., was completed, and production of elemental phosphorus was begun. Previously the corporation had bought phosphorus to make its high-purity phosphoric acid and various phosphate chemicals. This carbon-arc electric furnace uses Florida high-grade hard-rock phosphate. This rock is charged directly into the furnace without the sintering or nodulizing needed for the Florida land-pebble or the Tennessee brown-rock phosphates. Its lower iron content ties up less phosphorus in the form of ferrophosphorus in the smelting operations than do other phosphate rocks with higher iron contents. Low-cost power for the plant is obtained from the Santee-Cooper Project. A description of the plant has been published.[10]

Tennessee.—Tennessee remains the second-largest phosphate-rock-producing State. In 1950 the quantity of phosphate rock sold or used by Tennessee producers was 40,003 long tons greater than in 1949, rising from 1,344,470 long tons in that year to 1,384,473 tons in 1950. The total value in 1950 increased $960,815 over that of 1949 and rose to $10,028,404, according to reports from the producing companies.

Tennessee brown-rock phosphate-mining operations in 1950 were carried on by the following organizations:

Armour Fertilizer Works, Room 350, Hurt Bldg., Atlanta, Ga. (Columbia, Tenn.)
Federal Chemical Co., 634 Starks Bldg., Louisville, Ky. (Mount Pleasant, Tenn.)
Harsh Phosphate Co., Arlington Ave., Nashville 10, Tenn. (Nashville, Tenn.)
Hoover & Mason Phosphate Co., 8 S. Michigan Ave., Chicago, Ill. (Mount Pleasant, Tenn.)
International Minerals & Chemical Corp., 20 N. Wacker Drive, Chicago 6, Ill. (Columbia, Tenn.)

[1] Includes small quantity of Tennessee blue rock in 1945–47 and Virginia apatite in 1945–47 and 1949.

The Tennessee brown-rock phosphate deposits were described in a short article published during the year.[11]

The Tennessee Valley Authority continued its mining and phosphate-processing activities in Tennessee and technologic operations at its chemical plant, Muscle Shoals, Ala., in 1950.

According to the annual report of the TVA for the fiscal year ended June 30, 1950, all the TVA output of elemental phosphorus in the fiscal year 1950 was used in producing concentrated superphosphate and calcium metaphosphate fertilizers and dicalcium phosphate, a mineral feed supplement for livestock. The output of concentrated superphosphate in the fiscal year 1950 was 125,400 tons, making a total production of 1,160,000 tons. The process for manufacturing calcium metaphosphate, the most concentrated phosphate fertilizer yet made on a large scale, is now being demonstrated in a large-scale plant at Muscle Shoals. TVA has distributed about 93,300 tons of this material, chiefly for testing. In the fiscal year 1950, 6,600 tons were sold, while 9,600 tons were used in test demonstrations.

TVA discontinued the manufacture of dicalcium phosphate at the close of the 1950 fiscal year, since the material, a mineral supplement for stock feed, was becoming available from private industry. After 6½ years of operation, TVA had produced 171,800 tons of dicalcium phosphate, including 49,440 tons in the 1950 fiscal year. Complete information on TVA's manufacturing process and marketing channels was turned over to a number of potential producers. At the end of the fiscal year 1950, two companies had begun producing feed-grade dicalcium phosphate, and several others had indicated that they expected to enter this field.

During the year major research emphasis was placed on a group of related processes that produce nitrogen-phosphate or nitrogen-phosphate-potash fertilizers of high concentration. Pilot-plant developments on two of the processes were in advanced stages.

The TVA plant at Columbia, Tenn., produced about 17,500 tons of fused tricalcium phosphate during the fiscal year 1950, virtually all of the material being used for tests and farm demonstrations. Five years' production has totaled about 100,000 tons. The process is

[11] Burwell, H. B., Brown Phosphate Rock in Tennessee: Proc. Symposium on Mineral Resources of the Southeastern United States, Univ. of Tennessee, Knoxville, Tenn., 1950, pp. 128–131.

basically simple, requiring no sulfuric acid, coke, or large amounts of electricity, and it can use relatively low grades of phosphate rock to produce a fertilizer containing 26 to 30 percent plant food. It is economically suitable for distribution within a short distance of the plant.

Several reports dealing with TVA studies were published recently.[12]

The Monsanto Chemical Co. reported in June that a new electric furnace (its sixth) for producing elemental phosphorus, with a capacity of 25,000 kw., was to be erected at its plant at Monsanto, Tenn. It is stated that this will be the largest elemental-phosphorus electric furnace in the world. The phosphorus produced is to be hauled by tank car to processing plants at Trenton, Mich., and Carondelet, Mo., for the manufacture of phosphate chemicals. At Monsanto, Tenn., the company has installed a plant to absorb all the fluorine-containing gas from the electric furnace gases, to eliminate possible damage by these gases in the vicinity of the plant. The calcium fluoride formed is being stored in a waste pond.

The Victor Chemical Works, Chicago, Ill., continued to produce elemental phosphorus at its electric furnace plant at Mount Pleasant, in the Tennessee brown-rock field. Phosphate rock from its recently acquired deposits in the Melrose, Mont., field was shipped to this plant for smelting.

WESTERN STATES

Total marketed production of Western States phosphate rock fell considerably in 1950 from the 1949 level according to reports from producers to the Bureau of Mines, declining from 826,474 long tons in 1949 to 783,209 tons in 1950. The total value also declined, dropping from $4,489,455 in 1949 to $3,621,602 in 1950. Phosphate rock was produced in all four States of the western field—Idaho, Montana, Utah, and Wyoming. Montana sales declined. (See figure 2.) The combined total sales of the other States rose considerably but not enough to offset the drop in Montana.

Idaho.—Idaho retained its position as the leading phosphate-rock producer of the Western States in 1950, increasing its output in quantity over 1949 but showing a decline in value owing to the considerable quantities of lower-grade phosphate rock produced. Totals for the State cannot be given without disclosing the output of individual companies.

Only two companies reported producing phosphate rock in Idaho in 1950. The larger producer remains the Simplot Fertilizer Co., Pocatello, Idaho, which continued its open-pit operations at the Gay mine on Fort Hall Indian Reservation, Bingham County, about 16 miles east of Fort Hall. The high-grade phosphate rock from this property is used by that company for producing superphosphate at Pocatello. The low-grade phosphatic shales from this operation go to the Westvaco elemental phosphorus electric furnaces at Pocatello.

The Anaconda Copper Mining Co. operated its No. 3 mine at Conda, Caribou County, Idaho, processing the phosphate rock produced at the company plant at Anaconda, Mont., largely to high-

[1] Idaho includes Utah in 1946–48 and 1950, and Wyoming in 1949–50.

analysis superphosphate. A smaller quantity went into the manufacture of phosphoric acid and phosphate chemicals.

The company has installed a beneficiation unit at the mine for washing about 450 tons a day of phosphate-bearing material from a

7½-foot hanging-wall bed, formerly left unmined. The mill flow sheet includes crushing to ⅜-inch in a hammer mill, washing in a rotary scrubber, dewatering in drags with a vacuum pan at the discharge, and drying in rotary driers. Water will be recovered in a thickener.[13]

The San Francisco Chemical Co., Montpelier, Idaho, reported that there were no operations of any kind in 1950 at Waterloo mine on the slopes of Waterloo Hill, 5 miles east of Montpelier.

The Westvaco Chemical Division, Food Machinery & Chemical Corp., finished installing its second electric furnace for the production of elemental phosphorus at Pocatello, Idaho, early in 1950. Both furnaces were in operation in that year. Its first electric furnace, completed in 1949, was the first electric furnace for producing elemental phosphorus to be installed west of the Mississippi River to operate on the Idaho phosphate-rock deposits. In the fall of 1950 a third furnace was begun, and erection of a fourth is said to be planned for 1951. Power for these furnaces is obtained from the Snake River, Idaho, hydroelectric plants of the Idaho Power Co. The phosphatic raw material for the elemental phosphorus furnaces is the low-grade phosphatic shale from operations of the J. R. Simplot Co. on the Fort Hall Indian Reservation.

The elemental phosphorus is shipped in tank cars to Westvaco's Carteret, N. J., and Newark, Calif., plants, for conversion. A new plant is to be built at Lawrence, Kans., 35 miles west of Kansas City, Kans., to process the phosphorus into soluble phosphates to meet the demand in the Midwestern and Mountain States. Additional capacity for producing phosphate chemicals is being provided at the Newark, Calif., plant. Virtually all the output of elemental phosphorus of this Pocatello, Idaho, plant is to be converted into the so-called "molecularly dehydrated" sodium and potassium phosphates, such as "sodium tripolyphosphate" and tetrasodium pyrophosphate. None of the elemental phosphorus is expected to be converted into fertilizers. Some phases of the Westvaco phosphorus operations were discussed recently.[14]

The treble superphosphate plant of the Gem State Phosphate Co. (Idaho Farm Bureau-Gates Bros., Inc.) was in operation in 1950. No phosphate rock was mined by this company, that which was used being purchased from the San Francisco Chemical Co. A new evaporator was erected at the Wendell plant, and an ammonium phosphate plant is planned.

The property of the Teton Phosphate Co., Inc., Montpelier, Idaho, was inactive during 1950.

The Central Farmers Fertilizer Association of Chicago is reported to be actively engaged in developing phosphate rock deposits in Georgetown Canyon.

The Western Fertilizer Association—a group of eight Northwest cooperatives—holder of a Federal phosphate lease on Dry Ridge phosphate-rock deposits near Soda Springs, plans to construct a large phosphate-fertilizer plant but has not yet undertaken any plant construction, and the location of the proposed plant has not been

[13] Barr, J. A., Phosphate: Eng. and Min. Jour., vol. 152, No. 2, February 1951, pp. 98–100.

[14] Miller, J. G., Elemental Phosphorus and the Commercial Importance of the Molecularly Dehydrated Phosphates: Paper presented at Seattle, Wash., meeting, Am. Inst. Min. and Met. Eng., Apr. 6, 1950, 6 pp. (mim.).

determined. The Pacific Supply Cooperative, Portland, Oreg., is reported to be the major stockholder of this group.

A description of the Deer Creek Wells Canyon phosphate area was published in 1950.[15]

Montana.—Marketed production of Montana phosphate rock in 1950 reversed its recent upward trend and declined to 210,165 long tons, valued at $1,496,537, from 355,169 tons, valued at $2,574,330, both the lowest since 1946.

The Montana Phosphate Products Co., Trail, British Columbia, operated its Anaconda, Anderson, and Graveley mines, as well as several Government leases, all in the Garrison district, Powell County. The rock shipped from these mines was exported to the plant of the parent company at Trail, British Columbia. Mining operations were also carried on by George Relyea at the Relyea mine, also in the Garrison district, and the output was also shipped to Trail, British Columbia. Anderson Bros. Mining Co., Box 382, Helena, Mont., reports the production in 1950 of a small tonnage of phosphate rock at the Warm Springs mine in the Garrison district.

In the Philipsburg district, Granite County, Soluble Phosphates, Ltd., Maxville, Mont., reports that its mine was inactive throughout the year. The International Minerals & Chemical Corp., 20 North Wacker Drive, Chicago, Ill., states that its operations on its property in this district were restricted in 1950 to keeping its mine and plant in shape and maintaining watchman service. No other operations have been reported in this district.

The Victor Chemical Works, Chicago, Ill., began initial operations early in August 1950 toward construction of an elemental-phosphorus electric-furnace plant near Silver Bow, a few miles west of Butte, at the junction of the Union Pacific, Northern Pacific, and Chicago, Milwaukee & St. Paul Railroads. Completion of the plant is expected late in 1951. In 1947 and 1948 the Victor Chemical Works acquired two properties in the Melrose district, the public domain formerly leased to the Anderson Phosphate Mines, Inc., and the Martin Phosphate Mining Co., from which the phosphate rock for the electric furnaces will be obtained. Until the new plant is completed the phosphate rock from the mine, the first this company has operated, will be sent to the company electric furnaces at Mount Pleasant, Tenn., or Tarpon Springs, Fla. In 1950 several hundred tons were shipped to the Mount Pleasant plant. Eventually the phosphate rock will be transported by rail from the mine to the furnaces at Silver Bow. The elemental phosphorus produced will be shipped to company plants in Illinois and California for manufacture into phosphoric acid and phosphate chemicals. Power for the new plant will eventually be supplied by the Bonneville Power Administration from the Hungry Horse Dam, which is expected to be ready in the fall of 1952. Until then power will be furnished by the Montana Power Co.[16]

The phosphate-rock deposits of parts of Beaverhead and Madison Counties, Mont., are described in a recent report.[17]

Utah.—The only phosphate-rock-producing company in Utah in 1950 was the Pearl & Toland Phosphate Co. (307 South Central Ave., Ontario, Calif.), reported as a partnership consisting of F. J. Pearl and C. C. Toland. This company succeeded the F. J. Pearl Minerals Co. and operated its property at the south end of the Crawford Mountains in Rich County, northeastern Utah, near Woodruff. Some of the rock mined was shipped for stock and poultry feed and for direct application to the soil.

The Garfield Chemical & Manufacturing Corp., Salt Lake City, Utah, which has in the past produced metallurgical phosphate rock from a Federal lease in the Spanish Fork Canyon area in Utah County, near Thistle Junction, Utah, did not operate the mine in 1950. The Utah Phosphate Co., Morgan, Utah, is reported as not in operation in 1950 and not to have made any sales.

The Monsanto Chemical Co., St. Louis, Mo., is reported to have obtained an option to purchase a large acreage of phosphate-bearing land early in 1950 in the Vernal region, in Utah's Uintah Basin, from the Humphreys Phosphate Co., of Denver, Colo., and adjacent ground from J. H. Ratliff.

Wyoming.—The reported production and shipments of Wyoming phosphate rock in 1950 showed a great increase over the 1949 figures both in quantity and value; still in third place among the Western States group, the State remains an important producer.

Only one company was producing phosphate rock in Wyoming in 1950—the San Francisco Chemical Co., operating the Leefe mine on land leased from the Stauffer Chemical Co. in the Beckwith Hills syncline, 3½ miles west of Sage, in Lincoln County, Wyo., a station on the main line of the Union Pacific Railroad in southwestern Wyoming.

No phosphate rock was produced in 1950 from the mine of Phosphate Mines, Inc., Kemmerer, Wyo., but a small tonnage was shipped from stock for direct application to the soil. The shut-down of mining operations here is reported to be temporary.

Late in 1950 it was reported that the Continental Sulphur & Phosphate Corp., Dallas, Tex., was planning to develop phosphate-rock deposits in the Lander, Wyo., region.

Several publications of interest in connection with the development of the Wyoming phosphate-rock deposits appeared in 1950.[18]

California.—California does not produce any phosphate rock, but phosphate fertilizers have been produced there, as well as phosphate chemicals from phosphoric acid; elemental phosphorus was shipped into the State from more eastern points. The phosphate chemical plant of the Victor Chemical Works, Chicago, Ill., is at South Gate, Calif., near Los Angeles and that of the Westvaco Chemical Division, Food Machinery & Chemical Corp., is at Newark, Calif. The Kaiser Aluminum & Chemical Corp., Permanente, Calif., formerly the Permanente Metals Co., produced a fused calcium-magnesium-phosphate fertilizer from serpentine and Idaho phosphate rock.

CONSUMPTION AND USES

The apparent consumption of phosphate rock in the United States in 1950 increased 845,920 tons to a record high of 8,580,925 long tons, from 7,735,005 tons in 1949.

TABLE 8.—Apparent consumption[1] of phosphate rock in the United States, 1945–50, in long tons

Year	Long tons	Year	Long tons
1945	5, 457, 648	1948	7, 700, 081
1946	6, 221, 525	1949	7, 735, 005
1947	7, 425, 784	1950	8, 580, 925

[1] Quantity sold or used by producers plus imports minus exports.

Data regarding the sales of phosphate rock by uses both for individual States and for the United States are shown in table 9.

TABLE 9.—Phosphate rock sold or used by producers in the United States, 1949–50, by uses and States

PRICES

Prices for Florida land-pebble phosphate rock increased slightly during 1950, as shown in table 11. Tennessee brown-rock phosphate, however, showed no changes in the quoted prices, the levels remaining the same as in the second half of 1949. Table 11 gives the price quotations of the Oil, Paint, and Drug Reporter as of January 2, 1950, and January 8, 1951. Tennessee quotations are now on a P_2O_5 basis, instead of the B. P. L. content used in Florida and formerly in Tennessee. Quotations for Western States phosphate rock are not given in the trade journals.

TABLE 11.—Prices per long ton of Florida and Tennessee unground, washed, and dried phosphate rock, in bulk, f. o. b. cars at mine, by grades, in 1950–51

[Oil, Paint and Drug Reporter]

Grades (percent) [1]	Florida land pebble		Tennessee brown rock	
	Jan. 2, 1950	Jan. 8, 1951	Jan. 2, 1950	Jan. 8, 1951
68/66 B. P. L.	$3.75	(2)		
70/68 B. P. L.	4.155	$4.35–4.40		
72/70 B. P. L.	4.805	5.00		
75/74 B. P. L.	5.805	6.00		
77/76 B. P. L.	6.905	7.00		
27–26 P_2O_5			$6.45	$6.45
30–29 P_2O_5			7.21	7.21

[1] B. P. L. signifies bone phosphate of lime, $Ca_3(PO_4)_2$.
[2] Not quoted.

FOREIGN TRADE [19]

Data on imports and exports of phosphate rock and other phosphatic materials at domestic ports as reported by the United States Department of Commerce are shown in tables 12–15.

Sales or shipments of phosphate rock for export as reported by domestic producers to the Bureau of Mines are given in the section on Consumption and Uses.

TABLE 12.—Phosphate rock and phosphatic fertilizers imported for consumption in the United States, 1949–50

[U. S. Department of Commerce]

Fertilizer	1949		1950	
	Long tons	Value	Long tons	Value
Apatite	3,428	$43,002

[1] In addition to countries listed, Cayman Islands (B. W. I.), China (including Formosa), Korea, Madagascar, New Caledonia, Norway, Poland, and Rumania produce phosphate rock; but data of output are not available, and estimates have been included in the total.
[2] Data not available; estimate by author of chapter included in total.
[3] Estimate.

BASIC SLAG

Basic slag is a limited source of agricultural phosphorus in the United States. Domestic production comes from a single company smelting a phosphatic iron ore of the Birmingham, Ala., district. No figures on production or sales are released for publication by this company. Annual imports are negligible. In 1949 only 94 long tons were imported; in 1950, only 179 tons.

Platinum-Group Metals

By James E. Bell and Kathleen M. McBreen

GENERAL SUMMARY

REVERSING a downtrend that had persisted for several consecutive years, the demand for platinum rose sharply in 1950, particularly in the second half. Sales of platinum were the largest since 1945, and the quotation of $103 an ounce that prevailed from September 11 to October 18 was the highest since early 1927. Demand for palladium also was substantially higher, although the quantity of palladium sold was less than half that of platinum. Palladium was quoted at $24 an ounce throughout the year—a price that has persisted since 1940. Demand for iridium, osmium, rhodium, and ruthenium was at a much higher level, with rhodium showing the greatest percentage increase in sales. During the latter part of the year, the demand for platinum exceeded the supply, causing some dealers and refiners to follow a policy of rationing. In general, the increased activity in the platinum-group metals in 1950 was connected with requirements for the military program and expansion of defense-supporting industries.

TABLE 1.—Salient statistics of platinum-group metals in the United States, 1949–50, in troy ounces

	1949	1950
Production:		
Crude platinum from placers and byproduct platinum-group metals	[1] 24,807	[1] 37,855
Refinery production:		
New metal:		
Platinum	42,228	56,757
Palladium	6,008	11,819
Other	3,690	4,553
Total	51,926	73,129
Secondary metal:

Palladium	122,408	107,854
Other	35,587	33,474
Total	296,044	266,562
Imports for consumption:		
Unrefined materials	33,748	48,446
Refined metals	184,536	379,188
Total	218,284	427,634
Exports:		
Ore and concentrates	165	82
Refined metals and alloys, including scrap	40,778	37,699
Manufactures (except jewelry)	20,702	12,640

[1] Includes Alaska.

Refining of platinum in the United States in 1950 was at a rate 8 percent greater than in 1949, and importation of refined platinum was 114 percent greater. Domestic consumption, as measured by sales,

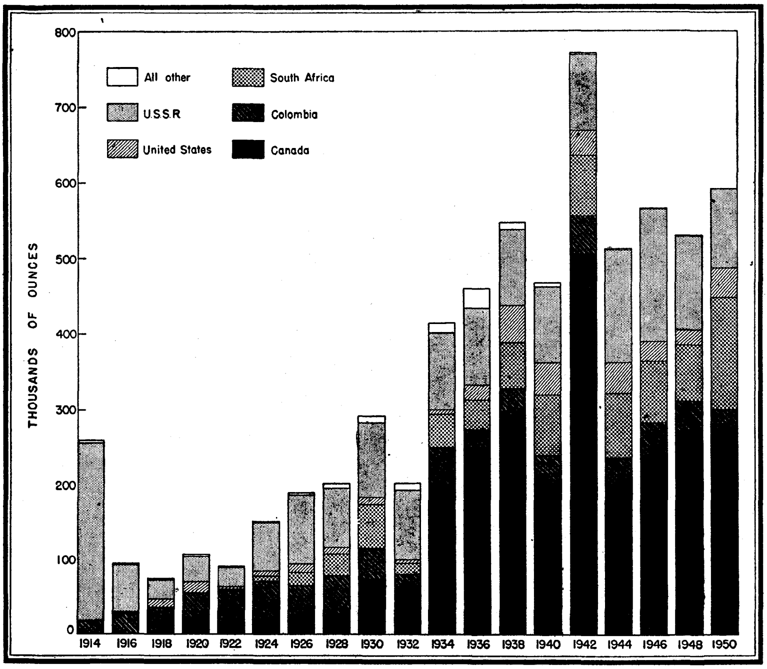

FIGURE 1.—World production of platinum-group metals, 1914–50.

was 102 percent greater, and stocks of refiners and dealers declined 9 percent. The jewelry trade was the largest buyer of platinum in 1950, taking 41 percent of the total sold to domestic consumers, although sales for jewelry and decorative uses were much smaller than those for chemical uses in the fourth quarter of the year.

Refining of palladium in the United States was at a rate 24 percent less than in 1949, but importation of refined palladium was 100 percent greater. Domestic consumption, as measured by sales, was 29 percent higher; the electrical industry was the largest buyer, taking 53 percent. Stocks in the hands of refiners and dealers declined 12 percent.

Slightly more iridium, osmium, and rhodium but considerably less ruthenium were refined in the United States in 1950 than in 1949. Imports of refined iridium, osmium, rhodium, and ruthenium were all much larger. Domestic consumption of the four metals together gained 85 percent, with the chemical industry the largest buyer; stocks in the hands of refiners and dealers declined 6 percent.

Total imports of platinum-group metals into the United States in 1950 were 96 percent higher than in 1949 and were the largest on record.

Figure 1 shows graphically the trend in world production of platinum-group metals since 1914.

CRUDE PLATINUM PRODUCTION

Mine returns indicate a domestic production of 37,855 troy ounces of platinum-group metals in 1950 compared with 24,807 ounces in 1949.

This production includes crude platinum recovered from placer-platinum deposits in the Goodnews Bay district in southwestern Alaska, byproduct crude platinum recovered from gold placer mining in California, and platinum-group metals contained in small quantities in some gold and copper ores and recovered as a byproduct in smelting and refining operations. No production of byproduct crude platinum was recorded in Montana or Oregon in 1950.

Purchases.—Buyers in the United States reported the purchase in 1950 of 69,056 ounces of crude platinum from Alaska, California, Oregon, Colombia, Union of South Africa, British Columbia (Canada), and Ethiopia. In 1949 the corresponding quantity was 50,233 ounces.

RECOVERY OF REFINED PLATINUM-GROUP METALS

New Metals Recovered.—Reports from refiners indicate that 73,129 ounces of new platinum-group metals were recovered in the United States in 1950, a 41-percent increase over the recovery in 1949. Of the new metal recovered in 1950, 57 percent was chiefly from Colombian crude and 22 percent from domestic crude; 21 percent was recovered as a byproduct of gold and copper ores.

Secondary Metals Recovered.—In 1950, 58,113 ounces of secondary platinum-group metals were recovered from the refining of scrap metal, sweeps, etc.—a 30-percent decrease from 1949.

Substantial quantities of worn-out catalysts, spinnerets, laboratory ware, and other products are returned to refiners for refining or reworking. The refined platinum-group metals recovered from these items (or their equivalent in refined metals) are returned to the consumers. The platinum-group metals so recovered are not considered secondary production or included in the statistics of secondary metals.

TABLE 2.—New platinum-group metals recovered by refiners in the United States, 1941–45 (average) and 1946–48, and 1949–50 by sources, in troy ounces

	Platinum	Palladium	Iridium	Osmium	Rhodium	Ruthenium	Total

1950	33,894	21,167	1,064	1,988	58,113

CONSUMPTION AND USES

As pure metals, combined, clad, or alloyed with other metals, the platinum-group metals are used for jewelry, in the chemical and and electrical industries, in dentistry, and for many miscellaneous purposes. Uses of the platinum-group metals are tabulated on page 801 of the Platinum and Allied Metals chapter in Minerals Yearbook, 1943. Total sales of platinum-group metals to domestic consumers in 1950 were 495,945 troy ounces, an increase of 207,322 ounces over those in 1949 and the largest since 1945.

Sales of platinum to domestic consumers in 1950 were 308,998 ounces, a gain of 156,340 ounces over 1949 and the largest since 1945; they comprised 62 percent of the total sales of platinum-group metals in 1950 compared with 53 percent in 1949. As is normal, the jewelry trade provided the largest market, taking 41 percent of the sales to domestic consumers. By percent, sales to jewelers were considerably less than in 1949, however, owing to a large decrease in the fourth quarter. The chemical and electrical industries accounted for 37 and 15 percent, respectively, of the domestic consumption of platinum in 1950, with most of the activity in the third and fourth quarters. Noteworthy was the large extension in the use of platinum as a catalyst for producing high-octane gasoline from low-grade and natural gasoline.[1] Sales for dental and medical and miscellaneous uses in 1950 were about double those of 1949. Platinum was imported by the Government for the National Strategic Stockpile, but this metal is not included in the figures on consumption.

Sales of palladium to domestic consumers in 1950 were 150,456 ounces, an increase of 34,221 ounces over sales in 1949. The electrical industry continued to be the largest market, taking 53 percent. Sales for jewelry and decorative uses [2] and dental and medical uses in 1950 were at nearly the same levels as in 1949, but sales to the chemical industry were at an all-time high.

Sales of iridium, osmium, rhodium, and ruthenium together comprised 7 percent of total sales of platinum-group metals in 1950; by quantity, the sales totaled 36,491 ounces, a gain of 16,761 ounces over 1949. The use of osmium for hydroxilation purposes in chemical processing has increased.

Total	308,998	150,456	36,491	495,945

STOCKS

Stocks of platinum-group metals in all forms in the hands of refiners, dealers, and importers totaled 266,562 troy ounces on December 31, 1950, compared with 296,044 ounces on December 31, 1949, a decrease of 10 percent.

TABLE 5.—Stocks of platinum-group metals held by refiners, importers, and dealers in the United States, December 31, 1946–50, in troy ounces

Year	Platinum	Palladium	Iridium, osmium, rhodium, and ruthenium	Total
1946	187,624	132,523	41,876	362,023
1947	133,300	167,364	36,859	337,523
1948	146,823	142,211	34,540	323,574
1949	138,049	122,408	35,587	296,044
1950	125,234	107,854	33,474	266,562

PRICES

The quoted retail price of refined platinum was lowered $3 an ounce on February 1 to $69, where it remained until the third quarter, when several increases resulted in a price of $103 on September 11; it was reduced to $93 on October 18 and remained unchanged during the balance of the year. The quotation for iridium was $100–$105 an ounce to February 9, then $100 to July 10, when it was raised to $160.

Two further increases placed it at $220 on September 7, but it was reduced to $200 on October 18. The nominal quotation of $100 an ounce for osmium was increased to $150 on July 20, then to $200–$215 on September 11. The price of ruthenium was lowered $3 an ounce to $69 on June 8; revised upward three times in the third quarter, reaching $103 on September 11; then reduced to $93 on October 18. The quotations for palladium and rhodium were $24 and $125 an ounce, respectively, throughout 1950.

Buyers reported purchases at $50 to $110.22 an ounce for domestic and foreign crude platinum-group metals in 1950. This price range results chiefly from variations in the iridium content of crudes and fluctuations in quotations for refined metals.

FOREIGN TRADE [3]

Imports.—Imports of platinum-group metals into the United States in 1950 were 96 percent greater than in 1949 and were an all-time high. The principal sources were Canada (192,906 ounces), United Kingdom (97,825 ounces), Soviet Union (45,896 ounces), Colombia (35,605 ounces), Union of South Africa (27,202 ounces), Netherlands (9,344 ounces), Switzerland (8,053 ounces), and Norway (3,149 ounces). Imports of refined metals in 1950 totaled 379,188 troy ounces compared with 184,536 ounces in 1949; corresponding figures for unrefined materials are 48,446 and 33,748 ounces. Imports of refined platinum, palladium, iridium, osmium, rhodium, and ruthenium were up 114, 100, 61, 590, 73, and 86 percent, respectively.

Platinum was imported from the United Kingdom by the United States Government for the National Stockpile. Also of special interest was the importation of 1,469 ounces of platinum and 44,427 ounces of palladium from the Soviet Union—the first receipts from this source after a considerable interval.

[1] On the basis of detailed information received by the Bureau of Mines from importers, certain items recorded by the U. S. Department of Commerce as "grain and nuggets," and "sponge and scrap" have been reclassified and included with other groups in this table.
[2] U. S. Department of Commerce categories are in terms of metal content. It is believed, however, that in many instances, gross weights are actually reported.
[3] Revised figure.

Exports.—Exports of refined platinum (including scrap) decreased to 12,753 ounces in 1950 (18,150 ounces in 1949), and exports of other platinum-group metals (including scrap) increased to 24,946 ounces (22,628 ounces in 1949). The chief foreign markets in 1950 for platinum were Germany (6,010 ounces), France (2,918 ounces), Mexico (1,147 ounces), and Cuba (668 ounces). For the other platinum-group metals Germany was the chief market, taking 18,763 ounces.

TABLE 9.—Platinum-group metals exported from the United States, 1946–50 [1]

WORLD REVIEW

Canada.—According to the Dominion Bureau of Statistics, the output of byproduct platinum-group metals from the nickel-copper ores of the Sudbury district, plus a small quantity from placers in British Columbia, amounted to 121,100 troy ounces of platinum and 148,342 ounces of other platinum-group metals in 1950 compared with 153,784 ounces of platinum and 182,233 ounces of other platinum-group metals in 1949.

Sales of platinum-group metals by The International Nickel Co. of Canada, Ltd., were 267,316 ounces in 1950 compared with 214,735 ounces in 1949. Some increase in production of byproduct platinum-group metals is expected to result from the 5-percent increase in refined-nickel production announced during July 1951.

Colombia.—The South American Gold & Platinum Co. produced 25,968 ounces of crude platinum-group metals in 1950 compared with 20,213 ounces in 1949. The crude material contains about 85 percent platinum-group metals.

United States: Placer platinum and from domestic gold and copper refining	34,984	26,312	18,406	19,253	24,807	37,855
Total (estimate)	[2] 675,000	575,000	500,000	525,000	575,000	575,000

[1] The production data have been revised since publication in the Minerals Yearbook as follows: 1941, Indonesia 33 troy ounces, Italy 868, Sierra Leone 5; 1942, Canada 285,218 (platinum), Colombia 43,103; 1943, Canada 219,706 (platinum), Colombia 34,564; 1944, Colombia 34,304.
[2] Includes certain adjustments in 1945, to account for metals produced in Canada in 1938–44 but not included in the statistics for those years.
[3] Exports for year ended Sept. 10 of year stated.
[4] Data not available; estimate included in total.
[5] Year ended June 30 of year stated.

Southern Rhodesia.—Large, low-grade, platinum-bearing deposits similar to those mined in the Union of South Africa are known in Southern Rhodesia. An unsuccessful attempt was made to work these deposits in the Bulawayo district in the late 1920's. A recent report from Bulawayo indicates that a new way has been found for treating the ore, and a company has been formed to sample the deposits over a large area. A pilot plant may be installed if the sampling results are favorable.[4]

Union of South Africa.—According to the Department of Mines, 2,078 tons of matte, averaging 42.81 ounces per ton of platinum-group metals, and 256,385 ounces of crude metallics, averaging 21.55 percent platinum-group metals, were produced in South Africa in 1950 compared with 1,329 tons of matte and 120,020 ounces of crude metallics

[4] The Financial Times (London), Platinum in S. Rhodesia: No. 19,230, Jan. 3, 1951, p. 6.

in 1949. These figures correspond to an output of about 144,200 ounces of platinum-group metals in 1950 (about 87,300 ounces in 1949). The production of osmiridium in 1950 was 6,449 ounces compared with 6,031 ounces in 1949.

Sales of platinum-group metals and gold from the Rustenburg district were 105,750 ounces in 1950 compared with 94,092 ounces in 1949. The proportions of the various metals of the platinum group and gold sold in 1949 were as follows:

Metal:	*Percent*
Platinum	61. 27
Palladium	29. 21
Iridium	. 30
Osmium and Osmiridium	. 10
Rhodium	1. 80
Ruthenium	3. 32
Gold	4. 00
Total	100. 00

Sales of osmiridium were 5,891 ounces in 1950 compared with 6,471 ounces in 1949. That sold in 1949 had the following average composition:

Metal:	*Percent*
Osmium	28. 02
Iridium	24. 86
Ruthenium	12. 58
Platinum	11. 28
Gold	3. 03
Rhodium	. 71
Balance (undetermined)	19. 52
Total	100. 00

The following is excerpted from an unpublished report on Platinum in Africa prepared by J. M. Warde, African Division, Foreign Minerals Region of the Bureau of Mines (December 1950):

* * * The bulk of the Union output comes from platinum ore occurring in the Merensky Reef, a horizon of the Bushveld complex in the Transvaal. The Merensky Reef constitutes one of the largest reserves of platinum in the world. It has been located at intervals over a distance of about 100 miles in the Brits and Rustenburg districts and some 40 miles in the Potgietersrust district. Average values of platinum metals in the Merensky Reef in the Lydenburg district are low, only about .10 ounces per ton over a large area tested. In the Rustenburg area, it ranges between .25 and .35 ounces per ton over stoping widths of about 30 inches through stretches measuring 5,000 to 18,000 feet along the strike and several hundred feet along the dip. The Rustenburg Platinum Mines Ltd., under the aegis of the Johannesburg Consolidated Investment Corporation Ltd., is the only company now engaged in mining the Merensky Reef. This Company absorbed a number of former producers and in 1949 expanded its mining and milling facilities and acquired the assets of the Union Platinum Mines Ltd. Combined milling capacity now controlled by the Rustenburg Platinum Mines Ltd., totals 70,000 tons of ore per month. * * * The platinum metals are recovered at the Company's reduction works by a combination of gravity concentration and flotation. By the former, a marketable concentrate of crude metallics averaging about 22 percent platinum-group metals is produced. The flotation concentrate consists of platiniferous sulphides of copper, nickel and iron, and gangue. This is smelted and the nickel-copper matte, which contains about 43 ounces per ton of platinum-group metals, is the product shipped.

The remainder of the production of the Union is osmiridium, a byproduct of gold mining in the Witwatersrand and extensions. The Union has for many years been the leading producer of osmiridium which occurs in minute quantities in the Witwatersrand conglomerates. Together with gold, the mineral is retained on corduroy tables during milling operations. The gold is removed by amalgamation and the osmiridium is further concentrated on shaking tables. An area in the center of the Far East Rand produces from .3 to 1.0 ounce of osmiridium per 1,000 tons of ore milled. Production from adjacent mines is much smaller. From 6 mines west of Boksburg the production varies from .10 to .25 ounce per 1,000 tons of ore crushed. During the past 15 years the osmiridium output from the Union has ranged between 5,000 and 7,000 ounces per annum The composition of the osmiridium is variable. It contains a number of platinum-group metals and gold which occur within the limits given below:

Metal:	*Range (percent)*
Osmium	44. 60–24. 13
Iridium	40. 55–21. 33
Ruthenium	16. 83– 8. 73
Platinum	18. 99– 3. 89
Gold	14. 94– 0. 05
Rhodium	1. 04– 0. 34

Other potential sources of platinum metals in the Union are dunite pipes in the Lydenburg district, contact metasomatic deposits of the Potgietersrust district, lode deposits of the Waterburg district, and alluvial and eluvial deposits in the platinum bearing areas described. Platinum has also been reported from many other localities of which Insizwa in Pondoland and Vlakfontein in the Rustenburg district are of interest in that the platinum is associated in minute quantities with copper and nickel bearing sulphides. * * *

The crude products obtained in the Rustenburg district are exported to England for treatment. The following account of treatment methods is excerpted from an article in The Mining Journal.[5]

Extensions at Brimsdown to Handle Rustenburg Ores

The Rustenburg platinum metals are shipped from the Union to London as a matte and are recovered here. In order to deal with the increasing scale of output from the Rustenburg Mines—to which have now to be added that of the Union Platinum property—very considerable additions to the treatment plant have been recently completed at the Brimsdown works of Johnson, Matthey and Co., Limited. * * *

* * *

Treatment at Brimsdown

The matte is smelted with salt cake. This is known as the "top and bottom" process, in which sodium copper sulphide constitutes the top and nickel sulphide the bottom. The copper sulphide "tops" are melted in a reverberatory and from thence are passed to a copper converter where they are blown to blister copper and cast into anodes for electro refining. The nickel sulphide "bottoms" are ground and roasted in rotary-hearth furnaces to nickel oxide. This is then briquetted with coal, reduced to metallic nickel in a reverberatory and cast into anodes, which are refined electrolytically.

The adherent slime containing the platinum metals, with a fairly large proportion of nickel, is removed from the anode, roasted and treated with sulphuric acid for the extraction of base metals. The residue containing the platinum metals, copper, nickel and lead, is treated for complete elimination of base metals, and the platinum metals brought into solution for their separation and individual purification.

Thus the principal features of the foregoing treatment are designed to effect a complete recovery of the platinum metals and at the same time yield electrolytically refined copper and nickel. * * *

Potash

By Bertrand L. Johnson and Nan C. Jensen

GENERAL SUMMARY

THE long-term upward trends in the production and sales of domestic marketable potassium salts, which had been interrupted in 1949 by the New Mexico strike, were resumed in 1950. Both production and sales reached record highs (see fig. 1). Exports declined in both quantity and value from 1949, but imports increased greatly in both categories. Apparent domestic consumption of potash (K_2O) in 1950 increased 339,629 tons from the 1949 figure, but stocks in producers' hands at the end of 1950 were larger than in other recent years.

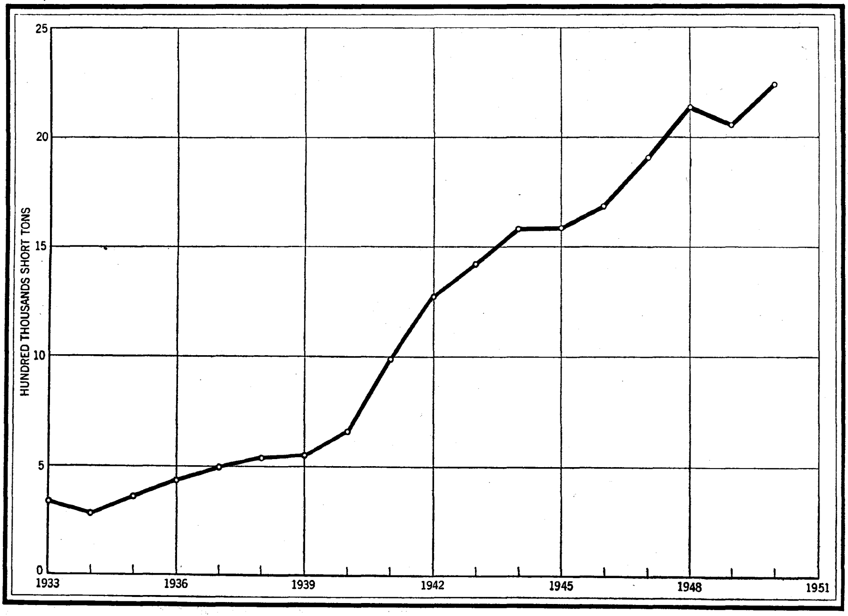

FIGURE 1.—Production of marketable potassium salts in the United States, 1933–50.

TABLE 1.—Salient statistics of the potash industry in the United States, 1948–50

	1948	1949	1950
Production of potassium salts (marketable) short tons	2,138,493	2,056,609	2,241,044
Approximate equivalent K_2O do	1,139,881	1,118,395	1,286,762
Sales of potassium salts by producers do	2,148,807	2,062,789	2,220,803
Approximate equivalent K_2O do	1,143,339	1,120,653	1,275,494
Value at plant	$35,998,758	$35,105,799	$39,695,038
Average per ton	$16.75	$17.02	$17.87
Imports of potash materials short tons	52,890	43,719	379,654
Approximate equivalent K_2O do	27,181	19,216	199,493
Value	$3,063,547	$2,358,557	$13,994,969
Exports of potash materials short tons	128,068	[1] 126,757	117,137
Approximate equivalent K_2O [2] do	69,733	[1] 69,558	65,047
Value	$8,288,955	[1] $7,110,835	$5,534,271
Apparent consumption of potassium salts [3] short tons	2,073,629	[1] 1,979,751	2,483,320
Approximate equivalent K_2O do	1,100,787	[1] 1,070,311	1,409,940

[1] Revised figure.
[2] Estimate by Bureau of Mines.
[3] Quantity sold by producers, plus imports, minus exports.

Articles were published on the domestic potash industry and on potash reserves.[1]

PRODUCTION AND SALES

In spite of the strike in the New Mexico potash field, which, starting in November 1949, had continued through January 1950, the upward trend in the annual production and sales of domestic marketable potassium salts, which had been in evidence from 1934 to 1948, was resumed in 1950. Total domestic output of potassium salts reached a record high of 2,241,044 short tons, with an equivalent K_2O content of 1,286,762 tons. Sales in 1950 were 2,220,803 tons, with an equivalent K_2O content of 1,275,494 tons; both likewise were records. The value of sales rose to $39,695,038, also a new high. The average value per ton of potassium salts sold increased from $17.02 in 1949 to $17.87 in 1950.

Production of the 60–62 percent K_2O minimum grade of muriate of potash increased markedly in 1950 over 1949, rising to a record high, but there was a notable decrease in the output of lower-grade muriate. The production of manure salts dropped very sharply—from 177,315 tons in 1949 to only 21,532 tons in 1950. The combined output of sulfate of potash and sulfate of potash-magnesia reversed its recent trend and rose in 1950 to a new high of 223,109 tons (see fig. 2).

The Western States remain dominant in domestic production of potash. California, New Mexico, and Utah furnished virtually all of the 1950 output, the largest part coming from the deeply buried Permian sylvite and langbeinite deposits in the Carlsbad region of southeastern New Mexico. The eastern United States supplied only a small quantity—from Maryland and Michigan.

1948	7	2,138,493	1,139,881	7	2,148,807	1,143,339	35,998,758	25,093	11,211
1949	8	2,056,609	1,118,395	8	2,062,789	1,120,653	35,105,799	18,913	9,066
1950	7	2,241,044	1,286,762	7	2,220,803	1,275,494	39,695,038	39,154	20,328

The potash-producing companies in the United States in 1950, by States, were as follows:

California:
- The American Potash & Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif. (plant at Trona, on Searles Lake, Calif.).

Maryland:
- North American Cement Corp., 41 East Forty-second Street, New York 17, N. Y. (plant at Security, Md.).

Michigan:
- The Dow Chemical Co., Midland, Mich. (brine wells and plant near Midland, Mich.).

New Mexico:
- International Minerals & Chemical Corp., 20 North Wacker Drive, Chicago, Ill. (mine and plant near Carlsbad, N. Mex.).
- Potash Company of America, Carlsbad, N. Mex. (mine and plant near Carlsbad, N. Mex.).
- United States Potash Co., Inc., 30 Rockefeller Plaza, New York 20, N. Y. (mine and plant near Carlsbad, N. Mex.).

Utah:
- Bonneville, Ltd., 540 West Seventh South, Salt Lake City 4, Utah (plant near Wendover, Utah).

REVIEW BY STATES

California.—The American Potash and Chemical Corp. continues to be the only potash-producing company operating in the Pacific Coast States. A potash-bearing brine is pumped from the saturated crystalline salt mass of Searles Lake in southeastern California. Potassium chloride and potassium sulfate are marketed. Two papers descriptive of the Searles Lake operations have been recently published.[2]

Maryland.—Maryland has but one producing potash company, the North American Cement Co., Security, Washington County, near Hagerstown. At this plant byproduct potash was recovered in 1950 from cement-kiln flue dust. The product—an impure sulfate of potash of low potash content—was sold for agricultural use. This operation continues to be the only one of its kind reported in the United States.

Michigan.—The Dow Chemical Co. was the only potash-producing company in Michigan in 1950. Potassium chloride was produced from its natural brine wells at Midland, Mich.

New Mexico.—Mine production of potassium-bearing salts in the Carlsbad region of New Mexico increased 20 percent (nearly a million tons) over 1949, surpassing the previous high of 1948. The equivalent K_2O content of the mined salts decreased slightly, however, from 21.00 percent in 1949 to 20.65 percent in 1950. The quantity of merchantable potash salts produced in 1950 also increased over 1949, as did quantity and value of sales.

All three of the producing companies—International Minerals & Chemical Corp., Potash Company of America, and United States Potash Co.—mined sylvite (potassium chloride), and one—International Minerals & Chemical Corp.—also mined langbeinite (a potassium-magnesium sulfate). The greater part of the mine production of the region was sylvite ore (sylvinite), most of which was processed

to yield 60 percent or higher-grade muriate. This was produced by all three companies. Potassium sulfate and potassium-magnesium sulfate (sulfate of potash-magnesia) were produced from langbeinite by the International Minerals & Chemical Corp. in the refinery at its mine near Carlsbad.

TABLE 4.—Production and sales of potassium salts in New Mexico, 1946–50, in short tons

Year	Crude salts [1]		Marketable potash salts				
	Mine production		Production		Sales		
	Gross weight	K_2O equivalent	Gross weight	K_2O equivalent	Gross weight	K_2O equivalent	Value
1946	4,309,649	893,126	1,428,860	782,166	1,432,565	789,473	$27,187,228

1950	5,802,004	1,198,021	1,904,565	1,086,996	1,878,094	1,072,772	31,944,365

[1] Sylvite and langbeinite.

The strike called on November 19, 1949, by the CIO Mine, Mill, and Smelter Workers' Union Local 415 at the three potash-producing plants of the Carlsbad region ended January 31, 1950, after 73 days.

Several papers were published on developments in the potash industry of New Mexico.[3]

In 1950 the International Minerals & Chemical Corp. was sinking a third shaft at its Carlsbad mine and planning to sink another early in 1951 to develop existing ore reserves. These new shaft sites were sealed from the surface before sinking by drilling a series of holes around the shafts into the known water-bearing stratum and sealing the entire area by pregrouting with concrete under pressure.

Recent improvements at the mine of the Potash Company of America have included a grinding-mill extension, a new compressor building, a new research building, and a new refinery control laboratory. Construction was begun in January 1950 on a research pilot-plant building. The new hoist at the mine is reported to be driven by two 500-hp. G-E motors which raise one 8-ton ore bucket per minute from 1,150 feet below ground. The sinking of No. 3 shaft is said to have been abandoned when it ran into heavy flows of water and running sand. No. 4 shaft, started later, is also said to have encountered quicksand, and work stopped. In July 1950, however, it is reported that a contract was awarded for completing this shaft, using a freezing method of stabilizing the quicksand.

The Potash Company of America is building a new plant at Dumas, Tex., for the production of sodium sulfate, potassium sulfate, and hydrochloric acid without the direct use of sulfuric acid. This plant is to use the Hargreaves process, or a modification of it, in which sulfur dioxide, steam, and air are blown through solid sodium chloride or

potassium chloride to produce the sulfates and hydrochloric acid. The sulfur used will be that recovered from west Texas sour natural gas. The sodium chloride and potassium chloride will come from their Carlsbad operations. The plant was expected to be in operation by the end of 1950. The Hargreaves process was formerly used extensively, but in recent years only one plant in this country has operated the process.

The United States Potash Co. started the installation of a new steel head frame at its No. 2 shaft for auxiliary hoisting and servicing during 1950.

The Duval Texas Sulphur Co. was organized in 1926 under the laws of Texas as a direct subsidiary of the United Gas Corp. and an indirect subsidiary of the Electric Bond & Share Co. The name of the company was changed in February 1950 to Duval Sulphur & Potash Co., with main offices in the Esperson Building, Houston 2, Tex. The mail address for the potash mine is P. O. Box 510, Carlsbad, N. Mex. This company began exploring for potash on Federal and State lands in the Carlsbad region in October 1947. By November 1, 1949, the company had drilled 60 holes. Construction of two mine shafts was started early in 1950. These are to be 1,500 feet deep. The potash beds are reported to be between 1,200 and 1,500 feet below the surface. The plant that the company proposes to build is being designed to mine and mill approximately 720,000 short tons of potash ore per year. A spur track is to connect the mine with the line of the Atchison, Topeka & Santa Fe Railway. Ashcraft-Wilkinson Co., Atlanta, Ga., will be the exclusive sales agent for the muriate of potash produced.

The Southwest Potash Corp., wholly owned subsidiary of the American Metal Co., Ltd., was formed in 1948 to hold Federal and State permits on lands in the potash field of Carlsbad, N. Mex. In 1950 this corporation decided to develop the large potash deposit it had discovered in 1949 near Carlsbad, mainly on Government lands. By the end of 1950, design and engineering work on the mine and plant were well advanced. Two circular shafts, 20 and 15 feet in diameter, were being sunk, and construction of surface installations, including power line, railroad, and a 24-mile water-pipe line, had been started. Production was expected to begin in the second half of 1952. The mine and mill will be capable of handling 2,500 tons of ore daily, which will be treated by the flotation process to produce standard muriate of potash (KCl), with a minimum equivalent of 60 percent K_2O, for use as a fertilizer. The initial capacity of the plant is to be approximately 185,000 tons of K_2O per year.[4]

Pennsylvania.—The Publicker Industries, Inc., reports that in 1950 it made no recovery of byproduct potassium-sulfate-bearing material from molasses residues at its Bigler Street distillery in Philadelphia. The 1949 output was sold for use as a fertilizer ingredient.

Utah.—Commercial production of potash in Utah in 1950 was still restricted to the operations of Bonneville, Ltd. This company continued to produce potassium chloride from the potassium-bearing brines of Salduro Marsh, at its plant near Wendover, Tooele County,

---

American Metal Co., Ltd., Annual Report for the 63d year, ended Dec. 31, 1950, 44 pp.

northwestern Utah. A brief description of the operations there was published during the year.[5]

No production of alunite was reported from the Marysvale district. It is stated, however, that some of the alunite deposits in that area are being worked for uranium ores.

Uranium mineralization of probable late Tertiary age has been found to be widespread in the Marysvale alunite area, in volcanic and plutonic igneous rocks of Tertiary age. A genetic relationship between this type of mineralization and the well-known alunite occurrences has not yet been determined.[6]

CONSUMPTION

Apparent consumption of potash (K_2O) in the United States and its possessions, as determined by subtracting exports from the sum of imports and producers' sales, increased from 1,070,311 short tons in 1949 to 1,409,940 tons in 1950. The relationship of apparent consumption to sales of domestic producers, as reported to the Bureau of Mines, is shown in figure 3.

TABLE 5.—Apparent consumption [1] of potash in the United States, 1945–50, in short tons

Year	Potassium salts	Approximate equivalent K_2O	Year	Potassium salts	Approximate equivalent K_2O
1945	1,490,112	808,688	1948	2,073,629	1,100,787
1946	1,568,721	867,096	1949	[2] 1,979,751	[2] 1,070,311
1947	1,879,441	1,011,142	1950	2,483,320	1,409,940

[1] Quantity sold by producers, plus imports, minus exports.
[2] Revised figure.

According to the American Potash Institute (press notice, February 24, 1951):

Deliveries of potash in North America during 1950 reached a new record high amounting to 2,579,085 short tons of salts containing an equivalent of 1,465,599 tons K_2O. This was an increase of 319,806 tons K_2O or 28 percent over 1949. Deliveries by the five leading domestic producers were the highest ever achieved, 1,255,218 tons K_2O, in spite of a strike which greatly reduced production in the Carlsbad area in January. Imports were 210,381 tons K_2O, the highest since 1938.

Deliveries for agricultural purposes in the continental United States for 1950 were 1,264,119 tons K_2O, an increase of 291,965 tons over 1949. Canada received 54,726 tons K_2O, Cuba 11,936 tons, Puerto Rico 24,728 tons, and Hawaii 13,430 tons. Exports to other countries amounted to 16,313 tons K_2O.

In this country the potash was delivered in 46 States and the District of Columbia. Illinois and Ohio with over 100,000 tons K_2O were the leading States in deliveries of agricultural potash and were followed in order by Georgia, Virginia, Florida, Maryland, North Carolina, and Indiana, each taking more than 70,000 tons K_2O during the year. Due to shipments across State lines, consumption does not necessarily correspond to deliveries within a State.

The 60 percent muriate of potash continues to be by far the most popular material, comprising 79 percent of the total K_2O delivered for agricultural purposes. The 50 percent muriate of potash made up nearly 13 percent, manure salts less than

[5] Newsweek, Salty Harvest: Vol. 36, No. 14, Oct. 2, 1950, p. 52.

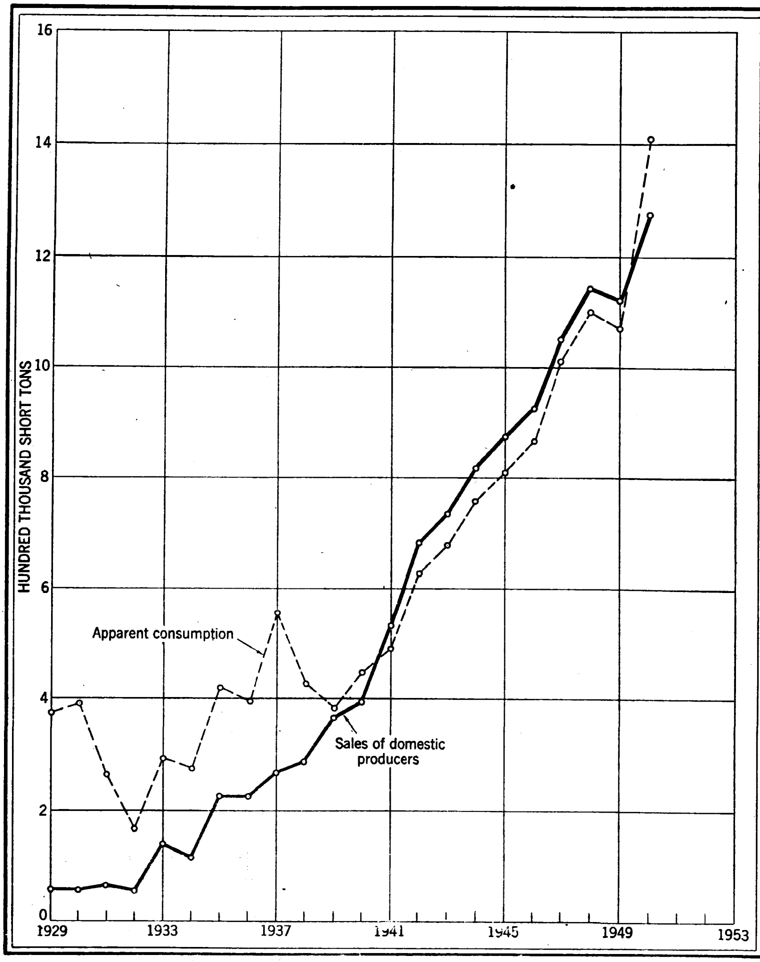

FIGURE 3.—Comparison of apparent domestic consumption of potash (K_2O) and sales of domestic producers of potash in the United States, 1929–50.

1 percent, and sulphate of potash and sulphate of magnesia 8 percent of deliveries. The increased refining capacity and the demand for potash in the more concentrated form have resulted in a marked decline in manure salts.

Deliveries for chemical purposes in 1950 were 121,330 tons of muriate of potash containing an equivalent of 76,111 tons K_2O and 8,390 tons of sulphate of potash containing 4,236 tons K_2O. The total chemical deliveries of 80,347 tons K_2O were 13,782 tons or 21 percent more than in 1949.

Deliveries of agricultural and chemical potash in North America from 1940 to 1950 are shown in the accompanying diagram (fig. 4).

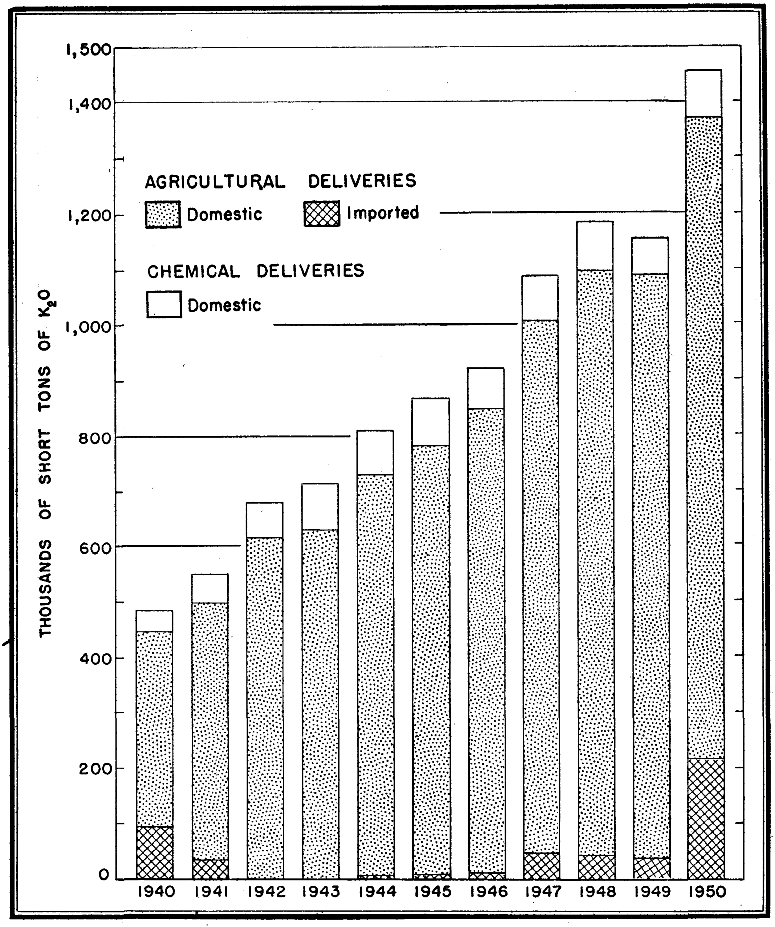

FIGURE 4.—Potash deliveries, by use groups, in North America, 1940–50 (American Potash Institute).

TABLE 6.—Deliveries of potash salts in 1950, by States of destination, in short tons of K_2O

STOCKS

Stocks in producers' hands at the end of 1950 were larger than at the end of any of the three preceding years. The trend since 1922 is presented graphically in figure 5; precise data for 1946–50 are included in table 3.

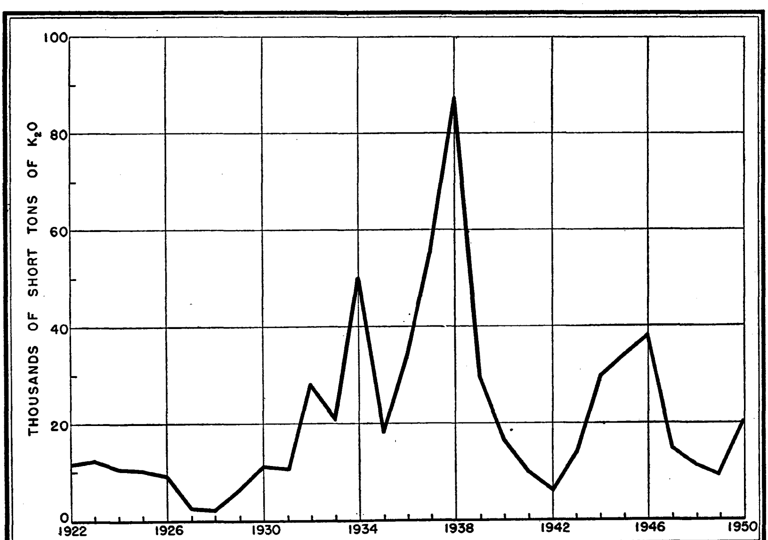

FIGURE 5.—Producers' stocks of potassium salts at end of year, 1922–50, in short tons of equivalent potash (K_2O).

PRICES

Prices for potash in the early part of 1950 were the same as those listed in the producers' price schedules for the 1949–50 season. (See Minerals Yearbook, 1949, p. 1034.)

On May 10, 1950, the American Potash & Chemical Corp. issued its price schedules for agricultural-grade Trona potash for the 1950–51 season. Its list price of muriate of potash, 60 percent K_2O minimum, f. o. b. Trona, Calif., bulk in carlots of not less than 40 tons, was quoted at 48.5 cents per unit K_2O. On October 13, 1950, the list price of the muriate was advanced 2 cents a unit to 50.5 cents per unit K_2O. The May 10, 1950, list price of sulfate of potash, 95–98 pereent K_2SO_4, was 84 cents per unit K_2O. This price was also advanced 2 cents a unit on October 13, 1950, to 86 cents per unit K_2O. The list prices of both muriate and sulfate were subject to seasonal discounts. There were additional charges for shipments in bags.

Price schedules for New Mexico potash for agricultural purposes for 1950–51 were issued in April and May 1950 by the three producing companies, as given in the following table. These prices were all higher than those for 1949–50, and they were raised again late in 1950.

TABLE 7.—Prices of agricultural potash quoted by producers, f.o.b. Carlsbad, N. Mex., for 1950–51 season[1]

Salt	Grade	Brand	Producer	Price: Period	Price: Per unit K_2O
Muriate of potash	62–63 percent K_2O	Sunshine State	U. S. P.	June 1–Oct. 19	$0.40

[1] Bulk in carlots (minimum 40 tons). Subject to seasonal discounts.
[2] International Minerals & Chemical Corp. quoted muriate of potash, 50–51 percent K_2O, packed in 5-ply plain paper bags, 100 pounds each, at $23.95 per short ton June 1–Oct. 8; $25.50 Oct. 9–May 31.
[3] Per short ton.

FOREIGN TRADE [7]

Imports.—Total imports of potash salts in 1950 were very much greater than in 1949, increasing from 43,719 short tons (19,216 tons K_2O) in 1949 to 379,654 tons (199,493 tons K_2O) in 1950, owing principally to a very large increase in the arrivals of potassium-bearing fertilizer materials. The total value of imports increased markedly—

[7] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

from \$2,358,557 in 1949 to \$13,994,969 in 1950. Germany, France, Spain, and Poland-Danzig, in the order given, were the principal supplying countries in 1950. A small quantity came from Russia.

Potash for fertilizer use constituted 97 percent of the total K_2O imports in 1950, 5 percent more than in the previous year. Imports for chemical use fell from 8 percent in 1949 to 3 percent of the total in 1950.

The principal potash salt imported in 1950 for fertilizer use was muriate (chloride), which entered principally from Germany, France, Spain, and Poland-Danzig. Considerable potassium sulfate came in from Germany. Chile supplied 20,409 tons (2,857 tons K_2O) of crude sodium-potassium nitrate mixtures, considerably over the amount that entered in 1949. A much larger quantity of potassium carbonate arrived in 1950 than in 1949, principally from Germany.

[1] Approximate equivalent as potash (K_2O)—1949–50: 37 percent.
[2] Less than 0.5 ton.

Exports.—Exports of potash materials declined in 1950 both in quantity and value, dropping to 117,137 short tons (65,047 tons K_2O) and $5,534,271. Decreases were registered in both fertilizer and chemical potash. The fertilizer materials (107,972 short tons) went mainly to Canada, but considerable tonnages also went to Cuba and Brazil. Exports of chemical potash salts (9,165 tons) were more uniformly distributed, Canada, Brazil, and Mexico being the leading recipients, with 2,960 tons, 2,161 tons, and 1,222 tons, respectively.

[1] In addition to countries listed, Chile, Ethiopia, Iran, Italy, Korea, and U. S. S. R. are reported to produce potash salts, but statistics of production are not available; estimates by senior author of chapter included in total. (Estimate for Chile included only for 1949–50.)
[2] Data not available; estimate by author of the chapter included in total.
[3] Estimate.
[4] Exports plus consumption, 1945–46.
[5] Production in fiscal years 1945–48 is for Palestine. Extracted from waters of Dead Sea.
[6] Production January through April when work was discontinued due to destruction of the Palestine Potash Co.'s large plant during hostilities of 1948.

The potash deposits of Germany, France, and Spain were described in a paper published early in 1950.[8]

Australia.—Potassium fertilizer is produced in Australia principally by the State Alunite Works of Western Australia, but small amounts are also obtained by precipitation of the flue dust from the kilns of some cement works.[9]

The plant of the State Alunite Works at Lake Campion has been producing a crude fertilizer containing 30 percent K_2O at a rate of 100 tons per week. The works are reported to be testing several process modifications that promise to give a better potassium yield and to enable the recovery of sodium sulfate and potassium chloride in addition to potassium sulfate. The present expansion program looks forward to a daily production of 40 tons of fertilizer containing 50 percent K_2O.

The potassium-bearing deposit consists of the finely divided mud, composed mainly of particles of alunite, forming the bed of the lake. This alunitic mud has an average content of 60 percent alunite and 21 percent silica; when air-dried it contains 13.5 percent potassium sulfate. Details of the process follow: [9]

By the original process the crushed airdried mud is heated in a rotary kiln to 700 degrees C. to 800 degrees C. so as to render the potash soluble in the raw material. The calcined fragments after cooling and reiheating are then passed on to a continuous leaching plant. It has now been establ shed that a more economic yield of potassium salts can be obtained by roasting a finely powdered mixture of the material with common salt to about 600 degrees C. and quenching the roasted charge with water, brine, or, preferably, magnesium chloride solution.

* * * Ordinarily only crude sulphate of potassium is obtained by fractional crystallization of the liquor, followed by centrifuging. However, by adding salt to the effluent and increasing the temperature to near boiling point anhydrous sodium sulphate can be made to crystallize out. The solution separated from the anhydrous sodium sulphate is evaporated and the mixed salts thus obtained are subjected to an ingenious flotation treatment, yielding a practically pure potassium chloride, mixed salt and glaserite.

The problem of separating the sulphates of sodium and potassium has been solved by forming a saturated solution (with respect to K) at about boiling point. Common salt is then added to the solution until it is saturated with respect to NaCl. The potassium chloride is crystallized out by cooling the solution in two stages, ultimately to 5 degrees centigrade.

Canada.—Discovery of potash in the Duperow-Crown No. 1 well southwest of Biggar has been officially announced. The Duperow-Crown No. 1 well was drilled and cored by the Tidewater Associated Oil Co., which turned the salt-potash core over to the Department of Natural Resources for sampling. From analyses by the Dominion Bureau of Mines, this core showed a section containing 19 percent potassium oxide over 20 inches, or a larger section of 4 feet 2 inches in length with a potash content of 9.8 percent. The salt-potash zone was encountered at a depth of over 4,000 feet.[10]

The Province of Saskatchewan has announced regulations under the Mineral Resources Act for leasing crown-owned potash rights to private concerns. The regulations provide for the issuance of exploration permits, leasing of mineral rights on a 21-year renewable term, reservation of areas as mineral reserves, and royalties. A maximum

[10] Canadian Mining Journal, Saskatchewan, Potash Discovery: Vol. 72, No. 1, January 1951, p. 81.

of two exploration permits for areas up to 100,000 acres each may be issued to one applicant. Requirements include a deposit of $20,000 as a guarantee and completion of $60,000 worth of work the first year and $80,000 in each succeeding year.

Saskatchewan potash is said to have been discovered during oil-well drilling not only in the Biggar, but also in the Unity, and Yorkton areas. All discoveries so far are said to have been on crown-owned land.

Ethiopia.—Exploitation of potash deposits in the northeastern part of Ethiopia near the Eritrean border are reported to have yielded a production of about 2,000 metric tons in 1949, all of which was used domestically for fertilizer. Concessions for development are reported to have been granted to an American-Swiss syndicate, which intended to begin operations before the end of 1950.

France.—Beds of sylvinite containing 14–19 percent K_2O are being mined in the Landes south of the town of Dax by the Société Minière du Sud Ouest de la France, with the help of the Mines Domaniales de Potasse d'Alsace. The present depth of the mine shaft is 725 meters, and there is a total of 10 kilometers of workings at six different levels. The mine has just been equipped for the extraction of 600 tons of ore a day, which will be used in agriculture in the crude state pending construction of a concentration plant at present under consideration. Reserves are estimated to be about 3 million tons of ore.[11]

Israel and Jordan.[12]—All operations of the Palestine Potash, Ltd., on the Dead Sea have been at a standstill since April 1948. The plant at the northern end of the sea remains in the hands of Hashemite Jordan. No representative of the company has been able to visit these premises, but the company reports that it has been told the buildings have been largely demolished and their contents removed. The company property at the south end of the Dead Sea, which had been occupied by the Israel military forces in May 1948, was handed back to the company in August 1949: it is reported to have been in fair condition. Palestine Potash, Ltd., continued negotiations in 1950 calculated to resume operations at a rate of 135,000 tons of potash per year. The Israel Government is constructing a road from the works at the southern end of the Dead Sea to Beersheba. After completion of this road it will be possible for the company to transport potash from the southern plant to an Israel port.

Spain.—According to Boletin Oficial del Estado, the Spanish Ministry of Industry and Commerce has granted exploitation rights to the Instituto Nacional de Industria (INI) of potassium salt deposits in the Province of Navarra, consisting of about 19,000 hectares. According to the application made by INI to exploit these deposits, discoveries of rich beds of potassium salts have been made in the area by the Spanish Geological Institute. The deposits are said to be close to the surface, conveniently located with regard to rail and highway transportation, and not too distant from port facilities. It is believed that it will be at least 5 years before mining of any

Palestine Potash, Ltd., acting chairman's speech to the 20th Annual General Meeting, October 31, 1950, 1 p.

sizable commercial quantities will be effected in this area by INI, principally because of the large expenditures involved in purchasing and installing suitable mining machinery and transportation equipment.[13]

United Kingdom.—Considerable information is now available regarding the recently discovered Permian potash field in the northeastern part of the North Riding district of Yorkshire, England, near the North Sea coast town of Whitby.[14]

The potash deposits lie at the gently sloping western end of the great potash-bearing basin of Zechstein (Permian) rocks, which also contains the great German deposits. These potassium-bearing sediments were laid down in a great sea, which in Zechstein time extended from what is now central Europe westward across the area now occupied by the present North Sea into the region of present northern England and Iceland. The Yorkshire potash beds are apparently nearly horizontal, dipping gently northeastward under the North Sea. The depth to the upper potash bed near the coast is 3,867 feet.

In that portion of the Permian beds cut in the existing borings, three thick salt beds were passed through. The sylvite (KCl) deposits lie 3,675 to 4,246 feet below the surface. One sylvite zone occurs in the upper salt bed and another in the middle salt bed. These two zones are separated from each other by intervals ranging from 48 to 137 feet in the different borings. Large quantities of polyhalite occur in the lower salt bed in two of the boreholes; the polyhalite-bearing zone extends to below 5,000 feet below the surface.

Development work in this area has been restricted to well-drilling. Five wells have cut the potash beds—four in the Whitby area and one near Robin Hood Bay, 4 miles southeast. The D'Arcy well in the Whitby area was put down in 1938. The other three wells were drilled in 1948 and 1949 by Imperial Chemical Industries.

In the Whitby area the reserves have been estimated to underlie an area of 12 square miles. The sylvite-bearing zone in the upper salt bed, 20 feet thick with an average content of 17 percent KCl, is estimated to contain 63.5 million tons of potassium chloride (KCl). The potash-bearing zone in the middle salt bed, averaging 25 feet in thickness, with a 32-percent potassium chloride (KCl) content, is estimated to contain 150 million tons KCl. Assuming a total reserve of 200 million tons, 35 percent of which can be extracted, gives a recoverable reserve of 70 million tons of KCl. The full extent of the field is not yet known, and there may be much more potash than now estimated, as there is no evidence that the present boreholes lie on the edges of the deposit.

---

13 Bureau of Mines, Mineral Trade Notes: Vol. 30, No. 2, February 1950, p. 43.

14 Fleck, Alexander, Deposits of Potassium Salts in North-East Yorkshire: Chem. and Ind. (London), Oct. 17, 1950, pp. S1–S15. Paper read before the Newcastle Section of the Society of Chemical Industry in the Lecture Theatre of the New Chemistry Department, King's College, Newcastle-upon-Tyne, on Oct. 17, 1950.

Chemical Trade Journal (London), Potash in North Yorkshire—Some Possibilities of Economic Production: Vol. 125, 1949, pp. 123–124.

Lees, G. M., and Taitt, A. H., The Geological Results of the Search for Oil Fields in Great Britain: Quart. Jour. Geol. Soc. London, vol. 101, 1945, pp. 252–317.

These deposits lie at a greater depth than those of any potash region now producing and are at greater depths than any known deposit except the recently discovered field in the Province of Saskatchewan, Canada, where the potassium-bearing beds lie 3,466 to 7,677 feet below the surface. The Yorkshire beds, however, compare well in thickness and potash content with the average of commercially worked beds.

British consumption is said to be currently about 235,000 tons of KCl a year for agricultural use, and this could well be increased to 400,000 tons a year, with another 100,000 tons for industrial use. Assuming an annual United Kingdom consumption of 500,000 tons of KCl, the present known recoverable reserve would suffice for 140 years. The prospect of satisfying the demand from domestic sources, with a further likelihood of having an export surplus, is one of great importance to the British economy. When developed, these potash resources will make the United Kingdom self-sufficient and will create a new British industry. There is no indication as yet as to when production on a commercial basis will commence, the chief problem to be solved at the moment being choice of the extraction method to be used.

Salines—Miscellaneous

By Joseph C. Arundale and F. M. Barsigian[1]

GENERAL SUMMARY

INCREASING production and sales, which began in the latter part of 1949 after a slump in the earlier part of the year, continued into 1950, and sales of many chemical materials set new all-time records. The military activity in Korea starting near the middle of the year, spurred industrial activity and caused demand for many of the chemical raw materials to rise sharply. At the end of the year production of many chemical compounds was sharply accelerated as the National Defense Program got under way. In this period the prices of many chemical raw materials were also increased.

Boron minerals were produced at a record high. Sales of bromine compounds were the highest for any year except the war year 1944. Sales of calcium chloride approached a record. Imports of iodine from Japan continued to increase. There was a serious shortage of soda ash because of increased demand and interruption of production by a strike in the industry. Salt-cake supplies were tight at the end of the year. The output of sodium metal was increased by production from a new plant.

CALCIUM CHLORIDE

Sales of calcium chloride increased nearly to the record high of 1948. Inventories generally were sufficient to meet all requirements.

An article was published reviewing the use of calcium chloride in portland cement. With the object of producing low-alkali cement, the amount of sodium oxide and potassium oxide in portland-cement clinker is reduced by adding calcium chloride to the kiln feed. The molecular sum of the alkalis removed was found to be proportional to the quantity of calcium chloride added.[2]

The Calcium Chloride Association sponsored development of a device for feeding flake calcium chloride to concrete mixers on large concrete projects and in ready-mix concrete plants. The flake is fed from a hopper into a cylindrical container, the capacity of which can be adjusted by means of removable wooden plugs. When a lever on the container is moved it revolves the cylinder. When the opening is directed toward the bottom of the hopper, a measured quantity of calcium chloride is dropped into the mixer. The lever on the side of the cylinder is opened and closed by an arm attached to the skip.[3]

TABLE 2.—Calcium chloride imported for consumption in and exported from the United States, 1946–50

[U. S. Department of Commerce]

Year	Imports		Exports	
	Short tons	Value	Short tons	Value
1946	1, 313	$14, 587	10, 073	$367, 993
1947	250	5, 514	11, 955	502, 818
1948	5	249	11, 456	437, 763
1949	1	20	21, 094	507, 845
1950	1, 881	54, 170	15, 624	403, 406

As a result of increased demand for calcium chloride in Canada, Brunner-Mond & Co., Ltd., undertook a major expansion of its facilities at Amherstburg, Ontario.[4]

A new-type polyethylene-lined paper bag for flake calcium chloride packaging was adopted by Solvay Sales Division, Allied Chemical & Dye Corp. It is said to have high resistance to moisture and long storage life and not to be affected by extremes of temperature.[5]

Dow Chemical Co. increased its production of anhydrous calcium chloride pellets offered for the past two seasons only in limited quantities.[6]

A Bureau of Mines report described the effects of rubber-tired coal-mine shuttle cars on mine road beds dusted with calcium chloride.[7]

The following companies produced calcium chloride (and calcium magnesium chloride) from natural brines in 1950: California Rock Salt Co., 2436 Hunter St., Los Angeles 21, Calif., plant at Amboy, Calif.; Hill Bros. Chemical Co., 2159 Bay St., Los Angeles 21, Calif., plant at Amboy, Calif.; Michigan Chemical Corp., 500 N. Bankson, St. Louis, Mich.; Wilkinson Chemical Co., Mayville, Mich.; Dow Chemical Co., Midland, Mich.; Pomeroy Salt Corp., Pomeroy, Ohio, plant at Minersville, Ohio; Westvaco Chemical Division, Food Machinery & Chemical Corp., South Charleston 3, W. Va.; Liverpool Salt Co., Hartford, W. Va.; and Desert Properties Co., Frank Thomas, receiver, 374 Court St., San Bernardino, Calif., plant at Amboy, Calif. National Chloride Co. of America, Room 634, 354 S. Spring St., Los Angeles, Calif., acquired the Desert Properties Co. on June 1.

[4] Canadian Chemistry and Process Industries, vol. 34, No. 2, February 1950, p. 149.
[5] Chemical Industries, vol. 66, No. 4, April 1950, p. 588.
[6] Wall Street Journal, vol. 136, No. 78, Oct. 2, 1950, p. 2.
[7] Nicholas, R. H., Whittaker, J. S., and Dornenburg, D. D., Shuttle-Car Tire and Road-Bed Study: Bureau of Mines Rept. of Investigations 4624, 1950, 22 pp.

According to Oil, Paint and Drug Reporter, the following prices for calcium chloride were quoted during 1950: Flake, 77 to 80 percent, paper bags, carlots, freight equalized, $22 per ton at the beginning of the year, advanced to $23.50 per ton in July and was quoted up to $25 per ton by October; liquor, works, basis 40 percent, tank cars, $9 per ton at the beginning of the year, increased to $9.75 per ton in July and was quoted up to $10.50 per ton by October; pellets, bags, carlots, works, $29 per ton at the beginning of the year, advanced to $31 per ton in July and were quoted up to $31.25 per ton by October; solid, 73 to 75 percent, drums, carlots, works, same basis, quoted at $20 per ton at the beginning of the year, advanced to $22 per ton at midyear, and further advanced to $23.50 per ton by October. October prices for these materials were still in effect at the end of the year.

BROMINE

Sales exceeding 98,000,000 pounds of bromine and bromine in compounds were the highest for any year except the war year 1944, when ethylene dibromide for manufacturing "knockless" gasoline for military aircraft accounted for much of the higher level of demand. Since the war, increased automotive fuel consumption, a preference for knockless gasoline, and the trend toward higher-compression motors have created a demand exceeding the capacity of producers. Producers were planning expansion of facilities.

The Ethyl-Dow Chemical Co., the largest producer of bromine in the United States, increased its sales of ethylene dibromide from its sea-water operation at Freeport, Tex. The Dow Chemical Co., Midland, Mich., second-largest producer, recovered bromine from Michigan well brines. American Potash & Chemical Corp., 3030 W. Sixth St., Los Angeles 54, Calif. recovered bromine from Searles Lake, and Westvaco Chemical Division, Food Machinery & Chemical Corp., 405 Lexington Ave., New York 17, N. Y., from its sea-water bitterns plant at Newark, Calif. The following recovered bromine from Michigan well brines: Great Lakes Chemical Corp., 502 Michigan National Bank Bldg., Grand Rapids 2, Mich., plant at Filer City, Mich.; Michigan Chemical Corp., 500 N. Bankson, St. Louis, Mich.; and Morton Salt Co., 120 S. LaSalle St., Chicago 3, Ill., plant at Manistee, Mich. Rademaker Chemical Corp., Eastlake, Mich., did not operate in 1950. Pomeroy Salt Corp., Pomeroy, Ohio, plant at Minersville, Ohio, and Westvaco Chemical Division, Food Machinery & Chemical Corp., South Charleston 3, W. Va., also recovered bromine from well brines.

TABLE 3.—Bromine and bromine in compounds sold or used by producers in the United States, 1945–50

Year	Pounds	Value	Year	Pounds	Value
1945	79,709,857	$14,796,229	1948	76,047,551	$14,825,470
1946	42,780,925	8,560,434	1949	88,725,709	16,267,908
1947	78,177,650	14,837,104	1950	98,502,300	18,794,978

TABLE 4.—Bromine and bromine compounds sold by primary producers in the United States, 1949–50

	1949			1950		
	Pounds		Value	Pounds		Value
	Gross weight	Bromine content [1]		Gross weight	Bromine content [1]	
Elemental bromine	3,428,476	3,428,476	$539,355	4,063,314	4,063,314	$760,274
Sodium bromide	808,922	628,128	209,041	993,614	771,541	256,942
Potassium bromide	1,925,997	1,293,307	498,603	2,879,256	1,933,420	748,253
Ammonium bromide	264,862	216,075	77,509	403,190	328,922	116,868
Other including ethylene dibromide	98,407,345	83,159,723	14,943,400	108,079,443	91,405,103	16,912,641
Total	104,835,602	88,725,709	16,267,908	116,418,817	98,502,300	18,794,978

[1] Calculated as theoretical bromine content present in compound.

According to Oil, Paint and Drug Reporter, purified bromine in cases, freight allowed, east of the Rockies, or in drums, lead-lined, delivered, was quoted at 21 cents per pound at the beginning of 1950, advanced to 23 cents per pound about the middle of the year, and advanced again to 25 cents per pound in December. Potassium and sodium bromides, U.S.P., were quoted at 33–34 cents per pound at the beginning of the year and by the end of the year were quoted at 34–35 cents per pound for sodium bromide and 34–37 cents per pound for potassium bromide.

IODINE

Dow Chemical Co. of Midland, Mich., and Deepwater Chemical Co., Ltd., Compton, Calif., recovered iodine from waste oil-field brines in California. As there were only two domestic producers during 1950, the Bureau of Mines may not publish the statistics on production of iodine. Imports of crude iodine increased over the previous year. However, imports are characteristically erratic and generally bear little relation to current rates of consumption. Large stocks usually are maintained in consuming countries, principally the United States, by Chilean Nitrate Sales Corp., sales agent for producers in Chile. Chile remained the principal foreign source of iodine, but imports from Japan nearly doubled those in the previous year and represented a substantial part (20 percent) of imports.

The history of titanium tetraiodide was reviewed and a new method for its preparation described. This compound is of special interest in titanium metallurgy, because it may be decomposed thermally to yield titanium metal. The procedure described may have value for qualitative and quantitative determination of metallic titanium.[8]

[8] Blumenthal, Warren B., and Smith, Howard, Titanium Tetraiodide, Preparation and Refining: Ind. Eng. Chem., vol. 42, No. 2, February 1950, pp. 249-251.

TABLE 5.—Crude iodine consumed in the United States in 1949–50

Compound manufactured	1949			1950		
	Number of plants	Crude iodine consumed		Number of plants	Crude iodine consumed	
		Pounds	Percent of total		Pounds	Percent of total
Resublimed iodine	5	117,965	11	5	145,534	11
Potassium iodide	9	753,911	69	8	1,014,940	73
Sodium iodide	5	42,453	4	5	59,818	4

Organic compounds	12	145,553	13	12	114,148	8
Total	[1] 22	1,094,558	100	[1] 22	1,392,145	100

[1] A plant producing more than 1 product is counted but once in arriving at total.

TABLE 6.—Crude iodine imported for consumption in the United States, 1945–50

[U. S. Department of Commerce]

Year	Pounds	Value	Year	Pounds	Value
1945	220,526	$232,070	1948	592,136	$847,752
1946	886,578	976,190	1949	489,999	719,758
1947	2,260,506	2,756,888	1950	724,858	1,055,946

The iodide process for producing titanium metal has not been used for large-scale production; however, it is a satisfactory means of producing high-purity titanium for studying the metal and its alloys. In preparing pure titanium by the iodide process, crude titanium is reacted with iodine in an evacuated bulb at such temperature as to form volatile titanium iodides, which are decomposed on a heated titanium filament.[9]

Crude iodine advanced during the year to $1.73 per pound for domestic and $1.70 per pound for Chilean imported material, according to Oil, Paint and Drug Reporter.

A very useful publication entitled "Iodine Abstracts and Reviews" is published periodically by the Chilean Iodine Educational Bureau, Inc., 120 Broadway, New York 5, N. Y. This bulletin is prepared by the Chilean Iodine Educational Bureau, Inc., Fellowship at Mellon Institute.

As a result of tests on the use of iodine compounds for disinfecting drinking water, a committee of the National Research Council is recommending to the Surgeons General of Army, Navy, and Air Force that the services adopt and standardize a compound releasing free iodine in concentrations of 8 p. p. m., although only for individual disinfection of drinking water in canteen quantities. The compound used in these tests was sodium iodide.[10]

SODIUM COMPOUNDS

Sodium Carbonate.—The soda-ash industry, facing a general oversupply in 1949 could not meet increased demand in 1950, as industrial activity accelerated and consumers attempted to build up inventory. A serious strike curtailed production from June until September. This shortage of soda ash had an adverse effect on many industries using this basic chemical material. Shortage of soda ash closed many of the country's glass plants. Imports were greatly increased during this period.

As a result of the shortage in supply, consumption of sodium carbonate in the United States in 1950 was slightly less than in 1949. Even greatly increased imports were not adequate to fill the demand-supply gap. Production of pulp and paper, lime-soda caustic, sodium bicarbonate, and many other products suffered from lack of soda ash. Exports were off sharply. Production of natural sodium carbonates—only a small percentage of the total soda ash supply—was nearly double that of 1949.

Natural soda ash was produced in California by the following companies in 1950: American Potash & Chemical Corp., 3030 W. Sixth St., Los Angeles 54, Calif., on Searles Lake; Kaiser Aluminum & Chemical Corp., 1924 Broadway, Oakland 12, Calif., on Owens Lake; Natural Soda Products Co., 405 Montgomery St., San Francisco 4, Calif., plant at Keeler; Pittsburgh Plate Glass Co., Columbia Chemical Division, Bartlett, Calif.; and West End Chemical Co., 608 Latham Square Bldg., Oakland 12, Calif., plant at Westend. Westvaco Chemical Division, Food Machinery & Chemical Corp., 405 Lexington Ave., New York 16, N. Y., reported production from its trona operation in Great River, Wyo.

TABLE 7.—Manufactured sodium carbonate produced [1] and natural sodium carbonates sold or used by producers in the United States, 1946–50

Year	Manufactured soda ash (ammonia-soda process) [2]	Natural sodium carbonates [3]	
	Short tons	Short tons	Value
1946	4,284,231	215,625	$3,427,086
1947	4,524,668	293,051	5,862,178
1948	4,575,452	[4] 288,769	[4] 6,623,280
1949	3,916,016	[4] 200,496	[4] 4,163,714
1950	3,991,199	351,075	7,543,769

[1] U. S. Bureau of the Census.
[2] Total wet and dry (98–100 percent Na_2CO_3). Includes quantities used in manufacturing caustic soda and sodium bicarbonate and quantities processed to finished light and finished dense soda ash.
[3] Soda ash and trona.
[4] Exclusive of Wyoming.

Installation of a new dredge on Lake Magadi in Kenya was expected to greatly increase the production of soda ash.[11]

An interesting article was published on the sodium salts used in detergents.[12]

[11] South African Mining and Engineering Journal, vol. 61, No. 2999, Aug. 5, 1950, p. 801.
[12] Niven, William W., Jr., and Gadberry, Howard, How Sodium Salts Work in Detergents: Chem. Ind. vol. 67, No. 1, July 1950, pp. 61–70.

The Australian Mining & Smelting Co. was granted temporary reserves in Western Australia totaling 5,000 square miles to search for alkalies.[13]

India increased the revenue duty on soda ash from 18 percent ad valorem to 40 percent ad valorem on imports from a British colony and from 30 percent ad valorem to 50 percent on imports under the standard rate applicable to those from the United States and the United Kingdom. In addition, a subsidy of 1 rupee per 112 pounds was to be paid to domestic producers.[14]

According to Oil, Paint and Drug Reporter, the prices of soda ash, dense, 58 percent, bulk, carlots, works, was quoted at $1.10 per 100 pounds at the beginning of the year and increased to $1.20 per 100 pounds in July and $1.30 per 100 pounds in October; light, same basis, was quoted at $1 per 100 pounds at the beginning of the year and advanced to $1.10 per 100 pounds in July and $1.20 per 100 pounds in October.

The consumption pattern of sodium carbonate, as estimated by Chemical Engineering, is shown in table 8.

TABLE 8.—Estimated consumption of sodium carbonate in the United States, 1946–50, by industries, in short tons

[Chemical Engineering]

Industry	1946	1947	1948	1949	1950
Glass	1,400,000	1,440,000	1,370,000	1,190,000	1,225,000
Soap	120,000	135,000	130,000	125,000	105,000
Caustic and bicarbonate	1,128,000	1,130,000	1,137,000	[1] 875,000	700,000
Other chemicals	910,000	1,030,000	1,030,000	950,000	1,050,000
Cleansers and modified sodas	125,000	130,000	135,000	130,000	110,000
Pulp and paper	190,000	260,000	230,000	200,000	200,000
Water softeners	90,000	100,000	110,000	110,000	100,000
Petroleum refining	20,000	22,000	24,000	24,000	24,000
Textiles	77,000	71,000	69,000	55,000	65,000
Nonferrous metallurgy	140,000	190,000	210,000	210,000	245,000
Exports	67,000	107,000	207,000	[1] 76,000	50,000
Miscellaneous	223,000	185,000	220,000	[1] 175,000	151,000
Total	4,490,000	4,800,000	4,872,000	[1] 4,120,000	4,025,000

[1] Revised figure.

Sodium Sulfate.—Sales of natural sodium sulfate in the United States remained virtually the same as in the previous year.

Demand for salt cake was steady in the early months of 1950, and inventories were adequate; however, during the latter part of the year, increased demands from the Kraft paper mills and from glass plants, as a result of the shortage of soda ash, depleted inventories, and by the end of the year the supply situation was somewhat tight.

Imports of crude salt cake and anhydrous sodium sulfate increased sharply in 1950. In Russia sodium sulfate rather than sodium carbonate is used in glass batches. The results of such practice on the roof and walls of the furnace were described in an article.[15]

The following firms reported production in 1950: American Potash & Chemical Corp., 3030 W. Sixth St., Los Angeles 54, Calif., on Searles Lake; Iowa Soda Products Co., P. O. Box 476, Council Bluffs,

[13] Foreign Commerce Weekly, vol. 41, No. 8, Nov. 20, 1950, p. 18.
[14] Oil, Paint and Drug Reporter, vol. 158, No. 6, Aug. 7, 1950, p. 40.
[15] Polinkovskaya, A. I., Savinov, V. T., and Solomin, N. V., Corrosion of Refractories in the Flame Zone of Gas Furnaces: Steklo i Keramika (Glass and Ceramics), April 1950, pp. 16–20.

Iowa, plant at Rawlins, Wyo.; Ozark-Mahoning Co., P. O. Box 449, Tulsa 1, Okla., plant at Monahans, Tex.; and Wm. E. Pratt, P. O. Box 738, Casper, Wyo.

According to Oil, Paint and Drug Reporter, salt cake, bulk, works, was quoted at $22 per ton at the beginning of the year, dropped to $15 per ton in August, and increased to $17 per ton in October. Anhydrous sodium sulfate, technical grade, bags, carlots, works, was quoted at $2.10 per 100 pounds at the beginning of the year and decreased to $2 per 100 pounds early in the year. Glauber's salt, anhydrous, crystalline, bags, carlots, works, was quoted at $2 per 100 pounds at the beginning of the year, dropped to $1.60 per 100 pounds in February, and in October was quoted at $45 per ton, freight allowed.

TABLE 9.—Sodium sulfate produced and sold or used, by producers in the United States, 1946–50

Year	Production (manufactured [1] and natural), short tons			Sold or used by producers (natural only)	
	Salt cake (crude)	Glauber's salt (100 percent $Na_2SO_4.10H_2O$)	Anhydrous refined (100 percent Na_2SO_4)	Short tons [2]	Value
1946	527,746	167,153	122,573	198,781	$1,695,413
1947	693,517	202,285	134,969	257,294	3,329,094
1948	668,246	184,744	169,018	265,862	4,248,613
1949	537,843	156,634	136,276	186,223	2,733,853
1950	561,395	185,626	184,254	186,537	2,199,336

[1] U. S. Bureau of the Census.
[2] Includes Glauber's salt converted to 100-percent Na_2SO_4 basis.

TABLE 10.—Sodium sulfate imported for consumption in the United States, 1946–50

[U. S. Department of Commerce]

Year	Crude (salt cake)		Crystallized (Glauber's salt)		Anhydrous		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	22,446	$352,407					22,446	$352,407
1947	49,157	583,377	91	$1,760			49,248	585,137
1948	29,612	468,561					29,612	468,561
1949	21,090	294,367	53	1,152	245	$4,953	21,388	300,472
1950	61,612	737,118			5,565	107,330	67,177	844,448

Sodium Metal.—The demand for sodium metal has been increasing for the past few years, and further increases are anticipated. Production in 1950 was greatly increased as a result of a plant expansion completed in 1949 by Ethyl Corp. at Baton Rouge, La. National Distillers Chemical Corp. shipped the first tankcar of sodium from its new plant at Ashtabula, Ohio, in June of 1950. Rated annual capacity of the new plant was reported to be 18,000 tons of sodium.[16]

E. I. du Pont de Nemours & Co., Inc., also produced sodium metal at Niagara Falls, N. Y.

The largest single use for sodium is in the manufacture of tetraethyl lead, an "antiknock" compound for gasoline. Other important uses are in dyes and in reducing fatty acid esters to fatty alcohols for use in the manufacture of synthetic detergents. The following is an approximate end-use pattern for sodium metal in 1947 and 1948; figures shown indicate millions of pounds.[17]

Use:	*1947*	*1948*
Tetraethyl lead	66	90
Sodium cyanide	25	32
Sodium alkyl sulfate	25	
Sodium peroxide	7	7
Sodium hydride	2	2
Indigo synthesis	2	2
Miscellaneous	6	6

The use of sodium as a reducing agent in the organic chemicals industry was summarized in an article.[18]

It was claimed that stable dispersions of sodium metal in a wide variety of solvents could be made. These dispersions average about 50 percent sodium in 1- to 50-micron particles. They are fluid at room temperatures and can be poured or pumped. It is hoped that the close feed-rate control made possible by this type of material and the large metal surface area afforded will broaden the market for sodium.[19]

According to Oil, Paint and Drug Reporter, prices of sodium metal at the end of 1950 were as follows: In tanks, works, 16 cents per pound; in bricks, drums, works, 17 to 18 cents per pound.

BORATES

Sales of boron minerals surpassed all previous years. Supplies, adequate in the early part of the year, were short in the latter part of the year, and the prices of most boron compounds were increased. Approximately half the boron minerals used are consumed by the glass and ceramics industry, the remainder going to a wide variety of uses.

The story of boron trifluoride as a useful chemical was told in a new booklet.[20]

Value	$2,644,760	$4,651,642	$4,075,049	$6,862,928	$8,301,081
Apparent consumption: Short tons [5]	377,436	416,200	379,994	358,101	505,167

[1] Borax, anhydrous sodium tetraborate, kernite, boric acid, and colemanite.
[2] Partly estimated.
[3] Revised figure.
[4] In addition, 21,286 pounds of crude valued at $200.
[5] Quantity sold or used by producers plus imports minus exports.

An investigation of eight hot-pressed oxides and carbonates for possible gas-turbine application was undertaken. The short-time tensile strength, thermal shock resistance, and density were determined for these materials, among which was boron carbide and 85 percent silicon carbide plus 15 percent boron carbide. Boron carbide had a short-time tensile strength of 22,550 pounds per square inch at 1,800° F., the highest at this temperature. The evaluation of strength of boron carbide at 2,200° F. was unsuccessful. Hot pressing of these bodies indicated that a density of at least 93 percent of theoretical density could be obtained.[21]

The House Ways and Means Committee voted to add borax along with several other materials to the 15-percent depletion-allowance group.[22]

A new proportional counter tube, sensitive to thermal neutrons, was made available. The boron-lined neutron counter tube will permit measurement of slow neutron intensity for nuclear scientific purposes.[23]

In 1950 the following firms reported production of boron minerals: American Potash & Chemical Corp., 3030 W. Sixth St., Los Angeles 54, Calif., plant at Trona, on Searles Lake; Pacific Coast Borax Co., 510 W. Sixth St., Los Angeles 14, Calif., mine at Boron; Pittsburgh Plate Glass Co., Columbia Chemical Division, Bartlett, Calif.; United States Borax Co., 510 W. Sixth St., Los Angeles 14, Calif., mine near Shoshone; West End Chemical Co., 608 Latham Square Bldg., Oakland 12, Calif., plant at Westend, on Searles Lake.

It was reported that the Maria Elena Co. in Chile was building a new plant in which it would recover potassium and sodium nitrate, with additional quantities of sodium sulfate, iodine, and boric acid by a new process.[24]

According to Oil, Paint and Drug Reporter the price of technical-grade borax, granular, bulk, carlots, works, increased from $31.25 per ton at the beginning of the year to $33.25 per ton in October.

Salt

By Florence E. Harris and F. M. Barsigian

GENERAL SUMMARY

HIGHER production of all three types of salt in the United States resulted in a total output of 16,629,809 short tons valued at $59,911,343 in 1950. The details by classes are given in table 1. As 1950 completes the first half of the century, figures for 1901 are also included in table 1 for comparison.

TABLE 1.—Salient statistics of the salt industry in the United States, 1901 and 1946–50 [1]

	1901	1946	1947	1948	1949	1950
Sold or used by producers:						
Dry salt:						
Evaporated (manufactured) short tons	1,725,528	3,249,457	3,158,718	3,207,403	3,284,361	3,329,288
Rock salt do	453,311	3,412,008	3,754,353	3,846,846	[2] 3,444,341	3,927,267
Total do	2,178,839	6,661,465	6,913,071	7,054,249	[2] 6,728,702	7,256,555
Value	(3)	$38,294,396	$43,032,621	$46,430,927	[2] $45,956,223	$51,795,728
Average per ton	(3)	$5.75	$6.22	$6.58	[2] $6.83	$7.14
In brine:						
Short tons	[4] 700,494	8,470,680	9,140,811	9,349,044	[2] 8,843,513	9,373,254
Value	(3)	$6,618,190	$9,159,067	$7,900,855	[2] $7,670,015	$8,115,615
Total salt:						
Short tons	2,879,333	15,132,145	16,053,882	16,403,293	[2] 15,572,215	16,629,809
Value [5]	$6,617,449	$44,912,586	$52,191,688	$54,331,782	[2] $53,626,238	$59,911,343
Imports for consumption:						
Short tons	201,733	4,253	[2] 1,909	5,621	6,309	7,869
Value	$676,332	$29,628	$22,893	$40,748	$60,605	$58,819
Exports:						
Short tons	9,433	223,426	[6] 188,307	387,601	359,776	190,377
Value	$86,414	$1,889,522	[6] $1,588,847	$5,930,170	$3,353,115	$1,776,062
Apparent consumption [7] short tons	3,071,633	14,912,972	[2][6] 15,771,005	16,021,313	[2] 15,218,748	16,447,301

[1] Includes Puerto Rico.
[2] Revised figure.
[3] Figures included in total value; separate figures not available.
[4] Includes a small quantity of evaporated salt.
[5] Values are f. o. b. mine or refinery and do not include cost of cooperage or containers.
[6] 96,479 short tons valued at $2,347,679, shipped under the U. S. Army Civilian Supply Program, is excluded from exports shown but is deducted from apparent consumption.
[7] Quantity sold or used by producers, plus imports, minus exports.

The 1950 total was an all-time high record. In midyear the effects of the Korean conflict reversed what appeared in the first part of 1950 to be the long-expected postwar leveling off of production, and the new record was attained despite strikes and labor difficulties encountered by some of the largest salt consumers.

Figure 1 shows the upturn in production in 1950 following the 1949 decline.

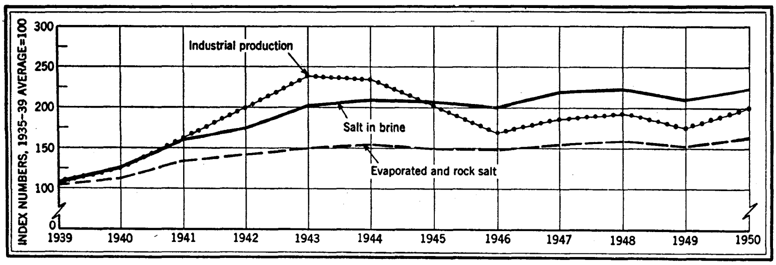

FIGURE 1.—Index of salt in brine and of evaporated and rock salt sold or used compared with industrial production, 1939–50. Index of industrial production from Federal Reserve Board.

The defense measures taken by the United States Government after the attack in Korea included many that affected the salt industry. Under the Defense Production Act of 1950, responsibility for salt production and consumption was assigned to the National Production Authority, which in turn delegated the production responsibility to the Defense Minerals Administration. Substantial expansion programs in some of the salt-consuming industries indicated continued growth in demand.

The Salt Producers Association formed a committee in 1950 to cooperate with the Government on problems affecting the industry and to assist members in obtaining necessary equipment and supplies. The monthly statistical reporting service instituted by the association a few years ago was discontinued in 1950.

PRODUCTION

PRODUCTION BY STATES

Slight changes occurred in the percentages of salt produced by the leading States; but the rank remained the same as for years past, with Michigan leading, followed by New York and Ohio. The three States together produced 59 percent of the total for the United States in 1950, as in 1949.

A number of changes and developments that occurred in the salt industry in 1950 follow.

California.—The City of San Jose, in 1950, instituted condemnation proceedings to acquire some of the salt ponds belonging to the Leslie Salt Co. as a site for the construction of a sewage-disposal plant. The company was reluctant to yield any of its ponds, however, and no decision had been reached by the end of 1950. The Leslie Salt Co. salt harvest was reduced approximately 100,000 tons by an unusually violent storm in November. The company, in the last few years especially, has exported large tonnages to Japan, but shipped none in 1950. The Long Beach Salt Co., Kern County, depends upon rain to flood the dry lake from which it obtains its salt; but in 1950, as in 1949, there was no rain and therefore no output. Beginning January 1, 1950, the Western Salt Co. leased the operations of the Irvine Co., at Tustin, for 10 years and produced solar salt from this tract as well as its other holdings.

TABLE 2.—Salt sold or used by producers in the United States, 1948–50, by States

State	1948			1949			1950		
	Quantity		Value	Quantity		Value	Quantity		Value
	Short tons	Percent of total		Short tons	Percent of total		Short tons	Percent of total	
California	914,035	6	$3,927,722	964,807	6	$4,110,271	868,496	5	$3,816,655

Total	16,403,293	100	54,331,782	[1] 15,572,215	100	[1] 53,626,238	16,629,809	100	59,911,343

[1] Revised figure.
[2] Less than 0.5 percent.
[3] Includes Nevada, New Mexico, Oklahoma, and Virginia.

Kansas.—The Carey Salt Co. did not operate at Lyons in 1950, but sold some salt from stock.

Louisiana.—Equipment used in the Carey Salt Co. mine at Winnfield was described in a brief article.[1] In 1950 the Solvay Process Co. was reported to have sold its rock quarry near Winnfield, La., to the Carey Salt Co. "The property includes about 1,800 acres of land and a 100-foot railroad right-of-way into Winnfield, a distance of about 5 miles." The salt mine of the Carey Salt Co. is immediately under this tract, which heretofore was leased.[2]

Michigan.—Manistee Salt Works, Manistee, put down two new wells at its works in the latter part of 1950. These will increase its capacity to supply brine for evaporated salt. The Michigan Chemical Corp. formed a wholly-owned subsidiary, The Michigan Salt Co., as a sales organization and salt-distributing company. Aided by an RFC loan, the parent company expanded its salt operations, putting a new evaporating plant into operation by midsummer. The Pennsylvania Salt Co. discontinued production of byproduct salt at its Wyandotte plant on December 31, 1950. The plant of the Saginaw Salt Products Co. is being scrapped.

Nevada.—Leslie Salt Co. dry-lake operations at Fallon are still supplying a small quantity of (crude) solar salt for local consumers.

New York.—The West Shore Salt Co., a new company, began well operations at Ithaca late in 1950. The output of grainer salt was small, but it was expected that production would increase in 1951.

Ohio.—The Pomeroy Salt Corp. at Pomeroy was shut down temporarily in 1950 and operated less than 300 days. The International Salt Co. continued to search in Ohio for a suitable deposit for a salt mine to supply requirements in that area. In 1950 salt supplies were brought in from International's Detroit mine.

[2] Pit and Quarry, Solvay Process Sells Quarry to the Carey Salt Co.: Vol. 42, No. 12, June 1950, p. 53.

Texas.—The work of combining and expanding the salt-production facilities of the Morton Salt Co. at Grand Saline was completed and production started in mid-1950. The new refining installations were described in trade magazines.[3] The old rock-salt mine was closed for about 2 months, because it was deemed unsafe, before work was begun at Morton's new mine. The Gulf Salt Co., with wells at Missouri City, resumed operations in 1950. It was inactive 2 months because of a cave-in that occurred toward the end of 1949 after only a few weeks of operation. The caved area was filled in, a warehouse replaced, and other damage repaired.[4]

Utah.—The old buildings of the Morton Salt Co., at Saltair, destroyed in the latter part of 1949, were replaced by a modern plant that went into operation in 1950. The Stansbury Salt Co., Inc., at Stansbury Island, is a new operation. A drying, screening, and bagging plant was constructed in 1950 and went into production in the latter part of the year.

Virginia.—The Mathieson Chemical Corp. let a contract for the construction of a large modern plant at Saltville in which chlorine and caustic soda will be made from salt. The new plant is scheduled for operation by the third quarter of 1951. The old plant at Saltville continued production of salt brine for making soda ash.[5]

PRODUCTION BY METHODS OF RECOVERY

The quantities of salt produced by each of the basic methods of recovery are given in table 3. These methods are described in the Salt chapter of Minerals Yearbook, 1948.

TABLE 3.—Salt sold or used by producers in the United States, 1949–50, by method of recovery [1]

Method of recovery	1949 [2]		1950	
	Short tons	Value	Short tons	Value
Evaporated:				
Bulk:				
Open pans or grainers	456, 896	$6, 670, 998	468, 169	$7, 545, 403

A modification in the usual evaporation process was introduced in the new plant of the Michigan Chemical Corp. at St. Louis, Mich., which employs a type of forced-circulation evaporator new to the commercial salt industry. The advantages claimed are "increased capacity, better heat transfer, lower steam requirement, uniform crystal size, and easier maintenance." An article was published which describes in general the method adapted and includes an isometric drawing of the system.[6]

Evaporated Salt.—In 1950 evaporated salt was produced in 48 plants in 12 States and Puerto Rico. Of this total, 726,480 tons was solar salt; the remainder was produced by mechanical evaporation. Evaporated salt was 20 percent of total salt output.

TABLE 4.—Evaporated salt sold or used by producers in the United States, 1948–50, by States

Rock salt.—In 1950 rock-salt production amounted to 3,927,267 short tons. It was produced in 18 mines in 8 States. It comprised 24 percent of total salt output.

TABLE 5.—Rock salt sold by producers in the United States,[1] 1945–50

Year	Short tons	Value	Year	Short tons	Value
1945	3, 505, 740	$12, 964, 391	1948	3, 846, 846	$16, 970, 742

1950	265, 835	3, 465, 935	63, 081	704, 600	328, 916	4, 170. 535

[1] There is no production of pressed-salt blocks in Puerto Rico.
[2] Revised figure.

Brine.—In 1950 production of salt in brine totaled 9,373,254 tons. The output came from 17 operations in 7 States and constituted 56 percent of total output of all types of salt—virtually the same as in 1949.

SALT PRODUCTION, 1901–50

Half a century of production in the United States has yielded more than 400 million short tons of common salt. Salt is now used in many articles and chemicals that were unknown 50 years ago; the outstanding growth, however, has been in the use of salt as a raw material for chemical making.

All three types of salt have shared in the growth in requirements. (See fig. 2.) Production of evaporated salt increased from 1,725,528 tons in 1901 to 3,329,288 tons in 1950; rock salt from 453,311 tons to 3,927,267, and brine from about 700,000 tons to 9,373,254 tons. Pressed blocks were first made about 1917.

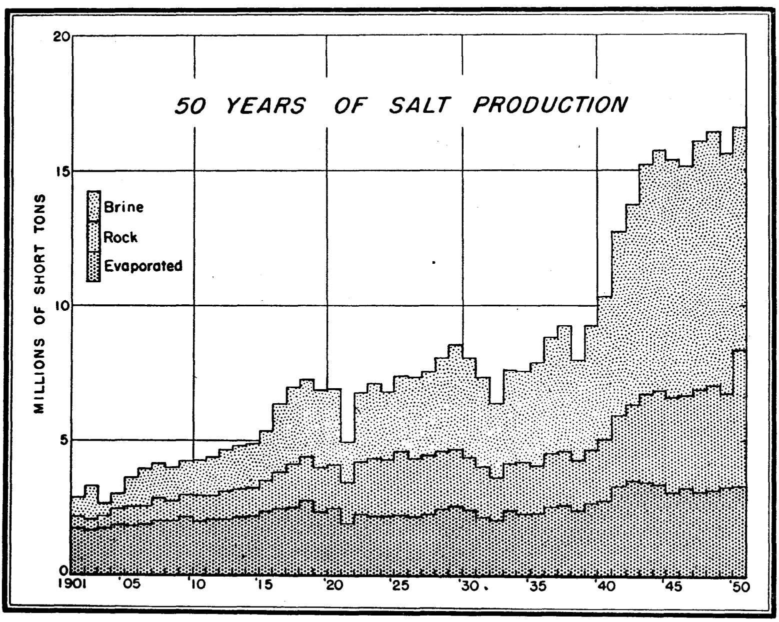

FIGURE 2.—Production of brine (salt content), rock salt, and evaporated salt, 1901–50.

The upward trend in salt production was accompanied by a downward trend in the number of plants providing the total output. The trend has been toward larger and fewer operations. Whereas in 1901 about 150 plants were producing, in 1950 there were less than half that number.

The 1950 salt production of 16,629,809 short tons was about a million tons more than was produced in the entire first 5 years of the century. Since 1897 the United States has been the largest salt-producing country.

CONSUMPTION AND USES

In 1950 the consumption of salt trended toward wartime uses, especially after the start of the Korean War in midyear. Thus increased quantities of salt were used for chlorine and soda-ash manufacture, for steel making and in other metallurgy, and for synthetic rubber manufacture. Chemicals made from salt required 67 percent of the total salt output in 1950.

It appeared in the first half of 1950 that chlorine production would attain a new peak (with 11-percent increase in the first 4 months of the year compared with the first 4 months of 1949), but a set-back was experienced in midyear because of strikes and other labor difficulties. Continuation of the strikes for many weeks resulted in short supplies of both chlorine and soda ash; however, following settlement plants were able to accelerate operations to such an extent that before the end of the year new records were registered in the quantity of salt consumed both in chlorine and in soda-ash production.

Further increases in consumption of salt for production of chlorine and soda ash, and of sodium metal, are indicated by expansion programs. In particular, the National Distillers Chemical Corp., Ashtabula, Ohio, is a potentially large user of salt for the production of chlorine and sodium. The company's new plant for making sodium metal, with a rated annual capacity of about 40,000,000 pounds, began shipping sodium in 1950. Further expansion of chlorine and caustic soda units on the west coast, started in the latter part of 1950, will call for increased quantities of salt from that area.

The consumption of salt in various uses is shown in table 7. The table contains a number of revisions for 1949, inasmuch as a better breakdown of the consumption for that year was obtained after publication of the 1949 Salt chapter.

Demand for salt for use in metallurgical industries increased when the defense program got under way. Salt and some of its derivatives are used in such metallurgical applications as descaling and heat treatment.[7]

Increased salt consumption was also reported for canning and preserving and in other food processing. The great increase in salt—especially rock salt—used for highways, railroads, and other dust and ice control in 1950 was due mainly to the severe winter.

The use of salt in soap and detergents increased in 1950. Soap and detergents are widely used in industry, as well as in the home. Salt has long been used in glazing tile, pipe, and other ceramic products.

[7] Munger, P. (in a symposium series), Chem. and Eng. News, vol. 29, No. 8, Feb. 19, 1951, pp. 647–649.

According to an article published in 1949, the use of salt in structural clay products manufacture was introduced at the turn of the century by Homer F. Staley, ceramist.[8]

Included under "Undistributed" in table 7 are several important uses. In addition to the chlorine so used, more than 50,000 tons of salt were employed directly in synthetic-rubber manufacture in 1950. About 35,000 tons went into paper and pulp making. State and Federal Governments bought a sizable quantity of salt in addition to that specifically identified as for use on highways. Smaller quantities were used for brick and tile, laundering and dry cleaning, pigment making, and tobacco.

Total	3,284	3,444	8,844	15,572	3,330	3,927	9,373	16,630

[1] Revised figures.
[2] Data for evaporated salt included with "Undistributed," in order to avoid disclosure of individual company operations.
[3] Data for salt in brine included with "Undistributed," in order to avoid disclosure of individual company operations.
[4] Livestock salt is about 90 percent of the total.
[5] Comprises miscellaneous uses and uses for which data may not be shown separately (see footnotes 2 and 3); also includes some exports and consumption in Territories and possessions.

One of the processes used for removing sulfur from coke-oven gas is absorption of sulfides by a sodium carbonate solution, but no figures on the quantity of salt so used are available.

Total salt consumed for food preparation and preservation increased. Details by areas on this use are not generally available; but it has been estimated that northern California consumes 6,500 tons of salt and 1,500 tons of caustic soda in food processing annually.[9]

[8] Cox, Paul E., A Salty Story: Ceram. Age, vol. 53, No. 1, January 1949, p. 26.
[9] California Journal of Mines and Geology, Food Processing: Vol. 46, No. 3, July 1950, p. 384.

Geographical Distribution.—Primary shipments of salt to the various States by the producers of the salt are shown in table 8. The table does not take into account reshipments, and because of this it gives only an approximation of the actual distribution of eventual consumption; however, this is the only available measure of consumption by States.

TABLE 8.—Distribution (shipments) of evaporated and rock salt in the United States, 1949–50, by States of destination, in short tons

Destination	1949		1950	
	Evaporated	Rock	Evaporated	Rock
Alabama	15,647	94,788	17,172	99,387

Total	3,284,361	[1] 3,444,341	3,329,288	3,927,267

[1] Revised figure.
[2] Includes shipments to Territories and possessions of the United States, exports, and some shipments to unspecified destinations.

TABLE 9.—Salt shipped to United States possessions,[1] 1948–50

[U. S. Department of Commerce]

Possession [1]	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
American Samoa	1	$53	20	$821	1	$127
Guam	98	4,202	51	3,556	103	5,740
Puerto Rico	7,000	407,883	6,651	397,918	9,822	640,277
Virgin Islands	41	2,669	36	2,688	39	3,766
Total	7,140	414,807	6,758	404,983	9,965	649,910

[1] Salt is also shipped to the Territories of Alaska and Hawaii, but no record has been kept of these shipments since March 1948.

PRICES

Prices quoted by the Oil, Paint and Drug Reporter for salt at New York City opened at the same levels as at the end of 1949, but changed during the latter part of the year as shown in table 10.

TABLE 10.—Price of bagged salt, delivered New York, Jan. 1 and Dec. 31, 1950, per 100 pounds

[Oil, Paint and Drug Reporter]

	Jan. 1, 1950	Dec. 31, 1950
Rock salt:		
Paper bags, carlots	$0.88	$0.94
Burlap bags, carlots	.98	1.09
Paper bags, less than carlots	1.09–1.12	1.15
Burlap bags, less than carlots	1.19–1.22	1.30
Table, vacuum common fine, bags:		
Carlots, works	.98–1.08	1.09
Less than carlots (delivered)	1.20–1.32	1.20

FOREIGN TRADE [10]

In 1950 imports increased more than 1,500 short tons, whereas exports decreased about 170,000 tons. In the text that follows the highlights of import and export developments over the past 50 years are noted. It was during this period that the United States changed from a salt-importing to a salt-exporting country. Previous to 1917 the United States commonly imported more salt than it exported.

Imports.—In 1901 salt imports totaled 201,733 short tons valued at $676,332 compared with 7,869 tons valued at $58,819 in 1950. Great Britain was our principal supplier in 1901, with about 40 percent of the total, followed by the West Indies (chiefly British) and Italy. From all other countries salt imports were small. In recent years our chief imports of salt have been from Canada.

[10] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TABLE 11.—Salt imported for consumption in the United States, 1949–50, by countries

[U. S. Department of Commerce]

Country	1949		1950	
	Short tons	Value	Short tons	Value
Bahamas			65	$180
Canada	3,264	$48,630	4,284	48,507
Jamaica	3,045	11,975	3,439	9,380
Netherlands Antilles			80	688
United Kingdom			1	64
Total	6,309	60,605	7,869	58,819

An outstanding modification of the salt import pattern has been the drop in importation of salt for fish curing. In 1901 salt imported for this purpose totaled 57,629 tons, and for many years it continued to be a large part of the total salt imports. Even until just before World War II, fish salt was the principal type imported. In 1942, however, it shrank to about 6,300 tons, and in 1943, for the first time in 80 years, the type disappeared entirely from the list of salt imports. Except for 1946 and a little in 1948, none has been imported since.

TABLE 12.—Salt imported for consumption in the United States, 1946–50, by classes

[U. S. Department of Commerce]

Year	In bags, sacks, barrels, or other packages (dutiable) [1]		Bulk			
			Dutiable		Free (used in curing fish)	
	Short tons	Value	Short tons	Value	Short tons	Value
1946	275	$4,456	2,571	$20,161	1,407	$5,011
1947	[2] 376	8,571	1,533	14,322		
1948	1,591	20,971	3,262	17,033	768	2,744
1949	2,851	40,308	3,458	20,297		
1950	3,395	43,567	4,474	15,252		

[1] Includes 2,000 pounds valued at $20 imported free in 1946.
[2] Revised figure.

Exports.—Whereas in 1901 salt exports from the United States were only 9,433 tons valued at $86,414, in 1950 they totaled 190,377 tons valued at $1,776,062. The record year for exports of salt was 1948, when 387,601 tons was shipped out of the country. At the beginning of the century, our salt exports were chiefly to Asiatic Russia, Canada (about 40 percent), Japan, and Mexico. The distribution in 1949–50 is shown in table 13. Salt exports to Canada in 1950 were 89 percent of the total.

TABLE 13.—Salt exported from the United States, 1949–50, by countries

[1] Less than 0.5 ton.

TECHNOLOGY

A new model of the Lixator—the International Salt Co. rock-salt dissolver—appeared on the market in 1949. It is made of stainless steel and has certain improvements that facilitate its use. It supplies saturated brine for many industrial uses.

A new special salt, in which 1 pound of a special compound is blended with 100 pounds of salt in a stainless-steel rolling drum, is reported to be more efficient in preventing fat rancidity in prepared food products.[11]

[11] Chemical Industries, Tenoxized Salt, vol. 66, No. 3, March 1950, p. 349.

A calorimetric method for determination of minimal quantities of iodine in iodized table salt was described.[12]

A chemical method for removing salt-deposit scale on distilling units aboard ship was developed by the Naval Engineering Experiment Station.[13]

So that more salt may be used effectively for de-icing streets and highways in winter, with less damage to automobiles because of rusting of fenders and other parts, a chemical that appeared on the market 2 years ago for other purposes has been adapted to salt mixtures.[14] The special mixture, which was previously purchasable separately only, can now be bought premixed with salt.[15] When the chemical is bought separately it is mixed in small quantities (1 percent) with the de-icing salt.

WORLD PRODUCTION

In most of the salt-producing countries of the world output increased in 1950 over 1949. The few decreases were moderate. The record of the past 50 years is also one of increased salt output for most countries. Food-salt requirements are greater, owing to the increase in world population, and industrial uses have also risen.

All tonnages mentioned in this world production section, unless otherwise stated, are metric.

[1] In addition to the countries listed, salt is produced in Afghanistan, Albania, Bolivia, British Somaliland, French Equatorial Africa, Gold Coast, Hungary, Leeward Islands, Madagascar, Nigeria, Southern Rhodesia, Sweden, and U. S. S. R., but figures of production are not available. Russian production is known to exceed 4,000,000 metric tons annually. Estimates by senior author of chapter included in the total.
[2] Data not available; estimates by author of the chapter included in total.
[3] Estimate.
[4] Excludes Sub-Carpathia, ceded to Hungary and U. S. S. R.
[5] April to December, inclusive.
[6] Exports.
[7] Incomplete data.
[8] Cochin-China only.
[9] Fiscal year ended Mar. 20 of year following that stated.
[10] Fiscal year ended Mar. 31 of year following that stated.
[11] South Korea only.
[12] Included under India.
[13] Fiscal year ended June 30 of year stated.
[14] Estimated by senior author of chapter.

NORTH AND CENTRAL AMERICA

Canada.—Canada has increased its production and expanded its markets for salt greatly in the past half century. In 1901 Canada produced about 54,000 metric tons, which rose to more than 725,000 tons in 1950. At present, efforts are being made to expand chlorine facilities, especially in Ontario, and this will require additional supplies of salt. Increases in 1950 over 1949 occurred in salt for both retail market and chemicals.

Dominican Republic.—The Government of the Dominican Republic assisted development of its salt industry in 1950 by floating a bond issue to provide capital for purchasing mining machinery and equipment. Also, new docks and warehouses will facilitate export shipments of salt.

SOUTH AMERICA

Uruguay.—In mid-1950 a solar salt project in Uruguay was 80 percent complete and impounding of sea water was expected to begin in November 1950. Heretofore, Uruguay has imported most of the salt it consumed.

Venezuela.—In September 1950 the Venezuelan Development Corp. started a study to determine the feasibility of establishing a plant in Venezuela to produce chlorine and its derivatives. A chemical analysis of the marine salt from Araya Peninsula was made.[16]

[16] Bureau of Mines, Mineral Trade Notes, vol. 31, No. 6, December 1950, pp. 34–35.

EUROPE

Austria and Hungary.—Austria in 1901 produced about 333,000 tons of salt, and Hungary produced about 184,000 tons. At present, Hungary produces only a negligible quantity whereas Austria maintains a fair proportion of its former output (about 237,000 tons in 1950).

France.—France produced 910,000 tons of salt in 1901, whereas the country now produces well over 2,000,000, approaching 3,000,000 tons in some years. The 1950 output figure is not available but presumably was much higher than for 1949.

Germany.—Germany produced 1,564,000 tons in 1901 (1,700,000 tons in 1925), and the Federal Republic of Germany (western Germany) produced 2,470,000 tons in 1950. During 1950 the Republic was able to increase its output considerably by reopening old salt pits in western Germany that were closed in 1919 to avoid overcompetition. Increased demand for salt by the chemical industries was the principal factor in augmenting the 1950 output.

Italy.—Italy produced 435,000 tons of salt in 1901 and now, commonly attains 1,000,000 tons or more a year.

Netherlands.—The salt works at Boekelo, slated to close early in 1950 because of high costs, were to have been transferred to Hengelo. However, because of increased demand and higher prices, they were kept active and produced 30,000 tons during the year. Netherlands attained an all-time peak of 412,570 tons in 1950, a substantial increase over 1949, owing chiefly to expanded and improved equipment at Hengelo, where 23 wells were in operation.

Spain.—Spain, which had a total output of 345,000 tons in 1901, now is approaching 1,000,000 tons annually.

Sweden.—During the first half of 1949, the Swedish Board of Trade reported that new salt deposits had been found near Trelleborg. It stated that two wells about 1,200 meters deep were expected to produce 100 cubic meters of brine per hour.[17]

United Kingdom.—The United Kingdom's output in 1901 totaled 1,812,000 tons; in 1950 it was around 4,000,000 tons. In March 1950 the Food Standards Committee of the Ministry of Food of the United Kingdom recommended that all prepacked free-running salt be required to contain iodide in amounts equivalent to not less than 15 and not more than 30 parts of iodine per million parts of salt and that, within 2 years of the date of the order, a similar requirement would apply to all other prepacked salt. It is understood that lack of proper packing materials was hindering production. Data for 1950 are not yet available, but in 1949 the statistics of commercial salt output by types were: Vacuum salt 545,913 tons, open-pan 378,417 tons, and rock salt 40,642 tons. A new chemical and salt works was built at Tetton, Cheshire.

Yugoslavia.—Yugoslavia planned in 1950 to increase its output so as to eliminate salt imports entirely. This can be done when the salt mines at Tusanji, near Tuzla, are opened. The Kreka salt mines cannot supply enough, and production costs are high. A kilogram of coal is required to produce a kilogram of salt. The Tuzla area is said to have large salt reserves, and within 10 years Yugoslavia plans to mine 300,000 tons of salt annually in the area.

[17] Chemical Age, vol. 60, No. 1548, Mar. 12, 1949, p. 403.

ASIA

Aden.—Aden produced 89,000 tons of solar salt in 1901 compared with 260,000 tons in 1950. A report on the salt industry of Aden described at length the four solar salt operations.[18] The output by these companies is exported to obtain foreign exchange and shipped chiefly to India and Japan. The Arab producers supply local demand. Packaged salt is imported.

Afghanistan.—Afghanistan's production of salt ranges from 35,000 to 100,000 tons annually and is consumed in the country. The salt is mined largely at Talaquan, Kataghan, and several salt lakes. The revenue acquired by the tax on salt production (8 million afghanis in 1950) is allocated to the Ministry of Mines for mineral development. In 1950 a leading mining engineer and official of Afghanistan visited various mining operations in the United States to observe American methods in the interest of improving exploitation in his own country. In addition to the recorded output, there is an unknown production by the native tribes, which satisfy their own salt requirements, and some salt is believed to be smuggled in.

India and Pakistan.—British India in 1901 produced 1,120,000 tons of salt. The equivalent area in 1950 produced more than 2,500,000 tons. At a meeting of the Central Salt Advisory Committee at New Delhi in January 1950 the committee recommended that no salt be imported in 1950. It was not possible, however, to attain the 200,000-ton increase in production in 1950 required to make the country self-sufficient. Imports have been mostly from Aden, with some from Italy and Spain. At the same time, however, India exported about 19,000 tons of salt to Japan compared with 7,000 tons in 1949. The committee felt that the current zonal system of salt distribution which is under the control at present of the respective Indian Governments, should continue.

It was reported that a model salt works was being laid out in the vicinity of the city of Bombay, with a research station and laboratory attached.[19] Also, the Government of West Bengal engaged technicians of a French salt-manufacturing concern to survey the Contai seaboard for the establishment of a large-scale factory.

In mid-July 1950, the Governments of India and Pakistan agreed to allow, effective immediately, imports of rock salt from Pakistan into India without any licensing or payment restrictions. The total annual output from Pakistan now averages 200,000 tons.

In 1950 the Pakistan Government considered a 5-year plan for development of a salt industry in the Province of East Pakistan, including establishment of new coastal sites for recovery from sea water and encouragement of cottage workers to increase output. Pakistan's salt sources were described in a Pakistan Government publication, "Mining Industry in Pakistan," reviewed in late 1950.[20]

Japan.—Japan produced 659,000 tons of solar salt in 1901 compared with 418,000 tons in 1950. During the half century, Japan worked deposits in North China and leased lands in the Kwantung Peninsula, which it lost in World War II. At present Japan is seeking foreign sources of cheap salt for its industries, as its own output is obtained by

[18] Bureau of Mines, Mineral Trade Notes, vol. 31, No. 4, October 1950, p. 42.
[19] Chemical Age, vol. 62, No. 1608, May 6, 1950, p. 697.
[20] Bureau of Mines, Mineral Trade Notes, vol. 31, No. 4, October 1950, p. 42.

necessarily costly processes. This is of particular importance because of the endeavor to restore the chemical industries in Japan to their former footing. Many obstacles were encountered in efforts to import salt in 1950, chief of which was transportation. This was especially true in the latter half of 1950 after the Korean trouble started. Although salt could be obtained from a number of countries at satisfactory f. o. b. prices, the lack of, or high cost of, shipping prohibited transactions. United States exports of salt to Japan were relatively small compared with 1949, as were also those from Italy and Spain.

Saudi Arabia.—A 5-year marketing contract by which Saudi Arabia would supply salt valued at $250,000 to Japan annually, was canceled before any salt was mined or shipped. It was planned to obtain the salt from the vicinity of Jizan, south Tihama, a short distance from the sea.

Turkey.—The United States Economic Cooperation Administration in 1949 approved a project to give technical assistance to the Government of Turkey to expand and modernize the salt industry of the country. American engineers completed a technical report in 1950, and two of the largest salt-producing plants were slated for improvements. It is expected that, when modernization is completed, annual production will be increased to 440,000 tons. During 1950 the Monopolies Administration placed orders in Germany under 1949–50 European Payments Agreement drawing rights for equipment to be installed at the salt mines of Camalti and Yavsan.

AFRICA

Algeria.—Algeria produced 19,000 tons of salt in 1901; in 1950 the figure was around 100,000 tons.

Egypt.—Egypt's output of salt in 1901 is not known, but in 1905 it was 37,000 tons; in 1950 more than half a million tons were produced. Salt exports from Egypt declined in 1950 after unusually large shipments in 1949 when a target figure of more than 444,000 tons was attained. Annual output now usually ranges from 500,000 to 600,000 tons, of which 250,000 to 300,000 tons are consumed locally and the remainder exported.

South Africa.—Salt and magnesium production from sea water began at a plant on the Cape West Coast in South Africa. Salt is collected by scrapers, dried, crushed, and graded.[21]

Tunisia.—From about 20,000 tons in 1901, output in 1950 had increased to about 100,000 tons a year. In 1950 the salt plant at Monastir announced the beginning of work on another 1,500 hectares of evaporation fields. Total production of the plant is expected to exceed 150,000 tons per year when expansion is completed.

OCEANIA

Australia.—Australia, which in 1901 produced 43,000 tons, now produces nearly 200,000 tons.

New Zealand.—Although more than 16,000 tons of salt had crystallized at the Lake Grassmere solar salt works in New Zealand, according to the press in March 1950, none was expected to be harvested during the year.

Sand and Gravel

By Henry P. Chandler and G. E. Tucker

GENERAL SUMMARY

THE YEAR 1950 was one of record production for the sand and gravel industry in the United States. The combined tonnage of these commodities increased 16 percent and the value 19 percent over the previous year, the dollar value of this industry in 1950 approaching the 300-million mark.

All classifications of sand and gravel, except railroad ballast, gained in tonnage over 1949. Under the heading of commercial operations, increases in tonnage were particularly noticeable in building and paving sand and in building gravel, while in the Government-and-contractor operations large tonnage increases were reported under paving sand and paving gravel. The output of sand was 37 percent and that of gravel 63 percent of the combined domestic production of these commodities during 1950.

In this chapter the terms "production" and "sales" are used interchangeably, inasmuch as stocks of sand and gravel are relatively small and fairly constant from year to year.

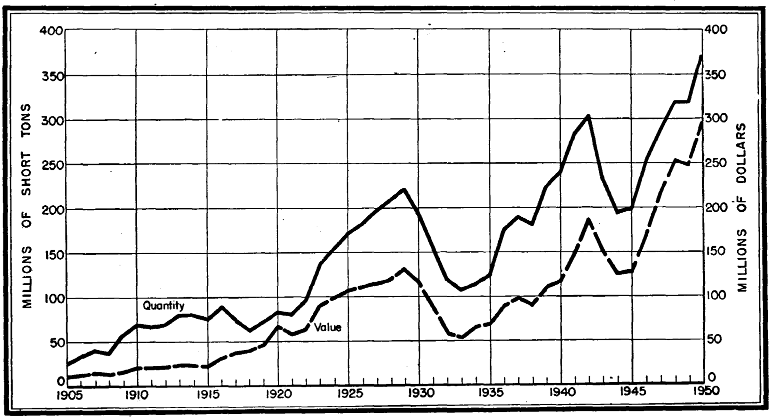

FIGURE 1.—Production of sand and gravel in the United States, 1905–50.

[1] Includes Alaska and Puerto Rico.
[2] Includes blast sand as follows—1949: 393,427 tons valued at $1,222,513; 1950: 470,717 tons, $1,463,623.
[3] Includes ballast sand produced by railroads for their own use as follows—1949: 169,219 tons valued at $13,748; 1950: 188,470 tons, $35,790.
[4] Includes some sand used by railroads for fills and similar purposes as follows—1949: 406,344 tons valued at $101,177; 1950: 198,616 tons, $59,992.
[5] Includes ballast gravel produced by railroads for their own use as follows—1949: 4,406,251 tons valued at $1,748,602; 1950: 3,959,670 tons, $1,361,734.
[6] Includes some gravel used by railroads for fills and similar purposes as follows—1949: 759,841 tons valued at $240,217; 1950: 828,723 tons, $184,105.
[7] Approximate figures for States, counties, municipalities, and other Government agencies directly or under lease.

DOMESTIC PRODUCTION

The production of sand and gravel in 1950 totaled 370,455,000 short tons valued at $295,040,000, 16 percent in quantity and 19 percent in value more than the output of 319,104,000 short tons valued at $248,443,000 in 1949. Increased construction activities in this country were reflected in a similar increase in the sand and gravel industry.

In 1950 California was the largest producer, followed by Michigan, New York, Wisconsin, Illinois, Texas, Ohio, Minnesota, and Pennsylvania, in the order named. These nine States, each with an output exceeding 13,000,000 tons, accounted for 51 percent of the total production.

Tables 3 and 4 show details of production by States and uses in 1950.

TABLE 2.—Sand and gravel sold or used by commercial and Government-and-contractor producers in the United States,[1] 1946–50

Year	Sand		Gravel (including railroad ballast)		Total	
	Quantity (thousand short tons)	Value (thousand dollars)	Quantity (thousand short tons)	Value (thousand dollars)	Quantity (thousand short tons)	Value (thousand dollars)
1946	96, 440	74, 975	157, 691	96, 411	254, 131	171, 386
1947	108, 719	94, 154	178, 940	122, 715	287, 659	216, 869
1948	118, 661	107, 915	200, 605	144, 583	319, 266	252, 498
1949	117, 036	105, 489	202, 068	142, 954	319, 104	248. 443
1950	138, 900	126, 311	231, 555	168, 729	370, 455	295, 040

[1] Includes Alaska and Puerto Rico.

TABLE 3.—Sand and gravel sold or used by commercial and Government-and-contractor producers in the United States in 1950, by States

[1] Figures that may not be shown separately are combined as "Undistributed."
[5] Includes 3,959,670 tons of ballast gravel valued at $1,361,734, produced by railroads for their own use.
[6] Includes 828,723 tons of gravel valued at $184,105, used by railroads for fills and similar purposes.

Government-and-Contractor Production.—As shown in figure 2 and tables 5 and 6, the output of sand and gravel from noncommercial or Government-and-contractor operations in 1950 was 30 percent of the total tonnage compared with 28 percent in 1949. The value of this output represented 18 percent of the total dollar value of the industry. A decided increase in the Government-and-contractor production in 1950 was noted.

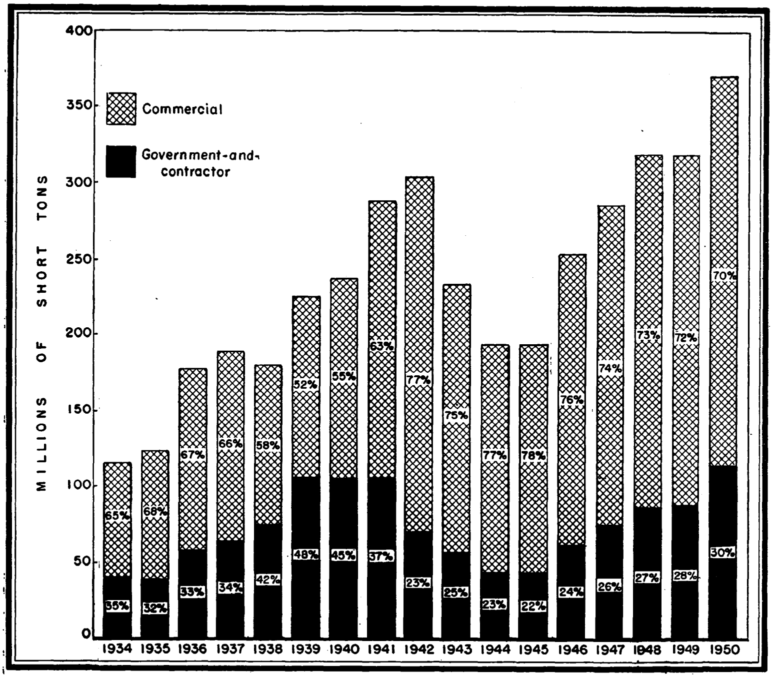

FIGURE 2.—Sand and gravel sold or used in the United States by commercial and Government-and-contractor producers, 1934–50.

[1] Includes Alaska and Puerto Rieo.

States reported 55 percent of the total Government-and-contractor output in 1950, counties 33, Federal agencies 10, and municipalities 2. In 1950 contractors furnished 57 percent of the Government-and-contractor tonnage and construction and maintenance crews 43 percent. The average value increased to 48 cents a ton in 1950 from 42 cents in 1949.

TABLE 6.—Sand and gravel sold or used by Government-and-contractor producers in the United States,[1] 1947–50, by type of producer

[1] Includes Alaska and Puerto Rico.

DEGREE OF PREPARATION

Whereas Government-and-contractor sand and gravel commonly includes a high proportion of unprepared material, the reverse is true of commercial plants. As preparation adds substantially to production costs, commercial output has the higher average value. Table 7 shows this relationship in the past 2 years. Prepared sand and gravel

TABLE 7.—Sand and gravel (prepared or unprepared) sold or used by producers in the United States,[1] 1949–50, by commercial and Government-and-contractor operations

	1949			1950		
	Quantity		Average value per ton	Quantity		Average value per ton
	Short tons	Percent		Short tons	Percent	
Commercial operations:

Grand total	319,104,000		.78	370,455,000		.80

[1] Includes Alaska and Puerto Rico.

(commercial and Government-and-contractor) represented 74 percent of the total production in 1950, the same as the previous year. While commercial operations used a slightly lower percentage of prepared sand and gravel in 1950 than in 1949, the Government-and-contractor operations increased their use of that material.

SIZE OF PLANTS

The average plant output of commercial operators, except railroad plants, approximated 101,000 short tons in 1950 compared with 92,000 short tons in 1949. Plants producing between 100,000 and 200,000 tons in 1950 supplied 20.5 percent of the total output, the largest quantity produced by any one group. The number of small plants producing under 25,000 short tons decreased from 953 to 890, while those producing 25,000 to 50,000 tons increased from 425 to 478. The number of plants with an output of over 1,000,000 tons increased from 14 to 22, with a total increased tonnage exceeding 12,000,000 tons, the largest tonnage increase recorded in 1950 by any group. Details of output, by size groups, are shown in table 8.

TABLE 8.—Comparison of number and production of commercial sand and gravel plants in the United States, 1949–50, by size groups [1]

Size group, in short tons	1949				1950			
	Plants [2]		Production		Plants [2]		Production	
	Number	Percent of total	Thousand short tons	Percent of total	Number	Percent of total	Thousand short tons	Percent of total
Less than 25,000	953	38.8	9,320	4.1	890	35.6	8,952	3.6
25,000 to less than 50,000	425	17.3	15,344	6.8	478	19.1	17,242	6.8
50,000 to less than 100,000	449	18.3	32,019	14.2	439	17.6	31,058	12.3

800,000 to less than 900,000	7	.3	5,906	2.6	4	.1	3,386	1.4
900,000 to less than 1,000,000	3	.1	2,881	1.3	7	.3	6,775	2.7
1,000,000 and over	14	.6	21,204	9.4	22	.9	33,347	13.2
Total	2,458	100.0	225,464	100.0	2,500	100.0	252,381	100.0

[1] Excludes operations by or for States, counties, municipalities, and Federal Government agencies as follows—1949: 807 operations with an output of 87,899,000 tons of sand and gravel; 1950: 835 operations, 112,899,000 tons. Excludes operations by or for railroads as follows—1949: 128 operations, with an output of 5,741,000 tons of sand and gravel; 1950: 142 operations, 5,175,000 tons. Includes Alaska.

[2] Includes a few companies operating more than one plant but not submitting separate returns for individual plants.

METHODS OF TRANSPORTATION

Truck transportation in 1950 moved 41 percent of the shipments from commercial sand and gravel plants. Assuming the entire output of Government-and-contractor operations to be moved by truck, 71 percent of the domestic sand and gravel output was so transported, compared with 69 percent during 1949. Railroads carried 20 percent, a 2-percent decrease from the previous year. Shipments by waterway, a method important in a few areas, remained at 6 percent and unspecified transportation at 3 percent. As shown in table 9, 91 percent of the total tonnage shipped (commercial and Government-and-contractor) moved by truck and rail.

TABLE 9.—Sand and gravel sold or used in the United States,[1] 1948–50, by method of transportation

	1948		1949		1950	
	Thousand short tons	Percent of total	Thousand short tons	Percent of total	Thousand short tons	Percent of total
Commercial:						
Truck	125,468	39	131,725	41	150,892	41
Rail	78,888	25	70,035	22	72,489	20

Grand total	319,266	100	319,104	100	370,455	100

[1] Includes Alaska and Puerto Rico.
[2] Entire output of Government-and-contractor operations assumed to be moved by truck.

CONSUMPTION

Sand and Gravel for Construction.—The demand for sand and gravel by the construction industry in 1950, as indicated by shipments from commercial plants, showed an over-all increase over the previous year as follows: Building sand increased 14 percent; paving sand, 16 percent; building gravel, 15 percent; and paving gravel, 4 percent. This reflected the increased building activity during 1950.

Industrial Sands.—The output of all classes of industrial sands increased in 1950: Molding sand, 33 percent; glass sand, 19 percent; and grinding and polishing, 20 percent. Lesser users also made substantial gains during 1950, as was to be expected because of increased industrial activity in all lines.

Employment and Productivity.—The total number of men employed in the sand and gravel industry in the United States during 1950 averaged more than 26,000, the same as in 1949. The average number of days worked increased slightly. The average number of hours per man per day in 1950 remained the same as the previous year, but the output per man per shift increased from 37.4 short tons to 41.0. As in the previous year, the California-Nevada region employed the largest number of men, while the highest production per man per shift continued to be in the Michigan-Wisconsin area. Table 10 gives a breakdown of employment and production of commercial sand and gravel, by regions.

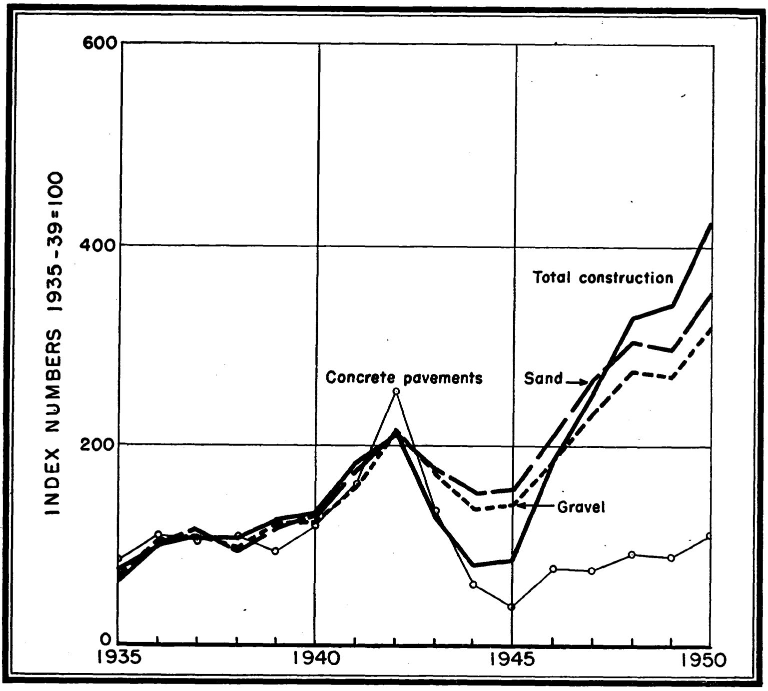

FIGURE 3.—Value of sand and gravel production compared with total construction (contract awards, value) and concrete pavements (contract awards, square yards) in the United States, 1935–50. Data on construction and pavements from Survey of Current Business.

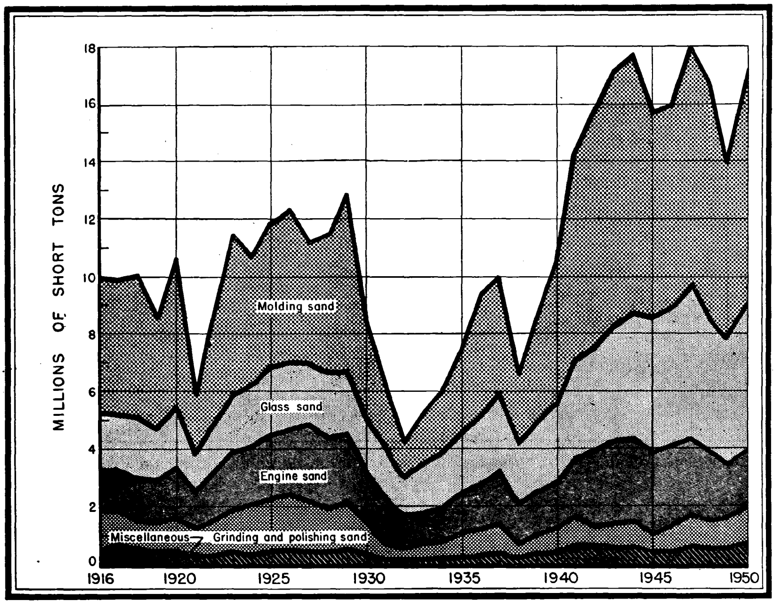

FIGURE 4.—Production of industrial sands in the United States, 1916–50.

TABLE 10.—Employment in the commercial sand and gravel industry and average output per man in the United States, 1946–50, by regions [1]

[1] Excludes plants operated by or directly for States, counties, municipalities, and Federal Government agencies.

PRICES

The average value for all shipments of sand and gravel in 1950, both from commercial plants and from the Government-and-contractor operations, increased 3 percent over the 1949 figures. Molding sand and sand for the glass and the building industries showed only slight changes. Material for grinding and polishing and for furnace, engine, ballast, and other uses recorded gains as high as 16 percent, while the prices of paving and filter sand showed declines. In nearly all instances gains were reported for the types of gravel used by the various operations.

FOREIGN TRADE [1]

Imports of sand and gravel in 1950 increased to 445,295 short tons valued at $320,557, or 3 percent in tonnage and 1 percent in value over the preceding year. Belgium furnished all but a small portion of the 9,191 short tons of glass sand, while Canada supplied 287,823 short tons of "other sand" and 142,159 short tons of gravel. Importations from other countries were insignificant.

TABLE 11.—Sand and gravel imported for consumption in the United States, 1941–50, by classes

[U. S. Department of Commerce]

Year	Sand				Gravel		Total	
	Glass sand [1]		Other sand [2]					
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1941			263,389	$105,088	164,175	$26,132	427,564	$131,220
1942	(3)	$5	408,825	297,122	146,116	60,389	554,941	357,516

[1] Classification reads: "Sand containing 95 percent or more silica and not more than 0.6 percent oxide of iron and suitable for manufacture of glass."
[2] Classification reads: 1941–47: "Sand, n. s. p. f. (not specially provided for)"; 1948–50: "Sand, n. s. p. f., crude or manufactured."
[3] Less than 0.5 ton.
[4] Revised figure.

[1] Figures on imports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TECHNOLOGY

A report, Engineering Activities, covering the field of sand and gravel, was presented at the annual meeting of the National Sand and Gravel Association.[2]

New methods of washing and screening gravel and sand were described in the technical press.[3]

The problem of combining stationary and portable operations in one operation has been worked out successfully by a large midwestern gravel company.[4]

New facilities and equipment have been added to the sand and gravel research laboratory at the University of Maryland.[5]

A method for handling a sand and gravel deposit containing clay was the subject of a recent magazine article.[6]

The removal of impurities found in sand and gravel deposits by installing a conical scrubber and dewatering units was explained in a technical journal.[7]

Sand for glass manufacture was described in a recent article.[8]

The use of a rod mill for sand production was described.[9]

Sampling of sand and gravel deposits and the correct evaluation of the results obtained are important to the industry. A recent article has been published explaining certain methods now in use.[10]

Secondary Metals—Nonferrous

By Archie J. McDermid[1]

GENERAL SUMMARY

MILITARY operations in Korea, which began in June, were directly or indirectly the chief reason for the increased consumption of all nonferrous scrap metals in 1950 and the accompanying rise in secondary metal production. This initial upswing in activity was due more to increased civilian demand for metal products in anticipation of future shortages than to military needs; because the latter did not substantially increase the demand for metal products for some time after hostilities had commenced.

TABLE 1.—Salient statistics of nonferrous secondary metals recovered from scrap processed in the United States, 1949–50

Metal	From new scrap		From old scrap		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1949						
Aluminum	136,166	$42,946,756	44,596	$14,065,579	180,762	$57,012,335
Antimony	3,085	2,389,641	14,976	11,600,410	18,061	13,990,051
Copper	329,595	129,860,430	383,548	151,117,912	713,143	280,978,342
Lead	48,043	15,181,588	364,140	115,068,240	412,183	130,249,828
Magnesium	3,023	1,239,430	2,939	1,204,990	5,962	2,444,420
Nickel	3,766	3,234,241	1,914	1,643,743	5,680	4,877,984
Tin	8,378	16,641,389	16,523	32,819,965	24,901	49,461,354
Zinc	186,162	46,168,176	51,651	12,809,448	237,813	58,977,624
Total		257,661,651		340,330,287		597,991,938
1950						
Aluminum	167,308	54,977,409	76,358	25,091,239	243,666	80,068,648
Antimony	3,091	1,818,126	18,771	11,041,102	21,862	12,859,228
Copper	492,028	204,683,648	485,211	201,847,776	977,239	406,531,424
Lead	54,755	14,783,850	427,520	115,430,400	482,275	130,214,250
Magnesium	2,770	1,220,462	4,970	2,189,782	7,740	3,410,244

Tin	11,298	21,592,060	24,183	46,217,098	35,481	67,809,158
Zinc	251,933	71,548,972	74,097	21,043,548	326,030	92,592,520
Total		374,461,911		427,431,581		801,893,492

Although the recovered quantities of all secondary metals increased, the average prices for primary antimony, lead, and zinc, on which the values in table 1 are based, were lower in 1950 than in 1949, and, as a result, the calculated total values of secondary antimony and secondary lead were lower in 1950 than in 1949. Prices of lead and aluminum scrap declined slightly in the first 4 months of the year, and those of

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Department of Commerce.

232294—53——70

copper and zinc scrap increased slightly. Later in the year, when supplies of all metals were less than the demand therefor, prices rose higher as scrap became scarcer. The price of unalloyed copper scrap was reported as high as 45 cents a pound in the "outside" market, and it was generally understood that abnormally high prices were often paid for other kinds of scrap.[2]

Many transactions at high prices were the result of "conversion" deals in which manufacturers of appliances, parts of which were made of scarce metals, purchased scrap and paid smelters to refine it for them. Producers of primary metals voluntarily held price rises to a minimum to stabilize the market, whereas scrap and secondary metal prices were more flexible. In January 1950, when No. 108 primary aluminum alloy was selling for 18.50 cents a pound secondary ingot of the same grade was quoted at 17.50. In December, with No. 108 primary at 20.60 cents, the secondary alloy of the same grade was 31 cents a pound. A similar relation, although not so pronounced, existed between the prices quoted for primary copper and those for copper-alloy ingot, which is made largely from scrap.

On December 11, 1950, the National Production Authority issued Order M–16, which was aimed at providing for the continuous flow of copper-base scrap into normal channels of distribution; it limited accumulations of scrap metal by generators and dealers and prohibited conversion or toll operations without specific permission from NPA. The order was to have become effective January 1, but acceleration of conversion dealings immediately after issuance of the order made it advisable for the Authority to issue an amendment making conversion transactions illegal on and after December 18.

TABLE 2.—Secondary metals recovered as unalloyed metal, in alloys, and in chemical compounds in the United States, 1946–50, in short tons

Metal	1946	1947	1948	1949	1950
Aluminum	278,073	344,837	286,777	180,762	243,666
Antimony	19,115	22,984	21,592	18,061	21,862
Copper	803,546	961,741	972,788	713,143	977,239
Lead	392,787	511,970	500,071	412,183	482,275
Magnesium	5,117	9,503	7,553	5,962	7,307
Nickel	8,248	9,541	8,850	5,680	8,795
Tin	27,671	30,054	30,124	24,901	35,481
Zinc	300,682	310,793	324,639	237,813	326,030

The value of metals recovered from both old and new purchased scrap consumed in 1950 was $801,702,712, compared with $597,991,938 in 1949. The increase is attributable both to the larger quantities recovered and to higher prices for several of the metals.

The quantity of "new" scrap generated each year depends upon the level of industrial activity. The quantity of skimmings, floor sweepings, and defective castings made at foundries increases when the foundries' operations increase. The same is true of clippings resulting from the operations of processors of sheet metal. Such plant scrap is usually disposed of almost as fast as generated, to dealers, smelters, or others, and the quantities reported used indicate the state of industrial activity.

[2] Zimmerman, J., Address to National Association of Waste Material Dealers: Metals, vol. 21, No. 6, December 1950, pp. 7–10.

The volume of "old" scrap generated also depends upon industrial activity. Worn battery plates, the most important lead-scrap item, become available in greater quantity when the use of automobiles is increased, as has been happening consistently over the past few years. War increases general industrial activity and at the same time generates greater quantities of scrap—aluminum from wrecked and obsolete aircraft, brass scrap from fired cartridge cases, etc. Some articles such as building hardware, remain in use over very long periods. The return of this material for reprocessing depends largely upon the rate of demolition of old buildings, which may be slow even during high industrial activity, if replacement materials are scarce.

Although the volume of both new and old scrap depends on the level of industrial activity, that of new scrap is more sensitive to changes in the industrial-activity level. Worn-out equipment may lie forgotten until salvaged in a scrap drive or found by a dealer.

The National Production Authority was organized on September 12 and on September 18 issued its first regulation, which limited inventories of all materials, including scrap, to a reasonable working quantity.

SCOPE OF REPORT

Plants canvassed in nonferrous secondary metal surveys include all known consumers of purchased nonferrous scrap metals, as well as consumers of refined copper and brass ingot. Table 3 classifies the plants canvassed by type of operation and kind of material consumed. Secondary smelters have been recorded in more than one column if they used more than one kind of material; otherwise, there is no duplication. The tabulation of plants in some categories is subject to limitations. The large number of foundries and the small size of many of them make it impossible to obtain reports from all units. On the other hand, a few large corporations operating more than one plant prefer to file consolidated reports, in which the number and

TABLE 3.—Number and classification of plants consuming nonferrous scrap metals, refined copper, and copper-alloy ingots in 1950

Kind of plant	Type of materials used				
	Aluminum	Copper	Lead and tin	Zinc	All nonferrous types
Primary producers	[1] 32	16	8		
Secondary smelters	[2] 74	[3] 108	265	125	
Distillers				[4] 25	
Chemical plants	15	52		24	
Brass mills		53			
Wire mills		[5] 14			
Foundries and miscellaneous manufacturers			30	[6] 77	[7] 2,700

[1] Includes aluminum reduction plants and rolling mills.
[2] Includes 71 aluminum-alloy ingot makers and 3 naval air stations.
[3] Includes 72 secondary copper smelters and 36 smelters using copper scrap in other than copper alloys.
[4] Includes 16 secondary plants, including zinc-dust plants, and 9 primary producers which used scrap in addition to ore.
[5] Refers to companies operating wire mills. Some companies operate more than 1 plant.
[6] Includes galvanizers, die casters, and zinc rolling mills.
[7] Chiefly brass foundries, but some aluminum foundries, iron foundries, steel plants, and miscellaneous manufacturers. Any or all types of nonferrous scrap were used by these consumers. Figure shown is the number of plants on Bureau of Mines mailing list. Reports received are estimated to account for about 80 percent of the total foundry output.

location of plants are not given, with the result that only one plant is credited. These limitations, however, do not affect seriously the validity of the data presented.

The statements from industry, on which data in this chapter are based, are received monthly from the larger smelters, chemical plants, and manufacturers and from brass and wire mills. Foundries, primary aluminum producers, and smaller plants of other types are canvassed on an annual basis.

Definitions of terms used in this chapter follow:

Secondary metals are metals or alloys recovered from scrap and residues. The term "secondary" applies only to the source of the metal and has no relation to the type of product recovered, either as to quality, degree of purity, or physical characteristics.

Scrap metals are divided into three main categories: Old scrap, process (or plant) scrap, and defective finished or semifinished articles returned by purchasers to be reworked.

Old scrap consists of metal articles that have been discarded because of wear, damage, or obsolescence, usually after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, fired-cartridge cases, automobile crank cases, used pipe, lithographers' plates, and obsolete military equipment (frequently unused).

Process scrap, or *plant scrap*, is that generated during the manufacture of articles for ultimate consumption. Typical examples of process scrap are clippings, turnings, borings, skimmings, slags, and drosses.

Process scrap is divided into two classifications: *Home scrap*, consumed in the plant of generation, and *new scrap*, which is consumed elsewhere, either after sale to another company or shipment to another plant of the same company.

Defective articles, the third main class of scrap, are classed as new scrap for tabulation purposes. In this chapter consumption of old and new scrap only is tabulated, no record being kept, in nonferrous metal canvasses, of home scrap. Scrap generated in a machine shop and consumed in a foundry at the same plant location is considered home scrap, and its consumption is not tabulated. Consumption of scrap is always measured at the point where it loses its identity as scrap and becomes secondary metal.

Borings and turnings and other items of process scrap, when consumed outside the plant where generated, are new scrap, whether clean, rusty, or oily and whether generated recently or long before reclamation. Residues are new scrap if generated in processing scrap or refined metal. For example, flue dust from smelting brass scrap is new scrap. Zinc-chemical residues resulting from the consumption of zinc dust in the manufacture of sodium hydrosulfite are also new scrap. On the other hand, residues generated in processing ore or concentrates are not scrap but "primary residue." Old mine tailings are primary residue because generated in processing ore.

SECONDARY ALUMINUM

The recovery of secondary aluminum from scrap totaled 243,666 short tons valued at $80,068,648, a 35-percent increase in quantity from the 180,762 tons, valued at $57,012,335, reclaimed from scrap processed in 1949. These values are calculated on the basis of the average prices received by producers of primary pig, which were 15.77 cents in 1949 and 16.43 cents in 1950.

TABLE 4.—Aluminum recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable aluminum-alloy content of scrap processed		
Kind of scrap	**1949**	**1950**
New scrap:		
Aluminum-base [2]	135,789	166,891
Copper-base	82	134
Zinc-base	99	135
Magnesium-base	196	148
Total	136,166	167,308
Old scrap:		
Aluminum-base [3]	44,030	75,616
Copper-base	134	104
Zinc-base	309	429
Magnesium-base	123	209
Total	44,596	76,358
Grand total	180,762	243,666

Aluminum recovered [1] from scrap processed		
Form of recovery	**1949**	**1950**
As metal	343	2,140
Aluminum alloys	178,502	239,577
In brass and bronze	450	270
In zinc-base alloys	600	868
In magnesium alloys	426	480
In chemical compounds	441	331
Grand total	180,762	243,666

[1] In accordance with common usage, the term "aluminum" covers aluminum alloys, and the figures include all constituents of the alloys recovered from aluminum-base scrap.
[2] Recoverable aluminum content of new aluminum-base scrap was 128,012 tons in 1949 and 156,978 tons in 1950.
[3] Recoverable aluminum content of old aluminum-base scrap was 41,194 tons in 1949 and 70,981 tons in 1950.

The recoverable aluminum-alloy content of old nonferrous scrap consumed increased 71 percent to 76,358 tons from 1949 to 1950, and that of new nonferrous scrap 23 percent to 167,308 short tons, although the increase in gross tonnage was about the same in each case. As usual, over 99 percent of the aluminum recovered was used in aluminum products.

Production of all types of aluminum-alloy ingot increased in 1950, except miscellaneous ingot, which is recorded as minus 10,347 tons because of large receipts of foreign scrap melted into ingot form abroad for greater convenience in transportation. This material was tabulated by the Bureau of Mines as purchased ingot rather than as scrap consumed, under the rule that consumption of scrap should be recorded at the point where it loses its identity as scrap. This imported material appears as negative production when received and as positive production when converted to specification ingot. Most of the ingot classed as miscellaneous is metal of such composition that it must be remelted and its composition changed by the addition of other metal.

Output of copper-silicon aluminum alloys (each over 2.5 percent Si) increased 37,739 tons in 1950, and that of ingot and shot for deoxidizing and other dissipative uses rose 16,058 tons. The total recorded 1950 production of ingot was 53 percent greater than in 1949. Primary aluminum producers increased their secondary recovery 4 percent, and the foundries' output of secondary aluminum in castings rose from 3,872 tons in 1949 to 11,439 tons in 1950.

TABLE 5.—Production of secondary aluminum and aluminum-alloy products in the United States, 1948–50, gross weight in short tons

Product	1948	1949	1950
Secondary aluminum ingot:[1]			
Pure aluminum (98.5 percent)	2,328	326	2,105
Silicon (max. Cu, 1 percent)	11,786	7,376	10,393
Silicon (Cu, 1 to 2.5 percent)	4,694	3,532	5,395
No. 12 aluminum	19,509	10,605	18,063
Other aluminum-copper (max. Si, 2.5 percent) alloys	[2] 17,612	[3] 1,955	[4] 6,043
Copper-silicon (each over 2.5 percent) alloys	80,940	52,900	90,639
Aluminum-copper- or aluminum-silicon-nickel alloys	3,791	5,152	7,466
Deoxidizing and other dissipative uses	34,143	23,828	39,886
Aluminum-base hardeners	3,989	2,209	4,697
Al-Mg and Al-Zn alloys	2,860	2,731	4,907
Miscellaneous	8,387	6,892	[5] −10,347
Total	190,039	117,506	179,247
Secondary aluminum recovered by primary producers	93,159	61,990	64,667
Aluminum powder[6]	56	17	35
Aluminum-alloy castings	5,289	3,872	11,439
Aluminum in chemicals	506	441	331

[1] Gross weight, including copper, silicon, and other alloying elements; total secondary aluminum and aluminum-alloy ingot contained 3,033 tons of primary aluminum in 1948, 2,206 tons in 1949, and 5,339 tons in 1950.
[2] Includes 13,766 tons produced at Naval Air Stations and plants of contractors melting down army planes.
[3] Includes 1,785 tons produced at Naval Air Stations.
[4] Of the total, 1,810 tons were produced at Naval Air Stations and United States Air Force bases.
[5] Negative production indicates consumption of this material at smelters greater than production.
[6] Does not include production measured as ingot for graining, powder, atomizing, or chemical purposes.

Consumption of all types of aluminum scrap advanced in 1950, the total being 273,192 tons compared with 199,039 tons in 1949. The most important increases were in the use of most kinds of old scrap by the secondary smelters and foundries. Consumption reported by the foundries was higher partly because many aluminum foundries that had not previously filed reports with the Bureau of Mines did so for 1950. Aluminum foundries consumed 5 percent of the total aluminum scrap used in 1950, whereas the brass foundries consumed 12 percent of the copper-base scrap reported as used. The latter can be used more conveniently at a foundry than aluminum scrap, because the composition of brass and bronze scrap and ingot can usually be determined accurately enough by visual inspection of a fresh surface, whereas different aluminum alloys have much the same appearance.

TABLE 6.—Consumption of old and new aluminum scrap in the United States in 1950, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Aluminum rolling mills and reduction plants		Foundries and other manufacturers		
	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
Pure clippings, wire, and foil	14,514	2,929	17,352	679	919	115	36,508
Castings and forgings	17,018	17,074	2,510	424	2,437	3,889	43,352
Alloy sheet	27,611	7,612	37,953	1,464	265	45	74,950
Scrap sheet and sheet utensil	------	9,281	1,206	1,197	168	4,174	16,026
Borings and turnings	37,573	------	2,625	------	489	------	40,687
Aircraft scrap	------	16,498	------	2,295	------	------	18,793
Miscellaneous aluminum and dross	18,255	23,682	98	513	101	227	42,876
Total	114,971	77,076	61,744	6,572	4,379	8,450	273,192

At aluminum plants where much scrap is used, more chemical or spectroscopic analysis is thus necessary than is economical at most foundries. Therefore, aluminum foundries in general rely more on alloy ingot as raw material than do brass foundries.

The secondary smelters apparently more than held their own in the competition with the primary producers for scarce scrap, increasing their consumption of aluminum 49 percent or 63,575 tons, compared with 4 percent or 2,714 tons by the primary plants. It is difficult to compare the operations of the primary plants with those of the secondary smelters. In some cases the former have foundries on the same sites with smelters or may have plants manufacturing aluminum-wrought products adjacent to rolling mills. In such instances scrap generated in the foundry or factory and consumed in the smelter or rolling mill is classified as home scrap and not reported. Where the foundry or factory is some distance from the smelter or rolling mill, process scrap generated at the first two and shipped to either of the second pair is classified as new scrap, regardless of plant ownership. Secondary aluminum smelters, except those owned by the primary producers, are not usually operated in connection with aluminum foundries or factories.

Detailed information on primary aluminum may be found in the Aluminum chapter of this volume.

TABLE 7.—Consumers' stocks of aluminum-base scrap in the United States at end of year, 1949–50, gross weight in short tons

Scrap item	Dec. 31, 1949	Dec. 31, 1950
Castings and forgings	2,792	2,422
Sheet, turnings, clippings, etc	12,917	11,774
Aircraft scrap	2,212	1,340
Miscellaneous aluminum and dross	2,244	1,723
Total	20,165	17,259

Dealers' buying prices for cast aluminum scrap averaged 7.75 cents a pound in January. The lowest monthly average was 7.25 cents in April, after which it rose each month for the remainder of the year; the December average was 15.75 cents and the annual average 10.10 cents. Prices for new aluminum clippings followed the same pattern in 1950 as those for castings scrap, the average price for January being 10.75 cents, for April 10.25 cents, for December 19.25 cents, and for the year 13.16 cents.

The monthly average price of secondary aluminum ingot (No. 12 alloy, at New York, as quoted by the American Metal Market) was 16.50 cents a pound in January, was lowest in March at 15.88 cents, and increased to 30.75 cents in December, the average for the year being 21.08 cents compared with 17.35 cents in 1949. The price of primary aluminum pig (New York American Metal Market), was 17 cents a pound at the beginning of the year, increased May 19 to 17.50 cents, September 25 to 18.25 cents, and October 3 to 19 cents, the average for the year being 17.69 cents.

Imports of aluminum scrap, most of which were actually in ingot form, in 1950 were 67,959 tons compared with 40,120 tons in 1949. Exports were 800 tons in 1950 and 397 tons in 1949.

SECONDARY ANTIMONY

Recovery of secondary antimony in 1950 from lead- and tin-base scrap totaled 21,862 short tons valued at $12,859,228, representing an increase of 21 percent in quantity but a decrease of 8 percent in value from the 18,061 tons, valued at $13,990,051, recovered in 1949. The value was computed at 38.73 cents per pound in 1949 and 29.41 cents in 1950, the average New York selling price.

Of the total secondary antimony recovered, 20,208 tons was reclaimed at secondary copper and lead smelters and 1,654 tons at primary lead refineries.

TABLE 8.—Secondary antimony recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable antimony content of scrap processed			Antimony recovered from scrap processed		
Kind of scrap	1949	1950	Form of recovery	1949	1950
New scrap:			In antimonial lead	11,566	13,326
Lead-base	3,085	3,091	In other lead alloys	6,311	8,299
Tin-base			In tin-base alloys	184	237
Total	3,085	3,091	Grand total	18,061	21,862
Old scrap:					
Lead-base	14,809	18,602			
Tin-base	167	169			
Total	14,976	18,771			
Grand total	18,061	21,862			

Consumption of battery plates rose 11 percent above the quantity used in 1949 and yielded 50 percent of all secondary antimony reclaimed. Antimony reclaimed in antimonial lead, in other lead-base alloys, and in tin-base alloys increased in 1950. Lead remelters, smelters, and refiners recovered 97 percent of the total and manufacturers and foundries the remaining 3 percent. Data on consumption of scrap from which antimony was reclaimed may be found in the tables on consumption of lead- and tin-base scrap in the sections of this chapter devoted to those metals. Products in which antimony was recovered are included in the lead- and tin-products table of this chapter, under the heading Secondary Lead. All the secondary antimony recovered in 1950, 21,862 tons, was used in metal products. Of the 15,494 tons of primary consumed in 1950, 9,626 tons were used in metal products. As far as could be determined, all secondary antimony was reclaimed in lead and tin alloys. Detailed information on primary antimony is given in the Antimony chapter of this volume.

Light consumer demand and availability of foreign metal at a lower price caused the price of domestic antimony to drop from an average of 31.70 cents a pound in January to 26.43 cents in August. In September the average monthly price rose to 32.80, and in October it advanced to 33.78, where it remained to the end of the year.

SECONDARY COPPER AND BRASS

The recovery of secondary copper from all classes of nonferrous scrap totaled 977,239 short tons valued at $406,531,424 in 1950, an increase of 37 percent in quantity over the 713,143 tons valued at $280,978,342 recovered in 1949. These values are computed at the average weighted price for all grades of refined copper sold by producers in the 2 years, that is, 19.7 cents in 1949 and 20.8 cents in 1950.

The uptrend in copper-base-scrap operations at secondary copper smelters, brass mills, and foundries, which began in the latter half of 1949, continued in 1950. Demand for copper products was at a high level due to national prosperity and increased when the Korean situation superimposed new military requirements upon those of the civilian economy. Recovery of copper from new scrap increased more than that from old (49 percent compared with 27) because heightened industrial activity increased the generation of plant scrap.

TABLE 9.—Copper recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable copper content of scrap processed: Kind of scrap	1949	1950	Copper recovered from scrap processed: Form of recovery	1949	1950
New scrap:			As unalloyed copper:		
Copper-base	323,666	485,054	At primary plants	212,392	189,746

Secondary copper smelters and brass mills produced approximately equal quantities of copper from scrap in 1949 and each group about two-thirds more in 1950. Primary producers' output of secondary copper declined from 215,214 tons in 1949 to 195,441 in 1950. Brass foundries increased their recovery of copper from copper-base scrap from 85,056 tons in 1949 to 116,767 in 1950.

The decrease in secondary output by the primary producers was caused by the relationship between prices for virgin metal and scrap. Rises in prices for nonferrous primary metals were voluntarily held to a minimum by the producers as a means of stabilizing the market. The price of copper scrap purchased by primary plants depended largely on the price of copper, while that purchased by the ingot makers depended on the more flexible prices of brass ingots. Normally, primary refiners buy a large proportion of the available copper scrap to make into refined copper, whereas the ingot makers buy a smaller proportion for alloying purposes. Primary producers' use of

TABLE 10.—Copper recovered from copper-base scrap processed in 1949–50, in short tons

unalloyed scrap declined from 140,142 tons in 1949 to 114,314 in 1950; ingot makers' consumption of this scrap rose from 65,352 tons in 1949 to 110,551 in 1950. The unusual condition may be attributed in part to the general scrap scarcity. In 1950 ingot makers frequently bought unalloyed copper scrap for use in making alloy ingot when they would have preferred brass or bronze scrap so that they could avoid the expense of purchasing zinc, tin, etc., to melt with the unalloyed scrap. Ingot makers are secondary smelters that normally produce copper-alloy ingot chiefly from copper-alloy scrap rather than from unalloyed primary metals or scrap.

[1] Of the totals shown, primary refiners reported the following: Unalloyed copper scrap, 68,554 tons of new and 45,760 tons of old; low-grade scrap and residues, 71,990 tons of new and 199,356 tons of old.
[2] Of the totals shown, chemical plants reported the following: Unalloyed copper scrap, 704 tons of new and 9,822 tons of old; copper-base alloy scrap, 26 tons of new and 185 tons of old.

The low-grade scrap and residues consumed by the primary smelters consist chiefly of refinery brass, brass ashes and skimmings, foundry residues, and irony brass, the latter consisting of such objects as old radio sets, appliances with brass and iron parts, and motor armatures. The irony brass can be used more economically by primary smelters than by other consumers because the iron may be used in forming the matte, a mixture of iron and copper sulfides, which is an intermediate product in the operation of a primary copper smelter.

Most primary plants make copper matte in reverberatory furnaces, but where large quantities of skimmings, scrap contaminated with iron, and other low-grade items are consumed a blast furnace is sometimes used. Sulfur for the matte is provided by mixing ore or concentrates with the scrap, the concentrates usually being sintered before smelting. Iron for the matte may be provided by the irony scrap, iron in the concentrates, scrap iron, or other sources. Iron is also a necessary constituent of the slag, but before it can form the latter by combining with lime and silica it must be oxidized. The atmosphere of a blast furnace is normally reducing, but when oxides of copper and other metals are present in the charge the iron absorbs enough oxygen from them to enter the slag. The composition of the charge must be planned so that the quantities of copper, iron, lime, silica, sulfur, and oxygen will be in balance. The same results can also be obtained by using a reverberatory furnace, which some metallurgists prefer to the blast furnace. Advantages claimed for the blast furnace are continuity of operation (contrasted with cyclic operation of the reverberatory furnace), greater facility in charging, and greater flexibility, which means that wider variation in composition of the charge is allowable.

After removal from the blast or reverberatory furnace, the matte is treated in a converter where scrap, including irony material, may also be added, the iron, as well as the sulfur, providing fuel for the reaction. When the sulfur and iron have been burned off, the resulting blister copper is further refined in a reverberatory where unalloyed scrap may be added. The next step is electrolytic refining, from which the copper emerges as cathodes for further refining in another reverberatory furnace and casting in refinery shapes. In this furnace only high-grade unalloyed scrap may be added. Oxidation of the last impurities is promoted by blowing with air, producing a copper oxide slag which is skimmed off and sent back to the blast furnace. Here the iron reduces the copper oxide to copper, which then enters the matte as copper sulfide. The iron is oxidized and enters the slag as a calcium iron silicate. Plants classed as primary smelters at times consume more scrap than primary material, but if any sulfur-bearing ores or concentrates are used in conjunction with the scrap, the primary plant procedure of making a matte is followed.

Some secondary copper smelters operate blast furnaces or cupolas to smelt low-grade irony scrap; but if they use no sulfur-bearing material no matte is made, and the product of the blast furnace is then black copper, an impure metallic alloy requiring further furnace treatment. The iron may be oxidized for slagging by adding oxides to the charge, such as are contained in slag from a reverberatory furnace or brass ashes and skimmings. The use of blast furnaces at primary copper smelters has decreased since introduction of the flotation process, which has increased the proportion of fines in primary raw materials smelted; but the blast furnace and cupola still compete with the reverberatory furnace at secondary smelters and at primary plants where large quantities of low-grade contaminated scrap are treated.

Most foundries are small compared with smelters. They melt brass ingot or scrap in crucibles or small melting furnaces to make castings and are usually better-equipped to use ingot than scrap. When ingot is not obtainable in sufficient quantities, however, they naturally compete for the available scrap. Some large foundries use scrap almost entirely; others use nothing but ingot. It is, of course, feasible for a foundry to operate a smelter or a smelting department to provide its own ingots. Foundries often have access to scrap supplies through their customers, the plumbing-supply companies, which may obtain worn-out plumbing articles from their customers, in turn, as part payment on replacements.

Primary copper smelters and refiners produced 189,746 tons of electrolytic grade and casting copper and a minor quantity of chemicals from scrap in 1950 compared with 212,392 tons of copper and a similar quantity of chemicals in 1949. The secondary copper smelters' output in 1950, including brass ingot, brass and copper billets for

[1] Gross weight of brass and bronze ingot. Includes 158,000 tons of copper, 6,364 tons of lead, 439 tons of nickel, 5,693 tons of tin, 25,665 tons of zinc, 64 tons of aluminum, and 3,821 tons of primary metals in 1949; and 276,646 tons of copper, 11,726 tons of lead, 659 tons of nickel, 10,321 tons of tin, 37,266 tons of zinc, 103 tons of aluminum, and 3,966 tons of primary metals in 1950.

[2] Gross weight of secondary brass and bronze in commercial shapes. Includes 189,027 tons of copper, 2,187 tons of nickel, 3,053 tons of lead, 221 tons of tin, 70,800 tons of zinc, and 151 tons of aluminum in 1949; and 298,930 tons of copper, 2,904 tons of nickel, 4,646 tons of lead, 467 tons of tin, 111,499 tons of zinc, and 125 tons of aluminum in 1950.

[3] Gross weight of secondary metal in brass and bronze castings. Includes 78,059 tons of copper, 45 tons of nickel, 10,381 tons of lead, 4,045 tons of tin, 6,727 tons of zinc, and 162 tons of aluminum in 1949; and 104,709 tons of copper, 74 tons of nickel, 13,735 tons of lead, 5,591 tons of tin, 7,812 tons of zinc, and 42 tons of aluminum in 1950.

brass mills, refined copper, copper powder, copper shot, and copper chemicals, totaled 394,665 tons gross weight, or 60 percent more than in 1949. Brass mills recovered 436,701 tons of nonferrous metals, including copper, tin, lead, zinc, and aluminum, from scrap in 1950 compared with 269,577 tons in 1949, an increase of 62 percent. The smelters' recovery of secondary copper was a little greater than that of the brass mills, but the total secondary recovery of the brass mills was greater because their scrap contained a greater proportion of zinc and metals, other than copper, than the scrap consumed by the smelters. The scrap used and the alloys produced by ingot makers average much higher in copper than brass-mill material.

The ingot produced at the smelters is used chiefly for castings. It contains tin to make the alloy nonporous and resistant to pressures. Without tin, pipes and valves filled with liquid or vapor under pressure would sweat; tin also resists corrosion. Lead makes casting alloys easy to machine, but in sheet brass it causes soft spots. Tin in sheet brass causes season cracking around grain boundaries. The chief alloys for wrought-brass products are those containing about two-thirds copper and one-third zinc.

TABLE 13.—Consumption of copper and brass materials, by principal consuming groups, in short tons, 1949–50

Item consumed	Primary producers	Brass mills	Wire mills	Foundries and other manufacturers	Secondary smelters
1949

Miscellaneous		1,193			16,143

[1] Recoverable copper content; gross weight not available.

It will be noted from table 13, showing estimated consumption of copper materials by principal consuming groups, that the primary producers' decrease in consumption of scrap was much more than counter-balanced by their increased use of primary raw material. The brass mills and secondary smelters had about the same scrap consumption in 1950 and the same increase over 1949 consumption. The former group increased its use of refined copper 41 percent, whereas its scrap consumption increased 62 percent. Consumption of refined copper by wire mills rose 5 percent. Foundries' consumption of scrap rose 15 percent and of brass ingot 71 percent in 1950 over 1949.

Consumption of brass ingot actually reported by foundries responding to Bureau of Mines questionnaires was 69 percent greater in 1950 than in 1949, totaling 273,433 short tons compared with

162,188 tons. In addition to the 273,433 tons reported by the foundries, 3,823 tons were consumed by brass and wire mills, and 531 tons were exported. Data on imports of brass ingot are not readily available, but of the 23,486 tons of brass scrap imported in 1950 much was probably melted into ingot form abroad for convenience in transportation. Brass ingot makers shipped 343,959 tons of brass ingot to foundries in 1950 and 204,969 tons in 1949. On the assumption that shipments equal domestic consumption plus exports, the foundry consumption survey achieved 80 percent coverage in 1950 compared with 81 percent in 1949. Over 3,300 plants were canvassed both years.

In table 14 ingot consumption reported in the 1950 foundry survey has been classified by nine general types and by States and geographic divisions. Similar breakdowns for earlier years have been published in past Minerals Yearbooks. As in 1949, the geographic division containing Ohio and Illinois consumed more than any other division—128,637 tons—and Ohio more than any other State—45,560 tons. The division using the next largest total, 70,621 tons, was the Middle Atlantic, in which the New York metropolitan area lies. These two regions together consumed 73 percent of the total quantity used by foundries. Consumption of composition ingot, the largest item, amounted to 169,166 tons, or 62 percent of the total.

Consumer's stocks of copper-base scrap at the end of 1950 were little changed from those at the end of 1949, except for increased holdings of low-grade material by primary producers. However, during most of 1949 stocks at secondary smelters were well above 30 days supply, whereas during all of 1950 they were considerably below monthly consumption.

TABLE 15.—Consumers' stocks of copper-base scrap in the United States at end of year, 1949–50, gross weight in short tons

Scrap item	Dec. 31, 1949	Dec. 31, 1950
Unalloyed copper	12,937	16,674
Copper-base alloy	46,011	41,826
Low-grade scrap and residues	34,999	60,702
Total	93,947	119,202

Dealers' buying prices for No. 1 composition scrap increased from 11.12 cents in January to 18.87 cents in November, then declined to 17.15 cents in December, the average for the year being 14.31 cents. The price of this scrap followed the price of copper at a level approximately 8 cents lower. The price of No. 1 heavy copper scrap averaged 13.62 cents in January through March, then increased to 24.75 cents in November, declining to 20.25 cents in the final month of 1950, the average for the year being 17.67 cents.

TABLE 16.—Brass and copper scrap imported into and exported from the United States, 1946–50, in short tons

	1946	1947	1948	1949	1950
Imports for consumption:					
Brass scrap	4, 008	112, 393	59, 984	23, 486	38, 092

Exports:					
Brass scrap	1, 184	3, 157	6, 584	13, 963	9 004
Scrap copper	909	969	2, 266	8, 284	9, 445

SECONDARY LEAD

Lead recovery reported by secondary smelters increased from 412,183 tons valued at $130,249,828 in 1949 to 482,275 tons valued at $130,214,250 in 1950; this represents a quantity gain of 17 percent. However, about half of the apparent increase in scrap recovery in 1950 was due to greater coverage of the survey. The companies that failed to report lead scrap operations to the Bureau of Mines in previous years did so in 1950. Another 15 percent of the gain was attributable to increased use of copper-base scrap, some types of which contain appreciable percentages of lead. The gain in recovery at lead plants reporting for both 1949 and 1950 was about 26,000 tons.

Value of lead recovered has been computed for both years on the basis of the yearly average weighted prices of all grades of refined lead sold by producers, or 15.8 cents in 1949 and 13.5 cents in 1950. For the

TABLE 17.—Lead recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable lead content of scrap processed			Lead recovered from scrap processed

Grand total	412, 183	482, 275	Grand total	412, 183	482, 275

[1] Includes 32,705 tons of lead recovered in antimonial lead from secondary sources at primary plants in 1949 and 38,383 tons in 1950.

fifth successive year, recovery of lead from scrap was greater than domestic mine production.

Production of refined soft lead decreased 14 percent from 156,910 tons, with a secondary lead content of 152,626 tons, in 1949 to 135,178 and 129,313 tons, respectively, in 1950. However, antimonial lead produced increased 36 percent, with the secondary lead content advancing 31 percent. Lead recovered in solder rose 25 percent, in type metals 52 percent, and in lead-base babbitt 33 percent. Total output of the secondary lead industry increased 19 percent over 1949 owing to a 13-percent increase in the use of scrap and to a more than 100-percent increase in the use of primary metals. As shown in table 18, the gross weight for most items is considerably greater than the total secondary metal content. Most of the differences represent primary metal, added to melts of scrap to bring the composition up to specifications. In the case of antimonial lead, the difference between gross weight and total secondary metal content is 23,713 tons, which represents primary lead, primary antimony, and elements not listed in the table. In 1950 secondary smelters consumed 111,581 tons of primary lead, 7,425 tons of primary antimonial lead, 20,551 tons of primary and detinners' brand tin, 7,014 tons of primary antimony, and 399 tons of miscellaneous metals, in conjunction with scrap and secondary metals.

Primary lead refineries recovered 44,739 tons of lead from scrap in 1950 or 9 percent of the total lead reclaimed. Of this quantity, 5,455 tons were refined soft lead, 38,383 in antimonial lead, and 901 in solder, compared with 23,230, 32,705, and 917 tons, respectively, in 1949. Antimony content of the secondary antimonial lead recovered was 1,654 tons.

A total of 609,877 tons of lead-base scrap was treated in 1950. Use of battery-lead plates increased 33,341 tons (11 percent) from 1949 to 1950, soft lead 10,737 tons (21 percent), hard lead 16,936 tons (125 percent), mixed common babbitt 6,900 tons (38 percent), solder 8,812 tons (67 percent), and type metals 8,685 tons (60 percent). Use of cable-lead scrap dropped 27 percent, and there was a 3-percent decrease in the treatment of drosses and residues. Smelters' heaviest operations were in the last quarter of the year, reaching the highest point in October, with November and December following in that order. The lowest recovery of the year was in April.

Plates from worn-out batteries constitute about three-fifths of the total lead scrap used. In 1950 consumption of this material was 349,383 tons, or 57 percent of the total. A few primary lead plants smelt their plate scrap with ore or concentrates; some add plate scrap when smelting drosses to increase the lead in the charge, but usually in both primary and secondary plants the plates are treated separately.

When the product is to be antimonial lead, battery-plate scrap is treated in a blast furnace. Old plates have a coating of lead oxide, lead sulfate, and usually a little sulfuric acid. The impurities to be removed in the smelting operation, including the oxygen, the acid, and the separators, constitute about 30 percent of the total weight of scrap in the charge. The sulfur forms a matte with some of the lead, copper, and iron, the last being added as mill scale, cast iron, or iron oxide. The iron also enters the slag in combination with lime and

TABLE 18.—Shipments[1] of secondary lead, tin, and lead- and tin-alloy products in the United States in 1950, gross weight in short tons

Product	Gross weight of products[2]	Secondary metal content

[1] Most of the figures herein represent shipments rather than production of the items involved. However, it has been necessary to record actual production figures in some instances where the information is secured from reports on that basis.
[2] Difference between gross weight of products and secondary metal content represents added primary metals or impurity content.

silica. The silica may be added as gravel, but much of it comes from the coke used. The copper comes from the copper terminal connections mixed with the plate scrap. In the reducing atmosphere of the blast furnace or cupola, the lead oxide is reduced to lead and, with the antimonial lead, gathers the silver, copper, and bismuth in the molten bath at the bottom of the furnace. The matte settles above the metal and slag above the matte. The matte is usually discarded, but the slag may be reused in subsequent charges. After the molten metal is drawn into a kettle, the copper is removed by the addition of sulfur. A small percentage of silver, about 0.025, is residual in battery plates and originates in the antimonial lead used in making the plates. It is not economical, even at primary plants, to desilverize antimonial lead unless the antimony is removed first.

In making soft lead from plate scrap, a reverberatory furnace is used. Some of the lead is changed, by blowing, to lead oxide, which oxidizes the antimony, forming an antimonial lead slag containing about 25 percent antimony, which may be returned to the blast furnace for production of antimonial lead. The antimony content of the soft lead may be reduced further by means of caustic soda. The silver cannot be economically separated at secondary smelters because the quantity recovered would not justify installation and operation of desilverizing equipment. The bismuth also is difficult to remove. These disadvantages hamper the secondary plants in competing with the primary producers in the production of the higher grades of refined lead. Data are not available to show how much of the refined lead produced from scrap at primary smelters and refineries was desilverized. Production of secondary refined lead at primary plants decreased to 5,455 tons in 1950, whereas output of antimonial lead, most of which was secondary, increased to 57,959 tons at these plants. Detailed information on primary lead is given in the Lead chapter of this volume.

TABLE 19.—Consumption of old and new lead scrap in the United States in 1950, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Soft lead		61,151	15	1,769	62,935
Hard lead		29,722		815	30,537
Cable lead		29,764	16	47	29,827
Battery-lead plates		349,376		7	349,383
Mixed common babbitt		12,736	42	12,384	25,162

Type metals		23,142		111	23,253
Dross and residues	66,706		84		66,790
Total	66,706	526,692	1,160	15,319	609,877

Treatment of soft lead and solder scrap is essentially a remelting operation at secondary smelters. Type metal and babbitt scrap may be smelted together in a reverberatory furnace to produce either babbitt or type metal.

During the first 4 months of 1950 the market for lead was dull. During this period monthly consumption, as recorded in the lead-consumption survey, ranged from 75,548 tons in February to 86,626 in March, whereas in other months of the year usage ranged from 93,300 tons in July to 126,090 in October. Lead-scrap consumption followed about the same pattern as that of refined metal. A second mild winter had lightened operation of the battery industry, which consumes most of the antimonial lead produced by the secondary smelters, and was a factor in the small rate of use in the early months of the year. Also demand for lead in foreign countries had fallen, increasing the lead available for export to the United States. The latter, together with the low tariff on lead and devaluation of foreign currency, caused a record-breaking quantity of lead to be imported in 1950 and weakened the market for domestic metal. With the outbreak of the Korean War and the accompanying increase in industrial activity, prices and demand for both scrap and refined lead increased rapidly, and toward the end of the year the National Production Authority started regulatory controls limiting inventories as an antihoarding measure. Smelting charges on battery plates were high at $55 to $65 during the first quarter, gradually decreased to $25 in September, and rose slightly to $32.50 in late December, denoting the trend from plentiful to tighter supplies.

Percentage and remelt metals circulated among remelters, smelters, and refiners in 1950 totaled 37,658 tons, consisting of 4,320 tons of solder, 2,663 of lead-base babbitt, 7,174 of soft lead, 20,876 of antimonial lead, 1,576 of type metals, 828 of cable lead, 159 of tin-base babbitt, 59 of remelt tin, and 3 of pewter.

TABLE 20.—Consumers' stocks of lead-base scrap in the United States at end of year, 1949–50, gross weight in short tons

Scrap item	Dec. 31, 1949	Dec. 31, 1950
Unalloyed lead	3,713	2,998
Lead-base alloy	25,280	32,242
Drosses and residues	17,761	21,399
Total	46,754	56,639

Smelters' stocks of lead alloys and drosses gained 28 and 20 percent, respectively, during the year but were 19 percent lower in unalloyed lead. Inventories on December 31 totaled 56,639 tons, an over-all gain of 21 percent; and smelters' year-end stocks of secondary metals totaled 23,115 tons, a decrease of 15 percent.

The price of lead scrap and secondary lead depends upon the price of primary lead. Between August 1949 and April 1950 there were nine successive drops in the price of primary lead, reducing it from 15.125 cents a pound to 12.00 cents on January 1 and to 10.50 cents a pound on March 14. Thereafter, although there were two decreases in June, the trend was upward, and the price reached 17 cents on October 31, where it remained to the end of the year. Prices for heavy scrap lead followed very much the same trend on a level a little over 2¼ cents a pound lower; the average for the year was 10.90 cents.

General imports of lead scrap totaled 20,085 tons (lead content) in 1950 compared with 14,649 tons (lead content) in 1949.

SECONDARY MAGNESIUM

Secondary magnesium (including alloying ingredients) recovered from scrap in 1950 totaled 7,740 short tons valued at $3,410,244 compared with 5,962 tons valued at $2,444,420 in 1949. Values have been calculated at 20.5 cents a pound in 1949 and 22.03 cents in 1950, the average prices for magnesium ingot (98.5 percent), f. o. b. Freeport, Tex., for the 2 years. Primary production in 1950 was 15,726 tons, all from operations at the Freeport, Tex., plant of Dow Chemical Co.

TABLE 21.—Magnesium recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable magnesium-alloy content of scrap processed			Magnesium recovered [1] from scrap processed		
Kind of scrap	1949	1950	Form of recovery	1949	1950
New scrap: Magnesium-base	3,023	2,770	Magnesium-alloy ingot [2] (gross weight)	4,249	3,682
Old scrap:			Magnesium-alloy castings (gross weight)	681	2,504
Magnesium-base	2,837	4,798	Magnesium-alloy shapes	96	281
Aluminum-base	102	172	In aluminum alloys	294	810
Total	2,939	4,970	In zinc alloys	4	57
			Chemical and other dissipative uses	83	95
Grand total	5,962	7,740	Cathodic protection	555	311
			Grand total	5,962	7,740

[1] Includes alloying elements.
[2] Figures include secondary magnesium and alloying elements incorporated in primary magnesium ingot.

Consumption of primary magnesium, including pure magnesium and magnesium content of primary alloy, totaled 18,051 tons compared with 11,947 tons in 1949.

Magnesium recovered from scrap in magnesium-alloy ingot decreased 13 percent from 1949 to 1950, but magnesium recovered by making castings from scrap increased 1,823 tons, or 268 percent. Recovery in all other products also increased, except in cathodic protection, for which 311 tons of scrap (recoverable content) were converted into anodes in 1950 compared with 555 in 1949. Secondary magnesium ingot consumed in 1950 was 5,039 tons compared with 3,809 in 1949. Magnesium-scrap consumption increased from 6,458 tons in 1949 to 8,367 in 1950. There were increases in the use of all types of magnesium material, including primary magnesium, primary magnesium alloy, secondary ingot, and scrap. An indeterminate quantity of secondary metal was contained in the primary alloy consumed. Old scrap constituted 62 percent of the total scrap used in 1950 compared with 48 percent in 1949; the increase resulted from greater consumption of old cast scrap.

The price of remelt magnesium ingot remained at 18 to 18.5 cents a pound when the price of primary metal held at 20.5 cents. The latter was increased to 21.5 cents on June 1, 1950; the remelt price immediately began to rise and was soon above the primary quotation, being quoted at 32 cents at the end of the year when the price of primary metal was 24.5 cents. This is another illustration of restraint in advancing primary prices while quotations for secondary metal were rising unchecked.

TABLE 22.—Stocks and consumption of magnesium scrap in the United States in 1950, gross weight in short tons

Scrap item	Stocks		Consumption during 1950
	Dec. 31, 1949	Dec. 31, 1950	
Cast scrap	2,113	2,335	5,795
Solid wrought scrap	737	156	1,597
Borings, grindings, drosses, etc	27	1,009	975
Total	2,877	3,500	8,367

Use of magnesium in aircraft construction rose in 1950, and this will later cause an increase in the recovery of secondary magnesium from wrecked and obsolete aircraft. It will be difficult, however, for consumers to record it as aircraft scrap, because it will have to be separated from the aluminum aircraft scrap, and most of it will have lost its identity as aircraft material by the time it reaches the smelter.

SECONDARY NICKEL

The recovery of secondary nickel from nonferrous scrap in 1950 totaled 8,795 short tons valued at $8,408,020, an increase of 55 percent in quantity over the 5,680 tons valued at $4,877,984 recovered in 1949. The total value was calculated at 47.80 cents a pound in 1950 and 42.94 cents in 1949, the average spot-delivery prices of Grade F nickel ingots and shot in 10,000-pound lots at New York.

The 1950 increase in recovery virtually equaled the 1949 decline. More secondary nickel was recovered in copper-base alloys in 1950 than in any other type of product (3,522 tons compared with 2,438 in 1949). Most of this came from nickel-silver scrap, a copper-base item, used at brass mills. There was a 2,601-ton increase in the recovery from old nickel-base scrap because more old Monel metal was used at steel plants than in 1949. This operation also increased the nickel recovered in iron and steel. Aside from the nickel obtained from scrap, the only production of nickel in the United States was a small quantity recovered as a byproduct from electrolytic copper refining. Detailed information on primary nickel may be found in the Nickel chapter of this volume.

TABLE 23.—Nickel recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable nickel content of scrap processed		
Kind of scrap	1949	1950
New scrap:		
Nickel-base	1,335	636
Copper-base	1,958	2,796
Aluminum-base	473	582
Total	3,766	4,014

Grand total	5,680	8,795

Nickel recovered from scrap processed		
Form of recovery	1949	1950
As metal	46	535
In nickel-base alloys	1,062	1,336
In copper-base alloys	2,438	3,522
In aluminum-base alloys	668	874
In lead-base alloys	21	39
In cast iron and steel [1]	1,201	1,824
In chemical compounds	244	665
Grand total	5,680	8,795

[1] Includes only nonferrous nickel scrap added to cast iron and steel.

Consumption of nickel scrap totaled 27,501 tons in 1950 compared with 18,160 tons in 1949. Use of all items increased, the principal gains being 6,774 tons in nickel silver (a copper-base item), 1,456 tons in Monel metal, and 788 tons in unalloyed nickel scrap. The total does not include nickel-bearing iron and steel scrap.

Most scrap residues are generated as byproducts resulting from the use of metals in various ways and are classed as new scrap. Exceptions are some nickel catalysts which are metal residues or salts. When no longer usable as catalyzers, they are classed as old scrap because they are worn-out material. The Raney nickel catalyst is aluminum-nickel alloy, from which the aluminum has been dissolved with caustic, leaving a nickel-sponge residue. This residue may be used as a catalyst for a considerable period, sometimes several years, before it becomes so saturated or poisoned with impurities that it ceases to function. It is then sold to chemical plants, where the nickel is reclaimed as a nickel salt, which can again be used as a catalyst or in other ways.

During the first 5 months of 1950, while the price of primary nickel was 42.97 cents a pound, prices quoted by dealers at New York were 17.5 cents for nickel sheet and clippings scrap and 11.5 cents for Monel-metal clippings. The advance of the primary price to 50.97

TABLE 24.—Consumption of old and new nickel scrap in the United States in in 1950, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Unalloyed nickel	127	99	54	918	1,198
Monel metal	297	1,608	192	2,362	4,459

Miscellaneous nickel alloys	38			110	148
Nickel residues	99		205	332	636
Total	785	6,189	16,669	3,858	27,501

[1] Copper-base scrap, and so tabulated except in this table and table 25.

cents on June 1 was accompanied by increases in scrap prices to 27 cents for nickel sheet and clippings and 16 cents for Monel-metal clippings. On September 21 the scrap prices rose to 47.5 and 20 cents, respectively, for the two types mentioned, whereas there was no increase in the primary price until December 13, when it was quoted at 53.80 cents a pound. On October 25 the scrap prices changed to 65 and 25 cents, respectively, where they remained until the end of the year.

TABLE 25.—Consumers' stocks of nonferrous nickel scrap [1] in the United States at end of year, 1949–50, gross weight in short tons

Scrap item	Dec. 31, 1949	Dec. 31, 1950
Unalloyed nickel	139	599
Nonferrous nickel alloys	2,866	2,476
Nickel residues	104	763
Total	3,109	3,838

[1] Includes nickel-silver scrap.

Imports of nickel scrap in 1948, 1949, and 1950 were 1,270 (revised) 1,429 (revised), and 625 tons, respectively. Exports in 1950 totaled 2,838 tons compared with 2,784 in 1949.

SECONDARY TIN

Recovery of secondary tin in 1950 totaled 35,481 short tons valued at $67,809,158 compared with 24,901 tons valued at $49,461,354 in 1949. Values were computed at 99.316 cents a pound in 1949 and 95.557 cents in 1950, the average New York selling price of Straits tin.

The tin-recovery table is double, as are those in the sections devoted to the other nonferrous secondary metals. It shows secondary tin recovered according to composition on the right and according to class of scrap processed on the left side. The data on the right side are compiled from individual plant outputs and those on the left by calculating the tin that could be recovered from the quantities of the different kinds of scrap reported used. The totals so derived for each side of the table do not agree because of slight errors introduced by the necessity of assuming recovery factors. As presented here, however, the items have been adjusted to give the exact balance theoretically expected. The word "recovery" thus may be applied to both sides of the table.

TABLE 26.—Secondary tin recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable tin content of scrap processed			Tin recovered from scrap processed		
Kind of scrap	1949	1950	Form of recovery	1949	1950
New scrap:			As metal:		
Tin plate	3,543	4,221	At detinning plants	3,265	3,766
Tin-base	854	1,314	At other plants	287	283

Copper-base	2,055	3,647	Total	3,552	4,049
Total	8,378	11,298	In solder	7,762	9,195
			In tin babbitt	1,084	873
Old scrap:			In chemical compounds	608	701
Tin cans	111	120	In lead-base alloys	3,463	5,148
Tin-base	2,976	2,874	In brass and bronze	8,432	15,515
Lead-base	5,592	8,888			
Copper-base	7,844	12,301	Total	21,349	31,432
Total	16,523	24,183	Grand total	24,901	35,481
Grand total	24,901	35,481			

More secondary tin was recovered at detinning plants and secondary smelter plants, but the quantity recovered in 1949 from copper-base scrap almost doubled in 1950. Detinners produced 3,697 tons of pig tin from old tin cans and new tin-plate clippings and 69 tons from tin-base scrap and residues. Secondary smelters recovered an additional 283 tons of pig tin. The total of 4,049 tons of tin reclaimed as metal was 14 percent above that reclaimed in 1949. Recovery of tin in solder, chemical compounds, and lead-base alloys increased nominally; but the recovery in brass and bronze, which had dropped 34 percent in 1949, increased 84 percent in 1950. Shipments of secondary tin and lead-tin alloys are presented in the Lead section of this chapter.

Consumption of all tin-base scrap increased 15 percent in 1950. Use of block-tin pipe and pewter scrap was reduced. Consumption of scruff and dross gained 43 percent, tin-base babbitt 2 percent, and use of residues was increased almost 6 times over.

The average monthly price of primary tin fluctuated between 75.92 cents a pound in January and 77.50 cents in June, rose to 89.88 cents

TABLE 27.—Consumption of old and new tin scrap in the United States in 1950, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Block-tin pipe, scrap, and foil		722	19	45	786
Tin scruff and dross	1,977		3	1	1,981
No. 1 pewter		117			117
High-tin babbitt		2,204	5	203	2,412
Residues	226			4	230
Total	2,203	3,043	27	253	5,526

in July, and averaged over 100 cents in the remaining months, reaching a high of 144.77 cents in December.

General Preference Order M–43, which had controlled the distribution and use of both secondary and primary tin, was revoked effective June 30. However, in September inventory control regulations were issued by the National Production Authority to limit the quantities held of most metals, except lead and antimony, to a practicable working inventory. Under provisions of NPA Order M–8, effective November 13, inventories of alloys and other materials containing tin, excluding ores and concentrates, were limited to 60 days' supply or a practicable working inventory, which ever was less. An amendment to Order M–8, effective December 18, set limits on nondefense uses of all tin—primary, secondary, tin-bearing alloys, and scrap—and prohibited use of primary tin where secondary metal could be substituted.

Exports of tin-base scrap totaled 3,137 short tons in 1950, less than one-third of the 10,332 tons exported in 1949. These exports were largely drosses and residues.

TABLE 28.—Consumers' stocks of tin-base scrap in the United States at end of year, 1949–50, gross weight in short tons

Scrap item	Dec. 31, 1949	Dec. 31, 1950
Unalloyed tin	35	32
Tin-base alloys	746	344
Drosses and residues	512	803
Total	1,293	1,179

Smelters' stocks of tin-base scrap decreased 9 percent in 1950. Unalloyed tin declined 9 percent and tin-base alloys 54 percent, whereas drosses and residues gained 57 percent. Dealers' buying price for scrap tin pipe averaged 62.00 cents a pound in January and 61.00 cents the next 5 months; it rose steadily thereafter to 90.00 cents in November and December, the average for the year being 70.39 cents.

Secondary tin recovered by detinning plants, as metal and in chemical compounds, increased 18 percent in 1950 compared with 1949. The total tin recovered was 4,467 short tons in 1950 against 3,798 in 1949. Tin-plate clippings and old cans were the source of 4,341 tons in 1950, of which 3,697 tons was reclaimed as metal in the form of pigs and 644 tons in the form of tin compounds. During 1949 the usage of such material provided 3,654 tons, comprising 3,195 tons of metal and 459 in compounds. The treatment of other tin-bearing materials accounts for the remaining production of 126 tons in 1950 and 144 in 1949.

The industry reported treating 469,417 long tons of tin-plate clippings in 1950. This was the largest on record and exceeded the previous peak (reached in 1949) by nearly 21 percent. The earlier peak year 1941 was exceeded by 38 percent. The average cost of such clippings delivered at plants increased from $25.21 a long ton in 1949 to $30.00 in 1950. The price of No. 1 Heavy-Melting steel scrap moved

Average delivered cost of old tin-coated containers .... do....	$19.69	$20.97

[1] Includes a small tonnage of pig tin of less than standard purity and consequently subject to further refining or alloying.
[2] Recovery from tin-plate clippings and old containers only. In addition, detinners recovered 70 tons of tin as metal and 74 tons of tin in compounds from tin-base scrap and residues in 1949 and 126 tons of tin as metal and in compounds from these sources in 1950.

upward in the latter part of 1950, reaching an exceedingly high level in December. Steel scrap is one of the products of the detinning industry, being sold to open-hearth mills in hydraulically compressed billets. Old cans processed increased 9 percent to only 16,818 long tons in 1950 compared with 15,382 tons in 1949 and with the record use of 175,870 tons in 1943. Tin recovered from tin-plate clippings in 1950 was 4,221 tons, 19 percent more than 1949, while that from old cans—120 tons (mostly in the form of pig tin)—increased 8 percent.

The average quantity of tin recovered per long ton of tin-plate scrap treated was 17.98 pounds in 1950 compared with 18.29 pounds in 1949. Before the introduction of electrolytic tin plate and wartime restrictions on the weight of tin on the hot-dipped product, recoveries averaged around 37 pounds per ton of material detinned. Lower recoveries per unit for the most part continued to reflect the treatment of a larger proportion of electrolytic tin plate carrying a much thinner coating of tin than the heavier-coated, hot-dipped product. The use of electrolytic tin plate has been expanding in the manufacture of cans, closures, and crowns. The average quantity of tin recovered per long ton of old tin-coated containers used decreased slightly from 14.43 pounds in 1949 to 14.30 pounds in 1950.

Imports of tin-plate scrap were 42,394 long tons in 1950 against 41,028 in 1949 (detinned, this material would provide the equivalent of about 400 tons of tin). In 1950, 562 long tons of tin-plate scrap were exported, mostly to Japan the latter part of the year. No exports of tin-plate scrap were recorded for 1948 and 1949.

SECONDARY ZINC

Secondary zinc recovered in 1950 from purchased scrap and residues totaled 326,030 short tons, with a value of $92,592,520, representing an increase in quantity of 37 percent over the 237,813 tons valued at $58,977,624 recovered in 1949. The values have been calculated at the average weighted price for all grades of refined zinc sold by producers, which was 12.4 cents in 1949 and 14.2 in 1950. In comparison, output of primary slab zinc was 843,467 tons in 1950 and 814,782 in 1949.

TABLE 30.—Zinc recovered from scrap processed in the United States, 1949–50, in short tons

Recoverable zinc content of scrap processed		
Kind of scrap	1949	1950

Zinc sulfate	4,418	4,677
Zinc chloride	11,366	12,600
Lithopone	8,588	11,558
Miscellaneous	658	833
Total	153,637	221,972
Grand total	237,813	326,030

[1] Zinc content.

Secondary zinc recovery from zinc-base scrap increased 22 percent from 1949 to 1950, whereas that from copper-base scrap increased 58 percent, owing chiefly to increased use of scrap at brass mills for military products. Use of copper-alloy scrap also increased at smelters and foundries, but the average zinc content of the scrap used at the mills was 26 percent compared with 10 percent at the smelters and 6 percent at the foundries. In 1950, 49 percent of the secondary zinc recovered was from copper-base scrap and 51 percent from zinc-base. In 1944, a war year, 62 percent was recovered from copper-base scrap and 38 percent from zinc-base. Secondary zinc recovered in zinc products (that is, metal, zinc-base alloys, and zinc compounds) totaled 163,948 tons in 1950, slightly over half of the total recovered, compared with 132,816 tons in 1949, which was 56 percent of the total recovery in that year.

Production of all secondary zinc products except galvanizers' stock, a minor item, increased in 1950, the greatest gains being 6,269 tons in output of chemical products (zinc content), 6,264 tons in zinc dust, and 4,381 tons in remelt die-cast slab. Of the chemicals, the greatest secondary recovery was 14,025 tons in lead-free zinc oxide. However, only about 12 percent of this pigment is made from scrap, 114,940

TABLE 31.—Production of secondary zinc and zinc-alloy products in the United States, 1946–50, gross weight in short tons

Products	1946	1947	1948	1949	1950

[1] Revised figure.
[2] Contains small tonnages of bars, anodes, etc.

tons of zinc having been recovered in this product from other materials than scrap in 1950.

In 1950, 10 plants made zinc dust, 9 from scrap and 1 from primary material. One plant that made zinc dust in 1949 did not operate in 1950. The 12 secondary distillers of slab zinc operating in 1949 continued in 1950. Primary plants using scrap, in addition to ore and concentrates, to make distilled slab totaled 10 in 1950 and 8 in 1949. Detailed information on primary zinc is given in the Zinc chapter of this volume.

All dross and sal skimmings generated, as well as a large proportion of ordinary zinc skimmings, are the result of galvanizing operations. Probably half of the total zinc scrap consumed in 1950 was generated in galvanizing operations. Consumption of galvanizers' dross increased 17 percent to 64,415 tons in 1950, whereas total zinc scrap consumption increased 21 percent. Dross is a high-grade, desirable scrap item, containing 90 percent or more zinc, so that most of that generated probably was consumed during the year. The consumption of 441,686 tons of slab zinc in galvanizing in 1950 compared with 350,880 tons in 1949 would indicate that generation of dross increased over 17 percent, except that, in the continuous method of galvanizing, use of which has been increasing, the generation of dross is less than in ordinary hot-dip galvanizing.

TABLE 32.—Consumption of old and new zinc scrap in the United States in 1950, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Clippings	3, 996		5, 102		9, 098
Sheet and strip		5, 381		308	5, 689
Engravers' plates		1, 392		331	1, 723
Skimmings and ashes	53, 893		38, 196		92, 089
Dross	64, 415				64, 415
Die castings		32, 712	1, 330	443	34, 485
Rod and die scrap		1, 530			1, 530
Flue dust	6, 091		6, 581		12, 672
Chemical residues	12, 382		8, 654		21, 036
Total	140, 777	41, 015	59, 863	1, 082	242, 737

Consumption of sal skimmings, data for which have been combined with ordinary skimmings in table 32, increased from 24,316 tons in 1949 to 28,528 in 1950. Sal skimmings result from the use of zinc ammonium chloride as a flux on the bath of molten zinc used in galvanizing; the flux prevents oxidation of the molten zinc, dissolves zinc oxide that forms, and otherwise keeps the zinc clean and bright. When the flux becomes saturated, it is skimmed off as a basic zinc oxide containing 50 to 65 percent zinc, partly in metallic form, and 5 to 15 percent chlorine, as well as carbon, iron, iron oxide, and silica. Values can be reclaimed from this residue most advantageously at chemical plants, where it may be used to make zinc chloride. Some is sold to smelters, where it is roasted to drive off the chlorine and is converted to zinc oxide pure enough to be used in the manufacture of lithopone, or to primary zinc distillation plants, where it may be mixed with ore and the zinc reduced to metallic form. Sal skimmings are, in general, an unsatisfactory type of scrap for smelting. In roasting, some of the zinc is driven off with the chlorine, and the skimmings tend to stick to the sides of the rotary kilns in which they are roasted. The chlorine gas given off pollutes the atmosphere if not absorbed by scrubbers or other means. Even in 1950, when demand for other types of zinc scrap was strong, galvanizers found it hard to dispose of this type of material.

Of the zinc scrap consumed in 1950, 83 percent was new, and in 1949, 85 percent. Most zinc scrap consists of residues, which are usually classed as new scrap. Most zinc products, except die castings, are such that very little can be salvaged for reuse. The principal use of slab zinc in 1950 was in galvanizing, and recovery from used galvanized material is as yet impractical. A little is recovered from galvanized clippings. The third-most-important use of zinc in 1950 was in brass products, from which no zinc was reported recovered in zinc form in 1950. Zinc-base alloys rank as the second-most-important use of zinc. A process has been developed for distilling zinc from brass scrap, providing an additional source of secondary unalloyed metal.[3] Used sheet and strip zinc does not return to processors of scrap in large quantity, and little zinc can be salvaged from that used for chemical purposes.

TABLE 33.—Consumers' stocks of zinc-base scrap in the United States at end of year, 1949–50, gross weight in short tons

Scrap item	Dec. 31, 1949	Dec. 31, 1950
Metallic zinc scrap	4,190	1,905
Dross	6,925	4,540
Skimmings and residues	19,101	18,024
Total	30,216	24,469

Dealers' buying prices for new zinc clippings averaged 10.38 cents a pound in 1950 compared with 7.28 in 1949 and 9.42 in 1948. The monthly average was 6.87 cents in January and February, thereafter increasing each month until November, when it was 14.75 cents. The average was unchanged in December. The prices for old zinc scrap

[3] Poland, F. F., Distillation of Zinc and Refining of Residual Metals from Copper-base Alloys: Am. Inst. Min. and Met. Eng. Tech. Pub. 2065, Metals Technol., September 1946, 15 pp.

followed about the same pattern as those for clippings. The average in January and February was 4.50 cents, after which it rose to 11.12 cents in October, at which level it remained for the balance of the year, the 12-month average being 7.77 cents compared with 5.45 in 1949 and 7.01 in 1948.

United States imports of old zinc scrap totaled 1,605 tons in 1950 compared with 1,064 in 1949. Imported drosses and residues totaled 1,229 tons in 1950 and 2,668 in 1949. Large quantities of fume from a primary plant in Canada were imported by one company for manufacturing zinc sulfate and lithopone; the zinc reclaimed from this material was not recorded as secondary zinc, but as recovered from material other than scrap. Exports of zinc scrap were 6,212 tons in 1950 compared with 1,570 in 1949.

Slag—Iron Blast Furnace

By D. G. Runner

GENERAL SUMMARY

A NEW record was established by the iron blast-furnace slag processing industry in 1950. Continued high-level activity in the construction field, combined with an increasing demand for slag as an aggregate, resulted in the largest tonnage processed in any single year by the industry during its entire history. Inasmuch as processed slag stocks are relatively small and constant from year to year, production virtually equals sales and, therefore, these terms are used interchangeably in this chapter. As indicated in table 1, sales in 1950 of all types of slag (air-cooled, granulated, and expanded) exceeded those reported for the previous year.

TABLE 1.—Iron blast-furnace slag processed in the United States, 1946–50, by types

[National Slag Association]

Year	Air-cooled						Granulated		Expanded		
	Screened			Unscreened						Value	
	Short tons	Value		Short tons	Value		Short tons	Value [1]	Short tons	Total	Average per ton

1947	16,712,177	17,045,020	1.02	447,908	257,683	.58	1,290,958	95,087	1,130,636	2,127,692	1.88
1948	17,656,200	19,254,900	1.09	604,100	370,000	.61	1,517,500	184,700	1,353,200	2,550,400	1.88
1949	17,769,330	21,090,445	1.19	727,595	372,727	.51	1,885,428	416,632	1,199,026	2,698,908	2.25
1950	20,047,844	24,444,231	1.22	1,005,436	639,499	.64	2,168,365	647,665	1,704,388	3,749,463	2.20

[1] Excludes value of slag used for hydraulic cement manufacture.

PRODUCTION

The output of slag from iron blast furnaces in 1950 amounted to an estimated 35,886,165 short tons compared with 30,093,957 tons reported for the preceding year.

The quantity of slag processed for commercial use in 1950, according to reports of processors to the National Slag Association, reached a new record of 24,926,033 short tons valued at $29,480,858. These totals are 15 and 20 percent, respectively, above the preceding year's figures of 21,581,379 short tons valued at $24,578,712. The output in 1950 came from 42 companies operating 63 plants for processing air-cooled slag and 12 companies operating 17 plants for expanding slag. Eight companies handle granulated slag for commercial uses.

During 1950, iron blast-furnace slag was processed in the following States: Alabama, California, Colorado, Illinois, Indiana, Kentucky, Maryland, Michigan, New York, Ohio, Pennsylvania, Texas, and West Virginia. The majority of the plants are east of the Mississippi River, with Ohio, as in 1949, being the largest processor. Alabama and Pennsylvania follow in order. These three States supplied 60 percent of the total tonnage reported during 1950. Table 2 shows the available details, by States, in 1950.

TABLE 2.—Iron blast-furnace slag processed in the United States in 1950, by States

[National Slag Association]

	Screened air-cooled			All types		
	Quantity		Value	Quantity		Value
	Short tons	Percent of total		Short tons	Percent of total	
Alabama	4,385,352	22	$4,499,213	4,969,901	20	$5,462,665
Ohio	4,915,988	24	6,592,279	6,211,631	25	7,619,969

[1] California, Colorado, Illinois, Indiana, Kentucky, Maryland, Michigan, New York, Texas, and West Virginia.

PREPARATION

Processed blast-furnace slag is sold in screened or unscreened air-cooled, granulated, and expanded forms. Air-cooled slag, formed when molten slag solidifies under atmospheric conditions, is processed like other crushed mineral aggregates. Granulated slag is the granular product formed when molten slag is suddenly chilled by immersion in water, whereas expanded slag is the foamed product formed when molten slag is expanded by applying a limited quantity of water. Details of these methods may be found in Bureau of Mines Bulletin 479, Iron Blast-Furnace Slag: Production, Processing, Properties, and Uses.

TRANSPORTATION

Virtually the entire output of processed slag in 1950 was moved by rail and truck, whereas only small quantities were moved by waterway. As indicated in table 3, railroads handled 47 percent and trucks 51 percent—the same pattern as in 1949.

TABLE 3.—Shipments of iron blast-furnace slag in the United States, by method of transportation, 1949–50

[National Slag Association]

Method of transportation	1949		1950	
	Short tons	Percent of total	Short tons	Percent of total
Rail	9,961,117	47	11,426,470	47
Truck	10,921,641	51	12,487,059	51
Waterway	401,785	2	499,157	2
Total shipments	21,284,543	100	24,412,686	100
Interplant handling [1]	296,836		513,347	
Total processed	21,581,379		24,926,033	

[1] This tonnage is used by the processor locally in making such products as concrete block, asphaltic concrete, etc.

CONSUMPTION

Screened air-cooled slag was the major type processed by the industry, constituting 80 percent of the total slag output during 1950. Granulated slag comprised 9 percent, expanded slag 7 percent, and unscreened air-cooled slag 4 percent.

Screened Air-Cooled Slag.—Consumption of screened air-cooled slag reached a new all-time high of 20,047,844 short tons valued at $24,444,231—2,278,514 tons above the previous record year of 1949. The use of screened air-cooled slag as aggregate in portland-cement concrete construction, bituminous construction, miscellaneous highway construction, and as railroad ballast consumed 17,908,480 short tons or 89 percent of the total for this type of slag. Other principal uses for this material were in the manufacture of concrete block, mineral wool, and as cover material and granules in roofing.

Unscreened Air-Cooled Slag.—In 1950 the quantity of unscreened air-cooled slag processed totaled 1,005,436 short tons valued at $639,499. Approximately half of this material was used in road construction.

Granulated Slag.—The consumption of granulated slag in 1950 amounted to 2,168,365 short tons—15 percent above the 1,885,428 tons reported in 1949. The chief uses for this type of material were in the manufacture of hydraulic cement and as road fill. These uses consumed 90 percent of the total processed.

232294—53——72

TABLE 4.—Air-cooled iron blast-furnace slag sold or used by processors in the United States in 1950, by uses

[National Slag Association]

Use	Screened		Unscreened	
	Short tons	Value	Short tons	Value
Aggregate in:

Other uses	381,649	352,287	516,604	326,272
Total	20,047,844	24,444,231	1,005,436	639,499

[1] Other than in portland-cement concrete and bituminous construction.

Expanded Slag Aggregate.—The consumption of expanded slag in 1950 increased over that for the preceding year, as 1,704,388 short tons valued at $3,749,463 were processed. These figures represent increases of 42 percent in quantity and 39 percent in value over 1949 totals. As in past years the principal use for expanded slag was in the manufacture of concrete block.

TABLE 5.—Granulated and expanded iron blast-furnace slag sold or used by processors in the United States in 1950, by uses

[National Slag Association]

Use	Granulated		Expanded	
	Short tons	Value	Short tons	Value
Road fill, etc	879,841	$409,107		
Agricultural slag, liming	44,966	48,548

Aggregate for concrete-block manufacture	159,877	174,210	1,601,033	$3,475,973
Aggregate in lightweight concrete			87,355	227,890
Other uses	21,000	15,800	16,000	45,600
Total	2,168,365	(1)	1,704,388	3,749,463

[1] Data not available.

PRICES

Average prices per ton for the various types of slag processed in 1950 are shown in table 6. Values for screened slag ranged from 89 cents for railroad ballast to $1.87 for slag used in the roofing industry. Unscreened air-cooled slag values ranged from 47 cents for railroad ballast to 65 cents for slag used in the construction of roads and streets. Available data on values of granulated slag show a low of 46 cents for road fill to a high of $1.09 for material used in the manufacture of concrete block, whereas average values of expanded slag were over 2 dollars per ton—$2.17 for concrete block manufacture to $2.85 for "other uses."

TABLE 6.—Average value per short ton of iron blast-furnace slag sold or used by processors in the United States in 1950, by uses

[National Slag Association]

Use	Air-cooled		Granulated	Expanded
	Screened	Unscreened		
Aggregate in:				
Portland-cement concrete construction	$1.31			[1] $2.61
Bituminous construction (all types)	1.34			
Highway and airport construction [2]	1.30	$0.65		
Manufacture of concrete block	1.23		$1.09	2.17
Railroad ballast	.89	.47		
Mineral wool	1.33			
Roofing (cover material and granules)	1.87			
Sewage trickling filter medium	1.67			
Agricultural slag, liming	1.38		1.08	
Road fill, etc			.46	
Other uses	.92	.63	.75	2.85

[1] Lightweight concrete.
[2] Other than in portland-cement concrete and bituminous construction.

IRON RECOVERY

The recovery of iron by slag processors during 1950 amounted to 296,603 short tons—an increase of 44 percent over the previous year's figure. Iron is recovered from slag either by magnetic methods or by hand picking, and the material so recovered is returned to the furnaces, thus representing a useful contribution to the iron and steel industry.

EMPLOYMENT

A total of 5,399,500 man-hours was expended by 2,015 plant and yard employees in the production of commercial slag during 1950. These figures represent a slight increase in the number of man-hours utilized and a decrease in the number of plant and yard employees compared with the previous year.

TECHNOLOGY

Considerable interest has been aroused in connection with the use of granulated slag to correct poor pavements. The granulated slag is spread over the old road and later covered with a bituminous surface. Granulated slag is also reported to be effective in correcting "rocking" concrete pavements.[1]

An unusual concrete paving project in which a special slag subgrade was used has been reported. The base was prepared run-of-crusher slag, graded from 4-inches to fines, with enough fine material present to prevent excessive mortar loss from the freshly laid concrete. The base was placed in two 4-inch loose courses each and compacted thoroughly; upon it was placed a 9-inch, reinforced concrete slab.[2]

The Silbrico Corp. of Clearing, Ill., is reported to operate the only slag brick factory in the United States. The process of manufacture, perfected by the corporation, combines 96 parts of water-granulated, steel mill slag and 4 parts of high-calcium lime.[3]

[2] Contractors and Engineers Monthly, vol. 47, No. 2, February 1950, pp. 61–63.
[3] Pit and Quarry, vol. 42, No. 11, May 1950, pp. 208, 213.

Demand for construction materials has resulted in widespread use of blast-furnace slag as an aggregate in block manufacture. The Chicago Block Co., Chicago Heights, Ill., manufactures standard, special, and catch basin units utilizing slag, from a nearby steel mill, with sand and limestone. Other products include coping, sills, lintels, and architectural specialties.[4]

As a result of numerous tests made to determine reactivity, it was concluded that "high alkali content in blast-furnace slag cement does not mean that the slag cement will produce or aggravate the alkali-aggregate reaction. On the contrary, the use of slag cement in an otherwise reactive mixture usually reduces the extent of the reaction." [5]

That the slag-processing industry is growing is evidenced by the installation of new plants and improvement in existing plants. Some of these new developments were at plants of the Buffalo Slag Co., Inc., Buffalo, N. Y.,[6] the Edward C. Levy Co., Detroit, Mich.,[7] and the Sloss-Sheffield Steel and Iron Co., Birmingham, Ala.[8]

Slate

By Oliver Bowles and M. G. Downey

GENERAL SUMMARY

THE DOMESTIC output of slate during 1950 was substantially higher than in 1949. Sales of roofing slate gained 9 percent in quantity and value but were still below the level of output in 1948. The average value per square in 1950 was $20.75, compared with $20.71 in 1949. Gains were reported in each of the principal roofing-slate-producing centers except Vermont and Maine, where the output declined slightly.

The mill-stock branch of the industry reported much larger gains, output reaching a higher level than in any recent year. The quantity produced was 16 percent and the value 23 percent higher than in 1949. Electrical slate, structural and sanitary products, and blackboards and bulletin boards, the three principal outlets for mill stock, all showed substantial gains both in quantity and value compared with 1949. Grave vaults and covers, billiard-table tops, and school slates, the three minor categories, declined considerably below the 1949 level.

Flagstones, including slate employed for walkways, stepping stones, and miscellaneous uses, gained 55 percent in quantity and 47 percent in value.

Slate granules and flour are included as part of the slate industry. A small fraction of the output is derived from waste slate at quarries and mills, where dimension-slate products are made, but by far the largest part is obtained at independent quarries that produce granules and flour only. Most of the material so used is unsuited for other slate products. Granules are used primarily for surfacing prepared roofing, and the flour is used as a filler in paint, linoleum, and various other products. Granules and flour together increased 25 percent in quantity and 30 percent in value in 1950 compared with 1949. Figures for sales of granules of all types, including slate, are presented in the chapter on Stone of this volume.

[1] Square feet approximate. Number of pieces: 1949, 682,270; 1950, 389,087.
[2] Includes slate used for walkways, stepping stones, and miscellaneous uses.

SALES

Dimension Slate.—Blocks or slabs cut to specified sizes and shapes are normally classed as "dimension slate"; this class includes all slate products except granules and flour. Table 2 shows sales of dimension slate for the latest 5-year period.

TABLE 2.—Dimension slate sold by producers in the United States, 1946–50

Year	Roofing			Mill stock		Other [1]		Total	
	Squares	Approximate equivalent short tons	Value	Approximate short tons	Value	Approximate short tons	Value	Approximate short tons	Value
1946	146,790	56,240	$1,982,928	12,150	$1,032,584	27,860	$403,990	96,250	$3,419,502

[1] Includes flagstones, walkways, stepping stones, and miscellaneous slate.

As roofing slate is used chiefly in residential building, it is interesting to compare sales of roofing slate with the trend in new units built during recent years. The relationship between these trends for the period 1925 to 1950 is shown in figure 1. Since 1944 the number of new dwelling units has increased remarkably, but roofing-slate sales have failed to even approach the dwelling-unit trend. Slate is apparently unable to compete with other types of roofing.

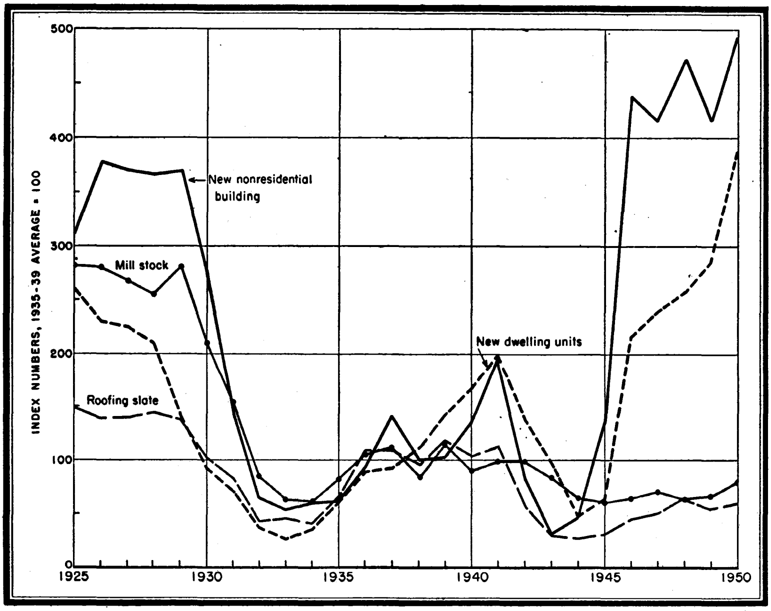

FIGURE 1.—Sales of roofing slate and mill stock compared with number of new dwelling units and value of new nonresidential construction, 1925–50. Data on number of new dwelling units (actual starts) in nonfarm areas from U. S. Department of Labor; on value of nonresidential construction activity from U. S. Department of Commerce, Survey of Current Business.

Mill-stock slate is used extensively for steps, baseboards, and other units in nonresidential types of buildings, and sales more or less paralleled construction activity in this field from 1929 to about 1939. Since that date sales of mill stock have dropped behind construction activity. Nonresidential building since 1944 has been exceptionally active, but the structures built are evidently types that use very little slate, because the increase in mill-stock output during the same period was quite moderate. These relationships are indicated in figure 1.

Figure 2 presents a graphic summary of the value of slate sold from 1915 to 1950, by uses. Two peaks were reached during this period, one in 1925 and the other in 1950. The industry declined greatly during the depression and to some extent during World War II.

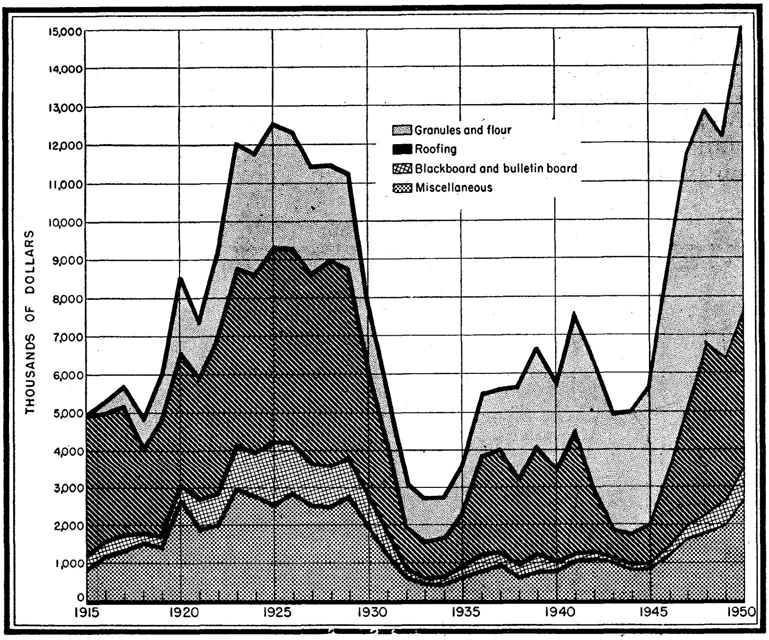

FIGURE 2.—Value of slate sold in the United States, 1915–50, by uses.

Granules and Flour.—Sales of granules increased 28 percent in quantity and 31 percent in value in 1950 compared with 1949. Both quantity and value were the highest in the history of the industry. The sales value per ton f. o. b. plant ($11.34) was also the highest on record. Sales of slate flour gained 15 percent in quantity and 16 percent in value. Granules and flour were produced in Arkansas, California, Georgia, New York, Pennsylvania, and Vermont, while Maryland and Virginia produced granules only. Sales of these products for the latest 5-year period are shown in table 3.

TABLE 3.—Crushed slate (granules and flour) sold by producers in the United States, 1946–50

Year	Granules		Flour		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1946	513,780	$4,851,314	149,740	$573,290	663,520	$5,424,604
1947	593,560	5,911,151	169,940	697,083	763,500	6,608,234
1948	499,440	5,306,568	159,430	707,809	658,870	6,014,377
1949	463,290	5,136,992	144,980	627,568	608,270	5,764,560
1950	595,200	6,747,325	166,530	728,831	761,730	7,476,156

REVIEW BY STATES AND DISTRICTS

As shown in table 1, total domestic production of slate increased 26 percent in quantity in 1950 compared with 1949. Ninety-four operators reported production during the year, an increase of 14. Table 4 shows sales of slate in 1950, by States and uses.

TABLE 4.—Slate sold by producers in the United States, 1946–50, by States and uses

	Operators	Roofing		Mill stock		Other uses (value)[1]	Total value
		Squares (100 square feet)	Value	Square feet	Value		
1946	61	146,790	$1,982,928	2,371,820	$1,032,584	$5,828,594	$8,844,106
1947	76	170,590	3,094,780	2,549,080	1,444,835	7,145,939	11,685,554

Total	94	197,570	4,098,842	3,180,600	2,130,430	8,818,209	15,047,481

[1] Flagging and similar products, granules, and flour.
[2] Included with "Undistributed" to avoid disclosure of individual company operations.

Maine.—The quarries near Monson, Maine, produce electrical slate primarily, although small quantities of roofing and other products are also made. As in 1949, only one company was active during the year.

New York.—The total number of slate operators increased to 21, 5 more than in 1949, and the value of sales increased 27 percent. The principal slate products made were flagging, granules, and flour. Roofing-slate production is relatively small.

Pennsylvania.—All types of slate products are made in Lehigh and Northampton Counties, Pa., the most productive slate areas in the United States. The "soft-vein," blue-black slate characteristic of this area is suited in texture and workability for the manufacture of mill products as well as roofing and accounts for the wide range of products. Slate produced in York County in the Peach Bottom district on the Maryland-Pennsylvania border in the vicinity of Cardiff, Md., and Delta, Pa., may not be shown separately and therefore is included in Northampton County, in table 5, which gives detailed figures for Pennsylvania.

The total value of all slate products sold in Pennsylvania in 1950 increased 21 percent compared with 1949. Gains in roofing slate, electrical slate, structural and sanitary products, blackboards and bulletin boards, and slate for miscellaneous uses (principally granules and flour) were substantial both in quantity and value. The most remarkable advance was in electrical-slate products, which increased more than threefold both in quantity and value. On the other hand, sales of vaults and covers, billiard-table tops, and school slates declined considerably both in quantity and value. The percentage changes in these items in 1950 compared with 1949 were as follows: Roofing slate, increase of 10 percent in both quantity and value; electrical slate, increase of 218 percent in quantity and 209 percent in value; structural and sanitary slate, increase of 32 percent in quantity and value; vaults and covers, decrease of 85 percent in quantity and 83 percent in value; blackboards and bulletin boards, increase of 24 percent in quantity and 28 percent in value; billiard-table tops, decrease of 2 percent in quantity and 4 percent in value; and school slates, decrease of 24 percent in quantity and 35 percent in values. Slate for other uses increased 36 percent in value. Detailed statistics of production appear in table 5.

TABLE 5.—Slate sold by producers in Pennsylvania in 1950, by counties and uses

County	Operators	Roofing slate: Squares (100 square feet)	Roofing slate: Value	Mill stock: Electrical: Square feet	Electrical: Value	Structural and sanitary: Square feet	Structural and sanitary: Value	Vaults and covers: Square feet	Vaults and covers: Value
Lehigh	7	8,070	$137,981	11,050	$12,044	849,970	$611,004	--------	--------
Northampton and York [1]	21	116,210	2,203,146					2,340	$2,097
Total: 1950	27	124,280	2,341,127	11,050	12,044	849,970	611,004	2,340	2,097
1949	26	112,870	2,124,573	3,480	3,894	645,060	463,980	15,200	12,472

County	Mill stock—Continued: Blackboards and bulletin boards: Square feet	Blackboards and bulletin boards: Value	Billiard-table tops: Square feet	Billiard-table tops: Value	School slates: Square feet	School slates: Value	Other uses (value)	Total value
Lehigh	479,200	$234,763	--------	--------	279,100	$8,936	$8,500	$404,643
Northampton and York [1]	941,760	594,747	161,030	$95,996	--------	--------	1,636,800	5,141,371
Total: 1950	1,420,960	829,510	161,030	95,996	279,100	8,936	1,645,300	5,546,014
1949	1,145,080	649,451	164,100	100,203	366,910	13,798	1,210,273	4,578,644

[1] York County produced granules and flour only; included with Northampton County to avoid disclosure of individual company operations.

Vermont.—In order to avoid revealing the production figures of an individual firm, Maine has been included with Vermont in table 4, showing slate sold in the United States by States and uses. The total value of slate products sold in 1950 by Vermont and Maine was 24 percent greater than in 1949. Roofing-slate production declined 2 percent in quantity and 1 percent in value, but mill stock increased 14 percent in quantity and 18 percent in value. The value of slate for other uses increased 37 percent. There was an increase of 4 in the number of operators.

Virginia.—Roofing slate is the principal product of the Buckingham, Va., quarries. No mill stock is made. Roofing-slate sales increased 25 percent in quantity and 19 percent in value in 1950 compared with 1949. Granules were produced in substantial quantities during the year, but details cannot be given because there were too few producers.

Other Districts.—Granules and flour were produced in Montgomery County, Ark., near Glenwood; near Placerville, El Dorado County, Calif.; near Fairmount, Bartow County, Ga.; and at Whiteford, Harford County, Md. Flagging was produced in Inyo, Mariposa, and Tuolumne Counties, Calif.

PRICES

The average value of roofing slate f. o. b. quarry or mill, as reported to the Bureau of Mines, increased 4 cents per square to \$20.75 in 1950. In Pennsylvania it was \$18.84 per square, in New York \$48.59, in Vermont and Maine \$22.43, and in Virginia \$26.07.

The average value of mill stock was 67 cents per square foot, compared with 63 in 1949. The average value of electrical slate increased 16 cents (to \$1.49); structural and sanitary slate declined 3 cents (to \$0.75); vaults and covers increased 10 cents (to \$0.92); and blackboards and bulletin boards increased 1.7 cents (to \$0.584). The average sales value of granules increased 25 cents per short ton (to \$11.34), while flour increased 5 cents (to \$4.38).

Price History.—The trend in yearly average value of roofing slate and mill stock compared with wholesale prices of all building materials over a 36-year period is indicated in figure 3. From 1915 to 1920 slate prices (compared with a 1935–39 base period) were below the general average for building materials, while from 1921 to 1936 they were above. Fairly close agreement with the general average was maintained from 1936 to 1945. Since 1945 mill stock has followed closely the trend of all building materials, but roofing-slate prices have advanced considerably beyond the general average.

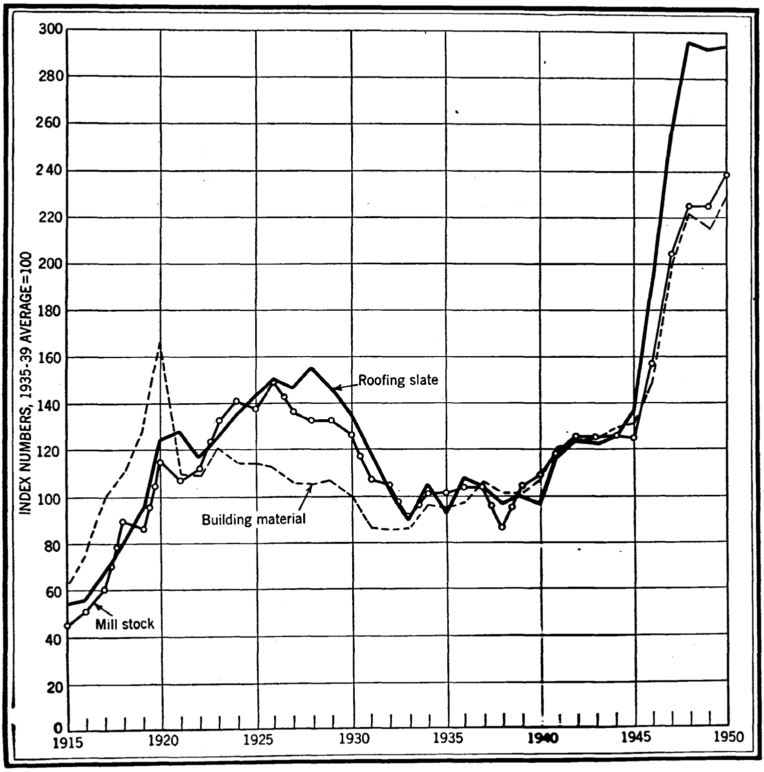

FIGURE 3.—Average value of slate compared with wholesale prices of building materials in general, 1915–50. (Wholesale prices from U. S. Department of Labor.)

FOREIGN TRADE [1]

Imports.—The value of slate imported for consumption, which has been increasing steadily during recent years, registered a remarkable gain in 1950, when it was nearly 5 times as great as in 1949. Most of the shipments were from Italy. Of the total value of imports for 1950 given in table 6, $2,351 (31,667 square feet) was for roofing, and $95,396 was classified as "other." More than three-fourths of the roofing slate originated in the United Kingdom and the remainder in Italy.

Exports.—Table 7 gives the value of exports of slate products for the latest 5-year period as reported by shippers to the Bureau of Mines. The total value of exports was 3 percent higher than in 1949.

TABLE 6.—Slate imported for consumption in the United States, 1946–50, by countries

[1] Figures collected by the Bureau of Mines from shippers of products named.
[2] Includes slate used for pencils and educational toys.

TECHNOLOGY

The Broughton Moor Green Slate Quarries, Coniston, Lancaster, England, is using the wire saw successfully in its quarries. It is employed to cut out the masses of slate that lie between tunnels driven 60 feet apart.[2]

[1] Figures on imports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.
[2] Quarry Managers' Journal (London), The Wire Rope Saw in Slate Quarry: Vol. 34, No. 6, December 1950, pp. 336–339.

Committee C–18 on Natural Building Stone of the American Society for Testing Materials is giving further consideration to a proposed Tentative Specification for Roofing Slate. This specification has been considered satisfactory by the Federal Government and various other buyers for some years; but, as further testing has been suggested by the slate industry, the specification has been tabled for 1 year, during which time additional test data may be assembled. The committee also is continuing for another year in tentative status the Method of Testing Durability of Slate for Roofing. Additional information has been published.[3]

Stone

By Henry P. Chandler and Nan C. Jensen

GENERAL SUMMARY

SALES of crushed and dimension stone combined (252,113,050 short tons) were 13 percent greater in 1950 than the previous year and 12 percent greater than the record production of 1948. Total value ($390,582,097) increased 14 percent over that reported for 1949. Production of dimension stone in 1950 increased 15 percent, and its value 13 percent. In the crushed- and broken-stone industry, increases in both unit value and tonnage occurred in the furnace flux, the material classified as crushed stone, and the miscellaneous groups; refractory stone decreased in unit value but increased in tonnage; riprap showed a downward trend both in production and average value; and agricultural limestone decreased in tonnage but increased in average value. The total for the crushed- and broken-stone group, however, increased 13 percent by weight and 15 percent in value.

The tables in this chapter give the quantities sold or used by producers and the values f. o. b. quarries and mills. Stone quarried and used by producers is considered sold and is therefore included with sales in the statistics. The data, however, do not include stone made into abrasives, such as grindstones, or material used in making lime and cement. These are reported in terms of finished products in the Abrasive Materials, Lime, and Cement chapters. Dimension stone and crushed stone are considered separately, except in introductory tables 1 to 4, which show the total sales of stone by kinds, uses, and States.

TABLE 1.—Stone sold or used by producers in the United States, 1946–50, by kinds

Year	Granite		Basalt and related rocks (traprock)		Marble		Limestone	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	11,119,490	$29,492,076	16,400,120	$20,683,202	205,260	$7,919,979	134,717,410	$155,649,197

[1] To avoid disclosing confidential information certain State totals are incomplete, the portion not included being combined with "Undistributed." The class of stone omitted from such State totals is noted in the State tables in the Statistical Summary chapter of this volume.
[2] Included with "Undistributed."

DIMENSION STONE

The term "dimension stone," as used in this chapter, is applied to blocks and slabs of natural stone, most of which are cut to definite shapes and sizes. Dimension stone is used principally for constructing masonry walls and memorials. Crushed and broken stone consists primarily of irregular fragments sized chiefly by mechanical screening and is used mainly as concrete aggregate, railroad ballast, furnace flux, and agricultural limestone.

Dimension-stone producers may be divided into three main groups on the basis of method of operation. The first group quarries stone and sells it as rough blocks or slabs; the second quarries stone and also manufactures it into finished products; and the third buys sawed slabs or rough blocks of stone and manufactures them into finished products. The Bureau of Mines statistical canvass covers the first and second groups but not the third. Bureau of Mines statistics are compiled from reports of quantities and values of original sales and include some material sold as rough blocks and some sold as finished products.

Total sales of dimension stone (including slate) in 1950 increased 16 percent in quantity and 14 percent in value compared with 1949. These over-all figures include slate, but detailed statistics of this branch of the industry appear in the Slate chapter.

TABLE 5.—Dimension stone sold or used by producers in the United States, 1949–50, by kinds and uses

Kind and use	1949	1950

Value	$58,145,841	$66,035,508	+14

[1] Includes soapstone, mica schist, volcanic rocks, argillite, and other varieties that cannot be classified in the principal groups.
[2] Details of production, by uses, are given in the Slate chapter of this volume.

BUILDING STONE

The largest use of dimension stone is for building purposes. Increased building activity in this country during 1950 resulted in the consumption of 15,993,810 cubic feet valued at $36,664,997, an increase over the 1949 figures of 35 percent and 23 percent, respectively. Table 6 gives the quantity and value of the major types of building stone sold or used in 1950.

TABLE 6.—Building stone sold or used by producers in the United States in 1950, by kinds

Kind	Rough			
	Construction		Architectural	
	Cubic feet	Value	Cubic feet	Value
Granite	935,400	$437,332	260,530	$550,436

[1] Sawed stone corresponds to dressed stone for construction work (walls, foundations, bridges) and cut stone to architectural stone for high-class buildings.
[2] Rough and cut miscellaneous stone included with sawed stone.

GRANITE

Sales of granite in the form of blocks and slabs increased 14 percent in quantity and 7 percent in value over 1949. However, the average unit value decreased 6 percent. Production of rough construction stone and rubble increased, while that of rough architectural and dressed building stone decreased. Total values of all classifications of granite used as a building stone increased. Rough monumental granite increased both in volume and value over the 1949 figures, while the value of dressed monumental stone declined in both instances. Both the volume and value of sales of paving blocks and curbing increased over 1949.

Tables 8 and 9 show sales of monumental granite in the Barre district, Vermont, exclusive of small quantities of Barre granite sold as construction or crushed stone.

Total value of granite	15, 873, 101	16, 487, 450	16, 859, 867

BASALT AND RELATED ROCKS (TRAPROCK)

Because of their dark color, basalt and related rocks are not used extensively as building stone. Sales for rough construction declined slightly from 1949 but increased in value. The volume of rubble sales increased 46 percent and its value 50 percent. Unit values of both types increased. The total increase over 1949 was 6 percent in tonnage and 10 percent in value. Basalt and related dark rocks are used to some extent for memorials but are classed in the trade as "black granite" and are therefore included with the figures for monumental granite.

TABLE 10.—Basalt and related rocks (traprock) (dimension stone) sold or used by producers in the United States in 1950, by States and uses

State	Active plants	Building stone				Total

[1] Included with "Undistributed" to avoid disclosure of individual company operations.
[2] 317,500 cubic feet (approximate).

MARBLE

Sales of all types of marble declined in 1950 compared with 1949. Total sales decreased 12 percent in cubic footage and 16 percent in value. Decreases in building stone during 1950 were 11 and 13 percent in quantity and value, respectively, while the decreases in monumental stone were 16 and 21 percent, respectively, from 1949. Unit values also declined. Tables 11 and 12 give details on marble, by uses and States.

TABLE 11.—Marble (dimension stone) sold by producers in the United States, 1949–50, by uses

Use	1949		1950	
	Cubic feet	Value	Cubic feet	Value

[2] Average value per cubic foot.

LIMESTONE

Almost all limestone blocks cut to definite shapes and sizes are used for building purposes, such as interiors and exteriors of public buildings and commercial structures. All classifications of limestone for building purposes, except rubble, increased substantially over 1949 both in quantity and value. All unit prices, except material for rough construction, advanced.

The Bedford-Bloomington, Ind., area continued to produce most of the dimension limestone in the United States, its output being 80 percent of the total rough architectural and finished (sawed and cut) limestone by volume and 74 percent by value. Tables 14 to 16 show production in the Bedford-Bloomington, Ind., and Carthage, Mo., areas over a 5-year period.

SANDSTONE

The output of sandstone in 1950 increased 18 percent in quantity and 32 percent in value over 1949. Gains in output over the previous year occurred in the case of sandstone for rough construction (71 percent), rough architectural stone (3 percent), sawed dressed building stone (60 percent), and flagging (39 percent). Losses in quantity from 1949 were noted in cut dressed building sandstone (3 percent), rubble (67 percent), and curbing (69 percent). Gains in unit prices occurred in every classification except sawed dressed building sandstone, which declined 2 percent.

Ohio continued to be the largest producing State, contributing 53 percent of the total. Other States, in order of production, were Pennsylvania, Tennessee, and New York.

Table 18 presents the sales of bluestone in 1941–50. Bluestone is a type of sandstone that splits into thin, uniform slabs. It is particularly adapted for flagging but is also used for building stone and curbing. The output declined slightly in 1950—to 1 percent less than the previous year—but the value increased 13 percent.

1945	109,330	89,448	1950	390,460	604,137

[1] New York and Pennsylvania were the only producing States.

MISCELLANEOUS STONE

Types of stone other than those included in the major groups already discussed are covered in table 19. The principal types in this classification are mica schist, argillite, light-colored volcanic rocks (such as rhyolite), soapstone, and greenstone. The quantity sold in 1950 increased 16 percent and the value 21 percent over 1949.

TABLE 19.—Miscellaneous varieties of stone (dimension stone) sold or used by producers in the United States in 1950, by States and uses

State	Active plants	Building				Flagging		Total

Average unit value			$35.74		$1.06		$12.08		$21.47

[1] Included with "Undistributed" to avoid disclosure of individual company operations.
[2] Approximately 720,740 cubic feet.
[3] Approximately 28,730 cubic feet.

TRENDS IN USE OF DIMENSION STONE

A 35-year history of the output of dimension stone by kinds is indicated in figure 1. The depression years of the 1930's and later the war years had a detrimental effect on the industry, but since 1944 there has been an upward trend.

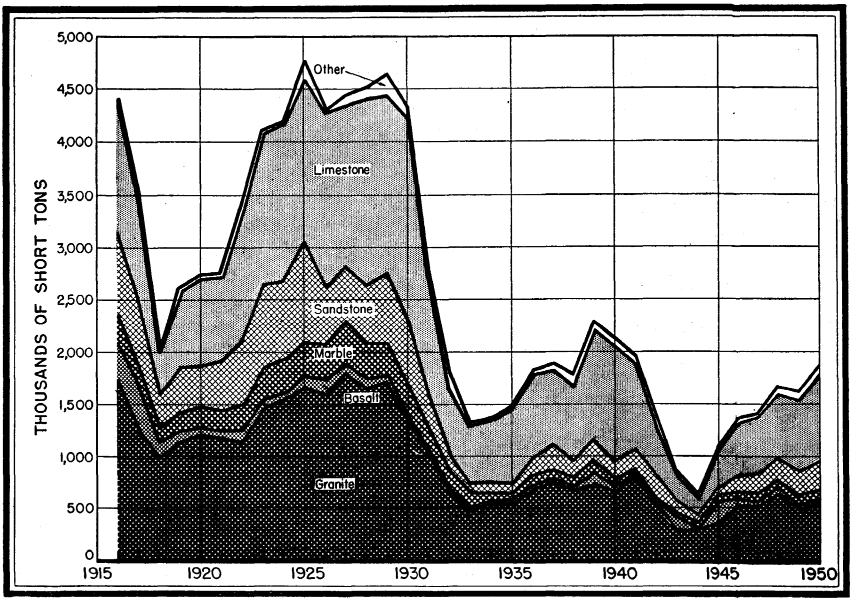

FIGURE 1.—Sales of dimension stone in the United States, by kinds, 1916–50.

Figure 2 traces, for a 36-year period, the history of production of building stones as a whole and of the chief variety, limestone, in their relation to nonresidential building, the class of construction using stone most extensively. Activity in building-stone production in peacetime generally follows the trend of nonresidential construction, and the industry is currently following this general trend.

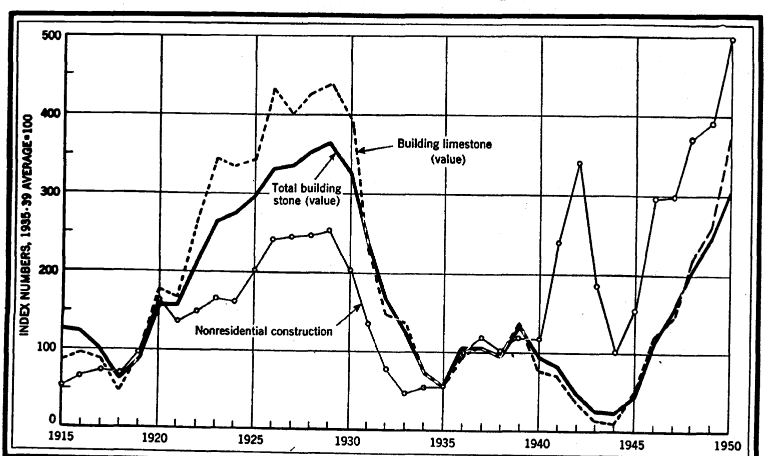

FIGURE 2.—Sales of all building stone and building limestone compared with nonresidential construction (public and private), 1915–50. Data on nonresidential-building construction from Survey of Current Business.

TECHNOLOGY

Recent trends in the preservation of natural stone masonry have been described,[1] and the methods of preservation in use over 150 years ago were cited to show the advantages of such treatment.[2]

A description of a large sandstone quarry, methods of working the deposit, and preparation of the stone for market has been published.[3]

The production of Italian marble and contemplated output for the next 3 years was the subject of a recent technical review.[4]

A special report on an occurrence of limestone in California has been published.[5]

Colorado "travertine" was discussed before the Colorado Mining Association.[6]

The commercial granites of Virginia have recently been described.[7]

California "black granite" was the subject of a recent report.[8]

A recent trade-journal article expressed the alarm felt in certain quarters at the possibility of increased importation of foreign stone into America.[9]

CRUSHED AND BROKEN STONE

Over 250 million tons of crushed and broken stone, in addition to that used for making cement and lime, were produced in the United States during 1950. This output constitutes a record for material of that type, and represents a 13-percent increase in quantity and 15-percent in value over the previous year.

Tonnage gained in all classifications except riprap and agricultural stone, where slight losses were noted. The average value was $1.33 a ton, a 3-cent gain over 1949.

Table 20 shows the quantity sold and the value of the output during 1949 and 1950, by uses. Detailed data on asphaltic stone and slate granules and flour are given in the Asphalt and Slate chapters of this volume.

Tables 21 and 22 show the tonnage and value of stone used for concrete and road metal and for railroad ballast for a series of years and by States for 1950.

[1] To avoid disclosing confidential information, total is somewhat incomplete, the portion not included being combined as "Undistributed."
[2] Included with "Undistributed."

COMMERCIAL AND NONCOMMERCIAL OPERATIONS

In contrast with strictly commercial operations, noncommercial operations represent tonnages reported by States, counties, municipalities, and other Government agencies as being produced by themselves or by contractors for their own consumption. Table 23 shows the production of crushed stone for concrete and road metal during recent years by both types of operations. Noncommercial operations during 1950 gained 22 percent over 1949 compared with an 18-percent gain for commercial ones, reversing the trend of the previous year.

TABLE 23.—Crushed stone for concrete and road metal sold or used by commercial and noncommercial operators in the United States, 1946–50

[Figures for "noncommercial operations" represent tonnages reported by States, counties, municipalities, and other Government agencies, produced either by themselves or by contractors expressly for their consumption, often with publicly owned equipment; they do not include purchases from commercial producers. Figures for "commercial operations" represent tonnages reported by all other producers.]

Year	Commercial operations				Noncommercial operations				Total	
	Short tons	Average value per ton	Percent of change in quantity from preceding year	Percent of total quantity	Short tons	Average value per ton	Percent of change in quantity from preceding year	Percent of total quantity	Short tons	Percent of change in quantity from preceding year
1946	83,879,680	$1.07	+41	93	6,479,220	$1.23	+36	7	90,358,900	+41

GRANULES

The output of granules for roofing purposes has been canvassed since 1942. Table 24 shows total production and value for the past 5 years. Separate figures for slate granules are given in the Slate chapter of this volume.

TABLE 24.—Roofing granules [1] sold or used in the United States, 1946–50, by kinds

Year	Natural		Artificially colored		Brick		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	447,910	$3,470,411	877,990	$12,939,512	54,660	$866,174	1,380,560	$17,276,097
1947	504,980	4,166,810	1,133,870	17,559,227	56,570	998,434	1,695,420	22,724,471

1950	489,794	4,312,531	1,294,275	22,276,565	13,660	263,752	1,797,729	26,852,848

[1] Manufactured from stone, slate, slag, and brick.

SIZE OF PLANTS

In 1950 the number of crushed-stone plants was 1,622, 40 less than in 1949, while the average production increased 16 percent, or approximately 141,000 tons. During the year, 520 plants produced less than 25,000 tons each but supplied slightly over 2 percent of the total output. On the other hand, the 32 plants that produced over 900,000 tons each contributed 25 percent of the total. Table 25 shows additional details of the size pattern of the industry.

TABLE 25.—Number and production of commercial crushed-stone[1] plants in 1949–50, by size of output

Size of output	1949 Number of plants	1949 Total production of plants (short tons)	1949 Percent of total	1949 Cumulative total (short tons)	1950 Number of plants	1950 Total production of plants (short tons)	1950 Percent of total	1950 Cumulative total (short tons)

Total	1, 662	203, 472, 860	100. 00	203, 472, 860	1, 622	228, 989, 330	100. 00	228, 989, 330

[1] Exclusive of marble, which is primarily a dimension-stone industry.

METHODS OF TRANSPORTATION

Little change was noted from the previous year in the transportation methods used by the crushed-stone industry in 1950. Over half of the tonnage continued to be moved by truck. Waterways provide relatively minor but locally important transportation facilities. In previous years the table included only transportation statistics on the commercial stone used for concrete and road metal. However, since 1946 the table has included all commercial crushed stone.

TABLE 26.—Crushed stone sold or used in the United States in 1950, by methods of transportation

Method of transportation	Commercial operations		Commercial and noncommercial[1] operations	
	Short tons	Percent of total	Short tons	Percent of total
Truck	114, 328, 140	50	135, 414, 730	54
Rail	78, 585, 650	34	78, 585, 650	31
Waterway	25, 013, 170	11	25, 013, 170	10
Unspecified	11, 240, 300	5	11, 240, 300	5
	229, 167, 260	100	250, 253, 850	100

[1] Entire output of noncommercial operations assumed to be moved by truck.

GRANITE

Both the quantity and the value of crushed-granite production gained sharply in 1950 over 1949, the increase being 34 percent in tonnage and 39 percent in value. The average unit price also advanced 5 cents a ton to $1.34. Material for concrete and road metal showed the largest individual gain. A loss in tonnage occurred in the crushed granite assigned to "other uses"; however, the value of this material advanced slightly. Gains in the average unit values were noted in riprap and the "other uses." Georgia was the principal producer in 1950, followed by North Carolina, Virginia, South Carolina, and California, in that order.

TABLE 27.—Granite (crushed and broken stone) sold or used by producers in the United States in 1950, by States and uses

State	Riprap		Crushed stone				Other uses [1]		Total

Total	1,560,580	1,785,088	16,545,580	23,125,707	2,930,080	3,430,014	961,950	1,113,141	21,998,190	29,453,950
Average unit value		$1.14		$1.40		$1.17		$1.16		$1.34

[1] Includes stone used for fill material, poultry grit, road base, stone sand, and unspecified uses.
[2] Included with "Undistributed" to avoid disclosure of individual company operations.

BASALT AND RELATED ROCKS (TRAPROCK)

Commercial traprock normally includes basalt, gabbro, diorite, and other dark igneous rocks and is widely used in industry for concrete and road metal and for railroad ballast. It is also used for riprap and such "other uses" as fill material, roofing granules, etc. The sales of crushed and broken traprock in 1950 were 7 percent greater in quantity and 13 percent greater in value than in 1949. The sales of riprap declined both in tonnage and value, but all other uses showed an increase. The average unit value increased from $1.42 in 1949 to $1.50 in 1950. In 1950 New Jersey was the leading producer, followed by Washington, Oregon, Massachusetts, and Pennsylvania, in that order.

MARBLE

Large quantities of waste material, consisting either of defective blocks or cuttings and spalls from marble-dressing operations, accumulate in the processing of marble blocks. This byproduct material is marketed for the great variety of uses listed in footnote 1 of table 28. The average value varies from State to State, for the reason that in certain States a large proportion of this material is marketed for such high-priced products as terrazzo or marble flour, whereas in other States a considerable amount is sold for roadstone, concrete aggregate, or other relatively low priced uses. The average unit value for crushed and broken marble increased 30 cents to $8.58.

TABLE 28.—Marble (crushed and broken stone) sold by producers in the United States in 1950, by States [1]

State	Active plants	Short tons	Value	State	Active plants	Short tons	Value
Alabama	2	(2)	(2)	Texas	1	10,550	$278,500
Arkansas	1	500	$2,250	Utah	1	5,950	62,000
California	1	4,410	80,212	Virginia	1	(2)	(2)
Georgia	1	(2)	(2)	Washington	4	1,490	11,621
Maryland	1	9,080	153,281	Undistributed		94,100	425,596
Missouri	2	8,000	103,800				
New Jersey	1	4,000	104,000	Total	21	177,930	1,525,847
New York	1	19,230	192,270	Average unit value			$8.58
Tennessee	4	20,620	112,317				

[1] Includes stone used for agriculture, asphalt filler, cast stone, composition flooring, crushed stone, magnesia, mineral food, plaster, poultry grit, shingles, spalls, stucco, terrazzo, tile, whiting (excluding marble whiting made by companies that purchase their marble), and unspecified uses.
[2] Included with "Undistributed" to avoid disclosure of individual company operations.

LIMESTONE

Because of its wide distribution, chemical and physical properties, and relatively moderate production cost, limestone is used in the United States more than any other type of stone. Sales of limestone were reported to the Bureau of Mines from 45 States and 2 Territories in 1950. In 1950 limestone (excluding that used in manufacturing cement and lime) constituted 72 percent of the total crushed and broken stone produced in the United States. Sales of limestone for riprap, fluxing stone, concrete and road metal, railroad ballast, and miscellaneous uses showed increases over the previous year, while that of agricultural limestone decreased in 1950.

Details by States and uses are shown in table 30.

Mineral food	413,850	1,837,105	463,050	2,252,857
Mineral (rock) wool	42,600	50,737	18,290	23,551
Paper mills	417,850	766,856	431,940	942,439
Poultry grit	101,980	904,053	95,100	893,298
Refractory (dolomite)	[3] 806,980	[3] 922,311	1,040,530	1,216,933
Road base	934,720	710,369	1,344,400	1,157,231
Stucco, terrazzo, and artificial stone	47,670	505,268	73,130	762,889
Sugar factories	555,030	1,361,169	717,620	1,608,097
Other uses [4]	589,290	926,608	1,031,270	1,550,805
Use unspecified	[3] 719,860	[3] 982,929	394,690	529,164
Total	[3] 15,846,890	[3] 27,234,971	17,081,140	31,979,462

[1] Includes stone for filler for calcimine, caulking compounds, ceramics, chewing gum, explosives, floor coverings, foundry compounds, glue, grease, insecticides, leather goods, paint, paper, phonograph records, picture-frame moldings, plastics, pottery, putty, roofing, rubber, tooth paste, wire coating, and unspecified uses. Excludes limestone whiting made by companies from purchased stone.
[2] Includes stone for refractory magnesia.
[3] Revised figure.
[4] Includes stone for acid neutralization, athletic-field marking, carbon dioxide, chemicals (unspecified), concrete blocks and pipes, dyes, fill material, light bulbs, motion-picture snow, oil-well drilling, patching plaster, rayons, roofing granules, spalls, and water treatment.

Dolomite (calcium-magnesium carbonate) has a variety of uses, some quite distinct from those of high-calcium limestone. Dead-burned dolomite is used as a refractory lining for metallurgical furnaces; statistical data on this product (which is closely allied to lime) are given in the Lime chapter of this volume. Raw dolomite is also used as a refractory, particularly for patching furnace floors.

Sales of dolomite and its primary calcined product, dolomitic lime, are listed by consuming industry, in table 32.

TABLE 32.—Dolomite and dolomitic lime sold or used by producers in the United States for specified purposes, 1949–50

	1949		1950	
	Short tons	Value	Short tons	Value
Dolomite for—				
Basic magnesium carbonate [1]	241,070	$428,723	236,480	$409,852
Refractory uses	[2] 806,980	[2] 922,311	1,040,530	1,216,933
Dolomitic lime for—				
Refractory (dead-burned dolomite)	1,318,708	15,930,226	1,759,440	21,725,560
Paper mills	50,000	552,000	55,000	642,000
Total (calculated as raw stone) [3]	[2] 3,785,000	----------	4,906,000	----------

[1] Includes dolomite for refractory magnesia.
[2] Revised figure.
[3] 1 ton of dolomitic lime is equivalent to 2 tons of raw stone.

Table 33 shows the tonnages and values of fluxing stone sold for use in various metallurgical operations.

TABLE 33.—Sales of fluxing limestone, 1946–50, by uses

Year	Blast furnaces		Open-hearth plants		Other smelters [1]		Other metallurgical [2]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	19,674,130	$15,803,857	4,869,300	$4,342,467	449,050	$490,566	165,280	$154,943	25,157,760	$20,791,833
1947	25,817,270	22,000,942	6,059,440	5,862,292	512,880	593,811	180,680	230,905	32,570,270	28,687,950
1948	26,339,790	24,721,052	7,873,410	8,695,137	503,490	609,354	185,250	224,465	34,901,940	34,250,008
1949	[3] 23,768,970	[3] 24,127,897	5,922,020	6,929,134	728,960	835,962	332,370	374,649	[3] 30,752,320	[3] 32,267,642
1950	28,397,710	29,222,700	6,936,900	7,948,041	457,630	587,643	177,580	174,004	35,969,820	37,932,388

[1] Includes flux for copper, gold, lead, zinc, and unspecified smelters.
[2] Includes flux for foundries and for cupola and electric furnaces.
[3] Revised figure.

The statistics of the lime and cement industries are presented in separate chapters of the Minerals Yearbook and are not covered in the Stone chapter; however, a commodity review of limestone would be incomplete without suitable recognition of the large tonnage of limestone consumed by these industries. Consequently, table 34 shows the total tonnage consumed for all purposes.

TABLE 34.—Limestone sold or used for all purposes in the United States, 1948–50, in short tons

Use	1948	1949	1950
Limestone (as given in this report) (approximate)	166,742,000	163,746,000	180,919,000
Portland and natural cement and cement rock [1]	54,513,000	55,219,000	59,361,000
Lime [2]	14,528,000	12,637,000	14,980,000
Total	235,783,000	231,602,000	255,260,000

[1] Reported in terms of cement in Cement chapter of this volume.
[2] Reported in terms of lime in Lime chapter of this volume.

SANDSTONE

The sales of crushed and broken sandstone in 1950 increased 31 percent and the value 16 percent over the preceding year. The increases occurred in the production of refractory stone, in concrete and road metal, and in railroad ballast. Decreases occurred in riprap and "other uses." The grand average unit value, however, decreased 27 cents a ton to $2.00.

MISCELLANEOUS STONE

Crushed and broken stone, other than the five principal varieties already discussed, includes light-color volcanic rocks, schists, boulders from river beds, serpentine, chats, and flint. Table 36 shows the sales of stone by types in 1950. The output during 1950 increased 11 percent in quantity and 21 percent in value compared with 1949. California was the largest producer in 1950, followed by Oklahoma, Kansas, Missouri, and Arkansas in that order. The grand average unit value increased 7 cents to 88 cents a ton.

TABLE 35.—Sandstone (crushed and broken stone) sold or used by producers in the United States in 1950, by States and uses

Average unit value	------------	$1. 00	------------	$1. 05	------------	$0. 50	------------	$0. 95	------------	$0. 88

1 Includes stone used for agriculture, asphalt filler, fill material, refractory, road base, roofing granules, spalls, and unspecified uses.
2 Included with "Undistributed" to avoid disclosure of individual company operations.
3 Chats; figures collected by Amarillo, Tex., office of the Bureau of Mines. Also includes small quantity of stone.

MARKETS

Crushed stone is used principally as an aggregate in concrete for highway and building construction. It is to be expected, therefore, that sales of crushed stone will follow the trends of shipments of portland cement, area of new concrete pavement, and value of new construction. These relationships are shown in figure 3.

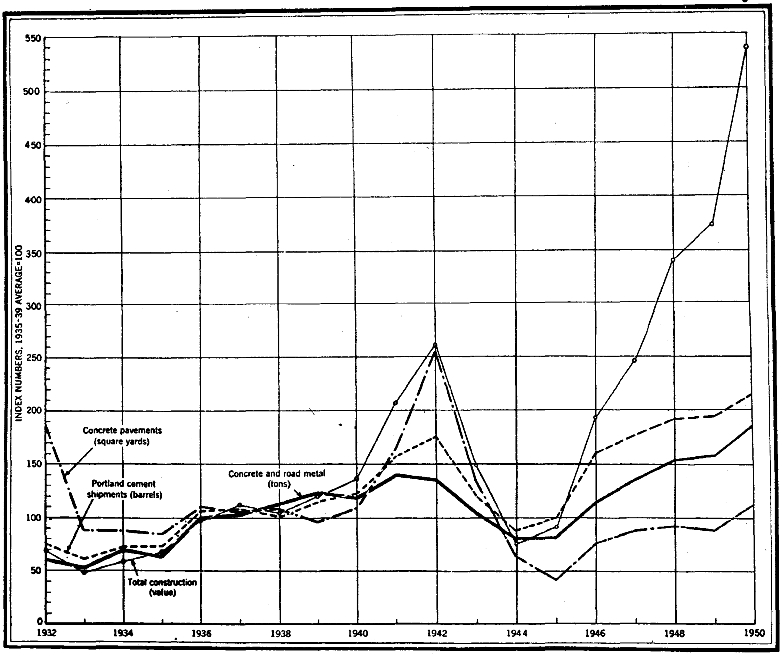

FIGURE 3.—Crushed-stone aggregates (concrete and road metal) sold or used in the United States compared with shipments of portland cement, total construction (value), and concrete pavements (contract awards, square yards), 1932–50. Data on construction and concrete pavements from Survey of Current Business.

The metallurgical industries in 1950 operated at a higher level than in 1949, and 1950 was a record year in the total sales of fluxing limestone, as shown in figure 4.

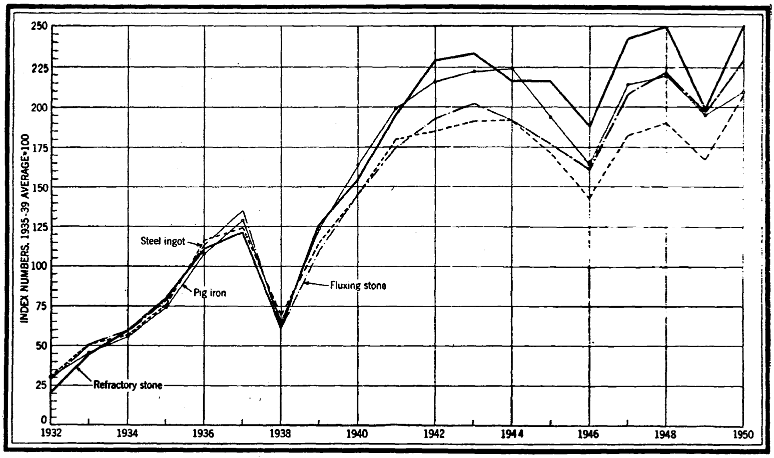

FIGURE 4.—Sales (tons) of fluxing stone and refractory stone (including that used in making lime) compared with production of steel ingot and pig iron, 1932-50. Statistics of steel-ingot production compiled by American Iron and Steel Institute.

TECHNOLOGY

The operation of a large traprock quarry in New Jersey and methods of stockpiling the various sizes of material were described in the technical press.[10] Many articles describing the new methods of blast-hole drilling that are coming into use have appeared in trade publications.[11]

The use of agricultural limestone was discussed in a trade paper.[12]

Underground mining practices of limestone deposits were reviewed.[13]

Methods of stockpiling and reclaiming stone were described.[14]

The operation of a single-stage stone crusher was the subject of a recent article.[15]

A review of a recent book on sedimentary rocks appeared in technical press.[16]

Methods of controlling tailings from washing plants were described.[17]

FOREIGN TRADE [18]

The importation of stone into the United States in 1950 increased slightly in both quantity and value in nearly all classifications. Marble slabs and paving tiles increased 132 percent in value in 1950, the largest such increase.

[18] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The export trade in 1950, covering marble and other building and monumental stone, decreased 32 percent in quantity and 28 percent in value from the previous year. "Other manufactures of stone" decreased 23 percent in value.

TABLE 37.—Stone and whiting imported for consumption in the United States, 1949–50 [1] by classes

[U. S. Department of Commerce]

Sulfur and Pyrites

By G. W. Josephson and F. M. Barsigian [1]

GENERAL SUMMARY

FOR MANY years sulfur consumers have become accustomed to assuming that there would always be an ample supply available irrespective of demand. Therefore, it came as a real shock to the industrial world in 1950 when an acute shortage of sulfur developed. However, as noted in the Sulfur chapter of previous Minerals Yearbooks, consumption of elemental native sulfur has been greater than production since 1942. Stocks finally declined below safe working levels, and consequently it became necessary to restrict sales to conform with production. In the latter part of 1950 the major producers notified their customers of impending reductions in shipments, and preparations were made to place sulfur under Government export control.

TABLE 1.—Salient statistics of the sulfur industry in the United States, 1935–39 (average) and 1947–50, in long tons

	1935–39 (average)	1947	1948	1949	1950
Native sulfur:					
Production (from Frasch mines)	2,175,057	4,441,214	4,869,210	4,745,014	5,192,184
Apparent sales [1]	1,986,597	4,839,548	5,015,230	4,870,723	5,636,959
Imports	3,982	15	38	32	25
Exports:					
Crude	566,361	1,299,060	1,262,913	1,430,916	1,440,996
Treated	16,374	50,477	32,630	[2] 30,135	37,526
Apparent consumption	1,407,845	3,490,026	3,719,725	[2] 3,409,704	4,158,462
Producers' stocks at end of year	[3] 3,560,000	3,371,034	3,225,014	3,099,305	2,654,530
Pyrites:					
Production	544,144	940,652	928,531	888,388	931,163
Imports	433,485	126,553	107,411	120,937	208,766
Recovery as byproduct:					
Production of byproduct sulfuric acid (basis, 100 percent) at Cu, Zn, and Pb plants	504,280	647,497	572,719	511,854	661,529
Production of recovered elemental sulfur (basis, 100 percent S)	(4)	43,427	44,369	56,781	142,475
Other byproduct sulfur compounds (basis, 100 percent S)	(5)	20,631	25,792	37,935	39,889

[1] 1935–39 (average) represents mine shipments.
[2] Revised figure.
[3] Mine stocks only.
[4] Date not available. In 1939, 4,307 long tons were produced.
[5] Date not available. In 1939, 13,000 long tons were recovered.

In 1950 production of native sulfur in the United States and for the world as a whole attained a new record. Italian output increased somewhat, but high production costs and technical difficulties re-

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

stricted the rate of output to a relatively modest figure. This record output was insufficient to supply the demand, and producers' stocks continued to decline. In response to the growing demand for sulfur-bearing minerals, the output of pyrite also increased in 1950.

Prices of United States crude sulfur were increased moderately during the latter part of the year, but much greater increases took place in other countries.

As industry became conscious of the potential effect of sulfur shortages on the operations of both producers and consumers, a great many investigations of supply and some production expansion programs were started.

In an attempt to present the somewhat complex statistics of the sulfur industry more clearly, the tables in this chapter have been modified this year.

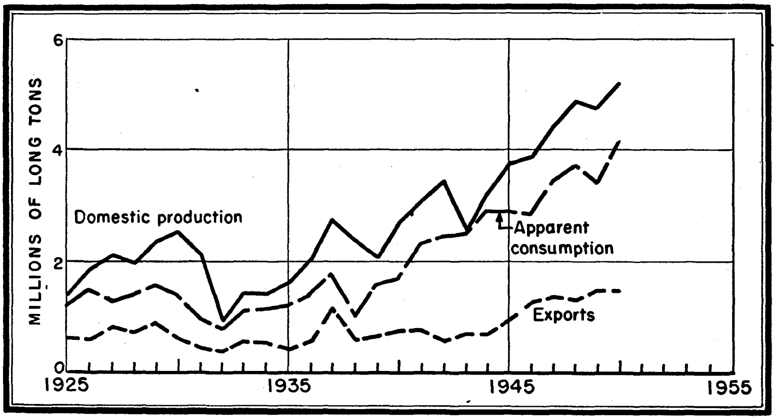

FIGURE 1.—Domestic production, apparent consumption, and exports of native sulfur, 1925–50, in long tons.

SULFUR

DOMESTIC PRODUCTION

In 1950 the United States sulfur industry produced 5,192,184 long tons of native sulfur from Frasch-process mines, 9 percent more than in the previous record year. Demand, particularly after the beginning of the Korean War, far exceeded output, and shipments from the mines totaled 5,504,714 long tons. In addition to the output of Frasch sulfur, a relatively small tonnage (3,327 long tons in 1950) is obtained by conventional mining methods from shallow deposits in California, Nevada, and Wyoming. This material is used principally for treating alkaline soils. Mines in Texas produced 76 percent of the total United States output in 1950, and Louisiana contributed 24 percent.

Several articles on sulfur-production methods were published during the year.[2]

TABLE 2.—Production of sulfur and sulfur-containing raw materials by producers in the United States, in 1949–50, in long tons

	1949		1950	
	Gross weight	Sulfur content	Gross weight	Sulfur content
Native sulfur:				
From Frasch-process mines	4,745,014	4,745,014	5,192,184	5,192,184
From other mines	5,678	2,092	3,327	1,072
Total native sulfur	4,750,692	4,747,106	5,195,511	5,193,256
Recovered elemental sulfur:				
Brimstone	53,922	53,853	139,731	139,352
Paste	6,454	2,928	6,452	3,123
Total recovered elemental sulfur	60,376	56,781	146,183	142,475
Pyrites (including coal brasses)	888,388	378,456	931,163	392,788
Byproduct sulfuric acid (basis, 100 percent) produced at Cu, Zn, and Pb plants	511,854	167,000	661,529	216,000
Other byproduct-sulfur compounds [1]	44,369	37,935	42,829	39,889
Total equivalent sulfur		5,387,278		5,984,408

[1] Primarily hydrogen sulfide used in making sulfuric acid.

TABLE 3.—Sulfur produced and shipped from Frasch mines in the United States, 1946–50

Year	Produced (long tons)			Shipped	
	Texas	Louisiana	Total	Long tons	Approximate value
1946	2,975,472	884,170	3,859,642	4,128,212	$66,100,000
1947	3,561,214	880,000	4,441,214	4,828,103	85,200,000
1948	3,867,545	1,001,665	4,869,210	4,978,912	89,600,000
1949	3,610,829	1,134,185	4,745,014	4,789,311	86,200,000
1950	3,949,164	1,243,020	5,192,184	5,504,714	104,000,000

California.—The only sulfur production in California in 1950 came from the Crater claims in Inyo County operated by Roy E. Kitching. The Siskon Mining Corp. reported that the Leviathan mine was optioned in 1950 to Anaconda Mining Corp. It may be operated as a source of sulfur for a copper operation.

Colorado.—Ben E. Warren produced sulfur ore in Delta County, Colo.

Louisiana.—A new record was established in 1950 for sulfur output in Louisiana. A total of 1,243,020 long tons was produced by the Freeport Sulphur Co. from the Grande Ecaille mine. Jefferson Lake Sulphur Co. acquired sulfur rights on Starks Dome in Calcasieu Parish and began construction of a plant on the property.

Nevada.—W. S. Peterson operated a sulfur mine in Humboldt County, Nev.

TABLE 4.—Sulfur ore (10–70 percent S) produced and shipped for agricultural use in the United States, 1946–50, in long tons [1]

Year	Produced (long tons)	Shipped	
		Long tons	Value
1946	6,907	6,344	$95,531
1947	4,082	4,303	65,124
1948	1,832	1,700	30,220
1949	5,678	5,392	101,991
1950	3,327	3,247	60,115

[1] 1946–48: California, Colorado, Nevada, and Texas; 1949–50: California, Colorado (1949 only), Nevada' and Wyoming.

Texas.—In 1950 sulfur was produced in Texas by the following firms: Duval Sulphur & Potash Co. (formerly Duval Texas Sulphur Co.) at Orchard Dome, Fort Bend County; Freeport Sulphur Co., at Hoskins Mound, Brazoria County; Jefferson Lake Sulphur Co., Inc., at Clemens Dome, Brazoria County, and Long Point Dome, Fort Bend County; and Texas Gulf Sulphur Co., at Boling Dome, Wharton County, and at Moss Bluff Dome, Liberty County. The Texas Gulf Sulphur Co. drilled test holes at Spindletop Dome near Beaumont, Tex.; and, as a commercial deposit was found, plant construction was begun in October. The difficulty of maintaining current high production rates was indicated by Texas Gulf Sulphur when it reported that in 1950 production at Boling Dome was at a rate about 150 percent of normally expected capacity.

TABLE 5.—Sulfur produced in Texas in 1950, by companies, in long tons

Company	First quarter	Second quarter	Third quarter	Fourth quarter	Total
Texas Gulf Sulphur Co	687,307	836,956	852,738	776,621	3,153,622
Freeport Sulphur Co	78,295	79,835	77,040	81,060	316,230
Jefferson Lake Sulphur Co., Inc	59,207	61,883	79,142	77,605	277,837
Duval Sulphur & Potash Co	51,465	51,555	47,815	50,640	201,475
Total	876,274	1,030,229	1,056,735	985,926	3,949,164.

Wyoming.—Sulfur ore was produced by the Cody Sulphur Co. at Cody in Park County. The Wyoming Gulf Sulphur Co. is reported to be the owner of Cody Sulphur Co. The Star Mining Co. at Afton in Lincoln County was inactive. The growing sulfur shortage revived interest in the surface deposits that occur in several areas in Wyoming. The Continental Sulphur & Phosphate Corp. explored the deposit in Sunlight Valley.

RECOVERY AS BYPRODUCT

To date the principal sources of sulfur in the United States have been the native sulfur deposits and pyrites as a primary product. This direct production of sulfur minerals is supplemented by substantial and growing tonnages recovered as byproducts of a variety of industrial operations. Large tonnages of byproduct-pyrite flotation concentrates are recovered in the milling of copper, zinc, and lead ores. The quantities of coal brasses washed out of midwestern coal are relatively large, but only a small amount is recovered for use as a sulfur raw material. The statistics of the byproduct pyrites are included in the Pyrites section of this chapter.

In the smelting of metal sulfide ores large volumes of sulfur-bearing gases are released, and a portion is recovered in the form of sulfuric acid. In 1950 the equivalent of 216,000 long tons of sulfur (167,000 long tons in 1949) was recovered from smelters. Table 6 shows the output of acid at smelters during the past 5 years. Recovery declined considerably after World War II but increased in 1950, and further increases are anticipated. Early in the year acid recovery was begun by the American Smelting & Refining Co. at its Tacoma smelter.

TABLE 6.—Byproduct sulfuric acid (basis, 100 percent) produced at copper, zinc, and lead plants in the United States, 1946–50, in short tons

	1946	1947	1948	1949	1950
Copper plants [1]	171,687	126,494	111,967	96,344	131,342
Zinc plants	544,529	598,703	529,478	476,932	609,571
Total	716,216	725,197	641,445	573,276	740,913

[1] Includes sulfuric acid produced as byproduct at a lead smelter.

The total tonnage of sulfur evolved as fumes from a great many other industrial operations is enormous, but in most cases the gases are either too dilute or too minor in quantity at the individual locations to permit profitable recovery. However, with growing demand, increasing prices, and other advantages, such as nuisance elimination, the outlook is for a considerable increase of byproduct recovery. The principal increase in elemental sulfur recovery in recent years has taken place in the processing of sour natural and refinery gases. The Texas Gulf Sulphur Co. began production of sulfur in 1950 in a plant at Worland, Wyo., using sour gas having a very high hydrogen sulfide content. This plant is the largest of its kind. Freeport Sulphur Co. brought a plant recovering sulfur from refinery gases near Westville, N. J., into production. At the end of the year, owing to the sulfur shortage, many other firms, principally oil companies, were proceeding with sulfur-recovery projects.

In 1950, 142,475 long tons of elemental sulfur were recovered in 10 States from coke-oven, refinery, natural, and other industrial gases. Shipments totaled 78,560 long tons, of which 96 percent was sold as brimstone and 4 percent as paste containing 40 to 57 percent sulfur. In addition, 42,829 long tons of hydrogen sulfide containing 39,889 long tons of sulfur were recovered and used principally in making sulfuric acid.

Statistics of byproduct sulfur production are summarized in table 2.

CONSUMPTION AND USES

Although it became increasingly difficult to obtain during the last half of the year, domestic consumption of native sulfur in 1950 apparently reached a new record, 12 percent above the previous high. A small portion of the apparent consumption of native sulfur (4,158,-

462 long tons) shown in table 7 may have gone into consumers' stocks. The comparable estimate of consumption made by Chemical Engineering was 4,066,000 long tons.

The apparent domestic consumption of sulfur in all forms, including pyrite, hydrogen sulfide, etc., as shown in table 8, is estimated to have totaled almost 5,000,000 tons in 1950.

Consumers were notified by producers in the fall that future shipments would be reduced in various ways. For example, Texas Gulf Sulphur Co. stated that its shipments would be on the basis of 80 percent of the annual maximum tonnage purchasable from the company under the terms of contracts.[3]

TABLE 7.—Apparent consumption of native sulfur in the United States, 1946–50, in long tons

	1946	1947	1948	1949	1950

Total	3,536,100	4,219,500	4,426,800	4,093,400	4,986,000

[1] Crude sulfur or sulfur equivalent.

[3] Texas Gulf Sulphur Co., Annual Report 1950.

Native sulfur consumption (*see* table 9) has been estimated by Chemical Engineering in a pattern somewhat different from the form used in past years. The revised form is particularly useful, as it separates the acid from nonacid uses.

TABLE 9.—Native sulfur consumed in the United States, 1948–50, by uses, in thousands of long tons

[Chemical Engineering]

Use	1948	1949	1950
Chemicals:			
H_2SO_4	2,631	2,622	2,916
CS_2	170	160	200
SO_2	18	16	20
Other	82	69	105
Sulfite pulp	350	295	375
Other wood pulp	50	50	60

Rayon and film	660	765			

[1] Revised figures.

No comprehensive record of the geographical distribution of sulfur consumption is available, but some idea can be obtained from sulfuric acid production statistics, as about three-fourths of domestic sulfur is converted into acid. Table 11, compiled from reports of the Bureau of the Census, shows the production of sulfuric acid in specified regions and States in recent years.

TABLE 11.—Production of new sulfuric acid (100 percent H_2SO_4), by geographical divisions and States, 1948–50, in short tons

[2] Includes data for plants in Iowa (1949 only), Kansas (1950 only), Michigan, Missouri, and Wisconsin.
[3] Included with "Other."
[4] Data includes plants in Arkansas, Delaware (1948–49 only), Louisiana, Maryland (1948–49 only), Mississippi, Oklahoma, and West Virginia.
[5] Includes data for plants in Arizona, California, Colorado, Montana, Utah, Washington, and Wyoming.

STOCKS

Producers' stocks have declined steadily since 1942, when they were reported to have totaled 5,114,000 long tons. By the end of 1950, they had decreased to 2,654,530 long tons, of which 2,388,113 were at the mines. Mine stocks at the end of 1949 have been revised upward by 50,491 tons to a total of 2,700,643 long tons, and stocks away from the mines have been reduced by the same amount owing to a change in classification of certain stocks by one of the producers.

PRICES

In 1950 crude sulfur price quotations for most of the year held at $18 per long ton f. o. b. mine for domestic consumption and $22 f. o. b. Gulf ports for export. However, in the last quarter price increases were announced, one of the major companies quoting $21 and the other $22 per long ton f. o. b. mine for domestic sale. Export prices ranged from about $24.50 to $27.

Even more noteworthy were the upward trends of prices in foreign countries. Even the highest-cost material that had previously been accumulating now found a ready market at prices reported to be triple that for United States crude.

FOREIGN TRADE

In 1950 the foreign demand for American sulfur far exceeded the supply. To serve these needs, a record total of 1,478,522 long tons of crude and refined sulfur was exported during the year, but producers warned foreign consumers of future reductions. The Office of International Trade of the Department of Commerce prepared to place sulfur under an export-control quota in the first quarter of 1951.

As shown in table 12, sulfur imports were negligible. Small tonnages of sulfur ore are said to be brought in from Mexico for use on alkaline soils in southern California.

TABLE 12.—Sulfur imported into and exported from the United States, 1946–50

[1] Revised figure.

WORLD REVIEW

Although native sulfur is produced in many countries, as shown in table 14 the bulk comes from only a few. It is estimated that in 1950 world output of native sulfur attained a new record of about 5,700,000 long tons. In addition, elemental sulfur produced from a variety of operations as a primary product or byproduct throughout the world (principally in the United States, Norway, Spain, and Germany) exceeded 350,000 long tons. Total elemental sulfur output, therefore, was well over 6,000,000 long tons in 1950.

TABLE 14.—World production of native sulfur, by countries,[1] 1945–50, in long tons

[Compiled by Helen L. Hunt]

[1] Native sulfur is believed also to be produced in China (continental), Egypt, Guatemala, India, Indonesia, Israel-Jordan, and U. S. S. R., but complete data are not available; estimates by senior author of chapter included in total.
[2] Estimate.
[3] Data not available; estimate by author of chapter included in total.
[4] In addition the following tonnages of ground sulfur rock (30 percent "S") were produced and used as an insecticide: 1945, 26,254 tons; 1946, 12,592 tons; 1947, 18,716 tons; 1948, 15,176 tons; 1949, 19,213 tons; 1950, 15,778 tons.
[5] Incomplete data.

Canada.—Petroleum developments in western Canada promise to increase sulfur output. Natural gases in the Jumping Pound and Pincher Creek areas of Alberta contain high percentages of hydrogen sulfide. Potential sulfur recovery was estimated at over 200,000 long tons a year, and the prospect of commercial development was being investigated.[4]

Colombia.—Sulfur is produced by Industrias Purace from a deposit at an altitude of 12,000 feet on the slopes of Purace Volcano, east of the town of Popayan. The deposit has been estimated to contain 12,000,000 tons of ore averaging 40 percent sulfur. The ore is hand-mined by pick and shovel and fed at about 1 ton per hour to a retort furnace yielding approximately 200 tons of high-quality sulfur per month. The product is consumed in Colombia. It is distributed in bags by truck to sugar refineries, sulfuric acid plants, and other consumers. To modernize the operation, the company in 1950 was preparing to use power equipment in mining and had ordered a new treatment plant having a capacity of 1,000 tons per month. The new plant was scheduled to be completed in 1951.[5]

France.—Early in 1950 it was reported that sulfur mines in France were experiencing a decline. Ste. Languedocienne de Recherches Miniéres was conducting a mineral development program. Ste. de Mines de Soufre d'Apiqui was nearly inactive in 1949.[6] Output for

[4] Chemical and Engineering News, vol. 28, No. 13, Mar. 27, 1950, p. 1040.
[5] Source: S. M. Anderson, chief, Latin American Division, Bureau of Mines.
[6] Chemical Age, French Sulfur: Vol. 62, No. 1592, Jan. 14, 1950, p. 92.

the full year 1950 is reported to have been about 8,000 long tons, approximately the same as in 1949.

Italy.—The sulfur shortage is providing Italy with at least a temporary solution to its marketing problem. In recent years its production costs (and consequently prices) have been so high that its sulfur was difficult to market internationally. In 1950, however, consumers were not disputing prices, and Italy could sell its current export surplus as well as its accumulated stock of Sicilian sulfur. A contract under which deliveries were made in 1950 is reported to have stipulated shipment of 150,000 long tons of sulfur to Australia and New Zealand.[7] The price is said to have been about triple the f. o. b. mine price in the United States, and payment was in sterling.

Japan.—New ore bodies have been reported at the Azuma mine by Teikoku Sulphur Mining Co. and at the Ogushi mine by Hokkaido Sulphur Mining Co.[8]

Total output of sulfur increased by almost 50 percent to a total of 90,940 long tons in 1950.

Mexico.—Mexico is not now a major source of sulfur, but in 1950 there was a great deal of exploration and development that may lead to large production. Cia. Exploradora del Istmo, a subsidiary of Texas Gulf Sulphur Co., began an extensive drilling program in the State of Vera Cruz, where a number of promising salt-dome structures are known to exist. By the end of the year no commercial discovery had been reported.

The Mexican Gulf Sulphur Co. was making financial arrangements for the commercial development of the sulfur deposit its previous exploration had found in the San Cristobal Dome.

The Pan American Sulphur Co. (Gulf Sulphur Co. de Mexico, S. A.) was proceeding with its exploration of the large Jaltipan Dome.

Petroleos Mexicanos installed a plant to recover sulfur from sour gas in the Poza Rica oil field. Its daily capacity was reported to be about 140 tons.[9]

Turkey.—Flotation tests on sulfur from a new ore body at Keciburlu have been successful, and construction of a 10,000 ton annual capacity plant is contemplated.[10]

PYRITES

DOMESTIC PRODUCTION

After declining moderately during the previous 2 years, production of pyrites increased in 1950. Output was about 5 percent greater than in 1949. Virtually all was consumed in making sulfuric acid, principally in captive operations. In 1950, producing companies consumed 763,843 long tons and sold 129,119 long tons.

The increased pyrite output in 1950 was not large but may mark a turning point in the industry. In recent years producers have had difficulty competing with crude sulfur, but when the shortage developed consumers began to take a renewed interest in pyrites. A change

from sulfur to pyrites as a raw material requires substantial modifications in equipment and also serious financial problems. However, if—as consumers were beginning to suspect—demand is increasing beyond the ability of Frasch mines to supply, a trend toward pyrite can be anticipated.

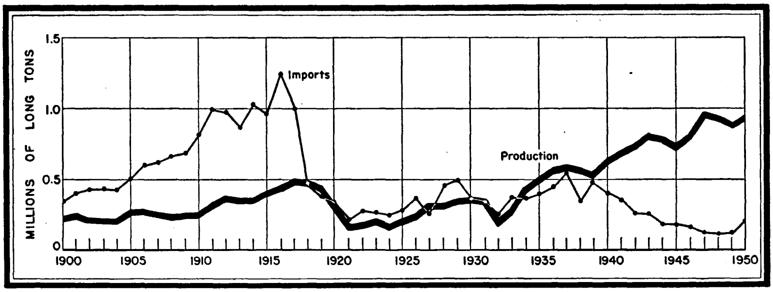

FIGURE 2.—Domestic production and imports of pyrites, 1900-50.

TABLE 15.—Pyrites (ores and concentrates) produced in the United States, 1945–50

Year	Quantity		Value	Year	Quantity		Value
	Gross weight (long tons)	Sulfur content (percent)			Gross weight (long tons)	Sulfur content (percent)	
1945	722,596	41.0	$2,700,000	1948	928,531	41.8	$3,950,000
1946	813,372	41.5	3,228,000	1949	888,388	42.6	3,904,000
1947	940,652	41.7	4,070,000	1950	931,163	42.2	4,059,000

California.—The Mountain Copper Co., Ltd., produced pyrites from its Hornet mine in Shasta County, Calif.

Colorado.—The Empire Zinc Division of the New Jersey Zinc Co., Eagle County, and Climax Molybdenum Co., Lake County, produced pyrites in Colorado in 1950. The Rico Argentine Mining Co., Dolores County, did not report any commercial production for 1950.

Indiana.—Output of pyrite (coal brasses) by the Snow Hill Coal Corp. at the Talleydale mine, Vigo County, increased in 1950.

Montana.—Production of byproduct pyrites at the copper-plant operations of Anaconda Copper Mining Co., Anaconda, Deer Lodge County, made Montana the third-largest producing State in 1950.

New York.—Pyrites output at the Balmat mine of St. Joseph Lead Co. in St. Lawrence County, N. Y., decreased in 1950.

Pennsylvania.—The Bethlehem Cornwall Corp. produced pyrites at its concentrator in Lebanon County, Pa.

Tennessee.—The Tennessee Copper Co., in the Ducktown area, Polk County—the largest producer of pyrites in the United States—increased its production in 1950. The pyrites concentrate was used by the company in the production of sulfuric acid and sinter.

Virginia.—Pyrites were produced by the General Chemical Co. at the Gossan mines to supply its sulfuric acid plant at Pulaski. Virginia was the second-largest pyrites producing State in 1950.

PRICES

Pyrites prices vary widely. In 1950 producers reported f. o. b. mine valuations from $1.12 to $6.95 per ton. The average value of all domestic output was $4.36, and the average value of the tonnage sold was $5.37 per ton. Spanish pyrites was quoted nominally by Oil, Paint and Drug Reporter at $8 per ton c. i. f. Atlantic ports and by E&MJ Metal and Mineral Markets at $0.14 to $0.16 per long ton unit.

FOREIGN TRADE

Receipts of pyrites from Spain, once our principal supplier, have dwindled in recent years, and in 1950 none was reported. Canada now supplies nearly all the pyrites imported into the United States. In 1950 pyrites imports were nearly twice as great as in 1949 but were only half the 1935–39 average. Production is centered in eastern Canada and shipments enter through the Buffalo customs district to serve the U. S. market.

No exports of pyrites were reported in 1950.

WORLD REVIEW

The postwar revival of pyrites output continued in 1950. Demand was growing steadily, as the economies of various European and Asiatic countries—the principal pyrites consumers—became more productive. Reports are not available from a number of producing countries, but world pyrites output is estimated to have been about 11,200,000 metric tons in 1950.

[1] In addition to countries listed, Belgium, Egypt, Hungary, India, Iran, Ireland, Kenya, Korea, U. S. S. R., and Uruguay produce or have produced pyrites, but production data are not available; estimates by senior author of chapter included in total.

[2] Estimate.

[3] Data not available; estimate by author of chapter included in total.

[4] Exports.

Australia.—In 1950 pyrite production in Australia increased to about 114,000 metric tons. Australia also recovers substantial tonnages of sulfuric acid from smelter gases; but well over half its sulfur supplies were obtained from abroad, principally the United States and Italy. Past efforts to increase its self-sufficiency have been only partly successful, but an extended shortage of native sulfur will add a new incentive.

Mount Morgan, Ltd., is reported to be interested in a relatively low-grade pyrite ore body being drilled in what is known as the Sugarloaf area. The deposit is believed to contain 10,000,000 tons.[11]

A large pyrite deposit was being explored by the Consolidated Zinc Corp. at Nairne, near Adelaide. The lode is several hundred feet wide.[12]

At Risdon the Electrolytic Zinc Co. has completed a large sulfuric acid plant utilizing roaster gases containing 8 percent sulfur dioxide.[13]

Canada.—Canada has ample pyrite resources to supply its sulfur requirements if necessary. Production was increased substantially in 1950 but principally for export to the United States. Paper companies, the major consumers of imported crude sulfur, began to show more interest in pyrites after curtailment of sulfur shipments was announced; but, as conversion to direct use of pyrites introduces difficult technical problems, there was no general move to convert. Other solutions to the supply problem promised to be more advantageous in some areas. International Nickel was preparing to recover liquid sulfur dioxide as a byproduct at Copper Cliff, Ontario, for use in the paper industry. Noranda Mines continued development of its method for recovering sulfur, sulfuric acid, and iron sinter from pyrite. The process, in which the pyrite is burned on a sintering machine, has been developed through the pilot-plant stage. The company was considering various possible sites for a plant, as location in an advantageous market area probably would be a strong factor in determining its commercial success. Noranda has enormous reserves of pyrites and has leased the nearby MacDonald pyrite deposit, reported to contain 18 million tons of ore averaging 80 percent pyrite.

Greece.—In 1949 pyrite output in Greece was very low—about 16,000 metric tons—but in 1950 it increased to over 87,000. Production facilities, which were damaged during the civil war, are being rehabilitated.

Japan.—Since the end of hostilities, Japanese pyrite production has made a great recovery. From 1946 to 1950 output increased from 474,842 metric tons to 1,916,181—almost the prewar level. Domestic requirements absorb the Japanese production.

Discovery has been reported of three major ore bodies at the Yanahara pyrite mine owned by the Dowa Mining Co., Okayama Prefecture, Honshu, Japan.[14]

[14] Mining World, Major Ore Bodies Found at Japanese Pyrite Mine: Vol. 13, No. 1, January 1951, p. 27.

Norway.—Norway maintained pyrite production in 1950 at about the same level as in the previous 3 years, but considerably lower than prewar rates.

Philippines.—The proposed construction of a fertilizer plant in the Philippines has led to investigation of sulfur and pyrite reserves available for use in the project.

South Africa.—A 50- to 60-ton per day sulfuric acid plant was to be erected at the Rhokana smelter to supply acid for leaching of Nchanga oxide concentrates and for the plant of the Rhodesia Copper Refineries, Ltd.[15]

Talc and Pyrophyllite

By Bertrand L. Johnson and F. M. Barsigian

GENERAL SUMMARY

MARKED increases occurred in 1950 in mine production of talc, pyrophyllite, and ground soapstone, as well as in the quantity and value of these commodities sold or used (*see* fig. 1). Total imports were also much higher, both in quantity and value, in 1950 than in 1949. Exports of crude and ground talc, steatite, soapstone, and pyrophyllite were also considerably greater in quantity and value. Exports of talcum powders again decreased sharply in total value, declining from $1,636,505 in 1949 to $1,234,318 in 1950.

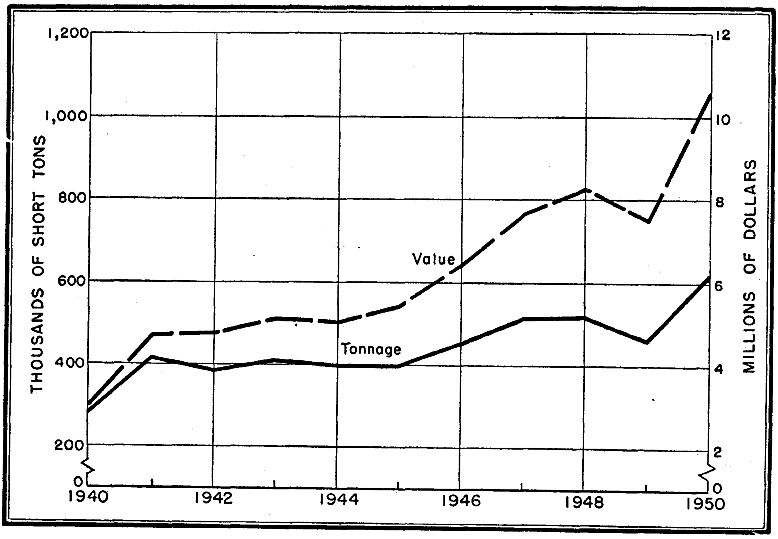

FIGURE 1.—Sales of domestic talc, pyrophyllite, and ground soapstone, 1940–50.

PRODUCTION AND SALES

The 620,750 short tons of domestic talc, pyrophyllite, and ground soapstone sold or used in 1950, valued at $10,620,743, constituted a record high, which greatly exceeded the previous high attained in 1948.

TABLE 2.—Talc, pyrophyllite,[1] and ground soapstone sold by producers in the United States, 1946–50, by classes

Year	Crude[1]			Sawed and manufactured

[1] Exclusive of pinite.

REVIEW BY STATES

In 1950, the talc alone produced in New York still exceeded, by a large margin, the combined talc, pyrophyllite and ground soapstone produced in any other State. For the three materials combined, North Carolina was second, and California third, as in 1949. Sales in all the listed States except Nevada were higher in 1950 than in 1949. Sales of pyrophyllite, most of which comes from North Carolina, increased in 1950 over 1949.

TABLE 4.—Talc, pyrophyllite, and ground soapstone, sold by producers in the United States, 1948–50, by States

State	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
California	98,681	$1,773,764	83,359	$1,434,046	109,747	$2,069,211
Georgia	53,602	624,694	49,338	580,405	70,749	774,148
Maryland and Virginia	40,276	341,875	32,256	268,423	41,206	355,075
Nevada [1]	8,019	107,730	8,837	147,148	8,581	170,736
New York	119,716	2,613,935	115,636	2,658,774	163,974	4,039,973

Vermont	70,922	1,014,718	64,508	788,341	72,135	906,396
Other States [2]	23,478	332,956	21,754	301,574	37,463	450,041
Total	518,746	8,265,363	461,896	7,523,478	620,750	10,620,743

[1] Includes pinite; no sales in 1949–50.
[2] Montana, Texas, and Washington.

CONSUMPTION AND USES

Sales to six industries—ceramics, paint, rubber, insecticides, roofing, and paper—accounted for 85 percent of the total sales of domestically produced talc, pyrophyllite, and ground soapstone in 1950, according to reports from the producers. Increases over 1949 occurred in all consuming industries itemized. The ceramics and paint industries continued to contend for the position of leading consumer and the data available indicate that the former industry was slightly in advance in 1950.

TABLE 5.—Talc, pyrophyllite, and ground soapstone sold by producers in the United States, 1948–50, by uses [1]

Use	1948		1949		1950	
	Short tons	Percent of total	Short tons	Percent of total	Short tons	Percent of total
Paint	108,500	21	100,100	22	145,000	23
Ceramics	108,000	21	94,700	20	148,500	24

[3] Less than 0.5 percent.
[4] Refractory, textile, asphalt filler, plaster, and miscellaneous other uses.

PRICES

The average value per ton of domestic talc, pyrophyllite, and ground soapstone sold (or used by producers) rose from $16.29 in 1949 to $17.11 in 1950, an increase of 82 cents a ton.

Prices of ground talc and pyrophyllite, quoted by the Oil, Paint and Drug Reporter for the first weeks of 1949, 1950, and 1951, are shown in the following table.

TABLE 6.—Prices quoted on talc and pyrophyllite, car lots, 1949–51, per short ton
[Oil, Paint and Drug Reporter]

Mineral and grade	Jan. 3, 1949	Jan. 1, 1950	Jan. 8, 1951

[1] Not quoted.
[2] In paper bags, $3 to $3.50 per ton extra.

FOREIGN TRADE [2]

Imports.—Total unmanufactured talc, steatite, or soapstone, and French chalk imported for consumption in the United States registered marked increases in 1950 over 1949 in both quantity and value. An increase of 4,571 short tons, or $114,564, resulted in the highest quantity since 1940 and a new record for value of the material imported. Imports of "manufactures," however, which are exclusive of toilet preparations, continued the decline in value evident in recent years.

The greater part of the unmanufactured imports remained the "ground, washed, powdered or pulverized, except toilet preparations" material. Most of the ground material came from Italy, with Canada in second place, and France, third. The manufactures came chiefly from China.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TABLE 7.—Talc, steatite or soapstone, and French chalk imported for consumption in the United States, by classes in 1946–48, and by classes and countries in 1949–50

[2] Less than 0.5 ton.

Exports.—The quantity of "talc, steatite, soapstone, and pyrophyllite, crude and ground" exported from the United States in 1950 rose 4,753 short tons above the exports of 1949 to a total of 20,593 tons—a new record, surpassing the previous high of 1947 by about 3,000 tons. The value of these exports—$560,752—was also a new record. The value of the exports of "powders—talcum (in packages), face and compact" continued the decline of recent years and reached the lowest point since 1943, when the value of the exports was only $756,024.

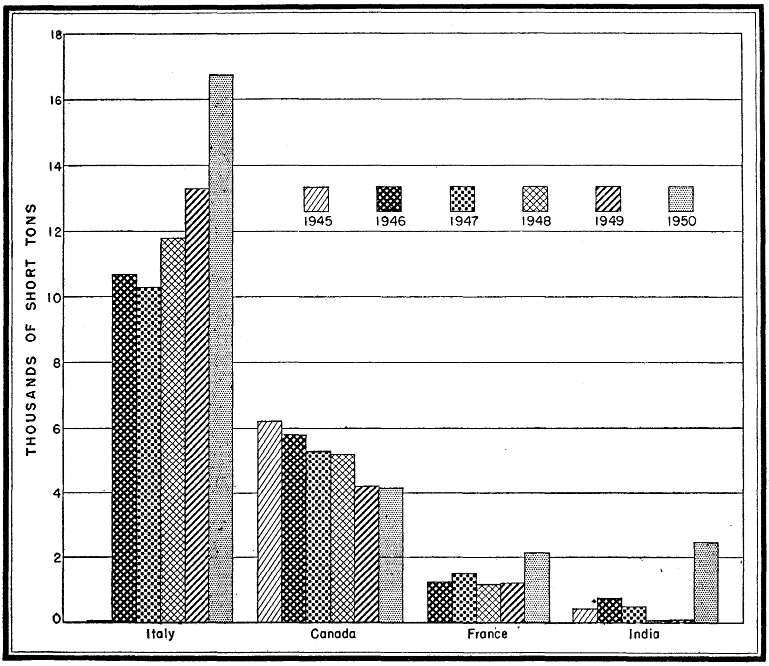

FIGURE 2.—Unmanufactured talc, steatite or soapstone, and French chalk imported for consumption in the United States, 1945–50, by principal countries.

WORLD REVIEW

The production of talc, pyrophyllite, and ground soapstone in recent years in various countries is shown in the accompanying table.

TABLE 9.—World production of talc, pyrophyllite, and soapstone,[1] 1943–50, in metric tons

[9] Includes steatite as follows: 1943: 9,741; 1944: 7,369; 1945: 15,577; 1946: 19,541; 1947: 20,835; 1948: 18,627; 1949: 20,880; 1950: 13,702.
[10] Talc, pyrophyllite, pinite, and ground soapstone sold by producers. (No pinite sold by producers in either 1949 or 1950.)

Canada.—Preliminary reports show that in 1950 Canada produced 27,200 short tons of talc and soapstone valued at $344,000, slightly larger both in quantity and value than in 1949.[3]

The Canadian talc and soapstone industry in 1949 was described in an official report as follows:[4]

Shipments of talc and soapstone by Canadian producers during 1949 amounted to 26,922 tons valued at $320,793 compared with 28,780 tons worth $309,823 in 1948. Ontario's production of 13,600 tons was mostly high-grade milled talc. Shipments from Quebec deposits included crayons, blocks and ground soapstone.

The industry employed 59 persons and distributed $105,736 in wages and salaries. Fuel cost $2,926 and electricity amounting to 1,567,092 k. w. h. cost $18,900.

[3] Canada, Dominion Bureau of Statistics, Preliminary Estimate of Canada's Mineral Production, 1950: Prepared in Mining, Metallurgical, and Chemical Section, Industry and Merchandising Division, Dominion Bureau of Statistics, Ottawa, Canada, Dec. 29, 1950, 4 pp.
[4] Canada, Department of Trade and Commerce, Dominion Bureau of Statistics, The Talc and Soapstone Industry, 1949: Industry and Merchandising Division, Mining, Metallurgical and Chemical Section, Ottawa, Canada, 1950, 3 pp.

Imports of talc and soapstone totalled 7,269 tons valued at $228,408. Exports of talc in 1949 amounted to 4,222 tons valued at $54,515.

Ground talc, including soapstone and pyrophyllite, is used chiefly in the paint, roofing, paper, rubber, insecticide, and ceramic industries. It is used also in foundry facings, bleaching fillers for textiles, cosmetics and pharmaceuticals, soaps, and cleansers, plaster, polishes, plastics, and for rice polishing. Soapstone is used extensively in the form of sawn blocks and bricks for lining the alkali recovery furnaces and kilns of kraft pulp and paper mills. It is used for brick and slab liners for fireboxes, stoves, and ovens, and for switchboard panels, laboratory benches, etc. Considerable quantities of soapstone quarry and sawing waste are ground and used as low-grade talc in the rubber, roofing, foundry, and other trades. Compact, massive talc, sawn into square pencils and slices, is an important material for steelmakers' crayons.

Consumption of ground talc and soapstone in Canada, by uses and Provinces, 1946–48, in short tons

Tin

By Abbott Renick and John B. Umhau

GENERAL SUMMARY

WORLD mine production of tin totaled 166,400 long tons in 1950—the highest since 1941—and was 4,600 tons (3 percent) greater than in 1949. Most of the gain over 1949 was in Malaya, Thailand, and Indonesia, where output expanded 5, 33, and 11 percent, respectively. World smelter production increased 4,300 tons (3 percent), principally because of increases of 10 and 9 percent, respectively, in the outputs in Malaya and the Netherlands. United States mine output remained negligible.

The International Tin Study Group held its fifth meeting in Paris during March, to continue its investigation of means for stabilizing the tin industry. The group requested the Secretary General of the United Nations to call a conference to discuss a commodity-control agreement. The United Nations Tin conference, attended by delegations from 20 countries, was held as a result in Geneva from October 25, 1950, to November 21, 1950. The Paris Draft Agreement, which relied essentially on production limitations and a buffer stock to stabilize the industry, was among the proposals considered. However, the conference did not develop an acceptable agreement from any of the various proposals submitted and adjourned subject to being reconvened by the Secretary General.

On September 8, 1950, the President signed the Defense Production Act, which provided, among other purposes, for the encouragement of exploration, development, and mining of critical and strategic minerals and metals, the expediting of production, and the allocation of scarce and critical metals. The Defense Minerals Administration was established in the United States Department of the Interior, to carry out the mineral production expansion provisions of the act, and tin was one of the commodities given a high priority rating in this connection.

Legislation was passed extending the authority to operate the Government-owned tin smelter (Longhorn smelter) at Texas City, Tex., for 5 years, until June 30, 1956. Ore purchase contracts were concluded with Bolivia, Indonesia, and Belgian Congo. The Reconstruction Finance Corporation and the Bolivian producers extended the 1950 contract late in December for 2 months. On November 13, 1950, the National Production Authority issued Tin-Control Order M–8. Under this order, tin inventories were limited to a 60-day supply, and all important consumers of tin were required to report their stocks and consumption. On December 18 the order was amended to limit all consumers in January 1951 to 100 percent of their average consumption during the first 6 months of 1950 (base period); this was to be cut to 80 percent during February and March.

Consumption of tin in 1950 in the United States increased 44 percent over 1949; primary tin increased 51 percent and secondary tin 32 percent. Domestic smelter output, nearly all from the Government-owned smelter at Texas City, decreased 3,917 long tons (11 percent) from 1949. Secondary tin production increased 43 percent.

Metal imports increased 38 percent and exceeded the tin content of concentrates by 219 percent. Receipts of concentrates, in terms of metal, were 32 percent lower than in 1949. The decrease was chiefly due to smaller receipts from Indonesia and Bolivia. Imports of tin in concentrates from Belgian Congo increased.

The total stocks of tin in the United States and in transit as of December 31, were 72,651 long tons, exclusive of the National strategic stockpile. As a reserve for civilian deficiency, the Reconstruction Finance Corporation on December 31, 1950, held 18,618 long tons of tin metal; 3,168 were of foreign origin, and 15,450 were produced at the Texas City smelter. In addition to the reserve stocks of tin metal, the RFC held 939 long tons of Copan metal. On December 31, tin concentrate and tin-bearing material held by the RFC, including ore stored abroad or in transit to the smelter from foreign sources, ore stored at the smelter, material in active process and inactive inventories, had a total estimated tin content of 20,674 long tons. As of December 31, tin stocks held by industry and in transit to consuming plants were 33,359 long tons.

Domestic price movements for grade A tin during the first 6 months of 1950 were orderly and averaged 76.277 cents, whereas during the final 6 months prices became chaotic, averaging $1.148. The annual average for 1950 was 95.557 cents.

Major progress was made during the year in accumulations for the National Strategic Stockpile.

TABLE 1.—Salient statistics of tin in the United States, 1941–45 (average) and 1946–50

[1] Including tin content of ores used direct to make alloys.

GOVERNMENT CONTROLS

Tin was under Government allocation control from December 17, 1941 (M-43), until December 1, 1949, when the control regulations were reduced to a reporting basis until June 30, 1950, when Public Law 153 expired. During 1950 tin and manufactures, including tin plate, continued on the positive list and required an export license for shipment to any destination abroad except Canada.

Following approval of the Defense Production Act of 1950 on September 8, the National Production Authority was established on September 11. Inventory Control Regulation 1, September 18, 1950, was the first to be issued by NPA. It limited to a "practicable minimum working inventory" the quantities of various materials in short supply, including primary and secondary tin and all tin and tin-base alloy scrap containing commercially recoverable tin. The announced purpose of the order was to make clear that national interest demanded that there be no accumulation beyond what was needed for immediate production. Under NPA Order M-8, November 13, 1950, tin was again placed under control. Tin reporting was made mandatory, and inventories of alloys or other materials containing tin, excluding ores and concentrates, were limited to 60 days' supply or a practicable minimum working inventory (as defined in NPA Regulation 1) whichever was less. On December 18, 1950, an amendment to Order M-8 limited the consumption of pig tin to 100 percent of the monthly average usage during the first half of 1950 and applicable to January 1951 tonnages. Use was to be cut to 80 percent in February and March. Defense orders were excepted, and allowance made for undue or exceptional hardship.

Under NPA Delegation 5, December 18, 1950, the Secretary of the Interior was made claimant for certain production facilities for minerals and metals and was given specified powers to control the distribution of metals and minerals through the processes of smelting and refining. The delegation included tin ores and concentrates as related to mines, mills, and primary and secondary smelters and refineries. NPA Notice 1, December 27, 1950, and Defense Minerals Administration Order MO-1, December 29, 1950, designating scarce materials whose hoarding was prohibited, included tin, all alloys containing tin, tin chemicals, tin products, tin-base alloys, tin ores and concentrates.

Tin pricing was freed to the open market after announcement of the withdrawal by the Reconstruction Finance Corporation on March 13, 1950, of all fixed quotations for sale of its tin. Public Law 723, Eighty-first Congress, second session, approved August 21, 1950, extended to June 30, 1956, the authority of the RFC to improve, develop, maintain, and operate by lease or otherwise the Government-owned tin smelter at Texas City, Tex., and to finance research in tin smelting and processing.

DOMESTIC PRODUCTION

MINE OUTPUT

Domestic mine production of tin in concentrates was 94.1 long tons in 1950 compared with 68.4 tons in 1949. Most of the output was derived from placer deposits in Alaska. With an output of about 79 long tons of concentrates containing about 41 long tons of tin, the largest producer was the United States Tin Corp., operating its placer on Lost River, Port Clarence district, Seward Peninsula region, Alaska. The second largest producer, the Northern Tin Co., operated on Buck Creek, Port Clarence district, Seward Peninsula, Alaska. About 35,000 cubic yards of material was processed by the company, from which about 54 long tons of concentrate containing 37.3 long tons of tin (69.6 percent) was recovered and shipped. At Climax, Colo. the Climax Molybdenum Corp. recovered a very small tonnage of tin as a byproduct of mining for molybdenum. Assay has shown only a trace of tin in the crude ore mined by the company.

In 1944 the Bureau of Mines in cooperation with the Geological Survey investigated the Hogan tin mine, Kern County, Calif. by trenching and diamond drilling 11 holes, totaling 1,000 feet.[1] During the decade 1939–49 under the Bureau of Mines strategic minerals development program, "Examinations have been made of 85 tin occurrences; projects have been run on 12 deposits, 7 of which indicated some tonnage with sufficient tin content that it could conceivably be recovered. The total indicated tin content of these deposits is insignificant in terms of national requirements." [2] As part of the Bureau of Mines activities a report was issued [3] presenting the factual data disclosed by sampling pegmatites containing cassiterite at the Coosa tin deposit, Coosa County, Ala. The results of beneficiation tests on samples of the pegmatites were reviewed.[3]

TABLE 2.—Mine production of tin (content) in the United States, 1941–45 (average) and 1946–50 by States, in long tons

Year	Alaska	South Dakota	Colorado	Other States	Total	
					Long tons	Value
1941–45 (average)	9.9	1.2		3.7	14.8	$17,180
1946						
1947	1.3				1.3	2,200
1948	[1] 4.7	(1)			4.7	10,380
1949	51.6		16.8		68.4	152,210
1950	79.5		14.6		94.1	201,446

[1] A very small quantity from South Dakota is included with Alaska.

SMELTER OUTPUT

Smelters in the United States produced 33,118 long tons of tin in 1950 compared with 35,834 tons in 1949. Output was essentially

[1] Bedford, Robert H., and Ricker, Spangler, Investigation of the Hogan Tin Mine, Kern County, Calif.: Bureau of Mines Rept. of Investigations 4609, 1949, 10 pp.

[2] Moon, Lowell B., Bureau of Mines Strategic Minerals Development Program-Summary of Progress, 1939–49: Bureau of Mines Rept. of Investigations 4647, 1950, pp. 19 and 30.

[3] Reed, H. A., Jr., Coosa Tin Deposits, Coosa County, Ala.: Bureau of Mines Rept. of Investigations 4704, 1950, 33 pp.

that of the Government-owned smelter at Texas City. This smelter (Longhorn smelter) produced 32,136 long tons (including 44 secondary from drosses) in 1950 and 36,053 (including 238 of secondary from drosses) in 1949. In addition, beginning in January 1950, a new alloy—"Copan"—was produced. The total output of Copan in 1950 was 940 long tons, including 743 from concentrates and 197 from "remelts" (conversion from other grade). (Copan to Copan "remelts" not counted above amounted to 152 tons.) The Vulcan Detinning Co. recovered tin from low-grade concentrates during 1950. The company annual report for 1950 contained the following statement:

The new plant for the production of tin from low grade tin concentrates, placed in operation in November, 1949, was run intermittently during the year 1950. Continuous operation was not possible for two reasons; first, the necessity for making some changes in and adjustments to equipment; and, second, because of inadequate receipts of concentrates.

Various technical difficulties arose, all of which are believed to be susceptible to elimination by our engineering staff, but efforts to this end have been hampered and evaluation of costs has been made very difficult because of the interruptions in operations due to lack of raw material.

This development was based on the theory that a much larger portion of our Country's tin requirements could be obtained from Western Hemisphere sources if a process could be developed to treat impure concentrates with low tin content without the admixture of high grade, high tin content material. We believe the results show that the development of such a process has been substantially accomplished. However, world conditions have created so great a demand for tin-bearing materials, not only abroad but also for the Government smelter at Texas City, that it is not possible for us to obtain supplies either in sufficient quantity to permit operation on a continuous basis or at economic prices. Therefore, it is entirely possible that we may have to place our plant in stand-by condition until the situation changes. In the meanwhile, the technology we have developed will be available for the Country's needs if and when required.

The Longhorn smelter treated concentrates, mainly from Bolivia, Indonesia, Thailand, and the Belgian Congo, in 1950. Dressing-plant, low-grade, coarse rejects, accumulated for the most part before the end of 1947, continued to be treated by the smelter. At the close of 1947, there were on hand about 27,100 long dry tons of these rejects containing 5,385 long tons of tin. This inventory had been reduced to 5,460 tons containing 1,322 tons of tin by the end of 1950. Of these rejects, 7,313 long tons (1,463 tons of tin) was shipped to the Capper Pass smelter, Hull, England, for treatment and the return to this country of tin content in form of high-grade electrolytic tin. Inactive inventories of dressing plant slimes, amounting to about 12,025 long dry tons containing 2,844 tons of tin at the end of 1947, were increased slightly to 12,120 tons containing 2,855 tons of tin at the end of 1950. Of the latter tonnage, 6,707 tons containing 1,722 tons of tin, has been held in 6 ponds since before the end of 1947. A seventh pond with 5,413 tons, containing 1,133 tons of tin, had a slight increase in tonnage. No attempt will be made to treat these slimes until the waste acid plant is in regular operation and recovery of certain byproducts made possible.

Construction of the waste acid plant, which was begun in October 1948, was completed in April 1950. When placed in regular operation this plant is expected to treat the waste acid resulting from current smelter operations and to dispose gradually of approximately 100,000,000 gallons of waste acid stored in ponds adjacent to the smelter, with recovery of a commercial grade of hydrochloric acid. The latter can be used by the smelter or sold. In addition, the plant will recover, in the form of a cement, various metal byproducts of considerable value, notably silver. Trial operations encountered numerous difficulties, mostly mechanical. Efforts of the experimental department of Tin Processing Corp. during 1950 were devoted in large part to correction of difficulties encountered. Limited operations, however, resulted in production of commercial-grade hydrochloric acid and proved the efficiency of the process, although continual mechanical difficulties prevented full and continuous operation. The cost of this plant to the end of 1950 amounted to $3,120,676, with an expenditure of $821,983 during 1950.

Of the total tin produced at the Longhorn smelter in 1950, 81 percent was 3-Star grade; 17 percent 2-Star; 2 percent Copan alloy and 1-Star. The smelter upgraded and recast 4,965 tons (of which 3,318 were recast into 3-Star) of previously produced lower grades of tin. No. 1-Star was produced after January and No. 2-Star after August 1950. With improved plant equipment and new operating procedures, only grade A 3-Star and 345 tons of Copan were produced from September to December 1950. In 1949 the proportions of the various grades were 64 percent of 3-Star, 27 of 2-Star, 5 percent of 1-Star, and 4 percent of No-Star G, with no Copan. In 1949, 1,290 tons of grade G were remelted, further refined, and converted into 2-Star and 1-Star. The Longhorn smelter continued to be operated on a cost-plus-fixed-fee arrangement by Tin Processing Corp. (a Delaware corporation and a subsidiary of N. V. Billiton Maatschappij). The contract with the firm extends to June 30, 1951.

Under Public Law 148, Eighty-first Congress, first session, approved June 30, 1949, the RFC sold to the Vulcan Detinning Co. during 1950 approximately 500 long tons of low-grade Bolivian tin concentrates containing approximately 19 percent tin. The RFC also contracted to purchase the resulting metal from the company for the account of General Services Administration.

TABLE 3.—Longhorn tin-smelter production, by months, 1942–50, in long tons

Month	1942	1943	1944	1945	1946	1947	1948	1949 [1]	1950 [2]
January	--------	2,611	2,153	3,114	3,812	3,024	3,172	3,257	2,627

November	2,300	2,020	2,852	3,628	3,119	2,759	2,907	2,994	3,207
December	2,343	2,037	2,907	3,676	3,209	3,041	3,153	2,791	3,005
Total	15,696	20,727	30,619	40,591	43,468	33,292	36,678	36,053	32,136

[1] Includes 238 tons of secondary from drosses.
[2] Includes 44 tons of secondary from drosses, but excludes tin content of ores (621 long tons) used direct to make alloys. Also exclusive of tin recovered from remelts.

Longhorn smelter operating costs before depreciation, metal loss and byproduct credits were $5,667,028 for 1950. Operating costs for the last 6 months were slightly higher than for the previous 6 months due to pay increases and higher cost of supplies, but unit operating costs were lower as a higher grade of ore was treated. RFC assets of property, plant, and equipment under the tin program were valued at $10,046,364 as of June 30, 1949, and had increased to $11,631,015 by June 30, 1950.

SECONDARY TIN

Secondary tin recovered from all sources totaled 31,680 long tons in 1950, an increase of 43 percent over 1949. The value was 37 percent greater than in 1949. Detinning plants, operating at a record-breaking rate, supplied 13 percent of the total recovered during the year but had ample capacity for treating a larger tonnage had more tin-plate clippings and old cans been available.

Detinning plants accounted for most of the recovery of tin as metal. In total, they recovered 3,875 long tons of tin as metal and in chemicals in 1950 from tin-plate clippings and old cans, of which 3,300 were reclaimed in the form of pigs and 575 tons in the form of tin compounds. The industry reported treating 469,417 long tons of tin-plate clippings in 1950—the largest tonnage on record and nearly 21 percent above the previous peak in 1949. The average quantity of tin recovered per long ton of clean tin-plate scrap in 1950 was 17.98 pounds, compared to 18.29 pounds in 1949. Before electrolytic tin plate was introduced, recoveries averaged about 37 pounds per ton of material detinned. Lower recoveries per unit reflect treatment of a larger tonnage of electrolytic tin plate, which carries a much thinner coating than hot-dipped tin plate. For additional data concerning the secondary tin industry, see Secondary Metals, Nonferrous, chapter of this volume.

TABLE 4.—Secondary tin recovered in the United States, 1941–45 (average) and 1946–50, in long tons

Year	Tin recovered at detinning plants			Tin recovered from all sources			
	As metal	In chemicals	Total	As metal	In alloys and chemicals	Total: Long tons	Total: Value
1941–45 (average)	3,920	412	4,332	4,460	28,680	33,140	$38,584,220
1946	2,480	330	2,810	2,600	22,100	24,700	30,205,663
1947	2,720	360	3,080	2,900	23,900	26,800	46,848,175
1948	2,930	340	3,270	3,100	23,800	26,900	59,796,140
1949	2,850	410	3,260	3,170	19,060	22,230	49,461,354
1950	3,300	575	3,875	3,615	28,065	31,680	67,809,158

CONSUMPTION

APPARENT CONSUMPTION

Apparent consumption derived by adding net imports of pig tin to domestic smelter production increased 20 percent in 1950 over 1949. As changes in consumer, dealer, and Government stocks are not taken into account, apparent consumption may vary greatly from actual consumption as measured in finished products. In 1949 it considerably exceeded actual consumption, chiefly as a result of Government stockpiling. Table 5 gives the data for 1941–45 (annual average) and 1946–50. A comparable series for 1910–38 was published in Minerals Yearbook, 1939 (p. 680), and for 1939–48 in Minerals Yearbook, 1948 (p. 1212).

TABLE 5.—Apparent consumption of primary tin,[1] 1941–45 (average) and 1946–50, in long tons

Year	Long tons	Year	Long tons
1941–45 (average)	61, 143	1948	85, 808
1946	58, 144	1949	95, 904
1947	57, 771	1950	115, 156

[1] Includes some secondary metallic tin in imports whose quantity cannot be separately determined.

CONSUMPTION BY USES

Total domestic consumption of tin was 44 percent more in 1950 than in 1949, as a result of a sharp rise in general manufacturing activity and continued improvement in supplies. For the first time since 1941, tin was free from restrictive Government controls. The total consumed in manufacturing in 1950 was 104,464 long tons (71,191 of primary and 33,273 of secondary), the largest recorded since 1941, when the total was 134,695 (103,086 primary and 31,609 secondary). The use of primary tin increased 51 percent and of secondary 32 percent. The ratio of primary to secondary was slightly greater than in 1949. Five items—tin plate and terneplate, solder, bronze, babbitt, and tinning—accounted for around 90 percent of the total consumed in 1949 and 1950. Tin platers, the largest consumers of primary tin, increased their total use only 19 percent. Next in rank, solder required 79 percent more tin than in 1949. Tonnagewise this increase (12,104 tons) in the use of tin for solder was greater than ever before. More primary tin was required for making solder in 1950 than in any previous year of record, and among all items using primary tin it accounted for the largest increase (10,193 tons). The use of secondary tin for solder increased for the fifth consecutive year. Consumption of primary and secondary tin for other major uses increased in 1950 as follows: Bronze 42 percent, babbitt 41 percent, and tinning 44 percent. Consumption in bronze increased the most (4,313 tons) among items in the secondary tin category. The consumption of primary tin for babbitt showed an increase for the first time since 1944 and was 72 percent more in 1950 than in 1949.

There were indications of the probable return to precontrol practice in the use of tin for some items that had been restricted or prohibited. The larger tonnage of tin used for white metal was mainly accountable to pewter and britannia metal, which had been on the prohibited list. The use of tin for galvanizing was resumed on a small tonnage basis. Collapsible tubes and chemicals used more in 1950 than in any year since 1941. The large increase shown for the item "miscellaneous alloys" mostly reflects the use of tin for Copan, which the Texas City tin smelter began making in January 1950. The quantity of tin per unit specified for some of the terne-metal tonnage was higher in 1950 than in 1949, indicating the probable return to heavier coated ternes.

Tin-plate production rose to a new high in 1950—23 percent more than in 1949 and 22 percent above the previous record year of 1948. Electrolytic lines operating at a high rate established a new record in 1950 and produced 33 percent more tin plate than in 1949. Electrolytic tin plate requires considerably less tin per unit of product than hot-dipped. About 64 percent of the tin used to make tin plate in 1950 was for making hot-dipped and 36 percent for electrolytic, but hot-dipped tin-plate production contributed only 41 percent and electrolytic 59 percent of the total output in 1950. The record of the tin plate and terneplate industry during the past 16 years (table 8) indicates that a greatly expanded tin-plate production now requires no material change in the total tonnage of tin consumed, owing to introduction of electrolytic tin plate during the past decade. The demand for long ternes has been increasing, but there has been a falling off in the tonnage of short ternes. The tin content of terne metal used for long ternes returned to prewar practice in 1950; and, except for 1941, the tonnage produced was greater than in any other year. The production of short ternes in 1950 was about a third of the average annual output before the war. Terneplate production required 52 percent more tin in 1950 than in 1949. Total terneplate production increased 15 percent, with short terne output decreasing 25 percent and long ternes increasing 39 percent.

Since 1925 both the total consumption and the per capita consumption of primary tin in the United States have dropped sharply. During 1925–29, the average population was 118,908,000, and tin consumption was 76,814 long tons or 1.447 pounds per capita. For 1946–50 the population averaged 146,563,000, and primary tin consumption 58,400 tons, which amounted to 0.893 pound per capita. This shows that there was a decrease of 24 percent in tonnage and 38 percent per capita for 1946–50 compared with 1925–29.

This may be attributed, aside from controls, partly to the drop in demand for tin for making foil and collapsible tubes and for weighting silk (tin chloride). In 1929 production of 2,016,003 short tons of tin plate required 27,681 long tons of tin. In 1950 production of 4,767,274 short tons of tin plate required only 35,380 long tons. Owing to the development of electrolytic tin plate, no material change in tin consumption has taken place.

STOCKS

Stocks of pig tin and tin in ore were 25 percent higher at the end of 1950 than at the beginning of the year. In addition, about 11,150 tons (10,550 at beginning of year) were in process, in scrap and as secondary tin. Industrial stocks of primary tin were 56 percent higher, with 73 percent of the total plant stock held by tin platers. RFC stocks of tin metal were 22,452 tons at the beginning of the year compared with 18,618 tons (including 390 tons comprising undelivered balances of consumers' sales contracts) at the year's close; stocks of concentrates contained 21,117 tons of tin at the beginning of the year and 15,068 at the close. Ores afloat or in foreign ports at the beginning of the year contained 2,919 tons of tin and at the end of the year 5,606 tons. Stocks of tin in New York at the end of 1950, according to reports to the Commodity Exchange, were 1,438 tons.

[1] Excludes Government purchases delivered for stockpiling or at Texas City smelter. Also excludes tin in process and secondary pig tin.

PRICES

The tense situation in Asia, fear of interruption in supplies, events in Korea, and national stockpiling brought on extraordinary price movements in tin during 1950. The year opened with the New York market price for Straits tin at 77.5 cents a pound and closed with the price at $1.50; the average for the year was 95.56 cents (99.32 cents in 1949). After averaging 76.28 cents during the first half, the price moved sharply upward during the second half to an average of 114.84 cents. On February 23 a price of 74⅛ cents was recorded—the lowest since 1947. On November 8, by contrast, the highest price recorded in the regular market was $1.63½ a pound, with a little business transacted in spot at $1.70.

On August 16, 1941, a ceiling price of 52 cents per pound was established by the Government (Office of Price Administration and Civilian Supply) and this price remained in force until November 12, 1946. The export price was raised to 58 cents per pound on March 1, 1946. After price controls were removed, November 13, 1946, the RFC (Office of Metals Reserve) set 70 cents as the domestic price; this was raised to 80 cents on April 1, 1947, and to 94 cents on December 19, 1947. On June 1, 1948, the RFC announced a new price of $1.03, which held until September 28, 1949; it was then lowered to 96 cents and to 95 cents on October 24, at which level it remained until reduced to 85 cents on November 21, 1949. A series of 12 separate mark-downs then brought the price to 74.50 cents on January 30, 1950.

Prices on the open market sagged to 74.125 cents, the lowest since 1947, during the period February 23 to February 28, 1950, reflecting the outcome of bilateral negotiations between an Anglo-Malayan delegation and the United States on a long-term tin purchase contract for stockpiling. Britain refused the United States a discount on the grounds that it would either interfere with the recently decontrolled tin market or would involve a subsidy to the United States by the British taxpayer equal to the difference between the market price and the selling price to the United States. There also were other difficulties, such as choice of market to be used for price fixing.

[9] Based upon price indexes of U. S. Department of Labor.

On March 13, 1950, the RFC withdrew its fixed daily quotations and under a new selling plan began marketing on an average price basis to be determined by published quotations in the trade. RFC prices for Longhorn 3-Star and grade A foreign brands would be the average, for the calendar week following the date of sale, of the quotations for prompt grade A or Straits tin published in any approved daily metal periodical or trade journal. This virtually removed RFC as a source of prompt tin, with prices too indefinite for practical buying.

The price of Straits tin in New York increased to 74.5 cents on March 2, where it remained until it began advancing again on March 13, after the action by RFC. The upward movement was reinforced by market sentiment following the opening of the International Tin study Group in Paris on March 20, which was expected to stabilize prices at higher levels. By March 23 the price had moved up to 77¾ cents. The plan for establishing international control met with some difficulty, and the market reacted in a downward trend until 74.25 cents was reached on April 3, but the price moved up to 76 cents on April 6, and increased further to 77½ cents on April 20. By the first week in June it had reached 78½ cents, after which there was an erratic period, with a drop to 76¾ cents on June 24, on the eve of the North Korean invasion. At this point, the trend turned upward again, owing largely to the prospect of reduced offerings by the British Ministry of Supply, the price reaching $1.04½ on August 25. The London market was in a turmoil on the afternoon of August 10 as a consequence of the Ministry of Supply decision, and there were no dealings. There was a total of 16 advances and 9 declines during August in daily average prices with unprecedented daily fluctuations.

In the latter part of August RFC announced that it was resuming sales of grades of tin below grade A. New York prices declined to 95½ cents, only to resume a daily upward course immediately (without a single setback until November 8). The price situation had become chaotic, with most sellers in New York temporarily withdrawn from the market. Spot tin was quoted at $1.70 on November 8, with few transactions. European observers were holding to the opinion that United States national stockpiling had been a major factor in driving prices upward to unreasonable levels; but the United States was acquiring tin under Belgian, Netherlands, and Indonesian contracts and not in the open market.

The price situation remained confused during the remainder of November and December, with the news from Korea dominating the market. However, the market was fairly stable at the year end, with a price on December 30, 1950, of $1.51, or nearly 100 percent higher than at the beginning of the year.

In London the monthly average price for standard tin in 1950 ranged downward from £600.5 per long ton in January to £595.8 in May, thence upward to £784.8 in August; it weakened to £776.5 in September, and advanced sharply to £1,163.9 in December. The average was £745.8 for 1950 compared with £600.8 in 1949. An all-time high of £1,300 was reached on November 8, 1950, mainly because of the decision of the British Ministry of Supply not to release any more tin from its stock after November 10. On December 29, 1950, the price was £1,155 (or 144.37 cents a pound).

The Singapore market price for Straits ex works averaged £723.1 for 1950; for the first 6 months it averaged £580 per long ton (equivalent to 72.45 cents a pound) and for the second half £867 (108.42 cents per pound). The 1950 opening price, which also was the lowest for the year, was £562. The highest price was £1,268.5 reached on November 8, after a total advance of £407 without a single set back from October 19. At the close of 1950 the price was £1,140.6.

FOREIGN TRADE [4]

Tin, one of the principal imports of the United States, ranked ninth in value among all the commodities received in 1950. Imports of pig tin and ore and exports of tin plate are the principal tin items in foreign trade of the United States. In 1950 imports of pig tin for consumption totaled 82,837 long tons, the highest tonnage since 1941 and an increase of 38 percent over 1949; imports of tin in concentrates were 25,960 long tons. Total exports of tin plate, taggers tin, and terneplate (including long ternes) were 442,953 tons, an 11-percent decrease from 1949.

Further data on imports and exports of tin and tin plate are shown in tables 11 through 16. Tin contained in babbitt, solder, type metal, and bronze imported and exported is accounted for in the Lead and Copper chapters of this volume.

[4] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Malaya was the principal source of metal in 1950, furnishing 65 percent of the total. Other important sources of metal in 1950 were United Kingdom, Belgium-Luxembourg, and the Netherlands. Imports from the United Kingdom increased 189 percent over 1949.

Imports of tin concentrates (tin content) into the United States decreased 32 percent in 1950, as compared with 1949. Bolivia, the chief source, supplied concentrates containing 14,419 long tons of tin and accounted for 56 percent of the total. The second largest source of tin imported as concentrates was Indonesia, supplying 6,925 tons. Other smaller sources included Thailand, Belgian Congo, Burma, Japan, and Mexico. Bolivia was the source of 68 percent of the tin in concentrates imported from 1941 through 1950, inclusive.

Since 1941 the United States has been the world's principal source of tin plate. In 1950 exports of tin plate, taggers tin, and terneplate, including long ternes, decreased 11 percent from 1949, and 20 percent from the high level attained in 1947. Exports to Canada, India, Portugal, Chile, France, Norway, and Egypt declined, while there were significant increases in exports to Australia, Cuba, and the Union of South Africa.

Exports of hot-dipped tin plate totaled 348,944 long tons, valued at $66,089,402 in 1950. Principal countries of destination were the Netherlands (50,256 tons), Australia (47,800 tons), Brazil (34,570 tons), Union of South Africa (27,997 tons), and Italy (25,673 tons). Exports of electrolytic tin plate totaled 78,535 tons, valued at $13,397-425. This material was shipped to 43 countries, the leading ones being Brazil, the Philippines, the Union of South Africa, Cuba, Turkey, Mexico, and Australia.

According to the American Iron and Steel Institute, producers in 1950 shipped for export 490,230 short tons (519,618 in 1949) of tin plate, of which 392,651 tons (402,821) were hot-dipped and 97,579 (116,797) electrolytic.

[1] Data revised to include tin-plate manufactures, not specially provided for.
[2] Not separately classified.
[3] Revised figure.

TECHNOLOGY

The Tin Research Institute released for publication several technical reports on varied subjects relating to tin and its industrial application.[5] The General Electric Co. announced a new chemical product called R–108, which it is claimed offers a great deal of promise in a coating to replace tin used in food containers and can be substituted in many applications for expensive and hard-to-get alloys. The Federated Metals Division, American Smelting & Refining Co., announced development of a group of solders that permit savings of 50 percent or more tin normally used for solders. The new tin-conserving solders are basically silver-tin-lead alloys compared with the usual tin-lead variety. The addition of a small percentage of silver permits a marked reduction in the tin content and at the same time gives a joint at least as good as that of the original alloy. United States patents issued during 1950 relative to tin include the following:

Nelson, George C., Relates to the Manufacture of Tin Plate: U. S. Patent 2,497-164, Feb. 14, 1950.

The Bureau of Mines is now making a laboratory study of sulfidization of cassiterite and volatilization of tin from low-grade Bolivian tin-ore. Preparations have been made for further tests on a larger scale to apply what has been learned to the continuous volatilization of tin from various Bolivian tin ores. A summarized report on the tin situation in the United States, which was published during 1950,

[5] Information concerning the institute's work and publication can be obtained in the United States from Tin Research Institute, Inc., 429 West 6th Ave., Columbus, Ohio.

included a progress report on this work.[6] The presence of tin was detected by spectrographic analysis in the minerals allanite, boulangerite, geocronite, and manganophyllite.[7] Preliminary studies indicating that a partial reduction leaching process can compete favorably with thermal smelting in producing tin were the subject of an article.[8]

WORLD REVIEW

INTERNATIONAL TIN STUDY GROUP

Representatives of eight major tin producing and consuming countries met in London in October 1946 and agreed that a Study Group should be established. The International Tin Study Group was organized at a meeting in Brussels in April 1947. A brief report on the meetings held by the Study Group through 1950 has been published as follows:[9]

At the first meeting of the International Tin Study Group held in Brussels in April, 1947, terms of reference for the Group were agreed. The principal features of these terms of reference are (1) that membership shall be open to all countries principally interested in the production, consumption or trade in tin; (2) that the Group shall have the functions of considering possible solutions to any problems or difficulties which are unlikely to be resolved by the ordinary development or world trade in tin; and (3) that the Group should establish a permanent secretariat.

The second Group Meeting was held in Washington in April, 1948. The Group reviewed the world tin position and agreed to recommend to member-governments the setting up of a Working Party to examine the appropriateness and practicability of framing an intergovernmental agreement on tin conforming to the general spirit and principles of the Charter of the International Trade Organization. The meeting of this Working Party was held in The Hague in June, 1948.

The Group held its third meeting in The Hague on October 25th/29th, 1948. The Group had before it the report of the Working Party. The purport of this report was that it would be appropriate and practicable to conclude an international tin agreement on the lines set out in the report. The Group modified these proposals in certain respects and forwarded to the member-governments a recommendation that, after certain preparatory steps, the member-governments should be asked to inform the Secretary whether they would be disposed to enter into an agreement on the broad lines proposed, and were willing to attend a conference to put the agreement into final form and to conclude it.

The Fourth Group Meeting was held in London on June 14th–22nd, 1949. The Group received the Report of the Drafting Committee set up at their last meeting and noted that the summoning of an International Commodity Conference on tin in the spring of 1949 had not been considered timely by all member-governments. The Group set up a Working Party to prepare a statement on the position and prospects of the tin industry and also to prepare the draft of an Intergovernmental Commodity Control Agreement.

The Working Party met in The Hague from October 26th to November 2nd, 1949. It prepared the statement and the draft tin control agreement for the consideration of the member-governments. The draft agreement was designed, in the spirit of the Havana Charter, to establish equilibrium between supply and demand on conditions equally satisfactory to producers and consumers.

The Fifth Group Meeting was held in Paris on March 20th–29th, 1950. The Group considered, amended and modified the Draft Agreement drawn up by The Hague Working Party. The Group adopted, by a majority, a resolution requesting a United Nations Conference to be convened to discuss a commodity control agreement on tin.

The United Nations' Tin Conference was held in Geneva from October 25th to November 21st, 1950, attended by delegations from 20 countries. The Paris Draft Agreement and other proposals relating to a buffer stock, the control of exports and action in the event of a tin shortage were considered. The Conference concluded that the various proposals submitted differed so widely in their methods of operation that further examination by governments was needed. It instructed the chairman to keep under review the further discussions and conclusions of the International Tin Study Group; to consult, on the basis thereof, with the Steering Committee of the Conference with a view to deciding upon a suitable date for the resumption of the Conference; and, if satisfied that the conditions for a resumption exist, to request the United Nations to invite those governments which were invited to the present meetings to come together again. The Conference then adjourned.

WORLD MINE PRODUCTION

World mine production of tin, exclusive of U. S. S. R., increased 3 percent in 1950. Of the total output, Asia supplied 64 percent; South America, 19 percent; Africa, 14 percent; and other sources, 3 percent. Most of the increase was provided by Malaya and Indonesia. Output in 1950 was 4,600 long tons greater than in 1949. Production in 1950 was 2 percent above the 1925–29 average and amounted to 97 percent of the 1935–39 average and about 68 percent of the 1941 peak. U. S. S. R. tin production was estimated as not having exceeded 8,000 metric tons of metallic tin in 1949. The target for 1950 was estimated at 12,000 tons.[10]

WORLD SMELTER PRODUCTION

Smelter production of tin in the world, exclusive of U. S. S. R., increased only 3 percent in 1950 over 1949. The Malayan tin-smelting plants at Penang and Singapore had a 10-percent increase in output, supplied 40 percent of the total, and were (as in 1949) the world's most important sources of pig tin. Next in rank as important tin-smelting sources are the United States, United Kingdom, Netherlands and Belgium. Smelters in these countries supplied 93 percent of the world's tin in 1950.

About 67 percent of the world smelter output in 1950 was for the United States (in 1949, 60 percent).

[2] Beginning January 1948, includes production from imported scrap and residues refined on toll.
[3] Including tin content of ores used direct to make alloys.

REVIEW BY COUNTRIES

Australia.—Production of tin in concentrates during 1950 increased 499 tons over 1949, an increase of 25 percent. Domestic smelter production amounted to 2,013 tons, a 3-percent increase. Concentrates treated were derived chiefly from the Tableland Tin Dredging, N. L., of Mount Garnet, Queensland. This company is the largest tin producer in Australia. The present rate of operations will exhaust the property in about 2 years. Examination of neighboring areas has been made without disclosing anything of value to the company, and it appears that there is no prospect of prolonging the life of the Return Creek area. The company has concluded arrangements with Alluvial Prospectors, Ltd., to acquire its rights over the Smith's Creek area, which has been churn-drilled and contains 50,000,000 cubic yards of ground of an average value of 11.46 ounces tin oxide per cubic yard; it is anticipated that substantial extensions of yardage will be obtained by further drilling. Moreover, it has been estimated that, based on average operations and recoveries by the dredge, the average yearly output from the new property will approximate 1,000 tons of tin concentrate. Plans for constructing a tin-plate mill at Port Kembla, New South Wales, remain in an embryonic stage.

Belgian Congo.—The Belgian Congo production of tin in concentrates was 13,700 long tons compared with 13,760 in 1949. Belgian Congo, including Ruanda-Urundi, contributed 59 percent of Africa's 1950 total tin production. Tin contained in exports of concentrates totaled 11,034 long tons, of which United States received 1,550 long tons and Belgium 9,484 long tons. Exports of metal from Belgian Congo were 3,604 long tons, of which United States received 2,100 long tons and Belgium 1,504 long tons. Stocks of tin metal decreased from 79 tons at the beginning of 1950 to 13 tons at the end. Stocks of tin in concentrates decreased from 686 tons at the beginning of 1950 to 673 tons at the end.

A new ore-purchase contract for tin was negotiated in February 1950 between United States and Belgian Congo tin producers.

The Economic Cooperation Administration made available $1,700,000 in Marshall Plan credit funds to the Compagnie Géologique et Minière des Ingenieurs et Industriels Belges (Géomines) for plant construction to treat the unaltered greissen underlying the eluvial ore bodies from which past production originated. By 1954 this company will be producing at least 37 percent of the total Congo output.

Bolivia.—Bolivia exported 9 percent less tin in concentrates in 1950 than in 1949. Total tin contained in exports of concentrates in 1950 was 30,820 long tons. Nearly 44 percent was consigned to the United States, with approximately 53 percent to the United Kingdom, leaving about 850 tons for delivery to Western Germany, Argentina, Belgium, and Chile. There were no great changes in the relative export shares of the several mine groups. That of Patino Mines increased from 42 percent in 1949 to 44 percent in 1950; Hochschild decreased from 25 percent in 1949 to 23 percent in 1950, Aramayo increased from 6 percent in 1949 to 7 percent in 1950. Exports of metal from the Oruro smelter were 393 tons in 1950, chiefly to the United States.

Tin prices, stimulated by the outbreak of the Korean War, began an upward trend and by the end of the calendar year had risen phenomenally, reaching an all-time high in February 1951. Producers who had fixed their production schedules at an annual rate of 30,000 to 32,000 metric tons of fine tin in concentrates, expecting that prices would remain steady, adopted a wait-and-see policy while making plans to resume exploitation of low-grade ores, abandoned as unprofitable after the price slump of late 1949. At the end of July, tin miners were further encouraged when the RFC contract was signed with the provision that all tin produced in the first half of the year, which in the absence of the contract had accumulated at Chilean and Peruvian ports, would be liquidated at the average New York price for the months of July, August, and September. The Hochschild Co. stated this average to be 94 cents.

The supreme decree of August 11 required producers to surrender to the Central Bank, at a rate of 60 bolivianos to the dollar, 100 percent of all foreign exchange derived from mineral exports. After being convinced by the mining industry that the companies could not continue operations under such restrictions, the Government issued a series of decrees designed to stimulate production by modifying the decree of August 11. The three major tin-producing companies, which by a special decree on October 30 were permitted to retain 40 percent of their foreign exchange to cover foreign currency costs, signed contracts with the Government in which they agreed to increase production within 6 months to an annual rate of 26,250 metric tons of tin in concentrates. This represents 75 percent of the total production objective of 35,000 tons per year set in the October 30 decree. The

Patino group was assigned 59 percent of the larger production quota, Hochschild 30.5 percent, and Aramayo 10.5 percent. Medium producers of high-grade tin concentrates were excepted from the provisions of the August 11 decree by the decree of November 23, while special foreign-exchange surrender regulations for small producers of all metals exporting through the Banco Minero were established in the decree of November 30. A decree of December 15 regulated foreign-exchange deliveries of direct exporters of low-grade tin concentrates.

The decree of October 30 also requires the mining companies to set aside 1,500 bolivianos per ton of exports for housing construction and 1,000 bolivianos per ton of exports for other facilities for mine workers when the price of tin exceeds 90 cents per pound.

Brazil.—During 1950 the Department of Mineral Production (D. N. P. M.) began prospecting newly discovered deposits of cassiterite in Sierra dos Tartarugais, Ampa Territory, and in the Basin of Rio das Mortes and Carandai, Minas Gerais, Brazil's principal sources of tin. In San Jose del Rei, where deposits have been worked since 1943, installations for obtaining metallic tin have been modernized and five foundries are now operating. The production of tin in concentrates in 1950 was estimated at 240 long tons compared with 325 tons in 1949. Output of tin plate at the Volta Redonda steel plant was 33,491 long tons in 1950 compared with 18,300 tons in 1949.

Burma.—Production of tin in concentrates was estimated at 1,682 long tons in 1950, a 6-percent decrease from 1949. Exports of tin in concentrate were about 1,511 long tons, of which 1,007 were shipped to the Malays for smelting. With intensification of Civil War many records were destroyed, and the Burmese Government was beset with difficulties in collecting reliable statistics. Throughout the year the Mawchi mine was completely isolated from the rest of Burma by insurgent occupation, and production was restricted to a negligible quantity, obtained from tributers. The mine and mill installations were on a care and maintenance basis. It is not expected that mining activity at Mawchi will be resumed while the area remains under rebel control. Conditions in the Taroy district continued to be most unsettled. After a long period of frequent raids, the mine managers and European staff members were finally expelled by the Communists during January 1951. On October 5, 1950, the Burmese Parliament amended the Special Company Act in such a way as to allow participation of the Burmese Government with private companies in joint development of mineral resources.

Indonesia.—In 1950, Indonesia was the second-largest tin producer in the world. Production of tin in concentrates totaled 32,099 long tons, an 11-percent increase from 1949. The Indonesian output of tin represented 19 percent of the world total. Tin production in Indonesia is confined to the islands of Banka, Billiton, and Singkep, which in 1950 supplied 61, 31, and 8 percent respectively. The Banka smelter which was dismantled during World War II has not been rehabilitated. Exports of tin in concentrates were 31,209 long tons, of which 21,658 were shipped to the Netherlands, 9,514 tons to the United States, and 37 tons to Malaya.

232294—53——78

Malaya Federation.—In Malaya 1950 was a year of great prosperity in the tin industry. Tin reached the all-time record of $642 a picul. The tin industry faced the same problems as those confronting the rubber industry—Communist activity, increasing costs, and shortage of labor and European staff for supervision. Mine production of tin in ore was 57,537 long tons in 1950, compared with 54,910 in 1949, 84,082 in the peak year 1940, and an annual average of 55,309 per year during the prewar period 1935–39. An output of 5,176 tons was made in May 1950, the highest postwar rate, owing mainly to increased output from dredges. More dredges have been brought into operation, but some were closed down for periods to permit repairs and reconditioning after being in operation for more than 2 years. The output from Chinese-owned open-cast mines would have been greater had there been a sufficiency of electric power. During the year 47 mining properties resumed operation, bringing the total worked to 733 when the year closed. There were more than 1,000 before World War II. The labor force employed in tin mining had been increased from 46,993 during 1949 to 47,244 during December 1950.

Postwar Rehabilitation plans had called for 80 dredges and 550 gravel pumping mines to be in operation by the end of 1950. During 1950, the number of dredges increased from 76 at the beginning of the year to 80 in December to fulfill the goal. Dredges accounted for 28,005 long tons or 49 percent of the 1950 production.

The number of gravel-pumping mines had exceeded the planned goal, increasing from 518 at the beginning of the year to 561 in December 1950, with a production in the last month of 21,261 tons of tin, or 37 percent of the 1950 total. The following tabulation of the operations of about half the dredging output in Malaya indicates that in the postwar period the grade of gravel extracted was lower than in 1940–41.[11]

TABLE 19.—Production of tin concentrates by selected dredging companies in Malaya, 1940–41 (total), and 1948–50

	1940–41 (total)	1948	1949	1950
Number of companies	27	25	22	9
Material dredged ... 1,000 cubic yards	99,893	59,075	70,124	34,116
Tin recovered in concentrate:				
Total ... long tons	20,214	11,633	12,534	5,570
Per cubic yard ... pound	0.4533	0.4411	0.4004	0.3657

The principal source of pig tin in the world in 1950 was Malaya—from the large smelting plants of the Eastern Smelting Co., Ltd., Penang, and Straits Trading Co., Singapore. These plants increased their output 10 percent and supplied 40 percent of the world smelter production in 1950. Concentrates treated were derived mostly from Malaya, with smaller tonnages from Thailand, Burma, Indonesia, and French Indochina. The tin content of concentrates available from Malaya was 57,537 long tons compared with 55,448 in 1949. Imports originating elsewhere contained 9,912 tons of tin against 6,560 in 1949. The plants shipped 81,805 tons of metal (about 56 percent from Penang and 44 percent from Singapore). Nearly 54

[11] The International Tin Study Group, Notes on Tin; No. 6, June 1951, p. 105.

percent went to the United States in 1950. Stocks of tin metal decreased from 15,103 tons at the beginning of 1950 to 1,991 at the end, while stocks of tin in concentrates decreased from 5,222 at the beginning to 4,521 at the end.

Nigeria.—The Colony and Protectorate of Nigeria, including the Cameroons, under British trusteeship is the largest British possession in west Africa. The tin deposits are situated chiefly in the Northern Provinces—Plateau, Kabba, Niger, and Benue. Deposits currently worked are alluvial or eluvial and are mined by placer methods. Lode deposits are known to occur. Production of tin in concentrate in Nigeria totaled 8,258 long tons in 1950, a 6-percent decrease from 1949. Most of the world supply of columbium is produced as a byproduct of tin mining in Nigeria. All of the tin concentrates are sold to the United Kingdom. The Amalgamated Tin Mines of Nigeria, Ltd., which annually supplies about half of Nigeria's tin production, is developing the alluvial reserves reputedly lying beneath the basalts of the high plateau. On the success of this development depends prolongation of tin mining in Nigeria.

Portugal.—Production of tin in concentrates is estimated at 690 long tons in 1950, a 12-percent decrease from 1949. Exports of tin in concentrates to the United Kingdom totaled 702 long tons.[12] The shortage of electricity affected tin mining during the summer months. However, the relatively favorable price for tin compared with wolframite caused mines having reserves of both to increase the proportion of cassiterite during 1950. Mina da Panasqueria, the largest wolframite producer, was reported to have stoped cassiterite-rich areas and to be producing about 30 tons monthly. Operations of the Portuguese American Tin Co., working alluvial tin deposits in the Gaia Valley in the Beira Baixa district, were suspended. The dredge was dismantled and transported to a new gravel deposit in the Machainas Valley about 15 miles away. One [13] of the chief sources of Portuguese tin ore is the tributer and not the concession owner. Provided that the price per kilo for the crudely washed tin and wolfram concentrates is high enough to make collecting worth while, thousands of workers on the land, all experts in such work, are ready to exploit the localities known to them.[14]

Thailand.—Rehabilitation of dredges was virtually completed by the end of 1950. Production of tin in concentrates in 1950 totaled 10,364 long tons, a 33-percent increase compared with 1949. The number of dredges operating increased from 29 in January to 31 in December. The output of 1,004 long tons of tin in concentrates during October approached the prewar monthly average of 1,147 tons for the 1935–39 period. In 1950 production of tin in concentrate from dredges amounted to 6,628 long tons or 64 percent of total output; production from gravel pumps and hydraulicking amounted to 2,334 tons or 23 percent of total output. Production from other means and from dulang washing accounted for 967 tons or 9 percent and 435 tons or 4 percent, respectively, of the total output. Exports (reported as imports by receiving countries stated) of tin in concentrate were

[12] Bureau of Mines, Mineral Trade Notes, vol. 30, No. 5, May 1950, p. 23.

[14] Work cited in footnote 12.

10,585 long tons, of which 2,457 were shipped to the United States, 8,113 to Malaya, and 15 tons to Netherlands. The only mines that have not been able to produce since the end of the war were the Pinyok mine and the Talering mine. Thailand Tin Mines, Ltd., found financial and technical difficulties in finishing the Cavaet plant at the Pinyok mine, and Tonghah Harbour Tin Dredging, Ltd., had to cope with hard dredging ground and a fuel problem at Talering.[15]

United Kingdom.—The London Metal Exchange reopened for dealings in tin in mid-November. Starting at around £600 per ton in January, by mid-August the price had reached £847; after further upward fluctuations, £1,300 was reached in November, easing slightly to £1,290 at the end of the year. Mine production totaled 960 tons in 1950 compared with 1,212 tons in 1949. United Kingdom smelter production of tin was the third largest in the world in 1950. Output declined 4 percent compared with 1949. Year-end stocks of tin in concentrate were 2,250 tons (6,080 at beginning of year) and of metal 7,217 tons (14,682 at the beginning). Total stocks, including tin metal and concentrates afloat and visible consumers' stocks, were reported to be 12,800 tons at the end of 1950—a 45-percent decrease from 23,138 tons at the beginning of the year. Total virgin tin consumed was 22,850 tons, 10 percent above 1949. The use of tin for making tin plate, the principal finished product, was virtually unchanged from 1949. Requirements for solder were 49 percent greater than in 1949.

Titanium

By Frank J. Cservenyak

GENERAL SUMMARY

DESPITE the great interest that has been aroused in development of titanium as a structural metal, titanium dioxide pigment continued, in 1950, to be the basis of the titanium industry. About 99 percent of the ilmenite production was consumed in this form.

New records were established in production of titanium pigments. This was accompanied by a production of 468,320 tons of ilmenite, also a new record.

Titanium metal was produced commercially on an increasing scale for the third successive year; commercial grades of high-strength titanium-base alloys were also available in 1950. The unique properties of titanium have aroused widespread interest and stimulated research on production and utilization of the metal and its alloys. In 1950, for the first time, titanium metal was offered to the market in a wide range of fabricated products, such as large plates, bar, forgings, tubing and wire, but producers of titanium sponge, ingot, and products were unable to meet the heavy demands for strategic and experimental applications.

The price of titanium sponge in 1950 was $5 per pound—equal to the price of aluminum 60 years ago or magnesium 45 years ago. It is to be expected that the price of titanium will decrease as the rate of production rises, as it has for aluminum and magnesium. At its present price the use of titanium is limited to such items as jet-engine parts, aircraft structures, and ordnance components, where the combination of lightness, strength, and corrosion resistance are important enough to justify the high cost.

Large-scale mining was started by the Quebec Iron & Titanium Corp. in the Allard Lake area of Quebec, Canada, reported to be the largest deposit of ilmenite in the world. Smelting operations on this ore were begun at Sorel; one electric furnace was in operation late in 1950. The high-titania slag from this operation is intended for export, principally to the United States, for production of pigments and metal. Although the price of this product will be higher than that of domestic and imported ores, its quality and uniformity are expected to be such as to command a higher price than the competing ores. This source assures the United States of an adequate supply of raw material for the industry for many years to come.

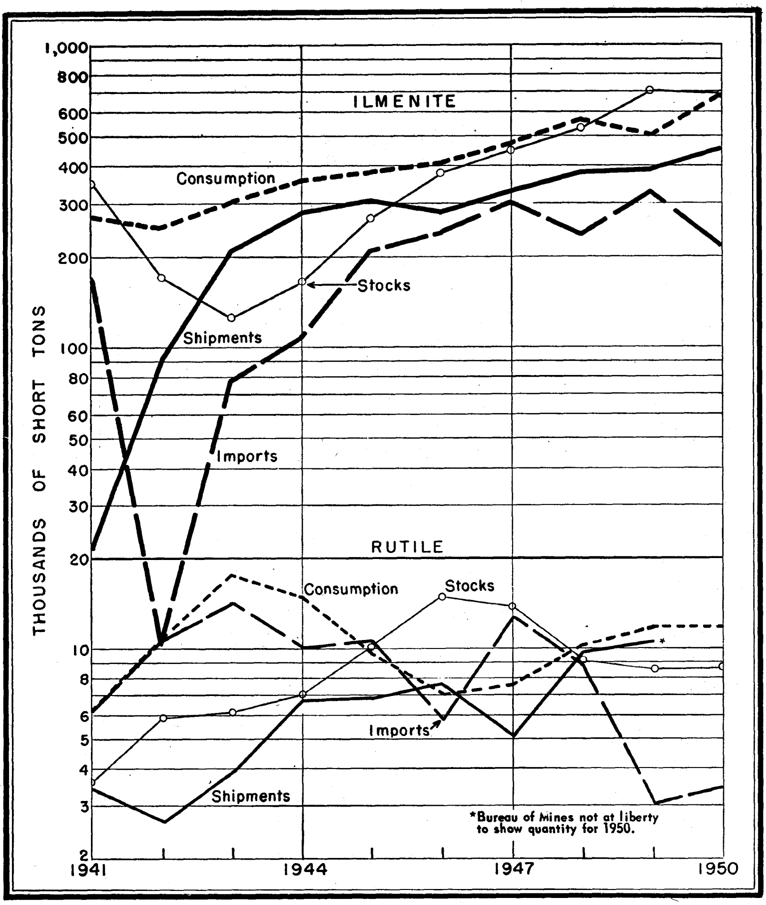

FIGURE 1.—Trends in domestic shipments, imports, consumption, and stocks of ilmenite and rutile, 1941–50

RESERVES

In his survey of the relative abundance of elements for the U. S. Geological Survey in 1924, F. W. Clarke found that titanium was the fourth most plentiful structural metal in the earth's crust, being exceeded only by iron, aluminum, and magnesium. However, only a few minerals bearing titanium are known to occur in bodies large enough to have economic importance. The principal minerals of titanium are rutile (TiO_2) and ilmenite ($FeTiO_3$); it also occurs as arizonite, titanite, and perovskite.

Titanium ores are found extensively throughout the United States, Canada, India, Australia, Norway, Ceylon, Brazil, Sweden, and the U. S. S. R. Large ilmenite deposits occur in Virginia and North Carolina. Extensive deposits of titaniferous iron ores occur in New York, Minnesota, Rhode Island, Wyoming, California, and New Mexico. Other occurrences of iron ores rich in titanium have been reported in North Carolina, South Carolina, Tennessee, New Jersey, Colorado, Montana, and Oklahoma. Rutile and ilmenite, with other minerals, are found in beach sands at many places along the Atlantic, Pacific, and Gulf coasts; they have been worked mainly in Florida and to some extent in Oregon. Rutile deposits also occur in Virginia and Arkansas.

The more significant publications issued up to January 1, 1950, on occurrence, exploration, mining, and treatment of titanium ores were listed in a bibliography prepared by the U. S. Geological Survey.[1]

The Magnet Cove rutile deposit, Hot Spring County, Ark., was explored by the Bureau of Mines; this work revealed an extension of the ore body from the previously mined area.[2]

Laboratory tests at the Bureau of Mines Experiment Station, Rolla, Mo., indicated that an ilmenite concentrate (about 20 percent TiO_2) and iron-ore concentrate could be recovered from the red mud or residue of the Hurricane Creek alumina plant operated by the Reynolds Metals Co.[3]

DOMESTIC PRODUCTION

Production of ilmenite in 1950 was 468,320 tons. Of the total, New York supplied more than one-half, Florida about one-fourth, and the remainder came from North Carolina and Virginia.

Both production and shipments of ilmenite increased 16 percent in 1950 and established new records for the fourth successive year. Ilmenite in 1950 includes a small quantity of mixed product containing altered ilmenite, leucoxene, and rutile. The mixed product was used in the manufacture both of titanium pigments and metal. The analysis of shipments of ilmenite ranged from 45 to 65 percent TiO_2; rutile shipments averaged 93 percent TiO_2.

TABLE 1.—Production and mine shipments of titanium concentrates from domestic ores in the United States, 1941–45 (average) and 1946–50, in short tons

Year	Ilmenite				Rutile			
	Production (gross weight)	Shipments			Production (gross weight)	Shipments		
		Gross weight	TiO_2 content	Value		Gross weight	TiO_2 content	Value

2 Reed, Donald F., Investigation of Magnet Cove Rutile Deposit, Hot Spring County, Ark.: Bureau of Mines Rept. of Investigations 4593, 1949, 9 pp.

3 Calhoun, W. A., Titanium and Iron Minerals from Black Sands in Bauxite: Bureau of Mines Rept. of Investigations 4621, 1950, 16 pp.

Important developments during 1950 included the formation of new titanium organizations. Rem-Cru Titanium, Inc., jointly owned by Remington Arms Co. and Crucible Steel Co. of America, was formed to make titanium and titanium-alloy products. National Lead Co. and Allegheny Ludlum Steel Corp. organized Titanium Metals Corp. of America to market and distribute titanium metal, its alloys, and various related products. Sharon Steel Corp. also announced that it was joining the ranks of steel companies going into the titanium-sheet business.

California.—A small quantity of ilmenite was produced at the property of the Ferro Titan Minerals Co., Sun Valley, Los Angeles County, Calif.

Florida.—The new operations of E. I. du Pont de Nemours & Co. at Starke, Fla., completed its first full year of operation. This property produced ilmenite and a mixed product containing altered ilmenite, leucoxene, and rutile.

Production of ilmenite and rutile in 1950 came again from the Rutile Mining Co. of Florida near Jacksonville. A small quantity of ilmenite and rutile was produced from the property of the Florida Ore Processing Co., near Melbourne, Fla., which was undergoing reorganization in 1950.

New York.—Production of ilmenite at Tahawus, Essex County, N. Y., by the National Lead Co. in 1950 was slightly below the peak production attained in 1949.

North Carolina.—The Yadkin Mica & Ilmenite Co., subsidiary of the Glidden Co., produced 26,543 tons of ilmenite (averaging 51 percent TiO_2) at Finley, Caldwell County, N. C., and shipped 25,843 tons. Production in 1950 was 15 percent under the record rate established in 1949.

Virginia.—Ilmenite was produced in 1950 at Piney River, Nelson County, Va., by the Calco Chemical Division of the American Cyanamid Co. Production at this property in 1950 increased about one-third over that in 1949.

CONSUMPTION AND USES

The consumption of ilmenite in 1950 was 33 percent higher than in 1949, establishing a new record of 679,244 tons. The manufacture of pigments again accounted for 99 percent of all ilmenite consumed. Rutile consumption in 1950 increased mainly in welding-rod coatings and alloys and carbide. Rutile consumption reported in 1949 included a mixed product containing altered ilmenite, leucoxene, and rutile; this product is included with ilmenite for 1950.

TABLE 2.—Consumption of ilmenite and rutile in the United States, 1942–47, total, and 1948–50, by products, in short tons

Product	Ilmenite		Rutile

[1] "Pigments" include all manufactured titanium dioxide, consumption of which in welding-rod coatings was 1,338 tons in 1948, 1,082 tons in 1949, and 1,439 tons in 1950.
[2] Included in "Miscellaneous," in order to avoid disclosure of individual company operations.
[3] Includes rutile used to make pigments.
[4] Includes a mixed product containing altered ilmenite, leucoxene, and rutile used to make pigments and metal.

Titanium Pigments.—Production and shipments of titanium pigments were 18 and 21 percent, respectively, above previous peaks in 1948. Figures in this industry are supplied in confidence and consequently are not given here. The percentage distribution of titanium pigment shipments, by consuming industries, is shown in table 3.

TABLE 3.—Distribution of titanium pigment shipments, by industries, 1935–45 (average) and 1946–50, in percent of total

Industry	1935–45 (average)	1946	1947	1948	1949	1950
Distribution by gross weight:						
Paints, varnishes, and lacquers	77.7	78.6	81.5	76.4	74.5	74.5

Total	100.0	100.0	100.0	100.0	100.0	100.0

Metal.—Titanium metal was produced on a commercial basis for the third successive year. Pilot plants were operated in 1950 by E. I. du Pont de Nemours & Co. at Newport, Del., and by the National Lead Co. at Sayreville, N. J. The Bureau of Mines pilot plant at Boulder City, Nev., produced 13,810 pounds of titanium sponge in 1950 giving a total of 34,000 pounds of metal produced at this plant since 1945.

The nominal annual capacity of all titanium pilot plants in operation in 1950 was 300,000 pounds; however, production of metal was only about 50 percent of this amount because the pilot plants were operated experimentally and did not produce continuously at designed capacity.

At the end of 1950, E. I. du Pont de Nemours and National Lead were both considering substantial expansions. Du Pont started construction of a commercial plant with a nominal capacity of 600 tons per year and was considering additional expansion in 1951. National Lead leased several buildings at the Henderson, Nev., site of the former Basic Magnesium, Inc., plant and announced plans for expanded production of titanium, as well as the magnesium to be used as a reducing agent in titanium production.

Commercially pure titanium metal (approximately 99.5 percent Ti) was offered in limited quantities in a wide range of products, such as large sheets, strip, plate, bar, forgings, tubing, and wire. Titanium ingots weighing 500 pounds were produced during 1950, and production of larger ingots was reported at the end of the year. Producers of titanium sponge, ingot, and products could not meet the heavy demands for strategic and experimental applications.

Titanium powder, 96–98 percent Ti, was produced by Metal Hydrides Inc., Beverly, Mass. This plant also produced cast titanium suitable for addition to nonferrous alloys, titanium hydride for powder metallurgy and chemical reactions, and titanium master alloys in powder and ingot form.

The Foote Mineral Co., Philadelphia, Pa., and New Jersey Zinc Co., Palmerton, Pa., produced small quantities of high-purity ductile titanium 99.9+ percent Ti, by thermal decomposition of volatile titanium iodides. This metal is used primarily for obtaining fundamental information on the properties of titanium and its alloys. The high-purity metal is costly and was not available in commercial quantities in 1950.

Welding-Rod Coatings.—Production of titanium-coated welding rods was 188,000 short tons in 1950, an increase of 22 percent over the 154,000 short tons in 1949; 188,000 tons were coated in 1948, 153,000 in 1947, and 481,000 tons in 1943. Of the 1950 tonnage, 55 percent was coated with natural rutile, 32 percent with manufactured titanium dioxide, 7 percent with both varieties, and 6 percent with ilmenite.

Other Uses.—Ceramic titanates are finding an increasingly important place in the electronic industry. Barium titanate and solid solutions of barium and strontium titanates have exceptionally high dielectric constants and show remarkable piezoelectric effects. The biggest field of application is in capacitors for television sets where compactness is of great value. They are also used for phonograph pick-ups, microphones, and high-frequency sound generators. Titanate ceramic radiators for production of ultrasonic energy may find new uses in application of ultrasonic radiation to chemical processes.[4]

The use of titanium dioxide as the major opacifying agent in porcelain enamels is finding increased application for stoves, refrigerators, signs, reflectors, architectural products, sanitary ware, and hollow ware. The chief advantages of titania enamels are their superior opacity or hiding power, extreme hardness, and excellent acid resistance.[5]

Titanium compounds have been used experimentally as fire-retardant agents for fabrics. A titanyl chloride-antimony trichloride complex, found to be effective in providing flame retardancy, has been applied to many types of cellulose fabrics.[6]

The alkyl titanates, derived from the action of titanium tetrachloride on alcohols, were reported to be very effective waterproofing agents. These compounds can impart a water-repellent finish to such diverse materials as paper, cotton, wool, rayons, nylon, silk, felt, and wood. Potential industrial applications depend on the commercial availability of these compounds at a reasonable cost.[7]

Clear, transparent rutile gems were available in 1950. Large boules were produced by fusing purified titanium dioxide in an electric furnace. Gems cut from these boules exhibit brilliance equal to that of diamonds. Rutile gems are only seven-tenths as hard as diamonds but have an index of refraction of 2.7 compared to 2.41 for diamonds, which means a higher degree of internal reflection.

The numerous uses of titanium in steels and alloys were discussed in detail in a text published in 1949.[8]

STOCKS

Inventories of ilmenite in 1950 decreased slightly, and those of rutile reflected little change from 1949. Year-end stocks of ilmenite and rutile (TiO_2 content basis) were sufficient to sustain industry at the 1950 rate of use for 11 months and 9 months, respectively.

TABLE 4.—Stocks of titanium concentrates in the United States at end of year, 1949–50, in short tons

Stocks	1949				1950			
	Ilmenite		Rutile		Ilmenite		Rutile	
	Gross weight	Estimated TiO_2 content	Gross weight	Estimated TiO_2 content	Gross weight	Estimated TiO_2 content	Gross weight	Estimated TiO_2 content

[1] Includes ilmenite and rutile content of mixed zirconium-titanium concentrates.
[2] Revised figure.

PRICES

Ore.—Quotations in E&MJ Metal and Mineral Markets covering ilmenite were unchanged in 1950. Nominal quotations for 56–59 percent TiO_2, per gross ton, f.o.b. Atlantic seaboard, according to grade and impurities, remained at \$14–\$16. Nominal quotations for rutile concentrate, guaranteed minimum 94 percent TiO_2, were 4–5 cents a pound until April 1950, when they dropped to 3½–4½ cents for the rest of the year.

Ferrotitanium.—According to the magazine Steel, quotations for ferrotitanium during the first 5 months of 1950 were as follows:

Ferrotitanium, Low-Carbon: (Ti 20–25 percent, Al 3.5 percent maximum, Si 4 percent maximum, C 0.10 percent maximum). Contract, ton lots, 2″ x D, \$1.40 per pound of contained Ti; less ton \$1.45. (Ti 38–43 percent, Al 8 percent maximum, Si 4 percent maximum, C 0.10 percent maximum). Ton lot \$1.28 less ton \$1.35, f. o. b. Niagara Falls, N. Y., freight allowed to St. Louis. Spot add 5¢.

Ferrotitanium, High-Carbon: (Ti 15–18 percent, C 6–8 percent). Contract \$160 per net ton, f. o. b. Niagara Falls, N. Y., freight allowed to destination east of Mississippi River and north of Baltimore and St. Louis.

Ferrotitanium, Medium-Carbon: (Ti 17–21 percent, C 3–4.5 percent). Contract, \$175 per ton, f. o. b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

Quotations for low-carbon ferrotitanium continued for the remainder of the year at $1.40 and $1.45 per pound of contained Ti, respectively, for ton and less-than-ton lots. Quotations for high-carbon ferrotitanium increased to $167 per net ton in June, continuing at that level for the remainder of the year. Quotations for medium-carbon ferrotitanium increased to $183 per ton in June also with no further change reported during the remainder of 1950.

Metal.—Titanium metal, 96–98 percent, was quoted at $5 a pound during 1950. Titanium sponge metal (titanium 99.5 percent minimum, iron 0.25 percent maximum, nitrogen 0.05 percent maximum) was quoted by E. I. du Pont de Nemours & Co., Pigments Department, Wilmington, Del., at $7.50 per pound in quantities of less than 100 pounds and $5 per pound in quantities of 100 pounds or more, all prices f.o.b. shipping point. Titanium Metals Corp. of America, New York, N. Y., announced the following prices for titanium metal, commercially pure and alloy grades, in October 1950: Base prices per pound in lots of 10,000 pounds and over in commercially pure and alloy grades f.o.b. mill: Hot and cold-rolled sheets, $15, Brackenridge, Pa.; hot-rolled sheared mill plate, $12, Brackenridge; cold-rolled strip, $15, West Leechburg, Pa.; rolled or cold-drawn round bar in small diameters and round wire, $10, Dunkirk, N. Y.; forgings (rounds, disks, and round-cornered squares and rectangles), $6, Watervliet, N. Y.; hot-rolled bars (rounds, flats, and squares), $6, Watervliet.

Manufactured Titanium Dioxide.—Prices, in cents per pound, for manufactured titanium dioxide (anatase) as quoted by Oil, Paint and Drug Reporter for the first 11 months of 1950 were listed as follows: Ceramic, 19½ cents; chalk-resistant, 19½ cents; plain, 19½ cents; and (rutile) nonchalking, 21½ cents. These prices were for carlots, in bags, delivered. In December quotations were increased on all grades. The ceramic and chalk-resistant grades were quoted at a range of 21–21½ cents and (rutile) nonchalking at 23–23½ cents. The plain grade was not shown in the December quotations; however, a "regular" grade was added at 21–21½ cents.

FOREIGN TRADE [9]

Imports.—Receipts of ilmenite in 1950 were 216,459 tons, 33 percent less than the record established in 1949; this is the lowest since 1945. Imports from India, the dominant source, dropped 35 percent; those from Norway dropped 18 percent. India supplied 87 percent and Norway, the second most important source, 13 percent of the 1950 total.

All imports of rutile were from Australia for the third successive year and totaled 3,427 tons, 11 percent above 1949.

[9] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TABLE 5.—Titanium concentrates[1] imported for consumption in the United States, 1941–45 (average) and 1946–50, by countries, in short tons

[1] Classified as "ore" by the U. S. Department of Commerce.
[2] Most of the imports of titanium from Australia in 1940–47 were in mixed zircon-rutile-ilmenite concentrates, which were included as ilmenite, rutile, and zirconium ore in U. S. Department of Commerce figures. The quantities reported by the U. S. Department of Commerce have been adjusted to reflect percentage content of each item based on reports to the Bureau of Mines from importers.
[3] Less than 0.5 ton.
[4] Includes 309 tons not recovered from mixed concentrates.
[5] Includes quantities reported by the U. S. Department of Commerce as originating in French Equatorial Africa, from which no rutile production has been recorded.

Exports.—Shipments of titanium pigments from the United States again established a new high level in 1950. As in previous years, titanium pigments constituted the major portion of exports of titanium materials. Canada continued to be the chief recipient with 24,450 tons, followed by Mexico with 1,579 tons, France 1,308, Brazil 1,062, Cuba 737, Belgium-Luxembourg 601. The remainder was distributed among 41 other countries. Exports of concentrates were the lowest since 1944 with Canada receiving 435 tons, Argentina 67, Netherlands 55, and eight other countries the remainder. Canada received 137 tons of the ferro-alloys exported and Belgium-Luxembourg 24; insignificant quantities went to four other countries.

TABLE 6.—Exports of titanium products from the United States, 1943–45 (average) and 1946–50, by classes

TECHNOLOGY

Metallic titanium owes its importance to an unusual combination of properties—lightness, strength, and resistance to corrosion. The density of titanium is 0.16 pound per cubic inch, 60 percent heavier than aluminum but only 56 percent as heavy as alloy steel. Titanium alloys are much stronger than aluminum alloys, having tensile strength and hardness approaching that of many alloy steels. The strength : weight ratio at ordinary temperatures exceeds that of either aluminum or stainless steel. Titanium alloys also have unusual resistance to fatigue and great impact strength. Titanium metal is more resistant to corrosion than aluminum and is as resistant as stainless steels; it is particularly resistant to sea-water corrosion and marine atmospheric weathering.

The chief disadvantages are high cost, difficulties of fabrication and its excessive reactivity at high temperatures. Although the melting point of titanium—3,150° F.—is extremely high, it absorbs oxygen and nitrogen and becomes brittle above 1,000° F.

Commercial production of titanium metal in 1950 was based on modifications of the Kroll process developed by the Bureau of Mines. Titanium tetrachloride, produced by chlorination of titanium ores, is reduced to the metallic state with magnesium in an inert atmosphere. Magnesium chloride and excess magnesium are removed from the sponge-like titanium metal by vacuum distillation. The titanium sponge or powder is consolidated by powder metallurgy techniques or melted in induction or electric-arc furnaces.[10]

A continuous method of producing titanium employing magnesium and titanium tetrachloride as the raw materials was proposed by the Battelle Memorial Institute in 1950. Liquid magnesium is continuously added to a titanium tetrachloride atmosphere in a reduction chamber to produce magnesium chloride and titanium at 1,400°–1,600° F. The reaction product runs continuously from the bottom of the reduction chamber into an arc furnace, where the titanium is melted and the magnesium chloride and unreacted

[10] Wartman, F. S., Walker, J. P., Fuller, H. C., Cook, M. A., and Anderson, E. L., Production of Ductile Titanium at Boulder City, Nevada: Bureau of Mines Rept. of Investigations 4519, 1949, 37 pp.

magnesium are volatilized, condensed, and removed. A continuously formed titanium ingot is withdrawn from the bottom of the furnace.[11]

Other processes under consideration include electrolytic reduction, use of mixtures of sodium and magnesium as reducing agents, reaction of titanium tetrachloride vapors and hydrogen in an arc, and improved iodide decomposition processes.[12]

The year 1950 was notable for increased interest in titanium technology.[13] Extensive research was in progress in 1950 on high-strength titanium-base alloys. Rem-Cru Titanium, Inc., developed and sold manganese and manganese-aluminum titanium alloys,[14] and the Titanium Metals Corp. of America offered chromium titanium alloys.[15] The Navy Bureau of Aeronautics reported development of a lightweight chromium-aluminum titanium alloy as strong as high-strength steel.[16]

A general description of the process presumably to be used on Allard Lake titaniferous ore at the Quebec Iron & Titanium Corp. smelting project at Sorel, Canada, was reported in a patent issued to that firm.[17] The process marks a new approach to the smelting of titaniferous ore. Previously the titanium and iron have been separated by a combination of ore dressing and normal smelting processes. Large amounts of flux were added to produce fluid slags and permit separation from the iron. The process used by Quebec Iron & Titanium Corp. utilizes little or no flux to give a titanium-rich slag of about 70 percent TiO_2 suitable for further processing and also a marketable iron product. A proportioned charge of ore, coal and 0 – 10 percent of lime for fluxing is smelted at 1,500° to 1,700° C. in a stationary box-shape electric furnace. Low-ash coal, ranging from 8 to 14 percent of ore weight, slightly less than stoichiometric requirements to reduce the iron oxide and to carburize the iron, is included in the charge. Ores reported to be suitable for producing titanium-slag concentrate are those with titanium dioxide content of 30 to 50 percent, iron 30 to 50 percent, and gangue up to 12 percent.

A chemical technique was devised by the Bureau of Mines for utilizing certain domestic titaniferous iron ores. Ninety percent of the iron in Tahawus magnetite was recovered experimentally as an iron powder analyzing 90 percent metallic iron and containing 2 to 3 percent TiO_2. The titania remains in the slag, from which it may be recovered as pigment-grade TiO_2. The main steps are (1) sintering

the ore at 1,050° C. with carbon and soda ash to reduce the iron to metal powder, retaining the titania in the slag; (2) separating the powdered iron from the slag, by magnetic or gravity separating methods; and (3) sulfuric-acid decomposition of the slag fraction to recover the titania.[18]

WORLD REVIEW

World production of ilmenite and rutile both established new peak records in 1950. The world production of ilmenite was estimated at 788,000 metric tons, an increase of 8 percent over 1949. Rutile production, estimated at 25,600 metric tons, increased 7 percent over 1949.

The United States continued to be the world's largest producer of ilmenite, supplying about one-half of the ilmenite produced in 1950. Australia again ranked first in the production of rutile.

Available data on world production of ilmenite and rutile in recent years are shown in table 7.

TABLE 7.—World production of titanium concentrates (ilmenite and rutile), 1944–50, by countries, in metric tons.

Australia.—The Australian Titan Products Pty., Ltd., a subsidiary of British Titan Products Co., Ltd., operated its new titanium-pigment plant near Burnie, Tasmania, in 1950.[19] This plant, with an annual capacity of 1,800 tons of titanium oxide, was completed in 1949. Plans to double plant capacity by installation of new equipment were completed in the latter part of 1950.[20] The titanium pigment has found a ready market in the Australian paint, enamel, rubber, soap, cosmetics, paper, and textile industries. Indian ilmenite was used as a raw material. Although Australia produces large amounts of ilmenite concentrate as a byproduct in the recovery of zircon and rutile from black sands, it is unsuitable for pigment manufacture because of its high chromite content, which ranges from 1 to 4 percent. Research on separation of chromite was in progress in 1950.

Canada.—The Allard Lake ilmenite property is being developed by the Quebec Iron & Titanium Corp., owned two-thirds by the Kennecott Copper Corp. and one-third by the New Jersey Zinc Co. The several basic operations consist of (1) mining the extensive ilmenite deposits in the Allard Lake district of the Quebec North Shore, north of Anticosti Island, (2) transportation, by company-owned railroad, to the docking and loading facilities at Havre St. Pierre, (3) precrushing and preparation of the ore at Havre St. Pierre, and (4) transportation by ship up the St. Lawrence to the smelter at Sorel. Mining operations eventually will center at the Lac Tio deposit, which is reported to contain more than 125 million tons and to be the largest deposit of its kind in the world. It is estimated that reserves, thus far proved, constitute 225 years' supply at the treatment rate of 1,500 tons per day. The grade of the ore is 35–36 percent TiO_2 and 40–42 percent Fe. Ore for the initial smelting operations was obtained from a small ore body near Grader Lake, 2 miles south of the main deposit, because it was near the railroad.

The mine will be operated for about 7 months, during the open shipping season. Enough ore will be mined, transported, and stockpiled during this period to feed the smelter on a year-round basis. Ore was being shipped from Grader Lake in October 1950 at the rate of three trainloads (570 tons each) daily. Approximately 100,000 tons of ore were delivered to Sorel in 1950. This will be ample for smelter operations beyond the time when navigation reopens in the spring of 1951. The railroad to Havre St. Pierre, 27 miles long, was completed near the end of 1950.

A temporary crushing plant has been built near the loading dock at Havre St. Pierre, pending construction of a permanent larger plant at Lac Tio. Loading facilities can handle from 2,000 to 2,800 tons per hour, and a 10,000-ton freighter can be loaded in 10 hours.

One 750-ton, 20,000-kw. furnace has been installed from which experimental tappings were made. Plans call for installation of four additional furnaces, starting in the spring of 1951. It is planned to

[19] Chemical Engineering, vol. 57, No. 4, April 1950, p. 234.
[20] Chemical Engineering and Mining Review, vol. 43, No. 1, Oct. 10 1950. p. 19

build and maintain a stockpile of approximately one-half million tons of prepared ore. A contract has been negotiated with the Shawinigan Water & Power Co. for 165,000 hp. to be delivered at an ascending rate as production gets under way.

Coproducts will be titanium dioxide slag (70 percent TiO_2) and iron, with ultimate annual production of 250,000 and 175,000 tons, respectively, from 550,000 tons of ore. According to the management, the company product will be competitive with Indian ilmenite. Although the price will be higher than for other TiO_2-bearing compounds, the concentration, quality, and uniformity are expected to be such that the product will be able to command this higher price. All or nearly all of the production is intended for export, principally to the United States. The iron product, as described by the company, will be too low in carbon to be classed as pig iron and, unless or until alloyed, cannot be properly classified as steel. It has been referred to as "non-specification steel," and Canadian steelmakers have shown some interest in it as a possible source of No. 1 Heavy Melt scrap. It is understood the company plans to market its entire ferrous output domestically. No information was forthcoming on company plans for eventual production of titanium metal although it reports that both Kennecott and New Jersey Zinc are experimenting along this line.[21]

Dominion Magnesium is producing titanium powder and sintered compacts for use in high-temperature alloy and stainless steel at its pilot plant at Haley, Ontario. Although titanium with a purity of 98.5 to 99 percent plus was obtainable, consistent production of ductile titanium metal has not yet been reported.

Ceylon.—Consideration has been given for a number of years to the production of ilmenite from extensive beach sands in Ceylon. It was reported that provision was made in the Ceylon Budget for establishing an ilmenite milling plant, probably at Pulmoddai, about 40 miles from Trincomalee on the east coast.[22] According to the government mineralogist, the sands contain about 70 percent ilmenite, 12 percent rutile, and 8 percent zircon.[23] Ceylon authorities hope to produce 60,000 tons of ilmenite (about 54 percent TiO_2) annually.

India.—Exports of ilmenite from India to the United States dropped from 289,739 short tons in 1949 to 187,834 short tons in 1950. The production of ilmenite has been greatly hampered by labor difficulties since the government took over the ilmenite companies.

A plant for the production of titanium pigments was under construction by the Travancore Titanium Products Co. in 1950. As this plant will consume only about 3,600 tons of ilmenite per year, it appears that India will continue to be a large exporter of ilmenite. Before the 1950 shipping season, India invited American importers and buyers to submit inquiries concerning the availability of ilmenite and rutile.[24]

Japan.—The Nippon Titanium Co., under joint American and Japanese sponsorship, was formed in 1950 to manufacture titanium dioxide. The company reported that Japanese ore will be treated by a process developed by Dr. Kyozo Ariyama, a graduate of the University of Minnesota.[25]

United Kingdom.—The National Physical Laboratory and Royal Aircraft Establishment conducted research on titanium phase diagrams, analytical methods, alloys, thermodynamics, and production processes. Reduction of titanium tetrachloride with hydrogen, electrolytic, and new electrothermic processes for producing titanium metal were under consideration.

Tungsten

By Robert W. Geehan

GENERAL SUMMARY

INCREASED demand for tungsten products early in 1950 reversed the downward trend of both consumption and production of concentrates. Later in the year, following the outbreak of fighting in Korea, consumption increased substantially, and international bidding for tungsten concentrates forced the price up to a level higher than at any time since World War II. Shipments of Class A (1.8 to 6 percent W) and Class B (19 to 22 percent W) high-speed steels increased 163 and 58 percent, respectively, compared with those in 1949. Domestic producers of tungsten concentrates could not increase production at a rate that would have corresponded to the increased demand; however, domestic production increased nearly 40 percent over 1949, and in the fourth quarter of 1950 production was over twice as high as in the corresponding quarter of 1949. California was again the premier tungsten-producing State, followed by North Carolina and Nevada. The Pine Creek mine of United States Vanadium Corp. rose to first place among United States producers of tungsten concentrates in 1950. The Nevada-Massachusetts Co., which suspended operations in 1949, resumed production in 1950, and production from its Mill City, Nev., plant was an important factor in the increased domestic output.

TABLE 1.—Salient statistics of tungsten ores and concentrates in the United States, 1946–50, in pounds of contained tungsten

Year	Production	Shipments from mines	Imports for consumption	Consumption	Industry stocks at end of year		
					Producers	Consumers and dealers	Total
1946	4,671,042	4,942,282	6,869,438	6,458,000	285,865	3,694,256	3,980,121
1947	3,026,470	2,944,622	6,018,005	7,812,000	368,316	3,343,392	3,711,708
1948	4,033,389	3,838,287	7,548,101	8,853,000	563,418	5,284,901	5,848,319
1949	2,896,084	2,631,506	6,274,102	4,958,000	827,045	4,229,444	5,056,489
1950	3,965,040	4,587,687	16,147,313	6,597,000	216,468	5,121,206	5,337,674

Imports of tungsten ores and concentrates for consumption were also larger than in 1949, totaling 16,966 short tons (60-percent WO_3 basis), an increase from 6,592 tons in 1949. However, these data are somewhat misleading because of large withdrawals from bonded warehouses by the United States Government, which are classified as imports for consumption. A more accurate picture of the increase in imports is obtained from the "general import" statistics, which indicate 8,765 tons for 1950 contrasted with 7,731 tons in 1949, both based on 60-percent WO_3. In spite of hostilities in Korea, that nation supplied more of the general imports than any other in 1950—

28 percent. A very great decrease in 1950 imports from China, normally the largest single source, is noteworthy; in 1950, 414 tons were received from China contrasted with 5,212 tons in 1949, based on 60-percent WO_3. The quoted prices for imported concentrates increased steadily throughout the year.

Consumption of concentrates (60-percent WO_3 basis) in the United States was 6,932 short tons in 1950, compared with 5,210 tons in 1949. Usage of tungsten concentrates for conversion to ferrotungsten decreased, but for direct charge to the steel bath and for the production of tungsten-metal powder and other tungsten products, it was much more than in 1949.

Industry stocks of tungsten concentrates (60-percent WO_3 basis) were 5,608 short tons on December 31, 1950, compared with 5,313 tons at the end of 1949.

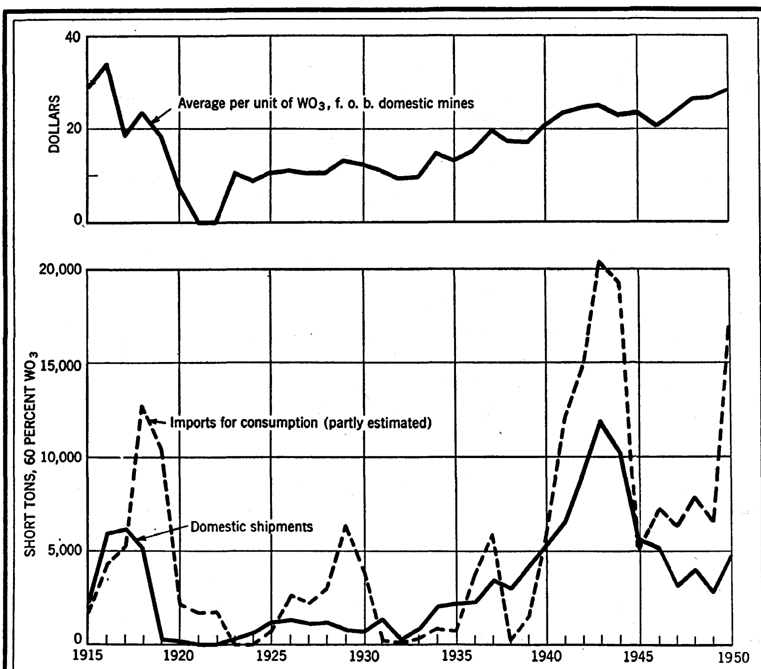

FIGURE 1.—Trends in domestic shipments, imports, and average price of tungsten ores and concentrates, 1915–50.

DOMESTIC PRODUCTION

The tungsten ore mined and milled in the United States, in general, contains 0.4 to 2.5 percent WO_3 and is beneficiated to a concentrate containing 60 percent or more WO_3. The leading tungsten producers in the Western States depend on ore carrying tungsten only as scheelite (calcium tungstate). Hübnerite (manganese tungstate) is the chief tungsten mineral in ores produced in North Carolina and, along with wolframite (iron-manganese tungstate) and ferberite (iron tungstate), contributed important quantities of the tungsten ore mined in 1950. Most of the concentrates are converted to ferrotungsten and tungsten-metal powder. Some high-purity concentrates, however, are charged directly to the steel bath.

TABLE 2.—Tungsten concentrates produced and shipped in the United States, 1949–50, by States

State	Produced				Shipped from mines			
	1949		1950		1949		1950	
	Short tons, 60 percent WO_3	Units	Short tons, 60 percent WO_3	Units	Short tons, 60 percent WO_3	Units	Short tons, 60 percent WO_3	Units

[1] Less than 0.5 ton.

Following the increased demand for tungsten in 1950, some mines that had suspended operation resumed production, and nearly all of the producing mines increased their production rates. By the end of the year several producers had completed plans for further expansion. Output of concentrates (60-percent WO_3 basis) increased to 4,166 short tons in 1950 compared with 3,043 tons in 1949. Production in 1950 was obtained from many widely scattered operations in seven States, but three States—California, North Carolina, and Nevada—supplied 91 percent of the total; and seven operators—Bradley Mining Co., Climax Molybdenum Co., Nevada-Massachusetts Co., Nevada Scheelite, Inc., Surcease Mining Co., Tungsten Mining Corp., and United States Vanadium Corp.—produced 94 percent of the United States total. California was again the premier tungsten-producing State and North Carolina the second largest. The United States

TABLE 3.—Tungsten concentrates shipped from mines in the United States, 1946–50

Year	Quantity		Reported value f. o. b. mines		
	Concentrates 60 percent WO_3 (short tons)	Tungsten content (Pounds)	Total	Average per unit of WO_3	Average per pound of tungsten
1946	5,193	4,942,282	$6,283,413	$20.17	$1.27
1947	3,094	2,944,622	4,349,851	23.43	1.48

[1] Less than 0.5 ton.
[2] Less than 0.01 percent.
[3] Revised figure.

Alaska.—United States Tin Co. produced a small quantity of tungsten concentrate at its Lost River mine.

Arizona.—George W. Campbell produced 22 units from the Blue Eagle Claims in Yuma County; a very small production was obtained from one other deposit.

California.—California, with an increased output of 56 percent, again was the chief tungsten-producing State. Production of concentrates was 1,468 short tons averaging 69 percent WO_3 in 1950, compared with 952 tons averaging 68 percent WO_3 in 1949. Shipments of tungsten concentrates totaled 1,751 short tons averaging 69 percent WO_3, compared with 839 tons averaging 68 percent WO_3 in 1949. Although concentrates were produced at a number of widely scattered operations, five producers (Fresno Mining Co., Mineral Materials Co., Surcease Mining Co., Tulare County Tungsten Mines Co., and United States Vanadium Corp.) supplied 96 percent of the total. The bulk of the remainder was contributed by Adams & Van Voorhis, Consolidated Tungsten Co., Garnet Dike Mine Co., and Sherman Peak Mining Co.

The Pine Creek mine and concentrator of United States Vanadium Corp. near Bishop was the foremost producer of tungsten concentrates in the United States in 1950 and also treated considerable quantities of low-grade concentrates produced by other firms. Mining of ore from the low-level adit was in progress in 1950. The plant was operated at a greatly increased rate in 1950, and production of concentrates increased 70 percent over 1949.

Fresno Mining Co. operated the Strawberry mine at nearly the same rate as in 1949, in spite of a fire which damaged the plant and a flood that washed out roads near the mine. The mill was rebuilt, and the new plant with a capacity of about 100 tons per day was placed in operation in October. The Star Bright mine near Barstow, operated by Mineral Materials Co., entered the ranks of the top five producers in the State. The deposit was core-drilled in 1950.

Surcease Mining Co. produced 12 percent more concentrates than in 1949 from deposits near Atolia. The Big Jim mine in Tulare County, operated by Tulare County Tungsten Mines, produced over three times as much in 1950 as in 1949. Adams & Van Voorhis operated in Inyo County but reported that operations were discontinued before the end of 1950. Production decreased at the Harrel Hill mine operated by Consolidated Tungsten Co., and the mine was idle during part of 1950. The Garnet Dike Mine Co. in Fresno County increased its production rate in 1950; the total was more than four times its 1949 output. The Sherman Peak mine in Tulare County produced less than in 1949.

An article on tungsten, with special reference to California deposits, was published,[1] and another describes the Tungsten Hills, Inyo County.[2] The results of sampling by the Bureau of Mines at the Atolia district, San Bernardino County, were described.[3]

Colorado.—Production and shipments of tungsten concentrates (60-percent WO_3 basis) in Colorado were 197 and 196 short tons, respectively, in 1950, compared to 220 and 222 tons, respectively, in 1949.

The Climax Molybdenum Co. operated its byproduct plant for the recovery of tin, tungsten, and other minerals, all of which occur in very minor amounts in molybdenite ore treated at Climax in Lake County. Although the tungsten content of the molybdenite ore is low, the total recovery was large enough to raise the Climax mine to fifth place among United States producers in 1950.

Comparatively small quantities of tungsten concentrates were produced by leasers in Boulder County.

Idaho.—The Bradley Mining Co. operated the Ima mine in Lemhi County and recovered tungsten concentrates from tailings and from antimony-gold ore at the Yellow Pine mine in Valley County. Production at the Ima mine was less than in 1949; the Yellow Pine was not a tungsten producer in that year.

Missouri.—A small quantity of tungsten concentrates was produced and shipped from this State; however, this was probably sorted from old dumps, as no mine was reported to be producing tungsten ore.

Montana.—No production of tungsten was reported from this State in 1950. The Alps Mining & Milling Co. was exploring the Argo mine, which contains ferberite.

Nevada.—Nevada remained the third-ranking producing State in 1950. Production of concentrates was 794 short tons averaging 76

percent WO_3 in 1950, compared with 483 tons averaging 74 percent in 1949. Shipments were 883 short tons averaging 76 percent WO_3 in 1950, compared with 606 tons averaging 73 percent WO_3 in 1949.

The Nevada-Massachusetts Co. resumed operations at its Mill City plant in Pershing County. This firm again was the largest producer of tungsten in Nevada and the third-ranking producer in the United States. Production in 1950 increased 88 percent over that of 1949. Ore from underground sources in the Stank, Humboldt and Sutton No. 2 was supplemented by production from an open pit. The crushing plant was modified to obtain greater efficiency, and some changes are planned for the milling plant.

Nevada Scheelite, Inc., operating a mine of the same name in Mineral County, again was the second-largest producer of tungsten concentrates in Nevada. Its operating rate was considerably higher than in 1949.

The chief smaller producers of concentrates in 1950 were the Cherry Creek Mining Co., operating the Cherry Creek mine in White Pine County; Lincoln Mining Co., operating the Lincoln mine in Lincoln County; and Minerva Scheelite Mining Co., operating the Scheelite Chief mine in White Pine County.

Lindsay Mining Co. was constructing a mill to treat tungsten ore from the Gunmetal mine in Mineral County.

Several tungsten deposits in Nevada were described in Bureau of Mines Report of Investigations.[4]

North Carolina.—The Tungsten Mining Corp., operating the Hamme mine in Vance County, N. C., was the second-ranking producer of tungsten concentrates in the United States. Output was 1,086 short tons averaging 60 percent WO_3 in 1950, compared with 921 tons averaging 61 percent WO_3 in 1949. Shipments by the company were 1,200 short tons averaging 62 percent WO_3, compared with 783 tons averaging 59 percent WO_3 in 1949. During 1950 the company did 12,149 feet of diamond drilling and 5,804 feet of development. The Sneed Shaft was sunk from the 200 level to the 500 level.

The Furniss tungsten deposits in Cabarrus County are described in Report of Investigations 4724.[5]

Oregon.—A small quantity of tungsten ore was mined at the Bratcher deposit, Jackson County, Oreg. The ore was stockpiled for later milling.

Utah.—The West Tintic deposit in Juab County was described in Report of Investigations 4640.[6]

Wyoming.—The Romur deposits in Fremont County were described.[7]

CONSUMPTION

Consumption of tungsten concentrates (60-percent WO_3 basis) in the United States was 6,932 short tons in 1950, compared with 5,210 tons in 1949. Of the total consumed in 1950, 1,165 tons (17 percent of the total) were converted into ferrotungsten, the form in which much of the tungsten is introduced into steel. However, high-purity tungsten concentrates are charged directly to the steel bath; 1,966 tons (28 percent of the total) were so used in 1950. Tungsten-metal powder and other tungsten products, chiefly the former, utilized 3,801 tons or 55 percent of the total concentrates consumed in 1950.

The unusually low percentage of consumption of concentrates for production of ferrotungsten was, in part, the result of a draw-down of the stocks of ferrotungsten in producers' plants; the amount of this decrease was equivalent to 555 tons of 60-percent WO_3 concentrates.

PRICES

Prices on imported tungsten concentrates advanced throughout 1950; prices on domestic concentrates increased during the last 4 months of the year. According to the Engineering and Mining Journal, quotations on imported concentrates ranged from $17.50 to $56 a short-ton unit of WO_3, duty paid; quotations on domestic scheelite of good known analysis ranged from $28.50 delivered to $47 f. o. b. mines. High-grade hübnerite concentrates of domestic origin were not listed early in the year but in December were quoted at $56.50, f. o. b. Henderson, N. C. The use of high-purity scheelite for direct smelting normally places a premium on this type of concentrate; this was the case in the early months of 1950, but at the year's end, the quotations reveal a reversal of this price situation. The unusually large percentage of tungsten concentrates used to produce tungsten-metal powder and other products not used in steel may have influenced the market; however, contracts for delivery of concentrates of the various types are also believed to have been an important factor.

As reported to the Bureau of Mines, the average price for domestic concentrates shipped was $28.25 a short-ton unit of WO_3 in 1950.

FOREIGN TRADE[8]

Domestic production is inadequate for requirements, and the United States imports both tungsten concentrates and products, chiefly the former. General imports (receipts) of ores and concentrates into the United States totaled 8,341,998 pounds (tungsten content), equivalent to 8,765 short tons of 60-percent WO_3 in 1950, a 13-percent increase over 1949. This quantity represents the ores and concentrates received in the United States, irrespective of final disposition. Although 22 foreign countries contributed material to this 1950 total, over 97 percent was obtained from 11 of these. There were significant changes in the import pattern in 1950. Korea replaced China as the main source of imports and contributed 2,344,505 pounds in that year, compared to 322,555 pounds in 1949; China dropped from first place to ninth and contributed only 394,441 pounds in 1950, compared to

[8] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

4,960,427 pounds in 1949; and there was a much wider distribution of important sources compared to 1949, when four nations supplied 94 percent of the total. Another important factor was a shift of imports from the wolframite group of minerals (iron-manganese tungstates) toward scheelite (calcium tungstate). Although there are no statistics to indicate the total quantities of each mineral type imported, mines in Australia, Brazil, and Korea—all major sources in 1950—are known to produce much scheelite, while China, formerly a very important source, produces much wolframite. As many consuming plants are designed to use only one type of tungsten concentrate, this trend could have considerable importance.

Imports of ores and concentrates for consumption in the United States were 16,147,313 pounds (tungsten content), equivalent to 16,966 short tons of 60-percent WO_3 in 1950, compared to 6,274,102 pounds in 1949. Imports for consumption represent ores and concentrates on which the duty has been paid and which have thereby entered the domestic commerce of the United States, and concentrates which enter duty-free for the United States Government. This classification includes concentrates that are withdrawn from bonded warehouses; actual physical imports of such concentrates may have been included under "general imports" in prior years. Much of the increase in imports for consumption indicated above was the result of warehouse withdrawals by the United States Government. China (46 percent), Korea (15 percent), Bolivia (11 percent), and Thailand (6 percent) were the original sources of 78 percent of the total.

In 1949, 434 short tons (60 percent WO_3) of ores and concentrates were withdrawn from warehouses for smelting, refining, and export; there were no such movements in 1950. In 1950, 328 tons (gross weight) were reexported and 7 tons (gross weight) exported, compared to 939 and 102 tons, respectively, in 1949. Of the 1950 exports, 13,440 pounds went to Germany and 614 pounds to Greece.

Imports of tungsten metal, chiefly from United Kingdom, were 210,972 pounds (13,455 pounds in 1949). Imports of ferrotungsten, chiefly from Japan, were 1,759,274 pounds (gross weight) containing 1,379,979 pounds of tungsten (45,295 pounds tungsten content in 1949). Reexports of ferrotungsten in 1950 were 164,157 pounds (gross weight). Imports of tungstic acid, all from Japan, contained 3,466 pounds of tungsten. Less than 200 pounds of tungsten were imported in 1950 in tungsten carbide, ferrochromium tungsten, tungsten-nickel, and other combinations containing tungsten (none in 1949).

Exports of ferrotungsten were 332,705 pounds (gross weight) in 1950 (620,645 pounds in 1949). Exports of tungsten metal, stellite, wire, shapes, and alloys other than ferrotungsten were 151,968 pounds (gross weight) in 1950 (106,860 pounds in 1949).

TABLE 5.—Tungsten ores and concentrates imported into the United States, 1949–50, by countries

[U. S. Department of Commerce]

[1] Comprises ores and concentrates received in the United States; part went into consumption during year and remainder entered bonded warehouses.
[2] Comprises ores and concentrates withdrawn from bonded warehouses during year (irrespective of time of importation) and receipts during year for consumption.

WORLD REVIEW

Increased demand and higher prices tended to stimulate tungsten production in nearly every major producing nation. A historical review of world tungsten production from 1905 through 1948 was presented in the chapter of this series in Minerals Yearbook 1949 (pp. 1240–1246).

[2] Estimate.
[3] Preliminary data for the fiscal year ended March 31 of year following that stated.
[4] Less than 1 ton.

Argentina.—Argentina formerly ranked as the second largest producer of tungsten in South America, with peak production in 1943 of 2,390 metric tons (60 percent WO_3). However, since 1943 production has declined continuously and virtually ceased in 1946. The 1950 actual production is not known, but the United States received 302,966 pounds, metal content, from Argentina. It was reported that operations at the Los Condores mine in San Luis were discontinued. This mine was the largest tungsten producer in Argentina during World War II.[9]

Australia.—During the year ended October 31, 1950, King Island Scheelite, Ltd., mined 160,533 long tons of ore, all by open-cut methods. The mill treated 160,167 long tons of ore averaging 0.54 percent WO_3 from which 776 tons of scheelite concentrates with an average grade of 67 percent WO_3 were produced. In the corresponding year, ended October 31, 1949, it milled 158,384 long tons averaging 0.59 percent WO_3, which yielded 971 tons of concentrate averaging 67.51 percent WO_3. Production during the early months of the year was curtailed because of a shortage of water. At the end of October 1950, the firm reported that ore reserves exceeded 2,500,000 tons and that long-term contracts for the sale of concentrates had been entered with the British Government and the United States Government. Arrangements were made to send a good part of the firm's output to the United States for refining.[10]

Belgian Congo.—In recent years Belgian Congo has maintained a regular production of tungsten concentrates. The deposits are reported to be placer-type, with recovery by sluices. In most instances, cassiterite is present in the concentrates along with wolframite.[11] Separation is made by hand-sorting coarse material and by electromagnetic treatment of fines. Much of the production is from the Marchal mines in the Kifurwe area to the east of Ruhengeri.

Canada.—Leedoro Snow Lake Mines, Ltd., is exploring a scheelite deposit in Northern Manitoba.

England.—At the Castle-an-Dinan mine a 1,000-gallon electric pump was installed, and development was in progress on three levels.[12] An extensive but low-grade deposit at Hemerdon near Plymouth is reported to have been sampled by the Ministry of Supply. The tests are said to have established the existence of 4,000,000 tons of ore of a probable grade of 3.19 pounds and 0.82 pound of equivalent 65-percent tungsten and tin concentrates, respectively, per ton of ore, of which 2.78 pounds and 0.71 pound, respectively, were estimated to be recoverable.[13]

Finland.—Scheelite concentrates are reported to be produced as a byproduct of copper mining.[14] The Ylöjärvi mine is reported to have produced, in 1949, 36 metric tons of scheelite concentrate containing 76 percent WO_3 from the tungsten-bearing portion of the ore body; the 93,573 metric tons of ore mined also produced 915 tons of copper.[15]

France.—Early in 1950 directors of the firm that operates the tungsten mine at Puy-les-Vignes, near Saint-Leonard-de-Noblat, in

the Department of Haute-Vienne, ordered the mine to cease operations owing to its inability to compete with low-priced imported tungsten concentrates. Annual requirements of France are said to be 1,800 metric tons of concentrates, of which 600 tons are produced at the three operating mines in that country.[16]

Portugal.—Portugal is the largest producer of tungsten concentrates in Europe. The Panasqueira, Ribeira, and Borralha mines are the chief producers, but numerous very small operations also contribute to production, particularly in periods when the price is high. As a result of low prices early in 1950, the Borralha mine virtually ceased operations and the Panasqueira began shifting to tin mining. Later in the year the Borralha resumed operations.[17]

Russia.—Tungsten is reported to be produced at the Djidinsk mine south of the southern tip of Lake Baikal and at the Tyrny Auz mine in the Caucasian district. Tungsten ore mined in the Urals between Sverdlovsk and Magnitogorsk is said to be smelted at Chelyabinsk.[18]

Southern Rhodesia.—Southern Rhodesia has been a producer of tungsten since 1906. It is reported that many of the mines produced scheelite but that the Tshontanda mine, a wolframite producer, situated at the western end of the Gwani tin fields, has produced nearly 24 percent of the value of the Colony's total tungsten production up to the end of 1947.[19] Most of the scheelite deposits are said to be in recognized gold belts; the Hippo mine in the lower Sabi Valley is an exception.

Uranium, Radium, and Thorium

By Jack W. Clark and H. D. Keiser

GENERAL SUMMARY

URGENCY was the keynote of the atomic energy program in 1950. Definite knowledge prevailed that the U. S. S. R. possessed the atomic bomb; moreover, the confession of Dr. Klaus Fuchs and the defection of Prof. Bruno Pontecorvo provided reason for believing that the Soviet Union possessed sufficient information for further rapid development of atomic weapons. Communist aggressors in Korea drove back United Nations forces the latter part of the year, and on December 16, 1950, President Truman proclaimed a state of national emergency. Congress soon thereafter approved appropriations for the atomic energy program, bringing the total to over $2,000,000,000 for the fiscal year ending June 30, 1951.

Construction of the so-called hydrogen or superbomb was authorized early in 1950, and on November 28 the Atomic Energy Commission announced plans for a $260,000,000 Savannah River Project in Aiken and Barnwell Counties, S. C. As further needs developed for the atomic energy program as a whole, this project was increased in scope before the close of the year. In addition, the AEC announced on December 15 plans for constructing a new $500,000,000 facility at the Kentucky Ordnance Works, near Paducah, Ky., to produce uranium-235 by the gaseous diffusion process, thereby increasing markedly the future availability of that atomic bomb material.

This same rapid expansion featured all phases of the atomic energy program in 1950. Production of domestic uranium ore was the highest on record, placing the United States ahead of Canada in rank and second only to the Belgian Congo. Outputs of the fissionable isotope uranium-235 and plutonium were at new record rates and at new low unit costs. Shipments of radioisotopes were substantially larger in number than in any previous year.

MINE AND MILL PRODUCTION

Most of the production of domestic uranium ore in 1950 resulted from greatly increased activity in the Colorado Plateau region in southwestern Colorado, southeastern Utah, and northeastern Arizona. More than 200 separate mining operations employing an aggregate of at least 1,600 men were reported.[1] Plants for processing the ores were operated by the Vanadium Corp. of America at Naturita and Durango,

[1] Haldane, William E., Uranium Mining Is Primarily a Field for Small Operators: Min. World, vol. 13, No. 1, January 1951, pp. 28–30.

232294—53——80

Colo.; the United States Vanadium Corp. at Rifle and Uravan, Colo.; and the Galigher Co. (for the AEC) at Monticello, Utah. A pilot plant for treating copper-uranium ores was operated at Hite, Utah, by the Vanadium Corp. of America. Two additional plants were nearing completion as the year closed—that of the Climax Uranium Co. at Grand Junction, Colo., and the plant taken over for remodeling at Salt Lake City, Utah, by the Vitro Manufacturing Co.[2] Uranium ore processing operations were described.[3]

Exploratory diamond drilling on the Colorado Plateau in 1950 by the AEC and by the Geological Survey on behalf of the AEC was at a combined rate of 300,000 to 400,000 feet a year and effected an increase in ore reserves.[4] Development operations in the Marysvale, Utah, area during 1950 were so encouraging that the AEC opened an ore-buying station at Marysvale on March 15 and on August 30 announced the accumulation of a stockpile of 1,000 tons of ore at the station, with some receipts of ore assaying 0.8 percent U_3O_8. Similar results were achieved during the year in the Lukachukai Mountains area, in the northern part of the Navajo Indian Reservation, Ariz. where 50,000 feet of diamond drilling was completed by the AEC in 1950.[5] Probably the most significant uranium discovery in 1950 was that made almost at the year end near Grants, N. Mex., along the main line of the Atchison, Topeka & Santa Fe Railway Co., where carnotite was found in limestone. The discovery extended the known limits of the sedimentary uranium deposits in the region.

Other significant developments in 1950 included further exploration of the primary uranium occurence discovered during 1949 in the Sunshine mine, Coeur d'Alene district, Idaho; prospecting by the Jones & Laughlin Ore Co. of the pitchblende deposit discovered late in 1949 on the upper peninsula of Michigan;[6] and exploration at the Caribou mine, in the Colorado Front Range.[7] Additional promising prospects were reported to have been found during 1950 in Arizona, Colorado, Idaho, Michigan, Montana, Nevada, New Mexico, Utah, and Wyoming, with an increasing number of mining companies investigating uranium deposits.[8]

The possibility of recovering uranium from low-grade uraniferous sediments continued to have the consideration of the AEC in 1950.[9] These sediments comprise principally the black shales, particularly the Chattanooga shale of the east-central United States and its equivalent in the midcontinent area; the land-pebble phosphate deposits in Florida; and the Phosphoria formation in Idaho, Montana, Utah, and Wyoming. International Minerals & Chemical Corp. announced plans to recover uranium as a byproduct in the processing of its Florida phosphate ores.[10]

In a survey of domestic thorium resources, the investigation of the monazite content of placer deposits, principally in Idaho and California, was continued in 1950 by the Bureau of Mines under contract to the AEC.[11] Domestic production of monazite as a coproduct of the Florida titanium-mining industry was on an increasing scale in 1950; production of monazite on a small scale was begun in Idaho during the year.

New types of radiation-detection instruments, particularly the scintillometer, were developed and applied in 1950.[12] Numerous publications were issued in 1950 relative to uranium and thorium raw materials.[13]

REFINERY AND REACTOR PRODUCTION

Uranium.—Production in 1950 of the fissionable isotope uranium–235 was achieved at a new record rate and at new low unit costs. Construction of the K–29 and K–31 additions to the Oak Ridge, Tenn., gaseous diffusion plant proceeded throughout the year. On December 15, 1950, the AEC announced plans for constructing a new facility to produce uranium–235 by the gaseous diffusion process on a 5,000-acre site at the Kentucky Ordnance Works, 16 miles west of Paducah, Ky. Union Carbide & Carbon Corp. will operate the new plant, the cost of which was estimated at $500,000,000. Construction of a chemical processing plant for recovering nuclear fuel from used reactor fuel elements at the reactor testing station, Arco, Idaho, was announced by the AEC; estimated cost of the plant was $8,000,000. The American Cyanamid Co. will operate the plant.

Plutonium.—Plutonium was also produced in 1950 at a new record rate and new low unit costs. Construction continued throughout the year on the expansion program underway at the Hanford, Wash., plutonium works.

TABLE 1.—Radioisotopes shipped by the U. S. Atomic Energy Commission, by kinds, 1946–50, in number of shipments

Radioisotope	1946 [1]	1947	1948	1949	1950	Total

[13] See selected bibliography at the end of this chapter listing publications not mentioned in footnotes.

Laboratory. Over 100 different kinds of radioisotopes were produced, with half lives ranging from a few hours to thousands of years. A new facility for handling and shipping isotopes, costing $2,400,000, was placed in operation at Oak Ridge in February 1950.

Radium.—Production of radium in the United States was practically at a standstill in 1950, except for a small amount salvaged from consumers' wastes. Processes employed by plants extracting uranium from domestic ores made no provision for radium recovery; hence, no radium-rich residues were available for further refinement. Radium and its derivatives were produced by the Canadian Radium & Uranium Corp. at its Mount Kisco, N. Y., refinery.

Thorium.—A few tens of thousands of pounds of thorium compounds were produced in 1950 in the United States in conjunction with the production of rare earths. Output of thorium metal was virtually negligible. Principal producers of thorium compounds (chiefly nitrate and oxide) were Lindsay Light & Chemical Co., West Chicago, Ill., and Maywood Chemical Works, Maywood, N. J.

TABLE 2.—Shipments of primary radium refined in the United States, 1941–43 (average) and 1944–48 [1]

Year	From domestic ores		From Canadian ores		Total	
	Milligrams	Estimated value	Milligrams	Estimated value	Milligrams	Estimated value
1941–43 (average)	2,042	$51,600			2,042	$51,600
1944	200	3,700	21,800	$403,300	22,000	407,000
1945	200	3,700	31,400	580,900	31,600	584,600
1946	200	3,700	17,400	321,900	17,600	325,600
1947	16,400	303,400			16,400	303,400
1948	4,219	77,980	3,510	63,200	7,729	141,180

[1] Excludes confidential figures representing certain shipments in October 1943 to May 1944. Data for 1949–50 withheld to avoid disclosure of individual company operations.

CONSUMPTION AND USES

Weapons.—On January 31, 1950, President Truman announced that he had directed the AEC "to continue its work on all forms of weapons, including the so-called hydrogen or superbomb."[14] Atomic weapons were produced in 1950 at the rate authorized by the President,[15] and uranium–235 and plutonium were produced at a new record rate, exceeding that of 1949.[16] Pursuant to the Presidential directive of January 31, the AEC announced on November 28, 1950, plans for the Savannah River Project, which involved construction of new facilities, on a 200,000-acre tract in Aiken and Barnwell Counties, S. C., to be designed, built, and operated by E. I. du Pont de Nemours & Co., wartime builders and operators of the Hanford, Wash., Engineer Works.[17] Total cost of the new facilities was estimated at $260,000,000. Preparations were continued for additional full-scale weapons tests, and the Eniwetok Proving Ground in the Marshall Islands was maintained. The AEC was authorized to use part of the 5,000-square-

mile Las Vegas, Nev., bombing and gunnery range for experiments necessary to the atomic weapons development program. Construction proceeded on new facilities for the Los Alamos, N. Mex., scientific laboratory and for the Sandia Corp. at Albuquerque, N. Mex.[18]

Industrial Power.—Nuclear energy as a possible source of industrial power continued to be the subject of much discussion in 1950,[19] with the general outlook for such a development in the relatively near future somewhat more encouraging than it had been in 1949. Completion of the AEC experimental breeder reactor, under construction in 1950 at the Commission's reactor-testing station near Arco, Idaho, was awaited with much interest (*see* Minerals Yearbook 1949, p. 1251). This reactor will test the feasibility of creating new nuclear fuel faster than it is consumed and will produce a small amount of power for experimental purposes.[20]

At the reactor station in Idaho the AEC began construction in 1950 of a materials-testing reactor and a land-based prototype submarine thermal reactor. The materials-testing reactor was designed to operate in the thermal, or slow, neutron energy range and will supply scientists with a much-needed tool to test materials under intense neutron bombardment. Although construction of the submarine thermal reactor was for the Navy, it was said to be giving impetus to the ultimate use of nuclear energy for industrial power production. At the Knolls (Schenectady, N. Y.) atomic power laboratory, development of a submarine intermediate-reactor power plant was undertaken for the Navy that will operate in a neutron-energy-range intermediate between thermal, or slow, neutrons and high-energy neutrons. The Oak Ridge, Tenn., national laboratory of AEC began construction of a pilot model of a fluidized reactor. All AEC reactors, except the Los Alamos, N. Mex., water boiler, are heterogeneous; that is, the fuel and moderator are separate, and in most reactors both are solids. In a fluidized reactor, fuel and moderator are mixed in a liquid.[21]

During 1950 the AEC received several inquiries looking toward the designing and constructing of nuclear reactors with private capital and their operation and use by industry. The proposals were welcomed by the Commission, which stated that it was studying the problems involved.[22]

TABLE 3.—Nuclear reactors operating, under construction, or proposed for near-future construction in various countries [1]

Country	Date of beginning operation	Fuel	Moderator	Coolant	Neutron velocity	Capacity (kw.)	Use
United States:							
Arco, Idaho	Under construction	Enriched uranium metal	(?)	Liquid metal	Fast	Very much higher than Los Alamos fast reactor.	Research in breeding fissionable material, heat transfer, and power production.
Do	do	Enriched uranium metal (?).	(?)	do (?)	Slow	Large	Research in testing reactor construction materials.
Do	do	do	(?)	do (?)	do	do	Research in power generation for submarine propulsion and industrial use.
Brookhaven, N. Y	Aug. 22, 1950	Uranium metal	Graphite	Air	do	30,000	Research and radioisotope and experimental-power production.
Chicago, Ill	Dec. 2, 1942 (subsequently dismantled and rebuilt at a different site).	Uranium metal and oxide.	do	None	do	Few kilowatts	Do.
Do	May 15, 1944	Uranium metal	Heavy water	Heavy water	do	300	Research.
Do	Under construction	do	do	(?)	do	Greater than 300	Do.
Hanford, Wash	February 1944	do	Graphite	(?)	do	Small	Research in plutonium production.
Do	3 additional reactors began operating 1944–45.	do	do	Water	do	Possibly 500,000 to 1,500,000.	Production of plutonium and radioisotopes.
Los Alamos, N. Mex	May 1944	Enriched uranium salts	Water	do	do	10	Weapons research.
Do	November 1946	Plutonium	None	Liquid metal	Fast	Variable	Do.
Oak Ridge, Tenn	Nov. 4, 1943	Uranium metal	Graphite	Air	Slow	Greater than 2,000	Research and radioisotope production.
Do	Under construction	Uranium salts (?)	Water (?)	(?)	(?)	(?)	Research in homogeneous type reactors.
Raleigh, N. C	do	Enriched uranium salts	Water	Water	Slow	10	Research.
Ellenton, S. C	3 reactors under construction.	Uranium metal	Heavy water	(?)	do	Possibly 500,000 to 1,500,000.	Production of tritium, plutonium, and radioisotopes.
Schenectady, N. Y	1948 (?)	Enriched uranium metal (?).	(?)	(?)	Intermediate (?).	Small	Experiments in reactor assembly.
West Milton, N. Y	Under construction	do	(?)	Liquid metal	Intermediate	Large	Research in power generation for submarine propulsion and industrial use.

Canada:							
Chalk River, Ont	September 1945	Uranium metal	Heavy water	None	Slow	3.5 watts	Research.
Do	Sept. 5, 1945	do	do	Water and air	do	10,000	Research and plutonium and radioisotope production.
Do	Under construction	(?)	do	(?)	(?)	Very large	Do.
France:							
Chatillon	Dec. 15, 1948	Uranium oxide	do	None	Slow	Few watts	Research.
Saclay	Construction begun August 1949.	Uranium metal	do	Nitrogen gas	Slow (?)	1,500	Research and radioisotope production.
Do	Planned for construction	do	(?)	(?)	do	Large	Plutonium production.
Netherlands.[2]							
Norway: Kjeller	Under construction	Uranium metal	Heavy water	(?)	Slow	100	Research and radioisotope production.
Sweden	do	Uranium metal (?)	(?)	(?)	(?)	(?)	Industrial power research.
U. S. S. R	Later than 1945 (?)	do	Graphite (?)	Water (?)	Slow (?)	Probably similar to Hanford, Wash., reactors.	Production of plutonium and radioisotopes.
United Kingdom:							
Harwell	August 1947	Uranium metal	Graphite	Air	Slow	100	Research and radioisotope production.
Do	July 3, 1948	do	do	do	do	6,000 (being increased to 10,000).	Do.
Sellafield	1949–50	do	do	Water	do	Probably similar to Hanford, Wash., reactors.	Production of plutonium and radioisotopes.

[1] In addition, India, Belgium, Denmark, Switzerland, Union of South Africa, and Argentina have declared their intention to build research reactors, and scientists in Western Germany have requested permission to build a reactor for fundamental research.

[2] Building reactor in cooperation with Norway. (*See* Norway)

Radiography.—As of December 1950, AEC-supplied isotopes were in use in 939 departments of 485 institutions in 47 States and Territories of the United States, compared with use in 549 departments of 305 institutions in 1949 and use in 241 departments of 160 institutions in 1947. Growth in isotope distribution was said to stem mainly from an increase in the number of scientists and technical personnel experienced in using radioactive materials, plus the construction and operation of a new AEC radioisotope-processing facility at the Oak Ridge, Tenn., national laboratory that made it possible to offer a wider range of radiomaterials at reduced costs.[23]

The AEC made 6,234 shipments of radioisotopes in 1950, or over 40 percent of the total 15,000 shipments made since the isotopes program was initiated in 1946. The major part of the radioisotope shipments in 1950 was for use in the field of medical therapy; but important new uses were developed in industry, particularly for cobalt-60, and were discussed in the scientific and technical press.[24] Radium was used principally in medical therapy, as an energy source in luminous paints, and for industrial radiography. New graphs were published for the exposure time required for radium radiography of steel.[25]

TABLE 4.—Radioisotopes shipped by the U. S. Atomic Energy Commission, by uses, 1946–50, in number of shipments

Use	1946 [1]	1947	1948	1949	1950	Total
Medical therapy	88	716	1,142	2,037	3,037	7,020
Animal physiology	78	508	777	1,028	1,230	3,621
Physics	17	134	202	315	448	1,116

Plant physiology	16	62	116	241	319	754
Industrial research	14	51	85	176	270	596
Bacteriology	4	33	53	83	87	260
Metallurgy	2	10	11	(2)	(2)	23
Other			33	262	[3] 569	864
Total	246	1,652	2,644	4,370	6,234	15,146

[1] Shipped by Manhattan District, Corps of Engineers, U. S. Army Service Forces.
[2] Included in "Industrial research."
[3] Specific field of utilization unknown (issuance of general authorizations permits approved applicant to use radioisotopes at a specified location for any research and development activity and permits him to obtain from any supplier any available form and quantity of any radioisotope distributed on authorization or approval of the U. S. Atomic Energy Commission).

PRICES

Uranium Ore.—Prices paid by the AEC in 1950 for uranium were the same as in 1949 (*see* Minerals Yearbook 1949, pp. 1253–1255), except that new pricing applied to ores from the Marysvale, Utah, area. On March 12, 1950, the AEC announced that an ore-purchase depot would be established at Marysvale and that the ores would

be purchased under contractual agreements negotiated with individual producers. On October 23, 1950, the Commission announced that lower-grade development ore would be accepted from the area. Under the new policy development ore containing as little as 0.10 percent U_3O_8 was acceptable, provided deliveries averaged about 0.15 percent. Previously, the minimum acceptable grade was 0.20 percent, with an average grade of 0.30 percent. The development allowance, under the new policy, was set so that payment, including the allowance, for ores containing 0.10 to 0.20 percent U_3O_8 amounted to $2.50 per pound of contained U_3O_8. The new pricing schedule for the Marysvale ores applied only to ores extracted during the prospecting and development stages of operations.

TABLE 5.—Consumption of uranium and thorium compounds for nonenergy purposes in the United States, 1945–50, in pounds of contained U_3O_8 and ThO_2

[U. S. Atomic Energy Commission]

Industry	1945	1946	1947	1948	1949	1950
URANIUM (U_3O_8 EQUIVALENT)						
Chemical (including catalytic)	(1) 3,800	2,500	2,400	1,993	2,426	2,835
Ceramic (including glass)	150	1,000	825	385	270	938
Photographic	(1)	360		225		
Electrical	1,000	300	150	200	103	33
Total U_3O_8	4,950	4,160	3,375	2,803	2,799	3,806
THORIUM (ThO_2 EQUIVALENT)

Total ThO_2	(2)	(2)	32,227	40,525	47,301	52,771

1 Photographic included with chemical.
2 Figure not available.

Uranium.—High-purity uranium metal was available throughout 1950 to AEC licensees at about $50 a pound. The metal, in the form of pencil-size rods about 4 inches long, was produced by Mallinckrodt Chemical Co., St. Louis, Mo., and distributed to all the major chemical companies, from whom the metal was available to the licensees in its original rod form, as rolled sheets, or as foil.

Radium.—Radium was quoted throughout 1950 at $25 to $30 per milligram of radium content, depending on quantity.

Isotopes.—Isotopes were available in 1950 through the Isotopes Division of AEC in a wider range and at lower prices than in 1949. All isotopes used to study, diagnose, or treat cancer and allied diseases were made available free of production costs.

Thorium.—Average prices in 1950 for thorium nitrate and oxide were reported by a large producer in 100-pound lots, f. o. b. producer's plant, as follows: Thorium nitrate, mantle grade—domestic price $2.20 per pound, export $3.50 per pound; thorium oxide, 97 percent ThO_2—domestic price $5.00 per pound; thorium oxide, photographic-lens grade, 99 percent ThO_2—domestic price $10.00 per pound. (*See* Minor Nonmetals chapter of this volume for monazite prices.)

FOREIGN TRADE [26]

The AEC announced that in 1950 receipts of foreign ore continued at a satisfactory rate and that new foreign sources of supply had been developed. Uranium used by the AEC is obtained principally from the Belgian Congo and Canada. Data are not disclosed on imports and exports of uranium and thorium ores, concentrates, metal, alloys, and compounds. Cumulative exports of radioisotopes reported by the AEC as of November 30, 1950, reached 975 shipments distributed among 29 different nations.

TABLE 6.—Radium salts imported for consumption in the United States, 1946–50

[U. S. Department of Commerce]

Year	Radium salts			Radioactive substitutes (value)
	Milligrams	Value		
		Total	Average per gram	
1946	16,596	$325,922	$19,600	
1947	76,681	1,504,814	19,600	
1948	77,018	1,385,337	17,900	$6,273
1949	98,032	1,719,656	17,500	370
1950	80,969	1,235,511	15,300	6,106

WORLD REVIEW

On October 24, 1950, in his United Nations Day speech at Lake Success, N. Y., President Truman proposed that the work of the United Nations Atomic Energy Commission and the United Nations Commission on Conventional Armaments be "revitalized" by continuing it through "a new and consolidated disarmament commission." [27]

At the Fifth General Assembly of United Nations, December 13 and 14, 1950, the Assembly adopted the following resolution, proposed by Australia, Canada, Ecuador, France, Netherlands, Turkey, United Kingdom, and the United States, that carried forward President Truman's suggestion that conventional and atomic weapons be considered in a joint disarmament commission: [28]

The General Assembly * * * decides to establish a committee of 12, consisting of representatives of the members of the Security Council as of 1 January 1951, together with Canada, to consider and report to the next regular session of the General Assembly on ways and means whereby the work of the Atomic Energy Commission and the Commission for Conventional Armaments may be coordinated and on the advisability of their functions being merged and placed under a new and consolidated disarmament commission.

Representatives of Canada, the United Kingdom, and the United States conferred in March 1950 at Chalk River, Ontario, on problems involved in the design and application of instruments for detecting and measuring radiations encountered in atomic energy work.[29] On

[26] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[29] Atomic Energy Control Board, Ottawa, Canada, Press Release: Mar. 16, 1950, 1 p.

November 23, 1950, an announcement was issued that the Governments of Canada, the United Kingdom, and the United States had adopted a revised "Declassification Guide" that permitted publication of information necessary for the design, construction, and operation of low-power nuclear reactors used for research purposes.[30]

In December 1950 the Union of South Africa announced an agreement providing for the sale of uranium to the United States and the United Kingdom. (*See* Africa, below.)

A conference in Washington, D. C., on January 31, 1950, of representatives of Belgium, the United Kingdom, and the United States was reported by the Belgian foreign office.[31] Indications were that the conference dealt mainly with the production of uranium ore in the Belgian Congo.

On March 1, 1950, Dr. Klaus Julius Emil Fuchs, German-born scientist and chief physicist at the British atomic research plant at Harwell, England, pleaded guilty of violating the Official Secrets Act and was sentenced to 14 years in prison. Evidence showed that he had communicated valuable atomic information to Russian agents in Britain and in the United States, where he had worked on the Los Alamos project.[32] In September 1950 Prof. Bruno Pontecorvo, a nuclear scientist and the possessor of highly classified information obtained while engaged on atomic energy programs in England and the United States, defected to the U. S. S. R.[33]

WESTERN HEMISPHERE

Brazil.—Near the end of 1950 the Brazilian Chamber of Deputies approved a bill that provided for control by the National Security Council of the mining, beneficiation, and industrialization of certain minerals suitable for the development of atomic energy. Under the bill the export of uranium, thorium, and other atomic-energy minerals would be prohibited, except on a Government-to-Government basis.[34]

Discovery was reported of an extensive deposit of the uranium mineral djalmaite at São João d'el-Rey in Minas Gerais. The deposit was said to be about 4 miles long and ranging in width from 66 to 165 feet.[35]

Canada.—In 1950 the mine of the Crown company, Eldorado Mining & Refining (1944), Ltd., at Great Bear Lake, N. W. T., was again the source of virtually all the uranium ore produced in Canada. Operations of the company were at a new high level, with total tons of ore milled and sorted 29 percent higher than in 1949. Development footage and exploratory diamond drilling totaled 13,388 and 26,148 feet, respectively, compared with 10,600 and 14,590 feet in 1949. Estimates indicated that ore reserves were being maintained.[36]

Underground development continued in 1950 in the Goldfields area of Saskatchewan, on the north shore of Lake Athabaska, the so-called uranium "hot spot" in Canada. Principal operator in the area was Eldorado Mining & Refining (1944), Ltd., along the north shore of Beaverlodge Lake. Development by the company on its Ace and Eagle claims included the sinking of two shafts, 10,582 feet

of drifting and crosscutting, and 21,716 feet of diamond drilling.[37] At the property of Nicholson Mines, Ltd., on Nicholson Bay, along the north shore of Lake Athabaska, development was also extensive, and the prediction was made that the property would probably be the first privately owned and financed uranium mine in Canada to become productive.[38] Development and exploration were likewise actively in progress during 1950 in the Black Lake, Lac La Ronge, and Charlebois Lake areas in northern Saskatchewan.[39] The Montreal River area, in the Algoma district, 50 miles north of Saulte Ste. Marie, was the main center of exploration for uranium in the Province of Ontario in 1950;[40] the various deposits were described.[41] Exploration continued at Hottah Lake and Contact Lake in the Great Bear Lake area of Northwest Territories, and in British Columbia activity was centered in the New Hazelton area.

On April 17, 1950, announcement was made that the period of guaranteed price for radioactive ores had been extended from March 31, 1955, to March 31, 1958,[42] and on the following day a new pricing formula was announced, superseding that which had been in effect since April 1948. Under the new formula producers would be paid up to C$6 a pound for uranium oxide, as compared with a previous minimum price of C$2.75 a pound.[43] Published details on the application of the new formula included the following:[44]

> The formula devised to determine the price to be paid for uranium oxide takes into consideration unusual operating conditions and is based upon: (1) A price of $2.75 per pound for the uranium oxide content of the ore or mill feed; (2) a milling allowance of $7.25 per ton of ore milled; (3) a maximum allowable price, which is based on a mill head of 0.25 percent uranium oxide; (4) a minimum extraction of 70 percent. Eldorado will purchase, f. o. b. rail, concentrates at a price per pound of uranium oxide determined by the following formula:
>
> The price per pound to be paid for the U_3O_8 content (uranium oxide) of acceptable concentrates containing 10 percent or more by weight of U_3O_8 shall be the product obtained by multiplying the average number of pounds of U_3O_8 per ton of mill feed by $2.75 a pound, adding to this a milling allowance of $7.25 per ton of ore milled, and dividing the sum of the two by 70 percent of the average number of pounds of U_3O_8 per ton of mill feed.
>
> The maximum price per pound of U_3O_8, which will be paid, is that based upon the formula applied to an ore, with an average grade of 0.25 percent or 5 pounds per ton. This works out to $6 per pound.
>
> It will be necesary for each mine to make an individual contract with Eldorado specifying the price that is to be paid. Eldorado reserves the right to adjust the contract from time to time to bring it into conformity with actual operating results. In other words, if the grade of ore actually mined turned out to be different from that which was used in calculating the price for the uranium oxide, the price would be revised to conform with the grade of ore that was actually treated. At the panel discussion, Mr. Bennett indicated that the average grade would be calculated on a yearly basis.
>
> The formula is designed to encourage efficiency in ore dressing. The greater the recovery that is obtained, the more pounds of uranium oxide there will be in the concentrates that are sold and, hence, the greater will be the value per ton of the ore that is mined and milled.

The price paid for uranium oxide includes all radioactive elements in the concentrates. Reimbursement will be made for other valuable metals that may be contained in the concentrates.

Mexico.—The Mexican Government was reported in 1950 to be investigating uranium deposits in the States of Chihuahua, Guerrero, and Oaxaca [45] and planning to erect a large plant for treating uranium ores.[46]

EUROPE

France.—Three uranium-mining centers in France were particularly active in 1950—Grury, in Saône et Loire; Lachaux, in Puy de Dôme, 25 kilometers southwest of Vichy; and La Crouzille, in Haute Vienne, 20 kilometers north of Limoges.[47] Mining operations reached a depth of 80 meters at Grury, and a fair tonnage of medium and low-grade ore was extracted. At Lachaux, a substantial tonnage of low-grade ore was mined, enough to warrant construction of mechanical-concentrating and chemical-processing plants. La Crouzille, where representatives of the Commissariat a l'Energie Atomique discovered a pitchblende deposit in 1948, was the main center of activity. On July 10, 1950, the first shaft at La Crouzille was placed in operation with appropriate ceremonies.[48] Continuity of the deposit was said to be remarkable. The new mine is 100 meters deep and equipped with a surface plant of the most-modern type for the recovery of uranium.

Italy.—Prospecting for uranium was active in Sardinia in 1950. The Mining Department of the Ministry of Industry and Commerce was reported prospecting a property in Calabria, southern Italy.[49] The Azienda Minerali Metallici Italiani was authorized by the Italian Government to start development of the uranium deposits in the Aosta Valley.[50] In Arbatax, Sardinia, uranium deposits were discovered and were to be taken over by a new organization, Societa Mineraria e Chemica per l'Uranio, of Milan.[51] Deposits of uranium reported to have been found south of Turin were to be examined by Italian Government representatives.[52]

Spain.—Discovery of radioactive ore was reported in 1950 at San Martin de Oscos in the Province of Oviedo, northwestern Spain,[53] and uranium was said to have been found at the Santa Matilde mine in the Province of Lerida.[54]

U. S. S. R.—A description of Soviet uranium mining in East Germany was issued on August 23, 1950, by the British Control Commission.[55] It stated that 300,000 Germans had been drafted by the Russians and the East German Government to mine ore. Operations were said to be on a 24-hour intensified basis aimed at producing a maximum of uranium regardless of wastage in manpower and material. Wismuth A. G., the Soviet monopoly that controls all uranium production in the Russian zone, was reported to have its own staff of secret police, immunity before all German courts, power of life or death over the

miners, authority to take over any village or property, and unlimited access to East German funds.

New uranium operations by the Russians in East Germany reported in 1950 included exploitation in the Katzhvette area, Province of Thüringia,[56] and the opening of a new mine near Weringerode in the Harz Mountains.[57] A concentrator was erected in 1950 at the Buhovo mine, situated about 18 miles from Sofia, Bulgaria. The mine is said to be the largest uranium producer in the Balkans.[58] A high-grade uranium deposit was reported to have been discovered about 35 miles southwest of Prague, Czechoslovakia,[59] and a number of new mines were said to be in operation in the Bohutice area in Bohemia.[60] Uranium deposits were discovered near the Polish border town of Goerlitz, southeast of Berlin.[61]

United Kingdom.—The Department of Scientific and Industrial Research announced in 1950 discovery of about a million tons of uraniferous black shale in north Wales.[62] The deposits, known as the Dolgelly black shales, are too low-grade to be economically important, containing 80 grams of U_3O_8 per ton, which is below the minimum content established by the Ministry of Supply.

AFRICA

Belgian Congo.—Early in 1950 the British Treasury sold 1,667,961 ordinary shares of Tanganyika Concessions, Ltd., to an Anglo-Belgian group; 600,000 of these shares were subsequently acquired by American interests. Tanganyika Concessions holds a 14.5-percent share interest, with 20 percent voting rights in Union Minière du Haut Katanga, operator of the Shinkolobwe mine in the Belgian Congo, the world's largest producer of high-grade uranium and one of the main sources of uranium metal used by the United States.[63]

Mozambique.—In 1947 a uranium-bearing titanium mineral, resembling davidite from Radium Hill, South Australia, was found at Mavuzi in the Tete district.[64] Uranium mineralization is distributed scantily over an area of about 300 square miles north of the community of Tete. Exploration at Mavuzi was undertaken jointly by the British South Africa Co., New Consolidated Gold Fields, Ltd., and Gold Fields Rhodesian Development Co., Ltd. About 150 tons of ore assaying up to 8 percent U_3O_8 were produced, the largest part being sold in France.[65]

Nigeria.—Monazite and thorite (thorium silicate containing 50–70 percent ThO_2) occur as minor constituents in the placer-tin deposits. In 1949 the United Kingdom Ministry of Supply announced a guaranteed price, effective for 10 years, at which it would buy thorium mineral concentrates: For concentrates sold as monazite a basic price of £50 per long ton, f. o. b. Jos or Dukura, bagged, combined monazite and thorite content not less than 95 percent, a £3 bonus to be added for each percent by which the thoria (ThO_2) content exceeds

6 percent; for concentrates sold as thorite, payment of £6 10s. for each percent ThO_2, minimum of 15 percent ThO_2, additional consideration to be made for abnormally high uranium content.[66] Despite the foregoing purchase guarantee, there was little resultant production of either thorite or monazite, the prices offered being too low to cover the cost of recovery.[67]

Union of South Africa.—In December 1950 an agreement was concluded by representatives of the United States, United Kingdom, and the Union of South Africa for the recovery of uranium as a byproduct in the processing of South African gold ores and for the sale of the uranium to the United States and the United Kingdom. The agreement marked successful completion of several years' intensive research and development by the three nations on the problem of recovering uranium economically from the gold ores. Although the uranium content of the ores is small, potential production of uranium is relatively large because of the great quantity of ore processed. Mining companies initially engaging in the project are West Rand Consolidated Mines, Ltd., Daggafontein Mines, Ltd., Blyvooruitzicht Gold Mining Co., Ltd., and Western Reefs Exploration & Development Co., Ltd. Design and construction of uranium-recovery plants will proceed on an expedited basis under the agreement. Negotiations leading to the agreement were a continuation of those held a year previously.[68]

ASIA AND AUSTRALIA

Australia.—Near the end of 1950, the Mines Department announced that a £A50,000 program would soon be undertaken at the Radium Hill deposit near Olary, South Australia, said to be the most important uranium occurrence in the Commonwealth. Plans included thorough testing of the ore, installation of a sampling mill, development of concentrating processes, and erection of a pilot plant, to be followed by commercial exploitation of the deposit. During 1950 the Commonwealth Government explored and drilled a number of deposits discovered in several different regions of Australia, including those found in the Rum Jungle field near Darwin in Northern Territory.[69] A lode deposit containing torbernite was discovered along the main north-south road at Fergusson River, 176 miles south of Darwin, and was judged to be one of the more significant discoveries made in the Territory.[70]

India.—The Government of India announced in April 1950 that rewards would be paid for the discovery of deposits of uranium ore in India. The new deposits would have to be at least 100 miles from already-known deposits. Such new deposits, if capable of producing 100 tons of uranium oxide in ore that assays not less than 0.4 percent U_3O_8, will command a reward up to Rs. 10,000. Grants-in-aid for mine development were made available to applicants who produce and deliver not less than 20 tons of uranium ore from a concession or mining lease not previously worked for uranium.

On July 11, 1950, the Government of India announced its decision to purchase all stocks of uranium in India in the hands of dealers or mine owners. A minimum uranium content equivalent to 10 percent by weight of uranium oxide in the ores or concentrates will normally be required. Payment will be made at the minimum rate of Rs. 9 per pound of contained uranium oxide, f. o. b. station of despatch, and the rate will be guaranteed for 5 years. Consideration will be given to the commercially recoverable value of any associated mineral constituents of the ores. The announcement pointed out that under the Atomic Energy Act XXIX of 1948 uranium was a "prescribed" mineral and could be compulsorily acquired by the Government, and that it would therefore be advantageous for dealers and mine owners or persons possessing stocks of uranium to sell such stocks to the Government of India at an early date.

Vanadium

By Hubert W. Davis

GENERAL STATEMENT

FOR security reasons, publication of figures on production and consumption of vanadium ore in the United States since 1947 has been suspended.

DOMESTIC PRODUCTION

The center of domestic vanadium-ore mining in the United States is the Colorado-Utah region. Small outputs are made in Arizona, Nevada, and New Mexico, and vanadium-bearing phosphate rock is mined in Idaho.

TABLE 1.—Vanadium in ores and concentrates produced in the United States, 1938–47 [1]

Year	Pounds	Year	Pounds
1938	1,613,155	1943	5,586,492
1939	1,984,068	1944	3,527,054
1940	2,162,916	1945	2,963,913
1941	2,513,051	1946	1,272,148
1942	4,439,130	1947	2,117,962

[1] Data for 1940–47 are receipts at mills and Government purchasing depots.

USES

About 90 percent of the vanadium used is consumed as ferrovanadium in the manufacture of tool steels, engineering steels, high-strength structural steels, non-aging rimming steels,[1] and special wear-resistant cast irons. Some ferrovanadium is used in welding-electrode coatings and as a deoxidizer, and some metal is utilized in magnets. Some vanadium oxide is also used in the production of tool steel. The largest uses of vanadium oxide and ammonium metavanadate are as catalysts, in glass and ceramic glazes, for driers in paints and inks, and for laboratory research. Ductile vanadium, 99.8 percent pure, was made available in 1950.[2]

PRICES

For many years vanadium ore has been quoted at 27½ cents a pound of contained V_2O_5. This quotation, however, disregards the grade of the ore or the presence or absence of objectionable impurities—matters

[1] Epstein, S., and others, Vanadium-Treated, Non-aging Rimming Steel for Deep Drawing Quality Sheet: Jour. Metals, vol. 188, No. 6, June 1950, pp. 830–834.
Epstein, S., and Frame, J. W., New Vanadium Steel for Deep Drawing Sheets: Iron Age, vol. 166, No. 15, Oct. 12, 1950, pp. 158–163.
[2] Iron Age, Pure Vanadium Now in Limited Production: Vol. 166, No. 14, Oct. 5, 1950, pp. 95–96.

important to the refiners, inasmuch as impurities vitally affect recovery. Throughout 1950 vanadium pentoxide (technical grade) was quoted at \$1.00 to \$1.06 a pound of V_2O_5 and ferrovanadium at \$3.10 to \$3.25 a pound of contained vanadium (depending upon the grade of the alloy).

FOREIGN TRADE [3]

Imports of vanadium concentrates (all from Peru) were 1,457,010 pounds (contained vanadium) in 1950, an increase of 164 percent over 1949. Flue dust containing 804 pounds of vanadium was received from Venezuela in 1950 (none in 1949). Imports of ferrovanadium were 130,022 pounds (gross weight) valued at \$91,193 in 1950 (none in 1949) and comprised 34,237 pounds from United Kingdom and 95,785 pounds from Japan. Vanadium ore and concentrates enter the United States free of duty. However, the rate of duty on ferrovanadium is 12½ percent ad valorem and on vanadic oxide, anhydride, salts, and compounds and mixtures of vanadium, 40 percent ad valorem.

TABLE 2.—Vanadium ore or concentrates and vanadium-bearing flue dust imported for consumption in the United States, 1941–50

Year	Vanadium ore or concentrates			Vanadium-bearing flue dust		
	Pounds		Value	Pounds		Value
	Gross weight	Vanadium content		Gross weight	Vanadium content	
1941	24,645,686	2,138,608	\$1,012,991	(1)	(1)	(1)
1942	36,492,268	2,422,376	1,274,483	624,423	154,028	\$29,545
1943	22,117,131	2,052,620	1,080,150	748,749	64,393	53,553
1944	4,247,490	1,284,603	633,719	191,901	40,171	28,059
1945	8,776,328	1,550,479	725,362	133,795	26,293	19,378
1946	2,784,349	791,057	390,077	97,750	20,931	13,480
1947	3,274,548	983,869	448,076	143,124	71,819	15,483
1948	4,034,509	1,051,675	534,374			
1949	2,028,980	551,337	272,124			
1950	5,110,403	1,457,010	708,806	9,575	804	2,475

[1] Not separately recorded.

Exports of vanadium ore and concentrates totaled 963 pounds (contained vanadium) valued at \$2,615 in 1950 compared with 13,130 pounds (corrected figure) valued at \$26,266 in 1949. The 1950 exports comprised 476 pounds to Canada and 487 pounds to Hong Kong. Exports of ferrovanadium totaled 82,449 pounds (gross weight) valued at \$183,307 in 1950 compared with 194,655 pounds valued at \$350,558 in 1949. The 1950 exports comprised 30,462 pounds to Canada and 51,987 pounds to Austria. Exports of vanadium metal, alloys, and scrap were 4,106 pounds valued at \$2,688 in 1950 compared with 2,754 pounds valued at \$17,851 in 1949. The 1950 exports comprised 139 pounds to Canada and 3,967 pounds to Italy.

[3] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

WORLD REVIEW

World production of vanadium ores is limited almost entirely to four countries—Northern Rhodesia, Peru, South-West Africa, and the United States. From 1941 through 1947 output from these sources ranged from 1,400 to 4,400 metric tons, with the United States the leading producer.

Vanadium has also been recovered commercially from phosphate rock, iron ore, chrome ore, magnetite beach sands, caustic soda solution employed in the Bayer process of refining bauxite, naphtha soot collected from the smokestacks of ships and industrial plants, and vanadiferous ashes derived from asphaltites.

Because complete information on the quantity of vanadium recovered as byproducts of iron ore and other raw materials is lacking, it is not possible to determine world production of vanadium from all sources. Consequently, table 3 reflects only the production of vanadium in ores and concentrates for the countries listed plus the quantity recovered in the United States as a byproduct of phosphate rock.

TABLE 3.—World production of vanadium in ores and concentrates, 1941–50, in metric tons

[Compiled by Berenice B. Mitchell]

Country	1941	1942	1943	1944	1945	1946	1947	1948	1949	1950
Argentina	6	------	------	4	3	6	7	(1)	(1)	(1)
Mexico	(2)	------	------	------	------	------	------	------	------	------
Northern Rhodesia	342	388	426	254	219	68	56	173	153	------
Peru	1,017	1,010	847	514	688	322	435	511	456	436
South-West Africa	269	453	577	385	420	430	282	187	163	295
United States (shipments) [3]	1,140	2,014	2.534	1,600	1,344	577	961	(4)	(4)	(4)
Total [5]	2,774	3,865	4,384	2,757	2,674	1,403	1,741	(4)	(4)	(4)

[1] Figure not available.
[2] Less than 1 ton.
[3] Includes also vanadium recovered as a byproduct of phosphate-rock mining.
[4] Bureau of Mines not at liberty to publish figure.
[5] Total represents data only for countries shown in table and excludes vanadium in ores produced in French Morocco, Spain, and U. S. S. R., for which figures are not available; the total also excludes quantities of vanadium recovered as byproducts from other ores and raw materials.

Northern Rhodesia.—The Rhodesia Broken Hill Development Co., Ltd., is the only producer of vanadium in Northern Rhodesia. There was no production in 1950, although shipments were made from stock. Output of vanadium oxide was 293 long tons averaging 91.89 percent V_2O_5 in 1949.

Peru.—The famous Mina Ragra mine of the Vanadium Corp. of America in the Andes near Ricran, Department of Junin, has been an important source of vanadium since 1907, when production was begun. Output in Peru was 779 metric tons of V_2O_5 in 1950 compared with 814 tons of V_2O_5 in 1949.

South-West Africa.—The Abenab West lead-vanadium mine of the South-West Africa Co., Ltd., was the chief producer of vanadium in South-West Africa in 1950. Some was also produced by P. Weidner. Output of ore and concentrates (V_2O_5 content) was 580 short tons in 1950 compared with 320 tons in 1949. Exports of ore and concentrates (V_2O_5 content) were 756 short tons, of which 66 tons went to Belgium, 147 tons to France, 251 tons to the United Kingdom, and 292 tons to the Netherlands. The flotation plant of the company commenced operation May 1, 1950.

Zinc[1]

By Richard H. Mote and Esther B. Miller

GENERAL SUMMARY

RESPONDING to the demand generated by the outbreak of Korean hostilities and acceleration of the National Defense Program, the zinc industry produced a greater quantity of slab zinc in 1950 than in any prior year in the peacetime history of the United States. Output totaled 910,437 short tons, including 65 percent from domestic ores, 28 percent from foreign ores, and 7 percent from secondary sources. Domestic mine production of recoverable zinc rose 5 percent over 1949 to total 623,375 tons but was well below the World War II average (719,000 tons per year). Imports of zinc contained in ore and concentrates increased 13 percent to 272,538 tons and imports of slab zinc rose almost 23 percent to 155,974 tons.

Despite the record production and high level of imports the slab-zinc supply in 1950 was insufficient to fill all demands. Stocks at primary and secondary smelters were reduced 91 percent during the year to less than 9,000 tons on December 31, the smallest reserve since November 1925. Consumers' inventories were also reduced during the year and on December 31 were 26 percent under the quantity on hand on January 1.

The stringent supply situation prevalent throughout most of the year was reflected in increases in the price of slab zinc. The quotation for Prime Western grade zinc at East St. Louis ranged between 9.75 and 10.00 cents per pound during the first quarter of 1950. Beginning March 27, the price began to rise, and every change thereafter was upward until September 7, when it reached 17.50 cents, where it remained for the balance of the year.

[1] This report deals primarily with the smelter branch of the industry. Fuller details of zinc mining are given in the various State reports of this volume. As some zinc ore is used directly in the manufacture of zinc pigments, *see also* the chapter on Lead and Zinc Pigments and Zinc Salts.

TABLE 1.—Salient statistics of the zinc industry in the United States, 1941–45 (average) and 1946–50

	1941–45 (average)	1946	1947	1948	1949	1950

GOVERNMENT REGULATIONS

Government controls over the zinc industry were introduced in the latter part of the year. Inventories were controlled by National Production Authority Regulation No. 1, effective September 18, 1950, and NPA Notice No. 1, effective December 27, 1950. NPA Regulation No. 1, designed to prevent accumulation of excessive inventories of materials in short supply, limited the quantities of such materials in stock to a practicable minimum working inventory. Zinc items covered by this regulation included slab zinc, zinc-base alloy, zinc dust, zinc oxide, and zinc and zinc-base alloy scrap. NPA Notice 1, issued to prevent hoarding of strategic materials, prohibited the accumulation, exceeding reasonable demands of business or for resale at prices over prevailing market prices, of certain designated materials, including slab zinc, zinc-base alloy, all zinc products (such as rolled and extruded shapes, wire, and castings), and zinc and zinc-base alloy scrap.

Priority ratings for defense orders were established in several regulations issued by the NPA. Regulation No. 2, effective October 3, 1950, authorized the assignment of a "defense-order" or "DO" rating to defense orders and gave priority to such orders. NPA Order M-9, effective November 16, 1950, applied particularly to producers and fabricators of zinc and dealers in zinc and zinc products. Under this order a producer of zinc, zinc dust, or zinc oxide was not required to accept rated orders for shipment in any one month in excess of 10 percent of his production. A fabricator of zinc-base alloys was not required to accept rated orders in any one month exceeding 20 percent of his average monthly shipments of products during the first 8 months of 1950. Similarly, fabricators of sheet zinc, strip zinc, zinc wire, zinc rod, zinc shapes, and zinc plate were not required to accept orders exceeding 15 percent of the average monthly shipments of such products during the first 8 months of 1950. A dealer was not required to accept rated orders for shipment in any one month of a total tonnage that exceeded 15 percent of the total quantity available to him during the month. The order further stipulated that producers and fabricators were not required to accept rated orders received less than 30 days before the first day of the month in which shipment was requested.

NPA Order M-15, restricting civilian use of zinc metal and zinc metal products, was issued effective December 1, 1950, and limited civilian consumers of zinc metal and zinc-metal products during 1951 to an average quarterly rate of 80 percent of the use during the first 6 months of 1950. The order further specified that inventories were to be held to a 45-day supply or a "practicable minimum working inventory," whichever was less.

DOMESTIC PRODUCTION

Statistics on zinc production are compiled both on a mine basis and on a smelter basis. The mine-output data, based upon the zinc content of ores and concentrates produced (adjusted to account for average smelting losses), form an accurate measure of domestic zinc output from year to year. Smelter production of slab zinc from domestic ores represents a more accurate figure of actual zinc recovery but usually differs from the mine figure owing to a time-lag between mine or mill shipments and smelter production. Over a period of years, these variations tend to balance out within the limits of statistical error.

MINE PRODUCTION

Zinc mining in the United States is centered largely in five areas—the Tri-State area of southeastern Kansas, southwestern Missouri, and northeastern Oklahoma; Tennessee-Virginia; Sussex County, N. J.; St. Lawrence County, N. Y.; and the Western States (principally Idaho, Montana, Arizona, Colorado, Utah, New Mexico, Nevada, and Washington, in descending order of production in 1950).

Mine production in the combined Western States increased 3 percent in 1950 compared with 1949. Almost 59 percent of the total domestic output of zinc in 1950 (60 percent in 1949) was produced in the Western States.

Idaho continued to be the largest producer of zinc in the United States, about 98 percent of the State total in 1950 coming from the Coeur d'Alene region and most of the remainder from the Warm Springs district. Zinc-lead ore and old tailings concentrated yielded 91 percent of the State total zinc; old zinc slag smelted and fumed, 5 percent; and zinc ore concentrated and lead ore concentrated, 3 percent. The Star mine near Burke in the Coeur d'Alene region remained the largest Idaho zinc producer; it was followed by the Page, Morning, Bunker Hill and Sullivan, Sidney, Frisco, Bunker Hill slag dump, Spokane-Idaho, and Tamarack. These nine properties supplied 83 percent of Idaho's total zinc in 1950.

Owing to a record high output at the Butte Hill mines and dumps of the Anaconda Copper Mining Co., Montana zinc production advanced 25 percent in 1950 to 67,678 tons, which placed the State second among the zinc-producing States, a position unattained since 1920. During 1950 Anaconda company-owned operations at Butte supplied 79 percent of the State's zinc output. Other important zinc producers during the year were the Emma mine, East Helena old slag dump, the Travona mine in Silver Bow County, and the Mike Horse property at Flesher in Lewis and Clark County. These five operations produced nearly 99 percent of the State total zinc output. Of Montana zinc in 1950, 96 percent was derived from zinc-lead ore, nearly 4 percent from zinc ore and old slag, and the small remainder from gold, silver, lead, and copper ores.

Arizona zinc output in 1950 declined 14 percent from the record attained in 1949 owing largely to a smaller production of zinc-lead ore from the Copper Queen mine at Bisbee. Although zinc output at the Copper Queen mine dropped 41 percent, the property remained the largest producer in Arizona. Other important producers of zinc, in order of output, were the Iron King mine at Humboldt, United Verde branch of the Phelps Dodge Corp. at Jerome, San Xavier mine near Sahuarita, St. Anthony property at Tiger, Flux group near Patagonia, Magma mine in Pinal County, Republic & Mammoth mine at Dragoon (Coronado Copper & Zinc Co.), and Old Dick property at Bagdad. More than 77 percent of the State total zinc came from zinc-lead ore and most of the remainder from zinc, zinc-copper, and zinc-lead-copper ores.

TABLE 2.—Mine production of recoverable zinc in the United States, 1941–45 (average) and 1946–50, by States, in short tons

State	1941–45 (average)	1946	1947	1948	1949	1950

July	39,933	48,675	Total	593,203	623,375

[1] Includes Alaska.

Zinc production in Colorado declined slightly in 1950 after 4 years of successive increases. In Summit County at Kokomo, depletion of ore reserves in the Victory-Lucky Strike-Wilson-McKinley group of mines caused this large producer to close April 19. The subsequent decrease in Summit County's zinc output was partly offset by expanded production in Eagle, San Miguel, and Lake Counties and reopening in July of the Rico Argentine mine in Dolores County, closed since May 1949. The leading zinc producers, in order of rank, were the Eagle mine, Eagle County; Treasury Tunnel-Black Bear (Idarado) group, San Miguel County; Resurrection group, Lake County; Victory (American Smelting & Refining Co. Kokomo unit), Summit County; and Smuggler Union-Montana group, San Miguel County. Zinc, zinc-lead, and zinc-lead-copper ores yielded 93 percent of the Colorado total zinc in 1950.

Utah zinc output in 1950 decreased 22 percent from that in 1949 and was the smallest since 1946. This loss resulted mainly from the closing during part of the year of the United States & Lark property at Bingham and from reduced zinc output of mines in the Park City, Ophir, and Rush Valley (Stockton) districts. The Lark mine was shut from July 16 through October 28 because of a fire in the lower levels; the United States mine was idle 2 months owing to a labor strike. Despite the fire and labor difficulties that lowered zinc output in 1950 about 27 percent under 1949, the United States & Lark property remained by far the largest producer of zinc in Utah.

It was followed by the properties of the Chief Consolidated Mining Co., Park Utah Consolidated Mines Co., New Park Mining Co., Butterfield group, and Honorine, Cardiff, Hidden Treasure, and Calumet mines. These nine properties supplied 97 percent of the Utah total zinc in 1950. Over 97 percent of the State total zinc was recovered from zinc-lead ore.

Most New Mexico mines that had closed in 1949 as a result of the decline in the price of zinc metal reopened in 1950. In the Central district, the New Mexico Consolidated Mines Co. Kearney mine resumed operations February 27; the Kennecott Copper Corp. Oswaldo mine, the American Smelting & Refining Co. Ground Hog, and the United States Smelting, Refining & Mining Co. Bayard group reopened in June; and the Peru Mining Co. Pewabic mine reopened October 16. The Hanover mine and mill of the New Jersey Zinc Co., Empire Zinc Division, which had operated throughout 1949, were closed by a work stoppage October 17, 1950, and remained idle the balance of the year. The principal New Mexico producers of zinc in 1950, in order of output, were the Kearney, Hanover (Empire Zinc), Ground Hog, Oswaldo, and Bayard groups. Nearly 94 percent of the State total zinc in 1950 was recovered from zinc ore.

Nevada zinc production in 1950 was 6 percent greater than in 1949. Most of the output was centered in the Pioche district, Lincoln County, where zinc and zinc-lead ores mined and concentrated were the source of 91 percent of the State total zinc. Rising zinc prices in 1950, especially after midyear, made possible movement to a Utah slag-fuming plant of notable tonnages of oxidized zinc ore, largely from mines in Clark, Eureka, and White Pine Counties and from the former Metals Reserve Co. World War II stockpile of Clark County ore at Jean, Nev. Leading Nevada producers of zinc included the Combined Metals Reduction Co. Pioche group and Ely Valley Mines, Inc., Ely Valley mine, both in the Pioche district, Lincoln County; the Copper Canyon Mining Co. Copper Canyon mine, Battle Mountain district, Lander County; and the L. F. Jacobson Yellow Pine mine, Yellow Pine district, Clark County. Over 78 percent of the Nevada total zinc in 1950 was recovered from zinc-lead ore and most of the remainder from zinc ore.

Recoverable zinc production in Washington in 1950 reached the highest level on record, owing mainly to a marked increase in tonnage of zinc-lead ore milled at the Grandview mine. The Grandview property replaced the Pend Oreille mine as the State's leading zinc producer; it was followed by the Holden and Deep Creek and Anderson mines. These properties supplied nearly 99 percent of the State total zinc. Zinc-lead ore supplied over 74 percent of the total zinc in 1950, zinc-copper ore 16 percent, and zinc ore nearly 9 percent.

California zinc production in 1950 exceeded the previous years' yield by a small margin. The Anaconda Copper Mining Co. Darwin group of mines dominated the State output and was followed, in second place, by the Coronado Copper & Zinc Co. Afterthought mine, Shasta County, which resumed operation in August 1950 after over 1 year of inactivity. In addition, the Anaconda Copper Mining Co. Shoshone group; the Penn Chemical Co. Penn mine, Campo Seco district, Calaveras County; and the J. Q. Little Carbonate King zinc mine, Ivanpah district, San Bernardino County—the latter a shipper of oxidized zinc ore to a slag-fuming plant—contributed to the State total recoverable zinc. Over 65 percent of the California output in 1950 was derived from zinc-lead ore, 23 percent from zinc ore, and the remainder from lead ore.

In Oregon a small tonnage of zinc was recovered from ores from the Bohemia district, Lane County.

Zinc production in the Tri-State district, which has been declining since 1942, advanced slightly in 1950 as a result of increased zinc and lead concentrate prices during the latter half of 1950. Output lagged during the first quarter of the year, when concentrate prices were low. In the second quarter zinc prices improved somewhat, while lead prices remained low, causing district ore production to rise about 5 percent. Continued advances in prices for zinc and lead concentrates resulted in a 31-percent increase in mine output during the latter half of the year compared with the first half. The five principal zinc producers in the Tri-State district in 1950, in order of output, were: Eagle-Picher Mining & Smelting Co. (Oklahoma and Kansas); Nellie B. Mining Co. (Oklahoma); National Lead Co., St. Louis Smelting & Refining Division (Kansas); Federal Mining & Smelting Co. (Oklahoma and Missouri); and Dale Mining Co. (Missouri).

Zinc production from mines in the States east of the Mississippi River increased 12 percent over 1949 in 1950. Production was re-

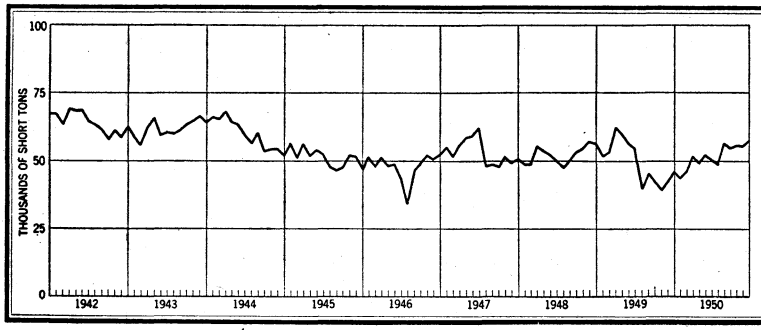

FIGURE 1.—Mine production of recoverable zinc in the United States, 1942–50, by months, in short tons.

ported in Illinois, Kentucky, New Jersey, New York, Tennessee, Virginia, and Wisconsin. The principal producer was again the New Jersey Zinc Co., operating the Franklin and Sterling Hill mines in New Jersey and the Austinville mine in Virginia. In Kentucky and Southern Illinois, zinc is produced chiefly as a byproduct or coproduct with fluorspar. The principal producers in this area were the Ozark-Mahoning Co. and the Minerva Oil Co. During the latter part of the year the Alcoa Mining Co. began producing and concentrating zinc ore from its newly developed Hutson mine in Kentucky. Output from the Kentucky-Southern Illinois area was 2 percent greater in 1950 than in 1949. New Jersey production was 8 percent greater than in 1949. Franklin and Sterling Hill, the two producing mines, operated continuously after resumption of work with the ending of a labor strike at the Palmerton, Pa., zinc smelter January 26. New York mines produced about the same quantity of zinc as in 1949, despite closing of the Universal Exploration Co. Hyatt mine on May 15. Other producers in New York during 1950 were the Balmat and Edwards mines, operated by the St. Joseph Lead Co. In Tennessee, zinc output increased 19 percent over 1949. The leading producers were: The American Zinc Co. of Tennessee, operating the Athletic, Grasselli, Jarnagin, and the Mascot No. 2 mines; the Universal Exploration Co.; and the Tennessee Copper Co. Production of zinc in 1950 in Virginia declined 6 percent compared with 1949, chiefly due to a labor strike from October 9 to November 23 at the Austinville mine of the New Jersey Zinc Co. The Wisconsin and Northern Illinois region reported a 50-percent increase in zinc output in 1950, most of which can be attributed to new operations of Calumet & Hecla Consolidated Copper Co. near Shullsburg, Wis., and the Eagle-Picher Mining & Smelting Co. near Galena, Ill. Other producers in the area include the Dodgeville Mining Co., Dodgeville, Wis. (operations resumed in July); the Vinegar Hill Zinc Co. near Shullsburg; and the Tri-State Zinc, Inc., in Illinois.

The 25 leading zinc-producing mines in the United States in 1950, listed in table 4, yielded 61 percent of the total domestic zinc output; the 3 leading mines produced over 21 percent and the 6 leading mines nearly 32 percent.

Detailed information on the production of mines and mining districts in the United States may be found in the chapters of this volume dealing with the mine production of gold, silver, copper, lead, and zinc in the various States.

Table 4.—Twenty-five leading zinc-producing mines in the United States in 1950, in order of output

Rank	Mine	District	State	Operator	Type of ore
1	Franklin & Sterling Hill	New Jersey	New Jersey	New Jersey Zinc Co	Zinc.
2	Butte Hill mines & dumps	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Zinc-lead.

[1] Includes very small quantity produced elsewhere in State.
[2] No production in Iowa since 1917.
[3] Includes Peshastin Creek and Wenatchee River districts.
[4] Quantity withheld to avoid disclosure of individual company operations.
[5] This district is not listed in order of 1950 output.

SMELTER PRODUCTION

During 1950, 18 primary zinc-reduction plants were in operation; 9 operated with horizontal retorts exclusively, 4 with vertical retorts exclusively (1 electrothermic), and 5 with electrolytic methods.

Horizontal-Retort Plants.—The total number of retorts reported at horizontal-retort primary plants in 1950 was 54,624, a 2-percent reduction from the 55,584 retorts on December 31, 1949, at plants that operated during that year. Of the total retorts reported, 52,484 (96 percent) were in use at the close of 1950 compared with 51,652 (93 percent) in operation at the end of 1949.

Vertical-Retort Plants.—Four vertical retort continuous distilling plants operated during 1950. The total number of vertical retorts increased from 79 on December 31, 1949, to 88 at the end of 1950. At the close of the year 82 vertical retorts were in operation.

Electrolytic Plants.—Five electrolytic zinc reduction plants were in operation during 1950. There was a total of 3,360 cells at the plants on December 31, 1950, of which 3,322 (99 percent) were in operation. The number of cells at the end of 1949 was 3,370, of which 3,235 (96 percent) were operating.

Smelting Capacity.—Irrespective of additions or subtractions of smelter recovery units, statistics on domestic smelting capacity vary from year to year, owing to changes in metallurgical practices among the various plants. According to reports to the Bureau of Mines, the zinc-reduction plants in the United States on December 31, 1950, had a stated annual capacity of 1,044,000 tons of slab zinc under normal operating conditions, allowing for necessary shut-downs for repairs. This figure, which compares with a 1,035,000-ton reported capacity at the end of 1949, indicates that 1950 output was 87 percent of capacity. Horizontal- and vertical-retort plants operated at 86 percent of a stated 619,000-ton capacity (82 percent of a 621,000-ton capacity in 1949), electrolytic plants at 93 percent of a 369,000-ton capacity (90 percent of 362,500-ton capacity in 1949), and secondary smelters at 69 percent of a 56,000-ton capacity (62 percent of a 52,000-ton capacity in 1949).

Waelz Kilns.—The following companies operated Waelz kilns in 1950:

Arkansas: Fort Smith—The Residue Co.
Illinois:
- Danville—The Hegeler Zinc Co.
- Fairmont City—American Zinc Co. of Illinois.
- La Salle—Matthiessen & Hegeler Zinc Co.

Kansas: Cherryvale—National Zinc Co., Inc.
Oklahoma: Henryetta—Eagle-Picher Mining & Smelting Co.
Pennsylvania:
- Donora—American Steel & Wire Co.
- Palmerton—New Jersey Zinc Co.

Slag-Fuming Plants.—The following companies operated slag-fuming plants in 1950 and produced impure zinc oxide, which was further treated to recover slab zinc:

Idaho: Bradley—Bunker Hill & Sullivan Mining & Concentrating Co.
Montana: East Helena—Anaconda Copper Mining Co.
Texas: El Paso—American Smelting & Refining Co.
Utah: Tooele—International Smelting & Refining Co.

During 1950 these four plants treated 652,172 tons of hot and cold slag, which yielded 102,826 tons of oxide fume containing 63,522 tons of recoverable zinc. Corresponding figures for the four operating plants in 1949 were 613,615, 98,263, and 65,854 tons, respectively.

Active Zinc-Reduction Plants.—Modernization and expansion of existing zinc smelters and the adoption of new metallurgical techniques were important features of the zinc industry in 1950. The last of the old horizontal retorts with which the New Jersey Zinc Co., Palmerton, Pa., smelter was originally equipped was removed in 1950. At the end of September the company put into operation 9 new vertical retorts, bringing the total to 43. Installation of the new retorts, which are equipped with splash condensers, is reported to have resulted in improved zinc recovery and higher productivity per retort.

Tests to establish the advantage of mechanical overhand charging at horizontal retort smelters continued at the American Smelting & Refining Co. plant in Amarillo, Tex. A mechanical charging machine was used during the year on all but two blocks of horizontal retorts. As a result of tests on sintering raw concentrates at its Blackwell, Okla., smelter, the American Metal Co. began to construct a sintering plant with one large machine 168 feet long and 12 feet wide. This machine, the largest ever constructed, will have a capacity of 600 tons of raw concentrate per day and is expected to exhibit a lower operating cost, greater elimination of cadmium, and a more uniform and desirable sinter than have heretofore been achieved on the standard-size sintering machines.

A list of zinc-reduction plants operating in the United States in 1950 follows:

Primary zinc distillers

Horizontal-retort plants

Arkansas: Fort Smith—Athletic Mining & Smelting Co.
Illinois:
    Fairmont City—American Zinc Co. of Illinois.
    La Salle—Matthiessen & Hegeler Zinc Co.
Oklahoma:
    Bartlesville—National Zinc Co., Inc.
    Blackwell—Blackwell Zinc Co.
    Henryetta—Eagle-Picher Mining & Smelting Co.
Pennsylvania: Donora—American Steel & Wire Co.
Texas:
    Amarillo—American Smelting & Refining Co.
    Dumas—American Zinc Co. of Illinois.

Vertical-retort plants

Illinois: Depue—The New Jersey Zinc Co.
Pennsylvania:
    Josephtown—St. Joseph Lead Co.
    Palmerton—The New Jersey Zinc Co. of Pennsylvania.
West Virginia: Meadowbrook—E. I. du Pont de Nemours & Co., Inc.

Electrolytic plants

Idaho: Kellogg—Sullivan Mining Co.
Illinois: Monsanto—American Zinc Co. of Illinois.
Montana:
    Anaconda—Anaconda Copper Mining Co.
    Great Falls—Anaconda Copper Mining Co.
Texas: Corpus Christi—American Smelting & Refining Co.

Secondary zinc distillers

Alabama: Fairfield—W. J. Bullock, Inc.
California:
 Los Angeles—American Smelting & Refining Co., Federated Metals Division.
 Torrance—Pacific Smelting Co.
Illinois:
 Beckemeyer—American Smelting & Refining Co., Federated Metals Division.
 Hillsboro—American Zinc, Lead & Smelting Co.
 Sandoval—Sandoval Zinc Co.
New Jersey: Trenton—American Smelting & Refining Co., Federated Metals Division.
New York: Tottenville—Nassau Smelting & Refining Co.
Oklahoma: Sand Springs—American Smelting & Refining Co., Federated Metals Division.
Pennsylvania:
 Bristol—Superior Zinc Corp.
 Philadelphia—General Smelting Co.
West Virginia: Wheeling—Wheeling Steel Corp.

SLAB ZINC

The output of primary slab zinc in 1950 advanced 4 percent over 1949 production. Output from domestic concentrates fell 1 percent. Production from foreign concentrates, however, rose 14 percent.

Production of redistilled slab zinc rose 22 percent from 1949 and was the highest on record. Of the 66,970 tons of redistilled secondary slab zinc produced in 1950, 28,411 tons (42 percent) were derived from primary smelters, and 38,559 tons (58 percent) were produced at secondary plants.

Data on output of remelted secondary slab zinc are not included with those for redistilled metal. In 1950 the production of slab zinc recovered by remelting purchased scrap was 7,243 tons (6,045 tons in 1949). Zinc rolling mills and other substantial consumers of slab zinc recovered large quantities of zinc from their own plant scrap; but such metal is not measured statistically, for it seldom enters the market as scrap.

In addition to redistilled and remelted unalloyed secondary zinc, a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in the Secondary Metals—Nonferrous chapter of this volume.

TABLE 6.—Primary and redistilled secondary slab zinc produced in the United States, 1941–45 (average) and 1946–50, in short tons

Year	Primary			Redistilled secondary	Total (excludes zinc recovered by remelting)
	From domestic ores	From foreign ores	Total		
1941–45 (average)	583,669	[1] 274,344	858,013	51,838	909,851
1946	459,205	269,057	728,262	44,516	772,778
1947	510,058	292,437	802,495	59,542	862,037
1948	537,966	249,798	787,764	62,320	850,084
1949	591,454	223,328	814,782	55,041	869,823
1950	588,291	[1] 255,176	843,467	66,970	910,437

[1] Includes a small tonnage of foreign slab zinc further refined into high-grade metal in the United States.

Labor strikes continued in 1950 to hamper smelter output of slab zinc, but not to the extent of 1948 and 1949. The strike at the vertical retort smelter at Palmerton, Pa., which started on September 26, 1949, was not settled until January 26, 1950. The horizontal-retort smelter at Henryetta, Okla., was strike-bound from July 31 through October 7. The coal shortage during the early months of the year resulted in a reduction in availability of electric power which curtailed production at the Josephtown, Pa., smelter in late February and early March.

Of the 1950 output of primary zinc, 59 percent was distilled and 41 percent produced electrolytically.

Production of Special High Grade, Selected, and Prime Western rose 18, 57, and 6 percent, respectively, in 1950. Output of Regular High Grade and Brass Special declined 7 and 17 percent, respectively. Production of Intermediate Grade and unchanged. Of the total 1950 output (comparable 1949 figures in parentheses) 41 percent (40 percent) was Prime Western, 30 percent (27 percent) Special High Grade, 21 percent (24 percent) Regular High Grade, 5 percent (6 percent) Brass Special, 2 percent (3 percent) Intermediate, and less than one-half of 1 percent Selected.

TABLE 7.—Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1941–45 (average) and 1946–50, in short tons

CLASSIFIED ACCORDING TO METHOD OF REDUCTION

Year	Electrolytic primary	Distilled	Redistilled secondary [1]		Total
			At primary smelters	At secondary smelters	
1941–45 (average)	278,903	579,110	23,829	28,009	909,851
1946	281,295	446,967	18,408	26,108	772,778
1947	295,520	506,975	22,093	37,449	862,037
1948	312,477	475,287	28,070	34,250	850,084
1949	326,152	488,630	22,782	32,259	869,823
1950	342,085	501,382	28,411	38,559	910,437

CLASSIFIED ACCORDING TO GRADE

Year	Grade A		Grade B (Intermediate)	Grades C and D		Grade E (Prime Western)	Total
	Special High Grade (99.99% Zn)	Regular High Grade (Ordinary)		Brass Special	Selected		
1941–45 (average)	239,814	234,986	64,012	74,472	18,832	277,735	909,851
1946	236,184	180,366	32,294	75,296	13,697	234,941	772,778
1947	239,274	190,429	36,812	61,104	12,844	321,574	862,037
1948	248,346	196,482	38,892	45,946	4,723	315,695	850,084
1949	230,576	206,651	21,513	56,388	2,565	352,130	869,823
1950	271,678	192,075	21,571	46,730	4,021	374,362	910,437

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

Montana continued to be the leading producer of primary slab zinc in 1950; Pennsylvania and Oklahoma were in second and third places, respectively. Of the States for which production statistics may be shown separately, Illinois, Idaho, and Arkansas occupied the next three positions. As usual, in Montana and Idaho slab zinc was produced by electrolytic methods only. In Illinois and Texas both electrolytic and distilled zinc metal were recovered, whereas in all other States zinc was recovered by distillation alone.

TABLE 8.—Primary slab zinc produced in the United States, by States where smelted, 1941–45 (average) and 1946–50, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Texas and West Virginia [1]	Total	
								Short tons	Value
1941–45 (average)	36,428	38,000	159,864	202,224	98,766	215,786	106,945	858,013	$144,317,898
1946	18,720	34,832	104,002	186,662	104,125	178,811	101,110	728,262	129,630,636
1947	17,158	41,801	113,192	197,453	128,398	193,524	110,969	802,495	171,894,429
1948	15,586	42,064	93,229	207,717	137,844	171,276	120,048	787,764	209,860,330

1950	20,688	53,922	108,301	216,104	145,117	162,539	136,796	843,467	240,050,708

[1] Includes Missouri, 1943–44 and 1947–50.
[2] Corrected figure.

BYPRODUCT SULFURIC ACID

Sulfuric acid made from sulfur dioxide gases produced in roasting zinc blende (sphalerite) is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consumed large quantities of native sulfur. Combined production of sulfuric acid from both sources (*see* table 9) increased 40 percent in 1950.

TABLE 9.—Sulfuric acid (basis, 100 percent) made at zinc-blende roasting plants in the United States, 1946–50

Year	Made from zinc-blende [1]		Made from native sulfur		Total [1]		
						Value [2]	
	Short tons	Value [2]	Short tons	Value [2]	Short tons	Total	Average per ton
1946	544,529	$6,842,541	160,886	$2,021,696	705,415	$8,864,237	$9.76
1947	598,703	8,001,205	266,104	3,556,281	864,807	11,557,486	10.38
1948	529,478	7,478,271	233,099	3,292,261	762,577	10,770,532	10.97

1950	609,571	8,829,236	243,743	3,530,464	853,314	12,359,700	11.25

[1] Includes acid from foreign blende.
[2] At average of sales of 60° B. acid.

ZINC DUST

Production of zinc dust in 1950 totaled 28,922 tons, a 27-percent increase over 1949 output. Zinc powder and blue powder are not included in the Bureau of Mines production totals; the zinc dust statistically reported is restricted to commercial grades that comply with close specifications as to percentage of unoxidized metal, evenness of grading, and fineness of particles. The zinc content of the dust produced in 1950 ranged from 92.86 to 99.72 percent and averaged 97.87 percent. Shipments of zinc dust, which totaled 26,518 tons—441 tons of which went to foreign countries—were slightly lower than production. The quantity consumed at manufacturers' plants (9 percent of output) was greater than the difference between production and shipments, with the result that producers' stocks decreased from 1,310 tons at the beginning to 571 tons at the end of the year.

The average price of zinc dust shipped to domestic consumers in 1950 was 16.6 cents a pound compared with 13.56 cents in 1949. The raw materials used to manufacture zinc dust are reviewed in the Secondary Metals—Nonferrous chapter of this volume. Most of the production is from zinc scrap (principally galvanizers' dross), but some is recovered from zinc ore, slab zinc, and as a byproduct of zinc refining.

TABLE 10.—Zinc dust [1] produced in the United States, 1941–45 (average) and 1946–50

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average per pound			Total	Average per pound
1941–45 (average)	25,122	$5,063,202	$0.101	1948	32,217	$10,051,704	$0.156
1946	28,574	6,057,688	.106	1949	22,776	[2] 6,195,072	.136
1947	30,602	7,589,296	.124	1950	28,922	9,602,104	.166

[1] All produced by distillation.
[2] Revised figure.

ZINC PIGMENTS AND SALTS

The principal zinc pigments are zinc oxide and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinc-bearing materials, including ore, metal, scrap, and residues. Details of the production of zinc pigments and salts are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

CONSUMPTION AND USES

According to reports from 588 plants, 967,134 tons of slab zinc were put into process in 1950, a 36-percent increase over the 1949 level and the largest quantity on record. Receipts at consumers' plants in 1950 were 946,091 tons. Comparison of the calculated figure of slab zinc available to consumers and the actual measured consumption since 1943 indicates that coverage of the consumer survey was approximately 96 percent.

Galvanizing continued to be the largest field of zinc use in 1950; the quantity so consumed during the year was 19 percent above the previous annual record established in 1948. Zinc-base alloys, largely die castings, continued to be the second-largest application of slab zinc, establishing a new high 23 percent over the 1948 record. Consumption of slab zinc for the manufacture of brass products rose 63 percent over 1949 to the highest point since 1946, but was well below the average of the immediate pre-World War II period. The low level of slab zinc consumption in brass in the postwar period is attributable to the abnormal flow of brass scrap to the mills.

TABLE 11.—Consumption of slab zinc in the United States, 1946–50, by industries, in short tons [1]

Industry and product	1946	1947	1948	1949	1950
Galvanizing: [2]					
Sheet and strip	113,816	115,147	120,360	146,923	188,406
Wire and wire rope	43,667	49,726	49,906	39,231	47,317
Tubes and pipe	62,460	77,238	81,874	78,030	91,877
Fittings	10,593	10,467	14,037	11,487	15,948

Wet batteries	1,635	1,462	1,368	1,359	1,527
Desilverizing lead	1,781	2,687	2,654	2,448	2,947
Light-metal alloys	545	607	1,125	1,060	1,356
Other [3]	4,642	4,405	5,522	2,887	4,087
Total other uses	8,603	9,161	10,669	7,754	9,917
Total consumption [4]	801,242	786,360	817,735	711,841	967,134

[1] Excludes some small consumers.
[2] Includes zinc used in electrogalvanizing and electroplating, but excludes sherardizing.
[3] Includes zinc used in making zinc dust, bronze powder, alloys, chemicals, castings, and miscellaneous uses not elsewhere mentioned.
[4] Includes 3,912 tons of remelt zinc in 1946, 3,577 tons in 1947, 3,141 tons in 1948, 2,394 tons in 1949, and 3,035 tons in 1950.

The quantity of slab zinc consumed for rolled products in 1950 increased 24 percent from the 1949 figure. In addition to slab zinc, the rolling mills remelt and reroll the metallic scrap produced from their fabricating operations. The scrap so treated in 1950 amounted to 13,841 tons, an increase of 54 percent above the 8,977 tons processed in 1949. Purchased zinc scrap, in the form of zinc clippings, old zinc scrap, and engravers' plates, totaling 4,516 tons was melted and rolled in 1950 (3,802 tons in 1949). Production of rolled zinc from both slab zinc and purchased scrap was 70,075 tons, an increase of 21 percent over the 1949 total. Inventories of rolled zinc were 1,420 tons on December 31, 1950, compared with 2,076 tons (revised figure) on the same date in 1949. In addition to the actual shipments of 56,253 tons of rolled zinc in 1950, the rolling mills processed 28,127 tons of rolled zinc (including that which was remelted and rerolled) in manufacturing 14,568 tons of semifabricated and finished products.

TABLE 12.—Rolled zinc produced and quantity available for consumption in the United States, 1949–50

	1949			1950		
	Short tons	Value		Short tons	Value	
		Total	Average per pound		Total	Average per pound
Production:						
Sheet zinc not over 0.1 inch thick	14,710	$5,642,609	$0.192	18,436	$8,805,695	$0.239
Boiler plate and sheets over 0.1 inch thick	757	257,855	.170	926	377,778	.204
Strip and ribbon zinc [1]	41,354	13,691,412	.166	49,167	18,335,444	.186

Exports	6,147	2,858,566	.232	3,290	1,496,158	.227
Available for consumption	[2] 53,919			67,652		
Value of slab zinc (all grades)			.124			.142
Value added by rolling			.050			.060

[1] Figures represent net production. In addition 8,977 tons of strip and ribbon zinc in 1949 and 13,841 tons in 1950 were rerolled from scrap originating in fabricating plants operated in connection with zinc rolling mills.
[2] Revised figure.

Table 13 shows the six commercial grades of refined slab zinc and purchased remelt spelter consumed by the various industries in 1950. Of the 967,134 tons of domestic and foreign zinc consumed, 44 percent was Prime Western, 34 percent Special High Grade, and 14 percent Regular High Grade, compared with 45, 33, and 14 percent, respectively, in 1949. All grades of zinc were used for galvanizing. Prime Western was the principal grade used in the hot-dip process, the higher grades being used chiefly for electrogalvanizing. Rigid specifications in brass manufacture necessitate the use of high-purity metal, 76 percent of the total used in this industry being of the two highest grades.

TABLE 13.—Consumption of slab zinc in the United States in 1950, by grade and industry, in short tons [1]

Industry	Special High Grade	Regular High Grade	Intermediate	Brass Special	Selected	Prime Western	Remelt	Total
Galvanizers	14,892	17,549	9,842	8,475	104	388,506	2,318	441,686

[1] Excludes some small consumers. For other qualifications, see footnotes to table 11.

CONSUMPTION OF SLAB ZINC BY GEOGRAPHIC AREAS [2]

The geography of slab zinc consumption is available in detail only since 1940. During the 11-year period through 1950, substantial

[2] This section is based partly on a detailed study by Ransome, Alfred L., Consumption of Slab Zinc in the United States by Industries, Grades, and Geographic Divisions, 1940–45: Bureau of Mines Inf. Circ. 7450, 1948, 30 pp.

shifts are observable, largely the result of conversion to war production in 1940–41 and reconversion to peacetime consumption in 1945–46. The distribution of slab zinc consumption by geographic divisions and States, both total and for individual uses, is shown in tables 14–20.

Consumption of Slab Zinc for All Uses.—During the period 1940–50 Illinois ranked first among the 42 zinc-consuming States and the District of Columbia, with an annual average of 136,978 short tons. Since 1945 Ohio has been in second place. Connecticut, which averaged second during the war period owing to the large quantities of zinc consumed in the brass plants of that State, has since dropped to fourth place. Since 1940 Pennsylvania has held either second or third place. The greatest concentration of slab-zinc consumption is in the region comprising Illinois, Indiana, Michigan, Ohio, and Wisconsin. This area, which has consistently ranked first in zinc consumption since 1940, uses nearly half the total quantity of slab zinc consumed annually in the United States. The region of least consumption is the Mountain States, including Arizona, Colorado, Idaho, Nevada, New Mexico, and Utah, which have accounted for less than 0.3 percent of the total.

TABLE 14.—Consumption of slab zinc in the United States, 1943–47 (average) and 1948–50, by geographic divisions and States [1]

[2] Nominal quantity consumed included with subtotal for division, as less than 3 companies reported.

Consumption of Slab Zinc for Galvanizing.—The iron and steel industry is the largest consumer of slab zinc, which it uses for galvanizing or rustproofing sheets, wire, tube and pipes, building and pole-line hardware, railway-signal equipment, chains, bolts, screws, and a multitude of other items. The principal iron- and steel-producing States are thus also the principal consumers of zinc for galvanizing. From 1940 through 1943, Pennsylvania ranked first among the 34 States that consumed zinc for this purpose. In 1944 Ohio displaced Pennsylvania and retained the top position in the succeeding years through 1950. The greatest concentration of zinc consumption for galvanizing is the region comprising Illinois, Indiana, Ohio, and Pennsylvania, which accounted for 62 percent of the average annual domestic consumption for this use in the period 1940–45. In 1946 total zinc used for galvanizing in these States rose to 65 percent but declined to 63 percent in 1947 and 1948, 61 percent in 1949, and 59 percent in 1950.

Consumption of Slab Zinc for Brass Products.—From 1940 through 1950 Connecticut has ranked first among the States consuming slab zinc for brass products; but, owing to the wartime demand for brass and the construction of new plant facilities, there has been some change in the rank of the other leading States. In 1940 Michigan was in second place, followed by New York, Illinois, Ohio, and Pennsylvania among the top six, whereas in 1950 Illinois ranked second, with Michigan in third place, followed by Ohio, New York, and Wisconsin.

Consumption of Slab Zinc for Zinc-Base Alloys.—The automobile industry is the largest user of zinc-base alloys, principally for die-cast parts and assemblies, such as fuel pumps, carburetors, radiator grilles, windshield wipers, and a wide variety of both interior and exterior hardware. Thus the region embracing Illinois, Indiana, Michigan, Ohio, and Wisconsin, in which the automobile industry is centered, is the area of greatest concentration of slab zinc consumption for zinc-base alloys. Nearly 63 percent of the zinc for die castings and other zinc-base alloy uses in 1950 was consumed in this region.

[1] Excludes remelt zinc.
[2] Quantity withheld to avoid disclosure of individual company operations.
[3] Includes States not individually shown (footnote reference 2).

Consumption of Slab Zinc for Rolled Zinc.—During the period 1940–50, although the quantity of slab zinc consumed for rolled zinc changed widely, the geographic pattern of consumption and rank of the consuming States varied little. Illinois and Indiana ranked first and second, respectively, and accounted for the greater part of slab zinc consumed for rolling in the United States. Pennsylvania held third place through 1946 but was displaced in 1947 and 1948 by Iowa, which moved up from fourth position. In 1949 New York ranked third, but in 1950, it was displaced by Pennsylvania, which moved up to third place again.

Consumption of Slab Zinc for Zinc Oxide.—Because of the small number of companies consuming slab zinc in the manufacture of zinc

TABLE 18.—Consumption of slab zinc for rolled zinc in the United States, 1943–47 (average) and 1948–50, by States

STOCKS

Producers' Stocks.—Inventories of slab zinc at producers' plants declined steadily throughout 1950. By the year end they were reduced to 8,884 tons, the lowest level for any year end since 1925.

TABLE 21.—Stocks of zinc at zinc-reduction plants in the United States at end of year, 1946–50, in short tons

	1946	1947	1948	1949	1950
At primary reduction plants	175,513	67,046	19,179	[1] 90,710	7,920
At secondary distilling plants	756	1,601	1,669	[1] 3,511	964
Total	176,269	68,647	20,848	94,221	8,884

[1] Revised figure.

Consumers' Stocks.—On December 31, 1950, consumers' stocks of slab zinc were 60,349 tons compared with 81,801 tons at the beginning of the year. At the average monthly rate of consumption in 1950, consumers' stocks on hand were approximately 22 days' requirements.

TABLE 22.—Consumers' stocks of slab zinc at plants at the beginning and end of 1950, by industries, in short tons

Date	Galvanizers	Brass mills [1]	Die casters [2]	Zinc rolling mills	Oxide plants	Others	Total
Dec. 31—							
1949	[3] 45,600	[3] 10,307	[3] 18,833	[3] 5,262	803	[3] 996	[3] [4] 81,801
1950	34,191	8,549	13,051	3,190	390	978	[4] 60,349

[1] Includes brass mills, brass ingot makers, and brass product producers.
[2] Includes producers of zinc-base die castings, zinc-alloy dies, and zinc-alloy rods.
[3] Revised figure.
[4] Stocks on Dec. 31, 1949 and 1950, exclude 103 (revised figure) and 512 tons, respectively, of remelt spelter.

PRICES

The market price for Prime Western grade slab zinc at East St. Louis opened in 1950 at 9.87½ cents per pound, then dropped to 9.75 cents on January 17. On March 14 the quotation advanced to 10.00 cents and thereafter continued to rise in ¼- and ½-cent intervals until May 29, when it stood at 13.00 cents. On June 2 a midwestern producer raised its quotation to 14.50 cents; other sellers followed on June 5. On June 12 the price advanced to 15.00 cents and was unchanged until September 7. On that date the quotation was established at 17.50 cents per pound, where it remained the rest of the year.

On December 30, 1949, the British Ministry of Supply established the price of zinc at London at £87 10s. per long ton (equivalent to 10.93 cents per pound computed on the basis of £ equals $2.7975). This price continued until January 25, when it was reduced to £85 10s. (10.68 cents). The uninterrupted uptrend in prices that characterized the remaining months of 1950 began on March 15. On that day the quotation was advanced to £87 10s. (10.93 cents). It was subsequently increased on March 28 to £89 10s. (11.18 cents), April 4 to £91 10s. (11.43 cents), April 20 to £95 10s. (11.93 cents), May 2 to £97 10s. (12.18 cents), May 5 to £99 10s. (12.43 cents), May 10 to

[2] Metal Statistics, 1951, p. 565.

£103 10s. (12.93 cents), May 25 to £107 10s. (13.43 cents), and May 30 to £111 10s. (13.93 cents). On June 5 the price was raised to £123 10s. (15.44 cents per pound on the new basis of £ equals $2.80, established on June 1). Further increases took place on June 16, with the new price at £127 10s. (15.94 cents), and September 8, when the price was placed at £147 10s. (18.44 cents). The final official London price, fixed on October 4, was £151 (18.88 cents).

FOREIGN TRADE [3]

Imports.—Total imports (general imports) of zinc in ores and concentrates in 1950 increased 13 percent over 1949. Of the 272,538 tons of contained zinc imported, 55 percent came from Mexico, 29 percent from Canada, 7 percent from Spain, and 6 percent from Peru. The remaining 3 percent was largely from the Union of South Africa, Australia, and Bolivia.

Slab-zinc imports totaled 155,974 tons, an increase of 23 percent over the quantity imported in 1949. Canada supplied 70 percent, Mexico 17 percent, Norway 5 percent, Belgium-Luxembourg 2 percent, and Italy 2 percent. The remaining 4 percent came principally from the Netherlands, Germany and Peru.

1950	237,081	23,743,502	155,304	38,741,797	211	92,862	2,834	677,154	472	80,564	63,335,879

[1] Excludes imports for manufacture in bond and export, which are classified as "imports for consumption" by the U. S. Department of Commerce.
[2] Includes dross and skimmings as follows: 1946—2,801 tons, $181,918; 1947—4,391 tons, $353,415; 1948—8,637 tons, $873,099; 1949—2,668 tons, $335,283; 1950—1,229 tons, $186,748.
[3] In addition, manufactures of zinc were imported as follows: 1946—$1,929; 1947—$4,429; 1948—$16,056; 1949—$2,583; 1950—$142,369.
[4] Less than 0.5 ton.

Exports.—The value of exports of zinc ores, concentrates, and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) amounted to $7,414,904 in 1950 compared with $23,159,259 in 1949. In addition to the items shown in tables 28 and 29, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. Export data on zinc pigments and chemicals are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

Exports of slab zinc in 1950 totaled 12,917 short tons—78 percent under the quantity exported in 1949. India and Pakistan (with 36 percent of the total) and the United Kingdom (with 38 percent) were the major importers. Table 29 contains details of exports of zinc slab and sheet.

[1] Changes in 1946 data (Minerals Yearbook, 1949, p. 1291): Slabs, pigs, and blocks—France, 112 tons; other countries, 92 tons.
[2] Less than 0.5 ton.

Tariff.—The import duty on zinc-bearing ores in 1950 remained at ¾ cent per pound (zinc content) and on zinc in blocks, pigs, slabs, and dust at ⅞ cent per pound. Congressional action (H. R. 5327) during the latter part of the year suspended the ¾ cent per pound duty on zinc scrap from October 2 until June 30, 1951.

WORLD PRODUCTION

World mine and smelter production of zinc in recent years, insofar as data are available, are shown in tables 30 and 31.

TABLE 30.—World mine production of recoverable zinc, by countries, 1944–50, in metric tons [1]

Minor Metals

By Jack W. Clark[1]

BARIUM AND STRONTIUM

DOMESTIC producers of barium and strontium metal and their getter-alloys during 1950 were Kemet Division, Union Carbide & Carbon Corp., Cleveland, Ohio, and King Laboratories, Inc., Syracuse, N. Y. Production of barium amounts to several thousand pounds annually; strontium output is usually negligible. (Barium and strontium minerals and chemical compounds are discussed in the Barite and Minor Nonmetals chapters, respectively, of this volume.)

Uses.—Barium and, occasionally, strontium are consumed almost exclusively in getter-alloys used for evacuative electronic tubes or other devices requiring vacuum. Pure barium is chemically unstable, hence is ordinarily alloyed with magnesium and aluminum, the former giving a lower flashing point and the latter conferring stability. A composition commonly used for high-speed vacuum-tube production contains the afore-mentioned metals in the approximate weight ratio of 1Ba:1Al:2Mg. The ideal getter is one having the highest practical barium content, which, in certain types of getter-alloys, may range up to 75 percent by weight. Special types may contain other elements to an appreciable degree, such as copper, iron, nickel, calcium, and beryllium.

Prices.—During 1949 and 1950 a major distributor quoted barium at $6 per pound in lots of more than 1,000 pounds and strontium at $10 in 500-pound lots. The foregoing prices were for cast billets, with extruded rods $1 per pound higher in each instance.

Technology.—Procedures were published for making barium and its alloys [2] and for vaporizing the element in vacuum tubes.[3]

Canada.—Dominion Magnesium, Ltd., Haley's Station, near Ottawa, Ontario, reported production of 2,116 pounds of barium in 1949, which compared with 10,652 pounds in 1948 and 1,040 in 1947. No strontium was produced in 1949. Data on 1950 Canadian production of barium and strontium are not available. Cooper Metallurgical Associates, Cleveland, Ohio, distributes Canadian-produced barium and strontium in the United States.

BERYLLIUM

Mine Production.—Mine shipments of beryl in the United States during 1950 were the largest on record, totaling 559 short tons. Consumer demand for beryl ore in 1950 was probably at the highest level ever attained, increased prices and production reflecting the demand.

The Harding mine near Dixon, N. Mex., was by far the largest individual producer of beryl during the year; nearly 200 tons of beryl were produced by Flaudio Griego, operating the property for Arthur Montgomery. According to Bureau of Mines records, the 1950 beryl production of the Harding mine was the highest annual output from a single mine ever achieved in the United States. Solely as a result of the Harding mine performance, New Mexico ranked first among the States in beryl production in 1950; New Hampshire, Colorado, and South Dakota were about equal in output, followed by Maine and Arizona. Shipments were reported in 1950 from New Hampshire by Ashley Mining Co., Beryl Mountain mine, South Acworth; Whitehall Mining Co., Ruggles quarry, near Grafton; and Beryllium Development, Inc., John Hill mine, near Grafton Center. Principal Colorado producers were Beryllium Mining Co., New Anniversary claims, near Ohio City, Gunnison County; Ralph Hermstain, Devil's Hole mine, near Texas Creek, Fremont County; and Consolidated Feldspar Corp., from various unspecified properties. Beryl Ores Co., Arvada, Colo., continued to beneficiate subspecification beryl ore and to grind beryl for use in the ceramic trade. Production in the Black Hills area of South Dakota came from a large number of mines: Beecher, Parker, Ingersoll, Peerless, Gold Star, Dike Lode, Ferguson, Frozen Foot, "The Mick," Johnson, and others undesignated. Largest individual producers were Keystone Feldspar & Chemical Co. (Peerless), Black Hills Keystone Corp. (Ingersoll), and Lawrence Sears (Johnson), all near Keystone, and George Bland (Beecher), near Custer. A small production of beryl was realized during 1950 in New York, North Carolina, and Massachusetts, but was not shipped. The Idaho Beryllium & Mica Corp. began to construct a 50-ton mica mill in the Avon mining district northeast of Troy, Latah County, Idaho, with the intention of recovering beryl as a coproduct. In the New England, Black Hills, and Colorado areas the Bureau of Mines continued studies throughout 1950 devoted to improving methods used in sampling, mining, and milling pegmatite ores. In Maine, beryl was shipped by Northern Mining Corp., Bumpus quarry, and Whitehall Mining Co., Newry N-40 mine, both near Bethel.

Average value per ton	$144.68	$157.26	$177.87	$173.89	$268.69	$321.02	$305.10

1 Included with "Other," to avoid disclosure of individual company operations.
2 Includes States indicated by footnote reference 1; in addition, 1944, Connecticut, North Carolina, and Virginia; 1947, Connecticut; 1949, Arizona and North Carolina; 1950, Arizona.

Refinery Production.—Companies producing beryllium products are as follows:

Producer and plant location:	*Products*
A. O. Smith Co., Milwaukee, Wis.	Ceramics.
Beryllium Corp., Reading, Pa.	Beryllium-copper master alloy (4% Be); beryllium-copper (0.25–2.85% Be) strip, sheet, rod wire, castings, and safety tools; beryllium nickel, beryllium-aluminum, and beryllium-aluminum-magnesium master alloys; beryllium metal; beryllium oxide and compounds.
Beryl Ores Co., Arvada, Colo.	Ground beryl; beryllium oxide.
Brush Beryllium Co., Cleveland and Luckey, Ohio.	Beryllium metal, oxide, compounds, and ceramics; beryllium-nickel. Company plans to reenter field of beryllium master-alloy production.
Champion Spark Plug Co., Detroit, Mich.	Ceramics.
Clifton Products Co., Painesville, Ohio.	Special beryllium products; research in field of beryllium; maintains standby plant for production of beryllium oxide and chemicals.
Consolidated Car Heating Co., Albany, N. Y.	Ticonium alloy (Ni-Co-Cr-Mo, 1–6% Be).
Foote Mineral Co., Philadelphia, Pa.	Ground beryl.
General Electric Co., Schenectady, N. Y.	Trodaloy No. 1 (0.40% Be, 2.6% Co, balance Cu); Trodaloy No. 7 (0.10% Be, 0.40% Cr, balance Cu); beryllium stainless steel (Turbelloy No. 4, 0.7% Be).
Illinois Zinc Co., Chicago, Ill.	Zn cube alloy (0.1% Be, 2–2.5% Cu, balance Zn).
Riverside Metal Co., Riverside, N. J.	Beryllium-copper wire, sheet, and strip.

Important papers were published during 1950 dealing with the occurrence of beryl in Colorado, Idaho, Montana, New Hampshire, Utah and Wyoming.[4]

Economic aspects of pegmatites were discussed in detail in a Bureau of Mines circular.[5]

Consumption and Uses.—Domestic consumption of beryl in 1950 was the highest in the history of the industry and provided a sharp contrast to the low consumption in 1949. Toward the end of 1950 demand for beryllium products, principally beryllium-copper, began to outrun supplies of beryl ore available to consumers. That this predicament arose during a peak year of ore supply was accounted for in significant measure by vigorous activity of the Government in obtaining beryl for the National Strategic Stockpile and for the Atomic Energy Commission. The Emergency Procurement Service of the General Services Administration serves as purchasing agent for the Strategic Stockpile, and the Brush Beryllium Co., Cleveland, Ohio, performs a similar function for the Atomic Energy Commission.

Hanley, John B., Heinrich, E. William, and Page, Lincoln R., Pegmatite Investigations in Colorado Wyoming, and Utah, 1942–44: Geol. Survey Prof. Paper 227, 1950, 125 pp.

[5] Tyler, Paul M., Economic Importance of Pegmatites: Bureau of Mines Inf. Circ. 7550, 1950, 57 pp.

Material in the Strategic Stockpile cannot be released for consumption without Presidential order. Other factors that accentuated consumers' difficulties in acquiring an adequate ore supply were (1) continuance of a dual economy in which it was presumed that both normal commercial and growing military demands could be simultaneously satisfied, and (2) increased difficulty of consumers in obtaining export licenses for ore shipments from Brazil, the major source of beryl supply for the United States.

The major use for beryllium is in the form of an alloying element with copper, in which role its function has been likened to that of carbon in the formation of steel. Addition of fractional percentages, up to a few percent, of beryllium to copper forms a series of heat-treatable, high-strength, high-conductivity alloys of almost unequaled utility in fields where such properties are desired.

Beryllium, a steel-gray, light metal, hard enough to scratch glass, has no commercial uses as yet that require it in quantity. Small quantities are used in radiography, because of the transparency of beryllium to X-rays, and in neutron-generating sources composed of beryllium and certain radioactive elements emitting alpha radiation. Beryllium metal, oxide, carbide, and other compounds are of major interest in the atomic energy program for undisclosed applications.

Beryllium oxide is an unusual refractory substance, with heat conductivity equivalent to that of certain metals and a high melting point. It has aroused considerable interest in research programs devoted to developing ceramics and ceramic-metal (cermets and ceramels) combinations, sought for superduty service in jet engine and gas turbines.

Stocks.—Quantitative data on industry or Government stocks of beryl are not available for publication. The year 1950 saw a sharp rise in Government holdings and a correspondingly sharp drop in industry stocks. Although the aggregate of Government-industry stocks was favorable from the standpoint of numerical requirements, the fact that beryl contained in the National Strategic Stockpile was not available, without Presidential sanction, to an industry faced with mounting military orders created a serious supply situation near the end of 1950.

Prices.—E&MJ Metal and Mineral Markets quoted domestic beryl ore in 1950, f. o. b. mine, per unit BeO, 10–12 percent BeO, as follows: January 5, \$35 (Colorado); \$25–\$30 (North Carolina); May 11, nominal (Colorado); September 14, \$26–\$30 (North Carolina); December 21, \$28–\$30 (North Carolina). For imported ore, c. i. f. United States ports, per unit BeO, 10–12 percent BeO: January 5, \$26–\$30; April 27, \$26–\$28; May 11, \$26; December 14, \$26–\$30; December 21, \$28. Published prices for domestic beryl are only roughly indicative of average prices actually paid by consumers. In general, the higher figures quoted above were paid for beryl having an exceptionally high BeO content or for beryl destined for use in ceramics where consumption is relatively small and ore cost is not of paramount importance.

Beryllium-copper master alloy, 4 percent Be, opened the year at \$24.50 per pound of contained Be and increased on July 14 to \$30.

On November 15 prices increased further, with master alloy quoted at $1.56 per pound of alloy (a changeover from the previous practice of quoting on the basis of contained beryllium). On the latter date, beryllium-magnesium-aluminum and beryllium-aluminum master alloys were quoted at $55 and $69 per pound of contained beryllium, respectively. Beryllium metal, technical-grade pebbles, was offered at $65 per pound during 1950; premium grade was quoted at $85.

Foreign Trade.—United States imports of beryl in 1950 were the second highest on record, nearly equaling the peak year 1943, when 4,840 short tons were received. The Union of South Africa, South-West Africa, and Southern Rhodesia achieved first-rank importance as sources of beryl for United States consumers. All indications pointed to the African Continent continuing as a major supplier of beryl in future years.

Exports of beryllium metal, alloys, and scrap from the United States in 1950 totaled 220,918 pounds, valued at $307,929. Of this quantity, 143,366 pounds went to the United Kingdom, 24,808 to Sweden, 41,228 to Canada, and the remainder to eight other countries.

TABLE 3.—Beryllium ore (beryl concentrates) imported for consumption in the United States by countries, 1936–50, in short tons

[U. S. Department of Commerce]

Year	Argentina	Australia	Brazil	India	Mozambique	Southern Rhodesia	Union of South Africa (includes South-West Africa)	Other	Total	
									Short tons	Value
1936	154	--------	2	--------	--------	--------	6	--------	162	$6,681
1937	152	--------	--------	30	--------	--------	--------	--------	182	8,031
1938	78	--------	--------	58	--------	--------	10	--------	146	5,990

[1] Figure reported to Bureau of Mines; value not included in total value figure.
[2] Madagascar, 74 short tons; Portugal, 1 ton.
[3] Less than 1 ton.
[4] British East Africa (principally Uganda), 15 tons; Anglo-Egyptian Sudan, less than 1 ton.
[5] British East Africa (principally Uganda), 7 tons; Madagascar, 11 tons; Nigeria, 22 tons.
[6] Hong Kong, 18 tons (country of export only—ore produced principally in Brazil and Argentina before, or during, World War II); Chile, less than 1 ton.
[7] British East Africa, 11 tons; French Morocco, 22 tons; Japan, 107 tons; (country of transshipment only, *see* footnote 6 on Hong Kong for original source); Norway, 10 tons.
[8] British East Africa (principally Uganda), 11 tons; Canada, 29 tons; French Morocco, 77 tons; Portugal, 28 tons.

Technology.—Because of its significance in atomic energy applications and its relatively difficult fabrication, beryllium metal has been the subject of extensive research in recent years. Several papers were published in 1950 covering methods for its fabrication into large shapes by powder metallurgy [6] and its extrusion into rods and tubing.[7] A patent was issued covering a method for brazing beryllium.[8] The effect of beryllium as an alloying additive in stainless steel (0.09–1.73 percent Be),[9] and in sand-cast aluminum-magnesium alloy (up to 0.20 percent Be) was reviewed.[10]

Beryllium oxide received its share of attention in 1949–50 with publication of a paper describing its physical properties [11] and issuance of patents pertaining to procedures for its fusion,[12] purification,[13] and extraction from crude ore.[14] The beneficiation of low-grade beryl ore by nuclear techniques continued to receive attention; it was concluded, however, that practical application awaited development of a less costly source of gamma radiation and of a mechanical device suitable for handling the crushed feed material at a uniform rate.[15]

WORLD REVIEW

North America.—Although numerous beryl occurrences of possible commercial value exist in Canada, a token production only, principally for promotional purposes, was reported before 1950. In view of this situation, an event of some significance was importation into the United States in 1950 of 29 tons of beryl mined recently, in Ontario Province. Northern Canada Mines, Ltd., and Kirkland Lake Gold Mining Co. became joint holders of options on a beryl prospect near Mont Laurier, Quebec, about 100 miles north of Ottawa; exploration was planned to begin early in 1951.[16] Long-term plans of Northern Chemicals, Ltd. (controlled by Lithium Corp. of America), Winnipeg, include construction of a selective flotation plant for recovering beryl as a coproduct with spodumene, mica, and feldspar in the Cat Lake area of Manitoba.[17]

1 In addition to countries here covered, beryllium concentrates have been, or are being, produced in Finland and the U. S. S. R. Production has also been indicated in past years from British Somaliland, Kenya, Italy, Rumania, and China (Manchuria). No production data are available for any of these countries; however, except for the U. S. S. R., their aggregate output is not believed to be significant.

For years before 1935 production for certain countries has been reported as follows: Argentina, 1932—10 tons, 1933—none, 1934—none; Brazil, 1924-34, 12 tons; Canada, 1926—2 tons (exports), 1927—2 tons (exports); India, 1932—281 tons, 1933—324 tons, 1934—551 tons; Madagascar, 1916—6 tons, 1920—522 tons, 1925—20 tons (exports), 1928-34, inclusive, annual exports of about 15 tons are estimated; South-West Africa, 1933-34, 50 tons reported produced at Steinkopf; Union of South Africa, 1929—20 tons.

2 United States imports.

3 Data not available; estimates by chapter author included in world totals for 1945-50.

4 Preliminary figure.

5 Exports.

6 Less than 1 ton.

7 Estimated exports.

8 Estimated.

9 Covers Afghanistan, Anglo-Egyptian Sudan, Canada, Chile, France, Nigeria, Northern Rhodesia, Norway, and Tanganyika. *See also* footnote 1.

10 Canadian production of beryl unofficially reported as follows: 1936, 18 tons; 1937, 18; 1938, 9; 1939, 161. The reliability of these figures, however, is questionable, and they are not therefore included in the tabulation.

11 Anglo-Egyptian Sudan, less than 1 ton (United States imports).

12 Nigeria (United States imports).

13 France, 2 tons; Tanganyika, 2 tons (exports); Chile, less than 1 ton (United States imports).

14 Norway, 9 tons (United States imports); Tanganyika, 1 ton (exports); France, data not available (estimate by chapter author included in world total).

15 Afghanistan, 7 tons; Canada, 26 tons (United States imports); Northern Rhodesia, 5 tons; France, data not available; (estimate by chapter author included in world total).

South America.—The famed Las Tapias mine of Argentina, probably the largest individual producer of beryl in the world, is in the western part of Cordoba Province, a few miles northeast of Villa Dolores. Total beryl production from Las Tapias during 1937–42 was about 3,500 tons. Numerous other pegmatites in the vicinity are reported to contain beryl. The adjacent San Luis Province has also been a significant producer of beryl ore.

In recent years, movement of Argentine beryl to foreign consumers has been hampered by numerous legal restrictions. Executive Decree 9.594 of May 13, 1950, specifically places beryllium under State control with regard to both exploitation and ultimate destination. In Resolution 1.161/50 of August 10, 1950, complying with Decree 9.594, the Argentine Industrial Credit Bank was empowered to purchase, for the account of the Argentine Institute for the Promotion of Trade (AIPT), all stocks of beryl then in the hands of nonproducers, paying a maximum price of 500 pesos per metric ton. Producers of beryl were authorized to receive a price of 800 pesos per ton henceforth. From stocks accumulated through such purchases, it was stipulated that part be retained as a domestic reserve, the remainder to be made available for export through AIPT.

Vigorous promotion and development of beryl pegmatites in the east-central part of Minas Gerais State, Republic of Brazil, during the late 1940's resulted in that area equaling the output of the famed Northeastern States in 1949 and surpassing that production in 1950. In part, the ascendancy of Minas Gerais over the northeastern area was brought about by a major decline in beryl production in the States of Paraíba, Rio Grande do Norte, and Ceará. During the peak years 1940–44 about 400 mines are reported to have been operating in the northeast, compared with a small fraction of that number in recent years. Numerous reasons have been cited to account foı the decline, such as lack of pıice incentive, poor market for associated tantalite, competition of other industries for labor supply, and lack of equipment.

Chamber of Deputies Bill 290/50 of the Brazilian National Congress decreed creation of the National Council of Research. Bill 290 became Law 1310 of January 15, 1951, upon its publication in the Diario Oficial on January 16. The law gives the council general authority over materials needed for atomic energy, stating beryllium to be one such material. It further decrees that beryllium ore may be exported only by permission of the President of Brazil after consideration by specialized Government departments. Thus, legislative expression was given to the long-standing desire of various Brazilian groups to conserve certain raw materials for domestic processing or end-use. The Orquima Co., engaged in chemical processing of monazite sand at São Paulo, was giving long-range consideration to similarly processing beryl ore. In addition, a smaller company was laying similar plans for an operation in São Paulo.

Undeveloped beryl deposits were reliably reported to exist in the interior highlands of Surinam (Netherlands Guiana), near the Brazilian border.

Europe.—Important deposits of beryl were reported to have been found in France, north of the hamlet of La Vedrenne, between Ambozac and Bessines, in the Haute-Vienne, north of Limoges.[18] Beryllium copper is included among the products to be made by Vacuumschmelze, A. G., Western Germany. The company is successor to Heraeus Vacuumschmelze, A. G., whose works were damaged severely by bombing during World War II. Reconstruction of the damaged facilities is reported nearly complete.[19]

Africa.—Important beryl deposits are found at Muiane, Alto Ligonho, Mozambique. Beryl also occurs at Ribaue, in Nyassa Province.[20] The first production of beryl in Northern Rhodesia was reported in 1950—an output of 5 tons from an undesignated locality. Beginning with a modest output of only 25 short tons of beryl in 1949, Southern Rhodesia emerged in 1950 as a major source of beryl, producing 932 short tons during the year. Production came principally from Bikita, about 50 miles east of Fort Victoria; Douglas Lawrie, Ltd., was the largest individual operator. Significant quantities were also produced by G. H. Nolan and much smaller amounts by several other individuals. Beryl from Bikita is white or colorless, massive in occurrence, and easily overlooked by even the practiced eye.

Not until the fall of 1949, when an investigating team of the United States representatives seeking strategic minerals visited the tin-tantalite operations in the area, was the potential value of the Bikita pegmatites as a source of beryl recognized. Production of beryl on an important scale began immediately thereafter. Output to date has been almost entirely from surface rubble overlying the source pegmatites.

Search for beryl in Southern Rhodesia, inspired by the Bikita discovery, was reported to be the high light of 1950.[21] Small but significant output of beryl is realized from several small mines in the Salisbury district, notably the Augustus and Pope claims a few miles to the northeast, and from the nearby Hatfield granite quarries. Other productive areas are the Miami mica district 125 miles northwest of Salisbury and the Mtoko area 90 miles northeast of Salisbury.

Pegmatites in the Warmbad district of South-West Africa, near the Union of South Africa boundary, and in the Karibib-Usakos area east of Walvis Bay were the source of large tonnages of beryl in 1950, production establishing a new high record for the country. The Union of South Africa achieved the position of the world's second-largest producer of beryl in 1950, with an output of 844 metric tons. The productive area lies both south of and athwart the boundary with South-West Africa. Exportation of beryl from the Union is prohibited without permission of the Atomic Energy Board.

Asia.—Production of beryl was recently reported from the Kunar Valley, in Afghanistan; 7 tons of concentrates were exported to the United States in 1950.

[21] Rhodesian Mining Review, vol. 16, No. 7, July 1951, pp. 19, 21.

The Indian Government announced in April 1950 that awards would be granted for discovery of domestic deposits of uranium and beryllium ore. In the instance of beryllium, the new deposit would have to be not less than 50 miles from any other such deposit already known to the Indian Atomic Energy Commission. A reward, up to 2,000 rupees, would be authorized for any such discovery capable of producing 100 tons of beryl or other beryllium minerals in equivalent amounts.[22] The export embargo placed on beryl in 1946 continued throughout 1950. Negotiations were reported in progress between the Government of India and representatives of beryl-consuming countries, such as the United States and France; objectives were manifold, including the desire to free available beryl for export, to reactivate beryl mining, and to arrange for possible construction of a jointly owned and operated beryllium oxide plant in India.

BORON

Production.—Domestic boron master-alloy output in 1950 totaled about 500,000 pounds, compared to about 300,000 in 1949. Shipments of producers in 1950 closely approximated production; in 1949 shipments amounted to about 200,000 pounds of master alloy. Companies producing boron alloys and related compositions are as follows: (for discussion of boron minerals, *see* Borates in the Salines—Miscellaneous chapter of this volume.)

Producer:	*Products (figures in parentheses indicate percent boron)*
American Electro Metal Corp., Yonkers, N. Y.	Miscellaneous metal borides; experimental.
F. W. Berk Co., Inc., Wood-Ridge, N. J.	Boron (82–86).
Cooper Metallurgical Associates, Cleveland, Ohio.	Boron (95–99); borides of Zr, Ta, W, Ti, Cr, Th, Mo, Cb, Al; cobalt boron (15); aluminum boron (5–30); lithium boron (20); copper boron (10); aluminum-titanium boron (1); boron nitride.
Electro Metallurgical Division, Union Carbide & Carbon Corp., Niagara Falls, N. Y.	Ferroboron (17.5), manganese boron (15–20), nickel boron, cobalt boron, Silcaz (0.55–0.75), calcium boride, boron carbide.
Metal Hydrides, Inc., Beverly, Mass.	Borohydrides of sodium, lithium, beryllium, and other elements.
Molybdenum Corp. of America, Washington, Pa.	Ferroboron (10–19), manganese boron (18), cobalt boron (10–16), chromium boron (12–18), calcium boride (30).
Niagara Falls Smelting & Refining Division, Continental-United Industries, Inc., Buffalo, N. Y.	Manganese–aluminum boron (2), nickel-aluminum boron.
Norton Co., Worcester, Mass	Boron carbide, boron, ferroboron (9).
Ohio Ferro-Alloys Co., Philo, Ohio	Borosil (3.5).
Titanium Alloy Mfg. Division, National Lead Co., Niagara Falls, N.Y.	Carbortam (1–2).
U. S. Atomic Energy Commission, Oak Ridge, Tenn.	Boron isotopes B–10 and B–11.
Vanadium Corp. of America, Bridgeville, Pa.	Grainal alloys (0.2–0.5).

[22] Mining Record, vol. 61, No. 24, June 15, 1950, p. 6.

Uses.—The most important use of boron in metallurgy is in the form of boron master alloys, which are added to medium- and high-carbon steels to confer depth hardenability and to intensify the effects of other ferro-alloy elements that may be present. On the basis of conferring hardenability to steel, boron is several hundred times as effective, per unit weight, as manganese, chromium, nickel, and molybdenum. In a 0.40-percent carbon steel, for example, 0.002 percent B will do the job of 0.30 percent Mn, 0.35 Mo, 0.50 Cr, or 2.00 Ni. As shortages of high-alloy steels became more severe late in 1950 with the onset of the Korean hostilities and threatened to become further accentuated, boron steels were given a prominent place in the melting schedules of several major steel producers. During World War II the NE (National Emergency) series of boron steels was developed to combat shortages of scarce ferro-alloy elements. At the close of hostilities, however, use of boron steel declined sharply as the more familiar high-alloy equivalents once more became abundant. Much has been learned about the preparation of boron-steel melts and the subsequent heat treatment of the resultant steels, so much so that uniform properties can now be assured. The boron steels now in commercial preparation or impending contain even smaller amounts of the scarce ferro-alloy elements than did the NE steels. Standard carburizing grades of all steels—for example, SAE–AISI 1320, 2515, 3120, 4118, 4620, 5120, 8620, and 8720—can be replaced by boron steel of composition: 0.17–0.23 C, 0.45–0.75 Mn, 0.15–0.35 Cr, 0.20–0.40 Ni, 0.08–0.15 Mo, 0.002 B. Standard full-hardening grades, such as SAE-AISI 1340, 4047, 4640, 5140, 8640, 8740, and 9440, are replaceable by boron steel of composition: 0.36–0.44 C, 0.70–1.00 Mn, 0.20–0.40 Ni, 0.15–0.35 Cr, 0.08–0.15 Mo, plus boron.

Boron is found in nature as the mineral borax, which is sufficiently abundant for any presently conceivable ferro-alloy requirements for the element. It has been estimated that about 2 million tons of boron steels have been used, all-told, since the late 1930's. Over 2 million tons may be produced in 1951 alone, and a sharp rise to as high as 20 million tons a year in 1952 has been indicated.

Important developments in boron-titanium,[23] boron-columbium, and boron-molybdenum [24] steels were recorded in 1949, and the use of medium-carbon boron steel in production was described.[25] Increased chill-depth and hardness are imparted to cast iron,[26] and a refined grain is given aluminum alloys. A few hundredths of 1 percent of boron is introduced into aluminum and copper intended for use as electrical conductors, the element effecting neutralization of impurities of certain high-resistance ferro-alloy metals that are sometimes present. Calcium boride and other additives are finding increased use for deoxidizing both ferrous and nonferrous melts.

Boron carbide, the hardest commercial synthetic substance known, finds wide use in powder form as an abrasive and in fabricated wear-resistant parts, such as sand-blast nozzle linings and contact faces of high-precision dimension gages. The material is also used in molded form as dressing sticks for small grinding wheels, nozzle liners of jets employed in spray-drying starch and in debarking logs in the paper industry, pump-seal rings, and oil-well flow chokes. Experimental work on titanium-boron carbide molded parts has shown promise, the addition of titanium imparting toughness and improved resistance to spalling and chipping. During 1949 the Bureau of Mines continued to study boron carbide as a possible substitute for industrial diamonds in certain types of drilling equipment. Borides of certain ferro-alloy elements show much promise for high-temperature applications because of their near-metal properties, combined with unusual refractoriness and hardness.[27] A zirconium boride compound, developed in 1949 by the American Electro Metal Corp., Yonkers, N. Y., under an Office of Naval Research contract, survived the highest temperature blasts of any material tested to date that could be considered suitable for parts exposed to the temperatures attained in gas turbines and jet and rocket engines.[28] It was reported that the refractory borides would be of great value in the newly developed jet-aircraft industry of Sweden.[29]

Sodium and lithium borohydrides are powerful reducing agents in organic and inorganic synthesis at ordinary temperatures;[30] beryllium borohydride is the most efficient source of hydrogen known, 1 gram generating almost 5 liters of gas. Boron hydride continued to be of great interest because of its possible use as a high-energy fuel,[31] and patents were issued covering its preparation.[32] Boron trifluoride[33] and trichloride[34] are important raw materials in the organic chemical industry.

Prices.—During 1949 the prices of most boron-alloy additive agents remained unchanged from 1948; increases were noted in nearly every instance, however, by the end of 1950. Borosil declined in price from $6.25 to $4.25 per pound in August 1949, the new price continuing in effect through 1950.

Technology.—Methods were described for producing elemental boron,[35] for improving the quality of boron carbide,[36] and incorporating the latter compound in ferro-alloys.[37]

Foreign Trade and World Review.—Boron products are produced in Canada, principally for United States companies. Blackwell's Metallurgical Works, Ltd., Liverpool, and Murex, Ltd., Rainham, Essex, United Kingdom, produce boron alloys of the ferrous and nonferrous metals.

CALCIUM

Production.—The Electro Metallurgical Division, Union Carbide & Carbon Corp., Sault Ste. Marie, Mich., and the New England Lime Co., Canaan, Conn., produce metallic calcium. Data on 1950 production are not available for publication. Output in previous years has amounted to a few tens of thousands of pounds a year. The Ethyl Corp. continued to develop plans throughout the year for producing calcium metal on a large scale in a granular, crystalline, highly reactive form suitable for use in chemical and refining operations. The metal would be recovered at Baton Rouge, La., from calcium-rich sludges that accumulate during electrolytic production of sodium metal.

Uses.—Calcium is used in metal-refining operations and, in some instances, as an alloy constituent of both ferrous and nonferrous metals. Calcium is reported to be an effective inoculant in the production of nodular iron.[38] Calcium-silicon and calcium-manganese-silicon are widely employed as deoxidizers and degasifiers in steel making and are sometimes used to confer finer grain, impact strength, and improved fluidity to cast steel.[39] About 1 to 6 pounds of calcium-silicon are ordinarily used per ton of steel. Calcium hydride is, perhaps, the most powerful desiccant known, a valuable reductant in both organic and inorganic reactions, and a notable condensation agent in organic synthesis. As a portable source of hydrogen, the calcium hydride gas generator has found extensive use.

Prices.—Calcium metal, ton lots, was quoted at $2.05 per pound throughout 1950.

Foreign Trade.—During 1950 imports of calcium metal were received from Canada (75,729 pounds) and Germany (27 pounds). Calcium-silicon was received from Canada (424,440 pounds) and France (67,200 pounds).

CERIUM AND OTHER RARE-EARTH METALS

Prompted by swelling military and civilian requirements for rare-earth products, numerous companies were active in the United States during 1950 in both exploration for and development of monazite and bastnaesite deposits. In the instance of monazite, interest centered mainly along the western flank of the Idaho batholith in Idaho, where monazite-rich gold gravels have been known to exist for many years. Similar activity was reported in connection with certain alluvial deposits of western Montana. A small tonnage of monazite was recovered in 1950, as in several years previous, from the ilmenite-zircon-rutile operations of the Rutile Mining Co. of Florida near South Jacksonville, Fla. In the course of evaluating the thorium resources of the United States, the Bureau of Mines continued its detailed studies of monazite gravels, particularly in Idaho. In related work, centered mainly in the Southeastern States of Virginia, the Carolinas, and Georgia, the Geological Survey demonstrated the existence of alluvial monazite deposits over a much more extensive area than was previously known.

The deposit of bastnaesite and other rare-earth carbonate minerals northeast of Baker, Cal., which was discovered in 1949, attracted widespread attention in 1950. Mineralization was shown to exist beyond the original discovery locality, over an area extending several miles to the southeast. Late in 1950 a massive lode deposit of rare-earth carbonate minerals, about 20 acres in extent, was found near the southern extremity of the aforementioned area. Certain sections of the lode were estimated to assay up to 40 percent rare-earth oxides. Total rare-earth oxides contained in the lode, assuming continuation of surface values to a depth of 150 feet, was estimated to be of the order of 3 billion pounds.

Most of the mineralized area was acquired by the Molybdenum Corp. of America, and underground and surface exploration and development were begun. The exceptionally high rare-earth tenor of the newly discovered ore body, coupled with its size and amenability to low-cost surface operation, suggested strongly that, for the first time, a rare-earth ore might become available cheaply enough for large-scale exploitation.

In 1950 Shattuck Denn Mining Corp. made milling tests on about 100 tons of bastnaesite ore mined from a fluorspar property near Gallinas, N. Mex. The company reported that the cost of producing a salable grade of bastnaesite concentrate was prohibitive. Later in the year William Heim was reported to have operated on a small scale and successfully produced and shipped bastnaesite concentrates in conjunction with fluorspar operations.

The deposit of rare-earth minerals north of Sundance, Wyo., discovered in 1949, was core-drilled by the Bureau of Mines during the spring and summer of 1950. Large, low-grade reserves were found. No rare-earth mineral has yet been identified at this property, and a conclusion has been reached that the rare earths may be present in colloidal form associated with clay and iron oxides.

Production.—Data on output of mischmetal, ferrocerium, and other alloys of the rare-earth metals are not available for publication. Important domestic producers of the basic alloy, mischmetal, are Cerium Metals Corp., Niagara Falls, N. Y.; General Cerium Co., Edgewater, N. J.; and New Process Metals Co., Newark, N. J.

Consumption and Uses.—The master alloy of the rare-earth metals, mischmetal, is consumed domestically to the extent of a few hundred pounds a year at most. Principal uses are in production of ferrocerium for lighter flints, in preparation of rare-earth alloys of magnesium, and in production of certain special types of nodular cast iron. A comprehensive account of uses of the rare-earth metals and compounds was published.[40]

The marked effect of the rare-earth elements in conferring hot workability and toughness to steel was being closely scrutinized by several large steel producers. The improvement in workability results in substantial economies through better ingot-to-billet yields, less billet preparation, and improved hot-rolled strip surfaces. Indications were that use of rare earths would eliminate the cost of forging normally required for conferring toughness. The cumulative economies gained by employing the rare-earth elements, combined with the

[40] Kremers, Howard E., The Rare Earth Industry: Jour. Electrochem. Soc., vol. 96, No. 3, September 1949, pp. 152–157.

greatly increased abundance of their raw materials due to fortuitous recent discoveries, suggested that the rare earths might find use in the greater part of steels to be produced in future years.

Prices.—During 1950 mischmetal was quoted at $4.50 per pound, and ferrocerium cast into form for lighter flints was quoted at $8 per pound. Pure cerium metal (98 percent Ce) was offered at $25 per pound.

Foreign Trade.—Domestic receipts of mischmetal and ferrocerium in 1950 came exclusively from Canada; rare-earth compounds (chloride) imported originated entirely in Brazil.

Mischmetal and ferrocerium alloys were exported from the United States during 1950, in pounds, to the following countries: Germany, 34,382; Portugal, 15,200; Canada, 3,247; Belgium-Luxemburg, 2,204; Switzerland, 220; United Kingdom, 20. Data on exports of rare-earth compounds are not available.

World Review.—(*See* Monazite section, Minor Nonmetals chapter of this volume.)

CESIUM AND RUBIDIUM

Production.—De Rewal International Rare Metals Co., Philadelphia, Pa.; Fairmount Chemical Co., Newark, N. J., and A. D. Mackay, Inc., New York, N. Y., produce cesium and rubidium metals and compounds. Maywood Chemical Works, Maywood, N. J., produces cesium metal and its compounds and compounds of rubidium. General Electric Co. produces cesium metal at Scotia, N. Y. Foote Mineral Co., Philadelphia, Pa., makes cesium compounds. Harshaw Chemical Co., Cleveland, Ohio, proposes to grow optical crystals of cesium iodide and rubidium bromide, used for infrared spectrometry. The mineral pollucite, usually containing over 30 percent Cs_2O, has been the only commercial source of cesium to date;[41] rubidium is extracted from lepidolite, a lithium mica.

Uses.—Cesium is important as the active component in some types of photoelectric cells, in cesium-vapor lamps used by the Armed Forces for infrared signaling, and in the newly developed cesium-vapor rectifier.[42] A method for producing cesium compounds, adaptable to large-scale operation and based upon the preferential solubility of cesium bromide in liquid bromine, was patented.[43] In the fission of U–235, various long-lived radioisotopes of cesium are among the more abundant end products, one such, Cs–135, having a half-life exceeding 600,000 years.[44] As a consequence, much attention has been devoted to the chemistry of cesium by the Atomic Energy Commission in developing processes for separation and disposal of atomic pile waste products.

Rubidium, in general, has the same uses as cesium. Although much more abundant in nature than cesium, unlike the latter it forms no known minerals in which it is an essential or major constituent. The rubidium content of commercial potassium chloride recovered from subterranean Michigan brines is approximately 0.05 percent. According to estimates, about 1 ton of elemental rubidium per year might be obtained from such brines. The naturally occurring radioisotope Rb–87 has a half-life computed to be about 600,000,000 years.[45] A method for determining the age of rocks is based upon observing the ratio of Rb–87 content to that of the stable strontium end product.[46]

COLUMBIUM (NIOBIUM) AND TANTALUM

Mine Production.—About 2,700 pounds of tantalite-columbite were produced from domestic sources during 1950. Individuals and companies reporting output were George C. Bland, Walter Clifford, Francis Michaud, and Mineral Mills, Inc., Custer, S. Dak.; Black Hills Keystone Corp., Keystone, S. Dak.; Ralph R. Hermstain, Texas City, Colo.; and Beryllium Mining Co., Inc., Ohio City, Colo. Domestic mine shipments for 1950 totaled 1,000 pounds (*see* table 15). The occurrence of tantalum in the famous Harding mine near Dixon, N. Mex., was described.[47]

Domestic Refiners.—Essentially all concentrates of tantalum and columbium minerals of domestic or foreign origin are consumed by two companies: Fansteel Metallurgical Corp., North Chicago, Ill. (miscellaneous tantalum and columbium products), and the Electro Metallurgical Division of Union Carbide & Carbon Corp., Niagara Falls, N. Y. (ferrocolumbium and ferrocolumbium-tantalum).

Consumption and Uses.—Military requirements for columbium in the swiftly expanding jet-engine program so far transcended any known or hoped-for supply that drastic measures had to be taken for allocation, conservation, and substitution. Accordingly, the National Production Authority issued Order M–3 on October 20, 1950, stipulating that production, distribution, and use of ferrocolumbium and ferrocolumbium-tantalum be limited to "DO" defense rated orders which are reserved under the NPA priorities system to procurement by the Department of Defense and the Atomic Energy Commission. The order provided further that use of ferrocolumbium-bearing steels be prohibited wherever ferrocolumbium-tantalum steels might be substituted and that use of either type of steel be prohibited where any other substitute was available.

The function of columbium and columbium-tantalum in alloy steels varies according to the type of alloy in which it is used. The presence of one or both of these elements is required in austenitic stainless steels (Type 347, 18–8) as a carbide stabilizer, to inhibit intergranular corrosion in the temperature range 800°–1,600° F. Columbium and tantalum confer high-temperature strength and creep resistance to the important low-iron superduty alloys used for jet-engine parts exposed to extreme heat and operating strain. Improved ductility and reduction in tendency to air-harden are imparted to plain chromium stainless steels through addition of columbium or tantalum.

[47] Montgomery, Arthur, Geochemistry of Tantalum in the Harding Pegmatite: Am. Mineral., vol. 35, Nos. 9 and 10, 1950, pp. 853–66.

Ferrocolumbium.	40	----	----	----	55	5	----	----	----	----	----	Master alloy for making 347 and other alloys containing columbium.
Ferrocolumbium-tantalum.	40	----	----	----	40	20	----	----	----	----	----	Master alloy for making 347 Cb-Ta and other alloys containing columbium and tantalum.

Columbium in the form of metal or compounds has only slight commercial use. Conversely, tantalum is extensively employed in metal form because of its desirable combination of easy formability and resistance to oxidation and other types of chemical corrosion. Tantalum is employed in chemical-processing equipment, vacuum-tube parts, surgical sutures and repair items, and electrolytic condensers (in powder form). As a carbide, tantalum finds special application in cast alloys, in cutting tools, and in shell-nosing dies. Tantalum oxide, combined with other elemental oxides, such as those of lanthanum and tungsten, forms a lens composition used in aerial photography. Another important use of the oxide, highly critical during World War II, is as a catalyst (2 percent Ta_2O_5–98 percent SiO_2) for efficient conversion of acetaldehyde-ethyl alcohol to butadiene, a basic raw material for synthetic rubber production.[48]

Prices.—Domestic quotations on columbite concentrates are not available. The Metal Bulletin (London) quotations for columbite ore, 50–55 percent combined columbium-tantalum oxides, per unit, c. i. f., showed an unbroken rise throughout 1950 as follows: January 6, 110s.–115s.; April 14, 117s.6d.–122s.6d; June 30, 120s.–122s.6d; July 7, 122s.6d.–127s.6d.; July 28, 130s.–135s.; September 1, 130s.–150s.; December 1, 170s.–180s.; December 15, 250s.–260s. The unparalleled

[48] Corson, B. B., Jones, H. E., Walling, E. E., Hinckley, J. A., and Stahly, E. E., Butadiene from Ethyl Alcohol: Ind. Eng. Chem., vol. 42, No. 2, February 1950, pp. 359–373.

demand for columbite, principally in military aircraft, was the principal factor in driving prices to the highest level ever attained, the rise being unbroken over the 3-year period 1948–50. In 1948 prices increased from 65s. to 75s.; in 1949, from 75s. to 115s.; and in 1950, from 115s. to 260s. Tantalum ore continued to be quoted nominally at \$2–\$2.50 per pound Ta_2O_5 contained, 60 percent Ta_2O_5 minimum, price varying with impurities.

Reflecting the increased price of columbite ore, ferrocolumbium alloy, 50–60 percent Cb, rose in price from \$2.90 per pound contained Cb, delivered, in January, to \$3.50 in March and to \$4.90 in November. Ferrocolumbium-tantalum (40 percent Cb, 20 percent Ta) was quoted for the first time in March at \$2.67 per pound contained Cb plus Ta, delivered, an increase to \$3.75 per pound being noted in November. Standard columbium-stabilized stainless steel, type 347, was quoted in January at 20 cents per pound, f. o. b. producing point, the price rising to 21 cents in July and to 21½ cents in December. Prices on columbium metal have remained unchanged since 1948, being quoted at \$280 per kilogram for rod and \$250 for sheet. Similarly, tantalum rod was quoted at \$160.60 and sheet at \$143.

Foreign Trade.—An increase in United States imports of columbite over the previous year was realized in 1950. The increase, however, was only apparent, being in terms of gross weight of concentrates rather than effective columbium content. This situation was brought about because declining receipts of columbium-rich Nigerian concentrates were counterbalanced by a sharply increased intake of columbium-poor concentrates from the Belgian Congo. Increased diversion of Nigerian columbite to consumers in the United Kingdom and continental countries contributed significantly to the decline in United States receipts from West Africa. Alloys of columbium, principally ferrocolumbium, amounting to 268,424 pounds, valued at \$92,280, were imported from the United Kingdom during 1950.

Export of columbium ore comprised 109 pounds to Germany. No tantalum ore was exported. Columbium metal and alloys were exported amounting to 17 pounds, valued at \$1,231; tantalum metal and alloys totaling 1,282 pounds and valued at \$61,322 were shipped abroad.

TABLE 10.—Columbite imported for consumption in the United States, 1934–50, in pounds

[1] Classified by U. S. Department of Commerce as from New Zealand, which has no recorded production.
[2] Presumably country of transshipment rather than original source.
[3] Classified by U. S. Department of Commerce as British East Africa.
[4] Anglo-Egyptian Sudan, 98 pounds; Canada, 700 pounds.

WORLD REVIEW

Belgian Congo.—Long-range development of the tin-tantalite-columbite pegmatites athwart the border of the Congo and Ruanda-Urundi promised an eventual large increase in production from this area. The principal operation is the Geomines concern. Financial support to the expansion program is being supplied by the Economic Cooperation Administration.

British Guiana.—Columbite is known to exist in the basins of the Rumong-Rumong and Morabisi Rivers about 100 airline miles southwest of Georgetown. According to estimates the Morabisi area contains 1,000,000 cubic yards of material averaging 2 pounds of concentrate (assaying 44.3 percent Cb_2O_5 and 21.1 Ta_2O_5) per yard.[49]

Nigeria.—Columbite is produced in the Provinces of Bauchi, Benue, Kano, Niger, Plateau, and Zaria. Largest producers are Amalgamated Tin Mines of Nigeria, Ltd.; Jantar Nigeria Co. Ltd.; Bisichi Tin Co. (Nigeria), Ltd.; and Minerals Research Syndicate, Ltd. Reserves of columbite in Nigeria, as of March 31, 1950, were estimated at 7,000 long tons proved and 2,276 indicated.[50] Geological study indicated columbite to be widespread in the Younger granite, possibly as a primary accessory constituent. This granite was believed to constitute the primary source of the Jos Plateau columbite, as it occurs at the headwaters of the Forum River, above the extensive Jantar deposit, said to be the largest in the world.[51]

Columbite is generally recovered in Nigeria as a secondary item in the production of tin concentrates. According to reports, however, Jantar Nigeria Co., Ltd., and Minerals Research Syndicate, Ltd., operate certain areas primarily for columbite.[52] Despite unlimited consumer demand and all-time high prices, official sources indicated an unpromising long-term outlook because of dwindling tin reserves.

Norway.—European press reports indicated active support of the Economic Cooperation Administration in developing a large deposit of columbium minerals (koppite and columbite) occurring in limestone southwest of Oslo.

Swaziland.—Columbite-bearing gravels occur in the Forbes Reef area. Investigation of the deposits was continuing.[53]

Uganda.—The columbium mineral, pyrochlore, occurs in significant quantity in calcareous rocks of the Tororo neighborhood, Eastern Province.[54] Recovery of the pyrochlore is reportedly contingent upon development of a cement plant on the northeast slope of Sukulu Hill, about 3 miles from Tororo station. In the course of mining limestone for cement production, the heavy minerals, including pyrochlore, would be separated for special treatment. The Geological Survey of Uganda reported that special investigations of columbite-tantalite deposits were being made to determine operating costs.

United Kingdom.—The report of Murex, Ltd., for the year ended April 30, 1950, stated that new facilities had been installed for producing tantalum metal.

[1] Concentrates produced in Argentina, Belgian Congo, French Equatorial Africa and Mozambique are frequently termed "columbite-tantalite," this designation being applied because, in general, their composition ($Cb_2O_5+Ta_2O_5$) lies in an intermediate range, neither Cb_2O_5 nor Ta_2O_5 being strongly predominant. In tabulating production of columbite and tantalite, all output designated "columbite-tantalite" has arbitrarily been placed in the columbite table. Concentrates imported into the United States are designated specifically as either columbite or tantalite, this classification sometimes being arbitrary; therefore discrepancies between figures in the columbite and tantalite production tables and United States import tables for these minerals should be viewed accordingly. In addition to countries shown, production of columbite in Madagascar has been reported in 1921, 4,410 pounds; 1922, 660; 1945, 22. There is believed to be current production in Madagascar; however, data are not available. Bolivia reportedly produced 1,034 pounds in 1945 and 6,834 in 1946. Production in Malaya during the Japanese occupation was estimated at about 10,000 pounds.

[2] Estimated average Cb_2O_5 content of concentrates.

[3] Exports.

[4] Production of fergusonite in 1913, 100 pounds and 1914, 4,300 pounds.

[5] Data not available.

[6] Columbite and tantalite production in the United States not always differentiated; *see* table 15, on tantalite.

[7] Tin-columbite-tantalite concentrates, columbite-tantalite content unspecified, produced as follows: 1938, 20,066 pounds; 1939, 8,014 pounds; 1940, 1,546 pounds; 1943, 15,700 pounds.

[8] United States imports.

[9] Contained in 17,687 pounds mixed (presumably tin-columbite-tantalite) concentrates in 1945; in 7,706 pounds in 1946; in 3,651 pounds in 1947; in 3,203 pounds in 1948.

[10] Sales and exports.

[11] In addition, tin-columbite-tantalite concentrates were produced as follows: 1947, 597,555 pounds, columbite-tantalite content unspecified; 1948, 1,148,050 pounds, columbite-tantalite content 13 percent; 1949, 1,944,810 pounds, columbite-tantalite content 10 percent; 1950, 2,432,115 pounds, columbite-tantalite content unspecified.

[1] *See* table 14, footnote 1. United States imports show 98 pounds of tantalite received from Anglo-Egyptian Sudan in 1944; 700 from Canada in 1944; and 1,805 and 2,442 pounds from India in 1943 and 1944, respectively.
[2] Estimated average Ta_2O_5 content of concentrates.
[3] Prior to 1941, concentrates were designated as "tantalite-columbite"; however, in composition Ta_2O_5 was strongly predominant over Cb_2O_5, therefore these concentrates have been tabulated in this table, rather than table 14, on columbite. From 1941–48, inclusive, tantalite and columbite are differentiated.
[4] Data not available.
[5] Also Southern Rhodesia, 2,000 pounds.
[6] Small production reported, quantity unspecified.
[7] Also South-West Africa 672 pounds, Uganda 60,480 pounds.
[8] Also South-West Africa 661 pounds.
[9] Exports.
[10] *See also* table 14, on columbite.
[11] In addition, tin-tantalite concentrates, unspecified tantalite content, produced as follows: 1936, 1,165 pounds; 1937, 1,322 pounds; 1938, 1,366 pounds; 1940, 1,456 pounds; 1941, 370 pounds; 1942, 161 pounds; 1943, 560 pounds; 1944, 2,000 pounds.
[12] Principally microlite.
[13] Includes 6,720 pounds of bismutotantalite.
[14] Bismutotantalite.
[15] Tantalite-columbite.

GALLIUM

Production.—Gallium metal was produced in 1950 by the Aluminum Ore Co., East St. Louis, Ill., and the Anaconda Copper Mining Co., Great Falls, Mont. Eagle-Picher Lead Co., Joplin, Mo., a significant producer in previous years, reported no output in 1950. Gallium oxide and a small quantity of metal were produced by Saratoga Laboratories, Inc., Saratoga Springs, N. Y.

Uses.—Except for an exceedingly small intermittent consumption as a component in direct-reading high-temperature thermometers, no important specific uses for gallium have been developed to date.

Research has been directed toward developing applications, and wide publicity has been given to the element to arouse further interest in its possibilities.

Prices.—Quotations on gallium metal in 1950, 99.9 percent pure, declined below 1949, the metal being offered at $4.50 per gram in lots of less than 100 grams; $3.50 per gram, for 100 to 999 grams; and $3.00 per gram, for 1,000 to 2,499 grams. Metal of 99.99 percent purity commanded a premium of $0.25 per gram. For experimental use in schools and research institutions, the standard grade was quoted at $3 per gram in lots of more than 5 grams.

World Review.—Gallium and germanium are extracted commercially from flue dust in England, the development having been pioneered by the Chemical Research Laboratory.[55] Coals of Northumberland, Durham, and Yorkshire are richest in gallium and germanium, although nearly all British coals are reported abnormally rich in the elements. The National Physical Laboratory has devoted much attention to a study of the electrical properties of gallium. (*See* Germanium review, this chapter, for further data on gallium.)

GERMANIUM

Production.—During 1950 the Eagle-Picher Co., Joplin, Mo., continued its unbroken dominance in the production of germanium and its compounds. Small but significant quantities of germanium dioxide were produced by the American Steel & Wire Co. (subsidiary of U. S. Steel Corp.), Donora, Pa., and by Saratoga Laboratories, Inc., Saratoga Springs, N. Y.

The U. S. Geological Survey, in the course of its exhaustive study of trace elements in ash of American coals, reported an occurrence of germanium-rich lignite (Cupressinoxylon wardi) in the Patuxent formation in the District of Columbia and environs. Germanium content of the ash from the lignite ranged up to 6 percent, with many samples containing 3 to 5 percent; gallium ranged between 0.003 and 0.2 percent. The ash analyzed represented between 2 to 9 percent by weight of the lignite from which it was derived.[56]

Consumption and Uses.—Consumer interest was keen in 1950; and apparent consumption, based on producers' shipments, reached a new high. The principal use of germanium to date has been in metallic form in the rectification of high-frequency electrical currents in radar and television circuits. The rectifier consists of a germanium-metal wafer, measuring about 3 by 3 by 0.6 mm., in contact with a pointed tungsten wire. Current will flow readily from the tungsten wire to the germanium, but a strong resistance prevails to flow in the reverse direction. Germanium that functions in this way is known as N-type and will, if pure enough, withstand back-voltages of 150 volts or more before any significant reverse flow of current develops. When certain impurities, such as arsenic, are present in germanium, P-type metal is formed which possesses rectifying properties. The impressed current flows, however, from the metal wafer to the tungsten point, directly

[55] Mining Journal (London), Two New Metals for British Industry: Vol. 234, No. 5982, pp. 367–368.
[56] Stadnichenko, Taisia, Murata, K. J., and Axelrod, J. M., Germaniferous Lignite from the District of Columbia and Vicinity: Science, vol. 112, No. 2900, July 28, 1950, p. 109.

contrary to the N-type. N-type germanium is generally desired for commercial use. Arsenic content of not more than about 0.5 part per million is required.[57]

Probably the largest potential use for germanium is in the transistor, a three-element electronic device constructed similar to the diode but possessing two tungsten contact points instead of one. A small positive voltage is impressed upon one contact and a large negative voltage on the other. A small change in voltage at the positive contact causes a much greater change in the current flow across the negative contact, making the transistor behave as an amplifier similar to a three-element vacuum tube. Unlike the latter, however, no filament current is required. The exceedingly small size of the transistor opens up new vistas for the design engineer wherever space saving is imperative, as in hearing aids and electronic-control devices in military equipment, such as guided missiles and proximity fuses.

A new type of photoelectric cell, of which germanium is an essential part, was announced in 1950 by the Bell Telephone Laboratories. The new device, called the "phototransistor," is similar in construction to the rectifying diode, described above, being composed of a tiny germanium disk with a tungsten contact wire impressed upon it. Light striking the germanium wafer on the side opposite the wire varies the current flow in the wire, making a device similar in function to a photoelectric cell. The new type of electric eye approximates a small-caliber rifle cartridge in size.[58]

The General Electric Co. reopened its Clyde, N. Y., plant late in 1950 for the manufacture of germanium products, principally diodes. Nearly a million diodes were reported used in television receivers in 1950. Company officials predicted that over 3 million would be used in 1951 for television and radio and over 2 million for industrial and military applications.[59]

Technology.—The Industrial Research Division of Washington State College, Pullman, Wash., was reported active in research to improve the technique for removing germanium from electrolytic zinc solutions. As little as 1 part per million of germanium, when present in such solutions, can cause difficulty in the production of electrolytic zinc.[60] Methods for extracting germanium and gallium from flue dust were developed,[61] and patents were issued relating to the preparation of germanium alloys for use in rectifiers, transistors, and photosensitive cells.[62] Important papers were published discussing the physical properties of germanium metal and metallurgical problems connected with its preparation in different physical states.[63]

World Review.—The general field of semiconductors, of which germanium is an example, was covered in a conference July 10–15, 1950, at the University of Reading, England. Research workers on semiconductors from Great Britain, the United States, Czechoslovakia, France, the Netherlands, Sweden, and Switzerland were reported in attendance. The conference, assisted by the United Nations Educational, Scientific, and Cultural Organization, was under the auspices of the International Union of Physics, in cooperation with the Royal Society.

Occurrence of the mineral renierite $(Cu,Fe)_3$ (Fe, Ge, Zn, Sn) $(S,As)_4$, reported to exist in quantity at Kipushi, Belgian Congo, was further described.[64] Renierite analyses have shown a germaniun content of 6.37 to 7.80 percent. Ash from some Indian coals was shown to contain germanium in the range of 0.1 percent.[65]

(*See* Gallium review, this chapter, for additional information on germanium.)

INDIUM

Production.—Domestic output of indium in 1950 reached an all-time high. Principal producers of indium are the American Smelting & Refining Co., Denver, Colo., and Perth Amboy, N. J., and the Anaconda Copper Mining Co., Great Falls, Mont. Other producers are the American Steel & Wire Co. (subsidiary of U. S. Steel Corp.), Donora, Pa., and the National Zinc Co., Bartlesville, Okla.

TABLE 16.—Producers' shipments of indium, 1941–50 [1]

Year	Troy ounces	Price per troy ounce [2]	Year	Troy ounces	Price per troy ounce [2]
1941	[3] 7,000	(4)	1946	9,667	$2.25
1942	[3] 21,000	$30–$15	1947	13,908	2.25
1943	59,568	$15–$10	1948	12,202	2.25
1944	82,427	$10–$ 7.50	1949	54,784	2.25
1945	57,434	$7.50–$ 2.25	1950	125,777	2.25

[1] Includes metal content of compounds.
[2] Nominal published prices, electrolytic grade, 99.9 percent.
[3] Estimated.
[4] Not available.

Uses.—Indium is consumed principally in producing high-quality engine bearings and, to a smaller extent, in fusible alloys and special solders.

Stocks.—Producers' year-end stocks of indium and its compounds in 1950 were nearly double those of 1949.

Technology.—An exhaustive bibliography on the subject of indium, covering 1863–1949, was published in 1950.[66] The process of recovering indium from the Rammelsberg ores of Germany was described.[67] Several patents were issued pertaining to the production [68] and use [69] of indium.

LITHIUM

Lithium is silver-white and the lightest of all metals, being about half as heavy as water. It is soft, ductile, and readily extrudable, like soft lead.

Production.—Maywood Chemical Works, Maywood, N. J., and Metalloy Corp. (subsidiary of Lithium Corp. of America), Minneapolis, Minn., reported output of lithium metal in 1950. Domestic production usually amounts to a few tens of thousands of pounds a year. Metalloy Corp. completed its program of plant expansion during 1950, making possible enlarged output of lithium metal and other lithium products (*see* Minor Nonmetals chapter, this volume, for information on lithium minerals and chemicals).

Consumption and Uses.—Apparent consumption of lithium metal in 1950 exceeded that for 1949 by about 70 percent.

The principal application for lithium metal is in the metallurgical field for degasification and deoxidation of high-conductivity copper and other nonferrous metals. Lithium metal is also used in certain organic chemical reactions and has figured prominently in press reports as a source of tritium for the thermonuclear bomb ("hydrogen bomb") project of the United States Atomic Energy Commission. Lithium–6, an abundant isotope, present in natural lithium metal, yields tritium when bombarded by neutrons.[70]

Magnesium-lithium alloys, potentially important because of their strength and light weight, continued to hold the interest of research groups.[71]

Prices.—Lithium metal, 98 percent pure, was quoted throughout 1950 at $9.85–$11 per pound by E&MJ Metal and Mineral Markets.

Canada.—The Dominion Department of Mines, Ottawa, Ontario, has been active in research devoted to the direct production of lithium metal from spodumene. Considerable work has been done on the problem of making high-purity lithium, particularly with reference to removing the undesirably high sodium content of currently available commercial lithium metal.

RHENIUM AND TECHNETIUM

Rhenium metal and potassium perrhenate were derived from molybdenite-roaster flue dust by the chemistry department of the University of Tennessee, at Knoxville. The Kupferkammer lead smelter of Mansfeld Kupferbergbau und Hüttenwerk, Hettstedt, Eastern Germany, is reported to have produced rhenium since October 1949.[72] Certain molybdenites are the richest-known natural source of rhenium, containing as much as 0.32 percent Re.[73] The element and its compounds were reviewed and methods described for its extraction and

determination in molybdenite [74] and electroplating on base metals.[75] Because of its scarcity, rhenium has found little use other than in research but is known to have exceptional corrosion resistance and catalytic properties.[76]

Technetium, element 43, is closely related to rhenium in properties and was formerly known as masurium. It was first identified in 1937 and produced by bombardment of molybdenum with neutrons or deuterons. Later, a long-lived isotope of technetium, Tc–99, was found to be produced in relatively large proportions as a result of the fission of U–235 in the atomic pile.[77] The half-life of Tc–99 has been tentatively estimated at about 940,000 years.[78] The name technetium derived from the Greek, alludes to the artificial origin of the element, no positive evidence of its existence in nature ever having been observed.

SELENIUM AND TELLURIUM

Production.—Companies reporting output of selenium and tellurium in 1950 were the American Smelting & Refining Co., Baltimore, Md.; U. S. Metals Refining Co., Carteret, N. J.; International Smelting & Refining Co., Perth Amboy, N. J.; and United States Smelting, Refining & Mining Co. (tellurium only), East Chicago, Ind. Facilities for producing selenium and tellurium were installed by the Kennecott Copper Co. at Garfield, Utah, in conjunction with the company's new electrolytic copper refinery. Installation of these new facilities could not be expected to increase the over-all supply of selenium and tellurium, inasmuch as the anode muds to be treated had previously been shipped to recovery plants on the eastern seaboard.

TABLE 17.—Salient statistics of elemental selenium and tellurium in the United States, 1941–45 (average) and 1946–50, in pounds

Year	Selenium					Tellurium		
	Production	Producers' shipments	Producers' stocks at end of year	Imports [1] Pounds	Imports [1] Value	Production	Producers' shipments	Producers' stocks at end of year
1941–45 (average)	558,009	552,062	370,749	136,055	$224,742	130,944	101,338	130,427
1946	291,103	405,226	257,135	[2] 475,881	806,205	3,765	38,523	148,769
1947	512,648	489,415	280,368	529,175	893,171	45,248	71,300	122,717
1948	561,156	570,718	270,806	267,118	489,762	48,806	78,788	92,735
1949	468,502	317,960	334,067	171,581	317,145	109,021	64,278	135,605
1950	511,325	723,128	124,201	363,312	767,952	59,713	98,070	97,249

[78] Motta, E. E., Boyd, G. E., and Larson, Q. V., Production and Properties of a Long-Lived Radioisotope of Element 43: Phys. Rev., vol. 72, No. 12, 1947, p. 1270.

Consumption and Uses.—Heavy demands for selenium for both civilian and military requirements brought about a critical supply situation in the late months of 1950. The Bureau of Mines initiated measures aimed to increase the supply through development of more effective recovery methods or discovery of new raw-material sources. The National Production Authority began to consider measures for allocating the dwindling supplies.

The major part of selenium consumed is in the elemental form; three principal grades are most commonly used; Commercial Grade (99.5 percent), DDQ (double-distilled quartz, 99.95 percent), and High Grade (99.99 percent plus). Consumption of selenium is confined largely to the electronics, glass, rubber, ferro-alloy, and pigments industries. The electronics industry generally requires the highest-purity grades.

Tellurium is roughly similar to selenium in properties and in certain applications may be substituted for it.

Prices.—The published quotation for selenium, black, powdered, 99.5 percent pure, was $2.00 per pound at the beginning of the year, increased to $2.25 on July 20 and $3.00–3.50 on October 5, and remained unchanged thereafter. Tellurium was quoted at $1.75 per pound throughout 1950, as in 1948 and 1949.

Foreign Trade.—Imports of selenium and salts into the United States in 1950 were principally from Canada, the source of about 94 percent of the total. Most of the remainder was received from Belgium-Luxembourg, Sweden, Germany, and France. No transactions on tellurium and salts were reported. Data on exports of selenium and tellurium from the United States are not available.

Technology.—Papers were published on the electrical properties of antimony-selenium alloys [79] and on methods of electroplating selenium,[80] and of removing both selenium and tellurium from partly refined copper.[81]

World Review.—Total Canadian production of selenium and tellurium in 1950 amounted, respectively, to 261,973 pounds, valued at C$633,975, and 10,075 pounds, valued at C$19,143. International Nickel Co. of Canada, which produces selenium and tellurium at its Copper Cliff refinery near Sudbury, Ontario, reported 1949 shipments of 117,636 pounds of selenium and 9,191 pounds of tellurium. Selenium and its compounds are produced by the same company at its Clydach refinery, near Swansea, Wales, United Kingdom.

Selenium and tellurium are produced in Australia by the Electrolytic Refining & Smelting Co. of Australia Pty., Ltd., Port Kembla, from the company's own anode muds and from those obtained from the Mount Lyell Mining & Railway Co., Queenstown, Tasmania.[82] Australian production of selenium is about 2 tons per annum. Broken Hill Associated Smelters Pty., Ltd., produces tellurium-lead and tellurium-king alloys, output during 1938–47 totaling 810 and 10.9 long tons, respectively.

[81] Baker, W. A., and Hallowes, A. P. C., Experiments on the Removal of Selenium and Tellurium from Blister and Fire-Refined Copper: Bull. Inst. Min. and Met., No. 521, April 1950, pp. 49-50.

[82] Dimmick, T. D., Minor Metals: Mineral Resources of Australia, Dept. of Supply and Development, Bureau of Mineral Resources, Geology and Geophysics, Summary Rept. 35, September 1949, p. 13.

THALLIUM

Production.—Output of thallium metal and sulfate in the United States generally amounts to a few thousand pounds a year. The American Smelting & Refining Co. is the only domestic producer. During 1950 owners of thallium-rich ore deposits and tailing dumps at Mercur, Utah, continued their efforts to develop new markets for thallium and its compounds.

Consumption and Uses.—Demand for thallium in rodenticides, its principal use, increased markedly in 1950, resulting in an abrupt rise in producers' shipments.

Prices.—Thallium metal and sulfate were offered throughout 1950 at $12.50 and $10.50 per pound, respectively, in 10-pound lots.

Technology.—The Bureau of Mines issued reports on the general subject of thallium [83] and on a method for its spectrochemical determination.[84] Patents were issued covering glass [85] and alloy [86] compositions.

World Review.—Thallium is present in the base-metal ores of Mount Isa, Queensland, Australia. About 1½ tons of thallium per month are reported to enter the smelter, but are not recovered because demand is insufficient to warrant installation of extractive facilities.[87]

ZIRCONIUM

Mine Production.—Domestic output of zircon concentrate in 1950 soared to the highest figure on record, production coming principally from the Rutile Mining Co. of Florida, South Jacksonville, Fla., and the Humphreys Gold Corp., Starke, Fla. A token output was reported by Florida Ore Processing Co., Inc., Melbourne, Fla. The large increase in production in 1950 was accounted for by sharply accelerated zircon recovery at the new plant of Humphreys Gold Corp., which began operations in a small way in 1949. Humphreys Gold Corp. operates the titanium-mineral concentrator of E. I. du Pont de Nemours & Co., at Starke, Fla., on a contract basis; all zircon production of the corporation is ultimately obtained from treatment of concentrator rejects. The du Pont Co. reported that monthly sand output from the dredge to its black-sand concentrator slightly exceeded 500,000 tons in 1950 and that operational difficulties in 1949 had been solved in large part.

Zircon-rich concentrator rejects were accumulated in the vicinity of McCall, Idaho, as a consequence of vigorous development of monazite recovery from black sands in that area; however, no production of high-grade zircon concentrate was reported from Idaho in 1950.

[86] Hensel, F. R., and Larsen, Earl I. (assigned to P. R. Malloy and Co., Inc.), Aluminum-Thallium Bearing: U. S. Patent 2,531,910, Nov. 28, 1950.

[87] Chemical Engineering and Mining Review, vol. 42, No. 12, Sept. 11, 1950, p. 491.

United States reserves of zircon contained in contemporary and ancient beach-sand deposits of Florida and in gold gravels of Idaho are noteworthy. The Bureau of Mines reported Florida zircon reserves to be enormously large as compared with United States requirements.[88]

Stocks.—Industry inventories of zircon (including a small quantity of baddeleyite) at the close of 1950 approximated 8,100 tons compared with 8,700 for 1949. Stocks of unseparated zircon-rutile concentrate at the end of 1950 totaled 2,400 tons (zircon content, about 1,500 tons), compared with only 300 tons (zircon content, 250 tons) for 1949.

Prices.—Zircon concentrate (65 percent ZrO_2), c. i. f. Atlantic ports, per ton, was quoted in E&MJ Metal and Mineral Markets during 1950 as follows: $40–$45, at beginning of year, $42–$47 on July 27, $45–$50 on October 26, and $50–$55 on November 9. Zirconium-metal powder was quoted throughout 1950 at $7–$8 per pound.

TABLE 18.—Zirconium ore (concentrates) imported for consumption in the United States, 1946–50, by countries, in short tons [1]

[U. S. Department of Commerce]

Year	Australia [2]	Brazil	Canada	India	Total	
					Short tons	Value
1946	14,379	2,431	4		16,814	$453,458
1947	21,894	4,619	[3] 2	4,181	30,696	891,161
1948	14,320	3,553	2	279	18,154	571,161
1949	18,839	1,994			20,833	636,529
1950	15,988	697	141		16,826	431,107

[1] Concentrates from Australia are either zircon or mixed zircon-rutile-ilmenite, and those from Brazil are either baddeleyite or zircon. All other imports are zircon only.

[2] Imports of zircon, rutile, and ilmenite from Australia until early 1948 were largely in the form of mixed concentrates. These mixed concentrates are classified by the U. S. Department of Commerce as one of the following: "Zirconium ore," "rutile," or "ilmenite." Total zircon content of the "Zirconium ore" (as shown in this table) and of the "rutile" and "ilmenite" concentrates (*see* Titanium chapter) are estimated as follows: 1946, 11,535 tons; 1947, 22,727 tons; 1948, 13,873 tons; 1949, 14,623 tons; and 1950, 15,098 tons.

[3] Revised figure.

Minor Nonmetals

By F. D. Lamb, O. S. North, H. P. Chandler, and J. C. Arundale[1]

GRAPHITE

PRODUCTION of domestic natural graphite in 1950 decreased to 5,102 short tons compared with 6,102 tons in 1949, while shipments increased to 5,605 tons valued at $427,908 compared with 5,213 tons valued at $475,264. The manufacture of artificial graphite continued to increase, but the Bureau of Mines is not at liberty to publish detailed figures for this type of graphite. There are too few domestic producers to allow publication of separate statistics on natural crystalline and amorphous graphite. However, table 1 shows combined figures for 1945–50.

During the year the Bureau of Standards conducted an investigation of the usability of domestic graphite for the manufacture of crucibles. The investigation is still in progress, but results to date have shown that domestic graphite of comparable flake sizes and carbon content can be used in place of Madagascar flake graphite with equal success.

TABLE 1.—Production and shipments of natural graphite in the United States, 1945–50

Year	Production (short tons)	Shipments: Short tons	Shipments: Value	Year	Production (short tons)	Shipments: Short tons	Shipments: Value
1945	4,888	5,334	$289,207	1948	9,949	9,871	$450,759
1946	5,575	4,844	252,596	1949	6,102	[1] 5,213	475,264
1947	4,387	5,207	221,260	1950	5,102	5,605	427,908

[1] Partly estimated.

Consumption.—Although coverage of the graphite consumption canvass is incomplete, the totals obtained indicate at least the minimum quantities of graphite used in making various products. The 1950 totals for the various uses are shown in table 2.

TABLE 2.—Consumption of natural graphite in the United States in 1950, by uses

Use	Short tons	Value	Use	Short tons	Value
Foundry facings	6,581	$481,196	Paints and polish	175	$16,988
Batteries	3,314	166,200	Packings	127	47,847
Lubricants	3,624	488,921	Retorts	335	83,135
Crucibles	2,200	497,653	Bearings	46	20,456
Stoppers, sleeves, and nozzles	1,080	222,999	Other [1]	2,217	734,818
Pencils	1,179	250,548	Total	20,878	3,010,761

[1] Includes brake lining, carbon brushes, electrodes, etc.

Prices.—Quotations for graphite increased during the year on certain grades, and at the year end the trade-journal listings were as follows: Madagascar, c. i. f., New York, standard grades, 85 to 87

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

percent carbon, $215 per ton; special mesh $270–$300; special grade 99 percent carbon, $700. Amorphous graphite, Mexican, f. o. b. point of shipment (Mexico), per metric ton $9–$16, depending on grade.

Foreign Trade.—Imports of graphite were considerably greater in 1950 than during 1949, as shown in table 3. The imports amounted to 43,669 short tons valued at $2,080,346—an increase of 37 percent in quantity and 65 percent in value from the 1949 figures. This increase in total imports was due largely to increased production of crystalline flake graphite in Madagascar and amorphous graphite in Ceylon and Mexico.

[1] Revised figure. [2] Less than 0.5 ton.

The United States tariff rates on graphite, effective January 1, 1948, remained in effect during 1950. They are: Amorphous, natural and artificial, 5 percent ad valorem; crystalline flake, 15 percent ad valorem, with a specific minimum of 0.4125 cent per pound and a specific maximum of 0.825 cent per pound; crucible flake and dust and other crystalline lump and chip, 7½ percent ad valorem.

Exports of natural graphite, 1946–48 were: 1946, 2,313 tons, $267,137; 1947, 1,546 tons, $171,607; 1948, 1,047 tons, $127,931. Data for 1949 and 1950 are shown in table 4.

[1] In addition to countries listed, graphite has been produced in Bulgaria, Finland, French Equatorial Africa, Greenland, Nyasaland, Peru, Uruguay, and U. S. S. R., but production data are not available. No estimates for these countries are included in totals.
[2] Data not available; estimates by author of chapter included in total.
[3] Excluding South Australia.
[4] Estimated Japanese imports from Manchuria.
[5] Estimate.
[6] South Korea only.
[7] Exports.

Exports of graphite from Madagascar in 1950 were greater than in any year since 1944 and reached a total of 12,757 metric tons. However, at the end of the year there was a shortage of Madagascar graphite, caused by an increase in world demand, Government purchasing, and lack of consumers' stocks which had been used up during 1948–49.

GREENSAND

Domestic firms reported the production of 3,935 short tons of greensand during 1950. The following companies reported production: The Permutit Co., 330 West Forty-second Street, New York 18, N. Y., Zeolite Chemical Co., Medford, N. J., and the Inversand Co., 226 Atlantic Avenue, Clayton, N. J. As for the past several years, all production was from open-pit operations in Burlington and

Gloucester Counties, N. J., and was sold for use in water softening and purification.

Prices of refined greensand, f. o. b. shipping point, ranged from approximately $62 to $115 per short ton.

TABLE 6.—Greensand marl sold or used by producers in the United States, 1945–50

Year	Short tons	Value	Year	Short tons	Value
1945	4,986	$477,919	1948	7,269	$392,959
1946	5,140	424,900	1949	6,128	276,564
1947	8,337	432,980	1950	3,935	304,321

KYANITE, ANDALUSITE, SILLIMANITE, AND DUMORTIERITE

Production.—The Bureau of Mines is not at liberty to publish the figures on domestic production of kyanite because there were only two producers during the year. These were Commercialores, Inc., 39 Cortlandt Street, New York, N. Y., from deposits near Clover, S. C., and Kyanite Mining Corp., Cullen, Va., from a property near Farmville, Prince Edward County, Va. Both of these firms reported increased output during the year.

All former producers of andalusite and dumorierite reported cessation of operations before 1950.

Results of a Bureau of Mines investigation of a South Carolina deposit of sillimanite-schist were published.[2] The deposit is in Spartanburg County. The exploration work consisted of six diamond-drill holes totaling over 680 feet. Although the maximum limits of mineralization have not been determined, the work indicated that the deposit is relatively shallow, with the content of 20 samples ranging from 3 to 30 percent sillimanite in the schist.

Consumption and Stocks.—Consumption of imported kyanite was 15,874 short tons in 1950 compared with 9,655 short tons in 1949.

Year-end stocks of imported kyanite were 4,772 short tons in 1950 compared with 4,664 short tons in 1949.

Prices.—Trade-journal quotations for domestic kyanite in December 1950 per ton f. o. b. point of shipment, Virginia, were as follows: 35-mesh, carlots, in bulk $26, in bags $29; for 200-mesh, in bags, carlots $37. Imported kyanite in bags was quoted at $47 to $50 per ton nominal, c. i. f. Atlantic ports.

Foreign Trade.—Data on imports and exports of kyanite and allied minerals are shown in table 7. Imports of 17,417 tons, principally from India and British East Africa, were the largest on record, with imports from India nearly double those of the previous year.

Angola.—The local press announced the discovery of kyanite in Angola in what are alleged to be fairly extensive deposits. They were discovered by technical personnel of the Services of Geology and Mines of the Angolan Government.[3]

Another showing of kyanite was disclosed in a mica operation. The operator's preliminary survey indicates a minimum of 5,000 to 6,000

[1] Revised figure.

tons of reserves and a possibility of 20,000 tons. The principal deterrents to exploitation of the deposit, should it prove satisfactory in analysis, are the high costs of transportation over poor roads to the port of Luanda, the critical shortage of native labor, and lack of water supply.[4]

India.—Kyanite produced in Bihar and Orissa is exported almost entirely to foreign markets. Consumption of kyanite by the refractory industry in India is negligible. The occurrence of kyanite in the Thirumalapur and Mavinkere areas of the Hassan District, Mysore State, was noted before 1929; however, the deposit was not worked until 1943. In the Thirumalapur area kyanite occurs as a bladed variety in a schist belt. Work in a small area indicates that reserves may not exceed 50,000 tons. However, additional areas in the same region contain kyanite. In the Mavinkere area massive bluish kyanite occurs in association with a peculiar type of pinkish corundum. The kyanite zone is reported to be over 880 yards long and 200 to 600 feet wide. The kyanite occurs in lode form, with an average thickness of 40 feet in the exposed area. Investigation of the exposed area indicates that the lode extends beyond a depth of 30 feet. On the basis of a 30-foot depth, reserves were calculated to exceed 250,000 long tons. New areas in this locality are being investigated.[5]

Surinam.—The Sara Creek Goldfields Co. obtained a grant of 25,000 guilders to prospect for and develop a deposit of kyanite reported to occur on the Lawa River. The funds were obtained from the "Prosperity Fund" furnished by the Netherlands.[6]

LITHIUM MINERALS

Rapid increase in the consumption of lithium minerals and compounds resulted in shipments during 1950 of 9,306 short tons of lithium-bearing ores and compounds containing 747 short tons of Li_2O—a figure exceeded only in 1944. At the end of the year the outlook was for further expansion of consumption of lithium minerals and compounds, and most of the producers had plans for expanding or had completed expanding their facilities for both mining and processing lithium ores and compounds. The Metalloy Corp. had completed a program of expansion of its facilities at Minneapolis.[7]

Foote Mineral Co. acquired properties near Kings Mountain, N. C., on which large deposits of spodumene-bearing ore occur, as well as the plant at this property, which was operated during World War II for recovering spodumene. Operations were suspended in February 1945 after Government contracts were canceled. The firm began rehabilitating this plant and planned to resume production in the fall of 1951. Indicated and inferred reserves of spodumene in the pegmatites of this area are considered to be very large.

TABLE 8.—Shipments of lithium ores and compounds from mines in the United States, 1935–39 (average) and 1946–50

Year	Ore (short tons)	Value	Li_2O (short tons)	Year	Ore (short tons)	Value	Li_2O (short tons)
1935–39 (average)	1,327	$48,280	88	1948	3,881	$210,792	291
1946	3,065	303,892	323	1949	4,838	345,970	475
1947	2,441	151,113	199	1950	9,306	579,922	747

Production.—In 1950 the following firms reported production of lithium ores and compounds: American Potash & Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif., on Searles Lake (crude sodium lithium phosphate); Black Hills Keystone Corp., Keystone, S. Dak. (amblygonite and spodumene); George C. Bland, Hill City, S. Dak. (spodumene); Walter Clifford, Custer, S. Dak. (spodumene); John Fisher, Custer, S. Dak., mine at Keystone (spodumene); Lithium Corp. of America, Inc., 2560 Rand Tower, Minneapolis, Minn., mine at Keystone, S. Dak. (spodumene); Maywood Chemical Works, Maywood, N. J., mine at Keystone, S. Dak. (spodumene); New Mexico Mining & Construction Co., Dixon, N. Mex. (lepidolite); and Whitehall Co., Inc., 17 Battery Place, New York 4, N. Y., mine at Newry, Maine (spodumene).

Uses.—The commercial possibilities of the mineral petalite, a lithium-aluminum silicate, were discussed in an article.[8] Recent discoveries of substantial quantities of petalite in southwest Africa have improved the likelihood of this material being commercially utilized in heat-resisting ceramics, porcelain enamels, and glasses.

The use of lithium-base greases has increased rapidly in the past few years, and this use accounts for a large portion of the consumption of

[7] Oil, Paint and Drug Reporter, vol. 157, No. 17, Apr. 24, 1950, p. 42.
[8] Clark, John D., Petalite—A New Commercial Mineral: Min. Eng., Trans. Am. Inst. Min. and Met. Eng., vol. 187, No. 10, October 1950, pp. 1068–1070.

lithium compounds. A detailed discussion of the uses of lithium-base "all-purpose" greases and their preparation was presented in an article.[9] Another very important use for lithium minerals and compounds is in various types of ceramic materials and glasses. A publication issued during the year reviewed these uses. This publication also contains an excellent bibliography of lithium ceramic references.[10]

The properties and uses of lithium chemicals as presented in the literature since 1940 were summarized in a booklet issued during the year.[11]

The applications and potential uses of lithia-bearing compounds in whiteware were reviewed briefly.[12]

A comprehensive discussion of spodumene as a flux in sanitary chinaware bodies was presented. Four groups of body compositions involving partial replacement of feldspar by spodumene were investigated.[13]

Technology.—A research project designed to produce additional data on the general fluxing characteristics of spodumene in glasses and whiteware bodies was initiated by the Department of Engineering Research, North Carolina State College, Raleigh, N. C.[14]

The results of valuable basic research in the lithia-alumina silica system were published.[15]

The production of lithium and other metals by the vacuum metallurgy method was reviewed.[16]

The production of lithium chloride and metallic lithium was discussed in an article.[17]

Prices.—Trade-journal quotations of prices for lithium ores were as follows: Amblygonite, air-floated, carlots, unchanged at $110 per ton; lepidolite, 4 percent Li_2O, powdered, carlots, unchanged at $80 per ton; spodumene, per short ton unit lithium oxide contained, unchanged at $6–$8 on 6-percent grade, carlots. These prices are nominal.

The American Potash & Chemical Corp. announced a price increase of approximately 10 percent effective November 1 on the dilithium sodium phosphate. The new price was $9 per unit of Li_2O.[18]

Canada.—The lithium-bearing pegmatites in northern Quebec were described in considerable detail. Lithium minerals occur in many of the pegmatites along the margins of a granitic stock in LaCorne Township, north of Val d'Or, Quebec. These dikes are unusually uniform in texture and average percentage of the spodumene in individual dikes. One series shows an average spodumene content of about 25 percent.[19]

MEERSCHAUM

Meerschaum is a soft, fine-grained, earthy material used principally in manufacturing pipes and other smokers' articles. Virtually all of the world's supply comes from deposits in Asia Minor. A few scattered deposits in the United States have yielded only a small production. Imports from Turkey, the only supplier for several years, increased substantially. A small quantity arrived from Italy.

TABLE 10.—Meerschaum imported for consumption in the United States, 1945–50 [1]

[U. S. Department of Commerce]

Year	Pounds	Value	Year	Pounds	Value
1945	33,292	$59,418	1948	3,000	$10,070
1946	14,469	21,785	1949	5,844	13,897
1947	5,758	10,534	1950	9,621	18,549

[1] 1945–49, all from Turkey; 1950—Italy, 20 pounds, $120; Turkey, 9,601 pounds, $18,429.

MINERAL EARTH PIGMENTS

Production.—The demand for mineral-earth pigments increased sharply in 1950 because of the high level of construction and industrial activity. The trend toward synthetic pigments continued, as for the past several years. During 1950 synthetic pigments were 35 percent of the total tonnage sold and 62 percent of the total value of sales. Although demand in the first part of the year was lower than in the previous year, paint manufacturers continued to call for increasing quantities. During the early part of the year supplies were ample, but later in the year some shortages developed, particularly in the pure red and yellow oxides.

The occurrence and uses of mineral pigments were outlined in an article.[20] The hiding power (opaqueness) of certain iron oxides and the method for determining such were discussed in an article.[21]

[20] South African Mining and Engineering Journal, vol. 61, No. 2986, May 6, 1950, p. 309.
[21] Oil, Paint and Drug Reporter, vol. 158, No. 20, November 1950, p. 83.

TABLE 11.—Natural mineral pigments and manufactured iron-oxide pigments sold by processors in the United States, 1949–50, by kinds

Pigment	1949		1950	
	Short tons	Value	Short tons	Value

Total	[1] 104,322	[1] 10,573,338	129,256	14,762,782

[1] Revised figure.

Prices.—According to the Oil, Paint and Drug Reporter, prices were quoted as follows during December 1950 (in cents per pound, bags, works, carlots, unless otherwise noted):

Synthetic iron brown (l. c. l.), 12.
Metallic oxide brown, 3.75.
Sap brown, crystals, 12.
Sap brown, powdered, 13.
Sienna, burnt, 4¼–15¼.
Sienna, raw, 4½–13.
Umber, burnt, American (barrels), 5¼.
Umber, Turkey type, 6¼.
Vandyke (barrels), 11.
Synthetic red iron oxide, 11¾.
Special, high color, synthetic red iron oxide, 60.
Persian Gulf oxide, 6¾.
Spanish oxide, Grade 1 (barrels), ex dock, 5¾.
Venetian reds, 3½–5¼.
Natural yellow iron oxide, 1.41.
Natural yellow iron oxide, French type, 4½.
Natural yellow iron oxide, Peruvian type, 1.85.
Synthetic yellow iron oxide, 9½.
Golden American yellow ocher, 1¼.
Metallic red (barrels), 2½.
Synthetic iron oxide black, 11.
Mineral black, 1.6.

Foreign Trade.—Imports and exports of mineral pigments are shown in tables 12 and 13.

TABLE 12.—Selected mineral pigments imported for consumption in the United States, 1947–50

[U. S. Department of Commerce]

Pigments	1947		1948		1949		1950

232294—53——86

MINERAL WOOL

The total value of mineral wool produced in this country in 1950 from rock, slag, and glass was $120,945,000 compared with $93,-023,000 in 1949, an increase of 30 percent, according to the Bureau of the Census. The 1947 report of the Bureau of the Census on mineral wool gives the following percentages for the broad classifications of its use: Structural insulation 56 percent, equipment insulation 23 percent, industrial insulation 17 percent, and unspecified 4 percent. A more detailed list of end uses can be found on page 1362 of the Minerals Yearbook 1948. The average number of persons employed by the mineral-wool industry during 1950 was 9,244, compared with 7,544 for the previous year.

Exports of mineral-wool products from the United States during 1950 amounted to $1,132,454.

An article describing the various materials suitable for the manufacture of mineral wool, the different processes in use, its appearance and insulating properties, and its application as an insulating material, appeared recently in a technical magazine.[22]

The new plant of the Owens-Corning Fiberglass Corp. at Santa Clara, Calif., was the subject of an article in the trade press. The raw materials used, manufacturing processes, and a description of the finished products were given, as well as the processing of the mineral wool for commercial application.[23]

Other new plants have been described in the trade journals.[24]

A new insulation has been put on the market by a well-known manufacturer of mineral wool. It comes in four densities—from 0.5 to 1 pound per cubic foot.[25]

Patents covering a method of waterproofing mineral wool [26] and for the production of mineral wool from molten material [27] have recently been issued.

MONAZITE
(Rare-Earth Minerals)

For many years supplies of monazite came from India, but in 1946 the Indian Government placed an embargo on shipments of monazite from that country. Subsequent to that, nearly all of our supply came from Brazil, but recently the Brazilian Government restricted shipments. The United States was then forced to find other sources. For several years important deposits have been known to occur in old beach sands of Florida and the placer sands and gravels of the Boise

[26] Zettel, Joseph H. (assigned to Johns-Manville Corp.), Method of Waterproofing Mineral Wool: U. S. Patent 2,493,845, Jan. 10, 1950.
[27] Richardson, Charles D., Mineral Wool Making Means: U. S. Patent 2,491,766, Dec. 20, 1949.

Basin in Idaho. There was production from both these areas in 1950; however, statistics on output, consumption, and imports of monazite are considered to be confidential and cannot be published for 1950. Further prospect of the United States becoming self-sufficient in rare earth minerals is indicated by discovery of a deposit of bastnäsite, a fluocarbonate of the rare earths, in San Bernardino County, Calif., and of rare-earth-bearing minerals in several other locations. However, utilization of these materials is in the research stage.

It was announcd that the Climax Molybdenum Co. expected to recover monazite, as a byproduct in its operations at Climax, Colo.[28]

The Bureau of Mines Rare and Precious Metal Experiment Station at Reno, Nev., investigated bastnäsite found recently in California.[29]

The known occurrences of monazite in Georgia were listed.[30]

There was continued interest and research on thoria ceramic refractory materials.[31]

A rapid method determining thorium in monazite sand was outlined.[32]

World Review.—World-wide occurrences of monazite were reviewed briefly in an article.[33]

In Australia research continued on the fundamental chemistry of the components of monazite, and the results so far were incorporated in a plan for improved chemical processing of this mineral.[34]

Titanium and Zirconium Industries Pty., Ltd., and other firms expect to produce monazite from the beach sands of Queensland, Australia.[35]

Several placer deposits in British Columbia and the Northwest Territories are known to contain monazite.[36] A summary of information on Canadian deposits of uranium and thorium through 1948 was presented.[37]

It was again reported that a plant for processing monazite sand would be established in India at Alwaye, near Erankulam.[38]

The occurrences of monazite in Brazil were described in some detail in an article.[39]

According to E&MJ Metal and Mineral Markets, price quotations on monazite during the year were advanced to 17 cents per pound, f. o. b. Atlantic ports, basis 65 percent of total rare-earth oxides, including thorium and cerium oxides. Lower-grade material can be sold at a penalty. This price was nominal.

OLIVINE

Sales of olivine in 1950 increased to 4,577 short tons valued at $64,144 from 3,528 short tons valued at $56,850 in the preceding year. The following firms reported production of olivine during the year: Harbison Walker Mining Co., Farmers Bank Building, Pittsburgh, Pa., from its Addie quarry near Addie, N. C.; The United Feldspar & Minerals Corp., Spruce Pine, N. C., from its Wray mine near Green Mountain, N. C.; and The H. P. Scheel Co. from its Big Slide mine near Sedro-Woolley, Wash. This material was used in the production of fire brick for furnace lining, foundry sand, and refractory cements.

TABLE 14.—Olivine sold or used by producers in the United States, 1946–50

Year	Short tons	Value	Year	Short tons	Value
1946	7,649	$92,868	1949	3,528	$56,850
1947	10,838	129,094	1950	4,577	64,144
1948	4,766	86,230			

A review of recent developments and techniques in the manufacture and use of forsterite refractories was published.[40]

PERLITE

The production and sales of perlite and its products set new records in 1950. Production of 110,694 short tons of crude was reported—an increase of 55 percent over the 1949 total. Furnace operators reported total sales of expanded perlite at 86,962 short tons valued at $4,741,383.

Sixty-three firms reported production and sale of crude perlite or expanded material in 1950. Of these, 12 produced both crude and popped perlite, 8 operated mines only, and 43 maintained furnace facilities only. Fourteen companies are known to be in operation in California, 6 in Utah, 4 each in Arizona, Texas, and Pennsylvania, 3 each in Illinois and Nevada, and 1 or 2 in each of 19 other States. Nine other companies reported plans to begin mine or furnace operations in the near future.

Mine development during the year included completion of a large crushing and sizing plant by Great Lakes Carbon Corp., New York, N. Y., at its Socorro, N. Mex. property.[41] The Alexander Film Co., Colorado Springs, Colo., offered the perlite facilities of the AleXitE Engineering Division for sale,[42] and Perlite Mines Co., Denver, Colo., made plans to purchase and operate the mine and plant units, principally to supply crushed and graded ore to eastern and midwestern expanders. Combined Metals Reduction Co., Salt Lake City, Utah, stepped up production of ore from its extensive deposits in eastern Nevada, near Pioche, to gain a major position among producers of crude ore.[43]

TABLE 15.—Production and sales of perlite in the United States, 1946–50

Year	Crude perlite					Expanded perlite		
	Production	Sold		Used at own plant to make expanded material		Production	Sold or used	
	Short tons	Short tons	Value	Short tons	Value	Short tons	Short tons	Value
1946	[1] 4,750	[1] 1,500	[1] $8,300	[1] 3,100	[1] $16,300	[1] 4,100	[1] 2,600	[1] $92,500
1947	[1] 10,500	[1] 550	[1] 3,000	[1] 9,900	[1] 55,000	[1] 9,700	[1] 7,700	[1] 271,000
1948	[1] 22,200	[1] 4,400	[1] 29,000	[1] 17,700	[1] 105,000	[1] 21,200	[1] 18,600	[1] 742,000
1949	[1] 71,500	[1] 27,300	[1] 193,000	[1] 43,800	[1] 317,000	[1] 58,100	[1] 52,200	[1] 2,385,000
1950	110,694	59,802	411,205	41,734	237,957	88,892	86,962	4,741,383

[1] Revised figure.

During the year reports were made of perlite deposits in Utah,[44] California,[45] New Mexico,[46] Washington,[47] Canada,[48] and Mexico.[49]

Several new or improved furnaces were reported in 1950.[50]

Patents were granted covering five furnaces or processes applicable to perlite.[51] These furnaces include a vibrating hearth apparatus, a vertical stationary, a horizontal rotary, a stationary horizontal with preheater, and a horizontal explosion unit with a vertical cooling-separation chamber.

A careful study of perlite furnacing problems and the principal furnace types was published.[52] The authors reported four variables of major importance in producing an economical and high-grade product: Perlite type, heating time, particle size, and temperature. Eight furnace types were described and evaluated according to the various aspects of performance.

Other articles detailed the complete operations of Great Lakes Carbon Corp.[53] and AleXitE Engineering Division.[54]

Taylor, C. W., Perlite Popping: From a Shaky Start a Solid New Industry: Chem. Eng., vol. 57, No. 1, January 1950, pp. 90–94.

The ore-processing practices of Airlite Processing Corp., Scottsburg, Ind.,[55] and Carr-Lite, Inc., Lake Zurich, Ill.,[56] were also described.

The Perlite Institute, a trade association composed of 37 members of the industry, held 2 meetings during the year. Results of research into various phases of perlite production, standardization, and utilization were presented and discussed. An official seal adopted by the institute may be used on the bags of perlite produced by member firms to indicate compliance with Institute specifications.

The mine value of crude perlite (crushed and sized) averaged $6.39 per short ton in 1950, while the average value of expanded material in bags at the plant was $54.52 per short ton.

Disposal of furnace fines continued to be a problem for many processors as they sought market outlets large enough to absorb the production of that fraction. Major uses for fines at present are as trowel and brush finishes, fillers, air entraining agents, and abrasives.

It has been estimated that 80 percent of the expanded material produced is used as a lightweight plaster aggregate. It is also used in poured-concrete roof decks and floors and in concrete beams, slabs, and blocks as a substitute for heavier aggregates, permitting a savings in structural steel requirements. Miscellaneous applications include: Loose fill, filtration medium, stucco, refractory brick, drill-mud component, roofing tile, soil reconditioner, as a filler and extender, and for numerous lesser special purposes that utilize its light weight, insulating characteristics, inertness, or other physical qualities.

RADIO-GRADE QUARTZ

Imports of quartz crystal continued at virtually the same rate as in the previous year, with an increase noted near the end of the year. Consumption of radio-grade quartz and production of piezoelectric units increased sharply. This increase was largely attributable to military orders late in the year as the Nation's defense program got under way.

As for many years past, the bulk of supplies came from Brazil, with small quantities coming from Hong Kong, India, and France. The imports from Hong Kong and France probably originated in Formosa and Madagascar, respectively. Domestic production of radio-grade quartz crystal is practically nil.

A sharp reduction in the number of finished units produced per pound of quartz consumed was noted. This is largely accounted for by stricter military specifications and new types of units ordered. Another noteworthy trend is utilization of smaller crystals, mostly ranging from 100 to 200 grams and even less. This is also reflected in the average price of imported crystals. The average price during 1949 was roughly $4.50 per pound, whereas the average price in 1950 was about $2.50 per pound. Although prices were reduced somewhat during the year, this reduction would not account for all of the decrease in average price.

TABLE 16.—Imports of uncut quartz crystal, consumption of radio-grade quartz, and production of piezoelectric units in the United States, 1946–50

Year	Imports of uncut quartz crystal [1]		Consumption of radio-grade quartz (pounds)	Production of piezoelectric units [2] (number)
	Pounds	Value		
1946	370,556	$2,376,598	172,400	1,744,100
1947	473,788	1,815,468	68,100	1,052,400
1948	1,238,820	4,209,531	61,600	1,225,400
1949	[3] 319,631	1,462,018	46,200	937,100
1950	310,251	791,412	114,300	1,614,000

[1] Includes optical-grade quartz used in production of optical instruments.
[2] Includes oscillators, resonators, and other piezoelectric units.
[3] Revised figure.

As a safeguard against interruptions of delivery of Brazilian quartz crystal and possible lack of reserves, the program of synthesizing quartz was continued during the year under the guidance of the Signal Corps. Two firms, Brush Development Co., Cleveland, Ohio, and Bell Telephone Laboratories, Inc., Murray Hill, N. J., are engaged in actual laboratory synthesis of radio-grade quartz. Crystals of over 500 grams weight and excellent quality have been produced. The Signal Corps has also contracted with many other firms, colleges, and research organizations for supporting types of research and investigation projects.

The current interest in high-frequency communication equipment has created a demand for very thin quartz-crystal oscillator plates. The equipment and procedure for manufacturing these plates were described in some detail in an article.[57]

It was reported that two large deposits of quartz crystal were discovered at Pium and Piaus, Goias State, in Brazil, and that these finds were attracting considerable interest.[58]

STRONTIUM MINERALS

No domestic production of strontium minerals has been reported, except for sample lots, since 1946. During the war years a considerable quantity of low-grade celestite was produced in Brown and Nolan Counties, Tex., and used principally as a substitute for barite in well-drilling muds. However, after the patent on the use of barite in well-drilling muds expired in 1943, payment of royalties was no longer necessary, and as soon as barite became plentiful at the end of World War II, production of celestite from this source was discontinued.

Manufacturers Minerals Co., Seattle, Wash., planned to explore and develop a celestite deposit on Fidalgo Island in Puget Sound, with production anticipated in 1951.

The principal consumers of celestite in the United States are: E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., and Foote Mineral Co., Philadelphia, Pa.

[57] Sogn, L. T., and Howard, W. J., The Mechanical Production of Very Thin Oscillator Plates: Jour. Research Nat. Bureau of Standards, vol. 43, November 1949, (Research Paper 2037).
[58] Mining World, vol. 12, No. 11, October 1950, p. 53.

All celestite received during 1950 was imported from the United Kingdom and Mexico. Shipments from Spain ceased in the previous year, when a preclusive buying agreement with that country was fulfilled.

The principal uses for strontium compounds are in red-flame pyrotechnic compositions, such as truck signal flares and railroad "fusees," tracer bullets, and military signal flares.

TABLE 17.—Strontium minerals [1] imported for consumption in the United States, 1948–50, by countries, in short tons

[U. S. Department of Commerce]

Country	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
Canada-Newfoundland			59	$788		
Mexico	1,114	$14,963	1,158	14,690	1,975	$23,910
Spain	14,614	440,318	3,263	74,829		
United Kingdom	6,043	103,428	4,904	86,378	6,655	118,303
Total	21,771	558,709	9,384	176,685	8,630	142,213

[1] Strontianite or mineral strontium carbonate and celestite or mineral strontium sulfate.

The occurrence of a typical deposit of celestite near Bellwood, Pa., as well as other deposits in this area, has been described.[59]

In addition to the previously reported deposit of celestite in the Trichinopoly District in India and the Mianwali District, Punjab, another deposit has been reported in Pakistan near Karachi. No estimate of the reserves in this deposit is available.[60]

At the end of the year trade-journal quotations of prices for celestite, in car lots, 92 percent $SrSO_4$, finely powdered, was unchanged at $54 per ton. Crude, 90 percent grade, f. o. b. cars California, was unchanged at $19. Strontianite, lump in car lots, minimum 84 to 86 percent, $SrCO_3$, was unchanged at $55 per ton. These prices are nominal.

TOPAZ

No production of topaz was reported to the Bureau of Mines during 1950. The Brewer mine near Kershaw, S. C., and the deposit near Naples, N. C., formerly worked by the Carolina Mining & Exploration Co., apparently were inactive during the year.

VERMICULITE

Production.—Sales of screened and cleaned vermiculite produced in the United States continued to gain and in 1950 were 208,096 short tons valued at $2,122,427, representing an increase of 23 percent in quantity and 26 percent in value over the preceding year.

Production in 1950 was reported by the following companies: Zonolite Co., 135 South LaSalle St., Chicago, Ill. (mines at Libby,

[59] Hamilton, Howard V., Notes of the Occurrence of Celestite in Pennsylvania: Rocks and Minerals, vol. 25, Nos. 7–8, July–August 1950, pp. 348–350.

[60] Bureau of Mines, Mineral Trade Notes: vol. 31, No. 4, October 1950, p. 32.

Mont., and Travelers Rest, S. C.); American Vermiculite Co., Spruce Pine, N. C. (mine near Spruce Pine, N. C.); Mikolite Sales Corp., Kansas City, Mo. (mine near Encampment, Wyo.); Vermiculite Supplies, Inc., Sylva, N. C. (mine near Sylva, N. C.); The Variegate Vermiculite Co., Greenmountain, N. C. (mine near Forbes, N. C.); and Colorado Vermiculite Co., Colorado Springs, Colo. (mine near Westcliffe, Colo.).

Miners and processors of vermiculite have formed the Vermiculite Association, Inc., to increase and diffuse the knowledge and uses of vermiculite in widely diversified fields. Standard specifications for both crude ore and expanded products are being developed.[61]

TABLE 18.—Screened and cleaned vermiculite sold or used by producers in the United States, 1943–50

Year	Short tons	Value	Year	Short tons	Value
1943	46,645	$471,595	1947	131,385	$1,338,572
1944	54,116	541,744	1948	138,635	1,387,233
1945	64,808	648,077	1949	168,819	1,686,419
1946	86,390	867,973	1950	208,096	2,122,427

Assuming an average price of $80 a ton for exfoliated material and a 5-percent loss in weight in the exfoliating process, the value of exfoliated vermiculite sold in the United States during 1950 would be about 16 million dollars.

Uses.—Since vermiculite entered the commercial market some 25 years ago, the variety of uses to which it may be put has steadily increased. In the main the uses are based on the structure and lightness of the aggregates of exfoliated grains. Among its many uses are: Aggregate for plaster and concrete, insulation, soundproofing, refractories, stucco, safe and vault linings, wallboard, filters, plastic products, rubber goods, and as an extender for paints. Recently increased attention has been paid to the use of vermiculite for agricultural purposes as a soil conditioner.[62]

A portable expanding furnace for vermiculite has been developed for situations where large operations are not justified. The furnace will make it possible to process vermiculite on the site at construction projects.[63]

The resilience of studless 2-inch solid vermiculite-plaster partitions was established in recent impact tests.[64]

Use of vermiculite as a refractory is beginning to attract wider interest, both as brick and in a variety of moulded shapes.[65]

Prices.—Domestic screened and cleaned vermiculite in 1950 averaged $10.20 a short ton, f. o. b. mines, while quotations of South African crude were $30 to $32 a short ton, c. i. f. Atlantic ports. The wholesale price of exfoliated material was about $80 a short ton during 1950.

61 Concrete, vol. 58, No. 12, December 1950, p. 14.
62 Saunder, D. H., Value of Vermiculite in Agriculture and Horticulture: Rhodesian Tobacco Jour. (Salisbury, Southern Rhodesia), January 1951, pp. 61–67.
63 Rock Products, vol. 53, No. 2, February 1950, p. 84.
64 Pit and Quarry, vol. 43, No. 3, October 1950, p. 125.
65 Refractories Journal, February 1950, pp. 36–39.

Africa.—Sales of vermiculite in the Union of South Africa during 1950 were 31,497 short tons, an increase of 35 percent over the preceding year. Of this amount, 16,531 short tons were exported to the United States, with a total f. o. b. export value of £S. A. 91,483, or about $15.49 a short ton.

The Department of Mines of the Union of South Africa has made an extensive study of a vermiculite deposit in northeast Transvaal and reports the existence of one deposit, with over 5 million tons of vermiculite of commercial grade. Other deposits have been located in the Petersburg and Zoutpansberg districts. Numerous tests carried out by the Geology Department of Witwatersrand University and by the Government Metallurgical Laboratory indicate that the hydrophlogopite type of vermiculite occurring in South Africa has an extension factor ranging from 21 to 30.[66]

At several places in Southern Rhodesia vermiculite deposits are known, and some production has been reported. Occurrences are also noted in Nyasaland.

Other Occurrences.—Vermiculite deposits are reported in the State of Mysore in India.

The vermiculite deposits near Liberdade, State of Minas Gerais, Brazil, have produced some material for local use.

A discovery of vermiculite at Stanleyville, near Perth, Ontario, has been announced by the Hon. James J. McCann, Minister of Mines and Surveys, Ottawa. The mineral varies in grade from place to place over a large area, and considerable development work will be necessary before the full potentialities are known.[67]

An occurrence of vermiculite in Queensland, Australia, has been reported, and further prospecting of the deposit is recommended by by the Queensland Geological Survey.[68]

WOLLASTONITE

The only deposit of wollastonite being worked in the United States today is at Bristol Mountain near Willsboro, N. Y. From this deposit the Willsboro Mining Co. produced approximately 2,500 short tons during 1950. This material was valued at $20 per ton, f. o. b. the shipping point. Sales were for use principally in ceramics and as a chemical raw material. A considerable amount of research into probable uses of this material has recently been carried on. These potential uses include electrical insulators, paint extender, paper filler, industrial and building tile, and many others.

PART III. STATE REVIEWS

The Mineral Industry of Alaska

By Alfred L. Ransome and William H. Kerns

GENERAL SUMMARY

GOLD output in Alaska in 1950, following a 2-year decline, increased to the highest point since 1942. This unexpected gain in production of the Territory's greatest value commodity was largely responsible for the increase in the over-all value of mineral output in the Territory to $17,852,000 from $15,549,000 in 1949. Although coal continued to rank second to gold in value of output, production was slightly less than the record production of 1949. The mining of platinum continued to be an important factor in the mineral industry, with production of crude platinum metals exceeding that of 1949. The output of lead was three times the 1949 production, and silver gained 46 percent over the previous year's total. Copper and zinc production—entirely as byproducts from other ores—showed an increase, but remained minor. Production of tin was relatively small, but substantially above the total for 1949.

TABLE 1.—Mineral production of Alaska, 1948–50

Mineral	1948		1949		1950	
	Quantity	Value	Quantity	Value	Quantity	Value

[1] Final figure. Supersedes preliminary figure given in commodity chapter.
[2] Value included with "Undistributed."
[3] Comprises value of clay and pumice (1948), platinum-group metals, and minerals whose value must be concealed for particular years (indicated in appropriate column by footnote reference 2).

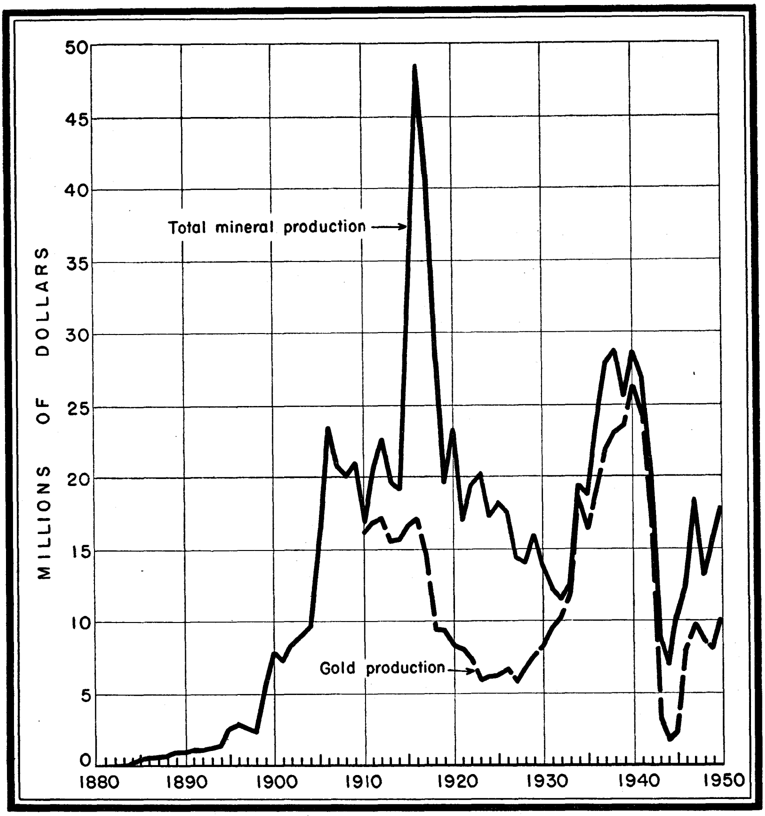

FIGURE 1.—Value of total mineral production (1880–1950) and gold production (1910–50) in Alaska. From 1911 to 1931 copper production accounted for most of the value of minerals other than gold.

Up to the present gold mining has maintained its position as the backbone of the mining industry in Alaska; however, the ever-increasing difficulty of balancing high costs of mining, labor, and supplies against the established United States Treasury price of $35 per fine ounce for gold makes questionable the future of this industry as the leader in value of production. The surprising advance in output for 1950 that occurred despite these difficulties was achieved by a smaller number of men, employed by eight fewer mining operations, than in 1949. Were it not for the greater efficiency of the relatively few larger-scale operations utilizing mechanical equipment—particularly bucket-line dredges—production would probably have been lower than in 1949, since an unusually dry season in the Territory resulted in a cessation of activity at a number of placer operations in several districts in the Yukon River Basin and Seward Peninsula regions. "Natural" or unprocessed gold continued to be legally sold on the open market at prices varying from $3 to $5 over the official price, but this phase of activity was considerably less than in 1949.

Lode mining in the Territory continued to remain virtually at a standstill; and, with the exception of coal, and sand and gravel, nonmetalliferous activity was negligible.

GOLD, SILVER, COPPER, LEAD, AND ZINC

Data on mine production of gold, silver, copper, lead, and zinc in Alaska, 1946-50, and 1880-1950, in terms of recoverable metal; the gold production at placer mines, by classes of mines and methods of recovery; mine production of gold, silver, copper, lead, and zinc, by regions; and ore and old tailings sold or treated, as well as various metallurgical compilations based on output in 1950, are shown in tables 2 to 11, inclusive.

A small proportion of the output recorded as having been produced in 1950 was mined in a former year but not shipped or sold until 1950.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations represent "bank measure"; that is, the material is measured in the ground before treatment. Close control of bank measure is kept by operators of bucket-line dredges, but the quantity of material handled by other placer-mining methods in Alaska is largely estimated by the individual operators on the basis of square feet of bedrock area worked and the average depth of the gravel.

The value of gold, silver, copper, lead, and zinc production reported herein has been calculated at the prices shown in table 2.

TABLE 2.—Prices of gold, silver, copper, lead, and zinc, 1946-50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948-50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946-47 includes bonus payments by Office of Metals Reserve for overquota production.

Gold.—The recorded production of gold in Alaska in 1950, which was 26 percent above that in 1949, marked a decided reversal of the trend of the past 2 years. This surprising gain was accomplished despite the fact that a smaller number of men was employed at 11 lode and 216 placer operations as compared to 18 and 223, respectively, in 1949. An unusually dry season in the Territory resulted in cessation of activity at a number of operations and curtailment at others in several districts in the Yukon River Basin and Seward Peninsula regions. Adverse economic conditions, including higher-than-ever costs for supplies and equipment, continued to harass the industry, and high wages offered by contractors connected with defense projects in areas adjacent to mines virtually eliminated the gold-mine operators from competition in the labor market. The gain in gold output was the result of increased production from a few larger operations, particularly those using bucket-line dredges, and to an over-all greater efficiency in labor and equipment at many of the operations using mechanical methods of placer mining. That the industry has survived—and even advanced in quantity of output—in the face of such obstacles, with an unchanged established price of $35 per fine ounce for the product, is remarkable. There is a penalty for current survival, however, which is not immediately apparent. In order to stay in business, it has been necessary to mine selectively the higher-grade deposits, with the result that the marginal zones—which together total millions of dollars in potential gold reserves—probably will never be worked.

TABLE 3.—Mine production of gold, silver, copper, lead, and zinc in Alaska, 1946–50, and total, 1880–1950, in terms of recoverable metal [1]

Year	Lode mines [2]		Placer mines [2]		Gold (lode and placer)		Silver (lode and placer)	
	Number of mines	Ore sold or treated (short tons)	Number of mines	Gravel washed (cubic yards)	Fine ounces	Value	Fine ounces	Value
1946	16	10,798	256	14,108,000	226,781	$7,937,335	41,793	$33,769

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; old tailings or slimes re-treated; and ore and old tailings shipped directly to smelters during the calendar year indicated.
[2] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[3] Revised.
[4] Figures not available.

The sale of unprocessed or natural gold by a few operators who hoped to gain by open-market transactions at prices exceeding $35 per fine ounce apparently was considerably less in volume than in 1949. The recorded production for 1950 includes 5,461 fine ounces of gold contained in natural gold sold on the open market by two producers. In addition, 394 ounces of natural gold in the form of nuggets, grains, and dust were reported sold by three producers on the open market for prices equivalent to $35 or more per fine ounce of gold contained therein; information on fineness was inadequate for calculating the recoverable gold and silver content for inclusion with the 1950 statistical record. Available information indicates that an undetermined quantity of natural gold was sold by several producers who did not report specifically, and 791 ounces of natural gold from one property was reported produced but not sold. An undetermined but substantial quantity of gold (at least several hundred and possibly several thousand ounces) reported sold in 1950—and recorded statistically in the record for the year—was undoubtedly produced in 1949, and disposed of as natural gold, or held speculatively and subsequently sold through the normal channels to the United States mints at the established United States Treasury price. Specific and accurate data regarding natural gold sales are not readily available, and the aforementioned figures giving the number of operators and quantities involved are incomplete. However, it can be assumed from these data that natural gold originating from Alaskan mines and sold in 1950 was substantially less than the estimated 22,000 ounces sold in 1949—and the latter may itself be an overestimate.

TABLE 4.—Fifteen leading gold-producing mines in Alaska in 1950, in order of output [1]

[1] Based on known output, including "Natural" gold sales in cases where fine gold content was calculable.
[2] Did not produce in 1949.
[3] Rank in 1949 was actually higher than shown because of natural gold sold, but not included statistically with recorded production.

The unusual seasonal limitations on mining activity in Alaska are indicated by the production of gold in 1950 by months, as shown in table 6. The data are based on mint and smelter receipts, which have been adjusted to exclude 6,304 fine ounces of gold received during the first 4 months previously credited to 1949 production, and to include 3,247 ounces received during the same period in 1951 but actually produced in 1950. Production was probably considerably less than the shipments shown for the last 3 months of the year but correspondingly higher for May through September, the season for active mining in the Territory between the spring breakup or thaw and the fall freeze. The principal reason for the relatively high receipts at mints and smelters during the last quarter is that numerous operators make their gold "clean-up" only once or twice during the active mining season, the result being that a substantial quantity of gold accumulated in the sluices, over a period of several months, is not recovered until late fall and often not reported as receipts at the mint or smelter until the following spring.

TABLE 5.—Gold produced at placer mines in Alaska, 1946–50, by class of mine and by method of recovery

1950	216		17,621,000	277,111	9,698,885	.550

[1] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[2] Data for 1948–49 revised owing to reclassification of one mine based on additional information received.
[3] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

The 15 leading gold-producing mines (14 placer and 1 lode) in Alaska in 1950, listed in table 4, yielded 76 percent of the total recorded gold output of the Territory; the 5 leading producers supplied 62 percent. The Fairbanks district in the Yukon River Basin region and the Nome district in the Seward Peninsula region ranked first and second, respectively, in gold production in the Territory because of the bucket-line dredging operations of the United States Smelting, Refining & Mining Co.

Activity at lode mines in interior Alaska was limited largely to a few operations in the Willow Creek district, the principal producer being the Alaska-Pacific Consolidated Mining Co., which worked the Independence mine. In Southeastern Alaska the LeRoy Mining Co. was active during the season, and the Hirst-Chichagof mine on Chichagof Island resumed limited operations in 1950 following a period of inactivity since October 15, 1942. A substantial quantity of gold was recovered by reworking old tailings and by mill clean-ups at the Alaska Juneau, Thane, and Treadwell mills on Gastineau Channel, and the Chichagof mill and old tailings pile on Chichagof Island.

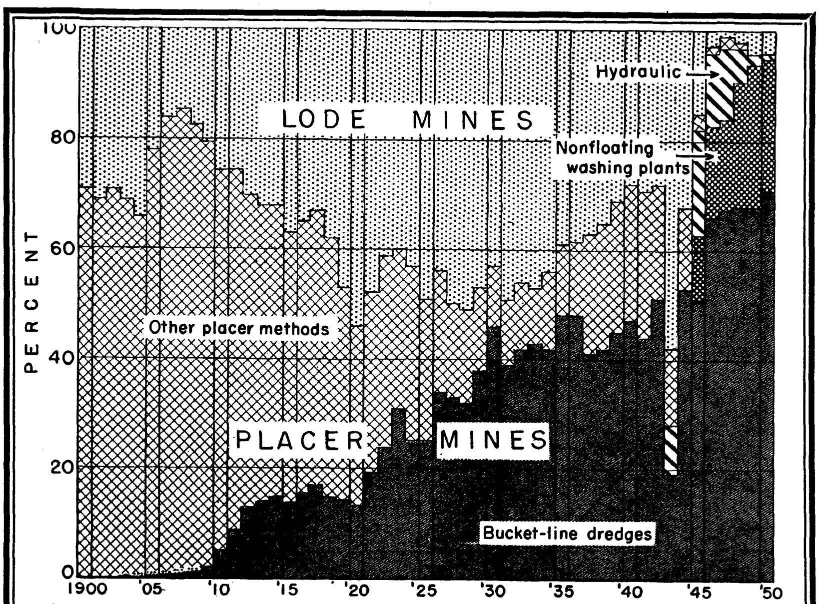

FIGURE 2.—Percentage of total Alaska gold produced at lode and placer mines and by various methods of placer mining, 1900–50; "other placer methods" include hydraulic and nonfloating washing plants, for which separate data are not available prior to 1943.

Silver.—The 52,638 fine ounces of silver produced in 1950 (a 46-percent increase over 1949) was largely the byproduct of gold mining (76 percent) and of lead ore (24 percent). The most-important producer of silver in Alaska in 1950 was the United States Smelting, Refining & Mining Co., which recovered silver as a byproduct of bucket-line dredging operations in the Fairbanks and Nome districts. E. M. Thompson, who operated the Riverside mine, Hyder district, Southeastern Alaska, under lease from J. H. Scott Co. during 1950, recovered silver as a byproduct from lead ore produced.

Copper, Lead, and Zinc.—Again as in 1949, production of base metals (copper, lead, and zinc) was limited almost entirely to output from one mine, the Riverside, near Hyder in Southeastern Alaska. A relatively small output of the metals came from several other properties in the region as byproduct recovery from ore and old tailings treated primarily for the recovery of gold.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Alaska in 1950, by months, in terms of recoverable metal [1]

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	487	34			
February	889	55			
March	1,079	65			
April	1,457	151			
May	9,056	2,611	1	12	1
June	13,995	3,306	1	18	1
July	26,257	5,465	1	25	1
August	45,096	8,297	1	30	1
September	61,321	11,522	1	30	1
October	51,698	9,353	1	25	1
November	43,167	7,219		9	
December	34,770	4,560			
Total: 1950	289,272	52,638	6	149	6
1949	229,416	36,056	4	51	2

[1] Derived mostly from mint and smelter receipts; data are adjusted to exclude receipts during the first part of 1950 previously credited to 1949 production, and to include receipts in 1951 which are a part of actual output in 1950.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Alaska in 1950, by regions, in terms of recoverable metal

Region	Mines producing [1]		Gold (fine ounces)			Silver (lode and placer, fine ounces)	Total value
	Lode	Placer	Lode	Placer	Total		
Cook Inlet-Susitna	3	11	8,701	2,857	11,558	1,084	$405,511
Copper River		6		1,610	1,610	181	56,514
Kenai Peninsula and Kuskokwim [2]	1	12	42	21,886	21,928	1,756	769,069
Northwestern Alaska		3		1,216	1,216	96	42,647
Seward Peninsula		64		66,631	66,631	7,417	2,338,798
Southeastern Alaska	5		3,103		3,103	13,429	[3] 165,189
Yukon River Basin	2	120	315	182,911	183,226	28,675	6,438,862
Total Alaska: 1950	11	216	12,161	277,111	289,272	52,638	[3] 10,216,590
1949	18	[4] 223	8,327	221,089	229,416	36,056	[5] 8,080,381

[1] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual output.
[3] Includes value of 6 short tons of copper ($2,496), 149 tons of lead ($40,230), and 6 tons of zinc ($1,704).
[4] Revised.
[5] Includes value of 4 short tons of copper ($1,576), 51 tons of lead ($16,116), and 2 tons of zinc ($496).

MINING INDUSTRY

Bucket-line dredges (28 in 1950 compared with a revised figure of 29 for 1949) washed 71 percent of the total gravel mined for gold in Alaska in 1950 and recovered 74 percent of the total placer gold and 71 percent of the total Alaska gold (lode and placer). Placer mining accounted for 96 percent of the total gold produced in Alaska in 1950 (the same as in 1949). No dragline dredges (operations using a floating washing plant and a dragline excavator) were reported in operation during 1950. However, several so-called "dry-land dredges" (operations using a power excavator and movable mechanical washing plant, both of which are on dry land) were operated at widely separated localities in the Territory during the year.

Placer operations using combinations of bulldozer and hydraulic methods—in many cases supplemented with dragline equipment—continue to become more widespread in the Territory because of the distinct advantage of relatively low initial cost of equipment in proportion to the small labor crews necessary and the large volume of material that can be handled. In general, the mining method is to bulldoze the gold-bearing material to sluice boxes (the latest successful innovation is the use of a sluice plate at the head of the sluice box on which the gravel is dumped or pushed) and to employ hydraulic giants to wash the gravel through (frequently in closed circuit with a settling pond downstream below the sluice box and a pump for the return of the water). Dragline equipment—when used—is generally utilized for disposing of tailings, and in some cases for transporting gravel to elevated sluice boxes or washing plants. Occasionally, draglines, or bulldozers are used for removing overburden, but by far the greatest proportion of the overburden, in the form of frozen "muck," is washed off with hydraulic giants. A new tool—the automatic hydraulic giant—has been developed and found particularly useful in certain areas for disposing of frozen overburden.

Combination methods of placer mining, in which the gravel is moved by mechanical means to the washing plant or sluice box (classified as nonfloating washing plants), washed 28 percent of the total gravel mined and recovered 25 percent of the placer gold, a 45-percent increase in gravel handled and an 18-percent gain in gold recovered compared with 1949. Operations in which gold was recovered primarily by hydraulic methods (excluding hydraulic stripping of overburden) again showed a decrease in the number of mines (partly because of reclassification from hydraulic to nonfloating washing plants), gravel washed, and gold produced.

Gold output from a greater number of small-scale hand operations was correspondingly higher than in 1949. Six drift mines produced only a small quantity of gold in 1950; this method of mining, once widespread in Alaska, is now virtually obsolete, being supplanted by the more efficient mechanical methods that are better-adapted to working deeper lower-grade gravels.

The total yardage of gravel washed at gold placer mines decreased 4 percent, whereas gold recovered was 25 percent higher. The average recoverable gold content of gravel increased 31 percent.

The tonnage of material from lode mines (gold, silver, copper, lead, and zinc) in Alaska treated in 1950 was 26 percent less than in 1949. Although the output of lode gold increased 46 percent, the quantity recovered from all active lode mines and from mill clean-ups and tailings re-treatment at inactive mines comprised only 4 percent of all gold produced in the Territory (lode and placer). Economically, conditions in 1950 did not favor lode-gold mining, and 60 percent of the total lode gold produced in 1950 came from one mine, the Independence, in the Willow Creek district, Cook Inlet-Susitna region. The only base-metal mine in operation during the year was the Riverside, a lead-tungsten property near Hyder in Southeastern Alaska. Positive results of the provisions of the Defense Production Act of 1950 with respect to strategic metal mining in Alaska had not become apparent by the end of 1950.

ORE CLASSIFICATION

Of the 58,668 tons of ore (including 44,394 tons of old tailings) sold or treated in 1950, 94 percent was gold ore and the remainder lead ore. Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 8.—Mine production of gold, silver, copper, lead, and zinc in Alaska in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Number of mines	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
		Ore (short tons)	Old tailings (short tons)					
Dry gold ore	10	10,774	44,394	11,805	1,423			
Lead ore	1	3,500		356	12,700	12,000	298,000	12.000
Total lode mines	11	14,274	44,394	12,161	14,123	12,000	298,000	12,000
Gravel (placer operations)	216			277,111	38,515			
Total: 1950	227	14,274	44,394	289,272	52,638	12,000	298,000	12,000
1949	241	8,813	70,026	229,416	36,056	8,000	102,000	4,000

METALLURGICAL INDUSTRY

All of the ore and old tailings processed during 1950 was treated at mills (with or without concentrating equipment); no ore was shipped for direct smelting. Of the lode gold produced, 82 percent was recovered by amalgamation. Smelters in the United States received 1,703 tons of flotation concentrates and 465 tons of gravity concentrates for smelting from Alaska mines producing gold and lead (with silver, copper, and zinc as byproducts).

TABLE 9.—Mine production of gold, silver, copper, lead, and zinc in Alaska in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Placer	277,111	38,515			
Amalgamation	9,993	1,011			
Smelting of concentrate:					
Flotation concentrate	1,703	12,912	12,000	298,000	12,000
Gravity concentrate	465	200			
Total: 1950	289,272	52,638	12,000	298,000	12,000
1949	229,416	36,056	8,000	102,000	4,000

TABLE 11.—Gross metal content of concentrates produced from ores mined in Alaska in 1950, by class of concentrate

Class of concentrate	Quantity treated (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold	254	1,812	412	1,663	2,359	-----------
Lead	410	356	12,700	14,668	346,500	17,740
Total: 1950	664	2,168	13,112	16,331	348,859	17,740
1949	386	1,130	4,145	9,131	105,285	4,765

REVIEW BY REGIONS AND DISTRICTS

COOK INLET—SUSITNA REGION

Willow Creek District.—The Alaska Pacific Consolidated Mining Co. operated the Independence mine on Fishhook Creek near Wasilla throughout 1950 and produced 60 percent of the year's total lode-gold output for the Territory; in 1949 the mine was operated on a leasing system. The ore was treated at the company 80-ton amalgamation-flotation mill on the property. From 9,575 tons of gold ore milled, 6,140 ounces of gold and 406 ounces of silver were recovered as bullion by amalgamation; in addition 197 tons of concentrate (containing 1,146 ounces of gold, 159 ounces of silver, and 1,223 pounds of copper) produced by flotation was shipped to a smelter in the

United States. The Fern Exploration Co., Inc., operated the Fern mine on Archangel Creek from February 2 to August 30. The gold ore was treated in a 50-ton amalgamation-flotation mill, and a substantial quantity of gold and some silver were recovered by amalgamation. Flotation concentrate (containing gold, silver, and a small percentage of copper) was shipped to a smelter in the United States. A small quantity of gold and silver was recovered from the Old Married Twins property by Ward Sroufe. The Snowbird Mining Co., Inc., continued its development and construction program at the Snowbird mine on Reed Creek during the year. Units completed by year's end included a mill of modern design, Diesel-electric power plant, and a complete camp. Underground development continued, but no report was received of any ore being treated by December 31.

Yentna-Cache Creek District.—Again, as in 1948 and 1949, the largest producer in the Yentna-Cache Creek district was Collinsville Mines (dry-land dredge with dragline equipment) operating on Mills Creek. The Falls Creek Venture was active in the Falls Creek area; a small quantity of gold and silver was recovered incidental to prospecting on the Carlson claims. The Alaska Exploration & Mining Co. property on Bird Creek was leased to Mike Trepte and Anton Meise, who recovered a moderate quantity of gold and silver by hydraulicking. Philip Brandl operated the Cache Creek property under lease from the Nugget Creek Mining Co. and recovered some gold and silver by hydraulicking. Several other operators recovered sizable quantities of gold by small-scale hand, hydraulic, and bulldozer-hydraulic combinations.

COPPER RIVER REGION

Chistochina District.—Only one property was active in the Chistochina district in 1950. The Mount Kimball Construction Co. operated at the mouth of Slate Creek from May 25 to October 12 under lease from the Slate Creek Mining Co. and recovered a substantial quantity of gold by a hydraulic-bulldozer combination method.

Nelchina District.—C. J. McMahan, reportedly the only operater in the Nelchina district in 1950, recovered a moderate quantity of gold from Albert Creek, using a carry-all-bulldozer combination to deliver gravel to a sluice box.

Nizina District.—Fred Bronniche recovered a small quantity of gold by small-scale hand operation on Slope Creek, and Chititu Mines recovered a moderate quantity of gold by hydraulicking on Rex and Chititu Creeks.

Yakataga District.—Eugene and Harry Cline and B. B. Watson recovered a small quantity of gold from the Yakataga Beach by small-scale hand methods.

KENAI PENINSULA REGION

Moose Pass-Hope District.—The Skeen-Leckner (Falls Creek) mine was operated by the Falls Creek Mining Co. during June, July, and August 1950; a small quantity of gold was recovered from gold ore treated by amalgamation in the 25-ton mill at the mine. Two other operations, both located on Resurrection Creek, each produced a small quantity of gold; H. A. Anderson by hydraulicking and L. E. Brenner by small-scale hand methods.

[1] Excludes itinerant prospectors, "snipers", "high-graders," and others who gave no evidence of legal right to property.
[2] Sources of total as follows: 14,123 ounces from lode mines, and 38,515 from placers.
[3] Included with "Undistributed" to avoid disclosure of individual company operations.
[4] Exclusive of placer output, which is included with "Undistributed."
[5] Includes values and quantities which cannot be shown separately for certain individual districts as indicated in the appropriate column by footnote reference 3.

KUSKOKWIM REGION

Goodnews Bay District.—Using a hydraulic-bulldozer combination on Fox Creek, the Walter G. Culver & Co. recovered 74 ounces of gold and 11 ounces of silver from 2,500 cubic yards of gravel from May 23 to September 1. Gold was recovered as a byproduct from platinum mined by the Goodnews Bay Mining Co. on the Salmon River.

McGrath District.—Strandberg & Sons resumed operation of its floating bucket-line dredge on Candle Creek during 1950; it was the only active placer mine in the McGrath district. Robert Stone and associates did development work at the Eagle Creek lode-gold mine near Medfra during the year. A small quantity of gold was recovered from a mill clean-up at the Nixon Fork mine near Medfra.

Tuluksak-Aniak District.—The New York-Alaska Gold Dredging Corp., the largest gold producer in the Kuskokwim region and the third largest in the Territory in 1950, as in 1949, operated two floating bucket-line dredges on the Tuluksak River. The Marvel Creek Mining Co., using a dragline-bulldozer-hydraulic combination on Marvel Creek, washed 90,000 cubic yards of gravel between April 1 and October 15 to recover 883 ounces of gold and 112 ounces of silver. Using a bulldozer-hydraulic combination with bedrock sluice boxes on Canyon Creek, the Canyon Creek Mining Co. (Jens Kvamme & Sons) washed 2,800 cubic yards of gravel to recover 311 ounces of gold and 38 ounces of silver. The Moore Creek Mining Co., operating with bulldozers on Taylor Creek from May through September, produced a substantial quantity of gold. Russel Schaefer worked on Forty-seven Creek from July 1 to October 1 and recovered a moderate quantity of gold; a bulldozer was used to deliver gravel to sluice boxes. Using a bulldozer-hydraulic combination, Harry Steen recovered a small quantity of gold from Julian Creek between June 20 and July 20.

NORTHWESTERN ALASKA REGION

Kiana District.—Helcolicon Mines, Inc., the only gold producer reported in the district in 1950, operated its floating bucket-line flume-type dredge on Klery Creek during a short season. The equipment was formerly owned and operated by Lammers Exploration Co. Helcolicon Mines, Inc., continued their systematic placer-drilling program on the Salmon River in 1950.

SEWARD PENINSULA REGION

One-quarter of the total Alaska placer-gold output in 1950 came from the Seward Peninsula region. Twelve floating bucket-line dredges were operated in the region during 1950 (2 less than in 1949); in addition, numerous operators used hydraulic giants, bulldozers, and dragline excavators either separately or in combination. No production was reported from any lode-gold mine.

Council-Bluff District.—The two principal gold producers in the Council-Bluff district during 1950 were the Alaska Placer Co., which operated a floating bucket-line dredge on Niukluk River from June 12 to October 10, and the Sourdough Dredging Co., which operated a bucket-line flume-type dredge, equipped with 62 4-cubic-foot buckets on Ophir Creek (777 ounces of gold and 83 ounces of silver were recovered). C. L. Dempsey spent the 1950 season moving his bucket-line dredge to a new location; 18 ounces of gold and 3 ounces of silver were recovered during prospecting on Lower Willow Creek.

Fairhaven District.—The Casa de Paga Gold Co., the largest gold producer in the Fairhaven district in 1950, operated two bucket-line dredges on the Inmachuk River from June 24 to October 18. Overburden was stripped by hydraulic giants and bulldozers, and 313,920 cubic yards of gravel were handled by the dredges to recover 5,510 ounces of gold and 573 ounces of silver. The Havenstrite Mining Co. operated a bucket-line dredge on Mud Creek and two dragline-bulldozer combinations at separate locations on Candle Creek. Other producers of moderate quantities of gold by the bulldozer-hydraulic combination method were Dahl & Bernard Exploration Co. on Bear Creek, Hannum Creek Mining Co. on Hannum Creek, Jump Creek Mines on Jump Creek, and Wallace Porter on Bear Creek (39 ounces of gold and 4 ounces of silver were recovered from 2,778 cubic yards of gravel).

Kougarok District.—Kougarok Consolidated Placers, Inc., was the largest producer in the district in 1950. The company did not operate its bucket-line dredge on the Kougarok River because of a shortage of water. A dragline was used to deliver gravel to elevated sluice boxes and between June 1 and September 15, 10,000 cubic yards was handled to recover 1,133 ounces of gold and 116 ounces of silver. Three bucket-line dredges—each equipped with 2½-cubic-foot buckets—were operated in the district during the season by the Gold Dust Mining Co. on the Kougarok River, the North Fork Dredging Co. on Harris Creek, and Tolbert Scott & Son on Iron Creek (from July 9 to October 5, 200 ounces of gold and 19 ounces of silver were recovered from 35,000 cubic yards of gravel). Atlas Mines (George J. Waldhelm), operating on Atlas Creek with a dragline-bulldozer-hydraulic combination, washed 2,046 cubic yards of gravel from May 20 to October 1 to recover 342 ounces of gold and 26 ounces of silver. Noonan & Whitmore (bulldozer-dragline-elevated flume operation on claim 7 below Johnson's Discovery, Mascot Gulch) produced a substantial quantity of gold. Other producers of a moderate quantity of gold in 1950—all using combinations of dragline-bulldozer-hydraulic equipment—were Grant Mining Co. on Coffee Creek, Macklin Mining Co. on Macklin Creek, Louis Nashenweng & Patrick J. Bliss Co. on Quartz Creek (claim No. 8) Silver Bow Mining Co. (Herb Jenks) on Coffee Creek, Trinity Mining Co. (Kanari & Carey) on Trinity Creek (tributary of Kougarok River), and N. B. Tweet & Sons on the Kougarok River near Mascot Gulch.

Koyuk District.—Baldwin & Moon worked on Sweepstake Creek during the 1950 season and recovered a substantial quantity of gold using bulldozer-hydraulic equipment; it was the only major operation in the district.

Nome District.—The United States Smelting, Refining & Mining Co., operating three of its fleet of four bucket-line dredges in the vicinity of Nome from May 9 to December 5, was the largest producer of gold in the Nome district and Seward Peninsula region and ranked second in the Territory in 1950. The three dredges in operation are electrically powered and equipped with 134, 109, and 78 nine-cubic-foot buckets respectively. Lee Bros. Dredging Co., the second-largest gold producer in the district in 1950, operated one of its two bucket-line dredges on the Solomon River. One other producer of over 100 ounces of gold was the E. W. Quigley bulldozer-hydraulic operation on the Solomon River. The remaining placer-gold production in the district came from small-scale hand and bulldozer-hydraulic operations.

The Big Hurrah lode-gold mine was taken over in 1950 by T. P. Lane, who plans to rework the tailings of previous operations and recover gold by cyanidation. Necessary equipment for such a plant was ordered and received in 1950.

Port Clarence District.—The Northern Tin Co. recovered a small quantity of gold as a byproduct from its tin placer operation on Buck Creek.

Serpentine River District.—George Bodis worked claim 12 above Discovery on Dick Creek from July 1 to October 1. Using bulldozer-hydraulic equipment with a bedrock flume, gold and silver were reported recovered from 6,000 cubic yards of gravel.

SOUTHEASTERN ALASKA REGION

One-fourth of the total Alaska lode-gold output in 1950 came from five operations in the Chichagof Island, Hyder, Juneau, and Ketchikan districts, the Southeastern Alaska region. No gold placers were reported in operation.

Chichagof Island District.—Hayes & Whitely Enterprises recovered 209 ounces of gold and 46 ounces of silver in the form of bullion by re-treating 537 tons of old tailings from the Chichagof mine by amalgamation; in addition, 9 tons of gravity concentrate (containing 188 ounces of gold, 56 ounces of silver, 123 pounds of copper, and 1,132 pounds of lead) was shipped to a smelter in the United States. The Hirst-Chichagof mine at Kimsham Cove resumed limited operation during 1950 following a period of inactivity since October 15, 1942.

Hyder District.—The Riverside mine was operated from April 1 to December 31 by E. M. Thompson (under lease from J. H. Scott Co.), who treated lead ore (containing scheelite) in the combination flotation-gravity concentration mill at the mine. From the 3,500 tons of lead ore which was milled, 410 tons of lead concentrate (containing 356 ounces of gold, 12,700 ounces of silver, 14,668 pounds of copper, 346,500 pounds of lead, and 17,740 pounds of zinc) was produced and shipped to smelters in the United States and Canada.

Juneau District.—The Alaska Juneau mine remained inactive during 1950. Hayes & Whitely Enterprises recovered 1,624 ounces of gold and 302 ounces of silver in the form of bullion by re-treating 43,800 tons of old tailings by amalgamation from the Alaska Juneau mill; in addition 31 tons of gravity concentrate (containing 252 ounces of gold, 102 ounces of silver, 145 pounds of copper, and 765 pounds of lead) was shipped to a smelter in the United States. The LeRoy Mining Co. operated the LeRoy (Rainbow) mine on Glacier Bay from April 3 to November 8 and treated gold ore in an 18–20-ton amalgamation-flotation mill; from the 119 tons of ore which was milled, 281 ounces of gold and 120 ounces of silver were recovered as bullion by amalgamation, and 4 tons of flotation concentrate (containing 71 ounces of gold, 46 ounces of silver, 11 pounds of copper, and 450 pounds of lead) was shipped to a smelter in the United States.

Ketchikan District.—The only mine in the district with reported production in 1950 was the Dawson on Prince of Wales Island, operated by Wendell Dawson from March 1 to July 15; gold ore was treated by amalgamation and gravity concentration and, small quantities of ore and concentrate were shipped to a smelter in the United States.

YUKON RIVER BASIN REGION

One hundred and twenty placer mines and 2 lode mines in 17 districts in the Yukon River Basin region supplied 63 percent of the total Alaska gold recorded as having been produced in 1950. Sixty-nine percent of the 182,911 ounces of placer gold produced in the region came from 11 bucket-line dredges. The Fairbanks district continued to be the most important gold-producing area in the region and the Territory.

Chandalar District.—The R. W. Sellars bulldozer-hydraulic operation on Big Creek produced a substantial quantity of gold during a short season from July 1 to September 30, 1950.

Circle District.—Two bucket-line dredges were active in the Circle district during 1950; Gold Placers, Inc., operated its Diesel-powered dredge (equipped with sixty 4-cubic-foot buckets) on Coal Creek from April 17 to October 29, and C. J. Berry Dredging Co. operated its dredge on Lower Mammoth Creek from May 30 to October 22 (385,000 cubic yards of gravel was washed to recover 5,770 ounces of gold and 1,098 ounces of silver). The P. R. & H. Mining Co. operation on Lower Deadwood Creek—using bulldozers to deliver gravel to a sluice plate—ranked third in production of gold in the district. Other producers of 100 ounces or more of gold in the district were Deadwood Mining Co. on Upper Deadwood Creek (dragline-bulldozer-hydraulic), Kelly & Wilkinson on Miller Creek (bulldozer-hydraulic; 396 ounces of gold and 73 ounces of silver recovered from 11,108 cubic yards of gravel washed between May 14 and September 23), Harrison Creek Mining Co. on Harrison Creek (hydraulic), Portage Mining Co. on Portage Creek (dragline-bulldozer), and A. A. Zimmerman on Independence Creek (hydraulic).

Eagle District.—The Yukon Placer Mining Co., using bulldozer equipment, operated on Fourth of July Creek from July 1 to August 31 and recovered a substantial quantity of gold. The Crooked Creek Placer Co. (Bauer & Celich) hydraulicked on Crooked Creek from April 15 to September 25 to recover 40 ounces of gold and 4 ounces of silver from 1,750 cubic yards of gravel washed.

Fairbanks District.—The United States Smelting, Refining & Mining Co. operated five bucket-line dredges in the Fairbanks district in 1950 and—as in previous years—was by far the largest producer of gold, not only in the district but in the Territory. The company operated three 6-cubic-foot Bethlehem dredges (one with 68 buckets and two with 78 buckets), one 10-cubic-foot Bethlehem dredge (with 93 buckets), and one 10-cubic-foot Yuba dredge (with 106 buckets); all dredges are operated electrically. Other equipment used (chiefly for removing overburden) included 213 Joshua Hendy hydraulic giants and an electrically powered Bucyrus 10-W dragline. The

Goldstream dredge was moved to Fairbanks Creek during the winter of 1949–50 and operated at the new location during 1950.

The Brinker-Johnson Co., the second-largest producer in the Fairbanks district in 1950, operated its Walter W. Johnson Co. Diesel-powered bucket-line dredge (equipped with seventy-eight 4½-cubic-foot buckets) on Caribou Creek from May 16 to October 31.

Of the producers of gold from placer mines worked hydraulically and in combination with a dragline, bulldozer, and pumping equipment, the Alder Creek Mining Co. operation on Fairbanks Creek was the largest. From 300,000 cubic yards of gravel washed between May 1 and October 15, 3,966 ounces of gold and 595 ounces of silver were recovered. The equipment used for moving tailings, removing overburden, and delivering gravel to sluice boxes included six hydraulic giants, two dragline excavators (with 1½ and 2-cubic-yard buckets, respectively), and three bulldozers. Other producers of a substantial quantity of placer gold in the district using similar combinations of equipment were Four A Mining Co. on Pedro Creek (bulldozer-hydraulic), Hassel & Sticha on Ready Bullion Creek (dragline-bulldozer-hydraulic), Hope Mine on Deep Creek and Faith Creek (bulldozer-bedrock sluice), Helmer Johnson on Cleary Creek (bulldozer-hydraulic), N. O. Kupoff on Pedro Creek (bulldozer-hydraulic), C. B. Martin on Pedro and Banner Creeks (bulldozer-hydraulic), and Ernest L. Maurer on First Chance Creek (bulldozer-hydraulic).

Production of gold from lode mines in the Fairbanks district showed an increase in 1950 over the 1949 production despite only two operators reporting activity. Verne Jokela & Charles Lazeration worked the Greenback claims at the head of Little Eldorado Creek, 1 mile north of Pedro Dome; from 139 tons of gold ore treated by amalgamation at the Cleary Hill Mines Co. mill on Cleary Creek, 274 ounces of gold and 44 ounces of silver were recovered as bullion. John Vuyovich operated a lode-gold property on Ester Dome and milled the ore in the St. Paul mill on Eva Creek to recover a small quantity of gold by amalgamation. Doug Jackson and Earl Beistline operated the Cleary Hill mine under lease from Cleary Hill Mines Co. and milled their ore at the property; no gold was reported as being marketed from the operation.

Fortymile District.—An unusually dry season with consequent shortage of water resulted in curtailment of mining activity and decreased gold production in the Fortymile district in 1950. The Wade Creek Dredging Co., using a bulldozer to deliver gravel to a sluice box on Wade Creek, was the largest gold producer in the district in 1950, even though the output was about half of what it was in 1949. The Franklin Mining Co. operation (dragline-bulldozer-hydraulic) on claim 2 below Discovery on Chicken Creek from June 1 to September 15 ranked second in production of gold in the district. The Yukon Placer Mining Co., operating on Canyon Creek, dropped from first place as a producer of gold in the district in 1949 to third in 1950; its bucket-line dredge was idle during the year, and operations were limited to the use of a bulldozer to deliver gravel to sluice boxes. Other operators producing 100 ounces or more of gold from placers worked in the district, using various combinations of dragline-bulldozer-hydraulic equipment in conjunction with sluice boxes either of the bedrock or elevated type, were Lee Dragon on Fortymile River, William Meldrum on claim 1 above Discovery on Chicken Creek (119 ounces of gold and 23 ounces of silver recovered from 5,000 cubic yards of gravel handled by the bulldozer-hydraulic method from March 1 to October 30), Myers Fork Mining Co. on Myers Fork (217 ounces of gold and 43 ounces of silver recovered from 1,733 cubic yards of gravel handled by bulldozer-hydraulic method from May 20 to September 21), Squaw Creek Mining Co. on Squaw Creek, and Uhler Creek Mining Co. on Uhler Creek.

Hot Springs District.—The largest producer of gold in the Hot Springs district in 1950 as in 1949 (on the basis of reported data), was A. W. Pringle on Rhode Island Creek (bulldozer-hydraulic). Other producers in the district with reported outputs exceeding 100 ounces of gold, using various combinations of dragline-bulldozer-hydraulic equipment, were Cleary Hill Mines Co. on Sullivan Creek and Tofty Gulch; Joe Coble & Earl Francis on Lower Eureka Creek, Pete Johnson & Louis Johnson on Glenn Gulch, and Norheim & Anderson on Alameda Creek (102 ounces of gold and 24 ounces of silver recovered from 3,330 cubic yards of gravel by the bulldozer-hydraulic method from July 1 to September 25). Larsen & Windish recovered a comparable quantity of gold by deep drift placer mining on the right limit of Woodchopper Creek.

Hughes District.—Only one producer reported activity in the Hughes district in 1950. Strandberg & Sons, using dragline-bulldozer equipment with a dry-land washing plant, recovered a substantial quantity of gold from Utopia Creek.

Iditarod District.—North American Dredging Co., the largest producer of gold in the Iditarod district in 1950 as in 1948 and 1949 (on the basis of reported data), operated its Diesel-powered bucket-line dredge equipped with seventy 3½-cubic-yard buckets on the Browne Estate property on Otter Creek from April 1 to November 9. The Pete Miscovich & Son operation on Otter Creek—using two bulldozers, hydraulic lift, hoe shovel (1½-cubic-yard), and hydraulic giant equipment—ranked second in gold production in the district. Other operators producing a moderate to large quantity of gold by various placer methods in the district included Backstrom & Pearson on Flat Creek (from 3,000 cubic yards of gravel hydraulicked between May 5 and October 1, 220 ounces of gold and 36 ounces of silver were recovered), Happy Placers on Happy Creek (from 7,407 cubic yards of gravel worked by the bulldozer-hydraulic method from May 25 to October 6, 170 ounces of gold and 42 ounces of silver were recovered), Hatton & Turner on Willow Creek (bulldozer-dragline), Prince Creek Mining Co. on Prince Creek (298 ounces of gold and 52 ounces of silver recovered from 30,000 cubic yards hydraulicked from June 15 to November 20), Patrick Savage on Willow and Flat Creeks (drag-line-bulldozer-hydraulic), Uotila & Ogriz on Slate Creek (525 ounces of gold and 105 ounces of silver recovered from 133,000 cubic yards of gravel handled by the dragline-bulldozer-hydraulic method from May 1 to October 7).

Innoko District.—Two bucket-line dredges were active in the Innoko district in 1950. Innoko Dredging Co. operated its Diesel-powered dredge (equipped with sixty-six 3½-cubic-foot buckets) on Upper Ganes Creek from May 26 to October 25. Neil Beaton operated a flume-type dredge on Lower Ganes Creek from June 10 to

October 5. Other principal operators of gold-placer mines in the district in 1950—nearly all of which used dragline-bulldozer-hydraulic equipment combinations in conjunction with a sluice box, either of the bedrock or elevated type—were Carlson & Lindquist on Victor Gulch, Colorado Creek Mining Co. on Colorado Creek, Joseph A. Degnan on Lower Little Creek, Gurtler & Myklebust on Anvil and Little Creeks, Hard & Uotilla on Forgotten Bench on Bear Creek and on the Wedge Fraction between Cripple and Beaver Creeks, H. Matheson and P. Savage on Spruce Creek, I. C. McFarland on Little Creek (Six Pup), Rosander & Reed on Yankee Creek, and Uotila & Hard on Ophir Creek.

Kaiyuh District.—Two gold-placer operations were active in the Kaiyuh district in 1950, Iditarod Operating Co. on Golden Creek and Morelock Mining Co. on Rosa Creek (both used bulldozer-hydraulic equipment).

Kantishna District.—The Hosler Mines operated on Moose Creek, a tributary of Kantishna River, from June 10 to September 10, 1950, using bulldozer-hydraulic equipment.

Koyukuk District.—The largest producer of gold in the Koyukuk district in 1950 was the Myrtle Creek Mining Co. on Myrtle Creek. The company operated from June through September using dragline-bulldozer equipment with bedrock sluices. The second-highest producer of gold in the district was Nesland & White on Vermont Creek (bulldozer-hydraulic). In addition, 13 individuals (on the basis of reported data) active in the district in 1950 produced small quantities of gold (under 100 ounces), using small-scale hand, hydraulic, and bulldozer-hydraulic methods of recovery. Joseph B. Blundell operated two drift placer mines, one on Jim Pup (claim No. 1 below Discovery) and one on Wakeup Creek.

Rampart District.—The Little Minook Mining Co. operated on Little Minook Creek (claim No. 9 above Discovery) during the 1950 Season from May 1 to September 30 and recovered 1,412 ounces of gold and 86 ounces of silver from 149,900 cubic yards of gravel. Equipment used included one dragline (1½-cubic-yard bucket), two bulldozers, three hydraulic giants, and one Diesel-powered pumping unit. Swanson Bros., operating on Hunter Creek from May 22 to September 11 (bulldozer-hydraulic with sluice plate and bedrock boxes), recovered a substantial quantity of gold. Hunter Creek Mining Co. produced 162 ounces of gold and 13 ounces of silver by the bulldozer-hydraulic method on Hunter Creek from May 14 to August 25. The Pioneer Mining Co. (J. H. Pierce) washed 8,800 cubic yards of gravel by the bulldozer-sluice plate method on Hoosier Creek and recovered 70 ounces of gold and 9 ounces of silver. Frank J. Dinan worked claim 2 below Discovery on Florida Creek by drift mining and recovered a small quantity of gold.

Ruby District.—Pete Miscovich & Son, using a dragline-bulldozer-hydraulic combination on Flat Creek June 1 through September 20, was the largest gold producer in the Ruby district in 1950. The Granite Creek Mining Co. on Ophir Creek recovered 589 ounces of gold and 119 ounces of silver from May 1 to October 7 from 20,000 cubic yards of gravel, using the bulldozer-hydraulic method. Other large producers of gold using similar methods were Iver Johnson & Co.

on Trail Creek (dragline-bulldozer-pump), Long Creek Mining Co. on Long Creek (dragline-bulldozer-hydraulic), and Sig Wiig on Spruce Creek. Clarence Zaiser on Spruce Creek recovered 67 ounces of gold and 8 ounces of silver from September 1 to September 30 by hydraulic methods, using a dragline and bulldozer for moving tailings and overburden.

Tolovana District.—Olive Creek Mines (as in 1949) was the largest producer of gold in the Tolovana district in 1950; the property was operated from June 1 to September 25 with dragline-bulldozer-pump equipment. Wilbur Creek Mines operated on Wilbur Creek (bulldozer-hydraulic) from July 1 to August 31. Warwick Mines, using a bulldozer-hydraulic combination on Gertrude Creek, recovered 22 ounces of gold and some silver from April 10 to September 29. Operations were curtailed because of a shortage of water.

OTHER MINERALS

Antimony.—Earl Pilgrim did development work and mining at the Stampede mine in the Kantishna district during the winter of 1950. None of the 62 short tons of ore mined, containing an estimated 58 percent antimony, was shipped by the end of the year. Although the Sawtooth Mining Co. did no mining during 1950 at its property near Rampart, 100 tons of 50-percent antimony ore mined in 1948 and stockpiled at the mine was sold in 1950 and reportedly was to be shipped to a smelter in the United States.

Coal.—Alaska produced 412,455 short tons (final figure) of bituminous and subbituminous coal in 1950, 5 percent less than the record total of 1949. The greatest proportion of the output was produced by the Evan Jones Coal Co. from the Matanuska field and the Healy River Coal Corp. and Usibelli Coal Mine, Inc., from the Nenana (Healy) field. The complete list of companies that operated coal mines in 1950 is given in table 13. Two mine fires that occurred almost simultaneously in the Suntrana mine of the Healy River Coal Corp. in late August resulted in serious curtailment of production for several weeks. Of interest to the industry was development of a new strip mine in the Nenana field during the late summer of 1950 by the Cripple Creek Coal Co. on ground adjacent to the Usibelli Coal Mine, Inc. Production for an Army contract began in November, and despite the delayed start, late in the season, output was high enough to place the mine fifth among Alaskan coal producers for the year.

Platinum Metals.—Placer deposits in the Goodnews Bay district, Kuskokwim region, continued to yield a substantial quantity of crude platinum metal; the output in 1950 was higher than in 1949. The Goodnews Bay Mining Co. operated its electrically powered bucketline dredge (with ninty-three 8-cubic-foot buckets) between April 24 and November 12 and a 1¼-cubic-yard dragline-bulldozer-hydraulic combination from May 24 to October 5 for recovering crude platinum metals; both operations were on the Salmon River. Because of the necessity of handling clay encountered during the early part of the season, the dredge was shut down several weeks for remodeling the

232294—53——88

TABLE 13.—Coal-producing mines in Alaska in 1950, in order of output

Rank 1950	Rank 1949	Company	Field	Region	Type of coal	Mining method
1	1	Evan Jones Coal Co	Matanuska	Cook Inlet-Susitna	Bituminous	Underground.
2	2	Healy River Coal Corp	Nenana	Yukon River Basin	Subbituminous	Underground and strip.
3	3	Usibelli Coal Mine, Inc	do	do	do	Strip.

1 Began operations in the fall of 1950.
2 Meade River mine.
3 Did not operate.

recovery system. An extension on the trommel screen and installation of a high-pressure pump washing system proved to be successful in solving the problem. An adjunct to the redesigned recovery system, of particular interest to dredge operators, is an ingenious distributor installed at the end of the stacker belt. By means of this device—which can be actuated manually by electric controls or set to operate automatically—any clayey material that passes over the stacker can be selectively placed on the tailing pile for subsequent reworking by other means for recovering contained platinum metals.

Pumice.—During 1950 pumice was mined at Geographic Bay off Shelikof Strait by Stock & Grove for building use in the Anchorage area.

Sand and Gravel.—Production of sand and gravel in Alaska in 1950 amounted to 3,050,000 short tons. Producers were R. J. Sommers Construction Co., Juneau; the Alaska Road Commission; Bureau of Public Roads; Naval Operating Base, Kodiak; and the Corps of Engineers, Department of the Army.

Tin.—The Northern Tin Co. recovered placer tin from its Buck Creek operation, and the U. S. Tin Corp. continued its tin-placer operation at Lost River in the Port Clarence district, Seward Peninsula region. The Cleary Hill Mines Co. reported recovery of a small quantity of tin concentrate as the byproduct of its placer-gold operation near Tofty in the Hot Springs district, Yukon River Basin region. The over-all production for the Territory in 1950 was approximately 150 short tons of placer-tin concentrate, containing 89 short tons (79 long tons) of tin. No lode-tin mines were active during the year, but the U. S. Tin Corp. formulated plans for developing known lode-tin deposits at Lost River. According to the company, the tin has proved to be recoverable from the tin-tungsten concentrate by using a tin-smelting process now under development, which is currently being operated on a pilot-plant scale at Tacoma, Wash.

Tungsten.—The J. H. Scott Co. reported shipment of some tungsten (scheelite) concentrate produced at the Riverside mine near Hyder, Southeastern Alaska. The material was from a stockpile accumulated as a byproduct of the milling of lead ore mined before 1950. The U. S. Tin Corp. produced 88.5 tons of tin-tungsten concentrate, containing 8.62 percent tungsten trioxide, from its placer property at Lost River, Port Clarence district, Seward Peninsula region, during 1950. By use of a new treatment process under development by the company, the tin would be recovered as a metallic tin and the tungsten as a tungsten-rich residue from the tin smelting. The Rocky Mountain Mining Co., shipped about 1,600 pounds of tungsten concentrate accumulated as a by product from gold-placer operations in the Nome district, Seward Peninsula region, during 1948 and 1949.

Miscellaneous Minerals.—Data on production of stone are not available for publication. There was no recorded production of asbestos, chromite, gem stones, mercury, or petroleum in Alaska in 1950. The Navy Department has released little official information regarding the oil-drilling project in progress on Naval Petroleum Reserve 4, north of the Brooks Range, Northern Alaska region. Reportedly, gas had been obtained from certain wells in adequate quantity for use in the camp, and heating and cooking units had been altered to utilize this natural fuel.

Arizona

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By Paul Luff

GENERAL SUMMARY

ARIZONA'S output of copper increased from 359,010 short tons in 1949 to 403,301 tons in 1950, the largest output since 1929, when the State reached its peak production of 415,314 tons. Gold production increased from 108,993 fine ounces in 1949 to 118,313 in 1950, a 9-percent gain, and silver from 4,970,736 fine ounces to 5,325,441, a 7-percent gain; however, the production of lead declined from 33,568 short tons to 26,383, a 21-percent loss, and zinc from 70,658 short tons to 60,480, a 14-percent loss. The State remained the largest producer of copper in the United States; ranked third in zinc, fourth in silver, fifth in lead, and sixth in gold; and again ranked first in total value of the five metals.

The total value of the five metals was $201,033,694 in 1950, the highest since 1918 and a 13-percent gain over the $177,894,134 in 1949. Arizona's total value of the five metals has exceeded $200,000,000 in only two other years—1917 and 1918. The total value of the gold in 1950 was $4,140,955—2 percent of the State total value; silver, $4,819,-793—2 percent; copper, $167,773,216—83 percent; lead, $7,123,410—4 percent; and zinc, $17,176,320—9 percent. The value of the metals recovered from copper ore was $169,717,981 in 1950 ($143,441,196 in 1949), or 84 percent of the State total, and that recovered from zinc-lead ore was $23,035,993 ($28,510,900 in 1949), or 11 percent of the State total. About 88 percent of the State gold production and 75 percent of the silver in 1950 came from six districts—Ajo, Big Bug, Copper Mountain (Morenci), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 99 percent of the copper came from eight districts—Ajo, Copper Mountain (Morenci), Eureka (Bagdad), Globe-Miami, Mineral Creek (Ray), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 93 percent of the lead came from six districts—Aravaipa, Big Bug, Harshaw, Old Hat, Pima, and Warren (Bisbee); and 93 percent of the zinc came from seven districts—Big Bug, Harshaw, Old Hat, Pima, Pioneer (Superior), Verde (Jerome), and Warren (Bisbee).

Outstanding features of Arizona's mining activities in 1950 were resumption in January of copper mining at the Copper Queen mine of the Phelps Dodge Corp. at Bisbee, resumption in July of zinc-copper mining at the Magma mine at Superior and in August at the Republic-Mammoth group near Dragoon, the beginning in January of open-pit mining at the Ray copper mine of the Kennecott Copper Corp., the closing in June of the Phelps Dodge copper smelter at Clarkdale, the beginning in July of smelting at the new copper smelter of the Phelps Dodge Corp. at Ajo, the record production of copper in the Mineral Creek (Ray) district, and the record output of zinc in the Big Bug and Verde (Jerome) districts.

All tonnage figures reported herein are short tons and "dry weight"; that is, they do not include moisture. The value of metal production has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948-50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in Arizona, 1946–50, and total, 1860–1950, in terms of recoverable metal [1]

Year	Lode mines		Placer mines		Gold (lode and placer)		Silver (lode and placer)	
	Number of mines	Ore sold or treated (short tons)	Number of mines	Gravel washed (cubic yards)	Fine ounces	Value	Fine ounces	Value
1946	194	31,058,179	33	168,200	79,024	$2,765,840	3,268,765	$2,641,162

1950	403,301	167,773,216	26,383	7,123,410	60,480	17,176,320	201,033,694
1860–1950	12,681,742	3,935,114,032	492,473	85,022,880	517,730	115,788,421	4,654,045,587

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; old tailings or slimes re-treated; and ore, old tailings, or copper precipitates shipped directly to smelters during the calendar year indicated.
[2] Figure not available.

The average price of copper and zinc increased in 1950—copper to 20.8 cents a pound and zinc to 14.2 cents a pound—but the average price of lead declined to 13.5 cents a pound. The price of gold remained at $35 a fine ounce and silver at $0.905+ a fine ounce. At the beginning of the year the price of copper was 18.50 cents a pound, lead 12.00 cents a pound, and zinc 9.75 cents a pound. At the close of the year the price of copper was 24.50 cents a pound, lead 17.00 cents a pound, and zinc 17.50 cents a pound.

TABLE 3.—Gold produced at placer mines in Arizona, 1946–50, by class of mine and method of recovery

Class and method	Mines producing	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average value per cubic yard
Surface placers:					
Gravel mechanically handled:					
Dragline dredges:					
1946	1	160,000	185	$6,475	$0.04
1947–50					
Nonfloating washing plants: [1]					
1946	2	6,000	116	4,060	.68
1947	2	2,700	34	1,190	.44
1948	3	97,800	637	22,295	.23
1949	3	76,800	426	14,910	.19
1950	1	100	75	2,625	26.25
Small-scale hand methods:					
Wet and dry:					
1946	26	2,000	81	2,835	1.42
1947	19	6,500	241	8,435	1.30

1948	11	135	16	560	4.15
1949	2	320	9	315	.98
1950	3	450	19	665	1.48
Grand total placers:					
1946	33	168,200	398	13,930	.08
1947	30	9,400	314	10,990	1.17
1948	39	100,895	838	29,330	.29
1949	32	81,485	565	19,775	.24
1950	24	3,290	142	4,970	1.51

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

TABLE 4.—Mine production of gold, silver, copper, lead, and zinc in Arizona in 1950, by months, in terms of recoverable metal

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	9,326	433,140	30,560	2,960	6,585
February	8,998	400,245	28,888	2,528	5,775
March	10,031	464,852	32,409	3,030	6,295
April	9,756	466,570	32,638	2,466	5,270
May	10,112	484,935	34,728	2,538	5,615
June	9,991	437,086	35,203	2,330	4,965
July	8,765	384,300	31,498	1,726	3,845
August	8,752	421,880	33,200	1,798	4,565
September	9,691	446,233	34,028	1,803	4,615
October	10,586	464,400	36,103	1,883	4,565
November	10,769	469,400	37,228	1,728	4,195
December	11,536	452,400	36,818	1,593	4,190
Total: 1950	118,313	5,325,441	403,301	26,383	60,480
1949	108,993	4,970,736	359,010	33,568	70,658

Gold.—Production of gold in Arizona in 1950 was 118,313 fine ounces, the largest since 1943 and a gain of 9,320 ounces over 1949. Most of the gold and silver produced in the State are byproducts of copper ore and zinc-lead ore; in 1950 these two classes of ore yielded 103,311 ounces of gold (87 percent of the State total) compared with 99,164 ounces in 1949. Copper ore yielded 79,567 ounces of gold (67 percent of the total), an increase of 832 ounces over 1949, and zinc-lead ore 23,744 ounces (20 percent of the total), an increase of 3,315 ounces. Most of the remainder of the gold came from zinc-copper ore (5 percent of the total), lead ore (4 percent of the total), and gold ore (2 percent of the total). The largest increases in gold output in Arizona in 1950 occurred at the Iron King zinc-lead mine at Humboldt, the Copper Queen copper mine at Bisbee, the Magma copper and zinc-copper mine at Superior, and the Morenci copper mine at Morenci. Gold from placers decreased from 565 ounces to 142. The New Cornelia mine of the Phelps Dodge Corp. in Pima County continued to be the leading gold producer in Arizona; it was followed by the Iron King mine in Yavapai County, the Magma mine in Pinal County, the Copper Queen (Bisbee) branch of the Phelps Dodge Corp. in

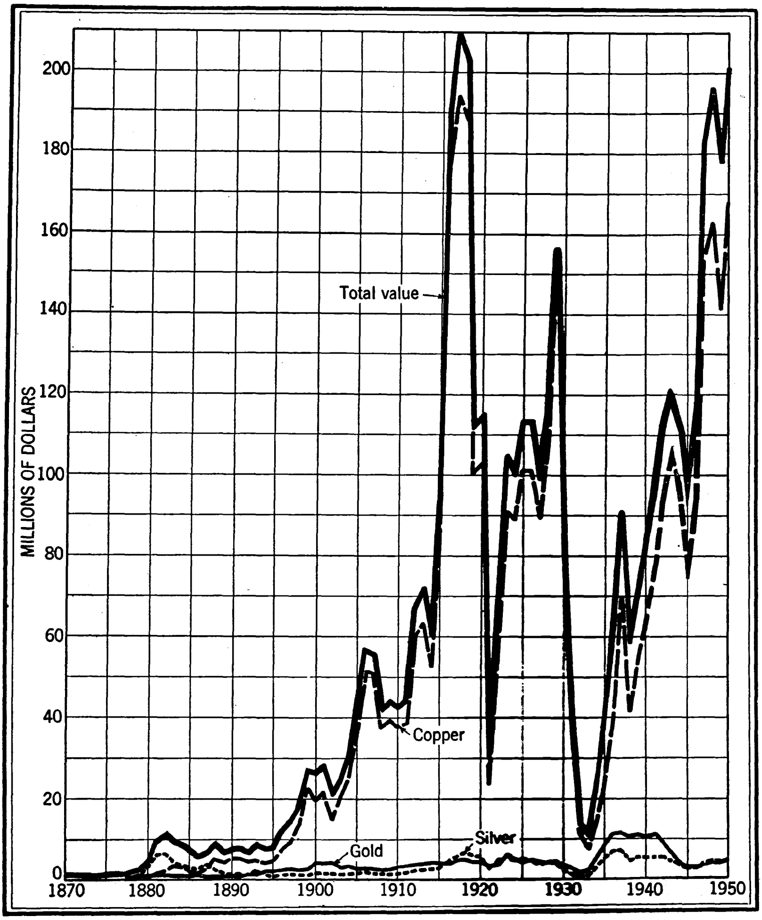

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1950.

Cochise County, the Morenci branch of the Phelps Dodge Corp. in Greenlee County, and the United Verde branch of the Phelps Dodge Corp. in Yavapai County; these six properties produced 88 percent of the State total gold.

Silver.—Production of silver in Arizona in 1950 was 5,325,441 fine ounces, the largest output since 1943 and a gain of 354,705 ounces over 1949. In 1950 copper ore and zinc-lead ore yielded 4,459,176 ounces of silver (84 percent of the State total) compared with 4,332,989 ounces in 1949. An increase in production of silver from copper ore in 1950 prevented a decline in the State silver output. Copper ore yielded 2,853,599 ounces of silver (54 percent of the State total), an increase of 441,240 ounces (18 percent) over 1949, and zinc-lead ore 1,605,577 ounces (30 percent of the total), a decrease of 315,053 ounces (16 percent). Most of the remaining silver came from silver ore (8 percent of the total), zinc-copper ore (7 percent of the total), and lead ore (1 percent of the total). The greatest increases in silver output in Arizona in 1950 occurred at the Morenci, Iron King, Magma, and Ray properties. The Phelps Dodge Corp., with a slightly higher output than in 1949, continued to be the chief silver producer in Arizona; its four properties (Copper Queen, Morenci, New Cornelia, and United Verde) produced 52 percent of the State silver output, 59 percent of the gold, and 61 percent of the copper. Other large silver producers in Arizona in 1950 were Iron King, Magma, Ash Peak, San Xavier (Eagle-Picher Mining & Smelting Co.), Flux, St. Anthony, and Ray (Kennecott Copper Corp.) properties.

Copper.—Arizona's output of recoverable copper increased to 403,301 short tons in 1950, the largest production since 1929 and 12 percent over 1949. Copper output increased substantially in each of the principal copper-producing districts except the Verde (Jerome) district, where it declined 3,924 tons. The Copper Mountain (Morenci) district, with an output of 154,689 tons of copper, remained the leading copper-producing district in the State; it was followed by the Globe-Miami district with 84,688 tons, Ajo with 64,400, Mineral Creek (Ray) with 36,442, Pioneer (Superior) with 22,636, Warren (Bisbee) with 13,345, Verde (Jerome) with 13,291, and Eureka (Bagdad) with 10,673. Copper production at the Ray property of the Kennecott Copper Corp. increased 17,767 tons or 96 percent. There were also substantial increases at the Inspiration, Morenci, New Cornelia, Bagdad, and Copper Queen properties. Copper ore and its products yielded 790,136,395 pounds of copper as follows: 37,586,791 tons of copper ore treated by concentration yielded 84 percent of the copper; 415,120 tons of copper ore shipped crude to smelters 5 percent; and 3,755,362 tons of copper ore leached and 17,378 tons of cement copper (from mine-water precipitates and underground leaching operations) 11 percent. The Morenci branch of the Phelps Dodge Corp. was again the largest copper producer in Arizona; it was followed in order by the New Cornelia branch of the Phelps Dodge Corp., Inspiration, Ray (Kennecott Copper Corp.), Miami, Castle Dome, Magma, Copper Queen branch of the Phelps Dodge Corp., United Verde branch of the Phelps Dodge Corp., and Bagdad properties. These 10 properties produced 99 percent of the State total copper.

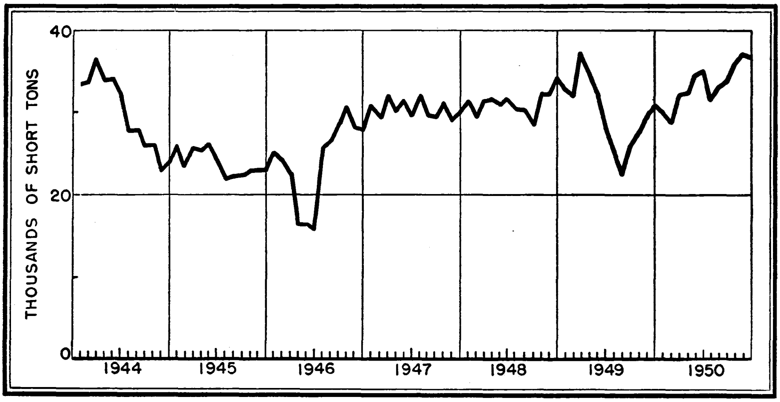

FIGURE 2.—Mine production of copper in Arizona, 1944–50, by months, in terms of recoverable metal.

Lead and Zinc.—In 1950 Arizona's production of recoverable lead and zinc was much less than in 1949; lead dropped to 26,383 short tons—a decrease of 7,185 tons—and zinc to 60,480 short tons—a decrease of 10,178 tons. These decreases resulted mainly from a decline in output of zinc-lead ore from the Copper Queen mine at Bisbee, where there is gradual depletion of ore reserves. Despite a 44-percent decrease in lead production and a 41-percent drop in zinc, the Copper Queen mine of the Phelps Dodge Corp. remained the largest producer of lead and zinc in Arizona. Other large producers of lead, in order of output, were the St. Anthony property at Tiger, Iron King mine at Humboldt, San Xavier mine near Sahuarita, Flux group near Patagonia, and Aravaipa group near Klondyke. Other large producers of zinc, in order of output, were the Iron King, United Verde branch of the Phelps Dodge Corp., San Xavier, St. Anthony, Flux, Magma, Republic & Mammoth (Coronado Copper & Zinc Co.), and Old Dick properties. Zinc production at the United Verde mine increased 79 percent, and both lead and zinc production increased substantially at the Iron King and Flux mines. Of the State totals, 30 percent of the lead and 34 percent of the zinc came from the Warren (Bisbee) district in Cochise County. Other large lead- and zinc-producing districts were the Big Bug in Yavapai County, Old Hat in Pinal County, Pima in Pima County, Harshaw in Santa Cruz County, and Aravaipa in Graham County. Additional large zinc-producing districts were the Verde (Jerome) in Yavapai County, Pioneer (Superior) in Pinal County, Eureka (Bagdad) in Yavapai County, and Cochise (Dragoon) in Cochise County. About 92 percent of the total lead and over 77 percent of the total zinc came from zinc-lead ore; 7 percent of the total lead came from lead ore, and most of the remainder of the lead came from zinc-copper ore, zinc-lead-copper ore, and gold-silver ore; and 20 percent of the total zinc came from zinc-copper ore and most of the remainder from zinc ore and zinc-lead-copper ore.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in Arizona in 1950, by counties, in terms of recoverable metal

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Cochise	20	1	15,464	$541,240	1,156,509	$1,046,699

MINING INDUSTRY

Despite a material decline in output of zinc-lead ore in Arizona in 1950, the State total ore mined and treated increased to 42,709,272 tons, the largest annual output ever recorded in the State's history and a gain of 4,336,393 tons (11 percent) over 1949. The demand for copper was strong throughout the year. Its price reached 24.50 cents a pound October 2, and copper ore was mined during the last quarter of the year at a higher rate than at any time during the past several years. The output of copper ore increased 12 percent—from 37,365,611 tons in 1949 to 41,757,273 tons in 1950, the highest annual tonnage ever mined in the State, but that of zinc-lead ore decreased 20 percent—from a record 773,617 tons in 1949 to 617,547 tons in 1950. Zinc-copper ore increased to 248,391 tons—a 52-percent gain—and siliceous ores to 63,238 tons—a 62-percent gain; but zinc ore declined to 7,159 tons—a 31-percent loss—and lead ore to 13,142 tons—a 17-percent loss. Of the State total ore, 41,722,536 tons (98 percent) was copper ore mined in the Ajo, Copper Mountain

(Morenci), Eureka (Bagdad), Globe-Miami, Mineral Creek (Ray), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee) districts. Of the State total zinc-lead ore, 588,760 tons (95 percent) was mined in the Big Bug, Harshaw, Old Hat (Oracle), Pima, and Warren (Bisbee) districts. Mining at six open pits—Ajo, Bagdad, Inspiration, Miami (Castle Dome), Morenci, and Ray—produced 33,358,059 tons of copper ore averaging 1.033 percent copper in 1950, compared with five open pits in 1949, which produced 29,082,243 tons of ore averaging 0.998 percent copper. Open-pit mining at the Ray property of the Kennecott Copper Corp. was begun in January. Labor was more plentiful in 1950 than in 1949, although skilled miners continued scarce.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Arizona in 1950, by class of ore or other source material, with content in terms of recoverable metal

Source	Number of mines (1)	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore:							
Dry gold	57	10,454	2,383	5,908	39,427	14,231	24,700
Dry gold-silver	6	441	141	2,768	4,855	5,239	
Dry silver	29	48,060	968	421,192	65,305	41,513	
Total	92	58,955	3,492	429,868	109,587	60,983	24,700
Copper	106	41,757,037	79,562	2,853,375	765,334,514	5,149	10,000
Lead	91	11,791	1,271	45,235	59,932	2,652,484	34,317
Lead-copper	3	7		300	2,708	1,330	
Zinc	4	7,159	85	3,911	191,533	73,530	2,163,701
Zinc-copper	9	248,391	6,334	354,302	11,662,135	337,506	24,436,230
Zinc-lead	29	617,547	23,744	1,605,577	4,327,878	48,427,851	93,759,618
Zinc-lead-copper	2	2,515		14,791	67,107	197,912	531,434
Total	244	42,644,447	110,996	4,877,491	781,645,807	51,695,762	120,935,300
Other "lode" material:							
Old tailings, etc.[2]	11	5,870	3,683	18,082	68,485	1,009,255	
Copper precipitates	8				24,778,121		
Total "lode" material	309	42,709,272	118,171	5,325,441	806,602,000	52,766,000	120,960,000
Gravel (placer operations)	24		142				
Total: 1950	333	42,709,272	118,313	5,325,441	806,602,000	52,766,000	120,960,000
1949	372	38,372,879	108,993	4,970,736	[3] 718,020,000	67,136,000	141,316,000

[1] Detail will not necessarily add to total because some mines produce more than 1 class of ore.
[2] Old tailings: Gold-silver, 4,280 tons; lead, 1 ton. Mill cleanings: Gold, 3 tons; lead, 2 tons. Smelter cleanings: Copper, 236 tons; lead, 1,318 tons. Old slag: Lead, 30 tons.
[3] Includes 76,951,738 pounds recovered from ore leached and mine-water precipitates.

METALLURGICAL INDUSTRY

Of the 42,709,272 tons of ore produced in 1950 in Arizona, 38,466,538 tons (90 percent) were treated at 35 milling plants and 3,755,362 tons (9 percent) at 1 copper leaching plant; the remainder—487,372 tons (1 percent)—was shipped crude to smelters.

Ore treated at milling plants in 1950 comprised chiefly 37,586,791 tons of copper ore averaging 1.073 percent copper and carrying minor quantities of gold and silver per ton of ore; 613,621 tons of zinc-lead ore averaging 0.05 ounce of gold and 3.22 ounces of silver to the ton, 0.50 percent copper, 4.46 percent lead, and 9.35 percent zinc; and 248,391 tons of zinc-copper ore averaging 0.05 ounce of gold and 2.16 ounces of silver to the ton, 2.74 percent copper, 0.15 percent lead, and 3.18 percent zinc. Copper ore from the Miami property was treated by a combination of leaching and concentration and copper ore from the Inspiration mine was treated by straight leaching and by leaching and concentration. The large copper-concentration plants at Morenci (45,000-ton-a-day), Ajo (25,000-ton), Miami (18,000-ton), Inspiration (18,000-ton), Castle Dome (10,000-ton), Hayden (10,000-ton), Bagdad (4,000-ton), Clarkdale (2,100-ton), and Superior (1,500-ton); the copper-leaching plants at Inspiration (9,000-ton), and Miami (3,000-ton); and the zinc-lead concentration mills at Bisbee (Copper Queen 900-ton), Humboldt (Iron King 670-ton), Tiger (St. Anthony 500-ton), and Patagonia (Trench 200-ton) were operated continuously in 1950, most of them at a higher rate than in 1949. Operations of the Sahuarita (Eagle-Picher) 500-ton flotation mill were interrupted during November and December by a labor strike. Five copper smelters in Arizona—Phelps Dodge Corp. at Douglas and Morenci, International Smelting & Refining Co. at Miami, American Smelting & Refining Co. at Hayden, and Magma Copper Co. at Superior—operated continuously throughout the year. The old copper smelter of the Phelps Dodge Corp. at Clarkdale shut down in June, but the new copper smelter of the Phelps Dodge Corp. at Ajo began operating in July. Most of the copper concentrates produced at mills in Arizona are treated at smelters in Arizona, but all the lead concentrates produced in Arizona in 1950 were shipped to the smelter at El Paso, Tex., and all the zinc concentrates were shipped to smelters at Amarillo, Corpus Christi, and Dumas, Tex.; Bartlesville and Henryetta, Okla.; St. Louis, Mo.; and Anaconda and Great Falls, Mont.

Tables 7 to 9 give details of the treatment of ores produced in Arizona in 1950.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Arizona in 1950, by method of recovery and type of material processed, in terms of recoverable metal

Method of recovery and type of material processed	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Lode:					
Almagation: Ore	185	75			
Concentration, and smelting of concentrates: Ore	95,650	4,036,319	679,214,112	47,825,269	120,450,248
Direct smelting:

REVIEW BY COUNTIES AND DISTRICTS

COCHISE COUNTY

California District.—Output in 1950 was principally 45 tons of zinc-lead ore from the Hilltop mine and 37 tons of lead ore from the Leadville group, both near Portal.

Cochise District.—In June 1949 low metal prices closed the Republic and Mammoth mines of the Coronado Copper & Zinc Co. near Dragoon. These mines were reopened in July 1950, and milling of zinc-copper ore was begun in August. The company reported that 21,821 tons of ore, treated in its 150-ton flotation mill in 1950, yielded 1,522 tons of copper concentrate and 2,134 tons of zinc concentrate.

Dos Cabezas and Tevis District.—W. R. Shanklin worked his Gold Prince mine 9 months and shipped 2,096 tons of ore containing 758

[1] All from lode mines.
[2] Not counted as mine, production coming from smelter cleanings and railroad-track clean-up.
[3] Dripping Springs district lies in both Gila and Pinal Counties.
[4] Pioneer district lies in both Gila and Pinal Counties.
[5] Not counted as mine, production coming from old mill cleanings.

232294—53—89

ounces of gold, 955 ounces of silver, 2,427 pounds of copper, and 5,602 pounds of lead. The rest of the district lode output was 167 tons of zinc-lead ore produced from the LeRoy Consolidated Mines and a small lot of gold ore from the Mary Joe No. 6 claim.

Smelter District.—Output in 1950 was 440 tons of lead residue shipped from the Phelps Dodge Corp. copper smelter at Douglas, Ariz., and 53 tons of railroad-track cleanings shipped by Frank Allen.

Swisshelm (Elfrida) District.—In 1950 Edwin Larson shipped 5,238 tons of lead ore from his Scribner mine near Elfrida, and the Chance Mining Co. shipped 791 tons of lead ore and 5 tons of lead-copper ore from its Chance group. The ore from both mines contained 581 ounces of gold, 22,096 ounces of silver, 17,867 pounds of copper, 1,217,200 pounds of lead, and 2,738 pounds of zinc.

Tombstone District.—Output in 1950 comprised 4,280 tons of low-grade gold-silver tailings shipped from the Grand Central dump; 1,195 tons of low-grade silver fluxing ore shipped from the San Pedro property; 870 tons of silver-lead ore produced from the Tombstone and Tombstone Extension groups; 436 tons of zinc-lead ore from the Brother George mine of the Mary Jo group; and 3 tons of lead ore from the San Diego claim.

Turquoise (Courtland, Pearce, Gleeson) District.—After the Abril and San Juan zinc mines closed in 1949, the output of the Turquoise district was small; in 1950 it consisted of only 12 tons of silver-lead ore produced from the Garnet, Johnny Boy, and X X X properties.

Warren (Bisbee) District.—Despite a marked drop in output of zinc-lead-silver ore in 1950, the Warren district remained the largest producer of silver, lead, and zinc in Arizona and ranked fourth in gold and sixth in copper. The copper output increased 36 percent and the gold 16 percent from 1949, but the lead output declined 44 percent, zinc 41 percent, and silver 7 percent. The value of the metal output of the district decreased from $18,505,611 in 1949 to $14,991,760 in 1950. The quantity of zinc-lead ore mined at the Copper Queen mine of the Phelps Dodge Corp. was much less than in 1949; but that of copper ore was greater, owing to resumption of copper mining, which had been suspended in June 1949. The corporation reported that the Copper Queen branch produced 218,404 tons of copper ore and 153,730 tons of zinc-lead ore in 1950 compared with 138,413 and 280,742 tons, respectively, in 1949. In addition, 355 tons of copper precipitates were produced. The zinc-lead ore and 19,871 tons of copper ore were treated in the corporation 900-ton flotation mill at Bisbee; the remainder of the copper ore and the copper precipitates were shipped direct to the corporation smelter at Douglas.

According to the corporation annual report for 1950, approaching exhaustion of zinc-lead ore at the Copper Queen branch and favorable economic conditions in the copper industry caused operations to be converted during the year from zinc-lead production to the mining of copper ore. Smelter copper production in 1950 was 21,203,333 net pounds compared with 21,864,907 net pounds in 1949; lead produced totaled 11,606,250 net pounds compared with 20,718,742 net pounds; and zinc produced totaled 33,423,374 net pounds compared with 56,685,269 net pounds.

COCONINO COUNTY

Lessees continued to operate the open pit of the Petoskey mine in the Jacob Canyon (Warm Springs) district and shipped 395 tons of carbonate copper ore containing 106 ounces of silver and 32,266 pounds of copper; 5 tons of similar ore were produced from the Emerald claim in the Francis district.

GILA COUNTY

Banner (Christmas and Tornado) District.—The Sam Knight Mining Lease, Inc., worked the Christmas mine all year and shipped high-lime fluxing ore (24,007 tons) containing an average of 2.86 percent copper to the copper smelter at Hayden, where it was needed for fluxing. Other district production comprised 234 tons of lead ore produced from the Kullman-McCool and London-Arizona groups, 82 tons of copper ore from the Chilito, London-Arizona, and "79" mines, 51 tons of gold ore from the Javoncillo and Round Top mines, and 17 tons of zinc-lead ore from the "79" mine.

Dripping Springs District.—Output in 1950 was 86 tons of lead ore and 29 tons of gold ore from the C–B claim and 32 tons of gold ore from the Gold Queen mine.

Globe-Miami District.—The Globe-Miami district, with a production of 169,376,600 net pounds of copper in 1950 (160,377,000 net pounds in 1949), continued to rank second among the important copper-producing areas in Arizona; the Copper Mountain (Morenci) district in Greenlee County remained in first place. The Inspiration property, with a yield of 77,025,822 net pounds of copper (62,805,750 net pounds in 1949), remained the leading copper producer in the district and ranked third in the State. The Inspiration Consolidated Copper Co. reported that 4,027,697 tons of copper ore were treated in 1950 compared with 3,619,906 tons in 1949. Of the total ore, 3,755,362 tons, averaging 1.008 percent copper—0.505 percent copper as oxide and 0.503 percent as sulfide—from which the slimes had been removed, were treated by acid ferric sulfate in the main leaching plant. Slimes (268,561 tons averaging 1.487 percent copper) removed from ore at the main leaching plant were treated in the company flotation concentrator for extraction of the sulfide copper content, and the tailings from the operation were leached by sulfuric acid solution for extraction of the oxide copper content. In addition, 3,774 tons of crude copper ore and 51 tons of copper precipitates were sent direct to the smelter at Miami. The total copper production per ton of ore treated in 1950 was 17.75 pounds.

According to the annual report of the Inspiration company for 1950, operations were conducted continuously on a 6-day-per-week basis, and leaching-in-place operations were begun the latter part of April. Production from this source was 4,178,194 net pounds of copper. Ore was produced from both underground and open-pit operations—2,114,423 tons of ore averaging 1.008 percent copper were mined from underground and 1,898,666 tons averaging 1.076 percent copper from the open pit. In addition to mining copper ore, open-pit operations also included removal of 4,228,273 tons of waste, a waste-ore ratio of 2.22:1.

The Miami mine of the Miami Copper Co. and the Castle Dome Copper Co., Inc. (a wholly owned subsidiary of the Miami Copper Co.), ranked second and third, respectively, in copper production in the district. The Miami Copper Co. reported that 91,364,999 net pounds of copper were produced from the two properties in 1950 (46,569,293 net pounds from the Miami mine and 44,795,706 net pounds from the Castle Dome) compared with 96,553,259 net pounds in 1949.

According to the annual report of the Miami Copper Co. for 1950, both properties operated on a 6-day-per-week basis throughout the year. Although the combined tonnage of copper ore mined and concentrated at the two plants exceeded that in 1949, less copper was recovered because lower-grade ore was handled. Copper was produced at the Miami mine by underground mining followed by flotation and by acid leaching of material overlying the mined-out areas. The 18,000-ton concentrator treated 4,003,306 tons of ore averaging 0.667 percent copper; 72,889 tons of copper concentrate and 2,831 tons of copper precipitates were shipped to smelters in Arizona. In addition to copper, the concentrate contained 1,129 ounces of gold and 54,463 ounces of silver, and re-treatment of copper concentrate recovered 627,288 pounds of molybdenum. Ore reserves, as of January 1, 1951, were estimated to be 18,609,263 tons averaging 0.78 percent copper. The Castle Dome open pit and 10,000-ton concentrator were operated continuously in 1950; the mill treated 3,690,465 tons of ore averaging 0.704 percent copper, which yielded 61,628 tons of copper concentrate. In addition to copper, the concentrate contained 935 ounces of gold and 69,635 ounces of silver. To uncover the ore, it was necessary to remove 855,419 tons of waste. As of January 1, 1951, ore reserves were estimated to be 10,032,618 tons averaging 0.665 percent copper, including Red Hill ore and a block of low-grade ore lying between the 4,040- and 4,085-foot levels of the Castle Dome ore body. An agreement was made to deliver the Castle Dome plant and mining equipment to the Copper Cities Mining Co. (wholly owned subsidiary of Miami Copper Co.) project in the Globe-Miami district at termination of the Castle Dome operations. A copper deposit amenable to open-pit mining and comparable in size and grade to the Castle Dome ore body was outlined in 1949 at the Copper Cities property.

The rest of the district output was largely 1,150 tons of low-grade silver ore shipped from the Rescue property and 849 tons of copper ore from the Black Beauty, Blue Bird, Copper Hill, and Keystone claims of the Old Dominion group, and Superior & Boston properties.

Summit District.—The Gibson and Yan mines near Miami together produced 140 tons of copper ore in 1950.

GRAHAM COUNTY

Aravaipa District.—The Athletic Mining Co. operated its Aravaipa group and 100-ton concentrator near Klondyke continuously in 1950. The company reported that 16,263 tons of zinc-lead ore were treated by flotation and 2,990 tons of similar ore shipped direct to the lead smelter at El Paso, Tex. The total ore contained 372 ounces of gold, 27,230 ounces of silver, 125,625 pounds of copper, 2,793,900 pounds of lead, and 2,790,000 pounds of zinc. Lessees worked the Sein Fein mine all year, shipped 1,238 tons of lead ore to a smelter, and hauled 300 tons of similar ore to the Athletic mill. The total ore contained 419 ounces of gold, 3,542 ounces of silver, 34,640 pounds of copper, and 480,326 pounds of lead. Other district production included 503 tons of zinc-lead ore from the Santa Teresa group and 336 tons of lead ore from the Abe Reed and Ben Hur properties.

Stanley Butte District.—Output in 1950 was 27 tons of copper ore produced from the Copper Chief, Copper Hill No. 4, and Silver Star claims and 3 tons of lead ore from the Legal Tender and Starlight claims.

GREENLEE COUNTY

Ash Peak District.—Ash Peak Lease worked the Ash Peak mine near Duncan all year and shipped to smelters in Arizona and Texas 24,717 tons of fluxing ore, averaging 0.035 ounce of gold and 9.198 ounces of silver to the ton and 80 percent silica.

Copper Mountain (Morenci) District.—The Copper Mountain district, with an output of 309,378,100 net pounds of copper in 1950 (283,867,000 net pounds in 1949), remained the chief copper-producing area in Arizona, as the Morenci mine of the Phelps Dodge Corp. continued to be the outstanding producer of copper in the State. The corporation reported that 16,025,008 tons of copper ore from the Morenci mine was treated in the 45,000-ton concentrator in 1950, compared with 14,488,723 tons in 1949, and that 564,351 tons of copper concentrate, 69,850 tons of crude copper ore, and 4,723 tons of copper precipitates were shipped direct to the Morenci smelter. In addition to copper, the mine was an important producer of gold and silver.

According to the annual report of the Phelps Dodge Corp. for 1950, the Morenci mine was operated throughout the year at a high rate, and a 6-day workweek was in effect until April 16, when operations were increased to a work schedule of 26 consecutive days followed by a 2-day shut-down. Copper ore mined totaled 16,094,858 tons, and waste and leach material removed, 26,734,814 tons, or a waste-ore ratio of 1.66 : 1. The experimental unit used to treat a portion of the copper concentrate for recovery of molybdenite operated throughout the year. The results, although erratic, were on the whole encouraging. It was hoped that during 1951 a marketable molybdenite concentrate would be produced.

Other district production was 179 tons of gold-silver smelting ore from the Bell and Climax Lode properties.

MARICOPA COUNTY

Cave Creek and Camp Creek District.—Output in 1950 was principally 63 tons of ore containing 6,443 ounces of silver and 17,596 pounds of copper produced from the Red Rover mine.

Osborn District.—Glenn D. Brubaker worked the General Grant claim 5 months and hauled 16 tons of lead ore to the Wickenburg Ore Market.

MOHAVE COUNTY

Cedar Valley District.—The 100-ton flotation mill of the Yucca Mining & Milling Co. at the Antler mine operated continuously in 1950 on zinc-copper ore from the Antler and Copper World mines near Yucca. The Antler mine, worked all year by the Yucca Mining & Milling Co., produced 10,648 tons of ore, and the Copper World mine, worked part of the year by Dye & Bathrick, produced 1,508 tons of ore. The total ore contained an average of 0.01 ounce of gold and 1.08 ounces of silver to the ton, 2.60 percent copper, 0.95 percent lead, and 6.48 percent zinc.

Copper Mountain District.—Lessees operated the Cox-Roth (Copper Mountain) property in 1950 and shipped 151 tons of ore containing 2 ounces of gold, 474 ounces of silver, and 94,000 pounds of copper.

Owens (McCracken and Potts Mountain) District.—Output in 1950 was 135 tons of copper ore produced from the Silverfield group and small lots of lead-silver ore, gold ore, and copper ore produced from various claims and sold to the Wickenburg Ore Market.

Wallapai (Cerbat, Chloride, Mineral Park, Stockton Hill) District.—Mining activity in the Wallapai district in 1950 was small compared with that in past years. The output consisted mainly of 137 tons of zinc-lead ore produced from the DeLaFountaine and Samoa groups, 85 tons of copper ore from the Detroit and Emerald Isle mines, 60 tons of lead ore from the St. Louis and Eagle mines, and 28 tons of gold-silver ore from the Hidden Treasure group.

PIMA COUNTY

Ajo District.—The Ajo district continued to rank first in gold and third in copper output in the State, owing to steady operation of the New Cornelia copper mine of the Phelps Dodge Corp. Copper ore treated in 1950 was 8 percent greater than in 1949. According to the annual report of the Phelps Dodge Corp. for 1950, the New Cornelia mine produced 8,790,024 tons of copper ore in 1950 compared with 8,122,473 tons in 1949. Waste removed totaled 8,794,909 tons compared with 5,700,740 tons in 1949. The company 25,000-ton concentrator treated 8,794,257 tons of copper ore, which yielded 131,717,340 net pounds of copper compared with 115,744,833 net pounds in 1949. A 6-day workweek was in effect until April 16, when operations were increased to a work schedule of 26 consecutive days followed by a 2-day shut-down. Construction of the new copper smelter at Ajo was completed in June, and smelting of New Cornelia concentrates was begun July 8.

Baboquivari District.—Leasers at the Papago Chief mine near Sells produced 160 tons of low-grade copper ore. L. J. Robison worked the Emmett & Elgin group and treated by concentration about 150 tons of gold ore, which yielded 6 tons of concentrate containing 135 ounces of gold, 26 ounces of silver, and 740 pounds of copper. Other district production was mainly old mill cleanings (gold) recovered from the mill at the Allison mine.

Cababi District.—Low-grade gold ore (254 tons) from the Cunquian mine near Sells was treated in a concentration mill by Picacho Mines, Inc., and 3 tons of high-grade gold ore were shipped to smelters.

Cerro Colorado District.—Lessees continued to work the Mary G mine near Amado and shipped 89 tons of silver ore to the smelter at El Paso, Tex.

Empire District.—E. P. Hilton worked his Lone Mountain group in 1950, treated 206 tons of lead ore in a concentration mill, and shipped 47 tons of similar ore direct to a lead smelter.

Helvetia (Rosemont) District.—Lessees worked the King in Exile mine all year and shipped 1,288 tons of ore containing 1,483 ounces of silver, 171,013 pounds of copper, and 3,550 pounds of lead. Other production was 43 tons of zinc-lead ore and 35 tons of copper ore from the Daylight mine and 148 tons of copper ore from the Forbes and Peach properties.

Pima (Sierritas, Papago, Twin Buttes) District.—Production of silver, copper, lead, and zinc in the Pima district in 1950 was less than in 1949, owing to a labor strike in November and December at the San Xavier property of the Eagle-Picher Mining & Smelting Co., one of the most important producers of zinc-lead ore in Arizona. The company reported that the mine produced 67,456 tons of zinc-lead ore in 1950 compared with 82,661 tons in 1949. This ore and 183 tons of custom ore were treated in the company 500-ton flotation mill; the yield was 10,585 tons of zinc concentrate and 5,459 tons of lead concentrate. Other district production included 49 tons of gold ore from the Golden Fleece mine and 33 tons of zinc-lead ore from the Paymaster.

Silver Bell District.—B. S. & K. Mining Co. operated the Atlas mine the last 5 months of 1950 and shipped 785 tons of ore containing 3 ounces of gold, 600 ounces of silver, 45,258 pounds of copper, 2,300 pounds of lead, and 63,636 pounds of zinc.

PINAL COUNTY

Casa Grande District.—Sherwood B. Owens worked the Silver Reef mine all year and shipped 12,445 tons of siliceous silver fluxing ore to smelters in Arizona and Texas. The Silver Lake mine produced 12 tons of zinc-lead ore and the Lead King claim 2 tons of high-grade silver-lead ore.

Cottonwood District.—Output in 1950 was 38 tons of gold ore produced from the Grand View group, 7 tons of copper ore from the Holy Cross claim, and 7 tons of silver ore from the Old Sample No. 11 claim.

Dripping Springs District.—In 1950 the output of the Dripping Springs district in Pinal County was mainly 47 tons of copper-silver ore produced from the Monitor mine near Ray and 35 tons of lead ore from the Lead Queen mine.

Goldfields District.—Operations at the old Mammoth property near Apache Junction by Goldfield Mines, Inc., included construction of a 100-ton amalgamation-flotation mill and treatment of 4,800 tons of low-grade gold ore.

Mineral Creek (Ray) District.—The Ray property of the Kennecott Copper Corp., one of the most important producers of copper ore in Arizona, increased its output of copper ore to 3,063,703 tons in 1950—a gain of 1,513,969 tons (98 percent) over 1949. The milling ore (3,056,425 tons), averaging 1.368 percent copper, was coarse-crushed in a 12,000-ton crushing plant at the mine, and the resulting product was hauled by rail 26 miles to the corporation 10,000-ton flotation mill at Hayden, where it was reduced to 115,004 tons of concentrate containing 666 ounces of gold, 130,000 ounces of silver, and 68,004,040 pounds of copper. In addition, 7,278 tons of crude smelting ore and 3,167 tons of copper precipitates, which together contained 5,594,141 pounds of copper, were produced. According to the annual report of the Kennecott Copper Corp. for 1950, the Ray Mines division produced 1,628,921 tons of copper ore by open-pit mining and 1,427,504 tons by underground mining. The work of converting a large part of the Ray mining activities from underground to open-pit operation has progressed to the extent that current open-pit production is approximately 8,000 tons a day.

The remaining district output was 7,858 tons of oxide ore, averaging 2.813 percent copper, produced from the Copper Butte open pit, and 299 tons of oxide lead ore from the Ray Silver-Lead and Richard Arlyn properties.

Mineral Hill District.—Output in 1950 was mainly 86 tons of copper ore from the Junction and Tom Thumb mines, 33 tons of gold ore from the Thanksgiving mine, and 27 tons of lead ore from the Silver King.

Old Hat (Oracle) District.—Although the output of zinc-lead ore from the Mammoth-Collins group of the St. Anthony Mining & Development Co., Ltd., at Tiger was 19 percent less in 1950 than in 1949, the property remained one of the most important producers of zinc and lead in Arizona. The company reported that 115,357 tons (142,500 tons in 1949) of ore, averaging 0.003 ounce of gold and 1.230 ounces of silver to the ton, 0.64 percent copper, 5.69 percent lead, and 5.65 percent zinc, were treated in its 500-ton gravity-flotation mill in 1950. In addition, 32 tons of lead ore and 814 tons of old smelter cleanings, containing 3,435 ounces of gold, 4,294 ounces of silver, 31,056 pounds of copper, and 661,819 pounds of lead were shipped to smelters. The rest of the district output was mainly 150 tons of silver ore produced from the Amphitheater group, 71 tons of gold ore from the Golden Dream and Southern Belle properties, and 49 tons of lead ore from the Stove Lid claim.

No ore was produced in 1950 from the San Manuel property of the San Manuel Copper Corp. (wholly owned subsidiary of Magma Copper Co.) south of Tiger, where extensive diamond drilling has outlined an ore body estimated to contain 462,784,500 tons of ore averaging 0.782 percent copper. According to the annual report of the Magma Copper Co. for 1950, the No. 1 shaft at the San Manuel property was sunk an additional 193 feet and the No. 2 shaft an additional 744 feet. Metallurgical testing was done continuously throughout the year to obtain data for designing a reduction and concentration plant. This work proved the ore to be readily amenable to standard methods of concentration, and company engineers have been drafting plans for a complete plant, as well as for developing and mining the ore body.

Owl Head District.—Lessees worked the Blue Copper and Desert mines in 1950 and shipped 456 tons of ore containing 6 ounces of gold, 137 ounces of silver, and 17,002 pounds of copper.

Pioneer (Superior) District.—The Magma mine (Magma Copper Co.), one of the most important producers of gold, silver, and copper in Arizona, became an important producer of zinc again in July 1950 (zinc mining had been suspended since July 1945). The company reported that 338,533 tons of copper ore and 50,527 tons of zinc-copper ore were milled in its 1,500-ton concentrator in 1950 and that 33,313 tons of copper ore and 6,342 tons of siliceous silver ore were shipped direct to its copper smelter at Superior. The copper milling ore averaged 0.031 ounce of gold and 1.080 ounces of silver a ton, and 6.146 percent copper; the zinc-copper ore averaged 0.019 ounce of gold and 2.543 ounces of silver a ton, 1.413 percent copper, 1.200 percent lead, and 8.453 percent zinc. According to the company annual report for 1950, the net metal produced from Magma crude smelting ore and concentrates comprised 14,257 ounces of gold, 517,518 ounces of silver, and 48,285,474 pounds of copper; 5,508 tons of zinc concentrate, averaging 50.451 percent zinc, were produced during the last 6 months of the year. The average cost of producing copper (after gold, silver, and zinc values were deducted) was 14.61 cents a pound in 1950 compared with 17.94 cents in 1949.

The rest of the district output was principally 950 tons of silver ore and 25 tons of lead-silver ore from the Reymert mine and 577 tons of low-grade gold-copper ore from the Lake Superior & Arizona group.

SANTA CRUZ COUNTY

Harshaw District.—In 1950 four properties in the Harshaw district produced 46,738 tons of ore containing 150 ounces of gold, 159,116 ounces of silver, 280,649 pounds of copper, 4,214,376 pounds of lead, and 9,741,578 pounds of zinc. Most of the output was 46,365 tons of zinc-lead-silver ore produced from the Flux mine near Patagonia by the American Smelting & Refining Co. This tonnage, along with 4,289 tons of ore received from custom shippers, was treated in the company 200-ton flotation mill; the yield was 3,210 tons of lead concentrate and 8,893 tons of zinc concentrate. Other district production was chiefly 307 tons of lead ore from the Blue Nose mine and 65 tons of silver ore from the Hermosa.

Oro Blanco (Ruby) District.—Hugo W. Miller operated his Montana group a short time in 1950 and shipped 190 tons of ore containing 21 ounces of gold, 2,752 ounces of silver, 3,020 pounds of copper, 37,331 pounds of lead, and 7,963 pounds of zinc. Other production included 158 tons of zinc-lead ore from the Choctaw mine and 91 tons of lead ore and 28 tons of zinc-lead ore from the Arizona group.

Pajarito District.—The Big Steve mine near Nogales produced 56 tons of lead ore.

Palmetto District.—Copper ore (86 tons) was shipped in 1950 from the Jack Pot waste dump and La Esperanza mine. Other production comprised small lots of lead ore from the Black Butte, Chloride, and Taft No. 4 claims.

Patagonia (Duquesne) District.—In 1950 six mines in the Patagonia district produced a total of 3,667 tons of ore containing 18,419 ounces of silver, 133,112 pounds of copper, 261,315 pounds of lead, and 867,510 pounds of zinc. A. R. Byrd, Jr., worked his Duquesne group all year and hauled 2,498 tons of ore, averaging 6.40 ounces of silver to the ton, 1.73 percent copper, 4.22 percent lead, and 12.44 percent zinc, to a custom flotation mill near Patagonia. The remaining district output was chiefly 626 tons of zinc ore produced from the Kansas mine and 466 tons of zinc-copper ore from the Pride of the West mine, treated in the Trench flotation mill near Patagonia.

Tyndall District.—The Bull Springs mine produced 179 tons of ore containing 2,119 ounces of silver, 362 pounds of copper, 37,229 pounds of lead, and 14,940 pounds of zinc. Other district production was mainly 64 tons of lead ore from the Bohlinger, Jefferson, and San Ramon properties.

YAVAPAI COUNTY

Big Bug District.—The metal output in the Big Bug district in 1950 was much greater than in 1949 owing to a substantial increase in output of zinc-lead-iron ore from the Iron King mine of the Shattuck Denn Mining Corp., which ranked second in gold and zinc production in the State and third in silver and lead. The corporation reported that 203,062 tons of ore, which averaged 0.134 ounce of gold and 4.453 ounces of silver to the ton, 0.169 percent copper, 2.621 percent lead, 6.949 percent zinc, and 22 percent iron, were treated in 1950 in its 670-ton flotation mill, which also treated 458 tons of custom ores. The mill product was 14,912 tons of lead concentrate, 19,972 tons of zinc concentrate, and 26,556 tons of iron-gold concentrate. According to the annual report of the corporation for 1950, the Iron King mine produced more ore in 1950 than in any previous year. The main shaft was sunk an additional 243 feet to a depth of 1,713 feet.

The remainder of the district lode output was chiefly 73 tons of gold ore from the M. & W. claim and 28 tons of copper ore from the Lone Pine mine. Placer gold (9 ounces) was recovered from three properties on Big Bug Creek.

Black Canyon District.—The most important district output was 34 tons of gold-silver ore from the Golden Turkey mine near Cleator.

Black Hills District.—Vern J. Huffaker worked the Shylock mine near Dewey in 1950 and shipped 57 tons of lead ore.

Black Rock District.—The Camp B. Mining Co. operated the Monte Cristo mine near Wickenburg in 1950 and treated about 300 tons of copper-gold ore by flotation. Small lots of copper ore and gold ore were produced from various claims and sold to the Wickenburg Ore Market.

Copper Basin District.—Fred D. Schemmer operated the Copper Basin group near Skull Valley until May 6, when the mine was shut down. During the time of operation, 4,666 tons of high-silica copper ore was shipped to the United Verde smelter at Clarkdale. The "U. S. Navy" mine produced 30 tons of zinc-lead ore and the Boston-Arizona group 103 tons of zinc ore.

Eureka (Bagdad) District.—In 1950, 12 mines in the Eureka district produced 1,267,235 tons of ore containing 2,150 ounces of gold, 110,799 ounces of silver, 29,355,803 pounds of copper, 534,857 pounds of lead, and 4,053,445 pounds of zinc—a 17-percent gain in ore output over

1949. The most important output was, as in 1949, copper ore produced from the open pit at the Bagdad mine by the Bagdad Copper Corp. The corporation reported that 1,250,892 tons of ore, averaging 1.158 percent copper, were treated in its 4,000-ton (capacity increased from 3,000 tons) flotation mill in 1950 compared with 1,058,311 tons in 1949. The 150-ton flotation mill of the Hillside Mining & Milling Co. operated all year on company ore and custom ores. The mill treated 7,750 tons of ore from the Hillside mine that averaged 0.25 ounce of gold and 4.35 ounces of silver to the ton, 0.32 percent copper, 2.41 percent lead, and 2.42 percent zinc; and 7,997 tons of ore from custom shippers in the district. Edgar Kellis (lessee) worked the Old Dick mine all year and hauled to the Hillside mill 6,330 tons of ore that contained an average of 0.02 ounce of gold and 0.71 ounce of silver to the ton, 1.82 percent copper, 0.75 percent lead, and 22.59 percent zinc. In addition, 22 tons of copper ore were shipped to a smelter. Other production included 2,140 tons of zinc-copper ore from the Copper King, Copper Queen, and Pinafore properties and 81 tons of zinc-lead ore and 17 tons of lead ore from the Desert Rose, Goodwin, and Vidano claims.

Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) District.—Jack Orr worked the Cash mine the first 6 months of 1950 and produced 226 tons of ore, which averaged 0.212 ounce of gold and 9.261 ounces of silver to the ton, 2.22 percent copper, 16.24 percent lead, and 9.88 percent zinc. The remainder of the district output was principally 136 tons of gold-lead ore from the Bodie mine and 39 tons of zinc-lead ore from the Ten Spot.

Humbug District.—Output in 1950 was 32 tons of gold-silver ore shipped from the Golden Anchor mine and 26 tons of silver ore from the Coberley claim.

Martinez (Congress) District.—Lessees at the old Congress mine shipped 267 tons of high-silica gold ore to the smelter at Hayden.

Pine Grove (Crown King) District.—About 660 tons of gold ore produced from the Gladiator mine in 1950 was treated in a flotation mill, and 516 tons of similar ore was shipped direct to the smelter at Miami. The total ore contained 515 ounces of gold, 3,850 ounces of silver, 8,167 pounds of copper, 11,250 pounds of lead, and 36,000 pounds of zinc. Other output included 20 tons of gold-lead ore from the Del Pasco group.

Silver Mountain District.—Output in 1950 was nearly all silver ore (23 tons) produced from the Little Joker claim near Wagoner.

Tip Top (Rock Springs) District.—The Black Canyon Copper Co., Inc., worked the Kay mine all year and shipped 831 tons of ore containing 62 ounces of gold, 969 ounces of silver, and 101,095 pounds of copper.

Turkey Creek District.—The Oro Fino claim produced 5 tons of high-grade silver-lead ore and the Senator claim 11 tons of silver ore and lead ore.

Verde (Jerome) District.—Production of zinc gained sharply (79 percent) in the Verde district in 1950 owing to a 45-percent increase in output of zinc-copper ore from the United Verde mine of the Phelps Dodge Corp.; however, the district production of gold, silver, and copper declined as a result of a material decrease (33 percent) in output of copper ore from the United Verde mine. The Phelps Dodge Corp. reported that the mine produced 199,803 tons of copper ore and 161,281 tons of zinc-copper ore in 1950 compared with 297,161 and 111,290 tons, respectively, in 1949. All the zinc-copper ore and 139,173 tons of copper ore were treated in the corporation 2,100-ton flotation mill. The copper concentrate (65,404 tons), plus 60,630 tons of crude copper ore and 139 tons of copper precipitates, was shipped direct to the corporation smelters at Ajo and Clarkdale. The zinc concentrate (18,489 tons) was shipped to a zinc smelter at Dumas, Tex.

According to the annual report of the corporation for 1950, the United Verde branch produced 25,759,366 net pounds of copper in 1950 compared with 34,477,880 net pounds in 1949; and 15,157,169 pounds of zinc were recovered compared with 8,005,488 pounds in 1949. No important ore discoveries were made; and, because of rapidly depleting ore reserves, the copper smelter at Clarkdale was closed June 6. The probabilities are that, owing to lack of ore reserves, mining will be discontinued by the end of 1951.

The remainder of the district output was 236 tons of old smelter cleanings shipped from the United Verde Extension copper-smelter site and 2 tons of copper precipitates from the Verde Exploration property.

Walker District.—Zinc-lead ore (35 tons) was produced from the Forshada mine and gold ore (2 tons) from the Gold Coin group.

Walnut Grove District.—Leasing operations at the McMahon group near Wagoner produced 73 tons of copper ore. Small lots of gold ore, copper ore, and lead ore were produced from various claims and sold to the Wickenburg Ore Market.

Weaver (Octave) District.—Output in 1950 was principally 119 tons of crude gold ore shipped to smelters from the Dutchman, Monica, and Octave mines.

YUMA COUNTY

Castle Dome District.—Desert Lead Co. operated the Hull mine 7 months and treated 928 tons of lead ore in a 50-ton gravity-concentration mill. Small lots of lead ore were produced from the Adams, Johnnie Lead, Minot, Orpha, Ruth Ann, Shirley Lee, and Sonora properties.

Cienega District.—Leasing operations at the Empire-Arizona group near Parker by the Lucky Tiger Combination Gold Mining Co. produced 416 tons of ore containing 96 ounces of gold, 40 ounces of silver, and 18,580 pounds of copper. Gold-copper ore (155 tons) was shipped from the Laura, Mammon, and Oro properties. Other production included 40 tons of gold ore from the Billy Mack mine treated by amalgamation and concentration.

Ellsworth (Harqua Hala) District.—J. W. Stewart shipped 168 tons of low-grade gold-silver-copper ore from the Bettle No. 1 claim.

Gold ore (169 tons) was shipped by lessees from the Blue Eagle, Blount El Tigre, Harqua Hala, Hercules, and Magic properties. The Big Chief, Bonanza, Desert, Mickey Doolan, and Mother Lode claims together produced 20 tons of copper ore.

Plomosa District.—The Southern Cross Mining Corp. worked the Lucky Lead group near Bouse all year and shipped 485 tons of ore containing 13 ounces of gold, 1,926 ounces of silver, 1,992 pounds of copper, 160,531 pounds of lead, and 13,455 pounds of zinc. Other district lode production was largely 73 tons of gold-copper ore from the Coronation group and 70 tons of gold ore from the Ah-Ve-Ha claims. Drift mining at the Crystal gold placer recovered 11 fine ounces of gold.

Trigo District.—Output in 1950 was all placer gold, recovered mostly by dry concentration at the Colorado River Valley property 50 miles north of Yuma.

California
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. Maurer

GENERAL SUMMARY

CALIFORNIA 1950 lead production broke a record of 33 years standing in establishing a new high for the metal in the State. Gold output, following the diminishing trend begun in 1948, dropped slightly below 1949 production, whereas silver, reflecting the expanded base-metal output in 1950, rose substantially over 1949. Zinc production exceeded the previous year by a small margin, but copper, largely recovered incidental to other metals in the State, decreased slightly compared to the relatively minor 1949 output. The total value of the five metals in 1950 was $22,081,859 or 7 percent above 1949. It was divided among the metals as follows: Gold, 65 percent; lead, over 19 percent; zinc, 10 percent; silver, nearly 5 percent; and copper, 1 percent. Comparing 1950 with 1949, gold decreased 1 percent in quantity and value; silver increased 37 percent in quantity and value; copper decreased 0.5 percent in quantity but increased 5 percent in value; lead increased 54 percent in quantity and 31 percent in value; and zinc increased 5 percent in quantity and 20 percent in value. Inyo County, leading contributor to metal-mining output in California, produced 32 percent of the State total value of the five metals in 1950 owing to lead and zinc production as well as to noteworthy quantities of gold, silver, and copper. Nevada County ranked second in 1950, principally because of gold ore mined in the Grass Valley-Nevada City district, and contributed 17 percent of the total value of the five metals. Sacramento County, in third place, produced somewhat over 15 percent of the total value of the five metals in 1950, mainly from large-scale gold dredging in the Folsom district. Thus, 64 percent of the State output was centered in 3 of the 58 counties.

Public Law 837, Eighty-first Congress, signed by the President September 25, 1950, opened to mining and other forms of entry approximately 289,500 acres of land in San Bernardino and Riverside Counties within the Joshua Tree National Monument.

All tonnage figures reported herein are short tons and "dry weight"; that is, they do not include moisture. Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment. The value of metal production has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

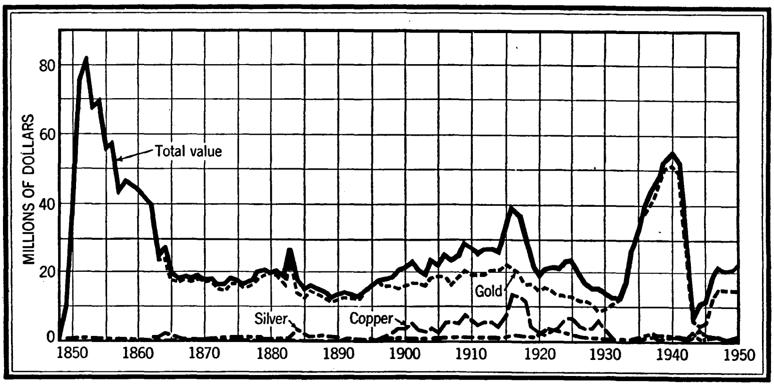

FIGURE 1.—Value of mine production of gold, silver, and copper, and total value of gold, silver, copper, lead, and zinc in California, 1848–1950.

Gold.—Renewed interest in California gold mining late in 1949, following the collapse of base-metal prices, continued in the first quarter of 1950 as rumors of an increase in the fixed price ($35 an ounce) for gold persisted. Spread of hostilities in Korea started an exodus of gold miners to defense jobs; this, coupled with rising operating costs and a realization that the rumors of increased gold price were unfounded, caused many of the newly opened gold mines to suspend operations before the end of 1950. Output of gold in 1950 (including gold in "natural gold" and amalgam sold on the open market), was down compared to 1949 owing to a 1-percent reduction in output of placer mines and an almost 2-percent reduction in that of lode mines. Production was depressed below normal output in November by flood conditions at many placer operations. Block leasing was practiced throughout the year by the State's two leading lode-gold producers, Idaho Maryland Mines Corp. and Empire Star Mines Co., Ltd.

The 20 leading gold-producing mines in California in 1950, listed in table 4, yielded 89 percent of the total gold, the 5 leaders producing 61 percent.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in California, 1946–50, and total, 1848–1950, in terms of recoverable metal [1]

Year	Lode mines [2]		Placer mines [2]		Gold (lode and placer)		Silver (lode and placer)	
	Number of mines	Ore, etc., sold or treated (short tons)	Number of mines	Gravel washed (cubic yards)	Fine ounces	Value	Fine ounces	Value
1946	150	627,767	172	84,351,000	356,824	$12,488,840	1,342,651	$1,084,862

[1] Small output in 1949, not separable, included with a group of mines.

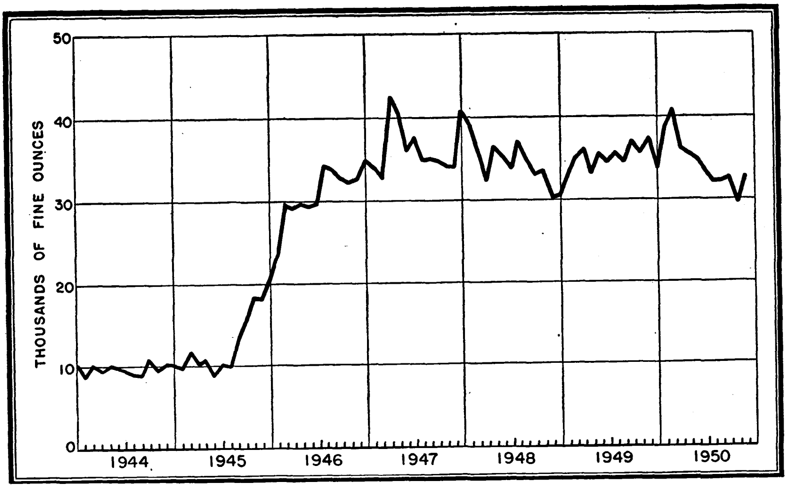

FIGURE 2.—Mine production of gold in California, 1944–50, by months, in terms of recoverable gold.

Silver.—The increase in California's total recoverable silver in 1950 over 1949 was due to expanded exploitation of argentiferous lead and zinc-lead ores, particularly in the Coso and Resting Springs districts of Inyo County. Of the State silver, 92 percent was derived from base-metal ores and 8 percent from precious metal ores and gravels; only a fraction of 1 percent was recovered from straight silver ore. The 10 leading silver-producing mines, listed in table 4, yielded 94 percent of the total silver in 1950, and the 5 leading mines yielded 90 percent.

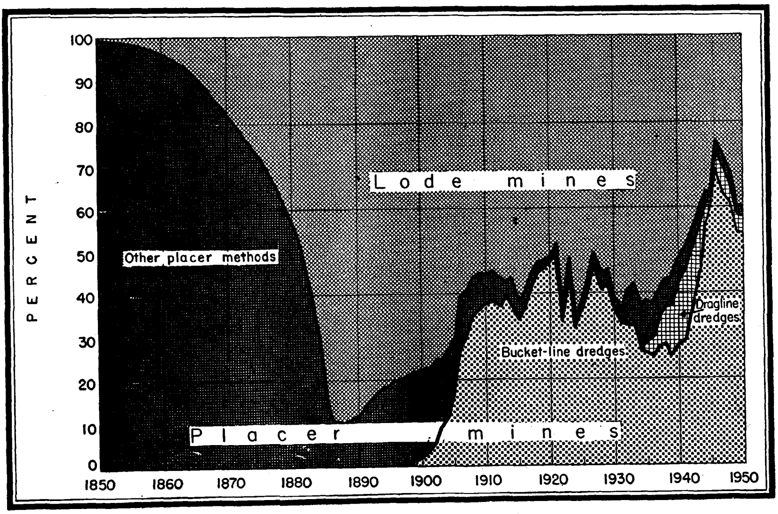

FIGURE 3.—Percentage of total California gold produced at lode and placer mines and by various methods of placer mining, 1850–1950.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in California in 1950, by months, in terms of recoverable metal

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	33,843	88,499	28	1,355	549
February	38,770	86,540	39	1,246	524
March	40,723	92,558	53	1,411	614
April	36,043	76,745	37	1,143	646
May	35,424	75,130	31	1,250	412
June	34,784	99,627	25	1,517	430
July	33,318	89,039	28	1,347	449

September	32,249	96,360	71	1,358	786
October	32,637	96,893	111	1,343	857
November	29,547	86,052	80	1,263	670
December	32,679	88,196	78	1,197	738
Total: 1950	412,118	1,071,917	646	15,831	7,551
1949	417,231	783,880	649	10,318	7,209

Copper.—There was a small increase in copper production from straight copper ore in 1950 compared with 1949, but ores mined primarily for other metals continued to be the principal source of the State copper. The leading producers of recoverable copper were the Coronado Copper & Zinc Co. Afterthought mine, Cow Creek (Ingot) district, Shasta County, and Penn Chemical Co. Penn mine, Campo Seco district, Calaveras County (zinc ore); Anaconda Copper Mining Co. Darwin group, Coso district, Inyo County (zinc-lead and lead ores); and United States Vanadium Corp. Pine Creek mine, Bishop district, Inyo County (tungsten ore).

Lead.—The record-breaking production of lead in California in 1950 was achieved largely because Anaconda Copper Mining Co. developed the Darwin group of mines, Coso district,[1] and the Shoshone group, Resting Springs district, Inyo County, to the extent that enough lead and zinc-lead ores were available to insure continuous operation at both properties throughout the year.

Other producers of lead included the Coronado Copper & Zinc Co. Afterthought mine; Louis Warnken, Jr., Gold Bottom mine dump, Slate Range district, San Bernardino County; George Lippincott, Lead King (Lippincott) mine, Ubehebe district, and Finley & Vignich, Minnietta mine, Modoc district, Inyo County. Of the 42 California mines with yields of recoverable lead, only 2 were in the category of 500 tons or more lead produced in 1950; 1 mine produced in the range of 100 to 200 tons of lead; and 5 mines were in the range of 20 to 50 tons. Each of the remainder produced less than 20 tons of lead during the year.

Zinc.—Anaconda Copper Mining Co. Darwin group of mines dominated the State output of zinc in 1950 and was followed in second place by Coronado Copper & Zinc Co. Afterthought mine, Shasta County, which resumed operation in August 1950 after more than 1 year of inactivity. In addition, Anaconda Copper Mining Co. Shoshone group; Penn Chemical Co. Penn mine, Campo Seco district, Calaveras County; and J. Q. Little, Carbonate King zinc mine, Ivanpah district, San Bernardino County—the latter a shipper of oxidized zinc ore to a slag-fuming plant—contributed to the State

[1] Mining World, vol. 12, No. 12, November 1950, pp. 8-11.

total of recoverable zinc. Of the 10 California mines with outputs of recoverable zinc, 3 were in the category of 500 tons or more zinc produced in 1950 and 1 mine produced in the range of 200 to 500 tons of zinc. The remainder had outputs below 50 tons of zinc for the year.

[1] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[2] Yuba County lode gold and lode silver included with Nevada County.
[3] Combined to avoid disclosure of individual output.
[4] From property not classed as a mine.

MINING INDUSTRY

The 11-percent increase in total tonnage of ores and old tailings treated in 1950 compared to 1949 reflected the substantial increases in all base-metal ores except zinc ore and lead-copper ore. Silver ore treated (largely for the added value of its lead content) increased over 1949, whereas output of gold ore and gold-silver ore declined in 1950. Despite the increased activity at mines and claims owing to the lifting of the moratorium on annual assessment work, actually 429 mines reported production in 1950 compared to 432 in 1949. Lode mines produced 40 percent of the State gold and placer mines 60 percent in 1950.

The average recoverable gold oontent of gravel treated in 1950 remained the same as 1949, whereas the yardage handled at placer mines decreased 1 percent compared with 1949. Bucket-line dredges washed 95 percent of the total gravel mined in the State and recovered 90 percent of the total placer gold, and drag-line dredges washed 4 percent of the total gravel handled and recovered 6 percent of the placer gold; fewer dredges of each type were operated in 1950 than in

1949. Thirteen suction dredges washed gravel in 1950 compared to 11 in 1949, and more nonfloating washing plants (used in conjunction with mechanical excavators) were operated in 1950 largely at mines formerly exploited by hydraulic and hand methods. Hydraulic mines, drift mines, and hand-operated placers were a source of only 2 percent of the total placer gold.

ORE CLASSIFICATION

California ores sold or treated in 1950 are classified in table 7. Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in California in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Number of mines [1]	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
		Ore (short tons)	Old tailings (short tons)					
Dry gold ore	193	372,218	9,133	155,811	49,458	34,200	38,400	----------
Dry gold-silver ore	4	767	1,732	363	9,735	9,400	100,700	----------
Dry silver ore	8	1,060	-------	7	7,935	500	45,100	----------
Total	204	374,045	10,865	156,181	67,128	44,100	184,200	----------
Copper ore [2]	10	2,473	17	1,218	26,831	440,100	----------	
Lead ore	22	54,298	---------	5,485	462,472	90,200	19,420,500	1,730,300
Lead-copper ore	1	3	---------	3	26	300	700	----------
Zinc ore	3	18,473	---------	563	49,959	553,600	411,200	3,521,700
Zinc-lead ore	5	87,067	---------	365	447,191	163,700	11,645,400	9,850,000
Total lode mines	243	536,359	10,882	163,815	1,053,607	1,292,000	31,662,000	15,102,000
Gravel (placer operations)	186	---------	---------	248,303	18,310	----------	----------	----------
Total: 1950 [2]	429	536,359	10,882	412,118	1,071,917	1,292,000	31,662,000	15,102,000
1949 [3]	432	491,957	2,949	417,231	783,880	1,298,000	20,636,000	14,418,000

[1] Detail will not add to totals because some mines produce more than one class of ore.
[2] Content of copper ore includes gold and silver recovered from tungsten ore; silver and copper from pyritic ore (residue); copper from precipitates, and gold, silver, and copper from furnace cleanup, not included with material treated.
[3] Includes gold, silver and copper from tungsten ore; silver and copper from pyritic ore (residue); copper from precipitates and copper from furnace matte, not included with material treated.

METALLURGICAL INDUSTRY

In 1950, of the 547,241 tons of lode material (including 10,882 tons of old tailings) from California mines sold or treated during 1950, 94 percent went to mills and 6 percent to smelters. Companies producing most of the State lode gold and mines that concentrated the bulk of California base-metal ores operated their own metallurgical plants. Included with the few mills that received custom ore were: Burton Bros., Inc., Rosamond, treatment by cyanidation of material from Kern, Inyo, San Bernardino, and Los Angeles Counties; the Mojave Mining & Milling Co. (Martin Beck), Mojave, concentration of precious metal ore and lead ore from Kern, Inyo, and San Bernardino Counties; and Butte Lode Mining Co., Randsburg, amalgamation and cyanidation of Kern and San Bernardino County ore. The Empire Star Mines Co., Ltd., Grass Valley, Nevada County, cyanided lots of

[1] Includes concentrates and gold, silver, and copper from tungsten ore not included with material treated.
[2] Figures under "ore" include both raw ore and concentrates produced from that ore, amalgamanted or cyanided.
[3] Combined to avoid disclosure of individual output.
[4] Includes ore milled and contained recoverable metal from Yuba County.
[5] Includes gold recovered and sold as "natural gold."
[6] Content of copper ore from Shasta County includes gold, silver, and copper from furnace cleanup, copper from precipitates, and silver and copper from pyritic ore (residue) not included with material treated.
[7] Includes gold, silver, and copper from furnace matte, copper from precipitates, and silver and copper from pyritic ore (residue) not included with material treated.

concentrates and milled small tonnages of ore from mines in Sierra, Amador, Nevada, El Dorado, and Placer Counties on a custom basis. The lead plant of the American Smelting & Refining Co. at Selby, Contra Costa County—the State's only smelter treating principally nonferrous primary materials—resumed operations March 6, 1950, following settlement of a labor dispute that closed the plant December 1, 1949. The Lippincott Lead Co. at Santa Ana, Orange County, reduced argentiferous lead ore in its blast furnace operated in conjunction with a storage-battery plant.

TABLE 10.—Mine production of gold, silver, copper, lead, and zinc in California in 1950, by method of recovery (except placer) and class of material processed, in terms of gross metal content

Class of material	Quantity treated (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
CONCENTRATE SHIPPED TO SMELTERS						
Dry gold	293	2,058	1,832	2,255	6,682	
Dry gold-silver	10	136	1,505			
Dry silver	1		14	58	233	
Copper	767	114	23,998	325,414	33,584	107,812
Lead	15,375	2,704	516,874	152,377	15,946,497	1,679,290
Zinc	11,151	[1] 347	[1] 74,858	[1] 483,467	[1] 1,011,146	[1] 12,239,355
Zinc-lead-copper	1,341					
Zinc-copper	802	52	6,185	64,958	24,849	731,509
Total: 1950	29,740	5,411	625,266	1,028,529	17,022,991	14,757,966
1949	23,289	7,457	417,023	1,091,328	10,336,797	13,597,359
ORE AND OLD TAILINGS SHIPPED DIRECTLY TO SMELTERS						
Dry gold ore	1,365	1,000	1,477	33,039	683	
Dry gold-silver ore and old tailings	1,803	152	4,582	12,581	103,322	
Dry silver ore	93	2	3,923	449		
Copper ore [2] and old tailings	2,490	1,185	10,050	274,193		
Lead ore	27,217	3,236	358,717	68,456	15,088,829	1,858,356
Lead-copper ore	3	3	26	305	719	
Zinc ore	151		1,865		2,233	122,022
Zinc-lead ore	185	4	419	258	58,623	41,477
Total: 1950 [2]	33,307	5,582	381,059	389,281	15,254,409	2,021,855
1949 [2]	29,026	4,894	302,680	363,019	10,765,787	2,272,170

[1] Combined to avoid disclosure of individual output.
[2] Content of copper ore includes gold, silver, and copper from furnace cleanup; copper from precipitates; and silver and copper from pyritic ore (residue), not included with material treated.

REVIEW BY COUNTIES AND DISTRICTS

AMADOR COUNTY

East Belt District.—Garibaldi Bros. worked the Garibaldi mine from February 15 to August 26, 1950, and recovered 89 ounces of gold and 13 ounces of silver from 12,000 cubic yards of gravel handled by dragline and trommel.

Mother Lode District.—Central Eureka Mining Co. operated the Old Eureka mine throughout 1950 and treated 39,993 tons of ore; 16,146 ounces of gold and 3,373 ounces of silver were recovered by amalgamation of ore and 2,992 ounces of gold and 702 ounces of silver by cyanidation of concentrates.

BUTTE COUNTY

Oroville District.—Yuba Consolidated Gold Fields operated three Yuba-type electric bucket-line dredges throughout 1950 on claims adjoining the Feather River. Gold Hill Dredging Co. worked its Kister electric bucket-line dredge from January 1 to June 30, 1950, 7 miles south of Oroville on the east side of the Feather River.

TABLE 11.—Mine production of gold, silver, copper, lead, and zinc in California in 1950, by counties and districts, in terms of recoverable metal

Total California [24]	243	186	547,241	163,815	248,303	412,118	1,071,917	1,292,000	31,662,000	15,102,000	22,081,859

1 Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
2 Source of total silver as follows: 1,053,607 ounces from lode mines and 18,310 ounces from placer mines.
3 Camanche district lies in Amador, Calaveras, and San Joaquin Counties.
4 From property not classed as a mine.
5 East Belt district lies in Amador, Calaveras, El Dorado, Mariposa, and Tuolumne Counties.
6 Mother Lode district lies in Amador, Calaveras, El Dorado, Mariposa, and Tuolumne Counties.
7 Included with "Undistributed."
8 Exclusive of lode output which is included with "Undistributed."
9 Folsom district lies in El Dorado and Sacramento Counties.
10 West Belt district lies in El Dorado and Mariposa Counties.
11 Friant district lies in Fresno and Madera Counties.
12 Slate Range district lies in Inyo and San Bernardino Counties.
13 White Mountains district lies in Inyo and Mono Counties.
14 Randsburg district lies in Kern and San Bernardino Counties.
15 Exclusive of placer output which is included with "Undistributed."
16 Includes gold recovered and sold as "natural gold."
17 Dale district lies in Riverside and San Bernardino Counties.
18 Klamath River district includes Humbug.
19 Salmon River district includes Liberty.
20 Scott River district includes Callahan, Deadwood, and Scott Bar.
21 Stanislaus River district includes Knights Ferry and Oakdale.
22 Tuolumne River district includes La Grange and Waterford.
23 Includes values and quantities which cannot be shown separately for certain individual districts as indicated in the appropriate column by footnote reference 7.
24 Includes gold and silver recovered from tungsten ore; silver and copper from pyritic ore (residue); copper from precipitates; and gold, silver, and copper from furnace clean-up; tonnage not included with ore and old tailings.

CALAVERAS COUNTY

Campo Seco District.—Penn Chemical Co. operated the Penn mine from July 1 through December 31, 1950; 7,611 tons of zinc ore milled yielded 389 tons of concentrate containing in gross metal 80 ounces of gold, 7,186 ounces of silver, 147,382 pounds of copper, 33,584 pounds of lead, and 107,812 pounds of zinc; 802 tons of concentrate containing 52 ounces of gold, 6,185 ounces of silver, 64,958 pounds of copper, 24,849 pounds of lead, and 731,509 pounds of zinc; and 6 tons of concentrate containing 141 ounces of gold, 106 ounces of silver, 190 pounds of copper, and 483 pounds of lead. The concentrates were shipped to lead, copper, and zinc smelters.

East Belt District.—Blackstone Mine worked the Blackstone mine throughout 1950 and milled 2,500 tons of ore; gold and silver were recovered by amalgamation, and flotation concentrate shipped to a smelter yielded gold, silver, and some lead.

DEL NORTE COUNTY

Monumental District.—Raymond Mitchell and E. C. Matthews worked the Monumental Consolidated mine for a short period in 1950 and shipped ore containing gold, silver, copper, and lead to a smelter.

EL DORADO COUNTY

East Belt District.—Hazel Creek Mine worked the Hazel Creek mine 6 miles southeast from Pollock Pines in 1950 and shipped ore containing gold and silver to a custom-cyanide plant for treatment.

Mother Lode District.—River Pine Mining Co., Ltd., operated a dragline with a 2-cubic yard bucket and a floating washing plant, both Diesel-powered, on the North Fork of the Cosumnes River throughout 1950. Lode-gold mines worked during the year included the Alhambra, Clysdale, El Dorado, Argonaut, Grit, Shaw, and Clayton.

West Belt District.—Wentworth, Mann & Smith developed the Sugar Loaf mine for 3 months in 1950 and recovered 21 ounces of gold and 2 ounces of silver by amalgamating the ore.

FRESNO COUNTY

Friant District.—Pacific Coast Aggregates, Inc., and the Anderson Rock Plant recovered gold and silver incident to operation of their commercial rock and gravel plants. L. A. Purinton operated a suction dredge for 45 days in 1950.

HUMBOLDT COUNTY

Orleans District.—Luthena White and Fred Ray hydraulicked the Pearch mine during 1950, recovering gold and some silver.

IMPERIAL COUNTY

Cargo Muchacho District.—Holmestake Mining Co., Inc., worked the Cargo Muchacho mine from July 1 to December 31, 1950, and recovered 1,718 ounces of gold and 415 ounces of silver from 5,686 tons of ore by cyanidation at the company rebuilt mill.

INYO COUNTY

Bishop (Pine Creek) District.—The United States Vanadium Corp. operated the Pine Creek mine throughout 1950 and produced by flotation a copper concentrate containing a substantial quantity of silver and some gold as a byproduct from ore treated primarily for tungsten.

Cerro Gordo District.—Santa Rosa Mining Co. worked the Santa Rosa mine in 1950 and shipped ore containing values in gold, silver, copper, and lead to a smelter.

Coso District.—Anaconda Copper Mining Co. operated the Darwin group of mines throughout 1950. The lead concentrate and zinc concentrate produced from the zinc-lead sulfide ore and treated at the company 300-ton flotation mill were shipped to smelters. In addition lead ore containing gold, silver, copper, and zinc was shipped for direct smelting.

Modoc District.—Ross Finley & Tom Vignich operated the Minnietta mine throughout 1950; 800 tons of ore milled at the company 40-ton gravity plant yielded 53 tons of concentrate containing in gross metal 3 ounces of gold, 2,827 ounces of silver, 162 pounds of copper, 44,247 pounds of lead, and 9,472 pounds of zinc. In addition, 140 tons of direct smelting ore (containing 10 ounces of gold, 4,221 ounces of silver, 755 pounds of copper, 33,071 pounds of lead, and 39,218 pounds of zinc) were shipped. Foreman & Skinner operated the Defense mine and A. L. Foss worked the Surprise mine in 1950; values in gold, silver, copper, and lead were recovered from the ores shipped to a smelter.

Resting Springs District.—Anaconda Copper Mining Co. operated the Shoshone group of mines throughout 1950. Sulfide flotation of the lead ore followed by flotation of oxidized lead minerals, using a sulfidizer, yielded a lead concentrate containing gold, silver, copper, and zinc. The concentrate and lead ore (containing substantial quantities of gold and silver and some copper and zinc) were shipped to smelters.

Slate Range District.—Louis Warnken, Jr., shipped 1,732 tons of tailing containing values in gold, silver, copper, and lead from the Gold Bottom mine dump. Ned E. Raymond shipped 43 tons of dump ore containing values in silver, lead, and zinc from the Ophir mine.

South Park District.—Harry A. Briggs shipped 40 tons of ore containing in gross metal 4 ounces of gold, 179 ounces of silver, 159 pounds of copper, 13,379 pounds of lead, and 14,335 pounds of zinc to a smelter in 1950 from the Red Cloud mine.

Ubehebe District.—Lippincott Lead Mines worked the Lead King (Lippincott) mine in 1950 and consigned argentiferous lead ore to the Lippincott reduction works at Santa Ana, Calif.

White Mountains District.—Morris Albertoli operated the Hope group of claims from October 1 to November 15, 1950, and shipped (to a smelter) 47 tons of ore containing in gross metal 1 ounce of gold, 405 ounces of silver, 95 pounds of copper, 9,313 pounds of lead, and 7,000 pounds of zinc.

KERN COUNTY

Mojave District.—Burton Bros., Inc., operated its cyanide mill throughout 1950 on ore from the Tropico and Cactus Queen mines and in addition treated ores from other mines in the Mojave district, including the Amethiste, Elephant-Eagle, and Standard. Mojave Mining & Milling Co. (Martin Beck) concentrated gold and silver ores from mines in the Mojave district, including the Whitmore, Blue Bird, Bob Tail, Liberty, Pride of Mojave, Yellow Dog, and Red Wing. Concentrates were shipped to a smelter.

Randsburg District.—Butte Lode Mining Co. operated the Butte Lode mine throughout 1950 and recovered gold and silver by amalgamating 327 tons of ore and cyaniding 500 tons of tailings. In addition, 1,315 tons of custom ore from other Randsburg district mines, including the Pioneer (in San Bernardino County), Big Dyke, Hard Cash (California), Nancy Hanks, Josephine, and Florence, were amalgamated. King Soloman Lease, E. B. Atkinson, partner, operated the Yellow Aster mine in 1950 and recovered gold and silver by amalgamation at the lessee's mill.

LOS ANGELES COUNTY

San Gabriel District.—San Gabriel Valley Placers recovered 86 ounces of gold and 12 ounces of silver as by-products of the Azusa Rock & Sand Co. aggregate plant operation.

MADERA COUNTY

Chowchilla River District.—Suction dredges were operated by the Chowchilla Dredge Co., L. R. Casteel, Howell Bros., Verne Snyder, and Merlyn Taylor in 1950.

Fresno River (Dennis) District.—Sherwood Green operated a 10-inch suction dredge at Hensley Bridge from January to September 1950; 73 ounces of gold and 24 ounces of silver were recovered from 25,000 cubic yards of gravel washed. Robert Brock, Elmer Holiday, Ernest Noble, and Ernest Smith also operated suction dredges in 1950.

MARIPOSA COUNTY

East Belt District.—Glenn-Steintorf Co. milled ore from the Marble Springs mine in 1950 and recovered gold and silver by amalgamation; concentrate shipped to a smelter contained gold, silver, and some copper and lead. Other mines that operated during the year included Mexican Diggings (R. H. Jackson), Schroeder group (Schroeder Mines), and Williams Bros. mine.

Hunter Valley (Hornitos) District.—Thurman & Wright dredged on Burns Creek from January 19 to September 25 and from November 25 to December 31, 1950, using a dragline with 5-cubic yard bucket and a Bodinson floating washing plant, both electrically powered.

Mother Lode District.—Gold ore from a number of mines worked during 1950 (including the A. J. claim, Combination and Blue Bird claims, Diltz Oro Grande, Lucky Boy, Nutmeg, and Specimen) was treated by amalgamation.

MERCED COUNTY

Merced River (Snelling) District.—Snelling Gold Dredgeing Co. operated a Yuba electric bucket-line dredge with 66 7-cubic foot buckets adjacent to the Merced River between Snelling and Merced Falls throughout 1950.

MONO COUNTY

Masonic District.—Sarita Milling Co. cyanided 3,575 tons of ore from the Sarita and Pittsburg mines from May 15 to September 10, 1950, recovering gold and silver.

NEVADA COUNTY

French Corral District.—R. L. Forkner operated the French Bar mine from September 1 to December 15, 1950, using a mechanical excavator in conjunction with a vibrating screen and sluice boxes; 220 ounces of gold and 21 ounces of silver were recovered from 5,000 cubic yards of gravel washed.

Grass Valley-Nevada City District.—Idaho Maryland Mines Corp. operated the Idaho and Brunswick units throughout 1950, treating gold ore by amalgamation followed by cyanidation of concentrates at the company 900-ton concentrating mill and 30-ton cyanide plant. A mine fire on September 4, 1950, caused only minor operational delays. The Empire Star Mines Co., Ltd., treated ore from the Empire Star group of mines in Nevada County and the Browns Valley group in Yuba County by amalgamation and cyanidation throughout 1950; ore and concentrates from several neighboring properties also were treated on a custom basis at the Grass Valley 500-ton mill and cyanide plant.

Washington (North Bloomfield) District.—Ancho Erie Mining Co. operated the Ancho & Erie group throughout 1950, recovering gold and silver by amalgamation and cyanidation at the company 200-ton concentration mill and 6-ton cyanide plant. Several placer mines were operated in 1950, including the Biglow (Cliff Frazier), Eastman (Crescent Pacific Mining Co.), Howie group (Howie Mining Co.), Omega (Goldfield Consolidated Mines Co.), Relief Hill (Western Gold, Inc., and lessees, and Waukashau (Mellott & Mellott).

PLACER COUNTY

Auburn (Penryn) District.—The Mary Len mine, formerly worked by Mary Len Mine (a partnership), was operated by A. H. L. Mining Co. for 6 months in 1950; 294 tons of gold ore were treated by amalgamation; flotation concentrates were shipped to a custom-cyanide plant.

PLUMAS COUNTY

Greenville District.—E. R. Lewis operated the L & L mine from April 1 to November 1, 1950, and amalgamated 45 tons of ore and 1 ton of old tailings.

La Porte District.—A. T. Merian worked tailings at the Jumbo mine by sluicing and at the Lucky Bend mine by dragline dredging in 1950. Gold and silver were recovered. The dragline dredge subsequently was operated in the Strawberry district, Yuba County.

RIVERSIDE COUNTY

Dale District.—Lyman Webster, Leslie Spell, and Arthur Becker operated the Oro Mega mine from January 1 to May 5, 1950; 500 tons of ore milled at the Ivanhoe plant yielded 31 tons of lead concentrate containing gold, silver, and some copper.

Ironwood District.—Dan Figueroa & Sons worked the Bald Eagle mine from November 5 to December 15, 1950, and shipped 56 tons of lead ore containing some gold, silver, and copper to a smelter.

SACRAMENTO COUNTY

Cosumnes River District.—Cosumnes Gold Dredging Co. operated a bucket-line dredge near Sloughhouse in 1950. Mountain Gold Dredging Co. worked the Van Vleck property by dragline dredging from January 1 to October 20, 1950.

Folsom District.—The Natomas Co. operated six bucket-line dredges (one 9 months, one 11 months) and four units 12 months in 1950 near the American River. According to the company annual report for 1950, normal production was maintained while operating costs were lower due mainly to a decrease in repair requirements for the year. Capital Dredging Co. worked two bucket-line dredges 5 miles south of Folsom throughout 1950. Fair Oaks Gravel Co. recovered as byproducts 147 ounces of gold and 11 ounces of silver from 50,424 cubic yards of material washed at its commercial gravel plant on the American River. General Dredging Co. operated a dragline dredge near Natoma the entire year.

SAN BERNARDINO COUNTY

Buckeye District.—Donald F. Love shipped gold ore and copper ore from the Roosevelt-Bagdad Chase mine to a smelter in 1950; substantial quantities of gold, silver, and copper were recovered.

Clark Mountain District.—Carbonate King Mines developed the Carbonate King group in 1950; 52 tons of ore containing in gross metal 18 ounces of silver, 15,271 pounds of lead, and 9,121 pounds of zinc were shipped to a smelter. Edward Koppelman shipped zinc-lead ore to a smelter from the Kally mine, and Mohawk Mines, Inc., shipped lead ore to a smelter from the Mohawk mine in 1950.

Ivanpah (Bullion) District.—Alloy Mining Co. operated the New Trail group throughout 1950 and shipped 566 tons of ore containing in gross metal 92 ounces of gold, 3,376 ounces of silver, and 63,800 pounds of copper to a smelter. J. Q. Little shipped 151 tons of zinc carbonate ore containing some silver and lead to a slag fuming plant in 1950.

Randsburg District.—Rhoades, Kirkland, Ralston & Ralston shipped 496 tons of gold ore to a custom mill from the Pioneer group from January 1 to November 15, 1950; gold and silver were recovered by amalgamation. Surcease Mining Co. operated a dry-land dredge at the Super Mold mine from January 1 to April 18, 1950; 13,107 cubic yards of gravel yielded 481 ounces of gold and 100 ounces of silver.

Whipple Mountains (Monumental) District.—Gold Trail Mine operated the Gold Trail group for a short time in 1950 and shipped 58 tons of ore (including ore mined in 1949), containing in gross metal

38 ounces of gold, 6 ounces of silver, and 2,629 pounds of copper to a smelter.

SAN JOAQUIN COUNTY

Comanche District.—The Gold Hill Dredging Co. worked its Lower Comanche bucket-line dredge throughout 1950 along the Mokelumne River.

SHASTA COUNTY

Cow Creek (Ingot) District.—Coronado Copper & Zinc Co. operated the Afterthought mine from August through December 1950. Zinc concentrate and zinc-lead-copper concentrate produced from the zinc ore milled at the company 100-ton plant were shipped to smelters.

Redding District.—Thurman Gold Dredging Co. operated its Yuba electric bucket-line dredge on Clear Creek throughout 1950. Roy S. Olson worked the Battams property by dragline dredging in 1950, and A. J. Jackson operated a small dragline dredge near Buckeye from January 2 to April 2, 1950.

SIERRA COUNTY

Alleghany District.—John O'Donnell worked the Kate Hardy mine throughout 1950; 2 tons of high-grade ore yielded 983 ounces of gold and 216 ounces of silver. Milling ore was stockpiled. The Original Sixteen to One Mine, Inc., operated its Original Sixteen to One Mine throughout 1950 and recovered gold and some silver by amalgamation and from concentrate shipped to a smelter.

Downieville District.—Best Mines Co. acquired the Brush Creek Mine lease in March 1950 and operated the Brush Creek mine through December. Gold and silver were recovered by amalgamation at the 100-ton Best mill and from concentrates cyanided at a custom mill.

SISKIYOU COUNTY

Klamath River District.—Reeves Ranch Dredging Co. worked its bucket-line dredge 1 mile from Happy Camp from January 1 to October 1, 1950. K. C. Columbia Mines, Inc., milled 200 tons of ore from the K. C. Columbia mine dump on McKinney Creek and recovered gold and silver by amalgamation; 2 tons of concentrate shipped to a smelter contained in gross metal 11 ounces of gold, 12 ounces of silver, 446 pounds of lead, and 48 pounds of zinc.

Salmon River District.—Hydraulic mines operated in 1950 included the Boulder Gulch group (Northwestern Mining Co.), Emma group (N. S. Dysert), Farnsworth (E. A. McBroom), Good Luck (Ted Finn), Joubert (Louis J. Joubert and lessees), Judge (Judge Hydraulic Mine), Rainbow group (W. M. Durch), and Whites Gulch (Alex Markon & Arthur Johnson).

Scott River District.—French Gulch Dredging Co. terminated operation of its bucket-line dredge at Indian Creek placer November 8, 1950. Yuba Consolidated Gold Fields operated a bucket-line dredge near Callahan throughout 1950. Emmor W. Little worked the Star mine on McAdams Creek by drag-line dredging throughout 1950. The Mill Creek Co. operated the Quartz Hill mine from May 7 to December 31, 1950. Ore amalgamated yielded gold and silver; concentrates produced were not treated.

STANISLAUS COUNTY

Tuolumne River (La Grange) District.—La Grange Gold Dredging Co. operated dredge No. 4 equipped with 62 10-cubic-foot buckets on the Tuolumne River bottom throughout 1950.

TRINITY COUNTY

Deadwood District.—Brown Bear Mines worked the Brown Bear mine from March to August 1950; 80 tons of ore were treated at the company 80-ton flotation plant and 2 tons of concentrate shipped to a smelter yielded gold and some silver.

Hayfork District.—T. C. Kelly operated the Kelly mine sporadically in 1950 and treated gold ore by amalgamation. M. M. Fariss and Jo Dowdell hydraulicked the Home Extension group from February to April 1950.

Trinity River District.—Goldfield Consolidated Mines Co. and Warren Gilzean, lessee, hydraulicked the Barthol-Jacobs (Red Hill) property from January 1 through May 31, 1950. Bennett Mining Co. hydraulicked the Bennett mine near Big Bar for 118 days in 1950. Other hydraulic mines worked included the Gold Dollar, Hickey, Rex, and Swanson. Fairview Placers operated a bucket-line dredge near Minersville throughout 1950.

TUOLUMNE COUNTY

East Belt District.—Stobaugh & Ray worked the Fidelity mine throughout 1950 and recovered 434 ounces of gold and 26 ounces of silver from 15 tons of ore amalgamated. In addition, 793 pounds of gold concentrate were shipped to a smelter. Other gold mines operated in the district included the Golden Star (George and John Miller), Hopeful (Gust Nystrom), Lucky Strike (Mel Coeur), and Tip-Top (A. C. Weaver).

Mother Lode District.—Terminal clean-up of the Eagle Shawmut mill was made by W. R. Leedom in 1950. Ralph W. and Jo Tapley recovered a substantial quantity of gold and some silver from the Ford pocket mine in 1950 by hand mortar and batch mill.

YUBA COUNTY

Browns Valley District.—Empire Star Mines Co. and lessees operated the Browns Valley group through the Dannebroge shaft during 1950 in conjunction with the company's Nevada County properties.

Yuba River District.—Yuba Consolidated Gold Fields operated its fleet of five bucket-line dredges in the Yuba River Basin throughout 1950.

Colorado

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

ALTHOUGH fewer mines producing gold, silver, copper, lead, and zinc operated in Colorado in 1950 than in 1949, the average output per mine, measured in value of recovered metals, was the highest since the counting of mines on a comparable basis was begun in 1904. With 232 mines producing in 1950, the total value of the output of the five metals was $29,323,268, compared with 282 mines and $27,474,322 in 1949 and a yearly average of 688 mines and $25,070,753 from 1904 to 1948. The count of mines includes all lode mines, placers, prospects, and dumps that produced one or more of the five metals. Zinc represented 44 percent of the total value in 1950, lead 25 percent, gold 16 percent, silver 11 percent, and copper 4 percent. Changes from 1949 in quantity of output were a decrease of 4 percent in zinc and increases of 1 percent in lead, 21 percent in silver, 27 percent in gold, and 31 percent in copper.

Except for two placer operations, continuous mining centered in the districts producing chiefly base metals or gold and silver along with base metals. The Upper San Miguel, Red Cliff (Battle Mountain), and Leadville districts had large increases in production and together contributed 79 percent of the total zinc, 77 percent of the copper, 60 percent of the lead, 58 percent of the gold, and 48 percent of the silver. The heaviest decline was in the Ten Mile (Kokomo) district, where the Victory-Lucky Strike-Wilson-McKinley group of mines, one of the State's leading producers, closed April 19. Output from the famous Cripple Creek gold district was the smallest since mining was begun there in 1891. Several other important gold districts had little or no output.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in Colorado, 1946–50, and total, 1858–1950, in terms of recoverable metal [1]

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1946	235	28	1,463,496	142,613	$4,991,455	2,240,151	$1,810,042
1947	290	33	1,544,694	168,279	5,889,765	2,557,653	2,314,676
1948	271	23	1,438,119	154,802	5,418,070	3,011,011	2,725,117
1949	255	27	1,262,355	102,618	3,591,630	2,894,886	2,620,018
1950	202	30	1,372,744	130,390	4,563,650	3,492,278	3,160,688
1858–1950			(2)	39,614,032	880,368,084	742,382,506	578,390,624

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1946	1,754	$568,296	17,036	$3,713,848	36,147	$8,819,868	$19,903,509
1947	2,150	903,000	18,696	5,384,448	38,745	9,376,290	23,868,179
1948	2,298	997,332	25,143	9,001,194	45,164	12,013,624	30,155,337
1949	2,403	946,782	26,853	8,485,548	47,703	11,830,344	27,474,322
1950	3,141	1,306,656	27,007	7,291,890	45,776	13,000,384	29,323,268
1858–1950	260,703	70,439,139	2,559,581	269,074,943	1,516,586	249,481,030	2,047,753,820

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; old tailings or slimes re-treated; and ore shipped to smelters during calendar year indicated.
[2] Figure not available.

TABLE 3.—Gold and silver produced at placer mines in Colorado, 1946–50, in fine ounces, in terms of recoverable metal

Year	Small-scale hand methods [1]		Gravel mechanically handled: Nonfloating washing plants [2]		Gravel mechanically handled: Bucket-line and dragline dredges		Total	
	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver
1946	89	15	1,047	169	19,036	3,514	20,172	3,698
1947	243	52	930	156	16,400	3,243	17,573	3,451
1948	106	29	662	103	12,479	2,680	13,247	2,812
1949	137	33	775	116	12,231	2,652	13,143	2,801
1950	83	21	1,246	196	18,084	3,522	19,413	3,739

[1] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[2] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

Gold.—Of the 130,390 fine ounces of gold produced in Colorado in 1950, San Miguel County contributed 41 percent, Lake 16 percent, Park 13 percent, San Juan 11 percent, Eagle and Teller, each 4 percent, and other counties 11 percent. Cripple Creek, ordinarily the State's largest gold-producing district, had little output in 1950, as there was no market for the mill-grade ore. The new Carlton custom mill, built to replace the old Golden Cycle mill as a market for the ore, was nearly completed in 1950. Dry gold and silver ores yielded 43 percent of the State total gold, zinc-lead and zinc-lead-copper ores 39 percent, placers 15 percent, and other ores 3 percent. The leading gold-producing properties, in order of rank, were Smuggler Union-Montana group (Telluride Mines) at Telluride, Treasury Tunnel-Black Bear (Idarado) in San Miguel County, Resurrection at Leadville, South Platte Dredging Co. dredge near Fairplay, and Shenandoah-Dives group near Silverton.

Silver.—Production of silver in Colorado totaled 3,492,278 fine ounces in 1950 compared with 2,894,886 ounces in 1949. Dry gold and silver ores yielded 45 percent of the State total silver, zinc-lead and zinc-lead-copper ores 43 percent, lead ore 7 percent, and other ores and placer gravel 5 percent. The leading producers of silver were the Eagle mine in Eagle County, Treasury Tunnel-Black Bear (Idarado) group in San Miguel County, Shenandoah-Dives group near Silverton, Emperius Mining Co. group at Creede, and Smuggler Union-Montana group at Telluride.

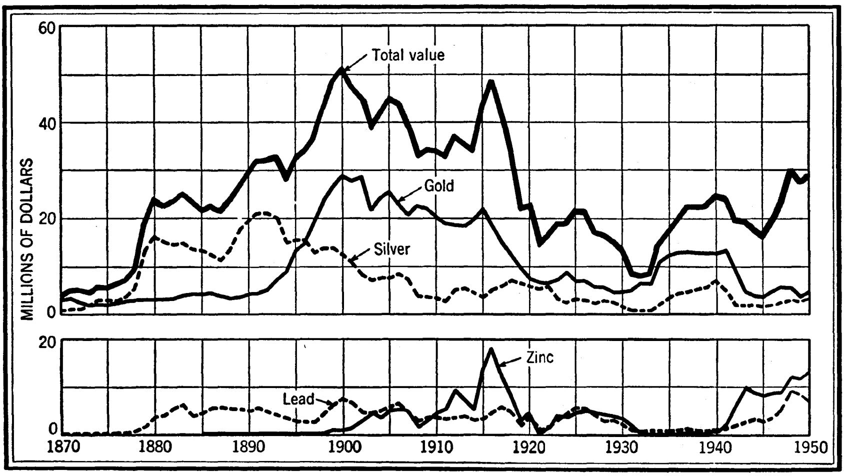

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1950. The value of copper has been less than $2,000,000 annually, except in a few years.

Copper.—The State output of copper increased from 2,403 tons in 1949 to 3,141 tons in 1950. The Idarado Mining Co., which makes a copper concentrate from complex gold-silver-copper-lead-zinc ore mined in San Miguel County, was the principal copper producer. The Eagle mine in Eagle County shipped copper-silver-gold ore; and several mines, mostly in the San Juan region, shipped lead or bulk concentrates containing considerable copper.

Lead.—The price of lead dropped from 12 cents to 10.5 cents a pound between January 1 and March 14, 1950, and did not rise above 12 cents until August 15. Further advances raised the price to 17 cents October 31, but the average yearly price (13.5 cents) was the lowest since 1946. The Colorado output of recoverable lead amounted to 27,007 tons in 1950 compared with 26,853 in 1949. San Miguel County contributed 29 percent of the State total lead, Lake County 24 percent, San Juan 13, Eagle 8, Summit 6, Mineral 5, and other counties 15 percent. Zinc, zinc-lead, and zinc-lead-copper ores yielded 70 percent of the total lead, gold and silver ores 20 percent, and lead, lead-copper, and copper ores 10 percent. The larger lead-producing mines, in order of rank, were the Resurrection, Treasury Tunnel-Black Bear (Idarado), Smuggler Union-Montana, Eagle, and Emperius Mining Co. group.

Zinc.—After increasing 4 years in succession, the production of recoverable zinc in Colorado showed a small decrease in 1950; the output was 45,776 tons compared with 47,703 tons in 1949. Eagle County produced 44 percent of the State total zinc, San Miguel County 19 percent, Lake 16, Summit 8, and other counties 13 percent. Zinc, zinc-lead, and zinc-lead-copper ores yielded 93 percent of the total zinc. The leading zinc-producing mines, in order of rank, were the Eagle, Treasury Tunnel-Black Bear (Idarado), Resurrection, Victory (American Smelting & Refining Co. Kokomo unit), and Smuggler Union-Montana.

In Summit County depletion of ore reserves in the Victory-Lucky Strike-Wilson-McKinley group of mines at Kokomo caused this large

producer to close April 19. The subsequent decrease in Summit County's production was partly offset by expanded output in Eagle, San Miguel, and Lake Counties and the reopening in July of the Rico Argentine mine in Dolores County, closed since May 1949.

Advances in the price of zinc between March 14 and September 7, 1950, raised the quotation for prime Western zinc at East St. Louis from 9.75 to 17.5 cents a pound, as high a quotation as has been registered in any recent year.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in Colorado in 1950, by months, in terms of recoverable metal

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)

MINING INDUSTRY

Lode mining centered in the districts producing chiefly zinc, zinc-lead, and silver-lead ores or complex gold-silver-lead and gold-silver-copper-lead-zinc ores. The mining of straight gold ore was confined to a few scattered small-scale operations. The quantity of each class of ore mined in 1950 is shown in table 6.

Under the classification system used, a large part of the complex ore falls into the dry-gold and gold-silver classes, although the revenue obtained from gold and silver must be supplemented by that derived from the accompanying base metals to make the mining of the ore profitable. On the other hand, much of the ore that falls into the base-metal classes is commercial because it contains gold and silver in addition to base metals.

The rise in the prices of lead and zinc was a factor in the reopening of the Rico Argentine mine and revived some smaller mining operations, but the total number of lode mines contributing to the State output of gold, silver, copper, lead, and zinc declined from 255 in 1949 to 202 in 1950. Of the 30 producing placers in 1950, only 2, the bucket-line dredge in Park County and the Mount Elbert dragline-dredge operation in Lake County, were important producers.

The mining companies carried on much exploration and development work, mostly in the vicinity of their producing or equipped properties. The Bureau of Mines resumed work on driving the Leadville drainage tunnel, did exploratory drilling in the Ross Basin (San Juan County) area, and made field examinations and metallurgical tests on ores.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Colorado in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Number of mines[1]	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	42	229,019	37.039	239,886	243,052	5,980,682	4,540,700
Dry gold-silver ore	21	312,202	19,129	1,137,863	1,238,495	4,258,795	1,486,177
Dry silver ore	22	19,071	305	197,321	19,121	715,968	61,901
Total	84	560,292	56,473	1,575,070	1,500,668	10,955,445	6,088,778
Copper ore	5	639	27	13,081	67,994	27,686	652
Lead ore	66	49,164	2,115	243,609	109,237	5,129,593	580,593
Lead-copper ore	1	1	7	109	131	108	----------
Zinc ore	9	210,661	1,826	150,666	71,658	4,100,307	40,505,609
Zinc-lead ore[2]	70	551,987	50,529	1,506,004	4,532,312	33,800,861	44,376,368
Total	130	812,452	54,504	1,913,469	4,781,332	43,058,555	85,463,222
Total lode mines	202	1,372,744	110,977	3,488,539	6,282,000	54,014,000	91,552,000
Gravel (placer operations)	30	----------	19,413	3,739	----------	----------	----------
Total: 1950	232	1,372,744	130,390	3,492,278	6,282,000	54,014,000	91,552,000
1949	282	1,262,355	102,618	2,894,886	4,806,000	53,706,000	95,406,000

[1] Detail will not add to totals because some mines produce more than 1 class of ore.
[2] Includes zinc-lead-copper ore, for which the Bureau of Mines is not at liberty to publish separate figures.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Colorado in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Placer	19,413	3,739			
Amalgamation	29,577	13,648			
Smelting of ore	9,564	760,928	715,432	2,598,432	95,643
Smelting of concentrates	71,836	2,713,963	5,566,568	51,415,568	91,456,357
Total: 1950	130,390	3,492,278	6,282,000	54,014,000	91,552,000
1949	102,618	2,894,886	4,806,000	53,706,000	95,406,000

METALLURGICAL INDUSTRY

The new 1,000-ton custom gold-ore reduction mill of the Golden Cycle Corp. in the Cripple Creek district was nearly completed in 1950. In other districts improvements resulting in increased capacity were made in several flotation mills treating zinc-lead and complex gold-silver-copper-lead-zinc ores. A total of 32 mills operated in the State all or part of 1950. The daily capacity of the mills ranged from 15 to 1,000 tons and averaged 210 tons. All the mills except two small gravity-concentration mills used flotation. Some of the flotation mills, using jigs in the ball-mill-classifier circuit and amalgamators to treat the hutch product of the jigs, recovered considerable gold for direct shipment to the mint. Ore treated in mills totaled 1,330,705 tons and that shipped crude to smelters 42,039 tons in 1950 compared with 1,238,651 and 23,704 tons, respectively, in 1949.

The principal market for Colorado lead, lead-copper, and siliceous gold-silver concentrates and direct-smelting ores continued to be the Arkansas Valley smelter at Leadville. Local markets for mill-grade lead and zinc ores were provided by the Resurrection mill at Leadville, the Shenandoah-Dives mill at Silverton, the American Zinc, Lead & Smelting Co. mill at Ouray, and the American Smelting & Refining Co. Leadville milling unit (closed April 19). The Front Range mill near Idaho Springs purchased gold-silver ore, and several small mills that did not buy ore accepted custom ore for milling at a fixed charge per ton. Custom mills and smelters in the Salt Lake Valley, Utah, afforded additional markets for Colorado zinc-lead ores and concentrates. Copper concentrates and ore were shipped to the El Paso, Tex., and Garfield, Utah, smelters. Zinc concentrates were shipped to smelters at Amarillo and Corpus Christi, Tex.; Depue, Ill; Palmerton, Pa.; and Anaconda and Great Falls, Mont.

Tables 8 and 9 show details of Colorado ores milled and smelted in 1950.

TABLE 8.—Mine production of gold, silver, copper, lead, and zinc in Colorado in 1950, by method of recovery (except placer) and class of material processed, in terms of recoverable metal

REVIEW BY COUNTIES AND DISTRICTS

ADAMS COUNTY

Gold and silver were recovered as byproducts in sluices operated by Kerkling and Slensker at the Brannan Sand & Gravel Co. washing plants 8 and 10 and the Superior Sand & Gravel Co. pit, all on gravel bars of Clear Creek northwest of Denver.

BOULDER COUNTY

Central (Jamestown) District.—The Ozark-Mahoning Co. and the General Chemical Co. shipped lead-silver-gold-copper concentrates recovered as byproducts in the beneficiation of fluorspar. A little gold ore was shipped from the Last Chance mine.

Gold Hill District.—The Cash mine, operated by Henna Mines, Inc., produced 1,369 tons of ore, of which 935 tons were shipped to the Front Range mill at Idaho Springs and 434 tons (averaging 1.46 ounces of gold and 14.95 ounces of silver to the ton and 1.87 percent lead) were shipped crude to the Leadville smelter. A little gold ore, removed in development, was shipped from the St. Paul claim. Placer gold was recovered as a byproduct in launders at a sand and gravel plant on the George Sawhill ranch.

Grand Island District.—The Consolidated Caribou Silver Mines, Inc., operated the Caribou mine and 100-ton mill. Ore treated totaled 7,606 tons yielding 154 tons of concentrate containing 159 ounces of gold, 58,262 ounces of silver, 4,899 pounds of copper, 70,988 pounds of lead, and 43,830 pounds of zinc; the zinc was not recovered, as the concentrate was shipped to a lead smelter. The net return from the concentrate sold was $59,778. Development in 1950 included 91 feet of winze, 1,916 feet of drifts, 210 feet of tunnel, and 743 feet of diamond drilling. Exploration was done on a vein containing pitchblende. A new vein, the Nelson, was opened on the 1,040-foot level.

Sugar Loaf District.—The Wood Mountain gold mine was operated

[1] Bureau of Mines not at liberty to show separate figures for placer production by districts in 1950.
[2] Includes amounts recovered from lead-silver-gold-copper concentrates produced as byproduct of beneficiation of fluorspar at 2 plants.
[3] Placer gold and silver from Box Creek district and small quantity of gold and silver from Sugar Loaf district are included with the California (Leadville) district.

by Harrison S. Cobb 9 months in 1950; the ore produced was shipped to the Front Range mill in Clear Creek County. Donald Scruggs shipped 20 tons of zinc-lead ore from the Albion J. mine. Gold ore was shipped from the Melvina (Front Range) and Nancy mines.

CHAFFEE COUNTY

Chalk Creek District.—At the Mary Murphy mine S. E. and W. E. Burleson repaired surface buildings and installed a compressor at the portal of the tunnel on the 1,400-foot level, retimbered the caved portal, and began work in the mine late in December 1950. Ore shipped during the year totaled 30 tons containing zinc, lead, silver, and gold. Some zinc-lead-silver ore was shipped from the St. Elmo-Stonewall group.

Granite District.—Wenger, Green & Brazil shipped 4 tons of gold ore from their property, and Carl Frederick shipped 1 ton of gold-silver-lead ore from the Marion Bell claim.

Monarch District.—The Garfield mine, owned by S. E. and W. E. Burleson, was under development, with intermittent production, throughout 1950. Shipments of ore totaled 457 tons containing 195 ounces of gold, 2,197 ounces of silver, 1,928 pounds of copper, and 151,830 pounds of lead. The Iron Duke and Neglected mines shipped a few tons of lead-silver ore.

CLEAR CREEK COUNTY

Alice (Lincoln) District.—Robert Kahl cleaned out 100 feet of tunnel at the Mary B mine and shipped some ore.

Argentine District.—Screened dump ore shipped from the Stevens property to the Black Eagle mill near Idaho Springs yielded lead-silver-gold concentrate and zinc concentrate.

Cascade District.—About 200 tons of gold-silver ore were shipped from the Humboldt-Mary Foster group.

Empire District.—The P. M. Leasers continued work (mostly prospecting) on the Gold Fissure group until July 10 and shipped some ore. At the Silver Spoon claim ore amalgamated by hand methods yielded a little gold.

Griffith District.—The Terrible-Dunderberg group was under development, with intermittent production, by Gold Mines Consolidated, Inc., throughout 1950. Ore shipped totaled 1,039 tons, from which were recovered 195 tons of combined lead and zinc concentrates containing altogether 23 ounces of gold, 5,838 ounces of silver, 2,126 pounds of copper, 121,891 pounds of lead, and 127,115 pounds of zinc. Lessees at the Griffith mine shipped 222 tons of lead-zinc-silver ore. Sample lots of ore removed in development at the Rio Grande property were treated in the Commonwealth mill. Other small producers included the Dives-Pelican, Endeavor, Silver Cloud-Copper Bottom, and Smuggler groups.

Idaho Springs District.—The Franklin mine was a consistent shipper of lead-zinc-silver-gold ore to custom mills in 1950. The Dixie mine of LeRoy Giles & Co. continued to be the only substantial producer of gold ore in the county; the ore was treated in the company mill, which also treated custom ore. The Front Range Mines, Inc., operated the Mattie-King Solomon group. The Black Eagle mill operated on custom ores. Small tonnages of ore were shipped from the Consolidated Park, Diamond Joe, Kitty Clyde, Oregon, Rainbow Draper, and Specie Payment mines and from several prospects and dumps.

Montana District.—The Nabob Development Co. shipped 922 tons of ore containing 33 ounces of gold, 23,434 ounces of silver, 4,523 pounds of copper, and 79,957 pounds of lead. The Front Range Mines, Inc., operated its mill near Dumont on company and custom ores from mines in Clear Creek, Boulder, and Teller Counties.

Trail Creek District.—The Montana Mining & Development Co. cleaned out tunnels and remodeled the mill at the Lamartine mine and used the mill to treat about 18,000 tons of gold-silver-lead ore from the dump. Other small producers were the Gum Tree, Turner, and Valentine mines.

CUSTER COUNTY

Hardscrabble District.—Small lots of lead-silver ore were shipped by Hartley & Landin and R. E. Kemper. Lessees began working the Defender mine in October and shipped 29 tons of lead-silver ore.

DOLORES COUNTY

Lone Cone District.—About a truckload of gold-silver ore was shipped from the Geyser claim.

Pioneer (Rico) District.—The Rico Argentine Mining Co., which suspended mining ore at its group of mines in May 1949, continued to work mostly on development from January to July 1950 and then resumed regular mining and milling operations. The mine is an important producer of zinc, lead, and silver. Ore from the Forest-Wedge and Sambo mines was shipped to custom plants outside the county. Some gold ore from the St. Louis mine was amalgamated.

EAGLE COUNTY

Red Cliff (Battle Mountain) District.—This district was again much the largest producer of zinc in Colorado; it was also a large producer of silver and a substantial producer of copper, lead, and gold. The district output of all five metals was larger than in 1949. The Eagle mine of the New Jersey Zinc Co., Empire Zinc Division, on Battle Mountain operated continuously in 1950. Some facts regarding this large producer were published.[1] The principal ore bodies occur as replacements in a flat-dipping bed of limestone. They are generally massive occurrences, with a core of iron-copper-silver-gold ore surrounded by an outer layer of zinc-lead ore. The mine is developed through a tunnel; a vertical shaft bottomed on the sixteenth, or tunnel, level (used to hoist and lower men and supplies); and a series of inclines, two of which bottom on the twentieth level and one on the twenty-fourth level. The mine is completely mechanized. Electric battery motors are used for haulage throughout the mine. The ore feed to the mill is about 47 tons per hour. The mill is underground, in an excavation in granite at the portal of the tunnel. The main room is 330 feet long, 52 feet wide, and 22 to 56 feet high. In the

[1] Brochure distributed by the New Jersey Zinc Co. to its employees, 1949.
Engineering and Mining Journal, Modernizing New Jersey Zinc's Eagle Mill, pt. 1: Vol. 151, No. 10, October 1950, pp. 80–85; pt. 2, vol. 151, No. 11, November 1950, pp. 101–105.

mill area are also underground shops, storage rooms, blower and drier rooms, a mine service incline, an ore-storage pocket for zinc-lead milling ore, and three ore-storage pockets and a loading tunnel for copper-silver-gold ore shipped direct to smelters.

The Curran lode near Redcliff shipped a small lot of gold ore, and the Morning mine 10 miles southwest of Redcliff shipped 64 tons of zinc-lead-silver ore.

EL PASO COUNTY

Material cleaned up at the Golden Cycle mill site yielded gold and silver, which was credited to the production of the Cripple Creek district, Teller County.

FREMONT COUNTY

Cotopaxi District.—The Pastoro Mining Co. shipped a small tonnage of zinc ore from the Cotopaxi mine.

GILPIN COUNTY

Northern Districts.—A little gold was recovered from ore removed in development at the We Got Em mine.

Southern (Blackhawk, Central City, Nevadaville, Russell Gulch) Districts.—Small quantities of lead-silver and lead-silver-gold ore were shipped from the Arris, Independence, and Jennie Blanche mines, and some gold-silver-lead ore from the West Notoway dump was treated in the Gold Ridge mill. Several lots of gold-bearing clean-up material were shipped from other properties. Placer gold was recovered by hand methods on North Clear Creek.

GUNNISON COUNTY

Elk Mountain District.—At the Keystone mine the Park City Consolidated Mines Co. continued an exploration and development project begun in 1949. Work done in 1950 included 600 feet of drifting and 1,000 feet of churn drilling. Some zinc-lead-silver ore removed in development was shipped. The Slate River Mining Co. operated the Eureka mine on Treasury Mountain 18 miles northwest of Crested Butte from July 1 to October 1. Ore shipped totaled 123 tons containing 46,398 pounds of zinc, 9,612 pounds of lead, 2,358 pounds of copper, and 810 ounces of silver. The Crested Butte Mining & Milling Corp. worked about 8 months on reopening the Daisy group. Most of the time was spent in building a road, erecting surface buildings, installing machinery, and in cleaning out and retimbering in the mine. Production was 84 tons of zinc-lead-silver ore. At the Independence mine Robert S. Palmer cleaned out two tunnels, installed track, and shipped 27 tons of zinc-lead-silver ore.

Gold Brick District.—A 4-ton lot of gold-silver-lead ore was shipped from the Victor mine. Ore produced at the Carter mine in December yielded some gold and silver.

Quartz Creek District.—A. L. Pearson reported a truckload shipment of complex silver-lead-zinc-copper ore from his Shady Side claim.

Taylor Park (Tin Cup) District.—The Star mine, worked by John Lambertson, shipped 144 tons of ore containing 68,430 pounds of lead, 3,648 pounds of zinc, 2,711 ounces of silver, and 2 ounces of gold. Other small producers were the Enterprise and Shadow claims.

Tomichi District.—The Akron-Erie mine and 100-ton flotation mill of the Callahan Zinc-Lead Co., Inc., at White Pine were active throughout 1950, but operations were on a curtailed basis part of the year. Output of zinc and lead concentrates was therefore less than in 1949. Ore treated totaled 12,342 tons, from which were recovered 869 tons of lead-silver concentrate averaging 0.025 ounce of gold and 62.46 ounces of silver to the ton, 66.31 percent lead, 9.16 percent zinc, and 1.19 percent copper; and 2,138 tons of zinc concentrate averaging 0.014 ounce of gold and 9.32 ounces of silver to the ton, 51.13 percent zinc, 7.18 percent lead, and 0.61 percent copper. Mine development during the year totaled 1,179 feet of drifts, 168 feet of crosscut, and 813 feet of raises; in addition, 675 feet of old drifts were rehabilitated.

HINSDALE COUNTY

Galena District.—Small-scale producers shipped a total of 149 tons of lead-silver and zinc-lead-silver ore in 1950. The ore came from the California, Ulay, and Yellow Medicine mines and the Crook smelter dump.

Lake District.—Output in 1950 comprised 27 tons of lead-silver-gold ore from the W. C. Garlock mine and 7 tons of zinc-lead-silver ore from the Sunflower.

JEFFERSON COUNTY

Placer gold was recovered as a byproduct in sluices at three commercial sand and gravel washing plants on Clear Creek, and a little gold was produced by placer miners.

LAKE COUNTY

Box Creek District.—In 1950 the General Gold Corp. operated its Mount Elbert placers, using two dragline dredges and bulldozers, during the open season, which lasted from May 1 through November.

California (Leadville) District.—Production of gold, silver, copper, lead, and zinc in the Leadville district increased sharply in 1950 over 1949. The Resurrection mine group, reopened in January 1942 by the Resurrection Mining Co. after an extensive development campaign, has been the only large-scale producer of zinc-lead ore from underground mines in the Leadville district since the Leadville Deep Mines Co. properties closed in 1931. Chiefly through operation of the Resurrection mine, the Lake County output of lead and zinc rose from a yearly average of 1,030 tons of lead and 579 tons of zinc in the period 1932 through 1941 to 4,893 tons of lead and 6,071 tons of zinc in the period 1942 through 1950. The zinc-lead ore from this mine has also yielded most of the county output of gold and silver since 1942. In 1950 improvements in the Resurrection mill raised its capacity, and the flow sheet was rearranged to permit treatment of custom ore in a separate unit. The custom ore came from Boulder, Chaffee, Clear Creek, Fremont, Gunnison, Lake, Mineral, Park, Saguache, and Summit Counties.

The American Smelting & Refining Co. closed its 400-ton Leadville milling unit April 19, 1950. The mill had been in operation since July 3, 1945, on ores from the company Kokomo unit in Summit County and custom ores from Lake, Summit, and other counties.

The company continued exploration and development on the Ibex-Garbut-Cora-Sunday group at Leadville and shipped considerable ore from this group.

Other Leadville shippers of ore to custom mills and smelters included the Fortune mine (a partnership), New Monarch-Valley, Dolly B, Rock Hill dumps, St. Louis, Chautauquan, Little Alice, Moyer, and American smelter dump. The Cadwell Mining Co. reopened the Hayden shaft and did development work in the mine.

The Arkansas Valley smelter of the American Smelting & Refining Co. operated continuously. Material treated included lead, lead-copper-gold-silver, and gold and silver ores and concentrates purchased from operators in all the active lode-mining districts of Colorado; and concentrates, residues from zinc smelters, and other material from outside the State. Receipts in 1950 totaled 101,701 tons compared with 103,386 tons in 1949. Work progressed on the company plant-improvement program; new installations include a copper-drossing unit, improved sinter-handling system, spray house for the Cottrell section, slag-granulation unit, and improved exhaust system at the roasters.

Early in 1950 the Bureau of Mines completed specifications for a contract to extend the Leadville drainage tunnel but found no contractor who was willing to bid a definite price. A negotiated contract with the Utah Construction Co. was signed August 16, and drilling at the tunnel heading 6,600 feet from the portal was begun September 20. On December 20, 1950, the heading was 7,440 feet from the portal.

Granite District.—A small output of gold and silver was made from the Millie G No. 1 and Wichita claims.

Sugar Loaf District.—A little gold-silver ore was shipped from the Lakewood mine.

Twin Lakes District.—The Goff placer on Lake Creek was worked a short period in 1950 by the Cripple Creek Mining & Milling Co.

LA PLATA COUNTY

California (La Plata, Hesperus) District.—Some gold ore from the Bessie G. mine and silver ore from the Muldoon were shipped in 1950.

LARIMER COUNTY

Masonville District.—Gold-silver ore was shipped from the Little Mary Mason mine.

MINERAL COUNTY

Creede District.—The Emperius Mining Co. operated its group of mines and 100-ton selective flotation mill continuously and at a higher production rate in 1950 than in 1949. The group, which includes the Amethyst, Commodore, New York-Volunteer-Del Monte-Aspen, and Equinox properties, ranked fourth in the State in silver production. Formerly the ore mined was valued chiefly for its silver content, but in 1949 and 1950 the value of the combined lead and zinc recovered exceeded that of the silver. The ore also carries gold and copper. Development during the year included 1,702 feet of raises, 2,089 feet of drifts, and 1,552 feet of tunnel. The Solomon Lease operated the Ethel-Solomon group from October 1 through December.

MONTEZUMA COUNTY

Animas Minerals, Inc., shipped gold-silver ore containing some copper from the Gold Dollar mine in the California district, part of which is in Montezuma and part in La Plata County.

OURAY COUNTY

Red Mountain District.—Melvin Brugger operated the Genessee tunnel throughout 1950 and shipped silver-copper-lead and zinc-lead-silver-copper ores. The Patsy and Lost Day mines of the Morningside Development Co. shipped high-grade silver-lead ore. Other small producers included the Beaver-Belfast, Hope, Kentucky Giant, Koehler-San Antonio, Monte Cristo, South Dakota Lode, and Stanley-Kremlin-J. I. C. properties. The Idarado mill treated ore from claims in San Miguel County.

Sneffels District.—The Camp Bird mine, operated by King Lease, Inc., was again the leading producer of gold, silver, copper, lead, and zinc in Ouray County. This mine, famous as a gold and silver producer since 1896, has recently been yielding zinc-lead ore, with accessory gold, silver, and copper. The mine has more than 7 miles of underground workings. Ore treated in 1950 totaled 46,163 tons compared with 38,755 tons in 1949. Smaller producing mines in the Sneffels district included the Atlas-San Pedro, Snowflake, and Tom Patterson.

Uncompahgre District.—Most of the output of metals from this district in 1950 came from the Mickey Breen (Monarch) mine, operated throughout the year by Southwest Metals, Inc. Small tonnages of ore were shipped from the Auxiliary, Bachelor, Newsboy, and Silver Bell properties. All the district output of ore was treated in the 300-ton custom mill of the American Zinc, Lead & Smelting Co. at Ouray. The mill also treated ore purchased from other mines in Ouray, Hinsdale, San Juan, San Miguel, and Dolores Counties.

PARK COUNTY

Alma Placers-Fairplay District.—The South Platte Dredging Co. operated continuously its electrically powered connected-bucket dredge (108 12-cubic-foot buckets) on South Platte River near Fairplay and ranked fourth in the State in gold production. Gravel washed totaled about 4,600,000 cubic yards, and output of gold increased materially over 1949. The Platte River Placer, Inc., operating a dry-land dredge on the Alma Placers from July to October, washed 40,000 cubic yards of gravel. Some gold was recovered by hand methods on the Gumaer placer.

Buckskin District.—The Phillips group, owned and operated by the Buckskin Joe Mines, Ltd., continued to ship ore to the Resurrection mill at Leadville. Production in 1950 was 1,562 tons of ore containing 1,481 ounces of gold, 8,004 ounces of silver, 55,004 pounds of copper, 54,248 pounds of lead, and 726,952 pounds of zinc.

Consolidated Montgomery District.—The 122 tons of ore shipped from this district in 1950 came from three properties—the Rocky Mountain Diamond Drilling Co. claims, the F. A. Woeber group, and the Wheeler group.

Horseshoe District.—Lessees at the Last Chance mine shipped 163 tons of ore containing 38,659 pounds of lead, 999 ounces of silver, 6,080 pounds of zinc, 403 pounds of copper, and 2 ounces of gold.

Mosquito District.—M. J. Krolicki shipped 44 tons of zinc-lead-silver-gold ore from the Orphan Boy mine in 1950. At the London Butte property development work was continued until about the end of the year.

PITKIN COUNTY

Independence District.—A lessee at the Mount Hope mine shipped 7 tons of gold-silver ore in 1950.

Lincoln Gulch District.—W. K. Martz shipped a ton of high-grade lead-silver ore from his Mascot mine.

Roaring Fork (Aspen) District.—The Midnight Mining Co. continued to operate its Midnight mine. Ore milled in 1950 totaled 3,066 tons (wet weight), which yielded 151 tons of lead concentrate averaging 166.20 ounces of silver a ton and 40.49 percent lead; and 62 tons of zinc concentrate averaging 38.95 percent zinc and 25.66 ounces of silver a ton. Crude ore shipped direct to the Leadville smelter totaled 115 tons averaging 40.74 ounces of silver a ton and 2.18 percent lead. The Bureau of Mines published the results of its investigation of the Smuggler mine.[2]

Spring Butte (Redstone) District.—Some lead ore was shipped from the C. & M. property in 1950.

SAGUACHE COUNTY

Crystal Hill District.—The Crystal Hill-Esperanza gold mine was worked from March to August 1950 by the Crystal Hill Mining Co. The ore mined was low-grade and was treated by flotation and amalgamation of the flotation concentrate in the company mill built near the mine in 1949.

Kerber Creek (Bonanza) District.—The Antoro mine, operated by S. E. and W. E. Burleson, shipped 2,226 tons of ore containing 86 ounces of gold, 15,697 ounces of silver, 540,231 pounds of lead, and 576,975 pounds of zinc. W. J. Costello continued to operate the Rawley group and shipped 903 tons of ore containing 35 ounces of gold, 15,855 ounces of silver, 52,163 pounds of copper, 339,423 pounds of lead, and 135,730 pounds of zinc. Some ore was shipped from the Cocomongo (mined late in 1949), Cora, and Little Jenny mines.

SAN JUAN COUNTY

Animas District.—The Shenandoah-Dives Mining Co., operating its Shenandoah-Dives consolidated group of mines and the leased Silver Lake group as a unit, continued to be much the largest producer of ore in San Juan County. Mine development in 1950 included 1,383 linear feet of drifts, 24 feet of raises, and 342 feet of diamond drilling. Stoping totaled 320,073 square feet. The mine is connected with the company 700-ton mill by an aerial tram nearly 2 miles long. Company ore milled in 1950 totaled 202,947 and cus-

[2] Volin, M. E., and Hild, J. H., Investigation of Smuggler Lead-Zinc Mine, Aspen, Pitkin County, Colo.: Bureau of Mines Rept. of Investigations 4696, 1950, 47 pp.

tom ore 4,530 tons, compared with 186,072 and 15,259 tons, respectively, in 1949. The yield of concentrates from the 207,477 tons of ore treated in 1950 was 4,130 tons of flotation lead concentrate, 1,501 tons of flotation zinc concentrate, and 667 tons of iron-gold-silver-lead table concentrate containing in aggregate 10,588 ounces of gold, 427,725 ounces of silver, 707,701 pounds of copper, 3,702,622 pounds of lead, and 2,155,501 pounds of zinc.

The Pride of the West 100-ton flotation mill operated throughout 1950, mostly on ore from the Great Eastern, Pride of the West, and Green Mountain mines; both lead and zinc concentrates were produced. The Highland Mary mine, equipped with a 100-ton mill, operated during the open season and shipped bulk lead-silver-gold concentrate. The Osceola Mining & Milling Corp. treated custom ores in the Lackawanna mill. The Old Hundred Gold Mining Co. rebuilt aerial tram terminals and eight cable-carrying towers, worked on repairing its flotation mill and shipped some ore from its Gary Owen group to custom mills. Other shippers of ore to custom mills and smelters included the Copper Queen, May Day, Mohawk, Molas, Mystery, Silent Friend, Silver Ledge, Winnemuca, and Zuni (dump) properties.

Eureka District.—The Columbus (Foursome) group shipped nearly 2,000 tons of ore to custom mills and produced additional ore that was treated in a small mill at the mine. The Lead Carbonate mine and 40-ton mill continued to operate; ore milled totaled 9,952 tons compared with 5,500 tons in 1949. The Bonita Mining & Developing Co. acquired the Pride of Bonita and Minnehaha groups and worked mostly on reopening and reconditioning old mine workings, installing equipment, and development; the company shipped some ore from each of the properties. Other producers included the Black Hawk, Burrows, Galena Queen, Great Eastern, Mastadon (dump), Occidental, and Queen Anne mines. The Bureau of Mines did exploratory drilling in the Ross Basin area during the open season there.

SAN MIGUEL COUNTY

Iron Springs District.—The Silver Bell group, worked since 1946 by the Silver Bell Mines Co., was in production throughout 1950, although operations were hampered in December when a fire destroyed the compressor house and change house. The ore was treated in the company 150-ton flotation mill, the product of which is bulk gold-silver-lead-copper concentrate. A screening-washing-sorting plant was built in 1950. Mine development included 1,999 feet of drifts and 16 feet of raise. Belisle & Reed shipped some ore from the New Dominion mine.

Lower San Miguel District.—The Bonanza No. 1 claim produced a little copper-silver ore, and a small placer yielded gold.

Upper San Miguel District.—Continued expansion of operations of the Idarado Mining Co. on the Treasury Tunnel-Black Bear-Ajax group and of Telluride Mines (Inc.) on the Smuggler Union-Montana group in 1950 put the Upper San Miguel district ahead of any other Colorado district in production of gold, silver, copper, and lead and raised it to second rank in zinc. The district output of the base metals was higher than in any previous year.

The Idarado mill is in Ouray County, at the portal of the 12,000-foot Treasury tunnel, which extends to the Black Bear-Ajax workings in San Miguel County. A 1,100-foot raise on the Black Bear vein connects the upper workings with the tunnel level. Another tunnel (old Meldrum), with its portal near Telluride, is being extended to explore the Idarado property at greater depth. The consolidated group includes the old Black Bear, Treasury tunnel, Argentine, Ajax, Barstow, Imogene, and other properties, comprising about 370 claims. The ore is crushed in an underground primary crushing plant before being transported to the mill. The capacity of the mill, formerly 500 tons daily, has been increased to nearly 1,000 tons. The tonnage of ore treated in 1950 increased 40 percent over 1949. The mill products are copper concentrate, lead concentrate, and zinc concentrate (all enriched by gold and silver), and gold-silver bullion (obtained by amalgamating a jig hutch product).

At the Smuggler Union-Montana group, output of ore increased, and the extensive development program begun in 1945 to open the Smuggler Union and Montana veins below former workings neared completion. A master raise and an ore chute (with a 50-foot pillar between the two) connecting the new 2-mile mill-level tunnel with the Pennsylvania-level workings on the Montana vein about 1,180 feet above were nearly finished. Other development during 1950 included 5,781 feet of drifting and 510 feet of diamond drilling. New equipment installed in the mill included a 42-inch Pan-American Duplex jig and a Wilfley table. In treatment the crushed ore is ground in a Marcy ball mill and discharged over the Pan-American jig. The jig concentrate goes to a Denver cleaner jig. The cleaner jig concentrate is amalgamated, and the cleaner jig tailings go to a table. High-grade table concentrate is shipped to a smelter, and the table tailings go to the ball mill. The Pan-American jig tailings go to lead flotation and the lead tailings to zinc flotation.

Lessees on the Tomboy dump treated ore in a 15-ton table mill. The East Ridge Co. worked the Andrus mine from June 15 to October 5 and shipped 287 tons of ore containing 37.3 ounces of gold, 595 ounces of silver, 3,760 pounds of copper, 39,060 pounds of lead, and 39,940 pounds of zinc. Small lots of gold bullion, recovered by hand methods from high-grade ore, were shipped from the Alleghany and Blixt claims.

SUMMIT COUNTY

Breckenridge District.—The Wellington group, operated by W. L. Davenport, was a steady shipper of zinc-lead-silver ore to custom mills at Leadville. Davenport also operated the Minnie group about 6 months and produced 1,000 tons of ore, which was concentrated in a jig mill at the mine. Other small producers were the Greenwood, Jessie, Little Fool, and Maenke lode properties and three placers.

Green Mountain District.—Zinc-silver ore from the Big Four mine of Frances L. McDaniel and high-grade silver ore containing some lead from the First Chance (operated by John J. McDaniel) were shipped in 1950.

Montezuma District.—Jeffrey & Ulibarri produced ore from the New York, Quail, Silver King, and Waterloo claims and operated the Plymouth mill. The Teller Basin Mining & Milling Co. operated the Chautauqua mine throughout 1950 on a small scale, treating the ore in the company mill. The Florado Mining Co. operated its Pinnicle mine part time with two men; the ore produced was shipped to custom plants, as the company mill was destroyed by fire. Other shippers to custom plants at Leadville were the Allen Emory (Brooks-Young Mining Co.), Ida Belle, Manerva, Mohawk, Radical, Silver Wing, Wauneita, and Wild Irishman mines.

Ten Mile (Kokomo, Robinson) District.—The Victory-Lucky Strike-Wilson-McKinley group of mines, operated continuously since September 1944 by the American Smelting & Refining Co., was closed April 19, 1950. In 1949 this group was the largest producer of lead and the second-largest producer of zinc in the State and ranked fourth in silver production; it also produced gold and copper. Although operated only 3½ months in 1950, this group was the largest Summit County producer of all five metals. The Colonel Sellers mine was worked on a small scale most of the year. Some ore was shipped from the Kimberly and Boston mines.

TELLER COUNTY

Cripple Creek District.—Construction of the new 1,000-ton Carlton custom mill of the Golden Cycle Corp. was almost completed in 1950. The mill represents an investment of more than $1,500,000. A report on design and construction of the mill was published.[3] The virtually fireproof building has about 3½ acres of floor space, including offices, laboratories, and warehouse; it is 438 feet long, with four stories at the front, and extends back 356 feet on the terraced slope housing the mill proper. Labor-saving devices, the latest improvements in equipment, and improved processes in gold recovery (some of them new) that apply to the sulfotelluride ores of the Cripple Creek district are some of the features of the new mill. All the mill feed will be treated by flotation. The concentrate—which will be largely auriferous pyrite, with some gold tellurides—will carry approximately 80 percent of the gold values and will go to the high-grade section of the mill. The flotation tailings will go to the low-grade section for further treatment by "carbon cyanidation." In the high-grade section the concentrate, after being filtered and thickened, will be roasted or calcined in the new type of roaster known as the Dorrco fluosolids reactor. This type of reactor is "self-sustaining"; sulfur in the pyrite concentrate will furnish the fuel to attain the temperature necessary to complete the reaction desired. The calcines from the reactor will be treated by the conventional cyanide-zinc dust precipitation process.

The Cripple Creek mines that shut down early in 1949 to await completion of the Carlton mill generally remained idle or worked only on development in 1950. The Front Range Mines, Inc., trucked ore

[3] Bowen, Max W., Golden Cycle's Modern Mill: Min. Cong. Jour., vol. 36, No. 11, November 1950, pp. 30–33 and 69.

from the Strong mine to the company mill in Clear Creek County for treatment. Some screenings and sorted ore from the El Paso mine (worked by John Robush & Co.) and a small tonnage of ore cleaned up at the Sangre de Cristo-Mollie Kathleen (Markley) mine were shipped to the Leadville smelter. Material cleaned up from the Golden Cycle mill site at Colorado Springs yielded gold and silver, which was credited to the production of the Cripple Creek district. In December the Ajax and Cresson mines began hiring men and putting equipment in shape to resume mining as soon as the Carlton mill was ready to receive ore.

East of the Mississippi River

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

by Samuel A. Gustavson

GENERAL SUMMARY

ANNUAL reports from producers of gold, silver, copper, lead, and zinc in the States east of the Mississippi River showed greater output in 1950 than in 1949 for all of these metals except lead.

Production increases in 1950 can be attributed to a relatively steady output from the larger mines of the region. The drop in lead output was the result of cessation of operations at several small mines in Wisconsin, Southern Illinois, and Kentucky during 1949, closing of the Universal Exploration Co. mine in New York, and a labor strike at the New Jersey Zinc Co. mine in Virginia during 1950.

Output, in terms of recoverable metals, in 1950 was 2,090 fine ounces of gold, 113,355 fine ounces of silver, 40,105 short tons of copper, 8,178 short tons of lead, and 174,507 short tons of zinc. In 1949 the output was 1,967 ounces of gold, 101,612 ounces of silver, 32,955 tons of copper, 9,755 tons of lead, and 156,298 tons of zinc, indicating increases of 6 percent for gold, 12 percent for silver, 22 percent for copper, and 12 percent for zinc and a decrease of 16 percent for lead.

All tonnage figures reported herein are short tons and "dry weight"; that is, they do not include moisture. The prices used for calculating the value of metal production, except for zinc in New Jersey, are shown in table 1. The value of the New Jersey output is the total value of the zinc recoverable as metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

1 Price under authority of Gold Reserve Act of Jan. 31, 1934.
2 Treasury buying price for newly mined silver, Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
3 Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

Copper prices, Connecticut Valley, opened at 18.5 cents and increased to 19.5 cents in May, 22.5 cents in June, and finally to 24.5 cents in October. Lead opened at 12.0 cents, New York, dropped to a low of 10.5 cents in March, increased to 12.0 cents in May, dropped again to 11.0 cents in July, then gradually increased to 17.0 cents by the end of October. Zinc opened at 9.75 cents and began to rise in March, reaching 15.0 cents in June, then increased to 17.5 cents in September, at which it remained to the end of the year.

Annual figures for the 5 years ended with 1950 and data showing the production of gold, silver, copper, lead, and zinc by months in terms of recoverable metal are given in tables 2 and 3. The figures for tonnage of ore sold or treated before 1949 do not include magnetite ore containing pyrite or chalcopyrite, from which copper, gold, and silver were recovered as byproducts. Minerals Yearbook 1947 (p. 1379), contains an historical table showing mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River by years for 1906–47. The 1947 volume also contains a table (p. 1380) showing production of gold, silver, copper, lead, and zinc by months for 1943–47. Monthly production data for earlier years are not available.

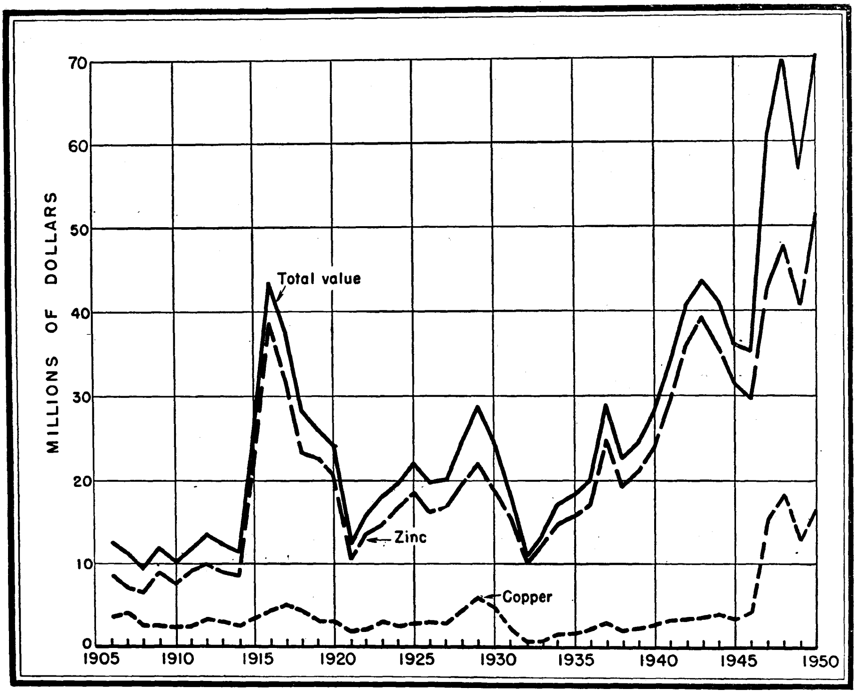

FIGURE 1.—Value of mine production of zinc and copper and total value of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1906–50.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1946–50, in terms of recoverable metal [1]

Year	Mines producing		Material sold or treated		Gold (lode and placer) [2]		Silver (lode) [3]	
	Lode	Placer	Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value	Fine ounces	Value
1946	108	5	[4] 5,451,340	3,763,871	1,432	$50,120	79,266	$64,047
1947	120	--------	[4] 6,293,007	3,411,070	1,997	69,895	137,780	124,691
1948	110	--------	[4] 6,544,541	2,349,877	2,479	86,765	101,171	91,565
1949	119	2	7,535,840	2,089,155	1,967	68,845	101,612	91,964
1950	66	--------	8,892,102	2,261,179	2,090	73,150	113,355	102,592

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1946	34,513	$11,182,212	11,127	$2,425,686	161,876	$35,472,314	$49,194,379
1947	36,875	15,487,500	9,026	2,599,488	181,792	42,810,934	61,092,508
1948	42,025	18,238,850	10,706	3,832,748	177,787	47,696,879	69,946,807
1949	32,955	12,984,270	9,755	3,082,580	156,298	40,560,934	56,788,593
1950	40,105	16,683,680	8,178	2,208,060	174,507	51,190,389	70,257,871

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; old tailings or slimes re-treated; and ore, old tailings, or copper precipitates shipped diiectly to smelters during the calendar year indicated.
[2] Includes placer gold as follows: 1946, 22 ounces; 1947–48, none; 1949, 27 ounces; 1950, none.
[3] No placer silver was produced during 1946–50.
[4] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

[1] Combined to avoid disclosing individual company operations
[2] Estimated.

Gold.—In the States east of the Mississippi River, most of the gold is recovered as a byproduct of mining copper and is recovered from slimes in the electrolytic refining of this copper. In 1950 production from the region was 2,090 fine ounces compared with 1,967 fine ounces in 1949. In Maryland one gold mine was operated intermittently during 1949 and 1950, producing 20 fine ounces of gold, all of which has been credited as 1950 production. The output of this mine constitutes all the production of gold from gold ores in the region during the year. No gold from placer operations was reported. Byproduct sources in 1950, as has been the case for several years, were magnetite-pyrite-chalcopyrite ore from the Cornwall mine, Lebanon County, Pa.; copper ore from the Elizabeth mine, Orange County, Vt.; and copper-iron-zinc ore from the Tennessee Copper Co. mines, Polk County, Tenn.

TABLE 4.—Mine production of gold in the Southern Appalachian States, 1799–1950

State	Period	Fine ounces	Value	State	Period	Fine ounces	Value
Alabama	1830-1950	49,495	$1,198,985	South Carolina	1829-1950	318,801	$7,562,125
Georgia	1830-1950	870,660	18,088,947	Tennessee	1831-1950	21,755	509,055
Maryland	[1]-1950	6,122	164,640	Virginia	1828-1950	167,558	3,577,509
North Carolina	1799-1950	1,164,601	24,328,298				
				Total	1799-1950	2,598,992	55,429,559

[1] Year of first production not recorded.

Silver.—All the silver produced in 1950 was recovered as a byproduct of zinc-lead, lead-fluorspar, or copper ore (including magnetite-pyrite-chalcopyrite ore). Producing States include Illinois (Southern), New York, Pennsylvania, Tennessee, and Vermont. Small amounts of silver are contained in ores produced in other States in the region but this silver is not usually recovered. Silver is purposely retained in copper produced in Michigan for the physical properties it adds to the copper. Silver recovered from mines in States east of the Mississippi River totaled 113,355 fine ounces in 1950 compared with 101,612 fine ounces in 1949, an increase of 12 percent.

Copper.—The Calumet & Hecla Consolidated Copper Co., Copper Range Co., and Quincy Mining Co. in Michigan, Bethlehem Steel Co. in Pennsylvania, Tennessee Copper Co. in Tennessee, and the Vermont Copper Co. in Vermont account for virtually all the copper produced in the States east of the Mississippi River. Total production in the region in 1950 was 40,105 short tons, a 22-percent increase over the 32,955 tons produced in 1949. Continuous operation of mines in Michigan, chiefly those of Calumet & Hecla Consolidated Copper Co., accounted for much of this increase. During 1949 the Calumet & Hecla Consolidated Copper Co. ceased most of its operations for a portion of the year owing to the relatively low price of copper. Output for Michigan increased 31 percent in 1950 over 1949. Output from Pennsylvania-Tennessee-Vermont increased 8 percent. The Copper Range Co. continued exploration and development of its White Pine ore body in Michigan. No labor strikes were reported in this portion of the metal-mining industry during the year. The annual weighted average price for copper was about 1.1 cents per pound higher in 1950 than in 1949.

Lead.—Lead is produced in the region chiefly as a byproduct or coproduct of the mining for zinc or fluorspar. Output in 1950 was

8,178 short tons, a 16-percent decrease from 1949. Most of the decrease can be attributed to a smaller output from fluorspar mines and closing of the Patrick mine in Southern Illinois by the Alco Lead Corp., which went out of business in the latter part of 1949. Zinc-lead mines in Wisconsin and Northern Illinois also recorded a decrease in production, and some output was lost owing to closing on May 15 of the Universal Exploration Co. Hyatt mine in New York. However, increased output from the St. Joseph Lead Co. Balmat mine offset the loss from the Hyatt mine, and the total output from New York State increased 13 percent. A labor strike at the Austinville mine of the New Jersey Zinc Co. from October 9 to November 23 resulted in a 2-percent decrease in the output of lead from Virginia mines. Lead was produced from mines in Illinois, Kentucky, New York, Virginia, and Wisconsin during 1950. In addition, exploration resulted in the production of a small quantity of lead ore from mines near Embreeville, Tenn.

Zinc.—Zinc produced from mines in the States east of the Mississippi River increased 12 percent in 1950 over 1949. Output in 1950 was 174,507 short tons and represented about 28 percent of the total United States output. In the region, zinc was produced from mines in Illinois, Kentucky, New Jersey, New York, Tennessee, Virginia, and Wisconsin. The principal producer was again the New Jersey Zinc Co., operating the Franklin and Sterling Hill mines in New Jersey and the Austinville mine in Virginia.

In Kentucky and Southern Illinois, zinc is produced chiefly as a byproduct or coproduct with fluorspar. The principal producers in this area were the Ozark-Mahoning Co. and the Minerva Oil Co. During the latter part of the year the Alcoa Mining Co. began producing and concentrating zinc ore from its newly developed Hutson mine in Kentucky. Output from the Kentucky-Southern Illinois area was 2 percent greater in 1950 than in 1949. New Jersey output was 8 percent greater than in 1949. The two producing mines—the Franklin and Sterling Hill—operated continuously after resumption of work when the strike at the Palmerton, Pa., zinc smelter ended January 26. New York mines produced about the same quantity of zinc as in 1949, in spite of the closing of the Hyatt mine of the Universal Exploration Co. on May 15. The other producers in New York during 1950 were the Balmat and the Edwards mines, operated by the St. Joseph Lead Co. Output of zinc from Tennessee mines increased 19 percent over 1949. This increase can be attributed to virtually continuous operation throughout the year by the leading producers and reopening of the Athletic mine in August by the American Zinc Co. of Tennessee. The leading producers were: The American Zinc Co. of Tennessee, operating the Athletic, Grasselli, Jarnagin, and Mascot No. 2 mines; the Universal Exploration Co.; and the Tennessee Copper Co. Production of zinc decreased 6 percent in Virginia, chiefly owing to a strike from October 9 to November 23 at the Austinville mine of the New Jersey Zinc Co. The Wisconsin and Northern Illinois area reported a 50-percent increase in output of zinc in 1950 over 1949. Most of this increase can be attributed to new operations of Calumet & Hecla Consolidated Copper Co. near Shullsburg, Wis., and the Eagle-Picher Mining & Smelting Co. near Galena, Ill. First shipments were made by these companies in September and April 1949, respectively. Other producers in the area include the Dodgeville Mining Co., Dodgeville, Wis. (operations resumed in July);

the Vinegar Hill Zinc Co., production at the new company mill and mine near Shullsburg, Wis., and at the Andrews mine, which began operation about December 10; and Tri-State Zinc, Inc., in Illinois. The Eagle-Picher Mining & Smelting Co. and the Vinegar Hill Zinc Co. accept custom ore at their mills.

MINING INDUSTRY

Again the base-metal mining industry experienced slumps in market demand and prices, followed by a period of strong demand with relatively high prices. In 1949 demand and prices for copper, lead, and zinc fell, causing closing of many small mines in the region and some curtailment of output or development at larger mines (most of the smaller mines did not resume operation in 1950). In 1950 shortages developed, and prices rose as the result of increased demand when consumers' stocks became low; this was followed by a stepped-up stockpiling program and then the Korean War, which added to national tension and demand. The Defense Production Act of 1950,[1] containing, among other things, provisions designed to stimulate mineral production, had little effect upon the industry before the year-end. (See Review of the Mineral Industries chapter of this volume and Copper, Lead, and Zinc chapters.)

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River in 1950, by class of ore in terms of recoverable metal

Class of ore [1]	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
Gold ore: Maryland	55	20				
Copper ore:						
Michigan	4,386,474			25,608		
Tennessee	1,088,653	160	39,958	[2] 14,497		(3)
Vermont	245,350	146	28,205	(2)		
Total	5,720,477	306	68,163	[2] 40,105		(3)
Magnetite-pyrite-chalcopyrite ore: Pennsylvania	1,954,144	1,764	10,563	(2)		
Zinc ore:						
Illinois	227,399				66	5,849
Kentucky	1,914					209
New Jersey	376,600					55,029
New York	119,200					10,500
Tennessee	1,165,981					[3] 35,267
Virginia	402					24
Wisconsin	28,567					639
Total	1,920,063				66	[3] 107,517
Zinc-lead ore:						
Illinois	528,601		2,001		2,661	21,133
Kentucky	49,727				66	522
New York	375,671		32,628		1,484	27,821
Tennessee	1,343				113	59
Virginia	426,030				3,254	12,372
Wisconsin	177,160				532	5,083
Total	1,558,532		34,629		8,110	66,990
Lead ore: Illinois	10				2	
Grand total: 1950	11,153,281	2,090	113,355	40,105	8,178	174,507
1949	9,624,995	1,940	101,612	32,955	9,755	156,298

[1] Includes old tailings.
[2] Data for copper in Pennsylvania (from magnetite-pyrite-chalcopyrite ore) and Vermont included with Tennessee in order to avoid disclosure of individual company operations.
[3] Zinc from Tennessee copper ore included with that from zinc ore in order to avoid disclosure of individual company operations.

[1] Public Law 774, 81st Cong., approved Sept 8, 1950.

METALLURGICAL INDUSTRY

Virtually all the ore and old tailings produced in the region were treated at concentration mills at or near the mines and then shipped to smelters, refineries, or oxide plants. Of the total of 11,153,281 short tons of material mined, 8,892,058 short tons were crude ore treated initially at a concentration mill, 44 tons were crude ore shipped direct to a smelter, and 2,261,179 tons were old tailings treated initially at tailings' reclamation plants. The ore tonnage includes 1,954,144 tons of magnetite-pyrite-chalcopyrite ore produced in Pennsylvania, which has not been included in reporting for years before 1949. This tonnage of Pennsylvania ore is also reported in the Iron Ore chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River, in 1950, by States, in terms of recoverable metal

State[1]	Mines producing		Ore and tailings (short tons)	Gold			Silver (all lode)	
	Lode	Placer		Fine ounces: Lode	Fine ounces: Placer	Total value	Fine ounces	Value
Illinois	17		[2] 756,010				2,001	$1,811
Kentucky	7		[2] 51,641					
Maryland	1		55	20		$700

Pennsylvania	(4)	(4)					[4] 71,300
Tennessee	[4] 14,497	[4] 6,030,752	113	30,510	35,326	10,032,584	[4] 16,135,610
Vermont	(4)	(4)					[4] 30,637
Virginia			3,254	878,580	12,396	3,520,464	4,399,044
Wisconsin			532	143,640	5,722	1,625,048	1,768,688
Total: 1950	40,105	16,683,680	8,178	2,208,060	174,507	51,190,389	70,257,871
1949	32,955	12,984,270	9,755	3,082,580	156,298	40,560,934	56,788,593

[1] Total for 1949 includes 18 ounces of gold ($630) from Georgia and 13 ounces of gold ($455) from North Carolina; no production in Georgia or North Carolina in 1950.
[2] Excludes lead-bearing material mined with fluorspar and from which some lead was recovered as a byproduct of the mining and milling of the fluorspar.
[3] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[4] Data for copper in Pennsylvania and Vermont included with Tennessee in order to avoid disclosure of individual company operations.

The methods of treatment used in the mills and other operating details, including the tonnage and grade of concentrates produced at some mills, are given in the Review by States that follows. About 55 tons of gold ore were treated by amalgamation in 1950.

Active smelters and refineries in States east of the Mississippi River that treated primary materials include copper plants at Hubbell and Hancock, Mich., Carteret, N. J., Laurel Hill, N. Y., Copperhill, Tenn., Baltimore, Md., and Barber, N. J.; lead plants at Barber, N. J., East Chicago, Ind., and Federal Hill, Ill.; zinc plants at Hillsboro, Fairmont City, La Salle, East St. Louis, and Depue, Ill., Donora, Palmerton, and Josephtown, Pa., Columbus, Ohio, and Meadowbrook, W. Va.

REVIEW BY STATES

ILLINOIS

Zinc and lead production from the State in 1950 was, in terms of recoverable metal, 26,982 and 2,729 short tons, respectively, a 49-percent increase in output of zinc over 1949, but a 29-percent decrease in lead. The output of silver, in terms of recoverable metal, all from Southern Illinois mines, was 2,001 fine ounces, a 36-percent decrease from the previous year.

Northern Illinois.—All production of lead and zinc in Northern Illinois in 1950 was from mines in Jo Daviess County. Output was from five mines, three operated by Tri-State Zinc, Inc., and two by the Eagle-Picher Mining & Smelting Co. Total production from these mines was 574,650 tons of ore, from which 1,819 tons of lead concentrates and 38,463 tons of zinc concentrates were made, containing, in terms of recoverable metal, 1,269 tons of lead and 21,071 tons of zinc.

Tri-State Zinc, Inc., operated the Bautsch, Black Jack, and Heer mines, hauling ore from them to the company's adjacent beneficiation plant (Gray Mill) by truck. The Bautsch and Black Jack mines both have inclined adit tunnels leading to the mine through which trucks are driven directly from the mill to stopes in the mine. At the Heer mine ore is hoisted to the surface through a 278-foot shaft. These mines are in R. 1 E., T. 27 N. The Black Jack mine is in sec. 4 and the Bautsch and Heer in sec. 10. The Bautsch mine was operated throughout 1950, whereas the Black Jack was operated part time after completion of the inclined adit in March. The Heer was operated during May, June, and July. Development work by the company included 1,020 feet of churn drilling at the Black Jack. No development was reported for the other two mines.

The Eagle-Picher Mining & Smelting Co. operated the Graham and Snyder mines and its Graham central mill, a few miles north of Galena, Ill., continuously throughout the year. The mines are in secs. 25 and 32, R. 1 E., T. 29 N. Custom ore was accepted at the mill, virtually all from mines in Wisconsin. Development at the company's mines included 2,030 feet of drift. Rated capacity of the mill in 1950 was 1,800 tons in 24 hours.

Southern Illinois.—Production of zinc, lead, and silver was reported from only 12 mines in Southern Illinois in 1950 compared with 23 in 1949. Output of silver and lead in terms of recoverable metal decreased 36 and 45 percent, respectively, whereas production of zinc increased 5 percent over 1949. The decreased output of silver and lead was chiefly due to cessation of operations at the Patrick mine of the Alco Lead Corp. in the latter part of 1949. Virtually all of the silver, lead, and zinc produced in the district was a byproduct or coproduct of fluorspar mining.

The Ozark-Mahoning Co. operated several mines and its all-flotation custom mill at Rosiclare and was the largest producer of all three metals in the district. The company mill was operated continuously throughout the year, and the mines operated almost continuously. Development at its Illinois mines included 428 feet of shaft, 450 feet of drifts, 514 feet of diamond drilling, and 13,952 feet of churn drilling. A shaft was sunk at the Mahoning mine during the year.

Minerva Oil Co. was the second-largest producer of zinc in Southern Illinois in 1950. The company operated its fluorspar-zinc mine and mill continuously, except for the period of a labor strike June 1–19. Several improvements were made at the mine and mill during the year, including a new drill jumbo, replacement of principal pumps in the mine, a new and larger crusher, addition of six flotation cells, a new and larger steel ore bin, and the addition of two capacitors to raise the power factor.

Other producers of zinc or lead in the district included The Rosiclare Lead & Fluorspar Co., Alcoa Mining Co., Crystal Fluorspar Mining Co., and three very small producers.

KENTUCKY

Zinc or lead was produced chiefly as a byproduct or coproduct with fluorspar from seven mines in Kentucky during 1950. Total output of recoverable zinc and lead was 731 and 66 short tons, respectively.

The Ozark-Mahoning Co., operating the Babb and Commodore mines, was the State's largest producer of both metals. The Commodore mine was operated for 10 months of 1950 and the Babb mine 6 months. Development at these mines during the year included 160 feet of shaft and winze and 312 feet of diamond drilling. A report of investigation of the Babb vein system, made in 1943–44 by the Bureau of Mines, was published.[2]

Initial production of concentrates from the Hutson mine of the Alcoa Mining Co. in Livingston County took place in October 1950. The ore is zinc sulfide with a high percentage of iron sulfide. Upper-level ore contains considerable zinc carbonate. This deposit is unique in the district in that there is virtually no lead sulfide or calcium fluoride (fluorspar). Ore is beneficiated at the company's new Hutson flotation mill on Sandy Creek about 5 miles southwest of Salem, Ky. Mill capacity is 100 tons per 24 hours. The mine is operated through two shafts, one 525 and one 200 feet deep. Other producers of zinc or lead in the State include the United States Coal & Coke Co., operating the Tabb No. 1 mine, and three other operators who produced very small quantities of lead or zinc.

MARYLAND

In Maryland one lode-gold mine was operated intermittently by E. T. and Huntley Ingalls in Montgomery County as a prospecting

[2] Swanson, A. S., and Starnes, X. R., Investigation of Fluorite deposits of Babb Vein System, Crittenden and Livingston Counties, Ky.: Bureau of Mines Rept. of Investigations 4677, 1950, 30 pp.

venture during 1949 and 1950. A total of 20 fine ounces of gold was produced during this period, all of which has been credited as 1950 output.

MICHIGAN

Continuous operation of Michigan copper mines and tailings-reclamation plants at a relatively steady production rate resulted in the output of 25,608 short tons of copper from the State in 1950. This is a 31-percent increase over the 1949 output. Three companies operated nine mines and three tailings-reclamation plants.

Of the three companies, Calumet & Hecla Consolidated Copper Co. was the largest producer. The company operated eight mines and two tailings-reclamation plants. Ore from the mines was beneficiated at the Ahmeek mill, and the tailings were treated at the Tamarack and the Lake Linden reclamation plants. Mill operations were conducted on a three-shift, 7-day-week basis. Extracts from the Calumet & Hecla annual report follows:

The Company's copper mines and reclamation plants operated at capacity throughout 1950, although high prices of scrap copper caused some curtailment of smelter output in the second half of the year. The improvement in production figures in 1950 over 1949 was marked. * * *

* * * Material treated was of a somewhat lower grade than previously, but the copper price in 1950 was high enough to make a satisfactory profit. Our smelter and refinery operations continued at a high level through most of the year. However, during the last few months of 1950 the abnormally high prices being charged for suitable copper scrap made it undesirable for us to process scrap for our own account. We did continue to refine scrap on toll for our customers until December when the Government prohibited this type of transaction.

Processing of scrap copper into copper chemicals and oxide was expanded in 1950 as demand increased, particularly for agricultural oxides.

A new power plant which was put into operation late in 1949 has performed satisfactorily and resulted in a considerable reduction of costs.

* * * * * * *

EXPLORATION

Exploration for copper and zinc ores and underground development work, cut back in 1949, was expanded during 1950. In northern Michigan mechanized equipment was used for removing overburden and uncovering bedrock. This relatively new method is believed to be more effective under conditions present in Northern Michigan than the older method of diamond drilling and will be resumed in the spring of 1951.

* * * * * * *

RESEARCH AND DEVELOPMENT

The program of research and development at Calumet has been enlarged and intensified. In order to effect cost reduction, study is being directed constantly to improving methods. The development of new processes and products is proceeding vigorously with promising results.

The Quincy Mining Co., second-largest producer in the State, continued treatment of tailings at its reclamation plant at Mason, Mich. Concentrates made were shipped to the company smelter at Hancock, Mich.

Copper Range Co. was third in rank with respect to production. Extracts from its annual report for 1950 follow:

Mining was carried on throughout the year in the East Vein of the Champion Mine. Changes in the price of copper during the year were reflected in the amount and scope of our development work and mining. By midyear it was decided that the collateral advantages to the Company in continuing to operate the mine, in addition to having a firm although small source of copper, justified increasing development and mining to a rate which would compensate for the curtailment of this work in the preceding twelve months. It has been planned, under the conditions of the present emergency, to gradually increase the tonnage up to the capacity of our mining plant. During the year 196,566 tons of ore were shipped to the Mill at Freda * * *. The results of development work and mining have continued to show the ore as barely marginal under the existing conditions. At the end of the year approximately 101,000 tons of broken ore were held in reserves in the shrinkage stopes. Wage increases made during the year, coupled with increases in the cost of material and supplies, resulted in a substantial increase in the cost of production.

The Mill at Freda operated throughout the year. The improvements made in the crushing and grinding circuit in late 1949 continued to operate satisfactorily and these and other improvements prevented the full impact of increases in labor and other costs from being reflected in our final results. The Freda reclamation plant was not operated in 1950 due to a lack of available stamp sands of satisfactory grade. These sands are not replacing themselves as rapidly as in former years and it is possible that this source of copper has been exhausted. No further plans were made to treat the stamp sands at Redridge and at Gay.

The Douglass property under lease to the Calumet and Hecla Consolidated Copper Company produced 8,109,962 pounds of copper in 1950 as compared with 4,755,052 pounds in the preceding year. Production came from the Kearsage Lode and the Houghton Conglomerate. Exploration and development work was continued in the Houghton Conglomerate area with favorable results.

The exploration program of the White Pine ore body by diamond drilling, started in May 1949, was completed in December 1950. Six holes were completed this year to total 9,516 feet. This work has added a substantial tonnage of ore to our reserves. The year-end estimate of 309,660,000 tons averaging 21.3 pounds of copper per ton in the total ore column, including 154,320,000 tons of ore averaging 24.3 pounds of copper per ton in the Parting Shale, can undoubtedly be greatly increased by further exploration.

Mining operations consisted of keeping the shaft unwatered and mining 2,700 tons of ore for the pilot mill at Freda and for testing and other experimental purposes. Stoping was carried on in two places in the mine in order to secure as representative an ore as possible.

Research on milling was continued in the laboratory throughout the first four months of the year, resulting in important improvements in the metallurgy. A pilot mill with a nominal capacity of ten tons per day was put in operation in May and has confirmed the laboratory work as well as developing some phases of the metallurgy and flow sheet that could not be effectively explored or determined in the laboratory. As a result of the testing and comprehensive research, a relatively simple flow sheet has been designed for the concentration of the ore to produce a concentrate carrying at least 25% copper and containing 85% of the total copper from ore, assaying about 24 pounds of copper per ton. Moderate variations in the grade of ore should not materially affect the over-all results anticipated in actual plant operation. The results of recent pilot mill tests have indicated further improvements in the metallurgy that promise better recovery and the lowering of our preliminary estimates of construction, equipment and operating costs.

In September the pilot leaching plant which covers the complete processes of roasting the concentrates in a Fluo-Solids reactor, agitation leaching, and electrolytic deposition of the copper from solution was completed and placed in operation by the engineers of the Dorr Company. Results of significant importance have been obtained and further studies and tests are being made. The investigation of whether the copper in the concentrates should be extracted by smelting and fire refining or by leaching and electrolytic deposition is being continued. The completion of these tests and research now being undertaken should give us sufficient additional information to resolve this important problem.

NEW JERSEY

Production and value of zinc produced from mines in New Jersey increased 8 and 19 percent, respectively, in 1950 over 1949. Output in 1950, in terms of recoverable content, was 55,029 short tons valued at $17,258,637, slightly less than half was refined to zinc metal and the remainder processed to zinc oxide. Mines producing were the Franklin and Sterling Hill in Sussex County. These mines were idle due to a strike at the Palmerton, Pa., smelter from September 27, 1949, to January 26, 1950. Mine operation was resumed January 30, 1950.

The value of the New Jersey output of zinc given in the tables of this chapter is the combined value of the zinc recoverable as metal or as oxide after freight, haulage, smelting, and manufacturing charges have been added.

NEW YORK

Production of silver, lead, and zinc from mines in New York was greater by 78, 13, and 1 percent, respectively, in 1950 over 1949. This increase was recorded, even though the Hyatt mine was permanently closed May 15. The Universal Exploration Co. began developing the Hyatt mine in 1938. First production of lead and of zinc concentrates was recorded from its new 200-ton-per-day flotation mill early in 1941. Production continued relatively steady until cessation of operations May 15, 1950.

The St. Joseph Lead Co. continued operation of its Balmat and Edwards mines throughout 1950. Lead and zinc are produced from the Balmat mine. A program to increase the daily capacity of the mill at the Balmat from 1,200 tons to 1,800 tons was initiated during the year. Development at the mine included 217 feet of shaft, 8,776 feet of drifts, and 44,590 feet of diamond drilling. The Edwards mine produces only zinc. Ore is treated in a 600-ton-per-day flotation plant. Development at this mine included 6,570 feet of drifts and 6,776 feet of diamond drilling.

Silver is carried in small quantities in the lead concentrates from both the Balmat and the Hyatt mine. Its recovery at the smelter depends greatly on the demand for desilverized lead. A larger percentage recovery of silver at the lead smelter in 1950 accounts for most of the increase in the State's silver output.

A report on an investigation of the Shawangunk mine in Sullivan County during 1948–49 was published.[3]

PENNSYLVANIA

Gold, silver, and copper were produced along with iron from the Cornwall mine by the Bethlehem Steel Co. No lead or zinc mining was reported in the State. However, the New Jersey Zinc Co. continued to develop its zinc mine near Friedensville.

Production in 1950 from the Cornwall mine, the only producer, showed a 27-percent increase in tonnage of magnetite-pyrite-chalcopyrite ore mined, but the output of gold increased only 7 percent and copper 4 percent, whereas silver production decreased 2 percent. This property is operated both as an open pit and underground mine. The ore is treated first in a 6,000-ton-per-day magnetic separation plant. The tailings then go to a 2,200-ton flotation plant and the magnetic product to a 2,400-ton sintering plant. The mill was operated three shifts per day 6 days a week in 1950. Operation was on a 5-day schedule in 1949.

Zinc smelters at Donora, Josephtown, and Palmerton, Pa., treat most of the zinc concentrates produced in New York, Tennessee, and Virginia, as well as large tonnages from other States and from foreign

[3] Eilertsen, N. A., Investigation of Shawangunk Mine, Zinc-Lead Deposit, Near Summitville, Sullivan County, N. Y.: Bureau of Mines Rept. of Investigations 4675, 1950, 41 pp.

countries. The smelter at Palmerton was idle due to a strike from September 26, 1949 to January 26, 1950.

Reports on investigations of the Perkiomen Creek copper deposits, the New Galena lead deposits and the Almedia lead-zinc deposit were published by the Bureau of Mines.[4]

TENNESSEE

Copper and zinc production from mines in Tennessee increased 6 and 19 precent, respectively, in 1950 over 1949. Gold, silver, and lead output decreased 6, 4, and 56 percent, respectively. Production was again reported by 5 companies from 12 mines. The total tonnage of ore produced in 1950 was greater than 1949 by 4 percent and explains the increases in copper and zinc produced. Gold and silver are byproducts of copper-zinc mining in Tennessee. These metals are virtually unassayable in the original ore. They are allowed to accumulate in the copper smelter and the copper sulfate circuit, usually for several months, until there is enough to warrant casting "high-gold-silver-copper" anodes for shipment to an electrolytic refinery. Because of the practice of allowing gold and silver to accumulate for several months, the monthly and annual mine-production rates of these two metals are estimated. Lead was produced in 1949 and 1950 as a result of prospecting and exploration performed near Embreeville, Washington County, and not from regular mining; consequently, the decreased output is not significant.

The American Zinc Co. of Tennessee operated the Grasselli, Jarnagin, and Athletic (Mossy Creek) mines in Jefferson County and the Mascot No. 2 mine in Knox County. Operations at the Athletic, shut down June 17, 1949, were resumed in August 1950, and the other mines were operated throughout the year. All ore is beneficiated at the company mill at Mascot. During the latter part of 1950 custom ore from the Timberville mine in Virginia and from the Universal Exploration Co. in Tennessee was also treated. Concentrates from this mill were shipped to eight different smelters or oxide plants. Development at the American Zinc Co. of Tennessee mines included 2,332 feet of drift and 25,921 feet of diamond drilling at the Mascot No. 2; 447 feet of drift at the Jarnagin; 1,763 feet of drift, 2,295 feet of diamond drilling, and 15,006 feet of churn drilling at the Grasselli; and 191 feet of drift at the Athletic.

The Tennessee Copper Co. operated the Burra Burra, Calloway, Mary, Eureka, and Boyd mines throughout 1950. Development during the year included 750 feet of shaft, 13,912 feet of drifts, 4,367 feet of raises, and 12,580 feet of diamond drilling. Ore is initially beneficiated at the company London and Isabella mills, which have a total daily capacity of about 3,200 tons. The products are zinc concentrates, copper concentrates, iron concentrates, and limestone tailings. Zinc concentrates were sent to smelters or oxide plants for further refining. Copper concentrates were converted to blister copper in the company 150-ton reverberatory furnace and cast chiefly as shot copper for the manufacture of copper sulfate.

[4] Earl, Kenneth M., Investigation of Perkiomen Creek Copper Deposits, Montgomery County, Pa.: Bureau of Mines Rept. of Investigations 4666, 1950, 13 pp. Investigation of New Galena Lead Deposit, Bucks County, Pa.: Bureau of Mines Rept. of Investigations 4703, 1950, 7 pp. Investigation of the Almedia Lead-Zinc Deposit, Columbia County, Pa.: Bureau of Mines Rept. of Investigations 4743, 1950, 9 pp.

In Jefferson County the Universal Exploration Co. continued to operate the Davis-Bible group of mines and its 800-ton-per-day flotation mill. Mine development included 15 feet of shaft, 2,201 feet of drifts, 2,447 feet of diamond drilling, and 2,231 feet of churn drilling. Most of the ore was treated at the company mill, but during the latter part of the year some ore was sent to the Mascot mill of the American Zinc Co. of Tennessee.

A small quantity of lead ore and zinc-lead ore was shipped to smelters from mines in Washington County.

The Bureau of Mines published a report on an investigation of the Brown-Tipton zinc deposit, Green County, made in 1944.[5]

VERMONT

The Vermont Copper Co. continued to operate the Elizabeth mine in Orange County. There was also small production from adjacent mine dumps. This company was the only producer of gold, silver, and copper in the State in 1950. Output of these three metals was greater by 22, 3, and 17 percent, respectively, than in 1949. The ore, containing chalcopyrite and pyrrhotite with a small quantity of gold and silver, was concentrated in the company 500-ton flotation mill. Concentrates are shipped to the Phelps-Dodge Corp. smelter and refinery at Laurel Hill, N. Y.

VIRGINIA

Production of zinc and lead from mines in Virginia was 6 and 2 percent less, respectively, in 1950 than in 1949, chiefly as the result of a strike at the Austinville mine of the New Jersey Zinc Co. from October 9 to November 23. This mine had been operated continuously during 1949. No copper, gold, or silver production was recorded during the year. The Austinville mine is in Wythe County. Ore is treated at the company 2,000-ton-per-day mill at the mine. Zinc concentrates were sent to the zinc smelters at Palmerton, Pa., and Hillsboro, Ill. Lead concentrates were shipped to the lead smelter at Federal, Ill. A small quantity of ore was shipped by the Timberville Mining Co., Frederick County, for concentration at the Mascot mill of the American Zinc Co. of Tennessee.

WISCONSIN

Although the number of producing mines in Wisconsin decreased from 46 in 1949 to 11 in 1950, the output of recoverable zinc increased from 5,295 to 5,722 tons. Producers not operating in 1950 were chiefly individuals who worked intermittently, several producing only high-grade lead concentrates from surface or near surface operations. These operators ceased mining because the price of lead and zinc dropped in 1949. Loss of this output was the chief reason for the decreased production of lead from 857 tons in 1949 to 532 tons in 1950. Continuous operation of the new mine and mill of the Calumet & Hecla Consolidated Copper Co. near Shullsburg (first production reported in September 1949) accounted for much of the State's zinc output. This company has a 1,200-ton-per-day mill at the mine. It was operated on a three-shift, 6-day-week basis. Concentration is

[5] Warner, A. H., Investigation of the Brown-Tipton Zinc Deposit, Green County, Tenn.: Bureau of Mines Rept. of Investigations 4645, 1950, 6 pp.

by jigs and flotation. Both zinc and lead concentrates are made. Development in the mine included 1,316 feet of drifts and 44,775 feet of churn drilling. In advancing a drift to open a new section of the mine to the south, considerable water, as expected, was encountered and caused curtailed production during October and November. Extracts from the Calumet & Hecla annual report follow:

The Company's zinc-lead mine at Shullsburg, Wisconsin, at the end of 1950 passed from an exploratory to what is expected to be a profitable operating basis. Fractured and folded rock formations retarded and hampered mining operations. An abnormally large flow of water required the installation of pumping capacity sufficient to handle 14,400 gallons per minute, which is believed to be ample to cope with any foreseeable future needs. The mine is operated through modern and efficient techniques, using diesel trucks and the latest mechanical equipment for loading and transporting ore. Substantial reserves assure many years of operation. A basis for profitable operations was achieved by the end of 1950.

* * * * * * *

In the Wisconsin zinc area, churn drilling was conducted to extend and outline the several ore bodies under development, and to explore the block of land under lease. Results have been encouraging. * * *

The Vinegar Hill Zinc Co. developed the Blackstone mine and built a new mill south of Shullsburg. The mill is rated at 600 tons per day. Production from this mine and operation of the new "Hancock" mill were begun in December.

The Cuba Mining Co., a subsidiary of Vinegar Hill Zinc Co., reopened the Andrews mine and shipped ore to the new mill. Custom ore from the Little Mullen and De Rocher mines was also accepted at the mill.

On July 20 the Dodgeville Mining Co., Iowa County, resumed operation of its mill and began to mine ore from the Dodgeville No. 3 mine. The mill has jigs and a 50-ton flotation plant. A new waste-disposal unit was added to the mill during the year.

Other operators producing in 1950 include the H. B. & H. Mining Co., Benton Milling Co., L. G. & W. Mining Co., Chestnut Hill Zinc Co., Little Grant Mining Co., Fred Hofer & Sons, and Whitechurch & Farr.

A report was published of an investigation of the White zinc-lead deposit, Lafayette County, by the Bureau of Mines in 1947.[6]

OTHER STATES

No production of gold, silver, copper, lead, or zinc was reported in other States in the region during 1950. The Bureau of Mines published reports of investigation on mines in Georgia, Maine, and New Hampshire.[7]

Idaho

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By Almon F. Robertson and Virginia Halverson

GENERAL SUMMARY

OUTPUT of all major nonferrous metals increased in Idaho in 1950. Gold output increased from 77,829 fine ounces in 1949 to 79,652 in 1950 (2 percent); silver from 10,049,257 fine ounces to 16,095,019 (60 percent); copper from 1,438 short tons to 2,107 (47 percent); lead from 79,299 tons to 100,025 (26 percent); and zinc from 76,555 tons to 87,890 (15 percent).

The lead output exceeded the zinc output by 14 percent compared with 4 percent in 1949. The total value of the five metals increased from $56,429,796 in 1949 to $70,198,647 in 1950, or 24 percent. Gold was valued at $2,787,820 or 4 percent of the State total; silver, $14,566,805 (21 percent); copper, $876,512 (1 percent); lead, $27,006,-750 (38 percent); and zinc $24,960,760 (36 percent). In 1950 Idaho remained the largest producer of silver and zinc in the United States and the second-largest producer of lead (exceeded only by Missouri). About 94 percent of the State silver production, 90 percent of the copper, 95 percent of the lead, and 98 percent of the zinc came from the Coeur d'Alene region of Shoshone County; the remaining silver, copper, lead, and zinc came largely from the Warm Springs district in Blaine County.

About 61 percent of the State gold production in 1950 came from a lode mine in the Yellow Pine district, Valley County; the remainder came largely from dredging operations in the Elk City district, Idaho County; Boise Basin district, Boise County; Yankee Fork district, Custer County; and Ten Mile district, Idaho County.

All tonnage figures reported herein are short tons and "dry weight"; that is, they do not include moisture. The value of metal production has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–50: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in Idaho, 1946–50, and total, 1863–1950, in terms of recoverabe metal [1]

Year	Lode mines		Placer mines		Gold (lode and placer)		Silver (lode and placer)	
	Number of mines	Ore sold or treated (short tons)	Number of mines	Gravel washed (cubic yards)	Fine ounces	Value	Fine ounces	Value
1946	139	2,882,187	71	4,178,023	42,975	$1,504,125	6,491,104	$5,244,812
1947	183	3,717,697	99	4,467,931	64,982	2,274,370	10,345,779	9,362,930
1948	194	3,981,846	78	4,042,245	58,454	2,045,890	11,448,875	10,361,810
1949	171	3,057,075	82	3,046,837	77,829	2,724,015	10,049,257	9,095,085
1950	155	3,300,215	75	2,560,730	79,652	2,787,820	16,095,019	14,566,805
1863–1950	----------	(2)	----------	(2)	8,121,666	187,397,713	568,424,342	402,418,623

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1946	1,038	$336,312	59,987	$13,077,166	71,507	$17,447,708	$37,610,123
1947	1,640	688,800	78,944	22,735,872	83,069	20,102,698	55,164,670
1948	1,624	704,816	88,544	31,698,752	86,267	22,947,022	67,758,290
1949	1,438	566,572	79,299	25,058,484	76,555	18,985,640	56,429,796
1950	2,107	876,512	100,025	27,006,750	87,890	24,960,760	70,198,647
1863–1950	114,596	35,793,779	6,287,196	762,378,126	1,627,453	298,224,745	1,686,212,986

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; old tailings or slimes re-treated; and ore and old tailings shipped directly to smelters during the calendar year indicated.
[2] Figure not available.

Gold.—The output of recoverable gold in Idaho in 1950 was 79,652 ounces, 1,823 ounces over 1949. This entire gain was from placer mines, as the output of gold from lode properties decreased 660 ounces. Gold from lode mines in 1950 was 62,091 fine ounces compared with 62,751 fine ounces in 1949, and that from placer properties was 17,561 fine ounces compared with 15,078. The Yellow Pine lode mine in Valley County, worked by the Bradley Mining Co., continued to be the largest producer of gold in Idaho; it was followed by a lode property at Atlanta worked by Talache Mines, Inc.; a bucket-line dredge at Idaho City worked by the Idaho-Canadian Dredging Co.; a bucket-line dredge at Elk City worked by the Warren Dredging Corp., and a bucket-line dredge at Elk City worked by H. & H. Mines, Inc. Of the total gold produced in Idaho in 1950, nearly 70 percent came from gold ore, 17 percent from bucket-line dredging, 4 percent from dragline dredging (including operations of nonfloating washing plants), and most of the remainder from zinc-lead ore. Four bucket-line dredges and 11 nonfloating washing plants and dragline dredges treated about 2,500,000 cubic yards of gravel in 1950 and recovered 17,072 fine ounces of gold and 5,187 fine ounces of silver.

Silver.—Idaho's output of recoverable silver in 1950 was 16,095,019 ounces, 6,045,762 more than in 1949. The State continued to be the largest producer of silver in the United States—a place it has held since 1933. The Coeur d'Alene region produced 15,056,131 fine ounces of silver in 1950, or 94 percent of the State total; the remainder came largely from the Warm Springs, Bayhorse, and Yellow Pine districts. Of the State total silver, silver ore yielded 60 percent, zinc-lead ore and old tailings 34 percent, lead ore 5 percent, and gold ore most of the remainder. Recovery of silver from silver ore increased 5,470,467 ounces, that from zinc-lead ore 1,207,840 ounces, and that from gold ore 66,265 ounces. However, recovery of silver from lead ore decreased 744,150 ounces.

TABLE 3.—Gold produced at placer mines in Idaho, 1946–50, by classes of mines and by methods of recovery

Class and method	Mines producing	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average value per cubic yard
Surface placers:					
Gravel mechanically handled:					
Bucket-line dredges:					
1946	7	3,766,746	17,448	$610,680	$0.162
1947	8	3,381,351	14,112	493,920	.146
1948	5	3,139,168	14,969	523,915	.167
1949	4	2,332,576	10,234	358,190	.154
1950	4	2,005,000	13,549	474,215	.237
Dragline dredges:					
1946	6	364,260	2,272	79,520	.218
1947	4	577,000	2,939	102,865	.178
1948	2	400,000	1,071	37,485	.094
1949	2	406,000	1,409	49,315	.121
1950	2	296,000	1,839	64,365	.217

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."
[2] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc. "Wet" method used exclusively in Idaho.
[3] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

Twelve mines—the Sunshine, Bunker Hill & Sullivan, Polaris, Silver Summit, Silver Dollar, Page, Triumph, Silver Syndicate, Sherman, Star, Dayrock, and Morning—produced 88 percent of the silver output of the State in 1950. Six properties (Sunshine, Polaris, Silver Dollar, Silver Syndicate, Sunshine Consolidated, and Metropolitan) near Kellogg, operated by the Sunshine Mining Co., in 1950 produced 8,293,869 ounces of silver, or 52 percent of the State total.

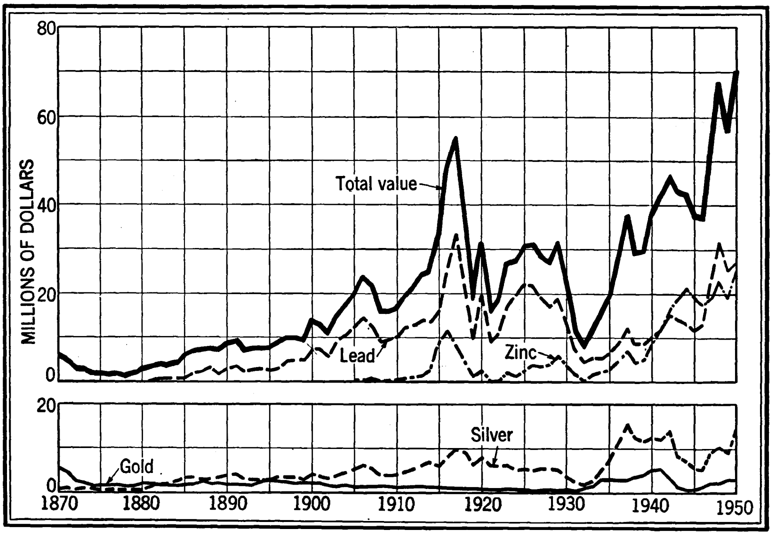

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc, and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1950. The value of copper has been less than $2,000,000 annually, except in a few years.

Copper.—The output of copper in Idaho increased to 2,107 tons in 1950, 669 tons more than in 1949. About 88 percent of the State copper output in 1950 was recovered as a byproduct in the treatment of zinc-lead ore and silver ore from mines in the Coeur d'Alene region; the remainder was recovered largely from zinc-lead ore produced in the Warm Springs district.

The Sunshine mine near Kellogg in the Coeur d'Alene region continued to be the largest producer of copper in Idaho. It was followed by the Bunker Hill & Sullivan, Polaris, Triumph, and Silver Dollar properties.

Lead.—In 1950 Idaho mines produced 100,025 tons of recoverable lead, 20,726 tons more than in 1949. In 1950, 95 percent of the State total lead came from the Coeur d'Alene region; most of the remainder was produced in the Warm Springs, Bayhorse, Texas, Port Hill, and Clark Fork districts. Zinc-lead ore and old tailings (1,989,821 tons) from the Coeur d'Alene region yielded 78 percent of the State total lead; and lead ore and silver ore, chiefly from the Coeur d'Alene region, yielded 17 percent. The remainder came largely from zinc-lead ore in the Warm Springs and Bayhorse districts, lead ore in the Bayhorse, Texas, Port Hill, Clark Fork, and Alder Creek districts, and old zinc slag in the Coeur d'Alene region. Lead recovered from zinc-lead ore and old tailings increased 35,872,985 pounds, that from silver ore 5,602,925 pounds, and that from zinc ore and lead-smelter slag 1,126,637 pounds; however, the lead recovered from lead ore decreased 1,165,139 pounds.

The Bunker Hill & Sullivan mine at Kellogg was by far the largest producer of lead in Idaho in 1950. The combined lead output of the seven largest producing mines (each producing more than 7,000,000 pounds)—the Bunker Hill & Sullivan, Page, Star, Morning, Sherman, Dayrock, and Sidney—was 139,306,500 pounds or 70 percent of the State total. Other important producers in 1950 were the Frisco,

Triumph, Bunker Hill & Sullivan mill tailing dump, Sunshine, Tamarack, and Spokane-Idaho properties.

Zinc.—Idaho's output of recoverable zinc increased to 87,890 tons in 1950, 11,335 tons more than that in 1949. About 98 percent of the 1950 State total came from the Coeur d'Alene region and most of the remainder from the Warm Springs district. Zinc-lead ore and old tailings concentrated yielded 91 percent of the State total zinc; old

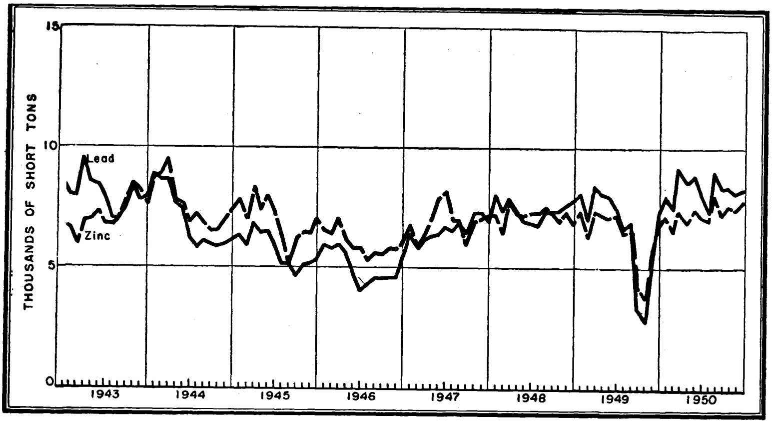

FIGURE 2.—Mine production of lead and zinc in Idaho, 1943–50, by months, in terms of recoverable metals.

lead-smelter slag smelted and fumed, 5 percent; and zinc ore concentrated and lead ore concentrated, 3 percent.

Nine properties (each producing over 6,000,000 pounds of zinc)—the Star, Page, Morning, Bunker Hill & Sullivan, Sidney, Frisco, Bunker Hill slag dump, Spokane-Idaho, and Tamarack—supplied 83 percent of the State total in 1950.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in Idaho in 1950, by months, in terms of recoverable metal

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	3,043	1,087,527	144	8,008	7,185

Total: 1950	79,652	16,095,019	2,107	100,025	87,890
1949	77,829	10,049,257	1,438	79,299	76,555

The Sullivan Mining Co. operated its electrolytic zinc plant near Bradley continuously during 1950, producing 53,922 tons of special high-grade slab zinc and 295 tons of cadmium. Output of metal in the year substantially exceeded that of any year during the 22 years' continuous operation of the plant. In addition, the plant recovered 8,957 tons of zinc, 3,985 tons of lead, 198 tons of copper, 550,665 ounces of silver, and 1,994 ounces of gold from residues, dross, and other byproducts.

MINING INDUSTRY

Production of zinc-lead ore and old tailings (by far the chief ore output of the State) increased from 1,920,206 tons to 2,074,300, gold ore from 624,083 tons to 632,884, and zinc ore and old slag from 49,401 tons to 74,416, and silver ore from 175,225 tons to 334,163; lead ore decreased from 287,664 tons to 182,905. The Yellow Pine mine at Stibnite, Valley County, produced 98 percent of the gold ore mined in Idaho in 1950. Output increased from 610,988 tons in 1949 to 620,800 tons in 1950. About 91 percent of the silver ore, over 99 percent of the zinc ore and old slag, 96 percent of the zinc-lead ore and old tailings, and 95 percent of the lead ore were produced in the Coeur d'Alene region. Placer mining indicated greater activity, and production of gold from this source increased. Sixteen dredges (11 dragline, 4 bucket-line, and 1 suction) recovered 17,087 fine ounces of gold in Idaho in 1950; 13 dredges (7 dragline, 4 bucket-line and 2 suction) recovered 14,761 fine ounces of gold in 1949.

ORE CLASSIFICATION

Details on ore classification are given in the Gold and Silver chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Idaho in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Number of mines [1]	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	38	632,884	55,731	174,878	6,323	11,977	700
Dry gold-silver ore	6	748	862	13,665	241	6,304	
Dry silver ore	16	334,163	809	9,721,043	2,574,359	10,447,901	603,869
Total	60	967,795	57,402	9,909,586	2,580,923	10,466,182	604,569
Copper ore	9	787	9	20,038	89,045	4,911	
Lead ore	41	182,905	805	730,867	117,364	22,700,268	2,014,513
Lead-copper ore	1	4		411	515	400	100
Zinc ore	7	[2] 74,416	14	29,320	9,478	2,309,117	12,549,607
Zinc-lead ore	53	2,074,300	3,858	5,398,836	1,416,075	164,563,322	160,609,911
Zinc-lead-copper ore	1	8	3	653	600	5,800	1,300
Total lode mines	155	[2] 3,300,215	62,091	16,089,711	4,214,000	200,050,000	175,780,000
Gravel (placer operations)	75		17,561	5,308			
Total: 1950	230	[2] 3,300,215	79,652	16,095,019	4,214,000	200,050,000	175,780,000
1949	253	[3] 3,057,075	77,829	10,049,257	2,876,000	158,598,000	153,110,000

[1] Detail will not necessarily add to totals because some mines produce more than 1 class of ore.
[2] Includes 51,366 tons of old lead-smelter slag.
[3] Includes 22,389 tons of old lead-smelter slag.

METALLURGICAL INDUSTRY

Of the 3,300,215 tons of ore produced in Idaho in 1950, 3,231,079 tons (98 percent) were treated at milling plants, and the remaining 69,136 tons (2 percent) were shipped crude to smelters.

In 1950 milling plants treated principally zinc-lead ore and old tailings (2,074,205 tons), gold ore (632,600 tons), silver ore (325,943 tons), lead ore (174,915 tons), and zinc ore (22,841 tons). Current hot lead-smelter slag totaling 143,916 tons was fumed, and 51,366 tons of old dump lead-smelter slag was delivered for smelting and fuming. Metals recovered from the old dump slag were credited to the Bunker Hill smelter dump, and metals recovered from the hot slag were credited to various producers of the ores and concentrates.

The Bunker Hill & Sullivan Mining & Concentrating Co. operated its Bradley lead smelter and refinery throughout the year on ore and concentrates, chiefly from the Coeur d'Alene region. Smelter output in 1950 exceeded that for any of the preceding 20 years. The company also operated its antimony and cadmium plants, 2,000-ton flotation mill (including a sink-and-float unit), 300-ton tailing-treatment plant for recovering silver, iron, lead, and zinc from old jig tailings, and 450-ton zinc slag-fuming plant at Bradley. According to the company annual stockholders' report for 1950, the smelter produced 3,668 ounces of gold, 11,949,907 ounces of silver, 174,428 pounds of cadmium, 1,398 tons of copper, 1,151 tons of antimony, 14,950 tons of zinc, and 75,249 tons of lead. The slag-fuming plant yielded 21,218 tons of deleaded zinc fume and 4,340 dry tons of zinc-lead fume.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Idaho in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Placer	17,561	5,308			
Amalgamation	2,647	1,946

TABLE 8.—Mine production of gold, silver, copper, lead, and zinc in Idaho in 1950, by method of recovery (except placer) and class of material processed, in terms of recoverable metal—Continued

B. For ore and old tailings shipped directly to smelters—Continued

	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
BY CLASS OF MATERIAL						
Dry gold	284	701	2,173	5,723	2,842	----------
Dry gold-silver	198	129	4,028	241	6,304	----------
Dry silver	8,220	194	63,864	5,000	1,882	235
Copper	762	9	20,038	87,745	4,911	----------
Lead	7,990	619	100,845	29,593	2,815,474	115,341
Lead-copper	4	----------	411	515	400	100
Zinc	[1] 51,575	1	24,599	685	2,054,644	9,649,217
Zinc-lead	95	----------	1,299	297	27,240	28,471
Zinc-lead-copper	8	3	653	600	5,800	1,300
Total: 1950	[1] 69,136	1,656	217,910	130,399	4,919,497	9,794,664

[1] Includes 51,366 tons of old lead-smelter slag smelted and fumed.
[2] Includes 22,389 tons of old lead-smelter slag smelted and fumed.

TABLE 9.—Mine production of gold, silver, copper, lead, and zinc in Idaho in 1950, by method of recovery (except placer) and class of material processed, in terms of gross metal content

Class of material	Quantity treated (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
ORE AND OLD TAILINGS TREATED AT MILLS						
Dry gold	632,600	69,027	219,549	980	11,450	1,400
Dry gold-silver	550	850	11,200	----------	----------	----------
Dry silver	325,943	786	9,853,833	3,571,444	11,024,561	908,976
Copper	25	----------	6	1,750	----------	----------
Lead	174,915	317	745,991	130,876	22,834,334	3,788,156

Lead-copper	4		411	606	449	162
Zinc	[1] 51,575	1	24,599	854	2,090,378	12,197,495
Zinc-lead	95		1,299	341	27,932	33,371
Zinc-lead-copper	8	3	653	687	5,915	1,608
Total: 1950	[1] 69,136	1,656	217,910	145,665	5,055,705	12,377,220
1949	[2] 45,460	833	173,528	139,466	4,430,237	6,161,628

[1] Includes 51,366 tons of old lead-smelter slag smelted and fumed.
[2] Includes 22,389 tons of old lead-smelter slag smelted and fumed.

REVIEW BY COUNTIES AND DISTRICTS

BLAINE COUNTY

Little Wood River (Muldoon) District.—Lessees operated the Eagle Bird mine from July to November and produced 758 tons of zinc-lead ore containing nearly 5 ounces of gold, 6,734 ounces of silver, 4,500 pounds of copper, 105,690 pounds of lead, and 99,417 pounds of zinc; the ore was treated in the Combined Metals Reduction Co. flotation mill at Bauer, Utah. The Eagle Bird property also produced 114 tons of lead smelting ore during the year.

Mineral Hill and Camas District.—The Snyder Mining and Development Co. worked the Apache Mines from September through December and treated 3,200 tons of zinc-lead ore in the 100-ton flotation mill at the property. Development of the Snoose mine in Colorado Gulch near Hailey during the last half of 1950 yielded 396 tons of zinc-lead ore, which was shipped to the Bauer mill for treatment. The remaining district output was 216 tons of gold smelting ore shipped from the Camas group, 79 and 8 tons, respectively, shipped from the Donavan Mines and the Treasure Vault property, and small tonnages of zinc-lead milling ore from the Lead Metals mine and the Red Cloud claim.

Warm Springs District.—Production of zinc-lead ore from the Triumph mine of the Triumph Mining Co. decreased from 49,014 tons in 1949 to 44,846 in 1950. All the ore, containing 4,161 ounces of gold, 625,572 ounces of silver, 286,835 pounds of copper, 6,268,451 pounds of lead, and 3,167,007 pounds of zinc, was shipped to Bauer, Utah, for treatment. Development at the Homestake mine during the summer yielded 41 tons of zinc ore and 26 tons of zinc-lead ore, which was treated at smelters in Utah. Remaining district production in 1950 came from zinc and zinc-lead ore shipped from the Red Top property and a claim worked by L. B. & J. B. Hall.

BOISE COUNTY

Boise Basin District (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—The chief producer in the district in 1950 was the Idaho-Canadian Dredging Co., which operated its 6-cubic-foot bucket-line dredge on Moores Creek near Idaho City from March 24 through the remainder of the year, treating 960,000 cubic yards of gravel. Small-scale hand methods at 15 placers recovered 47 ounces of gold and 5 of silver and suction dredging 15 ounces of gold and 4 of silver. Lode output for the district in 1950 consisted of 18 tons of lead smelting ore from the Come-Back mine; small tonnages of gold ore treated by amalgamation at the Sunshine group, the Red Rose, and five other properties; and gold ore shipped to smelters from the Gold Hill, Granite Creek, and the Hildamae mines.

Grimes Pass District.—Hydraulicking of gravels at the J. S. placer in April and May recovered 67 fine ounces of gold and 21 of silver.

BONNER COUNTY

Clark Fork District.—The largest operation in the district in 1950 was the Whitedelf mine, worked by lessees during the entire year. A total of 740 tons of lead ore was milled in a 75-ton flotation mill at the mine. Other production in the district included 170 tons of lead milling ore and 152 tons of lead smelting ore from the Hope mine and 6 tons of lead smelting ore from the Lawrence group.

Lakeview District.—The Weber mine was worked during most of the year, and 8,062 tons of high-siliceous silver ore was shipped to the smelter at Tacoma, Wash. Approximately 240 tons of silver ore from the Idaho-Lakeview property was treated at a custom flotation mill. Remaining district output came from 7 tons of silver smelting ore produced at the Keep Cool claim.

Pend d'Oreille District.—Output in 1950 comprised 6 tons of copper smelting ore from the Brown Bear property and 2 tons of silver ore from the Katherine claim.

BOUNDARY COUNTY

Moyie Yahk District.—Zinc-lead ore from the Regal claim was milled during the year and yielded 29 tons of lead concentrate and 14 of zinc concentrate.

Port Hill District.—Lessees operated the Idaho-Continental mine and shipped 273 tons of lead smelting ore during the year.

BUTTE COUNTY

M. C. Settles worked the Wilbert mine in the Dome district a few months in 1950 and shipped 13 tons of lead ore to a smelter in Utah.

CAMAS COUNTY

Lessees (J. R. Davies & Sons) operated the Princess-Blue Ribbon mine near Fairfield in 1950 and shipped 30 tons of lead smelting ore to a smelter in Utah.

CASSIA COUNTY

Blackpine District.—Ore treated by cyanidation at the Gem group by the Duvall Co. yielded 259 ounces of gold and 10 of silver. A small tonnage of lead smelting ore was shipped from the Old Dominion mine during the year.

TABLE 10.—Mine production of gold, silver, copper, lead, and zinc in Idaho in 1950, by counties and districts, in terms of recoverable metal

CLARK COUNTY

Birch Creek District.—Output in 1950 consisted mainly of 181 tons of copper ore produced from the Valley View mine.

CUSTER COUNTY

Alder Creek District.—Lessees operated the Homestake mine throughout the year and produced lead and zinc smelting ore, which was shipped to Utah for treatment. The remainder of the district output was 75 tons of lead smelting ore shipped from the Horseshoe mine, 4 miles west of Mackay.

Bayhorse District.—Zinc-lead ore from the Clayton mine, owned by the Clayton Silver Mines, continued to be the most important production in the district. The company reported that 30,749 tons of ore treated in its 120-ton flotation mill yielded 1,745 tons of lead concentrate and 630 of zinc concentrate. The concentrates contained 32 ounces of gold, 114,044 ounces of silver, 20,869 pounds of copper, 2,391,666 pounds of lead, and 830,859 pounds of zinc. According to the annual stockholders' report, the outstanding feature of company operations in 1950 was development of the North ore shoot on the new 400 level. Although the northern limit of the ore body on the 400 level was not determined, the part developed during the year was 280 feet long and over 40 feet wide. The company reports that stoping in this area has produced the best grade of ore yet found in the property.

Most of the remainder of the district output comprised 3,457 tons of lead ore from the Red Bird mine, 53 tons of copper smelting ore from the Ramshorn and Beardsley groups, and small tonnages of lead smelting ore from the Last Chance group, St. Joe, South Butte, and Turtle mines.

Boulder District.—Livingston Mines, Inc., operated its mine near Clayton 3 months of the year and shipped 50 tons of ore containing 1 ounce of gold, 1,158 ounces of silver, 19,600 pounds of lead, and 4,400 pounds of zinc to Montana and Utah smelters.

Seafoam (Greyhound) District.—District output in 1950 comprised 2 tons of zinc-lead ore from the Hard Scrabble mine and 7 tons of lead smelting ore from a property operated by Carl Anderson of Stanley, Idaho.

Yankee Fork District.—Placer gold continued to be the most important output in the Yankee Fork district. Principal placer operations included the Jordan Placers, Inc., dragline and nonfloating washing plant on Jordan Creek and the Warren Dredging Co. bucketline dredge on the Yankee Fork placer. The lode output of the district consisted of gold ore from the Gold Star lode and the Lucky Boy and Peak claims.

ELMORE COUNTY

Bear Creek (Rocky Bar) District.—Total district output in 1950 was derived from amalgamation of gold ore produced at the Empire and Independence properties.

Middle Boise (Atlanta) District.—Gold ore from the Boise-Rochester group operated by the Talache Mines, Inc., continued to be the principal production from the Middle Boise district. The company operated the group and its 400-ton amalgamation and concentration mill throughout the year and produced 8,825 tons of gold ore, which yielded 5,325 ounces of gold and 34,292 of silver. Other district output included gold ore treated by amalgamation at the Golden Stringer claim and gold-silver smelting ore shipped from the Tahoma lode.

GEM COUNTY

Gold ore from the Dewey group at Pearl and the Old Man property, both in the West View district, was the only output in Gem County in 1950. The Gem State Consolidated Mines, Inc., operated the Dewey property throughout the year and treated 890 tons of gold ore in a 25-ton amalgamation and concentration mill at the property. The mill proved defective during the year and was returned to the manufacturer in August. Most of the gold ore produced at the Old Man mine was treated by amalgamation and concentration, but a small tonnage was shipped to a Utah smelter for treatment.

IDAHO COUNTY

Burgdorf-Marshall Lake District.—The only output in the Burgdorf-Marshall Lake district in 1950 was 95 ounces of gold and 21 of silver recovered by hydraulicking and sluicing at the Golden Rule claim.

Dixie District.—Harry L. Bracken worked the Dixie placers during the summer months and recovered 52 ounces of gold and 10 of silver. A small quantity of gold smelting ore was shipped during the year from the Haystack and Skyhigh mines.

Elk City District.—Output in the Elk City district in 1950 consisted exclusively of placer gold and silver from eight properties. The principal producer continued to be the Warren Dredging Corp., which operated a bucket-line dredge on the Wild Rose group. A dragline and floating washing plant were operated on the American River by the Tyee Mining Co. from April to October. Gold and silver recovered from bucket-line-dredge operations of the H. & H. Mines, Inc., on Red Horse Creek were shipped to the Seattle Assay Office. The remainder of the district gold output came from five small-scale ground-sluicing operations.

Lower Salmon River District.—Gold and silver were recovered during the year from placer operations on the Sunshine and Lone Pine claims.

Ten Mile District.—In 1950 five lode mines and three placer mines were worked in the Ten Mile district. Brown, Karr & McHargue operated a dragline and floating washing plant on the South Fork of Clearwater River from April 10 to November 11; 172,000 cubic yards of gravel were treated, yielding 1,378 ounces of gold and 263 of silver. Placer gold and silver were also recovered from the Kleesattel and Twin Meadows claims. Most of the remaining district production came from gold ore amalgamated and concentrated at the Bob and New York mines and gold ore amalgamated at the Lone Pine and Wonder properties.

LATAH COUNTY

Placer gold and silver from the Wawawai claim and operations on the North Fork of the Palouse River were the only output in 1950 in Latah County. The Behrens Bros. operated a dragline and dry-land washing plant on the North Fork of the Palouse River from June 15 to September 1 and produced 328 ounces of gold and 18 of silver from 64,000 cubic yards of gravel.

LEMHI COUNTY

Birch Creek District.—Lessees worked the Cabin mine from May to November and shipped lead smelting ore to Utah and Montana for treatment.

Blue Wing District.—The Bradley Mining Co. operated its Ima and Mazda property on Patterson Creek, 1 mile east of Patterson, throughout the year. The 150-ton concentrator at the property treated 21,914 tons of ore containing 35,832 ounces of silver and 10,429 pounds of tungsten (WO_3), as well as a little copper and lead. Lead-silver-copper concentrate (701 tons) was shipped to a smelter in Utah and tungsten concentrate (nearly 160 tons) to various destinations.

Indian Creek District.—The Sage Creek Lumber Co. operated the Sage Creek mine from February 1 through March 15 and amalgamated 350 tons of gold ore in a 25-ton mill built on the property in 1950; 75 ounces of gold and 11 of silver were recovered during operation of the mill.

Junction District.—In 1950 two mines—Blue Jay and Owl & Owl—produced 54 tons of ore containing 411 ounces of silver, 9,917 pounds of copper, 449 pounds of lead, and 162 pounds of zinc, which were shipped to a smelter in Montana.

Nicholia District.—Asa W. Reid operated the Nicholia group 7 months of the year and shipped 234 tons of lead ore to a smelter in Utah; the ore contained 1 ounce of gold, 1,391 ounces of silver, 633 pounds of copper, 138,582 pounds of lead, and 17,866 pounds of zinc.

Spring Mountain District.—Total district output in 1950 consisted of 26 tons of lead ore containing 1 ounce of gold, 126 ounces of silver, 157 pounds of copper, 6,751 pounds of lead, and 574 pounds of zinc, which were shipped to smelters in Utah.

Texas District.—Joe Hamilton continued to operate his Hill Top mine near Gilmore and shipped 2,713 tons of lead ore containing 448 ounces of gold, 39,901 ounces of silver, 27,148 pounds of copper, 922,397 pounds of lead, and 13,610 pounds of zinc. The remaining district output consisted of lead smelting ore shipped from the Latest Out and Valley View mines.

OWYHEE COUNTY

Carson or French (Silver City) District.—Two lode mines and two placer mines operated in the district in 1950. Most of the lode output was from 28 tons of gold-silver ore shipped from the South Central claim to smelters in Utah. Ground sluicing on the Lewis group placer during part of the year yielded 20 ounces of gold and 19 of silver.

South Mountain District.—District output in 1950 consisted of 464 tons of copper smelting ore from the South Mountain mine, which was shipped to Utah for treatment.

SHOSHONE COUNTY—COEUR D'ALENE REGION

The value of the metal output of the region was $64,555,947 (92 percent of the State value), an increase of $13,856,023 from 1949. The region remained the largest silver-producing area in the United States and ranked second in lead and zinc; it produced 94 percent of Idaho's silver in 1950, 90 percent of the copper, 95 percent of the lead, and 98 percent of the zinc. The chief zinc-producing properties in the region in 1950, according to rank, were the Star, Page, Morning, Bunker Hill & Sullivan, Sidney, Frisco, Bunker Hill & Sullivan slag dump, Spokane-Idaho, Tamarack, and Liberal King mines. The chief lead-producing properties, according to rank, were the Bunker Hill & Sullivan, Page, Star, Morning, Sherman, Dayrock, Sidney, and Frisco. The chief producers of silver, according to rank, were the Sunshine, Bunker Hill & Sullivan, Polaris, Silver Summit, and Silver Dollar properties.

Of the total material (2,542,169 tons) produced in 1950 in the Coeur d'Alene region, 78 percent was zinc-lead ore and old tailings, 12 percent silver ore, 7 percent silver-lead ore, and 3 percent zinc ore and lead-smelter slag.

TABLE 11.—Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1946–50, and total 1884–1950, in terms of recoverable metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer, fine ounces)	Silver (lode and placer, fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
	Lode	Placer							
1946	56	1	2,559,636	1,758	5,655,672	1,619,000	113,096,000	134,858,000	$33,673,731
1947	61	4	2,957,143	2,808	9,234,906	2,624,000	146,120,000	158,502,000	49,226,932
1948	65	7	3,165,780	3,362	10,598,338	2,775,000	165,174,000	167,601,000	62,168,955
1949	61	1	2,282,614	2,438	9,146,146	2,341,000	148,304,000	148,739,200	50,699,924
1950	57	2	2,542,169	3,416	15,056,131	3,791,000	189,394,000	172,205,000	64,555,947
Total 1884–1950	-----	-------	(1)	405,090	476,322,945	[2] 71,131	[2] 5,856,563	[2] 1,520,391	1,349,577,140

[1] Figure not available.
[2] Short tons.

Beaver District.—The principal district output in 1950 was zinc-lead ore from the Monitor group (Carlisle, Interstate, Silver Tip, and Amazon) worked by the Day Mines, Inc., in January and July through December; the ore was treated in the Carlisle 500-ton flotation mill near Wallace. Lessees worked the Parrott mine, owned by the Day Mines, Inc., and hauled 4,702 tons of zinc-lead ore to the Rex flotation mill near Wallace. Zinc-lead ore was produced during the year by lessees working the Blue Grouse property, also owned by the Day Mines, Inc. The Sunset Lease (a partnership in which Day Mines, Inc., has a 70-percent interest) was operated intermittently during the year by sublessees, and 4,355 tons of zinc-lead ore was hauled to custom mills in the Wallace area. Zanetti Bros. operated the waste dumps at the Sunset property and at the Interstate group; ore was treated at the Rex mill. Zinc-lead ore was also shipped by the Zanetti Bros. from the Interstate-Callahan group, operated under lease from the Day Mines, Inc.

Evolution District.—The principal operation in the district in 1950 was by the Sunshine Mining Co. The company reported that 251,877 tons of ore from the Sunshine and Chester veins was treated in its 1,350-ton flotation mill, yielding 20,331 tons of lead-silver concentrate containing 8,114,321 ounces of silver, 2,188,393 pounds of copper 10,556,621 pounds of lead, and some zinc and gold. A small quantity of copper-silver concentrate was produced also. In addition to the Sunshine Mining Co. ore, the mill treated ore from properties of the Polaris Mining Co., Silver Syndicate, Inc., Silver Dollar Mining Co., and Metropolitan Mines Corp. Development reported by the Sunshine Mining Co. in 1950 included 2,763 feet of raising, 3,886 of drifting, 3,773 of crosscutting, and 583 of diamond drilling.

Lessees worked the Big Creek tailing deposit intermittently during the year and hauled 3,908 tons of old zinc-lead tailings to the Zanetti Bros. mill at Osburn. A total of 108 tons of concentrates was produced, which contained 1 ounce of gold, 3,604 ounces of silver, 2,400 pounds of copper, 74,908 pounds of lead, and 54,454 pounds of zinc. Zanetti Bros. continued to work the DeBlock tailing deposit at the mouth of Lake Gulch and hauled old zinc-lead tailings to its mill at Osburn. A substantial quantity of similar material from the Osburn tailings was also treated.

According to the annual report of the Coeur d'Alene Mines Corp. for 1950, operations at the Mineral Point mine were mainly development, exploration, and maintenance. The only ore mined and treated was 2,020 tons containing 29,204 ounces of silver, 18,584 pounds of copper, and a little antimony and gold.

Hunter District (Mullan).—The Star mine of the Sullivan Mining Co. continued to be the principal producer in the Hunter district and in 1950 ranked first in the production of zinc and third in lead in Idaho. The company operated the mine and its 1,000-ton flotation mill all year and treated 267,259 tons of zinc-lead ore, yielding 10,065 tons of lead concentrate and 43,571 of zinc concentrate, which together contained 183 ounces of gold, 256,158 ounces of silver, 145,711 pounds of copper, 16,530,639 pounds of lead, and 46,207,581 pounds of zinc.

The Morning mine and 1,200-ton flotation mill of the Federal Mining & Smelting Co. at Mullan were operated continuously and at a higher rate than in 1949. The company reported that 107,890 tons of mine ore were treated in 1950 compared with 87,757 in 1949; the ore contained an average of 2.03 ounces of silver to the ton, 6.53 percent lead, and 8.46 percent zinc.

The Lucky Friday Silver-Lead Mines Co. continued to work its Lucky Friday mine during 1950 and hauled 14,971 tons of zinc-lead ore to the Golconda custom flotation mill for treatment. Other important producing properties in the district included the Golconda, Gold Hunter, Lucretia mines, and Morning tailings.

Lelande District (Burke, Mace, Frisco).—The lower levels of the Frisco mine were worked by the Federal Mining & Smelting Co. and the upper levels by the Hull Lease. From the lower levels, 84,907 tons of zinc-lead ore (containing an average of 1.35 ounces of silver to the ton, 4.32 percent lead, and 6.12 percent zinc) were hauled to the Morning mill at Mullan for treatment. From the upper levels, the Hull Lease treated in its own 90-ton flotation mill 21,441 tons of ore, containing an average of 0.41 ounce of silver to the ton, 0.92 percent lead, and 9.44 percent zinc. The Day Mines, Inc., operated its Sherman mine and 300-ton flotation mill near Burke at a slightly lower rate than in 1949. Development during the year included 2,298 feet of drifting. The Day Mines, Inc., also worked its Hercules mine throughout the year; ore was treated in the Sherman mill. The remainder of the district output was mainly zinc-lead ore milled from the N. P. Lease, Black Bear & Black Bear Fraction and Hecla mines, and zinc-lead old tailings from the Canyon Creek tailing deposit.

Placer Center District.—The principal producer of ore in the district in 1950 was the Tamarack mine of Day Mines, Inc. The property was worked throughout the year, and ore produced was treated in the Tamarack 400-ton flotation mill at Dorn. Day Mines, Inc., also operated its Dayrock mine and 250-ton flotation mill at Bunn. Zanetti Bros. worked the Nine Mile tailing deposit on Nine Mile Creek from September through December and shipped the material to their mill at Osburn. The remaining district production in 1950 consisted of lead ore from the Galena mine and zinc-lead ore from the Success group and Tamarack No. 5 mines.

Summit District (Murray).—Zinc ore milled from the Terrible Edith group, worked by lessees during the latter part of 1950, yielded 68 tons of concentrates containing, in terms of recoverable metal, 147 ounces of silver, 300 pounds of copper, 16,800 pounds of lead, and 63,500 pounds of zinc.

Yreka District (Kellogg).—The Bunker Hill & Sullivan mine at Kellogg continued to be the most important producer of ore in the district and the largest producer of lead in the State; it ranked second in silver and fourth in zinc. The daily capacity of the company's main flotation mill, which is equipped with a sink-and-float unit, was increased during the year from 2,000 tons to 3,000. According to the company annual report to stockholders, development and prospecting of the Bunker Hill mine were continued throughout the year, with satisfactory results. The extent of the new high-grade lead-silver ore body on the Bunker Hill No. 17 level was determined and is now considered by the company to be of first importance. This ore body has been found, in part, on No. 18 level. The Gordon crosscut from the Main No. 1 shaft on the lowest mine level disclosed what is believed to be the Emery vein, first of the expected ore occurrences on No. 25 level.

Ore reserves fully developed and ready for mining January 1, 1951, totaled 3,014,476 tons of zinc-lead-silver ore, an increase of 51,392 tons from January 1, 1950. The zinc slag-fuming plant of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley ran continuously throughout 1950. During the year the plant received 143,916 tons of current hot slag from the lead furnaces of the Bunker Hill smelter at Bradley; the resulting zinc-lead fume (4,340 tons) was sent to the Bunker Hill lead smelter, and the zinc fume (21,218 tons) was shipped to smelters in Kansas and Texas. John George continued leasing operations in the upper levels of the Bunker Hill mine and treated about 15,000 tons of lead ore in his mill.

Production of zinc-lead-silver ore from the Page mine of the Federal Mining & Smelting Co. increased from 154,230 tons in 1949 to 159,663 in 1950. The ore, treated in the Page 500-ton flotation mill, contained an average of 3.56 ounces of silver to the ton, 7.03 percent lead, and 6.37 percent zinc. The mine ranked second in lead and zinc production in Idaho in 1950. Development completed during the year included 271 feet of shaft sinking, 2,588 feet of drifting, and 1,490 feet of crosscutting.

The Sidney Mining Co. operated its Sidney mine and 300-ton flotation mill throughout 1950. Production of zinc-lead-silver ore increased from 63,499 tons in 1949 to 85,731 in 1950; the ore contained an average of 2.17 ounces of silver to the ton, 4.95 percent lead, and 8.89 percent zinc. The Highland-Surprise Consolidated Mining Co. worked its mine on Stewart Creek continuously during the year.

Zinc-lead ore treated in the company 300-ton flotation mill dropped from 52,255 tons in 1949 to 32,100 in 1950. Mining and milling of zinc-lead ore from the Spokane-Idaho mine on Pine Creek were continuous throughout the year. The company 175-ton flotation mill treated 60,902 tons of zinc-lead ore in 1950 compared with 50,623 in 1949. The Sunset Minerals, Inc., operated the Liberal King mine on Pine Creek all year and treated about 32,000 tons of ore in its 100-ton flotation mill. Production of zinc-lead ore from the Little Pittsburgh mine on Denver Creek increased from 15,726 tons in 1949 to 21,104 in 1950. Most of the remainder of the district output came from zinc-lead ore from the Idaho, Nabob, and Senator Stewart mines.

VALLEY COUNTY

Deadwood Basin District.—Output in 1950 was 8 tons of zinc-lead-copper ore produced from the Deadwood mine.

Yellow Pine District.—The Bradley Mining Co. operated its Yellow Pine mine and 2,200-ton flotation mill at Stibnite all year. The company reported that in 1950 the mill treated 620,800 tons of ore containing 61,764 ounces of gold, 177,594 ounces of silver, and 7,495,112 pounds of antimony. The antimony and gold concentrates produced contained 48,472 ounces of gold, 137,073 ounces of silver, and 5,926,279 pounds of antimony.

WASHINGTON COUNTY

Heath District.—Total district output for 1950 consisted of 44 tons of lead ore, shipped to a smelter in Utah, from the Lead Zone Mining Co. property in Edna Mae Gulch.

Washington District.—The Silver Still Mining Co. operated its property on Dennet Creek from April through December 15 and shipped 139 tons of silver smelting ore containing 2 ounces of gold, 3,191 ounces of silver, 5,167 pounds of copper, and 2,136 pounds of lead to a smelter in Utah.

Missouri, Oklahoma, Kansas, and Arkansas

Silver, Copper, Lead, and Zinc

(MINE REPORT)

By F. F. Netzeband and Alice Feltch

GENERAL SUMMARY

MINE production of zinc and lead ores in the Tri-State district of Kansas, Oklahoma, and southwestern Missouri fluctuated over a wide range during 1950, reflecting the impact of world conditions on marginal producing areas. Tri-State production lagged during the first quarter of 1950, following similar conditions in the last quarter of 1949. Acceleration of the Government stockpiling program and the Korean War improved the demand for zinc, however, and resulted in higher concentrate prices during the remainder of the year.

Lead production in southeastern Missouri remained fairly uniform throughout 1950, increasing 6 percent over 1949. Silver recovery, a byproduct of the lead production from this region, increased 91 percent in 1950 over 1949, while copper, also a lead byproduct, increased 19 percent.

Zinc concentrate prices increased consistently from March 1950 to the year end, varying from a minimum of $55 to a high of $115 per ton, established in September and maintained for the remainder of the year. Erratic demand kept the price of lead declining until March, when a low of $126.07 per ton of concentrate was reached. A maximum of $218.42 was reached in October, and the price was sustained at that level until the year end.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

TABLE 2.—Mine production of silver, copper, lead, and zinc in Arkansas, Kansas, Missouri, and Oklahoma in 1946–49 and in 1950, by States, in terms of recoverable metal [1]

	Mines producing	Material sold or treated		Silver	
		Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value
1946	269	13, 831, 590	10, 178, 620	69, 401	$56, 076

TABLE 3.—Mine production of silver, copper, lead, and zinc in Arkansas, Kansas, Missouri, and Oklahoma in 1950, by months, in terms of recoverable metal

Month	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	22, 572	301	13, 662	5, 684
February	22, 309	259	13, 566	5, 721
March	21, 515	290	14, 901	6, 167
April	19, 744	230	13, 513	5, 488
May	20, 933	279	14, 143	6, 453
June	20, 716	240	14, 527	7, 277
July	19, 899	246	13, 617	6, 860
August	21, 604	263	13, 716	7, 413
September	20, 414	202	13, 467	7, 449
October	20, 269	219	13, 445	8, 117
November	12, 273	245	13, 298	7, 970
December	14, 025	208	12, 991	7, 513
Total: 1950	236, 273	2, 982	164, 846	82, 112
1949	123, 413	3, 670	157, 153	79, 378

Silver.—Silver is recovered as a byproduct in the smelting of southeastern Missouri lead concentrates and smelter residues. All of the lead concentrates are not desilverized, and only the silver that is recovered is recorded in this report. Some silver is also obtained from a lead-copper concentrate which is recovered in the copper processing.

Of the silver produced in 1950, 229,235 fine ounces was recovered from lead smelting and 7,038 fine ounces from lead-copper concentrate reduction. A total of 123,413 fine ounces was recovered in 1949.

Copper.—Copper production in southeastern Missouri amounted to 2,982 tons in 1950 compared with 3,670 tons in 1949. This copper was recovered from both byproduct matte and lead-copper concentrates.

Lead.—Lead production, in terms of recoverable metal, from mines in the four-State area of Arkansas, Kansas, Missouri, and Oklahoma amounted to 164,846 tons in 1950 compared with 157,153 tons in 1949. Of the 1950 total, 133,680 tons (81 percent) originated in the southeastern Missouri region; 31,157 tons (19 percent) in the Tri-State district of southwestern Missouri, Kansas, and Oklahoma; and 9 tons

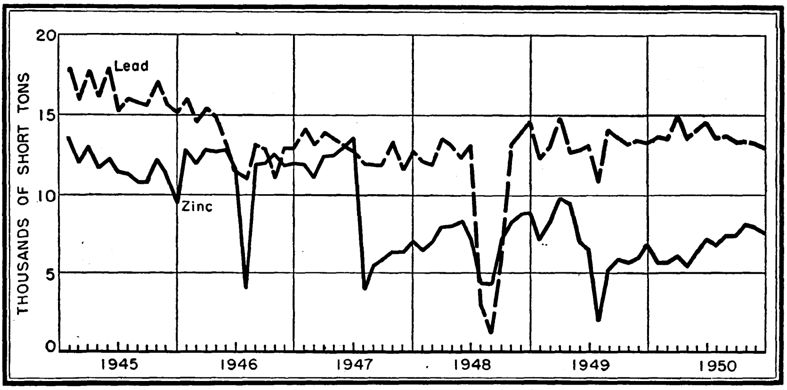

FIGURE 1.—Mine production of lead and zinc in Arkansas, Kansas, Missouri, and Oklahoma, 1945–50, by months, in terms of recoverable metal.

in Arkansas. In 1949 southeastern Missouri produced 126,269 tons, the Tri-State district, 30,883 tons, and Arkansas, 1 ton.

Zinc.—Zinc production from mines in the four-State area of Arkansas, Kansas, Missouri, and Oklahoma was, in terms of recoverable metal, 82,112 tons in 1950 compared with 79,378 tons in 1949. The Tri-State district (Oklahoma, Kansas, and southwestern Missouri) accounted for 80,558 tons (98 percent) of the recoverable zinc production for the four-State area, and southeastern Missouri for 1,546 tons (2 percent). Arkansas produced 8 tons during 1950. In 1949 the Tri-State district produced 78,628 tons of recoverable zinc; southeastern Missouri, 749 tons; and Arkansas, 1 ton.

MINING AND METALLURGICAL INDUSTRY

Zinc-lead mining operations during 1950 in the Tri-State district of southwestern Missouri, Kansas, and Oklahoma yielded 4,700,698 tons of ore, 5 percent more than the 4,470,778 tons produced in 1949. Re-treatment of tailings in the district declined nearly 40 percent in 1950 compared with 1949, Kansas production assuming the greatest portion of the decline. Exploratory drilling by private industry and the Bureau of Mines continued in the district on a reduced scale. Two hundred and fifty-five mines and 17 mills operated during the year; some were on a curtailed basis during the first half due to low concentrate prices of both zinc and lead.

Mine production in the southeastern Missouri disseminated-lead belt in 1950 continued at the same rate as that of 1949. There were 7,091,257 tons of ore mined in 1950, while 7,066,443 tons were produced in 1949. Nine mines and six mills accounted for the 1950 production.

All the ore produced in the region was concentrated by means of gravity and flotation methods. Custom mills remained an important factor in the industry, processing the ores from numerous small operations. These concentrates were shipped to smelters in Pennsylvania, Illinois, Missouri, Kansas, Oklahoma, and Texas. Lead smelters and refineries active in the region were the St. Joseph Lead Co. plant at Herculaneum, Mo., and the Eagle-Picher Mining & Smelting Co. plant at Galena, Kans. Zinc retort smelters active in the region were the Athletic Mining & Smelting Co., Fort Smith, Ark.; Blackwell Zinc Co., Blackwell, Okla.; Eagle-Picher Mining & Smelting Co., Henryetta, Okla.; and National Zinc Co., Inc., Bartlesville, Okla.

ORE CLASSIFICATION

Table 4 classifies the combined ore and old tailings produced in Arkansas, Kansas, Oklahoma, and Missouri in a manner comparable to the classes shown in the tables on ore classification in the other chapters devoted to mining in the Western States. The basis for classification is given in the gold and silver chapter of this volume. Additional details on the tenor of ore and old tailings milled and the concentrates produced in Kansas, Missouri, and Oklahoma are given in tables in the Tri-State District and Review by States sections that follow. Such tables are omitted for Arkansas because only small-scale, intermittent mining of lead and zinc was done there from 1918 through 1950.

TABLE 4.—Mine production of silver, copper, lead, and zinc in Arkansas, Kansas, Missouri, and Oklahoma in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Number of mines	Material sold or treated (short tons)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
Lead ore [1]	18	7,092,585	236,273	2,982	133,726	1,547
Zinc ore [2]	92	1,819,906			1,473	22,509
Zinc-lead ore	145	3,847,432			29,647	58,056
Total: 1950	255	12,759,923	236,273	2,982	164,846	82,112
1949	232	13,139,847	123,413	3,670	157,153	79,378

[1] Includes lead-copper ore from one mine; also 1,025,502 tons of old tailings remilled, concentrates from which were mixed with those from crude ore.

[2] Includes 967,926 tons of old tailings yielding 2,162 tons of recoverable zinc and 32 tons of recoverable lead.

TRI-STATE DISTRICT

The marginal mine production of the Tri-State district reflected domestic and world conditions as they affected the industry. Production lagged during the first quarter of 1950 when concentrate prices were low. In the second quarter, zinc prices improved, while lead prices remained low, causing district ore production to increase about 5 percent. In the last half of the year, when concentrate prices for both zinc and lead kept increasing, mine production was about 31 percent greater than in the first half, with the result that the full year's production was somewhat greater than that of 1949.

In 1950 the district produced 150,019 tons of zinc concentrates valued at $13,934,927 and 40,714 tons of lead concentrates valued at $6,245,660, for a combined production of 190,733 tons valued at $20,180,587. The district zinc production, in terms of recoverable metal, was 80,558 tons, while lead production was 31,157 tons. Zinc concentrate produced in 1949 amounted to 147,178 tons and lead concentrate, 41,471 tons, with recoverable content of 78,628 tons of zinc metal and 30,883 tons of lead.

TABLE 5.—Mine production of lead and zinc concentrates in the Tri-State district (Kansas, Oklahoma, and Southwestern Missouri), 1946–50

Year	Material milled (short tons)	Concentrates produced (short tons)		Concentrate recovery (percent)		Average assay of concentrates (percent)		Average value per ton of concentrates	
		Lead	Zinc	Lead	Zinc	Lead	Zinc	Lead	Zinc
FROM CRUDE ORE									
1946	8,271,512	30,468	224,910	0.37	2.72	77.40	59.88	$164.81	$116.15

DISTRICT TOTAL									
1946	18,450,132	30,650	258,705	0.17	1.40	77.23	59.71	164.37	116.27
1947	11,970,161	32,006	204,068	.27	1.70	77.25	59.53	190.30	106.79
1948	6,910,093	35,862	159,609	.52	2.31	76.53	59.04	231.51	87.27
1949	6,073,398	41,471	147,178	.68	2.42	75.98	59.36	188.68	77.76
1950	5,668,624	40,714	150,019	.72	2.65	78.08	59.66	153.40	92.89

Production from old tailings continued to decline sharply in 1950, the total treated being 40 percent less than in 1949. The 967,926 tons of old tailings yielded 4,218 tons of zinc concentrates and 55 tons of lead concentrates with a total value of $367,980 and accounted for 2,162 tons of recoverable zinc and 32 tons of recoverable lead.

[1] Increased smelting charge of $1.25.

The five principal zinc producers in the Tri-State district in 1950, in order of output, were: Eagle-Picher Mining & Smelting Co. (Oklahoma and Kansas); Nellie B. Mining Co. (Oklahoma); National Lead Co., St. Louis Smelting & Refining Division (Kansas); Federal

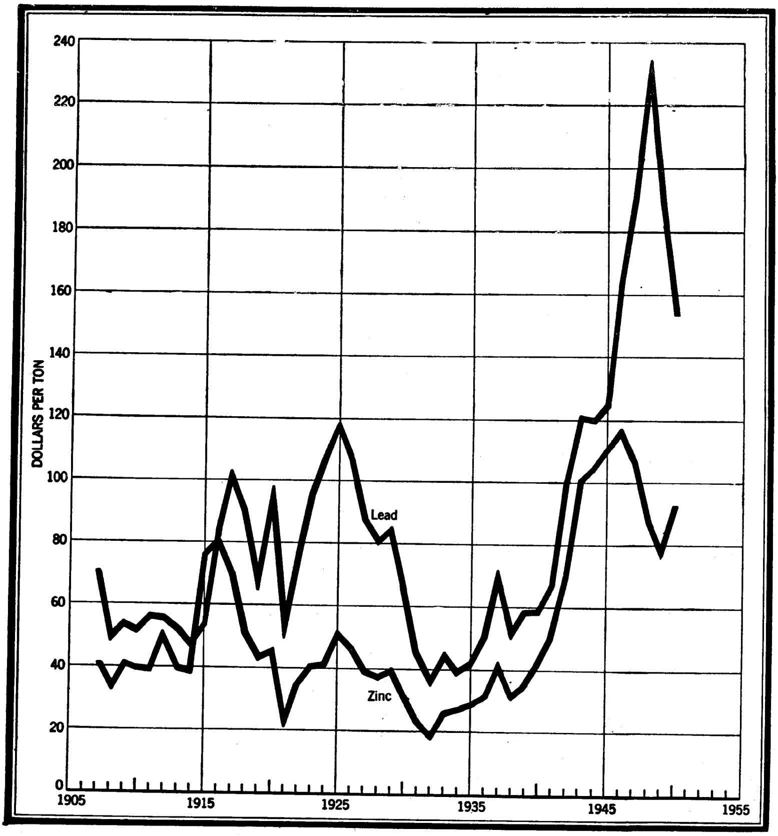

FIGURE 2.—Average prices received by sellers per ton of concentrate in the Tri-State district, 1907–50.

Mining & Smelting Co. (Oklahoma and Missouri); and Dale Mining Co. (Missouri). The five principal lead producers were as follows: Eagle-Picher, Nellie B., National, Federal, and W. M. & W. Mining Co. (Oklahoma).

In December of 1950 there were 16 mine mills, 1 tailings mill, and 3 clean-up mills operating, while 18 mine mills, 1 tailings mill, and 1 clean-up mill were operating during December 1949. About 80 mines were operating in December 1950 compared with 85 in December 1949; in addition to these, however, many small mines were active for only short periods during the year. The crude ore was hoisted from approximately 135 shafts, ranging in depth from 50 to 450 feet. Several open-pit operations continued during the year, and this mode

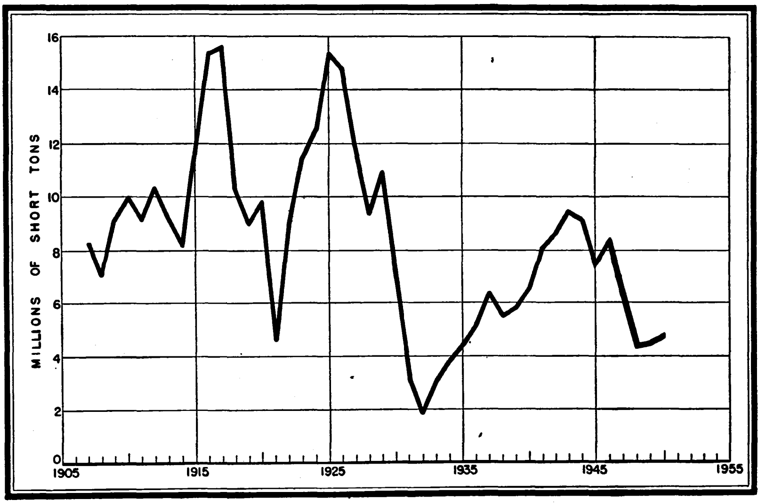

Figure 3.—Quantity of crude ore (rock) milled in the Tri-State district, 1907–50.

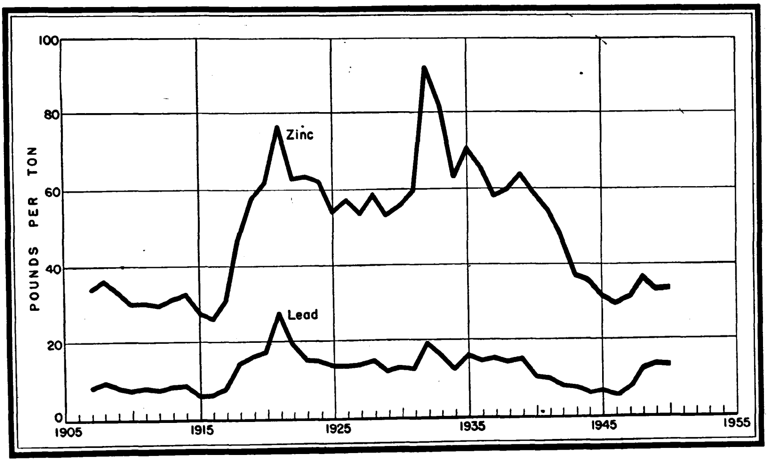

Figure 4.—Metal recovered per ton of crude ore (rock) milled in the Tri-State district, 1907–50.

of mining seemed destined to become a larger factor in the district operations.

Prospecting and development programs were limited in the Tri-State district during 1950. The Federal Bureau of Mines continued churn drilling in the Melrose, Kans., area and at the Canyon Diggings in Newton County, Mo. Private drilling programs on record were Eagle-Picher, Federal, Carl McDonald at Leigh, Mo., Dale Mining Co. at Stark City, Mo., and F. W. Evans at Alba, Mo.

The Federal Mining & Smelting Co. purchased 5,000 acres of lands and mining leases and three mills (Jasper, Snapp, and Northside) from George W. Potter, Joplin mine operator, early in 1950 in the largest single transfer in the district. All this property was in the Joplin area. Federal also sold five mines (Buffalo, Maxine, Walker, Rainbow, and Donna Jane) to Fred Childress & Sons. These mines lie about 1 mile east of Picher, Okla. Potter & Sims later subleased the Snapp property from Federal and began open-pit operations on this tract, treating the ore at the Snapp mill.

St. Louis Smelting & Refining Division of National Lead Co. completed mechanization of its Baxter Springs, Kans., plant with the installation of additional high-capacity loaders and Diesel-powered trucks. Its Hartley No. 8 shaft was deepened to accommodate a 300-ton skip pocket, a new steel-head frame, and a 5-ton skip installed to handle the additional tonnage.

REVIEW BY STATES

MISSOURI

Missouri was again the principal lead-producing State in 1950, a rank it has maintained for 43 consecutive years. The 1950 annual production, amounting to 134,626 tons of recoverable lead, was 6 percent greater than the 1949 production of 127,522 tons. The major portion of this lead production—133,680 tons of recoverable lead—came from the southeastern disseminated-lead belt in St. Francois and Madison Counties, with a considerable volume also originating in the southwestern Missouri part of the Tri-State area. Production of zinc likewise showed a substantial increase over 1949. The 1950 production of 8,189 tons of recoverable zinc was nearly 39 percent greater than that of 1949. Silver and copper were also recovered as byproducts of the smelting of lead and lead-copper concentrates from this region.

Southeastern Missouri.—The 1950 output of 133,680 tons of recoverable lead from this important mining region showed a 6-percent gain over the 1949 output of 126,269 tons. Zinc production amounting to 1,546 tons of recoverable metal more than doubled 1949 output of 749 tons. St. Joseph Lead Co., the Nation's largest producer of lead, operated its group of mines and four mills (Bonne Terre, Desloge, Federal, and Leadwood) in St. Francois County throughout the year and supplied the major portion of the region's production. These mills have a combined daily capacity of 26,800 tons. Mineral separation is by gravity methods followed by flotation. Underground operations are completely mechanized, with electrified main haulage systems, battery shuttle haulage, and loading and jumbo drills. The four principal ore shafts are located at each of the mills and vary in depth from 276 to 541 feet. Ore from two other shafts at Doe Run is trucked to the Federal mill. A new development shaft was sunk near Hayden Creek to a depth of 950 feet. In addition, this company operated the Mine La Motte property in Madison County, Mo., comprising four operating shafts, varying in depth from 75 to 307 feet, and a 2,000-ton mill.

According to the president's report to employees, the company development program was able to maintain its ore reserves in balance with production. Substantial tonnages of low-grade zinc-lead ore were indicated in the Desloge and adjacent mine areas. Company exploration projects have led to the discovery of large conglomerate-lead ore bodies at both Hayden Creek and Indian Creek, outside the lead belt proper, and warrant installation of a 2,000-ton-per-day sink-float mill at Hayden Creek. A three-compartment shaft with 5-ton skips will be sunk 950 feet to the ore body.

TABLE 7.—Mine production of lead and zinc in Southeastern and Central Missouri, 1946–50, in terms of concentrate and recoverable metal [1]

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite) [2]		Recoverable metal content [3]			
					Lead		Zinc	
	Short tons	Value [4]	Short tons	Value	Short tons	Value	Short tons	Value
1946	189,401	$21,677,221	1,731	$61,147	135,891	$29,624,238	451	$110,044
1947	183,084	31,762,029	560	15,996	129,581	37,319,328	[5] 295	71,390
1948	145,364	30,396,488	567	55,231	100,691	36,047,378	[5] 1,022	271,852
1949	179,725	32,665,768	1,074	79,347	126,269	39,901,004	[6] 749	185,752
1950	191,439	28,522,322	2,742	260,600	133,680	36,093,600	[7] 1,546	439,064

[1] Based on Southeastern and Central Missouri ore ("dirt") and old tailings treated at mills during calendar year indicated.
[2] Includes zinc-lead carbonate concentrates.
[3] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of concentrate ("ore") and metal it should be borne in mind that the value given for the concentrate is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.
[4] Values given are to a certain extent arbitrary, as part of the lead concentrates are smelted by the producer.
[5] Includes zinc recovered from lead-smelter slag.
[6] Includes zinc recovered from lead-smelter byproducts.
[7] Includes 180 tons recovered from byproduct matte from lead smelting.

TABLE 8.—Tenor of lead ore and concentrates in Southeastern Missouri disseminated-lead district, 1946–50

	1946	1947	1948	1949	1950
Total lead ore [1] ... short tons	5,491,239	5,856,334	5,384,861	7,066,443	7,091,257
Galena concentrate in ore ... percent	3.44	3.12	2.70	2.54	2.70
Average lead content of galena concentrates ... do	73.09	72.22	70.60	71.60	71.19
Average value per ton of galena concentrates	$114.39	$173.49	$209.11	$181.75	$148.99

[1] Includes lead-copper ore. Includes old tailings remilled: 1946—none; 1947—301,324 tons; 1948—1,164,356 tons; 1949—1,409,098 tons; 1950—1,025,502 tons.

In Madison County the National Lead Co., St. Louis Smelting & Refining Division, operated its Madison lead-copper mines and 1,200-ton all-flotation mill at Fredericktown. The company connected its Nos. 1 and 5 shafts by a haulage drift, and all the ore will be hoisted at No. 5 shaft in two 2-ton skips. Underground operations were fully mechanized with Diesel-powered trucks, loaders, and bulldozers. No. 1 shaft was used primarily for handling supplies and for ventilation.

Fredericktown Lead Co. operated its Catherine-Fleming mine and mill part of the year. Some additional lead production was reported from central Missouri and was incidental to the barite production in that region.

[1] Figures represent metal content of crude ore ("dirt") only insofar as it is recovered in the concentrate; data on tailing losses not available.

Southwestern Missouri.—Production of southwestern Missouri zinc, in terms of recoverable metal, amounted to 6,643 tons in 1950, an increase of about 28 percent over the 1949 production of 5,162 tons. Lead production, on the other hand, declined 25 percent, amounting to 946 tons of recoverable metal in 1950. The principal zinc producers in this region were Federal Mining & Smelting Co. operations at Duenweg, Dale Mining Co. at Stark City, Potter & Sims open-pit operations on the Snapp property, and A. G. Swartz at Joplin. There were numerous other producers in the region, accounting for the remainder of the tonnage.

OKLAHOMA

Oklahoma remained the largest producer of both zinc and lead in the Tri-State district in 1950 and accounted for 58 percent (46,739 tons) of the district's recoverable zinc and 67 percent (20,724 tons) of its recoverable lead. Zinc output was 6 percent greater than in 1949 and lead 4 percent greater.

TABLE 11.—Mine production of lead and zinc in Oklahoma, 1946–50, and total, 1891–1950, in terms of concentrate and recoverable metal [1]

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Recoverable metal content [2]			
					Lead		Zinc

[1] Based on Oklahoma ore ("dirt") and old tailings treated at mills during calendar year indicated.
[2] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of concentrate ("ore") and metal it should be borne in mind that the value given for the concentrate is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

TABLE 12.—Tenor of lead and zinc ore, old tailings, and slimes milled and concentrates produced in Oklahoma, 1949–50

	1949		1950	
	Crude ore	Old tailings and slimes	Crude ore	Old tailings and slimes
Total ore, etc., milled ... short tons	2,543,835	1,050,586	2,850,880	855,681
Total concentrate produced:

Sphalerite ... do	77,262	5,260	83,541	3,575
Ratio of concentrate to ore, etc.:				
Lead ... percent	1.06	0.002	0.95	0.005
Zinc ... do	3.04	0.50	2.93	0.42
Metal content of ore, etc.: [1]				
Lead ... do	0.80	0.001	0.74	0.003
Zinc ... do	1.80	0.29	1.75	0.24
Average lead content of galena concentrates ... do	75.32	57.69	77.61	55.56
Average zinc content of sphalerite concentrates ... do	59.35	58.29	59.73	56.81
Average value per ton:				
Galena concentrates	$186.60	$138.08	$154.82	$118.40
Sphalerite concentrates	$76.82	$89.76	$95.06	$85.66

[1] Figures represent metal content of the crude ore ("dirt") only insofar as it is recovered in the concentrate; data on tailing losses not available.

The five principal zinc producers of the State were Eagle-Picher Mining & Smelting Co., Nellie B. Mining Co., Federal Mining & Smelting Co., Sooner Milling Co., Inc., and the C. & M. Mining Co. The five principal lead producers were Eagle-Picher Mining & Smelting Co., Nellie B. Mining Co., Federal Mining & Smelting Co., W. M. & W. Mining Co., and Jake Dryer.

The Eagle-Picher Mining & Smelting Co. Central mill treated 2,802,281 tons of ore, the greater portion of which originated in Oklahoma. This 15,000-ton custom mill used its sink-float process for primary concentration of zinc and lead, followed by gravity and flotation for the final clean product. Company mines operating in Oklahoma during 1950 were Big Chief, Blue Goose Nos. 1 and 2, Buffalo, Crawfish, Crystal, Goodwin, Gordon No. 2, Grace Walker No. 2, Hum-bah-wat-tah Nos. 1 and 2, John Beaver No. 2, Kenoyer, Lottson No. 2, Netta, North Hunt, Piokee, Ramage, Royal, See Sah, Swift, Vantage, Wesah, White, Whitebird-Eudora, and Whitebird-Joseph. The principal Oklahoma custom shippers to the Central mill included Buffalo Mining Co. (Buffalo), Craig No. 1 Mining Co. (Craig), Mahutska Mining Co. (Jeff City, Eudora, and Mahutska), Frank Hudson (Bingham and Blackhawk), Sims Mining Co. (Pelican), and Wright & Dalton (Little Pat).

The Nellie B. Mining Co. was the second-largest producer in the State. The company operated its Rialto, Lawyers, and Barbara J. mines and mills throughout the year. The three mills are typical of the Tri-State area, using jigging, tables, and flotation methods to produce zinc and lead concentrates. Federal Mining & Smelting Co. was the third-largest producer during 1950, operating its Gordon and Lucky Syndicate-Howe-Ohimo mines and shipping to the Central mill.

Other companies operating custom mills were Harris Mining Co. (Farmington mine and Lucky Jenny mill), Scott Mining Co., Mission Mining Co., and C. & M. Mining Co.

Tailings-re-treatment operations included the Sooner Milling Co., Inc., and the Britt & Britt.

KANSAS

The Kansas zinc-lead mining areas are in the southeastern corner of the State, forming part of the Tri-State district and accounting, in 1950, for 34 percent of the zinc concentrates and 30 percent of the lead concentrates produced in the district. Kansas mines produced 8 percent less zinc concentrate and 6 percent less lead concentrate than in 1949. The Baxter Springs-Blue Mound-Treece areas accounted for 98 percent of the State 1950 production. Tailings-re-treatment operations dropped drastically in 1950, only 541 tons of zinc concentrates and 8 tons of lead concentrates being produced.

Eagle-Picher Mining & Smelting Co. was the largest producer of zinc and lead concentrates in Kansas, while National Lead Co., St. Louis Smelting & Refining Division, was next, followed by the C. K. & E. Mining Co. and the Bilharz Mining Co. Approximately 57 percent of the crude ore mined in the area was concentrated in the Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin, Okla. Eagle-Picher operated the following company mines: Big John, Foley No. 3, Mullen, Webber, Westside No. 2, and Wilbur.

TABLE 13.—Mine production of lead and zinc in Kansas, 1946–50, and total, 1876–1950, in terms of concentrate and recoverable metal [1]

Year	Mines producing	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Recoverable metal content [2]

[1] Figures represent metal content of the crude ore ("dirt") only insofar as it is recovered in the concentrate; data on tailing losses not available.

The Walter Hartley mine of the National Lead Co., St. Louis Smelting & Refining Division, was the largest single producer in the State for the second consecutive year. Other company mines were the Moore, Estes, and Mount Hope School tract. The No. 8 (Ballard) mill treated this ore, as well as that from the Clark mine operated by the Little Ben Mining Co. and the Liza Jane mine operated by the Liza Jane Mining Co.

The Beck No. 3 mill, located west of Baxter Springs, treated ore from the MacArthur, Mason-Brewster, and Brewster No. 6 mines. The Dines Mining Co. mill at Blue Mound north of Picher, Okla., concentrated ores from the Stoskopf, Hartley No. 1, and Homestake mines. The Wade-Rea mill treated company ore and many small lots from outside shippers. The Robinson mill of the Fox Mining Co. treated company ore from the Fox mine. Barr Surface Cleanup Co., operating the old Webber mill, treated slimes from the Webber, Stoskopf, Mid-Continent, and Scott-Jarrett tracts.

Kansas shippers to the Eagle-Picher Central mill included Mark Twain Mining Co. on the Naylor land, Bob White Mining Co. on the Cherokee and Chubb, Bilharz Mining Co. on the Muncie, Linda Lou Mining Co. on the Northern, C. K. & E. Mining Co. on the Karcher and Stebbins tracts, and the Grace Jarrett Mining Co. on the Wright land.

Small production also occurred in the Galena and Waco district.

ARKANSAS

Mine operations in Arkansas during 1950 were limited to small, intermittent production and accounted for 9 tons of recoverable lead and 8 tons of recoverable zinc. This production originated around Harrison in Boone County and Ponca in Newton County.

Montana

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By Almon F. Robertson and Virginia Halverson

GENERAL SUMMARY

MINE production of gold and copper in Montana decreased in 1950 compared with 1949. Gold output declined almost 2 percent and copper nearly 4 percent. Silver and lead outputs were, respectively, 4 and 9 percent higher. Zinc output advanced 25 percent to exceed copper production for the third time in Montana history. The total ore output increased about 39 percent, owing mainly to the mining of larger tonnages of special waste and dump material. The value of recoverable gold was almost 2 percent and lead nearly 7 percent less than in 1949; silver increased over 4 percent, copper nearly 2 percent, and zinc over 43 percent. The total value of the five metals increased from $49,003,447 in 1949 to $54,956,689 in 1950—over 12 percent. Gold accounted for approximately 3 percent, silver 11, copper 41, lead 10, and zinc 35 percent of the total value.

All tonnage figures reported herein are short tons and "dry weight"; that is, they do not include moisture. The value of metal production has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121

December	3,938	597,161	4,831	1,979	7,318
Total: 1950	51,764	6,590,747	54,478	19,617	67,678
1949	52,724	6,327,025	56,611	17,996	54,195

Gold.—Montana's output of gold decreased slightly in 1950 owing to a sharp drop in production from placer operations in Granite and Lewis and Clark Counties which more than offset a gain in output from zinc and lead operations at Butte. Gold production from dredging operations declined 4,812 ounces from the 1949 output, a drop of 62 percent. Of the State gold in 1950, 47 percent was derived from gold and silver ores (49 percent in 1949), nearly 47 percent from base metal ores (32 percent in 1949), and over 6 percent from placers (19 percent in 1949). Ores milled yielded 68 percent of the total gold and ores shipped to smelters nearly 25 percent.

Gold producers in Montana with an output of 1,300 ounces or more in 1950 were the properties of the Anaconda Copper Mining Co. (copper ore and waste materials and zinc-lead ore and dumps) at Butte; the Estelle mine of the McLaren Gold Mines Co. in Park County (gold ore), the Drumlummon mine of the Montana Rainbow Mining Co. (gold ore), and the Last Chance Gulch Placer of the Porter Bros. Corp., both in Lewis and Clark County; the Ruby group of the Ruby Gulch Mining Co. in Phillips County (gold ore); the Cornucopia mine in Madison County (gold-silver ore); and the American Pit (Victoria) mine of the Victoria Mines, Inc., in Madison County (gold ore). From these seven properties came 80 percent of the State total gold in 1950.

Silver.—Production of silver increased slightly in 1950, as output from zinc-lead ore mined at the Butte Hill properties of the Anaconda Copper Mining Co. more than offset the loss of silver from copper ore mined from the same area. In 1950 the company-owned Butte Hill operations of the Anaconda Copper Mining Co. supplied 87 percent of the State total silver output. Other important silver producers in 1950, in order of decreasing outputs, were the Emma mine at Butte, the Travona mine in Silver Bow County, the Cornucopia mine in Madison County, and the Mike Horse mine at Flesher in Lewis and Clark County. These five operations furnished 93 percent of the State silver production in 1950.

Zinc-lead ore supplied 68 percent of the State silver in 1950, copper ore 26 percent, gold and silver ores over 4 percent, and lead ore and zinc ore and old slag together over 1 percent. Ores milled yielded 94 percent of the total silver and smelting ores almost 6 percent; minor sources were placers and old lead-smelter slag fumed.

Copper.—An inadequate supply of mine labor and a fire in the Leonard mine caused a decline in copper output at the Anaconda Copper Mining Co., the State's only large producer. The company contributed over 98 percent of the State copper output in 1950.

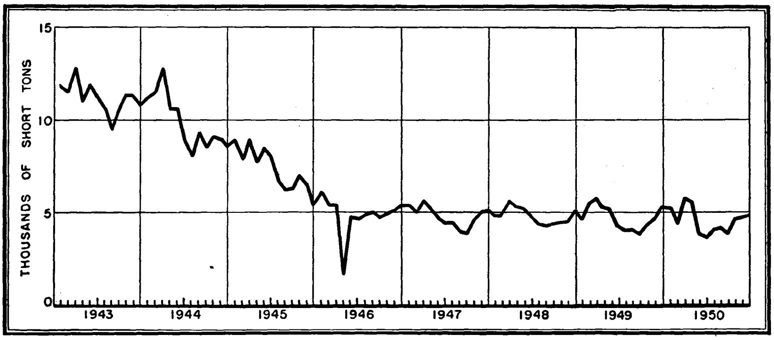

FIGURE 2.—Mine production of copper in Montana, 1943–50, by months, in terms of recoverable metal.

Lead.—Montana's production of recoverable lead in 1950 increased 9 percent owing to a substantial gain in output of zinc-lead ore from the Butte Hill mines and dumps of the Anaconda Copper Mining Co. Anaconda company-owned operations in 1950 supplied 69 percent of the State lead; other operations that produced over a million pounds of recoverable lead each were the Emma mine, the Mike Horse property, and the Jack Waite mine in Sanders County. These four supplied 86 percent of the total lead produced in the State. Of the latter total, 90 percent was recovered from zinc-lead ore, 7 percent from lead ore, 2 percent from gold and silver ores, and 1 percent from zinc ore and old slag.

Zinc.—As a result of record output at the Butte Hill mines and dumps of the Anaconda Copper Mining Co., Montana zinc production in 1950 increased 25 percent and for the third year in the State's history exceeded copper in output. During the year Anaconda company-owned operations at Butte supplied 79 percent of the State zinc output. Other important zinc producers, each with an output exceeding a million pounds of recoverable zinc, were the Emma mine, East Helena old slag dump, the Travona mine in Silver Bow County, and the Mike Horse property. These five operations produced 99 percent of the State total zinc output. Zinc-lead ore supplied 96 percent of the State zinc in 1950, and zinc ore and old slag nearly 4 percent; the remainder came from gold, silver, lead, and copper ores.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in Montana in 1950, by counties, in terms of recoverable metal

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Beaverhead	32		1,705	$59,675	61,970	$56,086

MINING INDUSTRY

Active lode mines in Montana decreased 13 percent from 281 in 1949 to 245 in 1950; active placer mines dropped 19 percent from 48 to 39. At the Butte properties of the Anaconda Copper Mining Co., preparation of mine and surface facilities for the Greater Butte project continued throughout the year. Construction of the main hoist house at the Kelley Shaft site and other necessary facilities, including installation of a 7,500-ton steel railroad ore bin, was completed during the year. Work on other portions of the project proceeded on schedule, and actual extraction of ore is expected to begin early in 1952.

The production of zinc-lead and lead ores increased 96 and 16 percent, respectively, in the State in 1950, but copper ore mined declined 3 percent owing largely to a fire in the Anaconda Copper Mining Co. Leonard mine at Butte. Of the 3,608,036 tons of ore treated during the year (2,595,934 in 1949), 63 percent was zinc-lead, lead, and zinc ores (46 percent in 1949), 33 percent copper ore (47 percent in 1949), and 4 percent gold and silver ores (7 percent in 1949).

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Montana in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Number of mines [1]	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	82	101,985	20,747	77,595	951,746	55,579	50,692
Dry gold-silver ore	38	19,061	3,071	98,228	20,170	358,741	103,833
Dry silver ore	41	12,729	332	110,081	22,076	327,920	298,920
Total	161	133,775	24,150	285,904	993,992	742,240	453,445
Copper	11	1,192,789	3,708	1,729,611	[2] 101,254,164		41
Lead	67	24,710	908	60,389	39,150	2,782,773	233,415
Zinc	3	[3] 20,945		21,987	909	510,013	4,771,990
Zinc-lead	27	2,235,817	19,564	4,492,529	6,667,785	35,198,974	129,897,109
Total lode mines	245	3,608,036	48,330	6,590,420	[2] 108,956,000	39,234,000	135,356,000
Gravel (placer operations)	39		3,434	327			
Total: 1950	284	3,608,036	51,764	6,590,747	[2] 108,956,000	39,234,000	135,356,000
1949	329	2,595,934	52,724	6,327,025	[4] 113,222,000	35,992,000	108,390,000

[1] Detail will not add to totals because some mines produce more than 1 class of ore.
[2] Includes 6,656,414 pounds recovered from precipitates.
[3] Includes 20,764 tons of lead-smelter slag fumed.
[4] Includes 4,419,019 pounds recovered from precipitates.

METALLURGICAL INDUSTRY

The 3,608,036 tons of ore produced from Montana lode mines in 1950 were treated as follows: 3,497,032 tons (97 percent) at mills (2,464,870 tons in 1949), 90,240 tons (2 percent) shipped to smelters (116,479 tons in 1949) and 20,764 tons (1 percent) of old lead-smelter slag fumed (14,585 tons in 1949).

The Anaconda Copper Mining Co. copper concentrator, zinc concentrator, and copper smelter (all at Anaconda) and the two electrolytic zinc plants (at Anaconda and Great Falls) operated throughout the year. The zinc plants treated 466,695 tons of zinc concentrates from many sources containing 494,909,180 pounds of zinc compared with 480,923 tons (revised figure) containing 507,592,850 pounds of zinc in 1949. The company slag-fuming plant at East Helena was operated throughout the year and treated 222,892 tons of hot slag and old cold slag, compared with 222,875 tons in 1949; output of zinc-lead fume increased from 36,827 tons in 1949 to 37,754 tons in 1950.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Montana in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)

[1] Includes copper recovered from mine-water precipitates as follows: 1950, 6,656,414 pounds; 1949, 4,419,019 pounds.

The program for expansion of the Anaconda Copper Mining Co. zinc concentrator at Anaconda from 2,000 tons to 4,000 tons per day was completed in October 1950. Remodeling of four sections of the copper concentrator to accommodate ore coming from the Greater Butte project progressed during the year, with completion anticipated by the end of 1951.

The lead smelter of the American Smelting & Refining Co. at East Helena operated throughout 1950 and treated chiefly lead-silver concentrates from mines in Idaho and Washington, residues from the electrolytic zinc plants at Anaconda and Great Falls, and crude ore, concentrates, and old tailings from numerous districts in Montana.

TABLE 9.—Mine production of gold, silver, copper, lead, and zinc in Montana in 1950, by method of recovery (except placer) and class of material processed, in terms of gross metal content

Class of material	Quantity treated (short tons)	Gross metal content

REVIEW BY COUNTIES AND DISTRICTS

BEAVERHEAD COUNTY

Argenta District.—A total of 3,640 tons of lead ore was shipped to a smelter during 1950 by operators working the Maulden mine. The Shafer group of claims was worked by Shafer Bros. and lessees; 1,234 tons of gold ore were shipped to smelters. The Eight Ball mine, owned by the W. E. Stinson Estate, was operated during part of the year, and a total of 259 tons of gold smelting ore was shipped. R. M. Fleming worked the Jack (Trader Horn) mine through May 15 and shipped 251 tons of lead smelting ore containing 232 ounces of gold, 5,296 ounces of silver, 684 pounds of copper, 59,136 pounds of lead, and 3,336 pounds of zinc. Several shipments of gold-silver smelting ore were also made from the Jack property. Remaining district production was principally lead ore from a number of small properties operated intermittently during the year.

Chinatown District.—A total of 78 tons of lead smelting ore was shipped from the H & S mine.

TABLE 10.—Mine production of gold, silver, copper, lead, and zinc in Montana in 1950, by counties and districts, in terms of recoverable metal

County and district	Mines producing		Ore and old tailings (short tons)	Gold (fine ounces)			Silver (fine ounces)			Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value

Medicine Lodge District.—Peter Sweeney operated his Owl Claims, Nos. 1 and 2 during the latter part of 1950 and shipped 9 tons of zinc-lead smelting ore containing 22 ounces of silver, 4,819 pounds of lead, and 3,083 pounds of zinc.

Vipond District.—Kathryn V. Bush and Geo. E. Hubbard operated the Monte Cristo mine during most of the year and shipped 236 tons of silver smelting ore. The Emma mine was operated during the last half of 1950 by J. R. Halverson, who recovered 166 tons of silver smelting ore containing 6,930 ounces of silver. Lessees worked the Quartz Hill Mines and shipped 149 tons of silver smelting ore containing 1,482 ounces of silver. Remaining district production, mostly from gold and silver ore, came from the G & W Moonlight 1 and 2, and Moosehorn Mining Co. properties.

BROADWATER COUNTY

Backer District.—The entire output was gold ore—78 tons from the Satellite mine and 76 tons from the Superior property.

Beaver District.—H. W. Carver operated the East Pacific group most of 1950 and produced 900 tons of gold-silver ore, which was treated in a 50-ton gravity mill on the property. In addition, 28 tons of zinc-lead ore was shipped to a smelter. Other district production was mainly gold smelting ore recovered at 6 mines operated intermittently during the year.

Cedar Plains District.—The principal output was 108 tons of zinc smelting ore produced by Roy E. Nicolls, owner and operator of the North Star group, and 114 tons of silver smelting ore from the Spar mine.

Park or Indian Creek District.—Dance & Anders operated the Marietta mine throughout 1950 and shipped gold smelting ore. William Zimmerman continued to work the Silver Wave mine and shipped 481 tons of gold smelting ore containing 83 ounces of gold, 676 ounces of silver, 925 pounds of copper, 32,095 pounds of lead and 5,555 pounds of zinc. Other properties in the district that recorded production during the year were the Coster, Diamond Hill, and Lookout.

CASCADE COUNTY

Montana District.—Lewis B. Stark operated the Galt and Equator mines and the Star mill continuously throughout 1950 and produced zinc-lead ore, which yielded 289 tons of lead concentrate and 241 tons of zinc concentrate. Small quantities of ore were shipped by lessees from the Lexington mine dump, the Hartley mine, and the Gone By claim.

DEER LODGE COUNTY

Georgetown District.—Gold ore comprised the bulk of the district output in 1950. The Acme Co. worked the Gold Coin mine continuously during the year and amalgamated 830 tons of gold ore. The Pyrenees Development Co. mined the Pyrenees property until August and shipped 869 tons of gold smelting ore containing 297 ounces of gold, 1,837 ounces of silver, and 25,408 pounds of copper.

GRANITE COUNTY

Alps District.—The principal district output came from the Alps group, operated by the Alps Mining & Milling Co. until October 1950, when the property was shut down for lack of ore reserve.

Boulder and South Boulder District.—As in 1949, silver ore comprised the bulk of lode production, 112 tons of which came from the Non-Pareil claim, 59 tons from the Moonlight (Annie) group, and 41 tons from the Princeton group. Operators on the Gold King mine shipped 127 tons of gold ore to a smelter.

First Chance District.—District output was entirely from gold ore, 63 tons of which were shipped to a smelter from the Gold Leaf property and 45 tons from the Sunrise mine. One hundred tons of gold ore from the Mitchell-Mussigbrod group were milled.

Flint Creek District.—The Taylor-Knapp Co. operated the Moorlight group throughout 1950 and milled 22,249 tons of manganese ore, containing varied amounts of gold, silver, copper, lead and zinc, in its 100-ton gravity and magnetic separation plant. Lead, zinc and iron concentrates totaling 40 tons, 194 tons, and 168 tons, respectively, were recovered from 875 tons of middling concentrate shipped to a custom mill.

Stony District.—A total of 68 tons of gold ore, recovered during development at the Moose Trail property, was shipped to a smelter.

JEFFERSON COUNTY

Boulder and Little Boulder District.—The bulk of the district output was recovered from 121 tons of dump ore shipped from the Boulder Mill & Smelter dump.

Cataract District.—Seven Consolidated Gold Mines operated the Josephine mine and produced gold-silver ore containing 32 ounces of gold, 639 ounces of silver, 321 pounds of copper, 370 pounds of lead, and 320 pounds of zinc. Harold J. Guilio operated the Comet mine and shipped 576 tons of silver smelting ore. Other properties in the district that reported small production during the year were the Golden Thread Placer, Hope & Bullion, Inc., Morning Glory, and Silver Hill.

Clancy and Lump Gulch District.—Principal production from the district during 1950 was 1,703 tons of silver dump ore from the Liverpool dump, which yielded 8,299 ounces of silver, 1,345 pounds of copper, 10,605 pounds of lead, and 45,465 pounds of zinc.

Colorado District.—Most of the district output in 1950 comprised 3,641 tons of dump material from the Alta dump, 2,059 tons of gold-silver smelting ore from the Custer dump, 3,059 tons of gold-silver smelting ore from the Gregory Mines dump, and 123 tons of gold-silver smelting ore from the Minah dump. Crenshaw, Boutinen & Smith worked the Mount Washington mine from April 1 to June 15, 1950, and shipped 547 tons of gold-silver smelting ore containing 51 ounces of gold, 2,355 ounces of silver, 1,117 pounds of copper, 45,292 pounds of lead, and 11,440 pounds of zinc.

Elkhorn District.—Production for the year was derived from 798 tons of silver ore from the Elkhorn mine, 1,656 tons of old silver tailings from the Elkhorn dump, and 483 tons of gold-silver ore from the Elkhorn Queen dump.

Golconda District.—The Golconda Mining Co. operated the Buckeye (Gold Coin) group 1 month of the year and treated 500 tons of gold ore in the company 80-ton cyanide plant. A small tonnage of zinc-lead smelting ore was shipped during the early part of 1950 from the Big Chief & Kodiak claims.

Lowland District.—District output was largely 480 tons of old silver tailings shipped from the Ruby Mill dump.

Warm Springs Creek District.—Most of the district output came from 53 tons of gold smelting ore shipped from the Bell, Best & Last claims.

Whitehall District.—Marvin Riebhoff and the Golden Sunlight mine operated the Golden Sunlight property and shipped a total of 1,348 tons of gold smelting ore during the year. The remaining district production was principally 188 tons of lead smelting ore from the Carbonate mine, 171 tons of gold smelting ore from the Lucky Hit mine, 155 tons of lead smelting ore from the Whitehall claim, 97 tons of gold smelting ore from the Florence property, and 60 tons of lead smelting ore from the Big Spot claim.

Wilson and Ticer Creeks District.—Operators at the Callahan property amalgamated a small tonnage of gold ore and shipped 24 tons of similar material to a smelter.

JUDITH BASIN COUNTY

Barker District.—Thorson & Brazee worked the Wright-Edwards (Block P) group all year and shipped 162 tons of zinc-lead smelting ore containing 7 ounces of gold, 5,329 ounces of silver, 887 pounds of copper, 107,478 pounds of lead, and 46,877 pounds of zinc. Other properties worked during the year were the Faith group and the Tiger.

Yogo District.—Walter Lehman operated the Gold Bug and Weatherwax claims from July 1 through October 15, 1950, and shipped 25 tons of gold smelting ore containing 11 ounces of gold and 74 ounces of silver.

LEWIS AND CLARK COUNTY

Heddleston District.—The Mike Horse Mining & Milling Co. reopened its Mike Horse mine in July and operated continuously the remainder of the year. The company's 300-ton flotation mill treated 23,634 tons of zinc-lead ore during the period of operation and recovered 1,372 tons of lead concentrate and 1,626 tons of zinc concentrate. Development at the property during the year included 2,100 feet of crosscuts and drifts.

Helena District.—Porter Bros. operated its 6-cubic-foot bucket-line dredge in Last Chance Gulch until August 25, when the dredge was closed down for lack of additional gravel to treat.

A. O. Barnes worked the Caswell placer with a dragline dredge during July and August and washed 2,800 cubic yards of gravel. The Discovery claim was also worked with a dragline dredge during the summer months. Remaining district output came from gold ore amalgamated at the Sara Jane mine, gold smelting ore shipped from the Independent property, and zinc-lead smelting ore shipped from the Humboldt claim.

Marysville District.—The Montana Rainbow Mining Co. and W. R. Wade operated the Drumlummon mine throughout the year. The 150-ton amalgamation-flotation mill at the property was destroyed by fire on April 2 and was not rebuilt. During the period the mill was in operation 3,800 tons of gold-silver ore were treated by amalgamation in riffle boxes followed by flotation. After April the operators shipped gold ore direct to a smelter. Louis Peura shipped 528 tons of tailings containing 65 ounces of gold, 1,247 ounces of silver, 528 pounds of copper, and 8,872 pounds of zinc from the Big Ox mine. A small quantity of gold was recovered by amalgamation of ore from the Marysville Lode.

Rimini District.—Principal production was 526 tons of lead smelting ore from the Evergreen mine and 99 tons of gold-silver smelting ore from the Free Speech mine and dump.

Scratch Gravel District.—Output was largely 450 tons of gold-silver ore and 16 tons of lead ore shipped to a smelter from the Franklin dump.

Smelter District.—Virtually all the metals credited to the Smelter district came from 20,764 tons of old lead-smelter slag treated at the East Helena slag-fuming plant of the Anaconda Copper Mining Co.

Stemple-Gould District.—Most of the metal production in the district in 1950 came from the Bondholder, Homestake, Iron Nerve, and Lucky Strike mines. Some gold and silver were recovered by amalgamation and concentration of ore from the Rover dump, worked by the Earl Mining Co., Inc.

LINCOLN COUNTY

Sylvanite (Yaak) District.—Exploration and development at the Keystone and Haywire groups of the Morning Glory Mines, Inc., yielded approximately 100 tons of gold ore, which was treated in the company 100-ton flotation mill.

MADISON COUNTY

McCarthy Mountains District.—C. O. Dale & Sons operated the Polly Jane and Bessie properties throughout the year and shipped 132 tons of lead smelting ore and 35 tons of gold-silver smelting ore. Other properties in the district that shipped small lots of smelting ore were the Lucky Knock, McCarthy group, and the Silver Buckle.

Norris and Norwegian District.—The entire district output in 1950 was gold ore—82 tons from the Bayles mine, 2 tons from the Galena, 3 tons from the Lincoln, and 1 ton from the Minnie.

Renova District.—Lessees on the Colorado mine shipped 132 tons of gold smelting ore during the year. Development of the Sunset claim yielded 5 tons of lead smelting ore.

Rochester District.—Commonwealth Lead Mining Co. worked the Calvin mine 3 months of 1950 and shipped 98 tons of lead smelting ore containing 4 ounces of gold, 1,697 ounces of silver, 280 pounds of copper, 70,500 pounds of lead, and 8,047 pounds of zinc. Bork & Verlanic operated the Thistle mine from April to September and milled about 300 tons of gold ore in addition to shipping 15 tons of gold smelting ore and 35 tons of lead smelting ore. Small tonnages of gold smelting ore were also shipped from the Big Bertha, Nobleville, North Star, and Shoemaker mines. A few tons of lead smelting ore were shipped from the Montrose and Plainview properties.

Sheridan District.—Lessees worked the Silver Bar mine and shipped 443 tons of silver smelting ore. Remaining district production came principally from 175 tons of gold-silver smelting ore shipped from the Latest Out claim and 80 tons of silver smelting ore shipped from the Bayard property.

Silver Star District.—The bulk of production was derived from approximately 26,950 tons of gold ore milled from the American Pit (Victoria) mine, which yielded 2,450 tons of copper concentrate.

Tidal Wave District.—As in 1949, virtually all the output of the district was gold ore, 177 tons of which came from the B. & H. Mines and 129 tons from the Moffet claim.

Virginia City District.—Most of the district production was gold-silver smelting ore—6,349 tons from the Cornucopia mine, 2,372 tons from the U. S. Grant mine, 126 tons from the Flagstaff property, 63 tons from the El Fleeda mine, and 56 tons from the Mountain Flower and Mountain Chief claims.

MEAGHER COUNTY

Castle Mountain District.—District production, all lead smelting ore, came from the Cumberland mine operated by the Silverton Mines, Inc., the Yellowstone mine, and the Silver Bullion property.

MINERAL COUNTY

East Hunter District.—Lessees operated the Silver Cable group of claims and milled 3,482 tons of zinc-lead ore which yielded 28 tons of lead concentrate and 129 tons of zinc concentrate.

Iron Mountain (Superior) District.—E. G. Smith, lessee, worked the dumps of the Iron Mountain mine and trucked 2,000 tons of zinc-lead ore to the Nancy Lee mill for recovery of lead and zinc concentrates.

Keystone District.—E. G. Smith also worked the Nancy Lee group and treated 1,200 tons of lead ore in the 100-ton flotation mill at the property.

MISSOULA COUNTY

Coloma District.—Gold smelting ore, which comprised the entire output of the district, was shipped from the Clementha Fraction, I. X. L., and Mammoth and East Mammoth group in 1950.

Copper Cliff (Cramer Creek) District.—Linton Mines operated the Blacktail open-pit mine and 500-ton sink-float plant beginning in March 1950 and treated 16,560 tons of lead ore which yielded 668 tons of lead concentrate.

PARK COUNTY

New World District.—McLaren Gold Mines Co. operated its open-pit Estelle and New Year's Gift group from January 1 through October 30 and treated 30,510 tons of gold ore in the company 200-ton flotation mill. Parkmont Corp. continued operations at the Homestake property; the gold ore mined was treated by amalgamation and concentration; and, in addition to gold bullion, the mill produced a copper concentrate that was shipped to a smelter. E. W. Wade and A. J. Madsen reopened the Big Blue mine south of Cooke City on February 5; 67 tons of lead smelting ore containing 2 ounces of gold, 694 ounces of silver, 264 pounds of copper, 69,324 pounds of lead, and 5,277 pounds of zinc were recovered during development of the property. Most of the remaining district output was lead smelting ore shipped from the Morning Star, New World, Shoo Fly, and Stump mines.

PHILLIPS COUNTY

Little Rockies District.—The Ruby Gulch Mining Co. continued operations at its Ruby Group and 300-ton cyanide leaching plant during 1950. The Gold Bug mine was worked part of the year and 55 tons of silver smelting ore were shipped.

POWELL COUNTY

Nigger Hill District.—Hopkins & Sons Mining Co. operated the Charter Oak mine 7 months of 1950 and shipped 72 tons of gold-silver smelting ore and 5 tons of lead smelting ore. In addition, 200 tons of gold-silver ore were treated in the company 40-ton flotation mill. Newman Bros. worked the Lilly group until June 13 and shipped 88 tons of gold smelting ore. The Golden Anchor Mining & Milling Co. shipped 39 tons of dump ore from the Evening Star property during the year.

Ophir Gulch District.—The Eldorado Mining Co., lessees on the Eldorado 1 and 2 claims, shipped 488 tons of copper smelting ore during the year.

Zozell District.—Most of the district output in 1950 was 159 tons of silver smelting ore shipped from the Hidden Treasure mine and 141 tons of gold smelting ore shipped from the Hidden Hand property.

RAVALLI COUNTY

Overwich (Hughes Creek) District.—About 28 ounces of gold were recovered in the course of development during the year at the Washington claim.

SANDERS COUNTY

Eagle District.—The American Smelting & Refining Co. operated the Jack Waite mine throughout 1950 and produced 6,778 tons of zinc-lead milling ore and 420 tons of lead smelting ore. The milling ore, all treated in the 300-ton flotation plant at the property, contained 7,694 ounces of silver, 1,545,600 pounds of lead, and 373,000 pounds of zinc.

SILVER BOW COUNTY

Ore production in Silver Bow County in 1950 increased to 3,387,270 tons, a 47-percent gain over 1949. The output of gold advanced 47 percent, silver 9 percent, lead 36 percent, and zinc 32 percent. Copper production continued to decline and fell 4 percent under the 1949 level. The total value of the five metals increased 18 percent and represented 93 percent of the State total value. The mines in Silver

Bow County in 1950 produced 45 percent of the State total gold, 93 percent of the silver, 99 percent of the copper, 80 percent of the lead, and 94 percent of the zinc. Table 11 gives the output of mines in the county.

TABLE 11.—Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1946–50, and total, 1882–1950, in terms of recoverable metal

Year	Mines producing	Ore (short tons)	Gold (lode and placer, fine ounces)	Silver (lode and placer, fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1946	27	1,827,606	6,926	2,417,969	115,809,000	4,713,000	14,216,500	$23,205,317
1947	32	2,624,915	19,801	5,252,011	114,374,000	21,269,500	81,425,000	42,379,878
1948	22	2,637,479	19,163	6,100,232	115,423,500	26,448,900	105,250,800	49,971,332
1949	15	2,297,584	15,757	5,636,112	111,890,500	22,979,600	95,963,100	43,225,091
1950	21	3,387,270	23,163	6,123,549	107,793,300	31,358,800	127,021,000	51,044,252
1882–1950	--------	(1)	2,104,081	568,896,883	[2] 6,768,560	[2] 285,890	[2] 1,775,599	2,786,032,565

[1] Figure not available.
[2] Short tons.

Summit Valley (Butte) District.—Company material treated at the copper concentrator of the Anaconda Copper Mining Co. at Anaconda comprised 1,105,856 tons of copper ore from the main Butte Hill mines (1,180,750 in 1949) and 50,744 tons of special waste (22,198 in 1949). Direct smelting ores totaled 20,246 tons (39,927 in 1949) and mine-water precipitates 5,823 tons (3,838 tons in 1949).

Production of zinc-lead ore from the Butte Hill mines of the Anaconda Copper Mining Co. was 871,191 tons in 1950 (747,962 tons in 1949) and that from the Butte Hill dumps 818,445 tons (261,958 tons in 1949).

The Emma and Travona mines, operated by the Anaconda Copper Mining Co., produced manganese ore that was milled to recover manganese concentrates and a zinc-lead middling concentrate. This middling concentrate was further milled to obtain zinc and lead concentrates amounting to 22,074 tons from the Emma middling and 2,545 tons from the Travona middling.

Copper smelting ore and silver smelting ore constituted most of the remainder of the district output in 1950. Of the copper-ore production, 12,402 tons came from the Bullwhacker claim, 2,953 tons from the Sarsfield mine, and 47 tons from the Columbia property. The most important producers of silver smelting ore included the Alloy mine, with an output of 1,284 tons; the Margaret Ann, 521 tons; the Elba, 235 tons; and the Magna Charta, 129 tons.

Nevada

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. Maurer

GENERAL SUMMARY

NEVADA copper production, largely from open-pit mines, responded to the stimulus of great demand and generally favorable base-metal prices in 1950 and advanced over 1949. Gold output, reflecting expanded large-scale placer mining and greater yield from both gold ore and copper ore, also increased in 1950, whereas output of silver, principally from fluxing ores and ores mined primarily for other metals, dropped in 1950. Lead production fell below the 1949 level owing largely to lower yield from straight lead ore and the closing for more than half the year of the State's second-largest lead-producing mine (also a leading silver producer) following a shaft fire. Zinc output was up compared with 1949. The total value of gold, silver, copper, lead, and zinc recovered from ores, old tailings, and gravels mined at 325 lode mines and 25 placer properties in 1950 was $38,181,872 an increase of 29 percent compared with $29,615,777, the 1949 output by 332 lode mines and 37 placer mines in 1949.

Comparing 1950 with 1949, the gold output increased 37 percent in quantity and value; copper increased 38 percent in quantity and 46 percent in value; zinc increased 6 percent in quantity and 21 percent in value; silver decreased 15 percent in quantity and value; and lead decreased 11 percent in quantity and 24 percent in value. Of the total value of the five metals, copper comprised 57 percent, gold and zinc 16 percent each, lead 7 percent, and silver 4 percent.

White Pine County accounted for 62 percent of the State total value of the five metals which were produced in 17 counties, all told, in 1950. It stood first in the State in the output of copper and gold, third in zinc and silver, and fourth in lead. Lincoln County, with 22 percent of the State total value, led in production of silver, lead, and zinc and was second in copper and eighth in gold.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production reported herein has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in Nevada, 1946–50, and total 1859–1950, in terms of recoverable metal [1]

Year	Mines producing [2]		Ore and old tailings sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1946	193	33	5,725,805	90,680	$3,173,800	1,250,651	$1,010,526
1947	276	31	6,541,635	89,063	3,117,205	1,377,579	1,246,709

1949	332	37	5,987,013	130,399	4,563,965	1,800,209	1,629,280
1950	325	25	7,745,119	178,447	6,245,645	1,537,217	1,391,259
1859–1950 [3]			(4)	26,026,442	589,487,146	596,108,737	546,613,908

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1946	48,616	$15,751,584	7,175	$1,564,150	22,649	$5,526,356	$27,026,416
1947	49,603	20,833,260	7,161	2,062,368	16,970	4,106,740	31,366,282
1948	45,242	19,635,028	9,777	3,500,166	20,288	5,396,608	34,055,480
1949	38,058	14,994,852	10,626	3,357,816	20,443	5,069,864	29,615,777
1950	52,569	21,868,704	9,408	2,540,160	21,606	6,136,104	38,181,872
1859–1950 [3]	1,968,140	583,035,366	584,152	71,708,027	426,795	76,197,832	1,867,042,279

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; old tailings or slimes retreated; and ore, old tailings, or copper precipitates shipped directly to smelters during the calendar year indicated.
[2] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[3] From 1904 (when first satisfactory annual canvass of mine production was made) to 1950, inclusive, the output was as follows: Gold, 14,199,566 ounces valued at $345,003,913; silver, 307,695,888 ounces, $209,455,685; copper, 1,966,214 tons, $582,388,738; lead, 346,361 tons, $49,071,465; zinc, 426,795 tons, $76,197,832; total value, $1,262,117,633.
[4] Figure not available.

Gold.—Gold from lode mines comprised 80 percent of the State's total gold in 1950 as compared with 94 percent of the smaller 1949 total and placer gold 20 percent (6 percent in 1949). The upsurge in lode-gold mining which began during 1949 continued until late in 1950, when high operating costs caused the closing of many Nevada gold properties, including those engaged in large-scale custom milling of precious metal ores. Gold from precious metal ores increased 12 percent compared with 1949 and comprised 49 percent of the State's total (60 percent in 1949). Byproduct gold from base-metal ores (largely copper ore) comprised 31 percent of the gold output (34 percent in 1949). Uninterrupted working during 1950 of Nevada's only bucket-line dredge and operation of the new project treating gold-bearing alluvium at Round Mountain, Nye County, during 1950 was reflected in the 358-percent increase in placer gold over 1949.

The 10 leading gold-producing mines in 1950 listed in table 3 contributed 88 percent of Nevada's output; the 4 leaders alone produced 65 percent.

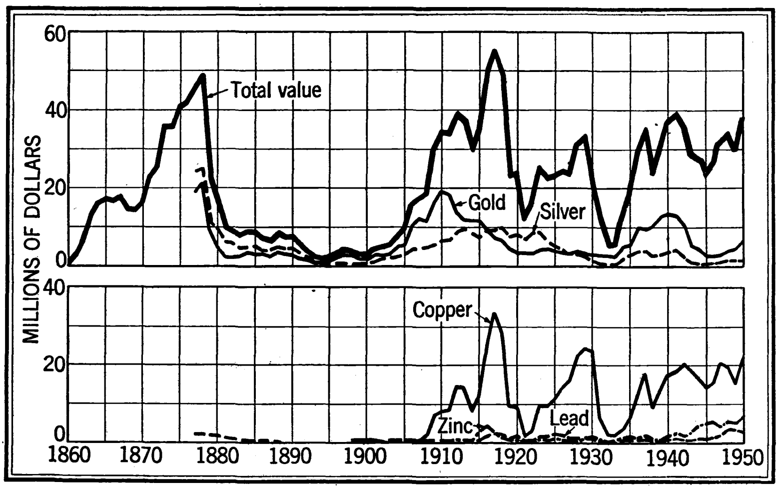

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc in Nevada, 1860–1950.

Silver.—In 1950 silver was produced principally as a byproduct, since a large percentage of the straight silver ore mined either was utilized as a fluxing material or beneficiated mainly for its contained base metals. However, the silver content of Nevada ores, still economically important, often was the determining factor in treating mined material profitably during the year. Base-metal ores were the source of 63 percent of the State silver production in 1950 (57 percent in 1949), while straight silver ore contributed 9 percent (17 percent in 1949).

The 10 leading silver-producing mines shown in table 3 yielded 79 percent of the State's output; the 3 leaders contributed 57 percent.

Copper.—Nevada copper production was centered in the Robinson (Ely) district, White Pine County, where the State's two leading producers—Kennecott Copper Corp. and Consolidated Coppermines Corp.—mined the porphyry ore of that district by open-pit method and supplied all but a small percentage of the State's total 1950 copper output. Data on a Humboldt County copper deposit were published.[1]

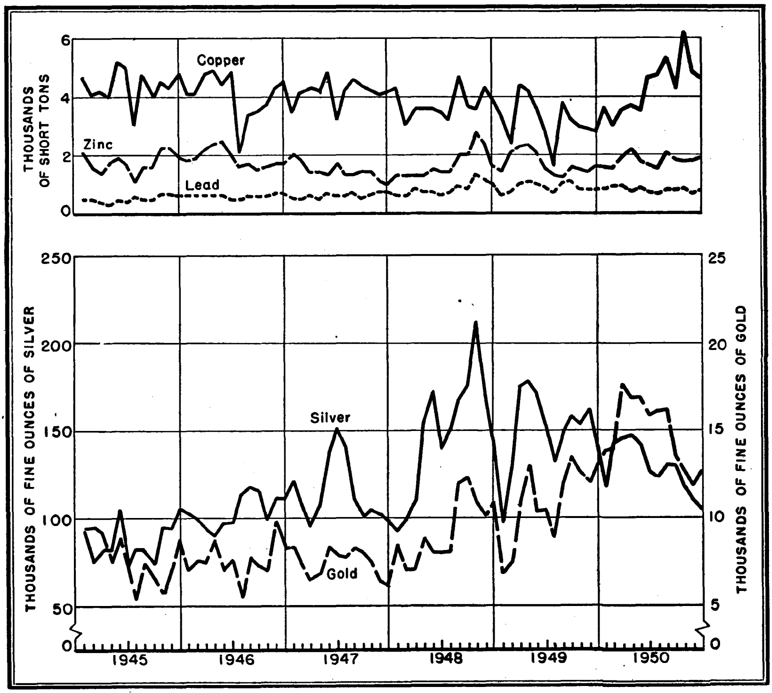

FIGURE 2.—Mine production of gold, silver, copper, lead, and zinc in Nevada, 1945–50, by months, in terms of recoverable metal.

Lead.—Recoverable lead in Nevada in 1950 was produced mainly from zinc-lead ore. The lead yield from straight lead ore declined 45 percent compared with 1949. Of the mines that produced the metal in 1950, only 2 had an output of more than 500 tons of recoverable lead during the year, 2 produced between 250 and 500 tons and 12 mined between 50 and 250 tons. Of the State's total, 72 percent was mined in the Pioche district, Lincoln County. The leading producers were: The Combined Metals Reduction Co., Pioche group, Pioche district, Lincoln County (zinc-lead ore); Copper Canyon Mining Co., Copper Canyon mine, Battle Mountain district, Lander County (silver ore), inoperative for 6 months of 1950; Ely Valley Mines, Inc., Ely Valley mine, Pioche district, Lincoln County (zinc and zinc-lead ore); Bristol Silver Mines Co., Bristol mine, Jack Rabbit district, Lincoln County (zinc-lead-copper ore); and McFarland & Hullinger, Delno mine, Delano district, Elko County (lead ore).

Zinc.—Nevada zinc production was centered in the Pioche district, Lincoln County, where zinc and zinc-lead ores mined and concentrated were the source of 91 percent of the State 1950 total zinc production. Rising zinc prices in 1950, especially after midyear, made possible the movement to a Utah slag-fuming plant of notable tonnages of oxidized zinc ore, largely from mines in Clark, Eureka, and White Pine Counties, and from the former Metals Reserve Co. World War II stockpile of Clark County ore at Jean, Nev. Only two mines had an output of more than 500 tons of recoverable zinc during the year, and nine mines produced in the range of 50 to 200 tons of zinc. Leading producers of recoverable zinc were: Combined Metals Reduction Co., Pioche group, and Ely Valley Mines, Inc., Ely Valley mine, both in the Pioche district, Lincoln County; Copper Canyon Mining Co., Copper Canyon mine, Battle Mountain district, Lander County; and L. F. Jacobson, Yellow Pine mine, Yellow Pine district, Clark County.

[1] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[2] From property not classed as a mine.
[3] Placer production from Humboldt and Lander Counties combined to avoid disclosure of output.

MINING INDUSTRY

Demonstrating the ability of open-pit mine production to respond quickly to changing market conditions, Nevada's copper production, after 5 months of moderate output, rose to a high level in June and subsequent months. It was primarily this expansion in open-pit copper that accounted for the 29-percent increase in total tonnage of Nevada ores and old tailings sold or treated in 1950 compared with 1949. Lead and zinc mines, predominantly underground operations, responded slowly to the incentive of higher metal prices because ore reserves needed for expanded production were not developed during the preceding period of depressed metal prices. Mining of precious metal ores declined sharply late in 1950 owing to a fixed gold price in the face of steadily increasing operating costs. The collapse of custom milling in the Virginia City-Silver City area of Lyon and Storey Counties and at Goldpoint, Esmeralda County, virtually halted mining of precious metal ores in these and neighboring districts after September. It was significant that the State's six leading gold-producing mines in 1950 were worked by surface methods.

Led by the Natomas Co.[2] bucket-line dredge in Lander County and the Round Mountain Dredging Corp.[3] conveyor-milling operation in Nye County, Nevada placer mines treated 5,243,450 cubic yards of material averaging $0.243 per cubic yard in 1950 compared with 1,382,140 cubic yards averaging $0.201 per cubic yard in 1949. Of the 25 placer mines that reported production in 1950, 1 was worked by bucket-line dredge, 10 by power excavators and washing plants, 3 by underground methods, and 11 by small-scale hand methods.

ORE CLASSIFICATION

Nevada ores sold or treated in 1950 are classified in table 6. Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Nevada in 1950, by class of ore or other source material, in terms of recoverable metal

Class of material	Number of mines [1]	Material sold or treated: Ore (short tons)	Material sold or treated: Old tailings (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold	132	635,952	19,272	81,090	92,601	30,400	1,800	------
Dry gold-silver	48	26,634	49,008	5,544	330,365	1,300	72,800	3,100
Dry silver	52	37,436	119	701	145,922	55,300	1,268,600	400,100
Total	218	700,022	68,399	87,335	568,888	87,000	1,343,200	403,200
Copper ore	26	6,693,277	------	49,438	147,599	[2] 104,264,500	700	------
Lead ore	64	[3] 10,906	------	[4] 611	[4] 115,794	[4] 23,700	[4] 2,436,000	[4] 32,100
Lead-copper ore	3	1,462	------	9	13,043	85,900	276,100	61,100
Zinc ore	13	[5] 37,539	------	[5] 172	[5] 21,465	[5] 62,800	[5] 432,200	[5] 8,496,900
Zinc-lead ore	24	230,167	------	4,470	600,682	366,400	13,720,400	33,868,500
Zinc-lead-copper ore	4	3,347	------	34	59,946	247,700	607,400	350,200
Total	115	[3,5] 6,976,698	------	[4,5] 54,734	[4,5] 958,529	[2,4,5] 105,051,000	[4,5] 17,472,800	[4,5] 42,808,800
Total lode mines	325	[3,5] 7,676,720	68,399	[4,5] 142,069	[4,5] 1,527,417	[2,4,5] 105,138,000	[4,5] 18,816,000	[4,5] 43,212,000
Gravel (placer operations)	25	------	------	36,378	9,800	------	------	------
Total: 1950	350	[3,5] 7,676,720	68,399	[4,5] 178,447	[4,5] 1,537,217	[2,4,5] 105,138,000	[4,5] 18,816,000	[4,5] 43,212,000
1949	369	[3] 5,938,801	48,212	130,399	[4] 1,800,209	[6] 76,116,000	[4] 21,252,000	[4] 40,886,000

[1] Detail will not add to totals because some mines produce over 1 class of ore.
[2] Includes 799,500 pounds from precipitates.
[3] Excludes tungsten ore.
[4] Includes metal recovered from tungsten ore.
[5] Includes 2,197 tons of ore and contained recoverable metal from the former Metals Reserve Co. stockpile at Jean, Nev.
[6] Includes metal recovered from tungsten ore; also includes 1,038,400 pounds from precipitates.

METALLURGICAL INDUSTRY

Of the 7,745,119 tons of lode material (including 68,399 tons of old tailings) from Nevada mines sold or treated during 1950, 99 percent (the output of 161 mines) went to mills and 1 percent (the output of 164 mines) to smelters. In addition to companies that operated metallurgical plants exclusively for their ores, the Combined Metals Reduction Co. at Pioche, Lincoln County,[4] treated by selective flotation zinc and zinc-lead ores on a custom basis from two Nevada mines and one Utah property and also milled company zinc-lead ore. The Kennecott Copper Corp. treated all the copper ore produced by Consolidated Coppermines Corp. on a contract basis, in addition to milling its own ore at the McGill concentrator. Kennecott also operated the McGill copper smelter, Nevada's only smelter, treating—in addition to copper ore and copper concentrate—gold and silver ores used for fluxing. The Dayton Consolidated Mining Co. milled gold and silver ore and tailings from mines in nine Nevada counties at the company flotation-cyanide plant in the Comstock district,

[4] *See* Holmes, George H. Jr., Mining and Milling Methods at the Caselton Mine, Combined Metals Reduction Co., Pioche, Lincoln County, Nev.: Bureau of Mines Inf. Circ. 7586, 1950, 24 pp.

Storey County, and the San Francisco Mining & Engineering Co. beneficiated precious metal ores on a custom basis at its Stateline mill in the Hornsilver district, Esmeralda County. Several other Nevada mills accepted occasional lots of custom ore.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Nevada in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Placer	36,378	9,800			
Amalgamation	5,083	3,182

[1] Includes 816,676 pounds from precipitates.
[2] Includes 2,197 tons of ore and contained metal from the former Metals Reserve Co. stockpile at Jean, Nev.
[3] Includes 1,060,572 pounds from precipitates.

REVIEW BY COUNTIES AND DISTRICTS

CHURCHILL COUNTY

Eastgate District.—Gale G. Peer worked the Oro-Plata (Wilson) mine from March through September 1950 and shipped 43 tons of ore, containing (gross) 13 ounces of gold and 721 ounces of silver, to a custom mill.

Sand Springs District.—Summit King Mines, Ltd., operated the Summit King group throughout 1950; 18,227 tons of ore (including a small quantity of custom ore) cyanided at the company plant yielded 2,466 ounces of gold and 200,618 ounces of silver.

CLARK COUNTY

Searchlight District.—The Desert Milling Co. recovered 668 ounces of gold and 2,626 ounces of silver from 17,631 tons of Quartette-mine tailings by cyanidation at the company 100-ton mill during 1950. Other mines operated included the Herland group (Golden Empire Mining Co.), Parallel group (Jeff Reid), Red Bird group (J. O. Knapp), and Ruth Elder (Ruth Elder Mining Co.).

[1] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[2] Source of silver as follows: 1,527,417 ounces from lode mines and 9,800 ounces from placers.
[3] Included with "Undistributed" in order to avoid disclosure of individual company operations.
[4] From property not classed as a mine.
[5] Includes 2,197 tons of ore and contained recoverable metal from the former Metals Reserve Co. stockpile at Jean, Nev.
[6] Battle Mountain district lies in Humboldt and Lander Counties.
[7] Exclusive of placer output which is included with "Undistributed."
[8] Excludes tungsten ore.
[9] Includes metal recovered from tungsten ore.
[10] Includes values and quantities which cannot be shown separately for certain individual districts as indicated in the appropriate column by footnote reference 4.
[11] Includes 799,500 pounds contained in precipitates.

Yellow Pine (Goodsprings) District.—J. W. Stewart milled 200 tons of ore from the Anchor mine in January 1950; 19 tons of jig and table concentrate containing (gross) 140 ounces of silver, 28 pounds of copper, 22,160 pounds of lead, and 1,610 pounds of zinc was shipped to a smelter. L. F. Jacobson operated the Yellow Pine mine and shipped 1,054 tons of zinc-lead ore to smelters. Other mines worked in the district included the Bullion (R. K. Hamilton), Combination group (Otto & Milton Schwartz), Honduras group (Honduras Mining Co.), Root Zinc mine (Bonanza Hills Mines). Zinc ore (2,197 tons containing (gross) 18 ounces of gold, 10,622 ounces of silver, 18,164 pounds of copper, 97,250 pounds of lead, and 1,123,844 pounds of zinc) was shipped to a slag-fuming plant from the former Metals Reserve Company stockpile at Jean.

DOUGLAS COUNTY

Buckskin District.—Jesse R. Wilson worked the Buckskin mine from April 25 to June 29, 1950, and shipped 33 tons of ore containing (gross) 7 ounces of gold, 15 ounces of silver, and 2,080 pounds of copper to smelters.

ELKO COUNTY

Delano District.—McFarland & Hullinger worked the Cleveland and Delno mines during 1950 and shipped 2,512 tons of lead ore to smelters.

Edgemont (Centennial) District.—Silas Cordes shipped 61 tons of ore containing (gross) 3 ounces of gold, 2,326 ounces of silver, 959 pounds of copper, 3,847 pounds of lead, and 632 pounds of zinc to smelters.

Railroad (Bullion) District.—Lead & Copper Mines, Inc. (Uhalde & Parker), operated the Aladdin mine in 1950 and shipped lead-copper ore to smelters. Gregory Bros. shipped 8 tons of ore containing (gross) 2 ounces of gold, 61 ounces of silver, and 1,961 pounds of copper to a smelter from the Sweepstakes mine.

Ruby Range District.—O. J. Streeter shipped 13 tons of ore containing (gross) 69 ounces of silver, 38 pounds of copper, 6,600 pounds of lead, and 228 pounds of zinc to a smelter from the Summit View claims.

ESMERALDA COUNTY

Divide District.—Tonopah Divide Mining Co. and lessees recovered 59 ounces of gold and 1,375 ounces of silver from 146 tons of ore shipped to a smelter.

Goldfield District.—Goldfield Deep Mines Co. of Nevada and leasing companies worked the Deep Mines group throughout 1950. A substantial quantity of gold and some silver and copper were produced from flotation concentrates shipped to a smelter.

Lida District.—John Loncar operated the Gold Bar and Colorado claims in 1950 and shipped 14 tons of ore, which grossed 0.4 ounce of gold, 40 ounces of silver, 54 pounds of copper, 2,437 pounds of lead, and 8,475 pounds of zinc, to a concentrator-smelter.

Montezuma District.—Pacific Buttes Mining Co. worked the New York-Eva group in 1950 and shipped lead ore containing gold, silver, and copper to smelters.

EUREKA COUNTY

Antelope District.—Hugh M. Baldwin and Associates shipped 43 tons of ore containing (gross) 0.213 ounce of gold, 47 ounces of silver, 11,179 pounds of lead, and 17,324 pounds of zinc to a concentrator-smelter from the Baldwin mine in 1950.

Eureka District.—Hammond & Partners worked the Diamond (Eureka Prospect) mine from May through December 1950 and shipped 115 tons of ore containing in gross metal, 31 ounces of gold, 3,670 ounces of silver, 319 pounds of copper, 28,734 pounds of lead, and 3,040 pounds of zinc to a smelter. The Lone Mountain Lease shipped 689 tons of zinc ore, which averaged (gross) 30 percent zinc, from the Mountain View mine to a slag-fuming plant in 1950. Other mines worked included the Doe Run group (Owen Rice), the Eureka Mines, Inc., group, and the Extension mine (Cardinalli & Frank).

HUMBOLDT COUNTY

Potosi District.—Getchell Mine, Inc. operated the Getchell mine and Pinson-Ogee lease in 1950 recovering a substantial quantity of gold and some silver from ore milled at the company 1,500-ton flotation-cyaniding plant.[5]

LANDER COUNTY

Battle Mountain District.—The Natomas Co. operated its Natomas-type electric bucket-line dredge at Greenan Placers throughout 1950. According to the company annual report, good recovery of values was made under severe operating conditions. Copper Canyon Mining Co. worked the Copper Canyon mine from January 1 to June 5, 1950, when a shaft fire rendered the mine and mill inoperable; 31,610 tons of ore milled at the company 350-ton flotation plant yielded 1,661 tons of concentrate containing (gross) 475 ounces of gold, 75,504 ounces of silver, 59,600 pounds of copper, 1,129,000 pounds of lead, and 543,680 pounds of zinc. The plant was operated on Copper Basin ore from September 13 to December 31, and 2,780 tons milled yielded 116 tons of concentrate, which grossed 41 ounces of gold, 507 ounces of silver, and 27,760 pounds of copper.

Bullion District.—The London Extension Mining Co. operated the Goldacres open-pit mine throughout 1950 and recovered gold and silver by cyanidation.

New Pass District.—Reorganized Silver King Divide Mining Co. worked the Thomas W-Gold Belt group from May 1 to September 30, 1950; 1,697 tons of ore yielded 424 ounces of gold and 58 ounces of silver by amalgamation and 5 tons of concentrate (containing (gross) 107 ounces of gold and 277 ounces of silver) which was shipped to a smelter.

LINCOLN COUNTY

Comet District.—Comet Mines, Inc., worked the Comet mine from January 1 to August 14, 1950, and shipped 616 tons of ore containing (gross) 47 ounces of gold, 2,187 ounces of silver, 3,776

---

[5] *See* Engineering and Mining Journal, vol. 151, No. 7, July 1950, pp. 60–62.

pounds of copper, 32,642 pounds of lead, and 124,072 pounds of zinc to custom mills.

Groom District.—Dan Sheahan operated the Groom mine in 1950 and milled 2,731 tons of ore, containing (gross) 1,356 ounces of silver, and 223,940 pounds of lead at the mine's 50-ton gravity and flotation plant; 126 tons of concentrate was shipped to a smelter.

Jack Rabbit District.—Bristol Silver Mines Co. worked the Bristol mine in 1950 and shipped to a smelter ore containing values in gold, silver, copper, lead, and zinc.

Pioche (Highland) District.—The Combined Metals Reduction Co. in 1950 received 5 percent more company ore but 4 percent less custom ore at the Caselton mill than in 1949. Company zinc-lead ore was derived from the Pioche group; some contained manganese and was stockpiled. Custom zinc and zinc-lead ores from Nevada came principally from the Ely Valley Mines, Inc., Ely Valley mine, which operated throughout 1950. The mill products were lead and zinc concentrates which were shipped to smelters.

LYON COUNTY

Silver City District.—Leo K. Johnson worked the Buckeye mine from January to September 1950 and shipped 292 tons of ore, which averaged 0.69 ounce of gold and 1.33 ounces of silver per ton to a custom mill. Other mines active in 1950 included the Dayton, Hayward, Silver City, and Three Brothers.

Wellington District.—Hatfield Goudey operated the Jack Pot mine in 1950 and shipped to smelters 40 tons of zinc-lead ore containing (gross) 1.81 ounces of gold, 83 ounces of silver, 740 pounds of copper, 6,193 pounds of lead, and 8,204 pounds of zinc and 141 tons of lead ore containing 0.52 ounce of gold, 229 ounces of silver, 1,959 pounds of copper, 20,401 pounds of lead.

Yerington District.—John Regan shipped to a smelter in 1950 21 tons of ore containing (gross) 74 ounces of silver, 1,308 pounds of copper, 4,444 pounds of lead, and 5,854 pounds of zinc from the Santa Cruz mine, ½ mile west of Mason.

MINERAL COUNTY

Aurora District.—Chessher & Co. worked the Chesco mine from January to October 1, 1950. Ore, amalgamated at the company mill, and concentrate, some of which was cyanided at a custom plant and the rest smelted, yielded substantial quantities of gold and silver.

Candelaria (Columbus) District.—G. A. Peterson operated the New Potosi mine in 1950 and with C. A. Wethern, lessee, shipped 1,842 tons of ore containing (gross) 457 ounces of gold, 20,531 ounces of silver, 1,104 pounds of copper, 243,014 pounds of lead, and 14,011 pounds of zinc to smelters.

East Walker District.—John Regan shipped 28 tons of ore containing (gross) 0.69 ounce of gold, 236 ounces of silver, 221 pounds of copper, 3,316 pounds of lead, and 276 pounds of zinc from the Empire mine to a smelter in 1950.

NYE COUNTY

Manhattan District.—Robert Selig worked the Sunshine mine during 1950; 175 tons of ore amalgamated at the mine 25-ton mill yielded 77 ounces of gold and 37 ounces of silver. Other mines operated in 1950 included the Baxter dump, Gold Metals group, Jumbo, Keystone group, Manhattan and Stray Dog (lode mines), and the Georgie group, Ajax, Jim, Jack, Jumbo, and Lucky Strike (placer mines).

Quartz Mountain District.—Douglas, Hill & Chiatovich worked the San Rafael mine from January 20 to December 31, 1950; 250 tons of ore milled at the 20-ton gravity mill yielded 21 tons of concentrate containing (gross) 1 ounce of gold, 835 ounces of silver, 135 pounds of copper, 15,506 pounds of lead, and 2,400 pounds of zinc. In addition, 861 tons of direct-smelting ore shipped contained 27 ounces of gold, 8,815 ounces of silver, 3,482 pounds of copper, 173,375 pounds of lead, and 16,975 pounds of zinc.

Round Mountain District.—Round Mountain Gold Dredging Corp. successfully worked the Round Mountain talus throughout 1950. Placer material was loaded by a 7-cubic-yard electric power shovel and belt-conveyed to the treatment plant, also electrically powered. Substantial quantities of gold and silver were recovered.

PERSHING COUNTY

Trinity (Arabia) District.—J. H. and Harry Green worked the G. W. claims for 9 months in 1950; 45 tons of ore shipped to a smelter contained (gross) 1.68 ounces of gold, 622 ounces of silver, 90 pounds of copper, and 12,089 pounds of lead.

Willow Creek District.—Wallace Calder operated a gasoline power shovel and trommel at the Wadley mine from July through September 1950; 7,900 cubic yards of gravel washed yielded 56 ounces of gold and 29 ounces of silver.

STOREY COUNTY

Comstock District.—Central Comstock Mines Corp. treated 48,808 tons of old tailings by cyanidation in 1950 and recovered substantial quantities of gold and silver. Dayton Consolidated Mines Co. operated its cyanide plant from January to September. The plant treated custom ores from various mining districts in Nevada and California, in addition to ore from the company-operated Consolidated Virginia, Justice, Keystone, Woodville, and Dayton (Lyon County) mines. Double King Mines, Inc. (W. M. Donovan), worked the Silver Hill open-pit mine from January to August 15, 1950, and cyanided 4,803 tons of ore in the company 100-ton mill at Silver City, Lyon County. Consolidated Chollar, Gould & Savage Mining Co. cyanided 42,482 tons of ore from the Overman open-pit mine from January 1 to July 10, 1950.

WASHOE COUNTY

Olinghouse (White Horse) District.—Mines operated during 1950 included the Butte (Jimmie D. More), Cabin No. 2, Texas No. 1 & Hutchinson (Emile Cabanne), Margaret Ext. (E. J. Cleary & A. J. Daniels), Monarch & Texas No. 3 (Roy Garrison), Renegade (G. W. De La Mare), and Texas No. 2 (R. B. Clemmons). Gold and silver were recovered by amalgamation.

WHITE PINE COUNTY

Aurum District.—Grand Deposit Mining Co. and lessees worked the Grand Deposit and the Kansas mines in 1950; 23 tons of lead ore containing (gross) 85 ounces of silver, 223 pounds of copper, 9,477 pounds of lead, and 1,830 pounds of zinc and 323 tons of copper ore containing 4 ounces of gold, 595 ounces of silver, and 32,388 pounds of copper were shipped to smelters.

Osceola District.—R. H. States & Hazel Green worked the Mary Ann placer drift mine throughout 1950; 110 cubic yards of gravel yielded 35 ounces of gold and 6 ounces of silver. Graham Development Corp. shipped 518 tons of ore containing (gross) 584 ounces of gold and 257 ounces of silver to a smelter from the Golden Eagle claim.

Robinson District.—The Kennecott Copper Corp. (Nevada Mines Division) operated the Ruth Pit and the Ruth Pit Extension, the latter for the account of Consolidated Coppermines Corp., throughout 1950. The ore was treated at Kennecott's McGill 18,000-ton-daily-capacity flotation concentrator and the copper concentrates smelted at the McGill reduction plant. The Consolidated Coppermines Corp. readied the Morris Brooks Pit for production and shipped lead ore and zinc ore to smelters from 10 lessee-operated claims in 1950. Sam M. Robison worked the Columbia group throughout 1950; 1,500 tons of ore concentrated by jigging yielded 39 tons of concentrate containing (gross) 1 ounce of gold, 107 ounces of silver, 157 pounds of copper, 32,960 pounds of lead, and 2,853 pounds of zinc. In addition, 1,639 tons of ore shipped to smelters and a slag-fuming plant contained (gross) 51 ounces of gold, 5,374 ounces of silver, 12,214 pounds of copper, 137,975 pounds of lead, and 422,864 pounds of zinc.

Ward District.—The O. B. Mining Co. worked the Pleadis and Good Luck claims from July 1 to November 9, 1950; 18 tons of ore shipped to a smelter contained (gross) 0.55 ounce of gold, 399 ounces of silver, 1,093 pounds of copper, 3,133 pounds of lead, and 2,768 pounds of zinc.

White Pine (Hamilton) District.—Andrew Siri and Alma Gubler operated the Great Valley mine throughout 1950; 190 tons of ore containing (gross) 1 ounce of gold, 1,613 ounces of silver, 12,478 pounds of copper, 82,224 pounds of lead, and 10,660 pounds of zinc were shipped to smelters. Kidder & King and lessees worked the Onetha and Ora claims from March 7 to November 17, 1950, and shipped ore with values in silver, copper, lead, and zinc to smelters.

New Mexico

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

EXTRAORDINARY demand for metals engendered by expanding industrial activity and the Korean conflict led to a sharp upturn in production of copper, lead, and zinc in New Mexico during the latter half of 1950. Prices of all three metals moved upward as the demand grew, and the average yearly zinc price was the highest on record. Five of the six major zinc-producing mines that shut down when the price of zinc declined in 1949 reopened in 1950—one on February 27, three in June, and one on October 16. However, return to the 1948 monthly production rate for zinc and lead in the State was delayed beyond the end of the year by a work stoppage, beginning October 17, that closed one mine and mill and caused several other mines served by the mill to suspend ore shipments temporarily. The large Chino open-pit copper mine in Grant County operated continuously and extended working time from 6 to 7 days a week in June. The Bonney-Miser's Chest underground copper mine in Hidalgo County worked steadily and expanded output materially.

The State production of copper increased 20 percent in quantity and 26 percent in value compared with 1949. Zinc output, although nearly the same in quantity as in 1949, rose 14 percent in value because of the advance in the average zinc price. Lead production declined 11 percent in quantity and 24 percent in value, the average price of lead dropping nearly 15 percent, as the price did not rise above 12 cents a pound until August 15, and it was October 31 before the year's high of 17 cents was quoted. Nearly all the gold and silver output was recovered as a byproduct from base-metal ores; gold production increased 5 percent from 1949, and silver output decreased 11 percent. The total value of the five metals was $37,437,915 in 1950 compared with $31,029,120 in 1949.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

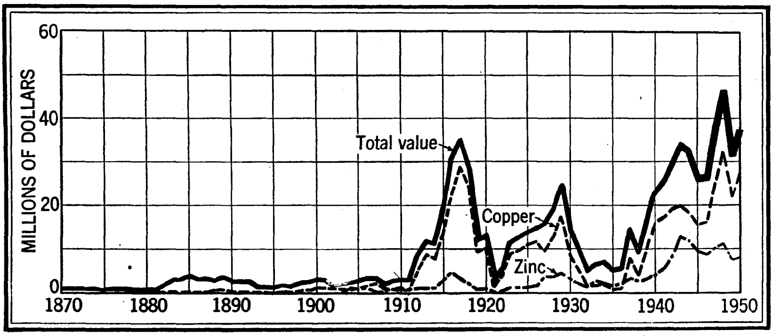

FIGURE 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1950. The value of gold, silver, and lead produced annually has been relatively small.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1950, by months, in terms of recoverable metal

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	332	28,215	4,718	143	830
February	275	14,310	5,271	160	830
March	225	19,229	5,759	192	1,555
April	268	18,147	4,895	109	1,645
May	133	17,195	4,680	102	1,917
June	130	18,645	5,340	162	1,671
July	366	25,434	5,320	365	3,410
August	217	35,579	5,964	574	4,187
September	185	30,000	6,375	417	3,823
October	300	46,293	6,160	664	3,408
November	487	47,590	6,051	686	3,000
December	496	37,944	5,767	576	2,987
Total: 1950	3,414	338,581	66,300	4,150	29,263
1949	3,249	380,855	55,388	4,652	29,346

Table 3 shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc and their annual output of ore and metals from 1946 to 1950, as well as the total production from 1848 to 1950. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent data, year by year, may be found in annual issues of Mineral Resources and Minerals Yearbook.

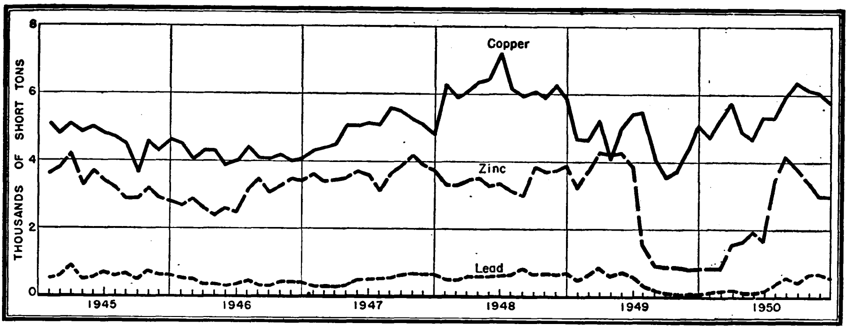

FIGURE 2.—Mine production of copper, lead, and zinc in New Mexico, by months, 1945-50, in terms of recoverable metal.

TABLE 3.—Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1946-50, and total, 1848-1950, in terms of recoverable metal [1]

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1946	50	4	6,594,890	4,009	$140,315	338,000	$273,104

1848-1950	1,606,779	505,532,647	297,679	35,724,509	989,154	163,329,150	809,332,304

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; and ore, old tailings, or copper precipitates shipped to smelters during the calendar year indicated.
[2] Figure not available.

TABLE 4.—Gold and silver produced at placer mines in New Mexico, 1945-50, in terms of recoverable metal

Year	Gold		Silver		Total value	Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value			Fine ounces	Value	Fine ounces	Value	
1945	15	$525	7	$5	$530	1948	9	$315	2	$2	$317
1946	10	350	2	2	352	1949	31	1,085	9	8	1,093
1947	23	805	10	9	814	1950	6	210	--------	--------	210

Gold.—The New Mexico output of gold in 1950 was 3,414 fine ounces, of which 2,942 ounces was recovered as a byproduct from base-metal ores (mostly copper ore) and 472 ounces was derived from dry gold and silver ores and placer gravel.

Silver.—Production of silver in New Mexico in 1950 totaled 338,581 fine ounces. Zinc and zinc-lead ores yielded 51 percent of the total silver, copper ore yielded 38 percent, lead and lead-copper ores 2 percent, and silver and gold ores 9 percent. The principal producers of silver were the Bonney-Miser's Chest copper mine in Hidalgo County and the Ground Hog zinc-lead mine and Hanover (Empire Zinc) zinc mine in Grant County.

Copper.—New Mexico's output of recoverable copper in 1950 was 66,300 tons compared with 55,388 tons in 1949 and an average of 65,712 tons annually for the 10-year period 1939–48. As usual, most of the State output of copper came from the Chino open-pit mine of the Kennecott Copper Corp. at Santa Rita, Grant County. The Banner Mining Co. Bonney-Miser's Chest mine in Hidalgo County was a

MINE PRODUCTION BY COUNTIES

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1950, by counties, in terms of recoverable metal

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Catron	2		41	$1,435	1,148	$1,039

Sandoval	3	1,248					1,257
Santa Fe	23	9,568					12,355
Sierra	2	832	4	1,080			7,187
Socorro	171	71,136	1,377	371,790	1,679	476,836	956,955
Total: 1950	66,300	27,580,800	4,150	1,120,500	29,263	8,310,692	37,437,915
1949	55,388	21,822,872	4,652	1,470,032	29,346	7,277,808	31,029,120

substantial producer. The Atwood mine in Hidalgo County and the Stauber in Guadalupe County shipped considerable copper ore directly to the El Paso smelter.

Lead.—The quantity of recoverable lead produced in New Mexico in 1950 was 4,150 tons compared with 4,652 tons in 1949. Although 15,727 tons of low-grade lead ore was mined in the Hansonberg (Oscura Mountains) district in Socorro County in 1950, most of the State output of lead came from zinc and zinc-lead mines in the Central and Magdalena districts. The principal producers of lead in 1950 were the Ground Hog mine (Central district), Lynchburg (Magdalena district), Bayard (Central district), and Portales (Hansonberg district).

Zinc.—Most of the mines in New Mexico that closed in 1949 as a result of the drastic decline in the price of zinc reopened in 1950, when the price rose from 9.75 cents a pound to 17.5 cents between March 13 and September 7. In the Central district, the New Mexico Consolidated Mines Co. Kearney mine resumed operations February 27; the Kennecott Copper Corp. Oswaldo mine, the American Smelting & Refining Co. Ground Hog, and the United States Smelting, Refining & Mining Co. Bayard reopened in June; and the Peru Mining Co. Pewabic reopened October 16. The Hanover mine and mill of the New Jersey Zinc Co., Empire Zinc Division, which had operated throughout 1949, were shut down by a work stoppage October 17, 1950, and remained idle the rest of the year. The shut-down of the mill caused the Oswaldo and several other mines served by the mill to suspend ore shipments temporarily. The State output of recoverable zinc, of which 92 percent came from the Central district, was 29,263 tons compared with 29,346 tons in 1949. The principal producers of zinc in 1950, in order of output, were the Kearney, Hanover (Empire Zinc), Ground Hog, Oswaldo, and Bayard groups.

MINING INDUSTRY

The Chino open-pit copper mine of the Kennecott Copper Corp. at Santa Rita, Grant County, is the largest single mining enterprise in New Mexico. About 45,000 tons of combined ore and waste rock are removed from the pit daily. Around 800 men are employed at the mine and 1,000 at the treatment plants and offices at Hurley; in addition, 200 people work at the hospital and other company-supported projects. The Bonney-Miser's Chest and Atwood underground mines in Hidalgo County and the Stauber in Guadalupe County also produced copper ore in 1950. The tonnage of copper ore mined in the State increased 23 percent from 1949. The combined tonnage of lead and zinc ores decreased 11 percent despite reopening of most of the mines that closed in 1949; a labor strike that shut down the Hanover (Empire Zinc) mine and mill October 17 prevented a return to full production during 1950. Deep development of zinc-lead ore bodies of the Ground Hog mine in the Central district continued, and one shaft reached a depth of 2,210 feet, making it probably the deepest mine shaft in New Mexico. The Bureau of Mines did exploratory drilling on a low-grade copper deposit in the Organ district and a zinc-lead deposit in the Cerrillos district.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1950, by class of ore or other source material, with content in terms of recoverable metal

Source	Number of mines [1]	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	11	935	182	378	739	1,912	----------
Dry gold-silver ore	5	1,224	270	12,741	3,698	5,800	----------
Dry silver ore	8	3,925	14	18,822	4,699	80,516	----------
Total	24	6,084	466	31,941	9,136	88,228	----------
Copper ore	14	7,510,499	2,587	127,455	[2] 131,918,424	150,027	----------
Lead ore	31	18,045	58	6,122	11,530	1,379,504	5,000
Lead-copper ore	1	56	2	507	3,000	18,989	----------
Zinc ore	12	335,703	265	135,023	604,066	4,616,833	55,027,500
Zinc-lead ore	7	28,667	30	37,533	53,844	2,046,419	3,493,500
Total	58	7,892,970	2,942	306,640	[2] 132,590,864	8,211,772	58,526,000
Total lode mines	78	7,899,054	3,408	338,581	[2] 132,600,000	8,300,000	58,526,000
Gravel (placer operations)	2	----------	6	----------	----------	----------	----------
Total: 1950	80	7,899,054	3,414	338,581	[2] 132,600,000	8,300,000	58,526,000
1949	80	6,539,602	3,249	380,855	[2] 110,776,000	9,304,000	58,692,000

[1] Detail will not necessarily add to totals because some mines produce more than one class of ore.
[2] Includes copper contained in precipitates recovered from mine water and leached dumps as follows: 1950—33,060,113 pounds of copper; 1949—30,789,314 pounds of copper.

METALLURGICAL INDUSTRY

Four flotation mills treated 98 percent of the zinc and zinc-lead ores mined in New Mexico in 1950. These mills were the 1,000-ton Peru mill and the new 400-ton American Smelting & Refining Co. mill at Deming; the Empire Zinc Co. mill at Hanover; and the United States Smelting, Refining & Mining Co. 600-ton mill at Bayard. A small mill at the Hornet mine at Hachita also treated zinc-lead ore. Copper ore was treated in the 20,000-ton (rated capacity) Chino concentrator at Hurley and the 500-ton Banner Mining Co. mill near Lordsburg. Lead ore from the Hansonberg (Oscura Mountains) district was concentrated in the jig mill built in 1950 at the Major Jones mine and in the Portales mill at San Antonio.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Placer	6	----------	----------	----------	----------
Amalgamation	90	35	----------	----------	----------
Smelting of ore	1,059	89,562	2,277,887	798,447	70,900
Smelting of concentrate	2,259	248,984	97,262,000	7,501,553	58,455,100
Smelting of precipitate (copper)	----------	----------	33,060,113	----------	----------
Total: 1950	3,414	338,581	132,600,000	8,300,000	58,526,000
1949	3,249	380,855	110,776,000	9,304,000	58,692,000

The Chino smelter of the Kennecott Copper Corp. at Hurley treated concentrates from the Chino mill, siliceous copper ore (used as a flux) from the Chino mine, and copper precipitates from company operations at Chino and Ray, Ariz. The smelter produces fire-refined copper and some blister copper. Direct-smelting ore and lead and copper concentrates from other New Mexico operations were shipped to smelters in Texas, Arizona, and Kansas. Zinc concentrates were shipped to smelters in Illinois, Montana, Pennsylvania, and Texas.

TABLE 8.—Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1950, by method of recovery (except placer) and class of ore[1] processed, in terms of recoverable metal

[1] Copper contained in precipitates recovered from mine water and leached dumps is included with that in copper concentrates as follows: 1950, 33,885,754; 1949, 31,408,905 pounds of copper.

REVIEW BY COUNTIES AND DISTRICTS

CATRON COUNTY

Mogollon (Cooney) District.—Mathis & Mathis worked the Lehigh Metals Co. Fanney Consolidated group from January 1 through March 6, 1950, and shipped 118 tons of ore containing 32 ounces of gold and 1,120 ounces of silver. At the Big John mine about 55 tons of ore were mined with hand tools. The mill-grade rock was stockpiled at the mine and 5 tons of ore containing 9 ounces of gold, 28 ounces of silver, and 45 pounds of copper[1] were packed 2 miles on burros to a road and trucked to smelters.

DONA ANA COUNTY

Organ District.—The Merrimac mine was operated under lease by Wade White and Ira L. Wright from July through December. The ore shipped (1,632 tons) averaged 18.44 percent zinc and contained also silver, copper, and lead. J. H. Brown shipped sample lots of copper-silver ore from the Torpedo group and lead-silver ore from the Bennett-Stephenson. The Bureau of Mines completed its Torpedo Copper diamond-drilling research project in April.

[1] No output of recoverable copper is shown for Catron County in 1950 because the quantity produced was too small to be tabulated in rounded figures.

[1] Includes Burro Mountain district, gold and silver figures for which Bureau of Mines is not at liberty to publish separately.
[2] All from lode mines.
[3] Includes copper recovered from precipitates.

GRANT COUNTY

Burro Mountain (Tyrone) District.—The Malone Darhasana Mining Co. drove 40 feet of drifts in its mine between Knight and Thompson Canyons and shipped some gold-silver ore.

Central (Bayard, Fierro, Georgetown, Hanover, Santa Rita) District.—The large Chino open-pit mine of the Kennecott Copper Corp. Chino Mines Division at Santa Rita operated continuously 6 days a week from January through May and 7 days the rest of 1950. The bottom level of the pit was about 400 feet below the lowest point on the rim and 845 feet below the highest point at the end of 1950. The distance across the pit at the widest point was 5,400 feet. A standard-gage railroad with 40 miles of track is used in the pit and on the dumps. Electric shovels handling 8 tons per dip are used on benches for loading ore and waste rock; about 45,000 tons of material, nearly half of which is ore, are generally handled daily. The ore is transferred from the mine railroad to the Atchison, Topeka & Santa Fe Railway branch line west of the pit for delivery to treatment plants at Hurley, 10 miles from the mine. The concentrator has a daily (maximum) capacity of 22,500 tons. Molybdenite is recovered in the mill as a byproduct. The copper concentrate is smelted in the company smelter adjacent to the mill. The smelter also treats precipitates derived from dump leaching and siliceous copper ore used as a flux. The copper bullion contains minor quantities of gold and silver, which are not recovered from fire-refined copper, the major product of the smelter; the blister copper made contains some recoverable gold and silver.

The Kennecott Copper Corp. Oswaldo zinc mine operated in 1950 from June 19 through December. The ore produced was shipped to the Hanover (Empire Zinc) mill until that mill was closed by a work stoppage October 17; most of the ore mined the rest of the year was stockpiled. During the year 2,101 feet of drifts and 132 feet of raises were driven. The total development in the Oswaldo mine at the end of 1950 comprised two vertical shafts 490 and 705 feet deep, 13,348 feet of drifts and crosscuts, and 772 feet of raises.

The Hanover mine of the New Jersey Zinc Co., Empire Zinc Division, the only large New Mexico zinc producer that operated throughout 1949, continued producing steadily in 1950 until October 17, when a labor strike (prolonged many months) shut down the mine and mill. As the mill treated custom ore in addition to company ore, its closing forced several other mines to suspend ore shipments or to seek other milling facilities.

The Kearney mine, operated by the New Mexico Consolidated Mining Co. (subsidiary of the Peru Mining Co.), was reopened February 27, 1950, and the Pewabic, operated by the Peru Mining Co., was reopened October 16; both mines had closed in June 1949 because of the low prices of zinc and lead. Development in the Kearney (opened by a 625-foot shaft) in 1950 included 1,335 feet of drifts and 4,530 feet of diamond drilling.

The Bayard mine of the United States Smelting, Refining & Mining Co. reopened in June 1950 after a year's shutdown caused by the decline in the price of zinc and lead in 1949. In 1950 the company 600-ton flotation mill operated from July 1 through December. Development during the year included 460 feet of raises, 1,283 feet of drifts and crosscuts, and 1,361 feet of diamond drilling.

The American Smelting & Refining Co. Ground Hog mine, which had suspended mining ore July 15, 1949, but continued development work, was active in development throughout 1950 and resumed mining operations June 20. Development in 1950 included 454 feet of shaft, 6,363 feet of drifts, raises, and crosscuts, and 9,940 feet of diamond drilling. The new three-compartment No. 5 shaft was extended to a depth of 2,210 feet and is probably the deepest mine shaft in New Mexico. The new four-compartment Star vertical shaft is 1,926 feet deep. The old North shaft is vertical to the 600-foot level and has a winze from there to the 1,800-foot level. The ore produced was shipped to the new company mill at Deming (see Luna County). The old Combination-Black Hawk mill, which formerly served the mine, was sold for dismantling.

Small-scale operators at the Betty Jo, Little Goat, and Jim Thayer mines shipped a total of 230 tons of ore.

Eureka District.—The Hornet mine, operated by Mineral Operations, Inc., produced from 20 to 35 tons of zinc-lead ore daily in 1950; the ore was concentrated in the company flotation mill at the mine. About a car of lead-silver ore was shipped from the Mairland claim.

Lone Mountain District.—Shipments of low-grade silver ore were continued from the Ben Hur-Mayflower property.

Pinos Altos District.—Mathis & Mathis operated the Houston-Thomas mine from June through December 1950 and shipped to the Peru mill near Deming 2,174 tons of ore containing 4,909 ounces of silver, 9,304 pounds of copper, 139,938 pounds of lead, and 334,884 pounds of zinc. Other small producers were the Langston and Geo. Schaffer mines.

Steeple Rock District.—L. H. Foster worked the Alabama group 9 months in 1950 and shipped 761 tons of ore containing 220 ounces of gold, 10,731 ounces of silver, and 901 pounds of copper. R. R. Rogers and Wm. McGuire, operating the Carlisle group, shipped 94 tons of ore containing 39 ounces of gold, 273 ounces of silver, and a little copper and lead.

Swartz (Carpenter, Camp Monarch) District.—The Royal John mine [2] was operated by lessees in 1950; the ore produced was shipped to custom mills at Hanover and Deming. The Patsy mine shipped about 700 tons of zinc ore. Some ore was shipped from the Aquilar and Luther M. Martin properties.

GUADALUPE COUNTY

Pintado District.—In 1950 Drunzer & Casner shipped 18,469 tons of siliceous copper ore from the Stauber mine to the El Paso smelter.

HIDALGO COUNTY

Gillespie (Red Hill) District.—Lessees at the Red Hill mine shipped 936 tons of silver-lead ore from the dump.

Lordsburg District.—The Banner Mining Co. stepped up production at its Bonney-Miser's Chest copper mine, equipped with a 500-ton flotation mill. The mill makes a 97-percent-plus recovery on the

[2] Soulé, John H., Investigation of the Royal John Lead-Zinc Deposits, Grant County, N. Mex.: Bureau of Mines Rept. of Investigations 4748, 1950, 14 pp.

copper. The ore was mined through the new Miser's Chest 1,191-foot vertical shaft. Development in 1950 included 10 feet of shaft, 1,212 feet of drifts, 1,003 feet of tunnel, and 2,018 feet of diamond drilling. The Atwood mine was worked in January, April, and May by C. H. and S. A. McIntosh and from July 27 through December under lease by Ira L. Moseley. The mine is opened by a three-compartment vertical shaft 792 feet deep and more than 4,000 feet of drifts and crosscuts on 4 levels. The ore produced contained copper, silver, lead, and gold and was shipped crude to the El Paso smelter. Other mines shipping a car or more of ore included the Anita, Last Chance, Lead Extension, Phoenix, and Ruth. Strong & Harris, Inc., continuing development at the Waldo mine, did 750 feet of drifting, 100 feet of raising, and 100 feet of diamond drilling.

San Simon District.—Some ore was shipped from the Bob Montgomery, Carbon Hill, Paint Horse, White Cloud, and World's Fair properties in 1950.

LINCOLN COUNTY

Nogal (Bonita, Parsons) District—Gold and silver were recovered by amalgamating ore from an open pit on the Pershing claim.

White Oaks District.—The Q. B. Q. Co., Inc., shipped a car of gold ore from the old North Homestake mine and recovered some gold and silver by amalgamation.

LUNA COUNTY

Cooks Peak District.—J. E. Price shipped 5 tons of lead-silver ore from the Johny claim.

Deming District.—The Peru Mining Co. operated its 1,000-ton selective lead-zinc flotation mill from March 15 through December 1950. The ore treated comprised 123,852 tons from the company's Kearney and Pewabic mines in the Central district and 2,573 tons of custom ore from other mines in Grant and Socorro Counties.

The American Smelting & Refining Co. completed its new 400-ton selective flotation mill at Deming in March 1950 and began operating it on a regular schedule July 6.[3] The mill served the company Ground Hog mine at Vanadium 46 miles northwest of Deming and also handled custom ore from 13 other mines, of which 9 were in New Mexico, 3 in Arizona, and 1 in Mexico. The mill features automatic sampling, efficiency of power consumption, ease of operation control, and economic high extraction of metals in treating zinc-lead-pyrite ore.

Tres Hermanas District.—Small tonnages of lead-silver ore were shipped from the Black Hawk No. 1 and Red Bird claims.

Victorio District.—About a car each of lead-silver ore was shipped from the Tungsten Hill and Virginia-Silver groups.

OTERO COUNTY

Sacramento District.—M. F. Drunzer shipped 486 tons of lead ore from the Warnock mine 9 miles south of High Rolls.

[3] Mining World, Deming—1950 Lead-Zinc Mill: September 1950, pp. 27–31.

SANDOVAL COUNTY

Nacimiento Mountains District.—Several hundred tons of low-grade copper ore was shipped from the Senorita mine, and 2 truckloads of 5-percent copper ore were shipped from the old San Miguel mine.

SANTA FE COUNTY

Cerrillos District.—The Bureau of Mines worked on a diamond-drilling research project on the Cash Entry group during May and June 1950. The mine was not in production during the year.

San Pedro or New Placers District.—Lessees at the San Pedro mine shipped 15 truckloads of copper-gold-silver ore. The Shamrock Gold Mining Co. worked on exploratory trenching and sampling on the Oro Quay group and remodeled its 25-ton mill at Golden. Ore milled for sampling yielded heavy iron sulfide concentrate, most of which was stockpiled at the mill; 9 tons, containing 12 ounces of gold and a little silver, copper, and lead, was shipped in 1950.

SIERRA COUNTY

Chloride (Apache, Cuchillo Negro) District.—Small lots of ore were shipped from the Big Bug, Dobies, and Minnehaha claims.

Hermosa (Lower Palomas Creek) District.—The Pelican mine was operated on a small scale by Ferguson & Jones.

Las Animas District.—The Anderson Extension, Bigelow, El Oro, and Snake gold mines produced small lots of ore.

SOCORRO COUNTY

Hansonberg District (Bingham).—The Portales Mining Co. open-pit lead mine was worked about 9 months in 1950 and produced 14,377 tons of ore, all trucked to the company mill at San Antonio for concentration. The Hurlow Mining & Milling Co. built a jig mill at the Major Jones open-cut lead mine and operated the mine and mill several months. The Mex-Tex Mining Co., Inc., did development on its lead-fluorspar-barite group (58 claims) and completed construction of a 500-ton mill near San Antonio designed to recover lead-silver concentrate, barite, and fluorspar as separate commercial products. Lead-silver concentrate was shipped in December. The new mill is adjacent to the company barite-grinding plant.

Magdalena District.—The Lynchburg mine of the New Jersey Zinc Co., Empire Zinc Division, operated under lease by C. S. Elayer, was the principal producer in the Magdalena district in 1950. The mine shipped zinc-lead-silver ore to custom mills in Grant and Luna Counties and copper-silver ore to the El Paso smelter. The 200-ton Waldo flotation mill of the American Smelting & Refining Co. was sold for dismantling; the Waldo zinc-lead mine was worked on a small scale by lessees. Other producers were the Juanita, Kelly, Nitt, and Queen mines.

Oregon

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. Maurer

GENERAL SUMMARY

REFLECTING the lower yield from dredging, Oregon gold production in 1950 fell 32 percent below 1949, whereas 1950 silver output, largely from lode mines, rose 11 percent over 1949. Zinc production increased 250 percent and lead 42 percent, but copper decreased 5 percent; the State's output of these three metals is minor, however.

Total value of the gold, silver, copper, lead, and zinc (in terms of recoverable metals) produced in Oregon was $417,765 in 1950 compared with $592,107 in 1949, a decrease of 29 percent. It was divided among the metals as follows: Gold, 93 percent; silver, 3 percent; and copper, lead, and zinc combined, 4 percent. Baker County was the leading metal producer in 1950, gaining slightly in gold and copper output, and supplied 54 percent of the State total value. Grant County, which fell to second place, owing largely to curtailed dredging, contributed 25 percent; Lane County, in third place by virtue of lode mining, 12 percent; and the other five producing counties, 9 percent.

Placer mines yielded 82 percent and lode mines 18 percent of Oregon gold produced in 1950. In 1949 the ratio was placer mines 89 percent and lode mines 11 percent.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121

1949	20	7,880	12	3,792	6	1,488	592,107
1950	19	7,904	17	4,590	21	5,964	417,765
1852-1950	12,398	4,663,095	796	91,125	169	21,770	138,931,490

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; old tailings or slimes re-treated; and ore, old tailings, or copper precipitates shipped directly to smelters during the calendar year indicated.
[2] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[3] Figure not available.

Gold.—Oregon gold production in 1950, including the fine-gold content of a relatively small amount of "natural gold" sold on the open market, decreased 32 percent compared with 1949. Gold output from placer mines—38 percent below 1949, due largely to the paucity of dredging properties that could be worked profitably—was 82 percent of the State output; of the placer total, bucket-line dredges recovered 87 percent, dragline dredges 5 percent, hydraulicking 5 percent, and nonfloating washing plants (with mechanical excavators), drift mining, and small-scale hand methods together 3 percent. The aggregate of small gains at several mines resulted in a 16-percent increase in lode gold over 1949, but 77 percent of the 1950 output was the yield from three mines. Ninety-five percent of the lode gold produced was from gold ore and old tailings, 4 percent from zinc ore, and 1 percent from gold-silver ore.

The following five producers, listed in order of output, supplied 85 percent of the State total: Powder River Dredging Co. (successor to Baker Dredging Co.) and Porter & Co. (bucket-line dredges); Champion Lease (Champion mine), R. G. Amidon & Co. (Buffalo mine), and Curl Bourne Mines (Bourne group) (lode mines).

Monthly output for 1950 shown in table 4 reflects the sporadic production of Oregon gold.

TABLE 3.—Gold produced at placer mines in Oregon, 1946–50, by class of mine and by method of recovery

Class and method	Mines producing [1]	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average value per cubic yard

1948	1	350	10	350	1.000
1949	1	250	7	245	.980
1950	1	400	8	280	.700
Grand total placers:					
1946	37	5,519,000	16,502	577,570	.105
1947	49	5,150,000	17,648	617,680	.120
1948	38	4,012,750	12,522	438,270	.109
1949	29	4,157,300	14,465	506,275	.122
1950	42	3,247,200	9,022	315,770	.097

[1] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[2] Data for nonfloating washing plants included with bucket-line dredges to avoid disclosure of individual output.
[3] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.
[4] Includes all placer operations using suction pump for delivering gravel to floating washing plant, except those producing less than 100 ounces of gold, which are included with "small-scale hand methods."
[5] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[6] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc. "Wet" method used exclusively in Oregon.

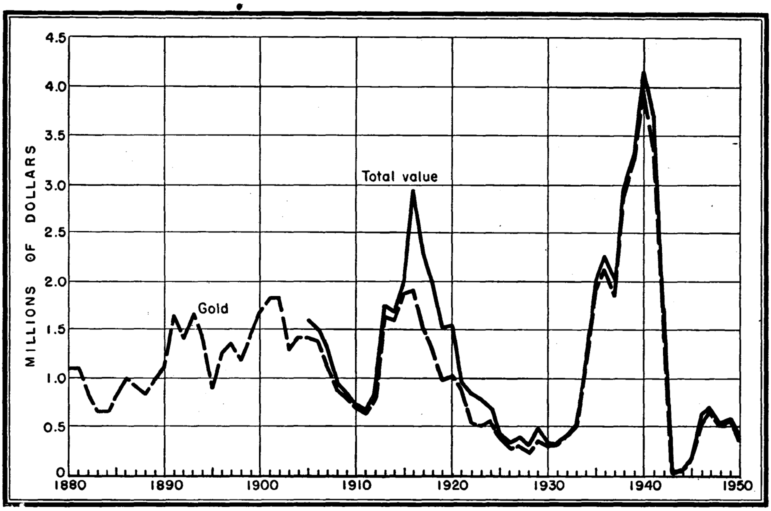

FIGURE 1.—Value of mine production in Oregon of gold, 1880–1950, and total value of gold, silver, copper, lead, and zinc, 1905–50.

Silver.—Oregon silver production in 1950 increased 11 percent over the relatively low output of 1949. Of the total, 74 percent was the yield of the following three leading silver producers, all lode mines, listed in order of output: The Buffalo mine, Champion mine, and Oregon King mine. Nearly 67 percent was recovered from gold ore and old tailings, 14 percent each from gold-silver ore and placer gravels, and more than 5 percent from zinc ore.

Copper, Lead, and Zinc.—Mining and milling of gold and zinc ores in the Bohemia district, Lane County, from July through December supplied most of the State copper, lead, and zinc production reported in 1950. The Champion mine (Champion Lease) was the principal producer of Oregon copper and contributed some of the State lead and zinc in 1950. The Musick mine (Tar Baby Mining Co.) was the leading producer of lead and zinc and followed the Champion mine in copper output. Other mines that produced recoverable base metals included: The Helena mine (Helena Mines, Inc.), Lane County, and the Buffalo mine, Grant County (copper, lead, and zinc); the Oregon King mine, Jefferson County (copper and lead); and the Bourne group, Baker County (copper).

TABLE 4.—Mine production of gold and silver in Oregon in 1950, by months, in fine ounces of recoverable metal

[1] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[2] From property not classed as a mine.
[3] Sources of total silver as follows—1950: 11,706 ounces from lode mines and 1,859 ounces from placers; 1949: 9,488 ounces from lode mines and 2,707 ounces from placers.

MINING INDUSTRY

Indicating a trend toward more selective mining, Oregon lode mines that reported production in 1950 increased 14 percent compared with 1949; and the tonnage of ore and tailings treated at mines or sold decreased 32 percent, whereas the value of gold, silver, copper, lead, and zinc produced at lode mines during 1950 increased 20 percent. Placer mines that reported production in 1950 increased 45 percent over 1949; however, the total yardage of gravel treated decreased 22 percent in 1950, owing largely to cessation of operation during a large part of the year by two dredges, both major producers of gold in 1949. The average value per cubic yard of gravel treated in Oregon in 1950 dropped 20 percent compared with 1949.

The two properties worked by bucket-line dredge had one dredge each; one operated throughout the year. Three dragline dredges washed gravel during periods of 1950, but only one operated at the close of the year.

Small mines predominated in 1950, due in part to the properties worked for short duration to complete assessment work. However, six lode mines produced 77 percent of the State ore and 97 percent of the gravel washed in 1950 was from four placer mines.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Oregon in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	3,593	1,929	8,957	32,000	12,100	11,000
Dry gold-silver ore	200	23	1,886	700	1,200

Old tailings (gold)	204	12	78		100	
Total lode mines	4,257	2,036	11.706	38,000	34,000	42,000
Gravel (placer operations)		9,022	1,859			
Total: 1950	4,257	11,058	13,565	38,000	34,000	42,000
1949	6,215	16,226	12,195	40,000	24,000	12,000

METALLURGICAL INDUSTRY

Of the 32 Oregon lode mines in 1950, 19 treated ore by amalgamation, 6 operated concentration mills and shipped the product to smelters, 4 shipped ore and old tailings for direct smelting, 2 consigned ore for concentration and smelting on a custom basis, and 1 cyanided old tailings; 86 percent of the State total ore and old tailings was treated in mills, and 14 percent was shipped crude to smelters. The 125-ton Champion mill operated by Kenneth O. Watkins near Disston, Oreg., treated custom ores from mines in the Bohemia district, Lane County, by selective flotation. All material requiring smelting was shipped out of the State.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Oregon in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)

REVIEW BY COUNTIES AND DISTRICTS

BAKER COUNTY

Cracker Creek District.—Curl Bourne Mines worked the Bourne group located 7 miles north of Sumpter from May through December 1950 and shipped ore containing substantial quantities of gold and silver and some copper to a smelter.

Sumpter District.—Baker Dredging Co. and successor Powder River Dredging Co. operated a Yuba electric bucket-line dredge with 70 9-cubic-foot buckets at Sumpter Valley Placers throughout 1950. Powder River Dredging Co. washed 1,158,092 cubic yards of gravel, which averaged 7 cents in gold and silver values a cubic yard, from July 20 to December 31, 1950.

GRANT COUNTY

Granite District.—Porter & Co. operated a Yuba electric bucket-line dredge with 60 4½-cubic-foot buckets on Olive Creek from March 31 to July 6, 1950. The equipment subsequently was moved to Crane Creek and worked from November 15 to December 31, 1950. R. G. Amidon & Co., an Oregon corporation, worked the Buffalo mine from July 16 to December 31, 1950; 530 tons of ore treated in the company 30-ton flotation plant yielded 82 tons of concentrate containing in gross metal 460 ounces of gold, 3,578 ounces of silver, 837 pounds of copper, 5,326 pounds of lead, and 4,119 pounds of zinc. The concentrate and 30 tons of crude ore containing in gross metal 105 ounces of gold, 510 ounces of silver, 187 pounds of copper, 765 pounds of lead, and 540 pounds of zinc were shipped to smelters. The mine was worked sporadically in 1950 prior to July 16.

North Fork District.—Calhoun & Howell, Oregon, Ltd., operated a Diesel dragline dredge with a 3-cubic-yard bucket on the North Fork of John Day River from March 4 to April 3, 1950; 60,000 cubic yards of gravel treated averaged 10 cents a cubic yard in gold and silver values.

JACKSON COUNTY

Gold Hill District.—R. E. Cook & Ed Koster hydraulicked the Lance mine on Foots Creek from February 1 to May 1, 1950; 3,000 cubic yards of gold-bearing gravel washed yielded 12 ounces of gold and 2 ounces of silver.

TABLE 10.—Mine production of gold, silver, copper, lead, and zinc in Oregon in 1950, by counties and districts,[1] in terms of recoverable metal

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 10 and their output included with "Other districts."
[2] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[3] Source of silver: 11,706 ounces from lode mines and 1,859 ounces from placers.
[4] Included with "Other districts."
[5] Exclusive of lode output, which is included with "Other districts."
[6] Greenhorn district is in Baker and Grant counties.
[7] From property not classed as a mine.
[8] Exclusive of placer output, which is included with "Other districts."
[9] Mill cleanup.
[10] Includes Baker (lode), Cracker Creek (lode), and Sumpter districts (placer) in Baker County, and Granite district (placer) in Grant County.

Jacksonville District.—Christean Bros. operated a gasoline dragline dredge with a 1-cubic-yard bucket on Miller Creek from February 16 to April 25, 1950, and recovered 46 ounces of gold and 7 ounces of silver from 9,000 cubic yards of gravel.

JEFFERSON COUNTY

Ashwood District.—Oregon King Mines, Henry Anderegg, lessee, operated the Oregon King mine for 1 month in 1950. Approximately 200 tons of ore treated by flotation yielded 39 tons of concentrate containing in gross metal 23 ounces of gold, 1, 886 ounces of silver, 712 pounds of copper, 2,034 pounds of lead, and 2,425 pounds of zinc, which was shipped to a smelter. A fire on August 2, 1950, damaged the mine shaft and some surface installations.

JOSEPHINE COUNTY

Galice District.—Naron & Van Devanter, Oregon, Ltd., operated a Diesel dragline dredge with a 1½-cubic-yard bucket and Bodinson floating washing plant at Lewis Bar from July 16 to December 31, 1950; the gravel washed averaged 24 cents a cubic yard in gold and silver values.

Greenback District.—Several hydraulic mines worked during 1950 included: The M. H. Davis group (Harry Steward), Goff (Cleo C. Clark), McIntosh (Harold McIntosh), and Schleigh (W. C. Schleigh); 2,000 cubic yards of gravel washed at the Schleigh mine yielded 14 ounces of gold and 3 ounces of silver.

Lower Applegate District.—Wm. S. Robertson & Associates worked the Humdinger mine on Horsehead Creek from January 1 through August 27, 1950; 56 tons of ore shipped to a smelter contained 79 ounces of gold, 129 ounces of silver, and 90 pounds of copper.

LANE COUNTY

Bohemia District.—The Champion Lease (Kenneth O. Watkins, partner) operated the Champion flotation mill from July 1 through December 31, 1950; 1,948 tons of ore from the Champion mine yielded 85 tons of flotation copper concentrate containing in gross metal 363 ounces of gold, 1,778 ounces of silver, 13,455 pounds of copper, 5,919 pounds of lead, and 4,239 pounds of zinc; 102 tons of flotation zinc-copper concentrate containing in gross metal 243 ounces of gold, 1,991 ounces of silver, 19,824 pounds of copper, 2,831 pounds of lead, and 13,833 pounds of zinc; and 9 tons of gravity lead concentrate containing in gross metal 132 ounces of gold, 134 ounces of silver, 644 pounds of copper, 2,111 pounds of lead, and 1,037 pounds of zinc. Ores from the Musick mine, Tar Baby Mining Co. (115 tons, yielding 22 tons of flotation zinc-lead-copper concentrate containing in gross metal 32 ounces of gold, 256 ounces of silver, 2,380 pounds of copper, 6,595 pounds of lead, and 11,920 pounds of zinc and an undetermined tonnage of zinc concentrate), and the Helena mine, Helena Mines, Inc. (145 tons, yielding 10 tons of zinc-lead-copper flotation concentrate containing in gross metal 34 ounces of gold, 194 ounces of silver, 1,380 pounds of copper, 4,303 pounds of lead, and 15,340 pounds of zinc and an undetermined tonnage of zinc concentrate), also were milled. Concentrates (zinc concentrate excepted) were shipped to smelters.

South Dakota

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By Samuel A. Gustavson

GENERAL SUMMARY

GOLD was produced by only two companies in South Dakota in 1950, compared with five in 1949. However, production was greater by 22 percent. The output of silver (all a byproduct of gold mining) increased about 30 percent. No production of copper, lead, or zinc was reported in 1950. The two operating companies were the Homestake Mining Co. at Lead and the Bald Mountain Mining Co. at Trojan, both in Lawrence County.

In the years following the recent war, labor shortages and increasing labor and material costs against set prices for gold and silver have been unfavorable for gold mining in the United States; consequently, many operators in the State have been unable to continue economical mining or have not resumed mining since War Production Board Limitation Order L 208 was rescinded July 1, 1945.

The Homestake Mining Co. reported having a fair supply of labor during the first half of 1950 and during November and December. An annual average of 45 more men were employed in the mine department than in 1949. With the beginning of the war in Korea, fear of the imminence of a third world war with another gold-mine closing order caused men to begin leaving the mines, with the result that average employment in the mine department was 272 less in October than in June. In November and December the migration of labor reversed as the international situation eased, and a substantial number of men returned.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the prices shown in table 1.

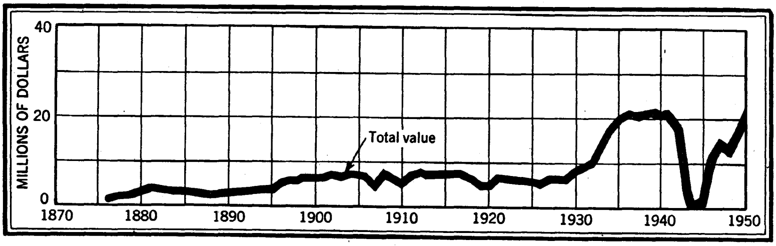

FIGURE 1.—Total value of mine production of gold and silver in South Dakota, 1876–1950

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)

August	50,304	12,310			

MINE PRODUCTION BY COUNTIES

During both 1949 and 1950 all gold and silver produced was from mines in Lawrence County. In 1949 a small quantity of lead was produced in Lawrence County. There has been no reported production of zinc in South Dakota since 1948 and no production of copper since 1944. Virtually all of the gold, silver, copper, lead, and zinc produced in South Dakota has come from mines in the mountain group known as the Black Hills, which is situated chiefly in Custer, Lawrence, and Pennington Counties. Most of the gold, silver, lead, and zinc has been produced from mines in Lawrence County and most of the copper from mines in Pennington County. No production of gold or silver has been recorded from mines in Custer County since 1941.

MINING AND METALLURGICAL INDUSTRY

Details of mining and milling in South Dakota are given in the following Review by Counties. The tables that follow show the quantity of material treated and the gold and silver recovered by amalgamation and cyanidation. The Homestake Mining Co. treats its ore by both amalgamation and cyanidation, accounting for a duplication of tonnage in the two tables.

TABLE 4.—Gold and silver bullion produced at mills in South Dakota by amalgamation, 1946–50

Year	Ore treated (short tons)	Gold in bullion (fine ounces)	Silver in bullion (fine ounces)
1946	793, 034	197, 425	35, 498
1947	849, 123	262, 257	52, 057
1948	896, 932	250, 782	72, 100
1949	1, 112, 193	312, 676	83, 538
1950	1, 265, 118	389, 473	111, 080

REVIEW BY COUNTIES

LAWRENCE COUNTY

Homestake Mine.—The Homestake Mining Co. operated its mine in the Whitewood district through three shafts (the deepest being 4,245 feet) and an inside winze to the 5,000-foot level. Development in the mine during the year included 24,649.5 feet of drifts, 13,597.5 feet of raises and 37,764 feet of diamond drilling. The mill treated an average of 3,466 tons per day on a 24-hour, 7-day schedule during 1950 compared with 3,047 tons daily in 1949. Gold and silver recovered are refined by the company at Lead, and virtually pure metals are shipped to the Denver Mint. The following data are extracted from the annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1950:

Ore mined in 1950 was 1,265,118 tons, which compares with 1,112,183 tons in 1949. Bullion with value of $19,264,048.20 was produced. This is $3,580,889.15 more than in 1949. Average realization was $15.23 per ton and metallurgical recovery was 97.03 percent, which again is a new record. This compares with $14.10 per ton and 96.98 percent in 1949.

Increased production of ore resulted primarily from the greater number of men available for underground work. For the first time since the resumption of operations, the accumulation of broken ore in shrinkage stopes was sufficient for steady production. The average number of men employed in the mine department during 1950 was 45 more than in 1949. When the international situation became serious, men began leaving with the result that the average number of men in the mine department in October was 272 less than in June. There was, however, a substantial increase during the last two months of the year and on December 31, 1950 there were only 56 less than on December 31, 1949.

For the first time since the end of World War II, there was in 1950 a slight decrease in the operating expense per ton of ore. Such expense, exclusive of taxes and contributions to the Pension Trust, was 3.22 percent lower in 1950 than in 1949. Even with inclusion of the Pension Trust cost, the 1950 cost was 2.58 percent lower than in 1949 although it was nearly 68 percent higher than in 1941.

Broken ore in shrinkage stopes decreased from 461,000 tons on December 31, 1949 to 430,000 tons at the end of 1950. The reserve of developed ore, including broken ore, is 20,804,000 tons as compared with 21,024,000 at the end of 1949.

The mine and plant were well maintained and are in excellent condition. Construction work was begun at the Yates crusher plant to add a third stage of crushing. Similar remodelling will be done at the Ross crusher plant. When completed, stamps will be eliminated in the South Mill with resultant economies in operation.

Sale of electrical energy in reduced amount to the Black Hills Power and Light Company continued during the first half of the year. A total of 4,415,200 kwh was delivered to its system. Such sale was discontinued on June 30, 1950 because further extension of the arrangement was not granted by the Federal Power Commission.

Natural gas again became available during the last part of the year. Where economies could be effected, plants converted to coal late in 1949 were reconverted for the use of gas.

Remodelling and modernization of the Homestake Recreation Building in Lead were completed except for some minor details.

The operation and output of our sawmill at Spearfish were normal.

The Wyodak mine produced 349,560 tons of coal in 1950, as compared with 314,197 tons in 1949. Receipts from the sale of electrical energy increased from $61,479.40 in 1949 to $83,845.24 in 1950.

Ore milled, receipts, and dividends, Homestake mine, 1946–50 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1946	792,994	$10,458,896.22	$13.1891	$2,812,992
1947	849,023	13,796,720.25	16.2501	4,018,560
1948	896,862	12,658,138.55	14.1138	4,018,560
1949	1,112,183	15,683,159.05	14.1012	4,520,880
1950	1,265,118	19,264,048.20	15.2271	5,525,520

[1] From 1876 to 1950, inclusive, this mine yielded bullion and concentrates that brought a net return of $513,377,199 and paid $170,702,314 in dividends.

Other Mines.—The Bald Mountain Mining Co.—the only other producer of gold and silver in the State in 1950—operated its property, which includes the Empire, Portland, Dakota, Clinton, Two Johns, Ajax-Alaska, Trojan, Foley, American Express, and "Mogul Mines Co." claims. The company milled 126,044 tons of ore in its cyanidation mill for a daily average of 345 tons in 1950. The mill is operated three shifts 7 days a week and has a rated capacity of 370 tons. Development in the mine during 1950 included 5,349 feet of crosscut and 100 feet of diamond drilling.

Texas

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By F. F. Netzeband and Alice Feltch

GENERAL SUMMARY

MINE production of gold, silver, copper, and lead from Texas during 1950 was valued at $39,598 compared with $55,003 for 1949. The R. I. Carr operations in Presidio County was the sole producer in 1950. In 1949 there had been four producers, located in Culberson, Hudspeth, and Presidio counties. Lead accounted for 88 percent of the total value, silver 6 percent, gold 4 percent, and copper 2 percent.

No zinc was reported from Texas crude ore in 1950. Considerable zinc was produced from hot slags of the lead smelter, but these are credited to the various mines on the basis of the assay report of the ore and are thus apportioned to the States from which they were produced.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946 to Dec 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

MINE PRODUCTION

Since 1947, lead has been the principal metal produced in Texas, and in 1950 its value was nearly 16 times greater than that of silver—the principal metal produced in the State from 1885 to 1946. With the closing of the Presidio mine in Presidio County in 1942 and the

Hazel mine in Culberson County in 1941, output of silver has decreased markedly. Table 2 shows the annual output of ore and the quantity and value of the metals recovered from Texas mine production from 1946 to 1950 as well as total metal production from 1885 to 1950.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in Texas, 1946–50, and total, 1885–1950, in terms of recoverable metal [1]

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1946	6,705	9	$315	42,922	$34,681
1947	4,552	45	1,575	20,547	18,595
1948	1,850	57	1,995	3,065	2,774
1949	2,140	40	1,400	2,691	2,435
1950 [2]	935	49	1,715	2,454	2,221
1885–1950	(3)	8,481	230,780	33,297,120	23,441,086

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1946	3	$972	47	$10,246	44	$10,736	$56,950
1947	6	2,520	78	22,464	22	5,324	50,478
1948 [4]	23	9,982	170	60,860			75,611
1949 [4]	24	9,456	132	41,712			55,003
1950 [2] [4]	2	832	129	34,830			39,598
1885–1950	1,364	392,833	5,344	659,561	810	122,551	24,846,811

[1] Includes recoverable metal content of ore shipped during the calendar year indicated.
[2] All of 1950 production was from one mine in Presidio County, which produced lead ore.
[3] Data not available.
[4] Does not include zinc and lead recovered by the slag-fuming plant at the El Paso smelter from old accumulated slag resulting from operations in previous years.

TABLE 3.—Mine production of gold, silver, copper, and lead in Texas in 1950, by months, in terms of recoverable metal

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)

METALLURGICAL INDUSTRY

The smelting and refining industry was an important segment of Texas industrial activity during 1950 and continued to surpass the State mine production in value. Smelters operating in Texas during 1950 included two zinc-retort, one copper, one lead, one antimony, and one tin; there were also one electrolytic zinc refinery and one electrolytic copper refinery.

The American Smelting & Refining Co. continued to operate lead and copper smelters at El Paso, treating ores purchased from mine operators in Arizona, Colorado, Missouri, New Mexico, Texas, and Utah, as well as ores from Mexico, Tasmania, Central America, Canada, South-West Africa, and Arabia. The company electrolytic zinc refinery at Corpus Christi treated concentrates from New Mexico, Colorado, Arizona, and Mexico. The company gas-fired retort zinc smelter at Amarillo handled ores and concentrates from Arizona, California, Colorado, New Mexico, Utah, and Texas.

The Machovec smelter of the American Zinc Co. of Illinois at Dumas operated throughout 1950 on concentrates from Arizona and New Mexico and zinc fume from slag-fuming plants in Utah and Idaho, as well as some concentrates of foreign origin.

The Nichols electrolytic copper refinery at El Paso continued to refine copper anodes from the Phelps Dodge Corp. smelters in Arizona. This plant also produced copper sulfate.

REVIEW BY COUNTIES

Presidio County.—R. I. Carr continued to produce lead ore from his properties in the famous Shafter district. This ore was shipped to the American Smelting & Refining Co. smelter at El Paso. Silver, gold, and copper were also recovered from these ores during 1950.

No other mine production was reported from Texas in 1950.

Utah

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By Paul Luff

GENERAL SUMMARY

MUCH more intensive copper mining in Utah in 1950 than in 1949 resulted in a record output of gold in the State, the largest output of copper since 1944, and a gain in output of silver; the production of lead and zinc, however, decreased materially. Compared with 1949, the output of gold increased 143,493 ounces (46 percent), silver 358,928 ounces (5 percent), and copper 81,385 short tons (41 percent); lead production declined 8,319 tons (16 percent) and zinc 8,992 tons (22 percent). Output of copper ore increased 10,125,367 tons (48 percent), but that of zinc-lead ore declined 262,495 tons (31 percent).

Utah remained the second-largest copper-producing State (Arizona was the largest) and ranked second in gold and silver, third in lead, and ninth in zinc.

The value of the five metals in 1950 (exceeded only by that for Arizona) was $159,415,431, the highest in the State's history and 31 percent greater than the value of $121,649,828 in 1949. Of the total value in 1950, copper contributed 73 percent, gold 10 percent, lead more than 7 percent, zinc less than 6 percent, and silver 4 percent. The value of the metals recovered from copper ore was $132,624,200 in 1950 (83 percent of the State total from all ores), and that recovered from zinc-lead ore was $23,854,200 (15 percent of the State total).

In 1950, 93 percent of Utah's gold production, 68 percent of its silver, more than 99 percent of its copper, 56 percent of its lead, and 51 percent of its zinc were recovered from copper ore and zinc-lead ore mined in the West Mountain (Bingham) district, Salt Lake County. The remainder of the gold, silver, copper, lead, and zinc was recovered largely from zinc-lead ore and siliceous ores mined in the Park City and Tintic districts.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production reported herein has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc in Utah, 1946–50, and total, 1864–1950, in terms of recoverable metal [1]

Year	Mines producing: Lode	Mines producing: Placer	Ore (short tons)	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value

Total: 1950	457,551	7,083,808	278,630	44,753	31,678
1949	314,058	6,724,880	197,245	53,072	40,670

Gold.—In 1950 Utah's output of recoverable gold increased to 457,551 fine ounces, the highest annual output in the State's history. Most of the gold produced in Utah is a byproduct of copper ore, and in 1950 this class of ore yielded 413,090 ounces of gold—145,199 ounces (54 percent) more than in 1949. The Utah Copper mine at Bingham accounted for all the increase. Zinc-lead ore supplied 37,324 ounces of gold in 1950, an increase of only 882 ounces (2 percent) over 1949. More than 96 percent of the gold recovered from zinc-lead ore came from the Park City region and West Mountain (Bingham) district.

Of the total gold in 1950, 90 percent came from copper ore, 8 from zinc-lead ore, and most of the remainder from silver ore, gold-silver ore, and lead ore. Four ounces of gold were recovered from placers in Grand and Millard Counties. The West Mountain (Bingham) district supplied 94 percent of the State total, the Park City region 5, and the Tintic district about 1 percent. Output of gold in the West Mountain (Bingham) district increased 50 percent from 1949 and in the Park City region 24 percent, but in the Tintic district it declined 36 percent.

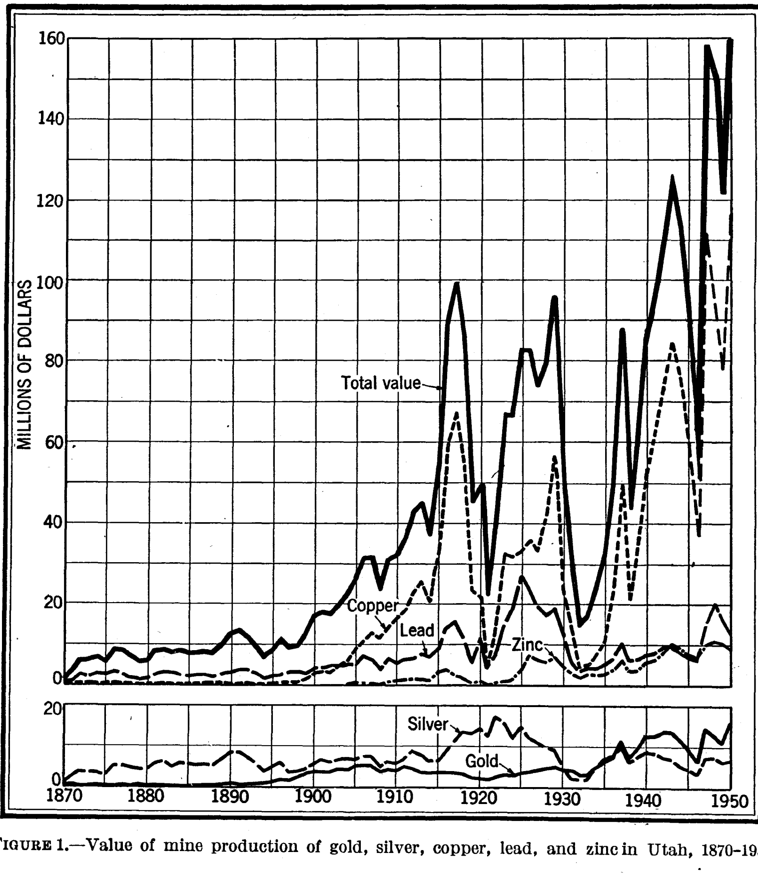

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc in Utah, 1870–1950.

The leading gold producers in Utah in 1950—each with an output exceeding 1,000 ounces of recoverable metal—were as follows: Utah Copper mine in the West Mountain (Bingham) district; the property of the New Park Mining Co. in the Park City region; United States & Lark group in the West Mountain (Bingham) district; Chief Consolidated Mining Co. property in the Tintic district; and Daly No. 1 waste dump and Park Utah Consolidated property in the Park City region. These six properties furnished 99 percent of the State gold.

Silver.—Utah's output of recoverable silver in 1950 was 7,083,808 fine ounces, a 5-percent gain over 1949. Copper ore supplied 3,312,949 ounces—1,079,241 ounces (48 percent) more than in 1949—and zinc-lead ore 2,849,674 ounces—828,059 ounces (23 percent) less than in 1949. More than 99 percent of the silver recovered from copper ore came from the West Mountain (Bingham) district, and 96 percent of the silver recovered from zinc-lead ore came from the Park City region, Tintic district, and West Mountain (Bingham) district. Copper ore furnished 47 percent of the State silver in 1950, zinc-lead ore 40 percent, and silver ore and gold-silver ore 10 percent; the remainder came principally from lead ore. Output of silver increased 15 percent in the West Mountain (Bingham) district and 1 percent in the Tintic district but declined 10 percent in the Park City region.

Utah properties that produced more than 150,000 ounces of recoverable silver each in 1950 were as follows: Utah Copper mine, United States & Lark group, properties of Chief Consolidated Mining Co. and New Park Mining Co., Daly No. 1 waste dump, Butterfield group, and Park Utah Consolidated Mines Co. property. These seven producers contributed 92 percent of the State silver.

Copper.—In 1950 Utah's output of recoverable copper increased to 278,630 short tons, the largest output since 1944. This resulted from continuous operations throughout the year at the Utah Copper open pit in Bingham Canyon, the State's only large producer. Operations were maintained throughout the year on a schedule of 6 days per

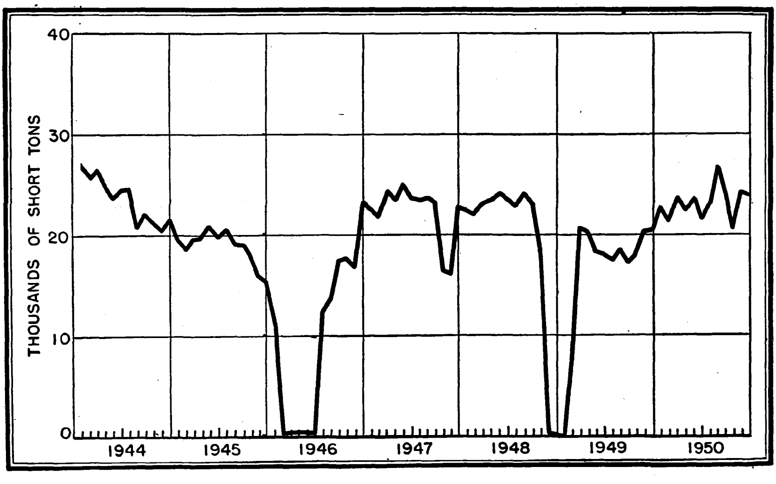

FIGURE 2.—Mine production of copper in Utah, 1944–50, by months, in terms of recoverable metal.

week and three shifts per day. The United States & Lark group, also at Bingham, was the only other Utah property to produce more than a million pounds of recoverable copper in 1950. These two producers contributed more than 99 percent of the State copper.

Lead.—Despite a good demand for lead and favorable metal prices during the last half of 1950, Utah's output of recoverable lead in 1950 (44,753 short tons) was the smallest since 1946 and showed a loss of 16 percent from that in 1949. This loss resulted mainly from the shut-downs, because of a fire and labor difficulties, at the United States & Lark property at Bingham, the largest producer of zinc-lead ore in the State. In 1950 zinc-lead ore from the West Mountain (Bingham) district supplied 25,240 tons of lead (56 percent of the State total), the Park City region 7,536 tons (17 percent), and the Tintic district 5,025 tons (11 percent). The remainder came largely from lead ore from the West Mountain (Bingham) and Ophir districts, silver ore from the Park City region and Tintic and West Mountain (Bingham) districts, and zinc-lead ore from the Rush Valley (Stockton) district. Output of lead in the West Mountain (Bingham) district was 16 percent less than in 1949, in the Park City region 12 percent, and in the Tintic district 2 percent.

The United States & Lark property remained by far the largest producer of lead in Utah, although its output in 1950 was about 15 percent less than in 1949; it was followed by the properties of the Chief Consolidated Mining Co., Park Utah Consolidated Mines Co., New Park Mining Co., Butterfield group, Silver King Coalition Mines Co., Hidden Treasure mine (Ophir district), and Honorine and Calumet mines (Rush Valley district). These nine producers supplied 95 percent of the State lead.

Zinc.—Utah's output of recoverable zinc in 1950 was 31,678 short tons, the smallest since 1946 and 22 percent less than in 1949. This loss resulted mainly from the closing during part of the year of the United States & Lark property at Bingham and from a reduced zinc production from mines in the Park City, Ophir, and Rush Valley (Stockton) districts. In 1950 zinc-lead ore from the West Mountain (Bingham) district supplied 16,120 tons of zinc (51 percent of the State total), the Park City region 7,348 tons (23 percent), and the Tintic district 5,972 tons (19 percent). The remainder came largely from zinc-lead ore from the Ophir and Rush Valley districts and from zinc ore and slag from the Big Cottonwood and Smelter (Tooele) districts. Production of zinc in the West Mountain (Bingham) district was 28 percent less than in 1949, in the Park City region 11 percent, in the Ophir district 63 percent, in the Smelter (Tooele) district 59 percent, and in the Rush Valley district 32 percent. Zinc output in the Tintic district in 1950 was nearly the same as in 1949.

The United States & Lark property remained by far the largest producer of zinc in Utah, although its output in 1950 was about 27 percent less than in 1949; it was followed by the properties of the Chief Consolidated Mining Co., Park Utah Consolidated Mines Co., New Park Mining Co., Butterfield group, Honorine mine, Cardiff mine, Hidden Treasure mine, and Calumet mine. These nine properties furnished 97 percent of the State total zinc.

TABLE 4.—Mine production of gold, silver, copper, lead, and zinc in Utah in 1950, by counties, in terms of recoverable metal

County	Mines producing		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver

MINING INDUSTRY

Low zinc and lead prices during the first half of 1950, a labor strike part of the year at the two principal zinc-lead districts—Bingham and Park City—in Utah, and a 3-month fire at the Lark zinc-lead mine caused a marked decline in the quantity of zinc-lead ore mined in Utah in 1950. Nevertheless, the State total ore mined and treated increased from 21,993,467 tons in 1949 to 31,855,601 tons in 1950, owing mainly to an increase of 10,125,367 tons (48 percent) in output of copper ore. Continuous operations at the Utah Copper open pit at Bingham, Utah's only outstanding copper mine, resulted in the greatest output of copper ore since 1943. Of the 579,946 tons of zinc-lead ore mined in Utah in 1950, 316,148 tons (55 percent) came from the Bingham district, 122,001 tons (21 percent) from the Tintic district, 120,129 tons (21 percent) from the Park City region, and 14,357 tons (2 percent) from the Rush Valley (Stockton) district. Of the 28,363 tons of lead ore mined in 1950, 15,681 tons (55 percent) came from the Bingham district, 4,303 tons (15 percent) from the Ophir district, and 3,353 tons (12 percent) from the Smelter (Murray) district. The siliceous material was largely silver ore and old tailings from the Park City, Tintic, and Bingham districts. One of the most significant projects started during the year involved the driving of a haulage tunnel 21,300 feet long from Bingham to Lark. The project is being carried on under an agreement between the United States Smelting, Refining & Mining Co. and the Kennecott Copper Corp. The tunnel is being driven to permit the Kennecott Copper Corp. to extend its open-pit operations toward the southwest.

Active lode mines in the State dropped 10 percent, from 93 in 1949 to 84 in 1950; the number of active placers remained the same (2).

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in Utah in 1950, by class of ore or other source material, in terms of recoverable metal

Source	Number of mines[1]	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	4	1,234	274	1,826	2,170	43,335	----------
Dry gold-silver ore	10	12,824	1,362	59,540	98,091	582,174	22,427
Dry silver ore	13	133,946	2,691	489,815	313,583	2,712,408	100
Total	24	148,004	4,327	551,181	413,844	3,337,917	22,527
Copper ore	12	31,049,641	413,090	3,312,949	[2] 553,681,586	14,030	----------
Lead ore	35	28,363	1,739	189,405	265,376	5,772,066	86,644

Zinc ore	4	[3] 5,535	18	4,528	14,601	164,024	1,411,935
Zinc-lead ore	31	579,946	37,324	2,849,674	2,780,080	78,698,136	61,734,197
Total	64	31,663,917	452,229	6,362,338	[2] 556,772,793	84,718,558	63,232,776
Old tailings [4]	5	43,680	991	170,289	73,363	1,449,525	100,697
Total lode mines	84	31,855,601	457,547	7,083,808	[2] 557,260,000	89,506,000	63,356,000
Gravel (placer operations)	2	----------	4	----------	----------	----------	----------
Total: 1950	86	31,855,601	457,551	7,083,808	[2] 557,260,000	89,506,000	63,356,000
1949	95	21,993,467	314,058	6,724,880	[5] 394,490,000	106,144,000	81,340,000

[1] Does not include operations processing only old slag or mill and smelter cleanings; data for such operations are, however, included in other columns. Detail will not add to totals because some mines produce more than 1 class of ore.
[2] Includes 14,561,870 pounds recovered from mine-water precipitates.
[3] Includes 3,843 tons of zinc slag.
[4] Silver 36,841 tons, gold-silver 4,339 tons, zinc 2,500 tons.
[5] Includes 15,822,418 pounds recovered from mine-water precipitates.

METALLURGICAL INDUSTRY

The 31,855,601 tons of ore produced in Utah in 1950 included the following: 31,628,415 tons (99 percent) treated at mills (21,811,661 tons in 1949); 223,343 tons (1 percent) shipped crude to smelters (164,326 tons in 1949); and 3,843 tons of old slag smelted and fumed (17,480 tons in 1949).

The nine mills active in Utah in 1950 treated Utah ore and tailings as follows: Three plants (Arthur, Magna, and Horn Silver), 31,047,220 tons of copper ore (the Horn Silver mill also treated 1,006 tons of lead ore); five mills (Bauer, Midvale, Silver King, Tooele, and United Mining Development Co.), 577,689 tons of zinc-lead ore; and one flotation mill in Summit County, 2,500 tons of current zinc tailings.

The Magna and Arthur concentrators (40,000 tons capacity each) of the Kennecott Copper Corp. operated continuously in 1950, except for a 1-day shut-down caused by collapse of a dewatering box, on copper ore from the Utah Copper open pit at Bingham. The Midvale 1,700-ton concentrator of the United States Smelting, Refining & Mining Co. operated 10 months of the year (idle July and August due to a labor strike), largely on zinc-lead ore from company-owned properties in the West Mountain (Bingham) district and from the property of the New Park Mining Co. in the Park City region. The 1,500-ton concentrator of the International Smelting & Refining Co. at Tooele operated throughout the year, mainly on zinc-lead ore supplied by operators in the Park City region and in the Tintic district; the copper unit at the concentrator remained idle. The 700-ton concentrator of the Combined Metals Reduction Co. at Bauer operated continuously, largely on zinc-lead ore supplied by company-owned or operated mines in Utah and Idaho and by the Chief Consolidated Mining Co. After a shut-down of nearly 16 months, the 800-ton concentrator of the Silver King Coalition Mines Co. at Park City began operating again October 16 on zinc-lead ore from the company-owned mine. The 500-ton concentrator of the Metal Producers, Inc. (Horn Silver), near Milford operated part of the year on copper ore from the O. K. mine and part of the year on lead ore from the Horn Silver mine.

The Garfield copper smelter of the American Smelting & Refining Co. operated continuously, principally on copper concentrates from the Magna and Arthur mills, siliceous crude ore from mines and dumps in the Park City, Tintic, and Bingham districts, and iron concentrates from the Bauer, Tooele, and Midvale mills. The Midvale lead smelter of the United States Smelting, Refining & Mining Co. operated 10 months of the year and treated lead concentrates, lead ores, gold and silver ores, and dump slag, chiefly from company-owned properties in Utah. The Tooele lead plant of the International Smelting & Refining Co. operated all year in conjunction with the company zinc-fuming plant and treated zinc-lead ore, lead ore and concentrates, and zinc ore and old slag from both company and custom sources. The fuming plant treated a total of 87,761 tons of current hot slag, old cold slag, and crude ore in 1950 compared with 107,774 tons in 1949; output in 1950 was 15,835 tons of zinc fume, averaging 74.17 percent zinc and 2.46 percent lead, and 2,312 tons of lead fume, averaging 50.56 percent lead and 18.36 percent zinc. The company copper smelter at Tooele remained idle all of 1950.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Utah in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Placer	4				
Smelting of:

[1] No bullion produced in 1950.
[2] Includes copper recovered from smelting of mine-water precipitates as follows: 1950—14,561,870 pounds; 1949—15,822,418 pounds.
[3] Includes 3,843 tons of old slag.
[4] Includes 17,480 tons of old slag.

Construction of the $16,000,000 copper refinery of the Kennecott Copper Corp. and the copper-anode plant of the American Smelting & Refining Co., both at Garfield, was completed in September, and the first shipment of wire bars was made October 17. Wire bars will constitute the principal production of the refinery, although some cathode sheets will be shipped as well.

[1] Includes copper content of mine-water precipitates as follows: 1950—14,858,820 pounds; 1949—16,063,930 pounds.
[2] Includes 3,843 tons of old slag.
[3] Includes 17,480 tons of old slag.

REVIEW BY COUNTIES AND DISTRICTS

BEAVER COUNTY

Beaver Lake District.—Metal Producers, Inc., operated the O. K. mine 3 months in 1950 and hauled 9,420 tons of dump ore to its 500-ton flotation mill near Milford; the mill recovered 323 tons of concentrate containing 33 ounces of gold, 1,593 ounces of silver, and 158,907 pounds of copper. In addition, 32 tons of mine copper ore were shipped to the smelter at Garfield.

TABLE 9.—Mine production of gold, silver, copper, lead, and zinc in Utah in 1950, by counties and districts, in terms of recoverable metal

[1] Tintic district lies in both Juab and Utah Counties.
[2] Production came from old smelter cleanings; not counted as a mine.
[3] Production came from old mill cleanings; not counted as a mine.

Granite District.—Output in 1950 was 10 tons of carbonate zinc-lead ore shipped to a smelter from the Beaver View group near Milford.

San Francisco District.—Metal Producers, Inc., worked the Horn Silver mine 6 months in 1950 and hauled 1,006 tons of lead ore to its 500-ton flotation mill, which recovered 45 tons of concentrate containing 9 ounces of gold, 558 ounces of silver, 925 pounds of copper, 17,138 pounds of lead, and 2,365 pounds of zinc. Leasing operations at the Horn Silver mine also produced 8 tons of high-grade lead-silver ore.

BOX ELDER COUNTY

Lucin District.—A. W. Jeffs and the Copper Mountain Co. worked the Copper Mountain (Salt Lake Copper) group near Montello, Nev., a few months in 1950 and shipped 153 tons of ore containing 32 ounces of silver and 23,670 pounds of copper.

JUAB COUNTY

Fish Springs District.—Lessees operated the Utah Mine group near Callao in 1950 and shipped 42 tons of ore containing 1 ounce of gold, 2,540 ounces of silver, 253 pounds of copper, 36,326 pounds of lead, and 5,000 pounds of zinc. A small lot of lead-silver ore was produced from the West Utah claim.

Mount Nebo (Mona) District.—Zinc ore (15 tons) was produced from the Little Eva mine and lead ore (8 tons) from the Vagabond claim.

Tintic District.—The Tintic district lies in both Juab and Utah Counties. Table 10 gives metal production in each section of the district in 1950, as well as the district total for prior years.

Chief Consolidated Mining Co. operated throughout the year its Chief No. 1 and Eureka Hill mines and old tailing dump in the Juab County part of the district. The company output of ore in 1950 was by far the largest in the entire district. According to the company annual report for 1950, the Chief No. 1 mine produced 116,573 tons of zinc-lead ore, 13,920 tons of siliceous silver ore, and 4,062 tons of lead-silver ore; and the Eureka Hill mine produced 1,350 tons of siliceous silver ore and 54 tons of lead-silver ore. All the ores together con-

TABLE 10.—Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1946–50, and total, 1869–1950, in terms of recoverable metal

	Mines producing	Ore and old tailings (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)	Total value

[1] Figures estimated for certain years before 1901.

tained 2,904 ounces of gold, 829,276 ounces of silver, 15,571,543 pounds of lead, and 16,664,001 pounds of zinc. In addition, the company shipped 33,325 tons of old tailings containing 700 ounces of gold, 130,000 ounces of silver, 46,000 pounds of copper, and 1,600,000 pounds of lead. Most of the Chief No. 1 zinc-lead ore was shipped to the custom flotation mill of the Combined Metals Reduction Co. at Bauer.

Lessees worked other properties in the Juab County part of the district; shipments in 1950 comprised 5,901 tons of silver ore and 131 tons of lead-silver ore from the American Star mine; 5,296 tons of silver ore, 1,467 tons of zinc-lead ore, 422 tons of gold-silver ore, and 115 tons of lead ore from the Godiva mine; 1,856 tons of gold-silver ore and 122 tons of lead ore from the Centennial-Beck-Victoria group; 1,175 tons of gold-silver ore from the Empire group; 366 tons of lead ore and 300 tons of zinc-lead ore from the Chief No. 2 mine; 97 tons of silver ore from the Showers waste dump; 93 tons of gold-silver ore from the Victor group; and small lots of lead ore and silver ore from the Bonnie Lee and Windridge claims.

In the Utah County part of the district, 4,339 tons of old gold-silver tailings were shipped from the Harold dump; 1,700 tons of gold-silver ore and 42 tons of zinc-lead ore from the Mountain View group; 1,174 tons of gold ore from the Colorado mine; 1,081 tons of silver ore and 10 tons of lead ore from the Tintic Standard waste dump; 412 tons of copper ore from the Eureka Lilly mine; 312 tons of gold-silver ore and 74 tons of lead ore from the Yankee mine; and 28 tons of gold-silver ore from the Iron Blossom waste dump.

West Tintic District.—Leasing operations at the "88" claim near Jericho produced 45 tons of ore containing 1 ounce of gold, 63 ounces of silver, 11,545 pounds of lead, and 4,375 pounds of zinc.

MILLARD COUNTY

Detroit District.—Cherry & Berry worked the E. P. H. claim (Ibex group) in 1950 and shipped 33 tons of copper ore to the smelter at Garfield.

Gordon District.—Lessees operated the Blue Bell group near Kanosh a short time in 1950 and shipped 33 tons of lead ore to the smelter at Midvale.

SALT LAKE COUNTY

Big Cottonwood District.—Cardiff Mining & Milling Co. operated the Cardiff mine throughout the year and produced 1,709 tons of sulfide zinc-lead ore, which was treated in a custom flotation mill at Midvale; 332 tons of carbonate zinc-lead ore and 199 tons of carbonate lead ore, which were shipped direct to smelters; and 1,132 tons of carbonate zinc ore, which was shipped to the zinc fuming plant at Tooele. The total ore contained 38 ounces of gold, 17,929 ounces of silver, 61,158 pounds of copper, 662,513 pounds of lead, and 999,210 pounds of zinc. The remainder of the district output was 57 tons of silver ore produced from the Lake Blanche group.

Little Cottonwood District.—Output in 1950 was 598 tons of ore containing 16 ounces of gold, 7,040 ounces of silver, 13,229 pounds of copper, 139,605 pounds of lead, and 122,740 pounds of zinc. The principal output was 506 tons of zinc-lead ore from the Columbus-

Rexall and South Hecla groups, while the remainder came from the Drain Tunnel property.

Smelter District.—In 1950 some ore and smelter cleanings from the lead smelter of the American Smelting & Refining Co. at Murray were shipped by various lessees to smelters in Utah and Colorado. The total amounted to 3,706 tons containing 355 ounces of gold, 31,304 ounces of silver, 123,427 pounds of copper, 685,536 pounds of lead, and about 150,000 pounds of zinc. The rest of the district output was some old slag (1,151 tons) from the Midvale and Sandy smelter dumps.

West Mountain (Bingham) District.—In 1950 the West Mountain (Bingham) district produced 94 percent of the State gold, 70 percent of the silver, more than 99 percent of the copper, 61 percent of the lead, and 51 percent of the zinc; total value of the five metals represented 92 percent of the State total. Output was 31,037,812 tons of copper ore, 316,213 tons of zinc-lead ore, 36,095 tons of siliceous silver ore and gold-silver ore, 15,681 tons of lead ore, and 9,121 tons of copper precipitates.

TABLE 11.—Mine production of gold, silver, copper, lead, and zinc in West Mountain (Bingham) district, Salt Lake County, Utah, 1946–50, and total, 1865–1950, in terms of recoverable metal

Year	Number of mines	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)	Total value

[1] Figures estimated for certain years before 1901.

Steady operations throughout 1950 at the Utah Copper mine of the Kennecott Copper Corp. resulted in the largest output of copper ore since 1943 and 10,115,500 tons more (48 percent) than in 1949. The corporation announced that its Utah Copper division established a 6-year record copper production in 1950 with 554,995,248 net pounds of copper, compared with the previously higher record in 1944 of 555,067,885 net pounds; in 1949 output was 394,667,367 net pounds. In 1950 the Utah Copper division moved 41,342,160 tons of waste and treated 31,037,800 tons of copper ore in its two flotation mills at Arthur and Magna, compared with 26,581,965 tons of waste and 20,922,300 tons of copper ore in 1949. The two milling plants maintained a schedule of 6 days per week and three shifts per day throughout the year. Average grade of ore mined in 1950 was 0.957 percent copper, but the greatest advancement in mining operations is the mining of sizable blocks of ore containing as little as 0.40 percent copper. The property is not only the largest producer of copper in the State, but in 1950 it was also the largest producer of gold and silver in the State and the second-largest producer of molybdenum in the United States.

Since the beginning of operations in 1904 and to the end of 1950, the Utah Copper division has moved about 703,000,000 short tons of overburden, mined and milled 589,000,000 short tons of copper ore, and produced 5,256,677 net tons of copper.

In 1950 output of zinc-lead ore from the West Mountain (Bingham) district dropped to 316,213 tons, a decline of 117,916 tons (27 percent) from that in 1949. This decline resulted from the temporary shutdown of the United States & Lark property of the United States Smelting, Refining & Mining Co., the largest producer of zinc-lead ore in the State. Operations at the Lark mine ceased July 16, when the lower levels of the mine caught fire, and were not resumed until October 28; the United States mine was idle 2 months during the summer due to a labor strike. Output from both mines in 1950 was 290,472 tons of zinc-lead milling ore, 36,025 tons of siliceous silver ore and gold-silver smelting ore, and 15,553 tons of lead smelting ore.

Combined Metals Reduction Co. and lessees operated the Butterfield group continuously and shipped 24,634 tons of zinc-lead ore to the Combined Metals custom flotation mill at Bauer; the output was 13,666 tons less than in 1949. In addition, 70 tons of gold-silver ore and silver ore were shipped to a smelter. The milling ore contained 1,677 ounces of gold, 259,175 ounces of silver, 100,000 pounds of copper, 5,916,800 pounds of lead, and 2,232,940 pounds of zinc.

Remaining district production was largely 704 tons of zinc-lead ore and 122 tons of lead ore from the Columbia group, operated by lessees.

SUMMIT AND WASATCH COUNTIES

PARK CITY REGION

The Park City region includes the Uintah district in Summit County and the Blue Ledge and Snake Creek districts in Wasatch County. Table 12 shows the production and total value of the five metals in 1950 compared with 1946–49 and the total from 1870 to 1950.

After the closing in 1949 of nearly all mines in the Park City region, owing to a drop in base-metal prices, the mines were reopened in 1950 as a result of a substantial rise in the market prices of copper, lead, and zinc. The New Park Mining Co. operated its property in the Blue Ledge district throughout 1950, and it was the leading producer in the Park City region. The company reported that 70,480 tons of

TABLE 12.—Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1946–50, and total, 1870–1950, in terms of recoverable metal

Year	Number of mines	Ore and old tailings (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)	Total value

1947	10	657,496	17,052	1,352,748	570	10,987	10,956	7,875,999
1948	10	506,671	19,087	1,703,864	597	12,670	10,320	9,749,907
1949	10	318,341	19,443	1,061,902	451	8,583	8,359	6,604,858
1950	12	209,640	24,125	952,632	417	7,538	7,425	6,023,922
Total 1870–1950		[1] 16,077,148	641,513	239,845,846	36,354	1,244,000	379,966	397,439,007

[1] Figures estimated for certain years before 1901.

zinc-lead milling ore were shipped in 1950 compared with 64,738 tons in 1949. The ore in 1950, containing 25,254 ounces of gold, 425,737 ounces of silver, 834,293 pounds of copper, 6,324,402 pounds of lead, and 8,767,300 pounds of zinc, was treated in the custom flotation mill of the United States Smelting, Refining & Mining Co. at Midvale. The New Park Mining Co. announced that a new level was opened in 1950 with favorable ore developments on both the Mayflower and Pearl fissures and that additional mining property was acquired during the year.

Due to low zinc and lead prices during the first half of 1950 and failure of wage negotiations, only maintenance work was done at the Judge unit of the Park Utah Consolidated Mines Co. The company operated its Keetley unit with a reduced crew to August 1, but both units resumed operations August 22 upon settlement of a new labor contract. The company reported that a total of 38,231 tons of zinc-lead milling ore was shipped in 1950 compared with 39,410 tons in 1949. The ore in 1950, containing 1,232 ounces of gold, 176,833 ounces of silver, 9,358 pounds of copper, 6,891,448 pounds of lead, and 8,170,340 pounds of zinc, was treated in the custom flotation mill of the International Smelting & Refining Co. near Tooele.

After a shut-down of 16 months, the 800-ton concentrator of the Silver King Coalition Mines Co. at Park City resumed operation October 16 on zinc-lead ore from the company-owned mine in the Uintah district of the Park City region. The company reported that 11,418 tons of ore were milled in 1950, which contained 500 ounces of gold, 84,000 ounces of silver, 45,000 pounds of copper, 2,466,000 pounds of lead, and 765,000 pounds of zinc.

McFarland & Hullinger worked the Daly No. 1 waste dump 5 months and shipped 80,010 tons of siliceous ore, which contained 1,410 ounces of gold, 270,590 ounces of silver, 169,780 pounds of copper, and 635,496 pounds of lead. McFarland & Hullinger also worked the Ontario waste dump and the Grasselli tailing dump a few months in 1950 and shipped 2,684 tons of siliceous silver ore from the waste dump and 2,939 tons of silver-lead-zinc material from the tailing dump. The rest of the district output comprised 498 tons of lead ore from the Silver King Western mine; 2,500 tons of current zinc tailings from the Silver King Coalition mill re-treated by Reuben Garbett; 458 tons of old silver tailings from the Atkinson property; 363 tons of mill cleanings containing principally silver, lead, and zinc shipped from the Pacific Bridge mill site; 36 tons of gold-silver ore produced from the Park Flag mine; 11 tons of lead-silver ore and 8 tons of zinc ore shipped from the New Quincy property; and 4 tons of high-grade lead-silver ore produced from the Revelator claim.

TOOELE COUNTY

Blue Bell District.—Lessees continued working the Blackhawk claim near Vernon and shipped 67 tons of lead ore.

Clifton (Gold Hill) District.—Five mines in the Clifton district produced 175 tons of ore in 1950 containing 31 ounces of gold, 1,696 ounces of silver, 16,049 pounds of copper, 14,355 pounds of lead, and

62 pounds of zinc. The main output was 139 tons of copper-silver ore produced from the Monocco mine.

Dugway District.—In 1950 Willis Smith operated four properties in the Dugway district. The principal output was 245 tons of zinc-lead ore produced from the Four Metals, Frances, and Raymond properties.

Erickson District.—The Bar X Mining Co. worked its Esther group most of the year and shipped 1,115 tons of milling ore containing 6 ounces of gold, 832 ounces of silver, 143,300 pounds of lead, and 147,745 pounds of zinc. The Ida-Desert View group produced 47 tons of zinc-lead ore.

Ophir District.—Lead ore (4,303 tons) and zinc-lead ore (1,642 tons) produced by lessees—McFarland & Hullinger—from the Hidden Treasure mine in 1950 were by far the chief output of the Ophir district. Other district production included 1,345 tons of zinc-lead ore from the Ophir unit of the United States Smelting, Refining & Mining Co.; 330 tons of zinc-lead ore and 117 tons of copper ore from the Ophir Hill mine; and 75 tons of lead-copper ore, 48 tons of copper ore, and 6 tons of zinc-lead ore from the Mono-Kearsarge group.

Rush Valley District.—The Combined Metals Reduction Co. operated the West Calumet (Calumet) and Honorine-Galena King properties throughout the year; however, ore output from the West Calumet mine dropped from 32,807 tons in 1949 to 6,378 tons in 1950, while that from the Honorine-Galena King group increased from 827 tons to 8,225 tons. The ore from both properties contained 1,094 ounces of gold, 115,501 ounces of silver, 60,266 pounds of copper, 3,043,321 pounds of lead, and 2,111,364 pounds of zinc; most of it (14,084 tons) was zinc-lead ore treated in the Combined Metals custom flotation mill at Bauer. Other district production was 273 tons of zinc-lead milling ore from the Silver Eagle mine (Hampton Mining Co., lessee), and 82 tons of lead smelting ore from the Bluestone and Blue Eagle groups.

Smelter District.—Output in 1950, all by International Smelting & Refining Co. plants near Tooele, comprised 2,097 tons of old zinc slag treated at the zinc-fuming plant, 1,746 tons of similar material smelted at the lead smelter, 451 tons of furnace cleanings (zinc) shipped from the zinc-fuming plant, and 1,308 tons of old smelter cleanings (copper) shipped from the copper smelter.

Third Term District.—Ray Mining & Development Co. worked the Third Term mine near Grantsville a few months in 1950 and shipped 26 tons of lead ore.

Willow Springs District.—Lessees continued working the Oro Del Rey group near Callao and shipped to smelters 218 tons of ore containing 379 ounces of gold, 1,116 ounces of silver, 688 pounds of copper, and 53,434 pounds of lead.

UTAH COUNTY

American Fork District.—Output in 1950 was 76 tons of zinc-lead milling ore from the Floral Lode and Silver Leaf properties and 18 tons of lead smelting ore from the Blue Rock (Pacific) mine.

Tintic District.—Mines in the Utah County section of the Tintic district are reviewed under Juab County.

WASATCH COUNTY

Park City Region.—Mines in the Wasatch County section of the Park City region are reviewed under Summit and Wasatch Counties.

WASHINGTON COUNTY

Tutsagubet District.—E. L. Cox operated the Dixie-Apex mine 18 miles southwest of St. George the last 4 months of the year and shipped 109 tons of ore containing 1 ounce of gold, 85 ounces of silver, 44,967 pounds of copper, and 475 pounds of lead.

Washington
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By Almon F. Robertson and Virginia Halverson

GENERAL SUMMARY

INCREASED consumer demand for metals and advanced metal prices during the latter half of the year resulted in record high outputs of zinc, lead, and gold from Washington mines in 1950. Ore production rose to an all time high of 1,279,595 tons, an increase of slightly more than 26 percent over the 1,012,198 tons mined in 1949. Silver output increased slightly, as compared with 1949, whereas the production of copper fell off.

The output of gold increased 28 percent from 71,994 fine ounces in 1949 to 92,117 in 1950; silver output increased 2 percent from 357,853 fine ounces to 363,656; lead advanced 61 percent from 6,417 short tons to 10,334; and zinc rose 38 percent from 10,740 short tons to 14,807; copper output dropped from 5,275 short tons in 1949 to 5,057, a decline of 4 percent.

Total value of the five metals increased from $9,613,307 in 1949 to $12,652,302 in 1950, or nearly 32 percent. Expanded production from many of the mines, together with higher average prices for copper and zinc, were mainly responsible for the increase. The value of gold produced in 1950 was $3,224,095, or more than 25 percent of the State total value; silver, valued at $329,127, comprised nearly 3 percent; copper, $2,103,712, nearly 17 percent; lead, $2,790,180, slightly over 22 percent, and zinc, $4,205,188, more than 33 percent.

Chelan County remained in first place among Washington counties in tonnage of ore treated but was replaced by Pend Oreille County in value of metals produced.

All tonnage figures reported herein are short tons and "dry weight"; that is, they do not include moisture. The value of metal production has been calculated at the prices shown in table 1.

Gold.—The increase of 20,123 ounces in Washington gold output in 1950 resulted mainly from an increased production from the Gold King mine near Wenatchee, Chelan County. The Holden mine, also in Chelan County, remained the State's leading gold producer, followed closely by the Gold King mine. The Knob Hill mine in Ferry County ranked third, followed in order by the Alder group in Okanogan County and the Aurum group in Ferry County. The first three properties mentioned contributed nearly 97 percent of the State total gold output for 1950.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35.00	$0.808	$0.162	$0.109	$0.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124
1950	35.00	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver: Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947-$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

TABLE 2.—Mine production of gold, silver, copper, lead, and zinc, in Washington, 1946–50, and total, 1860–1950, in terms of recoverable metal [1]

Year	Lode mines		Placer mines		Gold (lode and placer)		Silver (lode and placer)	
	Number of mines	Ore sold or treated (short tons)	Number of mines	Gravel washed (cubic yards)	Fine ounces	Value	Fine ounces	Value
1946	16	858,023	5	25,115	51,168	$1,790,880	264,453	$213,678

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; and ore or copper precipitates shipped directly to smelters during the calendar year indicated.
[2] 1860–1903: Figures not available; 1904–50, 16,467,648 tons produced.

Placers yielded only 39 fine ounces of gold; it came from six producers, compared with three in 1949. About 64 percent of the State gold was recovered from gold ore and most of the remainder from zinc-copper ore.

Silver.—The Knob Hill mine (gold ore) was the leading silver producer in Washington in 1950; its output was about 36 percent greater than that of the Holden mine (zinc-copper ore), the next largest silver producer. Other important silver-producing properties, in order of decreasing output, were the Bonanza mine (lead ore), the Gold King mine (gold ore), and the Grandview mine (zinc-lead ore). These five mines contributed 94 percent of the State silver. In 1950 gold ore supplied about 50 percent of the State silver, zinc-

TABLE 3.—Gold produced at placer mines in Washington, 1946–50, by class of mine and by method of recovery

Class and method	Mines producing	Material treated (cubic yards)	Gold recovered

September	7,624	31,737	407	807	1,259
October	6,516	25,879	342	932	1,331
November	6,624	28,830	367	682	1,236
December	6,812	30,846	407	862	1,321
Total: 1950	92,117	363,656	5,057	10,334	14,807
1949	71,994	357,853	5,275	6,417	10,740

copper ore 30 percent, and lead ore and zinc-lead ore most of the remainder.

Copper.—A decline of about 7 percent in the output of copper from the Holden mine in Chelan County was partly offset by increased production from the Alder group in Okanogan County, the Pend Oreille Mines in Pend Oreille County, and the Valley mine in Ferry County. Other properties in the State produced only small quantities of copper.

Lead.—Lead production in Washington in 1950 increased 61 percent over 1949 and was the largest annual output of any year in the State's history. Largely responsible for the record production were substantial increases in output from the Grandview mine in Pend Oreille

County and from the Bonanza mine in Stevens County. Lead output declined slightly at the Deep Creek and Anderson mine in Stevens County and at the property of the Pend Oreille Mines & Metals Co. in Pend Oreille County. The above four properties supplied over 99 percent of the State lead in 1950. About 72 percent of the total lead was derived from zinc-lead ore; nearly all the remainder was obtained from lead ore.

Zinc.—Production of recoverable zinc in Washington during 1950 established a record, owing mainly to a marked increase in tonnage of zinc-lead ore milled at the Grandview property. Production also increased at the Pend Oreille Mines but decreased at the Holden and Deep Creek and Anderson mines. The Grandview mine replaced the Pend Oreille Mines as the State's leading zinc producer, followed by the Holden and Deep Creek and Anderson mines. These four properties supplied nearly 99 percent of the State total zinc. Zinc-lead ore supplied nearly 75 percent of the total zinc in 1950, zinc-copper ore about 16 percent, and zinc ore nearly 9 percent.

TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in Washington in 1950, by counties, in terms of recoverable metal

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

1949	10,550,000	2,078,350	12,834,000	2,027,772	21,480,000	2,663,520	9,613,307

MINING INDUSTRY

Although the number of producing lode mines in Washington dropped from 29 in 1949 to 27 in 1950, ore output increased more than 26 percent to the highest annual level yet recorded. Considerably higher production in 1950, compared with 1949, was reported from the Grandview, Bonanza, Admiral, Knob Hill, and Holden mines. No serious work stoppages interfered with normal operations during the year.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

TABLE 6.—Mine production of gold, silver, copper, lead, and zinc in Washington in 1950, by class of ore or other source material in terms of recoverable metal

Source	Number of mines [1]	Material sold or treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	10	121,089	58,729	182,754	277,892		
Copper ore	1	286		385	9,508	1,000	
Lead ore	4	20,217		48,125	3,100	5,296,931	49,274
Zinc ore	3	62,206		1,515		445,008	2,592,181
Zinc-copper ore	1	657,634	33,347	109,406	9,808,000		4,859,000
Zinc-lead ore	9	418,163	2	21,461	15,500	14,925,061	22,113,545
Total lode mines	27	1,279,595	92,078	363,646	10,114,000	20,668,000	29,614,000
Gravel (placer operations)	6		39	10			
Total: 1950	33	1,279,595	92,117	363,656	10,114,000	20,668,000	29,614,000
1949	32	1,012,198	71,994	357,853	10,550,000	12,834,000	21,480,000

[1] Detail will not add to totals because some mines produce over 1 class of ore.

METALLURGICAL INDUSTRY

Of the 1,279,595 tons of lode material sold or treated in Washington in 1950, 1,235,765 tons (97 percent) went to mills and 43,830 tons (3 percent) to smelters compared with 98 and 2 percent, respectively, in 1949. The 1,235,765 tons treated at mills were distributed as follows: one plant, 657,634 tons of zinc-copper ore; four plants, 418,155 tons of zinc-lead ore; five plants, 77,273 tons of gold ore; three plants, 20,211 tons of lead ore; three plants, 62,206 tons of zinc ore; and one plant, 286 tons of copper ore.

TABLE 7.—Mine production of gold, silver, copper, lead, and zinc in Washington in 1950, by method of recovery, in terms of recoverable metal

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Placer	39	10			
Amalgamation	80	32			
Cyanidation	5,780	37,203

REVIEW BY COUNTIES AND DISTRICTS

CHELAN COUNTY

Chelan Lake District.—The Howe Sound Co. operated its Holden mine and 2,000-ton mill continuously during 1950; 657,634 tons of zinc-copper ore were treated by selective flotation and 268,640 tons of current sands and slimes by cyanidation. Gross metal content of the ore treated was 38,450 ounces of gold, 161,575 ounces of silver, 10,634,071 pounds of copper, and 7,025,492 pounds of zinc.

Peshastin Creek (Blewett) District.—The Calton Mining Co. operated its Polepick mine for about 9 months. About 20 tons of gold ore were treated in the company amalgamation mill.

Wenatchee District.—The Lovitt Mining Co., Inc., operated its Gold King mine during the entire year and shipped the total output (several thousand tons) to a smelter.

TABLE 10.—Mine production of gold, silver, copper, lead, and zinc in Washington in 1950, by counties and districts, in terms of recoverable metal

[1] District production combined; Bureau of Mines not at liberty to publish individual production.

FERRY COUNTY

Orient District.—The Talisman Mining & Leasing Co. operated its mine and 75-ton flotation mill during part of the year and shipped 18 tons of zinc concentrate to a smelter.

Republic (Eureka) District.—The Aurum Mining Co. was disincorporated in August 1950, and its interests were acquired by Day Mines, Inc. Intermittent operations by the two companies and by lessees during 1950 yielded several hundred tons of gold ore which were shipped to a smelter.

Knob Hill Mines, Inc., operated its mine and 400-ton flotation-cyanidation mill during the entire year. About 7 percent more ore was treated in 1950 than in 1949. The Valley mine was operated by Everett and I. G. Hougland from May 1 to September 1, during which time several hundred tons of gold ore and a small lot of copper concentrate were shipped to a smelter.

KITTITAS COUNTY

Swauk Creek District.—C. B. Jordan operated the Ace of Diamonds claim during part of the year and shipped a small quantity of bullion to the United States Assay Office at Seattle. The Nelson Hill mine was operated for a short time by S. H. Compton; one small lot of crude gold ore was shipped to a smelter.

OKANOGAN COUNTY

Loomis-Oroville District.—Kaaba Silver-Lead Mines, Inc., operated its Kaaba mine and mill during 1950. A small tonnage of lead concentrate was shipped to a smelter.

Methow District.—The Alder Gold-Copper Co. operated the Alder group and 250-ton flotation concentrator during 1950 and shipped 1,899 tons of concentrate to a copper smelter.

Myers Creek District.—One small lot of gold ore was shipped to a smelter from the Gray Eagle mine which was operated for a short time during the year.

PEND OREILLE COUNTY

Metaline District.—The American Zinc, Lead & Smelting Co. operated its Grandview mine and 700-ton flotation mill during the entire year and treated 231,031 tons of zinc-lead ore, over four times the tonnage milled in 1949, when operations were curtailed by a strike.

The Pend Oreille Mines of Pend Oreille Mines & Metals Co. was operated throughout 1950. One 800-ton unit of a new 2,400-ton flotation mill, under construction during the year, was completed and put into operation on December 15. A second 800-ton unit of the new mill was scheduled for completion and operation during the third quarter of 1951. The third unit was planned for completion early in 1952. Extensive mine development was in progress during 1950 to meet the ore requirements of the new milling facilities. Ore treated in 1950 totaled 186,197 tons, slightly less than the 186,955 tons treated in 1949. The gross metal content of the ore in 1950 was 18,000 ounces of silver, 30,000 pounds of copper, 6,336,653 pounds of lead, and 9,850,731 pounds of zinc. The mill produced 3,957 tons of lead concentrate and 7,659 tons of zinc concentrate.

STEVENS COUNTY

Bossburg District.—Bonanza Lead operated its Bonanza mine throughout the year and treated, in the company 100-ton flotation mill, about 20,000 tons (14,163 tons in 1949) of lead ore. The Silver Trail & Jasper mine was operated for a short time by the Silver Trail Mining Co.; 11 tons of lead ore were shipped to a smelter. The Young America mine was operated on a small scale by lessees who shipped 3 tons of lead concentrate and 15 tons of zinc concentrate to smelters.

Chewelah District.—District production consisted of 7 tons of zinc-lead ore from the Montgomery claim.

Deer Trail District.—One small lot of zinc-lead ore was shipped to a smelter from the Deer Trail mine.

Kettle Falls District.—The Gold Reef mine and mill were operated from January 1 to November 7. During the year the amalgamation mill was converted to a batch-leaching cyanide plant; 150 tons of gold ore were treated in 1950.

Northport (Aladdin) District.—The Admiral Consolidated Mining Co. Admiral mine and 75-ton flotation mill were operated for about 6 months during the year. Approximately 15,000 tons of zinc ore, containing 125 ounces of silver, 8,500 pounds of lead, and 308,750 pounds of zinc, was treated. The total mill output of 252 tons of zinc concentrate was trucked to a smelter. The Deep Creek and Anderson property of the Goldfield Consolidated Mines Co. was operated from July 5 to December 31; 46,980 tons of zinc ore was treated in the 260-ton flotation mill. The Last Chance Consolidated Mining Co. operated the Last Chance mine and 100-ton gravity-flotation mill part of the year. One 7-ton lot of zinc-lead concentrate was shipped. The Lead Trust mine was operated for a short time, and 6 tons of lead ore was sent to a smelter. Thomas D. Farmer operated the Farmer group for 60 days and shipped about 450 tons of zinc-lead ore to a custom mill. Approximately 156 tons of selected zinc-lead ore was shipped from the dump of the Red Top mine of the Red Top Mining Co. From this ore 3 tons of lead concentrate and 10 tons of zinc concentrate were produced.

Nashburg & Thompson shipped 23 tons of crude ore from its mine to a custom mill.

Wyoming

Gold, Silver, Copper, and Lead

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

NO GOLD or silver was mined in Wyoming in 1950. The output in 1949 was 389 fine ounces of gold worth $13,615 and 21 fine ounces of silver worth $19. No copper or lead was produced in the State from 1947 through 1950. No Wyoming output of zinc has been recorded.

The Carissa mine in the South Pass district, Fremont County, which contributed nearly all the State output of gold from 1947 through 1949, was not worked in 1950. The Duncan gold mine in the same district was unwatered and sampled. General interest in gold mining was lacking because of the high cost of labor and materials compared with the fixed price of gold.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the prices shown in table 1.

TABLE 1.—Prices of gold, silver, copper, lead, and zinc, 1946–50

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1946	$35	$0.808	$0.162	$0.109	$0.122
1947	35	.905	.210	.144	.121
1948	35	.905+	.217	.179	.133
1949	35	.905+	.197	.158	.124
1950	35	.905+	.208	.135	.142

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934.
[2] Treasury buying price for newly mined silver. Jan. 1 to June 30, 1946—$0.71111111; July 1, 1946, to Dec. 31, 1947—$0.905; 1948–50—$0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1946–47 includes bonus payments by Office of Metals Reserve for overquota production.

Table 2 shows the annual output of gold, silver, and copper in Wyoming from 1946 to 1950 and the total production of gold, silver, copper, and lead from 1867 to 1950.

The copper, which represents about three-fourths of the total value of the four metals, was mined in the Copper Mountain district, Fremont County; Encampment district, Carbon County; Hartville district, originally in Laramie County, now in Platte County; and Laramie (Douglas Creek) district, Albany County. About 76 percent of the copper was mined in 1883 and 1899 to 1909.

The lead came from the Spring Creek district in Carbon County, the Hurricane district in Crook County, and the Douglas Creek district in Albany County; it was mined in 1932, 1934, 1935, 1942, and 1945.

Although gold was produced from many localities throughout the State, most of the output came from placer and lode mines in the Atlantic City (South Pass) district in Fremont County. Gold has been produced in Wyoming in nearly all of the 84 years from 1867 to 1950, but cumulative output was only 80,031 ounces—more than half of which was produced before 1890.

The silver was recovered as a byproduct from copper, gold, and lead ores and placer gravel.

TABLE 2.—Mine production of gold, silver, copper, and lead in Wyoming 1946–1950, and total, 1867–1950, in terms of recoverable metal [1]

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total
		Fine ounces	Value	Fine ounces	Value	Short tons	Value	Short tons	Value	
1946	61	105	$3,675	26	$21	[2] 1	$324			$4,020
1947	6,059	1,486	52,010	95	86					52,096
1948	867	115	4,025	11	10					4,035
1949	[3] 1,800	389	13,615	21	19					13,634
1950										
1867–1950	(4)	80,031	1,909,413	74,819	51,912	16,326	5,684,372	14	$1,486	7,647,183

[1] Includes recoverable metal content of gravel washed (placer operations); ore milled; and ore shipped directly to smelters during the calendar year indicated.

[2] Includes less than ½ ton of recoverable copper produced in 1945 from the Bartlett (Copper King) mine in Laramie County.

[3] Ore milled; recovery was 86 ounces of gold and 3 ounces of silver in amalgamation and cyanidation bullion and 300 ounces of gold and 18 ounces of silver in 35 tons of concentrates smelted.

[4] Figure not available.

PART IV. WORLD REVIEW

Mineral Production of the World, 1949-50

By Berenice B. Mitchell, Pauline Roberts, Helen L. Hunt, and Viola May Haslacker[1]

INTRODUCTION

THE STATISTICAL tables in this chapter present, country by country, the mineral production of the world in 1949–50. The figures are on a mine basis, unless otherwise indicated, except for cement, coke, and steel, which are measured at the processing plant. The tables are essentially a retabulation, by countries, of the 53 commodity world tables appearing in the various chapters of this volume. For lack of comprehensive information, data for the following minerals are excluded: Andalusite, aplite, asphalt, boron, bromine, calcite (optical), calcium chloride (natural), carbon dioxide, clay, columbium (niobium), diatomite (kieselguhr), dumortierite, emery, garnet (abrasive), gem stones (other than diamonds), germanium, greensand, grindstones, helium, indium, iodine, kyanite, lithium, magnesium compounds (other than magnesite), meerschaum, mineral pigments, monazite, natural gas, natural gasoline, oil shale, olivine, perlite, pumice, quartz crystal, radium, sand and gravel, selenium, sillimanite, sodium salts (other than common salt), stone, strontium, sulfur (byproduct), tantalum, tellurium, thallium, topaz (industrial), tripoli, uranium, vermiculite, wollastonite, and zirconium. In addition, a few minor geographic areas for which no statistics are available, are also omitted from the tabulation; it is believed that no significant quantities of minerals are mined in any of these areas.

The statistics in these tables were derived principally from questionnaires sent, in cooperation with the United States Department of State, to the governments of each country. Supplementary sources were United States consular reports, the Imperial Institute's Statistical Summary of the Mineral Industry of the British Commonwealth and Foreign Countries, other official publications of various countries, the United Nations Statistical Yearbook, the Year Book of the American Bureau of Metal Statistics, Minerais et Metaux, business magazines, and company reports. Where official data were not available, esti-

[1] Assisted by Shirlye M. Pittle.

mates were often supplied by Bureau of Mines commodity specialists.

In the following tables, figures marked with an asterisk (*) are estimates. Figures for 1949 that differ from those given in the 1949 Mineral Production of the World chapter represent revisions based on the latest data available. Coke entries are for coke made at high temperatures (over 1,000° C.) in slot-type or beehive ovens and exclude gas house or retort coke.

Iron ore (thousand tons)	3,334	3,270	Smelter	186,920	185,935
Iron and steel (thousand tons):					
Pig iron and ferro-alloys	2,146	2,260			
Steel ingots and castings	2,894	3,070			
Lead:					
Mine	144,945	154,119			
Smelter	132,608	154,551			

[1] Magnesite has been produced in recent years, but no current data are available. Mercury is produced but no output was recorded in 1949–50.
[2] Includes antimony content of antimonial lead.
[3] Exclusive of sand, gravel, and stone.
[4] Refined metal plus bismuth content of bullion exported.
[5] Data not available.
[6] Figures comprise Canadian ore processed in Canada and exported (irrespective of year when mined), plus cobalt content of oxide made at Port Colborne from copper-nickel ore. However, figures exclude the cobalt recovered at Clydach (Wales) from Canadian nickel-copper ores.
[7] Recovered from tailing dumps.
[8] Includes titanium slag containing approximately 70 percent TiO_2.

COSTA RICA

Peat	117,509	118,589
Petroleum, crude (thousand barrels)	1,841,940	1,971,845
Phosphate rock (sold or used by producers)	9,131,173	10,418,122
Platinum-group metals (troy ounces):		
Platinum	19,013	37,855
Other platinum-group metals	5,794	
Potassium salts (equivalent K_2O)	1,014,586	1,167,325
Pyrites, including cupreous pyrites	905,746	946,108
Salt:		
Rock salt	3,124,637	3,562,738
Other salt	11,002,165	11,523,492
Silver (troy ounces)	34,944,554	42,308,739
Sulfur, native (long tons)	4,745,014	5,192,184
Talc, pyrophyllite, and soapstone (sold by producers)	419,023	563,132
Tin (long tons):		
Mine	68	94
Smelter [6]	35,834	33,118
Titanium concentrates:		
Ilmenite	364,989	424,851
Rutile	10,875	(7)
Tungsten concentrates (60 percent WO_3 basis) (shipments)	2,508	4,403
Zinc:		
Mine	538,142	565,513
Smelter	739,154	765,176

[1] Excludes bismuth and vanadium, data for which Bureau of Mines is not at liberty to publish. Corundum is produced, but no output was recorded in 1949–50.
[2] Smelter output from domestic and foreign ores, exclusive of scrap. Production from domestic ores only was as follows: 1949, 687,580 tons; 1950, 826,760.
[3] Data from American Iron and Steel Institute. Includes only that portion of steel for castings produced by companies manufacturing steel ingots.
[4] Figures cover lead refined from domestic and foreign ores; refined lead produced from foreign base bullion not included.
[5] Byproduct of electrolytic refining of copper.
[6] Including tin content of ores used direct to make alloys.
[7] Bureau of Mines not at liberty to publish the figures.

Petroleum, crude (thousand barrels)	22,589	23,353			

[1] Arsenic, asbestos, barite, beryl, bismuth, chromite, corundum, feldspar, fluorspar, graphite, gypsum, iron ore, pig iron, magnesite, manganese ore, peat, salt, talc, tungsten, and vanadium have been produced in recent years, but no current data are available.
[2] Data not available.
[3] In addition, the following quantities (metric tons) of asphaltite were produced and used as solid fuels: 1949, 79,477; 1950, data not available.

BOLIVIA

TABLE 15.—Mineral production,[1] 1949–50, in metric tons

Mineral[2]	1949	1950	Mineral[2]	1949	1950
Antimony	10,275	(3)	Silver (troy ounces)	6,634,627	6,566,950
Asbestos	182	(3)	Sulfur, native (long tons)	4,398	(3)
Bismuth in ore and bullion (kilograms)	[4] 8,222	(3)	Tin (long tons):		
Cement, hydraulic	41,546	(3)	Mine	34,115	31,213
Cobalt	----------	(3)	Smelter	405	393
Copper—mine	5,074	4,704	Tungsten concentrates (60 percent WO_3 basis)	2,543	2,461
Fluorspar	264	(3)	Zinc—mine	17,629	19,570
Gold (troy ounces)	33,533	1,737			
Lead—mine	26,351	(3)			
Petroleum, crude (thousand barrels)	678	616			

[1] All data are exports, except that those for cement, lead, petroleum, and zinc are actual production.
[2] Manganese ore, mica, and salt have been produced in recent years, but no current data are available. Mercury is produced, but no output was recorded in 1949–50.
[3] Data not available.
[4] Excludes bismuth content of tin concentrates exported.

BRAZIL

TABLE 16.—Mineral production, 1949–50, in metric tons

Mineral[1]	1949	1950	Mineral[1]	1949	1950
Arsenic, white	959	(2)	Magnesite	43,110	(2)
Barite	6,010	(2)	Manganese ore (exports)	149,896	*162,600
Bauxite	20,246	(2)	Mica (exports)	558	(2)
Beryllium concentrates (exports)	3,078	(2)	Nickel	7	(2)
Cement, hydraulic	1,281,047	1,381,976	Petroleum, crude (thousand barrels)	109	278
Chromite (exports)	3	(2)	Phosphate rock (apatite)	4,553	(2)
Coal (thousand tons)	2,117	*1,940	Salt	800,872	(2)
Coke	271,710	286,595	Silver (troy ounces)	21,041	*12,860
Diamonds (metric carats)	*250,000	*200,000	Talc and soapstone	7,221	(2)

Peat	(11)	(3)

[1] Arsenic, bauxite, bismuth, cobalt, gold, manganese ore, mercury, and phosphate rock have been produced in recent years, but no current data are available. Nickel is produced, but no output was recorded in 1949–50.
[2] Includes Soviet Zone.
[3] Not available.
[4] American-British zones (Bizonal area) only.
[5] Excludes production of the Saar.
[6] Approximate production.
[7] Includes secondary.
[8] Crude-production estimates based on the following calcined figures: 1949, 429,400; 1950, 286,592.
[9] Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese.
[10] Aluminum, arsenic, bauxite, bismuth, cobalt, copper, fluorspar, gold, lead, magnesium, manganese ore, mercury, phosphate rock, potassium salts, pyrites, and zinc have been produced in recent years, but no current data are available. Nickel is produced, but no output was recorded in 1949–50. *See also* introduction to chapter.
[11] Included with Federal Republic.
[12] Planned production.

GREECE

Talc and soapstone	1,700	2,500
Zinc—mine	1,695	3,184

[1] Gypsum, molybdenum, salt, silver, and native sulfur have been produced in recent years, but no current data are available. Nickel is produced, but no output was recorded in 1949–50.
[2] Data not available.

HUNGARY

TABLE 34.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	*14,000	(2)	Iron and steel (thousand tons):		
Bauxite	*600,000	(2)	Pig iron and ferro-alloys	428	*500
Cement, hydraulic	*640,000	(2)	Steel ingots and castings	849	1,022
Coal (thousand tons):			Lead—mine	(2)	300
Bituminous	*1,380	(2)	Petroleum, crude (thousand barrels)	3,791	*4,198
Lignite	*10,450	(2)			
Iron ore (thousand tons)	339	368			

[1] Arsenic, copper (mine), fuel briquets, gold, lead (smelter), manganese ore, peat, pyrites, salt, and silver have been produced in recent years, but no current data are available. Antimony is produced, but no output was recorded in 1949-50.
[2] Data not available.

ICELAND

Peat has been produced in Iceland in recent years, but no current data are available.

IRELAND

TABLE 35.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Cement, hydraulic	*453,000	(2)	Fuel briquets	16,257	(2)
Coal (thousand tons)	115	181	Peat	*4,079,400	(2)

[1] Barite, gypsum, phosphate rock, and pyrites have been produced in recent years, but no current data are available.
[2] Data not available.

ITALY

TABLE 36.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	25,647	37,070	Lead:		
Antimony	360	400	Mine	34,600	*38,000
Arsenic, white	1,440	[2] 520	Smelter	28,460	37,469
Asbestos	15,365	21,433	Magnesite	456	200
Barite	46,616	48,142	Manganese ore	24,219	16,208
Bauxite	104,852	153,433	Mercury (flasks)	44,527	53,346
Cadmium—smelter (kilograms)	73,000	[2] 42,000	Molybdenum	----------	(4)
Cement, hydraulic	4,036,501	5,003,546	Petroleum, crude (thousand barrels)	71	63
Coal (thousand tons):			Platinum—refinery (troy ounces)	----------	(4)
Bituminous and anthracite	1,104	1,030	Pyrites, including cupreous pyrites	866,179	895,459
Lignite	832	780	Salt	814,420	(4)
Cobalt	(3)	(4)	Silver (troy ounces)	793,545	851,995
Coke	1,511,171	1,501,616	Sulfur, native, crude (long tons) [5]	185,567	209,767
Copper:			Talc and soapstone	60,210	66,737
Mine	6	34	Tungsten concentrates (60 percent WO_3 basis)	1	2
Smelter	30	54	Zinc:		
Feldspar	10,901	14,254	Mine	73,800	85,348
Fluorspar	17,746	31,611	Smelter	26,612	38,119
Gold (troy ounces)	10,385	10,674			
Graphite	4,011	3,855			
Iron ore (thousand tons)	521	442			
Iron and steel (thousand tons):					
Pig iron and ferro-alloys	445	570			
Steel ingots and castings	2,055	2,362			

[1] Fuel briquets, gypsum, mica, peat, phosphate rock, and potassium salts have been produced in recent years, but no current data are available. Magnesium metal, nickel, and tin are produced, but no output was recorded in 1949-50.
[2] January to September, inclusive.
[3] Less than 1 ton.
[4] Data not available.
[5] In addition, the following tonnages of ground sulfur rock (30 percent S) were produced and used as an insecticide: 1949, 19,213 tons; 1950, 15,778 tons.

LUXEMBOURG

TABLE 37.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Cement, hydraulic	121,000	125,000	Iron and steel (thousand tons):		
Iron ore (thousand tons)	4,137	3,845	Pig iron and ferro-alloys	2,372	2,499
			Steel ingots and castings	2,272	2,449

[1] Gypsum has been produced in recent years, but no current data are available.

MALTA

Production of salt in Malta totaled 1,807 metric tons in 1949 and 1,827 tons in 1950.

NETHERLANDS

TABLE 38.—Mineral production, 1949–50, in metric tons

Mineral	1949	1950	Mineral	1949	1950
Cement, hydraulic	552,032	592,800	Iron and steel (thousand tons):		
Coal (thousand tons):			Pig iron and ferro-alloys	434	454
Bituminous	11,705	12,247	Steel ingots and castings	437	490
Lignite	205	194	Peat	779,000	520,000
Coke	2,474,400	2,803,900	Petroleum, crude (thousand barrels) [1]	4,314	4,897
Fuel briquets:			Salt	331,000	412,570
Bituminous	992,000	1,049,000	Tin—smelter (long tons)	19,247	21,027
Lignite	61,000	56,000	Zinc—smelter	15,614	19,752

[1] Data revised in accordance with recent information stating 6.948 barrels per metric ton.

NORWAY

TABLE 39.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	35,047	46,622	Magnesium metal		(2)
Cadmium—smelter (kilograms)	71,400	(2)	Mica (exports)	113	571
Cement, hydraulic	592,184	583,200	Molybdenum	71	62
Copper:			Peat	381,659	358,200
Mine	14,875	15,400	Pyrites, including cupreous pyrites	745,367	749,363
Smelter	9,306	9,338	Silver (troy ounces)	170,399	*150,000
Feldspar (exports)	21,932	20,846	Talc and soapstone	*[4] 40,900	55,000
Graphite (exports)	2,196	1,902	Titanium concentrates:		
Iron ore (thousand tons)	267	[3] 430	Ilmenite	99,013	105,000
Iron and steel (thousand tons):			Rutile	16	(2)
Pig iron and ferro-alloys	230	220	Zinc:		
Steel ingots and castings	72	70	Mine	6,610	6,900
Lead—mine	320	(2)	Smelter	41,040	44,000
Magnesite	1,100	(2)			

[1] Barite, beryl, bismuth, fluorspar, gold, and phosphate rock have been produced in recent years, but no current data are available. Coke, lead (smelter), nickel, tin (smelter), and tungsten are produced, but no output was recorded in 1949–50.
[2] Data not available.
[3] Including titaniferous iron ore.
[4] Exports.

POLAND

TABLE 40.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Cement, hydraulic	2,200,000	2,376,000	Iron and steel (thousand tons):		
Coal (thousand tons):			Pig iron and ferro-alloys	*1,243	*1,250
Bituminous	74,103	*77,530	Steel ingots and castings	2,305	(3)
Lignite	4,627	*4,750	Lead—smelter	17,850	(3)
Coke	5,751,000	5,924,000			
Fuel briquets:			Petroleum, crude (thousand barrels)	*1,205	*1,205
Bituminous	796,000	[2] 631,300			
Lignite	175,000	[2] 170,200	Pyrites, including cupreous pyrites	81,000	(3)
Gypsum	26,361	(3)	Salt	800,000	(3)
Iron ore (thousand tons)	699	790			

[1] Cadmium, magnesite, peat, phosphate rock, potassium salts, silver, and zinc have been produced in recent years, but no current data are available.
[2] Incomplete.
[3] Data not available.

PORTUGAL

TABLE 41.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Arsenic, white	[2] 744	801	Manganese ore	508	798
Asbestos	101	271	Mica	-------	(3)
Beryllium concentrates	*20	*49	Peat	266	402
Cement, hydraulic	521,435	572,549	Pyrites, including cupreous pyrites	622,925	613,522
Chromite	*500	(3)	Salt (exports) (other than rock)	(3)	30,765
Coal (thousand tons):			Silver (troy ounces)	31,958	(3)
Bituminous and anthracite	443	426	Tin (long tons):		
Lignite	111	95	Mine [4]	785	690
Fuel briquets	(3)	*78,300	Smelter	218	*240
Gold (troy ounces)	10,385	(3)	Titanium concentrates: Ilmenite	680	47
Gypsum	43,060	(3)			
Lead—smelter	304	591	Tungsten concentrates (60 percent WO_3 basis)	2,700	2,500

[1] Antimony, barite, feldspar, iron ore, salt (rock), and talc have been produced in recent years, but no current data are available.
[2] Exports.
[3] Data not available.
[4] Excluding content of mixed concentrates.

RUMANIA

TABLE 42.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Cement, hydraulic	560,000	650,000	Iron and steel (thousand tons):		
Coal (thousand tons):			Pig iron and ferro-alloys	*200	*243
Bituminous and anthracite	187	*3,045 (Bituminous and anthracite, and lignite)	Steel ingots and castings	*459	*558
Lignite	2,576		Manganese ore	*65,000	(2)
Coke	*100,000	*120,000			
Gold (troy ounces)	112,528	(2)	Petroleum, crude (thousand barrels)	*33,700	*32,000
Iron ore (thousand tons)	*324	*395	Pyrites, including cupreous pyrites	*5,000	(2)

[1] Bauxite, beryl, bismuth, copper (smelter), feldspar, fuel bricquets, gypsum, lead, mercury, mica, molybdenum, phosphate rock, salt, silver, talc, and zinc have been produced in recent years, but no current data are available.
[2] Data not available.

SPAIN

TABLE 43.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950
Aluminum	1,212	2,167
Antimony	171	[2] *400
Arsenic, white	124	(3)
Asbestos	40	(3)
Barite	7,665	(3)
Bauxite	11,962	12,186
Bismuth—smelter (kilograms)	19,854	(3)
Cement, hydraulic	2,247,608	2,521,107
Coal (thousand tons):		
Bituminous and anthracite	10,641	10,183
Lignite	1,321	*1,350
Coke	967,497	946,100
Copper:		
Mine [4]	6,702	6,802
Smelter	6,155	5,400
Feldspar (quarry) [5]	396	1,650
Fluorspar	59,594	32,669
Fuel briquets	1,135,859	1,092,000
Gold (troy ounces)	30,318	13,217
Graphite	256	313
Gypsum	1,293,552	2,251,831
Iron ore (thousand tons)	1,876	2,079
Iron and steel (thousand tons):		
Pig iron and ferro-alloys	634	680
Steel ingots and castings	652	759

Mineral [1]	1949	1950
Lead:		
Mine	31,550	[2] 32,400
Smelter	33,021	34,876
Magnesite	6,691	7,632
Manganese ore	18,651	*17,000
Mercury (flasks)	32,289	*50,000
Mica	9	14
Phosphate rock	23,093	24,080
Potassium salts (equivalent K_2O)	137,700	152,000
Pyrites, including cupreous pyrites	1,132,793	1,306,859
Salt:		
Rock salt	288,896	313,676
Other salt	546,886	(3)
Silver (troy ounces)	514,283	823,059
Sulfur, native (long tons)	5,000	7,600
Talc and soapstone [6]	38,208	25,131
Tin (long tons):		
Mine	666	*575
Smelter	803	844
Titanium concentrates: Ilmenite	376	637
Tungsten concentrates (60 percent WO_3 basis)	888	815
Zinc:		
Mine	*50,000	*64,000
Smelter	19,551	21,264

[1] Beryl, cobalt, and molybdenum have been produced in recent years, but no current data are available.
[2] Including Spanish Morocco.
[3] Data not available.
[4] According to Year Book of American Bureau of Metal Statistics.
[5] There is some additional production of feldspar, but comaparable figures are not available.
[6] Includes steatite as follows: 1949: 20,880; 1950: 13,702.

SVALBARD (SPITSBERGEN)

Production of coal in Svalbard (Spitsbergen) totaled 455,000 metric tons in 1949 and 379,000 tons (preliminary figure) in 1950, all from Norwegian mines.

SWEDEN

TABLE 44.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950
Aluminum (includes alloys)	3,929	4,000
Cement, hydraulic	1,698,369	1,944,000
Chromite	----------	(2)
Coal (thousand tons)	317	303
Coke	82,600	72,000
Copper:		
Mine	16,273	16,099
Smelter	14,359	16,708
Feldspar	38,959	(2)
Fuel briquets	54,500	(2)
Gold (troy ounces)	80,280	(2)
Graphite	----------	(2)
Gypsum	----------	(2)
Iron ore (thousand tons)	13,748	13,927
Iron and steel (thousand tons):		
Pig iron and ferro-alloys	860	848
Steel ingots and castings	1,370	1,438

Mineral [1]	1949	1950
Lead:		
Mine	23,900	(2)
Smelter	10,757	*[3] 14,500
Manganese ore	*10,850	(2)
Mica	61	(2)
Molybdenum	9	(2)
Phosphate rock (apatite)	1,604	(2)
Pyrites, including cupreous pyrites	424,007	(2)
Silver (troy ounces)	1,140,708	1,291,656
Talc and soapstone	11,293	(2)
Tungsten concentrates (60 percent WO_3 basis)	468	362
Zinc—mine	35,158	36,714

[1] Arsenic, barite, bismuth, cobalt, fluorspar, peat, and salt have been produced in recent years, but no current data are available. Mercury, nickel, and zinc (smelter) are produced, but no output was recorded in 1949–50.
[2] Data not available.
[3] Includes secondary.

SWITZERLAND

TABLE 45.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	21,000	21,000	Iron and steel (thousand tons):		
Asbestos	----------	(2)	Pig iron and ferro-alloys	*32	34
Cement, hydraulic	*950,000	1,078,000	Steel ingots and castings	100	*130
Gypsum	*80,000	*80,000	Salt	*100,000	94,000
Iron ore (thousand tons)	70	55			

[1] Barite and peat have been produced in recent years, but no current data are available. Coal, fluorspar, magnesium metal, and manganese ore are produced, but no output was recorded in 1949–50.
[2] Data not available.

TURKEY (IN EUROPE)

Data on output of Turkey in Europe are included with those of Turkey in Asia.

U. S. S. R. (IN EUROPE AND ASIA)

TABLE 46.—Mineral production, 1949–50, in metric tons (all data estimated)

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	165,000	190,000	Lead—smelter	90,000	104,000
Cement, hydraulic	8,000,000	10,500,000	Manganese ore	1,500,000	2,000,000
Chromite	350,000	500,000	Nickel	25,000	25,000
Coal (thousand tons)	236,000	264,000	Petroleum, crude (thousand barrels)	244,700	273,200
Coke	24,000,000	27,000,000	Platinum, placer (troy ounces)	100,000	100,000
Copper—smelter	200,000	218,000	Salt	(2)	(2)
Gold (troy ounces)	7,000,000	7,000,000	Tungsten concentrates (60 percent WO_3 basis)	1,500	1,500
Iron and steel (thousand tons):			Zinc—smelter	110,000	128,700
Pig iron and ferro-alloys	16,700	19,500			
Steel ingots and castings	23,000	27,000			

[1] Antimony, arsenic, asbestos, barite, bauxite, beryl, bismuth, cadmium, corundum, diamonds, feldspar, fluorspar, fuel briquets, graphite, gypsum, iron ore, lead (mine), magnesite, magnesium metal, mercury, mica, molybdenum, peat, phosphate rock, potassium salts, pyrites, silver, native sulfur, and talc have been produced in recent years, but no current data are available.
[2] Exceeds 4,000,000 tons.

UNITED KINGDOM

TABLE 47.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	30,832	29,941	Lead:		
Bauxite (Northern Ireland)	----------	(2)	Mine	2,156	3,073
Cadmium—smelter (kilograms)	102,662	118,878	Smelter	*2,156	*3,073
Cement, hydraulic	9,364,000	9,912,600	Magnesium metal [6]	5,100	4,900
Coal (thousand tons):			Petroleum, crude (thousand barrels)	338	340
Great Britain	218,570	219,791	Pyrites, including cupreous pyrites	*13,181	(2)
Northern Ireland:			Salt:		
Bituminous	(3)	(2)	Rock salt	*41,400	(2)
Lignite	(3)	(2)	Other salt	*3,740,000	(2)
Coke [4]	15,739,630	15,640,000	Northern Ireland	12,973	(2)
Feldspar (Northern Ireland)	----------	(2)	Talc and soapstone	2,616	(2)
Fluorspar	67,575	(2)	Tin (long tons):		
Fuel briquets	1,536,268	*1,406,000	Mine	1,212	960
Gypsum (Northern Ireland)	----------	(2)	Smelter [7]	28,384	27,310
Iron ore (thousand tons) [5]	13,612	13,145	Tungsten concentrates (60 percent WO_3 basis)	39	61
Iron and steel (thousand tons):			Zinc—smelter	65,124	71,418
Pig iron and ferro-alloys	9,653	9,785			
Steel ingots and castings	15,803	16,555			

[1] Arsenic, barite, bismuth, chromite, gypsum, and silver have been produced in recent years, but no current data are available. Manganese ore and zinc (mine) are produced, but no output was recorded in 1949–50.
[2] Data not available.
[3] Less than 1,000 tons.
[4] In Great Britain production of gas-house coke, which is not included herein, is especially important: It averaged 11,000,000 tons per year in 1941–45 and increased 15 percent in 1946–47 and 25–30 percent in 1948–49; data for 1950 incomplete.
[5] Exclusive of bog ore, which is used mainly for purification of gas.
[6] Includes secondary.
[7] Includes production from imported scrap.

YUGOSLAVIA

TABLE 48.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	2,400	*2,500	Lead:		
Antimony	2,789	(2)	Mine	72,200	*80,000
Bauxite	*368,000	(2)	Smelter	56,800	*69,800
Cement, hydraulic	*1,300,000	(2)	Manganese ore	*14,000	(2)
Chromite	*93,000	*100,000	Petroleum, crude (thousand barrels)	470	780
Coal (thousand tons)	12,122	*13,000	Pyrites, including cupreous pyrites	73,000	(2)
Copper—smelter [3]	34,000	40,000	Salt	*108,900	(2)
Iron ore (thousand tons)	835	*800	Zinc—mine	36,559	*43,500
Iron and steel (thousand tons):					
Pig iron and ferro-alloys	191	*210			
Steel ingots and castings	399	*420			

[1] Barite, bismuth, copper (mine), fuel briquets, gold, gypsum, magnesite, mercury, molybdenum, silver, and zinc (smelter) have been produced in recent years, but no current data are available.
[2] Data not available.
[3] Approximate production.

ASIA

ADEN

Production of salt in Aden totaled 308,302 metric tons in 1949 and 259,972 tons in 1950.

AFGHANISTAN

Salt and talc have been produced in recent years in Afghanistan, but no current data are available. Production of coal in Afghanistan totaled 5,000 metric tons in 1949; data for 1950 are not available. Production of beryllium in Afghanistan totaled 7 metric tons in 1950.

BAHREIN ISLAND

Bahrein Island produced 10,985,000 barrels of crude petroleum in 1949 and 11,016,000 barrels in 1950.

BRITISH BORNEO

TABLE 49.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Antimony [2]	1	2	Petroleum, crude (thousand barrels)	25,108	30,958
Gold (troy ounces) [2]	1,523	1,440	Phosphate rock (guano)	508	(3)

[1] Coal and silver have been produced in recent years, but no current data are available.
[2] Sarawak only.
[3] Data not available.

BURMA

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Antimony	*70	(2)	Salt	31,692	(2)
Gold (troy ounces)	158	(2)	Tin—mine (long tons)	1,781	*1,682
Lead—smelter	[3] 2,318	-------	Tungsten concentrates (60 percent WO_3 basis)	740	*600
Petroleum, crude (thousand barrels)	248	*450			

[1] Bismuth, lead (mine), iron ore, manganese ore, and silver have been produced in recent years, but no current data are available. Cobalt is produced, but no output was recorded in 1949–50.
[2] Data not available.
[3] Exports.

CEYLON

TABLE 51.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950
Graphite (exports)	12,437	13,030
Gypsum	37	(2)
Salt	28,780	66,093

[1] Mica is produced, but no output was recorded in 1949–50.
[2] Data not available.

CHINA (EXCEPT FORMOSA)

TABLE 52.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum [2]		(3)	Lead—smelter	2,062	*4,000
Antimony	*6,000	(3)	Petroleum, crude (thousand barrels)	730	*730
Cement, hydraulic [2]	218,000	430,000	Salt	*2,000,000	*2,500,000
Coal, bituminous and anthracite (thousand tons)	*16,000	[4] 36,660	Silver (troy ounces)	160,000	320,000
Coke	*100,000	*300,000	Tin—smelter (long tons)	*4,200	*3,600
Copper—smelter	1,874	[5] 4,000	Tungsten concentrates (60 percent WO_3 basis)	*8,000	*11,000
Gold (troy ounces)	*60,000	*160,000			
Iron and steel (thousand tons):					
Pig iron and ferro-alloys	*317	*1,022			
Steel ingots and castings	*100	*540			

[1] Arsenic, asbestos, barite, bismuth, coal (lignite), cobalt, feldspar, fluorspar, graphite, gypsum, iron ore, magnesite, magnesium metal, manganese ore, mercury, mica, molybdenum, phosphate rock, potassium salts, pyrites, native sulfur, talc, and zinc (smelter) have been produced in recent years, but no current data are available.
[2] Manchuria only. [3] Data not available. [4] Planned production. [5] Approximate production.

CHRISTMAS ISLAND

Exports of phosphate rock from Christmas Island totaled 255,236 metric tons in 1949; data for 1950 are not available. This Christmas Island is south of Java, not the Christmas Island south of Hawaii.

CYPRUS

TABLE 53.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Asbestos	12,556	(2)	Magnesite (exports)	20	20
Chromite (exports)	14,875	(2)	Pyrites, including cupreous pyrites	942,808	[3] 655,059
Copper—mine (exports)	23,936	23,301	Salt		(2)
Gypsum (exports)	25,788	65,485			

[1] Gold and silver have been produced in recent years, but no current data are available.
[2] Data not available.
[3] Exports.

FRENCH INDOCHINA

TABLE 54.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Cement, hydraulic	154,000	144,000	Salt	113,600	*89,600
Chromite		(2)	Talc and soapstone		(2)
Coal, bituminous and anthracite (thousand tons)	385	497	Tin (long tons):		
Molybdenum		(2)	Mine	40	62
			Smelter	*60	*60

[1] Asbestos, fuel briquets, gold, manganese ore, and phosphate rock have been produced in recent years, but no current data are available. Antimony, bauxite, coal (lignite), coke, graphite, iron ore, lead (smelter), tungsten, and zinc are produced, but no output was recorded in 1949–50.
[2] Data not available.

HONG KONG

Production of hydraulic cement in Hong Kong totaled 58,700 metric tons in 1949 and 68,400 tons in 1950. Production of iron ore in Hong Kong totaled 59,000 metric tons in 1949 and 169,000 tons in 1950. Silver has been produced in recent years, but no current data are available.

INDIA

TABLE 55.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	3,547	3,650	Lead—smelter	603	600
Asbestos	148	(2)	Magnesite	92,018	(2)
Barite	21,487	(2)	Manganese ore	656,190	[3] 679,163
Bauxite	41,302	(2)	Mica (exports)	13,743	15,874
Cement, hydraulic	2,135,737	2,652,000	Petroleum, crude (thousand barrels)	1,906	*1,867
Chromite	19,728	(2)	Phosphate rock (apatite)	588	(2)
Coal (thousand tons)	31,962	32,506	Salt:		
Coke	2,038,319	*2,000,000	Rock salt	4,229	(2)
Copper:			Other salt	2,022,060	2,657,929
Mine	6,305	7,000	Silver (troy ounces)	11,275	15,676
Smelter	6,493	6,720	Talc and soapstone	21,535	(2)
Corundum	1,493	(2)	Titanium concentrates:		
Feldspar	863	(2)	Ilmenite	226,816	216,076
Gold (troy ounces)	163,871	196,848	Rutile		(2)
Graphite	988	(2)	Tungsten concentrates (60 percent WO_3 basis)		(2)
Gypsum	142,190	(2)			
Iron ore (thousand tons)	2,854	*3,000			
Iron and steel (thousand tons):					
Pig iron and ferro-alloys	1,671	1,689			
Steel ingots and castings	1,374	1,437			

[1] Beryl, diamonds, fluorspar, and potassium salts have been produced in recent years, but no current data are available. Fuel briquets are produced, but no output was recorded in 1949–50.
[2] Data not available.
[3] Exports.

INDONESIA

TABLE 56.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Bauxite	678,138	551,143	Phosphate rock	*5,000	
Coal (thousand tons)	662	*790	Salt	320,000	(2)
Fuel briquets	25,323	25,278	Tin (long tons):		
Gold (troy ounces)	*32,000	(2)	Mine	28,965	32,099
Petroleum, crude (thousand barrels) [3]	44,932	50,148	Smelter	126	32

[1] Cement, silver, and native sulfur have been produced in recent years, but no current data are available. Copper (mine), manganese ore, nickel, and platinum are produced, but no output was recorded in 1949–50.
[2] Data not available.
[3] Includes New Guinea, whose production amounted to 1,725,500 barrels in 1949 and 1,748,000 barrels in 1950.

IRAN

TABLE 57.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950
Cement, hydraulic [2]	58,500	64,000
Coal (thousand tons)	[2] 170	(3)
Petroleum, crude (thousand barrels)	204,712	242,475

[1] Antimony, arsenic, chromite, manganese ore, and salt have been produced in recent years, but no current data are available.
[2] Fiscal year ended March 20 of year following that stated.
[3] Data not available.

IRAQ

TABLE 58.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950
Cement, hydraulic [2]	7,007	66,051
Petroleum, crude (thousand barrels)	30,957	49,919
Salt	8,989	12,000

[1] Gypsum has been produced in recent years, but no current data are available.
[2] First produced in October 1949.

ISRAEL AND ARAB PALESTINE

TABLE 59.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Cement, hydraulic [2]	241,393	380,128	Potassium salts (equivalent K_2O) [4]	-------	(3)
Gypsum	(3)	23,623	Salt	6,500	(3)

[1] Barite, feldspar, phosphate rock, and native sulfur have been produced in recent years, but no current data are available.
[2] Israel only.
[3] Data not available.
[4] Extracted from waters of Dead Sea.

JAPAN

TABLE 60.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Aluminum	21,222	24,764	Iron and steel (thousand tons):		
Antimony	172	161	Pig iron and ferro-alloys	1,625	2,286
Arsenic, white	2,489	1,627	Steel ingots and castings	3,111	4,848
Asbestos	5,456	4,948	Lead:		
Barite	9,322	14,239	Mine	9,106	10,853
Bismuth—smelter (kilograms)	25,946	33,049	Smelter [5]	7,596	9,984
Cadmium—smelter (kilograms)	52,484	90,348	Manganese ore	100,000	134,066
Cement, hydraulic	3,274,572	4,458,000	Mercury (flasks)	2,461	1,312
Chromite	27,003	31,953	Molybdenum	---------	13
Coal (thousand tons):			Petroleum, crude (thousand barrels)	1,353	2,048
Bituminous and anthracite	38,064	38,461	Phosphate rock	684	258
Lignite	2,088	1,263	Pyrites, including cupreous pyrites	1,535,082	1,916,181
Coke	2,580,000	1,337,754	Salt	395,676	418,144
Copper:			Silver (troy ounces)	2,887,265	3,680,617
Mine	32,741	39,322	Sulfur, native (long tons)	61,414	90,940
Smelter	74,037	84,749	Talc, pyrophyllite, and soapstone	262,433	283,566
Feldspar [2]	20,055	13,187	Tin (long tons):		
Fluorspar	960	2,425	Mine	190	326
Fuel briquets [3]	615,704	915,460	Smelter	290	390
Gold (troy ounces)	84,492	132,332	Tungsten concentrates (60 percent WO_3 basis)	20	64
Graphite	5,100	3,804	Zinc:		
Gypsum	117,123	114,505	Mine	44,314	52,032
Iron ore (thousand tons) [4]	780	910	Smelter	32,318	49,008

[1] Potassium salts have been produced in recent years, but no current data are available. Bauxite, cobalt, magnesium metal, and nickel are produced, but no output was recorded in 1949–50.
[2] In addition, the following quantities of aplite and other feldspathic rock were produced: 1949, 50,943 tons; 1950, 45,679.
[3] Briquets used by government railway only. In addition, an unknown amount is manufactured for household use; accurate data not available.
[4] Includes iron sand production as follows: 1949, 23,724 tons; 1950, 87,504 tons.
[5] Excludes secondary.

KOREA (SOUTH)

TABLE 61.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Asbestos		(2)	Graphite	40,671	(2)
Bismuth (kilograms)	173,420	(2)	Iron: Pig iron and ferro-alloys (thousand tons)		(2)
Cement, hydraulic	24,132	(2)	Lead—mine	87	(2)
Coal (thousand tons):			Mica		(2)
Bituminous and anthracite	1,066	[3] 397	Molybdenum	11	(2)
Lignite	60	[3] 15	Salt	188,812	(2)
Coke [4]	*411,514	*510,000	Silver (troy ounces)	18,932	(2)
Copper:			Talc, pyrophyllite, and soapstone	2,773	(2)
Mine	28	(2)	Tungsten concentrates (60 percent WO_3 basis)	[4] *2,448	*400
Smelter	308	(2)	Zinc, mine		(2)
Fluorspar	1,230	(2)			
Fuel briquets	168,358	(2)			
Gold (troy ounces)	3,419	(2)			

[1] Aluminum, arsenic, barite, beryl, lead (smelter), manganese ore, mercury, phosphate rock, potassium salts, pyrites, and steel have been produced in recent years, but no current data are available. Iron ore, magnesite, and magnesium metal are produced, but no output was recorded in 1949–50.
[2] Data not available.
[3] January to April, inclusive.
[4] Including North Korea.

KUWAIT

Production of crude petroleum in Kuwait totaled 90,000,000 barrels in 1949 and 125,722,000 barrels in 1950.

MALAYA

TABLE 62.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Coal (thousand tons)	393	422	Titanium concentrates: Ilmenite	20,034	25,315

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Feldspar	200	(3)	Mica	(3)	(2)
Gold (troy ounces)	2,243	1,042	Salt	85,760	(2)

[1] Cement, coal, iron ore, manganese ore, and potassium salts have been produced in recent years, but no current data are available.
[2] Data not available.
[3] Less than 1 ton.

ETHIOPIA

TABLE 78.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950
Cement, hydraulic	*8,000	(2)
Gold (troy ounces)	45,102	*43,200
Platinum—placer (troy ounces)	[3] 355	(2)

[1] Gypsum, mica, potassium salts, and salt have been produced in recent years, but no current data are available.
[2] Data not available.
[3] Exports for year ended September 10 of year stated.

FRENCH CAMEROON

TABLE 79.—Mineral production, 1949–50, in metric tons

Mineral	1949	1950
Gold (troy ounces)	8,938	7,170
Tin—mine (long tons)	73	67
Titanium concentrates: Rutile	403	25

FRENCH EQUATORIAL AFRICA

TABLE 80.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Diamonds (metric carats)	122,928	111,460	Titanium concentrates: Rutile		6
Gold (troy ounces)	57,260	54,996	Zinc—mine	44	621
Lead—mine	731	1,814			

[1] Graphite and salt have been produced in recent years, but no current data are available. Corundum is produced, but no output was recorded in 1949–50.

FRENCH MOROCCO

TABLE 81.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Antimony	660	670	Lead—mine	36,720	47,429
Asbestos	402	511	Manganese ore	233,830	287,265
Barite		4,910	Mica	54	82
Beryllium concentrates	211	56	Petroleum, crude (thousand barrels)	136	305
Cement, hydraulic	264,000	321,000	Phosphate rock	3,693,000	3,872,250
Coal (thousand tons)	341	368	Pyrites, including cupreous pyrites	202	1,470
Cobalt	209	390	Salt, rock	34,100	60,000
Copper—mine	360	18	Silver (troy ounces)	491,906	482,261
Fluorspar	445	40	Tungsten concentrates (60 percent WO_3 basis		7
Fuel briquets	*15,000	34,573	Zinc—mine	2,845	12,521
Gold (troy ounces)	643	119			
Graphite	72	75			
Iron ore (thousand tons)	357	319			

[1] Gypsum and salt (other than rock) have been produced in recent years, but no current data are available. Molybdenum, nickel, and tin (mine) are produced, but no output was recorded in 1949–50.

FRENCH SOMALILAND

Production of salt in French Somaliland totaled 60,000 metric tons in 1949 and 55,000 tons in 1950.

FRENCH WEST AFRICA

TABLE 82.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Bauxite	10,400	10,125	Salt	50,000	66,000
Diamonds (metric carats)	94,996	126,346	Titanium concentrates: Ilmenite [2]	8,338	788
Gold (troy ounces)	46,381	96,452			
Phosphate rock (aluminum phosphate)	5,675	11,035			

[1] Iron ore has been produced in recent years, but no current data are available.
[2] From Senegal.

GOLD COAST

TABLE 83.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Bauxite (exports)	147,340	116,793	Manganese ore (exports) [3]	752,963	711,416
Diamonds (metric carats)	[2] 972,976	*950,000	Silver (exports) (troy ounces)	38,887	43,317
Gold (exports) (troy ounces)	676,934	*680,000			

[1] Salt has been produced in recent years, but no current data are available.
[2] Exports.
[3] Dry weight.

ITALIAN SOMALILAND

The production of salt in Italian Somaliland totaled 3,000 metric tons in 1949 and 1,500 tons in 1950.

KENYA

TABLE 84.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Asbestos	716	(2)	Magnesite	10	181
Feldspar	20	(2)	Mica	4	6
Gold (troy ounces)	20,072	22,945	Salt	18,820	18,722
Graphite	----------	(2)	Silver (troy ounces)	2,279	2,586
Gypsum	181	610	Talc and soapstone	590	334

[1] Beryl and pyrites have been produced in recent years, but no current data are available.
[2] Data not available.

LIBERIA

Production of gold in Liberia totaled 14,656 troy ounces in 1949 and 11,025 ounces in 1950.

LIBYA

Production of salt in Tripolitania was estimated to be 6,000 metric tons in 1949 and 9,000 tons in 1950. In Cyrenaica it totaled 500 tons in 1949, but no data for 1950 are available.

MADAGASCAR

TABLE 85.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Asbestos	2	(2)	Gold (troy ounces)	1,663	1,935
Beryllium concentrates	27	486	Graphite (exports)	9,767	12,757
Coal (thousand tons)	16	(2)	Mica	959	802

[1] Beryl, cement, corundum, feldspar, iron ore, phosphate rock, salt, and talc have been produced in recent years, but no current data are available.
[2] Data not available.

MAURITIUS

Salt has been produced in Mauritius in recent years, but no current data are available.

MOZAMBIQUE

TABLE 86.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Bauxite	1,369	(2)	Graphite	110	(2)
Beryllium concentrates	136	260	Mica	103	40
Cement, hydraulic	45,841	(2)	Salt	11,004	(2)
Coal (thousand tons)	13	(2)	Silver (troy ounces)	244	(2)
Gold (troy ounces)	2,468	(2)			

[1] Corundum has been produced in recent years, but no current data are available. Tin (mine) is produced, but no output was recorded in 1949–50.
[2] Data not available.

NIGERIA

TABLE 87.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Coal (thousand tons)	559	*570	Tin—mine (long tons)	8,824	8,258
Gold (troy ounces)	2,515	2,238	Tungsten concentrates (60 percent WO_3 basis)	5	5
Lead—mine	(2)	(2)	Zinc—mine	72	----------
Silver (troy ounces)	484	325			

[1] Salt has been produced in recent years, but no current data are available.
[2] Less than 1 ton.

NORTHERN RHODESIA

TABLE 88.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Beryllium concentrates	----------	5	Lead:		
Cobalt [2]	402	670	Mine	14,169	13,905
Copper:			Smelter	14,169	13,905
Mine	259,084	297,487	Mica	3	2
Smelter	263,491	279,987	Silver (troy ounces) [5]	134,920	173,304
Gold (troy ounces) [3]	1,186	1,432	Tin—mine (long tons)	7	4
Iron ore (thousand tons)	2	(4)	Vanadium	153	----------
			Zinc—smelter	23,217	23,080

[1] Manganese ore has been produced in recent years, but it is too low-grade to be classified as such.
[2] Fiscal year ended June 30 of year stated.
[3] Included is yield from Nkana mine refinery slimes accumulated during the war: 972 tons in 1949 and 1,296 in 1950.
[4] Data not available.
[5] Recovered from an accumulation of refinery slimes.

NYASALAND

Nyasaland may have produced graphite in 1949–50, but no data are available. Nyasaland produced 113 metric tons of corundum in 1949, but no data for 1950 are available.

SEYCHELLES ISLANDS

Exports of phosphate rock (guano) from the Seychelles Islands totaled 14,171 metric tons in 1949 and 10,005 tons in 1950.

SIERRA LEONE

TABLE 89.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Chromite	22,101	(2)	Iron ore (thousand tons)	975	1,185
Diamonds (metric carats)	494,119	655,474	Platinum—placer (troy ounces)	38	(2)
Gold (troy ounces)	2,160	3,523			

[1] Silver has been produced in recent years, but no current data are available.
[2] Data not available.

SOUTHERN RHODESIA

TABLE 90.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Antimony	41	21	Lead—mine	83	--------
Arsenic, white	148	114	Magnesite	7,640	8,615
Asbestos	72,246	64,888	Manganese ore	166	--------
Barite	488	261	Mica	303	407
Beryllium concentrates	23	823	Phosphate rock	67	36
Chromite	243,506	291,525	Pyrites, including cupreous pyrites	16,968	13,810
Coal (thousand tons)	1,918	2,128	Silver (troy ounces)	84,495	85,549
Coke	81,251	*80,000	Tin (long tons):		
Copper—mine	80	117	Mine	70	65
Feldspar	--------	3,520	Smelter	75	80
Fluorspar	239	447	Tungsten concentrates (60 percent WO_3 basis)	26	64
Gold (troy ounces)	528,180	511,163			
Iron ore (thousand tons)	51	57			
Iron: Pig iron and ferro-alloys (thousand tons)	38	38			

[1] Cement and salt have been produced in recent years, but no current data are available. Corundum, graphite, and mercury are produced, but no output was recorded in 1949–50.

SOUTH-WEST AFRICA

TABLE 91.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Barite	48	--------	Salt:		
Beryllium concentrates	239	659	Rock salt	2,468	3,471
Cadmium (kilograms) [2]	755,000	787,000	Other salt	13,730	14,303
Copper—mine	9,622	10,961	Silver (troy ounces)	642,500	843,737
Diamonds (metric carats)	280,134	488,422	Tin—mine (long tons)	123	100
Gold (troy ounces)	32	32	Tungsten concentrates (60 percent WO_3 basis)	6	4
Graphite	2,264	1,380	Vanadium	165	295
Lead—mine	38,300	34,009	Zinc—mine [3]	12,700	11,500
Phosphate rock (guano)	957	581			

[1] Iron ore has been produced in recent years, but no current data are available. Lead (smelter) is produced, but no output was recorded in 1949–50.
[2] Cadmium content of ore and flue dust exported for treatment elsewhere.
[3] Zinc content of lead-copper ore sorted from dumps plus jig concentrates derived from same source.

SPANISH MOROCCO

TABLE 92.—Mineral production, 1949–50, in metric tons

Mineral	1949	1950	Mineral	1949	1950
Antimony	144	(1)	Lead—mine	159	(1)
Graphite	15	(2)	Manganese ore	653	*750
Iron ore (thousand tons)	944	860	Salt	*10	(2)

[1] Included in Spain.
[2] Data not available.

SWAZILAND

TABLE 93.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Asbestos	30,814	29,635	Silver (troy ounces)	120	60
Barite	104	441	Tin—mine (long tons)	32	37
Gold (troy ounces)	2,841	1,794			

[1] Corundum is produced, but no output was recorded in 1949–50.

TANGANYIKA

TABLE 94.—Mineral production, 1949–50, in metric tons

Gold (troy ounces)	889,057	850,000
Graphite	126	[7] 62
Gypsum	291,854	[8] 204,581
Iron ore (thousand tons)	1,484	2,403
Iron and steel (thousand tons): [5]		
Pig iron and ferro-alloys	1,062	1,101
Steel ingots and castings	1,183	1,400
Lead:		
Mine	216,918	222,419
Smelter	154,189	164,165
Magnesite	34,129	[7,8] 1,858
Manganese ore	13,299	[7] 14,689
Mica	736	*450
Molybdenum	4	3
Petroleum, crude (thousand barrels) (Victoria)	1	2
Phosphate rock	11	(2)
Platinum-group metals:		
Osmiridium (troy ounces)	39	46
Potassium salts (equivalent K_2O):		
Alunite	33	(2)
Alunitic mud	1,471	(2)
Pyrites, including cupreous pyrites	87,923	113,973
Salt	248,932	(2)
Silver (troy ounces)	9,849,213	10,677,456
Talc and soapstone	8,717	*7,000
Tin (long tons):		
Mine	1,973	2,472
Smelter	1,955	2,013
Titanium concentrates: [9]		
Ilmenite	10,094	*12,485
Rutile	12,615	18,606
Tungsten concentrates (60 percent WO_3 basis)	1,369	1,223
Zinc:		
Mine	184,919	196,360
Smelter	82,255	85,146

1 Chromite, diamonds, fuel briquets, and peat have been produced in recent years, but no current data are available. Magnesium metal and mercury are produced, but no output was recorded in 1949–50.
2 Data not available.
3 Incomplete data.
4 Partly estimated; excludes content of some bismuth-tungsten concentrates.
5 Fiscal year ended June 30 of year stated.
6 Includes some china stone.
7 Excluding South Australia.
8 Excluding New South Wales.
9 Excludes content of beach sand in stock dumps.

FIJI ISLANDS

TABLE 99.—Mineral production, 1949–50, in metric tons

Mineral	1949	1950
Gold (troy ounces)	104,036	103,421
Manganese ore	102	203
Silver (troy ounces)	29,755	37,736

FRENCH OCEANIA

Exports of phosphate rock from French Oceania (Makatea Island, Tuamotu Archipelago) totaled 239,532 metric tons in 1949 and 245,804 tons in 1950.

NAURU AND OCEAN ISLANDS

Exports of phosphate rock from Nauru Island were 802,070 metric tons in 1949 and 1,070,358 tons in 1950. Exports of phosphate rock from Ocean Island were 265,087 metric tons in 1949 and 251,218 tons in 1950.

NEW CALEDONIA

TABLE 100.—Mineral production, 1949–50, in metric tons

Mineral [1]	1949	1950	Mineral [1]	1949	1950
Chromite	88,792	(2)	Iron ore (thousand tons)		15
Coke	*80,000	*80,000	Manganese ore	2,100	1,842
Gypsum	17,119	15,200	Nickel	3,371	6,300

[1] Phosphate rock has been produced in recent years, but no current data are available.
[2] Data not available.

NEW GUINEA TERRITORY [2]

TABLE 101.—Mineral production, 1949–50, in metric tons

Mineral	1949	1950
Gold (troy ounces)	93,045	*75,000
Silver (troy ounces)	[1] 31,786	(2)

[1] Fiscal year ended May 31 of year following that stated.
[2] Data not available.

NEW ZEALAND

TABLE 102.—Mineral production, 1949–50, in metric tons

Iron ore (thousand tons)	4				

[1] Pig iron has been produced in recent years, but no current data are available. Mercury and platinum are produced, but no output was recorded in 1949–50.
[2] Data not available.

PALAU ISLANDS

Exports of phosphate rock from Angaur Island were 157,049 metric tons in 1949 and 119,000 tons (estimate) in 1950. The destination was Japan. Peak exports of bauxite from Babelthuap Island were 135,669 metric tons in the year ended March 31, 1943, but there was no output in 1946–50.

PAPUA

Papua may have produced gold and platinum in 1949–50, but no data are available. The production of manganese ore in Papua totaled 69 metric tons in the year ended June 30, 1949; no data for 1950 are available.

[2] Does not include western New Guinea, which is part of Indonesia, or southwestern New Guinea, which is the same as Papua.

MINERALS YEARBOOK 1950

Bureau of Mines

United States Department of the Interior

NOTICE TO READERS OF CHAPTER PREPRINTS

The following errors in Minerals Yearbook 1950 chapters have come to the attention of the Bureau of Mines since publication of the respective preprints. Some of these are in the nature of inconsistencies between various chapters arising from the availability of later or amended figures during the course of publication. Users of the preprints are advised to note the indicated corrections in their copies. All of the corrections have been incorporated into the bound volume of Minerals Yearbook 1950.

Preprint	Page	Location or item	Reads—	Should read—
Review of the Mineral Industries in 1950.	6	Zinc—primary	588	[12] 588
Employment and Injuries in the Mineral Industries.	1	First sentence	slightly over 1.5	approximately 1.6
Do	1	Third sentence	virtually equal to that	the same as
Do	6	Second paragraph, third sentence.	over 10	about 12
Do	9	Lead-Zinc Mines, third sentence.	or 5 percent	or 6 percent
Do	9	Gold-Silver Lode Mines, last sentence.	2,041 hours, or 32 less	2,038 hours, or 32 more
Do	13	Metallurgical plants, first paragraph, last sentence.	3 percent	4 percent
Arsenic	2	Table 2, Crude, shipments, short tons, 1950.	15,777	15,778
Bismuth	3	Table 3, Argentina, in ore, 1945.	3,000	31,000
Carbon Black	5	Table 5, seventh line of stub.	per thousand gallons	per gallon
Coal—Bituminous and Lignite.	7	Value of production, total, 1948.	2,993,153,747	2,993,267,021 (revised figure)
Copper	34	Table 35, title	in short tons	in metric tons
Gypsum	11	Table 10:		
		France, 1949	([2])	1,062,000
		Total, 1949	17,700,000	16,700,000
Magnesium	1	Fifth sentence	increased 23 percent * * * totaled 7,307	increased 30 percent * * * totaled 7,740
Do	1	Table 1, secondary magnesium, 1950.	7,307	7,740
Do	3	Secondary:		
		First sentence	totaled 7,307	totaled 7,740
		Second sentence	7,135 tons * * * from 7,886.	7,568 tons * * * from 8,367.
		Third sentence	about 65	about 62
		Fourth sentence	recovery, 3,249	recovery, 3,682
Secondary Metals—Nonferrous.	20	Secondary magnesium, first sentence.	7,307 short tons valued at $3,219,464.	7,740 short tons valued at $3,410,244
Do	21	17th line	49 percent	48 percent
Titanium	13	World review, second sentence.	877,000 metric * * * 20 percent.	788,000 metric * * * 8 percent.
Do	13	Table 7, Ilmenite:		
		Canada, 1950	91,172	[1] 2,585
		Total, 1950	[2] 877,000	[2] 788,000
South Dakota and Wyoming.	3	Table 5, material treated, total, 1950.	1,391,163	1,391,162
Washington	8	Table 10, boxhead	Ore and old tailings	Ore
Mineral Production of the World, 1949–50.	5	Table 11, stub	Bismuth, in pure bars	Bismuth, in impure bars

[2] Includes titanium slag containing approximately 70 percent TiO_2.
