FOREWORD

I am pleased to present this 1950 Minerals Yearbook. Its production was hindered to a large extent by the priority which the staff of the Bureau necessarily accorded the urgent problems associated with the defense mobilization. Despite these emergency burdens, however, I am confident that the usual high quality of the Yearbook has been maintained. Although the Bureau's work on mobilization planning, development of new mineral resources, synthetic-liquid-fuel production, mine safety, and the like may command more day-by-day attention, I believe (and in this I am reinforced by the comments of users in industry and elsewhere) that this less dramatic function— to provide year in and year out the basic data on minerals necessary for wise industrial planning and sound Government policy—is no less appreciated. Our efforts shall always be bent toward adapting these data to changing needs and conditions and toward improving their usefulness.

J. J. Forbes, *Director*.

PREFACE

In this edition of the MINERALS YEARBOOK, a continued effort has been made to improve both the quality of the information reported and its manner of presentation, to make it increasingly valuable both to those in industry who must plan pricing, marketing, expansion, and other policy matters and to those in Government who establish policies bearing on the Nation's welfare and security. It is hoped that users of the statistics and other data in these volumes will help the process of improvement and adaptation by making their needs known to us.

Questionnaires answered by mineral producers and users are the source of most of the information herein. Other sources are the business press, trade associations, scientific journals, international organizations, and Government agencies. In particular, data on foreign trade are obtained from the United States Department of Commerce and data on foreign production and developments largely through the United States Foreign Service.

During the course of publication, a few errors and inconsistencies were detected in the preprint chapters. These have been corrected in this volume, and for the benefit of those who previously obtained separate chapter preprints, an errata sheet is available.

Cooperating with the Bureau of Mines in the conduct of statistical canvasses in their respective States were the following State officials, to whom grateful acknowledgment is made:

Alabama: Walter B. Jones, State geologist, Geological Survey of Alabama, University.
Alaska: Leo Saarela, commissioner of mines, Department of Mines, Juneau.
California: Olaf P. Jenkins, chief, Division of Mines, and State mineralogist, Department of Natural Resources, San Francisco.
Florida: Herman Gunter, director, Florida Geological Survey, Tallahassee.
Georgia: Garland Peyton, director, Department of Mines, Mining and Geology, Atlanta.
Illinois: M. M. Leighton, chief, Illinois State Geological Survey, Urbana.
Iowa: H. Garland Hershey, district and State geologist, Iowa Geological Survey, Iowa City.
Kansas: John C. Frye, executive director, and R. C. Moore, State geologist and director of research, State Geological Survey of Kansas, Lawrence.
Kentucky: Arthur C. McFarlan, director, and Daniel J. Jones, State geologist, Kentucky Geological Survey, University of Kentucky, Lexington.
Maryland: Joseph T. Singewald, Jr., director, Department of Geology, Mines, and Water Resources, Baltimore.
Michigan: Frank Pardee, State geologist and division chief, Geological Survey Division, Department of Conservation, Lansing.
Missouri: Edward L. Clark, director and State geologist, Department of Business and Administration, Division of Geological Survey and Water Resources, Rolla.
New Hampshire: T. R. Meyers, State geologist, Mineral Resources Committee, New Hampshire State Planning and Development Commission, Durham.
New Jersey: Meredith E. Johnson, State geologist, Bureau of Geology and Topography, Department of Conservation and Economic Development, Trenton.
New York: John G. Broughton, State geologist, New York State Science Service, Office of Geology, Albany.

North Carolina: Jasper L. Stuckey, State geologist, Department of Conservation and Development, Division of Mineral Resources, Raleigh.
Oklahoma: Robert H. Dott, director, Oklahoma Geological Survey, Norman.
South Dakota: E. P. Rothrock, State geologist, South Dakota State Geological Survey, Vermillion.
Texas: John T. Lonsdale, director, Bureau of Economic Geology, University of Texas, Austin.
Utah: Arthur L. Crawford, director, Utah Geological and Mineralogical Survey, University of Utah, Salt Lake City.
Virginia: William M. McGill, State geologist, Department of Conservation and Development, Geological Survey Division, Charlottesville.
Washington: Sheldon L. Glover, supervisor, Division of Mines and Geology, Olympia.
West Virginia: Paul H. Price, State geologist, West Virginia Geological and Economic Survey, Morgantown.
Wisconsin: E. F. Bean, State geologist, Wisconsin Geological and Natural History Survey, University of Wisconsin, Madison.

Besides the work of my immediate assistant, John Hozik, and Robert E. Herman, who succeeded him during the course of the year, I am greatly indebted to the rest of the YEARBOOK staff for their assistance in checking manuscripts, editing, and expediting the flow of manuscripts. These included K. Joyce D'Amico, Blanche G. Robertson, Ethel M. Tucker, and Anna P. Lake. Credit is also due Adelaide B. Palmer, not only for drafting many of the charts for the YEARBOOK but for seeing that the many additional graphs prepared at the Bureau's Pittsburgh office under the supervision of Louis F. Perry were completed in good order.

All but one of the world-production tables were prepared under direct supervision of Berenice B. Mitchell, of the Foreign Minerals Region. Other Bureau of Mines statisticians and researchers who gave substantial assistance to the authors of chapters were: In Washington, D. C.—Hope R. Anderson, Elizabeth K. Elsner, Nina L. Jones, Naomi W. Kearney, James G. Kirby, Lena M. Lunsford, Ann C. Mahoney, Annie L. Marks, Zena M. Mohme, Robert C. Morris, Elizabeth J. Reid, Dora D. Springer, Mary E. Trought, and Virginia E. Wrenn. In Juneau, Alaska—Opal Y. Sharman. In San Francisco, Calif.—Leona Froehlich. In Denver, Colo.—Stella K. Drake and Katherine I. Mitten. In Minneapolis, Minn.—Luella Niemeyer. In Albany, Oreg.—O. William Esch, Catherine Moll, and John Ulman. In Pittsburgh, Pa.—Roy H. Davis.

I wish to acknowledge, finally, the work of my predecessor, Allan F. Matthews, who before his resignation from the Bureau early in 1951, did the advance planning for this edition and edited several chapters.

LEONARD L. FISCHMAN.

OCTOBER 1952.

PART I. GENERAL REVIEWS

Review of the Mineral Industries in 1950

By Paul W. McGann and Leonard L. Fischman

GENERAL SUMMARY

THE MINERAL INDUSTRIES had a near-record year in 1950, as rising industrial activity in general, greatly accentuated by the outbreak of hostilities in Korea in midyear, called forth increasing supplies of mineral fuels and raw materials. The aggregate value of mineral production was second only to that in 1948, and the aggregate physical volume was exceeded only in 1948 and 1947. Lower coal production accounted for the failure to surpass these earlier years.

Growth of production was fairly constant throughout the year, especially for crude petroleum; its physical output for the year as a whole exceeded that of 1949 by 7 percent. According to Federal Reserve Board indexes, other relative gains were 16 percent for coal, 9 percent for fuels in general, and 17 percent for metals. The increase for mining in general was of the order of 10 percent. This was not quite as large as the general increase in industrial production but clearly reflected the total-industrial trend (*see* fig. 1).

Consumption of certain metals increased sharply in 1950—notably arsenic, cobalt, the platinum-group metals, magnesium, and tin. Virtually all minerals, however, showed some increase in consumption. Petroleum consumption set a new record, as did consumption of iron ore. Consumption of coal increased slightly over 1949 but continued to be relatively low.

Although Bureau of Mines and Bureau of Labor Statistics data on employment in the mineral industries differ in nature, both series indicate a decline in average employment in the mineral industries as a whole between 1949 and 1950. As unemployment also declined, a net loss of workers was indicated. The increased production in 1950 was apparently accomplished largely by operating establishments a greater number of shifts during the year, the average workday remaining virtually unchanged.

Average hourly earnings generally increased, and there were more substantial rises in mineral manufacturing than in mining as such. With the minor exception of anthracite mining, where productivity declined, labor productivity in the crude-mineral sector generally increased and surpassed the previous peak (1947) by a significant margin.

The safety record of the mineral industries in 1950 was relatively good. Although both fatal and nonfatal injuries increased over 1949, the fatality rate per million man-hours of exposure was the second lowest on record and the nonfatal-injury rate the lowest. Absence of any major disasters (five or more fatalities) during the year facilitated this favorable showing.

Annual average prices of mineral products in 1950 were generally little changed from those in 1949, although there was an upward trend within the year for most categories. Metals in particular ended the year substantially higher than they started; but, except for iron ore, which underwent two big jumps, part of the increase was a recovery from decreases during 1949.

The increased sales of mineral products in 1950 resulted in larger mining corporate income before taxes. Mineral-manufacturing corporations, however, fared considerably better than mining corporations. Income after taxes also increased for both groups, but not to the same degree.

The income of unincorporated mineral-industry enterprises also increased, particularly that of oil-well operators, who gained a larger increase during the year, both absolute and relative, than their incorporated counterparts.

Plant and equipment expenditures for the year as a whole were lower than in 1949 for most mineral industries, but there was an uptrend as the year progressed. The bulk of the expenditure was on crude-petroleum production.

Foreign trade in minerals in 1950 advanced over 1949; but, owing to the heavier domestic demand for raw materials, most of the increased activity was in imports, particularly imports of steel, which rose sharply. As regards nonferrous metals, there was a shift from the importation of ores and concentrates to that of more processed forms.

Rates of duty on a number of mineral commodities were reduced as a result of the trade-agreement negotiations at Annecy. On the other hand, levies on a number of other products were increased at the year end as a result of termination of the 1943 trade agreement with Mexico and of withdrawal of China from the General Agreement on Tariffs and Trade. The import tax on copper came back in force July 1, when the previous suspension was allowed to lapse, but the general duty suspension on metal scrap was reinstated October 1.

The mineral industries continued to lead private investment abroad in 1950, both in terms of new investment and in terms of the outstanding total. About two-fifths of American direct investment abroad at the end of 1950 was in the mineral industries, and three-quarters of this, in turn, was in petroleum. There was a decided shift in new investment in 1950 from Latin America to Canada.

Principal trends in mining-industry technology in 1950 included the increased use of aerial geophysical prospecting and further development of the continuous miner. Use of roof bolting, of trackless mining, and of Diesel power continued to spread. Research on beneficiating taconite was spurred by the increasing demand for iron ore; new methods for beneficiating nonferrous ores also received serious attention. Outstanding in the field of fuel technology was the work of the Bureau of Mines on synthetic liquid fuels; considerable work was also done on coking coals.

World mineral production followed a similar course in 1950 to that in the United States. Production was generally higher than in 1949, and a number of records were set, petroleum, natural gas, and iron ore being among the principal minerals to reach new production peaks.

Anxiety over prospective surpluses early in 1950 led to tentative steps to reach an international commodity agreement on tin, but a conference for this purpose in October adjourned without any definitive results. Meanwhile, the mounting concern over shortages after the outbreak of hostilities in Korea produced various intergovernmental discussions, including conversations on possible raw-materials allocation among the United States, Canada, the United Kingdom, and France.

PRODUCTION

Value of Production.—Increases both in physical output and unit values pushed the value of mineral production in 1950 above that of 1949 in all major categories. Value of fuel production was up about 10 percent, of other nonmetallic minerals 16 percent, and of metallic minerals 23 percent. Total value, calculated on the revised basis,[1] was a little short of $12 billion, or about half a billion less than 1948, the only higher year.

The value of mineral production for 1946–50 is summarized in table 1. Detailed data will be found in the Statistical Summary chapter of this volume.

Table 1.—Value of mineral production in the United States, 1946–50

[Millions of dollars]

Year	Nonmetallic			Metallic	Grand total
	Fuels	Other	Total		
1946	5,084	1,249	6,333	729	7,062
1947	7,181	1,345	8,526	1,084	9,610
1948	9,495	1,559	11,054	1,219	12,273
1949	7,912	1,567	9,479	1,101	10,580
1950	8,681	1,823	10,504	1,351	11,855

Volume of Production.—The Federal Reserve Board index of physical volume of mineral production averaged 148 for the year (1935–39=100). It increased at an average rate of about 2 percent per month, somewhat less than the rate of increase of durable manufactured goods. The initial rise was partly a recovery from the trough of 1949, and the continued growth after midyear was due in large part to the hostilities in Korea.

The statistics of growth are smoothest for crude petroleum. The seasonally adjusted metal-mining index dropped significantly in April and at the year end, owing largely to the fact that weather conditions did not fit the average seasonal pattern for iron ore used in calculating the seasonal adjustment. Growth in the coal-production index was interrupted more seriously during the year—a reflection of the fluctuations in labor-management relations, especially the work stoppages in February.

There is no FRB monthly index of production for nonfuel, nonmetallic minerals. A rough volume index, obtained by multiplying

[1] For description of the revision, see Minerals Yearbook 1949, pp. 29–30.

Bureau of Labor Statistics production employment by weekly hours for nonmetallic minerals, shows a monthly growth trend similar to that for the aggregate of all minerals.

Annual physical production data for the mining sector in 1950, according to the best available data in each case, show the following increases over 1949: All mining, 10 percent; metallic minerals, 17 percent; nonmetallic, 6 percent; bituminous coal, 18 percent; anthracite, 3 percent; crude petroleum, 7 percent; and natural gas, 16 percent. The 1950 outputs of coal (both bituminous and anthracite), petroleum, and iron ore were below 1948, but outputs of nonferrous metals, nonmetallic minerals, and natural gas were above 1948.

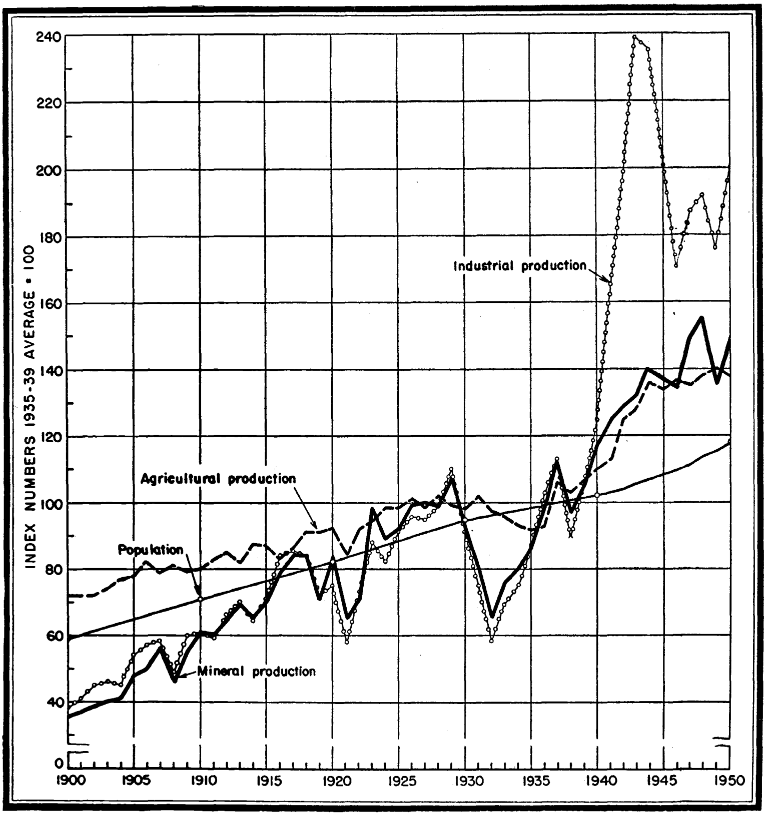

FIGURE 1.—Physical volume of mineral production compared with industrial production (manufactures and minerals), agricultural production, and population, 1900–50. Sources: Federal Reserve Board, U. S. Department of Agriculture, and Bureau of the Census.

Relation to National Income.—The 1950 figure for national income originating in mining industries was 10 percent greater than in 1949 and equaled the increase for all industries. The increase for mineral-manufacturing industries was over twice as great, owing largely to a 33-percent increase for the iron and steel industry. Although national income originating in the mining industry was less than in 1948, that for mineral manufacturing was the highest in history, even after adjustment for price changes.

In both mining and mineral manufacturing, most of the increase in income ended as net corporate income before taxes rather than as wage and related payments. This was true to a lesser extent for the rest of the economy in 1950. However, half of the increased corporate profit before taxes for the aggregate of all industries was due to increased inventory values, but only one-third of the increase in mining profit before taxes and less than one-tenth of that of the iron and steel industry resulted from this.[2]

Number and Size of Firms.—A slight additional decrease brought the number of mining firms down to 34,100 (end of year) compared with the postwar high of 35,800 in the fall of 1948.[3] These changes in number of firms affect mostly the 85 percent having less than 20 employees each and employing in total less than 13 percent of all mining-industry employees.[4] This net rate of business-population change is the difference between the gross rates of new firms entering and leaving, which are about five times greater. The gross, like the net, rates of change are much smaller for the larger firms.

CONSUMPTION AND STOCKS

Domestic Consumption.—Consumption of various minerals in the United States in 1950 almost without exception increased over that in 1949. Some of the larger increases took place among the metals, with consumption of cobalt, magnesium, platinum-group metals, and tin (primary) all increasing by 50 percent or more. Consumption of arsenic more than doubled, but there had been a pronounced drop in 1949, and the net increase over 1948 was only about one-third.

Other large increases (one-third or more) were reported in the consumption of antimony (primary), asbestos, chromium, copper, mica, nickel, talc, and slab zinc. Consumption of coal was virtually unchanged from 1949 and was well below both 1948 and the World War II peak. Consumption of iron ore, in keeping with increased steel output, was up about one-fifth to set a new record. Petroleum consumption, although up less than 10 percent, also set a new mark.

Sources of United States Consumption.—Tables 2 and 3 show the apparent consumption of principal minerals in the United States in 1950 and the sources from which that consumption was satisfied. Of the 27 minerals covered, requirements for more than one-fourth, including coal, salt, clays, phosphate rock, boron, and bromine, were satisfied in 1950 out of current mine production. Requirements for two other minerals whose domestic production is normally more than adequate—molybdenum and sulfur—were satisfied partly out of current domestic production and partly out of accumulated stocks. Thus, for fully one-third of the principal minerals, the United States was completely self-sufficient.

Zinc ... thousand short tons (Zn content)	[12] 588	74	662	380	1,042	107	1,149

[1] This table aims to show new supply and apparent consumption for each mineral in 1950 at the point where it ceases to be "extracted" or "recovered" and enters into specialized uses. This means, essentially, that all sources of the minerals, including imports in any form, are included as part of the supply, whereas exports of manufactured and semimanufactured items containing the mineral are excluded. Statistical exigencies, particularly in connection with arriving at the breakdown of sources of apparent consumption shown in table 3, necessitate various degrees of deviation from strict point-of-consumption measurement, but the main effect of such deviation is to attribute to consumption in 1950 quantities which, depending upon changes in stocks in various parts of the industrial pipeline, may actually have been consumed in an earlier or later year. The reason for including manufactured imports containing the mineral in question is that such imports substitute for domestic production which would otherwise have been needed for the equivalent end products.

"New supply" includes, in addition to net imports, both domestic primary production and recovery from "old" scrap. The latter is material that has already been in actual use in the form of end products, usually over a period of years. "New" or "process" scrap is considered, for purposes of this table, not as an element in supply and consumption, but as part of the industrial stocks of "goods in process"; no attempt is made to measure the magnitude of changes therein. Circulating "process" scrap is actually important only in the case of fabrication of metals, where it is important to distinguish between "new" and "total" (sometimes called "ingot-equivalent") supply. The practical effect of confining the data to new supply, as is done herein, is that the consumption figure is net of that portion of the metallic flow which is not actually included in end products, but becomes scrap at some point in the fabrication process and is "circulated" back through the industrial system for reprocessing.

The foregoing definition is chosen as the best measure of consumption that can be applied across-the-board to all mineral commodities. The resulting supply and consumption figures may not agree with those shown in the individual chapters of this volume, since the latter are more specifically oriented toward the particular statistical usages which prevail for each of the individual minerals.

Generally speaking, the data in this table apply to continental United States only. However, lack of differentiated data in certain instances—notably for imports and exports—introduces a certain amount of unavoidable error with respect to geographical coverage.

[2] Includes all material, not previously "consumed," that is ultimately of domestic origin—that is, has been extracted from the earth of the United States. The aim, however, is to measure quantities consumed during a given time period, and the actual extraction may have taken place in an earlier period. The figure includes any "secondary" recovery (from tailings, flue dust, slags, etc.) before the point of consumption.

To take fuller account of stock changes, actual production, rather than data on shipments, are shown in this table where available. The "production" figure may therefore differ from that shown in table 2 of the Statistical Summary chapter of this volume, where "shipments" are generally used to have a more accurate valuation.

[3] From "old" scrap only. Does not include either recovery from process scrap or secondary recovery before the point of consumption. (*See* footnotes 1 and 2.)

[4] Minus sign denotes net exports. Imports include all sources of the mineral, including finished products, for which it is possible to calculate the mineral content. Exports include only those shipments occurring prior to the point of consumption. (*See* footnote 1.)

[5] Minus sign denotes increase. Changes in National Stockpile are not taken into account.

[6] Recoverable metal content of mine output.

[7] Borax, anhydrous sodium tetraborate, kernite, boric acid, and colemanite.

[8] Metallic cadmium and cadmium content of compounds (excluding compounds made from metal).

[9] Includes stocks of metal producers (primary), compound manufacturers, and distributors for metallic cadmium.

[10] Less than 500 tons.

[11] Final figure.

[12] Primary refinery production from domestic ores.

[13] Usable ore (exclusive of ore containing 5 percent or more manganese).

[14] Includes manganese consumed in form of ferromanganese and all types of manganese-bearing ores.

[15] Recovered in copper refining; a portion, not separable, is actually recovered from imported blister copper.

[16] Potash (K_2O) equivalent of marketable potassium salts.

[17] Includes all forms of production—native and recovered elemental sulfur, and sulfur content of pyrites and byproduct sulfuric acid and other compounds.

[18] Includes 79 tons produced in Alaska in 1950 and assumed to be imported into continental United States.

[19] 60 percent WO_3 basis.

[20] Includes 13 tons shipped from mines in Alaska in 1950 and assumed to be imported into continental United States.

TABLE 3.—Percentage distribution by sources of supply of principal minerals consumed in the United States, 1950

Mineral and unit of measurement	Apparent consumption[1]	Percent from— Domestic production: Primary	Domestic production: Secondary[4]	Domestic production: Total	Net imports[2]: Canada and Mexico	Net imports[2]: Other Western Hemisphere	Net imports[2]: Other "free world"[5]	Net imports[2]: U.S.S.R. bloc	Net imports[2]: Total	Net decrease in stocks[3]
Antimony — short tons (Sb content)	35,517	6.6	49.9	56.5	16.7	17.0	9.4	0.4	43.5	------
Bauxite, crude — thousand long tons (dried equivalent)	4,260	31.3	------	31.3	------	47.5	10.4	------	57.9	10.8
Boron minerals and compounds — thousand short tons (gross weight)	505	100.0	------	100.0	------	------	------	------	------	------
Bromine and bromine in compounds — thousand pounds	97,739	100.0	------	100.0	------	------	------	------	------	------
Cadmium — thousand pounds (Cd content)	9,502	96.7	------	96.7	2.4	(6)	0.5	------	2.9	0.4
Chromite — thousand short tons	1,453	(6)	------	(6)	------	7.4	77.3	4.9	89.6	10.4
Clays — do	39,304	100.0	------	100.0	------	------	------	------	------	------
Coal:										
Anthracite — do	39,910	100.0	------	100.0	------	------	------	------	------	------
Bituminous and lignite — do	460,428	100.0	------	100.0	------	------	------	------	------	------
Cobalt — thousand pounds (Co content)	11,913	6.8	1.0	7.8	------	------	78.4	------	78.4	13.8
Copper — thousand short tons (Cu content)	2,222	41.5	21.8	63.3	4.6	12.8	------	------	17.4	19.3
Fluorspar, finished — short tons	433,971	64.8	------	64.8	18.6	------	16.6	------	35.2	------
Gypsum, crude — thousand short tons	11,360	72.1	------	72.1	27.9	------	------	------	27.9	------
Iron ore — thousand gross (long) tons	103,335	94.5	------	94.5	------	2.9	2.6	------	5.5	------
Lead — thousand short tons (Pb content)	1,440	29.1	29.7	58.8	22.9	5.7	8.2	------	36.8	4.4
Magnesium — short tons (Mg content)	26,293	59.8	18.9	78.7	------	------	1.1	------	1.1	20.2
Manganese — thousand short tons (Mn content)	1,205	15.5	------	15.5	2.5	9.0	67.1	2.9	81.5	3.0
Molybdenum — thousand pounds (Mo content)	37,317	65.4	------	65.4	------	------	------	------	------	34.6
Nickel — short tons (Ni content)	93,167	1.0	5.1	6.1	90.1	------	2.2	------	92.3	1.6
Petroleum, crude — million barrels	2,117	93.3	------	93.3	------	4.9	1.6	------	6.5	0.2
Phosphate rock — thousand long tons (gross weight)	8,509	100.0	------	100.0	------	------	------	------	------	------
Potash — thousand short tons (K_2O equivalent)	1,410	90.6	------	90.6	------	------	8.0	1.4	9.4	------
Salt, common — thousand short tons	16,434	100.0	------	100.0	------	------	------	------	------	------
Sulfur — thousand long tons (S content)	4,949	93.1	------	93.1	------	------	------	------	------	6.9
Tin — long tons (Sn content)	129,883	(6)	18.2	18.2	0.1	11.0	69.4	1.3	81.8	------
Tungsten ore and concentrates[7] — short tons (gross weight)	20,850	19.7	------	19.7	1.1	15.8	26.4	37.0	80.3	------
Zinc — thousand short tons (Zn content)	1,149	51.2	6.4	57.6	29.5	2.0	1.6	(6)	33.1	9.3

[1] For derivation, *see* table 2.
[2] Deduction for net export has been prorated among other sources of supply. Where there is an over-all net import, but a net export to a particular country group, the deduction for such net export is prorated among the net imports from other country groups.
[3] Deduction for net increase in stocks has been prorated among other sources of supply.
[4] From "old" scrap only, that is, from material previously in use.
[5] Other countries outside U. S. S. R. bloc.
[6] Less than 0.05 percent.
[7] 60 percent WO_3 basis.

For another group of the minerals covered—bauxite, chromite, cobalt, manganese, nickel, tin, and tungsten—over half of 1950 requirements were met out of imports, and for five of these—chromite, cobalt, manganese, tin, and tungsten—the bulk of the supply came from outside the Western Hemisphere. Except for these five, there were no minerals whose consumption in 1950 was met by as much as 20 percent from sources outside the Western Hemisphere. Tungsten was the only mineral for which we depended for more than 5 percent of our supply on countries now within the Soviet orbit.

Orders, Sales, and Inventories.—The Department of Commerce series on manufacturers' new orders, unfilled orders, sales, and inventories indicates greater expansion of sales and orders for iron and steel products in 1950 than for nonferrous. On the other hand, a much greater backlog of unfilled orders accumulated in the nonferrous-metal industries. Sales, inventory, and orders data for the industry groups processing mineral products, compared with durable-goods manufacture and manufacturing as a whole, are shown in table 4.

Table 4.—Variations in monthly value of manufacturers' sales, inventories, and orders in 1950 [1]

	Increase from Dec. 1949 to Dec. 1950, percent			
	Sales	Month-end inventories	Orders: New	Orders: Unfilled at month end
All manufacturing	35	18	45	92
Durable goods	50	18	64	92
Iron and steel and products	52	16	64	83
Nonferrous metals and products	55	7	41	140
Stone, clay, and glass products	45	11	(2)	(2)
Petroleum and coal products	20	(3)	(2)	(2)

[1] Based on U. S. Department of Commerce figures, published currently in Survey of Current Business.
[2] Not available.
[3] Slight decrease.

Stocks.—Physical stocks did not increase as much as book value of inventories over the year. For all United States industries (including trade) in 1950, the annual average physical increase in inventories was about 8 percent, but the value increase, 20 percent. Stocks of most important minerals declined from the unusual highs reached in the 1949 slump. The principal exceptions were stocks of anthracite (producers'), gasoline, pig tin, and superphosphates. Many mineral stocks fell below even those of the 1948 boom year: Bituminous coal, coke, residual fuel oil, iron ore (docks and furnaces), refined copper, slab zinc, sulfur, and pig tin. Particularly drastic declines occurred in stocks of the major nonferrous metals following the outbreak of hostilities in Korea.

LABOR

Employment and Unemployment.—Average total mining employment, according to Bureau of Labor Statistics data, was about 28,000 persons less in 1950 than in 1949, largely as a result of a reduced annual average employment of 23,000 in bituminous-coal mining. The slight increase in nonfuel, nonmetal employment was more than balanced by decreases in anthracite mining and in oil-field employment. Metal-mining employment increased slightly during the year.

Bureau of Mines data on average number of men working daily (computed on an active mine-days basis) show similar trends. According to these data, which include metallurgical plants, total mineral-industry employment declined about 2 percent between 1949 and 1950. Most of the decline in the Bureau of Mines series, however, was in metal mining and manufacturing, with the decline in coal mining a secondary contributor.

Unemployment statistics are seldom as firm as employment data but clearly show decreased unemployment from 1949 to 1950—from 8.0 to 6.2 percent of workers in the industry. In 1948, however, the rate had been only 2.3 percent.

Hours of Work.—The average workday, according to Bureau of Mines accident-exposure data, was virtually unchanged from 1949 at 7.9 hours. However, the mineral industry as a whole was active on more days during the year so that, despite the decline in average employment, total man-days and man-hours increased about 8 percent, activity in coal mines leading the way with a 12-percent increase.

Average weekly hours, according to the Bureau of Labor Statistics measurements of time paid for (including vacations, sick leave, and holidays), increased in all mineral industries. The greatest increase was in coal mining, even though annual average employment decreased. For industries where employment was greater in 1950, the percentage increases in weekly hours were about double the increases in employment. This lengthening of workweek persisted strongly throughout the year in both metal and coal mining; by December the workweek for copper mining reached 47.2 hours. The average workweek for the year for all mining was still a little less than 40 hours because of coal.

Payrolls.—Labor costs, for most analytical purposes, consist of payrolls and certain "supplements" to wages and salaries. Tabulations of other labor costs of a welfare nature are so rarely available in published form other than annually that they generally cannot be considered in industry-wide analyses.

The payroll increase in 1950 for coal mining was due primarily to increases in hours worked and to a lesser extent to increased hourly rates. For other mining industries, these two effects were approximately equal.

Increases in supplements to wages and salaries in mining industries were unusually large in 1950 owing primarily to the bargaining successes enjoyed by the bituminous-coal workers, which raised supplements to 13.5 percent of payrolls. Other big increases were obtained in nonmetallic mining, nonferrous-metal refining, and the stone, clay, and glass industries, but supplements for all of these were only about 5 percent of payrolls (as they were for metallic-mining and oil-field employees). Oil-refinery workers obtained the smallest increase (6 percent) in supplements, but their supplements were already about the highest of any industry (20 percent). (The average for all industries was 5 percent.)[5]

[5] Work cited in footnote 2, p. 163.

Hourly Earnings.—Average hourly earnings increased in all mineral industries, averaging 2.2 to 4.4 percent higher than in 1949. In metal mining the gains in hourly earnings until August represented largely a recovery from the decline in the fall of 1949. For other mining industries the 1949 decline had been less marked, and the monthly growth in 1950 was less regular. Mineral-manufacturing hourly earnings gained about twice as much during 1950 as those in mining industries and had the added advantage of having been less affected by the 1949 slump.

Despite general business declines in 1938, 1946, and 1949, annual average hourly earnings have increased in all mining industries for each year since 1933, except for a small decline in the 1938 figure for metal mining.

Productivity.—According to Bureau of Labor Statistics data, there was a substantial increase in annual average output per man-hour in 1950 over 1949 for most mining industries. The exception was anthracite mining, where productivity declined 3.8 percent to reach the lowest level in 14 years. The increase in mining as a whole to a level 5.7 percent above the previous high in 1947 apparently was due to the addition of machinery and the catching up on development work that took place during 1949, the only significant postwar year of minerals recession. Bituminous-coal output per man-hour was 12 percent above 1949, copper (recoverable metal) 12 percent, iron ore (usable) 7 percent, lead and zinc (recoverable metal) 11 percent, and mining as a whole (including gas and oil production) 8 percent. If output were based on ore mined rather than recoverable metal, the increase in productivity for copper, iron, and lead and zinc would be 15, 10, and 12 percent, respectively.

Bureau of Mines productivity data for the bituminous-coal industry, based on tons per man-day, show a similar trend in 1949–50 to the BLS data, except that the increase was only 5 percent.

Health and Safety.—Fatalities in the mineral industries in 1950 increased by 72 over the preceding year, and nonfatal injuries increased 1,674. Because of the increase in aggregate man-hours worked, however, the over-all accident-frequency rate declined from 44.71 (in 1949) to 42.86 (in 1950) per million man-hours of exposure. The fatality-frequency rate, while slightly higher than in 1949, was the second lowest on record, and the nonfatal-injury-frequency rate the lowest. For the second straight year, there was no major disaster in the mineral industries.

TRANSPORTATION

Railroad transportation of minerals increased somewhat more than mineral output, both in terms of annual averages and of monthly variation between January and December. This was due to the fact that petroleum, whose output is much more stable, from a seasonal standpoint, than that of other minerals, is shipped by railroad only to a slight degree. Seasonally adjusted monthly carloadings of metal ore more or less followed the Federal Reserve Board seasonally adjusted monthly index of metallic-mineral production, with an apparent small slump in March and April (due to the effects of a late spring on adjusted statistics) after the deep trough in October and November 1949. (It is necessary to use adjusted statistics of ore carloadings to detect the underlying change, because winter carloadings fall to one-tenth of summer loadings.) The same close relationship was true of coal carloadings and monthly production; the 1950 dips for coal were actual and occurred at different times—February and July. Annual freight revenue per ton of mineral freight originated rose 4 percent, continuing the steady increase since the low of 1946.

Oil-pipeline transportation increased over 1949 more than domestic crude production. Although crude-oil production increased 7.1 percent, the number of barrels of oil originated on line and received from connections increased 11.1 percent and oil-pipeline transportation revenue increased 16.6 percent. Annual discrepancies of this size are typical. However, the longer-run increases in oil production and pipeline transportation are comparable; between 1943 and 1950 each increased around 30 percent. Annual movements of pipeline revenues and pipeline volume matched closely from 1942 to 1948, after which revenues rose 17.1 percent from 1948 to 1950, while volume increased only 1.7 percent.

PRICES AND COSTS

The annual average of mineral prices was little changed in 1950 from that in 1949; furthermore, for many mineral products there was little change during the year. This is shown both by annual output and value reports to the Bureau of Mines and by the mineral price indexes of the Bureau of Labor Statistics. Estimates of price increases between 1949 and 1950, based on Bureau of Mines data, are: 1.0 percent for all minerals, 0.4 percent for fuels, 4.6 percent for metals, and 1.6 percent for nonmetals (other than fuels). The Bureau of Labor Statistics indexes show decreased prices for crude petroleum, natural gas, fertilizer materials, and manufactured fertilizers. Metal prices were higher.

The monthly behavior of prices varied. The BLS index for nonferrous metals hit a low in March 1950, after which it rose 43 percent by December, but this was only 5.8 percent above January 1949. There was almost no change (0.6-percent increase) in crude petroleum over the year, a slight decrease (1.5 percent) in the bituminous-coal index, a 4.6-percent increase in anthracite, a 6.1-percent increase in natural gas, and a 7.9-percent increase in petroleum products. The price of iron ore was jumped twice during the year, ending up 15 percent higher than it started.

The cost of mining materials per unit of input, as shown in a general way by various wholesale price indexes, increased during the year. The 1950 cost of fuel and power averaged about 1 percent over 1949, metal fabricated products about 2 percent, and lumber about 14 percent. The lumber index, which is notoriously volatile, rose about 22 percent between the beginning and the end of the year. The price of blasting powder rose sharply in December 1950, just before the price freeze, after over 2 years of great stability. The lesser percentage increase in average hourly earnings than in man-hour productivity (discussed above) indicates generally lower labor costs per unit output in 1950 compared with 1949.

INCOME AND CAPITAL EXPENDITURE

Income and Dividends.—Corporate income before Federal and State profit taxes increased significantly for all mineral industries, but increases for mineral manufacturing were about twice as much as for mineral mining. Fourth-quarter mining earnings before taxes doubled first-quarter earnings. Taxes comprised a 16-percent larger share of income before taxes in 1950 than in 1949 (increasing from 26.5 to 30.7 percent for mining industries). The increase in income after taxes was therefore somewhat less than in income before taxes.[6]

Except for coal mining, dividends paid by corporations were almost exactly the same share of income after taxes for each mineral industry as they were in 1949. They averaged one-third but were one-half for metal mining and one-fourth for bituminous coal.[7]

The much smaller income of unincorporated mineral enterprises apparently increased percentagewise somewhat more than that of corporations, but these data are less reliable than those for corporations. The large group of unincorporated crude-petroleum enterprises more than doubled the percentage increase in income experienced by incorporated enterprises in crude petroleum.[8]

Investment.—Expenditures on plant and equipment by mining industries continued downward in 1950 on an annual basis, although the quarterly figure rose after the first-quarter low, when it was only 83 percent of 1948 and was lower than at any time since the first quarter of 1947. A similar quarterly trend held for fuels (petroleum refining and coal products) and for primary metal manufacturing. Applications in the fall of the year for Government assistance in the form of accelerated tax amortization indicated a prospective rapid increase in investment, with iron and steel in front and petroleum, metal mining, and coke and coal substantially ahead of nonmetallic raw materials.

The bulk of crude-mineral capital expenditure in 1950 (expenditure by mining companies, plus that on crude petroleum) was for crude-petroleum production; however, capital expenditure in this sector was the smallest since 1948. The value for 30 large companies was $1,193 million, 72 percent of 1948.[9] The reduction from 1948 in mineral-industry capital expenditures closely paralleled that of industry in general, but the timing differed from that in durable manufactured goods and in manufacturing as a whole in that the latter experienced their reduction all in 1949.

FOREIGN TRADE AND INVESTMENT

Foreign Trade.—As might be expected from increased industrial activity and the drive to accumulate inventory after the outbreak of hostilities in Korea, imports of mineral raw materials were generally higher in 1950 than in 1949. Exports, on the other hand, because of the increased rates of domestic consumption, as a whole

[6] Work cited in footnote 2, pp. 167–171.
[7] Work cited in footnote 2, p. 173.

[9] Coqueron, F. G., and Pogue, J. E., Financial Analysis of Thirty Oil Companies for 1950: Chase National Bank of the City of New York, Petroleum Dept., June 1951, 23 pp.

showed no upward tendency and in a number of individual instances dropped sharply.

Metals in particular showed the effect of defense mobilization. Imports as a whole rose abruptly, and there was a pronounced shift from imports of ore and concentrate to imports of metal and other advanced forms. While receipts of bauxite, for example, were slightly lower, those of aluminum metal more than doubled. Imports of copper in ore and concentrate were off by about one-third and in semi-refined form by 7 percent, but imports of refined copper rose 18 percent, receipts of copper scrap more than quintupled, and those of copper manufactures also increased. Similarly, imports of lead in ore and concentrate were nearly one-third lower, while imports as metal, alloy, or scrap increased by three-fifths. Zinc, a partial exception to the general rule, was imported in increased quantity in all forms, including ore and concentrate.

Imports of crude steel nearly quadrupled in 1950, and those of basic steel-mill products were nearly five times as great as in 1949. Exports of crude steel, on the other hand, fell to less than one-fourth of those in 1949, while exports of castings and forgings and of other steel-mill products fell over one-third.

Fuel imports also responded to the increased industrial activity. Crude-oil receipts increased 14 percent and those of residual fuel oil nearly 60 percent. Exports of crude petroleum increased roughly half, but not enough in absolute amount to outweigh the increase in imports. Exports of fuel oil also increased somewhat, but those of motor fuel declined substantially. Exports of natural gas and of natural-gas liquids each increased by about one-fifth. Exports of bituminous coal, which had dropped markedly in 1949, declined still further in 1950, while exports of coke continued their very marked decline of recent years.

The record on nonmetallics was similar to that for metals with regard to imports but was somewhat mixed on the export side. There were substantial increases in imports of industrial diamonds and other abrasives, asbestos, and mica. Exports of sulfur, on which the rest of the world largely depends, increased substantially. Exports of phosphate rock—many times imports of the same material—increased, but those of other phosphates declined. Potash exports declined slightly, as imports increased ninefold to create a net import balance. Imports and exports of nitrogen compounds, which are roughly on the same level, increased slightly and decreased slightly, respectively.

Details on United States imports and exports of minerals in 1950 will be found in tables 5 and 6.

TABLE 5.—Imports for consumption of mineral products by the United States, 1948–50 [1]

TABLE 5.—Imports for consumption of mineral products by the United States. 1948–50 [1]—Continued

	Quantity			Value (thousand dollars)		
	1948	1949	1950	1948	1949	1950
METALS—continued						
Tin:						
Concentrate..short tons (Sn content)	41,991	42,908	29,075	72,170	78,176	47,163
Metal and scrap...do	55,100	67,451	92,777	103,323	133,707	152,903
Titanium:						
Ilmenite...short tons	242,119	324,157	216,459	1,759	2,479	1,199
Rutile...do	8,771	3,085	3,427	589	180	150
Ferrotitanium...do	28	38	130	17	20	81
Tungsten:						
Ore and concentrate [8] short tons (W content)	4,237	3,344	8,074	8,716	6,390	15,309
Metal and carbide...do	(3)	7	106	(9)	22	322
Ferrotungsten and alloys...do	----------	23	690	----------	31	1,083
Compounds...do	----------	----------	2	----------	----------	2
Vanadium ore and concentrate short tons (V content)	526	276	729	534	272	709
Zinc:						
Ore and concentrate [10] short tons (Zn content)	174,452	155,598	248,402	14,702	16,008	25,921
Metal...short tons	92,536	125,581	155,804	24,917	29,345	38,840
Scrap...do	10,273	3,733	2,862	1,181	559	688
Manufactures...do	(2)	(2)	(2)	49	11	235
Zirconium ore...do	18,154	20,833	16,826	571	637	431
FUELS						
Anthracite...short tons	945	----------	18,289	7	----------	255
Bituminous coal...do	291,337	314,980	346,706	2,003	2,368	2,369
Coke...do	161,400	277,507	437,585	2,110	3,976	5,297
Fuel briquets...do	329	365	804	3	3	2
Petroleum, crude and semirefined thousand barrels (42 gallons)	128,868	159,129	181,432	284,215	348,108	381,548
Petroleum products:						
Motor fuel...do	427	23	197	1,818	119	879
Kerosine and naphtha...do	152	1	302	579	27	956
Gas oil and distillate fuel oil...do	2,552	2,365	3,031	5,853	4,700	6,638
Residual fuel oil...do	55,536	77,612	123,037	118,193	122,194	190,273
Lubricating oils...do	102	(11)	1	278	5	14
Other...do	1,589	1,178	1,780	2,566	2,635	3,528
NONMETALLIC MINERALS						
Abrasives:						
Diamonds, industrial thousand carats	10,649	6,381	10,967	33,269	17,723	35,446
Other natural [12]...short tons	25,607	21,250	62,016	978	644	1,079
Artificial...do	174,672	129,548	158,543	10,918	8,023	10,547
Asbestos, unmanufactured...do	647,881	509,366	705,253	37,974	33,940	47,250
Asphalt and related bitumens, natural short tons	4,857	4,109	5,863	167	88	136
Barium:						
Barite...do	53,204	26,389	59,059	444	195	442
Witherite...do	2,470	2,113	2,089	95	63	51
Compounds...do	152	108	1,724	21	16	246
Boron minerals and compounds...do	18	15	22	33	36	35
Bromine and compounds...do	(3)	(3)	(3)	40	20	16
Calcium chloride...do	5	1	1,881	(9)	(9)	54
Carbon black...do	5,110	3,926	4,981	1,294	984	1,146
Cement...do	53,188	20,652	262,082	797	336	3,614
Clay, raw...do	135,941	105,105	161,261	2,124	1,481	2,001
Cornwall stone...do	1,390	887	1,388	18	12	14
Cryolite...do	2,353	20,506	17,134	210	1,312	978
Feldspar...do	34,773	17,725	13,851	220	108	84
Fluorspar...do	111,626	95,619	164,634	1,825	1,549	2,580
Gem stones:						
Diamonds, gem...thousand carats	1,298	969	1,312	100,645	69,674	103,301
Emeralds...carats	16,150	93,054	21,848	315	511	245
Other	(2)	(2)	(2)	14,980	13,947	16,095
Graphite...short tons	52,317	31,805	43,669	2,046	1,260	2,080
Gypsum:						
Crude, ground, and calcined thousand short tons	2,860	2,594	3,192	2,992	2,716	3,280
Manufactures	(2)	(2)	(2)	122	135	284
Iodine...short tons	296	245	362	848	720	1,056
Kyanite...do	17,091	12,119	17,417	259	325	588

For footnotes, *see* end of table.

TABLE 5.—Imports for consumption of mineral products by the United States, 1948–50[1]—Continued

	Quantity			Value (thousand dollars)		
	1948	1949	1950	1948	1949	1950
NONMETALLIC MINERALS—con.						
Lime:						
Hydrated ..... short tons..	2,861	1,674	1,253	48	35	24
Other ..... do....	30,336	30,807	30,904	401	546	524
Magnesium:						
Magnesite ..... do....	4,060	3,955	16,254	342	241	905
Compounds ..... do....	297	565	2,362	91	80	122
Meerschaum ..... do....	2	3	5	10	14	19
Mica:						
Uncut sheet and punch ..... do....	1,415	1,233	1,667	2,478	2,111	3,087
Scrap ..... do....	7,124	1,758	4,402	108	22	59
Manufactures ..... do....	9,357	9,747	12,441	12,961	17,212	20,507
Mineral earth pigments ..... do....	4,929	4,137	9,174	343	296	585
Mineral wax (ozokerite, etc.) ..... do....	402	893	1,171	261	310	481
Nepheline syenite ..... do....	61,147	59,994	63,208	346	416	739
Nitrogen compounds thousand short tons..	1,048	1,079	1,154	39,659	46,401	47,701
Peat ..... short tons..	91,073	94,747	124,864	3,195	3,184	3,866
Phosphorus:						
Phosphate rock ..... do....	53,876	72,678	97,634	609	822	1,114
Phosphatic fertilizers ..... do....	120,708	162,457	158,041	6,663	9,220	8,136
Potash ..... short tons (K_2O equivalent)..	27,181	19,216	199,493	3,064	2,359	13,995
Pyrites ..... short tons..	120,300	135,449	233,818	260	252	412
Quartz crystal ..... thousand pounds..	1,239	320	310	4,210	1,462	791
Salt ..... short tons..	5,621	6,309	7,869	41	61	59
Sand and gravel:						
Glass sand ..... do....	16,914	11,491	9,191	24	20	25
Other sand ..... do....	336,898	287,452	290,025	302	277	266
Gravel ..... do....	89,174	135,227	146,079	30	19	29
Slate	(2)	(2)	(2)	14	21	98
Sodium sulfate ..... short tons..	29,612	21,388	67,177	469	300	844
Stone	(13)	(13)	(13)	2,073	2,139	2,660
Strontium minerals ..... short tons..	21,771	9,384	8,630	559	177	142
Sulfur ..... do....	43	36	28	13	6	6
Talc:						
Unmanufactured ..... do....	18,377	18,816	23,387	519	577	692
Manufactures	(2)	(2)	(2)	15	9	8

[1] Table does not include certain minerals or mineral manufactures of relatively small importance or for which adequately differentiated statistics do not exist.
[2] Data not available.
[3] Less than 0.5 ton.
[4] Includes copper for smelting or refining and export as follows:

	Quantity (short tons)			Value (thousand dollars)		
	1948	1949	1950	1948	1949	1950
Ore and concentrate	16,070	6,093	6,501	7,074	2,827	2,884
Semirefined metal and alloys	2,603	448	23,796	1,137	200	11,204
Refined copper and alloys	------	-----	918	-----	-----	425
Scrap	------	-----	4,518	-----	-----	2,010

[5] Includes lead for smelting or refining and export as follows: 1948—44 short tons, $2,089; 1949—377 tons, $128,810; 1950—1,066 tons, $138,466. Does not include lead recorded as "nonrecoverable" as follows: 1948—43 short tons; 1949—56 tons; 1950—453 tons.
[6] Includes lead for smelting or refining and export as follows: 1948—38 short tons, $9,491; 1949—3 tons, $592; 1950—206 tons, $89,179.
[7] Includes manganese for smelting or refining and export as follows: 1948—412 short tons, $10,903; 1949—831 tons, $32,558; 1950—66 tons, $2,407.
[8] Includes tungsten for smelting or refining and export as follows: 1948—909 short tons, $938,668; 1949—207 tons, $434,078.
[9] Less than $500.
[10] Includes zinc for smelting or refining and export as follows: 1948—40,637 short tons, $2,963,942; 1950—10,838 tons, $1,607,517. Does not include zinc recorded as "nonrecoverable" as follows: 1948—112 short tons 1949—87 tons; 1950—93 tons.
[11] Less than 500 barrels.
[12] Includes value of abrasive paper and cloth but excludes quantity because not available on tonnage basis.
[13] Quantity cannot be aggregated because of varying units.

TABLE 6.—Exports of mineral products from the United States, 1948–50 [1]

[U. S. Department of Commerce]

	Quantity			Value (thousand dollars)		
	1948	1949	1950	1948	1949	1950
METALS						
Aluminum:						
Bauxite short tons (dried equivalent)	96,638	64,543	80,305	1,202	513	1,144
Metal short tons	49,546	37,179	21,284	29,037	21,455	11,029
Compounds do	17,881	18,861	17,403	1,067	1,219	1,205
Manufactures	(2)	(2)	(2)	14,183	11,470	11,124
Antimony:						
Ore and concentrate short tons	69	35	6	30	11	1
Metal and alloys do	258	450	148	181	337	86
Beryllium:

Manufactures [8]	(2)	(2)	(2)	2,229	1,637	1,260

[1] Table does not include certain minerals or mineral manufactures of relatively small importance or for which adequately differentiated statistics do not exist.
[2] Not available.
[3] Less than 0.5 ton.
[4] Less than $500.
[5] Weight of certain brass and bronze manufactures valued at $6,337,009 in 1948; $5,499,295 in 1949, and $5,175,294 in 1950, is not recorded and therefore omitted from the quantity figures only.
[6] Dross included with "ore and concentrate" during 1948, but with "metal and scrap" in 1949–50.
[7] Quantity cannot be aggregated because of varying units.
[8] Includes face and body powders.

Tariffs.—Reduced rates of import duty came into effect in the first half of 1950, as the result of trade-agreement negotiations at Annecy, France, in the summer of 1949, on boric acid, ammonium-chrome alum, mercury compounds, siennas, caustic potash and caustic soda, pumice and pumice products, talc, various types of earthenware, certain types of marble and breccia, manufactured or semimanufactured alabaster, granite, travertine, miscellaneous monumental and building stones, slate (other than roofing), ferrochrome, and various iron and steel products.

Further trade-agreement negotiations were undertaken at Torquay, England, in September 1950, with such items under discussion as coal-tar derivatives; resublimed iodine; phosphorus; mineral-earth pigments; crude and ground barite; brick, tile, clays, and earthenware; feldspar, mica, talc, and fluorspar; granite; pig iron, various ferroalloys, and various iron and steel products; titanium, barium, boron, strontium, thorium, vanadium, calcium, zirconium, and various alloys thereof; crude aluminum and alloys; bismuth; lead ore, matte, metal, and various products; zinc ore and metal; and compounds of ammonium, barium, cobalt, lead, zinc, tin, magnesium, potassium, sodium, strontium, thorium, and cerium.

By an exchange of notes on June 23, 1950, the United States and Mexico agreed that the 1943 Trade Agreement between the two countries would cease to be in force after December 31, 1950. The most important result was to cause the reduced import tax on crude petroleum, topped crude, and fuel oil to become subject once more to the quota arrangement applicable under the earlier Venezuela agreement, whereby the reduced rate of 10½ cents a barrel was limited each year to an amount equal to 5 percent of the quantity of crude processed in United States refineries in the preceding calendar year. For certain other commodities in the Mexican agreement, including fluorspar, lead ore, and various lead products, the duty reverted to the rate specified in the Tariff Act of 1930. Because it had been "bound" in the General Agreement on Tariffs and Trade (Geneva negotiations), the rate on zinc in ore and other forms did not change.

Because of Chinese withdrawal from the General Agreement on Tariffs and Trade, the United States withdrew, effective December 11, 1950, certain concessions it had originally negotiated with that country. As a result, rates of duty were increased on tungsten ore and concentrate, antimony metal, and certain manufactures of talc and other nonmetallic minerals.

Applications for relief under the trade-agreement "escape" procedure were brought early in 1950 by both the Reynolds Metal Co. and Kaiser Aluminum & Chemical Corp. with respect to the tariff on crude aluminum and aluminum-mill products; both were dismissed later in the year by the Tariff Commission after preliminary inquiry. Similar applications with respect to lead ore, bullion, and scrap were filed in May by the Emergency Lead Committee (New York) and the New Mexico Miners and Prospectors Association, but these two were also dismissed in January 1951 after preliminary inquiry.

The import tax on refined copper and copper in ore, etc., reverted to 2 cents per pound on July 1, 1950, when Congress declined to extend the previous suspension. The duty suspension on metal scrap, on the other hand, which had expired July 1, 1949, was reinstated October 1, 1950, until July 1, 1951.

Economic Cooperation Administration.—The Economic Cooperation Administration in 1950 continued to spend heavily, and this had a substantial effect on international mineral production, consumption, and capacity. Loans for expanding strategic mineral production and purchases of strategic minerals with counterpart funds provided direct stimulus to production expansion; indirect effects were achieved by using commodity-procurement authorizations by assisted countries to buy mineral products.[10]

Loans totaling about $36 million were approved for projects in ECA countries and their dependent territories to produce strategic minerals. Repayment was to be in the form of aluminum, lead, zinc, diamonds, copper, nickel, chromite, and tin for the United States National Stockpile. By far the largest of the 14 such projects was one for development of bauxite in Jamaica. The next largest loan was for further assistance to lead-zinc mining at Bou Beker, French Morocco.

Commitments were made by ECA in 1950 for purchasing over $25 million worth of strategic minerals (diamonds, ferromanganese, platinum, lead, fluorspar, mica, aluminum, and cobalt) in ECA countries and their dependencies. The big bulk of this was for payment from "5-percent counterpart" funds, representing local currency set aside by assisted countries for the use of the United States.

Roughly $600 million of procurement by assisted countries was authorized for minerals and mineral products; of this, the United States was the source of about one-fourth. Mineral products comprised over one-fourth of all ECA commodity-procurement authorizations in the year.

Private Foreign Investment.[11]—Mineral industries continued to lead private direct American investment in foreign countries, accounting for 40 percent of the outstanding total of $13,550 million at the end of

[10] Economic Cooperation Administration, Quarterly Reports to Congress for calendar year 1950.

[11] *See* Survey of Current Business, Private Capital Outflows to Foreign Countries: Vol. 31, No. 12, December 1951, pp. 12–14.

1950. Three-fourths of the mineral equity abroad was in petroleum. The net gain during the year in mineral-industry investment abroad was 11 percent, slightly more than for the total private direct American investment abroad. Three-fifths (or $700 million) of the total new investment (for all industries) was derived from new capital and the remainder from reinvested earnings. The sources of incremental investment funds in mining and smelting were in about the same ratio, but only one-tenth of the increased investment in petroleum was reinvested earnings. Petroleum represented about half of total net new direct foreign investment in 1950 and other mineral inductries about one-tenth.

The Western Hemisphere received 60 percent of the direct mineral investment. New investment in Canada was twice that in Latin America, even though the cumulative total in Canada is only half that in Latin America.

Total mining and petroleum investment abroad in 1950 equaled 20 percent of domestic investment. For petroleum alone the ratio was 27 percent and for other mining 15 percent.

DEFENSE MOBILIZATION

Defense Production Act.—The Defense Production Act of 1950 (Public Law 774, 81st Congress, 2d session, approved September 8, 1950) provided, among other things, for substantial assistance to expand mineral output, for assistance to mineral exploration, for material and equipment allocations, and for price and wage controls. Assistance was made available by means of accelerated tax amortization, Government loans, loan guarantees, advances, and contracts to procure or conditionally procure from expanded output. The assistance was open to American companies with properties either in the United States or abroad. A limit of $2 billion was placed on the gross commitments to be made during the year of the act's life, but this was not intended to limit the programing or negotiation of expansion projects involving far greater commitments.

Defense Minerals Administration.—The Defense Minerals Administration was organized in the United States Department of the Interior under Dr. James Boyd, who also continued as Director of the Bureau of Mines. Work was begun immediately on programs for minerals expansion, as well as on recommendations to the Defense Production Administration for accelerated tax amortization. Several contracts and loans were being negotiated or considered at the end of the year, but the only proposals recommended or certified to the Defense Production Administration during 1950 were the initial primary aluminum expansions by the existing companies for a combined 320,000-ton expansion. Besides being responsible for expanded mineral production, DMA was also made official claimant for scarce materials and equipment for the minerals industries.

Other Agencies.—The Petroleum Administration for Defense and the Defense Solid Fuels Administration were also set up in the Interior Department, with responsibility for petroleum and for coal and coke, respectively. Like DMA, DSFA was headed by a separate Administrator, Charles W. Connor. PAD, on the other hand, was headed by a Deputy Administrator, Bruce K. Brown, with Secretary of

Interior Oscar L. Chapman occupying the Administrator position. The functions of PAD and DSFA were similar to those of DMA.

The National Production Authority in the Commerce Department was also organized upon passage of the Defense Production Act. It had expansion and claimant responsibilities for manufacturing similar to those of DMA for mining, as well as allocation responsibilities for scarce materials. In November and December restrictions (some of them not effective until January 1) were announced on the consumption of steel, copper, aluminum, cobalt, nickel, zinc, and tin.

The line of jurisdiction was formally drawn between NPA and DMA in NPA Delegation 5, December 18, 1950, along the lines of division of industry responsibility between the Bureau of Mines and the Department of Commerce; that is, DMA was to be responsible, so far as expansion and claimant functions were concerned, for the ferrous-metals industry up to but not including blast furnaces, for the nonferrous-metals industry through smelting and refining, and for refractory and other nonmetallic-mineral production through the stage, as a rule, of the primary manufacture. In general, NPA retained the power to allocate refined metals and processed mineral products, while DMA was delegated allocating responsibility for ores and other crude materials.

The Economic Stabilization Agency was also organized under the Defense Production Act, and, near the end of January 1951, froze mineral prices, along with most others, at the highest obtained during the base period of December 19, 1950, through January 25, 1951. Plans were under way, however, for industry advisory committee meetings to consider specific price regulations for various individual commodities. (These meetings, held in January 1951, resulted in most metal prices being frozen at the December 19 level.)

National Strategic Stockpile.—The Emergency Procurement Service of the General Services Administration considerably accelerated its stockpiling operations during 1950. This was due both to revision of the stockpile objectives after Korea to accord with the changed strategic outlook and to considerable expansion in stockpile purchasing authority and in appropriations granted by Congress. Purchase contracts of $831 million were made during the year. The value of stockpile objectives at year end was $8,870 million, an increase of $3,768 million during the year; the value of stockpiles on hand was $2,719 million, $742 million more than a year earlier. However, curtailment of the rate of stockpile acquisition was under consideration at the end of the year because of the current material scarcities.[12]

Molybdenum, magnesium, and fluorspar (both acid and metallurgical grades) were transferred during the year from Stockpile Group II (materials accumulated only from Government surplus) to Group I (materials also purchased on the market). Abrasive-grade bauxite, rutile, iodine, and zirconium ores (baddeleyite and zircon) were transferred from Group I to Group II, and refractory-grade bauxite was added to the stockpiling list (Group I) for the first time. Monazite sand (Group I) was redesignated as "rare earths."

The movement of items from Group I to Group II is equivalent to

[12] Munitions Board, Department of Defense, Stockpile Report to the Congress: July 23, 1950, and January 23, 1951.

elimination of the objectives for those items and hence of the need to purchase; quantities already in the stockpile are retained, however.

The Bureau of Mines continued its efforts to improve the availability of stockpiled materials, with particular progress for the following: Aluminum and bauxite, antimony, asbestos, beryllium, chromite, cobalt, copper, kyanite, lead, zinc, cadmium, magnesium, manganese, mica, monazite, talc, tin, titanium, and tungsten.

TECHNOLOGY [13]

Mining.—Technologic developments in mineral mining in 1950 largely involved adoption of new equipment and new practices, with few noteworthy shifts in mining methods.[14]

Unusually large caving blocks were laid out in the Canadian asbestos mines, and introduction of block caving into the Lake Superior iron district brought this mining method back to the country of its beginnings. Sand filling of stopes was tested and techniques were perfected at a number of mines. A novel and interesting mining method reported during the year was that employed by the Round Mountain Gold Dredging Corp. in Nevada where, starting in January 1950, a large alluvial gold deposit was mined by "dry-land" methods.[15]

Roof bolting gained further acceptance in both metal and nonmetal mines, while steel and concrete supports were adopted in some mines as a means of holding openings in heavy ground.

In the equipment field, drilling economy as usual was the chief objective, with particular interest in competing types of drill bits. The carbide insert bit gained increased acceptance, but the multi-use and single-use (throw-away) detachable bit, the diamond drill, and even the conventional forged-steel bit appeared still to have uses from which they would not be displaced. Light drills on jackleg mountings were adopted at a number of mines, while at others mobile drill jumbos were installed. Millisecond-delay electric blasting caps were used experimentally in many mines, and results appeared to be definitely advantageous, particularly in stoping.

Diesel power was introduced underground more widely, not only for locomotives but for bulldozers, compressors, and other powered equipment. Mucking machines—track-mounted, rubber-tired, or with crawlers—and a variety of trackless transport equipment made further advances for loading and hauling.

Milling and Metallurgy.—Beneficiation of metallic and nonmetallic minerals continued to be improved. Great strides have been made in applying the Driessen cone, also known as the Dutch cyclone, in dewatering concentrates and fine coal and, if fed with a dense medium for separating granular heavy minerals from gangue, as a substitute for the use of tables. The Humphrey spiral concentrator has been increasingly used in the heavy sands of Florida for recovering ilmenite, rutile, leucoxene, zircon, monazite, and staurolite from sea sands and

[13] The sections on mining, milling and metallurgy, and fuels were prepared, respectively, by Charles H. Johnson, chief, Base Metals Branch; Oliver C. Ralston, chief metallurgist; and Arno C. Fieldner, chief fuels technologist.

[15] Huttl, J. B., New 17,000-Ton Dry-Land Dredge: Eng. and Min. Jour., vol. 151, No. 6, June 1950, pp. 68–70.

granular phosphate from the pebble phosphate area. Spirals are also used in the Adirondacks for recovering ilmenite. They can be installed in a small fraction of the space required for gravity-concentrating tables. Spirals also successfully treated flake mica from weathered material in the South; in this case the mica acts like the lightest specific gravity mineral present, due to its shape.

Beneficiation of the taconite ores continued at an accelerated pace. The problem of agglomerating fine iron-ore concentrate into particles suitable for blast-furnace feed has been acute. Briquetting, sintering, and pelletizing have been investigated and compared. Pelletizing involves processing flotation concentrates with the proper amount of moisture so that they can be rolled into water-bound spherules that can be indurated by heating to the proper temperature to mature the colloidal fraction into a permanent binder.

The Dorr fluosolids reactor, originally installed commercially for burning powdered limestone, is being tested for roasting and heat-treating a wide variety of powdered mineral products. The apparatus is capable of close control of temperature and close control of gas analysis in the hot gases supplied to or taken from the reactor. Better sulfate and chloridizing roasting is anticipated. Stronger SO_2 gas from the roasting of pyrite or pyrrhotite flotation concentrate is another possibility.

Mineral beneficiators are continually improving crushing and grinding techniques and apparatus. Every year new forms of apparatus are developed for dense-medium concentration of coarse and sand sizes of minerals.

Vacuum methods of reducing metals and melting them are finding more applications for treating titanium, zirconium, molybdenum, and other metals that are sensitive to ordinary furnace atmospheres. Magnesium was the metal that brought about rapid improvement in vacuum techniques during World War II, and suitable equipment is now easily acquired.

Fuels.—Development work on synthetic liquid fuels from coal and oil shale continued to occupy the greater part of the Bureau of Mines fuels research program; important progress was also made in determining the minable reserves of coking coal. Experimental research on coking coals has shown that many low-grade deposits can be upgraded by washing to remove sulfur and ash and that large reserves of weakly coking coals can be utilized by blending them with strongly coking coals for making metallurgical coke. Other research developed a new method for rapidly drying small sizes of lignite and noncoking coals in a fluidized or entrained state. The Bureau's research work on coal in 1950 is summarized in Information Circulars 7618 and 7647.[16]

Bureau of Mines Publications.—Among the more important Bureau of Mines publications of a theoretical nature released during the year were those dealing with: Theoretical metallurgy (p. 3, B 477),[17] generation and propagation of strain waves in rock (p. 13, RI 4683), vibrations in an elastic medium (p. 14, RI 4692), and evaporation of zinc (p. 15, RI 4710). Especially useful summaries of certain of the

Brown, R. L., and Carman, E. P., Annual Report of Research and Technologic Work on Coal, Fiscal Year 1951: Bureau of Mines Inf. Cir. 7647, 1952, 81 pp.

[17] Page references are to Supplement to List of Publications, Bureau of Mines, January 1 to December 31, 1950. B indicates Bulletin, RI Report of Investigations, and IC Information Circular.

Bureau's continuing investigations were also released—strategic-mineral development (p. 10, RI 4647), synthetic liquid fuels (p. 11, RI 4651, 4652, 4653, 4654), and explosives (p. 12, RI 4667). Publications of unusual interest on safety measures included those on: Dust (p. 3, B 478), coal-mine fires (p. 13, RI 4686), and permissible explosives (p. 11, RI 4663). Economic studies of interest covered core-drilling costs (p. 9, RI 4628) and energy uses and supplies (p. 23, IC 7582). Mining and development publications included, among others, papers on magnetic surveys (p. 8, RI 4586), treated timbers (p. 8, RI 4622), jumbo drilling (p. 9, RI 4625), Diesel underground haulage (p. 10, RI 4643), secondary recovery of oil (p. 14, RI 4690), explosive shooting of wells (p. 16, RI 4714), carbide insert bits (p. 21, IC 7558), and truck haulage (p. 23, IC 7584).

Metallurgical studies were made of many metals, including lead, titaniferous ores, zirconium alloys, zinc, ilmenite, and chromium. The most numerous investigations of mineral deposits were made on tungsten and manganese ores and on coal. Numerous analyses were published of properties of coals and crude oils from various sources.

WORLD REVIEW

Production.—Increased economic activity in most of the industrial countries of the world, plus the rush for raw materials occasioned by the outbreak of hostilities in Korea, affected world, as well as United States, production of minerals. The output of most minerals in 1950 was well above 1949 and in numerous cases reached new highs.

Crude petroleum, with an increase of about 10 percent from the preceding year, was one of the commodities whose world output broke all previous records. Although United States production (over half of the world total) was slightly under the 1948 peak, other important producers of crude oil—such as Venezuela, Iran, and Saudi Arabia—more than made up the difference.

World coal production, while substantially higher than in 1949, did not quite regain earlier losses. The three leading producers—the United States, the United Kingdom, and Germany—all increased output, but the United States failed to match its World War II record, and neither the United Kingdom nor Germany reattained prewar production levels.

Natural gas, like petroleum, reached a new production peak, with the United States, by far the largest producer, contributing most of the increase. Italy, a relative newcomer in large-scale use of natural gas, more than doubled its 1949 production. Venezuela, the world's second-largest producer, also established a new peak, as did Canada and Mexico, third and fourth largest producers (except possibly for the U. S. S. R.), respectively.

An increase of about 15 percent in world industrial activity over that in 1949 [18] was reflected in an increase of similar magnitude in world steel production but a smaller increase (about 10 percent) in iron-ore output. This was enough to establish a new record for world production of iron ore, although the United States, which produces about half the world supply, did not quite regain World War II peaks. World mine production of manganese, chrome, molybdenum, and

[18] Statistical Office of the United Nations, Statistical Yearbook 1951, New York, 1951, p. 120.

tungsten apparently also increased (data are not available for the U. S. S. R.), but only in the case of chrome ore was there an apparent new record.

In response to price increases during the year ranging from 33 percent (electrolytic copper, New York) to 117 percent (tin, London), world mine production of all principal nonferrous metals increased over 1949 but in no case reached World War II records. Despite the price rise, the smallest relative gain was in world production of tin.

Reflecting sustained construction activity all over the world, output of cement reached a level about 15 percent higher than in 1949 and half again as high as either prewar or the peak of World War II. World sulfur production, over 90 percent of which was supplied by the United States, also reached a new high, more than double prewar. Production of fertilizer materials—potash, phosphate rock, and nitrogen (including synthetic)—similarly rose well above any previous high.

Detailed statistics on world production of mineral commodities in 1950 will be found at the end of this volume.

Intergovernmental Action.—In the early part of 1950 proposals for intergovernmental action in the commodity field were concerned mainly with actual or expected surpluses; after hostilities broke out in Korea, concern shifted rapidly to actual or prospective shortages.

The early concern over surpluses was concentrated mainly on agricultural commodities but also included a mineral commodity—tin. Pressure to reach a commodity agreement for tin resulted in a Draft International Agreement (the so-called "Paris draft") at the fifth meeting of the International Tin Study Group in March 1950. The draft contained proposals for controlling exports and creating a buffer stock. The Study Group also adopted a resolution calling upon the Secretary General of the United Nations to convene a United Nations conference to discuss an international control agreement. After consideration of the resolution by the Interim Coordinating Committee for International Commodity Arrangements, such a Tin Conference met in Geneva in October, attended by delegates from the principal producing and consuming countries, but adjourned a month later to permit further study of the various control plans offered.[19]

Concern over raw-material shortages and soaring prices was expressed both at the meeting of the Deputies of the North Atlantic Treaty Council in London in July and at a meeting of the Foreign Ministers of France, the United Kingdom, and the United States in New York City in September. In October the Council of the Organization for European Economic Cooperation (Marshall Plan countries) initiated a study of raw-material shortages and methods for dealing with them and on December 1 came to the conclusion that any plan of action, to be successful, must be participated in not only by OEEC countries, but also by Canada and the United States. The problem was also recognized by the United Nations General Assembly in its fall meeting and by the Council of the Organization of American States in December.

Meanwhile, conversations took place directly among representatives of some of the more important raw-material-consuming countries. The "Statement of Principles for Economic Cooperation" which was

---

[19] Interim Coordinating Committee for International Commodity Arrangements, Review of International Commodity Problems, 1950: United Nations, January 1951, pp. 5-6.

adopted in an exchange of notes between the United States and Canada in October 1950 provided, among other things, for developing a coordinated program of requirements, production, and procurement and for instituting coordinated controls over the distribution of scarce raw materials and supplies. Conversations early in December between Prime Minister Attlee of the United Kingdom and the President of the United States resulted in agreement that

> * * * While defense production must be given the highest practicable priority in the case of raw materials whose supply is inadequate, the essential civilian requirements of the free countries must be met so far as practicable. In order to obtain the necessary materials and to devote them as rapidly as possible to these priority purposes, we have agreed to work closely together for the purpose of increasing supplies of raw materials. We have recognized the necessity of international action to assure that basic raw materials are distributed equitably in accordance with defense and essential civilian needs. * * *

This declaration was the forerunner of the International Materials Conference.[20]

Statistical Summary of Mineral Production

By K. Joyce D'Amico

GENERAL SUMMARY

THE TABLES in this chapter summarize the statistics on mineral production in the United States, each of the individual States, and the Territories, possessions, and other areas administered by the United States. Most of the tables, as noted in each case, deal with the area known as continental United States—the 48 States and the District of Columbia.

Mineral production may be measured at any of several stages of extraction and processing. The stage of measurement used in this chapter is, generally speaking, what is termed "mine output." This usually refers to minerals in the form in which they are first extracted from the ground, but customarily includes, for some minerals, the product of auxiliary processing operations carried on at or near mines—such as sizing and cleaning, in the case of coal, and concentrating, in the case of metallic ores.

Because of inadequacies in the available statistics, some of the series herein deviate from the foregoing definition. In particular, the limestone, cement rock, and clay that are processed into cement are measured as the latter rather than in their originally extracted form; similarly, limestone used for lime is measured as the latter rather than the former. Natural-gas liquids are measured in the form in which they leave the natural gasoline or cycle plants. The quantities of gold, silver, copper, lead, zinc, and tin are recorded on a mine basis—that is, as the recoverable content of ores sold or treated; the values assigned, however, are based on the average selling price of refined metal. Mercury is measured in the form of recovered metal and valued at the average New York price for metal.

A number of additional deficiencies in the previously existing series for value of mineral production were eliminated with revisions that are described in the Statistical Summary chapter of Minerals Yearbook 1949. The revised value series originally shown there for 1947–49 only has now been carried back to 1925 and is shown, along with the old series dating back to 1880, in table 1 herein. Tables

2 and 6 show quantities and values on the new basis for individual minerals, both for the United States and for individual States, for 1947–50. Table 5 gives totals on the new basis for the individual States for each of the years 1925–46.

The weight or volume units shown are those customary in the particular industries producing the respective products. No adjustment has been made in the dollar values for changes in purchasing power of the dollar.

TABLE 1.—Value of mineral production in the United States, 1880–1948 (old basis) and 1925–50 (new basis)

[Millions of dollars]

Year	Nonmetallic			Metallic	Grand total	Year	Nonmetallic			Metallic	Grand total

[1] *See* text. Data for 1925–46 are not strictly comparable with those for 1947–50, since for the earlier years the value of heavy clay products has not been replaced by the value of raw clays used in such products. Refers to continental United States only. For data for 1947–50 on Territories, possessions, and other areas administered by the United States, *see* tables 7 and 8.

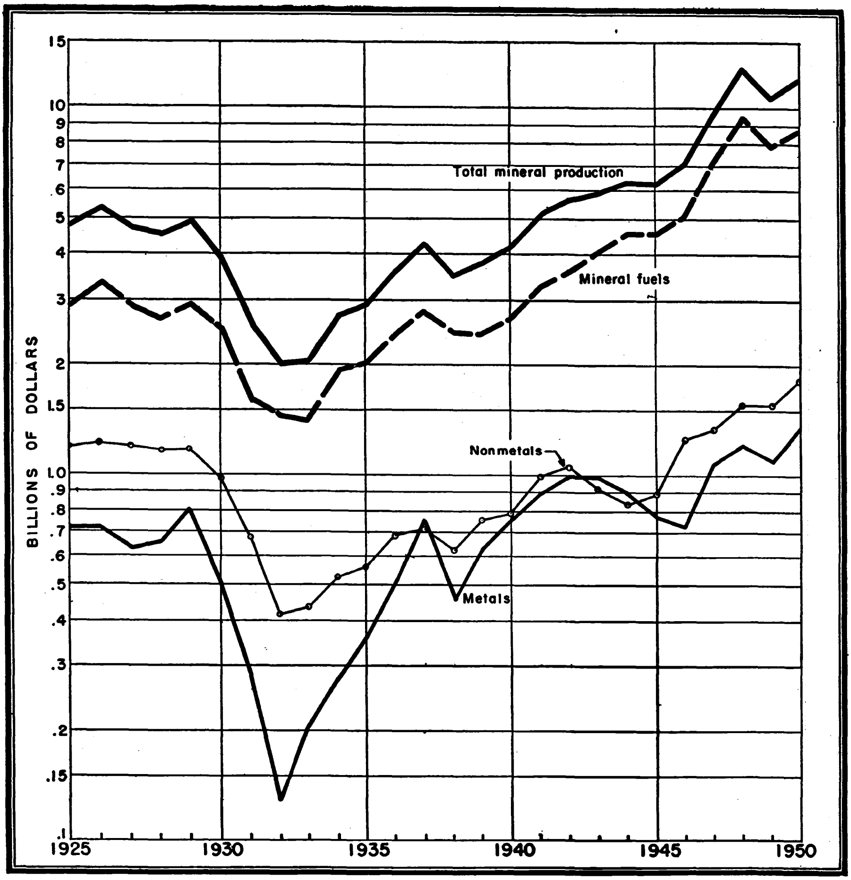

FIGURE 1.—Value of mineral production in continental United States, 1925-50.

TABLE 2.—Mineral production in continental United States, 1947–50, by individual minerals [1]

Mineral	1947		1948		1949		1950	
	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)
MINERAL FUELS								
Coal:								
Bituminous [2] ... thousand short tons	627,389	2,614,561	596,024	2,983,465	434,342	2,126,226	[3] 512,529	[3] 2,489,229
Lignite ... do	2,874	5,519	3,086	7,012	3,092	7,336	[3] 3,370	[3] 8,112
Pennsylvania anthracite ... do	57,190	413,019	57,140	467,052	42,702	358,008	44,077	392,398
Natural gas ... million cubic feet	4,582,173	274,709	5,148,020	333,173	[4] 5,419,736	[4] 344,034	[3] 6,282,060	[3] 408,521
Natural-gas liquids:								
Natural gasoline and cycle products ... thousands of 42-gallon barrels	87,130	228,174	94,124	341,154	[4] 99,217	[4] 303,136	[3] 109,679	[3] 321,832
LP-gases ... do	45,043	66,820	52,597	117,823	[4] 57,869	[4] 99,054	[3] 72,282	[3] 97,773
Petroleum (crude) ... do	1,856,987	3,577,890	2,020,185	5,245,080	[4] 1,841,940	[4] 4,674,770	[3] 1,973,574	[3] 4,963,380
Total mineral fuels	...	7,181,000	...	9,495,000	...	[4] 7,912,000	...	8,681,000
NONMETALLIC MINERALS (EXCEPT FUELS)								
Abrasive stone: [5]								
Grindstones and pulpstones ... short tons	10,696	482	7,954	405	4,507	247	4,468	233
Millstones	(6)	23	(6)	18	(6)	9	(6)	11
Pebbles (grinding) ... short tons	5,860	123	4,026	102	2,374	64	1,923	53
Tube-mill liners (natural) ... do	1,496	40	1,297	42	1,166	47	1,523	63
Asbestos ... do	24,035	919	37,092	1,806	43,387	2,614	42,434	2,925
Asphalt and related bitumens (native):								
Bituminous limestone and sandstone ... do	1,004,740	3,756	1,084,004	3,635	1,150,931	4,265	1,184,676	3,522
Gilsonite ... do	67,165	1,746	52,122	1,391	51,462	1,304	66,186	1,774
Wurtzilite ... do	17	1	...	...	...	...	...	...
Barite (crude) ... do	834,082	6,171	799,848	6,693	717,313	5,642	695,414	6,194
Boron minerals ... do	501,935	11,844	450,932	11,148	467,592	11,512	647,735	15,890
Bromine ... thousand pounds	78,178	14,837	76,048	14,825	88,726	16,268	98,502	18,795
Calcium-magnesium chloride ... short tons, 75-percent (Ca, Mg) Cl_2 basis	271,206	2,650	309,660	3,907	255,797	3,261	299,821	3,802
Carbon dioxide, natural (estimated) ... thousand cubic feet	581,000	412	545,000	397	489,000	376	472,334	369
Cement ... thousands of 376-pound barrels	188,516	356,639	205,239	446,465	207,142	475,074	228,788	537,652
Clays (including fuller's earth) [7] ... thousand short tons	28,192	71,250	31,304	80,997	28,474	74,619	32,301	89,676
Emery ... short tons	5,798	67	5,405	69	4,909	61	5,949	75
Feldspar (crude) ... long tons	459,910	2,411	460,713	2,564	369,378	2,278	407,925	2,558
Fluorspar ... short tons	329,484	10,955	331,749	11,227	236,704	8,267	301,510	10,620
Garnet (abrasive) ... do	8,722	614	8,039	588	6,578	505	9,304	794
Gem stones (estimated)	(6)	540	(6)	450	(6)	450	(6)	450
Graphite ... short tons	5,207	221	9,871	451	5,213	475	5,605	428
Gypsum (crude) ... do	6,208,216	16,530	7,254,535	19,113	6,608,118	18,319	8,192,625	22,735
Helium (shipments, calendar years) ... thousand cubic feet	52,322	501	50,915	610	51,501	689	80,889	1,028
Kyanite ... short tons	(8)	(8)	14,552	527	12,115	403	(8)	(8)
Lime (open-market) ... do	6,759,949	63,363	7,245,211	74,677	6,302,551	68,908	7,462,109	82,847

Lithium minerals do	2,441	151	3,881	211	4,838	346	9,306	580
Magnesite (crude) do	375,993	2,597	[8]	[8]	287,315	1,950	429,392	3,091
Magnesium compounds from sea water and brines (except for metal) short tons, MgO equivalent	89,500	5,840	91,700	6,918	63,000	5,033	89,300	7,283
Marl:								
Calcareous (except for cement) short tons	176,187	235	114,759	146	166,800	232	347,843	246
Greensand do	8,337	433	7,269	393	6,128	277	3,935	304
Mica:								
Scrap do	49,797	1,096	52,157	1,092	32,856	796	69,360	1,743
Sheet pounds	415,589	116	270,042	46	513,994	132	578,818	126
Olivine short tons	10,838	129	4,766	86	3,528	57	4,577	64
Peat do	136,232	869	129,581	930	129,532	1,020	130,723	1,143
Perlite do	10,495	58	22,112	134	71,203	511	101,536	649
Phosphate rock thousand long tons	9,027	46,639	8,669	50,502	8,987	51,415	10,254	59,028
Potassium salts short tons, K_2O equivalent	1,053,266	34,716	1,143,339	35,999	1,120,653	35,106	1,275,494	39,695
Pumice and pumicite short tons	442,552	2,022	607,646	2,501	716,742	2,369	719,356	2,661
Pyrites long tons	940,652	4,070	928,531	3,950	888,388	3,904	931,163	4,059
Quartz from pegmatites and quartzite short tons	101,317	425	161,861	751	107,552	475	160,508	707
Salt (common) thousand short tons	16,041	52,090	16,388	54,220	[4] 15,560	[4] 53,549	16,616	59,774
Sand and gravel do	283,189	212,568	318,070	252,244	315,895	245,661	367,304	292,559
Sand and sandstone (ground) short tons	644,508	5,154	692,773	5,778	610,789	5,258	750,673	6,463
Slate do	876,010	11,686	799,400	12,881	740,260	12,164	930,370	15,047
Sodium carbonate (natural) do	293,051	5,862	[9] 288,769	[9] 6,623	[9] 200,496	[9] 4,164	351,075	7,544
Sodium sulfate (natural) do	257,294	3,329	265,862	4,249	186,223	2,734	186,537	2,199
Stone [10] thousand short tons	206,242	286,792	224,475	326,660	222,549	339,442	250,844	387,911
Sulfur:								
Ore for direct agricultural use long tons	4,303	65	1,700	30	5,392	102	3,247	60
Frasch-process do	4,828,103	85,200	4,978,912	89,600	4,789,311	86,208	5,504,714	104,000
Talc, pyrophyllite, and ground soapstone short tons	516,094	7,682	518,746	8,265	461,896	7,523	620,750	10,621
Topaz (industrial) do	2,294	46	200	4	[8]	[8]	-----	-----
Tripoli do	34,578	751	26,845	706	25,525	691	43,720	1,174
Vermiculite do	131,385	1,339	138,635	1,387	168,819	1,686	208,096	2,122
Wollastonite do	80	2	75	2	500	7	800	16
Undistributed: Andalusite (1947–49), aplite, brucite, diatomite, dumortierite **(1949), epsom salts from serpentine** (1947), and epsomite (1949–50), iodine, **quartz crystal (1950), sharpening stones,** sodium carbonate (Wyoming 1948–49), **and minerals whose value** must be concealed for particular years (indicated **in appropriate column by** footnote reference 8)	-----	7,305	-----	10,549	-----	8,105	-----	9,824
Total nonmetallic minerals (except fuels)	-----	1,345,000	-----	1,559,000	-----	1,567,000	-----	1,823,000
METALS								
Antimony ore and concentrate short tons, gross weight	19,980	3,256	16,171	4,349	5,186	1,134	6,888	1,443
Bauxite long tons, dried equivalent	1,202,055	6,885	1,457,148	8,697	1,148,792	6,778	1,334,527	7,693
Beryllium concentrate short tons, gross weight	145	25	99	27	346	111	559	171
Chromite do	948	[11]	3,619	[11]	433	12	404	[11]
Cobalt (content of ore) pounds	676,612	[11]	580,703	[11]	673,773	[11]	660,025	[11]
Columbium (niobium) concentrate pounds, gross weight	-----	-----	100	[11]	-----	-----	[11]	[11]
Copper (recoverable content of ores, etc.) short tons	847,551	355,971	834,797	362,302	752,746	296,582	909,337	378,284
Gold (recoverable content of ores, etc.) troy ounces	1,829,197	64,022	1,765,862	61,805	1,762,367	61,683	2,104,959	73,674

For footnotes, see end of table.

TABLE 2.—Mineral production in continental United States, 1947–50 by individual minerals [1]—Continued

Mineral	1947 Quantity	1947 Value (thousand dollars)	1948 Quantity	1948 Value (thousand dollars)	1949 Quantity	1949 Value (thousand dollars)	1950 Quantity	1950 Value (thousand dollars)
METALS—continued								
Iron ore, usable (excluding byproduct iron sinter) thousand long tons, gross weight	92,670	317,629	100,275	391,230	84,174	377,637	97,151	483,358
Lead (recoverable content of ores, etc.) short tons	383,957	110,580	390,147	139,673	409,857	129,515	430,678	116,283
Manganese ore (35 percent or more Mn) short tons, gross weight	131,627	4,201	131,100	4,390	126,135	5,179	134,451	6,230
Manganiferous ore (5 to 35 percent Mn) do	1,174,355	3,447	1,340,565	(11)	1,078,395	4,040	1,087,597	4,609
Manganiferous residuum do	227,547	(11)	291,383	(11)	158,902	(11)	183,842	(11)
Mercury 76-pound flasks	23,117	1,936	14,288	1,093	9,830	781	4,535	368
Molybdenum (content of ore and concentrate) thousand pounds	22,190	15,178	29,669	20,418	23,280	19,332	44,544	37,729
Platinum-group metals (crude) troy ounces	324	(11)	(11)	(11)	(11)	(11)	(11)	(11)
Silver (recoverable content of ores, etc.) thousand troy ounces	35,757	32,360	38,029	34,418	34,639	31,350	42,406	38,380
Tantalum concentrate pounds, gross weight	3,259	9	500	(11)	----------	----------	(11)	(11)
Tin (content of ore and concentrate) long tons	----------	----------	(12)	(11)	17	37	15	31
Titanium concentrate:								
Ilmenite short tons, gross weight	336,061	5,029	381,508	5,794	389,234	6,212	468,320	5,607
Rutile do	5,157	534	9,907	647	10,559	490	(11)	(11)
Tungsten concentrate short tons, 60-percent WO_3 basis	3,081	4,336	4,033	6,355	2,765	4,377	4,807	8,157
Vanadium (content of ore and concentrate) pounds	2,117,962	1,285	(11)	(11)	(11)	(11)	(11)	(11)
Zinc (recoverable content of ores, etc.) short tons	637,583	153,112	629,955	167,974	593,201	148,913	623,369	178,667
Undistributed: Magnesium chloride for magnesium metal, zirconium concentrate, and minerals whose value must be concealed for particular years (indicated in appropriate column by footnote reference 11)	----------	3,876	----------	10,466	----------	6,671	----------	10,217
Total metals	----------	1,084,000	----------	1,219,000	----------	1,101,000	----------	1,351,000
Grand total mineral production	----------	9,610,000	----------	12,273,000	----------	[4]10,580,000	----------	11,855,000

[1] Production as measured by mine shipments or mine sales (including consumption by producers), except that fuels and the following additional minerals are strictly production: Gypsum, iodine, magnesite, pyrites, antimony, bauxite, and mercury. Excludes uranium ores and monazite.
[2] Includes small quantity of anthracite mined in States other than Pennsylvania.
[3] Final figure. Supersedes preliminary figure given in commodity chapter.
[4] Revised figure.
[5] Excludes sharpening stones, which are included with "Nonmetallic minerals, undistributed."
[6] Weight not recorded.
[7] Excludes clays sold or used for cement as follows: 1947—5,336,000 short tons, $2,987,000; 1948—6,362,000 tons, $4,320,000; 1949—6,676,000 tons, $4,573,000; 1950—7,080,000 tons, $5,574,000.
[8] Value included with "Nonmetallic minerals, undistributed."
[9] Excludes production from Wyoming, value for which is included with "Nonmetallic minerals, undistributed."
[10] Excludes abrasive stone, bituminous limestone, bituminous sandstone, and ground soapstone, all included elsewhere in table. Also excludes limestone for cement and lime.
[11] Value included with "Metals, undistributed."
[12] Less than 0.5 ton.

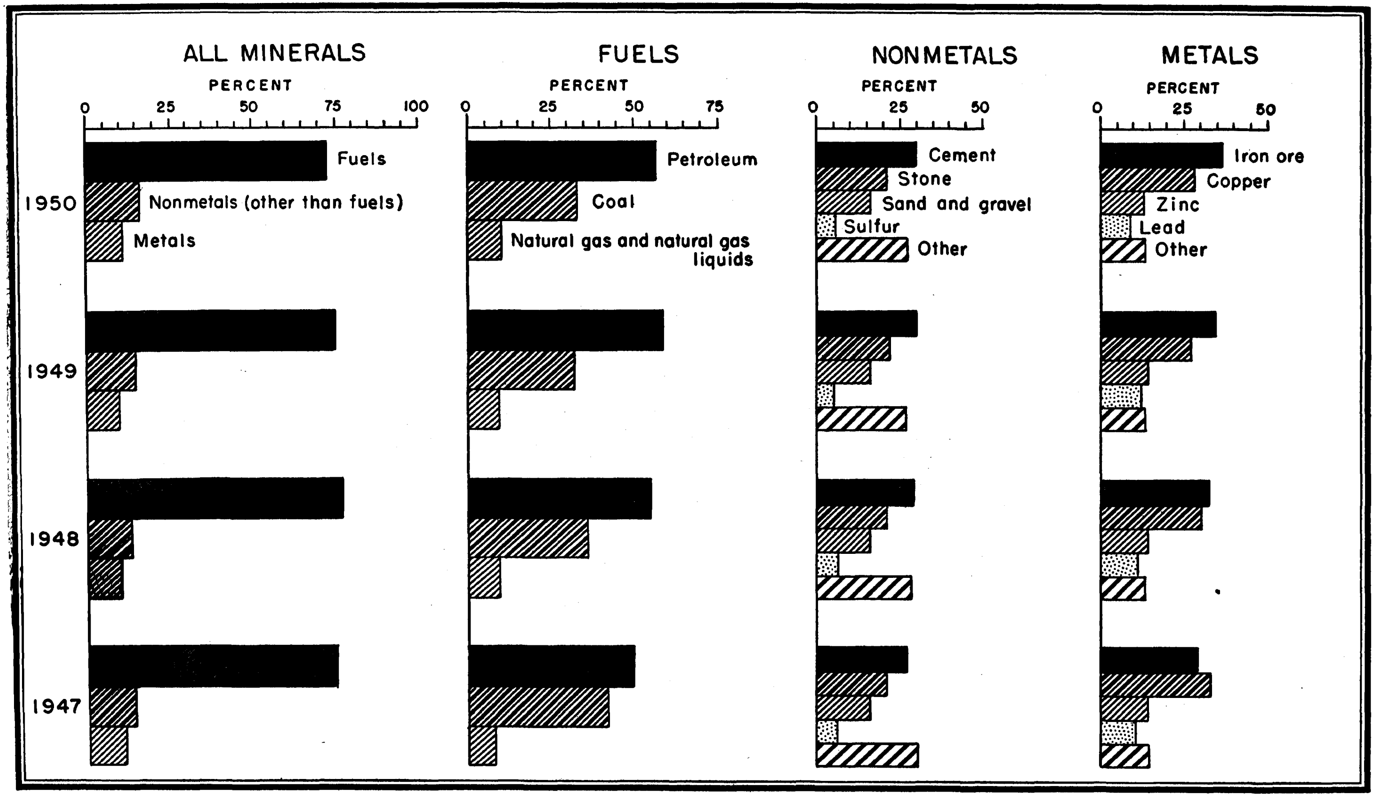

Figure 2.—Value of mineral production in continental United States, 1947–50, by mineral group and by minerals, in percent.

TABLE 3.—**Minerals produced in continental United States and principal producing States in 1950**

Rank in value	Mineral	Principal producing States: In order of quantity	Principal producing States: In order of value
	Abrasive stone:		
70	Grindstones and pulpstones	Ohio, West Virginia, Washington	Rank same as for quantity.
81	Millstones	Not available	North Carolina, Virginia.
77	Pebbles (grinding)	Minnesota, Wisconsin, Texas, Washington	Minnesota, Wisconsin, Texas, North Carolina.
76	Sharpening stones	Arkansas, Indiana, Ohio, New Hampshire	Arkansas, New Hampshire, Indiana, Ohio.
74	Tube-mill liners (natural)	Minnesota, North Carolina, Wisconsin	Rank same as for quantity.
49	Antimony ores and concentrates	Idaho, Nevada	Do.
63	Aplite	Virginia	Do.
42	Asbestos	Vermont, Arizona, North Carolina, Oregon	Do.
36	Asphalt (native)	Texas, Alabama, Oklahoma, Utah	Utah, Texas, Alabama, Kentucky.
34	Barite (crude)	Arkansas, Missouri, Georgia, Nevada	Do.
28	Bauxite	Arkansas, Georgia, Alabama	Arkansas, Alabama, Georgia.
71	Beryllium concentrates	New Mexico, New Hampshire, Colorado, South Dakota	Rank same as for quantity.
23	Boron minerals	California	Do.
22	Bromine	Texas, Michigan, California, West Virginia	Michigan, Texas, California, West Virginia.
66	Brucite	Nevada	Rank same as for quantity.
39	Calcium-magnesium chloride	Michigan, West Virginia, California, Ohio	Michigan, California, West Virginia, Ohio.
64	Carbon dioxide (natural)	California, Utah, New Mexico, Oregon	California, Oregon, Washington, Utah.
3	Cement	Pennsylvania, California, Texas, New York	Rank same as for quantity.
82	Chromite	California	Do.
13	Clays	Ohio, Pennsylvania, Georgia, Illinois	Georgia, Ohio, Pennsylvania, South Carolina.
2	Coal:		
	Bituminous	West Virginia, Pennsylvania, Kentucky, Illinois	Rank same as for quantity.
	Lignite	North Dakota, Montana, South Dakota, Texas	Do.
	Pennsylvania anthracite	Pennsylvania	Do.
62	Cobalt (in ores, etc.)	do	Do.
8	Copper	Arizona, Utah, New Mexico, Montana	Do.
31	Diatomite	California, Nevada, Oregon, Washington	Do.
72	Emery	New York	Do.
84	Epsomite	Washington	Do.
44	Feldspar (crude)	North Carolina, Colorado, South Dakota, New Hampshire	North Carolina, New Hampshire, Colorado, South Dakota.
26	Fluorspar	Illinois, Kentucky, New Mexico, Utah	Illinois, Kentucky, New Mexico, Colorado.
54	Garnet (abrasive)	New York, Idaho	Rank same as for quantity.
60	Gem stones	Not available	Oregon, California, Texas, Washington.

15	Gold (in ores, etc.)	South Dakota, Utah, California, Nevada	Rank same as for quantity
61	Graphite:		
	Amorphous	Rhode Island	Do.
	Crystalline	Texas, Alabama	Do.
21	Gypsum (crude)	Michigan, New York, Texas, Iowa	Do.
53	Helium	Texas	Do.
50	Iodine	California	Do.
4	Iron ore (usable)	Minnesota, Michigan, Alabama, Utah	Minnesota, Michigan, Alabama, New York.
57	Kyanite	Virginia, South Carolina	Rank same as for quantity.
11	Lead (in ores, etc.)	Missouri, Idaho, Utah, Colorado	Do.
14	Lime (open-market)	Ohio, Pennsylvania, Missouri, Virginia	Ohio, Pennsylvania, Missouri, Illinois.
59	Lithium minerals	South Dakota, California, New Mexico, Maine	California, South Dakota, New Mexico, Maine.
41	Magnesite (crude)	Washington, Nevada, California	Rank same as for quantity.
40	Magnesium chloride (for magnesium metal)	Texas	Do.
30	Magnesium compounds from sea water and brines (except for metal).	California, Michigan, New Jersey	Michigan, California, New Jersey.
33	Manganese ore	Montana, New Mexico, Arkansas, Arizona	Rank same as for quantity.
37	Manganiferous ore	Minnesota, Michigan, New Mexico, Nevada	Do.
48	Manganiferous residuum	New Jersey	Do.
	Marl:		
69	Calcareous	Michigan, Virginia, Wisconsin, Indiana	Michigan, Virginia, Nevada, Indiana.
68	Greensand	New Jersey	Rank same as for quantity.
65	Mercury	California, Nevada, Oregon	Do.
47	Mica	North Carolina, Georgia, Arizona, South Dakota	North Carolina, Georgia, Arizona, Pennsylvania.
	Scrap	do	Do.
	Sheet	North Carolina, Georgia, New Hampshire, South Dakota	North Carolina, New Hampshire, Georgia, South Dakota.
20	Molybdenum (in ores and concentrates)	Colorado, Utah, New Mexico, Arizona	Rank same as for quantity.
6	Natural gas	Texas, Louisiana, California, Oklahoma	Texas, California, Louisiana, West Virginia.
5	Natural-gas liquids:		
	Natural gasoline and cycle products	Texas, California, Louisiana, Oklahoma	Rank same as for quantity.
	LP-gases	Texas, California, Oklahoma, Louisiana	Do.
73	Olivine	North Carolina, Washington	Do.
52	Peat	New Jersey, Florida, Ohio, Michigan	Ohio, New Jersey, Michigan, Florida.
58	Perlite (crude)	Nevada, New Mexico, Oregon, Colorado	Nevada, New Mexico, Colorado, Oregon.
1	Petroleum (crude)	Texas, California, Louisiana, Oklahoma	Rank same as for quantity.
17	Phosphate rock	Florida, Tennessee, Idaho, Montana	Florida, Tennessee, Montana, Idaho.
79	Platinum-group metals (crude)	California	Rank same as for quantity.
18	Potassium salts	New Mexico, California, Utah, Michigan	Do.
43	Pumice and pumicite	New Mexico, California, Idaho, Oregon	New Mexico, California, Oregon, Idaho.
38	Pyrites	Tennessee, Virginia, Montana, California	Tennessee, Virginia, California, Montana.
83	Quartz crystal	Utah	Rank same as for quantity.
55	Quartz from pegmatites and quartzite	Washington, North Carolina, Connecticut, California	Washington, Connecticut, North Carolina, California.
16	Salt (common)	Michigan, New York, Ohio, Louisiana	Michigan, New York, Louisiana, Kansas.
9	Sand and gravel	California, Michigan, New York, Wisconsin	California, New York, Pennsylvania, Michigan.
32	Sand and sandstone (ground)	Illinois, New Jersey, West Virginia, Ohio	Illinois, West Virginia, New Jersey, Ohio.
19	Silver (in ores, etc.)	Idaho, Utah, Montana, Arizona	Rank same as for quantity

TABLE 3.—Minerals produced in continental United States and principal producing States in 1950—Continued

Rank in value	Mineral	Principal producing States: In order of quantity	Principal producing States: In order of value
24	Slate	Pennsylvania, Vermont, New York, Georgia	Pennsylvania, Vermont, New York, Virginia.
29	Sodium carbonate (natural)	California, Wyoming	Rank same as for quantity.
45	Sodium sulfate (natural)	California, Texas, Wyoming	Do.
7	Stone	Pennsylvania, Ohio, Michigan, Illinois	Pennsylvania, Ohio, Illinois, Indiana.
12	Sulfur (Frasch-process)	Texas, Louisiana	Rank same as for quantity.
75	Sulfur ore for direct agricultural use	California, Nevada, Wyoming, Colorado	Do.
25	Talc, pyrophyllite and ground soapstone	New York, North Carolina, California, Vermont	New York, California, North Carolina, Vermont.
78	Tin (in ores and concentrates)	Colorado	Rank same as for quantity.
	Titanium concentrates:		
35	Ilmenite	New York, Florida, Virginia, North Carolina	Do.
67	Rutile	Florida	Do.
51	Tripoli	Missouri, Illinois, Pennsylvania	Do.
27	Tungsten concentrates	California, North Carolina, Nevada, Idaho	Do.
46	Vermiculite	Montana, South Carolina, North Carolina, Wyoming	Do.
80	Wollastonite	New York	Do.
10	Zinc (in ores, etc.)	Idaho, Montana, Arizona, New Jersey	Idaho, Montana, New Jersey, Arizona.
56	Zirconium concentrates	Florida	Rank same as for quantity.

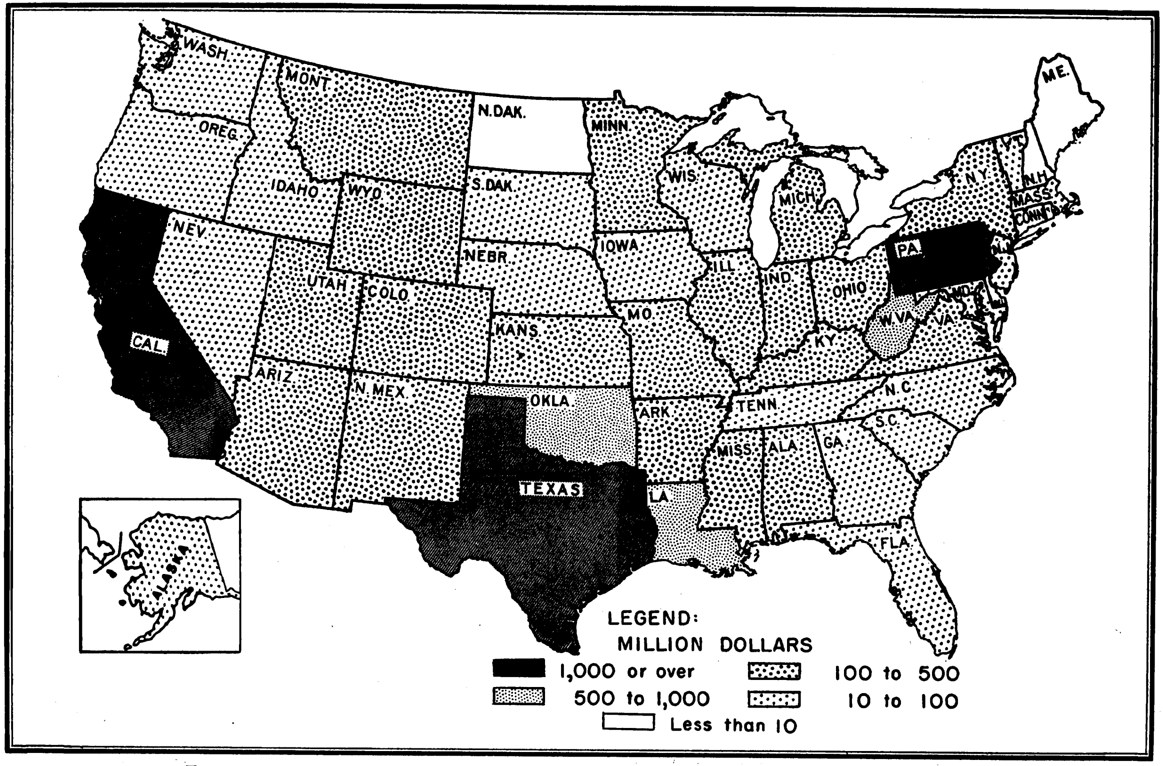

FIGURE 3.—Value of mineral production in continental United States and Alaska, 1950, by States.

TABLE 4.—Value of mineral production in continental United States, 1947–50, by States, in thousands of dollars, and principal minerals produced in 1950

State	1947	1948	1949	1950			
				Value	Rank	Percent of U. S. total	Principal minerals in order of value
Alabama	158,275	183,797	143,905	158,975	18	1.34	Coal, iron ore, cement, stone.
Arizona	186,092	200,382	181,094	207,406	15	1.75	Copper, zinc, lead, silver.
Arkansas	90,857	122,089	109,523	118,642	22	1.00	Petroleum, coal, bauxite, stone.
California	843,413	1,146,410	1,075,612	1,056,047	3	8.91	Petroleum, natural-gas liquids, natural gas, cement.
Colorado	102,448	128,861	139,858	154,897	20	1.31	Petroleum, molybdenum, coal, zinc.
Connecticut	3,863	4,484	4,887	5,675	45	.05	Stone, sand and gravel, lime, clays.
Delaware	340	403	335	522	48		Sand and gravel, stone, clays.
District of Columbia	61	64	63	60	49		Clays.
Florida	45,847	53,654	55,018	67,717	28	.57	Phosphate rock, stone, cement, sand and gravel.
Georgia	32,009	36,103	35,508	44,157	32	.37	Clays, stone, cement, sand and gravel.
Idaho	66,822	79,128	64,292	79,077	27	.67	Lead, zinc, silver, sand and gravel.
Illinois	425,380	521,038	449,894	488,144	7	4.12	Coal, petroleum, stone, cement.
Indiana	133,862	161,950	141,025	166,632	17	1.41	Coal, petroleum, cement, stone.
Iowa	31,023	35,955	37,458	41,773	33	.35	Cement, stone, coal, sand and gravel.
Kansas	265,061	361,160	337,162	368,614	9	3.11	Petroleum, natural gas, cement, stone.
Kentucky	426,101	504,080	372,229	459,956	8	3.88	Coal, petroleum, natural gas, stone.
Louisiana	404,779	604,198	631,813	693,607	5	5.85	Petroleum, natural-gas liquids, natural gas, sulfur.
Maine	5,784	8,094	6,742	7,461	44	.06	Cement, stone, sand and gravel, slate.
Maryland	23,291	25,002	20,461	22,725	37	.19	Sand and gravel, cement, stone, coal.
Massachusetts	10,576	12,583	12,449	16,014	40	.13	Stone, sand and gravel, lime, clays.
Michigan	166,634	202,885	201,260	229,862	12	1.94	Iron ore, petroleum, cement, salt.
Minnesota	218,374	267,248	257,540	331,567	10	2.80	Iron ore, sand and gravel, stone, cement.
Mississippi	67,644	119,317	103,711	102,945	25	.87	Petroleum, natural gas, natural-gas liquids, clays.
Missouri	103,928	108,291	111,293	113,191	23	.95	Lead, cement, stone, coal.
Montana	87,735	103,841	98,070	103,389	24	.87	Copper, petroleum, zinc, manganese.
Nebraska	6,704	8,385	10,102	14,022	41	.12	Cement, petroleum, sand and gravel, stone.
Nevada	40,926	42,503	37,372	48,499	30	.41	Copper, gold, zinc, lead.
New Hampshire	1,254	1,331	1,384	1,711	46	.01	Sand and gravel, stone, feldspar, beryllium.
New Jersey	38,433	44,388	38,584	46,391	31	.39	Zinc, stone, sand and gravel, iron ore.
New Mexico	157,548	220,080	198,825	210,294	14	1.77	Petroleum, potassium salts, copper, natural-gas liquids.

New York	122,333	143,623	138,493	156,529	19	1.32	Cement, iron ore, stone, sand and gravel.
North Carolina	16,386	18,231	19,755	26,343	36	.22	Stone, sand and gravel, tungsten, talc, pyrophyllite and ground soapstone.
North Dakota	6,258	8,478	8,818	9,614	43	.08	Coal (lignite), sand and gravel, stone, natural gas.
Ohio	244,444	284,816	242,080	274,572	11	2.32	Coal, stone, lime, cement.
Oklahoma	354,387	506,846	484,264	527,095	6	4.45	Petroleum, natural-gas liquids, natural gas, coal.
Oregon	15,865	23,923	21,845	21,542	38	.18	Sand and gravel, cement, stone, diatomite.
Pennsylvania	1,248,817	1,386,960	1,035,970	1,186,212	2	10.01	Coal, cement, petroleum, stone.
Rhode Island	785	1,450	929	1,425	47	.01	Stone, sand and gravel, graphite.
South Carolina	7,589	8,885	9,026	11,394	42	.10	Clays, stone, cement, vermiculite.
South Dakota	23,590	24,327	26,723	32,716	35	.28	Gold, stone, sand and gravel, clays.
Tennessee	79,941	93,599	77,333	89,694	26	.76	Coal, cement, stone, zinc.
Texas	1,945,634	2,830,283	2,379,793	2,673,950	1	22.55	Petroleum, natural-gas liquids, natural gas, sulfur.
Utah	206,015	204,459	177,825	229,956	13	1.94	Copper, coal, gold, molybdenum.
Vermont	14,717	15,999	17,384	18,563	39	.16	Stone, slate, asbestos, copper.
Virginia	130,296	143,333	116,408	137,806	21	1.16	Coal, stone, cement, sand and gravel.
Washington	38,051	48,928	40,863	49,055	29	.41	Cement, sand and gravel, coal, stone.
West Virginia	857,670	1,012,402	718,119	829,624	4	7.00	Coal, natural gas, petroleum, stone.
Wisconsin	34,491	37,108	35,878	41,693	34	.35	Stone, sand and gravel, iron ore, cement.
Wyoming	117,395	172,004	150,998	177,577	16	1.50	Petroleum, coal, natural-gas liquids, clays.
Total	9,610,000	12,273,000	10,580,000	11,855,000	--------	100.00	Petroleum, coal, cement, iron ore.

[1] New basis, except that for lack of sufficient data the value of heavy clay products for the years shown here has not been replaced by that of the raw clays used in such products.

TABLE 6.—Mineral production in continental United States, 1947–50, by States and individual minerals

ALABAMA

Mineral	1947		1948		1949		1950	
	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)
Cement [1] ... thousands of 376-pound barrels	9,510	16,664	9,949	20,140	9,394	20,321	10,575	23,176
Clays (except for cement) ... thousand short tons	853	955	956	1,076	857	934	993	1,045
Coal ... do	19,048	104,303	18,801	115,535	12,934	79,188	[2] 14,422	[2] 88,343
Iron ore (usable) ... thousand long tons, gross weight	7,208	23,437	8,024	32,544	7,314	27,553	7,402	28,933
Lime (open-market) ... short tons	345,160	2,727	388,197	3,275	359,446	3,203	389,071	3,578
Manganese ore (35 percent or more Mn) ... short tons, gross weight							138	(3)
Natural gas ... million cubic feet							2	(4)
Peat ... short tons			2,034	12				
Petroleum (crude) ... thousands of 42-gallon barrels	396	(3)	466	(3)	462	(3)	[2] 735	(3)
Sand and gravel ... thousand short tons	3,400	2,272	3,619	2,406	3,297	2,268	3,616	2,464
Stone (except for cement and lime) ... do	2,795	4,625	2,476	4,482	2,637	6,040	2,588	6,038
Undistributed: Native asphalt, bauxite, puzzolan cement, graphite, mica (1947), and minerals whose value must be concealed for particular years (indicated in appropriate column by footnote reference 3)		3,292		4,327		4,398		5,398
Total Alabama		158,275		183,797		[5] 143,905		158,975
Clays sold or used for cement ... thousand short tons	282	141	304	184	328	202	357	268
Coke ... do	5,870	47,087	6,015	57,612	5,161	55,493	5,833	64,332
Ferro-alloys ... short tons	132,603	15,030	129,615	16,817	99,268	14,276	165,002	23,403
Iron, pig ... thousand short tons	3,928	110,437	3,981	145,359	3,665	131,162	4,307	167,984

1 Excludes puzzolan cement, value for which is included with "Undistributed."
2 Final figure. Supersedes preliminary figure given in commodity chapter.
3 Value included with "Undistributed."
4 Less than $500.
5 Revised figure.
6 Less than 0.5 ton.
7 Sales in 1948 included with 1949.
8 "Commercial." Value of "Noncommercial" included with "Undistributed."
9 Excludes certain stone included with "Undistributed."
10 Bureau of Mines not at liberty to publish.
11 Less than 500 troy ounces.
12 Excludes natural cement, value for which is included with "Undistributed."
13 Weight not recorded.
14 "Noncommercial." Value of "Commercial" included with "Undistributed."
15 Value reported for zinc in New Jersey is estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
16 Less than 500 short tons.
17 Except clays sold or used for cement.
18 Less than 500 barrels.
19 Quantity not available.

Employment and Injuries in the Mineral Industries[1]

By Seth T. Reese

GENERAL SUMMARY

EMPLOYMENT in the mineral industries in 1950 declined to an average daily labor force of 711,947 or approximately 1.6 percent. Mineral plants were worked 20 days more than in 1949. The increased number of working days accounted for the 8-percent gain in total man-hours worked. At mineral plants in 1950, a shift of 7.88 hours was worked by the average employee, the same as in 1949. For a man-year in the industries the average hours worked in 1950 increased 154. Decreases at coal and metal mines and at metallurgical plants largely accounted for the lower rate of operating activity of the industries with respect to employment. Slight increases in employment were made in nonmetal mines and in stone quarries; at coke plants employment was steady.

The injury record of the mineral industries improved slightly in 1950, although 72 more men were killed than during the preceding year and the total nonfatal injuries increased 1,674. In 1949 the frequency rate for all injuries, including fatalities, was 44.71, and in 1950 this rate was 42.86 per million man-hours of exposure. This decrease is accounted for by the 8-percent increase in total man-hours worked. The fatality frequency rate increased 0.01 and the nonfatal rate per million man-hours of exposure decreased 1.86, or slightly over 4 percent. The fatality frequency rate (0.66) was the second lowest since complete injury data were made available in 1930, and the nonfatal rate of 42.20 was lower than in any year for which injury statistics are available.

For the second straight year there was no major disaster (a single accident in which five or more men are killed), and the record in this respect made in 1949 was continued.

Fatality experience improved in coal mines and stone quarries. At coke plants, metal and nonmetal mines, and metallurgical plants, the trends were reversed. The greatest reversal was at nonmetal mines, where the rate increased 89 percent, considerably more than the increase in man-hours worked.

---

[1] Data on petroleum, natural-gas, sand and gravel, and clay industries and on iron-smelting and steel industries are excluded from this chapter.

TABLE 1.—Salient statistics of employment and injury experience in the mineral industries in the United States, 1946–50, by industry groups

	1946	1947	1948	1949	1950 [1]
Average number of men working daily: [2]					
Coal mines	463,079	490,356	507,333	485,306	476,800
Metal mines	65,234	71,228	71,436	71,664	69,700
Nonmetal mines (except stone quarries)	11,312	12,176	11,950	12,077	12,100
Stone quarries	70,265	75,245	77,344	82,209	83,000
Coke plants	21,410	23,705	25,157	24,471	24,347
Metallurgical plants	44,954	49,082	47,768	47,663	46,000
Total	676,254	721,792	740,988	723,390	711,947
Average number of active mine-days: [3]					
Coal mines	224	239	227	170	193
Metal mines	249	275	282	252	271
Nonmetal mines (except stone quarries)	291	292	287	277	291
Stone quarries	274	279	284	275	273

Metallurgical plants	.20	.17	.12	.21	.23
Total	.86	.94	.84	.65	.66
Nonfatal:					
Coal mines	62.92	60.72	59.53	55.11	51.94
Metal mines	56.32	52.81	47.25	48.07	45.01
Nonmetal mines (except stone quarries)	50.94	45.40	42.33	41.75	40.64
Stone quarries	32.40	32.00	27.88	26.48	25.37
Coke plants	14.04	14.01	13.10	11.42	11.84
Metallurgical plants	27.48	26.32	22.71	22.90	22.62
Total	53.74	51.41	48.67	44.06	42.20

[1] Preliminary figures based on an average of 80 percent coverage.

Except at coke plants, the nonfatal injury record improved in all major mineral industries. The greatest improvement was at coal mines, with metal mines a close second.

Work Stoppages.—The mineral industries in 1950 were affected by 531 work stoppages, 38 more than in 1949, and resulted in a loss of 80,000 man-days at anthracite mines, 9,320,000 man-days at bituminous-coal mines, and 235,000 man-days at metal mines. At nonmetal mines and in quarries, 22 work stoppages caused a loss of 64,000 man-days, and the 24 work stoppages at cement mills, coke and coke-byproducts plants, and petroleum refineries resulted in an aggregate loss of 697,000 man-days.

The over-all loss due to work stoppages in all branches of the mineral industries in 1950 totaled 10,396,000 man-days or 46 percent less than in 1949.

Average Earnings.—In each of the mineral industries for which data are published by the Bureau of Labor Statistics the average hourly earnings increased in 1950 compared with 1949, and the average weekly earnings had the same favorable trends. The average weekly earnings were higher in 1950 than in 1949, and, except in anthracite and bituminous-coal mines, they were higher than in 1948.

Labor Turn-Over.—As in 1949, the labor turn-over in the mineral industries was highest in metal mining and lowest in petroleum refining, according to data published by the Bureau of Labor Statistics. Unlike 1949, the separation rates of labor turn-over in 1950 were lower than the accession rates in 1949, except in bituminous-coal mining. The anthracite-mining and petroleum-refining rates remained stable.

NATIONAL SAFETY COMPETITION

The National Safety Competition, conducted annually by the Bureau of Mines, attained the second lowest injury-severity rate in its 26-year history. The over-all injury experience at the 575 enrolled mineral operations was 5.87 days of disability per thousand man-hours of exposure to hazard and a frequency rate of 33.17 per million man-hours, the second lowest in the history of the competition and only slightly above the all-time record of 33.02 in 1940. Of the enrolled mines and quarries, 177 attained injury-free records. The 575 enrolled mineral operations worked nearly 150 million man-hours. The National Safety Competition is designed to promote safety in the mineral industries of the United States. It provides, at plant level, the opportunity for management and labor to cooperate in a program intended to increase the effectiveness of accident-prevention work in mines and quarries. Trophy awards for the best safety records in each of the six groups of the 1950 competition were made to the following:

Anthracite Underground Mines.—The Birdseye mine of The Hudson Coal Co., Throop, Pa.

Bituminous-Coal Mines.—The Reliance No. 7 mine of The Union Pacific Coal Co., Reliance, Wyo.

Metal Underground Mines.—The Tobin mine of the Republic Steel Corp., Crystal Falls, Mich.

Nonmetal Underground Mines.—The Barberton limestone mine of the Pittsburgh Plate Glass Co., Barberton, Ohio.

Open-Pit Mines.—The Embarrass mine of Pickands Mather & Co. (Lake Mining Co.), Biwabik, Minn.

Quarries.—The Rogers City quarry of the Michigan Limestone & Chemical Co., Rogers City, Mich.

COAL MINES

The safety record at coal mines in the United States in 1950 was better than in any year since 1930, when complete injury data were first available and compiled. The tentative frequency rate—52.84 injuries (fatal and nonfatal) per million man-hours of worker exposure—represented a decrease from 56.02 in 1949 and was 12.3 percent lower than the previous record for the coal industry established in 1944. The frequency rates in both anthracite and bituminous coal contributed to this improved performance.

The total number of fatalities (642) in 1950, which was bettered only by the total number in the preceding year, was the second-lowest annual total for the last 20 years. The total number of nonfatal injuries in 1950 is estimated at 37,235, a 5-percent increase over 1949. However, as exposure time increased about 12 percent in 1950, the over-all safety record (fatal and nonfatal) improved. This is the second calendar year since 1910, when complete disaster records first were made available, that the entire industry operated without a major disaster.

The average number of men working daily at coal mines decreased 2 percent to 476,800 in 1950. The mines were active an average of 193 days, an increase of 23 days compared with 1949. In 1950 the average coal-mining employee worked a 7.78-hour shift and accumulated 1,504 hours of work, 180 hours or 14 percent more than in 1949.

Bituminous-Coal Mines.—In 1950 the safety record of the bituminous-coal industry was better than in any year since 1930, when complete injury records first became available. The tentative rate of 48.76 injuries (fatal and nonfatal) per million man-hours of exposure was 7 percent lower than the 52.60 rate for 1949 and 15 percent less than the previous best record of 57.25 injuries per million man-hours in 1944. The fatality rate of 0.93 was identical with the 1949 rate, the best on record. Thus, in 1950 and for the second time since 1930 the fatality rate was less than 1 per million man-hours of exposure.

The estimated 28,380 nonfatal injuries, although 832 more than the 1949 total, resulted in a 7-percent decline in the frequency rate because of a corresponding percentage increase in man-hours of exposure. The 1950 frequency rate (47.83) was the lowest since 1930, when accurate injury data were first made available.

At bituminous-coal mines 475 fatalities occurred underground, 41 on the surface, and 34 in strip-pit operations. The 475 men killed in underground workings represented a 12-percent increase over the 425 killed in 1949. Falls of roof and face continued to be the leading cause of all underground fatalities and increased by 41 over 1949 to a total of 319. Accidents in underground haulage increased to 105 from 94 in 1949 and were second to roof falls in accident importance. Other underground fatalities in 1950 were charged to the following classifications: Machinery, 14; electricity, 13; explosives, 10; minor gas explosions, 3; and miscellaneous, 11.

Employment at bituminous-coal mines decreased 7,431 to an average of 402,000 men working daily in 1950. The mines were active 187 days, or 22 more than in 1949, and the total man-hours

TABLE 4.—Employment and injury experience at coal mines in the United States, 1946–50

[1] Includes lignite.

worked increased slightly over 60,000,000. The average worker had a 7.88-hour shift and accumulated 1,476 work hours in the year, an increase of 174 over 1949.

Anthracite Mines.—The injury experience in Pennsylvania anthracite mines was better in 1950 than in any year since 1930. The tentative frequency rate (fatal and nonfatal) per million man-hours of exposure was 72.47. Although the estimated number of fatalities in 1950 exceeded the 1949 total by one, the frequency rate (0.75) was the lowest on record for the industry. This decreased rate resulted from a 13-percent increase in the total number of man-hours worked in 1950. For the third successive year, there were no major disasters in the anthracite mines. In all, 8,855 nonfatal injuries occurred, at a rate of 71.72 per million man-hours of exposure. This rate was also the lowest attained in the accident-statistics history of the industry.

At anthracite mines 77 men were killed underground, 9 on the surface, and 6 in strip mining. Falls from roof and face caused 58 fatalities, an increase of 4 over 1949. Fatalities from haulage accidents were less by 4, but the number of men killed in minor gas explosions and by explosives, electricity, and miscellaneous causes increased from 7 in 1949 to 11 in 1950. Fatalities in surface works took 4 more lives in 1950 than in 1949, and twice as many strip-pit employees were killed.

The daily average number of men working in the anthracite mines during 1950 declined slightly over 1,000, but the mines were active 30 days more than in 1949. The aggregate worktime in the industry increased to 123,470,000 hours, a gain of 13 percent. A working shift averaged 7.31 hours, and the average employee worked a total of 1,651 hours, 210 hours more than in 1949.

METAL MINES

Injury experience at metal mines during 1950 improved, although there were 18 more fatalities than in 1949. The tentative frequency rate (fatal and nonfatal) was 45.59 per million man-hours of exposure, a 6-percent decline compared with the frequency rate for 1949. The total number of fatalities was greater in each group of mines, except at iron mines, where 21 men were killed in each comparable period. Nonfatal injuries continued to decrease in number, and in 1950 were less than in any of the four preceding years. Improvements at iron and lead-zinc mines and at gold placers more than offset the less favorable experience in other metal-mine groups.

Except at iron mines, the average number of men working daily at metal mines decreased in each group. The aggregate time worked increased 4 percent to 150,860,000 man-hours. This was due primarily to an 8-percent increase in the average number of active mine days

TABLE 5.—Employment and injury experience at metal mines in the United States, 1946–50, by industry groups

Industry and year	Men working daily	Average active mine days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours

[1] Includes antimony, bauxite, chromite, cobalt, manganese, mercury, molybdenum, pyrite, titanium, tungsten, and vanadium-uranium mines.

worked. The average length of shift for all metal-mines was 7.99 or equal to that in 1949. However, because of the increased average number of active working days, the average metal-mine employee accumulated 2,164 hours for the year, or 149 hours more than in 1949.

Iron Mines.—The safety record at iron mines continued to improve, although the number of fatalities was identical with that in 1949. The frequency rate for the 21 fatalities in 1950 was 0.35, or 8 percent lower than in 1949. The total number of nonfatal injuries dropped to 1,095 for a frequency rate of 18.40 per million man-hours of exposure. Employment was stable; and, as the mines were active 18 more days, the total worktime increased 7 percent over 1949. The average iron-mine employee worked an 8.00-hour shift and accumulated 2,141 hours, or 147 hours more than in 1949.

Copper Mines.—Injury experience at copper mines in 1950 showed a rise in the fatality frequency rate but an improved nonfatal rate. An increase of five in the number of fatalities caused an increase in frequency rate to 0.47 per million man-hours of exposure, or 27 percent higher than the 1949 rate. The number of nonfatal injuries increased 25, but the increase in working time had the effect of reducing the frequency rate. Although the average number of employees working daily decreased slightly in 1950, 29 more days were worked, increasing the worktime 9 percent over 1949. The average worker had a 7.96-hour work shift and an aggregate of 2,387 hours, or 220 hours more than in 1949.

Lead-Zinc Mines.—The fatality record at lead-zinc mines in 1950 was poor. The frequency rate was 1.03 per million man-hours of exposure, or 36 percent over the 1949 rate of 0.76. The nonfatal frequency rate improved to 83.58, or 6 percent below that of the preceding year. Employment decreased 10 percent, but the average worktime was not similarly affected because the average number of active mine days increased 8 percent. The average length of shift—8.03 hours—enabled the average worker to accumulate 2,104 hours, an increase of 161 hours over 1949.

Gold-Silver Lode Mines.—The safety record at gold-silver lode mines was worse than in 1949. The fatality frequency rate increased to 0.93 or 10 percent and the nonfatal rate to 120.37 or 8 percent. This latter rate was higher than the rates in the four preceding years. Employment remained stable, and there was only a slight increase—5 days—in the active mine worktime. The average worker had a 7.75-hour shift and accumulated 2,038 hours, or 32 more than in 1949.

Gold Placer Mines.—For the second successive year, there were no fatalities at gold placers. The total of 140 nonfatal injuries in 1950 was 47 less than in 1949, or a reduction of 25 percent, and the frequency rate of 23.97 injuries per million man-hours of exposure was a 22-percent decrease from that in 1949. The mines were slightly less active than in the preceding year, with the average number of men working daily decreasing by 123 and the total mine days by 2. The average employee had a 8.02-hour shift and accumulated 1,718 hours, or 10 hours less than in 1949.

Miscellaneous Metal Mines.—Injury experience at miscellaneous metal mines was worse in 1950 than in 1949. There were 4 more fatal and 50 more nonfatal injuries. The fatality frequency rate of 1.03 was 194 percent greater than in 1949, and the nonfatal frequency rate of 78.31 was 11 percent greater. The average number of men working daily decreased by 80, but 10 days more were worked. An average employee in this group had an 8.08-hour shift and accumulated 2,235 hours, or 94 more than in 1949.

NONMETAL MINES (EXCEPT STONE QUARRIES)

The injury experience in this group, which includes barite, feldspar, fluorspar, gypsum, magnesite, mica, phosphate rock, rock salt, sulfur, and miscellaneous nonmetallic operations, was not favorable in 1950. The fatality frequency rate of 0.70 almost doubled the 1949 rate, and that for nonfatal injuries decreased, although slightly, over the rate of 41.75 in 1949. The average number of active mine-days increased by 14, with a corresponding increase in the total number of man-hours worked. The average employee at mines in this group had an 8.10-hour shift, and accumulated 2,359 hours, or 128 more than in 1949.

TABLE 6.—Employment and injury experience at nonmetal mines (except stone quarries) in the United States, 1946–50 [1]

Year	Men working daily	Average active mine-days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours	
					Fatal	Nonfatal	Fatal	Nonfatal
1946	11,312	291	3,296,626	26,876,871	26	1,369	0.97	50.94
1947	12,176	292	3,554,901	28,809,150	12	1,308	.42	45.40
1948	11,950	287	3,432,304	27,784,119	15	1,176	.54	42.33
1949	12,077	277	3,340,482	26,948,124	10	1,125	.37	41.72
1950 (preliminary)	12,100	291	3,525,000	28,540,000	20	1,160	.70	41.75

[1] Includes barite, feldspar, fluorspar, gypsum, magnesite, mica, phosphate rock, rock salt, sulfur, and miscellaneous nonmetallic-mineral mines.

STONE QUARRIES

Injury experience in the quarrying industries was slightly better in 1950 than in 1949. The 42 fatal injuries during the year occurred at the rate of 0.23 per million man-hours, a 36-percent decrease from 1949. The number of nonfatal injuries declined 166 to 4,660 during 1950. The nonfatal-injury frequency rate of 25.37 was 4 percent lower than in 1949.

The average number of men working daily during 1950 advanced 1 percent to 83,000; they worked an aggregate of 183,660,000 man-hours. The average length of shift rose slightly to 8.10 hours in 1950; however, the average employee in the quarry industry worked 2,213 hours compared with 2,217 hours in 1949 because of a slight reduction in the number of active-plant days.

Cement Quarries.—The cement-industry safety record showed an over-all improvement in the frequency rate for all injuries. There was no increase in the number of fatal injuries in 1950 over 1949, as 18 men were fatally injured in both years. The nonfatal injuries declined 62 in number, and the nonfatal injury rate was approximately 10 percent lower than in 1949. Employment of 28,800 men was slightly lower than the number of men working in 1949; also, 3 fewer

[1] Includes burning or calcining and other mill operations.

days were worked, and the average length of shift in 1950 was 7.79 hours against 7.81 for 1949.

Limestone Quarries.—The safety record of limestone operations was much improved in 1950 over 1949. The fatality rate per million man-hours of employment was much lower, as was the actual number of fatalities. A slight improvement in the nonfatal injury rate in 1950 over 1949 was due to a decrease of less than 1 percent in the actual number of nonfatal injuries and a small increase in the number of man-hours worked. The number of men working rose slightly, but each employee had an average of 3 fewer working days in 1950 than in 1949. The average employee worked 1,944 hours during 1950, only 6 more than in 1949. The length of shift worked in 1950 was 8.50 hours compared to 8.37 in the previous year.

Lime Plants.—The number of fatal injuries was reduced, and the fatality rate at lime plants in 1950 decreased 51 percent compared with 1949. The nonfatal rate also improved 11 percent over the previous year. Employment in the lime operations increased, as did the man-hours worked; the average length of shift for the year was 7.81 hours.

Marble Quarries.—Although the average number of men employed and the number of man-hours worked in the marble quarries during 1950 decreased from 1949, the fatal injury record showed a frequency rate of 0.35 per million man-hours worked against a fatality-free year in 1949. However, the nonfatal injury record improved 16 percent over the year 1949. The average employee had an 8.33-hour shift and worked 2,089 hours during the year.

Granite Quarries.—No fatal injuries were reported at granite quarries in 1950. The number of nonfatal injuries, however, did not improve. Instead, it increased approximately 2 percent over 1949. The average number of men working increased 5 percent and the man-hours 4 percent. The average length of shift worked in 1950 was 8.30 hours; and the average employee worked 2,027 hours, a slight decrease from 1949 due to an average of 3 fewer working days.

Traprock Quarries.—The frequency record for fatal injuries improved 33 percent over 1949. The frequency of nonfatal injuries, however, increased to 51.19 in 1950 from a rate of 43.61 in 1949. The number of men working daily was virtually unchanged from 1949, and the number of working days declined by 1 day. The man-hours worked decreased less than 1 percent.

Slate Quarries.—Although employment in slate operations increased in 1950, the injury-frequency rates improved. The fatal rate improved by 69 percent, and the nonfatal rate improved by 19 percent. The man-hours worked increased by 8 percent over 1949, and the average length of shift was 8.67 hours. The average worktime per man per year was 2,300 hours, or 68 hours more than in 1949.

Sandstone Quarries.—The safety record at sandstone operations improved over 1949. No fatal injuries were reported, and the number of nonfatal injuries declined slightly; the frequency rate was 40.67 per million man-hours worked in 1950. The average length of shift was 8.33 hours, and the average hours worked per man was 1,990 in 1950—94 more than in 1949.

COKE PLANTS

Byproduct-Coke Plants.—The nonfatal rate of 8.52 improved 14 percent over 1949. The fatal rate of 0.21 per million man-hours worked, however, was not so favorable, due to an increase of six fatal injuries over 1949. The average number of men working declined, but the number of man-hours worked increased 3 percent, as did the number of days active for the year. The average work-shift in 1950 was 8.02 hours compared with 7.98 in 1949.

Beehive-Coke Plants.—There was one fatal injury in the beehive-coke plants in 1950 and a 100-percent increase in the number of

TABLE 8.—Employment and injury experience at coke plants in the United States, 1946–50

1949	24,471	321	7,860,181	62,445,782	7	713	.11	11.42
1950	24,347	341	8,292,135	65,861,005	14	780	.21	11.84

nonfatal injuries. This increase over 1949 was due to a greater number of active plant days and a 45-percent increase in the number of man-hours worked. The average employee worked a 7.37-hour shift and a total of 1,547 hours—an increase of 459 hours over 1949.

METALLURGICAL PLANTS

The over-all safety record at metallurgical plants did not change materially in 1950. The fatality frequency rate at metal mills was 0.20 per million man-hours of exposure, equal to the 1949 rate, and the nonfatal frequency rate declined to 22.61 from 22.82 in 1949. At nonferrous smelters 4 more fatalities and 51 more nonfatal injuries were charged against the industry than in the preceding year. Employment at metal mills decreased 6 percent, but the average active mill days increased 9 percent. At smelters, respective percentages were 2 and 6. The aggregate man-hours of work in 1950 at metallurgical plants increased 4 percent.

Ore-Dressing Plants.—Injury experience at metal mills in 1950 improved slightly over 1949. The injury frequency rate (fatal and nonfatal) was 22.81, and for the preceding year it was 23.02. The fatality rate decreased at copper and iron mills, and for the second successive year there were no fatalities at lead-zinc and miscellaneous metal mills. The best nonfatal frequency rates were attained at iron and miscellaneous metal mills.

This group includes crushing, screening, washing, jigging, magnetic separation, flotation, and other milling operations on metallic ores. Except at iron and miscellaneous metal mills, the average number of men working daily decreased over-all by 6 percent. The plants were active 24 days more than in 1949, with the result that the man-hours worked in this group rose slightly over 1949. In all groups, except gold-silver and lead-zinc, man-days worked were higher in 1950. The gain in employment at miscellaneous metal mills, so distinctly

marked in 1949 over 1948, continued in 1950, resulting in a 12-percent increase in man-hours worked. The average employee shift in 1950 in ore-dressing plants was 8.01 hours.

Nonferrous Reduction Plants and Refineries.—Iron and steel plants are not included in this group, but it does include reduction plants and refineries that are engaged in primary extraction of nonferrous metals from ores and concentrates and refining of crude primary nonferrous metals.

The over-all injury experience at nonferrous smelters and refineries was more favorable in 1950 than in 1949. The injury frequency rate (fatal and nonfatal) decreased from 23.15 to 22.93. Although fatalities increased by 4 in 1950 and nonfatal injuries by 51, the combined rate was reduced by a 4-percent increase in man-hours worked because of an increase of 18 active smelter days. The fatality frequency rate increased in each group except copper, where fatalities were cut almost in half. The nonfatal frequency rate decreased at copper and zinc smelters. Employment declined slightly at each group of smelters except at the miscellaneous metal smelter. Plants in each group were active more days than in 1949, and the total man-hours worked in each group increased materially, except at lead smelters. The average employee working shift was 8.02 hours.

PART II. COMMODITY REVIEWS

Abrasive Materials

By Henry P. Chandler and G. E. Tucker

GENERAL SUMMARY

THE year 1950 was one of increased activity in almost all branches of the abrasives industry, with nearly all abrasive materials showing a marked increase in tonnage and value. New records were made in the production of tripoli, ground sand and sandstone, pumice and pumicite, and garnet. Total production of crude artificial abrasives in the United States and Canada increased 17 percent in tonnage and 30 percent in value.

Imports of industrial diamonds increased 100 percent in total value and 72 percent by weight, the 1950 importation being the largest since 1944. Imports of corundum increased 76 percent in tonnage and 4 percent in value.

TABLE 1.—Salient statistics of the abrasives industries in the United States, 1949–50

	1949		1950		Percent of change	
	Short tons	Value	Short tons	Value	Short tons	Value
Natural abrasives (domestic) sold or used by producers:

[1] Average annual figure for 1948–50 was 240,890 short tons valued at $6,153,780; annual data not published separately in this case to avoid disclosing individual company operations.
[2] Tonnage not recorded.
[3] Less than 0.5 percent.
[4] Includes Canadian production.
[5] Revised figure.

This chapter includes data for most materials used for abrasive purposes, but certain clays, carbides, oxides, and other substances noted later under Miscellaneous Mineral-Abrasive Materials are not included in the statistics shown herein. Certain abrasive products for which figures are given also have important nonabrasive uses.

NATURAL SILICA ABRASIVES

Diatomite.—The production of diatomite continued to increase during 1950. To avoid disclosing individual company operations, the Bureau of Mines, in this case, does not publish the annual data separately; however, the average production for the 3 years 1948–50 was 240,890 short tons valued at $6,153,780, compared with 213,590 short tons valued at $4,307,100 for 1945–47, an increase of 13 percent by weight and 43 percent in value.

During 1950 diatomite was produced for sale in four States—California, Nevada, Oregon, and Washington. Increases in production were reported from three of these States. A small amount of crude material was mined in Utah.

The principal uses for which diatomite was consumed during 1950 were: Filtration, 57 percent; fillers, 28 percent; insulation, 8 percent; and other uses, including abrasives, 7 percent.

The plant of the Johns-Manville Co. near Lompoc, Calif., was enlarged in 1950.

As quoted in E&MJ Metal and Mineral Markets, prices of diatomite during 1950 continued unchanged from the previous year as follows (per ton, crude, in bulk, dried, nominal): Nevada, f. o. b. mill, 98- to 100-mesh, $25; low-temperature insulation, $25; high-temperature insulation, $40; fine abrasive, 2 to 3 cents a pound (bags extra); California, filtration grades, $20 to $50 f. o. b. mill.

Diatomaceous earth as a substitute for cinders in the manufacture of lightweight concrete and building blocks received special attention.[1] The use of diatomaceous earth as a catalyst in low-temperature hydrogen production was described.[2] Diatomaceous earth for filtering swimming-pool water is gaining in favor.[3] An article on the production of diatomite in Kenya, British East Africa, describing the character of the ore, mining conditions, and method of treatment, was published.[4]

Tripoli.—The sales of tripoli, amorphous silica, and rottenstone totaled 43,720 tons valued at $1,173,647 in 1950, an increase of 71 percent in tonnage and 70 percent in value over 1949. It was produced in Illinois, Missouri, and Pennsylvania.

The use of tripoli as an abrasive increased some 66 percent in 1950 over 1949. The other uses—for fillers, foundry facing, etc.—also increased materially.

---

Companies producing tripoli, amorphous silica, and rottenstone in 1950 were: Ozark Minerals Co., Cairo, Ill. (amorphous silica); Tamms Industries, Inc., 228 North LaSalle St., Chicago 1, Ill. (amorphous silica); American Tripoli Corp., Seneca, Mo., mine in Oklahoma, mill in Missouri (tripoli); Penn Paint & Filler Co., Antes Fort, Pa. (rottenstone); and Keystone Filler & Mfg. Co., Muncy, Pa. (rottenstone).

TABLE 2.—Tripoli [1] sold or used by producers in the United States, 1944–47, and 1948–50, by uses

Year and use	Short tons	Value	Year and use	Short tons	Value
1944	18,425	$301,863	1949: Abrasives	20,972	$587,241
1945	18,247	306,829	Filler	2,820	53,938
1946	28,955	549,099	Foundry facing, etc.	1,733	49,385
1947	34,578	751,422	Total	25,525	690,564
1948: Abrasives	22,193	606,402	1950: Abrasives	34,865	968,497
Filler	2,723	45,000	Filler	6,744	147,379
Foundry facing, etc.	1,929	54,121	Foundry facing, etc.	2,111	57,771
Total	26,845	705,523	Total	43,720	1,173,647

[1] Including amorphous silica and Pennsylvania rottenstone.

The use of tripoli as a mild abrasive and in automobile polishes was described.[5] The appearance of a German tripoli on the United States market was reported.[6]

Quotations on tripoli in E&MJ Metal and Mineral Markets during 1950 increased over the previous year. At the end of the year the following prices were quoted (per short ton, paper bags, minimum carlot 30 tons, f. o. b. Missouri): Once-ground through 40-mesh, rose and cream, $30; double-ground through 110-mesh, rose and cream, $32; air-floated through 200-mesh, $35.

Quotations appearing in Oil, Paint and Drug Reporter: Air-floated in bags, $35 a ton; double-graded, $32 a ton; single-graded, $30; all prices f. o. b. works.

Quartz.—Total sales of crude, crushed, and ground quartz from pegmatite veins or dikes and from quartzite in 1950 increased 49 percent both in tonnage and value compared with 1949. However, neither the tonnage nor value was quite as high as 1948. The principal uses for which the reported tonnage was consumed included glass and ferrosilicon, with smaller quantities for abrasives, filters, pottery, tile, and miscellaneous. The sales of crude quartz were less than in the previous year, but sales of crushed and ground quartz were the largest on record. These do not include sales of quartzite to cement mills and certain sales of quartz or quartzite for use in the manufacture of ferrosilicon.

The average value of the quartz reported in this section was $4.40 per ton in 1950 compared with $4.42 in 1949 and $4.64 in 1948.

TABLE 3.—Quartz (crude, crushed, and ground) sold or used by producers in the United States, 1946–50 [1]

Year	Crude		Crushed		Ground [2]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	38,587	$107,069	29,228	$109,437	5,364	$77,346	73,179	$293,852
1947	21,940	118,231	62,169	170,254	17,208	136,040	101,317	424,525
1948	41,081	250,184	104,496	374,781	16,284	125,702	161,861	750,667
1949	15,816	74,562	72,432	257,213	19,304	143,716	107,552	475,491
1950	11,062	52,591	117,499	430,256	31,947	223,877	160,508	706,724

[1] Does not include sales of quartzite to cement mills or certain sales of quartz or quartzite for use in the manufacture of ferrosilicon.
[2] To avoid duplication, the ground material shown here is only that ground by the original producers of the crude quartz or by grinders who purchase from small miners not reporting their production.

TABLE 4.—Quartz (crude, crushed, and ground)[1] sold or used by producers [2] in the United States, 1948–50, by States

State	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
Arizona, California, Oregon, Washington	91,926	$493,481	51,185	$212,114	[3] 89,290	[3] $318,720
Connecticut			16,225	97,350	27,560	166,810
Massachusetts	792	7,288	577	4,265	2,145	23,646
Other States [4]	69,143	249,898	39,565	161,762	41,513	197,548
Total	161,861	750,667	107,552	475,491	160,508	706,724

[1] To avoid duplication, the ground material included is only that ground by the original producers of the crude quartz or by grinders who purchase from small miners not reporting their production.
[2] Does not include sales of quartzite to cement mills or certain sales of quartz or quartzite for use in the manufacture of ferrosilicon.
[3] Arizona included with "Other States" to avoid disclosure of individual company operations.
[4] Arizona (1950), Maine (1950), Maryland (1948–49), North Carolina, South Dakota (1948), Tennessee (1948), and Wisconsin (1948–49).

Occurrences of quartz in Georgia have been described.[7] Recent discoveries of quartz deposits in the State of Goias, Brazil, have attracted much interest.[8] New quartz deposits containing some large crystals are reported in Burma.[9]

Ground Sand and Sandstone.—The sales of ground sand and sandstone in 1950 increased 23 percent both in tonnage and in value over 1949, making 1950 a record year for these commodities. The average value per ton in 1950 was $8.61 compared with $8.61 and $8.34 in 1949 and 1948, respectively. Illinois, the largest producing State, accounted for 35 percent of the total, with sales that increased 21 percent over 1949. Production from Idaho was noted for the first time. All other States for which data are shown also increased in production, the large producers being New Jersey, West Virginia, Ohio, and Pennsylvania, as in 1949.

[1] Included with "Other States" to avoid disclosure of individual company operations.
[2] California, Missouri, North Carolina (1950), Oklahoma (1949–50), Pennsylvania, Texas (1948), Washington (1949–50), and Wisconsin.

Consumers of ground sand and sandstone in 1950 were the pottery, porcelain, and tile industries (38 percent of the tonnage for which uses were reported), abrasives industries—chiefly cleansing and scouring compounds (21 percent), foundries (13 percent), fillers (11 percent), enamel (4 percent), and other (13 percent); glass sand decreased. The distribution by uses in 1950 was based on reports from companies accounting for 93 percent of the total sales.

TABLE 7.—Ground sand and sandstone sold or used by producers in the United States in 1950, by uses [1]

Use	Short tons	Value	
		Total	Average per ton
Abrasive:			
Cleansing and scouring compound	139,502	$1,170,667	$8.39

Total reported by uses	699,395	6,000,433	8.58

[1] Data represent 93 percent of total sales.

Abrasive Sands.—Considerable tonnages of natural sands with a high silica content are sold for abrasive purposes, such as glass grinding, stone polishing, coating sandpaper, and sand blasting. Sales of these sands in 1950 totaled 1,299,760 short tons valued at $2,670,791 compared with 1,080,886 valued at $2,063,866 in 1949. The 1950 figures include 470,717 tons of blast sand valued at $1,463,623, an increase of 20 percent in quantity and 20 percent in value compared with 1949. Detailed data regarding tonnages produced in each State appear in the Sand and Gravel chapter of this volume.

SPECIAL SILICA-STONE PRODUCTS

Grindstones and Pulpstones.—The sales of grindstones declined slightly in 1950, but those of pulpstones increased. The tonnage of grindstones sold was the lowest on record. Ohio and West Virginia were the only States reporting the manufacture of grindstones, and pulpstones were produced only in Washington.

TABLE 8.—Grindstones and pulpstones sold by producers in the United States, 1946–50

Year	Grindstones		Pulpstones		
	Short tons	Value	Quantity: Pieces	Quantity: Equivalent short tons	Value
1946	11, 605	$501, 444	22	72	$3, 880
1947	10, 620	476, 811	24	76	4, 976
1948	7, 921	402, 667	12	33	2, 100
1949	4, 479	244, 704	7	28	1, 975
1950	4, 435	230, 462	12	33	2, 100

Oilstones and Other Sharpening Stones.—Output of natural sharpening stones increased sharply in 1950 and doubled the 1949 production. The Bureau of Mines is not at liberty to publish the exact figures because of the small number of producers. Producing States in 1950 were: Arkansas—oilstones and whetstones; Indiana—whetstones and rubbing stones; New Hampshire—scythestones; and Ohio—scythestones, whetstones, and rubbing stones (holystones).

Millstones.—The value of millstones increased slightly over 1949. No chasers were reported in 1950. States marketing millstones in 1950 were North Carolina (Rowan County) and Virginia (Montgomery County).

TABLE 9.—Value of millstones and chasers sold by producers in the United States, 1945–50 [1]

Year	Number of producers	Value	Year	Number of producers	Value
1945	4	$15, 018	1948	3	$17, 733
1946	4	14, 780	1949	2	9, 400
1947	4	23, 189	1950	2	11, 300

[1] Produced in Minnesota (1945 only), New York (1945–48), North Carolina, and Virginia.

Grinding Pebbles and Tube-Mill Liners.—The output of grinding pebbles in 1950 decreased both in quantity and value from 1949, but the sale of tube-mill liners increased. The combined output showed very little change from 1949. The States from which grinding pebbles were reported in 1950 were: Minnesota, North Carolina, Texas, Washington, and Wisconsin. Tube-mill liners were produced in Minnesota, North Carolina, and Wisconsin as in 1949.

TABLE 10.—Grinding pebbles and tube-mill liners sold or used by producers in the United States, 1946–50

Year	Grinding pebbles		Tube-mill liners		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1946	4,652	$102,043	2,375	$44,247	7,027	$146,290

1950	1,923	53,007	1,523	62,535	3,446	115,542

NATURAL SILICATE ABRASIVES

Pumice and Pumicite.—The output of pumice and pumicite (volcanic ash) in 1950 showed a slight increase in tonnage and a 12-percent increase in value over 1949. Its use as an aggregate in lightweight concrete continues to be its largest market.

TABLE 11.—Pumice and pumicite sold or used by producers in the United States,[1] 1945–50

Year	Short tons	Value	Year	Short tons	Value
1945	157,011	$1,051,037	1948	607,746	$2,501,906

[1] Included with "Other States" to avoid disclosure of individual company operations.
[2] Alaska (1948), Arizona (1949), Colorado (1950), Kansas, Montana (1948 and 1950), Nebraska (1950), Nevada (1949–50), Oklahoma, Texas, and Utah (1949).

Output of pumice or pumicite in 1950 was reported from 14 States. The largest producing State was New Mexico, with California second. The largest increase was reported from Idaho. Decreases were noted in Oregon and Nebraska. The combined total from New Mexico, California, Idaho, and Oregon represented 95 percent of the total production compared with 94 percent in 1949.

Average values per ton are as follows: 1950, $3.70; 1949, $3.31; and 1948, $4.12.

TABLE 13.—Pumice and pumicite sold or used by producers in the United States, 1948–50, by uses

Use	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
Abrasive:						
Cleansing and scouring compounds and hand soaps	16,005	$245,994	15,926	$188,823	15,362	$198,053
Other abrasive uses	4,508	251,828	8,077	320,017	12,214	410,243
Acoustic plaster	3,612	109,498	10,018	182,990	6,662	151,766
Concrete admixture and concrete aggregate	559,697	1,665,727	672,592	1,559,587	672,125	1,750,269
Other uses [1]	23,924	228,859	10,129	117,665	12,993	150,721
Total	607,746	2,501,906	716,742	2,369,082	719,356	2,661,052

[1] Insecticide, insulation, brick manufacture, filtration, solvents, plastics, paint filler, absorbents, and unspecified.

The tonnage of pumice and pumicite used for concrete admixture and concrete aggregate declined slightly in 1950, but the dollar value increased 12 percent. The amount used for acoustic plaster declined in 1950, but the tonnage and value for all abrasive purposes increased. The tonnage for "other uses" increased 28 percent in 1950; "other uses" included insecticide, insulation, brick manufacture, filtration, solvents, plastics, paint fillers, absorbents, and unspecified. (*See* fig. 1.)

As reported in Oil, Paint and Drug Reporter, quotations on domestic and imported pumice in 1950 remained at nearly the same levels as in 1949 and were as follows: Domestic coarse-ground (sizes 0, ½, 1, 1½, 2, and 3) in bags, ton lots, New York, 3⅝ to 4 cents a pound, smaller lots, 3⅞ to 4½ cents; imported—Italian, silk-screened, fine, in bags, ton lots, 4 cents a pound; coarse, 5½ cents; sun-dried, fine or coarse in bags, ton lots, 2½ cents. The E&MJ Metal and Mineral Markets quoted per pound, f. o. b. New York or Chicago, in barrels, powdered, 3 to 5 cents; lump, 6 to 8 cents.

The use of pumice and pumicite in industrial and concrete products in California was described in the trade press.[10] New pumice block plants are reported in New Mexico and Colorado.[11] Washington State Institute of Technology is currently engaged in a research program on pumice concrete, concentrating on the causes and control of shrinkage in walls constructed with pumice concrete blocks.[12] The Oregon State Department of Geology and Mineral Industries has

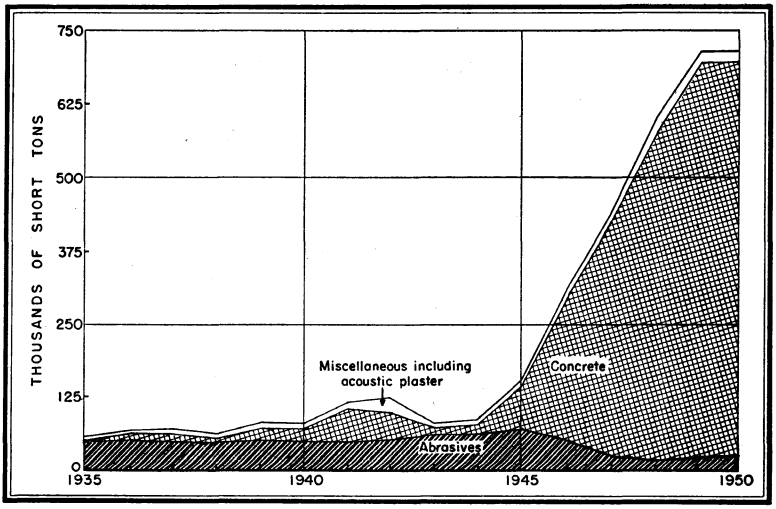

FIGURE 1.—Trends, by uses, of pumice and pumicite sold or used in the United States, 1935–50.

new uses for finely ground pumice, volcanic ash, and perlite.[13] New types of construction embodying the use of units manufactured with pumice are available.[14] Improved methods of processing pumice have been described.[15] The use of wall sections made with pumice has been mentioned.[16] An important deposit of pumice in California was noted.[17] Several problems in connection with the use of pumice and lightweight aggregate were discussed.[18] The pumice deposits of Arizona and their utilization were reviewed recently.[19] Research work in the use of pumice masonry is under way at the Washington State College.[20] New Mexico pumice was to be used in building an 800-home housing project at Biggs Air Force Base, El Paso, Tex.[21]

Garnet.—Garnet production in 1950 was 9,304 short tons valued at $793,558, the largest on record. The trend in output (sales) of garnet since 1920 is shown in figure 2. Producers reporting sales in 1950 were: Idaho Garnet Abrasive Co., Fernwood, Idaho; Willsboro Mining Co., Inc., Willsboro, N. Y.; and the Barton Mines Corp., North Creek, N. Y. The plant at Barton Mines has been enlarged recently, and the sale of fine sizes of garnet to the optical industry has increased. The production and marketing of garnet abrasives from Emerald Creek, Benewah County, Idaho, were the subject of a recent article.[22]

TABLE 14.—Abrasive garnet sold or used by producers in the United States, 1945–50

Year	Short tons	Value	Year	Short tons	Value
1945	6,306	$375,198	1948	8,039	$587,797
1946	7,743	570,186	1949	6,578	505,231
1947	8,722	614,071	1950	9,304	793,558

As quoted in the E&MJ Metal and Mineral Markets during 1950, the price of New York Adirondack garnet concentrates in grain form was $93 a ton, an advance of $8 a ton over preceding years.

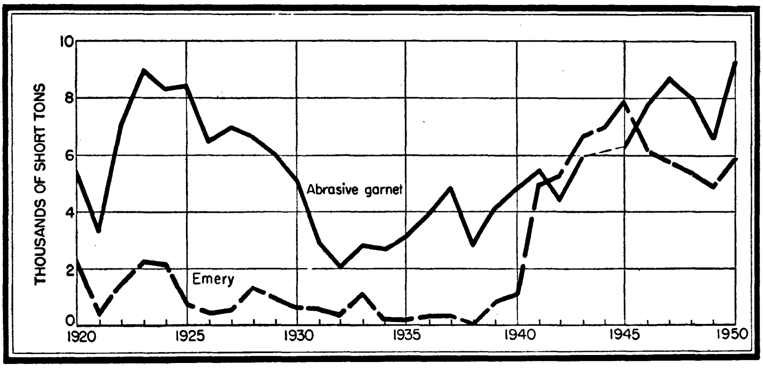

FIGURE 2.—Marketed production of abrasive garnet and domestic emery in the United States, 1920–50.

NATURAL ALUMINA ABRASIVES

Corundum.—The Union of South Africa continued to be the world's largest producer of corundum. The output in that country was 3,201 metric tons in 1950, its largest since 1945.

The United States has produced no corundum in recent years. Imports into the United States in 1950 were 3,543 short tons compared with 2,013 and 3,612 tons in 1949 and 1948, respectively. The American Abrasive Co. continued to be the only importer.

Articles were published in 1950 on the use of corundum by the abrasive industry in India,[23] the occurrence of a corundum deposit of possible commercial importance in Nyasaland,[24] and the corundum situation in South Africa.[25] Other articles described the corundum deposits in Montana [26] and Georgia.[27] The Bureau of Standards has recently developed a practical means of determining the abrasive value of corundum samples.[28]

[23] Sahni, M. R., Abrasives and Grinding Materials: Records Geol. Survey of India, vol. 76, Bull. 12, 31 pp. (reprinted 1946); Jour. Am. Ceram. Soc., vol. 33, No. 7, July 1950, p. 150 (abs.).

[25] Mining Engineering, vol. 187, No. 1, January 1950, pp. 68–69.
[26] Rock Products, Montana Corundum Deposit: Vol. 53, No. 2, February 1950, p. 124.
[27] Georgia Mineral Society, News Letter, vol. 3, No. 2, March–April 1950, p. 48.
[28] American Ceramic Society Bull., vol. 29, No. 4, April 1950, p. 166.

Prices of imported corundum are not quoted in the domestic press. Average value of corundum ore imported in 1950, as shown in the import statistics, was $54.88.

Quotations on natural corundum grain in 1950, as given in the E&MJ Metal and Mineral Markets, were as follows: Per pound, sizes 8 to 60, inclusive, 8½ cents; 70–275, inclusive, 9½ cents; 500, 28 cents; 850, 43 cents; 1,000, 45 cents; 1,200–1,600, 65 cents; and 2,600, 70 cents.

TABLE 15.—World production of corundum, 1943–50, by countries, in metric tons [1]

Total (estimate) [1]	5,625	5,700	6,900	3,250	2,700	3,100	4,200	3,700

[1] In addition to countries listed, corundum probably is produced in U. S. S. R., but data on production are not available; estimate is included in the total.
[2] Data not available; estimate by author of the chapter included in total.
[3] Reported as corundum and emery (believed to be largely emery).
[4] Imports into the United States.
[5] Estimate.
[6] Recovered from tailing dumps.
[7] Bureau of Mines not at liberty to publish figure, but total includes United States production as measured by sales.

Emery.—Production of emery for sale in 1950 increased to 5,949 short tons valued at $75,308, or 21 percent more in quantity and 24 percent more in value than in 1949. The producers of emery in the United States in 1950, as in recent years, were Joe DeLuca and DiRubbo & Ellis, both of Peekskill, N. Y. Because of its marked resistance to wear, a large part of the domestic output is used as a nonskid agent in concrete floors and steps. The balance is consumed for abrasive purposes, such as the manufacture of emery cloth, grinding wheels, and similar products. The sales since 1920 are presented graphically in figure 2. The use of natural emery versus manufactured abrasives was discussed in a trade journal.[29]

As quoted in E&MJ Metal and Mineral Markets, the price in 1950 of domestic crude ore, first grade, was $12 a ton f. o. b. New York. Grain emery in 1950 (f. o. b. Pennsylvania, in 350-pound kegs) was 10 cents a pound for Turkish and Naxos grain and 6½ cents a pound for American grain.

TABLE 16.—Emery sold or used by producers in the United States, 1945–50

Year	Short tons	Value	Year	Short tons	Value
1945	7,856	$75,977	1948	5,405	$69,408
1946	6,188	62,099	1949	4,909	60,917
1947	5,798	66,927	1950	5,949	75,308

INDUSTRIAL DIAMONDS

The world production of industrial diamonds in 1950 was approximately 12,590,000 carats, an increase of 15 percent over 1949. Of this amount some 9,900,000 carats was mined in the Belgian Congo. None were produced in the United States.

The total imports into the United States of all classifications of industrial diamonds in 1950 were 10,967,005 carats, valued at $35,445,506, an increase of 72 percent by weight and 100 percent in value over the 1949 figures. (*See* fig. 3.)

The United States Government continued to purchase industrial diamonds of all classes for the National Stockpile.

The cost of industrial diamonds increased materially during 1950. This was discussed in trade journals.[30]

The largest consumers of industrial diamonds in the United States continued to be the manufacturers of diamond grinding wheels. Expanding use of cemented-carbide cutting tools increased the demand for these wheels, and their successful application for glass grinding and concrete cutting have further extended their use in industry. Manufacturers have improved and expanded their production, and diamond grinding wheels are now available in vitrified, metal, and resin bonds. These wheels are now considered indispensable for many purposes, and cost cutting through their use has been described.[31]

Increased demand for wires of fine diameter during 1950 stimulated the production of diamond wire-drawing dies in this country.

Improved diamond-bit heads for oil-field drilling, as well as improved drilling techniques, have led to lower costs per foot drilled and have brought about an increase in use of diamond bits in that branch of industry.[32]

Diamond dressing and truing tools continue to represent the main use for whole, sound industrial stones. New methods have been developed for automatically controlling the area of contact between diamond and grinding wheel. Indexing devices by which a new diamond face is presented to the wheel after each dressing has permitted maintenance of correct angles and edges on the diamond. The results have been longer diamond life and an improved surface of the grinding wheel that has been dressed. The use of diamonds in dressing and truing grinding wheels has been explained.[33] There have been wider

applications for diamond tools, the scope of which is increasing in harmony with the general improvement in grinding practices. The methods of setting diamond tools have been summarized.[34]

The use of diamond powder, due to improvements in the technique of manufacture, expanded during the year. Modern production calls for high and rapid finish of many mechanical products, which is now made practical with closely graded diamond powder. The United States Bureau of Standards has set up Commercial Standards C. S. 123–49 governing diamond powders.

Diamond compounds have found an expanded market in the finishing of plastic molds, die-casting dies, production lapping, and in the manufacture of gages and precision parts.

Diamond dental tools are becoming more popular.

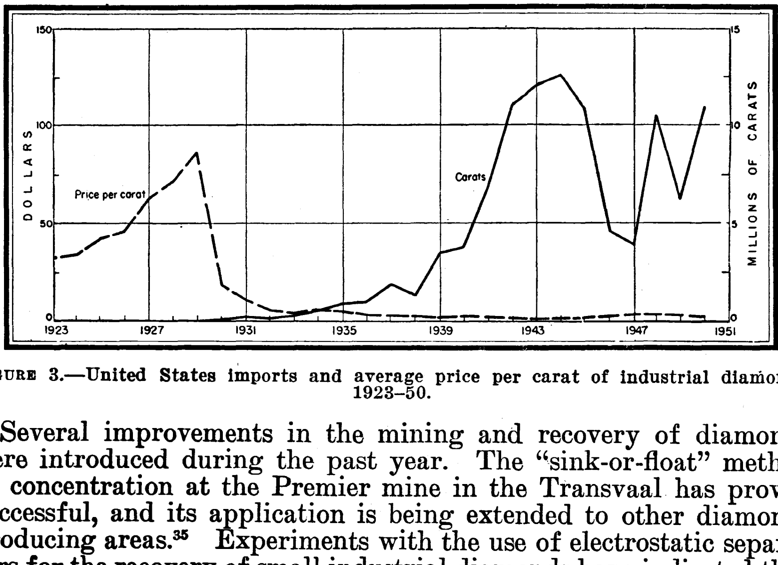

FIGURE 3.—United States imports and average price per carat of industrial diamonds, 1923–50.

Several improvements in the mining and recovery of diamonds were introduced during the past year. The "sink-or-float" method of concentration at the Premier mine in the Transvaal has proved successful, and its application is being extended to other diamond-producing areas.[35] Experiments with the use of electrostatic separators for the recovery of small industrial diamonds have indicated that material previously lost by existing methods can be saved.[36]

The Beceka mine in the Belgian Congo has expanded its production by recent extensive mechanization. A geophysical examination of the property indicates the occurrence of a mass of diamantiferous kimberlite that suggests the outcropping of a kimberlite pipe.[37]

Economic Cooperation Administration assistance to diamond producers in French Equatorial Africa has enabled two companies to mechanize their operations, thus increasing their production of industrial diamonds.[38]

[1] Revised figure.

Increased production of industrial diamonds from the Union of South Africa is indicated by the reopening of the Premier Mine in the Transvaal[39] and the New Jagersfontein mine in the Orange Free State.[40]

A possible application of atomic energy for increasing the hardness of diamonds has been described.[41]

No production of diamonds was reported from Arkansas during 1950.

ARTIFICIAL ABRASIVES

The combined tonnage of aluminum oxide and silicon carbide manufactured in the United States and Canada in 1950 increased 6 percent, and its value increased 32 percent over the 1949 production. Aluminum oxide showed a 12-percent increase in tonnage and 41-percent in value. The figure for aluminum oxide for 1950 includes 20,188 short tons of "white high-purity" material valued at $2,607,590, compared with 10,858 short tons valued at $1,178,290 in 1949, an increase of 86 percent in quantity and 121 percent in value. The tonnage of aluminum oxide used for refractories in 1950 was 2 percent compared with 3 percent in 1949. Production of silicon carbide showed a slight loss for 1950, being 4 percent less than 1949, but its value increased 21 percent. The percentage of the silicon carbide used for refractories was 24 in 1950, the same as in 1949.

TABLE 19.—Crude artificial abrasives produced in the United States and Canada, 1946–50

Year	Silicon carbide [1]		Aluminum oxide [1] (abrasive grade)		Metallic abrasives [2]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	63,849	$5,457,903	132,084	$8,367,158	111,512	$6,387,819	307,445	$20,212,880

[1] Bureau of Mines not at liberty to publish data for United States separately. Figures include a small quantity used for refractories and other nonabrasive purposes.
[2] Shipments from United States plants only.

The output of metallic abrasives in the United States alone in 1950 increased 38 percent in quantity and 26 percent in value over 1949. Stocks of aluminum oxide decreased 56 percent, silicon carbide 60 percent, and metallic abrasives 28 percent from the 1949 figures. The ratio of production to annual plant capacity of silicon carbide in 1950 was 77 percent, 6 percent less than in 1949. However, the ratio for aluminum oxide was 59 percent, an increase of 6 percent; and for metallic abrasives 69 percent, an increase of 23 percent.

1949	21,964	81,121	49,505	237,072	10,144	231,650
1950	8,766	84,398	22,025	238,500	7,291	209,850

[1] Figures pertain to United States plants only.

The production of aluminum oxide in the United States and Canada is largely concentrated in the Niagara Falls area. The remainder is at Anniston, Ala., and Arvida, Quebec. The larger part of the silicon carbide production is also in the Niagara region, with plants at Vancouver, Wash., and Cap-de-la-Madeleine and Shawinigan Falls, Quebec, manufacturing the remainder.

Statistics regarding metallic abrasives include those for steel shot and grit but not for steel wool, and pertain to shipments from United States plants only. During 1950, production was reported by 14 companies, totaling 16 plants. The States reporting the largest production were Michigan, Ohio, and Pennsylvania. Smaller quantities were produced in Illinois, New Hampshire, and New York.

The Carborundum Co. has begun operations at its new plant at Vancouver, Wash. The crude silicon carbide abrasive produced will be shipped to the eastern plants of the company for conversion into abrasive or refractory products.[42] The Grinding Wheel Institute, Greendale, Mass., publishes information on grinding wheels and bonded abrasives.[43]

The properties and applications of silicon carbides were reviewed in a trade journal.[44] Other articles published in 1950 discussed methods of manufacturing alumina for abrasive purposes,[45] abrasive costs and ways of reducing them,[46] toolroom grinding problems,[47] and the use of abrasives for surface-finishing stainless steel.[48] Still other articles outlined the history, manufacture, and industrial applications of coated abrasives [49] and summarized the physical, mechanical, and chemical properties of abrasives.[50] The use of glycerin in connection with diamond powder and other abrasives was recommended to make the final product more adaptable for certain functions.[51]

The Attorney General's Office announced a consent judgment against four abrasives manufacturers (Minnesota Mining & Manufacturing Co., St. Paul, Minn.; Behr-Manning Corp., Troy, N. Y.; The Carborundum Co., Niagara Falls, N. Y.; Armour & Co., Chicago, Ill.) whereby to create opportunities for the entrance of new competitors in the coated abrasive industry more than 200 existing patents are made subject to compulsory licensing. The companies are required to furnish, to any applicant, written manuals describing the methods, processes, materials, and equipment used by the companies in their commercial production under the licensed patents.[52]

MISCELLANEOUS MINERAL-ABRASIVE MATERIALS

In addition to the natural and manufactured abrasive substances for which data are included herein, many other mineral materials are used for abrasive purposes. A number of oxides, including tin oxides, magnesia, iron oxides (rouge and crocus), cerium oxide, chromium oxide, and manganese oxide, are employed as polishing agents. Zircon silicate and calcined kaolin are suggested for polishing optical glass. Certain carbides, such as boron carbide and cemented carbides, which include tantalum carbide, titanium carbide, and tungsten carbide, have been used for their abrasive properties, especially when required for their extreme hardness or durability. Other substances with abrasive applications include finely ground and calcined clays, lime, talc, ground feldspar, river silt, slate flour, and whiting.

The methods of preparation and the physical properties of cerium were described in a technical publication.[53]

FOREIGN TRADE[54]

Imports.—The total value of imports for consumption of both natural and artificial abrasives during 1950 increased 78 percent over the 1949 figure. With a few minor exceptions, every abrasive product listed showed a marked increase. Imports of industrial diamonds increased 72 percent in weight and 100 percent in value, and crude aluminum oxide abrasives increased 30 percent in weight and 44 percent in value.

Exports.—The value of exports of natural and artificial abrasives in 1950 declined 7 percent compared with 1949. Diamond grinding wheels, however, showed an increase in value of 56 percent over 1949.

Aluminum

By Delwin D. Blue

GENERAL SUMMARY

DEMAND for aluminum rose steadily during 1950, not only in the United States but throughout the industrialized countries of the world. The chief cause of this larger demand was increased military requirements arising from accelerated rearmament programs. Other contributing factors were the wider application of aluminum in both civilian and military goods as a result of improvements in alloying and fabrication technology and the substitution of aluminum for other nonferrous metals whose possibilities of expanded production were more limited. During the latter part of the year it became evident that supplies of aluminum were inadequate to meet miltiary and civilian requirements.

Domestic production of primary metal for 1950 was the largest since the peak war years 1943–44; imports increased, exports decreased, and secondary recovery was maintained at a high level. Although the total supply of aluminum was greater than in any previous year but 1943, it became necessary for the primary producers to inaugurate a system of voluntary allocations during the last half of the year. On November 13 the National Production Authority of the United States Department of Commerce issued NPA Order M–7, which established quotas for consumption of aluminum in nonmilitary uses.

TABLE 1.—Salient statistics of the aluminum industry, 1945–50

	1945	1946	1947	1948	1949	1950
Primary production short tons	495,060	409,630	571,750	623,456	603,462	718,622
Value	$140,864,000	$115,812,000	$161,626,000	$180,755,000	$190,303,000	$235,977,000
Quoted price per pound cents	15.0	15.0	15.0	15.7	17.0	17.7
Secondary production short tons	298,387	278,073	344,837	286,777	180,762	243,666
Imports	$99,370,633	$12,463,960	$6,603,722	$42,203,519	$36,815,965	$68,565,400
Exports	$9,906,041	$20,284,053	$52,231,972	$43,219,940	$32,924,653	$22,153,000
World production short tons	958,000	870,000	1,189,000	1,398,000	1,442,000	1,631,000

The increased production required was variously estimated at 500,000 to 1,000,000 tons per year. The initial expansion program formulated by the Government in 1950 called for construction of 446,000 tons per year of new capacity. The goal of this program was an aluminum supply sufficient to meet all military requirements plus civilian requirements. Under authority of the Defense Production Act of 1950 (Public Law 774) negotiations were under way at the end of the year between the Government and five private companies for construction of new plants. Full production from the new facilities was expected to be attained by the latter part of 1952.

PRODUCTION

The total output of aluminum in the United States for 1950 was about 1,000,000 tons, of which 75 percent was primary metal produced from bauxite ores, 17 percent secondary from plant scrap, and 8 percent secondary from old scrap. United States primary production accounted for 44 percent of the estimated world total.

Primary.—Domestic production of primary aluminum was 718,622 short tons during 1950, 19 percent more than in 1949. Except for the usual seasonal variation, monthly production increased throughout 1950. Output for the first quarter was 161,200 tons compared to 191,000 tons for the fourth quarter. The average monthly production rate was 59,885 tons, the highest attained by the industry since August 1944.

These primary production data represent output from the reduction cell. They include a small quantity of alloying constituents that are sometimes introduced into the cell feed and recovered with the aluminum.

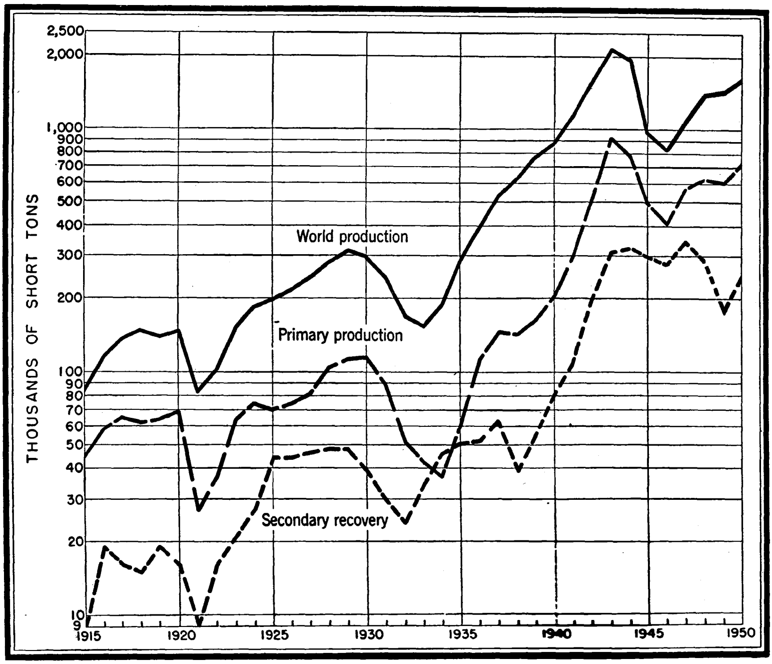

Figure 1.—Trends in world and domestic primary production and domestic secondary recovery of aluminum, 1915–50.

All of the primary aluminum in 1950 was produced by 3 companies, operating 11 reduction plants; the Aluminum Co. of America produced 49 percent, Reynolds Metals Co., 31 percent, and Kaiser Aluminum and Chemical Corp., 20 percent of the total.

A new reduction plant at Point Comfort, Tex., was put in operation in February by the Aluminum Co. of America. A strike closed this plant during the latter part of August and all of September; the rate of production attained in July had not been reached again by the end of the year. Two potlines at Reynolds' Jones Mills reduction plant were reopened—the first in April and the second in September. These facilities had been idle since 1944 except for a 4-month period in 1949 when one line was in operation. Aluminum-reduction facilities at Massena, N. Y., and Badin, N. C., which had been idle in recent years because of high power cost, were reactivated by the Aluminum Co. of America at the close of 1950. These new and reactivated facilities accounted for approximately one-third of the total increase in production; the remainder was a result of maintaining high-level production at previously operating facilities.

Operable reduction capacity of the aluminum industry at the year end was rated at approximately 750,000 tons annually, exclusive of the 105,000 tons of capacity available at Badin, N. C., Massena, N. Y., and Listerhill, Ala., which could be operated only by using high-cost power. This capacity was distributed as follows: The Aluminum Co. of America 50 percent, Reynolds Metal Co., 29 percent, and the Kaiser Aluminum & Chemical Corp., 21 percent.

During the latter part of the year it became evident that a large expansion in production facilities was required to meet the increasing demand for aluminum. Requirements for civilian consumption increased steadily during the first half of the year, civilian demand being estimated at 1,000,000 tons of primary and secondary metal annually. The new facilities required to satisfy these demands, meet military requirements, and leave a surplus for stockpiling were variously estimated at 500,000 to 1,000,000 tons of production capacity per year. Enactment of the Defense Production Act of 1950 (Public Law 774) in September enabled the Government to offer the following incentives to industry for expanding production: Accelerated amortization for tax purposes, guaranteed loans, subsidies to offset excess cost of power, and a guaranteed market for metal produced from the new facilities.

Negotiations, based on these incentives, were underway at the end of the year between the Government and five concerns for the construction of new aluminum-production facilities. These new facilities were to have an aggregate capacity of 446,000 tons of metal per year, full output to be reached during the latter part of 1953. Participating companies were the three established producers—Alcoa, Reynolds, and Kaiser—and two new concerns, Harvey Machine Co. of Torrence, Calif., and the Apex Smelting Co. of Chicago, Ill. The new capacity was to be distributed as follows: 120,000 tons to Alcoa for a 35,000-ton expansion of the Point Comfort, Tex., plant and construction of an 85,000-ton plant at Wenatchee, Wash.; 100,000 tons to Reynolds for a 25,000-ton expansion at the Jones Mills, Ark., plant and a new 75,000-ton plant at Corpus Christi, Tex.; 100,000 tons to Kaiser for a new plant to be constructed at Chalmette, La.; 72,000 tons to Harvey Machine Co. for a new plant at Kalispell, Mont.; and 54,000 tons to Apex Smelting Co. for a new plant, the location of which was undetermined. Under the expanded program the capacity would be, Alcoa 45 percent, Reynolds 25 percent, Kaiser 20 percent and new producers, 10 percent.

The main problem the industry faced in effecting this expansion was that of adequate low-cost power, about 1,000,000 kilowatts of which were required. The largest potential source immediately available was the natural gas of the Texas Gulf region, which could either be used directly for operation of gas Diesel engines, as at Point Comfort, or for generating steam for turbine-driven generators. Consideration was also given to generation of power by combustion of coal. The Harvey Co. planned to use hydroelectric power from the Hungry Horse Dam being built by the Bonneville Power Administration in western Montana.

Bauxite for the expansion was available through development of Jamaica deposits by Reynolds and Kaiser and increased imports from Surinam.

Alumina facilities for supplying the new reduction facilities were to be constructed by the producing companies. Alcoa had plans to increase the capacity of its Mobile, Ala., and East St. Louis, Ill., plants and to construct a new plant at Bauxite, Ark. Kaiser intended to produce its additional alumina requirements by expanding facilities at Baton Rouge, La. Reynolds planned expansion of their Hurricane Creek alumina plant and had under consideration construction of a new alumina plant on the Gulf coast, specially designed for treating Jamaica ores. Location of alumina facilities of new producers had not been determined.

Secondary.—Domestic recovery of aluminum from secondary sources was 243,666 tons in 1950, a 35-percent increase over 1949. A major factor contributing to the increased secondary supply was the high market price of secondary ingot; bid prices for secondary ingot went from 17.2 cents per pound in January to 31.2 cents in December 1950.

Secondary aluminum was recovered by the three primary producers, about 60 secondary smelters, and several thousand foundries and other manufacturers. Of the total, 69 percent was recovered from processing new (plant) scrap and 31 percent from old scrap. (Home scrap generated and reused in the same plant is not included.) The secondary product was marketed as aluminum ingot, aluminum alloys, and for use in deoxidizers, hardeners, chemicals, and other miscellaneous products.

Detailed information regarding secondary aluminum in 1950 is given in the Secondary Metals—Nonferrous chapter of this volume.

SUPPLY

The total supply of aluminum pig and ingot and ingot equivalent of scrap aluminum in the United States for 1950 was 1,198,847 tons, the largest in history except for the peak war year 1943. This supply comprises primary production, secondary recovery from both old and new scrap, net imports of pig and ingot, and the ingot equivalent of net imports of scrap aluminum. Home scrap (scrap used in the plant of generation) and changes in stocks of producers, consumers, and the National Stockpile are not included in this total. Metal recovered from new scrap, which result from fabrication operations, does not represent additional aluminum production but does represent a new supply for the manufacturers of aluminum ingots and for use in hardeners, deoxidizers, chemicals, etc. When aluminum requirements are expressed in terms of the equivalent weight of aluminum ingot, the usual method, secondary aluminum from new scrap must be included in the supply available for meeting these requirements.

The pattern of the sources of this aluminum supply has shown considerable variation from year to year over the past decade, as shown in figure 2. Before the war almost three-quarters of the supply was from primary production. In the 5 years since the war (1946–50) the average contribution of primary production has been 61 percent. Both imports and secondary production have increased in relative importance.

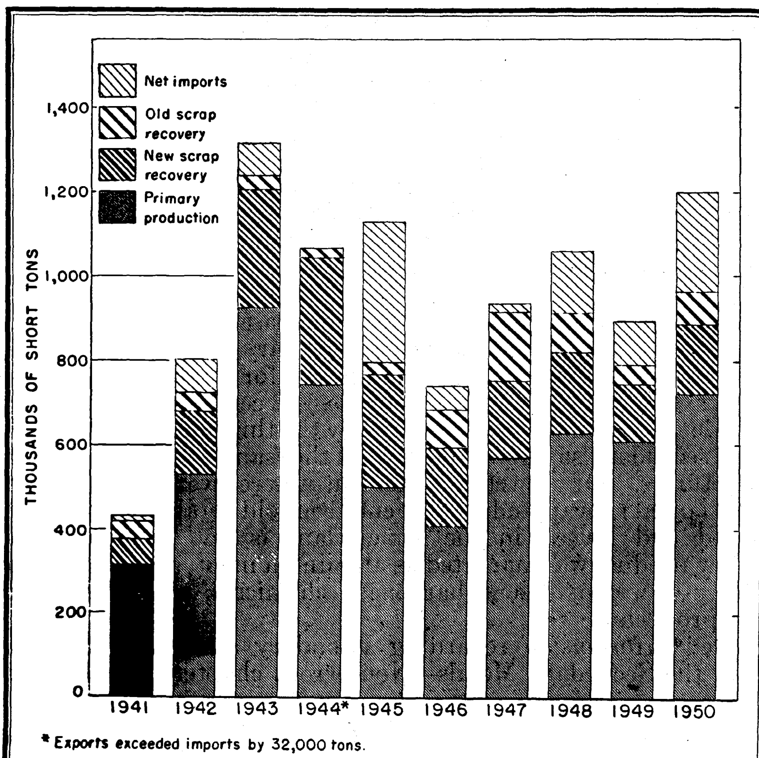

FIGURE 2.—Sources of United States aluminum, 1941–50; imported scrap converted to ingot equivalent.

CONSUMPTION

Apparent consumption of primary aluminum in 1950 was 898,336 short tons, as computed by adding primary production and net imports of ingots, slab, plate, sheet, bars, and other crude or semifabricated forms and adjusting for producers' stock changes. This total includes aluminum that went to the National Stockpile. Data on stocks of primary aluminum at fabricators and other consumers are not available, and no allowance has been made for stock changes other than at primary production plants.

Secondary aluminum for consumption was obtained from domestic recovery and from imported scrap. Imported scrap aluminum is largely in pig form for easier handling and shipping. Aluminum contained in imported "loose" scrap is also included in domestic secondary recovery, but since this type of material represents a small portion of the total imports, the net scrap imports must be considered as an additional supply. The recovery of aluminum from scrap is calculated at 90 percent.

TABLE 2.—Apparent consumption of primary aluminum and ingot equivalent of secondary aluminum in the United States, 1945–50, in short tons

Year	Primary			Secondary		
	Sold or used by producers	Imports (net)[1]	Apparent consumption[2]	Domestic recovery: From old scrap	Domestic recovery: From new scrap	Imports (net)[3]
1945	468,836	328,216	696,750	27,311	271,076	3,929
1946	435,964	25,913	575,687	90,535	187,538	12,468
1947	570,923	−46,964	571,789	163,847	180,990	13,412
1948	625,834	40,041	684,575	95,648	191,129	64,165
1949	587,532	48,424	635,956	44,596	136,166	35,751
1950	731,087	167,249	898,336	76,358	167,308	60,443

[1] Crude and semifabricated, excluding scrap. May include some secondary.
[2] For 1945–48, apparent consumption modified by changes in stocks held by the Office of Metals Reserve.
[3] Ingot equivalent of net imports (wt. × 0.90). Imports are largely scrap pig. Some duplication of secondary aluminum occurs because of small amount of loose scrap imported which is included as secondary recovery rom old scrap.

Shipments of aluminum products by intermediate producers, as reported by the Bureau of Census, totaled 1,071,150 short tons; 226,305 tons were shipped as castings and 844,845 tons as wrought products.[1] Aluminum consumed in various "dissipative" uses (such as deoxidizers, hardeners, and chemicals) and as a minor alloying agent in other base-metal alloys was not reported. Data on changes in consumers' stocks were not available.

During 1950 the demand for aluminum increased steadily; consumption was limited by the supply. In July a system of voluntary allocations was inaugurated by some of the primary producers. On October 27, 1950, the National Production Authority in the U. S. Department of Commerce issued N. P. A. Order M–5 which set rules for placing, accepting, and scheduling rated orders for aluminum. On November 13, N. . A. Order M–7 was issued, prescribing the dis-

[1] Bureau of the Census, Facts for Industry: Series M24–1–120, Feb. 12, 1951.
Bureau of the Census, Facts for Industry: Series M24E–120, Feb. 21, 1951.

tribution and uses of metal available after allowing for the requirements of national defense and allocations to the stockpile. This order established quotas for consumption of aluminum based on the average rate of consumption during the base period, which was fixed as the first 6 months of 1950. Each consumer was restricted in his 1950 consumption to 100 percent of the base-period rate and for his consumption after December 31, 1950, to 65 percent of the base-period rate. Amended order M-7 was issued on December 1 and provided for a gradual restriction of use to 80 percent in January, 75 percent in February, and 65 percent in March 1951 and thereafter. Provisions were made for adjusting the base rate when a business operation was started during the base period or when the restriction could be shown to impose an undue hardship not suffered by others in the same trade.

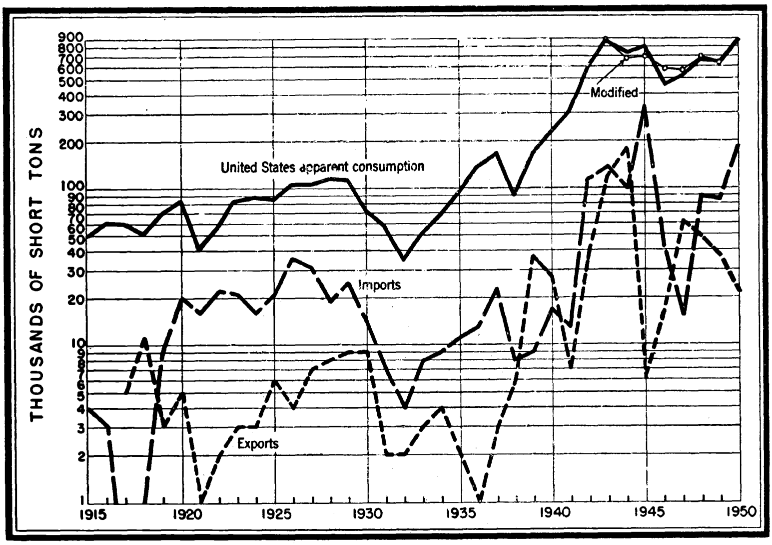

FIGURE 3.—Trends in imports, exports, and apparent consumption of aluminum, 1915–50. Imports and exports do not include scrap.

USES

Uses for aluminum in 1950 followed the general pattern noted in **postwar years.** Data are not available for all producers, but Alcoa **shipments** indicate that major changes in the consumption pattern as **compared with** 1949 were lower consumption for electrical power **transmission and** an increase for transportation facilities. Building **materials and** transportation facilities were the largest consumers of **aluminum.** Shipments made by Alcoa to various industries were **distributed as follows:**

	Percent
Building products	19
Transportation (all forms)	18
Power transmission	8
Household appliances	8
Cooking utensils	6
Machinery (general and electrical)	4
Unclassified fabricators	23
Other uses	14

The major military uses of aluminum are military aircraft, airborne equipment, and ship construction, but its use is being extended to such other equipment as bridges, radar towers, rockets and rocket-launching equipment, fire-control towers, portable shelters, fuel pipe, and other portable miscellaneous equipment used by ground troops. The new 35-inch-bore bazooka for antitank rockets requires 13 pounds of aluminum.

Improvements in fabrication techniques resulted in wider applications and lower costs for aluminum products.

The development of the Marform process for producing stampings and deep-drawn parts has resulted in large savings in fabrication costs and is particularly applicable when a limited number of parts are produced. In this process, the female die is replaced by a rubber pressure pad which forces the sheet aluminum to follow the contours of a male die when pressure is applied. The process makes possible forming the same shape from sheets of different thickness without changing the dies. Complex stampings can be manufactured by this process.[2]

Stretch-wrap-forming fabrication techniques came into wider use during 1950. This method of forming metal has become a necessity in all shops where parts, sheet, and extrusions must be contoured. Stretch forming is done by equipment that grips the edges of sheet metal and stretches it over a die machined to the proper contours. When the pressure is released the pressed part retains the shape of the male die. No female die is required. Large sections, such as leading edges of aircraft wings and rudders, are formed by this process.

Techniques used in welding, brazing, and soldering aluminum alloys were improved, and their application was expanded. Inert-gas-shield arc and flame welding achieved wider commercial application. The continuous-wire-feed Heliarc process implements the welding of heavy sections by using the V technique in common use in steel welding. The edges to be welded are "veed" out, and the cavity is filled with metal from the wire feed. During 1950 Alcoa developed new filler-wire alloys which provide high tensile strength and good ductility in the welds.

The Koldweld process for joining thin metal sections was developed by General Electric, Ltd., in England and was being handled in this country by the Koldweld Corp. The process consists of effecting a weld between specially prepared metal surfaces by applying high pressure and is applicable for welding aluminum to aluminum and aluminum to other malleable metals. Welding is limited to relatively thin sections. Application of this process should result in better and cheaper closures for sheet-metal fabrications.[3]

Improvements in brazing alloys and techniques have led to the development of new methods for making cast-aluminum assemblies. Experimental automobile engines have been built of aluminum parts joined by this new method. In 1950 Alcoa developed a new aluminum

[3] Light Metals Age, Further Developments in the Koldweld Process: Vol. 8, Nos. 9 and 10, October 1950, pp. 16–17.

soldering flux that has a greater soldering activity and allows higher soldering temperatures than previous fluxes. This flux is now used in fastening aluminum incandescent-lamp bases.

Process developments in casting aluminum alloys have resulted in increased economies, larger and more complex castings, and smooth, dimensionally accurate castings. The plaster-mold casting process developed in 1948 permitted commercial production of intricate aluminum castings for automobile torque converters,[4] and its usage has been expanded for production of various aircraft parts and other castings requiring close dimensional tolerances. An example of the large, complex die castings that can be made of aluminum is the experimental inner door frame developed and cast by the Doehler-Jarvis Corp. in collaboration with the Kaiser-Frazier Corp.[5] This casting covers an over-all dimensional area of 1,200 square inches and weighs slightly over 12 pounds when trimmed. The die used in making the door weighed approximately 13 tons and the trimming die over 4 tons. Regarding die-casting usages in the future Doehler said, "We recognize only the limitations of the designer's imagination. Applications in the manufacture of refrigerators, metal furniture, radio and television receivers, as well as many more automobile parts are well within our vision".[6]

Numerous processes and improvements for finishes on aluminum alloys were reported in 1950. Alcoa developed a new alloy for applications that require a bright Aluminite finish with a minimum of structural streaks.

STOCKS

During 1950 inventories of primary producers and secondary smelters were reduced to a minimum. Stocks held by primary producers decreased from 29,101 tons at the close of 1949 to 16,636 at the end of 1950. Stocks at secondary smelters decreased from 16,478 short tons to 9,215.

Aluminum held at primary and secondary smelters is not significant as a reserve source of metal, since it is equivalent to less than 2 weeks' production and represents only a necessary operating inventory.

Stockpile goals were increased, but deliveries to the stockpile were running behind schedule. To increase the supply of metal for stockpiling, idle facilities at Badin, N. C., and Massena, N. Y., were reactivated by a Government purchase contract, which provided subsidies to defray power costs above 5 mills per kilowatt-hour. This contract will provide 79,000 tons a year for stockpiling.

PRICES

The base price of primary aluminum ingot, 99 plus percent pure, was 19 cents per pound f. o. b. shipping point at the close of 1950. This was a 12-percent increase over the 17-cent price established October 11, 1948, and continued until May 1950. In May the price

was raised to 17½ cents per pound. Effective September 25, Alcoa raised the price of primary ingot to 19 cents per pound. Reynolds and Kaiser followed with comparable increases on September 29 and October 3, respectively.

During 1950 other metals increased by the following percentages: Finished steel, 5 percent; electrolytic copper, 33 percent; lead, 42 percent, and Prime Western zinc, 79 percent. The 12-percent rise in aluminum in 1950 was partly compensatory for the lesser rise in aluminum, compared with other metals, in the earlier postwar period. The 1950 average price of aluminum was only 16 percent higher than the average for 1941–45, compared with 65 percent for steel, 82 percent for electrolytic copper, 71 percent for zinc, and 109 percent for lead.

TABLE 3.—Prices of aluminum ingot and other major metals, 1941–50 [1]

Year	Aluminum, primary ingot (cents per pound)	Copper, electrolytic, New York (cents per pound)	Composite finished steel (cents per pound)	Lead, New York (cents per pound)	Zinc, Prime Western, St. Louis (cents per pound)
1941	16.50	11.87	2.65	5.79	7.48
1942	15.00	11.87	2.65	6.48	8.25
1943	15.00	11.87	2.65	6.50	8.25
1944	15.00	11.87	2.65	6.50	8.25
1945	15.00	11.87	2.73	6.50	8.25
1946	15.00	13.92	3.00	8.11	8.73
1947	15.00	21.15	3.42	14.67	10.50
1948	15.74	22.20	3.91	18.04	13.58
1949	17.00	19.36	4.21	15.36	12.15
1950:					
First quarter	17.00	18.37	4.38	11.65	9.83
Second quarter	17.23	20.25	4.38	11.39	12.49
Third quarter	17.55	22.83	4.38	13.46	15.70
Fourth quarter	18.99	24.37	4.45	16.68	17.50
Average	17.69	21.46	4.40	13.30	13.88

[1] Source: Metal Statistics, 1951 (American Metal Market).

The 19-cent-per-pound price applied only to domestic primary ingot. Since imported and secondary ingot comprises 40 percent of the total supply, it is necessary also to consider the prices of these materials, whose prices in 1950 varied widely from time to time both in actual amounts and in relation to the price of primary ingot. Canada supplied 88 percent of total imports in 1950, and Canadian export prices followed current United States prices. Prices at the point of shipment of ingot imported from 15 other countries rose from an average of 11.3 cents per pound in February 1950 to 21.1 cents per pound in December.

The average price of eight types of secondary alloy ingot in January 1950 was 17.2 cents per pound, just above the current primary ingot price. These prices prevailed until May with little change. In June the increasing shortage of ingot started a rapid rise of prices that continued through the end of the year. In December the average price of the same eight types of secondary ingot reached 31.4 cents per pound, 183 percent of the January average and 165 percent of the December price of primary ingot.

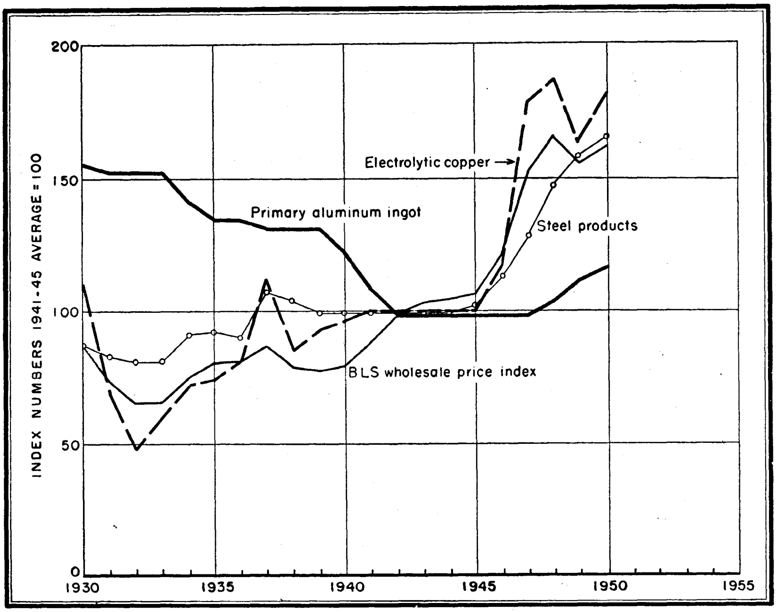

FIGURE 4.—Trends in price of aluminum ingot, electrolytic copper, and finished steel, compared with Bureau of Labor Statistics general wholesale price index, 1930–50. Index numbers computed for aluminum ingot, electrolytic copper, and finished steel from prices reported by the American Metal Market. Bureau of Labor Statistics index transposed from 1926 to 1941–45 base.

The weighted average price of domestic primary ingot, imported ingot and scrap, and domestic secondary ingot rose from 16.7 cents per pound in January 1950 to 21.4 cents per pound in December.

FOREIGN TRADE[7]

Foreign trade in aluminum, as indicated by total values of exports and imports, increased approximately 30 percent in 1950. Imports increased 86 percent; exports decreased 33 percent. The largest import items were ingot and scrap. Smaller quantities were imported as semifabricated material, such as plate, sheet, bars, etc. The largest export item was semifabricated material; some metal was exported as ingot and scrap. Net imports of nonfabricated metal (pig, ingot, and ingot equivalent of scrap) totaled 237,219 short tons—the largest tonnage since 1945, when excess Canadian ingot, which had been produced during World War II, was transferred to the United States. Very little scrap was imported before 1944, but in past years the volume of scrap has been steadily increasing. The largest amount was imported in 1948, coming mostly from a cleanup of war debris in Europe. The 1950 net import of 67,159 tons was only slightly smaller than in 1948.

[7] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

In 1950 Canada continued to be the leading exporter of aluminum to the United States, accounting for 88 percent of total imports; 7 percent of United States imports were received from Europe and 4 percent from Asia. The largest imports of scrap to the United Sates were

[1] Quantity not recorded.

from Europe, the total being 46,000 tons. Net imports of ingot in 1950 were 254 percent of the 1949 total, while net imports of scrap were 169 percent of 1949. Imports were stimulated by rising prices, and the import pattern shows that substantial tonnages of ingot and scrap may be expected from a number of countries whenever the price relationship is advantageous.

The import duty on aluminum in 1950 was as follows: Crude (ingot), 2 cents per pound; mill products (semifabricated), 3 cents per pound; scrap, 1.5 cents per pound until October 1, when all duty on scrap was lifted.

TECHNOLOGY

The method of manufacturing aluminum has remained basically the same in recent years, and the new capacity planned in the expansion program was designed to use established processes. United States production is obtained from bauxite, from which alumina is extracted by the Bayer process. The alumina is then reduced to metal in electrolytic cells.

During 1950 there was renewed interest in many of the processes for producing aluminum from low-grade materials such as clay, anorthosite, and aluminous rocks that had been investigated during the last war. At the close of the year no provision had been made for large-scale testing of these processes.

The location of reduction facilities for producing aluminum has been based, since the early days of the industry, on the availability of low-cost electric power. At the beginning of 1950, 8 of the 10 operating plants were at sites where low-cost hydroelectric power was available. Five of these plants, representing about half of the reduction capacity, were in the Pacific Northwest, distant from raw materials and the major markets, inasmuch as the requisite low-cost power has not been available in the more highly industrialized regions of the United States.

The development of gas and Diesel generator units, which generate direct-current power for use in electrolytic cells without conversion or transmission losses, as well as steam generators comparable in size with the largest hydroelectric generators has recently opened new areas for reduction facilities. One such area is the Gulf coast, which offers a convenient site because of availability of Caribbean and South American bauxite, as well as low-cost energy from southwestern gas and oil, and at the same time increases the defense security of the industry by increasing its dispersion. One new reduction plant has been constructed in this area, at Point Comfort, Tex., and two additional plants, at Corpus Christi, Tex., and Chalmette, La., were planned.

The new Alcoa plant at Point Comfort is entirely dependent on thermal power, which is supplied by natural gas from Texas gas fields. The gas engines that turn the generators were designed and built by the Nordburg Manufacturing Co. of Milwaukee and are unique in many respects. The engines are of the radial type, with 11 horizontal cylinders, 14-inch bore and 16-inch stroke, firing in rotation. These cylinders drive a master gear, which imparts rotation to the main shaft through a gear train. Each engine is directly coupled to a generator which produces 1,000 kilowatts of direct-current power at 667 volts. The power is fed into an aluminum bus bar leading directly to the pot rooms. One hundred and twenty of these engines supply the total electrical energy required for the 57,000-ton-annual-capacity plant.

The entire plant makes good use of its own product. The buildings are covered with aluminum roofing and siding; stacks, heat exchangers, transmission facilities, and the radial engines are constructed largely of aluminum. Other improvements in use at the Point Comfort plant and/or planned for the other new facilities are Soderburg self-baking electrodes and facilities for recovering dust and fume from the electrolytic cells, thus permitting recovery, in turn, of valuable alumina and electrolyte.[8]

WORLD REVIEW

World production of primary aluminum ingot was 1,628,000 short tons in 1950 (partly estimated), a 13-percent increase over 1949 (revised data). The United States and Canada continued to dominate the production field with a combined production of 1.1 million short tons of primary ingot, over 68 percent of the world total. The output of aluminum in the U. S. S. R. and satellite countries is not definitely known, but estimates indicate that they produce approximately 12 percent of the world total. Increased production in this area is believed to be about the same as that for the rest of the world. Almost all of the aluminum-producing countries increased their output in 1950. The largest percentage increase (79 percent) was achieved by Spain but represented less than 1,000 metric tons. Of the countries producing over 10,000 metric tons per year, the largest increase was achieved by Italy (45 percent or 11,400 metric tons), closely followed by Norway, with 33 percent or 11,600 metric tons. The largest tonnage gains were made by the two largest producers, the United States and Canada, with a total increase over 1949 production of 127,300 metric tons. Unused capacity awaiting additional power or better economic conditions was available in Austria, France, Western Germany, India, Italy, and Formosa. Construction of alumina and aluminum plants and other power facilities were underway in Norway, Brazil, Sweden, Yugoslavia, New Zealand, and Tasmania, as well as in the United States and Canada.

Australia.—During 1950 work was begun on construction of an aluminum-reduction plant at Bell Bay, Northern Tasmania, the first such facilities in Australia. The plant was reported to have been purchased in Norway. An initial production of 13,000 metric tons per year was planned, with subsequent expansion to 25,000 tons. Additional reduction facilities for Australia were in the planning stage. Malayan bauxite was to be treated.

Austria.—Difficulties associated with the power supply limited primary production in Austria in 1950. With a rated capacity of over 40,000 metric tons per year, production was only 18,000 tons. There

was not only a shortage of electrical power but also of transformer and distribution equipment.

Brazil.—In 1950 plans were underway for constructing an aluminum plant in São Paulo, near São Paulo City, with a production capacity of 7,800 metric tons per year to supply metal for the numerous aluminumware plants in the State. Bauxite was to be mined at Pocos de Caldas, about 150 miles from the plant.

Canada.—Canada, a country with relatively small domestic requirements, ranked among the top three world aluminum producers. The availability of low-cost power near ocean ports gives this country a cost advantage over other producers. During 1947–50 only 16 percent of the aluminum produced in Canada was sold in domestic market, and of this a part was later exported as fabricated or manufactured products. In 1950 shipments to the United States from Canada were 162,600 short tons, about 41 percent of Canadian production for the year. The United Kingdom is also a large purchaser of Canadian metal.

The capacity of existing plants was reported by Aluminium Ltd., the only primary producer, to be 470,000 metric tons per year. Production in 1950 was about 360,000 metric tons. The annual report of the company for 1950 states that "from the beginning of the year under review, the production of primary aluminum has been maintained at the maximum capacity determined by the availability of hydroelectric power." The Quebec Legislature passed a bill in 1950 which empowers the Provincial Government to enter into an agreement with Alcan for development of new power projects on the Perebonka

River, in the Saguenay district, near present facilities. An initial capacity of 50–60,000 hp. was proposed for installation by May 1952 and 200,000 hp. by August 1952.

The possibility of establishing a new aluminum center in British Columbia was being investigated. Plans called for this to be a 600-million-dollar installation, with an annual capacity of half a million tons of ingot.

China.—The production of aluminum in China was in previous years obtained from two plants in Manchuria and one in Taiwan (Formosa). No information on Manchurian operations in 1950 is available. The plant in Taiwan was closed down during the latter part of the year because of a lack of raw materials.

France.—France produced an estimated 61,000 metric tons of primary aluminum in 1950 from a rated capacity of 95,000 tons. A limiting factor was the available electrical energy, which is obtained from watersheds in the Alps and Pyrenees. The French plants can obtain capacity production only in the summer, when maximum hydroelectric power is available; thermal generators are necessary to increase production from existing installations.

Germany.[9]—The Federal Republic (Allied Zone) of Germany produced 27,000 metric tons of aluminum in 1950. An aluminum capacity of 85,000 tons per year was authorized by the Allied powers in 1949, but the way in which this capacity was to be distributed among the five existing plants had not been determined. Here, too, shortage of electrical power limited 1950 production.

The two plants in the Soviet Zone of Germany were reported to have been largely dismantled and shipped to the U. S. S. R. A small potline remaining at Bitterfeld was reported to be producing a small amount of primary aluminum for upgrading secondary metal. Secondary smelters were active.

Hungary.—Information regarding aluminum production in Hungary in 1950 is sketchy. Very little hydroelectric power was available, and lack of power facilities was a retarding factor in this country, which has large, high-grade bauxite deposits. The domestic chemical industry did not appear to be able to supply the necessary soda ash and cryolite for any extensive expansion. A new aluminum works was being erected at Almasfuzito, but its degree of completion was not known.

India.—India, with a reported capacity of 6,000 metric tons per year, produced 3,650 tons in 1950 and consumed approximately 12,000. Production was hampered by lack of power, slow deliveries of petroleum coke, and inadequate fuel for transportation of bauxite. The Indian Government announced a plan to subsidize output for 3 years to encourage production.

Italy.—Aluminum production in Italy increased 11,423 metric tons over 1949 for a 1950 total of 37,070 metric tons. This increase was due largely to a better electrical supply. A new aluminum plant, utilizing Gargano Peninsula bauxite, was planned for Bari.

Japan.—Japan produced 25,000 metric tons of primary aluminum in 1950, an increase of 17 percent over 1949. Japan's aluminum

---

[9] See Pearson, B. M., A Survey of the Aluminum Industry in Postwar Germany: Light Metal Age, June 1950, pp. 15–16.

production capacity was reported to be 114,000 metric tons per year in 1946, but output has been retarded by political and economic factors. Bauxite was obtained from Indonesia. In 1949 economic conditions limited the domestic market for aluminum products, and the world market was too low to permit substantial exports except for manufactured articles in relatively small amounts. Beginning in the middle of 1950, the increased world demand resulting from a shortage in the United States made export prices attractive, and exports of ingot, scrap, and fabricated products exceeded the total production for the year. About 40 percent of Japanese exports during 1950 came to the United States; the remainder was distributed widely, going principally to South America, Canada, and Asia.

New Zealand.—The New Zealand Government was reported to have plans for setting up a plant in the Antipodes with an annual capacity of 50,000 metric tons per year.

Norway.—The domestic market for Norwegian aluminum was small, probably not more than 5,000 metric tons per year, but projected plans provided for increasing the domestic capacity to 95,000 tons per year by 1952 or 1953. Capacity at the beginning of 1950 was about 50,000 tons. In 1950 the Government started construction of a new plant at Sunndalsoyia, near the Aura power station, and completed its first expansion of the German-built plant at Ardal. Approximately 40,000 tons of added Government capacity was under construction. The Stangfjord Electrochemical Works at Eydehavn was installing a plant for producing 1,500 tons per year of super-purity aluminum (99.996 percent Al). Only one of the seven Norwegian plants produced its own alumina; the remainder was imported.

Spain.—The large increase (79 percent) in Spain's aluminum output was achieved by opening new Government-owned production facilities at Valladolid. A part of this plant began operation in November 1949. When completed, this new plant was to have a reported capacity of 5,000 metric tons per year.

Sweden.—Sweden produced 4,000 metric tons of aluminum and aluminum alloys in 1950, which was sufficient to supply only one-quarter of its domestic requirements. To boost production, the Government guaranteed a subsidy of 30 kronen per ton up to a total of 240,000 kronen spread over a 20-year period. It was planned to increase the production of the Kubikenbork works to 8,000 tons per year.

Switzerland.—Aluminum production in Switzerland in 1950 was about the same as for 1949; no plans for expansion were reported. Swiss aluminum interests operated extensively outside of the country and owned stock in aluminum facilities in Italy, France, Great Britain, Spain, Hungary, Czechoslovakia, Austria, and Germany.

United Kingdom.—The 30,000 metric tons of aluminum produced in the United Kingdom in 1950 supplied about one-eighth of its requirements, the balance of its supply being obtained largely from Canada. The high industrial concentration and lack of additional economic power in the British Isles precluded any large home expansion. A commission was established to investigate development of an aluminum industry on the African Gold Coast, using power from the Volta River and Gold Coast bauxite.

U. S. S. R.[10]—The figure given for aluminum production in the U. S. S. R. for 1950 is an estimate, as no official information is obtainable. Published production estimates from various sources varied from 50,000 to 500,000 metric tons. The western plants of Volkhov near Leningrad and Zaporzhyte on the Dneiper, which were destroyed in World War II, had been rebuilt and were in operation. The main center of production was the Ural Mountains; existing plants were enlarged and new plants added. The large German installations, previously at Lauta and Bitterfield, had been dismantled and moved to the U. S. S. R. and were presumably contributing to U. S. S. R. production. There were also indications of production or construction of facilities in Siberia and at Yerevan in Armenia.

Venezuela.—The Reynolds Metal Co. considered construction of aluminum facilities near the Orinoco River in Venezuela. This location would offer the advantage of cheap ore transportation from the Guianas by coastal shipping, and hydroelectric power would be developed on the Orinoco River.

Yugoslavia.—In 1950 Yugoslavia had one small aluminum plant in operation, with an estimated production of 2,500 metric tons. New aluminum facilities were under construction at Strnisci near Ptuj, but the economic and political situation has retarded their completion. These facilities were designed and partly constructed by the Germans during World War II and were further completed by the U. S. S. R. They were estimated as being 70 percent complete in 1950 and were to have a capacity of 30,000 tons of aluminum per year when finally constructed. Power was to be supplied from hydroelectric facilities being constructed on the Drava River near Maribor.

Antimony

By Abbott Renick and E. Virginia Wright

GENERAL SUMMARY

THE WORLD production of 50,000 metric tons of antimony in 1950 was 13,000 tons higher than in 1949 and exceeded the 1941–45 average (47,000 tons) by 6 percent.

Increases in the domestic primary antimony industry were as follows: Mine output, 53 percent; smelter production of metal, oxide, and sulfide, 17 percent; consumption of primary antimony, 34 percent; and industry stocks, 23 percent. Imports of ore, metal, and needle antimony increased 53 percent. Secondary production was 21 percent above the 1949 output. Quoted prices for antimony, RMM Brand, in cases, New York City, varied between a low of 26.28 and a high of 33.78 cents per pound. Average price for this metal during 1950, according to the American Metal Market, was 29.41 cents per pound.

The "new supply" of primary antimony during 1950, in terms of recoverable metal, was 19,721 short tons. A breakdown of this supply shows that domestic antimony ores contributed 2,297 tons;[1] domestic and foreign lead-silver ores, 2,850; and imports 14,574 tons. The antimony imported arrived as follows: Ore and concentrates 8,966 tons; metal, 4,632; needle, 13; and antimony oxide, 963. The supply from secondary sources was 21,862 short tons.

TABLE 1.—Salient statistics for antimony in the United States, 1941–45 (average) and 1946–50

	1941–45 (average)	1946	1947	1948	1949	1950
Production:

[1] Data not available.
[2] Antimony recovered chiefly as antimonial lead at primary lead refineries from domestic and foreign silver and lead ores not included.
[3] American Metal Market.
[4] Exclusive of U.S.S.R. Data differ from those given for world production in Antimony chapters for previous years, where they were in terms of recoverable metal content, computed at 92 percent of reported gross content.

[1] In terms of recoverable metal content, calculated at 92 percent of mine and mill production. Smelter production from domestic ores was 1,200 tons in 1950.

Estimated consumption of antimony in the United States during 1950 was 40,206 tons, comprising 18,344 tons of primary and 21,862 tons of secondary.

Primary antimony consumed as such in the manufacture of finished products totaled 15,494 tons. This figure includes losses in certain intermediate smelting and refining operations. In addition to the 15,494 tons, 2,850 tons of primary antimony were recovered, chiefly

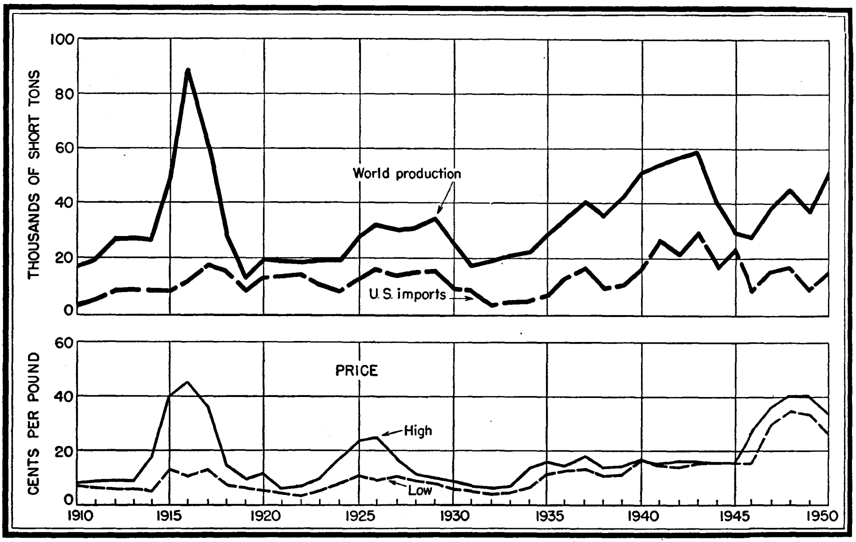

FIGURE 1.—Trends in world production, United States imports and New York price of antimony, 1910–50.

as antimonial lead, from domestic and foreign silver and lead ores. Secondary production and shipments of antimony, recovered chiefly in lead-base alloys at secondary plants, including antimony from scrap at primary lead refineries, amounted to 21,862 tons.

As of December 11, 1950, an increase from 1 cent to 2 cents a pound in the import duty on metal and regulus became effective.

DOMESTIC PRODUCTION

MINE PRODUCTION

During 1950 shipments of antimony ores and concentrates totaled 6,888 short tons containing 2,497 tons of antimony, of which 2,297 were estimated as recoverable. In addition, 2,850 tons of antimony were recovered from silver and lead ores at primary lead refineries. Compared with 1949, the 1950 output from antimony ores and concentrates increased 53 percent and from silver and lead ores 77 percent.

Alaska.—Earl Pilgrim operated the Stampede mine in the Kantishna District.

California.—Cordero Mining Co., in the Lone Tree district, San Benito County, is actively engaged in underground development. This property was diamond-drilled by the Bureau of Mines during the spring of 1950 as part of a program for ascertaining the Nation's potential supply of critical metals and minerals.

Idaho.—Bradley Mining Co., the principal producer of antimony in the United States, produced 6,723 tons of concentrate containing 2,424 tons of antimony. The new antimony smelter at this property operated intermittently during 1950, while numerous metallurgical difficulties were being worked out. Improvements and plant additions were made which were expected to raise 1951 output (largely in the form of antimony oxide) to over 3,500 tons.

Hermada Mining Co. operated its mine in Elmore County; the Coeur d'Alene Mining Corp. operated the Mineral Point mine at Wallace; and the Sunshine Mining Co., Shoshone County, recovered considerable antimony from silver-lead ores.

Nevada.—Tony Romano operated the Big Creek mine and Phil Cox operated the Antimony King mine at Austin and John B. Wardlaw operated the Last Chance mine at Tonopah.

TABLE 2.—Antimony-bearing ores and concentrates produced in the United States,[1] 1941–45 (average), and 1946–50, in short tons

Year	Gross weight	Antimony content		Year	Gross weight	Antimony content	
		Quantity	Average percent			Quantity	Average percent
1941–45 (average)	11,138	3,276	29.4	1948	16,239	6,489	40.0
1946	13,962	2,505	17.9	1949	5,260	1,636	31.1
1947	20,020	5,316	26.6	1950	6,888	2,497	36.3

[1] Includes Alaska.

SMELTER PRODUCTION

Primary.—Antimony smelters in the United States produced metal, oxide, and sulfide containing a total of 9,471 short tons of antimony from domestic and foreign ores in 1950, an increase of 17 percent over 1949. The Bureau of Mines is not at liberty to publish precise separate data on these three intermediate primary products. However, approximately 65 percent of the output in 1950 (about 60 percent in 1949) was in the form of oxide.

Antimonial lead produced as a byproduct by domestic primary lead refineries from ores and scrap totaled 61,912 tons containing 4,504 tons of antimony in 1950, an increase of 50 percent from the 1949 output of 41,402 tons containing 3,385 tons of antimony. A detailed discussion of antimonial lead production is contained in the Lead chapter of this volume.

Secondary.—Antimony produced at secondary metal plants, including 1,654 tons recovered from scrap at primary lead refineries, was 21,862 short tons, an increase of 21 percent over 1949. A detailed review is contained in the Secondary Metals—Nonferrous chapter of this volume.

TABLE 3.—Antimony metal, alloys, and compounds produced in the United States, 1941–45 (average) and 1946–50, in short tons

Year	Primary metal, oxide, and sulfide (antimony content)	Antimonial lead produced at primary lead refineries						Total secondary antimony (content of alloy [3])
		Gross weight	Antimony content					
			From domestic ores [1]	From foreign ores [2]	From scrap	Total		
						Quantity	Percent	
1941–45 (average)	(4)	53,982	2,068	564	1,213	3,845	7.1	17,669
1946	12,422	50,480	1,231	226	1,828	3,285	6.5	19,115
1947	13,782	86,075	1,460	571	2,902	4,933	5.7	22,984
1948	14,308	100,764	2,190	1,031	2,539	5,760	5.7	21,592
1949	8,099	41,402	1,214	396	1,775	3,385	8.2	18,061
1950	9,471	61,912	2,253	597	1,654	4,504	7.3	21,862

[1] Includes primary residues and small quantity of antimony ore.
[2] Includes foreign base bullion and small quantity of foreign antimony ore.
[3] Includes antimony content of antimonial lead produced at primary lead refineries from scrap.
[4] Data not available.

CONSUMPTION AND USES

During 1950 the consumption of primary antimony increased 34 percent. Consumption in metallic products increased 40 percent and in nonmetallic products 27 percent. The use of secondary material, chiefly in metallic products, remained on the same level as during 1949.

TABLE 4.—Industrial consumption of primary antimony, 1945–50, in short tons [1]

Product	1945	1946	1947	1948	1949	1950 [2]

Other	375	425	2,617	2,173	1,443	2,286
Total nonmetal products	13,155	5,853	6,555	6,074	4,631	5,868
Grand total	25,761	17,515	16,647	15,455	11,530	15,494

[1] Data for 1945–48 compiled from monthly applications filed with the Office of Materials Distribution, U. S. Department of Commerce (formerly with War Production Board and Civilian Production Administration).
[2] Data for 1950 include certain intermediate smelting and refining losses, which have been deducted for earlier years.
[3] Includes miscellaneous metallic products.
[4] Included with "Other." Bureau of Mines not at liberty to publish separate figures.
[5] Revised figure.
[6] Consumption April through December 1947; January through March included with "Other."

STOCKS

At the close of 1950, industry stocks of antimony were 35 percent higher than the 6,073 tons reported at the end of 1949. Mine stocks at the beginning and end of 1950 were 195 tons and 626 tons respectively. Other industry stocks were 5,878 tons in 1949 and 7,563 tons on December 31, 1950.

TABLE 5.—Industry stocks of antimony in the United States at end of year, 1949–50, in short tons of contained antimony

Raw material	Dec. 31, 1949			Dec. 31, 1950		
	Mine	Other	Total	Mine	Other	Total
Ore and concentrates	195	2,268	2,463	626	3,493	4,119
Metallic antimony		1,587	1,587		1,888	1,888
Antimony oxide		1,915	1,915		1,989	1,989
Antimony sulfide (needle)		108	108		193	193
Total	195	5,878	6,073	626	7,563	8,189

PRICES

The price of antimony metal in bulk, f. o. b. Laredo, Tex., averaged 27.626 cents per pound; ranging from 24.50 to 32.00 cents per pound in 1950. The New York price was approximately 1.78 cents a pound higher than the Laredo quotation and averaged 29.406 cents a pound for 1950. The 1949 average New York price was 38.73 cents per pound.

According to E&MJ Metal and Mineral Markets, opening and changes in nominal quotations for antimony ore during 1950, per unit (20 pounds) of antimony contained were as follows:

	50–55 percent	*58–60 percent*	*60–65 percent*
Jan. 5, 1950	\$2.50–\$2.60	\$2.60–\$2.70	\$2.70–\$2.80
Jan. 26, 1950	2.40–2.50	2.60–2.70	2.70–2.80
June 8, 1950	1.80–1.90	2.00–2.10	2.20–2.30
Sept. 21, 1950	2.70–2.80	2.90–3.00	3.00–3.10
Nov. 2, 1950	3.85–3.95	3.95–4.10	4.50–5.00
Dec. 7, 1950	4.25–4.30	4.30–4.40	4.75–5.00

FOREIGN TRADE [2]

Imports.—General imports of antimony in ore and as metal increased 30 and 150 percent, respectively; antimony as needle decreased 77 percent. The over-all increase in imports was due chiefly to the increased consumer demands. Imports of ore and concentrates came principally from Bolivia, Mexico, Peru, and Chile. Imports of metal were chiefly from Mexico, Belgium–Luxembourg, and Yugoslavia.

Imports of antimony oxide totaled 1,160 tons, valued at \$428,386. The bulk of it came from the United Kingdom and Belgium. This is in sharp contrast to the 56 tons imported in 1949. Imports of salts and compounds totaled 10 tons, valued at \$3,106. These originated in the United Kingdom.

As of December 11, 1950, an increase from 1 cent to 2 cents a pound in the import duty on metal and regulus became effective.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TABLE 6.—Antimony imported for consumption in the United States, 1946–50 [1]

[U. S. Department of Commerce]

[1] Data are general imports, that is, include antimony imported for immediate consumption, plus material entering the country under bond. Table does not include imported antimony contained in lead-silver ores.
[2] Revised figure.
[3] Imports shown from Chile probably were mined in Bolivia or Peru and shipped from a port in Chile.
[4] Less than 0.5 ton.

Exports.—Exports in 1950 (gross weight) of antimony ore were 6 tons valued at $865; metal and alloys, 148 tons valued at $86,496; and salts and compounds, 184 tons valued at $103,167. During 1949 exports (gross weight) included 35 short tons of antimony ore and concentrates valued at $10,984 and 450 tons of metal and alloys valued at $337,177. Reexports of ore in 1950 were 39 tons valued at $4,450, and of regulus or metal, needle, alloys, and scrap, 68 tons valued at $41,348.

TECHNOLOGY

Developments in the antimony industry were discussed in a review of published work, 1945–50.[3]

The antimony-smelting plant at Vajskova, Czechoslovakia, was described.[4]

Results of antimony-plating experiments were given in an article, Bright Deposits from Complex Citrate Baths by Electro Deposits.[5]

Several United States patents relative to antimony were issued during 1950.[6]

WORLD REVIEW

Algeria.—The Society of African Mines has instituted a vigorous development program at the Ain Kerma antimony deposits which will permit the recovery of substantial tonnages.[7]

Austria.—The Economic Cooperation Administration announced that a mill for concentrating antimony ore began operation in Carinthia during 1950. Construction of the mill was financed by the ECA. The annual capacity is 7,200 tons of ore.[8]

Japan.—Antimony is being produced by a new process at the Nakase smelting plant which was constructed late in 1948. The Nakase plant successfully treats domestic low-grade stibnite ore.[9]

Union of South Africa.—During the year, the Consolidated Murchison (Transvaal) Goldfields Development Co. made arrangements to increase its milling capacity to 14,000 tons of antimony ore monthly.[10]

Yugoslavia.—A new flotation mill at the Zaja mine, to be completed this year, will increase the production of antimony metal 15 percent.[11]

Arsenic

By Arnold S. Kemp

GENERAL SUMMARY

THE production of 13,273 tons of white arsenic in 1950 slightly surpassed the 1949 output. Shipments exceeded production and reduced producers' stocks on hand at the end of 1950 to 2,479 tons, nearly 5,000 tons from the 1949 year end. Producers' stocks at the end of 1949 had been the highest since 1939, the first year for which the Bureau of Mines compiled such data.

Toward the end of the year shortages in chlorine, phenol, benzol, and other raw materials for the manufacture of the organic insecticides reduced the available supply and prospects for DDT, benzene hexachloride, 24D, 24–5T, chlordane, toxaphene, and parathion, which have been substituted for lead and calcium arsenate to a large extent. As a result, the progressive replacement of arsenical insecticides by organic insecticides was arrested. It was generally believed, however, that such shortages would be short-lived because increased plant facilities were scheduled to expand the supply of the basic organic materials early in 1951.

TABLE 1.—Salient statistics of the white arsenic industry in the United States, 1941–45 (average), and 1946–50, in short tons [1]

Year	Production	Sales	Imports	Exports [2]	Apparent consumption [3]	Producers' stocks	Prices per pound [4]
1941–45 (average)	30.561	31.505	13,174	1,431	43,248	2,580	$0.039
1946	10,211	12,039	13,821	[5] 1,000	24,860	471	.04 –.06
1947	18.755	18,188	13.940	[5] 1,000	31.128	1,038	.06
1948	18,639	14.965	9,336	----------	24.301	4,712	.06 –.06¼
1949	12,795	10,181	4,696	----------	14,877	7,326	.06 –.05½
1950	13,273	17,330	14,774	----------	32,104	2,479	.05½–.06½

[1] For data for earlier years (1910–45), see Arsenic chapter, Minerals Yearbook, 1949.
[2] Figures for 1943–45 from U. S. Department of Commerce; figures for other years reported by producers to Bureau of Mines.
[3] Producers' shipments, plus imports minus exports.
[4] Refined white arsenic, carlots, as quoted by Oil, Paint and Drug Reporter.
[5] Conjectural.

DOMESTIC PRODUCTION

Crude and refined white arsenic was produced in 1950 by the Anaconda Copper Mining Co., at Anaconda, Mont. (copper smelter); United States Smelting, Refining & Mining Co., at Midvale, Utah (lead smelter); and American Smelting & Refining Co., in plants at Tacoma, Wash. (copper smelter), and Murray, Utah (lead smelter). The Murray smelter had intermittent production in 1949 and 1950. Additional arsenic-removal facilities were being installed at the Tacoma plant and were scheduled for completion in 1951. Arsenic metal was produced by Anaconda Copper Mining Co. but only on a very small scale. Domestic white arsenic is produced principally as a byproduct in the smelting of copper and lead ores.

TABLE 2.—Production and shipments of white arsenic by United States producers, 1941–45 (average), and 1946–50

Year	Crude			Refined			Total		
	Production (short tons) [1]	Shipments		Production (short tons)	Shipments		Production (short tons)	Shipments

[1] Excludes crude consumed in making refined. Includes crude white arsenic equivalent of compounds made directly from ores, flue dust, and speiss as follows: 1941–45 (average), 203 tons; 1946, 180; 1947, 97; 1948, 88; 1949, 26; 1950, none.
[2] Partly estimated.

CONSUMPTION AND USES

The major portion of white arsenic produced is employed in the manufacture of calcium and lead arsenate insecticides. The apparent consumption of white arsenic was 32,104 short tons in 1950—more than double the 14,877 tons for 1949, which had been the lowest consumption year since 1922. In recent years the trend has been for organic insecticides to replace arsenic compounds. However, in the cooler fruit areas lead arsenate has regained preference over DDT. Cold weather in the 1950–51 crop year brought about a lower degree of infestation; however, increased plantings of cotton induced by higher cotton prices tended to offset any decrease in the use of calcium arsenate against the boll weevil.

Arsenic is also consumed in glass manufacture, sheep dip, poisoned baits, pharmaceuticals, and acid-resistant copper and antimonial lead alloys. Sodium arsenite is used as a weed killer. Wolman salts or tanalith (25 percent sodium arsenate) is used as a wood preservative.

TABLE 3.—Production of arsenical insecticides and consumption of arsenical wood preservatives, in the United States, 1941–45 (average), and 1946–50

Year	Production of insecticides (short tons) [1]		Consumption of wood preservatives (pounds) [2]
	Lead arsenate (acid and basic)	Calcium arsenate (100 percent $Ca_3(AsO_4)_2$)	Wolman salts (25 percent sodium arsenate)
1941–45 (average)	37,207	28,201	1,049,514
1946	28,334	17,696	1,669,889
1947	15,094	23,594	1,156,847
1948	12,316	13,618	1,286,302
1949	8,434	8,003	1,003,992
1950 [3]	19,750	23,750	1,197,617

[3] Preliminary figures.

STOCKS

Year-end producers' stocks of white arsenic for 1950 were 2,479 short tons, a sharp drop from 7,326 tons at the close of 1949. Since shipments of 17,330 tons in 1950 exceeded the annual production of 13,273 short tons, the balance required for consumption depleted the producers' inventories.

PRICES

The carlot quotation for refined white arsenic, which had been 5½ cents per pound since October 1, 1949, was increased to 6 cents on September 25, 1950, and further advanced to 6½ cents on December 5, 1950.

FOREIGN TRADE [1]

Imports.—White-arsenic imports totaled 14,774 short tons in 1950, compared with 4,696 tons in 1949, 9,336 tons in 1948, and an average of 13,633 tons in the years 1945–47. Of the tonnage imported in 1950, 86 percent came from Mexico, which has been the principal foreign source.

Imports of metallic arsenic totaled 137,533 pounds, with the United Kingdom supplying 49 percent, Netherlands 24 percent, and Sweden 21 percent.

Practically all of the 1950 imports of arsenic sulfide originated in Belgium-Luxembourg; arsenical sheep dips came exclusively from the United Kingdom.

Exports.—Producers of white arsenic reported no direct foreign sales in 1950. Exports of calcium arsenate decreased 5 percent from those of 1949, whereas exports of lead arsenate increased 21 percent. Colombia was the principal recipient of calcium arsenate, with Mexico, El Salvador, and Peru following in order. Their respective portions of the total were 56 percent, 23 percent, 8 percent, and 7 percent. Cuba

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

was the principal recipient of lead arsenate and with Brazil accounted for 90 percent of the total exported.

TABLE 5.—Arsenicals imported into and exported from the United States by classes, 1941–45 (average), and 1946–50, in pounds

[1] Beginning Jan. 1, 1946, not separately classified. Figures for 1946–47 are conjectural; none believed exported in 1948–50.

WORLD REVIEW

Belgium.—Various arsenic products are made by Société Générale Métallurgique de Hoboken at plants near Antwerp, Herenthals, and Reppel; by Société des Mines et Fonderies de Zinc de la Vieille-Montagne, Liège; and by Belgochimie S. A., Ghent.

Canada.—The Deloro Smelting & Refining Co., Ltd., Deloro, Ontario, produced about 245 metric tons of refined white arsenic in 1950, most of it from the treatment of silver-cobalt ores from northern Ontario. Experiments were conducted by the Obrien Gold Mine Co. and Beattie Consolidated Gold Mine Co. to improve recovery of crude arsenics.[2]

Finland.—Output of arsenic concentrates at the Ylojarvi mine in 1950 was 266 metric tons.

Mexico.—Byproduct white arsenic was recovered by Cia. Metalurgica Peñoles, S. A. (subsidiary of American Metal Co.) at its Torreon, Coahuila, lead smelter. The American Smelting & Refining Co. also produced white arsenic at its San Luis Potosi copper smelter.

Portugal.—Mina de Pintor refinery produced 801 metric tons of refined white arsenic in 1950. During the year exports amounted to 1,276 tons, the bulk of it going to the United Kingdom, which had a contract for the entire output in 1950.

Sweden.—The Boliden Mining Co., largest individual producer of white arsenic in the world, confirmed reduction of exports of arsenic because of the inroads of organic compounds. The company announced that it has thousands of tons in stock, for which there appears to be no early consumption.[3]

Asbestos

By Oliver Bowles and F. M. Barsigian

GENERAL SUMMARY

ALTHOUGH production of asbestos in Canada, our principal source of supply, reached an all-time high in 1950, the demand for asbestos products steadily increased, and virtually all grades of asbestos were in short supply. Shortages were more acute for African than for Canadian fibers.

Domestic production nearly equaled the record output of 1949 but amounted to only about 6 percent of our domestic requirements. One mine in Vermont produces the bulk of the domestic output. Relatively small quantities of chrysotile, some of it of spinning grade, are produced in Arizona, and a small output of amphibole asbestos is recorded from several States.

Imports and apparent consumption exceeded all previous records. Imports from Canada attained an all-time high. Imports of low-iron chrysotile from Southern Rhodesia, however, and amosite and crocidolite from the Union of South Africa, were much smaller in 1950 than in 1949. This has created a rather critical situation with respect to these grades, which are obtainable from virtually no other foreign sources. All of the amosite and nearly all of the crocidolite are obtained from the Union of South Africa.

Industrial demand, much of it for defense orders, was so high that it was difficult to obtain material for the National Stockpile. Some progress has been made in developing substitutes. Prices of Canadian crudes remained constant throughout the year, but those of other grades advanced substantially during the fourth quarter. Prices of all grades were again advanced early in 1951.

[1] Revised figure.
[2] 1946–49 figures revised to exclude value of "Magnesia and manufactures." *See* footnote 1, table 6.

PRODUCTION

Domestic production and sales of asbestos were a little lower in 1950 than in 1949. Chrysotile was produced in Vermont and Arizona and amphibole in California, Georgia, North Carolina, and Oregon.

TABLE 2.—Asbestos sold or used by producers in the United States, 1946–50, by varieties

Year	Chrysotile		Amphibole		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1946	13,645	$499,260	430	$5,504	14,075	$504,764

1950	(1)	(1)	(1)	(1)	42,434	2,925,050

[1] Bureau of Mines not at liberty to publish figure separately.

Alaska.—No asbestos was produced in 1950 from the Alaska deposits in the Kobuk River district, but Philip S. Hoyt, P. O. Box 83, Aguila, Ariz., reported that in 1951 he planned production of asbestos suitable for filter fiber.

Arizona.—Production of chrysotile in Arizona almost doubled in 1950, and some high-quality material suitable for the National Stockpile was recovered. The following firms and individuals were active: Arthur Enders, P. O. Box 362, Globe; Gila Asbestos Co., Globe (started operations in March 1950 at the Wilson Cherry Creek mine near Young); Kyle Asbestos Mines of Arizona, P. O. Box 302, Globe; Phillips Asbestos Mines, Drawer 71, Globe; and R. G. Robertson, 1417 East MacDowell St., Phoenix (Bear Canyon mine on the San Carlos Indian Reservation).

California.—In Inyo County production of amphibole was reported by the Huntley Industrial Minerals, Inc., P. O. Box 305, Bishop. Powhatan Mining Co., 6721 Windsor Mill Road, Baltimore 7, Md., produced tremolite from the Sylvester mine near Hazel Creek in Shasta County. Sales of tremolite were reported by the Loma Blanca Mines, Inc., from Shasta County. There was no commercial production from this operation in 1950; in November 1950 the lease expired, and the property reverted to the owners. The Blas Asbestos Corp., La Moine, Calif., did not operate in 1950, and in August 1950, Johns-Manville Corp. took an option on the property.

Georgia.—Powhatan Mining Co. produced amphibole in Meriwether County, Ga., near Gay. Industrial Minerals Corp. reported development work on tremolite in Rabun County.

Montana.—Interstate Products Co., Inc., has done some development work on its amphibole-asbestos properties in the Gallatin Canyon.

North Carolina.—Powhatan Mining Co. produced amphibole in Transylvania County near Lake Toxaway. Industrial Minerals Corp., Asheville, continued development work on amphibole deposits in Macon and Yancey Counties.

New Mexico.—According to report, W. S. Beall, of Las Vegas, is developing a tremolite-asbestos deposit in the Guienas Canyon district 8 miles southeast of the Elk Mountain mining district, west of Las Vegas.

Oregon.—Philip S. Hoyt, P. O. Box 83, Aguila, Ariz., reported production in Oregon of asbestos suitable for use as filter fiber.

Vermont.—The Vermont Asbestos Mines Division of the Ruberoid Co., 500 Fifth Ave., New York 18, N. Y., the largest producer of chrysotile in the United States, prepared a range of well-graded fibers in its new mill, which began operation in 1949. The company used part of the output in its own asbestos-products plants.

CONSUMPTION AND USES

As shown in table 3, the apparent consumption of raw asbestos in the United States was about 36 percent higher in 1950 than in 1949; it was, in fact, the highest in the history of the industry. For both textiles and brake linings the demand was greater than the supply. Insulation products and building materials were in strong demand. The relationships between the consumption of asbestos, industrial production, and the volume of building construction are shown graphically in figure 1.

Articles on asbestos that appeared during the year included one on preparation of raw asbestos in the textile plant and the processes

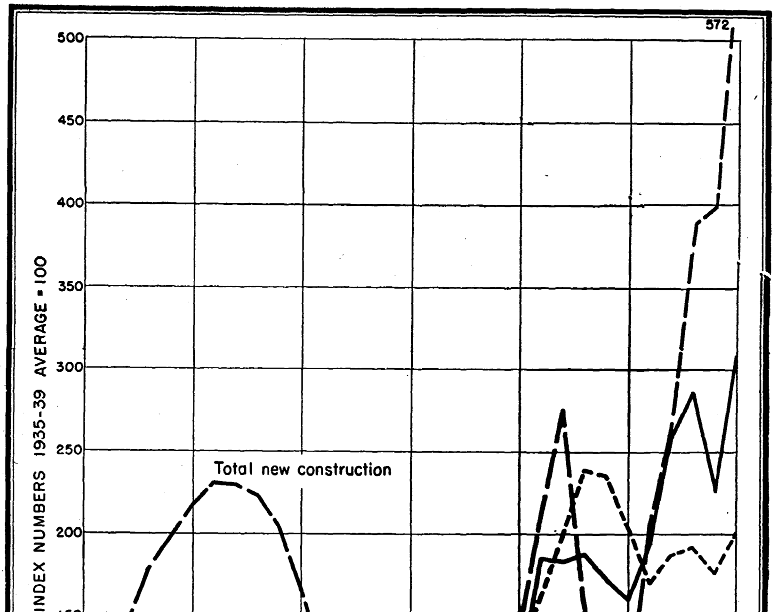

FIGURE 1.—Consumption of asbestos compared with total new construction and industrial production, 1920-50. Statistics on value of construction from Bureau of Foreign and Domestic Commerce and on industrial production from Federal Reserve Board.

employed in carding and spinning.[1] A wider use of asbestos in air filtering is indicated in another article.[2] There was also published a general summary of facts about asbestos and its industrial applications.[3]

TABLE 3.—Apparent consumption of raw asbestos in the United States, 1941–50

Year	Short tons	Value	Year	Short tons	Value
1941	438,741	$18,309,005	1946 [1]	458,727	$17,880,214
1942	433,949	21,582,096	1947 [1]	616,838	30,431,663
1943	445,902	23,351,483	1948	678,443	38,607,094
1944	389,241	18,864,291	1949	[1] 535,132	32,935,295
1945	378,030	15,926,622	1950	728,786	46,555,867

[1] Revised figure.

Foreign as well as domestic demand for all grades of raw asbestos was at a high level during 1950. Rehabilitation of asbestos-products plants in continental Europe increased the demand for both Canadian and African fibers in that area. The expanding military program resulted in numerous defense orders for products in which strategic grades of asbestos are used; in consequence, there was a shortage both of the spinning grades of Canadian fiber and the special grades that originate in Africa. The urgent need for increased production of asbestos, especially in the United States, stimulated active interest in exploration, but no promising results had as yet been reported.

PRICES

As quoted in the magazine Asbestos, the following prices, in short tons, f. o. b. mines, were constant throughout the year for Canadian asbestos: Group 1 (Crude No. 1) $960–$1,050; group 2 (Crude No. 2, Crude Run-of-Mine, and Sundry), $400–$550. Other grades were constant in price from January to October as follows: Group 3 (Spinning Fiber), $232–$425; group 4 (Shingle Fiber), $95.50–$141; group 5 (Paper Fiber), $78.50–$88; group 6 (Waste, Stucco or Plaster), $58; group 7 (Refuse or Shorts), $28–$52. From November to the end of the year the latter groups were quoted as follows: Group 3 (Spinning Fiber), $250–$425; group 4 (Shingle Fiber), $105–$155; group 5 (Paper Fiber), $85–$97; group 6 (Waste, Stucco, or Plaster), $63; group 7 (Refuse or Shorts), $30–$57.

Prices of Vermont asbestos, in short tons f. o. b. Hyde Park or Morrisville, Vt., were constant from January to October 1950 as follows: Shingle Fibers, $111.50–$124, Paper Fiber, $79–$96.50, Waste, Stucco, or Plaster, $59; Refuse or Shorts, $28.50–$52.50. From November to the end of the year, prices were advanced as follows: Shingle Fiber, $122.65–$148.50; Paper Fiber, $86.90–$106.15; Waste, Stucco, or Plaster, $64.90; Refuse or Shorts, $31.20–$57.60. Early in 1951 Canadian prices were advanced substantially, but Vermont prices were frozen at the December level.

FOREIGN TRADE [4]

Imports.—As the United States is the principal consumer of asbestos and produces only a small percentage (6 percent in 1950) of its requirements, large tonnages are imported. In 1950 imports were 38 percent higher than in 1949. Of this total, 96 percent came from Canada, 2 percent from the Union of South Africa, and about 1½ percent from Southern Rhodesia. On a value basis, the African percentages are much higher.

TABLE 4.—Asbestos (unmanufactured) imported for consumption in the United States, 1946–50, by countries and classes

[1] Revised figure. Changes in crude asbestos entries and country totals for 1946 in Minerals Yearbook, 1947, p. 147, are as follows: China (39 short tons, $3,000), total (39 short tons, $3,000); Southern Rhodesia (4,214 short tons, $762,820), total (4,438 short tons, $788,051); Union of South Africa (6,324 short tons, $633,312), total (6,324 short tons, $633,312), grand total, crude (13,878 short tons, $1,775,764), grand total, all countries (455,663 short tons, $18,770,817).

[2] Revised figure.

[3] Less than 0.5 ton.

[4] Includes 579 tons ($119,744) of chrysotile crude in 1949 and 207 tons ($44,895) in 1950 credited by U. S. Department of Commerce to Mozambique. Since Mozambique is not an asbestos producer, it is assumed that this actually originated in Southern Rhodesia.

[5] Includes in 1949, 2,930 tons ($113,279) of amosite crude, and in 1950, 1,000 tons ($96,075) of amosite crude and 10 tons ($2,715) of blue (crocidolite) crudes credited by U. S. Department of Commerce to Mozambique. Since Mozambique is not an asbestos producer, it is assumed that this originated in the Union of South Africa.

[4] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Exports.—Exports of unmanufactured asbestos were exceptionally high in 1949 and 1950. Exports of asbestos products, however, declined somewhat from 1949.

TABLE 5.—Asbestos and asbestos products exported from the United States, 1946–50

[U. S. Department of Commerce]

Year	Unmanufactured asbestos		Asbestos products [1]
	Short tons	Value	Value
1946	11,011	$1,395,367	$8,169,466

Total	----------	9,666,560	----------	8,111,922

[1] The item "Magnesia and manufactures" carried in this table for many years has been omitted because it includes a great variety of products only one of which (pipe covering) contains asbestos. The value of exports of "Magnesia and manufactures" was as follows: 1949—$1,231,457; 1950—$830,674.
[2] Quantity not recorded.

TECHNOLOGY

Further progress was made in developing processes for removing iron from Canadian asbestos to make it a suitable substitute for the low-iron chrysotile obtained in Southern Rhodesia. The shrinkage in imports from Southern Rhodesia was a powerful stimulus for such research. The Johns-Manville Corp. began making low-iron "Quinterra" asbestos paper in a new mill designed for this purpose at Tilton N. H. Raybestos-Manhattan, Inc., continued its research and pilot-plant work on a low-iron asbestos paper, "Novabestos." The Naval

Research Laboratory in Washington, D. C. also developed a process, employing the centrifugal action of water in a papermaker's "Vortrap," which accomplishes a remarkable reduction in the iron content of Canadian fiber.

Considerable work was done in the Bureau of Mines Electrotechnical Laboratories at Norris, Tenn., on asbestos synthesis, particularly in the field of the amphiboles, but no reports have yet been issued.

The Asbestos Textile Institute has maintained a research fellowship at Rutgers University since 1946. One of its accomplishments has been development of a testing machine for evaluating the resistance of asbestos textiles to abrasion and flexing action.

WORLD REVIEW

Although official statistics are too incomplete to permit an accurate estimate of total production at this time, it appears that for the first time in history world output exceeded a million tons in 1950. Canada produced about two-thirds of this total.

TABLE 7.—World production of asbestos by countries,[1] 1945–50, in metric tons

[1] In addition to countries listed asbestos is produced in Algeria, Bulgaria, China, Czechoslovakia, Uganda, and U. S. S. R. Estimates by authors of the chapter are included in total.
[2] Data not available; estimate by authors of the chapter included in total.
[3] January to June, inclusive.
[4] Exclusive of sand, gravel, and stone (waste rock only), production of which is reported as follows: 1945, 4,635 tons; 1946, 5,749 tons; 1947, 8,718 tons; 1948, 40,066 tons; 1949, 32,015 tons; 1950 data not available.
[5] Includes asbestos flour.
[6] Less than 1 ton.

CANADA

Canadian asbestos production in 1950 recovered remarkably from the low output of 1949, caused by a prolonged strike. Shipments of 875,344 short tons, valued at $65,854,568, compared with 574,906 tons, valued at $39,746,072, in 1949 were a gain of 52 percent in quantity and 66 percent in value. Further expansion was foreseen for 1951 and 1952. The Asbestos Corp. almost doubled its mill capacity at the British Canadian mine by building a new rock mill and reconditioning an old one.[5] Johnson's Co. was building a new mill at Black Lake with a daily capacity of 4,000 tons of rock, but this was not expected to be in operation before the end of 1951. Canadian Johns-Manville Corp. made satisfactory progress in its extensive block-caving development and expected to have substantial production from three blocks during 1951. United Asbestos Corp., Ltd., has extensive properties near and under Black Lake, and a shaft has been sunk. According to report, drilling results were quite encouraging, but production was still in the indefinite future.

In 1950, for the first time, a substantial output of asbestos was indicated for areas outside of Quebec. The completed mill of the Canadian Johns-Manville Corp. in Munro Township, Cochrane District, Ontario, began operation in April. A detailed description of the deposit, and also of the mine and mill, was published.[6] Teegana Mines, Ltd., made some progress in development work and erection of a mill on a property near South Porcupine in Deloro Township, Ontario. This property had produced a small tonnage of chrysotile asbestos many years earlier.[7]

Diamond drilling established the presence of a deposit of good-quality chrysotile in northern British Columbia. Conwest-Exploration Co., Ltd., Toronto, Canada, planned extensive development work during 1951.[8] These deposits have been described in some detail.[9]

AFRICA

Southern Rhodesia.—As indicated in table 9 asbestos production in Southern Rhodesia in 1950 declined considerably below the level of 1949 but was higher than in 1948. Increased prices are reflected in the substantial gain in value of sales in 1950. The bulk of the production is obtained from four mines in the Shabani area—the Nil Desperandum, Birthday, 170, and 177. A smaller output is obtained from the King and Gath mines in the Mashaba district and the Croft mine in the Filabusi district. Nearly all of the production is in the hands of the Rhodesian and General Asbestos Corp., a subsidiary of Turner & Newall, Ltd., of Manchester, England. The strong demand for low-iron chrysotile stimulated increasing activity in exploration and development of other asbestos deposits in Southern Rhodesia.

TABLE 9.—Asbestos produced in Southern Rhodesia, 1945–50

Year	Short tons	Value	Year	Short tons	Value
1945	56,293	£1,788,386	1948	68,897	£2,604,623
1946	55,872	1,676,503	1949	79,638	3,986,703
1947	54,094	1,738,484	1950	71,527	4,615,490

Union of South Africa.—Asbestos production in the Union, as indicated in table 11, made remarkable gains in 1949 and 1950. The amosite expansion program is reflected in an increase of about 40 percent in output in both 1949 and 1950 compared with 1948. The chrysotile output was nearly twice as great in 1950 as in 1949. This increase probably was due to growing activity in the new mine and mill of Kinlock Asbestos, Ltd., about 25 miles from Barberton. The output of crocidolite (blue asbestos) gained 44 percent in 1950 over 1949. Milling methods for amosite and blue asbestos were described.[10]

Swaziland.—The Havelock mine in Swaziland close to the Transvaal border has become a substantial producer of chrysotile. Output in 1950 was slightly lower than in 1949.

Madagascar.—An unusual type of peach-colored asbestos occurs in Madagascar. It has been identified by three independent laboratories

TABLE 10.—Asbestos produced in and exported from the Union of South Africa, 1946–50 [1]

	Production (short tons)			Exports	
	Transvaal	Cape Province	Total	Short tons	Value
1946	12,636	7,589	20,225	21,481	£557,008
1947	21,959	8,183	30,142	33,237	927,371

TABLE 11.—Asbestos produced in the Union of South Africa, 1945–50, by varieties and sources, in short tons [1]

Variety and source	1945	1946	1947	1948	1949	1950
Amosite (Transvaal)	16,737	9,838	18,780	30,372	41,974	42,391
Chrysotile (Transvaal)	1,765	1,666	2,253	4,441	7,609	14,015
Chrysotile (Natal)	----	----	----	----	----	320
Blue (Transvaal)	1,471	1,102	896	2,608	9,181	15,386
Blue (Cape)	8,200	7,589	8,183	8,301	11,999	15,211
Anthophyllite (Transvaal)	43	30	30	13	154	89
Total	28,216	20,225	30,142	45,735	70,917	87,412

[1] Data from Union of South Africa, Department of Mines, quarterly and monthly reports.

as anthophyllite; but, unlike most anthophyllites the fibers are as strong and flexible as those of chrysotile. The location and extent of the deposit have not yet been determined.

OTHER COUNTRIES

Corsica.—It is reported that the Canari mine produced 1,050 tons of asbestos during the first quarter of 1950.[11]

Cyprus.—Conditions in the Cyprus mines, which produce substantial quantities of short-fiber chrysotile, were described briefly.[12] Production figures for 1950 are not yet available, but the industry made large gains in 1949 when eight mills were in operation. According to a report, the fiber recovered is about 1 percent of the total rock quarried and about 3 percent of the mill rock.[13]

Italy.—Italian output of asbestos has expanded greatly during recent years. About 90 percent of production is from the Turin and Dondrio mines.[14]

Japan.—Both amphibole and chrysotile asbestos occur in Japan, but production is confined to short-fiber chrysotile. It was reported that asbestos mining there is unprofitable.[15] Mining activities are supported by the profits of asbestos-products plants.

Asphalt and Related Bitumens

By A. H. Redfield and Elizabeth Sims

GENERAL SUMMARY

DOMESTIC demand[1] for petroleum asphalt (including small quantities of imported lake asphalt and grahamite) was 19 percent larger in 1950 than in 1949, but export demand was nearly 39 percent lower. As export demand was little more in 1950 than 1 percent of the total demand, however, the total demand increased 17 percent from 1949 to 1950. In numerical terms, an increase of 1,678,777 tons in domestic demand, offset in part by a decrease of 91,227 tons in export demand, was more than met by an increase of 1,678,737 tons in refinery production and an increase of 111,358 tons in imports of petroleum and lake asphalt. As a result, stocks held at the refineries were increased by 68,179 tons during 1950, compared with a withdrawal of 134,366 tons from stocks during 1949.

TABLE 1.—Supply and distribution of asphalt and related bitumens in the United States, 1949–50, in short tons

	1949	1950
SUPPLY		
Native asphalt and related bitumens:		
Production	1,202,393	1,250,862
Imports (chiefly lake asphalt)	4,109	5,863
Petroleum asphalt (excluding road oil):		
Production	8,910,362	10,589,099
Imports	213,967	323,571
Stocks, Jan. 1	1,028,548	894,182
Total supply	11,359,379	13,063,577
DISTRIBUTION		
Native asphalt and related bitumens:		
Domestic demand[1]	1,185,721	1,232,045
Exports	16,672	18,817
Petroleum asphalt (excluding road oil):		
Indicated (apparent) domestic demand[1]	9,028,348	10,707,125
Exports	234,456	143,229
Stocks, Dec. 31	894,182	962,361
Total distribution	11,359,379	13,063,577

[1] Domestic demand for native asphalt excludes, and that for petroleum asphalt includes, lake asphalt, since this has the same sorts of uses as the manufactured product.

NATIVE ASPHALT AND BITUMENS

Bituminous Rock.—Sales of bituminous rock by producers in the United States increased in tonnage from 1,150,931 short tons in 1949 to 1,184,676 tons in 1950 but decreased in value from $4,264,989 in

[1] The term "domestic demand" as used in this chapter means apparent consumption, that is, production plus net imports and changes in refiners' stocks.

1949 to $3,522,308 in 1950. Bituminous limestone amounted to 920,874 tons valued at $2,536,912 in 1949 and 1,071,955 tons valued at $2,737,056 in 1950. Bituminous sandstone totaled 230,057 tons valued at $1,728,077 in 1949 and 112,721 tons valued at $785,252 in 1950. Average sales values of bituminous limestone decreased from $2.75 per short ton in 1949 to $2.55 per ton in 1950. Average sales values of bituminous sandstone decreased from $7.51 per ton in 1949 to $6.97 per ton in 1950.

Gilsonite.—Sales of gilsonite by producers in northeastern Utah increased from 51,462 short tons valued at $1,303,584 in 1949 to 66,186 tons valued at $1,774,330 in 1950. The average sales value per ton at the mine or railhead increased from $25.33 in 1949 to $26.81 in 1950.

MANUFACTURED OR PETROLEUM ASPHALT

Production.—Petroleum refineries in the United States produced 10,589,100 short tons of asphalt in 1950, an increase of 19 percent over the 8,910,400 tons produced in 1949. The increases were general, but were greatest in the East Coast, Louisiana-Arkansas, and Oklahoma-Kansas-Missouri districts.

Stocks.—Stocks of asphalt held at refineries increased nearly 8 percent from 894,200 short tons on December 31, 1949, to 962,400 tons on December 31, 1950. The principal increases were in the East Coast, Texas Gulf Coast, Indiana-Illinois-Kentucky, etc., Arkansas-Louisiana Inland, and Louisiana Gulf Coast districts. On the other hand, asphalt stocks were reduced in the Appalachian, California, and Texas Inland districts.

TABLE 2.—Supply and disposition of petroleum asphalt (exclusive of road oil) at refineries in the United States in 1950, by refinery districts, in short tons

District	Production	Receipts [1]	Stocks		Consumption by producers, transfers, [2] losses, and exports	Sales to domestic consumers
			Jan. 1	Dec. 31		
East Coast	2,750,200	457,500	128,700	149,800	193,100	2,993,500
Appalachian	376,200	41,100	40,700	24,000	28,700	405,300
Indiana, Illinois, Kentucky, etc.	1,934,400	60,300	186,500	198,200	273,500	1,709,500
Oklahoma, Kansas, Missouri	1,046,000	96,000	127,100	129,500	98,000	1,041,600
Texas:						
Gulf Coast	545,200	17,500	45,300	66,100	34,900	507,000
Inland	602,200	52,100	50,200	49,100	70,600	584,800
Total Texas	1,147,400	69,600	95,500	115,200	105,500	1,091,800
Louisiana-Arkansas:						
Lousiana Gulf Coast	638,000		62,200	76,000	68,700	555,500
Arkansas, Louisiana Inland	623,300	58,200	79,800	96,200	35,000	630,100
Total Louisiana-Arkansas	1,261,300	58,200	142,000	172,200	103,700	1,185,600
Rocky Mountain	413,400	126,700	50,200	61,100	30,000	499,200
California	1,660,200		123,500	112,400	69,300	1,602,000
Total: 1950	10,589,100	909,400	894,200	962,400	901,800	10,528,500
1949	8,910,400	958,000	1,028,500	894,200	1,081,600	8,921,100

[1] Receipts from intraindustry refinery transfers, addition of other petroleum products blended to make cut-back asphalts, imports, and transfers from stocks formerly not classified as asphalt.
[2] Transfers between refineries and transfers of asphalt to stocks not so classified.

Sales.—Sales of petroleum asphalt to domestic consumers increased 18 percent in quantity from 1949 to 1950 and 9 percent in value. The average sales value per short ton decreased from $18.21 in 1949 to $16.87 in 1950. The greatest increases in tonnage sold were in the East Coast, Louisiana Gulf Coast, Oklahoma-Kansas-Missouri, Texas Inland, California, and Rocky Mountain districts. The only exception to the general increase in asphalt sales was in the Texas Gulf Coast district.

Of the total petroleum asphalt sold to domestic consumers in 1950, 25 percent was manufactured from foreign petroleum, imported mainly from Venezuela, Colombia, and Mexico, compared with 23 percent in 1949. Although runs of foreign crude to stills increased 14 percent from 1949 to 1950, sales of asphalt made from foreign crude increased 17 percent from 1949 to 1950. Of the foreign crude processed, 8 percent (revised figure) was converted to asphalt in 1949 and a little over 8 percent in 1950. Ninety-four percent of the asphalt made from foreign petroleum in 1950 and all of it in 1949 was manufactured in East Coast refineries.

Highway and street construction and airport-runway surfacing used, in the form of paving asphalt, paving flux, cut-back asphalts, and asphalt emulsions, 66 percent of the total asphalt sold to domestic consumers by petroleum refineries in 1950 compared with 70 percent in 1949. Sales of all grades of asphalt devoted wholly or principally to street and road construction increased 11 percent in 1950 over 1949.

Total United States	8,921,094	162,437,731	10,528,466	177,563,593

Roofing manufacture made the second largest demand for asphalt, absorbing 26 percent of the total sales of asphalt to domestic consumers in 1949 and 27 percent in 1950. Domestic sales of roofing asphalt and roofing flux combined increased 21 percent—from 2,351,471 short tons in 1949 to 2,846,623 tons in 1950. These figures do not include roofing asphalt and flux consumed by the refining companies in factories, owned by themselves or by affiliated companies, making prepared roofing and siding and saturated felts. Sales of prepared roofing and asphalt siding reported to the Bureau of the Census increased 18 percent—from 55,903,000 squares (revised figure) in 1949 to 65,707,000 squares in 1950—and of saturated felt 21 percent—from 521,961 short tons (revised figure) in 1949 to 633,863 tons in 1950.

Sales of asphalts emulsified with water were 20 percent lower in 1950 than in 1949. Petroleum refineries sold 74,151 short tons (17,469,975 gallons) valued at $1,495,574 in 1949 and 119,489 tons (28,151,609 gallons) valued at $2,440,692 in 1950. In addition, 113,199,203 gallons valued at $13,482,130 in 1949 and 76,558,691 gallons valued at $9,323,628 in 1950 were sold by secondary producers that purchased asphalt from petroleum refineries and manufactured it into emulsions. Accordingly, total known sales of emulsified asphalts and fluxes decreased 20 percent in quantity—from 130,669,178 gallons (554,623 tons) in 1949 to 104,710,300 gallons (444,441 tons) in 1950—and 21 percent in value—from $14,977,704 in 1949 to $11,764,320 in 1950.

APPARENT CONSUMPTION

In contrast with a slight decline in 1949, the apparent domestic consumption of petroleum asphalt (including small quantities of imported lake asphalt and grahamite, which have similar uses and are supplementary to petroleum asphalt) increased 19 percent in 1950 over 1949. The apparent average monthly domestic consumption increased from 752,362 short tons in 1949 to 892,260 tons in 1950. Total apparent consumption was 9,028,348 short tons in 1949 and 10,707,125 tons in 1950.

DISTRIBUTION BY RAIL

Although the apparent domestic consumption of petroleum asphalt increased 19 percent from 1949 to 1950, the tonnage of asphalt terminated by class I railroads in the United States increased less than 1 percent; this amounted to 5,584,389 short tons in 1949 and 5,637,478 tons in 1950, according to the Interstate Commerce Commission. It may be noted, however, that railroad terminations of asphalt were equivalent to only 62 percent of the apparent consumption of asphalt in the United States in 1949 and 53 percent in 1950 and that considerable quantities of asphalt were delivered to consumers by water, minor railroads, and motor trucks. Accordingly, the figures in table 6 do not present a complete picture of the consumption of asphalt by States.

Of the total deliveries by rail, 52 percent in 1949 and 55 percent in 1950 were set down in the populous area north of the Ohio and Potomac Rivers and east of the Mississippi River, although this area comprises only 14 percent of the area of continental United States. In this area terminations of asphalt were 7 percent larger in 1950 than in 1949. In the States south of the Potomac and Ohio and east of the Mississippi, deliveries of asphalt were 3 percent greater in 1950 than in 1949. Between the Mississippi River and the Rocky Mountains, railroad terminations of asphalt were 5 percent less in 1950 than in 1949; the largest decreases were in Oklahoma, Louisiana, Texas, and Minnesota. In the Rocky Mountain States receipts of asphalt by rail were nearly 16 percent lower in 1950 than in 1949. In the three Pacific States rail deliveries of asphalt were more than 20 percent lower in 1950 than in 1949.

TABLE 6.—Asphalt (natural, byproduct, and petroleum) terminated by class I railroads in the United States, 1949–50, by States, in short tons

FOREIGN TRADE[2]

Imports.—Imports of natural asphalt and bitumen into the United States totaled 4,109 short tons valued at $87,693 in 1949 and 5,863 tons valued at $136,003 in 1950. Imports of lake asphalt from Trinidad increased fron 4,014 tons valued at $73,715 in 1949 to 4,855 tons valued at $66,953. Imports of grahamite from Cuba increased from 73 tons valued at $2,294 in 1949 to 880 tons valued at $27,880 in 1950.

Imports of solid petroleum asphalt increased from 194,911 short tons valued at $2,351,632 in 1949 to 308,959 tons valued at $3,275,967 in 1950. All of these imports in 1949 and 98 percent of those in 1950 came from the Netherlands Antilles.

In addition, the United States received 104,808 barrels (19,056 tons) of liquid petroleum asphalt valued at $263,321 in 1949 and 80,365 barrels (14,612 tons) valued at $205,031 in 1950. Nearly all of these imports, in 1949 and 1950, came from the Netherlands Antilles.

Exports.—The tonnage of natural asphalt, unmanufactured, exported from the United States increased from 16,672 short tons valued at $823,143 in 1949 to 18,817 tons valued at $931,046 in 1950. Of the

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

1950 exports, 56 percent went to Europe, notably to the United Kingdom, France, Germany, Italy, Belgium, Sweden, the Netherlands, Switzerland, and Denmark. Canada received 15 percent of the total and Mexico 3 percent.

Exports of petroleum asphalt from the United States declined from 234,456 short tons valued at $7,402,161 in 1949 to 143,229 tons valued at $4,512,043 in 1950. Decreased shipments to eastern Asia accounted principally for the decline, offsetting larger shipments to Latin America, especially to Mexico and Brazil.

[1] In addition, exports of "petroleum-asphalt manufactures" were valued as follows: 1949—$321,252; 1950—$381,019 (quantity not available).

ROAD OIL

Sales of road oil by petroleum refineries in the United States increased 8 percent in quantity—from 6,768,000 barrels in 1949 to 7,326,000 barrels in 1950—but, because of lower prices, declined 4 percent in value—from $17,485,000 in 1949 to $16,876,000 in 1950. The increase in quantity was due principally to greater sales in the Indiana-Illinois-Kentucky, etc. district, the Rocky Mountain district, the California district, and the Texas district. Four refining districts—Indiana-Illinois-Kentucky, etc., Oklahoma-Kansas-Missouri, Rocky Mountain, and California—together made 97 percent of all the road-oil sales in 1949 and 96 percent in 1950.

Of the total sales of road oil to domestic consumers, 97,207 barrels valued at $397,074 in 1949 and 71,291 barrels valued at $233,269 in 1950 were made from foreign petroleum, imported chiefly from Venezuela, Colombia, and Mexico.

Barite

By Joseph C. Arundale and F. M. Barsigian

GENERAL SUMMARY

DOMESTIC production of barite declined in 1950, but the United States remained the world's leading producer. Arkansas continued to be the leading producing State, supplying nearly half of the total. One producer in California and two in Tennessee reported discontinuation of operations. New production was reported from New Mexico, and a new grinder began operations in Missouri. There were reported shortages of barite, particularly for well-drilling use, and many consumers drew from stocks. There was a sharp increase in imports and consumption of lithopone. Imports of crude barite were nearly double those of the previous year; most of the increased tonnages came from operations in Nova Scotia. Interest continued in the barium titanates and titanate ceramic materials. Several articles reviewing the barite industry in foreign countries were published.

TABLE 1.—Salient statistics of the barite and barium-chemical industries in the United States, 1946–50

[1] Revised figure.

DOMESTIC PRODUCTION

Domestic producers reported production of 693,424 short tons of primary barite during 1950.[1] This was the smallest output since 1945; however, the United States continued to lead the world in barite production.

[1] The term "primary barite," as used in this chapter, applies to barite as first offered to the trade, whether lump, crushed, or ground. Where ground barite has been reported to the Bureau of Mines as original production, an estimate of the value of the lump equivalent of the ground has been assigned to such tonnage.

In 1950 Arkansas was still the leading producer by a large margin, although output from the State decreased; Missouri was second, and Georgia moved up to third place.

Although the available supply (production plus imports) of barite was slightly less than in the previous year, the demand was stronger, and many consumers were forced to draw from stocks. Decreases in output in Arkansas, Nevada, California, Idaho, and Tennessee were partly offset by increases from Georgia, South Carolina, and Missouri.

TABLE 2.—Domestic barite sold or used by producers in the United States, 1948–50, by States

State	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
Arkansas [1]	362,470	$2,899,760	363,382	$2,907,056	343,168	$3,088,512

Total	799,848	6,693,413	717,313	5,642,226	695,414	6,193,906

[1] Value estimated.
[2] Included with "Other States."
[3] 1948—Arizona, California, and Nevada; 1949—Arizona, California, Idaho, New Mexico, and South Carolina; 1950—Arizona, California, Idaho, and New Mexico.

TABLE 3.—Ground (and crushed) barite produced and sold by producers in the United States, 1946–50

Year	Plants	Production (short tons)	Sales	
			Short tons	Value
1946	23	456,327	455,240	$7,208,193
1947	23	552,227	549,965	8,979,400
1948	23	630,808	631,424	11,195,365
1949	24	561,258	554,028	10,156,590
1950	26	569,129	573,359	11,305,209

Arizona.—The Arizona Barite Co. continued to produce ground barite for the well-drilling trade at its mine and mill near Mesa.

Arkansas.—Magnet Cove Barium Corp., which had been in continuous operation since 1941, was sold to Dresser Industries, Inc., of Cleveland, Ohio. The firm took over operation of the barite mine at Magnet Cove and the plant at Malvern. Baroid Sales Division of National Lead Co., in continuous production since 1942, produced ground barite at Malvern. All production from Arkansas was consumed in well drilling.

California.—Baroid Sales Division of National Lead Co. reported that its El Portal mine near El Portal was shut down during the year; however, the firm is reported to be developing a new deposit disclosed by drilling in this area.[2] Barium Products, Ltd., crushed barite in its plant at Modesto, the crude barite coming from its Almanor mine

[2] Mining Congress Journal, vol. 36, No. 12, December 1950, p. 71. Mining Record, vol. 61, No. 39, Sept. 21, 1950, p. 5.

near Greenville and two mines in Nevada. The crushed product was used in chemicals and glass.

Georgia.—New Riverside Ochre Co. and Paga Mining Co. produced barite near Cartersville. Several smaller producers also operated in Georgia during the year.

A report on barite in the Cartersville district, Georgia, gave cumulative output of barite concentrates from this district through 1943 as 1,830,000 long tons, about 24 percent of the total production of the United States.[3]

Idaho.—Simplot Fertilizer Co. ground barite in its plant at Pocatello for well-drilling use.

Missouri.—Numerous operators produced barite during the year, and the total output from the State increased over that in the previous year. The Superbar Co. completed a new grinding plant near Mineral Point and began grinding purchased Missouri crude barite.

Nevada.—Production in Nevada decreased, but a number of producers still operated.

New Mexico.—Mudrite Chemical Corp. resumed production near Hatch. A new firm—the Mex Tex Mining Co.—started production from its mine near Bingham and new mill at San Antonio. Its daily capacity is expected to be 200 tons per day.

South Carolina.—Industrial Minerals, Inc., continued to produce barite at Kings Creek. This company reported that it had begun open-pit mining and intended to abandon underground operations.

Tennessee.—Production in Tennessee continued to decline as two producers discontinued operations in 1950, leaving only B. C. Wood and L. A. Wood producing barite near Sweetwater.

CONSUMPTION AND USES

The bulk of the barite consumed was used in well-drilling muds, barium chemicals, and lithopone, with minor quantities consumed in glass, paint, rubber, and other products. Over half of all the domestic barite consumed and some imported material went into drilling muds as a weighting agent. The industry reported a shortage during the year. An increasing number of oil and gas wells are being drilled to greater average depths each year. In 1950, 43,279 wells were drilled to an average depth of 3,680 feet.

Consumption of barite in lithopone during the year was greater than in 1949 but well below that in previous years. This is explained by the fact that, although the demand for most pigments was at a record high, titanium dioxide pigments are replacing lithopone to some extent. At present, substitution is limited by titania plant capacity.

A considerable quantity of barite was consumed in a relatively new use during the year—aggregate in concrete for coating and weighting oil and gas pipelines in river crossings and swampy conditions, for protecting the pipe from corrosion, and for other concrete work where a heavy or dense aggregate is desirable.[4]

Use of free-flowing carbonate may decrease requirements of barium carbonate by 25 percent in scum prevention.[5]

[3] Kesler, T. L., Geology and Mineral Deposits of the Cartersville District, Ga.: U. S. Geol. Survey Prof. Paper 224, May 1950, pp. 1–97.

[5] Brick and Clay Record, vol. 116, No. 4, April 1950, p. 99.

Two barium chemical plants damaged by fire in 1949 completed repairs and were put into operation. These were Barium & Chemicals, Inc., Willoughby, Ohio,[6] and Chemical Products Corp., Cartersville, Ga., which also was undergoing a modernization program.[7]

TABLE 4.—Crude barite (domestic and imported) used in the manufacture of ground barite and barium chemicals in the United States, 1945–50, in short tons

[1] Of any barium chemical.
[2] Includes purchased material.
[3] Exclusive of purchased material and exclusive of sales by one producer to another.
[4] Black-ash data include lithopone plants.
[5] Revised figure.
[6] Included with "Other barium chemicals."
[7] Consists mostly of titanium dioxide-barium sulfate pigments (except in 1949–50), with small quantities of barium acetate, chromate, nitrate, perchlorate, peroxide, and sulfide. Specific chemicals may not be revealed by specific years.
[8] Plants included in above figures.
[9] Also includes barium sulfate (synthetic).
[10] A plant producing more than 1 product is counted but once in arriving at grand totals.

PRICES

Trade journals quoted moderate price increases for certain types of barite during the year.

Crude.—E&MJ Metal and Mineral Markets quoted the following prices for crude barite, f. o. b. mines: In September, Georgia, jig and lump, was increased to $13.00–$13.50 per long ton; Missouri, minimum 94 percent $BaSO_4$, less than 1 percent iron, continued at $9.50; 93 percent $BaSO_4$, $9.25.

Ground.—The December 18, 1950, issue of the Oil, Paint and Drug Reporter quoted water-ground barite in paper bags, carlots, St. Louis, $37.60–$37.85 per short ton, an increase over the January quoted price of $35.05. In December the price of Georgia, beneficiated barite in paper bags was $16–$18 per short ton, according to E&MJ Metal and Mineral Markets. Well-drilling grades of ground barite average $18.85 a short ton, bulk, f. o. b. plant, according to reports of grinders to the Bureau of Mines.

Witherite.—Witherite (barium carbonate) was quoted in 1950 at $65 per short ton, air-floated, carlots (the same as in 1949); $72 on less than 1 carload.

TABLE 9.—Range of quotations on barium chemicals in 1950

[Oil, Paint and Drug Reporter]

Barium carbonate, precipitated, bags, 10 tons and up, works	short ton	$72.50 -$87.50
Barium chlorate, kegs, works	pound	.25½- .35
Barium chloride, technical, bags, carlots, works, freight equaled	short ton	90.00 -156.00
Barium chromate, bags, freight equaled	pound	.31½- .32
Barium dioxide (peroxide), drums, carlots, works	do	.12
Barium hydrate, crystals, bags	do	.09 - .09½
Barium nitrate, barrels, carlots, works	do	.11½
Barium oxide, ground, drums, carlots, works	do	.11
Blanc fixe (dry):		
Direct process, bags, carlots, works	short ton	85.00 - 90.00
Byproduct, bags, carlots, works	do	80.00 - 85.00
Lithopone:[1]		
Ordinary, bags, carlots, delivered	pound	.06¼- .07½
Less carlots, same basis	do	.06½- .08½
Titanated (high-strength), bags, carlots, delivered	do	.08¼- .09⅝
Smaller lots	do	.08½- .10⅝

[1] Pacific coast prices on lithopone ¾ cent to 1 cent per pound higher.

FOREIGN TRADE[8]

Barite.—Imports of crude barite were the greatest since 1944 and more than double the 1949 quantity. The bulk of the imported crude barite came from Nova Scotia, with lesser quantities from Mexico and Yugoslavia.

TABLE 10.—Barite imported for consumption in the United States, 1946–50, by countries

[1] Less than 0.5 ton. [2] Revised figure.

[8] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Barite was on the list of commodities discussed at the third round of the General Agreement on Tariffs and Trade held at Torquay, England, in September 1950. The Committee on Reciprocity Information held a hearing on the subject earlier in the year.

Witherite.—No witherite is being produced currently in the United States except as an "impurity" in barite. All imports of witherite came from Great Britain.

TABLE 11.—Witherite, crude, unground, imported for consumption in the United States, 1945–50

[U. S. Department of Commerce]

Year	Short tons	Value [1]	Year	Short tons	Value [1]

TECHNOLOGY

There was continued interest in the compound barium titanate, particularly with regard to its possible use in equipment producing high-intensity sound. Such equipment may be used in washing clothing, mixing paints, etc.[9]

An interesting article on titanate ceramics was published. This article described the properties of these titanates, barium titanate in particular, the research and development work being done, and their potential usefulness in producing ultrasonic waves in liquids.[10]

A new colloidal barium compound mixture has been developed, which is said to produce clearer X-rays of the stomach and intestinal tract.[11]

WORLD REVIEW

Austria.—Barite production rose rapidly during the postwar period after World War II and by 1947 was more than double that of 1937. By 1949 it was over nine times that of 1937. The bulk of the production in 1950 was from the French Zone, with smaller quantities from the Soviet Zone.

At the same time that Austrian output increased in the postwar years consumption also has increased. No barite is exported, and considerable quantities are imported, mostly from Yugoslavia, Italy, and Germany.

There are known deposits of barite in the French and Soviet Zones. The Grosskogel is an underground mine in the Tirol in the French Zone; the Erzkogel is an open-pit mine in lower Austria in the Soviet Zone; and a third mine at the Kirtzbuehler Horn in the Tirol (French Zone) is still in the exploration stage. The barite mined in Austria is sold in lumps, crushed and unbleached. The price in 1950 was 250 schillings (about $12 at the official exchange rate) per metric ton.[12]

Canada (Nova Scotia).—A report on the condition of the Canadian barite industry was published.[13]

Maritime-Barytes, Ltd., is reported to have arranged financing for mill construction, and preliminary work was under way at the property near Brookfield, Nova Scotia. Officials anticipate that the 40- to 65-ton plant for producing high-grade white filler barite, with oil-well grade barite as a byproduct, would be ready to operate next April. The plant, designed by General Engineering Co. of Toronto, introduces some new features to the barite-milling procedure that are expected to result in improved recovery and more economical operation.[14]

Germany.—Before World War II Germany produced nearly half the world's supply of barite. In the postwar years much smaller quantities have been produced, which are adequate for her own use, with surplus for export to Switzerland, Indonesia, Netherlands, Czechoslovakia, and Belgium. Barite is obtained from deposits in

[1] In addition to countries listed, barite is produced in Belgium, China, Czechoslovakia, Mexico, Norway, Pakistan, Switzerland, U. S. S. R., and Yugoslavia, but data on production are not available.
[2] Estimate.
[3] Data not available; estimate by author of chapter included in total.
[4] Excludes British zone.
[5] United States zone.
[6] Preliminary data for the fiscal year ended March 31 of year following that stated.
[7] Includes witherite.
[8] Estimated by author of chapter; excludes countries listed in footnote 1.

the Southern Harz Mountains at Richelsdorf, in Lower Hesse, in the Spessart area, and in the Black Forest. It is also obtained as a coproduct at a pyrite mine.[15]

Great Britain.—The barite reserves of Great Britain were surveyed in an article. Reserves of proved and probable ore in mines now operating in England and Wales are estimated to exceed 2 million tons. The report also states that barite in economic quantities has been found in the northern Pennines, Durham coal field, Devonshire, the Lake District, Derbyshire, Shropshire, north and central Wales, and Somerset. Precipitated barium sulfate is also recovered from the mine waters of the Backworth colliery, northeast of Newcastle-on-Tyne. Proved and probable reserves of about 160,000 tons are estimated for the two principal Scottish mines.[16]

[16] Mining and Engineering Journal, vol. 60, part 2, No. 2971, Jan. 21, 1950, p. 703.

The Muirshiel mine, near the village of Loch Winnoch in Renfrewshire, Scotland, is one of the largest producers of barite in the United Kingdom. A description of the deposit, a history of its operation, and an account of the present production methods were presented in an article.[17]

Greece.—Barite produced in Greece is marketed in the United Kingdom and Trinidad, with smaller quantities going to Saudi Arabia, Iraq, and Lebanon.[18]

Bauxite

By Horace F. Kurtz and D. D. Blue

GENERAL SUMMARY

BAUXITE supplies met the requirements of most consuming industries during 1950, although the general production and processing capacity became more critical than at any time since World War II. Large quantities of bauxite were absorbed by the National Stockpile, and increased aluminum production required more bauxite than in other postwar years. The aluminum expansion program, as planned at the end of 1950, foretold an increase of over 50 percent in the requirements of metallurgical bauxite by 1953. Similarly, bauxite consumption by the abrasive, chemical, and other industries was greater in 1950, and further increases were expected to meet defense requirements. The unique increase in consumption of bauxite by the refractory industry reflected a gradual change from diaspore to bauxite as a source of aluminous material. As a result of the outlook for future requirements of bauxite, one Canadian and two domestic aluminum producers accelerated their schedules for developing bauxite deposits in Jamaica, and further expansion was planned in both Surinam and Arkansas in 1950.

TABLE 1.—Salient statistics of the bauxite industry in the United States, 1941–45 (average), and 1946–50

	1941–45 (average)	1946	1947	1948	1949	1950

Imports (as shipped)....do....	969,732	852,005	1,821,580	2,488,915	2,688,164	2,476,677
Exports (as shipped)....do....	217,049	97,788	94,369	54,113	[1] 34,902	45,209
World production.........do....	7,644,000	4,307,000	6,216,000	8,083,000	8,169,000	8,205,000

The demand for bauxite in 1950 was met largely by increased domestic production and by imports from South America and Indonesia. Domestic output totaled 1,334,527 tons (dried equivalent), 35 percent of the total new supply. The supply was augmented by a reduction of stocks in the hands of consumers and withdrawal of bauxite from the Government-held low-grade stockpiles at Hurricane Creek, Ark.

Prices of bauxite in most forms were higher in 1950 than in 1949, but an increase in the quantity of low-grade domestic bauxite mined caused a slight reduction in the average price as shipped to consumers. The value of production was computed as $7,692,809.

World production was estimated at 8,205,000 long tons, compared with 8,169,000 tons (revised) in 1949. United States and the Guianas, principal producers in the Western Hemisphere, mined 61 percent of the 1950 total, about the same proportion as in the preceding year.

Aluminum metal and aluminum oxide abrasives are discussed in the Aluminum and Abrasive Materials chapters, respectively, of this volume.

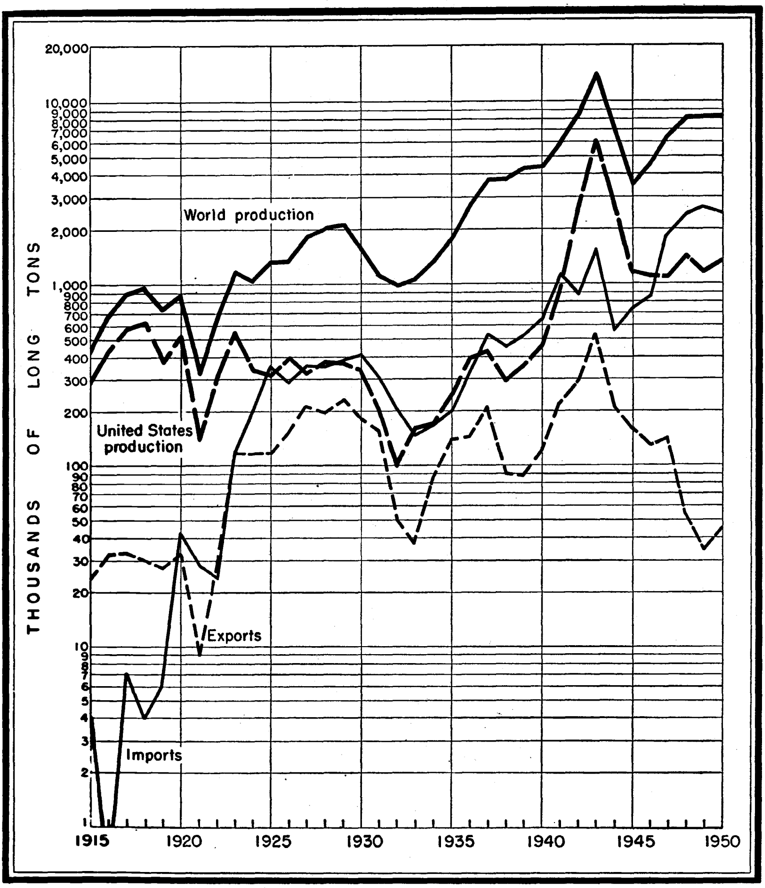

FIGURE 1.—Domestic production, imports, exports, and world production of bauxite, 1915–50.

RESERVES

Based on information obtained from drilling by the Bureau of Mines and information supplied by the bauxite-mining companies, the reserves of bauxite in Arkansas containing plus 32 percent available alumina were estimated in 1944 at 49,350,000 long tons in place. Assuming that the average moisture content is 15 percent, that 85 percent of the ore can be mined by open-pit methods with a 15-percent mining loss, and that 15 percent must be mined by underground methods with a 40-percent mining loss, the estimated reserves are equivalent to about 34,000,000 long tons after mining and drying. The "percent available alumina" was determined by subtracting 1.1 times the percentage of SiO_2 from the percentage of Al_2O_3. This is approximately the amount of alumina that would be recovered by the standard Bayer process.[1] More recent data developed by the

[1] Malamphy, M. C., Dale, G. K., Romslo, T. M., Reed, A. H., Jr., Ollar, A., and Tracey, J. I., Jr., Investigation of Arkansas Bauxite. Volume 1: Bureau of Mines Rept. of Investigations 4251, 1948, pp. 5, 9, and 10.

U. S. Geological Survey showed reserves of Arkansas bauxite at 38,900,000 tons in the ground (wet basis). This estimate included all measured, indicated, and inferred reserves in deposits 8 feet or more thick, containing not more than 15 percent silica or 6 percent ferrous iron and not less than 40 percent alumina and 32 percent available alumina. A typical analysis of the bauxite included in the estimate was given as: 52 percent Al_2O_3, 10 percent SiO_2, and 8 percent Fe_2O_3.[2]

Bauxite reserves in the Southeastern States, chiefly Alabama and Georgia, were estimated at 1,739,000 long tons in place, as of 1944. All bauxite measured, indicated, and inferred included in this estimate was in deposits 5 feet or more thick, containing not more than 15 percent silica and not less than 40 percent total alumina and 32 percent available alumina, with no restriction on iron content. A typical analysis of this ore showed 56 percent Al_2O_3, 13 percent SiO_2, and 1 percent Fe_2O_3.[3] More recent data on new discoveries and descriptions of deposits in various districts of the Southeastern States have been published since this estimate.[4]

In addition to reserves in the areas mentioned Oregon is known to have large deposits of high-iron bauxite.[5] Bauxitic clays, kaolin, alunite, anorthosite, and other aluminum silicates are widespread in the United States, and development of beneficiation and extractive processes that would make their treatment more economical would greatly increase the usable reserves of aluminous ore.[6] One method, used by Germany in World War II, for desilicating these materials was investigated by the Bureau of Mines.[7]

DOMESTIC PRODUCTION

In response to the demand for bauxite for the rearmament program, especially for expanding aluminum production, the domestic output of bauxite increased 17 percent to 1,584,753 long tons (1,334,527 tons, dried equivalent) from 1949 to 1950. Production from mines in Arkansas gained 21 percent over 1949, although Alabama and Georgia declined 43 and 54 percent, respectively. Arkansas supplied approximately 98 percent of the Nation's 1950 total.

[1] Figures adjusted to final annual totals.

Alabama.—All of the Alabama bauxite output in 1950 was produced by the Alcoa Mining Co. and D. M. Wilson Bauxite Co. from mines in the Eufaula district in southeastern Alabama. High-silica, low-iron bauxite mined by the Alcoa Mining Co., the largest of the two operators, was dried at its plant nearby, from which it was shipped to the chemical and refractory industries.

[1] Computed from selling price of bauxite shipped from mines.

Arkansas.—Arkansas bauxite was mined entirely from deposits within 25 miles south and southwest of Little Rock.

The Alcoa Mining Co. continued to mine low-silica bauxite in Saline and Pulaski Counties, Ark. Most of the ore from the mines in Saline County was dried at the company drying and calcining plant near Bauxite and shipped to alumina and chemical plants for consumption, but small quantities of undried bauxite were sold directly to the cement and abrasive industries. The Drury drying and calcining plant, serving the Pulaski County mines, shipped dried ore to the alumina and chemical industries and shipped calcined bauxite to abrasive producers. Some crude ore from this area was shipped to other processors.

The Rauch Leased mine was the only one operated by the American Cyanamid Co. in Arkansas during 1950. A drying plant in the Berger district, Pulaski County, near the mines, received ore from inventories at the idle Heckler and Berry Mahan mines, as well as the output from the Rauch Leased mine, and shipped the dried bauxite to chemical and oil-refining plants.

Consolidated Chemical Industries, Inc., did not mine bauxite during 1949 or 1950; however, ore was transferred from existing inventories at the Bierman Tract site, Pulaski County, for treatment at the Peiser Spur concentrating plant.

The Crouch Mining Co., subsidiary of the General Abrasives Co., mined bauxite from its Young mine in Saline County. After calcining at the plant near Bauxite, the ore was shipped for use in the manufacture of abrasives.

In 1950 the Dulin Bauxite Co. continued operating the Nutt-Bailey mine and began mining from the 400 B. C. mine. Most of the bauxite was sold in crude form, largely for alumina production. Ore calcined at the Dulin plant near Sweet Home was used for abrasives. The underground Nutt-Bailey mine was reported to be successfully using internal-combustion engines within the mine. Trailers powered by jeeps were used in the experiment to reduce bauxite-hauling costs.[8]

The Norton Co. resumed mining low-silica bauxite at the Norton mine, Saline County, during 1950. All of the mine production was calcined and shipped to the company plants for making abrasives.

Crude and dried bauxite were purchased from local producers by the Porocel Corp. and activated in its plant in Pulaski County. The finished product was used chiefly for oil refining.

[1] Includes crude, dried, calcined, activated, and sintered.

The Reynolds Mining Corp. remained the largest producer of domestic bauxite, although it mined only from its Saline County deposits in 1950. The entire production, generally high-silica ore, was sold to the parent Reynolds Metals Co. and converted to alumina at the Hurricane Creek, Ark., plant.

[8] Brandt, O. Thorsten, Nutt-Bailey Bauxite Mine in Arkansas: Explosives Eng., vol. 28, No. 1, January-February, 1950, pp. 7–11, 28.

The Riffe Construction Co. began operating the open-pit Ratcliffe mine near Sweet Home in 1950. The high-silica bauxite produced was used in the production of alumina.

TABLE 5.—Recovery of processed bauxite in the United States, 1946–50, in long tons

Year	Crude ore treated	Processed bauxite recovered			
		Dried	Activated, calcined, or sintered	Total	Dried bauxite equivalent

1950	657,798	480,623	63,713	544,336	579,884

Georgia.—The American Cyanamid Co. was the only bauxite producer in Georgia during 1950. Production came from mines in the Andersonville district, Sumter County, and from Bartow County when the Julia mine was opened late in the year. American Cyanamid Co. continued to dry ore at its plant in Sumter County before shipment to the chemical industry.

CONSUMPTION AND USES

Bauxite consumption totaled 3,332,803 long tons (calculated dried equivalent basis) in 1950, a gain of 24 percent over 1949 and the largest quantity recorded since the war year 1944. Consumption figures presented in this section include calcined bauxite shipped to abrasive plants in Canada for the manufacture of crude abrasives, which are returned to the United States for final manufacture and use, but do not include bauxite entering the National Stockpile. Consumption of bauxite on an "as-received" basis totaled 3,420,996 tons, consisting of 1,109,465 tons of crude ore, 2,151,707 tons of dried ore, 154,915 tons of calcined ore, and 4,909 tons of activated ore. Of the total bauxite consumption in 1950, 47 percent was from domestic sources and 53 percent from foreign. The alumina industry used approximately 87 percent of the total consumption, the abrasive industry 6 percent, the chemical industry 5 percent, the refractory industry 1 percent, and all other industries 1 percent.

[1] Revised figure.

Alumina.—Consumption of bauxite at alumina plants gained 26 percent in 1950, as the four large plants in operation produced 1,552,487 short tons of alumina. On the basis of a weighted average, about 1.86 long dry tons of bauxite were required to produce 1 short ton of alumina.

The Mobile, Ala., plant of the Aluminum Co. of America, which used imported bauxite, was the largest producer in 1950. Alcoa's East St. Louis, Ill., plant used mostly Arkansas ore and was the leading producer of commercial aluminum trihydrate and other special aluminas not to be reduced to metal. The Kaiser Aluminum & Chemical Corp. alumina plant at Baton Rouge, La., operated on South American bauxite. The Hurricane Creek, Ark., plant of Reynolds Metals Co., which had the largest capacity of the alumina plants, continued to extract alumina by the combination process developed during World War II. The sintering facilities at this plant permitted the use of relatively high silica bauxites, which were not economically feasible to process at the other three plants using the straight Bayer process. Silica is removed in the Bayer process in the form of red mud and usually discarded; however, each percent of silica in the bauxite carries with it at least as much alumina and attendant soda. At Hurricane Creek the red mud was sintered with limestone, which tied up the silica as dicalcium silicate. The ground sinter was then returned to the Bayer circuit, where alumina was extracted as sodium aluminate.

At the close of 1950 plans were being formulated to increase bauxite and alumina facilities to meet the requirements of the aluminum expansion program. Most of the additional bauxite supply was expected to come from Jamaica and Surinam. Alcoa had plans for increasing capacity of its Bayer plants at Mobile and East St. Louis and constructing a new combination-process plant near Bauxite, Ark. Kaiser intended to produce additional alumina by expanding Bayer facilities at Baton Rouge. Reynolds planned to expand the Hurricane Creek combination plant and facilities designed for treating Jamaica ores. The sources of alumina for new metal producers had not been determined.

Small quantities of alumina were reported produced from clay, chrome residues, and bauxite by companies other than the aluminum producers. Of the total alumina consumed, an estimated 90 percent was used at reduction plants in producing aluminum. The remainder was for chemicals, aluminum fluoride and cryolite, abrasives, oil refining, refractories, and other uses. Calcined alumina not used for metal production was consumed largely in the manufacture of white aluminous abrasives. Most of the aluminum trihydrate was consumed by the chemical industry or used to produce synthetic cryolite and aluminum fluoride.

Abrasive.—Consumption of bauxite for abrasives increased 5 percent in 1950. The abrasives industry also used alumina made from bauxite, consumption of this bauxite is included with data for alumina in table 6. Bauxite used in the production of abrasives was shipped in calcined form to areas of relatively inexpensive water power, particularly the Niagara Falls region, for electric furnacing. Much of the raw abrasive was produced on the Canadian side of the border, but since it was returned to the United States for final manufacture and consumption, the quantities of bauxite used in these operations are included with United States consumption figures. During 1950 abrasive-grade bauxite was removed from the Group I list of materials being purchased for the National Stockpile.

Chemical.—An increase of approximately 15 percent was noted in the direct consumption of bauxite by the chemical industry in 1950. In addition to bauxite, however, aluminum salts producers reported consumption of 97,553 short tons of clay, 16,929 tons of commercial aluminum trihydrate, 8,423 tons of secondary aluminum, and a small quantity of other aluminum-bearing materials.

[1] A company shipping more than 1 kind of salt is counted but once in arriving at total.

The total output of aluminum salts increased in 1950 despite a sharp decline in production of sodium aluminate. Significant gains were made in production, sales, and use of anhydrous aluminum chloride, iron-free aluminum sulfate, and general commercial aluminum sulfate. The total value of aluminum salts shipped or used by producers increased 28 percent.

Refractory.—The refractory industry required a consumption of 48 percent more bauxite than in 1949. With rapid depletion of adequate supplies of Missouri diaspore, the refractory industry was relying more on bauxite as a source of aluminous material. It was indicated at the close of 1950 that this trend would be accentuated in the next few years, and refractory-grade bauxite was added to the list of commodities to be purchased for the National Stockpile.

Other Industries.—Total bauxite consumption by the cement, oil-refining, steel and ferro-alloys, water-purifying, and other industries increased 29 percent in 1950.

STOCKS

Total inventories of bauxite at the close of 1950 were 7 percent lower than those reported for the beginning of the year. Stocks at mines and processing plants (including plants engaged in drying, calcining, or activating bauxite) were virtually unchanged, but inventories at consumers' plants were lowered approximately 10 percent from December 31, 1949. Starting in July 1950, Reynolds Metals Co. exercised its option to purchase bauxite in crude form from the Government-owned stockpiles near the Hurricane Creek, Ark., alumina plant. The amount withdrawn during 1950, as reported by General Services Administration, was 183,648 long tons; calculated on a dried-equivalent basis, the average analysis was about 50 percent Al_2O_3 and 10 percent SiO_2. All inventory figures mentioned in this chapter exclude bauxite held by the Bureau of Federal Supply for the National Stockpile.

TABLE 8.—Stocks of bauxite on hand December 31, 1946–50, in long tons

Year	Producers and processors		Consumers		Government, crude [2]	Total	
	Crude	Processed [1]	Crude	Processed [1]		Crude and processed [1] [2]	Dried-bauxite equivalent [2]
1946	547,164	9,853	62,442	181,708	3,277,090	4,078,257	3,516,901
1947	560,967	11,497	35,983	399,224	3,277,090	4,284,761	3,724,759
1948	654,601	7,441	57,191	590,124	3,277,090	4,586,447	4,023,300

PRICES

In 1950 the average value, f. o. b. mines and processing plants, was \$4.84 per long ton for crude (undried) bauxite, \$7.66 for crushed dried bauxite, \$16.95 for calcined bauxite, and \$60.73 for activated bauxite. Corresponding values in 1949 were as follows: \$4.98 for crude, \$7.50 for dried, \$16.31 for calcined, and \$16.19 for activated bauxite. The average value for all grades of domestic ore as shipped to consumers was \$6.57 per ton in 1950 (\$6.68 in 1949).

Nominal market quotations published in December by E&MJ Metal and Mineral Markets were as follows: Domestic ore, chemical, crushed and dried, 55 to 58 percent Al_2O_3, 1.5 to 2.5 percent Fe_2O_3, \$8 to \$8.50 f. o. b. Alabama and Arkansas mines; other grades, 56 to 59 percent Al_2O_3, 5 to 8 percent SiO_2, \$8 to \$8.50, f. o. b. Arkansas mines; pulverized and dried, 56 to 59 percent Al_2O_3, 8 to 12 percent SiO_2, \$14 to \$16, f. o. b. Arkansas mines; abrasive grade, crushed and calcined, 80 to 84 percent Al_2O_3, \$17, f. o. b. Arkansas mines; crude (not dried) 50 to 52 percent \$4.50 to \$5.50, f. o. b. Arkansas mines. The quoted price for the last item, crude bauxite, was \$4 to \$5 until late in 1950.

Bauxite from the stockpile at Hurricane Creek was sold to the Reynolds Metals Co. by General Services Administration under a price schedule similar to that used by Metals Reserve in purchasing the ore. The base price was \$4 per ton for bauxite analyzing 13 percent SiO_2 and 50 percent Al_2O_3 on a dry basis. Penalties of 43 cents for each percent of silica over 13 percent and 14 cents for each percent of alumina under 50 and bonuses of 20 cents for each percent of silica under 13 percent and 14 cents for each percent of alumina over 50 were imposed. An escalation provision for changes in labor costs was included in the pricing system.

FOREIGN TRADE

Imports of bauxite in 1950 decreased slightly to 2,476,677 long tons (as shipped). Most bauxite was shipped in the United States after drying to reduce shipping costs and facilitate handling. The duty on crude bauxite and dried bauxite remained at 50 cents per long ton throughout 1950, and the rate of 15 percent ad valorem for calcined bauxite was unchanged for most grades. However, a change from 15 percent ad valorem to $1 per long ton for the duty on calcined bauxite imported for use in the manufacture of fire brick or other refractories was approved September 27, 1950.

Of the total imports, 1,928,011 tons were from Surinam, 447,457 tons from Indonesia, 91,381 tons from British Guiana, and 9,828 tons from all other countries. By customs districts, 1,642,324 tons were received at Mobile, 744,330 at New Orleans, 23,505 at New York, 21,817 at Philadelphia, 12,908 at Virginia, 10,013 at San Francisco, 9,747 at Georgia, 8,650 at Massachusetts, and 3,383 at four other districts.

TABLE 9.—Bauxite and aluminum compounds imported for consumption in the United States, 1946–50

[U. S. Department of Commerce]

Year	Bauxite			Alumina		Aluminum compounds	
	As imported (long tons)	Dried bauxite equivalent [1] (long tons)	Value	Long tons	Value	Short tons	Value
1946	852,005	851,148	$5,965,124	4	$2,607	2	$654

[1] Calculated by Bureau of Mines.

Exports of bauxite and bauxite concentrates increased in 1950, reversing a downward trend begun in 1944. Bauxite and other aluminum ores comprised 37,150 tons of the 1950 shipments; 8,059 tons was classified as bauxite concentrates, including alumina. Canada, the recipient of over 97 percent of the total exports, used most of the bauxite to produce crude abrasives, which were returned to the United States for final manufacture and consumption.

TABLE 10.—Bauxite and aluminum compounds exported from the United States, 1946–50

[U. S. Department of Commerce]

Year	Bauxite (including bauxite concentrates), long tons			Aluminum sulfate		Other aluminum compounds	
	As exported	Dried bauxite equivalent [1]	Value	Short tons	Value	Short tons	Value

WORLD REVIEW

The world production of bauxite in 1950 was nearly the same as in 1949. The major bauxite output was in the Western Hemisphere; the United States, Surinam, and British Guiana supplied 61 percent of the world total. Production in the U. S. S. R. and satellite countries was estimated at 13 percent and in other European countries, 17 percent. The remaining world output, including Africa, Asia, and the Pacific Islands, was 9 percent of the total. Although Surinam and British Guiana continued the leading producers, both of these colonies produced less than in 1949. Among the major producers (over 100,000 tons a year), France, Italy, and the United States were the only countries that increased output. Estimated production for the U. S. S. R. and Yugoslavia also increased over that for 1949.

The anticipated expansion of the world aluminum industry renewed interest in exploration for bauxite deposits. During 1950 exploration for new deposits and re-evaluation of known deposits were reported in Australia, Brazil, British and French Guiana, France, India, Indonesia, Italy, Malaya, and the West Indies.

Plans for developing Jamaica bauxite deposits were firmly under way; by 1952 this country should join the major producers. Exploitation of Jamaica's deposits represents a major step to supplement Guiana bauxite imports for the North American aluminum industry. Futhermore, the development of the West Indies deposits is important as a security measure; Gulf coast ports are only about 1,000 miles from Jamaica, as compared to 2,500 miles from the Guianas, and the sea route to Jamaica can be patrolled effectively by land-based aircraft.

Other countries planning to enter the bauxite-production field were New South Wales and Tasmania in Australia, Malaya, Taiwan (Formosa), and French Guiana.

TABLE 11.—World production of bauxite, by countries, 1944–50 in metric tons

[1] Estimate.
[2] Data not available; estimate by authors of chapter included in total.
[3] Exports.
[4] Imports into Japan, Formosa, and Korea in fiscal year ended March 31 of year following that stated; preliminary figures.

Australia.—Australia has in the past been a small producer of bauxite, but with establishment of an aluminum industry in Tasmania production will probably increase. The Australian Aluminum Production Commission has reported 8,600,000 tons of proved reserves under control of the Commission, of which 850,000 tons are in Tasmania and 7,750,000 in New South Wales. Initial production of aluminum in Australia will come from high-grade Malayan ores. Steps have been taken to remove some overburden from deposits at St. Leonards, Tasmania, which contain a lower-grade ore than Malayan deposits, to make the local ore readily available for emergency use.

Brazil.—Brazil has the largest reserves of high-alumina low-iron bauxite in the Western Hemisphere. The Pocos de Caldas deposits are estimated to contain 120 million tons of high-grade ore. Numerous other deposits have been located in the States of Minas Gerais, Espirito Santo, São Paulo, Pará, Maranhão, Baia, and Rio de Janeiro. Plans for reopening an aluminum works constructed at Ouro Preto in the State of Minas Gerais during World War II resulted in renewed prospecting in the area, and bauxite for this plant will be mined from deposits near the alumina facilities. Bauxite from the Pocos de Caldas deposits was planned for use at an aluminum smelter to be built near São Paulo.

British Guiana.—Bauxite production in British Guiana in 1950 was 10 percent less than in 1949 and 15 percent less than in the postwar peak year 1948. Over 90 percent of the bauxite produced in the colony was exported to Canada. The Demerara Bauxite Co., Ltd., announced late in 1950 that supercalcined refractory-grade bauxite ("RASC") will be manufactured in British Guiana. A new drying kiln and expanded railway-transportation facilities planned for 1951 will greatly increase production by this company. A new mining concern, the Plantation Bauxite Co., Ltd., has taken over undeveloped bauxite-mining leases on the west bank of the Demerara River from former holders. Plans called for processing and loading ore produced by this company at facilities of the Demerara Bauxite Co., Ltd.

France.—French bauxite production in 1950 was the largest in history, with the exception of 1943. France was the only major aluminum-producing country that exported large tonnages of bauxite and alumina. Since production of alumina in France exceeded consumption, alumina was available for export. Data on French exports for 1947 to 1949 show that Switzerland, Norway, and Austria were the major foreign consumers of French alumina. The pattern of French bauxite exports has changed in recent years. Italy's imports of this material decreased from 26,000 tons in 1946 to 2,000 tons in 1949, and Norway's from 21,000 tons to zero. Major foreign consumers of French bauxite in 1949 were the United Kingdom (126,000 tons) and Germany (56,000 tons). The 1949 export patterns probably were carried through 1950.

French Guiana.—Gradual depletion of bauxite reserves in Surinam and British Guiana has brought about increased prospecting in French Guiana. Discovery of a large bauxitized zone 80 kilometers from Cayenne and 3 kilometers from a navigable river has been reported. The deposit consists of white bauxite above a stratum of red bauxite. The white bauxite was reported to contain 60 percent Al_2O_3, 1 percent SiO_2, and 0.3 percent Fe. Preliminary estimates were 10,000,000 tons of combined white and red bauxite. Smaller deposits of bauxite were believed to be located on the Island of Cayenne. The Société Pechiney was reported to be exploring for bauxite in French Guiana.

French West Africa.—The Campagnie des Bauxites du Midi made its first shipments of bauxite from the Iles de Loos in 1950. The objective is to export 300,000 tons of bauxite from these deposits by 1952.

Gold Coast.—The British Aluminum Co., Ltd., planned to increase bauxite production at its Gold Coast mines to 300,000 tons a year by addition of mining and processing machinery and of loading facilities at Takoradi.

Greece.—The Greek Government and the Economic Cooperation Administration Mission to Greece signed a series of agreements for carrying out the Greek reconstruction program. Under this program arrangements were made for shipping bauxite to the United States. Greek bauxite was also to be shipped to the Federal Republic of Germany, with repayment to be made in aluminum metal. The Eleusis bauxite mines were to be completely mechanized and production greatly expanded.

Hungary.—Hungary contains the largest bauxite reserves in Europe and during World War II produced over 1 million tons of bauxite a year. Destruction of mining and processing facilities by Germany at the end of the war and removal of the major market—the East Germany alumina plants—by the U. S. S. R. caused bauxite production to decline to 35,400 tons in 1945. Since that date production has been increasing. Although no data are available after 1947, there were indications that production was exceeding ready markets in 1950, and a French firm was requesting assistance in locating potential buyers for large tonnages of Hungarian bauxite. An alumina plant at Almasfuzuto on the Danube, 50 miles northwest of Budapest, was under construction, and operation was planned for 1951. Completion of this plant, with a reported initial capacity of 60,000 tons and a final capacity of 100,000 tons of alumina a year, will provide facilities for treating a large portion of the bauxite production. A large percentage of the alumina produced at this plant will be available for export.

India.—The Geological Survey of India announced discovery of a 300,000-ton bauxite deposit in the Sambhalpur district of Orissa. Bauxite was also discovered in the Belgaum and Kolhapur districts of Bombay, with reserves estimated at 30,000,000 tons. About 10 percent of this material was reported to contain over 50 percent Al_2O_3. As in most Indian bauxite, titania content was high, averaging 6 to 8 percent TiO_2 in the high-alumina ore.

Indonesia.—Bauxite production in Indonesia dropped almost 20 percent from the all-time high output of 1949. Labor difficulties, which temporarily closed the Bintan mines in July, were largely responsible for this decrease. The British Aluminum Co. was reported to be exploring a bauxite deposit at Sambas, West Borneo.

Italy.—Italian bauxite production suffered a severe loss when the Istrian mines were transferred to Yugoslavia by the peace treaty. A large part of the 1950 production was obtained from the Mount Gargano district, and the Italian Government has arranged to increase production in this area. A discovery of bauxite was made in the Calabria region, with reserves estimated at 2 million tons.

Malaya.—No bauxite has been produced in Malaya since the end of the Japanese occupation in 1944. In 1950 interest in Malayan bauxite was renewed. Aluminum Laboratories, Ltd., of Singapore applied for 2,500 acres of land for bauxite mining. Negotiations were underway to use high-grade Malayan ore in the initial operation of the aluminum facilities being constructed in Tasmania.

Surinam.—The 1950 production of bauxite in Surinam, the world's leading producer, was 2,080,657 metric tons, 45,997 tons less than in 1949. The Paranam plant produced 823,444 tons, Moengo 754,201 tons, and Billiton 503,012 tons. The decline in production was caused by operation of the Paranam mine on a two- instead of a three-shift basis and by extensive alterations at the Moengo mill. The bauxite deposits at Moengo were exhausted and abandoned late in 1949, and ore treated at the Moengo plant was mined at Rickanau Hill, about 13 kilometers east of the plant. Another drying kiln to be installed at this plant will increase output capacity to about 1 million tons annually. Late in 1950 plans were under way for opening mining operations at Rorac, 5 miles north of Paranam and on the opposite side of the river; the ore is to be loaded into barges and towed to the Paranam plant for processing. Surinam bauxite ore reserves were estimated as follows: Rickanau (Surinam Bauxite Co.) 40 to 45 million tons, Paranam (Surinam Bauxite Co.) 7.5 million tons, and Paranam (N. V. Billiton Co.) 15 million tons.

Taiwan (Formosa).—A company was formed late in November 1950 to mine bauxite deposits on Quemoy, a small island off the Chinese coast opposite the port of Amoy. The company, partly Government-financed, will produce 1,000 to 1,500 tons of bauxite monthly for the first 2 months and 3,000 tons a month thereafter. The bauxite will be shipped to the Taiwan Aluminum Corp. in Kaohsuing.

U. S. S. R.—No data on bauxite production in the U. S. S. R. are available, and estimates for bauxite production were made from (1) aluminum production estimates, (2) bauxite-consumption–aluminum-production ratio observed in other countries, and (3) the availability of bauxite from foreign countries. Hungary is the only country in the Soviet sphere that contains bauxite deposits and a mining development capable of supplying appreciable tonnages of this material to the U. S. S. R. Most of the U. S. S. R. aluminum facilities are in the eastern part of the Ural Mountains, and Hungarian bauxite for these plants would have to be transported a minimum of 2,000 miles. Thus, bauxite to supply the aluminum industry and other industrial uses located "behind" the Urals has probably been obtained from domestic sources. A large part of U. S. S. R. bauxite production would logically be mined from deposits in the Ural Mountains.

West Indies.—The West Indies have not yet realized any commercial production of bauxite, but the deposits in Jamaica, discovered in 1942, represent the largest known reserves in the Western Hemisphere and are being developed as a source of bauxite for the North American aluminum industry. The discovery of bauxite in Jamaica led to exploration of other islands in the area, and deposits were found in Hispaniola. Areas in Cuba considered to have favorable geologic conditions were investigated by the United States Geological Survey in cooperation with the Cuban Government, but bauxite was not found. The West Indies deposits that have been drilled and sampled to date are estimated to contain at least 350,000,000 tons of high-grade bauxite, of which 90 percent or more is in Jamaica.

The West Indies ores differ markedly in mode of occurrence, physical character, and chemical composition from others in the Western Hemisphere. The principal deposits occur in etched depressions on the broken plateaus of both Hispaniola and Jamaica. These depressions vary from sink holes 50 feet in diameter to huge bowls up to 50 miles in diameter and troughs nearly 20 miles long. There is virtually no overburden to be removed from the deposits. The ores are very porous, and the individual particle size is extremely fine, generally ranging from 0.1 to 1.0 micron. They contain some boehmite, as well as gibbsite. Diaspore is rare or absent. The average Al_2O_3 content is about 50 percent; Fe_2O_3, about 20 percent; and SiO_2, about 2 percent.

Shortly after their discovery, North American aluminum producers became interested in these deposits. In 1943, Jamaican Bauxites, Ltd., a subsidiary of Aluminum, Ltd., acquired property rights in Jamaica. In 1944 Reynolds Metals started active exploration and acquisition of mining rights in Jamaica and Haiti, and Kaiser Aluminum interests took up options on bauxite lands in 1947. Commercial development of Jamaican bauxite was initiated in 1950.

On January 24, 1950, an agreement was made between Reynolds Jamaica Mines, Ltd., and the Strategic Materials Division of Economic Cooperation Administration that the latter would advance up to $5,963,000 in Marshall Plan funds and 1,800,000 pounds sterling from Economic Cooperation Administration counterpart funds in Britain to develop 40 to 50 thousand acres of bauxite property in the St. Anne district owned or controlled by Reynolds. The total cost of the planned development was estimated at $14,500,000 and included, besides mining equipment, a processing mill at the mining operations, a 6-mile aerial conveyor system for transporting processed ore to the harbor, construction of Jamaica's largest, most modern deep-water pier at the west end of Ocho Rios Bay, and construction of a 12,500-ton, self-loading and unloading ore boat. The initial objective is production of 400,000 tons of bauxite per year, with the first shipments to be made in December 1951. The funds advanced by Economic Cooperation Administration are to be repaid over a period of 20 years in aluminum ingot, which will be added to the United States National Stockpile.

Jamaica Bauxites, Ltd., an Aluminum, Ltd., subsidiary, announced plans to construct an alumina plant in Jamaica. Economic Cooperation Administration funds amounting to $2,500,000 and 1,500,000 pounds sterling were advanced to finance the plant, and an additional $1,500,000 in capital costs was advanced by Aluminum, Ltd. Construction will start early in 1951 on a plant that will produce 40,000 tons a year. Bauxite will be mined from properties in Mile Gully near the mountain village of Manderville.

The Kaiser Aluminum & Chemical Corp. purchased properties in St. Elizabeth and took up options on properties in and around the Manchester and Manderville areas of south central Jamaica.

The Jamaica Legislature passed a law to permit the Government to make mining agreements with mining companies, which were to pay a royalty of 1s. a ton or such other royalty as the Government might specify.

Yugoslavia.—Data on bauxite production for 1950 were not available. It was reported that mining was carried on in Istria and near Mostar in Dalmatia and that facilities at Lake Novigrad were being modernized to permit shipments from that area. An agreement was made between the Yugoslav Government and German mining experts to develop bauxite resources of Cherso Island and the Sibenik district. Indications were that increased amounts of Yugolsav bauxite would be consumed in Germany in 1951. Bauxite deposits were discovered in Crna Gora, which are reported to contain several million tons. The alumina facilities at Strniste, planned by the Germans and partially constructed by Germany and the U. S. S. R., were reported as 70 percent complete when Yugoslavia broke from the Cominform. The plants were designed to produce a maximum of 100,000 tons of alumina a year, but the Yugoslav plan was to complete facilities for producing only 60,000 tons.

Bismuth

By Abbott Renick

GENERAL SUMMARY

THE 1950 domestic supply of bismuth metal, the largest ever recorded, exceeded that for 1949 by 24 percent. Increases in both production and imports contributed to this record. Exports of bismuth metal during 1950 increased 4 percent above the 1949 figure, and the United Kingdom again received the major portion. Stocks of metal held by producers were 22 percent higher on December 31, 1950, than at the end of 1949.

Peru continued in 1950 to be the largest foreign producer of refined metal. Canadian production of bismuth was substantially increased.

The price of refined bismuth in 1950 held at $2 per pound, in ton lots, until September 5, when it was advanced to $2.25.

DOMESTIC PRODUCTION

Virtually all domestic production of bismuth is derived as a byproduct from the smelting of lead ores and the refining of imported bismuth bars containing lead as a major impurity. The Bureau of Mines is not at liberty to divulge production figures, but 1950 output increased 17 percent over that in the previous year. This rise was due to increased domestic lead production and imports of bismuth bars during the year.

Companies reporting output of refined bismuth metal in 1950 were American Smelting & Refining Co., at Omaha, Nebr., and Perth Amboy, N. J.; Anaconda Copper Mining Co., at Anaconda, Mont.; and U. S. S. Lead Refinery, Inc. (subsidiary of United States Smelting, Refining & Mining Co.) at East Chicago, Ind. The Cerro de Pasco Copper Corp. is the principal domestic producer of bismuth alloys at its Brooklyn, N. Y. plant; bismuth metal used is obtained from the company lead smelter at La Oroya, Peru.

CONSUMPTION AND USES

Demand for bismuth, particularly in the form of refined metal, was firm in 1950. Bismuth consumption in the pharmaceutical industry increased 5 percent. During the final months of 1950, retooling of the aircraft industry increased demand substantially. Bismuth continued to play an important part in nuclear energy.

TABLE 1.—Percentage distribution of bismuth in the United States, 1946–50, by major use groups [1]

Use group	1946	1947	1948	1949	1950
Pharmaceuticals	63	52	49	31	36
Metal and alloys [2]	37	48	51	69	64

[1] Computed from figures by Civilian Production Administration, 1946, and by Bureau of Mines, 1947–50.
[2] Principally fabricating alloys but includes pure metal, ammunition solders, fuse alloys, aluminum alloys, and other minor compositions.

STOCKS

Producers' inventories of refined bismuth metal at the end of 1950 increased 22 percent above the end of 1949. High-grade metal was accumulated during the year for the National Stockpile.

PRICES

Refined bismuth metal was quoted in 1950 by E&MJ Metal and Mineral Markets at $2 per pound until September 5, when it was advanced to $2.25, a level maintained until the end of the year. The Metal Bulletin (London) quotation for high-purity metal, United Kingdom home trade, 5 cwt. minimum, held fairly steady at 14s. 6d. per pound from January to May 4. Subsequent fluctuations were recorded as follows: May 26, 13s. 9d.; August 4, 14s. 6d.; September 29, 17s. Bismuth ore, per pound of contained metal, c. i. f., United Kingdom home trade, was quoted December 5 at 10s. 10d., 65 percent minimum Bi, scaling downward to 2s. 3d. for ore assaying below 20 percent.

FOREIGN TRADE [1]

Imports.—Receipts of refined metal in 1950 showed a rise of 44 percent above 1949 and were the highest on record. The approximate percentage distribution of receipts, by country of origin, was: Peru 56, Canada 26, Yugoslavia 10, Belgium-Luxembourg 3, Japan 2, Korea 1, and others 2.

Exports.—Outgoing shipments of bismuth metal and alloys in 1950 increased 4 percent above a year earlier. The United Kingdom was again the principal recipient, taking 152,173 pounds; France received 44,814 pounds.

TABLE 2.—Bismuth metal and alloys imported into and exported from the United States, 1941–45 (average) and 1946–50

[U. S. Department of Commerce]

Year	Imports of refined metallic bismuth		Exports of metal and alloys	
	Pounds	Value	Pounds	Value
1941–45 (average)	270, 312	$265, 539	118, 078	$124, 062
1946	422, 336	464, 922	153, 058	173, 463
1947	310, 561	480, 808	240, 833	452, 147
1948	299, 824	464, 733	352, 027	711, 354
1949	541, 852	833, 940	190, 882	356, 576
1950	781, 670	1, 287, 098	199, 253	387, 458

TECHNOLOGY

The use of ductile bismuth wire and ribbon in the instrument control field was the subject of research.[2]

The use of bismuth carbonate in peptic ulcer therapy was described.[3]

[5] Excludes bismuth content of tin concentrates exported.
[6] Refined metal plus bismuth content of bullion exported.
[7] Incomplete data for year ended March 31 of year following that stated.
[8] Production included in total; Bureau of Mines not at liberty to publish separately.

WORLD REVIEW

Belgian Congo.—Bismuth is recovered as a byproduct of tin mining by Cie. Minière de Grands Lacs Africains (MLG) and Cie. Minetain. Production during the first 6 months of 1950 amounted to 1 ton.[4]

Canada.—The Consolidated Mining & Smelting Co. of Trail, B. C., continued during 1950 as the only Canadian bismuth producer. Recoveries of bismuth metal, all at the Trail smelter, amounted to 97 tons. About 40 tons are used each year in Canada, and the remainder is exported.

France.—Mines et Usines de Salsigne, which began to produce bismuth metal of 95 percent purity during July 1950 reached a rate of 5 tons a month in October.[5]

South Korea.—Bismuth output in Korea increased from 104 metric tons in 1948 to 173 tons in 1949. No production was reported for 1950.[6]

Union of South Africa.—In 1949, 12 short tons of bismuth ore was produced and shipped to the United Kingdom.[7]

Cadmium

By Richard H. Mote

GENERAL SUMMARY

DESPITE record production and large imports, additions to the domestic supply of cadmium during 1950 were insufficient to meet total demand during the year. The all-time high output of primary cadmium—12 percent greater than in 1949—combined with the second highest level of imports in history, failed to meet the expanding requirements of the latter half of the year; and, as a result, stocks were substantially reduced. The quotation for commercial sticks, which remained steady at $2.00 per pound throughout 1949 had, by December 1950, advanced to $2.55 per pound. Shipments of metallic cadmium were 22 percent above the previous year's total and exceeded production by 745,000 pounds. Industry stocks, rebuilt to adequate proportions during 1949, were reduced 16 percent, but purchases for the National Stockpile were continued. Apparent consumption increased 30 percent from 1949.

TABLE 1.—Salient statistics of the cadmium industry in the United States, 1941–45 (average) and 1946–50, in pounds of contained cadmium

	1941–45 (average)	1946	1947	1948	1949	1950

[1] 1942–45 average.
[2] Revised figure.

DOMESTIC PRODUCTION

The most important of the cadmium minerals is greenockite (CdS), theoretically containing 77.8 percent cadmium. The mineral occurs in the form of a yellow powder or stain on the mineral sphalerite or zinc blende (ZnS). Greenockite is almost always associated with sphalerite zinc ores and to a smaller extent with the ores of lead and copper containing zinc mineralization. It is never present in adequate quantities, however, to support profitable mining. Some zinc concentrates have been reported to contain as much as 1 percent cadmium; in general, however, the content seldom exceeds 0.5 percent. Zinc concentrates from the Tri-State district average 0.35 percent cadmium, and concentrates from mines in the Rocky Mountain region and far West rarely yield more than 0.2 percent cadmium.

TABLE 2.—Cadmium produced and shipped in the United States, 1941–45 (average) and 1946–50, in pounds of contained cadmium

Total value	6,258,079	6,361,605	13,146,878	12,999,446	15,195,024	20,556,899

[1] Revised figures.
[2] Excludes compounds made from metal.
[3] Bureau of Mines not at liberty to publish figures separately for secondary cadmium compounds.
[4] Value of metal contained in compounds made directly from flue dust or other cadmium raw materials (except metal).

The entire domestic supply of primary cadmium is recovered concurrently with the treatment of ores of other metals as a byproduct from the flue dusts of zinc-blende roasting furnaces and lead blast furnaces, from zinc dust collected in the early stages of distillation in zinc retorts, and from the high-cadmium precipitate obtained in purifying zinc electrolyte at electrolytic zinc plants. A small quantity of secondary metal is recovered from old bearings and other alloys but constitutes no great portion of the total supply. As most reduction plants participating in the recovery of cadmium treat both domestic and foreign cadmium-bearing materials without determining the cadmium content of either, the geographic origin of the metal produced from domestic plants is a matter of conjecture. Thus the data presented as domestic cadmium production in this chapter are not comparable to those given in other chapters of this volume for metals like copper, lead, and zinc.

The domestic output of primary metallic cadmium and the production of cadmium contained in primary compounds increased 10 percent and 68 percent, respectively, in 1950. Recovery of cadmium in secondary metal and compounds advanced 34 percent.

A list of plants producing cadmium metal in the United States in 1950 follows.

Primary metallic cadmium

Colorado: Denver—American Smelting & Refining Co.
Idaho:
- Bradley—Bunker Hill & Sullivan Mining & Concentrating Co.
- Kellogg—Sullivan Mining Co.

Illinois:
- Depue—New Jersey Zinc Co.
- East St. Louis—American Zinc Co. of Illinois.

Montana: Great Falls—Anaconda Copper Mining Co.

Oklahoma:
- Bartlesville—National Zinc Co., Inc.
- Henryetta—Eagle-Picher Mining & Smelting Co.

Pennsylvania:
- Donora—American Steel & Wire Co.
- Josephtown—St. Joseph Lead Co.
- Palmerton—New Jersey Zinc Co.

Texas:
- Corpus Christi—American Smelting & Refining Co.
- Dumas—American Zinc Co. of Illinois

Secondary metallic cadmium

Arkansas: Jonesboro—Arkansas Metals Co.

Output of cadmium oxide (by cadmium content) increased slightly more than 1 percent during the year, while the cadmium content of sulfide produced advanced 57 percent. Data for the production of other cadmium compounds are unavailable for 1950.

TABLE 3.—Cadmium oxide and cadmium sulfide produced in the United States, 1945–50, in pounds

Year	Oxide		Sulfide [1]		Year	Oxide		Sulfide [1]	
	Gross weight	Cd content	Gross weight	Cd content		Gross weight	Cd content	Gross weight	Cd content
1945	439,415	383,553	1,731,510	637,667	1948	334,859	291,847	3,137,035	1,096,770
1946	364,285	317,767	3,637,177	1,225,680	1949	570,993	497,876	2,631,888	999,386
1947	449,847	392,556	3,501,508	1,308,385	1950	579,538	505,336	4,383,943	1,570,522

[1] Includes cadmium lithopone and cadmium sulfoselenide.

CONSUMPTION AND USES

The apparent consumption of primary cadmium in all forms totaled 9,625,768 pounds in 1950, as computed by adding production and net imports and adjusting for producers', distributors', and compound manufacturers' stock changes. This figure reflected a 29 percent increase over the quantity apparently consumed in 1949. In 1950, as in the previous 2 years, cadmium metal was purchased by the Federal Government for the National Stockpile. About 95 percent of available cadmium is used in electroplating, bearing alloys, and pigments. The remaining 5 percent goes into miscellaneous alloys, laboratory reagents, and photographic chemicals.

Electroplating.—The principal use of cadmium metal is as a protective coating for iron and steel, and, to a much smaller extent, copper alloys. Its chief advantages as an electroplating medium compared to zinc are as follows: (1) Thinner coatings provide equal protection; (2) the rate of deposition for a given quantity of electric current is larger, hence electricity costs are reduced; (3) cadmium retains its metallic luster longer; (4) plated parts are more easily soldered; (5) cadmium has a greater resistance to atmospheric corrosion; (6) it is superior in throwing power, or ability to deposit uniformly in recesses; and (7) corrosion by galvanic action is more effectively minimized. A disadvantage of cadmium plating is its low resistance to acids. Items commonly electroplated with cadmium include nails, screws, rivets, bolts, nuts, washers, fasteners, and miscellaneous parts for a wide variety of products, including aircraft, ordnance, and automobiles.

Cadmium-Bearing Alloys.—Cadmium-base bearing metals are used successfully in internal-combustion engines that operate at high speeds and temperatures. The bearing alloys are generally of two types—the cadmium-nickel bearing, composed of 98.5 percent or more cadmium and 1.2 percent nickel, and the cadmium-silver bearing, containing 98.3 percent or more cadmium, 0.7 percent silver, and 0.6 percent copper. "Graphalloy," a cadmium-impregnated graphite containing 30 to 35 percent cadmium, is used in oilless bearings, bushing linings, and contacts for controller switches.

Cadmium Solders and Other Cadmium Alloys.—A minor use of cadmium metal is in the manufacture of low-melting-point alloys for soldering and brazing and fusible alloys for sprinkler apparatus, fire-detector systems, and valve seats for high-pressure gas containers.

Cadmium Compounds.—Cadmium sulfide and cadmium sulfoselenide are standard agents for producing yellow and red colors, respectively, in paint, soap, rubber, ceramics, paper, printing ink, and other products. Virtually all the cadmium oxide, hydrate, and chloride produced is used in cadmium plating solutions. Cadmium bromide, chloride, and iodide are used in photographic films, process engraving, and lithographing. A table listing the more important cadmium compounds, their physical properties, and uses can be found in the Cadmium chapter of Minerals Yearbook, 1949, pp. 187–188.

STOCKS

Total domestic stocks of cadmium metal and compounds, excluding consumers' stocks, for which data are not available, decreased 16 percent. Details are given in table 4.

TABLE 4.—Cadmium stocks at end of year, 1949–50, in pounds of contained cadmium [1]

	1949 [2]			1950		
	Metallic cadmium	Cadmium compounds	Total cadmium	Metallic cadmium	Cadmium compounds	Total cadmium
Producers	502,462		502,462	521,811		521,811
Compound manufacturers	9,655	164,189	173,844	15,378	134,713	150,091
Distributors [3]	185,250	40,499	225,749	48,715	38,949	87,664
Total stocks [4]	697,367	204,688	902,055	585,904	173,662	759,566

[1] Excludes cadmium in National Stockpile.
[2] Figures partly revised.
[3] Comprises principally 8 largest dealers.
[4] Excludes consumers' stocks, which were about 1,000,000 pounds at the end of 1944 (latest date for which figures were compiled).

PRICES

The quoted New York price of $2.00 a pound for commercial sticks of cadmium, established November 15, 1948, continued through June 14, 1950. Effective June 15 the quotation advanced to $2.15 a pound. On the same day the price for patented shapes was raised from $2.15 a pound to $2.30. On September 15, the quotation for commercial sticks advanced to $2.40 a pound and for patented shapes to $2.65.

A further rise to $2.55 a pound for commercial sticks occurred December 1.

The London market quoted 14s. 6d. ($2.03) per pound from January through June 21, when the price was advanced to 15s. 6d.($2.17). On September 18 and November 2 further rises occurred—to 17s. 3d. ($2.41) and 18s. ($2.52), respectively. The final increase to 19s. ($2.66) took place during the first week of December.

FOREIGN TRADE [1]

Total imports for consumption of metallic cadmium and of cadmium contained in flue dust increased 15 percent in weight and 59 percent in value in 1950. The total value of exports decreased 37 percent.

Imports.—Imports of cadmium-bearing flue dust, all derived from Mexico, were 11 percent below the 1949 level. Imports of metallic cadmium, however, increased four times over the quantity reported for 1949 and were the second highest in history. Of the more than 630,000 pounds imported, Canada supplied 38 percent, 31 percent came from Japan, 23 percent from Belgium-Luxembourg, and 5 percent from the Netherlands. Australia, Italy, Peru, New Zealand, Egypt, and the United Kingdom supplied smaller quantities.

TABLE 5.—Cadmium metal and flue dust imported for consumption in the United States, 1948–50, by countries

[U. S. Department of Commerce]

Country	1948		1949		1950	
	Pounds	Value	Pounds	Value	Pounds	Value

Total flue dust	1,828,139	1,438,136	1,789,667	1,595,943	1,601,640	1,519,104
Grand total	1,837,948	1,459,645	1,946,871	1,898,978	2,231,749	3,023,000

Exports.—Shipments to European Recovery Program "participating countries" accounted for 97 percent of the cadmium metal exported from the United States in 1950. Of the 352,927 pounds shipped—38 percent less than in 1949—Germany received 36 percent, the United Kingdom 27 percent, France 20 percent, Sweden 9 percent,

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

and the Netherlands 3 percent. The remaining 5 percent was distributed among 14 other countries. Exports of cadmium alloys tripled, rising from 3,000 pounds in 1949 to more than 9,000 in 1950. Canada received 73 percent of the total and the Union of South Africa the remainder.

TABLE 6.—Cadmium exported from the United States, 1948–50, by kinds, in gross weight

[U. S. Department of Commerce]

Kind	1948		1949		1950	
	Pounds	Value	Pounds	Value	Pounds	Value
Dross, flue dust, residues, and scrap	92,847	$55,247	500	$125		
Metal	955,701	1,872,467	566,135	1,264,307	352,927	$794,540
Alloys	1,506	2,657	3,000	6,150	9,106	11,575
Total		1,930,371		1,270,582		806,115

Tariff.—Action taken at the Geneva Trade Conference of 1947 reduced, as of January 1, 1948, the import duty on cadmium metal from 7½ cents per pound as established in the Canadian Trade Agreement of 1939 to 3¾ cents per pound. Cadmium contained in flue dust remained duty free in 1950.

WORLD PRODUCTION

World production of cadmium in recent years, insofar as data are available, is shown in table 7.

TABLE 7.—World production of cadmium, by countries, 1944–50, in kilograms

Carbon Black

By D. S. Colby, H. J. Barton, and B. E. Oppegard

GENERAL SUMMARY

TOTAL sales of carbon black produced in the United States increased 34 percent to 1,509 million pounds in 1950. Production totaled 1,382 million pounds, a 13-percent increase. Producers' stocks declined 127 million pounds to 90 million pounds.

Production rose in all reporting districts and States except Oklahoma; largest increases took place in Louisiana and Texas (other than Panhandle). Production of furnace blacks increased 28 percent to 765 million pounds and contact-black production declined 2 percent to 617 million pounds.

Sales in 1950 expanded more rapidly than production. Sales of furnace blacks increased 42 percent and sales of contact blacks 25 percent; the greater expansion in the former was occasioned by synthetic rubber consumption increasing at the expense of natural rubber. All classes of consumers used larger quantities of carbon blacks in 1950. Consumption by rubber companies rose 263 million pounds to 1,030 million pounds. The ink and paint industries purchased 59 percent more in 1950 than in 1949. Exports were 32 percent higher.

TABLE 1.—Salient statistics of carbon black produced from natural gas and liquid hydrocarbons in the United States, 1946–50

	1946	1947	1948	1949	1950

Average per pound cents	4.82	5.36	5.88	6.10	6.12

Stocks of both contact and furnace blacks declined sharply during 1950. On December 31 stocks of contact black totaled 65 million pounds, equivalent to a 36-day supply. Stocks of furnace blacks totaled 24 million pounds, a 10-day supply.

The quantity of natural gas used in the production of carbon blacks decreased slightly to 411 billion cubic feet in 1950. The use of liquid hydrocarbons, however, increased by nearly 50 percent to 108 million gallons.

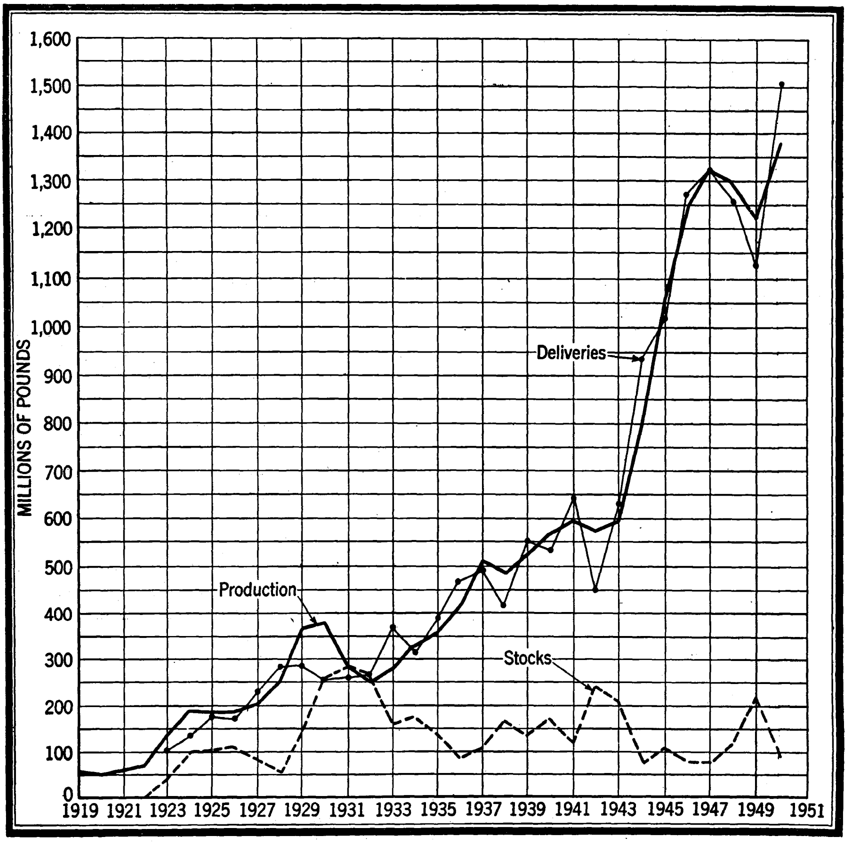

FIGURE 1.—Production, stocks, and deliveries of carbon black, 1919–50

The value at plants of the total output of carbon black in 1950 was $84,604,000. The average value was 6.12 cents per pound, only slightly higher than the 1949 average.

The number of plants operating during 1950 was 53 compared with 63 (revised figure) during 1949. Only one of the plants shut down was a furnace plant.

PRODUCTION

By States.—Production increased significantly in Louisiana (41 percent above 1949) and in Texas outside the Panhandle (25 percent above 1949). Only in Oklahoma did production decline, the result of two plants being shut down. Production in the Texas Panhandle district increased 2 percent in 1950 but did not reach the record production of 1948. In 1950 Texas supplied 68.7 percent of all carbon black produced in the country compared with 71.5 percent in 1949.

By Months.—In general, output of both furnace and contact grades of carbon black rose steadily during 1950. The rate of increase was approximately 1 percent per month for contact grades and 4 percent per month for furnace grades.

Grand total	410,852	7.56	1.75	19,677	4.79	107,707	3.02

[1] Detail will not add to totals, because some producers operate in more than 1 area.

[2] Comprises 15,800 million cubic feet used by furnace-plant operations in California, Oklahoma, and Kansas and 60,029 million cubic feet used by contact-plant operations in Kansas and New Mexico.

[3] Comprises 945 thousand dollars (5.98 cents per M cu. ft.) of natural gas used in California, Oklahoma, and Kansas for manufacture of furnace black and 2,826 thousand dollars (4.71 cents per M cu. ft.) used in Kansas and New Mexico for manufacture of contact black.

By Grades.—Production of furnace blacks in 1950 increased 28 percent compared with 1949, while the production of contact blacks was 2 percent below 1949. Furnace blacks represented 55 percent of the total production in 1950 compared with 49 percent in 1949. The rising price of natural gas and restrictions on the use of natural rubber caused the shift to furnace blacks.

In 1950, statistics were obtained for the first time on the production of furnace blacks by grades. The grades reported and their symbols are: Semireinforcing Furnace, SRF; High-Modulus Furnace, HMF; Fast-Extrusion Furnace, FEF; High-Abrasion Furnace, HAF; and "Other," which includes thermal blacks and miscellaneous furnace grades.

A larger volume of SRF was produced than of any other furnace grade. The rise in production of this grade during the year was also greater than that of other grades.

TABLE 4.—Production and shipments of carbon black in the United States in 1950, by months, in thousand pounds

[1] Compiled from reports of the National Gas Products Association and of producing companies not included in the association figures. Figures adjusted to agree with annual reports of individual producers.

Methods and Yields.—The over-all yield of carbon black from natural gas increased from 2.38 pounds per thousand cubic feet in 1949 to 2.57 in 1950. This increased yield was due partly to the increased production of furnace blacks from gas relative to the output of contact blacks and also to the higher yields of both furnace and contact blacks obtained from gas. The yield of contact black from gas continued its gradual rise, reaching 1.75 pounds per thousand cubic feet in 1950. The yield of furnace blacks produced from gas was 7.56 pounds per thousand cubic feet compared with 7.44 in 1949. Gas consumed in the manufacture of furnace blacks increased from 52 billion cubic feet in 1949 to 58 billion in 1950. Gas used for the production of contact blacks declined from 376 billion cubic feet in 1949 to 353 billion in 1950.

The yield of carbon black from liquid hydrocarbons in 1950 was 3.02 pounds per gallon. The consumption of liquid hydrocarbons in the production of furnace blacks increased by almost 50 percent in 1950, and the proportion of all furnace blacks produced from liquid feedstock increased from 35 percent in 1949 to 43 percent in 1950.

[3] Revised figure.

Number and Capacity of Plants.—The number of carbon-black plants operating in 1950 was 53 — 35 contact-type plants and 18 furnace-type plants. Nine contact-type plants and one furnace-type plant that had been shut down in 1949 remained inactive in 1950. The one furnace-type plant shut down in 1949 was the General Atlas Carbon Co. plant, Texas County, Okla. The nine channel-type plants shut down in 1949 were: United Carbon Co., Grant County, Kans. (one plant), Ouachita Parish, La. (one plant), Hutchinson County, Tex. (three plants); Cabot Carbon Co., Texas County, Okla. (one plant), Hutchinson County, Tex. (one plant); and Columbian Carbon Co., Hutchinson County, Tex. (two plants). One channel-type plant of United Carbon Co. in Hutchinson County, Tex., which had been shut down in June 1949, was reopened in February 1950. A channel-type plant of Columbian Carbon Co. in Gray County, Tex., which had been shut down in 1949 was leased by Coltexo Corp. and reopened in 1950.

The daily capacity of operating plants in 1950 was 4,075,200 pounds. The daily capacity of furnace-type plants was 2,371,000 pounds, 89,800 pounds above the revised 1949 figure; the daily capacity of channel-type plants was 1,704,200 pounds, 170,600 pounds below the revised 1949 figure.

[2] Revised figure.

Producers.—The number of producers remained at 20 in 1950. The Jefferson Lake Sulphur Co. had been classified as a producer in 1949, although it had no output and was merely liquidating stocks.

DEMAND—SALES

Domestic sales of carbon black in 1950 totaled 1,109 million pounds, an increase of 35 percent above 1949 and 11 percent above the previous peak year 1947. Exports increased 32 percent above 1949 to 400 million pounds, resulting in a total demand of 1,509 million pounds. Shipments of furnace blacks rose through the first three quarters of the year and declined in the fourth quarter. Shipments of contact blacks remained steady throughout the year, save for a sudden upsurge in August and September. Except during the last quarter, shipments of both contact and furnace grades exceeded production. Sales of furnace grades constituted 56 percent of total sales and 64 percent of domestic sales.

Sales to rubber companies increased 34 percent in 1950 and remained at 93 percent of total domestic carbon black sales. Domestic consumption of virgin rubber increased 26 percent while the ratio of

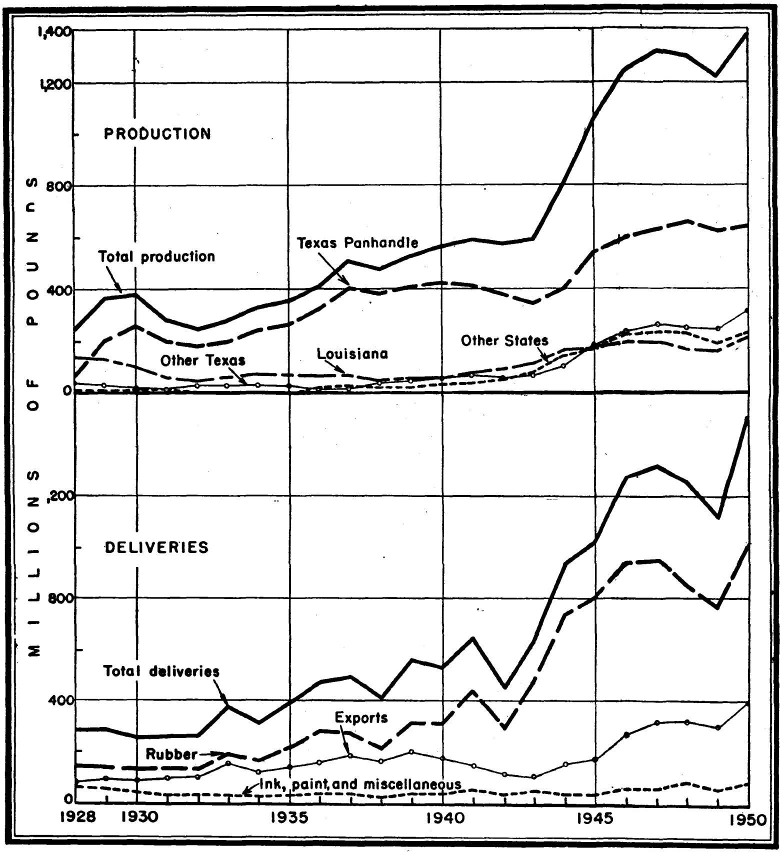

FIGURE 2.—Production and deliveries of carbon black, 1928–50. Production in "Other Texas" includes Oklahoma and Wyoming in 1932–35.

synthetic rubber to natural increased from 0.72 to 0.75. Allowing 105 million pounds for use in reclaim, indicated carbon-black loading of virgin rubber in 1950 was 741 pounds per long ton compared with 698 pounds in 1949.

Sales of carbon black to ink manufacturers increased 59 percent to 51 million pounds in 1950.

Sales of carbon black to the paint industry totaled 11 million pounds in 1950. This also was an increase of 59 percent and far ahead of the 20-percent over-all increase in sales by the paint industry.

TABLE 7.—Sales of carbon black for domestic consumption in the United States, by uses, 1946–50, in thousand pounds

Use	1946	1947	1948	1949	1950
Rubber	941, 464	943, 580	870, 564	767, 131	1, 030, 368

Total	998, 655	1, 000, 684	932, 433	822, 166	1, 109, 071

STOCKS

Producers' stocks of furnace and channel blacks declined sharply through the first 9 months of 1950 and leveled off in the fourth quarter. Furnace-black stocks declined from 97 million pounds (58 days' supply) at the end of 1949 to 24 million pounds (10 days' supply) at the end of 1950. Stocks of contact blacks declined from 120 million pounds (75 days' supply) to 65 million pounds (36 days' supply) during 1950.

TABLE 8.—Producers' stocks of contact- and furnace-type blacks in the United States, Dec. 31, 1945–50, in thousand pounds

Year	Furnace						Contact	Total
	SRF	HMF	FEF	HAF	Other	Total		
1945	(1)	(1)	(1)	(1)	(1)	37,049	64,956	102,005

[1] Data not available.

PRICES

The total value at plants of carbon black produced in the United States in 1950 was $84,604,000 compared with $74,685,000 in 1949. The average value of contact blacks remained essentially constant, declining 0.03 cent per pound to 7.19 cents per pound. The average value of furnace blacks continued to rise, increasing from 4.92 cents per pound in 1949 to 5.26 cents in 1950.

[1] Chiefly Easy-Processing (EPC) and Medium-Processing (MPC) but also includes Hard-Processing (HPC) and Conductive (CC) channel blacks.
[2] Office of Price Administration ceiling prices. Average realization on sales to the Rubber Reserve Company was generally higher.

The Oil, Paint and Drug Reporter quotes only one change in the market price of carbon blacks in 1950. On October 1, 1950, all grades listed advanced one-half cent per pound, except fine grades of furnace, which advanced 0.6 cent.

FOREIGN TRADE [1]

Imports.—Imports of "acetylene black" from Canada in 1950 totaled 9,911,197 pounds valued at 11.5 cents per pound. Other imports of "gas black or carbon black" were 48,350 pounds from Canada, 77 pounds from the Netherlands, and 2,920 pounds from Germany.

Exports.—There was a general upward trend to carbon-black exports through the first 9 months of the year, dropping off in the last quarter. For the year, exports increased 32 percent.

[2] Revised to zero.

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The United Kingdom remained our largest export customer, followed by Canada and France. Exports increased considerably to the United Kingdom, Canada, Argentina, Brazil, Italy, and Sweden. Japan showed by far the greatest decline in carbon-black purchases from this country.

TABLE 11.—Contact- and furnace-type blacks exported from the United States in 1950, by months, in thousand pounds [1]

TRENDS

The expanding pipeline demand for natural gas and the growing control that States are assuming over the field price of natural gas may progressively price natural gas out of a large segment of the carbon-black market. A number of channel plants have already shut down when their gas contracts expired. Blacks produced from liquid hydrocarbon feed are displacing the channel blacks. These oil-produced blacks are especially suitable for use with synthetic rubber but are even establishing acceptance for use with natural rubber stocks. Approximately 1 million pounds per day of oil-black producing capacity is in the planning stage or was under construction in the United States in 1951. A plant is also scheduled for construction at Sarnia, Ontario, in Canada. All these new carbon-black plants are to be located near petroleum refineries, their source of feedstock.

Cement

By Oliver S. North and Esther V. Balser

GENERAL SUMMARY

BOTH production, and apparent consumption as indicated by mill shipments, of cement in 1950 increased sharply over the preceding year's totals. Heavy demand for cement during the year resulted in a record-breaking output of 230,272,148 barrels of hydraulic cement—8 percent more than in 1949, the previous record year. The gains were reflected in both portland cement and the group "all other hydraulic cements." The output of the masonry, natural, and puzzolan group increased 33 percent over the 1949 total. The portland-cement industry operated at 84 percent and the remainder of the hydraulic cement industry at 96 percent of productive capacity during 1950. Mill shipments of portland cement (which totaled 227,756,636 barrels) represented an 11-percent increase over the 1949 total and set a new record. Shipments of other hydraulic cements increased 30 percent. Stocks of all hydraulic cements on hand at mills December 31, 1950, amounted to 13,217,036 barrels, 11 percent less than at the end of 1949.

The average net mill realization per barrel of portland cement reached $2.35—a 5-cent increase over the average 1949 price. Other hydraulic cements, as a group, reported a 4-cent gain per barrel to $2.52.

The long-term trend, as shown by the moving 12-month total of production of finished portland cement in the Bureau of Mines Monthly Cement Reports, continued the upward swing begun immediately after World War II and reached a new all-time high in December 1950.

Monthly production during 1950 totaled 15.2 million barrels in January, declined seasonably in February, increased steadily to a new record high in August, declined slightly in September, but again set a new record of 22,461,000 barrels in October. Production declined slightly in the next 2 months, although the totals were still remarkably high. The monthly average for the year exceeded 19 million barrels.

The pattern of monthly shipments from mills in 1950 was similar to that of 1949, but at a much higher level. A new record was reached in August, when total shipments exceeded 25 million barrels. Shipments totaled 9.6 million barrels in January, increased steadily through the next 5 months, declined in July, set a new high in August, declined in September, but increased again in October, before the usual November-December declines. December shipments amounted to 12.5 million barrels—7 percent above December 1949 shipments.

Through the first 3 months of 1950 stocks exceeded those of the same months in 1949, but during the rest of the year the peak demand for finished cement drove stocks on hand to lower totals. Finished-cement stocks at the end of January 1950 amounted to 20,275,000 barrels, and the maximum for the year was reached at the end of February. The year's low was reached in October, when 5,945,000 barrels were in stock.

Consumption trends of portland cement in 1950, as indicated in figure 1, continued to be essentially the same as in 1949. The Middle States were again the leading consuming area.

States in the regions shown in figure 1 are as follows: Northeastern—Connecticut, Delaware, District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont; Southern—Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia; Middle—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin; Rocky Mountain—Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming; and Pacific—California, Oregon, and Washington.

[3] Revised figure.
[4] 198,723 barrels, valued at $839,916, shipped under the U. S. Army Civilian Supply Program, is excluded from exports shown but deducted from apparent consumption.
[5] Shipments from domestic mills minus net exports.

The program of expansion and improvement of various plants continued throughout 1950, and many companies were planning such programs for the future. Various factors have led the different companies to initiate expansion programs, the primary consideration being to attain an increased capacity as quickly as possible to serve the current high demand.

The new 4,000-barrel-per-day wet-process plant of the Halliburton Cement Co. at Corpus Christi, Tex., began operations in March 1950. New cement plants are being built in several key areas, some of which will serve the Southeast, where cement shortages have been acute and persistent. Four plants with a combined designed capacity of 18,000 barrels per day were nearing completion at the end of 1950. They were: The Baton Rouge, La., plant of the Ideal Cement Co., the Brandon, Miss., plant of the Marquette Cement Manufacturing Co., and the Roanoke, Va., and Sweetwater, Tex., dry-process plants of the Lone Star Cement Corp.

Senate Bill S. 1008—which would have authorized basing-point pricing—was vetoed by the President. This action was commented on by the trade press.[1]

The Portland Cement Association officially opened its new research and development laboratories, reported to be the largest and most completely equipped facilities in the world devoted exclusively to research on portland cement and concrete. They are near Chicago at Skokie, Ill.[2]

PRODUCTION, SHIPMENTS, AND STOCKS

PORTLAND CEMENT

Portland cement, which constituted 98 percent of the entire output of hydraulic cements in 1950, was manufactured in 150 active plants in 36 States and Puerto Rico. One new plant in Texas began operating in March 1950, but production at one of the Pennsylvania plants ceased during the year.

Output in 1950 was greater than in 1949 in 18 of the 19 districts defined by the Bureau of Mines. The changes from 1949 figures ranged from a 3-percent decrease in Illinois to a 47-percent increase in Puerto Rico. The greatest increase in continental United States was made by the Rocky Mountain district (Colorado-Arizona-Wyoming-Montana-Utah-Idaho), whose production was up 24 percent. As usual, the Eastern Pennsylvania-Maryland district manufactured the greatest quantity—34,212,318 barrels—while California increased its output appreciably to 26,277,209 barrels. Nine districts reported an output exceeding 10 million barrels.

Shipments in 1950 were higher than in 1949 in all districts except Illinois, which reported a total 2 percent below that in the preceding year. Gains in continental United States ranged up to 28 percent for the Rocky Mountain district. Puerto Rico reported an increase of 47 percent.

Stocks of finished cement were 12 percent lower on December 31, 1950, than on the same date of the preceding year. Stocks were higher in 8 and lower in 11 districts, ranging from a 36-percent decrease in California to a 72-percent increase in Puerto Rico. The trend of month-end stocks of clinker followed the 1949 pattern through the first 7 months but dropped rapidly in the latter months, reaching a low for the year of less than 3 million barrels in October.

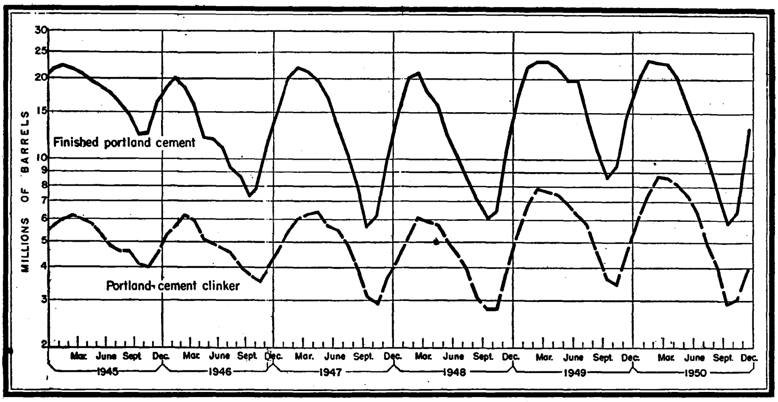

FIGURE 2.—End-of-month stocks of finished cement and portland-cement clinker, 1945–50

1950—Cement	13,027,712	October	5,945,000	February	23,583,000
Clinker	3,901,830	do	2,852,000	March	8,821,000

[1] Includes Puerto Rico and Hawaii, 1946; Puerto Rico only, 1947-50. There has been no production in Hawaii since 1946.
[2] Revised figure.

NATURAL, MASONRY (NATURAL), AND PUZZOLAN CEMENTS

Hydraulic cements, other than portland, were produced in nine plants in 1950. Output, shipments, and stocks during the year were, respectively, 33, 30, and 17 percent greater than in 1949. Producers of this group reported the consumption of 56,555 short tons of coal and 248,215,000 cubic feet of gas (equivalent to approximately 5,191 short tons of coal).

TABLE 5.—Natural, masonry (natural), and puzzolan (slag-lime) cements, produced, shipped, and in stock at mills in the United States, 1946–50

Year	Production		Shipments		Stocks on Dec. 31 (barrels of 376 pounds)
	Active plants	Barrels (376 pounds)	Barrels (376 pounds)	Value	
1946	9	2,474,674	2,533,106	$4,155,171	112,031
1947	9	2,951,098	2,927,885	5,764,398	145,408
1948	9	3,440,248	3,375,135	7,734,289	209,901
1949	9	3,185,229	3,233,525	8,006,361	161,605
1950	9	4,246,299	4,218,580	10,629,586	189,324

TYPES OF CEMENT

A breakdown of the total production of portland cement by various types for the 1946–50 period is shown in table 6. The output and shipments of all of the types, except type V, sulfate-resisting, were higher than in 1949. Marked percentage increases were noted for low-heat, portland-puzzolan, and high-early-strength cements.

Prepared Masonry Mortars.—Production of these mixed materials was reported by 99 plants in 1950 and totaled 11,199,099 barrels. Shipments reached 11,476,224 barrels valued at $32,581,066, an average mill value of $2.84 per barrel. These data are not included in the statistical tabulations in this chapter, but the portland cement used in manufacturing these mixtures is included.

TABLE 6.—Portland cement produced and shipped in the United States,[1] 1946–50, by types

Type and year	Active plants	Production (barrels)	Shipments		
			Barrels	Value	
				Total	Average
General use and moderate heat (types I and II):					
1946	153	139, 173, 936	144, 038, 503	$244, 051, 517	$1. 69
1947	150	157, 525, 464	158, 637, 287	297, 619, 024	1. 88

[1] Including Puerto Rico and Hawaii, 1946; Puerto Rico only, 1947–50. There has been no production in Hawaii since 1946.
[2] Includes hydroplastic, plastic, and waterproofed cements.

CAPACITY OF PLANTS

The total estimated annual capacity of all portland-cement plants in 1950, as reported to the Bureau of Mines by producers, increased 4 percent over that reported in 1949.

The over-all rate of operation in 1950 was 84 percent of the total capacity—3 percent greater than in 1949. As table 7 indicates, the percentage of capacity utilized rose in 13 and decreased in 5 districts, with 1 remaining unchanged. In continental United States the percentage changes ranged from a 4-percent decrease in the Iowa district to a 12-percent increase in the Colorado-Arizona-Wyoming-Montana-Utah-Idaho district. A 23-percent increase was recorded in the Puerto Rico district. The percentage of capacity utilized in each month of 1950 was lower during the first quarter than in 1949, but from May to the end of the year the 1950 percentages were markedly higher, attaining a peak figure of 102 percent in October. Production in November and December remained quite high.

TABLE 7.—Portland-cement-manufacturing capacity of the United States, 1949–50, by districts

District	Estimated capacity (barrels)		Percent of capacity utilized	
	1949	1950	1949	1950
Eastern Pennsylvania, Maryland	38,403,325	38,916,493	88.0	87.9
New York, Maine	17,398,048	17,084,962	79.5	83.1
Ohio	12,952,515	12,994,125	79.6	81.6

June	87	93	83	81	December	78	87	82	87

The total capacity of both wet- and dry-process plants, as indicated in table 9, continued to increase. Wet-process plants now constitute nearly 55 percent of the total productive capacity. The percentage of cement produced by wet-process plants in 1950 continued its trend of recent years by gaining slightly.

TABLE 9.—Capacity of portland-cement plants in the United States,[1] 1948–50, by processes

Process	Capacity: Thousands of barrels			Capacity: Percent of total			Percent of capacity utilized			Percent of total finished cement produced		
	1948	1949	1950	1948	1949	1950	1948	1949	1950	1948	1949	1950
Wet	136,588	139,169	147,049	53.7	53.7	54.8	81.4	83.7	86.6	54.1	55.6	56.3

[1] Includes Puerto Rico. There is currently no production in Hawaii.

A grouping of the cement plants based on their annual capacity is shown below. Plant improvements and kiln additions resulted in gains of one plant and two plants, respectively, for the 2,000,000–3,000,000-barrel-capacity and the 3,000,000–10,000,000-barrel-capacity groups. The less-than-1,000,000-barrel-capacity and the 1,000,000–2,000,000-barrel-capacity groups decreased one plant and two plants, respectively.

Number of portland-cement plants in the United States (including Puerto Rico), by size groups, in 1950

Estimated annual capacity, barrels:	*Number of plants*
Less than 1,000,000	25
1,000,000 to 2,000,000	85
2,000,000 to 3,000,000	29
3,000,000 to 10,000,000	13
Total	152

CLINKER PRODUCTION

The output of clinker—the intermediate product between raw materials and the finished cement—was 7 percent greater in 1950 than in 1949. Peak production was attained in October, while stocks reached their greatest accumulation in March. During the later months of 1950, month-end stocks were considerably lower than in the corresponding months of the preceding year. Stocks of clinker on December 31, 1950, were 15 percent lower than those reported at the end of 1949.

[4] Preliminary figures.

RAW MATERIALS

Among the raw materials used for manufacturing cement, the "limestone and clay or shale" classification represented 73 percent of the total output in 1950—a gain of 1 percent compared to 1949. "Cement rock and pure limestone" were the materials used in manufacturing 21 percent of the total—1 percent less than in 1949. The percentage made from "blast-furnace slag and limestone" varied only slightly from 1949 and amounted to 5 percent of the output. The use of "marl and clay" declined fractionally and now represents only 1 percent of the output.

TABLE 12.—Production and percentage of total output of portland cement in the United States,[1] 1902–14, 1926, 1929, 1933, 1935, and 1941–50, by raw materials used

Year	Cement rock and pure limestone		Limestone and clay or shale [2]		Marl and clay		Blast-furnace slag and limestone	
	Barrels	Percent	Barrels	Percent	Barrels	Percent	Barrels	Percent
1902	10,953,178	63.6	3,738,303	21.7	2,220,453	12.9	318,710	1.8
1903	12,493,694	55.9	6,333,403	28.3	3,052,946	13.7	462,930	2.1

[1] Includes Puerto Rico, 1941–50; Hawaii, 1945–46. There has been no production in Hawaii since 1946.
[2] Includes output of 2 plants using oystershells and clay in 1926; 3 plants in 1929, 1933, and 1935; 4 plants in 1941–45; 5 plants in 1946–49; and 6 plants in 1950.

The tonnages of raw materials (exclusive of fuel and explosives) required to produce portland cement in recent years are given in table 13. Limestone, cement rock, and clay and shale constitute 94 percent of the total materials consumed in 1950. Except for marl, which decreased 11 percent, all types of raw material consumed showed gains over the amounts consumed in 1949. The quantity of limestone and oystershells used increased over 4 million tons.

TABLE 13.—Raw materials used in producing portland cement in the United States,[1] 1948–50

Raw material	1948	1949	1950
	Short tons	*Short tons*	*Short tons*
Cement rock	13,046,856	12,628,494	12,981,679
Limestone (including oystershells)	43,489,837	44,968,739	49,035,439
Marl	601,716	722,606	640,462
Clay and shale [2]	6,440,584	6,698,408	7,169,015
Blast-furnace slag	896,474	847,375	971,125
Gypsum	1,507,876	1,543,198	1,660,466
Sand and sandstone (including silica and quartz)	723,769	724,624	769,806
Iron materials [3]	318,106	346,542	379,637
Miscellaneous [4]	133,716	140,999	148,290
Total	67,158,934	68,620,985	73,755,919
	Pounds	*Pounds*	*Pounds*
Average total weight required per barrel (376 pounds) of finished cement	654	654	653

[1] Including Puerto Rico. There was no production in Hawaii.
[2] Includes bentonite, diatomaceous shale, and fuller's earth.
[3] Includes iron ore, pyrite cinders and ore, and mill scale.
[4] Includes diatomite, fluorspar, pumicite, flue dust, pitch, red mud and rock, hydrated lime, tufa, cinders, calcium chloride, sludge, grinding aids, and air-entraining compounds.

FUEL AND POWER

Of the types of fuel consumed by the portland-cement industry, the quantity of coal used decreased slightly as compared to 1949, while all other types showed greater quantities consumed than in the preceding year. The amount of coal used declined fractionally while the percentage gains for the other fuel types were: Fuel oil, 15 percent; natural gas, 15 percent; byproduct gas, 6 percent.

The number of plants using electric energy, the kilowatt-hours generated and purchased, and the average electric energy used per barrel of cement are shown in table 16. The ratio between the amount of electricity generated and the quantity purchased remained about the same in 1950 as in 1949.

TABLE 14.—Finished portland cement produced and fuel consumed by the portland-cement industry in the United States,[1] 1949–50, by processes

Process	Finished cement produced			Fuel consumed [2]		
	Plants	Barrels of 376 pounds	Percent of total	Coal (short tons)	Oil (barrels of 42 gallons)	Natural gas (M cubic feet)
1949						
Wet	88	116, 522, 681	55. 6	3, 830, 313	3, 203, 950	61, 783, 635
Dry	62	93, 204, 736	44. 4	4, 157, 247	1, 382, 648	[3] 22, 905, 649
Total	150	209, 727, 417	100. 0	[4] 7, 987, 560	4, 586, 598	[3] 84, 689, 284
1950

[1] Including Puerto Rico. There was no production in Hawaii.

EMPLOYMENT AND PRODUCTIVITY

Trends in employment and output per man in the cement industry over the period 1943–47 are shown in tables 17 through 23.

TABLE 17.—Employment in the portland-cement industry, finished cement produced, and average output per man in the United States,[1] 1943–47

Year	Employment					Production			Percent of industry represented[2]
	Average number of men	Time employed				Finished portland cement (barrels)	Average per man (barrels)		
		Average number of days	Total man-shifts	Man-hours					
				Average per man per day	Total		Per shift	Per hour	
1943	25,453	300	7,626,376	7.7	58,737,442	132,445,838	17.37	2.25	99.3
1944	20,376	278	5,670,147	8.0	45,236,906	89,883,262	15.85	1.99	98.9

TRANSPORTATION

The quantity and proportion of cement shipped by each of the major methods of transportation for 1948–50 are listed in table 20. The percentage shipped in bulk increased 5 percent from 1949 to 1950 to 55 percent of the total output; this was the first time that bulk shipments have represented over half of the domestic production. A 3-percent increase in truck shipments was noted, while rail bulk shipments declined a like amount and boat shipments remained virtually the same.

TABLE 24.—Shipments of portland cement from mills in the United States,[1] 1948–50, in bulk and in containers, by types of carriers

[Barrels of 376 pounds]

Type of carrier	In bulk		In containers				Total shipments

[1] Includes Puerto Rico.
[2] Includes steel drums and iron and wood barrels.
[3] Includes cement used at mills by producers as follows—1948: 645,420 barrels; 1949: 643,174 barrels; 1950: 929,451 barrels.
[4] Less than 0.05 percent.

CONSUMPTION

Table 25 shows that the indicated consumption of portland cement in 1950 increased in 39 States and the District of Columbia. As compared to 1949, percentage increases ranged up to 80 percent for Montana, with New Mexico, South Carolina, Nevada, and Missouri showing substantial gains. West Virginia snowed the largest percentage decline with shipments off 32 percent. California, Texas, New York, Pennsylvania, Illinois, Ohio, and Michigan, in that order, were the largest consumers of cement in 1950. These 7 States accounted for 45 percent of the total consumption, while the 12 noncement-producing States, including the District of Columbia, accounted for 12 percent of the total consumption.

[1] Shipments by producers to foreign countries and to noncontiguous Territories of the United States (Alaska, Hawaii, Puerto Rico, etc.), including distribution from Puerto Rican mills.

LOCAL SUPPLY

The surplus or deficiency in the quantity of cement locally available is indicated in table 27. The comparison is based on shipments from mills and on consumption as shown by State receipts of mill shipments. The 1950 deficiencies occurred in one State and five districts.

The total surplus of producing States in 1950 was distributed as follows: 27,400,258 barrels to non-cement-producing States, Alaska, and Hawaii; 2,773,010 barrels to destinations outside continental United States (excluding local consumption of Puerto Rican production); and 35,049 barrels to unspecified destinations.

PRICES

The average net mill realization of all portland cement shipped from mills in 1950 advanced to $2.35 per barrel from $2.30 in 1949. The average net mill realization in each quarter of 1950 was: First, $2.33; second, $2.33; third, $2.34; and fourth, $2.43.

The composite wholesale price of portland cement, f. o. b. destination, according to the Bureau of Labor Statistics index (1926=100) was 136.6 in 1950, whereas in 1949 it was 133.8.

Average mill value per barrel, in bulk, of portland cement in the United States,[1] 1945–50

1945	$1. 63	1948	$2. 18
1946	1. 72	1949	2. 30
1947	1. 90	1950	2. 35

[1] Includes Puerto Rico and Hawaii. 1945–46 ;Puerto Rico only, 1947–50. There has been no production in Hawaii since 1946.

FOREIGN TRADE [3]

Imports.—Imports of hydraulic cement soared in 1950, when they amounted to 1,394,015 barrels compared with 109,821 barrels in 1949. For the most part, purchases were made from Germany and the United Kingdom (England). Imports of all hydraulic cement, except white, nonstaining, and other special cement, for 1948–50 are listed by country of origin in table 29. Imports of white, nonstaining cement in 1950 amounted to 4,856 barrels valued at $24,915.

[1] Excludes "white, nonstaining, and other special cement."

Exports.—Cement exports in 1950 declined nearly 50 percent to 2,418,435 barrels valued at $7,274,564. As indicated in the table 30, shipments to North America and to South America represented 96 percent of the total. The largest purchasers were Venezuela, Canada, Cuba, and Mexico.

Shipments of hydraulic cement to noncontiguous Territories of the United States for 1948–50 are shown in table 32. Shipments to Guam and the Virgin Islands were higher than in 1949, while shipments to Puerto Rico and American Samoa decreased. No shipments to Wake Island were reported.

[3] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TECHNOLOGY

An intensive study was made of blast-furnace slag cement and the results were published. The authors concluded that a basic slag, properly granulated, dried, and ground with activators will make a good hydraulic cement.[4]

According to a recent report, aged linseed oil with a specific gravity of 0.948–0.953 is a generally more satisfactory dispersing agent than oleic acid in the turbidimetric determination of specific surface of portland cement.[5]

Announcement was made of a mechanical method of determining time of set of portland cement. This apparatus, named a "spissograph," is a Vicat with a modified plunger and needle. It relieves the operator of the need of frequent checking and eliminates much of the human factor in the time-of-set test. The new mortar-setting test, as proposed by ASTM, is reported to be readily adapted to the spissograph.[6]

The National Bureau of Standards, United States Department of Commerce, has devised an analytical procedure using flame photometry to replace gravimetric methods in the determination of sodium and potassium oxides in portland cement.[7] Another development of the National Bureau of Standards was a rapid test for measuring sulfate susceptibility of portland cement.[8]

ASTM Committee C–1 on Cement issued a report on the optimum gypsum content of portland cement. Highlight of the Committee's conclusions was that specifications should permit higher SO_3 than now allowed, with increases of 1 to 2 percent in present limits. There is said to be little danger of excessive expansion unless the optimum amount is greatly exceeded.[9]

Other papers published included studies of the effect of gypsum content on compressive strength of cements,[10] and the use of calcium chloride in the reduction of alkalies in portland cement.[11]

TABLE 33.—World production of hydraulic cement, by countries,[1] 1945–50, in metric tons—Continued

[Compiled by Helen L. Hunt]

Country [1]	1945	1946	1947	1948	1949	1950
Africa:						
Algeria	105,035	115,410	127,815	129,867	128,075	322,071
Belgian Congo	76,264	81,514	115,441	[2] 126,942	[2] 156,914	[2] 186,519
Egypt	432,098	587,577	648,353	768,283	[2] 800,000	[2] 1,000,000
Ethiopia [2]	(3)	(3)	(3)	8,000	8,000	(3)
French Morocco	76,835	175,180	218,877	262,232	264,000	321,000
Mozambique	33,919	26,275	35,858	37,207	45,841	(3)
Southern Rhodesia	69,400	66,400	71,200	69,000	(3)	(3)
Tunisia	59,600	83,540	115,100	161,700	167,631	169,200
Union of South Africa	1,050,000	1,180,200	1,251,743	1,308,000	1,363,200	1,846,800
Oceania:						
Australia [12]	704,400	734,400	896,400	1,029,600	1,047,600	1,177,200
New Zealand	237,600	229,900	219,409	247,205	254,039	255,528
Total [13]	49,500,000	72,500,000	85,400,000	101,500,000	114,600,000	131,500,000

[1] In addition to countries listed, hydraulic cement is produced in Albania, Eritrea, and Madagascar, but data are not available (*see* footnote 13).
[2] Estimate.
[3] Data not available; estimate by senior author of chapter included in total.
[4] Data represent Trianon Hungary after October 1944.
[5] June to December, inclusive.
[6] April to December, inclusive.
[7] Manchuria only.
[8] Beginning September 1947, excludes Pakistan.
[9] Fiscal year ended Mar. 20 of year following that stated.
[10] Production in Government-operated plants only.
[11] Included in India.
[12] Fiscal year ended June 30 of year stated.
[13] Estimated by senior author of chapter; excludes estimates for countries listed in footnote 1 as production in those countries is believed to be negligible.

Chromium

By Norwood B. Melcher and Jachin M. Forbes

GENERAL SUMMARY

WORLD producers of chromite began 1950 with operations at a generally low level, and some marginal mines were shut down temporarily awaiting a more favorable market. The United States, as the largest consumer, had nearly a year's supply on hand in industry stocks, and imports had dropped 22 percent during 1949. Prospects were not encouraging for a good year in the chromite-mining industry. However, United States business and industry began to revive early in 1950; and consumption of raw materials, including chromite, continued to increase throughout the remainder of the year. The outbreak of hostilities in Korea in June and the passage of the Defense Production Act of 1950 gave a tremendous impetus to raw material consumption and resulted in the highest annual chromite consumption on record.

TABLE 1.—Salient statistics of chromite in the United States, 1945–50, in short tons

	1945	1946	1947	1948	1949	1950
Total supply	[1] 939,860	761,498	1,107,128	1,545,744	[2] 1,204,285	1,304,117
Imports for consumption	[1] 925,887	757,391	1,106,180	1,542,125	[2] 1,203,852	1,303,713
Domestic production	13,973	4,107	948	3,619	433	404
Consumption by industry	808,120	734,759	833,357	875,033	672,773	980,369
Exports	12,366	2,158	3,435	2,894	2,382	2,044

[1] Corrected figure. Imports for consumption erroneously carried in 1948–49 volumes as 914,765 tons.
[2] Revised.

The supply of chromite in 1950, virtually all from foreign sources, failed to keep pace with demand although total imports increased 8 percent over 1949. Difficulties in transportation were becoming apparent before the close of 1950 that foreboded serious supply problems as the rearmament program gathered momentum. A particularly difficult situation developed in connection with the movement of chromite from the Transvaal, Union of South Africa. This ore is shipped out of Lourenço Marques, Mozambique, and in the late months of 1950 a large tonnage of low-grade material destined for Europe accumulated on the docks and congested port traffic. Railway officials diverted cars serving the mines to other commodities, with the result that shipments of chromite to the United States were hampered by a lack of railroad cars, as well as bottoms. Since South Africa is now the only source of chemical-grade ore, it was apparent that emergency arrangements for additional shipping space would be necessary if the supply from this source were to be maintained. As world trade expanded in response to rearmament of the Western Powers, shipping facilities were also increasingly difficult to obtain for chromite from other sources, indicating that future chromite supply would be primarily a problem of transportation rather than expansion of mining operations.

The Union of South Africa displaced Turkey as the principal supplier of chromite to the United States in 1950. Of the 1,303,713 short tons received, the Union of South Africa furnished 354,706 tons, or 27 percent, most of it chemical-grade ore. Turkey was in second position, with 20 percent of the total, although most was high-grade metallurgical ore. The Republic of the Philippines dropped back to third place in 1950 with 16 percent, two-thirds of which was refractory-grade ore. Imports from this source were reduced 22 percent below the 1949 level. Southern Rhodesia nearly doubled the 94,239 tons shipped to the United States in 1949, moving into fourth place with 13 percent of total imports, the bulk of this being metallurgical-grade ore. Cuba was an important supplier of refractory-grade ore; including 13,385 tons of metallurgical ore, the 106,052 tons imported from this source represented 8 percent of the total. Imports from Russia declined again in 1950; the 71,556 tons of metallurgical-grade ore was 33 percent lower than in 1949 and 82 percent lower than in 1948. New Caledonia supplied significant quantities of chromite in 1950, and small shipments were received from Canada, Guatemala, India, Italy, Pakistan, Sierra Leone, and Yugoslavia.

DOMESTIC PRODUCTION

United States production of chromite was reduced to the output of one mine in 1950. R. F. Helmke reported 404 short tons of metallurgical chromite produced and shipped from the Lambert mine near Magalia, Calif.

Bureau of Mines laboratory research teams developed a process to produce electrolytic chromium metal from low-grade domestic ores; and, at the end of 1950, prospects favored commercial operation in the near future. The results of earlier studies in the metallurgy of chromium were published.[1] Field exploration of the large, low-grade chromite deposits of the Stillwater complex in Montana was completed, and tentative plans were set up for emergency development. Other domestic reserves were reviewed by the Bureau of Mines, Defense Minerals Administration, and the United States Geological Survey.

TABLE 2.—Chromite production (shipments) in the United States, 1946–50, by States, in short tons

State	1946	1947	1948	1949	1950
California	[1] 4,107	948	274	433	404
Oregon			3,345		
Total	4,107	948	3,619	433	404

[1] Bureau of Mines not at liberty to publish State totals separately.

1894	4,122	1914	662	1932	174	1950	404
1895	1,949	1915	3,675	1933	944		
1896	880	1916	52,679	1934	413	Total	848,556

[1] Production of chromite before 1880 was "about 200,000 long tons" (224,000 short tons), all from Maryland and Pennsylvania, according to Mineral Resources, 1908, pt. 1, p. 760. Most of the figures for 1880–95 represent conversions to short tons from rounded long tons.

CONSUMPTION AND USES

Chromite consumption during 1950 increased 46 percent above 1949 to the all-time high of 980,369 short tons. Consumption rose rapidly during the year, each quarterly total exceeding the preceding one. However, a shipping shortage was developing at the close of the year, which threatened to curtail imports, especially those from Africa.

Of the chromite consumed in 1950, 50 percent was metallurgical grade, which increased 70 percent over 1949; 36 percent was refractory grade, which increased 32 percent over 1949; and 14 percent was chemical grade, which increased 17 percent over 1949. Of the three grades, only the refractory consumption established a new high; the metallurgical total had been exceeded in 1943 and the chemical total in 1947 and 1948. The average chromic oxide content of all grades combined increased from 41.3 percent in 1949 to 42.4 percent in 1950.

TABLE 4.—Consumption of chromite and tenor of ore used by primary consumer groups in the United States, 1941–50, in short tons

Year	Metallurgical		Refractory		Chemical		Total	
	Gross weight (short tons)	Average percent Cr_2O_3	Gross weight (short tons)	Average percent Cr_2O_3	Gross weight (short tons)	Average percent Cr_2O_3	Gross weight (short tons)	Average percent Cr_2O_3
1941	402,208	50.1	270,947	34.8	127,135	46.3	800,290	44.3
1942	479,615	48.5	294,092	34.0	118,245	44.8	891,952	43.2
1943	555,259	48.5	282,178	34.0	127,163	44.7	964,600	43.8
1944	456,171	49.4	264,053	34.2	128,225	45.7	848,449	44.1
1945	429,644	49.1	252,407	34.2	126,069	45.0	808,120	43.8
1946	376,848	48.3	228,641	33.9	129,270	44.9	734,759	43.2

Consumption of ferrochromium in the United States in 1950 increased 69 percent to 147,911 tons, compared with 87,764 tons in 1949 and 122,753 tons in 1948. Additional tonnages of chromium were consumed in the form of chromium metal, briquets, Chrom-X, and some chromite used directly in the manufacture of stainless steel.

Specifications.—The mineral chromite does not have a fixed chemical composition. It is usually spoken of as $Cr_2O_3 \cdot FeO$ but also contains varying proportions of iron, alumina, magnesia, lime, and silica. These additional elements, although lowering the grade of the material in terms of chromium content, are essential to certain applications, as may be seen from the usual trade specifications outlined below.

For metallurgical use, as in the manufacture of ferrochromium, chromite should contain a minimum of 48 percent Cr_2O_3, with a chromium : iron ratio of not less than 3 : 1. Silica is undesirable, and combined alumina and magnesia of over 25 percent may be objectionable. However, ore of these specifications is not always obtainable, and the practice is to blend various analyses so that the most desirable composition will result in the furnace charge. Thus, an ore of high Cr_2O_3 content and high-iron content might be blended with chromite of somewhat lower Cr_2O_3 and an exceptionally low-iron content; together the ratio might be acceptable. Similar blending is practiced to attain the desired physical characteristics. For high-carbon ferrochromium, hard lumpy ore is desired, and for low-carbon grades, a crushed ore is preferable.

Refractory-grade chromite usually contains about 63 percent combined Cr_2O_3 and Al_2O_3, with 57 percent a common minimum. Iron and silica should be low, usually around 10 and 5 percent, respectively. Hard lump ore is desirable for making bricks, and ground material is suitable for cement. Magnesia content is around 15 percent.

Chemical-grade chromite should contain a minimum of 45-percent Cr_2O_3. High iron is not harmful within reasonable limits; a common chromium : iron ratio is 1.6 : 1. Silica must be less than 8 percent and sulfur low. Fines and concentrates are often preferred because they disintegrate readily in processing.

Metallurgical Uses.—To the general public, the most apparent use of chromium is for decorative electroplated finishes. However, these finishes are usually 0.00001 to 0.00005 inch thick and, in the aggregate, consume insignificant quantities of chromium. Heavy electroplating has important military uses, however.

It is generally known that chromium is an important constituent of stainless steel, in which a large proportion of the available chromium is consumed as low-carbon ferrochromium. Stainless steel, in turn, has many essential uses, such as chemical containers, equipment for manufacturing chemicals, marine parts, turbine blades, valve steel, petroleum-processing equipment, and numerous other applications where the metal is subjected to corrosive attack. When chromium is used in plain carbon steel for purposes other than corrosion resistance, the principal effects are to increase hardness and tensile strength with high ductility, thus permitting heat treatment of many products that must be shaped by rolling and forging. Small percentages of chromium are used in a wide variety of special steels; and, in fact, chromium is the most commonly used of all the alloying agents.[2]

[2] Manganese and silicon, although used in larger quantities, are employed mainly in production metallurgy, rather than as alloying elements.

This fact derives principally from the property of chromium to intensify and sometimes modify the effects of other alloys, an influence that metallurgical studies indicate is due to a reduction in the rate of reaction in and between the components of the steel during heat treatment.

Nonferrous uses of chromium are also expanding, especially for the purpose of increasing strength and resistance to the effects of high temperatures in alloys of aluminum and copper.

Chromium additions are made to steel in the furnace, and in the ladle before final solidification. For steel requiring low carbon content, a low-carbon ferrochromium is used; for other steels, a less expensive ferrochromium containing up to 10 percent carbon may be used. Where the metal is to receive chromium plus other alloying agents, several special combinations with other alloys have been made available in correct proportions for single additions. Nonferrous uses require chromium metal or combinations of chromium with copper.

Refractory Uses.—Chromite from the Philippines, Cuba, and (in smaller quantities) from other sources is suitable for use as a neutral lining for furnaces. Most of the ore is manufactured into bricks, and the greater part of these bricks is used in basic open-hearth steel furnaces. Because chromite refractories resist both acid and basic attacks at high temperatures, it is common practice to use a course of chromite bricks near the slag line in open-hearth furnaces, separating the silica bricks of the roof and side and the dolomite or magnesite bricks of the hearth and banks. Other chrome refractory uses have been developed in recent years, among which are ramming mixtures for furnace bottoms and finely ground chrome ore for patching furnace walls.

Chemical Uses.—The largest uses for chemical chromite are in the manufacture of pigments and the tanning of leather; surface treatment of metals represents the next-most-important use. In all chemical uses, sodium bichromate is the primary chemical produced from chromite. Chromium metal, although a metallurgical material, is also produced from chemical-grade chromite with sodium bichromate as the intermediate product. The metal is finding substantial markets in the production of high-temperature alloys, such as are used in engines for jet aircraft, and for antifriction purposes, where it is deposited by electrolytic methods. In the third-largest use mentioned (surface treatment of metals), sodium bichromate is used as the agent in cleansing, pickling, galvanizing, and red dip for brass.

STOCKS

TABLE 5.—Stocks of chromite at consumers' plants, December 31, 1947–50, in short tons

Grade	1947	1948	1949	1950
Metallurgical	191,104	256,770	325,881	248,872
Refractory	144,381	236,724	303,110	251,663
Chemical	75,582	108,997	128,004	105,736
Total	411,067	602,491	756,995	606,271

PRICES

Imported chromite is quoted on a long-ton basis, f. o. b. cars, Atlantic ports, plus ocean-freight differentials for delivery to the west coast. Domestic chromite is sold f. o. b. nearest rail point. Price quotations from the magazine Steel are shown in table 6.

TABLE 6.—Price quotations for various grades of chromite in 1950

[Steel]

Source	Cr_2O_3 (percent)	Cr:Fe ratio	Prices per long ton [1]	
			Jan. 1	Dec. 31
Indian and African	48	3:1	\$37.50	\$35.00-\$36.00

[2] Lump.
[3] Nominal.

Ferrochromium prices held firm at the 1949 level of 20.5 cents per pound of contained chromium for high-carbon grades through October 1950. In November the price rose to 21.75 cents and remained there through the end of the year. Low-carbon ferrochromium rose from 28.75 cents per pound to 30.5 cents at the end of 1950. Chromium metal (97 percent Cr min., 1 percent Fe, and 0.50 percent C max.) rose from \$1.03 per pound to \$1.08. The prices for metal and alloys given here are for bulk, carlots. Basic chrome-brick prices advanced from \$69 per short ton to \$77 f. o. b. Baltimore, Md., or Chester, Pa.

FOREIGN TRADE [3]

Imports of chromite in 1950 increased 8 percent over 1949 to a total of 1,303,713 short tons containing 581,804 tons of Cr_2O_3, valued at \$23,288,336. Average declared value per ton decreased 11 percent from \$20.10 in 1949 to \$17.86 in 1950.

Imports of ferrochromium in 1950 more than tripled the 1949 total, reaching 23,126 short tons containing 13,768 tons of Cr and valued at \$4,530,247. Canada supplied 21,419 tons; Japan, 770 tons; Sweden, 736 tons; Yugoslavia, 109 tons; Norway, 52 tons; and France, 40 tons. In addition, 59 tons of chromium metal were imported from Norway and the United Kingdom.

Exports of ferrochromium were reduced from 2,200 short tons in 1949 to 347 tons in 1950. Austria received 223 tons, Canada 62 tons, and Mexico 51 tons, while the remaining 11 tons went to the Canal

[3] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Zone, Italy, and Turkey. Chromic acid exports totaled 629,055 pounds valued at $146,499. Chromite exports in 1950 were 2,044 short tons valued at $63,409, of which 1,697 tons went to Canada.

[1] Reported as Mozambique, but the chromite is believed to have originated in the Union of South Africa.
[2] Presumed origin; actually classified as French Pacific Islands.
[3] Revised figure.
[4] Presumed origin; actually classified as British West Africa.

WORLD REVIEW

Cuba.—Cuban chromite mines, supported by a strong United States market, recovered from a drastic production slump and increased shipments to the United States in 1950. A moderate further increase may be expected from this important supplier of refractory-grade ore with the continued stimulus of higher prices. However, an exploration program to develop new reserves is needed.

New Caledonia.—This source supplied 10 percent of United States metallurgical-grade chromite imports in 1950. In 1949, New Caledonia exported 102,414 metric tons, of which 63,511 tons entered the United States.[4]

Pakistan.—Production of chromite in Baluchistan since 1915 is given in a report, Mining Industry in Pakistan, published by the Pakistan Ministry of Industries. A peak of 39,344 long tons was produced in fiscal year 1942, compared with only 15,673 tons in 1949. Of the 106 chromite leases, the Baluchistan Chrome Co., Ltd., has been granted 97. Pakistan Industries also has shown interest in chromite mining and has applied for a number of prospecting licenses. A few of these licenses have been granted; as a result, the company has started mining operations.[5]

[5] January to September, inclusive.
[6] Planned production as reported.
[7] Estimate.
[8] Fiscal year ended March 20 of year following that stated.
[9] Pakistan included with India, 1943–46.

Philippines.—As the third-largest supplier of chromite and particularly as the principal source of refractory-grade chromite, Philippine mines are important to the United States. However, lack of demand in 1949 and early 1950 caused a number of mines to shut down temporarily. From the standpoint of reserves, the Philippines could advance in relative importance as a chromite supplier.

Southern Rhodesia.—It was announced officially that a plant to produce ferrochromium will be constructed in the industrial area of Gwelo, Southern Rhodesia. Rhodesian Alloys, Ltd., sponsored by the British firm of John Brown & Co., Ltd., British South Africa Co., and Anglo-American Corp. of South Africa Co., Ltd., is financed to £1,000,000 and expects to begin production in 1952. Expansion will depend upon operating and marketing experience gained. The Selukwe district will supply chrome ore.[6]

Turkey.—Economic Cooperation Administration funds are being made available to Turkey, considerable emphasis being placed on

[6] South African Mining and Engineering Journal, vol. 61, part I, No. 2988, May 20, 1950, p. 409.

expansion of the chromite-mining industry. The Turkish Government-owned Eti Bank, which controls the chromite mines in the Guleman area, 18 kilometers north of Erganimadeni,[7] is engaged in an expansion program. The area produces some of the highest-grade chrome (52 percent Cr_2O_3) in the world, with ore reserves of over 1,000,000 tons. Production from this area in 1950 is estimated at 160,000 tons of metallurgical grade. Bilgin Maadin, Ltd., also is expanding and mechanizing operations at its properties in the Islahiye district in south central Turkey. Turk Maadin, Ltd., which operates the Kavek mine and concentrating plant east of Eskisehir, is undertaking to develop a number of promising ore bodies in the Oatmanlar district in the Department of Mugla, southwest Turkey. Production plans for this development call for an annual output of 20,000 tons of metallurgical-grade chrome ore. The Turkish Government plans a complete survey of the Taurus Mountain zone, where important chromite deposits have been reported.[8]

Chromite occurrences in the Tastepe district of Eskisehir, Turkey, were described.[9] Exports of chromite from Turkey in recent years are listed in table 9.

TABLE 9.—Exports of chromite from Turkey, by destination, 1935–39 (average) and 1947–49, in metric tons [1]

Destination	1935-39 (average)	1947	1948	1949
Austria	(2)	3,395	21,958	37,324

[2] Included with "Other."

Union of South Africa.—Large reserves of medium-grade chromite have placed the Union of South Africa in the lead as the largest producer outside of the U. S. S. R. The Union's ores suffer from a low chromium : iron ratio, which lessens its value for metallurgical uses. However, ores from the Union supply the bulk of the chromite used to manufacture sodium bichromate for chemical industry consumption. A discussion of the chromite-mining industry in the Union of South Africa was published.[10]

In the Transvaal, location of two high-grade seams of chrome ore, sufficient to keep its mine operating for 2 years, was reported by Palmiet Chrome Mines. A production of 2,600 tons of concentrates per month was expected.[11]

Clays

By Brooke L. Gunsallus and V. E. Ritenour[1]

GENERAL SUMMARY

TOTAL clay production in 1950 increased 12 percent over 1949. Records were made in all of the six chief classifications discussed herein—china clay or kaolin, ball clay, fire clay, bentonite, fuller's earth, and miscellaneous clays.

Sales of kaolin and ball clay increased from 1949 to 1950 by 24 percent and 30 percent, respectively. The paper, rubber, pottery, and refractory industries, principal consumers of kaolin, all showed substantial increases. Production of kaolin has shown an uptrend since 1945. Sales of ball clay in 1950 broke all previous records, with pottery manufacturers by far the principal consumers. Whiteware, enameling, and high-grade tile showed increases in clay consumption over 1949.

TABLE 1.—Salient statistics of the clay industry in the United States, 1949–50

	1949		1950	
	Short tons	Value	Short tons	Value
Domestic clay sold or used by producers:				
Kaolin or china clay	1,415,537	$19,007,547	1,750,858	$23,943,782
Ball clay	248,883	3,064,439	324,414	3,980,167
Fire clay, including stoneware clay	8,571,844	25,358,503	9,535,867	29,019,372
Bentonite	867,243	6,938,752	973,833	8,560,669
Fuller's earth	320,906	5,199,642	396,025	6,504,733
Miscellaneous clays	23,725,565	19,622,568	26,400,449	23,241,210
Total sold or used by producers	35,149,978	79,191,451	39,381,446	95,249,933
Imports:				
Kaolin or china clay	77,226	1,156,803	122,974	1,619,384
Common blue and Gross Almerode	24,123	299,450	34,974	345,274
Fuller's earth	389	7,859	237	3,685
Other clay	3,367	17,287	3,076	32,534
Total imports	105,105	1,481,399	161,261	2,000,877
Exports:				
Kaolin or china clay	21,839	362,615	28,261	509,376
Fire clay	80,736	766,195	74,693	704,016
Other clay (including fuller's earth)	142,308	3,666,775	135,166	3,784,343
Total exports	244,883	4,795,585	238,120	4,997,735

Except for a small decrease in 1949, output of bentonite has increased each successive year for the past 12 years. From 1949 to 1950, tonnage increased 12 percent and value 23 percent. The foundry and petroleum industries consumed most of the total tonnage, with use for rotary-drilling mud, filtering and decolorizing oils, and foundry-sand bond all increasing.

[1] Figures oni mports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Total production of fuller's earth increased 23 percent in 1950 over 1949 and 18 percent over the previous record year 1930. Mineral-oil refining, absorbent uses, insecticides, and rotary-drilling mud were all represented in the upward trend.

The production of fire clay in 1950 was 11 percent greater than in 1949 due to the expansion of steel-mill and foundry facilities and the pent-up civilian and industrial demand for heavy clay products.

Price quotations of clay and clay products in 1950, as shown in trade papers, remained steady in most cases, but some followed a general uptrend.

Imports of kaolin in 1950 were the heaviest since 1937, increasing 59 percent over 1949, but comprised only 7 percent of the total domestic consumption. Imports of common blue and ball clays and Gross Almerode clays increased 45 percent in volume and 15 percent in value. By far the greater part of the imports of kaolin and ball clay, and blue clay (including Gross Almerode), originated in the United Kingdom, although small amounts of kaolin and common blue and ball clays were imported from Canada and a very small amount of the latter from Germany.

Exports of kaolin or china clay in 1950 (28,261 short tons) rose 29 percent over 1949; 90 percent was shipped to Canada. Exports of fire clay in 1950 were 7 percent in tonnage and 8 percent in value less than in 1949, totaling 74,693 short tons valued at $704,016. Of the total, 85 percent was shipped to Canada, the remainder being distributed throughout the world.

CONSUMPTION AND USES

The clay-consumption data in table 2 for kaolin, ball clay, bentonite, and fuller's earth are comparable with statistics published in Minerals Yearbook for all previous years. However, the fire-clay and miscellaneous clay data include captive tonnage and therefore are not comparable with the years preceding 1944. A discussion of this difference appeared in Minerals Yearbook, 1944 (pp. 1326–1338).

Heavy clay products in 1950 consumed 14 percent more clay than in 1949 and comprised 58 percent of the total clay produced. Clays used in portland and other hydraulic cements amounted to 18 percent of the output of all clays; refractories 14 percent; paper filler and coating clays 2 percent; and rotary drilling mud, filtering and decolorizing oils, and pottery, 1 percent each. The remainder was consumed for a large number of miscellaneous purposes.

Although most uses of clay increased in tonnage in 1950 compared with the previous year, the following uses decreased: Enameling (4 percent), architectural terra cotta (10 percent), asbestos products (28 percent), fertilizers (54 percent), and artificial abrasives (98 percent). Many uses showed substantial gains in 1950 over figures reported in 1949. The proportional increases for some of the more important classifications were as follows: Paper filler and coating 18 percent, heavy clay products 14 percent, pottery 23 percent, high-grade tile 35 percent, refractories 9 percent, rubber 21 percent, cement 6 percent, rotary-drilling mud 6 percent, and insecticides and fungicides 106 percent.

TABLE 2.—Clay sold or used by producers in the United States in 1950, by kinds and uses, in short tons

Use	Kaolin	Ball clay	Fire clay and stoneware clay	Bentonite	Fuller's earth	Miscellaneous clay, including slip clay	Total
Pottery and stoneware:

1949	1,415,537	248,883	8,571,844	867,343	320,906	23,725,565	35,149,978

[1] Comprises the following: Mineral oils, 156,643 tons; vegetable oils, 21,261 tons.

CHINA CLAY OR KAOLIN

The 1950 domestic production of china clay or kaolin was the largest in the history of the industry and represented a 12-percent increase over the former record year 1948. With respect to 1949, there was a tonnage increase of 24 percent and a value increase of 26 percent. Thus there was a renewal of the upward trend in kaolin production that started in 1945.

As has been the pattern for the past several years, the paper, rubber, pottery and refractory industries were the principal consumers. Paper consumed 903,508 short tons, or 52 percent of the total kaolin, including 440,313 short tons for filler and 463,195 for coating. The rubber industry consumed 263,306 tons or 15 percent, refractories 157,016 tons or 9 percent, and pottery 143,245 tons or 8 percent. The remainder (16 percent) was consumed for a wide variety of purposes, including cement, high-grade tile, fertilizers, chemicals, insecticides, paint filler or extender, calcimine, and linoleum. Except for a few small consumers, substantial relative increases in consumption over 1949 were reported by all users, for example: Pottery 17 percent, paper filler 14 percent, paper coating 23 percent, rubber 33 percent, refractories 30 percent, paint filler 22 percent. The outstanding increase, 176 percent, was in insecticides.

TABLE 3.—Kaolin sold or used by producers in the United States, 1949–50, by States

[1] Included with "Other States."
[2] Includes States indicated by footnote 1 and Illinois, Nevada (1950 only), Utah, and Virginia.

Eleven States shipped kaolin in 1950 compared with 10 in 1949, Nevada being added in 1950. As has been the case for a number of years, Georgia ranked first with 70 percent of the total, South Carolina was second with 20 percent, and Pennsylvania was third with 4 percent. All States or groups of States for which statistics are published in table 3 show substantial gains in output in 1950 compared to 1949.

TABLE 4.—Georgia kaolin sold or used by producers, 1946–50, by uses

Year	China clay, paper clay, etc.			Refractory uses			Total kaolin		
	Short tons	Value		Short tons	Value		Short tons	Value	
		Total	Average per ton		Total	Average per ton		Total	Average per ton
1946	798,739	$9,075,123	$11.36	119,013	$595,926	$5.01	917,752	$9,671,049	$10.54
1947	902,554	12,034,383	13.33	129,459	721,658	5.57	1,032,013	12,756,041	12.36
1948	1,006,325	13,866,799	13.78	129,115	775,899	6.01	1,135,440	14,642,698	12.90

1950	1,087,174	16,533,582	15.21	133,481	806,946	6.05	1,220,655	17,340,528	14.21

Quotations on Georgia kaolin, as reported in E&MJ Metal and Mineral Markets, for filler and ceramic grades were given in December 1950 as $8.50 to $9.50 per ton depending upon grade, for crushed material and $13 to $17 for pulverized, in paper bags. North Carolina china clays, ceramic grades in bulk, carlots, were quoted at $20.25 to $22.25 per ton. Florida kaolins were quoted by the same source at $18.75 per ton for purified and crushed; $24.75 for washed and air-floated clays; and $38.50 for air-floated enamel grade. Crude Pennsylvania kaolin was quoted at $5 to $7.50 per ton and "purified" kaolin at $21 to $24. These prices were substantially the same as those quoted in 1949.

Prices of imported china clay in December 1950 were quoted by the Oil, Paint and Drug Reporter as follows: White lump, carlots, ex dock (Philadelphia and Portland, Maine), $19 to $40 per long ton; powdered, ex dock, in bags, $35 to $45 per net ton; and powdered, l. c. l., ex warehouse, $45 to $60. There has been no change in price since October 1949. The average value of domestic kaolin sold or used as reported to the Bureau of Mines in 1950 rose to $13.68 compared with $13.43 for 1949 and $12.59 for 1948.

Imports of kaolin for 1950 increased 59 percent over 1949, although the imports represented only 7 percent of total domestic consumption in 1950 compared with 5 percent in 1949. Imports for 1950 were the largest since 1937, when they represented 17 percent of the total tonnage of kaolin consumed by industry in the United States. Of 1950 imports, totaling 122,974 short tons, 450 came from Canada and the remainder from the United Kingdom.

Exports of kaolin or china clay in 1950 rose 29 percent over 1949 to 28,261 short tons, of which 90 percent was shipped to Canada. Small tonnages also were sent to Mexico, Central and South America, Europe, Africa (Union of South Africa), Asia (Japan and Indonesia), and Australia.

A survey was made of the sedimentary kaolins of Georgia.[2] The versatility of kaolin has resulted in demands for widely varying refined-clay specifications, thus transforming what was once a rather simple mining operation into a highly scientific process requiring close laboratory control.[3] The use of kaolin as a catalyst is becoming more extensive.[4]

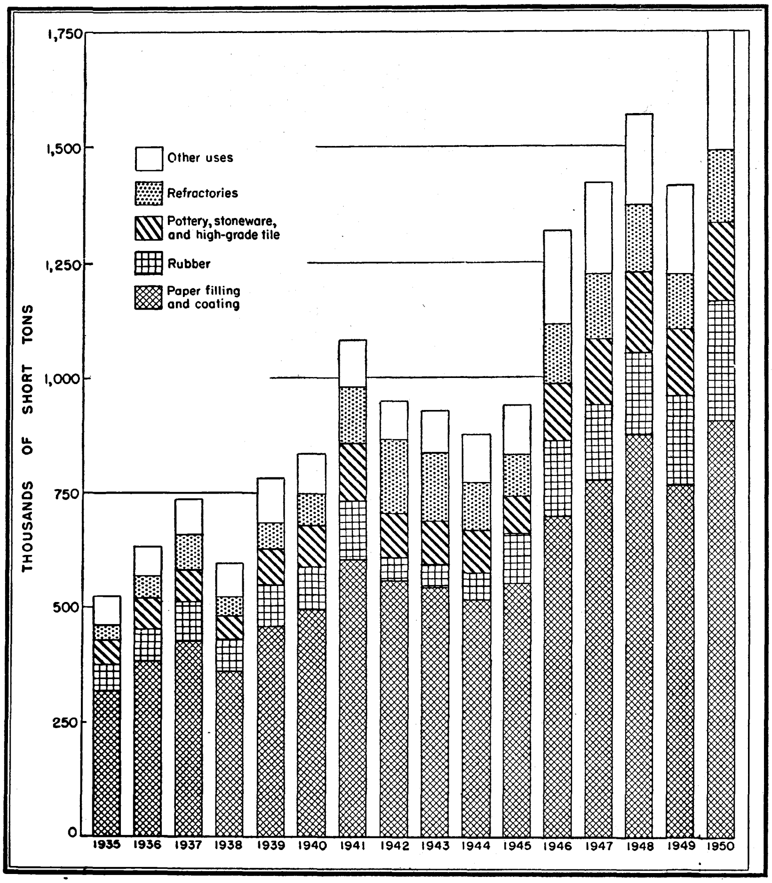

FIGURE 1.—Kaolin sold or used by domestic producers for specified uses, 1935–50.

BALL CLAY

Sales of ball clay in 1950 broke all previous records both in tonnage and value. The increase over 1949 was 30 percent both in tonnage and value; there was a 9-percent increase in volume over 1948, the previous high. Tennessee, with 57 percent of total sales, was first in

[2] Georgia Mineral Society, vol. 3, No. 4, July–August 1950, p. 112.

[4] Shabaker, Hubert A. (assigned to Houdry Process Corp.), U. S. Patent 2,489,332, Nov. 29, 1949 (Apr. 30, 1946), Am. Ceram. Soc. Jour., vol. 33, No. 6, June 1, 1950, p. 133, and U. S. Patent 2,494,586, Jan. 17, 1950 (Apr. 30, 1946), Am. Ceram. Soc. Jour., vol. 33, No. 7, July 1950, p. 153.

output for the eighth consecutive year, and Kentucky was second with 33 percent. The remainder was produced in Maryland, Mississippi, and New Jersey. Kentucky's and Tennessee's output increased 18 and 39 percent, respectively, compared with 1949; the other producing States also reported increases.

TABLE 5.—Ball clay sold by producers in the United States, 1948–50, by States

State	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
Kentucky	103,426	$1,155,530	89,281	$1,076,531	105,690	$1,325,161
Maryland, Mississippi, and New Jersey	21,756	284,588	27,265	327,427	34,290	424,480
Tennessee	173,797	1,902,529	132,337	1,660,481	184,434	2,230,526
Total	298,979	3,342,647	248,883	3,064,439	324,414	3,980,167

Almost 79 percent of all ball clay sold in 1950 was consumed by the pottery industry. Ball clay used in making whiteware in 1950 increased 28 percent over 1949; and the amount sold for use in high-grade tile, architectural terra cotta, and enameling increased (40 percent for high-grade tile) over 1949. High-grade tile comprised 12 percent of the national output in 1950, whereas 5 percent went to refractories and the remaining 4 percent was used for enamel, paper filler, and miscellaneous uses.

Price quotations appearing in E&MJ Metal and Mineral Markets in 1950 did not change from those given for 1949 and were as follows: Tennessee—crude ball clay, $10 per short ton, and air-floated and pulverized, $19.50 per ton; Maryland—shredded, in bulk, $7 to $9, and air-floated, in bags, $14 to $17.50 per ton. No quotations on Kentucky ball clay in 1950 were given in E&MJ Metal Mineral Markets. In 1950 the average value per ton for ball clay as reported by producers to the Bureau of Mines was $12.27 compared with $12.31 for 1949 and $11.18 in 1948.

Imports of common blue and ball clay and Gross Almerode clays in 1950 increased 45 percent in volume and 15 percent in value compared with 1949. Unmanufactured blue and ball clays represented the major share of imports; United Kingdom supplied 82 percent of this classification and virtually all the imports of manufactured blue and ball clay. Small tonnages of imports of blue and ball clays came from Canada and Germany. Imports of Gross Almerode clays (from Germany) in 1950 totaled only 34 short tons. Exports, if any, are not separately shown in official foreign trade returns.

A beneficiation technique for lignite-bearing ball clays was described.[5]

FIRE CLAY

Fire clay sold or used in 1950 was the second largest in the history of the industry. It exceeded the previous peak year (1948) by 3 percent and the total tonnage for 1949 by 11 percent. Expansion of the

[5] Phelps, G. W., Beneficiation of Lignite-Bearing Ball Clays: Am. Ceram. Soc. Bull., vol. 29, No. 8, August 1950, pp. 293–295.

national economy in general and increased activity in the refractory and construction industries in particular were for the most part the governing factors effecting increased fire clay output in 1950.

The principal consumers of fire clay in 1950 were refractories 5,148,904 tons (7-percent increase over 1949) and heavy clay products 4,020,357 tons (17-percent increase over 1949). Refractories and heavy clay products combined represented 96 percent of the total tonnage output in 1950—the same proportion as in 1949. About 2 percent was consumed in the manufacture of high-grade tile, 1 percent in chemicals, and the remainder in a wide variety of uses. The chief use of fire clay is in making fire brick and block; this took 3,888,481 tons in 1950, a 3.6-percent increase over 1949. Several less-important uses, including stoneware, rubber, clay crucibles, and glass refractories, each consumed a little less fire clay in 1950 than in 1949.

TABLE 6.—Fire clay, including stoneware clay, sold or used by producers in the United States, 1949–50, by states [1]

State	Sold by producer		Used by producer		Total

[1] Includes stoneware clay as follows: 1949—103,417 tons, $224,113; 1950—105,147 tons, $235,063.
[2] Included with "Other States."
[3] Includes diaspore and burley clay as follows: 1949—diaspore, 35,359 tons, $398,885; burley, 32,432 tons, $204,850; 1950—diaspore, 40,750 tons, $488,464; burley, 53,571 tons, $334,299.
[4] Includes States indicated by footnote 2 above and Delaware, Idaho, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oregon, South Carolina, and Virginia (1949 only).

In 1950 Ohio ranked first in output of fire clay, followed by Pennsylvania, Missouri, Indiana, Illinois, Kentucky, and California. These seven States supplied 78 percent of the total. The remainder was produced in 25 States in 1950 (26 in 1949; Virginia did not report in 1950). Of the 17 principal producing States shown in table 6, Arkansas and Washington reported decreases, and the 15 others reported increases. Price quotations on fire clay do not appear in trade journals. However, the average realization per ton reported to the Bureau of Mines by producers indicated that the average value of fire clay sold in 1950 was $3 compared with $2.91 in 1949. The average value of all fire clay, including both sales and captive tonnage, was $3.04 in 1950 compared with $2.96 in 1949. Quotations on brick manufactured from fire clay were reported in December 1950 in E&MJ Metal and Mineral Markets (1949 price in parentheses) are as follows: Missouri, Kentucky, and Pennsylvania, first quality, $116.60 per thousand ($100), and second quality, $99.60 per thousand ($80); Ohio firebrick, intermediate grade, $83 per thousand ($74), and second grade, $79.20 per thousand ($66).

Imports of fire clay are not shown separately in foreign trade statistics. Exports of fire clay in 1950 were 7 percent in tonnage and 8 percent in value less than in 1949 and totaled 74,693 short tons valued at $704,016. Canada took 85 percent of the total exports, Mexico 9 percent, and Chile 2 percent. The remainder (4 percent) comprised small tonnages to 39 destinations in Central and South America, Europe, Asia, and Africa.

The Harbison-Walker Refractories Co. has selected Windham, Ohio, as the location for a new firebrick plant to produce at the rate of about 20 million brick annually.[6]

BENTONITE

The bentonite producers enjoyed their best year in the history of the industry, with a 6-percent tonnage increase over the previous high year of 1948. Output in 1950 increased 12 percent in tonnage and 23 percent in value over 1949. The general upswing in national production, particularly the increased activity in oil-well drilling and the over-all expansion in the foundry industry, were directly responsible for this large bentonite tonnage. Sales to foundries in 1950 increased 41 percent and to the rotary-drilling industry 14 percent over 1949.

The foundry and petroleum industries consumed 93 percent of the total tonnage; rotary-drilling mud represented 37 percent (357,315 tons), filtering and decolorizing oils 30 percent (297,145 tons), and foundry-sand bond 26 percent (251,716 tons). A wide variety of uses consumed the remaining tonnage (67,675 tons). Bentonite used for filtering and decolorizing oils decreased 2 percent over 1949 and insecticides increased 5 percent. Nine States reported bentonite production in 1950, the same as in 1949. Increases in tonnage were noted for California, Mississippi, South Dakota and Wyoming and decreases for Texas, Arizona, Utah, and Idaho. Colorado reported a small tonnage in 1950 but did not report production in 1949.

[6] Pit and Quarry, vol. 43, No. 3, September 1950, p. 62.

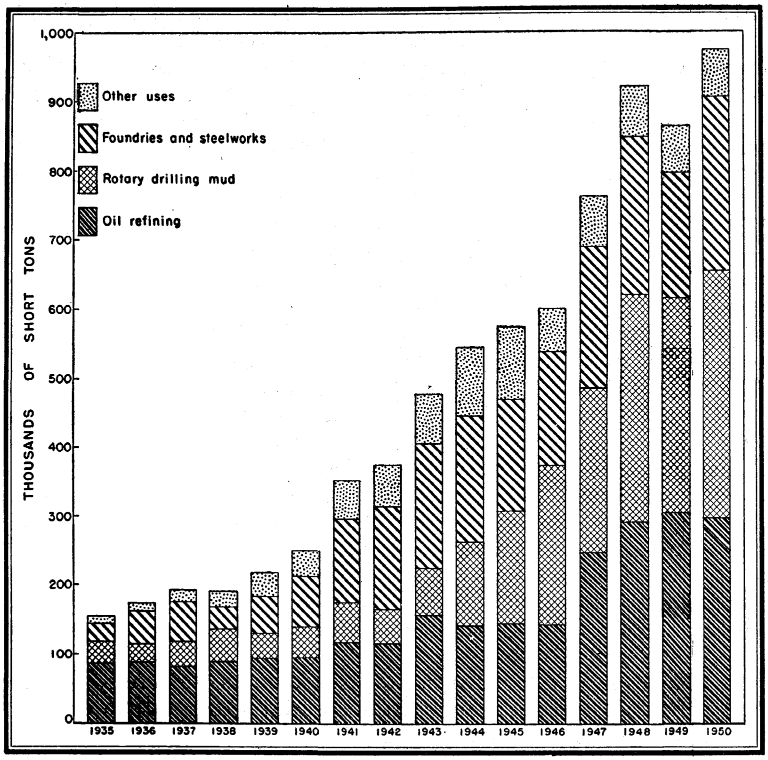

FIGURE 2.—Bentonite sold or used by domestic producers for specified uses, 1935–50.

TABLE 7.—Bentonite sold or used by producers in the United States, 1948–50 by States

State	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
California	18,676	$101,450	(1)	(1)	(1)	(1)
South Dakota	156,701	1,702,430	137,376	$1,515,927	192,591	$2,194,894
Texas	29,926	282,036	27,598	302,384	24,574	321,345
Wyoming	383,815	3,682,734	350,644	3,556,480	394,939	4,091,571
Other States [2]	332,442	1,367,658	351,625	1,563,961	361,729	1,952,859
Total	921,560	7,136,308	867,243	6,938,752	973,833	8,560,669

[1] Included with "Other States."
[2] Arizona, California (1949–50 only), Colorado (1948–50 only), Idaho (1949–50 only), Mississippi, Montana (1948–49 only), Nevada (1948 only), and Utah.

The Wyoming-South Dakota district produced 60 percent of the total bentonite in 1950 (Wyoming 40 percent and South Dakota 20 percent) compared with 56 percent in 1949. Texas furnished 3 percent of the total sales —the same as in 1949 and 1948—and the remainder came from California, Mississippi, Arizona, Colorado, Utah and Idaho. Trends in sales for principal uses are shown in figure 2.

In December 1950 Wyoming bentonite was quoted in E&MJ Metal and Mineral Markets as follows: Dried, crushed, in bulk, $9 per ton ($8 in July 1950); and 200-mesh, pulverized, in 100-pound bags $12.50 ($11 in July 1950). Oil-well grade was quoted at $14 per ton. The average value per ton as reported by the producers to the Bureau of Mines in 1950 increased to $8.79 per ton compared with $8 per ton in 1949 and $7.74 in 1948.

Less than 100 tons of bentonite was imported in 1950, entirely from Canada. Exports of bentonite are not shown separately in foreign trade statistics but are included under the blanket classification of "Other clays or earths, not specifically provided for." It is understood, however, that some domestic producers export part of their production to destinations throughout the world.

FULLER'S EARTH

The production of fuller's earth in 1950 reached the highest peak in the history of the industry, increasing 23 percent over 1949 and 18 percent over the previous record year (1930).

The use pattern in 1930 was much different from that in 1950. Mineral-oil refining consumed most of the tonnage in 1930. In 1950 it was still the largest single consumer; but new uses, such as absorbents, insecticides, and rotary-drilling mud, now form 60 percent of the 1950 total.

Fuller's earth consumed in mineral-oil refining in 1950 totaled 156,643 tons or 40 percent of the total output compared with 47 percent in 1949.

From 1946 to the present the increase in total production of fuller's earth has not been reflected in the quantity consumed in refining mineral oil, which has shown a downward trend. It is the consensus that this trend is due in part to improved methods of oil refining and the marketing of a higher quality of fuller's earth.

Absorbent uses took 83,684 tons (21 percent of the total compared with 22 percent in 1949); insecticides, 69,929 tons (18 percent compared with 12 percent for 1949); rotary-drilling mud, 37,631 tons (10 percent compared with 9 percent in 1949); and vegetable-oil and animal fats, 21,261 tons (5 percent compared with 6 percent in 1949). The remainder was used in other filtering and clarifying, binders, and other unspecified uses.

Illinois was the only State reporting production in 1949 that did not produce in 1950, while all other States increased over 1949 in 1950. Florida and Georgia combined accounted for 62 percent and Texas 28 percent of the total tonnage.

As reported by E&MJ Metal and Mineral Markets for December 1950, quotations on Georgia and Florida fuller's earth in 1950 remained unchanged from those of 1949. Prices were as follows: 30- to 60-mesh, $14.50 per short ton; 14- to 30-mesh, $14.00; 200-mesh up, $10.00; and 100-mesh up, $7.00. The average value of fuller's earth sold or used, as reported to the Bureau of Mines by producers, was $16.43 in 1950 compared with $16.20 in 1949 and $15.42 in 1948.

TABLE 8.—Fuller's earth sold or used by producers in the United States, 1948–50, by States

State	1948		1949		1950	
	Short tons	Value	Short tons	Value	Short tons	Value
Florida and Georgia	188,014	$3,224,169	181,993	$3,194,551	247,390	$4,273,890
Illinois	37,942	410,678	9,104	118,647

Other States [1]	23,815	476,668	29,064	643,886	36,169	837,070
Total	342,081	5,273,851	320,906	5,199,642	396,025	6,504,733

[1] Includes California, Mississippi, Nevada, Tennessee, and Utah.

Imports of fuller's earth in 1950 totaled only 237 short tons, all from the United Kingdom. Exports are not given separately in official foreign statistics. Reports from the producers to the Bureau of Mines, however, indicated exports of approximately 16,400 short tons in 1950 compared with 12,100 tons in 1949. Destinations reported include Canada, Central and South America, Netherlands, West Indies, several European nations, Bahrein Island, Saudi Arabia, and the Philippines.

A method for determining the heat of wetting of absorbents is described, and heat-of-wetting data of a series of organic liquids and water are given for activated bauxite and Attapulgus clay (fuller's earth).[7]

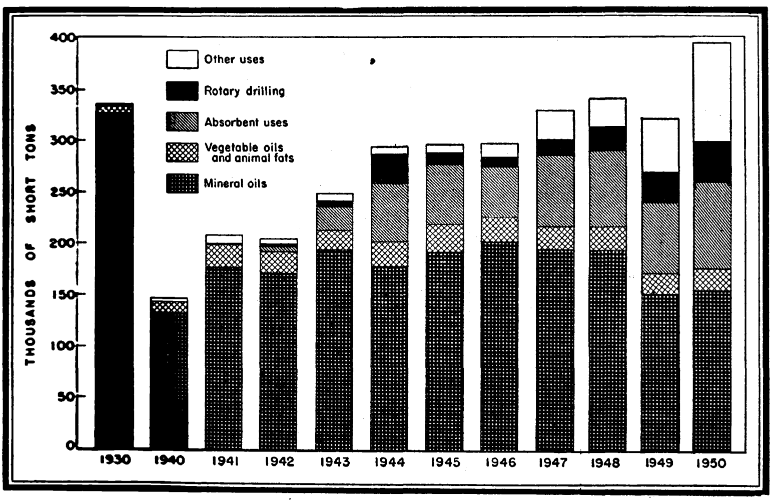

FIGURE 3.—Fuller's earth sold or used by producers for specified uses, 1930 and 1940–50.

MISCELLANEOUS CLAYS

This section includes statistics for the large-tonnage clays and shales, other than those discussed in the preceding pages, that are used in the manufacture of heavy clay products and portland cement. With these clays are grouped small tonnages of slip clay, oil-well

[7] Miller, John G., Heinemann, Heinz, and McCarter, W. S. W., Heat of Wetting of Activated Bauxite and Attapulgus Clay: Ind. Eng. Chem., vol. 42, No. 1, January 1950, pp. 151–153.

drilling mud, pottery clay, and other clays that cannot be clearly identified with one of the types discussed separately in this chapter.

Owing to the continued demand for clay products in the construction field, production of miscellaneous clays, increased 11 percent in tonnage over 1949. In 1950, 71 percent of the total miscellaneous clays were used in manufacturing heavy clay products and 27 percent in cement. Tonnage consumed in heavy clay products was 13 percent more than in 1949, and quantities used in cement manufacture rose 6 percent. Captive tonnage or clay produced by the mine operators for their own use in manufacturing brick, tile, cement, and other end products and marketed for the first time as such, amounted to 96 percent of all miscellaneous clays and shales (figures for which are given in this section). Cement represented 27 percent of the tonnage and heavy clay products 71 percent. The average value of the miscellaneous clays sold as crude or prepared clay in 1950 was $1.49. Some special types of clay included under the "miscellaneous" clay classification, however, sold for much higher amounts. The value of the captive tonnage was computed from individual estimates that generally are $1 or less per ton.

[1] Includes slip clay as follows: 1949–50—Indiana, Michigan, and New York; figures cannot be shown separately. Purchases by portland-cement companies of common clay and shale: 1949—559,682 tons, estimated at $494,147; 1950—555,910 tons, estimated at $466,600.

[2] Includes the following: Common clay and shale used by portland-cement companies: 1949—6,058,502 tons, estimated at $3,866,210; 1950—6,453,777 tons, estimated at $4,840,342.

[3] Included under "Undistributed."

[4] Figures include Arizona, Delaware, District of Columbia, Florida, Idaho, Nevada, North Dakota, South Dakota, Vermont, Virginia, and States indicated by footnote 3.

Miscellaneous clays, including shales and the so-called common or surface clays, are of widespread occurrence, and workable commercial deposits are reported in all States except Rhode Island. Two States—Illinois and Ohio—reported tonnages exceeding 2 million short tons each. Other States reporting a production of over 1 million tons were, in order of output: California, Pennsylvania, Texas, New York, Michigan, North Carolina, Alabama and Georgia. Of the States for which data are shown in table 9, 27 reported increases in output, and 11 reported decreases in 1950 compared with 1949.

HEAVY CLAY PRODUCTS

With construction expanding at an accelerated pace, especially industrial construction, shipments of structural clay products continued to increase; all principal classifications substantially reflected this surge upward except drain tile, which fell short of 1949 shipments by 9 percent; all others increased over 1949 as follows; unglazed brick (common and face) 24 percent; unglazed structural tile 5 percent; vitrified clay sewer pipe, 16 percent; hollow facing tile, glazed and unglazed, 21 percent; and glazed and unglazed floor and wall tile 37 percent.

TABLE 10.—Shipments of principal structural clay products in the United States, 1948–50 [1]

Product and unit of quantity	1948		1949		1950	
	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)	Quantity	Value (thousand dollars)
Unglazed brick (common and face) M stand. brick	5,706,838	134,445	5,251,633	129,179	6,486,332	164,470
Unglazed structural tile short tons	1,250,904	13,364	1,259,445	14,060	1,316,972	14,896
Vitrified clay sewer pipe do	1,432,512	46,731	1,349,598	44,641	1,567,664	53,402
Drain tile do	734,331	10,866	688,010	11,084	627,545	10,191
Hollow facing tile, glazed and unglazed M brick equiv	321,841	16,029	357,461	18,717	432,027	22,438
Glazed and unglazed floor and wall tile and accessories, including quarry tile M square feet	102,251	46,646	93,115	43,905	127,302	61,579

[1] Compiled from information furnished by the Bureau of the Census, U. S. Department of Commerce.

The total value of the principal structural clay products in 1950 increased 25 percent to $327,000,000 from $262,000,000 in 1949.

The value of shipments of all branches of the clay-refractories industry shown in table 11 increased in 1950 compared with 1949. Over-all expansion in the steel and foundry industries (due for the most part to the present national emergency) augmented the demand for clay refractories. The value of shipments of firebrick (except superduty) was 57,489,000, 18 percent over 1949; of superduty fire-clay brick, 32 percent over 1949; and of ladle brick, 41 percent compared to 1949.

TABLE 11.—Production and shipments of refractories in the United States, by kind, 1949–50

[Bureau of the Census]

Product	Unit of quantity	1949			1950		
		Production (quantity)	Shipments		Production (quantity)	Shipments	
			Quantity	Value (thousands of dollars)		Quantity	Value (thousands of dollars)
Clay refractories:							
Fire-clay brick, standard and special shapes, except superduty	1,000 9-in. equiv.	523,623	514,378	48,819	560,492	565,103	57,489
Superduty fire-clay brick, standard and special shapes.	do	57,353	51,586	7,680	63,105	64,046	10,108
High-alumina brick, standard and special shapes (50 percent Al_2O_3 and over, except fused alumina and mullite).	do	16,459	16,346	4,392	17,620	17,670	4,757
Insulating firebrick, standard and special shapes.	do	29,239	33,315	5,840	40,986	43,204	7,635
Ladle brick	do	164,089	159,790	8,557	196,869	198,230	12,075
Hot-top refractories	do	34,560	34,284	3,261	41,847	42,640	4,489
Sleeves, nozzles, runner brick and tuyères.	do	40,310	39,189	4,802	53,076	53,106	6,895
Glass-house pots, tank blocks, upper structure, and floaters.	Short tons	17,218	17,564	2,539	19,919	21,294	3,177
High-temperature bonding mortars	do	54,462	53,829	4,146	65,146	65,517	5,494
Plastic refractories (including wet and dry ramming mixtures).	do	79,386	77,080	3,701	90,687	91,455	4,511
Cast and castables (hydraulic setting).	do	47,437	47,675	3,430	57,743	57,300	4,396
Ground crude fire clay and high-alumina material.	do	329,470	327,864	2,943	380,385	381,163	3,611
Other clay refractories				2,034			2,049
Total clay refractories				102,144			126,686
Nonclay refractories:							
Silica brick, standard and special shapes.	1,000 9-in equiv.	266,596	261,719	30,320	312,334	309,353	38,222
Magnesite and magnesite-chrome (magnesite predominating) brick, standard and special shapes.	do	18,508	18,650	9,279	28,135	27,779	14,415
Chrome and chrome-magnesite (chrome predominating) brick, standard and special shapes.	do	35,847	34,777	14,312	46,528	45,489	19,672
Graphite and other carbon crucibles and retorts.	Short tons	7,180	7,328	3,628	10,116	10,329	5,690
Other graphite and carbon refractories.	do	846	814	298	1,269	1,206	503
Silicon carbide				6,116			7,957
Mullite and kyanite				2,454			3,509
Sillimanite				256			238
Fused alumina and bauxite				2,530			2,255
Zirconia, forsterite, fused magnesia, pyrophyllite, and other nonclay shapes.				1,693			3,995
High-temperature bonding mortars	Short tons	30,954	30,820	3,332	38,101	38,175	4,345
Plastic refractories (including wet and dry ramming mixtures).	do	72,339	72,015	4,934	98,721	98,858	7,175
Other nonclay refractory materials, sold in lump or ground form (including ground silica and nonclay cast and castables).				2,875			3,995
Total nonclay refractories [1]				82,027			111,971
Grand total refractories [1]				184,171			238,657

[1] Data for dead-burned magnesia or magnesite excluded to avoid duplication in other refractory products covered in this table (such as magnesite brick and shapes). Quantity and value of shipments of dead-burned magnesia or magnesite totaled 218,000 tons valued at $8,606,000 in 1949 and 283,000 tons valued at $11,901,000 in 1950.

The refractory material best-suited to each of the many complex applications was discussed.[8]

A wave of plant modernization and expansion swept over the structural clay products field to help stimulate the use of clays and shales.[9]

Research and development in the use and application of clays were discussed.[10]

The Kansas Geological Survey was about to start a study on the commercial uses of Kansas clays.[11]

The utilization of Wilcox-group clays in Arkansas was described.[12]

A clay-improvement process, designed to cut costs and improve quality, was announced by the University of Wisconsin.[13]

A survey was being made to check all known clay pits in Indiana, under the direction of Prof. John B. Patton, State geologist. Samples were to be analyzed and cataloged as to location and types.[14]

TECHNOLOGY

The Structural Clay Products Research Foundation, organized in 1949 to carry forward a $1,250,000 5-year investigation into all phases of the brick and tile industry, has taken definite form. A contract has been given to the Armour Research Foundation of the Illinois Institute of Technology in Chicago as the first step in this 5-year plan.[15] The Brick and Tile Research Institute, also organized in 1949 to further the interests of clay products manufactured in the Southeast, reports progress in product research.[16]

The interest in and production of lightweight aggregates from common clays and shales increased, and improved methods and new developments were discussed.[17]

Increased consideration is being given to the use of clays, including halloysite and bentonite, as catalytic agents in the oil-refining industry.[18] The Filtrol Corporation was constructing a $2,500,000 plant at Salt Lake City, Utah, to use halloysite for this purpose and expected it to be in operation early in 1951.[19]

[19] Engineering and Mining Journal, vol. 151, No 8, August 1950, pp. 148–149.

A number of articles have been published covering plant modernization in the structural clay products and pottery industries.[20]

Oil and natural gas are being used more extensively in the ceramic industry.[21] The behavior of clays during the several stages of drying was discussed.[22]

The Engineering College Research Council of America Society for Education has published its 1949 survey on engineering research. Physical and chemical properties of clays and shales in United States and their commercial potentialities are included in this report.[23]

An international committee for the study of clays was formed in London in 1949. The aim was to group specialists in the study of clays from all angles in different countries. R. E. Grim of the University of Illinois is the United States member of the executive subcommittee.[24]

The Department of Mines and Technical Surveys, Mineral Resources Division, Ottawa, Canada, published a survey of the manufacturers of clay products in Canada.[25]

The classification of industrial clays used in individual plants, their source, quantity, and type of products produced are given.

The Mineral Development Committee of Great Britain recently has issued a report giving estimates of deposits of various minerals including china clay.[26] Published data on clays in industrial periodicals were given on the following; Fire-clay resources of Japan, including ball clay[27]; shales, clays and kaolins of France[28]; a study of high-alumina clays found in France[29]; refractory clays in the Union of South Africa[30]; a substantial china-clay deposit was found in Ceylon.[31] The Commonwealth Scientific and Industrial Research Organization of Australia is making a survey of clay deposits suitable for producing heavy clay products. One large plant of United States design for producing brick and tile is now under construction.[32] The thermochemical changes in alundite clays found in Egypt were discussed. These clays are an important source of refractory material.[33]

Coal—Bituminous and Lignite[1]

By W. H. Young, R. L. Anderson, and E. M. Hall

GENERAL SUMMARY

THE output of soft coal in 1950—estimated at 512,000,000 tons[2]—was 17 percent higher than the 437,868,036 tons produced in 1949. The smaller amount of time lost by strikes in 1950 compared to 1949 largely explains the increase. According to the Bureau of Labor Statistics, 9,320,000 man-days were lost on account of strikes in 1950 compared to 16,700,000 man-days in 1949.

Production.—Production was low during the first 2 months of 1950, largely because of strikes and labor difficulties. During the last 10 months, output averaged close to the 11,000,000-ton-per-week level.

Trend of Employment.—The average number of men working daily at bituminous-coal and lignite mines in 1950 decreased to 431,000 from 433,698 in 1949.

Index to Capacity.—As it is not possible for all mines to operate every working day in the year, a conservative figure of 280 days for calculating potential capacity was suggested some years ago by the coal committee of the American Institute of Mining and Metallurgical Engineers. (*See* Minerals Yearbook, 1935, pp. 631–632.) The average output per day worked in 1950 was 2,994,152 tons, which (if applied to 280 days) gives an annual potential output of 838,000,000 tons compared with the actual production of 512,000,000.

Mechanization.—More coal was loaded mechanically at underground mines in the United States in 1950 than in 1949. Also, the percentage mechanically loaded increased from 67 percent of the total underground output in 1949 to 68 percent in 1950. Sales of underground loading equipment, in terms of capacity, were less in 1950 than in any year since 1935.

Mechanical Cleaning.—The total capacity of mechanical-cleaning equipment sold for use at bituminous-coal mines in 1950 was estimated at 12,200 tons of cleaned coal per hour, an 8-percent decrease from the previous year.

Consumption.—Five classes of consumers used less coal in 1950 than in 1949, while four classes increased their consumption. The total consumption in 1950 was approximately 8,000,000 tons more than in 1949. Table 36 shows trends in consumption for the major classes of consumers.

Trends of Fuel Efficiency.—During 1950 electric public-utility power plants attained increased fuel efficiency.

Competition With Oil and Gas.—Soon after World War II, increased competition developed among the fuels, with numerous reports of conversion from coal to fuel oil and gas.

[1] Data for 1950 are preliminary; final figures will be issued in a Mineral Market Report about November 1951. Data for 1949 are final.

[2] Throughout this chapter, "tons" refers to net tons of 2,000 pounds, except that the world table is in metric tons of about 2,205 pounds.

TABLE 1.—Salient statistics of the bituminous-coal and lignite industry in the United States, 1949–50

[All tonnage figures represent net tons]

	1949	1950 (preliminary)	Change from 1949 (percent)
Production	437,868,036	512,000,000	+16.9
Consumption in the United States	445,538,000	453,830,000	+1.9
Stocks at end of year:			
Industrial consumers and retail yards	45,111,000	72,516,000	+60.8
Stocks on upper Lake docks	3,261,996	6,206,997	+90.3
Imports and exports: [1]			
Imports	314,980	346,653	+10.1
Exports	27,842,056	25,468,403	−8.5
Price indicators (average per net ton):			
Average cost of railroad fuel purchased, f. o. b. mines [2]	$4.36	$4.49	+3.0
Average cost of coking coal at merchant coke ovens	$9.33	$9.27	−.6
Average retail price [3]	$15.83	$16.48	+4.1
Average railroad freight charge per net ton [2]	$3.00	$3.09	+3.0
Average value f. o. b. mines	$4.88	$4.85	−.6
Underground loading machinery sold:			
Mobile loading machines (number)	286	289	+1.0
Scrapers (number)	8	1	−87.5
Conveyors, including those equipped with duckbills (units)	394	316	−19.8
"Mother" conveyors (units)	116	132	+13.8
Surface stripping	106,045,299	122,000,000	+15.0
Mechanically loaded underground	222,375,882	266,000,000	+19.6
Mechanically cleaned	153,651,903	181,000,000	+17.8
Number of mines	8,559	8,400	−1.9
Average number of days worked	157	171	+8.9
Average number of men working daily	433,698	431,000	−.6
Production per man per day	6.43	6.95	+8.1
Fuel-efficiency indicator:			
Pounds of coal per kw.-hr. at electric power plants [4]	1.24	1.19	−4.0

[1] U. S. Department of Commerce.
[2] Interstate Commerce Commission.
[3] Bureau of Labor Statistics, U. S. Department of Labor.
[4] Federal Power Commission.

Electric-power utilities consumed 9 percent more bituminous coal, 14 percent more fuel oil, and 14 percent more gas in 1950 than in 1949.

Class I railroads decreased their consumption of coal 11 percent in 1950 from 1949 and increased their purchases of fuel oil and Diesel oil 8 percent during the same period.

The manufacture of domestic coal-burning equipment is reflected in statistics published by the Bureau of the Census. Factory sales of domestic stokers for burning bituminous coal decreased from 21,756 (revised figure) in 1949 to 13,138 in 1950. Shipments of domestic oil burners, boiler-burner units, and furnace-burner units increased from 569,445 (revised figure) in 1949 to 879,016 in 1950.

Stocks.—The reserve supply of bituminous coal and lignite in the hands of industrial consumers and retail coalyards increased from 45,111,000 tons at the beginning of 1950 to 72,516,000 tons at the close. The days' supply of stocks increased from 32 to 50. Stocks on the upper Lake docks increased 2,945,001 tons from January 1 to December 31, 1950.

SOURCES OF DATA

Bituminous-coal- and lignite-production statistics for 1950 are preliminary estimates based upon (1) weekly or monthly reports of railroad carloadings of coal and beehive coke by all the important carriers, (2) shipments by river as reported by the United States Army Engineers, (3) direct reports from a number of mining companies, and (4) monthly production statements complied by certain local operators' associations and State mine departments. In the estimates for 1950, allowance has been made for commercial truck shipments, local sales and colliery fuel, and small trucking or wagon mines producing 1,000 tons a year or more.

Data for 1949 are final and based upon detailed annual reports of production and mine operation furnished by the producers. As in previous years, all but a small percentage of the output was covered by the reports submitted. For the remaining output not directly reported—consisting chiefly of small mines—it has been possible to obtain reasonably accurate data from the records of the State mine departments, which have statutory authority to require such reports, or, in a few instances, from railroad carloadings.

In accordance with the practice followed by the Bureau of Mines in previous years, the statistics in this report relate to mines having an output of 1,000 tons a year or more and do not attempt to include many small mines producing less than 1,000 tons a year.

As in previous years, these data include all coal produced in Alaska and all that produced in the United States except Pennsylvania anthracite.

RESERVES[3]

TABLE 2.—Coal reserves of the United States, Jan. 1, 1950, by States

[In thousands of short tons]

State	Estimated original reserves					Reserves depleted to Jan. 1, 1950		Remaining reserves, Jan. 1, 1950	Recoverable reserves, Jan. 1, 1950, assuming 50-percent recovery
	Bituminous coal	Subbituminous coal	Lignite	Anthracite and semianthracite	Total	Produced [1]	Produced and lost in mining, assuming past losses equal production		
Alabama	67,570,000				67,570,000	821,590	1,643,180	65,926,820	32,963,410

[5] Past losses assumed to be 40 percent of coal originally in the ground.

[6] Small reserves of lignite included under subbituminous coal.

[7] Includes Arizona, California, Idaho, and Oregon.

[8] Includes Arizona, California, and Oregon.

[9] Includes California and Louisiana.

Averitt, Paul, and Berryhill, Louise R., Coal Resources of the United States: Geol. Survey Circ. 94, 1950, p. 5.

DOMESTIC PRODUCTION

The trend of average production of bituminous coal and lignite per working day in 1941–50 is illustrated in figures 1 and 5.

The demand for bituminous coal and lignite compared with petroleum, natural gas, and water power in 1899–1950 is shown in tables 38–40 and figures 8 and 9.

Production statistics for lignite are shown separately from bituminous coal in tables 43–47.

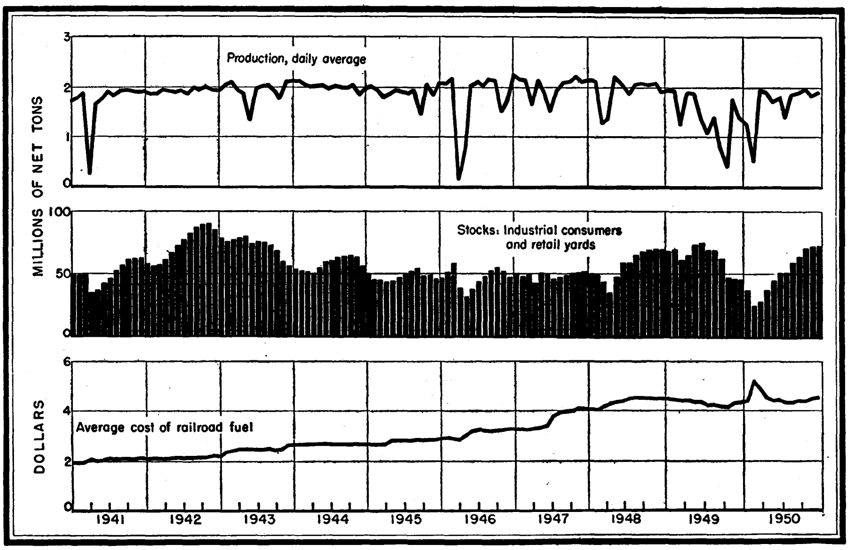

FIGURE 1.—Trends of production, stocks, and prices of bituminous coal and lignite in the United States, 1941–50.

PRODUCTION BY YEARS

Production and capacity of bituminous-coal and lignite mines in 1905–50 are shown graphically in figure 2.

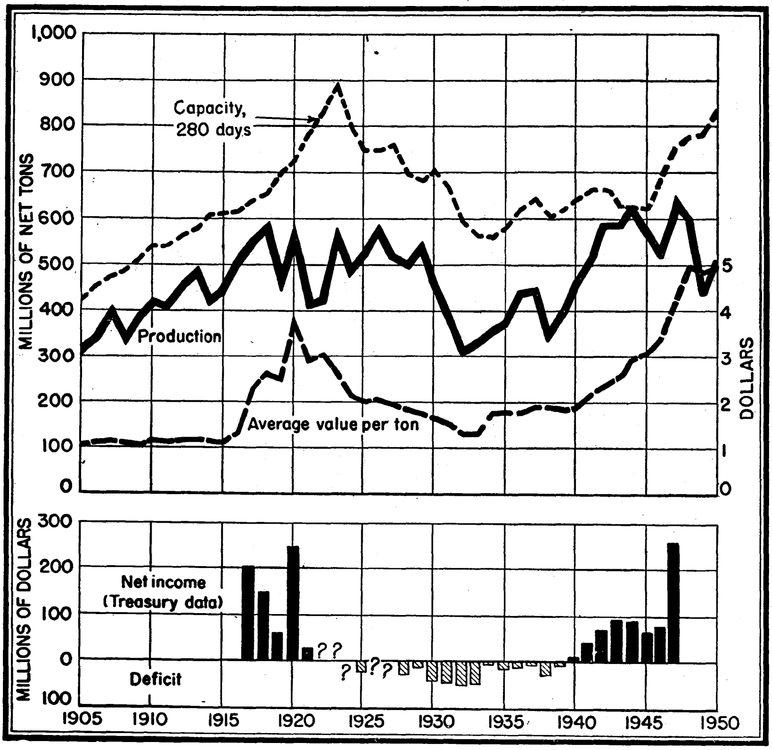

FIGURE 2.—Trends of bituminous-coal and lignite production, realization, mine capacity, and net income or deficit in the United States, 1905–50.

TABLE 3.—Growth of the bituminous-coal and lignite-mining industry in the United States, 1890–1949

Year	Production (net tons)	Value of production [1]		Number of mines	Capacity at 280 days (millions of tons)
		Total	Average per ton		
1890	111,302,322	$110,420,801	$0.99	(2)	137
1891	117,901,238	117,188,400	.99	(2)	148

[1] Figures for 1890 to 1936 and 1939 exclude selling expense. Figures for 1937–38 and 1940–49 include selling expense.
[2] Data not available.
[3] Revised figure.

PRODUCTION BY MONTHS AND WEEKS

The following tables summarize the statistics of monthly and weekly production of bituminous coal and lignite. The estimates given are based upon the latest information available and differ in some instances from the current figures published in the Weekly Coal Reports.

TABLE 4.—Bituminous-coal and lignite production (final figures) in the United States in 1949, with estimates by months

Month	Production (net tons)	Maximum number of working days	Average production per working day (net tons)	Month	Production (net tons)	Maximum number of working days	Average production per working day (net tons)
January	49, 011, 000	25. 1	1, 953, 000	July	27, 228, 000	25	1, 089, 000
February	46, 490, 000	24	1, 937, 000	August	37, 914, 000	27	1, 404, 000
March	33, 991, 000	27	1, 259, 000	September	19, 965, 000	25	799, 000
April	47, 633, 000	25	1, 905, 000	October	10, 545, 000	26	406, 000
May	48, 039, 000	25. 4	1, 891, 000	November	45, 037, 000	25. 3	1, 780, 000
June	35, 680, 000	26	1, 372, 000	December	36, 335, 000	26	1, 398, 000
				Total	437, 868, 000	306. 8	1, 427, 000

TABLE 5.—Coal production in the United States in 1949, by States (final figures), with estimates by months, in thousands of net tons

[Totals for year are based on final complete returns from all operators known to have produced 1,000 tons and over per year. In most cases monthly apportionment is based on current records of railway carloadings and waterway shipments; in some States upon direct tonnage reports by operators to State mine departments]

State	January	February	March	April	May	June	July	August	September	October	November	December	Total

SUMMARY BY STATES

Details on the bituminous-coal and lignite industry, by States and counties, are presented in other parts of this chapter, notably in table 34.

TABLE 9.—Coal produced in the United States, by States, 1940–49, with production of maximum year and cumulative production from earliest record to end of 1949, in thousands of net tons

State	Maximum production		Production by years										Total production from earliest record to end of 1949
	Year	Quantity	1940	1941	1942	1943	1944	1945	1946	1947	1948	1949

1 Includes coal loaded at mine directly into railroad cars or river barges.

2 Includes coal used by mine employees, taken by locomotive tenders at tipple, used at mine for power and heat, transported from mine to point of use by conveyor or tram, made into beehive coke at mine, and all other uses at mine.

3 Value received or charged for coal, f. o. b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked [not coke] as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

NUMBER AND SIZE OF MINES

TABLE 11.—Number and production of bituminous-coal and lignite mines in the United States, classified by size of output in each State, in 1949

[Exclusive of mines producing less than 1,000 tons]

TABLE 12.—Growth of the bituminous-coal- and lignite-mining industry in the United States, 1890-1949—Continued

Year	Men employed	Average number of days worked	Average days lost per man on strike	Net tons per man— Per day	Net tons per man— Per year	Percent of underground production— Cut by machines [1]	Percent of underground production— Mechanically loaded	Percent of total production— Mechanically cleaned [2]	Percent of total production— Mined by stripping
1945	383,100	261	[4] 9	5.78	1,508	90.8	56.1	25.6	19.0
1946	[5] 396,434	214	[4] 23	6.30	1,347	90.8	58.4	26.0	21.1
1947	[5] 419,182	234	[4] 5	6.42	1,504	90.0	60.7	27.7	22.1
1948	[5] 441,631	217	[4] 16	6.26	1,358	90.7	64.3	30.2	23.3
1949	[5] 433,698	157	[4] 15	6.43	1,010	91.4	67.0	35.1	24.2

[1] Percentages for 1890 to 1913, inclusive, are of total production, as a separation of strip and underground production is not available for those years.
[2] For 1906 to 1926, inclusive, these percentages are exclusive of coal cleaned at central washeries operated by consumers.
[3] Data not available.
[4] Bureau of Labor Statistics, U. S. Department of Labor.
[5] Average number of men working daily.

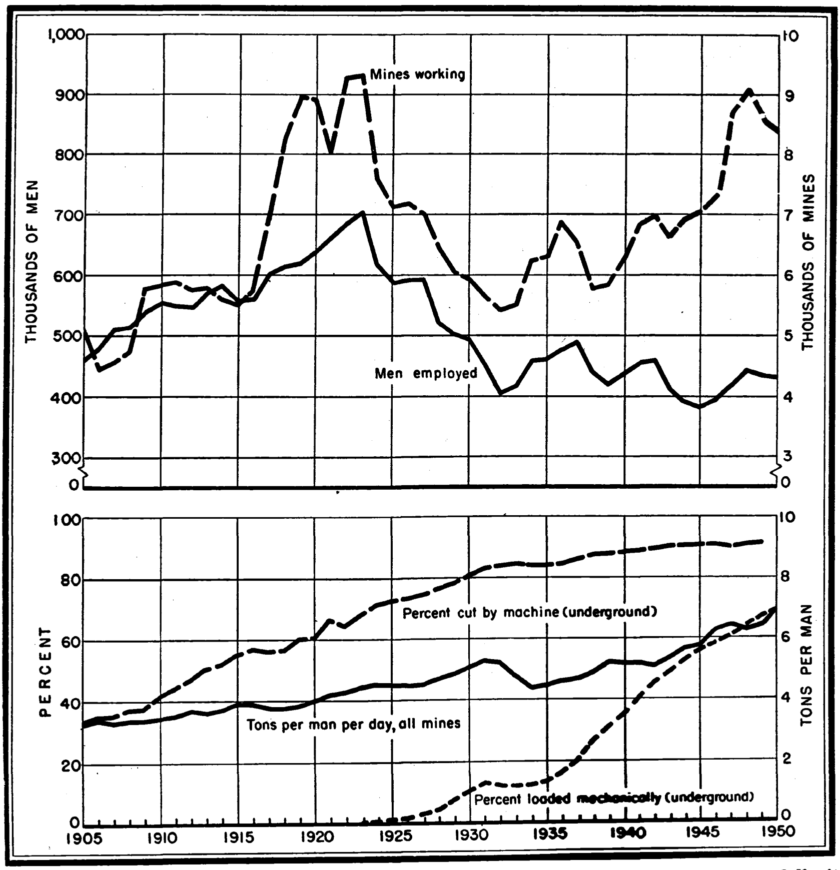

FIGURE 4.—Trends of employment, mechanization, and output per man at bituminous-coal and lignite mines in the United States, 1905-50.

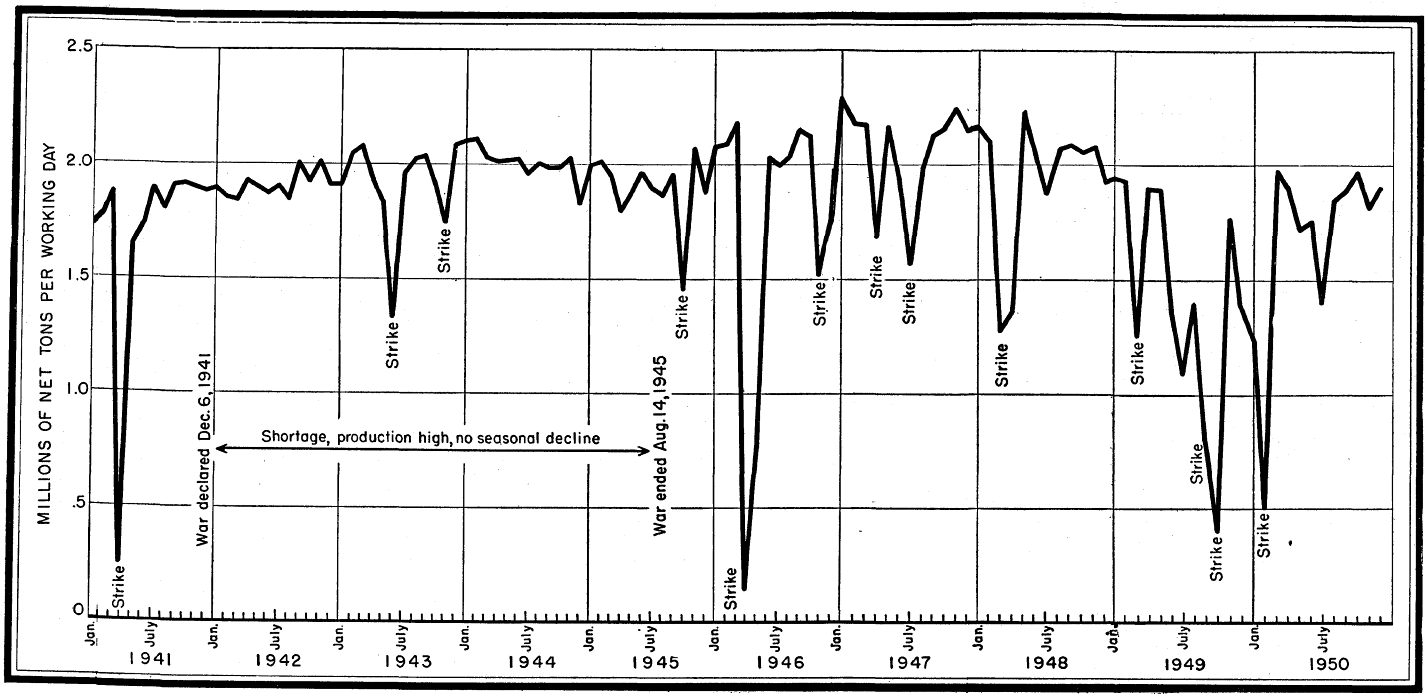

Figure 5.—Average production of bituminous coal and lignite in the United States per working day in each month, 1941–50.

TABLE 13.—Bituminous-coal and lignite production, by methods of mining and loading and average output per man per day, in the United States, by States, in 1949

State	Mined underground				Mined by stripping		Total

[1] Computed by deducting "Strip mines" data from "Total."
[2] Includes power strip pits proper and excludes horse stripping operations and mines combining stripping and underground in the same operation for the years 1914–42, inclusive. The years 1943–49, inclusive, include data on all strip mines.
[3] Data not available.
[4] Exclusive of horse stripping operations.

[5] See also tables 12, 42, 46, and 47 and figure 4.

TABLE 15.—Bituminous coal and lignite mined by different methods in the United States, by States, in 1949

[1] On returns from mines combining stripping and underground methods in same operation, tonnage has been separated and figures on employment prorated so that this table includes only data pertaining to strip mining.

MECHANICAL LOADING [7]

Bituminous coal and lignite mechanically loaded in underground mines amounted to 222,375,882 tons in 1949, or 67 percent of the total underground output.

Mechanical loading equipment used in underground bituminous-coal and lignite mines is divided into two types—devices that virtually eliminate hand shoveling (known as mobile loaders, scrapers, and self-loading conveyors) and those that greatly reduce the labor in hand shoveling (known as hand-loaded face conveyors and pit-car loaders). Devices in the first category are designated "machines" and those in the second category, "conveyors."

Several continuous miners were used in 1949. They are included with mobile loaders in the following tables.

Sales of Mechanical Loading Equipment.—Shipments of mechanical loading equipment for underground use in coal mines in the United States, in terms of capacity, were less in 1950 than in any year since 1935. Table 21 shows the reported sales of loading equipment to bituminous-coal and lignite operators, by type of equipment, and the number of manufacturers reporting for 1943–50.[8]

Table 22 compares loading equipment, "mother" conveyors, and shuttle cars in use in bituminous-coal and lignite mines in 1949, with sales in 1950, by States.

Extent of Mechanical Loading.—More than 79 percent of the underground tonnage mechanically loaded was handled by mobile loaders in 1949. Table 23 shows the tons and percentage handled by each type of equipment in 1948 and 1949.

During 1949, in underground bituminous-coal and lignite mines 4,205 mobile loaders handled 177,239,434 tons—an average of 42,150 tons per mobile loader per year; self-loading conveyors averaged 9,436; scrapers, 7,360; hand-loaded face conveyors, 7,131; and pit-car loaders, 3,171 per unit per year.

Mechanical Loading by States.—West Virginia has been the leading producer of mechanically loaded coal since 1939. During 1949 West Virginia produced 78,891,746 tons of mechanically loaded coal, followed by Pennsylvania with 39,676,493, Illinois with 30,433,947, Kentucky with 23,252,668, and Ohio with 9,807,877 tons. These five States produced 82 percent of the total output of underground, mechanically loaded bituminous coal in the United States in 1949.

Detailed data, by States, on the number of mines and machines and the production of coal mechanically loaded compared with the total production at mines using mechanical loading devices are given in table 25. Comparative changes in underground mechanical loading in 1948–49, by States, are shown in table 24.

Table 13 shows bituminous-coal and lignite tonnage mined by stripping, compared with underground hand-loaded and machine-loaded tonnage, as well as productivity at strip and underground mines, by States, for 1949.

[7] See also tables 12 and 13 and figure 4.

[1] Includes mobile loaders, scrapers, and conveyors equipped with duckbills or other self-loading heads; some mines in this class use conveyors or shuttle cars in conjunction with mobile loaders to perform initial phase of transportation.

[2] Includes hand-loaded conveyors and pit-car loaders.

[3] Includes continuous miners.

MECHANICAL CLEANING

Bituminous coal mechanically cleaned in 1949 totaled 153,651,903 tons, or 35 percent of the entire output.

Mechanical cleaning by wet methods includes jigs, concentrating tables, classifiers, launders, dense-medium processes, and any combinations of these five methods.

Pneumatic methods of coal cleaning include air tables, air flow, air sand, and any combination of these three methods.

Tables 26, 27, 30, and 31 include mechanical-cleaning data on all coal mined in the United States except Pennsylvania anthracite. Tables 28 and 29 are on the same basis but do not include consumer-operated plants. There are no mechanical cleaning plants at lignite mines. The percentage of total production mechanically cleaned in 1906–49 is shown in table 12.

Consumer-operated plants include those owned by steel companies that receive coal (usually from affiliated companies), clean it, and then consume it directly at the plant.

Types of Cleaning Equipment.—The tonnage of bituminous coal cleaned by wet-washing methods was 140,707,988 tons in 1949—a decrease of 15 percent from 1948. The quantity cleaned by pneumatic methods was 12,943,915 tons—a 20-percent decrease.

Table 27 compares the number of cleaning plants and the tons of cleaned coal, by types of equipment, for 1948 and 1949. During 1949, 550 wet-washing and 88 pneumatic cleaning plants were in operation. Sixty-seven tipples used both wet and dry methods at the same plant; deducting these duplications gives a net total of 571 plants that cleaned coal in 1949, an increase of 69 plants over 1948.

Mines served by cleaning plants (exclusive of those that ship to washeries operated by steel companies) produced 206,322,165 tons, or 47 percent of the total bituminous output in 1949. In this same group of mines, 145,602,899 tons were cleaned mechanically; therefore, 71 percent of the coal produced at mines with cleaning plants in 1949 was cleaned at the mine. The remainder of the output from these mines (29 percent) presumably represents the larger sizes commonly picked by hand. (*See* tables 29 and 31.)

Relation Between Raw Coal, Clean Coal, and Refuse.—For every 100 tons of raw coal cleaned during 1949 at the mines, 83 tons of clean merchantable coal, on an average, were obtained, and 17 tons of refuse were discarded. Table 31 shows total production of mines with cleaning plants and results of cleaning operations, by States.

Methods of Mining at Mines Served by Cleaning Plants.—Underground mechanical loading appears to be closely related to mechanical cleaning. Underground coal loaded mechanically in 1949 totaled 222,375,882 tons, of which 142,796,556 tons (64 percent) passed through tipples equipped with mechanical cleaning devices. Production of coal from strip mines in 1949 was 106,045,299 tons, of which 38,972,049 tons (37 percent) came from strip mines having mechanical cleaning tipples. Hand-loaded underground coal production in 1949 totaled 109,446,855 tons, of which 22 percent passed through tipples equipped with cleaning plants. (*See* tables 13 and 29.)

TABLE 26.—Bituminous coal mechanically cleaned by wet and pneumatic methods, in the United States, in net tons of clean coal, 1946–49

Method of cleaning	1946	1947	1948	1949	Change from 1948 (percent)
Wet methods:					
At mines	115,120,292	145,958,413	154,262,590	132,658,984	−14.0
At consumer-operated cleaning plants	6,938,347	10,125,039	10,401,932	8,049,004	−22.6
Total wet methods	122,058,639	156,083,452	164,664,522	140,707,988	−14.5
Pneumatic methods	16,611,198	18,352,485	16,215,801	12,943,915	−20.2
Grand total	138,669,837	174,435,937	180,880,323	153,651,903	−15.1

TABLE 27.—Bituminous coal cleaned in the United States, by type of equipment in actual operation, 1948–49

[Coal cleaned and plants operated by consumers at central washeries in Colorado and Pennsylvania included]

Type of equipment	Plants in operation		Net tons of clean coal		Cleaned by each type (percent of total)	
	1948	1949	1948	1949	1948	1949
Wet methods:						
Jigs	249	280	87,506,353	72,422,697	48.4	47.1

Washington	1,001,507	802,071	199,436	19.9	829,786
West Virginia [3]	45,295,837	38,718,596	6,577,241	14.5	65,961,917
Total at mines only [4]	175,773,553	145,602,899	30,170,654	17.2	206,322,165
Consumer plants [5]	8,917,449	8,049,004	868,445	9.7	
Grand total 1949	184,691,002	153,651,903	31,039,099	16.8	

[1] In Alabama (for example) for every 100 tons of raw coal cleaned in 1949, an average of 26.9 tons of refuse was discarded and 73.1 tons of clean marketable coal was obtained.
[2] Includes some coal that was mined in Pennsylvania and cleaned in Ohio.
[3] Includes some coal that was mined in West Virginia and cleaned in Ohio and Pennsylvania.
[4] Includes all mechanical cleaning other than washeries operated by consumer steel companies.
[5] Includes central washeries in Colorado and Pennsylvania operated by consumer steel companies.

MECHANICAL CRUSHING [9]

TABLE 32.—Mechanical crushing of bituminous coal at mines in the United States, 1940 and 1944–49 [1]

[Production figures in millions of net tons]

	1940	1944	1945	1946	1947	1948	1949
Grand total production—bituminous coal and lignite	460.8	619.6	577.6	533.9	630.6	599.5	437.9
Total production at mines where crushing is done	183.1	224.5	218.7	209.5	249.5	250.0	198.1
Production crushed	35.3	66.5	70.9	66.7	89.0	91.6	77.3
Number of mines crushing coal	716	814	830	851	904	995	1,120
Percentage of production crushed at mines where crushing is done	19.3	29.6	32.4	31.8	35.7	36.6	39.0
Percentage of total production crushed	7.7	10.8	12.3	12.5	14.1	15.3	17.7
Percentage of production mechanically cleaned at mines where crushing is done	(2)	(2)	(2)	39.9	41.4	42.1	47.3
Percentage of total production mechanically cleaned	22.2	25.6	25.6	26.0	27.7	30.2	35.1
Percentage of total production of mines where crushing is done:							
Mechanically loaded	(2)	(2)	(2)	52.8	56.0	59.0	61.4
Hand loaded	(2)	(2)	(2)	19.9	16.5	13.3	11.5
Strip mined	(2)	(2)	(2)	27.3	27.5	27.7	27.1
Total				100.0	100.0	100.0	100.0

[1] Exclusive of lignite and Virginia semianthracite. Data for 1940 and 1944–45 include mines with an average daily production of 50 tons and over and all mines with rail or river connections, regardless of size. Data for 1946–49 include all mines producing annually 1,000 tons and over. The figures are reasonably comparable for all the years.

[2] Data not available.

[9] Detailed data, by States and districts, for 1946–49, published in Bureau of Mines Weekly Coal Report 1740, Jan. 19, 1951.

TREATMENT [10]

TABLE 33.—Treatment of bituminous coal for allaying dust in the United States, 1940–49 [1]

	1940	1941	1942	1943	1944	1945	1946	1947	1948	1949

[1] Exclusive of lignite and Virginia semianthracite. Data for 1940-45, inclusive, include mines with an average daily production of 50 tons and all mines with rail or river connections regardless of size. Data for 1946–49, inclusive, include all mines producing 1,000 tons and over. The figures are reasonably comparable for all the years.

[2] On account of some mines using more than one method of treatment, this total is not the sum of the above items.

[10] Detailed data, by States and districts, for 1946-49, published in Bureau of Mines Weekly Coal Report 1741, Jan. 26, 1951.

BY STATES AND COUNTIES

Detailed production and employment statistics are given in table 34 for each coal-producing county in the United States from which three or more operators submitted reports for 1949. Statistics on counties with less than three reporting producers have been combined with data for other counties in the same State to avoid disclosing individual figures, unless the operators have granted permission to publish them separately. Production of mines on the border between two States has been credited to the State from which the coal was extracted rather than to that in which the tipple was situated. If the coal is mined from lands in both States, the tonnage has been apportioned accordingly.

The data in the present report, as in those published for many years by the Bureau of Mines, relate only to mines with an annual output of 1,000 tons or more. That fact should be borne in mind when the statistics in this report are compared with similar data compiled by State mine departments. Differences arise largely from variations in coverage by State reports, some of which include data for all mines regardless of size, and others only data for mines employing more than a specified minimum number, ranging from 2 to 10 men.

Because of a change in method of reporting, beginning with 1946, statistics of average production per man per day are not precisely comparable with those for other years. The figures since 1946 are based on the average number of men working daily, whereas the figures for previous years were based on the average number of men on the rolls per pay period.

Coal data by States are also shown elsewhere in this chapter in tables 5, 6, 9, 10, 11, 13, 15, 16, 17, 19, 22, 24, 25, 30, 31, 35, 42, 43, 44, and 51. Of these, tables 19 and 44 show counties separately.

TABLE 34.—Production, value, employment, days active, man-days, and output per man per day at bituminous-coal and lignite mines in the United States, by States and counties, in 1949

[Exclusive of mines producing less than 1,000 tons]

[1] Includes coal loaded at mine directly into railroad cars or river barges, hauled by truck to railroad siding, and hauled by truck to waterway.

[2] Includes coal used by mine employees, taken by locomotive tenders at tipple, used at mine for power and heat, transported to point of use by conveyor or tram, made into beehive coke at mine, and all other uses.

[3] Value received or charged for coal f. o. b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked [not coke] as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

[4] In certain counties the average tons per man per day is large due to strip mining or mechanical loading underground.

Total waterway shipments		21,828,484	21,828,484
Total loaded at mines for shipment by railroads and waterways.		378,430,302	378,430,302
Shipped by truck		47,786,511	47,786,511
Used at mine [2]		11,651,223	11,651,223
Total production 1949		437,868,036	437,868,036

[1] Includes coal loaded at mine directly into railroad cars or river barges, hauled by truck to railroad siding and hauled by truck to waterway. In general, figures show the quantity of bituminous coal and lignite originated for each railroad and waterway as reported by mine operators. It must be noted that in one year an operator may report coal loaded on the subsidiary railroad and in another year the same operator may report coal loaded on the parent railroad system.

[2] Includes coal used by mine employees, taken by locomotive tenders at tipple, used at mine for power and heat, coal transported from mine to point of use by conveyor or tram, coal made into beehive coke at mine, and all other uses at mine.

CONSUMPTION

TABLE 36.—Consumption of bituminous coal and lignite, by consumer class, with retail deliveries in the United States, 1933–50, in thousands of net tons

Year	Electric power utilities [1]	Bunker foreign trade [2]	Railroads [3] (class I)	Coke plants		Steel and rolling mills	Cement mills [4]	Other industrial [5]	Retail deliveries [5]	Total of classes shown [6]
				Beehive	Oven

[1] Federal Power Commission. Represents latest available revised figures for bituminous coal and lignite consumed by public-utility power plants in power generation, including a small quantity of coke amounting to approximately 100,000 tons annually.
[2] U. S. Department of Commerce.
[3] Association of American Railroads. Represents consumption of bituminous coal and lignite by class I railways for all uses, including locomotive, powerhouse, shop, and station fuel. The Interstate Commerce Commission reports that in 1949 consumption for all uses by class I line-haul railways, plus purchases of class II and class III railways, plus purchases by all switching terminal companies combined was 71,492,131 tons of bituminous coal and lignite.
[4] Includes a small amount of anthracite.
[5] Estimates based upon reports collected from a selected list of representative manufacturing plants and retailers.
[6] The total of classes shown approximates total consumption. It is not possible to calculate consumption closely from production, imports, exports and changes in stocks because certain significant items of stocks are not included in year-end stocks. These items are: Stocks on Lake and Tidewater docks, stocks at other intermediate storage piles between mine and consumer, and coal in transit.
[7] Preliminary figures.

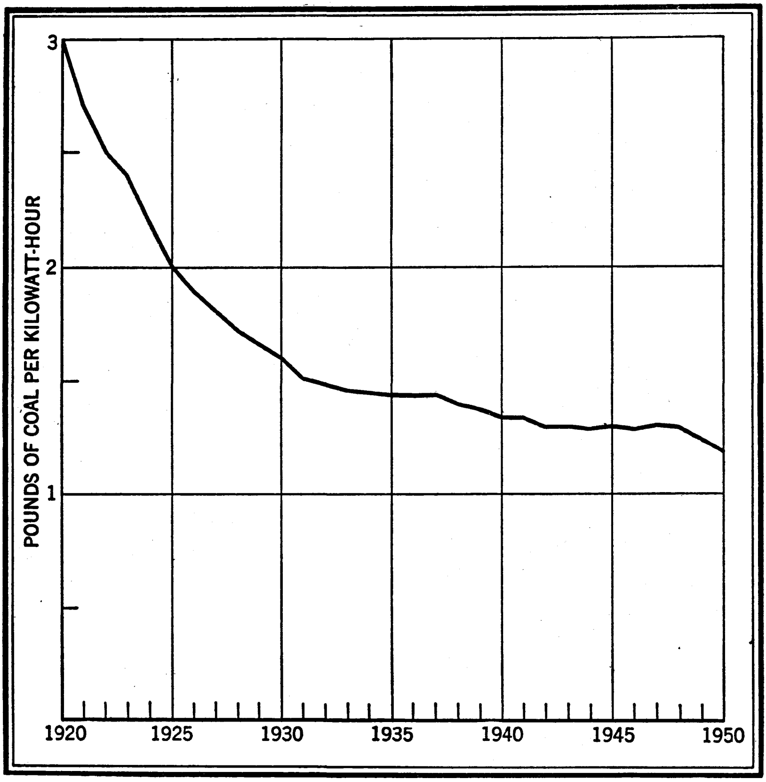

FIGURE 7.—Trend in fuel economy at electric-utility power plants in the United States, 1920–50.

RELATIVE RATE OF GROWTH OF COAL, PETROLEUM, GAS, AND WATER POWER

The total supply of available energy in the form of coal, oil, natural gas, and water power in 1950 was 35,137 trillion B. t. u.—an 11.5-percent increase over 1949.

The figures are expressed in British thermal units because some common denominator is necessary for such unlike quantities as tons of coal, barrels of oil, and cubic feet of gas. Table 38 summarizes the equivalent of each of the fuels in trillions of British thermal units. Water power is represented by the equivalent fuel required to perform the same work. The table covers 1889 and 1899 to 1950.

In converting water power to its equivalent of fuel required to perform the same work, the *prevailing* or average performance of all fuel-burning central electric stations for each year in question has been used. This average has declined from about 7.05 pounds of coal per kilowatt-hour in 1899 to 1.19 in 1950, which shows the influence of improving fuel efficiency. The *prevailing* fuel equivalent closely approximates the quantity of fuel that would have been needed in any one year to generate the same power in a steam-electric station. It should be noted, however, that the ultimate use of the water power generated often displaces fuel burned much less efficiently than in central stations and that no other important branch of fuel consumption has made advances in fuel efficiency approaching that of the central stations. As these tables attempt to determine the total energy from all fuels and from water power, the ideal factor for converting water power into fuel equivalent would be the average efficiency of all forms of fuel consumption in each year. No basis for determining such an all-embracing average exists at present, but enough is known to make certain that it would show much less reduction from 1899 to 1950 than do the central stations.

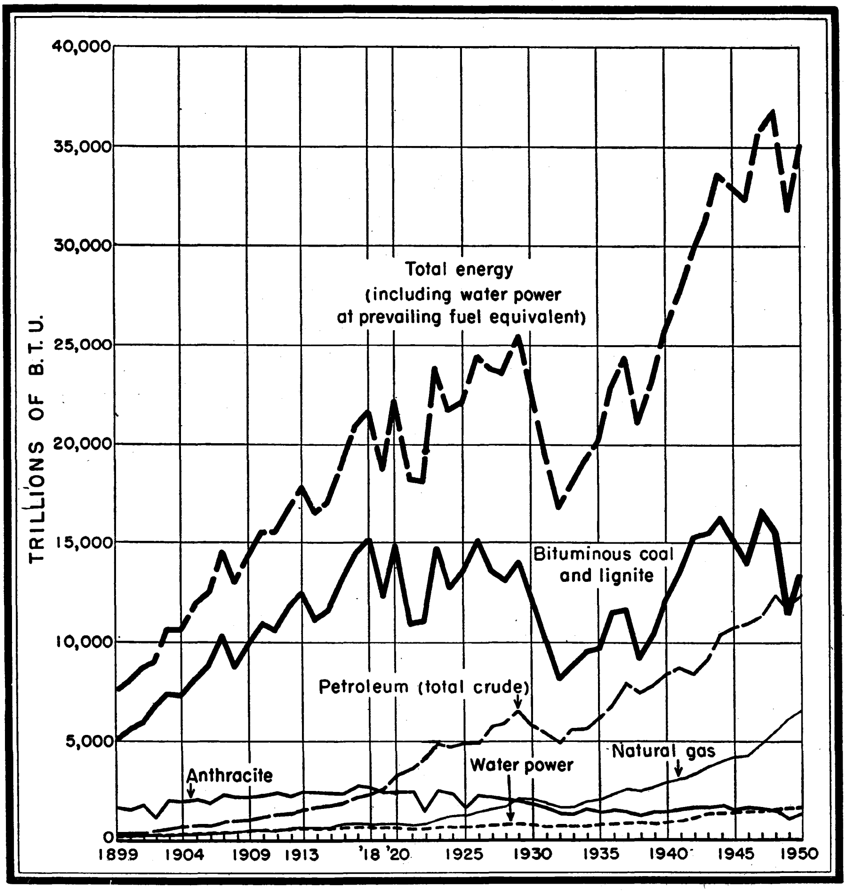

FIGURE 8.—Annual supply of energy from mineral fuels and water power in the United States, 1899–1950

The figures for oil represent production of crude petroleum and imports; the figures for natural gas represent marketed production. Most of this production does not come into direct competition with coal. Much of the supply of both oil and gas is used in regions of the country, such as California and portions of the Southwest, where coal is available only at unusually high cost because of high transportation charges. About one-third of the natural gas is used in the field for drilling or operating oil and gas wells and pipelines or for the manufacture of carbon black. More than half of the oil is used in the form of gasoline, kerosine, and lubricants, for which purposes coal cannot well compete, except at very much higher levels of oil prices. Even these refined products, however, involve a certain measure of indirect competition with coal, for the energy market of the country is becoming more fluid and competitive, and a demand that cannot be met by one source of supply tends to fall back on the others.

The subject of interfuel competition is exceedingly complex, and an elaborate analysis and the accumulation of data not now available would be required to determine even approximately how much of any one fuel actually has been displaced either by other fuels or by water power. The present tables do not permit determination of such displacement; their purpose is rather to measure the long-time trends in the total demand for energy.

An exploratory study concerned with interfuel competition and including a projection of 1965 energy requirements and supplies, by commodities, was published by the Bureau of Mines.[12]

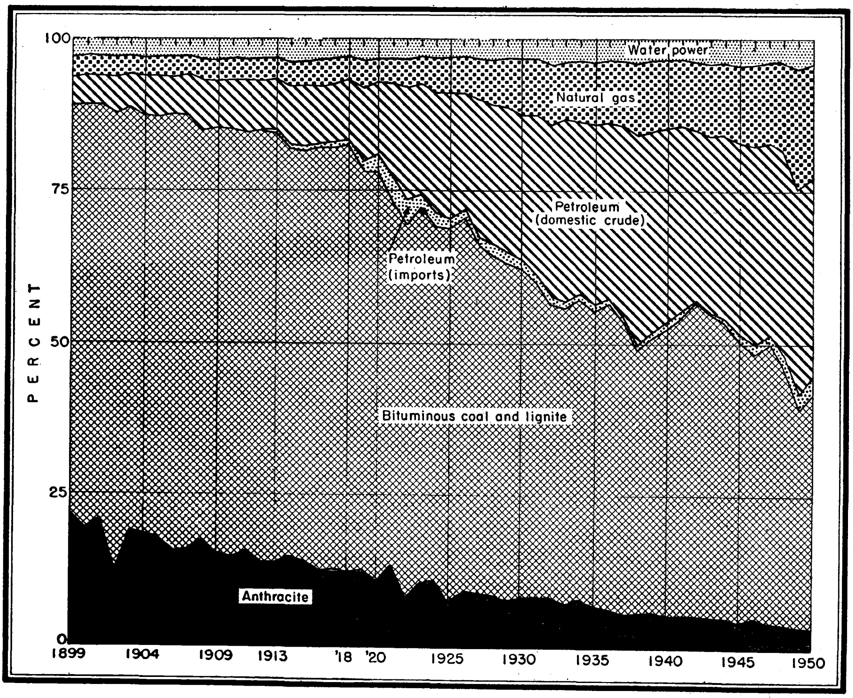

FIGURE 9.—Percentage of total British thermal unit equivalent contributed by the several sources of energy in the United States, counting water power at the prevailing fuel equivalent of central stations in each year, 1899–1950.

[1] The unit heat values employed are: Anthracite, 12,700 B. t. u. per pound; bituminous coal and lignite, 13,100 B. t. u. per pound; petroleum, 5,800,000 B. t. u. per barrel; natural gas, 1,075 B. t. u. per cubic foot. Water power includes installations owned by manufacturing plants and mines, as well as Government- and privately-owned public utilities. The fuel equivalent of water power is calculated from the kilowatt-hours of power produced wherever available, as it is true of all public-utility plants since 1919. Otherwise, the fuel equivalent is calculated from the reported horsepower of installed water wheels, assuming a capacity factor of 20 percent for factories and mines and of 40 percent for public utilities.

[2] Fuel equivalent calculated by assuming the average central-station practice for each of the years for which data are available.

[3] Data not available.

[4] Preliminary figures.

TABLE 39.—Index numbers for relative rate of growth of coal, oil, and water power in the United States, 1889 and 1899–1950

(1918=100)

Year	Pennsylvania anthracite	Bituminous coal and lignite	Total coal	Petroleum (crude)		Natural gas (marketed production)	Total petroleum and natural gas	Total mineral fuels	Water power	Grand total
				Domestic production	Imports

STOCKS

Stocks of bituminous coal and lignite in the hands of industrial consumers and at retail yards in 1941–50 are shown graphically in figure 1. Stocks at upper Lake docks in 1949–50 are listed in table 1.

TABLE 41.—Stocks of bituminous coal and lignite in hands of commercial consumers and in retail dealers' yards in the United States, 1949–50

Washington	6.14	6.79	6.71	6.78
West Virginia	4.54	5.39	5.30	5.16
Wyoming	2.77	4.06	3.83	3.83
Total	3.94	5.18	4.88	4.85

[1] Average gross realization, selling cost not deducted.
[2] Included in total.

The average values per ton of bituminous coal and lignite sold in 1890–1949 are listed in table 3, and those sold in 1905–50 are plotted in figure 2. The average values, classified according to method of mining, in 1914–49 are shown in table 14. The unit prices of railroad fuel and coking coal and the average retail price in 1949–50 are quoted in table 1. Figure 1 includes a graph of prices of railroad fuel in 1941–50. Lignite values are shown separately in tables 43, 44, and 47.

LIGNITE [13]

According to reports received by the Bureau of Mines, United States Department of the Interior, the production of lignite in the United States in 1949, exclusive of small mines producing less than 1,000 tons, totaled 3,092,130 net tons,—a slight increase over 1948 and the highest output since 1937. The average value per ton increased from $2.27 per ton in 1948 to $2.37 in 1949. The average

[13] Compiled by J. A. Corgan and M. I. Cooke.

number of men employed totaled 716, a slight increase over the 694 men working in 1948; and the output per man per day based upon calculated man-days was 18.50 tons in 1949. The industry worked an average of 233 days in 1949 compared with 254 in the preceding year. North Dakota produced 96 percent of the total lignite mined in the United States; California, Montana, South Dakota, and Texas together supplied the remaining 4 percent.

According to the Federal Power Commission, 1,212,901 tons of lignite were consumed in generating electric energy in 1949; this comprises 39 percent of the total lignite mined in the United States in that year. The consumption in the West North Central States was 1,190,935 tons, and the West South Central States and the Mountain States consumed 21,966 tons.

TABLE 43.—Summary of production, value, employment, days operated, man-days of labor, and output per man per day at lignite mines in the United States in 1949, by States [1]

	California	Montana [2]	North Dakota	South Dakota	Texas	Total
Production (net tons):						
Loaded at mines for shipment	----------	----------	2,366,045	620	49,213	2,415,878
Commercial sales by truck or wagon	3,900	45,050	508,714	25,809	----------	583,473
Used by employees, taken by locomotives at tipple, and other uses	----------	10	[3] 82,135	----------	260	82,405
Used at mine for power and heat	----------	8	10,366	----------	----------	10,374
Total:						
1949	3,900	45,068	2,967,260	26,429	49,473	3,092,130

[1] Output is obtained chiefly from strip pits in which the production per man per day is large.

In 1949, the Bureau of Mines received reports from 55 lignite mines producing 1,000 tons or more annually. Seven mines produced over 100,000 tons, and the output of these mines comprised 80 percent of the total production; 3 reported production of 50,000 to 100,000 tons each and supplied 7 percent of the total; and 45 mines producing less than 50,000 tons supplied 13 percent of the total.

TABLE 45.—Number and production of lignite mines in the United States, in 1949, classified by size of output

Class	Mines		Production		
			Net tons		
	Number	Percent	Total	Average per mine	Percent of total
100,000 tons and over	7	13	2,477,735	353,962	80
50,000 and under 100,000	3	5	214,316	71,439	7
10,000 and under 50,000	12	22	257,136	21,428	8
Under 10,000 tons	33	60	142,943	4,332	5
Total 1949	55	100	3,092,130	56,221	100

TABLE 46.—Lignite operations of underground mines in the United States, in 1949, by States

Method	Montana	North Dakota	Total
Shot off the solid ... net tons	40,371	24,885	65,256
Cut by machines [1] ... do		445,462	445,462
Total ... do	40,371	470,347	510,718
Number of employees:			
Underground	29	133	162
All other	7	49	56
Total	36	182	218
Average number of days mines operated	188	254	243
Man-days of labor	6,758	46,187	52,945
Average tons per man per day	5.97	10.18	9.65

[1] A total of 8 machines was used—2 "permissible" and 6 "other types."

The production of lignite from strip pits amounted to 2,581,412 tons—83 percent of the total output of the industry. North Dakota produced 97 percent of the lignite mined by this method; the output of lignite from stripping operations for the other four States totaled only 84,499 tons.

TABLE 47.—Summary of stripping operations that produced lignite in the United States in 1949, by States

	California	Montana	North Dakota	South Dakota	Texas	Total
Number of strip pits [1]	1	1	34	2	1	39
Number of shovels and dragline excavators	1	1	47	2	1	52
Coal produced by stripping ... net tons	3,900	4,697	2,496,913	26,429	49,473	2,581,412
Total value at mines	$39,000	$14,091	$5,982,382	$91,646	$50,410	$6,177,529
Average value per ton	$10.00	$3.00	$2.40	$3.47	$1.02	$2.39
Average number of men working daily:						
In strip pits	3	6	260	15	10	294
All others		1	195	2	6	204
Total	3	7	455	17	16	498
Average number of days worked	156	62	232	250	223	229
Man-days of labor	468	434	105,452	4,245	3,560	114,159
Average tons per man per day	8.33	10.82	23.68	6.23	13.90	22.61

[1] Includes some pits in which stripping is done by hand.

FOREIGN TRADE [14]

[1] Revised figure.
[2] Includes 8,824 tons, representing export shipments (except by air) individually valued under $25, data for which are not separately classified by customs districts.
[3] Includes 192,905 tons in 1947, 434,070 tons in 1948, and 277,555 tons in 1949, representing shipments on vessels operated by the United States Army or Navy. Excludes 102,179 tons exported to Austria in 1947 as a part of the Army Civilian Supply Program.

Virgin Islands	25,799	264,564	20,601	196,211	19,473	174,883

WORLD PRODUCTION

World production of anthracite and bituminous coal amounted to 1,508 million metric tons in 1950 and of lignite to 286 million tons—a total of 1,794 million tons. Total coal output in 1950, including lignite, was 141 million metric tons over that of 1949. Of the total world coal output, 73 percent was produced in four countries—the United States, Russia, Germany, and the United Kingdom. The United States supplied 505 million metric tons (bituminous, anthracite, and lignite) or 28 percent of the world output in 1950.

Most coal-producing countries in Europe enjoyed increased production during 1950; however, consumption requirements of the principal coal-producing countries on the European Continent exceeded available supplies.

Although increased world production was anticipated in 1951, it was expected that European output would not be adequate to meet requirements, and that the United States would be depended upon to make up a large part of the deficit.

TABLE 53.—World production of bituminous coal, anthracite, and lignite, by countries, 1943–50, in thousands of metric tons [1]

[1] Coal is also mined in British Borneo, Faroe Islands, and Italian East Africa (formerly), but production figures are not available and no estimate is included in the total.
[2] Data not available; estimate included in total.
[3] Estimate.
[4] In addition, the following quantities (metric tons) of asphaltite were produced and used as solid fuels: 1943, 105,625; 1944, 106,300; 1945, 135,300; 1946, 83,800; 1947, 80,900; 1948, 82,289; 1949, 79,477; 1950 data not available.
[5] Data previously published only production transported by rail.
[6] Includes anthracite.
[7] Does not include production of the Saar.
[8] Planned production.
[9] Data represents Trianon Hungary subsequent to 1944.
[10] January to October, inclusive.
[11] Includes that part of Germany which is under Polish administration (east of the Oder and Neisse Rivers).
[12] Norwegian mines only.
[13] Includes open-cast coal as follows, in thousands of tons: 1943, 4,498; 1944, 8,787; 1945, 8,246; 1946, 8,965 1947, 10,410; 1948, 11,937; 1949, 12,639; 1950, 12,380.
[14] Production less than 1,000 tons.
[15] Excludes production of Ombilin mines in Sumatra.
[16] Fiscal year ended Mar. 20 of year following that stated.
[17] Fiscal year ended Mar. 31 of year following that stated.
[18] January to April, inclusive.
[19] Included with India.
[20] Output from U. S. S. R. in Asia included with U. S. S. R. in Europe.
[21] Formerly Karafuto.

Coal—Pennsylvania Anthracite

By J. A. Corgan and Marian I. Cooke

GENERAL SUMMARY

PRODUCTION of Pennsylvania anthracite in 1950 totaled 44,076,703 net tons,[1] an increase of 3 percent over the output in 1949. As anthracite is used primarily for heating homes, apartments, hotels, etc., consumption fluctuates with the severity of the weather. In the New England and Middle Atlantic States and Canada—the primary markets for anthracite—the weather was considerably colder in 1950 than in 1949; hence, a large part of the increase in production may be attributed to colder weather. Competition from fuel oil and natural gas continued strong, and there was probably some loss to these fuels. Exports to countries other than Canada declined drastically in 1950 from 1949; however, it was expected that the demand for solid fuels would increase sharply in foreign countries during 1951 and that shipments of anthracite abroad would exceed those in 1950 by a substantial margin.

According to data of the Pennsylvania Department of Mines, the Middle Atlantic and New England States received approximately 84 percent of the total anthracite shipments in 1950; 6 percent was shipped to other States, and Canada and other foreign countries received 10 percent.

There was little change from 1949 in the percentages of anthracite produced by the various types of mining. Underground mining operations yielded 64 percent of the 1950 total, open-pit mining 27 percent, and culm-bank recovery 8 percent; the remaining 1 percent was obtained by dredging the rivers and creeks of the anthracite region. The number of men employed declined 4 percent, and the output per man per day remained virtually the same; thus the increased production was achieved by the 8-percent increase in average number of days worked.

Statistical Trends.—Pertinent statistical data on the Pennsylvania anthracite industry are presented in tables 1, 2, and 3.

Anthracite Committee.—The specifications approved and adopted by the Anthracite Committee in 1947 for "standard" anthracite (under the Anthracite Standards Law of the Commonwealth of Pennsylvania) were continued in effect in 1950. The specifications apply to Buckwheat No. 2 and larger sizes and limit the maximum amount of ash content and the quantity of undersized coal permitted in the marketed product. Coal that fully meets the specifications is referred to as "standard" anthracite, and that which does not conform is classed as "substandard" and must be so labeled before shipment. Standard anthracite specifications approved and adopted by the Anthracite Committee are shown in table 4. The committee continued its regular activities relating to production and requirements of anthracite.

[1] All tonnage figures in this chapter are expressed in net tons of 2,000 pounds unless otherwise stated.

Anthracite Institute.—During 1950 the anthracite industry appropriated over a million dollars for advertising, promotion, and information purposes. Television was utilized for the first time in 10 large cities throughout the primary market areas to convince the public of the advantages of Pennsylvania anthracite and automatic anthracite-burning equipment. A strong advertising campaign was continued in many American and Canadian newspapers and trade journals, exhibits were included in several home and trade shows, and promotional literature and an advertising mat service were developed for retail dealers. The institute also began monthly publication of a Retail Dealer News Bulletin intended to give this important segment of the industry the latest information on subjects of interest to fuel merchants.

During 1950 14 heating engineers were added to the staff of the institute to provide free consultation service to owners and managers of commercial and public buildings regarding problems of heating equipment and combustion practices. This new activity is designed primarily to promote greater use of anthracite through consultation

TABLE 2.—Statistical summary of monthly developments in the Pennsylvania anthracite industry in 1950

[All tonnage figures are net tons]

	January	February	March	April	May	June	July	August	September	October	November	December	Year 1950	Change from 1949 (percent)	Year 1949
Production (including mine fuel, local sales, and dredge coal)	2,893,000	2,563,000	4,847,000	3,331,000	4,228,000	4,166,000	2,855,000	4,386,000	3,835,000	4,282,000	3,355,000	3,336,000	44,077,000	+3.2	42,702,000
Shipments (breakers and washeries only, all sizes):															
By rail [1]	2,085.030	1,883,031	3,594.895	2,615,786	3,457,647	3,319,253	2,621,269	3,707,751	3,387,522	3,496.649	2,673,872	2,740,423	35,583,128	+1.0	35,232,356
By truck [2]	607,265	624,231	900,883	494,835	461,819	437,820	341,274	607,973	525,753	575,161	565,991	737,680	6,880,685	+13.0	6,088,124

[1] Furnished by Anthracite Institute.
[2] Pennsylvania Department of Mines.
[3] Association of American Railroads.
[4] Nearly all for Upper Lake docks. Source: Ore and Coal Exchange, Cleveland, Ohio.
[5] Partly destined for Canada. Source: Buffalo Branch, Ore and Coal Exchange, Cleveland, Ohio.
[6] U. S. Engineer Office, Duluth, Minn.
[7] Includes all commercial docks on Lake Superior and west shore of Lake Michigan as far south as Kenosha. Based on data courteously supplied by Maher Coal Bureau and direct reports to the Bureau of Mines.
[8] Furnished by Commonwealth of Massachusetts, Division on the Necessaries of Life.
[9] U. S. Department of Commerce.
[10] Federal Power Commission.
[11] Anthracite Committee. Represents coal in storage nearest available date to the end of the month.
[12] Revised figure.
[13] Bureau of Labor Statistics.

[1] "Bootleg" operations not included, except as indicated in footnote 9.
[2] U. S. Department of Commerce.
[3] Before 1913 the figures of consumption take no account of producers' stocks, there being no data available for this item.
[4] Data first collected in 1911.
[5] Data first collected in 1915.
[6] Data first collected in 1929.
[7] As reported by the Commonwealth of Pennsylvania, Department of Mines.
[8] Calculated on basis of Pennsylvania Department of Mines employment data.
[9] Includes some "bootleg" coal purchased by legitimate operators and prepared at their breakers.
[10] Output per man calculated on legitimate tonnages only; "bootleg" purchases excluded.

TABLE 4.—Standard anthracite specifications approved and adopted by the Anthracite Committee effective July 28, 1947 [1]

	Round test mesh, inches	Percent					
		Oversize, maximum	Undersize [2]		Maximum impurities [3]		
			Maximum	Minimum	Slate [4]	Bone or ash [5]	
Broken	Through 4⅜				1½	2	11
	Over 3¼ to 3		15	7½			
Egg	Through 3¼ to 3	5			1½	2	11
	Over 2⁷⁄₁₆		15	7½			
Stove	Through 2⁷⁄₁₆	7½			2	3	11
	Over 1⅝		15	7½			
Chestnut	Through 1⅝	7½			3	4	11
	Over 1³⁄₁₆		15	7½			
Pea	Through 1³⁄₁₆	10			4	5	12
	Over ⁹⁄₁₆		15	7½			
Buckwheat No. 1	Through ⁹⁄₁₆	10					13
	Over ⁵⁄₁₆		15	7½			
Buckwheat No. 2 (Rice)	Through ⁵⁄₁₆	10					13
	Over ³⁄₁₆		17	7½			
Buckwheat No. 3 (Barley)	Through ³⁄₁₆	10					15
	Over ³⁄₃₂		20	10			
Buckwheat No. 4	Through ³⁄₃₂	20					15
	Over ³⁄₆₄		30	10			
Buckwheat No. 5	Through ³⁄₆₄	30	No limit				16

[1] A tolerance of 1 percent is allowed on the maximum percentage of undersize and the maximum percentage of ash content.
[2] The maximum percentage of undersize is applicable only to anthracite as it is produced at the preparation plant.
[3] When the slate content in the sizes from Broken to Chestnut, inclusive, is less than these standards, bone content may be increased by 1½ times the decrease in the slate content under the allowable limits, but specified slate content shall not be exceeded in any event.
[4] Slate is defined as any material that has less than 40 percent fixed carbon.
[5] Bone is defined as any material that has 40 percent or more, but less than 75 percent fixed carbon. Ash determinations are on a dry basis.

with local authorities in communities where smoke-abatement regulations are contemplated or are already in force.

The institute continued its extensive research program. (*See* Technology section of this chapter.)

Labor Relations.—There were no serious labor disturbances in the anthracite industry in 1950. The 3-day week that had prevailed since December 5, 1949, was terminated March 4, 1950. An agreement replacing the amended contract of July 3, 1948, between the United Mine Workers and the anthracite operators became effective March 16, 1950. Under terms of this accord, the royalty on each ton of anthracite produced was increased from 20 cents per ton to 30 cents, and substantial wage increases were granted the miners. On January 26, 1951, after 3 days of negotiations, a further contract was drawn up whereby the miners received an additional daily wage increase of $1.60 across the board, effective February 1, 1951. The new agreement may be terminated by either party, on or after March 31, 1952, by giving 60 days' written notice.

Sources and Acknowledgments.—Basic statistics of the Pennsylvania anthracite-mining industry in this chapter are prepared from a canvass, by mail, of all known anthracite operations; about 99 percent of the tonnage is reported directly by producers, and the remaining 1 percent is estimated on collateral evidence. The data on individual operations furnished by the producers are voluntary and confidential, as is customary in the statistical services of the Bureau of Mines. In assembling available detailed information, free use has been made of the pertinent statistics prepared by the Pennsylvania Department of Mines, the Anthracite Institute, the Anthracite Committee, and the Association of American Railroads; thanks are extended to all of them for their cordial and continued cooperation.

PRODUCTION

The production of Pennsylvania anthracite in 1950 increased 3 percent over 1949. These statistics include deep-mined and strip-pit output, coal recovered from culm banks, anthracite purchased by the industry from so-called "bootleggers," and river or creek coal recovered from the streams draining the anthracite fields. A small tonnage of semianthracite (26,690 tons in 1950) produced in Sullivan County is also included.

"Breakers" and "Washeries".—As fresh-mined anthracite is brought to the surface it ranges in size from large lumps to fine dust and contains refuse and other impurities such as rock. In preparing the coal for market this "run-of-mine" material passes through a "breaker," or preparation plant equipped with complete crushing and screening facilities, where the large lumps are crushed and the impurities and refuse removed. The crushed coal is then washed and screened into various sizes for shipment to market.

In the early days of anthracite mining, large quantities of the smaller sizes were not marketable; and consequently, they were piled in large "culm" or refuse banks. As equipment was developed to burn the smaller sizes, "washeries" or small preparation plants equipped with facilities to screen and wash small sizes of anthracite were erected near the culm banks. Some culm-bank coal is also prepared at the breakers. Smaller sizes are currently in great demand, and little of the small-size coal is now dumped on refuse banks. The old banks are rapidly being depleted of marketable coal and will cease to be a source of marketable anthracite in the near future.

"Bootleg" Coal.—Before 1941, that anthracite referred to as "bootleg" coal was not included in production statistics of the Pennsylvania anthracite industry compiled by the Bureau of Mines. In 1941, however, the industry began to purchase run-of-mine coal from the so-called "bootleggers" for preparation and shipment to market. In 1950 these purchases totaled 600,529 net tons. As it is impractical to segregate the purchased anthracite in most instances from the output of the industry proper, it is included in the various production tables in the Minerals Yearbook chapters on Pennsylvania anthracite for 1941–50. To compute the output per man per day for the anthracite industry, it is necessary to deduct these purchases from the total tonnage shipped by the industry proper, because adequate data on man-days required to produce the "bootleg" coal are not available. Details on this procedure are discussed in the Employment section of this chapter.

The anthracite industry has continued its efforts to bring about elimination of anthracite bootlegging. Through subcontracting and leasing of coal lands to small independents the volume of "bootleg" coal has been reduced materially. See tables 5 and 6 for data on "bootleg" coal. For production and shipments by fields, regions, and counties, see tables 7 to 12. Tables 13 and 14 show percentages, by regions, of various sizes in relation to total breaker product.

TABLE 5.—Production, purchases by recognized operators, and fatalities at "bootleg" operations in the Pennsylvania anthracite industry, 1941–50

Year	Production (net tons) [1]	Purchased for preparation by recognized operations (net tons) [2]	Number of fatalities [1]	Year	Production (net tons) [1]	Purchased for preparation by recognized operations (net tons) [2]	Number of fatalities [1]

By Weeks and Months.—Weekly production figures for anthracite as published in the Bureau of Mines Weekly Anthracite and Beehive Coke reports are estimated from records of railroad carloadings and from reports obtained from trade sources. The weekly and monthly figures so obtained have been adjusted in tables 15 and 16 to the total annual anthracite production as obtained by a direct mail canvass of the operators.

Culm-Bank Coal.—The recovery of anthracite from culm banks in 1950 declined 22 percent from 1949, and output from this source was the lowest since 1940. Under an extremely heavy demand for coal during World War II, anthracite recovered from culm banks reached a peak in 1944 but has been declining since that year. Over the past 30 years many culm banks have been depleted of recoverable anthracite, and it is expected that future output from this source will decline sharply. Tables 17 and 18 give details on production of anthracite from culm banks.

TABLE 17.—Production of Pennsylvania anthracite from culm banks, by regions, 1935–50, in net tons

1950	[1] 213,577	35,270	1,388,760	840,253	2,477,860

[1] A small quantity of culm-bank coal was put through breakers in Sullivan County.
[2] Includes some washery coal.

MINING METHODS AND EQUIPMENT

Mechanical Loading.—The quantity of anthracite loaded mechanically underground increased 4 percent in 1950 over 1949. Mechanically loaded coal comprised 44 percent of the total underground production, the same percentage as in 1949. The coal beds of the Northern field are more adaptable to present-day mechanical loading methods, because of the relative flatness of the coal seams, than are the sharply pitching seams in the other fields; hence, 87 percent of the total tonnage loaded mechanically underground was produced in the Northern field compared with only 13 percent for the three other fields combined. Details on anthracite loaded mechanically underground are given in tables 19 to 21. The trend in underground mechanical loading, hand loading, and stripping of anthracite, 1928–50, is shown graphically in figure 1.

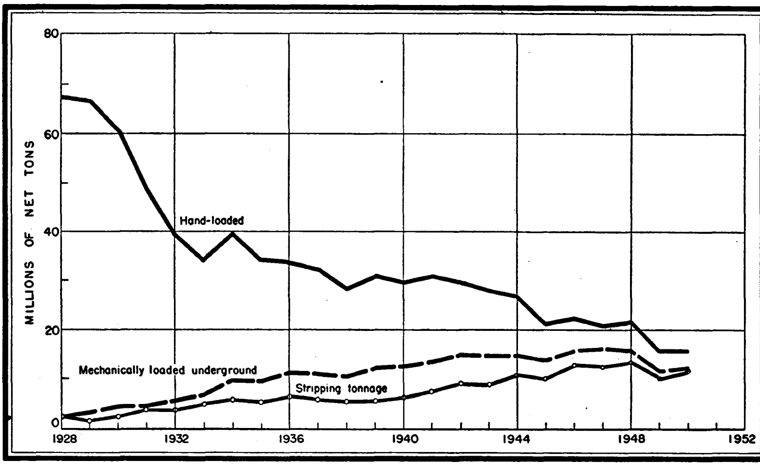

FIGURE 1.—Trends in mechanical loading, hand loading, and stripping of Pennsylvania anthracite, 1928–50.

[1] As reported by Commonwealth of Pennsylvania, Department of Mines.

Strip-Pit Operations.—The percentage of anthracite recovered by strip-pit mining has been increasing yearly and in 1950 accounted for 30 percent of the total fresh-mined anthracite compared with 28 percent in 1949. The thick bed outcrops of coal in the Schuylkill region are more adaptable to strip mining than are the thinner beds in the Wyoming region; for this reason, 56 percent of the total strip-pit output was produced in the Schuylkill region compared with 24 and 20 percent in the Wyoming and Lehigh regions, respectively. Data on strip-pit mining are given in tables 22 and 23. Figure 2 shows graphically the production of anthracite from strip pits, by regions, 1928–50.

Cutting Machines.—Anthracite cut by machines in 1950 totaled 611,734 tons compared with 557,599 tons in 1949. Of the cutting machines used in 1950, 151 were "permissible" and 7 "all other types" compared with 141 "permissible" and 12 "all other types" in 1949.

Dredge Coal.—The tonnage of anthracite recovered from the streams draining the Pennsylvania anthracite fields declined 28 percent in 1950 from 1949. Public utilities and other industries in the general vicinity of the anthracite fields are the principal users of anthracite recovered by dredging operations. Historical data on river-coal output are shown in table 24.

Total	619, 564	1, 677, 508	2.71

EMPLOYMENT

The number of men employed in the Pennsylvania anthracite industry in 1950 declined 4 percent from 1949. Of the total employees, 54 percent were employed in operations in the Wyoming region, 16 percent in the Lehigh, and 30 percent in the Schuylkill region; 67 percent of the total employees were men working underground, 11 percent worked in strip-pit operations, and 22 percent were in preparation plants and other surface operations.

Employment data, as shown in this study, do not include workers employed in "bootleg" coal-mining operations, conducted principally in the Schuylkill region. Although these workers are not included in the employment data, some of the coal which they produced (600,529 net tons in 1950) was purchased by the recognized industry for preparation and shipment to market, and the coal so purchased is included in the production tables of this chapter. Complete employment data on the "bootleg" holes from which this coal was produced are not available. Therefore, the purchased coal was deducted from the total tonnage reported by the operators, and the resulting net production was then used to calculate the output per man per day. Although the men employed at preparation plants of the industry proper were engaged part time in preparing this purchased coal for market, the inclusion of such time in calculating productivity will not detract materially from the validity of the figure obtained.

Detailed labor statistics are shown in tables 26 and 27.

TABLE 26.—Men employed and days worked at operations producing Pennsylvania anthracite in 1950, by region and type of plant [1]

[Includes operations of strip contractors]

[1] Men employed in "bootleg" operations excluded.
[2] Counties producing dredge coal only.

CONSUMPTION

Anthracite is primarily a space-heating fuel, and the 6-percent gain in consumption in 1950 over 1949 is attributable largely to the cooler weather that prevailed. This consumption is calculated on the basis of production, imports, exports, and changes in producers' stocks; data on retail dealers' stocks are incomplete, and no attempt is made to reflect stock changes for this category. Reported consumption by electric utilities increased 8 percent over 1949; consumption by railroads increased 5 percent; anthracite mixed with bituminous coal in making coke totaled 169,275 tons compared with 172,825 tons in 1949; and anthracite used in the manufacture of fuel briquets and packaged fuel totaled 638,356 tons compared with 646,897 tons in 1949.

[1] Shipments to these markets as reported by Pennsylvania Department of Mines; illicit coal not included.
[2] An important but undetermined part of anthracite shown as shipped to New Jersey is reshipped to New York City.
[3] U. S. Department of Commerce.
[4] Less than 0.05 percent.
[5] Shipments to the States indicated.
[6] Less than 500 tons.
[7] Converted to coal equivalent upon basis of 4 barrels of fuel oil equaling 1 ton of coal.

The New England and Middle Atlantic States, Maryland, Delaware, and the District of Columbia received 96 percent of the total shipments of anthracite to points in the United States in 1950. Data on the consumption of all fuels in this area are not available; however, the apparent consumption of anthracite, domestic coke, briquets, and heating and range oils, in terms of anthracite, are given in table 28.

Mechanical Stokers.—Data of the Bureau of the Census, United States Department of Commerce, show that factory sales of class 1 mechanical stokers for burning anthracite (capacity under 61 pounds of coal per hour) decreased from 4,616 units (revised figure) in 1949 to 4,191 units in 1950; sales of class 2 stokers (capacity 61 to 100 pounds of coal per hour) decreased from 489 units (revised figure) in 1949 to 487 units in 1950.

DISTRIBUTION

Data in table 30 cover the distribution of Pennsylvania anthracite for the coal year April 1, 1949, to March 31, 1950; they are not comparable with the statistics elsewhere in this chapter on production, consumption, exports, etc., inasmuch as the latter are compiled on a calendar year basis. The distribution data were voluntarily submitted to the Bureau by producers, American and Canadian wholesalers, and dock operators, and represent the eighth in a series of mineral market surveys on the subject.

Shipments (including local sales) reported for the 1949–50 coal year declined 14 percent compared with shipments for the 1948–49 coal year. The decline may be attributed to a combination of several factors, the most important of which was the generally mild weather in the primary anthracite market areas during the winter of 1949–50, the competition of natural gas and oil, marked improvement in the output of the major European coal-producing countries, and loss of a small part of the Canadian market to Welsh anthracite. Shipments to destinations in the United States declined 13 percent from the 1948–49 coal year, Canada showed a decrease of 17 percent, and exports to countries other than Canada declined 40 percent.

Data compiled from records of Pennsylvania State Department of Mines indicate that anthracite shipments from the mines to destinations in the United States increased 3 percent in 1950 compared with 1949. In 1950, 80 percent of the shipments destined to points in this country moved from the mines by rail and 20 percent by truck, as compared to 82 and 18 percent, respectively, in 1949. Pennsylvania received 86 percent of the truck shipments in 1950, New Jersey 6 percent, and New York 7 percent. Anthracite rail shipments by States of destination for 1947–50 are shown in table 29, and the movement of anthracite by truck in 1950, by months and States of destination, in table 31.

According to data compiled from records of the Massachusetts Division on the Necessaries of Life and the Association of American Railroads, rail receipts of Pennsylvania anthracite in New England increased 8 percent over 1949 while tidewater receipts decreased 43 percent. Details on anthracite movement to New England

[1] Includes "local sales."
[2] Shipments to other States generally referred to as being in the South Atlantic area are included in "All other States."
[3] Shipments to Indiana are included in "All other States."
[4] Japan received all of the Pea coal indicated and Italy all of the Buckwheat No. 1. The Netherlands imported about 95 percent of the Rice and Barley, and France received more than 98 percent of the Buckwheat No. 4 and smaller.

are given in table 32. Loadings at Lake Erie ports remained virtually the same, and receipts at upper Lake docks increased 14 percent over 1949.

Shipments of anthracite from the Lehigh, Schuylkill, and Wyoming regions, 1890–1950, inclusive, are shown graphically in figure 3.

[3] Total receipts by rail and by tidewater less imports.
[4] Data for individual States not available. Total tidewater as reported by Association of American Railroads.
[5] Less than 500 tons.

STOCKS

Stocks of Pennsylvania anthracite held by producing companies at the end of January 1950 totaled 657,710 net tons. A low point of 183,169 tons was reached in March, but stocks increased rapidly thereafter to a peak of 1,415,956 tons in November. They fell again to 1,268,300 tons at the end of December, but this represented a 30-percent increase over stocks held by producers in December 1949. Stocks on the upper Lake docks in December 1950 virtually equaled those in the same month of 1949—242,237 tons as compared to 246,825 tons. Stocks held by public utility plants remained at a level exceeding 4,000,000 tons throughout the year—totaling 4,720,147 tons in December. Stocks held by class I railroads in December 1950 were 61,081 tons compared to 66,388 tons in December 1949.

Early in 1950, for the first time in many years, the Bureau began to collect and publish monthly data on stocks of Pennsylvania anthracite held in retail dealer yards. The first canvass of a selected list of representative dealers indicated that stocks of space-heating sizes held in all retail yards handling anthracite on March 31, 1950, totaled 1,760,000 net tons, broken down as follows: Egg, Stove, and Chestnut sizes combined, 979,000 tons; Pea, 256,000 tons; and Buckwheat No. 1 and Rice, 525,000 tons. Stocks increased thereafter to a peak of 3,813,000 tons on October 31 but declined to 3,452,000 tons by December 31. Stocks at the close of the year comprised an estimated 2,041,000 tons of Egg, Stove, and Chestnut sizes, 342,000 tons of Pea, and 1,069,000 tons of Buckwheat No. 1 and Rice.

PRICES

According to Saward's Journal, f. o. b. mine prices for anthracite at the end of 1950 varied from $12.80 to $13.55 per net ton on Broken and Egg sizes; $12.75 to $13.80 on Stove; $12.60 to $13.80 on Chestnut; $10.50 to $11.20 on Pea; $7.40 to $8.00 on Buckwheat No. 1; $6.00 to $6.60 on Rice; and $4.75 to $5.05 on Barley. A number of companies normally sell coal of a certain grade from some mines at a small premium over the quoted circular prices. It is to be noted that the prices are f. o. b. mine quotations and differ from retail prices, which include transportation and dealer costs. Data compiled from reports of the Bureau of Labor Statistics, United States Department of Labor, giving retail prices for certain fuels in selected cities by months for 1950, are shown in table 33.

[3] Includes 1-percent sales tax.

[4] Commercial.

VALUE OF SALES

Increased labor and material expenses resulted in higher total mine costs per ton of anthracite in 1950 than in 1949. Average sales realization per net ton on breaker shipments to points outside the local sales area increased 5 percent over 1949; when colliery fuel, local sales, river coal, and washery coal are included, the average per-ton value of the 1950 production increased 6 percent over 1949. The average sales-realization figures in this study represent value at the breaker, washery, or dredge, and the reporting company is asked to "exclude selling expenses"; therefore, when a producing company sells its output to separately organized sales company, the value reported will exclude the margin of the sales company and may, therefore, be somewhat less than the circular price at which the coal is placed on the open market. See tables 34 to 36 for detailed sales-realization data.

TABLE 34.—Average sales realization per net ton of Pennsylvania anthracite shipped from breakers to points outside and inside producing region in 1950, by regions and sizes

Grand total	8.59	7.87	3.33	8.38	9.12	8.28	3.66	8.90

[1] Value given for shipments is value at which coal left possession of producing company and does not include margins of separately incorporated sales companies. Imputed value of colliery fuel, as reported by producers, based on market price.

FOREIGN TRADE [2]

Exports of Pennsylvania anthracite in 1950 decreased 21 percent from 1949. The decline may be attributed entirely to the sharp reduction in shipments to European destinations, inasmuch as exports to Canada increased slightly over 1949. Anthracite exports to Europe had reached a peak of 3,918,463 net tons in 1947 but declined steadily throughout the period 1948–50.

In addition to the anthracite exported from the United States to Canada in 1950, that country also received 395,867 tons from Great Britain and 262 tons from the Union of South Africa. Since in the Province of Ontario the British product is generally unable to compete in price with Pennsylvania anthracite, the effect of Welsh anthracite competition is felt chiefly in the Province of Quebec and the Maritime Provinces. In the years before World War II, Great Britain annually exported an average of 1,200,000 tons of anthracite to Canada. However, increased industrial activity in Great Britain and an accompanying rise in coal consumption forced drastic curtailment in British coal exports to all countries, beginning in the late months of 1950.

Imports of anthracite into the United States totaled 18,289 net tons in 1950, of which 18,176 tons came from Great Britain. Details on imports of anthracite for the period 1948–50 are presented in table 38.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TECHNOLOGY

The Bureau of Mines continued its cooperation with anthracite producers in various mechanical mining studies being conducted in an attempt to increase the output of anthracite per man per day. At the close of World War II, as part of an experimental program to increase productivity, the Bureau obtained a Korfmann universal shearing machine from Germany and installed it in a mine in the Southern field of the anthracite region. The cutting tests with this equipment are the first to be made in the United States in steep-pitch mining. A report containing details of preliminary tests of the Korfmann universal shearing machine concludes that the machine's performance warrants additional experimental work.[3]

Practical research in pneumatic packing in underground workings, which has been practiced for many years in Europe and the United Kingdom, has been under way through the laboratory for some time. A Brieden pneumatic packing machine (German manufacture) was made available by the Bureau of Mines for test purposes and has been tested intermittently for more than a year.

Research is being conducted with scraper-shaker loaders devised and built by the Bureau for working in thin, steeply pitched anthracite beds. Experiments have also been conducted in longhole retreat mining, and future projects include research in the use of yielding steel props, block caving, and longhole drilling.

Stream pollution by mine drainage has been the subject of considerable study both by the mining industry and Government agencies. In the Pennsylvania anthracite industry, the major problem concerns satisfactory disposal of a daily average mine-water discharge of approximately 472 million gallons, containing considerable quantities of sulfuric acid. Diversion of individual mine drainage in the anthracite region from receiving streams or purification before entering streams are alternative remedial measures to combat pollution of surface streams by acid mine drainage. The daily drainage from the mines is a huge volume of water, and the effect of its removal from the surface streams coursing through and beyond the anthracite region is one of the phases that must be considered in any solution of the mine drainage problem. When collected and made available at one point, such as the portal of a drainage tunnel, it is a potentially valuable source of water supply for industrial or other utilization if its chemical quality can be improved to make it suitable for use. Bureau of Mines Bulletin 508 indicates the scope of the problem in the anthracite industry and gives some suggestions concerning its solution. Samples of water from mines in the region have been collected, analyzed, and studied and reports made thereon.[4]

Factual data regarding water impounded in underground pools and in abandoned strippings have been gathered by the Bureau's Anthracite Flood-Prevention Section. Recent studies and reports on pumping and field work concerning drainage tunnels have increased materially the information available on the mine-water problem.[5]

Bureau of Mines Bulletin 494 discusses a clay and gravel deposit known as the "buried valley" of the Susquehanna River, situated in the Northern field of the anthracite region near Wilkes-Barre, Pa. Geographically, the buried valley extends 15 miles from West Nanticoke upstream to the vicinity of West Pittston. The existence of the buried valley has been known for many years, and the uncertainty regarding the physical condition of water-bearing valley-fill deposits has made great care necessary in mining operations to avoid break-

throughs between mine workings and the clay deposits. Whenever break-throughs have occurred, inundation of the underground workings has followed.

A large tonnage of anthracite has been mined beneath the buried valley, and a vast tonnage remains unmined. The materials that constitute the deep-filled deposits are water-bearing sediments consisting of alternating layers of gravel, sand, clay, and admixtures of all three. The main channel of the buried valley reaches its greatest depth near Plymouth, Pa., where the rock reaches a minimum altitude of 201 feet; the overlying mantle of valley-fill deposits is 320 feet deep at this spot.

Bulletin 494 furnishes data on the buried valley that should be useful in solving the anthracite mine-water problem and so conserving anthracite reserves and promoting employee safety. The report discusses physical characteristics of the valley, correlates pertinent data relating to the subject, presents accurate contour maps showing the position of the top of the solid rock underlying the valley fill, and gives cross sections at regular intervals across the valley showing the irregularities in thickness, configuration, and nature of the materials composing the water-bearing valley-fill deposits.[6]

The basic combustion research on the preparation and utilization of anthracite fines conducted by the School of Mineral Industries, Pennsylvania State College, and jointly supported by the Commonwealth of Pennsylvania and the Anthracite Institute, was continued in 1950.

The Anthracite Institute continued various research projects on fixed-bed silt gasification, upgrading of anthracite silt by pelletization, fluid-bed reduction of iron ore, anthratube performance, and fluidized and slagging gas producers.

WORLD PRODUCTION

World production of anthracite increased in 1950, although production in some of the European countries declined slightly. Table 39 presents details of world production, by countries, for 1946–50.

Cobalt

By Hubert W. Davis and Charlotte R. Buck

GENERAL SUMMARY

CONSUMPTION of cobalt in the United States reached the unprecedented total of 8,283,408 pounds in 1950—a gain of 76 percent over 1949 and 65 percent greater than in the former record year 1948, when it exceeded 5,000,000 pounds for the first time. Usage of cobalt for all important purposes, except high-speed steel, was larger in 1950 than in 1949. Quantitywise, the gains were most pronounced for magnet alloys and cobalt-base high-temperature alloys; these two outlets accounted for 62 percent of the total quantity consumed in 1950 and utilized twice as much as in 1949. Noteworthy gains were also recorded in the use of cobalt in ground-coat frit for porcelain enamel, alloy hard-facing rods, cobalt-alloy steels, and pigments. So great was the demand for cobalt that voluntary rationing was initiated by suppliers in the third quarter of 1950, and beginning November 21 the National Production Authority limited civilian use of cobalt.

Despite the fact that the new supply of cobalt metal (rondelles and granules) made available in 1950 was 9 percent greater than in 1949, it was inadequate for industry requirements and stockpile commitments. The deficit was met partly by withdrawals from suppliers' stocks, which dropped from 1,667,000 pounds on January 1, 1950, to 271,000 pounds on December 31; partly by withdrawals from industry stocks, which declined from 842,900 pounds on January 1 to 599,800 pounds at the end of 1950; and partly by greater use of purchased scrap, which increased from 14,900 pounds in 1949 to 126,400 pounds in 1950. Although the new supply of oxide made available in 1950 was 79 percent larger than in 1949, it likewise was insufficient to meet industry demand, and suppliers' stocks declined 69 percent.

Sales of cobalt metal in the United States were 42 percent greater in 1950 than in 1949; sales to industry were 96 percent larger, but those to the National Stockpile were 10 percent smaller. The metal was supplied chiefly by imports but partly by production in the United States. Imports of metal in 1950 established a new high and were 20 percent greater than in 1949, but domestic production gained only 2.5 percent.

The demand for cobalt oxide increased substantially in 1950, chiefly because of greater use in ground coat for porcelain enamel and pigments. Output of oxide in the United States was up 20 percent, and imports were 2½ times greater. Production and shipments of salts and driers were also greater in 1950 than in 1949, but those of hydrate were smaller.

The greater part of the cobalt metal, oxide, hydrate, and other cobalt products sold in the United States is made from crude cobalt (white alloy) produced in Belgian Congo. Imports of white alloy from Belgian Congo were 8 percent more in 1950 than in 1949. Belgian Congo also supplies a substantial quantity of cobalt granules, which are produced from precipitates recovered from the solutions used in the electrolytic copper plants. Some of the cobalt products sold are made from domestic and Canadian ores. Output of domestic ore was 55 percent greater than in 1949, and imports of Canadian ore were up 61 percent. Consumption of cobalt white alloy and ore, however, declined 3 percent.

The price of cobalt metal and oxide remained unchanged throughout 1950.

Government Regulations.—On November 21, 1950, the National Production Authority issued a temporary directive (NPA–71) limiting the civilian use of cobalt metal during the rest of November to 30 percent of the average monthly quantity used by the buyer in the first half year. In December (NPA–77) civilian use was increased to 50 percent. On November 30 the National Production Authority (NPA Order M–10) established specific inventory limitations for cobalt. No person could receive delivery of cobalt if his inventory exceeded, or by such receipt would exceed, his minimum requirements for the succeeding 20 days at his then-scheduled method and rate of operation.

On December 30, 1950, the National Production Authority amended Order M–10, which in effect constituted a completely new order, inasmuch as the former Order M–10 contained only inventory-control provisions similar to those contained in the amended order. Amended Order M–10, after January 31, 1951, prohibited the use of cobalt in the manufacture of specified products that are relatively less essential or in which substitute materials may effectively be used; established limits on additions to inventory; and placed cobalt under allocation by prohibiting, subject to limited exceptions, any deliveries not covered by allocation authorization to be issued monthly by the National Production Authority.

DOMESTIC PRODUCTION

Mine Production.—Despite the fact that the United States is the largest consumer of cobalt in the world, only a small part of its requirements has been furnished by domestic ore, as is evident from table 1, which shows production and shipments through 1950.

Production of cobalt ore in the United States in 1950 was 55 percent greater than in 1949, but shipments were 2 percent less.

The Bethlehem Steel Co. was the only producer of commercial cobalt ore in the United States in 1950. The cobalt-bearing material (averaging 1.4 percent cobalt in 1950) is contained in the sulfides that accompany the magnetite mined at Cornwall, Pa. The cobalt-bearing material is shipped to the Pyrites Co., Wilmington, Del., where it is processed to metal and other cobalt products.

The Sullivan Mining Co., Kellogg, Idaho, continued to recover cobalt at its electrolytic zinc plant in 1950 but, as in previous years, made no shipments. In 1950 it recovered 183 short tons of residues containing 15,515 pounds of cobalt.

The St. Louis Smelting & Refining Division of National Lead Co. continued to produce an iron reject containing about 3 percent cobalt

TABLE 1.—Cobalt ore produced and shipped in the United States through 1950

Year	Produced: Gross weight (short tons)	Produced: Cobalt content (pounds)	Shipped from mines: Gross weight (short tons)	Shipped from mines: Cobalt content (pounds)
Previous to 1921 (partly estimated)	(1)	730,000	(1)	730,000

[1] Data not available.

at its property near Fredericktown, Madison County, Mo. Inasmuch as no process is available at the plant at the present time for converting the material into salable products, it is stockpiled. For many years the company has studied the problem of making a successful recovery of separate products of cobalt, nickel, and copper from the iron rejects. The results of the research have led to a process which shows that the chemistry is sound and, consequently, a 50-ton plant (head feed) is planned.

The Calera Mining Co., a wholly owned subsidiary of the Howe Sound Co., continued underground development at its Blackbird mine near Salmon, Idaho. The ore carries about 0.6 to 0.8 percent cobalt, about twice as much copper, and a little gold. According to the Howe Sound Co.:[1]

Since this mine has been developed sufficiently for the practical purposes of initial production, no attempt to block out additional ore was made during the year. Considerable construction work continued and, except for the installation of machinery which is currently being received, the plant, as initially designed, is complete.

Research work in connection with the milling of the complex cobalt ore, and refining the cobalt product, continued. On the basis of information received, which has been carefully reviewed by Company metallurgists, and by a consulting metallurgist, the new refining process which was mentioned in last year's report has been accepted and the refinery will be designed and completed by the Chemical Construction Corporation, which is a subsidiary of the American Cyanamid Company.

During the year, after the acquisition of the refinery site, and in order to avoid any unnecessary delays, the building to house the refinery equipment was erected. An office building was built, as was a laboratory. Access roads to the refinery, which is about two miles west of Garfield, Utah, were improved. A railroad spur from the main line of the Union Pacific Railroad was installed. Grading and preparation of the site for the storage of the waste products of the process was completed, and a water line from Garfield was laid.

[1] Howe Sound Co., Annual Report: 1950, pp. 5-6.

Late in the year the Company was requested by officials of the United States Government to increase the capacity of both the mine plant and the refinery because of the critical shortage of cobalt. Your Directors have, therefore, agreed to increase the milling plant at the mine from a rated capacity of 600 tons to 1000 tons of ore per day and to proportionately enlarge the refinery so that its rated capacity will be in excess of 3,000,000 pounds of cobalt per year. The Company will undertake to finance the enlarged plants with its own funds and is negotiating contracts with the Government under which it will be assured of a market for a large portion of the cobalt to be produced during a five-year period.

No definite date for completion of the refinery can be given at this time. During this period of national emergency delivery of machinery and equipment may be delayed and the governing factors present unknown conditions which make time estimates difficult. It is believed, however, that if necessary priorities, which are to be obtained from the Government, are effective, this plant should be in operation before the end of the year. The milling plant at the mine will be ready for operation about July 1.

The Blackbird mine has been described in some detail in a business journal.[2]

An improved method of recovering the nickel and cobalt content from technical ammoniacal leach liquors containing compounds of such metals in solution with various unavoidable impurities has been developed.[3]

Refinery Production.—Consumption by refiners or processors of cobalt contained in alloy and ore was 2,526,755 pounds in 1950—a 3-percent decrease from 1949. However, usage of cobalt intermediates by refiners or processors was 70 percent greater. Of the alloy and ore consumed in 1950, much the greater part was utilized in making cobalt metal.

A patent[4] has been issued for the production of chemically pure cobalt metal.

TABLE 2.—Cobalt products produced and shipped in the United States, 1949–50, in pounds

Other					17,565	48,261

[1] The fines, granules, rondelles, hydrate, and carbonate consumed originated from alloy and ore; therefore, combining alloy and ore with these materials would result in duplication.

CONSUMPTION

Consumption of cobalt by industrial consumers established a new record in 1950; it was 8,283,408 pounds, a 76-percent gain over 1949 and 65 percent larger than in 1948, the previous record year. Usage of cobalt for all important purposes, except high-speed steel, was larger in 1950 than in 1949. Magnet alloys continued to be the largest single use for cobalt and represented 35 percent of the total quantity consumed in 1950; usage for this purpose, moreover, was 132 percent greater than in 1949.

The second-largest use of cobalt was for cobalt-chromium-tungsten-molybdenum alloys, which accounted for 27 percent of the total quantity consumed in 1950; moreover, usage for this purpose was 80 percent greater than in 1949. The popular grades of cobalt-base, high-temperature, jet-engine alloys, in order of their decreasing strategic alloy index, are shown in table 4.[5]

A high-temperature, high-strength alloy, which contains 58 to 63 percent cobalt, has been developed.[6]

A high-alloy sheet, for use at temperatures up to 1,800° F., has been based on cobalt (50 percent), chromium, nickel, and tungsten.[7]

More cobalt was also used in cemented carbides, alloy hard-facing rods, pigments, and in ground-coat frit for porcelain enamel than in 1949, and cobalt salts and driers were utilized at a rate about 44 percent greater. The use of cobalt oxide as an ingredient in ground-coat frit has been described.[8] Less cobalt was used for high-speed steel in 1950 than in 1949 but this loss was more than offset by greater utilization in other cobalt-alloy steels. An informative article on super-high-speed steels was made available.[9]

Elgiloy, a cobalt-chromium-nickel alloy, developed primarily for watch springs, is reported [10] to have found many applications outside of its original use.

TABLE 5.—Cobalt consumed in the United States, 1946–50, by uses, in pounds of cobalt

pound delivered east of Chicago; for quantities under 100 pounds it was $1.87 a pound. Metallurgical-grade oxide was $1.95 a pound of contained cobalt f. o. b. Niagara Falls, N. Y., and ceramic-grade oxide was $1.38 a pound (gross weight) east of the Mississippi River. The prices for metal and ceramic-grade oxide have been in effect since April 1, 1949, and that for metallurgical-grade oxide since November 17, 1949.

FOREIGN TRADE [11]

Imports.—Imports of cobalt into the United States established a new high in 1950 and were 22 percent larger than in 1949 and 3 percent greater than in 1948, the previous record year. Belgian Congo continued to be the chief source of imports; in 1950 it supplied 3,918,225 pounds of metal and 3,979,088 pounds of white alloy containing 1,792,348 pounds of cobalt. Belgium supplied 2,788,650 pounds of metal and 863,800 pounds of oxide containing 613,300 pounds of cobalt; both the metal and oxide were produced from Belgian Congo alloy. Canada supplied 69 pounds (gross weight) of oxide, 2,000 pounds (gross weight) of salts and compounds, and 164,188 pounds of ore containing 18,838 pounds of cobalt. The United Kingdom supplied 40,781 pounds (gross weight) of oxide and 2,649 pounds (gross weight) of salts and compounds.

[3] Adjusted by Bureau of Mines.

[11] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Historical table 8 shows imports of cobalt for 1923–50, by classes. Corresponding figures for earlier years are not available. However, imports of cobalt apparently did not exceed 500,000 pounds annually until 1926; from that year they increased steadily through 1929, when they reached 1,212,000 pounds. Imports declined abruptly during 1930–32, dropping to 303,000 pounds in 1932. Since 1933, however, imports of cobalt have increased almost steadily and reached an all-time high of 9,095,000 pounds in 1950.

During the 28 years 1923–50, receipts of metal comprised about 46 percent of the cobalt imports, most of which were supplied by Belgium and Belgian Congo. Smaller quantities of metal have been received from Austria, Canada, Finland, France, Germany, Japan, Sweden, and United Kingdom. Imports of alloy represented the second-largest quantity (38 percent), and virtually all was from Belgian Congo. About 11 percent of the imports of cobalt have been in the form of oxide, chiefly from Belgium. Substantial quantities of oxide have also been received from Germany and Canada, and smaller quantities from Australia, Finland, and France. Receipts of cobalt ore have comprised about 5 percent of the total imports; Canada has been the largest source, and most of the remainder came from Australia and French Morocco.

TABLE 8.—Cobalt imported for consumption in the United States, 1923-50, in pounds

Year	Gross weight					Total	
	Alloy	Ore	Metal	Oxide	Sulfate and other compounds	Gross weight	Cobalt content (estimated)
1923		58,719	225,639	258,574	45,644	588,576	426,000
1924		28,786	118,952	226,703	797	375,238	283,000
1925		34,782	198,669	287,265	13,256	533,972	408,000

1945	8,397,145	859,940	946,475	120,672	224	10,324,456	4,615,000
1946	1,648,595	657,787	1,935,582	1,074,630	350	5,316,944	3,451,000
1947	3,751,452	751,438	6,035,153	752,150	530	11,290,723	8,206,000
1948	4,879,413	8,167,545	5,266,521	790,300	1,374	19,105,153	8,821,000
1949	3,691,051	109,009	5,588,327	360,318	359	9,749,064	7,458,000
1950	3,979,088	164,188	6,706,875	904,650	4,649	11,759,450	9,095,000

[1] In addition to classes shown, 4,796,000 pounds of Burmese speiss containing 335,721 pounds of cobalt were imported.

Exports.—Exports of cobalt from the United States are small; 159,294 pounds of metal (chiefly scrap) valued at $81,805 were exported in 1950. Some oxide, salts, and driers are also exported, but the figures are not separately recorded by the United States Department of Commerce.

Tariff.—The duty on cobalt oxide continued to be 10 cents a pound, sulfate 5 cents a pound, linoleate 10 cents, and other salts and compounds 30 percent ad valorem. Cobalt metal and ore entered the United States duty-free.

WORLD REVIEW

Virtually all cobalt is found associated with other metals, such as copper, nickel, iron, arsenic, lead, zinc, manganese, silver, and gold. Belgian Congo and Northern Rhodesia, where cobalt occurs associated with copper, have been the chief producing countries in recent years, followed by the United States, Canada, and French Morocco. These five countries have contributed about 95 percent of the world output of cobalt in recent years. Iron pyrites from Finland, Germany, Greece, Italy, Norway, Spain, and Sweden contains cobalt, some of which is recovered. Although the quantities of cobalt present in iron pyrites are generally very small—often only 0.05 percent—and its recovery is only 50 to 60 percent, the very large tonnage treated during and preceding the war contributed greatly to the cobalt production in Germany. It is reported [12] that about 10 tons of cobalt concentrates are obtained from 100,000 tons of cinder. A complete record of output of cobalt from iron pyrites is lacking.

TABLE 9.—World mine production of cobalt, by countries, 1941–50, in metric tons of contained cobalt [1]

[Compiled by Berenice B. Mitchell]

Total (estimate)	4,000	3,500	4,200	3,900	4,700	3,500	5,000	6,100	5,900	7,100

[1] In addition to countries listed, Brazil, China, Germany, and Spain produce cobalt, but production data are not available. Estimate by author of chapter included in total.
[2] Less than 1 ton.
[3] Data not available; estimate by author of chapter included in total.
[4] Figures comprise Canadian ore processed in Canada and exported (irrespective of year when mined), plus cobalt content of concentrates made at Port Colborne from copper-nickel ore. However, figures exclude the cobalt recovered at Clydach (Wales) from Canadian nickel-copper ores, for which estimate by author of chapter has been included in world total.
[5] Year ended June 30 of year stated.

[1] Excludes cobalt in Canadian copper-nickel ores refined at Clydach, Wales.
[2] Year ended June 30 of year stated.
[3] Revised figure.

Belgian Congo.—The world's premier source of cobalt continues to be Belgian Congo, where the Union Minière du Haut-Katanga is the sole producer. Output was 5,148 metric tons in 1950, a new record. Commissioning of a new hydroelectric power station and more normal rainfall contributed to the gain in output. Production of cobalt in Belgian Congo was begun in 1924; since that year output has increased almost without interruption, and total production through 1950 has been about 41,854 metric tons, as shown in table 10.

The Union Minière du Haut-Katanga has six electric furnaces of 720 kw. each and has recently installed a 2,000-kw. furnace at Jadotville for smelting cobalt ores and concentrates from the Kamoto, Musonoi, and Luiswishi open-pit mines. The cobalt content of low-grade ore from the Kamoto mine is raised simply by washing, and the washed ore is sent either directly to the electric furnaces at Jadotville or to the concentrator at Kolwezi, depending upon the content. The vast Musonoi copper-cobalt deposit contains large veins, especially rich in cobalt, which, in spite of the mixture of ores, are worked separately by selective mining. The Musonoi ore is sent to the Kamoto washing plant or to the Kolwezi concentrator, thence to Jadotville. The mixed copper-cobalt ore from the Luiswishi mine is sent directly to Jadotville. The cobalt and copper obtained from smelting the cobalt-rich ores and concentrates are blended with other metals contained in the charge to form two alloys—a red alloy rich in copper and poor in cobalt and a white alloy rich in cobalt and iron but containing about 15 percent copper. The red alloy is treated in rotary furnaces at Lubumbashi to yield a cobaltiferous slag, which is returned to the electric furnaces. The white alloy, containing about 45 percent cobalt, is cast into ingots, which are sent to Belgium and the United States for refining.

Certain Katanga copper ores also contain cobalt. The ores and concentrates that are poorest in cobalt are sent to the electrolytic copper plant, also at Jadotville, where the cobalt enters into solution simultaneously with the copper. The cobalt precipitates are treated by electrolysis in a refining plant capable of producing 2,000 tons of granules annually. The cobalt is produced in the form of cathodes, which are melted and refined; the cobalt is then granulated and packed in drums for export.

On the basis of a rate of production of 4,000 metric tons annually, the company reported reserves of cobalt adequate for 40 to 50 years, and it anticipates that these reserves will increase as a result of further development of its copper deposits.

Canada.—Production of cobalt in Canada is measured by the quantities of Canadian ores processed and exported, irrespective of the year when mined, plus the cobalt content of concentrates produced by the International Nickel Co. of Canada, Ltd., at Port Colborne, Ontario. Canadian production figures, however, do not include the cobalt recovered by Mond Nickel Co. at its Clydach (Wales) nickel refinery from the nickel-copper ores of the Sudbury district.

According to the Dominion Bureau of Statistics, production of cobalt (content) in Canada was 626,400 pounds in 1950 compared with 619,065 pounds (revised figure) in 1949. Production figures on cobalt in Canada from 1904 through 1950 are shown in table 10.

In the cobalt area of northern Ontario, the Mensilvo Mines, Ltd., and Silanco Mining & Refining Co., Ltd., were the chief producers of cobalt ore in 1950. The smelter of the Cobalt Chemical & Refinery Co., Ltd., was damaged by fire in May 1950. In an effort to stimulate production of cobalt ore in northern Ontario, Deloro Smelting & Refinery Co. announced in mid-December an increase of 15 to 30 cents per pound of cobalt, depending on grade. Under the new price schedule an ore containing 10 percent cobalt will bring 80 cents per pound for the cobalt contained and a 15-percent ore, $1.10.

The International Nickel Co. of Canada, Ltd., continued to recover impure cobalt concentrates at its Port Colborne refinery; they are shipped to Clydach, Wales, for refining.

Falconbridge Nickel Mines, Ltd., continued to construct at its nickel refinery at Kristiansand, Norway, a plant to produce cobalt from the matte yielded by Sudbury nickel-copper ores. Production of cobalt is expected to begin the latter part of 1951.

During 1950, Eldorado Mining & Refining (1944), Ltd., produced byproduct cobalt-nickel speiss at its Port Hope refinery from pitchblende mined at Port Radium, Northwest Territory. The speiss averages about 14 percent cobalt.

French Morocco.—Production of cobalt ore in French Morocco was 3,509 metric tons containing 390 tons of cobalt in 1950 compared with 1,739 tons containing 209 tons of cobalt in 1949. La Société Minière de Bou-Azzer et du Graara, Casablanca, is the sole producer.

On October 11, 1950, the Economic Cooperation Administration announced an agreement with the French Government under which a commercial contract had been concluded for shipping 7,200 tons of cobalt concentrates up to November 1, 1952, by the producer. The concentrates, which contain about 12 percent cobalt, as well as some nickel, gold, and silver, will be refined to metal for the Economic Cooperation Administration by Deloro Smelting & Refining Co. at Deloro, Ontario, Canada.

Mexico.[13]—It is reported that eight concessions have been granted by the Ministry of National Economy for exploitation of cobalt and manganese-bearing tracts in Oaxaca.

Northern Rhodesia.—The second-largest producer of cobalt in the world continues to be Northern Rhodesia, where the Rhokana Corp., which has been producing cobalt since 1933, is the sole producer. The output of alloy was 1,954 short tons containing 739 tons of cobalt in the year ended June 30, 1950, compared with 1,171 tons containing 443 tons in 1949. The gain resulted from an improvement in the grade of cobalt in ore, which averaged 0.137 percent in 1950 compared with 0.104 percent in 1949. To improve the percentage of recovery and produce a commodity suitable for the market without further treatment, Rhokana Corp. is erecting an electrolytic cobalt refinery on its property in Northern Rhodesia. The plant, which is expected to begin production in the second half of 1951, is designed for a production of 1,500 short tons of electrolytic cobalt metal annually. Laboratory and pilot-plant investigations on the production of electrolytic cobalt from a flotation concentrate recovered by the Rhokana Corp., which led to the construction of the refinery, have been described.[14] Production figures on cobalt in Northern Rhodesia from 1933 through 1950 are shown in table 10.

United Kingdom.—A comprehensive report on cobalt refining at the Rainham Works of Murex, Ltd., England, has been made available.[15]

Coke and Coal Chemicals

By J. A. DeCarlo, J. A. Corgan, and Maxine M. Otero

GENERAL SUMMARY

COKE is a basic raw material, which, because of its indispensability to iron and steel production, occupies a very important position in the industrial potential of the United States. Output of oven and beehive coke in 1950 totaled 72,718,038 net tons, 14 percent over 1949 but 3 percent less than the record output in 1948. The gain in production over 1949 would have been greater had all ovens available and in working condition operated at normal rates during the year. However, the 3-day workweek during the first quarter of the year and several work stoppages for varying periods in the bituminous-coal industry hampered coke-oven operations, thereby reducing production in that quarter. Coking coal began to move into coke plants when the bituminous-coal miners returned to work March 6, 1950, and production rates for both oven and beehive coke increased rapidly. Oven-coke plants, which had operated at 78.6 percent of capacity during the first quarter, increased production to 95.3 percent in the last quarter. Virtually all of the beehive ovens that were idle during the 3-day workweek and many that had not been active for many years were reactivated, and the daily average output of 5,300 tons during the first quarter of 1950 increased to 21,100 tons in the last quarter.

High consumer demand, created by the outbreak of war in Korea, accelerated requirements for durable goods; consequently, the demand for coke by metallurgical industries increased rapidly in the last half of the year. Metallurgical operations in 1950 required the greatest proportion of coke output since 1924. Roughly, 88 percent of the oven-coke production was utilized by iron blast furnaces and foundry cupolas. One of the outstanding developments during 1950 in the consumption pattern of oven coke was the decline in its use for the manufacture of water gas. This use rose rapidly during World War II because of the need for large quantities of water gas for chemicals. However, it is now expected that the use of coke for this purpose will continue to decline owing to the availability of natural gas both for chemical synthesis and as a fuel. In 1950 several gas utilities using coke for water-gas manufacture changed over to the distribution of natural gas, and facilities were under construction at some large chemical plants to use natural gas instead of coke as a raw material for chemical synthesis. Beehive ovens, which traditionally produce coke for metallurgical purposes, shipped 93 percent of their production to blast furnaces and foundries and only 7 percent for all other uses. The use of coke for household heating (domestic) has been decreasing steadily during the past decade, largely because of the increased requirements of metallurgical coke and also because of competition from oil and natural gas. The quantity of coke used for residential

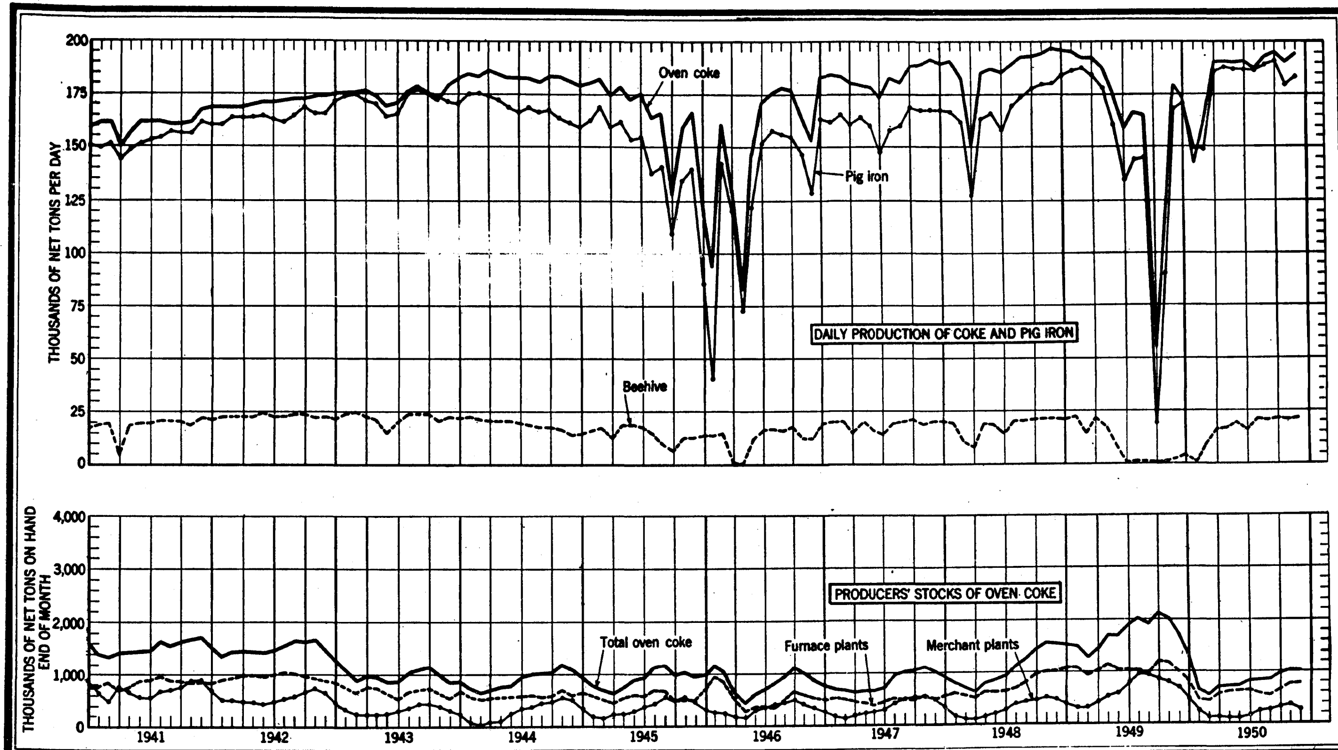

FIGURE 1.—Average daily production of oven and beehive coke and pig iron and producers' stocks of oven coke, 1941–50, by months.

heating was equivalent only to 4 percent of the total coke output, whereas 14 percent of the 1940 output was used for household heating.

One of the most pressing problems in the national defense program in 1950 was the matter of coke-oven capacity. The reason for this is that adequate coke capacity is essential for meeting steel-production goals. Roughly, 40 percent of the coking capacity in existence at the end of 1950 was built before and during World War I. Many of these ovens are in poor condition because of the long years of service and the extremely high rate of coke production that has been maintained continuously (except for short periods due to work stoppages) since the beginning of World War II. Oven failures, which exceeded new construction in 1949, continued in 1950. Although 574 new ovens were constructed and placed in operation during the year, 696 old ovens were taken out of production, resulting in a net decline of 1,222,000 net tons in actual capacity. The volume of new construction in 1950 was limited by the availability of silica brick and other essential construction materials. There were 706 new ovens under construction on December 31, 1950, and contracts were pending on several other batteries.

Approximately 80 percent of the total operating cost of a coke plant is represented by the delivered cost of coal. This, in turn, has a definite influence on the prices of coke and related products as, roughly, 1½ tons of bituminous coal are required to make 1 ton of coke Delivered costs of coal to both oven- and beehive-coke-plant operators increased in 1950, although the average value f. o. b. mines for the bituminous industry declined slightly. The average cost of coal delivered to oven-coke plant operators increased $0.15 per ton, or 2 percent, while costs of coal to beehive plants increased $0.28, or 5 percent. These rises generally resulted in higher prices for coke. Average receipts per ton of oven coke sold (merchant sales) increased for all grades except "other industrial", the increases ranging from $0.10 per ton for "domestic" to $1.56 for "water gas." The average realization for coke classified as "other industrial" declined $0.40. For beehive coke, slight increases were registered on sales for furnace, domestic, and miscellaneous industrial uses, while coke for foundry and water-gas uses declined.

According to the Bureau of Mines survey of employment in the coke industry in 1950, an average of 20,942 men worked 60,593,087 man-hours in the oven-coke industry. The number of workers decreased 199 from 1949, but the man-hours worked increased 1,770,848. In the beehive industry the number of men employed increased from 3,330 in 1949 to 3,405 in 1950, and the man-hours worked increased from 3,623,543 to 5,267,918. There has been a definite improvement in productivity at oven-coke plants since World War I. In 1918, 2.21 man-hours were required to produce 1 ton of oven coke, whereas only 0.91 man-hour was required in 1950. For the beehive plants there has also been a considerable increase in output per man-hour, as only 0.90 man-hour was required to produce 1 ton of coke in 1950 compared with 1.40 in 1918. The increased efficiency in the coke industry is due largely to improvements in equipment. Productivity in the oven-coke industry is considerably understated by the statistics, since employment on coke production as such cannot be separated from employment in the chemical-recovery plants; if the relevant man-hours were segregated, the figure on man-hours per ton for oven coke would be considerably lower than that for beehive.

Recovery of the principal coal-chemical materials depends on the rate of oven-coke production. The 11-percent gain in oven-coke production over 1949 increased the output of gas, tar, crude light oil, and ammonia. Coke-oven-gas production increased 11 percent; tar, 10 percent; crude light oil, 14 percent; and ammonia, 9 percent. Yields of coke-oven gas and crude light oil per ton of coal charged improved over 1949; but yields of tar and ammonia declined slightly. Benzene (benzol) was one of the coal chemicals that received a great deal of attention, both by Government and industry. This commodity, used mostly as a motor fuel before World War II, has become one of the Nation's most important chemical raw materials. Benzene goes into the making of styrene for synthetic rubber, polystyrenes and phenolics for plastics, dimethylaniline and picric acid for explosives, DDT for insect control, and for nylon, aniline dyes, and synthetic detergents. More benzene was used for styrene alone in 1950 than for all chemical purposes in 1940. Government and industry forecasts of future benzene requirements are far larger than the coke industry can produce, allowing for moderate increases commensurate with steel expansion. For this reason, in January 1951, the Government requested the petroleum industry to build facilities to produce about 100,000,000 gallons of benzene from petroleum as rapidly as possible. In 1950 the coke industry supplied 83 percent of the United States production of chemical grades of benzene, tar distillers supplied 12 percent, and 5 percent was produced from petroleum. Total value of coke and breeze produced and sales of coal-chemical materials totaled $1,278,823,829, the highest on record.

TABLE 1.—Salient statistics of the coke industry in the United States, 1937 and 1947–50

	1937	1947	1948	1949	1950

Foundry do	2, 038, 822	3, 650, 001	3, 750, 659	2, 778, 868	3, 523, 396
Other industrial (including producer and water gas) net tons	4, 597, 894	8, 028, 791	7, 733, 382	6, 412, 672	6, 366, 497
Domestic do	8, 107, 518	3, 977, 328	3, 445, 309	2, 755, 840	2, 565, 176
Coke ovens, end of year:					
Slot-type ovens in existence	12, 718	14, 728	15, 139	15, 104	14, 982
Beehive ovens in existence	12, 194	13, 443	14, 078	13, 662	17, 708
Slot-type ovens under construction	259	572	350	562	706
Cost of coal charged, oven-coke plants, average per ton	$3. 74	$6. 78	$8. 13	$8. 52	$8. 67

For footnote, see end of table.

TABLE 1.—Salient statistics of the coke industry in the United States, 1937 and 1947–50—Continued

	1937	1947	1948	1949	1950
Average prices of coke:					
Spot price of Connellsville blast furnace, f. o. b. ovens	$4.29	$10.49	$13.44	$13.77	$14.06
Receipts per ton of oven coke sold (merchant sales):					
Blast furnace	$4.34	$10.95	$13.78	$14.09	$14.31
Foundry	$8.47	$14.79	$18.78	$19.72	$20.05
Other industrial (including water gas)	$6.08	$11.13	$13.45	$13.74	$14.10
Domestic	$6.53	$11.19	$13.17	$13.50	$13.60
Yield of coal-chemical materials per ton of coal charged:					
Tar, gallons	8.67	7.78	7.60	7.81	7.79
Ammonium sulfate or equivalent, pounds	21.84	19.66	19.52	20.08	19.89
Crude light oil, gallons	2.86	2.75	2.73	2.77	2.81
Surplus gas sold or used, M cubic feet	6.66	6.27	6.25	6.35	6.35
Average gross receipts for coal-chemical materials per ton of coke produced:					
Tar sold and used	$0.502	$0.605	$0.828	$0.722	$0.691
Ammonia and its compounds	$0.326	$0.423	$0.545	$0.558	$0.468
Crude light oil and its derivatives (including naphthalene)	$0.435	[2] $0.567	[2] $0.686	$0.673	$0.871
Surplus gas sold or used	$1.483	$1.678	$1.839	$2.015	$1.977
Total coal-chemical materials (including breeze)	$2.974	[2] $3.711	[2] $4.418	[2] $4.446	$4.508

[1] Unless otherwise stated statistics relating to coke throughout this chapter do not include breeze. (*See* definition of coke and breeze in Scope of Report section of this chapter).
[2] Revised figure.

TABLE 2.—Statistical summary of the coke industry in the United States in 1950

	Slot-type ovens	Beehive ovens	Total
Coke produced—			
At merchant plants:			
Net tons	12,346,822	(2)	(2)
Value	$190,570,598		
At furnace plants:[1]			
Net tons	54,543,796		
Value	$709,096,729		
Total:			
Net tons	66,890,618	5,827,420	72,718,038
Value	$899,667,327	$77,235,875	$976,903,202
Breeze produced:			
Net tons	5,172,758	90,712	5,263,470
Value	$18,543,877	$144,629	$18,688,506
Coal charged into ovens:			
Bituminous:			
Net tons	94,757,035	9,088,385	103,845,420
Value	$821,275,295	$51,769,434	$873,044,729
Average per ton	$8.67	$5.70	$8.41
Anthracite:			
Net tons	169,275		169,275
Value	$1,311,021		$1,311,021
Average per ton	$7.74		$7.74
Total:			
Net tons	94,926,310	9,088,385	104,014,695
Value	$822,586,316	$51,769,434	$874,355,750
Average per ton	$8.67	$5.70	$8.41
Average yield in percent of total coal charged:			
Coke	70.47	64.12	69.91
Breeze (at plants actually recovering)	5.45	3.32	5.39
Ovens:			
In existence Jan. 1	15,104	13,662	28,766
In existence Dec. 31	14,982	17,708	32,690
Dismantled during year	696	213	909
In course of construction Dec. 31	706	145	851
Annual coke capacity Dec. 31, net tons	72,488,200	11,571,500	84,059,700

For footnotes, see end of table.

TABLE 2.—Statistical summary of the coke industry in the United States in 1950—Continued

	Slot-type ovens	Beehive ovens	Total
Coke used by producer—			
In blast furnaces:			
Net tons	40,728,294	67,434	40,795,728
Value	$528,032,395	$795,163	$528,827,558
In foundries:			
Net tons	103,000		103,000
Value	$1,814,725		$1,814,725
To make producer gas:			
Net tons	755,849		755,849
Value	$9,299,239		$9,299,239
To make water gas:			
Net tons	1,501,979		1,501,979
Value	$18,410,591		$18,410,591
For other purposes:			
Net tons	321,864	2,732	324,596
Value	$4,141,065	$38,011	$4,179,076
Coke sold—			
To financially affiliated companies—			
For blast-furnace use:			
Net tons	11,342,443	1,838,547	13,180,990
Value	$147,999,186	$23,017,375	$171,016,561
For foundry use:			
Net tons	53,530		53,530
Value	$1,152,019		$1,152,019
For manufacture of water gas:			
Net tons	695,852		695,852
Value	$10,207,796		$10,207,796
For other purposes:			
Net tons	161,344	1,871	163,215
Value	$2,295,432	$26,654	$2,322,086
To other consumers—			
For blast-furnace use:			
Net tons	3,590,561	3,351,270	6,941,831
Value	$51,397,686	$45,431,674	$96,829,360
For foundry use:			
Net tons	3,182,688	184,178	3,366,866
Value	$63,825,214	$2,764,756	$66,589,970
For manufacture of water gas:			
Net tons	929,463	40,514	969,977
Value	$14,006,516	$566,175	$14,572,691
For other industrial use:			
Net tons	1,598,474	356,555	1,955,029
Value	$21,645,189	$4,852,642	$26,497,831
For domestic use:			
Net tons	2,546,164	19,012	2,565,176
Value	$34,633,619	$225,054	$34,858,673
Disposal of breeze:			
Used by producer—			
For steam raising:			
Net tons	3,353,357	5,408	3,358,765
Value	$11,286,949	$7,950	$11,294,899
To make producer or water gas:			
Net tons	113,158		113,158
Value	$638,737		$638,737
For other purposes:			
Net tons	797,435	11	797,446
Value	$2,560,127	$170	$2,560,297
Sold:			
Net tons	1,407,041	50,120	1,457,161
Value	$5,514,409	$105,404	$5,619,813
Average receipts per ton sold (merchant sales):			
Blast-furnace coke	$14.31	$13.56	$13.95
Foundry coke	$20.05	$15.01	$19.78
Water-gas coke	$15.07	$13.97	$15.02
Other industrial coke	$13.54	$13.61	$13.55
Domestic coke	$13.60	$11.84	$13.59
Breeze	$3.92	$2.10	$3.86
Producers' stocks on Jan. 1, 1951:			
Blast-furnace coke, net tons	756,199	17,068	773,267
Foundry coke, do	8,466	884	9,350
Domestic and other coke, do	327,997	100	328,097
Breeze, do	1,114,662	5,253	1,119,915
Exports, do	(2)	(2)	397,846
Imports, do	(2)	(2)	437,585
Apparent consumption, do	(2)	(2)	73,416,519

Fo footnote, see end of table.

TABLE 2.—Statistical summary of the coke industry in the United States in 1950—Continued

	Slot-type ovens	Beehive ovens	Total
Coal-chemical materials produced:			
Tar ---------- gallons	739, 868, 767	----------	739, 868, 767
Ammonium sulfate or equivalent ---------- pounds	1, 849, 127, 582	----------	1, 849, 127, 582
Gas ---------- M cubic feet	979, 592, 988	----------	979, 592, 988
Burned in coking process ---------- percent	36. 81	----------	36. 81
Surplus sold or used ---------- do	61. 54	----------	61. 54
Wasted ---------- do	1. 65	----------	1. 65
Crude light oil ---------- gallons	260, 856, 875	----------	260, 856, 875
Yield of coal-chemical materials per ton of coal:			
Tar ---------- gallons	7. 79	----------	7. 79
Ammonium sulfate or equivalent ---------- pounds	19. 89	----------	19. 89
Gas ---------- M cubic feet	10. 32	----------	10. 32
Crude light oil ---------- gallons	2. 81	----------	2. 81
Value of coal-chemical materials sold:			
Tar:			
Sold	$37, 558, 999	----------	$37, 558, 999
Used by producer	$8, 663, 204	----------	$8, 663, 204
Ammonia (sulfate and liquor)	$31, 322, 588	----------	$31, 322, 588
Gas (surplus)	$132, 247, 656	----------	$132, 247, 656
Crude light oil and derivatives	$53, 819, 463	----------	$53, 819, 463
Other coal-chemical materials [3]	$19, 421, 444	----------	$19, 421, 444
Total value of coke and breeze produced and coal-chemical materials sold [4]	$1, 201, 244, 558	$77, 380, 504	$1, 278, 625, 062

[1] Plants associated with iron blast furnaces. (*See* definition in section on Production by Furnace and Merchant Plants.)
[2] Not separately recorded.
[3] Naphthalene, tar derivatives, intermediate light oil, and miscellaneous coal-chemical materials.
[4] Includes value of tar used by producer.

TABLE 3.—Coke produced, value, number of ovens, coal charged, and average yield in the United States in 1950, by States

State	Oven coke						
	Plants	Ovens	Coal charged (net tons)	Yield of coke from coal (percent)	Coke produced (net tons)	Value of coke at ovens: Total	Value of coke at ovens: Per ton
Alabama	7	1, 311	8, 221, 235	70. 95	5, 833, 142	$64, 331, 998	$11. 03

[1] Included with "Undistributed" to avoid disclosure of individual company operations.

SCOPE OF REPORT

The statistics in this chapter, except where otherwise noted, are based on data voluntarily supplied to the Bureau of Mines by coke-plant operators in the United States. Except for minor variations, the characteristic form and manner of presentation of material developed in coke chapters for preceding years are followed in this report, carrying the Bureau's series on coke and coal-chemical materials through 1950. For convenience, most of the statistical tables herein include comparable data for three or four preceding years.

These statistics are confined to operation of high-temperature beehive and slot-type coke-oven plants. In order to present data in this chapter on the carbonization of coal by other processes, salient statistics for gas retorts are shown in table 4. Statistics on medium- and low-temperature carbonization have also been shown in recent years; but, as less than three producing companies reported production in 1950, data are withheld to prevent disclosure of individual operations. When compared with the production of coke and related products from slot-type and beehive-coke ovens, production from retorts and low-temperature ovens is not an important factor in supply and requirements.

Some coke is made by processes not included in this report, namely, from the refining of petroleum and crude tar. Preliminary data for 1950 indicate that the production of petroleum coke totaled 3,444,800 net tons, and output of pitch coke, as reported by the United States Tariff Commission, totaled 42,000 net tons.

The standard unit of measurement in the coke industry in the United States is the short or net ton of 2,000 pounds. Unless otherwise specified, it is the unit employed throughout this chapter.

The term "coke" as used throughout this report refers only to the larger sizes (usually one-half inch plus), from which the smaller sizes have been screened. The fine coke, which is separated by screening, is known in the industry as "breeze" and is the term used by the Bureau of Mines to designate this material.

RETORT COKE

TABLE 4.—Salient statistics of the coal-gas industry in the United States in 1950 [1]

	Horizontal retorts	Vertical retorts	Total
Coke produced:			
Net tons	58,331	116,091	174,422
Value	$726,814	$1,283,998	$2,010,812
Breeze produced net tons	6,317	18,538	24,855
Coal charged into retorts:			
Net tons	91,456	208,768	300,224
Value	$1,024,897	$2,401,940	$3,426,837
Average per ton	$11.21	$11.51	$11.41
Average yield in percent of coal charged:			
Coke	63.78	55.61	58.10
Breeze (at plants actually recovering)	7.60	10.38	9.50
Retorts:			
In existence Dec. 31	448	171	619
In operation Dec. 31	245	135	380
Annual coal capacity net tons	194,200	304,000	498,200
Coke used by producer:			
Net tons	39,056	95,898	134,954
Value	$486,420	$1,042,398	$1,528,818
Coke sold to other consumers:			
Net tons	22,330	38,185	60,515
Value	$278,116	$470,854	$748,970
Stocks on Jan. 1, 1951:			
Coke net tons	3,137	24,917	28,054
Breeze do	427	2,052	2,479
Coal-chemical materials:			
Tar:			
Production gallons	1,113,074	3,242,844	4,355,918
Sales do	1,206,347	2,321,109	3,527,456
Value of sales	$71,579	$147,158	$218,737
Stocks on Jan. 1, 1951 gallons	222,310	1,643,258	1,865,568
Per ton of coal charged do	12.17	15.53	14.51
Crude light oil: [2]			
Production do	41,101	115,842	156,943
Sales do	42,551	123,315	165,866
Value of sales	$3,778	$8,553	$12,331
Stocks on Jan. 1, 1951 gallons	5,750	12,053	17,803
Per ton of coal charged do	1.66	0.81	0.94

1950	66.9	5.8	72.7	92.0	14,982	17,708	706	94.9	69.9	13.43	77	900	302	1,279

[1] Value for tar up to and including 1917 represented that of tar "obtained and sold" which did not always include value of tar used by producer. Beginning with 1918, tar used by producer is specifically included. Value of breeze produced at oven-coke plants is included for those years for which it was reported, namely, 1916, 1917, and 1919–50. For other coal-chemical materials, only value of those sold is included. Value of breeze produced at beehive plants is not included, as it has usually been much less than a million dollars.
[2] No accurate data on value of the coal-chemical materials available.

MONTHLY AND WEEKLY PRODUCTION

Statistics on monthly production of coke in tables 6 to 8 are based upon reports received from producers. Weekly production of beehive coke in table 9 is estimated from reports of carloadings received from all coke-carrying railroads. The totals in these tables have been adjusted to the total ascertained by an annual canvass of the producers. Data on weekly production of beehive coke are published by the Bureau of Mines in the Weekly Anthracite and Beehive-Coke Report, and monthly data for both oven and beehive coke are summarized in the Monthly Coke Report. These publications are distributed free upon request to the Publications Distribution Section, Bureau of Mines, Washington 25, D. C.

PRODUCTION BY FURNACE AND MERCHANT PLANTS

Production of oven coke by plants affiliated with iron blast furnaces, designated by the Bureau of Mines as "furnace" plants, and by all other plants, classified as "merchant" plants, is given in tables 10 and 11. This classification applies only to oven-coke plants and is maintained by the Bureau of Mines in the interest of those who wish to follow the coking activities of the two groups.

There has been a gradual increase during the past few years in the proportion of oven coke produced by the furnace group. This trend may be attributed to a number of economic factors that have had a definite influence on coke supply. Before World War II, iron and steel companies were reluctant to build slot-type ovens with coking capacity greater than 75 percent of their maximum blast-furnace coke requirements because of the fluctuation in steel demand. When peak steel-production rates were necessary, the steel industry could draw upon the merchant and beehive-coke ovens to meet their demands. However, the enormous demand for iron and steel products during and since World War II has increased metallurgical-coke requirements, and carbonizing capacity has been expanded at the furnace plants. Although demand for metallurgical coke has increased, markets for coke-oven gas and coke for household heating have diminished, and this has had a profound effect on the economic operation of some merchant plants. The use of natural gas and oil has increased rapidly in recent years and is currently spreading into many areas served by merchant-coke plants. These various factors have resulted in the closing of merchant-coke plants or their sale to iron and steel companies. The trend is clearly illustrated by table 10. Although there were 85 active plants in 1937, the same number as in 1950, 42 at that time were merchant plants that supplied nearly 27 percent of the total oven coke produced. By 1950 the number of merchant plants had declined to 30, and production was less than 19 percent of the total output.

TABLE 10.—Number and production of oven-coke plants connected with iron furnaces and of other oven-coke plants in the United States, 1913, 1918, 1937, and 1948–50

Year	Number of active plants		Coke produced (net tons)		Percent of production	
	Furnace plants	Merchant plants	Furnace plants	Merchant plants	Furnace plants	Merchant plants
1913	20	16	9,277,832	3,436,868	73.0	27.0
1918	36	24	19,220,342	6,777,238	73.9	26.1
1937	43	42	36,134,209	13,076,539	73.4	26.6
1948	55	31	54,951,858	13,332,499	80.5	19.5
1949	55	31	48,109,559	12,112,922	79.9	20.1
1950	55	30	54,543,796	12,346,822	81.5	18.5

PRODUCTION BY STATES AND DISTRICTS

There have been only minor changes since World War II in the distribution of coke production by States or geographic areas. During the period of rearmament and the war, a slight decentralization of iron and steel capacity necessarily caused a few minor changes in coke supply. The greatest change occurred in the Far Western States, where new slot-type ovens were constructed in California, Utah, and Colorado to supply coke requirements of new integrated blast furnaces.

Production of oven coke in this area (western district) increased from 1 percent of the national output in 1937 to nearly 4 percent in 1950. However, since World War II the only State in this area that has increased its coking capacity and production is California, where capacity increased by about one-third in 1950 and production increased 48 percent over 1949.

In quantity terms, the States that have increased oven-coke production most since 1937 are Ohio, Indiana, and Pennsylvania, with gains of 3,575,886, 2,788,561, and 2,631,736 tons, respectively. Comparison of 1950 production, by States, with either 1948 or 1949 figures would be meaningless because of the numerous interruptions in coking operations in 1949 and the first quarter of 1950.

There was no change in the order of coke production among the leading States in 1950. As in the past, Pennsylvania surpassed all other States, supplying about one-fourth of the total oven-coke output and nearly 90 percent of the beehive production. Ohio and Indiana followed, with 15 and 12 percent, respectively, of the oven-coke production, while Alabama and New York contributed about 8 percent each to the national total.

[1] Computed by dividing production of breeze by coal charged at plants actually recovering breeze.
[2] Included with "Undistributed" to avoid disclosure of individual company operations.
[3] Figure withheld to avoid disclosure of individual company operations.
[4] As reported; quantity produced but not used was undoubtedly greater. (*See* Mineral Resources of the United States, 1922, pt. II, pp. 726–727.)

NUMBER AND TYPE OF OVENS

Slot-Type Coke Ovens.—Construction of new slot-type coke ovens in the United States in 1950 was limited by the availability of refractories (coke-oven shapes) and other essential building materials, and for the second consecutive year the number of ovens completed dropped below the number abandoned or dismantled. The extremely high rate of obsolescence or oven failures during the past several years will probably continue because of the large number of ovens in existence at the close of 1950 that were over 20 years old. This is not to be construed that 20 years is the maximum life expectancy of coke ovens, as a number of much older batteries are still in good operating condition. Also, the length of efficient service that may be obtained from a new coke-oven battery depends on the operating conditions at each plant and upon the decision of the owners as to when maintenance and repairs on old batteries become excessive. However, coke-oven operators and builders agree that, with few exceptions, ovens older than 20 years become increasingly difficult to maintain in good operating condition.

The large number of old ovens and the rapidly expanding requirements for metallurgical coke caused by critical international conditions have intensified the efforts of Government and industry to increase slot-type coke capacity commensurate with blast-furnace expansion. Programed steel requirements for essential defense and civilian purposes indicated that 1950 coke capacity would have to be expanded at least by 14 percent in the following 2 years. This meant that construction would have to be accelerated rapidly, as slot-type ovens take considerable time to construct and put into production. A new battery of coke ovens requires 8 to 14 months for completion, the number that can be completed in a year depending on such factors as the availability of building materials, labor, and weather conditions. At the close of 1950, 706 new ovens were under construction, and contracts were pending on a number of additional batteries. Although some of the new construction was to consist of replacements for old ovens, it was believed that new oven completions in 1951 would exceed those taken out of production.

Beehive Ovens.—At the conclusion of World War II it was believed that the end of carbonizing coal in beehive ovens was in sight and that this type of carbonizing equipment would soon pass into oblivion. Events in 1950, however, proved that these forecasts were wrong, and more beehive ovens were pressed into service than in any other comparable period since 1942.

Although the number and coke capacity of beehive ovens have been ascertained annually for many years by the Bureau of Mines, no attempt was made until recently to separate the operable coking capacity from the total in existence. In table 20, however, showing beehive-oven capacity at the end of 1950, this distinction is made. It is to be noted that about 14 percent of the total beehive capacity reported in existence comprises old ovens that are not in operating condition and are incapable of producing coke without extensive repairs or rebuilding. Therefore, for practical purposes, only service-able ovens should be considered. The heavy demand for coke in 1950 is reflected by the steady increase in the number of active ovens (table 21); in other words, 94 percent of the ovens in operating condition at the end of the year produced coke in December.

CAPACITY OF OVEN-COKE PLANTS

The potential annual coke capacity of oven-coke plants declined for the second consecutive year in 1950, dropping 3 percent from the record capacity of 1948. The basis for calculating the potential annual coke capacity of a plant is the minimum coking time necessary to produce a coke with qualities suitable for its intended use. For this reason, the potential capacity of a plant is subject to change from year to year, depending on the age and condition of ovens, character and quality of coal charged, type of coke required, and other related economic conditions. The potential capacity reported to the Bureau of Mines by the coke-producing companies may differ, therefore, from the rated capacity estimated by the coke-oven builders at the time of construction. It is believed, however, that the potential capacity shown in table 22 is a good measure of the practical operating capacity.

The decline of 2 percent in coke capacity in 1950 was due largely to the number of ovens taken out of production for rebuilding. At the end of the year, construction of replacement ovens, as well as additional batteries, was proceeding as rapidly as weather and availability of building materials permitted, and over 3,900,000 tons of capacity were under construction.

The rate of coke production at oven-coke plants in October 1950 reached the highest point since April 1944. However, the average for the year, although well above 1949, was 2 points below 1948 and nearly 7 points below the record established in 1942. The performance in 1950 would have been better if all plants had operated at their normal rates in the first quarter. In this quarter, however, the

[1] Capacity of all ovens in existence, whether active or idle, based upon maximum daily capacity times days in month.

uncertainty of coal supplies caused oven-coke plants to curtail operations slightly, and the industry produced only 78.6 percent of capacity. Operations were accelerated rapidly after a new management-labor contract for the bituminous-coal industry was signed on March 6, and a relatively high rate of coke production was maintained for the balance of the year.

QUANTITY AND COST OF COAL CHARGED

Coke ovens (slot-type and beehive) are the largest consumers of bituminous coal in the United States, using over one-fifth of the annual output in 1950. Although natural gas and oil have displaced some bituminous coal on railroads, at industrial plants, and for household heating, there is no substitute for bituminous coal in the making of metallurgical coke, and coke ovens should continue to rank high for many years in bituminous-coal utilization. Although consumption of bituminous coal in coke ovens in 1950 increased 14 percent over the 1949 figure, it fell nearly 3½ million tons short of the record established in 1948. The 3-day workweek and complete stoppages for various periods during the first quarter of 1950 in the bituminous-coal industry adversely affected coke-oven operations in that quarter and drastically reduced the quantity of coal carbonized. In fact, many beehive operations closed during the last half of 1949 when the 3-day workweek started and did not resume production until the middle of March 1950. Beginning in the second quarter, consumption of bituminous coal increased substantially and remained at a relatively uniform rate for the balance of the year. Under normal conditions, the monthly consumption of bituminous coal is quite uniform because of the continuous nature of the coking process. The practice of mixing or blending a small percentage of anthracite fines, which started during World War II, was continued at 10 plants in 1950.

In manufacturing coke and coal chemicals, coal is the chief item of expense, usually approximating about 80 percent of the total manufacturing costs. For this reason coal costs have a definite influence on coke-oven operations and are of paramount importance to the coke-plant operators. Although the average value per ton, f. o. b. mines, of bituminous coal in the United States declined from \$4.88 per net ton in 1949 to \$4.85 per ton in 1950, it is significant that the average cost of coal for both slot-type and beehive ovens increased in this period. The average cost of coal at oven-coke plants in 1950, the highest on record, increased \$0.15 per ton or 2 percent over 1949 and was 136 percent higher than the 1940 figure. A large part of the coal used at oven-coke plants is long-haul coal, which necessarily increases the cost at ovens. For this reason, Rhode Island, California, and Massachusetts had the highest average costs, while West Virginia, which obtains coal from nearby fields, had the lowest.

Although the average cost of coal at beehive ovens in 1950 was the highest on record, because of their proximity to the mines, it was

lower than at oven-coke plants. However, in recent years many of the beehive operators have been burdened with an additional expense in trucking part, sometimes all, of their coal requirements. In the Connellsville region of Pennsylvania, coal was trucked as far as 40 miles to beehive plants in 1950. Transportation costs alone on such hauls approximated $2 per ton. This large increment in total coal costs for many plants had some influence on the cost of coal for the beehive industry. The average cost of $5.70 per ton was 5 percent above the 1949 average and 186 percent higher than the 1940 figure. Kentucky and Utah operators had the lowest cost, while Pennsylvania had the highest because of trucking charges.

PREPARATION AND SOURCE OF COAL

The coke industry, probably more than any other, maintains exacting specifications and standards for the coal required in manufacturing high-quality coke. The reason for this is obvious, as coke quality depends to a much greater degree upon the character and quality of coal carbonized than upon oven design or carbonizing practice. The steady increase in the proportion of cleaned coal carbonized in recent years is due largely to diminishing reserves of the better-quality coking coals and also to rapid increase in coal-mine mechanization. Mechanical mining and loading of coal, although increasing productivity with a consequent reduction in mining costs, often result in more refuse in the run-of-mine coal, necessitating extensive cleaning in some areas. All coal mined and used for the manufacture of coke in Alabama and Colorado was washed, and most of Oklahoma's and about half of Pennsylvania's were also washed before being carbonized. The quantity of washed coal carbonized in slot-type ovens in 1950, according to reports submitted by coke-plant operators, was 40 percent of the total tonnage of bituminous coal carbonized compared with 38 percent in 1949 and 28 percent in 1946. The proportion of washed coal charged into beehive ovens is less than in slot-type ovens and was 18 percent in 1950. Most of the cleaning or washing is done by the coal-mine operators at the mines. In 1950 bituminous coal cleaned at the mines was used by 45 oven- and 9 beehive-coke plants and comprised 79 percent of the washed coal carbonized. The remainder (8,336,228 tons) was washed at eight coke plants which have cleaning facilities.

Sources.—Because all coals will not fuse and form a coherent, strong, porous structure when heated to high temperatures (above 1,000° C.) in the absence of air, sources of coking coals are of extreme importance. Deposits of high-grade coals of established coking quality in the United States are being depleted because of unusually heavy war and civilian industrial demands. Coking-coal deposits are distributed irregularly and limited to relatively few geographic areas. The largest concentration of coking coal is in the Appalachian region, extending from Alabama to Pennsylvania. It is significant that normally about 95 percent of the coal used in coke manufacture is mined in the States comprising this region, whereas the estimated total recoverable reserves of coal in this region on January 1, 1950 (assuming 50 percent recovery), was under 29 percent of the United States total. The balance (about 5 percent) of the coal used in coke ovens comes from relatively small deposits in southern Colorado, northern New Mexico, certain counties in Utah, eastern Oklahoma, western Arkansas, and Illinois. The better-quality high-volatile and medium-volatile coking coals are found in West Virginia, Pennsylvania, eastern Kentucky, and Alabama. Low-volatile coking coals, which are important for improving the physical properties of metallurigical coke, especially its strength, come largely from West Virginia and to a lesser extent from central Pennsylvania, eastern Oklahoma, and western Arkansas.

To maintain a more uniform quality of coal and also to be assured of supplies in periods of extremely heavy demand, many larger coke-producing companies, especially those connected with the iron and steel industries, own or control coal mines. The quantity of coal shipped from such mines, known as "captive" mines, to oven-coke plants in

1950 was 56 percent of the total receipts of all coal for coking at slot-type ovens. Oven-coke plants associated with iron and steel works (classified as furnace plants) received 62 percent of their total receipts from captive mines. The merchant, or nonfurnace, plants, however, obtained only 29 percent of their total shipments from captive mines.

Blending.—Blending or mixing various types of coal before charging into ovens is an integral part of coal preparation at virtually all oven-coke plants. Many coke plants received coal from a number of mines and from different coal-producing fields. The quality of coal varies widely from field to field and even within the same field, and ample mixing facilities are necessary to obtain a uniform quality. A better coke can be obtained by a proper blend of two, three, or more different coals than from any one alone. Blending has several objectives and considers many factors important to the oven-coke plant operators; the primary objective is to produce economically a quality of coke satisfactory for the use intended. It also permits use of coals that have good coking properties but may be otherwise objectionable from the standpoint of excessive ash, sulfur, or phosphorus content and cannot be used alone as a 100-percent charge. Thus, in addition to providing a means of controlling the quality and strength of the coke and the yield of coproducts, blending permits flexible operation at oven-coke plants and use of a wider variety of coking coals. All oven-coke plants mix, or blend, coals before charging them into ovens. However, the mixing of coal of different volatile content was practiced at only 79 oven-coke plants in 1950. Of these plants, 56 used high- and low-volatile coal; 18, high-, medium-, and low-; 3, high- and medium-; and 2, low- and medium-volatile. Of the plants that did not blend coals of different volatile contents, three plants used straight high-volatile and three medium-volatile. The proportion of the different volatile contents of coals mixed before charging into ovens where practiced, varies widely from plant to plant, according to local conditions. Generally, about 20 percent low-volatile coal is used, although some plants reported using as much as 50 percent low-volatile.

TABLE 30.—Coal received for manufacturing oven coke in the United States in 1950, by fields of origin

State and district where coal was produced	Quantity received (net tons)	States where coal was consumed, in order of importance
Alabama	8,873,356	Alabama and Texas.
Arkansas	255,170	Colorado, California, and Illinois.
Colorado	880,814	Colorado.
Georgia	2,724	Tennessee.
Illinois	579,074	Illinois, Indiana, Missouri, and Minnesota.
Indiana	17,804	Indiana and Wisconsin.
Kentucky:		
Elkhorn	6,342,367	Indiana, Michigan, Ohio, Illinois, New York, Pennsylvania, Wisconsin, West Virginia, Massachusetts, New Jersey, and Maryland.
Harlan	6,008,570	Indiana, Illinois, Ohio, Minnesota, Pennsylvania, and New York.
Hazard	31,931	Illinois, Ohio, and Pennsylvania.
Kenova-Thacker	634,127	Ohio, Wisconsin, New York, and Pennsylvania.
Southern Appalachian	100,424	Tennessee and Ohio.
New Mexico	345,096	Colorado and California.
Oklahoma	1,021,540	Texas, Utah, and Missouri.

SHIPMENTS BY RAIL, WATER, AND TRUCK

Normally, only about 36 percent of the oven coke produced is shipped outside the producing plants because many of the larger oven-coke plants are integrated with iron blast furnaces and all of the large coke suitable for metallurgical use is transferred to the blast furnaces without leaving the establishment. Only 25 percent of all coke produced at furnace plants moved outside the plants in 1950. Of the coke produced by merchant plants, 84 percent was shipped. The principal method of moving oven coke is by rail, which accounted for 90 percent of total shipments in 1950. Movements by water and truck have not varied much in recent years and accounted for 3 and 7 percent, respectively, in 1950.

Beehive coke, unlike oven coke, is produced in plants at or near coal mines, and virtually all of the coke is shipped to centers of consumption. The percentage of beehive coke shipped by rail exceeds that for oven coke because it is used mainly for industrial purposes outside the producing areas. Movement of beehive coke by water and truck is small. Only a few plants are on waterways, and trucking coke long distances is not economically feasible.

DISTRIBUTION OF OVEN AND BEEHIVE COKE

The accompanying table shows the quantity of coke and coke breeze distributed to each State in 1950, according to principal end uses. A relatively few States; which have a large concentration of heavy industries, consume the bulk of the national total, although every State, as well as the District of Columbia, used some coke. Pennsylvania and Ohio are the main consuming States and together used 43 percent of the total coke distributed in 1950. Following these States were Indiana, New York, Illinois, and Alabama, in the order named, which, combined, accounted for 33 percent. Thus, these six States consumed over three-fourths of all the coke used in the United States. This is due to the large number of iron blast furnaces in these States and the fact that blast furnaces in the United States as a whole consumed 83 percent of all coke. The movement of the balance of the coke consumed was far more widespread, particularly that used in iron foundries and for miscellaneous industries. As in the past, Michigan was the leading State in foundry-coke consumption, with 19 per cent of the total, due to the large quantities of castings made in the automotive industry in the Detroit area. The quantity of coke used in foundries in 1950 exceeded the tonnage used for manufacturing water gas for the first time since 1941. The use of coke for the manufacture of water gas has declined nearly 800,000 tons since 1948.

It is expected that this trend will continue, as coke is being replaced by natural gas in both the fuel and chemical fields. Gas utilities in New York, however, still use large quantities of water-gas coke, and in 1950 this State consumed about one-third of the total. Consumption of water-gas coke in West Virginia dropped 48 percent because one of the large chemical plants that used coke in manufacturing synthetic ammonia did not operate part of the year. The downward trend in the use of coke for household heating continued, and only 3 percent of the total distributed was destined for the domestic-coke trade. Most of the coke used for household heating was consumed in States along the Atlantic seaboard, particularly New York, Massachusetts, and New Jersey.

TABLE 35.—Oven and beehive coke and breeze distributed to each State in 1950, in net tons

[Based upon reports from all United States producers showing destination of coke used by producer or sold in 1950. Does not include imported coke, which totaled 437,585 tons in 1950]

CONSUMPTION OF COKE

The indicated (apparent) consumption of coke, allowing for imports, exports, and changes in producers' stocks, increased 16 percent over 1949 but was over 250,000 tons below the previous maximum in 1948. The tightness in coke supply in 1950 is clearly indicated (table 36) by the excess of imports over exports and the decline in producers' stocks of coke by over 650,000 tons.

The principal reason for the tightness in supply was the unusual demand for blast-furnace coke following the outbreak of hostilities in Korea. Consumption of coke in iron blast furnaces was the highest on record, and the proportion of the total consumption so used was the highest since 1918. For the second consecutive year the fuel efficiency of blast furnaces improved. According to data compiled by the American Iron and Steel Institute, the quantity of coke required to produce 1 ton of pig iron dropped 27.3 pounds (2 percent) and for pig iron and ferro-alloys combined the decline was 30.3 pounds. This improvement could be attributed to a number of factors, such as increased proportion of pig iron being made in furnaces with a low coke-pig ratio, the increased tonnages of imported high-grade ore being charged, increased proportion of scrap charged into blast furnaces, and also to improvement in coal and coke quality because of recent expansion of coal-cleaning facilities.

The quantity of coke consumed for other than blast furnaces increased slightly over 1949, but the percentage so used declined from 19 percent to 17 percent. This decline was due largely to a sharp reduction in coke requirements for water-gas manufacture and to a further drop in sales of coke for residential heating.

TABLE 36.—Coke consumed in manufacture of pig iron and for other purposes in the United States, 1913, 1918, 1937, and 1948–50, in net tons

Year	Total production	Imports	Exports	Net change in stocks	Apparent United States consumption [1]	Consumed by iron furnaces [2]		Remainder consumed in other ways

[1] Production plus imports minus exports, plus or minus net changes in stocks.
[2] American Iron and Steel Institute; figures include coke consumed in manufacture of ferro-alloys.
[3] Data not available.

TABLE 37.—Coke and coking coal consumed per net ton of pig iron made in the United States, 1913, 1918, 1937, and 1948–50

Year	Coke per net ton of pig iron and ferro-alloys [1] (pounds)	Yield of coke from coal (percent)	Coking coal per net ton of pig iron and ferro-alloys (pounds calculated)	Year	Coke per net ton of pig iron and ferro-alloys [1] (pounds)	Yield of coke from coal (percent)	Coking coal per net ton of pig iron and ferro-alloys (pounds calculated)
1913	2,172.6	66.9	3,247.5	1948	1,937.2	69.6	2,783.3
1918	2,120.7	66.4	3,193.8	1949	1,895.8	[2] 69.6	[2] 2,723.9
1937	1,830.6	70.3	2,604.0	1950	1,865.5	69.9	2,668.8

[1] American Iron and Steel Institute; consumption per ton of pig iron only, excluding furnaces making ferro-alloys, was 2,172.6 pounds in 1913, 2,120.7 in 1918, 1,806.7 in 1937, 1,900.0 in 1947, 1,908.0 in 1948, 1,870.4 in 1949, and 1,843.1 in 1950.
[2] Revised figure.

Tables 38 and 39 show the disposal of coke by producers according to principal end uses. In the oven-coke industry many of the larger coke plants are integrated with iron blast furnaces, and virtually all of the coke output at these plants that is suitable for metallurgical fuel is used on the premises. Some of these plants, in addition to providing the coke required by integrated furnaces, also ship coke to other furnaces of the same company or to affiliated companies in other locations. These shipments, although shown as sales in the accompanying table, are really intracompany transfers and are not to be considered merchant sales. The only coke from the furnace-coke plants that is sold on the open market is generally small-size, which is unsuitable for metallurgical purposes. In 1950 furnace oven-coke plants only sold 499,007 tons of foundry coke and 696,847 tons classified as "other industrial"—or 2 percent of their total production. The merchant, or nonfurnace, plants, on the other hand, furnish the bulk of foundry and other industrial coke. Plants in this category, in addition to shipping 2,935,278 tons—or 24 percent of their production—to iron blast furnaces, supplied 85 percent of all oven coke used in foundry cupolas and 79 percent of the coke classified as "other industrial." The domestic (household and commercial) coke trade, which has been declining rapidly since the beginning of World War II, is supplied mainly by the merchant plants.

During the past 2 decades, beehive coke has been an important factor in meeting peak metallurgical-coke requirements. Although some of the large steel producers own or have a financial interest in beehive operations, about 66 percent of the operable capacity is owned by individuals or concerns independent of the iron and steel industry. However, the bulk of all beehive coke is used for metallurgical purposes. In 1950 iron blast furnaces and foundry cupolas received 93 percent, while all other industrial uses, including water-gas manufacture, accounted for 7 percent. Shipments of beehive coke to the domestic-coke trade for residential heating are insignificant.

1 Comprises only coke used at site.
2 Includes intracompany transfers.
3 Comprises 103,000 tons valued at $1,814,725 used in foundries; 755,849 tons, $9,299,239 to make producer gas; 1,501,979 tons, $18,410,591 to make water gas; and 321,864 tons, $4,141,065 for other purposes.
4 Includes 11,342,443 tons valued at $147,999,186 sold to financially affiliated companies.
5 Included with "Undistributed" to avoid disclosure of individual company operations.
6 Includes 53,530 tons valued at $1,152,019 sold to financially affiliated companies.
7 Includes 695,852 tons valued at $10,207,796 for manufacture of water gas and 161,344 tons, $2,295,432 for other industrial use sold to financially affiliated companies; and 929,463 tons, $14,006,516 for manufacture of water gas sold to other consumers.
8 Household and commercial.

[2] Includes intracompany transfers.
[3] Includes 1,838,547 tons valued at $23,017,375 sold to financially affiliated companies for blast furnace use.
[4] Included with "Undistributed" to avoid disclosure of individual company operations.
[5] Includes 1,871 tons valued at $26,654 sold to financially affiliated companies for other industrial use; and 40,514 tons valued at $566,175 sold to other producers for the manufacture of water gas.
[6] Household and commercial.

STOCKS OF COKE AND COKING COAL

Coke.—Producers' stocks of coke usually decrease when steel production and industrial activity are increasing. The output of coke did not keep pace with the rising demand in 1950, and stocks of oven coke dropped 36 percent while beehive coke stocks decreased 66 percent. The largest decrease in stocks was registered by domestic and other grades at oven-coke plants, which fell 62 percent, although the quantity of furnace and foundry grades dropped 10 and 36 percent, respectively. The large decrease in stocks of domestic and other coke was due principally to the fact that a number of "merchant" oven-coke plants curtailed production of domestic sizes to meet the increased requirement of metallurgical and other industrial grades. Normally, furnace plants carry only a few days' supply because of the vertical integration of their operations. Merchant plants, however, often find it necessary to stock coke, especially the domestic sizes. The total quantity of oven coke stocked at producers' plants on December 31, 1950, was equivalent only to 6 days' production at the prevailing rate. Producers' stocks of beehive coke, which usually are even smaller than stocks carried by oven-coke plants, amounted only to 1 day's production at the December rate.

Coal.—Adequate stocks of bituminous coal at oven-coke plants are necessary because of the continuous nature of the carbonizing process. A 30 days' supply of coal is usually the minimum desired by most oven-coke plant operators to safeguard against disruption in the flow of coal to the plants. Coke plants, however, which are located on the upper Lakes and are supplied mostly by Lake carriers, build up their inventories during the shipping season in order to have enough coal to carry them through the winter. These plants usually have 90 to 120 or more days' supply when the shipping season closes. Stocks of bituminous coal fluctuated widely during 1950 and ranged from a 17 days' supply in February to 61 days' in December, based on normal operating rates of coal consumption. The quantity on hand at producers' plants at the end of the year was the highest on record.

TABLE 40.—Summary of total stocks of coke on hand at all coke plants in the United States on Jan. 1, 1937, and 1947–51, in net tons

	1937	1947	1948	1949	1950	1951

VALUE AND PRICE

The term "value," as used in this report, is the value of the coke at the ovens as reported by producers. For that part of the output sold, the value is the amount received for the coke f. o. b. ovens. However, the greater part of the coke produced in the United States is made in ovens operated by corporations, which not only mine the coal used in manufacturing coke but also operate blast furnaces and steel mills, consuming the entire output of their ovens. Under such conditions, fixing a value for coal charged and for coke produced is governed by established accounting procedures. For example, at some plants the cost of coke to the furnace department equals the cost of production; at others, a margin of profit is added; or the reported value is based on what the coke would cost if purchased. The average value of all coke produced, measured in the foregoing way, was $13.43 per ton, the highest figure ever recorded and a 1-percent gain over 1949 (table 44).

A large part of the blast-furnace coke reported by the producers as sales is shipped to iron blast furnaces at other locations that are in some way connected with the coke producers and are actually intracompany transfers. Merchant sales of coke, as used in this chapter, do not include intracompany transfers or sales to financially affiliated corporations and represent only sales on the open market to other purchasers. The average price, f. o. b. ovens, received for each ton of coke sold (merchant sales) in 1950 established a new record and was 2 percent over the 1949 figure. Table 45 shows average receipts from sales, classified by uses and by States. It will be noted that prices vary notably with the distances from the coal mines. Thus, the highest average prices are those reported for the New England and Upper Lake States, where coke costs are higher because the coal must be hauled great distances.

TABLE 44.—Average value per net ton of coke produced and average receipts per net ton from coke sold (merchant sales) in the United States, 1937 and 1946–50

Year	Value per ton produced			Receipts per ton sold

[1] Household and commercial use.
[2] Included with "Undistributed" to avoid disclosure of individual company operations.

FOREIGN TRADE [1]

Imports.—Statistics on United States imports include coke made both from coal and petroleum, although the two varieties are separated in export statistics. Imports of coke exceeded exports for the first time in 1950, increasing 58 percent over the 1949 total. The total quantity, however, was less than a half million tons and represented less than 1 percent of apparent United States consumption. Canada is traditionally the principal source of imported coke, supplying 84 percent of our total imports in 1950. Significant ton-

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

nage came from the Netherlands, and Germany supplied a small quantity. The largest part of the coke imports entered through the Michigan customs district. Significant tonnages also entered through the Montana and Idaho, Massachusetts, Duluth and Superior, and Buffalo customs districts. The coke entering through the Montana and Idaho customs district probably was used for smelting nonferrous metals, while that coming in by way of Buffalo, Massachusettes, and the Lakes was used for residential heating and miscellaneous industrial purposes. Undoubtedly, some of the coke that entered through the Buffalo gateway was petroleum coke and was used for manufacturing carbon electrodes.

[1] Includes shipments on vessels operated by the U. S. Army or Navy as follows: 38 tons, value $618.

Exports.—Before the last quarter of 1949, exports of metallurgical coke were limited under Government control. Exports of coke were not restricted during 1950, but increased requirements in the United States caused shipments to foreign countries to decline 27 percent from 1949. Canada, which has always been considered part of the normal marketing area for some of our coke plants, received 91 percent of the total shipments outside the continental limits of the United States. The quantity shipped to Canada was 16 percent less than in 1949 and 943,835 tons—72 percent—less than the record movement of 1945. Shipments to Mexico declined substantially from 1949, and the total quantity shipped to all other countries was less than 1 day's production of beehive coke.

TECHNOLOGY

No spectacular new developments were reported in the field of coal carbonization in 1950, although considerable scientific work was accomplished by Government and State agencies, coal-research laboratories, and individual companies. Many new patents were issued during the year on processes for recovering coal chemicals, improving the efficiency of coke ovens, and development of new products.

The Bureau of Mines, which has conducted scientific and technologic investigations on coal and related products since its creation by Congress, continued its research work in these fields. The Fifteenth Annual Report of Research and Technologic Work conducted by the Bureau of Mines on coal and coal products [2] gives a brief résumé of special studies made by Bureau engineers from July 1, 1949, to July 1, 1950, on the carbonizing properties, plasticity, oxidation, expansion, and washing characteristics of coal. The report lists the original publications describing the individual studies and, in addition, presents research results that have not already been published.

Research achievements of Mellon Institute relating to byproduct coke and coal-chemicals technology during the fiscal year ended February 28, 1951, were summarized in the Thirty-Eighth Annual Report of the institute.[3]

WORLD PRODUCTION

Estimated world production of coke in 1950 increased 8 percent over 1949, reaching an all-time peak. Coke is used principally for industrial purposes, and the highly industrialized countries are generally the leading coke producers. The United States has dominated the world in coke output since 1938 and produced 37 percent of the total in 1950. Germany assumed temporary leadership in coke production in 1938, but war damages and territorial changes reduced production drastically for several years after the war. However, coke production in the famous Ruhr area has been increasing rapidly during the past several years, and production in western Germany (Federal Republic) in 1950 ranked second only to the United States. Little authentic information has been available on output in the Soviet Union since 1937, but estimates for 1950 place it third. Remarkable progress has been made in Russia in the past 20 years, and coking capacity has increased more rapidly than in any other country. Other important coke-producing countries in 1950 were Great Britain, France (including the Saar), Poland, and Czechoslovakia, which combined produced 21 percent of the total. Table 48 contains information on world production so far as data are available.

[1] Excludes gas-house coke.
[2] Estimate.
[3] Exports.
[4] Areas designated as Free China during the period of Japanese occupation.
[5] Includes Silesian production.
[6] Preliminary data for fiscal year ended Mar. 31 of year following that stated.
[7] In Great Britain production of gas-house coke is especially important: 10,770,130 tons in 1938, averaged 11,000,000 tons per year 1941–45, increased 15 percent in 1946–47, and 25–30 percent in 1948–49. Data for 1950 incomplete.

COAL-CHEMICAL MATERIALS

GENERAL SUMMARY

The vast postwar expansion of the chemicals industry has increased greatly the requirements of coal-chemical materials. Gas, ammonia, crude light oil, and tar are the basic coal-chemical materials, but the term also includes fractions and individual compounds that are recovered therefrom by a chain of industrial processes. The value of these materials to our defense program and civilian economy is difficult to estimate because the various coal products enter many fields and the finished product of one industry may become the raw material for another in the manufacture of a final commodity. Many new products that have increased the requirements of coal chemicals have been developed in the past 10 years. This, in turn, has caused the coke-plant operators to place more emphasis on processing the basic chemical raw materials in order to produce larger quantities of refined and pure aromatic hydrocarbon products.

Although many changes and improvements have been made in the construction and design of chemical recovery ovens proper that have increased the efficiency, economy, ease, and safety of operation of the ovens, there has been no radical change in the relative yield of the basic chemical raw materials. The high yields of tar, gas, ammonia, etc., that were attained in the mid-thirties cannot be compared with the current yields because of the difference in operating conditions of the ovens. However, relative yields were slightly lower in 1950 than in 1944 when ovens were also operated at maximum capacity.

Although markets for coal chemicals have been expanding, the proportion of revenue derived from their sale has not increased proportionately with the rise in coal costs or with the value credited to coke production. For example, the average cost of coal per ton of coke produced has increased 135 percent during the past 10 years, and the average value of coke produced has risen 179 percent, whereas the revenue from the sale of coal chemicals has increased 53 percent. The total revenue obtained from the sale of coal chemicals was equivalent to 23 percent of the total value of all products compared with 34 percent in 1940.

It is therefore evident that, in spite of the many improvements that have been made in recent years in the recovery and processing of the chemical raw materials (ammonia, tar, and crude light oil), these improvements have had little effect in reducing the cost of converting coal to coke. Surplus gas continues to rank second to coke as a source of revenue to coke-plant operators, a position it has maintained continuously since 1921. In 1950 surplus gas contributed 11 percent of the total value of all products (table 50). There was a change in the proportion of revenue contributed by the other coal-chemical materials, particularly ammonia and crude light oil and its derivatives. The decline in returns from the former was due to the marked decrease in the price of ammonium sulfate, while the gain in the light-oil group resulted from the substantial increase in the price of pure benzol. The possibility of higher coke oven returns through increased crude light oil and benzol yields appears limited, although the market position can be an important factor. The financial returns from tar

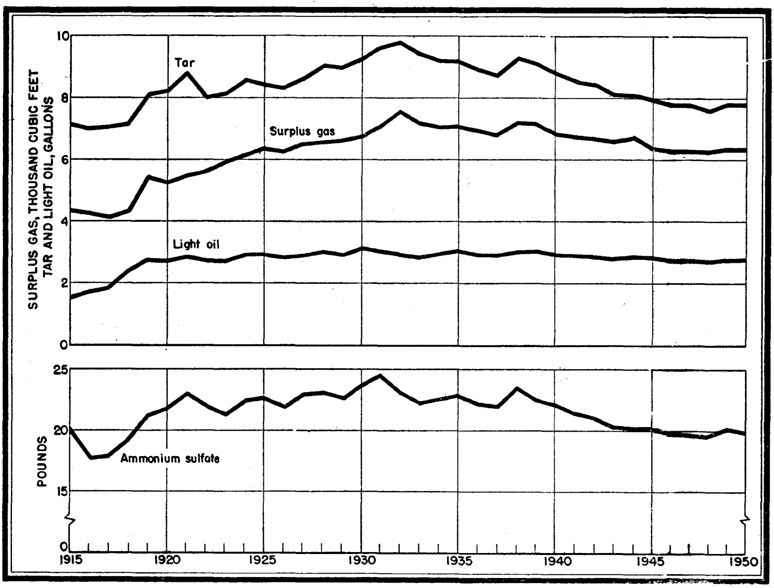

FIGURE 2.—Average yield of principal coal-chemical materials per net ton of coal carbonized in coke ovens, 1915–50. Yields of light oil and ammonium sulfate equivalent represent average for plants recovering these products.

and its derivatives which are credited to coke-oven operators have varied only slightly in recent years, because the greatest part of tar distillation in the United States is established as an independent industry. Tables 49 to 51 contain detailed statistics on the production and sales of the principal coal-chemical materials in 1950.

COKE-OVEN GAS

Approximately 17 percent by weight of the coal charged into slot-type ovens is recovered in the form of fuel gas. About one-third of the gas recovered is used to heat the coke ovens, and the remainder (surplus gas) is used in integrated metallurgical operations by neighboring industries or pumped through city mains for public consumption. The relative value of gas to coke-plant operators varies according to the type of operation. At coke plants integrated with iron and steel works, the bulk of the surplus gas is consumed within the works and assigned a low value, in accordance with established accounting procedures. Gas utilities and, to a large extent, the merchant plants market the largest proportion of their gas production through city mains for residential and commercial use, and for this a higher price is realized. Furnace plants used approximately 86 percent of their surplus gas within the plant as boiler fuel and in metallurgical furnaces and sold only 14 percent. Merchant plants, including the coke plants operated by gas utilities, consumed only 10 percent but sold 90 percent. Gas shown in table 54 as distributed through city mains is used principally for residential cooking and heating, although some of this gas is undoubtedly used for industrial purposes.

CRUDE COAL TAR AND DERIVATIVES

Crude tar represents 4 to 5 percent of the weight and 5 to 8 percent of the heat of the original coal from which it is made. The yield of tar varies greatly from plant to plant, depending on the kind of coal used, the temperature of oven operation, the completeness of tar recovery, and other factors. In modern plants, the yield of tar ranges from 6 to 10 gallons per ton of coal carbonized. The principal uses of tar are (1) as raw material for the manufacture of numerous organic chemicals and (2) as fuel. Refining or processing of crude coal tar is increasing in importance because of the rising demand of the synthetic chemicals industry. Coke-oven operators processed 27 percent of their production in 1950 and sold 55 percent to tar distillers. The quantity of tar burned dropped 30 percent from 1949 and represented only 13 percent of the production compared with 21 percent in 1949. The proportion of tar that is burned varies according to availability and price of fuel oil. When the price of fuel oil is high, the furnace-coke plants find it advantageous to burn larger quantities of tar. Unlike the majority of the iron and steel plants, which can burn the tar or sell it according to business and economic conditions, the merchant plants must market their production. It is of interest to note that the average unit value of the tar sold by furnace plants was over 1 cent per gallon higher than for the merchants. Coke-oven tar comprises about 80 percent of the tar refined in the United States; the remainder is made up of low-temperature coal tar, retort coal tar, water-gas tar, and oil-gas tar.

Coke-plant operators processed in integrated facilities 27 percent of the total tar output in 1950. The Bureau of Mines does not collect statistics on the production of tar derivatives made in tar-distilling plants operated independently of the coke-oven operations. Statistics on these tar plants are collected, compiled, and published by the United States Tariff Commission. The principal commercial tar products produced by coke-oven operators are creosote oil and tar-acid oil. About one-fifth of the total production of creosote oil in the United States comes from these plants. Creosote oil, used mainly for wood preservation, usually yields about 40 to 50 percent of the total revenue obtained by coke-oven operators from the sale of tar derivatives. The market for creosote oil improved in 1950, and the prices received by coke-oven operators increased slightly over 1949. Tar-acid-oil production increased 45 percent over the 1949 figure, principally because of the gain in quantity of tar processed. Tar-acid oil is a crude mixture of phenol, cresols, cresylic acid, xylenols, etc. These tar acids can be extracted with alkali from the tar-acid oil fraction for the manufacture of phenolic plastics, glues, disinfectants, and a host of other materials, or the tar-acid oil may be used for working up low-grade ores to concentrate the desired mineral. Details on the production of cresols, cresylic acid, anthracene, and other derivatives cannot be disclosed, as fewer than three producers reported these products to the Bureau. Pitch, the residue left when tar is topped or refined, is not marketed extensively in the coke industry and is used mainly as fuel. The soft- or medium-melting-point pitches are cut back (usually with virgin tar) to the desired viscosity

and used as fuel in metallurgical furnaces. The hard pitch made at several plants is pulverized and mixed with the coal before charging into ovens to improve the coke quality.

CRUDE LIGHT OIL AND DERIVATIVES

Crude light oil is the basic chemical raw material from which benzol, toluol, xylol, etc., are made. The tremendous increase in requirements of benzol for styrene, phenol, nylon, etc., in the past several years and particularly since the outbreak of hostilities in Korea have emphasized the importance of crude light oil to our defense program and civilian economy. Crude light oil yields roughly 65 percent benzol when it is fractionally distilled. The potential yield of crude light oil per ton of coal carbonized varies widely from plant to plant, depending on the quality and kind of coal charged, the design and condition of ovens, oven temperatures, and the kind of scrubbing equipment. In 1950 the yield of crude light oil ranged from 1.09 to 4.50 gallons per ton and averaged 2.81 compared with 2.77 in 1949. This wide range in recovery is clearly indicative that many plants can increase light-oil production by improving scrubbing facilities. In an effort to determine how much additional light oil and benzol could be obtained, the Defense Solid Fuels Administration started a survey of all coke plants in the fall of 1950. The survey indicated that benzol production might be increased about 10 percent by installing more modern scrubbing equipment at inefficient plants.

In 1950 production of chemical grades of benzol in the United States totaled about 186,000,000 gallons, including 10,000,000 gallons from petroleum. In addition, about 23,000,000 gallons of crude benzol was imported to meet essential requirements. Estimates by various industry and Government representatives on requirements over the next several years indicate that the gap between requirements and coke-oven benzol will widen, because benzol output from coal is limited generally by coke requirements, which, in turn, are governed by pig-iron production. Therefore, in the fall of 1950, the Government requested the petroleum industry to build facilities as rapidly as possible to produce about 100,000,000 gallons annually.

Toluol is another light-oil derivative that has many important applications in the chemical field. Toluol is used extensively as a solvent, particularly in the manufacture of synthetic plastics; it is also used for synthesizing a number of other chemicals, such as benzoic acid. In wartime its importance is derived from its use in manufacturing explosives and also for enriching aviation gasoline. Unlike benzol, which in the past has been largely made from coal, large-scale production of toluol from petroleum was begun during World War II. In 1950 coke-oven operators produced about 37 percent of the total national output of toluol. Xylol is another aromatic material that is being made from petroleum in increasing quantities. Coke-plant operators produced only 11 percent of the total in 1950. Prices on all of the derivatives increased in 1950, with the chemical grade of benzol showing the largest gain, advancing $0.057 per gallon (29 percent) over the average unit price in 1949.

[1] Revised figure.

COKE-OVEN AMMONIA

Ammonia is recovered at coke plants, either as its water solution (ammonia liquor) or as a crystallized ammonium sulfate. In 1950, 79 of the 85 active plants recovered ammonia; 64 made ammonium sulfate and 17 ammonia liquor (2 plants produced both sulfate and liquor). Purchased synthetic ammonia was converted into sulfate at four coke plants during the first half of 1950. Usually, 85 to 90 percent of the ammonia recovered from the ovens is converted into sulfate. Coke-oven sulfate is used almost exclusively for agricultural purposes. The merchant coke plants, however, recover a larger proportion of the ammonia in the form of ammonia liquor, and this group of plants produced over 60 percent of the total output. Ammonia liquor produced by coke-plant operators is used for both chemical and agricultural purposes. Although precise data are not available on the quantity of ammonia liquor used for each category, it is estimated that over half is used industrially in manufacturing soda ash, ammonium chloride, and sulfuric acid. Until recent years coke ovens furnished the bulk of the ammonium sulfate consumed in the United States. However, in the past several years a few of the large synthetic ammonia producers have constructed plants to produce ammonium sulfate; as a result, production of synthetic sulfate exceeds that of coke-oven sulfate. Shipments of sulfate exceeded production in 1950, indicating a large demand. Prices, however, dropped sharply, falling from $0.023 per pound in 1949 to $0.018.

COKE OVENS OWNED BY CITY GAS COMPANIES (PUBLIC UTILITIES)

Table 61 compares the activities of coke plants operated by gas utilities with those not owned by city gas companies for 1949 and 1950. This classification is maintained by the Bureau of Mines in the interest of those who may wish to follow coal carbonizing at public utility plants and also to show their relative position in the coke industry as a whole.

Normally, maximum production of gas of proper analysis is the primary objective of these plants; however, the extremely heavy demand for industrial coke during and since World War II has caused many operators to place a greater emphasis on coke, and in 1950 over a million tons of metallurgical coke from this group was shipped to iron blast furnaces and foundry cupolas. Although the volume of coke production has not decreased markedly in recent years, the number of operators has been declining steadily because of substitution of natural gas for coke-oven gas in certain areas. In 1950 the Wisconsin Public Service Co., Sheboygan, Wis., discontinued operating its oven-coke plant, leaving but 11 city gas coke plants in operation at the end of the year. Several other companies are planning to substitute natural gas for coke-oven gas in 1951 and will close their coke plants unless they can be disposed of to other interests. Economical operation of a coke plant requires a properly balanced market under favorable conditions for all products, since the production of any one is almost invariably accompanied by the production of all the others. Therefore, loss of a market for coke-oven gas makes it difficult for a city gas plant to operate economically. Revenue from sales of surplus coke-oven gas from these plants accounts for 26 percent of the total revenue obtained from all products. City gas plants in 1950 contributed 6 percent of the total production of oven coke, gas, and tar, 3 percent of the crude light oil, and 5 percent of the ammonia.

Copper

By Helena M. Meyer and Gertrude N. Greenspoon

GENERAL SUMMARY

MOST segments of the copper industry experienced increased activity early in 1950, continuing to recover from recession lows of mid-1949. In the latter part of the year this upward movement was accelerated, in large part because of speeding of defense mobilization after the outbreak of war in Korea. Mine, smelter, and refinery outputs from domestic ores, apparent consumption of new copper, and world production were the largest since 1944; refinery output from foreign ores and imports of refined copper were the greatest since 1945. Production of copper from old scrap in 1950 exceeded that in 1949 but was less than in 1948 and 1947. The average quoted price for the year for the electrolytic grade was less than in 1948 but otherwise was higher than at any time since 1918.

Short-lived labor strikes had an adverse effect on production during 1950, but outputs from primary domestic sources by mines, smelters, and refineries increased 20 to 32 percent nonetheless. The railway switchmen's strike early in July threatened output, particularly at Utah and Montana mines, but was terminated after about 1 week; and the "wildcat" strike at the Carteret refinery beginning in the last days of June ended July 18, although "not settled," because of the Korean situation.

Producers' stocks of refined copper at the end of 1950 were the smallest since 1906, whereas unrefined inventories represented a more nearly normal quantity.

Several attempts failed to enact legislation extending the suspension of the excise tax on copper beyond June 30. There was confusion regarding copper prices during the months when it was thought, first, that the suspension would be extended and then, after June 30, that the tax would be suspended and the action made effective retroactively. Additional price confusion was caused during the period of strong demand in the second half of the year, when purchases of copper well above quoted market prices were reported and when toll treatment of scrap purchased in some instances at prices exceeding those for primary copper resulted in costs for metal much larger than market quotations. Foreign copper sold at a premium of 2 cents a pound after the excise tax was resumed on July 1.

The sharp downtrend in prices that accompanied the fall in demand in mid-1949 was reversed before the end of 1949, and the rise continued in 1950. The price for electrolytic copper delivered Connecticut Valley was 18½ cents a pound at the beginning of the year and 24½ cents for domestic copper at the year end.

Early in July the Kennecott Copper Corp. announced that it would dispose of its copper on a uniform delivered price basis throughout the country, marking a noteworthy change in the long-established policy of this company and contrasting with the continuing policy of other companies.

Imports of unmanufactured copper in 1950 established a new peacetime peak for the third successive year. The large receipts in

1950, however, were 19 percent under the all-time record in 1945, and also below those in the other war years, 1941–44.

Exports of refined copper, by far the most important copper-export class, were about the same in 1950 as the average for the preceding 3 years.

The demand for copper increased greatly outside of the United States in 1950, and production and prices rose. The total world mine output (2,750,000 tons) was 11 percent above that in 1949. The expansion of output in Chile was interrupted several times by labor strikes. Two strikes lasting approximately 3 weeks each occurred at the Chuquicamata mine and one lasting from late August until October 1 occurred at the Andes mine. There were a few other strikes of shorter duration. Continued rail-transportation difficulties that impeded delivery of adequate supplies of coal to Northern Rhodesia mines interfered with the reaching of production objectives in that country.

The Defense Production Act, which became law early in September, gave the President the power to regulate the economy to assure adequate supplies of materials for expanded defense and essential civilian requirements. Among other things, it provided means of encouraging increased supplies, as well as of curtailing unessential consumption.

Pursuant to the act, the Defense Minerals Administration was established in the Department of the Interior to render Government assistance to industry in expanding supplies of critical minerals and to act as claimant agency for the mining industry. During 1950, it entered into a number of negotiations with private companies for new copper-production projects.

The National Production Authority in the Department of Commerce was among the other agencies created to carry out other provisions of the act. Orders issued by NPA in 1950 that affected copper were: Regulation 1, which prohibited accumulation of excessive inventories by limiting the quantities of materials that could be ordered, received, or delivered; Order M–12, which reduced civilian use of copper 15 percent in January and February and 20 percent in March 1951; M–11, which set rules for placing, accepting, and scheduling rated orders for copper and copper-base alloys; and M–16, which aimed at maintaining the flow of copper and copper-base alloy scrap through normal channels and limited toll agreements, except as authorized.

On December 15 the British Ministry of Supply announced that, beginning January 1, supplies of imported copper would be restricted to a total equal to the average monthly consumption in the first half of 1950; special "electro" shapes would be cut to two-thirds of the monthly average, the other one-third being permitted as standard copper.

Production Expansion.[1]—Work progressed during 1950 on the "greater Butte project" of the Anaconda Copper Mining Co., Butte, Mont. Extraction of ore from the project should begin early in 1952. Ore production is expected to be 6,000 tons a day in 1952 and 10,000 in 1953, with an eventual output of 15,000 tons of the low-grade ore a day. These daily tonnages will result in annual rates of 20,000, 30,000, and 45,000 tons of copper, respectively, and are in addition to operations in the normal, higher grade Butte vein structures.

[1] For developments before 1950 and background information on the following projects, see Copper chapter in Minerals Yearbook 1949 and earlier years.

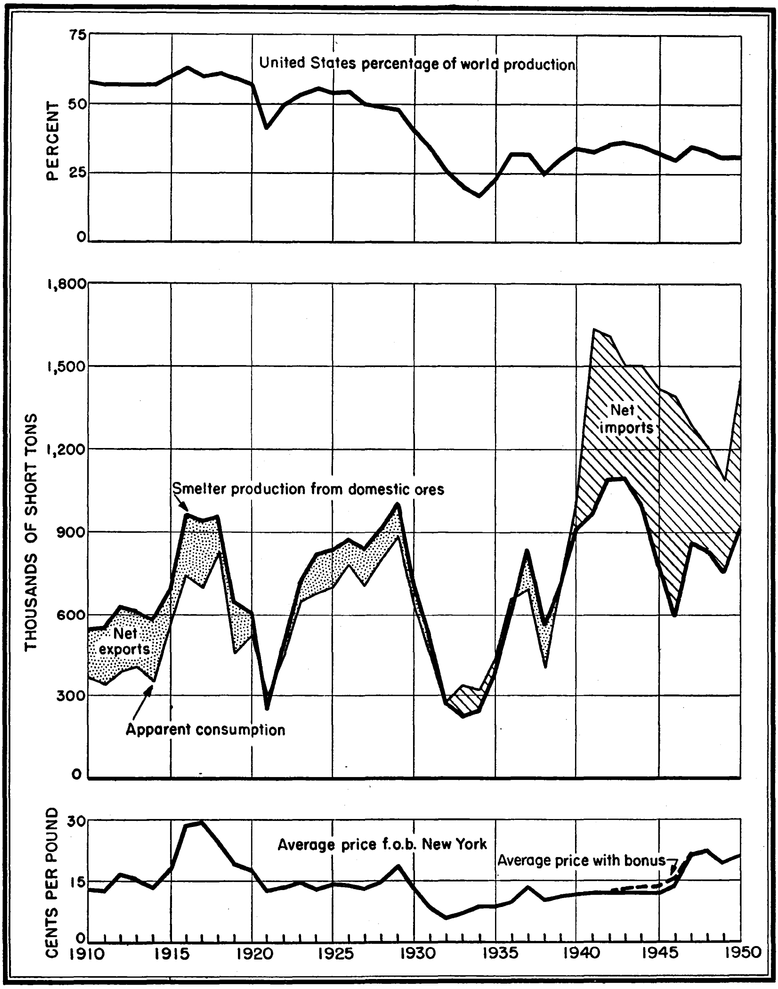

FIGURE 1.—Trends in production, consumption, and price of copper in the United States, 1910–50.

Remodeling of four sections in the copper concentrator at Anaconda to treat ores from the project is proceeding, and two sections were completed. Changes in the remaining two sections were expected to be finished by the end of 1951.

Construction of the new metallurgical plant for treating sulfide ores at the Chuquicamata mine of the Chile Exploration Co., subsidiary of the Anaconda Copper Mining Co., progressed during the year. This plant will consist of a sulfide concentrator and a smelter and should be in full operation before the end of 1952; the first unit should be ready in December 1951. The concentrator will have capacity to treat 30,000 tons of sulfide and mixed ores a day. The smelter will contain three reverberatory furnaces and three Pierce Smith converters. The estimated output will be 150,000 tons of blister copper annually. The expected cost of the new sulfide plant is about $90,000,000, of which $44,836,645 had been expended to the end of 1950; $21,803,984 was expended in 1950.

As a result of exploration work at the White Pine, Mich., property of the Copper Range Co., a substantial tonnage of ore was added to reserves; these were estimated at 309,660,000 tons, containing 21.3 pounds per ton, at the end of the year compared with 249,610,000 tons at its beginning. The company stated that further exploration would undoubtedly add greatly to the foregoing reserves.[2] Extensive research was carried on to assist in determining milling and further metallurgical methods.

A major stripping program providing for expansion of open-pit operations at the Chino mines division of the Kennecott Copper Corp. was begun in 1949 and continued throughout 1950. A drilling campaign was successful in developing a needed additional supply of water. A new unit at the precipitating plant was completed and put into operation, expanding copper production capacity 20 percent to 18,000 tons annually.

At the Nevada mines division of the Kennecott Copper Corp. a contractor began to strip the Kimbley ore body in November. The Consolidated Coppermines Corp. started to ship ore from its recently developed Morris pit to the Nevada division concentrator at McGill in the latter part of 1950.

Work of converting a large part of Kennecott's mining activities at the Ray mines division from underground to open-pit operation progressed to the point where open-pit production was about 8,000 tons of ore a day. When remodeling of the No. 2 crushing plant is completed (about August 1951), it was expected that the mine's full monthly production of 15,000 tons from open pit and underground could be handled.

The new electrolytic refinery of Kennecott at Garfield, Utah, was completed, and the first cathodes were produced September 1. By the year end production was at a monthly rate of 12,000 tons of copper.

At the San Manuel, Ariz., property of the Magma Copper Co., metallurgical test work was carried on continuously to obtain data for designing a reduction and concentrator plant. The work was said to prove the ore to be readily amenable to standard methods of concentration.

Exhaustion of ore reserves at the Miami and Castle Dome properties, Globe-Miami district, Gila County, Ariz., is expected within a few years. Negotiations were concluded in 1950 for a Government loan to bring the Copper Cities property, in the same district, into production. The Castle Dome plant will be moved to the Copper Cities property when the former mine is closed. Both properties are operated by wholly owned subsidiaries of the Miami Copper Corp.

The new smelter of the Phelps Dodge Corp. at Ajo was essentially completed in June, and the smelting of concentrates was begun on July 8. Of total smelter production of 65,858 tons of copper from Ajo concentrates in 1950, the Douglas smelter produced 39,782 tons and the Ajo plant 26,076 tons.

Development as an open-pit mine, of a low-grade body of ore (known as the Bisbee East Ore Body) in the Warren district of Arizona near Bisbee, was under consideration by Phelps Dodge. The ore body was estimated to contain 41,000,000 tons of concentrating ore, of an average grade of 1.14 percent copper; 31,000,000 tons of material to be leached, averaging 0.42 percent copper; and 70,000,000 tons of waste to be removed. It was estimated that $25,000,000 would be required

[2] Annual Report to Stockholders, 1950.

to bring the mine into production. The corporation stated that no production was to be expected from this source until 1954 or 1955 at the earliest.[3]

TABLE 1.—Salient statistics of the copper industry in the United States, 1941–45 (average) and 1946–50, in short tons

	1941–45 (average)	1946	1947	1948	1949	1950
New (primary) copper produced—						
From domestic ores, as reported by—						
Mines	974,894	608,737	847,563	834,813	752,750	909,343
Ore produced:						
Copper ore [1]	87,478,899	62,232,342	87,864,898	84,729,043	76,032,531	94,585,792
Average yield of copper, percent	1.04	.91	.90	.92	.91	.89
Smelters	986,621	599,656	862,872	842,477	757,931	911,352
Percent of world total	35	29	[2] 34	[2] 32	29	31
Refineries	974,374	578,429	909,213	860,022	695,015	920,748
From foreign ores, matte, etc., refinery reports	329,410	300,233	250,757	247,424	232,912	319,086
Total new refined, domestic and foreign	1,303,784	878,662	1,159,970	1,107,446	927,927	1,239,834
Secondary copper recovered from old scrap only	444,229	406,453	503,376	505,464	383,548	485,211
Imports (unmanufactured) [3]	770,988	[2] 396,380	413,890	507,449	[2] 552,709	690,231
Refined	434,991	154,371	149,478	249,124	275,811	317,050
Exports of metallic copper [4]	206,788	97,475	196,999	207,022	195,990	192,339
Refined (ingots and bars)	105,561	52,629	147,642	142,598	137,827	144,561
Stocks at end of year	359,900	350,000	273,000	250,000	322,000	258,000
Refined copper	88,200	96,000	60,000	67,000	61,000	26,000
Blister and materials in solution	271,700	254,000	213,000	183,000	261,000	232,000
Withdrawals (apparent) from total supply on domestic account:						
Total new copper	1,534,000	1,391,000	1,286,000	1,214,000	1,072,000	1,447,000
Total new and old copper (old scrap only)	1,978,000	1,797,000	1,789,000	1,719,000	1,456,000	1,932,000
Price average [5]....cents per pound	11.38	14.4	20.9	21.7	19.7	20.8
World smelter production, new copper	2,855,000	2,067,000	2,513,000	2,623,000	2,640,000	2,962,000

[1] Includes old tailings smelted or re-treated. Not comparable with mine production figure shown in that latter includes recoverable copper content of ores not classified as "copper."
[2] Revised figure.
[3] Data are "general" imports; that is, they include copper imported for immediate consumption plus material entering country under bond. Comprises copper in ingots, plates, and bars, ores and concentrates, regulus, blister, and scrap.
[4] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufactures of copper," for which quantity figures are not recorded. (See table 28.)
[5] Exclusive of bonus payments of the Office of Metals Reserve under Premium Price Plan, which covered the period February 1, 1942, to June 30, 1947, inclusive.

Owing to rapid depletion of ore reserves at the mine at Jerome the Clarkdale smelter of Phelps Dodge was closed June 6.

Bureau of Mines Reports.—The following Bureau of Mines reports of investigations, published recently, relate to copper in whole or in part:

4670. Flotation and Cyanidation Tests on a Gold-Copper Sulfide Ore from Cooke, Mont.
4689. Investigation of the Sunrise Copper-Gold Mine, Granite County, Mont.
4701. Douglas Copper Deposit, Hancock County, Maine.
4706. Lake Shore Copper Deposits, Pinal County, Ariz.
4718. Milan Copper Deposit, Coos County, N. H.
4732. Twin Buttes Copper Mine, Pima County, Ariz.
4760. West Belt Copper-Zinc Mines, El Dorado, Amador, Calaveras, and Mariposa Counties, Calif.
4791. Torpedo Copper Deposit, Organ Mining District, Dona Ana County, N. Mex.

The following Bureau of Mines information circulars likewise discussed copper:

7567. Electrical Blasting at Miami Copper Co., Miami, Ariz.
7598. Use of Visual Aids in the Morenci Branch Safety Program, Phelps Dodge Corp., Morenci, Ariz.

[3] Annual Report to Stockholders, 1950.

TABLE 2.—Salient statistics of the copper industry, 1919–50

[All figures in short tons, except price and tenor of ore]

Year	Mine production	Average tenor of copper ores (percent)	Refinery production from—			Imports (refined) [1]	Exports (refined) [1]	Apparent consumption of new copper [2]	Quoted price at New York [3] (cents per pound)	World production (smelter)	Production from scrap as metal and in alloys

[1] Imports and exports may include some refined copper produced from scrap. Categories not wholly comparable from year to year.

[2] Adjusted for changes in stocks.

[3] American Metal Market price for electrolytic copper in New York; f. o. b. refinery through August 1927, New York refinery equivalent thereafter.

DOMESTIC PRODUCTION

Statistics on copper production may be compiled upon a mine, smelter, or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better than mine figures for showing the actual recovery of metal and more accurate than refinery figures for showing the source of production; and refinery statistics are best for showing recovery of metal but indicate only in a general way the source of crude materials treated. Mineral Resources of the United States, 1930, part I (pp. 701–702), discusses differences among the three sets of figures.

TABLE 3.—Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1946–50, in short tons

Year	Mine [1]	Smelter	Refinery
1946	608,737	599,656	578,429
1947	847,563	862,872	909,213
1948	834,813	842,477	860,022
1949	752,750	757,931	695,015
1950	909,343	911,352	920,748

[1] Includes Alaska.

PRIMARY COPPER

Mine Production.—The figures for mine production are tabulated from reports supplied by all domestic mines that produce copper. These data are classified geographically, by metallurgical method, and by type of ore. Tables presenting the information in detail are to be found in the State chapters of this volume.

As usual, Arizona led all other States by a wide margin in production in 1950, supplying 44 percent of the total for the United States, followed by Utah, with 31 percent. Arizona's output comes from a number of important copper-producing districts and mines, whereas Utah's is predominantly from one mine, the largest copper producer in the United States. Production from New Mexico, Montana, Nevada, and Michigan, ranking next in importance as copper producers in 1950, made up 22 percent of the total. These six States produced 97 percent of the United States total in 1950 and 96 percent in 1949.

Classification of production by mining method shows that approximately 74 percent of the recoverable copper and 81 percent of the

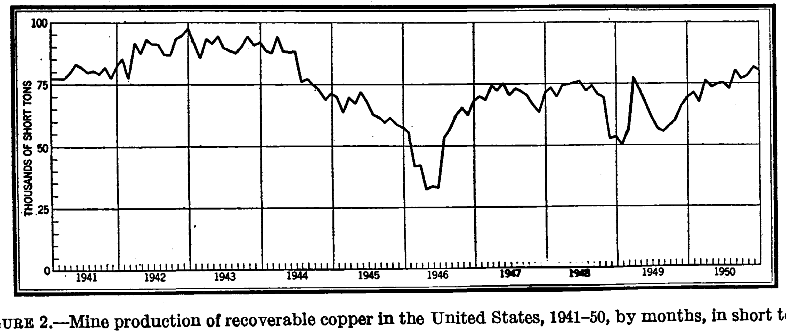

FIGURE 2.—Mine production of recoverable copper in the United States, 1941–50, by months, in short tons.

copper ore came from open pits in 1950. Most of the domestic copper ore was treated by flotation at or very near the mine of origin, and the resulting concentrates were shipped for smelting. Some copper ores were direct-smelted either because of their high grade or because of their fluxing qualities.

TABLE 4.—Mine production of recoverable copper in the United States in 1950, by months [1]

Month	Short tons	Month	Short tons
January	71,376	August	80,598
February	67,188	September	77,025
March	76,061	October	78,175
April	73,596	November	81,726
May	74,821	December	80,667
June	75,170		
July	72,940	Total	909,343

[1] Includes Alaska. Monthly figures adjusted to final annual mine production total.

TABLE 5.—Mine production of copper in the principal districts [1] of the United States, 1941–45 (average) and 1946–50, in terms of recoverable copper, in short tons

[1] For Missouri and States east of the Mississippi, maximum since 1905.
[2] Small quantity for Wisconsin included with Missouri.
[3] Data not available.
[4] The 1908 volume of Mineral Resources credits this figure to Massachusetts and New Hampshire; the 1909 volume credits it to New Hampshire alone.
[5] Bureau of Mines not at liberty to publish figure.
[6] Tennessee includes other States indicated by footnote 6; Bureau of Mines not at liberty to publish separate figures.
[7] Less than 0.5 ton.
[8] For States other than Michigan, figures represent largely smelter output. Excludes small quantity, not separable, for Wisconsin shown with Missouri.
[9] Largely smelter production for States east of the Mississippi except Michigan.

TABLE 7.—Twenty-five leading copper-producing mines in the United States in 1950, in order of output

Rank	Mine	District	State	Operator	Source of copper
1	Utah Copper	West Mountain (Bingham)	Utah	Kennecott Copper Corp	Copper ore.
2	Morenci	Copper Mountain (Morenci)	Arizona	Phelps Dodge Corp	Do.
3	New Cornelia	Ajo	do	do	Do.
4	Chino	Central	New Mexico	Kennecott Copper Corp	Do.
5	Butte Mines	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Copper, zinc-lead ores.
6	Ruth Pit [1]	Robinson (Ely)	Nevada	Kennecott Copper Corp	Copper ore.
7	Inspiration	Globe-Miami	Arizona	Inspiration Consolidated Copper Co	Do.
8	Ray	Mineral Creek (Ray)	do	Kennecott Copper Corp	Do.
9	Miami	Globe-Miami	do	Miami Copper Co	Do.
10	Castle Dome	do	do	Castle Dome Copper Co., Inc	Do.
11	Magma	Pioneer (Superior)	do	Magma Copper Co	Copper, zinc-copper ores.
12	Calumet & Hecla Consolidated	Lake Superior	Michigan	Calumet & Hecla Consolidated Copper Co	Copper ore and tailings.
13	Copper Queen	Warren (Bisbee)	Arizona	Phelps Dodge Corp	Copper, zinc-lead ores.
14	United Verde	Verde (Jerome)	do	do	Copper, zinc-copper ores.
15	Bagdad	Eureka (Bagdad)	do	Bagdad Copper Corp	Copper ore.
16	Ruth Pit Extension [2]	Robinson (Ely)	Nevada	Consolidated Coppermines Corp	Do.
17	Burra Burra, Calloway, Mary, Eureka, Boyd.	Polk County	Tennessee	Tennessee Copper Co	Copper-bearing pyrites.
18	Holden	Chelan Lake	Washington	Howe Sound Co	Zinc-copper ore.
19	Cornwall	Lebanon County	Pennsylvania	Bethlehem Steel Co	Magnetite-pyrite-chalcopyrite ore.
20	Elizabeth	Orange County	Vermont	Vermont Copper Co., Inc	Copper ore.
21	Quincy	Lake Superior	Michigan	Quincy Mining Co	Copper-ore tailings.
22	Bonney-Miser's Chest	Lordsburg	New Mexico	Banner Mining Co	Copper ore.
23	Treasury Tunnel-Black Bear	Upper San Miguel	Colorado	Idarado Mining Co	Zinc-lead-copper ores.
24	Champion	Lake Superior	Michigan	Copper Range Co	Copper ore.
25	United States & Lark	West Mountain (Bingham)	Utah	U. S. Smelting, Refining & Mining Co	Gold-silver, lead, silver, zinc-lead ores.

[1] Shown as "Ruth & Copper Flat Pit" in 1949 chapter.
[2] Shown as "Consolidated Coppermines group" in 1949 chapter.

The first 5 mines in the foregoing table produced 67 percent of the United States total, the first 10 produced 85 percent, and the entire 25 furnished 98 percent.

Quantity and Estimated Recoverable Content of Copper-Bearing Ores.—Tables 8 through 11 list the quantity and estimated recoverable copper content of the ore produced by copper mines in the United States in 1949 and 1950. Of the total copper produced from copper ores in the United States during 1950 (1949 data in parentheses), 94 (93) percent was obtained from ores concentrated before smelting, 2 (3) percent from direct-smelting ores, and 4 (4) percent from ore treated by straight leaching.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that estimated recoverable tenor is close to actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only all those that contain 2.5 percent or more recoverable copper but also those that contain less than this percentage if they are valuable chiefly for copper, notably the "porphyry ores." Mines report considerable copper from ores mined primarily for other products. These include siliceous gold and silver ores, lead and zinc ores, and pyritic ores.

TABLE 8.—Copper ore, old tailings, etc., sold or treated in the United States in 1949–50, with copper, gold, and silver content in terms of recoverable metal

State	Ore, old tailings, etc., sold or treated (short tons)	Recoverable metal content				Value of gold and silver per ton of ore

[1] Includes old tailings, smelted or retreated, etc.
[2] Includes copper ore leached.
[3] Includes ore from Washington classed as zinc-copper ore.

Smelter Production.—The recovery of copper by smelters in the United States from ores of domestic origin totaled 911,352 short tons in 1950, a 20-percent increase from the total of 757,931 tons for 1949. Output of United States smelters from domestic ores constituted 51 percent of the world production during 1925–29 but dropped sharply in the succeeding years until 1934, when it was only 17 percent. From 1936 to 1941 it fluctuated between 25 and 33 percent; in 1942–44 it was slightly above 35 percent; and in 1945–50 it ranged from 29 to 34 percent; for the year 1950 alone it was 31 percent.

The figures for smelter production shown in table 12 are based upon returns from all primary smelters handling copper-bearing materials produced in the United States. Blister copper is accounted for in terms of fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production, as well as in the refinery output. For Michigan, furnace-refined copper is included. Metallic and cement copper recovered by leaching is included in smelter production.

The quantity and value of copper produced from domestic ores by smelters in the United States are shown by years for 1845–1930 in Mineral Resources of the United States, 1930, part I (p. 703).

TABLE 12.—Copper produced (smelter output from domestic ores, in the United States, 1941–45 (average) and 1946–50, and total, 1845–1950

Year	Short tons	Value [1] (thousands of dollars)
1941–45 (average)	986,621	232,843
1946	599,656	172,701
1947	862,872	360,680
1948	842,477	365,635
1949	757,931	298,625
1950	911,352	379,122
Total 1845–1950	36,405,873	10,992,996

[1] Excludes bonus payments of Office of Metals Reserve under Premium Price Plan in effect Feb. 1, 1942, to June 30, 1947.

[1] Permanently closed during year.

Primary smelters in the United States are shown in table 13. The Clarkdale, Ariz., smelter of the Phelps Dodge Corp. was permanently closed during the year, and the new plant of the same company at Ajo, Ariz., began to produce during the third quarter.

Refinery Production.—The refinery output of primary copper in the United States in 1950 was made by 13 plants, shown in table 13; 9 of these employed the electrolytic method only, 2 the furnace process on Lake Superior copper, 1 the furnace process on western ores, and 1 both electrolytic and the furnace methods.

Five large electrolytic refineries are on the Atlantic seaboard, three Lake refineries on the Great Lakes, and four electrolytic refineries west of the Great Lakes—one at Great Falls, Mont.; one at Tacoma, Wash.;

one at El Paso, Tex.; and a new plant at Garfield, Utah. In 1942 fire-refined copper was produced for the first time at the Hurley, N. Mex., plant of the Kennecott Copper Corp.; virtually all of the plant output was treated by this method in 1949, but a substantial part went as blister to electrolytic refineries in 1950. The El Paso plant of the Phelps Dodge Refining Corp. produced fire-refined copper in addition to the electrolytic grade. The new electrolytic refinery of the Kennecott Copper Corp. at Garfield, Utah, went into production in the third quarter of 1950. Of the plants specified above, the Lake refinery of the Copper Range Co. has been idle since October 9, 1945. That of the Quincy Mining Co., idle since 1933, was reopened in the final quarter of 1948 and continued to produce through 1950.

The leaching plant of the Inspiration Consolidated Copper Co. at Inspiration, Ariz., is not, strictly speaking, a refinery, although so listed here; it produces electrolytic copper direct from leaching solutions. At one time all of this copper was shipped as cathodes to other refineries, where it was melted and cast into merchant shapes. In 1946, however, more than one-third went directly to consuming plants. In 1947 and 1948, the practice was continued on a considerably reduced scale, virtually ceased in 1949, and expanded again in 1950.

These 14 plants constitute what commonly are termed "primary refineries." The electrolytic plants, exclusive of that at Inspiration, have a rated capacity of 1,560,000 tons of refined copper a year. They produced at the rate of 84 percent of capacity in 1950.

Tables 14 and 15 show the production of refined copper at primary refining plants, classified according to source of copper, grade, and form in which cast.

TABLE 14.—Primary and secondary copper produced by primary refineries in the United States, 1941–45 (average) and 1946–50, in short tons

	1941–45 (average)	1946	1947	1948	1949	1950
Primary:						
From domestic ores, etc.:[1]

Other forms	25	2	16	1	29	2
Total	1, 353	100	1, 140	100	1, 430	100

In addition to the primary refineries, many plants throughout the country operate on scrap exclusively, producing metallic copper and a variety of alloys. The output of these plants is not included in the statements of refined-copper production in tables 14 and 15 but is included in table 17, on secondary-copper production.

Copper Sulfate.—Production and shipments of copper sulfate in 1950 were greater than in 1949. Shipments exceeded production in both years and stocks at the end of 1950 were only 19 percent of those held two years earlier.

Copper sulfate produced from blister or shot copper and from scrap is shown in table 16. The copper content thereof is not included in refinery production.

TABLE 16.—Production, shipments and stocks of copper sulfate in 1946–50, in short tons

Year	Production		Shipments (gross weight)	Stocks at end of year [1] (gross weight)
	Gross weight	Copper content		
1946	127, 800	31, 956	124, 700	13, 000
1947	89, 100	22, 276	86, 600	10, 200
1948	96, 700	24, 186	93, 100	11, 800
1949	79, 000	19, 749	84, 400	6, 400
1950	87, 300	21, 814	91, 300	2, 200

[1] Some small quantities are purchased and used by producing companies, so that the figures given do not balance exactly.

SECONDARY COPPER

Copper recovered from copper scrap, copper-alloy scrap, and other copper-bearing scrap materials as metal, as copper alloys without separation of the copper, or as copper compounds is known as secondary copper. Quantities are reported in terms of copper content.

Secondary copper is produced from new and from old scrap. "New scrap" is defined as refuse produced during manufacture of copper articles and includes defective finished or semifinished articles that must be reworked. Typical examples of new scrap are defective castings, clippings, punchings, turnings, borings, skimmings, drosses, and slag. "Old scrap" consists of metal articles that have been discarded after having been used. Such articles may be worn out, obsolete, or damaged. Typical examples are discarded trolley wire, fired cartridge cases, used pipe, and lithographers' plates.

Table 17 summarizes the production of secondary copper during 1941–50. Refined copper produced from scrap at primary refineries is included in the "unalloyed" class. Detailed information appears in the Secondary Metals—Nonferrous chapter of this volume.

TABLE 17.—Secondary copper produced in the United States, 1941–45 (average) and 1946–50, in short tons

	1941–45 (average)	1946	1947	1948	1949	1950
Copper recovered as unalloyed copper	120, 678	136, 909	303, 092	284, 026	250, 089	260, 704
Copper recovered in alloys [1]	818, 853	666, 637	658, 649	688, 762	463, 054	716, 535
Total secondary copper	939, 531	803, 546	961, 741	972, 788	713, 143	977, 239
From new scrap	495, 302	397, 093	458, 365	467, 324	329, 595	492, 028
From old scrap	444, 229	406, 453	503, 376	505, 464	383, 548	485, 211
Percentage equivalent of domestic mine output	96	132	113	117	95	107

[1] Includes copper in chemicals, as follows: 1941–45 (average), 14,460; 1946, 19,192; 1947, 18,838; 1948, 17,612; 1949, 14,840; 1950, 17,413.

CONSUMPTION

Consumption of primary copper, which includes copper shipped to the National Stockpile, was at a new peacetime peak in 1950. Figures on apparent consumption, as well as the derivation of these figures are shown in table 18; data for a long period are available on this basis. In estimating apparent consumption, it has been assumed that copper used in primary fabrication of copper is consumed. Although the table aims to show primary consumption only, it should be noted that exports and stocks, as well as the import component of "total supply," include some refined secondary copper that cannot be determined separately. Actual consumption of new copper would also differ from the figures shown in the table by changes in consumers' stocks. The figures on apparent consumption in 1947 and 1948 are especially distorted by the fact that during this period unusual quantities of copper were imported as scrap and reexported in refined form. Because refined exports cannot be broken down to show new and old copper, these reexports were necessarily deducted from apparent consumption even though the scrap from which they were produced was not included in available supply.

TABLE 18.—New refined copper withdrawn from total year's supply on domestic account, 1946–50, in short tons

	1946	1947	1948	1949	1950
Production from domestic and foreign ores, etc	878, 662	1, 159, 970	1, 107, 446	927, 927	1, 239, 834
Imports [1]	154, 371	149, 478	249, 124	275, 811	317, 050
Stock at beginning of year [1]	130, 000	96, 000	60, 000	67, 000	61, 000
Total available supply	1, 163, 033	1, 405, 448	1, 416, 570	1, 270, 738	1, 617, 884
Copper exported [1]	52, 629	147, 642	142, 598	137, 827	144, 561
Stock at end of year [1]	96, 000	60, 000	67, 000	61, 000	26, 000
Total	148, 629	207, 642	209, 598	198, 827	170, 561
Apparent withdrawals on domestic account [2]	1, 391, 000	1, 286, 000	[3] 1, 214, 000	[3] 1, 072, 000	[3] 1, 447, 000

[1] May include some copper refined from scrap.
[2] Adjusted for Office of Metals Reserve stock changes; OMR stocks consigned to National Stockpile late in 1948.
[3] Includes copper delivered by industry to the National Stockpile.

The Bureau of Mines began to compile figures on actual consumption of refined copper in 1945. Details for 1948 to 1950, inclusive, are shown in table 19. Unlike table 18, in which all but new copper is eliminated so far as possible, table 19 does not distinguish between new and old copper, but covers all copper consumed in refined form.

Consumption by wire mills was notably higher in the period 1947 to 1950, compared with 1945 and 1946. In the latest 4-year period wire mills have regularly taken over half of the total refined copper used.

TABLE 19.—Refined copper consumed in 1948–50, by classes of consumers, in short tons

Class of consumer	Cathodes	Wire bars	Ingots and ingot bars	Cakes and slabs	Billets	Other	Total
1948:							
Wire mills	13	743, 403	22, 390			43	765, 849
Brass mills	79, 235	62, 454	92, 889	209, 861	169, 875		614, 314
Chemical plants	45		655		5	2, 524	3, 229

Total	136, 663	763, 925	141, 275	212, 677	161, 180	8, 714	1, 424, 434

[1] Revised figures.

STOCKS

Industry stocks of metallic copper dropped in 1950, in contrast with the 1949 movement. Year-end inventories of refined copper were the lowest since 1906; unrefined stocks, however, remained at a more nearly normal level. Table 20 gives domestic stocks of copper as reported by primary smelting and refining plants. Blister and anode copper in transit from smelters to refineries are included with stocks of blister copper.

TABLE 20.—Stocks of copper at primary smelting and refining plants in the United States at end of year, 1945–50, in short tons

Year	Refined copper [1]	Blister and materials in process of refining [2]	Year	Refined copper [1]	Blister and materials in process of refining [2]
1945	130, 000	331, 000	1948	67, 000	183, 000
1946	96, 000	254, 000	1949	61, 000	261, 000
1947	60, 000	213, 000	1950	26, 000	232, 000

[1] May include some copper refined from scrap.
[2] Includes copper in transit from smelters in the United States to refineries therein.

The net drop during 1950 in producers' inventories of crude and refined copper combined was 20 percent. Only 10 percent of the end of 1950 total was in the form of refined copper, the remainder being in smelter shapes at smelters and in transit to refineries, and in smelter shapes and materials in process of refining at refineries.

Fabricators' stocks of refined metal (including in-process copper and primary fabricated shapes), according to the United States Copper Association, were 290,241 tons at the end of 1950 or 18 percent less than at the beginning of the year, continuing the downtrend since 1947. Working stocks (see table 21) were 288,392, or virtually unchanged from those at the end of 1949. After accounting for unfilled sales of metal, the deficiencies in stocks in relation to unfilled orders rose 181,911 tons to 218,831 tons at the end of 1950. The latter figure represented the largest deficiency since the end of 1946.

Figures compiled by the Copper Institute show that domestic stocks of refined copper decreased from 116,027 tons at the end of 1949 to 49,040 tons at the end of 1950. Inventory data of the Bureau of Mines and the Copper Institute always differ owing to somewhat different bases. Before 1947, a primary reason was that the Copper Institute coverage was limited to duty-free copper. The inclusion by the Copper Institute of all copper after January 1, 1947, reduced the differences chiefly to variations in interpretation. In the Bureau of Mines classification, cathodes to be used chiefly for casting into shapes are considered stocks in process and not refined stocks.

TABLE 21.—Stocks of copper in fabricators' hands at end of year, 1946–50, in short tons

[U. S. Copper Association]

	Stocks of refined copper [1]	Unfilled purchases of refined copper from producers	Working stocks	Unfilled sales to customers	Excess stocks over orders booked
1946	411,013	59,421	286,418	526,648	−342,632
1947	423,432	103,765	293,859	338,260	−104,922
1948	379,346	81,496	295,958	315,944	−151,060
1949	354,992	82,793	285,298	189,407	−36,920
1950	290,241	92,372	288,392	313,052	−218,831

[1] Includes in-process metal and primary fabricated shapes. Also includes small quantities of refined copper held at refineries for fabricators' account.

PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 1,512,000 short tons of copper were delivered to domestic and foreign purchasers in 1950 at an average price (f. o. b. refinery) of 20.8 cents a pound—a 6-percent rise from the 19.7 cents in 1949 and 51 percent above the annual average for 1942–47. The averages for 1942–47 exclude bonuses paid under the Premium Price Plan for overquota outputs of individual mines. These were first applicable to February 1942 tonnages; the plan ended June 30, 1947. The history of the Premium Price Plan is given briefly in Minerals Yearbook, 1947 (pp. 466–468) and at greater length in Bureau of Mines Information Circular 7536.

TABLE 22.—Average monthly quoted prices of electrolytic copper for domestic and export shipments, f. o. b. refineries, in the United States, 1949–50, in cents per pound

[1] As reported by American Metal Market.
[2] As reported by E&MJ Metal and Mineral Markets.

Under the stimulus of continued large and increasing demand, prices for electrolytic copper, delivered Connecticut Valley, advanced from 18.5 cents a pound at the beginning of the year to 24.5 cents at its end. There was an increase of 1 cent a pound on April 18 and of another cent on May 18. A 2-cent markup was made early in June, and another 2-cent rise to 24.5 cents occurred after mid-August, but all sellers did not immediately adopt the latter increase. It was not until October 2 that all primary factors were quoting 24.5 cents delivered Connecticut Valley (in case of Kennecott Copper Corp. delivered anywhere in the United States). Thereafter the price quotation continued unchanged for the remainder of the year.

The excise tax on copper became effective again on July 1, 1950. When reimposed, the tax amounted to 2 cents a pound on imported copper as against 4 cents before suspension. After July 1 customers were charged an additional 2 cents a pound for whatever foreign copper was used in filling their orders.

The price of export copper, f. o. b. refinery, was approximately 0.225 cent a pound above the domestic quotation through most of the year, but in September, when all producers failed to move to the higher price level for domestic copper, the average difference amounted to 1.399 cents.

London Price.—The prices of the British Ministry of Supply were raised similarly to those in the United States, although each increase carried the British price (converted to the equivalent in cents per pound) to about 1 cent above the United States price. A £16 per-ton drop immediately after the latest August rise, however, made the United Kingdom price temporarily lower than that in the United States. The price was £153 (equivalent to 19.1 cents a pound) a long ton on January 1, rose to £202 (equivalent to 25.25 cents) on August 22 (the highest sterling price on record), and dropped to £186 (equivalent to 23.25 cents) the following day. The price of £202 was reinstated effective September 1 and continued for the remainder of the year.

FOREIGN TRADE [4]

The long-term position of the United States in regard to copper was that of an exporting nation until World War II. For many years domestic mines produced far more copper than domestic industry could utilize. Domestic smelting and refining plants, moreover, had capacity to treat crude materials far over those coming from domestic sources; the excess capacity was used to smelt and refine imported copper under bond for reexportation in refined or manufactured forms. Much domestic copper as well was shipped for consumption in foreign markets. Starting in 1929, however, because of sharply reduced consumption the situation reversed, and the United States temporarily became a net importer, with the result than an excise tax of 4 cents a pound was imposed June 21, 1932, as a means of discouraging the entry of foreign copper into United States consumption channels. In 1933, the United States resumed its net export position. With the outbreak of World War II in Europe and the stepup of armament requirements there and elsewhere, the United States became a net importer of copper. During the war and just after, the Government was virtually the sole copper importing agent; at this time, the excise tax, not being applicable to Government purchases of "war material," was in effect suspended. After a brief period in which it was again applicable, the excise tax was suspended by acts of Congress, from April 30, 1947, to June 30, 1950. The suspended tax, meanwhile, was reduced as a result of the Trade Agreement negotiations at Geneva in 1947, to 2 cents a pound, effective March 16, 1949. The 2-cent tax finally came into effect on July 1, 1950, although several attempts were made in Congress to extend the suspension.

Much of the foreign copper currently entering the United States is exported after refining or after primary or later stages of fabrication. Much of the copper exported cannot be measured quantitatively, being in such items as electric motors, automobiles, and equipment of various types.

IMPORTS

Total imports of copper rose 25 percent in 1950, continuing the uptrend from the postwar low in 1946 and exceeding that year by 74 percent; they were, however, only 81 percent of the all-time peak in 1945. Refined copper accounted for 46 percent of total receipts and was 15 percent higher than in 1949. Partly refined copper (blister, etc.), second in importance of the import classes, rose 47 percent in 1950. Recently concentrates have gained in importance

[4] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

as a source of copper; but this class dropped 4 percent in 1950, and the unimportant ore class likewise fell. Imports of scrap, chiefly from Japan, had an outstanding increase, but the higher rate was not expected to continue. After supplying 52–70 percent of the total United States imports of unmanufactured copper in 1944–49, Chile fell to 42 percent of the total in 1950, although receipts from Chile increased slightly in that year. Receipts from Canada and Newfoundland were virtually unchanged, but this area's share of the total dropped from 15 to 12 percent. Rhodesia's share increased to 13, from 5 percent, with entries expanded to three times those in 1949. Mexico's tonnage and share of the total dropped, whereas Peru held its place, as imports therefrom rose 28 percent or similarly to the total.

TABLE 24.—Copper (unmanufactured) imported into the United States, 1941–45 (average) and 1946–50 [1]

[U. S. Department of Commerce]

Year	Short tons of contained copper	Year	Short tons of contained copper
1941–45 (average)	770,988	1948	507,449
1946	[2] 396,380	1949	[2] 552,709
1947	413,890	1950	690,231

[1] Data are "general" imports, that is, they include copper imported for immediate consumption plus material entering country under bond.

Total	[2] 396, 380	413, 890	507, 449	[2] 552, 709	690, 231

[1] Data are "general" imports, that is, they include copper imported for immediate consumption plus material entering the country under bond.
[2] Revised figure.
[3] Tonnages credited to Southern Rhodesia by the U. S. Department of Commerce have been added to Northern Rhodesia, inasmuch as copper of the grades reported does not originate currently in Southern Rhodesia.

Of the concentrates class, smaller imports came in 1950 from Canada and Newfoundland, Chile, and Mexico, but expanded tonnages came from Bolivia, Cuba, and the Philippines. Rhodesia's increased shipments of partly refined copper to the United States featured this class in 1950; Chile and Peru also sent greater tonnages, but Mexico, Turkey and Yugoslavia accounted for smaller quantities. Receipts of 27,427 tons of refined copper from Japan and of 4,098 tons from Norway were the highlights in this class, although entries from all other sources except Peru gained, and Peru maintained a steady tonnage.

EXPORTS

Most of the copper exported from the United States is in advanced forms of manufacture, in which the copper content is indeterminate, and in the form of refined copper. Shipments in refined form increased 5 percent in 1950. The United Kingdom received 51 percent of the total, France 13 percent, Italy 12 percent, India 6 percent, Netherlands 4 percent, and Switzerland nearly 4 percent; the remainder went to countries that each received 2 percent or less of the total. Of the foregoing countries, only the United Kingdom, with a gain of 183 percent, received more refined copper in 1950 than in 1949. Decreases of 4,000 tons or more each were indicated in shipments to France, Germany, India, Netherlands, and Switzerland and of over 1,000 tons each to Argentina, Austria, Brazil, and Italy. Denmark received 1,200 tons more and Norway 2,700 tons more. Foreign trade with Norway left a small balance in favor of the United States.

Exports of old and scrap were higher in 1950 than in 1949. All other export classes (rods, pipes and tubes, plates and sheets, and wire—insulated and other) showed marked declines in 1950.

WORLD REVIEW

World mine production of copper rose 11 percent in 1950, and the rate was the highest since 1944. Among leading copper-producing areas, Belgian Congo and Northern Rhodesia established new peaks, with gains of 24 and 15 percent, respectively, over 1949 and 6 and 12 percent over the previous high records in 1942 and 1940, respectively. Output in the United States increased 21 percent over 1949 and was the largest since 1944.

In Canada production was slightly less than in 1949, but otherwise at the highest level since 1944. Chilean production, in contrast, declined to the lowest rate since 1940.

[1] Copper content of blister produced.
[2] Smelter output from domestic and foreign ores, exclusive of scrap. Production from domestic ores only, exclusive of scrap, was as follows: 1944, 910,245; 1945, 710,073; 1946, 543,996; 1947, 782,780; 1948, 764,278; 1949, 687,580; 1950, 826,760. The diversion during the war of Belgian Congo matte from its previous destination, Belgium, for resmelting in the United States results in some duplication. The movement ended in 1945.
[3] United States imports.
[4] Figures represent blister copper only. Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from Belgian Congo and would therefore duplicate output reported under the latter country.
[5] Data not available; estimate by authors of chapter included in continental and world totals.
[6] Exclusive of material from scrap.
[7] Approximate production.
[8] Includes scrap.
[9] American and British zones only.
[10] Output from U. S. S. R. in Asia included with U. S. S. R. in Europe.
[11] Represents area designated as Free China during the period of Japanese occupation.
[12] Fiscal year ended Mar. 31, 1945.

Belgian Congo.—Conforming to the trend in most major copper-producing countries, copper production in Belgian Congo rose 24 percent in 1950, the largest percentage gain among the important copper areas. The rise, according to the Union Minière du Haut Katanga, only producer in the country, was made possible chiefly by the more normal rainfall during the year and by the commissioning of a new hydroelectric station. New electrolytic refining facilities have increased production capacity of electrolytic copper about 10,000 tons annually.

Belgium signed agreements with the Economic Cooperation Administration and the Export-Import Bank under which the country will receive a loan of $1,778,000 to help finance the initial stages of a major road development in Belgian Congo. The Congo road project is one phase of the Belgian Government's 10-year plan for the economic and social development of the African territory. The copper industry of Belgian Congo should benefit by the program.

Canada.—Mine production of copper fell 1 percent below 1949 but otherwise was the highest annual total since 1944. Refinery output rose 5 percent in 1950 continuing the up-trend in progress since the recent low in 1946. Refined-copper consumption was 106,868 tons in 1950 compared with 101,443 in 1949.

TABLE 34.—Copper produced (mine output) in Canada, 1946–50, by Provinces, in short tons [1]

Province	1946	1947	1948	1949	1950 (preliminary)
British Columbia	8,750	20,900	21,502	27,055	21,727
Manitoba	19,251	15,316	18,960	16,960	21,045
Newfoundland (not Canadian 1946–48)				3,617	3,057
Ontario	89,712	113,934	120,383	113,043	114,758
Quebec	34,899	42,561	48,813	67,822	72,826
Saskatchewan	31,356	33,151	31,074	34,960	28,501
Total	183,968	225,862	240,732	263,457	261,914

[1] Dominion Bureau of Statistics, Department of Trade and Commerce, Government of Canada, Preliminary Report on Mineral Production, 1950.

Ontario produced more than half of Canada's total for many years but fell to 43 percent in 1949 and 44 in 1950. The copper is derived from the nickel-copper ores of the Sudbury district; the International Nickel Co. of Canada, Ltd., is the outstanding producer in the Province and in Canada. Despite the company's importance as a copper producer, the principal value derived from the ore is from nickel, and the market for nickel is usually the dominant factor determining the rate of copper production. Accelerated open-pit output to fill World War II demands for nickel and copper has shortened the life of the pits. The company expects that surface deposits will be exhausted by 1953, but expanded underground operations to compensate for loss of pit ore are expected to lead to an output capacity of 13,000,000 tons of underground ore annually by that time. A major change is to involve the mining, by block-caving methods at the Creighton mine, of ores of lower grade than ever before. The new 6,000-ton mill at the Creighton is being enlarged and was planned to have a rated capacity of 10,000 tons by the end of 1951. The Murray mine was brought to a regular production basis during the year and by the end of the year was producing about 4,500 tons a day. Proved company reserves rose again in 1950 and stood at 252,859,725 short tons at the year end compared with 251,805,157 tons at its beginning. The nickel-copper content on December 31 was 7,669,219 tons compared with 7,630,099 a year earlier. The ore mined in 1950 was 9,849,024 tons compared with 9,984,891 in 1949, of which 5,733,269 and 5,015,318 tons, respectively, were underground, and 4,115,755 and 4,969,573 tons, respectively, open pit. The company delivered 106,474 tons of copper in 1950 and 110,538 in 1949, and 128,205 and 104,646 tons, respectively, of nickel in the same years. The company announced that oxygen flash smelting of copper concentrates would soon be in operation. A 300-ton-per-day oxygen generating unit and a new copper-concentrate smelting furnace of novel design were expected to be in operation before the end of the year; recovery of sulfur dioxide as a byproduct is a feature of the plant.

The Falconbridge Nickel Mines, Ltd.—the other important producer in Ontario—hoisted 881,838 tons of ore at the Falconbridge mine compared with 921,916 in 1949. Development ore at the McKim mine totaled 46,997 tons compared with 15,896 in 1949. The McKim was expected to begin regular production in 1951 and to reach full-scale operation by midyear. Reserves of developed ore were 9,369,000 tons averaging 1.60 percent nickel and 0.86 percent copper in the Falconbridge and McKim mines at the end of 1950; indicated ore reserves were 5,778,500 tons averaging 1.86 and 1.03 percent, respectively, in all Sudbury district holdings.

Quebec is regularly Canada's second most important copper Province. The largest producer here is Noranda Mines, Ltd., which operates the Horne mine. A total of 1,349,369 tons was hoisted in 1950, the largest tonnage since 1944. Copper production of 25,731 short tons, however, was slightly below 1949 and also under 1945. In addition, 202,453 ounces of gold and 572,080 ounces of silver were produced from Horne ore. Developed ore reserves above the 2,975-foot level were 16,590,000 tons averaging 2.22 percent copper and 0.186 ounce gold per ton, of which 4,031,000 tons averaged 7.05 percent copper and 0.157 ounce gold and 12,559,000 tons averaged 0.68 percent copper and 0.195 ounce gold. In addition to the 714,597 tons of Horne ore and concentrate the smelter treated 529,103 tons of custom material, which yielded 46,955 tons of copper.

At the end of 1950 the mill at the East Sullivan property was operating at close to maximum efficient capacity of 2,500 tons a day.

Production was begun at the property of Quemont Mining Corp., Ltd., in 1949, and 759,663 tons of ore were milled in 1950. The property, in which Noranda has a substantial interest, adjoins the Horne mine. Metal shipments were 11,634 tons of copper, 9,210 tons of zinc, 109,274 ounces of gold, and 412,007 ounces of silver. Copper concentrate goes to the Noranda smelter and zinc concentrate to the United States. As of January 1, 1951, reserves above the 2,340-foot level were 9,402,000 tons containing 1.43 percent copper, 2.87 percent zinc, 0.167 ounce gold, and 0.95 ounce silver to the ton.

The Normetal Mining Corp., Ltd., milled 363,297 tons of ore, averaging 2.45 percent copper, 8.08 percent zinc, 0.031 ounce gold, and 2.72 ounces silver in 1950. The copper concentrate is smelted at

Noranda; 58 percent of the zinc concentrate was shipped to the United States and the remainder to Belgium. Metals recovered were 7,853 tons of copper, 24,027 tons of zinc, 5,118 ounces of gold, and 491,798 ounces of silver. Ore reserves at the end of 1950 were 1,544,600 tons of ore averaging 3.37 percent copper and 7.41 percent zinc, and 28,500 tons of ore averaging 0.55 percent copper and 16.93 percent zinc.

At the property of the Waite Amulet Mines, Ltd. (controlled by Noranda), 424,365 tons of ore were milled and 12,936 tons of copper, 22,688 tons of zinc, 9,002 ounces of gold, and 373,398 ounces of silver produced. Ore reserves at the Waite mine were raised from 48,000 to 765,000 tons during the year owing chiefly to developments at "East Waite", where 700,000 tons averaging 4 percent copper and 3 percent zinc were in sight at the year end. Ore reserves of 1,123,186 tons at Amulet Dufault included 871,076 tons averaging 5.67 percent copper and 4.08 percent zinc, 52,110 tons averaging 1.11 percent copper and 6.02 percent zinc, and 200,000 tons averaging 2.75 percent copper and 0.6 percent zinc.

The Canadian Copper Refiners, Ltd. (controlled by Noranda), produced 123,200 tons of refined copper, compared with 111,100 tons in 1949.

At the Gaspé copper property of Noranda Mines, Ltd., 10,000,000 tons of ore was added to reserves. Reserves in Copper Mountain and in the upper zones in Needle Mountain average less than 1 percent copper, but 20,000,000 tons in the lower Needle Mountain zone average 2 percent. The total tonnage in the Gaspé property is now estimated at 57,000,000 tons, containing 1 percent copper.

Copper produced in *Saskatchewan* and *Manitoba* comes almost entirely from the Flin Flon mine of the Hudson Bay Mining & Smelting Co., Ltd., and the Sherridon operation of Sherritt Gordon Mines, Ltd. At the Hudson Bay mine 1,854,755 tons of ore was mined, of which 1,852,394 tons containing 2.24 percent copper, 4.6 percent zinc, 0.083 ounce gold, and 1.34 ounces silver per ton was milled; the concentrates therefrom—16,051 tons of direct-smelting ore from the stockpile and 41,496 tons of purchased concentrates—were treated for the production of 42,417 tons of copper, 48,944 tons of zinc, 130,041 ounces of gold, and 1,947,318 ounces of silver. Exclusive of custom production, company blister containing 42,632 tons of copper, 131,797 ounces of gold, 1,965,328 ounces of silver, and 142,242 pounds of selenium was shipped to the refinery. The company reported that no additional ore has been developed as yet in the lower levels of the mine but that geological conditions have not changed in depth and that a large amount of exploration work remains to be done. Reserves at the beginning of 1950 were reported as 20,157,000 tons, averaging 3.04 percent copper, 4.34 percent zinc, and 0.084 ounce gold and 1.14 ounces silver per ton.

In 1950, 375,592 tons of ore were hoisted by Sherritt Gordon Mines, Ltd., compared with 432,524 tons in 1949. The higher price for copper again extended the life of the West mine; and whereas no new ore was found, some marginal material became economic when mined with higher-grade reserves. Reserves at the end of the year were 128,431 tons, averaging 2.59 percent copper, 2.07 percent zinc, and 0.021 ounce gold and 0.62 ounce silver per ton. Production in 1950 was 7,337 tons of copper, 8,344 tons of zinc concentrates, 4,441 ounces of gold, and 135,339 ounces of silver. Plans for bringing the Lynn Lake property into production progressed during the year. This ore contains more nickel than copper, and the company plans to build a completely integrated plant, including a nickel refinery. Production annually of about 8,500 tons of refined nickel, 4,500 tons of copper, 300,000 pounds of cobalt, and 70,000 tons of ammonium sulfate is anticipated. To attain the foregoing output, initial production of about 2,000 tons a day from the two highest-grade ore bodies will be treated. Later on, as the lower-grade ore bodies are brought into production, the tonnage of ore treated will be increased to maintain metal output. Copper concentrates at first will be custom-smelted but will later be treated in the company's own refinery. Exploration work in 1950 added to Lynn Lake's reserves, which at the end of the year were 14,055,000 tons averaging 1.223 percent nickel and 0.618 percent copper.

Chief producers in *British Columbia* are the Granby Consolidated Mining, Smelting & Power Co., Ltd., and the Britannia Mining & Smelting Co., Ltd.

At the concentrator of Granby Consolidated Mining, Smelting & Power Co., Ltd., 1,799,853 tons of ore were treated. Company production was 12,743 tons of copper, 8,475 ounces of gold, and 173,424 ounces of silver compared with 17,847 tons of copper, 11,904 ounces of gold, and 255,931 ounces of silver in 1949. Rechecking previous estimates of tonnages and grade in various ore blocks resulted in a reduction in ore reserves to 5,530,000 tons of ore averaging 1–1.1 percent copper at the year end. At the end of 1949, reserves were reported to be 7,524,000 tons.

Exports of ingots, bars, and billets from Canada in 1950 as compared with 1949 were as follows, by countries of destination, in short tons:

Destination:	*1949*	*1950*
United Kingdom	59, 491	64, 325
United States	50, 212	50, 425
India	5, 741	6, 683
France	7, 403	5, 064
Netherlands	756	1, 871
Switzerland	1, 847	1, 867
Italy	98	1, 075
Brazil	790	858
Hong Kong	207	784
Other	615	1, 290
	127, 160	134, 242

Exports of copper in ore, matte, regulus, etc., totaled 32,299 (37,057 in 1949) tons, of which the United States was the destination of 25,495 (29,650) tons, Norway 6,118 (6,495) tons, the United Kingdom 686 (800) tons, and Belgium no (112) tons. In addition, 15,941 (31,529) tons of rods, strips, sheet, and tubing and 6,233 (3,514) tons of old and scrap copper, were shipped from the country.

Chile.—Mine output of copper decreased 3 percent in 1950, and smelter production fell 2 percent, continuing the declines from recent highs established in 1948. Production was interrupted several times by labor strikes, two of approximately 3 weeks' duration each occurring at the Chuquicamata mine and one at the Andes mine lasting from late August until October 1. Two or three other strikes of shorter duration affected production adversely. According to the annual report to stockholders of the Kennecott Copper Corp., martial law was imposed August 22, 1949, in all mining districts in Chile and was terminated in March 1950.

The Chuquicamata mine of the Chile Exploration Co., a subsidiary of the Anaconda Copper Mining Co., produced 172,286 short tons of copper compared with 193,001 tons in 1949. Deliveries were 183,695 and 196,575 tons, respectively, in the 2 years. Construction of the new metallurgical plant for treatment of sulfide ores which had been begun in 1949, progressed on schedule. The plant was made necessary by depletion of the oxide ores that have formed the basis of operations since they were begun in 1915. According to the company:

This plant, which will consist of a sulphide concentrator and a smelter, should be in full operation before the end of 1952. The concentrator will have capacity to treat 30,000 tons of sulphide and mixed ores per day. Each section consists of one 10 ft. x 14 ft. rod mill and one 10 ft. x 12 ft. ball mill with classifiers and 58 flotation cells. The smelter will contain three reverberatory furnaces each 35 ft. x 125 ft. and three 13 ft. x 30 ft. Pierce Smith Converters. The estimated output of this sulphide plant will be 300,000,000 pounds of blister copper per year.

During 1950 practically all of the excavation for the new Plant was completed, amounting to 1,900,000 cubic yards. A total of 24,000 tons of structural steel required for the Plant buildings, has been delivered and a substantial part of it has been erected. A gravity water pipe line with intake works, will be completed by April, capable of delivering 40,000 tons of water per day to the plant. Standard gauge electrified railroad lines for this project, totaling 12 miles, have been completed. 44 housing units for married members of the staff were completed and construction is now well under way on 545 additional houses for married workmen and their families. These units are in addition to accommodations built in 1949 for 950 single men.

The total estimated cost of the new Sulphide Plant is approximately $90,000,000. The expenditures on this project through December 31, 1950 totaled $44,836,645 of which $21,803,984 was expended during 1950.

At the Andes mine 49,869 tons of copper was produced compared with 53,473 tons in 1949.

At the Braden mine of the Kennecott Copper Corp. a total of 8,471,004 tons of ore, assaying 2.09 percent copper, was mined and milled. Smelter output was 157,910 tons compared with 139,592 tons in 1949. The company announced that the accelerated mine development program begun in 1949 had placed the mine in position to maintain normal production. The company stated: "The following economies were effected: (1) a saving in manpower was brought about by increasing the number of gathering dumps on the producing levels; (2) timber consumption has been greatly reduced through the changeover to modified sublevel caving; and (3) a considerable saving in upkeep was made by housing at Sewell the workers who formerly lived at the Teniente "C" camp." Snowfall greater by 55 percent than in 1949 virtually assured adequate water for normal operations during the winter months.

Chilean exports of the chief types of copper by countries, are shown in table 35. Other copper exports from Chile, all to the United States except as indicated, were 163 tons of ore, 16,005 tons of concentrates (415 tons to Germany), 341 tons of precipitates, 480 tons of cement copper, 766 tons of scrap, and 325 tons of remelted scrap bars (all to Argentina).

TABLE 35.—Principal types of copper exported from Chile in 1950, by countries, in metric tons

	Refined		Standard (blister)	Elongated wire bars	Total
	Electrolytic	Fire-refined			
United States	99,949	102,739	47,960		250,648
Italy	11,778	1,044	10,000		22,822
France	9,248	5,924	500		15,672
Brazil	10,577	1,749			12,326
Germany		3,402	3,734	1,086	8,222
Argentina		139		5,697	5,836
Poland			2,032		2,032
Denmark	51	1,422			1,473
Netherlands				597	597
Switzerland	584				584
Norway	526				526
Czechoslovakia		508			508
Belgium	102	127		100	329
Other countries	117	104			221
Total	132,932	117,158	64,226	7,480	321,796

France.—It is reported that a new company, Cie Générale d'Electrolyse du Palais, has been formed to lease the Palais-sur-Vienne electrolytic refinery near Limoges, France. The companies participating in the new concern are the Union Minière du Haut Katanga and its subsidiary (Société Générale Métallurgique de Hoboken—Belgium) and the French companies Cie Générale du Duralumin et du Cuivre (Cegedur), Cie. Francaise des Métaux and Tréfileries et Laminoirs du Havre. A minimum of 180,000 tons of rough copper in a 15-year period is guaranteed the refinery.[5]

Mozambique.—The Economic Cooperation Administration has granted Portugal aid to help solve the problem of traffic congestion at the port of Beira, long the principal outlet for mineral products of Northern and Southern Rhodesia, and to some extent of Belgian Congo. An advance of $950,000, as well as 4,250,000 Netherlands guilders (about $1,118,400), was granted from Marshall Plan counterpart funds. Copper is one of the chief items being shipped from Beira.

Northern Rhodesia.—Production of copper increased notably again in 1950, continuing the advance since 1946. Output thus established a new all-time high, exceeding the previous peak of 1940 by 12 percent. Nonetheless, continued rail-transportation difficulties that interfered with delivery of adequate supplies of coal prevented full attainment of production objectives. The copper companies, in conjunction with the Northern Rhodesian Government and the British South Africa Co., entered into an agreement to survey the coal resources of Northern Rhodesia, but, as late as November 1950, there were no indications of payable deposits. Burning of wood to supplement inadequate coal supplies increased still further in 1950. The Economic Cooperation Administration approved a technical assistance project to help the British Government make a preliminary survey in connection with the proposed construction of a railway link between Rhodesia and East Africa. The survey was to be financed jointly by ECA and the British Government; ECA was to pay the dollar costs, estimated at $40,000. Five members of the Anglo-American Corp. secured permission of the British Treasury to transfer their headquar-

[5]Metal Bulletin (London), No. 3531, October 6, 1950, p. 11.

ters offices from London to Northern Rhodesia. Substantial tax savings were to be realized by the move. The five companies were Rhokana Corp., Nchanga Consolidated Copper Mines, Rhodesia Copper Refineries, Rhodesian Anglo American, and Rhodesian Broken Hill Development.

A total of 3,366,500 short dry tons of ore, containing 2.38 percent copper, was mined at the Roan Antelope mine in the fiscal year ended June 30, 1950, or 10 percent above the previous fiscal year. Production of blister copper was 71,184 short tons compared with 62,901 short tons in the 1949 fiscal year. Ore reserves at the end of June 1950 were estimated at 93,317,965 tons, averaging 3.25 percent copper. The increase in reserves as compared with 1949 resulted from the thickness of ore in portions of the mine being greater than had been estimated from borehole information.

The Rhokana Corp., Ltd., produced 130,071 short tons of copper in the year ended June 30, 1950, of which 17,557 (13,734 in 1949) tons was Nkana blister copper, 39,866 (38,438 in 1949) Nchanga blister, and 72,648 (70,246 in 1949) Nkana electrolytic copper. Virtually the entire output in the next fiscal year will be electrolytic copper owing to anticipated completion of the extension of the Rhodesia Copper Refineries, Ltd. Ore reserves at the end of June 1950 were as follows:

	Short tons	*Copper (percent)*
Nkana north ore body	30, 700, 600	3. 10
Nkana south ore body	20, 165, 000	2. 78
Mindola ore body	52, 788, 000	3. 60
Total	103, 653, 600	3. 29

The over-all total was reduced during the year from 107,288,600 tons, averaging 3.35 percent copper.

The extension program at Nchanga—to increase production to about 64,000 long (nearly 72,000 short) tons—was reported to be nearing completion. Further expansion to 121,000 short tons, to be started immediately, was decided upon and planned for completion by the end of 1952. According to the Yearbook of the American Bureau of Metal Statistics for 1950, reserves at the Nchanga mine in 1950 were 138,391,954 short tons, averaging 4.66 percent copper.

The Mufulira Copper Mines, Ltd., mined 3,134,493 short tons of ore during the fiscal year ended June 30—a new record; of the 1949–50 tonnage, 56 percent was produced by block-caving methods. Blister-copper production was 86,294 tons, an increase of 9 percent over 1948–49. Construction of the company's electrolytic refinery was begun in April. Progress was said to be up to schedule, and the refinery was expected to start production of cathodes in the first half of 1952. Estimated ore reserves, as of June 30, were 162,822,000 tons, containing 3.89 percent copper.

Peru.—Mine output of copper rose from 27,959 metric (30,820 short) tons in 1949 to 29,930 metric (32,992 short) tons in 1950. The Cerro de Pasco Copper Corp. is by far the chief copper-producing company; it accounted for 22,868 metric (25,208 short) tons in 1950 of which 14,996 (16,530 short) was from corporation ores and 7,872 metric (8,677 short) tons from custom ores, compared with a total of 21,031 metric (23,183 short) tons in 1949, of which 13,010 (14,341) and 8,021 (8,842) tons, respectively, were from corporation and other ores. In addition to copper, the corporation produces noteworthy quantities of lead, gold, silver, and zinc concentrates. Lead and zinc outputs are making important gains, whereas copper production has decreased notably over a long period. Copper production from Cerro de Pasco ores in 1950 was little more than half of that in 1938. According to the corporation's annual report for 1950, half of the copper refinery at Huaymanta, near La Oroya, was converted to an electrolytic lead refinery, increasing the lead-refinery capacity to 160 tons a day, or to approximately the capacity of the existing lead smelter. The corporation has authorized extension of the Paragsha mill at Cerro de Pasco to increase daily capacity from 700 to 1,000 short tons of lead-zinc ores and an additional unit with an initial capacity of about 500 tons a day. The plan is to use the latter unit at first for flotation of copper ores from the Cerro de Pasco mine. Further expansion of this unit and its conversion to the flotation of lead-zinc ores are contemplated.

In 1949 the American Smelting & Refining Co. began an extensive churn- and diamond-drilling program on the Toquepala copper mine in southern Peru. This work was intensified in 1950. Exploration of the Quellaveco copper property, about 20 miles from Toquepala, was completed. The ore-reserve estimate showed a substantial tonnage, assaying slightly less than 1 percent copper. The entire tonnage at Quellaveco, was said to be susceptible to mining by open-pit methods, with a favorable stripping ratio. Consideration of placing either Toquepala or Quellaveco on an operating basis depends on completion of drilling at Toquepala and further investigations of power, water, railroad, and port facilities. Engineering studies in connection with these features are expected to require a long time.[6]

Philippines.—There was no output of copper in the Philippines in 1946, but production was resumed in 1947 and thereafter has increased each year, approaching pre-World War II levels in 1950. A report on reasons for the failure of the Philippine mining industry as a whole to reach prewar tonnages was recently published.[7]

The Lepanto Consolidated Mining Co. is the largest producer in the country. Operations at this property were described in a report which stated that the mill was handling 1,000 tons of ore averaging 4.5 percent copper daily. Metallurgical data for a recent month were as follows: Heads, 31,010 tons containing 4.12 percent copper and 0.128 ounce gold; tails, 26,810 tons, averaging 0.35 percent copper and 0.03 ounce gold; concentrates, 4,200 tons, containing 28.19 percent copper and 0.754 ounce of gold.[8]

Turkey.—The annual economic review of the United States Embassy at Ankara indicates that production of copper in Turkey rose from 11,300 metric tons in 1949 to 11,700 tons in 1950. The new concentrating plant at the Ergani mine went into partial operation in April and was in full operation by the end of the year. The crushing, flotation, and smelting plant at Murgul (Northeastern Turkey) was completed in 1950.

United Kingdom.—Consumption of copper increased 5 percent in 1950 to 521,998 long tons, of which 333,700 was virgin and 188,298 was scrap, from 496,720 tons in 1949, of which 318,736 was virgin and 177,984 scrap. Of the 1950 total, 303,833 tons was used as unalloyed copper, 204,427 was contained in brass or other alloyed form, and 13,738 tons in copper sulfate. The scrap tonnage includes processing scrap returned to mills of origin. Stocks of virgin blister and refined copper (held by the Ministry of Supply and consumers) dropped from 129,674 tons at the beginning of the year to 104,330 at the year end. These inventories include electrolytic (including rods), fire-refined, and blister copper on hand and in transit to the United Kingdom.

Two electrolytic copper refineries, one of 3,500 tons annual capacity and one of nearly 10,000 tons, were under construction during the year, and the latter began production. The smaller plant being erected at Widnes will treat rough copper produced there, and the larger (near Walsall) is operating on unalloyed and alloyed scrap.[9]

The British Ministry of Supply raised its price for unwrought copper £9 to £162 a long ton (equivalent to 20.25 cents a pound) on April 19, on May 18 to £164, and later the same day to £170 (21.25 cents). Further gains to £186 (23.25 cents) on June 9 and to £202 (25.25 cents) on August 22 were followed by rescinding of the latest rise on August 23. The price was returned to £202 effective September 1 and continued at this level for the remainder of the year. This is the highest sterling price ever recorded.

TABLE 36.—United Kingdom imports of copper in 1949–50, by country and class of copper, in long tons [1]

	1949			1950		
	Electrolytic	Standard	Total	Electrolytic	Standard	Total
Northern Rhodesia	36, 559	112, 887	149, 446	44, 387	105, 871	150, 258
United States	24, 132		24, 132	60, 791		60, 791
Canada	53, 267		53, 267	57, 202		57, 202
Belgium	21, 815		21, 815	23, 903		23, 903
Germany	18, 953		18, 953	14, 027		14, 027
Belgian Congo	17, 249		17, 249	9, 000		9, 000
Chile	1, 883	21, 960	23, 843	100	1, 833	1, 933
Other countries	1, 707	290	1, 997	556	279	835
	175, 565	135, 137	310, 702	209, 966	107, 983	317, 949

[1] Metal Statistical Digest, No. 43, January 1951, p. 2.

United Kingdom exports of copper in 1949 and 1950 were as follows (long tons):

	1949	*1950*
Ingots, etc	32, 113	23, 472
Plates, sheets, etc	9, 780	25, 620
Wire in coils	31, 378	29, 303
Tubes	6, 088	4, 777
Other manufactures	5, 143	2, 760
Total	84, 502	85, 932

According to the British Sulphate of Copper Association, Ltd., exports of copper sulfate from the United Kingdom increased to 43,391 long tons in the fiscal year 1949–50 from 34,988 tons in 1948–49.

[9] Metal Industry (London) Special Emergency News Bulletin: Vol. 77, No. 15, Oct. 13, 1950, p. 1. Mining World, vol. 12, No. 12, November 1950, p. 53.

A shortage of scrap might cause a drop in 1950–51, according to the association.

Yugoslavia.—It is reported that 40,000 tons of blister copper were produced in Yugoslavia in 1950. Although it had been feared that the Bor mine was nearing exhaustion, the report said that recent discoveries assured a considerable extension of life. A recently explored group of deposits, at Majdanpek, Eastern Serbia, containing ore of slightly over 1 percent copper and 0.5 to 2 grams gold per ton, was claimed to be second-largest in Europe. Geologists were searching for copper also in other parts of Yugoslavia—Macedonia, Bosnia, Herzegovina, and Montenegro. A new electrolytic refinery is under construction at the Bor mine and will have enough capacity for Yugoslavia's entire output. A modern copper rolling mill is being erected at Sevojno and is due to be completed in 1952. Its capacity is to be about 21,000 tons of finished products. A cable plant is under construction at Svetozarevo and is to produce all types of cables. The only existing cable plant, at Novi Sad, was said to be entirely inadequate to meet requirements of the Yugoslav electrification program.[10]

Feldspar

By Brooke L. Gunsallus and G. E. Tucker

GENERAL SUMMARY

CRUDE FELDSPAR production in 1950 increased 10 percent in tonnage and 12 percent in value over 1949. Ground feldspar increased 15 percent in quantity and 13 percent in value. The quantity of ground sales shipped to the pottery industry increased 25 percent, enamel industry 30 percent, and glass industry 6 percent in 1950 over 1949. Substitutes for feldspar in glass manufacture, such as aplite and nepheline syenite, held down the demand for ground feldspar in this industry. The large increase in sanitary ware, high-temperature electrical insulators, and whiteware manufacture was the reason for the unusually large demand for feldspar in the pottery industry. The demand for domestic appliances, such as stoves, washing machines, and refrigerators, and broader application of porcelain enamels in the construction field helped to increase the market demand for feldspar.

Imports of crude feldspar from Canada decreased 22 percent in 1950 compared with 1949. As American Nepheline, Ltd., closed its grinding plant at Rochester, N. Y., and shifted all grinding operations to Lakefield, Ontario, Canada, during 1950, the imports of crude nepheline syenite decreased 78 percent and imports of the ground product increased 189 percent in 1950 compared with 1949. Total imports of both crude and ground nepheline syenite for 1950 were 5 percent greater than in 1949. Total sales of aplite in 1950 increased very substantially over 1949, owing, in part, to the high level of glass-container production.

TABLE 1.—Salient statistics of the feldspar industry in the United States, 1940–44 (average), and 1947–50

	1940–44 (average)	1947	1948	1949	1950
Crude feldspar:					
Domestic sales:					
Long tons	316,275	459,910	460,713	369,378	407,925
Value	$1,559,673	$2,410,940	$2,564,357	$2,278,441	$2,558,390
Average per long ton	$4.93	$5.24	$5.57	$6.17	$6.27
Imports:					
Long tons	11,149	16,685	31,047	15,826	12,367
Value	$80,467	$124,587	$219,785	$107,925	$84,136
Average per long ton	$7.22	$7.47	$7.08	$6.82	$6.80
Ground feldspar:					
Sales by merchant mills:					
Short tons	329,385	482,700	506,451	386,707	446,523
Value	$3,565,610	$5,861,141	$6,462,231	$5,609,101	$6,343,619
Average per short ton	$10.83	$12.14	$12.76	$14.50	$14.21

DOMESTIC PRODUCTION

CRUDE FELDSPAR

Production of crude feldspar in 1950 increased 10 percent over 1949, and the total value increased 12 percent. The average value per ton was $6.27 compared with $6.17 in 1949. Eleven States reported production in 1950 compared with 13 in 1949. Wyoming and New York were the only States reporting in 1949 that did not report in 1950.

TABLE 2.—Crude feldspar sold or used by producers in the United States, 1945–50

Year	Long tons	Value		Year	Long tons	Value	
		Total	Average			Total	Average
1945	373,054	$2,021,529	$5.42	1948	460,713	$2,564,387	$5.57
1946	508,380	2,594,099	5.10	1949	369,378	2,278,441	6.17

Undistributed[2]	59,991	404,501	50,343	347,652	63,620	458,208
Total	460,713	2,564,387	369,378	2,278,441	407,925	2,558,390

[1] Included with "Undistributed," in order to avoid disclosure of individual company operations.
[2] Includes Arizona, California, Georgia, New Hampshire, New York (1948–49), Texas (1949–50), and Wyoming (1949).

In comparison with output in 1949, the following large producing States showed decreases: Colorado, Maine, and Virginia. With the exception of California, all other States showed increases. The principal producer was North Carolina with 183,027 long tons (45 percent of total), Colorado was second with 59,457 long tons (15 percent of total), and South Dakota third with 43,875 long tons (11 percent of total).

GROUND FELDSPAR

Sales of ground feldspar by merchant mills in 1950 reached 446,523 short tons, an increase of 15 percent over 1949 but lower than in 1946, 1947, and 1948. The total value increased 13 percent over 1949, and the average selling price per ton was $14.21, a decrease of 2 percent. The number of producing States was 14, the same as in 1949.

TABLE 4.—Ground feldspar sold by merchant mills [1] in the United States, 1946–50

Year	Active mills	Domestic feldspar			Canadian feldspar			Total	
		Short tons	Value		Short tons	Value		Short tons	Value
			Total	Average		Total	Average		
1946	28	454,869	$5,029,330	$11.06	15,330	$316,777	$20.66	470,199	$5,346,107
1947	26	464,179	5,461,576	11.77	18,521	399,565	21.57	482,700	5,861,141

1950	23	429,787	5,952,019	13.85	16,736	391,600	23.40	446,523	6,343,619

[1] Excludes potters and others who grind for consumption in their own plants.

As has been the case for several years, North Carolina again was by far the largest grinder of feldspar, followed by Colorado, South Dakota, and Tennessee. Colorado was the only State among the large grinders to show a decrease in 1950; but production in the smaller producing States—California, New York, and Virginia—also declined. Increases were shown ranging from 18 percent for Connecticut-New Jersey to 25 percent for North Carolina-Tennessee and even higher for certain other States.

TABLE 5.—Ground feldspar sold by merchant mills [1] in the United States, 1948–50, by States

State	1948			1949			1950		
	Active mills	Short tons	Value	Active mills	Short tons	Value	Active mills	Short tons	Value
Colorado	2	81,049	$825,476	2	69,294	$727,989	2	62,879	$663,712
Connecticut	2	23,412	446,060	2	21,572	437,030	2	25,532	510,501
New Jersey	1			1			1		
Maine	3	20,789	347,492	3	16,742	295,227	3	19,938	352,809
North Carolina	4	219,720	2,377,030	4	159,768	2,203,604	3	200,373	2,526,268
Tennessee	2			1			1		
Undistributed [2]	14	161,481	2,466,173	14	119,331	1,945,251	11	137,801	2,290,329
Total	28	506,451	6,462,231	27	386,707	5,609,101	23	446,523	6,343,619

[1] Excludes potters and others who grind for consumption in their own plants.
[2] Includes (number of active mills in parentheses) Arizona (1), California (1 in 1949–50), Georgia (1), Illinois (1), New Hampshire (3 in 1948–49, 2 in 1950), New York (3 in 1948–49, 1 in 1950), South Dakota (3 in 1948, 2 in 1949–50), and Virginia (2).

The percentage of total shipments from several States was: Colorado, 14 percent (18 percent in 1949); North Carolina-Tennessee, 45 percent (41 percent in 1949); Connecticut-New Jersey, 6 percent; and Maine, 4 percent, the same as in 1949.

Campo Milling Corp. of Campo, Calif., purchased a feldspar mill formerly owned by American Radiator & Standard Sanitary Co. A froth-flotation section will be installed.[1] Feldspar Flotation Corp. built a new plant at Spruce Pine, N. C.[2] The Consolidated Feldspar Corp. closed its flotation plant at Parkdale, Colo., owing to develop-

[2] Pit and Quarry, vol. 42, No. 7, January 1950, p. 97.

ment of feldspar sources nearer the Pacific-coast market.[3] In order to manufacture the finer grades of feldspar, the Appalachian Minerals Co., Monticello, Ga., installed a new pebble mill.[4]

CONSUMPTION AND USES

CRUDE FELDSPAR

Many merchant grinders also mine feldspar, either themselves or through affiliated firms. A large part of their supply of crude feldspar, however, is obtained from small operators who sell their product principally to the merchant mills. The tonnage of feldspar and feldspathic rock treated in flotation plants is increasing.

Most of the consumers of feldspar buy material already ground, sized, and ready for use in their products. Some pottery, enamel, and soap manufacturers, however, purchase all or part of their requirements crude and crush or grind it to their own specifications in their own mills. Some Canadian crude feldspar is purchased direct by consumers in this country. Manufacturers of artificial teeth annually consume a small tonnage of very carefully selected crude feldspar, which must be free from grit and is marketed at a considerable premium over No. 1 grade commercial feldspar.

GROUND FELDSPAR

The glass, pottery, and enamel industries consumed 99 percent of all ground feldspar in 1950 compared with a like amount in 1949 and 98 percent in 1948. In 1950, glass accounted for 48 percent; pottery, 44 percent; enamel, 7 percent; and other industries, including soaps and abrasives, the remaining 1 percent. Tonnage shipped to the enamel trade increased 30 percent, to the pottery industry 25 percent, and to glass manufacturers 6 percent. However, shipments to all other branches of industry using ground feldspar decreased about 3 percent in 1950.

TABLE 6.—Ground feldspar sold by merchant mills in the United States, 1948–50, by uses

Use	1948		1949		1950	
	Short tons	Percent of total	Short tons	Percent of total	Short tons	Percent of total
Ceramic:						
Glass	270,065	53.3	199,852	51.7	212,481	47.6
Pottery	202,905	40.1	158,218	40.9	197,817	44.3
Enamel	25,282	5.0	25,351	6.6	33,037	7.4
Other ceramic uses			30			
Soaps and abrasives	8,135	1.6	3,142	.8	3,028	.7
Other uses	64		114		160	
Total	506,451	100.0	386,707	100.0	446,523	100.0

The percentage of total consumption for the principal States in 1950 was as follows, the comparable 1949 figure being shown in parentheses: Ohio, 15 percent (14 percent); Pennsylvania, 13 percent

[3] Rock Products, vol. 53, No. 2, February 1950, p. 83.
[4] Rock Products, vol. 53, No. 1, January 1950, p. 86.

(15 percent); Illinois, 13 percent (13 percent); New Jersey, 12 percent (11 percent); West Virginia, 8 percent (8 percent); and Indiana, 7 percent (7 percent).

For the most part, shipments to all States held their own or increased in 1950 compared with 1949.

Names and addresses of merchant grinders of feldspar in the United States are listed below:

Abingdon Potteries, Inc., Abingdon, Ill.
Appalachian Minerals Co., Monticello, Ga.
Black Hills Tin Co., Tinton, S. Dak.
Carolina Mineral Co., Inc., Kona, N. C.
Clinchfield Sand & Feldspar Corp., 618 Mercantile Bldg., Baltimore, Md.
Consolidated Feldspar Corp., Trenton Trust Bldg., Trenton, N. J.
Eureka Mica Mining & Milling Co., Portland, Conn. (Eureka Flint & Spar Co., Inc., 190 West State St., Trenton, N. J., sales agent).
Feldspar Flotation, Inc., Spruce Pine, N. C.
Feldspar Milling Co., Burnsville, N. C.
Genesee Feldspar Co., 360 Boxart St., Rochester 12, N. Y.
Golding-Keene Co., 1401 New York Ave., Trenton, N. J.
J. F. Morton, Inc., P. O. Box 246, Bellows Falls, Vt.
North Carolina Feldspar Corp., Erwin, Tenn.
Northern Feldspars Corp., West Rumney, N. H.
Standard Flint & Spar Corp., New York Ave., Trenton 8, N. J.
Topsham Feldspar Co., Topsham, Maine.
United Feldspar & Minerals Corp., 10 East 40th St., New York 16, N. Y.
Western Feldspar Milling Co., 1333 W. Maple Ave., Denver, Colo.
Worth Spar Co., P. O. Box 763, Middletown, Conn.

TABLE 7.—Ground feldspar shipped, by States of destination, from merchant mills in the United States, 1945–50, in short tons

Destination	1945	1946	1947	1948	1949	1950
California	8,735	8,641	7,395	8,406	8,385	(1)
Illinois	53,114	68,737	72,212	66,064	51,202	56,513
Indiana	47,321	47,756	44,864	37,774	25,962	28,875
Maryland	9,411	18,374	19,531	19,832	16,371	20,861
Massachusetts	3,258	3,009	3,906	4,437	1,944	5,733
New Jersey	35,735	41,340	43,969	52,587	44,243	53,430
New York	19,005	19,420	20,279	20,887	19,900	22,362
Ohio	48,151	47,031	63,939	64,805	52,533	68,186
Oklahoma	(1)	14,411	13,248	13,315	15,722	(1)
Pennsylvania	47,217	70,706	84,026	87,021	57,160	57,190
Tennessee	8,881	18,337	10,263	10,211	7,917	11,202
West Virginia	58,653	66,024	51,129	60,310	30,393	37,246
Wisconsin	7,058	10,317	9,958	11,741	10,749	12,580
Other destinations [2]	35,189	36,096	37,981	49,061	44,226	72,345
Total	381,728	470,199	482,700	506,451	386,707	446,523

[1] Included with "Other destinations"; separate figure for State not available.
[2] Includes Arkansas, California (1950), Colorado, Connecticut, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Oklahoma (1945 and 1950), Puerto Rico, Rhode Island, Texas, Washington, shipments that cannot be segregated by States, and small shipments to Canada, England, Mexico, and other countries. Also includes specified shipments to Alabama (1949), District of Columbia (1947), Florida (1949), Iowa (1947), Kansas (1948), Maine (1948 and 1950), and North Carolina (1947).

PRICES

Quotations on crude feldspar do not appear in the trade press. Average values are computed from the returns of producers reporting their output annually to the Bureau of Mines. In 1950 the average selling price per long ton for all feldspar mined in the United States was $6.27 compared to $6.17 in 1949 and $5.57 in 1948.

The average realization per short ton for ground feldspar in 1950 was $14.21, a decrease from 1949 of 2 percent. Of the larger producing States, the State having the highest average value per short ton was New Jersey ($25.23), followed by New York ($23.40) and Illinois ($20.74). The lowest average value per short ton was for Colorado ($10.56).

Quotations on ground feldspar appearing in E&MJ Metal and Mineral Markets reports for 1950 were the same as in 1948 and 1949 as follows: North Carolina, bulk carlots, 200-mesh, $18.50 per short ton; 325-mesh, $22.50; glass feldspar, No. 18, $12.50; and semi-granular, $11.75 (add $3.00 per ton to bulk quotation for bags and bagging). Virginia feldspar presented the same price picture in 1950 as in 1949, as follows: No. 1, 230-mesh, $18.50 per ton, and 200-mesh, $17.50; No. 17 glassmakers' feldspar, $11.75 and No. 18, $12.50. Enamelers' feldspar was listed at $15 to $17 throughout the year.

FOREIGN TRADE [5]

Imports for consumption of crude feldspar in 1950 totaled 12,367 long tons (all from Canada, except 1 ton from Norway) valued at $84,136. Compared with 1949, there was a 22-percent drop both in tonnage and value. This tonnage of crude feldspar imported is the smallest since 1944.

TABLE 8.—Feldspar imported for consumption in the United States, 1945–50

[U. S. Department of Commerce]

Year	Crude		Ground	
	Long tons	Value	Long tons	Value
1945	14,924	$114,917		
1946	16,365	127,517	[1]	$2
1947	16,685	124,587		
1948	31,047	$219,785	[1]	$328
1949	15,826	107,925		
1950	12,367	84,136		

[1] Less than 0.5 ton.

Ground feldspar exported from the United States, as reported by merchant grinders in 1950, totaled 4,069 short tons, a drop of 4 percent below 1949. Countries of destination were Mexico, Canada, France, United Kingdom, and Puerto Rico.

Cornwall Stone.—Unmanufactured Cornwall-stone imports for consumption for 1950 amounted to 1,128 long tons compared to 772 long tons for 1949. Imports of ground Cornwall stone were 111 long tons for 1950 compared with 20 long tons for 1949. The only source of imports, either crude or ground, is the United Kingdom.

[5] Figures on imports are compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TABLE 9.—Cornwall stone imported for consumption in the United States, 1945–50

[U. S. Department of Commerce]

Year	Unmanufactured		Ground		Year	Unmanufactured		Ground	
	Long tons	Value	Long tons	Value		Long tons	Value	Long tons	Value
1945	838	$11,317			1948	1,124	$15,633	117	$2,719
1946	456	6,031	80	$1,806	1949	772	11,200	20	572
1947	706	9,522	148	3,124	1950	1,128	11,792	111	2,160

NEPHELINE SYENITE

Nepheline syenite is a quartz-free crystalline rock consisting largely of nephelite and albite and microcline feldspar. Impurities may be iron-bearing minerals, such as black mica and magnetite, and other minerals, such as zircon and corundum. Used originally almost entirely in glass manufacture, substantial quantities now are consumed in making pottery.

Domestic Deposits.—Nepheline syenite occurs in New Jersey, Arkansas, and other localities in the United States, but all the domestic material found thus far in any appreciable tonnage has contained too much iron for ceramic purposes.

Uses.—The largest consumer of nepheline syenite is the glass industry, which favors its use because of its high alumina content. Body compositions have been readjusted in many divisions of the ceramic industry to take advantage of the results of extensive research in the use and application of nepheline syenite. In pottery it has been utilized extensively as a part of the body mix as well as in the glaze. The enamel industry, as well as floor- and wall-tile manufacturers, have found that in many applications firing range has been increased and lower maturing temperatures have resulted, with a saving in fuel costs, when nepheline syenite is used. A study has been made of the use of nepheline syenite and talc mixtures as a flux in low-temperature vitrified bodies.[6]

Prices.—Quotations on crude nepheline syenite are not reported in trade journals; however, the average values per ton of imports for consumption in the United States may be taken as an approximation of the crude values for this material. These were: 1945, $3.77; 1946, $3.98; 1947, $3.57; 1948, $4.01; 1949 and 1950, $4.07 per short ton. According to the Oil, Paint and Drug Reporter, quotations on ground nepheline syenite during 1950 were as follows: Glass grade (24-mesh), bulk, f. o. b. Rochester, N. Y., $14.25; and pottery grade (200-mesh), bulk, f. o. b. Rochester, N. Y., $18.25. Nepheline syenite in bags was $3.00 per ton higher than in bulk.

Foreign Trade.—Imports of crude nepheline syenite decreased 78 percent from 1949. Imports of ground nepheline syenite on the other hand increased 189 percent. The average value per ton (foreign market value) of ground nepheline syenite imported was $12.96 in 1950; Canada was the sole supplier of both crude and ground material.

[6] Lynch, E. D., and Allen, A. W., Nepheline Syenite-Talc Mixtures as a Flux in Low-Temperature Vitrified Bodies: Am. Ceram. Soc. Jour., vol. 33, No. 5, May 1, 1950, p. 99.

TABLE 10.—Nepheline syenite imported for consumption in the United States, 1945–50

[U. S. Department of Commerce

Year	Crude		Ground		Year	Crude		Ground	
	Short tons	Value	Short tons	Value		Short tons	Value	Short tons	Value
1945	51,785	$194,975	1,073	$11,461	1948	53,570	$214,747	7,577	$130,860
1946	51,852	206,613	1,018	11,137	1949	41,215	167,567	18,779	248,224
1947	54,382	194,283			1950	8,966	36,453	54,242	703,008

Europe and Asia.—Deposits of nepheline syenite are known to exist in U. S. S. R. and have been tested for use in the ceramic industry, but production data are not available. Deposits in India and Finland have been reported but no development work has been recorded.

APLITE

The tonnage of aplite produced in 1950, as well as its value, show substantial increases over both 1948 and 1949. The only producers of aplite are Dominion Minerals, Inc., Piney River, Va., and Carolina Mineral Co., Inc., Kona, N. C. The operations are in Amherst and Nelson Counties, Va., near Piney River. The Bureau of Mines is not at liberty to publish production or sales data.

Research on aplite under way at the New York State College of Ceramics is reported to be making substantial progress. Indications are that aplite has wider prospective markets in the glass field.

TECHNOLOGY

An article on the use of colloidal aluminum phosphate as an ingredient in chinaware bodies containing 50 to 80 percent feldspar was published.[7]

Feldspar produced by froth flotation, the result of which is a spar with a lower iron content, is now being used on a wide scale. The product, containing 8 to 9 percent K_2O, is being successfully used in place of higher-K_2O feldspar through ceramic body readjustments.[8]

Four groups of body compositions for sanitary chinaware bodies involving partial replacement of feldspar by spodumene were investigated and some success was reported.[9]

---

[7] Journal of American Ceramic Society, vol. 33, No. 6, June 1950, p. 127.
[8] American Ceramic Society Bulletin, vol. 29, No. 4, April 1950, pp. 148–150.
[9] Journal of American Ceramic Society, vol. 33, No. 7, July 1950, p. 146.

A new product, feldspar-iron-alkali, as a Fischer-Tropsch catalyst has been developed (United States Patent 2,488,530). It is said to be particularly suited for catalyzing the synthesis of hydrocarbons in the reduction of carbon monoxide with hydrogen.[10]

The effect of varying the grinding procedure of feldspar and the partial and complete replacement of potash feldspar in a basic ceramic body with nepheline syenite and the addition of 2.5 to 5.0 percent of talc were studied. Nepheline syenite gave a fired body of lower quartz content and increased glass when used as the primary flux. Presence of talc was detrimental. Grinding up to 100 hours was found to be beneficial.[11]

Announcement has been made of the establishment of a 2-year cooperative research project at the Illinois Department of Ceramic Engineering, University of Illinois, Urbana, Ill., to investigate the applications of feldspar in the ceramic whiteware field.[12]

WORLD REVIEW

The estimated world production of feldspar in 1950 was 671,000 metric tons, an increase of 5 percent compared with 1949. The output of China and U. S. S. R., for which no data are available, is not included in the total.

The production of feldspar in the United States increased while other world production districts showed a general decrease. The ratio of United States output to estimated world output in 1950 was 62 percent compared with 59 percent in 1949. High-quality feldspar was discovered in Saskatchewan. It is said to have a low iron content, and the high alumina : silica ratio is advantageous in the manufacture of glass. The high potash : soda ratio qualifies it for use in ceramic-ware manufacture other than glass.[13] An excellent feldspar deposit on a highway and a railroad has been found in Angola (Portuguese West Africa).[14]

[1] In addition to countries listed, feldspar is produced in China, Rumania, and U.S.S.R., but data are not available.
[2] Data not available; estimate by author of chapter included in total.
[3] Includes some china stone.
[4] Excluding South Australia.
[5] Estimate.
[6] Data for fiscal year ended March 31 of year following that stated.
[7] January to October, inclusive.
[8] In addition, the following quantities of aplite and other feldspathic rock were produced: 1948: 35,840 tons; 1949: 50,943 and 1950: 45,679.
[9] Exports.
[10] There is some additional production of feldspar, but comparable figures are not available.
[11] Estimated by author of chapter. No estimates included for countries listed in footnote 1, except Rumania.

Ferro-Alloys

Norwood B. Melcher

GENERAL SUMMARY

SHARP increases in both the production and shipment of ferro-alloys in 1950 reflected the general rise in steel production during the year, including the pick-up in the production of alloy steels. Imports of both ores and ferro-alloys increased, but domestic output of ores—notably manganese and chromium—failed to keep pace with increased production of ferro-alloys because of a lack of economically exploitable reserves and the difficulty of expanding existing operations very quickly.

Steel making generally, and the production of alloy steels in particular, depends on the availability of ferro-alloys. Hence, with few exceptions, these materials receive the highest priority as strategic materials and are on the National Stockpile list. The exceptions are silicon, phosphorus, titanium, and zirconium, which are considered the only ones available in adequate quantities for an emergency period. The rest are obtained largely from foreign sources. Silicon is produced in the United States and Canada in sufficient tonnages to meet all anticipated requirements, and the bulk of the vanadium requirement is obtained from domestic sources. The United States produces about 90 percent of the world supply of molybdenum, but the fact that a large portion of the United States supply of this metal is obtained from one large undergound mine requires this material to be given special consideration. The Defense Production Act of 1950 (Public Law 774, 81st Congress, 2d Session) among other things, authorized the Government to aid producers of minerals through purchase contracts, loans, and other means.

The ores of ferro-alloys are discussed in detail in the following chapters of this volume, dealing with particular metals: Chromium, Manganese, Molybdenum, Titanium, Tungsten, Vanadium, and Minor Metals.

PRODUCTION AND SHIPMENTS

The production of ferro-alloys in 1950 totaled 1,871,000 net tons, compared with 1,544,442 tons in 1949, an increase of 21 percent. From 1948 to 1949, however, production had decreased 18 percent, and 1950 production was still 1 percent under 1948 production. In 1950 ferro-alloys were made in 14 blast-furnace plants, 33 electric-furnace plants, and 2 aluminothermic-furnace plants. Shipments of all classes of ferro-alloys from furnaces increased 39 percent in quantity and 53 percent in value over 1949.

Pennsylvania again led all other States in production (30 percent) and shipments of ferro-alloys, accounting for 30 percent of the total United States shipments and 38 percent of the value, compared with 31 and 39 percent, respectively, in 1949. New York followed Pennsylvania, supplying 16 percent of the shipments and 20 percent of the value, while Ohio was third, with 14 percent of the shipments and 8 percent of the value. Production and shipments of ferro-alloys also were reported from Alabama, California, Florida, Illinois, Iowa, Kentucky, Montana, New Jersey, North Carolina, Oregon, South Carolina, Tennessee, Virginia, Washington, and West Virginia.

Of all the ferro-alloys, the only one that contains a high percentage of the rare alloying metal which is produced mainly in blast furnaces is ferromanganese, although the low-carbon ferromanganese is produced by electric methods. Spiegeleisen, the 20-percent-manganese material, is also produced by blast furnaces, as are the lower grades (under 13 percent) of ferrosilicon. Most of the molybdenum alloys and a small part of the ferrotitanium are produced by the aluminothermic process, where powdered aluminum is employed as a reducing agent.

TABLE 1.—Ferro-alloys produced and shipped from furnaces in the United States, 1949–50

Alloy	1949			1950		
	Production (net tons)	Shipments		Production (net tons)	Shipments	
		Net tons	Value		Net tons	Value
Ferromanganese	577,345	560,180	$86,463,708	719,680	731,421	$116,043,055
Spiegeleisen	78,167	53,888	2,972,653	42,375	65,163	3,875,823
Ferrosilicon	647,981	590,168	55,415,405	742,407	795,072	75,984,345

Total	1,544,442	1,424,862	220,504,328	1,871,000	1,982,216	337,131,284

[1] Silicomanganese, manganese briquets, ferrochromium, ferrocolumbium, ferroboron, zirconium-ferrosilicon, and miscellaneous ferro-alloys.

Ferromanganese.—The ferromanganese produced in 1950 averaged 76.96 percent manganese, a decrease of 1.37 percent from 1949, and came from six electric-furnace and eight blast-furnace plants; this was an increase of two electric furnaces over 1949. Of the manganese ore used in 1950 for manufacturing ferromanganese, 93 percent was foreign compared with 90 percent in 1949. During the year, 731,421 net tons were shipped from furnaces, whereas consumption totaled 774,852 tons, the difference being accounted for by the imported material. The steel industry consumed most of the ferromanganese in 1950, using 13.6 pounds of contained manganese per ton of steel ingots produced. High-carbon ferromanganese is satisfactory for the bulk of the steel production, but the low-carbon alloy is required in some alloy steels, for example, austenitic stainless steels, wherein carbon must be kept very low.

Over half of the ferromanganese imported in 1950 was produced in Norway, most of the balance being received from Canada and France. Only 3.7 percent came from the U. S. S. R.; and very small quantities came from Japan, Yugoslavia, Belgium-Luxembourg, Germany, Chile, United Kingdom, and Sweden.

This was the first year since 1939 that France exported ferromanganese to the United States.[1] Before 1939 French exports were small and sporadic, but shipments in 1950 averaged 1,300 net tons per month. The source of the manganese was French Morocco.[1]

TABLE 2.—Producers of ferro-alloys in the United States in 1950

Producer	Plant	Alloy
American Agricultural Chemical Co.	South Amboy, N. J.	Ferrophosphorus (byproduct).
Anaconda Copper Mining Co.	Anaconda, Mont. Black Eagle, Mont.	Ferromanganese.
Bethlehem Steel Co.	Johnstown, Pa.	Do.
Climax Molybdenum Co.	Langeloth, Pa.	Ferromolybdenum, calcium molybdate, molybdenum oxide, oxide briquets, molybdenum trioxide, sodium molybdate, ferrotungsten, nickel molybdenum, cobalt molybdenum, molybdenum sulfide.
Electro Metallurgical Co.	Alloy, W. Va. Ashtabula, Ohio Columbiana, Ohio Holcomb Rock, Va. Niagara Falls, N. Y. Portland, Oreg. Sheffield, Ala.	Ferromanganese, silicomanganese, manganese briquets, ferrosilicon, silicon briquets, zirconium-ferrosilicon, ferrochromium, chromium briquets, ferrotungsten, ferrovanadium, ferroboron, ferrocolumbium, ferrotitanium.
General Abrasive Co., Inc.	Niagara Falls, N. Y.	Ferrosilicon (byproduct).
Globe Iron Co.	Jackson, Ohio	Silvery pig iron.
Hanna Furnace Corp.	Buffalo, N. Y.	Do.
Jackson Iron & Steel Co.	Jackson, Ohio	Do.
Kaiser Aluminum & Chemical Corp.	Permanente, Calif.	Ferrosilicon.
Keokuk Electro-Metals Co.	Keokuk, Iowa Wenatchee, Wash.	Ferrosilicon, silvery pig iron.
E. J. Lavino & Co.	Reusens, Va. Sheridan, Pa.	Ferromanganese.
Metal & Thermit Corp.	Carteret, N. J.	Ferrotitanium.
Molybdenum Corp. of America	Washington, Pa.	Ferrotungsten, ferromolybdenum, molybdic oxide, ferroboron, manganese boride, calcium molybdate.
Monsanto Chemical Co.	Anniston, Ala. Columbia, Tenn.	Ferrosilicon (byproduct), ferrophosphorus (byproduct).
New Jersey Zinc Co.	Palmerton, Pa.	Spiegeleisen.
Ohio Ferro-Alloys Co.	Philo, Ohio Tacoma, Wash.	Ferrosilicon, simanal, ferrochromium.
Oldbury Electro-Chemical Co.	Niagara Falls, N. Y.	Ferrophosphorus (byproduct).
Pacific Northwest Alloys, Inc.	Mead, Wash.	Ferrosilicon, ferrochromium.
Pittsburgh Metallurgical Co.	Charleston, S. C. Niagara Falls, N. Y. Calvert City, Ky.	Ferrosilicon, silvery pig iron, ferrochromium.
Sloss-Sheffield Steel & Iron Co.	N. Birmingham, Ala.	Ferromanganese.
Tennessee Products & Chemical Corp. (Southern Ferro-Alloys Division).	Chattanooga, Tenn.	Ferromanganese, ferrosilicon, silicon briquets.
Tennessee Valley Authority	Muscle Shoals, Ala.	Ferrophosphorus (byproduct).
Titanium Alloy Manufacturing Division, National Lead Co.	Niagara Falls, N. Y.	Ferrotitanium, ferrocarbontitanium.
U. S. Steel Corp. subsidiaries	Clairton, Pa. Etna, Pa. Duquesne, Pa. Ensley, Ala.	Ferromanganese, spiegeleisen.
Vanadium Corp. of America	Niagara Falls, N. Y. Bridgeville, Pa.	Ferrosilicon, silicon briquets, alsifer, ferrochromium, ferrovanadium, ferrotitanium grainals, ammonium meta vanadate, titanium aluminum, chrome-silicon alloy, ferrocarbontitanium.
Victor Chemical Works	Mt. Pleasant, Tenn.	Ferrophosphorus (byproduct).
Virginia-Carolina Chemical Corp.	Nichols, Fla. Charleston, S. C.	Do.

[1] Foreign Commerce Weekly, vol. 39, No. 11, June 12, 1950, p. 36.

Spiegeleisen.—Production of this alloy continued to decline in 1950, dropping 46 percent from the previous year. Shipments, however, increased 21 percent, reflecting the general rise in steel production. Spiegeleisen is in effect a high- (15- to 30-percent) manganese pig iron containing 4.5 to 6.5 percent carbon and is made from the lower grade manganese ores; maintenance production would therefore conserve the higher-grade ores for the manufacture of ferromanganese. Spiegeleisen is used for essentially the same purposes as ferromanganese, but more time is required to melt and remove carbon from the product to introduce equivalent quantities of manganese metal to the steel.

Shipments of spiegeleisen from furnaces in 1950 totaled 65,163 tons valued at $3,875,823 f. o. b. furnaces, or $59.48 per ton compared with $55.16 per ton in 1949 and $48.29 in 1948. Three-tenths pound of manganese in the form of spiegeleisen was used per ton of steel in 1950.

Ferrosilicon.—From the standpoint of tonnage more ferrosilicon is still produced than any other ferro-alloy. Forty percent of the total ferro-alloy output in 1950 consisted of ferrosilicon compared with 42 percent in 1949; ferromanganese production was 38 percent of the total ferro-alloy production in 1950. Silvery pig iron, which is included in the ferrosilicon figures, is produced largely in blast furnaces and used chiefly by iron foundries, whereas the standard 50-percent ferrosilicon manufactured in electric furnaces is used in the manufacture of steel. In 1950, as in 1949, the blast-furnace product averaged 9.8 percent silicon while electric-furnace output—mostly ferrosilicon containing over 20 percent silicon—averaged 37 percent compared with 40 percent in 1949. Shipments of all grades of ferrosilicon (including silvery pig iron) totaled 795,072 net tons valued at $75,984,345. The 50-percent-silicon grade is the most important and is used as a deoxidizer in the production of most grades of killed and semikilled steel. Only a small quantity of ferrosilicon is used by iron foundries and other industries. Alloys containing 75 percent silicon and miscellaneous silicon alloys are used as ladle additions in gray-iron foundries and in manufacturing of silicon electrical steels and high-silicon spring steel.

Ferrophosphorus.—Although ferrophosphorus may be produced in the blast furnace or the electric furnace, all ferrophosphorus in 1950 was produced in electric furnaces as a byproduct in the manufacture of phosphate fertilizers and other chemicals. Ferrophosphorus is used primarily as an addition agent in manufacturing certain open-hearth sheet steels to prevent sticking of sheets on packrolling. Shipments of ferrophosphorus increased threefold from 1949 but failed to reach the 1948 amount in spite of a 43-percent increase in production. Exports of ferrophosphorus recovered to large extent in 1950 from the precipitous drop in the previous year, reaching 42,789 net tons valued at $868,480, but were still under the record high of 52,988 tons valued at $1,310,260 attained in 1948.

Ferrotungsten.—The ferrotungsten produced in the United States during 1950 was made in electric furnaces from both foreign and domestic ores. The total consumption of tungsten concentrates in the United States during the year was 6,931 net tons (60 percent WO_3 basis), 1,165 tons of which were consumed in manufacturing ferrotungsten. The domestic material was obtained from five States and Alaska in 1950, but three States—California, North Carolina, and Nevada—supplied 92 percent of the total. Imports for consumption of tungsten ores and concentrates in 1950 were equivalent to 16,550 net tons of 60 percent WO_3, a 151-percent increase over 1949. These ores and concentrates came from 22 foreign countries in 1950 but supplied 65 percent of the total.

Ferrochromium.—All ferrochromium produced in the United States in 1950 was made in electric furnaces, chiefly from foreign ores. Ferrochromes are divided into two main classes—high-carbon, containing 65 to 70 percent chromium with carbon contents ranging from maximum 4.5 percent carbon to maximum 8.5 percent in the various grades, and low-carbon, containing 67 to 72 percent chromium with carbon ranging from maximum 0.03 percent to maximum 2.00 percent. Special ferrochromes, such as nitrogen-bearing and silicon-manganese ferrochromes, are also manufactured for special uses. The low-carbon grades of ferrochromium are used in the stainless steels and high-temperature alloys, which contain relatively high percentages of chromium and low percentages of carbon, and the high-carbon grades in other types of chromium-bearing steels. Consumption of ferrochromium in the United States in 1950 was 147,911 net tons compared with 87,764 tons in 1949 and 122,753 tons in 1948. This consumption was reported by consumers that normally use about 85 percent of the total. Imports were three times the 1949 figure, while exports dropped from 2,200 net tons to 347.

Ferromolybdenum.—The ferromolybdenum produced in 1950 was made by the aluminothermic and electric furnace processes and used domestic concentrates. The alloy was produced in only two plants during the year.

Molybdic Oxide, Calcium Molybdate, and Other Molybdenum Compounds.—Molybdenum compounds used in alloying agents in the production of iron and steel are included with ferro-alloys. These materials are used more extensively than ferromolybdenum because of their lower cost. As in the case of ferromolybdenum, virtually all of these compounds are made from domestic raw materials.

Ferrotitanium.—Most of the ferrotitanium in 1950 was produced in electric furnaces, but a small quantity was made by the aluminothermic process. The ferrotitanium produced in 1950 contained a higher percentage of titanium than in the preceding year, the average of all grades in 1950 being 24.0 percent Ti compared with 23.4 percent in 1949. Both foreign and domestic ores of titanium (ilmenite and rutile) were consumed in its manufacture. A number of grades of ferrotitanium are available for use in steel making. The low-carbon grades are used chiefly in manufacturing stabilized, austenitic stainless steels to render them resistant to intergranular corrosion in service. The high-carbon grades are used as deoxidizers and scavengers. In medium- and high-carbon killed steels the higher-carbon varieties of ferrotitanium are used as the final deoxidizer to prevent segregation and the occurrence of objectionable inclusions and in some cases to control grain size.

Ferrovanadium.—All ferrovanadium produced in 1950 was made in electric furnaces from both foreign and domestic ores. This alloy averaged 53 percent vanadium in 1950, compared with 50 percent in 1949 and 48 percent in 1948. Up to 0.10 to 0.25 percent of vanadium is added to engineering steels—usually to the ladle in open-hearth practice and to the furnace in basic electric practice. In high-speed steels the percentage ranges from approximately 1.00 to 2.50 percent, and some steels are made with a higher vanadium content. Vanadium is also employed to prevent age hardening in low-carbon rimmed steels.

Ferrocolumbium.—Columbium is used chiefly in manufacturing stabilized austenitic stainless (Cr-Ni) steels. It is also employed to reduce the air hardening characteristic of straight-chromium steels of the corrosion-resistant type. In 1950 the output of ferrocolumbium averaged 56 percent columbium compared with 57 percent in 1949 and was produced in electric furnaces.

Zirconium-Ferrosilicon.—The zirconium-ferrosilicon produced in 1950 averaged 14 percent Zr, as in the previous year. Zirconium, a deoxidizer and scavenger, combines readily with oxygen, nitrogen, and sulfur, eliminating them from the steel bath or minimizing their effect. Formation of zirconium nitride reduces age hardening in deep-drawing steels; and the formation of zirconium sulfide, as with manganese sulfide, diminishes hot shortness. The addition of over 0.10 percent zirconium to steels usually results in grain refinement. The alloy is used in place of ordinary ferrosilicon but is more effective for the purposes stated.

Silicomanganese.—Silicomanganese averaged 67 percent manganese in 1950. This alloy is used to introduce manganese into low-carbon killed steels because of its low carbon-manganese ratio.

Manganese Briquets.—Manganese briquets are made from ferromanganese or silicomanganese that has been crushed and bonded into briquets of convenient size. The foundry industry is the principal user of manganese briquets, which are added to molten iron as a deoxidizer and scavenger. Each of these briquets contains exactly 2 pounds of manganese, therefore the required amount of manganese can be added without weighing the material.

FOREIGN TRADE[2]

Ferromanganese continued to be the chief ferro-alloy import in 1950. Most of this alloy was received from Norway, Canada, and France and was manufactured from ores exported from Gold Coast and French Morocco. Hence, receipts of manganese in the form of alloy must be taken into account in considering receipts of ore from Gold Coast. The alloy received from these countries in 1950 was equivalent to 172,274 tons of manganese ore.

The over-all figure for exports of ferro-alloys in 1950 increased markedly over that for 1949 because of an eightfold increase in exports of ferrophosphorus. Exports of other ferro-alloys declined.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Fluorspar and Cryolite

By Hubert W. Davis

GENERAL SUMMARY

RECORD consumption and imports, wage increases, higher prices, abrogation of the reciprocal trade agreement with Mexico, and transfer of acid-grade fluorspar to the list of strategic and critical materials for stockpiling were some features of the fluorspar industry in 1950.

Although shipments of fluorspar from mines in the United States gained 27 percent over 1949, they were 9 percent less than the peacetime record in 1948 and fell far short of meeting industry's requirements. The deficit was met by imports, which were 72 percent greater than in 1949. The high level of operations in the steel and hydrofluoric-acid industries and a 26-percent gain in consumers' stocks were chiefly responsible for the accelerated activity in fluorspar in 1950.

Illinois maintained its rank as the premier producer of fluorspar in 1950 by supplying 51 percent of the total domestic shipments. Moreover, shipments from Illinois were 28 percent greater than in 1949. Arizona, Kentucky, Nevada, New Mexico, and Utah also shipped more fluorspar than in 1949, but Colorado, Montana, and Texas shipped less. Shipments from Utah established a new record.

For the tenth consecutive year, Mexico was the largest supplier of foreign fluorspar to the United States. Although it supplied proportionately less in 1950 than in recent years, imports from that source were 25 percent greater than in 1949 and were the second highest on record. Also noteworthy were the much larger imports from Spain and the receipt of 29,624 tons from Germany.

The steel industry, which set a new production record in 1950, continued to be the predominant user of fluorspar but absorbed proportionately less (56.5 percent) of the total consumed in 1950 than in 1949 (58.4 percent). Use by the industry was 20 percent greater than in 1949, but, because of the smaller utilization of fluorspar per ton of steel made, its total consumption of fluorspar fell short of the record made in 1942. The average consumption of fluorspar per long ton of basic open-hearth steel produced was 5.5 pounds in 1950 compared with 5.8 pounds in 1949 and 6.4 pounds in 1942. The hydrofluoric-acid industry, the second-largest utilizer of fluorspar, consumed 40 percent more than in 1949 and accounted for 29 percent of the total in 1950 compared with 26 percent in 1949. Consumption of fluorspar by the glass and enamel trades in 1950 reversed downward trends that had persisted for 2 years.

Deliveries of fluorspar to consumers in the United States totaled 463,319 short tons in 1950 (300,782 tons from domestic mines and

232294—53——34

162,537 tons from foreign sources). In 1949 deliveries to consumers totaled 325,780 tons (235,921 tons from domestic mines and 89,859 tons from foreign sources). Total deliveries to steel plants in the United States increased to 271,869 tons (188,047 tons in 1949), those to hydrofluoric-acid plants advanced to 127,401 tons (86,779 tons in 1949), and those to glass and enamel plants rose to 41,534 tons (34,482 tons in 1949).

The average composite selling price ($33.55 a short ton) of all grades of fluorspar (both domestic and foreign) delivered to consumers in the United States in 1950 was $0.36 more than in 1949.

Wage increases of 5 to 10 percent were made by many fluorspar-mining companies in 1950.

The total quantity of fluorspar shipped from mines and imported into the United States from about 1870 through 1950 was approximately 9,607,000 short tons, about 81.5 percent from domestic mines and 18.5 percent from foreign sources.

TABLE 1.—Salient statistics of fluorspar in the United States, 1941–50, in short tons

Year	Shipments from domestic mines	Foreign trade		Consumption	Industry stocks at end of year		
		Imports for consumption	Exports		Domestic mines [1]	Consumers' plants	Total
1941	320,669	7,524	12,184	303,600	31,997	108,900	140,897
1942	360,316	2,151	9,020	360,800	19,429	96,000	115,429
1943	406,016	43,769	9,068	388,885	19,026	105,933	124,959
1944	413,781	87,200	1,980	410,170	19,021	98,446	117,467
1945	323,961	104,925	1,420	356,090	19,863	103,148	123,011
1946	277,940	29,852	1,729	303,190	18,957	98,663	117,620
1947	329,484	78,725	1,180	376,138	33,101	114,150	147,251

[1] Finished fluorspar only.
[2] In addition, importers held 11,000 tons in 1949 and 7,500 tons in 1950 (none in 1941–48).

PRODUCTION AND SHIPMENTS

Production of finished fluorspar totaled 283,500 short tons, including 146,631 tons of flotation concentrates; however, the output also included 9,400 tons of finished fluorspar recovered from milling crude ore that had been mined before 1950. Thus, total new production (expressed in terms of finished fluorspar) was 274,100 tons in 1950, compared with 245,600 tons in 1949. Of the mine output in 1950, 6 mines (producing over 10,000 tons each) supplied 96,100 tons, or 35 percent; 11 mines (producing 5,000 to 10,000 tons each) supplied 78,700 tons, or 29 percent; 28 mines (producing 1,000 to 5,000 tons each) supplied 72,700 tons, or 27 percent; and 8 mines (producing 500 to 1,000 tons each) supplied 6,400 tons, or 2 percent. Thus, 53 mines produced 253,900 tons, or 93 percent of the total. Of the remaining output

(20,200 tons, or 7 percent), some (in quantities ranging from a few tons to 500 tons) came from an undetermined number of small mines and prospects, but much was derived from treated tailings from previous milling operations.

In 1950 mines operated by consumers produced 73,700 tons of finished fluorspar, compared with 61,900 tons in 1949.

Fluorspar shipments from domestic mines in 1950 aggregated 301,510 short tons valued at $10,619,717, increases of 27 percent in quantity and 28 percent in value over 1949. Of the 1950 total, 68,933 tons were shipped by river or river-rail for delivery to consumers, compared with 53,243 tons in 1949.

Illinois (51 percent) and Kentucky (27 percent) supplied 78 percent of the fluorspar shipped in 1950, as in 1949. Shipments from Illinois and Kentucky were 27 percent more than in 1949, equal to the percentage gain, as a group, of the other producing States.

The average value of all grades of domestic finished fluorspar shipped in 1950 ($35.22) established a new peak and was 30 cents more than the previous high in 1949.

Fluorspar shipments in 1950 comprised 146,029 tons of fluxing gravel (including 11,240 tons of flotation concentrates, which were blended with fluxing gravel) and foundry lump and 155,481 tons of ground and flotation concentrates. The bulk of the fluxing-gravel and foundry-lump fluorspar was shipped to steel plants and iron foundries, but a comparatively small tonnage moved to plants making cement, ferro-alloys, nickel, basic refractories, and fluxing compounds and to smelters of secondary metals. Of the ground and flotation concentrates shipped in 1950, hydrofluoric-acid plants took 63 percent and glass and enamel plants 25 percent; the remainder went chiefly to aluminum- and magnesium-reduction works; to manufacturers of steel, ferro-alloys, and welding rods; and to smelters of secondary metals.

[1] Fluxing gravel includes (and flotation concentrates exclude) the following quantities of flotation concentrates blended with fluxing gravel: 1949, 6,948 tons; 1950, 11,240 tons.
[2] Includes pelletized gravel.

SHIPMENTS, BY USES

As is evident from table 5 and figure 1, the predominant purchaser of fluorspar is the steel industry, which also consumes substantial quantities of hydrofluoric acid and sodium fluoride, for which fluorspar is the basic material.

TABLE 5.—Fluorspar shipped from mines in the United States, 1949–50, by uses

Use	1949				1950			
	Quantity		Value		Quantity		Value

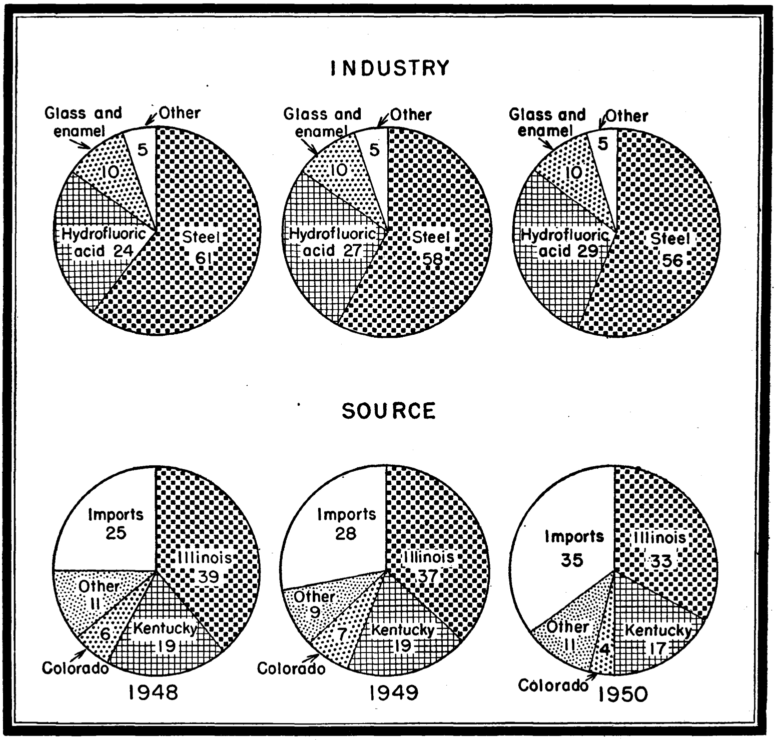

FIGURE 1.—Fluorspar sales (domestic and foreign) to consumers in the United States, 1948–50, by consuming industries and sources, in percent.

STOCKS AT MINES

According to the reports of producers, the quantity of fluorspar in stock at mines or shipping points at the close of 1950 totaled 75,090 tons, or 38 percent less than in 1949. These stocks comprised 19,038 tons of finished fluorspar and 56,052 tons of crude fluorspar (calculated to be equivalent to 27,000 tons of finished fluorspar).

TABLE 6.—Stocks of fluorspar at mines or shipping points in the United States, by States, at end of year, 1948–50, in short tons [1]

State	1948		1949		1950	
	Crude [2]	Finished	Crude [2]	Finished	Crude [2]	Finished
Colorado	6,498	757	7,995	851	6,837	869
Illinois	36,090	12,509	39,684	9,903	29,954	5,822
Kentucky	13,928	23,423	15,212	25,469	5,789	10,076

[1] Fluorspar used in making artificial cryolite and aluminum fluoride (aluminum raw materials) is included in the figures for hydrofluoric acid, which is an intermediate in their manufacture.
[2] Figures on consumption represent fluorspar used as a flux; see footnote 1.

TABLE 8.—Production of basic open-hearth steel and consumption and stocks of fluorspar (domestic and foreign) at basic open-hearth steel plants, 1946–50

	1946	1947	1948	1949	1950
Production of basic open-hearth steel ingots and castings ... long tons	54,034,000	68,506,000	70,830,000	62,634,000	76,873,000
Consumption of fluorspar in basic open-hearth steel production ... short tons	145,631	189,773	207,342	183,045	212,928
Consumption of fluorspar per long ton of basic open-hearth steel made ... pounds	5.4	5.5	5.9	5.8	5.5
Stocks of fluorspar at basic open-hearth steel plants at end of year ... short tons	61,600	68,400	106,300	97,400	128,300

Fluorspar was reported consumed in 41 States and the District of Columbia in 1950, but 3 States—Illinois, Ohio, and Pennsylvania—used 214,398 tons, or 50 percent of the total consumption. Pennsylvania was again the chief consuming State; it ranked first in consumption of fluorspar in both steel and glass. Illinois maintained its rank as the largest consumer of fluorspar in hydrofluoric acid in 1950.

Table 9 shows, so far as possible without revealing the figures of individual companies, the consumption of fluorspar by States in 1949 and 1950.

TABLE 9.—Fluorspar (domestic and foreign) consumed in the United States, by States, 1949–50, in short tons

REVIEW BY STATES

Arizona.—Production of fluorspar in Arizona was 952 short tons in 1950, compared with 846 tons in 1949. The 1950 output came chiefly from the Lone Star mine in Cochise County. The shaft at the Lone Star mine was extended about 40 feet to the 200-foot level, and a heavier hoist and a second air compressor were installed. Some fluorspar was also produced by mines in Maricopa County, by the Apache mine in Cochise County, and by the Arizona Fluorspar Development Co. from a property in Pima County. Except for the Apache mine output, which went to the flotation mill at Deming, N. Mex., the fluorspar produced in Arizona was shipped to steel plants.

California.—The Industrial Minerals & Chemical Co., West Berkeley, Calif., ground some Nevada fluorspar, which it sold chiefly to local dealers. The company also ground some Nevada fluorspar on a toll basis for Balfour, Guthrie & Co., Ltd., and L. H. Butcher Co., which sold it to glass and enamel plants.

Colorado.—Production of finished fluorspar in Colorado decreased for the sixth consecutive year; it was 18,500 short tons in 1950 compared with 22,400 tons in 1949. However, the 1950 production included 548 tons of finished fluorspar recovered from milling crude ore mined before 1950. Consequently, new production (expressed in terms of finished fluorspar) totaled 17,952 tons in 1950 compared with 23,000 tons in 1949. Output came from Boulder, Chaffee, Jackson, Jefferson, and Mineral Counties.

Shipments of fluorspar from Colorado in 1950 likewise declined for the sixth consecutive year and were the smallest since 1941; they were 18,489 tons, compared with 22,324 tons in 1949.

The Ozark-Mahoning Co., operating a flotation mill near Jamestown, produced 20 percent more flotation concentrates in 1950 than in 1949. The flotation-mill feed comprised ore from the Afterthought, Argo, Blue Jay, and Emmett mines, in Boulder County.

The flotation mill of the General Chemical Division, Allied Chemical & Dye Corp., near Jamestown, produced 13 percent less concentrates than in 1949. The flotation-mill feed came from the company-owned Burlington mine in Boulder County.

The Wagon Wheel Gap mine of the Colorado Fuel & Iron Corp. in Mineral County produced only about one-third as much fluxing-gravel fluorspar as in 1949. The mine was closed in the third quarter of 1950; it had been operated by the company since July 15, 1924.

No mining was done by Fluorspar, Inc., in 1950, but the company continued building its new flotation mill near Salida, Chaffee County.

At the property of the Colorado Fluorspar Corp., in Jackson County, development was carried on, and a substantial tonnage of fluorspar was added to reserves. Extensive deposits were opened in the northwest section of the property. No mining was done by the company, but 307 tons of jig tailings were shipped from the property to a cement plant.

During 1950 Alcoa Mining Co. acquired the Kramer claims, which adjoin on the north the property of the Colorado Fluorspar Corp.

Illinois.—Illinois maintained its premier position as a fluorspar-producing State. Production of finished fluorspar was 150,500 short tons in 1950; about 91 percent came from Hardin County and the remainder from Pope County. However, the 1950 production includes 3,800 tons of finished fluorspar recovered from milling crude ore mined before 1950. Consequently, new production (expressed in terms of finished fluorspar) totaled 146,700 tons in 1950 compared with 119,700 tons in 1949. Some Kentucky fluorspar is milled in Illinois, and some Illinois fluorspar is milled in Kentucky; the finished fluorspar so recovered, as well as that shipped, is credited in the statistics to the State of origin. The Argo, Blue Diggings, Crystal, Deardorff, Douglas, East Green, Empire, Fairview, Geely Shaft, Interstate, Jefferson, Mahoning Shafts Nos. 2, 4, and 5, Minerva, North Boundary, Pell, Pell Shaft, Recovery Shaft, Redd, Rosiclare, and Victory properties supplied about 96 percent of the fluorspar produced in Illinois in 1950. Most of the remainder came from many mines and prospects, chiefly the Austin, Baker, Blue Valley, Grand Pier, Hamp, Hillside, Humm, Lead Hill, Mahoning Shaft No. 3, North Green, Tems, and Twitchell.

Shipments of fluorspar from Illinois (154,623 tons) were 28 percent more than in 1949 and contributed 51 percent of the total domestic shipped. Of the 1950 total, 31,699 tons were shipped by river or river-rail to consumers, compared with 29,742 tons in 1949.

The Alcoa Mining Co. produced 69 percent more flotation concentrates in 1950 than in 1949. The mill feed comprised ore from the company-operated Argo, Blue Diggings, and Fairview mines. The ore from these mines is first treated in the company heavy-medium unit, which supplies an enriched product for flotation feed. The Argo-Blue Diggings vein system was worked through the Fairview shaft on the 300-, 400-, 500-, 600-, 700-, and 800-foot levels. A 30-foot winze was sunk from the 900-foot level as a drainage sump. Five holes between the Argo and Daisy faults on the Fairview tract were drilled to determine the geological conditions to decide whether grouting would decrease water coming into the Blue Diggings workings. The Joiner and Pankey tracts in Hardin County were drilled, but no fluorspar was found.

Despite the fact that its Crystal mine was flooded during the first 6½ months of 1950, the Crystal Fluorspar Co., Inc., produced 36 percent more finished fluorspar than in 1949. Excessive rains during the first half of 1950 caused the "Big Sink," a landlocked area covering 800 acres, to rise to a level several feet higher than during the 1937 flood of the Ohio River; consequently, water seeping into the mine through innumerable underground crevices and fissures caused it to flood. The Crystal Fluorspar Co. also operated the Jefferson mine, where a 180-foot shaft was being sunk to connect with a winze to permit mining at the 380-foot level.

The Ozark-Mahoning Co. produced 27 percent more fluorspar flotation concentrates in 1950 than in 1949. The mill feed comprised ore from the Deardorff, East Green, Mahoning Shafts Nos. 2, 3, 4, and 5, and North Green mines near Cave in Rock, Ill., the Delhi-Babb mine near Salem, Ky., and the Commodore mine near Marion, Ky., and some purchased ore, chiefly from the Alcoa Mining Co., Crystal Fluorspar Co., Inland Steel Co., and Rosiclare Lead & Fluorspar Mining Co. Production of finished fluorspar in 1950 comprised 74.9 percent acid grade, 23 percent pelletized gravel, and 2.1 percent filter cake; the filter cake was sold to a local producer for blending with fluxing gravel. Production and shipments of finished fluorspar from the Delhi-Babb and Commodore mines have been credited to Kentucky in the statistics. The Ozark-Mahoning Co. was the largest producer of fluorspar in the United States in 1950.

The Rosiclare Lead & Fluorspar Mining Co. operated the Eureka, Geely, Interstate, North Boundary, Pell, Recovery, and Rosiclare properties in 1950, but the North Boundary was the chief producing mine of the company. The company also purchased finished fluorspar and milling ore from local producers. The ore from company mines is mill feed for its heavy-medium, jig, and flotation mills. Production of finished fluorspar of all grades was 14 percent less than in 1950, but shipments were 5 percent larger.

Operations at the mine and flotation mill of Minerva Oil Co. were at increased rates in 1950. Despite a 19-day strike in June, production of flotation concentrates was 41 percent greater than in 1949. An air shaft was completed at the mine in anticipation of introducing diesel loading and hauling equipment in the "east stope" area to replace electric slushers and cable-reel trucks currently in use in mining the flat-bedded deposit. New steel bins were erected at the hoisting shaft.

Production in 1950 at the Douglas mine in Pope County, operated by the P. M. T. Mining Co. and Hicks Creek Fluorspar Mining Co., was 48 percent more than in 1949. The Redd mine operated by Redd Mining Co., Grand Pier mine operated by Grand Pier Mining Corp., and the Empire mine operated by Egyptian Mining Co.—all also in Pope County—and the Baker mine operated by Golconda Illinois Mining Co., Inc., Humm mine operated by C. C. Mackey, and Pell mine operated by Thurmond Coal Co.—all in Hardin County—were the largest of the many smaller mines worked in Illinois in 1950.

Inland Steel Co., which discontinued fluorspar mining in Illinois in 1948, sold the mineral rights of five tracts in Hardin County and the flotation mill, gravity mill, powerhouse, and head frame at Rosiclare to the Kentucky Fluor Spar Co., Marion, Ky., in 1950. The Kentucky Fluor Spar Co. operated the flotation mill and Hillside mine during the latter part of the year.

Federal and State funds were granted and preliminary surveys were made for constructing a $500,000 flood wall at Rosiclare, primarily for protection of the fluorspar properties.

Kentucky.—Production of finished fluorspar in Kentucky declined for the third consecutive year; it was 64,700 short tons in 1950 compared with 65,500 tons in 1949. However, the 1950 production includes 1,100 tons of finished fluorspar recovered from milling crude ore mined before 1950. Consequently, new production (expressed in terms of finished fluorspar) totaled 63,600 tons in 1950 compared with 64,800 tons in 1949. Shipments, however, were 80,137 tons compared with 63,438 tons in 1949. Of the 1950 shipments, 37,234 tons were shipped by river or river-rail to consumers, compared with 23,501 tons in 1949.

Production of fluorspar in Caldwell County was 900 short tons in 1950 compared with 400 tons in 1949. The 1949 output came chiefly from the Williamson mine.

The major part of the 1950 output in Crittenden County came from the Blue, Commodore, Delhi-Babb, Pigmy, Tabb No. 1, and Yandell No. 22 mines. Some of the remainder came from many smaller producing mines, including the Mary Belle, Watkins, Krausse, and Ainsworth; but most was recovered from tailings from previous milling operations.

Production and shipments of fluorspar in 1950 by the United States Steel Co. (formerly United States Coal & Coke Co.) were 16 and 25 percent, respectively, greater than in 1949. Output came from the Tabb No. 1 and Yandell No. 22 mines.

The Kentucky Fluor Spar Co. and affiliates shipped 21 percent more fluorspar and "fluorbarite" than in 1949. The company operates a mill at Marion and, through its mining division (Roberts & Frazer and Frazer & Hettiger) operates the Carr and Wright mines in Livingston County, Ky., and the Hillside mine in Hardin County, Ill. Only two-fifths of the output came from company mines in 1950; most of it was supplied by the Blue Valley, Empire, Mary Belle, May, Krausse, Pell, and Redd mines, the flotation mills of Minerva Oil Co. and Butler & Moodie, and by mines in Mexico. The Mexican fluorspar, which was used to raise the grade of locally purchased fluorspar, has not been included in the statistics for Kentucky.

The Inland Steel Co. suspended operations at its Keystone mine near Marion in 1950; this mine had been an important producer for many years However, its heavy-medium mill operated throughout 1950 treating stockpiled crude ore. Production at the heavy-medium mill was 5 percent less than in 1949. Shipments of fluorspar by Inland Steel Co. were nearly double those in 1949.

Output of fluxing-gravel fluorspar at the Pigmy mine of the Pigmy Corp. (subsidiary of the Rosiclare Lead & Fluorspar Mining Co.) declined for the sixth consecutive year and was 63 percent less in 1950 than in 1949. However, an appreciable tonnage of flotation concentrates was recovered from Pigmy pond fines at the flotation mill of Crider Bros. Fluorspar Co. for the Pigmy Corp. in 1950. Heavy rains caused a shut-down of operations at the Railroad shaft and interrupted work at the new 250-foot Hoptown shaft, which is down 170 feet.

All of the supply of Delhi Fluorspar Corp. in 1950 was purchased from local producers and from Mexico; the Mexican fluorspar was blended with domestic fluorspar. The Mexican fluorspar so blended and shipped has not been included in the statistics for Kentucky. Total sales were slightly less in 1950 than in 1949.

L. Conyer shipped 2.7 times more fluorspar in 1950 than in 1949. He operates a jig mill near Marion and depends on purchases of local ore and tailings for his supply. Most of it was obtained from the Baker, Pell, and Twitchell mines in Illinois and the Bonanza and Davenport mines in Kentucky.

Ben E. Clement, who also depends on purchased fluorspar from local mines, sold 7 percent less fluorspar than in 1949.

Crider Bros. Fluorspar Co. worked the Blue mine near Mexico, Ky., reclaimed some fluorspar from the Blue and Haffaw dumps, mined a small tonnage at the Marble mine in Caldwell County, and purchased fluorspar from local producers. The ore from the company mines is mill feed for its gravity-concentrating and flotation mills. Output in 1950 comprised 61 percent metallurgical-grade fluorspar and 39 percent flotation concentrates. In addition, the company produced flotation concentrates on a custom basis for Pigmy Corp., Inland Steel Co., and C & L Fluorspar Co. Sales of fluorspar by the company were 37 percent greater than in 1949.

C & L Fluorspar Co. did no mining in 1950 but depended on purchases of fluorspar from local mines and Mexico for its supply. Some flotation concentrates were produced for the company by Crider Bros. Fluorspar Co. Total sales by C & L Fluorspar Co. were 10 percent less than in 1949.

Davenport Mines, Inc., did not operate its Davenport and Hicks mines in 1950. However, its heavy-medium mill was operated on accumulated dump piles and produced a small tonnage of concentrates.

The Alcoa Mining Co. did not operate any fluorspar mines in Kentucky in 1950, but its Mary Belle mine was leased to and operated by F. B. Moodie, Jr. However, the company located some additional fluorspar by drilling at its Klondike mine, and auger drilling on the Eagle-Watson tract disclosed an area of gravel fluorspar in the overburden.

In Livingston County production of finished fluorspar increased to 10,400 tons in 1950 from 7,500 tons in 1949. The output in 1950 came chiefly from the Carr, May, Bonanza, Wright, and Mineral Ridge mines and from reworking the Klondike tailings.

Output at the Carr and Wright mines of Roberts & Frazer was 45 percent greater than in 1949.

Butler & Moodie continued to reclaim fluorspar from Klondike tailings at its flotation mill near Mullikin.

No fluorspar was mined in the Central Kentucky fluorspar district in 1950.

Montana.—Production of fluorspar in Montana was only 41 short tons in 1950 compared with 422 tons in 1949. The 1950 output came from the Coeur d'Alene Extension Mines, Inc., of the Riverside Copper Mining Co., in Mineral County near Superior. The company also did 250 feet of drifting in 1950.

Nevada.—Shipments of fluorspar from Nevada were 7,577 short tons in 1950 compared with 5,847 tons in 1949.

The chief producing mine in Nevada in 1950 was the Daisy, in Nye County, operated by J. Irving Crowell, Jr.; its production was 55 percent more than in 1949. The Baxter mine in Mineral County, operated by V. S. Baxter, was the second-largest producing mine in 1950; its output, however, declined 39 percent from 1949 and was the smallest since 1935. The Cirac Revenue Group in Churchill County, operated by C. P. Cirac, produced 45 percent more fluorspar than in 1949. The H. W. Gould & Co. bought the Baxter mine and plans to build a heavy-medium mill and a flotation mill to treat the ore.

New Mexico.—Production of finished fluorspar in New Mexico was 20,000 short tons in 1950, a gain of 54 percent over 1949. However, the production includes 3,700 tons of finished fluorspar recovered from milling crude ore mined before 1950. Consequently, production (expressed in terms of finished fluorspar) totaled 16,300 tons in 1950 compared with 20,800 tons in 1949. The 1950 output came from Grant, Luna, Sierra, and Valencia Counties. The Zuñi mines in Valencia County, Shrine mine in Grant County, and Greenleaf and White Eagle mines in Luna County supplied about 84 percent of the fluorspar produced in New Mexico in 1950. Most of the remainder came from many mines and prospects, chiefly the Clum, Greenspar, Linda Vista, Little Whitewater, Nakaye, Sadler No. 2, and Valley.

Shipments from New Mexico totaled 20,036 tons in 1950, a gain of 56 percent over 1949.

The flotation mill of General Chemical Division, Allied Chemical & Dye Corp., at Deming, produced 40 percent more concentrates in 1950 than in 1949. The mill feed comprised ore from the company-operated Shrine mine in Grant County and purchased ore from local mines, chiefly the White Eagle and Greenleaf in Luna County and the Little Whitewater, Greenspar, and Clum in Grant County.

The flotation mill of Zuñi Milling Co., at Los Lunas, produced 2.6 times more fluorspar in 1950 than in 1949. The mill feed comprised ore chiefly from the company mines near Grants in Valencia County, but some was purchased from local mines—principally the White Eagle and Nakaye—and from Mexico. The concentrate recovered from Mexican ore, as well as that shipped, has not been included in the statistics on production and shipments.

H. E. McCray operated the Greenleaf and Greenleaf No. 2 mines in Luna County near Deming and purchased fluorspar from the Valley and Sadler No. 2 properties.

Tennessee.—Charles H. Young, Director, Division of Chemical Engineering, Tennessee Valley Authority, states: [1]

Calcium fluoride produced by the Tennessee Valley Authority is a byproduct of a fluorine-recovery system under development at TVA's experimental fused tricalcium phosphate fertilizer plant near Columbia, Tenn. Since a market for the byproduct calcium fluoride has not been established, production of the material has not been recorded. The material produced was of varying composition and was discarded.

Texas.—Production of finished fluorspar in Texas was 649 tons in 1950 compared with 1,838 tons in 1949. However, the 1950 production included 146 tons recovered from milling crude ore mined before 1950. Consequently, new production (expressed in terms of finished fluorspar) was only 503 tons in 1950 compared with 1,916 tons in 1949. Shipments were 719 tons in 1950 compared with 1,770 tons in 1949. Output was from the Eagle Mountains mine in Hudspeth County, near Van Horn, operated by the Texas Fluorspar Mines, Inc. Production was discontinued in the second quarter of 1950.

Utah.—Production of fluorspar in Utah in 1950 established a new record; it was 20,626 short tons, a gain of 146 percent over 1949 and 117 percent greater than in 1948, the previous record year. The bulk of the production came from Juab County, near Delta, where Bell Hill Mining Co., Chesley & Black, T. A. Claridge, George Spor & Sons, Ward Leasing Co., and Willden Bros. operated. Heretofore, the fluorspar produced in the Delta area has been shipped to the steel plant at Geneva, Utah, but the 1950 output was marketed widely.

A report [2] on the J. B. fluorspar deposit in Beaver County has been issued.

MILLING

Output of flotation concentrates from domestic ore totaled 146,631 short tons in 1950, compared with 111,247 tons in 1949. In addition, 396 tons of flotation concentrates were recovered from milling 685 tons of Mexican ore at a plant in the United States in 1950.

Six flotation cells were added to the fluorspar circuit at the flotation mill near Cave in Rock, Ill., of Minerva Oil Co., to assist in converting a larger proportion of the production to ceramic grades.

The Ozark-Mahoning Co., which operates flotation plants at Rosiclare, Ill., and Jamestown, Colo., completed and began operating its drying plant at Wilmington, Del., in June 1950. Acid-grade filter cake from the flotation mill serving the Osor mine in Spain is dried at this plant, and the dried concentrates are shipped to Eastern consumers.

An improved process for the concentration of fluorspar ores by froth flotation has been developed.[3]

The separation of quartz and fluorspar has been described.[4]

PRICES

Metallurgical-grade fluorspar containing 70 percent or more effective calcium fluoride content was quoted at $37 a short ton f. o. b. Illinois-Kentucky mines on January 1, 1950, but advances of $2 a ton were made on September 14 and October 26. Corresponding increases were also made in the prices of other grades of metallurgical fluorspar. Imported metallurgical-grade fluorspar was quoted throughout 1950 at $38 to $40 a short ton at Atlantic Seaboard, duty paid. Acid-grade fluorspar containing a minimum of 97 percent calcium fluoride was advanced $3 a ton on October 12 to $46.50 a short ton f. o. b. Illinois mines.

The average selling price of all grades of domestic fluorspar shipped in 1950 was $35.22 a short ton—a new peak—compared with $34.92 in 1949.

FOREIGN TRADE[5]

Imports.—Imports of fluorspar into the United States established a new record of 164,634 short tons in 1950, a gain of 72 percent over 1949 and 47 percent over 1948, the former record year. The 1950 total comprised 43,488 tons containing more than 97 percent calcium fluoride and 121,146 tons of lower grade. Imports in 1950 were valued [6] at $2,579,667. The higher-grade fluorspar averaged $24.15 a ton and the lower grade $12.62. The duty on fluorspar containing not more than 97 percent calcium fluoride continued at $5.625 a short ton and on fluorspar containing more than 97 percent calcium fluoride $3.75. However, the reciprocal trade agreement between the United States and Mexico, which had been in effect since December 28, 1942, was abrogated effective December 31, 1950; the duty then reverted to the former rates of $7.50 a short ton for the lower grade and $5 for the higher grade.

The bulk of the fluorspar received in the United States in 1950 was for use by domestic consumers; however, a comparatively small tonnage of acid-grade fluorspar was delivered to the Government stockpile.

In 1950, 8,071 tons of Mexican fluorspar were blended with fluxing-gravel fluorspar from the Illinois-Kentucky district. The Mexican fluorspar so blended has been excluded from the statistics on shipments from mines in the United States and included in the figures on imports.

Table 11, compiled from data supplied to the Bureau of Mines by importers and domestic companies milling foreign fluorspar, shows the quantities of imported fluorspar delivered to consumers in the United States in 1949 and 1950, irrespective of year of importation into the United States. The quantities are based on the actual outturn weights and represent the finished fluorspar recovered from milling and drying foreign ore, rather than the ore milled or concentrate dried.

---

[5] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[6] Values are at country of origin. The cost to consumers in the United States also includes ocean freight, import duties, etc.

Total	89,859	2,579,527	28.71	162,537	4,954,721	30.48

Exports.—Producers of fluorspar reported exports of 728 short tons of fluorspar valued at $29,746 in 1950, compared with 783 tons valued at $32,521 in 1949. The exports comprised 705 tons of flotation concentrates to Canada, 10 tons to Colombia, and 5 tons to Mexico, and 8 tons of metallurgical-grade fluorspar to Canada. In addition to the fluorspar exported by producers in 1950, dealers exported 11 tons to Peru and 1 ton to Venezuela.

TABLE 12.—Fluorspar reported by producers as exported from the United States, 1945–50

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average			Total	Average
1945	1,420	$45,939	$32.35	1948	644	$24,819	$38.54

[1] In addition to countries listed, China and U. S. S. R. produce fluorspar, but data on output are not available; estimates by author of chapter included in total.
[2] Data not available; estimates by author of chapter included in total.
[3] Estimate.
[4] Exports to Japan.

Canada.—According to the Dominion Bureau of Statistics, production of fluorspar in Canada was 59,107 metric tons [7] in 1950, compared with 56,212 tons in 1949.

[7] 1 metric ton is equivalent to 1.10231 short tons.

The St. Lawrence Corp. of Newfoundland, Ltd., and Newfoundland Fluorspar, Ltd., both in Province of Newfoundland, are the chief producers of fluorspar in Canada. There is also comparatively small production in the Province of Ontario.

The St. Lawrence Corp. of Newfoundland, Ltd., has a gravity-concentrating mill and a flotation mill in Newfoundland for treating the ore from its several mines; a subsidiary, St. Lawrence Fluorspar, Inc., has a plant at Wilmington, Del., for drying the flotation concentrate. Shipments by the St. Lawrence Corp. of Newfoundland, Ltd., totaled 18,125 short tons in 1950 (23,891 tons in 1949) and comprised 12,338 tons of acid-grade filter cake and 5,787 tons of fluxing-gravel fluorspar. A shortage of hydroelectric power adversely affected operations in the second quarter of 1950.

Newfoundland Fluorspar, Ltd., has two mines and ships crushed fluorspar principally to Arvida, Quebec, where the Aluminum Co. of Canada, Ltd., has a flotation plant.

In the Province of Ontario, Cardiff Fluorspar Mines was sinking a 7- by 12-foot, two-compartment shaft on its property near Wilberforce.

France.—France has shown much enterprise since World War II in regaining its former position as an important producer of fluorspar. Production was 51,920 and 63,085 metric tons, respectively, in 1938 and 1939, after which it declined progressively to 13,400 tons in 1944. Since 1944, however, output has increased steadily to 39,954 tons in 1949. The chief producing mines are in the Departments of Haute-Loire, Var, and Puy-de-Dôme, where output was 10,766 tons, 9,548 tons, and 8,267 tons, respectively, in 1949. The remaining production came chiefly from the Departments of Aveyron, Saône-et-Loire, and Tarn. A review of the fluorspar industry in France from 1938 to 1949 has been given by Chermette.[8]

Korea.—The Kaekok fluorspar mine near Tanyang has been described.[9] In 1944 the mine was purchased by the Chosen Refining Co., which operated it until sometime in 1945, when it was closed. The mine was reopened in April 1949, since when it has yielded about 1,000 metric tons of hand-sorted fluorspar, which was added to a prewar stockpile of 500 tons.

Mexico.—Chiefly as a result of record demand in the United States—the principal market for Mexican fluorspar—production (as measured by exports) in Mexico was 65,667 metric tons in 1950, an increase of 18 percent over 1949 but 13 percent less than the record high established in 1948. About 2,200 tons of Mexican fluorspar are used in local metallurgical plants, and some is exported to Canada. It was reported[10] that newly found deposits of fluorspar have been opened in the Municipality of Muzquiz.

Spain.—The 3-year upward trend in production of fluorspar in Spain was halted in 1950, when there was a 45-percent decline from the record output of 59,594 metric tons in 1949. Consumption of fluorspar in Spain is small; consequently, the industry is largely dependent on the export market for its survival. The United States

[9] Hyde, Pitt W., A Report on the Kaekok Lead and Fluorite Mines: Economic Cooperation Administration Mission to Korea, Rept. 574, Apr. 24, 1950, 4 pp.

[10] Robertson, F. S., American Consulate Rept. 6, Piedras Negras (Mexico), Apr. 4, 1949.

was an important market in 1950; imports of Spanish fluorspar into the United States were 32,025 metric tons compared with 11,474 tons in 1949. Much of the fluorspar received in the United States from Spain in 1950 was acid-grade filter cake from the flotation mill serving the Osor mine in the Gerona district; the filter cake is dried at Wilmington, Del.

Sweden.[11]—Boliden Mining Co. has taken over mines producing fluorspar in the Osterlen district of southern Sweden. Output is in excess of the company's needs. Annual production of fluorspar is about 3,000 tons.

United Kingdom.—Fluorspar is found in economic quantities in various parts of Great Britain. Present production comes from old lead mines reopened for fluorspar, from veins in the lead-mining areas containing mainly fluorspar, and from dumps from old lead workings.[12] The bulk of the acid-grade fluorspar at present comes from Derbyshire—75 percent from the Glebe mine and the remainder from hand-picking pure lump spar. It is reported that new sources of supply will soon be available in Weardale, where two flotation plants are now under construction. About 85 percent of the metallurgical fluorspar comes from Derbyshire and the remainder from Durham.

The Glebe mine, at Eyam, Derbyshire, is served by a heavy-medium plant and a flotation mill.[13] The two largest producers of fluorspar in Weardale, Durham, are Weardale Lead Co., which works a number of veins, and Fluorspar, Ltd., which operates the Stanhope Burn mine.

The discovery of rich veins of fluorspar in the Allendale district, Northumberland County, has been reported.[14] Samples from the Whitewood and Barneycraig veins analyzed 99.33 and 98.61 percent calcium fluoride.

CRYOLITE

Cryolite occurs in commercial quantity and is mined at only one place—Ivigtut, Greenland.

Synthetic cryolite was manufactured in the United States in 1950 by the Aluminum Ore Co. at East St. Louis, Ill. and the Reynolds Metals Co. at Bauxite (Hurricane Creek), Ark.

Imports of natural and artificial cryolite into the United States were 15,298 long tons valued at $978,175 in 1950, compared with 18,309 tons valued at $1,312,260 in 1949. The imports in 1950 comprised 15,200 tons from Greenland and 98 tons from Belgium.

Exports of cryolite from the United States were 1,850 long tons valued at $404,931 in 1950, compared with 324 tons valued at $77,709 in 1949 and 650 tons (revised figure) valued at $143,430 (revised figure) in 1948. Of the 1950 exports, 1,555 tons went to Canada, 121 tons to Mexico, 87 tons to Trieste, 59 tons to Austria, and the remainder to Brazil, India, Union of South Africa, Uruguay, and Venezuela.

The preparation and use of natural cryolite have been described.[15]

Fuel Briquets and Packaged Fuel[1]

By J. A. Corgan and Golden V. Chiriaco

GENERAL SUMMARY

PRODUCTION of fuel briquets and packaged fuel in 1950 totaled 2,770,020 and 135,682 net tons, respectively, increases of 15 and 8 percent over 1949. Briquets were shipped to 37 States and the District of Columbia in 1950. Exports, all destined for Canada, totaled 175,768 tons, and imports, all from Canada, totaled 804 tons.

Bituminous coal and Pennsylvania anthracite were the principal raw fuels used in the manufacture of fuel briquets and packaged fuel in 1950. Asphaltic binders were used almost exclusively in making briquets, and both asphalt and starch, together with a small amount of cement, were employed as binders in manufacturing packaged fuel.

FUEL BRIQUETS

Pertinent data on the fuel-briquetting industry from 1946 to 1950 are summarized in table 1. Production, by regions, from 1917 to 1950 is illustrated in figure 1.

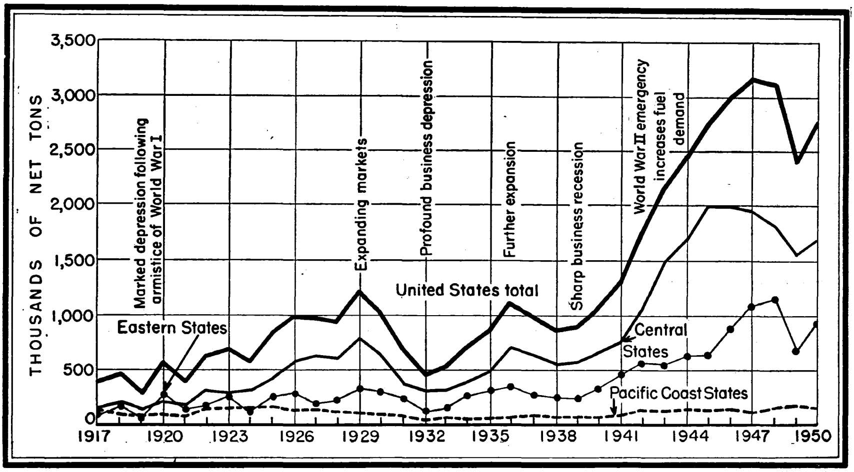

FIGURE 1.—Production of fuel briquets in the United States, by regions, 1917–50.

DOMESTIC PRODUCTION

The 15-percent increase in the output of fuel briquets in 1950, when a total of 2,770,020 net tons was produced, can be attributed largely to the somewhat colder weather prevailing in 1950 as compared to 1949, when 2,403,971 tons was produced.

[1] Briquets made from charcoal, wood scrap, and fruit pits are not included in Bureau of Mines review

TABLE 1.—Salient statistics of the fuel-briquetting industry in the United States, 1935–39 (average), and 1946–50

[1] Peak year of United States fuel-briquet production.
[2] 1937–39 average. Not reported separately before 1937.
[3] Production plus imports minus exports.
[4] Revised figure.

As shown in table 2, 31 plants produced briquets in 1950.[2] Fourteen States contributed to the 1950 production, the Central States with 22 plants accounting for 61 percent of the total output. Wisconsin, with 10 plants and 43 percent of the national output, was the largest individual producing State. West Virginia followed with 2 plants, and Pennsylvania ranked third with 4 plants operating. Other producing States, in order of output, were Missouri, Oregon, Illinois, North Dakota, Michigan, Washington, Indiana, Kansas, Arkansas, California, and Nebraska. The total value of the 1950 production was $32,039,379, an increase of about 12 percent over the value reported in 1949 ($28,641,424).

TABLE 2.—Production of fuel briquets in the United States, 1949–50

Capacity.—Reversing a downward trend which had started in 1948, the rate of production in 1950 (62 percent of capacity) showed a substantial increase. (See table 3.) Nine plants, each with an annual capacity of 200,000 tons or more, furnished 2,007,577 tons or about 73

[2] Directories of fuel-briquet and packaged-fuel operations and a list of manufacturers of briquetting machinery, M. M. S. Nos. 1964, 1965, and 1959, respectively, are obtainable on request from the Bureau of Mines, Washington 25, D. C.

percent of the total production, utilizing 65 percent of their combined capacity. Sixteen plants with an annual capacity of 100,000 tons or more each accounted for 90 percent of the total production.

TABLE 3.—Annual capacity and production of briquetting plants in the United States, 1946–50

	Number of active plants	Annual capacity (net tons)	Production

Total	31	4,455,000	2,770,020	62.2

Raw Fuels.—Bituminous coal was the principal raw fuel used in the manufacture of fuel briquets in 1950, followed in order by Pennsylvania anthracite and petroleum coke. These accounted for almost 89 percent of the raw fuels used. Residual carbon from the manufacture of oil gas, Arkansas hard coals, lignite char, and residual carbon from pyrolysis of natural gas also were used as raw fuels. Yard screenings used at 12 plants were the source of 19 percent of all raw fuels.

TABLE 4.—Raw fuels used in making fuel briquets in the United States, 1950

Type of raw fuel used	Plants using	Net tons used	Source of raw fuel used	Plants using	Net tons used		
					Yard screenings	Other raw fuels	Total
Pennsylvania anthracite	14	638,356	Yard screenings exclusively (from own or other yards)	2	79,552		79,552
Arkansas hard coals	8	111,757	Raw fuels (other than yard screenings) exclusively	19		1,439,267	1,439,267
Bituminous low-volatile coal	16	1,427,046	Both yard screenings and other raw fuels	10	414,778	665,782	1,080,560
Bituminous high-volatile coal	3	95,030					
Semicoke (lignite char)	1	183,808					
Residual carbon from pyrolysis of natural gas	1						
Residual carbon from manufacture of oil gas	2						
Petroleum coke	4	143,382					
Total	[1] 31	2,599,379	Total	31	494,330	2,105,049	2,599,379

[1] A number of plants used more than 1 kind of raw fuel; hence, the sum of the plants is greater than the actual number of plants active (31) in 1950.

Pennsylvania anthracite was used extensively, either alone or in combination with bituminous coal, in Pennsylvania and Wisconsin. Large quantities of bituminous coal were used widely in the Eastern and Central States. Residual carbon from oil gas and natural gas was the principal raw material used in the Pacific Coast States.

Binders.—Asphaltic binders are employed almost exclusively in making briquets in the United States. In 1950, 29 operators used approximately 170,641 tons of asphaltic binders and very small quantities of coal-tar pitch; 2 operators used no binder. The percentage of binder in the briquets (by weight) ranged generally from 5 to 9 percent. In a few instances, the percentage was higher. Twenty-three plants, accounting for about 91 percent of the 1950 production, used binders representing from 5 to 8 percent of the weight of the briquets.

TABLE 5.—Classification of briquetting plants in the United States, by type of binder used, 1947–50

	1947		1948		1949		1950	
	Plants	Percent of total briquet production	Plants	Percent of total briquet production	Plants	Percent of total briquet production	Plants	Percent of total briquet production
Type of binder used:								
No binder [1]	2	95.8	2	95.9	2	100.0	2	100.0
Asphalt	30		31		30		28	
Asphalt and coal-tar pitch	1	4.2	1	4.1	1		1

Rosin and wax			1					
Total	35	100.0	36	100.0	33	100.0	31	100.0

[1] Residual carbons from manufacture of oil gas and bituminous coal were raw fuels used at plants employing no binder.

SHIPMENTS

Weight and Shape.—In 1950 briquets ranged in weight from 1⅞ to 20 ounces. Pillow shapes, all under 5 ounces except for an 11-ounce bituminous high-volatile pillow, were made at 28 plants and represented 78 percent of the total production; 2½-ounce cylindrical (barrel-shaped) and 18- and 20-ounce cubes supplied 22 percent of the total production.

In addition to the 2,563,711 tons of fuel briquets shipped to 37 States and the District of Columbia in 1950, 175,768 tons was exported to Canada. Wisconsin, Minnesota, Missouri, and Michigan received 1,470,895 tons of the total briquets shipped. The difference between production in 1950 (2,770,020 net tons) and shipments within the United States (2,563,711 tons), or 206,309 tons, represents exports, briquets used at plants for power or heat, and changes in producers' stocks. Briquets are used almost entirely for space heating, but in 1950 operators reported 11,737 tons used for power or heat at their plants.

Of total shipments of fuel briquets in 1950, 79 percent moved by rail and 21 percent by truck. In the Eastern States about 97 percent was shipped by rail and 3 percent by truck; in the Central States about 71 percent moved by rail and 29 percent by truck; and in the Pacific Coast States about 48 percent moved by rail and 52 percent by truck.

TABLE 6.—Shipments of fuel briquets of domestic manufacture in the United States, by States of destination, as reported by producers, 1949–50, in net tons [1]

[1] Includes shipments outside the United States.
[2] Includes small tonnage shipped by scow.
[3] An additional 3,923 tons was used by 3 producers as fuel at their plants in 1949 and 11,737 tons by 4 producers in 1950.

PRICES

After an increase each year during the period 1946–49, the average value per ton of briquets (f. o. b. plant) produced in the Eastern, Central, and Pacific Coast States dropped slightly in 1950. (See table 1.) Proceeds per ton (f. o. b. plant) vary greatly because of the different local conditions under which briquets are made. In the Eastern States briquets are made relatively near the coal fields, hence, the cost of raw material does not involve large freight charges; therefore, the f. o. b. plant price is relatively low. In the Central States briquets generally are made at plants great distances from the original coal source; consequently, raw fuel costs at these plants include a considerable freight charge which is reflected in higher prices per ton f. o. b. plant. The highest plant values are shown in the Pacific Coast States, where the raw fuels used are residual carbons from the manufacture of oil gas and pyrolysis of natural gas.

These f. o. b. plant values vary considerably from the prices paid for briquets by consumers, as retail prices include transportation costs and retail dealers' margins. Retail prices of fuel briquets for selected cities may be obtained from the Bureau of Labor Statistics, United States Department of Labor, Washington 25, D. C.

FOREIGN TRADE [3]

Imports of fuel briquets into the United States reached a peak of 123,593 net tons in 1926, when a strike during the winter of 1925–26 in the Pennsylvania anthracite fields created a shortage of fuels in this country. Imports have been negligible since 1941, amounting to only a few hundred tons a year; in 1950, 804 tons, all of which came from Canada, was imported.

In 1950 exports of fuel briquets, all to Canada, totaled 175,768 tons, an increase of 5 percent over 1949. The value of 1950 exports was $2,617,007, an increase of 7 percent over 1949.

TECHNOLOGY

The Anthracite Institute and the Pennsylvania State College continued their research, which has been under way for several years, on the recovery, upgrading, and utilization of fine sizes of anthracite. A number of reports on briquetting or pelletization of anthracite fines by extrusion have been released by these organizations.

Cooperative work by the Bureau of Mines and the Natural Resources Research Institute, of the University of Wyoming, was continued on the briquetting of subbituminous coals. The fuels for briquetting were prepared at the Bureau of Mines laboratories and briquetted at the pilot plant at the university. Description of this work is contained in a publication released by the university in 1949.[4]

[3] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[4] Boley, Charles C., and Rice, Neal, Briquetting of Dried Low-Rank Western Coals: Univ. Wyoming Natural Resources Inst., Bull. 3, November 1949, 76 pp.

A pilot plant for drying and briquetting coal was designed by the Bureau and erected at the university by the institute. A fluidized drying process developed by the Bureau will preheat and dry the subbituminous coal fed to the briquetting press.

WORLD PRODUCTION

Data on the production of fuel briquets are not available for all countries; however, as indicated in table 9, Germany is one of the world's largest producers of fuel briquets.

TABLE 9.—World production of fuel briquets, by countries, 1946–50, in metric tons [1]

[1] In addition to countries listed, briquets are produced in Bulgaria, Italy, Mexico, Rumania, U. S. S. R., and Yugoslavia, but production figures are not available. Estimate included in total.
[2] Data not available; estimate included in total.
[3] Fiscal year ended March 31 of year following that stated.
[4] Estimate.
[5] British and American zones only.
[6] Briquets used by government railway only. In addition, an unknown amount is manufactured for household use; accurate data are not available.
[7] August to December, inclusive.
[8] Included with India.
[9] Incomplete.

PACKAGED FUEL

Salient statistics of the packaged-fuel industry in the United States from 1946 to 1950 are summarized in table 10.

TABLE 10.—Salient statistics of the packaged-fuel industry in the United States, 1935–39 (average), 1940, and 1946–50

	1935–39 (average)	1940 (peak year of production)	1946	1947	1948	1949	1950
Production:							
Eastern States net tons	5,052	6,349	9,065	2,153	1,859	125,948	135,682
Central States do	116,218	276,994	181,854	180,728	155,154

Eastern States	$9.45	$9.02	$12.93	$16.58	$17.64	$17.77	$17.19
Central States	$8.50	$8.36	$13.08	$15.75	$17.42	$17.76	$17.92
Pacific Coast States	$9.91	$12.82					

DOMESTIC PRODUCTION

In 1950, 54 plants operated in the United States, as compared with 57 plants in 1949, and produced 135,682 net tons of packaged fuel, valued at $2,430,847, an increase of 8 percent in tonnage and 9 percent in value over the preceding year. Michigan, Wisconsin, and Ohio, in the order named, were the three largest producing States, accounting for about 70 percent of the 1950 output. The average value per net ton (f. o. b. plant) of packaged fuel increased consistently in the Central States from 1946 to 1950. (See table 10.) In the Eastern States, however, after increasing steadily from 1946 to 1949, the average value per ton dropped slightly. Proceeds received by the manufacturers include cost of coal at the mine, freight to factory, direct and indirect manufacturing costs, and profit. For this reason the values may vary greatly from plant to plant, depending on the local conditions under which the product is manufactured. Production of packaged fuel, by States, for 1949–50 is shown in table 11.

TABLE 11.—Production of packaged fuel in the United States, by States, 1949–50

State	1949			1950		
	Plants	Net tons	Value	Plants	Net tons	Value
Indiana	2	(1)	(1)	3	16,355	$297,102
Michigan	19	39,254	$660,874	20	43,786	735,326
Minnesota	4	16,197	332,100	4	19,814	421,553
Ohio	17	28,768	516,792	15	24,150	430,660
Wisconsin	7	23,720	402,560	5	27,082	456,631
Other States	[2] 8	[3] 18,009	[3] 324,422	[4] 7	4,495	89,575
Total	57	125,948	2,236,748	54	135,682	2,430,847

[1] Included in "Other States" to avoid disclosure of individual company operations.
[2] Comprises 2 plants each in Illinois and Virginia, and 1 plant each in Iowa, Kentucky, Missouri, and Nebraska.
[3] Includes Indiana and States listed in footnote 2.
[4] Comprises 2 plants in Virginia and 1 plant each in Illinois, Iowa, Kentucky, Missouri, and Nebraska.

Number of Plants.—Of the 54 plants producing packaged fuel in 1950,[5] 20 plants, located in Michigan, accounted for 32 percent of the total output, 5 plants in Wisconsin accounted for 20 percent of the production, and 15 plants in Ohio accounted for 18 percent.

Capacity of Plants.—Table 12 gives comparative data on capacity and production for 1946 to 1950, inclusive, as reported by packaged-fuel operations active in those years. In 1950, 16 plants with a capacity of 5,000 tons or more, operating at 51 percent of their combined capacity, produced 106,881 tons of packaged fuel, or 79 percent of the total 1950 output. Thirty-eight plants, each with an annual capacity under 5,000 tons, produced 28,801 tons, or 21 percent of the total production, utilizing about 34 percent of their combined capacity.

TABLE 12.—Annual capacity and production of packaged-fuel plants in the United States, 1946–50

	Number of active plants	Annual capacity (net tons)	Production	
			Net tons	Percent of annual capacity
1946	70	530,760	190,919	36.0
1947	62	427,200	182,881	42.8
1948	62	397,620	157,013	39.5
1949	57	331,300	125,948	38.0
1950:				
Capacity of—				
Less than 5,000 tons	38	85,760	28,801	33.6
5,000 to less than 10,000	9	54,800	18,667	34.1
10,000 to less than 15,000	3	30,000	15,890	53.0
15,000 to less than 25,000	2	123,000	72,324	58.8
25,000 or more	2			
Total	54	293,560	135,682	46.2
Production of—				
Less than 1,000	28	56,760	9,958	17.5
1,000 to less than 3,000	17	72,800	28,375	39.0
3,000 to less than 5,000	3	21,000	13,166	62.7
5,000 to less than 10,000	3	35,000	20,612	58.9
10,000 to less than 30,000	3	108,000	63,571	58.9
Total	54	293,560	135,682	46.2

TABLE 13.—Raw fuels used in making packaged fuel in the United States, 1950

Type of raw fuel used	Plants using	Net tons used
Bituminous low-volatile coal	47	118,575
Bituminous high-volatile coal	4	3,891
Pennsylvania anthracite	1	3,186
Semianthracite	3	
Petroleum coke	4	7,230
Total	[1] 54	132,882

Source of raw fuel used	Plants using	Net tons used		
		Yard screenings	Other raw fuels	Total
Yard screenings exclusively (from own or other yards)	31	31,381	--------	31,381
Raw fuels (other than yard screenings) exclusively	11	--------	71,976	71,976
Both yard screenings and other raw fuels	12	8,418	21,107	29,525
Total	54	39,799	93,083	132,882

[1] A number of plants used more than 1 kind of raw fuel; hence, the sum of the plants above is greater than the actual number of plants active (54) in 1950.

[5] See footnote 2.

Raw Fuels.—Five kinds of raw fuel entered into the manufacture of packaged fuel in 1950. Bituminous low-volatile coal used at 47 plants, either alone or in combination with other fuels, comprised 89 percent of the total raw fuel used. Small quantities of bituminous high-volatile coal, Pennsylvania anthracite, semianthracite, and petroleum coke also were used in the manufacture of packaged fuel in 1950.

Yard screenings were used exclusively at 31 plants to produce 23 percent of the total output; raw fuels other than yard screenings were used exclusively at 11 plants to manufacture 55 percent; and screenings and other raw fuels combined were used at 12 plants to produce 22 percent of the total 1950 production.

Binders.—Starch, totaling 702 tons, or an average of about 14 pounds per ton of packaged fuel produced, was the principal binder employed and was used at 49 plants producing about 75 percent of the total 1950 output. Asphalt and cement were used exclusively at a few of the plants. Table 14 gives details on binders employed in manufacturing packaged fuel in 1947–50.

TABLE 14.—Classification of packaged-fuel plants in the United States, by type of binder used, 1947–50

	1947		1948		1949		1950	
	Plants	Percent of total packaged-fuel production	Plants	Percent of total packaged-fuel production	Plants	Percent of total packaged-fuel production	Plants	Percent of total packaged-fuel production
Type of binder used:								
Starch	58	77.9	57	79.8	52	78.3	48	74.6
Asphalt	2	22.1	3	19.5	3	20.6	2	25.4
Starch and asphalt	1		1	.7	1	1.1	1	
Cement	2		2		2		2	
Coal-tar pitch							1	
Total	[1] 62	100.0	[1] 62	100.0	[1] 57	100.0	54	100.0

[1] 1 plant making 2 types of packaged fuel used starch binder for 1 and asphalt and starch for the other; hence, the sum of the items shown exceeds the number of active plants.

SHIPMENTS

Sales of packaged fuel in 1950 totaled 134,550 net tons, of which 112,962 tons (84 percent) was listed as local sales (by truck) and 21,588 tons (16 percent) was reported as other than local sales. Of the 21,588 tons shipped outside the local area, 13,774 tons (about 64 percent) went by truck and 7,814 tons (36 percent) by rail.

TABLE 15.—Shipments of packaged fuel in the United States, by method of transportation, 1946–50, in net tons

Year	Shipped by truck			Shipped by rail	Total
	Local sales [1]	Other than local sales	Total truck		
1946	150,770	25,262	176,032	14,555	190,587
1947	147,599	23,749	171,348	11,270	182,618
1948	128,661	17,753	146,414	10,272	156,686
1949	108,606	11,036	119,642	6,306	125,948
1950	112,962	13,774	126.736	7,814	134,550

[1] Includes sales both called for and delivered.

Gem Stones

By W. F. Foshag,[1] George Switzer,[1] and H. P. Chandler

GENERAL

DOMESTIC PRODUCTION

THE United States continues to be an unimportant factor in world gem production. Although a wide variety of gems is produced in small amount, gem mining probably will continue to be a minor mining industry.

There are no large gem-mining companies in the United States. A few small companies have been organized from time to time to work certain deposits, such as jade, turquoise, sapphire, and tourmaline. Some professional lapidary shops employ a few miners. Most gemstone production results from the efforts of thousands of amateur lapidaries ("rockhounds"), who spend their vacations and week ends searching for materials suitable for cutting and polishing. Chief objects of their search are such varieties of quartz as agate, jasper, and petrified wood. Much of what they collect is sold or exchanged to mineral dealers, local jewelers, or roadside curio shops, particularly in the Southwestern, Western, and Northwestern States. The hobby of lapidary work and gem and mineral collecting has grown phenomenally in the past 15 years. No reliable figures are available as to the number of persons engaged in this hobby, but the best estimates range from at least 200,000 to a million or more.

Since only a small percentage is mined by companies on a commercial scale, no statistics have been compiled as to the value of the domestic output of gem stones. In the rough, it may approximate $400,000 to $500,000.

The many forms of quartz, chiefly the cryptocrystalline varieties, led the field, with kunzite (pink spodumene) second, jade third, and turquoise fourth. Of the producing States, California, Texas, Oregon, Washington, and Wyoming were the leaders.

Agate.—Agate production, including all other varieties of chalcedony, continues to increase as interest grows in the lapidary hobby.

Greatest production in 1950 appears to have been from the Alpine-Big Bend area, Texas, where agates were recovered having a value variously estimated at $10,000 to $50,000.

Another relatively large producing area was Deming, N. Mex., with an estimated production of 30 tons, of which not more than 3 tons was of good quality.

Large quantities of agate were also found in California, Oregon, and Washington, with smaller amounts in Arizona, Montana, and Wyoming. Small quantities of various varieties of chalcedonic quartz, such as petrified wood and jasper, were collected in almost every other State.

---

[1] Smithsonian Institution; consulting mineralogist to Bureau of Mines.

Kunzite.—Kunzite, the pink gem variety of spodumene, figured in the gem-production picture owing to the discovery of a pocket containing 280 pounds of rough kunzite crystals in the San Pedro mine, Pala district, San Diego County, Calif. This is the first discovery of a large quantity of this gem in many years. The value of the find was estimated at $20,000 to $30,000. The largest crystal fragment, containing a large proportion of gem material, weighed 5 pounds. The material is reported to be of good quality but rather pale.

Jade.—The Wyoming jade (nephrite) industry is reported to be decreasing rapidly. The deposits of good green jade are nearly exhausted, with a 1950 production of not over 200 pounds. Prices for good-quality green have increased to as high as $30 per pound. Black jade is still plentiful at $2.00 to $5.00 per pound. Approximately 1,500 pounds of the black variety were sold in 1950, but a market is hard to find. Some black jade has been used as a substitute for black onyx; but, because it is harder to saw and polish, lapidaries prefer the onyx.

In California about 700 pounds of nephrite jade, valued at $700, was produced at Porterville. Smaller amounts were picked up by collectors at other localities, chiefly in Monterey County.

The jadeite jade deposit discovered in San Benito County, Calif., in 1949 has been visited by many collectors but has not been exploited commercially because of its poor color. Other finds of jadeite have been reported in Mendocino County, but so far no good gem material has been reported.

No production of nephrite jade was reported for the year from the Kobuk area, northwestern Alaska.

Turquoise.—Turquoise production in the Southwest continues to diminish. No output was reported from the Cerrillos mine in New Mexico. Some turquoise was mined by the Nevada Turquoise Co. near Battle Mountain, Nev., and the open-pit Castle Dome (copper) mine near Miami, Ariz., produced a small amount of turquoise of good quality.

Other Gem Stones.—No diamonds were produced from the Arkansas diamond mines in 1950, although the newly organized American Diamond Mining Co. indicated the possibility of renewing operations there.

The South Dakota inspector of mines reports 68.5 tons of rose quartz produced in that State in 1950 for ornamental and monumental purposes. Scott's Rose Quartz Co., Custer, S. Dak., mined no gem rose quartz in 1950, but produced 7⅛ tons, valued at $506.50, for ornamental purposes.

A small quantity of rock-crystal quartz from Arkansas and about 500 pounds of asteriated quartz from the Springfield, N. H. area were sold for gem use.

Some quartz colored blue by chrysocolla was produced from various localities in the Southwest, especially at the Inspiration (copper) mine near Miami, Ariz.

No sapphires were produced at the Yogo Sapphire mine, Montana.

An estimated $5,000 worth of colorless to pale-blue topaz was produced in Mason County, Tex., mostly by local collectors for private collections.

A small amount of peridot from near Deming, N. Mex., was sold. This material is reported to be abundant but will only cut 4- to 8-point stones. Peridot in small quantity was also found on the San Carlos Indian Reservation and sold by the Indians in small lots.

Some pyrope garnet was produced near Fort Defiance, Ariz., and sold by the Indians.

CONSUMPTION AND USES

For the first 6 months of the year jewelry sales were slow. The general attitude among retailers was one of depression but not panicky concern, for the early months of every year are traditionally dull in the jewelry stores. Diamonds were particularly slow, principally in higher-valued pieces, because of the anticipated reduction of the jewelry excise tax from 20 percent to 10 percent. The outbreak of the Korean War, however, killed any possibility of a tax reduction and had a strong effect on the sale of diamonds, for there was now nothing to be gained by further postponement of purchases. Actually, consumers saw higher prices in the immediate future because of inflationary influences, higher wages among diamond cutters, and greater demand. These factors, plus an increase in the marriage rate, caused a strong diamond market during the last 6 months of the year.

As usual, the United States again in 1950 was the principal world market for diamonds. There was substantial purchasing of diamonds as investments in several troubled areas of the world and considerable evidence of such type of purchasing of fine-quality diamonds in America during 1950.

The jewelers' Christmas business was good. It gained over 1949 and sufficed to raise the year's volume for the jewelry industry to $1,140,000,000 compared with $1,055,000,000 in 1949, a gain of 8 percent.

Fashions in Jewels.—Fashions in gems showed relatively little basic change during 1950. Jewelry was light, flexible, and mobile. Designed on the theory that diamonds in motion look bigger than diamonds in repose, mountings were made to move loosely.

In mountings, curved lines were the most popular, but with fewer naturalistic flowers and abstract objects. In forms of diamond jewelry, the necklace remained the most important single piece. Earrings changed from the long pendant type to large button clusters on the lobe. Diamond wrist watches became increasingly popular.

The cluster, a large center stone surrounded by one or more rows of stones of matched sizes, was the outstanding motif in 1950, especially in diamonds. The cluster mountings might be marquise, square, oval, or round. Most popular usage of these clusters was in dinner rings.

Toward the end of the year the metal restrictions imposed or on the horizon made new designs uncertain. Gold was being used extensively owing to the shortage of platinum.

More fancy-cut diamonds were used than since the 1920's. Such shapes as pentagon, kite, trapeze, triangle, and half-moon were used extensively. The bulk of the diamond jewelry sold in America, however, is mounted with the standard brilliant, the emerald cut, and occasionally the marquise and baguette.

IMPORTS[2]

Imports of gem stones, exclusive of industrial diamonds, in 1950, as reported by the United States Department of Commerce, totaled $119,641,457, an increase of 42 percent over 1949.

TABLE I.—Precious and semiprecious stones (exclusive of industrial diamonds) imported for consumption in the United States, 1949–50

[U. S. Department of Commerce]

Commodity	1949		1950	
	Carats	Value	Carats	Value
Diamonds:				
Rough or uncut (suitable for cutting into gem stones), duty-free	[1] 633, 731	[1] $28,246,634	819, 083	$44, 775, 769
Cut but unset, suitable for jewelry, dutiable	335, 487	41, 427, 718	492, 671	58, 524, 902

Imitation		7, 802		3, 019
Total		[1] 84, 132, 466		119, 641, 457

[1] Revised figure.

TECHNOLOGY

Additional experiments in the artificial coloration of diamonds in a cyclotron were carried out during the year.[3] Color changes noted were usually from pale brown to green, white to bluish green, and yellow to yellow green. Occasional changes from yellow to golden brown were observed. The induced color appears to be permanent but is only present as a surface skin. No permanent induced radioactivity was observed. Diamonds subjected to neutron bombardment in an atomic pile were said to have been quickly blackened after first passing through an intermediate green color.

Research on diamonds was carried out by the Diamond Research Laboratory of Johannesburg, Union of South Africa, sponsored and supported by the Industial Distributors (1946), Ltd.

DIAMONDS

The year 1950 was a record-breaking one in the diamond industry. Sales of diamonds effected through the Central Selling Organization on behalf of South African and other producers set a new record, as follows: Gem diamonds £38,357,698, industrial diamonds £12,609,343, total £50,967,041. The previous record was a total of £38,000,000 established in 1948. Whereas the quantity of diamonds sold in 1950 was approximately the same as the quantity sold in 1948, the proceeds realized in sterling in 1950 exceeded by nearly £13,000,000 (34 percent) the sterling proceeds in 1948. This increase was due to devaluation of the pound sterling in terms of the dollar in September 1949.

A new record was also set for world production of diamonds in 1950, with a total of 15,300,000 carats, compared with 14,175,000 carats in 1949.

Cutting.—The strong demand for gem diamonds in 1950 tended to alleviate somewhat the unemployment situation in the cutting centers. Both the Diamond Manufacturers Association and the World Federation of Diamond Workers passed resolutions at their annual conventions in Amsterdam urging uniform working conditions and hours throughout the industry.

Belgium continues to be the largest cutting center, followed by Germany, Netherlands, Israel, and the United States. Smaller cutting centers are well-established in South Africa, England, and Puerto Rico. Efforts to revive the Cuban diamond-cutting industry failed. In the United States there are about 300 diamond-cutting establishments, employing approximately 1,500 workers. High cutting costs in the United States, compared to other cutting centers, foreign currency manipulation, and other difficulties were only partly offset by greater efficiency and finer categories of cutting in the American industry.

Imports.—Imports of gem-grade diamonds into the United States amounted to $103,300,671 in 1950 compared to $69,674,352 in 1949, an increase of 48 percent. Percentagewise, rough or uncut stones showed the greatest increase in total value. Belgium furnished 50 percent (value) of the cut in 1950.

[1] Revised figure.

World Production.—Official figures on diamond production are not available for all countries, but the figures in the accompanying table are believed to be reasonably accurate, as they have been compiled from Government reports, information supplied by officials of producing companies, and other authoritative sources. World production (gems and industrials) is estimated to have been 15,300,000 metric carats, which compares with 14,175,000 (revised figure) carats for 1949, an increase of 8 percent.

Belgian Congo is the leading producer by weight, but only about 5 percent of the Belgian Congo production is of gem quality. South Africa, although producing much less by weight, leads in value owing to the high percentage of gem stones.

TABLE 3.—World production of diamonds, 1947–50, by countries, in metric carats

[Including Industrial Diamonds]

Country	1947	1948	1949	1950
Africa:

[3] Estimated.
[4] Includes an estimated 100,000 carats for State mines of Namaqualand.

Industrial Diamonds.—Details regarding imports, production, sales, and uses of industrial diamonds will be found in the Abrasive Materials chapter of this volume.

OTHER GEM STONES

The price of most gem stones other than diamonds continued to increase owing to short supply of newly mined stones of fine quality.

Again in 1950 Canada produced very little in the way of gem stones. A few tons each of sodalite, peristerite, and labradorite are produced each year, but the total value probably does not exceed a few hundred dollars.

Ceylon maintained its output of important quantities of a variety of gems, chiefly ruby, sapphire, chrysoberyl (including alexandrite), topaz, spinel, garnet, zircon, and tourmaline. The Ceylon gems come from the alluvial gravels of the Ratnapura district. The gem-mining industry is chiefly handled by villagers and minor concerns. Value of the annual production is believed to be about $500,000.

Emeralds were mined at the Chivor-Somondoco mines in Colombia. Production for 1949 was reported to be 91,656 carats. According to latest reports, the famous Muzo, Colombia, mines are still closed. Some good-quality emeralds were mined at Kaliguman, India, a small village in the Udaipur district, State of Rajasthan. South Africa and Brazil continued to produce a few emeralds.

Australian gem-sapphire production for 1948 had a reported value of £A 6,000.[4] In September 1948 a 1,958-carat (uncut weight) blue sapphire was discovered at Anakie, central Queensland.

Gem-stone production of Burma for 1949 was as follows: Ruby 100 carats, sapphire 2,500 carats, spinel 12,500 carats, jadeite 2,393 pounds, total value approximately $88,500.[5]

The Australian opal-mining industry continues at a low ebb. South Australia is now the largest producer, with the main fields lying in the Stuart Range north of Tarcoola. Only about 100 miners are now active, and the value of the annual production averages about $200,000.[6]

Madagascar gem-stone production for the first half of 1950, chiefly tourmaline, beryl, and garnet, was 9,004 grams.[7]

In Mozambique the pegmatites in the Alto Ligonho district produced some fine-quality rubellite, morganite, and aquamarine, some of which came into the United States.

The zircon mining and cutting industry of Thailand, which experienced a sudden boom immediately after World War II, is now in a depressed condition. Bangkok cutters predict that, if the present export volume is not increased soon, it may be impossible to keep the industry alive. The zircons are mined in the Provinces of Chantaburi and Ubonrajathani, in southeast Thailand along the Thai-Indochina border.

Brazil continued to produce a large caratage of amethyst, aquamarine, citrine, topaz, and tourmaline and smaller amounts of euclase, chrysoberyl, andalusite, and other stones.

SYNTHETIC GEM STONES

Corundum and Spinel.—The year 1950 witnessed further recapture of the American market by European producers of synthetic corundum and spinel. Chief production is in Germany, followed by France. India and Japan are other foreign producers.

The Idar-Oberstein district, in the French zone of West Germany, resumed its former position of importance as the chief cutting center for synthetics. Favored by low labor rates and devaluation of currency, most synthetic gems used in the American market are now cut in Idar-Oberstein. Toward the end of the year, as large orders piled up and European deliveries became slower, more business was placed in the United States.

---

[4] Bureau of Mines, Mineral Trade Notes: Vol. 30, No. 6, June 1950, p. 36.
[5] Bureau of Mines, Mineral Trade Notes: Vol. 31, No. 6, December 1950, p. 31.
[6] Australian News and Information Bureau, New York: Vol. 8, No. 4.
[7] Bureau of Mines, Mineral Trade Notes: Vol. 31, No. 6, December 1950, p. 31.

Domestic synthetic corundum and spinel production for the year amounted to several million carats. Of this, approximately 70 percent was ruby-color synthetic corundum, 20 percent blue spinel, and the remainder corundum and spinel of other colors. Most of this material was used in educational ring stones, the buff-top, flat-back stones being the most popular style.

Synthetic Rutile (Titania).—During the year public acceptance of this relatively new synthetic gem material increased. When first introduced, the jewelry trade did not respond, but as a result of interest by the amateur lapidaries and direct-mail sales, public interest has been created to a point where the jewelry trade is now beginning to accept and promote titania.

Production has been largely on an experimental basis by the Linde Air Products Co. and the National Lead Co. Prices for boules are about 50 cents per carat for colorless and 75 cents per carat for colored (blue and red).

Synthetic Emerald.—This synthetic gem stone continues to be produced only by the Chatham Research Laboratories in San Francisco, Calif. Production in 1950 amounted to 50,000 carats of rough crystals, of which less than 10 percent was gem quality. No flawless stones of over 2 carats were produced. The retail price for top-quality synthetic emerald is $120 per carat.

Gold and Silver

By James E. Bell

GENERAL SUMMARY

REVERSING the downtrend that prevailed in 1948 and 1949, United States mine production of gold in 1950 rose 20 percent over that of the preceding year and was the largest since 1942. Silver production also was the largest since 1942, the output in 1950 gaining 22 percent over that of 1949. The increase in both gold production and silver production was due mainly to greater yield of byproduct gold and silver resulting from a high level of activity in base-metal mining. General freedom from strikes at the mines and treatment plants was a contributing factor. Impressive gains were made in the straight gold-mining industry, also, reflecting further recovery from the dislocation arising from War Production Board Limitation Order L–208, which restricted gold mining from October 1942 to July 1945. However, the growing inflation, with attendant high costs of labor and materials, combined with the fixed price of gold, has virtually eliminated straight gold mining in some areas.

As in 1949, South Dakota was the leading State in gold production in 1950. California, in second place in 1949, was forced into third place in 1950 by Utah. These three States, with Alaska, supplied 72 percent of the United States total. The South Dakota output was obtained almost entirely from gold ore produced at the Homestake mine; Utah gold was principally a byproduct from the treatment of copper ore mined in the West Mountain (Bingham) district; California production came mainly from straight gold-mining operations, both lode and placer; and Alaska production was almost entirely from placer operations, mainly bucket-line dredging. Of the gold produced in 1950, 26 percent was recovered by placer methods, 35 percent by amalgamation and cyanidation, and 39 percent in the smelting of ores and concentrates.

Idaho maintained its position as the leading silver-producing State by a very wide margin, followed in order by Utah, Montana, and Arizona, the same since 1943. These four States supplied 83 percent of the domestic silver output of 1950. Over half of the Idaho production was recovered from dry ore, but most of the rest from the four leading States was byproduct silver from ores mined principally for base metals. Approximately 98 percent of the domestic silver production was recovered by the smelting of concentrates and ores.

World production of gold outside the United States was nearly the same in 1950 as in 1949. Slight declines in the Union of South Africa, Australia, and elsewhere were more than offset by gains in other gold-producing countries, mostly in Canada. In the Rand district of South Africa, the gold-mining industry has continued to benefit from devaluation in September 1949 of the South African pound. A larger volume of lower-grade ore was mined at greater total profit, despite a substantial rise in working costs. World production of silver outside the United States rose 8 percent in 1950 over the preceding year, due mainly to substantial increases in Canada and Peru. The world production rates of gold and silver in recent years have been far below prewar averages.

With completion of several shafts and considerable horizontal underground work, the new gold field in the Orange Free State 150 miles south-southwest of Johannesburg approached the production stage. Thirteen separate properties were in development in 1950, and two were scheduled to start milling ore in 1951. Extensive exploratory drilling has indicated that the new field may ultimately rival the famous Rand district as a major gold producer.

Pressure for a higher price for gold continued to mount in 1950. Restrictions on the international movement of gold imposed by governments in recent years have led to black markets for gold in many parts of the world. The International Monetary Fund expressed its apprehension over such developments in a statement issued by its Executive Board in June 1947, as follows:

> Exchange stability may be undermined by continued and increasing external purchases and sales of gold at prices which directly or indirectly produce exchange transactions at depreciated rates. From information at its disposal, the Fund believes that unless discouraged this practice is likely to become extensive, which would fundamentally disturb the exchange relationships among the members of the Fund. Moreover, these transactions involve a loss to monetary reserves, since much of the gold goes into private hoards rather than into central holdings. For these reasons, the Fund strongly deprecates international transactions in gold at premium prices and recommends that all of its members take effective action to prevent such transactions in gold with other countries or with nationals of other countries.

The Union of South Africa took the position that the gold producers were being required to make "disproportionate sacrifices" in the Fund's program for monetary and exchange stabilization. In September 1949 the Governor for the Union of South Africa proposed to the Governors of the Fund the following resolution:

* * * * * * *

> SO THEREFORE, it is now Resolved by the Governors of the International Monetary Fund that nothing in the Articles of Agreement of the Fund shall be interpreted to prevent the sale, by the Government of any member of newly-mined gold in any market at such premium prices as may be ruling in that market provided the said member sells to the Fund or to one or more members of the Fund, or transfers to its own monetary reserves at least fifty percent of its newly-mined gold at the price from time to time current in terms of the Articles of Agreement of the Fund.

In a statement dated April 24, 1950, entitled "Report on External Transactions in Gold at Premium Prices," the Executive Board recommended that the Board of Governors do not adopt the resolution of the Governor for the Union of South Africa. The report, however, contains the following paragraph:

> The Fund has not overlooked the problems arising in connection with domestic transactions in gold at prices above parity. The conclusion was reached that the Fund would not object at this time to such transactions unless they have the effect of establishing new rates of exchange or undermining existing rates of other members, or unless they result in a significant weakening of the international financial position of a member which might affect its utilization of the Fund's resources.

This concession led to the sale of a considerable portion of newly mined gold at premium price in some of the gold-producing countries.

The position expressed in the South African resolution had found wide support among United States gold miners. Other United States interests, however, supported the Fund's position, in the belief that an increased quantity of gold available for hoarding would absorb funds, particularly in Economic Cooperation Administration countries, that otherwise would be available for foreign exchange support and for import of materials needed in economic rehabilitation. As a result, it was argued that the demands on the United States Government for grants and other support would be increased and in effect the United States would finance, in part at least, accumulation of gold in foreign privately held hoards.

The premiums paid by foreign hoarders for gold are difficult to determine. Much of the trade has been conducted in black markets, in violation of laws, with attendant secrecy. It is stated, however, that, in continental centers, prices continued to trend downward in 1950, ranging from $38 to $40 an ounce. In the Philippines, prices ranged up to $50 or more an ounce but are said to have declined greatly with strict enforcement of existing laws prohibiting private export of gold.

In the United States, the legality of domestic trade and holding of gold in its "natural" state was established under section 19 of the Provisional Regulations of the Gold Reserve Act of 1934 in these terms:

> Gold in its natural state may be acquired, transported within the United States * * * without the necessity of holding a license therefor.

As a result, much publicity was given in 1948 and 1949 to the possibilities of producers developing a premium market for their product among hoarders preferring gold to currency and speculators anticipating a rising price for gold. However, production that could qualify as "natural" gold suitable for trading was limited to placer gold recoverable without the use of quicksilver and to free lode gold recoverable from the ore mechanically or by washing. Most placer gold is recovered by amalgamation and most lode gold by metallurgical processes.

Considerable confusion existed in the public mind regarding permissible practices in the sale, purchase, and holding of "natural" or unprocessed gold, and in June 1950 the Treasury Department issued a statement explaining the regulations in detail:

> Section 54.19 of the Regulations issued under the Gold Reserve Act of 1934 is interpreted by the Treasury Department as permitting the purchase, sale and transportation of gold in its natural state, as defined therein, without the necessity of holding a license.
>
> Section 54.19 provides, in part, that gold recovered from natural sources which has not been melted, smelted or refined or otherwise treated by heating or by a chemical or electrical process may be acquired, transported within the United States, imported, or held in custody for domestic account without the necessity of holding a license therefor.
>
> The restriction "for domestic account" is interpreted to limit the privileges granted by section 54.19 to residents of the continental United States.
>
> Although gold in its natural state may be purchased, sold and transported within the United States, without the necessity of a license, it may not be exported without a license. The Treasury grants such licenses only for the purpose of sending the gold out of the country for refining or processing, and under the condition that an equivalent amount of gold in refined or processed form would be returned to the United States.
>
> Further, except as provided in section 54.19, gold in its natural state may be melted or treated only under an appropriate Treasury gold license.

Section 54.19 of the Regulations makes specific reference to gold amalgam resulting from the addition of mercury to gold in its natural state. Such gold amalgam may be dealt with in the same manner as gold in its natural state, although it is subject to all the restrictive provisions of section 54.19 of the Regulations. The Mints or Assay Offices do not purchase gold in the form of amalgam.

Section 54.19 provides that gold amalgam which results from the addition of mercury to gold in its natural state recovered from natural deposits in the United States or a place subject to the jurisdiction thereof, may be heated to a temperature sufficient to separate the mercury from the gold (but not to the melting temperature of gold) without a license by the person who recovered the gold from such deposits, or his duly authorized agent or employee. The retort sponge resulting from such heating of such gold amalgam may be held and transported by such person without a license; provided, however, that no such person may hold at any one time an amount of such retort sponge which exceeds in fine gold content 200 troy ounces. Such retort sponge may be acquired from such persons by the United States or by persons holding Federal gold licenses authorizing the purchase of such gold.

In other words, no license is needed for any resident of the United States to acquire, hold, or dispose of, in this country, gold in its natural state as defined in section 54.19 of the Gold Regulations. Nor is a license needed for miners to retort gold in its "natural state" recovered by them from natural deposits in the United States, provided they fully comply with the requirements of section 54.19. However, it is a violation of the Gold Reserve Act of 1934, and the Gold Regulations issued thereunder, for an unlicensed person to retort gold purchased by him from miners or other persons, and sell the retort sponge resulting therefrom; or, for persons, other than those holding licenses authorizing them to do so, to purchase from miners or other persons retort sponge and resell the same.

Section 54.35 of the Gold Regulations provides that the Mints, subject to the conditions specified in the Regulations in Subpart F, are authorized to puchase gold recovered from natural deposits in the United States. However, section 54.38 sets forth the conditions under which such gold will be purchased and provides three forms of statements to be filed with deposits. You will note that these statements refer to deposits (1) by persons who have recovered such gold by mining or panning themselves or (2) who have recovered such gold from gold-bearing materials in the regular course of their business or (3) who have purchased such gold *directly* from persons who have mined or panned such gold. There is no provision in the Regulations authorizing the Mints to purchase such gold from persons other than those enumerated above.

Gold in melted or treated form may be sold or disposed of *only* by a person or concern operating under a Treasury gold license authorizing the disposition of gold in such form.

The Secretary of the Treasury, subject to the approval of the President, has authority to revoke or modify the Gold Regulations.

Special canvasses were made in 1948 and 1949 to determine the quantity of "natural" gold sold at premium prices and the amount of the premiums. Most of the producers reported no such sales in either year. Not all those reporting were willing to furnish data on quantities sold and premiums received. However, it is estimated that "natural" domestic gold containing 25,000 ounces of fine gold reached the premium market in 1948 and 29,000 ounces in 1949. In 1949 approximately 75 percent of the metal was mined in Alaska and most of the remainder in California. Although there were rumors of high premiums, an extensive field check indicated some sales at up to $43 an ounce or a little higher in 1948 and an average price of $39 to $40 in 1949. "Natural" domestic gold continued to be legally sold on the open market in 1950, but information available to the Bureau of Mines indicates that sales were considerably less than in 1949. Some sellers were asking a premium of $5 an ounce over the Treasury price for gold to pay for the extra handling necessary to obtain a clean product.

Mint receipts in early 1950 included a disproportionate quantity reported as having been recovered in 1949, showing that some pro-

[5] Treasury buying price for newly mined silver.

ducers were accepting the Treasury price for gold they had been holding for the premium market.

The United States Treasury buying price for gold throughout 1950 continued at $35 per fine troy ounce.

International trade in silver was dominated by the regulations of various governments. The United States Treasury continued to purchase silver mined domestically after July 1, 1946, at $0.9050505+ per fine troy ounce, a price normally well above the New York price for metal that could not qualify for Treasury acceptance. The continued ban on imports imposed in India resulted in the Bombay silver market operating almost completely on an internal basis. In 1950 Mexico banned the export of silver during April and early part of May. The price of silver on the New York market in 1950 ranged from a low of $0.7175 to a high of $0.8000 an ounce 0.999 fine. Corresponding prices in 1949 were $0.7000 and $0.7325, respectively.

Silver consumed for coinage, particularly for Canada, China, Mexico, Syria, Venezuela, and the United States totaled approximately 42,000,000 fine ounces, of which over half was for United States coinage.

The net inflow of gold, which resumed in 1946 after a period when war expenditures had depleted United States holdings, continued through August 1949 and resulted in new all-time monthly highs in United States stocks. The inflow was reversed in September 1949, however, and United States stocks declined sharply in 1950; this outflow was largely a consequence of credits extended to foreign countries under the Marshall Plan. The net inflow of silver, also resumed in 1946, has continued steadily through 1950; compared with that of 1949, the inflow of silver in 1950 was 107 percent greater.

DOMESTIC PRODUCTION

Production of gold and silver in the United States is measured at mines and refineries. Both measures are tabulated by States of origin, but there is a small annual variation between them, explained largely by time lag. Over a period of years, the deviations are found to be negligible. Compared with the mine reports compiled by the Bureau of Mines, the refinery reports compiled by the Bureau of the Mint in cooperation with the Bureau of Mines for the 46 years, 1905-50 show a total excess of gold of 78,840 ounces (a difference of 0.05 percent) and a total excess of silver of 15,682,203 ounces (a difference of 0.63 percent).

TABLE 2.—Gold and silver produced in the United States, 1905–50, in fine ounces, according to mine and mint returns, in terms of recoverable metals

Year	Mine		Mint	
	Gold	Silver	Gold	Silver
1905–45	143, 693, 707	2, 315, 962, 406	143, 992, 699	2, 329, 440, 674

1950	2, 394, 231	42, 459, 014	2, 288, 708	42, 308, 739
Total 1905–50	153, 777, 668	2, 489, 930, 570	153, 856, 508	2, 505, 612, 773

MINE PRODUCTION

During the war years 1943–45, for the first time on record, over half of the domestic gold output was recovered from base-metal ores; but in the years since, dry ores and placer gravels together have exceeded base-metal ores in yield of gold. This recovery in gold mining, however, has not restored the industry to its prewar level. High wages, difficulties in recruiting labor, and high prices for equipment and supplies, together with an unchanged gold price, retarded recovery. A slight downtrend that began in 1948 and continued through 1949 was reversed sharply in 1950, when production exceeded that of the previous year by 20 percent. Even so, the output in 1950 amounted to only 49 percent of the all-time peak established in 1940.

Silver production, which had declined without interruption from 1940 to 1946, reversed the trend in 1947 and continued to gain through 1948. Production then declined in 1949 but rose 22 percent in 1950. An analysis of silver production, by ores, shows that approximately three-fourths was recovered as a byproduct from base-metal ores from 1945 to 1949 and about two-thirds in 1950. Moreover, all of the silver recovered at placers and part of that produced from dry ores were byproducts of operations carried on chiefly for gold.

TABLE 3.—Mine production of gold and silver in the United States, in 1950, by months, in fine ounces

	Gold	Silver		Gold	Silver
January	164, 247	3, 173, 015	August	228, 866	3, 880, 956
February	171, 808	3, 227, 270	September	232, 878	3, 632, 982
March	189, 396	3, 869, 529	October	223, 157	3, 517, 727
April	185, 404	3, 602, 919	November	206, 627	3, 609, 350
May	194, 640	3, 670, 476	December	199, 549	3, 573, 658
June	193, 508	3, 507, 098			
July	204, 151	3, 194, 034	Total	2, 394, 231	42, 459, 014

All tonnage figures used in this report are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. Figures in cubic yards used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before excavation. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated upon the basis of recovered or recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced.

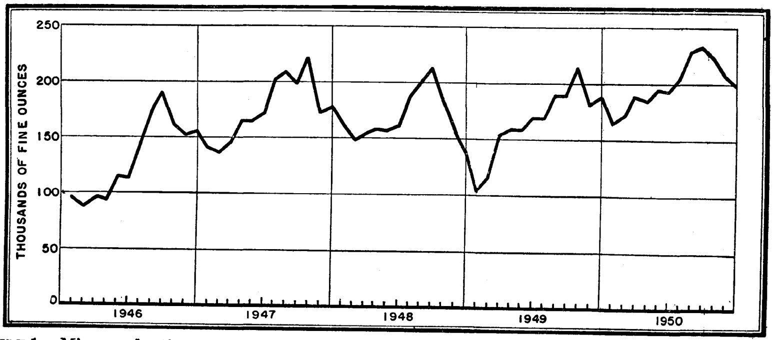

FIGURE 1.—Mine production of gold in the United States, 1946–50, by months, in terms of recoverable gold.

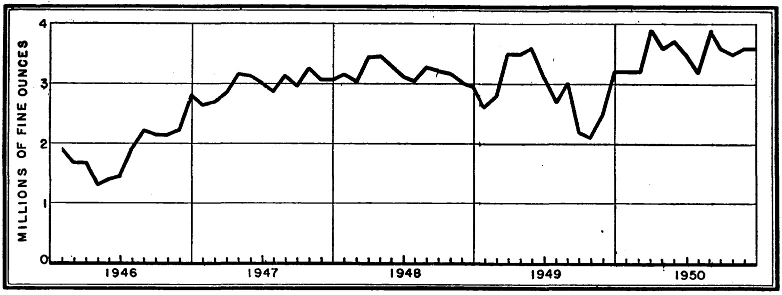

FIGURE 2.—Mine production of silver in the United States, 1946–50, by months, in terms of recoverable silver.

Mines are grouped in two main classes—placers and lodes. The placers are those in which gold and silver (and, in a few placers, platinum) are recovered from gravel as native metals or in natural alloy. Except for such small-scale hand methods as those utilizing the gold pan, the rocker, or the dry washer, all placer recovery methods employ sluice boxes; methods are distinguished by the means used for delivering the gravel to the sluices. Those methods where gravel is delivered mechanically include bucket-line dredging, dragline dredging, and treatment in nonfloating washing plants of gravel delivered by power shovel, dragline excavator, truck, slack-line scraper, or other mechanical means. In the hydraulic method the gravel is mined from the bank by a powerful jet of water; in some small-scale hand methods the gravel is shoveled into sluices; and in drift operations the gravel is mined underground and delivered to sluices at the surface. The lode mines are those yielding gold and silver from ore (as distinguished from gravel), mainly from underground workings and, in addition to those worked chiefly for one or both of the precious metals, include those that yield ore mined chiefly for copper, lead, zinc, or other metals but contribute the precious metals as byproducts. As far as possible, the mine unit used is not the operator but the mining claim or group of claims.

PRINCIPAL MINING DISTRICTS AND LEADING MINES

Lawrence County (Lead), S. Dak., which had been the leading gold producer for many years, was surpassed in 1943, 1944, and 1945 by the West Mountain (Bingham), Utah, copper district. In 1946 Lawrence County regained the lead, a position held through 1950; the West Mountain district has ranked second in this period. Third place was held by the Grass Valley-Nevada City gold-ore district, California, in 1949 and 1950.

The leading silver districts for many years have included many noted more for base-metal output than for silver yield, and this condition was unchanged in 1950. The three leading districts produced about two-thirds of the total United States output of silver in 1950.

Of the 25 leading gold-producing mines, 10 were lode-gold mines, 7 were placers worked by bucket-line dredges, 3 were copper mines, 2 were zinc-lead mines, and 1 was a zinc-copper mine; 2 produced more than 1 type of ore. The 3 leading mines contributed 44 percent of the total gold produced in the United States in 1950 and the 25 on the list, 75 percent.

TABLE 6.—Twenty-five leading gold-producing mines in the United States in 1950, in order of output

Rank	Mine	District	State	Operator	Source of gold
1	Homestake	Whitewood	South Dakota	Homestake Mining Co	Gold ore.
2	Utah Copper	West Mountain (Bingham)	Utah	Kennecott Copper Corp	Copper ore.
3	Fairbanks Unit	Fairbanks	Alaska	U. S. Smelting, Refining & Mining Co	Dredge.
4	Natomas	Folsom	California	Natomas Co	Do.
5	Yuba Unit	Yuba River	do	Yuba Consolidated Gold Fields	Do.
6	New Brunswick-Idaho-Maryland	Grass Valley-Nevada City	do	Idaho Maryland Mines Corp	Gold ore.
7	Yellow Pine	Yellow Pine	Idaho	Bradley Mining Co	Do.
8	Nome	Nome	Alaska	U. S. Smelting, Refining & Mining Co	Dredge.
9	Empire Star group	Grass Valley-Nevada City	California	Empire Star Mines, Ltd	Gold ore.
10	Ruth Pit [1]	Robinson (Ely)	Nevada	Kennecott Copper Corp	Copper ore.
11	New Cornelia	Ajo	Arizona	Phelps Dodge Corp	Do.
12	Holden	Chelan Lake	Washington	Howe Sound Co	Zinc-copper ore.
13	Getchell & Pinson-Ogee	Potosi	Nevada	Getchell Mines, Inc	Gold ore.
14	Gold King	Wenatchee	Washington	Lovitt Mining Co	Do.
15	Smuggler-Union, etc	Upper San Miguel	Colorado	Telluride Mines, Inc	Do.
16	Treasury Tunnel-Black Bear	do	do	Idarado Mining Co	Zinc-lead-copper ore.
17	Greenan Placers	Battle Mountain	Nevada	Natomas Co	Dredge.
18	Knob Hill	Republic (Eureka)	Washington	Knob Hill Mines, Inc	Gold ore.
19	Butte Hill mines and dumps [2]	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Copper, zinc-lead ores.
20	Park Galena-Mayflower	Park City	Utah	New Park Mining Co	Zinc-lead ore.
21	Goldacres	Bullion	Nevada	London Extension Mining Co	Gold ore.
22	Iron King & Ext	Big Bug	Arizona	Shattuck Denn Mining Corp	Zinc-lead ore.
23	Old Eureka	Mother Lode	California	Central Eureka Mining Co	Gold ore.
24	New York Alaska Gold Dredging Corp	Tuluksak-Aniak	Alaska	New York Alaska Gold Dredging Corp	Dredge.
25	Butte Unit	Oroville	California	Yuba Consolidated Gold Fields	Do.

TABLE 7.—Twenty-five leading silver-producing mines in the United States in 1950, in order of output

Rank	Mine	District	State	Operator	Source of silver
1	Butte Hill mines and dumps [1]	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Copper, zinc-lead ores.
2	Sunshine	Evolution	Idaho	Sunshine Mining Co	Silver ore.
3	Utah Copper	West Mountain (Bingham)	Utah	Kennecott Copper Corp	Copper ore.
4	Bunker Hill & Sullivan	Yreka	Idaho	Bunker Hill and Sullivan Mining & Concentrating Co.	Zinc-lead ore.
5	Polaris	Evolution	do	Polaris Mining Co	Silver ore.
6	United States & Lark	West Mountain (Bingham)	Utah	U. S. Smelting, Refining & Mining Co	Gold-silver, lead, silver, zinc-lead ores.
7	Coeur d'Alene	Evolution	Idaho	Silver Summit Mining Co	Silver ore.
8	Copper Queen	Warren (Bisbee)	Arizona	Phelps Dodge Corp	Copper, zinc-lead ores.
9	St. Germaine-Purim	Evolution	Idaho	Silver Dollar Mining Co	Silver ore.
10	Morenci	Copper Mountain	Arizona	Phelps Dodge Corp	Copper ore.
11	Chief and Eureka Hill	Tintic	Utah	Chief Consolidated Mining Co	Zinc-lead, lead, silver ores.
12	Iron King & Ext	Big Bug	Arizona	Shattuck Denn Mining Corp	Zinc-lead ore.
13	Eagle mine group	Redcliff	Colorado	New Jersey Zinc Co	Gold-silver ore.
14	Darwin group	Coso (Darwin)	California	Anaconda Copper Mining Co	Zinc-lead, lead ores.
15	Pioche group	Pioche (Highland)	Nevada	Combined Metals Reduction Co	Zinc-lead ore.
16	Page group	Yreka	Idaho	Federal Mining & Smelting Co	Do.
17	Magma	Pioneer (Superior)	Arizona	Magma Copper Co	Copper, zinc-copper ores.
18	Treasury Tunnel-Black Bear	Upper San Miguel	Colorado	Idarado Mining Co	Zinc-lead-copper ore.
19	Independence	Warm Springs	Idaho	Triumph Mining Co	Zinc-lead ore.
20	Silver Syndicate	Evolution	do	Silver Syndicate, Inc	Silver ore.
21	New Cornelia	Ajo	Arizona	Phelps Dodge Corp	Copper ore.
22	United Verde	Verde (Jerome)	do	do	Copper, zinc-copper ores.
23	Shenandoah, etc	Animas	Colorado	Shenandoah-Dives Mining Co	Gold-silver ore.
24	Park Galena-Mayflower	Park City	Utah	New Park Mining Co	Zinc-lead ore.
25	Amethyst, etc	Creede	Colorado	Emperius Mining Co	Do.

[1] States east of the Mississippi figures are peaks since 1896, except New York and Pennsylvania which are peaks since 1905. The Illinois figure is the peak since 1907. Alaska, California, Nevada, and Oregon are peaks since 1880.

[2] Includes a small quantity for New Hampshire.

Only 5 of the 25 leading silver-producing mines depended exclusively on silver ore; ores valuable chiefly for copper, lead, zinc, and gold were the source of most of the silver output. The nine leading mines, each producing over 1,000,000 ounces of silver in 1950, contributed 55 percent of the United States total. The list of 25 mines supplied 75 percent of the United States output. As several of the mine operators each worked more than one of the leading silver mines in addition to smaller mines, the output of silver by companies was substantially more concentrated than that by mines.

ORE PRODUCTION, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

Tables 10 to 17 give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that yielded gold and silver in the United States in 1950. These tables were compiled from the individual State chapters in this volume, in which more detailed data are presented.

TABLE 10.—Ore produced in the United States and average recovery, in fine ounces, of gold and silver per ton in 1950 [1]

[1] Missouri excluded.
[2] Includes metal recovered from tungsten ore.
[3] Includes 51,366 tons of old lead-smelter slag.
[4] Includes 20,764 tons of zinc slag fumed.
[5] Includes 2,197 tons of ore and contained recoverable metal from the former Metals Reserve Co. stockpile at Jean, Nev.
[6] Includes 3,843 tons of zinc slag.
[7] Excludes magnetite-pyrite-chalcopyrite ore and gold and silver therefrom.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and metal recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in metallurgy and the lowering of the grade of complex ores treated. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present); or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead-smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; and ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) had ranged from 16 to 45 percent zinc; but, with the development of slag fuming, which permits some oxidized ore in the charge, and with high zinc prices, the minimum has declined to as low as 5 percent recoverable zinc. Zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated.

Gold, gold-silver, and silver ores containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed base-metal ores are called "dry" ores, regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes its name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry ores" thus are ores, chiefly siliceous, valuable for their gold and silver content and, in some instances, for their fluxing properties, regardless of method of treatment. Dry gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made on a basis of value, using the rule that the bimetal classification is not used unless the metal of lower value equals or exceeds one-quarter of the combined value of the gold and silver.

The lead, zinc, and zinc-lead ores in most districts in the States east of the Rocky Mountains carry no appreciable quantity of gold or silver; such ores are excluded from this report unless otherwise indicated.

TABLE 11.—Mine production of gold in the United States, 1941–45 (average) and 1946–50, by percent from sources and in total fine ounces

Year	Percent from—						Total fine ounces

PLACERS

Over one-fourth of the gold produced in 1950 was derived from placer mines. Of the 611,413 ounces of placer gold, 492,939 ounces (81 percent) was recovered by bucket-line dredges. Although this dredge output was over four times that of 1944, the wartime low, it was far below the all-time high of 904,149 ounces established in 1940.

The quantity of gold recovered by bucket-line dredges from the inception of the industry as a commercial factor in 1896 to the end of 1950 is recorded as 21,819,001 ounces, originating by States as follows: California, 13,010,175 ounces; Alaska, 6,106,444 (including the production from single-dipper dredges and some gold by hydraulicking); Montana, 785,419; Idaho, 684,176; and other States, 1,232,787.

[1] Data for 1948–49 revised owing to reclassification of 1 mine based on additional information received; grand totals are unchanged.

[2] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

The second most important source of placer gold was nonfloating washing plants, with mechanical earth-moving equipment for gravel delivery. Production by this method has increased without interruption since 1944. Dragline dredging, a method that had risen phenomenally from 1933 to World War II, remained in third place in 1950. Production by hydraulicking, which has declined steadily since 1947, was surpassed by production by small-scale hand methods in 1950.

Alaska produced 45 percent of the United States placer gold in 1950, and California 41 percent. Other large producers, in order of importance, were Nevada, Colorado, Idaho, and Oregon. California was the leader in all but three methods of placer-gold production in 1950. Alaska led in nonfloating-washing-plant and hydraulic production, and Nevada in dry placering.

Table 18 shows the placer gold produced in the United States, classified by mining methods, in 1946–50.

Additional information on placer mining may be found in the State reviews of this volume.

REFINERY PRODUCTION

Table 19 contains official estimates of production of gold and silver in the United States, made by the Bureau of the Mint, based upon arrivals at United States mints and assay offices and at privately owned refineries. The mints and assay offices determine the State source of all newly mined unrefined material when deposits are received. The State source of material received by privately owned refineries is determined from information submitted by them and by intervening smelters, mills, etc., involved in the reduction processes.

CONSUMPTION AND USES IN INDUSTRY AND THE ARTS

Monetary use has claimed by far the largest part of the gold and silver output through the years, but this use to a large extent takes the form of stockpiling in Government and private hoards that can be made available to industry and the arts without smelter or refinery preparation. In contrast, the gold and silver that enter industry and the arts are consumed much as are other metals, any return as secondary metal requiring the usual channels of collection, smelting, and refining. The consumption of gold and silver in the arts antedates written history, but industrial use of these two metals is a comparatively recent development.

TABLE 20.—Gold and silver produced in the United States, 1792–1950 [1]

Period	Gold		Silver	
	Fine ounces	Value [2]	Fine ounces	Value [3]
1792–1847	1, 187, 170	$24, 537, 000	309, 500	$404, 500

[1] From Report of the Director of the Mint. The estimates for 1792–1873 are by R. W. Raymond, Commissioner of Mining Statistics, Treasury Department, and since then, by the Director of the Mint.
[2] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto, at $20.67+ per fine ounce.
[3] Silver valued in 1934 and thereafter at Government's average buying price for domestic product.

Gold.—The arts require a much larger quantity of gold than does industry, but the metal's corrosion resistance and other properties have resulted in some industrial demand. Consumption in the arts increased rapidly during the war. A high marriage rate and widespread prosperity have increased the sale of jewelry, watches, and many luxury items made of gold. Comparison of 1950 gold figures with those for 1949 shows an 8-percent decrease in the return from industrial use, a 10-percent decrease in issue for industrial use, and a 10-percent decrease in net consumption. The net absorption by industry and the arts exceeded the total new gold produced from domestic mines during 1950 by 17 percent.

TABLE 21.—Net industrial consumption of gold and silver in the United States, 1941–45 (average) and 1946–50

[U. S. Bureau of the Mint]

Year	Gold (dollars)			Silver (fine ounces)		
	Returned from industrial use	Issued for industrial use	Net industrial consumption	Returned from industrial use	Issued for industrial use	Net industrial consumption

Silver.—The 1950 consumption of silver in industry and the arts was the largest since 1945. Consumption was high in relation to prewar totals and exceeded any annual output ever achieved by domestic mines.

Widespread prosperity and a high marriage rate sustained postwar demand for sterling and plated silverware, jewelry, watch cases, church articles, pens, pencils, and other items largely in the luxury class. Consumption was large in photography, particularly for motion pictures. The industrial uses of silver had grown greatly during the war and continued to absorb much silver thereafter, although on a reduced scale.

MONETARY STOCKS

Gold holdings of the United States declined $1,721,000,000 (7 percent) from $24,427,000,000 on December 31, 1949, to $22,706,000,000 on December 31, 1950, according to the Federal Reserve Bulletin. Total world reserves are not positively known, inasmuch as data are not available for some countries, including Germany, Japan, Australia, and U. S. S. R. Currency-stabilization funds secretly held add to the difficulties in reaching an approximation. However, the Federal Reserve estimates that the total world reserves of gold on January 1, 1951, amounted to $35,820,000,000, exclusive of holdings of the U. S. S. R.

Foreign gold reserves increased rapidly after the United States entered the war late in 1941, largely because United States war purchases abroad so greatly exceeded commercial exports in value. During the war period foreign reserves increased nearly $5,000,000,000, and United States reserves decreased over $2,500,000,000. Sharing prominently in the increase were Switzerland, Sweden, Turkey, Iran, Spain, Union of South Africa, and Latin-American countries. In 1946, however, there was a reversal in the direction of the flow of gold, and United States reserves increased steadily through 1949, with a gain of about $4,400,000,000. The decline in United States stocks in 1950 substantially exceeded the world mine output.

United States Treasury silver holdings increased 5,000,000 fine ounces during 1950 to 1,983,000,000 ounces. The holdings do not include 410,553,011 ounces released under lend-lease agreements that provide for return of the silver.

PRICES

Since January 1934 the price of gold at the United States Mint has been $35 per fine troy ounce. The Treasury buying price for silver domestically mined after July 1, 1939, was fixed at $0.711+ per ounce on July 6, 1939; on July 31, 1946, the President approved an act (Public Law 579, 79th Cong.) which provided that the seigniorage to be deducted for silver mined after July 1, 1946, and delivered to the Treasury be reduced from 45 percent to 30 percent. The effect was to raise the price of domestically mined silver to 90.50505+ cents an ounce; there has been no price change since.

The average price of pound-sterling exchange in New York (buying rates for cable transfers, as certified by the Federal Reserve Bank of New York) was: January 1948–August 1949, $4.03; September 1949, $3.44; October–December 1949, $2.80). The London price of silver, per ounce, 0.999 fine, as reported by the Director of the Mint, opened in 1948 at 45d., a level maintained past midyear, when after a short upward movement it fell to 42.5d. by the year end. Changes in 1949 were of little significance until devaluation of the pound in September, following which the price rose to 64d., where it remained the rest of the year. Prices in 1950 ranged from a low of 63d. to a high of 70d. (equivalent, in United States currency, to $0.73518 to $0.81687). The New York price, per ounce, 0.999 fine, opened in 1950 at $0.7325, where it held until two small drops late in March placed it at $0.7175. It recovered to $0.7275 early in May and continued at this level to late in October. Two sharp rises then brought the price to $0.8000, where it remained the balance of the year.

FOREIGN TRADE [1]

The excess of gold imports over exports that has prevailed since 1946 was replaced in 1950 by an excess of exports over imports. The loss to monetary stocks from excess exports plus consumption in arts and industries greatly exceeded the output from domestic mines, so that monetary gold stocks decreased. The excess of silver imports over exports was 107 percent greater in 1950 than in 1949. Excess imports plus domestic production exceeded domestic consumption, with the result that silver holdings increased.

TABLE 22.—Value of gold and silver imported into and exported from the United States, 1946–50

[U. S. Department of Commerce]

	Imports	Exports	Excess of imports over exports [1]
Gold:

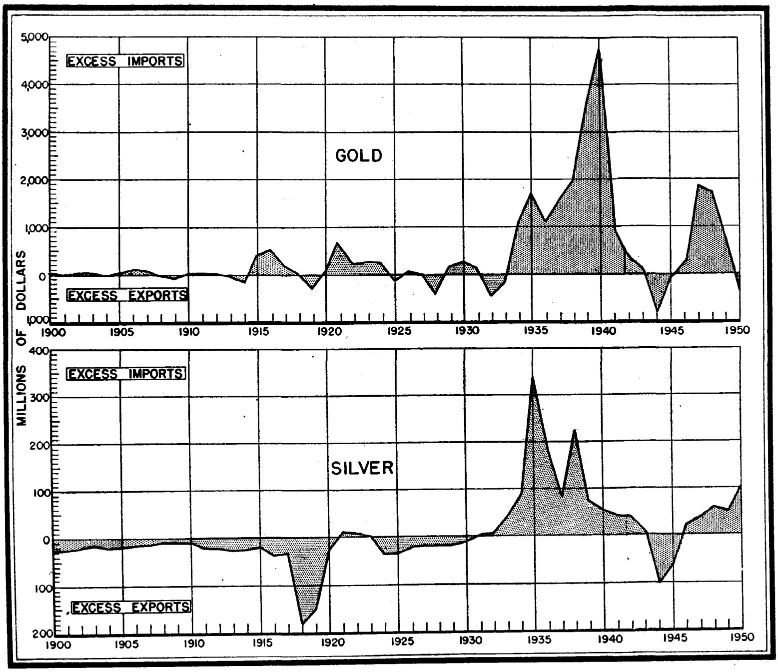

FIGURE 3.—Net imports or exports of gold and silver, 1900–50.

TECHNOLOGY

During 1948 and 1949 research studies were made at the Rare and Precious Metals Experiment Station of the Bureau of Mines, Reno, Nev., to improve procedures for recovering gold adsorbed by activated carbon from cyanide solution and pulp. A commercially feasible method was developed that accomplished this objective by leaching the gold-laden carbon with caustic sodium sulfide solution, followed by electrolysis. Advantages are economy, conservation of carbon for re-use, and production of high-purity gold bullion.[2]

WORLD REVIEW

World gold output rose slightly in 1950, continuing the movement since 1946, but the 1950 total remained considerably below annual quantities produced before World War II. World silver output rose 10 percent in 1950 over 1949, owing mostly to gains in the United States, Canada, and Peru.

[1] Figures used derived in part from American Bureau of Metal Statistics. For some countries accurate figures are not possible to obtain owing to clandestine trade in gold. Data not available for Austria, Bulgaria, Germany, Norway, Thailand, and Yugoslavia; estimates included in the total. In addition, production in Cyprus, Indochina, and Papua was negligible.
[2] Refinery production. Excludes production of the Philippines.
[3] Imports into United States.
[4] Exports.
[5] Estimate.
[6] Data not available; estimate included in total.
[7] Output from U. S. S. R. in Asia included with U. S. S. R. in Europe.
[8] Figure published by Director of the Mint, representing gold of Philippine origin refined but not necessarily mined during the year.
[9] Includes Ruanda-Urundi.
[10] Included is yield from Nkana mine refinery slimes accumulated during the war: 6,594 ounces in 1946, 547 in 1947, 999 in 1948, 972 in 1949, and 1,296 in 1950.

Total	8,351,000	9,296,000	9,818,000	10,351,000	10,143,000	10,945,000
World total (estimate) [1]	162,000,000	135,000,000	167,700,000	173,400,000	174,000,000	192,000,000

[1] Silver is also produced in Bulgaria, Cyprus, Greece, Hong Kong, Federation of Malaya, Indonesia, Poland, Sarawak, Sierra Leone, Turkey, U. S. S. R., and Yugoslavia; production data are not available but estimates are included in total.
[2] Imports into the United States. Scrap is included in this figure in many instances, most notably in th case of Cuba.
[3] Data not available; estimate included in total.
[4] Exports.
[5] Estimate.
[6] American and British zones only.
[7] Data represent Trianon Hungary after October 1944.
[8] Recovered from an accumulation of refinery slimes.
[9] Fiscal year ended May 31 of year following that stated.

Australia.—In comparison with the preceding year, gold production in Australia declined 4 percent to 850,000 ounces in 1950. Devaluation of the Australian pound had the effect of increasing the pound value of the gold output of 1950 about 20 percent, but this incentive was offset by the adverse factors of inflation and shortages of labor and supplies. Silver production in 1950 rose 8 percent to 10,677,456 ounces.

Canada.—Canada ranks third among the gold-producing countries of the world, exceeded in output by only the Union of South Africa and (probably) the Soviet Union. Despite the handicaps of the fixed value of gold and rising costs of labor and supplies, gold production in Canada rose 7 percent in 1950, and once again gold was the leading mineral product in regard to value. Eighty-four percent of the gold output of 1950 was obtained by straight lode-gold mining, 3 percent by gold placer mining, and 13 percent as a byproduct of base-metal mining. The gold-mining industry was aided by the exchange value of the Canadian dollar in relation to the United States dollar, which resulted in an average price of gold of $38.04 per troy ounce in Canadian funds in 1950. Nonetheless, the year closed with many straight gold-mining companies seeking tax and other concessions and with the Government showing concern for the ability of some lower-grade mines to remain in business.

Output of gold in 1949 and 1950 was as follows, in fine troy ounces:

Province or Territory:	*1949*	*1950*
British Columbia	304,307	291,984
Manitoba and Saskatchewan	231,607	273,197
Northwest Territories	177,493	200,973
Ontario	2,354,509	2,457,208
Quebec	964,184	1,097,593
Yukon	81,970	100,755
Others [1]	9,448	8,902
Total	4,123,518	4,430,612

[1] Alberta, Nova Scotia, and Newfoundland.

Canada also ranks third in silver production in the world, following Mexico and the United States. The output of silver rose 27 percent in 1950, continuing an uptrend that started in 1948.

Exports of silver from Canada in 1950 comprised 8,355,183 ounces of refined silver and 3,494,107 ounces of silver in ores and concentrates, compared with 6,211,912 and 4,054,614 ounces, respectively, in 1949.

Colombia.—Gold production in Colombia increased 6 percent to 379,412 ounces in 1950, continuing an uptrend that started in 1949 after a steady decline that began in 1941. About two-thirds of the gold output of Colombia is produced from placer mines and the remainder from lode mines. Silver production in 1950 increased 9 percent to 115,711 ounces. The entire silver yield of Colombia is obtained as a byproduct of gold-mining operations.

Honduras.—Honduras ranks first among the countries of Central America and sixth among the countries of the Western Hemisphere in silver production. The principal producers are the San Juancito and El Mochito mines, operated by the New York & Honduras Rosario Mining Co. The former had an output of 2,337,782 ounces of silver and 16,182 of gold in 1950, and the latter 1,168,363 and 700 ounces, respectively. The New Idria Honduras Mining Co. continued to operate its low-grade San Andres gold mine throughout 1950, with a production of bullion and concentrates valued at 1,007,298 lempiras (about $500,000) from 81,757 dry tons of ore.

Japan.—Gold and silver have been produced in Japan for centuries and to some measure from every part of the country, according to a recent report. Areas of intense Tertiary volcanic activity in Hokkaido, northwest Honshu, Izu-hanto, and central and southwest Kyushu have contributed most of the output. Pyrite deposits in Paleozoic rocks in Shikoku are also important producers. The early gold output was largely from placer mining, but this method has greatly decreased in importance. Most of the recent production of gold and almost half the silver were obtained from gold-silver lode mining and the remainder as byproducts of base-metal mining. The reserve position is not favorable, but enough ore has been blocked out to support continued operations for some years. With economic conditions no worse than in March 1949, about 150,000 ounces of gold and 5,000,000 ounces of silver probably can be produced annually by 1953. The average annual production from 1925 to 1945 was about 400,000 ounces of gold and 6,600,000 ounces of silver.[3]

Mexico.—Mexico maintained its normal position as the leading silver producer of the world in 1950, followed by the United States in second place. Since October 21, 1948, silver exports, whether in coins or bars, have been subjected to the approval of the Bank of Mexico. According to Handy and Harman: [4]

> As the largest single source of silver available to world markets, Mexico continued to play a dominant role. In spite of the very substantial quantities shipped to New York from other countries, sellers here remained sensitive to the official policies of Mexico, and throughout the year these policies to a large extent had the effect of stabilizing and supporting the New York market. During the first six months of 1950, the Bank of Mexico was a buyer on balance. However, the exceptionally high rate of trade demand in the United States which developed

[4] Handy and Harman, 35th Annual Review of the Silver Market: 1950, 24 pp.

during the last half of the year enabled Mexico to dispose of a large part of accumulated metal, so that on December 31st official stocks were about the same level as on January 1st.

At the end of 1949, the Mexican Congress authorized a new domestic silver-coinage program that provided for the minting of 1-peso, 50-centavo, and 25-centavo coins, to be composed of 300 parts of silver, 100 parts nickel, 100 parts zinc, and 500 parts copper. As of December 31, 1950, the following, in face value, had been minted: Of 1-peso coins, 3,360,000 pesos; of 50-centavo coins, 6,880,000 pesos; of 25-centavo coins, 19,140,000 pesos. Toward the end of 1950 the Bank of Mexico announced that it planned to mint a new issue of 5-peso coins to contain 720 parts of silver and 280 parts of copper.

Republic of the Philippines.—Although handicapped by import and exchange controls in obtaining supplies and equipment, some prewar gold mines made progress in rehabilitation, and others already in production were able to increase their output. Of the 54 prewar gold producers, only 9 were in actual operation in 1950. Gold production in the Philippines in 1950 was 333,991 ounces, compared with 287,844 ounces in 1949 and the all-time high of 1,144,332 ounces in 1941. The Philippine producers enjoy the privilege of selling up to 75 percent of their output in the domestic "free market," and turning over to the Government the remaining 25 percent at the world price of $35 an ounce. It is reported that, with this arrangement, the mining companies could realize an average of approximately $50 an ounce for their gold in 1950.[5] Several mines rehabilitating their plants in 1950 may add to the Philippine production in 1951.

Production of silver was 216,034 ounces in 1950 compared with 218,419 in 1949.

Union of South Africa.—An outstanding feature of the gold-mining industry in 1950 was the progress made in developing the new gold field in the Orange Free State. Twenty-five shafts were sunk or were being sunk on 13 properties, and extensive horizontal development workings were started. Two of the mines are expected to reach the production stage in 1951, four in 1952, and the remainder between 1953 and 1956. It is estimated that, when they are in full production, the new mines will have an output of about 8,000,000 ounces of gold annually.[6] The two most advanced mines, the Welkom and the St. Helena, will each have an initial plant capacity of 50,000 tons of ore per month. This new gold field lies about 150 miles south-southwest from Johannesburg and centers around Odendaalsrus; at present it measures about 30 miles long and 10 miles across at the widest point. The gold occurs in conglomerate beds or "reefs" generally similar in character to the gold-bearing formations extensively worked on the Rand; they have been intersected by borings at depths ranging between about 1,400 feet and 7,000 feet. Almost 500 drill holes have been put down to prove the deposits; underground development results have been very satisfactory. Data presently available indicate that rock temperatures at comparable depths will be higher than those on the Rand.

[5] Mining World, Apr. 15, 1951, p. 88.
[6] Mining Journal (London), May 1951, p. 135.

In the Transvaal some mines on the Far West Rand, in development in 1950, are scheduled to go into production in 1951 and 1952.

Gold was paid for throughout the year at 248s. 3d. per fine troy ounce. The increased price made it possible to mine ore containing less gold, and on the Rand the average grade of the ore treated was 3.759 dwt. per ton—a new record low. The tonnage milled increased by about 2,600,000 tons to 59,515,200 tons, but the gold output declined slightly to 11,663,713 ounces. Sales of some gold, at enhanced prices, for industrial and artistic purposes increased the gross revenue derived from mining by about 1.5 percent.

TABLE 29.—Salient statistics of gold mining in the Union of South Africa, 1946–50

[Transvaal Chamber of Mines]

	1946	1947	1948	1949	1950
Ore milled (tons)	56,927,500	53,712,300	55,285,700	56,881,550	59,515,200

Gypsum

By Oliver S. North and May G. Downey

GENERAL SUMMARY

PRODUCTION of gypsum and gypsum products in 1950 set new all-time records in nearly every category. Domestic production of 8,192,625 short tons of crude gypsum was well above the 1948 figure. All of the important gypsum products, led by prefabricated board and lath and particularly tile, which was up 58 percent, were manufactured in record quantities. Most of the plasters showed gains of about one-third.

The moving force behind these new records was the construction boom throughout the Nation. Nonresidential building continued at a high level, and new dwelling starts were at new highs through most of 1950. The importance of housing to the gypsum industry is emphasized by the fact that, whereas home building was up about 250 percent from 1939, production of board and lath had quadrupled. More gypsum products are used in homes than ever before.

Although many new production facilities were in operation, shortages of board, lath, and other materials were reported to have delayed completion of small dwelling units in some metropolitan areas and to have slowed the start of others.

To meet unusual demands, many plants rushed through expansion and improvement plans, which were to carry through into 1951. Although tightened credit was expected to cut back housing starts appreciably in 1951, other types of building construction were expected to be of sufficient volume to maintain gypsum demand at a high level.

TABLE 1.—Salient statistics of the gypsum industry in the United States, 1946–50

Value	$3,160,988	$3,430,022	$3,731,489	$3,562,017	$4,530,159
Building uses:					
Value	$88,927,786	$117,973,351	$165,175,523	$148,056,853	$193,734,651
Total value	$97,194,563	$128,415,479	$176,834,278	$158,746,367	$206,176,798
Gypsum and gypsum products:					
Imported for consumption	$1,833,088	$2,523,936	$3,114,762	$2,851,289	$3,563,696
Exported	$1,065,248	$1,599,578	$1,317,042	$1,936,148	$1,046,458

[1] Each mine, plant, or combination mine and plant is counted as 1 establishment.
[2] Excludes byproduct gypsum.
[3] Includes production from byproduct gypsum in 1946 only. Since then, all byproduct has been reported as used in uncalcined products.
[4] Made from domestic, imported, and byproduct crude gypsum.

ANHYDRITE

The production of anhydrite is of major importance in Great Britain, where the principal source of supply is the Teeside area in northeastern England. Resources in the Billingham area are likely to be at least 75 million tons. Further large deposits exist south of the Tees River. Reserves are clearly adequate to meet requirements at the present rate of consumption for many years to come.[1]

A small amount of anhydrite is produced in Canada, largely for export to the southeastern United States for use as a fertilizer for the peanut crop.[2]

DOMESTIC PRODUCTION

Crude.—The output of crude gypsum from mines in the United States reached the record figure of 8,192,625 tons in 1950. This tonnage was

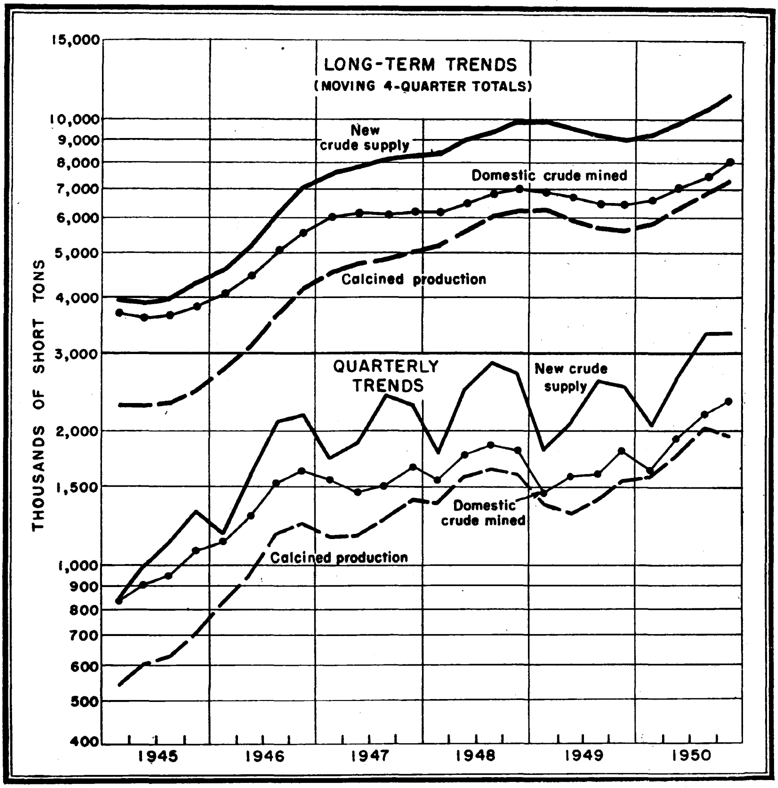

Figure 1.—Trends of new crude supply, domestic crude mined, and production of calcined gypsum, 1945–50, by quarters.

24 percent greater than the production in 1949 and 13 percent more than in the previous record year, 1948. Every producing State or district reported an increase in output. A total of 57 mines reported

[1] Mining and Engineering Journal, vol. 60, pt. 2, No. 2971, Jan. 21, 1950, p. 703.
[2] Rock Products, vol. 53, No. 6, June 1950, p. 109.

output in 1950; of these, 38 were open-pit operations, 15 were underground mines, and 4 were combination pit-underground mines.

Calcined.—Fifty-one plants, with 221 pieces of calcining equipment, sent the output of calcined gypsum to a new high with a production of 7,341,024 tons, 27 percent above the 1949 figure and 18 percent above that of 1948, formerly the record year. Production of calcined gypsum, the form in which most gypsum is utilized, is considered the most accurate over-all yardstick of the industry, as it includes both domestic and imported raw material.

TABLE 2.—Crude gypsum mined in the United States, 1948–50, by States [1]

State	Active mines			1948		194		1950	
	1948	1949	1950	Short tons	Value	Short tons	Value	Short tons	Value

[1] Production of some States is not shown separately, in order not to disclose individual company operations.

Mine and Calcining-Plant Developments.—Northwest Gypsum Co. has adopted a pump-and-pipe arrangement for carrying crushed material from the Idaho side of Snake River to the Oregon shore near Huntington, where a milling unit will process the gypsum. According to reports, 60 to 100 tons can be handled per hour.[3]

A Bureau of Mines publication discussed the gypsum operations of the Blue Diamond Corp., Clark County, Nev. The circular summarizes the history of company operations and describes the physical features and labor and living conditions. The geology, method of exploration, and mining practices, open-pit and underground, are described, as are the plants and the manufacturing procedures.[4]

Daily shipments of about 50 tons were being made from a large deposit of gypsum in Quatal Canyon, near Bakersfield, Calif. If an access road is built, Monolith Portland Cement Co., which is working the deposit, may build a plant at the site.[5]

[3] Pit and Quarry, vol. 43, No. 6, December 1950, p. 88.

[5] Engineering and Mining Journal, vol. 151, No. 9, September 1950, p. 114.

U. S. Gypsum Co., using modern equipment in all operations, is mining and calcining about 350 tons of gypsum rock per day from a deposit at Heath, Fergus County, Mont.[6]

It was reported that W. H. Coplen and his associates were installing a 25-ton mill at their gypsum-sulfur mine at Dixie Valley, Nev., and planned to utilize the material, which contains about 20 percent free sulfur and 13 percent gypsum, in the manufacture of a fertilizer for neutralizing alkaline soils.[7]

Shipments of gypsum for use in cement retarder were begun by Anderson-Dunham Co., Baton Rouge, La., from its Winnfield quarry. The company expects to ship about 10 carloads per day to cement mills in south central States.[8]

CONSUMPTION AND USES

The unprecedented boom in both residential and nonresidential construction created a vigorous demand in 1950 for all building materials, including gypsum products. During the first 9 months of 1950 nonfarm housing-unit starts were far ahead of similar periods of the preceding years; and by middle and late summer local shortages of various gypsum products, especially board and lath, were noted. This high level of housing starts tapered off in the latter months of 1950, and supply began to catch up with demand in some quarters. This was due to a slightly lessened demand, near-capacity production by existing facilities, activation of new plants, and expansions and improvements in many factories.

The total building uses, in dollar value, were 31 percent above 1949 and 17 percent above 1948.

TABLE 3.—Calcined gypsum produced in the United States, 1949–50, by districts

District	1949		1950	
	Short tons	Value	Short tons	Value
New Hampshire, Massachusetts, and Connecticut	189, 189	$1, 613, 134	260, 721	$2, 343, 843

232294—53——39

The capacity of U. S. Gypsum's Jacksonville, Fla., plant was doubled during the year, making it "the largest gypsum mill in the southeast," according to officials of the concern. The plant furnishes products to consumers in all of the southeastern States.[10]

U. S. Gypsum also doubled the capacity of its Fort Dodge, Iowa, plant, which produces wallboard, plaster, plaster base, sheathing, and other building materials.[11]

National Gypsum Co. announced a $1,000,000 expansion program. New warehouses are to be built at its plants at Clarence Center, N. Y., and National City, Calif.[12]

A trade journal dedicated one of its issues to National Gypsum Co., with an extensive coverage of the history and policies of that firm.[13]

Certain-teed Products Corp., Ardmore, Pa., began construction on a new gypsum-board plant at Fort Dodge, Iowa.[14]

Columbia Gypsum Co. was reportedly constructing a plaster and agricultural gypsum plant at Greenacres, Wash.[15]

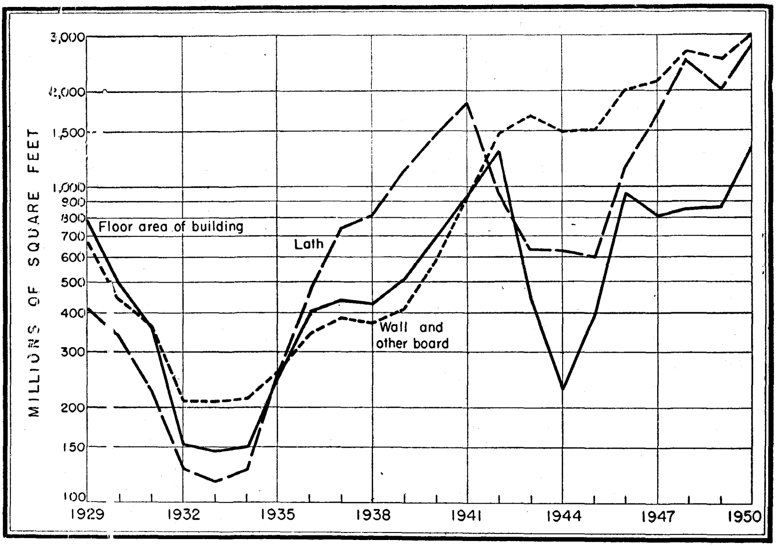

FIGURE 3.—Trends in sales of gypsum lath and wallboard and other board (includes wallboard, laminated board in terms of component board, and sheathing), compared with Dodge Corp. figures on combined floor area of residential and nonresidential building, 1929–50.

Kaiser Gypsum, a division of Kaiser Industries, Inc., Oakland, Calif., announced that it would operate the Standard Gypsum plant at Long Beach, Calif., and a gypsum-manufacturing unit at Redwood City, Calif.[16]

Certain-teed Products Corp. acquired the Phoenix, Ariz., plant of Union Gypsum Co. and announced plans that include the building of a gypsum wallboard and lath plant and the enlargement of present facilities.[17]

[1] Per M square feet, f. o. b. producing plant.
[2] Laminated board included with wallboard.
[3] Average value per M square feet of wallboard.
[4] Includes partition, roof, floor, soffit, shoe, and all other gypsum tiles and planks.
[5] Area of component board and not of finished product.
[6] Per M square feet, f. o. b. producing plant, of partition tile only.
[7] Bureau of Mines not at liberty to publish figure.

PRICES

Producers reported that the average value of crude gypsum mined was $2.78 per ton ($2.77 in 1949). Among uncalcined uses, the unit values of portland-cement retarder and agricultural gypsum remained virtually unchanged from 1949 at $3.23 and $4.28 per ton, respectively. The values of industrial gypsum products showed minor gains. Prefabricated materials and plasters advanced uniformly and moderately in average value, except for sanded plaster, which was 20 percent higher than in 1949.

On November 27, 1950, the Supreme Court of the United States upheld a decree by the United States District Court for the District of Columbia finding that seven of the larger gypsum products manufacturing companies, by their concerted action to fix prices and control methods of distribution through industry-wide license agreements, had gone beyond the scope of their patents and had violated the Sherman Anti-Trust Act. The Supreme Court also ordered the District Court to amend its decree so that it would, among other things, (1) prohibit price fixing by license agreements not only in the eastern part of the United States but throughout the country; (2) apply to all gypsum products instead of only patented gypsum board; and (3) forbid concerted agreements standardizing trade practices and calculating prices according to a delivered price system.[19]

[18] Rock Products, vol. 53, No. 11, November 1950, p. 106.
[19] *United States* v. *United States Gypsum Co., et al.*, 340 U. S. 76 (1950).

FOREIGN TRADE [20]

Imports of crude gypsum into the United States increased to 3,190,600 short tons, 93 percent of which was imported from Canada and represented slightly more than one-fourth of the apparent domestic supply. An increased tonnage came from Mexico, and for the first time Jamaica exported a considerable quantity to this country.

[1] Effective Jan. 1, 1949, calcined gypsum not separable from crude, crushed, or calcined.
[2] Due to changes in items included in each classification, data are not strictly comparable with earlier years (1946–48).

[20] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TECHNOLOGY

Committee C–11 on gypsum met at the National Bureau of Standards, Washington, D. C., on May 12. Most of the business transacted at this meeting was related to the presentation, discussion, and final acceptance of long-pending revisions of several standards. One of the principal revisions was substitution of a compressive strength requirement in place of tensile strength. A reorganization of the committee was approved which will streamline the work through reduction in subcommittees from four to two. The two subcommittees will be known as Subcommittee I on Plasters, and Subcommittee II on Structural Products.[21]

A report was published of theoretical work on the system $CaSO_4$–H_2O, involving specific heat measurements, heat of hydration, thermodynamic data, dissociation-equilibrium measurements, and stability diagrams reviewed in terms of practical calcining. This is a review and extension of the data in Bureau of Mines Technical Paper 625.[22]

A study of the effect of gypsum content on compressive strengths of cements was reported.[23]

Report was made of the conversion of a shuttlecar from storage-battery to Diesel-electric power for speedier and more economical underground haulage in a gypsum mine at Acme, Tex. Efficiency of the Diesel-electric power was reported at about 95 percent. Air samples tested showed virtually normal air, free from objectionable contamination.[24]

A new low-water, high-strength gypsum cement was reported. The product is said to make possible the fabrication of pure gypsum plaster casts having compressive strengths of from 10,000 to 15,000 p. s. i.[25]

WORLD REVIEW

Australia.—The huge gypsum deposit at Lake MacDonnell in South Australia attracted renewed interest and activity, as Waratah Gypsum Pty., Ltd., proceeded with small-scale production while making plans for the construction of a branch railway line from Kowulka to the deposit, erection of a new wharf, and eventual completion of a large new factory at Thevenard. Reserves at Lake MacDonnell cover 34 square miles and are estimated to total 765 million tons, chiefly of rock gypsum carrying less than 0.2 percent insolubles and more than 94 percent gypsum. Chief impurities are calcium carbonate and common salt. Large-scale development of this deposit would meet local and export demands indefinitely, and obviate the necessity for working a number of other smaller, low-grade deposits.[26]

[1] In addition to the countries listed, gypsum is produced in Angola, Ethiopia, Iraq, Luxembourg, Mexico, Rumania, U. S. S. R., and Yugoslavia, but production data are not available. Estimates for these countries are included in the total.
[2] Data not available; estimate by senior author of chapter included in total.
[3] Rail and river shipments.
[4] Excluding New South Wales.
[5] Estimate.
[6] Exports.
[7] Crude production estimates based on the following calcined figures: 1946, 136,500 tons; 1947, 125,600; 1948, 263,822; 1949, 429,400; 1950, 286,592.
[8] Includes Spanish Morocco production: 1946, 1,219 tons; 1948, 1,829.
[9] Production in Government quarries only.

Brazil.—A partial survey of the Sao Francisco Valley, Bahia, area to be benefited by the electric power production at the Paulo Afonso Falls reveals that the region is rich in minerals, including gypsum.

Mineracão Rosado, Mossoro, Rio Grande, has introduced modern surface-mining practices into its mine, eliminating animal and much hand labor and thereby reducing casualties and increasing production by 129 percent. Hand labor is still used extensively to discover and select the different qualities of gypsum to be mined.[27]

Canada.—The gypsum deposits of Canada, both commercially active and those undeveloped, were discussed in an article.[28]

Gypsum, Lime & Alabastine, Canada, Ltd., was reported to have doubled the capacity of its board plant at Winnipeg.[29]

Negotiations were completed for the construction of two gypsum plants at a cost of $2,000,000 on the west coast of Newfoundland, at Humbermouth. The two plants will produce gypsum wallboard and pulverized gypsum for plaster and dental plates.[30]

The geographical occurrences of gypsum in Canada were described, and official statistics show that 13 mines and 10 mills, with a total daily rated capacity of 3,000 tons, are in operation.[31]

Columbia Gypsum Products, Inc., began to ship gypsum rock from its Windermere, B. C., mine to the calcining plant in Spokane, where it will be converted into soil conditioner and building products. Shipments from the mine have also been made to Calgary.[32]

Cyprus.—The Hellenic Chemical & Manures Co. opened a gypsum mine at Kalvassos and planned to begin export from its Vassiliko mine.[33]

Gypsum & Plasterboard Co., Ltd., proceeded with plans for the construction of a stucco and plasterboard factory.[34]

Ecuador.—A small production of gypsum to meet local cement demands continued.[35]

France.—The dual demand for gypsum in cement and sulfuric acid manufacture in France focused attention on its large deposits, which are said to be almost inexhaustible. Some formations in the south, for example, in Devoluy, are particularly rich, one at Lazer containing tens of millions of tons.[36]

French Morocco.—Production of crude gypsum is reported to approximate 15,000 metric tons per year. No calcined gypsum is reported.[37]

Germany.—Between Foerste and Dorste in the North Rhine-Westphalia area, Germany, deposits of gypsum ranging up to 20 meters in thickness and totaling 40 million tons have been described.[38]

Great Britain.—An estimate of 100 million tons gypsum reserve was made. It was stated that the firm of British Plaster Board retained dominance in British production, with 10 active mills, 16 active mines, and 1 quarry. The company produced about 800,000 tons in 1949 and has set an output target of 1½ million tons. The reserves and production of anhydrite were discussed.[39]

India.—The Geological Survey of India reports an occurrence of gypsum totaling 4,000,000 tons near Ran Village, Halar District, in Saurashtra Union, and has recommended that the Government investigate the area with a view to establishing commercial production.[40]

Kenya-Uganda.—It is reported that gypsum reserves in Kenya-Uganda, which have received increasing attention in recent years, may exceed 100 million tons. Quarries at Tula, Northern Frontier Province, produce a high-grade gypsum, from which the plaster of paris derived has been used by the medical department and for blackboard chalk by the education department. It is believed that greater use of the gypsum can be made in the Kenya building trade to replace the commonly used lime, cement, and sand wall surfacing.[41]

New Caledonia.—La Société le Nickel continued to limit exploitation of its gypsum concessions in Pouembout to the extraction and washing of only such amount as it needed for its nickel smelting operations at Doniambo.[42]

Pakistan.—Annual production approximated 16,000 tons, mostly from Punjab with its estimated reserve of 30,000,000 tons, and was used principally in the manufacture of fertilizer.[43]

Spain.—Gypsum is mined in five Provinces, with the Province of Guipuzcoa producing about two-thirds of the total.[44]

Helium

By Paul V. Mullins and Henry P. Wheeler, Jr.

GENERAL SUMMARY

THE Bureau of Mines is the only known producer of helium in commercial quantities in the world. Production facilities are centered in the southwestern part of the United States—at Amarillo and Exell, Tex.; Otis, Kans.; and Shiprock, N. Mex.—where relatively large volumes of helium-bearing natural gas are available.

At the beginning of 1950, the Exell plant was capable of producing enough helium to meet the demand: and the Amarillo, Otis, and Shiprock production facilities were in stand-by status. The demand increased steadily throughout the year, however, and it was necessary to reactivate the Amarillo plant in August. The combined production of the two Texas plants in 1950 was 81,394,416 cubic feet.

The Army, Navy, Air Force, Weather Bureau, and other agencies of the Federal Government requisition helium directly from the Bureau of Mines. The Bureau also makes helium available to non-Federal purchasers in accordance with regulations approved December 3, 1949 (30 CFR 1). More than 30 commercial distributors of compressed gases purchase helium from the Bureau of Mines for resale in at least 100 cities in 35 States, the District of Columbia, and the Territory of Hawaii.

The Amarillo plant continued to serve as headquarters for all Bureau of Mines helium facilities and as a purification and shipping point for helium in standard compressed gas cylinders.

RESERVES

Helium is a constituent of the atmosphere estimated at 1 part in 185,000–200,000 parts of air at the earth's surface. It also is found in small quantities in radioactive rocks and in gases from some mineral springs, volcanos, and fumaroles. The only known raw material from which helium can be extracted economically in large quantities, however, is helium-bearing natural gas. Usually the gases of higher helium contents are found in fields that lie over buried granite ridges, such as the deeply buried Amarillo Mountains of the Texas Panhandle and the Nemaha Ridge of Kansas, and in fields that are closely associated with igneous intrusions, such as the Rattlesnake field of San Juan County, N. Mex.

Cliffside Field (Potter County, Tex.).—The Government owns all gas rights in about 50,000 acres covering the entire geologic structure of the Cliffside field, which supplies natural gas containing about 1.8% helium to the Amarillo helium plant. Although this plant has produced more than 250,000,000 cubic feet of helium, the field's original wellhead pressure of 725 p. s. i. has been reduced only about 5½ percent. The remaining helium reserve is estimated to be about 2,000,000,000 cubic feet.

Channing Area (Moore, Potter, and Hartley Counties, Tex.).—The Exell helium plant is supplied with helium-bearing natural gas containing about 0.9 percent helium from 31 wells on about 70,000 acres in the Channing area of the Texas Panhandle gas field. The helium reserve available from this source is estimated at about 1,500,000,000 cubic feet.

Rattlesnake Field (San Juan County, N. Mex.).—The Government has acquired from the Navajo Tribe of Indians a long-term lease covering an important helium-bearing natural gas reserve that lies at a depth of about 7,000 feet in the Rattlesnake field. This reserve consists of natural gas with a helium content of 7½ percent and a nitrogen content of about 77 percent. A pipeline connects it with the Navajo helium plant at Shiprock, N. Mex. Royalties and rentals were paid in advance and the lease is free from obligations to produce, so the gas can be conserved until it is needed. The estimated helium reserve in the Rattlesnake field is about 788,000,000 cubic feet.

Otis Field and Vicinity (Rush, Barton, and Pawnee Counties, Kans.).—The Otis helium plant is supplied with helium-bearing natural gas containing approximately 1.4 percent helium from about 87 wells in the Otis, Ryan, Pawnee Rock, Behrens, Unruh, Dundee, Bergtol, and Ash Creek fields of Kansas. The helium reserve available from this source is estimated at about 850,000,000 cubic feet.

Other Reserves.—Lands of the public domain covering the Woodside structure in Emery County, Utah, and Harley Dome in Grand County, Utah, have been set aside as Helium Reserves 1 and 2, respectively. Exploratory wells found gas containing 1.3 percent helium in the Woodside structure and 7 percent in Harley Dome. The extent of these reserves is not known at present.

PRODUCTION

Table 1 gives helium production statistics for Government plants in the period 1921–50, inclusive.

TABLE 1.—Helium production in the United States, 1921–50

Calendar year	Plant	Cubic feet
1921—January 1929 [1]	Fort Worth, Tex., plant	46,088,787
1929 (April) [1]—1941	Amarillo, Tex., plant	131,614,437
1942	do	33,252,582
1943	All plants	116,307,437
1944	do	126,933,130
1945	do	94,733,744
1946	Amarillo and Exell, Tex., plants	58,236,385
1947	Exell, Tex., plant	70,297,700
1948	do	63,143,513
1949	do	55,165,482
1950	Amarillo and Exell, Tex., plants	81,394,416
Total 1921–50		[2] 877,167,613

[1] No helium was produced at Government helium plants in February or March 1929. The Fort Worth helium plant was shut down on Jan. 10, 1929, and the Amarillo helium plant was not put into operation until April.

[2] Includes 83,363,800 cubic feet extracted at the Exell plant from gas from the Channing area and injected into the Cliffside gas reservoir for conservation in calendar years 1945–49; none stored in 1950.

The Bureau of Mines Exell, Tex., and Otis, Kans., helium plants extract helium from natural gas that is produced by privately owned companies for distribution and sale in fuel markets, whether or not the helium is removed. Whenever possible, these plants are operated in preference to the Amarillo and Navajo (Shiprock) plants, which obtain helium-bearing natural gas from reserves owned or leased by the Government. The fields that supply the various plants with gas are listed in the section on Reserves. Natural gas is not produced in substantial quantity from the reserves available to the Amarillo and Navajo plants unless these plants are operating.

As long as one plant was adequate to meet the demand, the Exell plant alone was operated. In addition to the recovery of helium from gas going to fuel markets, operation of this plant offers another advantage. Because of its proximity to the Cliffside field (about 16 miles) and the Amarillo plant (about 30 miles), a high-pressure, 2-inch pipeline was constructed in 1945 to connect these facilities. Thus, it is possible for the Exell plant to operate at rated capacity and to inject any helium produced in excess of the demand into the Government-owned Cliffside field for storage and conservation. In the period 1945–49, a volume of 83,363,800 cubic feet of helium was conserved in this manner.

The demand for helium increased so rapidly in the last months of 1950 that the Amarillo plant was reactivated in August to bridge the gap until the Otis plant could be made ready. Although the operating facilities of the Amarillo plant were in a stand-by status similar to that at Otis, the Amarillo plant had continued to serve as a repurification and shipping facility for helium in standard cylinders, and a partially trained crew was available when the production facilities were needed. The Amarillo plant continued in production through February 1951, and the Otis plant was put into operation the following month.

SHIPMENTS

Helium is shipped in special railway tank cars, automotive trailers, and standard compressed-gas cylinders. The tank cars and trailers are owned by the Navy Department and are used primarily in the service of Federal agencies. Because it is nearer trucking facilities and for other reasons, the Amarillo helium plant handles the shipment of all helium in standard cylinders. In 1950 all tank-car shipments originated at the Exell plant. The two plants handled 1,207 shipments consisting of 64,907 standard cylinders and 305 tank cars.

CONSUMPTION AND USES

As indicated by the marked increase in production, the consumption of helium increased about 50 percent in 1950. Federal agencies requisitioned 55,480,608 cubic feet, or about 69 percent of the total, and non-Federal purchasers consumed 25,408,382 cubic feet, or 31 percent. This is very nearly the same percentage distribution experienced in 1949. The Navy continued to be the largest user of helium; its requirements accounted for 42,023.934 cubic feet, or more than 50 percent of the total consumption.

The Bureau continued to produce and distribute two grades of helium—grade D, of 98.2 percent purity or better, for the inflation of airships and balloons, and grade A, of 99.995 percent purity or better, for use in helium-shielded arc welding and for other purposes that require helium of extremely high purity. Grade A helium represented about 60 percent of the volume distributed in 1950.

Important uses of helium in 1950 were the same as in 1949. Airships, weather balloons, and helium-shielded arc welding continued to represent most of the demand. The importance of helium for medical purposes and in many types of research remained unchanged. In addition, a potentially great demand appeared to be imminent as the result of recent developments requiring the use of helium as an inert gas shield in the production and fabrication of titanium.

PRICES

Federal agencies requisition helium from the Bureau of Mines at a price that represents their proportionate shares of the expenses incident to the administration, operation, and maintenance of the Government's helium plants and properties. The price of helium to non-Federal purchasers at a helium plant selected by the Bureau is $13.50 per 1,000 cubic feet. An additional charge of $2.00 per 1,000 cubic feet is made when helium is delivered in standard cylinders.

FOREIGN TRADE

Helium is not produced commercially outside the United States. It can be exported from the United States only upon application to the Secretary of State and upon receipt of a license authorizing exportation.

TECHNOLOGY

The Bureau of Mines continued research on helium production and utilization at laboratories in Amarillo, Tex.

Because of its rapidly growing use and importance, much of the research dealt with production and utilization of high-purity, grade A helium. Accomplishments in this research included (1) improved process equipment for helium purification, (2) unique, supersensitive instruments for use as operating guides to indicate and record minute impurities in helium, and (3) progress in studies of grade A helium utilization, especially in shielded-arc welding.

In other research, the Bureau did investigative work on a variety of natural-gas and helium processing, transportation, and utilization problems, many of them of mutual interest to industry and the Bureau. In the field of utilization, the Bureau continued to assist oil and gas companies in obtaining field and reservoir data by using helium as a tracer in natural gas injected for pressure maintenance and recycling purposes.

Iron Ore

By Norwood B. Melcher and Jachin M. Forbes

GENERAL SUMMARY

SEVERAL important development programs, all related to national defense, characterized the iron-ore industry in 1950. As the Western World began its rearmament program in the hope of averting a third world war, the United States passed the Defense Production Act of 1950, the North Atlantic Treaty Organization was formed to weld the nations concerned into an effective defense unit, and preparation of the Japanese Peace Treaty was hastened in order that Japan could be integrated into the over-all pattern. Industrial expansion was highlighted by the United States steel industry's decision to raise annual capacity to 120 million tons by 1953—a decision that in time focused attention upon the iron-ore supply situation.

Adequacy of the iron-ore supply, which had already received considerable attention during the last decade, was intensively reexamined. It was concluded that the serious drain upon the direct-shipping iron

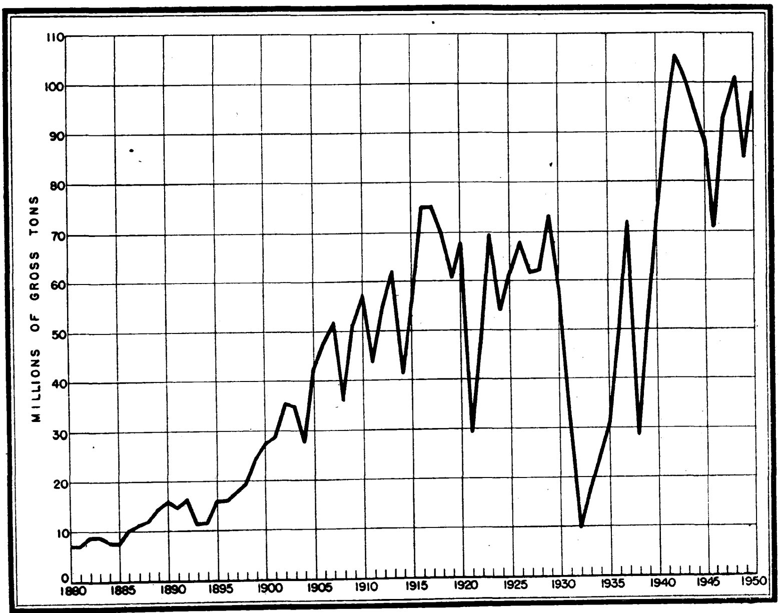

FIGURE 1.—Production of iron ore in the United States, 1880–1950.

ores of the Lake Superior region warranted acceleration of the program to produce large quantities of taconite concentrates, full and rapid development of the iron-ore deposits in Canada, Liberia, and Venezuela, and further exploration and development or expansion of deposits within the United States. The Defense Production Act of 1950 included provision for Government assistance in the exploration for and development of ore deposits; in addition, special aid in the form of accelerated tax amortization for new and expanded production facilities was authorized in the Internal Revenue Act of 1950.

Salient Statistics.—The domestic iron-mining industry, supported by a strong demand and unhampered by serious labor disputes, approached an output of 100 million tons in 1950. Undoubtedly, that level would have been exceeded if the Great Lakes transportation season had not opened late. Following the major steel strike in the fall of 1949, iron-ore consumption increased substantially; and, as the time passed for normal opening of Lake transportation, it became apparent that there would be difficulties in accumulating sufficient stocks of ore at lower Lake docks and furnace yards for the 1950–51 winter. Consequently, the mining and shipping industry took extraordinary measures to increase the movement of ore during the balance of the year. Emergency loads were permitted to September 30, navigation aids were maintained, and the Sault Ste. Marie locks were kept open until the last ship requesting passage was on its way. Nearly 1 million tons was shipped by lake in December 1950. Important additional tonnages were hauled in ships that normally convert to grain cargoes in the late months of the season; and all-rail movement of iron ore from Minnesota to Ohio and Pennsylvania was undertaken for the first time. A total of 3,686,182 gross (2,240-pound) tons are reported as having been shipped in this manner.

Crude-ore output from all domestic iron mines totaled 125,739,478 gross tons, within 1 million tons of the record 126,527,159 tons in 1942. "Usable" ore production was 98,045,360 tons, a total exceeded only in 1942, 1943, and 1948. Usable ore includes direct-shipping ore (mine product requiring no treatment), washed ore, concentrates, sinter, and byproduct cinder and sinter obtained from treating pyrites.

Although imports of iron ore increased 11 percent in 1950, the trend upward is at a modest rate compared with the upsurge expected in the next few years. The total—8,231,600 gross tons in 1950—was supplied from 3 leading sources—Chile, Sweden, and Canada—and 12 other sources with varying degrees of importance. Imports of 2,569,980 tons from Chile were off 2 percent from 1949 but still topped the list in magnitude. Sweden supplied virtually the same quantity of ore as in 1949 and remained in second position, while Canada in third position, increased its shipments to the United States 15 percent. No ore from new sources was received in 1950.

PRODUCTION AND SHIPMENTS

The iron-mining industry shipped 125,902,113 gross tons of crude ore during 1950. Of this, 55,469,337 tons went to beneficiation plants and resulted in 22,810,818 tons of usable concentrates and 4,350,251 tons of sinter. Additional sintering operations at consuming plants used 14,124,504 tons of iron-ore fines and concentrates. Treatment at the mines included concentration by means of simple log washers, heavy-medium plants, other gravity methods, and magnetic separators and agglomeration by means of sintering machines and pelletizers. In addition, 613,706 tons of byproduct cinder and sinter were shipped by the pyrites industry. Except for crushing, in some instances, 70,432,776 tons of ore was shipped as mined. In all, 98,045,360 tons of usable iron ore, including byproduct ore, was produced at mines and mills in 1950. This represented an increase of 15 percent over 1949 as did the 97,764,410 tons shipped to consumers.

The output in 1950, excluding byproduct material noted above, came from 247 mines, of which 38 mined over 1,000,000 tons of crude ore each. Minnesota, Michigan, and Alabama continued as the leading producing States, with 67, 13, and 7 percent, respectively of the total usable ore in 1950. The Lake Superior district (Michigan,

[1] Excludes an undetermined number of small pits. Output of these pits included in tonnage given.
[2] Approximate figure.

Minnesota, and Wisconsin) produced 79,627,294 tons of ore, 16 percent above 1949 but 4 percent less than in 1948. The Southeastern district (Alabama, Georgia, and Virginia) decreased its output of usable ore in 1950, the output of 7,507,508 tons being 1 percent less than in 1949. The Northeastern and Western States made substantial increases, 16 and 32 percent, respectively, above 1949, which was in each instance a new all-time high. Percentage distribution of production was: Lake Superior district 81.7, Southeastern States 7.7, Northeastern States 4.6, and Western States 6 percent, compared with 81.2, 9, 4.6, and 5.3 percent, respectively, in 1949.

Direct-shipping ore constituted 71.7 percent of the total production; shipping-grade concentrates, 23.3 percent; and sinter, 5 percent. Hematite was the principal iron-bearing mineral; 89 percent of all usable ore was of this type. Magnetite comprised 8 percent; brown ore, 3 percent; and byproduct ore less than 1 percent. Of the crude-ore production, 23 percent was from underground mines and 77 percent from open pits.

PRINCIPAL MINES

Table 9 lists, in descending order and with pertinent details, the iron mines of the United States that produced over 500,000 gross tons of crude ore each in 1950. The order of listing is based on ore tonnage, not iron content of product; thus mines producing low-grade crude ore that requires concentration are considered comparable in size to mines producing similar tonnages of direct-shipping ore.

Thirty-eight mines, each producing over 1,000,000 tons of ore, supplied 59 percent of the domestic output in 1950. In this group, a notable change is the loss of first position by the Hull-Rust pit, a position it held as early as 1913, though not every year since then. Of the 38 mines, 25 were in Minnesota, 5 in Alabama, 3 in New York, and 1 each in Michigan, Pennsylvania, Texas, Utah, and Wisconsin; 30 were open-pit mines, 6 underground, and 2 combined operations. Except for four mines producing magnetite, one producing semi-altered magnetite, and three producing brown ore, all of the million-ton mines produced hematite. In 1949, 36 million-ton mines produced 57 percent of the total output.

Forty-two mines, producing 500,000 to 1,000,000 tons of crude ore each, supplied 23 percent of the domestic output in 1950. Of these, 21 were in Minnesota, 11 in Michigan, 3 in Alabama, 2 in Utah, and 1 each in California, Missouri, New Jersey, New York, and Wisconsin. Eighty-two percent of the iron ore mined in the United States during 1950 came from the 80 mines listed in table 9.

SINTER

Domestic production of sinter for consumption in iron and steel furnaces during 1950 totaled 18,740,217 gross tons, a 22-percent increase above the 15,374,026 tons produced in 1949. Iron-bearing materials required were 14,124,504 tons of iron ore, 16,440 tons of manganiferous ore, 5,887,721 tons of flue dust, 448,329 tons of mill cinder and roll scale, and 663,101 tons of pyrites cinder. The total 21,140,095 tons, resulted in a conversion yield of 89 percent. Sintering plants at mines in 5 States produced 4,350,251 tons—23 percent of the total; and plants at blast-furnaces and custom mills in 14 States produced 14,389,966 tons or 77 percent.

TABLE 10.—Production and consumption of sinter in the United States in 1950, by States, in gross tons

REVIEW OF LAKE SUPERIOR DISTRICT

Production and Shipments.—Active mines and mills in the Lake Superior district reported 79,291,824, gross tons of usable iron ore (containing less than 5 percent manganese) produced during 1950, an increase of 16 percent above 1949, but 4 percent below 1948. The six iron ranges—the Marquette, Menominee, Gogebic, Vermilion, Mesabi, and Cuyuna—supplied 81 percent of all domestic output with 62 percent supplied by the Mesabi range alone. These proportions are almost identical with 1949. In addition, 335,470 tons of brown ore were produced in Fillmore County, Minn., which is not considered part of the true Lake Superior district, another 928,260 tons of ore containing (natural) 5 percent or more manganese were also produced in the district. Including these tonnages, output for the district, all grades, totaled 80,555,554 tons. Shipments from the district totaled 79,928,910 tons, of which 79,607,239 tons (including 867,188 tons of manganiferous ore) came from the six ranges and 321,671 tons from Fillmore County, Minn.

The Lake Superior Iron Ore Association reported 76,274,059 gross tons of iron and manganiferous ores shipped to upper Lake ports from United States mines in 1950, an increase of 12 percent over

1949. All-rail shipments, which included, for the first time, ore to Pittsburgh, Pa., were 3,686,182 tons compared with 1,428,416 tons in 1949.

Canadian mines in the Lake Superior region include those in the Michipicoten and Atikokan districts. Shipments from these mines in 1950 (not included in the above statistics) totaled 2,174,726 gross tons. Of this quantity, 958,113 tons came from the Helen mine in the Michipicoten district and 1,216,613 tons from Steep Rock mines in the Atikokan district.

The Great Lakes shipping season had considerable difficulty getting under way in 1950. Cold weather persisted into mid-May, although ore carriers had been fighting their passage through ice at irregular intervals since April 19, when the steamer *Sullivan Brothers* of the Gartland Steamship Co., left Escanaba, Mich., with the year's first cargo of iron ore. A group of seven ore carriers, which remained in the Duluth-Superior harbor during the winter, were escorted by the ice breaker *Mackinaw* to Two Harbors, where they were loaded and sent out on April 28. These were the first cargoes to depart upper Lake ports in 1950. However, there was much discussion as to just when the season was opened officially. Another 2 weeks passed before ice had cleared enough to permit full-scale shipping. In order to transport enough ore to meet the high demand for current consumption and to build up stockpiles for the 1950–51 winter, ore carriers continued in operation until mid-December. Final departures were the steamers *Benson Ford* and *Henry Ford* from Marquette, Mich., on December 14. All-rail shipments, the bulk of which normally go to furnaces in Duluth, Minn., and Granite City, Ill., were greatly increased when it was decided to supplement water-transported ore with rail shipments to lower Lake consuming centers. The movement was initiated in July and continued until freezing weather made it impracticable to unload the ore. At the end of the year, shipments were resumed, and small quantities of calcium chloride were used to retard freezing in the cars.

The 1950 shipping season emphasized the need for increased ore-transportation capacity. Moreover, the outbreak of hostilities in Korea and the rearmament program made it clear that industry would necessarily depend on large tonnages of Lake Superior ores for many years to come. It was apparent also that industry would need large quantities of ore produced from taconite in addition to the expected increase of imported ore. Therefore, anticipating an increase in concentrates to offset the decline in available direct-shipping ore, the shipping companies placed orders for a number of new vessels. These larger and faster vessels are well typified by the new *S. S. Wilfred Sykes* of Inland Steel's fleet. This ship entered service at the beginning of the season between upper Lake ports and Indiana Harbor, Ind. She is 678 feet long over-all and has a 70-foot beam. Bulk cargo capacity is 21,500 gross tons, and rated speed 17–18 knots loaded.

TABLE 11.—Iron ore produced in the Lake Superior district, 1854–1950, by ranges, in gross tons

[Exclusive after 1905 of ore containing 5 percent or more manganese]

Year	Marquette	Menominee	Gogebic	Vermilion	Mesabi	Cuyuna	Total

Technologic Trends and Operating Methods.—In order to produce increasing quantities of iron ore without a prohibitive increase in manpower, it has been necessary for the industry to develop labor-saving equipment. Moving the ore has always been the phase of operations most amenable to such mechanization, and the important trends have been toward greater transportation efficiency. Belt conveyors have proved extremely efficient when quantity of material and distance involved can be effectively balanced against cost of installation. Belt conveyors are installed in underground mines, open pits, and mills and on stockpiles and loading docks; it has even been proposed to install one from Lake Erie ports to the Pittsburgh area. Trucks are necessary where the terminals are temporary, and the trend in recent years has been toward Diesel-powered giants up to 550 horsepower. These trucks were discussed by Burton.[1]

An important trend counteractive to the manpower saved by mechanization is the increasing proportion of material that requires treatment before it goes to the furnaces. The plants for this purpose are becoming larger and more complex as leaner ores are yielding to profitable beneficiation. The projected expansion for treatment of taconite suggests the possibility of vastly increased use of manpower in the large mills that will be required to produce significant quantities of taconite concentrates.

Analyses.—Table 12 shows average analyses of all ore shipped from the Lake Superior district during the past 5 years. Although the average grade of the ore has gradually declined, it is anticipated that increasing quantities of high-grade concentrates will eventually halt the downward trend.

Reserves.—Tables 13 and 14 show reserves of iron ore in Michigan and Minnesota, by ranges. It should be borne in mind that these data represent only taxable and State-owned reserves and not the total that may be expected to become available. Tonnages are added to the reserve figures each year, and undoubtedly eventual production in the Lake Superior district will greatly exceed that indicated by present reserve tonnages.

MINING BY STATES

Alabama.—In contrast to other iron-mining States, Alabama was the only major producer that failed to make a substantial gain over 1949. Production decreased 1 percent, and shipments increased 1 percent. Operations in 1950 were not entirely free of labor disputes, but no production losses were sustained comparable with those of the 1949 steel strike.

The steel industry of the Birmingham district is supported principally by red-ore mines just outside of the city. One group, the Wenonah, Ishkooda, and Muscoda mines of the Tennessee, Coal, Iron & Railroad Co., was undergoing mechanization during 1950, with a view toward expanded production despite the difficulties involved in a 2-mile haul from the ore face to the surface. Other active red-ore mines in Jefferson County included the Ruffner and Sloss mines, Sloss-Sheffield Steel & Iron Co.; the Edwards and Spaulding mines, Republic Steel Corp.; and the Pyne and Songo mines, Woodward Iron Co. These nine mines supplied 87 percent of the total

Alabama output in 1950. The larger brown-ore mines included the Russellville No. 14 mine, Sloss-Sheffield Steel & Iron Co., and the Blackburn, Adkins, and Warner mines, Shook & Fletcher Supply Co. These 4 mines supplied 11 percent of the Alabama total, the remaining 2 percent being supplied by 22 small brown-ore operations and 2 red-ore mines.

The Alabama mining industry was described comprehensively by several authors in a special Birmingham issue of Mining Engineering.[2]

Arkansas.—The Magnet Iron Co., Little Rock, Ark., shipped magnetite concentrates from its mine near Butterfield to furnaces in the Birmingham district.

California.—The only major producer in California, Kaiser Steel Corp., shipped a mixed hematite and magnetite from its Eagle Mountain mine in Riverside County and hematite from its Vulcan mine in San Bernardino County. This latter mine did not produce, but shipped the remainder of a stockpile. The Bessemer mine in San Bernardino County, operated by Edward Hedstrom, shipped small quantities of magnetite to west coast steel furnaces.

Georgia.—Although reported iron-ore production in 1950 was 11 percent below 1949, considerable activity developed in the latter half of the year in anticipation of higher prices and a stronger demand for Georgia brown ore. Reserves of brown ore have not been accurately determined, but it is generally agreed that a significant tonnage can be extracted from these deposits over a period of years. The deposits are in the northwestern part of the State, and those in production during 1950 were in Bartow, Cherokee, and Polk Counties. A small shipment of red ore came from Walker County.

Kentucky.—Oolitic hematite deposits of the Rose Run area, Bath County, Ky., were described.[3]

Michigan and Minnesota.—*See* Review of the Lake Superior District.

Missouri.—The Iron Mountain mine of the Ozark Ore Co. produced hematite concentrates averaging 52.02 percent iron (natural) during 1950. Operations in the open pit are declining, and preparations are being made for underground mining. Beneficiation consists of crushing and jigging. Untreated brown ore from a number of small open pits in Wayne County were shipped by Doane & Ives, and a small tonnage of high-grade lump and direct-shipping hematite was shipped from the Christy mine in Crawford County, operated by the Missouri Mining Co.

Nevada.—Segerstrom & Heizer continued to ship small tonnages of high-grade ore from mines near Lovelock.

New Jersey.—The four underground mines producing magnetite lump and concentrates from New Jersey mines increased their 1950 output 31 percent over 1949. The Scrub Oaks and Washington mines, Alan Wood Steel Co., the Mount Hope mine, Warren Foundry & Pipe Corp., and the Richard mine, Richard Ore Co., continued to be the only active producers in New Jersey. Average iron content was 62.16 percent (natural). Small percentages of the ore were consumed in making cement and for miscellaneous uses. A description of iron mining in New Jersey was published.[4]

[4] Skillings, David N., Four Mines Maintain Iron-Ore Production Front for New Jersey; Skillings' Mining Review, vol. 39, Dec. 9, 1950.

New Mexico.—The Hanover-Bessemer mine in Grant County produced direct-shipping magnetite averaging 54.4 percent iron. Iron deposits in New Mexico were described.[5]

New York.—The Adirondack region increased iron-ore output in 1950, 13 percent over 1949. Virtually all production was magnetite, 63 percent of which came from open-pit mines. Of the usable ore produced, 5 percent was open-hearth lump ore, 83 percent sintered concentrates, and 12 percent unsintered concentrates. The average iron content was 62.35 percent.

Active mines included the Chateaugay, open pit and underground; the New Bed-Harmony-Old Bed, underground; and Fisher Hill, underground, all operated by Republic Steel Corp.; the Benson, open pit, Jones & Laughlin Steel Corp.; Clifton, underground, Hanna Coal & Ore Corp.; MacIntyre mine, open pit, National Lead Co.; and the underground hematite mine of the Clinton Metallic Paint Co.

Pennsylvania.—The Cornwall mine and Lebanon concentrator of Bethlehem Steel Co. increased output of usable concentrates and sinter 17 percent over 1949. Sinter comprised 57 percent of the total, and the average iron content of the usable product was 57.6 percent. The company was exploring eastern Pennsylvania during 1950 for additional deposits and, on the basis of air-borne-magnetometer surveys, began diamond drilling in Berks County for iron deposits not indicated on the surface.

Texas.—The iron-ore output of Texas in 1950 came from three mines, which together produced over a million tons of usable product for the first time. All were open-pit, brown-ore mines producing washed concentrates in Cass, Cherokee, and Morris Counties in east Texas.

Utah.—A 16-percent increase in Utah iron-ore output during 1950 brought the total above the 3-million-ton level and approached the record high of 3,233,413 tons in 1948. All production was in Iron County and came from the Blowout and Duncan mines, Colorado Fuel & Iron Corp.; the Excelsior mine, Utah Construction Co.; the Iron Mountain mine, Columbia Iron Mining Co.; and the Great Western mine of Helene E. Beatty. Average iron content of the semialtered magnetite was 54.41 percent.

Development and exploration was underway in the Bull Valley district of Washington County.[6] Results of magnetometer surveys in Iron County were published.[7]

Virginia.—Iron ore production in Virginia during 1950 was confined to Pulaski County, where a small quantity of brown ore was shipped for use in making paint.

Washington.—A contract has been let for the completion of a road from the Buckhorn Mountain iron mine to Chesaw.[8]

Wisconsin.—*See* Review of the Lake Superior District.

Wyoming.—Colorado Fuel & Iron Corp. continued to produce hematite from its underground Sunrise mine in Platte County. Output in 1950 averaged 45.7 percent iron content.

CONSUMPTION

Consumers of iron ore reported 106,610,273 gross tons used during 1950 (an increase of 19 percent above 1949), the highest annual total ever recorded. Blast furnaces consumed 82 percent, sintering plants 13 percent, steel furnaces 4 percent, and ferro-alloy furnaces, cement plants, pigment, and other items 1 percent in all. The iron ore consumed by sintering plants eventually went into blast furnaces and steel furnaces. Production and consumption of sinter is given in table 10 and consumption of iron ore in table 16.

TABLE 16.—Consumption of iron ore in the United States in 1950, by States and uses, in gross tons

STOCKS

Stocks of usable iron ore at mines on December 31, 1950, are given in table 17. Total stocks at the end of 1950 were 7 percent above 1949. Minnesota mines held the largest stocks—41 percent of the total, Michigan followed with 33 percent, and New York was the third largest holder with 20 percent. Including Wisconsin, the Lake Superior district held 76 percent of all mine stocks. Crude-ore stocks at mines were 3,199,045 tons on December 31, 1950, compared with 3,335,095 tons at the end of 1949. Consuming plants held stocks of iron ore and sinter totaling 34,917,950 gross tons at the end of 1950, 6 percent lower than 1949.

Stocks at Lake Erie Ports.—On December 1, 1950, 2 weeks before navigation closed for the season, the Lake Superior Iron Ore Association reported 4,623,561 gross tons of iron ore on Lake Erie docks, compared with 6,938,595 tons in 1949. By the opening of the 1951 season (May 1, 1951), 1,813,434 tons were in stock compared with 3,065,827 tons in 1950. The 2,810,127 tons withdrawn from these stocks during the 1950–51 closed season were 27 percent less than during the preceding winter, but diminution was 61 percent in 1950–51 as compared with 56 percent during 1949–50.

TABLE 17.—Stocks of usable iron ore at mines, Dec. 31, 1949–50, by States, in gross tons

PRICES[9]

The average value per gross ton of iron ore f. o. b. mines and mills was $4.99 in 1950 compared with $4.50 in 1949, and $3.91 in 1948. Table 18 gives the average value at mines of the different types of product and varieties of ore for each of the producing States, except where there are fewer than three shippers of a certain class of ore in a State and where permission has not been given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately. In general, the delivered cost is given less transportation costs to the consuming plant. In the Lake Superior district the mine value is the Lake Erie price less freight from mines to lower Lake ports. This value appears to be applied also to ore that is not sold on the open market.

[3] Cinder and sinter obtained from pyrites treated in, but not necessarily mined in, States indicated.

[9] For an explanation of the factors affecting the price of iron ore, *see* Minerals Yearbook, 1948, p. 647.

Prices of Lake Superior Iron Ore.—Lake Erie base prices for Lake Superior iron ores were effective January 26, 1950, for the 1950 season. Each ore classification carried a 50-cent-per-ton increase over 1949; quotations were as follows: Old Range Bessemer, $8.10; Old Range non-Bessemer, $7.95; Mesabi Bessemer, $7.85; Mesabi non-Bessemer, $7.70; High-Phosphorus, $7.70.[10] Prices for 1951 were effective December 2, 1950, indicating a further increase of 60 cents per ton for each of the basic grades.[11] These prices are for ore delivered at lower Lake ports, carrying 51.5 percent natural iron content with 0.045 percent (max.) phosphorus (dry), for Bessemer grades. Above 0.18 percent, the ores are classed as High-Phosphorus. Premiums and penalties are applied for variations in the analyses and physical structure.

Freight Rates.—Upper Lake freight rates remained at those effective May 6, 1949—$1.05 per gross ton from Minnesota ranges to upper Lake ports, including $0.13 per ton dock handling charge. Vessel rates were $1.45 per ton plus $0.20 unloading charge, effective September 1, 1949. Lower Lake rail freight rates from Lake Erie ports to the Pittsburgh and Wheeling district were $1.76 per ton plus $0.13 loading charge, effective September 2, 1949. Thus, total transportation charges f. o. b. cars at the Mesabi range to furnaces in Pittsburgh were $4.59 per gross ton, to which must be added the Federal transportation tax of 3 percent where applicable. Average value of iron ore shipped from the Mesabi range in 1950 was $4.80 per gross ton. By adding transportation charges and transportation tax to this figure, a calculated average value of $9.52 per gross ton of Mesabi ore at Pittsburgh is obtained. All-rail freight rates from the Mesabi range to Pittsburgh were $5.63 per ton, effective September 1, 1949, indicating that rail-transported ore had a calculated average value of $10.60 including $0.17 transportation tax.

Additional details on transportation costs were published.[12]

FOREIGN TRADE [13]

Tables 19 and 20 list the origin, tonnage, and value of iron ore imported and exported during 1948–50. The upward trend in the importation of iron ore continued in 1950, with an 11-percent increase over 1949, notwithstanding the fact that much-publicized new sources in Canada, Liberia, and Venezuela had not begun shipments. Chile was again the leading source but failed to equal the 1949 tonnage. Sweden was the second-largest source, with a total only slightly above 1949. Canada continued to import more iron ore from the United States than it shipped to the United States. All other sources supplied less than 1 million tons each but together accounted for 77 percent of the total increase over 1949. Brazil nearly doubled the tonnage supplied in 1949 and alone accounted for 41 percent of the increase. Except for 26 tons, all exports of iron ore in 1950 went to Canada. Japan, an important purchaser in 1949, received none.

BENEFICIATION

The quantity of usable iron-ore shipments subjected to some form of treatment designed to eliminate a portion of the undesirable constituents increased to 27.5 percent in 1950 compared with 24.5 percent in 1949. The trend toward more complex beneficiation of a greater proportion of the domestic output may be expected to continue as reserves of direct-shipping grades are diminished.

Taconite concentrates are expected to eventually reach a total exceeding 25 million tons annually, and plans for implementing this program are being pushed by three principal groups. The Oliver Iron Mining Co., subsidiary of United States Steel Corp., began construction of an agglomerating plant at Virginia, Minn., on April 4, 1950.[14] The plant will be a part of a $17 to $20 million program to obtain basic information before permanent processing plants are built. One of the most difficult problems encountered in the research phase was to agglomerate economically the fine iron oxide particles of the concentrate into a suitable physical structure for handling during transportation and charging into blast furnaces. The new plant will obtain data on several methods of agglomeration, already developed on a laboratory scale, to determine the most feasible one. Capacity is to be 1 million tons of product a year.[15]

Erie Mining Co., managed by Pickands, Mather & Co., has a plant in operation at Aurora, Minn., which is experimenting with taconite and other concentrates. Data obtained from this plant will supply the basis for planning permanent facilities estimated to reach an eventual capacity of 10 million tons a year.[16]

The Reserve Mining Co. owns a large quantity of magnetic taconite reserves and is formulating plans for processing facilities to be constructed in the near future.

The foregoing summary of the major developments refers to plans that will require enormous expenditures for processing plants and equipment and appreciable time before full production can be attained. A new approach to the problem that would bypass smelting in the blast furnace, and consequently the agglomeration necessary for such smelting, was presented by John J. Howard, former vice president of E. J. Lavino & Co. of Philadelphia.[17]

Other aspects of iron-ore beneficiation include heavy-medium separation, a method that is spreading rapidly owing to the very satisfactory results obtained where these plants are already in operation. The process utilizes a suspension of finely ground ferrosilicon (usually) in water, adjusted to a specific gravity between that of the iron-bearing particles and gangue particles of the feed. The growth and application of the process were described.[18]

Beneficiation of iron ore in the Birmingham district presents problems peculiar to low-grade hematite and brown ores. Since substantial reserves of these ores are available, it is evident that beneficiation research will receive increasing attention in the future. A survey of southern beneficiation was published.[19]

In general, iron-ore beneficiation is increasingly desirable for a number of reasons. The high iron content of the product affords savings in transportation, handling, and smelting. Often, concentrates may be blended with an ore, otherwise unusable, making a greatly increased tonnage available for use in blast furnaces; and, when certain treated products have been tested by charging into

EMPLOYMENT

Preliminary employment figures for 1950 indicate no significant change in the number of workers employed. However, the total man-hours worked increased 8 percent to 66,660,000. This total, divided into the 98,398,651 gross tons of usable iron and manganiferous ores produced, indicates an average output of 1.476 tons per man-hour, compared with 1.378 tons in 1949 and 1.462 tons in 1948. The low figure in 1949 is attributable to the generally relaxed pressure of demand and possibly in some instances to labor disturbances preceding and during the steel strike of 1949.

The above data and table 22 include, in the Lake Superior district, manganiferous ore, which is considered a special grade of iron ore by the trade.

TABLE 22.—Employment at iron-ore mines and beneficiating plants, quantity and tenor of ore produced, and average output per man in 1949, by districts and States [1]

1 Includes manganese-bearing ore from the Lake Superior district.
2 Man-hour data for Virginia are not available and are therefore excluded from all totals; however, production data for Virginia (4,349 tons of usable ore) are included with total production.

WORLD REVIEW

Table 24 shows world production of iron ore, by countries, in recent years.

The iron-ore resources of the world were reviewed by Einecke.[20] The work is in two volumes, one of text and tables, the other of maps showing iron, manganese, and coal deposits.

CANADA[21]

The time is approaching when Canada will take its place among the world's leading producers of iron ore. The vast reserves of ore in Quebec and Labrador are being developed rapidly; the Steep Rock mines in northwestern Ontario are being expanded in the face of difficult obstacles; production of siderite sinter has been expanded in the Michipicoten district; the Wabana deposits worked from Bell Island, Newfoundland, have prospects of a larger foreign market; and explorations are being made on Adirondack-type magnetite deposits in the Grenville area of Ontario and Quebec.

Canadian shipments in 1950 were 3,271,000 metric tons as compared with 3,334,000 tons in 1949, a decrease of 2 percent.

Labrador-Quebec.—A list of members of the board of directors, Iron Ore Co. of Canada, Ltd., was published, and all of the American firms participating in development of the Labrador-Quebec deposits were represented. The list includes George M. Humphrey, president, M. A. Hanna Co.; Jules R. Timmins, president, Hollinger Consolidated Gold Mines, Ltd.; C. M. White, president, and W. W. Hancock, secretary, Republic Steel Corp.; W. W. Holloway, chairman, and A. S. McFarland, president, Wheeling Steel Corp.; Frank Purnell, chairman, and J. L. Manthe, president, Youngstown Sheet & Tube Co.; J. Y. Murdock, president, Noranda Mines, Ltd.; Charles R. Hook, chairman, and W. W. Sebald, president, Armco Steel Corp.; John I. Rankin and Leo H. Timmins, N. A. Timmins Corp.; E. T. Weir, chairman, National Steel Corp.; and Joseph H. Thompson, president, Hanna Coal & Ore Corp.[22]

Development work and exploration on the deposits continued in 1950, and the last reserve figure published was 400 million tons of proved ore.[23] Emphasis was removed from exploration at the end of the summer, and efforts were concentrated on construction of the railroad to Seven Islands on the St. Lawrence River.[24] The construction contract has been let, and supplies have been distributed along the first 100 miles of right of way above Seven Islands. A winter road serves the construction points, and two airstrips were being built along the right of way. Temporary docks at Seven Islands for unloading supplies have been built, and permanent docks were scheduled for construction in 1951. Plans call for ore shipments to begin in 1955 and for the initial objective of 10 million tons a year to be reached shortly thereafter.

The need of the United States steel industry for this ore was a prime subject of discussion in Congressional hearings on the St. Lawrence Seaway during the spring of 1950, and it is anticipated

[23] Iron Age, vol. 166, No. 9, Aug. 31, 1950, p. 71.
[24] Skillings' Mining Review, vol. 38, No. 36, Dec. 16, 1950.

that transportation of Labrador ore may be instrumental in the final approval of this much needed facility. Aspects of this problem were presented.[25]

Newfoundland.—Output of iron ore from the Wabana hematite mines of Dominion Steel & Coal Corp., Ltd., decreased 29 percent below 1949 owing to lack of overseas markets. Shipments to the company furnaces at Sydney, Nova Scotia, increased 12 percent, and small shipments were made to Germany and the United States. However, shipments to the United Kingdom, normally a major purchaser, dropped from 720,000 long tons in 1949 to 127,000 tons in 1950. This drastic reduction in exports caused a drop in employment of 2,000 miners.[26] Prospects for 1951 were brighter owing to new purchase contracts with the United Kingdom made late in 1950.

The tramway, formerly used to transport ore 2 miles across the island to loading docks, has been replaced with 20-ton trucks, and underground mechanization continued. Wabana ore, though situated for cheap ocean transport, suffers from its high phosphorus and silica content, which prevents its wide use in United States furnaces.

Ontario.—Output of Steep Rock Iron Mines, Ltd., in 1950 was 1,217,000 tons compared with 1,134,000 in 1949. Production was from the Errington open pit, which was stripped for production during the winter of 1949–50. The northern part of the Errington pit was being stripped for production in 1951, and the Hogarth mine was being drained preparatory to removing 40 million cubic yards of gravel and silt. The expected output of the Hogarth mine will bring total production of the Steep Rock district to over 3 million tons per year. Underground development in the Errington mine continues, with sublevels planned for draining the working level. Extensive drilling on the "C" deposit at Falls Bay produced favorable results not yet released in detail.

Algoma Ore Properties, Ltd., produced and sintered siderite from its underground Helen mine in the Michipicoten district. The total of 958,000 tons of sinter was 45 percent higher than the 662,000 tons produced in 1949. After sintering, one-third of this ore is consumed by Algoma Steel Corp. at Sault Sainte Marie and two-thirds by United States furnaces. It is particularly desirable because of its high iron and 3-percent-manganese content.

Although the Helen mine was the only producer in this district during 1950, other ore bodies were being explored for possible exploitation. Near the Helen mine, the Ruth and Lucy deposits have an indicated 40 million tons of ore that may be developed by the Jalore Mining Co., Ltd., a subsidiary of the Jones & Laughlin Steel Corp.; Siderite Hill, also near the Helen mine, has a proved 100 million tons of ore grading slightly higher than Helen ore. It is estimated that 10 million tons could be mined from an open pit. The Britannia (formerly Bartlett) deposit, owned by Algoma Ore Properties, lies 10 miles northeast of the Helen mine and though not suitable for open-pit mining contains a high-grade ore. In general, expansion in this district is conditioned by sintering capacity, since transportation costs for carbonate ore are such as to necessitate calcination and sintering.

[25] Durrell, W. H., Labrador Iron Ore and the St. Lawrence Seaway: Eng. and Min. Jour., vol. 151, No. 5, May 1950, pp. 92–93.

[26] Metal Bulletin (London), No. 3459, Jan. 17, 1950, p. 15.

In the Greenville area of Ontario and Quebec, large deposits of magnetite were discovered when anomalies were indicated by air-borne magnetometric surveys in 1949. Diamond drilling by Bethlehem Steel Corp. has proved tonnage running to millions in a deposit at Marmora. These deposits are similar to those in the Adirondack region of New York, and presumably the ore would require crushing and magnetic concentration.

The Quebec Iron & Titanium Corp. is processing titaniferous iron ore, smelting 300 tons daily to produce 100 tons of pig and 130 tons of titania slag.[27]

OTHER COUNTRIES

Brazil.—The vast iron-ore resources of Brazil have been the subject of extensive investigation and study by John Van N. Dorr II, geologist, United States Geological Survey. The study, a joint project of the Survey and the Brazilian Departmento Nacional da Producão Mineral, undertook to appraise the quantity, quality, and types of iron ore in an area comprising approximately 4,000 square miles in the State of Minas Gerais. A preliminary discussion was published.[28]

Exploitation of Brazil's iron ore deposits is hampered by high costs, particularly with respect to transportation. A hard, dense, lump hematite is now being exported for use in open-hearth furnaces.

Chile.—El Tofo mine of Bethlehem Chile Iron Mines Co. increased output 15 percent over 1949 to 2,940,618 gross tons. Bethlehem's ocean transport facilities were described.[29]

Cuba.—The Mayari deposit produced a small quantity of brown ore during 1950. Table 23 gives historical data for Cuban iron-ore mines.

TABLE 23.—Iron ore shipped from mines in the Province of Oriente, Cuba, 1884–1950, in gross tons

Year	Juragua, Daiquiri and Estancia (hematite and magnetite)	Sigua (hematite)	Mayari (brown ore)	Guama (hematite)	El Cuero (hematite)	Total
1884–1948	22,740,281	20,438	4,079,158	41,241	903,103	27,784,221
1949			11,446			11,446
1950			30,215			30,215
Total	22,740,281	20,438	4,120,819	41,241	903,103	27,825,882

Egypt.—Iron deposits at Aswan on the upper Nile River are estimated to contain 13.5 million tons of ore minable by surface methods.[30] On the basis of this deposit, proposals to establish a domestic iron and steel industry capable of producing 300,000 tons of steel annually have been activated to the extent of having a survey of the possibilities made by European and American experts. This survey was reported to favor implementation of the proposed industry.

Finland.—The Diet granted an appropriation in the 1950 budget for establishing a joint stock company to exploit the Otänmaki iron

deposit. On March 10, 1950, the initial meeting was held, and a joint stock company, Otänmaki, Oy., was formed. The capital stock of the company is controlled by the Finnish Government, Bank of Finland, and Imatran Voima Oy, the leading Finnish electric power company.[31]

Finnish requirements for iron ore are made more urgent by efforts to pay war indemnities to Russia in terms of iron and steel products.

France.—It was reported in December 1949 that a rich vein of iron ore had been discovered in the region of Salzerais, Meurthe et Moselle. A concession has been applied for by the general director of the Société des Fonderies de Pont-à-Mousson.[32]

The deposits, near Caen, Normandy, which are principally carbonate ores, altered near the surface to hematite and magnetite, are being considered for reactivation. Reserves are quite large. Tonnage estimates vary according to the depth to which mining is judged practicable.[33]

French West Africa.—In addition to the Norman iron ore deposits, the French iron and steel industry has a deposit containing an estimated 165 million tons at Conakry, French West Africa. ECA funds amounting to $1,975,650 have been made available on a matching basis for development.[34] Development is under way, and the French-controlled Conakry Mining Co. hopes to begin ore shipments before the end of 1952.

India.—Although India has vast deposits of iron ore that might be worked for export trade as well as for the domestic iron and steel industry, internal transportation difficulties have caused the Ministry of Commerce to place iron ore under export control.[35]

A limited quantity was approved for export to Japan.

Japan.—Iron ore for Japanese furnaces for many years came from deposits under its control in North China and Manchuria. However, with revival of the iron and steel industry following World War II, this ore was unavailable, and it became necessary to look elsewhere. Some ore was obtained from the Philippines, Malaya, and India; but, due to various reasons, the supply from these sources could not keep pace with demand, and the industry turned to western North America for additional tonnages. During the latter part of 1950, miners and export firms on the Pacific coast were actively searching for substantial deposits of iron ore upon which to build an export trade to Japan.

Liberia.—The Bomi Hills deposit of open-hearth lump iron ore was in process of development during 1950. Since mining is to be a surface operation and will require little in the way of stationary equipment, principal efforts were in the construction of rail facilities from the deposit 45 miles to Monrovia.[36] This important new source of iron ore for United States consumption will begin shipments in 1951. A review of the history of this project explains the part played by the Liberia Mining Co., the Liberia Co., the Republic Steel Corp., and the Export-Import Bank.[37]

[37] Engineering and Mining Journal, vol. 151, No. 1, January 1950, p. 85.

Malaya.—The Bukit Besi mine at Kuala Dungan in the Trengganu State has installed modern mining equipment from the United States, and plans call for greatly expanded production which will go to Japan, and possibly to Britain.[38]

Republic of the Philippines.—Iron mining is undergoing an encouraging revival in the Philippines, supported by its principal customer, Japan. However, some uneasiness was expressed over currency exchange difficulties.[39] Prewar exports to Japan were of the order of 1,300,000 tons annually.

Sweden.—European and American demand for Swedish iron ore gained considerable weight in late 1950 owing to expanded steel production in support of rearmament plans for members of the North Atlantic Pact. Output has approximately doubled since 1946, roughly paralleling the rehabilitation of the European iron and steel industry. The Grangeburg iron mines were described.[40]

United Kingdom.—The lowest grade of iron ore in commercial use for the manufacture of iron and steel is produced from the "ironstone" mines, Lincolnshire, England. A description of these operations includes the following typical analysis: Iron, 22.80 percent; managenese, 0.69 percent; silica, 8.07 percent; alumina, 4.53 percent; lime, 18.30 percent; magnesia, 1.96 percent; phosphorus, 0.34 percent; sulfur, 0.32 percent; loss on ignition, 24.37 percent; moisture, 9.80 percent.[41]

It may be seen that use of this ore is possible because of the presence of over 20 percent of lime and magnesia, which more than fluxes the silica and alumina.

Venezuela.—Wide interest was evinced throughout the Western Hemisphere early in 1950 when the United States Steel Corp. released for publication the story of its iron-ore explorations and discoveries in Venezuela. The news of this important development is now general knowledge to the reading public, some reference to the discoveries having been made by most news publications. One of the most comprehensive descriptions is identified by the footnote below.[42] The Pao deposit, nearer to the mouth of the Orinoco River than Cerro Bolivar, has been under development for several years by Bethlehem Steel Co.; and, though no shipments were made during 1950, mining was begun and a stockpile was ready for shipment early in 1951.

Other iron deposits in the Orinoco River area of Venezuela have been discovered, and in the San Isidro area the Government of Venezuela is surveying the possibilities.[43]

Total (estimate)	162,000	154,000	187,000	217,000	220,000	245,000

1 In addition to countries listed, Belgian Congo, Bulgaria, Burma, Egypt, Eritrea, French West Africa, Madagascar, Portugal, and South-West Africa report production of iron ore in past years, but quantity produced is believed insufficient to affect estimate of world total.
2 Data not available; estimate by author of chapter included in total.
3 Production of Tofo mines.
4 Estimate.
5 Including Moselle (Lorraine).
6 Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese.
7 Data represent Trianon Hungary after October 1944.
8 Including titaniferous iron ore.
9 U. S. S. R. in Asia included with U. S. S. R. in Europe.
10 Exclusive of bog ore, which is used mainly for purification of gas.
11 Production of National Resources Commission only.
12 Includes iron-sand production as follows: 1945–46, 235,094 tons; 1946, 10,472 tons; 1947, 3,772 tons; 1948, 2,588 tons; 1949, 23,724 tons; 1950, 87,504 tons.
13 Fiscal year ended March 31 of year following that stated.
14 Less than 500 tons.

Iron and Steel

by Robert H. Ridgway and Norwood B. Melcher

GENERAL SUMMARY

STEEL production in the United States in 1950 reached an all-time high of 96,836,075 net (short) tons as compared with the previous maximum of 88,640,470 net tons in 1948. World production of steel ingots and castings in 1950 was estimated to be 186,000,000 metric tons (205,027,800 net tons). This figure does not include production of castings by companies that do not produce steel ingots in the United States. Beginning at a high level, production increased generally throughout the year. In April and October production exceeded 100 percent of capacity. In June, because of the outbreak of the Korean War, metal prices began to spiral. By September formula prices had been set on steel-making scrap. A steel gray market had developed, and cold-rolled steel brought up to $360 per ton. By December steel prices had advanced; the Iron Age base composite rose $5.88 per ton, and tool-steel prices advanced 10 percent. Scrap buying prices were raised by mills, sending the Iron Age scrap composite to $45.13. Steel gray-market prices were reported at approximately $400 a ton.[1]

Steel production advanced in spite of the coal strike in February. In September the pattern for the "fifth round" of wage increases was established, with an increase of 5 and 10 cents an hour plus cost-of-living adjustments and a $125 pension. In December steel wages were raised an average of 16 cents per hour.

The 5-year write-off of taxes on defense plants stimulated plans for expansion. The steel industry planned to expand capacity to 109,963,000 net tons by the end of 1952—9.4 million net tons over July 1, 1950, capacity. The United States Steel Corp. announced detailed plans for construction of the Fairless Works near Trenton, N. J. An integrated steel corporation for New England was planned, and a formal application for 5-year amortization of facilities was made. Western steel production followed the national pattern, with operations running 90 to 95 percent of capacity until the Korean War, when production reached 100 to 106 percent. Plant expansion and modernization of furnaces contributed to production capacity in the West as elsewhere throughout the country.

In spite of the Chrysler 100-day strike, virtually all of the automotive industry's production, sales, and profit records were shattered in 1950. The automotive industry received 14,496,230 net tons, or 20.3 percent of the finished steel produced, according to Steel Mag-

[1] Iron Age, vol. 167, No. 1, Jan. 4, 1951, p. 284.

azine.[2] An estimated 8,295,000 units (passenger cars and trucks) were produced.

The construction industry received 11.9 percent of steel shipments in 1950. Construction of new houses (permanent, nonfarm dwellings) was high in 1950, with an estimated 1,379,000 units started during the year as compared with 1,025,100 in 1949. Total new construction during the year was valued at $27.7 billion, compared with $19.3 billion in 1949, and absorbed 8.6 million tons of steel products.

TABLE 1.—Salient statistics of iron and steel in the United States, 1946–50, in net (short) tons

	1946	1947	1948	1949	1950

[1] American Iron and Steel Institute.
[2] Revised figure.

The container industry used more steel in 1950 than in 1949, when consumption dropped below the 1948 figure. The figure for 1950 was 5.9 million net tons and the 1948 figure, 5.3 million tons. Railroads received 6 percent of the steel products in 1950, as in 1949, and 8 percent in 1948. Freight-car loadings in 1950 increased substantially over 1949. Shipbuilding requirements were at the lowest point since 1946, and exports were at the lowest rate in more than a decade.

Steel products for export decreased markedly from 1949, according to the U. S. Department of Commerce. However, exports of galvanized iron and steel sheets increased from 85,594 net tons to 100,361 net tons; rail joints, splice bars, fishplates, and tieplates increased slightly; and railroad spikes more than doubled.

Average weekly hours per worker in the steel industry were 39.9 hours as compared with 37.9 hours in 1949 and 39.1 hours in 1948. Average hourly earnings were $1.689 as compared with $1.703 in 1949. Total employment was higher in 1950 than in 1949, increasing from

[2] Steel, vol. 128, No. 1, Jan. 1, 1951, pp. 123–136.

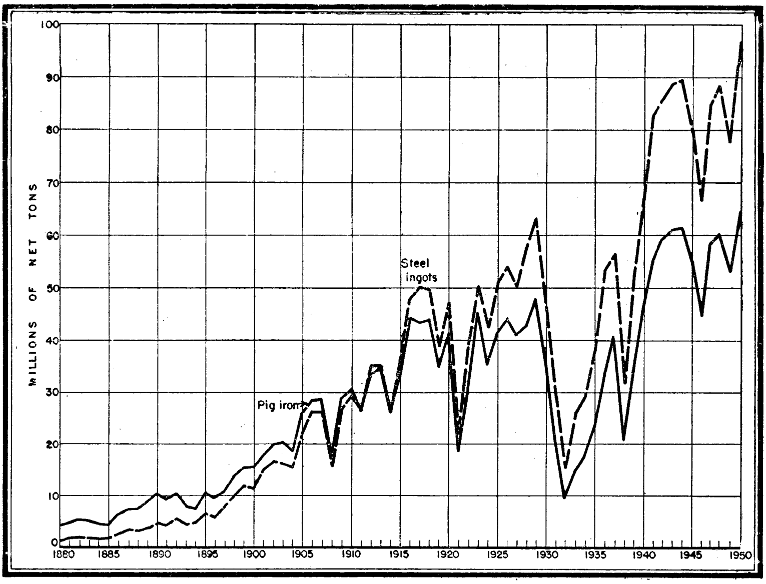

FIGURE 1.—Trends in production of pig iron and steel ingots in the United States, 1880–1950.

511,000 in January to 556,000 in December 1950. The composite price of finished steel as published in Iron Age was 3.837 cents per pound throughout the year until December, when the price was increased to 4.131 cents per pound.

PRODUCTION AND SHIPMENTS OF PIG IRON

Domestic production of pig iron, exclusive of ferro-alloys, increased 21 percent over 1949 and 7 percent over 1948 to 64,499,983 net tons in 1950. Pig iron production in 1950 consumed 91,600,306 net tons of domestic iron and manganiferous ores, and 6,635,420 tons of foreign ores (mainly from Africa, Canada, Chile, México, and Sweden), 18,766,333 tons of sinter, and 9,538,226 tons of miscellaneous iron-bearing materials. In addition to these raw materials, 2,020,407 tons of home scrap and 130,599 tons of flue dust were consumed in making pig iron in 1950.

Shipments of pig iron increased 22 percent in quantity and 24 percent in value from 1949. The figures in table 4 cover total "shipments," which consist predominantly of molten pig iron transferred to steel furnaces on the site. Values for merchant pig iron are included. However, the average value per ton of pig iron is lower than market prices published in trade journals because handling charges, selling commissions, freight costs, and other related items are not considered. The term "shipped," as distinguished from "production," refers in the case of onsite transfers to departmental transfers, upon which value is placed for bookkeeping purposes rather than to actual sales as in the case of merchant pig iron.

[1] Includes pig iron transferred directly to steel furnaces at same site.

Metalliferous Materials Used.—The production of pig iron in 1950 required 117,002,059 net tons of iron ore, sinter, and manganiferous iron ore, 3,533,600 net tons of mill cinder and roll scale, 3,600,267 net tons of open-hearth and Bessemer slags, 2,357,037 tons of purchased scrap, and 47,322 tons of other materials—an average of 1.962 tons of metalliferous materials (exclusive of home scrap and flue dust) per ton of pig iron made.

Alabama furnaces used red hematite from the Birmingham district and brown ores from Alabama and Georgia, as well as hematite from Missouri and the Lake Superior region. Pyrites cinder was shipped from Virginia and sintered with Alabama red ores, and cinder and byproduct ore were obtained from Tennessee. Foreign iron ore from Africa, Brazil, and Sweden and foreign manganese-bearing ores from Africa were also used.

Blast furnaces at Fontana, Calif., used iron ore from the Eagle Mountain and Vulcan mines in California and from the Excelsior mine in Utah. The small quantity of manganiferous ore used originated in Mexico.

The iron ore consumed in furnaces at Pueblo, Colo., originated from the Duncan and Blowout mines, Iron County, Utah, and the Sunrise mine, Platte County, Wyo. Manganiferous iron ore from the Boston Hill mine, Grant County, N. Mex., was also used.

Blast furnaces at Sparrows Point, Md., used various domestic iron ores, including manganiferous materials mined on the Cuyuna range in Minnesota, and foreign iron ore from Africa, Chile, and Sweden.

PRODUCTION OF STEEL

Steel production rose to 96,836,075 net tons in 1950, an increase of 24 percent over 1949, and steel capacity increased 4 percent. According to the American Iron and Steel Institute, average annual capacity as of January 1 and July 1, 1950, was 99,982,650 net tons. Of the total tonnage of steel ingots and castings produced in the United States in 1950, 89 percent was made in open-hearth furnaces as compared with 90 percent in 1949 and 90 percent in 1948; 5 percent was made in Bessemer converters, and 6 percent was made in electric furnaces compared with 5 percent in 1949.

In 1950, 38.8 percent of the domestic steel output was made by furnaces in the Pittsburgh-Youngstown district, 21.6 percent in the Chicago district, 19.4 percent in the Eastern district, 9.6 percent in the Cleveland-Detroit district, 5.6 percent in the Western district, and 5.0 percent in the Southern district, compared with 38.7, 22.0, 19.8, 9.0, 5.5, and 5.0 percent, respectively, in 1949.

The data concerning steel production used by the Bureau of Mines are furnished by the American Iron and Steel Institute. The output from steel foundries that do not produce steel ingots is not included in the production data.

Alloy Steel.—The steel output for 1950 included 8,570,105 net tons of alloy steel ingots and castings. This figure represents a sharp increase in alloy-steel production over 1949, when there was a slump, but is only slightly higher than that for 1948. Alloy production represents 9 percent of the total steel compared with 8 percent in 1949 and 10 percent in 1948. The alloy-steel data include steels in which the minimum of the range specified, in one or more of the elements named, exceeds the following percentages: Manganese, 1.65 percent; silicon, 0.60 percent; copper, 0.60 percent; or aluminum, boron, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, and other alloying elements, any added percent. The output of alloy steel in 1950 increased 45 percent over 1949 compared with the total steel increase of 24 percent. Of the alloy steel produced in 1950, 67 percent was made in basic open-hearth furnaces, 1.4 percent in acid open-hearths, and 31.6 percent in electric furnaces; none was produced in Bessemer converters. The percentage of alloy steel made in electric furnaces in 1949 was 27.

TABLE 7.—Steel capacity, production, and percent of operations, 1946–50, in net tons [1]

[1] Includes only that portion of steel for castings produced in foundries operated by companies manufacturing steel ingots. *See* table 7.
[2] Includes a very small quantity of crucible steel.

TABLE 11.—Alloy-steel ingots and castings manufactured in the United States, 1946–50, by processes, in net tons [1]

[American Iron and Steel Institute]

Process	1946	1947	1948	1949	1950
Open hearth:					
Basic	4,325,657	5,520,540	6,285,054	4,192,344	5,738,067
Acid	115,711	128,754	128,915	105,550	123,253
Crucible } Electric }	1,635,827	1,778,937	2,067,145	1,599,675	2,708,785
Total	6,077,195	7,428,231	8,481,114	5,897,569	8,570,105

[1] Includes only that portion of steel for castings produced in foundries operated by companies manufacturing steel ingots. *See* table 7.

Electric furnaces produced proportionately more alloy steels in 1950 than in 1949; 45 percent of the steel made in electric furnaces was alloy compared with 42 percent in the previous year. Typically, steels with high alloy content are made in electric furnaces and steels with lower alloy content by the open-hearth process.

Metalliferous Materials Used.—During 1950 steel furnaces used 3,495,862 tons of domestic iron ore and 1,799,089 tons of foreign ore; the latter originated in Africa, Brazil, Canada, and Sweden. Also used were 1,310,471 tons of sinter made from both foreign and domestic ores. Scrap and pig iron used in steel furnaces in 1950 totaled 107.4 million net tons; of this total, 52 percent was pig iron, 26 percent home scrap, and 22 percent purchased scrap. Both charge ore and feed ore are employed in the basic open-hearth process. Charge ore is used to add oxygen to the charge before it is melted. This ore should be low in combined and uncombined moisture, silica, and fines. Ore with a high silica content requires large additions of limestone and consequently produces large volumes of slag, which reduces furnace efficiency. Iron-ore sinter has been found to be a good charge ore in open-hearth practice.

Feed ore, which is added to the heat during the working period, should be hard, dense, coarse, and low in moisture. Although moderately high silica ore can be used as feed, it is undesirable as a charge ore because of the large quantity of slag resulting. Lump ore, which is preferred as a feed ore, is high-priced, and the supply is limited. The Vermilion range in Minnesota, the Marquette range in Michigan, and districts in New York and New Jersey are the large sources of this grade in the United States. Recently, large tonnages of high-grade lump ore have been obtained from Brazil, and Liberia is expected to begin shipments in 1951.

TABLE 12.—Metalliferous materials consumed in steel furnaces in the United States, 1946–50, in net tons

Year	Iron ore		Sinter	Manganese ore		Pig iron	Ferro-alloys	Iron and steel scrap	
	Domestic	Foreign		Domestic	Foreign			Home	Purchased

CONSUMPTION OF PIG IRON

Consumption of pig iron in 1950 increased 22 percent over 1949. Pig iron, a product of the blast furnace, is a semiraw material; except for a small quantity used in direct castings, it moves to steel-making or iron-melting furnaces for refining, alone or mixed with other ingredients. In 1950, 86 percent of the pig iron went to the steel-making furnaces (open-hearth, Bessemer, and electric) to be processed into steel. Direct castings took 4 percent, and the remaining 10 percent was consumed in iron-making furnaces, of which the cupola is the most important.

[1] In 1947 some pig iron consumed in California, Illinois, Kentucky, Maryland, New Jersey, Ohio, and Pennsylvania—not separable—is included with "Undistributed."

Plants using pig iron in 1950 were located in all 48 States and the District of Columbia, but consumption is concentrated largely in the steel-making centers of the North Central, Middle Atlantic, and the Southeastern States.

PRICES

The average value of all grades of pig iron given in the accompanying table is compiled from producers' reports to the Bureau of Mines. The figures represent value f. o. b. blast furnaces and do not include the value of ferro-alloys. The general average value for all grades of pig iron at furnaces was $42.85 in 1950 compared with $42.05 in 1949.

TABLE 15.—Average value per net ton of pig iron at blast furnaces in the United States, 1946–50, by States

State	1946	1947	1948	1949	1950
Alabama	$21.15	$28.12	$36.52	$35.79	$39.00

FOREIGN TRADE[3]

The increased demand for steel at home led to a marked increase in imports of both pig iron and steel from abroad and a decrease in exports in 1950. Imports of pig iron increased nearly eightfold (from 99,804 net tons in 1949 to 795,965 tons in 1950), and imports of steel (manufactures and semimanufactures) rose from 304,604 net tons to 1,095,571 tons. Exports of pig iron dropped from 81,309 net tons ($3,353,602) in 1949 to 6,813 tons ($321,975) in 1950 and steel, from 3,517,971 net tons to 2,566,473 tons.

Largest quantities of pig iron came from the Netherlands, Germany, and Canada, with Austria and France following in order.

Imports and exports of iron and steel products are given in detail in tables 19 and 20. Imports of semimanufactures increased more than that of manufactures between 1949 and 1950. The largest item in manufactures was structural iron and steel and in semimanufactures, "boiler and other plate iron and steel, n. e. s."

1 Revised figure.

WORLD PRODUCTION

World production of pig iron (including ferro-alloys) increased 15 percent and world production of steel, 17 percent. United States steel production was 47 percent of world production. The U. S. S. R., the world's second largest producer, produced 14.5 percent of the world's steel and Germany (Federal Republic), the third largest producer, 6.5 percent.

Argentina.—The Sociedad Mixta Siderurgica was reported soon to begin the erection of a blast furnace with a daily capacity of 1,200 tons, four open-hearth furnaces with capacities of 160 tons each, and a rolling mill with a yearly output of 250,000 tons. Finished products were to include rails and plates.[4]

Chile.—The blast furnace of Cia. Acero del Pacifico, near Talcahuano, began producing pig iron in June 1950. This was the first pig iron produced in Chile in a blast furnace employing coke as fuel. Cia. Acero del Pacifico's $90,000,000 mill is designed to produce 200,000 metric tons of steel per year—practically all the steel needs of Chile. It was built under the technical direction of Koppers, Ltd., and financed with $45,000,000 from the Export-Import Bank.[5]

Egypt.—Bids were received for the construction of a modern steel plant, with an annual capacity of 150,000 metric tons, at Aswan. The operating corporation was to be privately owned, with substantial Government participation, the foreign construction company being required to hold shares to guarantee the project.[6]

France.—The Lorraine district's 15 steel plants have been expanded greatly in the past 2 years with the aid of ECA funds. There were 9 new rolling mills and 75 operating furnaces, of which 25 had been rebuilt, with capacity increased by the end of 1950.[7]

Germany: Federal Republic.—In October 1950 the Federal Ministry of Economy began negotiations with the High Commission to hold the steel quota of 11.1 million tons exclusively for domestic requirements. Steel orders increased from 1.84 million tons in May to 2.4 million tons in September. The Federal Ministry of Economy believed that an annual production of 13 to 13.5 million tons was required to supply the steel needs of Western Germany.[8]

Germany: Soviet Zone.—Developments were reported as follows:[9]

Although the iron and steel industry (excluding armaments) was more thoroughly dismantled than any other in the Soviet Zone, it has been more intensely reconstructed than any other industry.

The largest individual iron and steel group in the Soviet Zone was the Flick Co., which included the Maximilianhuette in Unterwellenborn (with the only blast furnaces in the Zone), the Mitteldeutschen Stahlwerke in Riesa, Lauchhammer, Torgau, and Groeditz, Weber in Brandenburg, the Stahlwerke Henningsdorf, with the Spandauer plants and the steel casting plant at Doehlen. In addition to the Flick Co., there were the Thale Works, Krupp-Gruson in Magdeburg, Tangerhuette, and O. Kuntsch in Zeitz and Silbitz. East of the Oder-Neisse line, almost all of the iron and steel works belonged to the Vereinigten Oberschlesischen

Huettenwerken, which had production plants in Beuthen, Gleiwitz, Zawadski, Hindenburg, Malapane, and Laband.

All plants, with the exception of Unterwellenborn of the Flick Co., were completely dismantled. Dismantling of the Unterwellenborn plant ceased after it began, and the plant was taken over as a SAG (Soviet Joint Stock Co.) but later was returned to the Germans. Krupp-Gruson, the Eisenhuettenwerk Thale, and plants of O. Kuntsch remained Soviet joint stock companies.

Loss of real capital of the iron and steel industry in the Soviet Zone of Germany in millions of Reichmarks were 395 dismantled plants, 48 SAG plants, and 87 plants in operation.

Reconstruction of the iron and steel industry began in the middle of 1947 * * *. The production goal for 1950 (850,000 metric tons) was expected to be reached.

Reconstruction was centered at Unterwellenborn, the steel plants at Riesa and Henningsdorf, including the newly constructed rolling mill on the site of the former Reichbahn Repair Works in Kirchmoeser, and the new rolling mill in Burg. The Groeditz plants also were being rebuilt. Four plants in Ilsenburg, Auerhammer, Olbernhau, and Hettsedt, which formerly rolled nonferrous metals, were expanded and converted to produce steel plate.

India.—In January 1950 Foreign Commerce Weekly reported that the Government of India had granted the Steel Corp. of Bengal a loan of 50,000,000 rupees ($10,043,500) to be used in financing the expansion program of this company. The period of the loan was given as 3 years. It was expected to cover the first stage of the expansion program and to increase the company's annual production by 200,000 tons.[10]

Luxembourg.—During 1950 iron and steel production showed a progressive recovery, despite a coke shortage late in the year. The increase in output late in the year was accompanied by an increase in export prices.[11]

Mexico.—Plans to establish a large iron and steel plant between Saltillo and Arizpe, Coahuila, were made by the Mexican Government. To service southeastern Mexican and Central American markets, private interests were arranging to build and operate an iron and steel plant at the Port of Vera Cruz, Vera Cruz.[12]

Netherlands.—The Royal Dutch Blast Furnaces and Steel Co. planned to expand and modernize its property at a cost of about $47,000,000. Of this amount, $23,500,000 was granted by the United States. An increase of 25 to 50 percent in output of steel products was the aim of the project.[13]

Norway.—Production of electric pig iron was 61,093 metric tons, a decrease of 500 tons from 1949. Because of the European shortage of ferro-alloys, production capacity is being expanded. The increase in exports of ferro-alloys over 1949 was significant. The United States continued to be the principal importer of ferromanganese more than doubling its imports in part at the expense of Belgium-Luxembourg, the other large importer of this commodity.[14] Reports indicated that plant expansion was proceeding satisfactorily. Steel production at the rate of 80,000 tons per year was expected by the end of 1952.[15]

Rumania.—Recent developments include the addition of a fifth open-hearth furnace at the Hunedoara iron works and the production of nodular cast iron (the first produced in Rumania) at a foundry at Ploeste. Another new foundry product recently introduced was synthetic cast iron made entirely from scrap.[16]

Spain.—According to preliminary figures, iron and steel output in 1950 was the highest since 1930. A government decree published in July 1950 provided for the construction of a steel plant in Asturias, with an annual capacity of 600,000 tons. A proposed production of 200,000 tons of steel ingots was to be increased to 600,000 tons over a 10-year period.[17]

Sweden.—Iron and steel output declined in the third quarter of 1950. Moreover, imports declined, owing to a sharp increase in prices asked by Belgian, West German, and other European mills. The Wiberg-Soderfors furnace installed by the Sandviken steel mill to produce sponge iron, which is expected to begin operating in 1951 or early 1952, will add another 20,000 tons to the present annual sponge-iron capacity of about 30,000 tons. A detailed description of the Wiberg sponge-iron process has been published.[18] A shipment of 200 tons of Venezuelan iron ore was received and tested by Soderfors Bruk to determine its suitability in the manufacture of sponge iron by the Wiberg process. The results were said to be so promising that a sponge-iron plant is to be built in Venezuela.[19] On the basis of the purchase of a large blast furnace from Austria, the Norrbottensjarnwerk Co. (Norbotten Iron Works) will increase the company's annual pig-iron production from 250,000 to 350,000 tons.[20]

Venezuela.—The Venezuelan Government made plans to build a steel plant at the junction of the Caroni and the Orinoco Rivers, near the El Pao iron mines. The plant was to be built with a yearly output of 70,000 tons, eventually to be increased to 2,000,000 tons. The entire project was expected to cost the Government about 400,000,000 bolivars ($120,000,000). Included in the plans are the dredging of the Orinoco River to allow passage of ocean-going vessels; erection of a large hydroelectric power plant at Caroni Falls, and the laying of a pipe to carry natural gas from the eastern (oil) wells to the steel plant.[21]

Yugoslavia.—Construction of a large steel plant at Gustanj (Slovenia) which will take several years to complete, was begun.[22]

Iron and Steel Scrap

By James E. Larkin

GENERAL SUMMARY

RECORD production of steel ingots and castings in 1950 resulted in a 24-percent increase in the use of ferrous materials (scrap and pig iron) over 1949 and established an all-time record, exceeding 1948, the previous record year, by 7 percent. Consumption of both purchased and home scrap was the largest on record and represented 52 percent of the total charge. Pig-iron consumption also established a record high in 1950, showing a 22-percent increase over 1949 and exceeding 1948, the previous record year, by 4,916,714 short tons or 8 percent.

The proportions of scrap and pig iron used in steel furnaces in 1950—the same as in 1948—were 48 percent scrap and 52 percent pig iron, compared with 47 percent scrap and 53 percent pig iron in 1949. The charge of scrap and pig iron used in iron foundries, mainly cupola furnaces, comprised 65 percent scrap and 35 percent pig iron, the same as in 1949, but in 1948 these percentages were 67 and 33 percent, respectively.

The record use of purchased scrap during the year— a monthly average of 2,800,000 short tons—was accompanied by a new monthly record in October. May and October were the peak steel-producing months; 22 percent of the total charge in steel-making furnaces for these months was purchased scrap.

The increased consumption rate of purchased iron and steel scrap reduced stocks of this material held by consumers to a level 3 percent lower on December 31 than at the beginning of the year, equivalent to a 43-day supply at the 1950 average daily consumption rate of 91,144 short tons. These stocks reached a low of 3,196,000 short tons for the year at the end of April and a high of 4,138,000 short tons for the year at the end of October.

TABLE 1.—Salient statistics of ferrous scrap and pig iron in the United States, 1949–50

	1949 (short tons)	1950 (short tons)	Change from 1949 (percent)
Stocks, December 31: Ferrous scrap and pig iron at consumers' plants:			
Home scrap	1,564,054	1,469,463	−6
Purchased scrap	4,076,805	3,950,863	−3
Pig iron	1,657,634	1,800,137	+9
Total	7,298,493	7,220,463	−1
Consumption: Ferrous scrap and pig iron charged to—

Grand total	107,784,988	133,844,393	+24
Imports of scrap (including tin plate scrap)	[4] 1,151,294	777,886	−32
Exports of scrap:			
Iron and steel	294,960	208,775	−29
Tin plate, circles, strips, cobbles, etc	3,634	8,634	+138
Average prices per gross ton:			
Scrap:			
No. 1 Heavy-Melting, Pittsburgh [5]	$29.08	$39.29	+35
No. 1 Cast Cupola, Chicago [5]	[4] $39.00	$47.89	+23
For export	$27.54	$31.03	+13
Pig iron, f. o. b. Valley furnaces: [5]			
Basic	$46.00	$47.06	+2
No. 2 Foundry	$46.50	$47.58	+2

[1] Includes open-hearth, Bessemer, and electric furnaces.
[2] Includes cupola, air, Brackelsberg, puddling, crucible, and blast furnaces; also direct castings.
[3] Includes rerolling, reforging, copper precipitation, nonferrous, and chemical uses.
[4] Revised figure.
[5] Iron Age.

CONSUMPTION

The use of scrap and pig iron increased in every district during 1950, the total being 24 percent greater than in 1949. There was still a noticeably greater amount of scrap than pig iron used in the New England, Pacific Coast, and Southwestern districts. These districts together used 7 percent of the total scrap consumed in the United States and 3 percent of the pig iron, compared with 7 and 2 percent, respectively, in 1949. The average ratio of scrap to pig iron in these three districts was 2.8:1, whereas the United States average was 1.1:1.

Open-hearth furnaces continued to be the largest consumers of ferrous scrap and pig iron, increasing their consumption over that of 1949 by 7,989,567 tons of scrap and 9,163,628 tons of pig iron. Open-hearth consumption accounted for 63 percent of the total scrap in 1950 and 65 percent in 1949, 68 percent of the home scrap in 1950 and 71 percent in 1949, and 58 percent of the purchased scrap in 1950 and 59 percent in 1949. Pig-iron consumption in open hearths accounted for 78 percent of the total pig iron consumed in 1950, the same as in 1949.

Cupola-furnace consumption in 1950 was as follows: Home scrap, 15 percent of the total, the same as in 1949; purchased scrap, 16 percent, compared with 18 percent in 1949; pig iron, 9 percent, the same as for the 3 preceding years but 1 percent under 1946.

Bessemer converters consumed 8 percent of the pig iron during 1950, compared with 9 percent in 1949 and 8 percent for the 3 prevous years, and 0.4 percent of scrap, the same as for 1949 and 1948.

Electric furnaces consumed 11 percent of the total scrap, or 2 percent more than in 1949, and 0.2 percent of the pig iron, unchanged from 1947–48.

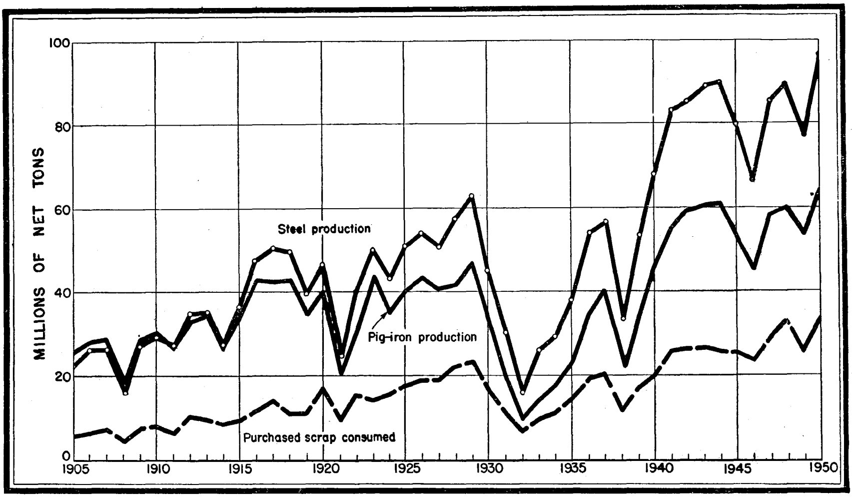

FIGURE 1.—Consumption of purchased scrap and output of pig iron and steel in the United States, 1905–50. Figures on consumption of purchased scrap for 1905–32 are from State of Minnesota vs. Oliver Iron Mining Co., et al., Exhibits, vol. 5, 1935, p. 328; those for 1933–34 are estimated by authors; and those for 1935–50 are based on Bureau of Mines records. Data on steel output from the American Iron and Steel Institute.

CONSUMPTION BY DISTRICTS AND STATES

During 1950 iron and steel scrap and pig iron were used in all 48 States and the District of Columbia; none was used in Alaska. As in 1949, the largest consuming districts were North Central, Middle Atlantic, and Southeastern. All districts increased over 1949 in total scrap and pig iron. The States having the largest consumption of scrap, with the percentage consumed, were: Pennsylvania 24, Ohio 18, Illinois 10, and Indiana 9.

CONSUMPTION BY TYPE OF FURNACE

Open-Hearth Furnaces.—Ferrous scrap and pig-iron consumption in open-hearth furnaces in 1950 totaled 94,458,155 short tons, an increase of 22 percent over 1949 and the largest consumption by this type of furnace in the history of the industry. The use of home scrap increased 18 percent, purchased scrap 29 percent, total scrap 22 percent, and pig iron 22 percent. The open-hearth furnace melt in 1950 consisted of 46 percent scrap and 54 percent pig iron, unchanged from 1949. Of the total scrap consumed, 44 percent was purchased, compared with 42 percent in 1949 and 46 percent in 1948.

Pennsylvania again led in the use of scrap in the open hearth in 1950, followed in order by Ohio, Indiana, and Illinois; this rank has remained unchanged since 1936. In 1935, the first year data were compiled on iron and steel scrap, Ohio consumed the largest quantity, followed by Pennsylvania, Indiana, and Illinois.

Bessemer Converters.—The 5,426,525 short tons of ferrous raw materials used in Bessemer converters in 1950 represents a 13-percent increase over the 1949 use of these materials. The ratio of scrap to total metal charge was 1:21 compared with 1:23 during 1949; of the scrap used, 82 percent was home scrap, the same as the previous year.

Following the usual pattern, Pennsylvania was the principal consumer of converter scrap in 1950.

Electric Steel Furnaces.—The melt of ferrous scrap and pig iron used in electric furnaces in 1950 totaled 7,476,511 short tons, a 56-percent increase over the 4,804,183 tons used in 1949. Of the total scrap used, 4,489,933 short tons was purchased scrap, which established a record high for the use of this material in these furnaces. Increases in the use of scrap occurred in all except the Southwestern district; pig iron increased in all districts.

Cupolas.—Figures released by the Bureau of the Census, United States Department of Commerce, indicate that shipments of gray-iron castings in 1950 increased 24 percent over 1949. Accordingly, requirements for scrap and pig-iron cupola consumption increased in 1950. Cupola furnaces used 16,780,164 short tons of scrap and pig iron, a 24-percent increase over the 13,521,458 tons used in 1949 and a record high for the consumption of these materials in this type of furnace. The use of home scrap increased 23 percent, purchased scrap 22 percent, total scrap 22 percent, and pig iron 27 percent.

Charges to cupolas consisted of 32 percent home scrap, 32 percent purchased scrap, and 36 percent pig iron compared with 32, 33, and 35 percent, respectively, in 1949.

As in 1949, Michigan continued to be the largest consumer of cupola scrap, followed in order by Ohio, Illinois, Pennsylvania, Alabama, Wisconsin, Indiana, New York, and New Jersey.

Air Furnaces.—Scrap and pig iron consumed in air furnaces (including two Brackelsbergs) in 1950 amounted to 1,529,878 short tons, an increase of 30 percent over the 1,174,239 tons melted in these furnaces in 1949. The use of home scrap increased 28 percent and of purchased scrap 42 percent; pig iron increased 22 percent.

Ohio led in the use of scrap in air furnaces, followed in order by Illinois–Indiana (combined), Pennsylvania, Wisconsin, Michigan, and New York.

[1] Includes 2 Brackelsberg furnaces, 1 each in Indiana and Ohio.

Crucible and Puddling Furnaces.—Crucible furnaces used 926 short tons of scrap and 1,190 tons of pig iron in 1950 compared with 1,211 and 1,052 tons, respectively, in 1949. Puddling furnaces used 5,545 tons of scrap and pig iron. Of the total puddling-furnace melt in 1950, 2,377 tons were scrap compared with 2,794 tons during the previous year. All of the scrap and pig iron consumed in puddling furnaces was in Pennsylvania.

Blast Furnaces.—Materials other than scrap constitute by far the largest proportion of the blast-furnace charge and in 1950 consisted of 117,002,059 short tons of iron ore, sinter, and manganiferous ore; 3,533,600 tons of mill cinder and roll scale; 3,600,267 tons of open-hearth and Bessemer slag; and 47,322 tons of miscellaneous materials.

Total consumption of scrap in 1950 by 72 plants operating blast furnaces was 4,390,065 short tons, a 46-percent increase over 1949. The scrap charged to blast furnaces was 46 percent home, 54 percent purchased, compared with 50 percent each for home and purchased in 1949, and 49 and 51 percent, respectively, in 1948. The proportion of scrap used to pig iron produced was 6.8 percent (home scrap 3.1 percent and purchased 3.7 percent) compared with 5.6 percent in 1949.

USE OF SCRAP IN FERRO-ALLOY PRODUCTION

The producers of ferro-alloys (by other than blast furnaces) in 1950 consumed 355,458 short tons of scrap, a 20-percent increase over 1949. Of this total, 253 tons were used in the aluminothermic process and the balance in electric furnaces. Purchased scrap accounted for 96 percent of the quantity used and home scrap 4 percent; in 1949 the percentages were 97 and 3, respectively.

Seventeen ferro-alloy plants used ferrous scrap in 1950, 1 less than in 1949. All of these plants operated electric furnaces. Two of this group employed both the electric and aluminothermic process.

Scrap used in blast furnaces in the manufacture of ferro-alloys is included in this chapter with blast furnaces.

MISCELLANEOUS USES

Scrap consumed in 1950 for miscellaneous purposes, such as rerolling, nonferrous metallurgy, and as a chemical agent, remained at slightly less than 2 percent of the total consumption. This percentage has been unchanged for the past 6 years. The quantity so used—1,144,627 short tons—was an increase of 21 percent over that used for these purposes in 1949. Of the quantity used, 96 percent was purchased and 4 percent home scrap.

STOCKS

Complete iron- and steel-scrap stock figures covering 1950 year-end stocks are not available; producers (railroads and manufacturers) were not canvassed. Dealers, automobile wreckers, shipbreakers, and consumers reporting to the Bureau of Mines had 5,718,828 short tons of material on hand December 31, 1950, compared with 6,063,132 short tons at the end of 1949, a decrease of 344,304 tons or 6 percent.

Consumers' Stocks.—Consumers' stocks of home and purchased iron and steel scrap on December 31, 1950, totaled 5,420,326 short tons—a decrease of 220,533 short tons or 4 percent from the beginning of the year. Stocks of home scrap (1,469,463 tons) decreased 6 percent and purchased scrap (3,950,863 tons) 3 percent. Stocks of pig iron on December 31, 1950, amounted to 1,800,137 short tons, an increase of 9 percent over the 1,657,634 short tons on hand December 31, 1949.

Suppliers' Stocks.—Stocks of iron and steel scrap in the hands of dealers (153,519 tons) and automobile wreckers (4,880 tons) totaled 158,399 short tons on December 31, 1950, compared with 324,387 tons on December 31, 1949—a decrease of 51 percent. Stocks held by shipbreakers amounted to 140,103 short tons on December 31, 1950.

PRICES

The composite price of iron and steel scrap was $26.58 per gross ton in January 1950—a drop of $14.78 per gross ton from $41.36 per gross ton in January 1949—but increased to a record high of $44.02 per gross ton in December, exceeding the previous high of $43.16 in August, September, and October 1948. No. 1 Cast scrap at Chicago was selling at $38.50 per gross ton in January 1950, a decrease of $18.75 per gross ton from January 1949 and $35.80 less than the peak price of $74.30 per gross ton established in August 1948. By December 1950 No. 1 Cast at Chicago had increased to a high for the year of $64.50 per gross ton. No. 1 Heavy-Melting steel at Pittsburgh and Chicago was quoted by Iron Age at $29.95 and $26.70, respectively, in January, which was the low for the year, but increased to a high of $45.57 and $43.44 per gross ton in December at Pittsburgh and Chicago, respectively.

FOREIGN TRADE [1]

Imports.—Imports of iron and steel scrap, including tin-plate scrap, totaled 777,886 short tons in 1950, a decrease of 32 percent from the 1,151,294 (revised) short tons imported in 1949, with the value amounting to $18,480,327 compared with $29,937,798 (revised) in 1949, a decrease of 38 percent. Of the 1950 imports, 185,839 tons came from Germany, 155,181 from France, 113,436 from Japan, 87,981 from Canada, and the remainder from other countries. There were 47,481 tons of tin plate scrap imported in 1950, mostly from Canada, compared with 45,951 in 1949.

Exports.—Exports of ferrous scrap from the United States in 1950 were 217,409 short tons valued at $6,023,737, a 27-percent decrease in tonnage from 1949 and an 18-percent decrease in value. Imports exceeded exports by 560,477 short tons. The tonnage exported amounted to 7 percent of the 5-year prewar average (1935–39) of 3,298,326 tons a year, compared with 9 percent during 1949. The 1950 exports included 8,634 tons of tin-plate circles, strips, cobbles, and terneplate clippings and scrap, valued at $761,490. The same materials in 1949 amounted to 3,634 tons valued at $395,370.

Lead[1]

By Richard H. Mote and Edith E. den Hartog

GENERAL SUMMARY

AT THE beginning of 1950, lead producers, having witnessed in 1949 one of the most precipitous market price declines in the history of the industry, were gravely concerned over the lack of consumer demand and the possibility of rapidly accumulating surpluses. This anxiety was further increased several months later by rumors within the trade that Government purchases of lead for the National Strategic Stockpile were to be discontinued in July. There was little evidence that smelter and refinery stocks of lead and material in process would decline from the abnormally high levels prevailing during the first quarter of the year. On January 1, 1950, stocks were higher than at any similar date since January 1, 1939. The lack of confidence in price stability was further evidenced during the first months of 1950 by consumers' cautious buying, which caused a further depression in the market quotation from 12 cents per pound on January 1 to 10½ cents on March 14.

With the outbreak of the war in Korea in late June and the acceleration of the National Defense Program that followed immediately thereafter, industrial activity increased. Consumers recalling the difficulties experienced in obtaining full requirements of lead in World War II promptly abandoned the prudent buying practices used early in 1950. Demand increased rapidly, and lead shipments from primary refineries, which had dropped as low as 21,855 tons in February, advanced to 47,031 tons in August and to over 62,000 tons in October. Lead prices strengthened throughout the summer and early fall, reaching 17 cents per pound at the end of October.

The net effect of the abrupt mid-year change was record-breaking in several instances. Total domestic lead consumption increased 29 percent over 1949 and was the largest quantity ever recorded. Mine output increased to the highest level since 1943, and imports reached a record-shattering total of 541,864 tons, a gain of 36 percent over the record peacetime high in 1949. Recovery of lead from secondary sources, which had been decreasing since 1947, gained 17 percent in 1950 and exceeded domestic mine output for the fifth consecutive year.

Despite the unpredicted rise in demand for lead during the latter part of the year, there was no apparent stringency in lead supply until just before the year end. On December 28, 1950, the National Pro-

[1] This report deals primarily with the smelting, refining, and consuming phases of the industry. For details of mining operations, see the various State chapters of this volume.

duction Authority issued an antihoarding order, which included lead, among other scarce materials, and limited the accumulation of such materials to quantities needed for "reasonable demands of business, personal, or home consumption."

Labor difficulties during the year caused some losses in production but not to the extent of 1948 and 1949. Toward the end of 1950 there were indications of a decline in the availability of labor in some mining districts, which forecast a possible obstruction to further expansion of domestic mine production in 1951.

TABLE 1.—Salient statistics of the lead industry in the United States, 1941–45 (average) and 1946–50, in short tons

	1941–45 (average)	1946	1947	1948	1949	1950
Production of refined primary lead:						
From domestic ores and base bullion	419, 081	293, 309	381, 109	339, 413	404, 449	418, 809

[2] Revised figure.

DOMESTIC PRODUCTION

Statistics on lead output may be prepared on a mine or smelter and refinery basis. Mine-production data, compiled on the basis of lead content in ores and concentrates, adjusted to account for average losses in smelting, are a better measure of domestic output from year to year and are most accurate for showing the geographic distribution of production. Pig-lead output, as reported by smelters and refiners, presents a more precise figure of actual lead recovery but indicates only in a general way the source of crude material treated. Smelter and refinery output generally differs from the mine figure owing to the lag between mine shipments and smelter treatment of ores and concentrates.

MINE PRODUCTION

Domestic mine output of recoverable lead rose 5 percent in 1950 compared with 1949 and was the largest since 1943. Except for January, production during the first half of the year was at a rate consistently above the 1,180-ton average daily output for the entire year. Production during the latter half of the year, however, declined somewhat, and the daily output, with the exception of November, remained below the annual average.

Production in 11 of the 22 lead-producing States in 1950 exceeded the rates established in 1949. In California the production surpassed any other year in the State's history, and a similar record was established in Washington. Not since 1927 have Colorado mines produced as much lead as was recovered in 1950. Lead output in Idaho, Montana, and Oklahoma reached the highest point since 1942, and production from Missouri mines approached the 1946 output.

Of the total lead produced at United States mines in 1950, 69 percent came from 25 properties. Missouri continued to rank first among the States in the production of lead, and the Southeastern Missouri district continued to be the largest lead-producing area, supplying 31 percent of the total domestic output. As in previous years, the St. Joseph Lead Co. produced the bulk of the output from its Bonne Terre, Desloge, Federal, and Leadwood mine groups in St. Francois County and the Mine La Motte property in Madison County. Each mine is equipped with a mill; the five have a combined daily capacity of about 28,800 tons of ore. In Madison County the National Lead Co., St. Louis Smelting & Refining Division, operated its Madison lead-copper mine and 1,200-ton flotation mill at Fredericktown. The Catherine-Fleming mine was operated part of the year by the Fredericktown Lead Co.

The Tri-State district produced 7 percent of the total domestic lead output in 1950. Owing to low concentrate prices, production was retarded during the first quarter of the year. In the second quarter increased zinc prices stimulated ore production somewhat, but the greatest gain in output occurred in the latter half of the year when the zinc price continued to advance and the lead quotation rose sharply. The five leading Tri-State lead-producing companies in 1950, in order of output, were: Eagle-Picher Mining & Smelting Co., Nellie B. Mining Co., National Lead Co. St. Louis Smelting & Refining Division, Federal Mining & Smelting Co., and the W. M. & W. Mining Co. In December 1950 there were 16 mine mills, 1 tailings mill, and 3 clean-up mills operating, compared with 18 mine mills, 1 tailings mill, and 1 clean-up mill operating in December 1949. About 80 mines were operating in December 1950, compared with 85 in December 1949. Increased activity in open-pit operations during the year indicated the growing importance of this mode of mining in the district.

Mine production of recoverable lead in the combined Western States increased 6 percent in 1950. During the year lead mines in the region contributed nearly 60 percent of the total domestic production compared with 59 percent in 1949.

Idaho continued to be the largest producer of lead in the Western States and second only to Missouri in the United States. In 1950, 95 percent of all Idaho lead came from the Coeur d'Alene region. The Bunker Hill & Sullivan mine at Kellogg was by far the largest producer. Other large producers, all in the Coeur d'Alene region, included the Page, Star, Morning, Sherman, Dayrock, and Sidney mines. These seven properties accounted for 70 percent of the State total lead output, 78 percent of which came from zinc-lead ore and old tailings.

Lead production in Utah in 1950 declined 16 percent from the 1949 output largely as a result of a shut-down of the United States & Lark property at Bingham. The Lark mine was closed from July 16 through October 28 because of a fire in the lower levels; the United

States mine was idle 2 months owing to a labor strike. Despite these difficulties, which reduced lead output in 1950 about 15 percent below 1949, the United States & Lark property remained by far the largest producer of lead in Utah. Production from the United States & Lark property, Chief Consolidated Mining Co., Park Utah Consolidated Mines Co., New Park Mining Co., Butterfield group, Silver King Coalition Mines Co., and Hidden Treasure, Honorine, and Calumet mines supplied 95 percent of the State total lead. Of this total 88 percent was recovered from zinc-lead ore.

Lead production from Colorado mines in 1950 increased slightly over 1949 and was the largest since 1927. The important lead producing mines, in order of rank, were the Resurrection, Treasury Tunnel-Black Bear (Idarado), Smuggler Union-Montana, Eagle, and Emperius Mining Co. group. Zinc-lead ore yielded 63 percent of the State total lead in 1950.

The output of lead in Arizona in 1950 dropped 21 percent below the record level established in 1949 owing largely to a decline in production of zinc-lead ore from the Copper Queen mine at Bisbee. Although lead production at the Copper Queen mine dropped 44 percent, the mine continued as the largest producer in Arizona. Other important producers of lead, in order of output, were the St. Anthony property at Tiger, Iron King mine at Humboldt, San Xavier mine near Sahuarita, Flux group near Patagonia, and Aravaipa group near Klondike. About 92 percent of the total lead output in Arizona in 1950 was recovered from zinc-lead ore, and the rest was recovered largely from lead ore.

Montana's production of recoverable lead in 1950 increased 9 percent owing to a substantial gain in output of zinc-lead ore from the Butte Hill mines and dumps of the Anaconda Copper Mining Co. Anaconda company-owned operations in 1950 accounted for 69 percent of the State lead; other important operations producing lead were the Emma mine at Butte, the Mike Horse property at Flesher, and Jack Waite mine in Sanders County. These four producers supplied 87 percent of the total lead produced in the State in 1950. Of this total 90 percent was recovered from zinc-lead ore and most of the remainder from lead ore.

The closing of the Copper Canyon Mining Co. mine in Lander County, Nev., early in June 1950, following a shaft fire, is reflected in the 11-percent decline in lead production in that State as compared with 1949. The Pioche district, Lincoln County, was again the principal source of Nevada's lead output, contributing 72 percent of the State's total production. The leading producers were: The Combined Metals Reduction Co., Pioche group; Copper Canyon Mining Co., Copper Canyon mine; Ely Valley Mines, Inc., Ely Valley mine; Bristol Silver Mines Co., Bristol mine; and McFarland and Hullinger, Delno mine. Nearly 73 percent of the Nevada lead output in 1950 was recovered from zinc-lead ore.

California 1950 lead production broke a record of 33 years' standing. The new record was achieved largely because Anaconda Copper Mining Co. developed the Darwin group of mines, Coso district, and the Shoshone group, Resting Spring district, Inyo County, to the extent that adequate lead and zinc-lead ores were available to assure continuity of operation at both properties throughout the year. Other important lead mines operated in California in 1950 included the Coronado Copper and Zinc Co., Afterthought mine; Lewis Warnken, Jr., Gold Bottom mine dump; George Lippincott, Lead King mine; and Finley and Vignich, Minnietta mine.

Lead production in Washington in 1950 increased 61 percent over 1949; this was the largest annual output of any year in the State's history. Largely responsible for the record production were substantial increases in output from the Grandview mine in Pend Oreille County and the Bonanza mine in Stevens County. Lead production declined slightly at the Deep Creek and Anderson mine in Stevens County and at the property of the Pend Oreille Mines & Metals Co. in Pend Oreille County. These properties supplied over 99 percent of the Washington lead in 1950. About 72 percent of the total output was derived from zinc-lead ore and nearly all the remainder from lead ore.

Lead production in New Mexico in 1950 declined 11 percent from the 1949 output. The principal producers during the year were the Groundhog mine in the Central district, Lynchburg property in the Magdalena district, Bayard mine in the Central district, and Portales mine in the Hansonberg district. Over 55 percent of the State total lead in 1950 was recovered from zinc ore, 25 percent from zinc-lead ore, and most of the remainder from lead ore.

TABLE 2.—Mine production of recoverable lead in the United States, 1941–45 (average) and 1946–50, by States, in short tons

Grand total	443,734	335,475	384,221	390,476	409,908	430,827

Mine production of lead in States east of the Mississippi River came from properties in Illinois, Kentucky, New York, Tennessee, Virginia, and Wisconsin and was largely a byproduct or co-product of zinc and fluorspar mining. Most of the decline in lead output in this region in 1950 can be attributed to a smaller production from fluorspar mines and to the closing of the Patrick mine in Southern Illinois by the Alco Lead Corp., which went out of business in the latter part of 1949. Zinc-lead mines in Wisconsin and Northern Illinois also recorded declines in production, and some output was lost owing to the closing on May 15 of the Universal Exploration Co.'s Hyatt mine in New York. A labor strike at the Austinville mine of the New Jersey Zinc Co. from October 9 to November 23 resulted in a 2-percent decrease in the output of lead in Virginia.

TABLE 3.—Mine production of recoverable lead in the United States by districts that produced 1,000 tons or more during any year, 1941–45 (average) and 1946–50, in short tons

District	State	1941–45 (average)	1946	1947	9148	1949	1950

Lead was also recovered in 1950 from ores mined in Oregon, Texas, and Arkansas. Virtually all the 149 tons of lead produced in Alaska in 1950 was recovered from the output of the Riverside mine near Hyder in the Southeastern Alaska region.

The 25 leading lead-producing mines in the United States in 1950, listed in table 4, yielded 69 percent of the total domestic output; the 8 leading mines produced 46 percent and the 4 leading mines 36 percent.

Detailed information on the production of mines and mining districts in the United States may be found in the chapters of this volume dealing with the mine production of gold, silver, copper, lead, and zinc in the various States.

SMELTER AND REFINERY PRODUCTION

Pig (refined) lead produced in the United States is derived from three principal sources—domestic mine production, imports of foreign ores and base bullion, and scrap materials (treated largely at secondary smelters)—and is recovered at primary refineries that treat ore, base bullion, and small quantities of scrap and at secondary plants that process scrap exclusively. Of the 13 primary lead plants in the United States, 6 combine smelting and refining operations, 5 produce only base bullion (containing approximately 98 percent lead plus gold and silver, and small quantities of other impurities recovered from the ores smelted), and 2 confine their activities to refining. Refined lead and antimonial, or "hard," lead may be produced by both primary and secondary plants. Because of the large quantity of hard lead, such as battery scrap, melted at secondary smelters, the output from this type of operation is essentially antimonial lead. Statistics on the production of refined lead and alloys at secondary plants are given in the Secondary Lead section of this chapter.

Of the 13 primary smelters in operation in 1950, all but 2 consumed substantial quantities of primary materials in the form of ores and concentrates. During the year these 11 plants consumed 511,433 short tons (lead content) of this type of material, of which 17 percent was of foreign origin. In 1949, 467,128 tons of ores and concentrates were consumed, 16 percent of which was foreign.

Active Lead Smelters and Refiners.—Primary lead smelters and refineries operating in the United States in 1950 were as follows:

California: Selby—Selby plant, American Smelting & Refining Co. (smelter and refinery).
Colorado: Leadville—Arkansas Valley plant, American Smelting & Refining Co. (smelter).
Idaho: Bradley—Bunker Hill Smelter, Bunker Hill & Sullivan Mining & Concentrating Co. (smelter and refinery).
Illinois: Alton—Federal plant, American Smelting & Refining Co. (smelter and refinery).
Indiana: East Chicago—U. S. S. Lead Refinery, Inc. (refinery).
Kansas: Galena—Galena plant, Eagle-Picher Co. (smelter and refinery).
Missouri: Herculaneum—Herculaneum plant, St. Joseph Lead Co. (smelter and refinery).
Montana: East Helena—East Helena plant, American Smelting & Refining Co. (smelter).
Nebraska: Omaha—Omaha plant, American Smelting & Refining Co. (refinery).
New Jersey: Barber—Perth Amboy plant, American Smelting & Refining Co. (smelter and refinery).
Texas: El Paso—El Paso plant, American Smelting & Refining Co. (smelter).
Utah:
- Midvale—Midvale plant, United States Smelting, Refining & Mining Co. (smelter).
- Tooele—Tooele plant, International Smelting & Refining Co. (smelter).

REFINED LEAD

Primary refineries in the United States in 1950 produced 513,769 short tons of refined lead, an increase of 3 percent over the 1949 output of 500,568 tons.

Of the 508,314 tons of primary refined lead produced during the year, domestic ores and base bullion were the source for 82 percent and imported ores and foreign base bullion for 18 percent. In 1949 the

ANTIMONIAL LEAD

Antimonial lead output at primary refineries in 1950 rose slightly above the 1949 level but was well below the record high established in 1948. Production increased at three of the five primary plants producing the alloy. Distribution of antimonial lead production at primary refineries in 1946–50 by source material is shown in table 8, as is also the average antimony content.

Although antimonial lead is an important byproduct of the refining of base bullion, the quantity derived from this source is only a small part of total domestic output. The major production is recovered from the smelting of antimonial lead scrap at secondary smelters. Production data from lead smelting plants treating scrap materials exclusively are summarized in the following section and discussed in detail in the Secondary Metals—Nonferrous chapter of this volume.

TABLE 8.—Antimonial lead produced at primary lead refineries in the United States, 1946–50

Year	Production (short tons)	Antimony content		Lead content by difference (short tons)			
		Short tons	Percent	From domestic ore	From foreign ore	From scrap	Total

1950	57,959	4,504	7.8	10,728	4,344	38,383	53,455

SECONDARY LEAD

Some scrap lead is treated at primary smelters, but the greater part is received at a large number of plants that specialize in the treatment of secondary materials. Secondary lead is recovered in the form of refined lead, antimonial lead, and other alloys.

Secondary lead recovery in 1950 was 17 percent above the 1949 figure and exceeded the domestic mine output of recoverable lead for the fifth consecutive year. Data on recovery, by type of plant, in 1946–50 are shown in table 9.

LEAD PIGMENTS

The principal lead pigments are litharge, white lead, red lead, sublimed lead, leaded zinc oxide, and orange mineral. These products are manufactured for the most part from metal, but some ore and concentrates are converted directly into pigments. Details of the production of lead pigments are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

CONSUMPTION AND USES

Domestic lead consumption (including lead in lead ore consumed directly in the manufacture of lead pigments and salts) totaled 1,237,981 short tons in 1950. Of the total consumed, 826,938 tons was refined soft lead, and 259,874 tons was contained in antimonial lead, 42,518 tons in unmelted white scrap, 50,311 tons in "percentage metals," 21,575 tons in copper-base scrap, 22,098 tons in drosses and residues, and 14,667 tons in lead ores used directly in the manufacture of lead compounds. During the year, 42 percent of total lead consumed was used in the manufacture of various metal products (other than storage batteries). Production of the three largest lead-consuming items—batteries, cable coverings, and tetraethyl fluid—used 52 percent of all the lead consumed in 1950. Batteries took 32 percent of the total, cable covering 11 percent, and tetraethyl fluid 9 percent.

STOCKS

Producers' Stocks.—Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in table 13. Stocks of refined and antimonial lead include metal held by all primary refiners and by some of the refiners of secondary metal who produce soft lead. According to monthly reports released by the American Bureau of Metal Statistics, stocks of refined lead and antimonial lead increased in January, February, March, and April to reach the year's peak of 88,581 tons on April 30. Inventories declined steadily thereafter, totaling 40,910 tons on December 31, a net decrease of 42 percent from the January 1 figure of 70,424.

TABLE 13.—Lead stocks at end of year at smelters and refineries in the United States, 1946–50, in short tons

[American Bureau of Metal Statistics]

	1946	1947	1948	1949	1950
Refined pig lead	40,870	13,634	29,050	61,329	28,894
Antimonial lead	6,717	7,694	9,594	9,095	6,725
Total	47,587	21,328	38,644	70,424	35,619
Lead in base bullion—					
At smelters and refineries	8,453	7,652	9,697	16,364	11,993
In transit to refineries	4,911	5,447	4,101	3,696	4,959
In process at refineries	16,042	16,328	17,939	15,561	15,341
Total	29,406	29,427	31,737	35,621	32,293
Lead in ore and matte and in process at smelters	111,836	77,199	76,373	95,481	69,757
Grand total	188,829	127,954	146,754	201,526	137,669

The Bureau of Mines annual survey of primary lead smelters and refiners indicated stocks of 60,816 (revised) tons (lead content) of refined soft lead at plants on January 1, 1950, and 28,894 tons on December 31, 1950. Primary antimonial lead stocks at these same plants decreased from 8,192 short tons (lead content) at the beginning of 1950 to 6,152 tons at the end of the year. In terms of lead content, stocks of ore and concentrates at the operating primary smelters and refineries decreased 31 percent, from 61,753 (revised) tons to 42,346 tons during the same period. The inventory of base bullion at refineries that receive base bullion as a raw material and at smelters that produce base bullion for shipment to refineries totaled 7,893 tons at the beginning of January and 11,658 tons at the end of December 1950. Stocks of in-process base bullion or work lead at four combination smelter-refinery plants are not included in reports to the Bureau of Mines. No direct comparison can be made between these data and the figures of the American Bureau of Metal Statistics. Figures reported to the Bureau of Mines represent physical inventory at the plants, irrespective of ownership, and do not include material in process or in transit.

Consumers' Stocks.—Consumers' stocks of lead increased 41 percent during 1950. Stocks of lead in copper-base scrap decreased 20 percent, but there were increases in all other classes, with refined soft lead advancing 33 percent and antimonial lead 56 percent. Total inventories showed a downward trend from the 97,267 tons at the beginning of the year to a low of 86,898 tons on September 30 but gained considerably each month thereafter to total 137,147 tons on December 31.

TABLE 14.—Consumers' stocks of lead at end of year, 1947–50, by type of material, in short tons, lead content

Date	Refined soft lead	Antimonial lead	Unmelted white scrap	Percentage metals	Copper-base scrap	Drosses, residues, etc.	Total

PRICES

The two major markets for lead in the United States are New York and St. Louis. Much of the lead produced domestically is sold at prices normally based upon quotation in these markets. Since suspension of trading on the London Metal Exchange in September 1939, the London market has had no direct influence on New York quotations, and the differential between St. Louis and New York prices has remained 0.2 cent a pound, an amount approximating the freight charges between the two cities.

The market price for common lead, New York, opened on January 1 at 12.00 cents per pound. Cautious buying caused the price to decline on March 9 to 11.00 cents and on March 14 to 10.50 cents. Renewed consumer interest advanced the price temporarily to 10.75 cents on April 20 and to 12.00 cents on May 11. Declining sales thereafter resulted in a drop in the quotation, which reached 11.00 cents on June 28. Developments in Korea and renewed demand for the metal arrested the downtrend and resulted in a series of advances to 17.00 cents per pound on October 31, at which level the price remained for the balance of the year.

TABLE 15.—Average monthly and yearly quoted prices of lead at St. Louis, New York, and London, 1948–50, in cents per pound [1]

Month	1948			1949			1950		
	St. Louis	New York	London [2]	St. Louis	New York	London [2]	St. Louis	New York	London [2]

[2] Conversion of English quotations into American money based on average rates of exchange recorded by Federal Reserve Board.

The official London price fixed by the Ministry of Supply for the United Kingdom was £97 per long ton (equivalent to 12.11 cents per pound computed on the basis of a $2.7975 exchange rate) at the beginning of 1950. The price was reduced on March 10 to £88 (10.99 cents) and on March 16 to £84 (10.49 cents). It was subsequently raised on April 21 to £86 (10.74 cents), April 27 to £88, May 5 to £90 (11.24 cents), May 11 to £92 (11.49 cents), and May 12 to £96 (11.99 cents). On June 24 it was dropped to £92 (11.50 cents at the $2.80 exchange rate established on June 1) and again on June 29 to £88 (11.00 cents). The final uptrend for the year started on July 13, when the price was raised once more to £92, followed on July 14 by an increase to £96 (12.00 cents) and other increases on August 16 to £104 (13.00 cents), August 22 to £112 (14.00 cents), September 2 to £120 (15.00 cents), September 9 to £128 (16.00 cents), and November 1 to £136 (17.00 cents), at which level it remained for the balance of the year.

FOREIGN TRADE [2]

Tariff.—The import duty set by the Tariff Act of 1930 on lead-bearing ores, flue dust, and mattes (lead content) was 1½ cents per pound and on lead bullion, pigs, bars, scrap lead, antimonial lead, type metal, babbitt metal, solder, and alloys not specially provided for, 2⅛ cents per pound. In accordance with the Mexican Trade Agreement of January 30, 1943, these rates were reduced to ¾ cent and 1$\frac{1}{16}$ cents per pound, respectively. In June 1948 these duties were suspended for 1 year by act of Congress. As the Congress took no action on a bill to extend the suspension beyond June 30, 1949, the expiration date of the original legislation, the import duty of 1$\frac{1}{16}$ cents a pound on pig lead and ¾ cent a pound on lead in ores and concentrates was reinstated automatically on July 1 and continued at these levels throughout 1950. The 1$\frac{1}{16}$ cents per pound duty on lead scrap was suspended by Congressional action for the period October 1, 1950, to June 30, 1951.

Imports.—Imports of lead in 1950 increased 36 percent over 1949 to total 541,864 tons, the largest annual quantity ever recorded. The rise was due largely to the abrogation in mid-1950 of the Mexican Trade Agreement, effective January 1, 1951, restoring as of that date the full duty established by the Tariff Act of 1930. Extraordinarily large quantities of lead were thus imported in the late months of 1950 to avoid payment of the higher tariff rates. The greater part of the lead imported in 1950 was in the form of pigs and bars, 50 percent of which came from Mexico, 24 percent from Canada, 10 percent from Yugoslavia, 7 percent from Peru, 5 percent from Australia, and 4 percent from other countries. Imports of base bullion increased 47 percent over 1949 and came principally from Australia and Japan. Ore and concentrate imports, which had gained in each of the preceding 4 years, dropped 29 percent in 1950 and were chiefly from Africa, Peru, Bolivia, Australia, and Canada.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TABLE 16.—Total lead imported into the United States in ore, matte, base bullion, pigs, bars, and reclaimed, by countries, 1946–50, in short tons [1]

[1] Revised figure.

Exports.—Total exports of pig lead (excluding reexports of foreign refined lead) increased almost threefold, from 969 tons in 1949 to 2,735 tons in 1950. Export restrictions imposed under the Export Control Act of 1940 remained in force throughout 1950.

[1] In addition 103 tons of foreign lead was reexported in 1946, 102 tons in 1947, none in 1948, 86 tons in 1949, and 53 tons in 1950.
[2] Revised figure.
[3] Less than 0.5 ton.

WORLD REVIEW

Lead is produced in many countries, but four—United States, Mexico, Australia, and Canada—have accounted for about three-fifths of the world output in recent years, as is apparent from tables 20 and 21, which show world mine and smelter production by countries 1944–50, insofar as statistics are available.

[1] Data derived in part from Monthly Bulletin of the United Nations, Statistical Summary of the Mineral Industry (Imperial Institute, London), and the Yearbook of the American Bureau of Metal Statistics.
[2] Estimate.
[3] Includes scrap.
[4] Data not yet available; estimate by author of chapter included in total.
[5] Included with Germany.
[6] Exclusive of secondary material. Includes Upper Silesia and Sudetenland through 1944.
[7] American and British zones only.
[8] January to June, inclusive.
[9] Data represent Trianon Hungary after October 1944.
[10] Revised data excludes scrap.
[11] Figures cover lead refined from domestic and foreign ores; refined lead produced from foreign base bullion not included.

Argentina.—The chief lead-producing district in Argentina is the Aguilar, where the Compania Minera Aguilar, S. A., a subsidiary of the St. Joseph Lead Co., operates the Aguilar group of mines. Throughout 1950 the property was operated at approximately 60 percent of the installed mill capacity owing to continued difficulty in obtaining adequate transportation facilities and to a lack of electric power. During the year a total of 174,398 metric tons of ore was milled, which yielded 23,777 metric tons of lead concentrates. Lead concentrates from the Aguilar mine are smelted at the National Lead Co., S. A., smelter at Barranqueras, Chaco Territory, which also treats lead ores and concentrates imported from Bolivia.

Australia.—The output of lead in Australia increased in 1950 despite local price control on domestic consumption, transportation difficulties, and shortages of steel, skilled labor, and coal.

As in previous years, the famous Broken Hill lode in New South Wales accounted for a substantial portion of Australian lead production. On the northern limb of the lode the North Broken Hill, Ltd., reported a slight increase in the production of ores and concentrates as compared to 1948 and 1949. For the year ended June 30, 1950, ore treated totaled 332,305 tons, from which were recovered 62,600 tons of lead concentrates and 62,239 tons of zinc concentrates. Ore reserves as of June 30, 1950, were estimated at 5,005,000 tons compared with 5,151,000 tons a year earlier. At Broken Hill South, Ltd., on the southern limb of the lode, production totaled 284,962 tons of ore assaying 12.7 percent lead, 12.2 percent zinc, and 7.5 ounces of silver per ton, from which 47,607 tons of lead concentrates containing 73.3 percent lead and 59,708 tons of zinc concentrates were recovered. Ore reserves on June 30, 1950, were reported to be 1,950,000 tons compared with 1,970,000 tons on the same date in 1949. Other companies operating in the Broken Hill area in 1950 included the Zinc Corporation, Ltd., and the New Broken Hill Consolidated, Ltd.

The Electrolytic Zinc Co. of Australasia continued to operate its Rosebery and Hercules mines in the Read-Rosebery district of Tasmania. Despite continued labor shortages in certain skilled categories, output from these two mines for the year ending June 30, 1950, totaled 150,583 tons compared with 126,870 tons for the year ending June 30, 1949. Ore mined was milled in the Rosebery mill and 46,299 tons of zinc concentrates, 9,959 tons of lead concentrates, and 3,889 tons of copper concentrates were recovered. Ore reserves were reported at approximately 1,500,000 tons on June 30, 1950. Zinc concentrates from the Rosebery mill were smelted in the company's Risdon zinc smelter; lead concentrates and copper concentrates continued to be shipped to the United States for treatment.

Burma.—Activity at the Burma Corp., Ltd., Bawdwin mine was limited to maintenance only in 1950, although some ore was extracted during routine repair operations. Resumption of mining and smelting at the property continued to be dependent upon restoration of railroad service between Rangoon and Lashio (railhead for the Bawdwin mine). Another factor in the reopening of the property is the rehabilitation of the Gokteik viaduct between Mandalay and Lashio, which would take about 6 months. Negotiations with the Government of the Union of Burma on the Burma Corp.'s concession on the Bawdwin mines continued throughout the year. Certain provisions of the proposed concession, such as expropriation of the property, terms of compensation, and requirements on the percentage of technical and administrative employees who must be citizens of Burma, were points of disagreement.

Canada.—At Kimberley, British Columbia, the Sullivan mine of the Consolidated Mining & Smelting Co. continued to be the principal source of Canadian lead production. Ore production in 1950 totaled 2,680,962 tons compared with 2,297,672 tons in 1949. The company reports that the grade of ore was lower than in previous years due to more extensive pillar mining and the resulting dilution of ore. New mine installations scheduled for completion in 1951 included the extension of the mine conveyer system to the 2,850-foot level and a coarse crushing plant on that level. Lead concentrates from the Sullivan mine were treated at the company smelter at Trail, B. C., together with ores and concentrates from other mining properties in British Columbia and Yukon. Production of refined pig lead at the smelter totaled 170,364 tons in 1950 compared with 146,176 tons in 1949. The increase was due largely to greater receipts from custom sources, which totaled 206,942 tons in 1950 compared with 134,510 tons in 1949. Production at the smelter was retarded somewhat during the year by the National Railway strike, unusually severe weather in January and February, and by the necessity of operating the old lead smelter during construction of the new one on the same site.[3]

Czechoslovakia.—Lead mining in the vicinity of Przibram continued throughout 1950. Three main shafts were operating at 1,200 to 1,500

[3] Consolidated Mining & Smelting Co., 1950 Annual Report to Stockholders

meters during the year. About 400 to 500 tons of ore, with an average metal content of 2.2 percent lead, 1.1 percent zinc, and 220 grams of silver per ton, was mined per day. Ore from the three shafts is milled in a central flotation plant; concentrated material is shipped to the Przibram lead smelter situated nearby. The smelter, mines, and mill are owned by the Czechoslovakian Government. Yearly production of soft lead from the smelter averages 2,000 to 3,000 tons.[4]

French Morocco.—The Economic Cooperation Administration announced in July an advance of approximately $4,000,000 to the Société des Mines de Zellidja to be used for modernization and expansion of its lead-zinc mine at Bou-Beker in eastern French Morocco near Oujda. The agreement provided for repayment of the loan over a period of 7 years in the form of zinc, and possibly lead, for the United States Government stockpile. It is estimated that the annual output of the company's mine, after the development program is completed, will reach 85,000 tons of lead and 120,000 tons of zinc concentrates. During 1950 the mine produced about 25,000 tons of lead concentrates.

Germany.—The equivalent of nearly $574,000 of Economic Cooperation Administration counterpart funds was received in 1950 by the Stolberger Zinc Mining & Smelting Corp. in Maubach to increase output of lead and zinc. Repayment of the loan will be made through shipments of lead and zinc to the United States stockpile, with deliveries expected to begin in 1951. The Maubach mine is located in the southwest part of Kreis Dueren, Land Nordrheim-Westfalen, on the northern slope of the Eifel Mountains. Average grade of ore is estimated to be 3 percent lead and 2 percent zinc.

Greece.—Economic Cooperation Administration counterpart funds totaling approximately $768,000 were advanced during the year to the Mediterranean Mines, Inc., for development of its Greek Laurium mines approximately 25 miles southeast of Athens. An estimated 300,000 tons of sulfide ore containing a minimum of 5 percent lead, 6 percent zinc, and 2½ ounces of silver to the ton were available for treatment in a flotation mill, which was to be constructed and in operation by the end of 1951. In addition, there were some 2,500,000 tons of tailings containing 2 to 4 percent lead and 1 to 2 ounces of silver which the company planned to re-treat in the mill.

Greenland.—Officials of a Danish Government geological survey party examining lead deposits on the east coast of Mesters Vig in the area around King Oscar Fjord and Davy Sound predicted mining operations would begin in 1951. The deposits, which were discovered in the summer of 1948, are reported to contain at least 1,000,000 tons of lead.

Guatemala.—Lead mining in the Departments of Alta Verapaz and Jalapa continued at about the same level as in 1949. The Caquipec mine owned by Compania Minera do Guatemala, near Coban, Department of Alta Verapaz, was worked throughout the year. Ores assayed about 50 percent lead and for a part of the year were treated in the newly constructed smelter at the mine. Owing to technical difficulties smelting was suspended after a few weeks, and subsequent

[4] Jensen, C. W., Lead Smelting at Przibram: Min. Mag., vol. 83, No. 1, July 1950, pp. 9–11.

production was exported in the form of ore. The ore is hauled 90 miles by truck over rough mountain roads to the town of El Rancho, in the Department of El Progreso, where it is transferred to cars of the International Railways of Central America and shipped to Puerto Barrios on the Atlantic coast.

The Santiago y Mercedes mine near Mataquesquintla, Department of Jalapa, was the only other important lead-producing mine operating in 1950. Most of the output came during the last half of the year. Activities during the first part of 1950 were directed to stope filling and construction of two bypass tunnels around a large fault encountered in the exploratory work.

Mexico.—The increase of activity at Mexican lead and zinc mines during the second half of 1950 was due largely to the impact of the Korean war upon the demand for these metals. According to the annual report to the stockholders of the San Francisco Mines of Mexico, Ltd., ore treated at the company flotation mill during the year totaled a record 623,000 tons, as compared with 580,000 tons in the preceding year. There were 51,119 tons of lead concentrates, 8,396 tons of copper concentrates, and 74,172 tons of zinc concentrates recovered from the ore milled. Ore reserves at the end of September 1950 totaled 4,164,000 tons, assaying 6.5 percent lead, 9 percent zinc, 0.6 percent copper, 0.7 gram of gold, and 155 grams of silver to the ton. This is equivalent to nearly 6 years supply of ore at the present mill capacity of 720,000 tons annually. The company reported an ample supply of labor, but its efficiency is declining.

Northern Rhodesia.—Plans for increasing lead production at Broken Hill were announced by the Rhodesia Broken Hill Development Co. during the year. The deepening of the Davis shaft was started in May 1950, and by the end of the year the shaft had been sunk 1,414 feet. The shaft is being deepened to allow the establishment of a main pumping station at the 1,585-foot level. Excavation and foundation for the new lead-smelter building were commenced during the year. The new plant has been designed to recover lead from the leach residues of the electrolytic zinc process; these residues are not amenable to treatment by the existing smelting equipment and until now have been stockpiled. According to the 1950 annual report to the stockholders, production from the mine during the year ended December 31, 1950, was 13,685 long tons of lead and 22,715 long tons of zinc. A total of 163,441 short dry tons of ore was hoisted during the year as compared with 172,576 tons in 1949. The average grade of ore treated in the concentrator was 19.8 percent lead and 30.8 percent zinc. Proved ore reserves on December 31, 1950, included 1,372,000 short tons of oxide ore and 1,064,000 short tons of sulfide ore.

Tanganyika.—Uruwira Minerals, Ltd., continued in 1950 to develop its lead deposit at Mpanda. Ore mined during development was treated in the company's 100-ton pilot plant. First shipments of lead concentrates were made early in September and were consigned to lead smelters in Antwerp, Belgium. The 131-mile Mpanda branch line of the East African Railways from Kaliua to Mpanda in the western province of Tanganyika, which has been under construction for nearly 3 years, was formally opened for all classes of traffic on August 21, 1950. The line was constructed by the Tanganyika

Government to provide a means of transportation of lead and zinc concentrates from the mine to Dar Es Sallam.

United Kingdom.—Lead consumption in the United Kingdom remained virtually unchanged in 1950 as compared to 1949. Over-all consumption, including pig lead recovered from scrap, in 1950 was 328,123 tons (328,539 in 1949), of which 26 percent was used in cable covering; 24 percent in sheet and pipe; 17 percent in white lead and oxides, excluding battery oxide; 16 percent in batteries; and 17 percent for miscellaneous purposes.

Stocks of refined lead in the United Kingdom on December 31, 1950, totaled 61,687 long tons compared with 51,399 tons on December 31, 1949.

Lead and Zinc Pigments and Zinc Salts

By Helena M. Meyer and Alethea W. Mitchell

GENERAL SUMMARY

SHIPMENTS of lead and zinc pigments and zinc salts rebounded in 1950 from the reduced rates that accompanied the industrial recession of mid-1949. All classes covered by this report were shipped in substantially greater quantities in 1950 than in 1949, particularly after the outbreak of hostilities in Korea in June; lead pigments rose more sharply than the zinc group.

In the second half of 1950 the following gains over the first half were noted in shipments of various products: White lead (dry and in oil) 46 percent, litharge 44 percent, red lead 40 percent, zinc oxide (lead-free) 15 percent, and leaded zinc oxide 33 percent. For all of 1950 as compared with 1949, lead-pigment gains ranged from 65 percent for white lead (dry and in oil) to 41 percent for red lead. Zinc-pigment increases ranged from 74 percent for leaded zinc oxide to 35 percent for lithopone. Zinc chloride gained 17 percent and zinc sulfate 19 percent.

Industries that are large users of pigments showed marked advances in 1950. Passenger automobile production rose 30 percent over 1949 to a new all-time high; trucks gained 17 percent to a peak lower only than the record in 1948; the value of sales of paint, lacquer, and varnish materials was 20 percent greater than in 1949 and 7 percent more than the previous peak in 1948; the value of private construction gained 27 percent and public construction 11 percent; consumption of natural rubber rose 24 percent and synthetic, 28 percent as compared with 1949. Of these, the paint and construction gains, being stated in value terms, reflect in part the rising price level.

Lead and zinc, chief raw materials of the pigments industry, were available in greater quantities in 1950 than in 1949; but demand for these metals increased at a higher rate than supplies, so that pigment manufacturers could not fill total raw material needs. The price of common lead at New York was 12 cents a pound when the year began and in the first quarter continued the downtrend of the last quarter of 1949. After dropping to the lowest quotation of the year—10.50 cents a pound in March—there was some fluctuation, followed in the latter part of the year by a rise to 17 cents. The price for Prime Western slab zinc at East St. Louis dropped ⅛ cent a pound in early January 1950, and thereafter every price change was upward, culminating in a peak price of 17.50 cents a pound September 7 and for the remainder of the year.

Lead- and zinc-pigment prices generally followed the pattern set by the constituent primary metals. Lead-pigment prices dropped in the first half of the year and after July advanced without interruption to the year's highest levels at the year end, or to 4 to nearly 7 cents a pound above opening prices. Zinc-pigment price changes were upward from the beginning to the end of the year. Advances of about 5 cents a pound for most zinc classes were proportionately greater than lead-pigment changes and carried prices of zinc pigments to heights never previously attained. Lead-pigment prices were at all-time highs in 1948 and early 1949.

The supply-demand situation in zinc led to a National Production Authority Order, M–15, effective December 1, which restricted nonpriority use of zinc metal and zinc metal products in 1951 to an average quarterly rate of 80 percent of that during the first 6 months of 1950. Rated orders and mandatory NPA directives were not included in the foregoing limitation. Inventories were restricted to a 45-day supply or to a "practicable minimum working inventory," whichever was less. Under NPA Order M–9, effective November 16, 1950, producers of zinc, zinc oxide, and other zinc products were not required to accept rated orders for shipment in one month exceeding 10 percent of production.

Shipments of white lead (dry) increased 81 percent, the largest gain of the products covered by this report. The "in oil" variety rose 43

TABLE 1.—Salient statistics of the lead and zinc pigments industry of the United States, 1941–45 (average) and 1946–50

	1941–45 (average)	1946	1947	1948	1949	1950

[1] Reported as sales before 1945.
[2] Data for basic lead sulfate in 1946 included under white lead; Bureau of Mines not at liberty to show separately.
[3] Excludes value of basic lead sulfate; Bureau of Mines not at liberty to publish.
[4] Corrected figure.

percent, litharge was 47 percent higher, and red lead gained 41 percent. Both classes of white lead in 1949 had been shipped at, by far, the lowest levels since considerably before the beginning of the present century. The greater tonnage for litharge in 1950 established a new high record for shipments of this product. Red-lead shipments, though substantially above 1949, were far below World War II years and also below those in the latter half of the 1920's.

Zinc oxide (lead-free) shipments were 46 percent over those in 1949 and equaled the previous record established in 1928 and duplicated in 1929 and 1947. The leaded variety rose 74 percent in 1950 but was little more than three-quarters of the peak in 1947. Lithopone increased 35 percent over 1949 but was well below all years from 1924–48, inclusive.

The zinc chloride and zinc sulfate gains of 17 and 19 percent, respectively, were small compared with those for the foregoing pigments. Both compounds, however, showed to advantage with the more distant past, that is, zinc sulfate shipments were lower only than in the record year 1946, and zinc chloride shipments probably fell below only the three earlier years 1920, 1947, and 1948.

Increases in shipments of pigments to ceramics manufacturers were greater on the whole than to the larger consumers. Shipments

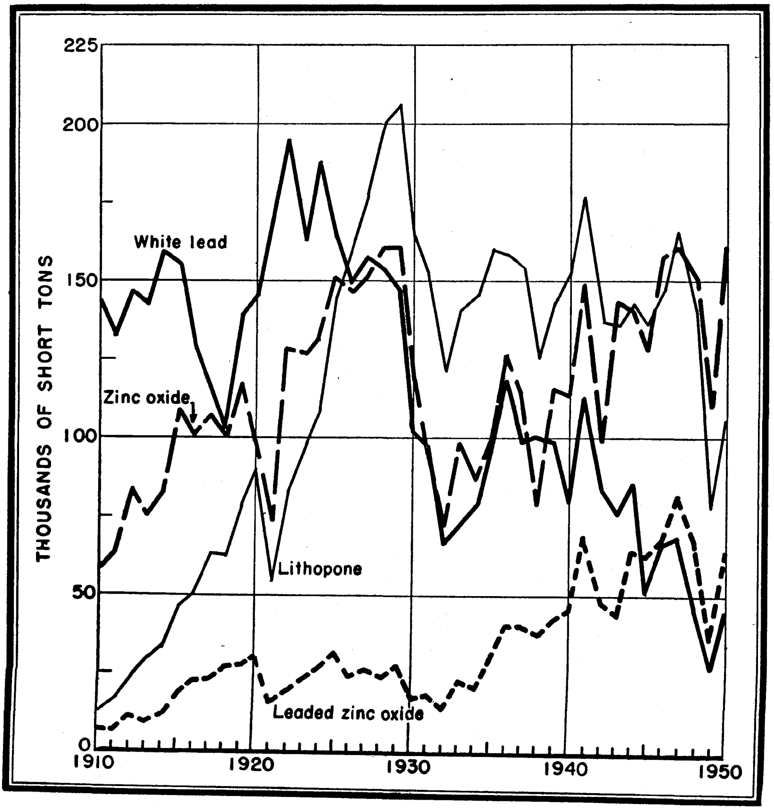

FIGURE 1.—Trends in shipments of white pigments, 1910–50.

of both litharge and white lead to this group increased more than 100 percent over the preceding year, while shipments of both litharge and zinc oxide were greater than ever before. Gains in distribution to paint makers of the pigments covered by this report ranged from 39 percent for lithopone to 75 percent for leaded zinc oxide. These increases were substantially more than the rise in total value of paint, varnish, and lacquer materials sold, a discrepancy that would appear even greater if the comparison were with physical volume.

Zinc oxide shipments to makers of rubber returned to the high levels of 1946–48 but increased less than the zinc oxide class as a whole. Litharge and lithopone shipments for rubber manufacture contrasted with each other in gaining 118 and 26 percent, respectively. The use of litharge for storage battery manufacture lagged behind the over-all performance of this pigment and consumption of red lead for this purpose fell short of the customary 50 percent or more of total red-lead shipments.

Double the 1949 quantity of litharge went into the manufacture of insecticides in 1950, and zinc sulfate shipments for agricultural use gained 32 percent. The quantities of both commodities sold for this purpose, however, were substantially below highs for recent years. Lithopone sales to makers of floor coverings and paper declined 17 and 4 percent, respectively, contrasting with almost every other item in this report.

Termination of the Mexican Trade Agreement at the end of December had no effect on the products covered by this report other than zinc sulfate. The tariff on zinc sulfate was restored to ¾ cent a pound from ½ cent under the Mexican Treaty.

Demand for the competitive titanium pigments was not satisfied in 1950 despite the fact that production and shipments of the titanium pigments established new record highs, 18 and 21 percent, respectively, above previous peaks in 1948. Except for 1949, titanium pigments have been establishing new records in each successive year. Pigment-plant capacity and not raw-material shortages limited production and prevented even greater increases in 1950 than actually occurred. At present, the Bureau of Mines is not at liberty to publish figures covering pigments of this class.

PRODUCTION

The value of lead and zinc pigments in 1950 (exclusive of that for basic lead sulfate, which cannot be shown) was $151,180,000, a 49-percent increase over 1949 compared with a 48-percent gain in tonnage. Lead pigments and zinc pigments comprised 53 and 47 percent, respectively, of the total value in 1950 and 58 and 42 in 1949.

For many years, figures on *sales* were used in this series of reports as a better guide than production to activity in the pigments industry. Beginning with 1945, the base was changed to shipments to conform with data compiled on Bureau of Mines lead and zinc schedules. Available information for 1945 (the year of change) indicated little difference between sales and shipments in that year. In reporting tonnages of pigments, an attempt is made to avoid all duplication, one of the chief problems being that finished pigments frequently are blended to make another product. Basic lead sulfate and zinc oxide, for example, are blended to make leaded zinc oxide, and in this instance the pigment weights appear in the total for the last-named class only. Pigments consumed by producing companies to make products beyond those covered by this report—that is, paints, storage batteries, and other articles—are considered as shipments.

LEAD PIGMENTS

Shipments of lead pigments rose 49 percent in quantity and 36 percent in value in 1950 compared with 1949. Average values of all items dropped in 1950, so that the greater total value is explained entirely by the substantial gains in tonnages shipped. Shipments of white lead (dry and in oil) increased 65 percent, of litharge 47 percent, and of red lead 41 percent. (Shipments of basic lead sulfate are excluded from the foregoing totals.)

Quoted prices for lead pigments dipped in the first half of 1950 and after July followed a continuous upward course, closing at the highest levels of the year. Average values reported by producers declined as follows: White lead (dry) 5 percent, white lead in oil 6 percent, red lead 6 percent, and litharge 10 percent.

White Lead.—Shipments of white lead rebounded in 1950 from the low levels of 1949, which were the lowest by far since much before the beginning of the present century; 1950 shipments were 65 percent

TABLE 2.—Production and shipments of lead pigments [1] in the United States, 1949–50

Pigment	1949				1950			
	Production (short tons)	Shipments			Production (short tons)	Shipments		
		Short tons	Value [2]			Short tons	Value [2]	
			Total	Average			Total	Average
White lead:								
Dry	15,609	15,719	$5,520,250	$351	27,954	28,506	$9,553,687	$335
In oil [3]	11,187	11,636	5,504,207	473	16,778	16,670	7,403,032	444

[2] At plant, exclusive of container.
[3] Weight of white lead only, but value of paste.

TABLE 3.—Lead pigments shipped by manufacturers in the United States, 1941–45 (average) and 1946–50, in short tons

Year	White lead			Basic lead sulfate or sublimed lead		Red lead	Orange mineral	Litharge
	Dry	In oil	Total	White	Blue			
1941–45 (average)	40,785	41,155	81,940	5,642	1,279	51,388	193	120,777
1946	[1] 41,892	24,609	66,501	(1)	(1)	32,526	123	133,799
1947	39,075	29,712	68,787	(2)	(2)	36,064		167,050
1948	26,551	19,519	46,070	(2)	(2)	30,787		154,775
1949	15,719	11,636	27,355	(2)	(2)	24,866		121,052
1950	28,506	16,670	45,176	(2)	(2)	35,072		177,658

[1] Basic lead sulfate included with white lead (dry); Bureau of Mines not at liberty to publish figure.
[2] Bureau of Mines not at liberty to publish figure.

higher than those in 1949 but otherwise were smaller than at any time since some years prior to 1900.

Basic Lead Sulfate.—The Bureau of Mines is not at liberty to publish figures on basic lead sulfate for 1946–50.

Red Lead.—Red-lead shipments rose 41 percent in 1950 but were far below World War II years and those in the latter half of the 1920's.

Orange Mineral.—No shipments of orange mineral were reported in 1947–50.

Litharge.—A new high record was established by shipments of litharge in 1950, which were 47 percent greater than in 1949 and 6 percent over the previous top in 1947. The peak automobile production rate, with its consequent large demand for storage batteries, was an important factor in the establishment of record litharge shipments.

Battery manufacturers produced 80,000 tons of black or suboxide of lead for their own use in place of litharge. This quantity was 45 percent over 1949 and 16 percent above the earlier peaks in 1948 and 1947. Black oxide production required 77,000 tons of pig lead in 1950 and 53,000 tons in 1949.

ZINC PIGMENTS AND SALTS

Shipments of zinc pigments rose 47 percent in quantity and 65 percent in value in 1950 over 1949. Unlike the lead group, all zinc-pigment average values gained; price quotations were believed to have established all-time peaks during the year. The total value of zinc pigments shipped likewise was higher than ever before. All price changes in zinc pigments were upward during 1950, the highest quotations of the year being those in effect at the year end.

Percentage increases in zinc-pigment shipments ranged from 35 percent for lithopone to 74 percent for leaded zinc oxide. Average values received by producers rose as follows: Zinc oxide (lead-free) 12 percent, leaded zinc oxide 8 percent, and lithopone 8 percent.

Shipments of zinc chloride and zinc sulfate gained 17 and 19 percent, respectively. The tonnage for zinc sulfate was second only to the record established in 1946, and the quantity of zinc chloride was 6 percent below 1948, believed to be the record year thus far, and

TABLE 4.—Production and shipments of zinc pigments and salts in the United States, 1949–50

Pigment or salt	1949				1950			
	Production (short tons)	Shipments			Production (short tons)	Shipments		
		Short tons	Value [1]			Short tons	Value [1]	
			Total	Average			Total	Average
Zinc oxide [2]	109,126	110,132	$25,299,970	$230	161,374	160,829	$41,439,269	$258

Zinc sulfate	20,952	20,065	2,365,120	118	23,587	23,912	3,124,413	131

[1] Value at plant, exclusive of container.
[2] Zinc oxide containing 5 percent or more lead is classed as leaded zinc oxide. In this table data for leaded zinc oxide include a small quantity containing less than 5 percent lead.

TABLE 5.—Zinc pigments and salts shipped [1] by manufacturers in the United States, 1941–45 (average) and 1946–50, in short tons

Year	Zinc oxide	Leaded zinc oxide	Lithopone	Zinc chloride (50° B.)	Zinc sulfate
1941–45 (average)	132,108	57,574	145,750	[2] 54,964	17,438
1946	157,851	67,971	147,001	57,316	24,931
1947	160,771	81,459	165,024	65,521	21,547
1948	150,958	67,441	140,033	68,701	21,513
1949	110,132	36,722	78,335	55,208	20,065
1950	160,829	63,973	105,650	64,564	23,912

[1] Reported as sales before 1945.
[2] 1942–45, inclusive; data for 1941 not available.

otherwise only slightly less than in one or two other high years. Average values of the two compounds increased 4 and 11 percent, respectively.

Zinc Oxide.—Zinc oxide (lead-free) shipments were 46 percent above 1949 and equaled the previous peak established in 1928 and duplicated in 1929 and 1947. The acceleration of defense mobilization after June threatened to reduce supplies of zinc metal and scrap to zinc oxide manufacturers and thus to curtail the availability of this pigment.

TABLE 6.—Production of zinc oxide (lead-free) by processes, 1945–50, as percent of total

Process	1945	1946	1947	1948	1949	1950
American process (ore and primary residues)	77	75	73	76	71	72
French process (metal and scrap)	15	17	17	15	17	18
Other	8	8	10	9	12	10
Total	100	100	100	100	100	100

Leaded Zinc Oxide.—Shipments of leaded zinc oxide rose 74 percent in 1950, a gain, among the products covered by this report, second only to white lead (dry). These shipments, however, were far from a record, reaching little more than three-fourths of the all-time peak of 1947.

Production of leaded zinc oxide, by grades (comparison with 1949 in parentheses) was as follows: 54,641 (31,434) tons of 35 percent lead and under and 8,553 (5,612) tons of over 35 percent lead.

Lithopone.—Lithopone shipments increased 35 percent over 1949 but fell well below all years from 1924–48, inclusive. Plant capacity for the manufacture of lithopone was reported to be 155,000 tons in 1950 compared with 157,000 in 1949.

The lithopone statistics in this report are given on the basis of ordinary lithopone sold as such plus the ordinary lithopone content of the high-strength product. This method of publication is used to conceal the operations of one company that always dominates the output of the high-strength product and has been the only producer in some years. In 1950, as in 1947–49, this company operated two plants producing high-strength lithopone.

Consumption of ordinary lithopone in the manufacture of titanated lithopone has dropped to very small proportions. The trend has been downward almost continuously since the peak—19,400 tons—was reached in 1937. In 1950 the tonnage increased 71 percent, the first gain since 1940, but the larger quantity was only 15 percent of the 1937 total. The lithopone figures in table 7 are included in the totals for ordinary lithopone in other tables.

TABLE 7.—Titanated lithopone produced in the United States and ordinary lithopone used in its manufacture, 1941–45 (average) and 1946–50, in short tons

Year	Titanated lithopone produced	Ordinary lithopone used	Year	Titanated lithopone produced	Ordinary lithopone used
1941–45 (average)	11,460	9,700	1948	2,100	1,700
1946	7,500	6,350	1949	2,000	1,700
1947	2,600	2,200	1950	3,400	2,900

Zinc Sulfide.—In 1950, as in several preceding years, only one company produced zinc sulfide; the Bureau of Mines is not at liberty to publish figures for this pigment.

Zinc Chloride.—Shipments of zinc chloride (50° B. solution) rose 17 percent in 1950, the smallest increase shown for the products covered by this report. The 1950 tonnage is believed to be smaller only than those for 1920, 1947, and 1948.

Zinc Sulfate.—A 19-percent increase in shipments of zinc sulfate resulted in the second-highest total on record for this compound; 1950 shipments were only 4 percent under the peak established in 1946.

RAW MATERIALS USED

Figures covering the raw materials used in making pigments and salts in 1950 and 1949 are shown in the accompanying tables.

Lead pigments and zinc pigments and salts are manufactured from a variety of materials, including ore, refined metal, and such secondary materials as scrap. In 1950, as in 1949, roughly 94 percent of the lead in pigments was derived from pig lead and the remainder from ore. Of the lead in ore used to make leaded zinc oxide, about 14 (6 in 1949) percent was from foreign sources. The proportion for zinc pigments was 73 (72) percent from ore and concentrates, 9 (8) percent from slab zinc, and 17 (20) percent from secondary materials; about 22 (18) percent of the ore used was foreign.

Tables 8 and 9 give the source of the metal used in manufacturing each pigment and salt. Pig lead is employed exclusively, either directly or indirectly, in manufacturing white lead, litharge, red lead, and orange mineral and is used also in manufacturing basic lead sulfate. The lead content of leaded zinc oxide made from basic lead sulfate, which in turn is made from pig lead, is credited to pig lead in the table. Zinc oxide is the only pigment in which considerable slab zinc is used. Ore is employed in manufacturing zinc oxide, leaded zinc oxide, lithopone, zinc sulfide, zinc sulfate, and basic lead sulfate. A substantial proportion of the zinc in lithopone (59 percent in 1950 and 65 in 1949) and most of that in zinc chloride (all in 1950 and 1949) made in the United States are derived from secondary material. For a number of years before the United States entered World War II, there had been a large increase in the quantity of secondary zinc used in manufacturing zinc oxide. The scarcity of supplies of both metal and scrap caused the proportion of the total oxide made by the French process—which uses only metal and scrap—to drop sharply in 1942 and to continue comparatively low in 1943–46, despite the fact that the total percentage from metal and scrap rose in 1943 and continued upward almost without interruption in 1944–50. The production of zinc oxide from metal and scrap accounted for the following percentages in relation to total production: 41 percent in 1939, 16 percent in 1942, 19 percent in 1943, 22 percent in 1944, 25 percent in 1945, 26 percent in 1946, 28 percent in 1947, 26 percent in 1948, 29 percent in 1949 and 29 percent in 1950.

Zinc sulfate	2,003	78		4,464	6,545	2,127	461		4,710	7,298

[1] Excludes zinc sulfide, data for which Bureau of Mines not at liberty to publish.
[2] These figures are higher than those shown in the report on Secondary Metals—Nonferrous because they include zinc recovered from byproduct sludges, residues, etc., not classified as purchased scrap material.

CONSUMPTION AND USES

LEAD PIGMENTS

White Lead.—As usual white-lead shipments were preponderantly to the paint industry, although the customary 90 percent or more was not indicated in the statistics for 1950. Doubtless, this situation was due to the inability of shippers to give complete data on end-use classification. It is known that some white lead sold to the Government was reported under "Other", and it is likely that a substantial part of the entire "Other" classification belongs properly under paint. Shipments to ceramics manufacturers, after declining since 1947, doubled in 1950 compared with 1949 and slightly exceeded the high level of 1941–45.

TABLE 10.—Distribution of white lead (dry and in oil) shipments,[1] by industries, 1941–45 (average) and 1946–50, in short tons

Industry	1941–45 (average)	1946 [2]	1947	1948	1949	1950
Paints	74,062	60,943	61,265	40,892	[3] 24,284	38,920
Ceramics	1,749	1,367	1,665	1,369	894	1,815
Other	6,129	4,191	5,857	3,809	[3] 2,177	[4] 4,441
Total	81,940	66,501	68,787	46,070	27,355	45,176

[1] Reported as sales before 1945.
[2] Data for basic lead sulfate included with white lead; Bureau of Mines not at liberty to show former separately.
[3] Revised figure.
[4] Of which 1,257 tons were for plasticizers and stabilizers.

Basic Lead Sulfate.—A distribution of basic lead sulfate shipments by uses has not been available for publication since 1945, when 3,009 short tons went to the paint industry, 200 tons to the rubber industry, and 686 tons to other industries. Substantial quantities of lead sulfate are also used as an intermediate product in manufacturing leaded zinc oxide. Such quantities have always been shown in this chapter under leaded zinc oxide rather than basic lead sulfate.

Red Lead.—Shipments to storage-battery manufacturers again were greater than to any other class, but this use failed to account for more than 50 percent of the total in 1950 as against 52 percent in 1941–45 and 59 percent in 1946. The paint industry took 40 percent of the total in 1950 compared with 29 percent in 1946 and 38 percent in 1941–45. Shipments to ceramics makers were similar to the tonnages for most recent years except 1946 and 1948.

TABLE 11.—Distribution of red-lead shipments,[1] by industries, 1941–45 (average) and 1946–50, in short tons

Industry	1941–45 (average)	1946	1947	1948	1949	1950
Storage batteries	26,900	19,115	20,883	14,854	12,163	17,478
Paints	19,586	9,318	11,362	10,863	9,634	14,103
Ceramics	932	1,228	977	1,275	603	981
Other	3,970	2,865	2,842	3,795	2,466	2,510
Total	51,388	32,526	36,064	30,787	24,866	35,072

[1] Reported as sales before 1945.

Orange Mineral.—No shipments of orange mineral have been reported since 1946, when 78 short tons went to the ink industry, 18 tons to the color-pigment industry, and 27 tons to other industries.

Litharge.—Shipments of litharge to ceramics makers were higher by 39 percent than the previous peak in 1948. This use took 16 percent of the total in 1950, compared with 10 percent in 1941–45 and a range of 10 to 13 percent in 1946 to 1949. Only storage batteries rank above ceramics in consumption of litharge, and these took nearly four times as much as the latter in 1950. The 1950 tonnage for batteries was only 6 percent under the all-time high, in 1947, and except for that year was a record. Insecticide makers doubled their use of litharge in 1950, but this industry took much less than half of its 1944 peak quantity. Chrome-pigment tonnages were comparable to the best totals of the recent past, as were those shipped to rubber manufacturers and, except for 1 or 2 years, to oil refineries. Shipments to the varnish industry were only slightly under the 1948 high.

TABLE 12.—Distribution of litharge shipments,[1] by industries, 1941–45 (average) and 1946–50, in short tons

Industry	1941–45 (average)	1946	1947	1948	1949	1950

[1] Reported as sales before 1945.

ZINC PIGMENTS AND SALTS

Zinc Oxide.—More than half of the 1950 tonnage of the lead-free class was for the manufacture of rubber, and the quantity so used was close to the largest ever consumed for this purpose. Paint manufacture stood second as an end use of zinc oxide in 1950, taking quantities smaller only than in 2 or 3 years from 1925 to 1930. A new top was established in the use of zinc oxide in ceramics, the previous

TABLE 13.—Distribution of zinc oxide shipments,[1] by industries, 1941–45 (average) and 1946–50, in short tons

Total	132,108	157,851	160,771	150,958	110,132	160,829

[1] Reported as sales before 1945.
[2] Includes the following tonnages for rayon: 1946—9,363; 1947—7,302; 1948—8,209; 1949—4,470; 1950—4,850.

high for 1948 being exceeded slightly. This use has made outstanding gains over a short period, the quantity for 1950 being 170 percent greater than the average for 1941–45. Despite substantial gains in shipments for coated fabrics and textiles and for floor coverings, these uses lagged well behind the level of some other recent years.

Leaded Zinc Oxide.—Leaded zinc oxide is used almost exclusively in manufacturing paint, and 98 percent of the shipments in 1950 were reported to be for this purpose. The tonnage for paint in 1950 was 20 percent below the 1947 peak and slightly smaller than in 1948 and 1946. The fact that leaded zinc oxide is made from ores rather than from metal or scrap improves the competitive position of this pigment for paint manufacture in times of metal and scrap scarcity such as existed during World War II and following the outbreak of war in Korea in June 1950.

TABLE 14.—Distribution of leaded zinc oxide shipments,[1] by industries, 1941–45 (average) and 1946–50, in short tons

Industry	1941–45 (average)	1946	1947	1948	1949	1950
Paints	55, 581	64, 816	77, 994	64, 912	35, 938	63, 002
Rubber	72	166	131	218	124	240
Other	1, 921	2, 989	3, 334	2, 311	660	731
Total	57, 574	67, 971	81, 459	67, 441	36, 722	63, 973

[1] Reported as sales before 1945.

Lithopone.—Paints, varnish, and lacquers regularly take around three-fourths of the total lithopone shipped, and the 74 percent for 1950 compares with 72 percent in 1949, 75 in 1948, and 82 in 1947. Textiles, second-largest use, consumed 20 percent more lithopone in 1950 than in 1949. Rubber used 26 percent more lithopone than in 1949 and made a good showing in relation to earlier years as well. Shipments to manufacturers of floor coverings and paper dropped 17 and 4 percent, respectively, in contrast to almost every other item covered by this report. Both classes of users took only about half of the average annual quantities for 1941–45.

Zinc Chloride.—Statistics on the end-use distribution of zinc chloride shipments are not available.

TABLE 15.—Distribution of lithopone shipments,[1] by industries, 1941–45 (average) and 1946–50, in short tons

Industry	1941–45 (average)	1946	1947	1948	1949	1950
Paint, varnish, and lacquers [2]	112, 793	123, 279	134, 830	104, 441	56, 146	78, 177

Other	10, 271	3, 937	5, 571	5, 727	3, 587	7, 011
Total	145, 750	147, 001	165, 024	140, 033	78, 335	105, 650

[1] Reported as sales before 1945.
[2] Includes a small quantity, not separable, used for printing ink, except in 1950.
[3] Included in "Other" before 1950, except for those quantities reported under "Paint, varnish, and lacquers."

Zinc Sulfate.—Rayon has ranked first in consumption of zinc sulfate continuously since 1946, when the agricultural use led, and in 1950 took a larger quantity than ever before, exceeding the previous peak in 1949 by 6 percent. Agriculture continued to rank second in 1950 but took a tonnage 46 percent less than in 1946 and only 52 percent of the 1950 quantity for rayon. Chemicals, in third place, have dropped in apparent importance over the years but this may be due to the fact that they overlap other uses and that producers' reports for recent years have been classified more precisely. Among other uses, the most significant detail appears to be the sharp falling off in shipments for paint and varnish processing. This use had gained in 1949 when most others declined.

TABLE 16.—Distribution of zinc sulfate shipments,[1] by industries, 1941–45 (average) and 1946–50, in short tons

[1] Reported as sales before 1945.

PRICES

Total and average values received by producers for lead and zinc pigments and zinc salts are given in the tables in the first part of this report. Average values for all lead pigments dropped in 1950, the declines ranging from 5 percent for white lead (dry) to 10 percent for litharge. This was the second annual decrease, following establishment of successive peaks for all types in 1947 and 1948. Lead-pigment price quotations followed closely the movement of pig-lead prices. The pigment quotations dropped ¾ to 1½ cents a pound, depending on the pigment, in the first half of the year, and after July followed a continuous upward course so that they were 4 to nearly 7 cents a pound higher at the end than at the beginning of the year. Both high and low extremes in lead-pigment price quotations in 1950 were below the respective highs and lows in 1949.

Average values received by producers for zinc pigments, unlike those for the lead group, were higher than in 1949, with rises varying from 8 percent for lithopone and leaded zinc oxide to 12 percent for zinc oxide (lead-free). Producers' average values and zinc-pigment quotations are believed to have established new all-time peaks. Zinc-pigment prices moved upward from the beginning to the end of

[1] Quotations for bags.
[2] Includes granulated.

the year, most of the varieties increasing about 5 cents a pound. Lithopone gains were about 2 cents a pound.

Average values received by producers for zinc chloride and zinc sulfate rose 4 and 11 percent, respectively, in 1950. Price quotations for these compounds also rose in 1950 and were at their highest levels of the year at the year end.

FOREIGN TRADE [1]

Imports of lead and zinc pigments are insignificant in relation to domestic shipments of the various items, receipts of white lead carbonate, the chief lead entry, amounting to 2 percent of domestic shipments in 1950 and of zinc oxide, the chief zinc item, to only 3 percent. Even this latter was unusually high, being due to the sharp gain in imports of zinc oxide in 1950. Of the total imports of this material, 2,875 tons were from Canada, 732 from Spain, 585 from Germany, and 529 from the United Kingdom. Lithopone imports also rose sharply in 1950.

Litharge is the chief lead-pigment export class, but shipments of this pigment abroad were only 1 percent of shipments by domestic producers.

Lithopone and zinc oxide are the chief zinc-pigment export classes; both of these classes dropped substantially in 1950.

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

1947	19,082	13,652	6,554,250	1950	3,094	9,357	2,124,367

[1] Includes also in 1945: Zinc sulfide, $25,399 (173,475 pounds); zinc chloride, $93,590 (1,499,755 pounds); zinc sulfate, $62,119 (1,243,826 pounds); other zinc salts and compounds, $179,747 (750,108 pounds). Beginning Jan. 1, 1946, none of the foregoing classes separately recorded.

WORLD REVIEW

Australia.—The plant of Durham Chemicals Australia Pty., Ltd., at Braybrook, Victoria, for the production of zinc oxide and later other pigments for the rubber, paint, and plastic industries, which was mentioned in the report of this series for 1947, was completed recently.[2]

Canada.—A report of the Dominion Bureau of Statistics of Canada published early in 1951 gave data on pigments consumed by the paint and varnish industry in Canada in 1948 and 1949. The figures for 1949 are as follows (1948 figures for comparison in parentheses):

[2] Chemical Engineering, vol. 58, No. 2, February 1951, p. 230.

Basic carbonate white lead (dry) 1,303 (2,344) short tons, basic carbonate white lead in oil 458 (717) tons, basic sulfate white lead 118 (22) tons, red lead (including orange mineral) 565 (691) tons, litharge 256 (300) tons, zinc oxide (lead-free) 2,013 (2,975) tons, leaded zinc oxide 1,071 (2,096) tons, lithopone (30 percent zinc sulfide) 5,767 (11,851) tons, titanium dioxide 5,894 (5,766) tons, extended titanium dioxide pigments 10,832 (8,791) tons, and "other white pigments" 705 (529) tons.

Canada's imports of lithopone, 8,141 and 14,787 tons, respectively, in 1949 and 1948, were large enough to more than cover use in the 2 years. Imports of zinc white (zinc oxide) were 1,094 and 1,732 tons, respectively. Imports of the other items listed in the preceding paragraph are very small except for titanium pigments. Imports of this item were not shown separately in the Canadian report, but United States records for titanium dioxide and pigments show 19,653 tons exported to Canada in 1949 and 19,787 tons in 1948. In 1950 the United States shipped 24,450 tons to Canada.

Greece.—Output of litharge was 398 tons and of red lead, 267 tons in 1950, or declines of 9 and 26 percent, respectively, from 1949.[3]

Italy.—According to a recent report,[4] about 5,000 metric tons of Italy's output of lithopone is absorbed by the domestic market, and the remainder is exported. Exports in 1949 were 2,000 tons, with Austria and Australia the chief destinations. Annual production capacity is 15,000 to 17,000 tons.[5]

Japan.—A recent article [6] described the paint industry in Japan and commented on the strong influence of United States practice in Japan. The report stated:

> In pigments, our attention is especially drawn to your Rutile-non-chalking titanium dioxide and Acicular zinc oxide. In oil, our attention is drawn to the process in applying drying properties by uniting non-saturated molecules to semidrying oil, and the products obtained therefrom such as styrenated oil, and the derivation of drying oil from semidrying oil and the product itself. In synthetic resin, we are interested in silico-resin, vinyl-resin, maleic-acid resin, and others such as anti-skinning agent, wetting agent, and emulsifier.

Norway.—Norway was reported [7] facing inadequate supplies of zinc oxide, owing to efforts of the Ministry of Commerce to increase exports of high-grade zinc. According to the report, Norway's three zinc-oxide manufacturers have a total capacity of over 7,000 tons of zinc oxide annually and produced 5,210 metric tons in 1949. Imports in 1949 were 1,774 tons. From January 1 to October 1, 1950, only about 3,300 tons of zinc oxide were produced, and imports were only 70 tons. Industrial requirements were estimated as 6,500 to 7,000 tons annually, mostly for paint manufacture.

Lime[1]

By Oliver Bowles, F. M. Barsigian, and A. H. Seebold

GENERAL SUMMARY

THE HIGH level of industrial activity stimulated by the program of national preparedness and by the Korean War during the latter half of the year was reflected in a substantial increase in lime production in 1950. Sales totaled 7,478,416 short tons, 18 percent higher than in 1949 and 3 percent greater than the record output of 1948. Of the total sales, 75 percent was in the form of quicklime and 25 percent hydrated lime. The average value of quicklime per ton increased from \$10.48 in 1949 to \$10.57 in 1950. Hydrated-lime value increased from \$12.31 in 1949 to \$12.80 in 1950. The number of active plants declined from 180 to 168.

TABLE 1.—Salient statistics of the open-market lime industry in the United States 1925–29 (average), 1935–39 (average), and 1949–50

	1925–29 (average)	1935–39 (average)	1949	1950

[1] Selling value, f. o. b. plant, excluding cost of containers.

Lime sales are influenced more or less by conditions in the consuming industries. Sales of building lime should presumably follow the trend of new building construction, and for many years such correlation was reasonably close. However, since 1939, as indicated in figure 1, the output of building lime has failed to keep pace with the indicated level of new construction. Throughout the 26-year period covered by figure 1, sales of refractory and chemical lime have followed closely the trend of industrial production.

Trends in lime sales by principal uses over a period of years are indicated in figure 2.

[1] Figures in this chapter pertain chiefly to open-market lime, excluding coverage of most captive lime operations.
