FOREWORD

In the victorious outcome of World War II, the mineral industries can deservedly take well-earned pride. The statistical and descriptive data presented in this edition of Minerals Yearbook reflect, for the war years, a remarkable record of accomplishment on their part. Throughout the conflict, the Bureau of Mines also devoted its full strength in all fields of its endeavors to the common cause, not only providing industry and Government those services with which it is normally charged but also special services arising from the national emergency. Executive and administrative personnel, engineers and technicians, economists and statisticians, safety and welfare workers, and the large number of clerical and other employees—whether in the Washington, D. C., headquarters, in the field offices of the Bureau, in research laboratories engaged on important investigations, or in mineralized areas seeking sources of critical and strategic raw-material supplies—all contributed in an outstanding manner to the Bureau's war work. Moreover, as in the mineral industries, both professional and nonprofessional personnel of the Bureau entered the armed forces. In all, 529 men and women from the Bureau of Mines so served their country; of these, 207 have returned to their former positions in accordance with the military furloughs granted them; and 12 gave their lives in that service.

Minerals Yearbook, 1945, like earlier editions, is a monument to the cooperative effort of industry and Government—without such effort there could not be such a volume. It is a pleasure therefore to acknowledge again the full share of credit owing the numerous branches of the mineral industries, trade associations, industry publications, and the thousands of companies and individuals that have provided information required in its publication. Likewise, the cooperation received, as heretofore, from other Federal and State agencies is gratefully acknowledged, particularly that from the United States Department of Commerce, which provided the data on exports and imports, and that from those States which have executed cooperative agreements with the Bureau. Under these agreements, producers and consumers of minerals complete but one set of inquiries, and the State officials are given the detailed information supplied to the Bureau of Mines by respondents in their respective States. State agents cooperating in the 1945 canvass were: Walter B. Jones, State geologist, University, Ala.; Herman Gunter, State geologist, Tallahassee, Fla.; Garland Peyton, director, division of mines, mining, and geology, department of natural resources, Atlanta, Ga.; M. M. Leighton, chief, and Douglas Stevens, research associate, State geological survey division, Urbana, Ill.; A. C. Trowbridge, director, Iowa Geological Survey, Iowa City, Iowa; Raymond C. Moore, State geologist and director, and John C. Frye, assistant State geologist and assistant director, State Geological Survey of

Kansas, Lawrence, Kans.; J. T. Singewald, Jr., director, department of geology, mines, and water resources, board of natural resources, Baltimore, Md.; R. A. Smith, State geologist, Lansing, Mich.; Edward L. Clark, State geologist, Rolla, Mo.; Edward Ellingwood, chairman, New Hampshire Mineral Resources Committee, Concord, N. H.; Meredith E. Johnson, State geologist, Trenton, N. J.; John G. Broughton, assistant State geologist, New York State Museum, Albany, N. Y.; Jasper L. Stuckey, State geologist, Raleigh, N. C.; Robert H. Dott, director, Oklahoma Geological Survey, Norman, Okla.; E. P. Rothrock, State geologist, Vermillion, S. Dak.; John T. Lonsdale, director, bureau of economic geology, Austin, Tex.; Arthur Bevan, State geologist, and Linwood H. Warwick, chief clerk, Virginia Geological Survey, Charlottesville, Va.; Sheldon L. Glover, supervisor, division of mines and mining, department of conservation and development, Olympia, Wash.; R. C. Tucker, assistant State geologist, Morgantown, W. Va.; and E. F. Bean, State geologist, Madison, Wis. In addition, B. D. Stewart, department of mines, Juneau, Alaska, and Walter W. Bradley, State mineralogist, San Francisco, Calif., assisted in the compilation of statistics for Alaska and California, respectively.

R. R. SAYERS, *Director*.

CONTENTS

INTRODUCTION

Reconversion to prewar scope and coverage has been the principal objective in the compilation of Minerals Yearbook 1945. Achievement of this goal involved more than the usual degree of care and patience, owing chiefly to the difficulty of collecting authoritative data in the immediate postwar period. An endeavor has also been made to expand the world aspects of the volume, in keeping with the broadened interest in the international status of mineral commodities. The large measure of success that the various chapters reflect in this respect may be attributed to the removal of practically all protective security restrictions on the publication of mineral production statistics, and to the detailed information contained in reports submitted by military Government officials in occupied countries and by mineral specialists serving as United States representatives in other countries.

Acknowledgments.—On May 31, 1946, Martha B. Clark retired from the Bureau of Mines after 46 continuous years of Government service, practically all of which were devoted to Minerals Yearbook and its predecessor, Mineral Resources of the United States. We in the Bureau regretted to have her leave the organization, but at the same time it was gratifying to see the leisure of retirement come to one who had so faithfully and loyally earned it. In addition to review of the entire volume for statistical consistency and accuracy, Miss Clark was the author of the keystone chapter—Statistical Summary of Mineral Production. To its preparation she gave year-round and painstaking editorial and statistical consideration; her records were the basis not only for the chapter but also for many statistical investigations undertaken in the Economics and Statistics Branch. Commodity specialists, division chiefs, branch heads, and numerous others sought her counsel, including—unbeknown to them—many in industry whose inquiries relative to mineral statistics were referred to Miss Clark for preparation of the appropriate letter of reply. On the part of Government and the public a debt of gratitude is owing Martha B. Clark—a true public servant.

In the preparation of the 1945 edition of Minerals Yearbook special credit is due Marian E. Meyer, of the Economics and Statistics Branch, successor to Miss Clark as author of the Statistical Summary chapter; Mabel E. Winslow, of the Office of Mineral Reports, who, with Anna B. Brown, edited the entire manuscript and who prepared the index; Louis F. Perry, of the Office of Mineral Reports, and Adelaide B. Palmer, of the Economics and Statistics Branch, for the preparation of charts; Eleanor C. Reid, of the Administrative Service, who assisted in reading proof; and John H. Ady, Chief of Publications of the Interior Department and liaison officer between the Department and the United States Government Printing Office, who contributed invaluable advice in the development and execution of the publishing program.

Furthermore, credit is owing the statistical analysts and others of the Economics and Statistics Branch who were of major assistance to authors in the compilation of the statistical material that appears in the various chapters. In the Washington, D. C., offices of the branch, Charlotte R. Buck, Marie R. Haney, Annie L. Marks, Robert C. Morris, Virginia M. Oliver, Anne Taeves, and Birley E. Vinskey were engaged on such work; in the Los Angeles, Calif., office, Edward T. Knudsen; in the San Francisco, Calif., office, Opal Y. Sharman; in the Denver, Colo., office, Helen G. Post, Florence H. Scott, and Tressa B. Westall; in the College Park, Md., office, Edith E. denHartog and Helen P. Mackall; and in the Salt Lake City, Utah, office, Alice Feltch, Virginia Halverson, LaRu T. Shepherd, and Edna P. Wolfgramm.

Part I. General Summary

REVIEW OF THE MINERAL INDUSTRIES IN 1945[1]

By E. W. Pehrson and H. D. Keiser

SUMMARY OUTLINE

INTRODUCTION

In 1945, for the first time since 1938, the total value of mineral production moved downward. The recession followed three successive peak years, years in which minerals were mined in the United States in unprecedented quantities to meet the demands of war for essential raw materials. Total value in 1945—$8,143,000,000—was 3.3 percent below the 1944 peak of $8,419,000,000 but 47.0 percent above the World War I high value of $5,540,708,000 recorded in 1918 and 16.6 percent more than the prewar high of $6,981,340,000 established in 1920. The decline in total value in 1945 was directly attributable to a decrease in the physical volume of production that more than offset a slight increase in the unit sales realizations of mineral producers.

Production in the mineral industries was again retarded by a shortage of manpower. The total labor force, which in 1944 declined 9 percent compared with 1943, shrank 6 percent in 1945 compared with 1944. Decreased demand for some minerals following termination of war contracts and labor disturbances, principally in the coal industry, resulted in a 10-percent reduction in total man-hours worked in 1945; this reduction continued the trend of 1944, when a 1-percent reduction was registered. Other factors adversely affecting mineral production included the lag in industrial reconversion from wartime to peacetime operations following VJ-day; the difficulty and, ofttimes, inability experienced by mining interests in obtaining necessary supplies and equipment required to replace that worn out in the course of expanded production effort during the war period; increasing costs; and, in the instance of some minerals, the depleted state of ore reserves

[1] In this report the term "billion" is equivalent to 1,000,000,000.

owing to heavy production over the war years without compensating development work to maintain such reserves at prewar level.

Industrial production reached its peak in the latter part of 1943, according to the monthly index of the Federal Reserve Board; the trend since then continued virtually steadily downward through 1944 and 1945. The Board's annual index of mineral production reached its highest level in 1944 and declined 2.1 percent in 1945. Although the consumption of some mineral commodities, particularly the liquid fuels and fertilizer minerals, established new records in 1945, that for many others, including most of the more important metals and coal, dropped appreciably, with the result that total mineral consumption in all probability decreased slightly. Total mineral production likewise declined, the gain made by the fuels as a group and the other nonmetals failing to offset the substantial losses in output suffered by the metals. Both Government and industry stocks were lower at the end of the year, despite increased imports; Government inventories were pared down markedly as the need for war munitions diminished.

Price levels, as reflected by producers' unit realizations, moved upward in 1945; metals and fuels exhibited the more important gains. The increase in producers' price realizations, which was estimated at 2.4 percent over 1944, compared favorably with the 1.7-percent rise in the Bureau of Labor Statistics indexes of wholesale prices for all commodities.

PRODUCTION

Value of mineral output.—The 3.28-percent decline in the total value of mineral production in 1945 resulted from a 15.60-percent decrease in the value of metallic output. Value of the production of fuels was 0.66 percent higher and that for the other nonmetallics 6.10 percent greater. Although metals represented only 24.3 percent of the total value, whereas fuels represented 64.0 percent and other nonmetallics 11.7 percent, the sharp drop in metallic valuation more than offset the gains made by fuels and the other nonmetallics. Comparative valuation figures in 1944 and 1945, with the 1944 figures in parentheses, were as follows: Total mineral production, $8,143,000,000 ($8,419,000,000); metallic, $1,975,000,000 ($2,340,000,000); fuels, $5,212,000,000 ($5,178,000,000); and other nonmetallic, $956,000,000 ($901,000,000). Trends in the production value of these branches of the mineral industries since 1880 are shown in figure 1.

In marked contrast to the situation in 1944 when minerals scored a 4-percent gain in value that compared favorably with advances made in other parts of the economy, the 3.28-percent decline in mineral value in 1945 compared with a 2.89-percent increase in gross farm income, as reported by the United States Department of Agriculture ($23,893,000,000 in 1944 and $24,584,000,000 in 1945, including Government payments), and with an 0.80-percent increase in gross national product from $197,600,000,000 in 1944 to $199,200,000,000 in 1945. War expenditures comprised 35 percent of gross national product in 1945 and 42 percent in 1944. National income increased 0.19 percent from $160,700,000,000 to $161,000,000,000 (unrevised), according to the

United States Department of Commerce. Compared with 1939 the value of mineral production in 1945 had increased only 66 percent whereas gross farm income increased by 133 percent, gross national product by 123 percent, and national income by 127 percent.

Explanation of the decline in mineral value in 1945, in the face of the aforementioned increases, may be attributed to several factors. Some minerals, notably gold, silver, and certain building materials, were adversely affected by war conditions, and after VJ-day the rate of improvement was so slow in the respective industries that for the

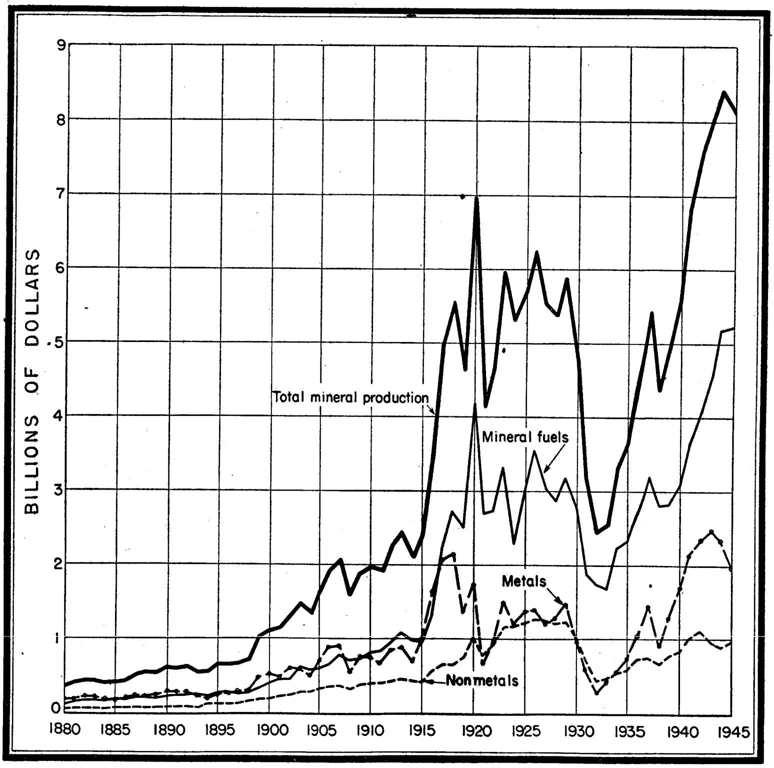

FIGURE 1.—Trends in value of mineral production in the United States, 1880–1945.

year their downward trends of 1944 were continued. Manpower shortages and labor disturbances were outstanding deterrents in the attempt to meet existing demand for some minerals, particularly coal and a number of the metals. Difficulty in obtaining mining supplies and new equipment to replace that worn out during the war period also retarded the execution of plans for reconversion to peacetime operation in many mineral industries. Moreover, as will be shown later, the prices of minerals over the war years advanced much less than those for other commodities; in consequence, upward movem of the total value of mineral production has been impeded.

Trends in physical volume of production.—Figure 2 compares the physical volume of mineral production during the last 46 years with industrial and agricultural production and with population growth, each expressed in terms of an index based upon yearly averages for 1935–39.[2]

During this 46-year period, a steadily upward trend in production has prevailed, with year-to-year and cyclical fluctuations prominent.

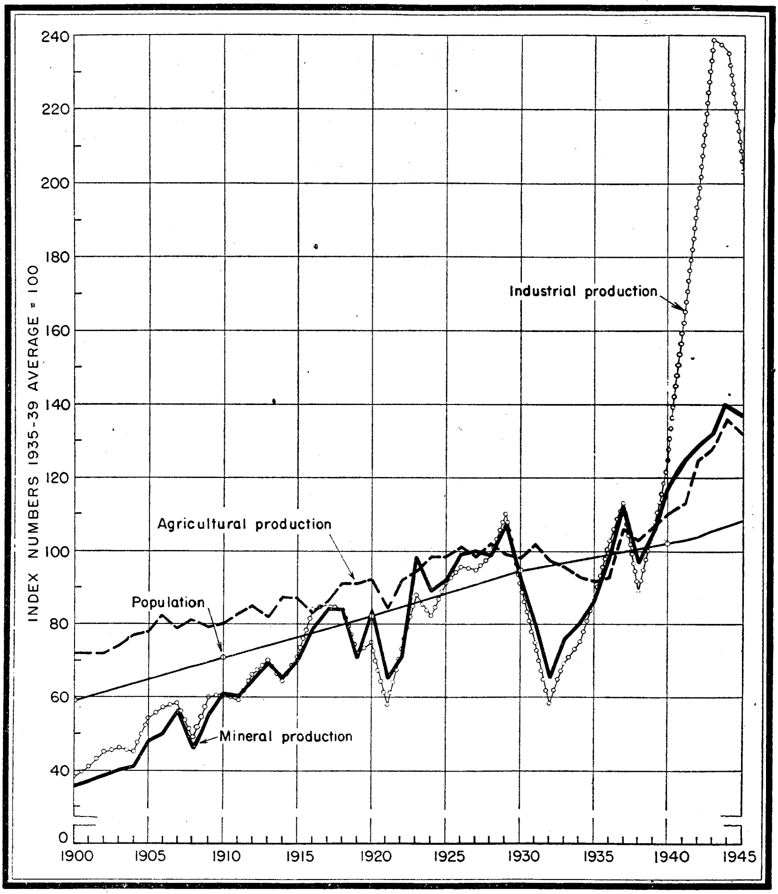

FIGURE 2.—Comparison of growth of physical volume of mineral production with that of agricultural and industrial production and population, 1900–1945.

Mineral production, except for the years of World War II, has kept closely in step with industrial production, reflecting the essentiality of mineral raw materials in the industrial economy. Fluctuations in agricultural production have been over a narrower range, with the

[2] The following indexes have been used: Volume of farm production, U. S. Department of Agriculture; mineral production, 1900–1918, Warren Persons' Forecasting Business Cycles; mineral production of 1919–45 and industrial production, Federal Reserve Board; total population of the United States, Bureau of the Census.

general upward movement of the growth line exhibiting approximate correlation with the growth in population.

Production of coal for domestic use and of petroleum for automobile fuel is relatively stable and has a decided influence on the trend of mineral output because it does not vary proportionately with changes in the rate of industrial activity. For this reason the index of mineral production tends to fall below the index of industrial production in periods of prosperity and to rise above it during depressions. The marked divergencies between the two indexes from 1941 to 1946 may be attributed in part to this characteristic. Substantial imports of minerals during the same years, to augment domestic supplies in the manufacture of munitions, has had the same general effect, inasmuch as their utilization has been reflected in the index of industrial production but not in the index for domestic mineral production. Further, certain mineral products, notably aluminum and magnesium, are not included in the Federal Reserve Board index of mineral production, whereas the index of industrial production involves the huge expansion in the output of aircraft during the war years that required unprecedented quantities of these two metals.

Notwithstanding a decline in the total production of minerals, new output records were established in 1945 by a number of minerals, particularly among the nonmetallics. Barite, feldspar, phosphate rock, potash, and sulfur all advanced to new high levels. Of the fuels, new peaks were recorded for crude petroleum, natural gasoline and liquefied petroleum gases, and natural gas, which gained 2, 11, and 4 percent, respectively. Titanium and nickel were the only metals to reach new heights. Bituminous coal dropped 7 percent from its 1944 peak and anthracite fell 14 percent. Plagued by continuing shortages of manpower and inefficiency of operating forces, mine production of copper, lead, and zinc—of the common metals produced in quantity in the United States—declined in output by 21, 6, and 15 percent, respectively; lead receded to the lowest level since 1938 and copper and zinc to the lowest levels since 1939. Output of virtually all the other metals suffered from the declining rate of war production in the first half of the year and from contract terminations and the lag in industrial reconversion after VJ-day. Arsenic decreased 33 percent; cadmium, 6 percent; chromite, 69 percent; iron ore, 4 percent; manganese ore, 26 percent; molybdenum, 20 percent; tungsten, 45 percent; and vanadium, 16 percent. Both aluminum and magnesium dropped sharply, by 36 and 79 percent, respectively. The position of the precious metals continued to deteriorate; gold decreased 4 percent, thus establishing a new low record since its discovery in California in 1848, and production of silver declined 16 percent. Besides titanium and nickel, increased production was achieved by platinum, selenium, and tellurium. Among the more important nonmetals—in addition to those already mentioned—increased production in 1945 was recorded for asbestos, cement, clay, gypsum, petroleum asphalt, sand and gravel, and slate; none of these, however, reached a new high level of output. Production of natural asphalt, fluorspar, graphite, lime, magnesite, mica, salt, and stone decreased.

STOCKS

With the end of the war coming near the middle of 1945 and reconversion to peacetime operations generally in progress the remainder of the year, the trend of inventories over the 12-month period was far from uniform for most of the more important minerals; however, the predominant change in stocks at the end of the year, compared with levels that prevailed a year earlier, was downward. Government stocks, particularly, were pared down, and about two-thirds of the entire list of more than 50 different minerals so held reflected the effect of decreased or suspended purchasing and the release of stocks to industry. For a group of 11 minerals, both industry and Government stocks declined; this group comprised antimony, arsenic, bauxite, beryllium, bismuth, cadmium, magnesium, mica splittings, platinum, tin, and vanadium. With the exception of bauxite, magnesium, and platinum, the decline in Government holdings of these 11 minerals exceeded, in quantity, the decline in industrial holdings by a substantial margin. Industry inventories of bauxite and platinum declined moderately more than Government inventories, but in the instance of magnesium the decline in industry stocks was much the greater. Inventories of cryolite, Indian kyanite, and tungsten held by industry increased, but the decline in Government holdings of each of the 3 minerals more than offset the industry increases. Although Government stocks of molybdenum increased, a marked decline in industry holdings resulted in a net stock loss for the metal. Net gains in stocks were registered for 12 minerals, including most of the major nonferrous metals. Increases in industry inventories of aluminum (probably), graphite, lead, mercury, and zinc exceeded, in each instance, losses in Government holdings; and, for chromite, the increase in Government holdings exceeded the decrease in industry inventories. Both industry and Government stocks of cobalt, copper, fluorspar, manganese ore, nickel, and titanium increased.

The general trend of industry inventories was also downward for those mineral commodities not held by the Government; this was notably true with respect to the mineral fuels. Stocks of bituminous coal and anthracite and coke decreased, and likewise those of crude petroleum, natural gasoline, and refined oils. Inventories of phosphate rock dropped sharply, whereas more moderate declines were reported for cement, selenium, and sulfur. Slight to moderate gains in stocks were recorded for iron ore, petroleum asphalt, potash, and tellurium.

Goals for Government-owned stock piles were set in June 1945 at 3 months' military requirements as established for the second quarter of 1945. Following VJ-day, Government controls on most raw materials were gradually removed, and stock-pile objectives were practically abandoned. These developments and subsequent action relative to the future disposition of Government stock piles are discussed under the section of this chapter entitled "Government Stock-Piling Activities."

CONSUMPTION

Over-all consumption of mineral commodities in 1945 reflected the lag in reconversion of industry for peacetime purposes from the wartime efforts of the immediately preceding years. Although about the same number of individual increases and decreases in consumption was recorded in a statistical analysis of 74 of the more important minerals, total mineral consumption was in all probability on a decreased scale as compared with 1944. Consumption of each of the major nonferrous metals—copper, lead, zinc, and tin—and of iron ore declined. Petroleum, natural gas, and natural gasoline consumption increased, but the consumption of anthracite and bituminous coal decreased; collectively, the energy supply from these 5 mineral fuels declined 4 percent. Slow improvement in certain categories of the construction industry resulted in decreased consumption of several of the nonmetallic minerals used for construction purposes.

The Federal Reserve Board index of industrial production declined from 235 in 1944 to 203 in 1945 (1935–39 average=100) after advancing to 239 in 1943 from 89 in 1938 and 109 in 1939. The monthly record shows that the peak war production was attained in October and November 1943, when the adjusted index stood at 247; from January to December 1944 the monthly index declined from 243 to 232 and from January to December 1945 from 234 to 163. The durable manufactures index, which was 78 in 1938 and 109 in 1939, rose to 360 in 1943, declined to 353 in 1944, and fell to 274 in 1945. The production index for transportation equipment, including airplanes, automobiles, ships, railroad cars, and locomotives, advanced from less than 100 early in 1939 to a peak of 786 in November 1943, fell back to 709 in December 1944, and dropped to 217 in December 1945.

Undoubtedly, the 14-percent decline in industrial production in 1945, as indicated by the Federal Reserve Board index, was greater than the over-all decrease in mineral consumption, although consumption of a few of the key mineral commodities, including iron ore, lead, and anthracite, declined to about that degree. A lower over-all decrease in mineral consumption would, in the main, be attributable to a less severe effect of contract terminations, in the second half of 1945 following the end of the war, in the raw-material industries than in the processing and finished product industries. Evidence of this lower decrease is seen in the 2-percent decline in 1945 of the mineral production index of the Federal Reserve Board; this index, which applies to the mineral fuels and most of the major metals, stood at 140 for 1944 and 137 for 1945.

Contract terminations, manpower shortages and labor disturbances, difficulties in obtaining necessary equipment and supplies, and other obstacles to expeditious industrial reconversion to peacetime operations were the principal underlying causes of decreased mineral consumption in 1945. Steel production decreased 11 percent, involving a 14-percent reduction in the consumption of iron ore and an 8-percent decrease in the demand for manganese ore. With a decline of 19 percent in the production of alloy steels, a lower level of consumption was recorded for the major ferro-alloy minerals. The decreased scale of general industrial activity was also reflected in a 13-percent reduction in the consumption of anthracite and a 5-percent decrease for bituminous coal. Lead consumption declined 12 percent; tin, 6 percent; copper, about 10 percent; and zinc, 4 percent. The most precipitous drop in consumption, among the metallic mineral commodities, was that of 67 percent for magnesium; this sharp decrease resulted from a marked falling off in demand for the metal for war purposes. Consumption of bauxite dropped 30 percent, largely because of the reduced rate of production of alumina for the aluminum industry. The more important mineral commodities that achieved new records of consumption in 1945 included petroleum, natural gas, natural gasoline and liquefied petroleum gases, phosphate rock, potash, silver (in the arts and industries), platinum, mercury, titanium, barite, carbon black, and sulfur. On a percentage increase basis, the consumption of mercury was outstanding, demand for the metal increasing 49 percent, principally as the result of its utilization in the manufacture of an improved dry battery which was required in substantial quantities by the armed forces in 1945.

Privately financed construction increased 63 percent in 1945, whereas public construction, owing to completion and suspension of construction for war needs, decreased 16 percent. According to the United States Department of Commerce, the total value of all new construction put in place in continental United States during the year was $4,661,000,000, a 15-percent increase from $4,049,000,000 in 1944 but a 65-percent drop from the peak of $13,498,000,000 in 1942; the value in 1938 was $5,274,000,000. The major increases in 1945 were in private commercial, industrial, and residential construction. As a consequence of these increases, consumption of a number of building materials of mineral origin, including cement, clays, gypsum, sand and gravel, and slate, increased moderately in 1945.

PRICES

For the third consecutive year, average mineral prices in 1945 advanced more than the general price level. An index of producers' unit realizations on 24 minerals that represented over 97 percent of the value of mineral production, weighted according to 1940 production, showed an average increase of 2.4 percent over 1944. Bureau of Labor Statistics indexes of wholesale prices for all commodities rose 1.7 percent; however, prices for farm products increased 4.0 percent. During the entire war period prices for minerals advanced much less than those of other commodities. Since 1940 unit price realizations for minerals have increased only 25.7 percent, whereas prices for all commodities have risen 34.6 percent and those for farm products 89.4 percent. These computations for minerals include premium prices paid for copper, lead, and zinc but do not include the transportation subsidies paid by the Government on other commodities.

During the war years fuel prices fared better than other mineral prices. Since 1940 the weighted average price realization by producers of 5 mineral fuels has increased 30.1 percent; 1945 averages were 2.4 percent over those in 1944. Average prices for 10 metals rose 21.2

percent from 1940 to 1945 but only 2.5 percent from 1944 to 1945. The index of prices for 9 nonmetallic minerals other than fuels advanced 15.7 percent from 1940 to 1945 and 1.6 percent from 1944 to 1945.

Aside from a number of regional and individual-company adjustments, principally among the nonmetallics, there were relatively few changes in ceiling prices in 1945. Of particular significance, however, were those for coal, granted largely as a result of wage increases, and those for pig iron to compensate for increased over-all production costs. Ceilings for copper, lead, and zinc were maintained at 1944 rates, but a larger proportion of the domestic production of all three metals came under premium prices. The average price of lead realized by producers in 1945 increased 0.6 cent per pound compared with 1944, and that for zinc advanced 0.1 cent; the average price of copper was unchanged. The average value of petroleum at the well was slightly higher in 1945 than in 1944, whereas the average value for natural gas at points of consumption and that for natural gasoline at producing plants were both slightly lower. With the exception of peat and crude and ground feldspar, prices of which declined, producers of nonmetallics generally received slightly higher or the same unit returns in 1945 as in 1944.

The Bureau of Labor Statistics index (1926=100) of wholesale prices for all commodities rose from 78.6 in 1940 to 104.0 in 1944 and 105.8 in 1945. The index for farm products was 67.7 in 1940, 123.3 in 1944, and 128.2 in 1945 and showed the greatest rise during the war period of any major group of commodities. The fuel and lighting index increased from 71.7 in 1940 to 83.0 in 1944 and 84.0 in 1945, and the index for anthracite rose from 95.6 in 1944 to 99.0 in 1945, for bituminous coal from 120.3 to 123.1, for coke from 130.3 to 132.5, and for petroleum and its products from 63.5 to 64.3. The metals and metal products index was 104.7 in 1945 and 103.8 in 1944 compared with 95.8 in 1940; fabricated products weigh heavily in the computation of indexes for this group. In the building materials field, the group index showed a slightly better than average rise in 1945—117.8 compared with 115.5 in 1944 and 94.8 in 1940. The price index for fertilizer materials was 81.6 in 1945, 81.3 in 1944, and 69.4 in 1940.

EMPLOYMENT

Manpower was scarce at mineral operations; and labor shortages, which had become progressively more acute since 1942, were continued through 1945. However, the continued downtrend in the number of men working daily was reversed soon after midyear and by the end of the year the labor-shortage problem had been eased to some extent. In the forepart of the year the labor supply had continued to shrink as Selective Service requirements for men for the armed forces were enlarged and production requirements for mineral raw materials were maintained at a high rate. The prompt termination of war contracts, the closing of munitions, armament, ship-building and other war-fostered industries, and the release of men from the armed forces shortly after the end of the Pacific war were factors in the uptrend in the number of men working during the latter part of the year. The easement of the labor shortages was greater in some

717372—47——2

mineral industries than was indicated by the uptrend in the labor force owing to the declining demand for many mineral raw materials as war contracts were voided and the mineral-consuming industries were converted to peacetime production. Demand for raw materials was reduced further toward the close of 1945 by the wave of strikes that virtually closed several important mineral-consuming industries. Despite these factors fostering an abatement of the labor supply problem, manpower shortages were prevalent in the mineral industries at the end of 1945.

Concomitant with the easing of the labor-supply problem, war controls on manpower were relaxed or abandoned. Selective Service requirements were reduced to a minimum, and the labor priority referrals (established in 1944) and other controls of the War Manpower Commission on the movement of labor were discarded soon after the end of the Pacific war.

Labor-management relations during 1945 were stable in each of the mining industries except coal, in which three major work stoppages—two in bituminous-coal and one in anthracite mines—as well as numerous minor shut-downs resulted from industrial disputes. A total of 670 work stoppages started during 1945 in all mining industries and caused a loss of slightly more than 6¼ million man-days of work, according to the United States Department of Labor.[3] Virtually all of this economic loss was in the coal industry, where 598 stoppages at bituminous-coal mines caused idleness for 5 million man-days and 43 stoppages at anthracite mines resulted in a loss of nearly 1¼ million man-days. The Solid Fuels Administration stated that 30 million tons of bituminous coal and nearly 4 million tons of anthracite were lost through strikes during 1945. In petroleum refining, 30 work stoppages during the year caused a loss of 429,000 man-days of work. A widespread 20-day stoppage resulting from a wage dispute was ended on October 4, when the major refining plants were seized and operated by the Federal Government.

In the coal industry, the major work stoppage at bituminous-coal mines on April 3 and that at anthracite mines on May 1 resulted from labor-management disputes on the so-called "fringe issues" (portal-to-portal pay, shift differentials, vacation pay, welfare fund, etc.) of the wage contracts. In both strikes, the Federal Government seized the mines to continue operations until agreements were reached by compromise between labor and the mine owners. The bituminous-coal mines were returned in small groups to the owners over a period of several months, and the anthracite mines were released for owner operation on June 23 after a majority of the anthracite workers had resumed their jobs on May 21. A second major stoppage at bituminous-coal mines started about September 21 at a few coal mines and spread rapidly until more than 200,000 mine workers were idle. The dispute was concerned with recognition of a supervisory employees' union and the privilege of this class of employees to unionize. Union officials terminated the strike, and mining was resumed on October 22. Several new issues were introduced in the 1945 coal disputes.

[3] U. S. Department of Labor, Bureau of Labor Statistics, Work Stoppages Caused by Labor-Management Disputes in 1945: Bull. 878, 1946, 41 pp.

Mine safety became a consideration of prime economic importance, and the union demanded a miners' health and welfare fund to be subsidized by a royalty on production. Although these issues and the right of supervisory employees to unionize were not parts of the final settlements, they did foretell union aims in future demands and negotiations.

A difficult employment problem was posed in 1945 by the obvious antipathy of the younger men to entering or returning to mining as a permanent occupation. The principal means employed by the companies to combat this reluctance was the establishment or the expansion of training schools for new or returned employees to provide skilled men for underground work. It was evident, however, that additional inducements were needed so long as higher-paying or less arduous work was available in other industries.

The uptrend in manpower in the latter part of the year was not of sufficient magnitude to affect the drastic withdrawals in the first half, and the average number of men working in the mining and refining industries during 1945 fell to 639,800, a 6-percent decline from 1944. This skeletonized labor force worked approximately 1⅓ billion man-hours, or 10 percent less than in 1944, owing principally to the reduced demand for some minerals and the work stoppages in the coal industry. All mineral operations in the country were active an average of only 273 days (13 less than in 1944), and the average employee worked 2,169 hours in 1945 compared to a workyear of 2,264 hours in 1944. The average length of shift in 1945—7.94 hours—was relatively unchanged from 1944.

The monthly pattern of employment in the mineral industries during 1945 probably followed that shown by a monthly review of the average number of men at work daily in bituminous-coal mines. In this series employment declined irregularly from 369,000 in January to 357,000 in August and turned upward to reach a total of 369,000 in November. The average for December declined to 365,000 owing probably to greater than usual absenteeism over the holidays. For 1945, the average number of men in bituminous-coal mines totaled 363,000 or 4 percent below 1944. In the anthracite industry, employment declined to 74,000 men and was the principal factor limiting production during 1945. At metal mines the average number of men working fell 12 percent from 1944 to a total of 62,200 in 1945. The labor shortage in some metal-mining industries was offset partly by increased activity at open pits, which have a higher productivity per man-hour than underground mines. Employment in the nonmetal mining and quarrying industries advanced over 1944 to respective totals of 12,200 and 59,400 in 1945. These gains indicated rapidly increasing employment in the closing months of the year, following removal of war restrictions on construction which materially affected demand and activity in important segments of these industries. At coke plants the number of men declined moderately to a total of 23,100 in 1945. Employment at metallurgical plants (ore-dressing mills and nonferrous smelters, refineries, etc.) fell sharply to 45,900 men in 1945, owing principally to the closing of Government-owned plants before and after the end of the war and to the general shortage of labor.

SAFETY

Safety at mineral operations in the United States continued to improve in 1945, and the over-all injury experience as measured by frequency per million man-hours of exposure to hazards was better than in any year since the start in 1931 of complete injury statistics on mining and quarrying. The more favorable safety record in 1945 was attained despite such adverse factors as the heavy production requirements (which necessitated more than usual days of work at longer hours per day with a skeletonized labor force through the first half of the year) and, in the latter part of the year, general relaxation of the workers (which made accident-prevention work more difficult after the end of the war when pressure for production was less urgent). The easing of the critical labor shortage indicated in the last 4 months of the year probably helped reduce the frequency of injuries at mineral operations. The greater number of men at work doubtless lowered the worker-fatigue that had been induced by the long work week in the fore part of the year.

Injuries in the mineral industries occurred at a rate of 55.69 per million man-hours in 1945—a slight reduction from a frequency of 56.61 in 1944. Fatalities happened at a rate of 0.93 per million man-hours of working time and for the first time since the statistical series started in 1931 were at a frequency of less than 1 per million man-hours. There was a slight improvement in nonfatal injury experience in 1945, and the frequency of occurrence was reduced to 54.76 per million man-hours from a corresponding rate of 55.59 in 1944.

Accidents in mineral operations during 1945 resulted in a total of 77,290 injuries, of which 1,285 were fatal and 76,005 were nonfatal lost-time injuries that disabled the injured person for longer than the day of the accident. Although this represented a marked reduction from the total of 87,242 injuries in 1944, the frequency rate per million man-hours was improved only slightly in 1945 owing to the shorter time of exposure of the workers to hazards. The average of 639,800 men, who reported daily, worked or were exposed to hazards for a total of slightly more than 1⅓ billion man-hours in 1945, an appreciable reduction from the 1½ billion hours of exposure in 1944.

Five major disasters occurred during 1945, all in bituminous-coal mines. Four of the disasters were mine explosions which caused a total loss of 63 lives, and 1 was a roof fall that killed 5 men. In 1944, 4 major mine disasters resulted in a loss of 94 lives—22 in mine explosions and 72 in mine fires. In 1944 disasters occurred only in bituminous-coal mines.

Injury experience in 1945 was improved in each of the mineral-industry groups except metallurgical plants, where the safety record was slightly less favorable than in 1944. The improvement was greatest in the nonmetal-mining group, in which the frequency of injuries was reduced to 42.99 per million man-hours in 1945 from 50.47 in 1944. In the metal-mining group a substantial improvement was made, and the 1945 frequency of injuries was lowered to 51.04. However, this more favorable showing was effected in part by greatly increased activity at open-cut metal mines and lessened activity at underground mines. At quarries and coke plants, injury experience in 1945 was slightly improved over 1944, the rate of occurrence declining to 32.75 per million man-hours for quarries and 13.02 at coke plants. The slight betterment in the safety record at coal mines resulted from reductions in the rates of occurrence of fatal and nonfatal injuries in bituminous-coal mines and of fatal injuries at anthracite mines. These improved rates more than compensated for the slightly less favorable frequency rate of nonfatal injuries at anthracite mines. The combined rate of occurrence of fatal and nonfatal injuries at all coal mines was 66.77 per million man-hours in 1945 compared with a frequency of 67.12 in 1944.

GOVERNMENT STOCK-PILING ACTIVITIES

Stock-piling for war.—Subsequent to August 1943, Government stock-pile objectives for the emergency were gradually reduced as the supply situation and the outlook for successful conclusion of the war improved. In June 1945 Government-owned stock-pile goals were set at only 3 months' military requirements as established for the second quarter of 1945. Following VJ-day virtually all stock-pile objectives were abandoned, as controls on most raw materials were gradually removed. As of August 1, 1946, public purchasing for emergency purposes had been discontinued on all but a few minerals that were in short supply—antimony, tin, lead, copper, and corundum. Buying of these was geared to reconversion needs, and the building up or maintenance of emergency stocks was no longer part of the procurement program.

Surplus-property transfers.—Section 22 of the Surplus Property Act of 1944 (see Minerals Yearbook, 1944, p. 12), directed the transfer of the surplus stocks of strategic and critical materials on hand at the close of the war to the permanent military stock piles of the Government. However, the act also directed the Surplus Property Board to withhold such transfers to the extent that the War Production Board determined that available supplies were deficient for the current needs of industry over a 6-month period. Uncertainties as to future requirements and budgetary complications retarded action under the bill, so that as of August 1946 the addition of war surpluses to the permanent stock piles of the Government were relatively small in terms of ultimate objectives.

SPA Regulation 17, governing transfers under the act, was promulgated November 16, 1945. The transfer provisions of the Strategic and Critical Materials Stock-Piling Act, passed in July 1946, superseded those of the Surplus Property Act of 1944, and on August 16, 1946, the War Assets Administration issued revised regulations; these were printed in the Federal Register (vol. 11, No. 170, August 30, 1946, p. 9573).

Stock-pile legislation.—Late in 1945 and early in 1946 the Military Affairs Committees of the United States Senate and the House of Representatives conducted hearings on various stock-piling bills pending in Congress. On July 9, 1946, the Congress passed S. 752, entitled the "Strategic and Critical Materials Stock-Piling Act." The bill, which was approved by the President July 23, 1946, is designated as Public Law 520—79th Congress, Chapter 590—2d Session, and reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Act of June 7, 1939 (53 Stat. 811), as amended, is hereby amended to read as follows:

That the natural resources of the United States in certain strategic and critical materials being deficient or insufficiently developed to supply the industrial, military, and naval needs of the country for common defense, it is the policy of the Congress and the purpose and intent of this Act to provide for the acquisition and retention of stocks of these materials and to encourage the conservation and development of sources of these materials within the United States, and thereby decrease and prevent wherever possible a dangerous and costly dependence of the United States upon foreign nations for supplies of these materials in times of national emergency.

Sec. 2. (a) To effectuate the policy set forth in section 1 hereof the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior, acting jointly through the agency of the Army and Navy Munitions Board are hereby authorized and directed to determine, from time to time, which materials are strategic and critical under the provisions of this Act and to determine from time to time, the quality and quantities of such materials which shall be stock-piled under the provisions of this Act. In determining the materials which are strategic and critical and the quality and quantities of same to be acquired the Secretaries of State, Treasury, Agriculture, and Commerce shall each designate representatives to cooperate with the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior in carrying out the provisions of this Act.

(b) To the fullest extent practicable the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior, acting jointly, shall appoint industry advisory committees selected from the industries concerned with the materials to be stock-piled. It shall be the general function of the industry advisory committees to advise with the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior and with any agencies through which they may exercise any of their functions under this Act with respect to the purchase, sale, care, and handling of such materials. Members of the industry advisory committees shall receive a per diem allowance of not to exceed $10 for each day spent at conferences held upon the call of the Secretary of War, the Secretary of the Navy, and the Secretary of the Interior, plus necessary traveling and other expenses while so engaged.

Sec. 3. The Secretary of War and the Secretary of the Navy shall direct the Secretary of the Treasury, through the medium of the Procurement Division of his Department, to—

(a) make purchases of strategic and critical materials with due regard to the objectives set forth in section 1 of this Act and pursuant to the determinations as provided in section 2 hereof, which purchases (1) shall be made, so far as is practicable, from supplies of materials in excess of the current industrial demand and (2) shall be made in accordance with title III of the Act of March 3, 1933 (47 Stat. 1520), but may be made without regard to section 3709 of the Revised Statutes. A reasonable time (not to exceed one year) shall be allowed for production and delivery from domestic sources and in the case of any such material available in the United States but which has not been developed commercially, the Secretary of War and the Secretary of the Navy may, if they find that the production of such material is economically feasible, direct the purchase of such material without requiring the vendor to give bond;

(b) provide for the storage, security, and maintenance of strategic and critical materials for stock-piling purposes on military and naval reservations or other locations, approved by the Secretary of War and the Secretary of the Navy;

(c) provide through normal commercial channels for the refining or processing of any materials acquired or transferred under this Act when the Secretary of War and the Secretary of the Navy deem such action necessary to convert such materials into a form best suitable for stock piling, and such materials may be refined, processed, or otherwise beneficiated either before or after their transfer from the owning agency;

(d) provide for the rotation of any strategic and critical materials constituting a part of the stock pile where necessary to prevent deterioration by replacement of acquired stocks with equivalent quantities of substantially the same material with the approval of the Secretary of War and the Secretary of the Navy;

(e) dispose of any materials held pursuant to this Act which are no longer needed because of any revised determination made pursuant to section 2 of this Act, as hereinafter provided. No such disposition shall be made until six months after publication in the Federal Register and transmission of a notice of the proposed disposition to the Congress and to the Military Affairs Committee of each House thereof. Such notice shall state the reasons for such revised determination, the amounts of the materials proposed to be released, the plan of disposition proposed to be followed, and the date upon which the material is to become available for sale or transfer. The plan and date of disposition shall be fixed with due regard to the protection of the United States against avoidable loss on the sale or transfer of the material to be released and the protection of producers, processors, and consumers against avoidable disruption of their usual markets: *Provided*, That no material constituting a part of the stock piles may be disposed of without the express approval of the Congress except where the revised determination is by reason of obsolescence of that material for use in time of war. For the purposes of this paragraph a revised determination is by reason of obsolescence if such determination is on account of (1) deterioration, (2) development or discovery of a new or better material or materials, or (3) no further usefulness for use in time of war.

Sec. 4. The Secretary of War and the Secretary of the Navy shall submit to the Congress, not later than six months after the approval of this Act, and every six months thereafter a written report detailing the activities with respect to stock piling under this Act, including a statement of foreign and domestic purchases, and such other pertinent information on the administration of the Act as will enable the Congress to evaluate its administration and the need for amendments and related legislation.

Sec. 5. The stock piles shall consist of all such materials heretofore purchased or transferred to be held pursuant to this Act, or hereafter transferred pursuant to section 6 hereof, or hereafter purchased pursuant to section 3 hereof, and not disposed of pursuant to this Act. Except for the rotation to prevent deterioration and except for the disposal of any material pursuant to section 3 of this Act, materials acquired under this Act shall be released for use, sale, or other disposition only (a) on order of the President at any time when in his judgment such release is required for purposes of the common defense, or (b) in time of war or during a national emergency with respect to common defense proclaimed by the President, on order of such agency as may be designated by the President.

Sec. 6. (a) Pursuant to regulations issued by the War Assets Administration or its successor, every material determined to be strategic and critical pursuant to section 2 hereof, which is owned or contracted for by the United States or any agency thereof, including any material received from a foreign government under an agreement made pursuant to the Act of March 11, 1941 (55 Stat. 31), as amended, or other authority, shall be transferred by the owning agency, when determined by such agency to be surplus to its needs and responsibilities, to the stock piles established pursuant to this Act, so long as the amount of the stock pile for that material does not exceed the quantities determined therefor pursuant to section 2 hereof. There shall be exempt from this requirement such amount of any material as is necessary to make up any deficiency of the supply of such material for the current requirements of industry as determined by the Civilian Production Administration or its successor. There shall also be exempt from this requirement (1) any material which constitutes contractor inventory if the owning agency shall not have taken possession of such inventory, (2) such amount of any material as the Army and Navy Munitions Board determines (i) are held in lots so small as to make the transfer thereof economically impractical; or (ii) do not meet or cannot economically be converted to meet, stock-pile requirements determined in accordance with section 2 of this Act. The total material transferred to the stock piles established by this Act in accordance with this section during any fiscal year beginning more than twelve months after this Act becomes law shall not exceed in value (as determined by the Secretary of the Treasury on the basis of the fair market value at the time of each transfer) an amount to be fixed by the appropriation Act or Acts relating to the acquisition of materials under this Act.

(b) Any transfer made pursuant to this section shall be made without charge against or reimbursement from the funds available under this Act, except that expenses incident to such transfer may be paid or reimbursed from such funds, and except that, upon any such transfer from the Reconstruction Finance Corporation, or any corporation organized by virtue of the authority contained in the Act of January 22, 1932 (47 Stat. 5), the Secretary of the Treasury shall cancel notes of Reconstruction Finance Corporation, and sums due and unpaid upon or in connection with such notes at the time of such cancellation, in an amount equal to the fair market value as determined by the Secretary of the Treasury of the material so transferred.

(c) Effective whenever the Secretary of the Treasury shall cancel any notes pursuant to subsection (b) of this section, the amount of notes, debentures, bonds, or other such obligations which the Reconstruction Finance Corporation is authorized and empowered to have outstanding at any one time under the provisions of existing law shall be deemed to be reduced by the amount of the notes so canceled.

(d) Subsection (b) of section 14 of the Act of October 3, 1944 (58 Stat. 765), is hereby amended to read as follows:

(b) Subject only to subsection (c) of this section, any owning agency may dispose of—

(1) any property which is damaged or worn beyond economical repair;

(2) any waste, salvage, scrap, or other similar items;

(3) any product of industrial, research, agricultural, or livestock operations, or of any public works construction or maintenance project, carried on by such agency;

which does not consist of materials which are to be transferred in accordance with the Strategic and Critical Materials Stock Piling Act, to the stock piles established pursuant to that Act.

(e) Section 22 of the Act of October 3, 1944 (58 Stat. 765), is hereby repealed: Provided, That any owning agency as defined in that Act having control of materials that, when determined to be surplus are required to be transferred to the stock piles pursuant to subsection (a) hereof, shall make such determination as soon as such materials in fact become surplus to its needs and responsibilities.

Sec. 7. (a) The Secretary of the Interior, through the Director of the Bureau of Mines and the Director of Geological Survey, is hereby authorized and directed to make scientific, technologic, and economic investigations concerning the extent and mode of occurrence, and development, mining, preparation, treatment, and utilization of ores and other mineral substances found in the United States or its Territories or insular possessions, which are essential to the common defense or the industrial needs of the United States, and the quantities or grades of which are inadequate from known domestic sources, in order to determine and develop domestic sources of supply, to devise new methods for the treatment and utilization of lower grade reserves, and to develop substitutes for such essential ores and mineral products; on public lands and on privately owned lands, with the consent of the owner, to explore and demonstrate the extent and quality of deposits of such minerals, including core drilling, trenching, test-pitting, shaft sinking, drifting, cross-cutting, sampling, and metallurgical investigations and tests as may be necessary to determine the extent and quality of such deposits, the most suitable methods of mining and beneficiating them, and the cost at which the minerals or metals may be produced.

(b) The Secretary of Agriculture is hereby authorized and directed to make scientific, technologic, and economic investigations of the feasibility of developing domestic sources of supplies of any agricultural material or for using agricultural commodities for the manufacture of any material determined pursuant to section 2 of this Act to be strategic and critical or substitutes therefor.

Sec. 8. For the procurement, transportation, maintenance, rotation, storage, and refining or processing of the materials to be acquired under this Act, there is hereby authorized to be appropriated, out of any money in the Treasury not otherwise appropriated, such sums as the Congress, from time to time, may deem necessary to carry out the provisions of this Act. The funds so appropriated, including the funds heretofore appropriated, shall remain available to carry out the purposes for which approppriated until expended, and shall be expended under the joint direction of the Secretary of War and the Secretary of the Navy.

Sec. 9. Any funds heretofore or hereafter received on account of sales or other dispositions of materials under the provisions of this Act, except funds received on account of the rotation of stocks, shall be covered into the Treasury as miscellaneous receipts.

Sec. 10. This Act may be cited as the "Strategic and Critical Materials Stock Piling Act."

The act is an amended version of the Strategic Materials Act of June 7, 1939. It authorizes the procurement of stocks of strategic and critical materials by purchase, by transfer of surplus war stocks owned by the United States Government, and by reverse lend-lease payments from foreign Governments. Except for rotation to prevent deterioration and disposal resulting from a revised determination of stock-pile quantities because of obsolescence of a material for use in time of war, the stock piles are frozen and can be released for use only in an emergency with respect to the common defense.

Section 7 (a) of the new bill directs the Secretary of the Interior, through the Directors of the Bureau of Mines and the Geological Survey, to make scientific, technologic, and economic investigations of domestic resources with a view to developing domestic sources of supply of those minerals which are essential to the common defense or the industrial needs of the United States but which are not produced in sufficient quantities to meet domestic requirements. This provision also was included in the act of 1939.

Section 7 (b) directs the Secretary of Agriculture to make similar studies of strategic and critical agricultural commodities; this provision was not included in the previous stock-piling act.

The old and new laws direct that purchases for the stock piles shall be made in accordance with the Buy American Act. In a message issued at the time he approved the bill, the President made the following statement regarding this provision of the law:

I have today signed the Strategic and Critical Materials Stock-Piling Act because it is important to the national interest that this Government have the power to acquire stock piles.

It is only because of the overriding importance of this purpose that I am able to overcome my reluctance to signing a bill which reaffirms the application to stock-pile purchases of the provisions of Title III of the Act of March 3, 1933 (47 Stat. 1520), known as the Buy American Act. These provisions will not only materially increase the cost of the proposed stock piles but will tend to defeat the conservation and strategic objectives of the bill by further depleting our already inadequate underground reserves of strategic materials. Furthermore, there can be a serious conflict between those provisions and the foreign economic policy which this Government is actively pursuing. It also seems to me that the application of the Buy American Act may frequently hamper the effective achievement of the essential purpose of the legislation which is to enlarge the stock of vital raw materials available within our borders in time of possible emergency.

The Buy American Act requires that only articles produced or manufactured from materials originating in the United States shall be purchased for public use. However, the Act also provides that exceptions to this rule may be made when Buy American purchases are determined "to be inconsistent with the public interest or the cost to be unreasonable." This provision clearly indicates that the stock-piling program should not be used as a means of generally subsidizing those domestic producers who otherwise could not compete successfully with other domestic or foreign producers. Furthermore, to insure that the necessary stock piles are accumulated as rapidly as deemed advisable and with a minimum cost to the public, this Act should not be used as a device to give domestic interests an advantage over foreign producers of strategic materials greater than that provided by the tariff laws.

It is the policy of this Government to work for international action to reduce trade barriers. We have proposed to other countries a set of principles governing trade, and look forward to the successful conclusion of broad international arrangements embodying the essential principles of these proposals. Pending the conclusion of such arrangements, it is the policy of this Government to avoid taking measures that will raise barriers to trade or prejudice the objectives of the forthcoming discussions. We are asking other countries to follow similar policies.

The United States is opposed to governmental policies fostering autarchy, for itself as well as for others. Encouragement of uneconomic domestic production and unjustified preferential treatment of domestic producers destroys trade and so undermines our national economic strength. A large volume of soundly based international trade is essential if we are to achieve prosperity in the United States, build a durable structure of world economy and attain our goal of world peace and security.

GOVERNMENT ORGANIZATION FOR WAR

Beginning with Minerals Yearbook, 1942, a brief summary has been presented under the foregoing heading of the Government agencies administering the war program with a view to preserving a chronological record of the major changes in organization and key personnel that affect the mineral industries. Similar summaries were presented in Minerals Yearbook, Review of 1940, and Minerals Yearbook, 1941, under the heading National Defense Activity. Minerals Yearbook, 1944, presented the record up to July 1945, and this review carries the record forward to July 1946. Details of the various actions taken by these agencies are given in the commodity chapters of this volume.

With the sudden cessation of World War II hostilities early in August 1945, the Government agencies faced the necessity for a rapid shift from production for war to reconversion for a peacetime economy. Plans had been made for reconversion, but they were based on a gradual transition to postwar operations. These circumstances involved many changes in the activities and personnel of the agencies during the latter half of 1945 and the first half of 1946, as well as termination of several of the agencies and the establishment of others. President Truman, on the surrender of Japan, called on the War Production Board to occupy a major role in "an orderly transition from war production to civilian production" and emphasized that WPB's controls "should be lifted as soon as they are no longer needed." In line with this public statement of the President, WPB began at once to remove its individual controls over industry and by August 20 had only 130 industry regulatory orders in effect compared with a wartime peak of more than 600 such orders.

Development of the atomic bomb and its use in bringing about an abrupt end to the war with Japan were followed by the issuance of an Executive order dated September 13, 1945, withdrawing and reserving for the use of the United States lands on the public domain containing radioactive mineral substances. Proposed legislation providing for the control of atomic energy was soon thereafter introduced in Congress, and scientific, military, industrial, and Government representatives were called upon to present their views before the Senate committee appointed to prepare the enabling bill. On June 1, 1946, the Senate passed the Atomic Energy Control Bill, S. 1717, which, however, was not destined to be signed by the President until August 5, 1946. The bill, as finally passed by the Congress and approved by the President, created a civilian commission for the control and development of atomic energy in the United States.

In September 1945 the Foreign Economic Administration was abolished by Executive order, and the functions of that agency were divided among the State, Commerce, and Agriculture Departments and the Reconstruction Finance Corporation. Announcement was made early in October 1945 that the War Production Board would be terminated on November 3 and that all its activities were to be transferred to a new agency, the Civilian Production Administration. The resignation of WPB chairman J. A. Krug was accepted by the President, effective with termination of the agency, and J. D. Small, Chief of Staff of WPB, was designated Administrator of CPA. Following the resignation in February 1946 of Harold L. Ickes as Secretary of the Interior, Krug was selected by the President for that cabinet post; the appointment was confirmed by the Senate early in March.

John R. Steelman, the administration's top labor consultant, was appointed in June 1946 to succeed John W. Snyder as Director of the Office of War Mobilization and Reconversion when the latter assumed the post of Secretary of the Treasury, vice Fred M. Vinson, who had been elevated to Chief Justice of the Supreme Court. In February 1946 a new agency, the War Assets Administration, with Lt. Gen. Edmund H. Gregory, Quartermaster General of the Army, as Administrator, took over disposal of surplus war property from the Surplus Property Board. Gen. Gregory was succeeded as Administrator in July 1946 by Maj. Gen. Robert M. Littlejohn.

Other recent developments include the passage and approval of the bill extending the life of the Office of Price Administration for 1 year and establishing a three-man Price Decontrol Board; placement of the Office of Economic Stabilization under the Office of War Mobilization and Reconversion; and the appointment of the members of the new Economic Advisory Council, the function of which three-man council is to study the economy of the Nation and make reports and recommendations to Congress and the President. Other changes in the organizations chiefly concerned with the mineral activities of the war program are recorded below.

War Production Board, Civilian Production Administration.—At the close of the war in the Far East, the functions of the War Production Board became wholly those of directing and guiding the United States toward orderly reconversion to peacetime activities, to be achieved as rapidly as possible. With this end in view, the year from July 1, 1945, to July 1, 1946, saw many changes in organization and personnel.

On October 4, 1945, the War Production Board was terminated, effective November 3, 1945. The residual functions were transferred to the Civilian Production Administration. On dissolution of the War Production Board, J. A. Krug resigned as Chairman, and J. D. Small, formerly Chief of Staff of WPB, became Administrator of Civilian Production Administration, with Philip Maguire as Deputy Administrator. At that time, in addition to the Administrator and

Deputy Administrator, Small announced the following organization and personnel of the Civilian Production Administration:

1. Bureau of Reconversion Operations; Director, Fred Glover. This bureau contains all the industry divisions, including Metals and Minerals, Rubber, Equipment, Forest Products, Textiles, Chemicals, Construction, and Consumers Hard Goods.
2. Bureau of Field Operations; Director, C. A. Woodruff.
3. Bureau of International Supply; Director, Robert Turner. This bureau has charge of exports, imports, and international supply. The Combined Boards, through which the United States, Great Britain, and Canada coordinated activities in shipping, food supply, and allocation of raw materials during the war, were under its jurisdiction until they disbanded at the end of the year.
4. Bureau of Reconversion Priorities; Director, Lincoln Gordon. General administration of priorities, allocations, regulations, inventory, compliance, and such controls as are required came under the functions of this bureau.
5. Bureau of Demobilization; Director, G. Lyle Belsley.
6. Office of General Counsel; General Counsel, L. M. Lombard.
7. Review and Analysis Staff; Director, Robert Turner.
8. Office of Labor Requirements; Director, Ralph Hetzel.
9. Information Division; Director, Maxey Morrison.

In the organization of the Civilian Production Administration, the Office of Vice Chairman for Metals and Minerals under the War Production Board became the Metals and Minerals Division. Before this transition, James Douglas resigned as Deputy Vice Chairman for Metals and Minerals on August 31, 1945. He was succeeded by F. H. Hayes, formerly Assistant Director of the Copper Division. With the advent of the CPA on November 3, R. C. Allen resigned as Vice Chairman, and Hayes became Director of the Metals and Minerals Division. At the same time, Roland D. Parks, who had been Assistant Deputy Director of Metals and Minerals Production, became Deputy Director. Parks returned to private employment in February 1946, and in May 1946 John J. Croston, Assistant Chief of the Tin, Lead, and Zinc Branch, succeeded him as Deputy Director. The Mineral Classification Committee and the Minerals and Metals Advisory Committee were disbanded, while the Mineral Resources Operating Committee continued on a "stand-by" basis, to function as needed.

On August 20, 1945, immediately following VJ-day, the War Production Board canceled 210 of 340 industry regulatory orders. On VJ-day 53 of these orders were handled by the Metals and Minerals organization. Orders were canceled as the need for them disappeared, so that on July 1, 1946, the Metals and Minerals Division had only 7 in effect, dealing with steel, tin, lead, antimony, and uranium. As reconversion progressed, the number of personnel was likewise reduced. On July 1, 1945, the Metals and Minerals organization totaled 616 employees. This number was reduced to 144 by November 3, when the War Production Board was terminated, and to 128 by July 1, 1946.

Membership in the Premium Price Quota Committee remained unchanged. In May 1946 John J. Croston took over the chairmanship, when he became Deputy Director of Metals and Minerals. Landon F. Strobel remained as secretary.

N. H. Bell resigned as Director of the Aluminum and Magnesium Division on September 1, 1945. A. B. Menefee assumed the duties as Director but left at the end of October. He was succeeded by R. L. Sebastian.

Michael Schwarz resigned as Director of the Copper Division at the end of September 1945. He was followed by J. J. Hines, Jr., who remained until the end of the year, when D. L. Forrester took over.

On October 2, 1945, Arthur S. Knoizen left the Mining Division, and Marcellus H. Stow became Director. At the end of the year, Stow resigned and his duties were taken over by Harold Montag. June 24, 1946, Montag resigned, and at that time the Mining Branch was combined with the Miscellaneous Minerals Branch under F. G. Rockwell.

When the War Production Board was terminated, November 3, 1945, W. B. Todd resigned as Director of the Steel Branch. His duties were taken over by P. J. Treacy.

Erwin Vogelsang continued as Chief of the Tin, Lead, and Zinc Branch.

As of July 1946, the members of the Civilian Production Administration dealing with policy or administration affecting the mineral industries were as follows:

Administrator	John D. Small.
Deputy Administrator	Philip F. Maguire.
Deputy Administrator	John C. Houston, Jr.
General Counsel	Harold L. Price.
Office of Labor Requirements, Director	Ralph Hetzel.
Review and Analysis Staff, Director	Robert E. Johnson.
Information Division, Director	Karl Keyerleber.
Bureau of Industry Operations, Director	Fred Glover.
Metals and Minerals Division, Director	F. H. Hayes.
Deputy Director	John J. Croston.
Premium Price Quota Committee:	
Chairman	John J. Croston.
Secretary	Landon F. Strobel.
Civilian Production Administration, Tin, Lead, and Zinc Branch.	C. A. Wright.
Civilian Production Administration, Tin, Lead, and Zinc Branch.	Edgar E. Barker.
Civilian Production Administration, Copper Branch.	P. B. Blakemore.
Office of Price Administration	Jesse L. Maury.
Office of Price Administration	J. J. Beeson.
Office of Price Administration	C. O. Mittendorf.
Tin, Lead, and Zinc Branch, Chief	E. Vogelsang.
Deputy Chief	S. K. Butterworth.
Cork, Asbestos, and Fibrous Glass Branch, Chief	Ray H. Coultrap.
Aluminum and Magnesium Branch, Chief	Robert L. Sebastian.
Copper Branch, Chief	D. L. Forrester.
Miscellaneous Minerals and Mining Branch, Chief	F. G. Rockwell.
Steel Branch, Chief	P. J. Treacy.
Deputy Chief	Charles Halcomb.

Office of Price Administration.—Price controls over most minerals remained in effect throughout the period January 1, 1945, to July 1, 1946, although steps were taken to decontrol such items as aluminum, aluminum mill products, and many ferro-alloys. Where controls remained, however, increasing costs and other factors characteristic of the transition from a wartime to a peacetime economy led the OPA, in applying its standards of price action, to permit a number of price increases. Prices of coal, iron ore, pig iron, and basic steel products were increased in amounts ranging from 3 to 8 percent. The Premium

Price Plan for copper, lead, and zinc continued in operation, although at the close of the period increases of about 20 percent and 25 percent, respectively, were permitted in the base maximum prices of copper and lead, to offset some of the increased costs resulting from wage increases in the mining industry, and to restore base period earnings.

As of July 1, 1946, the following officials had chief responsibility for price actions in the field of minerals:

Industrials Price Division, Director	Frederick C. Holder.
Metals Price Branch, Price Executive	Warren M. Huff.
Metals Mining Analysis Office, Director	Jesse L. Maury.
Rubber, Chemicals, and Drug Price Branch, Acting Price Executive	George W. Strasser.
Building and Construction Price Division, Director	Gordon Rieley.
Building Materials Price Branch, Price Executive	Julian Littau.

Petroleum Administration for War.—In the early months of 1945 demand on the United States for all oils reached record levels and taxed the facilities of the Petroleum Administration and the petroleum industry to meet, world-wide, the urgent needs of the United Nations in the final stages of the war. With the surrender of Germany in May, a major problem of coordination of supply and transportation of petroleum and products was posed by the shift in emphasis from the European to the Asiatic theater of military operations. It was necessary to curtail the eastward movement and to direct all available means to augment the rapid flow of products westward to the Pacific through the Panama Canal and overland through West coast ports until the surrender of Japan in August.

As had been frequently promised during the war, prompt action was taken to remove controls over the petroleum industry upon the end of hostilities. The day after the surrender of Japan, August 15, 1945, rationing of gasoline and fuel oils was ended, and wartime restrictions upon gasoline quality and most refining operations were removed. On August 23 most of the distribution and marketing regulations were rescinded. Many of the controls over petroleum supply and transportation were canceled on August 27, and regulations covering well spacing in the oil and natural-gas fields expired on September 1, as did limitations on construction in all branches of the industry. By October 15 all domestic orders had been terminated, and those affecting foreign operations became void by November 1.

By the end of 1945, six of the Division directors had resigned and the Washington staff had been reduced to 161 from 665 on August 1 and from a wartime peak before VE-day of 1,438. By April 1, 1946, the remaining Division directors had resigned and the staff numbered 58. The Administration's field staff, which had totaled 313 on August 1, 1945, was eliminated by April 1, 1946.

By Executive order of the President the Petroleum Administration for War was terminated, effective May 8, 1946. Shortly thereafter, however, a new Oil and Gas Division was organized in the Department of the Interior to undertake a program, recommended by the President, of coordination of Government activities with respect to petroleum and natural gas and to serve as a liaison agency of the Federal Government in its relations with appropriate State bodies and the petroleum industry.

Solid Fuels Administration for War.—The 1945 activities continued the agency's policy of encouraging the maximum production of coal, of requiring an equitable distribution of available supplies, and of educating consumers in methods of conservation. To augment the shortage of Southern Appalachian and other high-grade coals, SFAW encouraged the substitution, in part, of lower-grade solid fuels, especially run-of-mine sizes and reclaimed coke.

Special efforts were made to supply the Great Lakes docks before the close of the navigation season. This cut the Southeast short during the summer and fall, and, as soon as the lakes froze over, the deficiency in the Southeast was made up by special directives.

After the surrender of Japan the conservation campaign was dropped, and the regulations were modified as rapidly as possible, although the more important types of coal continued in short supply. As coal produced west of the Mississippi River began to meet requirements, all controls in that area were eased. By August 1945 restrictions on shipments of reclaimed coke to Canada were lifted; by September, controls over deliveries by retail dealers were revoked. In October most of the wartime restrictions on producers' and wholesalers' shipments of anthracite and coke to retail dealers were lifted. Scarcity of special purpose and other Southern Appalachian coals continued, and their distribution had to be further restricted.

Because of the serious manpower shortage, efforts were made throughout the war to have miners released from the draft. After the war, demobilization of experienced miners occurred too slowly to relieve the shortage during the winter. By the end of the fuel year, March 31, 1946, most of the remaining regulations and orders had been revoked, except for reporting to SFAW on production and distribution. At that time, SFAW was planning to liquidate at the end of the fiscal year. There followed the long strike in the soft-coal mines, necessitating a freezing order of coal on mine track, the issuance of an interim directive to provide for the emergency, and later a new regulation on soft-coal distribution.

With the fall of Germany, the demand for coal for the liberated nations of Europe placed a heavy responsibility upon SFAW. Only coal that was surplus, principally strip-mined coal, run-of-mine sizes and low-grade, could be released for export without upsetting the national economy. The rapid increase of strip mining during the war provided enough soft coal of usable quality to warrant a large export program, but care had to be taken that only usable coal was carried to the ports, and the compliance activities of SFAW in this field were increased.

In April 1945, the Government, by Executive order, again took over the soft-coal mines, because the miners failed to return to work under the new Government-approved contract between the coal operators and the United Mine Workers of America. In May, a break-down in anthracite wage negotiations threatened a fuel crisis, and the Government temporarily took over the hard-coal mines. SFAW carried out the take-overs as it had done several times during the war. By the end of the summer all the mines had been returned to their owners. In April and May 1946, during the long strike, the Government again took over the soft-coal mines, setting up a new Coal Mines Administration in the Department of the Interior. SFAW was called upon to assist the new agency, utilizing its wartime experience and records.

As of August 1, 1946, the organization and the executive heads of principal units of the Solid Fuels Administration for War were as follows:

Administrator	J. A. Krug.
Deputy Administrator	Dan H. Wheeler.
Assistant Deputy Administrator	Harlen M. Chapman.
Assistant Deputy Administrator (heads Bituminous Distribution Division).	Walter P. Neekamp.
Assistant Deputy Administrator	E. Boykin Hartley.
Assistant Deputy Administrator (heads Anthracite Distribution Division).	Thomas G. Valleau.
General Counsel (heads Legal and Compliance Divisions)	Thomas J. O'Brien.
Anthracite Distribution Division	Thomas G. Valleau.
Bituminous Distribution Division	Walter P. Neekamp.
Legal Division	Thomas J. O'Brien.
Compliance Division	Thomas J. O'Brien.
Production, Conservation and Information Division	William J. Dougherty.
Field Office Division	N. W. Wood, Jr.
Budget and Administrative Services Division	Mabel S. Bush.
Personnel Division	Julia Carpin.

Foreign Economic Administration.—The origin and functions of this agency were described briefly in Minerals Yearbook, 1944.

An Executive order issued in September 1945 abolished the agency and provided for the division of its functions among the State, Commerce, and Agriculture Departments and the Reconstruction Finance Corporation. Resignation of the Director, Leo T. Crowley, was accepted, effective October 15.

The State Department took over administration of lend-lease, United States participation in the United Nations Relief and Rehabilitation Administration, and the purchasing of certain strategic materials in liberated areas. It was also made the disposal agency for all surplus property, except certain vessels, in foreign areas.

Reconstruction Finance Corporation took over the United States Commercial Company, including its functions in the procurement of strategic commodities abroad, and also the Petroleum Reserve Corporation and the Rubber Development Corporation.

The Department of Commerce took over export controls, technical industrial intelligence, facilitation of trade, and the functions of the clearing office for foreign transactions and reports.

Programs dealing with food and food machinery were taken over by the Department of Agriculture.

The Foreign Economic Administration operated through two major bureaus—a Bureau of Supplies, of which Sidney H. Scheuer was Executive Director, and a Bureau of Areas, directed by Arthur Paul. Foreign procurement of commodities was carried on in a Foreign Procurement and Development Branch, of which Arthur Z. Gardiner was Director and Alan M. Bateman Associate Director. Actual operations in the foreign minerals procurement and development fields were conducted by the Metals and Minerals Divisions of that Branch. Key officials on the technical staffs of these two Divisions and of the associated Technical Services Division were as follows just prior to the abolishment of FEA:

Director of Metals and Minerals	Alan M. Bateman.
Metals Division, Chief	Mahlon M. Miller.
Copper Section, Chief	William C. Schmidt.
Zinc-Lead Section, Chief	F. R. McIntosh.
Tin, Mercury, Antimony, Bauxite Section, Chief	Clarence E. Peterson.
Ferro-Alloy Section, Chief	Cayford Burrell.
Scrap Metals Section, Chief	Benjamin Schwartz.
Minerals Division, Chief	Hugh E. McKinstry.
Mica-Graphite Section, Chief	Richard H. Vail.
Quartz and Abrasives Section, Chief	Carl Tolman.
Alloy and Rare Minerals Section, Chief	Robert W. Bridgeman.
Engineering Analysis and Contract Control Section, Chief	Robert K. Warner.
Service and Supply Section, Chief	Marshall Walker.
Administrative Section, Chief	Alfred Wilson.

Reconstruction Finance Corporation.—This agency has had a tremendous part in carrying out the defense and war programs on the industrial front, including the construction and management of mineral processing plants and the procurement of strategic and critical minerals. Its activities up to July 1, 1945, were described briefly in Minerals Yearbook, 1944. As of May 31, 1946, authorizations for RFC activities, including direct commitments for war purposes of approximately $2,900,000,000, have amounted to $37,600,000,000. Disbursements have exceeded $23,800,000,000, including $3,177,841,000 for direct subsidy payments to increase or maintain production of strategic or critical materials. The latter figure does not include losses arising from the purchase and sale of such materials.

As of July 1, 1946, Charles B. Henderson, Chairman of the Board of Directors of the Reconstruction Finance Corporation, was serving also as Acting Federal Loan Administrator.

Office of Metals Reserve

A substantial part of the war procurement and disposition of strategic and critical metals and minerals was conducted by Metals Reserve Company until July 1, 1945, when, under Public Law 109, 79th Congress, it was consolidated with the Reconstruction Finance Corporation. Activity continued through 1945 for war and reconversion needs and is expected to last through 1946 in order to meet the civilian deficiencies as estimated by Civilian Production Administration. Total purchase commitments as of May 31, 1946, exclusive of approximately $2,200,000,000 canceled or assigned to the Foreign Economic Administration, aggregated $3,581,342,000, of which $2,360,022,000 has been disbursed. Sales of materials, principally to war industries, have totaled $1,945,268,000. Strategic metals and minerals transferred to Treasury Procurement to become part of the permanent stock pile amounted to $109,001,000. Inventories on hand reflect a total cost of $587,448,000, not including such assets as advances to contractors and other receivables and mining supplies and equipment currently in use.

Reconstruction Finance Corporation, through its Office of Metals Reserve, also operates the tin smelter at Texas City and the Nicaro nickel plant in Cuba and operates the Premium Price Plan for domestic copper, lead, and zinc.

717372—47——3

The following, by virtue of appointment by the Board of Directors of RFC, direct the activities of the Office of Metals Reserve:

Morris Levinson, Executive Director; Jesse C. Johnson, Deputy Director; George S. Jewett, Deputy Director; S. P. Petterson, Deputy Director; R. E. Leahy, Assistant Director; G. W. Brodie, Assistant Director; J. F. Morse, Jr., Traffic Manager.

OFFICE OF DEFENSE PLANTS

Expansion of industrial plant capacity and plants for the production of munitions and strategic or critical materials required for the successful prosecution of World War II was, to a considerable extent, conducted through this agency. Total expenditures through May 31, 1946, for war plants, facilities, and machine tools were $7,433,589,850. (This includes 45 plants transferred to Office of Rubber Reserve, for which a total of $669,175,000 had been disbursed.) An additional $100,000,000 has been authorized and is pending cancellation settlements.

The expenditures involved the complete construction of 537 general-purpose plants, 529 special-purpose plants, 27 housing projects, and [illegible] scrambled facilities—a total of 1,164 wholly owned projects, including land, buildings, and equipment costing $6,583,000,000. In addition, the Corporation provided machinery and equipment valued at $692,626,000 to 1,185 plants owned by other operators. Commitments for the production of critical and strategic materials in foreign countries totaled $57,589,850.

The following, by virtue of appointment by the Board of Directors of RFC, direct the activities of the Office of Defense Plants:

Frank T. Ronan, Executive Director; James L. Kelehan, Associate Director; H. R. Rutland, Deputy Director in Charge of Plant Servicing Division; William J. Hickey, Assistant Director in Charge of Real Estate and Taxation Section; A. W. Greely, Deputy Director in Charge of Engineering Division; Leo Nielson, Assistant Director; John F. Williams, Assistant Director in Charge of Sales; James G. Boss, Chief Counsel; Fred Warren, Assistant Director in Charge of Accountability; Austin Roe, Assistant Director in Charge of Contract Termination Section.

OFFICE OF DEFENSE SUPPLIES

Although this agency has been concerned chiefly with products other than minerals, it has had some important functions related to the mineral industries. Its operations have included the purchase of strategic and critical materials, the payment of extraordinary transportation costs on oil, coal, and sugar, and various other activities such as the making of loans and the payment of subsidies in connection with the purchase of materials. Disbursements for such purposes, as of January 1, 1946, were $8,100,000,000. Receipts from the sale of materials, repayment of loans, and other sources amounted to $6,100,000,000. Total expenditures authorized by Defense Supplies aggregated $12,300,000,000, of which $1,400,000,000 had been canceled or assumed by private industry.

The following, by virtue of appointment by the Board of Directors of RFC, direct the activities of the Office of Defense Supplies:

Stuart K. Barnes, Executive Director; George B. Stoner, Associate Director; Henry D. Brite, Deputy Director, Petroleum and Chemicals; Charles A. Jostes, Deputy Director, Materials and Supplies; Irving M. Griffin, Assistant Director, Traffic Division.

STATISTICAL SUMMARY OF MINERAL PRODUCTION

(GENERAL UNITED STATES SUMMARY AND DETAILED PRODUCTION BY STATES)

By Marian E. Meyer

SUMMARY OUTLINE

INTRODUCTION

This report continues the series of annual statistical summaries published in previous years as chapters of Mineral Resources and Minerals Yearbook.

In order to meet the need of industry and the States for up-to-date statistics on State production of minerals, State summaries are presented for the current year. Because of the early date of publication, the fuel figures for 1945 are estimates subject to revision; it is believed, however, that the data shown represent a high order of accuracy.

UNIT OF MEASUREMENT

The unit of measurement used by the Bureau of Mines for each mineral product in reports on the mineral resources is that common to the industry concerned, and the variation in these units makes it impracticable, if not impossible, directly to combine and compare the different minerals except as to value. Although most of the products are measured by weight, some are measured by volume and some by number of "pieces," etc.; for some no total quantity figures are available.

ELIMINATION OF DUPLICATION

In the totals for the United States, shown in the following "general" tables, duplication has been eliminated wherever practicable, and in the State totals given in the State tables virtually all duplication has been eliminated. For instance, in both general and State tables the output of coke is shown but its value is not included in the totals, as the value of the coal used in its manufacture enters into the value of the coal production which is included in the totals. For asphalt, both native and oil are shown in the general tables, but the value of the oil asphalt is excluded from the totals as it duplicates that of the petroleum from which it is manufactured. For the clay industries, for years before 1936, the total value of clay products is included in both general and State totals as representing the first marketable form of the greater part of the clay produced; the quantity and value of the clay mined and sold in the raw state by miners to users of clay are shown separately also, but the value is not included in the totals as it is duplicated largely in that for clay products. For the years 1936 through 1944, the value of clay sold or shipped by producers and of clay products other than pottery and refractories are included in the United States and State totals. For 1945, total production of clay, as represented by clay sold or used, is given; but the value of clay used in heavy-clay products and in cement is omitted from the totals, as it is duplicated in the values for clay products other than pottery and refractories and for cement, both of which are included in the totals. These changes in practice should be borne in mind when comparing earlier years.

United States totals.—In the general tables both iron ore and pig iron are shown, but the value of the pig iron rather than the iron ore is included in the United States totals, as that is considered the better means of presenting the statistics for iron in its first marketable form. For gold, silver, copper, lead, and zinc the value of "smelter output" is included in the general totals, and to account more fully for the value of the ores treated these smelter figures are supplemented by the value of the byproduct sulfuric acid. The value of pigments (white lead, red lead, lithopone, litharge, and orange mineral) manufactured from metals is not included in the general tables, as the base from which they are made is included in the output of lead or zinc, whereas the value of sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide is included, as these are made in large part direct from the ores and do not enter into the lead or zinc totals, which represent smelter output.

State totals.—In the State tables also iron ore and pig iron are both shown. As blast-furnace products cannot be traced to the States in which the ore is mined, the value of the ore is used in the State totals. For ores of gold, silver, copper, lead, and zinc no values are shown, and in fact none are recorded; instead, for each of these metals the recoverable content of the ores is used as the basis of valuation. The value of the zinc and lead pigments is not included in the State total, as the recoverable zinc and lead content of the ores from which the products were made is included under zinc or lead. The value of the sulfuric acid produced as a byproduct of copper, lead, and zinc smelting and zinc roasting is not included in the State total, as tracing this product back to the State producing the ore has not been possible.

GENERAL TABLES

Mineral products of the United States, 1943–45 [1]

Product	1943		1944		1945	
	Quantity	Value	Quantity	Value	Quantity	Value
METALLIC						
Aluminum .... short tons (2,000 pounds)	920,179	$265,380,000	776,446	$222,416,000	496,487	$141,924,000
Antimonial lead .... do	[2] 63,515	(2)	[2] 57,902	(2)	[2] 56,495	(2)
Antimony:						
Metal .... do	(3)	(3)	(3)	(3)	(3)	(3)
Ore and concentrates .... do	16,785	913,576	13,501	563,296	14,966	561,630
Bauxite [4] .... long tons (2,240 pounds)	6,693,080	32,744,109	2,823,724	14,402,497	981,372	5,631,335
Beryllium ore .... short tons	356	44,407	388	56,135	39	6,133
Cadmium:						
Metal .... pounds	8,326,768	6,570,546	8,551,424	6,435,124	7,938,658	6,106,992
In compounds .... do	137,952	108,844	285,203	213,902	451,050	347,308
Chromite .... short tons	160,120	4,820,461	45,629	1,668,299	13,973	532,382
Copper [5], sales value .... do	1,092,939	[6] 257,934,000	1,003,379	[6] 236,797,000	782,726	[6] 184,723,000
Ferro-alloys .... do	1,995,171	271,487,609	1,860,956	246,014,039	1,661,657	210,509,657
Gold [7] .... troy ounces	1,394,522	48,808,270	1,022,238	35,778,330	928,893	32,511,255
Iron:						
Ore [8] .... long tons	99,462,850	[8] 269,016,546	95,135,675	[8] 256,885,512	88,136,715	[8] 243,760,986
Pig .... short tons	60,787,159	1,273,634,210	60,995,977	1,278,981,313	53,265,353	1,172,435,165
Lead (refined),[5] sales value .... do	406,544	[6] 52,038,000	394,443	[6] 50,489,000	356,535	[6] 45,636,000
Magnesium (new ingot) .... do	170,267	69,960,802	146,585	60,141,437	43,496	17,874,418
Manganese ore (35 percent or more Mn) .... do	205,173	7,278,758	247,616	9,014,875	182,337	7,320,309
Manganiferous ore (5 to 35 percent Mn) .... do	1,722,868	4,522,052	1,487,612	3,855,946	1,522,854	3,513,666
Mercury:						
Metal .... flasks (76 pounds net)	51,929	10,137,060	37,688	4,460,752	30,763	4,149,621
Ore .... short tons	(9)	(10)	(9)	(10)	(9)	(10)
Molybdenum .... pounds	53,955,000	38,500,000	39,423,000	27,999,000	32,524,000	23,107,000
Nickel .... short tons	642	(11)	988	(11)	1,155	(11)
Ores (crude), old tailings, etc.:						
Copper .... do	98,120,000	(10)	91,064,000	(10)	76,856,000	(10)
Dry and siliceous (gold and silver) .... do	4,963,000	(10)	2,620,000	(10)	1,984,000	(10)
Lead .... do	7,258,000	(10)	6,805,000	(10)	6,730,000	(10)
Lead-copper .... do	400	(10)	123,000	(10)	168,000	(10)
Zinc .... do	16,804,000	(10)	16,470,000	(10)	16,308,000	(10)
Zinc-copper .... do	813,000	(10)	943,000	(10)	812,000	(10)
Zinc-lead .... do	13,403,000	(10)	15,418,000	(10)	12,355,000	(10)
Zinc-lead-copper .... do	27,000	(10)	19,000	(10)	12,000	(10)
Platinum metals (refined) (value at New York City) .... troy ounces	34,917	1,455,000	33,021	1,481,000	33,592	1,543,000

See footnotes at end of table.

Product	1943 Quantity	1943 Value	1944 Quantity	1944 Value	1945 Quantity	1945 Value
METALLIC—continued						
Selenium ... pounds	521, 779	(11)	423, 906	(11)	666, 363	(11)
Silver [12] ... troy ounces	40, 900, 121	$29, 084, 530	35, 651, 049	$25, 351, 855	29, 063, 255	$20, 667, 205
Tantalum and columbium ores ... pounds	15, 182	29, 086	10, 412	24, 234	6, 649	13, 653
Tellurium ... do	62, 260	(11)	45, 323	(11)	60, 328	(11)
Tin (metallic equivalent) ... short tons	7	6, 800	6	6, 200		
Titanium concentrates:						
Ilmenite ... do	211, 715	3, 738, 970	280, 791	7, 371, 279	308, 518	7, 359, 170
Rutile ... do	3, 941	610, 879	6, 770	1, 088, 112	6, 837	869, 920
Tungsten ore (60-percent concentrates) ... do	11, 945	17, 973, 685	10, 283	14, 407, 143	5, 715	7, 957, 731
Vanadium ... pounds	5, 586, 492	3, 518, 493	3, 527, 054	1, 689, 578	2, 963, 913	1, 766, 500
Zinc,[5] sales value ... short tons	594, 250	[6] 102, 211, 000	574, 453	[6] 98, 806, 000	467, 084	[6] 80, 338, 000
Other metallic [13]		2, 506, 443		2, 576, 048		2, 961, 690
Total value of metallic products (approximate)		2, 488, 000, 000		2, 340, 000, 000		1, 975, 000, 000
NONMETALLIC						
Arsenious oxide ... short tons	32, 423	1, 519, 706	34, 472	1, 696, 819	24, 810	1, 197, 061
Asbestos ... do	6, 014	334, 815	6, 667	380, 334	12, 226	417, 348
Asphalt:						
Native ... do	886, 135	4, 288, 488	789, 516	3, 691, 279	703, 873	3, 816, 471
Oil (including road oil) [8] ... do	7, 131, 973	[8] 80, 615, 217	6, 408, 766	[8] 70, 310, 623	6, 311, 815	[8] 68, 930, 149
Barite (crude) ... do	420, 343	2, 796, 776	518, 617	3, 558, 489	696, 062	5, 348, 652
Boron minerals ... do	256, 633	6, 401, 507	277, 586	6, 579, 587	325, 935	7, 635, 365
Bromine ... pounds	94, 085, 937	19, 107, 065	102, 112, 462	19, 712, 819	79, 709, 857	14, 796, 229
Calcium-magnesium chloride ... short tons	199, 796	1, 549, 565	200, 964	1, 621, 227	218, 320	1, 818, 219
Cement ... barrels (376 pounds net)	129, 478, 662	202, 460, 328	95, 592, 155	151, 996, 646	107, 833, 108	175, 430, 858
Clay:						
Products (other than pottery and refractories)		[14] 75, 200, 000		[14] 65, 472, 000		[14] 86, 275, 352
Raw ... short tons	[15] 7, 287, 897	[15] 24, 915, 007	[15] 6, 275, 140	[15] 23, 524, 998	[15] 18, 627, 607	[15] 39, 795, 315
Coal:						
Bituminous [16] ... do	590, 177, 069	1, 584, 644, 477	619, 576, 240	1, 810, 900, 542	576, 000, 000	1, 777, 336, 000
Pennsylvania anthracite ... do	60, 643, 620	306, 816, 018	63, 701, 363	354, 582, 884	54, 933, 909	323, 944, 435
Coke [8] ... do	71, 676, 063	[8] 476, 117, 472	74, 037, 817	[8] 527, 921, 506	67, 308, 181	[8] 508, 540, 042
Diatomite ... do	(17)	(17)	(17)	(17)	(17)	(17)
Emery ... do	6, 666	63, 195	6, 940	64, 858	7, 856	75, 977
Feldspar (crude) ... long tons	308, 180	1, 646, 277	327, 408	1, 813, 937	373, 054	2, 021, 529
Fluorspar ... short tons	406, 016	11, 802, 255	413, 781	12, 503, 487	323, 961	9, 896, 879
Fuller's earth ... do	247, 258	2, 664, 027	294, 737	3, 297, 064	296, 368	3, 463, 913
Garnet for abrasive purposes ... do	5, 935	429, 120	(17)	(17)	6, 306	375, 198
Gems and precious stones		(18)		(18)		(18)

Graphite:						
Amorphous / Crystalline ... short tons	9,597	903,102	5,768	349,663	5,334	289,207
Grindstones and pulpstones ... do	12,623	488,205	(17)	(17)	(17)	(17)
Gypsum (crude) ... do	3,877,541	5,959,615	3,761,234	6,450,767	3,811,723	6,984,324
Helium [19] ... cubic feet	58,951,160	321,213	137,268,144	872,551	128,440,909	937,283
Iodine ... pounds	(17)	(17)	(17)	(17)	(17)	(17)
Kyanite ... short tons	9,561	238,649	(17)	(17)	(17)	(17)
Lime ... do	6,596,615	49,064,328	6,473,563	48,698,162	5,920,579	45,918,468
Lithium minerals ... do	8,155	314,660	13,319	552,977	2,446	285,520
Magnesite (crude) ... do	754,832	6,071,596	561,450	4,407,461	336,458	2,324,957
Magnesium compounds (natural) (including brucite) ... pounds	1,225,148,000	21,605,241	1,023,158,000	18,393,960	539,612,000	9,675,149
Marl:						
Calcareous ... short tons	147,153	152,821	178,036	171,599	154,122	188,311
Greensand ... do	10,056	522,124	4,908	505,651	4,986	477,919
Mica:						
Scrap ... do	46,138	738,025	51,727	1,089,072	32,880	509,600
Sheet ... pounds	3,448,199	3,228,742	1,523,313	3,262,711	1,298,587	737,342
Millstones	----------	9,240	----------	9,700	----------	15,018
Mineral pigments:						
Natural pigments and manufactured iron oxide pigments ... short tons	100,216	7,951,057	97,018	8,016,452	101,014	8,825,174
Zinc and lead pigments [20] ... do	192,827	26,340,947	211,403	28,991,887	194,448	26,555,658
Mineral waters ... gallons sold	(18)	(18)	(18)	(18)	(18)	(18)
Natural gas ... M cubic feet	3,414,689,000	760,950,000	3,711,039,000	797,255,000	3,875,172,000	821,099,000
Natural gasoline and allied products:						
Natural gasoline and cycle products ... gallons	2,773,218,000	122,500,000	3,031,308,000	148,200,000	3,251,172,000	152,500,000
Liquefied petroleum gases ... do	910,854,000	24,410,000	1,170,624,000	34,300,000	1,422,335,000	43,500,000
Oilstones, etc ... short tons	(17)	(17)	(17)	(17)	(17)	(17)
Olivine ... do	5,415	48,633	3,270	35,207	(17)	(17)
Peat ... do	60,002	491,460	57,987	524,521	78,272	600,287
Petroleum ... barrels (42 gallons)	1,505,613,000	1,809,020,000	1,677,904,000	2,032,960,000	1,711,103,000	2,093,300,000
Phosphate rock ... long tons	5,126,232	18,962,021	5,376,643	20,856,429	5,806,723	23,951,077
Potassium salts ... short tons	[21] 732,151	26,183,073	[21] 817,892	29,487,413	[21] 870,370	30,313,919
Pumice ... do	85,150	611,495	88,757	704,110	157,011	1,051,037
Pyrites ... long tons	802,384	2,844,000	788,530	2,598,000	722,596	2,700,000
Salt (sodium chloride) ... short tons	15,214,152	43,878,266	15,717,171	45,989,264	15,394,141	46,069,064
Sand and gravel:						
Glass sand ... do	3,971,931	7,376,566	4,443,031	8,227,502	4,681,920	8,374,218
Sand (molding, building, etc.) and gravel ... do	230,092,000	145,416,000	190,340,000	116,936,000	190,842,000	120,463,000
Silica (quartz) ... do	99,445	346,558	82,379	286,478	57,764	236,803
Slate ... do	468,860	4,870,237	477,840	5,004,195	551,890	5,658,913
Sodium salts (carbonates and sulfates) (natural) ... do	331,901	4,097,635	353,749	4,447,225	372,241	4,559,277
Stone [22] ... do	171,343,250	184,320,034	155,579,580	175,642,157	153,405,210	179,307,902
Sulfur ... long tons	2,953,845	47,300,000	3,519,083	56,300,000	3,833,294	61,300,000
Sulfuric acid (60° Baumé) (byproduct) [23] ... short tons	1,228,098	10,852,563	1,160,023	10,415,587	1,084,891	10,136,598
Talc, pyrophyllite, and soapstone [22] ... do	412,868	5,121,414	398,863	5,017,462	401,080	4,956,901
Tripoli ... do	14,912	244,365	18,425	301,863	18,247	306,829

See footnotes at end of table.

Mineral products of the United States, 1943–45 [1]—Continued

Product	1943 Quantity	1943 Value	1944 Quantity	1944 Value	1945 Quantity	1945 Value
NONMETALLIC—continued						
Vermiculite ... short tons	46,645	$471,595	54,116	$541,744	64,808	$648,077
Other nonmetallic [24]		4,770,156		4,511,391		4,224,387
Total value of nonmetallic products (approximate)		5,583,800,000		6,079,000,000		6,168,000,000
SUMMARY						
Total value:						
Metallic		2,488,000,000		2,340,000,000		1,975,000,000
Nonmetallic:						
Fuels		4,608,300,000		5,178,000,000		5,212,000,000
Other		975,500,000		901,000,000		956,000,000
Grand total approximate value of mineral products		8,071,800,000		8,419,000,000		8,143,000,000

[1] In this general statement certain of the figures represent shipments rather than quantity mined, and some of the figures for 1945 are subject to revision. For details see following chapters of this volume.
[2] Figures represent antimonial lead produced at primary refineries from both domestic and foreign primary and secondary sources; no figures for value of antimonial lead available. Estimate of value of primary antimony and lead contents of antimonial lead from domestic sources included in total value of metallic products.
[3] Largely from foreign ore; value not included in total value.
[4] 1943: As shipped; 1944–45: Dried-bauxite equivalent.
[5] Product from domestic ores only.
[6] Value does not include premiums paid to miners by the Government. Total over-ceiling payments for copper, lead, and zinc amounted to approximately $73,000,000 in 1943, $83,000,000 in 1944, and $79,000,000 in 1945.
[7] According to Bureau of the Mint. Valued at $35 per ounce.
[8] Value not included in total value.
[9] Figures not available.
[10] Figures showing values not available.
[11] Value included in total value of metallic products; Bureau of Mines not at liberty to publish figures.
[12] According to Bureau of the Mint.
[13] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.
1943 and 1944: Bismuth, cobalt, germanium, indium, thallium, and zircon.
1945: Bismuth, cobalt, germanium, indium (57,434 troy ounces), thallium, and zircon.
[14] 1943–44: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945: Figures obtained through cooperation with Bureau of the Census.
[15] 1943–44: Sold or shipped; 1945: Sold or used; value of clay used in cement and heavy clay products not included in total value.
[16] Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.
[17] Value included in total value of nonmetallic products; Bureau of Mines not at liberty to publish figures.
[18] No canvass. Estimate of value included in total value of nonmetallic products.
[19] Figures cover fiscal year ended June 30 of year stated.
[20] Sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide.
[21] Equivalent as K_2O.
[22] Figures for soapstone used as dimension stone included in figures for stone.
[23] From copper, lead, and zinc smelters and zinc roasters.
[24] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.
1943: Andalusite, crude aplite, natural sulfonated bitumen, calcite (Iceland spar), corundum, dumortierite, flint lining for tube mills (2,585 short tons, $46,071), pebbles for grinding (9,924 short tons, $157,778), quartz crystal (5,968 pounds, $25,598), silica sand and sandstone (ground) (541,350 short tons, $3,937,452), strontium minerals (7,566 short tons, $114,526), sulfur ore (2,572 long tons, $26,215), industrial topaz, and wollastonite.
1944: Andalusite, crude aplite, natural sulfonated bitumen, calcite (Iceland spar) (5,748 pounds, $57,480), corundum, dumortierite, flint lining for tube mills (2,063 short tons, $38,833), pebbles for grinding (8,012 short tons, $172,418), quartz crystal (3,934 pounds, $23,769), silica sand and sandstone (ground) (558,606 short tons, $3,989,981), strontium minerals (3,005 short tons, $48,165), sulfur ore (1,639 long tons, $8,950), industrial topaz, and wollastonite.
1945: Andalusite, crude aplite, dumortierite, flint lining for tube mills, pebbles for grinding (8,615 short tons, $201,806), silica sand and sandstone (ground) (533,656 short tons, $3,709,597), strontium minerals (2,784 short tons, $27,840), sulfur ore (1,426 long tons, $12,170), industrial topaz, and wollastonite.

Value of mineral products of the United States, 1880–1945 [1]

Year	Metallic	Nonmetallic			Grand total
		Fuels [2]	Other	Total	
1880 [1]	$190, 881, 000	$120, 241, 000	$56, 341, 000	$176, 582, 000	$367, 463, 000

[1] Figures for earlier years not available.
[2] Coal, natural gas, natural gasoline and allied products, petroleum.
[3] Subject to revision.

The sum of the following State totals does not reach the total for the United States given in the preceding table partly because figures for certain of the products included in the United States total are not available by States of origin. This fact is brought out in the opening text of this chapter and in the second table following.

In addition, there are many factors (the more important discussed in the opening text) that account for the disagreement between the sum of the State totals and the grand total for the United States, by products. Chief among these are: (1) The use of iron-ore values in State totals and pig-iron values in United States total; (2) the use of mine figures for gold, silver, copper, lead, and zinc in the State totals and mint and smelter figures (supplemented by the value of byproduct sulfuric acid from copper, lead, and zinc smelting and zinc roasting and the value of zinc and lead pigments made in large part direct from ores) in the United States total; and (3) the inclusion of estimates in the United States total for a few products for which no canvass has been conducted for many years and for which no estimate by States is made.

Many other less important differences are involved, but both State and United States totals are as complete and definite as seems possible with the data available. The practice is consistent from year to year, and it is believed that the reader can determine readily just what minerals are covered by the total concerned.

In every table each mineral produced is listed, and all figures are shown except those that the Bureau of Mines is not at liberty to publish.

Value of mineral products of the United States, 1941–45, and total, 1911–45, by States [1]

State	1941	1942	1943	1944	1945	1911–45 [1]

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis. Comparable totals for years before 1911 not available.

Value of mineral products of the United States, 1941–45, and total, 1911–45, by States—Continued

State	1941	1942	1943	1944	1945	1911–45		
						Total value	Rank	Percent of total for United States
Pennsylvania	$737, 143, 530	$841, 847, 147	$889, 077, 000	$985, 464, 000	$930, 113, 000	$26, 008, 966, 000	1	17. 82

Mineral products of the United States and principal producing States in 1944

Rank in value	Product	Principal producing States[1]	
		In order of quantity	In order of value
9	Aluminum	Washington, New York, Tennessee, Arkansas	Rank same as for quantity.
97	Andalusite	California	Do.
(2)	Antimonial lead	Not separable by States	Not separable by States.
68	Antimony ore	Idaho, Oregon, Nevada, Alaska	Rank same as for quantity.
85	Aplite (crude)	Virginia	Do.
55	Arsenious oxide	Montana, Utah	Do.
75	Asbestos	Vermont, Arizona, North Carolina, California	Vermont, Arizona, California, Alaska.
	Asphalt:		
49	Native	Texas, Kentucky, Oklahoma, Alabama	Utah, Kentucky, Texas, Oklahoma.
15	Oil	Not separable by States	Not separable by States.
50	Barite (crude)	Arkansas, Missouri, Georgia, Tennessee	Missouri, Arkansas, Georgia, Tennessee.
32	Bauxite	Arkansas, Alabama, Georgia	Rank same as for quantity.
90	Beryllium ore	South Dakota, Colorado, New Mexico, New Hampshire	Do.
59	Bismuth	Not separable by States	Not separable by States.
103	Bitumen (natural sulfonated)	Utah	Rank same as for quantity.
39	Boron minerals	California	Do.
29	Bromine	Texas, North Carolina, Michigan, California	Do.
38	Cadmium	Not separable by States	Not separable by States.
89	Calcite (Iceland spar)	Montana, California	Rank same as for quantity.
58	Calcium-magnesium chloride	Michigan, West Virginia, California, Ohio	Michigan, California, West Virginia, Ohio.
12	Cement	California, Pennsylvania, Texas, Indiana	Rank same as for quantity.
57	Chromite	California, Oregon, Alaska, Montana	Do.
	Clay:		
16	Products (other than pottery and refractories).		Ohio, Pennsylvania, California, Illinois.
27	Raw (sold or shipped by producers)	Pennsylvania, Missouri, Georgia, Ohio	Georgia, Pennsylvania, Missouri, Wyoming.
1	Coal:		
	Bituminous	West Virginia, Pennsylvania, Illinois, Kentucky	West Virginia, Pennsylvania, Kentucky, Illinois.
	Pennsylvania anthracite	Pennsylvania	Rank same as for quantity.
67	Cobalt	Pennsylvania, Missouri	Do.
5	Coke	Pennsylvania, Ohio, Indiana, New York	Pennsylvania, Indiana, Ohio, New York.
8	Copper	Arizona, Utah, Montana, New Mexico	Rank same as for quantity.
106	Corundum	South Carolina	Do.
51	Diatomite	California, Oregon, Nevada, Washington	Do.
104	Dumortierite	Nevada	Do.
87	Emery	New York	Do.
54	Feldspar (crude)	North Carolina, South Dakota, New Hampshire, Virginia	Do.
7	Ferro-alloys	Pennsylvania, New York, Ohio, West Virginia	Pennsylvania, New York, West Virginia, Ohio.
92	Flint lining for tube mills	Minnesota, North Carolina, Wisconsin	Rank same as for quantity.
33	Fluorspar	Illinois, Kentucky, Colorado, New Mexico	Do.
52	Fuller's earth	Texas, Georgia, Florida, Illinois	Georgia, Texas, Florida, Illinois.
78	Garnet (abrasive)	New York, Idaho	Rank same as for quantity.

See footnotes at end of table.

Mineral products of the United States and principal producing States in 1944—Continued

Rank in value	Product	Principal producing States: In order of quantity	Principal producing States: In order of value
(3)	Gems and precious stones	No canvass for 1944	No canvass for 1944.
98	Germanium	Not separable by States	Not separable by States.
22	Gold	Utah, Nevada, California, Arizona	Rank same as for quantity.
77	Graphite:		
	Amorphous	Rhode Island	Do.
	Crystalline	Texas, Alabama, Montana	Do.
76	Grindstones and pulpstones	Ohio, West Virginia	Do.
40	Gypsum (crude)	New York, Michigan, California, Iowa	New York, Michigan, California, Nevada.
63	Helium	Texas, Kansas, New Mexico	Rank same as for quantity.
74	Indium	Not separable by States	Not separable by States.
65	Iodine (natural)	California	Rank same as for quantity.
	Iron:		
6	Ore	Minnesota, Michigan, Alabama, New York	Do.
3	Pig	Pennsylvania, Ohio, Indiana, Illinois	Do.
82	Kyanite	Virginia	Do.
19	Lead	Missouri, Idaho, Utah, Colorado	Do.
20	Lime	Ohio, Pennsylvania, Missouri, West Virginia	Do.
69	Lithium minerals	North Carolina, South Dakota, California, Colorado	Do.
45	Magnesite (crude)	Washington, Nevada, California, Texas	Do.
17	Magnesium	Texas, Nevada, Ohio, Michigan	Do.
30	Magnesium compounds (natural)	Texas, Michigan, California, Nevada	Texas, Michigan, California, New Jersey.
35	Manganese ore	Montana, Nevada, California, Virginia	Rank same as for quantity.
48	Manganiferous ore	Minnesota, New Mexico, Michigan, Utah	Minnesota, New Mexico, Utah, Arkansas.
64	Manganiferous zinc residuum	New Jersey	Rank same as for quantity.
	Marl:		
84	Calcareous	Virginia, Michigan, Wisconsin, Illinois	Virginia, Michigan, West Virginia, Nevada.
73	Greensand	New Jersey	Rank same as for quantity.
43	Mercury	California, Oregon, Nevada, Idaho	Do.
46	Mica	North Carolina, Colorado, Georgia, South Dakota	North Carolina, New Hampshire, South Dakota, Idaho.
	Scrap	do	North Carolina, Georgia, New Hampshire, South Dakota.
	Sheet	North Carolina, New Hampshire, South Dakota, Connecticut.	North Carolina, New Hampshire, South Dakota, Idaho.
99	Millstones		North Carolina, Virginia, New York.
	Mineral pigments:		
36	Natural pigments and manufactured iron oxide pigments.	Pennsylvania, Illinois, New Jersey, Virginia	Pennsylvania, New Jersey, Illinois, Virginia.
24	Lead and zinc pigments	Pennsylvania, Illinois, Kansas, Ohio	Rank same as for quantity.
(3)	Mineral waters	No canvass for 1944	No canvass for 1944.
25	Molybdenum	Colorado, Utah, New Mexico, California	Colorado, Utah, New Mexico, Arizona.
4	Natural gas	Texas, Louisiana, California, Oklahoma	Texas, California, Louisiana, West Virginia.
10	Natural gasoline and allied products:		
	Natural gasoline and cycle products	Texas, California, Louisiana, Oklahoma	Rank same as for quantity.
	Liquefied petroleum gases	Texas, California, Illinois, Oklahoma	Do.
71	Nickel	Not separable by States	Not separable by States.
81	Oilstones, etc	Arkansas, Ohio, New Hampshire, Indiana	Rank same as for quantity.

93	Olivine	North Carolina	Do.
(4)	Ores (crude), etc.:		
	Copper	Arizona, Utah, New Mexico, Nevada	Value not available.
	Dry and siliceous (gold and silver)	Colorado, Nevada, Alaska, Idaho	Do.
	Lead	Missouri, Idaho, California, Arizona	Do.
	Lead-copper	Missouri, Idaho	Do.
	Zinc	Oklahoma, Kansas, Tennessee, Missouri	Do.
	Zinc-copper	Washington, Arizona, California	Do.
	Zinc-lead	Oklahoma, Kansas, Idaho, Missouri	Do.
	Zinc-lead-copper	Arizona, Utah	Do.
72	Peat	New Jersey, Illinois, Michigan, Pennsylvania	Michigan, New Jersey, Maine, Illinois.
83	Pebbles for grinding	Texas, Minnesota, North Carolina, Wisconsin	Rank same as for quantity.
2	Petroleum	Texas, California, Louisiana, Oklahoma	Do.
28	Phosphate rock	Florida, Tennessee, Montana, Idaho	Do.
60	Platinum metals	Alaska, Montana	Do.
23	Potassium salts	New Mexico, California, Utah, Maryland	Do.
66	Pumice	Kansas, California, Nebraska, New Mexico	California, New Mexico, Kansas, Nebraska.
53	Pyrites	Tennessee, California, Virginia, Montana	Tennessee, California, Virginia, New York.
96	Quartz crystal	Not separable by States	Not separable by States.
21	Salt	Michigan, New York, Ohio, Louisiana	Michigan, New York, Kansas, Louisiana.
13	Sand and gravel	California, Illinois, Michigan, Ohio	California, Illinois, Ohio, Pennsylvania.
61	Selenium	Not separable by States	Not separable by States.
80	Silica (quartz)	Washington, California, Wisconsin, North Carolina	California, Washington, North Carolina, Wisconsin.
47	Silica sand and sandstone (ground)	Illinois, New Jersey, Ohio, Pennsylvania	Illinois, Ohio, New Jersey, Pennsylvania.
26	Silver	Idaho, Utah, Montana, Arizona	Rank same as for quantity.
42	Slate		Pennsylvania, Vermont, New York, Maryland.
44	Sodium salts (carbonates and sulfates) (natural)	California, Texas, Wyoming	Rank same as for quantity.
11	Stone	Pennsylvania, Michigan, Ohio, Illinois	Pennsylvania, Ohio, Illinois, California.
91	Strontium minerals	Texas, California	Rank same as for quantity.
18	Sulfur	Texas, Louisiana	Do.
34	Sulfuric acid from copper, lead, and zinc smelters and zinc roasters.	Pennsylvania, Illinois, Tennessee, Indiana	Do.
100	Sulfur ore	Texas, Colorado	Do.
41	Talc, pyrophyllite, and ground soapstone [5]	New York, North Carolina, California, Vermont	New York, California, Vermont, North Carolina.
95	Tantalum and columbium ores	New Mexico, South Dakota, North Carolina, Virginia	Rank same as for quantity.
88	Tellurium	Not separable by States	Not separable by States.
86	Thallium	do	Do.
102	Tin	South Dakota, California, New Mexico, North Carolina	Rank same as for quantity.
	Titanium concentrates:		
37	Ilmenite	New York, Virginia, Florida, North Carolina	Do.
62	Rutile	Florida, Virginia, Arkansas	Do.
94	Topaz (industrial)	South Carolina	Do.
79	Tripoli	Illinois, Missouri, Pennsylvania, Arkansas	Do.
31	Tungsten ore	Idaho, California, Nevada, Colorado	Do.
56	Vanadium	Colorado, Utah, Idaho, Arizona	Do.
70	Vermiculite	Montana, Colorado, South Carolina, Wyoming	Do.
105	Wollastonite	New York	Do.
14	Zinc	Oklahoma, Idaho, New Jersey, Kansas	Oklahoma, Idaho, Kansas, New Jersey.
101	Zircon	Florida	Rank same as for quantity.

[1] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output. Compilation of rank for 1945 not yet available.
[2] Separate figures for antimonial lead from primary sources not available.
[3] No canvass for 1944. [4] Value not available. [5] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

States and their principal mineral products in 1944 [1]

State	Rank	Percent of total value for United States	Principal mineral products in order of value
Alabama	16	1.56	Coal, iron ore, cement, stone.
Alaska	39	.10	Coal, gold, platinum metals, stone.
Arizona	15	1.65	Copper, zinc, gold, silver.
Arkansas	24	.98	Petroleum, bauxite, coal, natural gas.
California	3	8.69	Petroleum, natural gas, natural gasoline, cement.
Colorado	21	1.15	Coal, molybdenum, zinc, gold.
Connecticut	43	.06	Magnesium, stone, sand and gravel, clay products.
Delaware	49	(2)	Clay products, sand and gravel, stone.
District of Columbia	50	(2)	Clay products.
Florida	33	.31	Phosphate rock, stone, cement, sand and gravel.
Georgia	34	.27	Raw clay, stone, clay products, cement.
Idaho	27	.73	Zinc, lead, silver, tungsten ore.
Illinois	5	4.74	Coal, petroleum, stone, sand and gravel.
Indiana	17	1.30	Coal, cement, petroleum, stone.
Iowa	31	.32	Coal, cement, stone, clay products.
Kansas	9	3.12	Petroleum, natural gas, zinc, coal.
Kentucky	7	3.96	Coal, natural gas, petroleum, stone.
Louisiana	6	4.13	Petroleum, natural gas, natural gasoline, sulfur.
Maine	46	.03	Sand and gravel, cement, stone, lime.
Maryland	36	.22	Coal, sand and gravel, cement, stone.
Massachusetts	41	.08	Stone, sand and gravel, lime, clay products.
Michigan	12	2.18	Iron ore, petroleum, salt, natural gas.
Minnesota	11	2.44	Iron ore, manganiferous ore, stone, sand and gravel.
Mississippi	35	.27	Petroleum, sand and gravel, clay products, raw clay.
Missouri	23	1.04	Lead, coal, zinc, lime.
Montana	18	1.27	Copper, petroleum, coal, natural gas.
Nebraska	42	.07	Sand and gravel, cement, stone, petroleum.
Nevada	26	.74	Copper, magnesium, zinc, gold.
New Hampshire	47	.02	Mica, feldspar, sand and gravel, clay products.
New Jersey	29	.48	Zinc, sand and gravel, clay products, iron ore.
New Mexico	14	1.79	Petroleum, potassium salts, copper, natural gas.
New York	19	1.25	Petroleum, iron ore, salt, zinc.
North Carolina	32	.32	Bromine, stone, clay products, mica.
North Dakota	44	.06	Coal, sand and gravel, natural gas, clay products.
Ohio	10	2.75	Coal, natural gas, stone, clay products.
Oklahoma	8	3.73	Petroleum, natural gas, zinc, natural gasoline.
Oregon	37	.14	Sand and gravel, stone, cement, clay products.
Pennsylvania	2	14.10	Coal, petroleum, natural gas, stone.
Rhode Island	48	.01	Sand and gravel, stone, graphite.
South Carolina	45	.06	Stone, raw clay, clay products, sand and gravel.
South Dakota	40	.08	Stone, raw clay, sand and gravel, mica.
Tennessee	25	.92	Coal, zinc, stone, cement.
Texas	1	18.91	Petroleum, natural gas, natural gasoline, sulfur.
Utah	13	2.14	Copper, coal, gold, zinc.
Vermont	38	.11	Stone, slate, talc, copper.
Virginia	20	1.25	Coal, stone, zinc, sand and gravel.
Washington	28	.52	Coal, cement, sand and gravel, magnesium.
West Virginia	4	8.56	Coal, natural gas, petroleum, natural gasoline.
Wisconsin	30	.33	Stone, iron ore, sand and gravel, zinc.
Wyoming	22	1.06	Petroleum, coal, natural gas, natural gasoline.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis. Compilation of rank for 1945 not yet available.
[2] Less than 0.01 percent.

Prices of gold, silver, copper, lead, and zinc, 1932–45 [1]

Year	Gold [2]	Silver [3]	Copper [4]	Lead [4]	Zinc [4]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1932	[5] $20.67+	$0.282	$0.063	$0.030	$0.030
1933	25.56	.350	.064	.037	.042
1934	34.95	[6] .646+	.080	.037	.043
1935	35.00	.71875	.083	.040	.044
1936	35.00	.7745	.092	.046	.050
1937	35.00	.7735	.121	.059	.065
1938	35.00	[6] .646+	.098	.046	.048
1939	35.00	[7] .678+	.104	.047	.052
1940	35.00	[8] .711+	.113	.050	.063
1941	35.00	[8] .711+	.118	.057	.075
1942	35.00	[8] .711+	.121	.067	.093
1943	35.00	[8] .711+	.130	.075	.108
1944	35.00	[8] .711+	.135	.080	.114
1945	35.00	[8] .711+	.135	.086	.115

[1] Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ per fine ounce. For table of prices for silver, copper, lead, and zinc from 1850 to 1931, by years, see Mineral Resources, 1931, pt. 1, p. A115.
[2] 1932: Legal coinage value; 1933–34: Yearly average weighted Government price; 1935–44: Price under authority of Gold Reserve Act of Jan. 31, 1934.
[3] 1932–33: Average New York price for bar silver; 1934 and 1938–45: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.
[4] Yearly average weighted price of all grades of primary metal sold by producers. Beginning 1942, price includes premiums paid to miners by the Government.
[5] $20.671835. [6] $0.64646464. [7] $0.67878787. [8] $0.71111111.

Pig	short tons	3,811,987	[2] 66,151,938	3,936,471	[2] 68,239,438	3,588,863	[2] 65,991,229
Lime	do	331,182	1,959,266	333,414	2,004,391	315,559	2,076,768
Manganese ore	do			49	(1)	32	(1)
Mica:							
Scrap	do	77	1,108	63	1,036		
Sheet	pounds	12,750	22,507	1,387	7,173	420	1,629
Mineral waters	gallons sold	(6)	(6)	(6)	(6)	(6)	(6)
Ore (dry and siliceous) (gold and silver)	short tons					400	(7)
Petroleum	barrels			43,000	(1)	181,000	(1)
Quartz crystal	pounds	(1)	(1)	(8)	(8)		
Sand and gravel	short tons	3,704,777	2,029,186	2,019,272	1,172,969	2,541,769	1,580,687
Silver	troy ounces					1	1
Stone	short tons	2,568,520	3,178,908	2,542,210	3,385,801	2,238,740	3,326,753
Miscellaneous [9]			17,427,758		16,573,667		12,163,970
Total value, eliminating duplications			102,584,000		109,149,000		111,158,000

[1] Value included under "Miscellaneous."
[2] Value not included in total value for State.
[3] Exclusive of puzzolan, value for which is included under "Miscellaneous."
[4] 1943–44: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945: Figures obtained through cooperation with Bureau of the Census.
[5] 1943–44: Sold or shipped; 1945: Sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[6] No canvass.
[7] Not valued as ore; value of recoverable metal content included under the metals.
[8] Figures not available.
[9] Includes minerals indicated by "1" and "3" above.

CALIFORNIA—Continued

Product	1943		1944		1945	
	Quantity	Value	Quantity	Value	Quantity	Value
Ores (crude), etc.:						
Copper...short tons	265, 526	(7)	556, 378	(7)	311, 326	(7)
Dry and siliceous (gold and silver)...do	412, 793	(7)	135, 597	(7)	173, 225	(7)
Lead...do	49, 038	(7)	39, 081	(7)	26, 053	(7)
Zinc...do	8, 428	(7)	69, 204	(7)	60, 105	(7)
Zinc-copper...do	3, 435	(7)	90, 059	(7)	112, 861	(7)
Zinc-lead...do	736	(7)	35, 634	(7)	34, 399	(7)
Peat...do	3, 677	$21, 365	4, 041	$27, 895	5, 192	$46, 635
Pebbles for grinding...do	(1)	(1)	(1)	(1)	(1)	(1)
Petroleum...barrels	284, 188, 000	298, 400, 000	311, 793, 000	330, 800, 000	326, 482, 000	347, 330, 000
Platinum metals (crude)...troy ounces	62	(1)			43	(1)
Potassium salts...short tons	(1)	(1)	(1)	(1)	(1)	(1)
Pumice...do	25, 490	160, 441	31, 409	245, 898	75, 238	481, 664
Pyrites...long tons	(1)	(1)	(1)	(1)	(1)	(1)
Quartz crystal...pounds	(1)	(1)	(3)	(3)		
Salt (sodium chloride)...short tons	596, 015	2, 839, 560	712, 558	3, 138, 185	694, 609	3, 424, 711
Sand and gravel...do	29, 025, 759	18, 548, 747	24, 228, 499	15, 171, 652	21, 599, 950	15, 176, 259
Sand and sandstone (ground)...do	(1)	(1)	(1)	(1)	(1)	(1)
Silica (quartz)...do	(1)	(1)	(1)	(1)	(1)	(1)
Silver...troy ounces	609, 075	433, 120	778, 936	553, 910	986, 798	701, 723
Slate		(1)		80, 959		(1)
Sodium salts (carbonates and sulfates) (natural)...short tons	257, 426	3, 146, 738	288, 012	3, 566, 183	(1)	(1)
Stone...do	8, 231, 250	6, 595, 799	[8] 9, 909, 680	[8] 9, 987, 362	9, 636, 810	8, 554, 461
Strontium minerals...do	(1)	(1)	(1)	(1)	(1)	(1)
Sulfuric acid (60° B.)[9]...do	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)
Talc, pyrophyllite, and ground soapstone...do	58, 003	912, 291	65, 191	1, 054, 312	75, 564	1, 098, 936
Tin (metallic equivalent)...do	(1)	(1)	2	1, 970		
Tungsten ore (60-percent concentrates)...do	3, 871	5, 805, 960	3, 027	4, 558, 545	1, 073	1, 488, 289
Zinc...do	1, 856	400, 896	8, 455	1, 927, 740	9, 923	2, 282, 290
Miscellaneous[10]		43, 980, 494		43, 704, 640		23, 312, 132
Total value, eliminating duplications		565, 441, 000		607, 302, 000		627, 306, 000

[1] Value included under "Miscellaneous."
[2] Value not included in total value for State.
[3] Figures not available.
[4] 1943–44: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945: Figures obtained through cooperation with Bureau of the Census.
[5] 1943–44; Sold or shipped; 1945: Sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[6] No canvass.
[7] Not valued as ore; value of recoverable metal content included under the metals.
[8] Exclusive of marble, value for which is included under "Miscellaneous."
[9] From lead smelting.
[10] Includes minerals indicated by "1" and "8" above.

Miscellaneous [11]		----	3,105,947	----	2,046,610	----	1,732,895
Total value, eliminating duplications		----	123,805,000	----	124,827,000	----	116,508,000

[1] Figures not available.
[2] Value included under "Miscellaneous."
[3] 1943–44: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945: Figures obtained through cooperation with Bureau of the Census.
[4] 1943–44: Sold or shipped; 1945: Sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[5] No canvass.
[6] Figures cover fiscal year ended June 30 of year stated.
[7] Not valued as ore; value of recoverable metal content included under the metals.
[8] Equivalent as K_2O.
[9] "Commercial." Value of "Government-and-contractor" included under "Miscellaneous."
[10] Exclusive of granite in 1943 and of sandstone in 1944, value for which is included under "Miscellaneous."
[11] Includes minerals indicated by "2," "9," and "10" above.

Total value, eliminating duplications		254,642,000		260,832,000		282,859,000

[1] Value included under "Miscellaneous."

[2] 1943–44: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945: Figures obtained through cooperation with Bureau of the Census.

[3] 1943–44: Sold or shipped; 1945: Sold or used; value of clay used in cement and heavy clay products not included in total value for State.

[4] No canvass.

[5] Not valued as ore; value of recoverable metal content included under the metals.

[6] From zinc smelting.

[7] Value not included in total value for State.

[8] Includes minerals indicated by "1" above.

Tripoli (rottenstone)......do....	(4)	(4)	(4)	(4)	561	8,452
Miscellaneous [10]		26,316,308		24,626,924		22,181,938
Total value, eliminating duplications		889,077,000		985,464,000		930,113,000

[1] Exclusive of natural cement, value for which is included under "Miscellaneous."
[2] 1943–44: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945: Figures obtained through cooperation with Bureau of the Census.
[3] 1943–44: Sold or shipped; 1945: Sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[4] Value included under "Miscellaneous."
[5] Value not included in total value for State.
[6] Copper, gold, and silver were recovered from magnetite-pyrite-chalcopyrite ore, which is included as iron ore produced. Bureau of Mines not at liberty to publish figures.
[7] No canvass.
[8] Exclusive of dimension basalt in 1943 and of crushed granite in 1944 and 1945, value for which is included under "Miscellaneous."
[9] From zinc smelting.
[10] Includes minerals indicated by "1," "4," and "8" above.

Strontium minerals ..... do	[1]	[1]				
Sulfuric acid (60° B.) [8] ..... do	[1 2]	[1 2]	[1 2]	[1 2]	[1 2]	[1 2]
Zinc ..... do	41,766	9,021,456	40,831	9,309,468	33,824	7,779,520
Miscellaneous [9]		64,836,623		54,324,215		46,155,760
Total value, eliminating duplications		64,485,000		63,998,000		60,199,000

[1] Value included under "Miscellaneous."
[2] Value not included in total value for State.
[3] 1943–44: Estimate by Bureau of Mines based on figures issued by Bureau of the Census covering certain classes of clay products; 1945: Figures obtained through cooperation with Bureau of the Census.
[4] 1943–44: Sold or shipped; 1945: Sold or used; value of clay used in cement and heavy clay products not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included under the metals.
[7] Exclusive of crushed sandstone, value for which is included under "Miscellaneous."
[8] From copper smelting.
[9] Includes minerals indicated by "1" and "7" above.

PART II. METALS

GOLD AND SILVER

By Charles White Merrill

SUMMARY OUTLINE

SUMMARY

Gold mining in the United States experienced more adverse effects from United States participation in World War II than any other large mineral industry. The ending of hostilities in 1945 at first gave promise of a speedy revival of the industry. War Production Board Order L–208 was rescinded, effective July 1, priority limitations on mining machinery were relaxed, and regulations curtailing the labor supply available to gold mines were revoked. The industry, however, responded very sluggishly to the returning freedom.

Although regulations affecting silver mining were not as harsh as those for gold, nevertheless domestic silver production declined uninterruptedly during World War II. War demand stimulated base-metal mining from which much domestic silver is a byproduct. Many of the increases in base-metal output, however, came from large low-grade mines where the silver content of the ores was very low, while production lagged at smaller base-metal mines where much of the byproduct silver is recovered. Gold mining is a substantial source of byproduct silver in the United States; WPB Order L–208, in suspending most gold-mining operations, reduced silver output as well.

Mine production of gold in the United States was 4 percent lower in 1945 than in 1944. Most States and districts in which gold was a byproduct of base-metal mining showed substantial decreases due to the reduction of copper, lead, and zinc outputs resulting largely from labor shortages. The declines at base-metal mines, however, were partly counterbalanced by large increases in some areas depending largely on straight gold ores and placers; South Dakota gold output increased 44,327 ounces or 381 percent, California 30,565 ounces or 26 percent, Alaska 18,821 ounces or 38 percent, Washington 10,583 ounces or 22 percent, and Oregon 3,098 ounces or 226 percent.

An analysis of 1945 gold production by methods of recovery reveals that over half the output was recovered by smelting of concentrates, whereas in prewar years amalgamation and cyanidation accounted for most of the lode gold produced. This shift was a result of the emphasis on base-metal mining and the curtailment of production at mines producing dry and siliceous gold ores.

Placer mining, which had experienced severe curtailment during the war, responded to relief from WPB Order L-208 more promptly than lode mining. Many placer operators found resumption of production easier than lode-mine operators because the placer mines and their equipment had deteriorated less and because the properties accounting for the bulk of the placer gold were near population centers and the recruitment of labor forces was thus facilitated.

Silver production, because the metal is closely associated with base metals in so many ores, had more nearly followed the course of base-metal output during the war period. Nevertheless, labor shortages and other difficulties had affected production adversely, with the result that the 1945 silver output was only 29,024,197 fine ounces, 40 percent of the recent record of 71,824,746 ounces produced in 1940.

Owing to restrictions on the international movement of gold and silver and the measures taken by governments to stabilize the exchange value of currencies, gold and silver lost much of their monetary significance. The eagerness of individuals to acquire the metals, however, appears to have increased, particularly where the monetary regulations were the most arbitrary. The press reported very high prices for both metals in a number of foreign markets. These prices were sustained, however, by various government regulations that restricted the movement of metals to the markets and the conversion of the proceeds of sales to the national currency of the seller. Moreover, some of the reported trading was being conducted in black markets. The reports of high gold prices led some domestic producers to advocate regulations under the Gold Reserve Act that would permit the free export of gold. Free export, however, would not insure profitable access to foreign markets because foreign gold import laws in most, if not all instances, provided that the gold be received by the foreign treasury or state bank; the price to be paid for it when exchanged was not to exceed $35 a fine ounce. Export of silver like that of gold did not offer domestic producers any prospect of profit over what could be derived from local sale.

The Treasury buying prices of $35 per fine ounce for gold and $0.7111+ per fine ounce for domestically mined silver remained unchanged throughout 1945. The Office of Price Administration fixed the ceiling price for domestically mined silver at $0.7111+ an ounce and of foreign silver at $0.45. On September 21, however, the OPA ceiling on foreign silver was raised to equal that for domestic silver.

The outflow of gold and silver from the United States in 1944, after a decade in which imports regularly exceeded exports, continued in 1945 but at a reduced rate. The net loss of gold in 1945 was worth $106,249,890, compared with $845,391,564 in 1944; comparable figures for silver were $63,658,505 and $103,542,307, respectively.

Salient statistics of gold and silver in the United States,[1] 1941–45

	1941	1942	1943	1944	1945
Mine production, fine ounces:					
Gold	4, 750, 865	3, 457, 110	1, 363, 815	998, 394	954, 572
Silver	67, 258, 997	54, 090, 765	41, 460, 826	34, 473, 540	29, 024, 197
Number of mines producing gold and silver:					
Lode	4, 542	2, 619	1, 394	1, 186	1, 112
Placer	3, 349	1, 758	362	367	440
Ore (dry and siliceous) produced (short tons):					
Gold ore	15, 117, 117	9, 487, 907	3, 766, 149	1, 964, 680	1, 364, 308
Gold-silver ore	1, 447, 371	1, 163, 970	553, 566	364, 698	276, 530
Silver ore	1, 074, 543	996, 823	643, 271	290, 297	343, 458
Percentage derived from—					
Dry and siliceous ores:					
Gold	55	50	38	30	30
Silver	41	37	26	17	24

LEGISLATION AND REGULATIONS

Although some new legislation was proposed during 1945, the principal changes in law and wartime regulations affecting gold and silver took the form of expiration of legislation and the rescinding of regulations. Several WPB Orders were revoked during the year Amendments removed limitations on the use of silver for uses classified as nonessential, but the revocation that affected the industry most widely was the rescission of Limitation Order L–208, which had forced most gold mines to lie idle after October 8, 1942. Before the order was rescinded, however, its restrictions had been relaxed to some extent by WPB grants to individual operators, which permitted operation of specified mines, usually on a severely curtailed basis. For example, one lode gold mine was granted permission to hire up to 175 men compared with a prewar crew averaging 1,000, and a dredge was granted permission to operate on a one-shift basis.

The Green Act, which permitted the sale of Treasury-held silver at 71.11+ cents an ounce for war and certain other purposes, expired December 31, 1945, before a bill extending the sale authority had been acted upon by the Congress. Legislation proposed but not passed during 1945 included bills providing relief for miners who had experienced losses attributable to Government action during the war, one particularly for gold mines closed by Order L-208, and bills authorizing silver purchase by the Treasury at prices exceeding 71.11+ cents an ounce.

Presidential approval on June 12, 1945, of an Act of Congress amending the Federal Reserve Act permitted reduction in the gold-reserve requirements of Federal Reserve banks against Federal Reserve notes in circulation and deposit liabilities from 40 to 25 percent. Thus, the need for additional gold to back rapidly expanding money requirements of the United States was sharply reduced, and a growing pressure for a higher price for gold or a lower price and wage level was relieved at least temporarily.

INTERNATIONAL MONETARY AGREEMENTS

The agreements formulated by the representatives of 44 nations at Bretton Woods, N. H., in July 1944 were in the process of ratification by the governments of the participating nations during 1945. Two of the most-important institutions created by the conference were the International Monetary Fund and an International Bank for Reconstruction and Development. The aims of the Fund are to promote exchange and currency stability as a means of restoring world trade; to establish a procedure for devaluating exchange when necessary; to eliminate such destructive practices as indiscriminate exchange restrictions, multiple currency practices, and bilateral clearing agreements; to assure member countries that the proceeds of sales to any one member can be used for the purchase of goods from any other member; and to reestablish international currencies on a gold basis, seemingly as a form of modified gold standard.

The Fund is intended to operate on a short-loan basis, to provide a revolving fund to meet temporary shortages in the balance of payments of the member countries. It was pointed out that such a fund cannot be used in the hope of curing the basic economic ills of a nation but at best can only tide over the country for the time being and that in the final analysis currency stability is not a matter of monetary mechanisms alone but depends primarily on a stable government and sound internal economic policies.

Holdings for the Fund would be built through assigned member quotas in gold and national currencies and would total $8,800,000,000 for the countries represented at the conference. The gold part of the subscription would be a minimum of 25 percent of the country's quota or 10 percent of its net official holdings of gold and United States dollars, whichever is smaller. The quota of the United States was placed at $2,750,000,000, of which about $687,500,000 would be required in gold.

Participation of the United States was authorized by the Bretton Woods Act approved by the President July 31, 1945. The Fund and the Bank came into existence on December 27, 1945, when the agreements were signed in Washington on behalf of governments contributing approximately 80 percent of the total subscriptions. Several others signed before the end of the year. Of the 44 governments that were eligible to sign before December 31 and become original members of the Fund and Bank, only 9 did not do so; they were Russia, Australia, New Zealand, Venezuela, Haiti, El Salvador, Nicaragua, Panama, and Liberia. Colombia signed the Fund Agreement but not the Bank Agreement.

The provisions of the Bretton Woods Agreement for the use of gold in international monetary transactions appeared to be an important move toward reestablishment of gold's historic function in international trade. During the war period the conversion of currencies to gold and the international movement of gold had been very severely restricted. In fact, even before the declaration of war in September 1939 the barter procedures in carrying on international trade had relegated gold to a subsidiary position in large areas where much of the world's trade is generated. The Agreement gave silver little monetary recognition.

DOMESTIC PRODUCTION

Production of gold and silver in the United States is measured at mines and at refineries. Both measures are tabulated by States of origin, but there is a small annual variation between them explained largely by time lag. Over a period of years the variations are found to be negligible. Compared with the mine reports compiled by the Bureau of Mines, the refinery reports compiled by the Bureau of the Mint in cooperation with the Bureau of Mines for the 41 years, 1905 to 1945, show a total excess of gold of 312,482 ounces (a difference of 0.22 percent) and a total excess of silver of 13,478,268 ounces (a difference of 0.58 percent).

Gold and silver produced in the United States, 1905–45, in fine ounces, according to mint and mine returns, in terms of recovered metals

Year	Mint		Mine	
	Gold	Silver	Gold	Silver
1905–40	130, 928, 821	2, 095, 399, 365	130, 852, 038	2, 088, 172, 477
1941	5, 976, 419	72, 336, 029	5, 881, 798	68, 483, 333
1942	3, 741, 806	56, 090, 855	3, 615, 836	54, 321, 962

1945	928, 893	29, 063, 255	954, 572	29, 024, 197
	143, 992, 699	2, 329, 440, 674	143, 680, 217	2, 315, 962, 406

MINE PRODUCTION

Domestic gold and silver production depended largely on base-metal output in 1945. This dependency had characterized silver production for many years as a result of the peculiar nature of argentiferous ores. Rising costs and WPB Order L–208 closed most mines worked principally for gold, with the result that byproduct gold from base-metal (principally copper, lead, and zinc) mining has accounted for over half the gold output since 1942 for the first time on record.

717372—47——7

Although Order L-208 was rescinded, effective July 1, gold mining made only moderate headway during the remaining 6 months of 1945. The gold output during the last quarter of the year exceeded that for the first quarter by 44 percent. However, the rate of production during the last quarter was only 25 percent of that for the all-time peak year 1940.

Silver production also declined during the war period despite great efforts to stimulate output at base-metal mines, many of which produced silver-bearing ore. This downward trend became pronounced during the latter part of 1945, when the efforts to produce copper, lead, and zinc slackened. The decline at the base-metal mines, however, was general, owing to persistent labor, equipment, and supply shortages. Moreover, the importance of small base-metal mines where silver commonly makes up a large proportion of the revenue decreased in comparison with the large-tonnage mines, treating low-grade ore (usually low silver) where mechanization permitted a high yield of base metal per man employed.

Production and value of gold and silver in the United States, in 1945, by months

	Gold		Silver	
	Fine ounces	Value	Fine ounces	Value
January	66,686	$2,334,010	2,600,214	$1,849,041

	954,572	33,410,020	29,024,197	20,639,429

UNITS OF MEASUREMENT

All tonnage figures are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. Figures in cubic yards used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before excavation. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated upon the basis of recovered and recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced. Prices of gold and silver are discussed in a later section of this report.

NUMBER OF MINES

The following table indicates the number of mines that produced gold and silver in 1944 and 1945. The placers are those in which gold and silver in natural alloy and, in a few placers, platinum are recovered from gravel. Except for such small-scale hand methods as those utilizing the gold pan, the rocker, or the dry washer, all recovery methods employ sluice boxes; methods are distinguished by the means used for delivering the gravel to the sluices. Those methods where gravel is delivered mechanically include connected-bucket dredging, dragline dredging, and treatment in nonfloating washing plants of gravel delivered by power shovel, dragline excavator, truck, slackline scraper, or other mechanical means. In the hydraulic method the gravel is mined from the bank by a powerful jet of water; in some small-scale hand methods the gravel is shoveled into sluices; and in drift operations the gravel is mined underground and delivered to sluices at the surface. The lode mines are those yielding gold and silver from ore as distinguished from gravel, mainly from underground workings, and include those that yield ore mined chiefly for copper, lead, zinc, or other metals but that contribute the precious metals as byproducts. As far as possible the unit is not the operator but the mining claim or group of claims.

Number of mines in the United States producing gold or silver, 1944–45, by States

State	Lode		Placer		Total

PRINCIPAL MINING DISTRICTS AND LEADING MINES

One of the anomalies of war economy has been the emergence of a copper district, West Mountain (Bingham), Utah, as the leading gold producer in the United States, surpassing Lawrence County (Lead), S. Dak., in 1943, 1944, and 1945. In fact, of the four leading districts in 1945 three accounting for 35 percent of the United States total output of gold were classified as copper districts.

Mine production of recoverable gold in the United States, by districts that produced 15,000 fine ounces or more during any year, 1941–45, in fine ounces [1]

[1] Exclusive of Alaska.
[2] Bureau of Mines not at liberty to publish.

The leading silver districts for many years have included many more noted for base-metal output than silver yield. Although the war demand for copper, lead, and zinc brought out much byproduct silver, the general order of districts was not nearly so disturbed by war as in the gold list.

Mine production of recoverable silver in the United States by districts that produced 200,000 fine ounces or more during any year, 1941–45, in fine ounces

(1) Bureau of Mines not at liberty to publish.

The 25 leading gold-producing mines were almost evenly divided between gold mines and base-metal mines; of the gold mines three were placers, all using connected-bucket dredges. The 5 leading mines contributed 40 percent of the total gold produced in the United States in 1945; the 10 leading mines accounted for 53 percent; and the list of 25, 70 percent.

Only 4 of the 25 leading silver-producing mines depended exclusively on silver ore; ores valuable chiefly for copper, lead, zinc, and gold accounted for most of the silver production. The 5 leading mines contributed 36 percent of the total silver produced in the United States in 1945; the 10 leading mines, 48 percent; and the list of 25, 65 percent. As several operators worked more than one of the leading silver mines as well as smaller producers, the output of silver by companies was substantially more concentrated than by mines.

Twenty-five leading gold-producing mines in the United States in 1945, in order of output

Rank	Mine	District	State	Operator	Source of gold
1	Utah Copper	West Mountain (Bingham)	Utah	Utah Copper Co	Copper ore.
2	Homestake	Whitewood	South Dakota	Homestake Mining Co	Gold ore.
3	Holden	Chelan Lake	Washington	Howe Sound Co	Zinc-copper ore.
4	Yuba unit	Yuba River	California	Yuba Consolidated Gold Fields	Dredge.
5	Ruth and Copper Flat pit	Robinson (Ely)	Nevada	Kennecott Copper Corp	Copper ore.
6	Natomas	Folsom	California	Natomas Co	Dredge.
7	Cripple Creek mines	Cripple Creek	Colorado	Golden Cycle Corp	Gold ore.
8	New Cornelia	Ajo	Arizona	Phelps Dodge Corp	Copper ore.
9	Idaho Maryland Brunswick	Grass Valley-Nevada City	California	Idaho Maryland Mines Corp	Gold ore.
10	Dives group and Silver Lake group	Animas	Colorado	Shenandoah-Dives Mining Corp	Gold-silver ore, gold ore.
11	Knob Hill	Republic	Washington	Knob Hill Mines, Inc	Gold ore.
12	Coppermines group	Robinson (Ely)	Nevada	Consolidated Coppermines Corp	Copper ore.
13	United States and Lark	West Mountain (Bingham)	Utah	U. S. Smelting, Refining & Mining Co.	Zinc-lead ore, gold-silver ore, lead ore.
14	Copper Queen	Warren (Bisbee)	Arizona	Phelps Dodge Corp	Copper ore, lead ore, zinc-lead ore.
15	Park Galena & Mayflower	Park City	Utah	New Park Mining Co	Zinc-lead ore, silver ore.
16	Smuggler Union	Upper San Miguel	Colorado	Telluride Mines, Inc	Gold ore.
17	Getchell	Potosi	Nevada	Getchell Mine, Inc	Do.
18	Butte mines	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Copper ore, silver ore, zinc ore.
19	Manhattan dredge	Manhattan	Nevada	Manhattan Gold Dredging Co	Dredge.
20	Goldacres	Bullion	do	Willow Creek Mines, Inc	Gold ore.
21	United Verde	Verde	Arizona	Phelps Dodge Corp	Copper ore.
22	Tintic Bullion	Tintic	Utah	North Lily Mining Co	Gold ore, zinc-lead ore.
23	Empire Star group	Grass Valley-Nevada City	California	Empire Star Mines Co., Ltd	Gold ore.
24	Resurrection group	California (Leadville)	Colorado	Resurrection Mining Co	Zinc-lead ore, gold ore.
25	Jardine	Sheepeater	Montana	Jardine Mining Co	Gold ore.

Twenty-five leading silver-producing mines in the United States in 1945, in order of output

Rank	Mine	District	State	Operator	Source of silver
1	Butte mines	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Copper ore, silver ore, zinc ore.
2	Utah Copper	West Mountain (Bingham)	Utah	Utah Copper Co	Copper ore.

[1] Philippine Islands and Puerto Rico excluded.

ORE PRODUCTION, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

A better index of lode mining than the number of mines or operators is the quantity and metallic content of ore mined. The following tables give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that yielded gold and silver in the United States (excluding the Philippine Islands and Puerto Rico) in 1945. These tables were compiled from the individual State chapters in this volume; the chapters contain additional data on the subject.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and smelter recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in recovery of metals and the lowering of grade of complex ores treated, accomplished by improved mill concentration processes. A "dry" ore is one that carries so little lead or copper that by itself it would not satisfy the requirements for the smelter charge in either lead smelting or copper smelting. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present), or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; an ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) range from 16 to 45 percent zinc; zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated. The smelter classification applies to concentrates.

[1] Illinois, Michigan, Missouri, Philippine Islands, and Puerto Rico excluded.
[2] Less than 0.0005 ounce per ton.
[3] A small quantity of lead ore included with zinc-lead ore.
[4] Includes 92,266 tons of old lead-smelter slag.
[5] Includes 25,711 tons of old lead-smelter slag.
[6] Includes 79,413 tons of old lead-smelter slag.
[7] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

Gold, gold-silver, and silver ores containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed ores are called "dry" ores regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly, the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes its name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry ores" thus, by elimination, include ores, chiefly siliceous, valuable for their gold and silver content and, in some instances, for their fluxing properties, regardless of method of treatment. Dry gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made on a basis of value, using the rule that the metal of lower value is not used in the bimetal classification unless its value equals or exceeds one-quarter of the combined value of the gold and silver.

The lead, zinc, and zinc-lead ores in most districts in the Eastern and Central States carry no appreciable quantity of gold or silver; such ores are excluded from this report unless otherwise indicated.

Mine production of gold in the United States, 1941–45, by percent from sources and in total fine ounces [1]

[1] Illinois, Michigan, Missouri, Philippine Islands, and Puerto Rico excluded.
[2] Less than 0.005 percent.
[3] Includes 23,464 tons of sands, slimes, and concentrates derived from ore amalgamated, cyanided.
[4] Comprises 131,076 tons of sand and slimes from ore first roasted and amalgamated and 78,812 tons of selective-flotation tailings.

PLACERS

Most of the placer gold output is obtained from gravels handled by connected-bucket floating dredges. In 1945 this method accounted for 84 percent of the total output from placers in the United States compared with 83 percent in 1944 and 69 percent in 1943. The quantity of gold recovered by dredges from the inception of the industry as a commercial factor in 1896 to the end of 1945 is recorded as 19,440,448 ounces, originating by States as follows: California, 11,787,158 ounces; Alaska, 5,237,783 (including the production from single-dipper dredges and some gold by hydraulicking); Montana, 717,425; Idaho, 613,864; Oregon, 470,809; Colorado, 462,491; other States, 150,918.

The following table shows the gold produced in the United States by connected-bucket floating dredges in 1941–45.

Additional information on placer mining may be found in the State reviews in this volume.

Gold produced in the United States by connected-bucket floating dredges, 1941–45, in fine ounces

Year	Dredges	California	Alaska	Other States [1]	Total
1941	123	418,282	307,087	141,636	867,005
1942	102	310,937	249,868	128,264	689,069
1943	21	66,999	18,554	24,373	109,926
1944	17	64,925	26,280	10,774	101,979
1945	36	88,318	34,885	31,269	154,472

[1] Colorado, Idaho, Montana, Nevada, and Oregon.

REFINERY PRODUCTION

The figures in the following table were obtained through cooperation between the United States Bureau of the Mint and the Bureau of Mines and were agreed upon after conference and adjustment between the two Bureaus.

The State totals are based upon bullion deposits in the United States mints and assay offices and upon returns to the Bureau of the Mint from smelting and refining companies. The State distribution is adjusted further by the Bureau of Mines from its geographical records of sources and production, both historical and current, from the producing mines and is tabulated for the mine reports. The data for the total production and in part for the distribution are obtained from records of (1) the unrefined domestic gold and silver deposited in the United States mints and assay offices; (2) the domestic gold and silver in fine bars reported by private refineries, supplemented by data of content of unrefined mattes, blister copper, copper anodes, and lead bullion; and (3) the unrefined domestic gold and silver contained in ore and matte exported for reduction. The last item is small.

Gold and silver produced in the United States, 1941–45, and approximate distribution of source, by States and Territories, in 1945

[Refinery figures supplied by U. S. Bureau of the Mint]

State or Territory	Gold[1]		Silver[2]	
	Fine ounces	Value	Fine ounces	Value

[1] From Report of the Director of the Mint. The estimates for 1792–1873 are by R. W. Raymond, Commissioner of Mining Statistics, Treasury Department, and since then, by the Director of the Mint.
[2] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto, at $20.67+ per fine ounce. Dollar figures are rounded.
[3] Silver valued in 1934 and thereafter at Government's average buying price for domestic product: In 1934 and 1938, at $0.64+ per fine ounce; in 1935, at $0.71875; in 1936, at $0.7745; in 1937, at $0.7735; in 1939, at $0.678787+, and in 1940–45, at $0.7111+.

CONSUMPTION AND USES IN INDUSTRY AND THE ARTS

Monetary use has claimed by far the largest part of the gold and silver output through the years, but this use to a large extent takes the form of stock-piling in Government and private hoards which are available to industry and the arts without smelter or refinery preparation. In contrast, the gold and silver entering industry and the arts are consumed much as are other metals, any return as secondary metal requiring the usual channels of collection, smelting, and refining. The consumption of gold and silver in the arts antedates written history, but industrial use of these two metals is a recent development.

Gold.—The arts require a much larger quantity of gold than does industry, but its corrosion-resistant and other properties have resulted in some industrial demand. Consumption in the arts increased rapidly during the war. A high war-stimulated marriage rate and widespread prosperity have increased the sale of jewelry, watches, and many luxury items made from gold.

Net industrial consumption of gold and silver in the United States, 1941–45 [1]

Year	Gold (dollars)			Silver (fine ounces)		
	Returned from industrial use	Issued for industrial use	Net industrial consumption	Returned from industrial use	Issued for industrial use	Net industrial consumption
1941	30,975,490	67,977,110	37,001,620	20,361,256	92,793,574	72,432,318
1942	28,447,685	75,742,495	47,294,810	30,020,529	131,419,224	101,398,695

[1] U. S. Bureau of the Mint.

Silver.—The annual consumption for war and other essential uses, based on consumption during the first 6 months of 1945, was estimated to exceed 110,000,000 ounces of silver. In addition, consumption for jewelry and silverware was estimated to be nearly 20,000,000 ounces. Solders and brazing alloys, used extensively in much important military equipment, occupied first place. Following closely for war purposes were photographic applications, electrical appliances, engine bearings, and military insignia. Appreciable quantities continued to be absorbed in making eating utensils for the armed forces, desalination equipment, and dental and medical supplies.

For allocation, the War Production Board divided silver into three classes: Treasury, domestic, and foreign. Treasury silver was eligible for engine bearings, official military insignia, solders and brazing alloys, identification neck chains, and desalination kits. Domestic silver was permitted in silverware, jewelry, watch cases, church articles, pens and pencils, mirrors, and other items classed as nonessential. Foreign silver was limited to photographic uses, electrical appliances, medical and dental supplies, and other items and processes carrying preference ratings.

Prosperity increased the demand for silver as well as gold. Under the Green Act Treasury silver was made available to silversmiths and manufacturing jewelers. The 1945 demand exceeded the current output of domestic mines, and the difference was supplied from the Treasury under the Green Act. The authority to release silver at 71.11+ cents an ounce granted by the Green Act was not renewed when that Act expired December 31, 1945, and silver consumers faced a serious raw-material problem for 1946; the Office of Price Administration ceiling of 71.11+ cents an ounce did not attract foreign silver to the United States market because the foreign price exceeded this level.

Consumption of silver in the arts and industries in the United States, by sources, 1944 and 1945 [1]

Source of silver	Fine ounces	
	1944	1945
Bar payment in exchange for bullion at mints and assay offices	154,196	183,925
Bar sales under Green Act by mints and assay offices [2]	38,287,082	81,560,599
Silver in various forms issued by private refiners and dealers [3]	137,770,787	102,606,868
United States silver coin (estimated)	77,344	309,375
Total	176,289,409	184,660,767
Old jewelry, plate, scrap, etc., returned to private refiners and dealers, and to monetary use	56,189,409	58,360,767
Net new silver used in industry	120,100,000	126,300,000

[1] U. S. Bureau of the Mint.
[2] Excludes silver sold under Green Act for monetary use.
[3] Excludes silver purchased from mints and assay offices under Green Act.

MONETARY STOCKS

Gold holdings of the United States dropped $554,000,000 (3 percent) from $20,619,000,000 on January 1, 1945, to $20,065,000,000 on January 1, 1946, according to the Federal Reserve Bulletin. Total world reserves are not positively known, inasmuch as data are not available from some countries, including the United Kingdom, Germany, Italy, Japan, Australia, and Russia. However, the Federal Reserve System estimates the total at about $35,000,000,000, of which over 57 percent is held by the United States.

Increases in foreign gold reserves have been rapid since the United States entered the war late in 1941, largely because United States war purchases abroad so greatly exceeded commercial exports in value. During this period foreign reserves have increased nearly $5,000,000,000, and United States reserves have declined over $2,500,000,000. Sharing prominently in the increase are Switzerland, Sweden, Turkey, Iran, Spain, South Africa, and the Latin American countries. As a result, many foreign countries entered the postwar period well-supplied with gold, and these reserves promise to be an element of strength in rehabilitating world trade on a peacetime basis.

United States Treasury silver holdings declined 340,000,000 fine ounces during 1945 to 2,005,182,232 ounces. Not included in the holdings are 410,814,344 ounces released under lend-lease agreements that provide for return of the silver.

IMPORTS AND EXPORTS [1]

The large excesses of exports over imports of both gold and silver in 1944 were greatly reduced in 1945. The production of domestic mines replaced only part of the net import-export losses with the result that total stocks of both gold and silver declined.

[1] Figures compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[1] Excess of exports.

PRICES

Since January 1934 the price of gold at the United States Mint has been \$35 per fine troy ounce; the price of domestic silver mined after July 1, 1939, was fixed at \$0.711+ per ounce on July 6, 1939. A complete account of regulations pertaining to gold and silver in 1933–34 is given in the chapter on Gold and Silver in Minerals Yearbook, 1934.

According to the Director of the Mint, the following prices for silver prevailed in London and New York throughout 1944: London price per ounce, 0.925 fine, 23.5 d.; exchange, New York on London, \$4.0350; United States equivalent, per fine ounce, of London price at current rate of exchange, \$0.42713; New York price of fine bar silver, \$0.45062. On January 1, 1945, the price was increased to 25.5 d., a level that was maintained until August, when the price became unsettled. On September 24 the London price was raised to 44.00 d. in response to the increase in the OPA ceiling price for foreign silver in the United States to 71.11+ cents a fine ounce; it remained unchanged until December 31.

Domestic consumers at the beginning of 1945 obtained their silver supplies from sources completely under Government control. Foreign silver at 45 cents an ounce was available for specified uses. Silver released from the Treasury under the Green Act at 71.11+ cents an ounce was also available for purposes approved by the Government. Domestic newly mined silver, which was under an OPA price ceiling of 71.11+ cents an ounce, was distributed on a quota basis for consumption in uses classified as nonessential under WPB Order M–199. The quotas approximated 50 percent of the buyer's consumption in 1941 or 1942, whichever was the larger. With the end of hostilities and the increase in the OPA ceiling price for foreign silver to that for domestic silver, larger supplies became available, but the relaxation of restrictions on use resulted in a continuing scarcity of purchasable silver.

EMPLOYMENT AND LABOR PRODUCTIVITY IN 1944

Data on employment at gold and silver mines are not nearly so comprehensive as those on production. Part of the mines that reported production of gold, gold-silver, and silver ores and placer gold also furnished employment data that could be matched with the production data. These data and the productivity of labor for the years 1941 to 1944 are presented in the following tables. Despite the great fluctuations in gold and silver production during the 4-year period covered, a remarkably narrow range in productivity of labor will be noted, whether measured in tons, metal recovery, or value of product.

Employment and production data for gold and silver lode properties in the United States in 1944, and labor productivity, 1941–44, by kinds of ore mined [1]

	Gold ore	Gold-silver ore	Silver ore
Employment, 1944:

[1] Comprises data for only those gold placer mines for which employment statistics were furnished; these properties accounted for 38 percent of total output of placer gold in 1944.

WORLD PRODUCTION

World outputs of both gold and silver have declined without interruption since the recent highs established by each metal in 1940. Not only has the trend been downward for both metals, but a review of 1944 and 1945 outputs by countries shows declines in almost every instance. Adverse factors including labor shortages, rising costs, shortage of supplies and equipment, and rising taxes appear to have been world-wide.

[1] Preliminary world gold-production table prepared, with revisions and adjustments, by B. B. Waldbauer and S. M. Anderson, Foreign Minerals Division, Bureau of Mines, in cooperation with the Office of the Director of the Mint. Figures used were derived in part from the Statistical Yearbook of the League of Nations and from the American Bureau of Metal Statistics. No official statistics are issued by Government of U. S. S. R., consequently figures released by the various authorities vary widely and are irreconcilable. In some countries accurate figures are not possible to obtain owing to clandestine trade in gold.

[2] Refinery production.

[3] Imports into United States.

[4] Exports.

[5] Data not available. Estimate included in total.

[6] Approximate production.

[7] Purchases by the State Central Bank.

[8] Conjectural figure published by the American Bureau of Metal Statistics (New York), Annual Issue.

[9] Beginning with 1939, Burmese production included with British India.

[10] Figure published by the Director of the Mint, representing gold of Philippine origin refined but not necessarily mined during the year.

[11] Beginning with 1941, production of Ruanda and Urundi included with Belgian Congo.

[12] Exclusive of nonmembers of the Transvaal Chamber of Mines.

[13] Includes New South Wales, Northern Territory, Queensland, South Australia, Tasmania, Victoria and Western Australia.

[8] Includes New South Wales, Northern Territory, Queensland, South Australia, Tasmania, Victoria, and West Australia.

REVIEW BY COUNTRIES

CANADA

Gold and silver production in Canada continued to drop in 1945, following a downward trend uninterrupted since 1941 for gold and since 1940 for silver. The gold output for 1945 was less than half that for 1941, the all-time record, and was below that for any year since 1930. Silver output was the lowest since 1920. Output of gold and silver in 1945 was distributed among the several Provinces as follows:

Province:	*Gold, fine ounces*	*Silver, fine ounces*
Alberta	7	1
British Columbia	188, 380	5, 596, 360
Manitoba	66, 903	496, 020
Northwest Territories	8, 737	1, 940
Nova Scotia	3, 378	114
Ontario	1, 590, 339	3, 184, 590
Quebec	664, 226	2, 107, 349
Saskatchewan	109, 000	1, 455, 000
Yukon	30, 597	25, 223
Total	2, 661, 567	12, 866, 597

The downward trend in employment at producing gold mines proceeded with only minor reversals from March 1944 (when 17,788 were employed) to October 1945 (when 14,173 were employed). In November and December the trend was sharply upward; a labor force of 17,621 men was employed in the latter month. Although seasonal fluctuations obscure the trend of employment at nonproducing gold mines, many more men were employed in this field during the latter half of 1945 than during any of the other three 6-month periods since January 1944. These data point to a strong revival of Canadian gold mining both in the expansion of production at prewar mines and in the prospecting and development of new properties.

MEXICO AND CENTRAL AMERICA

Mexico.—Mexico's long record as the world's leading silver producer continued in 1945 despite an uninterrupted decline in output since 1942 due largely to unstable labor conditions and a serious deterioration of rail facilities. Gold output in Mexico experienced a decline paralleling that for silver.

Honduras.—Honduras, the leading silver producer in Central America, derived most of its output in 1945 from the Rosario group near Tegucigalpa. Renewed exploration and development of gold and silver deposits were reported.

Nicaragua.—Nicaragua continued to be the leading gold producer in Central America.

SOUTH AMERICA

Brazil.—Gold output in Brazil in 1945, as for many preceding years, was centered in Minas Gerais, where the St. John d'El Rey Mining Co. was by far the most-important producer.

Chile.—Chilean gold production is derived about equally from gold ores and copper ores. In 1945 there was a marked decrease in output from that in 1944. Punitaqui continued to be the principal lode gold producer. A force of 2,000 workers was reported at the richer gold placers, but an estimated 30,000 men had found relief work at gold placers during periods of economic depression. The Government indicated that it considered gold placers a prime source of jobs for those who will be released as the demand for copper slackens.

Colombia.—Higher operating costs and difficulties in obtaining machinery, particularly dredging equipment for the gold-platinum placers, have proved adverse factors in the Colombian gold industry. Gold output in 1945, however, continued near the level of the past few years.

Peru.—Peru continued to produce over half the silver in South America. The local silversmithing industry based on Inca designs has expanded rapidly since 1941. Wrought silver was exported to Venezuela, the United States, Panama, the Canal Zone, Brazil, and many other countries.

AFRICA

Union of South Africa.—The level of gold output was sustained in the Union of South Africa but declined elsewhere, and consequently the Union accounted for over half the world output in 1945, a condition that had not prevailed since 1930. Rising costs at Rand mines reduced profits and caused the suspension of some operations. A reduction in the scale of operation seemed imminent unless the price of gold increased or the general price and wage level declined. The Government indicated its opposition to a subsidy system that would enable unprofitable mines to continue operations with funds exacted by taxation from profitable properties. The following data prepared by the Transvaal Chamber of Mines compare mining results in 1944 and 1945:

	1944	*1945*
Ore milled (tons)	58, 504, 400	58, 897, 600
Gold recovered (fine ounces)	12, 277, 228	12, 213, 545
Gold recovered dwt. per ton	4. 039	3. 997
Working revenue	£99, 623, 168	£101, 847, 382
Working revenue per ton	34s 1d	34s 7d
Working cost	£66, 681, 942	£69, 941, 061
Working cost per ton	22s 10d	23s 9d
Working cost per ounce	112s 11d	118s 10d
Working profit	£32, 941, 226	£31, 906, 321
Working profit per ton	11s 3d	10s 10d
Dividends	£13, 617, 895	£13, 056, 263

The figures for total gold recovered include 463,499 ounces in 1944 and 443,641 ounces in 1945 from miscellaneous producers not embodied in other data. The dividend figures include intercompany payments; the net dividends were £13,058,422 in 1944 and £12,505,386 in 1945.

During 1945 operation of the Van Ryn Deep Mine, one of the oldest Witwatersrand producers, was suspended indefinitely. Other properties were to be closed at the end of the year. Development on the Far West Rand and in the Orange Free State, however, gave some promise that new producers would be opened there to replace the mines reaching exhaustion in the Johannesburg area. Production was increasing in the Far West Area, and some phenomenally rich assays were reported for diamond drill cores from Orange Free State exploratory work. A huge stock-market boom resulted from the latter developments. The Orange Free State drilling and development work, however, has not advanced to a point where substantial tonnages of ore are blocked out.

ASIA

India.—Gold production in India continued to decline. Reports from the Bawdwin mine in Burma, the leading silver producer of Asia in prewar years, indicated that substantial output would require several years for reestablishing transportation facilities, recruiting a labor force, and rehabilitating the mine and surface plant.

Korea.—The large output of Korean gold mines under Japanese supervision collapsed with the Japanese defeat.

OCEANIA

Australia.—The decline in gold output of the Commonwealth of Australia in progress during the war appeared to have been arrested in 1945. High costs and labor shortages restricted a revival of the industry, however. Although gold production data for New Guinea are not available, this area gives promise of regaining shortly its prominence as a source of gold.

COPPER

By T. H. Miller and Helena M. Meyer

SUMMARY OUTLINE

SUMMARY

Most commodities were subject to widely varying economic conditions during 1945, and copper ranked with those most seriously affected because of its close relationship to the production of armament. In the first quarter of 1945 copper was consumed at a greatly expanded rate, easily representing the record until then, and there was every indication that consumption for all of 1945 would reach a new annual peak. Early in 1945 the opinion was fairly generally held that stated military requirements for copper were excessive to a marked degree. As the spring of 1945 arrived the defeat of German military forces appeared assured, and concern was growing as to the disposition of the surplus of world production over normal world requirements. Plans for defeating Japan called for the use of such large quantities of copper, however, that fears concerning surpluses were said to be premature. High authorities claimed that copper requirements for a one-front war would be only slightly different from those for a two-front conflict. Germany surrendered in May, and the sudden collapse of Japanese resistance in August gave much less time than expected for orderly working out of surplus world-supply problems during the progress of the one-front war. Countries such as Chile, Rhodesia, Belgian Congo, and Canada were gravely concerned with the problems surrounding the disposal of their anticipated surplus production of copper; in the three first-named countries copper exports are the most important source of foreign exchange.

Following Germany's surrender, copper deliveries of duty-free and duty-paid foreign copper for domestic consumption, as reported by the Copper Institute, dropped precipitously; they were 537,000 tons in the first quarter, 394,000 tons in the second, and 259,000 tons in the third and recovered to 328,000 tons in the final quarter of 1945. The first-quarter deliveries constituted a new high record by a substantial margin, the 218,488 tons for March having exceeded the prewar (1935–39) monthly average of nearly 57,000 tons by 283 percent. Only about one-third of the record March total was supplied from domestic sources, the remainder coming from Office of Metals Reserve stocks. Wanders,[1] in discussing the prospective return to peacetime consumption of copper, said:

> After living for several years with astronomical supply and requirement statistics that made sense only to the high command, the industry naturally is anxious to return to earth as soon as possible.

Despite the large demands for copper early in 1945 and the fact that proposed legislation, subsequently enacted into law in June, assured continuation of bonus payments until June 30, 1946, supplies from domestic mines were decreasing gradually. Mine production aggregated 204,000 tons in the first quarter of 1945, 207,000 in the second, 184,000 in the third, and 178,000 in the fourth. Total production in 1945 was 772,894 tons, or 21 percent below 1944 and 29 percent below the record annual rate for 1943. Production in the first quarter of 1945 was 24 percent below that in the first quarter of 1944, contrasted with the behavior of deliveries, which were 40 percent higher in the first quarter of 1945 as compared with the similar period in 1944. Declining production in the face of record requirements is explained in large part by the continuing inability of Government and operators to solve the problems imposed by the shortage of labor and the inefficiency of a segment of the available supply thereof. The failure by a wide margin of domestic mines to supply total needs for copper in the late months of 1945, after hostilities ended, was a promising factor for foreign producers; the United States appeared to require metal from abroad to fill a large pent-up civilian demand.

A War Production Board report on war production in 1944 gave an idea of the dislocation in the copper industry that would result from termination of fighting on both western and eastern fronts. This report stated, among other things, that under the Controlled Materials Plan in 1944 direct military and export requirements had absorbed 90, 69, and 71 percent, respectively, of the brass-mill, wire-mill, and foundry-copper and copper-base alloy products. These percentages showed that the problems involved in changing from a war- to a peace-time economy would be great but that the pent-up civilian demand undoubtedly was enormous.

Most of the Government foreign purchase contracts were terminated, effective October 31. Rumors recurred that producers in copper-exporting nations would be unable to dispose of much of their copper in peacetime world markets, and proposed stock-pile legislation was aimed not only at providing metal to supplement domestic production in case of a subsequent emergency but also at removing from the market possible unmanageable surpluses of metal, alloys, and scrap. Before the end of the year, however, domestic production was lagging far behind consumption, and Government stocks were being depleted. A large portion of the copper in the hands of the Office of Metals Reserve at the end of 1945 was in forms that would not meet all specifications. Moreover, the maintenance of a stock pile was known to be part of the long-range Government policy.

Salient statistics of the copper industry in the United States, 1941–45, in short tons

	1941	1942	1943	1944	1945
New copper produced—					
From domestic ores, as reported by—					
Mines	958,149	1,080,061	1,090,818	972,549	772,894
Ore produced:					
Copper ore	[1] 78,452,504	[1] 92,285,626	[1] 98,119,735	[1] 91,063,648	[1] 76,855,857
Average yield of copper, percent	1.15	1.09	1.04	.99	.93
Smelters	966,072	1,087,991	1,092,939	1,003,379	782,726
Percent of world total	32	35	35	35	33
Refineries	975,408	1,064,792	1,082,079	973,852	775,738
From foreign ores, matte, etc., refinery reports	419,901	349,769	297,184	247,335	332,861
Total new refined, domestic and foreign	1,395,309	1,414,561	1,379,263	1,221,187	1,108,599
Secondary copper recovered from old scrap only	412,699	427,122	427,521	456,710	559,815
Copper content of copper sulfate produced by refiners	6,984	8,076	7,667	8,269	8,237
Total production, new and old and domestic and foreign	1,814,992	1,849,759	1,814,451	1,686,166	1,676,651
Imports (unmanufactured) [2]	735,545	764,393	716,654	785,366	853,196
Refined [2]	346,994	401,436	402,762	492,395	531,367
Exports of metallic copper [3]	158,893	210,518	294,459	237,515	132,545
Refined (ingots, bars, rods, etc.)	114,753	131,732	177,341	69,002	53,572
Stocks at end of year	317,500	319,500	309,500	392,000	461,000
Refined copper	77,500	84,000	68,500	81,000	130,000
Blister and materials in solution	240,000	235,500	241,000	311,000	331,000
Withdrawals from total supply on domestic account:					
Total new copper	1,641,550	1,678,091	1,621,666	1,632,709	1,542,403
Total new and old copper	2,368,000	2,606,000	2,708,000	2,584,000	2,549,000
Price, average ... cents per pound	11.8	[4] 11.8	[4] 11.8	[4] 11.8	[4] 11.8
World smelter production, new copper	[5] 3,000,000	[5] 3,100,000	[5] 3,100,000	[5] 2,900,000	[5] 2,400,000

[1] Includes old tailings.
[2] Data include copper imported for immediate consumption plus material entering country under bond.
[3] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufacturers of copper," for which figures of quantity are not recorded.
[4] Exclusive of bonus payments of the Office of Metals Reserve.
[5] Estimated.

On the whole, by the end of the year sentiment had changed, and the consensus seemed to be that prospective postwar world consumption would be large enough to require most of the world's nonsubsidized copper production for a number of years, provided that foreign countries could arrange for financing purchases and that a United States Government stock pile was to be maintained. In consequence of the inadequacy of United States production, the Civilian Production Administration recommended resumption of foreign purchases late in December, when it announced that the gap between production and reconversion requirements had widened to 46,000 tons a month. Announcement of the resumption was made January 29, 1946, when the Reconstruction Finance Corporation indicated that 20,000 tons a month for the first 6 months of 1946, or a total of 120,000 tons, would be bought abroad by the Office of Metals Reserve. A reversal of the recent policy of the British Government, of reducing purchases and depleting stocks on hand, was indicated when it was announced that this nation had contracted for all Rhodesian and Canadian copper not previously committed for the first 6 months of 1946. Early in 1946 the British Government was reported to be negotiating also for Chilean copper.

In meeting the record war demands of early 1945, copper-consuming industries performed some remarkable feats. The brass-mill industry achieved a 400-percent production increase during the war, according to a chart released by the WPB.[2] Brass-mill production reached a record monthly peak of 517,539,000 pounds in March, compared with a peacetime monthly average of about 100,000,000 pounds. March production of copper communication wire increased to a new record total of 267,000 miles,[3] which elicited a tribute from the Army Signal Corps.

The United States benefited from reverse Lend-Lease in regard to copper in 1945. In April the Foreign Economic Administration announced that the British Government made 30,000 tons of Rhodesian copper available in the first quarter of 1945 under reverse Lend-Lease, consequently without cash expenditure, and 42,000 tons would be made available in the second quarter as part of a total of 175,000 tons requested during the remainder of the year. Copper from Cyprus had previously been made available through the same means.

In June 1945 the Navy Department released [4] a statement describing activities in connection with the substitution of steel for brass in cartridge cases. In addition to arriving at a solution of the problem to the point of making steel "functionally equal to and even superior to brass" the Department stated that its investigations had led to many design changes in brass-cartridge cases, as well as opening up new possibilities in the development of more powerful and effective guns. The report stated—

> Had these metallurgists failed in their attempt, it probably would have been virtually impossible to wage a modern war with the supplies of copper, major component of brass, then available in this country.

The fact that there were insufficient supplies of several nonferrous metals to meet expanded war requirements led to revised material specifications for and to substitutions for the metals in question. The possible future effects of such revisions and substitutions were recently discussed. [5] The broad conclusions reached were:

> In each of the nonferrous metals the stress of war has resulted in changes in specifications and in the specifying of materials. Much of it has been constructive and indications are that most of these changes will be retained. Some of the changes, or the restrictions imposed, were not too good. Like the house built on sand, they were soon washed away. The good has been retained and the bad discarded. On the whole the changes have definitely been on the credit side of the ledger; progress has been made.

Salient statistics for 1900 through 1945 are covered by the accompanying table.

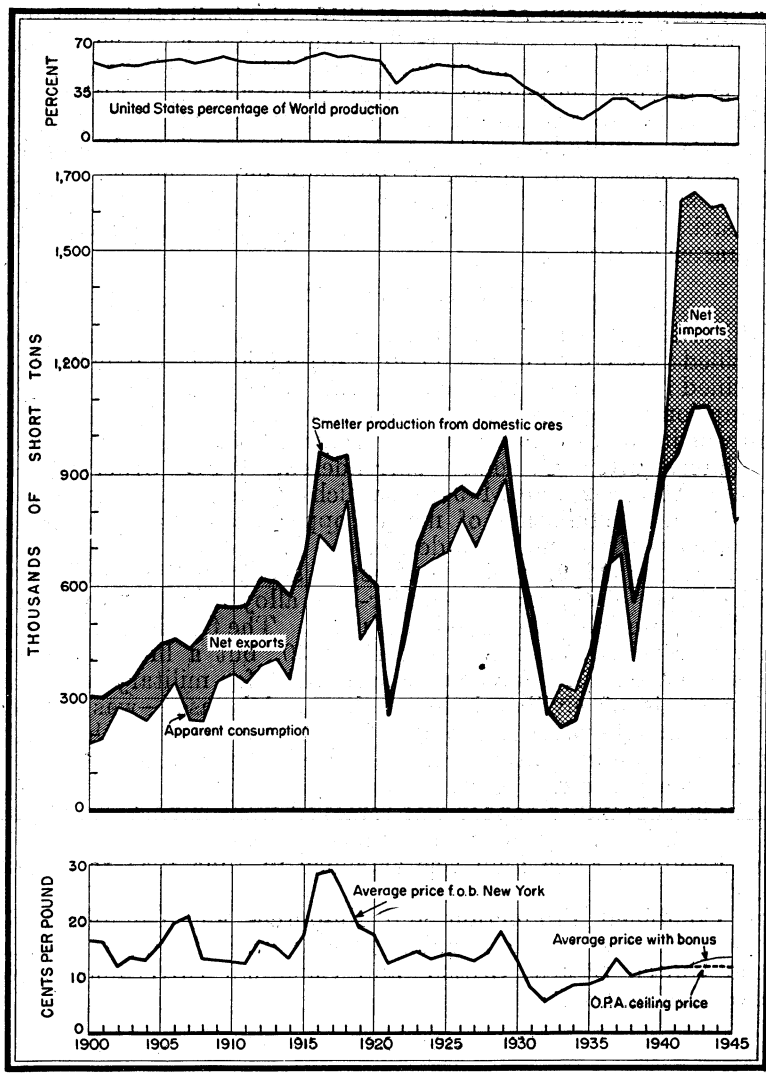

FIGURE 1.—Trends in production, consumption, and price of copper in the United States, 1900–1945.

LABOR PROBLEMS

The labor shortages and inefficiencies that plagued the copper industry in 1944 and earlier war years, described in the chapter on Copper in Minerals Yearbook, 1944, continued unabated in 1945. The stage was set in the final quarter of 1945 for reconversion of the copper industry to a peacetime basis. Reconversion, however, was delayed by a series of conflicts between management and labor concerning wages, bonuses, and other matters; and the problems affected major copper-consuming industries, such as the automobile industry, as well as the copper producing and fabricating industries. The labor problems present at the end of 1945, which affected many industries, appeared to require over-all consideration, and the President called representatives of management and labor to a joint conference aimed at solving the general problems in November. Although the meetings failed to find the constructive solutions desired, they were said to have resulted in better mutual understanding of the diverse viewpoints held. Any optimism that may have been felt regarding the labor situation late in 1945, however, was quickly dispelled when many strikes affecting the copper industry were called during the first quarter of 1946.

WAR AGENCY REGULATIONS

WPB orders that restricted the acceptance of delivery and the use of specified types of copper and copper-base alloys in the manufacture of specified items were discussed in earlier reports of this series. With consumption of copper at a new high rate early in 1945, Government action was in the direction of more stringent controls; but on May 11, immediately after Germany surrendered, WPB Orders M–9–c, M–9–c–1, M–9–c–2, and M–9–c–4, which restricted the manufacture, delivery, and installation of many copper products were revoked. In June copper was not included in the WPB list of items in short supply. Order M–9, which restricted acceptance of delivery of specified types of copper and copper-base alloy materials (other than controlled materials), was lifted in August. The Controlled Materials Plan was revoked, effective September 30, but a limited series of ratings—that is, AAA for emergencies, MM for military needs, and CC for needs of civilian industry in special cases—was retained. The WPB was dissolved November 3, and a new agency, the Civilian Production Administration, was assigned the task of converting industry to a peacetime basis.

Early in September copper was removed from import control by a revision of Order M–63 (General Import Order).

The Premium Price Plan was extended in June 1945 to June 30, 1946.

The Combined Production and Resources and Combined Raw Materials Boards, which handled various critical supply questions for the United States, British, and Canadian Governments, were dissolved December 31.

STOCK-PILE LEGISLATION

The report of this series for 1944 described the Surplus Property Act briefly. Through the provisions of the act the threat that surplus copper from Government contract cancellations would be dumped on the market was removed. The act, however, was a temporary measure only. Several permanent stock-pile bills were introduced in Congress in 1945, but none had become law by the end of the year. The mineral industry, in general, approved the principal of stock piling, as stated by Conover,[6] but it wanted assurance that the stock pile of strategic metals would not be used to the detriment of domestic producers. The Surplus Property Administrator extended the

[6] Conover, Julian D., Actual Dumping of Surplus Metals Would Do Less Harm Than Overhanging Threat of Sale: Metals, vol. 16, No. 5, November 1945, p. 6.

expiration date of his Administration's stock-piling regulations pertaining to materials believed to be acceptable for permanent stock piling from January 3 to April 1, 1946, pending enactment of legislation for permanent stock piles.

RECIPROCAL TRADE AGREEMENTS ACT

In June 1945 the Reciprocal Trade Agreements Act was renewed for 3 years. This act gives the President authority to cut rates of duty 50 percent below the January 1, 1945, level. The 4-cent tax on imports of copper is classed as an excise tax rather than a tariff but is subject to the terms of the Trade Agreements Act nonetheless. Briefs opposing extension of the act were filed by some of the large copper-producing companies and by the brass-mill industry. These briefs were published in Metals.[7]

UNITED STATES AND UNITED KINGDOM OPINION ON MINERAL POLICY

The report of this series for 1944 stated that postwar surplus world-production capacity over the prewar rate of consumption might call for international cooperative action. The United States and United Kingdom Governments have held conflicting views regarding cartels in the past, with cartel activity prohibited in the United States by the Sherman Antitrust Act. Recently Leith [8] informally and unofficially canvassed the views of nearly 100 mineral specialists, representing 20 minerals, from within Government, industry, and professional fields. The report, he said, was something of a composite of the many views presented but should not be regarded as committing all who were consulted. The recommendations given in the report were as follows:

(1) Freedom and equality of access to the world's mineral supplies. This to include protection of legitimate foreign investments, and the right to repatriate capital.

(2) Freedom of international trade and reduction of trade barriers, including the lowering of some of our own mineral tariffs.

(3) Stock-piling of strategic minerals for security purposes. This should be mainly from foreign sources and not used as a means of subsidizing marginal domestic production. So far as public aid may be necessary to develop processes and projects for low-grade materials, this to be covered by other legislation. Foreign purchase for stock piles may also serve as a stabilizing measure to aid in minimizing the anticonservational effects of excessive swings in production and price and to support the exchange position of producing countries.

(4) Possible use of buffer stocks or commodity pools accumulated by international cartels as a stabilizing influence to supplement stock-piling.

(5) Participation in mineral sanctions against warlike nations.

(6) Provisions for international fact finding.

(7) The right of American industry to participate in international cooperative arrangements and cartels in the interest of conservational production and of an orderly flow of minerals between the nations. This to be coupled with the necessary international political control, on a policy level, where the public interest is affected. Conservation to be the primary criterion.

(8) Early establishment of the necessary administrative machinery to accomplish these results.

In the House of Lords in March, in a debate on cartels, Lord Geddes,[9] chairman of the Rhokana Corp. group and deputy chairman of Nchanga Consolidated, admitted that Rhodesian copper producers

[7] Metals, vol. 15, No. 11, May 1945, pp. 9–11 and 12–13.

acted as a combination and pointed out that, as a result of their work, he was able to tell Neville Chamberlain in 1939 that they were able to meet the requirements of the war, at a time when the United States was not supplying anything to the belligerents. He said they weathered the greatest economic storm the world ever saw, while still developing, and indulged in the practice of price fixation and the limitation of output because, if they had competed with one another, they would have destroyed each other. He added:

> We told the British Government what we were doing. Do you suppose that we as responsible men would have acted for one moment contrary to the wishes of the British Government? No. Do you imagine we were ever denied information as to what the wishes of the British Government were? No. * * * The industries with which I am associated have absolutely no objection to the fullest information being at the Government's disposal at all times.

GEOLOGICAL SURVEY AND BUREAU OF MINES ACTIVITIES

The Geological Survey [10] program of investigation of copper deposits continued throughout 1945 on about the same scale as in 1944. The emphasis of the work continued to shift gradually from studies of individual mines and parts of mining districts, made during the war to aid production, to more comprehensive studies of larger mineralized regions.

Field studies were completed or practically completed during 1945 of the Bagdad mine and vicinity, Yavapai County, Ariz.; of the Empire mine and vicinity, Custer County, Idaho; of the copper-zinc deposits of the California Foothill Copper belt; and of some of the active mines of the Michigan copper district. Investigations undertaken before 1945 were still in progress at the end of the year of the copper-cobalt deposits, Blackbird district, Lemhi County, Idaho, and of Arizona copper deposits in the Globe-Miami districts, Gila County, the Dragoon-Johnson districts, Cochise County, and the San Manuel deposit, Pinal County. New investigations of large mineralized regions were begun during the year in the Jerome-Prescott area, Yavapai County, Ariz., and in Shasta County, Calif.

Preliminary geologic maps were released for public distribution of the Quail Hill, North Keystone, and American Eagle-Blue Moon mines in the Foothill Copper belt in California and of the San Manuel prospect in Arizona. Exploration of the San Manuel prospect was undertaken in 1943 as a cooperative project of the Geological Survey and the Bureau of Mines, and drilling during 1945 was continued by private interests. The deposit contains a large tonnage of low-grade copper ore and promises to be one of the most important discoveries in recent years in Arizona.

Preliminary reports were placed in the open files in 1945 of the Penn mine, California, the Charlemont-Heath copper-pyrite deposits, Massachusetts, the Moffet-Johnston mine, Montana, the Arlington and Pahaquarry mines, New Jersey, the San Pedro and Carnahan mines, New Mexico, and the Allamoore-Van Horn district, Texas.

Reports on copper deposits in Alaska, released during the year, described the Spirit Mountain nickel-copper prospect in the Copper River region and the Salt Chuck copper-palladium deposit on Prince of Wales Island.

[10] Information supplied by G. H. Espenshade

The Geological Survey under the sponsorship of the United States Department of State investigated in 1945 several copper deposits in Mexico in cooperation with the Comite Directivo para la Investigación de los Recursos Minerales de Mexico.

The Bureau of Mines continued its copper-exploration projects in 1945, and war minerals reports describing the results were issued for limited distribution among officials of the United States Government.

DOMESTIC PRODUCTION

Statistics on copper production may be compiled upon a mine, smelter, or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better than mine figures for showing the actual recovery of metal and more accurate than refinery figures for showing the source of production; and refinery statistics are best for showing metal recovery but indicate only in a general way the source of crude materials treated. The chapter on Copper in Mineral Resources of the United States, 1930, part I, discusses the differences among the three sets of figures.

For detailed information by States, districts, and mines, the reader is referred to the various State chapters on gold, silver, copper, lead, and zinc.

Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1941–45, in short tons

Year	Mine	Smelter	Refinery
1941	958,149	966,072	975,408
1942	1,080,061	1,087,991	1,064,792
1943	1,090,818	1,092,939	1,082,079
1944	972,549	1,003,379	973,852
1945	772,894	782,726	775,738

PRIMARY COPPER

Smelter production.—The recovery of copper by smelters in the United States from ores of domestic origin totaled 782,726 short tons in 1945, a decline of 22 percent from the total of 1,003,379 for 1944. Domestic smelter output constituted 51 percent of the world production during 1925–29 but dropped sharply in the succeeding years until 1934, when it was only 17 percent. From 1936 to 1940 it fluctuated between 25 and 33 percent, in 1942–44 it is believed to have been slightly above 35 percent, and in 1945 it dropped to about 33 percent.

The figures for smelter production are based upon returns from all smelters handling copper-bearing materials produced in the United States. For Michigan the sum of furnace-refined copper and copper cast into anodes for electrolytic refining is included. The figures for blister copper represent the fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production. Metallic and cement copper recovered by leaching is included in smelter production.

The precise quantity, in pounds, of copper produced by smelters in the United States and its value are shown by years for 1845–1930 in the Copper chapter of Mineral Resources of the United States, 1930, part I.

Copper produced (smelter output) in the United States, 1941–45, and total, 1845–1945

[Values rounded]

Year	Short tons	Value
1941	966,072	$227,993,000
1942	1,087,991	[1] 256,766,000
1943	1,092,939	[1] 257,934,000
1944	1,003,379	[1] 236,797,000
1945	782,726	[1] 184,723,000
Total, 1845–1945	32,431,585	9,416,233,000

[1] Excludes bonus payments of Office of Metals Reserve.

In 1945 the Bureau of Mines discontinued the compilation of smelter data by States of origin, because there was insufficient difference between smelter and mine figures to justify the work involved.

Mine production of recoverable copper in the United States, 1941–45, and total smelter output 1845–1945, by States, in short tons

[5] Pennsylvania and Vermont included under Tennessee. Bureau of Mines not at liberty to publish separate figures.
[6] Less than 1 ton.
[7] Approximate production through 1928. Figures for 1929–45 confidential and included under "Undistributed."
[8] Includes Tennessee for 1929–45.

Mine production.—The figures for mine production are based upon reports supplied to the Bureau of Mines by all domestic mines that produce copper. Details of the method of collecting the statistics and reasons for the discrepancy between mine-, smelter-, and refinery-production figures are given in the Copper chapter of Mineral Resources of the United States, 1930, part I.

Mine production is more accurate than either refinery or smelter production for showing the distribution of domestic output by States and districts. It also indicates the production by calendar years more exactly, because additional time is required for smelting and refining. Mine production in 1945 was 772,894 tons—a decrease of 21 percent from that in 1944 but 24 percent above the average for 1935–39.

Mine production of copper in the principal districts [1] of the United States, 1941–45, in terms of recovered copper, in short tons

Quantity and estimated recoverable content of copper-bearing ores.—The following tables list the quantity and estimated recoverable copper content of the ore produced by mines in the United States in 1944; complete details for 1945 are not yet available. Of the total copper produced from copper ores in the United States during 1944, 90 percent was obtained from ores concentrated before smelting, nearly 7 percent from direct smelting ores, and 3 percent from ore treated by straight leaching. The percentages for 1944 compared with 88 percent obtained from concentrated ore, 8 percent from direct smelting ores, and 4 percent by straight leaching in 1943.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that the estimated recoverable tenor is close to the actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only all those that contain 2.5 percent or more recoverable copper but also those that contain less than this percentage if they are valuable chiefly for copper. Mines report considerable copper from ores mined primarily for other metals. These include siliceous gold and silver ores, lead and zinc ores, and pyritic ores.

Copper ore, old tailings, etc., sold or treated in the United States in 1944, with copper, gold, and silver content in terms of recovered metals

State	Ore, old tailings, etc., sold or treated (short tons)	Copper produced		Gold produced (fine ounces)	Silver produced (fine ounces)	Value of gold and silver per ton of ore

[1] Includes old tailings, etc.

Refinery production.—The refinery output of copper in the United States in 1945 was made by 11 plants; 7 of these employed the electrolytic method only, 2 the furnace process on Lake Superior copper, 1 the furnace process on western ores, and 1 both the electrolytic and the furnace methods. The Lake smelter of the Copper Range Co. was idle at the end of 1945.

Five large electrolytic refineries are on the Atlantic seaboard, three Lake refineries on the Great Lakes, and three electrolytic refineries west of the Great Lakes—one at Great Falls, Mont.; one at Tacoma, Wash.; and one at El Paso, Tex. In 1942 fire-refined copper was produced for the first time at the Hurley, N. Mex., plant of the Kennecott Copper Corp., and all of the plant output was treated by this method in 1945. The El Paso plant of the Phelps Dodge Refining Corp. produced furnace refined copper in addition to the usual electrolytic grade. Of the plants specified above, the Lake refinery of the Quincy Mining Co. has been idle since 1933.

In addition to the foregoing plants, that at Inspiration, Ariz., is equipped to make electrolytically refined copper direct from the liquors obtained from leaching; this copper is shipped as cathodes to other refineries, where it is melted and cast into merchant shapes.

The 13 plants indicated constitute what commonly are termed "regular refineries." Of these plants, 8 employ the electrolytic process, 4 the furnace process, and 1 both methods. The electrolytic plants, exclusive of the one at Inspiration, have a rated capacity of 1,556,000 tons of refined copper a year. As they produced 1,052,000 tons in 1945, this part of the industry was operated at 68 percent of capacity.

The following tables show the production of refined copper at regular refining plants, classified according to source, grade, and form in which cast.

Primary and secondary copper produced by regular refining plants in the United States and imported, 1941–45, in short tons

	1941	1942	1943	1944	1945
Primary:					
Domestic: [1]					
Electrolytic [2]	929,711	963,177	938,727	837,089	669,705
Lake [2]	45,697	46,523	44,867	41,597	29,995
Casting		55,092	98,485	95,166	76,038
	975,408	1,064,792	1,082,079	973,852	775,738
Foreign: [1]					
Electrolytic	419,901	343,834	297,184	247,335	298,128
Casting and best select		5,935			34,733
Refinery production, new copper	1,395,309	1,414,561	1,379,263	1,221,187	1,108,599
Imports, refined copper [3]	346,994	401,436	402,762	492,395	531,367
Total new refined copper made available	1,742,303	1,815,997	1,782,025	1,713,582	1,639,966
Secondary:					
Electrolytic [4]	95,437	83,079	114,259	78,402	[5] 84,044
Casting	4,238	2,064	8,205	7,996	12,618
	99,675	85,143	122,464	86,398	96,662
Grand total	1,841,978	1,901,140	1,904,489	1,799,980	1,736,628

[1] The separation of refined copper into metal of domestic and foreign origin is only approximate, as accurate separation at this stage of manufacture is not possible.
[2] Some copper from Michigan is electrolytically refined at eastern refineries and is included as electrolytic copper.
[3] Data include copper imported for immediate consumption plus material entering country under bond.
[4] Includes some secondary Lake copper.
[5] Copper from scrap at Lake refineries included under "casting" copper in 1945.

Copper cast in forms in the United States, 1944–45

Form	1944		1945	
	Short tons	Percent	Short tons	Percent
Wire bars	493,000	37.69	467,000	38.75
Cathodes	358,000	27.37	231,000	19.17
Ingots	229,000	17.51	213,000	17.68
Cakes	104,000	7.95	153,000	12.70
Other forms	124,000	9.48	141,000	11.70
	1,308,000	100.00	1,205,000	100.00

In addition to the regular refineries, many plants throughout the country operate on scrap exclusively, producing metallic copper and a variety of alloys. The output of these plants is not included in the statements of refined-copper production in the preceding tables but is included in the following statement on secondary-copper production.

Copper sulfate.—The production of hydrous copper sulfate or bluestone by copper refineries in the United States was 32,900 short tons having a copper content of 8,237 tons in 1945 compared with 33,100 tons containing 8,269 tons in 1944. The output of copper sulfate by plants other than the regular primary refineries totaled 92,600 tons with a reported content of 23,154 tons in 1945 compared with 69,500 tons containing 17,377 tons of copper in 1944. Producers held 10,300 tons of copper sulfate at the beginning of 1945, total production was 125,500 tons, and shipments amounted to 114,800 tons. Some small purchases were made by producers during the year, and producers used a quantity equivalent to 11 percent of shipments. Inventories at the year end were 9,400 tons.

SECONDARY COPPER

Secondary copper includes material recovered from remelting old copper and copper scrap and from the treatment of copper alloys or alloys treated without separation of the copper. The following table summarizes the production of secondary copper during 1941–45. Further details appear in the chapter on Secondary Metals—Nonferrous.

Secondary copper produced in the United States, 1941–45, in short tons

	1941	1942	1943	1944	1945
Copper recovered as unalloyed copper	135,869	114,647	137,883	102,135	112,856
Copper recovered in alloys	[1] 590,527	[1] 813,108	[1] 948,164	[1] 848,807	[1] 893,660
Total secondary copper	726,396	927,755	1,086,047	950,942	1,006,516
From new scrap	313,697	500,633	658,526	494,232	446,701
From old scrap	412,699	427,122	427,521	456,710	559,815
Percentage of domestic mine output	76	86	100	98	130

[1] Includes copper in chemicals, as follows: 1941, 9,804; 1942, 17,455; 1943, 13,019; 1944, 13,357; 1945, 18,666 tons.

CONSUMPTION

The following table gives figures on apparent consumption of copper in the United States, and data for a long period are available on this basis. In estimating apparent consumption it has been assumed that copper used in the manufacture of primary fabrications of copper is consumed. Statistics compiled upon a different basis (for example, by taking consumption as including only copper made into automobiles, electrical equipment, ships, and other items) would show very different results. Much copper leaves the country as primary fabrications and considerably more in manufactured products containing copper. During the war large quantities of copper exported for military use were not accounted for in the foreign trade statistics. Likewise, scrap or other materials imported in returning transport vessels were not listed in import figures. The method of calculating the quantity of copper available for consumption is shown in the following table. It should be noted that exports and stocks include some refined secondary copper that cannot be determined separately and also that actual consumption of new copper would differ from the figures shown in the table by the changes in the consumers' stocks.

New refined copper withdrawn from total year's supply on domestic account, 1941–45, in short tons

	1941	1942	1943	1944	1945
Total supply of new copper	1,742,303	1,815,997	1,782,025	1,713,582	1,639,966
Stock at beginning of year	91,500	77,500	84,000	68,500	81,000
Total available supply	1,833,803	1,893,497	1,866,025	1,782,082	1,720,966
Copper exported [1]	114,753	[2] 131,406	[2] 175,859	[2] 68,373	[2] 48,563
Stock at end of year	77,500	84,000	68,500	81,000	130,000
	192,253	215,406	244,359	149,373	178,563
Withdrawn on domestic account	1,641,550	1,678,091	1,621,666	1,632,709	1,542,403

[1] Includes refined copper in ingots, bars, rods, or other forms.
[2] Excludes refined copper in rods.

The Bureau of Mines began to compile figures on actual consumption of copper in 1945. The results of the first year's canvass are given in the following table. Unlike the foregoing table, which attempts to measure new copper only, the following one does not distinguish between new and old copper. It covers copper consumed in refined form. Actual consumption of new and old copper in 1945 was less than apparent consumption of new metal largely because the apparent figures do not take into account changes in industry and Office of Metals Reserve inventories (see section on Stocks) both of which rose in 1945.

Refined copper consumed [1] in 1945, by classes of consumers, in short tons

Form	Wire mills	Brass mills	Chemical plants	Secondary smelters	Foundries and miscellaneous	Total
Cathodes	14	239,072	105	7,943	11,585	258,719
Wire bars	504,129	57,949			326	562,404
Ingots and ingot bars	15,438	219,343	215	10,543	30,405	275,944
Cakes and slabs		158,061	4,800	101	61	163,023
Billets	1	108,364	67	120	433	108,985
Other		1,880	5,111	9	3,197	10,197
Total	519,582	784,669	10,298	18,716	46,007	1,379,272

[1] Reported consumption.

STOCKS

The following table gives domestic stocks of copper as reported by primary smelting and refining plants. Stocks of blister and anode copper in transit from smelters to refineries are included under blister copper.

Stocks of copper at primary smelting and refining plants in the United States at end of year, 1941–45, in short tons

Year	Refined copper	Blister and materials in process of refining [1]	Year	Refined copper	Blister and materials in process of refining [1]
1941	77,500	240,000	1944	81,000	311,000
1942	84,000	235,500	1945	130,000	331,000
1943	68,500	241,000			

[1] Includes copper in transit from smelters in the United States to refineries therein.

Inventories of copper in virtually all hands gained in 1945; but fabricators indicated that the excess of booked orders over stocks, which had been declining since 1942, rose again in 1945.

Producers' stocks of refined copper were 60 percent larger at the end than at the beginning of 1945 and of blister and materials in process of refining were 6 percent more.

At the end of 1945 the Office of Metals Reserve held 565,710 tons of electrolytic and fire-refined copper in cathodes, shapes, and "in process" copper, all but a small part of which was in the United States; the remainder was in Canada. The foregoing total represents an increase of 37 percent over the 412,635 tons of refined copper held at the end of 1944. A substantial part of the metal on hand at the end of 1945 was blister copper and fire-refined copper that would not meet all specifications for refined metal, and only a relatively small part was in the form of wire bars. The large size of the stock pile thus did not indicate that industry could operate without new production for virtually 6 months at the 1940 rate of consumption of new copper. The anticipated large demand for wire bars in 1946 tended to accentuate the disproportionate nature of the items in the stock pile from the point of view of immediate consumption. The foregoing stocks are upon an ownership basis and therefore duplicate, in part, stocks of refined and "in process" copper reported by the refineries, which are on a physical plant basis. Of the Office of Metals Reserve inventories at the end of 1944, 11 percent was in the form of cathodes and shapes at refineries.

Stocks of copper in fabricators' hands at end of year, 1941–45, in short tons

	Stocks of refined copper [1]	Unfilled purchases of refined copper from producers	Working stocks	Unfilled sales to customers	Excess stocks over orders booked
1941	295,813	241,335	291,515	547,468	−304,675
1942	414,668	135,481	340,547	613,005	−403,403
1943	353,948	90,807	299,796	465,258	−320,299
1944	334,017	53,538	289,160	285,654	−187,259
1945	375,618	44,100	268,490	362,436	−211,208

[1] Includes in process metal and primary fabricated shapes. Also includes small quantities of refined copper held at refineries for fabricators' account.

Metal held by fabricators gained from 334,017 tons at the end of 1944 to 375,618 at the end of 1945. Unfilled sales, however, which had been pared from 613,005 tons at the end of 1942 to 285,654 at the end of 1944, rose to 362,436 tons in 1945. The excess of booked orders over stocks therefore rose in 1945 from 187,259 tons to 211,208. The oversold condition at the end of 1945, nonetheless, was vastly reduced from that which existed when unfilled sales were at their peak of 689,177 tons on June 30, 1942.

Figures compiled by the Copper Institute show that domestic stocks of refined, duty-free copper increased from 66,780 tons at the end of 1944 to 76,512 tons at the end of 1945. Inventory data of the Copper Institute and the Bureau of Mines are on different bases and, as a result, never agree. Under usual conditions the differences are due, in part, to the somewhat different coverage and in part to an arbitrary but permissible method used by the Copper Institute in designating the copper as domestic or foreign metal. Copper produced from foreign crude materials and held at refineries at the end of the year is included in Bureau of Mines inventory figures.

PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 860,000 short tons of copper were delivered to domestic and foreign purchasers (excluding deliveries of foreign copper to the Metals Reserve Company) in 1945 at an average price (f. o. b.

Salient statistics covering bonus payments[1] of the Government from the inception of such payments (February 1, 1942) through 1945

Ceiling price limitations, placed by the Office of Price Administration on electrolytic and casting copper, were described in earlier reports of this series. There were no changes in the ceilings in 1945. The Premium Price Plan also described in earlier reports, permitted Government payment of 5 cents a pound above the ceiling price to high-cost producers and to other producers for production from high-cost sections of mines. Special bonuses were permitted where the ceiling price plus the 5-cent bonus failed to cover mine costs; and, as is shown by the foregoing table, such payments in some instances aggregated as much as 27 cents, including the ceiling price. Bonuses have been paid on a higher percentage of output in each year—that is, on 11 percent in 1942 (February-December), 23 percent in 1943, 25 percent in 1944, and 27 percent in 1945. Total bonus payments declined 14 percent in 1945, so that the gain in percentage noted for

717372—47——10

that year was due to a fall of 22 percent in the nonpremium output. The gain in percentage of premium production was in the "A" class, as special bonuses were little changed percentagewise and Office of Metals Reserve contract payments fell from 2.7 to 1.3 percent largely because of the lapse in contracts with the Copper Range Co., the Quincy Mining Co., and the Isle Royale Copper Co. at the end of August. Mines of the first two companies closed, but Isle Royale operated under an "A" quota beyond the end of the year. The net result of the bonus plan was a rising average price: 12.25 cents in 1942, 13.30 in 1943, 13.54 in 1944, and 13.65 in 1945.

The official maximum prices, delivered to consumers' plants, have prevailed in the London market since December 18, 1939:

	Per long ton £	s.	d.
Electrolytic high conductivity	62	--	--
Fire refined:			
High conductivity	62	--	--
High grade	61	10	--
Minimum, 99.7 percent	61	--	--
Minimum, 99.2 percent	60	10	--
Hot-rolled black wire rods	65	10	--

FOREIGN TRADE[11]

The prewar movement of copper from producing to consuming centers was widely disrupted by the war. Before the war the United States, through its smelting, refining, and fabricating facilities, handled large quantities of foreign crude materials which were subsequently exported in finished form for consumption abroad. Such copper was not subject to the United States import tax because the copper was not for ultimate consumption here. After the outset of World War II the United States needed all the copper that entered the country in order to fill its huge armament requirements. Moreover, most of the chief prewar markets were no longer available to exports from the United States. In 1945 the United States continued to require large quantities of copper in its highest form of purity—refined—to supply new peak consumption needs in the first part of the year, and this class of imports again established a new annual record. The refined class represented 62 percent of the total unmanufactured copper entered in 1945, and blister, the next grade, 28 percent. In 1939 the respective percentages were 5 and 73. Chile for years has been the chief supplier of refined-copper imports, but its preeminent position declined somewhat, with a drop in tonnage in 1945. War needs of the British Empire subsided before those of the United States did, and late in 1944 imports of refined copper from Canada into the United States gained notably. In 1945, with British Empire contracts for Canadian and Rhodesian copper terminated and with Belgian Congo copper also diverted, the United States received 76,392 tons of refined copper from Canada, 41,782 tons from Belgian Congo, and 25,166 tons from Northern Rhodesia. The change in the British Empire supply position also released 64,374 tons of Rhodesian blister to the United States in 1945 compared with none in earlier war years. Other import

[11] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

features were outstanding gains in receipts of unrefined black blisert from Mexico and Belgian Congo and sharp drops in this grade from Chile and in regulus from Belgian Congo. The movements in lower grades were diverse with respect to countries, but imports of concentrates declined in continuation of the down trend in receipts of this low-grade material, with a contrasting slight upswing in receipts of ore.

Previous reports of this series have described the swing away from domestic participation in prewar export markets. Japan and Europe were formerly the chief destinations of United States exports of refined copper, for many years the largest export class. Of the most important export destinations in prewar years only the United Kingdom continued to receive large quantities of copper during the war. The U. S. S. R. joined the United Kingdom as a chief recipient of refined copper in 1942, having taken the lead in that year as a destination of wire. The U. S. S. R. received little refined metal in 1945 but continued to be the principal destination of exports of wire. One of the features of the war, as far as copper was concerned, was the sharp rise in exports of wire to the outstanding position in 1944 among the export classes, a position long held by the refined class. Exports of wire dropped sharply in 1945 but continued to lead all other groups.

IMPORTS

The tendency to stress imports of the higher grades of copper as the war progressed continued in 1945, and receipts of the refined class were higher than ever before. A noteworthy rise in entries of unrefined black blister and converter copper, the next lower grade, however, caused the relation of refined to total unmanufactured copper to drop from 63 to 62 percent, the first decline since 1938. Shipping space was utilized to best advantage, and time was saved in prosecution of the war by importation of the higher grades. Chile had supplied almost all of the refined copper that entered the United States from the time the excise tax was imposed in 1932 until midyear 1944. Thereafter, with the United Kingdom in a more abundant supply position, increased quantities of refined metal began to arrive from Canada, and in 1945 important quantities were received also from Belgian Congo and Northern Rhodesia. Total imports of refined copper rose 8 percent in 1945, and those of unrefined copper gained 39 percent. The increase in receipts of unrefined copper was also influenced by the lessened interest of the United Kingdom in copper supplies; receipts from Northern Rhodesia totaled 64,374 tons in 1945 compared with none in 1944, and those from Belgian Congo were 29,758 compared with 13,247. These gains and a large rise in receipts from Mexico much more than counteracted the sharp cut from Chile. Declines were noted in entries of regulus and concentrates of 61 and 18 percent, respectively. The former drop was because Belgian Congo shipped less of this grade, and the latter was due to reduced quantities for most countries except Bolivia, Chile, and Cuba. Larger imports of ore from Chile were the chief cause of the rise in this class of imports in 1945.

EXPORTS

It was almost possible to trace the battle areas of the world from a study of United States exports of insulated copper wire and cable. Although refined copper had dominated the export group, usually by a very substantial margin, from before 1900, the wire classification rose sharply during the war and stood first in 1944 and again in 1945. U. S. S. R. and Egypt took the largest quantities in 1942, U. S. S. R., United Kingdom, India, Egypt, New Zealand, Australia, and Algeria in 1943, and U. S. S. R., United Kingdom, India, and New Zealand in 1944. U. S. S. R. continued ahead of all others in 1945, and no other single country received one-tenth as much. Refined copper ranked second in 1945, and exports of this class declined 29 percent. The United Kingdom was the chief recipient of shipments of refined copper from the United States from 1941 through 1945, inclusive, but the 1945 quantity was only 46 percent of that for 1944. Mexico and Brazil stood second and third in 1945, with almost identical quantities, and the European Continent reentered the United States market for refined copper in 1944 and was credited with the receipt of its first tonnages in 1945, Switzerland, France, Belgium, and Sweden having received quantities ranging from 1,400 to 4,100 tons.

Exports of rods rose sharply in 1945, chiefly because of large shipments to Sweden. All other grades of primary fabrications were shipped in smaller quantities in 1945 than in 1944.

The drastic changes in destinations of United States exports of copper from prewar to war years were noted in previous reports of this series.

WORLD PRODUCTION

World output of copper is believed to have approximated 3,000,000 short tons annually in 1941–43, inclusive. Incomplete data indicate that output in 1945 was roughly 20 percent less than in 1943. Previous reports of this series have stressed the fact that the Axis Powers were sharply deficient in regard to supplies of copper, a lack that helped speed their defeat.

World mine and smelter production of copper, 1939–45, in metric tons

[1] Copper content of blister produced.
[2] Copper content of exports.
[3] Smelter output from domestic and foreign ores, exclusive of scrap. Production from domestic ores only, exclusive of scrap, was as follows: 1939, 646,524 tons; 1940, 824,703 tons; 1941, 876,401 tons; 1942, 987,004; 1943, 991,492; 1944, 910,245; 1945, 710,073.
[4] According to Yearbook of American Bureau of Metal Statistics.
[5] United States imports.
[6] Figures represent blister copper only. In addition to blister copper, Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from Belgian Congo and would therefore duplicate output reported under the latter country.
[7] Data not available.
[8] Approximate production.
[9] Exclusive of material from scrap.
[10] January to June, inclusive.
[11] Output from U. S. S. R. in Asia included under U. S. S. R. in Europe.
[12] Smelter product.
[13] Unoccupied China.
[14] January to September, inclusive.

REVIEW BY COUNTRIES

Canada.—Production of copper dropped from 273,535 short tons in 1944 to 238,142 tons in 1945, or 13 percent, a continuation of the movement in progress since the peak of 327,797 tons was reached in 1940. Labor shortages had much to do with the general down trend, and the ending of hostilities sharpened the drop in 1945. Moreover, as has been pointed out in previous reports of this series, Canadian copper occurs for the most part in ores carrying high values in other metals, such as nickel, zinc, and gold. Half of the output in 1945, for example, came from the nickel-copper mines of the Sudbury district, Ontario. The demand for nickel has a strong influence on the rate of copper output from such ores. The International Nickel Co. of Canada, Ltd., largest copper producer in Canada, began to curtail operations in August and by the year end, according to the annual company report to stockholders, the production of nickel was down to about 50 percent of the expanded capacity. The majority of United States Government foreign purchase contracts were terminated as of October 31, 1945. Fears recurred in some quarters that Canadian surplus copper would be without an adequate outlet, but late in 1945 it was made known that, for the first 6 months, at least, of 1946, the United Kingdom would buy not only all available Rhodesian copper but that from Canada as well. The Canadian purchase price was said to be 13½ cents (Canadian funds) a pound c. i. f. United Kingdom ports. Canadian Government restrictions on the purchase of domestic copper were removed in August. Statistics prepared by the Northern Miner and published in the May 16, 1946, issue show that Canada produced 35 percent of its all-time output of copper in World War II. Although Canada began to produce copper in 1886 and output to the end of 1945 had reached 10,199,539,257 pounds, 3,501,116,946 pounds were produced in 1940–45, inclusive. Mine production, by Provinces, is shown in the accompanying table.

Copper produced (mine output) in Canada, 1941–45, by Provinces, in short tons

Province	1941	1942	1943	1944	1945 (preliminary)
British Columbia	33,164	25,008	21,111	18,153	12,899
Manitoba	33,509	23,798	19,008	21,940	20,050
Ontario	166,915	154,141	138,920	142,655	118,174
Quebec	71,892	70,456	65,582	54,029	53,819
Saskatchewan	16,162	28,391	42,974	36,758	33,200
	[1] 321,658	[1] 301,831	287,595	[1] 273,535	238,142

[1] Includes Northwest Territories.

As has already been mentioned, half of the output of copper in 1945 came from the nickel-copper mines of the Sudbury district, Ontario; usually the proportion from this Province is even higher. According to the annual report to stockholders of the International Nickel Co. of Canada, Ltd., the war years imposed an extraordinarily heavy drain on ore reserves. Totals of 12,105,545, 12,117,567, and 10,136,350 short tons of ore were mined in 1943, 1944, and 1945, respectively, compared with an annual average of 5,321,634 tons for the prewar period, 1936–38. However, through an extensive diamond-drilling and exploration program the development of new ore was such that at the end of 1945 proved ore reserves totaled 217,373,000 tons, containing 6,866,000 tons of nickel and copper, compared with 212,368,000 tons, containing 6,806,000 tons of nickel and copper, at the end of 1938. International's sales of copper in all forms totaled 107,862 tons in 1945 compared with 132,356 tons in 1944 and 126,989 in 1943. Copper sales for the 3-year period exceeded nickel sales slightly. The Falconbridge Nickel Mines, Ltd., the other important producer in Ontario, hoisted 715,896 tons of ore and recovered 1,209 tons from the surface dump. In all, 716,868 tons were treated and yielded 19,470 tons of matte that contained 10,349 tons of nickel and 5,271 tons of copper. At the end of 1945 ore reserves totaled 13,682,000 tons, containing an average of 1.72 percent nickel and 0.93 percent copper, of which 7,935,500 tons were in the Falconbridge mine.

Production from copper-gold, copper-zinc, and copper-pyrites ores in western Quebec caused that Province to rank second in Canada. In comparison with 1944, Quebec, with a production drop of less than one-half of 1 percent, compared with 13 percent for Canada as a whole, made a better showing than any other Province. Noranda Mines, Ltd., is the chief producer in Quebec. A total of 1,330,534 tons of ore was hoisted at the Horne mine in 1945; 858,523 tons were milled, and 626,571 tons of ore and concentrate were smelted. The smelter treated 296,520 tons of custom material in addition. Copper production for the Horne mine was 26,783 tons of a total smelter output of 51,162 tons. In addition to copper, the Horne mine produced 174,217 ounces of gold and 439,330 ounces of silver. Developed ore reserves above the 2,975-foot level at the end of 1945 were 5,127,000 tons of sulfide ore averaging 7.08 percent copper, 15,228,000 tons of sulfide ore averaging 0.68 percent, and some siliceous fluxing ore. Labor shortages caused Noranda to cut its ore-treatment schedule by one-third in midyear and forced underground development to a virtual standstill. At the Normetal Mining Corp., Ltd., property 204,067 tons of ore were concentrated in 1945 compared with 192,994 tons in 1944, and the concentrates produced contained 6,934 and 5,889 tons, respectively, of copper. Ore reserves at the end of 1945 totaled 1,399,000 tons containing 3.53 percent copper and 7.04 percent zinc. Waite Amulet Mines, Ltd., produced 17,992 tons of copper from 517,213 tons of ore milled, decreases from 20,504 and 608,574 tons, respectively, in 1944. Total ore reserves of all grades at the end of 1945 were 2,500,000 tons in the Waite Amulet and Amulet Dufault mines, of which 2,200,000 tons in the Amulet Dufault mine contained averages of 6.01 percent copper and 4.26 percent zinc. Canadian Copper Refiners, Ltd., in which Noranda Mines, Ltd., has an interest of more than 92 percent, produced 96,000 tons of refined copper in 1945. The new company copper sulfate plant began to produce in June. It was recently described.[12] According to the Preliminary Report on the Mineral Production of Canada in 1945:

> One of the most interesting developments during the year under review was an extensive exploration program conducted by Quemont Mining Corporation, Ltd., on an important copper-gold-silver deposit adjoining the property of Noranda Mines, Ltd., in the Rouyn area of Quebec.

[12] Canadian Chemistry and Processing Industries, Copper Sulfate: Vol. 30, No. 4, April 1946, pp. 26–29.

The Hudson Bay Mining & Smelting Co., Ltd. (Flin Flon mine), and Sherritt Gordon Mines, Ltd., regularly account for the copper production of Manitoba and Saskatchewan. At the Flin Flon mine, 1,822,628 tons of ore were mined and milled, from which were produced 40,098 tons of copper, 47,468 tons of zinc, 131,239 ounces of gold, and 1,694,184 ounces of silver. In contrast with most other Canadian producers, Sherritt Gordon Mines, Ltd., produced more copper in 1945 than in 1944. A total of 646,092 tons of ore was mined and milled in 1945, a drop from 731,783 tons in 1944; a higher recovery of copper per ton of ore, however, resulted in the production of 13,117 tons in 1945—an increase over the 12,271 tons in 1944. In addition to the copper produced in 1945, 7,154 ounces of gold, 229,703 ounces of silver, and 18,773 tons of zinc concentrates (50 percent zinc) were recovered. Total copper-ore reserves at the end of 1945 were calculated to be 2,026,000 tons, containing 2.65 percent copper and 2.25 percent zinc.

Operations at properties of the Granby Consolidated Mining, Smelting & Power Co., Ltd., and Britannia Mining & Smelting Co., Ltd., chief copper producers in British Columbia, were hampered by labor deficiencies throughout most of the war period, but the situation was reported to have improved at the end of 1945.

The chief items in Canada's import classification were copper sulfate and copper in bars or rods for the manufacture of various electric wires and cables. Of the former class, 3,259 tons were entered in 1945, compared with 4,130 tons in 1944, and of the latter 1,263 and 289 tons, respectively. Exports for 1945 (comparison with 1944 in parentheses) were as follows: Copper in ingots, bars, cakes, slabs, and billets, 129,349 (135,233) tons; copper contained in ores, matte, and regulus, 19,295 (27,989) tons; copper in rods, strips, sheets, plates, and tubing, 7,281 (18,063) tons; and copper, old and scrap, 1,438 (964) tons.

Chile.—Production of copper in Chile dropped in 1945 but continued to be close to the peak rate for the war period. According to the annual report to stockholders of the Kennecott Copper Corp., the corporation was called upon during the year to increase wages, and the wage agreement carried a continuing obligation to vary wages in accordance with fluctutation in living costs. Living costs continued to advance in Chile, and a further increase in wages was granted. An ample supply of common labor was available during the year, but the shortage of technically trained men became critical. Legislation in Chile provided new social benefits in 1945, and taxes were raised. The subsidiary Braden Copper Co. mined and milled 8,693,296 short (7,886,400 metric) tons of ore having an average assay of 2.203 percent copper. Refined-copper output was 329,798,078 pounds (149,600 metric tons). In connection with the mine catastrophe in June, the company said:

> It is with deep regret that we report the death of 355 employees, resulting from an accident which occurred on the morning of June 19, 1945. The basic cause was a small fire which started in the car repair shop, a considerable distance from the mine workings. All employees were immediately ordered from the mine but before the instructions could be complied with a violent explosion of gases resulting from the burning of a small amount of lubricating oil forced a heavy concentration of carbon monoxide gas through many of the mine work-

ings. Strenuous efforts by the rescue squads to bring out and resuscitate the stricken men were of little avail, the toxic action of the gas being so swift and fatal. The origin of the fire is still being investigated by Chilean authorities.

The Chuquicamata mine of the Chile Exploration Co. and the Andes mine of the Andes Copper Mining Co., subsidiaries of the Anaconda Copper Mining Co., were also productive in 1945 and were also affected by increased costs. Both properties experienced labor strikes during the year. According to the Yearbook of the American Bureau of Metal Statistics for 1945, the former produced 261,929 (237,600 metric) and the latter 70,311 (63,800 metric) short tons of copper in 1945.

Exports of electrolytic copper totaled 233,284 metric tons in 1945, compared with 274,663 in 1944. In the remainder of the paragraph figures for 1944 are given in parentheses. Of the electrolytic exports in 1945, 209,431 (256,286) tons went to the United States, 10,061 (none) to Sweden, 9,891 (16,235) to Brazil, 1,999 (2) to Bolivia, 1,900 (2,040) to Argentina and 2 (none) to Ecuador. Of the exports of 198,630 (217,209) tons of standard (furnace refined), 183,511 (214,121) were shipped to the United States, 5,756 (none) to Italy, 2,827 (30) to Argentina, 2,439 (none) to Sweden, 2,158 (none) to Switzerland, 1,561 (2,811) to Brazil, and 378 (247) to Uruguay. Ore exports totaled 31,192 (20,811) tons, those of concentrate 7,520 (6,937) tons, and those of cement copper 16 (83) tons, all of which was destined to the United States.

Finland.—Production in Finland should increase markedly because capacity of the Outokumpu Copper Co. was recently enlarged by the construction of a modern smelting works at Harjavalta, according to the January 22, 1946, issue of the Metal Bulletin (London). The report said that former monthly output of not above 1,000 tons should be doubled. Copper refining is done at the Bjorneborg electrolytic plant, and this plant has been extended to accommodate the increased blister production. The concern also makes copper and brass alloys in sheets, tubes, bars, and other forms.

Germany.—Previous reports of this series have pointed out that the supply of copper, so needed to produce armaments, was a crucial problem in Germany because copper was one of the commodities in which Germany was seriously deficient; the shortage of copper doubtless contributed to the German defeat in 1945. Many figures have come out of Germany since the cessation of hostilities and some of the data are covered in the following discussion. The estimated average annual mine output of copper in 1940–44 was reported by the Metallgesellschaft as 25,200 metric tons (copper content). Production by smelters from ores and scrap for the same period averaged 41,200 tons and that by the refineries, from all sources, 169,000 tons. For 1944 alone the figures were estimated as 25,000, 30,000, and 180,000, respectively. Estimates included in another Metallgesellschaft report were that approximately 410,000 tons of copper, in the form of ores, concentrate, scrap material, unrefined, refined copper, and copper products, were available in Germany at the commencement of occupation by the Allies. Of the total, 50,000 tons were estimated to be in the American zone, 170,000 in the British, 10,000 in the French, and 180,000 in the Russian.

The Mansfeld operations, which include mining, smelting, refining, and fabricating facilities, suffered no war damage, and refining and fabricating plants at Ilsenburg were likewise unharmed by bombing. The Norddeutsche Affinerie and Zinnwerke Wilhelmsburg at Hamburg, according to current releases of the American Bureau of Metal Statistics, were seriously damaged but not irreparably so.

According to the Metal Bulletin (London) of April 19, 1946, Germany's annual production (capacity), based on current estimates, will be at a level of about 140,000 tons in 1949 contrasted with a prewar output (1936) of 292,000 tons.

Japan.—Estimates covering production, imports, exports, and consumption of copper in Japan were published [13] recently. Estimated production for Japan since 1937 was given as follows: 1938, 90,000 metric tons; 1939, 94,000; 1940, 104,000; 1941, 104,000; 1942, 104,000; and 1943, 123,000. The report states that the figures cover "Japan Proper" and later on says that—

> it is probable that all copper from Formosa and some from Korea and Manchuria are included.

Statistics showing refined-copper production, imports, exports, and consumption were recently made available in graphic form by General Headquarters of the Supreme Commander for the Allied Powers. As closely as the chart can be read, it appears that refined-copper output in 1938 was nearly 70,000 metric tons, in 1939 slightly over 70,000, in 1940 almost 100,000, in 1941 about 85,000, in 1942 nearly 105,000, in 1943 nearly 125,000, and in 1944 slightly below 100,000. The report gives no details as to what is covered by the figures on refined production, but they appear to include foreign as well as domestic copper. According to the first report mentioned, the copper industry in Japan is controlled largely by five powerful financial groups known as "Zaibatsu," namely, the Mitsubishi, Furukawa, Sumitomo Besshi, Fujita, and Nippon mining companies. These companies owned the mines, smelters, refineries, and, in most instances, their own fabricating plants. Mines that managed to continue operating are classified as 7 large, 5 medium-size, and 60 or more small ones. Most of the large and medium-size mines have been worked for many years and were reported to have been largely depleted of high-grade ores. They continued to contribute approximately 82 percent of the production, nonetheless.

Mexico.—Output of copper in Mexico rose sharply in 1945 to 61,680 metric tons from 41,302 tons in 1944. The 1945 production had been exceeded in only 5 years—1905, 1918, 1928, 1929, and 1930. The increase was due to the production from the "Low-Grade Project" of the Cananea Consolidated Copper Co., at Cananea, Sonora, where operation commenced September 1944. The Boleo mine at Santa Rosalia, Lower California, continued to produce in 1945, and the Oropeo Copper Co., in the State of Michoacan, began production in September.

According to the Yearbook of the American Bureau of Metal Statistics for 1945, Cobre de Mexico, S. A., expected to put an electro-

[13] Bureau of Mines, Foreign Minerals Survey, Mineral Resources of Japan: Vol. 2, No. 5, October 1945, p. 10.

lytic copper refinery, capable of producing 12,000 tons annually, into operation in Mexico, D. F., early in 1946.

Northern Rhodesia.—Statistics recently made available indicate that copper production reached a peak of 267,000 metric tons in 1940, dropped to 232,000 in 1941, rose to 255,000 in 1943, and declined thereafter to 196,000 in 1945. The United Kingdom was by far the chief destination of exports of Northern Rhodesian copper after the outbreak of World War II, through contracts that were terminated January 31, 1945. As the time for expiration of the contracts neared, producers were concerned regarding future markets for their product. It was soon learned that the United States could easily use additional metal in its huge armament program for 1945, and Rhodesian copper thus was scheduled to come here. The United States Foreign Economic Administration announced in April that the British had made available to the United States, under reverse Lend-Lease, 30,000 tons of Rhodesian copper in the first quarter of 1945 and had agreed to supply an additional 42,000 tons in the second quarter, of an original United States request for 175,000 tons for delivery from March to the end of the year. The majority of United States foreign copper purchase contracts were terminated October 31, but metal continued to arrive from Northern Rhodesia through December.

The following paragraphs on Rhodesia were abstracted from the respective company reports.

At the Roan Antelope mine, 2,622,710 short tons of ore, containing 2.63 percent copper, were mined in the fiscal year ended June 30, 1945, compared with 2,980,915 tons containing 2.74 percent in 1944. Ore reserves at the end of June 1945 totaled 102,458,330 tons, averaging 3.279 percent copper.

The Rhokana Corp., Ltd., produced 107,597 short tons of blister and electrolytic copper in the fiscal year ended June 30, 1945, compared with 113,951 tons in 1944. Of the 1945 total, 20,001 tons were Nkana blister, 17,976 tons Nchanga blister, and 69,620 tons Nkana electrolytic copper, compared with 25,227, 19,775, and 68,949 tons, respectively, in 1944. Ore reserves in the Nkana north ore body at the end of June 1945 totaled 23,748,600 short tons, containing 3.31 percent copper, of which 11,164,900 tons, averaging 3.23 percent, were partly developed, and 10,574,300 tons, averaging 3.32 percent, were undeveloped. The Nkana south ore body contained an undeveloped reserve of 19,614,000 short tons, averaging 2.77 percent copper. The reserve of 60,192,700 tons, averaging 3.70 percent copper, in the Mindola ore body contained 3,819,700 tons, averaging 4.56 percent, of partly developed ore and 51,700,000 tons, averaging 3.51 percent, of undeveloped ore.

The Nchanga Consolidated Copper Co. milled 476,300 short tons of ore, averaging 4.8 percent copper, that yielded 15,917 tons of copper in the fiscal year ended March 31, 1945. During the year under review a strike of European employees was called in November 1944 and lasted about 6 weeks, suspending production. A total of 18,140 tons of copper was produced in the 1944 fiscal year and 15,219 in 1943.

Mufulira Copper Mines produced 58,275 long (65,268 short) tons of blister copper in the fiscal year ended June 30, 1945, compared with a peak output of 85,523 (95,786) tons in the year ended June 30, 1942. Ore reserves at the Chambishi and Baluba properties were recalculated to be 138,678,000 short tons, averaging 3.84 per cent copper, on June 30, 1945.

Spain.—The Rio Tinto Co. is the principal producer of copper in Spain and has a production capacity of 8,000 metric tons [14] a year. The company is essentially a producer of iron pyrites which carries a varying copper content up to about 1.7 percent. The report indicates that Spain's annual copper requirements average 29,000 tons, indicating a large deficiency in supplies from domestic sources. According to Evan Bennett, minerals attaché at Madrid, figures on ore reserves are not released by the management of the company, but it is believed that 50,000,000 tons of 46+-percent pyrite are developed. About 5,000,000 tons of porphyry ore containing over 1.5 percent copper are available.

Turkey.—Production of blister copper amounted to 9,800 metric tons in 1945, compared with 11,404 in 1944. The mine at Ergani accounted for 9,544 tons in 1945 and 10,500 in 1944. The Kuvarshan mine near Murgul was closed during the second quarter of 1945, following exhaustion of known ore. Plans were made for completion of the new installation at Murgul, but it is not expected that this mine will be in operation before 1948. On January 1, 1945, the Government-controlled Turkish Copper Works, Ltd., was established by the Ministry of Economy to combine the operations of the existing copper mines in Turkey, to sell copper after it has been converted into blister or refined copper, and to exploit new copper mines. The mines were formerly operated as subsidiaries of the State bank, the Eti Bank; the new company is also under the general supervision of the Eti Bank.

United Kingdom.—At the outset of 1945, the United Kingdom was discontinuing purchases of copper, and contracts with Rhodesian and Canadian producers were terminated, the policy being to reduce large stocks of metal on hand. Rhodesian copper was released to the United States in 1945 under reverse Lend-Lease arrangements. By the end of the year, however, the British Government was again ready to buy large quantities of copper. Contracts were entered into with Rhodesian and Canadian producers to cover all copper not previously committed for the first 6 months of 1946. Some Chilean copper was even contracted for early in 1946. The general election, in which the Labor Party was returned by an overwhelming majority, was spoken of [15] as a disturbing factor in the market. Much progress was made during the year in freeing the nonferrous metals from wartime restrictions, but the Ministry of Supply remained the sole purchaser of raw materials from overseas for the trade. Stocks of virgin copper were reduced from 282,400 long tons at the beginning of 1945 to 123,100 tons at the end. Statistics showing consumption of copper in the United Kingdom were made available during the year.

United Kingdom copper prices were unchanged during 1945, despite considerable pressure to raise them; they were advanced early in 1946.

717372—47——11

LEAD [1]

By RICHARD H. MOTE

SUMMARY OUTLINE

GENERAL SUMMARY

Despite huge reductions in military requirements immediately following victory in both the European and Pacific phases of the war, the supply of lead available for industrial consumption throughout 1945 was seriously short of demand. Domestic mine production, the largest single source of supply, continued to decline. Imports of lead-bearing materials so urgently needed to offset the decreasing domestic mine output dropped to the lowest level since 1940. In contrast, however, the smelter production of secondary lead, always a substantial source of the heavy metal, increased 10 percent over the 1944 output. Consumption of refined lead, although 12 percent less than in 1944, continued at a high level, and to meet the demands for essential military and civilian uses monthly allocations were made from Government stocks of refined lead. As a result, the Government stock pile was reduced to 68,700 short tons at the end of 1945—slightly more than a month's supply at the average rate of consumption during the year.

Domestic mine production of recoverable lead, smallest of any year since 1938, declined 6 percent from the 1944 output. Refined primary lead production from domestic and foreign ores and base bullion decreased 5 percent in 1945. Stocks at primary refineries (physical inventory) more than doubled during 1945, while Government-owned stocks decreased 24 percent. Consumers' inventories recorded a 19-percent gain over 1944.

The established price of 6.50 cents a pound for lead at New York remained unchanged throughout 1945.

[1] This report deals primarily with the smelting, refining, and consuming phases of the industry. For full details of mining operations, see separate reports issued for the various States.

Salient statistics of the lead industry in the United States, 1925–29 (average) and 1941–45, in short tons

	1925–29 (average)	1941	1942	1943	1944	1945
Production of refined primary lead:						
From domestic ores and base bullion	660,525	470,517	467,367	406,544	394,443	356,535
From foreign ores and base bullion	123,104	100,450	99,472	63,068	70,320	87,050
	783,629	570,967	566,839	469,612	464,763	443,585
Recovery of secondary lead	280,000	397,416	323,001	342,094	331,416	363,039
Imports: [1]						
Lead in pigs, bars, and old	4,592	274,395	369,254	244,510	226,073	230,313

World smelter production of lead	1,850,000	(3)	(3)	(3)	(3)	(3)

[1] Data include lead imported for immediate consumption plus material entering the country under bond.
[2] Includes 3,874 tons of foreign lead reexported in 1942, 11,258 tons in 1943, less than 1 ton in 1944, and 377 tons in 1945, according to records of the U. S. Department of Commerce.
[3] Data not available.
[4] Revised figure.

Figure 1 shows trends in the domestic lead industry since 1900.

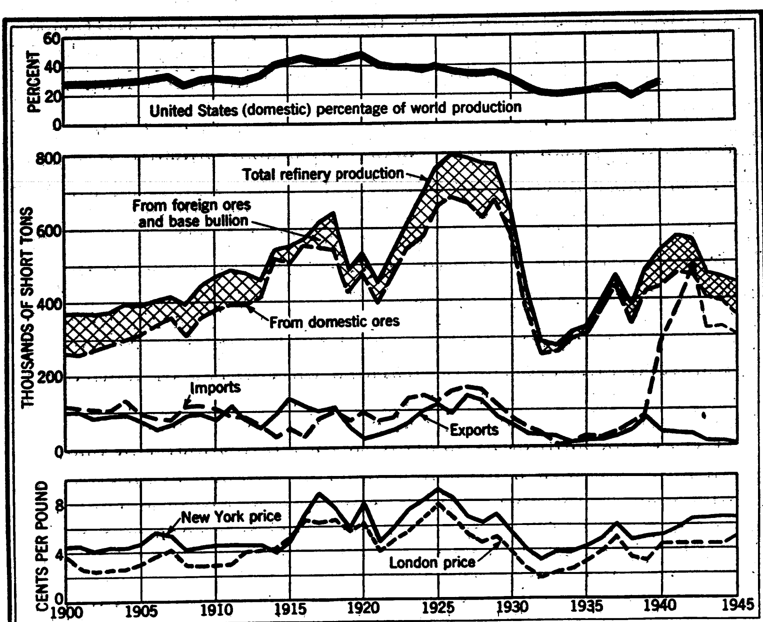

FIGURE 1.—Trends in the lead industry in the United States, 1900–1945. Imports include lead in ore, base bullion, pig lead, and scrap; exports include pigs, bars, and scrap lead exported in manufactures with benefit of draw-back. Data on lead exported in manufactures with benefit of draw-back not available for 1945

GOVERNMENT REGULATIONS

Lead continued under Government control during 1945, through the provisions of War Production Board General Preference Order M-38. In operation, the order prohibited use of lead for certain purposes and permitted all essential uses to function free of control Facing a critical supply position late in 1944, the WPB amended Order M-38, effective December 26. Under the revised order, the use of lead for most civilian applications was restricted to 60 percent of the 1944 level of consumption. The order contained three lists pertaining to the restriction and availability of lead: The first group, "A," banned the use of lead in certain civilian items; group "B" covered military uses, storage batteries, cable covering, tetraethyl lead, ammunition, and a few nonmilitary uses, such as solders, bearing metals, and brass and bronze, for which lead would be available without restrictions; and group "C," which contained the civilian items restricted to 60 percent of the 1944 consumption. Greater restrictions were placed on other than essential uses in an amendment to the order on January 15, 1945. A second amendment on February 1 increased the allowable use of lead in storage batteries for civilian use from 30 percent of the 1944 base period to 37.5 percent. The order was again amended, effective March 31, when a list of 64 permissible uses was substituted for the previous lists A, B, and C, which covered restricted uses, unrestricted uses, and quota percentage restrictions.

Government control over lead was extended on February 14 to imports of three important manufactured items when WPB General Imports Order M-63 was amended banning the importation by private purchasers of collapsible lead tubes, storage batteries, and lead foil. Later in April a subsequent amendment included lead disks, slugs, and other semifabricated forms in which lead is a component part.

As a result of cut-backs in military requirements, lead quotas for several manufactured articles were increased during the summer months. Storage-battery manufacturers were permitted an increase to 25 percent of the 1944 usage during the third quarter of 1945. A similar increase in the quota was permitted in the preparation of collapsible lead tubes. In late July, the WPB, because of increasing stocks, removed lead from the critical materials list and placed it on a list of products still under surveillance. Prompted further by the improved statistical position of lead during early August, the WPB removed entirely the limitations on the use of lead chemicals for rubber compounding and gasoline refining. The production of white and red lead was permitted a moderate increase.

Belief that the ending of hostilities had improved the lead supply situation enjoyed only a brief existence, however. The Government stock pile was dwindling rapidly, and it was obvious that reserves would soon be exhausted unless consumption was again restricted. Accordingly, on December 18 the Civilian Production Administration (successor November 3 to the WPB) announced a reduction in allocations for the first quarter of 1946 to producers of automobile batteries and tetraethyl lead. Quotas for the manufacture of industrial-type batteries, cable coverings, and collapsible tubes were unchanged.

Subsidy payments under the Premium Price Plan for overquota production were continued throughout 1945. A brief outline of the Premium Price Plan and an accompanying table giving production and payments from 1942 through 1945 are given in this chapter under Prices.

RECIPROCAL TRADE AGREEMENTS

On June 19, 1945, the Senate passed a bill (H. R. 2652) extending the Reciprocal Trade Agreements Act for 3 years and permitting as much as a 50-percent reduction in the rates of duty prevailing on January 1, 1945. The bill further provided that any temporary reduction under wartime agreements should remain temporary, however, and any cut in the duty should be with respect to the rates established by the 1930 tariff act. Under the "most-favored-nation" policy, any reduction embodied in a reciprocal agreement would apply equally to virtually all countries.

In accordance with the Mexican Trade Agreement of January 30, 1943, the tariff on lead-bearing ores, flue dust, and mattes remained at ¾ cent per pound (lead content) and lead bullion, pigs, bars, scrap lead, etc., 1$\frac{1}{16}$ cents per pound during 1945. A provision of the agreement permits the increase in the tariff on lead-bearing ores, flue dust, and mattes to 1½ cents per pound (lead content), and lead bullion, pigs, bars, scrap lead, etc., to 1$\frac{7}{10}$ cents per pound, 30 days after the war emergency is officially terminated.

DOMESTIC PRODUCTION

Statistics on lead output may be prepared on a mine or smelter and refinery basis. The mine-production data compiled on the basis of lead content in ore and concentrates and adjusted to account for average losses in smelting are the most accurate measure of production from year to year. The pig-lead output, as reported by smelters and refiners, presents a more precise figure of actual lead recovery but generally differs from the mine figure due to the overlap or lag between mine shipments and smelter receipts of ore and concentrates. These inequities, however, tend to balance over a period of years.

MINE PRODUCTION

The mine production of recoverable lead (including that made into pigments) from domestic mines in the United States and Alaska decreased 6 percent in 1945, was 21 percent under the war-period peak in 1942, and was 41 percent below the average production in the period 1925 through 1929. The domestic lead production comes principally from three areas—Southeastern Missouri; the Tri-State area (Joplin region), embracing Southwestern Missouri, Southeastern Kansas, and Northeastern Oklahoma; and the Western States (principally Idaho, Utah, Arizona, Colorado, and Montana). Of the total produced in the United States, approximately 66 percent came from the output of a relatively small number of mines, each of which produced over 4,000 tons of recovered lead in 1945. Missouri again ranked first in the production of lead, and the Southeastern Missouri district continued to be the largest lead-producing area, supplying 44 percent of the total domestic output. The four mines of the St. Joseph Lead Co. continued, as in the past, to produce the bulk of the output from this district. The Tri-State area produced 6 percent of the total domestic output in 1945 compared with 7 percent in 1944. The Western States contributed 47 percent of the total domestic production despite a decline of 12 percent from 1944. Idaho continued to be the largest producer of lead in the Western States and second largest in the United States, notwithstanding a production decline of 18 percent and the smallest output of any year since 1899. Nearly 93 percent of the State total lead came from the Coeur d'Alene region. Five properties in Idaho produced 51 percent of the State total lead, and of the total 81 percent came from zinc-lead ore and old tailings from the Coeur d'Alene region. Although lead output in Utah, the lowest since 1899, dropped 22 percent below the 1944 production, the State continued to rank second among the Western States. In spite of a decrease of over 7,000 tons from the 1944 output, the United States and Lark property in the West Mountain (Bingham) district, operated by the United States Smelting, Refining & Mining Co., remained by far the largest producer of lead in Utah. About 85 percent of the State total lead was recovered from zinc-lead ore. Lead production in Arizona was the largest in any year in the history of the State and 37 percent greater than in 1944. The Copper Queen mine of the Phelps Dodge Corp. at Bisbee was the largest Arizona lead producer in 1945; about 91 percent of the total lead was recovered from zinc-lead ore. Colorado production decreased 4 percent; the California (Leadville) district continued to be the largest lead-

Mine production of recoverable lead in the United States, 1925–29 (average) and 1941–45, by States, in short tons

State	1925–29 (average)	1941	1942	1943	1944	1945

SMELTER AND REFINERY PRODUCTION

The production of pig lead in the United States is derived from 3 main sources—domestic mine production, imports of foreign ore and base bullion, and secondary smelter production from scrap material—and is produced at primary plants that treat ore, base bullion, and small quantities of scrap and at secondary plants that process scrap exclusively. Of the 8 primary smelters operating in the Western States, only two (Selby, Calif., and Bradley, Idaho) produce refined merchant lead. The other 6 plants produce only base bullion (containing approximately 98 percent lead plus gold, silver, and small quantities of impurities recovered from the ore smelted), which is shipped to refineries in the Middle Western and Eastern States for recovery of the gold and silver and purification of the lead to meet commercial requirements. Both primary and secondary smelting plants may make refined lead or antimonial lead. Because of the large quantity of hard lead—such as battery scrap—melted at secondary smelters, the output from this type of operation is essentially antimonial lead alloys. Statistics on the production of refined lead and alloys at secondary plants are given in the section of this chapter on Secondary Lead. The 16 primary smelters and refineries in operation in the United States in 1945 consumed 454,778 short tons (lead content) of ore, 19 percent of which was mined in foreign countries, compared with 477,765 tons in 1944, 15 percent of which was foreign ore.

ACTIVE LEAD SMELTERS AND REFINERIES

A list of primary lead smelters and refineries operating in the United States in 1945 follows:

California: Selby—Selby plant, American Smelting & Refining Co. (smelter and refinery).
Colorado: Leadville—Arkansas Valley plant, American Smelting & Refining Co. (smelter).
Idaho: Bradley—Bunker Hill Smelter (smelter and refinery).
Illinois: Alton—Federal plant, American Smelting & Refining Co. (smelter and refinery).
Indiana:
- East Chicago—International Smelting & Refining Co. (refinery).
- East Chicago—U. S. S. Lead Refinery, Inc. (refinery).

Kansas: Galena—Galena plant, Eagle-Picher Co. (smelter and refinery).
Missouri: Herculaneum—Herculaneum plant, St. Joseph Lead Co. (smelter and refinery).
Montana: East Helena—East Helena plant, American Smelting & Refining Co. (smelter).
Nebraska: Omaha—Omaha plant, American Smelting & Refining Co. (refinery).
New Jersey:
- Barber—Perth Amboy plant, American Smelting & Refining Co. (smelter and refinery).
- Carteret—United States Metals Refining Co. (refinery).

Texas: El Paso—El Paso plant, American Smelting & Refining Co. (smelter).
Utah:
- Midvale—United States Smelting, Refining & Mining Co. (smelter).
- Murray—Murray plant, American Smelting & Refining Co. (smelter).
- Tooele—Tooele plant, International Smelting & Refining Co. (smelter).

REFINED LEAD

Primary refineries in the United States in 1945 produced 462,110 short tons of refined lead, a decline of 3 percent from the 1944 output of 476,131 tons.

Of the 443,585 tons of primary lead produced in 1945, domestic ores and base bullion supplied 80 percent, and 20 percent was derived from foreign ores and imported base bullion. In 1944 the origin was 85 percent domestic and 15 percent foreign. The quantity of refined lead produced from foreign base bullion has been negligible since 1943. The following tables give the production of refined lead by sources and by country of origin of the ore. Details of the sources of lead from domestic ores are given in the section of this chapter on Mine Production.

Refined lead produced at primary refineries in the United States, by sources, 1941–45, in short tons

ANTIMONIAL LEAD

Antimonial lead production at primary refineries decreased 2 percent to 56,495 tons in 1945. The distribution of the lead, according to source, is shown in the following table. The quantity of antimony contained in antimonial lead produced in 1945 dropped to 7.3 percent owing to a greater demand for low-percentage alloys for use in the

Antimonial lead produced at primary lead refineries in the United States, 1941–45

Year	Production (short tons)	Antimony content		Lead content by difference (short tons)			
		Short tons	Percent	From domestic ore	From foreign ore	From scrap	Total
1941	40, 237	3, 510	8. 7	14, 852	8, 013	13, 862	36, 727
1942	51, 762	3, 524	6. 8	24, 512	12, 165	11, 561	48, 238
1943	63, 515	3, 371	5. 3	16, 674	10, 583	32, 887	60, 144
1944	57, 902	4, 670	8. 1	13, 280	5, 477	34, 475	53, 232

manufacture of such items as type metal, solder, sheet and pipe, and collapsible tubes and foil. Although antimonial lead is an important byproduct of the refining of base bullion, the quantity derived from this source is only a small part of the annual domestic output. The major production is recovered from the smelting of antimonial lead scrap at secondary smelters. Production data from lead-smelting plants treating scrap materials exclusively are summarized in the following section and discussed in detail in the chapter on Secondary Metals—Nonferrous.

SECONDARY LEAD

Some scrap lead is treated at primary smelters and refineries, but the greater part is received at a large number of plants that treat secondary materials exclusively. Secondary lead is recovered in the form of refined lead, antimonial lead, and other alloys. Recovery at primary and other plants in 1944 and 1945 is shown in the following table. Secondary lead recovered in 1945 was 10 percent greater than in 1944 and was equivalent to 82 percent of the total refined primary lead produced in the United States. Further details appear in the chapter on Secondary Metals—Nonferrous.

Secondary lead recovered in the United States, 1944–45, in short tons

	1944	1945
As refined metal:		
At primary plants	11,368	18,525
At other plants	43,678	42,598
	55,046	61,123
In antimonial lead:		
At primary plants	34,475	42,366
At other plants	146,343	151,713
	180,818	194,079
In other alloys	95,552	107,837
Grand total:		
Short tons	331,416	363,039
Value	$42,421,248	$46,468,992

LEAD PIGMENTS

The principal lead pigments are litharge, white lead, red lead, sublimed lead, leaded zinc oxide, and orange mineral. These products are manufactured for the most part from metal, but some ore and concentrates are converted directly to pigments. Details of the production of lead pigments are given in the chapter on Lead and Zinc Pigments and Zinc Salts.

STOCKS

Producers' stocks.—Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in the following table. Stocks of refined and antimonial lead include metal held by all primary refiners and by some of the refiners of secondary material who produce soft lead, plus foreign lead smelted and refined in the United States and entered for domestic consumption. According to the monthly reports released by the American Bureau of Metal Statistics, stocks of refined lead and antimonial lead increased erratically from a low of 19,536 tons in January to 38,128 tons at the end of May, followed by alternating decreases and increases each month through September. From 36,514 tons on hand at the end of September, stocks advanced to a year-end total of 43,746 tons, high point for 1945, and a net gain of 124 percent from January 1.

Lead stocks at end of year at smelters and refineries in the United States, 1941–45, in short tons

	1941	1942	1943	1944	1945
Refined pig lead	15,973	28,815	28,821	15,602	35,853
Antimonial lead	4,212	6,122	4,269	3,934	7,893
	20,185	34,937	33,090	19,536	43,746
Lead in base bullion—					
At smelters and refineries	8,594	7,359	8,640	7,333	8,618
In transit to refineries	2,215	1,706	3,112	3,331	4,889
In process at refineries	17,709	13,925	16,020	14,473	15,097
	28,518	22,990	27,772	25,137	28,604
Lead in ore and matte and in process at smelters	51,446	59,247	68,678	80,461	89,462
	100,149	117,174	129,540	125,134	161,812

The Bureau of Mines annual survey of primary lead smelters and refiners indicated stocks of 16,788 tons (lead content) of refined lead at plants on January 1, 1945, and 37,690 tons on December 31, 1945. Primary antimonial lead stocks at these same plants increased from 3,387 short tons (lead content) at the beginning of 1945 to 6,773 tons at the end of the year. In terms of lead content, stocks of ore at the 16 operating smelters and refineries decreased 2 percent from 60,480 tons to 59,095 tons during the same period. The inventory of base bullion at refineries that receive base bullion as a raw material and at smelters that produce base bullion for shipment to refineries totaled 6,066 tons at the beginning of January and 7,125 tons at the end of December 1945. Stocks of "in-process" base bullion or work lead at 5 combination smelter-refinery plants are not included in reports to the Bureau of Mines. No direct comparison can be made between these data and the figures of the American Bureau of Metal Statistics. Figures reported to the Bureau of Mines represent physical inventory at the plants, irrespective of ownership, and do not include material in process or in transit.

Consumers' stocks.—Approximately 570 consumer plants reported stocks of 103,214 tons of domestic and foreign refined lead on hand December 31, 1945, a 19-percent increase over the 86,908-ton inventory (revised figure) reported at the end of 1944.

Government stocks.—Industry-owned stocks were augmented by a supply of Government-owned lead stored at strategic points throughout the United States for allocation to consumers as needed. According to reports submitted to the Civilian Production Administration (successor November 3 to the War Production Board), Government stocks of refined lead, mostly of corroding grade and from foreign sources, was 68,700 short tons on December 31, 1945, compared with 90,454 tons of refined lead on January 1, 1945.

Consumers' stocks of refined soft lead at the end of 1944 and 1945, by grades, in short tons

	Domestic and foreign					Foreign (all grades)
	Corroding	Chemical	Common	Other	Total	
Dec. 31, 1944 [1]	28,028	12,965	42,863	3,052	86,908	9,730
Dec. 31, 1945	32,395	21,520	47,735	1,564	103,214	6,692

[1] Revised figures.

DOMESTIC CONSUMPTION

A survey of 570 plants in 1945 representing an estimated 90 percent of the consumers of refined lead indicated a total consumption of 637,499 short tons of refined lead, a decrease of 12 percent from 1944. Some secondary as well as primary refined lead is included in this figure. Antimonial lead, unrefined scrap lead, and lead in alloys are excluded. Of the total consumed, 25 percent was used for making red lead and litharge, 14 percent for cable covering, 12 percent for tetraethyl fluid, 9 percent for storage batteries, 5 percent for white lead, 5 percent for sheet lead, 5 percent for ammunition, and the remaining 25 percent for a variety of products and uses shown in the accompanying table. A distribution of the total consumed by related uses indicates 49 percent consumed for metallic products, 30 percent for pigments, 13 percent in chemical products, and 8 percent in miscellaneous uses, such as annealing, galvanizing, lead plating, weights, and ballast.

Reports to the CPA indicate a consumption of 1,051,602 tons of primary, antimonial, and secondary lead in 1945 compared with 1,118,643 tons in 1944.

Consumption of refined lead in the United States, 1941–45, by uses, in short tons

	1941	1942	1943	1944	1945

[1] Included under "Other."

The following table shows the calculated apparent shipments of refined primary lead to domestic consumers. The apparent shipments of 670,122 tons in 1945 are probably more nearly correct than the actual receipts of 653,805 tons reported by consumers, because of incomplete coverage of the survey.

Apparent shipments of refined primary pig lead to domestic consumers, 1941–45, in short tons

[1] Official figures not available.
[2] Estimate based upon American Bureau of Metal Statistics data.
[3] According to reports submitted to the Tin-Lead-Zinc Division of the CPA.
[4] Includes 3,874 tons of foreign refined lead reexported in 1942, 11,258 tons in 1943, less than 1 ton in 1944, and 377 tons in 1945, according to records of the U. S. Department of Commerce.

PRICES

The two major markets for lead in the United States are New York and St. Louis; much of the lead produced domestically is sold at prices normally based upon quotations in these markets. Since suspension of trading on the London Metal Exchange in September 1939 the London market has had no direct influence on New York quotations, and the differential between St. Louis and New York prices has remained at 0.15 cent a pound, an amount approximating the freight charges between the two points.

The ceiling price for common lead—6.35 cents a pound, St. Louis, and 6.50 cents, New York—remained unchanged throughout 1945. The average price received by the primary producers for all grades of refined lead (excluding antimonial lead) sold remained at 6.4 cents a pound, f. o. b. plant. The 1945 price of 8.6 cents a pound for lead which appears in the separate State chapters represents the weighted average price received for all grades of refined lead (6.4 cents) plus the increment—in terms of cents per pound based upon the total domestic mine output of recoverable lead—of $17,429,467 in subsidies for overquota production and special mine contracts paid by the Office of Metals Reserve (successor July 1, 1945, to the Metals Reserve Company).

The general policy of the Quota Committee pertaining to the Premium Price Plan for overquota mine production of domestic lead (copper and zinc were also included) prevailed throughout 1945. The original plan in force since February 1, 1942, was operative only until July 31, 1945. Congress voted the Hayden-McFarland Bill, S–502, into Public Law 88 on June 14, 1945, extending the Plan until June 30, 1946. A compilation of important data showing production of lead under the Premium Price Plan since February 1942, at the various quota levels and the payments made, is given in the following table.

Salient statistics on lead with regard to the operation of the Premium Price Plan, 1942–45 [1]

1 Compiled from a report of the Office of Price Administration. Data subject to revision.
2 Premium Price Plan effective February 1, 1942; data refer to February–December, inclusive.
3 Preliminary figures from the OPA.
4 Production of Tri-State lead from Office of Metals Reserve, Joplin, Mo., all other from Bureau of Mines monthly reports. These data are preliminary and do not exactly equal final annual totals for the United States except for 1945.
5 Data on premium payments and Metals Reserve mine-contract payments from Office of Metals Reserve. All payments shown are subject to correction due to additional payments as a result of retroactive quota adjustments, late reports by smelters and custom mills, etc.
6 All average prices shown include OPA ceiling price of 6.50 cents a pound for lead.

The official London maximum price of £25 per long ton, duty paid, for Empire and foreign lead, fixed by the British Ministry of Supply in December 1939 was advanced to £30 on June 11, 1945. Quotations of the London Metal Exchange, discontinued at the outbreak of the war in September 1939, were not resumed during 1945.

Average monthly and yearly quoted prices of lead at St. Louis, New York, and London, 1943–45, in cents per pound [1]

[2] Average price of foreign lead, converted to cents per pound with the pound sterling at \$4.02½. Official maximum price raised on June 11, 1945.

FOREIGN TRADE [2]

Imports.—During 1945 imports of lead dropped to the lowest level since 1940 and were 39 percent below the record total of 1942. As in previous years, the greater part of the lead imported was in the form of pigs and bars, over 70 percent of which came from Mexico and virtually all the remainder from Peru, Canada, and Australia. Receipts of lead in ore and matte, which constituted 23 percent of the total imports, were 25 percent under 1944, due largely to a sharp decrease in imports from Australia and Newfoundland, which more than offset a substantial increase from Peru and Argentina. Imports of lead in ore and matte were principally from Australia, Newfoundland, Peru, Canada, and Argentina, which together supplied 90 percent of these receipts. Imports of lead in base bullion, all from Mexico, dropped to 8 tons. Four countries supplied 91 percent of the total lead in all forms imported in 1945: Mexico 54 percent, Peru 16, Australia 11, and Canada 10, compared with 54, 21, 10, and 3 percent, respectively, for a total of 88 percent in 1944.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[1] In addition to quantities shown (values included in total values), "reclaimed, scrap, etc.," imported as ollows—1941: 1,331 tons, $57,353; 1942: 1,305 tons, $137,393; 1943: 496 tons, $56,158; 1944: 3,315 tons, $298,712; 1945: 2,844 tons, $235,840. Figures for 1942–45 include foreign lead received by the Government and held in stock piles.

Miscellaneous products, containing lead, imported for consumption in the United States, 1941–45

Year	Babbitt metal, solder, white metal, and other combinations containing lead			Type metal and antimonial lead		
	Gross weight (short tons)	Lead content (short tons)	Value	Gross weight (short tons)	Lead content (short tons)	Value
1941	702	241	$711,388	1,657	1,454	$112,120
1942	971	274	66,096	245	210	19,631
1943	236	69	330,824	3,703	3,422	447,019
1944	26	18	12,706	7,562	7,174	954,255
1945	143	73	101,132	26,085	24,706	3,238,902

Exports.—Total exports of pig lead in 1945 dropped to 9 percent of the 1944 total due almost entirely to the sharp decline in shipments to the U. S. S. R. Export restrictions imposed under the Export Control Act of 1940 remained in force throughout the year.

Lead exported from the United States, 1941–45

Year	Pigs and bars		Foreign lead exported in manufactures with benefit of draw-back (short tons)	Year	Pigs and bars		Foreign lead exported in manufactures with benefit of draw-back (short tons)

[1] In addition, 3,874 tons of foreign lead were reexported in 1942, 11,258 tons in 1943, less than 1 ton in 1944, and 377 tons in 1945.

717372—47——12

WORLD PRODUCTION

The unconditional surrender of Germany and Japan in May and August 1945, respectively, permitted relaxation of censorship restrictions on production statistics by governments of most of the lead-producing countries in the world. Some information regarding the lead industry in European countries formerly under Axis control has become available during the year, and some progress toward presentation of comprehensive world lead-production statistics during the war years has been made. Nevertheless a statistical hiatus in the record for certain of the important lead-producing centers continues to prevent the final compilation of production data beyond 1940.

World production of lead, 1938–45, in metric tons [1]

[1] By countries where ~~smelted~~ but not necessarily refined. Data derived in part from Statistical Year-Book of the League of Nations and from the American Bureau of Metal Statistics (annual issue).
[2] Approximate production.
[3] Data not yet available; estimate included in total for 1939 and 1940.
[4] Unoccupied China.
[5] Exclusive of secondary material (Metallgesellschaft, Frankfort on the Main). Beginning in October 1939, includes Upper Silesia.
[6] Includes small tonnage of lead contained in exported ores and concentrates. Separate figures not available.
[7] Figures cover lead refined from domestic and foreign ores; refined lead produced from foreign base bullion not included.

REVIEW BY COUNTRIES

Argentina.—The Aguilar mine of the Compañía Minera Aguilar, S. A., subsidiary of the St. Joseph Lead Co., continued to be the leading producer in 1945, although ore production declined due to shortage of mine timber, fuel oil, and inability of the railroad to provide enough cars for shipping the concentrates from the mine. The lead concentrate production at the Aguilar mine in 1945 was 22,022 metric tons compared with 23,237 tons in 1944.

Australia.—Labor shortages, reportedly the most critical of any year since the beginning of the war, continued to restrict the production of lead at Australian mines and smelters in 1945. At Mount Isa Mines, Ltd., Queensland, a critical manpower shortage permitted operation of the copper section of the mine only. The need for adequate manpower seriously curtailed development programs at the mines.

For the fiscal year ended June 30, 1945, the production of crude ore at the Broken Hill South, Ltd., was 309,605 long tons compared with 341,920 tons output the previous year. A corresponding decrease was reported in the production of lead concentrates.

The Lake George Mining Corp., Ltd., at Captain's Flat, New South Wales, produced 164,549 tons of ore for the fiscal year ended June 30, 1945, compared with 239,900 tons for the previous year, the bulk of the ore for both years being taken from the Keating's ore body. The total estimated ore reserves remaining at the property on June 30 were 1,416,603 tons assaying 1.1 dwt. gold and 1.4 ounces of silver per ton, 7.3 percent lead, 12.8 percent zinc, and 0.7 percent copper.

Bolivia.—Construction of a new lead smelter in southern Bolivia for the purpose of stimulating Bolivia's lead-mining industry and providing exportable refined lead was under consideration early in the year by Banco Minero de Bolivia. The proposed smelter would have a monthly capacity of 300 to 400 tons of refined lead. The location tentatively selected for the smelter is at the junction of the Tupiza and San Juan del Oro Rivers in the Province of Sud Chichas in southern Bolivia.

Brazil.—Construction of a lead smelter (capacity, 20 metric tons of refined lead daily) at the Panelas or Brejauvas mine in Paraná, 20 kilometers from Ribeira, in São Paulo, by Plumbum, S. A., of São Paulo was completed in 1945. It is reported that this company also installed a complete plant for underground development of the mine. The customs smelter at Apiai, São Paulo, remained idle in 1945. The plant, built in 1941 by the State of São Paulo, is reported to have a capacity of 10,000 metric tons of furnace charge a year. Prospecting of lead deposits in the valley of the Ribeira de Iguape was conducted during the year by the States of São Paulo and Paraná.

Burma.—The famous Bawdwin lead-zinc mine and smelter—which before the war produced 75,000 tons of lead a year—was recaptured from the Japanese in February 1945. Engineers of the Burma Corp., owners of the property, reported the lower levels of the mine flooded and the upper levels in critical need of repairs to prevent further deterioration. The concentrating mill and a large section of the residential area were burned by the Japanese. The smelter and appurtenant installations, although suffering from disuse and neglect, were reported in fair condition. Resumption of mining and milling operations is contingent upon reconstruction of portions of the property destroyed during Japanese occupation, replacement of the hydroelectric plant, which was destroyed by the British before evacuation in April 1942, permission of the Shan States to import Indian, Chinese, or Burmese labor, which is at present prohibited or largely restricted, and reconstruction of the destroyed portions of the Burma Railway between Mandalay and Lashio to permit rail transportation of equipment, products, and personnel. The remaining reserves at the property are estimated at approximately 3,500,000 tons of ore averaging 15.7 ounces of silver per ton, 20.4 percent lead, 12.6 percent zinc, and 0.9 percent copper.

Canada.—Lead production increased in Canada in 1945 despite a continued shortage of mine and smelter labor, which showed little improvement until late in the year. At Trail, British Columbia, the Sullivan mine of the Consolidated Mining & Smelting Co., which operates the only Canadian lead smelter and electrolytic lead refinery, continued to be the principal source of Canadian lead production. Refined lead produced at the Trail smelter increased to 163,142 tons from 143,873 tons in 1944. Ore reserves at the end of the year showed a net increase of about 1½ million tons. Nearly 1,400 tons of lead concentrates averaging 80.96 percent lead were recovered during the year from 47,777 tons of ore milled at the Base Metals Mining Corp., Ltd., property in British Columbia. The New Calumet Mines, Ltd., at Calumet Island, Quebec, reported ore reserves on November 1, 1945, at 1,011,200 tons, assaying 2.9 percent lead, 9.1 percent zinc, 5.76 ounces of silver, and 0.038 ounce of gold per ton.

France.—The mine output of lead in France more than doubled in 1945 due largely to the removal of German control of the industry early in the year. Production of lead (content of lead in ores and concentrates) from 1938 through 1945, in metric tons, was as follows:

Year	1938	1939	1940	1941	1942	1943	1944	1945
Production	4,220	5,410	2,440	3,870	5,770	5,471	3,528	7,527

Mines that operated during the year were the La Plagne near Macot, Department of Savoie; Peyrebrune, near Realmont, Department of Tarn; La Loubatiere near Fontiers-Cabardes, Department of Aude; Labarre and Corbieres near Ceilhes, Department of Herault; and Pierrefitte, Department of Hautes-Pyrénées.

Germany.—The chief sources of lead and zinc ores in Germany are Upper Silesia, the Harz Mountains, and along the Rhine River in the Provinces of Rheinland, Westphalia, and Baden. As zinc is predominant in these ores, Germany during the war relied heavily upon imported lead concentrates from Yugoslavia. Newfoundland, Mexico, China, Australia, and Peru were important German prewar sources of lead. The mine production of recoverable lead from German properties from 1938 through 1943, in metric tons, was as follows:

Year	1938	1939	1940	1941	1942	1943
Production	85,026	91,088	91,868	98,693	99,778	104,590

Italy.—Of the three lead smelters in Italy, only one—the Pertusola plant at La Spezia—was damaged sufficiently during the war to prevent immediate resumption of operations.

Mexico.—Mexican mines operated during most of the year without any appreciable difficulties between labor and management, but heavy taxes and poor railroad facilities and service continued to be potent deterrents to operation. Late in the year labor unions presented demands for a 40-percent wage increase; to enforce these demands, a general strike of mine and smelter labor was called on December 31.

Newfoundland.—The mine production, in terms of lead content of concentrates produced, amounted to 22,608 short tons in 1945 compared with 29,661 tons in 1944. The bulk of the concentrates continued to be exported to the United States.

Peru.—The mine production of lead in Peru in 1945 was only slightly under that in the record year 1944. Of the total output, 40,001 tons were refined in bars at the Cerro de Pasco Copper Corp. Oroyo lead smelter and 11,934 tons (lead content) were exported in concentrates.

Spain.—Lead production in Spain declined in 1945 due to power shortages and drought. Jaen Province continued to be the principal producer of lead in 1945, accounting for over half of the total output. The average grade of concentrates in 1945 was 70.6 percent compared with 71.9 percent in 1944. Exports of pig lead declined from 8,142 metric tons in 1944 to 1,163 tons in 1945.

U. S. S. R.—Virtually no official production figures have been available on the Russian lead industry during the last 6 years. Certain data, however, presented in the announcement March 1946 of the new Five Year Plan indicate that lead output has been declining in recent years.

United Kingdom.—Consumption of pig lead (virgin metal) in the United Kingdom totaled 223,591 long tons in 1945 compared with 205,384 tons in 1944. Over-all consumption, including pig lead recovered from scrap, was 294,104 tons (282,621 tons in 1944), of which 26 percent was used in cable covering; 25 percent in sheet and pipe; 17 percent in batteries; 17 percent in white lead and oxides, excluding battery oxide; and 15 percent for miscellaneous purposes

Yugoslavia.—The properties of the Trepca Mines, Ltd., were recovered intact from the Germans in May 1945. Operation of the mine during German occupation is reported to have sharply reduced the ore reserves and damaged much of the plant and equipment. Production on a limited scale was resumed in July 1945, and the output was shipped to Russia.

ZINC [1]

By Richard H. Mote and Esther B. Miller

SUMMARY OUTLINE

GENERAL SUMMARY

Despite operational problems contingent upon reconversion from a wartime to peacetime basis and a persistent shortage of mine and smelter labor, the zinc industry continued to fulfill both civilian and military needs in 1945. Production and imports decreased, but the over-all new supply was sufficient to balance a high level of consumption with ample excess to add to an already high record level of stocks.

Domestic mine output was 15 percent less than in 1944, and total smelter production of primary slab zinc from domestic and foreign ores was 12 percent lower, although at a higher level than in prewar years. Year-end inventories at domestic smelters and consumers' plants were 10 and 14 percent, respectively, more than at the beginning.

Total imports of zinc in ores and concentrates and in the form of slab zinc declined 2 percent from 1944 and 20 percent from the record established in 1943. Ores and concentrates from Mexico and Canada constituted the greater part of the imports in 1945.

The established ceiling price of 8.25 cents a pound for Prime Western zinc at St. Louis remained unchanged throughout 1945.

[1] This report deals primarily with the smelting branch of the industry. Full details of zinc mining are given in the various State reports of this volume. As some zinc ore is used directly in the manufacture of zinc pigments, see chapter on Lead and Zinc Pigments and Zinc Salts.

Salient statistics of the zinc industry in the United States, 1925–29 (average) and 1941–45

GOVERNMENT REGULATIONS

During 1945 all Federal Government controls on zinc were eliminated. War Production Board (succeeded by Civilian Production Administration, November 3) Conservation Order M–11–b, which established restrictions and prohibitions on the use of zinc and zinc products, was revoked on June 14. WPB Limitation Order M–353 was revoked on March 26, when miscellaneous chemicals, including zinc sulfide, were made subject to WPB General Preference Order M–340. WPB General Preference Order M–11–1, relating to deliveries of zinc dust, was canceled on May 26; M–11, relating to deliveries of slab zinc, and M–11–a, outlining zinc oxide allocations and restrictions, were canceled on August 20. Import controls on slab zinc were removed on September 5, and Order M–340 was revoked on September 30.

Subsidy payments under the Premium Price Plan for overquota production were continued throughout 1945. A brief outline of the Premium Price Plan and an accompanying table giving production and payments from 1942 through 1945 are given in this chapter under Prices.

Some progress was made during the latter part of the year in providing legislation to authorize the establishment of a Federal Government stock pile of strategic minerals and metals for national defense when the Senate passed the Thomas-May Bill (S. 752) on December 20. Bill S. 752 authorizes the President to appoint a chairman of the Stock-Piling Board, determine what materials are strategic, and establish quantities and dates for stock piling. The Bill further provides that purchases for stock piling shall be made from supplies in excess of current industrial demand and at a price not to exceed the current open market price. Disposition of stock-piled material, unless obsolete for war purposes, cannot be made without 6 months' public notice and Congressional approval. During 1945 a small quantity of slab zinc was purchased for the Government stock pile of strategic metals.

RECIPROCAL TRADE AGREEMENTS

On June 19, 1945, the Senate passed a bill (H. R. 2652) extending the Reciprocal Trade Agreements Act for 3 years and permitting as much as a 50-percent reduction in the rates of duty prevailing on

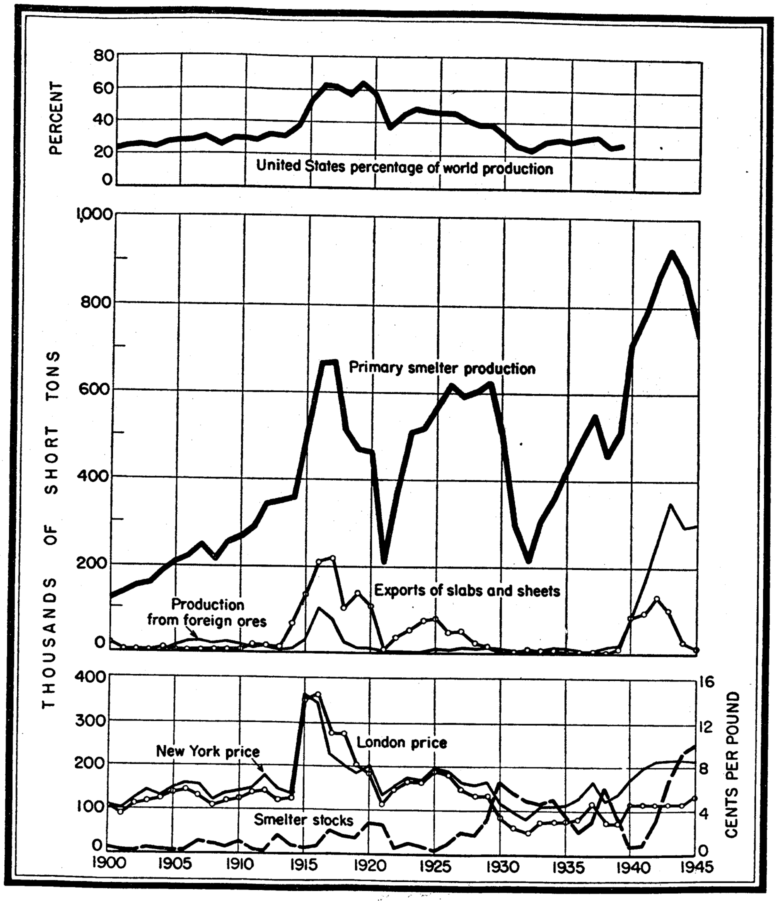

FIGURE 1.—Trends in the zinc industry in the United States, 1900–1945. Imports for consumption of slab and sheet zinc are not shown. Before 1936 they seldom exceeded 500 tons annually, but in recent years they have increased, amounting to 40,559 tons in 1941, 36,402 tons in 1942, 56,155 tons in 1943, 63,641 tons in 1944, and 96,712 tons in 1945.

January 1, 1945. The bill further provided that any temporary reduction under wartime agreements shall remain temporary, however, and any cut in the duty shall be with respect to the rates established by the 1930 Tariff Act. Under the "most-favored-nation" policy.

any reduction embodied in a reciprocal agreement would apply equally to virtually all countries.

The tariff on zinc-bearing ores remained at 1⅕ cents per pound (zinc content), Canada, and ¾ cent, Mexico; and zinc in blocks, pigs or slabs, and dust, 1⅗ cents per pound, Canada, and ⅞ cent, Mexico, during 1945. A provision of the Mexican Trade Agreement of January 30, 1943, provides that the tariff on zinc-bearing ores, blocks, pigs or slabs, and dust would revert to the levels contained in the Canadian Trade Agreement of 1939 (1⅕ cents and 1⅗ cents per pound, respectively) 30 days after the war emergency is announced as being officially terminated.

Figure 1 shows trends in the zinc industry in the United States since 1900.

DOMESTIC PRODUCTION

Zinc-production statistics may be prepared on a mine or on a smelter basis. The mine-production data compiled on a basis of zinc content in ores and concentrates and adjusted to account for average losses in smelting are the most accurate measure of output from year to year. The slab-zinc production, as reported by smelters, presents a more precise figure of actual zinc recovery but generally differs from the mine figure owing to overlap or lag between mine shipments and smelter receipts of ores and concentrates. These variations, however, tend to balance within the limits of statistical error over a period of years.

MINE PRODUCTION

The mine production of recoverable zinc (including that recovered as zinc pigments and salts directly from ore) in the United States decreased 15 percent in 1945 to the lowest level of any year since 1939. The continued drop in output from the wartime peak in 1942 was essentially due to manpower shortages, reportedly the most severe in 1945 of any year during the war period. Zinc mining is centered largely in five areas—the Tri-State area of southeastern Kansas, southwestern Missouri, and northeastern Oklahoma; Tennessee-Virginia; Sussex County, N. J.; St. Lawrence County, N. Y.; and the Western States (principally Idaho, New Mexico, Arizona, Colorado, Utah, Nevada, and Montana, in descending order of productivity in 1945).

Oklahoma, the leading zinc-producing State since 1918 (except for 1931 and 1932 when New Jersey ranked first), dropped to third place in 1945, yielding the lead to Idaho and second place to New Jersey.

The Western States contributed 48 percent of the total domestic output of zinc (46 percent in 1944) despite a 10-percent decline in production. Idaho continued to be the largest producer among the Western States, and, for the first time, ranked first among the States in the United States. More than 93 percent of the Idaho zinc output in 1945 came from the Coeur d'Alene region; zinc-lead ores and old tailings concentrated yielded 88 percent of the total zinc. New Mexico continued to rank second among the Western States despite a 21-percent decline in output. Approximately 90 percent of all zinc produced in New Mexico in 1945 came from the Central district, Grant County; zinc-lead ore yielded 62 percent and zinc ore 38 percent of the total zinc. Arizona took third place over Colorado by a substantial margin as zinc production increased 38 percent over the record output of 1944. About 45 percent of the total zinc came from mines at Bisbee, Cochise County; zinc-lead ore accounted for 85 percent of the total production. Colorado zinc output decreased 10 percent in 1945. Over 44 percent of the Colorado total output came from the Red Cliff district; zinc, zinc-lead, and zinc-lead-copper ores yielded 93 percent of the total zinc produced. Utah output, the lowest since 1935, declined 14 percent in 1945, as all principal zinc-producing districts reported decreased production; about 79 percent of the total zinc was recovered from zinc-lead ores concentrated. Production of zinc in Nevada in 1945 was the greatest in the history of the State. About 77 percent of the total zinc produced was mined in the Pioche district, Lincoln County; nearly 60 percent of the zinc recovered was from zinc-lead ore and 22 percent from lead ore. The output of zinc in Montana declined 52 percent in 1945 due principally to a marked decrease in zinc output from the zinc slag-fuming plant at East Helena; about 62 percent of the total zinc was derived from zinc-lead ore and 32 percent from zinc ore and slag.

Zinc production in the Central States, smallest since 1934, decreased 27 percent from the 1944 output. The Tri-State (Joplin) region maintained its position as the principal zinc-producing district, with 23 percent (26 percent in 1944) of the total United States output.

Mine production of recoverable zinc in the United States, 1925–29 (average) and 1941–45, by States, in short tons

State	1925–29 (average)	1941	1942	1943	1944	1945
Western States:						
Arizona	2,628	16,493	18,522	19,677	29,077	40,226
California	3,999	440	613	1,856	8,455	9,923
Colorado	32,868	15,722	32,215	44,094	39,955	35,773
Idaho	29,128	79,084	87,256	86,707	91,372	83,463
Montana	72,519	60,710	54,715	37,606	36,127	17,403
Nevada	5,570	15,129	10,197	13,647	20,699	21,457
New Mexico	23,351	37,862	46,461	59,524	50,727	40,295
Oregon						1
South Dakota	----	----	115	46	56	----
Utah	44,385	42,049	45,543	46,896	38,994	33,630
Washington	575	14,320	14,398	12,203	11,904	11,693
	215,023	281,809	310,035	322,256	327,366	293,864
Central States:						
Arkansas	71	206	181	96	19	303
Illinois	1,174	9,198	9,389	5,851	7,262	8,310
Kansas	114,323	71,403	55,874	56,944	63,703	48,394
Kentucky	644	427	407	931	341	182
Missouri	16,708	21,932	36,394	30,413	36,626	22,175
Oklahoma	226,969	166,602	146,510	114,085	91,449	69,300
Wisconsin	23,055	6,238	9,426	14,387	15,549	15,561
	382,944	276,006	258,181	222,707	214,949	164,225
Eastern States:						
New Jersey	93,839	93,781	94,040	92,864	80,288	81,392
New York	7,091	38,446	45,807	46,000	35,541	24,978
Tennessee	14,631	36,170	43,971	41,766	40,831	33,824
Virginia	11,192	22,913	15,991	18,603	19,667	16,075
	126,753	191,310	199,809	199,233	176,327	156,269
	724,720	749,125	768,025	744,196	718,642	614,358

Despite a decline of 11 percent in zinc production due largely to a sharp drop in the output from New York, the Eastern States contributed 25 percent of the total domestic output.

Detailed information on the production of mines and districts in the United States may be found in the chapters of this volume dealing with the mine production of gold, silver, copper, lead, and zinc in the various States.

Mine production of recoverable zinc in the United States, by districts that produced 1,000 tons or more during any year, 1941-45, in short tons

District	State	1941	1942	1943	1944	1945
Tri-State (Joplin region)	Kansas, southwestern Missouri, Oklahoma.	258,837	237,936	200,514	190,270	139,274

SMELTER PRODUCTION

ZINC-REDUCTION PLANTS

There was no change during 1945 in the number of active primary zinc-reduction plants. For the last 4 years there have been 22 commercial plants in operation, of which 13 operated with horizontal retorts exclusively, 1 with both horizontal and vertical retorts, 3 with vertical retorts exclusively (one electrothermic), and 5 with electrolytic methods.

The St. Joseph Lead Co. continued experimental operation of its slag-fuming plant at Herculaneum, Mo., in 1945 for the recovery of slab zinc as a direct product of the operation which treats lead blast-furnace slag containing 12 to 16 percent zinc.

Horizontal-retort plants.—The total number of retorts reported at horizontal-retort primary plants in 1945 was 74,120, an increase of 3 percent over the 71,912 retorts at these plants on December 31, 1944. Of the total retorts reported, 54,932 (74 percent) were in use at the close of 1945, an increase of 6 percent over the 52,000 (72 percent) in operation at the end of 1944. The increase can be attributed to a slight increase in the supply of available labor during the latter part of the year.

Vertical-retort plants.—Four vertical-retort continuous distilling plants operated during 1945. The St. Joseph Lead Co. operated its 9 electrothermic units at Josephtown, Pa., at near capacity throughout the year. Of the 66 vertical retorts at the remaining 3 plants, 61 were in operation on December 31, 1945.

Electrolytic plants.—Five electrolytic plants were in operation during 1945, as in 1944. There were 3,210 cells at the plants on December 31, 1945, of which 3,184 (99 percent) were in operation compared with 2,994 (93 percent) at the end of 1944. No new installations were reported under construction or planned.

Smelting capacity.—Irrespective of additions or subtractions of smelter recovery units, statistics on the domestic smelting capacity vary from year to year due to changes in metallurgical practices among the various plants. According to reports to the Bureau of Mines, the zinc-reduction plants in the United States on December 31, 1945, had a stated annual capacity to produce 1,054,000 tons of slab zinc under normal operating conditions, allowing for necessary shut-downs for repairs. This figure, which is 2 percent over the reported capacity at the end of 1944, indicates that the 1945 output was 77 percent of the capacity as compared with 89 percent in 1944. Horizontal- and vertical-retort plants operated at 77 percent of a stated 672,000-ton capacity (86 percent of a 670,000-ton capacity in 1944), electrolytic plants at 80 percent of a 338,000-ton capacity (94 percent in 1944), and secondary smelters at 64 percent of a 44,000-ton capacity (57 percent of a 43,000-ton capacity in 1944).

No additional smelting capacity was planned at the end of 1945, and only a small increase of four graphite retorts was under construction at one smelter.

Waelz kilns.—Waelz plants have been installed in recent years at several midwestern and eastern smelters to facilitate recovery of additional metals from the ore and to reduce over-all smelting losses. The following companies operated Waelz kilns in 1945:

Arkansas:
- Fort Smith—The Residue Co.

Illinois:
- Fairmont City—American Zinc Co. of Illinois.
- Danville—The Hegeler Zinc Co.
- La Salle—Matthiessen & Hegeler Zinc Co.

Kansas:
- Cherryvale—National Zinc Co., Inc.

Oklahoma:
- Henryetta—Eagle-Picher Mining & Smelting Co.

Pennsylvania:
- Donora—American Steel & Wire Co.
- Langeloth—American Zinc & Chemical Co.
- Palmerton—New Jersey Zinc Co.

Active zinc-reduction plants.—A list of the zinc-reduction plants operating in the United States in 1945 follows:

HORIZONTAL-RETORT PLANTS

Arkansas:
- Fort Smith—Athletic Mining & Smelting Co.
- Van Buren—Arkansas Smelting Co.

Illinois:
- Fairmont City—American Zinc Co. of Illinois.
- Danville—The Hegeler Zinc Co.
- La Salle—Matthiessen & Hegeler Zinc Co.

Oklahoma:
- Blackwell—Blackwell Zinc Co.
- Henryetta—Eagle-Picher Mining & Smelting Co.
- Bartlesville—National Zinc Co., Inc.

Pennsylvania:
- Langeloth—American Zinc & Chemical Co.
- Donora—American Steel & Wire Co.
- Palmerton—The New Jersey Zinc Co. of Penna.

Texas:
- Amarillo—American Smelting & Refining Co.
- Dumas—American Zinc Co. of Illinois.

West Virginia:
- Moundsville—United Zinc Smelting Corp.[2]

VERTICAL-RETORT PLANTS

Illinois:
- Depue—The New Jersey Zinc Co.

Pennsylvania:
- Palmerton—The New Jersey Zinc Co. of Penna.
- Josephtown—St. Joseph Lead Co.

West Virginia:
- Meadowbrook—E. I. du Pont de Nemours & Co.

ELECTROLYTIC PLANTS

Idaho:
- Kellogg—Sullivan Mining Co.

Illinois:
- East St. Louis—American Zinc Co. of Illinois.

Montana:
- Anaconda—Anaconda Copper Mining Co.
- Great Falls—Anaconda Copper Mining Co.

Texas:
- Corpus Christi—American Smelting & Refining Co.

PRODUCTION OF PRIMARY AND REDISTILLED SECONDARY SLAB ZINC

The output of primary slab zinc in 1945, the smallest since 1940, dropped 12 percent below the 1944 production. The use of foreign ore continued at a high level and the slab zinc produced from this source gained slightly in 1945. Production from domestic ore, lowest since 1938, declined 19 percent to continue the downward trend in evidence since 1941.

[2] Operations suspended July 10, 1945.

Production of redistilled slab zinc from zinc scrap remained virtually the same in 1945. Of the 49,242 short tons of redistilled secondary slab zinc produced, 21,205 tons (43 percent) were derived from primary smelters, and 28,037 tons (57 percent) were produced at secondary plants. Data on the output of remelted secondary slab zinc are not included with those for redistilled metal. In 1945 the production of slab zinc recovered by remelting purchased scrap amounted to 8,090 tons (7,741 tons in 1944). Zinc rolling mills and other consumers of slab zinc recover large quantities of zinc from their own plant scrap; but such metal is not measured statistically, for it normally does not enter the market as scrap.

Primary and redistilled secondary slab zinc produced in the United States, 1941–45, in short tons

Year	Primary			Redistilled secondary	Total (excludes zinc recovered by remelting)
	Domestic	Foreign [1]	Total		
1941	652,599	169,421	822,020	59,503	881,523
1942	629,957	[2] 261,915	891,872	53,195	945,067
1943	594,250	[2] 348,059	942,309	48,215	990,524
1944	574,453	[2] 294,849	869,302	49,037	918,339
1945	467,084	[2] 297,477	764,561	49,242	813,803

[1] Most of the foreign ores smelted in the United States in 1941 originated in Mexico, Canada, Newfoundland, and Peru; in 1942, in Mexico, Canada, Argentina, Newfoundland, Australia, and Peru; in 1943, in Canada, Mexico, and Australia; in 1944, in Mexico, Canada, Australia, Newfoundland, and Argentina; in 1945, in Mexico, Canada, Australia, Peru, Newfoundland, Argentina, and Bolivia.

[2] Includes a small tonnage of foreign slab zinc further refined into high-grade metal in the United States.

DISTILLED AND ELECTROLYTIC ZINC

Of the 1945 output of primary zinc, 65 percent was distilled and 35 percent was produced electrolytically compared with 63 and 37 percent, respectively, in 1944.

A continued decline in the demand for brass products for ammunition due to sharp reductions in military requirements was largely the cause for a decrease in the output of the higher grades of slab zinc. The available capacity for redistilling Selected and Prime Western zinc into High-Grade zinc was not fully utilized during the year. The output of electrolytic zinc plants, important producers of High-Grade zinc, dropped 15 percent as compared with a 10-percent decline in production of distilled primary zinc.

Brass Special was the only grade of slab zinc of which production increased in 1945, the total output being 39 percent above the 1944 figure. In contrast, Special High Grade decreased 12 percent, Regular (Ordinary) High Grade 24 percent, Intermediate 12 percent, Selected 29 percent, and Prime Western 8 percent. The original first-stage smelter production of the two lower grades of zinc was somewhat higher than is indicated in the following table, but to avoid duplication the quantity of each grade consumed in redistilling was omitted because the resultant Special and Regular High Grade slab zinc thus produced is reported. Of the total 1945 production (comparable 1944 figures in parentheses), 32 percent (31 percent) was Prime Western, 27 percent (27 percent) Special High Grade, 24 percent (27 percent) Regular High Grade, 9 percent (6 percent) Brass

Special, 6 percent (6 percent) Intermediate, and 2 percent (3 percent) Selected.

Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1941–45, in short tons

CLASSIFIED ACCORDING TO METHOD OF REDUCTION

Year	Electrolytic primary	Distilled	Redistilled secondary [1]		Total
			At primary smelters	At secondary smelters	
1941	224,313	597,707	27,904	31,599	881,523
1942	252,987	638,885	20,978	32,217	945,067
1943	329,902	612,407	24,385	23,830	990,524
1944	317,388	551,914	24,673	24,364	918,339
1945	269,924	494,637	21,205	28,037	813,803

CLASSIFIED ACCORDING TO GRADE

Year	Grade A		Grade B (Intermediate)	Grades C and D		Grade E (Prime Western)	Total
	Special High Grade (99.99% Zn)	Regular High Grade (Ordinary)		Brass Special	Selected		
1941	203,030	177,451	74,797	73,968	5,152	347,125	881,523

1944	251,210	251,595	55,928	54,396	24,396	280,814	918,339
1945	220,241	191,639	49,106	75,749	17,367	259,701	813,803

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

PRODUCTION OF PRIMARY SLAB ZINC BY STATES

Pennsylvania was the leading producer of slab zinc in 1945, thus regaining the rank held every year but two since 1943. Montana, which displaced Pennsylvania in 1943 and 1944, dropped to second place and was followed by Illinois. Of the States for which production data may be released, Oklahoma, Idaho, and Arkansas occupied the next three positions, in order of decreasing importance. Each State showed a decline in output from 1944. Montana and Idaho, as usual, produced electrolytic zinc only, Illinois and Texas made both electrolytic and distilled metal, and all other States confined their operations to distillation alone. Experimental production of slab zinc directly from the treatment of lead-smelter slag by the fuming process continued for the third year at a Missouri plant.

Some indication of the movement of foreign ores and concentrates within the United States is revealed when a breakdown of the production of primary slab zinc from this source is considered. Of the 297,477 tons of primary slab zinc of foreign origin recovered in 1945, smelters in Pennsylvania accounted for 26 percent, Montana 23 percent, Oklahoma 20 percent, Illinois 17 percent, and Texas, West Virginia, and Arkansas combined 14 percent. Only two smelters, one in Illinois and one in West Virginia, operated exclusively on domestic ores and concentrates. Of the total slab zinc produced from foreign ores and concentrates, 38 percent was recovered by electrolytic methods and 62 percent by distillation.

Primary slab zinc produced in the United States, by States where smelted, 1941–45, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Other States [1]	Total	
								Short tons	Value
1941	44, 045	39, 285	121, 921	176, 406	105, 885	222, 486	111, 992	822, 020	$123, 303, 000
1942	41, 649	39, 916	175, 455	193, 486	102, 422	231, 362	107, 582	891, 872	155, 186, 000
1943	35, 704	41, 129	221, 680	237, 585	72, 043	218, 058	116, 110	942, 309	162, 076, 000

[1] Texas and West Virginia; also Missouri in 1943 and 1944.
[2] Revised figure.

SECONDARY ZINC

In addition to the redistilled secondary slab zinc (unalloyed) already reported herein, some remelted slab zinc is produced, and a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in this volume in the chapter on Secondary Metals—Nonferrous.

BYPRODUCT SULFURIC ACID

Sulfuric acid made from the sulfur dioxide gases produced in roasting zinc blende (sphalerite) is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consume large quantities of sulfur. The production of sulfuric acid at zinc-blende roasting plants decreased 6 percent in 1945.

Sulfuric acid (60° B. basis) made at zinc-blende roasting plants in the United States, 1941–45

Year	Made rom zinc blende [1]		Made from sulfur		Total [1]		
						Value [2]

[1] Includes acid from foreign blende.
[2] At average of sales of 60° acid.
[3] Revised figures.

ZINC DUST

Zinc-dust production declined 2 percent from the peak output in 1944. Zinc powder and blue powder are not included in the total produced; the zinc dust statistically reported is restricted to commercial grades that comply with severe specifications as to percentage of unoxidized metal, evenness of grading, and fineness of the particles. The zinc content of the dust produced in 1945 ranged from 94.20 to

99.73 percent and averaged 97.46 percent. Shipments of zinc dust totaled 25,151 tons, of which 350 tons or 1 percent went to foreign countries. This figure is possibly somewhat low, as Federal Government purchases (of which a part was eventually shipped abroad) were not given separately, and a portion of this quantity doubtless was reported as domestic shipments. Shipments of zinc dust were slightly lower than production, and as the quantity consumed at manufacturers' plants was small (1 percent of output), producers' stocks showed a moderate increase from 1,285 tons (corrected figure) at the beginning to 1,750 tons at the close of the year.

The average price of zinc dust shipped to domestic consumers in 1945 was 10.1 cents a pound, as in 1944. The raw materials used to manufacture zinc dust are reviewed in this volume in the chapter on Secondary Metals—Nonferrous. Most of the production is from zinc scrap, principally galvanizers' dross, but some is recovered from zinc ore, slab zinc, and as a byproduct of zinc refining.

Zinc dust [1] produced in the United States, 1941–45

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average per pound			Total	Average per pound
1941	24,429	$4,641,580	$0.095	1944	26,511	$5,408,244	$0.102
1942	22,805	4,789,050	.105	1945	25,877	5,227,154	.101
1943	25,990	5,249,980	.101				

[1] All produced by distillation.

ZINC PIGMENTS AND SALTS

The principal zinc pigments are zinc oxide and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinc-bearing materials, including ore, metal, scrap, and residues. Details of the production of zinc pigments and salts are given in this volume in the chapter on Lead and Zinc Pigments and Zinc Salts.

STOCKS

PRODUCERS' STOCKS

Inventories of slab zinc at producers' plants continued to increase in 1945 and by December 31 were 10 percent above the previous year-end record total. Of the 256,216 tons on hand at the end of the year, 169,679 tons were Special High Grade and Regular High Grade and the remainder (86,537 tons) of lower grades, compared with 159,489 tons and 74,207 tons, respectively, at the end of 1944. Nearly the entire gain can be accounted for by the accumulation of Brass Special and High-Grade Zinc.

According to the American Zinc Institute, stocks of slab zinc followed a general downward trend until the end of April but advanced without interruption during the remaining months of the year.

Stocks of zinc ore (60-percent concentrates) in the Tri-State district (as reported by the Tri-State Zinc and Lead Ore Producers' Association) were 4,664 tons at the beginning of 1945. High point of the year was reached on January 27, with a total of 4,684 tons. For the remainder of 1945, stocks showed a slight trend downward to a low of 2,690 tons on July 7, followed by a general increase to 4,378 tons on December 22 and closing on December 29 at 3,677 tons. The noticeable lack of sharp variations in stocks of zinc concentrates reflects the financial assistance to smelters treating Tri-State concentrates, which assistance was in the form of special premium payments from the Office of Metals Reserve and permitted the smelters to accept and treat profitably virtually all concentrates offered.

Stocks of zinc on hand at zinc-reduction plants in the United States at end of year, 1941–45, in short tons

	1941	1942	1943	1944	1945
At primary reduction plants	24,212	82,498	168,777	233,044	254,765
At secondary distilling plants	890	1,942	1,829	652	1,451
	25,102	84,440	170,606	233,696	256,216

According to an American Zinc Institute survey, total stocks of domestic and foreign zinc ore and concentrates at primary zinc-reduction plants on December 31, 1945, totaled 911,624 tons averaging 55 percent zinc. This compares with 734,506 tons containing 54 percent zinc at the end of 1944.

CONSUMERS' STOCKS

Stocks of slab zinc at consumers' plants increased moderately in 1945, the total on December 31 being 14 percent over the quantity on hand at the beginning of the year. Inventories increased abruptly from the low point at the first of the year to a high of about 103,350 tons on April 30, followed by a general downward trend during the remainder of the year. A 24-percent drop in slab-zinc inventories at brass mills, ingot makers, and foundries reflects the sharp reduction in military requirements for zinc in the manufacture of brass following termination of the war. At the average monthly rate of consumption in 1945, consumers' stocks on hand at the end of 1945 were slightly more than 1 month's requirements. Exclusive of an indeterminate quantity in bonded warehouses, the approximate total slab zinc in stock (including company- and Government-owned stocks at producers' plants) on December 31, 1945, was 351,000 tons compared with 318,000 tons at the end of 1944.

Consumers' stocks of slab zinc at plants at the beginning and end of 1945, by industries, in short tons

	Galvanizers	Die casters [1]	Brass mills [2]	Zinc rolling mills	Oxide plants	Others	Total
Dec. 31, 1944	[3] 27,129	[3] 5,294	[3] 25,052	[3] 4,972	786	[3] 1,539	[3,4] 64,772
Dec. 31, 1945	33,915	11,900	18,951	6,317	612	1,848	[4] 73,543

[1] Includes producers of zinc-base die castings, zinc-alloy dies, and zinc-alloy rods.
[2] Includes brass mills, brass ingot makers, and brass products.
[3] Revised figures.
[4] Stocks on December 31, 1944 and 1945, exclude 482 tons and 428 tons, respectively, of remelt spelter.

DOMESTIC CONSUMPTION

NEW SUPPLY

The following table shows the 5-year record of primary slab zinc available for consumption in the United States. This calculated quantity, in effect, is equivalent to primary slab zinc apparently made available each year for shipment to domestic consumers during the year.

In addition to primary slab zinc, 48,443 tons of redistilled secondary slab zinc were made available to consumers in 1945 after allowance for an increase in stocks at secondary smelters. Also 8,090 tons of remelt spelter were produced from purchased scrap.

Primary slab zinc available for consumption in the United States, 1941–45, in short tons

	1941	1942	1943	1944	1945

[1] Adjusted to exclude imported slab zinc further refined into high-grade metal in the United States.
[2] Revised figures.

CONSUMPTION

According to reports from 690 plants, representing an estimated 98 percent of the consuming industry in the United States, 852,311 tons of slab zinc (including 5,111 tons of purchased remelt spelter) were put in process in 1945, a 4-percent decline from the record attained in 1944. Receipts at consumers' plants during 1945 were 861,028 tons. The apparent discrepancy between this figure and the calculated 883,160 tons of primary and secondary slab zinc and remelt spelter shipped to domestic consumers in 1945 can be attributed to incomplete coverage of the survey, variations in the quantity of metal in transit from producer to consumer at the beginning and the end of the year, and unaccounted-for slab zinc stored in bonded warehouses.

With the end of hostilities the two major use categories of slab zinc returned to their prewar relationship. Galvanizing regained its position as the principal use of slab zinc; the quantity consumed for this purpose in 1945 gained 7 percent over 1944. The use of slab zinc for brass products, through cut-backs in military orders for cartridge brass, declined 32 percent during the year. The quantity of zinc used for zinc-base alloys was 55 percent greater than in 1944, whereas zinc for French-process oxide declined 10 percent.

Consumption of slab zinc in the United States, 1941–45, by industries, in short tons [1]

[1] Based on a canvass of 600 plants in 1941 and 1942 and a somewhat larger coverage in 1943, 1944, and 1945 mostly from small consumers.
[2] Includes zinc used in electrogalvanizing, but excludes sherardizing.
[3] Separate figures not available but included in "Other."
[4] Includes miscellaneous articles not given elsewhere.
[5] Included under "Other uses" in 1941 and 1942.
[6] Included under "Zinc-base alloy" in 1943, 1944, and 1945.
[7] Includes zinc used in making zinc dust, bronze powder, alloys, chemicals, castings, and miscellaneous uses not elsewhere mentioned.
[8] Includes 6,982 tons of remelt zinc in 1944 and 5,111 tons in 1945.

Zinc for rolled products continued to gain in 1945; the quantity used for this purpose was 28 percent greater than in 1944. In addition to slab zinc, the rolling mills remelt and reroll the metallic scrap produced from their fabricating operations. The scrap so treated in 1945 amounted to 31,968 tons—a 48-percent increase from the comparable total processed in 1944. Purchased zinc scrap in the form of zinc clippings, old zinc scrap, and engravers' plates totaling 3,652 tons were melted and rolled in 1945 (1,786 tons in 1944). Production of rolled zinc from slab zinc and purchased scrap was 98,384 tons, an increase of 29 percent over the total for 1944. The total value of rolled products was 30 percent more than in 1944. Inventories of rolled zinc were 1,885 tons on December 31, 1945, compared with 1,700 tons (revised figure) on the same date in 1944. In addition to the actual shipments of 60,153 tons of rolled zinc in 1945, the rolling mills processed 70,014 tons of rolled zinc (including that which was remelted and rerolled) in manufacturing 41,499 tons of semifabricated and finished products.

Rolled zinc produced and quantity available for consumption in the United States, 1944–45

	1944			1945

Value added by rolling			.038			.040

[1] Figures represent net production. In addition, 21,555 tons of strip and ribbon zinc in 1944 and 31,968 tons in 1945 were rerolled from scrap originating in fabricating plants in connection with zinc rolling mills.
[2] Less than 1 ton.
[3] Allowances made for change in producers' stocks of rolled zinc.

The following table shows the six commercial grades of refined slab zinc and purchased remelt spelter consumed by the various industries in 1945. Of the 852,311 tons of domestic and foreign zinc consumed, 38 percent was Prime Western, 25 percent Special High Grade, and 22 percent Regular High Grade, compared with 35, 27, and 24 percent, respectively, in 1944. All grades of zinc were used for galvanizing and in the manufacture of brass and rolled zinc products. Prime Western was the principal grade used in the hot-dip process of galvanizing, the higher grades being used chiefly for electrogalvanizing. Rigid specifications in brass manufacture necessitate the use of high-purity metal, 72 percent of the total used in this industry being of the two highest grades.

Consumption of slab zinc in the United States in 1945, by grades, according to industry, in short tons

	Special High Grade	Regular High Grade	Intermediate	Brass Special	Selected	Prime Western	Remelt	Total
Galvanizing	10,909	8,049	10,505	8,759	1,387	294,234	3,338	337,181

PRICES

The base ceiling price established by the Office of Price Administration of 8.25 cents a pound for Prime Western-grade slab zinc at St. Louis and $55.28 per ton of 60-percent concentrates at Joplin, Mo., remained unchanged throughout 1945. In comparison, the weighted average price received by the producers for all grades of zinc sold in 1945 was 8.6 cents a pound, f. o. b. plants, as in 1944 and in 1943. The 1945 price of 11.5 cents for zinc, which appears in the State chapters, represents the weighted average price received for all grades of slab zinc (8.6 cents) plus the increment—in terms of cents per pound based upon the total mine output of recoverable zinc—of $36,205,177 in subsidies for overquota production and special mine and smelter contracts paid by the Office of Metals Reserve (successor July 1, 1945, to the Metals Reserve Company).

The general policy of the Quota Committee pertaining to the Premium Price Plan for overquota mine production of domestic zinc (copper and lead were also included in the plan) prevailed throughout 1945. The original plan in force since February 1, 1942, was operative only until July 31, 1945. Congress voted the Hayden-McFarland bill, S. 502, into Public Law 88 on June 14, 1945, extending the plan until June 30, 1946. A compilation of important data showing production of zinc under the Premium Price Plan since February 1942 at the various quota levels and the payments made is given in the following table.

[3] Production of Tri-State zinc from Office of Metals Reserve agency, Joplin, Mo.; all other from Bureau of Mines monthly reports. These data are preliminary and do not exactly equal final annual totals for the United States except for 1945.

[4] Data on premium payments, payments to smelters, and Metals Reserve mine-contract payments from Office of Metals Reserve. All payments shown are subject to correction due to additional payments as a result of retroactive quota adjustments, late reports by smelters and custom mills, etc.

[5] All average prices shown include OPA ceiling price of 8.25 cents a pound for zinc.

The official London maximum price of £25 15s. per long ton, duty paid, for foreign zinc delivered to consumers, and £26 10s. for domestic metal, including secondary, fixed by the British Ministry of Supply in December 1939, was advanced to £31 5s. and £32 0s., respectively, on June 11, 1945. Quotations of the London Metal Exchange, discontinued at the outbreak of the war in September 1939, were not resumed during 1945.

[1] Does not include overquota premium payments made by Office of Metals Reserve.
[2] American Metal Market quotes average prices of High Grade and Brass Special as follows: High Grade (f. o. b. New York)—1941, 8.48 cents; 1942, 9.25 cents (delivered); 1943, 9.25 cents (delivered); 1944, 9.25 cents (delivered); 1945, 9.25 cents (delivered). Brass Special (f. o. b. East St. Louis)—1941, 7.68 cents; 1942, 8.50 cents; 1943, 8.50 cents; 1944, 8.50 cents; 1945, 8.50 cents.

FOREIGN TRADE [3]

IMPORTS

Total imports of zinc in ores and concentrates declined 10 percent from 1944 and 29 percent from the record established in 1943. Of the 381,719 short tons of zinc imported in ores and concentrates in 1945, 46 percent came from Mexico, 24 percent from Canada, 11 percent from Bolivia, 9 percent from Peru, 6 percent from Newfoundland and Labrador, and 4 percent from Australia. The substantial gain in imports of ore from Bolivia reflected the increased activity in zinc mining there. Imports from Australia, 64 percent less than in 1944, were the only ones to reach the United States from the Eastern Hemisphere. Imports of slab zinc increased 53 percent over 1944 owing to a 157-percent gain in imports from Canada and a 222-percent increase in slab zinc from Australia, which more than offset a decline in Mexican imports.

Zinc imported into the United States in ore, blocks, pigs, or slabs, 1943–45, by countries, in short tons [1]

Country	1943	1944	1945
Ore (zinc content):			
Argentina	53,452	22,253	----------
Australia	122,305	42,216	15,377
Belgian Congo	14,835	----------	----------

1945	330, 397	14, 962, 057	96, 710	12, 165, 873	(3)	2	7, 331	477, 893	362	39, 789	27, 645, 614

[1] Includes dross and skimmings as follows—1941: 353 tons, $23,028; 1942: 3,214 tons, $150,913; 1943: 5,032 tons, $216,425; 1944: 4,694 tons, $224,995; and 1945: 4,323 tons, $231,946.
[2] In addition, manufactures of zinc imported as follows—1941: $1,099; 1942: $16; 1943: $35,355; 1944: $14,223; and 1945: $8,077.
[3] Less than 1 ton.

EXPORTS

The value of exports of zinc ores (and concentrates) and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) amounted to $2,956,222 in 1945 compared with $4,857,365 in 1944. Sheets, strips, or other forms replaced slabs, plates, or blocks as the principal export group. The exports of slabs, plates, or blocks declined 64 percent to the lowest level since 1939. In addition to the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. Export data on zinc pigments and chemicals are given in this volume in the chapter on Lead and Zinc Pigments and Zinc Salts. Much of the zinc used in the manufacture of such products is of foreign origin, and when they are exported a draw-back of 99 percent of the import duty is refunded upon the basis of zinc contained in the finished product. Data covering draw-back in 1945 are not yet available. Draw-back refunds were made on 7,274 tons in 1943 and on 29,738 tons in 1944.

WORLD PRODUCTION

The unconditional surrender of Germany and Japan in May and August 1945, respectively, permitted relaxation of censorship restrictions on production statistics of most of the zinc-producing countries in the world. Some information regarding the zinc industry in European countries formerly under Axis control has become available during the year, and some progress has been made toward presentation of comprehensive world zinc-production statistics during the war years. Nevertheless, a statistical gap in the record for certain important zinc-producing centers continues to prevent final compilation of production data beyond 1940.

World smelter production of zinc, 1938–45, by countries where smelted, in metric tons [1] [2]

1 In addition to the countries listed above, Argentina and Sweden also produce zinc, but complete data are not available.
2 Statistical data derived in part from the American Bureau of Metal Statistics, Yearbook.
3 Excludes electrolytic zinc production, data for which are not available.
4 Included with Germany.
5 Includes Austria; beginning in October 1938 includes Sudetenland, beginning in October 1939 includes Upper Silesia, and beginning in 1942 includes Lower Syria.
6 Data not available.
7 Estimate.
8 Some secondary metal included.

REVIEW BY COUNTRIES

Argentina.—The Aguilar mine of the Compania Minera Aguilar, S. A., subsidiary of the St. Joseph Lead Co., continued to be the leading producer in 1945, although ore production declined owing to shortage of mine timber, fuel oil, and inability of the railroad to provide enough cars for shipping the concentrates from the mine. The zinc-concentrate production at the Aguilar mine in 1945 was 25,862 metric tons, compared with 38,512 tons in 1944.

Australia.—Labor shortages, reportedly the most critical of any year since the beginning of the war, continued to restrict the production of zinc at Australian mines and smelters in 1945. At Mount Isa Mines, Ltd., Queensland, a critical manpower shortage permitted operating the copper section of the mine only. The need for adequate manpower seriously curtailed development programs at the mines.

The production of crude ore at the Broken Hill South, Ltd., for the fiscal year ended June 30, 1945, was 309,605 long tons, compared with 341,920 tons the previous year. A corresponding decrease was reported in the production of zinc concentrates. Although exploration and development were curtailed to release labor for production, the ore reserves increased slightly to 1,930,000 long tons averaging 11.1 percent zinc and 13.8 percent lead.

The Lake George Mining Corp., Ltd., at Captain's Flat, New South Wales, produced 164,549 tons of ore for the fiscal year ended June 30, 1945, compared with 239,900 tons for the previous year, the bulk of the ore for both years being taken from the Keating's ore body. The total estimated ore reserves remaining at the property on June 30 were 1,416,603 tons assaying 1.1 dwt. gold and 1.4 ounces of silver per ton and 7.3 percent lead, 12.8 percent zinc, and 0.7 percent copper.

The electrolytic plant of the Electrolytic Zinc Co. of Australasia, Ltd., at Risdon, Tasmania, which treats zinc concentrates from Broken Hill, New South Wales, as well as from the company-owned Tasmanian mines, produced 83,773 long tons of slab zinc during 1945.

Belgium.—The Belgian smelting industry made very little headway during 1945 toward resuming operations, largely owing to lack of raw materials, shortage of fuel, and delays in rehabilitating the plants. The three zinc smelters of the Société Anonyme de la Vielle Montagne began operations on a very limited scale during the middle of the year; concentrates smelted came from Sweden and the Belgian Congo. The Société Anonyme Métallurgique de Prayon smelter began producing slab zinc at approximately 6-percent plant capacity in October The Société Anonyme de Rothem smelter remained idle during the year for lack of fuel; production of slab zinc was resumed in January 1946.

Bolivia.—During 1945, 23,116 short tons of zinc (metal content of ore and concentrate) were exported, virtually all of which was produced at the Huanchaca mine of the Cia. Huanchaca de Bolivia.

Burma.—The famous Bawdwin lead-zinc mine and smelter—which before the war produced 40,000 to 50,000 long tons of zinc in concentrates a year—was recaptured from the Japanese in February 1945. Engineers of the Burma Corp., prewar operator of the property, reported the lower levels of the mine flooded and the upper levels in critical need of repairs to prevent further deterioration. The concentrating mill and a large section of the residential area were burned by the Japanese. The smelter and appurtenant installations, although suffering from disuse and neglect, were reported in fair condition. Resumption of mining and milling operations is contingent upon reconstruction of portions of the property destroyed during Japanese occupation, replacement of the hydroelectric plant which was destroyed by the British before evacuation in April 1942, permission of the Shan States to import Indian, Chinese, or Burmese labor which is at present prohibited or largely restricted, and reconstruction of the destroyed portions of the Burma Railway between Mandalay and Lashio to permit rail transportation of equipment, supplies, products, and personnel. The remaining reserves at the property are estimated at approximately 3,500,000 tons of ore averaging 15.7 ounces of silver per ton, 20.4 percent lead, 12.6 percent zinc, and 0.9 percent copper.

Canada.—Zinc production increased in Canada in 1945, despite a continued shortage of mine and smelter labor which showed little improvement until late in the year. At Trail, British Columbia, the Consolidated Mining & Smelting Co. continued to be the principal source of Canadian zinc production. Slab zinc produced at the electrolytic plant at Trail increased to 134,873 short tons from 117,365 tons in 1944. Ore reserves at the end of the year showed a net increase of about 1½ million tons. About 9,400 tons of zinc concentrates averaging 58.89 percent zinc were recovered during the year from 47,777 tons of ore milled at the Base Metals Mining Corp. property in British Columbia. The Zincton Mines, Ltd., suspended milling of ore June 1, 1945, upon expiration of its contract with the Office of Metals Reserve. Underground development continued during the summer months, and milling was resumed late in October. During the year 73,322 tons of ore were milled yielding 6,282 tons of zinc (metal content of concentrates).

The Hudson Bay Mining & Smelting Co., Ltd., at Flin Flon, Manitoba, produced 1,822,979 short tons of ore in 1945, the smallest output since 1940. About 140,870 tons of zinc concentrates averaging 45.55 percent zinc were produced at the company's flotation mill. Slab-zinc production at the company's electrolytic plant was 47,468 tons compared with 56,552 tons in 1944. Ore reserves to the 3,500-foot level, as of December 31, 1945, were reported to be 26,000,000 tons averaging 0.089 ounce of gold and 1.25 ounces of silver per ton, 4.24 percent zinc, and 2.99 percent copper. At Sherridon, Manitoba, the Sherritt Gordon Mines, Ltd., milled 646,092 tons of ore in 1945, of which 363,350 tons were from the West mine and 282,742 tons from the East mine. Zinc-ore reserves (East ore body) were reported at the end of the year to be 33,500 tons averaging 8.66 percent zinc compared with 113,000 tons containing 9.04 percent zinc at the end of the previous year. Ore reserves in the West mine at the end of 1945 were 1,908,500 tons averaging 2.24 percent zinc and 2.66 percent copper.

The Normetal Mining Corp., Ltd., at Normetal, Quebec, milled 204,067 tons of ore during the year averaging 3.68 percent copper and 7 percent zinc, which yielded 19,297 short tons of zinc concentrate (52.90 percent zinc) in addition to copper concentrate. Ore reserves at year end were 1,399,000 tons averaging 7.04 percent zinc and 3.53 percent copper. Ore reserves at the Waite Amulet Mines, Ltd., were reduced from 2,986,555 tons in 1944 to 2,517,538 tons at the end of 1945. The New Calumet Mines, Ltd., at Calumet Island, Quebec, reported ore reserves on November 1, 1945, at 1,011,200 tons assaying 9.1 percent zinc, 2.9 percent lead, and 5.76 ounces of silver and 0.038 ounce of gold per ton.

France.—The mine output of zinc in France increased 176 percent in 1945 largely owing to removal of German control of the industry early in the year. Production of zinc (content of zinc in ores and concentrates) from 1938 through 1945, in metric tons, was as follows:

Year	1938	1939	1940	1941	1942	1943	1944	1945
Production	95	500	1,420	3,055	3,215	2,648	2,387	6,599

Zinc-producing mines which operated during the year include the Pierrefitte and Sentein mines in the Pyrenees.

Germany.—The chief sources of zinc ores in Germany are Upper Silesia, the Harz Mountains, and along the Rhine River in the Provinces of Rheinland, Westphalia, and Baden. The mine production of recoverable zinc from German properties from 1938 through 1943, in metric tons, was as follows:

Year	1938	1939	1940	1941	1942	1943
Production	158,336	158,527	210,918	229,499	224,061	238,555

Italy.—Of the four zinc smelters in Italy, only one—the Porto Marghera electrolytic plant—was so damaged during the war as to prevent immediate resumption of operations.

Mexico.—There were relatively few difficulties between labor and management at Mexican mines during the year until the increased selling price for Mexican silver in the United States was announced in September. Shortly thereafter labor unions presented demands for a 40-percent wage increase; to enforce these demands, a general strike of mine and smelter labor was called on December 31. Heavy taxes and poor railroad facilities and service continued to restrict Mexican zinc production.

Newfoundland.—The mine production of zinc, in terms of zinc content of concentrates produced, totaled 49,350 short tons in 1945 compared with 59,472 tons in 1944. The bulk of the concentrates continued to be exported to the United States.

Peru.—The mine production of zinc in Peru decreased approximately 22 percent in 1945 largely because purchase contracts by the United States Government agencies were canceled and there was consequent uncertainty regarding markets.

Poland.—The Polish zinc industry is controlled and operated by the Zjednoczenie Przewyslu Cynkowego (Union of the Zinc Industry), which in turn is controlled by the Central Management of the Smelting Industry. Investments of the individual companies were nationalized early in 1946 and rearranged into 14 operating units, each consisting of a mine or smelter or both. Each unit has a local manager, who supervises routine operations, and a labor council to govern labor policies. Preliminary data covering the Polish zinc-smelting industry in 1945 indicate a production of 36,385 metric tons of slab zinc recovered from 71,607 tons of concentrates treated at the four operating smelters.

Spain.—The production of zinc concentrates in 1945 was reported to be 52,402 metric tons (60,178 tons in 1944) and of slab zinc 17,262 tons (18,054 tons in 1944). Exports of slab zinc, all to Portugal, totaled 800 tons. The Asturiana zinc smelter at Arnao, near Avilés, accounted for all the zinc produced in 1945; the smelter at Peñarroya, Province of Cordoba, closed at the end of 1944, remained idle throughout 1945.

United Kingdom.—Consumption of zinc in the United Kingdom totaled 250,383 long tons in 1945, of which 173,323 tons were primary zinc and 77,060 tons secondary (including remelted) zinc. Comparable figures for 1944 were 308,916 tons consumed, of which 184,241 tons were primary and 124,675 tons secondary. Of the total zinc consumed in 1945, 43 percent was used in brass products, 19 percent in galvanizing, 14 percent in zinc oxide, 10 percent in rolled zinc, 7 percent for die castings, and 7 percent for zinc dust and miscellaneous uses.

U. S. S. R.—Virtually no official production figures have been available on the Russian zinc industry during the last 7 years. Data, however, presented in the announcement March 1946 of the new Five Year Plan indicate that zinc output has been declining in recent years.

Yugoslavia.—The properties of the Trepca Mines, Ltd., were recovered intact from the Germans in May 1945. Operation of the mine during German occupation was such, according to reports, as to substantially reduce ore reserves and damage much of the plant and equipment. Production on a limited scale was resumed in July 1945, and the output was shipped to Russia.

LEAD AND ZINC PIGMENTS AND ZINC SALTS

By Helena M. Meyer and Alethea W. Mitchell

SUMMARY OUTLINE

GENERAL SUMMARY

Although hostilities with Germany and Japan ended in 1945, other factors were such that the pigments industry could not do much toward filling the large pent-up civilian demand for products covered by this report. War requirements for pigments continued large for more than half of the year, and civilian needs were not adequately supplied, but shipments of lead and zinc pigments as a group trended downward. The down-trend thus is not explained by the lack of demand for the products but rather by continued shortages, in varying degree, of materials that were inadequate in earlier war years. For most of the year supplies of lead and zinc pigments, and titanium pigments as well, were insufficient to meet war and civilian needs. The outstanding shortages in 1945 were of lead, particularly for the manufacture of white lead, and of linseed oil, although supplies of other drying oils likewise were inadequate for requirements. Had adequate quantities of the necessary crude materials, that is, lead and zinc metal, drying oils, and containers, and of labor, been available, the pigments industry would have produced much higher tonnages than it did.

The stepped-up tempo of the war early in the year led to more stringent controls on pigments and linseed oil at the time; leaded zinc oxide, for example, was subjected to distribution control in February for the first time in the war. White lead bore the brunt of curtailment in the use of lead in 1945 as lead became one of the most critical materials in the United States from an immediate supply point of view. The seeming favoritism toward other lead chemicals is explained by the fact that substitutes for white lead as a paint pigment could fill the needs for white lead more satisfactorily than could any substitutes for lead in uses such as storage batteries.

After VJ-day larger allotments of pig lead were made to the white-lead industry; and, in addition, restrictions on the end uses of white lead were removed. These actions proved to be premature, however, because the lead supply did not improve, and at the end of the year the outlook for obtaining sufficient metal in the near future for all needs was gloomy. As a consequence, allowances of lead to the pigment industry were reduced again in the first quarter of 1946. All zinc restrictions were removed after the Japanese surrender. Pigment makers, however, continued to find it difficult at times to obtain zinc slabs.

Previous reports of this series have pointed out that although supplies of zinc metal in relation to requirements were less plentiful than were those of lead early in the war, the relationships were reversed as the war progressed. This reversal was accentuated in 1945, and at the end of the year lead was one of the few commodities whose disposition continued to be controlled by the Civilian Production Administration (War Production Board until November 1, 1945). The raw material needs for making lead pigments are met almost entirely by metal, whereas those for zinc pigment manufacture, particularly for leaded zinc oxide and lead-free zinc oxide, come largely from ores. This difference has favored zinc pigments during the war period because supplies of ore were more abundant than were those of either metal.

One of the chief outlets for pigments, of course, is in the manufacture of paints. Sales of paint, varnish, and lacquer materials, figures on which are compiled by the United States Department of Commerce, established a new high record in 1945 for the third successive year, rising 4 percent above the previous peak in 1944. The value of sales for 680 establishments that contributed approximately 90 percent of the total value of the industry as reported in the Census of Manufactures for 1939 was $644,429,374 in 1945 compared with $618,325,532 in 1944.

Production and sales of titanium pigments, which normally compete for markets supplied by lead and zinc pigments, were again at new record high levels in 1945, continuing the long-time trend. The peak output was inadequate for requirements, and plant-capacity limitations prevented production expansion to cover total demand. Production capacity is to be expanded in 1946. The Bureau of Mines is not at liberty to publish figures covering titanium pigments.

Some of the features of the lead and zinc pigments and zinc salts industries in 1945 are outlined below. It should be borne in mind that many of the trends indicated were due to factors other than those of supply and demand for the finished products themselves, i. e. the restrictions on the use of lead in pigments or other restrictions. Shipments of litharge in 1945 were slightly above the previous peak for 1944 and those for zinc sulfate exceeded the previous peak for this commodity in 1941 by 9 percent. Consumption of litharge in the manufacture of storage batteries in 1945 was a new peak level for the third successive year, but the manufacture of black oxide by the storage-battery makers themselves declined from 1944 and the use of red lead for battery purposes likewise was below the peak for 1944 although comparing favorably with other earlier years. Despite the record sales of paints, varnish and lacquer materials in 1945 smaller

717372—47——14

quantities of most of the pigments covered by this report went into the manufacture of paints. Shipments of zinc oxide were an exception in registering a gain of 12 percent. The use of zinc oxide for chemical warfare purposes assumed importance in 1943, reached a peak of 27,686 tons in 1944 but in 1945 with the completion of the program amounted to only 7 percent of the record tonnage. The agricultural use of litharge declined 30 percent from the record high level established in 1944 but was at a relatively high rate as compared with other earlier years. Consumption of zinc oxide in the manufacture of floor coverings and textiles in 1945 appears to have been at a higher rate than ever before, although the statistical record covers the period 1929–45 only. The manufacture of ceramics has taken reduced quantities of lead and zinc pigments in recent years and took less in 1945 than the somewhat increased quantities in 1944. Zinc oxide consumption in ceramics, however, gained 39 percent over 1944 in contrast to the performance of other pigments covered by this report. Chrome pigments took 38 percent more litharge in 1945 than in 1944 and thus probably established the second-highest annual record for this class. Chrome pigments were governed by the restrictions for chrome rather than by those for lead.

Salient statistics of the lead and zinc pigments industry of the United States, 1940–45

	1940	1941	1942	1943	1944	1945
Production (sales) [1] of principal pigments:						
White lead (dry and in oil) short tons	80,562	113,000	83,639	76,167	85,726	51,170
Litharge do	89,841	122,280	91,513	113,091	138,203	138,798
Red lead do	42,200	53,838	48,369	53,378	53,972	47,381
Zinc oxide do	113,213	148,833	99,677	143,402	140,675	127,955
Leaded zinc oxide do	45,362	68,920	48,128	43,828	64,395	62,598
Lithopone do	151,802	176,642	137,320	135,723	142,905	136,161
Value of products:						
All lead pigments	$32,628,000	$46,572,000	$39,393,000	$41,897,000	$46,601,000	$39,045,000
All zinc pigments	28,747,000	39,210,000	30,785,000	36,260,000	39,288,000	36,644,000
Total	61,375,000	85,782,000	70,178,000	78,157,000	85,889,000	75,689,000
Value per ton received by producers:						
White lead (dry)	$137	$147	$160	$163	$163	$159
Litharge	126	134	150	152	146	148
Red lead	141	161	171	171	164	168
Zinc oxide	118	125	138	137	139	138
Leaded zinc oxide	114	118	129	132	132	132
Lithopone	67	71	79	79	78	78
Foreign trade:						
Lead pigments:						
Value of exports	$594,000	$1,228,000	$957,000	$1,439,000	$1,387,000	$1,421,000
Value of imports	14,000	12,000	4,000	3,000	6,000	8,000
Zinc pigments:						
Value of exports	1,585,000	3,525,000	2,741,000	2,737,000	2,017,000	2,279,000
Value of imports	46,000	22,000	8,000	5,000	1,500	(2)
Export balance	2,119,000	4,719,000	3,686,000	4,168,000	3,396,500	3,692,000

[1] Reported as shipments in 1945.
[2] Less than $500.

The Eagle-Picher Co. acquired an interest in the MacArthur, Irwin, Ltd., Montreal, Canada, in 1945, and immediate plans were made for expanding white-lead activities and for extending operations to the production of litharge and red lead. The National

Lead Co., through its subsidiary, Canada Metal Co., Ltd., Toronto, was reported to have completed plans in 1945 for construction of a plant for the manufacture of lead oxides. Through Canadian Titanium Pigments, Ltd., Montreal, the National Lead Co. is also interested in production in Canada of titanium dioxide.

Government controls.—On January 15, 1945, the lead pigments covered by this report (except litharge for storage-battery manufacture which remained under War Production Board Order M–38) were placed under a new chemicals order, M–384. Provisions of the chemicals order were described in the report of this series for 1944. Amendments to the order provided for the liberalization of allowances to pigment manufacturers after VJ-day and removed end-use limitations on lead in the production of chemicals by establishing an over-all quota for making these chemicals. Producers were restricted to a maximum quota of 55 percent of the aggregate quantity of lead put into process for the output of lead chemicals during the first 6 months of 1944. Thus greater flexibility in the production of chemicals was permitted. In mid-December M–384 was revoked and the chemicals were incorporated under the lead order, M–38. At that time the over-all percentage of lead allowed for chemicals was reduced from 55 to 48 percent.

Zinc metal and oxide controls were described in the report of this series for 1944. For the first time leaded zinc oxide was put under distribution control in February 1945 in a revision of Order M–11–a. Lithopone, titanated lithopone, titanium dioxide, and zinc sulfide were transferred in April from Order M–353 to M–340, with no changes in the provisions for authorized deliveries of these products. Zinc restrictions were removed following VJ-day.

Future prospects for consumption.—As has been pointed out in previous reports of this series, the potential consumption of pigments in the near future is great due to pent-up demand for houses, automobiles, and many other products that require large quantities. Recent discussions on certain aspects of the subject are outlined below. A high level of construction was recently forecast.[1] Assuming reasonable costs and close cooperation between all segments of the industry the beginning of a potential construction boom was expected in 1946. A forecast of 7.5 billion dollars of new construction and 5 billion of repair and maintenance compared with a total for the two classes of 9.2 in 1945. New construction was expected to be almost 60 percent above 1945 and to represent the highest volume registered since 1929, except for the war years. Veterans' requirements were said to exceed the total new houses that could be built, so that the housing shortage in the United States was expected to continue. The new construction rate in 1947 was forecast as 12 billion dollars. Concannon [2] said that the paint industry, which was comparatively free of reconversion problems in a technical sense, awaits only two things—first, increased supplies of certain essential materials and, second, a resurgence in demand for its products. He said that the supply of linseed oil loomed as the most vital factor in

[1] Shaw, Wm. H., Prospects for Construction: Domestic Commerce, vol. 34, No. 1, January 1946, pp. 9 and 29.
[2] Concannon, C. C., Industrial Trends in 1946 Discussed: Domestic Commerce, vol. 34, No. 1, January 1946, p. 6.

the coming months and that the supply of pigments was becoming more abundant, except for titanium dioxide and white lead. The futures of lead, zinc, and titanium pigments were discussed at the 1945 Convention-at-Home of the National Paint, Varnish and Lacquer Association, Inc., and were published thereafter.[3] Wormser's prediction that

> The white-lead industry expects to be back to a full prewar basis before the year end closes and both white lead in oil and dry white lead should again become plentiful

was not possible of accomplishment because supplies of lead in relation to demand therefor became less rather than more abundant. Actually reduced quantities of lead were permitted white lead manufacturers for the first quarter of 1946. Pickens said that

> Since the productive capacity of the titanium industry is not capable of meeting the demand for its products, the general outlook ahead is one of tight supply with the biggest single problem of the industry revolving around how soon additional productive facilities can be constructed and put into operation.

Gent felt that the capacity of the zinc pigments industry was adequate to take care of the anticipated large demand.

Bureau of Standards Simplified Practice Recommendation R144-43, Paints, Varnishes, and Related Products (colors and containers) was revised and became effective November 1, 1945, as R144-45. This revision provided for an increased number of colors and for some additional container sizes.

PRODUCTION

Figures on sales have been used in this series for many years as a better guide than production to activity in the pigments industry. If lead or zinc pigments are made from ores, statistics are gathered now by the Bureau of Mines on the lead and zinc questionnaires. These forms call for shipments rather than sales; and, for the sake of uniformity, the pigments schedule has been revised to call also for shipments. Available data make it appear that there was little difference between shipments and sales in 1945. An attempt is made to avoid all duplication in reporting pigment tonnages. One main method is elimination of products used in blending into another pigment from figures for the original class. Basic lead sulfate and zinc oxide that are blended to make leaded zinc oxide, for example, are shown under the last-named class only. Pigments consumed by the producing companies to make products beyond those covered by this report—that is, paint, storage batteries, and other articles—are considered as shipments.

The value of lead and zinc pigments in 1945 totaled $75,689,000, a decline of 12 percent from 1944. Lead pigments represented 52 percent of the total and zinc pigments 48 percent, compared with 55 and 45 percent, respectively, in 1939.

Pickens, Dennis K., What's Ahead in Raw Materials—Titanium Pigments: Paint Industry Mag., vol. 61, No. 1, January 1946, p. 11.

LEAD PIGMENTS

Production and shipments of lead pigments were adversely affected by restrictions of the lead chemicals order, as previously indicated, and total shipments declined 15 percent; they were, however, 3 percent above 1939. In both relationships lead pigments fared worse than zinc pigments. The high sales records established for litharge in recent years and the relatively high level of red-lead sales prevented a further decline in total lead pigments sales in 1945 in relation to 1944 and caused the increase as compared with 1939; white-lead sales have made a poor showing, which in 1945 particularly was due to circumstances beyond the control of the industry. The value of shipments of lead pigments fell 16 percent in 1945 as compared with 1944 but rose 10 percent as compared with 1939. In value of shipments, lead pigments gained less in 1945 as compared with 1939 than zinc pigments. There were some variations in producers average per ton values between 1944 and 1945, probably explained by shifts in delivery points, inasmuch as average quoted prices remained unchanged from 1944 levels.

Lead pigments sold [1] by domestic manufacturers in the United States, 1944–45

Pigment	1944			1945		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average

ZINC PIGMENTS AND SALTS

Although zinc metal and scrap were in scarcer supply than lead in the early days of the war—a condition resulting in greater limitations on supplies of zinc pigments that are made from metal—the situation was reversed in 1945, and zinc pigments fared better than lead pigments. Throughout the war American Process zinc oxide and leaded zinc oxide, because they are made from ores, were more abundant than most of the other products covered by this report. Leaded zinc oxide shipments were at a high though not record level in 1945, and those for zinc oxide compared favorably with other years except 1941, 1943, 1944, and several years in the late twenties. Sales of lithopone in 1945 were 5 percent less than in 1944 and the same percentage below 1939. Zinc pigments as a group dropped 6 percent in tonnage below 1944 but were still 9 percent over 1939. In value zinc pigments were 7 percent less than in 1944 and 27 percent higher than in 1939. The average per ton values of zinc pigments in 1945 were almost identical with those in 1944, as was to have been expected in view of the failure of average quoted prices to change from 1944 levels.

Shipments of zinc chloride totaled 56,230 tons (50° B.) and were at virtually the 1944 level. Zinc sulfate sales were 22 percent higher than the 1944 rate and 9 percent above the previous peak in 1941.

Zinc pigments and salts sold [1] by domestic manufacturers in the United States, 1944–45

Pigment or salt	1944			1945		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average

CONSUMPTION BY INDUSTRIES

WHITE LEAD

White lead was called upon by the provisions of the War Production Board's chemicals order, M–384, to bear the brunt of curtailment in the use of lead in 1945. In consequence, shipments of white lead, dry, declined 41 percent and were the smallest since 1934, and those for white lead in oil fell 39 percent and were the smallest since considerably before the beginning of the present century. The drop in shipments of white lead was in contrast to the peak sales of paints, varnish, and lacquers in 1945, in the manufacture of which well over 90 percent of the total white lead is used regularly. Barring restrictions, white lead shipments undoubtedly would have advanced instead of falling sharply in 1945. The use of white lead for ceramics in 1945 was at an even lower rate than the sharply reduced levels of recent years. A more precise break-down of the Other classification undoubtedly would increase the quantity shown under Paint.

Distribution of white lead (dry and in oil) sales,[1] 1941–45, by industries, in short tons

Industry	1941	1942	1943	1944	1945
Paint	100,665	76,837	66,441	79,948	46,418
Ceramics	3,704	1,812	1,444	946	839
Other	8,631	4,990	8,282	4,832	3,913
	113,000	83,639	76,167	85,726	51,170

[1] Reported as shipments in 1945.

BASIC LEAD SULFATE

Basic lead sulfate was included with basic carbonate white lead in the provisions of Order M–384, and thus production and shipments of this pigment were cut sharply in 1945. Shipments declined 38 percent from 1944 and were the smallest on record since the first statistics were published in 1902. Basic sulfate, likewise, is used chiefly in paints. A substantial quantity of this pigment is used regularly as an intermediate product in the manufacture of leaded zinc oxide, which is also used chiefly in paints. The basic lead sulfate used thus in blending is included in this report in the quantities shown for leaded zinc oxide and not in the figures for basic sulfate. In 1945, 8,900 tons of basic lead sulfate were sold for use in making leaded zinc oxide, compared with 7,800 tons in 1944.

Production of basic lead sulfate totaled 4,242 tons in 1945, compared with 4,605 tons in 1944.

Distribution of basic lead sulfate sales,[1] 1941–45, by industries, in short tons

Industry	1941	1942	1943	1944	1945

[1] Reported as shipments in 1945.

RED LEAD

Red-lead sales have remained high during the war owing to the applicability of this pigment as a construction paint and to its use in the manufacture of batteries. Shipments in 1945 were reduced by the restrictions of the chemicals order, M-384, rather than by a slowing in demand for red lead. Total shipments of this pigment were 12 percent below the peak rate in 1944 and the smallest since 1940 but compared favorably, nonetheless, with years before 1941. The tonnage of red lead used in storage batteries, although 12 percent below the peak rate in 1944, was close to the high average for 1940–43. Paints took 9 percent less red lead in 1945 than in 1944 and 26 percent less than the high record rate in 1943, but the quantity had probably not been exceeded prior to 1941. The use of red lead in ceramics fell 29 percent below 1944, when the rate was relatively low as compared with 1939–41.

Production of red lead amounted to 48,185 tons in 1945 compared with 53,398 tons in 1944.

Distribution of red lead sales,[1] 1941–45, by industries, in short tons

Industry	1941	1942	1943	1944	1945

	53,838	48,369	53,378	53,972	47,381

[1] Reported as shipments in 1945.

ORANGE MINERAL

The small-tonnage orange mineral dropped 54 tons in 1945, which was accounted for in shipments to the principal use, color pigments. The manufacture of ink took 63 tons in 1945 compared with 56 tons in 1944.

	246	128	79	284	230

[1] Reported as shipments in 1945.

LITHARGE

Shipments of litharge in 1945 exceeded by a slight margin the previous peak rate for 1944, largely because consumption in storage batteries continued at record heights for the third successive year. Allowances for the use of litharge in storage batteries, control of which was retained under the lead order, M-38, were more generous than for most lead chemicals, and this use took 58 percent of the total litharge shipped in 1945. Chrome pigments, which were restricted because of their chrome rather than lead content, took 38 percent more litharge in 1945 than in 1944, and oil refining took 14 percent more. Shipments for all other purposes declined in 1945 as compared with 1944. In addition to the litharge used to make batteries, the storage-battery manufacturers themselves produce a black or suboxide of lead which they use as a substitute for litharge. The quantity so used in 1945—56,000 tons—was 8 percent below the record tonnages for 1944 and 1941. In 1945, 53,000 tons of pig lead were required to manufacture the suboxide, compared with 58,000 tons in 1944. Black oxide figures are not included in the Bureau of Mines totals for litharge. Although the quantity of litharge used to make insecticides declined 30 percent in 1945, the total for that year had been exceeded only in 1937, 1941, 1943, and 1944. Consumption of litharge in ceramics was reduced 7 percent in 1945 but exceeded prewar levels.

Distribution of litharge sales,[1] 1941–45, by industries, in short tons

Industry	1941	1942	1943	1944	1945
Storage batteries	49,847	43,630	54,984	72,342	79,981

[1] Reported as shipments in 1945.

ZINC OXIDE

Although shipments of zinc oxide fell 9 percent in 1945, all normal peacetime uses made gains over 1944. The chemical warfare program, insofar as zinc oxide is concerned, was completed in 1945, and shipments for this purpose were only 7 percent of the peak for 1944. Total 1945 shipments were 14 percent below the wartime peak of 1941 but were relatively high, nonetheless, except when compared with war years other than 1941, 1943, and 1944 and the period of industrial activity in the late twenties. The rubber industry again stood out as a user of zinc oxide, taking 50 percent of total shipments. As pointed out in the chapter of this series for 1944, the manufacture of synthetic rubber requires a smaller percentage of zinc oxide than natural rubber. A return to the production of large quantities of natural rubber can be expected to call for increasing quantities of zinc oxide. Use of zinc oxide in paints was high in 1945, despite the fact that adequate supplies were not available and substitutes had to be accepted in part for uses such as paints. Floor coverings and textiles made the best showing in 1945, rising 27 percent over 1944 and probably establishing a new peak rate, although statistics are available for the period 1929–45 only. Ceramics, another use that was adversely affected by the war, made the largest percentage gain in 1945, but the quantity used in that year was exceeded in 1941 and in a number of earlier years. Of the total shown for floor coverings and textiles in the accompanying table, 9,873 tons were for coated fabrics and textiles and 2,034 tons for floor coverings compared with 7,585 and 1,978 tons, respectively, for 1944.

Production of lead-free oxide amounted to 139,374 tons compared with 152,366 tons in 1944. Of the total for 1945, 77 percent was made by the American process from ores and primary residues, 15 percent by the French process from metal and scrap, and 8 percent by other processes, compared with identical percentages in 1944.

Distribution of zinc oxide sales,[1] 1941–45, by industries, in short tons

Industry	1941	1942	1943	1944	1945

[1] Reported as shipments in 1945.

LEADED ZINC OXIDE

Shipments of leaded zinc oxide continued at a high level in 1945 despite the decline of 3 percent from 1944. Except for 1944 and the peak year 1941 shipments in 1945 had never been exceeded. As has been pointed out previously the fact that this pigment is made almost exclusively from ore has favored its production and use during the war period. Leaded zinc oxide has benefited from business diverted from other pigments and even so greater sales of leaded zinc oxide doubtless could have been made had larger quantities been available. Although leaded zinc oxide was previously without restrictions it was subjected to delivery controls under an amplification of the zinc order M–11–a of the War Production Board in February 1945. All zinc restrictions were removed after VJ-day. Leaded zinc oxide continued to be used almost entirely in the manufacture of paints in 1945. The figures for leaded zinc oxide include basic lead sulfate used in blending, as is indicated under Basic Lead Sulfate.

Leaded zinc oxide production totaled 62,519 tons in 1945 compared with 64,432 tons in 1944. The totals can be broken down as follows (comparison with 1944 in parentheses): Over 5–35 percent lead, 48,678 (52,022) tons; over 35–50 percent, 10,091 (8,364) tons; and most of the remainder in both years, 5 percent or less.

[1] Reported as shipments in 1945.

LITHOPONE

The lithopone statistics in this report are given on the basis of ordinary lithopone sold as such plus the ordinary lithopone content of the high-strength product. This method of publication is used to conceal the operations of one company which always dominates the output of the high-strength product and is the only producer in some years. In 1945 two companies, operating three plants, produced high-strength lithopone. The second-largest maker in 1944 produced none of the high-strength product in 1945. Total shipments of lithopone declined 5 percent in 1945. Sales for paint, which regularly make up three-quarters of the total, influenced by the peak record for the paint industry in 1945 rose slightly against the trend for the total, and those for floor coverings and textiles gained 7 percent; shipments to rubber manufacturers likewise increased but represented only a small fraction of the total. Separation of the quantities of lithopone shipped for floor coverings and textiles, based on somewhat incomplete data, indicates that 10,671 tons were for floor coverings (compared with 9,578 in 1944) and 5,150 for coated fabrics and textiles (compared with 5,168 tons in 1944). Floor coverings thus were responsible for the rise in the total for the two classes, and coated fabrics and textiles were virtually unchanged. The use of lithopone in the manufacture of paper has been on the increase but was cut in less than half in 1945 when 3,086 tons were shipped for this purpose contrasted with 6,488 tons in 1944. The total for 1944 was the largest for 1936–45 for which separate statistics are available, and that for 1945 was the smallest since 1939. Shipments reported for use in the manufacture of printing inks likewise dropped sharply in 1945. A tonnage sold for ink is not separable from that for paints, but figures for identical companies show a reduction in shipments for the manufacture of ink from 1,216 tons in 1944 to 864 tons in 1945. Exports are included mainly under Other, but at least one company classifies part of its exports according to end use.

Plant capacity for the production of lithopone was reported to total 153,000 tons in 1945 or virtually the same as the 155,000 tons for 1944.

Production of lithopone totaled 136,460 tons compared with 133,960 tons in 1944.

Distribution of lithopone sales,[1] 1941–45, by industries, in short tons

Industry	1941	1942	1943	1944	1945
Paints, etc.	[2] 132,691	[2] 109,216	[2] 103,860	[2] 108,800	[2] 109,398

Other	19,290	11,282	14,786	18,633	9,965
	176,642	137,320	135,723	142,905	136,161

[1] Reported as shipments in 1945.
[2] Includes a quantity, not separable, used for printing ink.

Consumption of ordinary lithopone in the production of titanated lithopone reached a peak in 1937 when 19,400 tons were used. Since 1937 there has been an almost continuous decline, culminating in the consumption of only 7,800 tons for this purpose in 1945. Titanated lithopone usually contains about 15 percent TiO_2. The lithopone figures in the following table are included in the totals for ordinary lithopone in the preceding table.

Titanated lithopone produced in the United States and ordinary lithopone used in its manufacture, 1941–45, in short tons

Year	Titanated lithopone produced	Ordinary lithopone used	Year	Titanated lithopone produced	Ordinary lithopone used
1941	16,800	14,100	1944	9,800	8,300
1942	11,700	9,900	1945	9,200	7,800
1943	9,800	8,400			

ZINC SULFIDE

In 1945, as in several earlier years, only one company produced zinc sulfide, and the Bureau of Mines is not at liberty, therefore, to publish figures for this pigment.

ZINC CHLORIDE

Shipments of zinc chloride, in terms of 50° B. solution, totaled 56,230 tons in 1945 compared with 57,545 tons in 1944. These figures include the zinc chloride equivalent of zinc ammonium chloride and of chromated zinc chloride produced. Complete figures covering distribution of zinc chloride shipments by uses are not available.

ZINC SULFATE

Zinc sulfate shipments in 1945 were larger than ever before, exceeding those for 1944 by 22 percent and those for the previous peak year, 1941, by 9 percent. The manufacture of rayon, the outstanding use, accounted for nearly one-third of the total shipments and took 13 percent more than the previous peak tonnage for 1944. The agricultural use of zinc sulfate almost equaled that for rayon in 1945 by rising 34 percent over 1944 and likewise established a new peak rate. The use classed as Chemicals rose also in 1945, but a better breakdown of this classification undoubtedly would increase quantities shown under other classes. Of the other uses, no significant movement is noted other than the drop to less than half in the quantity for Paints, etc. This use had been making steady gains until 1944, when noteworthy declines began.

In 1945, for the first time, shipments of zinc sulfate are available on a dry basis. The details are shown in the following table, which also covers the gross weight of the product.

Distribution of zinc sulfate sales,[1] 1941–45, by industries, in short tons

Industry	1941	1942	1943	1944	1945

PRODUCERS AND PLANTS

The following companies shipped or used lead and zinc pigments and zinc salts of their own production in 1945:

White lead:	
The Eagle-Picher Co	Cincinnati, Ohio.
Euston Lead Co	Scranton, Pa.
W. P. Fuller & Co	South San Francisco, Calif.
International Smelting & Refining Co (electrolytic process).	East Chicago, Ind.
John T. Lewis & Bros. Co	Philadelphia, Pa.
The John R. MacGregor Lead Co	Chicago, Ill.
National Lead Co	Melrose, Calif.
Do. (2 plants)	Chicago, Ill.
Do	St. Louis, Mo.
Do	Perth Amboy, N. J.
Do	Brooklyn, N. Y.
The Sherwin-Williams Co	Chicago, Ill.
Basic lead sulfate, or sublimed lead:	
The Eagle-Picher Co	Galena, Kans.
National Lead Co	St. Louis, Mo.
Red lead, orange mineral, and litharge:	
American Cyanamid Co	Newark, N. J.
E. I. du Pont de Nemours & Co	East Chicago, Ind.
The Eagle-Picher Co	Galena, Kans.
Do	Joplin, Mo.
Do	Newark, N. J.
Do	Cincinnati, Ohio.
W. P. Fuller & Co	South San Francisco, Calif.
Hammond Lead Products, Inc	Hammond, Ind.
Morris P. Kirk & Son, Inc	Los Angeles, Calif.
John T. Lewis & Bros. Co	Philadelphia, Pa.
The John R. MacGregor Lead Co	Chicago, Ill.
Metals Refining Division of the Glidden Co	Hammond, Ind.
National Lead Co	Melrose, Calif.
Do	Atlanta, Ga.
Do	Chicago, Ill.
Do	St. Louis, Mo.
Do	Brooklyn, N. Y.
Do	Dallas, Tex.
Do	Charleston, W. Va.
The Sherwin-Williams Co	Chicago, Ill.

Zinc oxide and leaded zinc oxide:	
American Zinc Co. of Illinois	Hillsboro, Ill.
American Zinc Oxide Co	Columbus, Ohio.
The Eagle-Picher Co	Hillsboro, Ill.
Do	Galena, Kans.
Gulton Manufacturing Corp	Metuchen, N. J.
International Smelting and Refining Co	East Chicago, Ind.
Monsanto Chemical Co	St. Louis, Mo.
The New Jersey Zinc Co. of Pennsylvania	Freemansburg, Pa.
Do	Palmerton, Pa.
The Ozark Smelting & Mining Division of The Sherwin-Williams Co.	Coffeyville, Kans.
Rohm & Haas Co	Bristol, Pa.
St. Joseph Lead Co. of Pennsylvania	Josephtown, Pa.
Superior Zinc Corp	Bristol, Pa.
Lithopone:	
The Chemical & Pigment Co	Oakland, Calif.
Do	Collinsville, Ill.
Do	Baltimore, Md.
E. I. du Pont de Nemours & Co	Newport, Del.
The Eagle-Picher Co	Argo, Ill.
Mineral Point Zinc Division of The New Jersey Zinc Co.	Depue, Ill.
The New Jersey Zinc Co. of Pennsylvania	Palmerton, Pa.
The Ozark Smelting & Mining Division of The Sherwin-Williams Co.	Coffeyville, Kans.
Zinc sulfide:	
The New Jersey Zinc Co. of Pennsylvania	Palmerton, Pa.
Zinc salts:	
American Cyanamid Co	Bound Brook, N. J.
American Smelting & Refining Co	Selby, Calif.
Do	Alton, Ill.
Do	Omaha, Nebr.
Do	Perth Amboy, N. J.
Brooklyne Chemical Works, Inc	Baltimore, Md.
The Chemical & Pigment Co	Oakland, Calif.
Chemicals Incorporated	Chicago, Ill.
E. I. du Pont de Nemours & Co	Newport, Del.
Do	East Chicago, Ind.
Do	Cleveland, Ohio.
Do	Weirton, W. Va.
Jordan Company	Chicago, Ill.
Morris P. Kirk & Son, Inc	Los Angeles, Calif.
Charles Lennig & Co	Bridesburg, Pa.
Mallinckrodt Chemical Works	St. Louis, Mo.
Marathon Battery Co	Wausau, Wis.
Merrimac Division of Monsanto Chemical Co	Everett, Mass.
Niro Incorporated	Riverdale, N. J.
Royce Chemical Co	Carlton Hill, N. J.
The Ruby Chemical Co	Columbus, Ohio.
The Ozark Smelting & Mining Division of The Sherwin-Williams Co.	Coffeyville, Kans.
Southern Agricultural Chemical Corp	East Point, Ga.
Sullivan Mining Co	Kellogg, Idaho.
United States Steel Corp. (American Steel & Wire Co.)	Donora, Pa.
Virginia Smelting Co	West Norfolk, Va.
The Youngstown Sheet & Tube Co	East Chicago, Ind.

RAW MATERIALS USED IN MANUFACTURE OF LEAD AND ZINC PIGMENTS AND ZINC SALTS

Figures covering the raw materials used in making pigments and salts were not available when the report of this series for 1944 was prepared. Data for 1944 are given below, and those for 1945 will appear in the next annual issue of this volume.

Lead pigments and zinc pigments and salts are manufactured from a variety of materials, including ore, refined metal, and such secondary materials as scrap. In 1944, 93 percent of the lead in pigments was derived from pig lead and 7 percent from ore. Of the lead in ore used to make leaded zinc oxide, about 12 percent was from foreign sources. The proportion for zinc pigments in 1944 was 77 percent from ore and concentrates, 8.5 percent from slab zinc, and 14.5 percent from secondary materials; about 13 percent of the ore used was foreign.

Metal content of lead and zinc pigments produced by domestic manufacturers, 1943–44, by sources, in short tons

Source	1943		1944	
	Lead in pigments [1]	Zinc in pigments	Lead in pigments [1]	Zinc in pigments
Ore and concentrates:				
Domestic	14,356	97,332	17,684	121,395
Foreign	1,168	15,220	2,063	18,256
Metal	202,783	11,752	247,225	15,198
Secondary materials [2]	----------	19,809	----------	25,975
	218,307	144,113	266,972	180,824

[1] Includes also lead recovered in leaded zinc oxide.
[2] Zinc ashes, skimmings, drosses, and old metal.

The following tables give the source of the metal used in the manufacture of each pigment and salt. Pig lead is employed exclusively, either directly or indirectly, in the manufacture of white lead, litharge, red lead, and orange mineral and is used also in the manufacture of basic lead sulfate. The lead content of leaded zinc oxide made from basic lead sulfate, which in turn was made from pig lead, is credited to pig lead in the table. Zinc oxide is the only pigment in which considerable slab zinc is used. Ore is employed in the manufacture of zinc oxide, leaded zinc oxide, lithopone, zinc sulfide, zinc sulfate, and basic lead sulfate. A substantial proportion of the zinc in lithopone (slightly over one-half in 1944) and most of that in zinc chloride made in the United States are derived from secondary material. For a number of years before the United States entered World War II there had been a large increase in the quantity of secondary zinc used in the manufacture of zinc oxide. The scarcity of supplies of both metal and scrap caused the proportion of the total oxide made by the French process, which uses only metal and scrap, to drop sharply in 1942 and to continue low in 1943 and 1944, despite the fact that the percentage from metal and scrap rose in 1943 and continued upward in 1944. The production of zinc oxide from metal and scrap accounted for the following percentages in relation to total production: 41 percent in 1939, 16 percent in 1942, and 19 and 22 percent, respectively, in 1943 and 1944.

Zinc chloride	--------	--------	11	11,765	11,776	--------	--------	13	12,560	12,573
Zinc sulfate	1,734	414	32	2,837	5,017	1,607	998	36	2,410	5,051

[1] These figures are higher than those shown in the report on Secondary Metals—Nonferrous because they include zinc recovered from byproduct sludges, residues, etc., not classified as purchased scrap material.
[2] Bureau of Mines not at liberty to publish.

PRICES

The total and average values reported by producers for lead and zinc pigments and zinc salts are given in the tables in the first part of this report. For most of the products covered there was little change in the average prices received, as was to be expected in view of the fact that there were no changes in average quoted prices as given in the table that follows. Producers' values are reported on an f. o. b. plant basis, so that the small variations in these values can be explained by changes in the proportions at the several points of delivery. The ceiling prices established by the Office of Price Administration for the pigments and salts covered in this report, and likewise those for the metals lead and zinc, were unchanged throughout 1945 at the levels that prevailed in 1944.

Range of quotations on lead pigments and zinc pigments and salts at New York (or delivered in the East), 1942–45, in cents per pound

Product	1942	1943	1944	1945
Basic lead sulfate, or sublimed lead, less than carlots, barrels	7.00- 7.75	7.50- 7.75	7.50- 7.75	7.50- 7.75
White lead, or basic lead carbonate, dry, carlots, barrels	7.50- 8.25	8.25	8.25	8.25
Litharge, commercial, powdered, barrels	7.35- 9.00	8.00- 9.00	8.00- 9.00	8.00- 9.00
Red lead, dry, 95 percent or less, less than carlots, barrels	8.75-10.00	9.50-10.00	9.50-10.00	9.50-10.00
Orange mineral, American, small lots, barrels	11.25-12.50	12.00-12.50	12.00-12.50	12.00-12.50
Zinc oxide:				
American process, lead-free, bags, carlots	7.25	7.25	7.25	7.25
American process, 5 to 35 percent lead, barrels, carlots	7.00- 7.38	7.25- 7.38	7.25- 7.38	7.25- 7.38
French process, red seal, bags, carlots	8.50	8.50	8.50	8.50
French process, green seal, bags, carlots	9.00	9.00	9.00	9.00
French process, white seal, barrels, carlots	9.75	9.75	9.75	9.75
Lithopone, ordinary, small lots, bags	4.50	4.50	4.50	4.50
Zinc sulfide, less than carlots, bags, barrels	8.50- 8.75	8.50- 8.75	8.50- 8.75	8.50- 8.75
Zinc chloride, works:				
Solution, tanks	2.50	2.50	2.50	2.50
Fused, drums	5.00- 6.50	5.00- 6.50	5.00- 6.50	5.00- 6.50
Zinc sulfate, crystals, barrels	3.65- 4.60	3.85- 4.60	[1] 3.65- 4.60	[1] 3.65- 4.40

[1] Quotation was reduced to 3.65–4.40 cents per pound in the September 11, 1944, issue of the Oil, Paint and Drug Reporter, which added "works, freight allowed," to the description.

FOREIGN TRADE [4]

The total value of foreign trade in lead and zinc pigments remained relatively high during the war as compared with prewar levels. Imports cover small quantities only, and the export balance has exceeded

Value of foreign trade of the United States in lead and zinc pigments and salts, 1944–45

	1944		1945	
	Imports	Exports	Imports	Exports
Lead pigments:				
White lead	$4	$572,848	$54	$611,688
Red lead		411,620		385,563
Litharge	400	386,685	1,566	414,167
Orange mineral		3,079		920
Other lead pigments	5,558	12,424	5,997	8,831
	5,962	1,386,656	7,617	1,421,169

	28,678	678,759	16,793	1,010,521
Grand total	36,182	4,082,332	24,441	4,710,411

[1] Data not available.
[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

$3,000,000 annually since 1941. Lithopone and zinc oxide exports both exceed any lead class. The total value of lead pigments exported rose 2 percent in 1945, and that of zinc pigments exported gained 13 percent. The value of exports of lead and zinc salts has been increasing and rose 49 percent in 1945. All of the foregoing foreign trade items are small compared with the totals for domestic trade.

Lead pigments and salts.—Imports of lead pigments and compounds continued to be insignificant in 1945. The principal items in the export classification are white lead, litharge, red lead, and lead arsenate; the last product ranked second in importance in 1945. All of the principal items except red lead gained in 1945, and without exception all were considerably larger in 1945 than in 1939.

Lead pigments and salts imported for consumption in the United States, 1941–45

Year	Short tons				Total value
	Basic carbonate white lead	Red lead	Litharge	Lead compounds	
1941	2	3	----------	17	[1] $15,367
1942	----------	2	2	11	[1] 5,841
1943	----------	4	1	----------	[1] 3,349
1944	(2)	----------	1	----------	[1] 5,962
1945	1	----------	8	(2)	[1] 7,635

[1] Includes also suboxide of lead, n. s. p. f., as follows—1941: $11,694 (65,268 pounds); 1942: $3,221 (13,228 pounds); 1943: $2,283 (6,614 pounds); 1944: $5,558 (19,842 pounds); 1945: $5,997 (19,842 pounds).
[2] Less than 1 ton.

Lead pigments and salts exported from the United States, 1941–45

Year	Short tons						Total value
	White lead	Red lead	Litharge	Orange mineral	Sublimed lead	Lead arsenate	
1941	2,901	2,966	2,892	(1)	(1)	4,797	$2,100,335
1942	2,249	1,391	1,999	7	95	296	1,030,472
1943	4,692	1,535	1,610	7	71	1,527	1,814,612
1944	3,052	2,117	2,391	13	82	2,133	1,888,129
1945	4,079	1,922	2,512	3	53	3,170	2,156,234

[1] Not compiled on an annual basis before 1942.

Zinc pigments and salts.—As in earlier years, zinc sulfate was the principal product in the import group, but only 421 tons of this salt entered the United States in 1945. Lithopone and zinc oxide rank first and second among the export products covered by the above heading. Exports of lithopone in 1945 were relatively unchanged from the reduced shipments for 1944, whereas those of zinc oxide rose 29 percent in 1945 and were the largest since 1941. The quantities for the two products mentioned amounted to nearly 9 and 6 percent, respectively, of total domestic shipments. On a tonnage basis, the principal zinc salts exported are zinc chloride and zinc sulfate; the former doubled in 1945, whereas the latter declined 39 percent. Zinc salts were shown separately on an annual basis in 1942 for the first time.

Zinc pigments and salts imported for consumption in the United States, 1941–45

Year	Short tons: Zinc oxide: Dry	Short tons: Zinc oxide: In oil	Short tons: Lithopone	Short tons: Zinc sulfide	Short tons: Zinc sulfate	Total value
1941	122	11	(1)	1	162	$29,835

[1] Zinc salts not separately recorded on an annual basis before 1942.
[2] Includes also—1942: Zinc sulfide $6,328 (37,691 pounds); zinc chloride, $42,674 (648,343 pounds); zinc sulfate, $53,624 (1,025,554 pounds); other zinc salts and compounds, $76,023 (519,458 pounds). 1943: Zinc sulfide, $29,523 (78,387 pounds); zinc chloride, $57,390 (751,861 pounds); zinc sulfate, $81,750 (1,830,508 pounds); other zinc salts and compounds, $22,087 (139,940 pounds). 1944: Zinc sulfide, $7,195 (40,223 pounds); zinc chloride, $47,133 (711,953); zinc sulfate, $83,566 (2,029,801 pounds); other zinc salts and compounds, $46,587 (167,474 pounds). 1945: Zinc sulfide, $25,399 (173,475 pounds); zinc chloride, $93,590 (1,499,755 pounds); zinc sulfate, $62,199 (1,243,826 pounds); other zinc salts and compounds, $119,747 (750,108 pounds).

THE MINERAL INDUSTRY OF ALASKA

(MINE REPORT)

By H. Foster Bain[1]

SUMMARY OUTLINE

GENERAL CONDITIONS

The year 1945 was another disappointing one so far as it concerned the mining industry of Alaska, even though the total value of mineral production increased 48 percent, from $6,903,000 in 1944 to $10,210,000[2] in 1945. The release of men and equipment from war work following VJ-day came too late in the season to have much influence on the mineral output. The ending of the war found most of the gold mines closed, stripped of tools and equipment, and with their former working forces widely scattered. In the fall it is customary for most of the men to come in from the creeks to spend the winter in town or "outside"; and between the end of the fighting in August and this annual exodus, there was not enough time to do much. The tie-up of transportation that came not long after as a result of picketing the docks at Seattle and a longshoreman strike at various Pacific coast ports prolonged the difficulty. Even when companies were able to buy new equipment, it was difficult to get it into the country. Where surplus Army tools and supplies were released, they were often in the wrong part of the Territory for immediate use in mining; and, moreover, there were complaints of slowness in the release of these materials. The year ended therefore with much less work than usual done on freighting in supplies preparatory to the 1946 season.

The dredging companies were in somewhat better position to resume work than others, since the dredges had not been taken over for war work; and, the bulk of their supplies being special, their inventories were not so depleted. A few operations had been allowed to continue uninterrupted for particular reasons, such as those of the Goodnews Bay Mining Co., which produce platinum, a highly strategic mineral. The U. S. Smelting, Refining & Mining Co. had been able to keep one dredge and a dragline operating on Cripple Creek near Fairbanks (later transferring the crew to No. 8 on Goldstream), and its powerhouse had operated steadily to supply current to various

[1] This chapter has been prepared with the especial cooperation of Robert S. Sanford, district engineer of the Bureau of Mines, and B. D. Stewart, Territorial Commissioner of Mines, both of Juneau, Alaska.
[2] For detailed table on Alaskan mineral production, see chapter of this volume, Statistical Summary of Mineral Production.

war enterprises. Minor repairs had been kept up; and, as promptly as labor became available, thawing at Chatanika was resumed with six drills, and a general overhaul of all dredges was begun in preparation for 1946. At Nome, the bunkhouses and other property taken over earlier by the Army were repurchased and redistributed in preparation for active operations, ditches were cleaned, and other preparatory work was accomplished. Little mining, however, could be done anywhere because of labor shortage which, in Alaska as elsewhere, was unexpected and greatly hampered any operations.

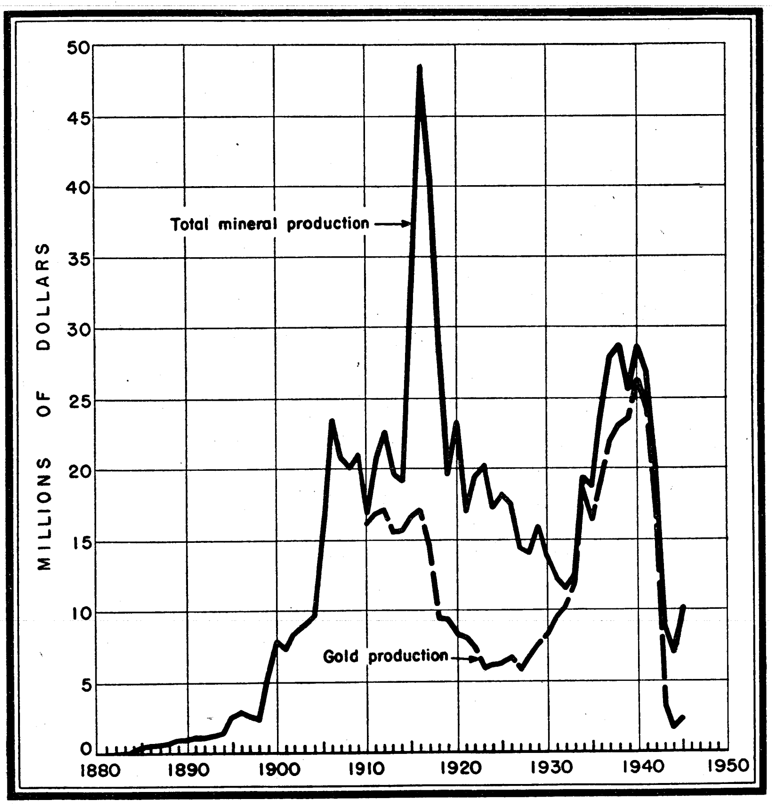

FIGURE 1.—Trends in value of total mineral production (1880–1945) and gold production (1910–45) in Alaska. In the years prior to 1910, mineral production was almost entirely gold. From 1911 to 1931 copper production accounted for most of the value of minerals other than gold.

In all, 13 dredges and 16 draglines operated some portion of the year in 1945. Production was credited to some others because outputs of earlier years were shipped in 1945. Lists of the dredge and dragline operations that shipped gold follow. In addition to those listed, 172 other placer properties were active some portion of the year. Of the lode mines, production was reported from 18 properties.

Dredges that shipped gold in 1945

Operator	District
Arctic Circle Exploration Co	Fairhaven
Council Dredging Co	Council-Bluff
Dry Creek Dredging Co	Fairhaven
Gold Placers, Inc	Circle
Goodnews Bay Mining Co	Goodnews Bay
Lee Bros	Nome
New York Alaska Gold Dredging Co. (2 dredges)	Tuluksak-Aniak
Nome Creek Mining Co	Tolovana
North American Gold Dredging Co	Iditarod
John Peterson and Victor Isaacson	Innoko
U. S. Smelting, Refining & Mining Co. (2 dredges)	Fairbanks
Wade Creek Dredging Co. & Mining Co	Fortymile

Draglines that shipped gold in 1945

Marvel Creek Mining Co. operated a dragline on Marvel Creek, in the Tuluksak area.
Arctic Circle Exploration Co. operated a dragline in conjunction with a dredge on Candle Creek.
Fisher & Fisher operated a dragline-hydraulic-bulldozer lay-out on Grant Creek, in Fort Gibbon Precinct.
Goodnews Bay Mining Co. operated a dragline in conjunction with its platinum dredge on Salmon River.
Joe Degnan operated a dragline-bulldozer lay-out intermittently on Little Creek, in the Takotna district.
Uotilla & Hard operated a dragline-bulldozer-hydraulic lay-out on Ophir Creek.
South Fork Mining Co. operated a dragline-bulldozer-hydraulic lay-out on the Gold Bench claim, in the Koyukuk district.
Awe Mining Co. operated a dragline-bulldozer lay-out on Chicken Creek, in the Flat district.
Uotilla & Ogriz operated a dragline-bulldozer lay-out on Slate Creek, in the Flat district.
Amy Creek Mining Co. operated a dragline-bulldozer-hydraulic lay-out on Amy Creek, in the Tolovana district.
Herbert Engstrom operated a dragline on Basin Creek, in the Nome district.
First Chance Mining Co. operated a dragline at the First Chance Mine, in the Fairbanks district.
Wolf Creek Mining Co. operated a dragline on Wolf Creek, in the Fairbanks district.
Patrick Savage operated a dragline on Flat Creek, in the Iditarod district.
Sid Paulson operated a dragline on the Colorado placer, in the Innoko district.
Nels J. Vibe operated a dragline on Little Creek, in the Innoko district.

The most serious factor hindering resumption of work was the diversion of labor from mining and the complete upset in the wage scale throughout the Territory. In the haste to get war construction completed despite shortage of manpower, not only had base rates of pay been raised, but also overtime pay had greatly increased the actual take-home wage. Still more disturbing was the general reclassification and upgrading of workmen in an effort to hold them on the job and avoid technical violation of wage regulations. The result was that actual rates of pay got all out of line with metal prices, so much so that until readjustments are made it will be impossible to operate many of the mines with any hope whatever of profit or even, in many instances, of avoiding loss. The great Alaska-Juneau, the largest industrial unit in Alaska, remained idle, with the plant in the hands of caretakers. This exceptional rise in wages hits mining hard because the labor cost is, in most mines, much the largest element in total cost. Coupled with this is the fixed price for gold, and gold mining normally accounts for 90 percent of the value of the annual mineral output of the Territory. Until a better balance between cost and price is re-established by one means or another, recovery of gold mining, and probably all mining in Alaska, is bound to lag. The time has been too short since fighting stopped to permit these adjustments, and such operations as are now under way in the Territory are being conducted very largely with an eye to the future rather than to immediate profit. The U. S. Smelting, Refining & Mining Co. has, for example, proved a considerable acreage of placer ground along Hog River in Northwestern Alaska but will not attempt for the present to equip for operation. Options have been taken on various smaller properties by local and outside companies; but, aside from examination, prospecting, and a limited amount of development, little is being done.

One feature of the present situation that may prove to have long-time significance is the interest being shown in the Territory by Canadian companies that have taken options on properties in several districts. Mining in Canada has been very profitable in recent years, and Canadian companies have considerable funds for reinvestment. They show a strong disposition to put their money into finding more mines, whereas the older American companies with heavy investments in reduction and manufacturing plants tend to be more cautious.

Another new current in mining in Alaska is the entrance into the field of some of the construction companies that came into the Territory to build airports and other war facilities. They are well-financed, are experienced in moving dirt and other operations common in mining, and are controlled by men accustomed to taking risks. If they win early success it may well have an important influence on the future of mining in Alaska. The C. F. Lytle Co. and the Green Construction Co. are prospecting the St. Amand ground near Fairbanks, and others have shown interest. The war advertised Alaska and introduced it to numerous individuals and groups to whom it was, until then, an unknown area, and this seems certain to affect its mining industry.

Although 1945 was a good season for mining, in that there was plenty of water, the industrial factors mentioned operated so strongly that gold production increased only moderately (38 percent). Fortunately, that is not the whole story. The wide search for strategic minerals by the Government and private individuals, which characterized the war effort, has left its mark. Among other material of future value is the complete set of maps of the Territory compiled by the Army Air Forces by trimetrogon photography, supplementing the earlier work of the Geological Survey. This work is still under way, and a map on the scale of 1:500,000 will soon be completed.

Another development that promises to result in a permanent industry has grown out of the work on mercury deposits. The two leading mines are the Red Devil and the Decoursey; a new mine, the Red Top, near Lake Alaknagik down in the Bristol Bay region, has become a producer.

Development was continued on the Cliffside lode of the Red Mountain Chromite, Inc., property, on Windy River, where a 180-foot adit was driven and is believed to have penetrated the Star Four ore body. No chromite, however, was mined or shipped, and Metals Reserve stopped buying it and other war minerals. Interest in antimony, tungsten, zinc, and other miscellaneous war minerals has accordingly died down, although some revival in copper mining is promised. It is announced that the Alaska Gold & Metals Co. will attempt to raise enough money to reopen the old Rush and Brown mine and to do additional drilling on the Salt Chuck property, both on Prince of Wales Island. A Bureau of Mines engineer sampled the old Khayyam copper mine on the same island and found some 90,000 tons of ore of the usual small copper-gold-silver value in pyrite.

Another event of possible future importance was the preliminary sampling by the Bureau of Mines of a deposit of mixed sulfide ores on Sedanka Island near Dutch Harbor. The Aleutian Islands have received little attention from mining men despite their ready accessibility by sea and now by air. The Sedanka deposit is about 25 miles from Dutch Harbor and near a deep, sheltered, local harbor. The lode has been explored and sampled for 240 feet of length and is dominantly a lead-zinc ore body, with minor quantities of copper, gold, and silver. The deposit evidently warrants serious consideration.

Coal mining slumped with the end of the war demand. The Army Coal Procurement Branch has withdrawn after making a settlement with W. E. Dunkle at the Colorado mine and with the company operating the Buffalo mine in the Matanuska field. At the Buffalo, underground equipment was removed and the mine allowed to fill with water. Both the Eska and Jonesville mines continued in operation, but against many difficulties and at high cost. At Healy, the Suntrana mine of the Healy River Coal Corp. continued in operation, and the Diamond Coal Co. began shipments near the end of the year. This company's mine is about 4 miles west of the railroad, and the coal is trucked to a loading bunker at Healy station. The Meade River mine, 65 miles southwest of Barrow, continued in operation all winter and delivered 700 tons of coal to Barrow, relieving the fuel situation at that point.

Also of possible great significance for the future is the considerable growth of interest in the nonmetallic minerals. In central Alaska a special survey is being planned along the railroad, and in southeastern Alaska preparations for shipments of limestone are now being made at two points. The Commissioner of Mines completed a survey of the limestones of that region, and the Federal Bureau of Mines also did some sampling there. Both organizations report large quantities of high-grade rock well-situated for quarry operations and easily accessible from the sea. Before the war the Superior Portland Cement Co., of Seattle, drew its supply from View Cove on Dall Island. Loss of its steamer, taken over by the Navy for wartime service, forced the company to stop this movement. Men have now been sent in to rehabilitate the camp and quarry in preparation for resuming shipments.

A new enterprise is being established by the Aluminum Co. of America at Edna Bay, on Kosciusko Island. After a study of the whole region, this point was selected by the company for establishing a limestone quarry. The camp of the Forest Service, operated as part of the Alaska spruce logging program, has been purchased and is being repaired and made ready to serve as the shipping point for the limestone. The latter is to be used in the lime roasting of certain bauxite deposits in Oregon.

In the northwest, the Arctic Circle Exploration Co. not only operated for gold but mined for both asbestos and jade along Kobuk River and its tributaries, where the Federal Bureau of Mines also continued its prospecting. Production for the year amounted to 10 tons of tremolite and 1 ton of chrysotile asbestos and 13 tons of nephrite jade. An area 45 miles long, in which these minerals are found, is still inadequately prospected. At the high prices at which asbestos of this grade and jade are sold, it seems probable that a small permanent industry may be built up here.

Another notable event of the year was the drilling of the first well in search of oil in Petroleum Reserve No. 4, in northern Alaska. This well was drilled by a Seabee crew to a depth of 1,900 feet and is reported to have passed through five "oil sands which had been drained" without getting to the bottom of the presumed productive formation. The Navy has now contracted with a private company to continue the exploration in 1946 and to make extensive geophysical surveys. A survey was also made for a pipeline to Fairbanks, and studies were made of the flowability of the oil expected to be found. No progress was made in exploration of the possible petroleum fields along the southern coast, although leases have been granted at Iniskin Bay.

One of the residual benefits of the war work in Alaska is a considerable extension of the road system. The Alaska Highway has been built from Fairbanks to Haines with a connection east to Whitehorse in Canada, and south by way of the Tok, Richardson, and Glenn Highways into the Copper River Basin, the Matanuska coalfield, Valdez, and Anchorage. A caterpillar trail has been opened north from the Alaska Highway, at Tancross, to the Fortymile district, and will, no doubt, be made over into a regular highway. It is already serving as a route of entry to various mining districts along the Yukon for supplies and machinery.

METAL PRODUCTION

The following tables show the mine production of gold, silver, copper, and lead in Alaska in 1941–45, and 1880–1945, in terms of recovered metals; the output of gold and silver in 1945, by types of operation; and the output of gold, silver, copper, and lead, from amalgamation and cyanidation mills (with or without concentration equipment) in 1945, by regions.

Much of the production shown in the tables following was actually mined in the years 1942–44 but apparently was not then shipped because of war conditions. The actual quantity by years is not known. Shipments of 6,120 ounces of gold and 896 of silver received at the Seattle Assay Office in February 1946 are here credited as 1945 production.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Gold and silver.—Placer and lode mines in 1945 yielded (in terms of recoverable metals) 68,117 ounces of gold valued at $2,384,095, compared with 49,296 ounces valued at $1,725,360 in 1944—an increase of 38 percent; and 9,983 ounces of silver valued at $7,099, compared with 13,362 ounces valued at $9,502 in 1944—a decline of 25 percent. Although gold production increased 38 percent, this improvement would appear to be no more than moderate in degree when the scale of prewar production (755,970 ounces, with a value of $26,458,950, in 1940) is considered. The ratio of silver production to gold production in 1945 was 1 : 6.82, compared with 1 : 3.69 in 1944—reflecting the decreased proportion of production from lode mines in 1945.

The Yukon River Basin region, of the eight mining regions, contributed the largest output of gold—49 percent of the total; the other regions, in order of greatest production, were Seward Peninsula, Kuskokwim, Southeastern Alaska, Cook Inlet-Susitna, Kenai Peninsula, Copper River, and Northwestern Alaska. The largest production of silver in 1945 also came from the Yukon Basin region, with Seward Peninsula and Southeastern Alaska in second and third place, respectively.

Mine production of gold, silver, copper, and lead in Alaska, 1941–45, and total, 1880–1945, in terms of recovered metals

Year	Gold (lode and placer)		Silver (lode and placer)	
	Fine ounces	Value	Fine ounces	Value
1941	695,467	$24,341,345	191,522	$136,193
1942	487,621	17,066,735	119,704	85,123
1943	99,583	3,485,405	42,788	30,427
1944	49,296	1,725,360	13,362	9,502
1945	68,117	2,384,095	9,983	7,099
1880–1945	25,856,647	617,997,247	19,748,505	14,047,822

Mine production of gold, silver, copper, and lead in Alaska, 1941–45, and total, 1880–1945, in terms of recovered metals—Continued

Year	Copper		Lead		Total value
	Pounds	Value	Pounds	Value	
1941	144,000	$16,992	1,324,000	$75,468	$24,569,998

Bullion of Alaska origin deposited at United States Assay Office, Seattle, Wash., during year ended Dec. 31, 1945, in fine ounces

Region	Gold	Silver	Region	Gold	Silver
Cook Inlet-Susitna	1,851	124	Seward Peninsula	17,570	2,392
Copper River	11	1	Southeastern Alaska	3,104	616
Kenai Peninsula	214	66	Yukon River Basin	26,708	3,587
Kuskokwim	8,736	747			
Northwestern Alaska	22	5		58,216	7,538

Placer mines, principally in the Yukon River Basin and Seward Peninsula regions, produced 85 percent of the gold and 71 percent of the silver from Alaska in 1945. Floating connected-bucket dredges, of which 7 were in the Yukon River Basin region, 4 in the Seward Peninsula, and 3 in the Kuskokwim, produced 51 percent of the total gold output of the Territory in 1945 and 39 percent of the silver; 9 dredges were active in 1944. The Arctic Circle Exploration Co. was the largest producer of gold and silver from bucket-dredging operations in 1945; the company operated 1 dredge on Candle Creek in the Seward Peninsula region during part of the 1945 season and handled 176,000 cubic yards of gold-bearing gravel—the remainder of the open season was employed in preparation for full-scale operations during 1946. The United States Smelting, Refining & Mining Co. was the second most productive bucket-dredging operation in Alaska during 1945. Dredging was carried on a total of 156 days between May 21 and November 16, and a total of 1,041,227 cubic yards of material was washed. In addition, the company removed about 500,000 cubic yards of overburden by hydraulicking and using a dragline. The New York Alaska Gold Dredging Co. operated its dredge on the Tuluksak River in the Kuskokwim region from May 10 until November 13. Gold Placers, Inc., operated its 4-cubic foot Diesel-powered dredge on Coal Creek in the Yukon River Basin region from June 18 until October 17. During the period of operations, 221,500 cubic yards of gravel were washed which yielded about 3,500 ounces of fine gold. Other large dredging operations in Alaska in 1945 were the North American Dredging Co. at Flat, the Council Dredging Co. at Council, and the Lee Bros. Dredging Co. at Solomon. The Goodnews Bay Mining Co. operated its Yuba electrically powered dredge on Salmon River in the Kuskokwim region from April 24 to November 15, 1945, and handled 1,125,850 cubic yards of gravel; some gold was recovered although the principal yield was platinum. A total of 16 dragline dredges were active in Alaska in 1945 and contributed 16 percent of the total gold recovered in the Territory during the year. One of the largest producers in Alaska in 1945 using a dragline dredge was the South Fork Mining Co., operating on the Gold Bench claim in the Koyukuk district. The company washed about 70,000 cubic yards of gold-bearing gravel during an operating period of 90 days and recovered 1,692 fine ounces of gold and 246 ounces of silver. Other producers included the Uotila & Hard operation on Ophir Creek in the Yukon River Basin region, the Marvel Creek Mining Co. on Marvel Creek in the Kuskokwim region, and the Arctic Circle Exploration Co. in the Seward Peninsula region. In addition, 172 mines were being worked by other methods of placer mining in 1945.

The Cleary Hill Mines Co. operated its mine on Cleary Creek in the Fairbanks district during 1945 and was the largest producer of lode gold in Alaska. The Alaska Juneau Gold Mining Co. closed its Alaska Juneau mine on April 9, 1944, for an indefinite period. During 1945 the mine remained closed; however, the company shipped gold bullion to the Seattle Assay Office and lead concentrates to the Selby, Calif., smelter from plant absorption clean-ups. The Alaska Pacific Consolidated Mining Co. employed 20 men in its mining operation at its Independence mine in the Willow Creek district north of Wasilla. The mine and 70-ton Independence amalgamation-flotation-concentration mill were worked from January 1 until August 8, when all operations ceased. During the period of activity, 1,747 tons of gold ore were treated, making gold bullion, which was shipped to the Seattle Assay Office, and gold concentrates, which were shipped to the Tacoma, Wash., smelter.

Chromite.—The mine of the Chrome Queen Mining Co., in the Kenai Peninsula region, was closed throughout 1945, operations having been indefinitely suspended in August 1944 on completion of the company's contract with the Metals Reserve Company. A publication [3] describing the exploration of the Red Mountain chromite deposits on the Kenai Peninsula was issued recently by the Bureau of Mines.

Copper.—Copper output in 1945 came entirely from the Copper River region, where production totaled 10,000 pounds valued at $1,350, compared with 4,000 pounds valued at $540 in 1944—an increase of 150 percent in quantity. The average weighted yearly price per pound for copper in 1945 was $0.135, as in 1944.

Lead.—The Southeastern Alaska region was the sole source of lead production in 1945. Output totaled 22,000 pounds valued at $1,892, compared with 88,000 pounds valued at $7,040 in 1944—a decrease of 75 percent in quantity. The average weighted yearly price per pound for lead advanced from $0.080 in 1944 to $0.086 in 1945.

Platinum metals.—Placer deposits in the Goodnews Bay district in Southeastern Alaska yielded 26,505 ounces of platinum in 1945, compared with 33,616 ounces in 1944. Production was won by a large modern dredge and well-mechanized draglines. A small quantity of gold was recovered as a byproduct.

Mercury.—Output in most mercury-producing areas in the United States decreased in 1945, whereas in Alaska production reached a new peak. The two principal producers were the Red Devil (New Idria-Alaska) and the Decoursey Mountain mines. Operations at both properties were closed at the end of the year because of the winter season. The Red Devil ore was treated in a 3- by 40-foot Gould rotary furnace; that at Decoursey Mountain was reduced in a two-tube D-type retort. Most of the ore treated at the Red Devil mine was from the new 100-foot level.

Tin.—In 1945, for the second consecutive year, no tin production was reported for Alaska. Some concentrates that had been produced prior to 1944 and acquired by the Reconstruction Finance Corporation were

[3] Rutledge, F. A., Exploration of Red Mountain Chromite Deposits, Kenai Peninsula, Alaska: Bureau of Mines Rept. of Investigations 3885, 1946, 26 pp.

shipped out of the Territory in 1945 to the Texas City, Tex., tin smelter. A lode deposit on Seward Peninsula, which is reported to have greater potentialities than any other known domestic source of tin, was tested by diamond drilling under the exploratory program of the Bureau of Mines.

Tungsten.—No tungsten concentrates were produced in Alaska in 1945. Milling of tungsten ore at the Riverside mine near Hyder was suspended throughout the year owing to economic conditions and insufficient labor; 1,300 tons of ore, however, were mined at the property.

Other metals.—There was no recorded production of antimony, iron ore, manganese, molybdenum, vanadium, or zinc in Alaska in 1945.

NONMETALLIC PRODUCTION

As in 1944, and for the second time in the history of Alaskan mining, the value of the yield of nonmetals in 1945 exceeded that of the metals, amounting to $6,484,000 as compared with $3,732,000 for the metals.

Coal.—Coal output in 1945 totaled 300,000 tons valued at $1,905,000 as compared with 348,375 tons and $2,239,684 in 1944—a decrease of 14 percent in quantity and 15 percent in value. Although coal mining slumped with the end of the war, an increase in demand for the fuel developed with the close of the year.

Sand and gravel.—Production of sand and gravel in Alaska in 1945 was considerable, but figures cannot be released at this time.

Stone.—Production of stone in Alaska in 1945 was also considerable, but figures likewise cannot be released at this time.

Asbestos.—Ten tons of tremolite asbestos and 1 ton of longslip-fiber chrysotile, as already mentioned, were produced by the Arctic Exploration Co. from deposits in the Dahl Creek area, Kobuk River district.

Jade.—Thirteen tons of jade, some of it of gem quality and comparable with the better New Zealand nephrite, was produced by the Arctic Exploration Co., as already mentioned, from an occurrence along the Kobuk River.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN ARIZONA

MINE REPORT)

By C. E. Needham and Paul Luff

SUMMARY OUTLINE

SUMMARY

Despite a decrease of 20 percent in the production of copper in Arizona in 1945 compared with 1944, the State remained the largest producer of copper in the United States. The drop in the output of copper ore not only resulted in a marked decline in production of copper but also of gold and silver, as copper ore is the principal source of gold and silver in Arizona. The production of both lead and zinc, however, increased considerably. Production in 1945 (in terms of recoverable metals) was 77,223 fine ounces of gold, 3,558,216 fine ounces of silver, 574,406,000 pounds of copper, 45,734,000 pounds of lead, and 80,452,000 pounds of zinc, indicating decreases from 1944 of 31 percent in gold, 19 percent in silver, and 20 percent in copper; lead increased 37 percent and zinc 38 percent. The total value of the five metals was $95,963,006 in 1945 compared with $113,094,806 in 1944. The total value of the gold was $2,702,805—3 percent of the State total value; silver, $2,530,287—nearly 3 percent; copper, $77,544,810—81 percent; lead, $3,933,124—4 percent; and zinc, $9,251,980—nearly 10 percent. The value of the metals recovered from copper ore was $80,461,465 in 1945 ($101,163,271 in 1944), or 84 percent of the State total. About 93 percent of the State gold production and 79 percent of the silver in 1945 came from seven districts—Ajo, Big Bug, Copper Mountain (Morenci), Globe-Miami, Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 98 percent of the copper came from eight districts—Ajo, Copper Mountain (Morenci), Eureka (Bagdad), Globe-Miami, Mineral Creek (Ray), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); nearly 90 percent of the lead came from six districts—Big Bug, Harshaw, Old Hat, Pima, Wallapai (Chloride), and Warren (Bisbee); and nearly 95 percent of the zinc came from nine districts—Big Bug, Cochise (Dragoon), Harshaw, Old Hat, Patagonia, Pima, Pioneer (Superior), Wallapai (Chloride), and Warren (Bisbee).

Since inauguration in February 1942 of the Government premium price plan, the base price of copper, lead, and zinc has remained unchanged; copper has been $0.12 a pound, lead $0.065 (New York), and zinc $0.0825. The basic Government policy of premium payments for overquota production remained in force throughout 1945.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Arizona, 1941–45, and total, 1860–1945, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)

Gold and silver produced at placer mines in Arizona, 1941–45, in fine ounces, in terms of recovered metals

Year	Sluicing [1]		Drift mining		Dredges				Total	
					Dry-land [2]		Dragline floating [2]			
	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver
1941	976	125	77	5	824	717	10,054	1,358	11,931	2,205
1942	885	176			35	5	1,916	217	2,836	398
1943	315	14	4						319	14
1944	242	90							242	90
1945	535	45	5						540	45

[1] Includes placer sands treated by dry concentration plants.
[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

Gold.—Although the War Production Board gold-mine closing order (L–208), issued October 8, 1942, was rescinded July 1, 1945, no revival at gold mines in Arizona was noticeable during the year. In 1945 more than 80 percent of the State gold output was recovered from copper ore, 14 percent from zinc-lead ore, 3 percent from siliceous ores, and most of the remainder from lead ore and zinc-copper ore and from placers. Gold from siliceous ores declined 78 percent and that from copper ore more than 31 percent, but that from zinc-lead ore increased 49 percent. Gold from placers increased from 242 ounces to 540. The New Cornelia mine of the Phelps Dodge Corp., in Pima County, was the leading gold producer in Arizona; it was followed by the Copper Queen (Bisbee) branch of the Phelps Dodge Corp., in Cochise County, the United Verde and Iron King mines in Yavapai County, the Morenci branch of the Phelps Dodge Corp. in Greenlee County, the Magma mine in Pinal County, and the Denn mine in Cochise County; these seven properties produced 88 percent of the State total gold.

Silver.—Most of the silver produced in Arizona is a byproduct of copper ore and zinc-lead ore, and in 1945 these two classes of ore yielded 91 percent of the State total (copper ore yielded 59 percent and zinc-lead ore 32 percent); the remainder came principally from siliceous ores, zinc-copper ore, lead ore, and zinc-lead-copper ore. Silver from copper ore declined 992,865 ounces or 32 percent, that from siliceous ores 45,044 ounces or 23 percent, and that from lead ore, zinc-copper ore, and zinc-lead-copper ore 134,215 ounces or 45 percent; however, the output of silver from zinc-lead ore increased 330,264 ounces or 42 percent. The Phelps Dodge Corp. continued to be the chief silver producer in Arizona, although its output was 23 percent less than in 1944; its four properties (Copper Queen, Morenci, New Cornelia, and United Verde) produced 68 percent of the State gold output, more than 56 percent of the silver, and 58 percent of the copper. Other large silver producers in Arizona in 1945 were the Iron King, Magma, Trench-Flux, San Xavier (Eagle-Picher Mining & Smelting Co.), Castle Dome, and Shattuck Denn properties. More than 40 percent of the State total silver came from the Warren and Verde districts, but the output from these districts decreased 701,574 ounces from that in 1944.

717372—47——16

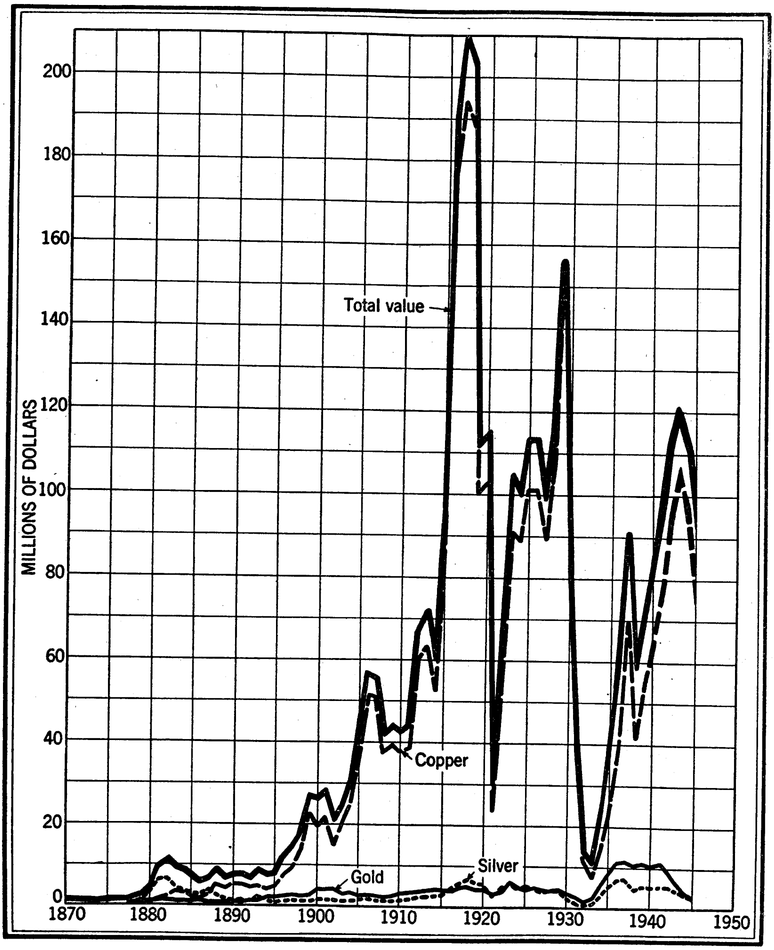

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1945. The value of lead and zinc has been less than $2,000,000 annually, except in a few years.

Copper.—Arizona has been the outstanding producer of copper in the United States since 1907 except in 1909, when Montana held first place. The output of recoverable copper in Arizona in 1945 was 574,406,000 pounds—a decrease of 142,200,000 pounds or 20 percent from 1944. The Copper Mountain (Morenci) district, with an output of 201,652,200 net pounds of copper, remained the leading copper-producing area in the State; it was followed by the Globe-Miami district with 157,291,400 pounds, Ajo with 75,900,000, Verde (Jerome) with 40,224,000, Mineral Creek (Ray) with 39,342,400, Warren (Bisbee) with 25,133,000, Pioneer (Superior) with 16,730,000, and Eureka (Bagdad) with 8,212,800. Marked decreases in copper output were recorded in each of these districts, particularly in the Warren (Bisbee) district where the decrease was 40,233,000 pounds. Copper ore and its products yielded 568,695,092 pounds of copper, as follows: 27,504,-

269 tons of copper ore treated by concentration yielded 80 percent; 662,730 tons of copper ore shipped crude to smelters, 10 percent; and 2,477,471 tons of copper ore leached and 13,555 tons of cement copper (from mine-water precipitates and underground leaching operations), 10 percent. The Morenci branch of the Phelps Dodge Corp. was again the largest copper producer in Arizona in 1945, although its output was less than in 1944; it was followed in order by the New Cornelia branch of the Phelps Dodge Corp., Castle Dome, Inspiration, Miami, United Verde, Ray (Kennecott Copper Corp.), Magma, Bagdad, Copper Queen, and Shattuck Denn properties.

Lead and zinc.—Each year for the past 6 Arizona has made a record output of zinc, and in 1945 the output of 80,452,000 pounds exceeded the record output of 1944 by 22,298,000 pounds or 38 percent. Production of lead in 1945 (45,734,000 pounds) was the largest in any year in the history of the State and exceeded the record output of 1944 by 12,320,000 pounds or 37 percent. These increases in both lead and zinc resulted principally from a greater output of zinc-lead ore from the Copper Queen mine of the Phelps Dodge Corp. at Bisbee. The property was the largest producer of lead and zinc in Arizona in 1945. Other large producers of lead, in order of output, were the Mammoth-St. Anthony property at Tiger, San Xavier mine near Sahuarita, Iron King mine at Humboldt, Trench-Flux group near Patagonia, and Tennessee mine at Chloride. Other large producers of zinc, in order of output, were the Iron King, Mammoth-St. Anthony, San Xavier, Magma, Trench-Flux, Republic, Duquesne, and Tennessee properties. About 41 percent of the State total lead and 45 percent of the zinc came from mines at Bisbee in Cochise County, 23 percent of the lead and more than 17 percent of the zinc from Pinal County, 9 percent of the lead and 9 percent of the zinc from mines near Sahuarita in Pima County, and more than 8 percent of the lead and 12 percent of the zinc from a mine at Humboldt in Yavapai County; most of the remaining lead and zinc output came from Santa Cruz, Mohave, Gila, and Graham Counties. About 91 percent of the total lead and 85 percent of the total zinc came from zinc-lead ore; 6 percent of the total lead came from lead ore and nearly all the rest of the lead from siliceous ores, zinc-lead-copper ore, zinc-copper ore, and zinc ore; and 10 percent of the total zinc came from zinc-copper ore and nearly all the rest of the zinc from zinc ore and zinc-lead-copper ore.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1945, by counties, in terms of recovered metals

County	Mines producing: Lode	Mines producing: Placer	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value
Cochise	22	-------	16,274	$569,590	1,006,747	$715,909

Total, 1944	35,900,641	111,920	4,393,949

Gold and silver produced at placer mines in Arizona in 1945, by counties, in fine ounces, in terms of recovered metals

County	Sluicing [1]		Drift mining		Dredges				Total	
					Dry-land [2]		Dragline floating [2]			
	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver
Greenlee			4						4	
Maricopa	10								10	
Mohave	5								5	
Yavapai	520	45							520	45
Yuma			1						1	
	535	45	5						540	45
Total, 1944	242	90							242	90

[1] Includes placer sands treated by dry concentration plants.
[2] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

MINING INDUSTRY

In spite of a serious shortage of labor the mining of zinc-lead ore in Arizona in 1945 was far greater than in any year in the history of the State; however, the mining of copper ore, the most important part of the State mining industry, declined from that in 1944. The marked increase in output of zinc-lead ore resulted principally from the mining of more zinc-lead ore from the Copper Queen mine at Bisbee, Iron King mine at Humboldt, and Mammoth-St. Anthony property at Tiger. The effect of the labor shortage on the domestic copper industry was especially acute in Arizona owing to the fact that the State has seven large copper-producing districts and six copper smelters. Other important factors that affected the output of ore were the suspension in July of mining zinc-copper ore from the Magma mine at Superior, suspension in October of mining zinc-lead ore from the Tennessee mine at Chloride, the undertaking early in May of mining zinc-copper ore from the Republic mine near Dragoon, and a general decline in the mining of siliceous ores. The total production of ore of all classes dropped from 35,900,641 tons in 1944 to 31,266,904 tons in 1945. The output of copper ore was 30,644,470 tons—a 13-percent loss from 1944; zinc-lead ore, 480,061 tons—a 42-percent gain; zinc-copper ore, 81,123 tons—a 16-percent loss; lead ore, 21,340 tons—a 21-percent loss; and zinc-lead-copper ore, 11,488 tons—a 38-percent loss. The output of siliceous ores was 19,506 tons compared with 129,086 tons in 1944—an 85-percent decline. Of the State total ore, 30,515,579 tons (more than 97 percent) was copper ore mined in the Globe-Miami, Copper Mountain (Morenci), Ajo, Mineral Creek (Ray), Eureka (Bagdad), Verde (Jerome), Warren (Bisbee), and Pioneer (Superior) districts; 98 percent of the State total zinc-lead ore was mined in the Warren (Bisbee), Big Bug, Old Hat (Oracle), Harshaw, Pima, and Wallapai (Chloride) districts; nearly all the zinc-lead-copper ore came from a mine in the Patagonia district; 94 percent of the zinc-copper ore came from two properties—one in the Cochise (Dragoon) district and the other in the Pioneer

(Superior) district; and 58 percent of the lead ore came from one property in the Castle Dome district. More than 62 percent of the State total siliceous ores was silver ore from properties near Duncan and Superior and gold-silver ore from properties at Tombstone. Mining operations at two open-pits—Ajo and Morenci—produced 15,689,098 tons of copper ore in 1945 compared with 17,722,944 tons in 1944.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Arizona in 1945, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	33	2,251	1,210	3,314	19,683	8,876	42,000
Dry and siliceous gold-silver ore	12	6,784	880	38,487	40,806	110792	
Dry and siliceous silver ore	16	10,471	274	105,653	14,911	866	
	61	19,506	2,364	147,454	75,400	120,534	42,000
Copper ore	85	30,644,470	62,265	[1] 2,113,537	[2] 568,695,092	62,708	
Lead ore	47	21,340	426	54,145	59,141	2,885,923	2,400
Lead-copper ore	1	2		7	290	952	
Zinc ore	6	8,914	89	14,201	136,401	149,277	2,220,788
Zinc-copper ore	5	81,123	516	76,022	1,760,435	219,716	8,107,400
Zinc-lead ore	18	480,061	10,880	1,121,992	3,332,903	41,697,193	68,491,812
Zinc-lead-copper ore	6	11,488	143	30,813	346,338	597,697	1,587,600
Total, lode mines	[3] 202	31,266,904	76,683	[1] 3,558,171	[2] 574,406,000	45,734,000	80,452,000
Total, placers	18		540	45			
	220	31,266,904	77,223	3,558,216	574,406,000	45,734,000	80,452,000
Total, 1944	243	35,900,641	112,162	[4] 4,394,039	[5] 716,606,000	33,414,000	58,154,000

[1] Includes 322 ounces recovered from underground mine-water precipitates.
[2] Includes 56,344,468 pounds recovered from ore leached and mine-water precipitates.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 295 ounces recovered from underground mine-water precipitates.
[5] Includes 79,003,481 pounds recovered from ore leached and mine-water precipitates.

METALLURGIC INDUSTRY

Of the 31,266,904 tons of ore produced in 1945 in Arizona, 28,098,648 tons (90 percent) were treated at concentration plants, 2,477,471 tons (8 percent) at two leaching plants, 200 tons at a cyanidation plant, and 6 tons at an amalgamation plant; 690,579 tons (2 percent) were shipped crude to smelters.

Ore treated at concentration plants in 1945 comprised chiefly 27,504,269 tons of copper ore, 480,003 tons of zinc-lead ore, 81,123 tons of zinc-copper ore, 13,130 tons of lead ore, and 11,488 tons of zinc-lead-copper ore. Copper ore from the Miami property was treated by a combination of leaching and concentration, copper ore from the Inspiration mine was treated by straight leaching and by leaching and concentration, and copper ore from the Emerald Isle mine was treated by straight leaching. The large copper-concentration plants at Morenci (45,000-ton-a-day), Ajo (25,000-ton), Clarkdale (2,100-ton), Hayden (10,000-ton), Miami (18,000-ton), Inspiration (18,000-ton), Bagdad (2,500-ton), and Superior (850-ton) were operated continuously in 1945 but at a much lower rate than in 1944. The 10,000-ton copper concentrator of the Castle Dome Copper Co., Inc., near Miami was the only plant that operated at a higher rate than in 1944. The copper-leaching plants at Inspiration (9,000-ton) and Miami (3,000-ton) and the copper smelters at Clarkdale, Douglas, Hayden, Miami, Morenci, and Superior were operated also at a reduced rate. The rated capacity of charge of the six copper smelters was as follows: Clarkdale, 1,400,000 tons per year; Douglas, 1,600,000; Hayden, 360,000; Miami, 360,000; Morenci, 600,000; and Superior (Magma), 210,000. The Phelps Dodge Corp. reported that the Douglas smelter operated throughout the year on a reduced two-furnace basis and smelted 448,612 tons (925,431 tons in 1944) of new material. Much experimental work was done in connection with different types of furnace charge. Under present conditions of ore receipts raw charging has been adopted, and the roasting of ores and concentrates has been discontinued. The smelter at Clarkdale treated 353,603 tons of new material in 1945 compared with 518,627 tons in 1944; only one reverberatory furnace was operated throughout the year, and during the latter half of the year only one converter was necessary. The Morenci smelter treated 390,949 tons of new material in 1945 compared with 422,320 tons in 1944; two reverberatory furnaces and three converters were operated throughout the year. Both furnace and converter practices were improved. Labor shortages prevented full utilization of smelting facilities, and surplus concentrates were shipped to the Douglas smelter. Nearly all the lead concentrates produced at mills in Arizona in 1945 were shipped to the smelter at El Paso, Tex., and all the zinc concentrates were shipped to smelters at Amarillo, Dumas, and Corpus Christi, Tex., and Bartlesville, Okla.

The following tables give details of the treatment of all ores produced in Arizona in 1945.

Mine production of metals in Arizona in 1945, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	6	25	5			
Old tailings cyanided	200	4	455			
Concentrates smelted	1,013,484	51,573	2,393,737	460,719,258	43,397,346	80,032,845
Ore smelted	690,579	25,081	1,163,652	57,342,274	2,336,654	419,155
Copper precipitates smelted	13,555		322	[1] 20,193,515		
Copper ore leached	[2] 2,477,471			36,150,953		
Placer		540	45			
		77,223	3,558,216	574,406,000	45,734,000	80,452,000
Total, 1944		112,162	4,394,039	716,606,000	33,414,000	58,154,000

[1] Distributed as follows: Cochise County, 601,250 pounds; Gila County, 7,667,942 pounds; Greenlee County, 1,026,700 pounds; Mohave County, 136,050 pounds; Pinal County, 10,356,373 pounds; and Yavapai County, 405,200 pounds.
[2] Treated by straight leaching at 1 plant in Gila County and 1 plant in Mohave County.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Arizona in 1945, by types of mills and by counties, in terms of recovered metals

AMALGAMATION MILLS

County	Material treated (short tons)	Recovered in bullion		Concentrates smelted and recovered metal					
		Gold (fine ounces)	Silver (fine ounces)	Concentrates produced (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)

[2] White Picacho district lies in both Maricopa and Yavapai Counties.
[3] Old Hat district lies in both Pima and Pinal Counties.

COCHISE COUNTY

California district (Hilltop).—A lessee operated the Crosby mine near Portal until November 1 and shipped 876 tons of carbonate lead ore and 168 tons of siliceous copper ore to smelters; the lease was abandoned in November. The rest of the district output was small lots of lead ore and silver ore produced from the El Tigre claim.

Cochise district.—The Coronado Copper & Zinc Co., owner of the Republic mine near Dragoon, completed in May a 150-ton flotation mill at the mine. During the remainder of the year the mill treated 30,289 tons of zinc-copper ore, which yielded 1,066 tons of copper concentrate and 2,745 tons of zinc concentrate. Lessees operated the Mammoth mine (also owned by the Coronado Copper & Zinc Co.) the first 7 months of the year and shipped 2,894 tons of siliceous copper ore to the smelter at Douglas.

Dos Cabezas and Tevis district.—Shipments of highly siliceous copper ore were made throughout the year by a lessee operating the Elma claim of the Tout group; the total output of 2,287 tons was shipped to the copper smelter at El Paso, Tex.

Hartford (Huachuca Mountains) district.—Development, by the owners, of the State of Texas mine near Hereford resulted in the shipments of 7 cars (357 tons) of zinc-lead ore to a custom flotation mill at Bisbee. The rest of the district output was small lots of lead ore and lead-copper ore produced from the James mine.

Swisshelm district (Elfrida).—Lessees continued in 1945 to operate the Scribner mine near Elfrida and shipped 1,729 tons of silver-lead ore to the lead smelter at El Paso, Tex. A car of similar ore also was shipped from the Chance claim.

Tombstone district.—The output of the Tombstone district in 1945 was 3,860 tons of old siliceous tailings, containing principally gold, silver, and lead, and 689 tons of silver-lead ore shipped direct to smelters. All the old tailings came from the Grand Central dump near Fairbank and virtually all the silver-lead ore from the Tombstone Extension and Silver Bill properties at Tombstone.

Turquoise district (Courtland, Pearce, Gleeson).—Bargin Mines, Inc., operated under lease the Abril group near Pearce from January 5 to October 5, 1945, and shipped 1,614 tons of zinc ore to a custom mill at Bisbee. In December the property was taken over, under option to purchase, by the Shattuck Denn Mining Corp. The remainder of the district output comprised 379 tons of copper ore produced from the Shannon group, 261 tons of lead ore and copper ore from the Tom Scott mine, and 31 tons of copper ore from the Leadville mine.

Warren district (Bisbee, Warren).—In 1945 the Warren district ranked first in the State in output of silver, lead, and zinc, second in gold, and sixth in copper; however, the output of gold dropped to 15,863 ounces (a 59-percent loss from 1944), silver to 963,180 ounces (a 38-percent loss), and copper to 25,133,000 pounds (more than 61-percent loss). The output of lead increased to 18,800,500 pounds (a 169-percent gain) and zinc to 36,156,600 pounds (a 124-percent gain). The decline in production of gold, silver, and copper was due to the drop in output of copper ore from the Copper Queen branch of the Phelps Dodge Corp.; however, the increase in production of lead and zinc resulted from the marked rise in output of zinc-lead ore from this property. The corporation reported that 185,394 tons of copper ore were mined and smelted in 1945 compared with 634,650 tons in 1944 and that 177,513 tons of zinc-lead ore were treated in various flotation mills compared with 55,571 tons. In addition, 677 tons of copper precipitates were produced by surface and underground precipitation plants and sent to the corporation smelter at Douglas.

According to the corporation annual report for 1945, mining operations were seriously hampered throughout the year by an acute shortage of manpower, resulting in a marked decline in the production of gold, silver, and copper. Exploration and development were necessarily curtailed and comprised 15,354 feet of drifting, crosscutting, and raising, 5,649 feet of stope preparation, and 34,180 feet of diamond drilling. In spite of the reduced development, ore reserves were adequately maintained; several interesting developments and extensions were discovered in the zinc-lead ore areas. The erection of a zinc-lead ore concentrator, with a daily capacity of 450 tons and producing both lead and zinc concentrates, was completed in November. As a result, zinc-lead ore shipments previously made to custom concentrators were greatly reduced.

Mining and milling operations at the Denn property of the Shattuck Denn Mining Corp. were continuous throughout the year; however, the corporation 150-ton zinc-lead ore concentrator was utilized in 1945 entirely for the treatment of custom ores. The corporation reported that the Denn mine produced 59,672 tons of copper ore in 1945, which was sent to the smelter at El Paso, and that the concentrator treated 58,134 tons of zinc-lead ore for custom shippers. About 91 percent of the custom ore was zinc-lead ore received from the Copper Queen mine at Bisbee.

According to the corporation annual report for 1945, no new ore was found at the Denn mine; the known ore of commercial grade above the 2,900 level—the present lowest level of the mine—is limited in quantity, and mining conditions underground are difficult and costly.

The remainder of the district output was 773 tons of copper ore, 188 tons of gold-silver ore, and 26 tons of copper precipitates shipped by a lessee working the Shattuck mine.

COCONINO COUNTY

Jacob Canyon and Warm Springs district—Atherley & Ryan continued in 1945 to operate under lease the Mackin-Kennedy-Ryan group and the Petoskey group near Jacobs Lake and shipped 5,119 tons of carbonate copper ore to the smelter at Garfield, Utah; the ore was mined by a power shovel from surface pits at both groups. Similar ore was produced also from the Brown Derby and Little Buck properties.

Kaibito Plateau district.—The Mardun Co. operated the Mardun mine, 57 miles north of Cameron, from January 1 to July 1, 1945; about 540 tons of copper ore were treated in the company 120-ton concentration plant, and 52 tons of similar ore were shipped direct to a smelter.

GILA COUNTY

Banner and Dripping Springs district.—Mining of high-lime fluxing ore, needed by the copper smelter at Hayden, was continuous throughout the year at the Christmas mine by Sam Knight Mining Lease, Inc.; 19,260 tons of ore containing principally copper, were shipped to the smelter in 1945. According to an information circular released March 12, 1946, by the Geological Survey, the Christmas mine has produced over 27,500 tons of copper since it was opened in 1905. The ore is in flat, tabular bodies, which are replacements of certain favorable limestone beds close to the limestone-diorite contact. Accessible ore reserves were nearly depleted at the time (fall of 1942) a study was undertaken by the Geological Survey, in cooperation with the Bureau of Mines. Sufficient ore was developed by the exploration-drilling campaign in 1943 and early 1944 to allow continued operation of the mine for several years. The rest of the district output in 1945 was mainly 2,708 tons of zinc-lead ore produced from the "79" mine by the 79 Lead-Copper Co. and treated in the Shattuck Denn custom mill at Bisbee.

Globe-Miami district.—The Globe-Miami district, with a production of 157,291,400 net pounds of copper in 1945 (190,609,200 net pounds in 1944), ranked second among the important copper-producing areas in Arizona; the Copper Mountain (Morenci) district in Greenlee County remained in first place. The Castle Dome Copper Co., Inc., a wholly owned subsidiary of the Miami Copper Co., with a yield of 53,341,226 net pounds of copper (49,987,529 net pounds in 1944), was the chief producer of copper in the district and ranked third in the State. The company reported that 4,183,769 tons of ore averaging 0.743 percent copper were treated in the 12,000-ton concentrator leased from the Defense Plant Corporation. In addition to copper, the concentrates contained 1,860 ounces of gold and 100,395 ounces of silver.

According to the annual report of the Miami Copper Co. for 1945, the Castle Dome open pit, unlike underground mine operations, was not hampered by a labor shortage, and the property was operated at full capacity 3 shifts a day 7 days a week throughout the year, except 5 days lost on national holidays and 5 days lost through failure of equipment. At the tailings-disposal site a major improvement, begun in 1944, was completed and put in operation. It will permit a much larger tonnage of tailings to be deposited and greatly simplify the disposal of tailings, which will reduce the cost of operations. A geological study made early in the year indicated the possibility of an occurrence of commercial ore lying northeast of the known ore body, but after 7 exploratory holes were drilled in it to an average depth of 385 feet no commercial ore was found. The drilling equipment was moved to an area lying southwest of the known ore body, and 10 holes were drilled in this area with promising results. Ore reserves as of January 1, 1946, are estimated to be 19,003,782 tons averaging 0.74 percent copper.

The Inspiration property, with a yield of 53,292,670 net pounds of copper in 1945 (81,996,557 net pounds in 1944), ranked second in copper production in the district. This marked decrease in production resulted from a labor shortage, which hampered all operations throughout the year. The Inspiration Consolidated Copper Co. reported that 3,852,543 tons of copper ore and tailings were treated in 1945 compared with 4,545,134 tons of ore and tailings in 1944. Of the total ore, 2,472,471 tons, averaging 1.170 percent copper—0.527 percent copper as oxide and 0.643 percent as sulfide—from which the slimes had been removed, were treated in the main leaching plant; 199,899 tons of slimes, averaging 1.223 percent copper, and 1,180,173 tons of leached ore, averaging 0.749 percent copper, from the main leaching plant were treated in the company concentrator. Sulfuric acid leaching, for extraction of the oxide copper content of the ore, was used to treat 1,096,760 tons of ore in the main leaching plant during the first 6 months of the year. During the last 6 months, 1,375,711 tons of ore were leached by acid ferric sulfate. Slimes removed from ore at the main leaching plant were treated by flotation concentration for extraction of the sulfide copper content, and the tailings were leached with sulfuric acid for extraction of the oxide copper content. The total copper production per ton of ore treated in 1945 was 20.526 pounds.

According to the annual report of the company for 1945, ore mined during the year totaled 2,672,370 dry tons assaying 1.174 percent copper—0.546 percent as oxide and 0.628 percent as sulfide. Of the total ore mined, 61,268 tons were from development. The area undercut and caved during the year was 2.219 acres. Total underground development aggregated 22,378 feet of drifts and raises and 1,566 cubic yards of miscellaneous development. During the first half of the year the "dual process" (combined leaching and concentration) of ore treatment was continued, pending completion of reconstruction of the electrolytic tank house, which was destroyed by fire October 1, 1944. This reconstruction was completed in the latter part of May 1945, when ore treatment by the dual process was discontinued and treatment by the ferric sulfate process resumed.

Mining and milling at the Miami property of the Miami Copper Co. were continuous throughout the year. The company 18,000-ton concentrator and 3,000-ton leaching plant treated 4,003,409 tons (4,717,138 tons in 1944) of ore averaging 0.644 percent copper, and 2,993 tons of copper precipitates were produced from leaching of ore in place. In addition, 571 tons of molybdenum concentrate were recovered as a byproduct in treating copper ore.

According to the annual report of the company for 1945, the loss in copper production at the Miami mine resulted entirely from a severe shortage of underground labor. Mine development during the year comprised 3,909 feet of drifts and 3,737 feet of raises; in addition, 13,711 feet of drifts and raises were driven for stoping account. In line with the low development footage, ore mined was low at an average daily rate of 11,121 tons for the 360 days of mine operations. The manpower situation reached a low point in October but picked up in an encouraging manner during the remainder of the year. As the mining of ore in place progresses, the problem of leaching copper from the broken stope fill remaining becomes more important. The total copper recovered in this manner since leaching started in 1941 has been 22,551,073 pounds. Virtually all of this copper was leached from oxidized copper minerals by water containing sulfuric acid. Nearly all of the copper remaining to be leached is contained in sulfide copper minerals, mostly chalcocite. To leach this copper will require a solvent containing both acid and ferric sulfate. To produce the solvent, in order to test the leaching process, a pilot plant was designed, and its construction is nearing completion. Ore reserves as of January 1, 1946, are estimated to be 39,109,637 tons averaging 0.855 percent copper.

The rest of the district output was principally 19,329 tons of copper ore shipped direct to smelters; 8,762 tons came from various claims and waste dumps of the Old Dominion property, 7,165 tons from the Carlota mine, 2,306 tons from the Van Dyke mine, 746 tons from the Superior & Boston property, and 350 tons from the Al & Hal group. Ceferino Liano operated his Albert Lea mine throughout the year and shipped 769 tons of lead ore to the smelter at El Paso.

Green Valley district.—In 1945 the Summit mine near Payson was under development by the Summit Copper Mines, Inc., and 23 tons of gold-copper ore were shipped to the copper smelter at Miami.

Pioneer (Pinal Mountains) district.—Lessees continued in 1945 to work the Mariana and Bob Tail claims and shipped a total of 67 tons of silver-copper ore to a smelter.

Summit district.—In 1945, as in 1944, the only output in the Summit district was copper ore shipped to a smelter from the Gibson waste dump west of Miami.

GRAHAM COUNTY

Aravaipa district.—The Athletic Mining Co. operated the Aravaipa group near Klondyke continuously in 1945 and shipped 6,030 tons of zinc-lead ore to the flotation mill of the Eagle-Picher Mining & Smelting Co. near Sahuarita and 882 tons of silver-lead ore to the lead smelter at El Paso, Tex. A little (5 tons) silver-lead ore was produced also from the Lead Jewel claim.

Stanley district.—Some lead ore (19 tons) was produced in 1945 from the Dos Amigos mine southeast of the Coolidge Dam.

GREENLEE COUNTY

Ash Peak district.—Fluxing ore, needed by the International copper smelter at Miami, remained the principal output in the Ash Peak district. The ore (6,573 tons) was produced from the Ash Peak mine by the Ash Peak Lease and averaged 0.036 ounce of gold and 8.97 ounces of silver to the ton and 84.40 percent silica. The rest of the district output was 200 tons of old tailings (silver), treated by cyanidation, from the Ash Peak property and 46 tons of silver ore produced from the Golden Eagle (Hardy) mine.

Copper Mountain district (Morenci).—The Copper Mountain district, with a production of 201,652,200 net pounds of copper in 1945 (213,851,000 net pounds in 1944), remained the chief copper-producing area in Arizona. The Morenci mine of the Phelps Dodge Corp. again was the outstanding producer of copper in the State. The company reported that 10,390,862 tons of copper ore were treated in the combined (Phelps Dodge and Defense Plant Corp.) 45,000-ton concentrator and that 41,791 tons of crude copper ore and 1,019 tons of copper precipitates were shipped direct to the Morenci smelter.

According to the annual report of the Phelps Dodge Corp. for 1945, production of ore from the Morenci open pit totaled 10,432,653 tons, and waste stripped totaled 11,586,169 tons. Mining operations were conducted on 19 benches, the top bench being the 5,500 and lowest the 4,600. Three additional stripping benches were opened on the west side of the pit and were completed to pit limits. A diamond drilling program to determine more definitely the stripping limits at the northwest corner of the ore body was in progress at the end of the year. Metallurgical research at the concentrator improved the ratio of concentration and therefore the copper content of the concentrate.

Nearly all the rest of the district output was crude, high-silica, copper oxide ore (1,698 tons) shipped to the Morenci smelter from the Keating mine, operated under lease by the Auto Specialties Manufacturing Co.

MARICOPA COUNTY

Osborn district.—Nearly all the output in the Osborn district in 1945 was 232 tons of lead ore and 56 tons of gold ore shipped to a smelter from the Belmont-McNeil mine southwest of Wickenburg. The property was worked in January by the East Vulture Mining Co. and during the last 9 months of the year by Ralph Pfeffer, both lessees.

Vulture district.—The output of the Vulture district was small in 1945—7 tons of gold ore were produced from the Lucky Cuss claim, 4 tons of silver ore from the Cumberland claim, and 1 ton of lead ore from the Nugget claim. In addition, 2 ounces of placer gold were recovered from the Vulture property.

Wickenburg district.—Old tailings (186 tons), containing principally gold, remained the only output in the Wickenburg district.

MOHAVE COUNTY

Cedar Valley district.—The Arizona Antlers Mining Co. operated the Antler mine 20 miles southwest of Yucca throughout the year and shipped 2,028 tons of zinc-copper ore to a custom flotation mill at Midvale, Utah, for treatment. Similar ore (2,991 tons) was produced from the Copper World mine by the Dye & Bathrick Mining Co. and also shipped to Midvale for treatment; in addition, 2,573 tons of copper ore were shipped to the United Verde copper smelter at Clarkdale, Ariz.

Hacks Canyon district.—Carbonate copper ore (178 tons) continued in 1945 to be mined from shallow depths of the Hacks Canyon mine by the Canyon Copper Co. and shipped to the smelter at Miami.

Owens (McCracken and Potts Mountain) district.—Leasing operations at the Stein mine produced 334 tons of copper ore, which was shipped direct to a smelter.

Wallapai district (Cerbat, Chloride, Mineral Park, Stockton Hill).—The Mines Operating Co., an organization of a few employees of the Tennessee Schuylkill Corp., worked the Tennessee mine and 150-ton flotation mill at Chloride from January 1 to October 20, 1945, when all operations ceased. During the year 11,523 tons of ore, averaging 0.075 ounce of gold and 2.517 ounces of silver to the ton, 6.005 percent lead, and 7.168 percent zinc, were treated in the mill, which yielded 966 tons of lead concentrates and 1,164 tons of zinc concentrates. Mining of carbonate copper ore from the Emerald Isle mine by the Emerald Isle Copper Co. was continuous throughout the year. The company treated, by sulfuric acid, about 5,000 tons of copper ore in its new 300-ton leaching plant and shipped 3,312 tons of similar ore direct to the United Verde smelter at Clarkdale. Ralph R. Langley, owner of the Summit group north of Kingman, worked his property continuously in 1945 and shipped 3,473 tons of zinc-lead ore to custom milling plants in Arizona and Utah. The rest of the district output was principally 892 tons of zinc-lead ore from the Eureka, Juno, Lone Jack, and New London properties and 206 tons of gold-silver ore from the White Eagle mine.

Weaver district.—The only output in the Weaver district in 1945 was old mill cleanings, containing mainly gold, recovered from the Pilgrim mill near Chloride.

PIMA COUNTY

Ajo district.—As usual, the output of the Ajo district was all copper ore from the New Cornelia mine of the Phelps Dodge Corp. In 1945 the district ranked first in gold, third in copper, and fifth in silver output in the State. According to the annual report of the Phelps Dodge Corp. for 1945, the New Cornelia open pit and 25,000-ton concentrator were operated continuously throughout the year; production amounted to 5,255,672 tons of copper ore and 3,555,348 tons of waste. The concentrator treated 5,256,445 tons of ore with metallurgical results comparable with those in 1944.

Amole district.—The old Palo Verde mine, 11 miles west of Tucson, was reopened by the owners in 1945 after being idle for the past 20 years. The mine was unwatered to the 215-foot level and retimbered; 172 tons of zinc-lead ore were hauled to the Eagle-Picher mill near Sahuarita.

Baboquivari district.—Leasing operations at the Papago Chief mine produced 144 tons of high-silica silver-copper ore, which was shipped to the smelter at Hayden.

Helvetia (Rosemont) district.—A total of 29,188 tons of ore was produced in the Helvetia district in 1945. The most important output was 24,604 tons of high-silica low-grade copper ore shipped to smelters from the Helvetia and Mohawk properties near Sahuarita. The rest of the district output was mainly 2,030 tons of copper ore from the Bulldozer mine, 1,112 tons of copper ore from the Rosemont mine, 848 tons of copper ore from the Newman mine, and 395 tons of zinc-lead ore from the Daylight mine; all of these properties were worked by lessees.

Old Hat district (Oracle).—Mining and milling of copper ore at the Geeseman mine south of Oracle, by the Control Mines Co., were continuous throughout the year; about 10,600 tons of copper ore were treated by flotation, and 979 tons of similar ore were shipped direct to the copper smelter at Hayden.

Pima (Sierritas, Papago, Twin Buttes) district.—Approximately 99,100 tons of ore were treated in 1945 in the 400-ton flotation mill of the Eagle-Picher Mining & Smelting Co. near Sahuarita. Of this total, 39,816 tons averaging 3.81 ounces of silver to the ton and 0.83 percent copper, 6.07 percent lead, and 12.07 percent zinc came from the

San Xavier group at Sahuarita operated by the Eagle-Picher Mining & Smelting Co.; 49,598 tons were zinc-lead ore from the Copper Queen mine of the Phelps Dodge Corp. at Bisbee, and 9,698 tons were various classes of ore from custom shippers. The San Xavier mine also produced 456 tons of lead ore, which was shipped direct to the smelter at El Paso, Tex. The remainder of the district output was 2,603 tons of zinc ore produced from the Contention and San Xavier Extension mines and treated in the Eagle-Picher mill.

Roskruge and Waterman (Silver Hill) district.—During the first 6 months of 1945 the old Silver Hill mine was operated by A. R. Byrd, Jr., and the last 6 months by the Arizona Copper Bell Mining Co.; a total of 5,655 tons of copper-silver ore was shipped to smelters in Arizona and Texas.

Silver Bell district.—Byrd & Dillard operated the Arizona-Indiana mine a few months in 1945 and shipped 366 tons of silver-lead ore to the smelter at El Paso. The rest of the district output was 207 tons of copper ore shipped from the old Silver Bell mine 40 miles northwest of Tucson.

PINAL COUNTY

Bunker Hill district (Copper Creek).—The only output in the Bunker Hill district in 1945 was 58 tons of copper ore produced from the Magma Chief mine near Sombrero Butte.

Martinez Canyon district.—A total of 555 tons of lead ore was produced in 1945 from the Silver Bell-Martinez group by the California Steel Products Co.; 340 tons were treated in the company 50-ton gravity-concentration mill, and 215 tons were shipped direct to a smelter.

Mineral Creek district (Ray).—Difficulty in obtaining a sufficient supply of underground miners at the Ray property of the Kennecott Copper Corp. resulted in a further drop in output of copper ore; in 1945 the output was 1,366,473 tons compared with 1,893,683 tons in 1944. The crude ore, averaging 1.277 percent copper, was hauled by rail 26 miles to the company 10,000-ton flotation mill at Hayden, where it was reduced to 62,947 tons of copper concentrate; the concentrate was smelted in the American Smelting & Refining Co. plant also at Hayden. In addition, 6,082 tons of copper precipitates were shipped to the Kennecott Copper Corp. smelter at Hurley, N. Mex. The rest of the district output was 7,798 tons of oxide copper ore produced from an open pit at the Copper Butte property and shipped direct to the smelter at Hayden.

Mineral Hill district.—W. O. Kay developed the Sunset property near Price throughout the year and shipped 55 tons of copper ore to a smelter; 43 tons of similar ore was produced from the Blackwater claim.

Old Hat district (Oracle).—The Mammoth-St. Anthony property at Tiger, one of the most important producers of zinc-lead ore in Arizona, was operated continuously in 1945 by the Mammoth-St. Anthony, Ltd. During the year the company treated 76,075 tons of ore, averaging 0.01 ounce of gold and 1.50 ounces of silver to the ton, 0.69 percent copper, 7.73 percent lead, and 9.11 percent zinc, in its 350-ton combined gravity and flotation mill. The lead concentrate (7,721 tons) and the zinc concentrate (10,144 tons) were shipped to smelters in

Texas. The property ranked second in production of lead in Arizona in 1945 and third in zinc. Three tons of gold ore produced from the Last Chance claim were treated by amalgamation. No ore was produced in 1945 from the San Manuel property south of Tiger, owned by the Magma Copper Co., but according to the company annual report for 1945, exploration of the property continued throughout the year; 38 churn-drill holes have been completed, and drilling is continuing on 7 others. A total of 39,311 feet has been drilled, and mineralization has been proved in an area 1,000 feet wide by 4,000 feet long, with the 2 ends and 1 side still open for extension. An estimate of tonnage and grade of ore based on drill-hole data without adding anything for extensions beyond boundaries as defined by completed holes shows a total of 83,900,000 tons of mixed oxide and sulfide ore averaging 0.79 percent copper and containing small (undetermined) quantities of gold, silver, and molybdenum.

Pioneer district (*Superior*).—Mining operations at the Magma mine, one of the most important producers of gold, silver, copper, and zinc in Arizona, were seriously affected in 1945 by the shortage of underground labor; the output of copper ore and zinc-copper ore dropped from 305,262 tons in 1944 to 177,712 tons in 1945. The labor shortage became so acute that the company ceased production of zinc-copper ore in July. During the year 106,249 tons of copper ore and 45,749 tons of zinc-copper ore were treated in the company 850-ton concentrator, and 25,714 tons of crude copper ore along with 34,498 tons of copper concentrates recovered from copper ore and 3,422 tons of copper concentrates recovered from zinc-copper ore were sent to the company 450-ton smelter at Superior. The zinc concentrates (5,140 tons) were shipped to Amarillo, Tex.

According to the company printed annual report for 1945, the net metal produced from Magma ore and concentrates was 5,406 ounces of gold, 210,228 ounces of silver, 16,791,415 pounds of copper, and 4,337,864 pounds of zinc. The average net cost of producing copper after deduction of gold, silver, and zinc concentrate values was 13.70 cents a pound in 1945 compared with 12.48 cents in 1944. The increased cost resulted largely from a decreased production of gold, silver, copper, and zinc. The labor situation in 1945 was worse than in 1944; the number of men on the underground pay roll reached a low point in the third quarter of the year, being less than one-half the number required for necessary development and full production. Available labor has improved as compared with the low point, but the pay roll still had fewer men at the beginning of 1946 than at the beginning of 1945; however, the mine was operated continuously throughout the year. Copper ore was mined between the 4,000 level and the 3,400 level; the bulk of the tonnage came from the 4,000- and 3,800-level stopes. Remnants of ore were removed above the 3,600 level, and at the end of the year all known ore above the 3,600 level on the west side of the mine had been removed. Zinc-copper ore was mined from the 2,250 level to the 1,500 level on the east side of the mine from January 1 to July 3, when operations ceased because it was more economical to put all of the available men on copper production than to divide them between copper and zinc stopes. Plans are under way and designing has begun for a new crushing plant and mill to replace the one now in use. The present mill is obsolete, and deterioration has progressed so far that replacement is necessary. Development in 1945 comprised 1,156 feet of raising, 784 feet of drifting, and 302 feet of crosscutting.

The remainder of the district output was principally 1,758 tons of siliceous silver ore produced from the Reymert mine by Reymert Lease and shipped to the Magma smelter.

Summit district.—Lessees continued operating the American mine 12 miles west of Miami and shipped 360 tons of copper ore to the Magma smelter at Superior.

SANTA CRUZ COUNTY

Harshaw district.—As usual the most important output in the Harshaw district in 1945 was zinc-lead-silver ore produced from the Trench-Flux-January groups, 12 miles south of Patagonia, by the American Smelting & Refining Co.; however, the output of ore was less than in 1944. The company reported that 44,437 tons of zinc-lead-silver ore produced from the Trench-Flux-January groups and 9,711 tons of zinc-lead-copper ore received from custom shippers in the Patagonia district were treated in its 200-ton flotation mill. The total ore yielded 2,692 tons of lead-copper concentrates and 4,769 tons of zinc concentrates. The rest of the district output was 110 tons of oxide silver-lead ore produced from the Hardshell mine by the American Smelting & Refining Co.

Oro Blanco district (Ruby).—Hugo W. Miller operated under lease the Montana mine near Ruby throughout the year, shipped 223 tons of silver-lead ore to the smelter at El Paso, and hauled 191 tons of zinc-lead ore to a custom mill near Sahuarita.

Palmetto district.—In 1945, as in 1944, the output of the Palmetto district was all sulfide copper ore (5,251 tons) produced from the old Three "R" mine near Patagonia by Pierce & Bird and shipped direct to the smelter at El Paso.

Patagonia (Duquesne) district.—A total of 10,019 tons of ore was produced from 5 mines in the Patagonia district in 1945; 9,711 tons of it were zinc-lead-copper ore produced from the Duquesne and Pride of the West properties and treated by flotation in the Trench mill near Patagonia, owned by the American Smelting & Refining Co. The Duquesne property was operated by A. R. Byrd, Jr., and the Pride of the West mine by the Humphrey Mining Co.; the latter mine was sold late in the year to C. O. Byrd. The rest of the district output was 308 tons of copper ore shipped direct to a smelter from the Arizona, Buena Vista, and Line Boy properties.

Tyndall district.—Lessees operated the Jefferson and Royal Blue mines in 1945 and produced a total of 1,673 tons of ore; 1,068 tons were lead ore from the Jefferson mine, and 410 tons were zinc-lead-copper ore and 195 tons copper ore from the Royal Blue mine. Gold-silver ore (4 tons) was produced from the Riggs claim.

YAVAPAI COUNTY

Agua Fria district.—In 1945, as in 1944, all the output in the Agua Fria district was high-silica copper ore shipped direct to a smelter; 3,062 tons were produced from the Binghampton mine 6 miles east of Mayer, 3,159 tons from the Stoddard mine, and 185 tons from the Yaller Kid claim.

Big Bug district.—In 1945 the Big Bug district ranked second in zinc production in the State and fourth in gold, silver, and lead production. The Iron King mine of the Shattuck Denn Mining Corp. was by far the principal producer; it was operated continuously throughout the year, and 116,486 tons of zinc-lead-iron ore (98,988 tons in 1944) were treated in the company 375-ton flotation mill. In addition, 800 tons of siliceous gold-silver ore were shipped direct to a smelter. The mill treated a total of 120,211 tons of ore (including 3,725 tons of custom ores) in 1945, which yielded 7,436 tons of lead concentrate, 12,546 tons of zinc concentrate, and 4,852 tons of iron concentrate. According to the annual report of the Shattuck Denn Mining Corp. for 1945, underground mine developments at the Iron King property were favorable, and ore reserves were well-maintained in both quantity and grade. The rest of the district lode output was 12,000 tons of old copper tailings from the Humboldt tailing dump treated by flotation, 1,146 tons of copper ore from the Blue Bell mine shipped to the smelter at Clarkdale, 972 tons of zinc-lead-copper ore from the Hackberry mine treated in the Iron King custom mill, and 20 tons of gold-lead ore produced from the Snow Drift claim. The placer output was 492 ounces of gold and 45 ounces of silver; nearly all of it was recovered by sluicing at the Standard claim near Mayer.

Black Canyon district.—The output of the Black Canyon district in 1945 comprised 87 tons of gold ore produced from the Golden Turkey, Hooping Dasher, and Mineral Hill properties, 71 tons of zinc ore from the French Lilly mine, 13 tons of silver-lead ore from the Silver Cord mine, 10 tons of gold-silver ore from the Golden Belt mine, and 7 tons of silver ore from the Thunderbolt mine.

Bullard (*Pierce*) *district*.—Mining of siliceous gold-copper ore at the Bullard mine near Aguila was carried on only 1 month (January) in 1945, resulting in a marked decrease in the district production of gold, silver, and copper.

Cherry Creek district.—The Volcano mine was operated a short time in 1945, and 14 tons of siliceous gold ore were shipped to a smelter.

Copper Basin district.—Approximately 12,515 tons of ore were produced in the Copper Basin district in 1945 compared with 15,638 tons in 1944; 9,842 tons were low-grade siliceous copper ore shipped direct to a smelter from the Commercial mine near Skull Valley, and 2,673 tons were zinc ore from the Boston-Arizona mine hauled to the Iron King flotation mill at Humboldt for treatment.

Eureka district (*Bagdad*).—Copper ore mined from the Bagdad property of the Bagdad Copper Corp. continued to be the most important production in the Eureka district. The company reported that 618,766 tons of ore, averaging 0.915 percent copper to the ton, were treated in 1945 in its 2,500-ton flotation plant and that 11,337 tons of copper concentrates were shipped to the smelter at El Paso. In addition, 2,371 tons of copper ore were shipped direct to a smelter, and 13 tons of molybdenum concentrates were produced. The remainder of the district output was principally 1,953 tons of zinc oxide ore and 199 tons of zinc-lead sulfide ore shipped to various reduction works in Utah and Nevada from the Copper King mine, 935 tons of gold-silver ore shipped direct to a smelter from the Hillside mine, and 775 tons of copper ore shipped to a smelter from the Eureka mine.

Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) district.—Small lots of ore and 3 ounces of placer gold were produced from various claims in the Hassayampa district in 1945. The largest output was 41 tons of gold ore from the Sacramento claim.

Pine Grove district (Crown King).—About 850 tons of gold ore, containing some silver, copper, lead, and zinc, were produced in 1945 from the Gladiator-War Eagle group near Crown King by the Gladiator Mining Co. Most (750 tons) of the ore was treated in a 50-ton flotation mill, and the remainder was shipped direct to a smelter. The rest of the district output was mainly 339 tons of copper ore produced from the Springfield mine. The Western Gold Mines, Inc., did considerable work in 1945 in cleaning out the old 1,300-foot tunnel at the Wildflower mine, erecting new mine surface plants, and reconditioning the 75-ton flotation mill; however, no ore was treated during the year.

Squaw Peak district.—Copper-molybdenum ore (145 tons) was produced from the Squaw Peak mine in 1945 and treated in a 10-ton pilot flotation mill, which yielded 10 tons of copper concentrate and 2 tons of molybdenum concentrate.

Tiger district.—Lessees continued to operate the Pilgrim claim near Crown King and shipped 266 tons of rich gold ore to the smelter at Clarkdale. Gold ore (41 tons) was shipped also from the old Boaz mine.

Verde district (Jerome).—The United Verde mine, one of the most important producers of gold, silver, and copper in Arizona, was operated continuously in 1945 by the Phelps Dodge Corp.; however, the output of copper ore declined from 503,620 tons in 1944 to 377,217 tons in 1945. Of the ore mined in 1945 from the property, 202,288 tons were siliceous copper ore shipped to the corporation smelter at Clarkdale, and 174,929 tons were similar ore treated in the corporation 2,100-ton concentrator. In addition, 278 tons of copper precipitates were shipped to the smelter.

According to the annual report of the corporation for 1945, continued depletion of the underground ore reserves caused a marked decline in the rate of copper production. Stoping operations, which were on a reduced scale, were confined to the lower levels of the mine. Exploration and development totaled 23,680 feet, comprising 600 feet of drifting, 536 feet of raising, 130 feet of calyx drilling, and 22,414 feet of diamond drilling. Of the total footage driven, 85 feet of drifting and 19,835 feet of diamond drilling were for the purpose of exploring the deep levels of the mine off the No. 8 shaft; however, no important additions were made to the ore reserves.

The rest of the district output was 14,433 tons of siliceous copper ore shipped to the smelter at Clarkdale from the Dundee-Arizona, Florentia, and Verde properties and 645 tons of siliceous gold-silver ore shipped to a smelter from the Iron King-Equator group. Leasing operations at the latter property ceased in March, resulting from the exhaustion of all known ore.

Walker district.—Lessees operated the Alturas, Alturas Extension, Emma, and Hot Spot properties in 1945 and shipped a total of 110 tons of rich gold-lead ore to a smelter. The remainder of the district output was principally 54 tons of zinc-lead ore produced from the New Strike mine.

Weaver district (*Octave*).—The output of the Weaver district in 1945 comprised 147 tons of gold ore shipped from the Octave waste dump, 8 tons of old tailings (gold) shipped from the Monica dump, 1 ton of gold ore produced from the Piper claim, and 5 ounces of placer gold recovered from gravel at Rich Hill.

White Picacho district.—Three properties in the White Picacho district in Yavapai County produced a total of 155 tons of ore in 1945; 119 tons were gold ore shipped to a smelter from the Robertson and Young properties, and 36 tons were silver-lead ore produced from the Independence mine.

YUMA COUNTY

Castle Dome district.—The Arizona Lead Co. mined about 12,250 tons of oxidized lead ore from the De Luce group in 1945. Of the total ore mined, 12,200 tons were treated in the company 150-ton mill, equipped with jigs and tables, and 50 tons were shipped to a smelter at El Paso. The milling ore yielded 794 tons of concentrate containing 2 ounces of gold, 14,769 ounces of silver, 813,846 pounds of lead, and a little copper. The company suspended mining lead ore in December and began a diamond-drilling program to investigate gold-bearing ore bodies. The rest of the district output was all lead ore (511 tons) produced mainly from the Sonora mine.

Cienega district.—Three mines in the Cienega district produced a total of 174 tons of ore in 1945. Nearly all (169 tons) of it was highly siliceous gold-copper ore produced from the Empire-Arizona property, 12 miles east of Parker, by Strategic Metal Mines.

Ellsworth (*Harqua Hala*) *district.*—The Liberator Mines Co. continued in 1945 to mine low-grade gold-copper ore from the Yuma Copper mine near Vicksburg; 3,617 tons of ore, containing 109 ounces of gold, 990 ounces of silver, and 125,855 pounds of copper, were shipped to smelters in Arizona.

Plomosa district.—A total of 447 tons of ore was produced in the Plomosa district in 1945; most of it (428 tons) was siliceous silver ore shipped to a smelter by lessees working the R. & A. mine.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN CALIFORNIA

(MINE REPORT)

By Alfred L. Ransome and Burton H. Marliave

SUMMARY OUTLINE

SUMMARY

California gold production in 1945 was 26 percent above the record low level of 1944, an increase for the first year since 1940. Silver production was 27 percent higher than in 1944, making 1945 the second year of increase. Lead production was the largest in quantity and value since the record output of 1917; and zinc was the largest in quantity since 1926 and in value in the history of mining in California. Copper production, on the other hand, dropped 49 percent below the 1944 output, and for this reason the total value of the five metals ($11,152,081) increased only 2 percent above 1944. The upward trend in gold was largely the result of termination of War Production Board Limitation Order L–208 on July 1, 1945, the immediate effect of which was an accelerated output from placer-mining operations. The increase in production of silver, lead, and zinc and the marked decline in copper were largely the result of the activity of a few mines and did not reflect a general change in the industry. A continuation of higher wages, rising prices of supplies and equipment and difficulties of obtaining them, high taxes, the fixed prices for gold and silver, and the countrywide economic uncertainty following the end of the war were factors that prevented a more widespread recovery of mining in California, particularly with regard to gold.

Comparing 1945 with 1944, gold increased 26 percent and silver 27 percent both in quantity and value; copper decreased 49 percent both in quantity and value; lead increased 27 percent in quantity and 37 percent in value; and zinc increased 17 percent in quantity and 18 percent in value. The total value of the five metals was 2 percent more than in 1944; of the total value, gold represented 47 percent, zinc 20 percent, copper 16 percent, lead 11 percent, and silver 6 percent.

The counties of the State, arranged by value of the five metals, were in decidedly different order in 1945 from 1944 and other recent years; 1945 was the beginning of a transition period from wartime emphasis on base-metal output that raised certain counties to leadership, back to a peacetime basis, which includes the unrestricted production of gold. In earlier years the counties at the top of the list were invariably big gold producers, and in 1945 the influence of increased gold output was already beginning to show. Inyo County, second on the list in 1944, first in 1943, and seventh in 1942, was the leader again in 1945 owing almost entirely to lead production, which represented over one-half the total value of its metal output; the greater portion of lead as well as substantial quantities of silver, copper, and zinc came from the Darwin group of mines, Coso district. Shasta County, sixth on the list in 1944, was second in 1945. Production of copper and zinc ores was higher, and the output of copper and zinc in relation to that in other counties was greater by virtue of shut-downs of large copper and zinc mines elsewhere. Nevada County, third on the list in 1945 (ninth in 1944), was well on its way to regaining the leading position held in 1942, largely from an increase in output of gold ore. Sacramento County was fourth on the list in 1945, an advance from seventh place in 1944 owing entirely to the expansion of connected-bucket dredging operations. Calaveras County, fourth on the list in 1944, dropped back to fifth place in 1945; operations along the Mother Lode and in the East Belt remained suspended, and termination of activity at the Keystone copper mine, Copperopolis district, in July offset the gain in output of zinc and copper from the Eagle Shawmut Mine's Penn mine, Campo Seco district. Other counties of the leading 10, listed in order of total value of output, were: Yuba County (largely from connected-bucket dredging), Mariposa County (largely from zinc ore), Butte County (largely from zinc ore), Siskiyou County (largely from copper from the Gray Eagle Copper Co. Dakin mine, Klamath River district, which shut down in June), and Stanislaus County (entirely from connected-bucket dredging). Of the 29 counties producing, these 10 furnished 88 percent of the total value of the five metals produced in the State during the year.

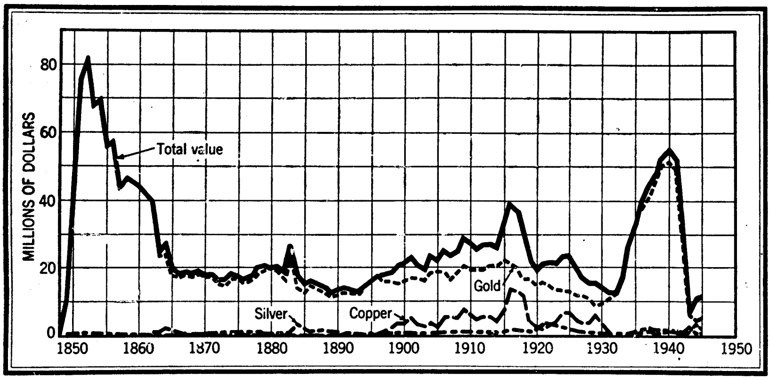

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in California, 1848–1945. The value of lead and zinc has exceeded $1,000,000 in only a few years.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of god, silver, copper, lead, and zinc in California, 1941–45, and total, 1848–1945, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	835	724	4,280,185	1,408,793	$49,307,755	2,154,188	$1,531,867

1848–1945 [1]			(8)	65,263,022	1,419,943,416	(8)

[1] For historic data by years see Minerals Yearbook, Review of 1940, p. 219.
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Includes all placer operations using suction pump for delivering gravel to floating washing plant except those producing less than 100 ounces of gold which are included under "Small-scale hand methods."
[4] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[5] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[6] From property not classed as a "mine."
[7] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.
[8] Complete data not available.

Gold.—An uninterrupted rise beginning in 1929 culminated in the production of $50,948,485 in gold in 1940, the largest value since 1856. In 1941, however, a reaction set in that gained headway in 1942. By January 1943, monthly production had sunk to 16,425 fine ounces, and until November 1945 it fluctuated between that figure and a low of 8,547 ounces established in February 1943. In 1945 the rescinding of WPB Limitation Order L–208 effective July 1 and the end of the Japanese phase of World War II on August 14 paved the way toward a marked increase in the production of gold. Monthly production in 1945, which remained within narrow limits during the first 8 months, showed an unmistakable trend upward commencing in September, and the monthly average for the year was 12,328 ounces compared with 9,781 ounces for 1944. The expected sharp gain did not materialize as rapidly as some had predicted owing to the many interrelated problems of reconversion plus the factors of rising costs, the difficulty of obtaining adequate labor and supplies, and the fixed price of gold. Placer mining accelerated rapidly, but lode gold mining, except for increased production at most properties already in operation, was slower in becoming reestablished, and many of the mines that were large producers before the war had not reopened by the end of 1945.

The monthly production figures since January 1937 through the war years have been discussed in detail in this chapter for 1944; however, because of the importance to the gold-mining industry of the termination of Order L–208, it is of interest to review briefly the course of gold production during the period centering about the months when the order was in effect. Monthly production of gold in California declined approximately 4 percent a month fairly regularly from January 1941 to May 1942, when the downward trend greatly accelerated and continued at about 16 percent a month to December 1942. Strangely, the period when WPB Order L–208 was becoming effective did not mark a substantial change in the trend. Apparently economic forces were curtailing gold production so rapidly in 1942 that exercise of Federal authority was not needed to accomplish a most drastic curtailment of gold mining in California.

Mine production of gold in California, 1937–45, by months, in fine ounces, in terms of recovered metal

Month	1937	1938	1939	1940	1941	1942	1943	1944	1945

[1] Not operated in 1944.

FIGURE 2.—Mine production of gold in California, 1937–45, by months, in terms of recovered gold.

The 25 leading gold-producing mines in California in 1945, listed in the foregoing table, yielded 92 percent of the total gold output of the State; the leading 5 mines produced 65 percent and the leading 10 mines 77 percent.

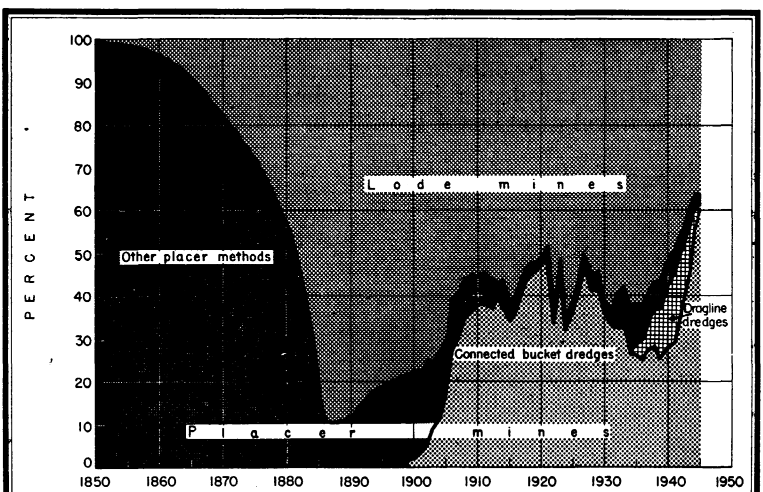

FIGURE 3.—Percentage of total California gold produced at lode and placer mines and by various method of placer mining, 1850–1945.

Silver.—Most of the silver output in California in 1945 was more localized than that of the gold; the 10 leading silver-producing mines listed in the following table yielded 95 percent of the State total recoverable silver in that year, and the 3 leading mines yielded 72 percent. Of the 10 leading silver-producing mines, 9 derived their silver from argentiferous base-metal ores and 1 from gold ore.

717372—47——18

Ten leading silver-producing mines in California in 1945, in order of output

Rank	Mine	District	County	Rank in 1944	Operator	Source of silver
1	Darwin group	Coso	Inyo	1	Darwin Mines (Arthur J. Theis, trustee) and Anaconda Mining Co.	Zinc-lead ore.
2	Blue Moon	Hunter Valley	Mariposa	2	Red Cloud Mines, Inc.	Zinc ore.
3	Hornet	Flat Creek	Shasta	4	The Mountain Copper Co., Ltd.	Zinc-copper.
4	Penn	Campo Seco	Calaveras	7	Eagle Shawmut Mine	Zinc ore.
5	Columbia No. 2	Resting Springs	Inyo	3	Shoshone Mines, Inc., and Finley Co.	Lead ore.
6	Modoc	Coso	do	(1)	L. D. Foreman & Co.	Do.
7	Mohawk	Clark Mountain.	San Bernardino.	17	Dunton-Ray & Greenwood	Zinc-lead ore.
8	Big Bend	Yankee Hill	Butte	14	Hoefling Bros	Zinc ore.
9	Newton	Ione	Amador	27	Winston Copper Co.	Copper ore.
10	Idaho Maryland and Brunswick.	Grass Valley-Nevada City.	Nevada	29	Idaho Maryland Mines Corporation.	Gold ore.

[1] Not operated in 1944.

Silver production by months in 1945, as presented in the following table, shows an uninterrupted but gradual decline during the first 6 months, a spurt upward in July followed by a drop to the low point of 49,695 fine ounces in August, and a subsequent rapid rise during the remaining 4 months. The entire background for the trends in production is closely allied to the operation of the Darwin group of mines, Coso district, Inyo County. Purchased by the Anaconda Copper Mining Co. August 1, the Darwin property was energetically developed; although production during August was low, the rapid increase in output is reflected in the unchecked rise in total production for the State during the last 4 months of 1945.

Mine production of silver, copper, lead, and zinc by months in 1945, in terms of recovered metal

Month	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	76,226	827	563	713
February	72,068	570	544	673
March	69,922	694	517	845
April	69,333	477	407	834
May	66,169	883	441	766
June	63,546	814	358	910
July	72,829	245	464	756
August	49,695	329	449	877
September	71,282	306	687	885
October	107,948	412	735	841
November	124,613	422	868	955
December	143,167	494	1,191	868
	986,798	6,473	7,224	9,923

Copper.—Copper production in California in 1945 dropped 49 percent below that for 1944 owing to the closing of two of the State's largest wartime copper producers, the Dakin or Gray Eagle mine (Gray Eagle Copper Co.), Klamath River district, Siskiyou County, and the Keystone mine (Keystone Copper Corp.), Copperopolis district, Calaveras County, after producing during the first half of 1945. The monthly copper-production figures given in the preceding table show an erratic fluctuation during the first half of 1945 followed by a marked drop in July, which reflects the shutdown of the two major producers. Although the trend was upward during the latter half of the year, output of copper did not recover, the monthly average production in the last half being only 52 percent of that for the first 6 months. The following eight properties (operators in parentheses), listed in order of output and each producing over 100,000 pounds, supplied 92 percent of the State total, and the first three 65 percent: Hornet mine, Flat Creek district, Shasta County (The Mountain Copper Co., Ltd.); Dakin mine, Klamath River district, Siskiyou County (Gray Eagle Copper Co.); Newton mine, Ione district, Amador County (Winston Copper Co.); Keystone mine, Copperopolis district, Calaveras County (Keystone Copper Corp.); Penn mine, Campo Seco district, Calaveras County (Eagle Shawmut Mine); Big Bend mine, Yankee Hill district, Butte County (Hoefling Bros.); Blue Moon mine, Hunter Valley district, Mariposa County (Red Cloud Mines, Inc.); and the Darwin group, Coso district, Inyo County (Darwin Mines and Anaconda Copper Mining Co., operating at different periods in 1945).

Lead.—Lead production in California in 1945 advanced 27 percent over 1944 and was the largest in quantity and value since the record output of 1917. A study of the monthly lead-production figures given in the preceding table shows a variable trend, the background for which is closely allied to operation of the Darwin group of mines explained in the paragraph on silver. The three leading producers contributed 88 percent of the State total in 1945. The following seven properties (operators in parentheses), listed in order of lead output and each producing over 100,000 pounds, furnished 97 percent of the State total: The Darwin group, Coso district, Inyo County (Darwin Mines and Anaconda Copper Mining Co., operating at different periods in 1945); Columbia No. 2 mine, Resting Springs district, Inyo County (Shoshone Mines, Inc., and Finley Co., operating at different periods in 1945); Modoc mine, Modoc district, Inyo County (L. D. Foreman & Co.); Mohawk mine, Clark Mountain district, San Bernardino County (Dunton-Ray & Greenwood); Blue Moon mine, Hunter Valley district, Mariposa County (Red Cloud Mines, Inc.); Penn mine, Campo Seco district, Calaveras County (Eagle Shawmut Mine); and Big Four mine, Wild Rose district, Inyo County (Silas Ness).

Zinc.—Zinc production in California in 1945 was 17 percent above that for 1944 and the largest in quantity since 1926 and in value in the history of mining in California. Most of the output came from mines brought into production since 1942. The following seven properties (operators in parentheses), listed in order of zinc output and each producing over 100,000 pounds in 1945, contributed 99 percent of the State total: Blue Moon mine, Hunter Valley district, Mariposa County (Red Cloud Mines, Inc.); Penn mine, Campo Seco district, Calaveras County (Eagle Shawmut Mine); Hornet mine, Flat Creek district, Shasta County (The Mountain Copper Co., Ltd.); Big Bend mine, Yankee Hill district, Butte County (Hoefling Bros.); the Darwin group, Coso district, Inyo County (Darwin Mines and Anaconda Copper Mining Co., operating at different periods in 1945); Mohawk mine, Clark Mountain district, San Bernardino County (Dunton-Ray

& Greenwood); and Afterthought mine, North Cow Creek district, Shasta County (Jordan & Glennan). Monthly production of zinc in 1945 was erratic, but an upward trend was discernible. Production reached the high point of 955 short tons in November but decreased in December. The decline can be attributed in part to permanent shutdown of the Blue Moon mine on November 15.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in California in 1945, by counties, in terms of recovered metals

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Output from property not classed as a "mine."

MINING INDUSTRY

The tonnage of material from lode mines in California treated in 1945 decreased 22 percent compared with 1944, but the yardage at placer mines increased 38 percent. The output of lode gold advanced 29 percent and placer gold 25 percent. Placer gold accounted for 63 percent of the total gold output of the State, compared with 64 percent in 1944. The decrease in base-metal ore production was greater than the increase in gold-ore output. The average recoverable gold content of gravels decreased 10 percent.

Dredges of the connected-bucket type washed 96 percent of the total gravel mined in the State in 1945 and recovered 94 percent of the total placer gold; the value and quantity of gold produced by connected-bucket dredges were the largest since 1942. Dragline dredges washed 1 percent of the total gravel mined and recovered 1 percent of the placer gold, the lowest point reached by dragline dredging in either yardage washed or gold recovered since 1933, the year in which the method was first used in California. All other placer-mining methods, except nonfloating washing plants, showed an increase in quantity of gold recovered; material handled was less in the cases of drift and small-scale hand methods. No Becker-Hopkins dredges or suction dredges have been reported in production since 1942. Nonfloating washing plants to which gravel was delivered by mechanical means (dragline excavators, power shovels, slackline excavators, trucks, and bulldozers) treated more gravel and recovered less gold than in 1944.

Hydraulic mining began to increase in 1945 following termination of WPB Order L–208, and gold production from small-scale hand methods showed an 8-percent increase. The number of drift mines operating in 1945 was the same as in 1944, but the quantity and value of the gold produced were greater.

Consumption of quicksilver at California placer mines that indicated the use of this metal totaled 2,123 pounds in 1945. The following quantities of gold were recovered to the pound of quicksilver used in 1945 (1944 figures in parentheses): Connected-bucket dredging, 42 ounces (63); dragline dredging, 5 ounces (46); nonfloating washing plants with mechanical gravel handling, 15 ounces (45); hydraulicking, 22 ounces (40); and small-scale hand operations, 5 ounces (9).

ORE CLASSIFICATION

Of the 717,969 tons of ore (including 220,303 tons of old tailings) sold or treated in 1945, 43 percent was copper, 24 percent gold, almost 16 percent zinc-copper, 8 percent zinc, almost 5 percent zinc-lead, and almost 4 percent lead. Gold-silver and silver ores comprised less than a third of 1 percent.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in California in 1945, with content in terms of recovered metals

[1] Includes 22,000 pounds from precipitates.
[2] Excludes tungsten ore.
[3] Includes metal recovered from tungsten ore.
[4] Includes 61,100 pounds from precipitates.

METALLURGIC INDUSTRY

During 1945, 67 percent of the total ore and old tailings handled was treated at concentrating mills, 23 percent was treated at amalgamation and cyanidation mills, and 10 percent was shipped for direct smelting. Smelters also received 55,838 tons of flotation concentrates and 14 tons of gravity concentrates from California mine operators. Comparing 1945 with 1944, material treated at cyanidation mills remained virtually unchanged, the quantity of material amalgamated increased 31 percent, and the quantity of crude ore and old tailings smelted increased 13 percent. The quantities of ore and old tailings concentrated decreased 35 percent.

Because of unusual conditions in the California gold industry in 1944 and 1945, quicksilver and cyanide consumption data at mills were not representative of the industry.

The Selby lead smelter of the American Smelting & Refining Co. was the only custom plant that treated gold, silver, copper, or lead ores in California in 1945. Some ore and concentrates were shipped to out-of-State custom mills and smelters, but most of the ore produced in the State was treated in company-owned metallurgical plants at the mines.

Mine production of metals in California in 1945, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated	Gold	Silver	Copper	Lead	Zinc

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 13 and their output included under "Other districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 980,748 ounces from lode mines and 6,050 ounces from placers.

[4] Output from property not classed as a "mine."

[5] Mother Lode district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[6] East Belt district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.

[7] West Belt district lies in Calaveras and Eldorado Counties.

[8] Included under "Other districts."

[9] Exclusive of lode output which is included under "Other districts."

[10] Randsburg district lies in Kern and San Bernardino Counties.

[11] Includes 22,000 pounds from precipitates.

[12] Exclusive of placer output which is included under "Other districts."

[13] Includes following: East Belt district (lode) in Eldorado County; Resting Springs district in Inyo County; Green Mountain district in Kern County; Snelling district in Merced County; French Corral and North Bloomfield districts in Nevada County; Butcher Ranch district in Placer County; Camanche district in San Joaquin County; French Gulch district (placer) and Igo district in Shasta County; Alleghany district (lode) and Downieville district in Sierra County; Callahan and Greenhorn districts, and Humbug district (lode), Klamath River district (placer), and Quartz Valley district, Siskiyou County; Salyer district, Trinity County; and Yuba River district, Yuba County.

AMADOR COUNTY

Ione district.—The Winston Copper Co. operated the Newton mine throughout 1945 and shipped 14,875 tons of copper smelting ore, from which 133 ounces of gold, 12,119 ounces of silver, and 1,653,800 pounds of copper were recovered.

Mother Lode district.—The Nevada Wabash Mining Co. operated the Nevada Wabash mine during part of 1945 and treated the ore by amalgamation. Tom Kloczko shipped old tailings from the Garibaldi Ranch mine to a smelter and recovered a small quantity of gold and silver. The Argonaut Mining Co., Ltd., recovered a small quantity of gold from a mill clean-up at the idle Argonaut mine.

BUTTE COUNTY

Butte Creek district.—The Wyoming mine operated during most of 1945, a small quantity of gold being recovered by amalgamation.

Oroville district.—The Yuba Consolidated Gold Fields placed in operation on October 6 its Butte unit, a connected-bucket electric dredge equipped with 84 9-cubic foot buckets; the unit was 1 of 4 dredges which closed down October 15, 1942. The Gold Hill Dredging Co. placed its Kister dredge in operation August 1 on the east side of the Feather River about 7 miles south of Oroville. The electrically operated dredge has 74 9-cubic foot buckets. The Morris Ravine Mining Co. produced 1,000 cubic yards of gravel at the Morris Ravine drift mine and recovered 430 ounces of gold and 40 ounces of silver.

Yankee Hill district.—Hoefling Bros. operated the Big Bend mine from January 1 to December 28, 1945, and trucked 10,580 tons of zinc ore to the Surcease mill; 751 tons of copper concentrate (containing 360 ounces of gold, 11,751 ounces of silver, 316,171 pounds of copper, 33,663 pounds of lead, and 227,920 pounds of zinc) and 2,564 tons of zinc concentrate (containing 180 ounces of gold, 7,000 ounces of silver, 120,080 pounds of copper, 16,820 pounds of lead, and 2,624,881 pounds of zinc) were recovered by flotation and shipped to smelters. The mine shut down on December 28.

CALAVERAS COUNTY

Campo Seco district.—Eagle Shawmut Mine operated the Penn mine throughout 1945 and shipped 27,895 tons of zinc ore to the company mill at the Eagle Shawmut mine near Jacksonville; 2,577 tons of copper concentrate (containing 1,871 ounces of gold, 41,814 ounces of silver, 1,208,025 pounds of copper, and 293,160 pounds of lead) and 4,702 tons of zinc concentrate (containing 286 ounces of gold, 20,086 ounces of silver, 29,881 pounds of copper, 42,777 pounds of lead, and 4,742,830 pounds of zinc) were recovered by flotation and shipped to smelters.

Copperopolis district.—The Keystone mine was operated during the first half of 1945 by the Keystone Copper Corp., the Corporation ranked third as a producer of copper in the State in 1945. The Pacific Mining Co. operated a flotation plant on old tailings at the Union mine during the first half of 1945.

Jenny Lind district.—Allen W. Doe, lessee, amalgamated gold ore produced at the Royal mine.

Mother Lode district.—A small quantity of gold was recovered at the Calaveras Crystal drift mine on McSorley's Ranch.

West Belt district.—G. Ivan Smith worked the Quail Hill mine for a short period in 1945; zinc ore was shipped to a concentrator smelter.

ELDORADO COUNTY

Cosumnes River district.—Hoosier Gulch Placers operated a dragline dredge (boat No. 2) from October 17 to December 6, 1945. The operation ranked first among placers and second in total production of gold in the county.

East Belt district.—E. C. Ogle operated the Cooley drift mine northeast of Georgetown and recovered 10 ounces of gold from 500 cubic yards of gravel. Cosumnes Mines, Inc., operated the Cosumnes mine at Grizzley Flat during the last 5 months of 1945 under a program of rehabilitation and produced flotation gold concentrates which were shipped to a smelter. Columbus Sciaroni operated the Mount Hope mine and recovered 17 ounces of gold and 8 ounces of silver by amalgamation.

Mother Lode district.—Pioneer-Lilyanna Mines completed a 250-ton flotation mill in 1945 and produced 207 tons of copper concentrate (containing 80 ounces of gold, 990 ounces of silver, and 98,300 pounds of copper) from copper ore obtained as the result of development work; the concentrate was shipped to a smelter. A. L. McGuire conducted placer operations at Bacchi Ranch from August 1 to December 31, 1945.

FRESNO COUNTY

Friant district.—The Grant Service Rock Co., Consolidated, recovered 117 ounces of gold and 17 ounces of silver as a byproduct from preparing 178,967 tons of sand and gravel at its commercial gravel plant at Ball Ranch on the San Joaquin River.

HUMBOLDT COUNTY

Orleans district.—The Pearch hydraulic mine operated during the first 3 months of 1945; 12,000 cubic yards of material handled yielded 47 ounces of gold and 7 ounces of silver. A small dragline operating at the Red Cap mine from January 15 to March 1, 1945, recovered a few ounces of gold.

INYO COUNTY

Cerro Gordo district.—L. D. Foreman & Co. shipped material to a smelter from the Cerro Gordo old slag dump.

Coso district.—The Darwin group of mines, which includes the Defiance, Independence, Essex, Thompson, Lucky Jim, Lane, Promontory, and Columbia claims, was operated by Darwin Mines (Arthur J. Theis, trustee) from January 1 through July 31, 1945. On August 1 the Anaconda Copper Mining Co. purchased the property and for the remaining 5 months of the year production proceeded at an increasing rate. A total of 6,564 tons of zinc-lead ore was treated in the 125-ton bulk flotation mill on the property, and 409 tons of lead concentrate (containing 13 ounces of gold, 15,099 ounces of silver, 3,419 pounds of copper, 357,437 pounds of lead, and 81,724 pounds of zinc) and 951 tons of zinc concentrate (containing 13 ounces of gold, 10,726 ounces of silver, 7,434 pounds of copper, 122,097 pounds of lead, and 949,533 pounds of zinc) were shipped to smelters. In addition, 20,177 tons of zinc-lead ore containing 351 ounces of gold, 504,002 ounces of silver, 119,152 pounds of copper, 8,425,070 pounds of lead, and 1,383,815 pounds of zinc were shipped for direct smelting. L. D. Foreman & Co. shipped material to a smelter from the Last Chance old slag dump.

Modoc district.—L. D. Foreman & Co. shipped lead ore and old slag to a smelter from the Modoc property.

Resting Springs district.—The Columbia No. 2 mine was operated throughout 1945—January through May by Shoshone Mines, Inc., and June through December by the Finley Co.; lead ore was shipped to a smelter.

Slate Range district.—Damon & Damon worked the Gold Bottom and Ophir mines throughout 1945; 202 tons of lead ore (containing 22 ounces of gold, 365 ounces of silver, 871 pounds of copper, 34,228 pounds of lead, and 17,582 pounds of zinc) and 451 tons of gold-silver old tailings (containing 25 ounces of gold, 604 ounces of silver, 3,483 pounds of copper, and 26,669 pounds of lead) were shipped to smelters. The moving of the 150-ton concentration and flotation mill of the Mineral Reduction Co. from Benton Station and its reconstruction at the Ophir mine was completed in 1945; 2,000 tons of lead ore were milled, and the resulting 72 tons of lead concentrate (containing 88 ounces of gold, 1,160 ounces of silver, 1,341 pounds of copper, 35,371 pounds of lead, and 5,266 pounds of zinc) were shipped to a smelter.

Union district.—T. L. Bright shipped lead ore to a smelter from the Reward (Brown Monster) mine.

Wild Rose district.—Silas Ness shipped zinc-lead ore from the Big Four mine to a smelter.

KERN COUNTY

China Grade district.—The Kern Rock Co. recovered 330 ounces of gold and 59 ounces of silver as byproducts from its gravel-washing operation on Cottonwood creek.

Green Mountain district.—Mattie Moreland amalgamated ore from the Lone Star mine during an operating period from May to November 1945.

Mojave district.—Burton Bros., Inc., cyanided 1,800 tons of gold ore from the Tropico mine during the last 4 months of 1945 and recovered 223 ounces of gold and 208 ounces of silver.

Randsburg district.—The Butte Lode Mining Co. treated 1,568 tons of gold ore and 368 tons of old tailings by amalgamation and cyanidation and recovered 176 ounces of gold and 54 ounces of silver. Max Hess recovered a few ounces of gold by amalgamating 100 tons of ore from the Marie Rose group of claims during a short operating period in December. E. B. Atkinson did development work at the Sunshine mine during a 3-month period in 1945; and gold and silver were recovered by amalgamation from a small tonnage of gold ore produced.

717372—47——19

LOS ANGELES COUNTY

San Gabriel district.—The Consolidated Rock Products Co. recovered gold and silver as byproducts from the Largo No. 10 gravel-washing plant operated for the production of crushed rock, sand, and gravel for concrete aggregate.

MADERA COUNTY

Daulton district.—Ace H. Alexander, lessee, recovered copper cement from mine water pumped from the Daulton mine during 1945.

MARIPOSA COUNTY

East Belt district.—Schroeder, Odgers, & Schroeder worked the Schroeder group from January 1 to August 15, 1945, and amalgamated 84 tons of ore, from which 302 ounces of gold and 38 ounces of silver were recovered.

Hunter Valley district.—L. M. Brady, lessee, worked the B. A. B. mine during a short period in 1945 and shipped gold-silver ore to a smelter. Red Cloud Mines, Inc., an operating subsidiary of the Hecla Mining Co. of Wallace, Idaho, worked the Blue Moon mine from January 1 to November 15, 1945, on which date a major cave-in in the mine resulted in operations being closed down. During the period of operation, 21,389 tons of zinc ore treated in the company 200-ton flotation mill yielded 488 tons of copper-lead concentrate (containing 738 ounces of gold, 55,651 ounces of silver, 144,444 pounds of copper, 199,613 pounds of lead, and 156,389 pounds of zinc) and 6,153 tons of zinc concentrate (containing 815 ounces of gold, 39,741 ounces of silver, 74,692 pounds of copper, 42,484 pounds of lead, and 6,756,451 pounds of zinc), which were shipped to smelters. Roy F. Hollis recovered 9 ounces of gold and 5 ounces of silver from a 3-week clean-up of old mining equipment at the Jenny Lind mine. The Mount Gaines Mining Co. operated the Mount Gaines mine throughout the year and amalgamated 2,037 tons of ore from which were recovered bullion containing 951 ounces of gold and 285 ounces of silver and 38 tons of flotation concentrate containing 417 ounces of gold, 140 ounces of silver, and 400 pounds of lead.

Mother Lode district.—The A. J. Lode, Lucky Boy, and Specimen mines were worked during relatively short periods in 1945, small quantities of gold being recovered by amalgamation at each property.

MERCED COUNTY

Snelling district.—The Merced Dredging Co. resumed operation of its connected-bucket dredge with 60 9½-cubic-foot buckets on Merced River ¾ mile south of Snelling on July 15. The unit had been inoperative since October 13, 1942, as the result of WPB Limitation Order L–208. Dredging was halted on September 13, owing to an antidredging ordnance passed by the county board of supervisors; injunction proceedings by the company against the resoiling ordnance were taken, but the case had not had a court hearing by December 31. The Merced Sand & Gravel Co. recovered a small quantity of gold as a byproduct of its gravel-washing operation on the Merced River.

MODOC COUNTY

High Grade district.—Ed Benefiel worked the Klondyke mine for a short period late in 1945 and shipped a small quantity of gold ore to a smelter.

NEVADA COUNTY

Grass Valley-Nevada City district.—The Empire Star Mines Co., Ltd., operated the Empire Star group throughout 1945, and the Idaho Maryland Mines Corp. operated the Idaho Maryland and Brunswick properties all year. Both companies had been operating under a limited employment grant by the WPB since March 1944, and production had been curtailed far below that of prewar years. The expected increase in output following the end of WPB Limitation Order L–208 on July 1, 1945, failed to materialize, owing to the difficulty of obtaining labor. Ore from the Empire Star group was treated by amalgamation and cyanidation. Gold and silver from the Idaho Maryland and Brunswick properties was recovered by amalgamation, with subsequent cyanidation of concentrates produced from a 600-ton flotation plant. Jordan & Glennan shipped old tailings from an old chlorination plant near Nevada City; a substantial quantity of gold and silver was recovered.

Washington district.—The Ancho-Erie Mining Co., taking advantage of the end of WPB Limitation Order L–208, commenced operation of the Ancho and Erie groups on July 2, 1945, and produced continuously for the remainder of the year; 7,010 tons of gold ore were milled, from which 1,227 ounces of gold and 129 ounces of silver were recovered by amalgamation. In addition, 696 ounces of gold and 65 ounces of silver were recovered from 84 tons of flotation concentrates produced at the company 100-ton plant and shipped to the Empire Star plant at Grass Valley for treatment by cyanidation.

ORANGE COUNTY

Santa Rosa district.—The Blue Light Silver Mines Co. worked the Silverado mine throughout 1945 on a small scale; work was confined mostly to development. Zinc ore (145 tons) containing 15 ounces of gold, 2,928 ounces of silver, 696 pounds of copper, 9,076 pounds of lead, and 36,173 pounds of zinc was shipped to a concentrator smelter.

PLACER COUNTY

Butcher Ranch district.—The Golden Feather Dredging Co. operated an electric dragline excavator equipped with a 5-cubic yard bucket on the Middle Fork of the American River, about 8 miles northeast of Auburn, from September 9 through December 31, 1945. The equipment had been moved from its former location on the Feather River Channel at Oroville, Butte County, in 1944.

Iowa Hill district.—The Drummond Mining Co. worked the Drummond mine from January 1 to December 15, 1945. From the operation, which was limited largely to rehabilitation and development work, 166 tons of gold ore were produced from which 53 ounces of gold and 14 ounces of silver were recovered by amalgamation.

Last Chance district.—The Red Star Mining Co. operated the Red Star hydraulic mine at intervals during the first half of 1945.

SACRAMENTO COUNTY

Folsom district.—Recovery of gold as a byproduct of gravel-washing operations was reported by C. M. Craig at the Brighton Sand & Gravel, De Paso Rock Products, and Perkins Gravel plants and by the Fair Oaks Gravel Co. at its plant on the American River. At the last-named operation 199 ounces of gold and 15 ounces of silver were produced from 48,664 cubic yards of material handled. The Capital Dredging Co. resumed operation of its connected bucket electric dredge, equipped with 100 18-cubic foot buckets, on ground 5 miles south of Folsom on October 8, 1945; the dredge was one of two which ceased operation October 15, 1942, in compliance with WPB Limitation Order L–208. The Lancha Plana Gold Dredging Co. placed in operation its connected-bucket dredge No. 4 on the American River October 22. By December 31, 1945, the Natomas Co. had resumed operation of five of its fleet of seven electric connected-bucket dredges at and near Natoma. Two of the units worked throughout the year; and one was placed in operation August 28, one on October 9, and one on December 10. The number and size of buckets for all seven dredges in the fleet are: No. 1, 62 16-cubic foot; No. 4, 67 15-cubic foot; No. 5, 105 12-cubic foot; No. 6, 106 11-cubic foot; No. 7, 98 9-cubic foot; No. 8, 105 11-cubic foot; and No. 10, 83 15-cubic foot. All seven dredges were in operation until October 15, 1942.

SAN BERNARDINO COUNTY

Buckeye district.—Donald F. Love, lessee, shipped gold ore from the Roosevelt mine to smelters.

Calico district.—Zinc-lead ore was shipped to a smelter from the Burcham mine in 1945, and the New Sutherland Divide Mining Co. shipped lead ore from the New Sutherland Divide mine to a smelter.

Cima district.—Willis Loveless shipped copper ore from the New Trail mine to a smelter as the result of operations from May through July.

Clark Mountain district.—Dunton-Ray & Greenwood worked the Mohawk mine and shipped zinc-lead ore to a smelter.

Exchequer district.—The Dutch Oven Mining Co. worked the Von Trigger mine during a short period in the first half of 1945 and shipped gold ore to smelters.

Ivanpah district.—Edward Johnson shipped lead ore to a smelter from the Albermarle mine. James E. Boland shipped gold ore from the Beverley Glenn mine and zinc-lead ore from the Lady Luck mine to smelters.

New York Mountains district.—The California Sulphur Co. produced silver ore at the Sagamore mine.

Randsburg district.—Hoefling Bros. recovered 71 ounces of gold and 14 ounces of silver as the byproduct of a placer operation carried on during 1945, principally for scheelite, at the Spud Patch mine.

SAN JOAQUIN COUNTY

Comanche district.—The Gold Hill Dredging Co. operated its Lower Comanche connected-bucket dredge along the Mokelumne River throughout 1945; the dredge, which had 87 8½-cubic-foot buckets, was operated before July 1, 1945, under a special grant from the WPB, which permitted the company to operate one dredge. On November 21, 1945, the company placed its Upper Comanche connected-bucket dredge in operation. This electric dredge was equipped with 66 7¾-cubic-foot buckets.

SHASTA COUNTY

Flat Creek district.—The Mountain Copper Co. Ltd., mined zinc-copper ore from the Mattie ore body in the Hornet mine throughout 1945; 112,710 tons of ore were treated in the company 350-ton selective flotation mill, and 16,112 tons of copper concentrate (containing 382 ounces of gold, 68,658 ounces of silver, 3,670,113 pounds of copper, 10,434 pounds of lead, and 1,159,784 pounds of zinc) and 3,994 tons of zinc concentrate (containing 60 ounces of gold, 18,559 ounces of silver, 133,020 pounds of copper, 13,281 pounds of lead, and 3,808,397 pounds of zinc) were recovered and shipped to smelters.

French Gulch district.—The French Gulch Dredging Co. resumed operation of its connected-bucket dredge on Clear Creek on September 22, 1945, following a period of inactivity under WPB Limitation Order L–208. The electrically operated dredge was equipped with 76 4½-cubic-foot buckets. E. H. Blagrave shipped 7 tons of gold ore from the Hobo mine to a smelter, from which 24 ounces of gold and 6 ounces of silver were recovered. The St. Jude Mining Co. worked the St. Jude mine and treated gold ore by amalgamation and concentration; the concentrate was shipped to a smelter.

Igo district.—The Thurman Gold Dredging Co. operated its connected-bucket dredge (72 9-cubic-foot buckets) on Clear Creek from August 24 through December 31, 1945; the dredge had been idle since October 15, 1942.

North Cow Creek district.—Jordon & Glennan shipped zinc-copper ore to a smelter and zinc-lead ore to a concentrator smelter from the Afterthought mine in 1945; operations were limited to a short period in the latter half of the year.

SIERRA COUNTY

Alleghany district.—C. M. Hawkins, lessee, worked the American Hill and Pilgrim Annex mine of the American Hill Mining Co. intermittently during the latter part of 1945; 170 tons of gold ore were treated by amalgamation, from which 30 ounces of gold and 4 ounces of silver were recovered. The Original Sixteen to One Mine, Inc., operated all year, recovering a substantial quantity of gold and a lesser quantity of silver by amalgamation. Before Limitation Order L–208 was rescinded effective July 1, 1945, the mine operated on a limited basis under a grant issued by the WPB.

Downieville district.—C. L. Best produced a small quantity of gold from gravel mined at the Ruby drift mine as the result of maintenance work during 1945. Alfred L. Merritt, lessee, worked the Brush Creek mine intermittently in 1945; gold ore was treated by amalgamation.

SISKIYOU COUNTY

Callahan district.—Yuba Consolidated Gold Fields (Siskiyou unit) placed its connected-bucket dredge in operation on Scott River on November 5, 1945. The dredge, which had 72 9-cubic-foot buckets, operated through December 31.

Klamath River district.—The Yreka Gold Dredging Co. operated a connected-bucket dredge with 67 6-cubic-foot buckets in Seiad Valley from October 19 to December 31, 1945. The Gray Eagle Copper Co. operated the Dakin or Gray Eagle mine during the first half of 1945. The mine was closed down in June, and all machinery and equipment were dismantled. Copper ore was treated in the company 700-ton flotation mill and concentrates were shipped to a smelter.

Liberty district.—S. Czerwinski worked the Joubert hydraulic mine during a 2-month period, April 25 to June 25, 1945. Judge Hydraulic Mine carried on hydraulicking at the Judge mine from January 1 to July 4.

Scott Bar district.—George A. Milne carried on hydraulicking at the Quartz Hill mine in November 1945.

STANISLAUS COUNTY

La Grange district.—The La Grange Gold Dredging Co. operated a connected-bucket dredge (No. 4) equipped with 62 10-cubic-foot buckets on the Tuolumne River from September 27 to December 31. The Tuolumne Gold Dredging Corp. operated its connected-bucket dredge throughout 1945 on a one-shift basis. The electrically operated dredge was equipped with 100 12-cubic-foot buckets.

TRINITY COUNTY

Big Bar district.—Perry T. Bennett, lessee, worked 9,367 cubic yards of gravel at the T. & T. hydraulic mine from January 1 to June 1, and recovered 125 ounces of gold and 14 ounces of silver.

Junction City district.—Chapman & Sons hydraulicked the Chapman and Fisher mine during the first 6 months of 1945; 44 ounces of gold and 4 ounces of silver were recovered from 20,000 cubic yards of gravel. The Goldfield Consolidated Mines Co. worked the Red Hill mine by hydraulicking during 1945. The Junction City Mining Co. operated a Yuba electric connected-bucket dredge with 75 10-cubic-foot buckets along Trinity River near Junction City from early in October through December 1945.

Trinity Center district.—The Thompson Divide Mining Co. operated a dragline dredge at the Squirrel Gulch mine from November 25 to December 23.

Weaverville district.—W. E. Woodbury conducted a hydraulic operation at the Rex mine from January 10 to June 23. Thomas Davidson and M. L. Benoist hydraulicked 18,000 cubic yards of gravel at the Canyon (Harman Hill) mine during the first quarter of 1945 and recovered 23 ounces of gold and 2 ounces of silver.

TUOLUMNE COUNTY

East Belt district.—Harper Bros. operated the Eureka mine near Big Oak Flat intermittently from April 1 to November 18, 1945; 109 ounces of gold and 24 ounces of silver were recovered by amalgamation from 5 tons of ore.

Mother Lode district.—Miller & Clemson (Eagle Shawmut Mine) worked the Eagle Shawmut mine from January 1 to November 15, 1945; 61,781 tons of gold ore treated by amalgamation and flotation yielded bullion (containing 98 ounces of gold and 26 ounces of silver) and 1,926 tons of concentrate (containing 4,471 ounces of gold, 2,754 ounces of silver, and 24,891 pounds of copper).

YUBA COUNTY

Camptonville district.—Hydraulicking of old tailings from the Joubert mine by H. M. Allen from January 4 to March 24 produced 50 ounces of gold and 3 ounces of silver.

Yuba River district.—Yuba Consolidated Gold Fields operated five of its fleet of six dredges during the 12 months of 1945, though not concurrently. After the rescinding of WPB Limitation Order L–208 July 1, dredges in addition to the two permitted to operate under a WPB grant resumed work; by the end of the year five dredges were working. The dredges were of the Yuba type, electrically operated, and had the following number and capacity of buckets: Two with 100 18-cubic-foot buckets; one with 126 18-cubic-foot buckets, one with 87 18-cubic-foot buckets, and one with 135 18-cubic-foot buckets.

SILVER, COPPER, LEAD, AND ZINC IN THE CENTRAL STATES

(MINE REPORT)

By A. J. Martin

SUMMARY OUTLINE

SUMMARY

With no change in ceiling prices of copper, lead, and zinc and extension of the Premium Price Plan, nearly all the mines in the Central States producing these metals operated throughout 1945 upon essentially the same economic basis as in 1944. About the only repercussion that followed the end of hostilities was the shut-down of certain copper mines that were operating under special-price Government contracts for copper and were unable to operate at the lower premium price after the contracts were not renewed at the end of August. The manpower shortage hampered production as a whole more severely than in 1944, although it was ameliorated late in the year by return to the mines of veterans and workers from war-industry factories. The output of recoverable copper decreased 26 percent from 1944. The quantity of lead produced was nearly the same as in 1944 and exceeded that of zinc for the first time since 1932; a decrease in lead production in the Tri-State (Kansas-Missouri-Oklahoma) district was offset by expanded output in other districts, mainly the Southeastern Missouri district, where some of the mines shifted men from development work to mining while the lead supply was critical in the first part of the year. The output of zinc decreased 24 percent in quantity from 1944. The largest decrease occurred in the Tri-State district, where there was an 18-percent drop in tonnage of crude ore mined, caused largely by labor shortage, and a decline in the average grade of the ore and old tailings treated. Zinc production in the Wisconsin-Northern Illinois (Upper Mississippi Valley) district increased for the fifth consecutive year.

The silver produced in the Central States is a minor byproduct derived from some of the base-metal ores. No production of gold has been reported from Central States mines since 1940.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of silver, copper, lead, and zinc in the Central States, 1941–45, in terms of recovered metals

Year	Mines producing	Ore and old tailings (short tons)	Silver		Copper	
			Fine ounces	Value	Pounds	Value
1941	447	28, 959, 189	448, 824	$319, 164	95, 680, 000	$11, 290, 240
1942	502	30, 726, 994	130, 884	93, 073	93, 958, 000	11, 368, 918
1943	407	32, 653, 764	161, 917	115, 141	96, 208, 000	12, 507, 040

	118, 883	33, 800	201, 520	164, 225

Silver.—The mine output of recoverable silver in the Central States in 1945 comprised 89,460 ounces derived from refining some of the lead bullion made in smelting Southeastern Missouri lead concentrates, 21,863 ounces from copper bullion and native silver recovered from Michigan copper ore, 5,362 ounces from copper concentrates made in treating Missouri lead-copper-cobalt-nickel-iron ore, and 2,198 ounces from lead concentrates produced in treating Southern Illinois zinc-lead fluorspar and lead fluorspar ores.

Copper.—Michigan (Lake Superior region) produced 90 percent of the Central States total output of copper in 1945; the State output comprised 44,265,000 pounds recovered from crude ore and 16,537,000 pounds from old tailings. In 1944 crude ore yielded 63,967,000 pounds and old tailings 20,875,000 pounds. The rest of the Central States output in both years came from the Southeastern Missouri region; part of the copper was contained in byproducts shipped from smelters treating lead concentrates and part in copper concentrates shipped from the Madison mill at Fredericktown, which treated lead-copper-cobalt-nickel-iron ore.

Lead.—Mines in the Central States produced 201,520 tons of recoverable lead in 1945—more than half the United States total mine output. The principal mines are in the disseminated-lead district of Southeastern Missouri. This district, with an output of 173,005 tons of recoverable lead (a 2-percent increase over 1944), continued to be much the largest lead-producing district in the nation. During the 6 World War II years ended with 1945 the district output averaged 175,528 tons of recoverable lead annually and totaled 1,053,165 tons. The Tri-State district (Kansas, Southwestern Missouri, Oklahoma) produced 23,556 tons of lead in 1945 compared with 28,059 tons in 1944. These two districts contributed 98 percent of the Central States lead output in 1945; the rest came from Wisconsin, Illinois, Kentucky, Central Missouri, and Arkansas.

Zinc.—The 50,724-ton drop in mine production of recoverable zinc in the Central States in 1945 was the heaviest in a single year since 1931 and the output of 164,225 tons the lowest since 1934. Production in the Tri-State district, which contributed 85 percent of the Central States total in 1945, was 50,996 tons less than in 1944. A general review of mining and milling in this district is given in this chapter under Southwestern Missouri. The Wisconsin-Northern Illinois district, the annual output of which increased steadily from 1941 to 1945, yielded 12 percent of the Central States total zinc output in 1945 and 8 percent in 1944. Other producing districts were Kentucky-Southern Illinois, Southeastern and Central Missouri, and Northern Arkansas.

MINE PRODUCTION BY STATES AND REGIONS

Mine production of silver, copper, lead, and zinc in the Central States in 1945, by States, in terms of recovered metals

State	Mines producing	Material sold or treated		Silver	
		Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value
Arkansas	4	14,891			
Illinois	11	[1] 252,271	24,988	2,198	$1,563

Oklahoma	13,660,191	1.08	13,611,730	.85	12,185,306	.74
Wisconsin	548,022	3.09	623,811	3.00	957,677	1.81
	32,527,725		34,056,666		31,574,130	

[1] Only small-scale intermittent mining done in Arkansas from 1918 to 1945; Kentucky and Illinois excluded because part of the metal output (lead and zinc) was a byproduct of fluorspar mining, and the quantity of metal-bearing material hoisted could not be determined.

[2] The percentages represent metal content of the ore insofar as it is recovered in the concentrates. In Michigan the metal so recovered is copper; in Missouri, copper, lead, and zinc; and in Kansas, Oklahoma, and Wisconsin, lead and zinc. The relative proportions of the metals are shown in the third table of this chapter and in tables of tenor of ore given in sections devoted to the respective States.

MINING AND METALLURGIC INDUSTRY

The outstanding accomplishment in mining in the Central States in 1945 was the increased production by lead mines in Southeastern Missouri in spite of manpower shortage and the heavy drain upon ore reserves in recent war years. The average grade of the lead ore mined varied little from 1944. The grade of the copper, zinc, and zinc-lead ores declined materially, indicating further depletion of reserves of high- and medium-grade ores and a growing dependency upon the low-grade ore to maintain production rates. Recent technical advances in mechanizing underground operations and economies effected in transportation and milling are important factors in extending the life of the low-grade mines. Most of the decrease in number of producing mines in 1945 resulted from abandonment of small-scale operations where conditions were unfavorable for using mechanized equipment. Drilling and development work on extensions of ore bodies and adjacent territory in the producing areas resulted in maintaining or expanding ore reserves in some places. No important discoveries were reported from exploratory drilling and geophysical investigations conducted outside known mineralized areas. The Bureau of Mines, in cooperation with the Geological Survey, continued to investigate sources of strategic and critical minerals. The work done on copper, lead, and zinc included exploratory drilling, geophysical surveys, field examinations, and metallurgical tests. Some of the work was curtailed with the passing of the war emergency.

Nearly all the mills in the Central States used gravity concentration and flotation. Flotation concentrates comprised 35 percent of the total copper concentrates (excluding copper-lead flotation concentrates from Missouri), 44 percent of the lead concentrates, and 60 percent of the zinc concentrates produced. The location of the smelters that treat the concentrates is given in the 1943 report of this series (Minerals Yearbook, 1943, p. 296). Six waelz plants operated in conjunction with zinc smelters in the Central States treated a total of 239,695 tons of old residues, current residues, mineralized rock, and clean-up material yielding 40,582 tons of oxide averaging 66 percent zinc and about 3 percent lead. Most of the oxide was smelted along with concentrates to produce metal.

REVIEW BY STATES

ARKANSAS

Production of zinc concentrates in Arkansas totaled 852 tons (mostly carbonate) in 1945 compared with 57 tons (all carbonate) in 1944. One ton of lead concentrates was produced in 1945 and none in 1944. Most of the zinc output came from the Big Hurricane open-pit carbonate mine in Searcy County, operated by the Grimmett Construction Co. The mine is equipped with a 500-ton jig- and table-concentration mill. The concentrates were shipped to the Mineral Point smelter at Depue, Ill. The North Star mine near Harrison and the Gloria-Jack Pot at Zinc each shipped a few lots of sulfide ore to custom mills in the Tri-State district. The Brewer near Ponca shipped a car of zinc carbonate to the Athletic smelter at Forth Smith and a ton of lead concentrates to the Eagle-Picher smetler at Galena, Kans.

ILLINOIS

Northern Illinois (see section on Wisconsin for output data).—The principal producers of zinc and lead in Northern Illinois in 1945 were the Graham-Ginte mine of the Ginte Mining Co. and the Gray mine of Tri-State Zinc, Inc. The Graham-Ginte is equipped with a 400-ton mill producing bulk zinc-iron-lead rougher jig concentrates, sold to the Vinegar Hill Zinc Co. custom flotation mill at Cuba City, Wis., and finished lead concentrates, sold to local buyers. The Gray mine is a newly developed property that began producing late in 1944. It is opened by a 6- by 12-foot shaft 200 feet deep and drifts on the 197-foot level. The ore is treated in the 600-ton jig and flotation mill at the shaft. The zinc concentrates averaged 62.0 percent zinc and the lead concentrates 75.5 percent lead. After August the mill also treated old tailings from other properties nearby. The Big Six (North Unity) mine shipped crude ore to the Vinegar Hill mill. The Bureau of Mines did exploratory drilling on the Bautsch, Boevers, Gray, and Bell (Southcott) properties.

Southern Illinois.—Zinc and lead sulfides are mined along with fluorspar in some of the mines of Southern Illinois. The Mahoning Mining Co. group of mines near Cave in Rock has been the principal producer of zinc since 1939 and of lead since 1940. The ore occurs generally in flat-lying or blanket formation with alternating layers, one consisting largely of fluorspar and the other mostly of sphalerite and galena. The shafts operated in 1945 were the W. L. Davis-Deardorff, East Green, and West Green, which are 311, 230, and 363 feet deep, respectively. The ore from all three shafts was trucked to the company flotation mill at Rosiclare for treatment. The products of the mill were fluorspar concentrates (mostly acid grade), zinc concentrates containing 63.0 percent zinc, and lead concentrates containing 70.3 percent lead. Besides company ore, the mill treated custom ore and bulk concentrates and middlings containing zinc, lead, and fluorspar from other mines and mills in Southern Illinois and Kentucky; the Illinois custom shippers to the mill were the Rosiclare Lead & Fluorspar Mining Co. and the Aluminum Ore Co. The Minerva Oil Co. fluorspar-zinc mine, which began producing in March 1944, operated steadily in 1945. The mine is opened by a 645-foot double-compartment shaft and is equipped with a 200-ton flotation mill.

The fluorspar concentrates shipped were of ceramic grade and the zinc concentrates averaged 63.3 percent zinc. Operations of the company are described in an article in Pit and Quarry of June 1945. The total output of lead concentrates in Southern Illinois in 1945 was 3,657 tons averaging 70.3 percent lead and about 5 ounces of silver to the ton, and that of zinc concentrates was 8,019 tons averaging 63.1 percent zinc. Production (in terms of recoverable metals) was 2,520 tons of lead, 2,198 ounces of silver, and 4,553 tons of zinc, compared with 1,878 tons of lead, 2,437 ounces of silver, and 5,569 tons of zinc in 1944.

KANSAS

The Kansas zinc and lead mines are in the Tri-State (Joplin) mining region, embracing parts of Cherokee County, Kans., and Ottawa County, Okla., and about 12 counties in Southwestern Missouri. General details of the Tri-State mining industry are given in the following pages on Southwestern Missouri.

Production of zinc concentrates in Kansas decreased 24 percent in 1945 from 1944 and lead concentrates 18 percent. The Baxter Springs-Blue Mound-Treece area produced 77,646 tons of zinc concentrates and 8,621 tons of lead concentrates (87 and 86 percent, respectively, of the State total) in 1945. About 33 percent of the crude ore mined in the area was concentrated in the Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin, Okla. Most of the ore was transported to the mill over the Northeast Oklahoma Railroad, which has spur tracks from the main line to the principal ore-hoisting shafts. Eagle-Picher mines in this area shipping to the mill were the Big John, Cherokee, Leopard-Youse Slaughter, Parmenter, Sim C., Webber mines, Westside mines, and Wilbur. Churn drilling north of the Westside-Foley shaft disclosed ore bodies at a deeper level than those to the south, and the company nearly completed sinking a new 455-foot shaft on the north end of the Foley lease. The company drilling campaign was extended northward over a considerable area and continued throughout the year. The Paxson, Stoskopf, and Swalley "D" mines and the Paxson mill were operated by Eagle-Picher as agent for the Metals Reserve Company. The Mid-Continent (Wright and Longacre) mines, Ebenstein (Bilwil), and Mark Twain shipped ore to the Central mill.

Mine production of lead and zinc in Kansas, 1941–45

Year	Mines producing	Lead concentrates		Zinc concentrates		Metal content [1]			
						Lead		Zinc	
		Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1941	58	18,888	$1,264,147	131,406	$6,595,506	14,538	$1,657,332	71,403	$10,710,450
1942	81	12,253	1,167,302	103,247	6,926,745	9,419	1,262,146	55,874	10,392,564
1943	82	12,243	[2] 1,473,891	105,656	[2] 10,792,583	9,213	1,381,950	56,944	12,299,904
1944	85	12,176	[2] 1,418,781	117,827	[2] 11,959,317	9,394	1,503,040	63,703	14,524,284
1945	82	9,967	1,236,322	89,305	9,715,271	7,370	1,267,640	48,394	11,130,620

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the value of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

[2] Revised figures, resulting from inclusion of overceiling payments not previously reported for certain concentrates.

Tenor of lead and zinc ore and old tailings milled and concentrates produced in Kansas, 1944–45

	1944		1945	
	Crude ore	Old tailings	Crude ore	Old tailings
Total ore and old tailings milled……short tons	3,175,152	2,054,643	2,693,110	1,883,269

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.
[2] Revised figure.

The Ballard central mill of the St. Louis Smelting & Refining Co. treated company ore from the Ballard, Clark, English "O", Keith (North 60), Moore, Shanks, Slaughter, and Walter H. mines and custom ore from the Keith (South 20) mine and the C. & M. Mining Co. lease on the St. Louis No. 4 mine in Oklahoma. The Smith and Swalley (Beck) mines and the MacArthur mine continued to ship ore to the Beck No. 3 mill at Baxter Springs. The Liza Jane (Lula Bell) mine shipped to the Farmington mill in Oklahoma until that mill burned on October 14, when the ore was diverted to custom mills. The Harris Mining Co. operated the Robinson and Silver Fox mines (closed during the year) and the E–W No. 24, shipping the ore to the Youngman mill. This mill also treated custom ore from the Federal Muncie group (closed in March), the Southern mine (closed in April), and the Baird in Oklahoma. The Bilharz Mining Co. operated the Bilharz-Brewster mine and mill until October 31, when both were closed owing to expiration of the lease. In November the mill was purchased by the M. &.W. Mining Co., which operated it on ore from company mines in Oklahoma. The Dines mill treated company ore from the Dines No. 3 (Okla.), Tar Creek, and Hartley mines and custom ore from the C. K. & E. (Stebbins) and Douthit (Robinson). The Wade-Rea mill handled company ore from the Wade-Hunter mine and some custom ore. The New Blue Mound (Worley) mill treated old tailings and custom mine dirt from January to March; it was then closed and dismantled. The Barr Cleanup Co. ran a section of the old Webber mill on clean-up material, mostly from Oklahoma. The Captain tailing mill was run continuously. The Semple (Early Bird) tailing mill, a large producer since 1935, was closed May 19, 1945. F. W. Evans Mines installed heavy equipment and carried on stripping operations to open the caved part of the old Peru mine workings and also built a plant for crushing, sizing, and washing barren rock for sale as railroad ballast.

In the Galena area the principal producers were the Eagle-Picher Murphy and Illinois mines, the Galena Mining Co. Southside mine, and the Mess Cave, Murray-Davis, North End, and Rosenberry small-scale open-pit operations; most of the ore was shipped to the Central mill. The Eagle-Picher lead smelter and lead and zinc pigment plant at Galena purchases most of the lead concentrates produced in the Tri-State district. At Peacock the Carson Mining & Milling Co. continued to operate its tailing mill.

In the Waco district (Kansas part) the St. Louis Smelting & Refining Co. operated its No. 9 mill and the Barnsdall and Grasselli mines. Besides company ore the mill handled custom ore from the Stotts City Mining Co. Bennett leases. The F. W. Evans Mines operated its mill and the St. Louis and O'Neill groups. Both mills also handled ore from other mines across the State line in Missouri.

KENTUCKY

Mines in Kentucky yielded 182 tons of recoverable zinc and 129 tons of lead in 1945 compared with 341 and 170 tons, respectively, in 1944. The Twin Valley (old Gratz) zinc-lead mine and 100-ton mill in Owen County operated in January and February 1945; they were then idle until September, when they were taken over by the K. T. Dome Mining Syndicate, which worked mostly on mine development and mill repairs the rest of the year. In Crittenden County the Delhi Fluorspar Co. shipped byproduct lead concentrates and the United States Coal & Coke Co. produced zinc and lead concentrates by flotation of tailings in its fluorspar mill at Mexico. In Livingston County the Kentucky Fluor Spar Co. shipped byproduct lead concentrates. Other fluorspar producers shipped material containing zinc, lead, and fluorspar to the Mahoning mill at Rosiclare, Ill.; the principal shipper was the Eagle Fluor Spar Co. at Salem. The Corod Minerals Corporation fluorspar-zinc-lead flotation mill at Marion was idle throughout 1945.

MICHIGAN

The mine production of recoverable copper in Michigan decreased 28 percent in 1945 from 1944. Operations from January to August were hampered by acute manpower shortage. Certain mines that were operating under special-price Government contracts for copper were closed when the contracts were not renewed at the end of August; the price obtainable under the Premium Price Plan was inadequate to enable these mines to continue operations. The district has been producing continuously since 1845, and the best ore in many of the mines has been extracted or the workings have reached deep levels where the cost of mining is high. The average price per pound of fine copper paid for the mine output (including increment from special prices and premiums for overquota production) was 12.83 cents in 1942, 16.19 cents in 1943, 16.54 cents in 1944, and 17.77 cents in 1945. The ceiling price was 12 cents throughout the 4-year period. In 1945 mine mills treated 2,020,618 tons of rock yielding 44,265,000 pounds of fine copper compared with 2,382,525 tons yielding 63,967,000 pounds in 1944. Reclamation plants handled 3,176,314 tons of old tailings yielding 16,537,000 pounds of copper compared with 3,027,713 tons in 1944 yielding 20,875,000 pounds.

The concentrate ("mineral") produced at mills in Michigan in 1945 and the mass copper shipped direct from the mines were smelted at plants of the Calumet and Hecla Consolidated Copper Co. at Hubbell and the Copper Range Co. at Houghton. The Copper Range smelter was shut down early in October and remained idle the rest of the year. Some of the copper bullion was cast into anodes and shipped to the electrolytic refinery at Laurel Hill, N. Y., where silver was recovered. Most of the bullion, however, is not desilverized, because of the cost and because silver is a desirable element in copper used in the manufacture of many articles. The report of this series for 1944 gives additional data on silver in lake copper and native silver recovered in the mills.

Mine production of silver and copper in Michigan, 1941–45 [1]

Year	Silver (fine ounces)	Copper			Concentrate ("mineral")		Crude ore and sands (short tons)
		Pounds	Yield		Pounds	Yield (percent copper)	
			Pounds per ton of crude ore and sands	Percent			
1941	60,796	92,880,000	21.7	1.08	141,100,268	65.8	4,282,448
1942	61,674	91,358,000	20.9	1.05	141,372,582	64.6	4,362,640
1943	48,479	93,528,000	21.2	1.06	143,142,155	65.3	4,403,594
1944	54,218	84,842,000	15.7	.78	129,646,181	65.4	5,410,238
1945	21,863	60,802,000	11.7	.58	97,467,825	62.4	5,196,932

[1] Figures based upon actual recovery of copper from "mineral" smelted and estimated recovery from "mineral" not smelted during year.

Value of silver and copper produced in Michigan mines, 1941–45

Year	Silver	Copper		Total	Year	Silver	Copper		Total
		Total	Per ton of crude ore and sands				Total	Per ton of crude ore and sands	
1941	$43,233	$10,959,840	$2.56	$11,003,073	1944	$38,555	[1] $11,453,670	[1] $2.12	$11,492,225
1942	43,857	[1] 11,054,318	[1] 2.53	11,098,175	1945	15,547	[1] 8,208,270	[1] 1.58	8,223,817
1943	34,474	[1] 12,158,640	[1] 2.76	12,193,114					

[1] Value of copper calculated at average weighted price (including Government bonuses) for all domestic copper sold (see first table of this chapter, footnote 3). If calculated at actual prices paid to Michigan operators, the value of the copper was—1942: $11,722,792, or $2.69 to the ton of crude ore and sands; 1943: $15,139,831, or $3.44 to the ton; 1944: $14,033,131, or $2.59 to the ton; 1945: $10,801,506, or $2.08 to the ton.

The mines and reclamation plants of the Calumet and Hecla Consolidated Copper Co. continued in 1945 to contribute the largest part of the Michigan output of copper. The operating mines comprised the Ahmeek, Central (closed December 31), Douglass, Iroquois, North Kearsarge, Peninsula, Allouez, and Centennial. Shortage of labor hampered production. The ore from all eight mines was treated in the 6,400-ton Ahmeek stamp mill by gravity concentration followed by flotation of the fines. According to the annual company report to stockholders, from which the following data are extracted, the mill in 1945 stamped 1,395,064 tons of rock yielding 28,796,120 pounds of copper. The output of primary copper from the two reclamation plants totaled 10,261,172 pounds. The Lake Linden plant operated on conglomerate tailings 3 months and on amygdaloid tailings the rest of the year. The small quantity of conglomerate material now remaining is contiguous to, or underlies, operating plants

717372—47——20

and can be treated only as a final clean-up preparatory to shutting down some of the Lake Linden treatment plants permanently. The amygdaloid tailings are of such grade that they are of commercial value at present only when copper sells at 17 cents a pound or higher. The Tamarack reclamation plant, operating on amygdaloid tailings under the Premium Price Plan, showed a small profit. The smelter treated company and custom concentrates, refined copper on toll for the Metals Reserve Company and private companies, and treated a substantial tonnage of secondary copper. A new secondary copper department was organized, equipment was installed, and treatment of many grades of secondary material on a large scale was begun. Purchase of the properties of the Peninsula Copper Co., held under lease and option since June 13, 1938, was completed during the year. Underground development at all operating shafts proceeded at a normal rate and developed ground of average grade. Exploration of company holdings by diamond drilling continued throughout the year. The results of drilling in the recently acquired Clark and Keweenaw Copper lands in the Copper Harbor area were much less encouraging than indicated by reports of drilling done in previous years, but drilling was being continued. The many deposits thus far explored are of too low a grade for present exploitation.

The Copper Range Co. operated its Champion and Globe mines until September 20, when operations were suspended owing to discontinuance of the Government special prices for copper and inability to complete arrangements to operate under the Premium Price Plan. The stamp mill and smelter were shut down soon after production stopped at the mines. All essential maintenance work was continued at the mines, mill, and smelter in order that operations can be resumed when conditions are favorable. The tailing plant at the Freda mill was operated from April to August. The smelter treated company concentrates and also handled custom concentrates and mass copper from the Isle Royale and Quincy mines. Other data abstracted from the annual company report to stockholders follow: The drilling program at the White Pine property was completed in 1945. An exploration shaft, known as the Bill Schacht Shaft, was started in June and progress by the end of the year was satisfactory. The mill tailings at the Baltic mill at Redridge were examined and studied. About 8,000,000 tons of recoverable tailings having an average copper content of about 7½ pounds per ton were indicated. Further work is under way to determine if the copper in these tailings can be recovered profitably.

The Isle Royale Copper Co. operated throughout 1945, but shortage of labor limited operations from January through August; later, experienced labor became available. According to the annual company report to stockholders, production of refined copper was 5,599,280 pounds, a reduction of 2 percent from 1944. Copper recovered per ton of rock stamped was 18.946 pounds compared with 18.344 pounds in 1944. Production costs, including selling and delivery, were 18.929 cents a pound. Depreciation and depletion totaled 1.448 cents, making an over-all cost of 20.377 cents a pound. From January to August the company operated under a special contract with the Metals Reserve Company and from September to December under the Premium Price Plan. The lower price received for copper under the Premium Price Plan necessitated a revision of the operational program. All development work was suspended and the entire underground force was placed on production, which resulted in a 30-percent increase in production rates for the rest of the year. Experimental work done to determine the feasibility of reworking the stamp sands shows that their copper content is low, and until new methods are devised to reduce greatly present grinding costs, these sands must be considered of little economic value.

The output of copper from the Quincy Mining Co. tailings reclamation plant increased substantially over 1944. Additional equipment was installed in the plant to increase its capacity and obtain greater efficiency in handling the very fine sands. The original capacity of the mill was 4,000 tons daily. The Quincy mine was shut down August 31, 1945, when the Metals Reserve Company ceased paying special prices for the copper produced.

MISSOURI

The mine output of lead in Missouri (the chief lead-producing State for the past 38 years) increased 1 percent in 1945 over 1944 and that of zinc decreased 39 percent. The lead output comes largely from St. Francois and Madison Counties in the Southeastern Missouri region. Silver and copper are recovered as byproducts in smelting lead concentrates produced in this region, and considerable copper and a little silver have been recovered in some years (including 1944 and 1945) from lead-copper-cobalt-nickel-iron ore mined in the southern part of the region. Silver recovered in 1945 totaled 94,822 ounces and copper 3,399 tons compared with 92,243 ounces and 3,302 tons, respectively, in 1944. In the sale of the lead concentrates, no value is attached to the silver and copper, as the quantity recovered per ton of concentrates is very small. The output of zinc comes mostly from zinc-lead ore mined in Southwestern Missouri. The Central district of Missouri, an intermittent producer of zinc and lead, had a small output in each of the years 1941–45, inclusive; the figures are included with those of Southeastern Missouri in the table that follows.

Mine production of lead and zinc in Southeastern and Central Missouri, 1941–45

Year	Lead concentrates (galena)		Zinc concentrates [1]		Metal content [2]			
					Lead		Zinc	
	Short tons	Value [3]	Short tons	Value	Short tons	Value	Short tons	Value
1941	228,572	$15,404,226	5,192	$73,202	164,388	$18,740,232	1,100	$165,000
1942	277,255	19,426,540	1,739	41,913	197,432	26,455,888	[4] 842	156,612
1943	257,305	18,490,413	2,284	99,710	179,134	26,870,100	[5] 923	199,368
1944	243,279	19,920,200	3,206	112,485	169,962	27,193,920	[6] 1,508	343,824
1945	245,805	21,870,243	1,335	45,706	173,053	29,765,116	[7] 595	136,850

[1] Includes zinc-lead carbonate concentrates.
[2] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.
[3] Values given are to a certain extent arbitrary, as part of the lead concentrates are smelted by the producer.
[4] Includes 450 tons recovered from lead-smelter slags.
[5] Includes 360 tons recovered from lead-smelter slags.
[6] Includes 776 tons recovered from lead-smelter slags and byproduct matte from lead smelting.
[7] Includes 240 tons recovered from byproduct matte from lead smelting.

Mine production of lead and zinc in Southwestern Missouri, 1941–45

Year	Lead concentrates				Zinc concentrates				Metal content [1]			
	Galena		Carbonate		Sphalerite		Silicate		Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value

Zinc silicates and carbonates	88.88		73.60	

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

Southeastern and Central Missouri.—Production of recoverable lead in Southeastern Missouri was 173,005 tons in 1945 compared with 169,622 tons in 1944. The output in 1944 represented 41 percent of the United States total mine production and in 1945 close to 45 percent.

The bulk of the district output comes from the mines of the St. Joseph Lead Co. in St. Francois County. The groups operated in 1945—the same as in other recent years—were the Bonne Terre, Desloge, Leadwood, and Federal. Each group has a central ore-hoisting shaft and a mill. Other shafts are used for men, supplies, and poor rock. The depth of the 13 operating shafts ranged from 181 to 755 feet and averaged 424 feet. The four mills together have a total daily capacity of 21,400 tons of ore. Treatment is by table concentration followed by flotation. Owing to the need for increasing lead production in the first part of the year, the company transferred some men from development work to mining and operated the mines beyond their economic capacity. According to the company annual report to stockholders, the demand for lead necessitated continuance of uneconomic production rates after the end of 1945. Owing to lack of development work the "proved" ore reserves were less at the end than at the beginning of the year, but with the return of former employees from military service additional exploration work could be undertaken. Regarding the electrothermic zinc plant at the Herculaneum smelter, the annual report stated that the employment of additional men would permit completion of alterations to the slag furnace, which was last operated in 1944, when the process was proved to be an efficient one and the quality of the zinc and lead metals recovered from the smelter slag was found to be satisfactory. The smelter treats part of the concentrates produced in the company mills and also handles custom concentrates from other mills, mostly in the Southeastern Missouri region. The rest of the company concentrates are shipped to the Federal smelter at Alton, Ill. The concentrates contain a little silver, copper, and zinc, some of which were recovered in byproducts at smelters and refineries.

In Madison County the Mine La Motte mine, equipped with a 1,500-ton mill, continued to be the largest producer of lead. The property is owned by the Mine La Motte Corp. and operated by the St. Joseph Lead Co. Two shafts 115 and 307 feet deep were operated. The St. Louis Smelting & Refining Co. operated its Madison mine and 600-ton all-flotation mill steadily. The ore contains lead, copper, cobalt, nickel, and iron; the products of the mill were copper-lead, lead-copper, cobalt nickel, and iron concentrates. The lead-copper concentrates were shipped to the Herculaneum smelter, the copper-lead concentrates to the Garfield (Utah) and El Paso (Tex.) smelters, and the other concentrates were mostly stored at the mine. After midyear, operations centered on producing lead, and the output of the other metals decreased. The Park City Consolidated Mines Co. ran its Ruth mine and 500-ton flotation mill throughout the year. The Fredericktown Lead Co., operating its 400-ton mill and the Catherine and Fleming mines, increased production. Other companies were active in leasing and prospecting (mostly by geophysical methods) in Madison and Sainte Genevieve Counties. The Bureau of Mines made a magnetic survey near Fredericktown.

At Valles Mines, Jefferson County, the DeSota Lead & Zinc Co. 200-ton mill operated most of the year on zinc-lead-iron carbonate ore from dumps on the Valle Mining Co. properties; the concentrates were shipped to the Ozark pigment plant at Coffeyville, Kans.

In Central Missouri the open-pit zinc-lead-coal mine and 100-ton jig mill on the Monarch Coal & Mineral Co. land in Moniteau County, operated by the Wemhaner Mining Corporation since 1940, were closed in May 1945. Small lots of galena were shipped from barite diggings.

Southwestern Missouri.—The following table, the first four paragraphs, and the graphs under this heading pertain to the Tri-State mining industry as a whole; the remaining text reviews mining and milling in Southwestern Missouri only.

Production of lead and zinc concentrates in the Tri-State district (Kansas, Oklahoma, and Southwestern Missouri), 1941–45

Year	Ore, etc., milled (short tons)	Concentrates produced (short tons)		Concentrate recovery (percent)		Average assay of concentrates (percent)		Average value per ton of concentrates	
		Lead	Zinc	Lead	Zinc	Lead	Zinc	Lead	Zinc
FROM CRUDE ORE

[1] Revised figures, resulting from inclusion of overceiling payments not previously reported for certain concentrates.

Although the output of zinc and lead in the Tri-State district decreased heavily in 1945, the district continued to be much the largest zinc-producing district in the United States and ranked third in lead production. As in other recent years, a substantial part of the output came from remnants of ore bodies left in old mines and from other low-grade deposits that had not been commercial at pre-war concentrate prices but could be worked at the higher prices paid under the Premium Price Plan. Such deposits and the low-grade portions of the richer ore bodies now being worked constitute the largest part of the ore reserves of the district. Their utilization has been facilitated by mechanizing underground operations and effecting economies in transportation and milling, but much of the advantage thus gained has been offset by increases in the cost of labor and materials. To maintain the district output at the level of 1945 during the next few years would require continued high prices for concentrates—probably approximating those now obtainable under the Premium Price Plan. If prices should recede to a point at which the low-grade ore could not be utilized along with the high-grade, production will probably decline at a fairly rapid rate unless important new discoveries are made.

The method of marketing the mine output of the Tri-State or Joplin region is explained in the reports of this series for 1940 and 1941. The total value given for all the concentrates is based upon actual receipts by the sellers, including premiums paid by the Government since February 1, 1942, for overquota mine production. The quoted weekly market price for zinc concentrates at Joplin remained at

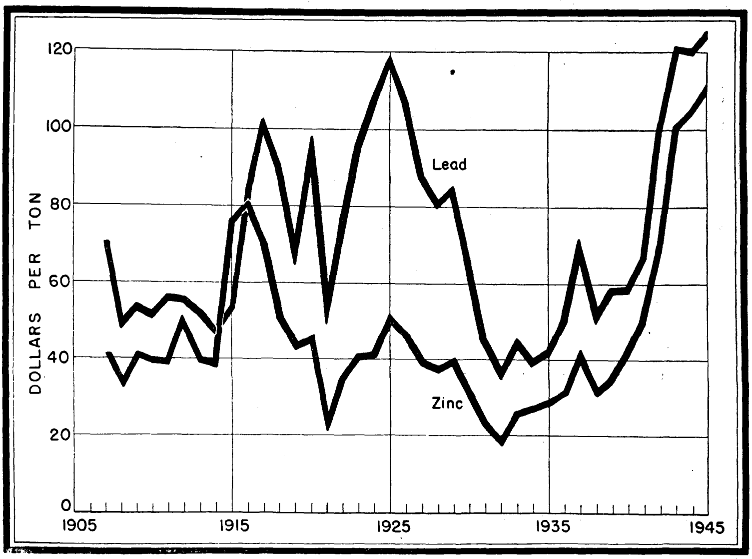

FIGURE 1.—Average prices received by sellers per ton of concentrates in the Tri-State district, 1907–45.

$55.28 a ton throughout 1945 but was reduced to $50 the first week in January 1946. The reduction resulted from an increase in the smelting charge caused by termination of the $5-a-ton Government subsidy paid to smelters on Tri-State concentrates treated. The quoted metal contract price on galena continued at $76.01 throughout 1945. Government premium payments for 60-percent zinc concentrates continued at $29.70 a ton for assigned production under the A-level quota, $59.40 for B-level, and $89.10 for C-level; for 80-percent lead concentrates the payments were $41.80 for A-level and $83.60 for B-level.

Shortage of labor hampered operations severely in 1945. The number of men employed directly by the mining companies dropped from around 6,000 in July 1944 to 5,000 in July 1945 and did not increase materially for several months after the end of hostilities in August. Production of concentrates in the last half of 1945 was 11 percent less than in the first half. About 50 mills were operating in the region in December 1945, of which 16 were tailing mills, compared with 52 in December 1944, including 16 tailing mills. The mine mills, a number of which treated company and custom ore, together

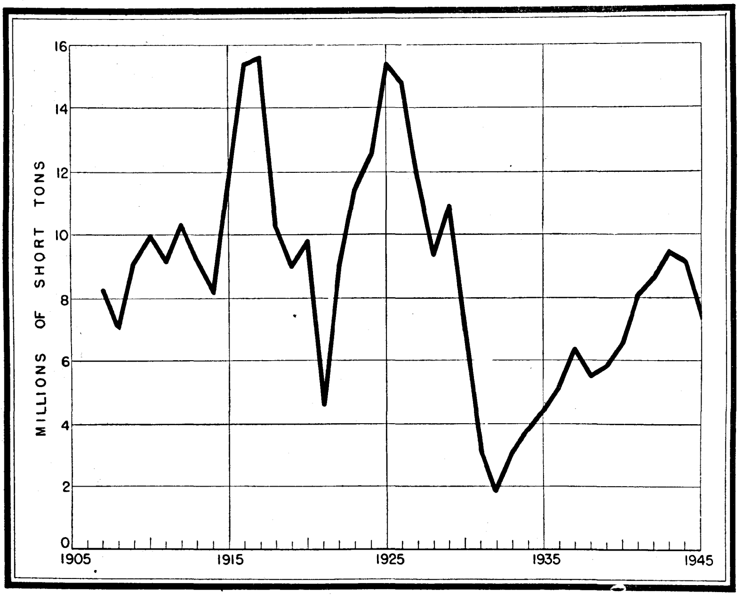

FIGURE 2.—Quantity of crude ore milled in the Tri-State district, 1907–45.

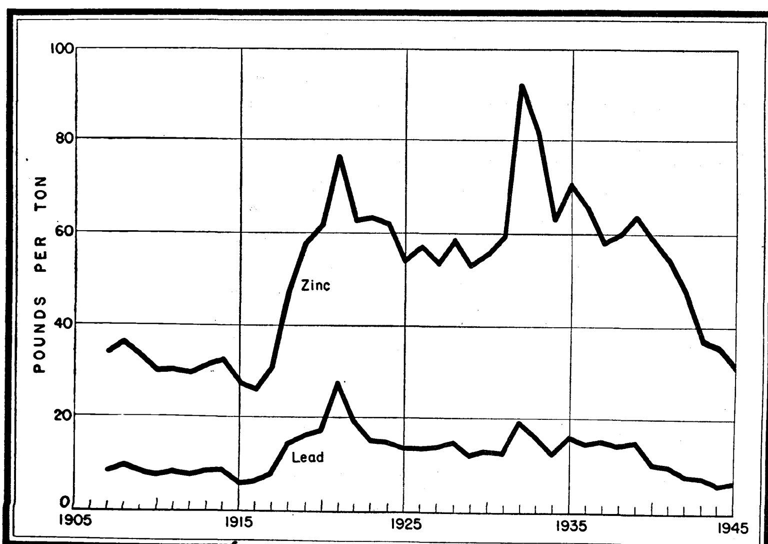

FIGURE 3.—Metal recovered per ton of crude ore (rock) milled in the Tri-State district, 1907–45.

served about 190 mines operated by 80 companies. These mines do not include small gouges and clean-ups but include one important mill clean-up operation and 14 of the larger clean-ups of boulder piles at idle shafts; the total producing mines, gouges, and clean-ups was 226. Eleven companies operated 15 tailing mills throughout the year; in addition there were 7 small-scale or intermittent tailing operations. Stocks of concentrates in the mill bins were small at the end of the year. Churn drilling by the mining companies was confined chiefly to extensions of ore bodies and prospecting in or near known mineralized areas. The Bureau of Mines did exploratory drilling in the Baxter Springs, Galena, Joplin, Melrose (geophysical survey also), and Racine areas. Facilities for aluminum-powder treatments to prevent silicosis were being installed by the mine operators as the year ended.

In Southwestern Missouri production of zinc concentrates decreased 39 percent from 1944 and lead concentrates 26 percent. The Oronogo Circle open-pit mine was again the largest single producer of zinc in Missouri. Part of the ore was treated in the Eagle-Picher leased American mill on the property (closed November 1), and part was shipped to the Central mill in Oklahoma. Fenix & Sons, operating a shaft on the Oronogo Mutual lease, shipped ore to the Central mill. The newly reopened Eagle-Picher Needmore mine was about ready to ship ore in December. The La Tosca (Fenix & Martin) mine and mill continued producing except during March, April, and May. Kansas Explorations, Inc., operated the Snapp mill and the Buckingham mine all the year and the Snapp mine from January to May; the company also continued to operate its Jasper mine and mill near Joplin. Other producers near Joplin and Thoms Station included the Missouri Mining Co. tailing mill, the O'Jack and Swartz mines (ore treated in the C. & O. or Southside mill), and the Big Tom, Little Judy, and Little Pat (ore shipped to the St. Louis Mining & Milling Co. custom mill at Thoms Station). The C. G. & C. Co. sank a shaft on the Potter land and leased the Northside mill, which had been idle since the Northside mine was closed in February; the mill was used to treat custom ore in November and December.

The Federal Mining & Smelting Co. operated the company-owned Granby-American and Duenweg mines and mills throughout the year; the leased Granby-Davis mine was closed June 1 but was purchased by Federal in November. The American Zinc, Lead & Smelting Co. continued to operate its Hunter mines and mill at Aurora. Producers in the Missouri part of the Waco district included the Gascho and High Five (St. Louis) and O'Neill (F. W. Evans) mines (ore treated in company mills in Kansas) and the C. C. Playter (Reynolds) mines and mill. The F. W. Evans Mines also worked the McBee and Martin mines at Smithfield until August and reopened the Sucker Flat open-pit mine and washing-concentrating plant at Webb City, formerly operated by Cooley Bros. The Capital mine and mill at Stotts City were operated until March, when heavy rains flooded the mine; the mill treated some old tailings after October. The Wentworth Mining & Milling Co. resumed operations in June. Other small producers of sulfide concentrates were the Blue Bonnet Mining Co., which treated old tailings in the Navy Bean mill near Wentworth; the New Dalite mine near Carthage (ore milled in the Berkey mill at Alba); the Dividend at Spurgeon; the Hughes sand-slime plant and Gaunt (old Sciota) tailing mill at Webb City; and the Mary Arnold mine near Ozark. The Southwest silicate-carbonate mine and 250-ton mill at Stark City operated most of the year, and the Alice mine in Ozark County shipped sorted crude carbonate and sulfide ores.

OKLAHOMA

Mining and milling in the Tri-State region—which includes Northeastern Oklahoma—are discussed in the preceding pages on Southwestern Missouri. Mines and tailing mills in Oklahoma produced 50 percent of the total Tri-State output of zinc and 54 percent of the lead in 1945 compared with 48 and 50 percent, respectively, in 1944. The zinc output decreased 24 percent from 1944 and lead 9 percent.

Mine production of lead and zinc in Oklahoma, 1941–45

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1941	32,628	$2,202,876	307,207	$15,427,235	25,021	$2,852,394	166,602	$24,990,300
1942	29,794	2,985,285	272,209	19,163,622	22,806	3,056,004	146,510	27,250,860
1943	26,423	3,208,885	[2] 213,195	21,251,796	19,733	2,959,950	114,085	24,642,360
1944	18,455	2,258,188	170,470	18,067,967	13,944	2,231,040	91,449	20,850,372
1945	17,198	2,097,952	128,934	14,021,165	12,664	2,178,208	69,300	15,939,000

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.
[2] Includes 58 tons of zinc carbonate averaging 31.03 percent zinc.

Tenor of lead and zinc ore, old tailings, and slimes milled and concentrates produced in Oklahoma, 1944–45

	1944		1945	
	Crude ore	Old tailings and slimes	Crude ore	Old tailings and slimes
Total ore, etc., milled ... short tons	3,890,257	9,721,473	3,266,151	8,919,155
Total concentrates produced:

Zinc concentrates	108.12	99.30	110.54	103.39

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

The 14,000-ton Central mill of the Eagle-Picher Mining & Smelting Co. operated at less than capacity most of the year; the acute shortage of labor, besides limiting output of the mines supplying the ore, caused delays in surface transportation and handling ore at the mill. The mill is equipped with differential-density (sink-and-float) preliminary-concentration units, which furnish an enriched product for treatment by jigging and flotation. Crude ore treated in 1945 totaled 3,058,438 tons, of which 1,964,785 tons (64 percent) came from Oklahoma mines, compared with 3,433,670 tons in 1944, of which 2,213,214 tons (also 64 percent) came from Oklahoma. Eagle-Picher mines in Oklahoma shipping to the mill were the Blue Goose mines, Douthat, Goodeagle mines, Gordon No. 2, Grace Walker No. 2, Hum-bah-wat-tah mines, John Beaver No. 2, Little Greenback, Lotson, Netta, See Sah, Slim Jim, and Wesah Greenback. The company also milled a large tonnage of low-grade boulders obtained from waste dumps at various shafts in the Picher field. Other large Oklahoma shippers to the mill included the Davis Big Chief (Skelton, Lucky Bill, Imbeau), F. W. Evans (Shorthorn, Craig), Federal Mining & Smelting Co. (Lucky Syndicate-Howe, Gordon, Quapaw-Davenport), M. & M. Mining Co. (Piokee, Swift, Crawfish, White), W. M. & W. Mining Co. (Velie), Mahutska Mining Co. (Acme-Blackhawk, Cortez, Jeff City), Carpenter Mining Co. (New York-Grace Walker, Oko), Bob White Mining Co., and Mary Ann mine. The Eagle-Picher 2,400-ton Bird Dog mill was not run in 1945.

The Evans-Wallower No. 7 mine and mill were operated by Evans-Wallower Zinc, Inc., from January to August, when they were sold to the American Zinc Co. of Oklahoma, which operated them the rest of the year. The Lula Bell Mining Co. Farmington mill burned October 14, and the Farmington mine was shut down. The Beck No. 1 mill treated custom ore, mostly from the M. & W. Mining Co. Brewster-Huttig-Ninety-Six, Sequoyah, and Liza Jane (Kans.) mines. The Mission mill handled custom ore from the Pelican, Toltec, Kropp, and other mines. The United Zinc Smelting Corp. Royal mill treated company ore from the Royal and Park Walton mines and custom ore from the C. & R. and Baird leases. The Park Walton, a recently-developed mine near Melrose, was among the district's best lead producers; the 700-ton mill built at the mine began operating in February 1946. Other important-producing mine mills were the Cameron & Henderson (Admiralty mine), Kansas Explorations (Ritz), Lawyers Lead & Zinc (mine dirt and old tailings), Rialto, Scott, and Weidman (Woodchuck and Townsite mines). The St. Louis No. 4 mill treated tailings; the No. 4 mine dirt was shipped to the No. 8 (Ballard) mill in Kansas. The Four-Mile Mining Co. sank a shaft and erected a mill on the T. R. Smith land.

All the large Oklahoma tailing mills that were active in 1944 continued running throughout 1945; they comprised the Atlas, Big Chief, Britt & Britt, C. G. & C., Cardin Nos. 2, 3, and Western, Evans-Wallower No. 4, Semple (Martin), and Tri-State Zinc Ottawa and Sooner.

WISCONSIN

The Wisconsin zinc and lead district is part of the Upper Mississippi Valley region, which extends into Illinois and Iowa. The Iowa part has had no production since 1917. In 1945 the total regional output of finished (60-percent) zinc concentrates was 34,758 tons and lead concentrates 3,011 tons compared with 31,819 and 2,085 tons, respectively, in 1944. The output of recoverable zinc in 1945 (19,318 tons) was the largest since 1927 and compares with 7,956 tons in 1941, the year before the Government began paying premiums which enabled the mining of lower-grade ore. With the recent expansion of the productive area south of Galena and the general progress made in mechanizing underground operations, the region probably can support a sizable mining industry for many years if the price of and demand for zinc and lead are sufficient to warrant the mining of low-grade ore (3.5 to 4.5 percent zinc-lead content).

Since 1942 part of the crude ore produced in the region has been sold to the Metals Reserve Company and stock-piled at the Vinegar Hill Zinc Co. custom flotation mill at Cuba City, Wis. The metal output from the stock-piled ore is credited to the production of the year in which the ore is milled rather than to the year in which it is mined.

Of the total regional output in 1945, Northern Illinois contributed 6,726 tons of zinc concentrates (60-percent basis) and 648 tons of lead concentrates compared with 3,123 and 131 tons, respectively, in 1944; the yield, in terms of recoverable metals, was 3,757 tons of zinc and 485 tons of lead in 1945 compared with 1,693 and 93 tons, respectively, in 1944. Crude ore milled in 1945 totaled 125,893 tons and old tailings 24,988 tons.

The Vinegar Hill mill,[1] principal producer of finished concentrates in the region, treats crude ore and rougher jig zinc-iron-lead sulfide concentrates purchased from operators in both Wisconsin and Northern Illinois. Besides zinc and lead concentrates, the mill produces iron concentrates used in making sulfuric acid in the company plant adjoining the mill. The principal Wisconsin shippers of crude ore to the mill in 1945 were the Cuba Mining Co. (Andrews mine), Gill Bros. (James), Meloy & Baker (Hoskins, Martin), the Thompson, North Star, Piquette (Trego mine), Kittoe, Fox (Cottingham), Hofer (Boyle), Little Grant (Arensdorf & Murray), Pittsburg, and Deuce (New Harty) mining companies, Whitechurch & Farr (Little Mullen), and Harold Reinke partnership (Federal). Wisconsin shippers of rough jig concentrates to the mill were the C. F. & H. Mining Co. (Mulcahy mine), the Liberty Mining Co., and the New Lucky Hit Mining Co. (Coughlin, Wilkins).

The Dodgeville Mining Co. operated its mill at Dodgeville on ore from the Dodgeville mine (a group of city lots) until June, when the mine was cleaned up and abandoned; the mine equipment was then moved to the newly developed Simpson mine, which furnished ore for the mill the rest of the year. The W. E. Faithorn mill at New Diggings operated on ore from the reopened Champion mine. The producing tailing mills were the United Milling & Mining Co. 2,000-ton plant on the Coker property near Livingston; the Chestnut Hill Zinc Co. 200-ton mill on the Field property near Shullsburg; and the Northwest Zinc Co. new 2,000-ton mill at the Kennedy tailing pile east of Hazel Green, operated from July through December. The tailing mills together produced 4,597 tons of zinc concentrates averaging 60.93 percent zinc.

---

[1] Pett, G. H., Vinegar Hill Zinc: Min. Cong. Jour., vol. 31, No. 11, November 1945, pp. 22-27.

The exploratory program of the Bureau of Mines and Geological Survey was curtailed after the Allied victory in Europe. Wisconsin zinc-lead properties drilled in 1945 included the Coker near Livingston, the Dale Rundell near Mifflin, and the Piquette, Schmitz, and Pleumer in the Tennyson area.

Mine production of lead and zinc in Wisconsin, 1941–45 [1]

Year	Lead concentrates		Zinc concentrates (sphalerite)		Metal content [2]			
					Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1941	1,639	$111,014	11,685	$594,323	1,225	$139,650	6,238	$935,700
1942	1,092	[3] 104,896	17,449	[3] 1,028,828	775	103,850	9,426	1,753,236
1943	1,307	[3] 111,360	26,632	[3] 1,624,858	920	138,000	14,387	3,107,592
1944	1,954	[3] 166,853	28,696	[3] 1,892,313	1,415	226,400	15,549	3,545,172

[1] Most of the ore mined in Wisconsin in 1941–45 was first treated in gravity-concentration mills producing bulk concentrates which were re-treated by flotation.
[2] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.
[3] Most of the finished zinc concentrates and part of the lead concentrates produced in Wisconsin in 1942–45 came from a custom mill treating purchased crude ores and low-grade bulk concentrates on which premium payments had been made previously to mine operators; therefore the value of these concentrates is calculated at market prices. Premium payments not reflected in the value of the finished concentrates amounted to about $399,000 in 1942, $1,059,000 in 1943, $1,384,367 in 1944, and $1,087,243 in 1945 for zinc and $18,500, $40,600, $71,498, and $96,074 respectively, for lead; part of these payments, however, were for ore which was stock-piled.

Tenor of lead and zinc ore and old tailings milled and concentrates produced in Wisconsin, 1944–45

[2] Percentage represents finished flotation concentrates.
[3] Percentages represent metal content of the ore insofar as it is recovered in the concentrates.
[4] Most of the finished zinc concentrates and part of the lead concentrates produced in Wisconsin in 1944–45 came from a custom mill treating purchased crude ores and low-grade bulk concentrates on which premium payments had been made previously to mine operators; therefore, the value of these concentrates is calculated at market prices.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN COLORADO

(MINE REPORT)

By G. E. Woodward and S. A. Gustavson

SUMMARY OUTLINE

SUMMARY

Despite the rescission of Limitation Order L–208 by the War Production Board, effective July 1, Colorado gold output in 1945 was the smallest since 1873 and silver production the lowest since 1873 except for 1931–33. Output of both lead and zinc decreased in 1945, but copper output gained. A substantial increase in output of placer gold was due to operation resumed by a floating connected-bucket dredge in Park County.

Colorado mines in 1945 yielded, in terms of recoverable metals, 100,935 fine ounces of gold, 2,226,780 ounces of silver, 2,970,000 pounds of copper, 34,088,000 pounds of lead, and 71,546,000 pounds of zinc, the total valued at $16,676,521, a 6-percent decrease compared with 1944. Comparing 1945 with 1944, gold decreased 9 percent and silver 1 percent in both quantity and value; copper increased 42 percent in quantity and value; lead decreased 4 percent in quantity but increased 4 percent in value; zinc decreased 10 percent in quantity and value. Of the total value of these five metals, zinc represented 49 percent, gold 21 percent, lead 18 percent, silver 10 percent, and copper 2 percent.

Eagle County continued to rank first in value of production of the five metals and was first in production of zinc. Lake County was again second in value of production of these five metals, first in production of lead, and second in zinc. San Juan ranked third; San Miguel, fourth; and Dolores, fifth. These five counties, each producing over $1,000,000 in value of the five metals, accounted for 72 percent of the State total value.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Annual figures for the 5 years ended with 1945 and total production from 1858 are given in the table that follows. Colorado is second in the production of silver and gold, having yielded first place in the production of silver to Montana in 1942; California is the leading gold producer.

Mine production of gold, silver, copper, lead, and zinc in Colorado, 1941–45, and total, 1858–1945, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	579	324	2,222,786	380,029	$13,301,015	7,301,697	$5,192,318
1942	311	68	1,797,386	268,627	9,401,945	3,096,211	2,201,750
1943	235	17	1,631,318	137,558	4,814,530	2,664,142	1,894,501

[1] Dragline and power-shovel excavators with sluices or special amalgamators.

Gold.—Colorado mines yielded 100,935 ounces of gold in 1945 compared with 111,455 ounces in 1944. The principal gold-producing districts were: Cripple Creek in Teller County, which produced 28 percent of the State total gold output; Animas in San Juan County, 22 percent; Upper San Miguel in San Miguel County, 18 percent; California (Leadville) in Lake County, 16 percent; Fairplay in Park County, 7 percent; and Sneffels in Ouray County, 3 percent. Dry and siliceous ores yielded 73 percent of the State total gold; zinc-lead ore, 17 percent; placers, 8 percent; and copper, lead, zinc, zinc-copper, and zinc-lead-copper, 2 percent.

Silver.—The output of silver decreased from 2,248,830 ounces in 1944 to 2,226,780 ounces in 1945. The leading silver-producing districts were: Creede in Mineral County, which produced over 19 percent of the State total silver; California (Leadville) in Lake County, slightly less than 19 percent; Animas in San Juan County, 14 percent; Upper San Miguel in San Miguel County, 12 percent; Pioneer (Rico) in Dolores County, 7 percent; and Sneffels in Ouray County, 4 percent. Dry and siliceous ores yielded 52 percent of the total State silver; zinc-lead ore, 41 percent; and copper, lead, zinc-lead-copper ores, and placers, 7 percent.

Copper.—The output of recovered copper from mines in Colorado in 1945 was 2,970,000 pounds compared with 2,096,000 pounds in 1944. Most of the copper produced in Colorado is recovered as a byproduct from ores mined for their zinc, lead, or precious metal content; the exceptions are the ores from the Cashin mine in Montrose County and the Idarado Mining Co. in San Miguel County—the latter makes a copper concentrate from its complex gold-silver-copper-lead-zinc ore. Dry and siliceous gold ores yielded 56 percent of the total State copper; zinc-lead ore, 24 percent; copper ore, 16 percent; and lead, zinc, zinc-copper, and zinc-lead-copper ores, 4 percent.

Lead.—The mine production of recovered lead in Colorado was 34,088,000 pounds in 1945 compared with 35,396,000 pounds in 1944. The Leadville district, Lake County, continued to be the largest lead-

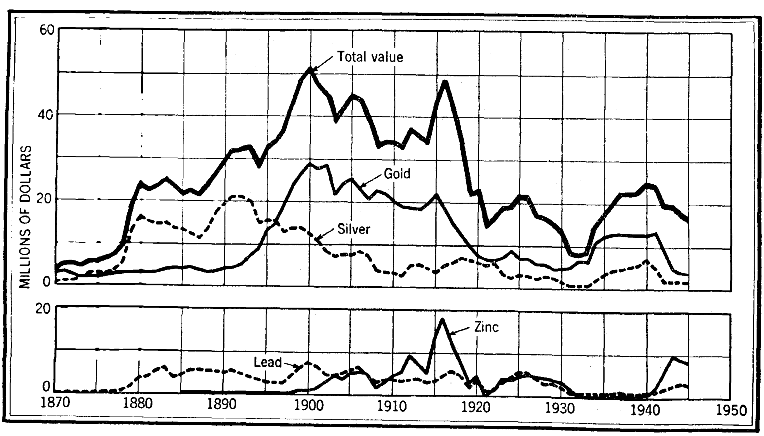

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1945. The value of copper has been less than $2,000,000 annually, except in a few years.

producing area in the State, followed by the Animas in San Juan County, Pioneer (Rico) in Dolores County, Upper San Miguel in San Miguel County, Ten Mile in Summit County, and Red Cliff in Eagle County. Each of these districts produced over 1,000,000 pounds and combined accounted for 78 percent of the lead produced in the State in 1945. Zinc-lead ore yielded 64 percent of the State total; siliceous ores, 27 percent; and copper, lead, zinc, and zinc-lead-copper, 9 percent.

Zinc.—The output of recovered zinc from mines in Colorado decreased from 79,910,000 pounds in 1944 to 71,546,000 pounds in 1945. The principal zinc-producing districts in 1945, in order of output, were: Red Cliff, California (Leadville), Pioneer (Rico), Ten Mile, Upper San Miguel, Animas, Breckenridge, Griffith, Tomichi, and Kerber Creek; these 10 districts produced 94 percent of the State total output in 1945. Zinc, zinc-lead, and zinc-lead-copper ores yielded 93 percent of the State total zinc and dry and siliceous ores 7 percent.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1945, by counties, in terms of recovered metals

MINING INDUSTRY

The nonferrous metal-mining industry in Colorado in 1945 was affected by several factors. Among the more favorable factors were: The continued successful development of the Black Bear vein in San Miguel County by the Idarado Mining Co., which has not only demonstrated greater depth of the mineral deposits in the San Juan region (Ouray, San Juan, San Miguel Counties) but has added a substantial tonnage of copper-zinc-lead ores to the State reserves; the successful developments at the Telluride Mines, Inc., property in the Upper San Miguel district, which have prompted the company to begin work on a new tunnel to open the mine at greater depth; the milling program of the American Smelting & Refining Co. at Leadville, which has stimulated the mining of base-metal ores in Lake and adjacent counties; and the resumption of placer mining in Park County on a large scale. The greatest deterrent to a larger output of ores from Colorado mines and the pursuit of more vigorous development in the mines was the extreme shortage of manpower. The shortage was more severe during the first 10 months of 1945 than in any other period during the war. The shortage of equipment and supplies was also evident in the postponement of the development programs at several mines throughout the State. Some relief from this labor shortage was noted during November and December 1945.

In June 1945 Congress passed legislation permitting continuation of the Premium Price Plan for copper, lead, and zinc until June 30, 1946. The plan was extended on about the same conditions as heretofore and included the noncancellation requirement, meaning that all classes of premiums shall be noncancellable unless necessary to make individual adjustments of income to specific mines. On June 16 the War Production Board announced revocation of its Limitation Order L-208, effective July 1, 1945.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Colorado in 1945, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	432,028	61,833	264,025	346,174	4,631,780	1,984,400
Dry and siliceous gold-silver ore	120,963	11,675	340,787	1,199,349	3,218,987	2,738,700
Dry and siliceous silver ore	74,532	265	563,844	111,646	1,504,291	195,400
	627,523	73,773	1,168,656	1,657,169	9,355,058	4,918,500
Copper ore	7,230	92	23,017	465,552	44,341	
Lead ore	7,229	1,087	55,048	14,824	1,570,506

Total, 1944	1,550,422	111,455	2,248,830	2,096,000	35,396,000	79,910,000

METALLURGIC INDUSTRY

Of the 1,357,551 tons of ore mined in 1945 in Colorado, 784,093 tons (58 percent) were treated at concentrating mills and 544,450 tons (40 percent) at amalgamation and cyanidation mills with concentrating equipment; 29,008 tons (2 percent) were shipped crude to smelters. Colorado has no zinc smelters, consequently all zinc concentrates produced were shipped out of the State; markets for these concentrates were had at Amarillo and Dumas, Tex., Depue, Ill., Palmerton, Pa., and Anaconda and Great Falls, Mont. The Arkansas Valley lead bullion-leady copper matte smelter at Leadville purchased most of the siliceous gold-silver and lead concentrates and silver, lead-copper, and lead ores shipped to smelters during the year; the Golden Cycle mill at Colorado Springs offered a market for nearly all the gold ores shipped for treatment. Smelters and custom mills in the Salt Lake Valley, Utah, became increasingly important as a market for zinc-lead ores and concentrates.

Mine production of metals in Colorado in 1945, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and concentrates amalgamated [1]	197,919	11,386	2,390			
Sands and slimes cyanided [2]	[3] 209,888	24,203	16,466	----------	----------	----------
Concentrates smelted	129,138	55,182	2,093,481	2,449,214	31,971,051	71,509,400
Ore smelted	29,008	2,263	113,048	520,786	2,116,949	36,600
Placer [1]	----------	7,901	1,395	----------	----------	----------
	----------	100,935	2,226,780	2,970,000	34,088,000	71,546,000
Total, 1944	----------	111,455	2,248,830	2,096,000	35,396,000	79,910,000

[1] Quicksilver used by amalgamation mills was approximately 1,314 pounds. Placer mines used approximately 81 pounds.
[2] Cyanide (in terms of 96 to 98 percent NaCN) used was 179,970 pounds.
[3] Comprises 131,076 tons of sands and slimes from ore first roasted and amalgamated and 78,812 tons of selective-flotation tailings.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Colorado in 1945, in terms of recovered metals

[1] Includes 2,915 ounces of gold and 1,459 ounces of silver recovered from amalgamating 159 tons of concentrates caught in gold trap of flotation mill.

The quantity of siliceous ores sold or treated decreased from 640,864 tons in 1944 to 627,523 in 1945 and all base metal ores from 909,558 to 730,028. Of the ore treated at concentrating plants, 258,449 tons were gold ore, 225,588 tons zinc-lead ore, 146,399 tons zinc ore, 94,353 tons gold-silver ore, 55,725 tons silver ore, and 3,579 tons lead, zinc-copper, and zinc-lead-copper. The classification of ores treated at the Golden Cycle mill, the only amalgamation-cyanidation-concentration mill active in Colorado in 1945, is discussed under El Paso and Teller Counties.

The destination and treatment of concentrates and ore produced by operators in the State are discussed in the following review by counties and districts.

By far the greater part of the placer gold and silver produced in 1945 came from a connected-bucket dredge in Park County; the remainder was recovered largely by hand-sluicing methods, and no accurate data on the yardage treated are obtainable.

Mine production of metals from concentrating mills in Colorado in 1945, in terms of recovered metals

ADAMS COUNTY

Sand and gravel handled in the washing plants by three operators on Clear Creek and the Platte River yielded gold as a byproduct in sluices operated by lessees.

BOULDER COUNTY

Central (Jamestown) district.—Nearly all the gold, silver, copper, and lead produced in the Central district in 1945 came as byproducts of mining and milling fluorspar ore. H. M. Williamson & Son operated the Argo, Brown Spar, and Emmett group of mines and treated 21,036 dry tons of fluorspar ore. Some gold was recovered by amalgamation and cyanidation from the John Jay and Invincible mines.

Gold Hill district.—The Ingram mine was operated from August through December and produced 563 tons of gold ore, which were shipped to the Golden Cycle mill. Aaron Stromberg shipped 324 tons of zinc-lead ore from the Gardner mine to the Golden Cycle custom mill for selective-flotation treatment. The property was operated from January through May. The partnership, Griswold & Stromberg, operated the Home Sweet Home mine from January through May and shipped 237 tons of gold ore to the Golden Cycle mill. Zinc-lead ore was produced from the Slide mines and siliceous ore from the Comet No. 2 and Tramway mines in 1945.

Grand Island district.—A small lot of silver ore was shipped from the Blue Bird mine to the Leadville smelter in 1945.

Sugar Loaf district.—Production from the Sugar Loaf district was principally gold ore shipped to the Golden Cycle mill for treatment; however, one lot of zinc-lead ore was shipped from the J. Albion claim. Mines active in the Sugar Loaf district in 1945 included the Poorman-Relief, Wood Mountain group, and Alpine Horn, all of which shipped gold ore to the Golden Cycle mill for treatment.

Ward district.—Charles W. Strong, Jr., worked the Boston Lode from October through December and shipped 26 tons of gold ore to the Leadville smelter.

CHAFFEE COUNTY

Granite district.—A small lot of gold ore from the Monogram mine was amalgamated and the bullion sent to the Denver Mint in 1945.

Monarch district.—The entire output of the Monarch district in 1945 came from the Alaska and Little Annie claims of the Garfield mine group, operated by S. E. Burleson. The property was active from April 28 through the remainder of the year. Production amounted to 1,454 tons of zinc ore, part of which was shipped to the Golden Cycle custom mill at Colorado Springs and the remainder to the Leadville milling unit of the American Smelting & Refining Co. at Leadville. The ore contained 48 ounces of gold, 5,004 ounces of silver, 14,794 pounds of copper, 39,584 pounds of lead, and 516,064 pounds of zinc. Some development was done in the mine, and it was reported that during December a body of copper-silver ore was opened up 58 feet below the tunnel level. The mine is developed by an 1,800-foot tunnel from which three winzes (30 feet, 40 feet, and 60 feet) and two drifts (30 feet and 85 feet) have been opened.

CLEAR CREEK COUNTY

Alice district.—Some clean-up from the Gold Bug mine was shipped to a smelter in 1945.

Argentine district.—O. Barlow Willmarth operated throughout most of 1945 the National, Sussex, and Newcastle claims in Grizzly Gulch 8 miles southwest of Georgetown. A total of 2,712 wet tons of zinc-lead ore from the property was treated in the Silver Spruce mill, which made 280 tons of zinc-lead middlings containing 168 ounces of gold, 2,297 ounces of silver, 3,785 pounds of copper, 246,830 pounds of lead, and 79,641 pounds of zinc. The middlings were shipped to the Midvale, Utah, concentrator for further treatment. On January 31, 1946, the three patented claims operated in 1945 and five claims held by location were sold to the Lupton Mining Co.

Cascade and Ute Creek district (Idaho Springs).—The Tyone Mining Co. shipped a small lot of silver ore from the Tyone (formerly Charter Oak) mine to the Leadville smelter in 1945.

Empire district.—Zinc-lead ore from the Ivanhoe dump and lead ore from the Atlantic mine (shipped to smelters) and gold ore from the Mint mine (shipped to the Golden Cycle custom mill) comprised the production from the Empire district in 1945.

Griffith district.—By far the largest producer of zinc and lead in the Griffith district and in Clear Creek County in 1945 was the Mendota mine at Silver Plume, operated continuously in 1945 by Wallace K. Howard in the name of the Utze Lode Mining Co. The ore was treated in the 100-ton Mendota mill, equipped for gravity and flotation concentration. Approximately 4,400 tons of ore were treated and made 512 tons of high-grade lead concentrates and 1,079 tons of zinc concentrates. The lead concentrates were shipped to the Leadville smelter and the zinc concentrates to the Midvale, Utah, smelter, which in turn shipped them to the Anaconda, Mont., electrolytic zinc smelter. The character of the ore is such that most of the lead can be concentrated into a high-grade product by jigging. To this product is added the lead flotation concentrate. Most of the development in 1945 consisted of drifting on the ore body. The Mile High Mining Co. operated the Smuggler mine and the Silver Leaf mill most of the year. Zinc and lead concentrates were produced and shipped to the Amarillo, Tex., and Leadville smelters. Zinc-lead ore was shipped to the Golden Cycle mill from the New Boston mine. A small tonnage of ore was produced from the Pelican, Payrock, and Stevens mines.

Idaho Springs district.—Virtually all the ore produced from the mines active in the Idaho Springs district in 1945 was concentrated at various custom mills in the State. A total of 2,655 tons of ore from the East Lake, Franklin, Bald Eagle, and Stanley mines was treated at the Golden Cycle mill at Colorado Springs. Local custom mills operating intermittently during the year included the Silver Spruce, Ruth, Chicago Creek, and Barrett. These mills treated 1,157 tons of ore from the Idaho Bride, Franklin, and Dixie mines. The concentrates produced were shipped to the Leadville and Tooele, Utah, smelters. A little placer gold was recovered from sluicing on Clear Creek.

Montana district.—The Jo Reynolds mine and dump operated under lease accounted for the entire production from the Montana district in 1945. S. S. Huntington milled approximately 3,700 tons of dump ore and made 108 tons of concentrates rich in silver, which were shipped to the Leadville smelter. Robineaux & Sperlach, lessees at the mine, shipped 380 tons of zinc-lead ore to the Golden Cycle mill and 53 tons of similar ore to the Leadville milling unit of the American Smelting & Refining Co.

Trail Creek district.—Zinc-lead ore from the Ben Harrison mine, operated by the Harrison-Croesus Mining Co., comprised the bulk of the output from the Trail Creek district in 1945. A total of 588 tons was shipped to concentrating mills—451 tons to the Golden Cycle mill at Colorado Springs and 137 tons to the Resurrection mill at Leadville. T. J. Traynor operated the Lone Tree mine and shipped a car of ore to the Golden Cycle mill for treatment.

COSTILLA COUNTY

Gold was recovered from a placer operation in Costilla County in 1945.

CUSTER COUNTY

Hardscrabble district.—The Lady Franklin mine near Westcliffe, the largest zinc producer in Custer County in 1945, was operated by George L. Beardsley the entire year. A total of 1,646 tons of zinc-lead ore was mined, of which 1,461 tons were shipped to the Golden Cycle mill for concentration and 185 tons to the Leadville milling unit of the American Smelting & Refining Co. Colgate & Hoge operated the Keystone mine throughout the year under lease agreement. A total of 1,732 tons of zinc-lead ore was produced, of which 1,584 tons were shipped to the Golden Cycle mill and 148 tons to the Leadville milling unit of the American Smelting & Refining Co. William A. Walker and partners worked the Defender mine throughout 1945 and shipped 795 tons of crude silver-lead ore to the Leadville smelter. The ore contained a total of 5 ounces of gold, 6,121 ounces of silver, 187 pounds of copper, and 208,353 pounds of lead. The New Hope Mining Co. from January to the end of September rehabilitated the New Hope property, retimbering the shaft and underground workings preparatory to further operations. On the surface, the roads leading to the property were repaired, and a commissary building and hoist house were built. During the period of rehabilitation, 329 tons of zinc-lead ore were mined, of which 227 tons were shipped to the Golden Cycle mill and 102 tons to the Tooele, Utah, concentrator for treatment. All operations were conducted by the New Hope Mining Co. under bond and lease until September, when the property was repossessed by Major Priorities, Inc., the owner. Crude zinc-lead ore from the Bull Domingo mine was shipped to the Golden Cycle mill, and a small lot of lead ore was shipped from the Passiflora mine to the Leadville smelter.

DOLORES COUNTY

Pioneer district (Rico).—The Rico Argentine Mining Co., one of the large producers of lead and zinc in Colorado, operated its extensive property near Rico continuously in 1945 and shipped lead and zinc concentrates to the Leadville and the Amarillo, Tex., smelters. Ore milled in the company 135-ton selective-flotation plant totaled 35,796 tons, averaging about 17 percent zinc and 9 percent lead. The lead concentrates produced (3,600 tons) contained 107 ounces of gold, 123,122 ounces of silver, 49,858 pounds of copper, 4,728,098 pounds of lead, and 461,165 pounds of zinc, and the zinc concentrates (8,127 tons) contained 64 ounces of gold, 41,324 ounces of silver, 163,552 pounds of copper, 370,707 pounds of lead, and 8,753,806 pounds of zinc. Development during the year comprised 157 feet of winzes and shafts, 5,637 feet of drifts and crosscuts, 788 feet of raises and inclines, and 3,128 feet of diamond drilling. Markey Bros. operated the Yellow Jacket group under lease from the Rico Argentine Mining Co. and shipped 266 tons of zinc-lead ore to the Midvale, Utah, concentrator; 153 tons were shipped also by A. C. Sampfel and H. Barnes from the North Lilly mine.

EAGLE COUNTY

Red Cliff district (Battle Mountain).—The Red Cliff district continued to rank first among Colorado districts in the total value of its production of the five metals. In 1945 the district produced 44 percent of the total output of recovered zinc in the State. The New Jersey Zinc Co. Empire zinc division operated its Eagle mine and 600-ton underground selective-flotation mill continuously during the year, maintaining an almost constant rate of production during all the year except for the period November and December, when output was lowered due to a fire underground. The previous high rate of production was resumed in January 1946. The ore mined and milled yields zinc concentrates chiefly, which are shipped to the company smelters at Depue, Ill., and Palmerton, Pa. Some lead concentrates were made and shipped to the Leadville smelter. Some copper-iron-silver-gold ore was shipped to the Leadville and Murray, Utah, smelters.

EL PASO COUNTY

GOLDEN CYCLE MILL

The Golden Cycle mill at Colorado Springs operated throughout the year on company and custom ores from nearly all mining districts in the State; 227,063 tons of ore of all classes were treated in 1945 compared with 221,543 tons in 1944. Of the total ore treated, 129,770 tons (113,565 tons in 1944) were company and custom gold-silver sulfotelluride ores from the Cripple Creek district (Teller County), and 97,293 tons (107,978 tons in 1944) were miscellaneous zinc-lead, zinc-lead-copper, and gold ores and middlings from Boulder, Chaffee, Clear Creek, Custer, Fremont, Gilpin, Gunnison, Lake, Park, Pitkin, Saguache, San Juan, San Miguel, and Summit Counties. The tonnage from the Cripple Creek district in 1945 was well over 50 percent dump ore; as a result, the average gold content of the ore was considerably below normal. The 500-ton selective-flotation unit of the mill handled approximately 96,112 tons of mostly complex zinc-lead sulfide ores in 1945. Because of the varied character of the ores purchased, the metallurgy is not always the same. Ores from the Cripple Creek district are roasted, amalgamated, and cyanided.

Complex ores containing base metals are first treated by selective flotation; the tailings from this operation are separated into sands and slimes and cyanided.

Owing to strikes at eastern zinc smelters during the latter part of 1945, the Golden Cycle Corp. notified all its shippers of complex ores that after December 1, 1945, no further shipments would be accepted. Ores in transit on December 1, however, would be accepted.

FREMONT COUNTY

Arkansas River district.—Thomas G. Stevens shipped ores of several classes from an old dump at the Florence smelter site to the Leadville and Coffeeville, Kans., smelters.

Cotopaxi district.—The Monarch Galena Co. operated its Cotopaxi mine throughout 1945 and shipped 3,862 tons of zinc ore to the Golden Cycle mill and the Leadville milling unit for treatment. The ore contained 97 ounces of gold, 8,372 ounces of silver, 115,118 pounds of copper, 109,354 pounds of lead, and 1,047,077 pounds of zinc. The company reported that the ore body mined from 1942 through 1945 was nearly exhausted, and mostly low-grade ore remains. The company also reported that development completed in 1945 comprised 100 feet of drifts.

Grape Creek district.—Christison & Van Buskirk operated the Horseshoe (School Section) mine throughout most of 1945 and shipped zinc-lead ore to the Golden Cycle mill for treatment. On November 11, 1945, the mine was acquired by Eichheim & Hart, which operated the property the remainder of the year and shipped 3 cars of zinc-lead ore to the Golden Cycle mill and the Leadville milling unit for treatment.

GILPIN COUNTY

Southern districts (Blackhawk, Central City, Nevadaville, Russell Gulch).—The Meeker-Success group operated by Eugene T. Richards and the Boodle mine operated by L. H. Griffith contributed the bulk of the output from mines in the Southern districts of Gilpin County in 1945. Crude siliceous ore (81 tons) was shipped from the Meeker-Success group to the Leadville and Midvale, Utah, smelters; in addition, approximately 300 tons of zinc-lead ore were milled, making zinc-lead concentrates, which were shipped to the Tooele, Utah, smelter. A little over 300 tons of zinc-lead ore from the Boodle mine were milled during 1945, making concentrates which were shipped to the Leadville and Tooele, Utah, smelters. Neeper & Co. operated the West Notaway mine intermittently during 1945 and shipped a total of 65 tons of copper ore to the Golden Cycle mill. Among other mines active in the district in 1945 were the Martin, Justice Hill Extension, Banta Hill, and Denver. Several small-scale placer operations on the North Fork of Clear Creek and in Russell Gulch were active during 1945. All the placer gold recovered was from hand sluicing.

Northern district.—A little gold was recovered from the Perigo mine dump in 1945.

GUNNISON COUNTY

Elk Mountain district.—A. D. Hahn shipped a test lot of ore from the Forest Queen group to the Leadville smelter in 1945.

Rock Creek district.—A. J. Betz worked the Catalpa mine in 1945 and shipped 89 tons of ore containing 306 ounces of silver, 3,021 pounds of copper, 9,419 pounds of lead, and 14,573 pounds of zinc to the Leadville milling unit of the American Smelting & Refining Co.

Taylor Park district.—A total of 225 tons of carbonate silver-lead ore was shipped crude to the Midvale, Utah, and Leadville smelters from the Bull Domingo mine on Italian Mountain by John Lambertson, part owner, and Jack McLain, under lease agreement; the operations were conducted separately. The Star mine, adjoining the Bull Domingo and connected to it by a drift, was operated nearly all year by John Lambertson; 42 tons of carbonate silver-lead ore were shipped to the Midvale, Utah, smelter.

Tomichi district.—The Callahan Zinc-Lead Co. continued to operate its Akron unit at White Pine during 1945. The unit comprises a large number of claims, of which only the Lost Contact and Sunset lodes were productive during the year. The property has no milling facilities; consequently the ore mined was shipped to the Midvale, Utah, concentrator, the Golden Cycle mill, and the Leadville milling unit of the American Smelting & Refining Co. for treatment. A total of 6,176 tons was treated which contained approximately 68 ounces of gold, 27,800 ounces of silver, 38,000 pounds of copper, 959,000 pounds of lead, and 1,300,000 pounds of zinc. The property is developed by a 3,000-foot adit (with 250 feet of raises and 1,000 feet of drifts) and an 800-foot adit (with 750 feet of drifts); 850 feet of new drifts were completed in 1945.

HINSDALE COUNTY

Lake district.—John M. Wells, lessee, shipped a test lot of copper ore from the Gold Quartz Lode to the Garfield, Utah, smelter in 1945.

JEFFERSON COUNTY

Placer gold was recovered from several small sluicing operations on Clear Creek in 1945.

LAKE COUNTY

California (Leadville) district.—One furnace of the American Smelting & Refining Co. Arkansas Valley lead bullion-leady copper matte smelter was operated during 1945. A total of 88,152 tons of material was received for treatment, of which 70,444 tons were considered of domestic origin and 17,708 tons of foreign origin. Over half of the material of domestic origin came from mines in almost every active mining district of Colorado; the remainder was largely residues from smelters or reduction plants in Illinois, Massachusetts, Maryland, New Jersey, Oklahoma, and Pennsylvania. Much of the material of foreign origin was transferred by the Metals Reserve Company from stocks held at eastern plants to Leadville in order to release lead.

In March 1945 the American Smelting & Refining Co. purchased the gravity- and flotation-concentration and amalgamation mills of the California Gulch Mining & Milling Co.—one 75- to 125-ton capacity and one 450-ton capacity. The larger mill was remodeled to handle the company ore from the Lucky Strike mine near Kokomo, Summit County, and custom ore from various shippers. The mill is known as the Leadville milling unit of the American Smelting & Refining Co. Operations at the mill commenced July 3 and continued the rest of 1945. Custom ore was received from operators in Clear Creek, Custer, Gunnison, Lake, Park, Pitkin, Saguache, San Juan, and Summit Counties.

The Resurrection Mining Co. operated its Resurrection mine the entire year and was the largest producer of lead and zinc in the county. The mine is developed by a vertical shaft 1,323 feet deep, with six different levels, and by a 4-mile tunnel at the surface which intersects the shaft at the 850-foot level. A total of 1,253 feet of development was completed in 1945, including 936 feet of drifts and 317 feet of raises. The property is equipped with a 600-ton selective-flotation mill which has two 300-ton units; only one unit was operated in 1945. The installation of a new flotation circuit was completed in 1945. Aside from the treatment of company zinc-lead sulfide ore, substantial quantities of custom ore from mines in Clear Creek, Lake, Park, and Summit Counties were handled. Virtually the entire mill feed in 1945 was complex zinc-lead ore and was concentrated into lead and zinc concentrates which were shipped to the Leadville and Amarillo, Tex., smelters.

The Ore & Chemical Co. 1,000-ton Heavy Media separation plant was operated until December 1, 1945, on ores from the R. A. M., North Moyer, Robert E. Emmett, Colorado No. 2, M. A. B., and Tucson dumps. The plant was idle throughout December due to strikes at zinc smelters which made it impossible to market the zinc-lead middlings produced. The Heavy Media plant is rated at 1,000 tons daily capacity, but the actual tonnage that can be handled depends largely on the character of the dump ore treated; it is smallest when material is wet, contains clay, and is fine. In 1945 the tonnage treated ranged from a low average of less than 600 tons to a high of well over 1,200 tons daily. During the 11 months of operation, approximately 251,000 tons of dump material were treated and made 52,882 tons of zinc-lead middlings which were shipped to the Golden Cycle mill for further concentration. The middlings were made up of both sink concentrates (obtained from the Heavy Media separation) and jig concentrates. The sink concentrates contain about 11.6 percent zinc and 4 percent lead, while the jig concentrates contain about 6.4 percent zinc and 3 percent lead.

John Hamm Mining & Milling, Ltd., operated its 600-ton gravity-concentration mill the entire year on ore from the Maid of Erin and Wolftone dumps. A total of 91,109 tons of dump material was reported as treated, making 28,277 tons of zinc-lead-silver jig concentrates which contained 724 ounces of gold, 131,851 ounces of silver, 287,198 pounds of copper, 1,789,437 pounds of lead, and 3,305,075 pounds of zinc. The concentrates were shipped to the Golden Cycle mill and Leadville milling unit for further concentration.

Ore was milled at either the Resurrection mill or Leadville milling unit from the Garibaldi dump and the New Monarch, Little Johnny, Ibex, Fortune, A. Y. & Minnie, Resurrection No. 1, Valley, Thomas Starr Placer, and Dolly B mines in 1945. Crude smelting ore was shipped to the smelter at Leadville from the New Monarch, Ibex, Commerce, Golden Eagle, Hummer No. 1, Rock, Matchless, Little Ellen, and Dolly B mines; several thousand tons of old slag from the American Smelting & Refining Co. dump were re-treated in 1945.

Tunneling operations on the new Leadville drainage tunnel were discontinued September 1, 1945, after the tunnel had been driven 6,600 feet. Late in 1945 it was reported that Steirs Bros. Construction Co., the contractor driving the tunnel, had removed all its equipment. The Bureau of Mines keeps a maintenance crew at the tunnel.

St. Kevin district.—Some clean-up was shipped to the Leadville smelter from the St. Kevin property in 1945.

LA PLATA COUNTY

California (or La Plata) district (Herperus, La Plata).—High-grade gold ore shipped to the Midvale, Utah, and Garfield, Utah, smelters from the Bessie G and Idaho mines was the only output from La Plata County in 1945.

MINERAL COUNTY

Creede district.—The Emperius Mining Co., which in 1945 controlled nearly all mining properties in the Creede district, operated its 100-ton flotation mill the entire year on ore from the Amethyst group of properties, New York group, Commodore group, Del Monte-Aspen group, and Equinox mine. The flotation mill was operated under lease until March 1945, when it was purchased from Creede Mills, Inc. No custom ores were purchased during the year; all ores milled were obtained from the properties on company account, with the exception of a small quantity mined by lessees. The mill was operated on a three-shift basis 7 days a week and treated 18,006 tons of ore, which contained 117 ounces of gold, 449,525 ounces of silver, 904,101 pounds of lead, and minor amounts of copper and zinc. The concentrates made (1,726 tons) were predominantly silver-lead and were shipped to the Leadville smelter; 43 tons of zinc-lead concentrates were shipped to the Tooele, Utah, smelter. The Ridge Mining Co. shipped 348 tons of lead ore to the Leadville smelter from the Ridge property.

MONTROSE COUNTY

La Sal district.—The New Cashin Mines, Inc., continued to ship copper fluxing ore to the Garfield, Utah, smelter from the Cashin group of claims.

San Miguel River district.—Some placer gold was recovered from gravels in the San Miguel River in 1945.

OURAY COUNTY

Red Mountain district.—Nearly all the production from the Red Mountain district in 1945 was shipped to the Midvale, Utah, concentrator. Six properties were productive during the year; the largest was the Genesee-Vanderbilt and Yankee Girl group of claims, which was operated by George E. Collins under lease. The property was worked throughout the year and produced 1,218 tons of zinc-lead-copper-silver ore, which contained 43 ounces of gold, 5,894 ounces of silver, 32,689 pounds of copper, 197,596 pounds of lead, and 189,721 pounds of zinc. The other mines active in the district in 1945 were the San Antonio group of mines, Lost Day, Galena, Belfast, and Ida L.

Sneffels district.—By far the largest producer in Ouray County in 1945 was the Camp Bird mine and its 100- to 125-ton amalgamation-flotation mill, operated the entire year by the King Lease, Inc. A total of 25,947 tons of gold-silver ore was treated, making 2,249 tons of zinc-lead-copper-silver-gold concentrates that were shipped to the Tooele, Utah, lead smelter for treatment. The bullion recovered by amalgamation was shipped to the Denver Mint. Development during the year included 812 feet of raises, 289 feet of drifts, and 2,104 feet of diamond drilling.

Uncompahgre district.—The Franz brothers, operating as the General Ore Reduction Co., continued to run a custom mill in Ouray in 1945. The mill made lead and zinc concentrates, all of which were shipped to the Midvale, Utah, smelter for smelting or transfer to the Anaconda, Mont., electrolytic zinc plant. J. R. Sonza, lessee of the Bachelor Consolidated mine, shipped approximately 4,200 tons of zinc-lead-silver ore to the General Ore Reduction Co. mill for concentration. The mine was rehabilitated through the use of a Reconstruction Finance Corporation loan, which has now been paid by earnings from the mine. The Southwest Metal Co. operated the Micky Breen mine and James H. Wardle the Terrible Queen; both shipped ore to the General Ore Reduction Co. mill for concentration.

PARK COUNTY

Alma Placers district.—Some gold was recovered by sluicing in 1945.

Beaver Creek district.—Sluicing on Beaver Creek yielded some placer gold in 1945.

Buckskin district.—The Buckskin Joe Mines, Ltd., operated its Phillips group of mines in Buckskin Gulch and the Alma-Betts 65-ton selective-flotation mill in Mosquito Gulch throughout 1945. The products of the mill were lead, zinc, and iron concentrates; a small lot of high-grade gold-silver-lead ore was shipped crude to the Leadville smelter. The company also operated the Baxter mine under lease and milled the ore making lead concentrates. A clean-up at the Criterion millsite and a test shipment from the Sweet Home mine constituted the only other production in the district in 1945.

Fairplay district.—The total value of metal production from Park County in 1945 increased 70 percent over 1944 and that of the Fairplay district from $70 in 1944 to $257,743 in 1945. The chief cause of both gains was the resumption of gold dredging by the South Platte Dredging Co. on July 12 after 3 years of idleness. Dredging was continued the remainder of the year. The property controlled by the company aggregates approximately 2,800 acres of ground along the South Platte River near Fairplay. The dredge is electrically powered and used 103 12-cubic foot buckets. In 1945, 2,204,795 cubic yards of gravel were washed, yielding about 7,300 fine ounces of gold and 1,280 ounces of silver. In 1945 the Lee Andrews, Gold Pan, and Cincinnati placers were worked. Lessees recovered some gold from the Snowstorm placer by sluicing.

Freshwater district.—Copper ore from the Betty and Futurity-Utopia mines shipped to the Garfield, Utah, smelter and zinc ore milled from the Betty accounted for the output from the Freshwater district in 1945.

Mosquito district.—The Alma Mills, Inc., treated a stock pile of ore from the North London dump in 1945 which had been hauled to the mill in 1944. The stock pile of 1,336 tons of gold ore required 24 days to concentrate, making 39 tons of gold concentrates which were shipped to the Leadville smelter. Some clean-up from the South London mill site was shipped to a smelter.

Pulver district.—The Great Western mine on Wilkerson Pass 10 miles west of Lake George was worked from January 1 to October 1945 by O. N. Sandholm; 1,090 tons of zinc-copper ore containing 8 ounces of gold, 15,137 pounds of copper, and 89,840 pounds of zinc and small amounts of silver and lead were shipped to the Golden Cycle mill for concentration.

PITKIN COUNTY

Roaring Fork district (Aspen).—The Midnight Mining Co. operated its Midnight mine and 50-ton selective-flotation mill the entire year. A total of 5,752 tons of ore containing 15.9 ounces of silver to the ton, 2.8 percent lead, and 2.2 percent zinc was concentrated by selective flotation into 225 tons of lead concentrates high in silver and 98 tons of zinc concentrates. Herron Bros. operated its 150-ton gravity-concentration mill throughout 1945 and treated approximately 12,000 tons of dump material from the Smuggler-Durant, Henry Clay, and Molly Gibson mines. The dump material was concentrated into 455 tons of zinc-lead-silver middlings, part of which was shipped to the Golden Cycle mill and the remainder to the Leadville milling unit for further treatment. In addition, 647 tons of silver-lead ore were shipped crude to the Leadville smelter. Jessen Bros. shipped 109 tons of zinc-lead ore from the Aspen Contact to the Tooele, Utah, smelter. Maintenance work at the Mountain Ranger mine resulted in production of 10 tons of lead ore, which were shipped to the Leadville smelter.

RIO GRANDE COUNTY

Summitville district.—The Gold Links mine comprises a large number of claims in the Summitville district near Wightman's Fork of the Alamosa River. The property, equipped with a 50-ton amalgamation and flotation concentration mill, was operated (under special grant from the WPB until July 1, 1945) throughout 1945 by the Gold Links mine, a lessee. A total of 948 tons of ore, averaging 0.47 ounce of gold to the ton, about 9 ounces of silver, and minor quantities of copper, was milled; 96 tons of gold concentrates were made and shipped to a smelter, and gold bullion was shipped to the Denver Mint.

ROUTT COUNTY

Milbank Franz worked the Greenville mine in the Hahns Peak area during 1945 and shipped 494 tons of zinc-lead ore to the Midvale, Utah, custom concentrator. The ore contained a total of 4 ounces of gold, 766 ounces of silver, 5,744 pounds of copper, 15,625 pounds of lead, and 139,073 pounds of zinc.

SAGUACHE COUNTY

Kerber Creek district (*Bonanza*).—The Superior-Erie group of mines was the most productive in Saguache County in 1945. During the first 3 months of the year Lester Pickering operated the group; thereafter, operations were by the Superior Mines Division of the Conejos Corp. A total of 4,754 tons of ore was shipped, containing 59 ounces of gold, 36,061 ounces of silver, 51,482 pounds of copper, 396,237 pounds of lead, and 811,156 pounds of zinc; 2,956 tons of the total ore were shipped to the Midvale, Utah, custom concentrator and the remainder to the Leadville milling unit of the American Smelting & Refining Co. The Pratt-Bonanza Mining & Milling Co. worked the St. Louis group of mines the entire year, completing 315 feet of tunnel development and 200 feet of drift development. The production—948 tons of ore containing 10 ounces of gold, 3,559 ounces of silver, 4,505 pounds of copper, 112,162 pounds of lead, and 168,906 pounds of zinc—was shipped to the Bauer, Utah, custom concentrator for treatment. Output from the Rawley mine amounted to 517 tons of copper ore shipped to the Garfield, Utah, smelter, 190 tons of lead ore to the Leadville smelter, and 48 tons of zinc-lead ore to the Midvale, Utah, custom concentrator. Other production shipped either to the Midvale, Utah, custom concentrator or the Golden Cycle mill came from the Warwick group of mines, Cora, and Little Johnny.

SAN JUAN COUNTY

Animas district.—The Shenandoah-Dives Mining Co. continued in 1945 to be the chief producer of metals in San Juan County. The company worked the Shenandoah-Dives consolidated group of claims on King Solomon Mountain and the Silver Lake group of properties, owned by the American Smelting & Refining Co. The Silver Lake property is connected underground by a crosscut from the Shenandoah workings. In 1945, 152,084 tons of ore from the Shenandoah-Dives and Silver Lake properties were milled in the 700-ton Shenandoah-Dives selective-flotation mill. The mill is on the Animas River near Silverton and is connected with the Shenandoah-Dives mine by an aerial tramway. A total of 4,205 tons of concentrates was made, including 2,493 tons of flotation lead concentrates, 1,012 tons of flotation zinc concentrates, and 700 tons of iron-gold-silver-lead table concentrates, containing in aggregate 17,238 ounces of gold, 142,968 ounces of silver, 404,047 pounds of copper, 2,258,893 pounds of lead, and 1,602,004 pounds of zinc. The lead and iron concentrates were shipped to the Leadville smelter, and the zinc concentrates were shipped to the Amarillo, Tex., smelter. Development completed was 1,935 feet of drifts, 64 feet of raises, and 757 feet of diamond drilling. A small quantity of custom ore was treated in the mill from the Bandora, Kittimac, Mountain Queen, and Lead Carbonate mines, all in San Juan County.

The Denver Equipment Co., as agent, operated the Pride of the West group and Green Mountain mines and the Pride of the West concentrator at Howardsville during 1945 for the owners of the property, Pride of the West, Inc. The Pride of the West group was worked throughout the year, while the Green Mountain mines were active only part of the year, due to winter conditions. The concentrator at Howardsville is a 100-ton selective-flotation mill and in 1945 handled 27,473 tons of ore and made 2,159 tons of combined flotation and jig lead concentrates and 401 tons of zinc concentrates. Due to the low zinc content of the ore from the Pride of the West group of mines, no zinc concentrates were made when the mill feed came only from this group. Reserves of broken ore were increased during 1945 to a point that virtually assures capacity operation of the mill. Some additional grinding equipment was installed in the mill during the year; development completed in the mines amounted to 1,616 feet of drifts and 1,674 feet of diamond drilling.

Highland Mary Mines, Inc., operated its Highland Mary mine and 100-ton selective-flotation mill in Cunningham Gulch from May 7 until December 28, 1945. Due to snowslides in Cunningham Gulch the operation is seasonable, closing down for about 4 or 5 months during the winter. Attempts are being made to shorten the shut-down period or to eliminate it. The vein being mined is the southerly extension of the Shenandoah-Dives vein worked by the Shenandoah-Dives Mining Co. The main working level is entered by way of the Bradley crosscut at an elevation of 11,350 feet; ore is trammed about 3,000 feet to the portal by mule power. Ore is crushed to 1 inch at the mine portal and delivered to an aerial tram 1,200 feet long, which carries it to the concentrating mill approximately 650 feet below the mine portal. The tonnage of ore treated during 1945 was more than double that in 1944 due to the increased capacity of the mill. The mill makes a bulk flotation concentrate with a jig for recovering free gold. The bulk concentrate and jig concentrate were shipped separately to the Leadville smelter. During the period of operation, 13,028 tons of ore containing approximately 2,866 ounces of gold, 64,749 ounces of silver, 41,689 pounds of copper, 604,499 pounds of lead, and 44,295 pounds of zinc were concentrated into 964 tons of gold-silver-copper-lead concentrates. Mine development completed in 1945 amounted to 375 feet of drifts.

Zinc-lead ore from the Lark mine was shipped to the Golden Cycle mill for treatment, and the Kittimac mine produced 211 tons of ore which were milled at cutsom plants. A car of lead ore was shipped from the Belcher mine to the Leadville smelter.

Eureka district.—The Foursome Mining Co. operated the Columbus mine from June 22 to the end of the year and shipped 184 tons of ore to the Golden Cycle mill and 417 tons of ore to the Leadville milling unit for treatment. Ore for milling was shipped either to the Shenandoah-Dives mill or Tooele, Utah, custom concentrator from the Burrows, Lead Carbonate, and Mountain Queen mines. Ore was shipped also from the Mountain Queen to the Leadville smelter.

Ice Lake Basin district.—Esmeralda Lease operated the Bandora mine from May 10 to September 7; 182 tons of zinc-lead ore were shipped to the Shenandoah-Dives mill.

SAN MIGUEL COUNTY

Iron Springs district.—Dan Roth amalgamated a small quantity of gold ore from the Commercial mine in 1945.

Upper San Miguel district (Telluride).—Telluride Mines, Inc., operated throughout 1945 but on a much smaller scale than in 1944, due to lack of manpower. The company 550-ton amalgamation and gravity- and flotation-concentration mill at Pandora 2½ miles east of Telluride treated company ore from the Smuggler Union, Montana, and Cimarron mines. Mill tonnage was augmented by ore from the Tom Boy and Argentine dumps. The lead and zinc concentrates made were shipped to the Midvale, Utah, smelter and to the Anaconda, Mont., electrolytic zinc plant, respectively. Gold bullion was recovered by amalgamating gold concentrates caught in a jig placed in the mill circuit at the discharge of the ball mill; the bullion was sent to the Denver Mint. Development of the property continued during the year, and toward the end of 1945 surface work was begun for a low-level adit.

The production of the Idarado Mining Co. is credited to San Miguel County, although the property is developed and worked through the 12,000-foot Treasury tunnel, with its portal in Ouray County; the ore comes from claims in San Miguel County. During 1945 the Idarado continued to develop its Black Bear property through the Treasury tunnel, although operations were handicapped by a shortage of labor and absenteeism. The 300-ton selective-flotation mill built during 1944 at the portal of the Treasury tunnel was operated the entire year. A total of 46,662 tons of gold-silver-copper-lead-zinc ore was milled, and the lead-copper concentrates recovered were shipped to the Leadville smelter, the copper concentrates to the Garfield, Utah, smelter, and the zinc concentrates to the Amarillo, Tex., smelter. The addition of more mill capacity during 1946 was planned. The Black Bear vein was developed for a considerable distance along the strike of the vein for stoping on the Treasury tunnel level. Some progress was made on the raise from the Treasury tunnel level to the old Black Bear workings 1,100 feet above. At the end of the year the raise had advanced over 400 feet. Intermediate levels were cut at 200 and 375 feet and are being developed each way along the vein. Development in 1945 included 1,350 feet of drifts completed, 594 feet of raises, and 534 feet of diamond drilling.

The Alta Mines, Inc., continued full-year operation of its 100-ton flotation mill and Alta-St. Louis mine. Production was smaller than in 1944 due to acute shortage of labor; however, 32,914 tons of gold ore were mined and milled, which made 1,530 tons of lead-copper concentrates. Some gold ore was amalgamated in 1945 from the Allegheny and Orion lodes.

SUMMIT COUNTY

Breckenridge district.—The bulk of the output from the Breckenridge district in 1945 was zinc and zinc-lead ore shipped to custom milling plants. The Sally Barber mine was operated by F. P. Lilly and T. C. Moran under lease agreement; 1,377 tons of zinc ore containing over 30 percent zinc were shipped to Midvale and Tooele, Utah, concentrators. The Golden Cycle Corp. operated its Monte

Cristo mine from June 26 to November 27, 1945, and mined 3,843 tons of zinc-lead ore. The ore contained 202 ounces of gold, 20,464 pounds of copper, 403,745 pounds of lead, and 296,664 pounds of zinc and was shipped to the company selective-flotation concentrator at Colorado Springs. The Garvie London Gold Mining Co. operated its Country Boy mine throughout 1945 and shipped 1,657 tons of ore to the Resurrection Mining Co. mill at Leadville; the ore contained 82 ounces of gold, 4,086 ounces of silver, 1,345 pounds of copper, 23,074 pounds of lead, and 642,501 pounds of zinc. Some gold ore was shipped from the Jumbo mine.

Green Mountain district.—Walter McDaniel shipped zinc ore from the Big Four mine to the Combined Metals Reduction Co. custom mill at Bauer, Utah, during 1945.

Montezuma district.—The Florado Mining Co. operated the Pinnacle claim throughout the year, but its 100-ton flotation mill was operated intermittently. Approximately 1,500 tons of lead ore were handled, making 154 tons of lead concentrates shipped to the Leadville smelter. About 240 tons of lead ore from the Silver King mine were treated by the Summit Mining & Milling Co. in its 25-ton flotation mill; only part of the concentrates made was marketed—the remainder was stored. Jeffrey & Ulibarri operated the Erickson mine and shipped 211 tons of zinc-lead ore to the Leadville milling unit and 60 tons of lead ore to the Leadville smelter. Other mines in the Montezuma district in 1945, from which ore was trucked to either the Leadville milling unit or to the Resurrection mill at Leadville, included the New York, Ida Belle, Rose, Morgan Group, and Superior.

Ten Mile (Kokomo, Robinson) district.—The Ten Mile district assumed added importance as a zinc and lead producer in 1945. The output of lead nearly trebled and zinc nearly doubled, as compared with 1944. The American Smelting & Refining Co. operated its Lucky Strike group of properties (Washington & Hancock group of mines) the entire year. The operation in the Ten Mile district is known as the Kokomo unit. The mine ore was shipped to the Resurrection mill at Leadville during the first 5 months of the year; after that it was shipped to the company Leadville milling unit. The tonnage shipped for treatment was virtually all zinc-lead mill ore; however, about one-half a car of lead ore was shipped direct to the Leadville smelter. The property is developed by the Victory tunnel, which is approximately 1,000 feet long; 700 feet of drifts were completed as development in 1945. Both the Resurrection mill and the Leadville milling unit received zinc-lead ore from the Wilfley mine, which was worked throughout 1945 by the Wilfley Leasing Co. A total of 7,401 tons of ore (including about 1,200 tons of dump ore) was shipped and contained 444 ounces of gold, 30,095 ounces of silver, 322,564 pounds of lead, 1,377,753 pounds of zinc, and some copper. Considerable development—mainly diamond drilling with the purpose of locating deeper ore—was completed during the year. The Kokomo Metals Consolidated Co. operated the Nettie B mine and shipped zinc-lead ore to the Resurrection mill until June, after which no shipments were made during the balance of the year; on August 1, R. E. Mackey began a development program which continued the remainder of 1945. Zinc-lead-silver ore was shipped from the Wilson and Kimberly mines to custom concentrators at Leadville and Colorado Springs. Some silver ore and lead ore were shipped to the Leadville smelter from the Golden Queen mine.

TELLER COUNTY

CRIPPLE CREEK DISTRICT

The Cripple Creek district yielded 28 percent of the total gold production of the State in 1945. From 1891, when gold was discovered in the area, through 1945 the district has yielded 18,525,259 fine ounces of gold valued at $401,958,547, or 48 percent of the State total output of gold from 1858 to 1945, inclusive. The total production of ore from Cripple Creek mines and dumps in 1945 was 129,770 tons, all treated in the Golden Cycle mill (see El Paso County).

MINES REVIEW

Operations of the Golden Cycle Corp., which owns and operates the Golden Cycle mill at Colorado Springs and several mines in the Cripple Creek district, are described in the following extract from its annual report to stockholders for the year ended December 31, 1945 (dated March 25, 1946):

We have endeavored to keep stockholders fully informed about War Production Board Order L–208 and its effect upon our activities. This order was repealed July 1, 1945, but its removal did not bring the immediate relief we had hoped for. The drastic shortage of labor, miners, and materials for all our operations continued throughout the year. We hope these conditions will become better during 1946 and that we can start the long road back to the resumption of normal operations.

Production of strategic metals.—(1) During 1945 a total of 96,112 tons of complex ore with a total gross value of $702,234.76 was purchased from shippers for the production of zinc-lead concentrates. It is significant to note that the complex ore purchased during this period contained the following strategic metals: 14,882,879 pounds of zinc; 6,292,547 pounds of lead; 808,296 pounds of copper; 414,845 ounces of silver; and 3,785 ounces of gold; gross value $702,234.76.

(2) During the year 10,904 tons of zinc concentrates were shipped to smelters of the American Zinc Co. at Dumas, Tex., and Carondelet, Ill.; and 4,914 tons of lead concentrates were shipped to the American Smelting & Refining Co. at Leadville, Colo.

(3) Zinc-lead ore for treatment at the Golden Cycle mill at Colorado Springs was received during the year from mines located in and near Leadville, Montezuma, Kokomo, the Bonanza district, Alma, Clear Creek County, San Juan County, and other mineralized areas of Colorado.

(4) During the summer of 1945 the Golden Cycle Corp. engaged on its own account in the mining of lead-zinc ore on the Monte Cristo property, located near the top of Hoosier Pass, Summit County, Colo.

(5) Some royalty was received from the Wilson group of mining claims, located in the Kokomo mining district, near Leadville, Colo., a portion of which is now under lease to the American Smelting & Refining Co.

Gold-mining operations. Ajax, Anchoria Leland, Cameron, and Index mines.—Gold-mining operations in the Cripple Creek mining district during 1945 reached the lowest level in the entire history of the Cripple Creek district. It was hoped that, with the lifting of War Production Board Order L–208 and the end of the war, considerable numbers of miners and lessees would quickly return to the Cripple Creek mining district. However, this did not materialize and, while the labor condition now shows some betterment, it will still be necessary for additional hundreds of miners and lessees to return to the Cripple Creek district before normal operations can be resumed.

Total ore production from the Cripple Creek mining district during 1945 shipped to the Golden Cycle mill at Colorado Springs was 129,770 tons, with an average value of $8.719 per ton and total gross value of $1,131,502. Of this total tonnage Golden Cycle mine properties produced 31,645 tons with an average per ton value of $12.21. Of the 31,645 tons, 10,792 tons came from the Granite dump at the Ajax mine. The average value of the dump ore was only $3.32 per ton, but this tonnage was shipped to help maintain sufficient tonnage for the operation of the Midland Terminal Railroad and the Golden Cycle mill.

Operating as a lessee, the Golden Cycle Corp. also shipped, from the Theresa dump, owned by the United Gold Mines Co., 44,940 tons of dump ore, with an average value of $3.25 per ton.

Of the total ore received by the Golden Cycle mill during the year, 75 percent was dump ore, and this fact accounts for the low average per ton value of the gold ore treated at the mill during the past year.

Ajax operation.—During 1945 the Ajax operations were greatly curtailed due to the shortage of men and materials. However, a special effort was made to do as much development work as possible. During the year 4,692 feet of drifts, crosscuts, and raises were completed, and the result of this development work was satisfactory since a number of ore shoots were opened up in the lower levels of the mine. During the year 11,868 tons of ore with an average value per ton of $20.90 were shipped to the mill. In the same period Ajax lessees shipped 5,710 tons of ore with an average value of $13.06 per ton.

Preparations to commence stoping ore are now being made, particularly on the 27th level of the mine, and we hope that during 1946 the production from the Ajax will be increased over 1945.

Anchoria Leland.—During 1945 the entire production of this property was accounted for by lessees. The company did not work on the property except to maintain and operate the shaft for the accommodation of split-check lessees. Lessees' production during the year amounted to 3,247 tons with an average value of $8.52.

Cameron and Index.—No work was done on either of these two properties during the year.

Summary of gold mining operations.—It is still impossible to forecast with any certainty the immediate future of our corporation. It is hoped that during 1946 miners and lessees will return to the Cripple Creek district at an accelerated rate. Without sufficient manpower we cannot expect to get our properties back upon a normal basis.

The gold-mining industry is also faced with added labor and material costs, and these factors, coupled with the fact that the selling price of gold is fixed by the Government, furnish an added hardship for us to overcome.

Carlton drainage tunnel.—The Carlton drainage tunnel functioned perfectly during 1945 and no trouble of any kind was experienced with its operation. The water flow remained constant during the year at approximately 4,500 gallons of water per minute. The value of this tunnel both to present and to future operations of the Cripple Creek mining district cannot be overestimated. Because of the drainage from the tunnel we were enabled during 1945 to work the lower levels of the Ajax and Portland mines and the best grade of ore shipped from the Cripple Creek mining district during the year was from these properties.

The annual report of the United Gold Mines Co., an operating and holding company for property scattered throughout the Cripple Creek district, for the year ended December 31, 1945 (dated February 1, 1946), gives the following details on operations at individual mines:

Operating loss in 1945 was $408 vs. operating loss in 1944 of $16,792, or a betterment of $16,384. Production from the United Gold Mines properties during the year was 82,893 tons with a gross value of $553,062, or an average of $6.67 per ton. This compares to production in 1944 of 67,885 tons with a gross value of $478,455, and an average value of $7.05 per ton. Of the 1945 production 44,940 tons with a total gross value of $146,228, and an average per ton value of $3.25 was shipped from the Theresa dump. While the production for 1945 was somewhat better than 1944 the production was still far below normal in both tonnage and value

The Cripple Creek district is still badly in need of miners and lessees. It was hoped that men would return to the district in large numbers after VJ-day, but this has not materialized. The latter part of 1945 there was a slight betterment in the numbers of miners and lessees returning to the Cripple Creek mining district, but the return is very slow and the Cripple Creek district still suffers from a drastic lack of manpower. Some betterment has taken place in the number of lessees operating on United Gold Mines property and it is hoped during 1946 that additional operators will be interested in leasing various portions of our properties.

Many of our properties did not operate during the year. A résumé of the chief operations which were carried on is as follows:

Portland operation.—Operations carried on through Portland No. 1 and No. 2 shafts showed an improvement over preceding year. The number of sets of lessees increased from eight in January 1945 to fourteen in December 1945. Company operations were carried on in the lower levels of No. 2 shaft at a fairly constant rate throughout the year. 928 feet of development work was done.

Pulling old stope fill together with a limited amount of stoping accounted for 6,596 tons of ore with an average value of $13.23 per ton.

Lessees accomplished 1,820 feet of development work and shipped 4,244 tons of ore, with an average value of $36.47 per ton. This is the highest average value of lessee ore from the Portland in many years and was due to the fact that one lessee shipped in the early part of 1945 a considerable tonnage of exceptionally high-grade ore.

Vindicator operation.—The Vindicator shaft was closed down almost two months during the year while the hoist was overhauled and a new main shaft installed.

Lessees shipped 10,835 tons of ore, with an average value of $6.37 per ton. The company shipped 1,384 tons with an average value of $3.75 per ton.

Lessees accomplished 1,309 feet of development work during the year. No company development work was done during 1945.

Miscellaneous operations.—The Rose Nicol was closed down during the entire year, due to the lack of sufficient manpower to operate.

The Patti Rosa was the only property on Bull Hill to operate throughout the year and accounted for most of the ore shipped from the Bull Hill group of the United Gold Mines.

A fair tonnage of crushed rock was shipped during the year. This production also resulted in the company shipping 3,754 tons of rock screenings with an average value of $4.96 per ton.

Production of company ore by United Gold Mines Co. in 1945

Mine	Net tons	Gross value [1]	Company ore cash receipts	Average gross value per ton [1]
Vindicator	1,384	$5,193	$1,167	$3.75
Rose Nicol	87	567	280	6.56
Portland	6,596	87,266	54,768	13.23
No. 2 Plant	3,754	18,611	7,198	4,96
Theresa-Cycle Dump	44,940	146,228	11,235	3.25
	56,761	257,865	74,648	4.54

[1] Settlement value.

The annual report of the Cresson Consolidated Gold Mining & Milling Co. for the 12 months ended December 31, 1945 (dated February 1, 1946), says—

PRESIDENT'S REPORT

No mining was carried on in the Cresson mine during 1945 due principally to the continued drastic labor shortage. While the labor situation has become somewhat better in the Cripple Creek mining district since VJ-day, there are still insufficient men available to start up and operate the property. Competition of nearby areas has kept much labor from returning to the district. We hope by mid-1946 labor and other conditions will have improved sufficiently to permit us to reopen and continue operating the property.

During the year maintenance work was continued and retimbering of the main shaft completed. The shaft is now in the best condition it has been in for 25 years. Much work was also done on the ore house and bins. These improvements are of a permanent nature and should last for many years. Timber foundations under the ore house and ore bins for the past years have been a steady source of difficulty and expense and it is expected that the new work done during 1945 should eliminate much trouble and expense.

Before the mine can be reopened several weeks of repair work on the hoist and boilers will be necessary. This will be done as soon as possible so the mine will be in readiness to reopen when sufficient labor is available.

When the Cresson property is reopened development work will be of the utmost importance. The upper levels above the Roosevelt drainage tunnel have been operated for many years and cannot be expected to produce ore in the same quantities as in the past. The area between the Roosevelt and Carlton drainage tunnels must be developed as the primary source of ore for future years. One of the first major development projects which should be carried out is to drive the lateral on the Carlton drainage tunnel level from the Portland shaft to the Cresson ground so complete drainage can be had. The length of this lateral will be approximately 4,000 feet.

During 1945 only 1,622 tons of ore with a gross value of $28,222 was shipped by lessees and the company. Part of this ore was mined by lessees working through the Rose Nichol shaft on the Cresson property and part was clean-up from under the Cresson ore bins.

Production of Cresson Consolidated Gold Mining & Milling Co., 1903 to Dec. 31, 1945

Period	Dry short tons	Gross value [1]	Freight and treatment	Net value
1903 to Dec. 31, 1944	3,216,736	$46,443,045	$15,342,779	$31,100,266
1945:				
Company ore	192	4,227	1,344	2,883
Lessee ore	1,430	23,995	8,107	15,888
1903 to Dec. 31, 1945	3,218,358	46,471,267	15,352,230	31,119,037

See footnotes at end of table.

Production of Cresson Consolidated Gold Mining & Milling Co., 1903 to Dec. 31, 1945—Continued

Period	Royalties received by company	Amount paid lessees	Average gross value per ton	Average net value per ton	Dividends
1903 to Dec. 31, 1944			$14.44	$9.67	$13,564,673
1945:					
Company ore			21.90	14.94	
Lessee ore	$2,787	$13,101	16.78	11.11	
1903 to Dec. 31, 1945			14.44	9.67	[2] 13,564,673

[1] Settlement value.
[2] Represents 29.19 percent of gross value and 43.59 percent of net value.

Shipments from the Stratton Estate properties in 1945 totaled 3,816 tons of gold ore produced by lessees on the Logan, Specimen, War Eagle, Porcupine, and Proper claims in the Bull Hill group and Block 107 in the Globe Hill group of mines. Other producing mines and dumps in the Cripple Creek district in 1945 included, in order of production, the Mary McKinney, Tenderfoot group, Joe Dandy, Mary Cashen, Queen, School Section, Empire Lee, Dr. Jackpot, New Gold Dollar, Free Coinage, and Home & Homestead.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN THE EASTERN STATES

(MINE REPORT)

By A. J. Martin

SUMMARY OUTLINE

SUMMARY

The most significant events of 1945 affecting metal mining were the surrenders of Germany in May and of Japan in August, which removed military necessity as the governing factor in many phases of mining operations. To the end of the year, however, there had been no substantial change in mine-production rates of gold, silver, copper, lead, or zinc in the Eastern States. The yearly output of each of these metals was lower in 1945 than in 1944, owing mainly to the cumulative adverse effect of prolonged curtailment of development work, caused by manpower shortage, and the fact that the most crippling stage of the mine labor shortage came in 1945. The quantity of zinc produced decreased 11 percent from 1944 and was the lowest since 1934. Notwithstanding the drop in zinc production, the Eastern States contributed 25 percent of the total United States mine output, as in 1944. The Eastern States production of the other four metals is comparatively small; in recent years it has been 1 or 2 percent of the total domestic output for copper and lead and less than 1 percent for gold and silver. War Production Board Limitation Order L–208 was revoked, effective July 1, 1945, but this action had not resulted in the reopening of any important gold mine in the Eastern States by the end of the year. Nearly all the gold and silver output was recovered as a byproduct of the mining of other metals.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported, except that of zinc in New Jersey, has been calculated at the prices in the following table. The value of the New Jersey output is the total value of the zinc recoverable as metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Annual figures for the 5 years ended with 1945 are given in the table that follows. The figures for tonnage of ore sold or treated do not include magnetite ore containing pyrite and chalcopyrite, from which copper, gold, and silver were recovered as byproducts.

Mine production of gold, silver, copper, lead, and zinc in the Eastern States, 1941–45, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons) [1]	Gold (lode and placer) [2]		Silver (lode and placer) [3]	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	43	14	3,780,397	21,982	$769,370	106,051	$75,414
1942	36	17	4,130,226	14,699	514,465	105,307	74,885
1943	29	3	4,211,961	2,878	100,730	128,129	91,114
1944	26	2	4,202,461	2,595	90,825	124,006	88,182
1945	24	----------	3,718,073	1,857	64,995	81,983	58,299

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Short tons	Value	Short tons	Value	
1941	27,132,000	$3,201,576	5,513	$628,482	191,310	$29,484,423	$34,159,265
1942	28,404,000	3,436,884	4,475	599,650	199,809	36,190,180	40,816,064
1943	28,490,000	3,703,700	4,843	726,450	199,233	39,225,222	43,847,216
1944	30,098,000	4,063,230	6,266	1,002,560	176,327	35,977,536	41,222,333
1945	24,910,000	3,362,850	5,159	887,348	156,269	31,520,742	35,894,234

[1] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.
[2] Includes placer gold as follows: 1941, 203 ounces; 1942, 69 ounces; 1943, 12 ounces; 1944, 5 ounces.
[3] Includes placer silver as follows: 1941, 15 ounces; 1942, 2 ounces; 1943–45, none.

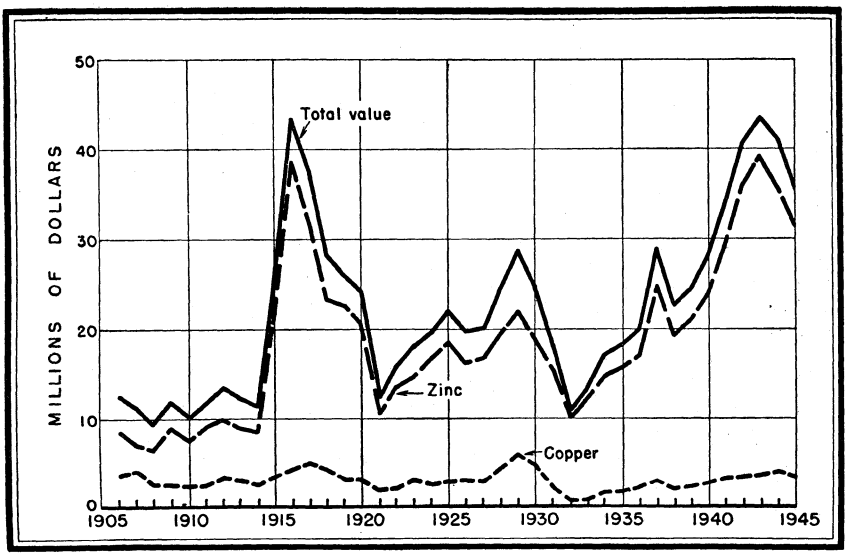

FIGURE 1.—Value of zinc and copper and total value of gold, silver, copper, lead, and zinc in the Eastern States, 1906–45. The combined value of gold, silver, and lead has not exceeded $1,485,660 annually in any year of the period.

Mine production of gold, silver, copper, lead, and zinc in the Eastern States in 1945, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	162	7,438	993	495	14,572
February	155	8,237	939	393	12,360
March	181	9,760	1,086	487	13,853
April	180	7,716	1,078	533	12,714
May	143	4,187	1,018	440	13,497
June	121	4,260	1,015	284	13,547
July	132	3,418	1,044	295	11,814
August	138	3,473	1,034	279	12,461
September	191	12,299	1,038	434	12,554
October	139	7,528	1,045	568	14,533
November	154	6,324	1,001	516	13,131
December	161	7,343	1,164	435	11,233
	1,857	81,983	12,455	5,159	156,269

Gold.—Revocation of WPB Limitation Order L–208, effective July 1, 1945, resulted in little immediate expansion of activity in gold mining in the Eastern States. Most of the gold produced in 1945, as in the 2 preceding years, was recovered as a byproduct from magnetite-pyrite-chalcopyrite ore from the Cornwall mine in Lebanon County, Pa. The gold from this mine was contained in copper concentrates shipped to the Phelps Dodge smelting and electrolytic-refining plant at Laurel Hill, N. Y. A little gold was recovered from copper-iron ore from the Tennessee Copper Co. mines in Polk County, Tenn., from copper ore from the Elizabeth mine in Orange County, Vt., from zinc-lead ore from the Valzinco mine in Virginia (closed in January), and from old tailings from the Hog Mountain gold mine in Alabama.

The principal producers of gold when the wartime shut-downs occurred in 1942 were the Haile gold mine in Lancaster County, S. C., and the Condor (old Howie) in Union County, N. C., both equipped with cyanidation mills. The estimated output of gold in the Southern Appalachian States from 1799 to 1945 is recorded as follows:

Mine production of gold in the Southern Appalachian States, 1799–1945

State	Period	Fine ounces	Value	State	Period	Fine ounces	Value
Alabama	1830–1945	49, 494	$1, 198, 950	South Carolina	1829–1945	318, 801	$7, 562, 125
Georgia	1830–1945	870, 526	18, 084, 257	Tennessee	1831–1945	20, 870	478, 080
Maryland	(1) –1945	6, 102	163, 940	Virginia	1828–1945	167, 558	3, 577, 509
North Carolina	1799–1945	1, 164, 588	24, 327, 843	Total	1799–1945	2, 597, 939	55, 392, 704

[1] Year of first production not recorded.

Silver.—The mine output of silver in the Eastern States in 1945 comprised 56,370 ounces recovered from copper and copper-iron ores from Tennessee, Vermont, and Virginia; 15,178 ounces from zinc-lead ore from New York and Virginia; 10,434 ounces from magnetite-pyrite-chalcopyrite ore from Pennsylvania; and 1 ounce from old gold-silver tailings from Alabama.

Copper.—The Ducktown district in Polk County, Tenn., is the principal copper-producing district in the Eastern States. There were four producing mines in this district in 1945, all owned and operated by the Tennessee Copper Co. The ore contains heavy sulfides of iron, copper, and zinc; in recent years the values of both the iron and the sulfur (recovered as sulfuric acid) have exceeded the value of the copper. The Pennsylvania output of copper was recovered as a byproduct of iron mining at the Cornwall mine of the Bethlehem Steel Co. in Lebanon County. The ore contains chiefly magnetite but carries pyrite and chalcopyrite, which are treated by flotation to produce pyrite concentrates and copper concentrates. The Vermont production continued to come from the Elizabeth copper mine in Orange County, operated by the Vermont Copper Co. Nearly all the 70 tons of copper shown for Virginia was contained in copper ore shipped from the Toncrae mine in Floyd County; a few tons were recovered from zinc-lead ore mined in January from the Valzinco property in Spotsylvania County.

Lead.—The lead output of the Eastern States in 1945 was derived chiefly from zinc-lead sulfide ore from the Austinville mine in Virginia and zinc-iron-lead sulfide ore from the Balmat in New York. The other lead-producing mines were the Embree in Tennessee, which shipped lead carbonate concentrates in December, and the Valzinco zinc-lead mine in Virginia, operated in January only. The total output of recoverable lead was 5,159 tons in 1945, a decrease of 18 percent from 1944.

Zinc.—The mine production of recoverable zinc in the Eastern States in 1945 was 156,269 tons—a decrease of 11 percent from 1944 and 22 percent from the record output of 199,809 tons in 1942 and the almost equally high output (199,233 tons) in 1943. In New Jersey, the leading producer in the Eastern States, production of zinc recoverable as metal or in oxide amounted to 81,392 tons in 1945 compared with 80,288 tons in 1944 and 92,864 tons in 1943. The output in Tennessee decreased from 41,766 tons in 1943 to 40,831 tons in 1944 and 33,824 tons in 1945. The New York production, which was 46,000 tons in 1943, decreased to 35,541 tons in 1944 and 24,978 tons in 1945. The output in Virginia was 18,603 tons in 1943, 19,667 tons in 1944, and 16,075 tons in 1945. The heavy decreases in production in the past 2 years were attributed largely to labor shortage, which severely hampered mining and development operations. The average cost to the Government under the Premium Price Plan of zinc produced by mines in the Eastern States during the war was considerably lower than the average for the rest of the country. Some of the large zinc and zinc-lead mines operated from February 1, 1942, the effective date of the Premium Price Plan, through 1945 without receiving premium payments for any part of their output. In 1942 and 1943 less than 5 percent of the total "mine" value of the zinc concentrates (calculated for all concentrates upon the basis of the average grade and value reported for the New York, Tennessee, and Virginia concentrates) represented premium payments for overquota production, and in 1944 and 1945 only 7 percent represented premium payments.

MINE PRODUCTION BY STATES

Mine production of gold, silver, copper, lead, and zinc in the Eastern States in 1945, by States, in terms of recovered metals

State	Mines producing		Ore (short tons)	Gold			Silver (all lode)	
	Lode	Placer		Fine ounces, Lode	Fine ounces, Placer	Total value	Fine ounces	Total value
Alabama	1		[1] 400	5		$175	1	$1
New Jersey	2		[1] 522,177					
New York	3		325,102				14,271	10,148

Total, 1944 [4]	26	2	[3] 4,202,461	2,590	5	90,825	124,006	88,182

[1] Alabama, all old tailings; New Jersey includes 5,952 tons old tailings.
[2] Ore is magnetite-pyrite-chalcopyrite, flotation copper concentrates from which yielded gold, silver, and copper; Bureau of Mines not at liberty to publish figures for ore and copper.
[3] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.
[4] Includes output from Georgia as follows: 2 placer mines; gold produced, 5 ounces, value, $175; and output from North Carolina as follows: 3 lode mines; ore treated, 6,438 tons; gold produced, 21 ounces, value, $735; silver, 1,461 ounces, $1,039; copper output, included under Tennessee.

Mine production of gold, silver, copper, lead and zinc in the Eastern States in 1945, by States, in terms of recovered metals—Continued

State	Copper		Lead		Zinc		Total value
	Pounds	Value	Short tons	Value	Short tons	Value	
Alabama							$176
New Jersey					81,392	[5] $14,299,032	[8] 14,299,032
New York			862	$148,264	24,978	5,744,940	5,903,352
Pennsylvania	(6)	(6)					[7] 63,000
Tennessee	[6] 24,770,000	[6] $3,343,950	54	9,288	33,824	7,779,520	[8] 11,163,105
Vermont	(6)	(6)					[7] 18,279
Virginia	140,000	18,900	4,243	729,796	16,075	3,697,250	4,447,290
	24,910,000	3,362,850	5,159	887,348	156,269	31,520,742	35,894,234
Total, 1944 [4]	30,098,000	4,063,230	6,266	1,002,560	176,327	35,977,536	41,222,333

[4] Includes output from Georgia as follows: 2 placer mines; gold produced, 5 ounces, value, $175; and output from North Carolina as follows: 3 lode mines; ore treated, 6,438 tons; gold produced, 21 ounces, value, $735; silver, 1,461 ounces, $1,039; copper output, included under Tennessee.
[5] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[6] Pennsylvania and Vermont included under Tennessee; Bureau of Mines not at liberty to publish separate figures.
[7] Excludes value of copper, which is included under Tennessee.
[8] Includes also value of copper from Pennsylvania and Vermont.

MINING INDUSTRY

The total output of ores and old tailings yielding gold, silver, copper, lead, or zinc in the Eastern States, excluding magnetite-pyrite-chalcopyrite ore from Pennsylvania, was 3,718,073 tons in 1945 compared with 4,202,461 tons in 1944. The principal factor in the decreased output in 1945 was the accentuated shortage of labor. No gold ore was mined during the year, but 400 tons of old tailings were re-treated at the Hog Mountain gold mine in Alabama. The output of copper ore (includes copper-iron-zinc ore from Tennessee and copper ore from Vermont and Virginia) decreased 3 percent from 1944, and that of zinc and zinc-lead ores together decreased 15 percent. Most of the ores yield byproducts (besides gold and silver), the values of which are not shown in the tables of this chapter but which would have to be considered to show the full value of the crude ore mined. Copper-iron-zinc ore from Tennessee and zinc-iron-lead ore from New York yield pyrite concentrates that are used in the manufacture of sulfuric acid; the Tennessee pyrite concentrates also yield iron sinter, which is sold to iron and steel producers. Sulfuric acid is made from gases produced in roasting zinc sulfide concentrates from zinc and zinc-lead ores of Tennessee, New York, and Virginia. New Jersey zinc ore yields a residue which is treated further for the recovery of other metals; and zinc ore milled in Tennessee yields a commercial tailing, some of which is sold for its lime content and some for use in concrete. The quantity of the various types of ore mined is shown in the table on ore classification that follows. Activity in exploratory drilling and development outside the producing areas was reported curtailed owing to shortage of manpower. The Bureau of Mines completed several drilling and geophysical survey projects on copper, lead, and zinc that were under way the first part of the year and made field examinations and tests of ore-treatment methods in investigating sources of strategic and critical minerals.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in the Eastern States in 1945, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (short tons)	Zinc (short tons)
Dry and siliceous gold ore	[1] 400	5	1			
Copper ore	1,097,730	252	56,370	[2] 24,896,000		(3)
Magnetite-pyrite-chalcopyrite ore	(4)	1,588	10,434	(2)		
Zinc ore	1,942,016					121,264
Zinc-lead ore	[5] 677,927	12	15,178	14,000	5,159	35,005
Total, all lode mines	[6] 3,718,073	1,857	81,983	24,910,000	5,159	156,269
Total, 1944	[6] 4,202,461	2,595	124,006	30,098,000	6,266	176,327

1 Old tailings re-treated.
2 Copper from magnetite-pyrite-chalcopyrite ore included with that from copper ore.
3 Zinc from copper ore included with that from zinc-lead ore; Bureau of Mines not at liberty to publish separate figures.
4 Bureau of Mines not at liberty to publish separate figures for ore and copper.
5 Includes small tonnage of lead ore.
6 Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

METALLURGIC INDUSTRY

The large copper, zinc, and zinc-lead ore-reduction mills in the Eastern States that were active in 1944 and other recent years continued running throughout 1945 but generally operated at less than capacity owing to shortage of labor in the mines. The 100-ton flotation mill at the Valzinco zinc-lead mine in Spotsylvania County, Va., built in 1942, was closed in January 1945 and was later offered as surplus property by the Reconstruction Finance Corporation for sale or lease. The ore-washing gravity-concentration plant at the Embree zinc and lead carbonate mine at Embreeville, Tenn., idle in 1944, was operated most of 1945. The methods of treatment used in the larger mills and other operating details, including the tonnage and grade of the concentrates produced by some of the mills, are given in the Review by States that follows. Most of the concentrates were shipped to smelters operated by the companies that own the mines. No amalgamation or cyanidation mills were operated during the year. At the Hog Mountain gold mine in Alabama 5 ounces of gold and 1 ounce of silver were recovered from 400 tons of old tailings concentrated in a burlap-lined sluice and amalgamated. Direct-smelting ore (1,047 tons) yielded 393 ounces of recoverable silver in 1945, and concentrates smelted (72,188 tons) yielded 1,852 ounces of gold and 81,589 ounces of silver; the figures for ore and concentrates do not include material yielding no gold or silver. The total for direct-smelting ore was 145,417 tons and for concentrates (including low-grade concentrates shipped to oxide plants) 626,665 tons.

REVIEW BY STATES

ALABAMA

At the Hog Mountain mine 13 miles northeast of Alexander City, Tallapoosa County, an important producer of gold from 1934 to 1937 and in earlier periods, 400 tons of old tailings were treated experimentally in a burlap-lined sluice in 1945; the material recovered, which was shipped to the Philadelphia Mint, weighed 11.98 ounces and contained 5.34 fine ounces of gold and 0.34 fine ounce of silver.

GEORGIA

Placer gold amounting to less than 1 ounce was recovered in 1945 by individuals in Lumpkin County and sold to a dealer in Dahlonega; the gold, which was not shipped to the mint during the year, will be credited to the production of the year in which it is shipped. Late in 1945 Calhoun Mines, Inc., was reported to be preparing to do underground development work at the old Calhoun mine in Lumpkin County.

NEW JERSEY

New Jersey ranked first among the States in zinc production in 1945. Its output of recoverable zinc as metal or in oxide was 81,392 tons compared with 80,288 tons in 1944. Crude ore hoisted totaled 516,225 tons in 1945 compared with 543,007 tons in 1944. In addition to the crude ore milled in 1945, 5,952 tons of old tailings were remilled. The producing mines in both years were the Mine Hill at Franklin and the Sterling Hill at Ogdensburg, Sussex County, each of which is equipped with a mill. The commercial ore minerals comprise chiefly franklinite (a zinc-iron-manganese mineral) and willemite (zinc silicate) but also include zincite (red oxide of zinc). In reduction of the ore the franklinite is removed from the crushed ore by magnetic separators, and the willemite and zincite are concentrated on jigs and tables. The concentrates are shipped to smelting and manufacturing plants at Palmerton, Pa. The franklinite is used in the manufacture of zinc oxide and spiegeleisen, and the willemite-zincite concentrate is smelted to produce high-grade slab zinc.

The value of the New Jersey output of zinc given in the table of this chapter under the heading Mine Production by States is the combined value of the zinc recoverable in both metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

In the past, copper ore, some of which contained a little silver, has been mined in New Jersey, but no output of copper or silver from mines in the State has been recorded since the annual canvass of mines began in 1907. A description of the copper deposits and a résumé of copper mining in the State are given in a recent publication.[1] Copper and lead smelters and refineries at Carteret and Perth Amboy treat ores, scrap, byproducts, and bullion from various States and foreign countries.

[1] Woodward, Herbert P., Copper Mines and Mining in New Jersey: New Jersey, Dept. of Conservation and Development, Geol. Ser., Bull. 57, Trenton, 1944, 156 pp.

NEW YORK

The mine production of recoverable zinc in New York was 24,978 tons in 1945 compared with 35,541 tons in 1944 and the record high of 46,000 tons in 1943. Lead produced in 1945 totaled 862 tons compared with 1,644 tons in 1944 and the peak of 2,434 tons in 1942. The silver output (recovered from lead concentrates made from zinc-lead ore) was 14,271 ounces in 1945, 25,238 ounces in 1944, and 38,004 ounces in 1943. No commercial mine output of gold or copper in the State has been reported during the period covered by the annual mine canvass, which began in 1907. The sharp drop in production of zinc, lead, and silver in 1944 and 1945 was due largely to manpower shortage. The producing mines were the Balmat and Edwards of the St. Joseph Lead Co., southeast and east, respectively, of Gouverneur, and the Hyatt mine of the Universal Exploration Co. near Emeryville, all in St. Lawrence County. The Balmat ore contains zinc, iron, and lead sulfides, and some silver is associated with the lead; it is mined through a 2,655-foot 40° inclined shaft (vertical depth, about 1,300 feet) and treated in the 1,200-ton selective flotation plant at the mine. The mill feed in 1945 totaled 228,062 tons; it yielded 1,425 tons of lead concentrates containing 61.75 percent lead and 12.5 ounces of silver to the ton, 32,766 tons of zinc concentrates containing 56.77 percent zinc, and 46,302 tons of pyrite concentrates containing 40.89 percent iron and about 49 percent sulfur. The Edwards mine was operated through a vertical shaft 1,560 feet deep and an underground shaft (inclined 42° from horizontal) 1,226 feet to the mine workings. Ore treated totaled 79,928 tons yielding 12,975 tons of zinc concentrates containing 59.17 percent zinc. The zinc concentrates from both mills were shipped to the company smelter at Josephtown, Pa.; the lead concentrates from the Balmat mill were shipped to the company Herculaneum, Mo., smelter. The pyrite concentrates were sold to sulfuric acid plants. The Hyatt mine is opened by a 450-foot shaft. Development work in 1945 totaled 588 feet of drifts and 465 feet of diamond drilling. The ore was treated in the 200-ton flotation mill at the mine, and the concentrates were shipped to the Donora, Pa., smelter.

There are no zinc or lead smelters in New York. The Phelps Dodge Refining Corp. has a custom copper smelter and an electrolytic refinery at Laurel Hill, which treat copper ore, matte, bullion, and copper-bearing scrap material.

NORTH CAROLINA

No mine output of gold, silver, or copper was reported from mines in North Carolina in 1945, and the output in 1944 was small. The State has produced no recoverable lead since 1938 and no zinc since 1913. The largest producer of gold in the State when the wartime shut-downs occurred in 1942 was the Condor (old Howie) mine near Waxhaw, Union County. The Fontana mine in Swain County, principal producer of copper in recent years, was closed January 31, 1944.

PENNSYLVANIA

The Bethlehem Steel Co. continued in 1945 to recover gold, silver, and copper as byproducts of iron mining at its Cornwall mine in Lebanon County, Pa. The mine is developed by an open pit and three inclined shafts 1,700 feet deep. The ore is crushed to about 1-inch size at the shafts in Cornwall and shipped in 70-ton hopper-bottom railroad cars to the combined magnetic concentration and flotation mill at Lebanon. The daily capacity of the mill in 1945, which varied slightly from that reported for 1944, was 6,000 tons for the magnetic separation equipment and 2,200 tons for the flotation equipment. Other equipment includes a 2,400-ton sintering plant which handles part of the magnetic concentrates; the rest is shipped to another plant at Bethlehem. The flotation equipment treats tailings from the magnetic separators for the recovery of copper concentrates, which contain most of the gold and silver, and pyrite concentrates, which contain cobalt. The copper concentrates are shipped to the Phelps Dodge smelter and eletrolytic refinery at Laurel Hill, N. Y., and the pyrite concentrates to plants outside the State for recovery of sulfur (as sulfuric acid) and cobalt; the final pyrite residue is sintered and shipped to an iron and steel plant.

The zinc mines in Pennsylvania have been idle for many years. The deposits in the Saucon Valley, Lehigh County, were worked extensively from 1853 to 1876.[2] The only activity reported in recent years was exploratory drilling totaling 2,367 feet in 5 holes done by the Bureau of Mines from September 1943 to January 1944 on the Correll property in the Friedensville district. Zinc smelters at Donora, Langeloth, Josephtown, and Palmerton treat the largest part of the zinc concentrates produced in the Eastern States, as well as large tonnages from the Central States and foreign countries. There is a roasting plant for concentrates at New Castle and an electrogalvanizing plant for sheets at Johnstown that uses roasted zinc concentrates.

SOUTH CAROLINA

The wartime shut-down of the gold mines in South Carolina continued throughout 1945. From 1937 to 1942 the State ranked first among the Eastern States in gold production; the principal producer was the Haile mine in Lancaster County, equipped with a 400-ton cyanide mill.

TENNESSEE

The output of recoverable zinc in Tennessee in 1945 was 33,824 tons compared with 40,831 tons in 1944 and the peak of 43,971 tons in 1942. The decline in production since 1943 was due to labor shortage, caused in large part by migration of workers to the Oakridge atom-bomb plant and other war plants near Knoxville. The output of lead was 54 tons in 1945 and none in 1944; the peak output was 2,531 tons in 1917, nearly all from the Embreeville district. The production of copper, gold, and silver was less than in 1944. The gold and silver were recovered as byproducts from copper-iron-zinc sulfide ore from the mines of the Tennessee Copper Co. at Ducktown, Polk County.

[2] Geological Survey, Mineral Resources, 1882, pp. 361-365.

The mines operated during the year were the Burra Burra, Boyd, Calloway, and Eureka. The ore from the Boyd and Calloway mines and the upper levels of the Burra Burra was hoisted through the 1,600-foot Burra Burra shaft and that from the lower levels of the Burra Burra through the 2,400-foot (vertical) McPherson shaft. The ore-hoisting shaft at the Eureka mine is 750 feet. Other shafts were used for ventilation and service. Development work done in 1945 totaled 34 feet of shaft, 10,437 feet of drifts, and 49,568 feet of diamond drilling. Other work included geological studies, aerial photographs, mapping, and magnetometer surveys over a 3- by 5-mile area covering most of the district. Most of the ore mined was concentrated by selective flotation in the London and Isabella mills, which together have a daily capacity of 2,000 tons. Some of the ore was smelted direct in a blast furnace in the company smelter at Copperhill. The copper concentrates from the mills were smelted in a reverberatory furnace. The matte from the reverberatory and blast furnaces was treated in a converter. Most of the blister copper from the converter was cast into pigs and shipped to an electrolytic refinery on the Atlantic seaboard where some gold and silver were recovered as byproducts. Shot copper was produced for use in the company sulfate plant at Copperhill. The iron concentrates were used in making sulfuric acid in company plants at Copperhill and Isabella; they also yielded iron sinter, which was sold to iron and steel plants. The zinc concentrates were shipped mostly to the Donora, Pa., smelter. The smelter slag is screened and sized for sale, mostly as railroad ballast, road material, and concrete aggregate; some of it is granulated and sized for roofing granules.

The principal zinc mines in Tennessee are at Mascot, New Market, and Jefferson City, 14, 23, and 28 miles, respectively, northeast of Knoxville. Those operated by the American Zinc, Lead & Smelting Co. in 1945 comprised the Mascot No. 2 in Knox County and the Grasselli, Jarnagin, Mossy Creek, and Shallow Ore in Jefferson County. The Mascot is opened by a 520-foot shaft and an inclined shaft from the 520-foot level to the maximum depth of 850 feet; it also has an auxiliary manway shaft and a ventilating shaft. The Grasselli has one operating shaft and an auxiliary manway shaft and is 350 feet deep. The Jarnagin has one operating shaft 280 feet deep, with an auxiliary manway shaft. The Mossy Creek is opened by a 249-foot incline shaft. The Shallow Ore is developed by two open pits, one of which is more than 100 feet deep. All the mines are fully mechanized. Slushing is the principal method of underground loading, and power shovels, bulldozers, and heavy-duty trucks are used in loading and haulage in the open pits. Development at the five mines in 1945 totaled 6,858 feet of drifts and raises, 33,302 feet of diamond drilling, and 4,924 feet of churn drilling. The crude ore from all five mines was treated in the company mill at the Mascot No. 2 mine. The ore from the four mines in Jefferson County was transported to the mill over the Southern Railway. The mill is equipped with a differential-density cone unit, jigs, and flotation machines and has a daily capacity of 4,000 tons. In 1945 it treated 1,119,569 tons of crude ore yielding 45,520 tons of 61-percent zinc concentrates compared with 1,339,862 tons in 1944 yielding 55,690 tons of concentrates of nearly the same grade. The following data are extracted from the annual company report to stockholders: The reduction in tonnage of crude ore mined in 1945 was caused by manpower shortage. Drilling results were very satisfactory. Additional ore reserves proved on company-owned properties in Knox and Jefferson Counties are expected to produce 64,625 tons of concentrates. During the year the company purchased mineral rights on properties near Friends Station, Jefferson County, as sufficient ore was proved to warrant the major development required to bring the property into production. Development work, however, will not be started until the supply of manpower improves substantially. Company reserves of proved and indicated ore at this time are the highest heretofore recorded for Tennessee. The ore reserves on the Grasselli property were reduced by 8,145 tons. The Shallow Ore mine, a substantial producer in 1944 and 1945, will be worked out during the first half of 1946.

The Universal Exploration Co. operated its Davis-Bible mine and 800-ton mill at Jefferson City throughout 1945. The mine is opened by two shafts 180 and 240 feet deep. Mining and development continued to be hampered by the acute labor shortage, and the output of ore was much less than the normal capacity of the mine. Development during the year totaled 620 feet of drifts, 6,831 feet of diamond drilling, and 9,383 feet of churn drilling. Additional mine-car loaders and slusher hoists were installed underground. The mill is equipped with crushers, rod mills, and flotation machines. The concentrates produced averaged 64.08 percent zinc. The company continued developing the Straight Creek mine near New Tazewell, Claiborne County. In the Embreeville district, Washington and Unicoi Counties, the Tennessee Zinc Co. resumed mining zinc and lead carbonate ores. Development during the year included four shafts 25, 30, 75, and 95 feet deep; drifting from the shafts; and 200 feet of tunnels. The deepest shaft was sunk on a body of lead carbonate ore in the Lick Log area; mining through this shaft was begun in November. Shipments of zinc concentrates were made in February, April, and each month after June. Concentration is accomplished by washing, jigging, tabling, and drying. In Cannon County the Hoover mine of Gant Gaither east of Murfreesboro, equipped with a 25-ton mill, produced about a car of 58-percent zinc concentrates monthly. The Bureau of Mines did exploratory drilling in the Powell River area of Claiborne County and trenching on the Brown-Tipton property in Greene County during the first part of the year.

VERMONT

The Vermont output of gold, silver, and copper in 1945 came from the Elizabeth copper mine at South Strafford, Orange County. The mine has been operated continuously since October 1943 by the Vermont Copper Co., Inc.[3] The last previous operation was by the National Copper Corp., which closed the mine in June 1930 owing to the low price of copper. The mine is developed by a haulage adit about 1,200 feet long, an underground 30° inclined shaft 925 feet long, and four main levels opening up the vein. The ore minerals

[3] Jacobs, Elbridge C., The Vermont Copper Co., Inc.: Report of State Geologist on Mineral Industries and Geology of Vermont, 24th of series, 1943–44, pp. 1–13, (Office of State Geologist, Burlington; Fleming Museum, University of Vermont, December 1944.)

are chalcopyrite and pyrrhotite, carrying some silver and a little gold. The gangue minerals are quartz, feldspar, and mica. The ore is treated by flotation in the 500-ton mill at the mine. The concentrates averaged 22.56 percent copper and 0.012 ounce of gold and 2.50 ounces of silver to the ton; they were shipped to the Phelps Dodge smelter at Laurel Hill, N. Y.

VIRGINIA

Mines in Virginia yielded 16,075 tons of recoverable zinc and 4,243 tons of lead in 1945 compared with 19,667 and 4,622 tons, respectively, in 1944. The Austinville mine in Wythe County, which has been in continuous operation since 1924, contributed the bulk of the State output of both metals; the ore is treated in the 2,000-ton flotation mill at the mine. The Valzinco zinc-lead mine near Paytes in Spotsylvania County, reopened by Panaminas, Inc., in September 1942 and operated throughout 1943 and 1944, was closed in January 1945. The mine was equipped with a 100-ton flotation mill. The ore contained, besides zinc and lead, a little gold, silver, and copper, some of which was recovered in the concentrates. The products of the mill were zinc concentrates, shipped to the Langeloth, Pa., smelter, and zinc-lead concentrates, shipped to the International, Utah, lead smelter and slag-fuming plant. The Toncrae Mining Co. operated the Toncrae copper mine in Floyd County from January through August; the ore produced, which averaged 6.16 percent copper and 0.38 ounce of silver to the ton, was shipped to the U. S. Metals Refining Co. at Carteret, N. J. In September the company began building a plant at the mine to heap-roast and leach the ore and precipitate the copper.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN IDAHO

(MINE REPORT)

By C. E. NEEDHAM AND PAUL LUFF

SUMMARY OUTLINE

SUMMARY

Despite a 9-percent decrease in zinc output in 1945 compared with 1944, Idaho attained first place among zinc-producing States for the first time. Lead output, however, fell to a level below that for any year since 1899. This shifting prominence from lead to zinc paralleled the increasing ratio of zinc to lead in the ores of many Coeur d'Alene mines as mining reached greater depths.

Although the base prices of gold, silver, copper, lead, and zinc in 1945 were the same as those in 1944 and the premium payments for overquota production of copper, lead, and zinc remained in force throughout the year, the production of each metal in Idaho in 1945 was less than that in 1944; in fact, the production of gold was the smallest since 1927; silver, the smallest since 1934; copper, the smallest since 1936; and zinc, the smallest since 1941. The principal cause of the 1945 decreases was the shortage of labor. Production in 1945 (in terms of recoverable metals) was 17,780 fine ounces of gold, 8,142,667 fine ounces of silver, 3,096,000 pounds of copper, 136,894,000 pounds of lead, and 166,926,000 pounds of zinc, indicating decreases from 1944 of 29 percent in gold, 18 percent in silver, 8 percent in copper, and 18 percent in lead. The total value of the gold was $622,300—2 percent of the State total value; silver, $5,790,341—15 percent; copper, $417,960—1 percent; lead, $11,772,884—31 percent; and zinc, $19,196,490—51 percent. The total value of the five metals was $37,799,975 in 1945 compared with $42,591,137 in 1944. About 87 percent of the State silver production, 66 percent of the copper, 93 percent of the lead, and 93 percent of the zinc came from the Coeur d'Alene region of Shoshone County; the rest of the silver, lead, and zinc came largely from the Warm Springs district in Blaine County.

About 63 percent of the State gold production came from the Warm Springs district in Blaine County and the Yellow Pine district in Valley County.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers, 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Idaho, 1941–45, and total, 1863–1945, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	331	524	2,704,686	149,816	$5,243,560	16,672,410	$11,855,936
1942	203	236	2,900,704	95,020	3,325,700	14,644,890	10,414,144

1945	168	26	8						1,593	379	1,769	405

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline floating dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

Gold.—Despite a decrease of 36 percent in output of recoverable gold from lode mines in Idaho in 1945 compared with 1944, the output from placers increased from 136 ounces to 1,769 ounces. This increase resulted from resumption, in September, of bucket dredging at Idaho City in Boise County after L–208 (the War Production Board gold-mine closing order of October 8, 1942) was rescinded July 1, 1945. The Idaho-Canadian Dredging Co. resumed operating its 7½-cubic foot bucket dredge at Idaho City in September. The yield of gold from lode mines decreased from 24,872 ounces in 1944 to 16,011 in 1945, because less gold ore was treated from the Boise-Rochester-Monarch group at Atlanta by the Talache Mines, Inc., and production of gold from the Yellow Pine mine at Stibnite and Triumph property near Hailey declined. The Bradley Mining Co., operating the Yellow Pine mine, treated gold-tungsten-antimony ore in its 800-ton flotation plant from January to July, inclusive. During the next 4 months the company treated only tungsten tailings, but in December it resumed milling gold-tungsten-antimony ore. About 81 percent of the State total gold in 1945 came from zinc-lead ore from the Triumph property, gold-tungsten-antimony ore from the Yellow Pine mine, zinc-lead ore from various mines in the Coeur d'Alene region, and bucket dredging in Boise County.

Silver.—Although Idaho's production of recoverable silver dropped from 9,931,614 fine ounces in 1944 to 8,142,667 fine ounces in 1945, the State remained the largest producer of silver in the United States—a place it has held since 1933. Large decreases in silver output were reported by the Sunshine, Coeur d'Alene (Mineral Point mine), Bunker Hill & Sullivan, Federal, Triumph, Clayton, Tamarack, Bradley (Yellow Pine mine), and Sullivan (Star mine) mining companies; however, a marked increase was made from treating old tailings from the Osburn dump by the Hecla Mining Co. The Coeur d'Alene region produced 87 percent of the State total silver in 1945; the remainder came largely from the Warm Springs, Bayhorse, Deadwood Basin, Blue Wing, Yellow Pine, South Mountain, and Clark Fork districts. Of the State total silver, zinc-lead ore and old tailings yielded 49 percent, silver ore 44 percent, lead ore 5 percent, and zinc ore and slag and gold ore nearly all the remainder. The recovery of silver from silver ore and lead ore decreased 1,379,469 ounces, owing chiefly to the decline in output of ore from property operated by the Sunshine Mining Co. The apparent increase in recovery of silver from silver ore and the decrease from lead ore in 1945 resulted from a change in the class of part of the ore mined by the Sunshine Mining Co. from lead ore in 1944 to silver ore in 1945. The State output of silver recovered from zinc-lead ore decreased 334,603 ounces owing to a decline in output of zinc-lead ore from most of the principal producers.

Ten mines—the Sunshine, Polaris, Osburn tailing plant, Bunker Hill & Sullivan, Silver Dollar, Triumph, Page, Morning, Sherman, and Star—produced more than 76 percent of the silver output of the State in 1945. All but the Triumph are in the Coeur d'Alene region.

Copper.—In 1945 about 66 percent of Idaho's copper output was recovered as a byproduct in the treatment of zinc-lead ore, silver-copper-antimony ore, silver ore, and lead ore from mines in the Coeur d'Alene region; the remainder was recovered largely from copper ore produced in the Alder Creek district and from zinc-lead ore produced in the Warm Springs district. The State copper output in 1945 was 8 percent less than that in 1944, owing principally to a decline in output of silver-copper-antimony ore from the Mineral Point mine near Osburn in Shoshone County.

The Empire mine of the Mackay Exploration Co. near Mackay was the largest producer of copper in Idaho. It was followed by the Osburn tailing plant, Sunshine, Polaris, and Triumph properties.

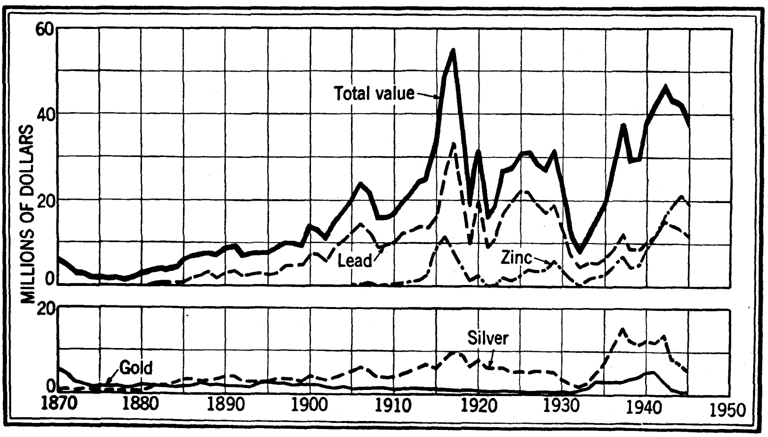

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Idaho, 1870-1945. The value of copper has been less than $2,000,000 annually, except in a few years.

Lead.—Despite the fact that the output of recoverable lead in Idaho in 1945 (136,894,000 pounds) was the smallest since 1899, the State remained the largest producer of lead west of Missouri. Marked decreases in lead output were reported by the Federal (Page and Morning mines), Bunker Hill & Sullivan, Sunshine, Hecla (Hecla mine), Sullivan (Star mine), Tamarack, Triumph, and Clayton mining companies; however, substantial increases were made at the Osburn and Sweeny tailing dumps. Nearly 93 percent of the State total lead came from the Coeur d'Alene region; most of the remainder was produced in the Warm Springs, Bayhorse, Deadwood Basin, Lava Creek, Texas, Mineral Hill & Camas, Dome, and Clark Fork districts. Zinc-lead ore and old tailings (2,519,004 tons) from the Coeur d'Alene region yielded 81 percent of the State total lead; and lead ore and silver ore, chiefly from the Coeur d'Alene region, yielded 11 percent; the remainder came largely from zinc-lead ore in the Warm Springs district and from zinc slag in the Coeur d'Alene region. Lead recovered from lead ore decreased 19,340,076 pounds and that from zinc-lead ore and old tailings 15,280,648 pounds; but lead from silver ore increased 4,282,892 pounds and that from zinc ore and slag 158,340 pounds.

In 1945 the combined lead output of the five largest producers—the Bunker Hill & Sullivan, Osburn tailing plant, Morning, Star, and Page—was 70,131,690 pounds, 51 percent of the State total. In 1944 the combined lead output of these properties was 86,640,704 pounds. Other important producers in 1945 were the Sweeny tailing dump, Sherman, Tamarack, Triumph, Frisco, Monitor, Bunker Hill slag dump, Sunshine (Chester vein), Dayrock, Spokane-Idaho, and Polaris (Chester vein) properties.

Zinc.—The output of recoverable zinc (166,926,000 pounds) in Idaho in 1945 was 9 percent less than the record output in 1944, but again it was greater than the lead output. Nevertheless, Idaho as a zinc-producing State advanced from second place in 1944 to first place in 1945, ahead of New Jersey and Oklahoma. Marked decreases in output of zinc at the Bunker Hill & Sullivan, Page, Star, Tamarack, and Triumph properties more than offset substantial increases at the Osburn tailing plant, Bunker Hill slag dump, Sidney, Spokane-Idaho, and Daylight Lease (Interstate-Callahan) properties. More than 93 percent of the State total zinc in 1945 came from the Coeur d'Alene region and nearly all the remainder from the Warm Springs, Deadwood

MINE PRODUCTION BY COUNTIES

Basin, South Mountain, Lava Creek, Bayhorse, and Mineral Hill & Camas districts. Zinc-lead ore and old tailings concentrated yielded 88 percent of the State total zinc, old zinc slag smelted and fumed 11 percent, and zinc ore concentrated, lead ore concentrated, and silver ore concentrated nearly all the remainder.

Ten properties—the Star, Osburn tailing plant, Bunker Hill smelter slag dump, Morning, Page, Tamarack, Monitor, Frisco, Bunker Hill & Sullivan mine, and Triumph—produced more than 74 percent of the State total zinc in 1945.

MINING INDUSTRY

As a result of a serious labor shortage throughout 1945, base-metal mining in Idaho experienced a marked decline in output of nearly all classes of ore, especially in silver-lead ore and zinc-lead ore mined in the Coeur d'Alene region and in gold-antimony-tungsten ore mined in the Yellow Pine district. No revival at lode gold mines was noticeable during the last 7 months of the year after L–208 was rescinded July 1; however, a former large producer of placer gold (bucket dredge at Idaho City) resumed operations in October. The suspension December 19 of mining operations—resulting from a fire—on the 2,900 level of the Sunshine mine affected the State output of silver ore and lead ore. The output of zinc-lead ore and old tailings (by far the chief output of the State) increased 7 percent, siliceous gold ore declined 56 percent, lead ore decreased 57 percent, and zinc ore and slag decreased 22 percent; but siliceous silver ore increased 13 percent, and copper ore increased 165 percent. Nearly all the gold ore mined in Idaho in 1945 came from one property in the Yellow Pine district; 70 percent of the silver ore, 90 percent of the lead ore, 92 percent of the zinc ore and slag, and nearly 94 percent of the zinc-lead ore and old tailings came from various properties in the Coeur d'Alene region; and 97 percent of the copper ore came from one mine in the Alder Creek (Mackay) district.

Gold and silver produced at lode mines in Idaho in 1945, by counties, in terms of recovered metals

[1] Includes 92,266 tons of lead-smelter slag.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[3] Includes 115,281 tons of lead-smelter slag.

METALLURGIC INDUSTRY

Of the 3,139,286 tons of ore produced in 1945 in Idaho, 3,027,500 tons (96 percent) were treated at concentration plants, 109,856 tons (3 percent) were shipped crude to smelters, and 1,930 tons (1 percent) were treated at amalgamation mills.

Concentration plants in 1945 treated 109,821 tons of gold ore, 10 tons of gold-silver ore, 117,692 tons of silver ore, 1,850 tons of copper ore, 103,381 tons of lead ore, 7,773 tons of zinc ore, and 2,686,973 tons of zinc-lead ore and old tailings. Current hot zinc slag totaling 60,805 tons was fumed, and 92,266 tons of old dump lead-smelter slag were delivered for smelting and fuming in 1945. The old dump slag was credited to the Bunker Hill smelter dump, and all the hot slag was credited to various producers of the ores and concentrates that contributed during the year to the slag-making material.

Ore treated at straight amalgamation mills in 1945 totaled 109 tons and that at combined amalgamation and concentration plants, 1,821 tons; none was treated at cyanidation plants.

The Bunker Hill & Sullivan Mining & Concentrating Co. operated its Bradley lead smelter and refinery at a lower rate than in 1944 on ore and concentrates, chiefly from mines and mills in the Coeur d'Alene region. The company also operated its antimony and bismuth plant, 1,700-ton flotation mill (including sink-and-float unit), 300-ton tailing-treatment plant for recovery of silver, iron, and lead from old jig tailings, and 450-ton zinc slag-fuming plant at Bradley; early in 1945 it began producing high-grade metallic cadmium from accumulated smelter residues at its new cadmium plant annex at the Bunker Hill smelter. The slag-fuming plant yielded 24,043 dry tons of deleaded zinc fume and 1,882 dry tons of lead fume; the production of lead and zinc in 1945 was slightly greater than in 1944. The Sullivan Mining Co. operated continuously at capacity its 100-ton electrolytic zinc plant near Bradley on zinc and zinc-lead concentrates produced mainly in the Coeur d'Alene region. During the year the Bunker Hill & Sullivan Mining & Concentrating Co., the Sullivan Mining Co., and the Office of Metals Reserve (successor to Metals Reserve Company July 1) stock-piled several thousand tons of zinc concentrates at Bradley. Antimony, tungsten, and antimony-iron-gold concentrates were produced 8 months of the year in the 800-ton flotation mill of the Bradley Mining Co. at Stibnite. During August, September, October, and November the company treated only old tungsten tailings. Some of the tungsten concentrates produced at the company mill at Stibnite were hauled to the company leaching plant at Boise, where muriatic acid was used to eliminate the apatite and calcite and caustic soda to eliminate the antimony from the concentrates; this additional treatment produced a 70-percent tungstic oxide concentrate. The antimony concentrate was shipped to the antimony plant of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley, Idaho, and the antimony-iron-gold concentrate to the lead smelter of the United States Smelting, Refining & Mining Co. at Midvale, Utah. Tungsten concentrates and silver-copper-lead-iron concentrates were produced throughout the year in the Ima mill at Patterson.

Mine production of metals in Idaho in 1945, by methods of recovery, in terms of recovered metals

[1] Lava Creek district lies in both Blaine and Butte Counties.

ADAMS COUNTY

All of the output in Adams County in 1945 was carbonate copper ore (68 tons) shipped to a smelter from the Arkansaw-Decorah, Lockwood, and South Peacock properties, which are near Cuprum in the Seven Devils district.

BLAINE COUNTY

Lava Creek district.—Hoyt Ray continued operating the Paymaster mine, 32 miles southwest of Arco, and shipped 3,043 tons of zinc-lead-iron ore to a custom flotation mill at Midvale, Utah, where it was separated into a lead concentrate, a zinc concentrate, and an iron concentrate.

Little Wood River (Muldoon) district.—The Eagle Bird Lease continued working the Eagle Bird mine in Garfield Canyon and shipped 276 tons of oxide silver-lead ore and 94 tons of zinc-lead ore to treatment plants in Utah. The rest of the district output was 198 tons of zinc-lead ore produced from the Idaho Muldoon mine and 1 ton of similar ore from the Black Rock claim.

Mineral Hill and Camas district.—Except for gold, the metal output of the Mineral Hill district increased considerably in 1945, owing to the large gain in output of zinc-lead ore from the Snoose mine near Hailey and to the increase in shipments of old tailings, containing principally silver, lead, and zinc, from the Red Elephant dump. Jensen & Stevens operated the Snoose mine throughout the year and shipped 3,166 tons of ore, containing an average of 0.04 ounce of gold and 3.91 ounces of silver to the ton, 0.22 percent copper, 2.04 percent lead, and 4.70 percent zinc, to custom milling plants in Utah. Old tailings (6,433 tons) from the Red Elephant dump were shipped to the custom flotation mill at Midvale by Frank R. Plughoff.

Warm Springs district.—Despite a decrease of 16 percent in the output of zinc-lead-silver ore from the Triumph-North Star-Independence groups near Ketchum in 1945 compared with 1944, the property remained the most important producer of gold, silver, lead, and zinc in southern Idaho. The Triumph Mining Co. operated the groups throughout 1945 and treated 61,695 tons of low-grade zinc-lead-silver ore in its 300-ton gravity-flotation mill, recovering lead-silver concentrates and zinc-lead middlings. The middling (17,722 tons) and 30,372 tons of higher-grade zinc-lead-silver ore were shipped to Bauer, Utah, for treatment, and the lead-silver concentrate (1,593 tons) was shipped direct to a lead smelter. The rest of the district output comprised 1,179 tons of siliceous gold ore shipped direct to a smelter from the June Day mine, 752 tons of zinc-lead ore produced from the Homestake mine, and 250 tons of zinc ore from the Lucky Boy mine.

BOISE COUNTY

Boise Basin district (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—The Boise Basin district became an important producer of gold again in 1945, resulting from the rescinding by the Government of L–208. In September the Idaho-Canadian Dredging Co., a large producer of gold in 1942, resumed operating its 7½-cubic foot bucket dredge at property near Idaho City; during the last 3½ months of the year the dredge treated 250,000 cubic yards of gravel, which yielded 1,593 fine ounces of gold and 377 fine ounces of silver. Other producers of placer gold included the Fountain Spring, Moe, and Ophir Creek properties. Gold produced from lode mines in the district totaled 223 fine ounces, which came largely from old mill cleanings from the Gold Hill & Iowa property and from crude ore shipped direct to a smelter from the Come-Back mine.

Summit Flat district.—A total of 78 tons of rich gold ore was produced in 1945 from two mines—Jessie and Rock Creek—and treated by amalgamation.

BONNER COUNTY

Clark Fork district.—In 1945 the Whitedelf mine was the only producer in the Clark Fork district. The property was worked throughout the year by the Whitedelf Mining & Development Co., and 3,055 tons of ore containing 40,000 ounces of silver, 211,800 pounds of lead, and a little copper and zinc were treated in the company 50-ton flotation mill.

Lakeview district.—The Hewer (Idaho-Lakeview) mine was worked throughout the year principally on development; however, 600 tons of silver ore, containing a little copper, lead, and zinc, were treated by flotation.

Pend d'Oreille district.—Approximately 193 tons of zinc-lead ore were produced from the Gold Coin mine in 1945 and treated by flotation; a new organization—Gold Coin Mining & Milling Co., Inc.—operated the mine continuously.

BONNEVILLE COUNTY

The Lottie placer near Gray in the Mount Pisgah district was operated a few months in 1945, and 35 fine ounces of gold were recovered from bench gravel by hydraulicking and sluicing.

BOUNDARY COUNTY

Moyie Yahk district.—The Regal mine, 14 miles northeast of Bonners Ferry, was operated throughout the year by Silver Crescent, Inc. The company reported that 4,269 tons of sulfide ore containing 300 ounces of gold, 5,500 ounces of silver, 5,000 pounds of copper, 120,000 pounds of lead, and 170,000 pounds of zinc were treated by flotation; zinc-lead concentrate (243 tons) and zinc concentrate (80 tons) were shipped to reduction plants at Bradley, Idaho.

Port Hill district.—In 1945, 2,400 tons of lead ore were produced from the Idaho-Continental mine and treated by flotation, which yielded 124 tons of silver-lead concentrates.

BUTTE COUNTY

Dome district.—William H. Gibson operated the Wilbert mine and tailing dump under lease in 1945; he shipped 555 tons of crude lead ore direct to a smelter and treated 930 tons of old tailings (containing chiefly lead) by flotation.

Lava Creek district.—Zinc-lead-iron ore was mined throughout the year at the Horn Silver mine, 20 miles southwest of Arco, by the Era Mining & Development Co., Inc.; a total of 3,840 tons of sulfide ore, containing 100 ounces of gold, 9,079 ounces of silver, 35,967 pounds of copper, 248,824 pounds of lead, 588,828 pounds of zinc, and some iron, was shipped to custom flotation mills in Utah, where it was separated into lead concentrate, zinc concentrate, and iron concentrate. The rest of the district output was 35 tons of lead ore produced from the Eureka and Zinc-Clarke properties.

CLARK COUNTY

The only output in Clark County in 1945, as in 1944, was lead ore produced from the Scott mine on Birch Creek. The Birch Creek Mining Co., Ltd., operated the mine continuously and shipped 505 tons of oxide lead ore to a smelter in Utah.

CLEARWATER COUNTY

Clearwater River district.—Approximately 17 fine ounces of gold and 7 fine ounces of silver were recovered in 1945 by hydraulicking and sluicing at the Clearwater Placers.

CUSTER COUNTY

Alder Creek district.—The output of gold, silver, and copper in the Alder Creek district was much greater in 1945 than in 1944, owing to a larger production of copper ore from the Empire mine near Mackay. The Mackay Exploration Co. worked the mine and 100-ton mill, shipped 6,478 tons of ore (containing 456 ounces of gold, 7,620 ounces of silver, and 367,893 pounds of copper) to a smelter in Utah, and treated 1,850 tons of similar ore by flotation. The remainder of the district output was 175 tons of silver-lead ore produced from the Horseshoe and Homestake properties.

Bayhorse district.—In 1945 six mines in the Bayhorse district produced a total of 35,309 tons of ore, compared with 48,830 tons in 1944. As usual, the most important output was zinc-lead ore from the Clayton mine operated by Clayton Silver Mines, but the output of ore from this mine declined from 39,258 tons in 1944 to 29,127 tons in 1945. All the ore was treated in the company 120-ton concentrator, which yielded 1,495 tons of high-grade lead-silver concentrate and 605 tons of zinc concentrate. Swigert Mines operated the Pacific claim of the Salmon River group near Challis throughout the year, treated 3,780 tons of oxide lead-silver ore by gravity concentration, and shipped 552 tons of zinc-lead-silver ore to a smelter in Utah. The rest of the district output comprised 1,436 tons of oxide lead-silver ore produced from the Red Bird mine by the Monongahela-Mt. Washington Mining Co., 302 tons of similar ore from the South Butte mine, 67 tons of high-grade silver-lead-copper ore from the Ramshorn mine, and 45 tons of lead-silver ore from the Turtle claim.

Boulder district.—Lessees worked the Livingston mine near Clayton in 1945 and shipped 313 tons of zinc-lead ore to a custom mill in Utah and 39 tons of lead-silver ore to a smelter.

Seafoam district.—The Shirts & Larson Lease operated the Mountain King mine northwest of Stanley a few months in 1945 and shipped 141 tons of zinc-lead-silver ore to Midvale, Utah, for treatment.

Yankee Fork district.—All the output of the Yankee Fork district in 1945 was high-grade gold ore (17 tons), produced from the Fourth of July and Snowdrift claims near Sunbeam.

ELMORE COUNTY

Middle Boise (Atlanta) district.—The value of the metal output of the Middle Boise district dropped from $175,129 in 1944 to $30,148 in 1945, as a consequence of treating a smaller quantity of gold ore than in 1944 from the Boise-Rochester-Monarch property of the Talache Mines, Inc. The company reported that work during 1945 was devoted principally to maintenance and repair and that the 400-ton amalgamation and concentration mill ran only intermittently, treating 1,815 tons of gold ore compared with 43,541 tons in 1944. In addition, 37 tons of high-grade gold ore were shipped to a smelter. The remainder of the district output was 14 tons of gold ore produced from the Golden Stringer and Lucky Strike claims at Atlanta.

IDAHO COUNTY

Most of the mining districts in Idaho County are gold-producing areas (placer and lode), but despite rescission of WPB Order L-208 on July 1, 1945, no revival at gold properties in any districts in Idaho County was noticeable during the year. Most of the output in 1945 was 54 ounces of placer gold recovered from claims in the Burgdorf, Camp Howard (Salmon River), Elk City, Florence and French Creek, Newsome, Orogrande, and Simpson (Salmon River) districts. A little (14 ounces) lode gold was recovered from gold ore from three claims—King Fish, Little Giant, and Smith—in the Warren district.

LEMHI COUNTY

Blue Wing district.—The Ima mine at Patterson, owned by the Ima Mines Corp. and a producer of silver, lead, copper, and tungsten for the past 27 years, was taken over under lease and option to purchase January 5, 1945, by the Bradley Mining Co. The latter company worked the mine and 150-ton concentration plant continuously in 1945; about 32,000 tons of ore containing hübnerite, galena, tetrahedrite, and pyrite were treated in the mill. Tungsten was recovered by gravity and flotation concentration, followed by magnetic separation, and silver, copper, and lead were recovered by bulk sulfide flotation. Lead-copper-silver concentrate (1,083 tons) was shipped to a smelter in Utah, and tungsten concentrates were sent to an eastern market.

Eureka district.—Lessees worked the Pope-Shenon (Grandview) mine near Salmon a short time in 1945 and shipped 101 tons of copper ore to a smelter in Utah.

Mackinaw district.—Roy Jackson operated the Copper King mine, 8 miles south of Shoup, nearly all of 1945 and shipped 70 tons of copper ore to a smelter in Montana.

Rattlesnake Creek district.—Twin Peaks Mine, Inc., did considerable work in 1945 at the Twin Peaks mine south of Salmon. The company erected a 1,000-foot aerial tramway, a 30-ton flotation mill, and surface buildings; rebuilt roads; did 502 feet of development; and shipped 53 tons of lead ore to a smelter.

Texas district.—The output of the Texas district in 1945 comprised 719 tons of oxide zinc-lead-silver ore produced from the Latest Out mine near Gilmore, 53 tons of lead-silver ore from the Alex Stevens mine, and 7 tons of lead ore from the Hutchings claim.

Unorganized (Reno) district.—Frank G. Worthing worked his Cabin mine throughout the year and shipped 42 tons of oxide lead ore to a smelter in Utah.

OWYHEE COUNTY

South Mountain district.—The South Mountain Mining Co. operated the Golconda mine until December 22, when operations were abandoned permanently. During the year the company shipped 7,523 tons of ore, containing 82 ounces of gold, 48,152 ounces of silver, 115,848 pounds of copper, 61,650 pounds of lead, 1,718,384 pounds of zinc, and some iron to the International flotation mill at Tooele, Utah, where it was separated into zinc-lead-copper-silver concentrate, zinc concentrate, and iron concentrate.

SHOSHONE COUNTY

COEUR d'ALENE REGION

In 1945 the Coeur d'Alene region, Shoshone County, remained the largest silver-producing area in the United States, ranked second in lead, and was third in zinc; it produced 87 percent of Idaho's silver, 66 percent of the copper, 93 percent of the lead, and 93 percent of the zinc. The value of the metal output of the region was $34,258,050 (91 percent of the State value) compared with $38,307,297 in 1944. The output of each metal decreased; gold declined 9 percent, silver 18 percent, copper 21 percent, lead 17 percent, and zinc 8 percent. The chief producers of zinc in the region in 1945, according to rank (each producing more than 8,000,000 pounds), were the Star, Osburn tailing plant, Bunker Hill smelter-slag dump, Morning, Page, Tamarack, and Monitor properties; the chief producers of lead, according to rank (each producing more than 6,000,000 pounds), were the Bunker Hill & Sullivan, Osburn tailing plant, Morning, Star, Page, Sweeny tailing dump, and Sherman properties; and the chief producers of silver, according to rank (each producing more than 250,000 ounces), were the Sunshine, Polaris, Osburn tailing plant, Bunker Hill & Sullivan, Silver Dollar, Page, and Morning properties.

Of the total material (2,794,208 tons) produced in 1945 in the Coeur d'Alene region, 90 percent was zinc-lead ore and old tailings, 3 percent lead-silver ore, 3 percent zinc slag, and the remainder silver ore.

Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1944–45, and total 1884–1945, in terms of recovered metals

Year	Mines producing		Ore	Gold (lode and placer)	Silver (lode and placer)	Copper	Lead	Zinc	Total value
	Lode	Placer							
			Short tons	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*	
1944	47	1	2,765,483	2,075	8,669,371	2,578,000	153,625,000	170,454,000	$38,307,297
1945	49	1	2,794,208	1,898	7,115,646	2,036,000	126,860,000	156,059,000	34,258,050
Total, 1884–1945			(1)	391,308	426,631,752	[2] 64,554	[2] 5,475,519	[2] 1,129,437	1,089,251,651

[1] Figures not available.
[2] Short tons.

Beaver district.—The output of the Beaver district in 1945 was 112,607 tons of zinc-lead ore compared with 101,180 tons of zinc-lead ore and 6,600 tons of zinc ore in 1944. The most important output was 77,555 tons of ore, averaging 0.97 ounce of silver to the ton, 2.49 percent lead, and 5.44 percent zinc, from the Amazon-Carlisle-Portland groups (Monitor Mining Co.) treated in the Hercules, Dayrock, and Carlisle flotation mills near Wallace. According to the printed annual report of the Monitor Mining Co., the output of ore in 1945 increased slightly over that in 1944; however, labor shortages prevented the expansion of production that had been expected a year earlier. Since rehabilitation of the Monitor properties was seriously undertaken in the autumn of 1942, the company has reopened and partly explored several different vein systems with success; however, much work remains to be done. The present ceiling prices of silver, lead, and zinc do not promise profitable operations despite substantial tonnages of developed low-grade ore. In August 1945 the Monitor Mining Co. purchased the old Interstate group from the Callahan Zinc-Lead Co. The group consisted of 79 patented and 4 unpatented claims contiguous to the east and south of the Monitor holdings. As rapidly as conditions permit, the lower part of the Interstate mine, under water for more than 20 years, will be pumped out and connected to the Carlisle mill level by approximately 1,800 feet of drifting. The Monitor management believes that substantial tonnages of ore equal in grade to that being mined at the Amazon mine remain in the Interstate mine.

Sunset Lease worked the Sunset mine continuously and hauled 24,982 tons of ore, averaging 2.14 ounces of silver to the ton, 4.45 percent lead, and 8.19 percent zinc, to the Golconda custom flotation mill near Wallace. The rest of the district lode output was 10,070 tons of zinc-lead ore produced from the Nipsic claim of the Interstate-Callahan group by the Daylight Lease.

Eagle district.—The Crystal Lead Lease operated the Crystal Lead group near Murray in 1945 and hauled 4,288 tons of lead ore to the Galena (Zanetti) custom mill near Wallace. In addition, 36 tons of high-grade lead ore were shipped to a smelter.

Evolution district.—The output of the Evolution district in 1945 comprised 981,330 tons of zinc-lead old tailings, 75,487 tons of lead-silver ore, and 12,455 tons of silver-copper-antimony ore, compared with 724,121 tons of zinc-lead old tailings, 64,515 tons of lead-silver ore, 40,674 tons of silver ore, and 28,635 tons of silver-copper-antimony ore in 1944. Most of the old tailings in 1945 came from the Osburn dump, all the lead-silver ore from the Chester vein and the Silver Syndicate fault zone, and all the silver-copper-antimony ore from the Mineral Point mine. The 2,500-ton sink-and-float plant and 500-ton flotation mill at the Osburn tailing dump were operated at capacity throughout the year by the Hecla Mining Co. The company reported that 974,433 tons of old tailings, containing an average of 1.22 ounces of silver to the ton, 1.41 percent lead, 1.69 percent zinc, and a little copper, were treated during the year in the sink-and-float plant; the resulting zinc-lead middling (617,186 tons) was treated in the Osburn, Polaris, Hecla, and Silver Crescent flotation mills, where it was separated into 10,533 tons of lead concentrates and 18,956 tons of zinc concentrates. The property ranked second in lead and zinc production in Idaho in 1945 and third in silver. The Sunshine Mining Co. operated the Chester vein and the Silver Syndicate fault zone until December 17, when all production ceased owing to a fire that broke out in a locomotive-battery charging station on the 2,900 level. The original fire was extinguished, but a secondary fire, possibly due to spontaneous combustion induced by heat from the first, broke out in drift and stope timber some 300 to 400 feet east of the original fire. By January 30, 1946, the fire was put out and mining resumed; however, it will take several months before operations can be fully restored. The Chester vein and Silver Syndicate fault zone (known as Rambo, Omega, and Rotbart areas) includes property owned by the Sunshine Mining Co., Polaris Mining Co., Silver Dollar Mining Co., and Silver Syndicate, Inc., but all exploration, development, and mining and milling of ore are done by the Sunshine Mining Co. The Sunshine Mining Co. reported that the total output of ore in 1945 was 75,179 tons (32,312 tons for Sunshine account and 42,867 tons for account of Polaris, Silver Dollar, and Silver Syndicate) compared with 91,956 tons in 1944; the ore averaged 47.42 ounces of silver to the ton, 0.44 percent copper, 4.58 percent lead, and a little zinc. The tailings averaged 0.77 ounce of silver to the ton and 0.15 percent lead; lead recovery was 97.2 percent and silver 98.6 percent. Lead-silver concentrates (9,845 tons) contained 3,514,178 ounces of silver, 843,000 pounds of copper, and 6,703,810 pounds of lead, of which the net for Sunshine account was 1,467,070 ounces of silver, 347,853 pounds of copper, and 2,953,949 pounds of lead. Production credited to other companies (Polaris, Silver Dollar, and Silver Syndicate) was 2,047,108 ounces of silver, 495,148 pounds of copper, and 3,749,861 pounds of lead. According to the annual report of the Sunshine Mining Co., the labor shortage in 1945 was more acute than at any time during the war, and this with a 200-percent labor turn-over was responsible for a 21-percent decrease in tons of ore mined and a 38-percent decrease in development footage compared with 1944. Development in all areas in 1945 comprised 2,018 feet of drifting, 1,137 feet of raising, and 682 feet of crosscutting; and diamond drilling of 7 test holes totaled 1,926 feet. The most important development during the year was the discovery of lead-silver ore in the Silver Syndicate fault zone on the 3,700 level in territory in which Sunshine Mining Co. and Silver Syndicate, Inc., have equal interests. The ore varied in width from a few inches up to 12 feet for 169 feet in length. The average width for this length was 4.2 feet, and the average assays of the samples of ore cut were 47 ounces of silver to the ton and 22 percent lead. This discovery opens extensive exploration possibilities because of its great distance from any previously known ore occurrences. Exploration and development of the Chester vein in 1945 indicated a continuous ore shoot for a length of 950 feet on the 3,700 level, including 388 feet in the Omega area and 562 feet in the Rotbart area. The average width of the ore was 4 feet and the average silver assay 64 ounces per ton; the lead content was extremely low, being less than 0.5 percent. Developed ore reserves were increased during the year and are estimated at 987,000 tons, of which 544,000 tons are in areas where other companies participate in the production.

Output of silver-copper-antimony ore at the Mineral Point mine of the Coeur d'Alene Mines Corp. dropped from 25,337 tons in 1944 to 12,455 tons in 1945, and the company 600-ton flotation mill operated intermittently. Copper concentrate (291 tons) containing 110,364 ounces of silver, 161,653 pounds of copper, and 95,556 pounds of antimony was shipped to the copper smelter at Tacoma, Wash. According to the corporation printed annual report, the large decrease in output of ore in 1945 was due to the low grade of the ore, plus the fact that less than one-third of the underground crew could be employed breaking ore, the others being needed for development and maintenance. Ore containing an average of 9.04 ounces of silver to the ton, 0.67 percent copper, and 0.39 percent antimony was mined in 1945 from the 1,600, 1,800, 2,000, and 2,200 levels. The known ore bodies on the 1,600 and 1,800 levels are nearly exhausted, and future production will rely on ore below the 1,800 level. During the year considerable drifting was done on the 2,200 level, but despite good silver assays the vein was too narrow to provide commercial ore. The ore reserve on December 31, 1945, was estimated at 73,310 tons, with an average silver content of 10 ounces per ton. All this is marginal ore and can be mined at a profit only by handling a large tonnage under ideal conditions. The rest of the district output was 6,897 tons of old zinc-lead tailings from dumps near Osburn, treated in the Golconda custom mill.

Hunter district (Mullan).—A total of 450,343 tons of ore and old tailings was produced in 1945 from six properties in the Hunter district, compared with 528,015 tons of ore from six properties in 1944; the most important output was 395,838 tons of zinc-lead ore from the Morning and Star mines. Mining and milling operations at the Morning property of the Federal Mining & Smelting Co. were continuous throughout the year. The 1,250-ton mill treated 173,864 tons of waste-dump ore, containing an average of 0.7 ounce of silver to the ton, 1.2 percent lead, and 1.0 percent zinc; and 76,447 tons of mine ore, containing an average of 2.3 ounces of silver to the ton, 6.7 percent lead, and 8.6 percent zinc. The average mill recoveries in lead concentrate were silver 76.4 percent, lead 87.4 percent, and zinc 10.4 percent; in zinc concentrate, silver 13.2 percent, lead 3.9

percent, and zinc 81.4 percent. According to the printed annual report of the company for 1945, operations were on a 6-day work week throughout the year, and owing to the labor shortage the mine operated only one shift a day. Some additional labor began to come into the district in November and thereafter; the crew on January 1, 1946, was still about 235 men below normal. No shaft sinking was done in 1945; however, the shaft station and ore pockets on the 4,850 level were completed, and the crosscut was driven to intersect the vein which showed ore 3½ feet in width and of good grade. Ore reserves at the end of the year, including developed and probable ore in both the Morning and You-Like portions of the mine, are estimated at 582,500 tons, an increase of 52,500 tons over the estimated tonnage at the end of 1944.

The 1,000-ton flotation mill of the Sullivan Mining Co. at the Star mine operated continuously in 1945 on a basis of 6 days a week, three shifts per day, but only at 50-percent capacity owing to a shortage of miners in the Star mine. The mill treated 145,527 tons of zinc-lead ore (195,562 tons in 1944) from the Star mine, yielding 7,390 tons of lead concentrate and 23,646 tons of zinc concentrate, which contained 130 ounces of gold, 179,069 ounces of silver, 12,387,809 pounds of lead, and 24,964,866 pounds of zinc. The mine continued as the largest producer of zinc in Idaho. Hunter Lease operated the Gold Hunter mine and 500-ton flotation mill at Mullan throughout the year; 35,173 tons of ore and 4,416 tons of old tailings averaging 2.61 ounces of silver to the ton, 2.41 percent lead, and 0.75 percent zinc were treated in 1945, which yielded 1,315 tons of lead concentrate and 81 tons of zinc concentrate. The remainder of the district output comprised 6,016 tons of old zinc-lead tailings from the Mary D. property treated in the Golconda custom mill, 6,000 tons of waste-dump ore (containing chiefly silver and lead) from the Simia dump, and 2,900 tons of zinc-lead-silver ore from the Lucky Friday mine treated in the Golconda mill.

Lelande district (*Burke, Mace, Frisco*).—The output of the Lelande district was 152,512 tons of zinc-lead-silver ore and old tailings and 3,290 tons of lead ore in 1945 compared with 136,180 tons of zinc-lead-silver ore and old tailings and 31,748 tons of lead ore in 1944. Most of the output in 1945 was 77,490 tons of zinc-lead-silver ore from the Frisco and Sherman mines and 67,600 tons of old zinc-lead tailings from the Canyon Creek property above Wallace. The Federal Mining & Smelting Co. worked the lower levels of the Frisco mine at Gem throughout the year and hauled 27,909 tons of ore (containing an average of 1.28 ounces of silver to the ton, 3.60 percent lead, and 5.81 percent zinc) to the Morning mill at Mullan; Hull Lease continued working the upper levels and, in its own 90-ton flotation mill at Gem, treated 22,954 tons of similar ore, which yielded 1,530 tons of lead concentrate and 3,155 tons of zinc concentrate. According to the printed annual report of the Federal Mining & Smelting Co., operations at the Frisco mine were on a basis of 6 days per week throughout the year. The water level in the shaft was held 25 feet below the 1,200 level, but because of the labor shortage only a small amount of development was done. Ore reserves at the end of the year were estimated at 205,000 tons of developed and probable ore. From present indications, additional ores will be developed as the lower levels are made accessible.

Approximately 26,627 tons of zinc-lead-silver ore were produced in 1945 from the Sherman mine by the Sherman Lead Co. and treated in the company 300-ton flotation mill, which yielded 5,350 tons of zinc-lead-silver concentrate. The ore contained an average of 9.11 ounces of silver to the ton, 12.26 percent lead, and 2.00 percent zinc. According to the printed annual report of the company, very little development has been done in the mine during the war period. In 1945 development comprised 631 feet of drifting, 10 feet of crosscutting, and 139 feet of raising; diamond drilling aggregated 714 feet. Development was confined to the 1,500 level, which disclosed a medium-size, fair to low-grade ore shoot. The Sherman mine and mill are in excellent condition, and production can be increased whenever circumstances warrant. Factors affecting full resumption of operations are availability of labor, wage rates, and prices of silver and lead.

Small Leasing Co. operated its 140-ton flotation mill continuously in 1945 on old tailings (containing an average of 1.9 ounces of silver to the ton, 2.2 percent lead, and 2.8 percent zinc) deposited along Canyon Creek 3 miles above Wallace; 56,196 tons were treated in its own mill and 11,404 tons hauled to the Golconda custom mill. The rest of the district output was principally 7,292 tons of old zinc-lead tailings from property along Canyon Creek and 3,290 tons of lead ore produced by lessees from the Black Bear, Hecla, and Hercules mines.

Placer Center district.—The output of ore and old tailings in the Placer Center district dropped from 185,581 tons in 1944 to 149,112 tons in 1945, owing chiefly to a decline in output of zinc-lead-silver ore from the Tamarack mine; nevertheless, the mine remained the most important producer of ore in the district. The Tamarack & Custer Consolidated Mining Co. reported that 66,082 tons of ore (containing an average of 1.1 ounces of silver to the ton, 3.7 percent lead, and 6.6 percent zinc) were produced from the mine in 1945 (94,527 tons in 1944) and treated in its 400-ton flotation mill. In addition, lessees hauled 4,443 tons of dump ore and 276 tons of underground ore to the Galena (Zanetti) custom mill. According to the printed annual report of the company, the decline in output of ore from the Tamarack mine in 1945 was due entirely to lack of manpower. A crew of about 200 men is required at Tamarack No. 7 to maintain normal operations. At the beginning of the year, only 115 men were working and at the end of the year, 137. Some development was done in 1945 on all levels of the mine, except the 1,350, from the 1,000 down to the 2,000; no significant disclosures of ore were made. The 2,400 level, the lowest in the mine, will be explored in 1946, and the success of this work will have an important bearing upon the mine's future. The mine and mill are in good condition and ready for maximum production whenever additional manpower is available. Exploration has lagged in recent years, but the mine will undergo extensive development as soon as labor is available. Ore reserves have declined during the war period, both in quantity and quality.

The Dayrock Mining Co. operated its mine and 200-ton flotation mill continuously in 1945; a total of 30,922 tons of ore averaging 3.07 ounces of silver to the ton, 4.16 percent lead, and 0.40 percent zinc was treated in the Dayrock and Hercules milling plants and

717372—47——25

yielded 1,868 tons of high-grade silver-lead concentrate. In addition to Dayrock ore, the Dayrock mill treated 8,779 tons of custom ores. According to the company printed annual report, work at the mine in 1945 included deepening the shaft from the 500 to the 800 level. Other development comprised 1,561 feet of drifting, 350 feet of cross-cutting, and 739 feet of raising; diamond drilling aggregated 985 feet. Ore developed during the year was approximately equal to the tonnage extracted. Reserves developed during the year included ore on the 300 and 400 levels. A 150-horsepower hoist was installed on the main haulage level, which will permit efficient hoisting from the new lower levels.

About 25,300 tons of zinc-lead ore were produced in 1945 from the Red Monarch, Rex, and Delaware groups near Wallace by the Callahan Consolidated Mines Co. and treated in the company 100-ton flotation mill; the ore averaged 0.80 ounce of silver to the ton, 2.48 percent lead, and 2.59 percent zinc. The remainder of the district output was principally 20,742 tons of zinc-lead old tailings from the Rose, Tomsche, and Zanetti properties and 1,319 tons of zinc-lead ore produced by lessees from the Success mine—all treated in custom flotation mills near Wallace.

Summit district (*Murray*).—The Dan Murphy Leasing Co. worked the Orofino mine in 1945 and shipped 315 tons of zinc-lead ore to the Hercules custom mill near Wallace.

Yreka district (*Kellogg*).—The Yreka is the chief lead- and zinc-producing district in Idaho and ranks second in silver. In 1945 material treated in the district included 700,933 tons of zinc-lead-silver ore and old tailings, 92,266 tons of zinc slag, 48,383 tons of zinc-lead-iron-silver old tailings, and 10,851 tons of silver-lead ore—a total of 852,433 tons compared with a total of 917,240 tons in 1944. Despite a decrease of more than 100,000 tons of zinc-lead-silver ore from the Bunker Hill & Sullivan mine at Kellogg in 1945, it remained the most important producer of ore in the district. The company's main 1,700-ton flotation mill, equipped with a sink-and-float unit, operated continuously and treated 150,947 tons of zinc-lead-silver ore from the Bunker Hill & Sullivan mine and 312,719 tons of zinc-lead old tailings from the Sweeny dump. The ore contained an average of 4.87 ounces of silver to the ton, 7.25 percent lead, and 2.77 percent zinc and the old tailings, 0.83 ounce of silver to the ton, 1.62 percent lead, and 0.81 percent zinc. The mill yielded a total of 22,423 tons of lead concentrate and 5,952 tons of zinc concentrate, which were shipped to the lead- and zinc-reduction plants at Bradley. John George continued leasing operations in the upper levels of the Bunker Hill & Sullivan mine and treated about 6,000 tons of silver-lead ore in his mill. In addition, 449 tons of silver-lead ore were shipped direct to a smelter. The Bunker Hill & Sullivan Mining & Concentrating Co. also operated its 300-ton gravity-flotation plant from April 4 to November 17; treated 48,383 tons of old jig tailings containing an average of 1.19 ounces of silver to the ton, 2.29 percent lead, 1.29 percent zinc, and 15.74 percent iron; and shipped 92,266 tons of old Bunker Hill smelter slag (containing an average of 0.36 ounce of silver to the ton, 1.83 percent lead, and 12.18 percent zinc) to its lead smelter at Bradley. The resulting hot slag was sent to the slag-fuming plant, also at Bradley, to recover the zinc. According to the company printed annual report, there were produced and recovered from Bunker Hill & Sullivan mine ore (including lessee ore) 678,154 ounces of silver, 21,624,000 pounds of lead, and 7,124,000 pounds of zinc. Because of a continued shortage in manpower, especially for underground mine labor, metals recovered in 1945 decreased substantially compared with 1944. Although a relatively small amount of development and prospecting was done in 1945, ore reserves are large but decreased owing entirely to lack of competent underground mine labor. Ore reserves January 1, 1946, undercut and available for mining, totaled 2,631,835 tons of zinc-lead-silver ore. Operations at the zinc slag-fuming plant of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley were carried on throughout the year at a slightly greater rate than in 1944. In 1945 the plant received 92,266 tons of old, reclaimed dump slag and 60,805 tons of hot current slag from the lead furnaces of the Bunker Hill smelter at Bradley; the resulting lead fume (1,882 tons) was sent to the Bunker Hill lead smelter, and the zinc fume (24,043 tons) was shipped to the smelters in the East. All of the lead and zinc produced at the plant in 1945 was credited to the mines furnishing the slag-making material.

Mining and milling of zinc-lead-silver ore from the Page mine (no ore was produced from the Blackhawk mine in 1945) by the Federal Mining & Smelting Co. were continuous in 1945 but at a lower rate than in 1944; 80,727 tons of ore were treated in 1945 compared with 116,976 tons in 1944. The ore, treated in the Page 500-ton flotation mill, contained an average of 4.22 ounces of silver to the ton, 7.21 percent lead, and 8.18 percent zinc. According to the printed annual report of the company, no shaft sinking was done in 1945 and very little development because of the shortage of labor; on the 1,800 level the drift on the Tony vein was driven 115 feet eastward. Ore reserves at the end of the year were estimated at 696,000 tons of developed and probable ore—a decrease of 59,000 tons from the estimated tonnage at the end of 1944.

The Little Pittsburg mine on Denver Creek was operated under lease throughout the year by the Denver Development Co.; 42,244 tons of ore, containing an average of 1.30 ounces of silver to the ton, 3.21 percent lead, and 7.77 percent zinc, were treated in the company 150-ton flotation mill, which yielded 1,057 tons of zinc-lead concentrate and 4,782 tons of zinc concentrate. Mining and milling of zinc-lead ore from the Highland-Surprise mine on Stewart Creek by the Highland-Surprise Consolidated Mining Co. were continuous in 1945. The company 200-ton flotation mill treated 30,528 tons of ore yielding 4,292 tons of zinc-lead concentrate. About 26,150 tons of ore, containing an average of 3.06 ounces of silver to the ton, 4.57 percent lead, and 9.12 percent zinc, were produced during the year from the Spokane-Idaho property on Pine Creek and treated in the company 150-ton flotation mill. The Small Leasing Co. continued operating the Douglas mine, also on Pine Creek, and treated 19,116 tons of zinc-lead ore in its 100-ton flotation mill, which yielded 3,046 tons of zinc-lead concentrate. Mining and milling of zinc-lead-silver ore from the Sidney mine on Denver Creek by the Sidney Mining Co. were continuous throughout the year. The company reported that 12,900 tons of ore (containing an average of 2.82 ounces of silver to the ton, 6.37 percent lead, and 12.71 percent zinc) were treated in its own

50-ton mill and 4,386 tons in a custom mill. In September the company began erecting a new 250-ton milling plant. About 15,400 tons of zinc-lead ore were produced in 1945 from the Liberal King mine by the Sunset Minerals, Inc., and treated in the company 100-ton flotation mill. The rest of the district output was mainly 4,402 tons of silver-lead-iron fluxing ore shipped direct to a smelter from the Sierra-Nevada waste dump and 3,990 tons of zinc-lead ore produced from the Nabob mine during the first 6 months of the year. The Lynch-Pine Creek Mining Co. relinquished its lease on the Nabob mine in June; during the remainder of the year the property was developed by the owner—Nabob Silver-Lead Co. In September the company began erecting a new 250-ton flotation mill.

VALLEY COUNTY

Deadwood Basin district.—Production of gold, silver, copper, lead, and zinc in the Deadwood Basin district was much greater in 1945 than in 1944, owing to continuous milling of zinc-lead-silver ore from the Hall-Interstate property by the Callahan Zinc-Lead Co. The company reported that 24,377 tons of ore, containing an average of 0.02 ounce of gold and 3.89 ounces of silver to the ton, 0.23 percent copper, 1.43 percent lead, and 3.53 percent zinc, were treated in its 100-ton flotation mill. According to the printed annual report of the company, 4 years of unremitting effort at the Hall-Interstate mine has failed to disclose ore of the grade and quantity hoped for, and despite maximum Premium Price Plan payments for lead and zinc in 1945 operations were disappointing.

Yellow Pine district.—Gold-silver-iron-antimony-tungsten ore was mined 8 months of the year from the open pit at the Yellow Pine mine by the Bradley Mining Co. and treated in the company 800-ton flotation mill. During August, September, October, and November the company treated only old tungsten tailings. In 1945 the mill treated 109,796 tons of ore and 47,359 tons of old tailings, yielding 5,098 tons of low-grade tungsten concentrate, 138 tons of high-grade tungsten concentrate, 2,500 tons of antimony-silver-gold concentrate, and 2,308 tons of gold-silver-antimony-iron concentrate. The remainder of the district output was 10 tons of gold-silver ore produced from the Red Metals claim.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN MONTANA

(MINE REPORT)

By C. E. Needham and Paul Luff

SUMMARY OUTLINE

SUMMARY

Zinc bore the brunt of the pronounced decrease in metal production in Montana in 1945, showing a drop in output of 52 percent from that in 1944. Declines in output of the other four metals, although not so great, were nevertheless marked—gold, 11 percent; silver, 16 percent; copper, 25 percent; and lead, 24 percent. The downward trend in total value of the five metals, in progress since 1942, grew steeper in 1945 despite slightly higher average prices for lead and zinc. The drop from $49,039,855 in 1944 to $35,405,505 in 1945 was nearly 28 percent. Copper contributed over 67 percent of the total value, silver 12, zinc 11, lead 5, and gold over 4. The sharp slump in metal output resulted largely from the acute labor shortage at mines, mills, and smelters, especially at Butte and Anaconda.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Montana, 1941–45, and total, 1862–1945, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

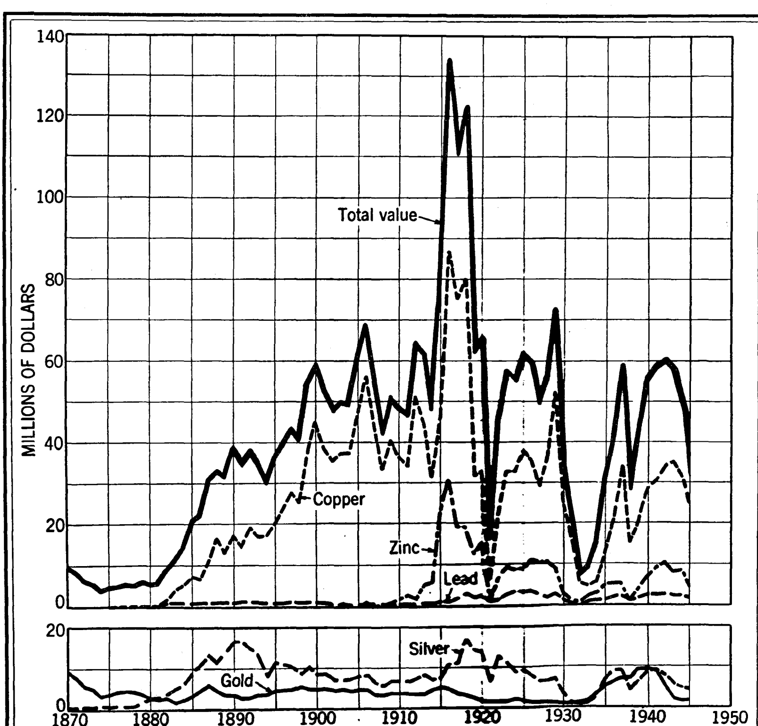

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Montana, 1870–1945.

Mine production of gold, silver, copper, lead, and zinc in Montana in 1945, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
January	3,032	562,163	17,846,000	1,398,000	3,112,000
February	3,591	508,566	15,916,000	1,570,000	3,030,000
March	2,854	570,842	17,920,000	1,772,000	3,402,000
April	3,161	478,858	15,466,000	1,812,000	3,332,000
May	2,894	547,532	16,948,000	2,096,000	3,156,000
June	3,355	548,010	16,170,000	1,644,000	2,930,000
July	4,177	508,228	13,372,000	1,754,000	2,862,000
August	4,612	494,216	12,464,000	1,328,000	1,998,000
September	4,807	490,214	12,722,000	1,524,000	2,058,000
October	4,472	501,227	14,154,000	1,786,000	2,462,000
November	3,998	421,204	13,158,000	1,806,000	3,442,000
December	3,644	311,010	10,876,000	1,508,000	3,022,000
	44,597	5,942,070	177,012,000	19,998,000	34,806,000
Total, 1944	50,021	7,093,215	236,380,000	26,210,000	72,254,000

Gold.—Base-metal mines supplied the greater part of Montana gold production in 1945, although some improvement in the status of the gold-mining industry was noted following the rescinding, July 1, of War Production Board Order L-208. The 11-percent drop in gold output in 1945 compared with 1944 can be attributed mainly to lower production from the copper-producing operations of the Anaconda Copper Mining Co. and to reduced output from a number of fairly important gold mines.

Placer mining regained some of its importance in 1945, particularly following the revocation of WPB Order L-208, and 56 percent more gold was recovered from gravels than in 1944. Greater activity was recorded in connected-bucket and dragline dredging; but output from hydraulicking, small-scale hand methods, and drift mining declined. Connected-bucket dredges showed an increase over 1944 of 25 percent in quantity of gravel washed and 56 percent in value of gold recovered. The two operations—one in Granite County and the other in Lewis and Clark County—washed 97 percent of the total gravel mined in the State in 1945 and produced 95 percent of the State placer gold.

Of Montana's total gold in 1945, 45 percent was derived from siliceous gold and silver ores, 33 percent from base-metal ores, and 22 percent from placers, compared with 51 percent from siliceous ores, 36 percent from base-metal ores, and 13 percent from placers in 1944. Ores concentrated yielded 32 percent of the State total gold; ores shipped to smelters, nearly 28 percent; and ores treated at amalgamation and cyanidation mills (with or without concentrating equipment), over 18 percent.

The leading gold producers in Montana in 1945 were the Anaconda Copper Mining Co. (copper ore and waste materials) at Butte and Anaconda; Jardine Mining Co. (gold ore) at Jardine; Porter Bros. (placer); H. and H. mines (placer); the Golden Sunlight mine (gold ore) near Whitehall; the Granite-Bimetallic tailing dump (gold-silver ore) at Philipsburg; and the U. S. Grant mine (gold-silver ore) near Virginia City. These seven producers furnished 78 percent of the State total gold.

Silver.—Although the output of recoverable silver in Montana in 1945 decreased 1,151,145 ounces from that in 1944, the State remained the Nation's third leading silver producer, being exceeded only by

Idaho and Utah. The decline in silver output from the previous year resulted mainly from a much smaller output of byproduct silver from the copper-producing operations of the Anaconda Copper Mining Co. at Butte and Anaconda. However, the company, from its copper mines, mine dumps, tailing dumps, slime ponds, zinc mines, and the North Butte and Flathead mines, supplied 77 percent of the State total compared with 79 percent in 1944. Other important sources of silver were the Emma mine at Butte, the Granite-Bimetallic tailing dump at Philipsburg, the Mike Horse mine at Flesher, and the Elkhorn dump at Elkhorn.

Copper ore and tailings furnished over 75 percent of the State total silver; siliceous ores, 11 percent; zinc-lead ore, nearly 11 percent; and lead ore and zinc ore, less than 3 percent. Ore treated at concentrating mills yielded 87 percent of the total silver, and smelting ore over 12 percent; minor sources were slag fumed, ores amalgamated or cyanided in plants with or without concentrating equipment, and placers.

The mining of straight silver ore in 1945 did not keep pace with the 1944 rate, and production declined over 10,000 tons. However, the grade of ore was higher in 1945, and output of recoverable silver from this source was greater than in 1944.

Copper.—The output of recoverable copper in Montana in 1945 dropped 59,368,000 pounds from that in 1944 and was the lowest since 1938. The sharp decline was due largely to the marked decrease in tonnage of crude mine ore and waste material from the properties of the Anaconda Copper Mining Co. at Butte and Anaconda. The Anaconda Co. supplied about 95 percent of the State total copper, and the North Butte mine at Butte furnished all but a very small part of the remainder. The production of copper in the Butte district declined from 234,725,400 pounds in 1944 to 175,895,800 pounds in 1945, a decrease of 25 percent.

Lead.—Most lead-producing properties and districts in Montana showed declines in lead output in 1945, and State production dropped 6,212,000 pounds from that in 1944 to reach the lowest point since 1938. In opposition to the general downward trend the Mike Horse mine near Flesher made a substantial increase in lead production. Following the Mike Horse mine as the leading lead producer in the State were the Emma mine at Butte, the Jack Waite mine in Sanders County, the Toledo-Buckeye group near Sheridan, the Poulin mine at Butte, the Orphan Girl and Travona mines at Butte, and the Elkhorn dump at Elkhorn. These seven sources contributed over 14,000,000 pounds, or 70 percent, of Montana's total lead. About 72 percent of the State lead output was recovered from zinc-lead ore, 10 percent from zinc ore and slag, 10 percent from siliceous ores, and 8 percent from lead ore.

Zinc.—Zinc experienced the greatest percentage decline in production in 1945 of any of the five metals in Montana; output of recoverable zinc was 37,448,000 pounds, or 52 percent less than in 1944. The loss resulted principally from the marked decline in zinc output from the zinc slag-fuming plant at East Helena and from the Silver Cable, Mount Washington, and Iron Mask properties. The leading producers of zinc in 1945, in order of output, were the Emma (manganese ore), Anaconda slag-fuming plant (old lead-smelter slag), Mike Horse (zinc-lead ore), Poulin (zinc ore), Toledo-Buckeye (zinc-lead ore), Orphan Girl and Travona (zinc-lead ore), Elkhorn dump (silver ore), and Forest Rose (zinc ore). These eight sources contributed nearly 81 percent of Montana's total zinc in 1945. About 62 percent of the State total zinc was derived from zinc-lead ore, 32 percent from zinc ore and slag, and nearly all the remainder from siliceous gold and silver ores.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Montana in 1945, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

MINING INDUSTRY

The labor shortage at the mines, mills, and smelters in Montana in 1945 was the most acute yet experienced during World War II and was the principal factor in reducing the total output of ore and of old tailings treated by 1,129,900 tons (nearly 19 percent) below that in 1944. The greatest decline was in output of zinc ore and slag—56 percent—but loss in production of zinc-lead ore also was high—36 percent.

The number of producing lode mines declined from 188 in 1944 to 160 in 1945; only zinc-ore mines increased in number.

About 91 percent of the total ore and tailings treated in 1945 was copper ore, 4 percent was siliceous gold and silver ores, 3 percent was zinc-lead ore, and 2 percent was zinc ore and lead ore.

Copper ore mined at Butte declined from 2,559,796 tons in 1944 to 1,924,775 tons in 1945, and waste-dump ore from 879,879 tons to 489,469 tons; but old tailings and slimes increased from 1,906,626 tons to 2,059,648 tons. The Heddleston district was an exception to the general trend and showed a substantial increase in ore production. Compared with 1944, the grade of primary copper ore treated in the Butte district in 1945 decreased about 0.4 pound of recoverable copper per ton of copper ore.

The Bureau of Mines made preliminary examinations during the year on a number of base-metal deposits and conducted diamond drilling at a few properties.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Montana in 1945, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	47	65,776	14,671	13,834	44,697	41,006	28,587
Dry and siliceous gold-silver ore	22	67,867	4,408	316,691	198,363	796,159	144,425
Dry and siliceous silver ore	30	55,070	1,025	320,221	412,361	1,089,674	1,546,933
	99	188,713	20,104	650,746	655,421	1,926,839	1,719,945
Copper ore	10	4,463,131	11,378	4,487,436	[1] 175,372,169		
Lead ore	31	14,919	840	52,641	53,805	1,625,296	190,116
Zinc ore	12	[2] 87,801	438	116,298	153,346	1,960,336	11,238,012
Zinc-lead ore	33	164,998	2,147	634,139	777,259	14,485,529	21,657,927
Total, lode mines	[3] 160	4,919,562	34,907	5,941,260	[1] 177,012,000	19,998,000	34,806,000
Total, placers	26		9,690	810			
	186	4,919,562	44,597	5,942,070	[1] 177,012,000	19,998,000	34,806,000
Total, 1944	212	6,049,462	50,021	7,093,215	[4] 236,380,000	26,210,000	72,254,000

[1] Includes 5,803,665 pounds recovered from precipitates.
[2] Includes 25,711 tons of old lead smelter slag fumed.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 4,173,664 pounds recovered from precipitates.

METALLURGIC INDUSTRY

The 4,919,562 tons of ore produced from Montana lode mines in 1945 were treated as follows: 4,664,259 tons (95 percent) at concentrating mills, compared with 5,569,756 tons in 1944; 183,037 tons (nearly 4 percent) shipped to smelters, compared with 240,783 tons in 1944; 25,711 tons of old lead-smelter slag fumed, compared with 187,988 tons in 1944; 45,217 tons (nearly 1 percent) at amalgamation-cyanidation-concentration mills, compared with 50,430 tons in 1944; and 1,338 tons at amalgamation mills compared with 505 tons in 1944. The ore that went to concentrating mills comprised 4,418,846 tons of copper ore, 161,306 tons of zinc-lead ore, 58,363 tons of zinc ore, 15,634 tons of siliceous ore, and 10,110 tons of lead ore.

The 12,320-ton copper concentrator, the 2,000-ton zinc concentrator, and the 2,000-ton slime-disintegrating plant of the Anaconda Copper Mining Co., all at Anaconda, were operated continuously in 1945, but at reduced rates. The company copper smelter (annual capacity, 1,300,000 tons of charge) and the two electrolytic zinc plants at Anaconda and Great Falls (combined capacity, 233,400 tons of slab zinc per year) also were operated throughout the year below capacity. The zinc plants treated 394,110 tons of zinc concentrates containing 425,699,262 pounds of zinc, compared with 469,412 tons containing 510,740,695 pounds of zinc in 1944. The concentrates were received from mills in Idaho, California, Montana, Nevada, New Mexico, Utah, Colorado, and several foreign countries. The company zinc-fuming plant at East Helena was operated at below capacity (about 16,500 tons of slag per month) throughout the year except for short shut-downs for repairs. The output of zinc-lead fume decreased from 38,115 tons in 1944 to 32,233 tons in 1945; nearly all was treated at Anaconda's Great Falls zinc plant.

The lead smelter of the American Smelting & Refining Co., at

East Helena treated chiefly lead-silver concentrates from the Coeur d'Alene region in Idaho, residues from the electrolytic zinc plants of the Anaconda Copper Mining Co. at Anaconda and Great Falls, and crude ores, old tailings, and concentrates from various districts in Montana. The plant was operated continuously in 1945, except for brief repair periods.

Details of treatment of all ores produced in Montana in 1945 are given in the tables that follow.

Mine production of metals in Montana in 1945, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	1,338	200	40			
Ore cyanided	45,217	7,747	1,592			
Concentrates smelted [1]	422,070	14,635	5,188,080	167,580,415	15,946,075	27,532,573
Copper precipitates smelted	4,218			5,803,665		
Ore smelted	183,037	12,325	747,368	3,627,920	3,621,925	2,923,427
Slag fumed	25,711		4,180		430,000	4,350,000
Placer		9,690	810			
		44,597	5,942,070	177,012,000	19,998,000	34,806,000
Total, 1944		50,021	7,093,215	236,380,000	26,210,000	72,254,000

[1] Includes zinc concentrates treated at electrolytic plants.

Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Montana in 1945, by types of mills and by counties, in terms of recovered metals

[1] Barker district lies in Cascade and Judith Basin Counties.

BEAVERHEAD COUNTY

Argenta district.—Output from the Argenta district in 1945 comprised 686 tons of lead ore from the Iron Mountain mine and 534 tons of gold-silver ore and 340 tons of lead ore from the Louis Phillip mine; all was shipped to smelters.

Bryant district.—From the Hecla mine and dumps L. D. Foreman shipped to smelters in Utah a total of 6,346 tons of material that comprised 2,738 tons of old silver tailings, 2,360 tons of old zinc-lead slag, 648 tons of gold-silver ore, 329 tons of lead ore, and 271 tons of zinc ore.

Vipond district.—The Quartz Hill Leasing Co. operated the Quartz Hill Mines group in 1945 and shipped 31 tons of ore containing 1,395 ounces of silver to the copper smelter at Anaconda.

BROADWATER COUNTY

Beaver district.—H. W. Carver, lessee, worked the East Pacific and No. 4 Tunnel claims in 1945; the milling of about 6,400 tons of old tailings yielded 14 tons of zinc concentrate, 201 tons of lead concentrate, and 32 tons of iron concentrate. In addition, 87 tons of zinc-lead ore were shipped to the lead smelter at East Helena. From the January group George G. E. Neill shipped 100 tons of lead ore and 46 tons of zinc-lead ore to mills in Utah and 7 tons of zinc-lead ore to the East Helena lead smelter. Remaining production from the district totaled 154 tons of gold ore shipped to the East Helena lead smelter from the Aurora, Edna No. 2, Joe Dandy, Martha Washington, Viola, and Vosburg properties.

Cedar Plains district.—The bulk of the output from the Cedar Plains district in 1945 was old tailings and waste dump material—1,361 tons of zinc ore from the Ruby Silver waste dump, 1,064 tons of old cyanide tailings from the Ohio Keating dump, and 170 tons of lead ore from the Joe Dandy waste dump. In addition, zinc and zinc-lead ore were produced from the Ruby Silver mine, lead ore from the North Star property, and gold ore from the Nada and Buckhorn mines. All the output from the district was sent to the East Helena smelter.

Park or Indian Creek district.—The Broadwater Zinc & Lead Co. produced 4,429 tons of zinc ore in 1945 from the Iron Mask mine; 3,500 tons were milled at the Anaconda zinc concentrator, and 929 tons were shipped to the East Helena lead smelter. Other output from the district was 390 tons of gold ore, treated by amalgamation, from the Diamond Hill mine and a little placer gold recovered by sluicing.

CASCADE COUNTY

Barker district.—Total production from the Barker district in 1945 was 559 tons of zinc-lead ore shipped to the Midvale, Utah, concentrator from the Fairplay & Bon Ton group. Gross metal content of the ore was 2 ounces of gold, 2,876 ounces of silver, 856 pounds of copper, 81,320 pounds of lead, and 306,417 pounds of zinc.

Montana district.—The Bennett Mining Co. operated the Dacotah group throughout the year and milled 12,571 tons of zinc ore that yielded 813 tons of zinc concentrate and 404 tons of lead concentrate.

The Neihart Mine & Milling Co. worked the Broadwater group continuously in 1945 and produced 13,324 tons of zinc-lead ore, which was treated in the company 80-ton selective flotation mill; the ore yielded 625 tons of zinc concentrate and 278 tons of zinc-lead concentrate. Development at the property during the year comprised 100 feet of shaft sinking, 100 feet of drifts, and 500 feet of diamond drilling. The Benton group and the Ripple mine were operated by the Montana Leasing Co. in 1945. Output from the Benton group—4,774 tons of silver ore—yielded 327 tons of zinc-lead concentrate, and that from the Ripple mine—1,393 of silver ore—produced 65 tons of zinc-lead concentrate. All concentrates were shipped to the East Helena lead smelter. Loretta L. Rives operated the Star group and the 50-ton flotation mill during the year. The output of 2,520 tons of zinc-lead ore yielded 211 tons of zinc-lead concentrate, which contained 20 ounces of gold, 16,816 ounces of silver, 785 pounds of copper, 142,183 pounds of lead, and 67,361 pounds of zinc.

FLATHEAD COUNTY

Hog Heaven district.—Output of the Hog Heaven district in 1945 was 1,437 tons of siliceous silver ore shipped to the Anaconda copper smelter by the Anaconda Copper Mining Co. from its Flathead and West Flathead mines.

GRANITE COUNTY

Boulder and South Boulder district.—Leon Heroux operated the Annie claim in 1945 and shipped to the East Helena smelter 171 tons of lead ore containing 7,244 pounds of copper, 51,889 pounds of lead, and 4,048 pounds of zinc.

Dunkelburg district.—The Forest Rose Syndicate, operating the Forest Rose, Wasa, and Monarch claims, was the only producer in the Dunkelburg district in 1945. The company 100-ton flotation mill ran continuously and produced 1,137 tons of zinc concentrate and 82 tons of lead concentrate, which were shipped to the Anaconda zinc plant and the East Helena lead smelter, respectively.

First Chance district.—Lode production in the First Chance district in 1945 was all siliceous ore shipped to the Tacoma, Wash., smelter from three claims—8 tons of gold ore from the Homestake and 5 tons of silver ore from the New Hope and Old Tex. Placer production was 23 ounces of gold from the Lucky Jim and Star Pointer properties.

Flint Creek district.—J. C. and Juanita Yob continued to work the Granite-Bimetallic dumps, which produced the bulk of the output from the Flint Creek district in 1945. The Tacoma, Wash., smelter received 48,902 tons of the old tailings, and the East Helena lead smelter the remaining 1,869 tons. The Trout Mining Division of American Machine & Metals, Inc., shipped to smelters 2,119 tons of low-grade gold ore and 40 tons of zinc-lead ore from its Trout group of claims which produce principally manganese ore. Silver ore (28 tons) was sent to the Anaconda copper smelter from the Silver Prince mine.

Henderson district.—The connected-bucket dredge operations of the

H. and H. Mines on Henderson Creek were expanded during the year, and gold output rose from 3,582 ounces in 1944 to 4,439 in 1945 and silver from 225 ounces to 270. Remaining production from the district was 3,014 tons of siliceous silver old tailings shipped to the East Helena lead smelter from the Combination group.

JEFFERSON COUNTY

Amazon district.—A. J. Schevers and A. C. H. Rex shipped to the East Helena lead smelter 59 tons of gold-silver ore from the East Mint property.

Big Foot and State Creek district.—Ed Lahey worked the Big Four dump in 1945 and shipped 293 tons of lead ore to the East Helena lead smelter. The Blue Jay mine produced the remainder of the district output (34 tons of zinc-lead ore), which was treated at the Midvale, Utah, concentrator and 7 tons of zinc-lead ore shipped to the East Helena lead smelter.

Boulder and Little Boulder district.—The entire output of the Boulder and Little Boulder district comprised 63 tons of silver ore from the Baltimore mine and 30 tons of old gold-silver tailings from the Golden Thread claim, all shipped to the East Helena smelter.

Cataract district.—The Golden Messenger Corp. worked the Crystal mine in 1945 and shipped 631 tons of gold-silver ore to the East Helena lead smelter. From the Morning Glory mine J. K. Curtiss shipped to the Anaconda copper smelter 235 tons of silver ore containing 39 ounces of gold and 5,975 ounces of silver. The remainder of the district output was mainly siliceous ore shipped to smelters from the Queen of the Hills, Jupiter, Shoo Fly, Sirius, Comet, and Bullion properties; in addition, gold ore produced from the Gray Lead mine was amalgamated, and zinc-lead ore from the Aurora mine was treated at the Midvale, Utah, concentrator.

Colorado district.—As in 1944, the leading producer in the Colorado district in 1945 was the Monongahela-Mount Washington Mining Co. operating the Mount Washington mine. Output comprised 694 tons of zinc-lead ore shipped to the East Helena lead smelter and 560 tons of zinc-lead ore treated in the company mill. The resulting 53 tons of zinc concentrate were smelted at Amarillo, Tex., and 19 tons of lead concentrate at the East Helena smelter. Other production from the district included 713 tons of gold-silver ore from the Minah No. 2 dump, 28 tons of lead ore from the Enterprise claim, and 2 tons of zinc-lead ore from Corbett and Ida May claims (all shipped to the East Helena lead smelter) and 21 tons of gold-silver ore from the Blue Bird group.

Elkhorn district.—The bulk of the production from the Elkhorn district in 1945 came from the Elkhorn property. The output (17,471 tons of dump silver ore and 206 tons of crude silver mine ore) was shipped to the East Helena smelter. Francis Wickham worked the Elkhorn Queen mine and sent 507 tons of lead ore to the East Helena smelter. From the Klondyke mine Taylor & Lewis shipped 377 tons of gold ore to the Anaconda copper smelter. Remaining production from the district was negligible.

Montana City district.—Total output of the Montana City district was 16 tons of gold ore shipped to the East Helena smelter from the Last Chance mine.

Whitehall district.—The Golden Sunlight mine, operated by Marvin F. Riebhoff, was one of the most important gold-producing mines in Montana in 1945. The property produced 12,339 tons of gold ore, which was shipped to the Anaconda copper smelter. Ralph Huckaba and Lester Lindquist worked the Carbonate mine and shipped to the East Helena smelter 599 tons of lead ore containing 16 ounces of gold, 1,526 ounces of silver, 331 pounds of copper, 190,178 pounds of lead, and 17,899 pounds of zinc. Gold ore (560 tons) was sent to the East Helena smelter from the Lucky Hit mine; the gross metal content was 279 ounces of gold, 768 ounces of silver, 3,369 pounds of copper, 29,156 pounds of lead, and 23,823 pounds of zinc. From the Minerva mine Theodore Davenport shipped 513 tons of lead ore to the East Helena smelter. Remaining production from the district was lead ore consigned to the East Helena smelter from the Perhaps, Surprise, and Inspiration properties and a car of gold ore shipped from the Midas mine to the Anaconda smelter.

Wilson and Ticer Creeks district.—Gold ore (287 tons) from the Deer Horn Nos. 1, 2, and 3 claims was treated by amalgamation and concentration.

JUDITH BASIN COUNTY

Barker district.—During 1945, 67 tons of zinc-lead ore containing 2 ounces of gold, 2,925 ounces of silver, 874 pounds of copper, 41,331 pounds of lead, and 19,990 pounds of zinc were shipped to the East Helena smelter from the Wright-Edwards group.

Yogo district.—Walter Lehman worked the Gold Bug mine in 1945 and sent to the Anaconda copper smelter 40 tons of gold ore containing 21 ounces of gold, 147 ounces of silver, and 879 pounds of copper. The Blue Dick mine and 50-ton concentration mill were operated from June to October; the milling of about 600 tons of gold-copper ore yielded 38 tons of copper concentrate.

LEWIS AND CLARK COUNTY

Blue Cloud district.—Production from the Blue Cloud district in 1945 comprised 33 tons of gold ore from the Pearl claim and 7 tons of zinc-lead ore from the Lincoln property.

Heddleston district.—The Mike Horse mine, one of the leading producers of lead and zinc in the State in 1945, was worked the first 6 months of the year by the Mike Horse Mining & Milling Co. and the latter 6 months by the American Smelting & Refining Co., after purchase July 1. The 250-ton flotation mill on the property treated a total of 68,581 tons of zinc-lead ore, which yielded 5,634 tons of lead concentrate and 3,030 tons of zinc concentrate. Development at the mine during the year totaled 1,613 feet of drifts. Other production from the district was 2,500 tons of zinc-lead ore from the Carbonate mine treated in the 75-ton flotation mill on the property; 231 tons of zinc-lead concentrate containing 15 ounces of gold, 3,977 ounces of silver, 15,108 pounds of copper, 175,430 pounds of lead, and 51,150 pounds of zinc were recovered.

Helena district.—In July Porter Bros. Corp. resumed operations with its 6-cubic foot Yuba dredge on Last Chance Gulch, after idleness since August 1943. The dredge washed 719,646 cubic yards of gravel. Lode production from the district was very small.

Marysville district.—The Empire group was operated by Mines Operating Co. in 1945, and 8,199 tons of lead ore were treated to recover 359 tons of lead concentrate; 1 ton of lead ore went direct to a smelter. Output of the Drumlummon mine, operated by the Montana Rainbow Mining Co., was 660 tons of gold ore—484 tons went to the East Helena smelter, and 176 tons were treated by amalgamation and concentration. The Belmont mine produced 401 tons of gold ore shipped to smelters; gross-metal content was 264 ounces of gold and 463 ounces of silver. Remaining production from the district was 33 tons of gold ore sent to the East Helena smelter from the Penobscot mine.

Rimini district.—The Anna May & Broadway group was operated under lease in 1945 by the Armstrong Mining Syndicate. The company erected a new flotation mill during the year and treated 2,320 tons of low-grade gold-silver-lead ore. In addition, 206 tons of lead ore were shipped to a smelter. Zinc-lead ore (277 tons) was shipped direct to a smelter from the Red Mountain Consolidated Mining Co. group of claims. Remaining district production was small consignments of gold-silver ore from the Copper Dyke mine and the Lee Mountain dump to the East Helena smelter.

Smelter district.—In 1945 the Smelter district was outranked only by the Summit Valley (Butte) district as a State zinc producer. As in previous years, the bulk of production came from operations of the Anaconda slag-fuming plant at East Helena. Although hot slag and cold slag treated at the plant totaled 197,244 tons in 1945 compared with 233,948 tons in 1944, only the metals recovered from fuming 25,711 tons of old cold lead smelter slag are credited to the plant as a producer in the Smelter district. The remaining metals, after elimination of materials from foreign sources, are credited to the individual domestic mines producing the ores and concentrates that yielded the current hot slag treated in the slag-fuming plant. The American Smelting & Refining Co. resmelted 651 tons of old zinc slag during the year.

LINCOLN COUNTY

Libby district.—The Standard Silver Lead Mining Co. operated its 40-ton flotation mill from May 15 to November 1; about 4,000 tons of old tailings from the Snowshoe group were treated to recover 73 tons of zinc concentrate and 66 tons of zinc-lead concentrate. The Liberty and Hard Times placer claims were worked during the summer and produced 7 ounces of gold.

West Fisher Creek district.—Total production of the West Fisher Creek district in 1945 was 15 tons of gold ore amalgamated—10 tons from the Midas group and 5 tons from the Merrill claim.

MADISON COUNTY

McCarthy Mountain district.—Herman Mueller worked the Polly Jane mine in 1945 and shipped 150 tons of lead ore to the East Helena smelter.

Norris and Norwegian district.—K. W. Leavitt amalgamated about 400 tons of dump material from the Revenue mine. The Boaz mine was operated under lease from January to August and then was sold to A. J. Theis, who operated it the rest of the year. Output was 93 tons of gold ore shipped to the East Helena smelter; metal content was 200 ounces of gold, 107 ounces of silver, 3,666 pounds of lead, and 1,674 pounds of zinc. Remaining district output was gold ore from the Santa Christo, Revenue, and Galena claims and gold-silver ore from the Bettle mine, all shipped to smelters.

Rochester district.—The Calvin group produced 57 tons of zinc-lead ore which was shipped to the Tooele, Utah, lead smelter; 50 tons of similar ore from the Emma group were treated at the Midvale, Utah, concentrator; and from the Copper Sage claim Ted J. Farrow trucked a load of copper ore to the Anaconda copper smelter.

Sheridan district.—The Victoria Mines, Inc., operated its Toledo-Buckeye group and 125-ton flotation mill throughout the year; 31,467 tons of zinc-lead ore were treated, yielding 609 tons of lead concentrate and 1,637 tons of zinc concentrate. From the Dictator & Bell Union group Bell and Bukvich shipped 237 tons of gold ore to the Anaconda smelter. C. Becker Hoskins and Clifford Hyndman worked the Silver Bullion group under lease and shipped to the Anaconda smelter 179 tons of silver ore containing 3 ounces of gold and 2,595 ounces of silver. The rest of the district output was 29 ounces of placer gold recovered from small-scale hand operations.

Silver Star district.—Gold ore (126 tons) was shipped to smelters from the Stella mine.

Tidal Wave district.—Shipments of 225 tons of gold ore and 46 tons of lead ore were made to smelters from the High Ridge and High Ridge Fraction claims. The rest of the district output comprised 74 tons of gold ore from the Corncracker mine, 34 tons of copper ore from the Moffet group, and 8 tons of lead ore from the Dutchland claim, all shipped to smelters.

Virginia City district.—The U. S. Grant Mining Co. operated its U. S. Grant mine throughout 1945; 7,253 tons of gold ore shipped to the Anaconda copper smelter contained 1,140 ounces of gold and 85,778 ounces of silver. In September Ralph E. Davis resumed dragline dredging at the Barton Gulch placer and during the rest of the year washed 29,300 cubic yards of gravel. Remaining district lode production was 43 tons of gold-silver ore sent to the Anaconda smelter from the Eureka claim.

Washington district.—Total output of the Washington district in 1945 was 10 tons of gold ore shipped to a smelter from the Snowslide mine.

MINERAL COUNTY

Keystone district.—E. G. Smith worked the Nancy Lee group in 1945 and mined 1,811 tons of lead ore that was treated in the 100-ton flotation mill constructed on the property during the year. The resulting 40 tons of lead concentrate contained 1 ounce of gold, 990 ounces of silver, 1,466 pounds of copper, 49,224 pounds of lead, and 4,280 pounds of zinc.

Packer Creek district.—The Hecla Mining Co. operated the Silver Cable mine under lease in 1945 and hauled 2,725 tons of zinc-lead ore to its mill at Burke, Idaho. Concentrates produced comprised 487 tons of zinc concentrate and 94 tons of zinc-lead concentrate. The company reported that all available ore was exhausted during the fall, and the lease was terminated.

MISSOULA COUNTY

Coloma district.—The only output in the Coloma district in 1945 was 44 tons of gold ore shipped to the East Helena smelter from the Mammoth group.

Copper Cliff district.—The Blue Bell mine had an output in 1945 of 45 tons of copper ore, 30 tons of silver ore, and 10 tons of lead ore, all shipped to smelters.

Nine Mile district.—Hand placering recovered 10 ounces of gold in 1945.

PARK COUNTY

New World district.—McLaren Gold Mines Co. treated 3,318 tons of copper ore from the Estelle mine in the company 100-ton flotation mill; it yielded 150 tons of copper concentrate containing 606 ounces of gold, 797 ounces of silver, and 42,768 pounds of copper. The Irma mine produced 1,147 tons of zinc-lead ore during the year; 77 tons were shipped to a smelter, and 1,070 tons of mill ore yielded 99 tons of lead concentrate and 115 tons of zinc concentrate. Other district production was 41 tons of ore shipped to a smelter from the Black Warrior mine, containing 27 ounces of gold, 611 ounces of silver, 92 pounds of copper, and 14,168 pounds of lead.

Sheepeater district.—The Jardine Mining Co. worked the Jardine mine 11 months in 1945 and treated 45,217 tons of gold ore in the company combination flotation-cyanidation-amalgamation mill. The bullion yielded 7,747 ounces of gold and 1,592 ounces of silver, and the 81 tons of concentrate yielded 65 ounces of gold and 28 ounces of silver.

PHILLIPS COUNTY

Little Rockies district.—High-grade gold ore (12 tons) was shipped to a smelter from the Little Ben mine.

POWELL COUNTY

Finn district.—Ray W. Crumb and Dan Pyper operated a washing plant at the Peacock placer in Madison Gulch from August to October and recovered 30 ounces of gold from 3,000 cubic yards of gravel.

Nigger Hill district.—From the Charter Oak mine Hopkins & Sons Mining Co. shipped 19 tons of lead ore to a smelter and treated 385 tons of zinc-lead ore in the company 40-ton flotation mill; the mill ore yielded 10 tons of zinc concentrate and 16 tons of zinc-lead concentrate. Remaining district lode output comprised 5 tons of lead ore and 17 tons of zinc-lead ore from the Flora Best group, 42 tons of zinc-lead ore from the Sunset group, and 2 tons of lead ore from the Pauper claim. R. Milleand recovered a little gold by hand placering.

Pioneer district.—Kenneth Davis operated a dragline dredge on Gold Creek for 3 weeks.

Zozell district.—John B. White, Jr., constructed a 100-ton mill at the Emery group and made test runs on gold-silver ore. It is expected that the mine and mill will operate regularly in 1946.

RAVALLI COUNTY

Curlew district.—Hamilton-Victor Mining & Milling Co. operated the Curlew mine throughout 1945 and the 70-ton flotation mill from April 16 to the end of the year. Zinc ore (4,050 tons) was treated to recover 51 tons of lead concentrate and 244 tons of zinc concentrate.

SANDERS COUNTY

Camas Prairie district.—Laurence G. Howard operated the Glaucus mine in 1945 and shipped to the Anaconda smelter 345 tons of copper ore containing 5 ounces of gold, 585 ounces of silver, and 26,575 pounds of copper.

Eagle district.—The Jack Waite mine was operated throughout the year by the American Smelting & Refining Co. Of the output (4,690 tons), 136 tons of lead ore containing 1 ounce of gold, 870 ounces of silver, 90 pounds of copper, 201,565 pounds of lead, and 16,153 pounds of zinc were shipped to a smelter, and 4,554 tons of zinc-lead ore were treated in the company 400-ton flotation mill at Duthie, Idaho. The resulting 675 tons of lead concentrate and 154 tons of zinc concentrate contained 8 ounces of gold, 4,710 ounces of silver, 13,343 pounds of copper, 1,015,385 pounds of lead, and 207,700 pounds of zinc.

Revais Creek district.—The Drake group was operated under lease by the Green Mountain Mining Co. and produced 412 tons of copper ore during the year.

SILVER BOW COUNTY

Ore production in Silver Bow County declined nearly 17 percent from that in 1944, resulting in decreases of 19 percent in gold output, 17 percent in silver, 25 percent in copper, and 13 percent in lead; zinc, however, gained 5 percent. The slight increase in zinc production and the slightly higher average prices for lead and zinc failed to offset the loss in value of metals produced, and the total value of the five metals was the lowest since 1939, representing a decrease of 22 percent from that in 1944. The following table gives the output of mines in Silver Bow County, which includes the Summit Valley (Butte) district, in 1944 and 1945 and the total from 1882 to the end of 1945.

Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1944–45, and total, 1882–1945, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1944	27	5,429,931	15,463	6,001,695	234,732,200	6,395,000	16,173,500	$38,877,303
1945	24	4,528,282	12,484	4,976,910	175,899,200	5,551,500	16,986,400	30,179,133
1882–1945	-------	(1)	2,019,271	543,367,010	[2] 6,485,914	[2] 232,505	[2] 1,563,661	2,576,206,695

[1] Figures not available.

[2] Short tons.

Summit Valley (Butte) district.—The aggregate tonnage of copper-mine ore, dumps, waste tailings, and slimes treated by the Anaconda Copper Mining Co. in 1945 declined 17 percent from that in 1944. The copper concentrator at Anaconda treated 1,747,946 tons of copper ore from company-owned Butte mines compared with 2,362,041 tons in 1944, and 4,114 tons of copper mine-water precipitates were treated compared with 3,706 tons in 1944. Additional material treated in the concentrator comprised 591,914 tons of New Works sand tailings compared with 1,387,782 tons in 1944; 905,001 tons of Butte tailings compared with none in 1944; 424,684 tons of mine dumps compared with 752,571 tons in 1944; 64,375 tons of special waste compared with 125,372 tons in 1944; and no Old Works tailings compared with 4,364 tons in 1944. Direct smelting material comprised 43,522 tons of crude ore, 410 tons of special waste, and 14,517 tons of Old Works tailings.

Slimes treated at the slime-disintegrating plant were as follows (1944 figures in parenthesis): Butte slimes, 264,385 tons (279,007 tons of Butte and Boston slimes); 283,831 tons of New Works Valley Pond slimes (207,133 tons); and no Old Works slimes (13,816 tons). The 548,216 tons of slimes treated in 1945 averaged 1.73 percent copper compared with 514,480 tons treated in 1944, which averaged 2.36 percent copper.

The Anaconda Copper Mining Co. operated the North Butte group throughout the year under contract. Output was slightly greater than in 1944 and comprised 133,032 tons of copper mill ore, 39 tons of copper smelting ore, and 104 tons of copper mine-water precipitates. Zinc ore mined from all company zinc mines totaled 3,712 tons in 1945. Anaconda continued operating the Emma mine under lease and produced 20,337 tons of zinc-lead middlings from the treatment of manganese ore. In addition, 5,692 tons of zinc-lead middlings were produced in milling manganese ore from the Orphan Girl and Travona mines; the middlings were treated further at the Anaconda zinc concentrator.

Lessees of the Anaconda Copper Mining Co. operated a number of properties at Butte during the year and produced 27,803 tons of ore, of which 15,016 tons (zinc ore) came from the Poulin mine. The remainder of the district output was mainly 4,033 tons of material (containing chiefly silver, lead, and zinc) shipped to a smelter from the Alloy dump.

German Gulch district.—Hand placering recovered 10 ounces of gold from the Beal Hill claim.

Smelter district.—The Domestic Manganese & Development Co. treated manganese ore from several mines in the vicinity and produced 1,750 tons of zinc-lead middlings, which were separated into 569 tons of lead concentrate and 192 tons of zinc concentrate.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEVADA

(MINE REPORT)

By Alfred L. Ransome and Burton H. Marliave

SUMMARY OUTLINE

SUMMARY

Production of zinc in Nevada in 1945 was the largest, both in quantity and value, in the history of the State, surpassing the previous record of 1944 by 4 percent in quantity and 5 percent in value. Gold output, on the other hand, was 23 percent below the total for 1944 and was the lowest in quantity since 1895. Silver production fell 17 percent to the lowest level since 1899. The total value of gold, silver, copper, lead, and zinc recovered from ore, old tailings, and gravels in Nevada in 1945 was $24,186,294 compared with $27,371,513 in 1944, a decline of 12 percent, owing to smaller outputs of gold, silver, copper, and lead. Rising costs of labor, supplies, and equipment, the difficulty of obtaining them, and the fixed prices for gold and silver were factors in reducing output. An expected increase in production of gold following the rescinding of War Production Board Limitation Order L-208 on July 1, 1945, did not materialize, except at placer mines.

Comparing 1945 with 1944, gold output decreased 23 percent, silver 17 percent, and copper 14 percent in both quantity and value; lead decreased 5 percent in quantity but increased 2 percent in value; and zinc increased 4 percent in quantity and 5 percent in value. Of the total value of the five metals, copper comprised 59 percent, zinc over 20 percent, gold over 13 percent, lead over 4 percent, and silver 3 percent.

White Pine County continued its lead over the other counties by producing 64 percent of the State total value of the five metals; it stood first in output of copper and gold, second in silver, third in zinc, and fourth in lead. Lincoln County produced 20 percent of the State total value and ranked second to White Pine County; it led the State in output of zinc, lead, and silver.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Nevada, 1941–45, and total, 1859–1945, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	799	78	8,799,635	366,403	$12,824,105	5,830,238	$4,145,947
1942	434	49	9,383,379	295,112	10,328,920	3,723,435	2,647,776
1943	168	17	8,364,043	144,442	5,055,470	1,620,280	1,152,199
1944	146	11	6,863,505	119,056	4,166,960	1,259,636	895,741
1945	163	12	5,374,673	92,265	3,229,275	1,043,380	741,959
1859–1945 [2]			(3)	25,426,321	568,482,911	588,353,061	539,716,076

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1941	157,822,000	$18,622,996	19,246,000	$1,097,022	30,258,000	$2,269,350	$38,959,420
1942	167,326,000	20,246,446	10,752,000	720,384	20,394,000	1,896,642	35,840,168
1943	142,136,000	18,477,680	9,580,000	718,500	27,294,000	2,947,752	28,351,601

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Data for years 1859–1944 compiled by Chas. W. Henderson, Bureau of Mines. From 1904 (when first satisfactory annual canvass of mine production was made) to 1945, inclusive, the output was as follows: Gold, 13,599,444.51 ounces valued at $323,999,678; silver, 299,940,212 ounces, $202,557,853; copper, 1,732,126 tons, $489,305,310; lead, 302,214 tons, $36,046,805; zinc, 324,839 tons, $49,962,160; total value, $1,101,871,806.
[3] Figures not available.
[4] Short tons.

Gold.—Gold production in Nevada in 1945, decreasing 23 percent from the 1944 output, was the lowest in quantity since 1895 and in value since 1933. The only appreciable effect on gold production of the termination of WPB Limitation Order L–208 was an increase of 30 percent in the gold produced by placer-mining methods in 1945 compared with 1944. The monthly production figures shown in the accompanying table indicate no sharp increase in the latter half of the year following the rescinding of Order L–208, but rather a general decline followed by a trend upward during the last 2 months of the year. The December total (8,661 ounces) was short of the general level attained during the first 6 months. Byproduct gold from base-metal ores comprised 59 percent of the output of gold, again exceeding the gold recovered from precious metal ores, which was 31 percent of the total.

The 10 leading gold-producing mines in 1945 produced 93 percent of Nevada's output, the three leaders contributing 60 percent.

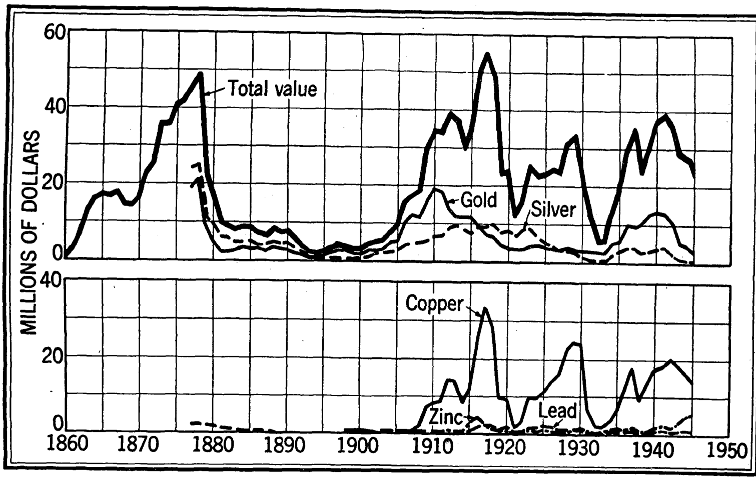

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Nevada, 1860–1945.

Ten leading gold-producing mines in Nevada in 1945, in order of output

[1] Did not produce in 1944.

Silver.—The 10 leading silver-producing mines in Nevada in 1945 produced 71 percent of the State total recoverable silver, the first 2 yielding 32 percent of the total. As in preceding years, most of the silver was a byproduct of ore mined chiefly for other metals;

only 5 percent of the silver was derived from straight silver ore. Base-metal ores were the source of 84 percent of the State's silver output in 1945. The monthly production figures in the accompanying table show a fluctuating output during 1945, with no definite trend.

Ten leading silver-producing mines in Nevada in 1945, in order of output

Rank	Mine	District	County	Rank in 1944	Operator	Source of silver

	92,265	1,043,380	52,595	6,275	21,457

Copper.—Of the recoverable copper output of Nevada in 1945, 97 percent came from the three leading producers: The Kennecott Copper Corp. (Nevada Mines Division), working the Ruth mine and the open-pit mine at Copper Flat (both in the Robinson district, White Pine County); the Consolidated Coppermines Corp., working the Coppermines group at Kimberly (also in the Robinson district); and the Mountain City Copper Co., working the Mountain City mine at Mountain City (in the Cope district, Elko County). During 1945 the Kennecott Copper Corp. did extensive preparatory stripping of overburden in extending its pit to mine ore belonging to the Consolidated Coppermines Corp. by mutual agreement of both companies. The monthly production of copper from Nevada remained fairly constant throughout the year.

Lead.—The Pioche district, Lincoln County, supplied 48 percent of the lead produced in Nevada during 1945; the leading lead properties were: The Pioche group operated by the Combined Metals Reduction Co., the Ely Valley mine operated by Ely Valley Mine, the Prince mine operated by the Prince Consolidated Mining Co., and the Financier mine operated by the Salt Lake-Pioche Mining Co. and lessees. Other important producers in the State were: The Nevada Lead & Zinc Co., Nevada Lead mine (Spruce Mountain district, Elko County); McFarland & Hullinger and others, Cleveland mine (Delano district, Elko County); the International Mining Corp., Groom mine (Groom district, Lincoln County); and the Bristol Silver Mines Co., Bristol Silver mine (Jack Rabbit district, Lincoln County). The State total production of lead showed a general upward trend during the second half of 1945; the data by months are given in the accompanying table.

Zinc.—In 1945, as in recent years, zinc production in Nevada was centered in the Pioche district, Lincoln County, where 77 percent of the State total for the year was mined. The Combined Metals Reduction Co. (including the Raymond Ely West mine), Ely Valley Mine, and Prince Consolidated Mining Co. were the State's leading producers, in that order; all were in the Pioche district. Other important producers in the State were: Callahan Zinc-Lead Co., Mount Hope mine (Eureka district, Eureka County); Grand Deposit Mining Co., Grand Deposit and Kansas mines (Aurum district, White Pine County); Union Lead Mining & Smelting Co., Union Lode mine (Galena district, Washoe County); Nevada Lead & Zinc Co., Nevada Lead mine (Spruce Mountain district, Elko County); and Sam Robison, Columbia mine (Robinson district, White Pine County). The monthly State total production figures given in the accompanying table show a fluctuating output during the year. Output was highest in October, followed by a gradual decline during November and December.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Nevada in 1945, by counties, in terms of recovered metals

[2] Output from property not classed as a "mine."

MINING INDUSTRY

The 22-percent decline in total tonnage of ores and old tailings sold or treated in Nevada in 1945 compared with 1944 reflects a decline in all ores except zinc-lead and silver ores. The decrease in production, which was general throughout the industry, resulted from increasing costs after the war ended, with no proportionate increase in gross income and a continued shortage of labor.

The connected-bucket dredge of the Manhattan Gold Dredging Co. in the Manhattan district, Nye County, was again the largest producer of placer gold and fourth-largest producer of total gold in the State. Except for this operation, Nevada placer mines were limited almost entirely to small-scale hand operations.

ORE CLASSIFICATION

The following table classifying ores sold or treated in Nevada in 1945 shows that 92 percent of the tonnage (including old tailings) was copper ore, 3 percent zinc-lead ore and old tailings, 3 percent gold ore and old tailings, and the remainder zinc ore and gold-silver, silver, and lead ore and old tailings.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Nevada in 1945, with content in terms of recovered metals

Source	Material sold or treated		Gold	Silver	Copper	Lead	Zinc
	Ore	Old tailings					
	Short tons	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*

[1] Includes 4,459,300 pounds of copper from precipitates.
[2] Includes 9,245,700 pounds of copper from precipitates.

METALLURGIC INDUSTRY

Of the 5,374,673 tons of lode material from Nevada mines sold or treated during 1945, 94 percent went to concentrating mills, 3 percent to amalgamation and cyanidation mills, and 3 percent to smelters; of the total, 0.26 percent was old tailings, all cyanided or smelted. Flotation was employed to the exclusion of gravity methods at concentration mills, with the exception of a small production at three plants. Of the gold recovered as bullion, cyanidation supplied 95 percent and amalgamation 5 percent; of the silver recovered as bullion, 89 percent was derived by cyanidation and 11 percent by amalgamation. The tonnage of crude ore and old tailings shipped to smelters decreased 15 percent compared with 1944.

Insufficient information as to cyanide and quicksilver consumption precludes publishing figures on this phase of the industry.

717372—47——27

The 500-ton selective-flotation mill operated by the Combined Metals Reduction Co. at Pioche, Lincoln County, treated zinc-lead and zinc ores on a custom basis for several neighboring mines and also

[1] Figures under "Ore" include both raw ore and concentrates amalgamated or cyanided, but not raw ore concentrated before amalgamation or cyanidation of concentrates.

milled company zinc-lead ore. The Kennecott Copper Corp. treated all the copper ore produced by the Consolidated Coppermines Corp., upon a contract basis, in addition to milling its own ore. The Kennecott Copper Corp. also operated the McGill copper smelter, Nevada's only smelter and the most important privately financed metallurgical plant in the State.

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 8 and their output included under "Other districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 1,039,569 ounces from lode mines and 3,811 from placers.

[4] Included under "Other districts."

[5] Output from property not classed as a mine.

[6] Exclusive of lode output, which is included under "Other districts."

[7] Includes 4,459,300 pounds of copper precipitates.

[8] Includes following districts: Eastgate in Churchill County; Cope (lode) in Elko County; Gold Run in Humboldt County; Bullion and Hilltop in Lander County; Quartz Mountain in Nye County; Antelope (Majuba) and Nightingale in Pershing County; and Galena in Washoe County.

CHURCHILL COUNTY

Eastgate district.—W. H. Schweis shipped gold ore to a smelter from the Gold Ledge mine during 1945.

Fairview district.—Lowell Thompson shipped lead ore to a smelter from the Chalk Mountain mine during 1945.

CLARK COUNTY

Searchlight district.—The Golden Dawn Mining & Milling Co. shipped gold ore to a smelter from the Blossom mine during 1945; the mine was ninth on the list of the leading gold producers in 1945.

Yellow Pine (*Goodsprings district*).—The Argentena Consolidated Mining Co. worked the Argentena mine throughout 1945; 1,807 tons of zinc ore containing 17 ounces of gold, 9,445 ounces of silver, 3,831 pounds of copper, 123,540 pounds of lead, and 679,045 pounds of zinc were shipped to a smelter. William T. Frazer worked the Hoosier mine from March through August 1945, shipping to a smelter 498 tons of lead ore containing 2 ounces of gold, 1,069 ounces of silver, 258 pounds of copper, 155,977 pounds of lead, and 126,877 pounds of zinc. The Diamond Gold Mining Co. operated during the first 7 months of 1945, shipping zinc-lead ore from the Mountain Top mine and lead and silver ores from the Kirby mine to a smelter. The Root Zinc Lease worked the Root Zinc mine throughout 1945, except for the period July through September; 251 tons of zinc-lead ore containing 1 ounce of gold, 2,388 ounces of silver, 396 pounds of copper, 40,772 pounds of lead, and 179,894 pounds of zinc, were shipped to a smelter. L. F. Jacobson continued to operate at the Sultan mine, milling zinc-lead ore in a 75-ton gravity-concentration plant to produce 293 tons of zinc-lead concentrate containing 2 ounces of gold, 4,888 ounces of silver, 610 pounds of copper, 161,054 pounds of lead, and 87,267 pounds of zinc; in addition, 1,194 tons of zinc ore containing 7 ounces of gold, 10,784 ounces of silver, 2,372 pounds of copper, 221,102 pounds of lead, and 510,300 pounds of zinc were shipped to a smelter. The Coronodo Copper & Zinc Co. worked the Yellow Pine mine during the first 6 months of 1945 and shipped zinc-lead ore to a smelter.

ELKO COUNTY

Contact (*Salmon River*) *district.*—The Marshall Mining Co. shipped to a smelter during 1945, 5,227 tons of gold-silver ore containing 47 ounces of gold, 3,669 ounces of silver, and 252,560 pounds of copper. E. A. Yadon operated the Queen of the Hills mine during 1945 shipping copper ore to a smelter.

Cope (*Mountain City*) *district.*—The Mountain City Copper Co. (the third-largest copper producer in Nevada) operated throughout 1945; most of the ore was treated in the company 400-ton flotation mill, but some high-grade copper ore was shipped for direct smelting.

Delano district.—The Cleveland mine was worked by lessees Harrison, McWhorter, McFarland, and Hullinger throughout 1945 and produced 39 tons of silver ore containing 724 ounces of silver, 408 pounds of copper, and 1,494 pounds of zinc, and 2,146 tons of lead ore containing 20 ounces of gold, 64,727 ounces of silver, 15,757 pounds of copper, and 745,779 pounds of lead.

Dolly Varden district.—The International Smelting & Refining Co. shipped copper ore from the Victoria mine in May and June 1945.

The Anaconda Copper Mining Co. also made a shipment of gold-silver ore from the Victoria mine in 1945.

Loray district.—During the last quarter of 1945 Charles E. Roberts shipped old tailings containing silver and lead to a smelter from the Maybelle mine.

Merrimac district.—A small clean-up of lead concentrates was shipped to a smelter in 1945 from the Rip Van Winkle mine, which suspended operations November 1, 1944.

Spruce Mountain district.—R. J. Birch worked the Monarch mine throughout 1945, shipping lead ore and silver ore to a smelter. The Nevada Lead Zinc Co., operating throughout 1945, shipped zinc-lead ore to a smelter from the Nevada Lead mine. William J. Walker shipped slag from the old Spruce Mountain smelter dump during the last 6 months of 1945.

ESMERALDA COUNTY

Divide district.—The Divide mine, operated by lessees throughout 1945, produced 2,582 ounces of gold and 12,181 ounces of silver from 2,378 tons of gold ore shipped to a smelter.

Silver Peak district.—Fred Vollmar shipped gold ore to a smelter from the Mary mine during 1945.

EUREKA COUNTY

Eureka district.—The Callahan Zinc-Lead Co. worked the Mount Hope mine throughout 1945. The company completed erection of its 200-ton flotation mill and operated it from July 1 to the end of the year, treating all the company ore mined in 1945. Treatment of 19,243 tons of zinc-lead ore produced 95 tons of lead concentrate (containing 7 ounces of gold, 11,504 ounces of silver, 1,093 pounds of copper, 113,240 pounds of lead, and 15,200 pounds of zinc) and 2,346 tons of zinc concentrate (containing 10 ounces of gold, 4,701 ounces of silver, 11,589 pounds of copper, 15,624 pounds of lead, and 2,261,075 pounds of zinc), which were shipped to smelters. The Mountain View Mining Co. operated the Mountain View mine during the first half of 1945 and shipped zinc ore to a smelter.

HUMBOLDT COUNTY

Awakening district.—Austin Bros. Gold Mining Co. treated gold ore from the Jumbo mine by amalgamation during 1945.

Potosi district.—Getchell Mine, Inc., operating for the first 4 months of 1945, treated gold ore from the Getchell mine in a 1,000-ton cyanide plant. In addition, a small tonnage of ore was shipped direct to a smelter. Mining was suspended about May 1, 1945, due to shortage of labor and materials.

LANDER COUNTY

Battle Mountain district.—Lessees operated the Copper Canyon Mining Co. Copper Basin property during 1945; copper ore was shipped to a smelter. The Copper Canyon mine and 350-ton flotation mill of the Copper Canyon Mining Co. were operated under lease until November 30, 1945, by the International Smelting & Refining Co. and then throughout December 1945 by the owners; copper concentrates were shipped to a smelter. O'Leary & Troester worked the Copper Queen mine during the first 4 months of 1945 and shipped copper ore to a smelter. Claude A. Post, lessee, worked the Gold Butte mine and shipped 464 tons of gold-silver ore (containing 40 ounces of gold, 3,410 ounces of silver, 590 pounds of copper, and 27,866 pounds of lead) to a smelter. Symanzik & Wrobel worked the Trinity mine throughout 1945; 176 tons of zinc-lead ore containing 22 ounces of gold, 5,556 ounces of silver, 581 pounds of copper, 32,379 pounds of lead, and 28,952 pounds of zinc were shipped to a concentrator-smelter, and in addition 328 tons of silver ore containing 28 ounces of gold, 4,297 ounces of silver, 521 pounds of copper, and 16,600 pounds of lead were shipped for direct smelting.

Bullion district.—Willow Creek Mines, Inc., worked the Goldacres mine throughout 1945. Ore mined by open-pit method was treated at the company 300-ton cyanide mill.

New Pass district.—Wayne E. Smith worked the Thomas W. mine throughout 1945 and amalgamated 320 tons of ore, which yielded 171 ounces of gold and 24 ounces of silver.

LINCOLN COUNTY

Comet district.—Comet Mines, Inc., worked the Comet mine during the latter months of 1945; 270 tons of zinc-lead ore treated by flotation yielded 15 tons of lead concentrate containing 3 ounces of gold, 815 ounces of silver, 12,089 pounds of lead, and 1,785 pounds of zinc and 67 tons of zinc concentrate containing 2 ounces of gold, 577 ounces of silver, 1,857 pounds of lead, and 70,739 pounds of zinc. In addition, 53 tons of lead ore containing 17 ounces of gold, 584 ounces of silver, 210 pounds of copper and 8,513 pounds of lead were shipped for direct smelting.

Groom district.—The International Mining Corp. worked the Groom mine throughout 1945; 2,194 tons of lead ore containing 5 ounces of gold, 8,304 ounces of silver, 5,893 pounds of copper, and 658,916 pounds of lead were shipped to a smelter. The company 50-ton flotation mill remained idle during 1945.

Jack Rabbit district.—The Bristol Silver Mines Co. worked the Bristol Silver mine throughout 1945; 858 tons of copper ore containing 3 ounces of gold, 7,424 ounces of silver, 54,730 pounds of copper, and 24,670 pounds of lead, and 4,643 tons of zinc ore containing 19 ounces of gold, 41,505 ounces of silver, 167,201 pounds of copper, 364,202 pounds of lead, and 603,259 pounds of zinc were shipped to a smelter.

Pioche district.—The Combined Metals Reduction Co. operated its 500-ton flotation mill at Pioche, Nev., at full capacity, treating both company and custom ore throughout 1945. Company ore for the mill was derived from the Abe Lincoln, Amalgamated Pioche, and Pioche 802 properties (which with the Raymond Ely West mine had been called Pioche Nos. 1 and 2 group). In addition to company-produced ore, the mill treated zinc-lead ore from the Raymond Ely West and Ely Valley mines, and a smaller quantity of zinc-lead ore from the Prince Consolidated Mining Co.'s Prince mine. The Salt Lake-Pioche Mining Co. worked the Apex and Financier mines throughout 1945. Silver ore totaling 562 tons, containing 37 ounces of gold, 12,001 ounces of silver, 178 pounds of copper, and 36,805 pounds of lead, was shipped to a smelter from the Apex mine. The content of 1,323 tons of lead ore shipped from the Financier mine (which was leased to Free Bros.) was 105 ounces of gold, 49,091 ounces of silver, 1,010 pounds of copper, and 375,236 pounds of lead. The Queen Mining Co., operating from June 16 to September 1, shipped 372 tons of gold-silver smelting ore containing 64 ounces of gold, 1,889 ounces of silver, 1,445 pounds of copper, and 15,922 pounds of lead.

LYON COUNTY

Yerington district.—Anton Lilja, lessee, worked the Mason Valley mine all year and shipped 1,941 tons of copper ore, containing 5 ounces of gold, 454 ounces of silver, 170,264 pounds of copper, and 835 pounds of lead, to a smelter. Ed Parr shipped copper ore to a smelter from the Malachite mine during 1945. Eleanor S. Manson operated the Western Nevada mine January through September and shipped 1,373 tons of gold-silver ore containing 8 ounces of gold, 280 ounces of silver, and 69,357 pounds of copper. The Angelus Basin Copper Co. shipped copper ore to a smelter in 1945 from the Northern Lights mine.

MINERAL COUNTY

Columbus (Candelaria) district.—During the last 6 months of 1945, Charles R. Hammock shipped tailings from the Columbus mine containing silver and lead to a smelter.

Santa Fe district.—L. Wilson and J. A. Simpson operated the Mary mine during 1945 and shipped zinc-lead ore to a custom mill.

Silver Star district.—During the first 6 months of 1945, Charles R. Hammock shipped tailings containing silver, copper, and lead from the Copper Blossom mine to a smelter.

NYE COUNTY

Bullfrog district.—The Burm Ball Mining Co. shipped gold-silver ore to a smelter from the Bullfrog mine during 1945.

Manhattan district.—The Manhattan Gold Dredging Co., the only large producer of placer gold in the State in 1945, operated an electric-powered, connected-bucket dredge throughout the year. The dredge was equipped with 108 9½-cubic foot buckets.

Quartz Mountain district.—Louis Warnken, Jr., shipped dump ore containing gold, silver, and lead to a smelter during 1945. Obie Lefavor, lessee, worked the San Rafael mine during 1945 and shipped lead ore to a smelter.

Tonopah district.—Lessees worked the property of the Tonopah Mining Co. of Nevada during 1945 and shipped gold-silver ore containing 486 ounces of gold and 47,274 ounces of silver to a smelter.

Tybo district.—E. S. and V. J. Barndt, lessees, worked the Tybo group of mines the latter half of 1945 and shipped lead ore and old smelter slag containing silver and lead to a smelter.

Union district.—L. D. Foreman & Co., shipped material from the Lodivale and Montezuma old slag dump to a smelter.

PERSHING COUNTY

Aldrich district.—Potter & Rainey operated the Valmy mine from April through November 1945 and shipped lead ore to a smelter.

Antelope (Majuba) district.—The Greenan-Kerr Tin Mine ceased operations in May 1945, and the partnership was dissolved. During the first months of 1945, 2,513 tons of copper ore containing 19 ounces of gold, 3,391 ounces of silver, and 153,364 pounds of copper were shipped to a smelter.

Seven Troughs district.—The Portland mine was operated by several lessees throughout 1945; gold ore produced was treated by amalgamation and concentration.

STOREY COUNTY

Comstock district.—The Dayton Consolidated Mines Co. operated the company custom cyanide mill at Silver City, Lyon County, treating gold ore from the Keystone mine, the Overman mine, and various smaller shippers.

WASHOE COUNTY

Galena district.—The Union Lead Mining & Smelting Co. treated zinc-lead ore from the Union Lode mine by jig concentration and shipped the product to custom concentrators for selective flotation. In addition, a small tonnage of silver ore was shipped to a smelter.

White Horse (Olinghouse) district.—Lessees treated 86 tons of ore by amalgamation at the Texas No. 2 lode mine and recovered 41 ounces of gold and 16 ounces of silver.

WHITE PINE COUNTY

Aurum (Silver Mountain) district.—The Grand Deposit Mining Co. operated the Grand Deposit mine throughout 1945 and shipped 1,002 tons of copper ore containing 11 ounces of gold, 1,033 ounces of silver, and 77,632 pounds of copper and 6,282 tons of zinc ore containing 31 ounces of gold, 7,313 ounces of silver, 91,284 pounds of copper, 112,123 pounds of lead, and 2,228,351 pounds of zinc. A new Diesel compressor and Diesel-electric generating plant were installed at the property in 1945.

Hunter district.—L. D. Foreman & Co. shipped material from the Hunter old-slag dump during 1945.

Osceola district.—The Gilded Age Mining Co. worked the Gilded Age mine the latter half of 1945 and shipped gold ore to a smelter.

Robinson (Ely) district.—The Nevada Mines Division of the Kennecott Copper Corp. worked the Copper Flat pit and Ruth mine throughout 1945 and produced over half of the total ore and over half the total copper for the State. The corporation also advanced to first place in production of gold in Nevada. This company, the largest privately financed industrial organization in Nevada, also operated the McGill flotation concentrator (daily capacity, 20,000 tons) and the McGill copper smelter, both at McGill where the product of its mines and that of the Consolidated Coppermines Corp. were treated. By mutual agreement between Kennecott Copper Corp. and Consolidated Coppermines Corp. the Kennecott Liberty pit was being extended to the west during 1945 to provide for the mining by Kennecott of Coppermines ores in this area. The Consolidated Coppermines Corp., second-largest copper and gold producer in the State in 1945, worked the Emma, Morris, and Richard mines throughout 1945. Production by both companies was slightly under their 1944 output. Sam Robison shipped to a smelter from the Columbia mine 3,401 tons of zinc ore containing 50 ounces of gold, 7,241 ounces of silver, 10,240 pounds of copper, 223,298 pounds of lead, and 976,097 pounds of zinc. L. D. Foreman & Co. shipped material containing silver and lead from the King old-slag dump. The Smith, Siegle, Bibson Co. worked the Veterans mine throughout 1945 and shipped copper ore to a smelter. Ernest R. Wooley shipped lead ore from the Young Treasure mine to a smelter.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEW MEXICO

(MINE REPORT)

By G. E. Woodward and S. A. Gustavson

SUMMARY OUTLINE

SUMMARY

Chiefly due to conditions arising from the war, the production of gold, silver, copper, and zinc from New Mexico mines decreased in 1945; the output of lead increased principally because of a change in the grade of ore mined by three of the leading producers in the State. The greatest single factor affecting production was the serious shortage of labor, which was more acute during the first 10 months of 1945 than in any period during the war. In November and December 1945 the labor shortage was relieved somewhat at various operations.

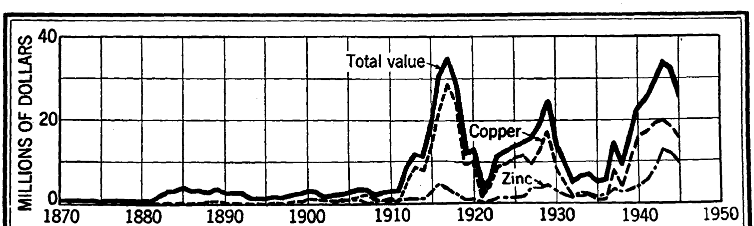

FIGURE 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1945. The value of gold, silver, and lead produced annually has been relatively small.

In 1945 the production (in terms of recovered metals) of gold was 5,604 fine ounces, silver 465,127 ounces, copper 113,142,000 pounds, lead 15,324,000 pounds, and zinc 80,590,000 pounds valued at $26,386,781, compared with 6,918 ounces of gold, 535,275 ounces of silver, 139,460,000 pounds of copper, 14,530,000 pounds of lead, and 101,454,000 pounds of zinc valued at $32,178,026 in 1944. A comparison of mine production in 1945 with 1944 and former years shows: Gold production decreased 19 percent from 1944 and except for 1943 was the lowest since 1876; silver decreased 13 percent and was the lowest since 1926; copper decreased 19 percent but was greater than during any year prior to 1940; lead increased 5 percent in quantity and 13 percent in value and exceeded any year except those during the period 1927 through 1934, with a peak in 1931 of 22,537,000 pounds; and zinc decreased 21 percent in quantity and 20 percent in value and was the highest of any year prior to 1942—the peak of 119,048,000 pounds was reached in 1943.

Of the 10 counties producing in New Mexico in 1945, Grant County was by far the largest contributor to the metal output, accounting for 94 percent of the State total value, and ranking first in the production of each of the five metals. Socorro County produced these five metals valued at 3 percent of the State total, Hidalgo County 2 percent, and all other counties 1 percent.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1945, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
January	396	39,623	10,210,000	1,068,000	7,366,000
February	449	39,153	9,634,000	1,272,000	7,742,000
March	569	47,848	10,202,000	1,834,000	8,402,000
April	429	33,200	9,792,000	1,076,000	6,630,000
May	553	36,467	10,096,000	1,148,000	7,434,000
June	434	41,138	9,620,000	1,366,000	6,894,000
July	435	38,043	9,520,000	1,202,000	6,426,000
August	535	44,362	9,170,000	1,308,000	5,844,000
September	515	35,914	7,534,000	1,070,000	5,842,000
October	523	40,912	9,336,000	1,506,000	6,540,000
November	411	34,433	8,686,000	1,272,000	5,822,000
December	355	34,034	9,342,000	1,202,000	5,648,000
	5,604	465,127	113,142,000	15,324,000	80,590,000

The following table shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc and their annual output of ore and metals from 1941 to 1945, as well as the total production from 1848 to 1945. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent records year by year may be found in annual issues of Mineral Resources and Minerals Yearbook.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1941–45, and total, 1848–1945, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	145	103	7, 530, 226	27, 845	$974, 575	1, 328, 317	$944, 581
1942	78	48	8, 221, 512	11, 961	418, 635	676, 170	480, 832
1943	64	16	8, 329, 043	5, 563	194, 705	463, 583	329, 659
1944	55	3	7, 943, 846	6, 918	242, 130	535, 275	380, 640
1945	46	4	6, 843, 327	5, 604	196, 140	465, 127	330, 757
1848–1945			(1)	2, 178, 826	49, 593, 103	67, 416, 731	52, 672, 094

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1941	146, 956, 000	$17, 340, 808	9, 336, 000	$532, 152	75, 724, 000	$5, 679, 300	$25, 471, 416

(1) Figures not available. (2) Short tons.

Gold and silver produced at placer mines in New Mexico, 1941–45, in terms of recovered metals

Year	Gold		Silver		Total value	Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value			Fine ounces	Value	Fine ounces	Value	
1941	2, 488	$87, 080	284	$202	$87, 282	1944	8	$280			$280
1942	1, 247	43, 645	135	96	43, 741	1945	15	525	7	$5	530
1943	92	3, 220	25	18	3, 238						

Gold.—On June 16, 1945, the War Production Board announced that resumption of gold mining would be permitted through revocation of its Limitation Order L–208, effective July 1, 1945. Rescinding of this order did not affect the gold output from New Mexico during the year. Mine production of recovered gold in New Mexico decreased from 6,918 ounces in 1944 to 5,604 ounces in 1945. The principal gold-producing districts in 1945 were: Central, Grant County, which produced 29 percent of the State output of recovered gold; Mogollon, Catron County, 25 percent; Lordsburg, Hidalgo County, 25 percent; and Steeple Rock, Grant County, 17 percent. All others produced about 4 percent. Dry and siliceous ores yielded 53 percent of the State total gold; zinc-lead ore 33 percent; copper ore 10 percent; and lead and zinc ores and placers 4 percent. The principal producers in 1945, in order of output, were as follows: The Silver Creek Mining Co. in Catron County, United States Smelting, Refining & Mining Co. (Bullfrog and other company properties) in Grant County, Atwood mine in Hidalgo County, Elayer & Richmond (Center mine) in Grant County, Banner Mining Co. in Hidalgo County, Exploration Syndicate, Inc. (Carlisle mine) in Grant County, New Mexico Ore Processing Co. (Peerless mine) in Grant County, and American Smelting & Refining Co. (Ground Hog group) in Grant County. These eight properties produced 93 percent of the State total output of gold.

Silver.—Mine production of recovered silver in New Mexico declined from 535,275 fine ounces in 1944 to 465,127 ounces in 1945—a 13-percent decrease. The principal silver-producing districts in 1945 were: Central, Grant County, which produced 44 percent of the State total; Mogollon, Catron County, 20 percent; Lordsburg, Hidalgo County, 19 percent; Magdalena, Socorro County, 8 percent; Steeple Rock, Grant County, 6 percent; and Pinos Altos, Grant County, 2 percent. Production of silver from these six districts amounted to 99 percent of the State total. Of the total silver produced in the State during 1945 zinc-lead ore yielded 51 percent, dry and siliceous ores 34 percent, copper ore 5 percent, and lead and zinc ores and placers 10 percent. The following 12 producers, in order of output, contributed 92 percent of the State total: The United States Smelting, Refining & Mining Co. (Bullfrog mine and other company properties) in Grant County, Silver Creek Mining Co. (Bearup group) in Catron County, Atwood mine in Hidalgo County, American Smelting & Refining Co. (Ground Hog Unit) in Grant County, American Smelting & Refining Co. (Magdalena Unit) in Socorro County, Banner Mining Co. (Bonney mine group) in Hidalgo County, Exploration Syndicate, Inc. (Carlisle mine), in Grant County, Empire Zinc Co. (Hanover mine group) in Grant County, Black Hawk Consolidated Mines Co. (Hobo and Hobo No. 2 mines) in Grant County, New Mexico Ore Processing Co. (Peerless mine) in Grant County, and McDonald & Dobson (Nitt properties) in Socorro County.

Copper.—Mine production of recovered copper in New Mexico in 1945 was 113,142,000 pounds, a 19-percent decrease from 1944. The Chino open-pit mine of the Kennecott Copper Corp. at Santa Rita, Grant County, was by far the largest copper producer in the State; the second-largest was the leaching operation at the Burro Mountain properties of the Phelps Dodge Corp. at Tyrone, Grant County. Other substantial producers (in order of output) were the Bonney mine south of Lordsburg, Hidalgo County, operated by the Banner Mining Co.; the Bullfrog and other company properties operated by the United States Smelting, Refining & Mining Co., Grant County; the Atwood group of mines operated by C. H. & S. A. McIntosh; and the Ground Hog Unit operated by the American Smelting & Refining Co., Grant County. The above six mines produced 99 percent of the total State production of copper in 1945; of the total copper produced copper ore, mine-water precipitates, and precipitates from leaching dump material accounted for 98 percent and lead, zinc, and zinc-lead ores virtually all of the remainder.

Lead.—Lead production in New Mexico in 1945 increased 5 percent in quantity and 13 percent in value over 1944 although the total tonnage of lead, zinc-lead, and zinc ores decreased. This increase in production of lead can be accounted for largely by an increase in the lead content of the ore mined at several of the more important lead-producing properties in the State. Zinc-lead ore yielded 85 percent of the total lead, lead ore 10 percent, zinc ore 4 percent, and all others 1 percent. The principal lead-producing districts in 1945 were the Central, Grant County (70 percent); Magdalena, Socorro County (16 percent); Steeple Rock, Grant County (7 percent); Lordsburg, Hidalgo County (2 percent); and San Simon, Hidalgo County (2 percent). The 10 largest producers of lead in New Mexico accounted for 94 percent of the State total; in order of output they were: The United States Smelting, Refining & Mining Co. (Bullfrog and other company properties), Grant County; American Smelting & Refining Co. (Hanover Unit), Grant County; American Smelting & Refining Co. (Magdalena Unit), Socorro County; Black Hawk Consolidated Mines Co. (Hobo and Hobo No. 2), Grant County; Exploration Syndicate, Inc. (Carlisle mine), Grant County; New Mexico Ore Processing Co. (Peerless mine), Grant County; Empire Zinc Co. (Kelly mine group), Socorro County; Byrd Mining Co. (Crosby mine), Hidalgo County; Peru Mining Co. (chiefly the Kearny mine), Grant County; and Empire Zinc Co. (Hanover mine group), Grant County.

Zinc.—Production of recovered zinc in New Mexico in 1945 decreased 21 percent in quantity and 20 percent in value from 1944. Virtually all the major zinc producers in the State, with the exception of the United States Smelting, Refining & Mining Co.—the State's largest producer of zinc (operating the Bullfrog and other company properties in Grant County)—mined less ore in 1945 than in 1944. Although the production of ore from the properties of the United States Smelting, Refining & Mining Co. was greater, its output of zinc in 1945 remained very nearly the same as in 1944.

The 11 leading producers of zinc in New Mexico in 1945 accounted for 99 percent of that metal and in order of output were: The United States Smelting, Refining & Mining Co. operating the Bullfrog mine and other company properties, Empire Zinc Co. operating the Hanover mine unit, Peru Mining Co. and subsidiary operating the Pewabic, Copper Flat, and Kearny mines, American Smelting & Refining Co. operating the Ground Hog group, and the Black Hawk Consolidated Mines Co. operating the Hobo and Hobo No. 2 mines, all in Grant County; American Smelting & Refining Co. operating the Graphic and Waldo mines and Empire Zinc Co. operating the Kelly group, in Socorro County; Kennecott Copper Corp. operating the Oswaldo mine and Exploration Syndicate, Inc., operating the leased Carlisle group, in Grant County; McDonald & Dobson operating the Nitt properties, in Socorro County; and New Mexico Ore Processing Co. operating the Peerless mine, in Grant County.

Zinc-lead ore yielded 62 percent of the total zinc and zinc ore 38 percent. Six mining districts produced all the recovered zinc in the State; they were the Central, Grant County (90 percent); Magdalena, Socorro County (8 percent); and Steeple Rock, Pinos Altos, and Swartz, Grant County, together with Cerrillos, Santa Fe County (2 percent).

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1945, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Catron	2		1,415	$49,525	91,786	$65,270
Coffax		2	5	175	4	3
Grant	22	1	2,665	93,275	241,079	171,434

MINING INDUSTRY

During most of 1945 skilled labor virtually was unobtainable and common labor very short in the metal-mining industry of New Mexico; however, near the end of the year this situation was alleviated. Absenteeism continued to be high, especially on the second and third shifts. Materials and supplies were more difficult to obtain. In June Congress passed legislation to permit continuation of the premium-price plan for copper, lead, and zinc until June 30, 1946. The plan was extended on about the same basis as heretofore and included the noncancellation requirement—meaning that all classes of premiums shall be noncancellable unless necessary in order to make individual adjustments of income to specific mines. Properties continued to be subject to quota revisions, which often had a disturbing effect on the trend of metal production. On June 16, 1945, the War Production Board announced that resumption of gold mining would be permitted through the revocation of WPB Limitation Order L-208, effective July 1, 1945. The removal of this restriction had virtually no effect on mine production in New Mexico during the remainder of the year. Production of ore from metal mines in New Mexico decreased 14 percent in 1945 from 1944.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in New Mexico in 1945, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	1,412	784	2,831	10,809	24,972	
Dry and siliceous gold-silver ore	13,068	2,197	155,694	488,597	188,220	
Dry and siliceous silver ore	3		22			
	14,483	2,981	158,547	499,406	213,192	
Copper ore	6,228,727	557	[1] 23,460	[2] 111,065,644	1,873	
Lead ore	4,627	171	17,855	34,643	1,459,214	
Zinc ore	265,931	55	29,687	160,245	581,677	30,384,285
Zinc-lead ore	329,559	1,825	235,571	1,382,062	13,068,044	50,205,715
	6,828,844	2,608	[1] 306,573	[2] 112,642,594	15,110,808	80,590,000
Total, lode mines	6,843,327	5,589	[1] 465,120	[2] 113,142,000	15,324,000	80,590,000
Total, placers		15	7			
	6,843,327	5,604	[1] 465,127	[2] 113,142,000	15,324,000	80,590,000
Total, 1944	7,943,846	6,918	535,275	[3] 139,460,000	14,530,000	101,454,000

[1] Includes 381 ounces of silver recovered from precipitates from mine water and leached dumps.
[2] Includes 23,855,551 pounds of copper recovered from precipitates from mine water and leached dumps.
[3] Includes 23,936,645 pounds of copper recovered from precipitates from mine water and leached dumps.

METALLURGIC INDUSTRY

Of the 6,843,327 tons of ore from New Mexico mines in 1945, 99 percent (6,764,415 tons) was treated at 10 concentrating plants and 1 percent (78,912 tons) was shipped crude to smelters. Of the 6,764,415 tons of ore sent to concentrating plants, 6,168,925 tons were copper ore, 329,559 tons zinc-lead ore, and 265,931 tons zinc ore. Of the 78,912 tons of ore sent crude to smelters, 59,802 tons were copper ore, 13,068 tons gold-silver ore, 4,627 tons lead ore, 1,412 tons gold ore, and 3 tons silver ore. Most of the copper ore shipped crude to smelters was highly siliceous and was used as flux at the El Paso, Tex., and Hurley copper smelters.

The 10 concentrating plants operating in New Mexico in 1945 were: The Hanover unit of the American Smelting & Refining Co. (company and custom zinc and zinc-lead ores); Magdalena unit of the American Smelting & Refining Co. (company zinc-lead ore); Banner mill of the Banner Mining Co. (company copper ore); East Camp mill of the Exploration Syndicate Inc. (company zinc-lead ore); Hanover Milling Unit of the Empire Zinc Co. (company and custom zinc and zinc-lead ores); Hurley concentrating unit of the Kennecott Copper Corp. (company copper ore); Moline mill of the Moline Mining & Milling Co. (company zinc-lead ore); Continental mill of the New Mexico Ore Processing Co., which was shut down in February 1945 (company zinc-lead ore); Peru mill of the Peru Mining Co. (company zinc and custom zinc-lead ores); Bullfrog mill of the United States Smelting, Refining & Mining Co. (company zinc-lead ore).

The Chino reverberatory copper smelter of the Kennecott Copper Corp. was operated throughout 1945 and treated company copper concentrates, siliceous copper ore, and copper precipitates; the precipitates were derived from the company operation at Chino and company operation at Ray, Ariz. All of the copper produced during the year was marketed as fire-refined copper bars. Other smelters receiving ore and concentrates from New Mexico mines in 1945 were: The American Smelting & Refining Co. copper smelter and lead smelter at El Paso, Tex., zinc smelter at Amarillo, Tex., and electrolytic zinc plant at Corpus Christi, Tex.; American Zinc Co. of Illinois zinc smelter at East St. Louis; American Zinc Co. of Illinois zinc smelter at Dumas, Tex.; Anaconda Copper Mining Co. electrolytic zinc plant at Anaconda, Mont.; International Smelting & Refining Co. copper smelter at Miami, Ariz.; New Jersey Zinc Co. of Pennsylvania zinc plant at Palmerton Pa.; and New Jersey Zinc Co. Mineral Point Division zinc plant at Depue, Ill.

Mine production of metals in New Mexico in 1945, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Concentrates smelted	266, 259	2, 407	[1] 287, 960	[2] 110, 782, 151	13, 651, 594	80, 590, 000
Ore smelted	78, 912	3, 182	177, 160	2, 359, 849	1, 672, 406	
Placer		15	7			
Total		5, 604	465, 127	113, 142, 000	15, 324, 000	80, 590, 000
1944		6, 918	535, 275	139, 460, 000	14, 530, 000	101, 454, 000

[1] Includes 381 ounces of silver recovered from precipitates from mine water and leached dumps.
[2] Includes 23,855,551 pounds of copper recovered from precipitates from mine water and leached dumps.

Gross metal content of concentrates (all produced at concentrating mills) from ores mined in New Mexico in 1945, by classes of concentrates smelted

Class of concentrates	Concentrates produced (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (wet assay) (pounds)	Lead (wet assay) (pounds)	Zinc (pounds)
Copper	173, 301	5, 076	[1] 96, 583	[2] 111, 492, 912	3, 121	
Lead	10, 320	1, 188	146, 893	700, 707	11, 855, 295	1, 781, 863
Lead-copper	516	35	15, 601	66, 270	454, 142	
Zinc	82, 122	679	113, 476	1, 068, 849	2, 163, 240	88, 687, 952
Total	266, 259	6, 978	[1] 372, 553	[2] 113, 328, 738	14, 475, 798	90, 469, 815
1944	346, 165	10, 906	510, 421	[3] 140, 554, 340	15, 152, 388	118, 963, 894

[1] Includes 405 ounces of silver contained in precipitates from mine water and leached dumps.
[2] Includes 24,348,144 pounds of copper contained in precipitates from mine water and leached dumps.
[3] Includes 24,449,757 pounds of copper contained in precipitates from mine water and leached dumps.

Mine production of metals from concentrating mills in New Mexico in 1945, in terms of recovered metals

[1] Includes Burro Mountain district, figures for which Bureau of Mines is not at liberty to publish separately.
[2] Includes copper recovered from precipitates.

CATRON COUNTY

Mogollon district.—The Silver Creek Mining Co. operated the Eureka mine (part of the Bearup group) throughout 1945 and shipped 1,996 tons of dry gold-silver ore containing 1,403 ounces of gold, 90,902 ounces of silver, and 1,262 pounds of copper to the El Paso smelter. The Lehigh Metals Co. shipped one lot of ore, the result of a mill clean-up, to the El Paso, Tex., smelter.

COLFAX COUNTY

Mount Baldy district.—Placer operators sold 5 ounces of gold and 4 ounces of silver to bullion buyers during 1945.

GRANT COUNTY

Burro Mountain (Tyrone) district.—Leaching operations at the Burro Mountain mine of the Phelps Dodge Corp. were continued throughout 1945. Water is percolated through subsided areas of the former mine workings and copper is precipitated from the return solutions. The copper content of the leach water and production of precipitates were slightly less than in 1944, a result of partial channelizing of the water and the lowering of the mineral content of the ore body.

Central district (Bayard, Fierro, Georgetown, Hanover, Santa Rita).—The Chino Mines Division of the Kennecott Copper Corp., the largest copper producer in New Mexico, operated its open-pit mine at Santa Rita and its flotation mill and reverberatory copper smelter at Hurley at near capacity. The mill was operated on a 6-day week. The critical labor shortage at the beginning of the year was eased near the end of the year. Copper produced in 1945 was marketed in the form of fire-refined copper bars; as a result, molybdenite was the only byproduct made from the ore containing gold, silver, copper, and molybdenum. Copper was recovered also by leaching accumulated dump material from the pit and from siliceous copper ore used in the converter as flux. The company continued development of its Oswaldo zinc property and shipped zinc-lead ore to the Empire Zinc Co. mill at Hanover. Development in the Oswaldo mine in 1945 included 4,885 feet of drifts, 79 feet of raises, and 13,987 feet of diamond drilling.

The largest production of zinc and lead in New Mexico in 1945 came from the Bullfrog mine and other company properties operated by the United States Smelting, Refining & Mining Co. The ore was treated in the company 450-ton selective-flotation mill. The lead concentrates made were shipped to the El Paso, Tex., smelter; zinc concentrates were shipped to the Anaconda, Mont., electrolytic plant.

The Empire Zinc Co. operated its Hanover mine group and selective flotation mill throughout 1945 and was the second-largest producer of zinc in the State. In addition to ore from the company properties in the Central district, the mill treated ore from the company Kelly mine group at Kelly, Socorro County, and the Oswaldo mine of the Kennecott Copper Corp. in the Central district. Zinc concentrates were shipped to Palmerton, Pa., and Depue, Ill., smelters.

The Peru Mining Co. and its subsidiary operated the Pewabic, Copper Flat, and Kearny mines throughout 1945. The Copper Flat and Kearny mines were operated by the New Mexico Consolidated Mining Co., a wholly owned subsidiary of the Peru Mining Co. Ore from the mines was treated at the company 1,000-ton selective-flotation mill at Wemple, 5 miles north of Deming, Luna County. Part of the product (chiefly zinc concentrates) was shipped to the Dumas, Tex., smelter and the remainder to the Metals Reserve Company stock pile at Dumas, Tex.; the lead concentrates produced were shipped to the El Paso, Tex., smelter. Custom ore also was treated from the Campbell Junction mine of the Phelps Dodge Corp., Bisbee, Ariz.

The American Smelting & Refining Co. operated throughout 1945 the leased 400-ton Hanover milling unit (formerly Combination-Black Hawk mill) and treated zinc and zinc-lead ores from its Ground Hog group (Ground Hog, Lucky Bill, San Jose, and Denver claims), custom ores, and ores purchased from the Metals Reserve Company (originally from the Hobo mine, Central district). Zinc concentrates were shipped to the electrolytic zinc plant at Corpus Christi, Tex., and lead concentrates to El Paso, Tex., smelters. Crude lead ore from the Denver and San Jose claims was shipped to the El Paso smelter. Development at the Ground Hog group included 10,255 feet of crosscuts and raises and 40,635 feet of diamond drilling; some improvements also were made in mine ventilation. Custom ore treated at the mill (comprising about 50 percent of the total mill feed) was from the Hobo, Hobo No. 2, Peerless, and Little Shingle mines in the Central district, Grant County; Columbia-Grandview and Royal John mines in the Swartz (Carpenter) district, Grant County; Cleveland and Houston-Thomas properties in the Pinos Altos district, Grant County; Tom Payne and Pennsylvania mines in the Cerrillos district, Santa Fe County; and the Nitt properties, Magdalena district, Socorro County.

The Black Hawk Consolidated Mines Co. operated throughout 1945 its Hobo and Hobo No. 2 mines and produced 33,551 tons of zinc-lead ore, which were shipped to the Hanover milling unit of the American Smelting & Refining Co. Development completed at the Hobo No. 2 included 781 feet of drifts and raises and 839 feet of diamond drilling and at the Hobo 2,330 feet of drifts and raises and 2,941 feet of diamond drilling.

The New Mexico Ore Processing Co. operated its Peerless mine until the middle of September, when all operations were suspended. The company 100-ton selective-flotation mill was closed on February 10, 1945, and the zinc-lead ore mined after that date was shipped to the American Smelting & Refining Co. Hanover milling unit. The Shingle Canyon Mining Corp. operated its Little Shingle mine and shipped zinc-lead ore to the Hanover milling unit. Cesario Holguin made a small shipment of gold ore to the El Paso smelter.

Gila River district.—Gallagher & Hightower made a shipment of 3 tons of gold-silver ore to the El Paso, Tex., smelter.

Pinos Altos district.—D. B. White, lessee, operated the Empire Zinc Co. Cleveland mine and shipped zinc ore to the Hanover milling unit. A small shipment of mill tailings was made to the Dumas, Tex., smelter. B. O. Shepherd operated his Houston-Thomas mine and shipped lead ore to the El Paso, Tex., smelter and zinc-lead ore to the Hanover milling unit.

Steeple Rock district.—The Exploration Syndicate, Inc., operated during 1945 its 125-ton selective-flotation mill and leased the Carlisle group of mines. The lead concentrates and zinc concentrates made were shipped to the El Paso, Tex., and Amarillo, Tex., smelters. Mine development consisted of 350 feet of drifts and 420 feet of diamond drilling. Elayer & Richmond operated the Center mine under lease and produced 1,370 tons of dry gold ore containing 744 ounces of gold, 2,807 ounces of silver, 11,104 pounds of copper, and 41,620 pounds of lead. Billingsley Bros. made a small shipment of dry gold-silver ore from the Ontario mine to the El Paso smelter.

Swartz (Carpenter, Camp Monarch) district.—The Black Range Development Co. operated its Grandview and Columbia mines throughout the year and shipped 1,510 tons of zinc-lead ore containing 982 ounces of silver, 4,407 pounds of copper, 88,990 pounds of lead, and 163,581 pounds of zinc to the Hanover milling unit. A. L. Owen shipped 65 tons of zinc-lead ore from the Royal John mine to the Hanover milling unit.

GUADALUPE COUNTY

The Guadalupe Mining Co. operated its Stauber mine from January 1 to March 4, 1945, when all operations were suspended and the mine shut down. The mine produced siliceous copper ore which was shipped to the El Paso, Tex., smelter.

HIDALGO COUNTY

Gillespie (Red Hill) district.—McDonald & Walker operated the Red Hill group of mines and produced 238 tons of lead ore containing 637 ounces of silver, 174 pounds of copper, and 35,077 pounds of lead; the ore was shipped to the El Paso smelter.

Lordsburg district.—The Banner Mining Co., the largest producer in Hidalgo County in 1945, operated its Bonney mine and 500-ton flotation mill throughout 1945; the property is 6 miles south of Lordsburg. The mill was operated three shifts, 6½ days a week, at the beginning of the year and later the operation was reduced to one shift a day; the mill handled an average of 198 tons of ore a day and made copper concentrates which were sent to the El Paso smelter. Development completed included 1,708 feet of drifts and 3,594 feet of diamond drilling. About June 1 the company took over operation of its newly acquired Misers Chest group of mines. These properties, which adjoin the Bonney group, are to be worked through that group. Some siliceous copper ore from the Misers Chest mine was shipped to the Miami, Ariz., smelter by Charles J. Hutchinson, former owner of the Misers Chest.

The Atwood group of claims on Atwood Hill near Valedon 4 miles south of Lordsburg was operated throughout the year by C. H. & S. A. McIntosh. The mine was worked through a three-compartment vertical shaft 800 feet deep with crosscuts to the vein at three levels—the 210-foot, 350-foot, and 500-foot. Prior to 1945 the main operation was confined to the 350-foot level, but during the year the shaft was unwatered to the 500-foot level, where a 200-foot crosscut was driven to the vein. The ore mined was shipped to the El Paso smelter.

The El Paso smelter received lead ore from the Tom group of mines, silver ore from the Silver Peak mine, and gold ore from the property of the Walrich Mining Co.

San Simon (Steins) district.—J. H. Byrd operated the Crosby mine and shipped 876 tons of lead ore containing 1,374 ounces of silver, 1,319 pounds of copper, and 333,014 pounds of lead to the El Paso smelter.

LUNA COUNTY

Deming district.—The Peru Mining Co. 1,000-ton selective-flotation mill at Wemple, 5 miles north of Deming, operated throughout 1945 on ore from the company Pewabic, Copper Flat, and Kearny mines near Hanover, Grant County, and on custom ore from the Phelps Dodge Corp. Campbell Junction mine at Bisbee, Ariz.

OTERO COUNTY

Sacramento district.—The open-cut Courtney mine about 4 miles south of High Rolls was operated from April through the end of the year by its owner, B. D. Lampros. A total of 59 tons of copper ore containing 10 ounces of silver and 2,670 pounds of copper was shipped to the El Paso, Tex., smelter.

SANDOVAL COUNTY

Cochiti district.—J. G. Cleary made a small shipment of copper ore to the El Paso smelter from the San Miguel mine.

SANTA FE COUNTY

Cerrillos district.—The Moline Mining & Milling Co. operated its 35-ton selective-flotation mill (2½ miles north of Los Cerrillos) during the last 3 months of 1945. The mill treated 1,500 tons of zinc-lead ore mined before 1945 from the Franklin group (Cash Entry, Franklin claims, Chicago group, and others). Concentrates made were shipped to the El Paso and Amarillo, Tex., smelters. The Cerrillos Lead & Zinc Co. operated its Pennsylvania group of mines from April 15 to December 31; 291 tons of zinc-lead ore containing 4 ounces of gold, 1,519 ounces of silver, 1,486 pounds of copper, 76,155 pounds of lead, and 102,345 pounds of zinc were produced and shipped to the American Smelting & Refining Co. Hanover milling unit in Grant County. Development completed during the year amounted to 125 feet of shaft and 50 feet of drifts. Mine production was chiefly from the 200-foot level. Andrew B. Stewart shipped 53 tons of lead-zinc ore from the Tom Payne mine to the American Smelting & Refining Co. Hanover milling unit. The ore contained 1 ounce of gold, 124 ounces of silver, 286 pounds of copper, 6,982 pounds of lead, and 13,382 pounds of zinc.

San Pedro (New Placers) district.—J. Quintana sold a few ounces of gold from sluicing on the Golden Placer.

SIERRA COUNTY

Hermosa district.—A. W. Emerick shipped 5 tons of lead ore to the El Paso smelter from his Palomas Chief claim, and A. W. Emerick and E. R. Armour shipped 3 tons of lead ore from their Welford No. 1 claim to the El Paso smelter.

Kingston district.—Everheart & Miller, lessees of the Empire Zinc Co. Kingston group of mines, shipped a small lot of lead ore from the Iron King claim to the El Paso smelter.

SOCORRO COUNTY

Magdalena district.—The American Smelting & Refining Co. operated its Magdalena unit (Waldo mine) and 200-ton selective-flotation mill throughout 1945. The mill was operated three shifts, 4 days a week; lead concentrates and zinc concentrates were sent to the El Paso and Dumas, Tex., smelters. Development completed in the mine included 1,961 feet of drifts and 15,166 feet of diamond drilling, the major portion of which was done on the 15th and 16th levels from a winze sunk in 1944. The Empire Zinc Co. Kelly mine group (Lynchburg, Kelly, Imperial, Young America, and others) was operated during 1945 by lessees (Kenneth Hughes, J. E. Torres, and C. S. Elayer). The zinc-lead ore produced was shipped to the Empire Zinc Co. Hanover milling unit, Grant County, for concentration. McDonald & Dobson operated their Nitt properties throughout the year producing zinc-lead ore which was shipped to the American Smelting & Refining Co. Hanover milling unit for concentration. Several shipments of lead ore were made to the El Paso smelter from the West Star mine by lessees L. Yacoma and M. Fuller and also by the owners, Sadie and Pio Papa.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN OREGON

(MINE REPORT)

By Alfred L. Ransome

SUMMARY OUTLINE

SUMMARY

Production of gold in Oregon in 1945 advanced 226 percent above the 1944 output entirely because dredging operations were resumed, but the total recovered was only 4 percent of the all-time record set in 1940. Silver production was down to half the 1944 output and was the lowest since 1932. The recovery of copper, lead, and zinc was extremely low, but the output of zinc, even though small, was the first since 1937.

The total value of the gold, silver, copper, lead, and zinc (in terms of recovered metals) produced in Oregon was $164,456 in 1945, compared with $63,760 in 1944 and $4,148,271 in the peak year 1940. It was divided among the metals as follows: Gold, 95 percent; silver, 4.5 percent; copper, lead, and zinc each less than 0.2 percent. Baker County was first in total value of metal output in 1945, Grant County being second. Jefferson County dropped to third place from the leading position held in 1944.

The revocation of the War Production Board Limitation Order L-208, effective July 1, 1945, with the end of hostilities soon afterward on August 14, released gold mining from some of its impediments, and a number of properties that had been idle since 1942 resumed production. However, rising wages, the difficulty of obtaining labor, the high cost of supplies and equipment, and the continuing difficulties of obtaining them, high taxes, and a fixed price for gold and silver (principal metals produced in the State) were factors that continued to hold the mining industry down to a rate of production that otherwise might well have been considerably higher. As these factors, at least in part, had less effect upon placer operations, this class of mining promptly forged ahead, but of all the larger gold, silver, copper, lead, and zinc lode mines that had suspended operations before December 31, 1942, only a few had begun to produce by the end of 1945. As some other properties did not operate in 1945, the net result was fewer producing lode mines in 1945 than in 1944.

Placer mines contributed 89 percent and lode mines 11 percent of the gold produced in Oregon in 1945. In 1944, the ratio was placer mines 21 percent and lode mines 79 percent. Thus, the predominance of placer production prevailing for many years prior to 1943 was reestablished.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67 + ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Oregon, 1941–45, and total, 1852–1945, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	91	153	98,160	96,565	$3,379,775	276,158	$196,379
1942	48	83	31,728	46,233	1,618,155	87,376	62,134
1943	16	16	2,680	1,097	38,395	10,523	7,483
1944	13	10	4,217	1,369	47,915	20,243	14,395
1945	9	10	1,378	4,467	156,345	10,461	7,439
1852–1945	-----------	-----------	(2)	5,673,954	126,551,433	5,218,385	4,788,838

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1941	166,000	$19,588	118,000	$6,726	-----------	-----------	$3,602,468
1942	296,000	24,926	46,000	3,082	-----------	-----------	1,708,297
1943	12,000	1,560	8,000	600	-----------	-----------	48,038

1941	1	100	3	105	1.050
1942–45					
Underground placers:					
Drift:					
1941	6	4,600	94	3,290	.715
1942	4	1,500	50	1,750	1.167
1943	2	250	10	350	1.400
1944–45					
Grand total placer:					
1941	153	14,646,000	60,430	2,115,050	.144
1942	83	8,150,000	38,336	1,341,760	.165
1943	16	41,000	208	7,280	.178
1944	10	30,200	293	10,255	.340
1945	10	1,938,000	3,986	139,510	[8].071

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.
[3] Gold from terminal clean-up; property and equipment not counted as producing.
[4] Includes all placer operations using suction pump for delivering gravel to floating washing plant, except those producing less than 100 ounces of gold, which are included under "small-scale hand methods;" no suction dredges reported for 1942–45.
[5] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[6] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms dip boxes, pans, etc.
[7] Quantity not reported.
[8] Average excludes small-scale hand methods for which quantity of material treated was not reported.

Gold.—Although the level of gold production in Oregon in 1945 was approximately three times that in 1944, the monthly rate of output during the latter half of the year was much higher than the average for the entire year. Uncurtailed production was limited to the six-month period following the revocation of War Production Board Limitation Order L–208. A glance at the monthly production figures in the accompanying table shows the marked break at mid-year followed by a rise in output that greatly increased in the last quarter. Placer mining was the quicker to resume operations, lode mining being held back because of the narrower margin of profit between the fixed price for gold and the higher costs of operation. Connected-bucket dredge operations, inactive since 1942, accounted for 94 percent of the placer gold and 84 percent of the total gold produced in Oregon in 1945. All of the lode gold came from siliceous ores, and most of this ore was valued chiefly for gold. There were 19 Oregon properties producing in 1945—9 lode mines and 10 placers.

Mine production of gold and silver in Oregon in 1945, by months, in fine ounces, in terms of recovered metal

Month	Gold	Silver	Month	Gold	Silver
January	84	36	August	347	608
February	40	10	September	375	428
March	79	1,236	October	892	160
April	57	6,954	November	1,138	374
May	94	12	December	963	266
June	52	7			
July	346	370	Total	4,467	10,461

Silver.—Silver production in Oregon in 1945 was half the total for 1944. Jefferson County again, as in 1944, yielded over 80 percent of the State total. Dry silver ore was the principal source of silver, and the direct smelting of ore was the principal method of recovery. The monthly production figures show minor output during the first half of 1945 with the exception of March and April, during which time one property, subsequently inactive, accounted for the bulk of the output. Production during the last 6 months, although erratic, was on a generally higher level, roughly paralleling the increase in gold output.

Copper, lead, and zinc.—No copper, lead, or zinc mines were in operation in 1945 in Oregon. The recovery of these metals, totaling only 2,000 pounds in each case, was from siliceous ore mined chiefly for the gold and silver content. The recovery of zinc was the first since 1937.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, and lead in Oregon in 1945, by counties, in terms of recovered metals

County	Mines producing [1]		Gold					
	Lode	Placer	Lode		Placer		Total	
			Fine ounces	Value	Fine ounces	Value	Fine ounces	Value
Baker	3	2	179	$6,265	2,961	$103,635	3,140	$109,900
Curry	1		81	2,835			81	2,835
Grant		1			830	29,050	830	29,050
Jackson	1	1	59	2,065	76	2,660	135	4,725
Jefferson and Lane [2]	3		148	5,180			148	5,180
Josephine	1	6	14	490	119	4,165	133	4,655
	9	10	481	16,835	3,986	139,510	4,467	156,345
Total, 1944	13	10	1,076	37,660	293	10,255	1,369	47,915

County	Silver (lode and placer) [3]		Copper		Lead		Zinc		Total value
	Fine ounces	Value	Pounds	Value	Pounds	Value	Pounds	Value	
Baker	1,613	$1,147							$111,047
Curry	14	10							2,845
Grant	75	53							29,103
Jackson	24	17							4,742
Jefferson and Lane [2]	8,716	6,198	2,000	$270	2,000	$172	2,000	$230	12,050
Josephine	19	14							4,669
	10,461	7,439	2,000	270	2,000	172	2,000	230	164,456
Total, 1944	20,243	14,395	6,000	810	8,000	640			63,760

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual outputs.
[3] Sources of total silver as follows—1945: 9,672 ounces from lode mines and 789 ounces from placers; 1944: 20,205 ounces from lode mines and 38 ounces from placers.

MINING INDUSTRY

Of the 1,378 tons of ore sold or treated in Oregon in 1945, Baker County produced 1,015 tons or 74 percent. Jefferson and Lane, of the other producing Counties, each produced more than 100 tons, but the total of the two Counties was only 16 percent. Of the total ore from the State, 91 percent was dry gold ore, the remainder being dry silver ore.

The three properties worked by connected-bucket dredges had one dredge each. All dredges commenced working after July 1, 1945, in the same locality as before the war, and none was moved elsewhere during the year. No dragline dredge or nonfloating washing plant to which gravel was delivered by mechanical means was reported in operation in 1945. Of the five properties worked by hydraulic methods, one reported the use of two hydraulic giants and another property reported six monitors in use. Reports on the use of quicksilver at Oregon placer mines indicate that only 161 pounds was consumed at seven properties, dredge and hydraulic, that submitted data on quicksilver. The two connected-bucket dredges reporting consumption of quicksilver in 1945 recovered 24 ounces of gold for each pound of quicksilver used, compared with 37 ounces in 1942, the previous operating year. Five hydraulic mines reported the consumption of 21 pounds of quicksilver, or 1 pound per each 8 ounces of gold recovered in 1945, compared with 1 pound of quicksilver for each 33 ounces of gold recovered at hydraulic operations in 1944.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore and old tailings sold or treated in Oregon in 1945, with content in terms of recovered metals

Source	Material sold or treated		Gold	Silver	Copper	Lead	Zinc
	Ore	Old tailings					
	Short tons	*Short tons*	*Fine ounces*	*Fine ounces*	*Pounds*	*Pounds*	*Pounds*
Dry and siliceous gold ore	1,258		443	1,229	2,000	2,000	2,000
Dry and siliceous silver ore	120		38	8,443			
Total, lode mines	1,378		481	9,672	2,000	2,000	2,000
Total, placers			3,986	789			
	1,378		4,467	10,461	2,000	2,000	2,000
Total, 1944	3,217	1,000	1,369	20,243	6,000	8,000	

METALLURGIC INDUSTRY

Of the State total ore (1,378 tons), 48 percent was treated in amalgamation mills with or without concentrating equipment, 47 percent was shipped crude to smelters; and 5 percent was treated in cyanidation mills without concentration. Ultimate recovery of 53 percent of the total lode gold was from direct smelting of ore; 21 percent was as bullion from the amalgamation of ore; 17 percent was as bullion from the cyanidation of ore; and 9 percent was recovered by the smelting of flotation concentrates produced at amalgamation mills. Of the total lode silver recovered, 91 percent came from direct smelting of ore, and most of the remainder by the smelting of flotation concentrates. All material requiring smelting was shipped out of the State, as Oregon has no smelters. No data are available covering quicksilver or cyanide consumption at Oregon mills in 1945.

717372—47——29

Mine production of metals in Oregon in 1945, by methods of recovery, in terms of recovered metals

[1] Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 5 and their output included under "Combined counties and districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of total silver as follows: 9,672 ounces from lode mines, 789 ounces from placers.
[4] Output from a property not classed as a "mine."
[5] Includes following districts: Virtue in Baker County; Ashwood in Jefferson County; Grants Pass in Josephine County; and Bohemia in Lane County.

BAKER COUNTY

Cracker Creek district.—Bald Mountain Mine operated the Bald Mountain mine throughout 1945; the mill operated 2 months. Part of the gold output was recovered by amalgamation. The remainder was recovered from flotation concentrates produced at a newly installed plant and a minor quantity of smelting ore; the flotation product and the ore were shipped to a smelter.

Greenhorn district.—The Sunshine Mining Co. (Burnt River Division) resumed operation of its Yuba electric connected-bucket dredge with 72 4½-cubic foot buckets on October 16, 1945. Operation had been suspended in October 1942 as a result of the War Production Board Limitation Order L-208. The gravel treated during 2½ months in 1945 yielded 404 ounces of gold and 86 ounces of silver.

Sumpter district.—The Sumpter Valley Dredging Co., the largest producer of gold in Oregon in 1945, resumed operation of its Yuba electric connected-bucket dredge with 72 9-cubic foot buckets on July 5 following a period of idleness since October 31, 1942. Treatment of 1,143,616 cubic yards of gravel from the property, which is on the Powder River near Sumpter, yielded 2,543 ounces of gold and 596 ounces of silver.

Virtue district.—Anthony Bradenthaler shipped 416 tons of antimony ore from the Gray Eagle mine; the ore contained 106 ounces of gold and 26 ounces of silver.

Weatherby district.—A. V. Lovejoy recovered 11 ounces of gold and 3 ounces of silver from 13 tons of ore produced at the Lovejoy (Gleason) mine, which was operated intermittently from June 1 to December 31.

CURRY COUNTY

Chetco district.—The Robert E. mine was operated by W. D. Bowser throughout 1945; 66 tons of ore cyanided yielded 81 ounces of gold and 13 ounces of silver.

GRANT COUNTY

Canyon district.—The Western Gold Dredging Co. resumed operation of its connected-bucket dredge on John Day River August 26 following a period of inactivity since October 13, 1942. The dredge has 72 6-cubic foot buckets.

JACKSON COUNTY

Gold Hill district.—John H. Mardon amalgamated a small quantity of ore in 1945 from the Sunrise mine from which 59 ounces of gold and 10 ounces of silver were recovered.

Upper Applegate district.—George and William Lewis and Paul Pearce hydraulicked 12,000 cubic yards of gravel at the Sterling mine between January 1 and July 15, 1945, and recovered 63 ounces of gold and 10 ounces of silver.

JEFFERSON COUNTY

Ashwood district.—The Oregon King mine was in operation during the first part of 1945; silver ore was shipped for direct smelting. The property, located on Trout Creek, was the State's largest producer of silver in 1945 despite the short productive period.

JOSEPHINE COUNTY

Greenback district.—M. H. Davis carried on hydraulicking operations at the Blue Channel mine from January 1 to April 15 in 1945. The Goff mine was operated by hydraulic methods from March 1 to April 30 by C. C. Clark.

Illinois River district.—Harry H. McGrath hydraulicked 1,500 cubic yards of gravel at the Frances mine on Josephine Creek between January 1 and June 1, 1945, and recovered 13 ounces of gold and 1 ounce of silver.

Waldo district.—Ben Baker operated the Blanket Ledge mine on Green's Creek from July 1 to October 20, 1945; 70 tons of ore were milled, from which 14 ounces of gold and 5 ounces of silver were recovered by amalgamation. Hydraulicking at the Esterley mine by R. F. Oliphant during 1945 yielded 20 ounces of gold and 2 ounces of silver from washing 2,025 cubic yards of gravel.

LANE COUNTY

Bohemia district.—The Evening Star mine was operated by Fred J. Bartel for a short period late in 1945; gold ore containing a small quantity of base metal was shipped to a smelter for direct treatment. The Silver Shield Mining & Milling Co. operated the Noonday mine, near Disston, during the later months of 1945. Gold ore was shipped to smelters for treatment. In addition to gold and silver, small quantities of copper, lead, and zinc were recovered. The production of zinc in 1945 from the Bohemia district was the only reported instance of recovery of this metal from Oregon since 1937, when smelter payments were made for zinc in ore from the same district.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN SOUTH DAKOTA

(MINE REPORT)

By G. E. Woodward

SUMMARY OUTLINE

SUMMARY

Lode gold mining, the principal source of mineral revenue in South Dakota, was at a standstill in 1945 until War Production Board Limitation Order L–208 was rescinded on July 1. With lifting of this restriction only the Homestake Mining Co. at Lead and the Bald Mountain Mining Co. at Trojan, both in Lawrence County, resumed operations. Neither company, however, was able to attain full-scale operations due chiefly to a shortage of labor. Some difficulties were experienced in reopening stopes, but at the end of the year both companies were operating at about 50-percent capacity. The output of recovered gold in South Dakota was 55,948 fine ounces valued at $1,958,180 compared with 11,621 ounces valued at $406,735 in 1944. The output of silver, a byproduct of gold mining, was 26,564 fine ounces valued at $18,890 compared with 5,445 ounces valued at $3,872 in 1944. There was no production of copper, lead, or zinc in 1945.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

MINING AND METALLURGIC INDUSTRY

The total ore mined and treated by producers of lode gold and silver in South Dakota in 1945 was 312,612 tons, yielding in recovered metals 55,948 fine ounces of gold and 26,564 fine ounces of silver. No copper, lead, or zinc was produced; all ore mined was dry and siliceous gold ore containing no economically recoverable base metal. A break-down by methods of treatment shows that 298,828 tons of ore, yielding 53,498 ounces of gold and 12,583 ounces of silver, were treated by amalgamation followed by separate cyanidation of sands and slimes; 13,782 tons, yielding 2,449 ounces of gold and 13,981 ounces of silver, were treated by cyanidation only; and 2 tons of ore, yielding 1 ounce of gold, were treated by amalgamation only.

No recovery of metals was made from placer operations.

METALLURGIC RECOVERY

Gold and silver bullion produced at mills in South Dakota by amalgamation, 1941–45

Year	Ore treated	Gold in bullion	Silver in bullion	Quicksilver used
	Short tons	*Fine ounces*	*Fine ounces*	*Pounds*
1941	1,506,183	328,166.44	62,423	6,537
1942	1,275,138	276,298.00	56,852	3,561

1945	13,782		237,503	251,285	20,550.00	19,310	[3] 109,900

[1] In terms of 96- to 98-percent strength.
[2] From 17,614 tons of crude ore treated by table and jig concentration.
[3] Includes 217,952 pounds of calcium cyanide (48- to 49-percent strength); all reduced to equivalent of 96- to 98-percent strength to conform with earlier use of figures for high-strength NaCN and KCN.

REVIEW BY COUNTIES

LAWRENCE COUNTY

Homestake mine.—The Homestake Mining Co. resumed operation of its Homestake mine July 2, 1945, after a shut down, except for maintenance work, since June 8, 1943 (the last ore was hoisted from the mine May 26, 1943). Operation of the mill units was started July 9, and the first bullion produced was shipped August 8, 1945. An average of 1,700 tons of ore per day was treated during the remainder of the year—capacity of the plant is about 3,900 tons a day. The annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1945, says—

On June 16, 1945, word was received that Order L–208 of the War Production Board, under which operations of the gold mines in the United States had been suspended in 1942, was rescinded effective July 1, 1945. Plans were made for immediate resumption of production. Work in the mine began on Monday, July 2, 1945, and milling on a small scale was resumed one week later.

During the balance of the year 298,828 tons of ore were milled from which bullion worth $1,873,872.64 was produced. The indicated recoverable grade of $6.27 per ton is low on account of the necessity of obtaining the major part of the ore from caving operations on the upper levels where maximum tonnage could be mined with the men available. Tons milled increased from 12,119 in July to 64,404 in December with a corresponding rise in value of bullion from $25,318.86 to $652,263.85.

The mine and plant had been maintained in full readiness for resumption of operations and the rate of increase in production was limited only by the technical problems of getting stopes into operation after the extended shut-down and by the number of men to break ore in them.

All effort during the last half of the year was centered on production. No diamond drilling was done nor was any drifting or raising undertaken except for raises and short extensions of drifts necessary for stoping.

The reserve of developed ore is 18,979,000 tons. This includes 167,000 tons of broken ore in shrinkage stopes which is greater by 75,000 tons than the amount of broken ore on hand when operations were resumed.

Production of materials essential to the war effort in the machine shop and foundry continued until the end of the war. Most contracts were terminated soon after V-J Day and conversion to our normal operations proceeded very rapidly.

Production of lumber and timber from our sawmill at Spearfish, S. Dak., was normal. Approximately 82 percent of production was sold commercially. After V-J Day production of mine timber was gradually increased to meet our own needs.

Output of coal from the Wyodak mine was low during the first part of the year but grew steadily in the last half of the year both because of the greater demand in our own power plant at Homestake and because of larger outside sales. Results for the year were satisfactory.

Four hundred eleven more men were on the payrolls at the end of the year than in June. Of the 498 former employees who had joined the armed services, 165 have returned, and in addition 124 World War II veterans not previously with the company have been hired.

Ore milled, receipts, and dividends, Homestake mine, 1941–45 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1941	1,499,988	$19,529,080.70	$13.0195	$9,041,760
1942	1,275,138	17,068,437.84	13.3856	7,534,800
1943	183,246	3,629,507.33	19.8067	
1944	(2)	402,591.29	(2)	
1945	298,828	1,873,872.64	6.2707	

1 From 1876 to 1945, inclusive, this mine yielded bullion and concentrates that brought a net return of $441,516,237 and paid $149,805,802 in dividends.

2 No ore milled; bullion product recovered in clean-up of launders, pipe lines, mill liners, and other machinery during course of mill maintenance.

Other mines.—The Bald Mountain Mining Co. began rehabilitation of its properties at Trojan on July 1, 1945, and began milling operations in its 350-ton all-sliming counter-current-cyanidation plant, also at Trojan, September 20, 1945. An average of 134 tons of ore per day was treated during the remainder of the year. The company mined only oxide ores and did not operate its 110-ton, gas-fired, rotary hearth furnace. The company did no development in 1945. The Belle Eldridge Gold Mines, Inc., at Deadwood, in 1945 performed development only in the mine (1,191 feet of drifts and 2,835 feet of diamond drilling) and made some changes in its 50-ton selective-flotation mill adding jig, amalgamation, and cyanidation equipment.

PENNINGTON COUNTY

R. E. Nelson and James A. Murphy recovered 1 ounce of gold by amalgamation in the process of cleaning out a cave-in in their Western Bell and James Lode mining properties near Hill City.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN TEXAS

(MINE REPORT)

By S. A. Gustavson

SUMMARY OUTLINE

SUMMARY

Mines in Texas produced (in terms of recovered metals) 23,265 fine ounces of silver and 110,000 pounds of copper in 1945, compared with 5,355 ounces of silver and 230,000 pounds of copper in 1944. No gold or lead has been produced in the State since 1943 and no zinc since 1917.

Four mines accounted for all of the 1945 output—three in Hudspeth County and one in Culberson County. All ore was shipped without concentration to the copper smelter at El Paso.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

MINE PRODUCTION

The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1941 to 1945, as well as the total metal production from 1885 to 1945.

Mine production of gold, silver, copper, lead, and zinc in Texas, 1941–45, and total, 1885–1945, in terms of recovered metals

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1941	140, 818	306	$10, 710	1, 096, 027	$779, 397
1942	100, 698	236	8, 260	672, 781	478, 422
1943	4, 134	4	140	10, 284	7, 313
1944	4, 160			5, 355	3, 808
1945	2, 693			23. 265	16, 544
1885–1945	(1)	8, 281	223, 780	33, 225, 441	23, 380, 380

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1941	12, 000	$1, 416	372, 000	$21, 204			$812, 727
1942	198, 000	23, 958	362, 000	24, 254			534, 894
1943	162, 000	21, 060	26, 000	1, 950			30, 463
1944	230, 000	31, 050					34, 858

[2] Short tons.

Mine production of silver and copper in Texas in 1945, by counties, in terms of recovered metals

County	Mines producing	Ore (short tons)	Silver (fine ounces)	Copper (pounds)
Culberson	1	397	1, 963	13, 000
Hudspeth	3	2, 296	21, 302	97, 000
	4	2, 693	23, 265	110, 000
Total, 1944	3	4, 160	5, 355	230, 000

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Texas in 1945, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Silver (fine ounces)	Copper (pounds)
Dry and siliceous silver ore	3	1, 093	22, 857	22, 000
Copper ore	1	1, 600	408	88, 000
	4	2, 693	23, 265	110, 000
Total, 1944	3	4, 160	5, 355	230, 000

SMELTING AND REFINING PLANTS IN TEXAS

Texas has in its smelting industry a capacity for the reduction of ores and concentrates containing gold, silver, copper, lead, and zinc far beyond the capacity of its mines and mills to produce them. The industry shows a diversity of smelter products that is equaled only by Montana among the western States. Texas smelters provide a market for ores and concentrates from mines chiefly in the nearby western States of New Mexico, Arizona, and Colorado and from mines in foreign countries of the Western Hemisphere; a substantial quantity of smelter residue is treated from other sections of the United States. The industry has abundant supplies of natural gas available as fuel.

In 1945 the smelters and refineries within the State had capacity for producing 114,000 tons of slab zinc and 240,000 tons of refined copper. Lead smelters had capacity for treatment of 250,000 tons of ores and concentrates. Copper smelter capacity was 600,000 tons of ores and concentrates. Gold and silver ores were absorbed at both lead and copper smelters as flux.

The smelting industry in 1945 was beset by a shortage of skilled workers; generally, however, the zinc reduction plants at Dumas and Amarillo were affected most seriously. These zinc plants were able to produce at far less than capacity; the rate at Dumas was less than one-third. The lead plant at El Paso and the electrolytic zinc plant at Corpus Christi, however, maintained capacity operations throughout the year. The copper smelter at El Paso was operated at less than capacity, mostly due to insufficient supply of ores and concentrates, and the copper refinery was operated at about 65 percent of capacity.

The lead and copper smelters in El Paso, owned by the American Smelting & Refining Co., operated throughout 1945. The lead plant consisted of two blast furnaces having a total capacity of 250,000 tons of charge annually. Ores and concentrates were supplied domestically by operators in Arizona and New Mexico; material received from operators in Mexico, Argentina, Canada, Newfoundland, French Equatorial Africa, and Australia contributed materially to the plant intake. The copper plant consists of two reverberatory furnaces and three converters having a total annual capacity of 600,000 tons of charge. In 1945 ores and concentrates were supplied domestically by operators in Arizona, New Mexico, Texas, and Utah, and foreign material was received from Mexico and Newfoundland. Both the lead and copper plants also treated residues from other smelting plants.

The zinc-smelting component of the Texas smelting industry is made up of three reduction plants—two horizontal retort plants and one electrolytic plant. The American Smelting & Refining Co. operated its gas-fired horizontal zinc retort plant at Amarillo throughout the year but at a greatly reduced capacity, because primarily of a shortage of skilled smelter workers. The plant is equipped with eight furnaces having a total of 6,400 horizontal retorts and has an annual capacity for producing 36,000 tons of zinc metal. In 1945 only minor improvements were made at the plant. The Metals Reserve Company maintains a stock pile of concentrates at the plant.

Concentrates were received from operators in Arizona, Colorado, Montana, Nevada, New Mexico, and Utah. The American Zinc Co. of Illinois operated its gas-fired horizontal-retort zinc smelter at Dumas throughout the year. The plant is equipped with eight furnaces having a total of 6,656 retorts and can produce 48,000 tons of zinc metal annually. A stock pile of zinc concentrates is maintained at the plant by the Metals Reserve Company. In 1945 concentrates were purchased from operators in Arizona, Colorado, Idaho, New Mexico, Utah, and Mexico. No major additions or improvements were made at the plant in 1945.

Electrolytic zinc was produced throughout 1945 by the American Smelting & Refining Co. at its Corpus Christi plant, which has an annual production capacity of 31,200 tons of cathode zinc. The bulk of the 1945 output was obtained from the reduction of Mexican concentrates; some concentrates of domestic origin were received from operators in Arizona and New Mexico.

The Phelps Dodge Corp. operated its copper refinery in El Paso at about 65 percent of its rated capacity of 240,000 tons of copper cathodes annually. No additions were made to the plant in 1945, and improvements were confined to operating efficiency. The corporation produced both electrolytic and fire-refined copper and received most of the blister copper for refining from its Arizona smelters at Clarkdale, Douglas, and Morenci.

REVIEW BY COUNTIES

Culberson County.—A. P. Williams operated the Hazel mine near the Culberson-Hudspeth County line 14 miles northwest of Van Horn. A total of 397 tons of dry silver ore containing 1,963 ounces of silver and 13,732 pounds of copper was shipped to the El Paso copper smelter from March through June.

Hudspeth County.—The Black Shaft mine in the Carrizo Mountains 9 miles northeast of Allamoore was operated throughout 1945 by M. F. Drunzer; a total of 1,600 tons of copper ore containing 408 ounces of silver and 90,550 pounds of copper was produced. M. F. Drunzer also made two shipments of dry silver ore from the Garren Lease on the Sancho Panza property 7 miles northeast of Allamoore, which totaled 86 tons and contained 1,347 ounces of silver and 1,000 pounds of copper. M. F. Drunzer and H. E. Stumberg operated the Hackberry mine and shipped 610 tons of dry silver ore containing 19,547 ounces of silver and 8,633 pounds of copper. All ore shipped from Hudspeth County went to the El Paso copper smelter.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN UTAH

(MINE REPORT)

By C. E. Needham and Paul Luff

SUMMARY OUTLINE

SUMMARY

The output of gold, silver, copper, lead, and zinc in Utah continued to decline during 1945, and in spite of slightly higher average prices for lead and zinc the value of the five metals decreased 19 percent, from $111,036,247 in 1944 to $90,018,641 in 1945. Copper furnished nearly 68 percent of the total value, gold 11, zinc nearly 9, lead 8, and silver nearly 5 percent. Comparing quantities of metals produced in 1945 with 1944, lead showed the largest decline (22 percent), but the rise in lead price reduced its percentage decrease in value below the average for the five metals. Although declines were general in all the more important districts, the total value of the five metals produced in the State exceeded that of any State except Arizona. Compared with 1944, the value of the five metals produced in the West Mountain (Bingham) district in 1945 declined 20 percent; Park City region, 20 percent; and Tintic district, less than 1 percent. The Utah Copper Co. continued to supply most of the value of the State metal production.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*

Gold.—Utah retained its position as the leading gold-producing State in 1945, but gold output decreased 19 percent from that in 1944. Gold mining as such remained at a low level in 1945, and over 92 percent of the State total gold output was derived from copper ore and zinc-lead ore; most of the remainder came from siliceous ores. No placers were active in 1945.

In 1945, the West Mountain (Bingham) district was again the leading gold-producing area in the United States, but it experienced a drop of 20 percent from 312,493 ounces in 1944 to 248,570 ounces in 1945. Each of the major gold-producing mines in the district contributed to the loss in output.

The Tintic district forged ahead of the Park City region in 1945 to become second to the West Mountain (Bingham) district in gold production. Output rose from 11,417 ounces in 1944 to 14,536 ounces in 1945, a 27-percent gain. The increase resulted largely from higher-grade ore produced from the Tintic Bullion mine. The Tintic district was the source of most of the siliceous ores produced in the State in 1945, of which the greater part was used as flux at the Garfield and Tooele reverberatory copper smelters.

Production of gold held up well in 1945 in the Park City region, which ranked third in State gold output; the output declined only 9 percent, from 15,149 ounces in 1944 to 13,822 ounces in 1945. Most of the decrease resulted from reduced tonnage of zinc-lead ore from the New Park property.

The Utah Copper Co. produced 20 percent less gold in 1945 than in 1944, yet none of the large prewar gold mines in the country were able to increase production enough, following revocation of War Production Board Order L-208 July 1, 1945, to displace the Utah Copper Co. as the Nation's leading gold producer. Following the Utah Copper Co. in State gold output, in the order named, were the United States & Lark group (zinc-lead ore) in the West Mountain (Bingham) district, the New Park property (zinc-lead ore) in the Park City region, the Tintic Bullion mine (gold ore) and the Tintic Standard property (gold-silver ore and lead ore) in the Tintic district, the Niagara mine (zinc-lead ore) in the West Mountain (Bingham) district, the Eureka Lilly mine (gold-silver ore) in the Tintic district, the Boston Consolidated property (copper ore) and the

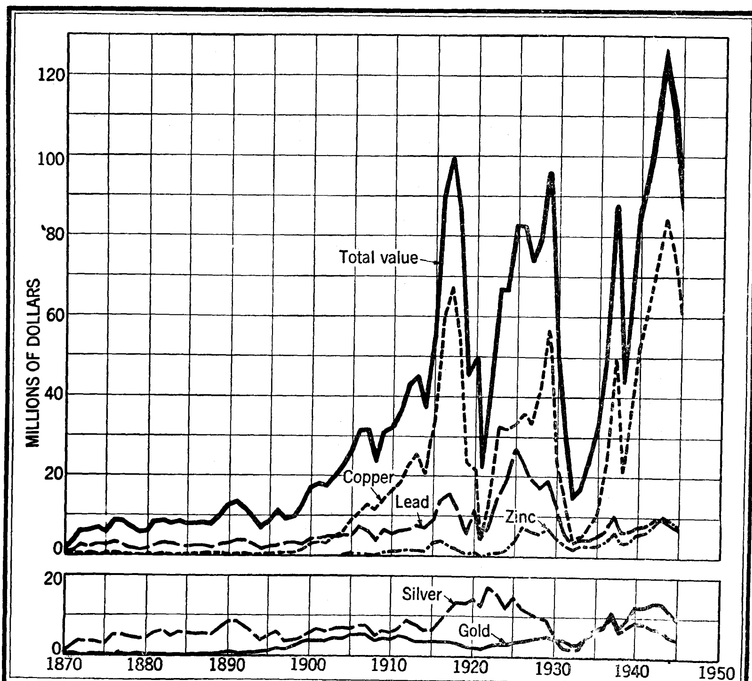

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc, and total value in Utah, 1870–1945.

National Tunnel & Mines Co. (copper ore and zinc-lead ore) in the West Mountain (Bingham) district, and the Calumet mine (zinc-lead ore) in the Rush Valley district. These 10 properties produced 97 percent of the State gold output in 1945.

Silver.—Of the three leading silver districts in Utah—West Mountain (Bingham), Tintic, and Park City—the first two showed declines in silver output in 1945 and the third recorded a small increase; the State output showed a reduction of 20 percent from 1944.

Although output in the West Mountain district slumped over 1,000,000 ounces in 1945 compared with 1944, the district supplied 59 percent of the State silver output. The decrease resulted from a smaller output from the two principal silver-producing mines in the district—the Utah Copper Co., and the United States & Lark properties. In the Tintic district, the second leading silver-producing area, substantial increases were recorded from the Tintic Standard and Chief Consolidated properties, but these gains were nearly offset by losses from the Harold dump, resulting in a net increase of only 16,221 ounces for the whole district. In the Park City region, the third leading silver-producing area in the State, output dropped 395,820 ounces (28 percent), owing to marked decreases at each of the three principal producers—Park Utah Consolidated, Silver King Coalition, and New Park.

Zinc-lead ore, zinc-ore, and lead ore together supplied 51 percent of the total silver in Utah in 1945, copper ore supplied 34 percent, and siliceous ores, 15 percent.

The Utah Copper Co. remained the leading silver producer in the State in 1945, but its output was nearly half a million ounces less than in 1944, owing to a decline in production of copper ore. It was followed by the United States & Lark property, which also showed a loss of nearly half a million ounces from 1944, because of a smaller output of zinc-lead ore. Other important producers of silver, in order of output, were the Tintic Standard, New Park, Park Utah Consolidated, Silver King Coalition, Chief Consolidated, Calumet, Godiva, and Butterfield properties. These 10 properties furnished 89 percent of the State total silver in 1945.

Copper.—The output of recoverable copper in Utah in 1945 dropped 20 percent below that in 1944 and was the lowest since 1939; yield was only 70 percent of that for the peak year 1943. With the exception of the Ohio Copper Co. operation in San Juan County, all the principal copper-producing operations showed a decline in 1945, the greatest being at the Utah Copper Co. property at Bingham. However, this property remained the leading copper mine in the United States.

Utah mines that yielded over a million pounds of recoverable copper each in 1945 included the Utah Copper Co. mine, the National Tunnel & Mines Co. property, the Columbia group of the Ohio Copper Co., the United States & Lark property, all in the West Mountain (Bingham) district, and the Big Indian property of the Ohio Copper Co. in the La Sal district in San Juan County. These five properties supplied 99 percent of the State output of copper.

Lead.—The principal lead-producing mines in Utah continued to be seriously handicapped by labor shortages in 1945. The labor situation, coupled with the fact that the mines worked only one shift a day, resulted in a 22-percent decline in State lead output from that in 1944. Production in 1945 was the lowest since 1899.

The West Mountain (Bingham) district showed a loss in lead output of nearly 17,000,000 pounds in 1945 from that in 1944, but it remained the chief source of lead in the State. Decreases were substantial at all the larger operations, but the slump was especially marked at the United States & Lark group—over 15,000,000 pounds. The Park City region ranked second in lead production but yielded only 76 percent as much as in 1944. Each of the larger producers in the region showed a decrease, the greatest being from the property of the Park Utah Consolidated Mining Co. Decline in lead output in 1945 from the Tintic district, the third leading source of lead in the State, was not so marked—only 7 percent. An increase of over 1,100,000 pounds of lead from the Tintic Standard property was more than offset by decreases from the Harold dump and the Chief Consolidated mine. A large supply of siliceous material containing 3 to 4 percent lead continued to be shipped from the Tintic district as flux for the copper smelters in the Salt Lake Valley area. The lead recovered from this material tended to compensate the losses at other properties in the district.

The United States & Lark group in the West Mountain (Bingham) district, operated by the United States Smelting, Refining & Mining Co., remained by far the largest producer of lead in the State. It was followed by the New Park and Park Utah Consolidated properties in the Park City region, the Calumet mine in the Rush Valley district, the Tintic Standard mine in the Tintic district, the Silver King Coalition mine in the Park City region, the Chief Consolidated mine in the Tintic district, the Montana-Bingham and the Butterfield properties at Bingham, and the Tooele slag-fuming plant in Tooele County. From these 10 operations came 98 percent of the State total output of lead in 1945.

About 85 percent of the total lead output was recovered from zinc-lead ores concentrated, and most of the remainder from lead, siliceous, and zinc-lead ores smelted and zinc slag fumed.

Zinc.—The output of recoverable zinc in Utah in 1945 fell 14 percent below the output in 1944 and was the lowest since 1935. All the principal zinc-producing districts contributed to the decline, except Tooele County, which recorded a substantial increase mainly because of the gain in zinc production at the Tooele slag-fuming plant. The West Mountain (Bingham) district showed a decline of 23 percent, attributed largely to the loss in output at the United States & Lark property. The Park City region had a similar decline—22 percent—resulting mainly from decreases at the Park Utah Consolidated and Silver King Coalition properties. The decrease of over 1,000,000 pounds in zinc production from the Tintic district was due almost entirely to the drop in output from the Chief Consolidated mine, virtually the only producer of zinc in the district. The Tooele slag-fuming plant showed a marked increase in zinc production in 1945 over that in 1944 and ranked second among State zinc sources.

The leading producers of zinc in Utah in 1945 were the United States & Lark group in the West Mountain (Bingham) district, the

Tooele slag-fuming plant in Tooele County, the New Park mine in the Park City region, the Chief Consolidated mine in the Tintic district, the Park Utah Consolidated property in the Park City region, the Calumet mine in the Rush Valley district, and the Silver King Coalition mine in the Park City region. These seven properties furnished 93 percent of the State total output of zinc.

Nearly 79 percent of the State total zinc was recovered from zinc-lead ores concentrated, and most of the remainder from lead-smelter slag fumed.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Utah in 1945, by counties, in terms of recovered metals

County	Mines producing [1]	Ore (short tons)	Gold		Silver	
			Fine ounces	Value	Fine ounces	Value
Beaver	12	19,537	454	$15,890	85,770	$60,992

[1] All lode mines; no placers operated in 1945 or 1944.

MINING INDUSTRY

Shortage of labor was the chief factor in driving down ore production in Utah in 1945; work stoppages were of no great moment, and on the whole the price structure was favorable, compared with 1944. Fewer mines operated in 1945 than in 1944, and the list of active mines included almost no new important operations.

Ore production in 1945 was 20 percent less than in 1944, and most of the loss for the State was in copper ore and zinc-lead ore from the West Mountain (Bingham) district. Nearly 97 percent of the total ore and tailings treated was copper ore, about 2 percent was zinc-lead ore and tailings, and the remainder was principally siliceous ore, zinc ore and slag, and lead ore. During the year, the 12 leading properties—Utah Copper Co., United States & Lark, Columbia, National Tunnel & Mines Co., Tooele slag-fuming plant, Chief Consolidated, New Park Mining Co., Big Indian, Tintic Standard, Calumet, Silver King Coalition, and Park Utah Consolidated—produced 24,544,085 tons of ore, or 99 percent of the State total.

The quantity of siliceous ore mined in the State continued to decline in 1945; the decrease was especially noted in the Tintic district.

The grade of copper ore showed little change from the 1944 content of recoverable metals, but zinc-lead ores increased slightly in content of recoverable lead and zinc, and gold ores improved markedly in gold content.

The severe labor shortage had its effect in curtailing development in 1945, and most of the underground work other than that in the stopes was directed toward preparation for stoping. The most significant project was the continued construction of the 4,600-foot transportation tunnel to the floor of the Utah Copper open pit to provide an outlet for sublevel copper ore. At the close of the year the tunnel was nearing completion.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Utah in 1945, with content in terms of recovered metals

Source	Mines producing [1]	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	10	19,869	10,147	19,140	328,684	34,669	972
Dry and siliceous gold-silver ore	14	56,001	6,649	238,506	659,988	1,048,172	----------
Dry and siliceous silver ore	23	71,821	2,633	670,881	355,308	2,965,000	----------
	47	147,691	19,429	928,527	1,343,980	4,047,841	972
Copper ore	15	23,978,159	229,526	2,087,402	[2]448,735,815	36,917	----------
Lead ore	33	24,305	1,281	280,256	140,402	6,038,051	164,822
Zinc ore	6	[3]104,499	28	7,208	8,370	1,054,562	12,524,369
Zinc-lead ore	28	468,530	29,715	2,803,152	2,523,433	70,456,629	54,569,837
	[4] 89	24,723,184	279,979	6,106,545	[2]452,752,000	81,634,000	67,260,000
Total, 1944	97	30,940,205	344,223	7,593,075	[5]565,150,000	105,038,000	77,988,000

[1] All lode mines; no placers operated in 1945 or 1944.
[2] Includes 22,787,627 pounds recovered from mine-water precipitates.
[3] Includes 79,413 tons of zinc slag.
[4] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[5] Includes 35,936,977 pounds recovered from mine-water precipitates.

METALLURGIC INDUSTRY

The 24,723,184 tons of ore produced in Utah in 1945 were treated as follows: 24,456,945 tons (99 percent) at concentrating mills, compared with 30,632,016 tons in 1944; 186,826 tons (nearly 1 percent) shipped crude to smelters, compared with 259,309 tons in 1944; and 79,413 tons (0.3 percent) of old slag fumed, compared with 48,880 tons in 1944.

The nine concentrating mills active in Utah in 1945 treated ore as follows: 5 plants (Arthur, Magna, Ohio Copper, Tooele, and Big Indian), 23,969,590 tons of copper ore and old tailings; 4 mills (Bauer, Midvale, Silver King, and Tooele), 464,355 tons of zinc-lead and lead ores; and 1 flotation mill in Summit County, 23,000 tons of current zinc tailings. The three custom concentration mills in the Valley area have a capacity of 3,900 tons per day, but only about half the capacity was used in 1945. The Midvale 1,700-ton concentrator, operated by the United States Smelting, Refining & Mining Co., was the largest custom mill in the area and treated principally zinc-lead ore, most of which was obtained from company-owned properties in the West Mountain (Bingham) district. The Tooele 1,500-ton concentrator, owned and operated by the International Smelting & Refining Co., was active intermittently in 1945 whenever enough milling ore was available for a run. The concentrator comprises three sections—copper, oxide lead, and sulfide zinc-lead—each of 500 tons daily capacity. At times the sulfide zinc-lead or oxide-lead section was used to treat zinc-copper ore. As in 1944, the bulk of the ore was custom ore. The zinc-copper ore came from California, the oxide ore from the Tintic Standard mine, the copper ore from the National Tunnel & Mines Co., and the zinc-lead ore principally from the Park Utah Consolidated Mines Co., all three in Utah. The 700-ton concentrator of the Combined Metals Reduction Co. at Bauer operated continuously in 1945; the material treated was virtually all zinc-lead ore, and nearly all of it came from company-owned or operated mines in Utah and Idaho. The Silver King Coalition 800-ton concentrator at Park City was active throughout the year and treated only zinc-lead-silver ore from the company mine.

Of the two copper smelters in Utah—the Garfield, operated by the American Smelting & Refining Co., and the Tooele plant of the International Smelting & Refining Co.—only the Garfield plant was active throughout the year. Nearly all the output of the Utah Copper Co. was treated at this plant, and this constituted by far the greatest portion of plant feed. The Tooele copper smelter closed July 1 owing to insufficient ore and concentrates. During its period of operation it treated principally copper concentrates produced from copper ore of the National Tunnel & Mines Co. at Bingham and copper concentrates from milling plants in Nevada.

The Salt Lake area has three lead smelters—Tooele, operated by the International Smelting & Refining Co.; Midvale, operated by the United States Smelting, Refining & Mining Co.; and the Murray plant of the American Smelting & Refining Co. Only the Tooele and Midvale plants were active throughout 1945.

The Tooele lead plant was operated in conjunction with the Tooele slag-fuming plant and treated zinc-lead ore, zinc-copper ore, lead concentrates, and zinc ore from company-owned operations as well as from custom sources. The slag-fuming plant treated 175,562 tons of slag and crude ore in 1945, compared with 133,378 tons in 1944. The resulting zinc fume (18,193 tons) averaged 72.84 percent zinc, and the lead fume (2,034 tons) averaged 46.93 percent lead. The zinc fume was shipped to the National Zinc Co., Inc., Bartlesville, Okla.; the lead fume was re-treated at the Tooele lead smelter. The Midvale plant treated lead concentrates, lead ore, and siliceous ore, mostly from company-owned properties in Utah. The Murray plant closed May 5 for lack of a sufficient supply of lead concentrates and crude lead ore, but reopened in December.

Mine production of metals in Utah in 1945, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Concentrates smelted	870,935	259,077	4,850,504	427,233,200	69,697,635	53,574,745
Ore smelted [1]	266,239	20,902	1,256,041	2,731,173	11,936,365	13,685,255
Mine-water precipitates smelted [2]	13,772			22,787,627		
		279,979	6,106,545	452,752,000	81,634,000	67,260,000
Total, 1944		344,223	7,593,075	565,150,000	105,038,000	77,988,000

[1] Includes 79,413 tons of old slag.
[2] All from Salt Lake County.

Gross metal content of concentrates produced from ores mined in Utah in 1945, by classes of concentrates smelted

Class of concentrates	Concentrates (short tons)	Gross metal content				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)

[1] No placers operated in 1945.
[2] La Sal district lies in both Grand and San Juan Counties.
[3] Tintic district lies in both Juab and Utah Counties.
[4] Property not counted as a "mine"; material credited to district came from a slag dump.
[5] Includes production from Smelter district; Bureau of Mines not at liberty to publish separate figures.

BEAVER COUNTY

Beaver Lake district.—The only output from the Beaver Lake district in 1945 was copper ore produced from the O. K. mine by Jesse R. Villars, lessee, and shipped to the Garfield smelter.

Granite district.—A small quantity of lead ore was produced in 1945 from one mine in the Granite district.

Pine Grove district.—The Wah Wah Mining Co., the only operator in the Pine Grove district in 1945, shipped 46 tons of lead ore to the Murray smelter, 1,392 tons of zinc ore to the Tooele lead smelter, and 71 tons of zinc-lead ore to the Bauer mill for concentration.

Rocky district.—The Prosper Mining Co. operated its Old Hickory group and shipped to the Garfield smelter 5,175 tons of copper ore, which contained 85 ounces of gold, 9,419 ounces of silver, and 269,462 pounds of copper.

San Francisco district.—The Horn Silver mine was worked throughout 1945; silver ore was shipped to the Garfield smelter, lead ore to the Murray and Midvale smelters, zinc-lead ore to the Tooele lead smelter, and zinc-lead ore to the Bauer mill. Other production from the district included copper ore shipped direct to smelters from the Imperial group and Cactus mine.

Star and North Star district.—The Moscow Silver Mines Co. worked its group of claims in 1945 and shipped mostly zinc-lead ore to the Bauer mill; one car of lead ore went to the Midvale smelter. Lessees of the Golden Reef group shipped to smelters 392 tons of lead ore containing 47 ounces of gold, 89 ounces of silver, 354 pounds of copper, and 68,485 pounds of lead. James D. Williams, lessee, worked the Harrington-Hickory group throughout 1945; the output comprised 1,641 tons of lead ore, 362 tons of zinc-lead ore, and 86 tons of silver ore, all sent to smelters, and 981 tons of zinc-lead ore treated at the Midvale concentrator. Remaining production from the district was a shipment of lead ore from the St. Mary claim to the Midvale smelter.

BOX ELDER COUNTY

Crater Island district.—Some gold ore was consigned to the Tooele copper smelter from the Copper Blossom mine.

Lucin district.—From the Copper Mountain property, C. E. Massae, lessee, shipped 143 tons of copper ore and 3 tons of lead ore to the Garfield and Tooele smelters.

Promontory district.—The Lakeview Mining Co. shipped zinc-lead ore from the Lake View Carbonate mine to the Tooele lead smelter.

GRAND COUNTY

La Sal district.—Small lots of silver ore and copper ore shipped to the Garfield smelter from the Beaver mine comprised the total metal production of Grand County in 1945.

IRON COUNTY

Indian Peak district.—The only output from Iron County in 1945 was 600 tons of zinc ore from the New Arrowhead mine sent to the Tooele lead smelter.

JUAB COUNTY

Detroit district.—The Ibex Gold Mining Co. shipped a car of gold ore in 1945 to the Garfield smelter.

Fish Springs district.—Lessees shipped lead ore to the Murray smelter from the Utah Mines group.

Tintic district.—The Tintic district, which lies in both Juab and Utah Counties, is reviewed here. The table that follows gives the metal production in each section of the district in 1945, a comparison with the total in 1944, and the grand total from 1869 to 1945.

Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1944–45, and total, 1869–1945, in terms of recovered metals

	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1945								
Juab County	8	90,893	1,477	418,275	195,000	4,070,000	5,694,600	$1,380,359
Utah County	10	69,923	13,059	668,160	723,000	5,789,000	160,800	1,546,152
	18	160,816	14,536	1,086,435	918,000	9,859,000	5,855,400	2,926,511
Total, 1944	22	214,467	11,417	1,070,214	1,066,200	10,637,700	6,899,000	2,942,075
Total, 1869–1945		(1)	2,570,574	259,196,005	242,295,064	1,855,383,079	61,575,538	390,501,118

1 Figures not available.

The Chief Consolidated Mining Co. operated its Chief No. 1, Gemini, and Eureka Hill mines throughout 1945; the Plutus mine was idle. Output from the three mines totaled 75,109 tons, comprising 72,644 tons of zinc-lead ore, 2,189 tons of siliceous silver ore, and 276 tons of lead ore. The total ore contained 789 ounces of gold, 260,585 ounces of silver, 111,387 pounds of copper, 3,824,502 pounds of lead, and 6,277,458 pounds of zinc. The zinc-lead ore went to the Bauer mill for treatment, the silver ore to the Garfield smelter, and the lead ore to the Murray smelter. According to the company printed annual report for the year ended December 31, 1945, 72,644 tons of ore were extracted from the Chief No. 1, 334 tons from the Gemini, and 2,131 tons from the Eureka Hill.

Development at the properties during the year consisted of 3,619 feet of drifts. The company printed annual report states further that the Chief No. 1 shaft was repaired, that part of the Gemini shaft was retimbered, and that a permanent pumping system was being established in the Chief No. 1, which would permit the lower workings to be always accessible down to the 2,500 level. Repair of the Chief No. 1 shaft necessitated a five-day work week in the stopes instead of the usual six-day work week, which was the main factor in reducing output of ore from the mine.

Lessees operated the Centennial-Beck-Victoria mine of the United States Smelting, Refining & Mining Co. from April through December and shipped several cars of siliceous silver ore to the Garfield smelter and a quantity of lead ore to the Midvale smelter. The Mammoth Mining Co. operated at a reduced rate in 1945 and sent about 6,000 tons of siliceous gold-silver ore to the Garfield smelter. Philip Clark, lessee, worked the Godiva mine of the Godiva Mining & Milling

Co. throughout the year and shipped several cars of siliceous silver ore to the Garfield smelter. The Alaska mine produced zinc-lead ore, which was treated at the Midvale concentrator. Other production from the district, all shipped direct to smelters, was as follows: Dragon and Martha Washington properties, siliceous gold-silver ore; Showers group, siliceous silver ore; Lockheed group, siliceous gold ore; Bonanza group, lead ore; Old Scotia mine, lead ore; and Treboar & Huber property, lead ore.

The Tintic Standard Mining Co. and its subsidiary companies continued in 1945 to produce the major part of the recoverable metal from the Utah County section of the Tintic district. In spite of a continued shortage of manpower, ore produced from the Tintic Standard and the Iron Blossom mines totaled 40,880 tons (Tintic Standard. 38,064 tons; Iron Blossom, 2,816 tons), a gain of 12,735 tons over the output in 1944.

The Tintic Standard mine produced 38,064 tons of ore with metal content as follows: 25,402 tons of siliceous silver ore shipped to the Garfield and Tooele copper smelters contained 1,537 ounces of gold, 309,330 ounces of silver, 188,427 pounds of copper, and 2,622,809 pounds of lead; 11,391 tons of lead ore consigned to lead smelters at Tooele, Murray, and Midvale contained 412 ounces of gold, 146,958 ounces of silver, 59,719 pounds of copper, 3,285,091 pounds of lead, and 198,000 pounds of zinc; and 1,271 tons of lead ore treated at the Tooele concentrator yielded 689 tons of lead concentrate containing 22 ounces of gold, 11,572 ounces of silver, 1,749 pounds of copper, 270,027 pounds of lead, and 18,885 pounds of zinc. Output from the Iron Blossom mine was 2,816 tons of siliceous silver ore sent to the Garfield smelter; the metal content was 108 ounces of gold, 15,981 ounces of silver, 3,574 pounds of copper, and 278,303 pounds of lead. Development at the Tintic Standard and Iron Blossom mines consisted of 2,969 feet of drifts at the Tintic Standard and 145 feet of drifts at the Iron Blossom. In 1945 the Harold dump was worked only during April and supplied 1,633 tons of gold-silver ore to the Garfield smelter, compared with 56,587 in 1944.

The Eureka Lilly Consolidated Mining Co. and the Colorado Consolidated Mines Co. operated their properties throughout 1945. Gold-silver ore was produced from each and shipped to the Garfield smelter—9,046 tons from the Eureka Lilly mine contained 1,668 ounces of gold, 80,192 ounces of silver, 389,695 pounds of copper, and 328 pounds of lead, and 4,497 tons from the Colorado mine contained 280 ounces of gold, 21,560 ounces of silver, 6,176 pounds of copper, and 344,758 pounds of lead.

Throughout 1945 the North Lily Mining Co. worked the Tintic Bullion, North Lily, and Eureka Bullion mines. The Tintic Bullion produced mainly gold ore, which was shipped direct to smelters, but some zinc-lead ore was treated at the Tooele concentrator; gold-silver ore was produced from the North Lily and sent to smelters; and the output from the Eureka Bullion was mostly silver ore, which, along with some gold-silver ore, was shipped direct to smelters. Development at the three mines comprised 371 feet of crosscuts, 346 feet of drifts, 392 feet of raises, and 2,973 feet of diamond drilling. Other production in the district included gold-silver ore shipped to smelters from the Mountain View group and the Yankee mine.

SALT LAKE COUNTY

Little Cottonwood district.—Test lots of ore were taken in 1945 from various places in the South Hecla mine of the Alta United Mines Co.; five cars of silver ore and two of copper ore were shipped to the Garfield smelter, and one car of lead ore to the Murray smelter. The Wasatch Mines Co. operated its Columbus-Flagstaff group and shipped copper ore and a little silver ore to the Garfield smelter and a car of lead ore to the Murray smelter. The total of 510 tons contained 17 ounces of gold, 10,168 ounces of silver, 61,385 pounds of copper, 84,788 pounds of lead, and 12,917 pounds of zinc.

Smelter district.—Output credited to the Smelter district in 1945 was lead plant dump slag shipped to a smelter.

West Mountain (Bingham) district.—In 1945 the West Mountain (Bingham) district produced 89 percent of the State gold output, 59 percent of the silver, 99 percent of the copper, 56 percent of the lead, and 44 percent of the zinc; the total value of the metal output declined 20 percent from that in 1944. The following table shows production from mines in the Bingham district in 1944 and 1945 and the total from 1865 to 1945.

Mine production of gold, silver, copper, lead, and zinc in Bingham or West Mountain district, Salt Lake County, Utah, 1944–45, and total, 1865–1945, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1944	11	30,344,838	312,493	4,671,478	562,199,000	62,337,300	38,302,000	$99,509,472
1945	8	24,209,565	248,923	3,628,229	448,568,800	45,446,000	29,340,800	79,131,715
Total, 1865–1945	--------	(1)	5,703,152	141,094,341	[2] 4,558,238	[2] 1,549,686	[2] 472,104	1,754,997,392

[1] Figures not available.
[2] Short tons.

At the Utah Copper Co. mine in Bingham Canyon operations in the open pit were continuous throughout the year except for brief stoppages resulting from labor strikes. The chief factor in preventing the company from maintaining its high production level of the war years was the continued acute labor shortage. Nevertheless, the company remained the Nation's leading copper and gold producer, and it also ranked high in the production of silver and molybdenum. Copper ore was milled at the Arthur and Magna plants at the rate of 67.517 tons a day, compared with 80,868 tons in 1944. The ore treated averaged slightly lower in gold content but slightly higher in copper and silver. Late in the year the company announced a new schedule for the two mills—12 days in operation and 2 days closed because of the inability of the Garfield smelter to handle concentrates from the two mills when both were operating at full time.

In addition to the large quantity of copper produced from copper concentrates from the Magna and Arthur mills, the company continued to produce important quantities of copper from the leaching of waste dumps. The precipitating plant is at Lead Mine in the mouth of Bingham Canyon.

After the war the company announced that it would shortly launch a $3,500,000 program to rehabilitate the mine and the mills after a long war period of crowding all production facilities beyond the normal limit. It is planned to develop the mine extensively and to replace much worn mine and mill equipment.

The Boston Consolidated mine, owned by the Utah Copper Co., was worked under lease from January to September by the American Smelting & Refining Co.; gold-copper ore was shipped to the Garfield smelter.

The United States & Lark property, operated by the United States Smelting, Refining & Mining Co., continued to be the leading producer of lead and zinc in the State and was second in the production of gold and silver. The mine produced nearly 115,000 tons less ore in 1945 than in 1944, which caused a marked decline in output of lead and zinc in the West Mountain (Bingham) district. The great bulk of the output was zinc-lead ore treated at the Midvale concentrator, but in addition some gold-silver ore was shipped to the Garfield smelter, lead ore to the Midvale smelter, and a small quantity of zinc-lead ore to the Tooele slag-fuming plant. The ore produced declined slightly in gold and copper content but increased in silver, lead, and zinc. Development at the property was less than in 1944 and comprised 11,589 feet of drifts, 2,960 feet of raises, and 3,108 feet of diamond drillings. The Niagara mine and the Montana-Bingham Consolidated Mining Co. group also were operated by the United States Smelting, Refining & Mining Co. Ore from the two mines in 1945 was about 1,300 tons less than in 1944 and was nearly all zinc-lead ore treated at the Midvale concentrator; a small quantity of gold ore from the Niagara mine was shipped to the Garfield smelter. Development at the two properties included 991 feet of drifts and 1,625 feet of diamond drilling.

The National Tunnel & Mines Co. worked the Apex-Delaware group throughout the year, but output of ore was nearly 35 percent less than in 1944. The output was largely copper ore treated at the Tooele concentrator, but a substantial tonnage of zinc-lead ore also went to the Tooele concentrator, and smaller quantities of gold-silver ore were shipped to the Garfield and Tooele copper smelters and zinc-lead ore to the Tooele lead smelter. Development at the mine was less than in 1944 and comprised 1,460 feet of crosscuts and raises, 1,579 feet of drifts, 93 feet of winze, and 5,368 feet of diamond drilling.

The Ohio Copper Co. operated continuously its 1,500-ton leaching-flotation plant near Lark, but the precipitation plant for treating solutions pumped through old stopes was closed in July. During the year, 465,620 tons of old tailings were treated containing an average of 7.8 pounds of copper to the ton, compared with 493,413 tons treated in 1944 containing an average of 7.7 pounds of copper to the ton. Production of copper concentrate in 1945 was 5,303 tons containing 371 ounces of gold, 3,939 ounces of silver, and 2,287,521 pounds of copper. In addition, 175,910 pounds of copper were produced at the leaching-precipitation plant. According to the company printed annual report for the year ended December 31, 1945, 1,855,000 tons of old tailings are still available for treatment. Plans have been completed and equipment ordered to set up a cheaper method of moving the tailings to the concentrator to make profitable the treatment of the remaining tailings pile despite its lower copper content.

Combined Metals Reduction Co. and lessees operated the Butterfield group in 1945 and produced 19,584 tons of zinc-lead ore, compared with a total of 26,221 tons in 1944. The Bauer mill treated 18,458 tons of the 1945 output, and the remainder went to the Tooele concentrator.

SAN JUAN COUNTY

La Sal district.—The Ohio Copper Co. expanded operations at its Big Indian open-pit mine in 1945 and increased production to 45,380 tons, compared with 8,009 tons in 1944. The company's 250-ton flotation mill treated 45,166 tons of carbonate copper ore, which yielded 1,925 tons of copper concentrate containing 585 ounces of silver and 1,038,331 pounds of copper. In addition, 214 tons of copper ore containing 16,837 pounds of copper were shipped to the Garfield smelter.

SUMMIT AND WASATCH COUNTIES

PARK CITY REGION

Included with the Park City region are the Uintah district in Summit County and the Blue Ledge and Snake Creek districts in Wasatch County. Although output of the five metals continued to decline in 1945, the region remained a large producer of lead and zinc and furnished appreciable quantities of gold and silver. The following table shows the production and total value of the five metals in 1945 compared with 1944 and the total from 1870 to 1945.

Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1944–45, and total, 1870–1945, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1944	8	203, 001	15, 149	1, 429, 650	956, 800	23, 319, 600	19, 111, 000	$5, 720, 245
1945	12	154, 609	13, 822	1, 033, 830	740, 800	17, 831, 500	14, 870, 000	4, 562, 505
Total, 1870–1945		(1)	544, 850	233, 765, 278	67, 744, 913	2, 391, 698, 934	668, 058, 611	361, 639, 653

1 Figures not available.

The Silver King Coalition Mines Co. operated its mine throughout the year and produced a total of 31,117 tons of ore, a decline of 43 percent from the output in 1944. Of this quantity, 28,524 tons of zinc-lead ore were treated in the company's 800-ton flotation mill at an average daily rate of 127 tons. The mill feed produced 3,299 tons of lead concentrate containing 244 ounces of gold, 218,551 ounces of silver, 94,109 pounds of copper, and 4,596,666 pounds of lead and 2,059 tons of zinc concentrate containing 20 ounces of gold, 7,079 ounces of silver, 7,677 pounds of copper, 59,491 pounds of lead, and 2,548,420 pounds of zinc. In addition, direct shipments to smelters comprised 1,606 tons of siliceous silver ore containing 25 ounces of gold, 13,884 ounces of silver, 5,341 pounds of copper, and 106,862 pounds of lead and 987 tons of lead ore containing 58 ounces of gold, 56,269 ounces of silver, 19,354 pounds of copper, and 433,792 pounds of lead.

According to its printed annual report for the year ended December 31, 1945, the company operated under the following assigned quotas from the Quota Committee of the Premium Price Plan during 1945:

Copper, zero A quota, 5-cent premium over the ceiling price.
Lead, zero A quota, 2¾-cent premium, and zero B quota, an additional 2¾ cents.
Zinc, zero A quota, 2¾-cent premium; zero B quota, an additional 2¾ cents; and zero C quota, another 2¾ cents, or a total of 8¼ cents over the ceiling price.

Development at the property comprised 917 feet of raises, 10,096 feet of drifts, 9 feet of winze, and 430 feet of diamond drilling. In addition, the company's printed report states that unwatering of the West End section of the mine was completed, and mining operations were resumed on the 1,800, 1,900, and 1,960 levels. Preparations for sinking below the 1,960 level have been nearly completed.

The Park Utah Consolidated Mines Co. worked its Park Utah Consolidated group in Summit and Wasatch Counties throughout 1945, but at a reduced rate, owing to labor shortage. Output was 27,893 tons of zinc-lead ore, a decrease of 28 percent from that in 1944. Of the ore produced, 26,388 tons were treated at the Tooele concentrator; gross metal content was 656 ounces of gold, 296,970 ounces of silver, 141,539 pounds of copper, 6,031,056 pounds of lead, and 5,064,809 pounds of zinc. The remaining 1,505 tons were shipped to the Tooele lead smelter; metal content was 27 ounces of gold, 18,218 ounces of silver, 15,884 pounds of copper, 455,260 pounds of lead, and 525,280 pounds of zinc. Development during the year was much less than in 1944 and comprised 9,483 feet of drifts and 3,502 feet of diamond drilling. Employment at the mine dropped from an average of 290 men in 1944 to 218 in 1945, according to the company's printed annual report for the year ended December 31, 1945.

The New Park Mining Co. operated its Park Galena and Mayflower properties continuously in 1945 and produced 50,043 tons of ore, compared with 57,640 in 1944. Nearly all (49,888 tons) was zinc-lead ore treated at the Midvale concentrator; gross metal content was 13,754 ounces of gold, 352,040 ounces of silver, 719,078 pounds of copper, 7,096,498 pounds of lead, and 10,150,280 pounds of zinc, indicating an increase in gold, copper, lead, and zinc content but a decrease in silver compared with 1944. The remaining output was 155 tons of silver ore shipped to the Midvale smelter; it contained 6 ounces of gold, 2,346 ounces of silver, 7,441 pounds of copper, and 2,825 pounds of lead. Development exceeded that in 1944 and comprised 73 feet of shaft sinking, 3,181 feet of drifts, 850 feet of raises, and 10,986 feet of diamond drilling. In addition, a station and skip pocket were being cut on the 1,380 level.

Reuben Garbett, working on Silver Creek with a small flotation mill, continued to re-treat current tailings from the Silver King Coalition mill. From about 23,000 tons of tailings, 311 tons of zinc middling were produced and sent to the Midvale concentrator for further treatment. The remaining production from the Uintah district was 32,134 tons of old tailings, principally siliceous, shipped to the Garfield smelter. From the New Quincy mine in the Snake Creek district in

Wasatch County the Empire Canyon Mining Co. shipped 291 tons of zinc-lead ore to the Tooele concentrator.

TOOELE COUNTY

Camp Floyd district.—The Geyser Marion group, the only producing property in the Camp Floyd district in 1945, was worked from January to September, and siliceous gold-silver ore was shipped to the Garfield smelter.

Dugway district.—The Rip Van Winkle Consolidated Mining Co. operated the Smelter Canyon and Four Metals group throughout the year. Of the total output, the Tooele lead smelter received 1,471 tons of zinc-lead ore containing 9 ounces of gold, 1,125 ounces of silver, 348 pounds of copper, 110,068 pounds of lead, and 402,845 pounds of zinc. The remaining 484 tons of zinc-lead ore went to the Tooele concentrator and Bauer mill for treatment; the metal content was 3 ounces of gold, 411 ounces of silver, 68 pounds of coper, 43,143 pounds of lead, and 110,042 pounds of zinc. Other production from the district was from the Cannon property and comprised 21 tons of copper ore consigned to the Tooele and Garfield copper smelters and 10 tons of lead ore to the Tooele lead smelter.

Erickson district.—The Ida group and the Tintic Delaware mine together produced 52 tons of zinc-lead ore in 1945; 38 tons went to the Tooele lead smelter and 14 tons to the Tooele concentrator.

Free Coinage district.—Total production from the Free Coinage district in 1945 was 33 tons of lead ore shipped to the Tooele lead smelter; metal content was 90 ounces of silver, 10,160 pounds of lead, and 753 pounds of zinc.

Lakeside district.—Two properties were worked in the Lakeside district in 1945—one produced 49 tons of zinc ore sent to the Tooele lead smelter and the other 111 tons of lead ore shipped to the Murray smelter.

North Tintic district.—H. A. Bellows shipped 45 tons of zinc ore from the Scranton waste dump to the Tooele lead smelter.

Ophir district.—The Ophir Hill mine, operated by the Ophir Development Co. throughout the year, was the largest producer in the Ophir district. Output comprised 490 tons of zinc-lead ore treated at the Tooele concentrator, 265 tons of zinc-lead ore shipped to the Tooele lead smelter, and 61 tons of silver ore shipped to the Garfield smelter. Recovered metals totaled 6 ounces of gold, 5,831 ounces of silver, 12,711 pounds of copper, 146,953 pounds of lead, and 66,488 pounds of zinc. The Ophir unit of the United States Smelting, Refining & Mining Co. operated at about 65 percent of its 1944 rate. The bulk of the output was zinc-lead ore treated at the Midvale and Tooele concentrators. Other production from the district included 54 tons of copper ore consigned to the Garfield smelter from the Shoo Fly group and 30 tons of lead ore shipped to the Midvale smelter from the Mecca group.

Rush Valley district.—The leading producer in the Rush Valley district in 1945 was the West Calumet (Calumet) mine operated by the Combined Metals Reduction Co. The company mined 31,263 tons of zinc-lead ore, which was treated at the Bauer mill, and 414 tons of lead ore shipped to the Tooele lead smelter. The company also operated the Honerine & Galena King group and mined 769 tons of zinc-lead ore—545 tons went to the Bauer mill and 224 tons to the Tooele lead smelter. From the Silver Eagle group the Hampton Mining Co. shipped 36 tons of zinc-lead ore to the Tooele lead smelter and 172 tons of similar ore to the Bauer mill for treatment. Gross metal content of the total ore was 11 ounces of gold, 976 ounces of silver, 18,428 pounds of lead, and 26,162 pounds of zinc. The Blue Eagle Mining Co. produced from its three claims 72 tons of lead ore, which were shipped to the Tooele lead smelter.

Silver Islet district.—Total production of the Silver Islet district in 1945 was 40 tons of lead ore shipped to the Murray smelter from the Morning Star mine.

Smelter district.—The slag-fuming plant of the International Smelting & Refining Co. remained the second largest producer of zinc in Utah in 1945. The plant was operated continuously during the year and fumed a total of 175,562 tons of hot current slag, old cold slag, and crude ore. However, only the metals recovered from the fuming of 79,413 tons of old slag are credited to the plant as a producer in the "Smelter district." The remaining metals are credited to the individual mines producing the ore and concentrates that yielded the current hot slag for treatment in the slag-fuming plant.

Willow Springs district.—Lessees operated the Oro Del Rey group and shipped 173 tons of lead ore to the Murray and Tooele lead smelters and 114 tons of gold ore to the Garfield and Tooele copper smelters. Metal content of the total ore was 336 ounces of gold, 1,571 ounces of silver, 2,614 pounds of copper, and 90,671 pounds of lead. Lee Trout sent a test lot of gold ore from the Depression claim to the Garfield smelter.

UTAH COUNTY

American Fork district.—From its Globe mine, the Howell Mining Co. shipped to the Tooele concentrator 331 tons of zinc-lead ore containing 9 ounces of gold, 2,968 ounces of silver, 1,460 pounds of copper 49,424 pounds of lead, and 65,012 pounds of zinc.

Tintic district.—Mines in the Utah County section of the Tintic district are reviewed under Juab County.

WASHINGTON COUNTY

Tutsagubet district.—The Apex Mining Co. operated the Dixie mine from June to the end of the year and shipped 2,025 tons of copper ore to the Garfield smelter.

WAYNE COUNTY

Hanksville district.—A. Hunt & Sons shipped 5 tons of silver ore from the Copper Queen claim to the Garfield smelter.

GOLD, SILVER, COPPER, LEAD, AND ZINC IN WASHINGTON

(MINE REPORT)

By C. E. Needham and Paul Luff

SUMMARY OUTLINE

SUMMARY

In Washington the production of gold only, of the five metals gold, silver, copper, lead, and zinc, gained in 1945 compared with 1944. Gold output increased 22 percent in both quantity and value, but silver declined over 12 percent in quantity and value, copper nearly 6 percent in quantity and value, lead 35 percent in quantity and 30 percent in value, and zinc nearly 2 percent in quantity and 1 percent in value. The total value of the five metals, in terms of recoverable metals, decreased from $7,195,136 in 1944 to $7,140,242 in 1945; zinc contributed 38 percent of the total value, gold 28, copper 22, lead 9, and silver 3.

Although Pend Oreille County outranked all other counties in total value of the five metals in 1944, it yielded first place to Chelan County in 1945, largely because of an increased gold and zinc output from the Holden mine of the Howe Sound Co. and a marked decrease in lead and zinc production in Pend Oreille County. The two counties remained far in the lead among Washington counties in 1945 and together produced 84 percent of the State total value of the five metals.

Labor shortages continued to hamper both production and development of base-metal deposits throughout the year, but lode-gold output, principally at the Knob Hill mine, was stimulated considerably following the revocation, July 1, 1945, of War Production Board Order L-208. However, the loss in byproduct gold more than balanced the gain in straight gold mining, so that total output for the later months of the year did not equal that of some of the earlier months.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–5: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

Mine production of gold, silver, copper, lead, and zinc in Washington, 1941–45, and total, 1860–1945, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1941	61	56	1,238,509	84,176	$2,946,160	402,030	$285,888
1942	37	18	1,222,937	75,396	2,638,860	369,038	262,427
1943	24	2	1,131,281	65,244	2,283,540	370,440	263,424

[1] 1860–1903: Figures not available; 1904–45: 11,667,399 tons produced.
[2] Short tons.

Mine production of gold, silver, copper, lead, and zinc in Washington in 1945, by months, in terms of recovered metals

	Gold (ounces)	Silver (ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
January	3,993	22,719	1,014,000	790,000	2,122,000
February	3,705	21,798	778,000	880,000	2,166,000
March	5,116	28,921	1,264,000	920,000	2,374,000
April	5,471	28,169	1,116,000	714,000	2,112,000
May	5,478	28,638	1,130,000	674,000	2,210,000
June	5,322	23,668	1,008,000	632,000	1,962,000
July	5,337	23,475	878,000	324,000	1,402,000
August	5,732	26,470	950,000	650,000	1,456,000
September	4,025	19,436	784,000	464,000	1,772,000
October	4,544	19,518	862,000	580,000	1,912,000
November	4,443	18,315	880,000	430,000	2,116,000
December	4,694	20,317	978,000	546,000	1,782,000
Total	57,860	281,444	11,642,000	7,604,000	23,386,000

Gold.—The increase of over 10,000 ounces in the State output of recoverable gold in 1945 over 1944 resulted largely from a greater output of gold from the Holden property of the Howe Sound Co. in Chelan County, which remained the State's leading gold producer. Although the tonnage of zinc-copper ore from this mine dropped 19 percent from 1944, the average gold content of the ore increased enough in 1945 to bring the gross value of the recoverable gold to a total one-half million dollars above that for the preceding year. The only other important gold producer in 1945 was the Knob Hill mine in Ferry County, which failed to equal its 1944 output by about 2,000 ounces. These two mines produced 97 percent of the State total output of gold in 1945. Output of gold from placers in 1945 (14 fine ounces) was less than one-fourth the quantity produced from such deposits in 1944. Nearly 88 percent of the State gold output in 1945 was recovered from ore treated in concentration mills and most of the remainder from current slimes cyanided.

Silver.—No silver ore was produced in Washington in 1945; thus silver production remained entirely a byproduct of gold and base-metal ores, and the output from these sources declined more than 12 percent from that in 1944. As with gold, the two leading silver producers were the Holden and Knob Hill mines, which together furnished nearly 82 percent of the State total. The Kaaba mine in Okanogan County contributed an additional 9 percent, but its output in 1945 was only half of that in 1944.

Zinc-copper ore advanced to first place in 1945 as a source of silver, supplying 43 percent of the State total; gold ore dropped to a close second with 42 percent, followed by zinc-lead ore with 14 percent. Placers yielded no silver in 1945. About 86 percent of the State silver output in 1945 was recovered from ore treated in concentration mills, 10 percent from concentrates and current slimes cyanided, and the remainder from crude ore smelted.

Copper.—For the fifth consecutive year production of copper in Washington declined; output in 1945 was only 61 percent of that in the peak year 1940. As in previous years, the only significant production came from zinc-copper ore treated by flotation from the Holden mine in Chelan County. Smaller quantities of copper were produced at the Kaaba mine in Okanogan County and at the Sunset mine in Snohomish County.

Lead.—The sharp decline in the output of recoverable lead in Washington in 1945 was due mainly to a reduced tonnage of zinc-lead ore from the Metaline district in Pend Oreille County and to a lower lead content of the ore treated. The Grandview mine of the American Zinc, Lead & Smelting Co. was the largest producer, followed by the properties of the Pend Oreille Mines & Metals Co. and the Metaline Mining & Leasing Co., all in Pend Oreille County, and the Deep Creek mine of the Jamison-Higginbotham Mining Co. in Stevens County, in the order named. These four properties produced 95 percent of the State total in 1945. About 96 percent of the total lead output was recovered from zinc-lead ore concentrated and nearly all the remainder from lead ore concentrated.

Zinc.—The output of recoverable zinc held up well in Washington in 1945, and the slight decline resulted chiefly from less zinc-lead ore mined from the property operated by the Pend Oreille Mines & Metals

Co. in the Metaline district. However, this property was exceeded in production in 1945 only by the Grandview mine and was followed in order by the Metaline Mining & Leasing Co., the Holden mine of the Howe Sound Co., which doubled its output, and the Deep Creek mine. These five properties produced 99 percent of the State total zinc in 1945. About 67 percent of the total zinc was recovered from zinc-lead ore concentrated, nearly 21 percent from zinc-copper ore concentrated, and 12 percent from zinc ore concentrated.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Washington in 1945, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Benton		1	11	$385		
Chelan	2		40,450	1,415,750	121,434	$86,353
Ferry	5		17,363	607,705	117,599	83,626
Kittitas		1	2	70		
Okanogan	3		22	770	24,314	17,290
Pend Oreille	3	1	1	35	11,191	7,958
Pierce	1		2	70	21	15
Snohomish	3		4	140	218	155
Stevens	4		5	175	6,667	4,741
	21	3	57,860	2,025,100	281,444	200,138
Total, 1944	25	3	47,277	1,654,695	321,608	228,699

County	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
Benton							$385
Chelan	11,605,600	$1,566,756			4,837,600	$556,324	3,625,183
Ferry	2,800	378	3,500	$301	11,000	1,265	693,275

Stevens	31,708	5	6,667
	968,246	57,846	281,444
Total, 1944	1,150,662	47,218	321,601

Gold and silver produced at placer mines in Washington in 1945, by counties, in fine ounces, in terms of recovered metals

County	Sluicing and hydraulic		Dragline and dry-land dredges [1]		Total	
	Gold	Silver	Gold	Silver	Gold	Silver
Benton	11				11	
Kittitas	2				2	
Pend Oreille	1				1	
	14				14	
Total, 1944	4		55	7	59	7

[1] A floating washing plant supplied with gravel by a dragline excavator is called a "dragline dredge"; a stationary or movable washing plant supplied with gravel by any type of power excavator is called a "dry-land dredge."

MINING INDUSTRY

In addition to inadequate manpower to maintain production and development of ore, the industry in 1945 was handicapped in some districts by a shortage of houses, particularly for men from the armed forces returning to the mines. Supplies and equipment remained in short supply in many sections, thus further hindering the industry.

The base prices of copper ($0.12 a pound), lead ($0.065 a pound), and zinc ($0.0825 a pound) remained unchanged in 1945, and the Government policy of premium payments for overquota production continued during the year. Owing to upward revisions in premium payments, the average weighted prices of copper, lead, and zinc advanced slightly over prices prevailing in 1944, the greatest advance being in the price of lead.

Although the general trend of prices for base metals was slightly upward in 1945, the general trend of ore output was downward, resulting in an 18-percent reduction in the quantity produced. During the year, the seven leading properties produced 947,167 tons of ore—98 percent of the State total. Declines were especially sharp in zinc-copper ore mined in the Chelan Lake district and in zinc-lead ore mined in the Metaline district.

The grade of gold ore treated in 1945 showed little change from 1944, but zinc-copper ore improved substantially in content of recoverable gold, silver, copper, and zinc. On the other hand, zinc-lead ores showed a marked drop in content of recoverable silver, copper, and lead but slight change in zinc.

Development on company account in the seven leading properties—Holden, Pend Oreille, Metaline, Grandview, Kaaba, Knob Hill, and Deep Creek mines—was much less than in 1944 and consisted largely of preparation for stoping. Total footage comprised 8,824 feet of drifts and raises and 37,824 feet of diamond drilling. The Bureau of Mines continued its program of diamond drilling, mostly in the Metaline district, but late in the summer was forced to curtail the program severely because of a reduced budget.

ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

Ore sold or treated in Washington in 1945, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	8	53,174	17,630	118,568	----------	----------	----------
Copper ore	3	38	4	218	11,000	----------	----------
Lead ore	1	1,800	2	2,644	822	287,056	3,970
Zinc ore	3	29,607	----------	911	2,800	24,700	2,826,800
Zinc-copper ore	1	617,120	40,207	120,482	11,605,600	----------	4,837,600
Zinc-lead ore	6	266,507	3	38,621	21,778	7,292,244	15,717,630
Total, lode mines	[1] 21	968,246	57,846	281,444	11,642,000	7,604,000	23,386,000
Total, placers	3	----------	14	----------	----------	----------	----------
	24	968,246	57,860	281,444	11,642,000	7,604,000	23,386,000
Total, 1944	28	1,180,662	47,277	321,608	12,338,000	11,650,000	23,808,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

Of the 968,246 tons of lode material from Washington mines sold or treated during 1945, 914,931 tons (94 percent) went to concentrating mills, 34,623 tons (4 percent) to a cyanidation-concentration mill, and 18,692 tons (2 percent) to smelters, compared with 95 percent to concentrating mills, nearly 4 percent to a cyanidation-concentration mill, and less than 2 percent to smelters in 1944.

Cyanidation mills.—In 1945 the cyanide plant of the Holden mill of the Howe Sound Co. operated only in December, during which time 45,265 tons of current flotation tailings from copper ore were cyanided. The 400-ton cyanidation-concentration mill of Knob Hill Mines, Inc., was active throughout the year and cyanided 32,453 tons of current flotation tailings and 774 tons of flotation concentrates from the company mine. The two cyanide plants consumed 81,182 pounds of calcium cyanide, 16,858 pounds of zinc dust, and 473,400 pounds of lime.

The 914,931 tons of ore treated by concentration in 1945 were distributed among eight mills as follows: One plant, 617,120 tons of zinc-copper ore; four plants, 266,034 tons of zinc-lead ore; two plants, 29,562 tons of zinc ore; and one plant, 1,800 tons of lead ore and 370 tons of zinc-lead ore. In addition, 45 tons of zinc ore were shipped to the Combined Metals Reduction Co. plant at Bauer, Utah, for treatment.

Mine production of metals in Washington in 1945, by methods of recovery, in terms of recovered metals

BENTON COUNTY

The metal output of Benton County in 1945 was 11 ounces of placer gold from a small-scale hand operation along the Columbia River near Paterson.

CHELAN COUNTY

Chelan Lake district.—The Holden mine of the Howe Sound Co. again was the leading producer of gold and copper in Washington in 1945 and moved to first place in silver and to third place in zinc output. Ore production dropped nearly 140,000 tons from 1944, but the grade was higher so that outputs of recoverable gold, silver, and zinc were greater than in 1944, and copper was only slightly lower. The company operated its 2,000-ton concentrator continuously on a three-shift basis and treated 617,120 tons of zinc-copper ore. The 25,189 tons of copper concentrate, rich in gold and silver, were shipped to the copper smelter at Tacoma, Wash.; 5,277 tons of zinc concentrate went to the Sullivan zinc plant at Kellogg, Idaho. In addition, 45,265 tons of current tailings were treated by cyanidation and the precipitates shipped to the Selby (Calif.) smelter. Development completed during the year comprised 4,559 feet of drifts, 681 feet of raises, and 8,041 feet of diamond drilling. According to the company printed annual report for the year ended December 31, 1945, employment in the mine reached an all-time low during the summer months, and development was suspended entirely. All the reserve of low-grade ore, which had been subject to premium payment for its copper content, was mined during the first half of the year, and thereafter ore of normal grade was produced from the 1,775 level.

Wenatchee River district.—Knob Hill Mines, Inc., conducted exploration and sampling at the Gold King and MacBeth mines near Wenatchee and shipped highly siliceous gold ore to the Tacoma smelter.

FERRY COUNTY

Orient district.—Glen L. Brink and associates operated the Talisman-Snowbank groups at Laurier and hauled 172 tons of zinc ore to the Gibbs concentration mill near Colville. A 50-ton flotation mill was being constructed on the property in February 1946.

Republic district.—In 1945 over 91 percent of the State total gold ore came from the Republic district, but production was considerably less than in 1944. Knob Hill Mines, Inc., operated its mine throughout the year and produced nearly three-fourths of the ore mined in the district. The company 400-ton cyanidation-concentration mill was operated continuously 7 days a week on a one-shift basis; flotation tails were treated by cyanidation, using agitation and countercurrent decantation. The concentrate was shipped to the Tacoma smelter until late in the year, after which the flotation concentrate was cyanided and the bullion shipped to the Seattle Assay Office. Development on the property consisted of 500 feet of drifts. Lessees worked the Aurum group and shipped several cars of highly siliceous gold ore to the Tacoma smelter. During the year, 580 feet of drifts were driven. Everett Houghland operated the Republic dump from June to October and shipped 2,620 tons of siliceous gold ore to the Tacoma smelter. C. M. Trevitt and E. J. Pierce shipped 8,376 tons of siliceous ore (mostly dump) from the South Penn mine to the Tacoma smelter.

KITTITAS COUNTY

The only production in Kittitas County in 1945 was a small quantity of placer gold recovered from gravel along the Yakima River.

OKANOGAN COUNTY

Loomis-Oroville district.—In 1945 the Kaaba-Texas Mining Co. produced zinc-lead ore from its Kaaba mine at half the 1944 rate. The recoverable metal content of the ore, all treated in the company mill, averaged slightly lower than in 1944. The remaining production from the district consisted of 8 tons of gold ore shipped to the Tacoma smelter by A. D. Heffernar.

Methow district.—The only operator in the Methow district in 1945 was Franklin C. Blocksom, who shipped 39 tons of gold ore from the Minnie Copper-Zinc mine to the Tacoma smelter. The ore yielded 18 ounces of gold and 308 ounces of silver.

PEND OREILLE COUNTY

Metaline district.—The Metaline district produced 95 percent of the State total zinc-lead ore in 1945. The value of recoverable metals declined from $2,961,173 in 1944 to $2,403.559 in 1945, in spite of slightly higher average prices for lead and zinc. Not only did ore production slump, but the recoverable content of lead dropped appreciably; zinc content held steady.

The Pend Oreille Mines & Metals Co. operated its Josephine, Hortense, Sullivan, and Yellowhead groups throughout the year and treated 116,696 tons of zinc-lead ore in the company 750-ton flotation mill. Concentrates produced comprised 1,665 tons of lead concentrate shipped to the Bunker Hill smelter and 5,002 tons of zinc concentrate, most of which was smelted at La Salle, Ill. Manpower shortages forced curtailment of development which, during the year, comprised 559 feet of drifts, 383 feet of raises, and 5,792 feet of diamond drilling.

The Grandview mine of the American Zinc, Lead & Smelting Co. operated continuously in 1945 but at a slightly reduced rate compared with 1944. According to the company printed annual report for the year ended December 31, 1945, 93,870 tons of milling ore were produced, which were concentrated into 8,699 tons of zinc and lead concentrates. Manpower shortage retarded production and much-needed underground development and made it impossible to maintain the mine in a properly developed condition.

In 1945 the property worked by the Metaline Mining & Leasing Co. ranked fourth in zinc output and third in lead among State producers. Ore production from the property dropped about 18 percent below that in 1944. The ore was milled in the Grandview 600-ton mill, and the lead concentrate was shipped to the Bunker Hill smelter and the zinc concentrate to the Great Falls, Mont., and Dumas, Tex., electrolytic zinc plants. Development during the year comprised 1,587 feet of drifts and 10,947 feet of diamond drilling.

PIERCE COUNTY

Mount Rainier district.—Five tons of gold ore shipped to the Tacoma smelter from the Silver Creek mine constituted the metal production of Pierce County in 1945.

SNOHOMISH COUNTY

Index district.—Two producers in 1945 shipped to the Tacoma smelter a total of 28 tons of copper ore, which contained 2 ounces of gold, 190 ounces of silver, and 9,444 pounds of copper.

STEVENS COUNTY

Bossburg district.—Victory Metals, Inc., assumed operation of the Bonanza mine from Russell Parker in July 1945 and during the last quarter of the year treated about 1,800 tons of lead ore in the Bonanza mill. Sam Halsey spent most of the year developing the Young America mine and shipped 19 tons of zinc-lead concentrate and 10 tons of zinc-lead ore to the Bunker Hill smelter and 18 tons of zinc concentrate to the Sullivan zinc plant.

Coleville-Middleport district.—DaRoy Metals Co., working the Northwest zinc mine, shipped 45 tons of zinc ore to the Bauer, Utah, plant of Combined Metals Reduction Co. for treatment. The concentrate contained 31 ounces of silver, 278 pounds of lead, and 16,065 pounds of zinc.

Northport district.—From the Deep Creek mine the Jamison-Higginbotham Mining Co. produced 29,390 tons of zinc ore and 93 tons of zinc-lead ore. The zinc ore was treated in the Blue Ridge flotation mill on Deep Creek, owned by the Sierra Zinc Co., and the zinc-lead ore was shipped direct to a smelter. The concentrate produced (2,695 tons) contained 565 ounces of silver, 21,804 pounds of lead, and 3,086,350 pounds of zinc, and the crude ore shipped contained 41 ounces of silver, 35,894 pounds of lead, and 25,200 pounds of zinc. No other production was reported from this district in 1945.

GOLD, SILVER, COPPER, AND LEAD IN WYOMING

(MINE REPORT)

By G. E. Woodward

SUMMARY OUTLINE

SUMMARY

The total value of gold, silver, and lead recovered from ores mined in Wyoming in 1945 was $608, compared with gold and silver valued at $702 in 1944. Two mines accounted for the 1945 production. The Esterbrook Lead Mining Co. shipped 15 tons of lead ore, yielding 17 fine ounces of silver and 6,000 pounds of lead, from its Esterbrook and Douglas mining claims in Albany County near Esterbrook; the ore was shipped to a lead smelter at Midvale, Utah. Harry Ferguson made a test shipment of 37 tons of dry and siliceous gold ore from the Bartlett (formerly Copper King) mine in the Silver Crown district, Laramie County. The ore yielded 2 fine ounces of gold and 14 fine ounces of silver and was shipped crude to a Garfield, Utah, smelter.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1941–45

Year	Gold [1]	Silver [2]	Copper [3]	Lead [3]	Zinc [3]
	Per fine ounce	*Per fine ounce*	*Per pound*	*Per pound*	*Per pound*
1941	$35.00	[4] $0.711+	$0.118	$0.057	$0.075
1942	35.00	[4] .711+	.121	.067	.093
1943	35.00	[4] .711+	.130	.075	.108
1944	35.00	[4] .711+	.135	.080	.114
1945	35.00	[4] .711+	.135	.086	.115

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver.
[3] 1941: Yearly average weighted price of all grades of primary metal sold by producers; 1942–45: Price includes bonus payments by Metals Reserve Company for overquota production.
[4] $0.71111111.

The following table shows the annual output of ore from lode mines producing gold, silver, copper, and lead and the quantity and value of the metals recovered from both lode and placer mines in Wyoming from 1941 to 1945; it also gives the total production of metals from 1867 to 1945.

Mine production of gold, silver, copper, and lead in Wyoming, 1941–45, and total, 1867–1945, in terms of recovered metals

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total value
		Fine ounces	Value	Fine ounces	Value	Pounds	Value	Pounds	Value	
1941	159	478	$16,730	94	$67	8,000	$944			$17,741
1942	84	23	805	52	37			6,000	$402	1,244
1943										
1944	6	20	700	3	2					702
1945	52	2	70	31	22			6,000	516	608
1867–1945	(1)	77,936	1,836,088	74,666	51,776	[2] 16,325	5,684,048	[2] 14	1,486	7,573,398

[1] Figures not available.
[2] Short tons.

A summary of the past production of Wyoming shows that the State has produced gold, silver, copper, and lead valued at $7,573,398 during the period 1867 to 1945. Gold and silver have been produced from many localities throughout the State, whereas the output of copper (most of which was mined prior to 1924 and accounts for over three-fourths of the total recorded value of the four metals) has come from the Encampment district, in Carbon County, and the Hartville district, originally in Laramie County, now in Platte County. All the lead produced in the State before 1945 came from the Spring Creek district in Carbon County and the Hurricane district in Crook County and was mined during 1932, 1934, 1935, and 1942.

SECONDARY METALS—NONFERROUS

By Herbert L. Cullen and A. J. McDermid [1]

SUMMARY OUTLINE

GENERAL SUMMARY

The recovery of nonferrous secondary metals from purchased scrap continued in 1945 at the high level engendered by war production, with slight gains recorded for most of the metals surveyed except the light metals aluminum and magnesium. The aluminum and magnesium industries were the first to suffer cuts in production and were slower to invade civilian markets, while the other metals with established uses in civilian products were in continued demand throughout the year. In general, the recovery of metal from new scrap was less than in the preceding year, and the recovery from old scrap was higher, illustrating the decline in the volume of production scrap and the increased return of old scrap from all sources for remelting. This gain in the ratio of old scrap to new scrap used continued the trend indicated in the preceding year and marked a drift toward the prewar ratio after the abnormally high use of new scrap during the war years.

Salient statistics of nonferrous secondary metals recovered in the United States, 1944–45

Metal	New scrap		Old scrap		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944						
Aluminum	302,746	$86,706,454	22,899	$6,558,274	325,645	$93,264,728

[1] Corrected figures.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The total value of metals recovered in 1945 from both new and old scrap was $481,582,318, compared with $467,294,751 in 1944. This gain was due entirely to the increased value of metals recovered from old scrap—from $199,672,975 (corrected figure) in 1944 to $232,227,-507 in 1945; in contrast, the value of metals reclaimed from new scrap declined from $267,621,776 (corrected figure) in 1944 to $249,354,811 in 1945.

Secondary metals recovered as unalloyed metal, in alloys, and in chemical compounds in the United States, 1941–45, in short tons

Metal	1941	1942	1943	1944	1945

When wartime demands for metals exceeded supply, the use of critical and strategic metals had to be restricted to essential applications. Better utilization of materials was the common aim and was achieved in several ways. Where specifications seemed too rigid, emergency alternate specifications were introduced, not on a mandatory but on a voluntary basis. Some revisions allowed changes in the basic composition of alloys or substitution of one metal for another; others raised the impurity limits. The aftereffects of these wartime changes, substitutions, and down gradings have been analyzed in an article by C. S. Cole of The American Society for Testing Materials.[2]

Changes in specifications for wrought-copper alloys were made to permit the use of high-grade fire-refined copper and to remove restrictions on the use of scrap of known purity. No longer did Federal specifications say: "Only primary metal shall be used." They said, instead: "The metal used shall be such as to meet the chemical requirements of this specification." That change applied to all metals.

Plants that had been obtaining desired compositions by mixing primary metals began to utilize scrap and ingot when they could not get virgin material, such as copper or tin. As alloy ingot is made chiefly from scrap, this practice increased the consumption of scrap by brass ingot makers. Some practices adopted when materials were scarce were abandoned when the supply became more abundant. The steel cartridge-case program, for instance, was dropped when copper became more plentiful late in the war. Many wartime changes in metallurgical practice, however, were continued in peacetime procedure; this applied especially to changes that were made to conserve tin and those that permit the use of scrap in place of primary metal. Before the war many items were being made of high-tin bronze, requiring all or nearly all new metal, when yellow brass or even a ferrous metal would do. In addition, experimentation with low-tin babbitts has proved their suitability in many uses formerly reserved for high-tin babbitts.

[2] Cole, C. S., Impact of War on Nonferrous Specifications: Metal Prog., October 1945, pp. 684–692.

Some of the new alloys introduced commercially during 1945 included an age-hardening copper-manganese-nickel alloy (No. 720), which was designed for use in springs; Phosnic, a precipitation-hardening nickel-phosphor bronze that is hot- and cold-workable and corrosion-resistant; and copper alloys containing tellurium.

In general, these changes in specifications and improvements in metallurgical practice represent advances in efficient utilization of metal resources, whether of primary or secondary origin. Many of the changes will be discarded when critical materials again become plentiful, but there is little doubt that a number will be retained.

SCOPE OF REPORT

Data on scrap and secondary metals for 1945 were derived from a number of surveys covering all known consumers of purchased nonferrous scrap metals and a representative group of dealers. For the first time, consumption of copper-base scrap, copper-alloy ingot, and refined copper was incorporated in a single report so that consumers could report consumption of copper in all forms on one schedule. Reports on consumption of copper materials were received from 106 plants classed as remelters, smelters, or refiners and from 2,456 plants classed as brass mills, foundries, wire mills, chemical works, and miscellaneous manufacturers. The large consumers of scrap in the secondary lead, zinc, and aluminum industries were canvassed on a monthly basis by the Bureau of Mines, and additional information was received on annual reports from 1,156 foundries, aluminum rolling mills, and other manufacturers concerning all types of nonferrous scrap except copper-base scrap. In all, 392 plants were represented in the group classed as remelters, smelters, or refiners. In the monthly dealer survey, approximately 2,100 companies were canvassed until August, when the mailing list was cut to some 1,300 companies to relieve the reporting burden on this group as much as possible.

Definitions of the terms used in this chapter are as follows:

"Secondary metals" are metals or alloys recovered from scrap and residues. The term "secondary" applies only to the source of metal and has no relation to the type of product recovered, either as to degree of purity or impurity or physical characteristics.

"Purchased scrap" means all scrap that entered any plant in scrap form and includes scrap treated for customers upon a toll basis or conversion agreement and interplant transfers of scrap. Scrap salvaged by railroads from line operations and melted in their own foundries and that melted by Navy Yard foundries which originated in salvage operations are included in this category, as a definite recovery of secondary metal results from the melting of such scrap.

"Interplant transfers" are those made between separate plants owned or operated by the same parent company but not located on the same ground. A transfer of scrap from a machine shop to a foundry at the same plant location is not an interplant transfer, and such "home scrap" is not included in this report. In some isolated instances where a foundry and a brass mill, or a brass mill and a wire mill, were operated at the same general location, it has been necessary to record scrap transferred from one operation to the other and include its consumption in these surveys.

"New scrap" is defined as the refuse produced during the manufacture of articles for ultimate consumption, including all defective finished or semifinished articles that must be reworked. Typical examples of new scrap are defective castings, clippings, punchings, turnings, borings, skimmings, drosses, and slag.

"Old scrap" is defined as scrap consisting of metal articles that have been discarded after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, fired cartridge cases, automobile crankcases, used pipe, and lithographers' plates.

SECONDARY ALUMINUM

The recovery in 1945 of 298,387 short tons of aluminum, valued at $85,279,005, from scrap, though very large by prewar standards was well below the record 325,645 tons valued at $93,264,728 recovered in 1944. Values were calculated for 1944 on the basis of the replacement value of primary aluminum at 14.32 cents a pound. For 1945 the price per pound used was 14.29 cents, which was the calculated average market price of all grades of primary ingot and pig.

Secondary aluminum[1] *recovered in the United States, 1944–45, in short tons*

Secondary aluminum recovered			Recoverable aluminum-alloy content of scrap		
Form of recovery	1944	1945	Kind of scrap processed	1944	1945
As metal	2,336	2,145	New scrap:		
Aluminum alloys	320,040	293,967	Aluminum-base[2]	302,230	270,810
In brass and bronze	1,466	1,162	Copper-base	429	107
In zinc-base alloys	187	267	Zinc-base	87	159
In chemical compounds	1,616	846			
				302,746	271,076
	325,645	298,387	Old scrap:		
			Aluminum-base[3]	22,359	26,712
			Copper-base	440	491
			Zinc-base	100	108
				22,899	27,311
				325,645	298,387

[1] In accordance with common usage, the term "aluminum" covers aluminum alloys, and the figures include all constituents of the alloys recovered from aluminum-base scrap.
[2] Recoverable aluminum content of new aluminum-base scrap was 281,804 tons in 1944 and 252,098 tons in 1945.
[3] Recoverable aluminum content of old aluminum-base scrap was 20,495 tons in 1944 and 24,527 tons in 1945.

Although the recoverable aluminum-alloy content of the total scrap consumed declined, the recoverable content of the old scrap used rose because of increased recovery from aircraft scrap. The aluminum recovered in aluminum alloys constituted over 98 percent of the total aluminum salvaged from all classes of scrap both in 1945 and 1944. Aside from its use as metal and in aluminum alloys, aluminum is used in a few chemicals (of which aluminum chloride is the most important), in manganese and aluminum bronze, and in zinc die castings. It constitutes about 10 percent of aluminum bronze, 5 percent of manganese bronze, and 4 percent of zinc die castings.

Production of secondary aluminum and aluminum-alloy products in the United States, 1943–45, gross weight, short tons

	1943	1944	1945
Secondary aluminum ingot:[1]			
Pure aluminum (98.5 percent)	715	1,151	2,066
Silicon (max. Cu, 1 percent)	471	2,885	10,618
Silicon (Cu, 1 to 2.5 percent)	13,348	14,600	14,635
No. 12 aluminum	11,302	19,735	22,674
Other aluminum-copper (max. Si, 2.5 percent) alloys	25,160	9,772	26,360
Copper-silicon (each over 2.5 percent) alloys	24,861	20,744	50,983
Aluminum-copper- or aluminum-silicon-nickel alloys		11,864	18,208
Deoxidizing and other destructive uses	32,770	48,652	44,175
Die-casting alloys	8,390	22,631	(2)
Aluminum hardeners	6,267	5,961	3,964
Wrought alloys	45,063	21,651	(2)
"Primary-grade" ingot	1,401	17,078	(2)
Ingot for chemicals, powder, etc	14,536	5,638	(2)
Piston alloys	10,295	11,815	(2)
Miscellaneous (and Mg and Zn alloys)	1,794	702	4,743
	[3] 196,373	[3] 214,879	198,426
Secondary aluminum at primary plants [4]	121,827	[5] 124,108	108,705
Aluminum powder	961	[6] 346	[6] 79
Aluminum-alloy castings	448	[5] 1,134	2,555
Aluminum in chemicals	1,180	1,616	846

[1] Gross weight of alloys, including copper, silicon, and other added elements; total secondary ingot contained 8,471 tons of primary aluminum in 1943, 8,792 tons in 1944, and 6,816 tons in 1945.
[2] Production for 1945 included under other classifications.
[3] Includes 18,552 tons produced on toll in 1943 and 9,089 tons in 1944.
[4] Combined with primary aluminum for the production of wrought products and castings.
[5] Revised figures.
[6] Does not include production measured as ingot for graining, powder, atomizing, or chemical purposes.

Production of remelt aluminum ingot, which had risen rapidly in the war years, decreased from 214,879 tons in 1944 to 198,426 tons in 1945. The obvious cause for the decrease in activity was the cessation of hostilities with Germany and Japan, which resulted in curtailment of demand for both primary and secondary aluminum. Monthly ingot production exhibited a rising trend for the first 3 months of the year, increasing about 5,000 tons in that period. Output then fell from 20,644 tons in March to 10,916 tons in September, the low point of the year, and rose moderately during the final quarter, when the price of high-grade ingot rose in some markets to 13.5 and 14 cents a pound.

As the data in the production table for 1944 were assembled from a War Production Board canvass and those for 1945 from Bureau of Mines surveys, the two sets of figures are not fully comparable. In the Bureau questionnaire which replaced Form WPB–554, the number of items both for scrap and ingot was drastically reduced to lessen the time and effort that the industry had to devote to completing the reports. Ingot for chemicals, powder, etc., which included aluminum employed in chemical warfare, incendiary bombs, and other war uses, appears in the table as a separate item for 1943 and 1944 but was combined with ingot used for deoxidizing and other destructive uses in the column for 1945. The quantity used for war purposes would naturally decline after cessation of hostilities, but that fact is not evident from the table. Other items omitted in the 1945 column were combined in a similar manner. Information obtained from the monthly aluminum-scrap survey indicated that there was a decreasing trend during the year in the production of alloys containing nickel and of ingot made for deoxidizing and other destructive uses and a rising trend in output of No. 12, the general-purpose casting alloy.

New artificial aging-treatment technique, which was developed during 1945, resulted in improving the properties of a number of the high-strength wrought alloys, including 75S and R301, which were introduced in 1943 and 1944, and 24S. Alloy 63S was developed in 1945 and was designed particularly for architectural and building applications. Aluminum casting alloys containing beryllium and cobalt were shown to have superior strength properties, together with high thermal stability and unusual oxidation resistance. Another alloy introduced in 1945, R317, is a free-machining material with mechanical properties similar to 17S. The metallurgical problems connected with reclaiming aluminum from aircraft scrap with caustic soda solution were solved during the year, but the process did not appear to have much possibility of commercial success because of scrap transportation costs. An article by Colwell [3] compares returns from several procedures, including the caustic soda method, for disposing of air-frame scrap. Among the new civilian uses for aluminum alloys that were introduced during 1945 were a new type of roofing sheet, aluminum piano plates, and a number of developments in cargo and travel equipment. A survey conducted by the Aluminum Association showed that the number of uses of aluminum had increased to approximately 3,500 compared with some 2,000 before the war.

In 1945, plants producing primary metal recovered 108,705 tons of aluminum from scrap, which was combined with the much larger primary aluminum production and used by rolling mills and foundries to make sheet, bar, extruded shapes, castings, and other similar products. Since so many aluminum alloys can be used for both wrought products and castings, it was not possible to determine the proportions of secondary aluminum used for the two purposes.

Aluminum-ingot makers consumed 323,676 tons of aluminum scrap in 1945, or 9 percent less than in 1944. Decreases were registered in all categories except castings and forgings and aircraft scrap. One cause of the lowered consumption of new scrap was the curtailment of scrap generators' operations, on account of contract terminations and strikes. Melting of aircraft scrap totaled 15,840 tons in 1945 compared with 7,755 tons in 1944, and the increase in treatment of this scrap caused the total consumption of old scrap to rise to 32,031 tons, which is 6,808 tons more than the same total for 1944. The Navy Department increased its consumption of this material at six naval air stations from 2,278 tons in 1944 to 5,994 tons in 1945. The work at these stations helped considerably in solving the problems of storage and disposal of the large accumulation of aircraft which became obsolete and surplus when the war ended. Improvements in metallurgical technique by the Navy produced ingot from aircraft scrap that contained less than 1 percent iron, 4 or 5 percent copper, about 1 percent magnesium, and smaller percentages of other metals. This ingot was readily usable for castings and wrought products of similar

[3] Colwell, Donald L., Navy Recovers Aluminum from Aircraft: Modern Metals, vol. 1, No. 9, October 1945, pp. 8–12.

composition. Of the total scrap consumed, 207,135 tons (64 percent) were used by ingot makers at 70 plants. To bring their products to specified compositions they used 6,816 tons of primary aluminum, 2,010 tons of copper and brass scrap, and 4,664 tons of other alloying ingredients, such as zinc and magnesium.

Consumption of purchased aluminum scrap in the United States in 1945, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Aluminum rolling mills		Foundries and other manufacturers		
	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
Pure clippings, wire, and foil	6,986	115	1,925		388	6	9,420
Castings and forgings	19,384	10,910	8,901		434	1,214	40,843
Alloy sheet	39,713	1,083	92,073	1,010	11	30	133,920
Scrap sheet and sheet utensil		1,329			10	107	1,446
Borings and turnings	98,316		5,120		682		104,118
Die castings					245	96	341
Aircraft scrap		12,198		3,612		30	15,840

	181,209	25,926	108,019	4,622	2,417	1,483	323,676

During the year the WPB and the Surplus Property Administration issued a number of directives, which had the effect of removing or liberalizing restrictive orders on the use of aluminum scrap and ingot, and the Office of Price Administration made some additions to and changes in ceiling prices. On January 29 a flat maximum price of 18 cents a pound was established for scrap generated in the fabrication of aluminum products and suitable for use without remelting. Plants were allowed to sell this material to dealers at the same maximum prices as to fabricators. In the same directive, the method for computing charges for toll operations on scrap was amended and clarified. On January 18 the Metals Reserve Company was authorized to sell, for war-production purposes, aluminum scrap being held in Government storage. This was done on advice from the WPB Metals Division that recent changes in the progress of the war had caused an increase in the need for products made from aluminum. On May 5 an amendment to Maximum Price Regulation 2 was issued that is of special interest because of the definitions it contains. Aluminum scrap was defined to include all aluminum and aluminum-alloy materials that are the waste or byproduct of any kind of metal working, as well as any materials that have been discarded from inventory or use because of obsolescence, failure, or other reasons and that are to to be remelted for further use. Secondary aluminum ingot means all ingots, alloys and hardeners containing 50 percent or more aluminum by weight and produced from 50 percent or more of scrap materials. A hardener is an intermediate alloy that is not suitable for direct use without combination with other materials and that is designed to facilitate the introduction of one or more of the constituent metals into other alloys. The Controlled Materials Plan was partly relaxed on June 13 to permit aluminum producers to fill unrated orders for aluminum products except extrusions, provided such orders did not interfere with delivery of authorized material on orders they had been specifically directed to fill.

Consumers' stocks of purchased aluminum-base scrap in the United States at end of year, 1944–45, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1944	Dec. 31, 1945
Castings and forgings	1,689	9,904
Sheet, turnings, clippings, etc	12,367	15,006
Aircraft scrap	(1)	10,551
Miscellaneous aluminum and dross	1,611	2,128
	15,667	37,589

1 Combined with sheet, turnings, clippings, etc., in 1944.

On October 10 the Surplus Property Administration established price limits below which aluminum scrap in contractor inventories could not be sold but would be stock-piled in Government storage depots. Minimum prices laid down in the regulation were as follows: (a) Pig or ingot resulting from melting of obsolete or wrecked aircraft, 6 cents a pound; (b) segregated solids (plant or production scrap or any other solids consisting of only one alloy and so identified), 6 cents; pure cable (clean and free of iron), 6 cents; foil (clean and new), 6 cents; (c) mixed solids (plant or production scrap consisting of an unknown alloy or consisting of more than one alloy), 5 cents; obsolete castings and forgings (alloy unknown or not segregated), 5 cents; obsolete pistons (alloy unknown or not segregated), 5 cents; any other clean solids free of all metal other than aluminum, 5 cents; (d) solids mixed with foreign materials (any scrap, other than as defined in paragraphs (e) and (f) that is contaminated by or mixed with foreign materials), 4 cents; (e) prepared aircraft scrap (not including engines or engine parts) recovered from wrecked, crashed, obsolete, or uncompleted air frames cut or sheared into pieces approximately 48 by 60 by 24 inches or less and shipped in 30,000-pound minimum cars, 2½ cents; (f) wrecked, crashed, obsolete, or uncompleted air frames to be scrapped (without preparation of any kind), 1¼ cents.

On November 15, the Surplus Property Administration issued Regulation 17, defining the policy to be followed by Government agencies in stock-piling surplus strategic materials. The reserves of Government-owned surplus property needed to cover civilian deficiencies were to be estimated by the Civilian Production Administration (successor to the War Production Board November 3) and would then be available for disposal. The screening of surplus property, to determine what should be stock-piled and what disposed of, was delegated to the Reconstruction Finance Corporation and the Army and Navy Munitions Board.

Ceiling prices for secondary aluminum ingot were the same in 1945 as they had been in 1944, the price for high-grade secondary ingot being 12.50 cents. On November 20 aluminum scrap and secondary ingot were both removed from price control. Dealers' buying prices for cast-aluminum scrap in New York averaged 3.73 cents per pound in 1945, which was 0.31 cent below the 1944 average of 4.04 cents and the lowest yearly average since 1932. The average quotation for January was 3.58 cents; but by February the price was up to 3.75 cents, where it remained throughout the year. The average price for new aluminum clippings was 5.83 cents in 1945, an increase of 0.71 cent over the 1944 average of 5.12 cents.

During 1945 scrap-metal dealers purchased 154,726 short tons of aluminum scrap, a decrease of 17 percent from the 186,171 tons received during 1944. Dealers' shipments of aluminum scrap to consumers were 156,804 tons in 1944 and 155,043 tons in 1945. Shipments of aircraft scrap to consumers increased from a monthly average of 107 tons during the first 6 months to a monthly average of 207 tons during the latter half of 1945. Shipments of machinings, borings, and turnings dropped from a monthly average of 7,487 tons during the first half of the year to 3,078 tons during the second half. Stocks held by dealers dropped steadily for the first 8 months, after which gains were recorded, so that at the end of the year stocks of 55,495 tons were only 317 tons below the 55,812 tons on inventory December 31, 1944.

SECONDARY MAGNESIUM

The recovery of secondary magnesium (including alloying ingredients) during 1945 totaled 9,247 short tons, a 35-percent decrease from the 14,185 tons reclaimed in 1944. The value of secondary magnesium recovered in 1945 was $3,791,270 compared with $5,815,850 in 1944, value being computed at 20.50 cents a pound in both years.

Recovery of magnesium from old scrap during 1945 amounted to 9 percent of the total, showing a substantial increase over the 1944 proportion, less than 2 percent of the total. Analysis of the figures for consumption of magnesium scrap by grade reveals a substantial decline in the ratio of borings, turnings, and sawings used to total scrap used—65 percent of the total in 1945, compared with 89 percent in 1944. This indicates that, in spite of war production during the first half of 1945, the ratio of solid magnesium scrap to borings and turnings treated is approaching normal practice and in time will be more like that of the other nonferrous metals.

Secondary smelters produced only 7,835 tons of secondary magnesium-alloy ingot during 1945, compared with 14,419 tons in 1944. This, of course, indicates that the demand for secondary magnesium ingot was very weak during the latter half of the year, experiencing the same decline after the end of hostilities as that for primary magnesium ingot. The 7,835 tons of secondary ingot produced required a blending of 422 tons of primary magnesium and 168 tons of alloying ingredients, in addition to the purchased scrap used.

Secondary magnesium recovered in the United States, 1944–45, in short tons

Secondary magnesium recovered

Form of recovery	1944	1945
Magnesium-alloy ingot[1] (gross weight).	13,379	7,359
Magnesium-alloy castings (gross weight).	235	496
Magnesium-alloy shapes	----------	864
In aluminum alloys	23	274
In zinc alloys	5	3
In other alloys	2	10
Chemical and incendiary uses	541	241
	14,185	9,247

Recoverable magnesium-alloy content of scrap

Kind of scrap processed	1944	1945

Aluminum-base	----------	128
	209	825
	14,185	9,247

[1] Figures include secondary magnesium incorporated in primary magnesium ingot.

Although some magnesium foundries reported they were unable to use their own home scrap, such as gates and risers, because of contamination of foundry sand by tiny particles of magnesium oxide and the resulting surface defects on castings, the consumption of purchased magnesium scrap in foundries was more than twice as great in 1945 as in 1944. Recovery of secondary magnesium in magnesium-alloy castings was 496 short tons in 1945 compared with 235 tons in the preceding year. Recovery of secondary magnesium in rolled and extruded products was reported for the first time in 1945. A total of 864 tons of secondary magnesium was recovered in these products, all of it from solid wrought scrap, a pure-magnesium material.

Standardization in the metallurgical treatment of wrecked aircraft scrap made it possible to calculate the recovery of a small quantity of magnesium from this source in 1945, and the figures have been incorporated in the above table showing recovery of secondary magnesium. In addition to this tonnage of magnesium recovered in the melting of aluminum-base scrap, an increased quantity of magnesium scrap was reported used in aluminum alloys. Owing to the end of hostilities, the consumption of magnesium scrap in chemical and incendiary uses declined, the recovery of magnesium in such applications decreasing from 541 tons in 1944 to 241 tons in 1945. Chemical applications included use in fluxing compounds, in the Grignard reaction, and in the production of magnesium nitrate and chloride; and the incendiary uses were in the production of war materials, such as flares and incendiary bombs. As in former years, the fire hazard presented by the storage of magnesium turnings and borings prevented full utilization of this material, and large quantities were disposed of by burning to avoid the risk incident to storage.

Stocks and consumption of magnesium scrap in the United States in 1945, gross weight, in short tons

Scrap item	On hand—		Consumption during 1945
	Dec. 31, 1944[1]	Dec. 31, 1945	
Cast scrap	1,037	1,424	2,107
Solid wrought scrap	19	625	1,644
Borings, grindings, drosses, etc	187	227	6,899
	1,243	2,276	10,650

[1] Revised figures.

Because consumption of magnesium in all forms was declining toward the end of the war, productive capacity exceeded demand for the metal by a substantial margin. As a result, magnesium was free from WPB controls during 1945, except for reporting production and consumption. Even this burden was lifted from industry at the end of the war, the last reports submitted to WPB covering the month of August.

Maximum prices on magnesium scrap and remelt ingot which had been established under OPA Maximum Price Regulation 302 on January 20, 1943, were continued without change until August 31, 1945. On that date OPA issued Suspension Order 129, which lifted the price control on magnesium scrap, primary and secondary magnesium, and magnesium castings. This action was possible because production of these items had expanded during the year, and when the cut-back in the manufacture of aircraft occurred, there was excess capacity for the production of all forms of magnesium. Before controls were suspended, the maximum prices were as follows: New segregated solids were exempt from price ceilings, and segregated borings had a maximum price of 9 cents a pound, mixed borings 8 cents, and mixed solids 12 cents. The ceiling on class A remelt ingot was 21.5 cents a pound.

SECONDARY COPPER AND BRASS

The recovery of secondary copper from scrap totaled 1,006,516 short tons valued at $237,537,776 in 1945, a 6-percent gain over the 950,942 tons valued at $224,422,312 recovered in 1944. The value of copper has remained at 11.8 cents a pound, exclusive of bonus payments under the Premium Price Plan, for the past 5 years.

Recovery of copper from old scrap climbed from 456,710 tons in 1944 to 559,815 tons (56 percent of the total recovered) in 1945, marking a return to the prewar preponderance of old scrap over new scrap. Reclamation of metal from old scrap is regarded as a definite addition to the pool of metal in use and may be combined with the data for imports and domestic mine production in any given year to compute the total addition to the Nation's metallurgical pool for that particular metal. During 1945 the War Department continued to return fired cartridge and shell cases from overseas wherever possible. The salvage units of War and Navy Departments built up an enviable record in the return of this item of old scrap to consumers for remelting during the war years. In addition, a larger proportion of the total yellow brass scrap used in 1945, particularly at brass mills, was reported as being old scrap, indicating that the ratio may swing more heavily toward old scrap during 1946, when worn and obsolete consumer goods are replaced by new products.

Secondary copper recovered in the United States, 1944–45, in short tons

Secondary copper recovered			Recoverable copper content of scrap		
Form of recovery	1944	1945	Kind of scrap processed	1944	1945
As unalloyed copper:			New scrap:		
At primary plants	86,398	96,662	Copper-base	479,244	432,687
At other plants	15,737	16,194	Aluminum-base	14,586	13,211
			Nickel-base	401	803
	102,135	112,856	Tin-base	1	----------
In brass and bronze	814,898	860,287		494,232	446,701
In alloy iron and steel	2,454	2,133			
In aluminum alloys	17,054	12,055	Old scrap:		
In other alloys	1,044	519	Copper-base	454,938	557,884
In chemical compounds	13,357	18,666	Aluminum-base	949	1,204
			Nickel-base	648	503
	848,807	893,660	Lead-base	----------	60
			Tin-base	175	164
	950,942	1,006,516			
				456,710	559,815
				950,942	1,006,516

Recovery of copper from new scrap declined from 494,232 tons in 1944 to 446,701 tons in 1945, even though the total consumption of new scrap in 1945 was slightly larger than in the preceding year. The explanation of this apparent anomaly lies in the fact that a much larger tonnage of low-grade scrap and residues, of which the major portion was new scrap, was available for treatment during 1945. The net recovery of copper from low-grade scrap and residues is low compared with that from other items of scrap.

The production of refined copper (electrolytic grade) from scrap increased from 93,046 tons in 1944 to 98,338 tons in 1945, a 6-percent gain. This increase was largely attributable to the increased use of low-grade residues and refinery brass at primary plants in copper production. Total recovery of unalloyed copper from scrap increased 10 percent—from 102,135 tons in 1944 to 112,856 tons in 1945.

Experiencing a sharp decline after the end of the war, the commercial production of brass and bronze ingot fell from its 1944 record of 518,261 short tons (gross weight) to 378,454 tons in 1945, a 27-percent decline. The 378,454 tons of ingot contained 305,914 tons of copper, of which 18,716 tons were primary refined copper and the rest was recovered from scrap. Total shipments of ingot during the year were 370,398 tons, as stocks at producers' plants increased from 15,135 tons (revised figure) at the beginning of the year to 23,191 tons on December 31. Seventy-one plants produced brass and bronze ingot for sale in 1945, but two foundries that had made ingot for their own use in 1944 discontinued this practice during that year and did not report production in 1945.

Continuing a practice inaugurated in 1943, three brass-ingot makers produced brass-mill billets and cakes from their scrap melts, which were later rolled into finished products at brass mills. These smelters produced 16,653 tons of brass billets for this purpose. Itemization of the tonnage of each type of brass and bronze billets made cannot be published, as this would reveal individual company operations. The production of one plant which operated both a brass-ingot plant and a brass mill is not included in the above figure, since the two operations were tabulated separately in 1945.

Analysis and production of secondary copper and copper-alloy products in the United States, 1944–45

Item produced from scrap	Approximate analysis (percent)						Gross weight produced (short tons)	
	Cu	Sn	Pb	Zn	Ni	Al	1944	1945
Refined copper (electrolytic grade)	100						93,046	98,338
Casting copper	99						2,933	3,339
Copper sheet, rod, tubing, etc	99						540	8,037
Copper powder	98						[1] 2,857	2,727
Copper castings	98						2,759	415
Total unalloyed copper products							102,135	112,856
Brass and bronze ingots:								
Tin bronze	88	10		2			53,552	41,621
Leaded-tin bronze	88	6	1.5	4.5			108,336	37,963

Silicon bronze	92			4			5,096	3,060
Conductor bronze	94	2	2	2			(4)	438
Hardeners and special alloys	81						17,453	7,287
Total copper-alloy ingots							518,261	378,454
Brass mill billets made by ingot makers							33,180	16,653
Brass and bronze sheet, rod, tubing, etc							[5] 509,153	[5] 576,115
Brass and bronze castings							[6] 143,665	[6] 142,532
Brass powder							883	659
Copper in chemical products (content)							13,357	18,666

[1] Corrected figure.
[2] Production of this item combined with 80-10-10 group in 1944.
[3] Production of this item combined with leaded yellow brass in 1944.
[4] Production of this item combined with 85-5-5-5 group in 1944.
[5] Gross weight of secondary brass and bronze in commercial shapes. Includes 347,429 tons of copper, 275 tons of nickel, 4,210 tons of lead, 330 tons of tin, 156,830 tons of zinc, and 79 tons of aluminum in 1944; and 398,822 tons of copper, 937 tons of nickel, 4,938 tons of lead, 837 tons of tin, 170,099 tons of zinc, and 482 tons of aluminum in 1945.
[6] Gross weight of secondary brass and bronze castings. Includes 118,391 tons of copper, 29 tons of nickel, 9,987 tons of lead, 7,493 tons of tin, and 7,765 tons of zinc in 1944; and 112,768 tons of copper, 158 tons of nickel, 12,917 tons of lead, 8,138 tons of tin, 8,517 tons of zinc, and 34 tons of aluminum in 1945.

Total production of brass-mill products from copper and copper-base scrap showed a 15-percent increase over the 1944 level. The tonnage of unalloyed copper products reported recovered from scrap rose from 540 tons in 1944 to 8,037 tons in 1945 and of brass and bronze sheet, rod, and tubing from 509,153 tons in 1944 to 576,115 tons in the following year. Military requirements for brass strip, which had been at a war peak at the beginning of the year, declined steadily until June, when those plants operated under contracts of the Defense Plant Corporation were closed because of reduced demand. During the latter part of the year brass mills swung easily into civilian production but were hampered at the year end by labor difficulties. The CPA estimated that total 1945 production of brass-mill products was approximately 27 percent less than that in 1944, which would indicate that a larger proportion of these products was made from scrap in 1945 than in the preceding year. In this connection, it should be noted that the 1945 statistics of production from secondary sources include figures covering the reduction of fired-cartridge cases to slabs under the stock-piling program.

As outlined by the Readjustment Division of the Army Service Forces in July, the original plan was to stock-pile cartridge brass, gilding metal, and leaded rod brass, to be obtained from salvage, termination inventories, and final production scrap originating in the war program. The metal was to be melted down into slabs if it met specifications, the idea being to allot this material to consumers gradually so that it would be replaced in Metals Reserve Company stock piles by refined copper and zinc. For some weeks, cartridge cases were offered to the trade at ceiling prices, and if they remained unsold they were melted into slab and stored. Then it was announced that the Treasury was unwilling to provide the funds for purchasing the cartridge cases for stock piling, and the Surplus Property Administration ordered them sold to the highest bidder under sealed bids. This was found to be contrary to the Surplus Property Act of 1944; and at a conference held by the representatives of the Army Service Forces, the Surplus Property Administration, and the Treasury Department, it was decided to stock-pile all clean brass cartridge cases. By the end of the year, the scarcity of scrap made another reversal of policy necessary, and the Army Service Forces once again offered cartridge cases for sale at ceiling prices instead of stock-piling them.

Brass and bronze foundries reported the recovery of 142,532 tons of secondary brass and bronze in castings during 1945—a slight decrease from the 143,665 tons of castings produced from scrap in 1944. As in the past, a large part of this tonnage consisted of bronze railroad bearings remelted in railroad foundries and in plants of bearing companies on a toll basis.

Consumption of purchased copper scrap in the United States in 1945, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Brass mills		Foundries and other manufacturers		
	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
No. 1 wire and heavy	20,809	46,387	7,271	2,612	2,007	15,756	94,842
No. 2 wire, mixed heavy, and light	14,889	54,925	10,969	2,534	3,297	7,338	93,952
Composition or red brass	43,828	52,716			22,165	26,931	145,640
Railroad-car boxes		939				51,424	52,363

Bronze	9,745	25,842	105	2,932	1,391	7,064	47,079
Nickel silver	668	2,151	3,867	1,192	160	12	8,050
Low brass	14,345	166	17,887	12,947	175	5,798	51,318
Aluminum bronze	115	592	6	372	86	122	1,293
High-lead brass						1,692	1,692
Low-grade scrap and residues	189,648	66,701			802	137	257,288
	331,999	382,965	363,578	232,783	34,491	124,921	1,470,737

Consumption of purchased copper and brass scrap in 1945 totaled 1,470,737 short tons, gross weight, compared with 1,407,860 tons used in 1944. Use of scrap at plants of brass-ingot makers and refineries declined 2 percent to 714,964 tons and in brass and bronze foundries 5 percent to 159,412 tons. However, brass mills increased their consumption of scrap from 511,661 tons in 1944 to 596,361 tons in 1945—a gain of 17 percent. The remelting of fired cartridge cases declined from 136,448 tons in 1944 to 104,282 tons in 1945, marking the first decline in use of this item in 4 years. War Department reports on sales of fired cartridge cases indicated the use of a slightly larger tonnage, and this classification may have been combined with another item of scrap by some reporting companies.

During 1944 and 1945, the War Department operated on a policy of expediency in the matter of returning both ferrous and nonferrous scrap from overseas. Items of scrap that could be readily identified and transported were returned to the United States for reuse; however, in the fall of 1945 a committee of experts on ferrous and nonferrous scrap was sent to Europe by the Army Service Forces to survey the quantity of material on hand and to recommend a plan for its disposal. War Department policy evolved from this survey, regarding the disposition of nonferrous scrap, is stated as follows:

> Tin-bearing scrap and lead scrap will be returned after clearance with the Civilian Production Administration. Copper and brass scrap will be returned to the United States except from the United Kingdom, France, Belgium, and the Netherlands. All aluminum scrap, except landing mat, will be disposed of locally. Aluminum landing mat will be returned because of its high metal content. All other nonferrous scrap will be disposed of locally.

Sales of nonferrous scrap by the War Department from both overseas and domestic sources during the year were as follows: Cartridge cases, 127,640 short tons; other copper and brass scrap, 110,789 tons; aluminum scrap, 84,653 tons; and all other nonferrous scrap, 33,487 tons.

During the first part of the year the supply of and demand for copper-base scrap were sufficiently in balance to provide full production of materials to keep prices at ceiling levels. After the end of the war, reconversion of manufacturing plants and curtailment of production due to labor troubles decreased the generation of scrap and therefore its consumption. The copper-scrap situation at the end of the year was one of strong demand for most types and marked scarcity of some items, including those in OPA group 2 and brass mill scrap.

Consumers' stocks of purchased copper-base scrap in the United States at end of year, 1944–45, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1944 [1]	Dec. 31, 1945
Unalloyed copper	10,660	16,307
Copper-base alloy	53,456	58,658
Low-grade scrap and residues	39,686	45,620
	103,802	120,585

[1] Revised figures.

Inventories of copper and brass scrap at consumers' plants increased 16 percent from 103,802 tons (revised figure) at the beginning of the year to 120,585 tons on December 31, 1945.

Dealers shipped 490,789 tons of copper and brass scrap to consumers during 1945, or 2 percent less than the 501,493 tons shipped during the preceding year. A noticeable decline in shipments of copper and brass scrap was evident during the latter half of the year; however, an all-time high was reached in March 1945, when 50,413 tons were moved. Stocks held by dealers at the end of the year totaled 70,604 tons, the largest inventory on record and an increase of 36 percent over the 51,726 tons held on December 31, 1944.

There were no changes in ceiling prices on brass and bronze ingot during the year, the last revision in OPA Maximum Price Regulation 202 having been made on April 1, 1944. After that date the prices on the principal grades of ingot were as follows: 85–5–5–5, 13.00 cents a pound; 80–10–10, 15.75 cents; yellow brass, 10 cents; and 88–10–2, 16.50 cents. Maximum prices for copper and brass scrap were regulated under revised Maximum Price Regulation 20, on which two amendments were issued during the year. Under amendment 3 to the regulation, issued on March 3, 1945, written agreements between railroad companies and bearing companies for the conversion of railroad scrap were no longer required to be approved by the WPB. Amendment 4, effective August 6, 1945, allowed a special use premium of 1¼ cents a pound for copper-alloy scrap when the scrap was prepared to meet the specifications of certain qualified consumers. A similar premium had been provided in the past for unalloyed copper scrap. Ceiling prices for the basic copper-scrap items were unchanged, with No. 1 wire and heavy copper at 9.75 cents a pound, No. 2 wire and mixed heavy copper at 8.75 cents a pound, and No. 1 composition at 9.00 cents a pound f. o. b.

Scrap generated from the fabrication of brass stock produced by brass mills was designated as "brass-mill scrap," and maximum prices were first established on June 18, 1941, under Maximum Price Regulation 12. In 1944 and 1945 this regulation covered 32 different grades of scrap, with a separate price within each class for clean heavy scrap, rod ends, and clean turnings.

The average dealers' buying price for No. 1 copper scrap at New York opened at 9.37 cents a pound. This price was maintained until November, when it dropped to 9.12 cents and remained there for the rest of the year, resulting in an average price of 9.33 cents. The average price of No. 1 composition scrap for 1945 was 8.83 cents a pound, 0.04 cent below the average for 1944.

The early part of the year brought a tightening of WPB controls on copper under Orders M–9 and M–9–c; but, as the end of the war came closer, controls began to be lifted. Order M–9–c and its related orders, which restricted the manufacture, delivery, and installation of many copper products, were revoked on May 12. Several changes were made in Order M–9 in June, easing the restrictions on copper raw materials. Finally this order was revoked by the WPB on August 20 and the Controlled Materials Plan on September 30, so that the only control of copper materials remaining in effect was the 30-day inventory limitation on copper and copper-base alloys. Later in the year the OPA revoked section 9 of RMPR 20, no longer requiring the reporting of settlements for copper-base scrap.

Brass and copper scrap imported into and exported from the United States, 1944–45, in short tons

	1944	1945
Brass scrap imported	6,226	7,727
Scrap copper imported	1,055	1,348
Brass scrap exported	38	421
Scrap copper exported	99	133

SECONDARY NICKEL

Secondary nickel recovered from nonferrous scrap in 1945 totaled 6,483 short tons valued at $4,538,100, a 50-percent gain over the 4,321 tons valued at $3,024,700 in 1944. The total value was calculated for both years at 35.0 cents a pound, the spot-delivery price of electrolytic nickel. The principal reason for this large increase in recovery of secondary nickel lies in the fact that improvements in the metallurgy of secondary aluminum ingot and in reporting procedure have made it possible, for the first time, to reckon definite recovery of secondary nickel from the melting of certain items of aluminum-base scrap.

Secondary nickel (nonferrous) recovered in the United States, 1944–45, in short tons

Secondary nickel recovered			Recoverable nickel content of scrap		
Form of recovery	1944	1945	Kind of scrap processed	1944	1945
As metal	392	31	New scrap:		
In nickel-base alloys	1,128	672	Nickel-base	1,693	2,203
In copper-base alloys	1,866	2,120	Copper-base	430	821
In cast iron and steel [1]	525	1,702	Aluminum-base		1,227
In chemical compounds	410	594		2,123	4,251
In aluminum-base alloys		1,364			
	4,321	6,483	Old scrap:		
			Nickel-base	1,522	1,449
			Copper-base	676	643
			Aluminum-base		136
			Lead-base		4
				2,198	2,232
				4,321	6,483

[1] Includes only nonferrous nickel scrap added to cast iron and steel.

The total recovery of nickel as metal fell from 392 tons in 1944 to 31 tons in 1945, and the production of secondary monel-metal pig, shot, and castings dropped from 1,100 tons in 1944 to 450 tons in 1945. The production of copper-nickel pig and shot declined from 776 tons averaging 49 percent nickel in 1944 to 670 tons averaging 51 percent nickel in 1945. The year marked a definite swing in the use of nickel-base scrap, as comparatively insignificant tonnages of this material were used in the production of nickel as metal or in nickel-base alloys, whereas a much larger quantity of nickel in monel scrap than ever before was reported used by steel plants and gray-iron foundries for alloying purposes in cast iron and steel products. Consumption of all types of nickel scrap increased over that in the previous year, the most important single factor being the gain in use of nickel-silver scrap, particularly in brass mills and foundries. Total stocks of 4,350 tons of nickel scrap at consumers' plants on December 31, 1945, were more than double the 2,045 tons on hand December 31, 1944. Stocks of nickel scrap in scrap-metal dealers' yards increased from 1,994 tons to 2,114 tons in the same period.

Consumption of purchased nickel scrap in the United States in 1945, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Pure nickel	89	58	394	388	929
Monel metal	705	888	1,617	579	3,789
Nickel silver	668	2,151	4,027	1,204	8,050
Miscellaneous nickel alloys	2				2
Nickel residues	127		172	313	612
	1,591	3,097	6,210	2,484	13,382

Nickel remained under allocation and under restrictive orders governing its use during the first half of 1945, but as the end of the war approached the WPB moved swiftly to end control. On July 19, Conservation Order M–6–b and Direction 1 to that order, which controlled the end uses of nickel and nickel solutions respectively, were revoked. Order M–6–a, which governed the allocation of nickel, remained in effect until August 16, when it also was revoked. Thereafter only general regulation of nickel was exercised under General Preference Order M–21, which controls the production of alloy steel and alloying materials used in steel production.

Maximum prices on all types of ferrous and nonferrous nickel scrap, secondary monel ingot and shot, and secondary copper-nickel shot were lifted under OPA Suspension Order 129, effective August 31, 1945. Up until that date the maximum price for nickel scrap had remained unchanged, having been set at 26 cents a pound for pure nickel scrap and 20 cents a pound for new monel clippings on June 2, 1941. Dealers' buying prices for nickel scrap in New York were quoted at 18.50 cents a pound and for monel clips at 12.50 cents a pound throughout the entire year. These prices are comparable with the average quotation of 19.50 for nickel clips and 15 cents for monel clips in 1944.

No imports of nickel-bearing scrap were reported in 1944 or 1945, but exports in 1945 totaled 2,287 short tons compared with 4,021 tons in 1944.

Consumers' stocks of purchased nonferrous nickel scrap [1] in the United States at end of year, 1944–45, gross weight, in short tons

Scrap item	On hand— Dec. 31, 1944	On hand— Dec. 31, 1945
Unalloyed nickel	161	937
Nonferrous nickel alloys	1,339	2,375
Nickel residues	545	1,038
	2,045	4,350

[1] Includes nickel-silver scrap.

SECONDARY LEAD

The secondary lead industry continued operations at a high level in 1945, with 363,039 short tons of lead valued at $46,468,992 recovered from scrap, compared with 331,416 tons valued at $42,421,248 recovered in 1944. Values were computed for both years at 6.4 cents a pound, the average selling price of all grades of primary lead exclusive of premium price payments. This increase in production from secondary sources did much to offset the declining domestic production and dwindling imports of primary lead. Production of soft lead from scrap rose 15 percent—from 61,700 tons in 1944 to 70,951 tons in 1945—and the secondary lead content of antimonial lead produced rose 7 percent—from 180,818 tons in 1944 to 194,079 tons in 1945. Secondary lead recovered in solder declined from 22,245 tons in 1944 to 19,964 tons in 1945, whereas the secondary lead content of type metals produced showed a substantial increase for the first time in several years—28,525 tons in 1945, compared with 23,870 tons in 1944 and 23,201 tons in 1943. Data furnished by responding companies revealed that the primary-metal content of secondary lead products increased slightly, but total production of the secondary lead industry showed a substantial gain during the year.

Secondary lead recovered in the United States, 1944–45, in short tons

Secondary lead recovered: Form of recovery	1944	1945	Recoverable lead content of scrap: Kind of scrap processed	1944	1945
As metal:			New scrap:		
At primary plants	11,368	18,525	Lead-base	33,127	44,793
At other plants	43,678	42,598	Copper-base	8,356	7,417
	55,046	61,123		41,483	52,210
In antimonial lead [1]	180,818	194,079	Old scrap:		
In other lead alloys	68,271	77,051	Battery-lead plates	164,106	186,241
In copper-base alloys	26,667	30,346	All other lead-base	113,145	107,351
In tin-base alloys	614	440	Copper-base	12,640	17,198
			Tin-base	42	39
	276,370	301,916		289,933	310,829
	331,416	363,039		331,416	363,039

[1] Includes 34,475 tons of lead recovered in antimonial lead from secondary sources at primary plants in 1944 and 42,366 tons in 1945.

Shipments[1] of secondary lead, tin, and lead- and tin-alloy products in the United States in 1945, gross weight, in short tons

	Gross weight of product[2]	Secondary metal content			
		Lead	Tin	Antimony	Copper
Refined pig lead	51,507	51,507	-	-	-
Remelt lead	19,444	9,616	-	-	-
Lead foil	-	-	-	-	-
	70,951	61,123	-	-	-
Refined pig tin	3,622	-	3,622	-	-

[1] This table has been titled incorrectly in previous chapters of the Minerals Yearbook. Most of the figures herein represent shipments rather than production of the items involved. However, it has been necessary to record actual production figures in some instances where the information is secured from reports on that basis.
[2] Difference between gross weight of product and secondary metal content represents added primary metals or impurity content.

Of the total secondary lead recovered, 338,424 short tons were reclaimed from lead- and tin-base scrap; the remaining 24,615 tons were contained in secondary brass and bronze and reclaimed by remelting copper-base scrap. A total of 5,731 tons of lead in lead-base scrap was added to brass and bronze to bring the total recovery of secondary lead in this type of product to 30,346 tons.

Consumption of purchased lead scrap in the United States in 1945, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Soft lead	-	44,749	10	1,799	46,558
Hard lead	-	19,320	1	2,137	21,458
Cable lead	-	9,303	12	26	9,341
Battery-lead plates	-	279,454	-	17	279,471
Mixed common babbitt	-	5,791	55	12,382	18,228
Solder and tinny lead	-	7,793	-	2,096	9,889
Type metals	-	15,143	-	45	15,188
Dross and residues	72,362	-	-	-	72,362
	72,362	381,553	78	18,502	472,495

Consumption of lead-base scrap totaled 472,495 short tons, gross weight, in 1945, compared with 429,261 tons used in 1944. The use of battery-lead plates rose 33,213 tons, of drosses and residues 8,786 tons, of hard-lead scrap 4,556 tons, of cable-lead scrap 1,067 tons, and of type-metal scrap 532 tons; but consumption of solder and tinny-lead scrap declined 2,543 tons, of soft lead 2,051 tons, and of mixed common babbitt scrap 326 tons. The best index of activity at plants of secondary lead smelters and remelters is their consumption of scrap each month. Consumption of all lead-base items reached a low point for the year in February and gained until May, after which it declined sharply to another low point in August at the end of the war, then climbed sharply to the year's peak in October.

Throughout 1945 the demand for lead considerably exceeded supply, necessitating a constant drain on stock piles of the metal held by Office of Metals Reserve (successor to Metals Reserve Company, July 1). This critical situation was attributable to the manpower shortage throughout both the primary and secondary branches of the industry. Plant capacity was adequate in all instances, but the labor problem could not be overcome. Early in January, WPB officials met with lead producers in an effort to increase secondary output. As a result, secondary lead production was placed on the national production urgency list, in order to assist the War Manpower Commission in determining manpower priority ratings. Another boost in secondary lead production was brought about by a program effected through the assistance of Metals Reserve Company, for converting low-grade lead byproducts to usable metal. Much of this idle material in the hands of dealers and secondary smelters was shipped to plants equipped to handle it, and the Government paid a subsidy in the form of transportation costs.

Percentage metals circulated in pig form among remelters and smelters in 1945 totaled 58,693 short tons, consisting of 37,003 tons of antimonial lead, 7,750 tons of lead babbitt, 6,812 tons of soft lead, 4,551 tons of solder, 1,724 tons of type metal, 695 tons of tin babbitt, 92 tons of remelt tin, 61 tons of cable lead, and 5 tons of pewter.

Consumers' inventories of lead scrap rose from 71,598 tons on hand December 31, 1944, to 79,974 tons at the end of 1945. Stocks of both soft-lead scrap and the lead-base alloys increased, whereas inventories of drosses and residues declined, probably as a result of the campaign for the reduction of this material. During the same period stocks of secondary pig, bar, and ingot metals at these plants increased from 17,709 short tons to 28,982 tons.

Consumers' stocks of purchased lead-base scrap in the United States at end of year, 1944–45, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1944	Dec. 31, 1945
Unalloyed lead	2,457	3,624
Lead-base alloy	35,785	49,162
Drosses and residues	33,356	27,188
	71,598	79,974

Scrap-metal dealers' stocks of lead-base scrap declined from 38,906 tons on December 31, 1944, to 36,734 tons on December 31, 1945, but shipments of lead scrap from dealers to consumers totaled 304,825 tons in 1945, compared with 283,165 tons in the preceding year. Movement of scrap through dealer channels was particularly slow during January and February because of severe snowstorms in the North and East, but activity was brisk thereafter, reaching a peak in October, after which it experienced another seasonal decline at the end of the year.

The maximum prices for lead scrap were continued unchanged throughout 1945. The price schedule outlined the formula for the maximum prices of heavy lead scrap as follows: Primary pig lead at New York was fixed at 6.50 cents a pound, and the price of heavy lead scrap was 0.55 cent less, or 5.95 cents a pound. Considerable agitation for a free market in lead developed toward the end of the year, but the ceiling on primary lead was kept at 6.5 cents a pound, despite a somewhat higher average over-all production cost, and the difference was paid to producers under the Premium Price Plan.

Dealers' buying prices for heavy lead scrap remained unchanged for the third consecutive year at 5.37 cents a pound, the monthly average quotation at New York being constant since August 1942. Dealers' buying prices for battery-lead plates averaged 2.927 cents a pound for the year, being quoted at 2.75 cents until the middle of April, then at 3 cents for the rest of the year. Battery-plate smelting charges, which determined the dealers' net selling price, were seldom quoted, toll agreements for smelting scrap being prohibited except on authorization by the OPA.

As in 1944, both scrap and secondary lead were subject to allocation by the WPB, but free movement of these materials was encouraged as much as possible. The only lead allocated was that released by the Metals Reserve Company, the greater portion of which was imported. Efforts of the Lead-Tin-Zinc Branch of the WPB were laregly devoted to constant check of inventories and turn-over, in order to insure equitable distribution and prevent hoarding. General Preference Order M–38 was amended several times during the year, sometimes raising, sometimes lowering the quota of lead permissible for certain industrial uses. In August, Order M–72 controlling the flow of lead and tin scrap was revoked, but on October 24 Direction 5 to Priorities Regulation 32 was issued, making continued reporting mandatory for all dealers with a 20-ton inventory of lead and tin scrap. This direction also prohibited dealers from receiving lead and tin scrap unless they had disposed of an amount at least equal to their current inventory during the preceding 60 days. In view of the continued shortage of these metals and agitation for increased prices, this action was deemed necessary in order to prevent accumulation of excess stocks. On December 19, the CPA issued an amendment to Order M–38, to become effective January 1, 1946, prohibiting the use of primary metal when secondary was obtainable and usable for the purpose.

Imports of lead scrap from other countries declined from 3,315 tons (revised figure; lead content) in 1944 to 2,844 tons (lead content) in 1945.

SECONDARY TIN

Secondary tin recovered from scrap totaled 35,133 short tons valued at $36,538,320 in 1945, compared with 32,589 tons valued at $33,892,560 recovered in 1944. The value was computed at 52 cents a pound in both years.

Detinning plants produced 3,527 short tons of pig tin from new tinplate clippings and old tin cans, and 13 tons of tinfoil and 177 tons of tin as metal in other forms were recovered at various plants from tin-base scrap and residues. The total recovery of unalloyed tin from scrap was 3,717 tons, a decline of approximately 12 percent from the 4,245 tons recovered in 1944. Although the recovery of tin in tin-base babbitts declined from the 1944 figure, recovery in solder, in chemical compounds, in lead-base alloys, and in brass and bronze all increased.

Secondary tin recovered in the United States, 1944–45, in short tons

Secondary tin recovered: Form of recovery	1944	1945
As metal:		
At detinning plants	3,751	3,527
At other plants	494	190
	4,245	3,717
In solder	4,892	7,740
In tin babbitt	2,448	1,592
In chemical compounds	[1] 463	465
In lead-base alloys	3,301	3,990
In brass and bronze	[1] 17,240	17,629
	28,344	31,416
	32,589	35,133

Recoverable tin content of scrap: Kind of scrap processed	1944	1945
New scrap:		
Tin plate	2,654	2,911
Tin-base	2,002	1,772
Lead-base	732	1,360
Copper-base	5,852	5,113
	11,240	11,156
Old scrap:		
Tin cans	1,447	1,070
Tin-base	4,487	4,392
Lead-base	5,684	5,156
Copper-base	9,731	13,359
	21,349	23,977
	32,589	35,133

[1] Revised figures.

The flow of all types of tin-base scrap except the pure tin item, block-tin pipe, declined slightly from the 1944 level, reflecting the growing scarcity of tin in the United States. The increase in use of block-tin-pipe scrap was probably due to more intensive salvage efforts, bringing material into circulation which would not normally have been reclaimed. The National Lead Co.'s program for recovering tin from excess type metal accounted for 11 tons of tin in 1945 compared with 113 tons (revised figure) in 1944. This material was recovered as a tin-bearing chemical residue and later reduced to metallic tin at one of the detinning plants.

The Government-owned stock pile of tin, which had amounted to 83,076 tons of tin on January 1, 1942, was down to 23,350 tons on December 31, 1945, precluding any possibility of relaxation of controls even after hostilities ended. Tin-bearing scrap was scarce, and demand constantly exceeded supply, so that ceiling prices prevailed throughout the year. CPA officials feared that reconversion would cause demands for the metal that could not possibly be satisfied and that delay in reconversion to civilian production might result, particularly in the automotive industry.

Consumption of purchased tin scrap in the United States in 1945, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Block-tin pipe, scrap, and foil		665		158	823
Tin scruff and dross	2,863		2		2,865
No. 1 pewter		101		2	103
High-tin babbitt		4,135		37	4,172
Residues	118				118
	2,981	4,901	2	197	8,081

Because of the dwindling stock pile and the constant demand for tin, the WPB issued several orders tightening controls during the year. In December, however, its successor agency, the CPA, eased controls slightly. An amendment to General Preference Order M–43 on March 8 prohibited the use of tin in the manufacture of automobile solder and the use of solder containing tin in the repair of automobile bodies and fenders. This amendment also provided that users of fabricated bearings containing more than 12 percent tin must furnish the manufacturer with a "use certificate." On May 31 Order M–43 was again amended, establishing the corresponding quarter of 1944 (instead of 1940) as the base period for allocations. On December 17 the order was revised further to permit freer use of tin in some products. One of these changes specified that solder containing no more than 4 percent of secondary tin could be used for automobile solder.

Consumers' stocks of purchased tin-base scrap in the United States at end of year, 1944–45, gross weight, in short tons

Scrap item	On hand—	
	Dec. 31, 1944	Dec. 31, 1945
Unalloyed tin	81	69
Tin-base alloys	481	191
Drosses and residues	784	762
	1,346	1,022

Dealers' buying prices on block-tin-pipe scrap at New York were quoted at 45.5 cents a pound throughout the year, this being the fourth successive year that the price had held at that figure. Total shipments of 1,167 tons of tin babbitt and pewter and 209 tons of block-tin pipe to consumers were reported by scrap-metal dealers during 1945, indicating that most shipments of tin scrap went directly to consumers from industrial sources. Imports of tin dross amounted to only 57 long tons in 1945 and 48 tons in 1944, compared with exports of tin scrap and waste of 3,453 and 3,157 tons in the same 2 years.

Detinning plants.—A total of nine detinning plants reported operations in 1945: Johnston & Jennings Co., Metal & Thermit Corp. (three plants), Standard Metal Refining Co., Vulcan Detinning Co. (two plants), Southern Detinning Co., and the Compressed Steel Co.

at Denver, Colo. The last plant operated for only a short time and discontinued treatment of tin plate before the end of the year. These plants had a much greater capacity for handling tin-plate clippings and used cans than was needed during 1945, because the supply of material for processing continued the decline begun in 1944.

Secondary tin recovered at detinning plants in the United States, 1944–45

	1944	1945
Scrap treated:		
Clean tin plate……long tons	227,220	257,545
Old tin-coated containers……do	146,976	114,311
	374,196	371,856
Tin recovered from new tin-plate clippings……short tons	2,654	2,911
Tin recovered from old tin-coated containers……do	1,447	1,070
	4,101	3,981

Tin recovered in compounds……do	[2] 350	[2] 454
	4,101	3,981
Weight of tin compounds produced……short tons	774	933
Average quantity of tin recovered per long ton of clean tin-plate scrap used……pounds	23.36	22.61
Average quantity of tin recovered per long ton of old tin-coated containers used……pounds	19.68	18.73
Average delivered cost of clean tin-plate scrap……per long ton	$14.72	$14.18
Average delivered cost of old tin-coated containers……do	$14.12	$14.09

[1] Includes a small tonnage of pig tin averaging less than 95 percent tin content and, consequently, subject to further refining or alloying.

[2] Represents the total recovery of tin in compounds reported by the detinners as an industry. Some of this material was reduced to metallic tin at the Texas City tin smelter, and some was sold for use in the form produced. In calculating total domestic tin production, only the tin recovered as metal at detinning plants should be used.

On four occasions during 1945 the WPB issued amendments and directions to Conservation Order M–325, striving to increase the tonnage of used cans and tin-plate clippings being shipped to detinners. None of these measures was effective in increasing the flow of old cans, however, because they failed to reach the housewives who were responsible for saving and preparing them. In general, those homemakers who were still preparing cans for collection stopped doing so after the end of hostilities, and collection systems in the major cities broke down almost immediately. Only 28,223 long tons of prepared cans were sold by the War Department to detinners in 1945, compared with 40,000 tons in 1944, reflecting the decline of personnel in camps in the United States.

The average quantity of tin recovered per long ton of scrap treated continued its downward trend in 1945, showing the effect of substitution of electroplating for hot dipping of tin plate and the use of lacquered or "bonderized" metal instead of tin plate in many cans. The average recovery of tin from new clippings was 22.61 pounds per long ton in 1945, compared with 23.36 pounds in 1944, and the average recovery from old cans was 18.73 pounds per long ton in 1945, compared with 19.68 pounds in 1944.

Imports of tin-plate scrap increased from 17,323 long tons in 1944 to 18,072 tons in 1945. Exports of tin-plate scrap, circles, wastewaste, and clippings rose from 4,670 long tons (revised figure) in 1944 to 14,710 tons in 1945.

SECONDARY ANTIMONY

Recovery of secondary antimony in lead-base and tin-base alloys totaled 17,148 short tons valued at $5,432,487 in 1945, an 8-percent increase over the 15,886 tons valued at $5,032,685 recovered in 1944. The value was computed in both 1945 and 1944 at 15.84 cents a pound—the average selling price for ordinary American-brand antimony in the 2 years at New York.

Secondary antimony recovered in the United States, 1944–45, in short tons

Secondary antimony recovered			Recoverable antimony content of scrap		
Form of recovery	1944	1945	Kind of scrap processed	1944	1945
In antimonial lead	10,894	11,223	New scrap:		
In other lead alloys	4,643	5,712	Lead-base	327	2,097
In tin-base alloys	349	213	Tin-base	1	----------
	15,886	17,148		328	2,097
			Old scrap:		
			Lead-base	15,255	14,766
			Tin-base	303	285
				15,558	15,051
				15,886	17,148

As in former years, the principal source of antimony recovered from scrap in 1945 was old battery plates. Due to the efforts of the WPB and its successsor agency, the CPA, in channeling all types of lead- and tin-base scrap back to smelters' plants for reconversion, the tonnage of battery plates treated increased from 246,258 tons in 1944 to 279,471 tons in 1945. This resulted in a recovery of 8,804 tons of antimony from this source during the year, an increase of 13 percent over the 7,757 tons of antimony reclaimed in 1944. The quantity of antimony recovered in antimonial lead and in other lead-base alloys increased over that in 1944, but recovery of antimony in tin-base alloys declined. Remelters, smelters, and refiners recovered 90 percent of the antimony reclaimed in 1945, the other 10 percent being recovered by bearing manufacturers and other foundries. Consumption of purchased scrap from which antimony was recovered may be found in the tables on consumption of lead-base and tin-base scrap in the sections of this chapter devoted to those metals. Products in which antimony was recovered are included in the lead- and tin-products table.

As in the past, all antimony recovered from scrap remained in the alloyed state, none being regained as unalloyed metal or in chemical compounds as far as could be determined. It should be noted also that the antimony content of antimonial lead scrap makes it desirable to process this material back to antimonial lead, even when processed in primary lead plants. Reports from prinary lead plants on the annual survey have established the fact that very little antimonial lead scrap actually goes into refined lead at these plants. In the instances where this does occur, the antimony skimmings collected in the lead refining process are retained until a large enough quantity accumulates to justify making a run of antimonial lead.

Early in 1945 the critical shortage of antimony made it necessary for the WPB to assume full control of deliveries and use of the metal, by amending General Preference Order M–112, effective February 10. This amendment stipulated that no one might receive, in any one current month, more than 224 pounds of antimony (compared to 2,240 pounds permitted previously), except by allocation. The amendment of February 10 also limited inventories of antimony ore to a 45-day supply and other forms of antimony to a 30-day supply. Manufacturers were having difficulty in procuring the metal which had been allocated to them, even for war purposes. The demand for all types of antimony exceeded domestic production by a wide margin. On May 12 Order M–112 was again amended, requiring purchasers of over 224 pounds of antimony to certify their needs to the WPB. In October, an amendment to General Preference Order M–38 was issued, restricting the antimony content of storage-battery plates for general use to 9 percent.

There was no change in the ceiling prices for antimony in alloy metals or metallic scrap during 1945, the price having remained at 15.50 cents a pound of contained antimony since April 1942. There was no regulation of prices for antimony in drosses or other residues. The maximum price for standard-grade antimony remained 14.50 cents a pound at Laredo, Tex.

SECONDARY ZINC

Secondary zinc recovered in 1945 from purchased scrap and residues totaled 360,444 short tons with a value of $61,996,368, calculated at 8.6 cents a pound, the average selling price for the year of all grades of refined zinc, not including bonuses paid by Metals Reserve Company under the Premium Price Plan. This total was 4 percent higher than in 1944, when 345,469 tons with a value of $59,420,668 at 8.6 cents a pound were recovered.

Secondary zinc recovered [1] in the United States, 1944–45, in short tons

Secondary zinc recovered		
Form of recovery	1944	1945
As metal:		
By distillation:		
Slab zinc	48,582	48,816
Zinc dust	22,753	23,416
By remelting	8,178	11,704
	79,513	83,936
In zinc-base alloys	6,826	6,531
In brass and bronze	222,383	226,756
In aluminum-base alloys	9	1,355
In chemical products:		
Zinc oxide (lead free)	7,076	9,130
Zinc sulfate	2,558	3,216

	113,161	121,597
	345,469	360,444

[1] Zinc content.

The recoverable zinc content of zinc-base scrap consumed in 1945 increased 5 percent and that of the copper-base scrap consumed 3 percent. Zinc is salvaged from zinc-base scrap chiefly by distillers, remelters, and chemical plants in the form of zinc-base products but is recovered from brass scrap largely by brass-ingot makers, brass mills, and foundries and emerges for reuse in copper and brass. In 1945 only 3,238 tons of zinc were recovered in brass from zinc scrap. It may be said of secondary copper, aluminum, and lead that each is recovered mostly from scrap of which it is the chief constituent, but more zinc is reclaimed from brass scrap than from zinc-base scrap. In the years after the war galvanizing can be expected to increase, so that the generation and, consequently, the consumption of zinc-base scrap will increase. In 1945, 219,681 tons or 61 percent of the total secondary zinc recovered came from copper-base scrap, nearly the same percentage as in 1944.

Secondary zinc recovered in 1945 increased in nearly all types of products, that reclaimed by remelting rising from 8,178 tons in 1944 to 11,704 tons in 1945, that recovered in zinc oxide from 7,076 tons to 9,130 tons, and that in lithopone from 13,720 tons to 15,647 tons. There was a small decrease in the recovery of zinc from scrap in zinc-base alloys, which included remelt die-cast slab and zinc-die alloys such as kirksite. Zinc recovered by remelting included remelt spelter, rolled zinc, cast zinc, and galvanizers' stock. Although the galvanizing industry is a major consumer of slab zinc, it does not use much scrap but generates galvanizers' dross, skimmings, and sal skimmings. Sal skimmings, which result when sal ammoniac flux is added to the molten zinc in the galvanizing kettle, have a zinc content of 40 to 50 percent and contain considerable zinc chloride. This item of scrap is used by chemical plants in the manufacture of zinc chloride and zinc ammonium chloride. If treated in a smelting furnace for recovery of zinc in metallic form, the zinc chloride must first be dissolved out or it will pass off in the flue gases and be lost.

Twenty-two distillers used zinc scrap in 1945, and of these 11 made only redistilled slab, 5 made only dust, and the other 6 made both. One plant that had produced slab in 1944 distilled no scrap in 1945; but all 1944 dust producers were still operating in 1945, and 1 new plant was added to the list covered by the survey.

Production of secondary zinc and zinc-alloy products in the United States, 1944–45, gross weight, in short tons

Product	1944	1945
Redistilled slab zinc	49,037	49,242
Zinc dust	[1] 23,307	23,892
Remelt spelter [2]	7,741	8,090
Remelt die-cast slab	3,760	4,727
Zinc-die and die-casting alloys	1,786	2,281
Galvanizing stock	594	701
Rolled zinc	1,737	3,054
Secondary zinc in chemical products	36,738	41,866

[1] Revised figure.
[2] Contains small tonnages of zinc anodes.

Secondary zinc recovered at 43 chemical plants in 1945 totaled 41,866 tons compared with 36,738 tons in the previous year. Secondary zinc recovery increased in all types of chemicals tabulated except the miscellaneous group, which includes leaded zinc oxide, zinc carbonate, and minor zinc chemicals.

In addition to the distillers and chemical plants, those covered by the survey included 117 remelters, brass-ingot makers, zinc smelters, and scrap-metal dealers and 81 foundries and other manufacturers.

Consumption of purchased zinc scrap in the United States in 1945, gross weight, in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Clippings	4,597		4,995		9,592
Sheet and strip		4,774		499	5,273
Engravers' plates		1,670		88	1,758
Skimmings and ashes	45,044		28,531		73,575
Dross	52,997		598		53,595
Die castings	2,715	8,145	254	186	11,300
Rod and die scrap	1,492	4,477			5,969
Flue dust and residues	9,361	6,700	16,312	9,290	41,663
	116,206	25,766	50,690	10,063	202,725

Consumption of zinc-base scrap totaled 202,725 tons in 1945 compared with 199,000 tons in 1944. Of this, 168,833 tons (83 percent) were byproduct residues and the remainder metallic scrap. Of the residues, those resulting from galvanizing operations, galvanizers' dross, and skimmings showed the greatest increases in use for the year, that of the former rising from 48,613 tons in 1944 to 53,595 tons in 1945 and consumption of skimmings and ashes increasing from 64,902 tons in 1944 to 73,575 tons in 1945. A major use of galvanizers' dross is its distillation to make zinc dust, several plants in the country being devoted exclusively to this operation.

Of the metallic zinc items, consumption of die-cast and die scrap combined rose from 11,080 tons in 1944 to 17,269 tons in 1945. A factor in this rise was the increased salvage of obsolete and worn-out forming dies which had been used in the manufacture of aircraft. However, very little of the rod and die scrap was used in making new forming dies. Nearly all of it emerged as redistilled slab and zinc oxide.

Owing to the increased use of die-cast and rod and die scrap, metallic zinc-scrap consumption exhibited an erratic but generally rising trend during 1945. Total residue consumption decreased because, although galvanizing residue treatment increased, that of flue dust and chemical residues declined. The latter is a byproduct from the manufacture of sodium hydrosulfite.

Consumers' stocks of purchased zinc-base scrap in the United States at end of year, 1944–45, gross weight, in short tons

Scrap item	On hand— Dec. 31, 1944	On hand— Dec. 31, 1945
Metallic zinc scrap	2,222	10,903
Dross	7,475	6,605
Skimmings and residues	20,164	21,670
	29,861	39,178

Stocks of zinc scrap in the hands of consumers totaled 39,178 tons at the end of 1945, which compares with 29,861 tons at the end of the previous year. The rise was caused principally by increased inventories of die-cast and die scrap, which are included in the figure for consumers' stocks of metallic scrap.

Dealers supplied consumers with 56,491 tons of zinc scrap during 1945, an increase of 13,720 tons over the 42,771 tons shipped during 1944. The increase in shipments to consumers could largely be attributed to gains in shipments of die-cast and die scrap, especially aircraft forming-die scrap in the latter half of the year. Dealers bought up this material as fast as it was offered, and as a result there were sharp increases in shipments to consumers and in dealers' receipts of zinc scrap, which rose from 44,171 tons in 1944 to 59,477 tons in 1945. Stocks of 9,730 tons in dealers' yards and warehouses on December 31, 1945, were the highest on record.

In 1944, the use of monthly zinc-allocation certificates had been discontinued, but on February 27, 1945, General Preference Order M–11 was amended by the WPB, formally placing slab zinc again under allocation control. The allocation order was revoked on August 20, and thereafter no restrictions on the use of either zinc or zinc scrap remained in effect. On May 25, the OPA issued an amendment to Maximum Price Regulation 3, establishing a maximum price of 4.95 cents per pound for zinc-base forming and stamping dies sold as scrap. Explaining the creation of the new classification the agency said that expansion of the aircraft industry during the war had resulted in greatly increased use of forming and stamping dies made of zinc-base alloy. Because a larger volume of this material was expected to enter the scrap-metal market, and because industry had requested it, the additional classification of scrap was provided.

Ceiling prices for secondary slab zinc remained the same as in 1944, the price for Prime Western zinc being 8.25 cents a pound. Maximum prices for zinc scrap also remained unchanged, with new clippings at 7.25 cents a pound and old zinc at 5.75 cents. Dealers' buying prices for new zinc clippings averaged 5.83 cents a pound during 1945, which is a slight increase over the monthly average of 5.81 cents in 1944 and 0.62 cent less than the 1942 figure of 6.45 cents. The price in 1945 averaged 5.87 cents for January through October but dropped to 5.62 cents for November and December. The average price for old zinc was stationary at 4.37 cents during 1945, where it had remained since April 1944.

Imports of old zinc scrap into the United States totaled 3,308 tons in 1945, compared with 909 tons (revised figure) in 1944. Imported drosses and residues totaled 4,323 tons in 1945, a decrease of 371 tons from the 4,694 tons received from abroad in 1944. Large quantities of fume from a primary smelter in Canada were imported by one company for the manufacture of zinc sulfate and lithopone, but the zinc reclaimed from this material was not counted as secondary metal.

717372—47——34

IRON AND STEEL SCRAP

By NORWOOD B. MELCHER AND JAMES E. LARKIN

SUMMARY OUTLINE

GENERAL SUMMARY

The supply of iron and steel scrap in the United States was critically short throughout 1945. Except for a small increase in consumers' stocks in the Southeastern district, all districts reported declines from the previous year, indicating that suppliers were unable to meet the demand, even though requirements decreased considerably during the year. The pig-iron supply also became tighter during 1945, and the ratio of the average pig to total melt in all furnaces decreased from 50 percent in 1944 to 49 percent.

Consumption of iron and steel scrap during the first 2 months of 1945 continued at approximately the same level as in previous war years. In March consumption reached 5,476,000 short tons to establish the second highest [1] monthly rate on record. Total consumption in 1945 amounted to 56,191,085 short tons, compared with 61,349,201 tons in 1944—a 5.2-million ton decrease, most of which occurred in the last 5 months of the year, as a result of the cancellation of war contracts and the conversion of plants to peacetime production.

Manpower shortages, which restricted preparation of scrap by dealers, and the freight embargo in February, which curtailed shipments of scrap, forced consumers to draw from stock piles, resulting in a continuous decrease in inventories to a near-record low of 3,924,203 short tons on December 31—a drop of 11 percent from 1944. This lack of scrap, accompanied by a decrease in pig-iron production, resulted in a reduction in consumers' pig-iron stocks in December to 1,237,058 short tons, compared with 1,501,599 tons on December 31, 1944.

[1] A record total of 5,582,000 short tons of ferrous scrap was used in October 1941.

Salient statistics of ferrous scrap and pig iron in the United States, 1944–45

	1944	1945	Change in 1945 (percent)
Stocks, December 31:			
Ferrous scrap and pig iron at consumers' plants:	*Short tons*	*Short tons*	
Home scrap	1,435,056	1,218,493	−15
Purchased scrap	2,983,663	2,705,710	−9
Pig iron	1,501,599	1,237,058	−18
	5,920,318	5,161,261	−13

[1] Estimated.
[2] Includes open-hearth, bessemer, and electric furnaces.
[3] Includes cupola, air, Brackelsberg, puddling, crucible, and blast furnaces; also direct castings.
[4] Includes rerolling, reforging, copper precipitation, nonferrous, and chemical uses.
[5] Iron Age.

The ferrous raw materials charged into steel-making furnaces during 1945 comprised 48 percent scrap and 52 percent pig iron, compared with 47 and 53 percent, respectively, during 1944. However, there was virtually no change with reference to iron furnaces, which used 64 percent scrap and 36 percent pig iron in 1945 and 1944. This increase of percentage in scrap used during 1945 over that of 1944 resulted in a substantial reduction in scrap inventories. Even though the pig-iron percentage of use was lower in 1945, consumers' stocks nevertheless declined owing to curtailed production.

Battlefield scrap has been considered a means for bolstering the dwindling supply of purchased scrap in the United States, but full utilization has not yet been deemed advisable because of the high alloy content and the presence of contaminating elements normally undesirable in steel compositions. These elements are copper, tin, cadmium, zinc, lead, and some boron and arsenic from enemy sources. Arsenic which is not removed in the melting process and is present in some German steels has a detrimental effect on the toughness of steel and its response to heat treatment. Therefore, it is felt that before battlefield scrap can be successfully used in making American steels it must be properly segregated. Dealers were not able to segregate this scrap properly due to the labor shortage, but since hostilities have ceased abroad it is expected that the battlefield scrap will be returned to the United States, properly segregated and will eventually flow into commercial channels.

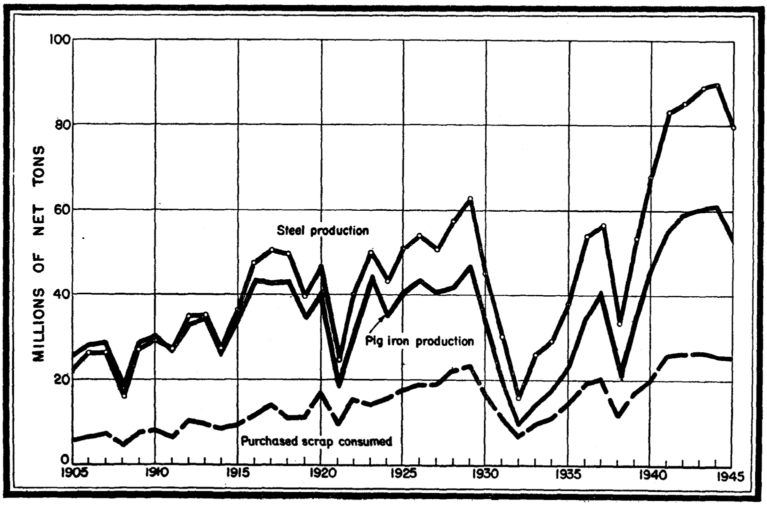

FIGURE 1.—Consumption of purchased scrap and output of pig iron and steel in the United States, 1905–45. Figures on consumption of purchased scrap for 1905–32 are from State of Minnesota vs. Oliver Iron Mining Co. et al., Exhibits, vol. 5, 1935, p. 328; those for 1933-34 are estimated by authors; and those for 1935–45 are based on Bureau of Mines reports. Data on output of steel are as given by the American Iron and Steel Institute.

The Bureau of Mines in its collection of the iron- and steel-scrap statistics reduced its wartime list of respondents greatly after September 1945. During the final war months reports were requested of 12,000 respondents, including producers, dealers, and consumers. Forms for October were mailed to only about 1,200 consumers and 900 dealers; the producer form (WPB 2903) was eliminated. Although less than half of the United States consumers were then canvassed, these companies used 97 percent of the United States consumption of total ferrous scrap and 98 percent of pig iron in 1945. Form WPB 2904 (consumers) was superseded by Bureau of Mines Form 6–1070–M and WPB 2905 (dealers and auto wreckers) by 6–1072–M.

WAR PRODUCTION BOARD

As of January 15, 1945, all basic open-hearth steel ingot producers were prohibited from accepting further shipments of electric furnace and foundry steel scrap. However, they were permitted to apply to the War Production Board requesting exceptions, furnishing complete information to justify departure from the terms of Direction 1 to General Preference Order M–24. The grades that the basic open-hearth consumers were prohibited from purchasing were the following: Billets, bloom and forge crops; bar crops and plate scrap; cast steel; punchings and plate scrap; electric furnace bundles; cut structural and plate scrap (3 feet and under); 1- and 2-foot foundry steel; springs and crank-shafts.

Direction 2 to General Preference Rating Order M–24, effective March 1, required consumers of scrap to take into account both home and purchased scrap in computing scrap inventories on hand. However, an inventory up to 50 tons was permitted regardless of the provision, for the benefit of small consumers.

In May the WPB revoked Conservation Order M–126 which banned the uses of iron and steel in less essential civilian products. This order, effective since May 1942, prohibited the use of iron and steel in a wide variety of products. Because of need for stainless steel by the armed forces, restrictions for this material were not lifted.

Scrap became increasingly scarce in July as material from industrial sources was reduced by military cut-backs while demand for steel continued strong. The scrap shortage became so serious that WPB allowed some steel makers to buy electric furnace grades for use in open-hearth, thus reducing the supply of the higher grades to electric furnace operators.

The WPB ceased allocation of scrap as of September 30, 1945, following the capitulation of Japan in August.

The functions of the WPB were transferred to the Civilian Production Administration on November 3, 1945.

OFFICE OF PRICE ADMINISTRATION

On April 14, 1945, the Office of Price Administration authorized scrap dealers to charge a commission of 50 cents per gross ton on material sold at the same price at which it was purchased, even though it was below ceiling. After November 16 a commission was allowed only on scrap bought and sold at ceilings. Other April 14 changes included provisions for railroad scrap specifications consistent with changes by the Association of American Railroads. They permitted Heavy-Melting steel from railroad equipment demolished by a dealer on railroad property to sell at the ceiling for railroad Heavy-Melting steel, resulting in an increase of $1 per ton over previous practice. Preparation-in-transit privilege was allowed on cast iron in zone C, which covers central and eastern areas. Provisions of iron- and steel-scrap regulation were extended to cover all export scrap or scrap sold to an exporter, making domestic maximum prices applicable to all export scrap sales.

STOCKS

Complete iron- and steel-scrap stock figures covering 1945 year end stocks are not available. The respondent list was cut sharply after September, the dealers canvassed during October held 67 percent of stocks based on maximum coverage, and automobile wreckers held only 27 percent of the total for that industry on the same basis. Producers (railroads and manufacturers) were not canvassed after September 1945. It is estimated that total stocks of iron and steel scrap on December 31, 1945, totaled 5,381,000 short tons—a decrease of 10 percent from 1944. This is the third consecutive year that stocks declined; at the end of 1943 stocks had declined 8 percent, and in 1944 a drop of 17 percent was experienced.

Most of the decline in 1945 was due to drops in consumers' stocks, both home and purchased. Dealers were unable to meet the high consumer demand for scrap in view of a greatly diminishing supply, especially from manufacturers.

CONSUMERS' STOCKS

Consumers' total home and purchased iron- and steel-scrap stocks on December 31, 1945, had decreased to 3,924,203 short tons or 11 percent from 4,418,719 tons at the beginning of the year. Stocks of home scrap (1,218,493 tons) had decreased 15 percent and purchased scrap (2,705,710 tons) 9 percent.

Stocks of pig iron on December 31, 1945, amounted to 1,237,058 short tons, an 18-percent decrease from the 1,501,599 tons on hand on December 31, 1944.

SUPPLIERS' AND PRODUCERS' STOCKS

Stocks of iron and steel scrap in the hands of dealers, automobile wreckers, railroads, and manufacturers decreased from 1,550,498 short tons on December 31, 1944, to an estimated 1,457,000 tons on December 31, 1945—a drop of 6 percent.

Consumers' stocks of ferrous scrap and pig iron on hand in the United States on Dec. 31, 1944, and Dec. 31, 1945, by States and districts, in short tons

State and district	Dec. 31, 1944				Dec. 31, 1945

CONSUMPTION

In gathering data on the consumption of scrap in 1945, the practice of the past few years was continued, in that figures on the use of scrap in the production of ferro-alloys and for various miscellaneous uses are included. Figures for some States are grouped to avoid disclosing the details of individual operations.

The large use of scrap as compared with that of pig iron again was noticeable in the New England, Southwestern, and Pacific Coast districts in 1945. These districts used 6 percent of the total scrap consumed in the United States, but only 2 percent of the total pig iron. The ratio of scrap to pig iron in these three districts was 3.20 : 1, whereas for the United States at large it was 1.06 : 1.

Open-hearth steel furnaces are by far the largest consumers of ferrous scrap and pig iron. The portions of the total scrap and pig-iron supply used in open-hearth furnaces have remained relatively constant, as the following data will show: Open-hearth consumption accounted for 67 percent of the total scrap in 1945, also 67 percent in 1944, and 65 percent in 1943; 73 percent of the home scrap in 1945, 73 percent in 1944, and 73 percent in 1943; and 60 percent of the purchased scrap in 1945, 57 percent in 1944, and 56 percent in 1943.

Cupola-furnace consumption in 1945 increased percentage-wise for home scrap and pig iron, but purchased scrap remained unchanged as follows: Home scrap, 12 percent of the total in 1945, 10 percent in 1944 and 1943; purchased scrap, 15 percent in 1945 and 1944, 17 percent in 1943; pig iron, 8 percent in 1945, 6 percent in 1944 and 1943.

Bessemer converters consumed 9 percent of the pig iron in 1945 (9 percent also in 1944) but only 0.6 percent of the scrap.

Electric furnaces consumed 9 percent of the total scrap in 1945 (10 percent in 1944) but only 0.3 percent of the pig iron.

Ferrous scrap and pig iron consumed in the United States and percent of total derived from home scrap, purchased scrap, and pig iron, 1944–45, by districts

[1] Includes some pig iron used in making direct castings.
[2] Where 2 or more separate departments, such as blast-furnace, open-hearth, foundry, etc., are situated at the same place and are operated by 1 establishment, each appears as 1 plant in the total.

CONSUMPTION BY DISTRICTS AND STATES

In 1945 iron and steel scrap and pig iron were used in all 48 States and the District of Columbia; none was used in Alaska. The largest consuming districts were the North Central, Middle Atlantic, and Southeastern. The Southwestern district showed an increase over 1944, but all other districts showed a decrease during the year. The nine States having the largest consumption of scrap, together with the percentage consumed, were: Pennsylvania 25, Ohio 18, Indiana 11, Illinois 10, Michigan 6, New York 5, Maryland 4, Alabama 3, and California 3. This order varies slightly from 1944; Michigan and Alabama changed positions, and California was added to the group. Pennsylvania, Ohio, Indiana, and Illinois remained as the leading States in iron- and steel-scrap consumption.

Consumption of ferrous scrap and pig iron in the United States, 1941–45, by districts

[2] Where 2 or more separate departments, such as blast-furnace, open-hearth, foundry, etc., are situated at the same place and are operated by 1 establishment, each appears as 1 plant in the total.

CONSUMPTION BY TYPE OF FURNACE

Open-hearth furnaces.—Ferrous scrap and pig iron consumed in open-hearth furnaces in 1945 totaled 79,438,872 short tons, an 11-percent decrease from 1944. The use of home scrap decreased 13 percent, purchased scrap increased 2 percent, total scrap decreased 7 percent, and pig iron decreased 14 percent.

Charges to open-hearth furnaces in 1945 consisted of 48 percent total scrap and 52 percent pig iron, compared with 46 percent and 54 percent, respectively, in 1944 and 1943. Of the total scrap consumed, 40 percent was purchased compared with 36 percent in 1944, and 37 percent in 1943.

Pennsylvania led in the use of scrap in the open-hearth in 1945, followed in order by Ohio, Indiana, and Illinois; this ranking is unchanged from 1944.

Bessemer converters.—The total of 5,067,707 short tons of ferrous raw materials used in bessemer converters in 1945 represents a 15-percent decrease from the 1944 use of these materials. The proportion of scrap in the metal charges was 6 percent, of which 74 percent was home scrap.

Following the usual pattern, Pennsylvania was the principal consumer of scrap in converters in 1945.

Electric steel furnaces.—Ferrous scrap and pig iron used in electric furnaces in 1945 amounted to 5,246,788 short tons, a decrease of 21 percent from the 6,662,336 tons used in 1944. The recent high consumption of ferrous raw materials in electric-furnace practice is a result of the increase in the number of these furnaces, which amounts to a 32-percent increase in electric-furnace capacity since 1942.

The decrease of 77,025 short tons of pig iron consumed in 1945 from the 1944 consumption is in large part due to a decrease of 47,051 tons in Ohio. This decrease continues a trend that became noticeable in 1943; a large plant in eastern Ohio which formerly used an unusually high percentage of pig iron in electric furnaces has altered melting practice to conform more nearly with that of the United States average.

Consumption of ferrous scrap and pig iron in electric steel furnaces in the United States in 1945, by districts and States, in short tons

Cupola furnaces.—In 1945 cupola furnaces used 11,427,858 short tons of scrap and pig iron—virtually unchanged from 1944. The use of home scrap decreased 1 percent, purchased scrap decreased 4 percent, total scrap decreased 3 percent, but pig iron increased 4 percent. The decrease in purchased scrap and the increase in pig iron were due to the marked shortage of suitable cast scrap in relation to the availability of pig iron for cupola use. However, suppliers of foundry pig iron were short of meeting demands at the end of the year.

Charges to cupola furnaces consisted of 31 percent home scrap, 33 percent purchased scrap, and 36 percent pig iron, compared to 32, 34, and 34 percent, respectively, in 1944.

Michigan cupola furnaces used the largest tonnage of scrap in 1945, followed in order by those of Ohio, Illinois, Pennsylvania, New York, and Wisconsin.

[1] Includes some pig iron used in making direct castings.

Air furnaces.—Scrap and pig iron consumed in air furnaces (including 2 Brackelsbergs) in 1945 amounted to 1,503,877 short tons, an 11-percent decrease from the 1,690,343 tons melted in these furnaces in 1944. The use of home scrap decreased 12, purchased scrap 7, and pig iron 13 percent.

There was a noteworthy change in the relative position of the principal consuming States; Indiana, which had been the fourth largest user for several years, dropped behind Michigan and Wisconsin into sixth position. Ohio led in the use of scrap in air furnaces, followed in order by Illinois, Pennsylvania, Michigan, Wisconsin, Indiana, and New York.

[1] Includes 2 Brackelsberg furnaces, 1 each in Indiana and Ohio.

Crucible and puddling furnaces.—Crucible furnaces used only 797 short tons of scrap and 552 tons of pig iron in 1945 compared with 1,218 and 863 tons, respectively, in 1944. Puddling furnaces used 30,549 tons of scrap and pig iron, a drop of 21 percent from 1944. Of the total puddling-furnace melt in 1945, 7,824 tons were scrap compared with 10,704 tons during the previous year. The bulk of the consumption was in Pennsylvania, as in 1944.

1 Included with total for United States.

Blast furnaces.—Materials other than scrap constitute by far the largest proportion of the blast-furnace charge and in 1945 were 81,072,236 short tons of iron and manganiferous ores, 17,284,828 tons of sinter, cinder, and mill scale, 3,450,162 tons of open-hearth and bessemer slag, 98,934 tons of raw flue dust, and 62,661 tons of miscellaneous materials.

Total consumption of scrap in 1945, as reported by 74 plants operating blast furnaces, was 3,338,677 short tons, an 8-percent decrease from 1944. These figures do not include 10,517 tons of home and 17,747 tons of purchased scrap used in blast furnaces in the manufacture of ferro-alloys. The scrap charged to blast furnaces was divided into 39 percent home and 61 percent purchased, as in 1944. In 1943, these percentages were 40 and 60, respectively. The ratio of scrap used to pig iron produced was 6.27 percent compared with 5.96 percent in 1944; purchased scrap accounted for 3.85 percent and home scrap 2.42 percent in 1945.

[1] Does not include scrap used for the production of ferro-alloys.

USE OF SCRAP IN FERRO-ALLOY PRODUCTION

The production of ferro-alloys in 1945 consumed 311,795 short tons of scrap, a 6-percent decrease from the 1944 figure. Purchased scrap accounted for 94 percent of the quantity used and home scrap 6 percent. Twenty-one plants were engaged in this business, compared with 27 in 1944.

Of the scrap consumed in the manufacture of ferro-alloys, 9 percent was used in blast furnaces and 91 percent in electric furnaces; and 469 tons were used in the aluminothermic process.

Of a total of 21 ferro-alloy plants which used iron and steel scrap in 1945, 3 operated blast furnaces, and 18 employed electric furnaces. One of the latter group also used the aluminothermic process.

MISCELLANEOUS USES

Slightly less than 2 percent of the 1945 consumption of scrap was for miscellaneous purposes, such as rerolling, in nonferrous metallurgy, and as a chemical agent. The quantity so used—961,789 short tons—was a decrease of 5 percent from that used for these purposes in 1944. Of the quantity used 94 percent was purchased and 6 percent home scrap.

FOREIGN TRADE[2]

Imports.—Imports of iron and steel scrap in 1945 decreased 59 percent in quantity (46,271 short tons as compared with 111,974 tons in 1944) and 66 percent in value ($555,471 as compared to $1,627,117 in 1944). Of the 1945 imports, 29,603 tons came from Canada, 5,070 from Cuba, 3,914 from Curaçao, and the remainder in small tonnages from other countries. In addition, 20,240 tons of tin-plate scrap were imported (18,851 tons from Canada) as compared with 19,402 tons in 1944 and 21,927 tons in 1943.

Exports.—Exports of ferrous scrap from the United States in 1945 were 95,734 short tons valued at $2,589,239, a negligible increase in tonnage but an increase of 36 percent in value over 1944. Exports exceeded imports by 49,463 short tons (not counting 20,240 tons of imported tin-plate scrap). The tonnage exported amounted to slightly less than 3 percent of the 5-year prewar average (for 1935-39) of 3,298,326 tons a year. The high requirement for scrap in the United States and the chaotic conditions abroad were the major factors causing the low level of exports. The 1945 exports included 16,475 tons of tin-plate scrap, circles, strips, cobbles, and waste and terneplate clippings and scrap valued at $1,359,360. The same materials in 1944 amounted to 5,229 tons valued at $446,971. The accompanying table shows the principal countries to which scrap was exported during the period 1941–45.

Ferrous scrap exported from the United States, 1941–45, by countries, in short tons

REVIEW BY COUNTRIES

Argentina.—Decree 1,143 of January 16, 1945, fixed maximum prices on scrap iron in Argentina at 50 pesos per ton for first-class-quality scrap iron and at 30 pesos per ton for second-class-quality. The decree also stated that scrap iron is considered critical material and comes under Decree 29,671, which places critical materials under the control of the Secretariat of Industry and Commerce.[3]

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.
[3] U. S. Dept. of Commerce, Foreign Commerce Weekly: Vol. 19, No. 3, Apr. 14, 1945, p 14.

Canada.—Production of steel ingots and castings in Canada in 1945 totaled 2,881,323 short tons, a decrease of 5 percent from 1944. Of the 1945 output, 2,747,206 tons were ingots compared with 2,878,-407 tons in 1944. Alloy steel produced in 1945 amounted to 290,710 tons. Pig iron consumed in steel furnaces totaled 1,397,631 tons in 1945 and 1,511,518 tons in 1944. Iron- and steel-scrap consumption in 1945 totaled 1,775,819 tons, of which 925,482 tons was home scrap and 850,337 tons purchased scrap. In 1944 home- and purchased-scrap consumption in steel furnaces amounted to 1,007,473 tons and 842,471 tons, respectively.

There was a short supply of virtually all grades of scrap throughout 1945. However, the situation was less critical during the summer months, when transportation was not hindered by inclement weather.

Poland.—Collection of scrap iron in Poland was resumed in March 1945, and by the end of the year 152,390 tons had been collected.[4]

Sweden.—The supply of all raw materials for steel production in Sweden was critically short. There were virtually no imports of scrap iron during the first 8 months of 1945, and domestic strikes reduced production of scrap, which previously amounted to 10,000 tons per month. Sweden had counted on importing some scrap from the Baltic area, but it became apparent that Russia would require all of this scrap for its own needs. About 20,000 tons of scrap are expected from Belgium under a new Belgian-Swedish trade agreement.[5]

IRON ORE

By Norwood B. Melcher and John Hozik

SUMMARY OUTLINE

SUMMARY

An 11-percent decline in steel production, accompanied by a proportional easing of pig-iron requirements, resulted in a 6-percent decrease in iron-ore production during 1945. Decreases occurred in all major districts, and the Lake Superior district maintained its usual position and supplied 85 percent of the United States total during the year. The labor supply became worse during 1945—mines in the Lake Superior district were obliged to transfer into production work men who would normally be utilized for development work in underground mines. A critical labor shortage in Alabama resulted in the shipping of 115,000 tons of ore from stock piles at Gary, Ind., to furnaces in the Birmingham district. Total employment at iron mines and mills decreased from an average of 29,244 men in 1944 to 26,900 in 1945.

The iron-mining companies of the Lake Superior district were aided by price increases that were effective for the entire 1945 season. The increases ranged from 10 to 20 cents per gross ton but applied only to ore shipped for sale. The industry considered these increases inadequate, and further increases were being sought at the close of the year.

Iron ore reentered the United States import trade in quantity during 1945, especially in the closing months of the year. Trade in Chilean ore, which was suspended early in the War, was resumed in August, and a total of 214,670 tons had entered the United States by the end of the year. Canadian ore imports increased from 255,431 tons in 1944 to 704,225 tons in 1945 as a result of expanded production at the Steep Rock mine near Atikokan, Ontario. Ore from North Africa entered the United States in quantity during 1945. Algeria supplied 221,526 tons compared with 134,104 tons in 1944 and 89,766 tons in 1943; Tunisia shipped 10,382 tons (all during the last 2 months). Imports from all countries amounted to 1,193,514 gross tons compared with 463,532 tons in 1944.

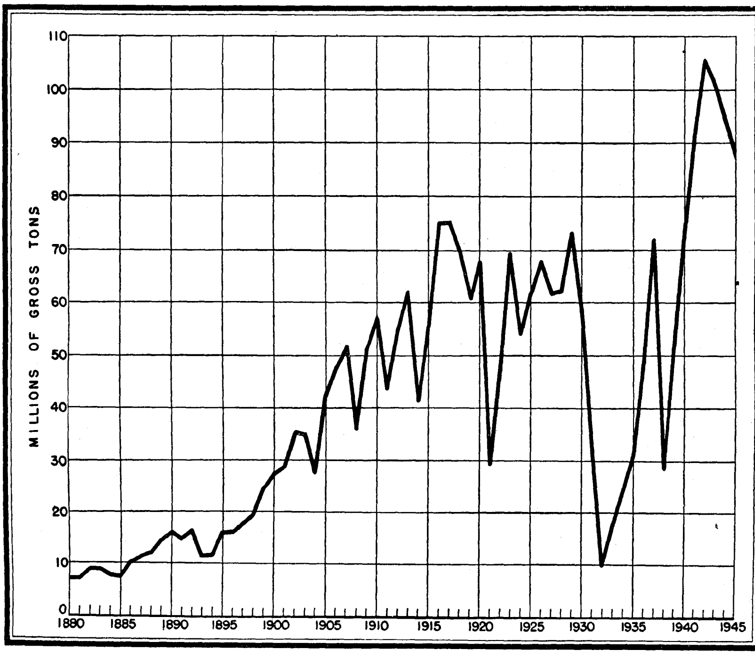

FIGURE 1.—Trends in production of iron ore in the United States, 1880–1945.

PRODUCTION AND SHIPMENTS

United States iron-ore mines produced crude ore totaling 106,312,399 gross tons and shipped 106,538,936 tons in 1945—decreases of 4 and 5 percent, respectively, from 1944. Of the 1945 shipments, 36 percent was sent to beneficiation plants and 64 percent went direct to consumers, compared with 34 percent and 66 percent, respectively, in 1944. From the crude ore shipped to beneficiation plants, 16,812,961 tons of concentrate and 3,276,999 tons of sinter were produced. In addition, 517,440 tons of byproduct cinder and sinter were produced by the pyrites industry. In all, 88,376,393 gross tons of usable iron ore were produced at mines and mills in 1945. Output came from 199 mines, of which 28 mined over 1,000,000 tons of crude ore each. Minnesota, with 61,620,337 tons, supplied 70 percent of the usable ore; and Michigan, with 11,832,493 tons or 13 percent, was the second-largest producer. These two States and Wisconsin, with 1,368,215 tons or 2 percent, constitute the Lake Superior region, which supplied 85 percent of the domestic output. About three-fourths of the iron ore mined in 1945 came from open-pit mines.

Shipments of usable ore from mines totaled 87,580,942 gross tons in 1945. Of this quantity, 67,994,160 tons (78 percent) were direct shipping ore for all uses. Total shipments also included 1,562 tons for cement manufacture, 9,642 tons for paint, and 106,069 tons for miscellaneous uses. Shipments of byproduct ore for use in iron and steel totaled 555,773 tons in 1945 valued at $2,758,954.

[6] Cinder and sinter obtained from pyrites treated in, but not necessarily mined in, States indicated.

PRINCIPAL MINES

In this discussion, the size of a mine is determined by the quantity of crude ore excavated. Consequently, mines providing low-grade ores, which require concentration, will be comparable in size to mines producing similar quantities of direct shipping ores. Twenty-eight mines, each yielding more than 1,000,000 gross tons of crude ore, produced 56 percent of the United States output in 1945. Of these producers, 19 were in Minnesota, 3 in Alabama, 3 in New York, and 1 each in Utah, Wisconsin, and Pennsylvania; 20 were open-pit operations, 5 underground, and 3 combination mines. Except for 5 mines that produced magnetite, all the million-ton mines produced hematite.

[2] Includes Muscoda and Wenonah.
[3] Excludes an undetermined number of small pits. The output of these pits is included in the total given.

BENEFICIATION

Iron ore is concentrated by washing, jigging, tabling, and magnetic and high-density separation to remove objectionable impurities, thereby improving its grade. Fine ores are agglomerated or sintered into lumps, which are desirable in blast and steel furnaces because of their porous character and their improved grade and structure. Sintering likewise has a beneficial effect by reducing the sulfur and moisture content. At many mines the ore is crushed and screened to improve its physical characteristics, but ore known to be so improved is not included in the statistics on beneficiated ore.

In 1945, 20,089,960 gross tons of beneficiated ore were produced from 38,544,776 tons of crude ore. Beneficiation of iron ore was reported at 99 mines in 11 States in 1945 compared with 104 mines in 9 States in 1944. Beneficiated ore shipped from domestic mine plants in 1945 decreased 4 percent from 1944 and totaled 19,586,782 tons; concentrates comprised 19 percent and sinter 4 percent of total usable ore shipments.

The ratio of crude ore used to usable ore produced was 1.919:1 in 1945 compared with 1.867:1 in 1944.

Iron ore shipped from mines in the United States, 1925–29 (average), and 1941–45, in gross tons, and percentage of beneficiated ore compared to total shipped

[Exclusive of ore containing 5 percent or more manganese and ore sold for paint]

Year	Beneficiated	Total	Proportion of beneficiated to total (percent)	Year	Beneficiated	Total	Proportion of beneficiated to total (percent)
1925–29 (av.)	8,653,590	66,697,126	13.0	1943	[1] 20,117,685	[1] 98,817,470	20.4

[1] Includes ore for paint.

SINTER

Domestic sintering plants in 1945 used 10,835,840 gross tons of iron ore, 4,859,550 tons of flue dust, 493,587 tons of mill cinder and roll scale, 571,396 tons of pyrites cinder, and 1,184 tons of aniline sludge to produce 14,985,517 tons of sinter—a loss in weight of 11 percent.

Sinter production in 1945 came from plants at mines, blast-furnace plants, custom mills, and a number of rotary cement kilns converted to iron-ore roasting. Of the sinter produced in the United States in 1945, 22 percent was made at mine plants in 4 States and 78 percent was produced at blast-furnace plants and custom mills in 14 States.

Production and consumption of sinter in the United States in 1945, by States, in gross tons

State	Sinter produced	Sinter consumed: In blast furnaces	Sinter consumed: In steel furnaces

[1] Included with average for all States.
[2] Included with other States in 1945.
[3] Includes Arkansas and Washington in 1944, and Colorado, Missouri, New Mexico, and Wisconsin in 1945. Also includes California, Nevada, South Dakota, Texas, Virginia, and Wyoming in 1944 and 1945.
[4] Cinder and sinter obtained from pyrites treated in, but not necessarily mined in, States indicated.

The accompanying table gives the average value at the mines of the different classes of iron ore in 1945 for each of the producing States or groups of States, except when there are fewer than three shippers of a certain class of ore in a State and permission was not given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately. In general, the delivered cost less transportation costs to the consuming plant is given. In the Lake Superior district the mine value is the Lake Erie price less freight from mines to Lower Lake ports. This value appears to be applied also to ore which is not sold on the open market.

CONSUMPTION

A total of 86,158,495 gross tons of iron ore was reported consumed in 1945. Of this, 83 percent was consumed in iron blast furnaces, 12 percent in sintering plants, 4 percent in steel furnaces, and less than 1 percent in ferro-alloy furnaces. The 115,711 tons of "paint" and "all other" ore shipped from mines and mills in 1945 were assumed to have gone directly into consumption.

Consumption of iron ore in the United States, in 1945, by States and uses, in gross tons

STOCKS OF IRON ORE

Stocks of usable iron ore at mines on December 31, 1945, increased 7 percent over 1944. Of the quantity in stock piles, 40 percent was at mines in Michigan, 31 percent in Minnesota, and 4 percent in Wisconsin—a total of 75 percent in the Lake Superior district.

Stocks of crude ore at mines totaled 2,685,495 gross tons on December 31, 1945, compared with 2,869,226 tons in 1944.

Stocks of iron ore at consuming plants totaled 34,642,259 gross tons on December 31, 1945, compared with 32,914,774 tons at the end of 1944.

Stocks of usable iron ore at mines, December 31, 1944–45, by States, in gross tons

[1] Includes pyrites cinder.

Exports of iron ore, of which virtually all went to Canada, totaled 2,063,125 gross tons valued at $6,688,156. Canada received 2,062,992 tons valued at $6,684,499. Relatively insignificant quantities went to Colombia, Cuba, Mexico, Trinidad and Tobago, and United Kingdom.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

REVIEW OF LAKE SUPERIOR DISTRICT

Production and shipments.—Production of iron ore from mines in the Lake Superior district in 1945 was 5 percent lower than in 1944 but supplied 85 percent of the United States total compared with 84 percent in 1944. The Mesabi, largest of the six producing ranges, supplied 78 percent of the district total and 66 percent of the United States total. In addition to 74,821,045 gross tons of iron ore produced in the Lake district, 1,197,097 tons of manganiferous ore were produced, making a total output of all grades of 76,018,142 tons. The total shipments of 75,956,291 tons consisted of 1,257,613 tons containing over 5 percent manganese and 74,698,678 tons containing less than 5 percent.

Increased shipments from the Steep Rock mine, although smaller than expected, raised Canadian output; the Josephine-Ruth mine did not begin production in 1945, as was planned. Statistics covering output of these mines are not included in the Lake Superior totals.

The Lake Superior Iron Ore Association reported 74,752,161 tons of iron and manganiferous ore shipped to Upper Lake ports from United States mines in 1945, a decrease of 7 percent from 1944. All-rail shipments totaled 1,208,710 gross tons in 1945 compared with 1,182,995 tons in 1944. The 1945 shipping season opened early, and 7,235,142 tons were shipped from United States ports during April compared with 5,254,400 in April 1944. The first ore was loaded at Escanaba on April 2, 1945, and at the same port April 5 of the previous year. The final cargo of iron ore from the Lake Superior district was carried by the vessel *J. C. Williams*, which cleared Escanaba harbor on December 5. In 1944, the final cargo left Ashland harbor on November 28.

Iron ore produced in the Lake Superior district, 1854–1945, by ranges, in gross tons

[Exclusive after 1905 of ore containing 5 percent or more manganese]

Year	Marquette	Menominee	Gogebic	Vermilion	Mesabi	Cuyuna	Total
1854–1943	225,053,662	201,447,840	237,478,238	74,237,762	1,314,036,795	31,390,054	2,083,644,351

Total	234,438,731	209,876,909	247,098,033	77,185,585	1,434,386,138	34,591,320	2,237,576,716

Mining developments.—The trend from dependence on direct shipping ore to concentration of low-grade ores continued in 1945. The new screening-washing plant of the Inter-State Iron Co., at the Columbia mine at Virginia, Minn., which was operated experimentally in 1944, was put into full operation. A new washing plant at the Wabigon mine was completed in 1945. A second cone for high-density separation was installed at the Patrick plant at Cooley; there are now four plants on the Mesabi range using this method. Several new conveyor belts for moving ore from pit to loader or beneficiation plant were installed during the year. Among these were conveyors at the Gross Marble and Hill Annex mines. Development of the Jordan Reserve, 5 miles southwest of Grand Rapids, continued during 1945. This will be the westernmost mine on the Mesabi.

Research on the concentration of low-grade Mesabi ores was accelerated during 1945. Extensive work is being carried on by various companies, the Minnesota Mines Experiment Station, Minneapolis, and the Battelle Memorial Institute, Columbus, Ohio. In addition, the Oliver Iron Mining Co. is building a large laboratory at Duluth to study further present methods of concentration and the concentration of taconites, both magnetic and nonmagnetic. The Iron Range Rehabilitation and Resources Commission recently appropriated $300,000 for an experimental powdered iron plant on the Mesabi range, and $25,000 for a pilot plant to process peat for fuel in roasting iron ore and for other purposes.

The last important mine on the lower Menominee range, the Penn group, was exhausted and abandoned late in the year, after shipping 604,339 tons of ore during the 1945 season and having shipped almost continuously since 1887.

Exploration by the Federal Geological Survey and the Michigan Geological Survey Division continued during 1945.

Average costs, per gross ton, of mining iron ore at underground mines and at siliceous open pits in Michigan in 1945 [1]

Item	Underground				Siliceous open pits
	Gogebic	Marquette	Menominee	Average	
Cost of mining:					
Labor	$1.4657	$1.6948	$1.1478	$1.4367	$0.3074
Supplies	.6673	.7270	.5463	.6460	.2629
Deferred costs	.2628	.0473	.1348	.1366	.0431
Taxes	.2519	.2350	.1150	.2019	.0665
General overhead	.2180	.2264	.1551	.1984	.1235
Transportation	1.8875	1.5771	1.6725	1.7114	1.5604
Marketing	.0602	.0984	.0843	.0828	.0824
Total ore cost	4.8134	4.6060	3.8558	4.4138	2.4462
Lake Erie value per ton	4.9958	4.8960	4.5289	4.7849	2.6955
Gross ore profit [2]	.1824	.2900	.6731	.3711	.2493
Other costs:					
Royalty	.3222	.2032	.2118	.2388	.0882

[1] Pardee, F. G., General Statistics Covering Costs and Production of Michigan Iron Mines: Michigan Dept. of Conservation, Geol. Survey Div., 1946, 9 pp.
[2] This figure does not represent true profit, as much ore is sold below the Lake Erie price.

Analyses.—The following table was compiled by the Lake Superior Iron Ore Association.

Average analyses of total tonnages (bill-of-lading weights) of all grades of iron ore from all ranges of Lake Superior district, 1941–45

Year	Gross tons	Iron (natural)	Phosphorus	Silica	Manganese	Moisture
		Percent	*Percent*	*Percent*	*Percent*	*Percent*
1941	79,941,240	51.83	0.085	8.18	0.78	11.01
1942	92,069,902	51.65	.089	8.21	.79	10.98
1943	85,116,347	51.58	.091	8.32	.82	11.06
1944	81,039,404	51.72	.088	8.42	.74	11.02
1945	75,206,781	51.01	.088	8.41	.70	10.82

Stocks at Lake Erie ports.—On December 1, 1945, just before navigation stopped, the Lake Superior Iron Ore Association reported 4,814,991 tons of iron ore at Lake Erie ports compared with 5,472,556 tons in 1944. At the opening of the 1946 season (May 1, 1946), 3,019,184 tons of ore were in stock at these ports compared with 1,959,675 tons on May 1, 1945. Withdrawals from stocks during this 5-month period in 1945–46 were only about one-half that of a year ago.

Prices of Lake Superior ore.—Amendment 2 to Office of Price Administration Revised Maximum Price Regulation 113, effective December 29, 1945, granted price increases for Lake Superior iron ore ranging from 10 to 20 cents per gross ton. The increases were effective for the entire 1945 shipping season under an order issued a year before, which allowed the industry to quote prices subject to adjustments allowed by OPA. The price agency found from its studies that underground mining operations, which supply the bulk of the merchant ore, were being carried on at a loss. Consequently, greater increases were allowed the underground mines. The increases apply only to ore shipped for sale, or to about 19,000,000 tons in 1945. The new ceiling prices per gross ton for standard (51.50 percent iron) iron ores and the amount of increases were as follows: Mesabi Non-Bessemer, \$4.55, an increase of 10 cents; Mesabi Bessemer, \$4.70, an increase of 10 cents; Old Range Non-Bessemer, \$4.80, an increase of 20 cents; Old Range Bessemer, \$4.95, an increase of 20 cents; High Phosphorus, \$4.55, an increase of 20 cents. Prices of manganiferous, siliceous, and lump ores were increased 20 cents.

Reserves.—The following tables showing reserves of iron ore in Michigan and Minnesota were compiled by the Michigan Department of Conservation and the Minnesota Department of Taxation, respectively. It should be borne in mind that these data represent only taxable and State-owned reserves and do not represent the total that

Iron-ore reserves in Michigan, January 1, 1942–46, in gross tons

Range	1942	1943	1944	1945	1946
Gogebic	30, 073, 528	32, 901, 951	32, 791, 848	32, 686, 550	31, 828, 392

Filmore County			250, 000	259, 859	231, 393	
State ore (not taxable)	21, 376, 816	19, 304, 808	31, 978, 475	16, 672, 818	13, 000, 996	19, 865, 715
	1, 222, 204, 911	1, 195, 336, 033	1, 181, 296, 240	1, 137, 746, 490	1, 108, 067, 528	1, 054, 165, 393

may be expected to become available. Pehrson [2] has shown that 33 percent of the United States reserves of commercial ore, or about 1.8 billion tons, occurs in the Lake Superior district.

MINING BY STATES

Alabama.—Production of crude ore in Alabama, the third largest producing State, dropped 18 percent in 1945 from 1944. Output of brown ore, all from open-pit operations, decreased 28 percent and that of hematite, all from underground mines, declined 12 percent. Ninety percent of the brown ore came from mines in Franklin, Colbert, Tuscaloosa, and Bibb Counties. The hematite was produced at the Red Mountain group, Sloss-Sheffield's Sloss Nos. 1 and 2 mines, and the Spaulding mine of Republic Steel Corp. All hematite was from Jefferson County.

Tennessee Coal, Iron & Railroad Co.'s Red Mountain group produced hematite, some of which was sintered before consumption and the rest crushed and blended and shipped direct to furnaces. Sinter was also produced at the Spaulding mine. Hematite from this mine was concentrated and mixed with pyrites cinder from Virginia and other materials before being sintered. Sinter produced from materials other than iron ore has been excluded from Alabama mine statistics but has been credited to sinter production at consuming plants. A process for concentrating Alabama red ore by flotation is described by Clemmer and others.[3]

Labor shortages in Alabama were responsible for the decline in mine output, and local supplies had to be supplemented during the year by shipments of 115,474 gross tons of Lake Superior ore from stocks at Gary, Ind. Twenty-one mines were active in Alabama in 1945 compared with 28 in 1944 and 52 in 1943.

California.—Production of crude ore in California fell to 280,573 gross tons in 1945 from 845,260 tons in 1944. This sharp drop is attributed to a substantial shift of Kaiser Steel Co.'s source of iron ore from its Vulcan mine in San Bernardino County to the Walker Iron Mining Co. operation in southwestern Utah. Although one-half, or 141,823 tons, of California's 1945 output was from the Vulcan, this mine in 1944 produced 695,233 tons. The hematite ore in 1945 averaged 52.04 percent Fe (natural) and was shipped directly to the blast furnace at Fontana. Aside from the output of the Vulcan mine, Santa Cruz and Shasta Counties produced 138,750 tons of magnetite, all of which was beneficiated by table concentration, crushing, and washing. The 66,786 tons of concentrate recovered together with 488 tons from stock comprised the 67,274 tons of magnetite shipped for use as ship ballast. Ballast ore is usually graded according to specific gravity.

Colorado.—The Bruce mine at Leadville, Lake County, carried on exploration work during the last 2 months of 1945 and shipped 117 tons of hematite to blast furnaces at Pueblo. The mine is operated by Stiron Metals, Ltd.

[2] Pehrson, Elmer W., The Mineral Position of the United States and the Outlook of the Future: Min. and Met., vol. 26, No. 460, April 1945, p. 209.

[3] Clemer, J. Bruce, Clemmons, B. H., Rampacek, Carl, Williams, M. F., Jr., and Stacy, R. H., Beneficiation of Iron Ores by Flotation: Bureau of Mines Rept. of Investigations 3799, 1945, 42 pp.

Georgia.—The output of Georgia totaled 1,352,050 gross tons of crude ore—4 percent less than in 1944. After washing, 276,050 tons were recovered and shipped for use in making pig iron and steel. Georgia's output consisted entirely of brown ore mined by open-pit methods and was centered in Bartow, Polk, and Whitfield Counties. The Hodge Mining operation in Bartow County was the largest in the State.

Michigan and Minnesota.—See Review of Lake Superior District.

Missouri.—Production of crude ore in Missouri rose from 19,282 gross tons in 1944 to 257,591 tons in 1945. This large increase was brought about by the reopened (December 1944) Iron Mountain mine of the M. A. Hanna Co. in St. Francois County. After crushing and jigging, the hematite from this pit averaged 54.86 percent Fe (natural). A small tonnage of brown ore was produced at various mines by Chapman, Doane & Ives.

Nevada.—With the drop in demand for ballast by West coast shipyards, production of magnetite in Nevada dropped from 36,581 gross tons in 1944 to 6,196 tons in 1945. All of the ore was mined in Pershing County, mostly by Segerstrom and Heizer; 54 percent was for ballast, 45 percent for metallurgical purposes, and 1 percent for cement.

New Jersey.—The output of crude ore from New Jersey mines totaled 855,470 gross tons in 1945, 21 percent less than in 1944. All came from underground mines in Morris and Warren Counties; some was shipped directly to consumers, but most was concentrated magnetically. The Alan Wood Steel Co., largest producer, operated the Scrub Oaks mine in Morris County and the Washington mine in Warren County. The Warren Foundry & Pipe Co. operated the Mount Hope mine and the Richard Ore Co. the Richard mine; both are in Morris County.

New Mexico.—The St. Louis Smelting & Refining Co. El Paso iron claim at Hanover, Grant County, shipping magnetite, supplied the State total of 369 tons in 1945.

New York.—Crude magnetite was produced from six mines in the Adirondack district in 1945. The Benson mine of the Jones & Laughlin Ore Co. in St. Lawrence County was the largest producer of crude ore in New York; a total of 1,558,457 tons was mined during the year compared with 984,020 tons in 1944. The MacIntyre mine of National Lead Co. was the second largest producer followed by Republic Steel Co. New Bed-Harmony-Old Bed mine, which was first in 1944. All the ore from the three mines was concentrated and sintered except the lump ore from Republic's mine, which was shipped directly to furnaces.

The hematite produced in New York came from the mine of Clifton Metallic Paint Co. in Oneida County.

Pennsylvania.—Except for the small tonnage of carbonate and brown ore from Carbon and Centre Counties, respectively, the entire output consisted of magnetite from the Cornwall mine in Lebanon County. Ore from Cornwall is shipped to Lebanon, where it is concentrated magnetically and treated further by flotation to remove chalcopyrite, pyrite, and other minerals. Some magnetite concentrates are sintered, and some are shipped to consuming plants for sintering.

The Prince Manufacturing Co. mined carbonate ore from the Hazard and Little Gap mine, and the small tonnage of brown ore was produced by the Scotia Mining Co., which concluded its operation of the Scotia mine on June 18.

South Dakota.—Paint ore was produced at the Rochford mine, formerly Iron Lode, by the Lor Mining Co. which took over the operation from John Lessering on May 1, 1945.

Texas.—Brown ore was mined at the Lone Star Steel Co. Lone Star mine in Morris County and was shipped to furnaces at Birmingham and Gadsden, Ala. At the end of 1945, the Lone Star's blast furnace at Daingerfield had not yet been blown in. Sheffield Steel Co. North Basin and Mount Haven mines, in Cass and Cherokee Counties,

[2] Includes output from 1 plant reprocessing tailings.

produced brown ore in 1945 for use at its blast furnace at Houston.

Hematite was mined and shipped by Tillie B. Moss from the Iron Mountain mine in Llano County.

Utah.—The iron ore mined in Utah in 1945 was semi-altered magnetite from open-pit mines in Iron County. The active mines during the year were the Iron Mountain, Duncan, Walker Iron Mining Co., and Great Western.

The Iron Mountain mine, operated by the Columbia Iron Mining Co., supplied the ore for blast and steel furnaces at Geneva and Provo, Utah; the Duncan mine of the Colorado Fuel & Iron Corp. shipped ore to the blast furnaces at Pueblo, Colo.; and the Walker Iron Mining Co. shipped to the Kaiser Co. plant at Fontana, Calif. Iron ore from the Great Western mine, operated by Helene E. Beatty, was shipped to steel furnaces in the San Francisco area.

Virginia.—In 1945, as in 1944, the only output from Virginia consisted of brown ore produced at the American Pigment Co. mine at Hiwassee, Pulaski County. The ore was hand picked at the mine and washed at the mill before being used as pigment.

Wisconsin.—See Review of Lake Superior District.

Wyoming.—Hematite for Pueblo (Colo.) furnaces was mined at the Sunrise mine in Platte County by the Colorado Fuel & Iron Corp. during 1945.

EMPLOYMENT AT IRON MINES

Complete data on employment at iron mines in 1945 are not yet available. Preliminary figures indicate an 8-percent decline in the number of workers from 1944. The average number employed is estimated at 26,900 men working 61,650,000 man-hours to produce 89,056,050 gross tons of ore—an average of 1.44 tons per man-hour, virtually unchanged from 1944. The above data and the table that follows include manganiferous ore in the Lake Superior district, which is treated by the trade as a special grade of iron ore.

Employment at iron-ore mines and beneficiating plants, quantity and tenor of ore produced, and average output per man in 1944, by districts and States [1]

[1] In addition to the countries listed China, Egypt, Eritrea, Finland, French West Africa, and Madagascar report production of iron ore, but complete data are not available.
[2] Production of Tofo mines. [3] Data not available. [4] Bohemia, Moravia, and Slovakia. [5] Estimate included in total.
[6] Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese. [7] Estimate. [8] Exports.
[9] U. S. S. R. in Asia included with U. S. S. R. in Europe.
[10] Exclusive of bog ore, which is used mainly for purification of gas. [11] Croatia only.
[12] January to July, inclusive.

REVIEW BY COUNTRIES

Algeria.—The Ouenza-Boukadra group of mines, which normally supplies two-thirds of the iron-ore output of Algeria, was virtually the only producer in 1945. The other producers are the Zaccar, Dj Bou, Amorane, and Tinezrit. Shipments of ballast ore from the Kelousha-Beni Saf mines dropped sharply in the second quarter of 1945.

Canada.—The new ore dock at Port Arthur, Ontario, opened July 21, 1945, when the steamship *Marquette* took out 7,300 tons of Steep Rock ore. The docks have a storage capacity of 30,000 tons and an annual loading capacity of 2,000,000 tons.

Steep Rock mine shipped a total of 505,375 gross tons of iron ore in 1945, and the Helen mine in the Michipicoten range shipped 513,804 tons. Most of this is exported to the United States; receipts of Canadian ore (including some pyrites cinder) totaled 704,225 gross tons. However, Canada is largely dependent upon United States ore and in 1945 imported 2,062,992 tons.

Colombia.—Wide interest is being shown in plans of the Colombian Government to organize a domestic iron and steel industry, using the iron-ore deposits at Paz del Rio on the Chicamoch River. The Instituto de Fomento Industrial has a 30-year concession to exploit the ore on the west side of the river. Reserves are reported to be 50 million tons of iron ore ranging from 38 percent to 50 percent Fe, 6 to 20 percent SiO_2, 1 percent P, 6 percent Al_2O_3, and less than 0.2 percent S. The ore occurs at depths requiring underground mining methods. The steel plant is to be constructed at Belencito.

Chile.—Chilean output of iron ore in 1945 was hematite supplied by the Tofo mine in Coquimbo Province. This ore, which averaged (natural) 62.99 percent Fe, was shipped to local blast furnaces at Corral near Valdivia and to the United States. Production totaled 929,945 gross tons and shipments amounted to 234,305 tons. United States imports from Chile totaled 214,670 tons.

Cuba.—Except for a small experimental production (302 gross tons) from the Mayari mine in Oriente Province, there was no output in Cuba during 1945.

PIG IRON, FERRO-ALLOYS, AND STEEL

By NORWOOD B. MELCHER AND JOHN HOZIK [1]

SUMMARY OUTLINE

GENERAL SUMMARY

Successive cut-backs in steel requirements following VE-day resulted in an 11-percent decrease in production of ingots and castings during 1945. The operating rate dropped from 92 percent of capacity in May to 87 percent in June; after July the monthly operating rate did not exceed 80 percent, and consequently only 46 percent of the 1945 total was produced during the last 6 months. Output of steel ingots and castings totaled 79,701,648 net tons compared with 89,641,600 tons in 1944. Delays in steel deliveries began in January, when heavy snows forced transportation to a virtual standstill, and persisted throughout 1945. Following this, orders were placed for war materials in preparation for the 1945 offensives. This new demand resulted in efforts by the War Production Board to direct steel into arms production, and deliveries of much Controlled Materials Plan tonnage were held up. In March, United Nations military successes in Europe resulted in cut-backs in orders for war material, which delayed further deliveries of steel products. A Navy program for construction of 84 combat ships was reduced to 12, which adversely affected steel rolling in April. In the same month the shell program was reduced 10 percent, and reductions in merchant shipbuilding released 120,000 tons of plates and 40,000 tons of shapes. Order cancellations continued through June and July, and steel production dropped to 60 percent of capacity during the week following Japan's capitulation in August. Civilian demands caused steel production to rise during the closing months, but not to the wartime rate. The

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Controlled Materials Plan, which proved successful in expediting war production for many months, was made ineffective on September 30, 1945. A plan for voluntary rationing was begun by steel producers late in the year.

Salient statistics of pig iron, ferro-alloys, and steel in the United States, 1944–45

	1944		1945	
	Net tons	Value	Net tons	Value
Pig iron:				
Production	61,003,759	[1]	53,224,213	[1]

Acid	1,195,659		869,726	
Bessemer	5,039,923	[1]	4,305,318	[1]
Crucible	25		24	
Electric	4,237,699		3,456,704	
	89,641,600	[1]	79,701,648	[1]
Shipments to consuming industry	60,352,690	[1]	57,242,240	[1]

[1] Data not available.

Shipments of steel products to consuming industries declined from 60,352,690 net tons in 1944 to 57,242,240 tons in 1945. This decline was more than explained by a drop in deliveries to the shipbuilding industry. This industry reached enormous proportions during the war; and in 1943, a total of 1,896 ships were launched, representing a deadweight tonnage of 19,000,000 tons. In 1944, the industry used 10,287,299 tons of steel and was still the largest consumer, but in 1945 shipments dropped to 2,719,415 tons. Of the latter quantity, naval vessels used 1,169,367 tons and commercial vessels 1,550,048 tons. At the close of 1945, shipyards were considering conversion to peacetime products, including freight cars, oil-refinery fabrication work, and prefabricated houses. Railroads did not show the upsurge in construction and rehabilitation that was expected to follow the close of World War II. Deliveries to that industry declined from 5,424,798 tons in 1944 to 5,121,197 tons in 1945. Containers used 17 percent more steel than in 1944, and the construction industry used 5 percent more. Although the potential requirements of the automobile industry are very large, there was no substantial increase in receipts of steel in 1945.

Pig iron continued under specific ceiling prices during 1945, but two increases were granted during the year—the first since prices were frozen at the late 1940 level by the Office of Price Administration. An increase of $1 per gross ton was made effective February 14, 1945, and a second increase of $0.75 on all grades except charcoal became effective on October 23. Interim price increases on fine steel products became effective January 11, 1945. Hot-rolled carbon plates and sheets advanced $2 per ton, galvanized sheets and steel rails $3 per ton, and nails and staples other than galvanized $5 per ton. Effective May 23, further increases were announced, which applied to the schedule of April 16, 1941, and included the interim prices of January 1945. Carbon semifinished steel advanced $2 per ton; carbon steel

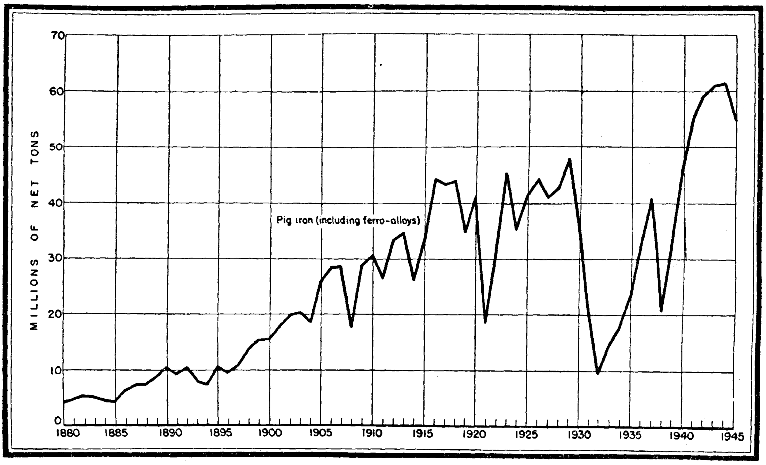

FIGURE 1.—Trend in production of pig iron in the United States, 1880–1945.

tube rounds and billets, $4; carbon plates, $3; rails, except light, $3; light rails, $5; tin plate, $3 per net ton; carbon hot-rolled bars and bar shapes, $2 per gross ton; carbon wire rods, $3; carbon manufacturers' and merchants' wire, $3; nails and staples, except galvanized, $7; twisted barbless and barbed wire, $2; bail ties, $7; hot-rolled sheets, $2; galvanized sheets, $2; and track spikes, $5. On August 6 a further increase of $2 per ton on cold-finished bars became effective.

PIG IRON

PRODUCTION AND SHIPMENTS

Domestic production of pig iron in 1945, exclusive of ferro-alloys, decreased 13 percent from the record year 1944. Output comprised 53,176,388 net tons using coke and 47,825 using charcoal as fuel. Pennsylvania continued its position as the largest producer of pig iron in 1945, with 30 percent of the total; Ohio ranked second with 21 percent.

Pig iron produced and shipped in the United States, 1944–45, by States

State	Produced		Shipped from furnaces			
	1944	1945	1944		1945	
	Net tons	Net tons	Net tons	Value	Net tons	Value

CONSUMPTION OF METALLIFEROUS MATERIALS

The production of pig iron in 1945 required 95,128,548 tons of iron ore, sinter, and manganiferous iron ore, 3,228,516 tons of mill cinder and roll scale, 3,450,162 tons of open-hearth and Bessemer slag, 2,049,140 tons of purchased scrap, and 62,661 tons of miscellaneous material, an average of 1.952 tons of metalliferous materials (exclusive of home scrap and flue dust) per ton of pig iron made.

Of the pig iron manufactured in 1945, it is calculated that 179,587 tons valued at $3,859,947 were made from 338,014 tons of foreign ores, including ore from Africa, Canada, Chile, Cuba, and Mexico, indicating an average yield of 53.13 percent from imported ore. Domestic ore and sinter (94,790,534 tons) and other materials (8,790,479 tons) totaling 103,581,013 tons were reported as used in the manufacture of 53,044,626 tons of pig iron, indicating an average pig-iron yield of 51.21 percent from domestic materials. In addition, 1,289,537 tons of home scrap and 98,934 tons of flue dust were consumed in making pig iron in 1945.

Alabama furnaces used red hematite from Jefferson County, Ala., and the Lake Superior district, brown ore from Alabama and Georgia, and sintered brown ore from Texas. Manganese-bearing ores of domestic and Mexican origin were also used. Because of the preponderance of relatively low-grade ore used in Alabama furnaces, the consumption of ore per ton of pig iron is higher than in any other State.

The iron ore used at Fontana, Calif., furnaces came from the Vulcan mine in San Bernardino County, Calif., and the Senter Walker mine in Iron County, Utah. Manganese ore from Lower California was also used.

Maryland furnaces used foreign iron ore from Africa, Chile, and Cuba, as well as manganiferous ore and iron ore from the Lake Superior district.

Blast furnaces in Illinois, Indiana, Kentucky, Michigan, Minnesota, and West Virginia used Lake Superior iron ore and manganiferous iron ore almost exclusively.

In New York the furnaces in the Buffalo district used ore from the Lake Superior district and Canada and magnetite from New York; the furnace at Troy consumed magnetite sinter from the Chateaugay mine at Lyon Mountain, N. Y.

Ohio blast furnaces consumed magnetite sinter from New York and hematite from the Lake Superior district, both domestic and Canadian.

Virtually all the ore consumed in western Pennsylvania furnaces came from the Lake Superior district. Those in the eastern part of the State used some Lake ore, some magnetite ores from Pennsylvania, New Jersey, and New York, and some ore from Africa.

The Colorado furnaces used hematite from the Sunrise mine in Wyoming, semialtered magnetite from the Duncan mine (Utah), and magnetite and manganese-bearing ores from New Mexico.

The Utah furnaces used semialtered magnetite from the Iron Mountain mine near Cedar City, Utah, and manganese-bearing ores, chiefly from Nevada and Utah. The sinter used was produced at Geneva and Provo from Iron Mountain fine ore.

The Houston, Tex., furnace used brown ore from eastern Texas and iron and manganese ore from Mexico.

Iron ore and other metallic materials consumed and pig iron produced, 1944–45, by States, in net tons

VALUE AT BLAST FURNACES

The average value of all grades of pig iron given in the following table is based upon reports of producers to the Bureau of Mines. The figures represent the values f. o. b. blast furnaces and do not include the values of ferro-alloys. The general average value for all grades of pig iron at the furnaces was $22.01 a net ton in 1945 compared with $20.97 in 1944.

Average value per net ton of pig iron at blast furnaces in the United States, 1940–45, by States

State	1940	1941	1942	1943	1944	1945
Alabama	$14.30	$17.25	$17.30	$17.35	$17.34	$18.39

CONSUMPTION

Consumption of pig iron in 1945 decreased 13 percent from 1944. Pig iron, a product of the blast furnace, is a semiraw material and, except for the small quantity used in direct castings, moves to steel- or iron-melting furnaces for further refining, alone or mixed with other ingredients. In 1945, 88 percent of the pig iron went to steel-making furnaces (open-hearth, bessemer, and electric) to be processed into steel. Direct castings took 4 percent and the remaining 8 percent was consumed in iron-making furnaces, of which the cupola is the most important. It is noteworthy that during 1945 pig-iron consumption in cupola furnaces increased 124,000 net tons over 1944 and 463,000 tons over 1943, whereas all other furnaces showed a decrease. This is an outcome of the progressive increase in supply of Foundry pig iron during the last few years. Pig iron was used to replace purchased scrap, as indicated by a 233,000 net ton decrease in purchased-scrap consumption in 1945 from 1944 and a drop of 808,000 tons from 1943.

Consumption of pig iron in the United States, 1942–45, by type of furnace

Type of furnace or equipment	1942		1943		1944		1945	
	Net tons	Percent of total	Net tons	Percent of total	Net tons	Percent of total	Net tons	Percent of total

[1] Some pig iron used in making direct castings included in cupola.
[2] Less than 0.05 percent.

Plants using pig iron in 1945 were located in all 48 States and the District of Columbia, but consumption is concentrated largely in the steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas in 1945 used about 97 percent of the pig iron, Pennsylvania (the leading consumer) taking about 31 percent of the total and Ohio (the second-largest consumer) 20 percent.

[1] Pig iron is produced in Chile, New Zealand, and Philippine Islands, in addition to the countries listed, but production figures are not available.
[2] Year ended June 30.
[3] Estimate included in total for 1940; data not available for other years.
[4] Estimate.
[5] Estimated production includes Manchuria.
[6] Unoccupied China.
[7] Approximate production as published by Steel, vol. 196, No. 1, January 1940, p. 269.
[8] Included in German figure in 1940.
[9] Approximate production as published by Iron Age, vol. 147, No. 1, Jan. 2, 1941, p. 61.
[10] Excluding Lower Rhine and Moselle; data not available on those areas.
[11] Beginning with March 1935, production of the Saar included with that of Germany.
[12] Excluding ferro-alloy production, for which data are not yet available.
[13] Croatia only.

FERRO-ALLOYS

PRODUCTION AND SHIPMENTS

The production of ferro-alloys in 1945 totaled 1,732,423 net tons compared with 1,893,855 tons in 1944—a decrease of 9 percent. In 1945 ferro-alloys were made at 15 blast-furnace plants, 25 electric-furnace plants, and 3 aluminothermic plants. The 25 electric-furnace plants include 5 plants that made ferrophosphorus and 2 plants that made ferrosilicon as a byproduct. Shipments of all classes of ferro-alloys in 1945 decreased 11 percent in quantity and 14 percent in value from 1944. Pennsylvania again was by far the largest producer and shipper of ferro-alloys in 1945, both in tonnage and value. Of the ferro-alloys shipped in 1945, Pennsylvania contributed 35.8 percent of the total tonnage and 42.1 percent of the total value; New York was second, with 17.3 percent of the tonnage and 22.9 percent of the value.

A description of German ferro-alloy operations was given by Kinzel [2] during 1945.

Ferro-alloys produced and shipped from furnaces in the United States, 1944–45

Alloy	1944			1945		
	Production (net tons)	Shipments		Production (net tons)	Shipments

	1,893,855	1,860,956	246,014,039	1,732,423	1,661,657	210,509,657

[1] Silicomanganese, manganese briquets, ferrochromium, ferrocolumbium, ferroboron, zirconium-ferrosilicon, alsifer, grainals, and simanal.

Ferromanganese.—The ferromanganese produced in 1945 averaged 79 percent manganese and came from eight blast-furnace plants and two electric-furnace plants. Of the manganese ore used in 1945 in the manufacture of ferromanganese, 90.2 percent was from foreign sources. During 1945 steel producers used 13.5 pounds of metallic manganese as ferro-alloys per ton of steel produced. Of this quantity, 12 pounds were in the form of ferromanganese. In addition to the 13.5 pounds, 0.1 pound was added directly to the steel in the form of manganese ore. A total of 641,622 tons of ferromanganese was consumed during the year—virtually all by the iron and steel industry. A detailed discussion of manganese alloys appears in the chapter on Manganese.

Spiegeleisen.—Production of spiegeleisen in 1945 dropped 16 percent from 1944, but shipments from furnaces were 2 percent greater. The output came from five blast-furnace plants and averaged 19.74 percent manganese. Shipments in 1945 totaling 157,774 tons were valued at $5,108,144 f. o. b. furnaces or $32.38 per ton compared with $31.23 in 1944 and $32.16 in 1943. Six-tenths of a pound of manganese metal in the form of spiegeleisen was used per ton of steel produced in 1945.

Ferrosilicon.—With respect to tonnage produced and shipped, ferrosilicon in 1945 supplanted ferromanganese as the most important ferro-alloy. Of the 660,403 tons of ferrosilicon produced, 36 percent or 237,274 tons were made in blast furnaces and 64 percent or 423,129 tons in electric furnaces. Included in the latter figure are 415 tons of ferrosilicon produced as a byproduct in the manufacture of artificial

[2] Kinzel, A. B., Ferro-Alloy Manufacture and Use: U. S. Office of Military Government for Germany November 8, 1945, 15 pp.

abrasives. The silicon content of the blast-furnace output averaged 9.6 percent and that of the electric furnace 41 percent. Ferrosilicon containing 5 to 20 percent silicon is classified as silvery pig iron. Shipments of all grades of ferrosilicon in 1945 declined 10 percent from 1944 and totaled 615,596 tons valued at $34,968,350. Exports in 1945 totaled 1,089 net tons valued at $114,520. Imports were 23,067 tons and averaged 31 percent silicon.

In 1945 steel plants used about half of the total consumption of silvery pig iron (iron foundries used most of the remainder) and over 90 percent of the other grades of ferrosilicon. In the manufacture of steel, alloys of low silicon content are used as deoxidizers and scavengers, whereas, in the manufacture of iron castings, this type is used for the alloying effect of the silicon. The most important grade of ferrosilicon is the standard 50 percent, which is used as a deoxidizer and solidifier in the manufacture of most grades of killed and semi-killed steel. Only a small quantity of this alloy is used in foundries and other industries. Alloys containing 75 percent silicon and over are used as ladle additions in gray-iron foundries and in the manufacture of high-silicon steels for use in electrical equipment and high-silicon spring steel. Another important use of ferrosilicon is in the beneficiation of low-quality ores. In the beneficiation process, finely ground 15-percent ferrosilicon is added to water and agitated—the resulting high-density fluid floats a part of the feed, which may be either the valuable portion or the waste.

Consumption of ferrosilicon, silicon metal, and miscellaneous silicon alloys in the United States in 1945, by industries, in net tons [1]

Alloy	Steel ingots and castings [2]	Steel castings [3]	Miscellaneous	Total
Silvery pig iron: 5-20 percent silicon	149, 974	17, 282	165, 639	332, 895
Ferrosilicon:				
50 percent silicon	140, 292	20, 507	12, 945	173, 744
75 percent silicon	39, 444	290	4, 049	43, 783
Other grades [4]	26, 699	555	26, 301	53, 555
	356, 409	38, 634	208, 934	603, 977

[1] As reported by companies that account for about 96 percent of the total consumption.
[2] Includes only that part of castings made by companies that also produce steel ingots.
[3] Excludes companies that produce both steel castings and steel ingots.
[4] Includes grades of ferrosilicon not listed separately and other miscellaneous silicon alloys.

Ferrophosphorus.—All ferrophosphorus in 1945 was produced in electric furnaces as a byproduct in the manufacture of phosphate fertilizers and other chemicals. Shipments from producing plants totaled 10,358 net tons valued at $623,791 compared with 7,504 tons valued at $473,084 in 1944. Exports in 1945 totaled 603 net tons valued at $42,204.

Ferrotungsten.—Output of ferrotungsten in 1945 dropped to 4,107 net tons from 6,696 tons in 1944 and 7,561 tons in 1943. Shipments in 1945 contained 79.65 percent (6,351,054 pounds) tungsten and were valued at $1.868 per pound of contained metal. The ferrotungsten was produced in electric furnaces from both domestic and foreign ores. Four hundred thirty-one net tons were exported in 1945.

Ferrochromium.—Ferrochromium, an electric furnace product, was produced by four companies in six States during 1945. Industrial consumers reported using 144,447 net tons of ferrochromium in 1945 compared with 159,911 tons in 1944. Exports in 1945 totaled 1,471 tons.

Ferromolybdenum.—The bulk of the ferromolybdenum produced in 1945 was made by the aluminothermic process; some was made in electric furnaces. All was produced in Pennsylvania and averaged 62.8 percent molybdenum. Eight hundred eighty-four net tons valued at $1,050,863 were exported.

Molybdic oxide, calcium molybdate, and molybdenum compounds.—As these compounds are used as alloying agents in the production of iron and steel, they are included with ferro-alloys. These materials are considerably less expensive than ferromolybdenum and consequently are used to a greater extent; the Mo content averaged 54.3 percent in 1945.

Ferrotitanium.—Virtually all of the ferrotitanium produced in 1945 was made in electric furnaces—a little was produced by the aluminothermic process. The ferrotitanium produced in 1945 averaged 20 percent titanium, and both foreign and domestic ores were consumed in its manufacture. Ferrotitanium is used as a deoxidizer and scavenger in steel manufacture. When used as a deoxidizer, ferrotitanium is charged in combination with silicon or some other deoxidizing agent, the titanium alloy being added as a final purifier. As an alloying agent, ferrotitanium prevents intergranular corrosion. Combined exports of ferrotitanium and ferrocarbontitanium in 1945 totaled 744 net tons valued at $122,887.

Ferrovanadium.—In 1945 ferrovanadium was produced by electric and aluminothermic processes using foreign and domestic ores. The alloy averaged 43 percent vanadium compared with 44 percent in 1944. A total of 86 net tons was exported in 1945.

Silicomanganese.—The silicomanganese produced in 1945 averaged 68 percent manganese and was produced in electric furnaces.

Manganese briquets.—The foundry industry is the principal user of manganese briquets, the alloy being added to molten iron to overcome the harmful effects of sulfur and to act as a deoxidizer and scavenger. The briquets produced in 1945 averaged 58 percent manganese.

Ferroboron.—Shipments of ferroboron in 1945 averaged 14.6 percent boron. Ferroboron is used in special steels as a hardening agent, but it is also a highly efficient deoxidizer.

Ferrocolumbium.—Ferrocolumbium is used in stainless steels to prevent intergranular corrosion. It also reduces air hardening and oxidation at high temperatures in chromium steels. In 1945 the output of ferrocolumbium averaged 56 percent Cb and was produced in electric furnaces.

Zirconium-ferrosilicon.—The zirconium-ferrosilicon produced in 1945 averaged 14 percent Zr. Zirconium is a powerful deoxidizer and scavenger, reduces age hardening, and thereby improves deep drawing properties of sheet steel. It is used as a substitute for ordinary ferrosilicon and is more effective.

Producers of ferro-alloys in the United States in 1945

Producer	Plant	Alloy
American Agricultural Chemical Co.	South Amboy, N. J.	Ferrophosphorus (byproduct).
Bethlehem Steel Co.	Johnstown, Pa.	Ferromanganese.
Climax Molybdenum Co.	Langeloth, Pa.	Ferromolybdenum, calcium molybdate, molybdenum oxide, oxide briquets, molybdenum trioxide, molybdenum silicide.
Electro Metallurgical Co.	Alloy, W. Va. Ashtabula, Ohio Columbiana, Ohio Holcomb Rock, Va. Niagara Falls, N. Y. Portland, Oreg. Sheffield, Ala. Spokane, Wash.	Ferromanganese, silicomanganese, manganese briquets, ferrosilicon, silicon briquets, zirconium-ferrosilicon, ferrochromium, chromium briquets, ferrotungsten, ferrovanadium, ferromolydenum, ferrotitanium, ferroboron, and ferrocolumbium.
General Abrasive Co., Inc.	Niagara Falls, N. Y.	Ferrosilicon (byproduct).
Globe Iron Co.	Jackson, Ohio	Silvery pig iron.
Hanna Furnace Corp.	Buffalo, N. Y.	Do.
Inland Steel Co.	E. Chicago, Ind.	Spiegeleisen.
Jackson Iron & Steel Co.	Jackson, Ohio	Silvery pig iron.
Keokuk Electro-Metals Co.	Keokuk, Iowa	Ferrosilicon and silvery pig iron.
E. J. Lavino & Co.	Reusens, Va. Sheridan, Pa.	Ferromanganese.
Metal & Thermit Corp.	Jersey City, N. J.	Ferrotitanium.
Molybdenum Corporation of America.	Washington, Pa.	Ferrotungsten, ferromolybdenum, calcium molybdate, molybdenum oxide, ferroboron.
Monsanto Chemical Co.	Anniston, Ala. Columbia, Tenn.	Ferrosilicon (byproduct), ferrophosphorus (byproduct).
New Jersey Zinc Co.	Palmerton, Pa.	Spiegeleisen.
Ohio Ferro-Alloys Co.	Philo, Ohio Tacoma, Wash.	Ferrosilicon simanal, ferrochromium.
Permanente Metals Corp.	Permanente, Calif.	Ferrosilicon and silicon briquets.
Phosphate Mining Co.	Nichols, Fla.	Ferrophosphorus (byproduct).
Pittsburgh Metallurgical Co.	Charleston, S. C. Niagara Falls, N. Y.	Ferrosilicon, silvery pig iron, and ferrochromium.
Sloss-Sheffield Steel & Iron Co.	N. Birmingham, Ala.	Ferromanganese.
Southern Ferro Alloys Co.	Chattanooga, Tenn.	Ferrosilicon.
Tennessee Products Corp.	Rockwood, Tenn.	Ferromanganese.
Tennessee Valley Authority	Muscle Shoals, Tenn.	Ferrophosphorus (byproduct).
Titanium Alloy Mfg. Co.	Niagara Falls, N. Y.	Ferrotitanium.
United States Steel Corp. Subsidiaries.	Ensley, Ala. Gary, Ind. Clairton, Pa. Duquesne, Pa. Etna, Pa.	Ferromanganese and spiegeleisen.
Vanadium Corporation of America.	Niagara Falls, N. Y. Bridgeville, Pa.	Ferrosilicon, silicon briquets, alsifer, ferrochromium, ferrovanadium, ferrotitanium, and grainals.
Victor Chemical Works	Mt. Pleasant, Tenn.	Ferrophosphorus (byproduct).

FOREIGN TRADE

Imports and exports of the rarer ferro-alloys are not recorded separately but are grouped as shown in the following tables. Ferrosilicon comprised most of the imports in 1944; ferromanganese supplied the bulk in 1945.

Ferro-alloys and ferro-alloy metals imported for consumption in the United States, 1944–45, by varieties

Variety of alloy	1944			1945		
	Gross weight (net tons)	Content (net tons)	Value	Gross weight (net tons)	Content (net tons)	Value
Ferromanganese:						
Containing over 1 percent carbon	4,199	3,308	$394,641	----	----	----
Containing not less than 4 percent carbon	----	----	----	35,521	27,694	$3,733,846

[1] Includes ferrosilicon, ferrotungsten, ferrovanadium, and other ferro-alloys.

STEEL

GENERAL FEATURES

Steel production decreased 11 percent from 1944, although capacity for making steel increased 1,941,000 net tons to reach a new record total of 95,505,000 tons. Total production of steel in the United States in 1945 was 79,701,648 tons. Of the total 90.3 percent was made in open-hearth furnaces, 5.4 percent in bessemer converters, 4.3 percent in electric furnaces, and only 24 tons in crucible furnaces. In 1945, 91 percent of the domestic steel output was made in furnaces in the Northeastern district, 4.6 percent in the Southern district, and 4.4 percent in the Western district compared with 90.6, 4.5, and 4.9 percent, respectively, in 1944.

The data concerning steel production used by the Bureau of Mines are furnished by the American Iron and Steel Institute. The output from steel foundries that do not produce steel ingots is not included in the statistics.

Steel electrically manufactured in the United States, 1941–45, in net tons

[Includes only that portion of steel for castings produced in foundries operated by companies manufacturing steel ingots]

Year	Ingots	Castings	Total	Year	Ingots	Castings	Total
1941	2, 758, 611	110, 645	2, 869, 256	1944	4, 131, 703	105, 996	4, 237, 699
1942	3, 843, 757	130, 783	3, 974, 540	1945	3, 381, 678	75, 026	3, 456, 704
1943	4, 473, 377	115, 693	4, 589, 070				

The steel output for 1945 includes 8,647,711 net tons of alloy-steel ingots and castings, which represents 11 percent of the total. This figure includes steels in which the minimum of the range specified in one or more of the elements named exceeds the following percentages: Copper, 0.60 percent; manganese, 1.65 percent; and silicon, 0.60 percent. Steel containing aluminum, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, and zirconium in any percentage are included. The output of alloy steels in 1945 decreased 19 percent, whereas total steel decreased 11 percent from 1944. Of the total alloy-steel output in 1945, 65 percent came from basic open hearths, 3 percent from acid open hearths, 32 percent from electric furnaces, 18 tons from crucible furnaces, and none from Bessemer converters.

From the accompanying tables it will be seen that most of the steel made in electric furnaces (81 percent in 1945) is alloy steel. Typically, steels with higher alloy content are made in electric furnaces and steel with lower alloy content by the open-hearth process.

Alloy-steel ingots and castings manufactured in the United States, 1941–45, by processes, in net tons

[Includes only that portion of steel for castings produced in foundries operated by companies manufacturing steel ingots]

Process	1941	1942	1943	1944	1945
Open hearth:					
Basic	5, 306, 415	7, 524, 209	8, 539, 523	6, 494, 627	5, 572, 353
Acid	433, 240	608, 867	677, 416	515, 662	274, 889
Bessemer	3, 890				
Crucible	933	522	136	23	18
Electric	2, 461, 651	3, 392, 776	3, 932, 743	3, 622, 774	2, 800, 451
	8, 206, 129	11, 526, 374	13, 149, 818	10, 633, 086	8, 647, 711

CONSUMPTION OF METALLIFEROUS MATERIALS

During 1945 steel furnaces used 5,109,956 net tons of iron ore (excluding mill scale) and sinter. Of this quantity 24,465 tons were foreign, originating in Africa, Canada, Chile, and Sweden.

Both charge ore and feed ore are used in the basic open-hearth process. Charge ore is added to furnish oxygen to the charge before it is melted. This ore should be low in combined and uncombined moisture, silica content, and fines. Ore containing high quantities of silica requires large additions of limestone and consequently produces large volumes of slag, which reduce furnace efficiency.

Feed ore, which is added to the heat during the working period, should be hard, dense, coarse, and low in moisture. Although moderately high silica ore can be used as feed ore it is undesirable, as in charge ore, because of the larger quantity of slag necessitated. Lump ore, which is preferred as feed ore, commands a high price, and the supply is limited.

Sintered pyrites ash and sintered iron ore frequently are used as charge and feed ores. However, these materials are less dense than lump ore and lower in oxygen content. Consequently, more sinter is required to accomplish the same oxidation.

Metalliferous materials consumed in steel furnaces in the United States in 1945, by districts, in net tons

District	Iron ore		Sinter	Manganese ore		Ferro-alloys	Iron and steel scrap		Pig iron

MANGANESE

By Norwood B. Melcher and John Hozik [1]

SUMMARY OUTLINE

GENERAL SUMMARY

The year 1945 witnessed a sharp decline in the wartime production rate of domestic manganese ore, but requirements continued to be met by a high rate of imports of foreign ore. Shipments from the U. S. S. R., which were temporarily terminated during the war, reentered the trade in April, and receipts from Chile and Union of South Africa were greatly expanded during the last half of 1945. Total imports during the year were 1,461,945 shorts tons—an increase of 26 percent over 1944 and only slightly under the record year 1941, when 1,562,133 tons were received.

Domestic production, which depended largely upon Government purchases during the war, was curtailed during 1945 as a result of new specifications which excluded ore containing less than (dry) 42 percent Mn. Output, as measured by shipments from mines, totaled 182,337 short tons compared with 247,616 tons in 1944. The value of manganese ore shipped in 1945 totaled $7,320,309 ($40.15 per short ton) compared with $9,014,875 ($36.41 per ton) in 1944. However, a larger proportion of high-grade ore was shipped in 1945, and the average price per long-ton unit increased only slightly—from 77 cents in 1944 to 79 cents in 1945. Eleven States contributed in 1945 compared with 13 during the previous year. The total number of shippers dropped from 133 in 1944 to 37 in 1945. At the end of 1945 there were no provisions for Government purchases of domestic manganese ore. Shipments of ferruginous manganese ore (10 to 35 percent manganese) amounted to 114,327 tons, and shipments of manganiferous iron ore (5 to 10 percent manganese) were 1,408,527 tons compared with 297,136 and 1,190,476 tons, respectively, in 1944.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Department of Commerce.

Salient statistics of the manganese industry in the United States, 1925–29 (average) and 1941–45, in short tons

	1925–29 (average)	1941	1942	1943	1944	1945

[3] Manganese content.
[4] Includes small quantity of other manganese alloys.

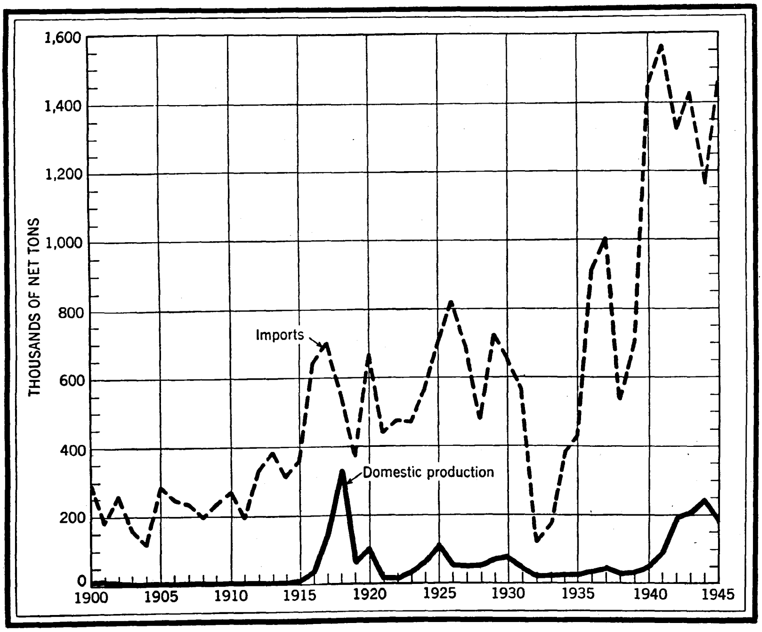

FIGURE 1.—Imports and domestic production (mine shipments) of manganese ore, 1900–1945. Statistics on imports shown in the graph represent general imports for 1900–1933, imports for consumption adjusted for changes in bonded warehouse stocks for 1934–39, and general imports for 1940–45.

Manganese ore stock-piled by the Office of Metals Reserve (successor to Metals Reserve Company, July 1, 1945) paced releases to industry during 1945. At the close of the year, ore stored by this agency in the United States totaled 1,076,113 long dry tons, compared with 991,341 tons at the end of 1944. Domestic ore comprised 25 percent (266,476 tons) compared with 26 percent (245,117 tons) on December 31, 1944. Total storage outside the United States (Brazil and Chile) on December 31, 1945, was 181,770 tons; on the same date of 1944, foreign storage (Chile and Cuba) amounted to 252,647 tons.

All Government purchases of domestic manganese ore ceased at the close of 1945; purchases of manganese nodules from the Anaconda Copper Mining Co., the largest domestic supplier, terminated on September 30, 1945.

In March the Bureau of Mines made public a record [2] of raw material exploration during World War II; a summary of results of manganese ore exploration in 15 States follows:

Tonnage and grade of manganese ore explored by the Bureau of Mines

Manganese, percent (approximate)	Tons	Manganese, percent (approximate)	Tons
8	1, 160, 000	40	8, 000
12	20, 188, 000	50	11, 000
15	485, 000		
18	3, 417, 000	Total	26, 528, 000
20	933, 000		
22	31, 000	3.5 (Boulder City, Nev.)	10, 000, 000
24–26	268, 000	Under 2 (Chamberlain, S. Dak.)	10, 000, 000
30	27, 000		

DOMESTIC PRODUCTION

The following table shows the various types of manganiferous materials shipped by domestic producers from 1941 to 1945.

Manganiferous raw materials shipped by producers in the United States, 1941–45, in short tons

Year	Metallurgical ore				Battery ore	Miscellaneous
	Manganese ore (35 percent or more Mn)	Ferruginous manganese ore (10 to 35 percent Mn)	Manganiferous iron ore (5 to 10 percent Mn)	Manganiferous zinc residuum		
1941	73, 852	512, 162	918, 725	282, 049	11, 399	2, 543
1942	177, 966	265, 663	1, 500, 613	292, 051	15, 410	473
1943	195, 096	468, 862	1, 251, 275	270, 328	12, 704	104
1944	241, 170	296, 981	1, 190, 476	247, 402	6, 224	377
1945	174, 295	114, 327	1, 408, 527	224, 331	8, 042	-------

Shipments of various grades of manganese-bearing ores during the last 5 years are given, by States, in the following tables. In addition, battery-grade manganese ore was produced in Montana, and manganiferous zinc residuum was produced from New Jersey zinc ores in 1945.

MINING BY STATES

Alabama.—The Cobalt Hill mine in Cherokee County supplied the manganese ore from Alabama in 1945, as in 1944; the ore averaged (dry) 39.22 percent Mn.

Arizona.—Shipments totaling 709 short tons were made from the Manganese King mine in Pima County by R. H. Van Morel; the ore averaged (natural) 45 percent Mn. Smaller shipments were made from Long Valley in Coconino County, and from the Victory mine in Yavapai County. The small output of ferruginous manganese ore averaged (natural) 33.6 percent Mn and came from the Black Warrior mine in Mohave County.

The manganese deposits in the Artillery Mountains region are described by Lasky and Webber.[3]

Arkansas.—All of the ore produced in Arkansas during 1944 came from mines in Independence County; the Southern Hill mine, operated by Davis Mining Enterprises and R. B. Potashnick, was the largest producer. Shipments of ferruginous ore were made by the Walter H. Denison Manganese & Contracting Co., Inc., the Arkansas Manganese Co., C. C. Sims, and the Office of Metals Reserve. The ferruginous ore averaged 19 percent Mn and was shipped to blast furnaces in the Birmingham, Ala., district; the ore shipped by the Office of Metals Reserve was mined before 1945 but was not included in shipments in earlier years, as it was originally stock-piled for concentrating.

California.—Shipments of manganese ore from California mines in 1945 amounted to only 1,668 tons—the lowest since 1940; 10 shippers contributed compared with 56 in 1944.

[1] Containing 35 percent or more manganese (natural).
[2] Value included in total.
[3] Containing 10 to 35 percent manganese (natural).
[4] Containing 5 to 10 percent manganese (natural).

The largest producer during 1945 was the Irish Hills mine in San Luis Obispo County, which shipped 890 short tons of ore containing (natural) 54.4 percent Mn. Other shipments were made from Alameda, Humboldt, Imperial, Plumas, Riverside, Trinity, San Joaquin, and Stanislaus Counties. The small shipment of ferruginous ore was made from the Old Bill claim in Shasta County.

All purchases of California ore were made by the Office of Metals Reserve during 1945.

Colorado.—The Mohawk Mining Co., Silverton, Colo., shipped a small quantity of ore containing (natural) 33 percent Mn to blast furnaces at Pueblo, Colo., during 1945.

Georgia.—H. M. McKnight, shipping from the Cherokee Mining Co. mine in Lincoln County, was the largest (780 tons) shipper in Georgia during 1945. Neel & Neel and H. S. Simpson shipped the remainder from mines in Bartow County.

Michigan.—Manganiferous iron ore from Michigan was shipped from the Rogers mine stock pile during 1945.

Minnesota.—Shipments of manganiferous ore were made from the Hopkins, Merritt, Louise, Mahnomen, Sagamore, and Hillcrest-Alstead-Arko Group mines on the Cuyuna range, and the Corsica mine on the Mesabi range during 1945. All contained less than 10 percent Mn.

Montana.—Montana shipped 83 percent of both the metallurgical ore and total manganese ore in the United States in 1945. The bulk came from the reduction works of the Anaconda Copper Mining Co. at Anaconda, Mont., using carbonate ore mined at the Anselmo, Emma, and Travona mines at Butte. The flotation-nodulizing plant at Butte, operated by the Domestic Manganese & Development Co., produced 14,094 short tons of nodules averaging 54.47 percent Mn. Battery ore was produced from oxide ore mined at the Moorlight Group and Trout mines in the Philipsburg district.

Nevada.—The Black Diablo mine in Pershing County shipped ferruginous manganese ore containing (natural) 29 percent Mn to the Geneva Steel Co., Geneva, Utah. All of the manganese ore in 1945 and the rest of the ferruginous ore from Nevada was shipped from Manganese Mining Co. mine in White Pine County.

New Mexico.—The gravity concentration mill of the United Mining & Milling Co. produced and shipped 3,334 short tons of concentrate averaging (natural) 44.8 percent Mn from Socorro County during 1945. Twelve percent manganese-bearing ore was shipped from the Boston Hill mine in Grant County to blast furnaces at Pueblo, Colorado, by the A. A. Luck Mining Co., Silver City.

South Carolina.—A small shipment of metallurgical ore was made from the Dorn mine in McCormick County during 1945.

South Dakota.—A description of the manganese deposits of Chamberlain and methods of beneficiating these low-grade ores have been presented by Dupuy, Calhoun, and Rasmussen.[4]

Tennessee.—The Minerals Co. of Virginia shipped ferruginous manganese ore averaging (natural) 13.62 percent Mn to the Birmingham, Ala., district.

Utah.—All of the manganese-bearing ore from Utah in 1945 was

[4] Dupuy, Leon W., Calhoun, W. A., and Rasmussen, R. T. C., Mining and Concentration of Missouri Valley Manganese at Chamberlain, S. Dak.: Bureau of Mines Rept. of Investigations 3839, 1946, 103 pp.

ferruginous ore ranging in manganese content (dry) from 18.20 percent to 26.00 percent. Except for very small shipments from one mine each, in Juab and Grand Counties, all came from the Black Boy mine in Juab County, operated by the Ward Leasing Co.

Virginia.—The important producer of manganese ore in Virginia in 1945 was the Dominion Manganese Corp., which produced and shipped 8,299 short tons and 8,154 tons respectively from the Old Dominion mine in Augusta County; the ore averaged (natural) 43.34 percent manganese. The rest of the ore from the State came from properties in Campbell and Smyth Counties.

Washington.—The total output of manganese ore from Washington in 1945 was hausmanite ore from the Crescent mine in Clallam County. The ore averaged (dry) 51.71 percent Mn, 1.66 percent Fe, 9.52 percent SiO_2, and 0.06 percent P.

IMPORTS OF MANGANESE ORE

Imports of battery-grade ore totaled 86,551 short tons in 1945. Of this quantity, 84,445 tons came from Gold Coast and 2,106 tons from U. S. S. R. The ore averaged 55.60 percent Mn or 87.95 percent MnO_2. Imports for consumption of battery ore amounted to 60,447 tons of which 58,341 tons originated in Gold Coast and 2,106 tons in U. S. S. R. Import data for battery-grade ore include the tonnage of ore destined for chemical purposes.

There were no entries of ore containing less than 35 percent Mn in 1945. Imports for consumption of this material (all from Mexico) amounted to 68 tons containing 28 tons of manganese and were valued at $1,078.

The following table gives imports of ore containing over 35 percent manganese.

Manganese ore (35 percent or more Mn) imported into the United States, 1944–45, by countries

Country	General imports [1]				Imports for consumption [2]

[1] Comprises ore received in the United States during year; part went into consumption, and remainder entered bonded warehouses.

[2] Comprises receipts during year for consumption and ore withdrawn from bonded warehouses during year (irrespective of time of importation).

[3] Less than 1 ton.

CONSUMPTION AND STOCKS OF MANGANIFEROUS RAW MATERIALS

The consumption of manganese ore in 1945 decreased 7 percent from the total of 1,593,098 tons used in 1944. In 1945, 90 percent was of foreign origin, as in 1944. Industrial stocks of manganese ore on December 31, 1945, were 3 percent greater than the 494,872 tons on hand at the end of 1944.

The following table shows actual tons of manganese ore (containing 35 percent or more manganese, natural) and alloys consumed during 1944 and 1945 by type of consumer and stocks at the end of the year.

Consumption of manganese ore and manganese alloys in the United States, 1944–45, and stocks December 31, 1945, gross weight in short tons

[1] Excluding Government stocks.
[5] The greater part of the consumption of ore was used in the manufacture of ferromanganese and silicomanganese. Combining consumption of ore with that of ferromanganese and silicomanganese would result in duplication.

The following table shows ores available for consumption in the United States in 1945 without adjustments for changes in consumer or Government stocks.

Indicated consumption of manganiferous raw materials in the United States, in 1945

	Ore containing 35 percent or more Mn		Ore and residuum containing 10 to 35 percent Mn		Ore containing 5 to 10 percent Mn	
	Short tons	Mn content (percent)	Short tons	Mn content (percent)	Short tons	Mn content (percent)
Domestic shipments	182,337	56.7	338,658	14.7	1,408,527	6.9
Imports for consumption	1,311,346	48.3	68	(1)	(2)	(2)
Total available for consumption	1,493,683	49.4	338,726	14.7	1,408,527	6.9

[1] Data not available. [2] Estimated none was consumed.

METALLURGICAL INDUSTRY

The steel industry in 1945 used an average of 13.6 pounds of manganese per short ton of steel produced. Of this consumption, 12.0 pounds were in the form of ferromanganese, 0.6 pound as spiegeleisen, 0.9 pound as silicomanganese, and 0.1 pound as manganese ore used directly. In 1944 the consumption of manganese contained in ferromanganese, spiegeleisen, silicomanganese, and manganese ore amounted to 11.7 pounds, 0.6 pound, 0.9 pound, and 0.1 pound, respectively, per ton of steel.

The above data apply to the consumption of manganese ore in the manufacture of steel ingots and that part of steel castings manufactured by concerns that also produce steel ingots.

Electrolytic manganese.—There are two commercial producers of electrolytic manganese—the Electro-Manganese Corp., Knoxville, Tenn., and the Olympic Mines, Inc., Hoodsport, Wash. The Bureau of Mines, in cooperation with industry, has been active in conducting research to determine the acceptability of this material in ferrous and nonferrous metallurgy. Electrolytic manganese can replace ferromanganese technologically in virtually all uses but shows particular advantage in critical grades of stainless steel, where it is difficult to meet carbon and phosphorus specifications, and in low-carbon steels and ingot irons; the present relatively high cost of this material limits wider acceptance.

Production of electrolytic manganese in the United States, 1939–45, by producers, in pounds

Year	Electro-Manganese Corp.	Bureau of Mines	Total
1939	43,669		43,669
1940	418,837		418,837
1941	1,190,042		1,190,042
1942	1,306,310	149,380	1,455,690
1943	2,385,486	464,690	2,850,176
1944	3,308,071	476,200	3,784,271
1945	3,398,569	280,336	3,678,905
	12,050,984	1,370,606	13,421,590

Ferromanganese.—The domestic output of ferromanganese decreased 12 percent from 1944—from 702,632 tons in 1944 to 619,760 tons in 1945, and was produced at the following plants during the year:

Bethlehem Steel Co., Johnstown, Pa.
E. J. Lavino & Co., Reusens, Va. and Sheridan, Pa.
Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.
Tennessee Products Corp., Rockwood, Tenn.
U. S. Steel Corp., Ensley, Ala. and Etna and Clairton, Pa.
Electro-Metallurgical Co., Niagara Falls, N. Y., and Alloy, W. Va.

Ten percent of the total manganese ore used in 1945 for the production of ferromanganese was of domestic origin, as in 1944. Based on the relative manganese content of foreign and domestic ore, 12 percent of the ferromanganese was made from domestic ore in 1945. The recovery of manganese from ore in making ferromanganese was 85.62 percent in 1945 compared with 85.76 percent in 1944.

Ferromanganese and spiegeleisen imported into and made from domestic and imported ores in the United States, 1944–45, in short tons

[2] Source of ore not reported by consumer.
[3] "Orient" reported by consumer as source of ore.

Shipments of ferromanganese in 1945 decreased 15 percent in quantity and 14 percent in value from 1944. The record of shipments for the past 5 years follows:

Ferromanganese shipped from furnaces in the United States, 1941–45

Year	Short tons	Value	Year	Short tons	Value
1941	619,395	$69,378,004	1944	715,059	$91,406,229
1942	659,219	82,726,298	1945	610,376	78,907,189
1943	722,658	93,481,580			

Imports for consumption of ferromanganese were eight times those of 1944, and exports increased 39 percent.

Ferromanganese imported into and exported from the United States, 1941–45

Year	Imports for consumption			Exports [1]	
	Gross weight (short tons)	Mn content (short tons)	Value	Gross weight (short tons)	Value
1941	7,032	5,696	$557,150	5,155	$771,575
1942	14,772	11,635	1,274,749	7,165	976,923
1943	2,302	990	160,600	12,510	1,717,888
1944	4,199	3,308	394,641	600	101,445
1945	35,521	27,694	3,733,846	836	175,556

[1] 1941: Includes spiegeleisen; not separately classified before July 1, 1941.

Ferromanganese imported for consumption in the United States, 1944–45, by countries

Country	1944			1945		
	Gross weight (short tons)	Mn content (short tons)	Value	Gross weight (short tons)	Mn content (short tons)	Value
Canada	2,791	2,232	$296,359	35,521	27,694	$3,733,846
India and Dependencies	1,408	1,076	98,282			
	4,199	3,308	394,641	35,521	27,694	3,733,846

Spiegeleisen.—Production of spiegeleisen decreased 16 percent from 1944; shipments increased 2 percent in quantity and 5 percent in value.

Spiegeleisen produced and shipped in the United States, 1941–45

Year	Produced (short tons)	Shipped from furnaces		Year	Produced (short tons)	Shipped from furnaces	
		Short tons	Value			Short tons	Value
1941	177,915	181,177	$5,793,481	1944	165,530	155,325	$4,851,490
1942	186,026	186,163	5,931,728	1945	139,039	157,774	5,108,144
1943	149,036	150,136	4,827,954				

Spiegeleisen was manufactured at the following plants during 1945:

Inland Steel Co., East Chicago, Ind.
New Jersey Zinc Co., Palmerton, Pa.
U. S. Steel Corp., Ensley, Ala., Gary, Ind., and Duquesne, Pa.

In addition to the foregoing plants, shipments were made by E. J. Lavino & Co., Reusens, Va.

All of the spiegeleisen produced in the United States in 1945 was made from domestic raw materials. Imports of spiegeleisen for consumption in 1945 decreased 16 percent in quantity and 7 percent in value from 1944. The total supply came from Canada.

Spiegeleisen imported for consumption in the United States, 1941–45

Year	Short tons	Value	Year	Short tons	Value
1941	4,741	$215,108	1944	3,761	$153,032
1942	1,990	95,853	1945	3,146	142,883
1943	3,254	140,247			

The value of spiegeleisen at producers' furnaces, was $32.38 per short ton compared with $31.23 in 1944.

Manganiferous pig iron.—Pig-iron blast furnaces used 28,766 tons of of manganiferous zinc residuum and a total of 1,175,813 tons of domestic ore containing over 5 percent (natural) manganese in 1945; of this ore, 673 tons contained 35 percent or more manganese, 232,745 tons contained 10 to 35 percent manganese, and 942,395 tons contained 5 to 10 percent manganese. In addition 19,460 tons of foreign ore containing over 35 percent manganese and 800 tons containing 10 to 35 percent manganese were used during the year.

Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1942–45, in short tons

BATTERY AND MISCELLANEOUS INDUSTRIES

Manganese ore for battery use should have a high content of available oxygen with minimum iron and be relatively free from such metals as arsenic, copper, nickel, or cobalt, which are electronegative to zinc. Chemical ore has a wide range in analyses and a great many uses; the bulk is used in photography (in the manufacture of hydroquinone), in fertilizers, and in coloring agents for paints and ceramics.

Data covering production, imports, consumption, and stocks of such ores are given elsewhere in this chapter.

PRICES

Prices of manganese (except battery and chemical ore) are upon a unit basis, the unit being 1 percent of a long ton or 22.4 pounds of contained manganese. Prices of chemical ore are quoted upon a per-ton basis, with a minimum requirement of manganese dioxide. A duty of one-half cent per pound of contained manganese is imposed on all imported manganese ore except that from Cuba and the Philippine Islands, which enters duty free. Prices as listed by E & MJ Metal and Mineral Markets at the end of 1945 were: (Per long-ton unit of contained Mn, basis 48 percent, subject to premiums, penalties, freight differentials, and other provisions of Office of Price Administration MPR No. 248, as amended) Metals Reserve Company sales prices, effective May 15, 1944—85 cents, based on New York, Philadelphia, Baltimore, Norfolk, Mobile, and New Orleans; 91 cents based on Fontana, Calif., Provo, Utah, and Pueblo, Colo. Chemical grades, per gross ton, coarse or fine, minimum 80 percent MnO_2, Brazilian or Cuban, were quoted at $55 in carloads, $60 to $65 barreled; Javan or Caucasian, 85 percent minimum, at $70 to $75. Domestic, 70 to 72 percent, was quoted at $45 to $50, in carloads, f. o. b. mines.

For sales made on basing points that are also ports of discharge of imported manganese ore, the prices were f. o. b. cars, shipside, at the dock most favorable to the buyer. Selling prices on imported ore included duty.

WORLD PRODUCTION

The following table shows, insofar as statistics are available, the world production of manganese ores from 1938 to 1945 and their average manganese content. Official statistics of the countries are used, supplemented by data from semiofficial and other sources.

Manganese ore produced in principal countries of the world, 1938–45, in metric tons [1]

[Compiled by B. B. Waldbauer]

Country [1]	Percent Mn	1938	1939	1940	1941	1942	1943	1944	1945

[1] In addition to countries listed Belgium produces manganese ore, but data of output are not available. Czechoslovakia reports a production of manganese ore, but as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in the table.

CANADA

The presence of high-grade float manganese ore in the Steep Rock iron-ore deposit [5] has aroused considerable interest, but no commercial production has been reported.

COSTA RICA

The manganese deposits of Costa Rica are on the Nicoya Peninsula, in the province of Guanacaste, on the Pacific coast. Between 1915 and 1920 nearly 32,000 long tons of high-grade ore was shipped to the United States; except for exploratory work, the mines have been inactive since 1920.[6]

CUBA

Production of manganese ore in Cuba decreased 23 percent from 1944. In 1944, production at the Isabelita mine, Oriente Province, by the Cuban-American Manganese Corp. totaled 140,019 long dry tons.

INDIA

Manganese has been mined in many parts of the Indian Peninsula, the most important area being the Central Provinces.[7] Indian deposits are of three main groups—those interbedded with the Archeans, including the gondites, deposits associated with the kodurites, and the lateritoid deposits. The bulk of production is of the gondite type and is distributed through Bibar, Bombay, Central India, Central Provinces, Eastern States, Madras, Madras States, Mysore, and Orissa. The relatively unimportant kodurite type is found in Madras and Orissa. Lateritoid deposits are found in virtually all of the above locations and in Goa and Delgaum.

IRAN

Manganese dioxide is found in lenticular veins of calcite near Shahryar, 40 miles southwest of Teheran.[8] The Iranian Government developed the Robat Karum mine in this deposit before the war to supply manganese to the Karaj Steel Works. A concentrate was produced by hand picking.

MEXICO

The sintering plant of the Lucifer Manganese Co. at Santa Rosalia, Lower California, began operations during the second quarter of 1945. This company is at present the most important producer of manganese in Mexico, not only in quantity, but in grade of product.

At the Concepcion Bay, Mulege, Lower California, manganese operations of the Cia. Manganeso de Mexico, the concentrating plant was completed and operations commenced. At the end of the second quarter of 1945 this plant was closed due to metallurgical difficulties.[9]

The production of manganese ore in Mexico in 1945 decreased 36 percent from 1944.

PANAMA

A decree, published in La Estrella de Panama, January 10, 1945, concedes the mining rights for manganese ore in eight deposits in the Porto Bello district of Colon Province to Dr. Robert R. Aleman, as legal representative of Stuart St. Clair of Washington, D. C.

TURKEY

In the past Turkey has produced manganese from as many as 50 mines. However, costs of production and Russian competition made difficult profitable exploitation of these deposits. In 1927 production totaled 11,398 metric tons but dropped to 61 tons in 1928. In 1935 production rose to 15,600 tons but declined to 530 tons in 1937. During 1944 four licensed manganese mines in the Provinces of Ankara, Eskisehir, and Kutahya were in operation; 1,865 tons were produced and 1,970 tons were shipped. Shipments in 1943 were 834 tons, whereas production totaled 2,687 tons.

A considerable amount of prospecting has been done by the M. T. A. (Turkish Mining and Prospecting Institute), which divides deposits of ore into three regions: (1) Those along the Black Sea coast (Alpine formation), (2) those of the southern or Taurus region (Alpine formation), and (3) those of the Central or Asia Minor region (Hersenian formation). There are many deposits in these regions, but they are small. Most of the manganese along the Black Sea coast is high in SiO_2, and although the Turks have prospected intensively near Karabuk they have found only small deposits of commercial ore.

The largest known deposit is northeast of Gocek. At Ovacik an English and German company, Cenub Anadoli Maden Sirketi, developed some deposits, but excessive costs and transportation difficulties forced the company to suspend operations in 1936. The ore in this district is principally pyrolusite and psilomelane, with some rhodochrosite. The manganese content is approximately 30 percent.

The Karabuk Steel Works requires 4,000 to 5,000 metric tons a year of manganese, and because of the difficulty in finding a steady source of supply, the Ministry of Economy has singled out manganese to allow exploitation permits of 5 or 6 years to entrepreneurs and makes the tax only 1 percent of the value of the ore. The M. T. A. and the Ministry of Economy are now encouraging exploitation of the few more promising deposits. Vehbi Koc, the General Motors representative, is now exploiting one deposit of manganese ore at Alibey which has been furnishing 1,000 to 1,500 metric tons of 37-percent ore to Karabuk for 3 years. There are, however, no reserves, and Koc intends to exploit another deposit in the Bregli coal basin, 30 miles from Zonguldak. Sakir Yorulmaz, a Turk interested in many types of mines, has been shipping small quantities of 44-percent manganese ore from deposits near Sazak.

CHROMITE

By Edwin K. Jenckes and Katharine D. Wildensteiner

SUMMARY OUTLINE

SUMMARY

The new supply of all grades of chromite available to industry was 35,000 short tons greater in 1945 than in 1944. The supply from domestic sources (mine shipments) decreased 69 percent, but imports increased 8 percent. Exports, though small, increased markedly over those in 1944.

Salient statistics of chromite in the United States, 1944–45

	1944		1945	
	Short tons	Value	Short tons	Value
New supply:				
Domestic production (shipments)	45,629	$1,668,299	13,973	$532,382
Imports for consumption	848,390	15,924,992	914,765	17,530,293
Total	894,019	[1] 17,593,291	928,738	18,062,675
Distribution:				
Consumption by industry	848,449	(2)	808,120	(2)
Exports	1,019	43,601	12,366	342,114
Additions to stocks [3]	44,551	(2)	108,252	(2)
Total	894,019	[1] 17,593,291	928,738	18,062,675

[1] Revised figures. [2] Not available. [3] Calculated to strike a balance.

Judged by wartime production alone, domestic ore takes on an apparent importance entirely out of proportion to its true position in industry. The actual significance of domestic chromite is revealed by the fact that, of the 339,721 short tons produced in the war period (Office of Metals Reserve purchases, 1941–45), only 65,270 tons (19 percent) have been absorbed by industry, even under the pressure of wartime shortages, because of low quality. It seems worth repeating[1] that the currently known ore bodies cannot be expected to produce significant quantities of readily marketable ores unless and until commercially feasible methods for their utilization are developed.

[1] Jenckes, E. K., and Wildensteiner, K. D., Chromite: Minerals Yearbook, 1944, p. 603.

This problem has been under intensive investigation by Bureau of Mines engineers for a number of years.

Chromite shipped from mines in the United States, 1913–20 and 1938–45

Year	Short tons	Year	Short tons
1913	286	1938	909
1914	662	1939	4,048
1915	3,675	1940	2,982
1916	52,680	1941	14,259
1917	48,973	1942	112,876
1918	92,322	1943	160,120
1919	5,688	1944	45,629
1920	2,802	1945	13,973

GOVERNMENT ACTIONS

Office of Metals Reserve (successor to Metals Reserve Company July 1).—The Office of Metals Reserve purchasing program for domestic chromite, both contract and small-lot purchases, terminated December 31, 1945, and only one chromite purchase depot for small lots (Grants Pass, Oreg.) was in operation after July 1.

Civilian Production Administration (successor to War Production Board November 3).—On August 1, 1945, WPB General Preference Order M–18–a (chromium) and WPB Supplementary Order M–18–a–1 (chromium) were revoked, and the controls on chromium passed to WPB General Preference Order M–21 of May 4, 1945 (as amended). This last order provided that alloy iron and steel (as defined by the order) should not be melted except upon approval by WPB and that producers of alloying materials (whether ferro-alloys or other compounds usable in iron and steel) should file monthly production schedules with the Board.

Order M–21 (iron and steel), as amended, was reissued on August 24, 1945, and provided that the Board might issue, from time to time, directions regulating the production and distribution of alloy steel and iron and ferro-alloys and alloying compounds.

On May 15, 1945, WPB General Allocation Order M–300, Schedule 62 (as amended)—primary chromium chemicals—was issued, which continued allocation control, redefined small-order exemptions, and directed that the users of sodium bichromate who consumed between 450 and 4,000 pounds of that material in April 1945 file a "one-time report" on such use.

Chromium chemicals for domestic consumption were removed from allocation on September 30, 1945, but the supply was not adequate to permit uncontrolled exports.

United States Department of Justice.—On July 16, 1945, the United States Department of Justice announced that 19 companies who were under indictment on charges of price fixing and control of production and distribution of chromic acid, bichromates, and other chemicals entered pleas of nolo contendere and that the fines imposed amounted to $142,500. The original indictments were returned on June 26, 1942.

Office of Price Administration.—On February 12, 1945, the Office of Price Administration issued MPR 575, which permitted the following increase in prices: Dry chromates and bichromates, 50 cents per 100 pounds; chromate and bichromate liquors, 50 cents per 100 pounds for the equivalent weight of sodium bichromate crystals contained; one-bath chromium tanning compounds, 25 cents per 100 pounds; and chromic acid 75 cents per 100 pounds. No price changes for these primary chromium compounds had been authorized since July 1941. The increases were allowed because of admitted increasing costs and decreasing or disappearing profits.

HISTORICAL SURVEY OF SUPPLY

A survey of the relation of domestic production to total supply for 5-year periods from 1891 to 1943 is given in Minerals Yearbook, 1943 (p. 632). The details, in tonnages, for 1941–45 are given in the accompanying table.

Total supply, imports for consumption, domestic production, and consumption of chromite, 1941–45, in short tons

	1941	1942	1943	1944	1945
Total supply	1,129,551	1,094,483	1,088,696	894,019	928,738
Imports for consumption	1,115,292	981,607	928,576	848,390	914,765
Domestic production	14,259	112,876	160,120	45,629	13,973
Consumption by industry	800,290	891,952	964,600	848,449	808,120

DOMESTIC PRODUCTION

The domestic production of chromite in 1945, measured by shipments from mines, declined to 13,973 short tons and was at the lowest point since 1940. Production of chromite in the United States since 1880 has totaled 615,042 short tons, of which 198,312 tons (32 percent) were mined during World War I, 353,887 tons (58 percent) during World War II, and 62,843 tons (10 percent) in peacetime.

As in 1941, only California and Oregon shipped chromite in 1945, the former supplying 69 percent and the latter 31 percent of the total. The average chromic oxide (Cr_2O_3) content of the ore shipped was 46 percent compared to 44 percent in 1944. The increase in average Cr_2O_3 content of domestic ores mined (shipped) in 1945 followed the

Chromite production (shipments) in the United States, 1941–45, by States, in short tons, and number of producers in 1945

State	1941	1942	1943	1944	1945				
					Number of producers	Cr_2O_3, percent			Total
						45.00 and over	35.00 to 44.99	Under 35.00	
Alaska			5,569	1,845					
California	13,419	44,873	62,495	34,715	40	4,015	5,555	37	9,607
Idaho		25							
Montana		65,238	75,691	1,251

Texas			2						
Washington		57							
Total	14,259	112,876	160,120	45,629	50	6,017	7,919	37	13,973

raising by Office of Metals Reserve of the minimum acceptable content from 35 percent to 42 percent on January 1, 1945.[2]

California.—Of the total shipments of chromite from California in 1945, 70 percent was from Del Norte County, 29 percent from Eldorado, Placer, San Luis Obispo, Shasta, Siskiyou, and Tehama Counties and 1 percent from Butte, Calaveras, Fresno, Humboldt, and San Benito Counties.

The French Hill mine in Del Norte County, owned and operated by Tyson Chrome Mines, Ltd., was the largest source. Shipment of 3,412 short tons of ore averaging 43 percent Cr_2O_3 and 13 percent Fe was made from this property.

Ranking second in quantity of ore shipped was the High Plateau mine in Del Norte County, owned and operated by Eugene R. and Beatrice Brown; 2,974 short tons of ore averaging 52 percent Cr_2O_3 and 11 percent Fe were shipped from this property.

Oregon.—The chromite shipped from Oregon in 1945 was produced in Josephine and Curry Counties, the former furnishing the bulk of the total.

The Oregon Chrome mine in Josephine County, operated by William S. Robertson, was, for the second year, the largest producer in the State. Total shipments of ore amounted to 2,726 short tons averaging 45 percent Cr_2O_3 and 11 percent Fe. It is reported [3] that the operators began diamond drilling the deposit.

Exploration and development.—During 1945 the Bureau of Mines continued its experimental work on the beneficiation [4] [5] of chrome ore by both physical and chemical means and on the production of metallic chromium.

No extensive field work was done by either the Bureau or the Geological Survey during the year.

CONSUMPTION AND USES

In 1945 the consumption of chromite dropped to 808,120 short tons (a decrease of 40,329 tons (5 percent) from the 1944 figure), marking the second successive year of decline from the all-time high of 1943. However, consumption remained at a relatively high level; this is accounted for in part by the fact that large tonnages of stainless steel were required to satisfy the deferred civilian demand. Industry recognizes three grades of chromite—metallurgical, refractory, and chemical—whose designations are descriptive enough to constitute a definition of their use. The accompanying table shows the total consumption of chromite and the tenor of ore consumed by primary consumer groups for 1940–45.

During 1945, the Office of Metals Reserve sold 337,682 short tons of chromite, of which only 16,440 tons was of domestic origin.

Metallurgical chromite specifications normally call for a material containing 48 percent Cr_2O_3 minimum, with a Cr : Fe ratio of 3: 1 or higher, and for hard, lumpy ore. Ore purchased under less exacting

Consumption of chromite and tenor of ore used by primary consumer groups in the United States, 1940–45, in short tons

Year	Total chromite consumed		Tenor of ore (percent Cr_2O_3)		
	Gross weight (short tons)	Average tenor (percent Cr_2O_3)	Metallurgical	Refractory	Chemical
1940	562,915	45.0	50.5	35.8	47.2
1941	800,290	44.3	50.1	34.8	46.3
1942	891,952	43.2	48.5	34.0	44.8
1943	964,600	43.8	48.5	34.0	44.7
1944	848,449	44.1	49.4	34.2	45.7
1945	808,120	43.8	49.1	34.2	45.0

specifications has been used successfully during the war, but it is probable that during normal times only the highest-grade chromite will be used metallurgically. Ferrochrome, the product made from metallurgical ore, finds its way into alloy iron and steel, where it increases hardenability, strength at high temperatures, and resistance to abrasion, corrosion, and oxidation. Chromium is therefore an essential component of high-speed steel, many of the engineering steels, stainless steel, and a large proportion of other corrosion-resistant alloys. An interesting development in stainless steel is the addition of molybdenum to improve resistance to certain types of corrosion.[6] [7] The utility of Ti additions to stainless steels has been studied, and the effect of Ti in Cr-Mn stainless has been described.[8]

A new stainless type of steel which possesses hardenability through heat treatment and is magnetic has been developed.[9] Outstanding instances of the use of chromium in high-temperature alloys in the United States are for gas turbines (including jet-propulsion units) and gas-engine superchargers [10] and in Germany for gas turbines, especially in connection with jet propulsion.[11]

A comprehensive description of the testing of resistance to corrosion, by salt water and salt air, of various materials, including stainless steel and other chromium alloys, is available.[12] Chromium is also used for special-analysis cutting tools and as a constituent of some hard facing alloys.

Chemical-grade chromite should contain a relatively high percentage of Cr_2O_3 to avoid cutting down furnace capacity and should be low in silica to prevent excessive costs for soda ash. The primary chemicals derived from chromite are chromic acid and chromates and bichromates of sodium and potassium. The principal uses for chromium chemicals are listed in the 1944 Minerals Yearbook (p. 610). Much work has been done on surface protection, utilizing

various chromium products for surface impregnation with metallic chromium;[13] [14] on chromate finishes;[15] [16] and on chrome plating, porous [17] and nonporous.[18] Platings of porous chromium have been used successfully in Diesel engines to prolong the life of the cylinder bores.[19]

Refractory chromite must be high in Cr_2O_3 plus Al_2O_3, and low in Fe and SiO_2, which lower the softening and melting points of the refractory. Refractory chromite is processed into plastic cement and chrome brick and has been used as chrome-magnesia and magnesia-chrome brick. Chrome refractories are useful in basic open-hearth furnaces, and their use is being extended to arc furnaces.[20]

OFFICE OF METALS RESERVE STOCKS AND SALES

On December 31, 1945, the Office of Metals Reserve had in its possession in the United States 1,004,669 short tons of chromite of all grades, held in central stock piles, at purchase depots, and by agencies. The accompanying table shows gross weight and average analyses of the ore by points of origin and use grade classification.

Stocks of chromite held by Office of Metals Reserve in the United States in central stock piles, and at purchase depots and in hands of agents, by grades, points of origin, and average analysis, on Dec. 31, 1945

Grade and origin	Gross weight (short tons)	Average analysis

[1] Data not available.

Total Metals Reserve sales of domestic chromite during 1945 amounted to 16,440 short tons. The tenor of this domestic ore and concentrates sold was as follows:

Cr_2O_3 content (percent):	Short tons sold
48.00 and over	------
45.00 to 47.99	5,533
42.00 to 44.99	807
35.00 to 41.99	10,100
	16,440

Total sales of chromite by the Office of Metals Reserve (1941 to 1945) are shown in the accompanying table.

Sales of imported and domestic chromite by Office of Metals Reserve, 1941–45, in short tons

Year	Foreign	Domestic	Total
1941	9,697	------------	9,697
1942	105,838	14,598	120,436
1943	158,975	20,068	179,043
1944	319,205	14,164	333,369
1945	321,242	16,440	337,682
	914,957	65,270	980,227

MARKET AND PRICES

The Office of Metals Reserve was the largest purchaser of domestic chromite in 1945, as it has been since November 1941; purchases were discontinued December 31, 1945. The price schedules in effect in 1944 and 1945 are given in the accompanying table.

Office of Metals Reserve price schedules of chromite in effect in 1944 and 1945

	1944	1945
Base price for ore 48 percent Cr_2O_3 and Cr : Fe ratio 3 : 1 per long ton	$52.80	$52.80
Minimum acceptable analysis:		
Cr_2O_3 percent minimum	35	42
Cr : Fe ratio minimum	1½ : 1	2 : 1
SiO_2 percent maximum	--------	10
Premiums:		
For each 1 percent of Cr_2O_3 in excess of 48 percent per long ton	$1.10	$1.10
For each 0.1 in ratio above 3 : 1 not to exceed 3½ : 1 do	$1.50	$1.50
Penalties:		
For each 1 percent Cr_2O_3 below 48 percent down to limiting acceptable analysis do	$1.10	$1.10
For each 0.1 in ratio below 3 : 1 down to 2 : 1 do	$1.50	$1.50
For ratio below 2 : 1 down to 1½ : 1 do	[1] $15.00	--------

[1] Plus $1 per ton for each decrease of 0.1 below 2 : 1.

OPA Maximum Price Regulation 258, which governed commercial transactions, continued in effect during 1945. The price schedule will be found in Minerals Yearbook, 1942 (p. 633).

Prices quoted during 1945 by E&MJ Metal and Mineral Markets for the various grades of chromite are given in the accompanying table.

E&MJ Metal and Mineral Markets price quotations for various grades of chromite in 1945, per long ton

	Cr_2O_3, percent	Cr : Fe ratio	Price
African and Indian	48	2.8 : 1	$41.00
Do	48	3 : 1	43.50
Do	48		31.00
South African: Transvaal	44		27.40
Do	45		28.30
Do	48		31.00
Do	50		32.80
Brazilian	44	2½ : 1	33.65
Do	48	3 : 1	43.50
Rhodesian	45		[1] 28.30–28.50
Do	48		31.00
Do	48	3 : 1	[2] 43.50–48.50
Domestic	48	3 : 1	[3] 43.50

[1] From Mar. 1 to June 7, $28.50; rest of year, $28.30.
[2] From Mar. 8 to June 7, $48.50; rest of year, $43.50.
[3] Less $7 per ton freight allowance.

FOREIGN TRADE [21]

Imports of chromite in 1945 were 914,765 short tons, an increase of 66,375 tons (8 percent) over those in 1944. Imports in 1942, 1943, and 1944 showed successive declines from the record figure of 1941.

Chromite imported for consumption in the United States, 1941–45, by countries

[1] For change in presentation of data for 1942 and following years, see Minerals Yearbook, 1943, p. 634.
[2] Listed as French Oceania by U. S. Department of Commerce.

[21] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The only importations of ferrochrome were from Canada and totaled 6,371 short tons having 4,292 tons chromium content. Chromates were imported aggregating 600 short tons.

Exports of chromite were 12,366 short tons, of which 12,116 tons went to Canada, 230 tons to Mexico, 18 tons to Cuba, and 2 tons to Curaçao.

Exports of ferrochrome were 1,471 tons, of which 1,347 tons went to Canada and 23 tons of chromium metal, alloys and scrap were exported. Exports of salts and compounds were 159 tons.

WORLD PRODUCTION

World production of chromite, 1939–45, by countries, in metric tons

1 Data not available, estimate included in total except for the years 1944 and 1945.
2 Estimate.
3 Estimate may include some production in Yugoslavia.
4 Fiscal year ended March 20 of year stated.
5 Planned production.
6 Exports.
7 January to September, inclusive.

It is to be noted in the table above that production figures are presented for Southern Rhodesia in place of the export figures given in Minerals Yearbook, 1944 (p. 612).

Australia.[22]—Australian production of chromite has been small, reaching a high point of 1,371 metric tons in 1944. Numerous deposits

22 Bureau of Mines Foreign Minerals Survey, The Mineral Industry of Australia: Vol. 2, No. 3, March 1945, pp. 75–78.

are known in New South Wales, Queensland, Western Australia, and Tasmania, but little metallurgical-grade ore has been developed, although proper concentration might produce a small tonnage. The Australian ore is largely refractory grade. The 1942 requirements were substantially 10,000 tons of metallurgical and 5,000 tons of refractory grade. Imported ores and concentrates were smelted for the production of ferrochrome by Broken Hill Proprietary Co., Ltd. (the only consumer in 1942), at its Newcastle plant. This company and the Newbold General Refractories, Ltd., were the major consumers of refractory-grade ore.

Ores are imported from South Africa, Rhodesia, and New Caledonia.

Brazil.—A new company, the Companhia Minas E Exploracão de Reservas Metalicas, called "Merm," has been formed which owns deposits of chromite and other minerals in the States of Bahia, Goiaz, and Minas Gerais. A chrome refractory plant to supply 1,800 tons a year and a chemical plant with a capacity of 2,000 tons of chrome chemicals are planned. Concentrates are to be supplied to the local steel industry.

Cuba.—Production in 1945 was 11,014 metric tons of metallurgical- and 161,612 tons of refractory-grade chromite. Exports were substantially below production, and by December 31 stocks rose to virtually 50,000 tons. United States Government purchases of Cuban chromite ceased in 1945.

Cyprus.[23]—There are two chromite mines in Cyprus, the Troodos mine of the Cyrpus Chrome Co., Ltd., which has been noted in previous Minerals Yearbooks,[24] and the Louveras mine of the Cyprus Mineral Co., which is in the development state.

Egypt.—Chromite has been produced on a small scale; several deposits have been opened, but costs are very high. The high cost of many materials—among them chromium salts—has led the Government to undertake a program of geological mapping of unexplored regions, to initiate a road-building program to serve the Eastern Desert, and to remove restrictions that have prevented the opening of known deposits of chromite, nickel, wolfram, and other minerals.[25]

France.[26]—Importations of chromite and chrome chemicals are given in Statistique mensuelle du commerce extérieur de la France for the immediate prewar years as follows, in metric tons:

	Chromite	*Chrome chemicals*
1935	34, 723	12, 484
1936	46, 823	11, 827
1937	38, 121	10, 146
1938	40, 179	9, 134

Importations from French colonial possessions (included above) were: 1935, 4,557 tons; 1936, 7,050 tons; 1937, none; 1938, 3,305 tons. The article states that the New Caledonian production can supply French chromite requirements and that other sources in French colonial possessions are capable of development.

23 Mining Journal (London), vol. 226, No. 5762, Jan. 26, 1946, p. 69; and No. 5765, Feb. 16, 1946, p. 126.

26 Demassieux, N., Le Chrome dans le monde: Chim. et ind., vol. 55, No. 1, January 1946, pp. 58–64.

Germany.—In the course of World War II, nickel was the first alloying element to become scarce in Germany, and substitutions of Cr–Mo and Cr–V–Mo steels were made for Ni-containing steels. The subsequent shortage of Mo forced the adoption of Cr–V and Mo–V steels, and the following shortage of Cr resulted in the use of Mn–V and Mn–Si steels as a measure to conserve Cr for essential uses, such as high-speed steel and corrosion- and heat-resisting steels and other alloys to serve the same purposes. A small quantity of chromium was used for catalysts in the high-pressure synthesis of hydrocarbons.[27]

Greece.[28]—The four principal producers of chromite in Greece are Société Union Minière (mine at Xinca), A. Apostolidas (mine near Isagli), S. Papassotirious (Burinos mine near Kozani), and P. Vryonis (Vavdos mine near Salonika in Macedonia).

The most recent available export statistics (in metric tons and by countries of destination) are:

	1939	*1940*
Germany	22, 278	1, 449
United States	14, 080	26, 281
United Kingdom	11, 255	3, 427
Belgium	1, 767	1, 300
Holland	607	------
Others	2, 373	661
	52, 360	33, 118

India.—Chromite has been found in the Kistna and Salem districts of the Madras Presidency. A small production has come from the Kistna district, and the reserves in the Salem district are reported to be extensive.

During World War II the Tata Iron & Steel Co. developed methods for manufacturing alloy steels and was successful in producing such specialties as tool steels, special alloy steel (armor plate), and Cr–Mo–Ni steels.[29]

New Caledonia.—A comprehensive article by Demassieux [30] states that, in addition to the well-known chromite mines [31] in the north of the island, several less-extensive deposits are found in the southern part near Nouméa, of which Alice-Louise is the most important. The paper presents figures for New Caledonian production for 1900–1938, exports for 1929–1938 with countries of destination, and other valuable data.

Philippine Islands.[32]—During the early stages of the Japanese invasion of the Philippines, American engineers did as much sabotaging as possible—burning oil and supplies, and caving and flooding mines. During their occupation the Japanese exploited what mines they were able to operate and left many mines in worse shape than when they found them, although it is reported that nothing was done

at the Masinloc mine [33] and that the property of the Acoje Mining Co. is in good shape.[34]

The mining industry has been second in importance to sugar in the Philippines and may assume first place if exports of that commodity to the United States should be curtailed after independence. Chromite occupied fourth place in the major minerals produced in the Islands in 1939.

Portugal.[35]—Exports of chromite to Spain from the mines near Braganza were 1,700 metric tons in 1945.

Spain.—Ferrochrome is produced in Spain, apparently from imported Portuguese ores. One steel company, S. A. Echevarria, Bilbao, is known to specialize in tool and alloy steels. In 1944 the domestic consumption of alloy steel was virtually 13,500 metric tons.

Sweden.[36]—In 1945 imports of chromite were 13,155 metric tons.

Turkey.—Turkish production figures for 1944 are now available and place the tonnage for that year at 184,573 metric tons. British and American (Government) purchases ceased on January 1, 1945, and the year's production is expected to be less than that for 1944. The production of the Guleman mines in 1945 was 70,000 tons, an increase of 3,000 tons over 1944.

M. T. A. (the Mine Prospecting and Research Institute) has reported the discovery of 164 chrome deposits since its inception in 1935.

Union of South Africa.[37]—The Union's chromite deposits are situated chiefly in the Lydenburg and Rustenburg districts. The former originates along the upper reaches of the Dwars River, crosses the Steelpoort River near Steelpoort Station, and bends gradually northwestward to Malipsdrift on the Olifants River, a distance of 70 miles. The Rustenburg deposits extend virtually 100 miles from Brits to Rustenburg and thence northward almost to the Crocodile River. Some chromite is found in Northern Transvaal and Natal, and some ore has been shipped from the latter Province.

In the Rustenburg deposits the chromite is associated with anorthosite and pyroxenite, while in the Lydenburg deposits it occurs usually with pyroxenite. Titaniferous magnetite is sometimes found with the chromite in the Bushveld Complex. In Northern Transvaal and Natal the chromite is associated with ancient schistose rocks.

U. S. S. R.—Large mineral-resource developments are claimed to be the result of intense and systematic geological examinations instituted by the Central Government.[38] It is reported [39] that the Urals occupy one of the first places in the world in chromium deposits. In Aktiubinsk [40] a plant has been installed for the production of ferroalloys.

United Kingdom.—Imports of chromite into the United Kingdom have been [41] 37,638 tons in 1938, 93,770 tons in 1944, and 50,768 tons in 1945.

NICKEL

By Hubert W. Davis

SUMMARY OUTLINE

SUMMARY

Nickel was the least abundant of the major ferrous alloying elements during World War II and one of the first metals placed on a restricted-use basis. Nevertheless, supplies were adequate to meet all war needs. Nickel was consumed at a high rate up to VE-day, after which demand slackened until VJ-day, when, because of the cancellation of war contracts, consumption declined sharply. Nevertheless, 96,252 short tons of nickel (exclusive of purchased and home scrap) were consumed in 1945. Steel mills and ferrous foundries accounted for about three-fifths of the total nickel used in 1945. The continued use of NE (national emergency) steels and the recovery of nickel scrap resulted in a substantial saving in nickel in 1945. The War Production Board removed restrictions on the use of nickel August 20, 1945.

Salient statistics for nickel, 1941–45

	1941	1942	1943	1944	1945
United States:					
Production:					
Primary short tons	660	612	642	988	1,155
Secondary do	5,315	4,142	6,917	4,321	6,483
Imports (gross weight)[1] do	124,130	132,954	141,249	134,932	122,528
Exports (gross weight)[2] do	7,125	7,096	9,464	7,931	3,876
Price per pound[3] cents	35	35	35	35	35
Canada:					
Production short tons	141,129	142,606	144,009	137,299	121,978
Imports do	1,011	499	545	424	762
Exports do	137,595	138,795	135,547	133,599	108,222
World production (approximate) do	179,000	182,000	183,000	180,000	169,000

[1] Excludes "All other manufactures of nickel"; weight not recorded.
[2] Excludes "Manufactures"; weight not recorded.
[3] Price quoted by International Nickel Co. of Canada, Ltd., for electrolytic nickel at New York, in 2-ton minimum lots.

Imports of nickel in all forms were about 9 percent less than in 1944 and 12 percent smaller than in the peak year 1943. Smaller receipts from Canada and New Caledonia were partly offset by much larger supplies from Cuba and the United Kingdom.

Production of nickel in Canada in 1945 was 11 percent less than in 1944. Output continued at a high rate until VJ-day, when a program of curtailment of operations was inaugurated, and by the year end the production of nickel was down to about half of the expanded capacity.

Although much greater than in recent years, the domestic output of primary nickel was, as heretofore, insignificant in 1945.

The St. Louis Smelting & Refining Co., which began production of nickel commercially at its property near Fredericktown, Madison County, Mo., in July 1944, produced 50 percent more nickel in 1945 than in 1944. The complex ore is treated in a flotation mill, which yields a nickel-cobalt concentrate, a lead concentrate, and a copper concentrate containing some lead. The production of nickel-cobalt concentrate was suspended at the close of September 1945.

The Geological Survey published a report on the Spirit Mountain nickel-copper prospect in Alaska.[1]

The Chelan nickel deposit near Winesap, Wash., was described by Patty and Kelly.[2]

PRODUCTION

Domestic production of nickel is small and comprises metals recovered from scrap-nickel anodes, nickel silver, and copper-nickel alloys (including Monel metal), and primary nickel recovered in copper refining and produced from ore and as a byproduct of talc production, as listed in the following table. Domestic primary nickel was recovered in 1945 as a byproduct in copper refining at Baltimore, Md.; Carteret, N. J.; Laurel Hill, N. Y.; Perth Amboy, N. J.; and Tacoma, Wash. Although all the nickel recovered as a byproduct of copper refining is credited as domestic production, some of it is recovered from imported blister copper. Roasted nickel-cobalt concentrate containing about 19 percent nickel and 13 percent cobalt was produced at Fredericktown, Mo., during the first 9 months of 1945. No concentrates containing nickel were recovered as a byproduct of talc production in Vermont in 1945.

Nickel produced in the United States, 1941–45

Year	Primary (short tons)[1]		Secondary[2]	
	Byproduct in copper refining[3]	Other[4]	Short tons	Value
1941	619	41	5,315	$3,720,500
1942	612		4,142	2,899,400
1943	642		6,917	4,841,900
1944	[5] 988	([5])	4,321	3,024,700
1945	[5] 1,155	([5])	6,483	4,538,100

[1] Bureau of Mines not at liberty to publish value.
[2] Nickel recovered as metal and in alloys and salts.
[3] Nickel content of nickel salts and metallic nickel.
[4] Nickel content of concentrates and matte produced from ore and of concentrates produced as byproduct of talc.
[5] Production from "Other" included under "Byproduct in copper refining." Bureau of Mines not at liberty to publish figures.

FOREIGN TRADE [3]

The quantity of nickel imported into the United States in 1945 was 9 percent smaller than in 1944 and 12 percent less than in the peak year 1943. Imports comprised chiefly metallic nickel, matte, and oxide. As heretofore, Canada was the chief source of the imports; it supplied 150,392,339 pounds of metallic nickel, 37,067,200 pounds of Monel matte (averaging 53 to 54 percent nickel and 25 percent copper), 1,656,519 pounds of washed sulfide (averaging 75 percent nickel), and 4,965,965 pounds of oxide. The washed sulfide and virtually all the oxide were refined to nickel, and the Monel matte was refined to Monel metal and other products at the plant of the International Nickel Co., Inc., Huntington, W. Va. About 2,300 short tons of nickel were produced at Huntington from Canadian washed sulfide and oxide in 1945. New Caledonia supplied 11,353,451 pounds of matte that contained 77 to 78 percent nickel; it was shipped to Huntington for refining. About 5,300 short tons of nickel were produced from New Caledonian matte in 1945. Cuba furnished 33,208,880 pounds of oxide, a relatively small part of which was refined at Wilmington, Del., in January 1945. The United Kingdom supplied 6,411,878 pounds of metallic nickel.

The nickel content of the unmanufactured nickel products imported into the United States is estimated at 214,866,000 pounds in 1945, compared with 236,586,000 pounds in 1944.

Exports of nickel comprise largely products manufactured from imported raw materials. Exports of alloys and metallic nickel were substantially less than in 1944 but exports of nickel-chrome electric resistance wire and nickel silver were appreciably greater.

The United Kingdom (2,578,247 pounds), Canada (1,875,922 pounds), and U. S. S. R. (1,247,701 pounds) were the chief markets for nickel, Monel metal, alloys, and scrap in 1945; the U. S. S. R. (7,279,135 pounds), United Kingdom (6,712,461 pounds), and Canada (861,728 pounds) were the chief markets in 1944.

Nickel products (excluding residues) imported for consumption in the United States, 1943–45, by classes

Class	1943		1944		1945	
	Pounds	Value	Pounds	Value	Pounds	Value
Unmanufactured:						
Nickel ore and matte	86,971,459	$13,017,158	72,828,746	$11,713,123	50,077,170	$8,223,086
Nickel pigs, ingots, shot, etc	184,042,404	46,272,805	186,104,935	48,144,356	156,804,166	42,813,780

1 Quantity not recorded.

CONSUMPTION AND CONSUMERS' STOCKS

The following tables give data on consumption and consumers' stocks of nickel. The data cover all known consumers of nickel in the form of primary, secondary, oxide, and cobalt-nickel compound. The figures for nickel salts, however, fall short of the total; nevertheless, they cover almost all of the larger and many of the smaller users of nickel in this form.

Nickel (exclusive of purchased and home scrap) consumed in the United States in 1945 and stocks at consumers' plants on Dec. 31, 1944 and 1945, by forms, in pounds of nickel

Form	Stocks at consumers' plants Dec. 31, 1944	Consumption in 1945	Stocks at consumers' plants Dec. 31, 1945	In transit to consumers' plants Dec. 31, 1945
Primary	11,180,467	153,235,789	13,386,772	566,383
Secondary (remelted from scrap)	1,909,384	7,906,606	2,976,386	2,000
Oxide	213,942	11,035,457	1,359,466	230,375
Matte	3,383,004	19,809,007	3,409,699	------------
Mayari iron ore	268,975	100	262,125	------------
Nickel-cobalt compound	947	8,681	3,569	------------
Salts	256,641	509,108	367,250	228
	17,213,360	192,504,748	21,765,267	798,986

Nickel (exclusive of purchased and home scrap) consumed in the United States in 1945, by uses

Use	Pounds of nickel
Ferrous:	
Steel (including heat and corrosion resisting alloys and high-iron alloys)	111,114,967
Cast iron	6,025,564
Nonferrous (comprises copper-nickel alloys, nickel silvers, brass, bronze, and aluminum alloys, and Monel, Inconel, and malleable nickel)	52,802,013
High temperature and electrical resistance alloys	7,902,392
Electroplating (anodes and solutions)	12,736,349
Catalysts	890,253
Ceramics	43,042
Other	990,168
	192,504,748

GOVERNMENT STOCKS

Stocks of nickel held by the Office of Metals Reserve on December 31, 1945, totaled 37,911,675 pounds of contained nickel and comprised 854,000 pounds in Burma speiss, 1,339,665 in nickel-cobalt concentrate and matte, 19,080,154 in oxide, 4,045 in hydroxide, 153,983 in Moroccan ore, and 16,479,828 in refined nickel.

WORLD PRODUCTION

The following table shows world production of nickel by countries, 1937–45, insofar as statistics are available.

World production of nickel (content of ore), 1937–45, by countries, in metric tons [1]

[Compiled by B. B. Waldbauer]

Country [1]	1937	1938	1939	1940	1941	1942	1943	1944	1945

United States [6]	199	377	357	503	599	555	582	896	1,048
Total (estimate)	120,100	115,500	122,000	140,000	162,000	165,000	166,000	163,000	153,000

[1] In addition to countries listed Finland, Japan, and Sweden produce nickel, but data of output are not available.
[2] Data not yet available; estimate included in total.
[3] Excludes small quantity produced in British Columbia.
[4] Fiscal year ending Mar. 20 of year stated.
[5] Estimate.
[6] Byproduct in electrolytic refining of copper. In 1941 includes also production from ore and as byproduct of talc; in 1944 and 1945 includes also production from ore.

Canada.—Virtually all the Canadian output is derived from copper-nickel ores of the Sudbury district, Ontario. Some nickel is also recovered as a byproduct from silver-cobalt ores of Cobalt and other areas in northern Canada. Two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Nickel production in Canada was 121,978 short tons in 1945 compared with 137,299 tons in 1944.

According to the International Nickel Co. of Canada, Ltd.:[4]

> The cessation of hostilities in the summer of 1945, followed by the cancellation of war contracts, caused a sharp decline in deliveries of our metals and an accumulation of nickel stocks. As all of our plants were equipped for sufficient output to fulfill the maximum wartime demands of the United Nations, it became necessary to inaugurate a program of curtailment of operations. This was commenced in August and by the year end the production of nickel was down to about 50 percent of the expanded capacity.

[4] International Nickel Co. of Canada, Ltd., Annual Report: 1945, p. 4.

The war years imposed an extraordinarily heavy drain on the ore reserves of the Company and the annual tonnage of ore mined greatly exceeded that of any prewar year. The ore mined in 1943, 1944 and 1945 was 12,105,545 short tons, 12,117,567 short tons and 10,136,350 short tons, respectively. This compares with an average yearly output of 5,321,634 short tons for the three prewar years 1936, 1937 and 1938.

It has nevertheless been possible through our extensive diamond drilling and exploration program to make great progress in the replenishment of proven ore reserves. In spite of the tremendous tonnage of ore removed from the mines during the war years, the proven ore reserves at the end of 1945 stood at 217,-373,000 short tons containing 6,866,000 tons of nickel-copper, compared with 212,368,000 short tons at the end of 1938 containing 6,806,000 tons of nickel-copper.

The underground development in 1945 totaled 50,701 feet, compared with 66,104 in 1944. This brings the total footage of underground development to 1,136,045 at the year end.

Sales of nickel in all forms by the International Nickel Co. of Canada, Ltd., were 201,572,987 pounds in 1945, compared with 250,740,110 and 270,498,674 pounds, respectively, in 1944 and 1943.

Because of a shortage of labor to mine ore, Falconbridge Nickel Mines, Ltd.,[5] was forced to close the smaller of its two furnaces at the end of June 1945; consequently, both the tonnage of ore treated and of metal produced declined substantially from the all-time peak established in 1944. Ore treated in 1945 totaled 716,868 short tons (830,254 tons in 1944) and comprised 422,679 tons of milling ore and 294,189 tons of smelting ore. The ore treated averaged 1.596 percent nickel in 1945 (1.59 percent in 1944). Matte produced in 1945 contained 10,349 tons of nickel (12,049 tons in 1944). Ore reserves were 13,682,000 tons averaging 1.72 percent nickel on December 31, 1945.

Shortly after hostilities in Europe ceased, part of the production of matte by Falconbridge Nickel Mines, Ltd., was diverted to its Kristiansand, Norway, refinery, which during the period of occupation of Norway had been operated under German control. By late November the entire output of matte was being shipped to Kristiansand.

Cuba.—Production of nickel in Cuba in 1945 was more than double that of 1944; as a consequence it surpassed New Caledonia as a producer. The ore is converted to oxide at the plant of Nicaro Nickel Co. at Lengua de Pajaro, from which it is exported to the United States, where it is sold to the steel industry. However, during the latter half of 1944 and January 1945 some of the oxide was refined at Wilmington, Del. Production of nickel oxide was 15,425 short tons (12,015 tons nickel content) in 1945 compared with 6,902 tons (5,158 tons nickel content) in 1944. Exports of nickel oxide from Cuba were 16,326 short tons (12,625 nickel content) in 1945 compared with 4,435 tons (nickel content not stated) in 1944. The mine and metallurgical plant of Nicaro Nickel Co. have been described by Baragwanath and Chatelain.[6]

According to the Freeport Sulphur Co., of which the Nicaro Nickel Co. is a subsidiary:[7]

Nicaro Nickel Company has continued to operate the nickel mining and recovery plant at Nicaro, Cuba. This plant is owned by Reconstruction Finance Corporation and is operated by us with funds supplied by that agency. * * * During 1945 steady and substantial progress was made in the production of nickel oxide,

[5] Falconbridge Nickel Mines, Ltd., 17th Annual Report: 1945, pp. 1-11.

[6] Baragwanath, J. G., and Chatelain, J. B., Development and Equipment of the Nicaro Nickel Project: Min. and Met., vol. 26, No. 464, August 1945, pp. 391-394.

[7] Freeport Sulphur Co., 33d Annual Report: 1945, pp. 5-6.

and the steel industry has widely accepted the product and given the project its wholehearted support. For the last half of the year the plant was producing at a rate equivalent to approximately 30 percent of the prewar United States consumption of this strategic material for which this country has been almost entirely dependent upon foreign sources. It is very gratifying to be able to report that operations in this period were on a basis which permitted a profit to Reconstruction Finance Corporation on its sales of our current production, there being no charge for depreciation. The successful development of this important project, using a new process and a plant designed and operated by the Freeport staff, is a source of great pride to the management.

It is our hope that arrangements can be made whereby this plant can continue to operate as an additional source of nickel for this country and as an important factor in national defense. Final disposition of the plant is under consideration by the interested government departments, but is as yet undetermined.

New Caledonia.—New Caledonia was surpassed by Cuba in 1945 as a producer of nickel. The Sociètè Le Nickel owns a number of properties in various parts of the island, but the most important are those around Thio on the east coast and around Voh and Koné on the west coast. Its smelter, comprising four furnaces, is at Noumea and produces a matte containing 77 to 78 percent nickel. During the war the matte was exported to the United States, where it was refined at Huntington, W. Va. With the end of the war, the matte will as formerly be sent to the company works at Le Havre, France. However, as a result of the proposal to install additional electric power facilities, it is planned to refine the matte in New Caledonia.[8]

The nickel ore produced in New Caledonia contains 2.5 to 5 percent nickel.

Production of nickel ore and matte in New Caledonia, 1941–44, in metric tons

	1941	1942	1943	1944
Ore	395,348	256,555	210,697	231,850
Matte	8,085	6,600	7,025	7,248

Norway.—The Falconbridge nickel refinery at Kristiansand, which, during the period of occupation, had been operated under German control, was found to be intact and in good condition when Norway was liberated, but all stocks of matte were depleted.[9] During the period of occupation, the output of two Norwegian mines and some ore from Petsamo were also used. In July 1945 shipments of matte from Canada to Kristiansand were resumed.

U. S. S. R.—It is reported that the productive facilities at the Petsamo nickel properties are being restored and that operations have begun at the Kaulatunturi mine.[10] Rich nickel deposits in Nivalo, near Petsamo, are to be further investigated with a view to their exploitation.[11] Pure nickel will soon be produced at Monchegovsk in the Kola Peninsula; the mines were closed when the Germans occupied the area.[12] In the Southern Urals the nickel mine and smelter at Norilsk in far Northern Siberia is producing more than five times as much metal as before the war.[13]

COBALT

By Hubert W. Davis

SUMMARY OUTLINE

SUMMARY

Cobalt was of great importance in the production of some essential military equipment, and its consumption in high-speed steel, stellite and carbide-type alloys, magnets, jet-propulsion gas turbines, and other applications expanded phenomenally during the war. Despite the large increase in use, however, supplies were adequate for requirements.

During the first half of 1945 domestic consumption of cobalt for industrial purposes was at the record rate of 233 tons monthly as compared with an average of 193 tons monthly in 1944 and 185 tons in 1943. However, had not hostilities with Japan ended on August 14, usage ultimately would have exceeded 600 tons monthly, chiefly because of the requirements of cobalt in the jet-propulsion gas turbine. Vitallium, an alloy containing about 65 percent cobalt, 30 percent chromium, and 5 percent molybdenum, is used for the turbine buckets of both the gas turbines and the turbo-superchargers.[1] To provide for the increased demand the African Metals Corp. (which refines cobalt at Niagara Falls, N. Y.), at the request of the War Production Board early in 1945, made arrangements with the Union Minière du Haut Katanga (which produces cobalt metal and alloy in the Belgian Congo) to supply to the United States monthly 600 tons of cobalt in finished and other forms. To this end it was planned to use the refining capacity (in excess of 200 tons a month) at Niagara Falls, N. Y., the refining plant (capacity about 200 tons a month) at Oolen, near Antwerp, Belgium, and the new refining plant (capacity about 225 tons a month) at Jadotville, Belgian Congo. However, the end of the war in Europe, followed soon thereafter by victory in the Pacific, completely changed the requirements. Meanwhile, the plant at Niagara Falls continued operating, although at a reduced rate during the last quarter of 1945, the plant in Belgium resumed in June, and the new plant in Belgian Congo was brought into production, and as a consequence output of metal substantially exceeded demand during the latter half of 1945, resulting in the accumulation of sizable stocks.

[1] Iron Age, vol. 157, No. 1, Jan. 3, 1946, p. 126.

Production of cobalt ore in the United States established a new record and was 33 percent greater than in 1944. Imports of cobalt in all forms were also greater (18 percent) than in 1944 but 20 percent less than in 1943, the peak year.

Consumption of cobalt contained in ore, alloy, and concentrate by refiners or processors was 12 percent less than in 1944, but consumption of cobalt products by industrial consumers declined only about 4 percent, owing mainly to increased demand for salts, driers, ground-coat frit, pigments, and carbide-type alloys.

Maximum prices for cobalt metal, fines, powder, oxides, and other alloys and compounds established by the Office of Price Administration on November 2, 1943, continued in effect in 1945. The maximum price for metal containing 97 percent cobalt was fixed at $1.50 to $1.57 a pound on contract and $1.60 to $1.67 on spot sales. The maximum prices for other cobalt products were the highest charged by a seller on a delivery made during January, February, or March 1942. Cobalt ores, concentrates, and crudes are exempt from the provisions of the price regulation.

Further developments upon a combined chemical and electrolytic process that will materially facilitate the production of cobalt metal from domestic ores are reported in Bureau of Mines Report of Investigations 3832.[2]

The metallurgical treatment of cobalt ores from the Goodsprings mining district, Nevada, are reported in Bureau of Mines Report of Investigations 3836.[3]

Refining of cobalt ores is the subject of United States Patent 2,379,659.

MINE PRODUCTION AND DEVELOPMENT

Production and shipments of cobalt ore in the United States were 33 and 130 percent, respectively, greater in 1945 than in 1944. The St. Louis Smelting & Refining Co., Fredericktown, Mo., displaced the Bethlehem Steel Co., Bethlehem, Pa., as the chief producer in 1945. The Bureau of Mines is not at liberty to publish figures on production and shipments of cobalt in the United States for 1944 and 1945; however, shipments may now be revealed for 1940 to 1943 and were as follows: 1940, 127,000 pounds; 1941, 521,627 pounds; 1942, 661,657 pounds; and 1943, 763,772 pounds.

The St. Louis Smelting & Refining Co., which began production of cobalt commercially at its property near Fredericktown, Madison County, Mo., in July 1944, produced 79 percent more cobalt in 1945 than in 1944. The complex ore is treated in a flotation mill, which yields a nickel-cobalt concentrate, a lead concentrate, and a copper concentrate containing some lead. The roasted nickel-cobalt concentrate produced in 1945 contained about 19 percent nickel and 13 per-

[2] Shelton, F. K., and others, A Study of Certain Factors in the Hydrometallurgy and Electrodeposition of Cobalt: Bureau of Mines Rept. of Investigations 3832, 1945, 43 pp.

[3] Shelton, F. K., Metallurgical Treatment of Cobalt Ores from the Goodsprings Mining District, Nevada. Bureau of Mines Rept. of Investigations 3836, 1946, 34 pp.

cent cobalt; it was sold to the Office of Metals Reserve. In addition to the roasted concentrate, some ore and calcines were produced and shipped to The Pyrites Co., Wilmington, Del. Production of nickel-cobalt concentrate was suspended in September 1945. The problem of making a successful recovery of separate products of nickel and cobalt is being studied by the St. Louis Smelting & Refining Co. The Bureau of Mines continued its investigation on the extraction of cobalt, nickel, and copper from a pyritic reject accumulated in the milling operation of the company.

The Bethlehem Steel Co. produced 4 percent less cobalt than in 1944. The cobalt is contained in the sulfides that accompany the magnetite mined at Cornwall, Pa. The cobalt-bearing material (averaging 1.4 percent cobalt in 1945) is shipped to The Pyrites Co., Wilmington, Del., where it is processed to metal and other cobalt products.

The Sullivan Mining Co., Kellogg, Idaho, recovered 67 short tons of residues, containing 5,855 pounds of cobalt, at its electrolytic zinc plant. However, it made no shipments in 1945.

The Blackbird mine near Salmon, Idaho, was acquired by the Calera Mining Co., a wholly owned subsidiary of the Howe Sound Co. During 1945 an adit about 500 feet long was driven to crosscut the shear zone in the vicinity of the Chicago claim. Approximately 1,000 feet of drifting and crosscutting has been completed in the zone, and an ore shoot, which offers promise of extensions at both ends, has been developed for a length of about 600 feet. The average width of the ore, which is mostly massive sulfide, is about 20 feet. The ore carries copper and gold as well as cobalt. According to the Howe Sound Co.,[4] "the work to date is most encouraging and during 1946 should be sufficiently advanced to definitely determine the commercial possibilities of the mine."

FOREIGN TRADE [5]

Imports.—Imports of cobalt into the United States in 1945 were 18 percent greater than those in 1944 and the second-largest ever recorded. The Belgian Congo continued to be the chief source of imports into the United States; in 1945 it supplied 1,486 pounds of metal and 8,397,145 pounds of alloy containing 3,616,000 pounds of cobalt. Canada supplied 40,000 pounds of metal, 859,940 pounds of ore containing 109,112 pounds of cobalt, and 120,672 pounds of oxide containing 89,300 pounds of cobalt. Belgium and Germany, respectively, supplied 465,805 and 438,684 pounds of metal. The receipts from Germany represent metal seized by the United States Army; the metal was placed in Government stock piles. The United Kingdom supplied 500 pounds of metal.

[4] Howe Sound Co., Annual Report: 1945, p. 3.
[5] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Cobalt imported for consumption in the United States, 1941–45, by classes [1]

Year	Alloy			Ore			Metal	
	Pounds		Value	Pounds		Value	Pounds	Value
	Gross weight	Cobalt content		Gross weight	Cobalt content			
1941 [1]	9,970,589	4,064,276	$4,330,085	2,443,725	262,653	$257,702	554,030	$842,288
1942	[2] 10,313,867	[2] 4,188,687	[2] 3,971,056	834,797	91,597	99,898	148,304	228,452
1943	[3] 10,110,879	[3] 4,357,335	(4)	[5] 10,556,042	[5] 1,268,788	[5] 1,620,869	266,670	373,948
1944	[3] 8,500,516	[3] 3,737,000	(4)	[6] 473,529	[6] 61,123	[6] 53,434	73,088	102,323
1945	[3] 8,397,145	[3] 3,616,000	(4)	859,940	109,112	91,554	946,475	1,582,670

Year	Oxide		Sulfate		Other salts and compounds	
	Pounds	Value	Pounds	Value	Pounds	Value
1941	38,002	$55,120	4,480	$3,779	500	$885
1942					200	448
1943	58,928	95,463			56	164
1944	225,609	400,356			115	354
1945	120,672	215,563			224	700

[1] In addition to classes shown, 4,796,000 pounds of Burmese speiss, containing 335,721 pounds of cobalt, were reported by processor to Bureau of Mines as imported in 1941; value not available.
[2] Includes 2,384,915 pounds of alloy, containing 980,000 pounds of cobalt and valued at $867,799, received in December 1942 but recorded as January 1943 by U. S. Department of Commerce.
[3] Reported by importer to Bureau of Mines; not separately classified by U. S. Department of Commerce.
[4] Data not available.
[5] Recorded by U. S. Department of Commerce as 12,253,292 pounds, containing 1,995,168 pounds of cobalt and valued at $2,270,889; these figures, however, include some alloy.
[6] Recorded by U. S. Department of Commerce as 1,628,066 pounds, containing 522,188 pounds of cobalt and valued at $499,087; these figures, however, include some alloy.

Exports.—Exports of cobalt are small, as is evident from the next table. Cobalt salts and compounds, which were 107 percent greater than in 1944, comprised the bulk of the exports in 1945, and Algeria, Brazil, Mexico, Norway, Sweden, and the U. S. S. R. took 79 percent of the total. Exports of metal and alloys declined from 348,439 pounds in 1944 to 1,856 pounds in 1945.

Cobalt exported from the United States, 1943–45, by classes

Class	1943		1944		1945	
	Pounds	Value	Pounds	Value	Pounds	Value
Ore and concentrates	38,755	$58,182	5	$33	50	$95
Metal and alloys	368,989	537,664	348,439	520,763	1,856	3,943
Oxide	14,699	29,105	92,031	183,158	(1)	(1)
Salts and compounds	20,836	17,955	40,046	30,488	83,041	48,835

[1] Not separately classified by the U. S. Department of Commerce.

CONSUMPTION

Refiners or processors.—Consumption of cobalt contained in alloy, ore, and concentrate by refiners or processors was 4,808,825 pounds in 1945 compared with 5,457,000 pounds in 1944. In addition, the cobalt content of other cobalt raw materials consumed by refiners or processors in 1945 was as follows: Fines, 453,538 pounds; hydrate, 133,831 pounds; carbonate, 18,460 pounds; and rondelles, 64,872 pounds. Thus, the total cobalt content of cobalt raw materials consumed by refiners or processors was 5,479,526 pounds in 1945, of which about 86 percent was processed to metal, oxide, and hydrate and 14 percent was used in making salts and driers.

Refiners and processors of cobalt in the United States in 1944, the cobalt product made, and the cobalt raw material used are listed on page 628 of the Cobalt chapter in Minerals Yearbook, 1944.

Specified cobalt products[1] produced and shipped in the United States, 1944–45, in pounds

Product	Produced		Shipped (gross weight)[2]
	Gross weight	Cobalt content	
1944:			
Oxide	364,877	226,350	311,198
Hydrate	416,513	155,043	448,825
Salts and driers	8,633,891	653,288	8,712,038
1945:			
January–September:			
Oxide	371,040	261,560	566,545
Hydrate	260,268	98,197	260,065
Salts and driers	8,063,341	553,243	7,816,203
October–December:			
Oxide	79,461	55,634	75,964
Hydrate	68,504	27,771	79,859
Salts:			
Acetate	59,191	13,800	63,183
Carbonate	15,425	7,549	14,026
Sulfate	33,027	6,716	17,572
Other	3,794	813	2,804
Driers	2,360,099	146,475	2,389,252

[1] In addition, cobalt metal (rondelles, granules, fines, and powder) was produced, but the Bureau of Mines is not at liberty to publish figures on production and shipments.
[2] Comprises shipments to customers, deliveries to Office of Metals Reserve, and consumption at producing plant. Excludes sales of imported products and sales by Office of Metals Reserve.

Industrial consumers.—Consumption of cobalt (exclusive of salts and driers) by industrial consumers was 3,734,255 pounds in 1945, a decrease of 6 percent from 1944; about 92 percent was used for metallic purposes and 8 percent for nonmetallic applications in 1945 compared with 95 and 5 percent, respectively, in 1944. The largest use of cobalt in 1945 was for stellite and stellite-type alloys, but 11 percent less cobalt was thus used than in 1944. The second-largest amount was employed in magnets, which used 16 percent less cobalt than in 1944. Less cobalt also was used in high-speed steel, but substantially more was employed in carbide-type alloys, ground-coat frit, and pigments in 1945 than in 1944. The quantity of salts and driers used is not known; however, the quantity of salts and driers produced in 1945 contained 728,596 pounds of cobalt compared with 653,288 pounds in 1944.

Cobalt consumed in the United States, 1943–45, by uses [1]

[Exclusive of salts and driers]

Use	Pounds of cobalt		
	1943	1944	1945
Metallic:			
High-speed steel	399,736	361,437	335,059
Stellite and stellite-type and carbide-type alloys	2,041,409	1,757,673	1,617,353
Magnets	1,032,374	1,322,097	1,105,880
Welding rod and stock for tipping tools	70,068	89,061	31,293
Dies and valve steel	29,604	36,865	25,566
Other	186,664	233,782	318,967
Total metallic	3,759,855	3,800,915	3,434,118
Nonmetallic:			
Ground-coat frit	80,504	116,884	173,428
Pigments	39,384	53,654	100,789
Other	35,415	17,459	25,920
Total nonmetallic	155,303	187,997	300,137
	3,915,158	3,988,912	3,734,255

[1] Comprises metal, oxide, purchased scrap, and cobalt-nickel compound, and ore used directly in magnets and other industrial applications.

STOCKS

Stocks of cobalt held by refiners or processors, industrial consumers, and Office of Metals Reserve are given in the following table.

Stocks of cobalt held by refiners or processors, industrial consumers, and Office of Metals Reserve on December 31, 1945

Product	Pounds of cobalt		
	Refiners or processors	Industrial consumers	Office of Metals Reserve

WORLD PRODUCTION

As cobalt-production data for many countries are lacking, it is impossible to prepare an accurate statement of world output. The following table shows world production by countries, 1938–45, insofar as statistics are available.

World production (partly estimated) of cobalt, 1938–45, by countries, in metric tons [1]

[Compiled by B. B. Waldbauer]

Country [1]	Cobalt-bearing material	Cobalt content							
		1938	1939	1940	1941	1942	1943	1944	1945
Australia	Cobalt oxide [2]	20	20	18	20	20	15	13	(3)
Belgian Congo	Cobalt alloy	1,532	(3)	[4] 1,423	[4] 1,844	[4] 1,900	[4] 1,976	[4] 1,695	(3)
Bolivia (exports)	Cobalt ore	------	------	2	2	(5)	(5)	(3)	(3)
Burma	Cobaltiferous nickel speiss	[6] 238	[6] 229	218	73	(3)	(3)	(3)	(3)
Canada	Cobalt ores, oxide, and metal	208	332	360	119	38	80	16	49
Chile	Cobalt ore	(3)	(3)	(3)	2	(5)	3	5	(3)
Morocco, French	do	720	730	365	79	3	275	284	(3)
Northern Rhodesia [6]	Cobalt alloy	1,073	1,598	1,223	650	914	943	978	874
United States (shipments)	Cobalt ore	------	------	58	237	300	346	(7)	(7)

[1] In addition to countries listed, Brazil, China, Finland, Germany, Italy, Japan, Mexico, Spain, and Sweden produce cobalt, but production data are not available.
[2] Produced from Australian ore.
[3] Data not available.
[4] Imports into United States.
[5] Less than 1 ton.
[6] Year ended June 30, of year stated.
[7] Bureau of Mines not at liberty to publish figures.

Belgian Congo.—Belgian Congo continues to be the world's chief source of cobalt. To meet the increased demand for cobalt during the war, the Union Minière du Haut Katanga installed at Jadotville two single-phase cobalt electric furnaces to supplement the four previously in existence, thereby bringing the monthly capacity of this plant to about 300 tons. In addition, the company also erected at Jadotville a new refining plant capable of producing about 225 tons a month of refined cobalt granules of high purity and very low carbon content. Thus, the total possible monthly production is about 525 tons. The company resumed operations at the mine and cobalt-concentrating plant at Kabolela and opened and equipped a new cobalt mine and ore-treatment plant at Kamoto. Production data for Belgian Congo have not been published since 1938, when 1,532 metric tons were produced. Since 1938, however, production has increased substantially.

The following information concerning the cobalt activities of the Union Minière du Haut Katanga is contained in a monograph published by that company in 1943.

The refinery has also two rotary furnaces refining crude copper from Lubumbashi and the cobaltiferous red alloy from the electric furnaces. The solutions used in the electrolytic plants contain cobalt. This metal is recovered by a special process of precipitation, the precipitates being smelted in the cobalt electric furnaces. In the near future it will be treated by electrolysis in a new plant by a process developed in the company's research laboratories.

The electric furnace plant comprises six furnaces and smelts the cobalt-bearing ores and slags, as well as the cobaltiferous precipitates coming forward from the electrolytic works. The fines are first sintered in a Dwight-Lloyd machine. The furnaces are of 650 Kw. on single phase current and have an upper diameter of over six feet. The elements added to the charge are lime, as a flux, and nut coke, as a reducer. Nearly all of the cobalt and copper is reduced.

The metal tapped from the furnaces separates into two layers. The lower one is a kind of crude copper containing cobalt, which is treated in the rotary furnaces of the copper refinery. The upper layer is crude cobalt; it is cast into ingots, or granulated by pouring it on a flat jet of cold water. The granules or ingots are sent to the United States, where they are treated to produce pure cobalt or cobalt salts.

Canada.—Production of cobalt (content) in Canada increased to 109,123 pounds in 1945 from 36,283 pounds in 1944. The Silanco Mining & Smelting Corp., which operates a concentrator and mines cobalt-silver ore at the Agaunico and other properties in and about Cobalt, Ontario, was the chief producer in 1945. The mining and beneficiation of cobalt ore by the Silanco Mining & Smelting Corp. have been described by McLaren.[6]

The Silanco Mining & Smelting Corp. has begun construction of a smelter 1 mile south of Gillies siding and 6 miles from Cobalt on the Temiskaming & Northern Ontario Railway.[7] The smelter will have a daily capacity of 10 tons of concentrates, using electric furnaces for smelting and chemical treatment for separation of the copper, nickel, arsenic, and silver in the ores.

The reduced demand for and large stocks of Canadian cobalt are viewed with some alarm by the Northern Miner, which comments as follows:[8]

> Production in the Cobalt district is now down to only one important operation because of difficulties encountered in finding a good market for cobalt. Silanco Mining & Smelting Corp. continues at a reduced scale but is only selling one-half its concentrates and is adding to the greatest stock pile of cobalt metal in Cobalt's history. Silanco has 2,000 tons or more of concentrates and Temiskaming Testing Laboratories is holding something like 500 tons for a number of different small producers. Added to this is a large stock pile of finished and unfinished metal for the United States Government at another point in Canada.
>
> Canada's single cobalt smelter at Deloro has kept its refinery busy throughout the war years treating for the British Government high cobalt content residues secured as a byproduct from the Rhodesian copper producers. * * * The Canadian plant has treated Canadian ores and concentrates whenever stock piles reached a point where operation of the smelter justified. * * *
>
> While at first glance stocks of cobalt in Canada would appear to be a handicap to the return of a satisfactory market, those close to the industry take the view that they will encourage the use of the metal. Inquiries have been received for unusually large tonnages and it is felt that for the first time the producers of the Cobalt area are able to consider a commitment of that kind. * * *

Northern Rhodesia.—The second-largest producer of cobalt in the world is Northern Rhodesia, where the mineral occurs associated with copper in certain of the ore found in the copper mines. The production of cobalt by the Rhokana Corp. has been described by the South African Mining and Engineering Journal.[9]

According to the Rhokana Corp.:[10]

> The smelter practice in connection with cobalt production has not been basically altered during the war years but the steady increase in the iron content of the ore with greater depth in mining has increased production difficulties enormously. Recently, conditions have been such that it was impossible to meet the specifications for alloy to be shipped for refining and it became necessary to re-treat considerable quantities of alloy in the converters. By these means, shipments were maintained but losses and costs were inevitably increased.

MOLYBDENUM

By Edwin K. Jenckes

SUMMARY OUTLINE

SUMMARY

In 1945, for the second successive year, the production of molybdenum concentrates dropped from the all-time high of 1943. The output (in terms of molybdenum content) of 30,802,000 pounds was 80 percent of that for 1944. In contrast, consumption increased 4 percent over 1944. The net result of decreased production and increased consumption, plus an excess of exports over imports, was a decline of 13 percent in the stocks in the hands of producers and consumers of concentrates in 1945.

Imports of molybdenum concentrates in 1945 declined to 19 percent of those for 1944 and included a substantial quantity imported from Canada for conversion and return to that country. Exports in 1945 decreased to 48 percent of those for the previous year. Exports were made to Canada, U. S. S. R., France, Sweden, and the Netherlands.

Salient statistics of the molybdenum industry in the United States, 1941–45, in thousands of pounds of molybdenum contained in ore and concentrates

	1941	1942	1943	1944	1945
Production	40, 363	56, 942	61, 667	38, 679	30, 802
Imports for consumption	4	756	1, 789	3, 499	665
Shipments (including exports)	38, 377	66, 437	53, 955	39, 423	32, 524
Consumption	[1] 16, 891	56, 388	49, 891	31, 520	32, 696
Stocks (producers' and consumers') Dec. 31	21, 226	12, 540	17, 811	[2] 19, 335	16, 899

[1] 6 months, July to December.
[2] Revised figure.

Inasmuch as the principal use of molybdenum is in alloy steels, its consumption follows their production in a general way. Alloy-steel production decreased 19 percent in 1945 compared to 1944, but the drop in consumption of the molybdenum compounds entering into alloy steel was only 14 percent, the difference being accounted for by the broadening of the use of molybdenum as an alloying element. The consumption of other molybdenum products increased 57 percent.

WAR PRODUCTION BOARD AND CIVILIAN PRODUCTION ADMINISTRATION ACTIONS

War Production Board Order M–21–a (allocation of alloy iron and steel) was revoked on May 4, 1945, and was superseded by Order M–21 of May 4, 1945, as amended. This order provided that alloy steel and alloy iron (as defined by the order) should not be melted except upon approval by WPB and that producers of alloying materials (whether ferro-alloys or other compounds usable in iron and steel) should file monthly production schedules with the Board.

Order M–21 (iron and steel), as amended, was reissued on August 24, 1945, and provided that WPB "may issue from time to time" directions regulating the production and distribution of alloy steel and iron and ferro-alloys and alloying compounds.

Order M–21–j (tool steel) was issued April 7, 1945, and amended May 18, 1945. This order directed that, of all high-speed steel melted, delivered, or accepted, not over 15 percent should be class B (straight tungsten steel) and the balance should be class A (to contain 6.75 percent or less of tungsten and 3 percent or more of molybdenum). This order was necessitated by the extremely large tungsten requirements of the armed services for the tungsten carbide projectile cores. This order was revoked July 2, 1945.

Order M–110 (molybdenum), which required suppliers of molybdenum products to report sales of more than 2,000 pounds of molybdenum per month, was revoked May 21, 1945.

Direction 6 to Order M–21 was issued July 20, 1945, continuing the allocation control of molybdenum wire.

Order M–369 (molybdenum) was reissued April 10, 1945, and continued the allocation of molybdenum metal, molybdenum products, and tungsten-molybdenum alloys. Because of the easing of military requirements, Order M–369 (allocation of molybdenum products) was revoked July 20, 1945. This revocation left molybdenum wire the only molybdenum product under control.

Direction 6 to Order M–21 was revoked August 21, 1945, thus removing the last WPB control of molybdenum or its products.

On November 3, 1945, Executive Order 963 abolished the War Production Board and established the Civilian Production Administration, which then assumed the controls previously exercised by WPB.

DOMESTIC PRODUCTION

During the first 8 months of the year, shipments of molybdenum concentrates exceeded production, but in September and subsequent months this condition was reversed. The net result was a decrease in concentrate inventories held by their producers and consumers of 2,436,000 pounds (in terms of Mo content) during the year. However, the year-end stocks of 16,899,000 pounds represent substantially a 6 months' supply at the 1945 average consumption rate.

Domestic shipments from 1914 to 1945, inclusive, are shown in the accompanying table.

The total United States production of molybdenum concentrates for 1914–45, inclusive, has amounted to 424,935,000 pounds of Mo

Molybdenum in ore and concentrates shipped from mines in the United States, 1914–45 [1]

Year	Pounds	Value [2]	Year	Pounds	Value [2]
1914–18	1,601,643	$2,070,213	1940	25,329,000	$17,189,000
1919–23 [3]	355,493	370,371	1941	38,377,000	25,996,000
1924–28	8,498,343	6,160,304	1942	66,437,000	47,275,000
1929–33	18,954,917	11,406,000	1943	53,955,000	38,500,000
1934–38	94,077,000	64,244,000	1944	39,423,000	27,999,000
1939	32,415,000	22,157,000	1945	32,524,000	23,107,000

[1] For shipments by years, 1914–38, see chapter of this series for 1941.
[2] Largely estimated by Bureau of Mines.
[3] No shipments in 1920 and 1921.

contained. There was a small production before 1914, which probably did not exceed 100,000 pounds of Mo.

Total production of molybdenite declined 7,877,800 pounds of contained Mo (20 percent) in 1945 as compared to 1944. Production at straight molybdenum mines dropped 5,239,100 pounds (22 percent), and byproduct molybdenum output by other producers declined 2,638,700 pounds (18 percent). The byproduct molybdenum represented 38 percent of the total molybdenite produced in 1945, as compared to 35 percent in 1944. Molybdenite was recovered at 10 operations during 1945, of which 3 only operated on molybdenum ore. Of the 11 producers in 1944 one, Mammoth-St. Anthony, Ltd., Tiger, Ariz., has reported no production in 1945.

Producers of molybdenum concentrates in the United States in 1945

Type of ore	Molybdenum mineral	Location of mine	Operator
Molybdenum	Molybdenite	Climax, Colo	Climax Molybdenum Co.

Tungsten	Molybdenite and powellite.	Pine Creek, Calif	United States Vanadium Corp.

[1] Ore of the Consolidated Coppermines Corp. is milled in same circuit with Kennecott ore.

REVIEW BY STATES

Molybdenite was produced in six States in 1945, the order of magnitude of production being Colorado, Utah, New Mexico, Arizona, Nevada, California. Although molybdenum is known to occur in other States, no deposits of commercial importance have been developed.

Arizona.—Three producers recovered molybdenite as a byproduct of copper mining. Miami Copper Co. has been producing molybdenite since 1938 from copper ores mined at Miami, Ariz. The concentrates are roasted to molybdenum oxide and shipped east to the market. Bagdad Copper Corp. produced concentrates during the first quarter of 1945 but has reported no production since March.

The production of the Squaw Peak Copper Mining Co. was sporadic in the first 4 months of the year, no production having been made in the latter months. Mammoth-St. Anthony, Ltd., reported no production in 1945.

California.—A small quantity of molybdenum concentrates was produced by the United States Vanadium Corp. at Bishop as a by-product of its tungsten operation, substantially 90 percent of it being in January. The mining operations at Bishop have been curtailed severely during the entire year.

Colorado.—Colorado is by far the largest producer of molybdenite in the United States and supplied over half of the output in 1945. Two companies operate in the State; each mines primarily for molybdenite.

Climax Molybdenum Co.[1]—Between 1926 and 1941 the milling capacity of the Climax mill was increased from 1,200 to 18,000 tons a day, largely by plant additions. Under the stress of wartime requirements, changes in milling practice enabled the plant to raise the capacity to a consistent 20,000 tons a day, and refinements in the flotation circuit insured a high percentage of recovery. Recovery at the normal rate is 91 percent, which drops to 88.6 percent under forced conditions. The recovery can be raised to 93 percent if the rate is dropped slightly below normal. It is interesting to note that the ball mills are lined with chrome-molybdenum steel. Mill heads run 0.65 percent MoS_2, 1.0 to 1.5 percent iron sulfide, and 0.01 percent copper. The concentrates shipped under the company label run less than 0.2 percent copper, 0.3 percent iron, and 0.15 percent combined lead and zinc.

In the spring of 1945 the National Mediation Committee settled a dispute between the International Union of Mine, Mill, and Smelter Workers and the company concerning seniority and other grievances. The demand for a closed shop was not granted.[2] In April 1946 the company employed about 600 men, the smallest crew employed since 1932. However, the demand for molybdenum has fallen to such an extent that consumers have not suffered from a shortage of the material. Current milling practice is described by W. H. Dennis in the May 1945 issue of Mine and Quarry Engineering and in the May 1945 issue of The Mining World.

Molybdenum Corp. of America.—The Urad mine at Empire, Colo., owned and operated by the Molybdenum Corp. of America, has been a consistent shipper of concentrates throughout the year, although it has not yet been possible to operate the mine and mill at capacity because of a shortage of labor.

Nevada.—Molybdenite is recovered by the Kennecott Copper Corp. at its McGill copper concentrator from ore mined at the Ruth mine and the Copper Flat open pit. Ore from the Emma Nevada Group of the Consolidated Coppermines Corp. is also milled at the McGill concentrator.

New Mexico.—There are two producers of molybdenite in New Mexico, the Molybdenum Corp. of America at Questa and the Chino Mines Division of the Kennecott Copper Corp. at Hurley. The Questa property, which has been operated since 1919, is operated for

[1] Mining World, Wartime Milling at Climax: Vol. 7, No. 6, May 1945, pp. 15–19.
[2] Arizona Mining Journal, vol. 28, No. 22, April 15, 1945, p. 22.

molybdenum only. At Hurley molybdenite has been recovered as a byproduct of copper operations since 1937.

Utah.—The operations of the Utah Copper Co. at Arthur and Magna, where molybdenite is recovered as a byproduct, make Utah the second largest producer in the United States. There is no other producer of molybdenum in Utah.

EXPLORATION AND DEVELOPMENT

During 1945 the Bureau of Mines examined properties in Okanogan and Skagit Counties, Wash.; Bonner County, Idaho; and Mesa County, Colo. None of these deposits offers commercial possibilities at the present time.

The Geological Survey has studied the occurrence of molybdenum in porphyry copper deposits. Reports on the Castle Dome and Bagdad deposits, Arizona, are being prepared for publication. About 50,000 pounds of MoS_2 a month could be recovered at Castle Dome if facilities were available. Bagdad has produced concentrates. San Manuel copper deposit, Pinal County, Ariz., is under investigation, and preliminary geologic maps have been released for distribution.

Reports of the Survey's investigation on the following deposits have been prepared and are open for inspection.

Mine	District	County	State	Ore reserve (tons)	MoS_2 content (percent)
Loma Prieta	Copper Basin	Yavapai	Arizona	1,750,000	0.10-0.15
Big Ben	Neihart	Cascade	Montana	3,100,000	.20- .33
Starr		Okanogan	Washington	850,000	.20- .30
New Year's Eve	Amargosa Molybdenum and Copper Corp. properties.	Pima	Arizona	65,000	.20- .50
Esperanza	Amargosa Molybdenum and Copper Corp. properties.	Pima	Arizona	(1)	.05
Pine Creek	Bishop	Inyo	California	854,000	1.00

1 Large tonnage.

CONSUMPTION AND USES

Molybdenum is employed predominantly as an alloying element in iron and steel, but molybdenum finds important though relatively small uses in electrical equipment (radio and radar), special heat- and corrosion-resistant alloys, lithographing and printing inks, chemical reagents, and other minor applications. Molybdenum finds its way into the consumers' hands in many forms, as illustrated in the accompanying table.

Consumption of molybdenum products in the United States, July 1941–December 1945, in thousands of pounds of contained molybdenum

Year	Ferromolybdenum	Calcium molybdate	Molybdenum oxide [1]	Other [2]	Purchased scrap	Total
1941 [3]	3,899	2,724	6,546	372	510	14,051
1942	10,673	5,501	27,824	414	1,252	45,664
1943	6,663	5,099	26,383	580	2,940	41,665
1944	4,617	2,351	21,303	631	2,777	31,679
1945	4,560	2,166	17,583	989	1,631	26,929

1 Includes also molybdenum trioxide and molybdic acid, 1942–44.
2 Ammonium molybdate, sodium molybdate, molybdenum silicide, molybdenum metal, and alloys; also molybdenum trioxide and molybdic acid in 1941.
3 July to December.

During the early years of World War II molybdenum, either alone or in combination with other elements, was used as a substitute for scarcer materials, particularly tungsten and nickel. This application of molybdenum reduced visible stocks at the rate of approximately a million pounds a month in late 1941 and early 1942. In 1943 other alloying elements became increasingly available and were therefore employed to replace the molybdenum that had been substituted for them. However, the applicability of molybdenum had been broadened as a consequence of experience gained in these new applications. Before the war [3] molybdenum was used in about 30 percent of the total tonnage of alloyed engineering steels but is now a component of 80 percent of these steels. A part, at least, of this increase has resulted from the relative availability of molybdenum compared to that of other alloying elements. However, its growing field is indicated by numerous reports of new applications. The outstanding example of a new use for molybdenum in alloy steel is its addition to stainless steel to improve corrosion resistance. Practical applications have been made in the United States in the handling of highly corrosive chemicals,[4] and a thorough study of the corrosion resistance of this type of steel has been made in the U. S. S. R.[5] In Germany Cr-Ni-Mo steels are employed to combat corrosive effects encountered in the processing of fats, oils, and their products.[6] The improvement in tensile properties of 12-percent chromium steel by the addition of molybdenum in quantities up to 1 percent is noted in an article by Sanderson,[7] who also reported on an investigation into the graphitization in molybdenum-steel piping used to withstand high pressures and temperatures, which has been fully described by Kerr and Eberle.[8] The influence of molybdenum in Russian low-alloy steel, Russian specification AE 84, which corresponds closely to SAE X 4340, has been reported upon.[9] Other corrosion-resistance applications of molybdenum-containing alloys are in the impellers of gas turbines (16 percent Cr, 25 percent Ni, 6 percent Mo, and 0.08 percent carbon) used in jet-propulsion engines, and in turbine buckets for both gas turbines and turbo-superchargers, which are made of vitallium (65 percent Co, 30 percent Cr, and 5 percent Mo).[10]

It is reported that the engine of the Crosley postwar automobile will be built of thin sheet-steel stampings instead of castings and forgings and that the cylinder walls, which are only 1/16 inch thick, will be of Cr-Mo steel.[11] In spite of the stringent shortage of molybdenum in Germany, its use in tool and special steels was considered necessary, as is shown by the analyses of a large number of these

steels in a comprehensive article by Gill.[12] The effect of molybdenum in cast iron has been studied and reported upon.[13]

The fabrication of molybdenum wiré at the plant of the Wickwire Spencer Metallurgical Co. has been described in a recent publication.[14] Wartime requirements for elemental molybdenum—largely for radio, radar, and electrical equipment—necessitated very large expansion of facilities for producing the pure metal.[15] The use of molybdenum products which do not enter into the production of iron and steel to an appreciable extent (molybdenum metal, ammonium molybdate, sodium molybdate, and special molybdenum alloys) has increased over 100 percent in the period 1942–45. These special products are used largely in electrical equipment (particularly in radio and radar as pointed out above), in dry color lakes for printing and lithographing inks, and in special alloy applications, such as hard facing compounds, hard cutting alloys, and heat- and corrosion-resistant materials.

STOCKS

Stocks of molybdenite in the hands of producers and consumers of concentrates reached a low point of 8,060,700 pounds of molybdenum in May 1943, in spite of largely increased production. This decline was the result of four factors: Expansion of the tonnage of alloy steels of which molybdenum was an established component; substitution of molybdenum for scarcer alloying elements; development of new applications; and large net exports much for Lend-Lease account.

Stocks of molybdenite for 1942–45 are shown in the accompanying table.

Stocks (Jan. 1 and Dec. 31) of molybdenite in hands of producers and consumers of MoS_2 and consumers of molybdenum products in the United States, 1942–45, and net yearly change in such stocks

Year	Mo contained, thousands of pounds		
	Jan. 1	Dec. 31	Net change during year [1]
1942	21,226	12,540	−8,686
1943	12,540	[3] 17,811	[2] +5,271
1944	[2] 17,993	[3] 19,335	+1,342
1945	19,335	16,899	−2,436
Net change			[4] −4,327

[1] Net change due to balancing of production, receipts, consumption, shipments, and inventory adjustments.
[2] Stock figure for Jan. 1, 1944, includes 182,000 pounds not previously reported in statement of inventories.
[3] Revised figure.
[4] Figure covers stock change noted in footnote 2.

Year-end stocks in the hands of the Office of Metals Reserve have been: 1943—2,167,000 pounds; 1944—3,972,700 pounds; 1945—4,746,200 pounds. All but 2,000 pounds of these stocks are imported concentrates.

PRICES

During 1945 the quoted price of molybdenite held at 45 cents per pound of MoS_2 in 90-percent concentrates, the published price since 1938. This is an open-market price, and contracts probably can be obtained at a somewhat lower figure, dependent upon the quantity involved, terms of payment, etc.

The following prices for molybdenum products, which were quoted in the trade journals during the year, conform to maximum prices established by the Office of Price Administration in MPR-489, dated November 8, 1943.

Product:	*Per pound contained Mo*
Ferromolybdenum	$0.95
Molybdenum oxide, technical (powder or briquets)	.80
Calcium molybdate	.80

FOREIGN TRADE[16]

Imports of molybdenite into the United States are normally small but increased greatly during the war years. The peak of importation was in 1944, when 3,499,000 pounds of molybdenum (in concentrates) were brought in. In 1945 this figure fell to 665,000 pounds, an 81-percent decrease.

Exports declined for the third year in succession and amounted to 48 percent of those in the previous year. For many years export sales have constituted a major market for molybdenum and in some years have been estimated to be as high as 60 to 70 percent of sales. It is unquestionably true that there is a large potential market in European countries which the United States has the productive capacity to supply.

The last Lend-Lease shipment of molybdenum was made in July 1945. Lend-Lease shipments are included in the export figures in this report.

Imports and exports of molybdenum ore and concentrates in 1944 and 1945 appear in the accompanying tables.

Molybdenum ore and concentrates imported for consumption in the United States, 1944-45, by countries

Country	1944			1945		
	Pounds		Value	Pounds		Value
	Gross weight	Molybdenum content		Gross weight	Molybdenum content	
Canada	[1] 2,245,520	[1] 1,145,440	[1] $1,086,072	[1] 887,153	[1] 460,416	[1] $443,359
Chile	3,811,772	2,164,888	1,285,127	251,368	138,252	75,000

WORLD PRODUCTION AND DEVELOPMENTS

Reliable data concerning the production of molybdenum are incomplete, but it is a reasonable assumption that the United States continued to be the world's largest producer. The interest in molybdenum as a steel-alloying element in the U. S. S. R. (indicated above in the section on Consumption and Uses), coupled with the continued exports to that country from the United States, may be taken as an indication that the Russian developments noted below have not yet reached a point at which that country is self-sufficient in molybdenum.

World production of molybdenum in ores and concentrates, 1938–45, by countries, in metric tons

[Compiled by B. B. Waldbauer]

Country	1938	1939	1940	1941	1942	1943	1944	1945
Australia [1]	32	39	20	24	7	15	9	(2)

Total [4]	16,400	15,100	16,800	19,600	27,900	30,500	20,200	15,600

[1] Gross weight of ore and concentrates reported; molybdenum content estimated.
[2] Estimate included in total.
[3] Less than 1 ton.
[4] Estimate.
[5] Estimate by the author for Greece, Rumania, and Yugoslavia included in total; in addition, molybdenum ore is produced in Burma, China, Finland, France, Japan, Manchuria, Sweden, and U. S. S. R., but data of production are not available or are incomplete.

Canada.—The La Corne Molybdenite Project continued to be the principal producer in 1944. A description of the geology of the deposit and the milling practice has been published.[17]

[17] McLaren, D. C., La Corne Molybdenite Project: Canadian Min. Jour., vol. 66, No. 6, June 1945, pp. 371–379.

Chile.—Molybdenum concentrates were produced at the rate of about 150 tons a month at the Braden Copper Co. In 1944, 61 percent of the molybdenum imported into the United States came from Chile.[18] Although molybdenum is known to occur in the ores of the three big copper companies, it is recovered from those of the El Tiente mine of the Braden Copper Co. only. Because of wartime demand, the production was increased from 30 tons of Mo in concentrates in 1939 to 680 tons in 1943.[19] The 1944 production was 1,058 tons.

Finland.—In 1944, 193.9 metric tons of molybdenite concentrates were produced, of which 20 to 30 tons were retained for domestic consumption and the balance exported.

Germany.—The substitution of alloying elements in the engineering steels in Germany during the war followed a definite pattern—as nickel became scarce, Cr-Mo and Cr-Mo-V steels replaced nickel steels; next, when the supply of molybdenum ran low, Cr-V and Mo-V steels were adopted; and, finally, when Cr became extremely critical, recourse was had to Mn-V and Mn-Si steels. However, molybdenum was considered necessary in special applications, such as high-speed steel and special steels for resistance to extreme corrosion.

Greece.[20]—During the war the Krupp Co. invested large sums in a flotation plant and other equipment to concentrate molybdenum south of Gevgeli in the Department of Florena. This machinery is intact, but the property is idle. The deposits are said to contain about 1 percent MoS_2. Other deposits are known, but no effective prospecting has been done.

Japan.[21]—Molybdenum deposits are known in Japan, and production came from the Yamasa mine in Shimane Prefecture and the Hirase mine (the largest producer), Gifu Prefecture. Japan imported small quantities of molybdenum from Korea (Chosen).

Korea (Chosen).—The Korean production of molybdenite is small, being probably less than 200 metric tons a year.[21] The principal producers were the Chosui mine (North Zenra Province) and the Seiyo mine (South Chusei).

Mexico.—The Department of National Economy reports production of 780 metric tons and exports of 773 tons of molybdenite in 1945. The Cananea Consolidated Copper Co. at Cananea, Sonora, is the principal producer. The production in and exports of molybdenite from Mexico, 1939–44, in metric tons have been as follows:[22]

	1939	1940	1941	1942	1943	1944
Production, ore and concentrates	871	516	870	1,426	1,897	1,195
Mo content (estimated)	523	310	522	855	1,138	717
Exports, ore and concentrates	924	532	923	1,421	1,885	1,188

[19] Bureau of Mines, Foreign Minerals Survey, Minerals Review of Latin America, 1939–44: Vol. 2, No. 4, October 1945, p. 38.

[20] Bureau of Mines, Mineral Trade Notes: Vol. 22, No. 2, Feb. 20, 1946, p. 17.

[21] Bureau of Mines, Foreign Minerals Survey, Mineral Resources of Japan: Vol. 2, No. 5, October 1945, p. 43.

[22] Bureau of Mines, Foreign Minerals Survey, Minerals Review of Latin America, 1939–44: Vol. 2, No. 4, October 1945, pp. 82 and 84.

In 1943 the concentrates were sent to the United States for transshipment to the United Kingdom and U. S. S. R.[23]

Norway.—Norway's output of molybdenite in 1939 was 722 metric tons compared with 379 tons in 1943. The A/S Knaben Molybdängruber plant[24] was seriously damaged by bombs twice during 1943. In that year the operation produced 353 metric tons of MoS_2 in concentrates. There was no production from Kvina Gruver, but Oterstrand Gruber (formerly Laksadalen Molybdengruber A/S) produced about 28 metric tons of 82 percent concentrates. During the first 9 months of 1944, 285.8 metric tons of concentrates were produced compared to 308.5 tons in the corresponding period of 1943.

Peru.—The 1944 production figures of the Peru Molibdeno, S. A., the only company mining molybdenum in Peru, have been revised slightly from the figures reported in the 1944 chapter of this series. This latest report states that 22,704 metric tons of ore averaging 0.462 percent MoS_2 were produced, from which 104.6 metric tons of concentrates running 82.73 percent MoS_2 were obtained. The concentrates which were exported to the United States contained "a small amount of copper." From 1936 to 1945, 1,899 metric tons of concentrates containing 1,533 tons of MoS_2 were produced. The prewar market for this company was in England, Germany, or Japan. Measured or known reserves in November 1944 were estimated at 12,000 metric tons containing 0.6 percent MoS_2. The ore is concentrated by flotation. The only other producer,[25] the Salazar mine of Toribia Atachaguay Salazar, is very small. Peru's 1945 production is expected to decline abruptly.

Production in and exports of molybdenum in concentrates from Peru, in metric tons, have been as follows:[26]

	1939	1940	1941	1942	1943	1944
Production	165	166	146	154	85	62
Exports	115	176	147	194	99	53

Spain.—The production of wulfenite in Spain amounted to 27 metric tons in 1945 compared to 18 tons in 1944 and 25 tons in 1943. The La Reconquista mine at Velez de Benaudalla, Granada, has a capacity of 2 tons a month. In 1942, 11 tons of ore containing 9 percent Mo were refined to a crude molybdic oxide, and an experimental production of calcium molybdate was made.[27] Other prospects at Huejar-Sierra (Granada) and Oria (Almeria) have been examined. Wulfenite is the molybdenum mineral at these properties.

Sweden.—Late quantitative data from Sweden are lacking, but some ferromolybdenum is known to have been produced.[28] In 1935

total production was 415 metric tons, of which 359 tons were for export, and in 1939 the quantities were 312 and 166 tons, respectively. Domestic sources of molybdenum were being exploited.

United Kingdom.—Upon the withdrawal of molybdenum from distribution under Lend-Lease, its use in high-speed steel decreased. Tungsten for this purpose was reported to be plentiful.[29]

U. S. S. R.—Reliable production statistics from the U. S. S. R. continue to be lacking, but press notices evidence development of molybdenum resources. In Armenia a molybdenum plant was under construction[30] in the latter part of 1944 and early 1945. Uzbekistan is reported[31] to be an important eastern supplier of molybdenum for wartime use. Near Balkhash Lake the eastern Kounrad molybdenum mine has been opened and a mill erected.[32] This region supplies 60 percent of Russia's molybdenum.[33] Exploration and development work have been increased. The known deposits of molybdenum in Kazakhstan have been increased 25 percent since 1940.[34] Deposits of molybdenum have been discovered recently in the Chianytski area.[35]

VANADIUM

By Edwin K. Jenckes

SUMMARY OUTLINE

SUMMARY

The production of domestic vanadium ores in 1945 dropped to 2,963,913 pounds (measured in vanadium content), a decline from the previous year of 563,141 pounds. Consumption of domestic ore amounted to 3,821,419 pounds of contained vanadium and was 291,890 pounds below that in 1944. In both production and consumption 1945 was the second year of progressive decline from the all-time highs established in 1943.

Inasmuch as consumption of domestic vanadium ore exceeded production, stocks of ore at mills decreased during 1945. Inventories on December 31, 1945, represented less than 4 months' supply of ore at the 1945 rate of consumption. However, the relatively high rate of ore consumption has been accompanied by the building up of stocks of vanadium products.

Imports and exports in 1945 increased over those for 1944 by 253,826 pounds and 107,673 pounds, respectively.

Salient statistics of the vanadium industry in the United States, 1941–45, in pounds of vanadium contained

	Pounds of vanadium contained				
	1941	1942	1943	1944	1945
Mine shipments of ores and concentrates [1]	2,513,051	4,439,130	5,586,492	3,527,054	2,963,913
Imports:					
Ore or concentrates	2,138,608	2,422,376	2,052,620	1,284,603	1,552,307
Vanadium-bearing flue dust	(2)	154,028	64,393	40,171	26,293
Exports of ore, concentrates, and vanadium oxide	25,462	22,140	38,180	6,254	113,927
Consumption (domestic ores only)	2,393,478	3,914,673	5,179,290	4,113,309	3,821,419

[1] Measured by receipts at mills and Government purchasing depots.

GOVERNMENT ACTIONS

War Production Board and Civilian Production Administration.—War Production Board General Preference Order M–23–a (vanadium) was revoked on June 5, 1945, and the authority to regulate the production, distribution, and use of this element then resided in General Preference Order M–21 of May 4, 1945 (as amended)—iron and steel production. This order provided that alloy steel and alloy iron (as defined by the order) should not be melted except upon approval by WPB, and that producers of alloying materials (whether ferro-alloys or other compounds usable in iron and steel) should file monthly production records with the Board. Order M–21 (as amended) was reissued on August 24, 1945, and provided that the Board might issue from time to time directions regulating the production and distribution of alloy steel and iron and ferro-alloys and alloying compounds.

No close formal control over vanadium or its products was exercised during 1945. However, controls could have been re-established under General Preference Order M–21.

On November 3, 1945, Executive Order 963 abolished the War Production Board and established the Civilian Production Administration, which then assumed the controls previously exercised by the Board.

Office of Price Administration.—No changes in or amendments to Maximum Price Regulation 489, which would affect vanadium or vanadium products, were made in 1945. Maximum prices as established by this order are given in Minerals Yearbook, 1944 (p. 643).

Department of Justice.—The United States Department of Justice initiated a Federal grand jury investigation in Colorado of the vanadium-mining industry to determine whether evidence exists to warrant a suit on the grounds of monopolistic practices. This is the first action of its kind to be instituted in the Federal courts of Colorado.

Office of Metals Reserve.—The Office of Metals Reserve succeeded the Metals Reserve Company on July 1, 1945, and all reference to this agency in this chapter will be under the name of Office of Metals Reserve.

DOMESTIC PRODUCTION

The production of domestic vanadium ores for the last 10 years is given in the accompanying table.

Vanadium in ores and concentrates produced in the United States, 1936–45

Year	Pounds of vanadium	Year	Pounds of vanadium
1936	139,512	1941 [1]	2,513,051
1937	1,086,125	1942 [1]	4,439,130
1938	1,613,155	1943 [1]	5,586,492
1939	1,984,068	1944 [1]	3,527,054
1940 [1]	2,162,916	1945 [1]	2,963,913

[1] Receipts at mills and Government purchasing depots.

The production of the United States for the period 1910–45, inclusive, has reached the total of 43,143,000 pounds of contained V, of which 21,192,556 pounds (49 percent) were mined in 1940–45.

The Office of Metals Reserve purchasing program was terminated on February 29, 1944, as the result of the accumulation of large inventories of vanadium in ores and in vanadium products, especially fused vanadium oxide and ferrovanadium. Prices paid for ore had been dictated by the wartime necessity for large quantities of vanadium and many otherwise marginal and submarginal claims became productive during the emergency period. A consequence of the withdrawal of Metals Reserve purchases at high prices was a marked decrease in the number of operators in 1944. In 1945, 75 independent operators delivered ore to the processing mills, compared to 82 in 1944. The quantity of ore so delivered declined, but the ore was of better grade.

Domestic ores may be divided into those occurring in the sediments of the Morrison,[1] Entrada,[1] and Shinarump formations (in which carnotite and roscoelite are the types most frequently mentioned) and various complex ores. The sandstones are found in Colorado, Utah, New Mexico, and Arizona and form the largest source of domestic vanadium. The complex ores include the phosphate rock in Idaho (currently the only commercial source of domestic vanadium not derived from the sandstones), phosphatic shales of Utah, Idaho, and Wyoming, lead vanadates of Arizona and Nevada, and some titaniferous magnetites, particularly those adjacent to Sanford Lake, New York.

Except for the examination of a number of claims, neither the Bureau of Mines nor the Geological Survey did any extended exploring or developing in 1945, but the Survey has published maps covering two vanadium mining areas in the Colorado-Utah fields.[2] [3]

The weighted average of prices as reported to the Bureau of Mines places the value of the 1945 production at $1,766,500.

REVIEW BY STATES

The accompanying table shows the total production by all producers, by States, measured in terms of receipts at mills.

Vanadium in ores and concentrates produced in the United States, 1944–45, by States, in pounds

State	Pounds of vanadium contained	
	1944	1945
Colorado	3,058,727	2,701,103
Utah	287,045	97,572
Other [1]	181,282	165,238
	3,527,054	2,963,913

[1] 1944: Arizona, Idaho, and New Mexico; 1945: Arizona and Idaho.

[1] The name McElmo was formerly and is still locally applied to parts of the Morrison and Entrada formation.

[2] Fischer, R. P., Simplified Geologic Map of the Vanadium Region of Southwestern Colorado and Southeastern Utah: Geol. Survey Pubs., June 1944.

[3] Stokes, W. L., Russell, R. T., Fischer, R. P., and Butler, A. P., Jr., Geologic Map of the Gateway Area, Mesa County, Colo., and the Adjoining Part of Grand County, Utah: Geol. Survey Pubs., May 1945.

Arizona.—One small delivery of ore was made from Arizona. Mammoth-St. Anthony, Ltd. (Tiger, Ariz.), Arizona's oldest vanadium producer, did not recover any vanadium from its complex ores in 1945.

Colorado.—Colorado was the largest producer of vanadium ores, thus maintaining the position it has held since 1942; the Bureau has not been at liberty to publish production figures for all States for the years prior to 1942. At the Uravan plant of the United States Vanadium Corporation, both the main plant and the auxiliary leaching plant for the recovery of vanadium were closed during the entire year, and at the Durango plant both the main plant and the auxiliary leaching plant were idle in the last quarter of the year.[4] [5] The Durango plant was purchased from Office of Metals Reserve by the United States Vanadium Corp.[6] A substantial proportion of the 1945 operation of this plant was the refining of ore on a toll basis for Office of Metals Reserve, the remainder being for company account. The company's plant at Rifle operated throughout the year, but at a reduced rate during the latter months, and mining activity was reduced to development work.[7] A decision of the Nonferrous Metals Commission directing the United States Vanadium Corp. to continue portal-to-portal payments to the miners at Rifle was affirmed by the War Labor Board.[8]

The Grand Junction treatment plant, which had been erected as part of the tailings recovery program, was being dismantled at the end of the year.[9] The properties and plants of the North Continent Mines, Inc., at Slick Rock, Colo., were purchased by the United States Vanadium Corp. in 1945. The mill was not operated during the year.

The Nonferrous Metals Commission denied 2 weeks' vacation with pay after 2 years' employment for Vanadium Corp. of America employees at Naturita. The employees now get 1 week after 1 year and 2 weeks after 4 years. The Commission ordered muckers' pay increased from 75 to 82 cents an hour and that of miners from 83 to 90 cents, plus night differentials. The Vanadium Corp. of America operated its mill at Naturita through September, when the plant was shut down for the remaining months of the year.

The mining operations of the Garfield Vanadium Corp. in Garfield County were resumed after repairing damages caused by a fire that destroyed their shop and some equipment and damaged the compressor.[10]

The discovery of a rich supply of vanadium ore has been announced.[11] This strike, which was named the Hermosa-Barlow Creek Lode, originates near Rico and extends northward beneath Barlow Creek and the Dolores River and on to the watershed of the San Miguel River 5 miles west of Telluride. Later accounts have served to moderate considerably the original optimism over this discovery.

[10] Mining Journal, vol. 29, No. 21, Mar. 30, 1946, p. 26.
[11] Mining Record, Colorado Makes Bonanza Strike of Vanadium Ore: Vol. 57, No. 12, Mar. 21, 1946, p. 8.

Idaho, Montana, and Wyoming.—The byproduct recovery of vanadium by the Anaconda Copper Mining Co. from phosphate rock mined at Conda, Idaho, and treated at Anaconda, Mont., has been consistent since 1941. The Phosphoria formation in Idaho and Wyoming contains extensive vanadium-bearing shales, but their treatment offers serious technical difficulties.[12]

Utah.—The Vanadium Corp. of America leased the Monticello plant from the Defense Plant Corporation. The stock pile of ore at Monticello was purchased from the Office of Metals Reserve and is being refined in the Monticello plant.[13] Late in 1945, the Vanadium Corp. of America reached an agreement with the Mercur Dome Gold Mining Co. of Salt Lake City under the terms of which the Corporation will develop the vanadium ore occurring on the Mercur Dome property.[14]

The vanadium-bearing shales in the Camp Floyd mining district in Tooele County [15] have been examined by engineers of the Bureau of Mines.

Although the greater part of the vanadium oxide produced in the United States comes from the sandstone area of Colorado, Utah, and New Mexico, additional recoveries are made from imported ores and concentrates from Peru, which are treated at Bridgeville, Pa.; from phosphate rock; and from flue dust and fly ash from oil-burning ships, largely from those burning Venezuelan fuel oil. Byproduct vanadium is recovered at Glens Falls, N. Y.

CONSUMPTION AND USES

Consumption of domestic vanadium rose continuously from 1940 (the first year for which these data were collected) to the peak year of 1943, when the consumption was 2.4 times that in 1940. Since 1943 consumption has fallen off each year, and that for 1945 was 74 percent of the 1943 figure.

The first step in the processing of domestic vanadium to a marketable form is the conversion of the V in the ore to vanadium pentoxide (V_2O_5). Some vanadium reaches the market in this form for use either as a direct addition to the steel bath or as a catalyzer. In peacetime the proportion of vanadium sold as pentoxide is small, but during the war significant quantities were used in the production of high-octane aviation gasoline.

The preponderant proportion of vanadium pentoxide is converted to ferrovanadium, small quantities going into other vanadium alloys for specialized uses. It is probable that well over 95 percent of the vanadium consumed in the United States finds its way into alloy steel in the form of ferrovanadium.

Vanadium imparts to steel the qualities of increased strength and hardness and enhances the utility of steel at elevated temperatures. The ultimate tensile strength, impact strength, elastic limit, yield point, and resistance to fatigue are raised by proper additions of vanadium to steel. Vanadium steels are inherently fine-grained at

[12] Johnson, A. C., and Davis, C. W., War Development Proves Large Vanadium Reserves: Eng. and Min. Jour., vol. 146, No. 4, April 1945, pp. 105–107.
[13] Work cited in footnote 8, p. 140.
[14] Mining World, Vanadium Corp. Leases Mercur Dome: Vol. 8, No. 1, January 1946, p. 30.
[15] Work cited in footnote 12.

normal and elevated temperatures and therefore stable under extreme use conditions. The usual vanadium content of the engineering steels is less than 0.2 percent and frequently in the range of 0.05 to 0.10 percent. Vanadium is also a potent agent in producing a clean steel and is a powerful deoxidizing agent, although it is too costly to be used for this purpose except in conjunction with cheaper deoxidizers.

In addition to its wide use in the usual engineering steels, it is an essential component of high-speed tool steel, where it is used to the extent of 1 to 2 percent, the vanadium content depending on the type of steel and the use to which it is to be put.

During the shortages of 1941–43 more abundant alloying elements were substituted for vanadium wherever practicable. Among the extreme examples were the omission of vanadium from rolled tank armor and the use of Mn-Ti steel for high-strength plate for the Navy[16] in place of a vanadium-containing steel. As vanadium became more freely available, it has undoubtedly been finding its way back into steels that did not contain this element during the war. A considerable volume of work has been done in the United States on nitriding vanadium steels.

A new and interesting use for vanadium is in Vicalloy.[17] The preferred analyses are 38.5 percent Fe, 52 percent Co, and 9.5 percent V (Vicalloy I), and 35 percent Fe, 52 percent Co, and 13 percent V (Vicalloy II). After a small amount of hot work, the alloys may be machined, punched, tapped, or drilled. Heat treatment is necessary to develop the preferred magnetic properties.

It is interesting to note that during the war German metallurgists developed a high-speed steel of the following composition: C, 0.90–1.00 percent; W, 2.50 percent; Cr, 4.00 percent; V, 2.50 percent; and Mo, 2.50 percent, which is claimed to be as effective as the conventional 18W–4Cr–1V. It is also noteworthy that in many steels the Germans increased the vanadium content as the war progressed and as other alloying elements became more and more scarce. The same pattern was followed in the cemented-carbide industry in Germany, where a composition known as V814, 45 percent titanium carbide and 45 percent vanadium carbide with 10 percent of binder (either all Ni or 7 percent Ni and 3 percent Co), was developed as a substitute for tungsten carbide containing tool tips. The Germans also developed a number of high-temperature alloys, particularly for use in connection with jet propulsion and gas turbines, among which the four steels in the accompanying table are typical of those containing vanadium.

Analyses of four German high temperature-resistant steels

	C	Si	Mn	Ni	Cr	Mo	V	Ti	W	N_2
V2AED 50 / Vanidur [1]	0.12			10.50	17.50		1.00	0.60		
Cromadur	.15		18.00		12.00		.70			0.18
FKDM 10	.22	0.40	.38		2.8	0.40	.80		0.38	
FKM 10	.22	.40	.38		2.7	.25	.60			

[1] This steel is known as Vanidur after being given 20 percent reduction of area (cross section) by cold rolling. Its properties at high temperatures depend upon this cold work.

STOCKS

No data on stocks are available except those pertaining to Office of Metals Reserve holdings.

Office of Metals Reserve.—The refining of the remainder of Office of Metals Reserve vanadium ore at Durango and the sale of the inventory at Monticello have consumed the residue of all of the sandstone ore purchased by that agency. Office of Metals Reserve agents reported on the purchase and disposition of the ore to the Office of Metals Reserve in Washington on one hand and to the Bureau on the other, but not necessarily on the same basis. It is of interest to note how closely the accounting set up by the Bureau of Mines agrees with that by Office of Metals Reserve. The accompanying table presents a "V_2O_5 balance sheet" for the Metals Reserve operations based upon reports made to the Bureau.

Stocks (Jan. 1 and Dec. 31) of Office of Metals Reserve ore, 1942–45, and net yearly changes in such stocks, in pounds of V_2O_5 contained

Year	January 1	December 31	Net yearly change [1]
1942		919,968	+919,968
1943	919,968	2,365,538	+1,445,570
1944	2,365,538	2,019,053	−346,485
1945	2,019,053		[2] −1,770,646
			[3] −236,643
			[4] −11,764

[1] Net change due to balancing receipts and consumption unless otherwise noted.
[2] Consumption and sales.
[3] Over-all inventory adjustment figure from Office of Metals Reserve.
[4] Lack of balance between Office of Metals Reserve and Bureau of Mines accounting.

The item of 11,764 pounds of V_2O_5, difference between Bureau of Mines and Office of Metals Reserve figures, represents less than 0.2 percent of the amount of V_2O_5 involved in 4 years' operation and shows a very satisfactory agreement, taking into account the fact that cross-checking was not resorted to until all the ore was consumed.

PRICES

Vanadium ore has been quoted at 27½ cents per pound of V_2O_5 since 1935. This, however, is a quotation without regard to grade of ore or presence or absence of objectionable impurities, matters of importance to the refiners inasmuch as they affect recovery vitally. It is probable, however, that with the ready availability of vanadium in 1945 the high prices realized during the war were not readily obtainable. The Office of Price Administration has not placed vanadium ore under price control at any time.

Maximum prices established by MPR 489 for vanadium products are given in the 1944 Minerals Yearbook, p. 643, and remained unchanged during 1945.

Prices for vanadium products quoted in trade publications for 1945 were: Ferrovanadium, \$2.75–\$2.90 per pound of V contained (depending on the carbon content of the alloy); and fused vanadium pentoxide, \$1.10 per pound of V_2O_5 contained (for contract deliveries).

FOREIGN TRADE [18]

Vanadium imports into the United States comprise ore, concentrates, dried precipitated vanadium pentoxide, and flue dust. In 1945, all ore, concentrates, and pentoxide were imported from Peru and the flue dust from Curaçao. The percentage of V_2O_5 in the imports from Peru was considerably lower than in 1944.

Vanadium ore or concentrates and vanadium-bearing flue dust imported for consumption in the United States, 1944–45, by countries

Country	1944			1945		
	Pounds		Value	Pounds		Value
	Gross weight	Vanadium content		Gross weight	Vanadium content	
Ore or concentrates:						
Peru	4,247,490	1,284,603	$633,719	8,777,018	1,552,307	$725,666
Vanadium-bearing flue dust:						
Curaçao (N. W. I.)	169,274	36,370	24,695	133,795	26,293	19,378
Venezuela	22,627	3,801	3,364			
	191,901	40,171	28,059	133,795	26,293	19,378

Vanadium ore or concentrates imported for consumption in the United States, 1936–45

Year	Pounds		Value	Year	Pounds		Value
	Gross weight	Vanadium content			Gross weight	Vanadium content	
1936	3,734,080	342,720	$155,730	1941	24,645,686	2,138,608	$1,012,991
1937	14,806,400	1,258,880	638,799	1942	36,492,268	2,422,376	1,274,483
1938	19,962,880	1,384,320	891,475	1943	22,117,131	2,052,620	1,080,150
1939	31,387,722	2,132,548	991,511	1944	4,247,490	1,284,603	633,719
1940	45,102,004	2,574,951	1,216,705	1945	8,777,018	1,552,307	725,666

Exports of vanadium ore and concentrates increased from 6,254 pounds of contained V in 1944 to 113,927 pounds in 1945. The large increase was due to shipments to France. Exports for the years 1943–45 are shown in the accompanying table.

Vanadium ore and concentrates [1] exported from the United States, 1943–45, by countries, in pounds

Country	1943		1944		1945	
	Gross weight	Vanadium content	Gross weight	Vanadium content	Gross weight	Vanadium content
Australia	5,160	1,445				
Canada	75,438	26,186	6,390	2,201	3,049	955

	118,274	38,180	16,268	6,254	241,592	113,927

[1] Classed as ore and concentrates but probably also includes fused vanadium oxide.

[18] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

WORLD PRODUCTION AND DEVELOPMENTS

Complete information on world production of vanadium in 1945 is lacking, but the indications are that it will be virtually equal to that for 1944. Of the countries for which reliable figures are available, the United States, Peru, and South-West Africa are the largest producers.

World production of vanadium in ores and concentrates, 1938–45, in metric tons

[Compiled by B. B. Waldbauer]

Country	1938	1939	1940	1941	1942	1943	1944	1945
Argentina	-------	15	1	6	-------	-------	(1)	(1)

1 Data not available.
2 Less than 1 ton.
3 Exports.
4 Preliminary.
5 Total comprises figures appearing in the table. It is known that Germany produced vanadium from the minette ores; accurate figures are not yet available.

Germany.—The pattern of alloy use in Germany was very definite—when Ni became scarce, Cr–Mo and Cr–Mo–V steels were substituted; as the scarcity of Mo increased, Cr–V and Mo–V steels were adopted; and, finally, with the increasing scarcity of chrome, recourse was had to Mn–V and Mn–Si steels.

Vanadium was the one alloying element found in Germany in quantity sufficient or nearly sufficient for war needs. Reliable data regarding the production of vanadium in Germany are lacking, but the quantity produced must have been large, as evidenced by the widespread substitution of vanadium for other steel-alloying elements. Three sources of vanadium were available to the Germans: (1) the importation of vanadium-bearing slags from Norway; (2) recovery of the element found in the red mud of the Bayer (aluminum) process; and (3) recovery from the minette (iron) ores. The latter source is probably by far the most important of the three. Vanadium occurs in the "minette" ores of Luxembourg and Belgium to the extent of about 0.1 percent V. In the usual German practice this vanadium goes into the pig iron, and, when the iron is blown in a Thomas converter, is concentrated in the slag. Upon remelting the slag in a special blast furnace, the vanadium goes into pig iron, which is again blown in a converter, thus transferring the vanadium into a second slag, which averages 10 percent V.[19] The slag is treated chemically. From 50 to 60 percent of the vanadium in the minette ores is recovered. Comprehensive discussions of German metallurgical practice are available.[20] [21]

19 Joint Intelligence Objectives Agency, Recovery of Vanadium from Iron and Steel Plant Slags: Rept. 23, June 30, 1945.
20 Gill, James P., German Toolsteel and Special Steel Industry: Metal Prog., vol. 49, No. 1, January 1946, pp. 122–124; and Steel, vol. 117, No. 13, Sept. 24, 1945, pp. 120–136.
21 Fry, John H., General Review of German Metallurgical Practices: Metal Prog., vol. 49, No. 1, January 1946, pp. 76–86.

India.—Work has been carried out in the laboratories of the Tata Iron & Steel Co. on the production of a "vanadium bearing intermediate manganese cast steel." [22] The National Vanadium Trust Co. of India has made a laboratory recovery of vanadium pentoxide from deposits in British India, just outside Mayurbhanj State, and from deposits in Mayurbhanj State. A pilot plant is being erected. These ore deposits, which contain iron and titanium as well as vanadium, were discovered 7 or 8 years ago.

New Zealand.—Beach sands, often referred to as "Taranaki iron sands," which contain iron, titanium, and vanadium, occur on the beaches of the North Island from Wanganui to Kaipara Heads and on the west coast of the South Island. No process has been developed for the commercial utilization of these sands, but Brian Mason has described the deposits and suggested [23] that new blast-furnace practice capable of utilizing high-Ti ores may be applicable.

Peru.—The old leaching plant of the Vanadium Corp. of America at Jumasha continued regular operations during the first half of 1945. The new plant, which was erected for the Defense Plant Corporation at a cost of about $4,000,000 and which required 2½ years for completion, was placed in partial operation in October 1944.[24] Full operation was not attained until the end of June 1945.

The decline in Peruvian production from 1940 until 1945 is attributed largely to the gradual exhaustion of direct shipping ore.[25] Exports from Peru during the first 9 months of 1945 were 2,015 metric tons of ore and 1,253 tons of concentrates. Stocks at Callao on September 30 were 172 tons of concentrates.[26] Peruvian production for the year was 1,366,480 pounds of V (620 metric tons of V).

South-West Africa.—South-West Africa has been an important producer and exporter of vanadium concentrates for at least 10 years.

Spain.—Spain has four steel plants capable of producing alloy steel, although the technique and probably the mechanical installations could be improved. Ferrochrome and ferrotungsten have been produced in Spain, but the other alloys are imported. Five metric tons of ferrovanadium are known to have been imported in 1943. About 13,000 metric tons of alloy steel were consumed in 1944.

Sweden.—The development of Sweden's hydroelectric resources has furnished a source of cheap electric energy necessary to the manufacture of ferro-alloys. Late production data are lacking, but in 1935 Sweden produced 24 metric tons of ferrovanadium, all of which was exported, and in 1939, 98 tons were produced, of which 40 tons were exported.[27] It is not known whether this alloy was made from domestic or imported ores.

U. S. S. R.—A large deposit of vanadium has been discovered at Jabagai in the steppes of Kazakhstan,[28] [29] and deposits of many of the alloying and base metals have been found in the Ural Mountains. A ferro-alloy plant has been built at Aktiubinsk, and the first sections of iron and steel mills have been opened at Karaganda.

Union of South Africa.—The Bushveld iron ores contain up to 1.5 percent V_2O_5 and 8 to 25 percent TiO_2. Some of the TiO_2 is present as granular ilmenite, which can be separated magnetically, but the vanadium is not present in a mineral that can be separated from the ore by any known physical process. A very large reserve of vanadium will be available if a satisfactory means of separation can be developed.[30]

TUNGSTEN

By Hubert W. Davis

SUMMARY OUTLINE

SUMMARY

The decline in tungsten production that began in May 1944 continued almost uninterruptedly through April 1945. Production was at a low monthly rate of about 340 tons (60 percent WO_3) during the first 4 months of 1945. In May, however, the chemical-treatment plant of the Office of Metals Reserve at Salt Lake City and the mill of Boulder Tungsten Mills, Inc., at Boulder, Colo., resumed operations and the new mill serving the Riley mine, near Winnemucca, Nev., made its initial output. In July the chemical-treatment plant of United States Vanadium Corp. near Bishop, Calif., also resumed operations. Chiefly for these reasons, the monthly rate of production increased to an average of 600 tons during the 5 months May–September. As a consequence of lessened demand for tungsten following VJ-day, output dropped to an average of about 480 tons during the last 3 months of 1945.

Total production of tungsten concentrates was 5,666 short tons (60 percent WO_3 basis) in 1945 compared with 10,260 tons (revised figure) in 1944. The importance of large mining and millings units in the tungsten industry is shown by the fact that four operators, each producing over 500 tons, supplied 68 percent of the entire output in 1945. Domestic production was equivalent to only 38 percent of United States consumption in 1945.

The total quantity of tungsten concentrates shipped from domestic mines from 1900 through 1945 was 110,949 short tons (60 percent WO_3). It is noteworthy that, of the total shipments, 53,449 tons (48 percent) were shipped during the past 7 years (1939–45).

During 1945 the Yellow Pine mine in Idaho of Bradley Mining Co., the M. G. L. mine in Nevada of M. G. L. Mining Co., the Conger mine in Colorado of Vanadium Corp. of America, and the mines in Nevada of Tungsten Metals Corp. were permanently closed because of exhaustion of known ore bodies or for other reasons. The importance of these properties as producers of tungsten is evidenced by the fact that in 1944 their combined output of both primary and secondary concentrates was 275,154 units, equivalent to 4,586 tons of 60 percent WO_3.

Receipts of imported tungsten ore and concentrates were 9,078 short tons (60 percent WO_3 basis) in 1945, a decline of 53 percent from 1944. Supplying 46 percent of the total, Bolivia was the chief source of imports in 1945; and Brazil (26 percent) was the second-largest source.

Consumption of tungsten concentrates was 14,900 short tons (60 percent WO_3 basis) in 1945, a decline of 26 percent from 1944. During the first 8 months of 1945 concentrates were consumed at a rate of 1,538 tons monthly, compared with a rate of 1,675 tons monthly in 1944. As a result of the lessened demand following the end of hostilities with Japan, consumption dropped to an average of 640 tons monthly during the last 4 months of 1945.

Consumption of tungsten powder during the first 8 months of 1945 was at a high rate, chiefly because of the military tungsten carbide shell-core program. In fact, during several months both production and consumption of tungsten powder were greater than ferrotungsten.

Stocks of primary concentrates held by the Office of Metals Reserve were 21,648 short tons (60 percent WO_3 basis) on December 31, 1945. These stocks, when declared surplus, will be transferred to the Treasury Procurement Division, in accordance with the Surplus Property Act of 1944, Public No. 457, Seventy-eighth Congress, section 22 (a), approved October 3, 1944.

Salient statistics of tungsten ore and concentrates in the United States, 1941–45, in pounds of tungsten

Year	Production [1]	Shipments from mines [1]	General imports (receipts)	Consumption	Stocks at end of year: Consumers and brokers	Producers [1]	Government stock pile [1]	Total

[1] Primary concentrates. [2] Revised figures.
[3] Excludes stocks held by the Treasury Procurement Division and United States Navy.

Despite the large stocks of tungsten that had been accumulated, it appeared early in 1945 that they would be insufficient for the requirements of the tungsten carbide shell-core program, which would involve the expenditure of several million dollars in plant and equipment expansion and would greatly expand the consumption of tungsten. Accordingly, the War Production Board, on May 18, 1945, issued Order M–21–j, which limited purchases of tool steel with high tungsten content, and the Office of Metals Reserve resumed operations at its chemical-treatment plant at Salt Lake City, Utah, in May. However, before this program got well under way the European phase of the war was brought to a victorious end, and cut-backs in Army requirements resulted in a cancelation of the plant-expansion program. Inasmuch as tungsten supplies were again ample for all requirements, the War Production Board revoked Order M–21–j on July 3.

Figure 1 shows trends in domestic shipments, imports, and prices of tungsten ore and concentrates since 1915.

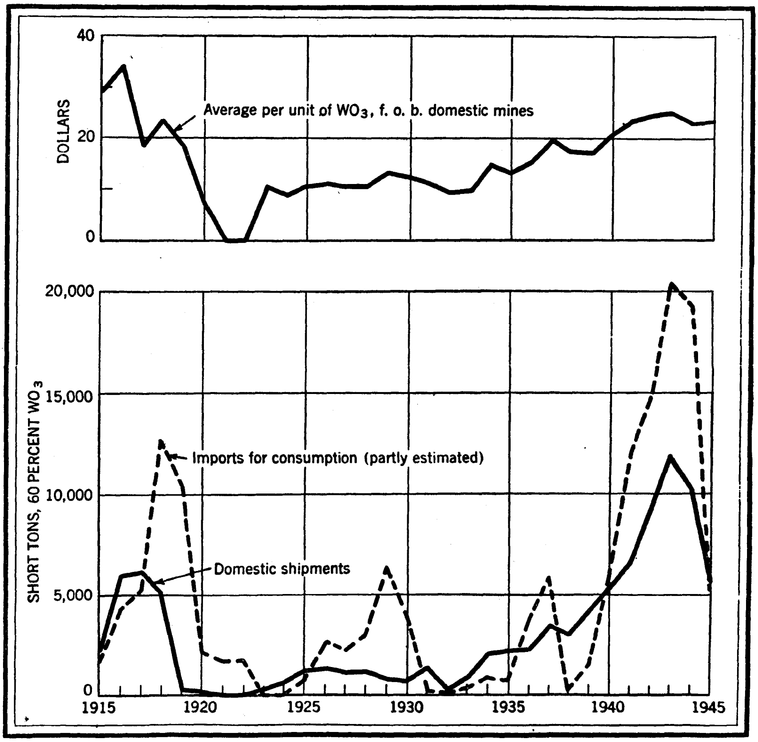

FIGURE 1.—Trends in domestic shipments, imports, and average price of tungsten ore and concentrates, 1915–45.

PRICES

Quotations on tungsten ore and concentrates remained steady throughout 1945. According to the Engineering and Mining Journal, foreign ore was quoted at $24 a short-ton unit of WO_3, duty paid, and domestic scheelite of good known analysis, in carlots, delivered, was $24 to $24.50 a unit. The average price for domestic primary concentrates shipped in 1945, as reported to the Bureau of Mines, was $23.21 a short-ton unit of WO_3.

DOMESTIC PRODUCTION

The tungsten ore mined and milled in the United States, in general, contains 0.5 to 2.5 percent WO_3 and is beneficiated to a concentrate containing 60 percent or more WO_3. Scheelite (calcium tungstate) is the tungsten mineral in most domestic ore mined. The leading tungsten producers and many small operators depend on ore carrying tungsten only as scheelite. Ferberite (iron tungstate), hübnerite (manganese tungstate), and wolframite (iron-manganese tungstate), in the order listed, contribute a comparatively small part of the tungsten in domestic ores. Most of the concentrates are converted to ferrotungsten and tungsten metal. Some high-purity concentrates, however, are charged directly to the steel bath. Wolframite is preferred for the filament in electric light bulbs.

Lessened demand for tungsten in 1945 resulted in a decline in production of primary concentrates to 5,666 short tons (60 percent WO_3 basis), as compared with 10,260 tons (revised figure) in 1944. Output was obtained from many widely scattered operations in 10 States, but 3 States—California, Idaho, and Nevada—supplied 91 percent of the total, and 4 operators (United States Vanadium Corp., Bradley Mining Co., Nevada-Massachusetts Co., and Office of Metals Reserve) produced 68 percent of the United States total.

Since 1942 a substantial tonnage of milling ore and secondary concentrates has been produced; the milling ore was stocked at various purchasing depots of the Office of Metals Reserve, and the secondary concentrates were shipped to the chemical-treatment plants at Salt Lake City, Utah, and Bishop, Calif. The milling ore and secondary concentrates so produced have not been included in the statistics. Since April 1943, however, substantial tonnages of milling ore and secondary concentrates have been treated, and the resulting primary concentrates recovered each year have been credited in the statistics to the State of origin.

Alaska.—No tungsten concentrates were produced in Alaska in 1945. Because of economic conditions and insufficient labor, no milling of tungsten ore was undertaken at the Riverside mine near Hyder; but some development was done and 1,300 tons of ore were produced.

Arizona.—Production of primary tungsten concentrates in Arizona was 140 short tons averaging 41.77 percent WO_3 in 1945 compared with 27 tons averaging 53.3 percent WO_3 in 1944. Shipments were also 140 tons averaging 41.77 percent WO_3 compared with 32 tons averaging 54.31 percent WO_3 in 1944. Williams & Ryan, operating a mill at Tucson, accounted for the bulk of the concentrates produced in 1945; the concentrates produced resulted from treating ore purchased from

Tungsten ore and concentrates produced and shipped in the United States, 1944–45, by States [1]

1944	[1] 10,283	[1] 9,786,537	[1] 14,407,143	[1] 23.35	1.47
1945	5,715	5,439,080	7,957,731	23.21	1.46

[1] Revised figures.

the Office of Metals Reserve. A. A. Cohen, Roy Williams, Gold Hill Dredging Corp., G. W. Campbell, and Dalton Robinett also contributed to the 1945 output.

California.—California dropped from second to third place as a tungsten-producing State in 1945. Output of primary concentrates in 1945 was 1,140 short tons averaging 55 percent WO_3 compared with 2,912 tons averaging 61 percent in 1944. Of the 1945 total, Inyo County supplied 25.8 percent; San Bernardino 22.5 percent; Tulare 24.6 percent; Madera 5.8 percent; and Fresno, Kern, and Mono together 4.1 percent; the source of 17.2 percent was not reported, but the bulk came from Inyo and Tulare Counties.

Shipments of tungsten concentrates from California in 1945 totaled 1,186 short tons averaging 54.28 percent WO_3 compared with 2,940 tons averaging 61.78 percent WO_3 in 1944. The 1945 production and shipment figures include 146 tons of concentrates averaging 68.5 percent WO_3 that were recovered at the Salt Lake City, Utah, chemical plant from the treatment of secondary concentrates originating in California. Although primary tungsten concentrates were shipped from many widely scattered operations, six producers—United States Vanadium Corp. and Tungstar Corp. (in Inyo County), Hoefling Bros. (in San Bernardino County), Tulare County Tungsten Mines and Consolidated Tungsten (in Tulare County), and Haggerty & Madden (in Madera County)—supplied 968 tons or 82 percent of the State total. The bulk of the remainder was shipped from the Salt Lake City plant, the Marble mine in Inyo County, and the Garnet Dike mine in Fresno County.

In addition to the primary concentrates produced and shipped in 1945, 262 short tons of secondary concentrates averaging 7.4 percent WO_3 were shipped to the chemical-treatment plant near Bishop for further treatment; they came from the mine of the Tungstar Corp. The secondary concentrates are not included in the 1945 statistics; instead, the resultant primary concentrates recovered are included.

The United States Vanadium Corp. did not produce any ore at its Pine Creek mine near Bishop, Inyo County, in 1945. Its chemical plant, however, was operated part of January and from late July through December; as a consequence, production of concentrates was only half that in 1944. The plant feed comprised secondary concentrates, chiefly from the Tucson Ore Milling Co. in Arizona, the Yellow Pine mine in Idaho, the Tungstar mine in California, and the Cherry Creek mine and the Mill City mill in Nevada. The primary concentrates recovered from the treatment of secondary concentrates originating in Arizona, Idaho, and Nevada have been credited in the statistics to those States. A rotary nodulizing unit for scheelite concentrate was added to the Pine Creek treatment plant. To eliminate a difficult snow condition that has hampered operations at the Pine Creek mine, a 6,500-foot adit is being driven about 1,500 feet below the original mine entry. The adit terminates directly beneath the present mine workings, and a shaft will connect it with the main operation. Ore will be sent through the adit, which terminates about halfway between the present mine site and the treatment plant.

The Tungstar mine near Bishop, operated by the Tungstar Corp., produced 57 and 54 percent, respectively, less primary and secondary concentrates than in 1944.

On August 1 Hoefling Bros., which works the Spud Patch placer in San Bernardino County, began operating a portable washing plant, which has expanded the scope of the operations into the western part of the area. Nevertheless, production of concentrates was 19 percent less than in 1944.

The Big Jim mine in Tulare County was operated by the Tulare County Tungsten Mines at a greatly increased rate in 1945 and produced 57 percent more concentrates than in 1944.

Haggerty & Madden operated the Strawberry mine in Madera County only about 4 months in 1945, and production of concentrates was 42 percent less than in 1944.

Consolidated Tungsten, operating the Harrel Hill mine in Tulare County, produced 51 percent less concentrates than in 1944.

The El Diablo Mining Co. completed an aerial tramway at the Brownstone mine in Inyo County. The mine was nonproductive in 1945.

The Hi Peak mine and mill of the United States Flare Corp. in Kern County ceased operations on December 25.

The Alpine Mining Co. did considerable development at the Alpine mine in Alpine County and at the close of 1945 was installing a mill to treat the ore.

A new mill to serve the Black Eagle mine in Imperial County was being installed at the close of 1945 by Charles Kirton to replace one destroyed by a cloudburst.

A mill was installed at the Victory mine in Fresno County by Harold Keown.

Colorado.—Production and shipments of primary concentrates (60 percent WO_3 basis) in Colorado were 252 and 234 short tons, respectively, in 1945, compared with 299 and 296 tons, respectively, in 1944.

The Firth-Sterling Steel Co. (Wolf Tongue Division), Geo. H. Teal & Associates, Vanadium Corp. of America, Boulder Tungsten Mills, Inc., and Elmer Hetzer accounted for virtually the entire output.

The Vanadium Corp. of America discontinued operations at the Conger mine in May 1945.

The Boulder Tungsten Mills, Inc., purchased the stock piles of ore at Nederland and Tungsten, Colo., from the Office of Metals Reserve and resumed operations at its mill in May.

The mill of Geo. H. Teal & Associates operated on ores from the Salida, Colo., and Deadwood, S. Dak., stock piles, which were purchased from the Office of Metals Reserve. The concentrates recovered from milling the ore from South Dakota have been credited in the statistics to that State.

The Firth-Sterling Steel Co. (Wolf Tongue Division) began driving a prospect tunnel under Hurricane Hill during 1945.

Idaho.—Production of primary concentrates in Idaho was 1,727 short tons averaging 70 percent WO_3 in 1945 compared with 4,224 tons averaging 56.21 percent WO_3 in 1944. Shipments also declined to 1,852 tons averaging 69 percent WO_3 in 1945 compared with 4,278 tons averaging 56.17 percent WO_3 in 1944. The 1945 production and shipment figures include 768 tons of concentrates averaging 68.5 percent WO_3 recovered at the Salt Lake City, Utah, plant from treating secondary concentrates originating at the Yellow Pine mine of Bradley Mining Co. The figures also include the concentrates recovered from treating Yellow Pine secondary concentrates at the plant of the United States Vanadium Corp. near Bishop, Calif.

The Yellow Pine mine near Stibnite, Valley County, operated by the Bradley Mining Co., was worked at a greatly reduced rate. It produced 109,796 tons of scheelite ore averaging 0.424 percent WO_3 in 1945 compared with 211,382 tons averaging 1.42 percent WO_3 in 1944. The ore mined in 1945, with 45,359 tons of tailings averaging 0.755 percent WO_3 and 3,290 tons of low-grade concentrates averaging 6.322 percent WO_3, was treated, yielding 176 tons of primary concentrates averaging 58.97 percent WO_3 and 5,551 tons of secondary concentrates averaging 9.97 percent WO_3. These secondary concentrates, which were shipped to the plant of the United States Vanadium Corp. near Bishop, Calif., and to the purification plant of the Bradley Mining Co. at Boise for further treatment, are not included in the 1945 statistics; instead, the resultant primary concentrates recovered are included.

All known tungsten ore in the Yellow Pine mine was virtually exhausted in 1945. The presence of tungsten at the Yellow Pine mine was discovered jointly by engineers of the Bureau of Mines and geologists of the Geological Survey in the spring of 1941. Production was initiated in August 1941; between that time and December 31, 1945, 611,284 short tons of ore averaging 1.645 percent WO_3 were produced and treated, from which were recovered 10,373 tons of primary concentrates containing 503,915 units of WO_3 and 29,889 tons of secondary concentrates containing 322,055 units of WO_3. This mine produced more tungsten than any other mine in the United States from August 1941 to December 1945.

Production of primary concentrates at the Ima mine in the Blue Wing district, Lemhi County, was 183 short tons (64.74 percent WO_3) in 1945 compared with 189 tons (68.24 percent WO_3) in 1944. In addition, 16 tons of secondary concentrates (23 percent WO_3) were produced in 1945. The Bradley Mining Co. acquired the Ima mine on January 10, 1945.

Nevada.—Production and shipments of primary concentrates (reduced to an equivalent of 60 percent WO_3) were 2,065 and 2,038 short tons, respectively, in 1945 compared with 2,747 and 2,665 tons, respectively, in 1944. The 1945 production and shipment figures include 421 tons of concentrates averaging 68.5 percent WO_3, which were recovered at the Salt Lake City, Utah, plant from treating Nevada secondary concentrates. In addition, the concentrates recovered in

California from treating Nevada secondary concentrates have been credited to Nevada in the statistics.

The Nevada-Massachusetts Co. and affiliated companies, operating plants at Mill City, Golconda, and Toulon, continued to be the chief producers in Nevada, but output was 33 percent less in 1945 than in 1944. Operations at the Golconda plant were suspended in June 1945. The scheelite-manganese deposit at Golconda has been described by Huttl.[1]

Smaller but important producers of primary concentrates in 1945 were Nevada Scheelite, Inc., operating a mine of the same name in Mineral County, and the Northern Nevada Mining Co., operating the Riley mine in Humboldt County. Nevada Scheelite, Inc., did much development at its mine and added two slime tables and a grinding unit to its mill. The new concentrating mill serving the Riley mine was brought into production on May 25, and both the mine and mill were sold to the United States Vanadium Corp. on October 5. The new owners of the Riley property have installed a flotation mill.

The remaining production of primary concentrates in Nevada in 1945 came from a number of smaller operations. The bulk was, however, produced by the Tungstonia Mining Co., operating the Tungstonia mine, Tungsten Metals Corp., operating the Scheelite Chief, Oriole, Everitt, and Silver Bell mines, and the Cherry Creek Tungsten Co., operating the Cherry Creek mine, all in White Pine County; Lincoln Mines, Inc., and Atolia Mining Co., operating the Lincoln mine in Lincoln County; and the M. G. L. Mining Corp., operating the M. G. L. mine in Pershing County. The mines of the Tungsten Metals Corp. were closed on May 31 and all mine and mill equipment was removed. Lincoln Mines, Inc., was taken over by the Atolia Mining Co. on June 1, and production was suspended on September 1; the mill was improved during the latter part of 1945. Mining and milling operations at the M. G. L. mine ceased on January 10 because of the exhaustion of known ore; all buildings, machinery, and equipment were sold.

In addition to the primary tungsten concentrates produced and shipped in 1945, 1,839 tons of secondary concentrates averaging 13.57 percent WO_3 were shipped to the chemical plants near Bishop, Calif., and Salt Lake City, Utah, for further treatment. These secondary concentrates came from Getchell Mine, Inc., Nevada-Massachusetts Co., United States Vanadium Corp., and Cherry Creek Tungsten Mining Co. These secondary concentrates have been omitted from the 1945 statistics, but the resultant primary concentrates recovered are included.

The flotation plant of Getchell Mine, Inc., which discontinued milling tungsten ore on June 20, 1944, resumed operations in August 1945, treating (under toll agreement with the Office of Metals Reserve) the stock piles of ore in the vicinity of the mill. During the remainder of 1945, 45,773 tons of ore were milled which yielded 1,470 tons of concentrates averaging 15.6 percent WO_3. The concentrates were shipped to the chemical plant at Salt Lake City for further treatment.

North Carolina.—Effective June 11, 1945, Tungsten Mining Corp.,

---

[1] Huttl, J. B., Unique Golconda Deposit Yields Its Tungsten: Eng. and Min. Jour., vol. 146, No. 8, August 1945, pp. 79–81.

wholly owned by Haile Mines, Inc., and General Electric Co., took over the operation of the Hamme tungsten mine in Vance County. Production of concentrates was 219 short tons averaging 37.89 percent WO_3 in 1945 compared with 321 tons averaging about 35 percent in 1944.

The Southern Aggregates Corp. did no mining at its property, also in Vance County. However, extensive core drilling was carried on; as a result additional ore bodies were located and known ore bodies proved at greater depth.

South Dakota.—A small stock pile of ore (172 tons averaging 2.03 percent WO_3) at Deadwood was purchased from the Office of Metals Reserve by the David Taylor Co. in 1945. The ore was treated in the George Teal mill at Boulder, Colo. The O-F Exploration Co. shipped a small quantity of tungsten concentrates from stock; they were produced at a property near Keystone, Pennington County, in 1944.

Utah.—Production and shipments of high-grade tungsten concentrates in 1945 were each 5 short tons averaging 64 percent WO_3 compared with 10 tons averaging 56 percent in 1944.

The chemical-treatment plant of the Office of Metals Reserve at Salt Lake City resumed operations in May 1945 after being inactive since April 30, 1944. During 1945 it treated 8,658 tons of concentrates averaging 11.9 percent WO_3. The plant feed comprised secondary concentrates, chiefly from the Yellow Pine mine of Bradley Mining Co. and the mill of Getchell Mine, Inc. The resultant primary concentrates produced and shipped in 1945 have been credited in the statistics to California, Idaho, and Nevada.

Washington.—A small quantity of concentrates (69 units of WO_3) was produced at the Germania Consolidated mine in Stevens County in 1945. Output in 1944, which came from the Deer Lake, Keith, and Germania Consolidated mines, was 5 tons averaging 68 percent WO_3.

The tungsten occurrences in Washington have been described by Culver and Broughton.[2]

FOREIGN TRADE[3]

Domestic production is inadequate for requirements, and the United States imports both tungsten concentrates and products, chiefly the former. Receipts of imported ore and concentrates totaled 8,639,374 pounds (tungsten content), equivalent to 9,078 short tons of 60 percent WO_3 in 1945, a decrease of 53 percent from 1944. Although ore and concentrates were received from 18 foreign countries in 1945, two—Bolivia (46 percent) and Brazil (26 percent)—supplied 72 percent of the total.

Imports for consumption amounted to 4,773,861 pounds (tungsten content), equivalent to 5,016 short tons of 60 percent WO_3 in 1945; Bolivia, Brazil, and Argentina supplied 51, 28, and 16 percent, respectively, of the total. In addition, 331,510 pounds (tungsten content), equivalent to 348 tons of 60 percent WO_3, were imported from Bolivia and Peru (duty free) for smelting, refining, and export.

---

[2] Culver, H. E., and Broughton, W. A., Tungsten Resources of Washington: Washington Dept. of Conservation and Development, Div. of Geology, Bull. 34, Olympia, Wash., 1945, 89 pp.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The duty on tungsten ore or concentrates is 50 cents a pound on the metallic tungsten contained therein. This is equivalent to \$7.93 a short-ton unit.[4]

Exports of tungsten ore and concentrates from the United States are insignificant; 4,240 pounds were exported in 1945 compared with none in 1944.

There were no imports of tungstic acid in 1945 compared with 21 pounds (tungsten content) in 1944. Imports of tungsten metal were 4,396 pounds in 1945 compared with none in 1944. No tungsten carbide or combinations containing tungsten or tungsten carbide were imported in 1944 and 1945.

Exports of tungsten metal, stellite, wire, shapes, and alloys other than ferrotungsten were 260,435 pounds in 1945 compared with 313,174 pounds in 1944. Exports of ferrotungsten were 861,461 pounds in

Tungsten ore and concentrates imported into the United States, 1944–45, by countries

[1] Comprises ore and concentrates received in the United States; part went into consumption during year, and remainder entered bonded warehouses.

[2] Comprises ore and concentrates withdrawn from bonded warehouses during year (irrespective of time of importation) and receipts during year for consumption.

[3] In addition, 611,348 pounds containing 331,510 pounds of tungsten and valued at \$317,635 were imported or smelting, refining, and export.

[4] A unit, as applied to tungsten ores, is 1 percent of a ton of tungsten trioxide (WO_3). Thus, a short-ton unit is 20 pounds of WO_3 or 15.86 pounds of tungsten (W).

1945 compared with 2,353,340 pounds in 1944. Exports of tungsten salts and compounds were 7,872 pounds in 1945 compared with 2,485 pounds in 1944. Exports of tungstic acid were 123 pounds in 1945 compared with none in 1944.

CONSUMPTION

Consumption of tungsten ore and concentrates in the United States was about 14,900 short tons (60 percent WO_3 basis) in 1945 compared with 20,100 tons in 1944. Of the total consumed in 1945, 7,400 tons (50 percent) were converted to ferrotungsten, the form in which most of the tungsten is introduced into steel. However, high-purity tungsten concentrates are charged directly to the steel bath; and 2,000 tons (13 percent of the total) were so used in 1945. Tungsten-metal powder and other tungsten products, chiefly the former, employed about 5,500 tons or 37 percent of the total ore and concentrates consumed in 1945. As shown in the following table, the production of tungsten-metal powder increased substantially in 1945 over 1944, whereas that of ferrotungsten declined drastically.

Production of specified tungsten products in the United States, 1944–45, in pounds

Product	1944		1945	
	Gross weight	Tungsten content	Gross weight	Tungsten content
Ferrotungsten	13,391,658	10,264,824	8,214,504	6,545,277
Tungsten-metal powder	4,123,867	4,117,586	4,909,061	4,900,177
Special tungsten alloys	317,684	196,277	409,040	253,200
Sodium tungstate [1]	573,721	321,280	421,704	236,085
Tungstic oxide [1]	492,966	390,233	599,828	474,092
Tungstic acid and ammonium paratungstate [1]	625,911	452,998	689,889	497,460

[1] Figures cover production for sale only and therefore exclude production as an intermediate product by producers. Probably the greater part of the production reported for tungstic acid, tungstic oxide, and ammonium paratungstate is used in making tungsten powder.

WORLD PRODUCTION

The following table shows world production of tungsten by countries from 1937 to 1945, insofar as statistics are available.

Argentina.—Argentina was displaced by Brazil as the second largest producer of tungsten in South America in 1945. Output in Argentina comes principally from San Luis and Córdoba Provinces; much smaller quantities are produced in San Juan, Catamarca, Mendoza, and La Rioja. Production was about 450 to 500 metric tons (66 percent WO_3) in 1945 compared with 2,262 metric tons (66 percent WO_3) in 1944.

Australia.—According to the Mining Magazine:[5]

The mill of King Island Scheelite, N. L., is now in production. The crushing and gravity sections of the plant came into operation in April, but the flotation section, for the treatment of slimes, has yet to be installed and some pilot work will probably be done before the final layout is decided upon.

The mine is a very large open-cut proposition, situated on King Island, in Bass Strait, and upon the restriction of tungsten supplies, following the entry

[1] In addition to countries listed, tungsten ore is produced in Japan, U. S. S. R., and Western Australia, but data on production are not available.
[2] Data not available.
[3] January to June, inclusive.
[4] Less than 1 ton.
[5] Exports.
[6] January to September, inclusive.
[7] Estimate.

of Japan into the war, the Commonwealth Government supplied finance and technical direction for the increase of the mine output. * * * Diamond drilling carried out in the early stages proved 1,293,000 tons of ore having an average grade of 0.75 percent WO_3 and in connection with mining by open cut 917,400 tons of rock overburden and 227,700 tons of sand must be removed. * * * The daily output of ore will approximate 800 tons. * * * The estimated tonnage of ore reserves is sufficient for full-scale operation for five years, but does not represent the full mineral resources of the area, as a large section of the property still remains unexplored.

The problem of future marketing in the face of peacetime competition from other producing countries and decreased demand for tungsten will be a difficult one. The Government, to which the company is under contract (until six months after the end of the war with Japan), has asked the company to revert to half-scale production, but the request has been declined and a full rate of output is to be continued during the term of the contract. * * *

During the year ended October 31, 1945, the King Island Scheelite, N. L., milled 89,518 long tons of ore, which yielded 434 long tons of concentrates.

Bolivia.—Bolivia continues to be the largest tungsten producer in South America. Most of the deposits are in the Departments of La Paz, Oruro, Potosí, and Cochabamba. Output (as indicated by exports) was 3,851 and 7,935 metric tons (60 percent WO_3 basis), respectively, in 1945 and 1944.

The Chicote tungsten deposit in the Department of Oruro has been described by Ahlfeld.[6]

Brazil.—Brazil, which became an important producer of tungsten in 1943 as a result of the discovery (early in 1942) of deposits of scheelite in the States of Paraíba and Rio Grande do Norte, displaced Argentina as the second-largest producer in South America in 1945. Exports were 2,039 metric tons (66 percent WO_3) in 1945 and 1,989 tons (67 percent WO_3) in 1944. The scheelite deposits have been described by Johnston and De Vasconcellos.[7]

China.—The following information concerning the tungsten industry in China is reported by Chong.[8]

Given adequate power and machinery China can supply the whole world's requirements of tungsten at a remarkably low price. Even with the handicap of the entire absence of modern equipment, China has been the lowest cost producer. Its peak production touched 16,000 tons in 1940 to meet the needs of the United Nations.

The only mechanical equipment of the industry is the magnetic separator to remove tin impurities. This was an innovation introduced by the Chinese Government after taking over the control of the industry in 1936.

The Chinese Government has also done some development work but has not introduced mechanical mining yet. In fact, mining is still carried on by private mining groups on partnership basis but the ore is sold to the Government.

Mining is carried out only along the outcrop. The workings are largely confined to the upper levels and their narrow shafts or tunnels seldom exceed 200 yards in length as depth means higher transportation cost. Some of them are mere holes so small that the miners have to crawl along. The shafts or tunnels follow the richer payshoots without any regard to system with the result that many veins of economic values have been abandoned or buried for the sake of quick returns of the richer veins, thus causing enormous waste of valuable resource. With the development by the Government of crosscut tunnels through the country rock at a low level which, with raises and winzes, provide better

haulage ways and ventilation, the separate private mining groups are able to extend their upper workings to greater depths.

The ore dressing is extremely simple. Instead of a huge mechanical jaw-crusher, the Chinese miners wield a hammer to break up the ore. The coarse ore is then put into baskets for jigging in a big tub of water. The baskets have bamboo screens as bottoms. The jigging process is repeated several times, the gangue being scraped off each time. The fines that accumulate is a concentrate of 50 percent WO_3 which is sold to the Government redressing plant where further treatment consists in additional jigging and regrinding and then the removal of tin impurities by a magnetic separator. The ore is finally roasted in a specially-constructed furnace which drives out the arsenic. The final product is a high-grade concentrate assaying about 70 percent WO_3, less than 1 percent tin, and about 0.1 percent arsenic.

Most of the deposits are situated in very inaccessible places not served by highways hence all supplies and ore have to be carried by coolies, pack mules or bullock carts.

The most outstanding deposits are in Kiangsi Province, namely, Si-hua Shan, Kwei-Mei Shan, Ta-chi Shan, and Pan-ku Shan, all of which have the benefit of development work done by the Government during the war and it is planned to mine mechanically the first three deposits.

The mechanization of the Chinese tungsten industry will reduce cost of production at least by 50 percent apart from recovering vast quantities of molybdenum and bismuth ore.

Peru.—Through the Institute of Mining Engineering, which is maintained by the Government, encouragement is given miners of tungsten deposits in the Departments of Ancash and La Libertad and in the Provinces of Pallasca, Cabana, and Santiago de Chuco. A 30-ton tungsten concentrator is operated near Callao by the Peruvian Government.

Production of tungsten in Peru was 317 metric tons (60 percent WO_3 basis) in 1945 compared with 635 tons in 1944.

The tungsten deposits of Peru have been described by Knox.[9]

BAUXITE

By John H. Weitz and Mary E. Trought

SUMMARY OUTLINE

SUMMARY[1]

Bauxite production in the United States in 1945 dropped to an estimated [2] 1,146,785 long tons (981,372 tons, dried equivalent), the lowest since 1941 and a decline of 65 percent from the 3,322,442 tons (2,823,724 tons, dried equivalent) produced in 1944. Decreased demand, higher imports, lower exports, and consumption of some of the Government stocks contributed to the lowered output. Consumption declined 30 percent to an estimated 2,430,263 tons (dried equivalent) compared with 3,459,761 tons in 1944, largely because of the reduced rate of production of alumina for the aluminum industry. Stocks of bauxite at mines and processing plants dropped from 527,093 tons to an estimated 395,509 tons during the year, and consumers' stocks decreased from 663,346 tons on December 31, 1944, to an estimated 467,663 tons on December 31, 1945. Government-owned stock piles in Arkansas held 2,756,729 tons on December 31, 1945, compared with 2,969,367 tons at the beginning of the year.

Imports of bauxite from Surinam and British Guiana in 1945 increased 32 percent in tonnage and 37 percent in value and totaled 739,581 long tons; exports, on the other hand, decreased for the second consecutive year and totaled only 126,077 tons. Estimated world output of bauxite dropped nearly 50 percent and totaled only 3,926,000 metric tons. Nearly 60 percent of the total world production is estimated to have been mined in the Western Hemisphere in the United States and the Guianas.

[1] All domestic statistics in this chapter are expressed in long tons instead of short tons.
[2] Figures for 1945 include estimates for one of the newer producers which had not reported at the time the canvass was closed.

Salient statistics of the bauxite industry in the United States, 1942–45

	1942	1943	1944	1945
Production (crude ore) [1] ... long tons	2,602,034	6,232,883	2,823,724	[2] 981,372
Value [3]	$12,981,400	$30,659,900	$14,402,497	$5,631,335

PRODUCTION

Domestic mine production of crude bauxite in 1945 dropped sharply to an estimated 1,146,785 long tons (981,372 tons, dried equivalent), a decline of 65 percent from the 3,322,442 tons (2,823,724 tons, dried equivalent) produced in 1944. The outstanding reasons for this decline in output were decreased demand in the alumina and other industries, use of ore from stock piles, and a larger excess of imports over exports.

Production of bauxite dropped 66 percent in Arkansas and 72 percent in Alabama and increased less than 1 percent in Georgia. Some output was reported in Virginia in 1945, whereas none had been produced the preceding year. In Saline and Pulaski Counties, Ark., whence 93 percent of the 1945 production came, only seven companies operated mines during 1945.

Alabama.—Only two mining companies produced bauxite in Alabama during 1945, and a third company purchased ore for consumption in its activating plant. Alcoa Mining Co. produced crude ore from its Eufaula mines in Barbour and Henry Counties, and the

Production and shipments of crude bauxite from mines in the United States, 1941–45, by States, in long tons

1944	1,408,344	964,613	152,465	1,117,078	1,188,869
1945	874,180	522,533	132,525	655,058	719,416

Barbour Bauxite Co. operated its mines near Eufaula in Barbour County. The ore was sold in crude, dried, and activated form to the alumina, refractory, chemical, and oil-refining industries. A drying plant was operated by Alcoa Mining Co. and an activating plant by Floridin Co. No production of ore was reported in 1945 by the four other companies that operated in 1944.

Arkansas.—Alcoa Mining Co. produced high-grade bauxite from its Drury mine near Sweet Home, Pulaski County, for sale to the nearby Drury calcining plant of its affiliate, Aluminum Ore Co., which calcined the ore for sale to the abrasive industry. In Saline County the company dried and calcined ore at its facilities near Bauxite for sale to alumina, abrasive, and other plants. Numerous underground and open-pit mines were operated by Alcoa in the vicinity of Bauxite. American Cyanamid & Chemical Corp. mined ore from the Heckler, Rauch Extension, Rauch Leased, and Berger No. 100 mines near Berger, Pulaski County. The Keod, Leonoro, Kathleen, Elizabeth, Pickens and Selby, and England mines in the same county were returned by American Cyanamid to the original owners on expiration of the respective leases, July 5, 1945. The company continued operation of its rotary, gas-fired, drying plant during the year near Berger. Near Bauxite, Saline County, the company drying and calcining plants were dismantled, and no further operation is contemplated. There was no production of bauxite in Saline County by American Cyanamid, and the company reported that its Globe No. 28, Cleveland, Quapaw, Ozark No. 24, and Ozark No. 28 mines in that county have been abandoned.

Neither the Bierman mine in Pulaski County nor the Alexander No. 2 mine in Saline County was operated in 1945 by Consolidated Chemical Industries, Inc., although the company continued to ship ore from stock piles on both properties. Crouch Mining Co. mined high-grade ore from its Young mine in Saline County and processed all output in its drying and calcining plant near Bauxite. The Brown-Ratcliffe lease of the Dulin Bauxite Co. was surrendered to the owners on October 10, 1945; the mine was reported exhausted. The Thorpe and Harley leases were exhausted, and no ore was produced from them in 1945; however, the leases were not reported surrendered. The Dulin Bauxite Co., Inc., produced ore from the Penzel and Coe mine (although it was in operation only 4 months owing to the labor shortage) and from the Dixie and Brown-Ratcliffe mines during 1945. The company sold crude ore to the Metals

Reserve Company (since July 1, Office of Metals Reserve, Reconstruction Finance Corporation) and crude and calcined bauxite to the abrasive and other industries. Production from the Childress mine of the Macke Mining Co. ceased entirely after January 1945; all ore was sold to Metals Reserve Company. Both the calcining plant and the Norton mine of the Norton Co. operated during 1945 to produce bauxite for the abrasive industry. Reynolds Mining Corp. operated the Hurricane and Covington mines in 1945.

Georgia.—In Georgia both American Cyanamid & Chemical Corp. and Alcoa Mining Co. operated mines and drying plants during 1945. Cyanamid produced bauxite from the Hatton & Thig Pen mines in the Andersonville district, Sumter County, and Alcoa worked its mines in the Hermitage area of Floyd County. All ore was shipped to the alumina and chemical industries in dried form. The Dupont mine of American Cyanamid & Chemical Corp. at Reesburg, Floyd County, was reported as abandoned during the year, as was the Lane McMichael mine at Oglethorpe, Macon County. No other producers were active in Georgia in 1945.

Oregon.—Aluminum Co. of America announced in its 1945 Annual Report that the company conducted extensive research on the utilization of low-grade laterite ore, large quantities of which have been reported in Oregon, for the production of alumina. The work is said to offer promise, and investigations are being continued.

Virginia.—Mine production at the Lightner, Allen, and Harris mines near Spottswood, Augusta County, was resumed by Alcoa Mining Co. in 1945, and ore was shipped to industry in crude form.

STOCKS

Stocks of bauxite (dried equivalent) on hand at mines and processing plants on December 31, 1945, totaled an estimated 395,509 long tons, compared with 527,093 tons (revised figure) on December 31, 1944. Stocks at consumers' plants decreased from 663,346 tons at the end of 1944 to an estimated 467,663 tons at the end of 1945. Government-owned stocks of bauxite held by Office of Metals Reserve, totaled 2,756,729 tons on December 31, 1945, compared with 2,969,367 tons on December 31, 1944, a decrease of 212,638 tons or 7 percent.

CONSUMPTION

Consumption totaled an estimated 2,430,263 long tons (dried equivalent) in 1945 compared with 3,459,761 tons in 1944, a decline of 30 percent. The consumption figures for both years include calcined bauxite shipped for export to American-owned abrasive plants in Canada for the manufacture of crude abrasives, which are returned to the United States for final manufacture and consumption. Of the 2,430,263 tons of bauxite consumed in 1945, the alumina industry is estimated to have used 84 percent or 2,049,934 tons, the chemical industry 6 percent or 134,766 tons, abrasive and refractory industries 8 percent or 201,182 tons, and the cement, oil-refining, and steel and ferro-alloy industries 2 percent or 44,381 tons. Consumption of bauxite as shipped is estimated to have totaled 2,492,520 tons and consisted of 968,457 tons of crude ore, 1,383,243 tons of dried ore, 125,845 tons of calcined ore, and 14,975 tons of activated ore. Of the bauxite consumed (dried-equivalent basis), it is estimated that 30 percent was foreign and 70 percent domestic. Of the foreign ore consumed, the alumina industry is estimated to have used 92 percent and the chemical, abrasive, cement, and other industries the remaining 8 percent.

Domestic consumption, shown in the following table, is presented upon two different bases. Apparent consumption within the United States does not correspond with the data above, inasmuch as calculations are based upon shipments to domestic plants and do not consider fluctuations in consumers' stocks (including Government-owned stock piles). Although partly estimated for 1945, actual consumption, including shipments to Canada for processing, is based upon monthly consumer surveys and eliminates shipments destined to stock piles.

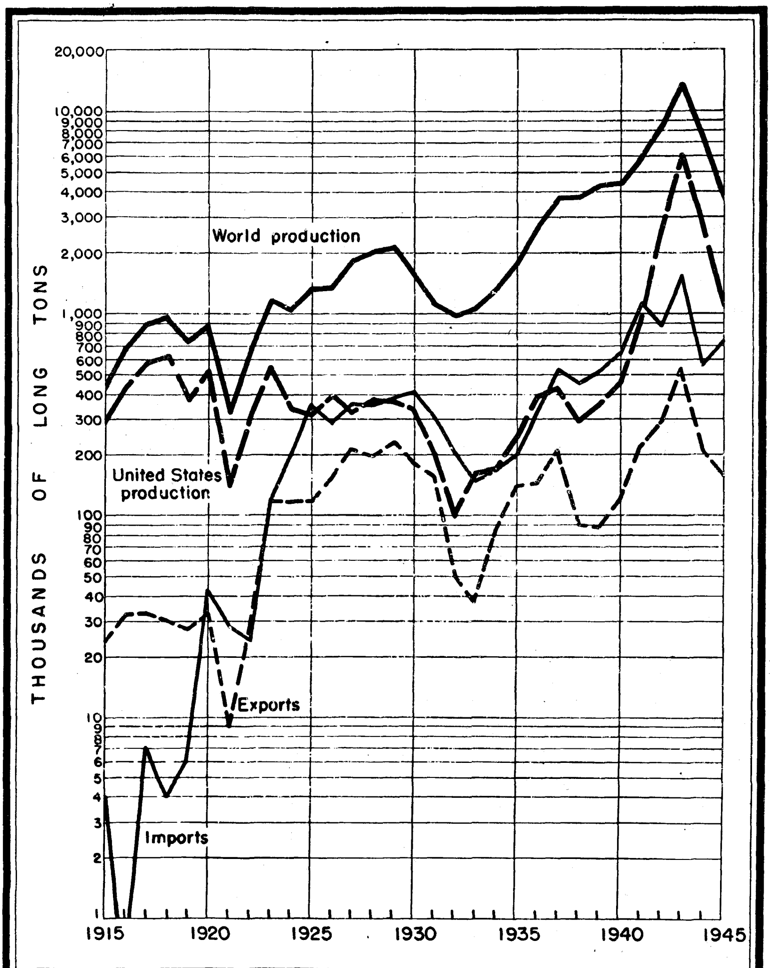

FIGURE 1.—Trends in domestic production, imports, exports, and world production of bauxite, 1915-45.

Shipments, imports, exports, and consumption of bauxite in the United States, 1941–45, in long tons

[Dried-bauxite equivalent]

Year	Domestic shipments from mines and processing plants to industry: Arkansas	Alabama, Georgia, and Virginia	Total	Imports	Exports	Apparent consumption within United States	Actual consumption [1]
1941	857, 804	79, 812	937, 616	1, 116, 546	218, 691	1, 835, 471	1, 721, 475
1942	2, 311, 283	[2] 137, 199	2, 448, 482	884, 217	294, 176	3, 038, 523	2, 518, 325
1943	5, 765, 491	182, 350	5, 947, 841	1, 541, 929	528, 839	6, 960, 931	4, 760, 848
1944	2, 568, 770	129, 568	2, 698, 338	555, 647	210, 852	3, 043, 133	3, 459, 761

Total value	$13, 672, 727		$33, 372, 382		$15, 814, 431		$7, 471, 618	

[1] Includes crude, dried, calcined, activated, and sintered.
[2] Includes 600,000 tons (522,000 dried equivalent) shipped to Metals Reserve Company stock piles.
[3] Includes 3,384,874 tons (2,852,773 dried equivalent) shipped to Metals Reserve Company stock piles.
[4] Includes 1,594,487 tons (1,332,673 dried equivalent) shipped to Metals Reserve Company stock piles.
[5] Includes 400,096 tons (339,052 dried equivalent) shipped to Metals Reserve Company stock piles.
[6] Small quantity of bauxite shipped to makers of refractories probably included under "Abrasive."

Alumina.—Bauxite consumption by the alumina industry in 1945 decreased approximately 32 percent from that in the previous year, totaling an estimated 2,049,934 tons compared with 3,033,903 tons in 1944. Of all the bauxite consumed in 1945, the alumina industry used 84 percent compared with 87.7 percent the preceding year. Domestic bauxite consumed totaled 1,383,075 tons (estimated) or 67 percent, whereas foreign ore consumed totaled 666,859 tons (estimated) or 33 percent. The industry employed crude and dried ore from Alabama, Arkansas, Georgia, Surinam, and British Guiana. Not all bauxite consumed by the alumina industry is destined to emerge finally as aluminum metal, since some of the alumina is used by the chemical, abrasive, and refractory industries, and some of it is processed into special products, such as activated and tabular aluminas for use in the oil-refining and ceramic industries.

Chemical.—The chemical industry used an estimated 6 percent of all domestic and foreign bauxite consumed in 1945; consumption in the industry increased less than 1 percent, exclusive of ore used to produce alumina for chemical purposes. Shipments of domestic bauxite from mines and processing plants to the chemical industry decreased 24 percent from 1944. Consumption by the industry totaled 134,766 long tons, but this included ore used to make some aluminum chemicals other than those shown in the following table. Ore used to manufacture the aluminum salts and alumina shown in the table totaled 258,205 tons, of which 211,273 tons (82 percent) were domestic, and 46,932 tons (18 percent) were foreign bauxite. In addition to bauxite, producers of aluminum salts reported consuming 13,249 short tons of commercial aluminum trihydrate, 13,523 tons of secondary aluminum, 91,073 tons of clay, and a quantity of alunite and bichromate residue.

Production of aluminum salts decreased 3 percent, whereas shipments decreased 2 percent in quantity and 8 percent in value in 1945. Output of alumina (aside from that used in making aluminum) decreased 16 percent, and shipments decreased 14 percent. Of this alumina, 20 percent was consumed by aluminum salts producers; the remainder was used by manufacturers of abrasives, refractories, petroleum products, spark plugs, glass, rubber, paints, and various other commodities.

Aluminum salts and alumina produced and shipped in the United States, 1944–45

	1944				1945

[1] 147 pounds in 1941 and 50 pounds in 1942.

Abrasive and refractory.—Manufacturers of crude aluminous abrasive pigs in Canada and the United States and manufacturers of bauxite refractories in the United States used 201,182 tons (8 percent) of all the foreign and domestic bauxite consumed in 1945, a 23-percent decrease from the 260,761 tons used in 1944. Except for a relatively small quantity from British Guiana, all the ore requirements of the industry were supplied from Saline and Pulaski Counties, Ark.

Other.—Consumption of bauxite in the cement, steel and ferro-alloy, and oil-refining industries decreased 52 percent in 1945.

PRICES

In 1945 the average selling price, f. o. b. mines and processing plants, was estimated at $4.50 a long ton for crude (undried) bauxite, $5.93 for crushed dried bauxite, $14.29 for calcined bauxite, and $53.80 for activated bauxite. Prices in 1944 were as follows: $4.33 for crude, $5.59 for dried, $14.17 for calcined, and $56.67 for activated. The average price for all grades of domestic ore as shipped was $6.90 a long ton ($5.43 in 1944). Nominal market quotations, given in the following table from E&MJ Metal and Mineral Markets, remained static throughout 1945 for all grades of domestic bauxite.

The Metals Reserve Company purchases of ore in Arkansas were under the same price schedule as that in effect during 1944 and shown in Minerals Yearbook, 1944. The schedule is based on percentages of contained alumina, silica, and ferrous iron. The base price is $4.15 a long ton for ore containing 50 percent Al_2O_3, 13 percent SiO_2, and less than 6 percent FeO. Bonuses are as follows: 20 cents a ton for each percent of silica under 13, and 14 cents a ton for each percent of alumina over 50. Penalties are as follows: 43 cents a ton for each percent of silica over 13; 14 cents for each percent of alumina under 50; and 43 cents for each percent of iron in the ferrous state, calculated as FeO, over 6 percent. This price schedule has been in effect since September 1943.

Range of quotations on bauxite, 1942–45

Type of ore	Chemical specifications (percent)		Prices during year

[6] Not published after Feb. 6, 1941.

FOREIGN TRADE [3]

Imports of bauxite in 1945 (739,581 long tons) increased 32 percent in tonnage and 37 percent in value over those in 1944 (560,461 tons). Exports dropped for the second consecutive year, totaling only 126,077 tons valued at $2,424,921, compared with 146,638 tons valued at $2,928,799 in 1944. Of the 1945 imports, 713,854 tons came from Surinam and the remaining 25,727 tons from British Guiana, according to the United States Department of Commerce. By customs districts, imports were as follows: 683,705 tons at Mobile, 30,909 tons at Philadelphia, 14,262 tons at New Orleans, 10,705 tons at Massachusetts, and less than 1 ton at Connecticut.

Bauxite imported into and exported from the United States, 1941–45

Year	Imports for consumption [1] [2]		Exports (including bauxite concentrates) [3]		Year	Imports for consumption [1] [2]		Exports (including bauxite concentrates) [3]	
	Long tons	Value	Long tons	Value		Long tons	Value	Long tons	Value
1941	1,116,546	$7,475,039	134,746	$2,773,877	1944	560,461	$3,844,315	146,638	$2,928,799
1942	884,217	5,952,451	260,600	5,086,695	1945	739,581	5,273,122	126,077	2,424,921
1943	1,547,854	10,860,149	417,186	5,575,128					

[1] Also "alumina" as follows: 1941: 60 tons, $5,544; 1942: 21,711 tons, $1,570,377; 1943: 12,372 tons, $1,108,104; 1944: Less than 1 ton, valued at $1; 1945: 179 tons, $10,940.
[2] Chiefly dried ore.
[3] As shipped.

Of the 1945 exports, 111,908 long tons were classified as bauxite and other aluminum ores and 14,169 tons as bauxite concentrates (including alumina). Canada was the largest recipient of the exports, 111,655 tons of bauxite and other aluminum ores having been shipped to that country; only 197 tons went to Curaçao, 56 tons to

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

U. S. S. R., and less than 1 ton to Mexico. Aside from shipments to Canada for abrasive manufacture, the exports consisted almost entirely of activated bauxite destined for use in oil refineries. Bauxite concentrates (including alumina) were exported to the following countries: Canada 13,913 tons, Dominican Republic 107, Cuba 76, Curaçao 54, U. S. S. R. 10, and less than 10 each to the United Kingdom, Mexico, Australia, Brazil, and Argentina.

WORLD PRODUCTION

Estimated world output of bauxite dropped nearly 50 percent for the second consecutive year and totaled only 3,926,000 metric tons in 1945. Reliable data on central European and Far Eastern countries are not available in most instances. Nearly 60 percent of the total world production is estimated to have been mined in the Western Hemisphere by the United States and the Guianas.

REVIEW BY COUNTRIES

Brazil.—The birth of Brazil's aluminum industry has caused the tremendous undeveloped reserves of bauxite in this South American country to take on new importance to its internal economy. Formerly bauxite was used solely for manufacture of aluminum sulfate and for export, mainly to Argentina but also to the United States and the United Kingdom during the war. It is expected that domestic and export demands will increase markedly from the prewar level Bauxite was made subject to import licensing during 1945. Exports of bauxite from Brazil in 1945 totaled 7,061 metric tons compared to an estimated production of about 11,000 tons.

British Guiana.—Exports of bauxite in 1945 dropped about 15 percent from 1944 and totaled 738,544 long tons. They were lower than in any year since 1940 but were greater than in any year before the war. During the last quarter of 1945, however, shipments declined to about 30,000 tons a month compared with an average of about 72,000 tons for the first 9 months. The Demerara Bauxite Co., controlled by the Aluminum Co. of Canada, was the major producer and shipped virtually all its output to Arvida, Quebec, Canada, for the production of alumina. Operations of the Berbice Bauxite Co., which had been suspended since early 1943, were resumed on a limited scale during the last quarter of 1945. The company is not expected to produce more than about 12,000 tons a month for the next several years.

China.—According to reports, Chinese engineers are working on development of high-grade bauxite deposits recently discovered in western China. Deposits near Kunming, Yunnan, are officially estimated to contain 10,000,000 metric tons of bauxite amenable to treatment by the Bayer process.

Dominican Republic.—Concessions were obtained during 1945 for mining bauxite in the Provinces of Barahona, Bahoruco, San Rafael, Benefactor, and Samana. The concessionaire was not named. As reported in the 1944 chapter of this series, the Republic Mining & Mfg. Co. (now Alcoa Mining Co.) was conducting exploratory work in the Dominican Republic during 1944.

France.—Recent statistical data from a reliable source indicate that shipments of French bauxite during the war years were as follows (metric tons):

Year	Domestic	Export		Total
		Germany	Other countries	
1940	450,592		44,608	495,200
1941	440,514	232,055	1,915	674,484
1942	419,260	230,685	3,599	653,544
1943	436,305	480,564	1,928	918,797
1944	238,751	292,872	1,824	533,447

Production of bauxite in France during 1945 averaged between 17,000 and 20,000 metric tons a month, or about 30 percent of the 1938 average rate of production.

Germany.—Military Government reports from Germany have stated that during the war the grade of bauxite used in the German aluminum industry (largely imported from Hungary and Croatia) declined markedly. In 1938 only 2.23 metric tons of bauxite were required to make 1 ton of alumina, whereas by 1943 the ratio was 2.75 : 1. This was presumably due to the greatly increased imports of ore from Croatia and Hungary, resulting in less selective mining and a greater proportion of low-grade bauxite. The decline in grade meant that the 1,449,250 metric tons of bauxite consumed to make alumina in 1943 was 272,500 tons more than would have been required had

1938 grade been maintained. Thus the lower-grade bauxite used in Germany not only made treatment more difficult but also further overloaded transport facilities to move the required quantities from central and southern Europe. Reports indicate that the decline in quality of the bauxite used resulted in a decline in utilization of alumina capacity to 83 percent in 1943.

Imports of bauxite into Germany were as follows: 1,090,800 metric tons in 1940, 1,171,400 in 1941, 1,508,000 in 1942, 1,534,800 in 1943, 985,800 in 1944, and 45,900 in the first 2 months of 1945. Stocks of ore at alumina plants fluctuated from about 900,000 to 1,100,000 metric tons but had declined to 866,000 tons by July 1, 1944, and to 450,000 tons by February 1, 1945.

Gold Coast.—During 1945 the mines at Ejuanema near Nkawkaw were closed for an indefinite period, and most of the year's estimated output of 120,000 metric tons came from the Kanaiyerebo mine at Awaso, Sefwi-Bekwai, Western Province. Both production and exports (134,760 tons in the first 10 months) were greater than in 1944. Stocks at the port of Takoradi were maintained at a fairly uniform level and represented approximately 1 months' exports.

Greece.—Estimates indicate that there are approximately 15,000,000 tons of developed and probable bauxite reserves in Greece. This country was reported to have produced the best grade of bauxite at the lowest cost of any European country before the war. Greek partisans destroyed the plant of the most productive mine, the Topolia mine of the S. A. Mines de Parnasse, during the war, and before operations can be resumed a new 12-kilometer ropeway from the mine to the port must be constructed. The materials for this ropeway were requested by the Greek Government from United Nations Relief and Rehabilitation Administration. Mines at Eleusis and on the island of Amorgos were reported to be in working condition in August 1945 and capable of immediate resumption of operations. Reports indicate that about 200,000 tons of high-grade bauxite were exported from Greece during the German occupation.

Haiti.—The Reynolds Metals Co. is reported to have continued its exploratory work in Haiti, especially on the Rochelois Plateau, where topographic surveys and test drillings have been carried out. The company has also built an access road and rehabilitated an old road in the area. Production in 1945 was recorded as 300 long tons for experimental purposes.

Hungary.—Recent estimates of bauxite reserves in Hungary range from 116,000,000 to 400,000,000 metric tons, but according to a reliable source only 24,000,000 tons are proved ore containing 50 to 55 percent alumina and less than 6 percent silica. No data are available on 1945 output, but it is not likely that more than one-third as much ore was produced as in 1944 (900,000 metric tons, estimated) owing to the complete transport break-down early in the year and to the Red Army occupation. Late in 1945 it was reported that bauxite was being shipped to Poland in exchange for coke.

Italy.—Bauxite mining was resumed on a small scale at Foggia in southern Italy late in 1945.

Japan.—The following table shows the imports of bauxite and aluminous shale into Japan and Formosa from 1940 to 1945. It is noteworthy how heavily the Japanese were forced to rely on the in-efficient and costly use of shale from North China, when their southern shipping routes grew increasingly subject to losses.

Imports, in metric tons

Fiscal year beginning Apr. 1	Bauxite				Aluminous shale from North China
	Bintan	French Indochina	Malay States	Palau	
1940	194,729		62,965	22,495	41,760
1941	58,059	3,215	26,140	59,297	59,649
1942	274,449		55,831	13,097	44,609
1943	594,589		138,555	84,940	48,323

1945 [1]	1,800				38,902

[1] April to June.

Nyasaland.—Sampling of the Mlanje bauxite deposits by the Geological Survey, Department of the Nyasaland Protectorate, showed that most of the ore is high in silica and low in alumina. An average of 160 samples had 41.6 percent alumina, 14.2 percent ferric oxide, 19.6 percent silica and silicates, 1.5 percent titania, and 23.1 percent loss on ignition. The report suggested that flotation might lower the silica content to a point where the ore would be commercial. Deposits have been found over a total area of 3½ square miles, with depth ranging generally from 15 to 30 feet.

Surinam.—The bauxite deposits of Surinam (Netherlands Guiana) were heavily drawn on during the war years, having produced over 5,200,000 metric tons from 1941 to 1945, inclusive. Reserves are, however, reported still to be very large in blocked-out areas, probably representing only a small part of the total. Little exploration of new fields has been undertaken in recent years, and some of the known, though unexploited, fields are too far from navigation to be commercially important at present. Surinamsche Bauxite Maatschappij, subsidiary of the Aluminum Co. of America, is said to control the major share of the known workable deposits of bauxite in Surinam. Reserves of the company have never been disclosed to the public, but the mines at Moengo have been worked continuously for 25 years. The Moengo mines are thought to be nearly worked out at present. The company is constructing a railroad from the Moengo works to a nearby deposit at Rikenau Hill, said to be larger than the former. Reserves are estimated at 60 years at the present rate of production, according to a reliable source. The mine at Paranam is reported to have ore reserves as large as those at Moengo were before exploitation. The local management of the company has announced plans for converting a drying kiln to produce calcined ore for the abrasive trade in the United States. It is understood that the company plans to produce about 70,000 tons of calcined bauxite a year.

Small deposits of ore in the Para Creek district are owned by the N. V. Billiton Maatschappij, but they are considered to be too small to warrant construction of processing plants, such as those at Moengo and Paranam. It is reported that this company may cease operations in the near future.

A third company, the Nederlandsch Guyana Bauxite Exploitatie Maatschappij, N. V., was incorporated in Surinam in 1945 and plans to exploit a deposit on the Cottica River just north of Moengo. No development work was done in 1945.

United Kingdom.—The sole source of bauxite from within the British Isles during the war was in County Antrim, Northern Ireland, where geological work located several deposits in an area formerly exploited for bauxite but believed worked out. Three mines were operated during the war period and produced about 300,000 metric tons of bauxite. Operations reached a peak in 1943, when more than 100,000 tons of ore were mined, but declined greatly in 1944 and 1945. Finally in November the Ministry of Supply and Aircraft Production decided to close down the last of the three mines at Temple Patrick, which had produced about 900 tons of ore a week during October.

ALUMINUM

By John H. Weitz and Mary E. Trought

SUMMARY OUTLINE

SUMMARY

The production of primary aluminum in the United States in 1945 is estimated [1] at 496,487 short tons, a decrease of 36 percent from the 776,446 tons produced in 1944. Domestic output came from the privately owned plants of the Aluminum Co. of America, the Reynolds Metals Co., and the Government-owned plants operated by Alcoa and Olin Corp. The decreased output resulted from lessened foreign and domestic demand after the German and Japanese surrenders. Military reverses late in 1944 on the western front in Europe made necessary a moderate production increase early in 1945, but after May output dropped steadily. Producing facilities were gradually curtailed, and the last of the Government-owned primary metal plants and the last Government-owned alumina plant were closed on October 31, 1945, leaving only the privately owned plants of Reynolds and Alcoa in operation. During the latter part of the year the most important problem facing both Government and industry was the disposal of Govenment-owned facilities, and it was still largely unsolved by the year's end.

Stocks of virgin ingot held by the Government on December 31, 1945, totaled 185,750 tons, most of which were in the United States. Total stocks of metal in primary and secondary form at producing, fabricating, and consuming plants and in the form of wrecked and obsolete aircraft are estimated to have exceeded 1,000,000 short tons at the end of 1945. Imports of crude and semicrude aluminum totaled 339,293 tons, more than 3⅓ times the 1944 imports; exports, on the other hand, decreased 97 percent in 1945 and totaled only 6,543 tons. Recovery of secondary aluminum decreased from 325,645 tons in 1944 to 298,387 tons in 1945. Apparent consumption of primary aluminum (production plus imports minus exports plus or minus changes in producers' stocks) in 1945 increased from

[1] Figures for 1945 include estimates for one of the newer producers which had not reported at the time the canvass was closed.

744,627 tons in 1944 to an estimated 796,081 tons in 1945, owing largely to the transfer of Government stocks from Canada to the United States.

World production of aluminum was estimated to have been only slightly more than half the 1944 total. The greatest declines in output were in Germany and other parts of Central Europe and in Japan and territories formerly Japanese-controlled.

Salient statistics of the aluminum industry, 1942–45

	1942	1943	1944	1945
Primary production short tons	521,106	920,179	776,446	[1] 496,487

PRODUCTION

Primary.—The output of an estimated 496,487 short tons of virgin aluminum in 1945 represents a 36-percent decline in output from the 776,446 tons produced in 1944 and is 46 percent below the all-time high of 920,179 tons in 1943. The decline resulted from gradual curtailment of operations in producing facilities; the last of the Government-owned primary metal plants shut down on October 31, 1945. Reduction of operations was due to decreased demands for aluminum in aircraft and other war material after VE-day and to further diminished requirements after VJ-day. Final shut-down of the Government-owned plants, the operation of which had been greatly reduced previously, came at the termination by the Reconstruction Finance Corporation of its operating contracts with the Aluminum Co. of America. Other factors influencing the cut-back decisions were the growing stocks of ingot held by the Government, mainly Canadian-produced metal imported in vast quantities during 1945, and substantial stocks held by producers and fabricators, both in ingot and semifabricated form.

The most important problem facing the aluminum industry and the Government during the latter part of 1945 was how to dispose of the Government-owned facilities so that the largest number would remain active and so that the industry would be in the best position to take advantage of its great postwar possibilities. On March 12, 1945, the Second Federal Circuit Court in New York, sitting as a panel of the Supreme Court under Public Law 332 (June 10, 1944), held that the New York Federal District Court had erred in finding that Alcoa had not operated in violation of section two of the Sherman Act. The reversal was, however, restricted to the virgin-aluminum-ingot situation, and in handing down its decision the court left unsettled the contention of the Government that Alcoa should be dissolved, inasmuch as the wartime construction and operation of plants had altered the situation. The court said that the need for the application of such a remedy as dissolution was for the District Court to decide and recognized that the postwar situation might be very different from that existing in 1940. In the latter part of 1945 reports on the disposal of surplus aluminum facilities were issued by the United States Department of Justice and by the Surplus Property Administration, which arrived at differing conclusions. The Department of Justice report took the position that it is virtually impossible to find industrial organizations willing to enter into competition with Alcoa and that therefore it might be best to break that company into several competing units, whereas the Surplus Property Board report took the stand that competition could be fostered only by Government subsidy in the form of favorable leases, aid in raw-material procurement, and assurance of a market to prospective newcomers.

Later in 1945 the Reynolds Metals Co. offered to lease the Hurricane Creek alumina and the Jones Mills reduction plants from the Reconstruction Finance Corporation, and by the end of the year the offer had been approved by the latter. Offers to purchase the two Government-owned Bayer alumina plants and several of the reduction plants were made by the Aluminum Co. of America, but under a ruling by the Attorney General (whose approval is necessary in the sale of the Government plants), the disposal of any Government-owned aluminum plants to Alcoa would violate the antitrust laws, unless such disposal were accompanied by relinquishment of properties now owned by Alcoa to the extent necessary to create competition. However, at the end of the year, the impasse in aluminum-plant disposal, promised to be overcome with the submission to the RFC of several lease and purchase offers. It appeared that at least two companies other than Alcoa would be important factors in the industry through the lease of Government-owned facilities. Alcoa contributed to the Government's plant-disposal program by granting RFC, for use at the Hurricane Creek alumina plant, a royalty-free license under all of the company patents covering the process of extracting alumina from bauxite. These patents are essential to the competitive operation with low-grade bauxite of the Hurricane Creek plant.

Stocks of virgin ingot aluminum held by the RFC on December 31, 1945, totaled 185,750 tons, of which 94 percent was held in the United States and the balance in Canada. The stocks of Government-owned primary metal at the end of 1945 were held under the freezing provisions of section 22 of the Surplus Property Act of 1944, which provisions were to expire January 3, 1946. Several stock-piling bills under consideration by Congress provided for the holding of a large share of the available stocks as a strategic reserve against future emergency. Total stocks of aluminum, including metal at aircraft and other consuming plants, in process and in plant inventories in the aluminum industry, and in Government stock piles, plus secondary and scrap aluminum in the hands of dealers and smelters and in the form of wrecked and obsolete aircraft at the end of 1945, have been estimated to be more than 1,000,000 tons.

Secondary.—Recovery of secondary aluminum in 1945 totaled 298,387 short tons compared with 325,645 tons in 1944 and 313,961 tons in 1943. The 298,387 tons recovered from secondary sources included 2,145 tons of pure metal (98.5+ percent), 293,967 tons of aluminum alloys, 1,162 tons of aluminum in brass and bronze, 267 tons in zinc-base alloys, and 846 tons of aluminum in chemical com-

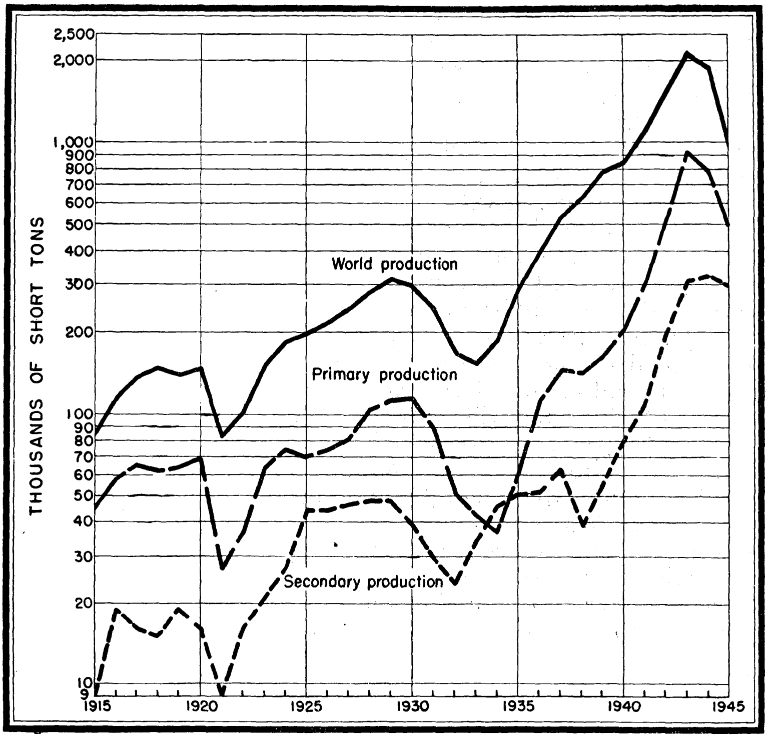

FIGURE 1.—Trends in domestic primary and secondary production and world production of aluminum, 1915–45.

pounds. Production in the form of secondary ingots totaled 198,426 tons (214,879 tons in 1944). The secondary aluminum recovered in 1945 required the consumption of 323,676 tons of aluminum scrap, of which 32,031 tons (10 percent) were old scrap (25,223 tons or 7 percent in 1944) and 291,645 tons (90 percent) were new scrap (328,959 tons or 93 percent in 1944). Remelters, smelters, and refiners used 64 percent of this scrap; aluminum rolling mills, 35 percent; and foundries and other manufacturers, 1 percent. Additional information on secondary aluminum is given in the chapter of this volume on Secondary Metals—Nonferrous.

CONSUMPTION AND USE

No statistics are gathered on the consumption of aluminum, and therefore no accurate figure for domestic aluminum consumption is available. Apparent consumption of primary aluminum, figured by adding imports to domestic production less exports and adding producers' stock increases, totaled an estimated 796,081 tons in 1945, or 7 percent more than 1944. This figure is somewhat inflated, however, inasmuch as Government stocks in the United States increased greatly during the year owing to heavy imports from Canada. Probably proportionately less metal was used for aircraft and military purposes and more for civilian purposes than in 1944, but no percentage data are obtainable.

As a result of the tremendous wartime expansion of primary aluminum-producing capacity, more aluminum is available to consumers than ever before. Expansions in fabricating facilities assure that sheet, rod, bar, forging, extrusion, and casting capacity is ample to process the primary and secondary metal available. According to the results of a survey conducted by one of the basic producers, aluminum has expanded and diversified its markets until there are now 3,500 uses for the metal compared with 1,500 before the war.[2]

According to the Annual Report for 1945 of the Aluminum Co. of America, the future for aluminum markets, both new and old, is promising. Among the new markets, perhaps aluminum roofing sheet has the greatest possibility for immediate large expansion; it is reported that major producers have a large volume of orders on hand for this material, and the potential market runs into hundreds of millions of pounds. In railroading, 1,100 passenger cars were ordered during the past year, of which 100 will be of all-aluminum construction (averaging 20,000 pounds per car), and the balance will use 2,000 to 10,000 pounds per car. A number of aluminum-hopper cars were built in 1945 for railroad use, and experimental aluminum refrigerator cars were under construction. More aluminum is being used in truck and trailer bodies and buses where the advantages of lower operating cost, lower maintenance cost, and increased pay load make aluminum a preferred material in many instances. More general use of the metal is reported in light civilian pleasure aircraft.

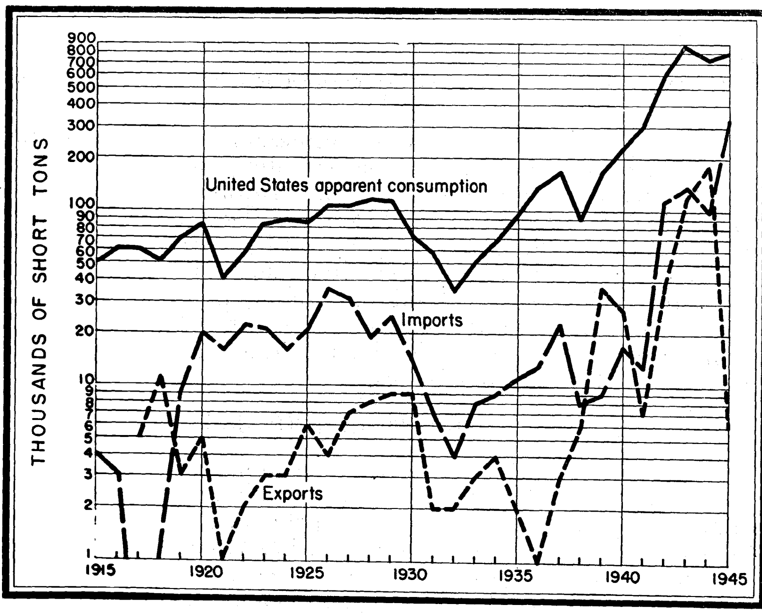

FIGURE 2.—Trends in imports, exports, and apparent consumption of aluminum, 1915–45.

[2] Schooley, Daisy L., Peace Demands for Aluminum Expand: Domestic Commerce, April 1946, pp. 27–30.

Marine construction companies are using additional quantities of aluminum on ships, particularly in superstructures. One instance was reported in which two complete aluminum upper decks are being build for cargo-passenger ships. Aluminum is being widely used in construction of new davits and lifeboats; large-scale production of aluminum canoes and other small pleasure craft was begun in 1945. Other fields in which aluminum is finding new and increased applications are building—roofing, sheathing, rain gutters and spouts, window frames, venetian blinds, screen cloth, and garage doors—refrigeration equipment, ladders, furniture, cooking utensils, tablewares, and appliances, industrial chemical equipment, textile machinery, bearings, license plates, foil wrappings, and deisel engine construction.

Production, imports, exports, and apparent consumption of primary aluminum and production of secondary aluminum in the United States, 1941–45

Year	Primary aluminum					Secondary aluminum	
	Production		Imports (short tons)	Exports (short tons)	Apparent consumption [1] (short tons)	Short tons	Value [2]
	Short tons	Value					
1941	309,067	$100,395,000	13,358	7,405	302,788	106,857	$34,707,153
1942	521,106	151,371,000	112,112	38,747	588,969	196,464	57,446,074
1943	920,179	265,380,000	135,581	117,624	877,349	313,961	90,546,352
1944	776,446	222,416,000	100,969	188,108	744,627	[3] 325,645	[3] 93,264,728
1945	[4] 496,487	[4] 141,924,000	334,125	5,741	[4] 796,081	298,387	85,297,005

[1] Data not available on fluctuations in consumers' stocks. Withdrawals from producers' stock totaled 55,320 tons in 1944; additions to producers' stocks totaled 12,232 tons in 1941, 5,502 in 1942, 60,787 in 1943, and 28,790 in 1945.
[2] Based upon average price of primary aluminum as reported to Bureau of Mines.
[3] Corrected figure.
[4] Partly estimated.

PRICES

During 1945, as in the preceding 3 years, the New York open-market base price of primary aluminum remained at 15 cents a pound for lots of 10,000 pounds or more, 99-percent-plus virgin ingot aluminum, delivered. Pig aluminum remained at 14 cents a pound, delivered, for 99-percent-plus virgin pigs during 1945. On August 30, 1945, the Office of Price Administration announced that price controls over primary aluminum ingot and pig were suspended. Controls over most aluminum castings were also suspended but sheet, rod, tubing, and other fabricated products as well as scrap and secondary aluminum were kept under price regulations.

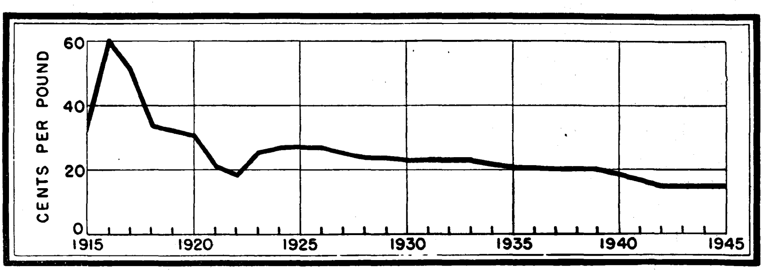

FIGURE 3.—Trend in average quoted price of aluminum, 1915–45. Price is for No. 1 virgin 98–99 percent at New York through 1929, thereafter for 99-percent-plus virgin ingot, as reported by American Metal Market.

FOREIGN TRADE [3]

Imports of crude and semicrude aluminum in 1945 reached an all-time high mark of 339,293 short tons, approximately 3⅓ times the 1944 imports and nearly 2½ times the previous record attained in 1943. The value of the 1945 imports, $98,289,843, likewise set a new record and was more than three times the 1944 value. The tremendously increased imports are attributed to the fact that the wartime virgin-aluminum contracts between the United States and Canada were completed by dint of heavy deliveries in 1945. All of the imports of crude metal, scrap, and plates, sheets, and bars were from Canada, except for 589 tons of plates, sheets, and bars shipped from the United Kingdom. Imports of aluminum (crude metal and alloys only) constituted 42 percent of the apparent consumption of primary aluminum during 1945. Manufactured aluminum articles imported rose considerably in value over 1944 and were the highest since 1942.

Aluminum imported for consumption in the United States, 1943–45, by classes

Class	1943		1944		1945	
	Short tons	Value	Short tons	Value	Short tons	Value
Crude and semicrude:

[1] Less than 1 ton. [2] Quantity not recorded.

Exports of crude and semicrude aluminum during 1945 dropped to 6,543 tons from the previous year's peak of 188,521 tons. The exports were lower than in any year since 1938 and represented only 3 percent of the 1944 total. Virtual cessation of Lend-Lease shipments of primary aluminum to Russia during 1945 caused the precipitous drop in exports as compared with the previous several years. Of the 1945 exports of ingots, slabs, and crude metal (2,209 tons), 520 tons went to Brazil, 476 to U. S. S. R., 261 to Mexico, 178 to Canada, 144 to Chile, 133 to Argentina, 122 to Cuba, 117 to Uruguay, 90 to Sweden, and less than 50 tons each to Venezuela, Colombia, China, Peru, Spain, Syria, Turkey, Newfoundland, Canal Zone, Union of South Africa, Surinam, Ceylon, and Bolivia. Of 802 tons of scrap aluminum exported, 353 tons went to Canada, 252 tons to Mexico, 140 tons to Brazil, 56 tons to Cuba and less than one ton each to Venezuela and Bermuda. Of 3,532 tons of plates, sheets, bars, etc., 1,375 tons went to U. S. S. R., 935 to Canada, 480 to Brazil, 163 to Colombia, 163 to Mexico, and less than 100 tons each to 44 other countries.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Aluminum exported from the United States, 1943–45, by classes

TECHNOLOGIC DEVELOPMENTS

A revolutionary method for recovering aluminum from aircraft scrap was tested at East St. Louis, Ill., by the Aluminum Ore Co. in conjunction with the Army Air Forces during June and July of 1945.[4] The test was conducted on 500,000 pounds of wrecked aircraft scrap, and the aluminum was recovered by a process involving its reaction with a dilute caustic soda liquor in an open outdoor tank. Steel, copper, magnesium, lead, and nonmetallic materials found in the scrap were little affected by the solution and were removed from the tank after the aluminum had been dissolved. The aluminum reacted with the caustic soda solution to form sodium aluminate and the resulting solution was pumped into the Bayer process alumina plant where it lost its identity by being mixed with other alumina in process from treatment of bauxite. This scrap-recovery process is thus analogous to the recovery of aluminum from bauxite. The conclusion drawn from the results of the experiment was that the method was workable but that further tests should be made to determine its economic feasibility.

The Aluminum Co. of America, in its Annual Report for 1945, stated that numerous advances in aluminum technology had been effected through research during 1945 and included the following: A practical method for employing aluminum alloys in protection—by electrochemical action—of underground pipelines, and the interiors of steel tanks, against rusting; development of a new cast-aluminum bearing alloy; development of a new wrought and two new casting alloys, which can be made from low-cost alloyed aluminum resulting from the scrapping of war equipment; and various improvements in the manufacture of aluminum sand and permanent mold castings.

Alloy 63S, designed particularly for architecture and building applications and noted for its ability to take a bright anodic coating,

4 Aluminum Ore Co., East St. Louis, Ill. Preliminary report, Aug. 3, 1945.

was introduced during 1945, a year that also saw the commercial introduction of Alclad 14S sheet. Significant progress was made in 1945 in the fields of welding, brazing, and resin bonding. Further perfection of the Alumilite process has been reported, and peacetime customers will find the metal available in virtually every color.

GOVERNMENT REGULATIONS

War Production Board Supplementary Limitation Order M-1-k controlling aluminum was revoked on July 24, 1945, and finally virtually all controls over primary aluminum were removed on September 30, 1945, by elimination of the Controlled Materials Plan. Cancellation of military ratings and allotments had been announced on August 18 but general controls were not revoked until the Controlled Materials Plan ceased to function. On September 30, 1945, amendments to Priorities Regulations 28 and 29 represented the only controls still in effect over aluminum. The cancellation of all priority ratings except the special "top priority AAA", and the military "MM" was affected by the amendment. A civilian "CC" preference rating was introduced to be used sparingly to hasten reconversion and insure continued production and services.

WORLD PRODUCTION

Although very few reliable data are available to give a measure of the world output of primary aluminum in 1945, it can be safely stated that output was not much more than half the 1944 production. The greatest decline in output was in Germany and the central and southeastern European countries, where facilities were overrun and captured during the first 4 months of the year. There is reason to believe that many of the plants in existence in those countries were dismantled and moved as war reparations, and those that were not moved were either destroyed or ordered closed by the Allied Military Government. In the Pacific area—Japan, Formosa, Korea, and Manchuria—production, which was slowed greatly by transport difficulties and shortages of essential materials before the end of hostilities, was probably almost entirely stopped after the middle of August.

A great shift in the balance of the world capacities and world production has taken place. Germany, which ranked first among the nations of the world in capacity before World War II, is no longer a factor in the industry and will be required to import the limited quantity of metal allowed it. Japanese aluminum facilities probably will be permitted to operate at a very limited rate. New aluminum industries are developing in countries which formerly imported all their requirements—India, Brazil, China, and possibly others. Despite Russian secrecy there is some evidence which indicates that Russia is greatly expanding its capacity to produce the metal by building new plants and by relocating plants formerly situated in eastern Europe and possibly Manchuria.

In recognition of the vastly changed conditions in the world aluminum industry, the Alliance Aluminium Cie., A. G., of Basle, Switzerland, the world aluminum cartel, ceased to function in 1945.

REVIEW BY COUNTRIES

Brazil.—On March 29, 1945, the first primary aluminum to be made in South America was poured at the Saramenha plant of Electro-Chimica Brasileira in the State of Minas Gerais. This, the first of three projected plants in Brazil to go into production, is rated at 2,500 metric tons annual capacity. The plant of Companhia Brasileira de Aluminio, S. A., at Rodovalho in São Paulo is reported to be partly constructed; but the third plant at Campos, to be built by Companhia Industrial Brasil-Aluminio, is said to be still in the planning stage. A number of factors are favorable to the establishment of an aluminum industry in Brazil, among them being large deposits of high-grade bauxite, a high hydro-power potential, abundant and cheap labor, a domestic market with possibilities for great expansion, and the favorable attitude of the Brazilian Government toward establishment of new industrial enterprises and toward their protection from foreign competition. As an indication of the present domestic market for aluminum in Brazil, more than 3,000 tons of primary metal were imported in the first 9 months of 1945.

Canada.—The Aluminum Co. of Canada, Ltd., reported that in the five war years, 1940 to 1944, inclusive, 55 percent of its production was sold to the United Kingdom; sales to the United States were 32 percent of the total; Russia took 4.3 percent; Australia, 1.2 percent; and other United Nations countries, 1.5 percent. Only 6 percent of total production of aluminum during these years was consumed in Canada. According to H. H. Richardson, vice president of Aluminium Laboratories, Ltd., increasing civilian outlets for the metal should enable Canada to maintain production exceeding 200,000 short tons a year, or 40 percent of total rated wartime capacity. Canada is now in a position to manufacture extruded shapes and castings and to roll sheet in much larger sizes than before the war. A large outlet is expected in aluminum roofing sheet and in aluminum houses being built to relieve the domestic housing shortage.

717372—47——45

On May 17, 1945, Aluminium, Ltd., called for the dissolution of the Alliance Aluminium Cie., A. G., in Switzerland (the international aluminum cartel) and formally denounced the agreements between itself and the European shareholders in the company.

China.—According to articles in the American press, China plans a gigantic development program and estimates that 100,000 tons of aluminum capacity will be in operation by the tenth year of the plan. The Sixth Kuomintang Congress resolved that China should establish a large aluminum industry to provide raw material for its aircraft program and as a partial substitute for copper. At the request of the Chinese Government, the Bureau of Reclamation, United States Department of the Interior, is said to be working out a basinwide development program in the Yangtze River Valley. Plans call for construction of a large dam and hydroelectric plant.

France.—Reliable reports from France state that imports, exports, and consumption of primary aluminum were as follows, in metric tons, from 1939 to 1944:

	1939	1940	1941	1942	1943	1944
Imports	2, 332	19, 109	3, 689	1, 691	968	766
Exports	13, 052	9, 095	28, 383	10, 272	15, 890	1, 830
Consumption	41, 780	71, 754	39, 221	36, 649	31, 538	25, 086

Germany.—The production of primary aluminum has been banned in Germany, and imports into that country will be limited to 30,000 tons of metal a year, or about one-tenth of the annual consumption rate from 1940 to 1944, inclusive. Until further reports are available, it is not possible to estimate the 1945 output of aluminum in Germany, but it certainly was less than half of that produced in 1944.

Hungary.—According to reports received since the collapse of Germany, the German plans for a great expansion of the Hungarian alumina industry were not completed before the surrender. The 60,000-ton plant being constructed by the Dunavoelgye Timfoeldgyar, a company formed in 1941 by joint participation of the Bauxite Trust and the German and Hungarian Governments, was nearly completed in 1945. However, sensing that the Danube Valley area would be overrun by the Russian army, the Germans removed much of the equipment from the plant and abandoned it. It is reported that additional equipment was appropriated by the Russians as war booty and that Russia will obtain the remaining processing facilities as reparations. If no further processing capacity is removed from Hungary as reparations, the country will have two alumina plants with a capacity of 26,000 metric tons a year. The two plants are the 14,000-ton-a-year works at Magyarovar owned by a subsidiary of the Bauxite Trust and the 12,000-ton-a-year works at Ajka owned by the Magyar Bauxitbanya, R. T.

Three aluminum-reduction plants in Hungary have a total capacity of 18,800 metric tons annually, approximately 5,800 tons in excess of the quantity that can be produced from domestic alumina. At Ajka a 10,000-ton plant owned by Magyar Bauxitbanya, R. T., was completed in 1943 and used coal from the Ajka Coal Mines, Inc., as its source of electric power. The company rolling mill at Szekesfehervar formerly processed the aluminum metal produced at Ajka, but the mills have been dismantled by the Russians. It is reported that, in spite of the loss of machinery taken for reparations by Russia, the company would be able to operate on a limited scale if equipment removed by the Germans was returned. The Felsoegalla plant of Hungarian General Coal Mines, Inc., which began operations in 1940, has a capacity of 4,800 tons annually and is reported to be intact. The third plant at Csepel, owned by the Manfred Weiss concern, which began production in 1935, incurred serious damage during the latter part of the war, reducing its 4,000-ton capacity by some 30 percent.

India.—According to official statements, the present capacity of the aluminum industry in India is 7,000 tons annually, and it is anticipated that, with favorable conditions, production will be increased to 20,000 tons within 10 years. Late in 1945 output of the Aluminium Co. of India, Ltd., was stated to be about 100 tons of metal a month, and the company expects to begin using Indian bauxite as a raw material as soon as its alumina plant, under construction at Lohardaga, Bihar, is completed. The other producing company in India, Aluminium Corporation of India, Ltd., located in the Asansol area of Bengal, is said to have a daily capacity of 13.5 tons of aluminum ingot and 40 tons of alumina. Production presumably began at Asansol during 1945.

Italy.—A report of the British Intelligence Objectives Subcommittee on aluminum-reduction plants in Italy states that production at the 3,000-ton plant of the Societé dell 'Alluminio Italiano at Borgofranco declined steadily from the high point reached in 1941, owing to power and raw material shortages, and that the plant was finally closed in December 1944 following exhaustion of alumina supplies. The plant is said to have incurred little or no war damage. Output from the Porto Marghera works, which includes a 75,000-ton alumina plant and a 20,000-ton aluminum-reduction unit owned by the Swiss-controlled Societé Alluminio Veneto Anonima, was stopped in June 1944 owing to a lack of raw materials, but production was resumed on a limited scale at the reduction plant in October 1945. The reduction plant was considerably damaged by bombing during 1943 and is incapable of capacity operations at present. Industria Nazionale Alluminio owns two plants in the Adige Valley, a 16,000-ton plant at Bolzano and a 14,000-ton plant at Mori. The Mori plant was shut down entirely, and the Bolzano plant was cut to a low rate of output when the Porto Marghera alumina works ceased operations. Permission was obtained late in 1945 from the Allied Commission to operate the Bolzano plant at 12 tons a day and the Mori plant at 5 tons a day. The plants escaped bomb damage during the war, although the town of Bolzano itself was heavily damaged.

Japan.—Military Government reports from Yokohama late in 1945 indicate that, at the end of war, Japan had a total Bayer-process alumina capacity of 307,000 metric tons annually in the home islands and in addition had 47,500 tons annual capacity for making alumina from clay, shale, and alunite. Plants in Formosa, Korea, and Manchuria actually completed by the end of the war were capable of producing about 87,000 tons annually from bauxite and aluminum shales. Rated capacity of aluminum-reduction plants in the home islands was 134,200 tons annually and in the occupied territories

68,000 tons. Incomplete reports of Japanese army and navy inventories indicated that about 150,000 metric tons of aluminum and aluminum alloys were on hand at the end of the war. According to Military Government authorities, this quantity would make Japan self-sufficient in light alloys for permitted uses for 8 to 10 years. Stocks of bauxite and alumina in Japan are thought to have been very low late in the year, but enough was on hand to allow the Nippon Light Metals Co. to begin production of aluminum on November 25. This was the first output since the surrender. During December 1945, 641 metric tons of sheet and wire were produced in 22 rolling mills in Japan from aluminum and aluminum alloy.

Mexico.—Reynolds Metals Co. announced in May 1945 that it had established an aluminum-fabricating company in Mexico in cooperation with the Banco Nacionale de Mexico. The new company, known as Reynolds Internacionale de Mexico, will produce aluminum sheet, plate, and foil and plans later to enter other fields of fabrication, such as forgings, extrusions, rod, bar, cable, powder, and paste.

Norway.—According to military intelligence reports, early in 1945 Germany gave up its program for producing aluminum in Norway and began to evacuate or destroy equipments from plants it had built or was building. As a result, the Norwegian plants (which had operated on imported raw materials prior to the German occupation) were forced to curtail output even further, owing to lack of supplies. Reports in late August were that Norwegian aluminum output was at an all-time low, with the Norsk Aluminium Co. operating at 50 percent of capacity. Demand for the metal far exceeded supply, owing to deferred repairs, construction requirements, and substitution of aluminum for other metals such as tin.

When adequate supplies again become available, however, it is likely that Norway will find itself with more aluminum-reduction capacity than can be used, since the normal domestic market took only a small part of total sales before the war. Most of the prewar metal was exported (28,600 metric tons in 1938), but increased competition from enlarged wartime facilities abroad may force the price lower than that at which Norway can compete in the world market.

Sweden.—Much pessimistic comment concerning the future position of the Swedish aluminum industry appeared in various trade journals during 1945, even though domestic capacity represents little over 50 percent of estimated demand. The main difficulty is the high cost of production, said to almost double the American and Canadian selling prices for the metal. In November an attempt was made to limit imports by requiring a Government license, but this was later removed, along with price control on aluminum ware. This latter action followed reports that subsidy or "equalization" payments to producers were discontinued and may force closing of Swedish aluminum reduction works.

Switzerland.—Owing to a lack of domestic aluminum raw materials and to the fact that alumina is not made in any plants in Switzerland, the Swiss aluminum industry was faced by grave problems in attempting to maintain output during the war years. According to the annual report of Aluminium-Industrie, A. G., imports of alumina were sufficient to allow operations at a moderately high rate during the early years of the war. Because of the general scarcity of alumina on the continent, however, supplies were exported to Switzerland from France and Italy on a quota basis and under conditions requiring that a portion of the metal produced should be reexported.

Before the summer of 1943, about two-thirds of Switzerland's alumina imports had come from Porto Marghera, Italy, and during that summer imports were interrupted owing to transportation difficulties. In the following summer, imports from France stopped entirely until the spring of 1945. Steps were taken in 1943, despite the then large stocks of alumina, to cut down metal production at Chippis; further cuts were necessitated in 1944, so that only one-third of the plant capacity was in use most of the year. By the last few months of 1944, output was at 20 percent of capacity, and finally at the end of January 1945 the aluminum-reduction works was closed. Stocks of aluminum metal and manufactured products were at a very low level in early 1945. After many attempts at reestablishing imports of alumina, a shipment of 600 tons was received during April 1945, and it was hoped that aluminum production would begin shortly thereafter as further imports were received. No data are available on the Swiss industry during the last half of 1945, but it is probable that production was resumed, although not at a rate approaching capacity.

Union of South Africa.—Aluminium, Ltd., of Canada announced that it has formed a subsidiary to be known as Aluminium Co. of South Africa (Pty.), Ltd., which would produce foil and sheet at Pietermaritzburg.

United Kingdom.—Data released by the Light Metals Control in the Monthly Digest of Statistics revealed that consumption of virgin aluminum was approximately 100,000 long tons in 1945, compared with a peak of 207,600 tons in 1943. In the 6 years from 1940 to 1945, inclusive, production of virgin aluminum was just over 210,000 tons and imports about 730,000 tons. Total supply during this period was thus 940,000 tons, compared with recorded consumption of about 870,000 tons in the same period, indicating that stocks of metal on hand were some 70,000 tons greater than at the beginning of 1940, when they were at a very low level. In 1945 the percentage of secondary aluminum in the total United Kingdom consumption was 39.5 percent. Secondary ingot production for 1945 was 61,912 tons, compared with virgin production of 31,896 tons.

U. S. S. R.—A new Russian aluminum-reduction plant was reported to have begun operation in the middle of 1945 at Bogoslovsk, west of Serov, where it is said a giant aluminum-producing center is partly built. Three hydroelectric stations being built or enlarged on the Kola Peninsula are expected to speed expansion of rebuilt and new plants in the Kandalaksha area. Reconstruction of the great Dniepr dam and power station in the Ukraine is understood to be progressing and may allow resumption of aluminum output at the Zaporozhe reduction works. Russia claimed in 1945 that it was second to the United States in aluminum production, although it seems unlikely that facilities in the U. S. S. R. are equal in capacity to those in Canada.

MERCURY

By Helena M. Meyer and Alethea W. Mitchell

SUMMARY OUTLINE

SUMMARY

Despite the ending of hostilities in Germany in May and the collapse of resistance in Japan in August, the promise that war demand for the new dry battery would cause mercury consumption to reach new record levels in 1945 was fulfilled in generous measure, and the consumption of 63,900 flasks exceeded the previous record in 1943 by 17 percent. The quantity of mercury used, nonetheless, fell far short of expectations had 1945 proved a full war year. Consumption was on the uptrend at the beginning of 1945 and continued upward through May, when a new high monthly record rate of 8,900 flasks was established. Total consumption dropped in June, but the quantities used for batteries reached a peak in that month. War contracts for the new-type battery were canceled following termination of hostilities with Japan; consumption fell to 5,300 in August and to only 2,000 flasks in December, when it was at the lowest rate for nearly 6 years.

Another record was broken by a wide margin in 1945—that for imports. The anticipated enormous expansion in consumption of mercury at the outset of 1945 caused manufacturers to look to Spain for large, rapidly increased supplies of metal to augment production from domestic mines. Metal from stocks on hand in Spain began to enter the country in large quantity in April; general imports of 10,963 flasks in April marked a new high monthly record, which was almost doubled by the entry of 19,504 flasks in July. In November imports totaled 18,261 flasks, a quantity second only to that for July. Imports in July and November resembled prewar annual totals more closely than monthly ones. Recorded imports totaled 71,508 flasks in 1945, or 49 percent more than the previous annual peak entries in 1943.

Production at domestic mines declined in 1944 following cancellation of Government-purchase contracts and the sharp reduction in prices that accompanied the belief, widely held at the time, that all requirements were amply provided for. The price rise that resulted from the placing of battery contracts probably followed the disappointments of other sharp price movements too closely to tempt domestic operators to reopen mines or to expand output at already active mines without some assurance that the higher prices would continue. Production of 1,200 flasks in October 1945 was less than the average monthly rate for any year since 1933. The monthly average for the final quarter of 1945 was nearly 10 percent below the average monthly rate that prevailed in the prewar years 1938–39.

Salient statistics of the mercury industry in the United States, 1941–45

[Flasks of 76 pounds]

[1] Large quantities were reexported in 1942 and 1943.

The price began to rise in the latter part of 1944 under the influence of the battery program. In July of that year the average quoted price for mercury at New York was less than $101 a flask. The top of the upswing was reached in February 1945 when the monthly quotation was $166 a flask. Doubtless the availability of large stocks of metal in Spain and the actual receipt therefrom of supplies ample for the battery program caused a collapse in quotations, which reached a low point of $96 a flask in September. After the end of the Japanese phase of the war, fears were held that the market would have to absorb unprecedented quantities of metal released by Government contract cancelations. The removal of such surplus stocks from the market for the permanent Government stock pile resulted in an upward reaction in prices in the final quarter of 1945; the average for December was 13 percent above that for September, when the lowest monthly average for the year was established. During 1944–45, while the prices of other commodities controlled by Office of Price Administration ceilings remained constant at the ceiling levels, the price of mercury was unique in that it fluctuated widely. Mercury ceiling-price restrictions were suspended late in August 1945.

Undoubtedly industry stocks rose to unprecedented levels in 1945, although long-time records on inventories have not been maintained. From the time the Bureau of Mines began to compile monthly data in September 1939 to the end of 1944 consumers' and dealers' stocks ranged between 7,400 and 15,300 flasks. At the end of October 1945, following battery contract terminations and before the Government began to absorb surplus metal into the permanent stock pile, consumers and dealers held 37,800 flasks. Industry stocks fell to 17,000 flasks by the end of the year, and a large part of this total was scheduled for the stock pile.

Thus, supply conditions in the mercury industry in the United States were reversed again in 1945, as had already happened twice since World War II started. To take care of emergency war needs for the metal, the Government released mercury from stocks of the Office of Metals Reserve at the beginning of the year. By the third quarter conditions had changed so that it became desirable for the Government to acquire ownership of mercury released from contract cancelations for the permanent stock pile. This latter action had the effect of preventing complete disruption of the domestic market.

Figure 1 shows trends in production, consumption, and price of mercury from 1910 to 1945.

Conditions in foreign countries.—Italy and Spain each produced about 40,000 flasks of mercury in 1945, or less than half of the capacity of either country. Italian production has advanced following the

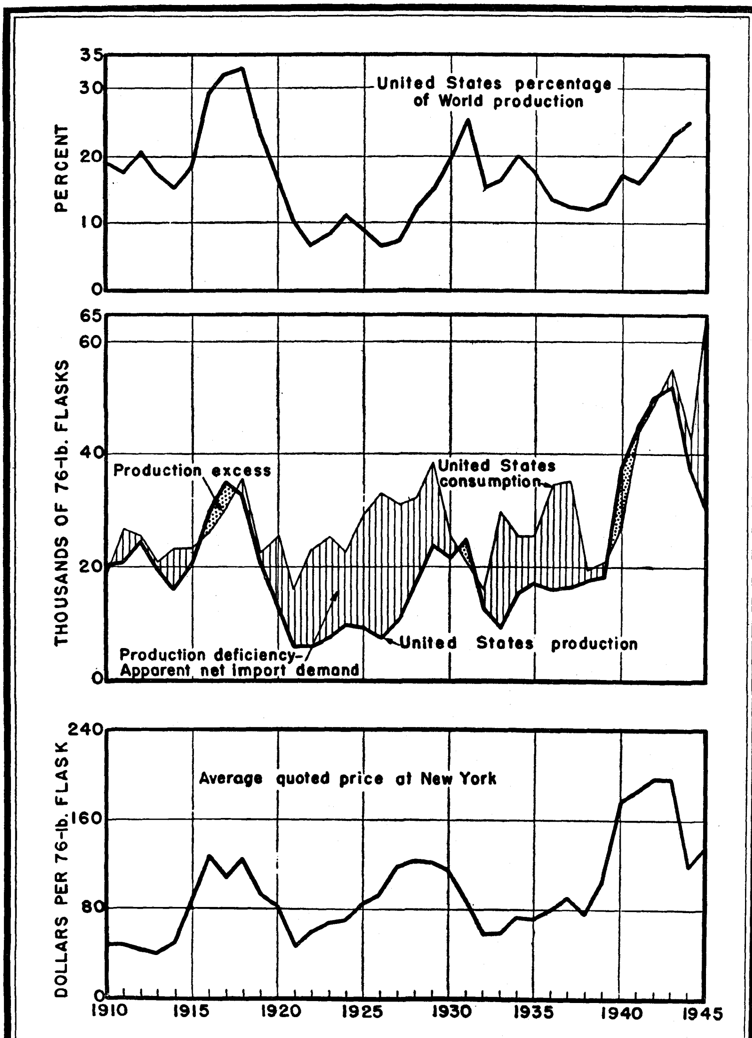

FIGURE 1.—Trends in production, consumption, and price of mercury in the United States, 1910–45.

operating difficulties experienced after the Germans retreated (described in the report of this series for 1944 under Italy) and those that coincided with the carrying on of operations under an army of occupation. Spanish output was low in 1945 because large stocks were on hand at the beginning of the year and because world demand was expected to shrink considerably in the postwar years. Canadian mines remained idle in 1945 in the absence of sufficient incentive to cause their reopening. Production in Mexico was reduced because of the canceling of contracts with the United States Government in 1944 and because the price for mercury was inadequate for numerous operations.

Mercury cartel.—The mercury cartel, Mercurio Europeo, was being revived at the end of 1945. The Spanish mine at Almaden and two Italian producers, Società Anonima Mineraria Monte Amiata and Stabilimento Minerario del Siele, are reported to have formed a selling organization to handle all export sales of mercury, with offices at Madrid (Alcala 47) and Rome (Via Regina Elena 47). The firm advertised internationally its desire to hire representatives in the United States and Europe. The policy of the United States Government toward cartels is such that the appointment of a cartel sales agent in the United States at least for other than export sales was expected to involve difficulties.

Future prospects for world consumption.—There seems to be no prospect that postwar world consumption of mercury will soon approach the quantities used in the war period, and it is unlikely too that postwar use of the metal will even equal the quantities absorbed in the immediate prewar years. Germany vied with the United States as the largest mercury-consuming nation in the world before World War II, and Japan ranked among the first four countries in this regard. Germany's increased consumption[1] went largely into new or expanded plants where mercury was used as a catalyst or in the electrolytic production of chlorine and caustic soda, and in such plants the mercury is available for recovery for subsequent use if the plants are dismantled in whole or in part. In addition, a quantity of metal (see section on Germany) adequate for, roughly, 2 years' consumption at prewar levels was held in stock in Germany at the end of the war. Thus, not only will it be unnecessary to import mercury into Germany for some time to come, but metal in use there during the war may fill part of the postwar requirements of other nations. Japan is in a similar position, although smaller quantities of mercury are involved in that country. The prospects for increased consumption in the United States appear to be related closely to the postwar development of the new dry-cell battery, although certain other new uses are said also to promise greater use of mercury. The company that controls the patents for the battery's manufacture is restrained in predicting the size of postwar consumption.[2] It is also possible that prospective increases in mercury consumption in the manufacture of batteries may be offset, in part, at least, by declines in consumption for other purposes. On the whole, however, it appears that in the United States, mercury probably will be consumed in the future at

[1] Minerals Yearbook, 1943, p. 729.
[2] Bradley, Worthen, Mercury Meanderings—pt. II: Min. Cong. Jour., vol. 32, No. 3, March 1946, pp. 35–38.

not less than prewar levels, with prospects for a rise to considerably higher rates at least a possibility. Undoubtedly consumption in the United Kingdom will follow the use pattern in the United States, even to production of the new batteries, and the United Kingdom likewise should require as much mercury as before World War II.

Geological Survey[3] *and Bureau of Mines activities.*—After hostilities ceased in 1945, Geological Survey work on quicksilver was aimed at increasing the knowledge of ore deposits as an aid in finding new ore bodies if another emergency occurred. With this in mind the New Almaden, Calif., project was enlarged to include not only Mine Hill but also a large surrounding area. Field work was still in progress at the end of 1945. At Steamboat Springs, Nev., special emphasis is being placed on a study of the origin of the springs and conditions under which deposits of mercury and antimony develop. A preliminary paper has been prepared and will be published in the near future. Two of the Survey's quicksilver reports were published during the year by the California Division of Mines.[4]

In 1945 the Geological Survey issued a report on the quicksilver-antimony deposits of Huitzuco, Guerrero, Mexico.[5] Reports on other mercury districts in Mexico are in course of publication. Field work on the study of the Huancavelica mercury district, Peru, was completed by the Geological Survey under the auspices of the State Department, and the report is being prepared for publication.

The Geological Survey continued investigations of Alaskan quicksilver deposits during 1945. New lower levels of the Red Devil mine near Sleitmut were mapped in detail. New openings at the Decoursey Mountain mine near Crooked Creek were examined. Aerial reconnaissance mapping of intervening regions was continued, and formations favorable for the occurrence of quicksilver were discovered along the upper Holokuk River.

The Bureau of Mines continued the work begun in earlier years at numerous locations.

DOMESTIC PRODUCTION

The monthly production rates for 1945 varied widely due largely to the unusual conditions that characterized the industry in that year. Consumption was pointed upward at the beginning of the year and was headed for historic peak levels later in the year; prices also were high early in 1945. Domestic producers, however, had recently experienced wide price movements and may have hesitated to expand production, pending more stable conditions. Moreover, rains and winter weather adversely affect domestic output in December and January, and in the 2 months in question labor supplies were inadequate and were thus a further deterrent to production. Production in December 1944 and in January 1945 was 2,500 flasks, or well below the average for the war period, particularly in relation to that part of the period that preceded July 1944. In July 1945, production rose to a high monthly rate for the year of 3,600 flasks, but by that time

[3] Information obtained from Juanita Crawford, Geological Survey.

record quantities were arriving from Spain, and the end of the war demand was in sight. The collapse of consumption and prices that coincided with the end of hostilities caused the output to sink to lower levels than before the war; in the final quarter of the year, production was only half of the reduced rate in the first quarter and averaged even less than in the period 1938–39.

Mercury produced in the United States, 1941–45, by months, in flasks of 76 pounds

Month	1941	1942	1943	1944	1945
January	3,100	3,700	4,200	4,400	2,500
February	2,900	3,400	3,900	3,800	2,700

	68	30,763	4,149,621

[1] Value calculated at average price at New York.

There was an 18-percent drop in production for the United States as a whole, and totals for all areas except Nevada and Alaska declined more than the average; output in Nevada gained 76 percent and in Alaska 52 percent. California continued to account for an outstanding share of the total, or 69 percent in 1945 compared with 74 percent in 1944. Production in California dropped 24 percent, in Oregon 21 percent, and in Arizona, Arkansas, Idaho, and Texas even more sharply. Nevada rose to second place among the mercury-producing areas in 1945, having displaced Oregon which held second position continuously from 1936 through 1944.

The principal producing mines in 1945 were as follows:

Alaska—Red Devil and Decoursey Mountain mines.

Arizona—Gila County, Ord mine.

California—Contra Costa County, Mount Diablo mine; Lake County, Abbott, Mirabel, and Sulphur Bank mines; Napa County, Knoxville mine; San Benito County, New Idria mine; San Luis Obispo County, Buena Vista (Mahoney) mine; Santa Barbara County, Red Rock mine; Santa Clara County, Guadalupe and New Almaden mines; Sonoma County, Mount Jackson mine; Yolo County, Reed mine.

Idaho—Valley County, Hermes mine.

Nevada—Humboldt County, Cordero mine; Pershing County, Red Bird mine.

Oregon—Douglas County, Bonanza mine.

Texas—Brewster County, Chisos-Waldron mine.

In 1945 these 20 mines produced 97 percent of the United States total; in 1944, 31 mines contributed 97 percent; and in 1942, 34 mines produced 89 percent.

Of the larger mines listed in the chapter of this series for 1944, the following are missing from the foregoing list: Pine Mountain, Arizona; Helen, Oat Hill, Klau, Falcon (Santa Ynez), Culver-Baer, and Altoona, California; Red Rock and Pershing, Nevada; Horse Heaven, Oregon; and Big Bend, Texas Almaden, and Fresno mines, Texas. The only name added was the Red Rock, California. None of the principal mines in 1945 produced less than 100 flasks of mercury. Of these properties, only the following reported production in December: Mount Diablo, Abbott, Knoxville, New Idria, Red Rock, Guadalupe, Mount Jackson, Reed, Hermes, Cordero, Bonanza, and Chisos-Waldron. These 12 mines produced 98 percent of the December total.

The trend toward the treatment of higher grades of ore, as a consequence of lower prices (noted in the chapter of this series for 1944), continued in 1945. The average grade of ores treated in 1945 was 0.54 percent (10.8-pound ore) compared with 0.47 percent (9.4-pound ore) in 1944, 0.31 percent (6.28-pound ore) in 1943, and 0.25 percent (5-pound ore) in 1942. The 1945 grade was the highest reached since 1926 and equaled the record for that year. There was a continuation in 1945 of the closing of properties with only low-grade reserves.

REVIEW BY STATES

Alaska.—Alaskan production of mercury reached a new peak in 1945, rising against the trend in most areas. Operations at both the Red Devil (New Idria-Alaska) and the Decoursey Mountain properties were closed at the end of the year because of the winter season. As previously, the Red Devil ore was treated in a 3- by 40-foot Gould rotary furnace, and that at Decoursey Mountain was reduced in a two-tube D-type retort. The main shaft at the Red Devil mine was sunk 50 feet to the 100-foot level, and most of the ore treated in 1945 was from the new level.

Arizona.—Only two mercury properties produced metal in 1945—the Ord in the Brown district, Gila County, and the National in the Sunflower district, Maricopa County. The Pine Mountain mine, also in the Sunflower district, which produced in 1944 and earlier years since 1940, closed in December 1944 and remained idle throughout 1945. At the Ord mine 889 tons of ore were treated in a 20-ton Foster furnace in 1945 to recover 117 flasks of mercury. The National ore was also furnaced at one of the new plants mentioned in the report of this series for 1944.

California.—Production of mercury in California declined 24 percent from 1944, or more than the average decrease of 18 percent for the country as a whole, but this State continued, nevertheless, to produce a very substantial proportion of the United States total, that is, 69 percent in 1945 as compared with 74 percent in 1944. The largest mercury-producing mine in the Western Hemisphere was again the New Idria, San Benito County. This property produced less metal than in 1944 because of market conditions in the latter part of the year; output in the first 8 months was at approximately the peak annual rate of 1943. Among the larger producers, the following had greater outputs in 1945t han in 1944: Mount Diablo, Contra Costa County; Buena Vista, San Luis Obispo County; Red Rock, Santa Barbara County; Guadalupe, Santa Clara County; and Mount Jackson, Sonoma County. Substantial decreases or complete discontinuance of operations were reported for the Abbott, Mirabel, and Sulphur Bank mines, Lake County; Knoxville and Oat Hill mines, Napa County; New Idria mine, San Benito County; Klau mine, San Luis Obispo County; Falcon (Santa Ynez) mine, Santa Barbara County; New Almaden mine, Santa Clara County; Altoona mine, Trinity County; and Reed mine, Yolo County.

Fourteen counties contributed some production in 1945, as follows: Contra Costa, Del Norte, Fresno, Inyo, Kings, Lake, Napa, San Benito, San Luis Obispo, Santa Barbara, Santa Clara, Sonoma, Trinity, and Yolo. Mono, Monterey, and Stanislaus were among the producing counties in 1944 but Kings County was not.

The Bradley Mining Co. produced mercury again at its Mount Diablo mine in Contra Costa County. This property is equipped with a Gould rotary furnace and D-type retort.

Oscar E. Hanno produced 69 flasks of mercury from 103 tons of ore in a 2-ton inclined retort at the Patricks Creek mine, Del Norte County, in 1945. The ore was followed for 30 feet on a 45° incline, and a new adit was being driven 6 feet below the bottom of the incline to determine the course of the ore.

Joe Larios produced nine flasks of mercury in a retort at the Santa Rita mine, Fresno County. The property was reported closed for the winter.

Production of mercury was reported for the Kings and Dawson properties, Kings County, in 1945. Retorts were used at both locations.

Seven properties in Lake County produced mercury in 1945. This county was second only to San Benito as a mercury-producing area in the United States in 1944 but dropped in importance in 1945 to rank only fifth among the counties of California. Production of 1,447 flasks of mercury from 9,556 tons of ore represented only 38 percent of the 1944 output. The chief producer was again the Abbott mine, 3 miles by road southwest from Wilbur Springs; this property dropped to sixth place among mercury producers in the United States in 1945 after having risen quickly to third place in 1944. A Gould rotary furnace, with a rated capacity of 40 tons of ore a day, was in operation at the end of the year. Development at the Abbott consisted of drifting into virgin ground and prospecting in an area that had been very productive years ago. Next to the Abbott mine, the Sulphur Bank mine, operated by the Bradley Mining Co., and the Mirabel mine were the most productive in the county, rotary kilns being used at both properties. An article on the Sulphur Bank and Reed (Yolo County) plants[6] was recently published. The Mirabel mine was closed November 17, with no plans for reopening. Mercury was produced in a Gould rotary furnace by Kline and Peterson. Small outputs were also made in retorts at the Big Chief and Thorne properties by John Johnson, who turned the properties back to the owners. The Bradley Mining Co. produced a small quantity of mercury, probably from clean-up operations, at the Great Western mine.

Output of mercury in Napa County was sharply reduced in 1945; the total (287 flasks) was only 24 percent of that for 1944. The drop is explained by discontinuance of the larger operations at the Oat Hill and Knoxville mines, although there were two separate producers on each of these properties in 1945. Cerar, Carr & Truitt and Hickox & Wilson both produced at the Knoxville mine and accounted for the larger part of the total for Napa County. Output at Oat Hill was largely from clean-up activity in connection with dismantling and removing the furnace. The Eureka No. 3 Dump and three other properties produced small quantities.

The outstanding mercury producer in the United States in 1945, by a wide margin, was the New Idria mine, operated by the New Idria Quicksilver Mining Co. A total of 10,193 flasks of mercury was produced in the county in 1945. The New Idria mine, in the Idria district 70 miles south of Hollister, produced more metal than its next three competitors in the United States. Two of the four furnaces were in operation in the early part of the year, but toward the end only one was active, and even this one was idle during October and most of November. A new condensing system of somewhat new design was installed at two furnaces near the end of the year. Bradley[7] said that the New Idria had found a "magnificent ore body by an intelligently planned and executed development campaign." New Idria, he said, already had ore; but recent discoveries, stimulated by isometric plotting of the ground, had added years of life to this remarkable old mine. The Stayton mine, operated by R. B. Knox, had a small output from a retort in 1945, and Arthur Weerts reported small retorting operations at the Mitchell and Pico Rico properties.

A total of 873 flasks was produced in San Luis Obispo County. Production was dominated by operations of W. R. and F. M. Wyatt and by Virgil Smith at the Buena Vista mine. Clean-up around the plant and dumps at the Klau mine and possibly the same type of activity at the Oceanic mine yielded the remainder of the county total.

Mercury was produced in a 35-ton Gould rotary furnace at the Red

[6] Hall, R. G., and Bradley, Worthen, Concurrent Firing at the Sulphur Bank and Reed Quicksilver Plants: Am. Inst. Min. and Met. Eng., Metals Technol., vol. 12, No. 8, December 1945, 11 pp.
[7] Bradley, Worthen, Mercury Meanderings—pt. I: Min. Cong. Jour., vol. 32, No. 1, January 1946, p. 37.

Rock mine, Cachuma district, Santa Barbara County, by the National Mining &Milling Co.

The New Almaden mine, operated by the New Almaden Corp., and Guadalupe mine, operated by Laco Mining Co., Inc., led as producers of mercury in Santa Clara County in 1945. In all, 1,646 flasks were produced in the county compared with 1,699 flasks in 1944 and with the recent peak of 2,715 flasks in 1941. Large furnaces were used at each of the mines already mentioned. The New Almaden mine was recently described.[8] In addition to the foregoing the Almaden Dumps were operated by C. L. Thomas, and three other operators produced small quantities at other locations.

The Mount Jackson mine produced a very high percentage of the total output of Sonoma County in 1945, a continuation of the situation that has existed since 1941. Sonoma County ranked third among the mercury-producing counties of the country in output of mercury in 1945, and the Mount Jackson mine was the third largest producing mine, having moved up from fourth place held in 1944. Production of Mount Jackson gained over 1944, a movement contrary to the trend for the country as a whole. C. A. Baumeister & Sons produced mercury in a 20-ton rotary furnace at the Culver-Baer mine; Severs, Landrebe & McPherson produced a small quantity in an inclined retort of 1½ tons capacity; and one other operator had a small output. The Bradley Mining Co. was doing some exploratory work at the Cloverdale mine in 1945, but no mercury was produced there in that year. A new development adit was run at the Riley-Contact mine in 1945 by H. G. Walker, who reported no production in that year. A 4- by 50-foot (50 tons daily capacity) rotary furnace is said to be on the property.

The Marsman Co. of California, operating the Altoona mine, was again the only producer of mercury in Trinity County in 1945. A rotary furnace of 30 tons rated capacity was used at this mine. The Altoona was the ninth largest mercury-producing mine in the United States in 1944, but it dropped from the list of important producers in 1945.

The Bradley Mining Co., operating the Reed mine, was again the only producer in Yolo County. The Reed was fourth in output among the mercury mines of the country, having dropped from second place held in 1944. Production at this mine fell 22 percent in 1945 following the advance in 1944 of 92 percent over 1943.

Idaho.—Bonanza Mines, Inc., produced mercury at the Hermes mine, Yellow Pine district, Valley County, in 1945, accounting for the only output of mercury in the State. A total of 7,330 tons of ore and dump material was treated in 1945 in one or both of the two 4- by 60-foot Gould rotary furnaces at the mine, and 627 flasks of mercury were recovered. The Hermes ranked as the seventh largest mercury-producing mine in 1944 but dropped somewhat below the first 10 places in 1945, when output fell 53 percent. The company reported that 1,000 feet of development drifting had been done during 1945.

Nevada.—Nevada was the second-largest mercury-producing State in 1945, a place not held since 1930. The assumption of this high

[8] Mining World, New Almaden, Still Going Strong After 120 Years of Operation: Vol. 7, No. 8, July 1945, pp. 42–43.

position is due to the sharp gain in output of mercury at the Cordero mine, Humboldt County, and to declines in or discontinuance of production at the Bonanza, Horse Heaven, Bretz, Opalite, and Black Butte mines in Oregon and at the Big Bend, Fresno, Chisos, and Rainbow mines in Texas. The total of 4,338 flasks for 1945 fell short of the peak output of 4,764 flasks in 1929 but was second to that year only. Production was high in 1929 because of the outputs of the Nevada Quicksilver and Pershing mines in the Antelope Springs district, Pershing County; the B. & B. and Red Rock (Good & McKinney) mines in the Fish Lake Valley district, Esmeralda County; and the Castle Peak mine in the Castle Peak district, Storey County. Of the properties listed for Nevada, only the Red Rock was active in 1945. The 4,338 flasks of mercury produced in Nevada in 1945 were recovered from 18,939 tons of ore, indicating a recovery of 17.4 pounds of mercury to a ton of ore or 0.87 percent.

There were no productive operations at mercury mines in Elko County in 1945.

W. F. Dunnigan produced 60 flasks of mercury at the Red Rock mine, Fish Lake Valley district, Esmeralda County, from 280 tons of ore treated in a Gould rotary furnace.

In all, 4,050 flasks were produced in Humboldt County in 1945, making this county the second most important in mercury production in the United States. The Cordero mine, operated by the Cordero Mining Co., was second only to the New Idria mine, San Benito County, Calif., as a producer of mercury in the United States in 1945, output having risen against the trend for most areas. In 1944 the mine ranked sixth and in both 1945 and 1944 stood first in Nevada. The mercury produced in 1945 was 166 percent greater than in 1944, while the tonnage of ore treated gained only 54 percent, indicating a noteworthy rise in the grade of ore treated. Bradley[9] said that a "magnificent ore body" had been found at the Cordero mine. The property was about to be closed, he said:

> * * * when its management decided on a campaign of churn drill prospecting. This paid off to the extent of high-grade ore down to 600 feet, which not only changed the ore reserves picture but toppled the long-held theory that cinnabar ore could only be relatively shallow in Nevada.

Production in 1945 was again from the large Herreshoff furnace on the property. Several smaller producers were Geo. H. Johnson operating the Cahill mine, C. D. Edmondson the Blackrock, John Mayeroff the Santa Rosa, and A. Gilmet the Grayson. Other properties, including some formerly large producers, were inactive in 1945.

The Hitt claim, operated by E. W. Morris, is believed to have been the only productive mercury property in Mineral County in 1945. A small quantity only was involved.

Very little mercury was produced in Nye County in 1945.

Young & MacAfee Enterprises operated a furnace at the Red Bird mine, Antelope Springs district, in 1945 and was the largest producer in Pershing County. Output for the county totaled 214 flasks or less than one-third of the 1944 total. The Pershing mine, largest producer in the county in 1944, was idle throughout 1945; and the Red Bird mine, already mentioned, was shut late in August 1945. Other

[9] Bradley, Worthen, work cited in footnote 7.

producers in the county in 1945 included Melvin McCoy at the Goldbanks mine, where the ore was retorted, and two others.

Oregon.—Oregon lost its place to Nevada as the second most important mercury-producing State in 1945. Production of 2,500 flasks was 21 percent below 1944 and 72 percent below 1941 and 1940. The Bonanza mine was by far the largest producer in the State and increased its dominant position by supplying 94 percent of the State's total. Of the total output, 2,425 flasks were recovered from 12,612 tons of ore, indicating a recovery of 14.6 pounds of mercury to a ton of ore or 0.73 percent. The remaining metal was recovered from furnace clean-up and dumps.

The output of 75 flasks of mercury from 32 tons of ore in Crook County is outstanding in the United States, where production is largely from low-grade ores. Eickemeyer Bros., operating the Maury Mountain mine, was the largest producer, and contributions to the total were made also by Frank S. Towner, operating the Lost Cinnabar No. 1, and the Amity Mining Co., operating the Amity mine. The three mines are in the Ochoco district, and retorts are used at each property.

As usual, the Bonanza mine of Bonanza Mines, Inc., was the outstanding mercury producer in Oregon in 1945, and in that year its dominant position was strengthened despite a decrease of 3 percent in output. The mine continued to hold fifth place in the United States. At Bonanza 2,350 flasks of mercury were recovered from furnacing 12,580 tons of ore, compared with 2,426 flasks from 15,547 tons of ore in 1944, indicating an increase in the average mercury content of the ore treated in 1945. Production was made in a Gould rotary furnace. In 1944 the company reported a Herreshoff plant also at the mine.

A small output of mercury at the War Eagle mine in Jackson County was reported.

The Horse Heaven mine, Jefferson County, has been the second most important mercury-producing property in the State in recent years; it ranked tenth in the United States in 1944. A fire at the mine closed operations on November 22, 1944, and output in 1945 was confined to clean-up activity at the furnace site.

Three properties that have produced important quantities of mercury in the past—the Black Butte in Lane County and the Bretz and Opalite in Malheur County—were idle in 1945.

Texas.—The Esperado Mining Co., operating the Chisos and Waldron properties, Terlingua district, Brewster County, was the only producer in Texas in 1945. Output for the State declined because the Fresno mine, Presidio County, which ranked first in the State by a narrow margin in 1944, was inactive in 1945. The larger output at the Chisos and Waldron mines in 1945 was insufficient to offset the inactivity in that year of the Fresno and two smaller properties which were productive in 1944.

CONSUMPTION AND USES

The record-breaking rise in consumption of mercury in 1945 was described in the opening section of this report. The rapid development of the new-type dry-cell battery for war uses, calling for enormous

717372—47——46

quantities of mercury, has been one of the outstanding features of the mercury industry for all times. The question as to the possibilities of adapting the battery to large-scale peacetime use is the most important one now facing the industry. A beginning has been made in this direction, and batteries for hearing aids are already on the market. Numerous other prospects are being explored.

A newly developed mercury "clutch" for fractional horsepower electric motors, to be used in washing machines, air-conditioning units, refrigerator equipment, and other ways, is claimed to have promise. Mercury chemicals protected millions of yards of military fabric from mildew. A recent advertisement told of a powerful new mercury fungicide with marked water-repellent properties, which protects textiles, felt, cork, paints, lacquers, varnishes, oils, greases, waxes, paper, leather, and wood from mildew, mold, rot, and other forms of destruction by microbes.

Mercury cells for the electrolytic production of chlorine and caustic soda have recently received considerable publicity.[10] The editorial notes in connection with the first article were as follows:

> Of the half hundred alkali-chlorine plants in this country, only four use the mercury cathode type of cell. Yet this cell, about which comparatively little has been published, has certain advantages over other designs more widely used. It produces, for instance, a caustic soda solution that needs no further purification even for the rayon trade. Attention is now being directed to basic advantages of the mercury cathode cell.

As indicated in the section on Germany, war expansion of the German caustic soda and chlorine industry was in mercury cells. Earlier reports of this series pointed out Germany's favorable position during the war in regard to supplies of mercury and the practicability of putting mercury to widespread use there.

Mercury-arc rectifiers as a source of direct-current power for mill drives were recently discussed.[11]

The development of new chemicals, such as the sulfa drugs and penicillin, may curtail the consumption of mercury in pharmaceutical uses.

Supply of mercury in the United States, 1941–45, in flasks of 76 pounds

Year	Production	Imports for consumption	Exports	Consumption
1941	44,921	7,740	2,590	44,800
1942	50,846	[1] 38,941	[1] 345	49,700
1943	51,929	[1] 47,805	[1] 385	54,500
1944	37,688	19,553	750	42,900
1945	30,763	68,617	1,038	63,900

[1] Large quantities were reexported in 1942 and 1943.

	26,800	44,800	49,700	54,500	42,900	63,900

STOCKS

Consumers' and dealers' stocks of mercury undoubtedly reached a new high level in 1945, although the statistical record covers the period since September 1939 only. For the period September 1939 to the end of 1944 consumers' and dealers' stocks fluctuated from a high point of 15,300 flasks at the end of August 1942 to a low point of 7,400 flasks at the end of October 1944. The record for 1945 cannot be considered normal and resulted from the same factors that influenced prices (discussed under Prices). After the record high receipts of mercury from abroad in July, industry stocks were at double the highest levels of the preceding 5-year period and more. Month-end inventories continued at the inflated levels for 3 months and even rose 13 percent over the July total to 37,800 flasks at the end of October. The absorption of surplus stocks from Government contract cancelations into the permanent stock pile caused a reduction in industry stocks to 17,000 flasks by the end of December, and of this total a large quantity was scheduled for the Government inventory.

Producers that regularly account for more than 95 percent of the total domestic output held (not necessarily owned) large stocks of mercury in 1945, but at no time were such stocks as large as they had been early in 1944. Producers held 3,200 flasks at the end of 1945 compared with 2,700 flasks at the end of 1944 but at the high point for 1945 (September) had only 4,200 flasks compared with 6,200 flasks at the end of May 1944. The May 1944 stocks must have been larger than at any other time since 1900 at least and may never have been exceeded.

Stocks held by the Office of Metals Reserve fluctuated little in 1945 after the end of January. They were 67,812 flasks at the beginning of the year and were reduced to 63,067 flasks in January to accommodate war orders. At the end of the year 63,638 flasks were held.

Data covering metal in the permanent Government stock pile are not available for publication.

PRICES

Mercury prices were subject to rather violent fluctuations after the beginning of World War II. Following the establishment of ceiling limitations in February 1942 the price was stabilized at close to the ceiling for almost 2 years. In 1944 and 1945 the price fluctuated severely beneath the ceiling and in this regard was in contrast to the inaction of virtually all commodities subject to price controls. The relationship between supplies and requirements was reversed in 1943, when supplies became adequate and even abundant for anticipated needs, and this new condition caused the price to drop sharply from December 1943 to July 1944. The monthly price was $196 a flask at New York in August 1943; it was $190.08 in December, $151.60 in January 1944, and $100.56 in July. The anticipation of new record rates of consumption due to the development of the new dry-cell battery, of which mercuric oxide is an important component, caused the price to jump to $165.55 in February 1945. The expectation that enough mercury for the expanded consumption would be

Average monthly prices per flask (76 pounds) of mercury at New York and London, and excess of London price over New York price, 1943–45

[1] Engineering and Mining Journal, New York.

[2] Mining Journal (London) prices in terms of pounds sterling are converted to American money by using average rates of exchange (official for January 1943 through June 1945 and free thereafter) recorded by Federal Reserve Board. Official prices were £68 10s. to £69 15s. until October 1945, when they were reduced to £30 to £31 5s.

forthcoming from Spain, and the actual receipts of record-breaking quantities therefrom, brought reversal of the new price movement in 1945. The end of World War II, followed by the canceling of Government contracts for batteries, accelerated the price drop to \$95.84 a flask in September. Removal from the market of surplus stocks from Government contract cancelations for the permanent stock pile was responsible for the return of somewhat higher prices in the final quarter of the year; in December the average price was \$108.

Control maximum prices in London remained unchanged from those during the late months of 1942 until October 1945 at £69 15s. a flask for over 1 flask and less than 11 flasks and £69 for larger quantities, ex sellers' premises in both cases. Prices dropped to less than half when they changed in October 1945 and were £30 to £31 5s. a flask.

FOREIGN TRADE [12]

One of the features of the mercury industry in 1945 was the high record rate of imports during the year. Imports for consumption totaled 68,617 flasks, or 251 percent more than in 1944 and 44 percent above the previous peak in 1943. The foregoing gains were caused by the enormous demands for mercury due to the war requirements for the new dry-cell batteries. The need to acquire large supplies very rapidly turned the attention of manufacturers to Spain. Receipts of 55,391 flasks of mercury from Spain alone would have been sufficient to establish a new annual peak by a noteworthy margin for total United States imports; but, in addition, 10,853 flasks came from Mexico, 1,720 from Canada, 477 from Chile, 153 from Peru, and 23 from Honduras. Spain had not shipped to the United States since 1941 and then only 104 flasks. Receipts from Mexico declined 36 percent in 1945, and those from Chile dropped 51 percent. While those from Canada increased 10 percent, the small quantity from Peru was virtually trebled, and that from Honduras marked the entry of a new item from that country.

General imports may differ considerably from imports for consumption and are a better guide to actual entries into the country during a specified period. General imports totaled 71,508 flasks in 1945 and 19,819 flasks in 1944. The distribution by countries (comparisons with 1944 in parentheses) were as follows: Canada, 1,720 (1,564); Chile, 751 (982); Honduras, 23 (—); Mexico, 13,082 (17,221); Peru, 185 (52); and Spain, 55,747 (—). Imports from Canada were from stocks, inasmuch as the mercury mines of the country were idle in 1945. The entry of metal into the United States was highly concentrated in three periods, that is, April–May, July, and November. April imports marked a new high record monthly total, those for July were not far from double the April rate, and those for November were only a little less than the total for July.

No imports of mercury compounds were recorded in either 1945 or 1944.

Exports of mercury rose 38 percent in 1945 following a sharp increase in 1944 but despite these gains were insignificant in relation to the import movement. The total of 1,038 flasks shipped in 1945

[12] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Mercury imported for consumption in the United States, 1941–45

Flasks	19,553		68,617	

[1] 567,059 pounds (7,461 flasks) were reexported in 1942 and 1,128,727 pounds (14,852 flasks) in 1943. These quantities cannot be separated by countries of origin.

represented only 1 percent of general imports of mercury in the same year. Sweden received 600 flasks in 1945 (compared with none in 1944), and no other country received more than 10 percent as much. The larger quantities shipped in 1945 (comparison with 1944 in parentheses) went to the countries discussed below. Brazil was the destination of 62 (227) flasks, Iran 51 (6), Venezuela 33 (21), Colombia 29 (28), Canada 26 (25), and no other country as much as 25 flasks. Altogether 66 countries received mercury exported from the United States in 1945. The distribution of exports by continents was as follows: North and Central America (including the West Indies), 98 (109) flasks; South America, 138 (295) flasks; Europe (including U. S. S. R.), 675 (105) flasks; Asia, 86 (79) flasks; Africa, 40 (46) flasks; and Oceania, 1 (116) flask.

Mercury exported from the United States, 1941–45

Year	Pounds	Flasks of 76 pounds	Value	Year	Pounds	Flasks of 76 pounds	Value
1941	196,837	2,590	$470,903	1944	57,007	750	$123,481
1942	26,252	345	76,448	1945	78,852	1,038	121,615
1943	29,236	385	88,842				

Reexports of mercury rose sharply in 1945, particularly because of Sweden's requirements for metal. In addition to the previously mentioned exports of 600 flasks to Sweden in 1945, 1,211 flasks of mercury that were imported into the United States in an earlier period were reexported to that country in unchanged form. Brazil was the destination of 172 flasks of reexported mercury, Canada and Belgium-Luxembourg were shipped 75 flasks each, and Argentina was sent 73 flasks. No other country received more than 20 flasks. Reexports totaled 1,693 flasks compared with 126 flasks in 1944.

Exports of mercury salts do not represent very significant quantities of equivalent metal. The exports of compounds in 1944 and 1945 are shown in the following table. A sharp drop in shipments of mercuric fulminate and a substantial increase in those of mercuric oxide in 1945 will be noted from examination of the table, which also shows that miscellaneous mercury compounds rose notably in 1945.

Mercury salts exported from the United States, 1944–45, in pounds

	1944	1945		1944	1945
Mercurous chloride (calomel)	21,351	23,901	Mercuric nitrate	446	35,746
Mercuric chloride (corrosive sublimate)	40,816	33,104	Mercuric sulfate	65	
Mercuric fulminate	26,190	506	Mercuric sulfide	222	
Mercuric oxide (red and yellow)	13,054	26,451	Other compounds	10,327	

WORLD PRODUCTION

Italy surpassed Spain in production of mercury in World War II until American forces arrived. The output of over 94,000 flasks in Italy in 1941 was an all-time record for all countries. Spain's output of 86,473 flasks in the same year was an all-time high record for that country. Each of these countries produced about 40,000 flasks in 1945. Italy's output was on the upgrade after the disintegration of

World production of mercury, 1938–45, by countries, in flasks
