FOREWORD

The appearance of MINERALS YEARBOOK each year invariably marks a milestone of achievement. The record of our minerals industry becomes part of history.

The Bureau of Mines has always considered that the publication of this factual document constitutes one of its most important assignments, and with the passing of the years the position of the YEARBOOK has become more important not only to industry but to the Nation. Many future decisions will be based upon data available in these pages, and the editors are ever striving to make the YEARBOOK a more authoritative and a more useful tool.

The 1948 edition marks a turning point in the publication history of this document. The importance of foreign minerals to our domestic economy in both peace and war has been recognized; consequently, the YEARBOOKS of the future must be expanded to meet new factual requirements. There is also increased need for presentation of minerals data on a domestic regional and State basis; future issues of MINERALS YEARBOOK will take this into account.

The Bureau of Mines trusts that the 1948 issue will at least partially satisfy these many requirements and that industry and the public will find the presentation both interesting and authoritative. The editors deeply appreciate the assistance rendered to them by the many industrial concerns and State agencies that have made possible this contribution to the work of the Bureau of Mines.

JAMES BOYD, *Director*.

INTRODUCTION

Among the principal objectives of the Bureau of Mines is publication of Minerals Yearbook within the year following the year of review. Minerals Yearbook, 1948, represents an 8-month step-up in the publication schedule. Further progress is expected to result in issue of Minerals Yearbook, 1949, before the end of 1950.

This 1948 edition of Minerals Yearbook culminates a series of nine volumes prepared under the direction of Elmer W. Pehrson, whose services are now devoted to other Bureau of Mines problems. Among the improvements in Minerals Yearbook during Mr. Pehrson's tenure, more data on consumption were added, strategic materials were covered more fully, estimates were developed for figures not available, State tables were made current with the rest of the volume, charts were clarified, the typography was improved, and uniformity of presentation was achieved.

The 1948 volume was checked for statistical precision and consistency by John Hozik, statistical editor, assisted principally by K. Joyce D'Amico and, later in the program, by Vane N. L. Glendening. Wording of the manuscript was enhanced by the editing of Mabel E. Winslow, of the Office of Mineral Reports, who also applied type specifications and prepared the comprehensive index. To the more than 100 charts graphically indicating mineral-industry trends, 17 new charts were added. Most of these were drafted by Adelaide B. Palmer, of the Minerals Yearbook Section, and others were prepared under the supervision of Louis F. Perry, Region VIII, Pittsburgh, Pa.

Arrangements for printing Minerals Yearbook, 1948, were under the able guidance of John H. Ady, Chief of Publications of the Department of the Interior and liaison officer between the Department and the Government Printing Office.

Completion of questionnaires by the mineral industry is the valued source of most of the facts comprising this volume. Other information is obtained from business magazines, trade associations, scientific journals, and Government agencies. In particular, data on foreign trade and foreign production are received from the United States Department of Commerce and the United States Department of State, respectively. The following officials cooperated with the Bureau of Mines in compiling production data for their respective States:

Alabama: Walter B. Jones, State geologist, University.
Alaska: B. D. Stewart, commissioner of mines, Department of Mines, Juneau.
California: Olaf P. Jenkins, chief, and Charles V. Averill, supervising mining engineer, California Division of Mines, San Francisco 11.
Florida: Herman Gunter, director, Florida Geological Survey, Tallahassee.
Georgia: Garland Peyton, director, Department of Mines, Mining and Geology, Atlanta.
Illinois: M. M. Leighton, chief, and Walter H. Voskuil, mineral economist, State Geological Survey Division, Urbana.
Iowa: H. Garland Hershey, State geologist, Iowa City.
Kansas: Raymond C. Moore, research director and State geologist, and John C. Frye, executive director, State Geological Survey of Kansas, Lawrence.
Maryland: Joseph T. Singewald, Jr., director, Department of Geology, Mines and Water Resources, Baltimore 18.

Michigan: Gerald Eddy, State geologist, Lansing.
Missouri: Edward L. Clark, State geologist, Rolla.
New Hampshire: T. R. Meyers, geologist, State Planning and Development Commission, Durham.
New Jersey: Meredith E. Johnson, State geologist, Trenton.
New York: John G. Broughton, State geologist, Albany.
North Carolina: Jasper L. Stuckey, State geologist, Raleigh.
Oklahoma: Robert H. Dott, director, Oklahoma Geological Survey, Norman.
South Dakota: E. P. Rothrock, State geologist, Vermillion.
Texas: John T. Lonsdale, director, Bureau of Economic Geology, University of Texas, Austin.
Utah: Arthur L. Crawford, director, Utah Geological and Mineralogical Survey, Salt Lake City.
Virginia: William M. McGill, State geologist, and Linwood H. Warwick, office administrator, Virginia Geological Survey, Charlottesville.
Washington: Sheldon L. Glover, supervisor, Division of Mines and Geology, Olympia.
West Virginia: Paul H. Price, State geologist, Morgantown.
Wisconsin: E. F. Bean, State geologist, Madison 6.

Bureau of Mines statisticians and researchers who rendered substantial assistance to the authors of this volume include the following: In Washington, D. C.—Hope Anderson, Ivan F. Avery, Dorothy M. Burch, Leon W. Geyer, Marjorie Kahn, Naomi W. Kearney, James G. Kirby, Lena M. Lunsford, Ann C. Mahoney, Annie L. Marks, Edith D. McKinney, Lena Mohme, Robert C. Morris, Virginia M. Oliver, Elizabeth Parker, Carribel Rockwell, Emma M. Seeley, and Virginia E. Wrenn. In Juneau, Alaska—Opal Y. Sharman. In Los Angeles, Calif.—Edward T. Knudsen, Adele B. Esser, and Harry L. Scarborough. In Denver, Colo.—Helen G. Post and Florence H. Scott. In Salt Lake City, Utah—Alice K. Feltch, Virginia C. Halverson, and LaRu T. Shepherd.

CONTENTS

PART I. GENERAL REVIEWS

Review of the Mineral Industries in 1948

By ALLAN F. MATTHEWS

MINES and smelters in the United States had a record output in 1948 valued at $15,670,000,000. The dollar value was 26 per cent larger and the physical volume 4 percent larger than in the previous peak year 1947. This output was matched by a record consumption of petroleum, natural gas, sulfur, fertilizer, and many building materials, but not of coal and metals. Mineral prices in 1948 averaged double those of 1940, but the inflation was generally appreciably less than for farm products. Imports of minerals by the United States increased more than one-half, and exports declined. The mineral industry operated in 1948 with the best safety record to date. World production of tin, chromite, and bauxite gained more than one-fourth over 1947 outputs.

PRODUCTION

Value of Production.—The United States mined and processed in 1948 mineral products worth 15.7 billion dollars, an all-time high and one-fourth greater than the previous record in 1947. Over two-thirds of the gain was contributed by a 29-percent expansion in the value of fuels output. Production of metals and nonmetallic minerals (other than fuels) increased 21 and 16 percent, respectively. Of these three major mineral groups in 1948, fuels were valued at 10.3 billion dollars (66 percent of the total), other nonmetallics at 1.9 billion dollars (12 percent), and metals at 3.5 billion dollars (22 percent).

While the value of mineral output was gaining 26 percent in 1948, the value of agricultural products increased 2 percent, all products combined 11 percent, and national income 12 percent. The basis of this comparison are Bureau of Agricultural Economics reports on cash receipts from farm marketings (30,545 million dollars in 1948 and 30,014 million dollars in 1947, excluding Government payments) and Bureau of Foreign and Domestic Commerce reports on gross national product (262.4 billion dollars in 1948 and 235.7 billion dollars in 1947) and national income (226.2 billion dollars in 1948 and 201.7 billion dollars in 1947).

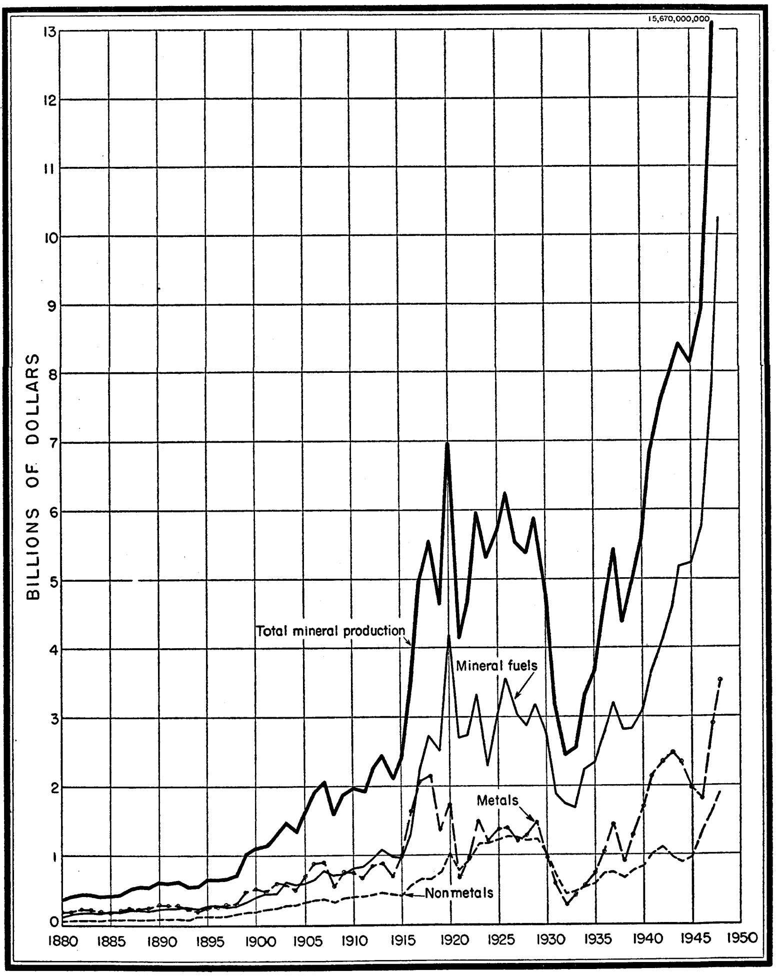

FIGURE 1.—Trends in value of mineral production in the United States, 1880–1948.

Volume of Production.—The physical volume of production in 1948 compared with 1947 increased 4 percent for minerals and 3 percent for manufactures but decreased nearly 1 percent for agricultural products, according to the Federal Reserve Board. The Board's index of mineral production (1935–39=100) reached a record annual high of 155 in 1948 and a record monthly high of 162 (adjusted for seasonal variation) in May.

Mineral fuels, as a group, were produced in 1948 in quantities 5 percent greater than in 1947. Petroleum and natural gas established new records by advancing 9 and 12 percent, respectively, in a volume of output. Mining bituminous coal and lignite, on the other hand, declined 6 percent because of work stoppages in March and April 1948 and declines in domestic and export demand in the latter half of the year. Anthracite production, influenced by abnormally mild weather in the Northeastern States in November and December 1948, was little changed from 1947.

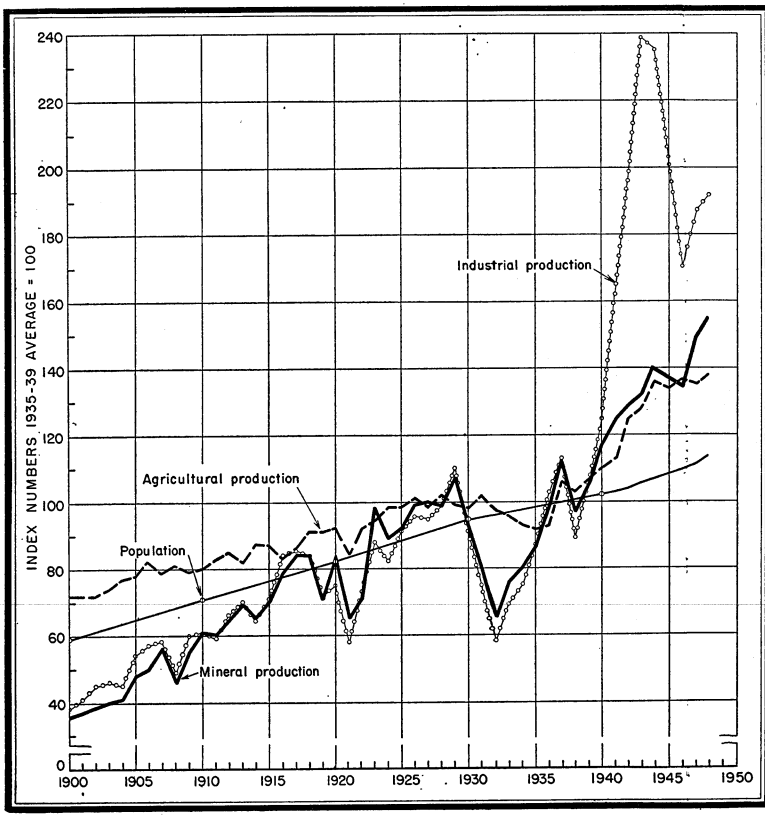

FIGURE 2.—Physical volume of mineral production compared with agricultural and industrial production (manufactures and minerals) and population, 1900–48. Sources: Federal Reserve Board, U. S. Department of Agriculture, and Bureau of the Census.

The metals group gained 3 percent in 1948, partly because steel operations were the third greatest in history. The tonnage yields of iron ore, pig iron, and ferro-alloys were up 8, 3, and 6 percent, respectively. A record was established in output of stainless steels. Among the ferro-alloy-metal ores, there was no appreciable improvement in domestic manganese and chromium supplies, although mines shipped a third more tungsten and molybdenum. Copper was in strong demand during 1948, but a strike of mine-locomotive engineers in the Nation's largest mine resulted in a 2-percent decline in copper output. Eleven percent less lead was refined from domestic ores, but a 5-percent increase in zinc materialized. Gold mining slumped 6 percent in 1948 because of rising production costs of the price-pegged metal, whereas silver mining gained 2 percent in response to the second full year of a higher Treasury purchase price. Output of bauxite and aluminum reached peacetime records 21 and 9 percent, respectively, above those of 1947. Shipments of magnesium metal in 1948 recovered from the previous year's low but remained relatively small because of heavy stocks of war scrap and limited consumer acquaintance with its advantageous properties. Mercury recovery in 1948 was 38 percent lower than in 1947 and by December was at a rate lower than for any year in the preceding century. Unabated demand for white pigments, on the other hand, resulted in ilmenite (titanium) shipments 14 percent larger than ever before.

Nonmetallic minerals (other than fuels) showed a composite gain in 1948 of 8 percent, greater than for any other major group. The insistent demand for building materials pushed the output of cement, sand and gravel, stone, and gypsum to all-time highs. Production records were also made in mining chemical raw materials such as sulfur, lime, salt, and potash, although 4-percent declines were noted for phosphate rock and barite. Fluorspar and pyrites rates were little changed. Demand from ceramics plants influenced more active mining of clay, a steadying of feldspar quarrying, and smaller recovery of boron.

Number of Firms.—According to the Department of Commerce, 35,500 mining firms were active in the United States in the fall of 1948. Of these, 48 percent were petroleum and gas producers, 40 percent metal and coal producers, and 12 percent nonmetallics producers. During 1948, 4,800 mining firms discontinued business, but 5,900 new firms were organized.[1]

Mining and related manufacturing firms in the United States on Sept. 30, 1944–48

[U. S. Department of Commerce]

Year	Mining firms				Mineral manufacturing firms			
	Metal and coal mining	Petroleum and natural gas	Nonmetallic mining	Total mining	Metal smelting and refining	Fabricated metal products	Products of petroleum and coal	Stone, clay, and glass products
1944	11, 900	15, 200	3, 900	31, 000	4, 500	12, 400	1, 200	7. 200
1945	11, 700	15, 900	3, 700	31, 300	5, 000	13, 700	1, 300	7, 900
1946	12, 200	16, 500	4, 200	32, 900	6, 000	16, 300	1, 400	12, 600
1947	13, 000	16, 800	4, 400	34, 200	6, 200	17, 900	1, 400	13, 100
1948	14, 200	16, 900	4, 400	35, 500	6, 200	18, 000	1, 400	12, 000

National Income.—Of the national income of the United States, 2.2 percent originated at mines in 1948 compared with 2.0 in 1947, according to the United States Department of Commerce. To the national income in 1948, food and raw-materials producers contributed 27 billion dollars—81.3 percent from farms, 17.9 percent from mines, 0.6 percent from fisheries, and 0.2 percent from forests. Of the

[1] Churchill, Betty C., Revised Estimates of the Business Population, 1929–48: Survey of Current Business, vol. 29, No. 6, June 1949, pp. 19–24.

5-billion-dollar mine income, 47 percent was from coal mining, 33 percent from oil and gas extraction, 11 percent from metal mining, and 9 percent from nonmetallic minerals.

National income is defined as the aggregate earnings of labor and property that arise from the current production of goods and services by the Nation's economy. Its five principal components, with the value of each for the mining industry in 1948, in millions of dollars, are as follows: Wages and salaries, 3,344; supplements to wages and salaries (employer contributions for social insurance and private pensions funds, pay of military reserve, etc.), 191; income of corporate and unincorporated enterprises before taxes, 1,438; inventory adjustment, —86; net interest, 16; total, 4,903.

National income originating in mining and related manufacturing industries in the United States, 1944–48, in millions of dollars

[U. S. Department of Commerce]

Industry	1944	1945	1946	1947	1948
Bituminous coal and lignite	1, 271	1, 204	1, 248	1, 718	1, 976

Products of petroleum and coal	1, 360	1, 326	1, 684	2, 253	3, 228
Stone, clay, and glass products	1, 137	1, 147	1, 562	1, 910	2, 174

[1] Including ordnance.

Equipment and Materials.—Expenditures on new plant and equipment by the mining industry in the United States totaled $800,000,000 in 1948 compared with $690,000,000 in 1947, the United States Department of Commerce reports. In both years the outlay constituted 4 percent of the total spent on expansion and replacement by all domestic industries.

In underground bituminous-coal and lignite mines, the tonnage cut by machines first reached 25 percent in 1900, 50 percent in 1913, 75 percent in 1927, and 91 percent in 1944, and it was 91 percent in 1948. In these underground soft-coal mines, the quantity mechanically loaded first exceeded 10 percent in 1930, 25 percent in 1938, and 50 percent in 1944, and it established a record of 64 percent in 1948. Bituminous-coal and lignite mines purchased 723 mobile loaders, 17 scrapers, 1,025 mechanical-loading conveyors, and 230 "mother" haulage conveyors in 1948, according to the Bureau of Mines.

Industrial explosives sold for consumption in the United States in 1948 reached a new high of 725,227,173 pounds compared with 651,390,937 pounds in 1947 (revised to include liquid-oxygen explosive). Of the 1948 total, 126,282,153 pounds were permissible high explosives, 550,085,616 pounds were high explosives other than permissible, 33,239,700 pounds were black blasting powder, and 16,561,539 pounds were liquid-oxygen explosives. Coal mining used 46 percent of these explosives, construction (railway and other) 18 percent, nonmetal mining (including quarrying) 17 percent, metal mining 16 percent, and other activities 3 percent.

Productivity.—Production of bituminous coal and lignite in 1948 for the third successive year exceeded 6 net tons per man-day, although Bureau of Mines data indicate a somewhat lower productivity in 1948 (final figures) than in 1946–47. The rate of output of anthracite in 1948—2.8 tons per man-day—was higher than in any year before 1939 but lower than the 1941 record of 3 tons. Anthracite productivity is only half that for soft coal because anthracite seams are steeply pitching and thus less adaptable to mechanical cutting and loading. About 1.47 gross tons of usable iron ore per man-hour were produced in 1948, according to preliminary Bureau of Mines figures; this represents greater efficiency than in any year since 1941.

TRANSPORTATION

Railroads.—More than half of all rail freight in the United States is mineral. Class I railroads in 1948 loaded 1,508 million short tons of revenue freight, of which 430 were bituminous coal, 48 anthracite, 23 coke, and 344 were other products of mines (including petroleum). These compare with 1,538, 446, 49, 23, and 330, respectively, in 1947, according to the Interstate Commerce Commission.

Pipe Lines.—Interstate and export movements of natural gas (including gas stored or lost in transmission) in 1947 were 1,402 billion cubic feet, over one-third of the total marketed production of the United States. Natural-gas pipe lines now exceed railroads in milage. Petroleum refineries received a total (intrastate and interstate) of 1,475 million barrels of crude by pipe line in 1948 compared with 1,363 million barrels in 1947.

Shipments of various mineral products in the United States, by method of transportation, 1947–48, in thousands of short tons

Mineral product	1947				1948			
	Railroad	Boat	Truck	Total	Railroad	Boat	Truck	Total
Cement	28, 898	713	5, 637	35, 248	31, 243	673	6, 493	38, 409
Coal:								
Bituminous	527, 282	29, 803	55, 859	612, 944	498, 194	26, 735	58, 260	583, 189

[1] Including packaged fuel.
[2] Transportation by truck included with railroads.
[3] In addition, 202, 949 thousand tons in 1947 and 219,646 thousand tons in 1948 were transported by pipe line.
[4] In addition, method of transportation not specified for following, in thousands of tons: 1947—10,237; 1948—10,308.
[5] In addition, method of transportation not specified for following, in thousands of tons: 1947—11,620; 1948—9,762.

CONSUMPTION AND SELF-SUFFICIENCY

Record consumption of the following important minerals was achieved in 1948: Petroleum, natural gas, natural gasoline (with liquefied petroleum gases), sulfur, salt, phosphate rock, potash, lime, gypsum, cement, sand and gravel, stone, barite, ilmenite, and feldspar. Not a single metal was consumed in tonnages equal to previous highs, although use of lead was greater in 1948 than in any year except 1947.

Consumption of bituminous coal declined 5 percent in 1948 compared with 1947, but anthracite increased 4 percent. The gain by petroleum was 9 percent, natural gas 12 percent, and natural gasoline and liquefied petroleum gases 9 percent. Consumption of iron ore, manganese ore, and molybdenum was 5, 8, and 24 percent, respectively, greater in 1948. Of the base metals (primary and secondary), 3 to 4 percent more zinc and tin were used in 1948 but 3 percent less copper and lead than in 1947. Consumption of virgin aluminum was 27 percent greater in 1948 but was still below demand, particularly for building products such as roofing and siding. Apparent consumption of major chemical and fertilizer minerals increased in 1948 as follows: Sulfur, fluorspar, potash, and barite, 7 to 9 percent; phosphate rock, 4 percent; and salt, 2 percent. Sales of carbon black for domestic use dropped 7 percent, reflecting a smaller demand for rubber and a lower ratio of synthetic to natural rubber output. Cement, lime, sand and gravel, stone, and clay gained 7 to 12 percent, and calcined gypsum 25 percent.

A detailed study of consumption of slab zinc by uses, grades, and regions during World War II was published.[2]

Consumption and self-sufficiency of the United States in various mineral products in primary form in 1948

Mineral	Unit	Mine production	Consumption (primary)	Self-sufficiency (percent) [1]
Antimony	Short tons	5,970	15,455	39
Bauxite	Thousand long tons (dried equivalent).	1,457	2,725	53
Cement	Thousand barrels (376 pounds)	208,889	202,040	103
Chromite	Short tons	3,619	875,033	(2)
Coal:				
Bituminous and lignite [3]	Thousand short tons	594,000	531,161	112
Pennsylvania anthracite	do	57,140	50,200	114
Cobalt	Short tons	290	2,525	11
Copper	Thousand short tons	835	1,214	69
Diamonds, industrial	Thousand carats		[4] 10,418	
Fluorspar	Short tons	333,900	406,269	82
Graphite	do	9,949	20,770	48
Iron ore (usable)	Thousand gross tons	101,003	100,499	101
Lead	Thousand short tons	390	655	60
Manganese ore	do	131	1,538	9
Mercury	Flasks (76 pounds)	14,388	46,253	31
Mica, sheet and punch	Short tons	135	5,505	2
Molybdenum	do	13,353	12,578	106
Nickel	do	883	93,558	1
Petroleum [3]	Million barrels	2,016	2,108	96
Phosphate rock	Thousand long tons	9,388	7,700	122
Platinum group	Troy ounces	13,741	250,227	5
Potash	Thousand short tons K_2O	1,140	1,108	103
Quartz, radio-grade	Pounds		61,600	
Sulfur, native	Thousand long tons	4,869	3,720	131
Tin	Long tons	6	59,863	(2)
Tungsten	Short tons	2,003	4,427	45
Zinc	do	629,977	923,000	68

1 Ratio of production to consumption.
2 Less than 0.5 percent.
3 Preliminary figures.
4 Imports for consumption.

2 Ransome, Alfred L., Consumption of Slab Zinc in the United States by Industries, Grades, and Geographic Divisions, 1940-45, Including a Summary of Consumption Since 1900: Bureau of Mines Inf. Circ. 7450, 1948, 46 pp.

United States consumption of coal, sulfur, cement, phosphate rock, potash, and molybdenum in 1948 was more than equaled by domestic production, leaving important tonnages for export. In addition, the Nation met its needs in iron ore and nearly so in petroleum. Of crucial importance is the fact that the United States in 1948 had to import more than 90 percent of its requirements of manganese, chromium, uranium, tin, nickel, platinum, tantalum, sheet mica, industrial diamonds, asbestos, and radio-grade quartz.

STOCKS

Bituminous-coal inventories held by consumers were enlarged 33 percent and those of anthracite in the hands of producers were increased 37 percent during 1948, continuing the trends of 1947.

Industry stocks of pig iron, primary lead in all forms, and tin in concentrates or pig were 62, 16, and 19 percent larger, respectively, at the end of 1948 than at the beginning of the year. (The tin figure includes metal owned by the Reconstruction Finance Corporation.) On the other hand, producers' and fabricators' holdings of refined copper decreased 8 percent, producers' stocks of aluminum declined 15 percent, and industry stocks of slab zinc fell 21 percent.

Producers of nonmetallic minerals lowered their stocks of sulfur 4 percent and potash 24 percent in 1948, following the 1947 trend. But producers increased by 11 and 61 percent, respectively, the tonnages of portland cement and phosphate rock on hand.

PRICES

Mineral prices gained another 20 percent in 1948 and reached a level double those of 1940, according to the Bureau of Mines index of producers' realizations on 24 minerals representing all but a few percent of the total value of United States mineral production. As a group, fuels duplicated their 24-percent price rise of 1947, metals were up 15 percent, and nonmetallics (other than fuels) 9 percent.

Of the 24 major minerals, the sharpest price advances in 1948 were for natural gasoline and cycle products (44 percent), crude petroleum (34 percent), lead (24 percent), and pig iron (22 percent). Rises of 10 to 20 percent were made in the unit prices of bituminous coal, ferro-alloys, cement, phosphate rock, anthracite, zinc, and lime. The only notable price decline was for potash—5 percent.

Weighted average price index of 24 major mineral commodities, 1942–48

[1940=100]

Group	1942	1943	1944	1945	1946	1947	1948 [1]

[1] Preliminary.
[2] Includes bonus payments on copper, lead, and zinc, 1942–47.

Wholesale prices of all commodities as a group, according to the Bureau of Labor Statistics index (1926=100), rose 9 percent from 152.1 in 1947 to 165.1 in 1948 and for farm products alone 4 percent from 181.2 to 188.3. The indexes for various mineral products were as follows:

Product	1947	1948	Product	1947	1948
Anthracite	117.6	130.3	Fertilizer materials	105.6	116.1
Bituminous coal	157.6	187.0	Iron and steel	133.7	155.2
Brick and tile	140.0	156.3	Nonferrous metals	140.3	157.5
Cement	115.7	130.5	Paint and materials	162.6	159.8
Chemicals	118.7	126.1	Petroleum products	90.2	122.1
Coke	166.6	207.1	Structural steel	134.5	163.7

EMPLOYMENT, WAGES, AND SAFETY

Employees in the mining industry in 1948 averaged 985,000, 5 percent more than in 1947 and 13 percent more than in 1946, according to the Bureau of Labor Statistics.

Earnings per full-time employee in the mining industry in 1948 averaged $3,395, 9 percent greater than in 1947 and 25 percent greater than in 1946.

Number of employees and average earnings in mining and related manufacturing industries, 1946–48

[U. S. Bureau of Labor Statistics]

Industry	Number of full-time equivalent employees (thousands)			Average annual earnings per full-time employee

[1] Including ordnance.

The average number of days worked by the mining and metallurgical industries (exclusive of petroleum and steelmaking) was 250 (preliminary figure) in 1948 compared with 260 in 1947 and 240 in 1946, according to the Bureau of Mines.

The safety record of the mineral industries in 1948 was the best in the 37 years for which statistics are available. The injury frequency rate improved from 53.3 per million man-hours in 1947 to 50.8 in 1948. The number of fatalities decreased from 1,414 in 1947 to 1,229 in 1948.

883326—50——2

FOREIGN TRADE [3]

Imports of mineral products by the United States in 1948 were a third more than exports—a reversal of the foreign trade balance in 1947 and a return to the usual situation. This resulted primarily from a decline in coal shipments abroad and from larger entries of foreign petroleum, tin, and other nonferrous metals. The principal mineral imports, in order of value in 1948, were petroleum, copper, tin, diamonds, and lead. The leading exports were coal, petroleum, and copper.

Principal mineral products imported into and exported from the United States, 1946–48

INCOME AND TAXATION

The income of all enterprises in the mining industry was 1,438 million dollars in 1948 compared with 1,102 in 1947 and 687 in 1946. These totals are before deduction of depletion charges and taxes. Federal and State taxes on corporate income in the mining industry ranged between 27 and 34 percent in 1942–48 and were 33 percent in 1948.

Income and corporation taxes of mining and related manufacturing enterprises in the United States in 1948, in millions of dollars [1]

[U. S. Department of Commerce]

Industry	Corporate income				Income of unincorporated enterprises	Grand total
	Taxes (Federal and State)	Dividend payments	Undistributed	Total		
Bituminous coal and lignite	113	73	110	296	57	353
Anthracite	17	19	12	48	3	51
Petroleum and natural gas	145	128	181	454	201	655
Metals	75	96	69	240	9	249
Nonmetallic minerals	36	31	56	123	7	130

MINERAL POLICY DEVELOPMENTS

Economic Cooperation with Europe.—The European Recovery Program (Marshall Plan) was defined and implemented by passage of the Economic Cooperation Act of 1948 (title I, Public Law 472, 80th Cong.), approved April 3, 1948; the Foreign Aid Appropriation Act, 1949 (Public Law 793, 80th Cong.), approved June 28, 1948; and various bilateral treaties between the United States and each of the 16 participating European countries. The legislation established the Economic Cooperation Administration and provided it with $5,000,000,000 to promote industrial and agricultural production in the participating countries, to further the soundness of European finances, and to stimulate international trade.

Commodity procurements authorized by ECA during its first year, ended April 2, 1949, totaled 1.3 billion dollars, of which 41 percent was for food and feed, 29 percent for mineral products, 7 percent for machinery and vehicles, and 23 percent for textiles, forest products, tobacco, and chemicals. Of the 363 million dollars authorized for mineral products, 179 were for nonferrous metals, 153 for petroleum and products, 17 for iron and steel, and 14 for nonmetallic minerals. In addition, 17 million dollars were allotted to rehabilitate coal, iron, and nickel mines, 59 million to build steel mills, and 2 million for an aluminum plant.

In each participating country the person or firm receiving ECA commodities pays his respective government for them in local currency. Thus each cooperating government has a "counterpart fund" in its own currency that equals the dollar grants made to the country as ECA aid. Such funds may be used for exploration, development, plant modernization, plant expansion, or transportation. In this way facilities are being improved for producing coal and nitrate in France and for completing steel plants begun in Italy during World War II. At least 5 percent of each counterpart fund is to be spent for strategic materials exported to the United States.[4] Among the first of such shipments arranged for was graphite from Madagascar and palm oil from Indonesia.

Stock Piling.—Meeting the objectives of the National Stock Pile is expected to cost $3,217,000,000. About one-fourth of this had been either spent ($242,000,000) or obligated ($540,000,000) by the end of 1948.

The strategic and critical materials subject to stock piling are defined by the Munitions Board as "those raw or semiprocessed materials that are required for essential uses in a war emergency, and whose procurement in adequate quantities, quality or time is sufficiently uncertain for any reason to require prior provision for their supply." Such materials are classified by the Munitions Board into three groups.

Group 1–a comprises "those strategic and critical materials for which stock piling is deemed necessary to insure an adequate supply for a future emergency primarily because of a dependence on foreign sources of supply." As of September 23, 1948 (Munitions Board Circular 53), the strategic materials in group 1–a consisted of 18 agricultural materials and some 33 minerals and metals. The latter were as follows:

Antimony.
Asbestos:
  Chrysotile.
  Amosite.
Bauxite:
  Metal grade.
  Abrasive grade.
Beryl.
Bismuth.
Cadmium.
Celestite.
Chromite:
  Metallurgical grade.
  Refractory grade:
    Type A.
    Type B.
Cobalt.
Columbite.
Copper.
Corundum.
Diamonds, industrial.
Graphite:
  Amorphous lump.
  Crystalline flake:
    Crucible grade.
    Lubricant and packing grade.
Iodine.
Kyanite.
Lead.
Manganese ore:
  Battery grade.
  Metallurgical grade.
Mercury.
Mica:
  Muscovite block, good stained and better.
  Muscovite film.
  Muscovite splittings.
  Phlogopite splittings.
Monazite.
Nickel.
Platinum-group metals:
  Iridium.
  Platinum.
Quartz crystals.
Rutile.
Talc, steatite, block.
Tantalite.
Tin.
Tungsten.
Vanadium.
Zinc.
Zirconium ores:
  Baddeleyite.
  Zircon.

[4] Falco, Tom, ECA's Strategic Materials Division: Eng. and Min. Jour., vol. 149, No. 9, September 1948, pp. 70–74.

Group 1–b is stated to include "those strategic and critical materials for which stock piling is deemed necessary to insure an adequate supply for a future emergency primarily because of the lack of the means for obtaining adequate domestic production to meet emergency needs." This definition is so inexact that it literally includes everything in group 1–a. It was meant to cover only those stock-piled semiprocessed materials whose existing processing capacity represents a rate of domestic production inadequate to meet emergency requirements. On the group 1–b list September 23, 1948, were no agricultural products and two mineral products:

Jewel bearings:
- Instrument jewels, except vee jewels.
- Sapphire and ruby vee jewels.

Jewel bearings—Continued
- Watch and time-keeping device jewels.
- Sapphire and ruby.

Group 2 materials, although strategic, "are not recommended for stock-pile purchase but offer supply problems which will require either further study before a final determination can be made on stock piling or other action to assure adequate supplies in a future emergency." Materials relegated to group 2 as of September 23, 1948, include 15 agricultural products and 24 mineral products. The latter were:

Aluminum.
Asbestos, Canadian chrysotile.
Barite.
Chalk, English.
Chromite, chemical grade.
Cryolite, natural.
Diamond dies.
Emery.
Fluorspar:
- Acid grade.
- Metallurgical grade.

Glass, optical.
Graphite, crystalline fines.
Iron ore.
Magnesium.
Mica:
- Muscovite block, stained and lower.
- Phlogopite block.

Molybdenum.
Petroleum and petroleum products.
Platinum-group metals:
- Osmium.
- Palladium.
- Rhodium.
- Ruthenium.

Radium.
Scrap, iron and steel.
Selenium.
Talc, steatite, ground.

Mining Subsidies.—Under the Premium Price Plan in effect February 1, 1942, to June 30, 1947, the Federal Government subsidized overquota mine production of copper, lead, and zinc. A report contains an organization summary, chronology of activities, and fifteen statistical tables on metal recoveries, premiums paid, and costs.[5]

TECHNOLOGY

A review of 37 ore deposits developed in North America in the past decade was published in 1948.[6] Papers were written on the thickness of coal seams,[7] the making of blast holes by means of a flame,[8] and progress in heavy-medium separation.[9] Reports were made on research in fuel production and utilization,[10] including synthetic

liquid fuels.[11] The Bureau of Mines published a series of 18 reports containing core-drill data from a $2,250,000 wartime investigation of Arkansas bauxite deposits.[12] An issue of Mining and Metallurgy was devoted largely to the operations of the United States Smelting, Refining & Mining Co.[13] German innovations in metallurgy were described.[14]

In the field of health and safety in the mineral industry, the Bureau of Mines published a bibliography,[15] lists of equipment rated as permissible in coal mining,[16] and reports of research in recent years.[17]

WORLD REVIEW

World production of petroleum, chromite, cement, native sulfur, and phosphate rock were at record heights in 1948. The largest gains in 1948 over 1947 were made by tin concentrates (33 percent) and chromite and bauxite (each 27 percent). World output of iron ore, petroleum, cement, native sulfur, salt, and fluorspar increased 10 to 20 percent. The only drastic decline was in mercury recovery (27 percent).

North America.—A number of descriptions of the Quebec-Labrador iron-ore occurrences [18] were published in 1948. Plans were under way for developing a deposit near Allard Lake, Quebec, containing 125 million tons of ore averaging 30 to 40 percent titanium dioxide.[19] Known reserves of high-grade bauxite (50 percent Al_2O_3 and 2 percent SiO_2) on Caribbean islands total 350 million tons, 90 percent of which is in Jamaica and the remainder in Haiti and the Dominican Republic.[20] The status of mine taxation in Mexico was outlined.[21]

Sulfur, native (thousand long tons)	4,800	4,441	93	5,300	4,869	92
Talc and pyrophyllite [3]	980	468	48	1,070	471	44

1 Partly estimated, particularly as regards U. S. S. R.
2 Outputs designated as smelter are from both imported and domestic ores.
3 Exclusive of U. S. S. R.
4 Less than 0.5 percent.
5 1 ton in 1947 and 6 tons in 1948.
6 60 percent WO_3 basis.
7 Bureau of Mines not at liberty to publish figures.

Europe.—A series of articles on the status of mining in Austria, Belgium, Denmark, France, Germany, Italy, Luxembourg, Netherlands, and Portugal and in their overseas territories appeared in Engineering and Mining Journal (October–December 1948). Various minerals in France,[22] coal in Spitzbergen,[23] and mercury in Spain [24]

22 Wright, Charles Will, French Mineral Position: Min. and Met., vol. 29, No. 501, September 1948, pp. 497–499.
23 Ljone, Odmund, Spitzbergen—Norway's Arctic Coal Treasure: Min. and Met., vol. 29, No. 498, Sect. 1, June 1948, pp. 330–332.
24 Bennett, Evan, Almaden—World's Greatest Mercury Mine: Min. and Met., vol. 29, No. 493, January 1948, pp. 6–8.

were described. The Bureau of Mines reviewed coal and coke practices in Germany.[25]

Asia.—An exhaustive study of the mineral resources of China was published.[26] Supplements to Bureau of Mines Mineral Trade Notes in 1948 included reports on Asiatic bauxite, Chinese aluminum and magnesium, and Japanese manganese (metallurgy), cement, copper, mercury, gold, and silver. Other notable papers described coke [27] and sponge iron [28] in Japan, rehabilitation of Philippine mines,[29] Middle East petroleum (including forecasts for 1951),[30] and undeveloped Turkish reserves of coal, petroleum, chromite, manganese, and nonferrous metals.[31]

Mine production index numbers for various countries, 1943 and 1947–48

[United Nations index numbers, 1937=100]

Country	1943	1947	1948	Country	1943	1947	1948
Algeria	27	130	(1)	Morocco, French	51	171	192
Belgium [2]	(1)	95	105	Netherlands (coal only)	92	71	77
Canada	113	107	122	Southern Rhodesia	92	74	(1)
Chile	120	118	124	Sweden [3]	126	145	150

Statistical Summary of Mineral Production

(General United States Summary and Detailed Production by States)

By JOHN HOZIK AND K. JOYCE D'AMICO

THIS statistical summary corresponds in form and content with those presented in preceding editions of Minerals Yearbook. Fuel statistics for 1948, except for Pennsylvania anthracite, are preliminary.

STATISTICAL PROCEDURE

Coverage.—Statistics used in this chapter to derive total mineral production of the United States and of individual States represent primary products only; that is, they exclude products from scrap. Insofar as practicable, the figures pertain to production exclusively from domestic mines. Geographically, the figures represent the 48 States, the District of Columbia, the Philippine Islands (through 1945 only), and the Territories of Alaska, Hawaii, and Puerto Rico. Data for United States possessions, such as the Canal Zone, Guam, and Virgin Islands, are not compiled. The Bureau of Mines does not canvass producers of gem stones, carbon dioxide, and mineral waters, but estimates for gem stones and mineral waters are included in the United States total.

Units of Measurements.—In expressing quantities of minerals, the Bureau of Mines has adopted the weight units (or in some instances, the volume or piece units) commonly employed by each individual industry. The unit of value is the United States dollar. No adjustment is made for fluctuations in the purchasing power of the dollar.

Stage of Production Measured.—Measuring the total mineral production of the United States and individual States at the crude-ore stage (rather than at the refined stage) would provide statistics most indicative of mine output. However, totals have not been derived strictly for the crude stage alone, largely because of the impracticability of obtaining meaningful values for ores of gold, silver, copper, lead, and zinc. Instead, the State totals in this chapter represent each mineral at the earliest stage of production for which a value is reported. The United States totals are on the same basis, except that they include iron, ferro-alloy metals, and aluminum valued at the smelter rather than at the mine.

Relationship of United States Totals to State Totals.—The total of United States mineral production differs from the sum of those of the 48 States, the District of Columbia, and Alaska in that the United States total includes: (1) Pig iron valued at the smelter instead of iron ore at the mine; (2) aluminum and ferro-alloy metals valued at the smelter and regardless of whether from foreign or domestic ores; (3) gold, silver, lead, copper, and zinc mint, refinery, or smelter production rather than mine output; (4) natural gas valued at points of consumption instead of at wells;[1] (5) certain lead and zinc pigments—sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide—and certain smelter and refinery byproducts, such as arsenic, bismuth, cadmium, minor metals, and sulfuric acid, whose States of origin are not reported; (6) estimates for gem stones and mineral waters, for which no canvasses are conducted; and (7) data for Hawaii, the Philippine Islands (through 1945), and Puerto Rico.

Elimination of Duplication.—In numerous instances in the tables of this chapter, production is shown both in the crude and in the refined stages, but in virtually every instance duplication is eliminated by including in the totals the value of each mineral at one stage only. For example, the values of coke made from coal, oil asphalt from petroleum, and lead and zinc pigments from metal are excluded from the totals. Likewise (but in these instances discounting the crude material rather than the refined product), the values of clay used in making heavy clay products or cement, and of limestone used in making lime or cement, are excluded from the totals.

Planned Revisions.—The general United States totals are to be improved in the near future by revisions that will eliminate virtually all of the inadequacies indicated in the three preceding paragraphs.

GENERAL TABLES

The following tables present salient production data of the mineral industry of the United States as a whole.

Value of mineral products of the United States, 1880–1948 [1]

Year	Metallic	Nonmetallic			Grand total
		Fuels [2]	Other	Total	
1880 [1]	$190,881,000	$120,241,000	$56,341,000	$176,582,000	$367,463,000
1881	192,663,000	149,798,000	60,659,000	210,457,000	403,120,000
1882	219,070,000	170,479,000	63,557,000	234,036,000	453,106,000
1883	201,131,000	185,760,000	61,170,000	246,930,000	448,061,000
1884	182,784,000	165,825,000	58,431,000	224,256,000	407,040,000

See footnotes at end of table.

[1] Both the United States total and the State totals include natural gas valued at points of consumption for years before 1943.

Value of mineral products of the United States, 1880–1948 [1]—Continued

Year	Metallic	Nonmetallic			Grand total
		Fuels [2]	Other	Total	
1885	$174,718,000	$183,075,000	$61,758,000	$244,833,000	$419,551,000
1886	204,795,000	184,608,000	66,782,000	251,390,000	456,185,000
1887	241,183,000	217,251,000	77,199,000	294,450,000	535,633,000

[1] Figures for earlier years not available.
[2] Coal, natural gas, natural gasoline and allied products, petroleum.
[3] Subject to revision.

Mineral products of the United States, 1946–48 [1]

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
METALLIC						
Aluminum .... short tons (2,000 pounds)	409,630	$115,812,000	571,750	$161,626,000	623,456	$180,755,000
Antimonial lead .... do	[2] 50,480	(2)	[2] 86,075	(2)	[2] 100,764	(2)
Antimony:						
Metal .... do	(3)	(3)	(3)	(3)	(3)	(3)
Ore and concentrates .... do	13,962	797,715	20,020	3,272,079	16,239	4,378,398
Bauxite .... long tons (dried equivalent)	1,104,054	6,892,864	1,202,055	6,884,666	1,457,148	8,696,708
Beryllium concentrates .... short tons	100	17,787	145	25,214	99	26,600
Cadmium:						
Metal .... pounds	6,180,265	6,094,572	7,852,907	12,358,526	7,639,113	12,679,571
In compounds .... do	270,789	267,033	500,859	788,352	192,696	319,875
Chromite .... short tons	4,107	105,041	948	(4)	3,619	(4)
Cobalt .... pounds	506,884	(4)	(4)	(4)	(4)	(4)
Copper (smelter output from domestic ores) .... short tons	599,656	[5] 172,701,000	862,872	[5] 360,680,000	842,477	[5] 365,635,000
Ferro-alloys .... do	1,551,624	176,273,655	1,841,682	220,021,974	1,952,246	273,450,420
Gold (mint output) [6] .... troy ounces	1,462,354	51,182,390	2,165,318	75,786,130	2,025,480	70,891,800
Indium .... do	9,667	16,618	13,908	23,901	12,202	16,741
Iron:						
Ore [7] .... long tons (2,240 pounds)	70,090,410	[7] 215,006,427	93,314,635	[7] 320,864,981	100,821,714	[7] 394,460,751
Pig .... short tons	45,075,890	1,103,928,986	58,367,510	1,770,658,663	60,051,350	2,232,121,837
Lead (refinery output from domestic ores) .... do	293,309	[5] 49,276,000	381,109	[5] 108,997,000	339,413	[5] 121,510,000
Magnesium (new ingot) .... do	8,916	3,654,164	5,264	(4)	8,489	3,480,496
Manganese ore (35 percent or more Mn) .... do	143,635	4,811,068	131,627	4,200,947	131,100	4,390,199
Manganiferous ore (5 to 35 percent Mn) .... do	1,171,183	3,126,711	1,174,355	3,447,149	1,340,565	(4)
Mercury .... flasks (76 pounds net)	25,348	2,490,188	23,244	1,946,453	14,388	1,100,538
Molybdenum .... pounds	16,786,600	11,529,000	22,189,800	15,178,000	29,669,000	20,418,000
Nickel .... short tons	352	(4)	646	(4)	883	(4)
Ores (crude), old tailings, etc.:						
Copper .... do	61,741,000	(8)	87,633,000	(8)	84,120,000	(8)
Dry and siliceous (gold and silver) .... do	2,995,000	(8)	4,235,000	(8)	4,202,000	(8)
Lead .... do	5,651,000	(8)	6,165,000	(8)	5,866,000	(8)
Lead-copper .... do	144,000	(8)	183,000	(8)	208,000	(8)
Zinc .... do	14,895,000	(8)	10,045,000	(8)	6,798,000	(8)
Zinc-copper .... do	654,000	(8)	350,000	(8)	710,000	(8)
Zinc-lead .... do	12,730,000	(8)	12,530,000	(8)	10,668,000	(8)
Zinc-lead-copper .... do	12,000	(8)	11,000	(8)	152,000	(8)
Platinum metals (refined) (value at New York City) .... troy ounces	30,237	1,802,000	17,442	990,000	17,067	1,239,000
Radium .... milligrams	200	3,700	16,400	303,400	3,510	63,180
Selenium .... pounds	405,226	(4)	489,415	(4)	570,718	(4)
Silver (mint output) [9] .... troy ounces	21,103,269	19,099,524	38,587,069	34,923,246	39,228,468	35,503,744
Tantalum concentrates .... pounds	3,475	8,793	3,259	8,677	500	(4)
Tellurium .... do	38,523	(4)	71,300	(4)	78,788	(4)
Tin (metal content of ore) .... short tons	--------	--------	1	2,200	6	12,780

Titanium concentrates:						
Ilmenite ... do	282,708	4,878,917	336,061	5,029,490	381,508	5,793,973
Rutile ... do	7,514	996,989	5,157	533,548	9,907	647,334
Tungsten concentrates ... short tons (60 percent WO_3 basis)	5,193	6,283,413	3,094	4,349,851	4,005	6,312,161
Vanadium ... pounds	1,272,148	710,582	2,117,962	1,285,026	(4)	(4)
Zinc (smelter output from domestic ores) ... short tons	459,205	[5] 81,738,000	510,058	[5] 109,152,000	537,966	[5] 143,099,000
Other metallic [10]		1,851,846		2,636,551		3,235,659
Total value of metallic products (approximate)		1,825,000,000		2,909,000,000		3,510,000,000
NONMETALLIC						
Arsenious oxide (white arsenic) ... short tons	12,039	655,077	18,188	1,533,756	15,516	1,267,603
Asbestos ... do	14,075	504,764	24,035	918,558	37,092	1,806,261
Asphalt:						
Native ... do	845,898	4,262,886	1,071,922	5,503,048	1,136,126	5,025,630
Oil (including road oil) [7] ... do	7,056,882	[7] 82,910,877	8,165,631	[7] 116,002,372	8,006,196	[7] 149,168,720
Barite (crude) ... do	724,362	5,242,755	834,082	6,171,342	799,848	6,693,413
Boron minerals ... do	430,689	9,575,866	501,935	11,844,108	450,932	11,147,735
Bromine ... pounds	42,780,925	8,560,434	78,177,650	14,837,104	76,047,551	14,844,152
Calcium-magnesium chloride ... short tons	262,147	2,278,954	271,206	2,650,205	301,936	3,902,788
Cement ... barrels (376 pounds net)	172,100,699	296,551,514	190,419,754	361,978,374	207,679,797	453,412,362
Clay:						
Products, heavy clay (other than pottery and refractories)		[11] 178,756,000		[11] 219,004,000		[11] 268,081,000
Raw (sold or used) ... short tons	[12] 30,265,194	[12] 57,160,315	[12] 33,270,405	[12] 69,612,873	[12] 37,385,900	[12] 80,074,421
Coal:						
Bituminous [13] ... do	533,922,068	1,835,539,476	630,623,722	2,622,634,946	594,000,000	2,941,417,000
Pennsylvania anthracite ... do	60,506,873	413,417,070	57,190,009	413,019,486	57,139,948	467,051,800
Coke [7] ... do	58,497,848	[7] 486,729,382	73,445,850	[7] 776,405,520	74,861,928	[7] 928,281,854
Diatomite ... do	(14)	(14)	(14)	(14)	(14)	(14)
Emery ... do	6,188	62,099	5,798	66,927	5,405	69,408
Feldspar (crude) ... long tons	508,380	2,594,099	459,910	2,410,940	460,713	2,564,387
Flint lining for tube mills ... short tons	2,375	44,247	1,496	40,303	1,297	41,555
Fluorspar ... do	277,940	9,038,969	329,484	10,954,875	331,749	11,227,452
Fuller's earth ... do	298,752	3,702,993	329,068	4,660,614	342,081	5,273,851
Garnet for abrasive purposes ... do	7,743	570,186	8,722	614,071	8,039	587,797
Gem stones		(15)		(15)		(15)
Graphite (amorphous and crystalline) ... short tons	4,844	252,596	5,207	221,260	9,871	450,759
Grindstones and pulpstones ... do	11,677	505,324	10,696	481,787	7,954	404,767
Gypsum (crude) ... do	5,629,398	12,441,829	6,208,216	16,529,884	7,254,535	19,112,669
Helium [16] ... cubic feet	63,403,345	478,654	63,198,650	541,307	67,486,567	641,848
Iodine ... pounds	(14)	(14)	(14)	(14)	(14)	(14)
Kyanite ... short tons	(14)	(14)	(14)	(14)	(14)	(14)
Lime ... do	5,992,700	51,032,517	6,778,979	63,826,387	7,263,976	75,162,879
Lithium minerals ... do	3,065	303,892	2,441	151,113	3,191	185,952
Magnesite (crude) ... do	324,640	2,225,850	375,993	2,596,747	(14)	(14)
Magnesium compounds [17] ... short tons (MgO equivalent)	215,372	8,316,300	155,713	9,529,000	165,800	11,467,000
Marl:						
Calcareous ... short tons	213,448	248,530	176,187	235,190	114,759	145,712
Greensand ... do	5,140	424,900	8,337	432,980	7,269	392,959

See footnotes at end of table.

Mineral products of the United States, 1946–48 [1]—Continued

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
NONMETALLIC—continued						
Mica:						
Scrap ..... short tons	53,602	$1,041,423	49,797	$1,095,578	52,157	$1,091,698
Sheet ..... pounds	1,078,867	217,955	415,589	116,110	270,042	45,940
Millstones	------	14,780	------	23,189	------	17,733
Mineral pigments:						
Natural pigments and manufactured iron oxide pigments ..... short tons	115,097	10,004,150	115,367	11,167,161	111,317	10,957,422
Zinc and lead pigments [18] ..... do	[18] 225,822	[18] 32,354,517	[18] 242,230	[18] 46,508,398	[18] 218,399	[18] 49,411,004
Mineral waters	(15)	(15)	(15)	(15)	(15)	(15)
Natural gas (valued at point of consumption) ..... M cubic feet	4,030,605,000	885,878,000	[19] 4,444,693,000	[19] 1,032,200,000	[19] 4,963,853,000	[19] 1,197,550,000
Natural gasoline and allied products:						
Natural gasoline and cycle products ..... gallons	3,451,688,000	146,202,000	3,659,449,000	228,174,000	3,929,429,000	351,576,000
Liquefied petroleum gases ..... do	1,409,345,000	36,079,000	1,891,818,000	66,820,000	2,180,698,000	112,042,000
Oilstones, etc. ..... short tons	(14)	(14)	(14)	(14)	(14)	(14)
Olivine ..... do	7,649	92,868	10,838	129,094	4,766	86,230
Peat ..... do	140,707	1,006,231	136,232	868,979	129,581	929,560
Pebbles for grinding ..... do	4,652	102,043	5,860	122,883	4,026	101,583
Perlite (crude or refined) (sales) ..... do	3,022	46,103	9,265	94,309	9,868	184,306
Petroleum ..... barrels (42 gallons)	1,733,939,000	2,442,550,000	1,856,987,000	3,577,890,000	2,016,282,000	5,196,034,000
Phosphate rock ..... long tons	6,860,713	31,043,821	9,027,030	46,638,837	8,668,769	50,501,598
Potassium salts ..... short tons (K_2O equivalent)	928,374	32,175,716	1,053,266	34,716,051	1,143,339	35,998,758
Pumice ..... short tons	319,883	1,585,753	442,552	2,021,880	607,746	2,501,906
Pyrites ..... long tons	813,372	3,228,000	940,652	4,070,000	928,531	3,950,000
Quartz ..... short tons	73,179	293,852	101,317	424,525	161,861	750,667
Salt (sodium chloride) ..... do	15,132,145	44,912,586	16,053,882	52,191,688	16,403,293	54,331,782
Sand and gravel:						
Glass sand ..... do	4,848,602	9,541,405	5,321,247	11,395,245	4,542,260	10,770,845
Sand (molding, building, etc.) and gravel ..... do	249,282,000	161,845,000	282,338,000	205,474,000	314,724,000	241,727,000
Sand and sandstone (ground) ..... do	575,888	4,125,398	651,120	5,181,113	702,572	5,814,664
Slate ..... do	759,770	8,844,106	876,010	11,685,554	799,400	12,880,929
Sodium carbonate (natural) ..... do	215,625	3,427,086	293,051	5,862,178	[20] 288,769	[20] 6,623,280
Sodium sulfate (natural) ..... do	198,781	1,695,413	257,294	3,329,094	265,862	4,248,613
Stone [21] ..... do	178,852,360	234,339,486	207,554,790	289,344,482	225,535,390	328,984,571
Strontium minerals ..... do	243	3,726	------	------	------	------
Sulfur ..... long tons	4,128,212	66,100,000	4,828,103	85,200,000	4,978,912	89,600,000
Sulfuric acid (basis, 100 percent) (byproduct) [22] ..... short tons	716,216	8,226,751	725,197	9,178,402	641,445	8,584,051
Sulfur ore ..... long tons	6,344	95,531	4,303	65,124	1,700	30,220
Talc, pyrophyllite, and ground soapstone [23] ..... short tons	457,066	6,445,344	516,094	7,682,481	518,746	8,265,363
Topaz, industrial ..... do	700	10,500	2,294	45,873	200	4,000
Tripoli ..... do	28,955	549,099	34,578	751,422	26,845	705,523

Vermiculite ... do	86,390	867,973	131,385	1,338,572	138,635	1,387,233
Other nonmetallic [24]		(14)		(14)		(14)
Total value of nonmetallic products (approximate)		7,071,000,000		9,575,000,000		12,160,000,000
SUMMARY						
Total value:						
Metallic		1,825,000,000		2,909,000,000		3,510,000,000
Nonmetallic:						
Fuels		5,760,000,000		7,941,000,000		10,266,000,000
Other		1,311,000,000		1,634,000,000		1,894,000,000
Grand total approximate value of mineral products		8,896,000,000		12,484,000,000		15,670,000,000

1 In this general statement most of the figures represent shipments rather than quantity mined, and some of the figures for 1948 are subject to revision. For details see following chapters of this volume.

2 Figures represent antimonial lead produced at primary refineries from both domestic and foreign primary and secondary sources; no figures for value of antimonial lead available. Estimate of value of primary antimony and lead contents of antimonial lead from domestic sources included in total value of metallic products.

3 Largely from foreign ore; value not included in total value.

4 Value included in total value of metallic products; Bureau of Mines not at liberty to publish figure.

5 Value does not include premiums paid to miners by the Government. Total over-ceiling payments for copper, lead, and zinc amounted to approximately $77,000,000 in 1946, and $21,000,000 in 1947. In addition, exploration premiums totaling $6,213,545 were paid to miners from July 1, 1946, through Dec. 31, 1947, to encourage exploration and development of copper, lead, and zinc deposits.

6 According to Bureau of the Mint. Valued at $35 per ounce.

7 Value not included in total value.

8 Value figure not available.

9 According to Bureau of the Mint.

10 Includes value of bismuth, columbium (1948), germanium, thallium, and zircon.

11 Figures obtained through cooperation with Bureau of the Census.

12 Value of clay used in cement and heavy clay products is included here but is not included in total value of nonmetallic products.

13 Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.

14 Value included in total value of nonmetallic products. Bureau of Mines not at liberty to publish figure.

15 No canvass. Estimate of value included in total value of nonmetallic products.

16 Figures cover fiscal year ended June 30 of year stated.

17 Includes compounds from raw sea water, well brines, sea-water bitterns, brucite, and serpentine only. Data for 1946 are not quite comparable with 1947–48 in that the former are on a gross-weight basis and include some compounds made from a combination of sea water and dolomite, and of well brines and dolomite.

18 Includes sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide except that in 1946–48 data for sublimed blue and white lead are excluded from this grouping; however, the value is included in the total value of nonmetallic products.

19 Estimate.

20 Excludes production from Wyoming; value is included in total value of nonmetallic products.

21 Excludes limestone for cement and lime.

22 From copper, lead, and zinc smelters and zinc roasters.

23 Figures for soapstone used as dimension stone included in figures for stone.

24 Includes andalusite (1947–48), crude aplite, monazite (1948), and wollastonite.

Value of mineral products of the United States, 1944–48, by States [1]

State	1944	1945	1946	1947	1948
Alabama	$109,149,000	$110,360,000	$123,029,000	$162,663,000	$182,987,000
Alaska	6,903,000	10,174,000	12,426,000	18,458,000	13,201,000
Arizona	115,592,000	98,574,000	118,086,000	186,767,000	201,244,000
Arkansas	64,079,000	58,257,000	65,985,000	92,289,000	123,138,000
California	506,216,000	515,214,000	592,294,000	859,039,000	1,174,674,000
Colorado	79,137,000	77,236,000	77,573,000	104,828,000	129,326,000
Connecticut	4,496,000	3,498,000	5,584,000	5,677,000	6,745,000
Delaware	182,000	131,000	491,000	613,000	717,000
District of Columbia	111,000	229,000	710,000	746,000	835,000
Florida	21,896,000	24,928,000	31,093,000	45,924,000	53,877,000
Georgia	19,005,000	19,988,000	30,449,000	37,037,000	42,662,000
Idaho	51,321,000	44,348,000	44,444,000	66,941,000	79,330,000
Illinois	329,147,000	330,184,000	358,628,000	436,770,000	523,422,000
Indiana	89,760,000	88,802,000	107,479,000	143,298,000	166,803,000
Iowa	22,452,000	25,008,000	35,957,000	38,951,000	45,129,000
Kansas	170,560,000	166,644,000	194,563,000	267,046,000	363,362,000
Kentucky	250,735,000	250,919,000	272,558,000	428,507,000	506,249,000
Louisiana	217,733,000	222,413,000	273,882,000	405,576,000	593,403,000
Maine	2,150,000	2,521,000	4,389,000	6,049,000	8,482,000
Maryland	15,264,000	15,329,000	21,991,000	26,125,000	27,922,000
Massachusetts	5,263,000	5,450,000	9,745,000	11,859,000	13,844,000
Michigan	140,520,000	127,869,000	133,310,000	169,597,000	205,954,000
Minnesota	170,488,000	167,138,000	155,734,000	219,685,000	268,813,000
Mississippi	18,675,000	21,370,000	33,672,000	68,986,000	119,635,000
Missouri	72,890,000	74,347,000	88,357,000	107,878,000	113,506,000
Montana	82,290,000	68,829,000	62,114,000	88,231,000	103,125,000
Nebraska	5,060,000	4,963,000	7,277,000	7,405,000	9,432,000
Nevada	51,800,000	31,307,000	35,454,000	42,639,000	45,110,000
New Hampshire	1,164,000	802,000	1,451,000	1,574,000	1,732,000
New Jersey	33,828,000	31,267,000	33,518,000	44,245,000	51,092,000
New Mexico	112,180,000	104,234,000	111,938,000	157,652,000	221,022,000
New York	84,286,000	88,678,000	103,571,000	130,667,000	156,140,000
North Carolina	22,199,000	14,766,000	20,428,000	23,754,000	27,885,000
North Dakota	4,334,000	4,505,000	5,118,000	6,330,000	8,581,000
Ohio	174,582,000	179,682,000	221,356,000	291,960,000	328,228,000
Oklahoma	225,833,000	243,314,000	263,282,000	355,750,000	503,654,000
Oregon	9,657,000	9,463,000	11,807,000	16,573,000	24,871,000
Pennsylvania	962,208,000	913,232,000	1,074,004,000	1,269,762,000	1,407,347,000
Rhode Island	612,000	508,000	561,000	785,000	1,450,000
South Carolina	4,192,000	5,043,000	8,189,000	10,362,000	12,105,000
South Dakota	5,471,000	7,137,000	18,389,000	23,604,000	24,296,000
Tennessee	63,994,000	58,672,000	68,031,000	85,664,000	95,863,000
Texas	1,133,756,000	1,150,597,000	1,313,003,000	1,954,351,000	2,809,071,000

Wyoming	68,034,000	74,620,000	78,745,000	117,594,000	172,818,000

[1] ... iron ore ... iron, is taken as the basis of iron valuation.

Mineral products of the United States and principal producing States in 1948 [1]

Rank in value	Product	Principal producing States [2]: In order of quantity	Principal producing States [2]: In order of value
14	Aluminum	Washington, Tennessee, New York, Oregon	Rank same as for quantity.
100	Andalusite	Nevada	Do.
(3)	Antimonial lead	Not separable by States	Not separable by States.
48	Antimony ore	Idaho, Nevada, Alaska, California	Rank same as for quantity.
81	Aplite (crude)	Virginia	Do.
62	Arsenious oxide	Not separable by States	Not separable by States.
58	Asbestos	Vermont, Arizona, Georgia, California	Rank same as for quantity.
	Asphalt:		
46	Native	Texas, Kentucky, Alabama, Oklahoma	Texas, Utah, Kentucky, Oklahoma..
15	Oil	Not separable by States	Not separable by States.
40	Barite (crude)	Arkansas, Missouri, Georgia, Nevada	Rank same as for quantity.
36	Bauxite	Arkansas, Georgia, Alabama	Do.
96	Beryllium concentrates	South Dakota, New Hampshire, Colorado, Maine	New Hampshire, South Dakota, Colorado, Maine.
54	Bismuth	Not separable by States	Not separable by States.
34	Boron minerals	California	Rank same as for quantity.
29	Bromine	Texas, Michigan, California, West Virginia	Texas, Michigan, West Virginia, California.
30	Cadmium	Not separable by States	Not separable by States.
52	Calcium-magnesium chloride	Michigan, West Virginia, California, Ohio	Michigan, California, West Virginia, Ohio.
6	Cement	Pennsylvania, California, Texas, New York	Rank same as for quantity.
88	Chromite	Oregon, California	Do.
	Clay:		
12	Products, heavy clay (other than pottery and refractories).		Ohio, Pennsylvania, California, Illinois.
19	Raw (sold or used by producers)	Ohio, Pennsylvania, California, Illinois	Georgia, Pennsylvania, Ohio, Missouri.
2	Coal:		
	Bituminous	West Virginia, Pennsylvania, Kentucky, Illinois	Rank same as for quantity.
	Pennsylvania anthracite	Pennsylvania	Do.
78	Cobalt	do	Do.
4	Coke	Pennsylvania, Ohio, Indiana, Alabama	Pennsylvania, Ohio, Indiana, New York.
105	Columbium ores	Maine	Rank same as for quantity.
8	Copper	Arizona, Utah, New Mexico, Montana	Do.
44	Diatomite	California, Oregon, Nevada, Washington	Do.
91	Emery	New York	Do.
55	Feldspar (crude)	North Carolina, Colorado, South Dakota, New Hampshire	North Carolina, New Hampshire, South Dakota, Colorado.
11	Ferro-alloys	Pennsylvania, New York, Ohio, West Virginia	Pennsylvania, New York, West Virginia, Ohio.
93	Flint lining for tube mills	Minnesota, Wisconsin, North Carolina	Rank same as for quantity.
33	Fluorspar	Illinois, Kentucky, Colorado, New Mexico	Illinois, Kentucky, New Mexico, Colorado.
45	Fuller's earth	Georgia, Texas, Florida, Illinois	Rank same as for quantity.
74	Garnet (abrasive)	New York, Idaho	Do.
(4)	Gem stones	No canvass for 1948	No canvass for 1948.
89	Germanium	Not separable by States	Not separable by States.
21	Gold	California, South Dakota, Utah, Alaska	Rank same as for quantity.
76	Graphite:		
	Amorphous	Rhode Island	Do.
	Crystalline	Texas, Alabama	Do.
79	Grindstones and pulpstones	Ohio, West Virginia, Washington	Do.

See footnotes at end of table.

Mineral products of the United States and principal producing States in 1948 [1]—Continued

Rank in value	Product	Principal producing States [2]	
		In order of quantity	In order of value
28	Gypsum (crude)	Michigan, New York, California, Texas	Rank same as for quantity.
73	Helium	Texas	Do.
98	Indium	Not separable by States	Not separable by States.
60	Iodine (natural)	California	Rank same as for quantity.
	Iron:		
7	Ore	Minnesota, Michigan, Alabama, Utah	Minnesota, Michigan, Alabama, New York.
3	Pig	Pennsylvania, Ohio, Indiana, Illinois	Rank same as for quantity.
75	Kyanite	Virginia, Georgia, South Carolina	Do.
17	Lead	Missouri, Idaho, Utah, Arizona	Do.
20	Lime	Ohio, Pennsylvania, Missouri, West Virginia	Do.
82	Lithium minerals	South Dakota, California, Maine	California, South Dakota, Maine.
56	Magnesite (crude)	Washington, Nevada, California	Rank same as for quantity.
53	Magnesium	Texas	Do.
32	Magnesium compounds (natural)	Nevada, California, Michigan, Texas	Michigan, Nevada, California, Texas.
47	Manganese ore	Montana, Virginia, Arizona, Arkansas	Rank same as for quantity.
49	Manganiferous ore	Minnesota, New Mexico, Nevada, Montana	Do.
66	Manganiferous zinc residuum	New Jersey	Do.
	Marl:		
85	Calcareous	Virginia, West Virginia, Indiana, Minnesota	Virginia, Nevada, West Virginia, Indiana.
80	Greensand	New Jersey	Rank same as for quantity.
65	Mercury	California, Oregon, Nevada, Idaho	Do.
64	Mica	North Carolina, Colorado, South Dakota, Georgia	Do.
	Scrap	do	Do.
	Sheet	North Carolina, New Mexico, Georgia	Do.
97	Millstones		North Carolina, New York, Virginia.
	Mineral pigments:		
35	Natural pigments and manufactured iron oxide pigments.	Pennsylvania, Illinois, New Jersey, Virginia	Pennsylvania, Illinois, New Jersey, Ohio.
23	Lead and zinc pigments	Pennsylvania, Kansas, Illinois, Ohio	Rank same as for quantity.
([4])	Mineral waters	No canvass for 1948	No canvass for 1948.
27	Molybdenum	Utah, Colorado, New Mexico, California	Rank same as for quantity.
101	Monazite sand	Idaho	Do.
9	Natural gas [5]	Texas, Louisiana, California, Oklahoma	Texas, California, West Virginia, Louisiana.
5	Natural gasoline and allied products:		
	Natural gasoline and cycle products	Texas, California, Louisiana, Oklahoma	Rank same as for quantity.
	Liquefied petroleum gases	Texas, California, Oklahoma, Louisiana	Texas, California, Louisiana, Oklahoma.
71	Nickel	Not separable by States	Not separable by States.
84	Oilstones, etc	Arkansas, Indiana, Ohio, New Hampshire	Arkansas, New Hampshire, Indiana, Ohio.
90	Olivine	North Carolina, Washington	Rank same as for quantity.
([6])	Ores (crude), etc.:		
	Copper	Arizona, Utah, New Mexico, Nevada	Value not available.
	Dry and siliceous (gold and silver)	South Dakota, Idaho, Nevada, Colorado	Do.
	Lead	Missouri, Idaho, Oklahoma, Colorado	Do.
	Lead-copper	Missouri, Arizona, New Mexico, Nevada	Do.
	Zinc	Oklahoma, Kansas, Tennessee, New Jersey	Do.
	Zinc-copper	Washington, Arizona	Do.
	Zinc-lead	Idaho, Oklahoma, Montana, Utah	Do.
	Zinc-lead-copper	Colorado, Arizona, Utah	Do.

68	Peat	Florida, New Jersey, Ohio, Michigan	New Jersey, Ohio, Michigan, Illinois.
87	Pebbles for grinding	Minnesota, Wisconsin, Texas, North Carolina	Rank same as for quantity.
83	Perlite (crude or refined)	Oregon, Colorado, Arizona, California	Oregon, Arizona, Colorado, Pennsylvania.
1	Petroleum	Texas, California, Louisiana, Oklahoma	Rank same as for quantity.
24	Phosphate rock	Florida, Tennessee, Idaho, Montana	Do.
63	Platinum metals	Alaska, California	Do.
25	Potassium salts	New Mexico, California, Utah, Michigan	Do.
57	Pumice	California, New Mexico, Oregon, Idaho	Do.
51	Pyrites	Tennessee, Virginia, California, Colorado	Do.
69	Quartz	Washington, North Carolina, California, Wisconsin	Washington, North Carolina, California, Arizona.
92	Radium	Colorado, Utah, Arizona	Rank same as for quantity.
22	Salt	Michigan, New York, Ohio, Louisiana	Michigan, New York, Louisiana, Ohio.
13	Sand and gravel	California, Michigan, Wisconsin, Illinois	California, Pennsylvania, Ohio, Illinois.
67	Selenium	Not separable by States	Not separable by States.
42	Sand and sandstone (ground)	Illinois, New Jersey, Pennsylvania, Ohio	Illinois, Ohio, New Jersey, Pennsylvania.
26	Silver	Idaho, Utah, Montana, Arizona	Rank same as for quantity.
31	Slate		Pennsylvania, Vermont, New York, Virginia.
39	Sodium carbonates (natural)	California, Wyoming	Rank same as for quantity.
50	Sodium sulfates (natural)	California, Texas, Wyoming	Do.
10	Stone	Pennsylvania, Ohio, Michigan, Illinois	Pennsylvania, Ohio, Illinois, New York.
18	Sulfur	Texas, Louisiana	Rank same as for quantity.
37	Sulfuric acid from copper, lead, and zinc smelters and zinc roasters.	Pennsylvania, Illinois, Indiana, Utah	Do.
95	Sulfur ore	Colorado, Texas, Nevada, California	Colorado, Nevada, Texas, California.
38	Talc, pyrophyllite and ground soapstone [7]	New York, North Carolina, California, Vermont	New York, California, North Carolina, Vermont.
104	Tantalum concentrates	South Dakota	Rank same as for quantity.
86	Tellurium	Not separable by States	Not separable by States.
94	Thallium	do	Do.
99	Tin	Alaska, South Dakota	Rank same as for quantity.
	Titanium concentrates:		
43	Ilmenite	New York, Florida, Virginia, North Carolina	New York, Virginia, Florida, North Carolina.
72	Rutile	Florida, Virginia	Rank same as for quantity.
102	Topaz (industrial)	South Carolina	Do.
70	Tripoli	Missouri, Illinois, Pennsylvania	Do.
41	Tungsten concentrates	California, North Carolina, Nevada, Colorado	California, Nevada, North Carolina, Colorado.
59	Vanadium	Colorado, Idaho, Utah, New Mexico	Rank same as for quantity.
61	Vermiculite	Montana, South Carolina, North Carolina, Wyoming	Do.
103	Wollastonite	New York	Do.
16	Zinc	Idaho, New Jersey, Montana, Arizona	Do.
77	Zircon	Florida	Do.

[1] Revisions in the corresponding table for 1947, published in Minerals Yearbook, 1947, pages 29–32, are as follows:

Rank in value (original rank shown in parentheses): Aplite 77 (76), iodine 62 (63), kyanite 78 (77), magnesium 54 (55), magnesium compounds 35 (37), natural gasoline and allied products 8 (9), platinum metals 63 (64), pumice 55 (54), selenium 64 (62), silica, quartz 76 (78), sodium salts 36 (35), stone 9 (8), and sulfuric acid 37 (36).

Principal producing States in order of quantity: Magnesium compounds—Nevada, California, Michigan, and Texas. Silica (quartz)—North Carolina, Washington, California, and Wisconsin.

Principal producing States in order of value: Magnesium compounds—Michigan, California, Nevada, and Texas. Silica (quartz)—North Carolina, California, Washington, and Arizona.

[2] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output.

[3] Separate figures for antimonial lead from primary sources not available.

[4] No canvass for 1948.

[5] The rank of natural gas in this table (in contrast to corresponding tables in editions prior to Minerals Yearbook, 1947) is based on value at wells rather than value at points of consumption.

[6] Value not available.

[7] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

States and their principal mineral products in 1947[1]

State	Rank	Percent of total value for United States	Principal mineral products in order of value
Alabama	15	1.65	Coal, iron ore, cement, clay products.
Alaska	38	.19	Gold, sand and gravel, coal, stone.
Arizona	13	1.90	Copper, zinc, lead, silver.
Arkansas	23	.94	Petroleum, coal, bauxite, natural gasoline.
California	4	8.73	Petroleum, natural gas, natural gasoline, cement.
Colorado	22	1.07	Petroleum, coal, zinc, molybdenum.
Connecticut	46	.06	Clay products, stone, sand and gravel, lime.
Delaware	50	.01	Clay products, sand and gravel, stone.
District of Columbia	49	.01	Clay products, raw clay.
Florida	28	.47	Phosphate rock, stone, cement, sand and gravel.
Georgia	33	.38	Raw clay, stone, clay products, cement.
Idaho	27	.68	Lead, zinc, silver, phosphate rock.
Illinois	5	4.44	Coal, petroleum, stone, cement.
Indiana	17	1.46	Coal, cement, petroleum, stone.
Iowa	32	.40	Cement, clay products, stone, coal.
Kansas	10	2.72	Petroleum, cement, natural gas, zinc.
Kentucky	6	4.36	Coal, petroleum, natural gas, stone.
Louisiana	7	4.12	Petroleum, natural gasoline, natural gas, sulfur.
Maine	45	.06	Cement, stone, sand and gravel, slate.
Maryland	35	.27	Coal, sand and gravel, cement, clay products.
Massachusetts	41	.12	Stone, sand and gravel, clay products, lime.
Michigan	14	1.72	Iron ore, petroleum, cement, salt.
Minnesota	11	2.23	Iron ore, sand and gravel, stone, manganiferous ore.
Mississippi	26	.70	Petroleum, natural gas, sand and gravel, clay products.
Missouri	21	1.10	Lead, cement, coal, stone.
Montana	24	.90	Copper, petroleum, zinc, coal.
Nebraska	43	.07	Cement, sand and gravel, clay products, stone.
Nevada	30	.43	Copper, zinc, gold, tungsten ore.
New Hampshire	47	.02	Sand and gravel, stone, clay products, feldspar.
New Jersey	29	.45	Zinc, clay products, sand and gravel, stone.
New Mexico	16	1.60	Petroleum, potassium salts, copper, zinc.
New York	19	1.33	Cement, petroleum, iron ore, stone.
North Carolina	36	.24	Clay products, stone, sand and gravel, talc and pyrophyllite.
North Dakota	44	.06	Coal, sand and gravel, clay products, natural gas.
Ohio	9	2.97	Coal, clay products, stone, lime.
Oklahoma	8	3.62	Petroleum, natural gasoline, natural gas, coal.
Oregon	39	.17	Sand and gravel, stone, cement, clay products.
Pennsylvania	2	12.91	Coal, cement, petroleum, stone.
Rhode Island	48	.01	Stone, sand and gravel, graphite.
South Carolina	42	.10	Stone, clay products, raw clay, sand and gravel.
South Dakota	37	.24	Gold, stone, raw clay, sand and gravel.
Tennessee	25	.87	Coal, cement, stone, phosphate rock.
Texas	1	19.87	Petroleum, natural gasoline, natural gas, sulfur.
Utah	12	2.10	Copper, coal, gold, lead.

Vermont	40	.15	Stone, slate, talc, copper.
Virginia	18	1.36	Coal, stone, zinc, clay products.
Washington	31	.41	Cement, coal, sand and gravel, stone.
West Virginia	3	8.78	Coal, natural gas, petroleum, natural gasoline.
Wisconsin	34	.35	Stone, sand and gravel, iron ore, zinc.
Wyoming	20	1.20	Petroleum, coal, natural gasoline, raw clay.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation. The rank of natural gas in this table (in contrast to corresponding tables in editions before Minerals Yearbook, 1947) is based on value at wells rather than at points of consumption.

States and their principal mineral products in 1948 [1]

State	Rank	Percent of total value for United States	Principal mineral products in order of value
Alabama	16	1.47	Coal, iron ore, cement, clay products.
Alaska	41	.11	Gold, coal, platinum metals, sand and gravel.
Arizona	15	1.62	Copper, zinc, lead, silver.
Arkansas	22	.99	Petroleum, coal, bauxite, natural gasoline.
California	3	9.44	Petroleum, natural gasoline, natural gas, cement.
Colorado	21	1.04	Petroleum, coal, zinc, molybdenum.
Connecticut	46	.05	Clay products, stone, sand and gravel, lime.
Delaware	50	.01	Clay products, sand and gravel, stone, raw clay.
District of Columbia	49	.01	Clay products, raw clay.
Florida	28	.43	Phosphate rock, stone, cement, sand and gravel.
Georgia	33	.34	Raw clay, stone, clay products, cement.
Idaho	27	.64	Lead, zinc, silver, antimony ore.
Illinois	6	4.21	Coal, petroleum, stone, clay products.
Indiana	18	1.34	Coal, cement, petroleum, stone.
Iowa	31	.36	Cement, clay products, stone, coal.
Kansas	9	2.92	Petroleum, cement, natural gas, coal.
Kentucky	7	4.07	Coal, petroleum, natural gas, stone.
Louisiana	5	4.77	Petroleum, natural gasoline, natural gas, sulfur.
Maine	45	.07	Cement, sand and gravel, stone, clay products.
Maryland	35	.22	Coal, sand and gravel, cement, clay products.
Massachusetts	40	.11	Stone, sand and gravel, clay products, lime.
Michigan	13	1.65	Iron ore, petroleum, cement, salt.
Minnesota	11	2.16	Iron ore, stone, sand and gravel, manganiferous ore.
Mississippi	23	.96	Petroleum, natural gas, clay products, natural gasoline.
Missouri	24	.91	Lead, cement, coal, stone.
Montana	25	.83	Copper, petroleum, zinc, lead.
Nebraska	43	.08	Cement, sand and gravel, clay products, stone.
Nevada	32	.36	Copper, zinc, gold, lead.
New Hampshire	47	.01	Sand and gravel, clay products, feldspar, stone.
New Jersey	29	.41	Zinc, clay products, sand and gravel, stone.
New Mexico	12	1.78	Petroleum, copper, potassium salts, zinc.
New York	20	1.25	Cement, iron ore, petroleum, stone.
North Carolina	36	.22	Clay products, stone, sand and gravel, talc and pyrophyllite.

See footnote at end of table.

States and their principal mineral products in 1948 [1]—Continued

State	Rank	Percent of total value for United States	Principal mineral products in order of value
North Dakota	44	0.07	Coal (lignite), sand and gravel, clay products, natural gas.
Ohio	10	2.64	Coal, clay products, stone, lime.
Oklahoma	8	4.05	Petroleum, natural gasoline, natural gas, coal.
Oregon	37	.20	Sand and gravel, stone, cement, clay products.
Pennsylvania	2	11.31	Coal, cement, petroleum, stone.
Rhode Island	48	.01	Sand and gravel, stone, graphite.
South Carolina	42	.10	Stone, clay products, raw clay, vermiculite.
South Dakota	38	.19	Gold, stone, sand and gravel, raw clay.
Tennessee	26	.77	Coal, cement, stone, phosphate rock.
Texas	1	22.57	Petroleum, natural gasoline, natural gas, sulfur.
Utah	14	1.65	Copper, coal, lead, gold.
Vermont	39	.13	Stone, slate, asbestos, talc.
Virginia	19	1.27	Coal, stone, cement, clay products.
Washington	30	.41	Cement, coal, sand and gravel, stone.
West Virginia	4	8.10	Coal, natural gas, petroleum, natural gasoline.
Wisconsin	34	.30	Stone, sand and gravel, iron ore, cement.
Wyoming	17	1.39	Petroleum, coal, natural gasoline, raw clay.

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation. The rank of natural gas in this table (in contrast to corresponding tables in editions before Minerals Yearbook, 1947) is based on value at wells rather than at points of consumption.

STATE TABLES

Mineral products of the United States, 1946–48, by States

ALABAMA

Product	1946 Quantity	1946 Value	1947 Quantity	1947 Value	1948 Quantity	1948 Value
Aluminum ..... short tons	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)	(1 2)
Asphalt (native) ..... do	(1)	(1)	(1)	(1)	(1)	(1)
Bauxite ..... long tons (dried equivalent)	(1)	(1)	(1)	(1)	(1)	(1)
Cement ..... barrels	[3] 8,071,979	[3] $13,120,084	[3] 9,509,697	[3] $16,663,543	[3] 9,948,600	[3] $20,140,177
Clay:						
Products, heavy clay (other than pottery and refractories)	------	[4] 4,419,000	------	[4] 5,089,000	------	[4] 5,600,000
Raw (sold or used) ..... short tons	[5] 1,064,000	[5] 1,073,052	[5] 1,135,386	[5] 1,096,414	[5] 1,260,149	[5] 1,260,059
Coal ..... do	16,183,298	77,867,999	19,048,225	104,303,456	18,040,000	109,864,000
Coke ..... do	4,665,939	[2] 32,669,886	5,869,738	[2] 47,086,856	6,015,460	[2] 57,611,881
Ferro-alloys ..... do	137,042	[2] 14,510,937	132,603	[2] 15,030,000	129,615	[2] 16,817,011
Gold ..... troy ounces	1	35	------	------	------	------
Graphite, crystalline ..... pounds	(1)	(1)	(1)	(1)	(1)	(1)
Iron:						
Ore ..... long tons	5,993,800	17,458,295	7,207,556	23,436,620	8,024,052	32,543,713
Pig ..... short tons	3,145,303	[2] 66,517,978	3,928,007	[2] 110,436,827	3,980,677	[2] 145,358,582
Lime ..... do	294,654	2,164,209	345,160	2,727,464	388,197	3,275,402
Mica:						
Scrap ..... do	338	6,621	(1)	(1)	------	------
Sheet ..... pounds	289	74	(1)	(1)	------	------
Mineral waters	(6)	(6)	(6)	(6)	(6)	(6)
Peat ..... short tons	------	------	------	------	2,034	11,620
Petroleum ..... barrels	380,000	(1)	396,000	(1)	466,000	(1)
Sand and gravel ..... short tons	2,923,240	1,937,576	3,400,103	2,271,534	3,619,469	2,405,901
Stone ..... do	1,874,330	3,385,892	2,795,240	4,624,892	2,475,530	4,482,133
Miscellaneous [7]	------	10,804,325	------	14,982,280	------	18,921,153
Total value, eliminating duplications	------	123,029,000	------	162,663,000	------	182,987,000

[1] Value included with "Miscellaneous."
[2] Value not included in total value for State.
[3] Exclusive of puzzolan, value for which is included with "Miscellaneous."
[4] Figure obtained through cooperation with Bureau of the Census.
[5] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[6] No canvass.
[7] Includes minerals indicated by footnotes 1 and 3 above.

Mineral products of the United States, 1946–48, by States—Continued

ALASKA

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
Antimony ore (concentrates) short tons			40	$16,056	68	$29,336
Arsenic do	(1)	(1)				
Clay, raw (sold or used) do					(2)	(2)
Coal do	366,809	$2,354,952	361,220	2,554,797	410,000	(2)
Copper pounds	4,000	648	24,000	5,040	32,000	6,944
Gem stones		(3)		(3)		(3)
Gold troy ounces	226,781	7,937,335	279,988	9,799,580	248,395	8,693,825
Lead short tons	115	25,070	264	76,032	329	117,782
Mercury flasks (76 pounds)	699	68,670	127	10,635	100	7,649
Ores (crude), etc.:						
Copper short tons					14	(4)
Dry and siliceous (gold and silver) do	8,979	(4)	8,327	(4)	1,795	(4)
Lead do	1,819	(4)	5,064	(4)	4,005	(4)
Zinc do			500	(4)		
Zinc-lead do					200	(4)
Platinum metals (crude) troy ounces	22,882	(2)	13,512	(2)	(2)	(2)
Pumice short tons					(2)	(2)
Sand and gravel do	(2)	(2)	(2)	(2)	(2)	(2)
Silver troy ounces	41,793	33,769	66,150	59,866	67,341	60,947
Stone short tons	(2)	(2)	(2)	(2)	40,730	54,637
Tin do			1	2,200	6	(2)
Tungsten concentrates short tons (60-percent WO_3 basis)	19	(2)	13	(2)		
Zinc short tons			25	6,050	22	5,852
Miscellaneous [5]		2,005,241		5,927,319		4,224,112
Total value, eliminating duplications		12,426,000		18,458,000		13,201,000

[1] Figure not available.
[2] Value included with "Miscellaneous."
[3] No canvass.
[4] Not valued as ore; value of recoverable metal content included with the metals.
[5] Includes minerals indicated by footnote 2 above.

ARIZONA

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
Arsenious oxide ... short tons	(1)	(1)	(1)	(1)	(1)	(1)
Asbestos ... do	(2)	(2)	(2)	(2)	(2)	(2)
Barite ... do	(2)	(2)	(2)	(2)	(2)	(2)
Bismuth ... pounds	(1)	(1)	(1)	(1)	(1)	(1)
Clay:						
Products, heavy clay (other than pottery and refractories)		[3] $479,000		[3] $752,000		[3] $917,000
Raw (sold or used) ... short tons	[4] 168,081	[4] 230,703	[4] 184,345	[4] 292,193	[4] 178,296	[4] 325,997
Coal ... do	6,414	24,304	10,060	46,415	10,000	(2)
Copper ... pounds	578,446,000	93,708,252	732,436,000	153,811,560	750,242,000	162,802,514
Diatomite ... short tons	(2)	(2)				
Feldspar (crude) ... long tons	(2)	(2)	(2)	(2)	(2)	(2)
Fluorspar ... short tons	389	7,959	1,601	(2)	1,271	(2)
Gem stones		(5)		(5)		(5)
Gold ... troy ounces	79,024	2,765,840	95,860	3,355,100	109,487	3,832,045
Gypsum (crude) ... short tons	(2)	(2)	23,980	128,725	(2)	(2)
Lead ... do	23,930	5,216,740	28,566	8,227,008	29,899	10,703,842
Lime ... do	50,354	489,091	54,562	582,074	54,608	763,296
Manganese ore ... do			133	(2)	240	(2)
Manganiferous ore ... do			62	(2)		
Mercury ... flasks (76 pounds)	95	9,333				
Mica, scrap ... short tons			(2)	(2)		
Molybdenum ... pounds	(2)	(2)	(2)	(2)	(2)	(2)
Ores (crude), etc.:						
Copper ... short tons	30,386,149	(6)	37,810,448	(6)	39,072,204	(6)
Dry and siliceous (gold and silver) ... do	53,094	(6)	73,190	(6)	56,090	(6)
Lead ... do	13,441	(6)	24,478	(6)	23,231	(6)
Lead-copper ... do	1,066	(6)	12	(6)	242	(6)
Zinc ... do	13,233	(6)	16,619	(6)	3,966	(6)
Zinc-copper ... do	63,854	(6)	82,192	(6)	101,405	(6)
Zinc-lead ... do	515,047	(6)	624,397	(6)	664,603	(6)
Zinc-lead-copper ... do	12,295	(6)	4,944	(6)	3,945	(6)

Miscellaneous[11]...	----------	21,909,443	----------	29,565,251	----------	41,595,712
Total value, eliminating duplications...	----------	592,294,000	----------	859,039,000	----------	1,174,674,000

[1] Figure not available.
[2] Value included with "Miscellaneous."
[3] No canvass.
[4] Figure obtained through cooperation with Bureau of the Census.
[5] Sold or used; value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[6] Value not included in total value for State.
[7] Comprises all compounds from raw sea water and bitterns. Data for 1946 are not quite comparable with 1947-48 in that the former are on a gross-weight basis and include some compounds made from dolomite in combination with sea water. Figures for 1947-48 are partly estimated.
[8] Not valued as ore; value of recoverable metal content included with the metals.
[9] Exclusive of marble in 1946-47 and of dimension basalt in 1948, values for which are included with "Miscellaneous."
[10] From lead smelting.
[11] Includes minerals indicated by footnotes 2 and 9 above.

Total value, eliminating duplications		30,449,000		37,037,000		42,662,000

[1] Value included with "Miscellaneous."
[2] Figure obtained through cooperation with Bureau of the Census.
[3] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[4] No canvass.
[5] Not valued as ore; value of recoverable metal content included with the metals.
[6] Includes minerals indicated by footnote 1 above.

Mineral products of the United States, 1946–48, by States—Continued

IDAHO

Product	1946 Quantity	1946 Value	1947 Quantity	1947 Value	1948 Quantity	1948 Value
Antimony ore (concentrates) ... short tons	13,732	$784,489	18,258	$3,193,806	15,941	$4,294,790
Arsenious oxide ... do	(1)	(1)	(1)	(1)	(1)	(1)
Bismuth ... pounds	(1)	(1)	(1)	(1)	(1)	(1)
Cement ... barrels	(2)	(2)	(2)	(2)	(2)	(2)
Clay:						
Products, heavy clay (other than pottery and refractories)		[3] 149,000		[3] 131,000		[3] 214,000
Raw (sold or used) ... short tons	[4] 18,696	[4] 24,802	[4] 31,920	[4] 33,262	[4] 33,856	[4] 33,077
Copper ... pounds	2,076,000	336,312	3,280,000	688,800	3,248,000	704,816
Garnet, abrasive ... short tons	(2)	(2)	(2)	(2)	(2)	(2)
Gem stones		(5)		(5)		(5)
Gold ... troy ounces	42,975	1,504,125	64,982	2,274,370	58,454	2,045,890
Lead ... short tons	59,987	13,077,166	78,944	22,735,872	88,544	31,698,752
Mercury ... flasks (76 pounds)	868	85,272	886	74,194	543	41,534
Monazite ... short tons					40	(2)
Ores (crude), etc.:						
Copper ... do	903	(6)	3,303	(6)	1,383	(6)
Dry and siliceous (gold and silver) ... do	256,001	(6)	765,765	(6)	822,378	(6)
Lead ... do	113,175	(6)	165,218	(6)	253,648	(6)
Lead-copper ... do	119	(6)	27	(6)	5	(6)
Zinc ... do	104,585	(6)	67,133	(6)	79,674	(6)
Zinc-lead ... do	2,407,404	(6)	2,716,251	(6)	2,824,758	(6)
Phosphate rock ... long tons	(2)	(2)	(2)	(2)	431,392	2,094,197
Pumice ... short tons	108,847	163,515	98,618	119,882	79,426	93,602
Sand and gravel ... do	2,082,874	1,572,088	3,209,766	2,067,891	3,671,033	2,552,224
Silver ... troy ounces	6,491,104	5,244,812	10,345,779	9,362,930	11,448,875	10,361,810
Stone ... short tons	548,870	568,159	[7] 1,044,780	[7] 991,599	1,081,060	1,003,858
Tungsten concentrates ... short tons (60-percent WO_3 basis)	641	(2)	61	(2)	86	(2)
Vanadium ... pounds	(2)	(2)	(2)	(2)	(2)	(2)
Zinc ... short tons	71,507	17,447,708	83,069	20,102,698	86,267	22,947,022
Miscellaneous [8]		3,494,386		5,180,456		1,267,691
Total value, eliminating duplications		44,444,000		66,941,000		79,330,000

[1] Figure not available.
[2] Value included with "Miscellaneous."
[3] Figure obtained through cooperation with Bureau of the Census.
[4] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metals.
[7] Exclusive of unclassified stone, value for which is included with "Miscellaneous."
[8] Includes minerals indicated by footnotes 2 and 7 above.

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value

[7] Includes minerals indicated by footnotes 3 and 6 above.

MISSOURI

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
Asphalt (native) short tons	(1)	(1)	(1)	(1)	(1)	(1)
Barite do	270,850	$2,168,067	291,619	$2,405,249	278,071	$2,413,802
Cement barrels	6,887,517	12,142,018	8,030,939	15,066,390	8,428,343	17,911,257
Clay:						
Products, heavy clay (other than pottery and refractories)	----	[2] 3,963,000	----	[2] 4,123,000	----	[2] 5,314,000
Raw (sold or used) short tons	[3] 1,689,229	[3] 3,257,687	[3] 1,744,411	[3] 4,051,157	[3] 2,135,547	[3] 5,309,128
Coal do	3,732,815	10,432,591	4,236,427	14,093,663	4,470,000	15,779,000
Cobalt pounds	(1)	(1)	(1)	(1)	----	----
Coke short tons	(1 4)	(1 4)	(1 4)	(1 4)	(1 4)	(1 4)
Copper pounds	3,714,000	601,668	3,520,000	739,200	4,740,000	1,028,580
Iron ore long tons	156,350	(1)	171,356	(1)	165,326	(1)
Lead short tons	139,112	30,326,416	132,246	38,086,848	102,288	36,619,104
Lime do	799,742	5,931,485	889,090	7,006,426	1,009,993	8,998,691
Mineral paints (zinc and lead pigments) do	(1 4)	(1 4)	(1 4)	(1 4)	(1 4)	(1 4)
Mineral waters	(5)	(5)	(5)	(5)	(5)	(5)
Natural gas (estimated value at wells) M cubic feet	40,000	6,000	38,000	5,000	27,000	5,000

See footnotes at end of table.

Mineral products of the United States, 1946–48, by States—Continued

MISSOURI—Continued

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
Ores (crude), etc.:						
Lead ... short tons	5,361,694	(6)	5,711,700	(6)	5,219,718	(6)
Lead-copper ... do	141,698	(6)	183,442	(6)	207,186	(6)
Zinc ... do	700,849	(6)	606,910	(6)	176,980	(6)
Zinc-lead ... do	1,297,689	(6)	804,755	(6)	94,970	(6)
Petroleum ... barrels	51,000	(1)	55,000	(1)	53,000	(1)
Sand and gravel ... short tons	5,136,904	$4,070,448	[7] 4,597,495	[7] $4,193,474	4,886,611	$4,197,922
Sand and sandstone (ground) ... do	(1)	(1)	(1)	(1)	(1)	(1)
Silver ... troy ounces	69,401	56,076	93,600	84,708	114,187	103,345
Stone ... short tons	7,258,990	8,996,440	[8] 8,438,320	[8] 11,195,993	[8] 9,020,580	[8] 12,320,220
Sulfuric acid (basis, 100 percent) [9] ... do	(1 4)	(1 4)	(1 4)	(1 4)	(1 4)	(1 4)
Tripoli ... do	12,180	211,244	19,375	469,927	(1)	(1)
Tungsten concentrates ... short tons (60-percent WO_3 basis)	----	----	----	----	4	(1)
Zinc ... short tons	22,234	5,425,096	17,074	4,131,908	6,463	1,719,158
Miscellaneous [10]	----	4,520,383	----	7,271,714	----	8,148,556
Total value, eliminating duplications	----	88,357,000	----	107,878,000	----	113,506,000

[1] Value included with "Miscellaneous."
[2] Figure obtained through cooperation with Bureau of the Census.
[3] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[4] Value not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metals.
[7] "Commercial." Value of "Government-and-contractor" included with "Miscellaneous."
[8] Exclusive of sandstone in 1947–48, values for which are included with "Miscellaneous."
[9] From zinc smelting.
[10] Includes minerals indicated by footnotes 1, 7, and 8 above.

MONTANA

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
Arsenious oxide (white arsenic) ... short tons	(1)	(1)	(1)	(1)	(2)	(2)
Bismuth ... pounds	(2)	(2)	(2)	(2)	(2)	(2)
Cement ... barrels	(1)	(1)	(1)	(1)	(1)	(1)
Clay:						
Products, heavy clay (other than pottery and refractories)	----	[3] $191,000	----	[3] $206,000	----	[3] $281,000
Raw (sold or used) ... short tons	[4] 56,423	[4] 187,201	[4] 67,912	[4] 156,094	[4] 55,370	[4] 149,799

Coal:						
Bituminous ... do	3,682,913	6,450,781	3,139,221	6,395,054	2,800,000	5,488,000
Lignite ... do	40,013	105,331	38,669	112,198		
Copper ... pounds	116,962,000	18,947,844	115,800,000	24,318,000	116,504,000	25,281,368
Ferro-alloys ... short tons	----	----	----	----	(1 5)	(1 5)
Fluorspar ... do	----	----	----	----	318	(1)
Gem stones	----	(6)	----	(6)	----	(6)
Gold ... troy ounces	70,507	2,467,745	90,124	3,154,340	73,091	2,558,185
Gypsum (crude) ... short tons	(1)	(1)	(1)	(1)	(1)	(1)
Lead ... do	8,280	1,805,040	16,108	4,639,104	18,411	6,591,138
Lime ... do	(1)	(1)	(1)	(1)	(1)	(1)
Manganese ore ... do	137,522	4,643,050	129,689	4,153,045	130,184	4,362,066
Manganiferous ore ... do	3,816	(1)	3,671	(1)	4,135	(1)
Mineral waters	(6)	(6)	(6)	(6)	(6)	(6)
Natural gas (estimated value at wells) ... M cubic feet	30,713,000	1,419,000	34,282,000	1,560,000	36,551,000	1,696,000
Natural gasoline and allied products:						
Natural gasoline ... gallons	2,624,000	183,000	2,768,000	216,000	3,403,000	370,000
Liquefied petroleum gases ... do	1,973,000	109,000	2,988,000	208,000	5,046,000	350,000
Ores (crude), etc.:						
Copper ... short tons	1,781,895	(7)	1,838,580	(7)	1,511,069	(7)
Dry and siliceous (gold and silver) ... do	149,611	(7)	287,730	(7)	217,248	(7)
Lead ... do	5,857	(7)	12,508	(7)	25,398	(7)
Zinc ... do	73,727	(7)	10,758	(7)	34,048	(7)
Zinc-lead ... do	223,868	(7)	950,437	(7)	1,232,544	(7)
Petroleum ... barrels	8,825,000	12,710,000	8,742,000	16,960,000	9,380,000	24,238,000
Phosphate rock ... long tons	179,944	1,207,054	236,229	1,571,117	248,683	1,720,254
Pumice ... short tons	----	----	2,035	9,476	(1)	(1)
Pyrites ... long tons	(1)	(1)	(1)	(1)	(1)	(1)
Sand and gravel ... short tons	2,428,681	1,301,867	4,203,797	3,129,921	7,383,873	3,256,957
Silver ... troy ounces	3,273,140	2,644,697	6,326,190	5,725,202	6,930,716	6,272,648
Stone ... short tons	441,480	440,046	632,620	574,726	614,950	613,024
Talc ... do	(1)	(1)	(1)	(1)	(1)	(1)
Tungsten concentrates ... short tons (60-percent WO_3 basis)	84	(1)	4	(1)	----	----
Vermiculite ... short tons	(1)	(1)	(1)	(1)	(1)	(1)
Zinc ... do	16,770	4,091,880	45,679	11,054,318	59,095	15,719,270
Miscellaneous [8]	----	3,235,005	----	4,131,126	----	4,903,714
Total value, eliminating duplications	----	62,114,000	----	88,231,000	----	103,125,000

[1] Value included with "Miscellaneous."
[2] Figure not available.
[3] Figure obtained through cooperation with Bureau of the Census.
[4] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[5] Value not included in total value for State.
[6] No canvass.
[7] Not valued as ore; value of recoverable metal content included with the metals.
[8] Includes minerals indicated by footnote 1 above.

Miscellaneous [9]		15,260,706		18,293,785		22,557,682
Total value, eliminating duplications		33,518,000		44,245,000		51,092,000

[1] Figure obtained through cooperation with Bureau of the Census.
[2] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[3] Value included with "Miscellaneous."
[4] Value not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metal.
[7] "Commercial." Value of "Government-and-contractor" included with "Miscellaneous."
[8] Value reported for zinc in New Jersey is estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[9] Includes minerals indicated by footnotes 3 and 7 above.

Mineral products of the United States, 1946–48, by States—Continued

NEW MEXICO

Product	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
Arsenious oxide ... short tons	(1)	(1)	(1)	(1)	(1)	(1)
Beryllium concentrates ... do			(2)	(2)		
Bismuth ... pounds	(1)	(1)	(1)	(1)	(1)	(1)

Miscellaneous [9]	----------	25,858,979	----------	33,660,156	----------	41,330,702
Total value, eliminating duplications	----------	1,074,004,000	----------	1,269,762,000	----------	1,407,347,000

[1] Figure obtained through cooperation with Bureau of the Census.
[2] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[3] Value included with "Miscellaneous."
[4] Value not included in total value for State.
[5] The magnetite-pyrite-chalcopyrite ore from which copper, gold, and silver are recovered is classed by the Bureau of Mines as iron ore.
[6] No canvass.
[7] Exclusive of dimension basalt, value for which is included with "Miscellaneous."
[8] From zinc smelting.
[9] Includes minerals indicated by footnotes 3 and 7 above.

Miscellaneous [8]	-----	48,445,809	-----	49,143,383	-----	52,350,062
Total value, eliminating duplications	-----	68,031,000	-----	85,664,000	-----	95,863,000

[1] Value included with "Miscellaneous."
[2] Value not included in total value for State.
[3] Figure obtained through cooperation with Bureau of the Census.
[4] Value of clay used in cement and heavy clay products is included here but is not included in total value for State.
[5] No canvass.
[6] Not valued as ore; value of recoverable metal content included with the metals.
[7] From copper smelting.
[8] Includes minerals indicated by footnote 1 above.

[6] Includes minerals indicated by footnote 1 above.

Employment and Injuries

in the Mineral Industries[1]

By FORREST T. MOYER AND JOSEPH H. SCHUSTER

GENERAL SUMMARY

THE labor force in the mineral industries gained 3 percent in 1948 to an average of 722,300 men working daily. These men worked 250 days or 10 less than in 1947. The average shift worked at mineral operations in 1948 was 7.92 hours, which was nearly ¼-hour shorter than in 1947. The total man-hours of worktime in 1948 declined 3 percent from 1947 owing to the fewer days of work and the shorter shift that more than offset the increased employment. Despite the decrease in aggregate worktime, output from mineral operations in 1948 was at record levels in both tonnage and dollar volumes. It is apparent that output per man-hour was increased in 1948. The increase in productivity probably was attained principally from increased mechanization and from greater utilization of open-pit and strip-mining methods.

Salient statistics of employment and injury experience in the mineral industries in the United States, 1944–48, by industry groups

	1944	1945	1946	1947 [1]	1948 [2]
Average number of men working daily: [3]					
Coal mines	453,937	437,921	463,079	[4] 469,100	485,600
Metal mines	70,413	61,294	65,234	71,228	72,000
Nonmetal mines	11,261	10,371	11,312	12,176	12,200
Quarries	58,476	58,180	70,265	75,245	78,200
Coke plants	24,766	22,987	21,410	23,705	25,000
Metallurgical plants	58,085	46,467	44,954	49,082	49,300
Total	676,938	637,220	676,254	700,536	722,300
Average number of active mine-days: [5]					
Coal mines	281	259	224	[4] 244	229
Metal mines	289	288	249	275	277
Nonmetal mines	282	291	291	292	284
Quarries	268	264	274	279	282
Coke plants	351	344	337	350	350
Metallurgical plants	329	329	284	313	315
Total	287	271	240	260	250

See footnotes at end of table.

[1] Data on petroleum, natural gas, sand and gravel, and clay industries and on iron smelting and steel industries are excluded from this chapter.

[1] All data are final, except that data on coal mines are preliminary.
[2] Preliminary figures based on an average of 75 percent coverage.
[3] Average number of men at work each day mine was active. Because absenteeism and labor turn-over are taken into consideration, this number is lower than number of men available for work as measured by a count of names on pay roll.
[4] Preliminary figure based upon 70 percent coverage of the industry.
[5] Average in which operating time of each mine is weighted by average number of workers in mine.
[6] Totals of man-days and man-hours are additions of the rounded subtotals and may differ slightly from totals obtained before rounding.
[7] Revised figure.
[8] Data included for bituminous-coal mines are on portal-to-portal basis.

The safety record of the extractive industries in 1948 was the best annual record in the 37-year statistical history of these industries. The over-all frequency rate of 50.81 fatal and nonfatal injuries per million man-hours of worktime was a marked improvement over the corresponding rate of 53.30 in 1947. There were 1,229 fatal injuries during the year, 185 fewer than in 1947. The fatality rate of 0.86 per million man-hours was considerably better than the rate in the preceding year and lower than that of any year except 1946, in which the rate was also 0.86. The relatively favorable fatality experience in 1948 resulted largely from a significant reduction in the number of fatal injuries in anthracite and bituminous-coal mining. Nonfatal-injury experience was also appreciably better than in 1947. In fact, the rate of 49.95 nonfatal injuries per million man-hours was lower than that of any year for which injury statistics are available. Although most of the mineral industries improved their nonfatal-injury records in 1948, the greatest decreases in nonfatal injury-frequency rates occurred in metallurgical plants, quarries, metal mines, and nonmetal mines.

Work Stoppages.—The mineral-mining industries were affected by work stoppages to a greater extent than any other segment of the economy during 1948, largely because of prolonged labor-management disputes in the bituminous-coal industry. The 10,514,400 man-days of idleness resulting from work stoppages in mining operations amounted to more than 30 percent of the total man-days lost in the country because of stoppages, according to the United States Department of Labor. Excepting the records of 1943 and 1946, this was the largest annual total for mining since 1927. The 1948 work stoppages hampered the mining industries considerably more than in 1947, when 2,561,380 man-days of work were lost through strikes.

During the year there were 623 work stoppages in the mineral industries. Of these, 561 strikes causing a loss of 9,560,000 man-days were at bituminous-coal mines, 26 with a loss of 274,000 man-days were at anthracite mines, 11 with a loss of 473,000 days were at metal mines, and 5 causing a loss of 114,000 days were at metallurgical plants (primary smelters and refiners of nonferrous metals). Time lost through stoppages was not significant in the other mineral industries. Labor-management disputes at bituminous-coal mines accounted for more than 90 percent of the total man-days lost in the mining industries. Several stoppages in anthracite mining resulted from sympathy strikes in support of the demands of the United Mine Workers for effectuation of a welfare and pension plan for bituminous-coal miners.

The first major strike (one involving more than 10,000 men) started in the bituminous-coal industry on March 15 as a result of a dispute over activation of the miners' pension and welfare fund. President Truman appointed a board of inquiry under the national emergency provisions of the Taft-Hartley Act on March 23. The board's report was followed on April 3 by a court order instructing the union to order the miners back to work and directing the parties to resume collective bargaining. There was no immediate response to this injunction, and on April 7 the Government filed a request for contempt action against the union and its president, John L. Lewis. On April 19 the union and Mr. Lewis were found guilty of contempt of court; the union was fined $1,400,000, and its president was fined $20,000. Virtually all miners were back at their jobs on April 26. This stoppage involved 320,000 workers and lasted from March 15 to about April 25, although not all workers were idle for the entire period. It caused the loss of about 8,080,000 man-days of work. Because of this dispute, a sympathy strike started on April 6 in anthracite mines, where approximately 30,000 men remained away from work 2 to 8 days.

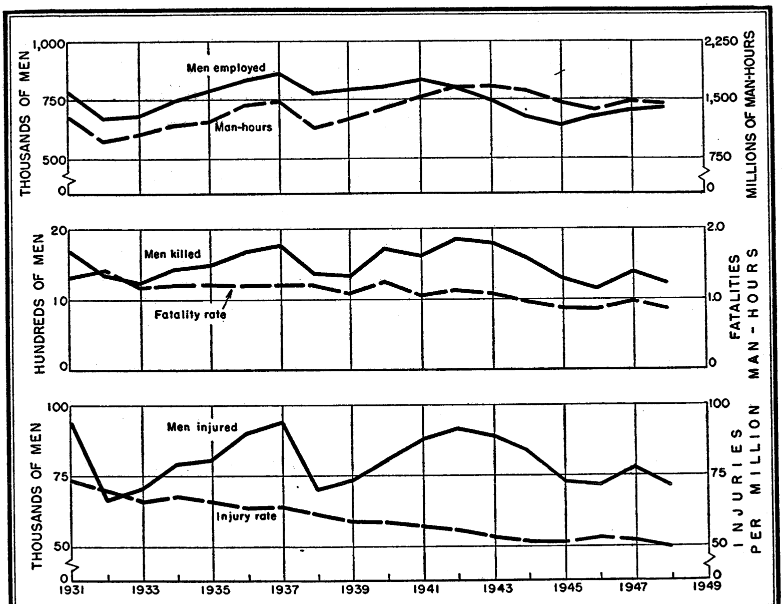

FIGURE 1.—Trends in employment and injury experience in the mineral industries of the United States, 1931–48.

Negotiations for a new wage agreement were concluded successfully by the commercial bituminous-coal operators and labor before the 1947 contract expired. The new agreement made no change in daily working time but increased the payment to the United Mine Workers of America Welfare and Retirement Fund to 20 cents per ton of coal mined for use or for sale.

However, on July 6 about 42,000 workers in "captive" bituminous-coal mines were involved in a work stoppage that lasted for 9 days when management refused to accept the union shop provision in the 1948 contract previously agreed upon with the commercial-mine operators. The captive-mine operators filed an unfair-labor-practice charge against the union with the National Labor Relations Board, contending that the provision violated the Labor-Management Relations Act (Taft-Hartley Act). About 40,000 commercial miners stopped work in a sympathy strike. The NLRB charged the union with a violation of the act and gave the union until July 13 to answer the charges. On that date the strike was settled temporarily when the operators accepted the union-shop clause with the provision that it would be modified if subsequent court rulings so required. This stoppage involved 82,000 workers and caused approximately 528,000 man-days of idleness.

Injury Experience.—All major disasters (a single accident in which five or more men are killed) in both 1948 and 1947 occurred in the coal-mining industry. The six major disasters in 1948 were in bituminous-coal mines, whereas in 1947 there were three disasters in bituminous-coal mines and three in anthracite mines. There were 49 deaths caused by the 6 major disasters in 1948, compared with 179 deaths from disasters in 1947. The Centralia mine explosion in March 1947, which killed 111 men, caused the 1947 disaster record to be extraordinarily high. Anthracite mines had no disasters in 1948, whereas 3 disasters at these mines resulted in 33 fatal injuries in 1947. The improvement of the major-disaster record of coal mines over that of 1947 was responsible, to a great extent, for the more favorable fatality experience of coal mines, as well as that of the mineral industries as a whole, in 1948.

The history of the coal-mining industry shows that progress has been made in recent years in lowering both the frequency and severity of major disasters. In the 21-year period, 1910–30, there was an average of 11 disasters with 264 deaths per year. However, in the 18 years since 1930 the annual average has been 5 disasters with 88 deaths. Thus, for the period since 1930, the frequency of disasters has been less than one-half that of the earlier period, and the severity has been one-third. Needless to say, the fact that there were six

Employment and injury experience of the mineral industries of the United States, 1931–48

[2] Partly preliminary.
[3] Preliminary.

disasters in bituminous-coal mines in 1948 demonstrates pressing need for more intensified work to control the hazards that cause disasters in coal mines.

The number of fatal injuries declined in each of the major branches of the mineral industries except nonmetal mines and coke ovens, which together reported an increase of five fatalities over the comparable total in 1947. The greatest decrease in the number of fatal injuries occurred in bituminous-coal and anthracite mines, which had 155 fewer fatal injuries than in 1947. Metallurgical plants recorded the greatest percentage decrease in the number of deaths—13 in 1948 compared with 21 in 1947. The total of 1,229 fatal injuries was 185 less than in 1947 and was lower than that of any year except 1946, according to fatality statistics on the mineral industries first compiled in 1911.

Nonfatal-injury experience improved appreciably during 1948. The total of 71,450 nonfatal injuries in all mineral industries was lower than that of any year since 1938, when man-hours of worktime were much lower than in 1948. The nonfatal injury-frequency rate of 49.95 per million man-hours was lower than in any year for which injury statistics are available for the mineral industries of the country. In 1948 all major groups of the mineral industries had fewer nonfatal injuries and lower nonfatal injury-frequency rates than in 1947.

NATIONAL SAFETY COMPETITION

The National Safety Competition, conducted annually by the Bureau of Mines, has been an effective means of promoting accident-prevention work in the mines and quarries of the country. Many of the 509 mineral operations (a record enrollment for any contest year) achieved outstanding safety records in 1948. Of the enrolled mines and quarries, 115 operations attained injury-free records. Aggregate worktime at these injury-free plants was more than 11 million man-hours. Trophy awards for the best safety records in each of the six groups of the competition were made to the following:

Anthracite Underground Mines.—The Hunter Tunnel mine of the Philadelphia & Reading Coal & Iron Co., Ashland, Pa.

Bituminous-Coal Underground Mines.—The Reliance No. 7 mine of the Union Pacific Coal Co., Reliance, Wyo.

Metal Underground Mines.—The Fraser mine of the Oliver Iron Mining Co., Fraser, Minn.

Nonmetal Underground Mines.—The Ironton mine of the Alpha Portland Cement Co., Ironton, Ohio.

Open-Pit Mines.—The Spruce mine of the Oliver Iron Mining Co., Eveleth, Minn.

Quarries.—The Hanover mine of the Bethlehem Steel Co., Hanover, Pa.

COAL MINES

The safety record of coal mines in the United States in 1948 was better than in 1947. The preliminary frequency rate of 63.46 injuries (fatal and nonfatal) per million man-hours of worktime was lower than in any other year except 1944 and 1945. On a production basis, the injury frequency rate of 83.84 injuries (fatal and nonfatal) per million tons of coal mined was the best annual record in the statistical history of the coal-mining industry in the United States. During 1948, 1,010 fatal injuries occurred in coal mining, a reduction of 155 from the number of deaths charged to the industry in 1947. The fatality rates of 1.16 per million man-hours and 1.54 per million tons were more favorable than the corresponding rates in the preceding year. The number of nonfatal injuries for the year likewise was considerably lower than in 1947, but the nonfatal-injury frequency rates for the year were only slight improvements over the corresponding rates in the previous year, since man-hours of exposure and production declined almost as significantly as the number of injuries. The drop in man-hours of worktime in the industry resulted from a slightly lower average length of shift and a decrease in the average number of days that coal mines were active. The average miner worked a 7.81-hour shift for 229 active days during the year, compared with a shift of 8.17 hours for 244 days in 1947. The average workyear per man was 1,786 hours, 203 hours less than in 1947. The average number of men working in the industry increased to 485,600, compared with 469,100 in the preceding year.

BITUMINOUS COAL

Employment.—The number of men working daily in bituminous-coal mines averaged 404,800 for 1948, a 4-percent increase over 1947. The results of a monthly canvass of bituminous-coal operations showed little variation in employment through the year. Work stoppages occurred in March and April, and the average number of men employed dropped to 391,300 in April, the lowest during 1948. Peak employment—409,900—was attained in August. Although the labor force in bituminous-coal mines was higher than in 1947, man-hours of worktime fell to 715,720,000, a reduction of 8 percent from the total worktime in 1947. The reduced worktime resulted in part from the 8-hour portal-to-portal shift effective throughout 1948, whereas in 1947 a 9-hour shift was worked during the first 6 months. During the year the average miner worked a shift of 7.95 hours for 223 workdays, compared with the shift of 8.35 hours and 239 workdays in the previous year. Thus, the average worker in bituminous-coal mines had a total workyear of 1,768 hours, 232 hours less than in 1947. Production in 1948 was 599,518,229 tons (final figure), or 5 percent below 1947.

Injuries.—Fatality experience in bituminous-coal mines was better in 1948 than in the preceding year. The total of 870 fatalities was 120 less than the number killed in 1947. These fatalities occurred at rates of 1.22 per million man-hours and 1.45 per million tons, which were more favorable than the respective frequencies of 1.27 and 1.57 in 1947. The rate per million tons for the year was the lowest in a statistical history of the industry extending over the past 75 years.

There were nearly 4,000 fewer nonfatal injuries than in 1947. The total of 41,715 nonfatal injuries occurred at the rate of 58.28 per million man-hours, a slight improvement over the rate of 58.50 in 1947. On a tonnage basis, the frequency rate of nonfatal injuries was 69.58 per million tons, compared with 72.47 in the preceding year. The appreciable decline in the number of injuries in 1948 was partly offset by the decline in man-hours of worktime and tonnage.

Employment and injury experience at coal mines in the United States, 1944–48

[1] Includes lignite.
[2] Revised figure.

During the year there were 6 major disasters, which resulted in the death of 49 men—3 explosions killed 32 men, 2 falls of roof resulted in the death of 12 men, and 5 men died from suffocation when gases from a surface fire were pulled underground. The total of six disasters for the year was the highest number in any year since 1943, when seven disasters occurred in bituminous-coal mines. However, the number killed in disasters was considerably lower than in 1947, when 146 men were killed in 3 disasters.

The 870 fatal injuries were distributed to the following types of operations in 1948: 773 in underground workings, 53 in surface works associated with deep mines, and 44 in stripping operations. In underground workings, falls of roof and face caused 484 deaths, haulage 154, explosions (major and local) 44, machinery 25, explosives 22, and electricity 19. Falls of roof and face was the only major cause of fatal injuries in bituminous-coal mines that proved to be a much greater hazard in 1948 than in 1947. Roof falls accounted for 56 percent of the fatalities in 1948 compared with 47 percent in 1947. The Health and Safety Division of the Bureau of Mines has established a Roof Control Section to make investigations and conduct research to find ways to control this hazard more effectively. Suspension-type roof supports or "roof bolting," advocated by the Bureau of Mines, has been standardized in some mines and is now past the experimental stage. The fatality record of bituminous-coal mines in 1948 was better than in 1947 because of the significant drop in fatal injuries caused by haulage and explosions.

ANTHRACITE

Employment.—Employment at anthracite operations during 1948 increased 3 percent over 1947 to an average of 80,800 workers in 1948. Results of a monthly canvass of the Bureau of Mines showed a gradual upward trend from a low of 78,300 workers in January to a high of

83,300 employees in November. This increased working force averaged 259 active working days during the year, compared with an average of 265 days in the preceding year. The decrease in the average number of working days offset the increase in employment; as a result, the total worktime in anthracite mines—151,780,000 man-hours—was slightly lower than in 1947. Total production of 57,139,948 tons of anthracite was only slightly less than total output in the preceding year.

Injuries.—Injury experience at anthracite mines was more favorable during 1948 than in 1947. The fatality rates of 0.92 per million man-hours and 2.45 per million tons were significantly lower than the rates of 1.15 and 3.06, respectively, for the preceding year. On the basis of both man-hours of exposure and total output of anthracite, these fatality rates stand out as the best annual records in the history of anthracite mining in the United States. Nonfatal injury-frequency rates likewise were improved in 1948. The total of 12,330 injuries for the year had frequencies of 81.24 per million man-hours and 215.79 per million tons, compared with a total of 12,500 injuries with rates of 82.24 and 218.57, respectively, in 1947.

The 140 fatal injuries at anthracite mines occurred as follows: 121 in underground workings, 12 in surface works associated with underground mines, and 7 in stripping operations. Falls of roof and face caused 85 fatalities, or 70 percent of the total in underground working. As was the case in bituminous-coal mining, the rate of occurrence of fatal injuries caused by this hazard was higher than in 1947. The relatively favorable fatality experience in anthracite mining in 1948 was due primarily to the lowering of the number of men killed in explosions from 35 in 1947 to 2 in 1948. Haulage accidents caused six fewer fatalities in 1948 than in the year preceding, but this reduction was offset by an increase of six fatalities in stripping operations in 1948.

In 1948 there were no major disasters in anthracite mines, whereas in 1947 3 disasters, all explosions, resulted in the death of 33 workers. The disaster-record of the anthracite industry has been good in recent years—8 of the past 10 years have been disaster-free.

METAL MINES

The safety record of metal mines for 1948 was much better than in 1947. The over-all injury-frequency rate (fatal and nonfatal) was 47.46 per million man-hours, which was significantly lower than the comparable rate of 53.62 for the preceding year. The safety performance of each of the metal-mining groups showed improvement over that of the year before. Nonfatal frequency rates declined in all groups. Fatality rates declined in all groups except gold-silver lode mining, in which the rate of 1.27 deaths per million man-hours was the same for both years. There was little change in employment in 1948. The 72,000 metal miners worked 160,480,000 man-hours during the year, a very slight increase over the total worktime in 1947. Metal mines worked an average shift of 8.06 hours for 277 days. Thus, the average worker had a workyear of 2,229 hours, an increase of 24 hours over 1947.

Employment and injury experience at metal mines in the United States, 1946–48, by industries

[1] Includes antimony, bauxite, chromite, cobalt, manganese, mercury, molybdenum, pyrite, titanium, tungsten, and vanadium-uranium mines.

IRON

Employment.—The average number of men at work daily in iron mines increased slightly to a total of 26,900 in 1948. Iron mines averaged 284 active days during the year and had a total of 61,920,000 hours of worktime, which was slightly higher than in 1947. The average employee in iron mines had a workyear of 2,302 hours, or 106 hours more than in the preceding year.

Injuries.—The number of fatal injuries in iron mines declined slightly to 33, compared with 36 deaths in 1947. This decline in fatal injuries, together with increased exposure time in 1948, resulted in a rate of 0.53 death per million man-hours, an improvement over the rate of 0.62 for the preceding year. The increase in nonfatal injuries to 1,460 in 1948 was more than offset by the increase in worktime over that in 1947. As a result, the nonfatal-injury rate of 23.58 per million man-hours was lower than the rate for the preceding year.

COPPER

Employment.—The number of men working in copper mines gained slightly to an average of 16,300 for the year. Copper mines averaged 306 working days during the year and provided a total of 39,850,000 man-hours of employment, a 4-percent increase over 1947. The average employee worked an 8-hour shift during the year and had 2,445 hours of work, or approximately the same as in 1947.

Injuries.—Despite the increased man-hours of worktime in 1948, both fatal and nonfatal injuries were reduced in number at copper mines. The rates of 0.78 fatality and 39.65 nonfatal injuries per million man-hours were much better than the corresponding rates in 1947.

883326—50——7

LEAD-ZINC

Employment.—Available reports indicate that employment in lead-zinc mines declined below that of 1947 to a total of 16,400 men. Lead-zinc mines had an average of 255 working days during the year and worked a total of 33,470,000 man-hours, a decline of 6 percent from aggregate worktime at these mines in 1947. The average work-year per man was 2,041 hours, or 101 hours less than in 1947.

Injuries.—The safety record of lead-zinc mines was much better than in 1947. Fatality experience at these mines was improved greatly. In all, 19 men were killed in 1948, compared with 33 deaths in the preceding year. The rate of 0.57 death per million man-hours was a sharp improvement over the rate of 0.93 in 1947. Similarly, the 2,925 nonfatal injuries occurred at a rate of 87.39 per million man-hours, which was lower than the rate of 90.43 for 1947.

GOLD-SILVER LODE

Employment.—The employment of 5,400 men in gold and silver lode mines during the year was a slight reduction from the average number of men working at these mines in 1947. As these mines worked an average of 261 days, compared with 255 days in 1947, the total of 11,000,000 man-hours of worktime was only slightly less than in 1947. Each employee averaged 2,037 man-hours of work during the year, or 39 more than in 1947.

Injuries.—There were 14 fatal injuries in both 1948 and 1947 in gold-silver lode mines; the fatality rate of 1.27 per million man-hours was identical in both years. However, the number of nonfatal injuries was reduced 20 percent from the 1947 total to 950. The frequency rate of 86.36 per million man-hours was appreciably better than the rate of 107.74 in 1947.

GOLD PLACER

Employment.—The average number of men working daily in gold placer mines increased slightly to 4,100 in 1948. These mines averaged 217 working days during the year, or 5 more than in 1947. Total man-hours of worktime increased 7 percent over the 1947 figure to a total of 7,660,000 man-hours. The average employee worked 1,868 hours during the year, or 40 more than in 1947.

Injuries.—There were 1 fatality and 180 nonfatal injuries in gold placer mines during the year, compared with 3 fatalities and 230 nonfatal injuries in 1947. Thus, injuries were reduced at these mines despite increased exposure-time. The rates of 0.13 fatality and 23.50 nonfatal injuries per million man-hours of work were marked improvements over the corresponding rates in 1947.

MISCELLANEOUS METAL

Employment.—The labor force of 2,900 men during the year was slightly lower than in 1947 in the mines of this group, which includes antimony, bauxite, chromite, cobalt, manganese, mercury, molybdenum, pyrite, titanium, tungsten, and vanadium-uranium operations. These mines operated an average of 279 working days during the year, virtually the same as in 1947. Total man-hours of worktime were slightly less than in the year preceding. These mines worked an average shift of 8.12 hours, compared with 8.01 hours in 1947. The average workyear per man was 2,269 hours, or 25 more than in the preceding year.

Injuries.—The injury record of miscellaneous metal mines during the year was a significant improvement over that of the preceding year, when their safety record was relatively unfavorable. The number of fatal and nonfatal injuries was reduced greatly; there were 3 fatal and 420 nonfatal injuries during the year, compared with 8 fatal and 592 nonfatal injuries in 1947. The frequency rates of 0.46 fatal and 63.83 nonfatal injuries per million man-hours were considerably lower than the corresponding rates of 1.18 and 87.63, respectively, in the year preceding.

Employment and injury experience at nonmetal mines and quarries in the United States, 1946–48, by industries

Industry and year	Men working daily	Average active mine-days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours	
					Fatal	Nonfatal	Fatal	Nonfatal

[1] Includes barite, feldspar, fluorspar, gypsum, magnesite, mica, phosphate rock, rock salt, sulfur, and miscellaneous nonmetallic-mineral mines.
[2] Includes burning or calcining and other mill operations.

NONMETAL MINES

Employment.—The average of 12,200 men at work daily in 1948 was virtually the same as in the preceding year in this group of mines, which comprises barite, feldspar, gypsum, magnesite, mica, phosphate rock, rock salt, sulfur, and miscellaneous nonmetallic-mineral operations. Total man-hours of worktime at these mines was slightly lower than in 1947. The average workyear per man was 2,324 hours, or 42 less than in 1947.

Injuries.—The over-all safety record of nonmetal mines for the year was better than in 1947 because of improved nonfatal-injury experience. However, fatality experience was less favorable. The 15 deaths at these mines occurred at the rate of 0.53 per million man-hours, compared with 12 fatalities and a rate of 0.42 in 1947. The rate of 41.09 nonfatal injuries per million man-hours was appreciably better than the rate of 45.40 in 1947.

QUARRIES

The over-all injury experience in the quarry industries during 1948 was more favorable than in 1947. There were fewer fatal and nonfatal injuries in 1948, despite the fact that man-hours of exposure were 5 percent greater than in 1947. The fatality rate of 0.40 per million man-hours was an improvement over the comparable rate of 0.44 in 1947, and the nonfatal-injury rate of 27.77 was appreciably lower than the rate of 32.00 for the previous year. Operating activity in the quarry industries was greater than in 1947. The average of 78,200 men working was approximately 3,000 higher than in the previous year. These industries worked an average shift of 8.18 hours for 282 days, or 3 more than in 1947. The average employee had a workyear of 2,307 hours, or 21 more than in 1947.

CEMENT

Employment.—The average number of men working in cement quarries and mills increased slightly in 1948 to a total of 28,700. These men worked an average of 327 days, or 12 more than in the preceding year. Total man-hours of worktime increased to 75,190,000 man-hours, or 6 percent more than the comparable figure for 1947. The average employee worked a shift of 8.02 hours during the year and had a workyear of 2,620 hours, or 109 hours more than in the previous year.

Injuries.—Despite increased exposure time in cement quarries and mills during the year, there were fewer fatal and nonfatal injuries than in 1947. The 24 fatalities occurred at a rate of 0.32 per million man-hours, and the 800 nonfatal injuries had a rate of occurrence of 10.64. Both rates represent improvements over the corresponding frequencies in 1947.

LIMESTONE

Employment.—Employment at limestone operations in 1948 was slightly higher than in 1947, but the average number of active working days dropped to 239, or 7 less than in the preceding year. Men at these operations had a total worktime of 43,900,000 man-hours, or slightly less than in the preceding year. Each employee worked an average shift of 8.46 hours and had a total workyear of 2,023 hours, or 65 hours less than in 1947.

Injuries.—The over-all injury experience at limestone operations was favorable because of a greatly improved nonfatal-injury record. However, fatality experience for the year was less favorable than in 1947. The 28 fatalities occurred at a rate of 0.64, compared with a rate of 0.54 for the year preceding. The nonfatal injury-frequency rate of 39.52 per million man-hours was a significant improvement over the rate of 43.45 for 1947.

LIME

Employment.—Employment at lime plants and associated quarries in 1948 increased to an average of 9,900 men working daily. As this increased working force averaged 299 active days, 8 more than in 1947, aggregate man-hours of worktime increased 9 percent to a total of 23,710,000. The average employee at these operations worked a shift of 8.00 hours for the year and had a total workyear of 2,395 hours, or 53 more than in 1947.

Injuries.—Fatality experience at lime plants and associated quarries was less favorable than in 1947. The nine fatalities occurred at a rate of 0.38 per million man-hours, compared with six deaths and a frequency rate of 0.28 in 1947. On the other hand, the rate of 41.97 nonfatal injuries per million man-hours was significantly lower than comparable rate of 47.16 for the preceding year. From an over-all standpoint, the safety record of these operations was improved considerably in 1948.

MARBLE

Employment.—Activity in marble operations dropped in 1948. These operations employed 3,100 men for an average of 243 working days, or 19 less than in 1947. Total man-hours of worktime during the year declined 14 percent from the 1947 total to 5,900,000. Each employee averaged a shift of 7.82 hours during 1948 and had a total workyear of 1,903 hours, 256 less than in 1947.

Injuries.—The number of fatal and nonfatal injuries in marble operations declined in 1948. The fatality rate of 0.17 per million man-hours was lower than the comparable rate of 0.29 in 1947. However, the nonfatal rate of 31.36 per million man-hours was higher than the rate of 29.27 for the preceding year.

GRANITE

Employment.—Employment in 1948 gained 10 percent over 1947 to a total of 6,300 men, who worked an average of 268 days, or 15 more than in the preceding year. Total worktime was 15 percent higher than the comparable total for 1947. In 1948 the average granite worker had a shift of 8.19 hours and a workyear of 2,192 hours, 96 more than in 1947.

Injuries.—Fatality experience in granite operations was less favorable than in 1947. The six fatalities occurred at the rate of 0.43 per million man-hours, which was higher than the rate of 0.33 for the preceding year. However, nonfatal-injury experience improved considerably. The rate of 36.21 nonfatal injuries per million man-hours was much more favorable than the rate of 54.32 for 1947.

TRAPROCK

Employment.—The average number of men working at traprock quarries increased to 2,600 men, who averaged 232 working days during the year, 10 less than in 1947. The aggregate worktime in these operations was virtually the same in both years. The average employee worked a shift of 8.43 hours and a workyear of 1,958 hours, 99 less than in the preceding year.

Injuries.—Injury experience in these quarries during the year was more favorable than in 1947. The rates of 0.20 fatal and 51.08 nonfatal injuries per million man-hours were lower than the corresponding rates for the preceding year.

SLATE

Employment.—An average of 1,900 men worked in slate quarries in 1948, a slight gain over the preceding year. These quarries averaged 275 working days, 8 more than in 1947. The aggregate worktime of 4,890,000 man-hours was 17 percent higher than the comparable total for the preceding year. The average employee worked a shift of 9.37 hours and had a workyear of 2,574 hours, 175 hours more than in 1947.

Injuries.—The preliminary totals of 3 fatalities and 195 nonfatal injuries occured at frequencies of 0.61 and 39.88 per million man-hours of work. Both of these rates were more favorable than the comparable frequency rates for 1947.

SANDSTONE

Employment.—Employment at sandstone quarries increased to a total of 4,000 men, who worked an average of 239 days, 4 less than in 1947. The aggregate of 7,950,000 man-hours of work at these quarries was 10 percent higher than the corresponding total for 1947. The average shift was 8.32 hours, and each worker averaged a workyear of 1,988 hours, 67 hours less than in 1947.

Injuries.—Fatality experience at sandstone quarries was improved remarkably in 1948. There was one fatality during the year, compared with seven deaths chargeable to 1947. The rate of 0.13 death per million man-hours was significantly lower than the rate of 0.97 for the preceding year. Nonfatal-injury experience likewise was much better in 1948. The rate of 42.77 nonfatal injuries was appreciably better than the rate of 53.09 for 1947.

COKE PLANTS

The fatality record at coke plants during the year was slightly less favorable than in 1947, but the nonfatal experience was improved. Total employment increased to 25,000 men, who averaged 350 active working days during the year. Man-hours of worktime at coke plants increased 5 percent over that in 1947 to a total of 69,540,000. Fatality experience was slightly less favorable than in 1947; the rate of 0.24 death per million man-hours was slightly higher than in 1947. On the other hand, the nonfatal injury-frequency rate of 13.01 was an improvement over the corresponding rate in the preceding year.

Employment and injury experience at coke plants in the United States, 1946–48

Type and year	Men working daily	Average active plant-days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours	
					Fatal	Nonfatal	Fatal	Nonfatal
Byproduct ovens:								
1946	18,906	354	6,693,947	53,547,047	8	648	0.15	12.10
1947	20,778	362	7,526,622	60,271,826	11	701	.18	11.63
1948 (preliminary)	21,900	363	7,958,000	63,590,000	15	680	.24	10.69
Beehive ovens:								
1946	2,504	204	510,740	4,163,075		162		38.91
1947	2,927	262	766,542	5,846,933	4	225	.68	38.48
1948 (preliminary)	3,100	256	795,000	5,950,000	2	225	.34	37.82

BYPRODUCT COKE

Employment.—The average of 21,900 men working in byproduct-coke plants was slightly higher than in 1947. These men averaged 363 active days, and their aggregate worktime totaled 63,590,000, or 6 percent higher than in the preceding year. The average shift at these plants was 7.99 hours and the average workyear per man 2,904 hours.

Injuries.—The 15 fatalities at byproduct-coke plants occurred at a rate of 0.24 per million man-hours, which was higher than the rate of 0.18 in 1947. However, nonfatal-injury experience was better than in the preceding year. The rate of 10.69 nonfatal injuries per million man-hours was an improvement over the rate of 11.63 for 1947.

BEEHIVE COKE

Employment.—Employment at beehive plants during the year increased to 3,100 men, who averaged 256 active working days, 6 less than in 1947. The aggregate worktime of 5,950,000 man-hours at these plants was slightly higher than in 1947. The average shift at these plants was 7.48 hours and the average workyear per employee was 1,919 hours, 79 less than 1947.

Injuries.—The injury record of beehive plants during the year was better than in 1947. The two fatalities occurred at the rate of 0.34 per million man-hours, which was one-half the rate of 0.68 for 1947. The nonfatal frequency of 37.82 per million man-hours was slightly lower than the comparable rate for the preceding year.

METALLURGICAL PLANTS

The safety record of metallurgical plants was much better in 1948 than in 1947. There were 13 fatal injuries compared with 21 the year before. The fatality rate of 0.10 per million man-hours was a significant improvement over the rate of 0.17 for the preceding year. Nonfatal experience was also appreciably better. Employment was virtually the same as in 1946, but active working days increased to 315. The average length of shift was 8.01 hours and the average workyear per man 2,519 hours, 21 more than in 1947.

ORE-DRESSING PLANTS

Ore-dressing includes such milling operations as crushing, screening, washing, jigging, magnetic separation, and floatation of ores (metallic).

Employment.—The average number of men working in all metal mills in 1948 increased very slightly to 16,100. Increases in employment in copper and lead-zinc mills more than offset the slight decline in the average number of workers in gold-silver, iron, and miscellaneous-metal mills. Aggregate worktime in these metal mills increased to 36,730,000 man-hours. The average employee worked 8.02 hours per shift and 2,280 hours during the year, 8 hours more than in 1947.

Injuries.—The fatality record of metal mills was less favorable than in 1947. The nine fatalities chargeable to these mills occurred at the rate of 0.25 per million man-hours, compared with a rate of 0.19 in the preceding year. On the other hand, the nonfatal rate of 22.73 injuries per million man-hours was lower than the rate of 24.05 in 1947.

Employment and injury experience at ore-dressing (metallic) plants in the United States, 1946–48, by industries [1]

Industry and year	Men-working daily	Average active mill-days	Man-days worked	Man-hours worked	Number of injuries		Injury rates per million man-hours	
					Fatal	Nonfatal	Fatal	Nonfatal
Copper:

[1] Includes crushers, grinders, washers, ore concentrators, and sintering, cyaniding, leaching, and other ore-dressing plants and auxiliary works.
[2] Includes aluminum, antimony, chromium, manganese, mercury, molybdenum, tungsten, vanadium, and other metals.

NONFERROUS REDUCTION PLANTS AND REFINERIES

The reduction plants and refineries in this classification are engaged in the primary extraction of nonferrous metals from ores and concentrates and the refining of crude primary nonferrous metals. Iron and steel plants are excluded.

Employment.—Employment in each group of plants except the zinc group was higher in 1948 than in 1947. The average of 33,200 men working was slightly higher than in the preceding year. The aggregate worktime of 87,470,000 man-hours likewise was slightly higher. In 1948 the average employee worked 8 hours per shift and 2,635 hours during the year, 28 more than in 1947.

Injuries.—The safety record of these operations during the year was considerably improved over that of 1947. The number of fatal injuries was lower in each group of plants except zinc, which had one fatal in both 1947 and 1948. The number of nonfatal injuries was lower in all groups. The 4 fatal injuries occurred at a rate of 0.05 per million man-hours, compared with 14 fatalities and a rate of 0.16 for 1947. Similarly, the nonfatal injury-frequency rate of 22.58 per million man-hours was an improvement over the rate of 27.27 for the preceding year.

Employment and injury experience at primary nonferrous reduction and refinery plants in the United States, 1946–48, by industries [1]

PART II. COMMODITY REVIEWS

Abrasive Materials

By ROBERT W. METCALF

GENERAL SUMMARY

RECORD high outputs were established in 1948 for quartz, ground sand and sandstone, and pumice and pumicite. Sales of diatomite remained at an active level. Particularly noteworthy are the large increases shown for quartz (due to a large new operation) and for pumice and pumicite, the latter because of the large gain in use as aggregate in the West and Southwest. Garnet and emery each declined moderately in volume. Production of garnet, however, except for 1947 was the highest of any year since 1925, and value of emery output was the second highest since 1918. For other natural abrasives, for which figures are given in the accompanying table, large proportional decreases in tonnage were reported. Production of silicon carbide and aluminum oxide and shipments of metallic abrasives in 1948 were slightly less than in 1947, although the total realizations for silicon carbide and aluminum oxide were somewhat higher than in 1947. The value of metallic abrasives was 22 percent higher.

The value of imports of natural abrasive materials in 1948 totaled $34,184,654, an increase of 143 percent over 1947. Augmented imports of diamond bort, carbonados and ballas, and diamond dust were the chief factors in this large rise. Receipts of crude pumice and corundum ore also rose in both quantity and value, while imports of flint and Turkish emery declined. The value of exports of natural abrasive products in 1948 declined 21 percent to $2,643,608, all classes of exports showing substantial losses in quantity compared with 1947.

Salient statistics of the abrasives industries in the United States, 1947–48

	1947		1948		Percent of change in 1948	
	Short tons	Value	Short tons	Value	Short tons	Value

[1] Average annual figure for 1945–47 was 213,588 short tons valued at $4,307,088; Bureau of Mines not at liberty to publish annual data separately.
[2] Revised figure.
[3] Bureau of Mines not at liberty to publish figure.
[4] Tonnage of millstones not recorded.
[5] Includes Canadian production.
[6] Not feasible to total weights because of incommensurable units.

This chapter includes data for many of the materials used for abrasive purposes, although certain clays, carbides, oxides, and other substances noted later under Miscellaneous Mineral Abrasive Materials are not included in the statistics shown herein. Certain of the abrasive products for which figures are given also have important nonabrasive uses.

NATURAL SILICA ABRASIVES

Diatomite.—Output of diatomite in 1948 continued at an active pace. Current production figures may not be published by the Bureau of Mines, but the average annual production of diatomite for the 3-year period 1945–47 totaled 213,588 short tons valued at $4,307,088. Average annual data for preceding periods were: 1942–44, 174,957 tons, valued at $3,298,178; and 1939–41, 120,167 tons valued at $1,915,405.

Producing States in 1948 were California, Oregon, Nevada, and Washington. The largest producer by far is California. Moderate increases in output in 1948 as compared with 1947 were reported by two States and moderate decreases by the others. Exact statistics showing uses of diatomaceous earth may not be published. It is, however, possible to indicate approximate percentages of diatomite consumed in the major uses: Filtration, somewhat over half of the total shipments; fillers, about one quarter of shipments; and insulation, about one eighth. Other uses, including abrasives, comprised the remainder.

Prices for diatomite continued firm during 1948 and the market stable, with supplies adequate for most grades. In fact, quotations on diatomite for 1946 through 1948, as reported in E&MJ Metal and Mineral Markets, remained unchanged as follows: Per ton, f. o. b. mill, Nevada, crude, in bulk, dried, nominal: 98- to 100-mesh, $25; low-temperature insulation, $25; high-temperature insulation, $40; fine abrasive, 2 to 3 cents per pound (bags are extra). California filtration grades were quoted at $20 to $50 per ton f. o. b. mill.

The effect of continued inhaling of diatomaceous earth was described.[1] Various types of diatomite filters were described,[2] including use for swimming-pool recirculating systems [3] and Canadian army filtration apparatus.[4]

Considerable interest has been manifest in the use of diatomite in cobalt catalysts in the Fischer-Tropsch process and several studies dealing with phases of this development have been published.[5]

An investigation of Australian diatomites as filter mediums was published.[6] A good description of tests of Scottish diatomite from the Isle of Skye was given in the British trade press.[7] A diagram showing many possible applications for this material was included. Algerian diatomaceous earth deposits were described.[8] A comprehensive study of the diatomaceous earth deposits of the Union of South Africa includes information as to occurrence, mining, preparation, uses, and other phases of the industry.[9]

Tripoli.—Sales of tripoli, amorphous silica, and rottenstone in 1948 declined 22 percent in quantity and 6 percent in value to 26,845 short tons valued at $705,523. The total value, however, is 24 percent greater than that in 1920, the peak year in value except for 1947. The decrease in tonnage was due largely to discontinuance of the business of one of the two firms reporting production in Illinois for many years. Other States producing these mineral substances in 1948 were Missouri and Pennsylvania.

Tripoli is used chiefly as an abrasive in polishing and buffing compositions, and as a filler. Tripoli sold for abrasive uses in 1948 declined 26 percent and that sold as filler increased 6 percent compared with 1947. Tonnages sold for other uses, including foundry facing, decreased 10 percent.

1945	18,247	306,829	1948	26,845	705,523

[1] Including Pennsylvania rottenstone.

Tripoli [1] sold or used by producers in the United States, 1946–48, by uses

Use	1946		1947		1948	
	Short tons	Value	Short tons	Value	Short tons	Value
Abrasives	21,206	$406,620	29,866	$654,232	22,193	$606,402
Filler	4,450	89,721	2,573	47,640	2,723	45,000
Other uses [2]	3,299	52,758	2,139	49,550	1,929	54,121
Total	28,955	549,099	34,578	751,422	26,845	705,523

[1] Including Pennsylvania rottenstone.
[2] Foundry facing and miscellaneous uses.

As quoted in E&MJ Metal and Mineral Markets, prices on tripoli in 1948 were the same as in the preceding 4 years (per short ton, f. o. b. Missouri, in paper-lined burlap bags, minimum carlot 30 tons): Once-ground, through 40-mesh, rose or cream, $14.50; double-ground, through 110-mesh, rose or cream, $16; air-floated, through 200-mesh, $26. Dry-ground, 325-mesh amorphous silica, f. o. b. works, Illinois, at the beginning of 1948 was quoted in Oil, Paint and Drug Reporter at $24 to $40 per ton in carlots and $29 for less than carlots. These quotations were reduced in July to $20 to $30 per ton for carlots and $25 for less than carlots. No change occurred during the balance of the year. Quotations on rottenstone throughout 1948, as given by the same source, were unchanged from those reported in April 1947: Carlots, in bags, at mines, $36 per short ton; and less than carlots, $43 per ton.

Firms actively producing tripoli, amorphous silica, and rottenstone in 1948 were: Illinois (amorphous silica)—Ozark Minerals Co., Cairo; Oklahoma (mine) and Missouri (mill)—American Tripoli Corp., Seneca, Mo.; and Pennsylvania (rottenstone)—Keystone Filler & Mfg. Co., Muncy, and Penn Paint & Filler Co., Antes Fort. Ray Williams and Charles Hinz, of Cairo, Ill., who had acquired the Olive Branch Mineral Co., Olive Branch, Ill., discontinued operations early in 1948.

Quartz.—Sales of crude, crushed, and ground quartz from pegmatite veins or dikes and from quartzite in 1948 rose to 161,861 short tons, valued at $750,667, a new record in both tonnage and value. The 1948 level was 60 percent in quantity above 1947 and 6 percent greater than the former record tonnage in 1914 (153,401 tons). The value reported for 1948 was 77 percent greater than that in 1947, the former peak year in realization. These increases in 1947 and 1948 were due largely to the augmented use of crushed quartz in the manufacture of ferrosilicon in Western States and to the greater use of vein quartz from North Carolina.

Quartz (crude, crushed, and ground) [1] sold or used by producers in the United States, 1944–48

Year	Crude		Crushed		Ground		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1944	15,222	$35,279	61,823	$170,325	5,334	$80,874	82,379	$286,478
1945	24,392	72,392	28,718	93,631	4,654	70,780	57,764	236,803
1946	38,587	107,069	29,228	109,437	5,364	77,346	73,179	293,852
1947	21,940	118,231	[2] 62,169	[2] 170,254	17,208	136,040	[2] 101,317	[2] 424,525
1948	41,081	250,184	104,496	374,781	16,284	125,702	161,861	750,667

[1] To avoid duplication, the ground material shown here is only that ground by the original producers of the crude quartz or by grinders who purchase from small miners not reporting their production.
[2] Revised figure.

Quartz (crude, crushed, and ground) [1] sold or used by producers in the United States, 1946–48, by States

State	1946		1947		1948	
	Short tons	Value	Short tons	Value	Short tons	Value
Arizona, California, Oregon, Washington	41,844	$160,266	54,137	$255,044	91,926	$493,481
Massachusetts	829	7,715	1,019	9,185	792	7,288
Other States [2]	30,506	125,871	[3] 46,161	[3] 160,296	69,143	249,898
Total	73,179	293,852	[3] 101,317	[3] 424,525	161,861	750,667

[1] To avoid duplication, the ground material included is only that ground by the original producers of the crude quartz or by grinders who purchase from small miners not reporting their production.
[2] Maryland, North Carolina, South Dakota, Tennessee, and Wisconsin.
[3] Revised figure.

Crude and crushed quartz outputs were substantially higher in 1948 than in 1947, and sales of ground material decreased somewhat. The average value per ton of such quartz sold in 1948 rose to $4.64 compared with $4.19 in 1947 and $4.02 in 1946. Not included in these statistics in 1948 were sales of quartzite to cement mills and certain sales of quartz or quartzite for use in the manufacture of ferrosilicon.

Combined production of Arizona, California, Oregon, and Washington in 1948 again rose sharply and probably was largely consumed in the manufacture of ferrosilicon. Output in Eastern States also increased substantially. Quotations on "hard-quartz" silica at the beginning of 1948, reported in Oil, Paint and Drug Reporter, were as follows: 325-mesh, (99½-percent grade) carlots in bags, $20 per ton, and less than carlots, $25; and 140-mesh (99½-percent grade) carlots in bags, $15 per ton, and less than carlots, $20. During the first week in July all these prices were reduced $5 per ton and remained at the lower level for the rest of 1948.

Ground Sand and Sandstone.—Ground sand and sandstone sold or used by producers in 1948 topped the previous year in both tonnage and value and reached a record high. The sales in 1948 totaled 702,572 short tons valued at $5,814,664—8 percent greater in quantity and 12 percent higher in value than in 1947, the former peak year. Average value per ton in 1948 rose to $8.28 compared with $7.96 in 1947. Sales in Illinois, the largest producing State, were 17 percent above 1947. The Ohio-Virginia-West Virginia district in 1948 rose 9 percent above 1947. Georgia and Massachusetts showed small gains in 1948 compared with 1947. Sales in New Jersey, one of the larger producing States, decreased slightly. Large producing States other than New Jersey and Illinois were Ohio, Pennsylvania, and West Virginia.

Ground sand and sandstone sold or used by producers in the United States, 1944–48

Year	Short tons	Value	Year	Short tons	Value
1944	558,606	$3,989,981	1947	651,120	$5,181,113

The chief consumers of ground sand and sandstone in 1948 were the pottery, porcelain, and tile industries (40 percent of the tonnage for which uses were reported), makers of cleaning and scouring compounds and other abrasive products (23 percent), foundries (15 percent), glass manufactures (6 percent), and producers of enamel (5 percent). This distribution is based on reports from companies accounting for 92 percent of the total sales. Filler and miscellaneous comprise the rest of the tonnage for which data were given. The uses showing increases in 1948 over 1947 were pottery, porcelain, and tile; foundries and abrasive products.

Ground sand and sandstone sold or used by producers in the United States in 1948, by uses [1]

Use	Short tons	Value	
		Total	Average per ton
Abrasive:			
Cleansing and scouring compound	138,138	$1,003,643	$7.27

Other uses	56,822	435,243	7.66
Total reported by uses	646,372	5,336,964	8.26

[1] Data represent 92 percent of the industry.

Abrasive Sands.—Large quantities of natural sands with a high silica content annually are sold for glass grinding, stone polishing, coating sandpaper, sandblasting, or other abrasive purposes. Sales of such abrasive sands in 1948 totaled 1,119,802 short tons valued at $2,151,095, an increase of 2 percent in quantity and 19 percent in value compared with 1947. The 1948 figures include 381,455 tons of blast sand valued at $1,189,530. Detailed data regarding tonnages produced in each State appear in the Sand and Gravel chapter of this volume.

SPECIAL SILICA-STONE PRODUCTS

Grindstones and Pulpstones.—Sales of grindstones in 1948 decreased by 25 percent compared with 1947 and were the lowest since 1939. The value declined to a point slightly above the 1945 level. Grindstones were produced in Ohio and West Virginia, and output of pulpstone was reported from Washington.

Grindstones and pulpstones sold by producers in the United States, 1944–48

Year	Grindstones		Pulpstones		
			Quantity		Value
	Short tons	Value	Pieces	Equivalent short tons	
1944	9,373	$356,106	(1)	(1)	(1)

[1] Bureau of Mines not at liberty to publish figure.

Oilstones and Related Products.—Production of natural sharpening stones, including oilstones, whetstones, scythestones, and rubbing stones, continued at an active rate in 1948; the Bureau of Mines is not at liberty to publish the figures. Producing States in 1948, and the type of abrasive stones reported from each, were: Arkansas—oilstones; Indiana—scythestones, whetstones, and rubbing stones; New Hampshire—scythestones; and Ohio—scythestones, whetstones, and rubbing stones (holystones).

Millstones.—The value of sales of millstones and chasers in 1948 declined 24 percent compared with 1947, but still was higher than other years since 1929. As in 1947, marketed production in 1948 of millstones and chasers was reported in Ulster County, N. Y., Rowan County, N. C., and in Montgomery County, Va.

Value of millstones and chasers sold by producers in the United States, 1943–48 [1]

Year	Number of producers	Value	Year	Number of producers	Value
1943	4	$9,240	1946	4	$14,780
1944	3	9,700	1947	4	23,189
1945	4	15,018	1948	3	17,733

[1] Produced in Minnesota (1945 only) New York, North Carolina, and Virginia.

Grinding Pebbles and Tube-Mill Liners.—The quantity of grinding pebbles sold or used in 1948 was 31 percent less than in 1947 and the total value 17 percent less. The tonnage of tube-mill liners also decreased, although the value of sales showed a small increase. Grinding pebbles were produced in 1948 in California, Minnesota, North Carolina, Texas, Washington, and Wisconsin and tube-mill liners in Minnesota, North Carolina, and Wisconsin.

Grinding pebbles and tube-mill liners sold or used by producers in the United States, 1944–48

Year	Grinding pebbles		Tube-mill liners		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	8,012	$172,418	2,063	$38,833	10,075	$211,251
1945	8,615	201,806	1,982	45,933	10,597	247,739
1946	4,652	102,043	2,375	44,247	7,027	146,290
1947	5,860	122,883	1,496	40,303	7,356	163,186
1948	4,026	101,583	1,297	41,555	5,323	143,138

The following firms produced for sale the products indicated: Crystal Silica Co., Los Angeles, Calif., grinding pebbles; Jasper Stone Co., Sioux City, Iowa, liners and grinding pebbles (quarries in Minnesota); Harris Granite Quarries Co., Salisbury, N. C., liners and grinding pebbles; Dezendorf Marble Co., Austin, Tex., grinding pebbles; Mineral Products Co., Seattle, Wash., grinding pebbles; and Baraboo Quartzite Co., Baraboo, Wis., liners and grinding pebbles.

Comparative tests of the wear rates of porcelain balls and French flint pebbles for the paint and ceramic industries showed the much greater resistance to attrition of the flint pebbles.[10]

NATURAL SILICATE ABRASIVES

Pumice and Pumicite.—Pumice or pumicite (volcanic ash) sold or used totaled 607,746 short tons valued at $2,501,906 in 1948, a new record in both quantity and value, and 37 percent greater in tonnage and 24 percent greater in value than the former high year 1947. This active market was due to the greatly augmented use of these materials as aggregate for construction, particularly in the Western States. A great deal of research and testing work has been undertaken. A very active demand continues to exist for concrete containing properly sized pumice. Addition of this material to the batch lightens the weight of the finished concrete while in most instances maintaining adequate strength.

Pumice and pumicite sold or used by producers in the United States, 1943–48

Year	Short tons	Value	Year	Short tons	Value
1943	85,150	$611,495	1946	319,883	$1,585,753
1944	88,757	704,110	1947	442,552	2,021,880

[1] Figures that may not be shown separately are combined as "Undistributed."

Output in 1948 was reported from 11 States and Alaska. The largest producer in 1948 was California, whose production was 17 percent larger than in 1947. New Mexico attained second place in order of output, more than doubling the production of 1947, and Oregon was third, having 220 percent more than in 1947. Idaho, which was fourth in production, showed a substantial loss in tonnage, and Washington and Utah showed small gains. Nebraska reported a smaller output. The increases were due to the larger demands for pumice in construction. On account of the lower costs and less extensive preparation required for pumice used as aggregate as well as the smaller tonnages of pumice consumed for abrasive purposes, the average realization per ton for all pumice and pumicite has been dropping steadily. In 1946 the average value per ton was $4.96; in 1947, $4.57; and in 1948, $4.12.

Pumice and pumicite sold or used by producers in the United States, 1946–48, by uses

Use	1946		1947		1948	
	Short tons	Value	Short tons	Value	Short tons	Value
Abrasive:						
Cleansing and scouring compounds and hand soaps	52,085	$386,593	25,266	$323,885	16,005	$245,994

Concrete admixture and concrete aggregate	248,247	607,695	397,223	1,083,630	559,697	1,665,727
Other uses [1]	12,840	338,900	8,836	124,657	23,924	228,859
Total	319,883	1,585,753	442,552	2,021,880	607,746	2,501,906

[1] Insecticide, insulation, brick manufacture, filtration, solvents, plastics, paint filler, absorbents, and unspecified.

Pumice and pumicite sold for concrete admixture and concrete aggregate in 1948 reached 559,697 short tons in 1948, an increase of 41 percent over the active year 1947. Pumice used for abrasive purposes and for acoustic plaster each declined by about one third in 1948 compared with the previous year. Other uses increased by 171 percent and included sales for absorbents, insecticides, insulation, and paint filler. Trends in sales of pumice and pumicite in recent years, separated according to chief uses, are indicated in figure 1.

Quotations on domestic and imported pumice in 1948 were given in Oil, Paint and Drug Reporter as follows: Domestic—ground, coarse (sizes 0½, 1, 1½, 2, 3), in bags, ton lots, New York, 3⅝ to 4 cents per pound (Chicago, 4½ cents), smaller lots, 3⅞ to 4¼ cents; fine, in bags, ton lots, 3⅜ cents per pound, smaller lots, 3⅝ to 4 cents; imported—Italian, silk-screened, fine, in bags, ton lots, 4 cents per pound; coarse, in bags, ton lots, 5½ cents; sun dried, fine, in bags,

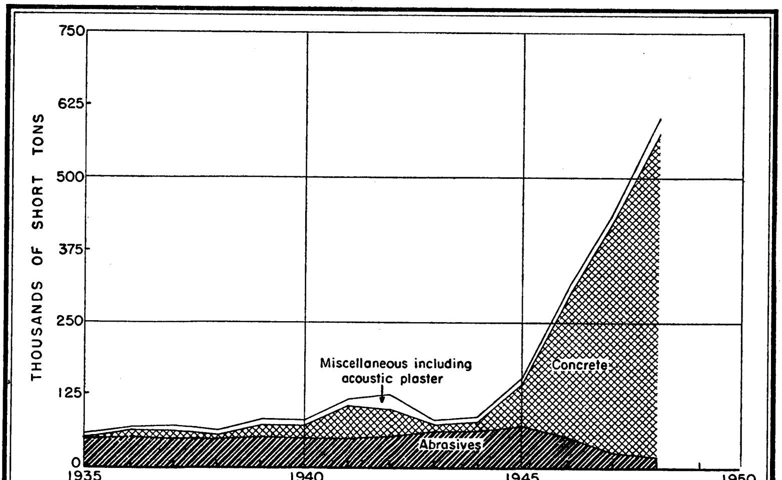

FIGURE 1.—Trends, by uses, of pumice and pumicite sold or used in the United States, 1935–48.

ton lots, 3 cents per pound; coarse, in bags, ton lots, 4½ cents. Pumice in barrels was quoted at ½ cent per pound higher.

The heavy demand for aggregates and the resultant greatly increased production of pumice and pumicite in the Western and Southwestern States led to formation of a Pumice Producers Association about the middle of 1948. The initial aims were outlined to be an organized research program, the standardization of pumice for use as concrete aggregates, and a program of national advertising. Technical sessions stressed construction operations in which pumice had been used, the lines along which future research should be directed, and the advantages to be gained by pumice construction.[11] Representatives of the pumice industry and related fields in the State of Washington also were reported to be organizing an association with similar aims.[12] California has under way a study of its pumice resources and their utilization, and a two- to five-year research program to aid in the development and wider commercial application of the Washington pumice deposits has been initiated at Washington State College, Pullman.[13]

Many new enterprises both in the mining and the processing of pumice products have arisen in the last two or three years. Specifications and methods of manufacture and new applications have been described in the literature. Among the operations described have been three plants in New Mexico.[14]

A technical discussion of pumice in various concrete mixes [15] and its application to prefabricated housing construction [16] was published. An informative series of articles entitled "The Story of Pumice" was presented in the trade journal, Concrete, beginning in the August 1948 and continuing through the December issue (vol. 56, Nos. 8–12). Subjects discussed included mining, processing and grading, precasting house panels, ready-mixed concrete, monolithic concrete hospital construction, progress of structural design, and manufacture and tests of concrete masonry units.

A study of the many types of lightweight aggregates (including pumice) in use in the Los Angeles area was published.[17] Based largely on the above study but giving much additional information was a discussion of lightweight aggregates in Architectural Record.[18] The Oklahoma Geological Survey has discovered that volcanic ash can be bloated or expanded to make satisfactory light, cellular products with good insulating and structural possibilities in the lightweight aggregate field.[19] Glazes compounded with volcanic ash have a long fusion range and are said to be suitable for a wide range of colors.[20]

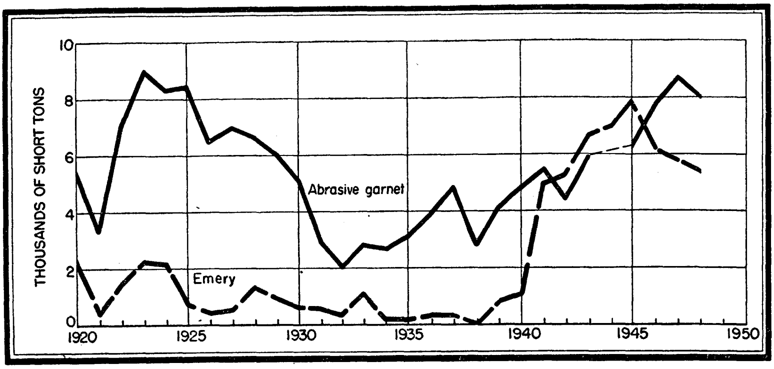

FIGURE 2.—Marketed production in the United States of abrasive garnet and domestic emery, 1920–48.

Garnet.—Output of garnet in 1948 totaled 8,039 short tons valued at $587,797, or 8 percent less in tonnage and 4 percent less in value than in 1947. Except for 1947, this production in 1948 was larger in both quantity and value than in any year since 1925. The trend in output (sales) of garnet since 1920 is shown in figure 2. The following producers reported sales in 1948: Idaho Garnet Abrasive Co., Inc., P. O. Box 1452, Spokane 6, Wash. (deposit near Fernwood, Idaho); Garnet Mines, Inc., Fernwood, Idaho; Barton Mines Corp., North Creek, N. Y.; and Northern Minerals, Inc., Essex, N. Y. Occurrence of garnet deposits in Japan was studied and output data given in a recent publication.[21]

Abrasive garnet sold or used by producers in the United States, 1943–48

Year	Short tons	Value	Year	Short tons	Value
1943	5,935	$429,120	1946	7,743	$570,186
1944	(1)	(1)	1947	8,722	614,071
1945	6,306	375,198	1948	8,039	587,797

1 Bureau of Mines not at liberty to publish figure.

The quotations on domestic garnet in 1948, as given in E&MJ Metal and Mineral Markets, remained at the same level as in immediately preceding years: New York Adirondack garnet concentrates, grain, $85 per short ton.

NATURAL ALUMINA ABRASIVES

Corundum.—The corundum consumed in the United States in recent years, aside from moderate tonnages recovered from tailing dumps in the Craigmont area, Ontario, Canada, was imported from southern Africa, particularly the Union of South Africa. Transportation difficulties and inability to increase output substantially have resulted in smaller shipments. Although a sizable demand exists for this product in the United States, imports have fallen behind the potential market. Efforts have continued to stimulate higher

21 Cobb, Edward H., Garnet Resources of Japan: General Headquarters Supreme Commander of the Allied Powers (Tokyo), Natural Resources Sect., Prelim. Study 7, 1947, 10 pp. Chem. Abs., vol. 42, No. 2, Jan. 20, 1948, p. 494.

production in the chief country of origin of this commodity. Although the imports of corundum ore from the Union of South Africa in 1948 reached 3,612 short tons, or 50 percent greater than in 1947, they nevertheless were considerably under most recent years. The recovery of corundum from tailing dumps in Canada has been discontinued, while production on a commercial scale in other possible producing areas, such as Brazil, India, and South African areas other than the Transvaal, has been small or nonexistent.

Available statistics of world production of corundum in recent years appear in the accompanying table.

World production of corundum by countries, in metric tons, 1937–48 [1]

[Compiled by Pauline Roberts]

Country [1]	1937	1938	1939	1940	1941	1942	1943	1944	1945	1946	1947	1948

United States (sales)	------	------	------	------	------	------	(8)	(8)	------	------	------	------
Total [9]	2,300	1,537	2,456	3,910	6,207	7,029	5,600	5,650	6,800	3,850	3,000	3,300

[1] In addition to countries listed, corundum probably is produced in U. S. S. R., but data on production are not available.
[2] Reported as corundum and emery (believed to be largely emery).
[3] Data not available.
[4] Imports into United States.
[5] Estimate.
[6] Recovered from tailing dumps.
[7] Less than 1 ton.
[8] Bureau of Mines not at liberty to publish figure.
[9] Includes estimates for entries where footnote 3 indicates data not available and includes United States production as measured by sales. Excludes estimates for U. S. S. R.

Quotations on crude corundum imported into the United States do not appear in domestic trade journals. Corundum grain in 1948 was quoted in E&MJ Metal and Mineral Markets as follows: Per pound, sizes 8 to 60, inclusive, 8¾ cents; 70–275, inclusive, 9¾ cents; 500, 30 cents; 850, 45 cents; 1,000, 45 cents; 1,200 to 1,600 inclusive, 65 cents; and 2,600, 70 cents.

Emery.—Marketed output of emery in 1948 decreased 7 percent in tonnage in 1948 compared with 1947. The total value of sales, however, increased 4 percent to the highest value (except for 1945) since 1918. The only producers of emery in 1948 were Joe DeLuca, and DiRubbo & Ellis, of Peekskill, N. Y. The crude emery is shipped to manufacturers of grinding wheels, abrasive sticks, and other abrasive products. A large part of the output also is used as a nonslip agent in concrete floors and steps. The production since 1920 is presented graphically in figure 2.

The quotation on crude domestic emery ore in E&MJ Metal and Mineral Markets up to May 1947 was $10 per short ton for first-grade ore, f. o. b. New York. Beginning May 1947 and continuing through 1948, this figure was given as $12 per ton. The same publication quoted grain emery before September 1947 as follows (per pound, in 350-pound kegs, f. o. b. Pennsylvania): Turkish and Naxos, 7 cents; American, 5 cents. After September 1947 and continuing through 1948, quotations were reported as 10 cents per pound for Turkish and Naxos and 6½ cents for American.

Emery sold or used by producers in the United States, 1943–48

Year	Short tons	Value	Year	Short tons	Value
1943	6, 666	$63, 195	1946	6, 188	$62, 099
1944	6, 940	64, 858	1947	5, 798	66, 927

NATURAL CARBON ABRASIVES [22]

Industrial Diamonds.—World sales of industrial diamonds in 1948 rose more than 150 percent to the highest figure on record, £11,300,000, according to Industrial Distributors (Sales), Ltd., London, the diamond-syndicate marketing organization. Chief factors in this large increase in sales were the wider and more intensive employment of abrasive diamonds in industry and in mining. Contributing largely also to the higher sales were substantial purchases by the United States Government under its stock-piling program. The much larger imports for consumption in the United States during 1948 were the direct result of these developments.

Extensive experimentation in industrial laboratories in the United States,[23] as well as in the Diamond Research Laboratory at Johannesburg, Union of South Africa,[24] are increasing the uses and applications of industrial diamonds and promoting more efficient recovery methods. Sending an electric arc through the fine steel needles used in boring minute holes in wire-drawing dies speeds up the drilling processes, according to a recently issued patent.[25] One type of unusually clear diamond, free from flaws, has been discovered to be useful to the nuclear physicist as an efficient radiation counter.[26]

The geology and occurrences of diamonds throughout the world were described.[27] Location of deposits and approximate total value of production of minerals including diamonds in the mineral belt extending from the Congo down through southern Africa were presented by means of a map and table.[28] Production and history of wartime development were published for diamond mines in Tanganyika [29] and in Sierra Leone.[30] New diamond discoveries in the

Congo [31] and in British Guiana [32] were reported. A detailed description of the diamond fields of Venezuela, including production figures and methods of recovery, was published.[33] Resources and the results of wartime investigation of the diamond deposits near Murfreesboro, Ark., were reported.[34]

ARTIFICIAL ABRASIVES

Production of silicon carbide and aluminum oxide and shipments of metallic abrasives each were only slightly smaller in 1948 than in 1947. The total realization was somewhat higher in 1948; that for metallic abrasives rose 22 percent to a new record. The tonnage of metallic abrasives was higher than in any year except 1947. The total for aluminum oxide shown in the accompanying table includes 15,706 short tons of "white high-purity or special" material valued at $1,726,093, a small decrease in both quantity and value compared with 1947. The estimated percentage of aluminum oxide used for refractory and other nonabrasive purposes in 1948 remained at 4 percent, the same as in 1947, while the similar figure for silicon carbide rose to 47 percent in 1948 compared with 42 percent in 1947.

Crude artificial abrasives produced in the United States and Canada, 1944–48

Year	Silicon carbide [1]		Aluminum oxide [1] (abrasive grade)		Metallic abrasives [2]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1944	56,291	$4,717,675	185,573	$11,668,838	144,540	$8,441,505	386,404	$24,828,018
1945	53,773	4,238,655	147,016	9,130,093	146,771	8,524,073	347,560	21,892,821
1946	63,849	5,457,903	132,084	8,367,158	111,512	6,387,819	307,445	20,212,880

1948	63,033	5,874,731	154,972	10,279,583	147,218	15,174,773	365,223	31,329,087

[1] Bureau of Mines not at liberty to publish data for United States separately. Figures include a small quantity used for refractories and other nonabrasive purposes.
[2] Shipments from United States plants only.

Stocks of silicon carbide at the end of 1948 rose sharply, and those of aluminum oxide showed a small increase, while those of metallic abrasives decreased slightly. Capacity of plants producing silicon carbide and aluminum oxide remained at virtually the same level. The capacity of the metallic abrasives industry was reported to be 2 percent less than in 1947. Operations in 1948 were at a somewhat lower rate compared with capacity than in 1947: Silicon carbide, 86 percent in 1948 compared with 88 in 1947; aluminum oxide, 66 percent in 1948 and 69 in 1947; and metallic abrasives, 61 percent in 1948 and 64 in 1947.

1948	5,387	73,250	34,177	233,500	9,907	240,129

1 Figures pertain to United States plants only.

Production of aluminum oxide and silicon carbide is concentrated largely in the Niagara Falls region of Canada and the United States and in Quebec in areas of plentiful and relatively cheap water power; some aluminum oxide, however, is produced in Alabama. Neither the new plant of the Coated Products Division of Carborundum Co., nor the proposed silicon carbide plant at Vancouver, Wash., projected by the same firm, are yet in operation. The new furnace plant of Electro Refractories & Alloys, Canada, Ltd., at Cap-de-la-Madelaine, near Three Rivers, Quebec, was not placed in production until January 1949. Toward the end of 1948, the Abrasive Grain Association and five individual manufacturers of artificial abrasives in an anti-trust consent judgment by the United States District Court at Buffalo, N. Y., were enjoined from fixing prices and uniform conditions of sale of artificial abrasive grain and from exchanging price lists or quotations. Under the judgment, purchasers have the option of buying at a delivered price or at a factory price based on delivered price less actual cost of transportation.[35]

Statistics for metallic abrasives cover steel shot and grit but do not include steel wool. The figures represent operations of plants in the United States only. As in 1947, 18 companies with 19 plants reported sales in 1948. The three largest producing States were Ohio, Michigan, and Pennsylvania. Other States in which metallic abrasives were manufactured in 1948 were Illinois, Massachusetts, New Hampshire, and New York.

Two high-purity aluminum oxide powders of ultrafine, uniform particle size have proved useful in metallographic polishing and are said to be suitable for optical and gem polishing, metal finishing, as catalyst carriers, and in the manufacture of phosphors for lighting.[36] Use of type 32 aluminum oxide in vitrified bonding wheels was described and advantages reported.[37] The chemical properties, history and manufacture of boron carbide were outlined.[38]

Shot-peening of nonferrous metals increased fatigue and corrosion resistance appreciably, reduced the susceptibility of brass to season-cracking, and was effective as a cure for porosity in aluminum die castings.[39]

MISCELLANEOUS MINERAL ABRASIVE MATERIALS

In addition to the natural and manufactured abrasive substances for which data are included herein, many other mineral materials are used for abrasive purposes. A number of oxides, including tin oxides, magnesia, iron oxides (rouge and crocus), cerium oxide, chromium oxide, and manganese oxide, are employed as polishing agents. Certain carbides, such as boron carbide and the cemented carbides, which include tantalum carbide, titanium carbide, and tungsten carbide, have been used for their abrasive properties or because of their extreme hardness or durability. Other substances with abrasive applications include finely ground and calcined clays (ball clays, china clays, fire clays), lime, talc, ground feldspar, river silt, slate flour, and whiting.

FOREIGN TRADE[40]

Imports.—The total value of imports for consumption of natural abrasive products rose 143 percent in 1948 compared with 1947. Crude or unmanufactured diamond bort, carbonado and ballas, and diamond dust were the chief contributors to this increased import trade, showing gains in 1948 of 166, 125, and 95 percent, respectively, over 1947 levels. Imports of corundum ore, crude or unmanufactured pumice, and garnet were considerably higher in 1948 than in 1947. Imports of manufactured diamond bort and emery ore registered large decreases, while receipts of unground flint, flints, and flintstones were only slightly less than in 1947.

Exports.—The value of exports of natural abrasive products in 1948 declined 21 percent compared with 1947. All classes of products shown in the accompanying table showed moderate to substantial decreases in quantity of exports. Exports of grindstones, emery and corundum wheels, and emery powder, in particular, were 37, 72, and 49 percent, respectively, less than in 1947, and the weight of "Other natural abrasives" decreased by 14 percent.

Aluminum

By RICHARD H. MOTE AND HORACE F. KURTZ

GENERAL SUMMARY

PRIMARY aluminum output in the United States in 1948 rose to a new peacetime record despite floods and electric-power shortages which curtailed production and forced plant closures. Even though the 1948 output exceeded all but that in the war years 1943 and 1944, the quantity was insufficient to meet heavy consumer demand for the metal in established uses and in new and substitute uses resulting from the prevailing short supply and relatively high price of many competing materials. Apparent consumption of virgin aluminum in 1948 was 27 percent greater than in the preceding year, as net imports in crude and semicrude form added approximately 40,000 tons to the total supply. Consumption of the metal for the manufacture of building products, particularly roofing and siding, continued to lead the field of uses in 1948. In addition to the expanded use of primary aluminum, large quantities of secondary aluminum were reclaimed from scrap and made available for consumption during the year.

Salient statistics of the aluminum industry, 1939–43 (average) and 1944–48

	1939–43 (average)	1944	1945	1946	1947	1948
Primary production short tons	424,035	776,446	495,060	409,630	571,750	623,456
Value	$131,408,000	$222,416,000	$140,864,000	$115,812,000	$161,626,000	$180,755,000
Quoted price per pound [1] cents	17.0	15.0	15.0	15.0	15.0	15.7
Secondary production short tons	150,318	325,645	298,387	278,073	[2] 344,837	286,777
Imports	$18,543,732	$30,322,653	$99,370,633	$12,463,960	$6,603,722	$42,202,648
Exports	$29,436,083	$89,800,122	$9,906,041	$20,284,053	$52,231,972	$43,185,781
World production short tons	1,301,000	[2] 1,844,000	[2] 958,000	[2] 873,000	[2] 1,195,000	1,394,000

[1] Ceiling price 15 cents, April 1942–August 1945.
[2] Revised figure.

The broad inflationary price trend in 1948 forced a break in the price of standard 99.0–99.5 percent aluminum ingot, which had been 15 cents a pound since the latter part of 1941. Increased costs of labor and materials precipitated two price rises of 1 cent each in June and October and established the quotation at 17 cents.

World production of aluminum advanced 17 percent from 1,084,000 metric tons in 1947 to approximately 1,265,000 tons in 1948. As in the United States, output in most foreign countries was generally hampered by power shortages.

Aluminum ores, alumina, and aluminum salts are discussed in the Bauxite chapter of this volume.

PRODUCTION

Primary.—Domestic production of primary aluminum totaled 623,456 short tons in 1948, an increase of 9 percent over the 571,750 tons produced in 1947 and the highest peacetime output in the history of the industry. The accelerated growth of aluminum production in recent years is strikingly indicated by comparison with growth in over-all industrial output. The index of total production [1] increased from 170 in 1946 to 192 in 1948, a gain of 13 percent during the 2-year period. The index for aluminum production, calculated on the same base period, advanced from 328 in 1946 to 498 in 1948, an increase of 52 percent, which shows that the aluminum industry expanded during the period at a rate four times that of industrial output as a whole.

Production of primary aluminum in the United States, 1941–48, by months, in short tons [1]

Month	1941	1942	1943	1944	1945	1946	1947	1948

Total	309,067	521,106	920,179	776,446	495,060	409,630	571,750	623,456

[1] Monthly data 1941–July 1946 from producers' reports to War Production Board and its successor, Civilian Production Administration; all other data from reports to Bureau of Mines. Monthly figures have been adjusted to final annual totals.

Except in January, February, and June, the monthly production of primary aluminum in 1948 was at a rate exceeding 600,000 tons annually. Early in the year a drought in the Southeast caused a power shortage in the Tennessee Valley, which curtailed operations in that area and caused domestic primary aluminum output to drop to 45,699 tons in February, the low point of the year. Production gained steadily thereafter to reach the 1948 peak monthly output of 55,450 tons in May. Serious floods along the Columbia River from late May until early July forced the Reynolds Metals Co. plant at Troutdale, Oreg., to close for almost 2 months and curtailed operations at the Reynolds plant at Longview, Wash., and the Aluminum Co. of America plant at Vancouver, Wash. As a result, production slumped to 48,557 tons in June. The monthly output rose in the following months but fell again during the latter part of the year owing to a seasonal drop in water level in the Northwest.

[1] Federal Reserve Bank indexes of physical volume of industrial production; 1935–39 equals 100.

Although congressional approval of a program for Air Force expansion and the persistent demand for aluminum in markets formerly supplied by other metals indicated a potentially increasing need, domestic production of the light metal appeared to be limited to a level not exceeding the 1948 output by the lack of additional electric power. According to the Federal Power Commission, the total power load in December 1948 was almost equivalent to the total national installed capacity. Although increases in generator capacity are scheduled over the next few years, they are barely adequate to cover existing commitments and do not allow for any substantial increase in the number of aluminum reduction units.

Aware of the lack of surplus hydroelectric power, the Aluminum Co. of America turned to natural gas as a source of energy for producing electricity. In conjunction with the Nordberg Manufacturing Co., Alcoa developed a special type of spark-fired internal-combustion engine which will use natural gas as a fuel to generate electric energy for its new aluminum reduction plant at Point Comfort, near Port Lavaca, Tex. Construction at Point Comfort was begun in 1948, and installations will include a three-pot-line plant with a production capacity of approximately 57,000 tons of aluminum metal per year, a plant for making carbon electrodes, and a 120,000-kw. power plant, which will utilize 120 of the newly developed gas engines. Tentative plans to expand the Permanente Metals Co. alumina plant at Baton Rouge, La., to include pot lines for aluminum reduction with electric power to be generated from natural gas were reported during the year.

The industry functioned in 1948 along competitive lines established in 1946. Alcoa operated about 330,000 tons, or 51 percent of the total 649,000 tons operable rated annual reduction capacity; Reynolds, 190,000 tons or 29 percent; and Permanente, 129,000 tons or 20 percent. Nearly all wartime aluminum plants held by the War Assets Administration for which electric power was not economically available were disposed of during 1948. The Torrence, Calif., reduction plant was sold to Columbia Steel Co. for conversion into a sheet-steel mill. The rod and bar mill at Newark, Ohio, was acquired by the Permanente Metals Co., and equipment for manufacturing steel-reinforced aluminum-conductor cable was added during the year. The plant at Massena, N. Y., was sold to the Aluminum Co. of America during the latter part of the year, along with some of the carbon-producing equipment at the Burlington, N. J., plant. Alcoa announced late in 1948 that its old plant at Massena would be shut down and the power thus made available would be used for the newly purchased installation. The company also announced that its Niagara Falls plant would close in 1949 owing to lack of power.

Secondary.—Owing to virtual exhaustion of scrapped military aircraft that had been plentiful since 1942, recovery of secondary aluminum from scrap in 1948 dropped 17 percent from the record high tonnage reclaimed in 1947. In addition to the production of remelt alloy ingot at Navy air stations, output was recorded in 1948 from five Army airfields, where the last of the wartime military planes sold to private contractors was melted.

Detailed information regarding secondary aluminum in 1948 is given in the Secondary Metals—Nonferrous chapter of this volume.

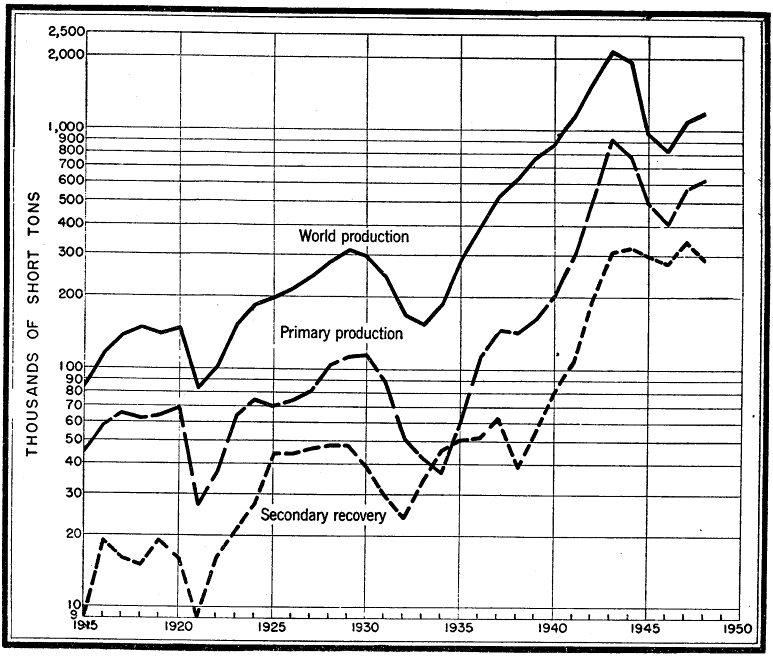

FIGURE 1.—Trends in world and domestic primary production and domestic secondary recovery of aluminum, 1915–48.

CONSUMPTION AND USES

The apparent consumption of primary aluminum totaled 665,950 tons in 1948, as computed by the usual method of adding production and net imports and adjusting for producers' stock changes. This total was 27 percent greater than the 524,200 tons used in 1947. However, as pointed out in the 1946 chapter of this series, the large importation and subsequent holding by the Office of Metals Reserve of Canadian aluminum during the war years greatly distorted the apparent consumption; and for the purpose of presenting a truer picture of domestic aluminum consumption a modified set of figures was evolved, taking into account releases of Canadian aluminum from Reconstruction Finance Corporation inventories. These stocks, which at the end of 1946 were 71,760 tons, were reduced to 18,700 tons by December 31, 1947, and completely disposed of in 1948. The adjusted apparent consumption figures for 1944 through 1948 are 671,072, 696,750, 575,687, 571,760, and 684,650 tons, respectively.

If the modified figures for apparent consumption of primary aluminum are added to the figures for secondary recovery from old scrap

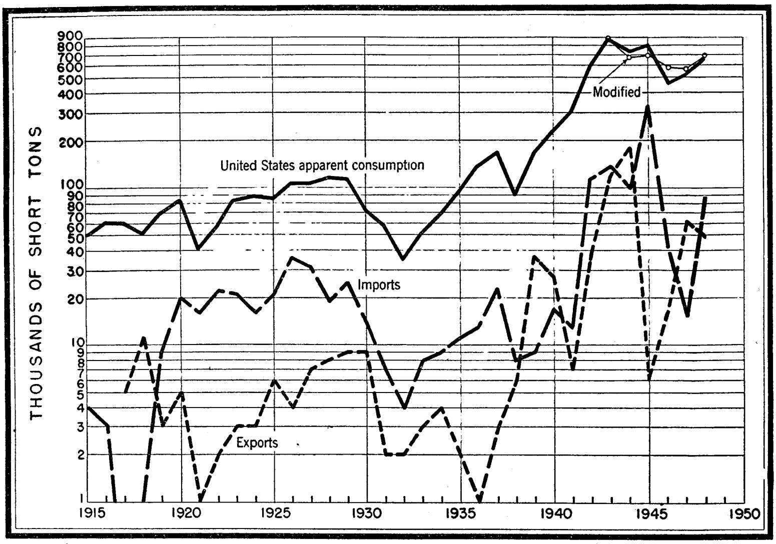

FIGURE 2.—Trends in imports, exports, and apparent consumption of aluminum, 1915–48.

only, the following total consumption figures are obtained (quantities in short tons):

Year	Apparent consumption of primary aluminum	Secondary aluminum recovered from old scrap	Total consumption
1939–43 (average)	432,753	40,282	473,035
1944	[1] 671,072	22,899	693,971
1945	[1] 696,750	27,311	724,061
1946	[1] 575,687	90,535	666,222
1947	[1] 571,760	[2] 163,847	[2] 735,607
1948	[1] 684,650	95,648	780,298

[1] Modified.
[2] Revised figure.

The building trade was the best customer of the aluminum industry for the third successive year. The largest use of the light metal was in the manufacture of roofing and siding, but substantial quantities were also consumed in the fabrication of window frames, shingles, heating and ventilating ducts, nails, gutters and down-spouts, screens, thresholds, venetian blinds, electric conduits and accessories, awnings, garage doors, and prefabricated housing panels. Use of aluminum as heating, ventilating, and air-conditioning ducts was formally approved in 1948 by the National Board of Fire Underwriters; Federal Housing Administration building specifications were revised to permit usage of aluminum in these applications. A wider acceptance of aluminum in building construction was anticipated in future with the introduction in 1948 of pattern aluminum sheet for use in wall facing. Early application of this product has been mainly on industrial and institutional buildings, but the versatility of pattern design suggests a much wider functional and decorative use.

Production, imports, exports, and apparent consumption of primary aluminum and production of secondary aluminum in the United States, 1939–43 (average) and 1944–48

Year	Primary aluminum					Secondary aluminum	
	Production		Imports (short tons)	Exports (short tons)	Apparent consumption [1] (short tons)	Production	
	Short tons	Value				Short tons	Value [2]
1939–43 (average)	424,035	$131,408,000	57,555	45,459	432,753	150,318	$46,668,155
1944	776,446	222,416,000	100,969	188,108	744,627	325,645	93,264,728
1945	495,060	140,864,000	334,117	5,901	797,052	298,387	85,297,005
1946	409,630	115,812,000	42,607	16,694	461,877	278,073	78,639,044
1947	571,750	161,626,000	15,610	62,333	524,200	[3] 344,837	[3] 97,450,936
1948	623,456	180,755,000	89,149	49,033	665,950	286,777	82,477,065

[1] Data not available on fluctuations in consumers' stocks. Withdrawals from producers' stocks totaled 55,320 tons in 1944, 26,334 in 1946, and 2,378 in 1948; additions to producers' stocks averaged 3,378 tons from 1939 through 1943, and totaled 26,224 in 1945, and 827 in 1947. Figures not adjusted for changes in Government stocks.
[2] Based upon average price of primary aluminum as reported to Bureau of Mines.
[3] Revised figure.

The advantages of aluminum continued to be demonstrated in the field of transportation. Use of the metal in commercial vehicles such as trucks, busses, and trailer units remained large, and a strong trend toward use in the passenger-car field appeared to be developing. Growing applications in railroad rolling stock, such as passenger, hopper, box, refrigerator, and tank cars, were noted during 1948.

Use of aluminum in the electrical field exhibited a rising trend during the year. More than 1,500,000 miles of ACSR (aluminum conductor, steel-reinforced) cable is now in use in high-voltage and rural distribution lines, and an announcement by the Rural Electrification Administration that it needed additional wire and cable for about 25,000 miles of poles recently erected in the South and Midwest forecast an increase in the quantity of aluminum to be consumed for this purpose.

Consumption for aircraft production, although not large in 1948 when compared with wartime rates, is expected to increase in the immediate future as a result of expansion of the Air Force.

Other growing uses for aluminum include application in household appliances, office machines, furniture, hardware, tools, instruments, and packaging in the form of foil, caps, seals, collapsible tubes, drums, barrels, and carboys.

Shipments of aluminum by the Aluminum Co. of America in 1948 were distributed as follows (comparable 1947 figures in parentheses): Building products, 18 percent (19 percent); transportation, 13 (15); cooking utensils, 9 (9); machinery, electrical and general, 4 (6); household appliances, 9 (7); power transmission, 6 (6); shipments to fabricators for further processing, 25 (24); and all other, 16 (14). Although these figures may not fully parallel the entire aluminum industry's distribution, they do show the general use pattern of the metal.

STOCKS

Stocks of primary aluminum at reduction plants at the end of 1948 were 13,171 short tons compared with 15,549 tons at the beginning of the year. Low point of the year was at the end of November, when inventories dropped to 8,075 tons. Government stocks available for allocation, which totaled 18,700 tons on January 1, 1948, were completely disposed of during the year. Data on consumers' inventories were unavailable.

PRICES

A significant factor in the increasing acceptance of aluminum for uses formerly supplied by copper has been the price advantage it has maintained since November 1946. Although increased costs of labor and materials induced aluminum producers to raise the market price twice during 1948, the quotations continued to be substantially under the copper market price. When considered on a volumetric basis, the basis on which metals are ordinarily used, rather than by weight, the price differential was even more favorable to aluminum. The base price of 15 cents a pound for 99.0–99.5 percent virgin aluminum ingot, New York, established on October 1, 1941, continued until June 28, 1948, when the quotation was advanced to 16 cents. A second price rise to 17 cents occurred on October 11. The primary aluminum pig prices were advanced at the same time in 1948 to 15 and 16 cents per pound. Readjustments in pricing of other aluminum products were also made during 1948.

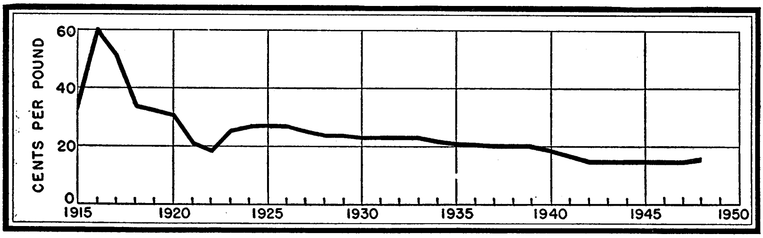

FIGURE 3.—Trend in average quoted prices of aluminum, 1915–48. Price is for No. 1 virgin metal 98–99 percent at New York through 1929; thereafter for 99-percent-plus virgin ingot, as reported by American Metal Market.

FOREIGN TRADE [2]

In contrast with 1947 foreign trade, the United States became a net importer of crude and semicrude aluminum during 1948. Imports of metal (excluding scrap and manufactures) totaled 89,149 tons in 1948, an increase of nearly six times the preceding year's total and the largest quantity since 1945. About 90 percent of the 1948 receipts came from Canada and the remainder largely from United Kingdom, Italy, Switzerland, and Norway. Imports of aluminum scrap likewise gained substantially during 1948 and reached the highest annual level ever recorded (separate reporting of scrap was begun in 1939). Although there was some controversy as to the origin of scrap designated from certain European countries, 22,012 tons were reported shipped from Canada, 15,127 tons from United Kingdom, 6,968 tons from Italy, 5,912 tons from Germany, and the remainder from 30

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

other countries. The actual quantity of manufactures imported was not recorded, but their total value increased 33 percent over 1947.

Aluminum imported for consumption in the United States, by classes, 1946–48

Exports of aluminum (excluding scrap and manufactures) declined from the 62,333 tons shipped in 1947 to 49,033 tons in 1948. Most of the decrease resulted from curtailed shipments of metal classified as ingots, slabs, and crude, as exports of plates, sheets, bars, and other semifinished forms were only slightly reduced. France, chief recipient among the 18 countries that purchased aluminum in ingot and slab form during 1948, received approximately 49 percent of the total. Of the plates, sheets, and bars exported, 15,421 tons went to the Republic of the Philippines, 7,499 tons to Venezuela, and the remainder to 93 other countries. Shipments of scrap dropped to 438 tons, almost all of which went to Haiti, Canada, and Germany. The value of aluminum manufactures exported in 1948 declined 26 percent.

TECHNOLOGY

Technologic progress reported during 1948 that broadened the field of aluminum use included an improvement in welding technique for efficiently joining thicker aluminum-alloy plates than had hitherto been successfully joined by other welding processes. The new procedure—a modification of shielded arc-welding—consists of feeding a bare or processed filler-metal wire carrying the welding current through a suitable wire holder. Joining is accomplished by a direct-current arc maintained between the end of the wire and the work. As in other shielded-arc processes, the arc is contained in an envelope of inert gas. Among the commercial applications of welded aluminum in 1948 were the first experimental field-welded aluminum pipe lines for carrying crude oil, which were laid near Magnolia, Ark., and Raceland, La.

WORLD REVIEW

World production of aluminum in 1948 totaled approximately 1,265,000 metric tons, an advance of 17 percent over 1947. A large share of this increase was due to gains in the United States and Canada, the two largest producing countries.

World production of aluminum, 1942–48, by countries, in metric tons

Australia.—Surveys for the combined alumina and aluminum reduction plant being erected by the Australian Aluminum Production Commission at Native Point, 16 miles from Launceston, Tasmania, were virtually completed during 1948, and lay-outs for the plant building were progressing rapidly. The Production Commission expects to have the plant completed in 2 years, for an initial capacity of 13,000 tons annually.

Austria.—Although aluminum production in Austria continued to be handicapped by shortages of electric power and alumina, output in 1948 nearly tripled the 1947 figure. Of the 13,319 metric tons recovered during the year, 10,000 tons were produced in the great United Aluminum Works plant at Ranshofen and 3,319 tons in the plant at Lend. Almost half of the 1948 output was returned to foreign countries as payment for raw materials supplied. New sources of hydroelectric power were being considered during the year in order to put the aluminum industry on a year-round operating basis. Water shortages due to winter drought conditions have limited production of electric power and permitted continuous aluminum output only from March through September.

Canada.—At Arvida, Quebec, low water in the latter part of 1948, resulting in an electric power shortage, forced the Aluminum Co. of Canada to shut down one of three pot lines that had been in steady operation. Despite this handicap, production of aluminum in 1948 was 23 percent above the 1947 level. Even with the expanded production, consumer demand for the metal in both raw and fabricated form remained greater than the supply, and the company was forced to allocate its output.

The aluminum plant at Shawinigan Falls resumed operation during the year with two of the four war-installed pot lines in operation. The reduction plants at La Tuque and Beauharnois, which were closed in 1945, remained idle during 1948.

According to Aluminum, Ltd., the largest single field of consumption of its products in 1948 was in architectural and building uses, which accounted for more than 35 percent of the total. Household applications, including cooking utensils, accounted for 20 percent of the consumption; transportation, 19 percent; the electrical industry, 9 percent; food and farming, 5 percent; canning and packaging, 4 percent; the chemical industry, 1 percent; and miscellaneous uses, 5 percent.

China.—American and Canadian companies were reported investigating the possibility of restoring the plant of the Taiwan Aluminum Co. in Takao, Formosa. The plant originally comprised three units, but one was completely destroyed by bombing during World War II. During the latter part of 1948 the plant was utilizing 76 pots and producing ingot at an annual rate of 4,200 tons. Restoration of the entire plant to its designed annual capacity of 22,000 tons is estimated to require the equivalent of $2,000,000.

France.—Output of primary aluminum in France in 1948 totaled a little more than two-thirds of theoretical capacity, the producing facilities being handicapped by limited availability of power. On October 20 the French Price Directorate freed aluminum from price control.

Germany.—Early in 1948 the American Military Government announced that the German aluminum industry in the British and American zones would be permitted to resume production temporarily. Relaxation of the ban on output was based on the existence of approximately 300,000 tons of bauxite stock piled in Western Germany, which were regarded as adequate for 1 year's production of metal. The Töging plant in Bavaria began operating late in March, and produced in April the first new aluminum to be recovered in the Bizonal Area since the end of World War II. Output at this plant was curtailed later in the year, however, owing to limited power supplies. The other two smelters that were permitted to reopen—the Lünen plant near Dortmund and the Erftwerk Grevenbroich smelter—did not resume production during 1948.

Italy.—Producers of Italian aluminum sent a large part of the total domestic output abroad in 1948. Of the 33,100 metric tons produced, 13,000 tons were exported compared with 1,900 tons in 1947. Although Italy's home consumption of aluminum products is comparatively low, production had not recovered sufficiently in 1948 from wartime destruction to supply the country with the 35,000 to 40,000 tons of metal required annually. Thus, the Italian Government has been forced to authorize temporary importation of aluminum bars, wire, sheets, and tubes. It is intended to ban imports as soon as the level of home production rises to meet the nation's needs. As the price of Italian aluminum is one-third higher than the world market level, the motive in preventing free importation of metal as a protective measure to insure continuation of the home market is apparent.

Norway.—The first half of the Aardal aluminum plant, construction of which was begun during the war by the German occupation forces and completed by the Norwegians after liberation, began production of aluminum at half capacity early in 1948. Completion of the second half of the plant is scheduled for late 1949 or 1950 and will bring the total annual plant capacity to 24,000 tons. Some loss of production was experienced late in the year, when a disastrous fire on October 26 caused heavy damage and put out of action 40 of the 140 operating furnaces. Aluminum produced at the Aardal plant is recovered from alumina from Canada.

Philippines.—Plans to construct an aluminum reduction plant at Mindanao, using power from the projected Maria Christina hydroelectric development, were considered during 1948 by the Aluminum Co. of Canada. It is proposed to obtain bauxite for the plant from mines in Malaya. Aluminum produced would be shipped to the United States and Canada for processing and rolling.

Switzerland.—Exports of aluminum from Switzerland, which totaled only 979 metric tons in 1947, increased to 10,787 tons in 1948. Imports declined from 7,161 tons to 7,032.

Yugoslavia.—Five hydroelectric plants have been completed on the Drau River, and four more are now under construction, which will give a total capacity of 100,000 kw. Electricity from these plants will serve an industrial district which includes the aluminum reduction plant at Strnishche. The Strnishche plant now under construction will have a capacity of 30,000 tons of pig aluminum annually. Bauxite for the new plant will be shipped from the mines of Istria, situated in an area ceded to Yugoslavia by Italy in the peace treaty at the conclusion of World War II.

Antimony

By SAMUEL A. GUSTAVSON and MARY E. TROUGHT

GENERAL SUMMARY

DOMESTIC mine production of antimony from antimony ores increased 22 percent, and total imports of primary antimony in metal, ores, concentrates, and needle antimony increased 15 percent in 1948 over 1947, whereas consumption decreased about 7 percent. Thus supply exceeded current use, and both industrial and total Government stocks increased. Demand remained strong, however, and the price of antimony increased for the third consecutive year. The average market price during 1948, for ordinary brands of antimony metal, f. o. b. New York in carlots, was 36.67 cents per pound. The year-end quotation was 40.17 cents. These were the highest antimony prices on record except for a brief period in 1916, when a high of 45 cents per pound was reached.

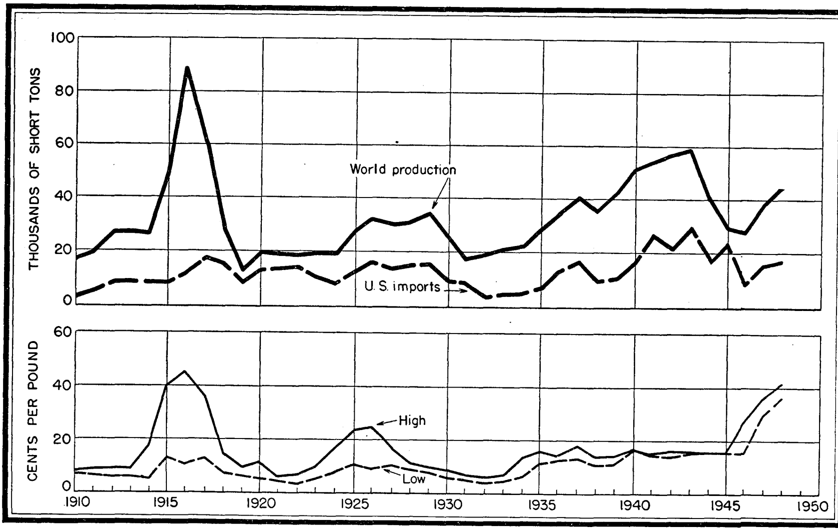

FIGURE 1.—Trends in world production, United States imports, and New York price of antimony, 1910–48.

New supply of primary antimony available for consumption during 1948, in terms of recoverable metal,[1] was 21,968 short tons. Of this total, domestic ores contributed 5,970 tons; and imports 3,176 tons as metal, 12,449 tons in ores and concentrates, and 373 tons in needle antimony. Consumption of primary antimony (including processing

[1] A factor of 92 percent of the content was used to determine quantity of metal recoverable from antimony ores and concentrates shipped to smelters.

losses) was 17,112 tons, according to the Office of Domestic Commerce, United States Department of Commerce.

Salient statistics for antimony in the United States, 1944–48

	1944	1945	1946	1947	1948
Production of primary antimony:

[1] American Metal Market.
[2] Data not available.

Secondary antimony production was 21,592 short tons in 1948 compared with 22,984 tons in 1947. High price was the major factor in maintaining a large secondary output.

Government allocation of antimony provided in War Production Board General Preference Order M–112, as amended, was continued throughout 1948.

Minor changes in export regulations were made during the year. On December 27, 1948, War Production Board General Preference Order M–112 was revised and redesignated Allocation Order M–112 by the Department of Commerce. This order was revoked March 25, 1949.

DOMESTIC PRODUCTION

MINE PRODUCTION

Shipments of antimony ores and concentrates in 1948 totaled 16,239 tons containing 6,489 tons of antimony, of which 5,970 tons are estimated as recoverable—a 22-percent increase in antimony content from 1947. The Bradley Mining Co. operation of the Yellow Pine mine supplied 93 percent of the domestic mine output in 1948 and 97 percent in 1947.

Antimony-bearing ores and concentrates produced in the United States, 1944–48, in short tons

Year	Gross weight	Antimony content		Year	Gross weight	Antimony content	
		Quantity	Average percent			Quantity	Average percent
1944	13,501	4,735	35.1	1947	20,020	5,316	26.6
1945	14,966	1,930	12.9	1948	16,239	6,489	40.0
1946	13,962	2,505	17.9				

Alaska.—Stampede Mines, Inc., operating the Stampede mine, was the Territory's only antimony producer in 1948. Production and shipments were 68 tons of 65-percent antimony concentrates.

California.—Carl Yackel shipped 5 tons of 39.7-percent antimony concentrates from the Rocket mine in Inyo County during 1948.

Idaho.—Two antimony mines were operated in Idaho during 1948; in order of output, they were the Yellow Pine mine and the Hermada mine. In 1947 the Yellow Pine mine was the only producer.

In May 1948 the Bradley Mining Co., operator of the Yellow Pine mine, began constructing a smelter to treat its antimony and gold concentrates. The company expected to complete construction in August 1949. Smelter capacity will be 9,000 tons of antimony oxide a year. Metal also can be produced, but the smelter capacity would be less. Custom ores and concentrates will probably be accepted. The company mine and mill are designed to produce antimony at the rate of 6,000 tons per year. Production in 1948 was 6,004 short tons of antimony contained in high-, medium-, and low-grade antimony concentrates. Antimony in the gold concentrates was not recovered.

The Hermada Mining Co. operated its mine in Elmore County, shipping 155 tons of ore assaying 36.6 percent antimony and 510 tons of concentrates assaying 59.4 percent antimony.

Nevada.—A total of 225 short tons of antimony ores and concentrates containing 78 tons of antimony were shipped from mines in Nevada during 1948. Shipments in 1947 totaled 1,352 tons of ore containing 55 tons of antimony. Producers in 1948 included the Big Creek Mining & Milling Co. and Phil Cox, operating mines in Lander County; N. L. Brown, operating in Nye County; and Ott F. Heizer and John M. Heizer, operating mines in Pershing County.

SMELTER PRODUCTION

Primary.—Domestic primary antimony smelters produced 14,308 short tons of antimony metal, oxide, and sulfide in 1948, a 4-percent increase over 1947. The Bureau of Mines is not at liberty to publish separate data on these three intermediate primary products. However, more than half of the output was in the form of metal and most of the remainder as oxide.

The output of antimonial lead produced as a byproduct by domestic primary lead refineries increased 17 percent. Production in 1948 was 100,764 tons of antimonial lead containing 5,760 tons of antimony compared with 86,075 tons containing 4,933 tons of antimony in 1947. A detailed discussion of antimonial lead production is contained in the Lead chapter of this volume.

Secondary.—Total production of antimony at secondary plants, including antimony recovered from scrap at primary lead refineries, was 21,592 short tons in 1948, 6 percent less than in 1947. The high antimony price has been the predominating factor in maintaining this high rate of recovery of antimony from secondary scrap material during the last 2 years. A detailed review is contained in the Secondary Metals—Nonferrous chapter of this volume.

Antimony metal, alloys, and compounds produced in the United States, 1944–48, in short tons

Year	Primary metal, oxide, and sulfide (antimony content)	Antimonial lead produced at primary lead refineries: Gross weight	Antimony content: From domestic ores [1]	From foreign ores [2]	From scrap	Total: Quantity	Total: Percent	Alloys (antimony content) produced at secondary smelters and by remelters
1944	20,000	57,902	2,015	842	1,813	4,670	8.1	15,886
1945	21,000	56,495	1,749	243	2,156	4,148	7.3	17,148

1948	14,308	100,764	2,190	1,031	2,539	5,760	5.7	21,592

[1] Includes primary residues and small quantity of antimony ore.
[2] Includes foreign base bullion and small quantity of foreign antimony ore.

CONSUMPTION AND USES

Consumption of primary antimony in finished products decreased for the third consecutive year. Use in metallic and nonmetallic products totaled 15,455 tons in 1948, compared with 16,647 tons in 1947, a 7-percent decrease, according to the Department of Commerce. The over-all use pattern has not changed materially since 1946.

Industrial consumption of primary antimony, 1944–48, in short tons [1]

Product	1944	1945	1946	1947	1948
Metal products:					
Ammunition	93	107	30	24	21
Antimonial lead [2]	5,287	5,920	4,827	6,172 (Antimonial lead and battery metal)	6,024

[1] Compiled from monthly applications filed with Office of Materials Distribution, Department of Commerce (formerly with War Production Board and Civilian Production Administration).
[2] Includes miscellaneous metallic products.
[3] Included with "Other." Bureau of Mines not at liberty to publish separate figures.
[4] Consumption April through December 1947; January through March included with "Other."

Processing losses of primary antimony, in addition to quantities consumed as shown in the accompanying table, were reported by OMD and ODC as 1,371 tons, 2,467 tons, 646 tons, 2,049 tons and 1,657 tons, respectively, from 1944 through 1948, an average loss of 7.6 percent for the 5-year period.

STOCKS

Industrial stocks of antimony raw materials were 38 percent greater on December 31, 1948, than on December 31, 1947. The Office of Metals Reserve (OMR) purchased no antimony during the year but transferred some of its stocks to the National Strategic Stock Pile and sold some to industry. OMR stocks on December 31, 1948, of antimony contained in ores, concentrates, and as metal totaled 4,211 short tons. The Bureau of Mines is not at liberty to publish data on stocks in the National Strategic Stock Pile.

Stocks of antimony in the United States at end of year, 1947–48, in short tons of contained antimony

Total	3,044	4,246	5,139	3,047	3,691

PRICES

The price of antimony continued its upward trend throughout 1948. Domestic metal in bulk, f. o. b. Laredo, Tex., opened the year at 33 cents per pound, rose to 35 cents May 22, and then to 38.5 cents October 8, according to E&MJ Metal & Mineral Markets. The average price per pound for antimony metal, carlots, New York, during 1948 was 36.67 cents, according to American Metal Market. In 1947 the average was 33.45 cents.

Changes in nominal quotations according to E&MJ Metal & Mineral Markets, for antimony ore, per unit (20 pounds) of antimony contained were as follows:

	50–55 percent	*58–60 percent*	*60–65 percent*
Jan. 1	\$4. 40–\$4. 45	\$4. 50–\$4. 60	\$4. 60–\$4. 70
Mar. 18	4. 50– 4. 55	4. 55– 4. 65	4. 60– 4. 70
May 13	4. 50– 4. 55	4. 55– 4. 65	4. 70– 4. 80
May 27	4. 60– 4. 70	4. 70– 4. 80	4. 80– 5. 00
July 8	4. 70– 4. 80	4. 80– 4. 90	4. 90– 5. 10
July 29	4. 80– 4. 90	4. 90– 5. 10	5. 10– 5. 20
Aug. 12	4. 90– 5. 00	5. 00– 5. 10	5. 10– 5. 20
Aug. 26	5. 00– 5. 10	5. 10– 5. 15	5. 15– 5. 30
Oct. 7	not quoted	5. 10– 5. 20	5. 20– 5. 30

FOREIGN TRADE [2]

Imports.—Total general imports of antimony ore, metal, and needle or liquated antimony increased 15 percent in 1948 over 1947. A 42-percent decrease in imports of metal, chiefly from China, was more than offset by increases in imports of ore, principally from Mexico, Bolivia, and Peru.

The estimated antimony content of type metal and antimonial lead imported for consumption was 1,549 short tons compared with 187 tons in 1947 and 246 tons in 1946. For gross weight and value, see Lead chapter of this volume.

Antimony imported for consumption in the United States, 1944–48

[1] Approximate recoverable metal content of ore produced, exclusive of antimonial lead ores; 92 percent of reported gross content is used as basis for calculations in nearly every instance. U. S. S. R. and Yugoslavia produce antimony but data on production are not available; an estimate for Yugoslavia is included in the total.
[2] Includes antimony content of antimonial lead.
[3] Estimate.
[4] Data not available; estimate included in total.
[5] January to June inclusive.
[6] Data represent Trianon Hungary after October 1944.
[7] Includes Spanish Morocco.
[8] Data represent area designated as Free China during the period of Japanese occupation.
[9] Fiscal year ended Mar. 20 of year following that stated.
[10] Revised data; previously shipments were listed in some cases in lieu of production data.
[11] Included under Spain.
[12] Excluding New South Wales; data not available.
[13] Estimated by senior author of chapter.

Argentina.—Antimony deposits in the Cochinoca area, Jujuy Province, northwestern Argentina, were described by Federico Ahlfeld.[3]

Bolivia.—A guaranteed price for antimony by the Banco Minero in 1947 and 1948 was the chief factor in the increase in output during those years. Exports, in terms of antimony contained, were 12,260 metric tons in 1948, an increase of 13 percent over 1947 and 76 percent

[3] Ahlfeld, Federico, An Unusual Antimony Deposit in Argentina: Econ. Geol., vol. 43, No. 7, November 1948, pp. 598–602.

over 1946. A description of the antimony deposits in Bolivia, published in Mineria Boliviana in 1946, was translated by the Federal Bureau of Mines.[4]

Canada.—Antimonial lead output declined from 1,150,463 pounds in 1947 to 298,000 pounds in 1948. Imports of antimony regulus during the year totaled 1,093,835 pounds. Antimony Mines & Metals (Slocan), Ltd., has been formed to work an antimony prospect 6 miles west of Slocan City, British Columbia.

India.—Since suspension of operations in 1947 at the Chitral mine, now in Pakistan, the Star Metal Refinery in Bombay has depended chiefly on imports of antimony concentrates. Imports of concentrates totaled 571 long tons in 1948.

Japan.—A report by the Natural Resources section, SCAP, describes the antimony resources of Japan.[5] A deposit of antimony said to contain a million tons of ore has been discovered in the Santo mine, Wakayama.

Mexico.—Antimony is produced chiefly from mines in the States of San Luis Potosi, Oaxaca, Queretaro, Sonora. Production increased 7 percent in 1948 over 1947, owing largely to high prices and to the increased activities of Mexican subsidiaries of the National Lead Co.

Union of South Africa.—The 1948 output of antimony in the Union was 7,437 short tons of concentrates, 28 of which were sold locally and 7,188 exported. For some years following the organization of Consolidated Murchison (Transvaal) Goldfields & Development Co., Ltd., in 1934 to produce gold, the antimony in the ore was allowed to go to the waste dump. But with a firmer market and higher price for antimony, the company shifted its interest and now derives most of its income from antimony and only a fraction from gold.[6]

Arsenic

By JACK W. CLARK

GENERAL SUMMARY

DOMESTIC output of white arsenic in 1948 was slightly above 1947, reflecting a continued high level of activity at copper and lead smelters where arsenic is recovered as a byproduct. The price of refined white arsenic averaged 6¼ cents per pound for 1948, highest since 1924. Imports of white arsenic declined by 33 percent compared to 1947 and were the lowest since 1932. Arsenic metal imports doubled those of the previous year. Producers' inventories of white arsenic rose for the third successive year and were nearly five-fold those of 1947. Foreign output was steady, and stocks, held abroad were reported very large, especially in Sweden. The sharp rise in domestic stocks and appreciable decline in imports of white arsenic were believed related to several factors, principally the increased consumption of nonarsenical organic insecticides and the light insect infestations during 1948, particularly in the cotton-growing regions of the South. Estimated 1948 domestic production of calcium and lead arsenate declined 19 and 45 percent, respectively, below 1947 levels. Because of the variety of new organic insecticides available and generally mild weather, buyers were reluctant to place orders in advance, causing unwillingness on the part of producers to maintain high production levels. Year-end stocks of calcium and lead arsenate are thought to have been small. Exports of calcium and lead arsenate, particularly the latter, declined below 1947. Large purchases of these insecticides for the European Recovery and China Aid Programs, directed by the Economic Cooperation Administration, caused a notable shift from the normal export pattern.

Salient statistics for white arsenic in the United States, 1944–48

	1944	1945	1946	1947	1948
Production……short tons	36,094	24,349	10,211	18,755	19,367
Imports for consumption……do	9,965	13,149	13,822	13,940	9,336
Exports……do	2,401	858	(1)	(1)	(1)
Apparent consumption [2]……do	40,025	38,100	27,000	31,000	24,000
Price per pound, end of year	$0.04	$0.04	$0.06	$0.06	$0.06

[1] Data not available.
[2] Producers' shipments, imports minus exports (exports estimated at 1,000 tons annually in 1946–47; producers reported 500 tons exported in 1948). Actual consumption was 43,500 tons in 1944 (differing from apparent consumption because of reductions in consumers' stocks); actual consumption data for 1945–48 not available.

DOMESTIC PRODUCTION

Domestic white arsenic is produced principally as a byproduct in smelting complex copper and lead ores. Production of the crude grades was a little below 1947, whereas that of the refined material

883326—50——10

doubled the previous year's figure, presumably owing to increased demand by the glass industry, which requires the premium grade. Companies reporting output in 1948 were the American Smelting & Refining Co., at Tacoma, Wash., El Paso, Tex., and Murray, Utah; Anaconda Copper Mining Co. at Anaconda, Mont., and the United States Smelting, Refining & Mining Co. at Midvale, Utah. Significant quantities of metallic arsenic were produced by the Anaconda company. Sodium arsenite solution was produced by the Shepherd Chemical Co., Cincinnati, Ohio, from imported Canadian cobalt-nickel arsenide concentrates.

White arsenic produced and shipped by producers in the United States, 1944–48

Year	Crude			Refined			Total		
	Production (short tons) [1]	Shipments		Production (short tons)	Shipments		Production (short tons)	Shipments	
		Short tons	Value [2]		Short tons	Value [2]		Short tons	Value [2]
1944	31,182	29,159	$1,370,602	4,912	5,313	$326,217	36,094	34,472	$1,696,819
1945	21,358	22,180	1,041,614	2,991	2,630	155,447	24,349	24,810	1,197,061

[1] Excludes crude consumed in making refined. Includes crude white arsenic equivalent of compounds made directly from ores, flue dust, and speiss as follows: 1944, 443 tons; 1945, 112 tons; 1946, 180 tons; 1947, 97 tons; 1948, 88 tons.
[2] Partly estimated.

CONSUMPTION AND USES

During 1948 apparent consumption of white arsenic (domestic producers' sales plus imports, minus estimated exports) was nearly 24,000 short tons, a decline of 23 percent below 1947 and the lowest for any year since 1933. The reduced consumption was due largely to the warm, dry summer weather which discouraged serious insect infestations, especially in the cotton regions of the South, and to the increasing use of synthetic organic insecticides such as DDT, benzene hexachloride, chlordane, and toxaphene. Lead arsenate was reported in steady demand by fruit growers. According to industry sources, 1948 over-all insecticide needs were only 60 to 75 percent of those in the previous year, although producers were prepared to meet requirements over 1947. Competition from the organic preparations became increasingly intense; large inventories of DDT were carried over from 1947 at lowered prices. Production of benzene hexachloride doubled that of 1947, and prices were reduced. Other organics competing with the arsenicals, such as chlordane and toxaphene, were in ample supply, according to the United States Department of Agriculture.

The major portion of all arsenic produced is employed in manufacturing calcium and lead arsenate insecticides. Calcium arsenate is consumed principally by cotton growers for boll-weevil control. Lead arsenate is extensively used to suppress the codling moth in apple orchards and chewing insects in other plantings. Appreciable quantities of sodium arsenite are used in solution form as a weed killer.

Arsenic is also consumed in glass manufacture, arsenical lead alloys, sheep dip, wood preservatives,[1] poisoned baits, and acid inhibitors,[2] and is used in the Thylox process for industrial gas purification. The use of arsenic in pharmaceutical preparations for treating syphilis has declined with the advent of more effective organic preparations, such as penicillin.

A series of important interpretations of the requirements of the Insecticide, Fungicide and Rodenticide Act were issued in July 1948 by the Insecticide Division of the Department of Agriculture's Production and Marketing Administration.[3] The interpretations are for the guidance of manufacturers and distributors of commerical poisons and carry the force of law until modified.

Production of arsenical insecticides, consumption of arsenical wood preservatives, and production of arsenical drugs in the United States, 1944–48

Year	Production of insecticides (short tons) [1]			Consumption of wood preservatives (pounds) [2]		Production of drugs (pounds) [3]
	Lead arsenate (acid and basic)	Calcium arsenate (100 percent $Ca_3(AsO_4)_2$)	Paris green (cupric aceto-arsenite)	Wolman salts (25 percent sodium arsenate)	Zinc meta-arsenite	
1944	45,352	22,175	2,265	782,256	11,503	100,190
1945	35,261	[4] 12,889	1,950	732,154	17,980	[5] 36,759
1946	28,334	17,696	(6)	1,669,889	14,650	(6)
1947	15,094	23,594	(6)	[7] 1,156,847	(6)	(6)

7 Revised figure.
8 Estimated.

STOCKS

Year-end producers' stocks of white arsenic for 1948 were nearly five times 1947 holdings and exceeded those of any year since 1940. Increased availability of organic insecticides curtailed demand for calcium and lead arsenates, lowering, in turn, the consumption of white arsenic. Data on stocks of calcium and lead arsenate held by producers are not available, but with output in 1948 closely geared to near-term demand, inventories are believed small. Stocks of white arsenic held by foreign producers, especially the Boliden Mining Co. in Sweden, are believed very large.

PRICES

The quotation on refined white arsenic, in Oil, Paint and Drug Reporter, which had remained unchanged at 6 cents per pound for carlots throughout 1947, was raised to 6¼ cents early in January 1948. This level was maintained until late in December, when it declined to

1 Häger, Bror O. (to Bolidens Gruvaktiebolag), Wood Impregnating Solutions Containing Heavy Metal Compounds with Arsenic and Chromic Acids: U. S. Patent 2,432,007, Dec. 2, 1947.
2 Wachter, Aaron (to Shell Development Co.), Prevention of Corrosion in Hydrogen Fluoride Catalytic Organic Reactions: U. S. Patent 2,431,715, Dec. 2, 1947.
Wachter, A., Treseder, R. S., and Weber, M. K., Arsenic as a Corrosion Inhibitor in Sulfuric Acid: Corrosion, vol. 3, No. 8, August 1947, pp. 406–414.
3 Oil, Paint and Drug Reporter, vol. 154, No. 4, July 26, 1948, p. 7.

the former price of 6 cents. Crude grades of white arsenic were sold at 4 to 6 cents per pound. Imported white arsenic was held at a substantial premium over the domestic contract price.

Calcium arsenate, in carlots, warehouse, was quoted at 9½ cents in January, increased to 9½ to 10½ in May, and in November was quoted at 10½, where it remained unchanged. Lead arsenate, carlots (in 6-pound bags), was quoted at 21¾ cents per pound early in January; successive increases in the price of lead during the year brought about a corresponding rise in lead arsenate quotations as follows: Mid-April, 23½ cents; late August, 24¾ to 25; mid-November, 30 to 31½; late November, 31½, this price remaining effective the balance of the year. The quoted price of paris green, carlots, remained steady throughout the year at 31 cents per pound. Similarly, sodium arsenate, carlots, was steady at 12 cents per pound. Gray sodium arsenite, carlots, works, was quoted at 10¾ cents per pound in January, increasing to 11¾ cents early in February, where it remained until early August, when Oil, Paint and Drug Reporter stated no further stocks were available; thereafter, sodium arsenite solution was quoted at 70 cents to $1 per gallon. Oil, Paint and Drug Reporter quoted arsenic metal in mid-July at 55 cents per pound; prices jumped to 75 to 90 cents in early November, remaining unchanged through December. No stocks of arsenic sulfide or zinc meta-arsenite were available during the year, according to Oil, Paint and Drug Reporter.

Producers and Government year-end stocks of arsenic compounds in the United States, 1944–48, in short tons

End of year	White arsenic			Calcium arsenate [1] (producers)	Lead arsenate [2] (producers)
	Producers	Government	Total		
1944	2,760	3,029	5,789	7,648	7,404
1945	2,299	1,987	4,286	[3] 6,389	[3] 6,869

FOREIGN TRADE [4]

Imports.—White-arsenic imports for 1948 totaled 9,336 short tons and were 33 percent below 1947 receipts and 27 percent below the 10-year average for 1939–48; 1948 imports were the lowest since 1932, when 6,882 short tons were received.

Mexico continued to be the principal supplier of white-arsenic imports, accounting for 76 percent of the total. Receipts from the U. S. S. R., the second largest supplier in 1947, dropped 69 percent; imports from Sweden were slightly below those in 1947. White arsenic was imported from Italy for the first time on record, receipts totaling 337 short tons.

Metallic arsenic imports were double those of 1947, Poland accounting for 29,979 pounds valued at $13,529 and the United Kingdom

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

6,608 pounds valued at $4,038. Essentially all of the arsenic sulfide reported was shipped from Belgium and was valued at $15,755. All receipts of sheep dip were from the United Kingdom and were valued at $6,692.

Arsenicals imported into and exported from the United States by classes, 1944–48, in pounds

[U. S. Department of Commerce]

Class	1944	1945	1946	1947	1948
Imports for consumption:					
White arsenic (As_2O_3 content)	19, 929, 608	26, 297, 962	27, 641, 765	27, 879, 965	18, 671, 621

U. S. S. R.	---	---	---	---	251	18, 833	1, 445	156, 459	449	49, 320
Total	9, 965	545, 355	13, 149	687, 973	13, 822	773, 025	13, 940	1, 145, 468	9, 336	883, 529

Exports.—Calcium arsenate and lead arsenate exports for 1948 declined 8 and 34 percent, respectively, below 1947 totals. Germany and Peru each received 30 percent of the calcium arsenate shipped; France received 19 percent, and the remaining 21 percent was distributed among 11 other countries. China received 57 percent of the lead arsenate exported; 8 percent went to Japan and about 5 percent each to Brazil, Austria, and Korea. The remainder—about 30 percent—was shipped to 24 other countries. In previous years Latin-American countries have been the most important export markets for United States producers of calcium and lead arsenate. During 1948 these markets continued to be important but were overshadowed by purchases made for the European Recovery and China Aid Programs.

WORLD REVIEW

The world production record of white arsenic in recent years, insofar as data are available, is shown in the following table.

World production of white arsenic, by countries, in metric tons, 1943–48 [1]

[Compiled by Bernice B. Mitchell]

Country [1]	1943	1944	1945	1946	1947	1948
Australia	2, 320	2, 341	2, 021	1, 651	1, 210	406

Total [9]	66, 300	68, 000	55, 600	40, 000	53, 000	53, 000

[1] Arsenic is also believed to be produced in China, Czechoslovakia, Hungary, Iran, Korea, Turkey, and U. S. S. R., but data are not available.
[2] Arsenic content of ore mined.
[3] Data not available; estimate by author of chapter included in total.
[4] Exports.
[5] January to July, inclusive.
[6] Incomplete data.
[7] Reported production appears to be too low in relation to reported exports.
[8] Exports. In addition, 173 tons of arsenic concentrates were exported.
[9] Estimated by author of chapter; excludes countries listed in footnote 1.

Argentina.—Deposits of arsenical ores containing copper, molybdenum, and bismuth occurring at Tocota, San Juan Province, were studied, and potential production was estimated.[5] The Five-Year Plan set the annual production goal for lead arsenate in 1947 at 500 metric tons.[6]

Australia.—The arsenic condensing and refining plant at Wiluna, Western Australia, owned by the Victor Leggo Mining Co. Pty., Ltd., ceased operations in April 1948. Since 1946, when the Wiluna gold mine closed down, the arsenic plant had been using previously impounded crude material. It is reported the plant will be kept intact, as there are possibilities of several of the Western Australian gold mines producing arsenical gold concentrates. The Bendigo arsenic plant, owned by the same firm, will continue to produce a few hundred tons of refined arsenic annually.[7]

Canada.—About 493 tons of refined white arsenic were produced by the Deloro Smelting & Refining Co., Ltd., Deloro, Ontario, in 1948, part being recovered in treating silver-cobalt ores from northern Ontario and part from processing of crude oxide obtained from

[5] Kittle, E. and Bellio, N., Estudio Geologico-Economico de los Yacimientos de Arsenico de Tocota, Departmento Iglesia, Provincia de San Juan: Revista Minera, vol. 17, No. 4, October–December 1946, pp. 73–144.
[6] U. S. Department of Commerce, Chemicals and Drugs: March 1947, p. 23.
[7] Bureau of Mines, Mineral Trade Notes: Vol. 27, No. 3, September 1948, p. 3.

O'Brien Gold Mines, Ltd., in northern Quebec. Some crude arsenic was exported by Beattie Consolidated Gold Mines, Ltd., northern Quebec.[8] A coal shortage was reported to have curtailed Canadian production during the year.

Colombia.—Reserves of arsenopyrite ores at El Zancudo Mine were estimated at 100,000 tons.[9]

France.—Domestic mines producing arsenical ores were listed and their locations given.[10]

Iran.—Small quantities of arsenic were produced in 1947.[11] Orpiment and realgar ores are mined at Zarah Shah. A description of Iranian arsenic ore deposits has been published.[12]

Peru.—Cerro de Pasco Copper Corp. completed construction of its new calcium arsenate plant at Oroya in 1947. Production began late in the year and had reached a rate of 100 metric tons per annum in 1948.[13]

Poland.—In March 1947 the Polish Central Chemical Board signed an agreement to export 257 tons of arsenic to the United Kingdom, 50 tons to the United States, 100 tons to South American countries, and 20 tons to Denmark.[14] By order of the Ministry of Agriculture the Azoty factory at Jaworzno is producing "Arsopol," an arsenic compound used in spraying trees from the air.[15]

Portugal.—Reports state that a new plant for production of high-grade white arsenic has been constructed at Pintor, southeast of Oporto, and began production late in 1947. Monthly output is said to be 230 tons on a three-shift day, 7-day-week basis. Raw materials comprise ore from the mine at Pintor and concentrates from Tuella Tin Mines Limitada and Minas dos Mouros, Tres-os-Montes Province; and from Beralt Tin and Wolfram Ltd., Beira Baixa Province.

Sweden.—The Boliden Mining Co., largest individual producer of white arsenic in the world, was reported to be expanding refining capacity. Crude-arsenic stocks on hand are said to be large enough to meet world demand for many years.[16] The annual report of the company for 1948 indicates concern over the encroachment of organic compounds in the insecticide field and states that research is active in seeking new uses for arsenic. An abundance of native arsenic was reported in one vein at the Linskold Copper mine, northern Sweden.[17]

Asbestos

By G. W. JOSEPHSON AND F. M. BARSIGIAN

GENERAL SUMMARY

THE world-wide shortage of asbestos continued to be acute in 1948. After the war many asbestos-products manufacturers embarked upon expansion programs as demand increased, but it soon became apparent that the supplies of raw asbestos were inadequate to support this rapid expansion program. Consequently, growth of the industry has been inhibited, and it has not been possible to take full advantage of all the manufacturing capacity available. The shortage has stimulated the search for substitute fibers that might be available in larger quantity.

Asbestos was mined in the United States at a record rate, but the total was only a small fraction of our requirements—only 5 percent of the asbestos consumed in the United States in 1948.

The bulk of the asbestos produced in the United States is chrysotile, coming largely from Vermont and Arizona. The market for amphibole asbestos is still comparatively small but has increased recently owing to use in a new type of insulating product.

Imports of asbestos also attained a new record. Canada is our principal supplier of chrysotile; relatively small quantities are received from Southern Rhodesia and Russia.

United States amosite supplies come from South Africa, as does nearly all of the crocidolite used in this country. Interest in and development of blue asbestos deposits in other countries, such as Australia and Bolivia, have been noteworthy during the past year, but these have not yet become suppliers of large tonnages.

The general shortage of asbestos fibers has been so acute that comparatively little progress was made in their procurement for the National Strategic Stock Pile during the past year.

Prices of raw asbestos increased considerably during 1948.

Salient statistics of the asbestos industry in the United States, 1947–48

	1947		1948	
	Short tons	Value	Short tons	Value
Domestic asbestos—				
Produced:				
Chrysotile	24,462	(1)	(2)	(1)
Amphibole	677	(1)	(2)	(1)

[2] Bureau of Mines not at liberty to publish figure separately.
[3] Quantity sold or used by producers, plus imports, minus exports.

PRODUCTION

In 1948 production of asbestos in the United States attained a new record of 37,237 short tons—48 percent more than in 1947. Chrysotile production was reported from Vermont and Arizona and amphibole from California, Georgia, and North Carolina. During 1948 considerable exploration was carried on, but no large commercial developments were reported. However, one promising deposit of chrysotile was being investigated.

Asbestos sold or used by producers in the United States, 1944–48, by varieties

Year	Chrysotile		Amphibole		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	6,275	$373,112	392	$7,222	6,667	$380,334
1945	11,986	442,056	240	3,989	12,226	446,045
1946	13,645	499,260	430	5,504	14,075	504,764
1947	23,586	912,340	449	6,218	24,035	918,558
1948	(1)	(1)	(1)	(1)	37,092	1,806,261

1 Bureau of Mines not at liberty to publish figure separately.

Alaska.—Alaska has some rather inaccessible deposits of tremolite and chrysotile in the Kobuk River district, but in 1948 no output was reported from them.

Arizona.—In 1948 chrysotile production in Arizona was substantially higher than in the previous year. The following firms and individuals were active: Apache Asbestos Mines, Inc., Arizona Chrysotile Asbestos, Arthur Enders, Ted Heron, Charles Ireland, Louis Kuehne, Roger Q. Kyle, Phillips Asbestos Mines, K. Reidhead, and the Globe Asbestos Co. The Globe firm operates the largest mill in the area.

California.—In Shasta County production of tremolite was reported by Homer E. Fenn of Hazel Creek, Ray J. Sylvester of Mount Shasta, and the Powhatan Mining Co. (Woodlawn, Baltimore, Md.). H. Zimdars and J. Delume of Foresthill mined a small quantity of tremolite in Placer County but discontinued mining later in the year.

Georgia.—Powhatan Mining Co. mined anthophyllite in Rabun County near Dillard and in Barrow County near Statham.

North Carolina.—The only asbestos production in North Carolina in 1948 came from an amphibole mine in Macon County, operated by Powhatan Mining Co. of Woodlawn, Baltimore, Md.

Vermont.—Vermont was the principal asbestos-producing State in 1948. The Vermont Asbestos Mines Division of the Ruberoid Co., the only producer in Vermont, increased its production considerably. This asbestos is a high-grade chrysotile that is milled by the company, largely for use in its own asbestos products.

CONSUMPTION AND USES

A census of manufactures covering 1947 was taken by the Bureau of the Census during 1948. This is the first such census taken since 1939. The production statistics for asbestos products are shown in the following table.

Production of asbestos products in the United States, 1939 and 1947, and shipments, 1947

[U. S. Bureau of the Census]

Product	Unit of measure	1939 Production [1] Quantity	1939 Production [1] Value $1,000	1947 Production Quantity	1947 Shipments and interplant transfers Quantity	1947 Shipments and interplant transfers Value $1,000
Asbestos-cement products:

Apparent consumption of raw asbestos in the United States, 1944–48

Year	Short tons	Value	Year	Short tons	Value
1944	389,241	$18,864,291	1947	616,787	$30,423,663
1945	378,030	15,926,622	1948	678,443	38,607,094
1946	459,752	17,840,775			

The Census data, as well as those in the accompanying table of raw-asbestos consumption, indicate the rapid rate of expansion that has taken place in the asbestos industry. The major uses of asbestos in industry are in such products as pipe covering, packing, gaskets, brake linings, and various textiles. The building industry also consumes very large tonnages in asbestos-cement products (such as shingles, sheets, and pipes), floor tile, and other uses. The correlation between activity in construction, general industrial production, and asbestos consumption during the past 29 years is shown in figure 1.

Market Conditions.—As in 1947, the world demand for asbestos was greater than the supply. Production was being expanded, particularly in Canada, but the increase during the year was not nearly sufficient. American factories purchased the largest part of world production, but the demands of other consumers were becoming increasingly important factors in the market. Toward the latter part

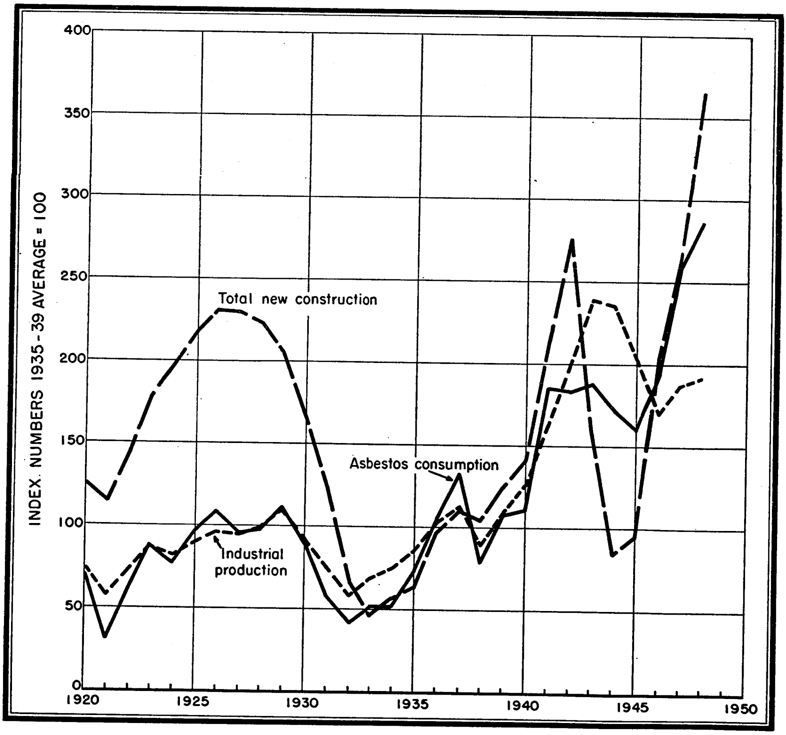

FIGURE 1.—Consumption of asbestos compared with total new construction and industrial production, 1920–48. Units are reduced to percentages of the 1935-39 average. Statistics on value of construction from Bureau of Foreign and Domestic Commerce and on industrial production from Federal Reserve Board.

of the year there was some evidence that the shortage of textile fibers was easing, but this did not reach a point that would release fiber for stock piling. There was also a slight recession in demand for shorts during part of the year, but this is said to have been largely overcome. The exploration and mine-development work that are progressing throughout the world promise some relief for the future. As indicated in the World Review section of this chapter, a number of important expansion programs are in progress. However, at the end of 1948 contracting activities indicated that more than the available supply would be required for 1949 and that any early relief from the shortage can come only from a decline in demand for asbestos products.

Asbestos varies widely in physical properties and consequently in utility. Each variety has fundamental advantages and disadvantages, and even within a single variety the properties vary so much that great care must be exercised in proper handling and processing of the product in order to attain the most efficient use of the raw materials. A brief paper discussing asbestos research and the properties that determine utilization was published in 1948.[1]

New Uses.—Some noteworthy new products were announced during 1948. An outstanding example is Quinterra paper. In making this product, chrysotile fibers are formed by a special paper-making process into a paperlike tape having a thickness of only 1.5 to 20 mills. It is used for electrical wire insulation.[2] A new plant has been built for its manufacture.[3]

Another new product that attracted attention during 1948 was phospho-asbestos, a molded asbestos material having superior properties for use in circuit breakers.[4]

Many varieties of asbestos have found commercial use, but anthophyllite generally has such a weak fiber that comparatively little has been consumed in the United States in the past. However, it appears to be the most suitable type for use in a newly developed insulating material composed principally of a plastic and anthophyllite. The product is now in commercial production, and the prospect of developing a substantial market for it is considered to be promising.

PRICES

Under current market conditions, coupled with higher material and labor costs, the prices of all grades of crude and milled asbestos fiber from both Canada and Vermont increased in 1948. As quoted in the magazine, Asbestos, the prices per short ton of Canadian fiber, f. o. b. mines, in January were as follows, in United States dollars: Group 1 (Crude No. 1), $800; group 2 (Crude No. 2, Crude Run-of-Mine, and Sundry), $302.50–$545; group 3 (Spinning or Textile Fiber), $170.50–$354.50; group 4 (Shingle Fiber) $82.50–$127; group 5 (Paper Fiber), $58–$73.50; group 6 (Waste, Stucco, or Plaster), $43–$47.50; and group 7 (Refuse or Shorts), $19.50–$44.50.

Prices of Canadian asbestos increased in February and these figures were quoted from then until December: Crude No. 1, $896–$960;

[1] Badollet, M. S., Research on Asbestos Fibers: Canadian Min. and Met. Bull., vol. 42, No. 432, April 1948, pp. 213–216.

[2] Asbestos, Quinterra, a New Type of Electrical Insulation: Vol. 30, No. 2, August 1948, pp. 12–14.

[3] Asbestos, Johns Manville's Newest Plant: Vol. 30, No. 5, November 1948, pp. 16–18.

[4] Asbestos, Phospho-Asbestos; Vol. 30, No. 5, November 1948, pp. 10–12.

Crude No. 2, Crude Run-of-Mine, and Sundry, \$350–\$545; Spinning or Textile Fiber, \$204.50–\$378; Shingle Fiber, \$84.50–\$128; Paper Fiber, \$69.50–\$78; Waste, Stucco, or Plaster, \$47–\$51.50; and Refuse or Shorts, \$24.50–\$46.

At the end of the year, another general price increase was being put in effect.

The prices of Vermont asbestos in short tons f. o. b. Hyde Park or Morrisville, Vt., quoted in January 1948, were: Shingle Fiber, \$92.50–\$102.50; Paper Fiber, \$65–\$73; Waste, Stucco, or Plaster, \$48.50; Refuse or Shorts, \$25.50–\$44.50. These prices were increased in March 1948 and remained unchanged throughout the year, as follows: Shingle Fiber, \$97–\$107; Paper Fiber, \$68.50–\$85; Waste, Stucco, or Plaster, \$51; Refuse or Shorts, \$25.50–\$46.50.

FOREIGN TRADE[5]

As the major producing countries are not large consumers, a very high proportion of the asbestos output of the world moves in foreign trade. The United States has only a negligible export trade in unmanufactured asbestos. The exported material is largely domestic chrysotile from Arizona and a modest tonnage of foreign material that is reexported, with or without blending, to higher-priced markets. On the other hand, exports of manufactured asbestos products are substantial, totaling \$10,471,059 in 1948.

Asbestos imported for consumption in the United States, and asbestos and asbestos products exported from the United States, 1944–48

[U. S. Department of Commerce]

Year	Asbestos (unmanufactured)				Manufactured asbestos products—exports (value)
	Imports		Exports		
	Short tons	Value	Short tons	Value	
1944	383,049	\$18,542,940	475	\$58,983	\$5,614,243
1945	374,354	16,317,752	8,550	837,175	7,264,288
1946	456,688	18,731,378	11,011	1,395,367	9,263,092
1947	594,839	29,821,519	2,087	316,414	12,823,480
1948	647,881	37,974,092	6,530	1,173,259	10,471,059

United States imports of unmanufactured asbestos were 9 percent higher than in 1947. Canada supplied 93 percent of the total, the Union of South Africa 3 percent, Southern Rhodesia 2 percent, and Russia 2 percent. Small quantities were received from other countries as indicated in the accompanying table.

[5] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

TECHNOLOGY

Iron removal received considerable attention during 1948, and a review was published on the subject.[6] The problem is of particular importance because of the use in military equipment of low-iron chrysotile that is now obtained principally from Southern Rhodesia. Development of methods of beneficiating more available grades of asbestos would improve our military supply position.

The shortage of amosite is resulting in serious efforts to find substitutes. In this case one of the most promising lines of investigation is leading toward the substitution of glass fiber in some heat-insulating products.

WORLD REVIEW

Although official statistics are not available for some producing areas, it is estimated that Canada supplied nearly two-thirds of the world asbestos output in 1948. Russia probably was in second place, Southern Rhodesia third, and the Union of South Africa fourth.

CANADA

In 1948 the Canadian asbestos industry reached a new output record of 716,769 short tons valued at $42,231,475, an increase of 8 percent in tonnage over 1947. The block-caving method is coming into greater use. Seven companies that are not now producers are said to have been carrying on exploration and development work. It was reported that the United Asbestos Corp. has discovered a large deposit under Black Lake, and an aggressive drilling program is in progress. Indications are that the deposit contains 50,000,000 tons averaging 4½-percent asbestos.[7]

The Potash Co. of America optioned 25,000 acres held by the Reed estate and has started an exploration program. Another firm reported to be carrying on a diamond-drilling program is the Coleraine Asbestos Co.[8]

Sales of asbestos in Canada, 1947–48, by grades

AFRICA

Southern Rhodesia.—During 1948 preparations for the reopening of the Croft mine were being made by Mashaba Rhodesian Asbestos Co. In the Belingwe area, Vanguard Asbestos Mines, which has absorbed claims previously held by the H. M. H. Syndicate, was making arrangements to mine a large deposit.[9] In the Mashaba district the Mangwana property was investigated and found to have promise as a possible source of shingle fiber.[10]

Southern Rhodesian asbestos is distributed to many countries. In 1947 the bulk, over 40 percent, went to the United Kingdom and 20 percent to the United States. Australia, India, and France followed in that order.[11]

Asbestos produced in Southern Rhodesia, 1943–48

Year	Short tons	Value	Year	Short tons	Value
1943	58,146	£1,673,025	1946	55,872	£1,676,503
1944	58,293	1,674,467	1947	54,094	1,738,484
1945	56,349	1,788,386	1948	68,897	2,604,623

Swaziland.—The asbestos produced in Swaziland is chrysotile mined at the Havelock mine by Turner & Newhall, Ltd. Both open-pit and underground mining methods are used.[12] Output in 1948 totaled 29,421 metric tons—almost equal to the record of 29,628 tons produced in 1944.

Union of South Africa.—Exploratory work by the Stoltzburg Asbestos Co., in the Eastern Transvaal, has revealed reserves of over 5,000,000 tons of ore ranging from 3 to 5 percent asbestos. The deposit is being prepared for mining by ring stoping or block caving. Expansion of the mill to bring capacity up to 350–400 tons of fiber per month was in progress.[13]

It is reported that a program for expanding amosite production capacity by at least 50 percent was started in 1948.

The principal grades of crocidolite and amosite as outlined by the Department of Mines of the Union of South Africa are as follows:[14]

			Length of fiber, in.
Cape blue:			
No. 3 or S			0 to 3/8.
2 or A			3/8 to 3/4.
1 or B			3/4 to 1 1/4.
Long or C, D, E			1 1/2 plus.
Transvaal blue:			
Crude:		Fiberized:	
TX		TDX	+1 1/2.
T1		TD1	−1 1/4 to +7/8.
T2		TD2	−7/8 to +1/2.
T3		TD3	−1/2 to +1/4.
T4		TD4	−1/4.

Amosite:	
Longs	3/4 in. and over.
Shorts	3/4 in. and less.
B1	Best long grayish-white fiber.
B3 and D3	Second-grade long fiber, varying in color from yellow to dark brown.
M	Uniform mixed shorts.
MD	Shorts of all grade.

		Length of fiber, in.
White amosite fiber:		
Crudes:	Fiberized:	
AL1	D1	+1 1/2.
AL2	D2	−1 1/2 to +3/4.
AL3	D3 or DD	−3/4 to +1/2.

[1] Data from Union of South Africa, Department of Mines, Quarterly Report.

OTHER COUNTRIES

Australia.—Blue asbestos is being mined on a modest scale in the Wittenoom Gorge of the Hammersley Range in a remote section of Western Australia. The two asbestos seams are said to total 2 to 6 inches in thickness and are mined by the room-and-pillar method. The asbestos occurs in a hard, ferruginous quartzite. First about 48 inches of the quartzite is removed from above the asbestos, and then the bottom 24-inch section containing the two seams of cross-fiber crocidolite is mined. The mine is operated by Blue Asbestos, Ltd., a subsidiary of Colonial Sugar Recovery, Ltd. The product is used almost entirely in Australia itself. Output is now comparatively small, but capacity is being increased.[15]

Bolivia.—Bolivian crocidolite output is small, as it is somewhat lacking in strength; however, some interest in the fiber has developed, as it appears to serve satisfactorily as a filtering material.

Finland.—Finska Mineral Aktiebolaget produces about 6,000 tons of anthophyllite annually from surface mines at Paakkila in Northern

[15] Mining Magazine (London), Blue Asbestos Deposits in the Hammersley Range: Vol. 78, No. 4, April 1948, pp. 205–207.

Savolax and at Maljasalmi in Northern Karelia. The company also operates an asbestos-products plant in Helsinki, where most of its own asbestos as well as chrysotile from the Urals is used.[16]

France.—During 1948 a deposit of tremolitic asbestos near Chateau-Queyras, France, received considerable attention. It had been operated on a small scale in the past. The fiber is said to be of promising quality, and an attempt is being made to bring the deposit into commercial production.[17] In 1948 the Canari mine in Corsica was being developed for a projected production rate of 15 to 20 tons per day of chrysotile slip fiber.[18] A deposit of chrysotile is being operated on a small scale in French Morocco.

Italy.—Articles on the geology of Italian asbestos deposits were published during 1948.[19]

Switzerland.—Deposits of asbestos close to Alp Quadrada, near Poschiavo (Canton Grisons), Switzerland, are mined by Studiengesellschaft für Asbestgewinnung. The mine has been worked since 1942, producing 85.2 metric tons from 1942 to 1946. The product is considered to be of good quality for use in filters.[20]

U. S. S. R.—Russia exported 500 tons of raw asbestos to Norway in 1947.[21]

Asphalt and Related Bitumens

By A. H. REDFIELD AND SARAH J. SPENCER

GENERAL SUMMARY

DOMESTIC demand [1] for petroleum asphalt was 6 percent higher in 1948 than in 1947, but export demand was 51 percent lower. However, export demand was only 3 percent of the total demand, domestic and foreign, so that the total demand increased 2 percent from 1947 to 1948. In numerical terms, an increase of 482,517 tons in domestic demand—offset in part by a decrease of 285,991 tons in export demand—was met by an increase of 478,517 tons in refinery production and by greater imports of petroleum and lake asphalt totaling 77,078 tons. As a result, stocks held at the refineries increased 342,912 tons during 1948 compared with a decrease of 16,364 tons (revised figure) during 1947.

NATIVE ASPHALT AND BITUMENS

Bituminous Rock.—Sales of bituminous rock by producers in the United States increased from 1,004,740 short tons valued at $3,756,074 in 1947 to 1,084,004 tons valued at $3,634,917 in 1948. Bituminous limestone totaled 747,934 tons valued at $1,947,038 in 1947 and 904,183 tons valued at $2,292,873 in 1948. Bituminous sandstone amounted to 256,806 tons valued at $1,809,036 in 1947 and 179,821 tons valued at $1,342,044 in 1948. Two companies in Texas and one in Alabama were responsible for the general gain in 1948 over 1947; in Kentucky, Missouri, Oklahoma, and Utah less rock asphalt was sold in 1948 than in 1947. Sales values per ton were generally larger in 1948 than in 1947; in Alabama, however, they were lower, and in Oklahoma they remained at the same level as in 1947.

Gilsonite.—Sales of gilsonite by producers in northeastern Utah decreased from 67,165 short tons valued at $1,746,228 in 1947 to 52,122 tons valued at $1,390,713 in 1948. However, the average sales value per ton at the mine or railhead increased from $26 in 1947 to $26.68 in 1948.

MANUFACTURED OR PETROLEUM ASPHALT

Production.—Petroleum refineries in the United States produced 9,439,800 short tons of asphalt in 1948, an increase of 5 percent over the 8,961,100 tons produced in 1947. The increase was greatest in the

[1] The term "domestic demand" as used in this chapter means apparent consumption, that is, production, plus net imports, and changes in refiners' stocks.

Indiana–Illinois–Kentucky, etc., district and in the East Coast district. California was the conspicuous exception to the general increase. Less asphalt was produced in the Appalachian and Louisiana Gulf Coast districts.

Stocks.—Stocks of asphalt held at refineries increased 50 percent—from 685,700 short tons (revised figure) on December 31, 1947, to 1,028,600 tons on December 31, 1948. The increase was general, but was greatest in the Indiana–Illinois–Kentucky, etc., district and the Oklahoma–Kansas–Missouri district.

Production, receipts, stocks, consumption, transfers, losses, exports, and domestic sales of asphalt (exclusive of road oil) at petroleum refineries in the United States in 1948, by districts, in short tons

District	Production	Receipts [1]	Stocks		Consumption by producers, transfers, losses, and exports	Sales to domestic consumers
			Jan. 1	Dec. 31		
East Coast	2,683,100	524,000	130,000	140,500	361,800	2,834,800

[1] Receipts from interindustry refinery transfers, addition of other petroleum products blended to make cut-back asphalts, imports, and transfers from stocks formerly not classified as asphalt.
[2] Revised figure.

Sales.—Sales of petroleum asphalt to domestic consumers increased 5 percent in quantity from 1947 to 1948 and, because of higher prices, 40 percent in value. The average sales value per short ton increased from $14.64 in 1947 to $19.48 in 1948.

Of the total sold, 26 percent was manufactured from foreign petroleum (imported chiefly from Venezuela, Colombia, and Mexico) in 1948, compared with 22 percent in 1947. Although runs of foreign crude to stills increased 28 percent from 1947 to 1948, sales of petroleum asphalt from this source increased only 25 percent. Of the foreign crude processed, 9 percent was converted into asphalt in 1947 and 10 percent in 1948. Ninety-nine percent of the asphalt made from foreign crude was manufactured in east coast refineries.

Highway and street construction and airport-runway surfacing (in the form of paving asphalt, paving flux, cut-back asphalts, and asphalt emulsions) used 62 percent of the total asphalt sold to domestic consumers by petroleum refineries in 1947 and 67 percent in 1948. Sales of all grades of asphalt devoted wholly or principally to street and road construction increased 14 percent in 1948 over 1947.

Sales of asphalt (exclusive of road oil) at petroleum refineries to domestic consumers in the United States, 1947–48, by districts

Grand total: 1948	6,821,405	128,414,477	2,356,716	50,373,837	9,178,121	178,788,314
1947	6,855,391	96,731,464	1,880,095	31,137,992	8,735,486	127,869,456

Sales of emulsified asphalt were higher in 1948 than in 1947. Petroleum refineries sold 55,408 short tons (13,055,205 gallons) valued at $876,070 in 1947 and 124,760 tons (29,395,889 gallons) valued at $2,976,116 in 1948. In addition, 86,242,707 gallons valued at $7,634,291 in 1947 and 102,815,746 gallons valued at $11,009,785 in 1948 were sold by major industrial companies that purchased asphalt from petrolum refineries and manufactured it into emulsions. Accordingly, total known sales of emulsified asphalts and fluxes increased 33 percent in quantity—from 99,297,912 gallons (421,433 tons) in 1947 to 132,211,635 gallons (561,137 tons) in 1948—and 64 percent in value—from $8,510,361 in 1947 to $13,985,901 in 1948.

Roofing manufacture made the second-largest demand for asphalt, absorbing 32 percent of the total sales of asphalt to domestic consumers in 1947 and 28 percent in 1948. Although sales of prepared roofing and asphalt siding reported to the Bureau of the Census decreased 15 percent—from 74,240,000 squares in 1947 to 63,219,000 squares in 1948—domestic sales of roofing asphalt and roofing flux combined decreased 8 percent—from 2,835,114 short tons in 1947 to 2,611,092 tons in 1948. These figures do not include roofing asphalt and flux consumed by the refining companies in factories making prepared roofing and siding, owned by themselves or by affiliated companies.

APPARENT CONSUMPTION

The period of high demand that had characterized 1940–47 continued into 1948. The apparent average monthly domestic consumption of petroleum asphalt (including small quantities of imported lake asphalt and grahamite) was increased 6 percent—from 719,432 short tons (revised figure) in 1947 to 759,667 tons in 1948. Total apparent consumption was 8,633,181 tons (revised figure) in 1947 and 9,115,698 tons in 1948.

DISTRIBUTION BY RAIL

Although the apparent domestic consumption of petroleum asphalt increased 6 percent from 1947 to 1948 and refinery sales to domestic consumers 5 percent, the tonnage of asphalt (natural, byproduct, and petroleum) terminated by class I railroads in the United States decreased 4 percent—from 7,063,978 short tons in 1947 to 6,764,934 tons in 1948, according to the Interstate Commerce Commission. It may be noted, however, that railroad terminations of asphalt were equivalent to only 82 percent of the total apparent consumption of asphalt in the United States in 1947 and 74 percent in 1948 and that considerable quantities of asphalt were delivered to consumers by water, minor railroads, and motor trucks. Accordingly, the figures in the accompanying table do not present a complete picture of the consumption of asphalt by States.

Of the total deliveries by rail, 54 percent in 1947 and 56 percent in 1948 were set down in the populous area north of the Ohio and Potomac Rivers and east of the Mississippi River, although this area comprises only 14 percent of the area of continental United States. In this area terminations of asphalt were 2 percent lower in 1948 than in 1947. In the States lying south of the Potomac and Ohio, deliveries of asphalt were slightly less in 1948 than in 1947. Between the Mis-

Asphalt (natural, byproduct, and petroleum) terminated by class I railroads in the United States, 1947–48, by States, in short tons

sissippi River and the Rocky Mountains, railroad terminations of asphalt were 10 percent less in 1948 than in 1947; declines in Texas and Louisiana were partly offset by increases in Iowa, Missouri, the Dakotas, and Nebraska. In the Rocky Mountain States receipts of asphalt by rail were 4 percent larger in 1948 than in 1947. In the three Pacific States rail deliveries of asphalt were 18 percent lower in 1948 than in 1947.

FOREIGN TRADE [2]

Imports.—Imports of natural asphalt and bitumen into the United States totaled 5,802 short tons valued at $242,526 in 1947 and 6,690 tons valued at $181,018 in 1948. Imports of lake asphalt from Trinidad increased from 3,291 tons valued at $73,017 in 1947 to 4,667 tons valued at $97,444 in 1948. Imports of grahamite from Cuba decreased from 466 tons valued at $11,364 in 1947 to 76 tons valued at $2,297 in 1948. Imports of 1,754 tons valued at $8,071 in 1947 and 1,833 tons valued at $13,754 in 1948 were ascribed to the Netherlands West Indies.

Imports of solid petroleum asphalt increased from 183,365 tons

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce

valued at $1,444,545 in 1947 to 247,176 tons valued at $1,898,767 in 1948. Virtually all of the 1947 and 1948 imports came from the Netherlands West Indies.

In addition, the United States received from the Netherlands West Indies 123,795 barrels (22,508 short tons) of liquid petroleum asphalt valued at $247,847 in 1947 and 191,880 barrels (34,887 tons) valued at $506,930 in 1948.

Exports.—The tonnage of natural asphalt, unmanufactured, exported from the United States decreased from 23,902 short tons valued at $1,065,386 in 1947 to 13,682 tons valued at $559,462 in 1948. Of the 1948 exports, 42 percent went to Europe, notably to the United Kingdom, Sweden, Belgium, and the Netherlands. Canada received 18 percent of the total and Mexico 23 percent.

Exports of petroleum asphalt from the United States dropped from 555,949 short tons valued at $14,207,963 in 1947 to 269,958 tons valued at $8,984,509 in 1948. The principal decreases were in exports to Europe and to Australasia. On the other hand, more asphalt was exported to Far Eastern countries of Asia, except Malaya and China.

1947	7,074	855	606	613	964	6,958

[1] Receipts from interindustry refinery transfers, imports, and transfers from stocks formerly not classed as road oil.

6,115,000 barrels in 1948—but increased 4 percent in value—from $17,235,000 in 1947 to $17,870,000 in 1948. The principal decrease was in California; it more than offset increases in the Indiana-Illinois-Kentucky, etc. district, and in the Rocky Mountain district. Four refining districts—Indiana-Illinois-Kentucky, etc., Oklahoma-Kansas-Missouri, Rocky Mountain, and California—together made 95 percent of all road-oil sales in 1948, compared with 96 percent in 1947.

Of the total sales of road oil to domestic consumers, 87,594 barrels valued at $243,545 in 1947 and 186,489 barrels valued at $698,172 in 1948 were made from foreign petroleum, imported chiefly from Venezuela, Colombia, and Mexico.

Barite

By JOSEPH C. ARUNDALE AND F. M. BARSIGIAN

GENERAL SUMMARY

DOMESTIC mine production of 777,841 short tons of barite during 1948 was short of the record established in 1947, although well in excess of any other year on record, and the United States remained the world's leading producer of barite. Consumption of 894,309 short tons of barite was greater than during any previous year. Approximately 71 percent of the 799,848 short tons of primary barite [1] sold or used by producers was consumed by the well-drilling industry. Sales to all other major consuming industries declined, with the exception of a small increase in sales for rubber filler. Total imports of 53,204 short tons of barite represented no appreciable change from the level of 1947.

Salient statistics of the barite and barium-chemical industries in the United States, 1944–48

[1] Although all barite is crushed before use in chemicals, barite used in chemicals is not included in the 1945–48 totals for ground. In 1944 small quantities of crushed barite used by chemical producers are included.

Arkansas remained the principal producing State, with Missouri a close second. Georgia and Tennessee continued to feel the effects of competition from crude barite imported from Nova Scotia.

A sluggish demand for lithopone was reported during the latter part of the year.

[1] The term "primary barite," as used in this chapter, applies to barite as first offered to the trade, whether lump, crushed, or ground. Where ground barite has been reported to the Bureau of Mines as original production, an estimate of the value of the lump equivalent of the ground has been assigned to such tonnage.

On April 5, 1948, the Interstate Commerce Commission decided that the maintenance of lower rates on unground barite, not precipitated or refined by chemical process, than on the same commodity in ground form was not justified by transportation conditions. The Commission also found that the rates on ground barite from Malvern, Ark., and on ground and unground barite from Mineral Point, Mo., and Cartersville, Ga., to certain destination areas were unreasonable. New maximum reasonable rates on ground and unground barite were prescribed.[2]

DOMESTIC PRODUCTION

The reduced demand for barite from the lithopone, glass, and chemicals industries during the latter part of the year was a particular depressant to the Georgia and Tennessee producers, who for some time have experienced strong competition in these markets in the East from imports of barite from Nova Scotia. Georgia producers reported that operations at the end of the year had been greatly curtailed, and Tennessee production continued a rapid decline.

Barite production in the United States was reviewed.[3]

Ground (and crushed) barite produced and sold by producers in the United States, 1944–48 [1]

Year	Plants	Production (short tons)	Sales	
			Short tons	Value
1944	19	344, 377	344, 757	$5, 455, 835
1945	20	473, 749	468, 939	7, 519, 759
1946	23	456, 327	455, 240	7, 208, 193
1947	23	552, 227	549, 965	8, 979, 400
1948	23	630, 808	631, 424	11, 195, 365

[1] Barite used in chemicals, although crushed before use, is not included in 1945–48 totals. In 1944 small quantities of crushed barite used by chemical producers are included.

Arizona.—The Arizona Barite Co., which operates a mine and mill east of Mesa, Ariz., acquired a second property about 20 miles southwest of Aguila. Results of considerable development work at this new location are said to indicate that the deposit will prove large enough to justify installation of another mill. Present open-pit operations are producing approximately 50 tons of ore daily.[4]

Arkansas.—The Bureau of Mines issued a report describing 10 barite deposits in Arkansas.[5]

California.—Baroid Sales Division of National Lead Co. dismantled its Los Angeles grinding plant late in 1947 and transferred it to Merced, Calif., where crude barite from its various mines was ground during 1948 for use in drilling mud.

Idaho.—The Simplot Fertilizer Co. of Pocatello, Idaho, reported purchase of the Sun Valley Barite Co. Its barite deposit is near

[3] 1946 and 1948: Arizona, California, and Nevada; 1947: Arizona and California.

Hailey, Idaho, and the occurrence is such that the property is amenable to strip mining by benching. The barite as mined and shipped has a specific gravity of 4.05 to 4.15 and contains 84 to 88 percent barium sulfate. Although there was no production from this operation during 1948, a small tonnage produced during 1946–47 was in stock. (This previously unreported tonnage has been included with the 1948 production statistics.)

Missouri.—Barite deposits of central Missouri were described.[6] A new producer in Missouri, R. E. Wood, recovered barite from tailings from the lead-ore mill of the Fredericktown Lead Co. at Valles Mines. The Potosi Mining Co. discontinued operations at its mine near Potosi, Mo., during the latter part of 1947 and was idle during 1948.

Nevada.—Edwin L. Beck and partner mined and shipped barite from a deposit 25 miles south of Beowawe, Nev. The ore is trucked to Beowawe, from where it goes by train to the Yuba Milling Corp., Berkeley, Calif. Production was from an open-pit operation. Preparations are being made for mining two more deposits in the vicinity.[7] Baroid Sales Division of National Lead Co. reported the shut-down of its Sanders mine in Humboldt County, Nev.

New Mexico.—The Royal Flush Mining Co. prepared to develop by tunnel a barite-galena-fluorite ore deposit in the Hansonberg mining district of the Oscura Mountains in New Mexico. Owners are considering the possibilities of trucking the ore to the Blanchard Hanson mill at Hot Springs.[8] Mudrite Chemical Corp. reports that it is developing a barite property near Hatch, N. Mex., and expects to be in production during the first quarter of 1949.

North and South Carolina.—North Carolina and South Carolina State geologic departments are cooperating with the Tennessee Valley Authority in surveying the barite deposits in the vicinity of Kings Mountain, S. C.[9]

Tennessee.—The Tennessee Mining Co. discontinued operations at its mine near Del Rio, Tenn.

CONSUMPTION, USES, AND STOCKS

The distribution of consumption of barite in the United States in 1948 was reported as follows (1947 in parentheses): For well drilling, 565,249 short tons (467,350); for lithopone, 153,987 (167,321); for chemicals, 100,038 (107,267); for glass, 23,580 (33,641); for paint filler, 22,000 (29,000); for rubber filler, 18,000 (17,000); and for other purposes, including grinding losses, 11,455 (14,239); total, 894,309 (835,818). These figures include both foreign and domestic barite. Consumption of barite during 1948 was the greatest on record. Since both sales by producers and consumption were greater than production, it is evident that a considerable tonnage was withdrawn from both producers' and consumers' stocks. Most of the increase in consumption was occasioned by increased activity in well drilling in which barite is used as a weighting agent in drilling muds. More and more wells are being drilled to increasingly greater depths. This use of barite was about 21 percent greater than in any previous year. Consumption of barite in lithopone was sharply reduced during the latter part of the year as the supply situation in titanium dioxide was eased [10] and that material was substituted more widely for lithopone as a pigment in paints.

[1] Of any barium chemical.
[2] Includes purchased material.
[3] Exclusive of purchased material and exclusive of sales by one producer to another.
[4] Black-ash data include lithopone plants.
[5] Included with "Other barium chemicals."
[6] Consists mostly of titanium dioxide-barium sulfate pigments, with small quantities of barium acetate, chromate, nitrate, perchlorate, peroxide, and sulfide. Specific chemicals may not be revealed by specific years.
[7] Plants included in above figures.
[8] Also includes barium sulfate (synthetic).
[9] A plant producing more than 1 product is counted but once in arriving at grand totals.

PRICES

Prices of crude barite, witherite, and most barium chemicals in 1948 remained practically unchanged from the previous year. Ground barite was moderately increased in value.

883326—50——12

Crude.—The December 30, 1948, issue of E&MJ Metal and Mineral Markets quoted the following prices for crude barite, f. o. b. mines: Georgia, crude, $11.50–$12.00 per long ton; Missouri, crude, minimum 94 percent $BaSO_4$, less than 1 percent iron, $9.50; 93 percent $BaSO_4$, $9.00–$9.25, f. o. b. mines.

Ground.—In December the price of water-ground barite in paper bags, carlots, St. Louis, was advanced to $35.05 a ton (an advance of $1.75 a ton), according to Oil, Paint and Drug Reporter. Well-drilling grades of ground barite averaged $16.80 a short ton, bulk, f. o. b. mine, according to reports of grinders to the Bureau of Mines.

Witherite.—Witherite (barium carbonate) showed no price increase and was quoted in 1948 at $65 per ton, air-floated, carlots; $73 on less than a carload.

FOREIGN TRADE[11]

Barite.—Imports of crude barite were at about the same rate in 1948 as the previous year. Canada continued to lead as a source of imports—principally to eastern lithopone and chemicals producers. Increased imports from Mexico went mostly to western and southwestern well drilling. For the first time since before World War II, Italy shipped a sizable tonnage to the United States.

A reduced import duty of $3.50 per ton of crude barite became effective January 1, 1948, as a result of the General Agreement on Tariffs and Trade, signed at Geneva October 30, 1947.

The Office of International Trade announced December 2 that, in view of the increased domestic supply of lithopone, no fixed export quotas were established for the fourth quarter of 1948. Accordingly, applications for licenses to export these commodities could be submitted to the OIT at any time during a calendar quarter.[12]

Following the announced intentions of the Government to negotiate trade agreements with 11 additional countries at Geneva in April 1949, hearings were held concurrently before the Tariff Commission

[11] Figures on imports and exports complied by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.
[12] Oil, Paint and Drug Reporter, vol. 154, No. 23, Dec. 6, 1948, p. 3.

and the Committee for Reciprocity Information. The hearings before the Tariff Commission were intended to develop the "peril point" below which tariffs cannot be reduced in the new agreements if injury to domestic industry is to be avoided. The CRI hearings were held to gather the views of industry on the possible effect of further cuts in duties on domestic industry.

Protests against any further reductions in tariffs on barite ore and barium products were heard from a number of industry representatives, They said that the present duty of $7.50 a ton on ground, white barite is not adequate to protect the domestic industry, and any further reduction would virtually turn the eastern market for this material over to the importers. The domestic product, they said, is undersold on the world market by as much as $20 a ton. Italy, it was stated, recently offered a small shipment in the United States at a price $7.54 under the domestic price; and, while it was of a lower grade than the domestic product, it could be used for paint pigments, inks, and certain other purposes for which the domestic product is sold.[13]

TECHNOLOGY

The Bureau of Mines published a report on dressing barite ores from New Mexico, Missouri, and Arkansas.[14]

The Clinchfield Sand & Feldspar Co., Baltimore, Md., is making laboratory tests to develop processing methods for economical recovery of barite from low-grade deposits in the area of Kings Mountain, S. C., which previously yielded barite only by hand picking.[15] The company has a processing plant at Kings Creek, S. C., where ore from Tennessee is treated.

An article was published describing conversion of barite to barium carbonate by a process involving the solution of barite in fused sodium chloride, separation of insoluble impurities by settling and decantation, addition of sodium carbonate to the melt followed by slow cooling, and separation of the barium carbonate by leaching out the other salts. It is claimed that this procedure has the advantage over the preparation of barium carbonate from barium sulfide of yielding a barium carbonate free from objectionable sulfur compounds.[16]

An article was published describing the production of blanc fixe from barite by a process involving solution of barite in molten salt; separation of impurities by settling; decolorizing the traces of impuri-

ties left; quenching the melt in water; and washing, filtering, and drying the product.[17]

A report was published on German practice in the manufacture of barium compounds.[18]

WORLD REVIEW

Australia.—The treatment of barite from South Australian deposits is being undertaken by the Adelaide Chemical Co., Ltd., which is constructing a new plant at Port Adelaide for manufacture of barium sulfate, chloride, and carbonate.[19]

World production of barite, 1943–48, by countries, in metric tons [1]

Canada.—Shipments of crude barite to the Cleveland area of the United States were expected to be started by Woodhall Mines, Ltd., in early 1948. The material will be produced from the company's 560-acre property in Langmuir Township of the Porcupine district. The company planned to erect a modern processing plant at Whitby, Ontario, during 1948 to process the ore being shipped out by rail from Connaught Station. The underground workings at the Langmuir property were being reopened, and development work at the two "open" ends of the 60-foot level was to be continued from where the operators left off. The No. 1 vein was exposed for 2,500 feet on the surface; an adit tunnel has already been driven 200 feet along that vein. In the summer of 1947, 1,200 tons of high-grade barite was stockpiled, but none was shipped out or exported. A successful financing program provided funds on hand considered enough to cover plans for development work and construction of the initial processing unit.[20]

Output of barite at the quarry at Walton, Nova Scotia, owned by Canadian Industrial Minerals, Ltd., totaling 131,190 short tons in 1947, was the largest in the history of the company. During 1947 a crosscut was driven at the 270-foot level of the shaft, and a raise was carried up to the quarry floor. Output by this method approximates 2,200 tons per week in addition to the regular open-cut production.

Investigations of the barite deposits on the east side of Lake Ainslie were discontinued temporarily in 1947 by the Provincial Department of Mines and were to have been resumed later, possibly in the fall of 1948. It is understood that the Department was concentrating on investigation of the fluorspar deposits and that therefore the equipment necessary to continue the barite investigation was not available.[21]

Diamond drilling was begun on what may be Nova Scotia's second replacement deposit of barite ore. The first is the Walton ore body brought into production several years ago by the Springer, Sturgeon subsidiary, Canadian Industrial Minerals, Ltd. With the exception of these two, all the other known occurrences of barite in Nova Scotia consist of irregular veinlets and fissure fillings.

Maritime Barytes, Ltd., holds property 7 miles east of the village of Brookfield. A geophysical survey was successful in tracing the favorable contact. The drilling is being done under the usual arrangement whereby the Nova Scotia Department of Mines provides the drills, the company paying the operating expense. The company controls a second barite deposit at Upper Brookfield in an outlier off the main contact. Diamond drilling here has indicated 50,000 tons of barite ore that can be mined cheaply by open-cut quarry methods. Plans are being considered to install a process of mechanical separation to bring this deposit into production as soon as possible.[22]

Germany.—It was reported that Sachtleben A.-G., Germany, has been granted permission to double production of lithopone in 1949 at its Homberg works. The plant will then be operating at more than 50 percent of capacity.[23]

India.—A process for manufacturing barium chloride from barite and magnesium chloride has been developed at the university department of chemical technology, Bombay. The method involves roasting barite with wood charcoal, powdering the resulting mass, and heating the pulverized material with 46 to 47 percent magnesium chloride solution. The process, it is stated, yields a low-cost barium chloride suitable for the removal of sulfate impurities in brine. Sulfur is obtained as a byproduct. The commercial possibilities are being investigated.[24]

Large deposits of barite occur in Dhone taluk (Kurnool district), Pulidendla taluk (Cuddapah district), and Tadpatri taluk (Anatapur district). The mining methods are primitive. A Bombay firm recently erected pulverizers for powdering barite (300-mesh). Annual production is estimated at 20,000 to 30,000 tons.[25]

Indonesia.—Three occurrences of barite are known; however, the two in Java are so small that they are not considered to have value. A third deposit, in southwest Borneo, has not yet been fully explored but may be workable on a small scale.[26]

Union of South Africa.—Barite is mined by two producers in the Barberton district, Transvaal, and ground material in gray, midwhite, and superwhite can be supplied.[27]

United Kingdom.—Laporte Chemicals, Ltd., of Luton, announced that they expected to begin production of barium chloride near the end of 1948 in its plant being erected at the Barnsley works of its subsidiary, John Nicholson & Sons, Ltd. It was expected that this plant will be large enough to meet the home trade requirements, with perhaps a supply available for export. The closing down at the beginning of 1948 of this department of the Athole G. Allen Co. created a scarcity of barium chloride and increased dependence on continental supplies. Domestic barite is considered adequate to supply all foreseeable needs.[28]

The Bridford mine of the Devonshire Baryta Co. is producing barite, using jigs and tables for concentration. Elsewhere in the country. a number of small mines are also producing barite.[29]

Bauxite

By RICHARD H. MOTE AND HORACE F. KURTZ

GENERAL SUMMARY

DOMESTIC mine production of crude bauxite increased for the third consecutive year in 1948 and totaled 1,724,437 long tons (1,457,148 tons, dried equivalent), a gain of nearly 21 percent over the 1947 output. Mines in Arkansas supplied 96 percent of the 1948 total.

Imports of bauxite in 1948 surpassed the previous record established in 1947, increasing 37 percent to 2,488,915 tons. Receipts from Surinam constituted 82 percent of the total in 1948, compared with 91 percent the preceding year. Exports of bauxite and concentrates, chiefly to Canada, decreased for the fifth successive year and totaled 54,113 tons.

Bauxite consumption in the United States totaled 2,725,140 tons (dried equivalent), 6 percent higher than the 2,564,442 tons used in 1947. Of the total for 1948, about 84 percent was consumed at alumina plants.

Salient statistics of the bauxite industry in the United States, 1939–43 (average), and 1944–48

	1939–43 (average)	1944	1945	1946	1947	1948
Crude ore production (dried equivalent) long tons	2,117,296	2,823,724	981,009	1,104,054	1,202,055	1,457,148
Value of production	\$10,447,407	\$14,402,497	\$5,591,084	\$6,892,864	\$6,884,666	\$8,696,708
Imports (as shipped) long tons	939,670	560,461	739,581	852,005	1,821,580	2,488,915
Exports (as shipped) do	189,216	146,638	126,077	97,788	94,369	54,113
World production (as shipped) long tons	7,348,000	7,028,000	3,525,000	4,493,000	6,385,000	8,116,000

Stocks of bauxite at mines and processing plants were 568,075 tons (dried equivalent) on December 31, 1948, an increase of 15 percent over inventories at the close of 1947; consumers' stocks totaled 669,698 tons, compared with 446,434 tons at the end of 1947. The War Assets Administration stock pile in Arkansas remained unchanged at 2,785,527 tons throughout 1948. Bauxite stocks in the National Strategic Stock Pile were not disclosed.

World production of bauxite in 1948 was estimated at 8,116,000 long tons, or 27 percent above the 1947 output. The United States and the Guianas, collectively, mined two-thirds of the world total.

Aluminum metal is discussed in the Aluminum chapter of this volume.

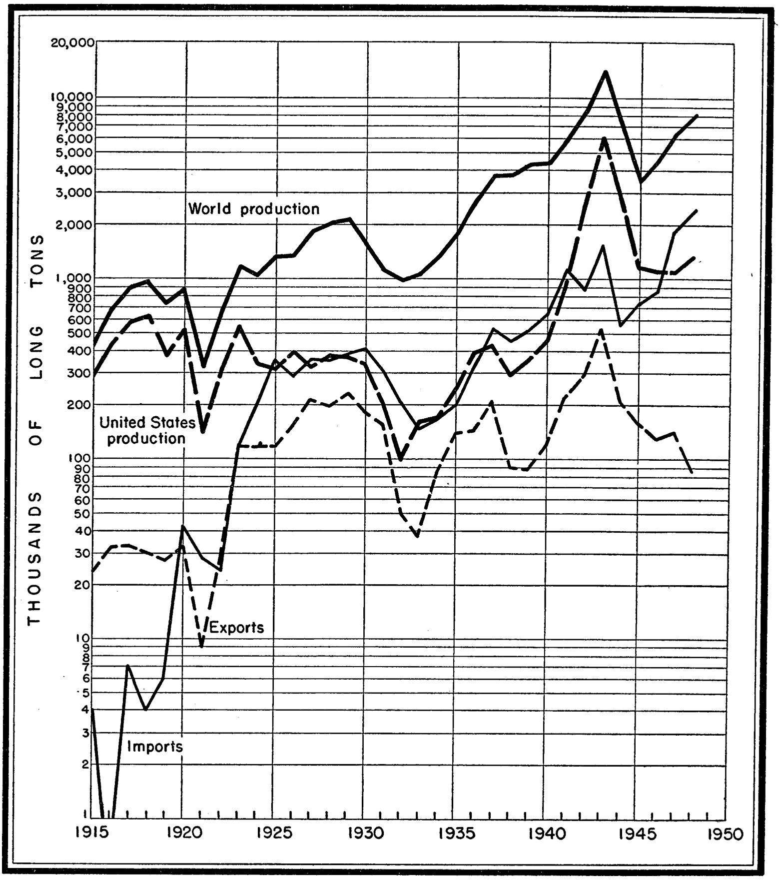

FIGURE 1.—Trends in domestic production, imports, exports, and world production of bauxite, 1915–48.

RESERVES

In 1944 the Bureau of Mines and the Geological Survey estimated [1] reserves of domestic bauxite at 36,341,000 long tons. This figure included all deposits (measured or indicated) 8 feet or more in thickness in which the material did not exceed 15 percent SiO_2 or 6 percent FeO but did contain at least 40 percent Al_2O_3 recoverable bauxite on a mined and dried basis. These limits of analysis were the theoretical extremes for bauxite to be used in the production of alumina by wartime modifications of the Bayer process. Although no revisions of the original estimate have been made, deduction of the quantity mined during the past 4 years reduced the total domestic reserves to about 31,600,000 tons.

Construction of improved alumina plants did not appear forthcoming at the end of 1948; however, the existing plant at Hurricane

[1] Investigation of National Resources, Hearings before a Subcommittee of the Committee on Public Lands, United States Senate, 80th Cong., 1st sess., 1947, pp. 217–224.

Creek, Ark., is capable of processing bauxite of greater than 6 percent FeO content, and this fact may permit a considerable increase in the reserve figure. Larger tonnages of low-grade ore await the development of improved methods of concentration and purification, but it seems unlikely that extensive additional deposits of high-grade bauxite, economically recoverable by existing mining methods, remain in the United States. A deposit[2] of high-silica bauxite was discovered in Clackamas County, Oreg., in 1948 and shows possibilities of being usable for purposes other than alumina.

PRODUCTION

Domestic mine production of crude bauxite in 1948 increased for the third successive year of the postwar period, despite greater imports of foreign ore. The gain of 21 percent over 1947 to 1,724,437 long tons (1,457,148 tons, dried equivalent) was due largely to the rising peacetime demand for aluminum. The output of bauxite from mines in Alabama, Arkansas, and Georgia increased 21, 21, and 34 percent, respectively. Virginia mines remained idle throughout 1948.

Alabama.—The Alcoa Mining Co. and the D. M. Wilson Bauxite Co. operated mines in the Eufaula district, Barbour and Henry Counties, and produced Alabama's entire output. The Alcoa Mining Co. also operated a drying plant nearby, from which dried bauxite was shipped chiefly to the chemical and refractory industries. Alabama bauxite ore processed in the activating plant of the Floridin Co., Quincy, Fla., was shipped to petroleum-refining industries.

Production and shipments of crude bauxite from mines in the United States, 1944–48, by States, in long tons

State and year	Production			Shipments to processing plants, consumers, and Government stock piles

[1] Includes crude, dried, calcined, activated, and sintered.

Arkansas.—The Alcoa Mining Co. continued operations at its mines in the vicinity of Bauxite, Saline County, and at the Drury mines near Sweet Home, Pulaski County, increasing production slightly over 1947 in both localities. Bauxite from the mines in Saline County was processed at the drying and calcining plant near Bauxite and shipped mostly to alumina plants, although smaller tonnages went to chemical, abrasive, and other industries. On June 1, 1948, the Alcoa Mining Co. began operating the Drury calcining plant of its affiliate, the Aluminim Ore Co. This plant, which serves the Drury mines, shipped dried and calcined bauxite to chemical, abrasive, and alumina plants during the year.

The American Cyanamid Co. worked two mines in the Berger district, Pulaski County, in 1948. Output from the Rauch Leased mine was reduced from the previous year, but the Berry-Mayhan mine was put into operation, so that total production for this company increased about 30 percent. Ore from these two mines and a portion of the inventory at the idle Heckler mine went to the company drying plant near Berger. Total shipments of dried bauxite, all destined for the chemical and oil-refining industries, were less than in 1947.

Consolidated Chemical Industries, Inc., resumed mining low-silica bauxite at its Bierman Tract operation, Pulaski County, in 1948. All of the mine shipments were treated at the Peiser Spur concentrating plant in Little Rock and later consumed in the alumina industry.

Although output totaled less than in the preceding year, the Crouch Mining Co. continued to produce high-grade ore from its Young mine, Saline County, throughout 1948. The company calcining plant, in the vicinity of Bauxite, served the mine, and the calcined ore was sold entirely for use in the abrasive industry.

In 1948, the Dulin Bauxite Co. produced considerably more ore from its mines in Pulaski County than in 1947. After extraction, the bauxite is either shipped directly to consumers or other processors or sent to the company calcining plant near Sweet Home. The ore is calcined mainly for abrasive manufacture.

The Norton Co. did not operate the Norton mine, Saline County, during 1948, but purchased ore from another company for calcining at its plant near Bauxite. The entire plant output, used for the production of abrasives, was less than half the 1947 total.

The Porocel Corp. operated its milling, activating, and purifying plant at Berger, Pulaski County, during 1948, treating a slightly smaller quantity of bauxite than in 1947. The Porocel plant for impregnating activated bauxite with chemicals remained idle. Crude ore was purchased from local producers; the finished product was shipped to oil-refining and chemical plants.

Operations ceased at the Rummel mine of the Pulaski Mining Co., in Pulaski County, during the second quarter of 1948. Output for the year was about one-tenth of the 1947 total. Since closing, the Rummel property has been sold to the Reynolds Mining Corp.

The Reynolds Mining Corp. continued to operate its underground and open-pit mines in Saline and Pulaski Counties during 1948. The company increased output by about one-third of the 1947 total and remained the largest producer of domestic bauxite. All of the ore was sold to the parent Reynolds Metals Co. for use at the Hurricane Creek alumina plant.

A description of the activities and results of bauxite investigations by the Bureau of Mines at its project in Saline and Pulaski Counties, together with data and maps showing the location of holes drilled and the deposits developed, has been published in a series of reports.[3]

Georgia.—The American Cyanamid Co. mined high-silica bauxite from its Hatton and Thigpen mines in the Andersonville district, Sumpter County, increasing production over 1947. All the ore was dried in the adjacent oil-fired standard-rotary-drying plant and shipped to the chemical industry. The Alcoa Mining Co. did not operate any of its Georgia mines in 1948.

Virginia.—The mines near Spottswood, Augusta County, owned by the Alcoa Mining Co., remained idle throughout 1948.

Recovery of processed bauxite in the United States, 1944–48, in long tons

Year	Crude ore treated	Processed bauxite recovered			
		Dried	Activated, calcined, or sintered	Total	Dried bauxite equivalent
1944	1,408,344	964,613	152,465	1,117,078	1,188,869

Value	$7,386,337		$7,725,939		$8,473,704		$9,963,032	

[1] Includes crude, dried, calcined, activated, and sintered.
[2] Includes shipments to Office of Metals Reserve stock piles as follows: 1945—400,096 tons (339,052 dried equivalent). 1946—33,382 tons (28,375 dried equivalent).
[3] Small quantity of bauxite shipped to makers of refractories probably included with "Abrasive."

CONSUMPTION AND USES

Bauxite consumption totaled 2,725,140 long tons (dried equivalent) in 1948, a gain of more than 6 percent over 1947. The consumption figures for both years include calcined bauxite shipped for export to American-owned abrasive plants in Canada for the manufacture of crude abrasives, which are returned to the United States for final manufacture and use. Consumption of bauxite on an as-shipped basis totaled 2,743,053 tons, consisting of 748,906 tons of crude ore, 1,835,569 tons of dried ore, 151,319 tons of calcined ore, and 7,259 tons of activated ore. Of that consumed (dried-equivalent basis) in 1948, 45 percent was domestic ore and 55 percent foreign. The alumina industry used 78 percent of the domestic ore and 88 percent of the foreign ore consumed during 1948.

Bauxite consumed in the United States, 1947–48, by industries, in long tons

[Dried-bauxite equivalent]

Industry	1947			1948		
	Domestic	Foreign	Total	Domestic	Foreign	Total
Alumina[1]	869,796	1,258,135	2,127,931	965,081	1,314,042	2,279,123

Total	1,201,191	1,363,251	2,564,442	1,231,709	1,493,431	2,725,140

[1] Includes some bauxite used in making chemicals and other products.
[2] Revised figure.

Alumina.—The alumina industry used domestic and foreign crude and dried bauxite, principally from Arkansas, Surinam, Indonesia, and British Guiana. Of the total bauxite consumed in the United States in 1948, alumina plants used 84 percent compared with 83 percent in 1947. Although most of the bauxite consumed by the alumina industry is destined to emerge finally as aluminum metal, some of the alumina is used by the chemical, abrasive, and refractory industries, and some is processed into special products, such as activated and tabular aluminas, for use in the oil-refining and ceramic industries.

Chemical.—Producers of aluminum salts increased their consumption of bauxite by 9 percent in 1948. Of the other aluminum-bearing materials used in the manufacture of aluminum salts, producers reported consuming 13,923 short tons of aluminum trihydrate, 4,324 tons of secondary aluminum, 79,871 tons of clay, and a small quantity of bichromate residues. Consumption of bauxite for the production of nonmetallurgical alumina is included with the figures for alumina in the preceding paragraph and table.

Gains in production and shipments of aluminum sulfate were sufficiently large in 1948 to effect substantial increases in the totals for aluminum salts. Although the same number of companies shipped aluminum salts in 1948, the value of shipments was 13 percent greater. Output of alumina for purposes other than aluminum production gained slightly, but shipments to consumers were 24 percent less.

Aluminum salts and alumina produced and shipped in the United States, 1947–48

	1947				1948

[1] A company shipping more than 1 kind of salt is counted but once in arriving at total.
[2] Excludes alumina produced for use in making aluminum; includes activated, calcined, and crude alumina and light and heavy hydrate, converted to a calcined-alumina equivalent.

Abrasive and Refractory.—Consumption of bauxite by the manufacturers of abrasive pigs in Canada and the United States and the manufacturers of refractories in the United States declined 5 percent in 1948. The most notable change in the consumption pattern of these industries was the increased use of foreign bauxite.

Other.—Bauxite consumption in the cement, steel, ferro-alloy, and petroleum-refining industries increased 27 percent during 1948.

STOCKS

Total stocks of bauxite on hand December 31, 1948, increased 8 percent over inventories at the beginning of the year. Stocks at mines and processing plants totaled 568,075 long tons (dried equivalent) compared with 492,798 tons at the end of 1947. Consumers' plants had 669,698 tons on hand December 31, 1948, a gain of 50 percent during the year. The large Government-owned (War Assets Administration) stock pile of medium-grade bauxite in Arkansas, on which the Reynolds Metals Co., as operators of the Hurricane Creek plant, held option to purchase if needed, remained unchanged at 2,785,527 tons throughout 1948. All stock figures mentioned in this chapter exclude bauxite held by the Bureau of Federal Supply for the National Strategic Stock Pile.

Stocks of bauxite on hand December 31, 1944–48, in long tons

[1] Dried, calcined, activated, and sintered.
[2] Excludes stocks in the National Strategic Stock Pile.
[3] Revised figure.

PRICES

In 1948 the average selling price, f. o. b. mines and processing plants, was \$5.08 a long ton for crude (undried) bauxite, \$7.50 for crushed dried bauxite, \$14.90 for calcined bauxite, and \$57.93 for activated bauxite. Corresponding prices in 1947 were as follows: \$4.82 for crude, \$7.67 for dried, \$15.99 for calcined, and \$55.30 for activated. The weighted average price for all grades of domestic ore as shipped to consumers was \$6.69 a long ton in 1948 (\$6.85 in 1947). The following nominal market quotations were changed during 1948: Domestic ore, chemical, crushed and dried, 55 to 58 percent Al_2O_3, 1.5 to 2.5 percent Fe_2O_3, \$7.50 to \$8.50 a long ton f. o. b. Alabama and Arkansas mines; other grades, 56 to 59 percent Al_2O_3, 5 to 8 percent SiO_2, \$7.50 to \$8.50 f. o. b. Arkansas mines; and abrasive grade, crushed and calcined, 80 to 84 percent Al_2O_3, \$16 f. o. b. Arkansas mines. Prices quoted at the close of the year were \$8 to \$8.50 for chemical, crushed and dried, \$8 to \$8.50 for other grades, and \$17 for abrasive grade, crushed and calcined. Quotations on foreign bauxite have not been published in domestic trade journals since February 1941.

FOREIGN TRADE [4]

Imports of bauxite in 1948 established an all-time record. The gain of 37 percent over 1947 receipts marked the fourth year of uninterrupted increase. Of the ore imported in 1948, 2,051,265 long tons came from Surinam, 302,079 tons from Indonesia, 114,764 tons from British Guiana, 16,178 tons from Brazil, 4,623 tons from Trinidad and Tobago, and 6 tons from three other countries. By customs districts, 1,390,388 tons were received at Mobile, 1,018,730 at New Orleans, 25,139 at Philadelphia, 18,135 at Maryland, 12,340 at Massachusetts, 10,903 at New York, 5,582 at Georgia, 4,205 at San Francisco, 3,487 at Sabine, and 6 at two other districts. The duty on bauxite remained unchanged at 50 cents a long ton throughout the year.

Bauxite and aluminum compounds imported into the United States, 1944–48

[U. S. Department of Commerce]

Year	Bauxite			Alumina		Aluminum compounds	
	As imported (long tons)	Dried bauxite equivalent [1] (long tons)	Value	Long tons	Value	Short tons	Value
1944	560,461	555,647	$3,844,310	(2)	$1		
1945	739,581	737,081	5,273,122	179	10,940		
1946	852,005	851,148	5,965,124	4	2,607	2	$654
1947	1,821,580	1,842,176	11,869,631			80	2,348
1948	2,488,915	2,558,037	15,820,743	6	3,547	5,559	124,167

[1] Calculated by Bureau of Mines. [2] Less than 1 ton.

Exports of bauxite and bauxite concentrates declined for the fifth successive year, totaling 43 percent less than in 1947. Of the 1948 exports, 46,220 tons were classified as bauxite and other aluminous ores and 7,893 tons as bauxite concentrates (including alumina). Virtually all the bauxite shipments went to Canada to be used in the production of crude abrasives, which are returned to the United States for final manufacture and consumption. Canada also received about 90 percent of the bauxite concentrates exported.

Bauxite and aluminum compounds exported from the United States, 1944–48

[U. S. Department of Commerce]

Year	Bauxite (including bauxite concentrates), long tons			Aluminum sulfate		Other aluminum compounds	
	As exported	Dried bauxite equivalent [1]	Value	Short tons	Value	Short tons	Value
1944	146,638	210,852	$2,928,799	41,434	$1,072,140	3,802	$528,821

[1] Calculated by Bureau of Mines.

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

WORLD REVIEW

The total world output of bauxite in 1948 was estimated to have increased 27 percent over 1947. Expanded production in British Guiana, Indonesia, Surinam, and the United States contributed most to the over-all gain. Two regions in the Western Hemisphere, comprising three Southern States in the United States and two of the Guianas, mined 67 percent of the 1947 and 1948 totals.

World production of bauxite, by countries, in metric tons, 1941–48 [1]

[6] Imports into Japan and Formosa in fiscal year ended Mar. 31 of year following that stated; preliminary figures.
[7] Croatia only; estimate for rest of Yugoslavia included in total.

British Guiana.—The Demerara Bauxite Co., the largest producer in British Guiana, shipped most of its ore to Arvida, Quebec, to be reduced to aluminum by its affiliate, the Aluminum Co. of Canada. A new company, named the Plantation Bauxite Co., has been formed recently in Georgetown to develop extensive bauxite deposits on the west bank of the Demerara River. It is associated with the Demerara Bauxite Co. and, therefore, also affiliated with the Aluminum Co. of Canada.

A royalty of 2 cents a long ton is levied on all ore mined and processed within the colony, whereas 25 cents a ton is collected in royalties and taxes on bauxite exported in the raw state. Some long-established companies, such as the Demerara Bauxite Co., however, may continue to export crude ore under old leases which provide for a royalty and tax of only 10 cents a ton.

France.—Output of bauxite in France during 1948 increased 17 percent over the 1947 total and reached a level higher than the prewar average. As the largest producer in the Eastern Hemisphere, France continued to dominate the European aluminum industry. French ore, essentially a monohydrate, was not desirable for alumina production by the process used in America. Both domestic consumption and exports of bauxite were greater in 1948 than in the preceding year.

Gold Coast.—Shipments of bauxite from Gold Coast increased 36 percent in 1948. The only large producing mine, situated near Awaso, Sefwi-Bekwai, Western Province, was operated by the British Aluminum Co. on behalf of the United Kingdom Ministry of Supply. Plans have been made for construction of a dam on the Volta River eventually to supply electric power for a reduction plant. Reserves exceeding 200,000,000 tons, much of which is high-grade ore, have been indicated by recent surveys.[5]

Hungary.—Before the close of World War II, Hungary exported most of its bauxite to Germany for aluminum production. As the German market has largely disappeared, an attempt has been made to increase domestic consumption for production of the metal. The U. S. S. R. received about half of the 1948 exports, and the remainder was shipped to other nations in continental Europe.

In February 1948, the anticipated bill for nationalization of the bauxite and aluminum industries was enacted by the Government. Following this action, a new company, entitled the Hungarian Bauxite-Aluminum Co., Ltd., wholly owned by the Hungarian State, was established.

Indonesia.[6]—Mining operations of major proportions were resumed in 1948 on Bintan Island, site of the largest known bauxite deposits in the Far East. Open-pit methods are employed, and since the arrival of new equipment to replace that destroyed or confiscated by the Japanese, production has been highly mechanized. Part of the output was shipped to the aluminum industry in Formosa, but the bulk of it was exported to the United States. It was reported that the Netherlands Indies Bauxite Exploration Co., Inc., a subsidiary of the N. V. Billiton Maatschappij and the sole bauxite operator on Bintan Island, planned to build an alumina plant at Palembang, southern Sumatra, utilizing Bintan bauxite.

Italy.—Postwar treaties, having deprived Italy of the Istrian Peninsula, formerly the source of nearly 70 percent of the Italian bauxite production, have caused that nation to rely on imports and the development of new ore deposits. Most of the domestic output in 1948 was mined in the Foggia and Bari areas, with lesser tonnages coming from the Puglia and Abruzzi areas. The Ministry of Industry and Commerce had issued plans for increasing production 100 percent within the next 5 years. Imports, which came almost exclusively from France and Yugoslavia, increased considerably during 1948.

[6] Bureau of Mines, Mineral Trade Notes, Sources of Bauxite in Asia: Vol. 26, Spec. Suppl. 27, June 1948, pp. 9–13.

Malaya, Federation of.—During 1948, Canadian, Australian, and British companies expressed interest in Malayan bauxite deposits, which have been unproductive since cessation of the Japanese occupation. Tentative plans would use Malayan ore in proposed southwest Pacific aluminum-reduction plants. It was believed that prospecting would reveal new deposits to supplement the abundant known reserves.

Surinam.—Production of bauxite in Surinam, the world's largest producer in 1948, exceeded 2,000,000 long tons and established a new record for the colony. The Surinaamsche Bauxiet Maatschappij remained the largest producing company, supplying bauxite for its affiliate, the Aluminum Co. of America, and for the Baton Rouge, La., alumina plant of the Permanente Metals Corp. The other large company, the N. V. Billiton Maatschappij, continued to mine throughout 1948 while working on expansion of its excavating, washing, drying, and transportation operations.

Bismuth

By JACK W. CLARK

GENERAL SUMMARY

AT THE CLOSE of 1948 the supply of bismuth metal was able to meet domestic consumptive demand. The purchase program for the National Strategic Stock Pile, however, injected a note of uncertainty as to the over-all adequacy of supplies of refined metal. Domestic production was up 24 percent over 1947, the increase being due, apparently, to appreciably larger imports of bismuth-rich lead bullion from Mexico and Peru shipped to the United States for refining. Total 1948 imports of refined bismuth were slightly below those for 1947; all imported metal originated in Peru. Exports of bismuth metal were up almost half again as large as in the year preceding; over 95 percent of the shipments were destined for the United Kingdom. Late in 1948, the Economic Cooperation Administration authorized $50,000 to France, under the European Recovery Program, for purchase of bismuth metal in the United States. Stocks of metal and compounds held by producers, consumers, and distributors at the year end in 1948 are thought to have been small. No quantitative information is made public regarding the strategic stock pile. Foreign stocks are not believed to be large. Peru continued in 1948 to be the largest foreign producer of refined metal. A Canadian producer suspended production near the end of the year.

Domestic consumption of metal was believed somewhat lower than in 1947; manufacturers of pharmaceutical chemicals and low-melting alloys were the major users. Trade in finished products, particularly pharmaceuticals, was fairly strong during the first half of 1948, weakening thereafter.

The price of refined bismuth metal held at $2 per pound, ton lots, throughout the year; this level, reached in February 1947, was the highest since 1928. Prices of compounds increased generally in the last 6 months of 1948, owing to higher production costs.

Bismuth appears to show promise in the field of nuclear energy because of its extremely low absorption of neutrons, combined with other desirable characteristics, such as chemical stability and a favorable range between melting and boiling points.

DOMESTIC PRODUCTION

Virtually all the refined bismuth produced in the United States is recovered as a byproduct in refining domestic and imported lead and copper ores and imported lead bullion. Domestic production figures cannot be divulged, but 1948 output increased 24 percent over the previous year; this rise was believed due to sharply increased imports of lead bullion during the year, principally from Mexico and Peru.

Refined primary bismuth metal is produced by the American Smelting & Refining Co. at Omaha, Nebr. and Perth Amboy, N. J.; the Eagle-Picher Co. at East Chicago, Ind.; and the U. S. S. Lead Refinery, Inc. (subsidiary of United States Smelting, Refining & Mining Co.), at East Chicago, Ind. The Eagle-Picher plant—reported to custom-refine bismuth concentrates—was purchased September 25, 1946, from International Smelting & Refining Co. (subsidiary of Anaconda Copper Mining Co.) The Anaconda firm continues to market bismuth from its ores; the metal is refined on a toll basis by the American Smelting & Refining Co. Many small companies that refine nonferrous metal scrap are believed to produce small quantities of bismuth.

Results of the exploration and metallurgical testing of bismuth-bearing base metal ores at Alta, Utah, were published by the Bureau of Mines.[1] A small deposit of high-grade bismuth ore was reported near Dixon, N. Mex.

CONSUMPTION AND USES

Although data on quantities of bismuth consumed domestically are not available, trade journals indicated that usage in 1948 was down somewhat from 1947. Demand was firm early in 1948, slackening in midyear, with slow trading and low sales volume thereafter. Consumption of bismuth metal in 1948, based upon producers' sales, was divided about equally between manufacturers of pharmaceuticals and low-melting alloys, being little changed from the year previous. The Bureau of Federal Supply was in the market throughout 1948, purchasing refined metal for the National Strategic Stock Pile; in the fall, producers and importers of bismuth met with United States Department of Commerce and Munitions Board representatives to discuss methods for facilitating procurement for the stock pile.

Bismuth compounds are used principally in indigestion remedies, cosmetics, and antisyphilitic drugs. The thioglycolate was reported effective in weakening the virus of rabies and its use recommended as an adjunct to the Pasteur treatment.[2] In the catalytic oxidation of ammonia to nitrous oxide a manganese oxide-bismuth oxide catalyst was shown to be very effective, giving a maximum yield of 71 percent.[3]

Alloys of bismuth have been extensively studied,[4] those of most importance commercially being characterized by low melting points and virtual constancy of volume upon solidification. Bismuth content of most of these alloys is 50–60 percent, the balance being tin, lead, cadmium, indium, and zinc in variable percentages. In years before World War II the fusible alloys were used almost wholly for

fire alarms, sprinklers, and other safety devices; thereafter, bismuth alloys found extensive applications in the aircraft industries as an aid in bending thin-walled metal tubing and in pattern making. These uses have continued to be of considerable importance during the post-war reconversion period.[5] Bismuth metal also finds use in solders and selenium rectifiers and as a minor alloying constituent of aluminum and other metals, imparting improved machinability. A novel heating element for use in high-temperature furnaces was described. Taking advantage of the high electrical resistance, low vapor pressure, and other favorable properties of bismuth, an element was constructed consisting of a spiral vitreous silica tube filled with a 25-percent bismuth alloy. A nichrome preheater winding around the silica tube was used to heat the bismuth alloy to its melting point before use. Temperatures up to 1,350° C. were attained.[6] Bismuth metal has been considered as a possible coolant for a nuclear energy power-producing pile; its absorption cross section for thermal neutrons is exceedingly low, being excelled only by beryllium, among the metals. An estimated 5 tons of metal would be required for an enriched reactor of 100,000 kw. output.[7] Methods of recovering bismuth [8] and of beneficiating bismuth ores [9] were described.

Bismuth consumed in the United States, 1946–48, by uses

Uses	1946 [1]		1947 [2]	1948 [2]
	Pounds	Percent of total	Percent of total	Percent of total
Pharmaceuticals	831,882	63	52	49
Fabricating alloys	306,891	23	34	47
Ammunition solders	68,860	5	(3)	(3)
Fuse alloys	38,900	3	(3)	(3)
Aluminum alloys	33,514	2	3	(3)
Other	50,221	4	11	4
Total consumption	1,330,268	100	100	100

[2] Estimated by producing companies.
[3] Included in "Other."

STOCKS

Year-end bismuth metal inventories for 1948 of primary producers declined about 20 percent below those reported on hand as of December 31, 1947. Stocks of refined metal are held in the National Strategic Stock Pile, but quantities cannot be revealed. Supplies of alloys and compounds in the hands of producers, distributors, and consumers at the end of the year are believed to have been small.

PRICES

Bismuth metal was quoted by E&MJ Metal & Mineral Markets at $2.00 per pound, ton lots, throughout 1948. London quotations for metal as given in the Metal Bulletin at the beginning of the year were 11s. per pound, 5-cwt. lots; this price declined to 10s. 9d. early in October and remained unchanged thereafter. Metal Bulletin average quotations on bismuth ores containing 50, 40, and 30 percent bismuth, respectively, were 6s. 9d., 6s. 2d., 5s. 5d. from January to May 1948, then declined to 6s. 6d., 6s., and 5s. 2d. until October, when prices dropped further to 6s., 5s., and 4s. 3d., remaining unchanged thereafter through December.

Prices of bismuth chemicals remained firm for the first 6 months of 1948; but, in general, scattered increases, due mainly to higher manufacturing costs, were noted thereafter. Prices per pound at the beginning of 1948 and at year end, as quoted by the Oil, Paint and Drug Reporter, were as follows:

	January 1948	*December 1948*
Chloride	$4. 50	$3. 95
Citrate	3. 12	3. 27
Hydroxide	4. 00	4. 18
Nitrate	1. 60	1. 85
Oxychloride	3. 80	3. 97
Oxide	4. 20	4. 60
Phenolsulfonate	--------	4. 70
Subcarbonate	2. 60	2. 80
Subgallate	2. 45	2. 75
Subiodide	4. 13	4. 90
Subnitrate	2. 15	2. 30
Subsalicylate	3. 05	3. 20
Sulfocarbolate	4. 05	4. 20
Ammonium citrate	3. 70	3. 80

FOREIGN TRADE [10]

Imports.—Refined bismuth-metal imports in 1948 decreased for the second successive year; however, the decline was only 3 percent under 1947 receipts. All refined-metal imports originated in Peru. Lead bullion containing bismuth is imported from Peru and Mexico for refining in the United States. In 1948 quantities received exceeded shipments in 1947 by nearly five times. The bismuth content of this bullion is not included in the import totals given below. No import trade in bismuth compounds or mixtures was reported.

Exports.—Shipments of bismuth metal and alloys in 1948 increased for the fourth consecutive year and were 46 percent above exports for 1947. The United Kingdom was the largest recipient, accounting for 336,390 pounds valued at $680,078. Late in 1948 the Economic Cooperation Administration allocated $50,000 to France for purchase of bismuth metal in the United States as a part of the European Recovery Program. Of the amount allocated, $45,000 was expended in 1948 and $5,000 carried over into the first quarter of 1949. Exports of bismuth compounds are included in a group classification with other chemicals and are not separately available.

[10] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Bismuth imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Bismuth ore [1]			Refined metallic bismuth		Bismuth compounds and mixtures	
	Pounds		Value	Pounds	Value	Pounds	Value
	Gross weight	Bi content					
1944	118,739	51,349	$60,878	363,980	$345,796	40	$352
1945				333,231	316,135		
1946	(2)	(2)	(2)	422,336	464,922		
1947	(2)	(2)	(2)	310,561	480,808

WORLD REVIEW

The world production of bismuth in recent years, insofar as data are available, is shown in the following table.

World production of bismuth, 1942–48, by countries, in kilograms [1]

[Compiled by B. B. Mitchell]

Country [1]	1942	1943	1944	1945	1946	1947	1948
Argentina: Metal	13,101	18,000	14,000	20,120	22,000	22,000	(2)
In ore [3]	17,000	25,000	24,500	31,000	12,000	20,000	(2)
Australia (in ore) [4]	762	5,741	3,556	3,251	1,270	3,201	4,000
Bolivia (in ore and bullion exported) [5]	8,896	12,419	605	15,337	27,867	88,964	35,142
Canada: Metal [6]	157,648	184,882	56,188	86,098	109,090	128,988	108,971
China (in ore) [3]	11,000	(2)	(2)		1,380	(2)	(2)
France (metal)	11,000	5,000	3,000				[3] 30,000
Germany: In bismuth ore	17,500	(2)	(2)	(2)	(2)	(2)	(2)
In other ores	14,700	(2)	(2)	(2)	(2)	(2)	(2)
Japan (metal)	[7] 71,000	[7] 66,000	[7] 54,000	(2)	(2)	22,862	23,300
Mexico (in impure bars)	128,041	175,055	165,379	161,368	76,000	256,000	161,000
Peru: Metal	373,942	482,920	416,159	307,446	221,778	233,794	205,861
In lead-bismuth alloy	16,913			1,500	89,665	3,043	47,225
Spain (metal)	15,880	15,198	4,910	10,071	13,756	21,172	38,000
Sweden					12,441	10,998	(2)
Union of South Africa (in ore)	167	1,890	818	610	711		437
United States	(8)	(8)	(8)	(8)	(8)	(8)	(8)
World production (estimate)	1,700,000	1,400,000	1,200,000	1,100,000	900,000	1,400,000	1,400,000

[1] Bismuth is believed to be produced also in Brazil, Burma, Norway, Rumania, Uganda, U. S. S. R., United Kingdom, and Yugoslavia. Production figures are not available for these countries, but estimates by author are included in total.
[2] Data not available. Estimate by author included in total.
[3] Estimate.
[4] Partly estimated. Excludes content of some bismuth-tungsten concentrates.
[5] Excludes bismuth content of tin concentrates exported.
[6] Refined metal plus bismuth content of bullion exported.
[7] Incomplete data for year ended March 31 of year following that stated.
[8] Production included in total; Bureau of Mines not at liberty to publish separately.

Australia.—Bismuth ores are smelted and refined by Bismuth Products Pty., Ltd., Sydney.

Brazil.—Deposits of bismuth ore in the Borborema Plateau in the States of Rio Grande do Norte and Paraiba were described. Production of bismuth in 1943 was estimated at 6½ metric tons.[11]

Canada.—The Consolidated Mining & Smelting Co. of Canada, Ltd., Trail, B. C., continued during 1948 in its position as Canada's largest bismuth producer. Production has been intermittent since 1928. Annual capacity is 60 tons. Some shipments of metal were made by the Molybdenite Corp. of Canada, Ltd., before operations ceased at its mine at La Corne, Quebec, in November 1948. During the year the Deloro Refining & Smelting Co. of Canada, Ltd., Deloro, Ontario, exported speiss containing bismuth.[12] For the period 1937–46, production of bismuth (metal content) in all forms was about 900 short tons. For the same period production of bismuth metal was 865 tons, and domestic consumption, exports, and imports totaled 296, 702, and 5 tons, respectively.[13]

China.—Bismuth is found as the mineral bismutite, a carbonate, associated with tungsten ores at Pangkushan, Anyuanhsien, southern Kiangsi Province. Reserves of bismutite are estimated at 3,000 metric tons.[14]

Korea.—Bismuth is reported to occur as the mineral bismuthinite in the tungsten ores of the Sang Dong mine, southeast of Seoul in the American-occupied zone. Before and during World War II, this mine was a large producer of bismuthinite concentrates. About 300 tons of high-grade concentrates are believed to have been exported to the United States in 1948.

Peru.—Large quantities of refined bismuth metal are produced by the Cerro de Pasco Copper Corp. as byproducts of its copper and lead smelting operations at Oroya. Peruvian customs figures give the content of metallic bismuth in all products exported since 1940, in metric tons, as follows: 1940, 383 tons; 1941, 520; 1942, 346; 1943, 484; 1944, 446; 1945, 272; 1946, 311; 1947, 219; 1948, 250 (estimated for first 11 months).

Sweden.—Small quantities of bismuth are produced by the Boliden Mining Co.[15]

Uganda.—Several hundred pounds of bismuth ore have been produced from deposits where it is found in association with tungsten and tin ores.[16]

United Kingdom.—Bismuth ores and residues are smelted and refined by Capper Pass, Bristol, and Mining & Chemical Products, Ltd., London.

U. S. S. R.—Bismuth is produced as a byproduct in the treatment of zinc and lead concentrates at the electrolytic zinc plant in the North Caucasus.[17]

Cadmium

By RICHARD H. MOTE

GENERAL SUMMARY

CADMIUM was relatively plentiful during the first part of 1948, but the supply became less abundant as the year progressed. Whereas domestic consumption continued at a slightly greater rate than in 1947, production of primary metallic cadmium declined 5 percent, and output of primary cadmium compounds dropped sharply. Imports of cadmium-bearing flue dust and metallic cadmium fell off 22 percent and 52 percent, respectively, thus further limiting the availability of the metal during the year. At the end of 1948 the continuing high level of consumption in face of reduced production and imports had caused a 62-percent reduction in total industry stocks. Prices advanced during the year from $1.75 a pound for commercial sticks and $1.80 for patented shapes to $2 and $2.05, respectively.

Salient statistics of the cadmium industry in the United States, 1944–48, in pounds of contained cadmium

	1944	1945	1946	1947	1948
Production (primary)	8,779,856	8,383,629	6,471,187	8,508,146	7,775,657
Imports (metal)	66,627	28,724	17,415	20,292	9,809
Exports (metal)	548,015	102,199	140,385	303,401	955,701
Consumption, apparent	[1] 8,865,000	8,642,799	6,983,610	[2] 7,726,753	7,818,485

[1] Actual consumption.
[2] Revised figure.

DOMESTIC PRODUCTION

The most important ore mineral of cadmium is greenockite (CdS, 77.8 percent cadmium), which occurs in minor quantities associated with virtually all zinc ores and to a smaller extent with lead and copper ores containing zinc mineralization. No ore is beneficiated for the cadmium alone, as cadmium contents are always too small to support profitable mining. For the same reason the quantity of cadmium contained in ores is rarely determined. In zinc concentrates the cadmium content seldom exceeds 1 percent, which itself is exceptional. Zinc concentrates from the Tri-State region average 0.35 percent cadmium, and concentrates from mines in the Rocky Mountain region and far West rarely carry more than 0.2 percent cadmium.

The entire domestic supply of primary cadmium is recovered concurrently with the treatment of ores of other metals as a byproduct from the flue dusts of zinc-blende roasting furnaces and lead blast furnaces, from zinc dust collected in the early stages of distillation in zinc retorts, and from the sludges of electrolytic zinc plants. A small quantity of secondary metal is recovered from old bearings and other alloys but constitutes no great proportion of the total supply. As most reduction plants participating in the recovery of cadmium treat both domestic and foreign cadmium-bearing materials without determining the cadmium content of either, the origin of the metal produced from domestic sources is a matter of conjecture. Thus the data presented as domestic cadmium production in this chapter are not comparable to those given in other chapters of this volume for metals like copper, lead, and zinc.

Cadmium produced and shipped in the United States, 1944–48, in pounds of contained cadmium

	1944	1945	1946	1947	1948
Production:					
Primary:					
Metallic cadmium	8,453,470	7,932,579	6,200,398	8,007,287	7,582,961
Cadmium compounds [1]	326,386	451,050	270,789	500,859	192,696
Total primary production	8,779,856	8,383,629	6,471,187	8,508,146	7,775,657
Secondary (metal and compounds) [1] [2]	106,850	72,473	355,104	104,764	121,159
Shipments by producers:					
Primary:					
Metallic cadmium	8,551,424	7,938,658	6,180,265	7,852,907	7,639,113
Cadmium compounds [1]	285,203	451,050	270,789	500,859	192,696
Total primary shipments	8,836,627	8,389,708	6,451,054	8,353,766	7,831,809
Secondary (metal and compounds) [1] [2]	106,850	67,513	360,924	134,793	121,159
Value of primary shipments:					
Metallic cadmium	$6,435,124	$6,106,992	$6,094,572	$12,358,526	$12,679,571
Cadmium compounds [3]	213,902	347,308	267,033	788,352	319,875
Total value	6,649,026	6,454,300	6,361,605	13,146,878	12,999,446

[1] Excludes compounds made from metal.
[2] Bureau of Mines not at liberty to publish figures separately for secondary cadmium compounds.
[3] Value of metal contained in compounds made directly from flue dust or other cadmium raw materials (except metal).

The domestic output of primary metallic cadmium decreased 5 percent in 1948 owing largely to a work stoppage beginning in August at the Fairmont City zinc smelter of the American Zinc Co. of Illinois. The production of cadmium contained in primary compounds dropped sharply, but the recovery of cadmium in secondary metal and compounds increased.

A list of plants producing cadmium metal in the United States in 1948 follows:

Primary metallic cadmium

Colorado: Denver—American Smelting & Refining Co.
Idaho:
  Bradley—Bunker Hill & Sullivan Mining & Concentrating Co.
  Kellogg—Sullivan Mining Co.
Illinois: Fairmont City—American Zinc Co. of Illinois.
Montana: Great Falls—Anaconda Copper Mining Co.
Oklahoma:
  Bartlesville—National Zinc Co., Inc.
  Henryetta—Eagle-Picher Mining & Smelting Co.
Pennsylvania:
  Donora—American Steel & Wire Co.
  Josephtown—St. Joseph Lead Co.
  Palmerton—New Jersey Zinc Co.
Texas: Corpus Christi—American Smelting & Refining Co.

Secondary metallic cadmium

Arkansas: Jonesboro—Arkansas Metals Co.
Michigan: Detroit—Aetna Smelting & Refining Co.
New York: Whitestone—Neo-Smelting & Refining, Inc.

The cadmium content of the cadmium oxide and sulfide produced in 1948 decreased 18 percent from the 1947 output. Data for the production of other cadmium compounds are not available for 1948.

Cadmium oxide and cadmium sulfide produced in the United States, 1944–48, in pounds

Year	Oxide		Sulfide [1]		Year	Oxide		Sulfide [1]	
	Gross weight	Cd content	Gross weight	Cd content		Gross weight	Cd content	Gross weight	Cd content
1944	571,366	499,507	1,312,263	466,794	1947	449,847	392,556	3,501,508	1,308,385
1945	439,415	383,553	1,731,510	637,667	1948	334,859	291,847	3,137,035	1,096,775
1946	364,285	317,767	3,637,177	1,225,680					

[1] Includes cadmium lithopone and cadmium sulfoselenide.

CONSUMPTION AND USES

The apparent consumption of cadmium in all forms in 1948 totaled 7,818,486 pounds, a 1-percent increase over 1947. By far the largest single use of cadmium is for electroplating iron, steel, and, to a much smaller extent, copper alloys. The metal is desired for this use because (1) a thin coating is adequate to provide the necessary protection against corrosion; (2) cadmium has a high rate of deposition; (3) the metal has a high throwing power (the property of depositing uniformly in recesses); (4) cadmium is capable of imparting an enduring metallic luster to the electroplated item; and (5) cadmium has high resistivity to atmospheric corrosion. A disadvantage of cadmium plating is its low resistance to acids.

Another large use of cadmium metal is in the manufacture of bearing metals. Cadmium-base bearing metals containing 98.3 to 98.5 percent cadmium and varying quantities of nickel, silver, or copper, depending upon the type of bearing desired, are used successfully in internal-combustion engines that operate at high speeds and temperatures.

Small quantities of cadmium metal are consumed for the manufacture of solders and other alloys.

Compounds of cadmium have a wide variety of uses. Cadmium oxide, hydrate, and chloride are used in making electroplating solutions, while cadmium sulfide and cadmium sulfoselenide are employed as standard agents for producing yellow and red colors, respectively, in paint, soap, rubber, ceramics, paper, printing ink, leather, and other products. Cadmium bromide, chloride, and iodide are used in photographic films, process engraving, and lithographing.

Advantages of the nickel-cadmium storage battery, a new domestic use of cadmium, gained publicity in 1948. This type of battery—used for many years in Europe—consists of negative and positive plates composed of perforated-steel tapes within which are clamped the active battery materials. In the negative plates these materials are cadmium oxide and iron; positive plates contain nickel hydroxide and graphite. The individual plates, held apart by polystyrene separators, are assembled into plate units and suspended in an alkaline electrolyte of potassium hydroxide. The entire battery unit, consisting of positive and negative plates and electrolyte, is housed in an all-steel case. The standard European nickel-cadmium automobile battery contains approximately 7 pounds of cadmium. An American manufacturer, using techniques developed in Germany during World War II, plans to produce an automobile battery containing only 1.4 pounds per battery. This reduction in use of cadmium is accomplished by utilizing sintered battery plates molded from powdered nickel. The use of these thin, extremely porous plates, which are impregnated with cadmium and other active battery materials, permits construction of a lighter, smaller battery capable of delivering a high voltage per pound of weight. Among the reported [1] virtues of the nickel-cadmium battery are its normal life of 15 to 20 years; its ability to hold a charge when idle for long periods of time; its resistance to freezing; its ability to withstand physical abuse without case breakage; long periods of use without addition of distilled water; and the noncorrosive nature of the alkaline electrolyte, which eliminates deterioration of the battery case, insulation, and plate separators.

A recent article [2] presents the results of research on the comparative behavior of the nickel-cadmium and lead-acid storage batteries based upon data from tests and actual experience. With respect to the life of the battery, the report concludes that the nickel-cadmium product will remain serviceable longer under normal conditions. Comparative tests on self-discharge indicated that, under normal service conditions, where the battery is not left idle for more than a month, the lead battery is far superior. During this initial period the cadmium battery loses capacity rapidly. Only when the battery is idle for a long time does the cadmium battery show better residual capacity. Freezing of the electrolyte is an important factor in operating a battery at low temperatures. Lead-acid batteries will freeze in subzero temperatures while discharged. Dr. Willihnganz points out that, despite the claim that the cadmium battery cannot freeze, the normal alkaline electrolyte, such as is used in the cadmium battery, freezes at —25° C. (—13° F.). A German manufacturer of cadmium batteries recommends that, for exceptionally severe temperatures, the electrolyte gravity be increased to 1.24 with a lower freezing point and that this electrolyte be used only in emergency because it seriously reduces the life of the battery. Water consumption of a battery depends almost entirely on the amount of overcharge. Tests on water consumption indicated that, on a simple cycle service, the cadmium battery required more water than the corresponding lead battery.

STOCKS

Total domestic stocks of cadmium metal and compounds, excluding consumers' stocks for which data are not available, decreased 61 percent in 1948. Details are given in the following table.

Cadmium stocks at end of year, 1947–48, in pounds of contained cadmium

	1947 [1]			1948		
	Metallic cadmium	Cadmium compounds	Total cadmium	Metallic cadmium	Cadmium compounds	Total cadmium
Producers	443,870		443,870	388,950		388,950
Compound manufacturers	26,620	214,960	241,580	10,610	93,872	104,482
Distributors [2]	319,351	48,720	368,071	70,741	33,810	104,551
Government [3]	484,462		484,462			
Total stocks [4]	1,274,303	263,680	1,537,983	470,301	127,682	597,983

[1] Figures partly revised.
[2] Comprises principally 6 largest dealers.
[3] Excludes cadmium in national strategic stock pile.
[4] Excludes consumers' stocks, which were about 1,000,000 pounds at the end of 1944 (latest date for which figures were compiled).

PRICES

The quoted New York price was $1.75 a pound for commercial sticks and $1.80 a pound for patented shapes until August 2, when it advanced to $1.90 and $1.95, respectively. It was further advanced November 15 to $2 for sticks and $2.05 for patented shapes. The average price for domestic metal, as reported to the Bureau of Mines by primary producers, was $1.66 a pound in 1948, compared with $1.57 in 1947, 99 cents in 1946, 77 cents in 1945, 75 cents in 1944, and 79 cents in 1943 and 1942.

FOREIGN TRADE [3]

In 1948 total imports for consumption of metallic cadmium and of cadmium contained in flue dust decreased 23 percent in weight and 14 percent in value. Exports of cadmium increased 151 percent in value.

Imports.—Imports of cadmium-bearing flue dust, virtually all from Mexico, decreased 22 percent from the 1947 rate. Metallic cadmium imports dropped 52 percent from 1947, to the lowest level since 1932. Of the 9,809 pounds of metal imported in 1948, Canada supplied 64 percent and Peru 36 percent.

Cadmium metal and flue dust imported for consumption in the United States, 1946–48, by countries

[U. S. Department of Commerce]

Country	1946		1947		1948	
	Pounds	Value	Pounds	Value	Pounds	Value
Metallic cadmium						
Belgian Congo	6,700	$5,444				
Belgium and Luxembourg	2,240	5,366	2,000	$7,073		
Canada	3,568	5,459	14,612	20,551	6,300	$14,491
Peru	4,907	7,629	3,658	4,508	3,509	7,018
Switzerland			2	150		
United Kingdom			20	63		
Total metallic cadmium	17,415	23,898	20,292	32,345	9,809	21,509
Flue dust (Cd content)						
Australia					621	303
Mexico	1,609,366	598,494	2,355,588	1,673,153	1,827,518	1,437,833
Netherlands	43,539	19,397				
Total flue dust	1,652,905	617,891	2,355,588	1,673,153	1,828,139	1,438,136
Grand total	1,670,320	641,789	2,375,880	1,705,498	1,837,948	1,459,645

Exports.—Owing to a sharp rise in exports of metallic cadmium to countries included in the Organization for European Economic Cooperation, the total value of cadmium exported in 1948 was over two and one-half times greater than in the previous year. Of the 955,701 pounds of cadmium metal exported, Germany received 28 percent, France 24, United Kingdom 12, Switzerland 9, Belgium and Netherlands each 8; the remaining 11 percent went to 16 other countries.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Cadmium exported from the United States, 1946–48, gross weight, by kinds

[U. S. Department of Commerce]

Kind	1946		1947		1948	
	Pounds	Value	Pounds	Value	Pounds	Value
Dross, flue dust, residues, and scrap	459,775	$45,587	18,251	$21,838	92,847	$55,247
Metal	140,385	163,879	303,401	746,804	955,701	1,872,467
Alloys	75	99	----------	----------	1,506	2,657
Total	----------	209,565	----------	768,642	----------	1,930,371

Tariff.—Action taken at the the Geneva Trade Conference of 1947 reduced as of January 1, 1948, the import duty on cadmium metal from 7½ cents per pound as established in the Canadian Trade Agreement of 1939 to 3¾ cents per pound. Cadmium contained in flue dust remained duty free in 1948.

WORLD PRODUCTION

World production of cadmium in recent years, insofar as data are available, is shown in the accompanying table.

World production of cadmium, by countries, in 1940–48, in kilograms

Carbon Black

By F. S. LOTT, D. S. COLBY, AND H. BACKUS

GENERAL SUMMARY

PRODUCTION and consumption of carbon black in the United States declined in 1948 for the first time since 1942. Production of all types dropped nearly 2 percent below the 1947 level to 1,297,729,000 pounds. The decrease took place in the furnace types of black, while production of contact types was almost 4 percent above that of last year.

Total sales were 5 percent below 1947. Sales for domestic use totaled 932,433,000 pounds, a decline of 7 percent, but exports increased 1 percent to 321,915,000 pounds. Stocks in producers' storage of furnace and contact types increased during the year by 43,131,000 pounds. The stock of contact blacks rose from 8,619,000 pounds to 27,646,000 and that of furnace types from 66,493,000 pounds to 90,597,000. Stocks on December 31, 1948, equaled a 54-day supply of furnace black and a 16-day supply of contact black, at year's end sales rates.

The carbon-black industry consumed 480,646,000 thousand cubic feet of natural gas and 44,600,000 gallons of liquid hydrocarbons in 1948. Contact plants yielded an average of 1.61 pounds and furnace plants an average of 8.07 pounds of black per thousand cubic feet of natural gas used. The value of all blacks produced averaged 5.88 cents per pound compared with 5.36 cents in 1947.

Salient statistics of carbon black produced from natural gas and liquid hydrocarbons in the United States, 1944–48

	1944	1945	1946	1947	1948

Average per pound ... cents	3.67	4.02	4.82	5.36	5.88

The consumption of carbon black by the rubber industry in 1948 declined 7 percent to 870,564,000 pounds. The industry also reversed the trend toward furnace blacks and used a larger percentage of contact black in 1948 than in 1947, influenced by the increasing percentage of natural rubber being used and a better supply situation with respect to contact blacks.

Sales to ink companies remained high and substantially unchanged, but paint companies bought only 6,799,000 pounds, 16 percent less than in 1947. Miscellaneous uses increased 36 percent.

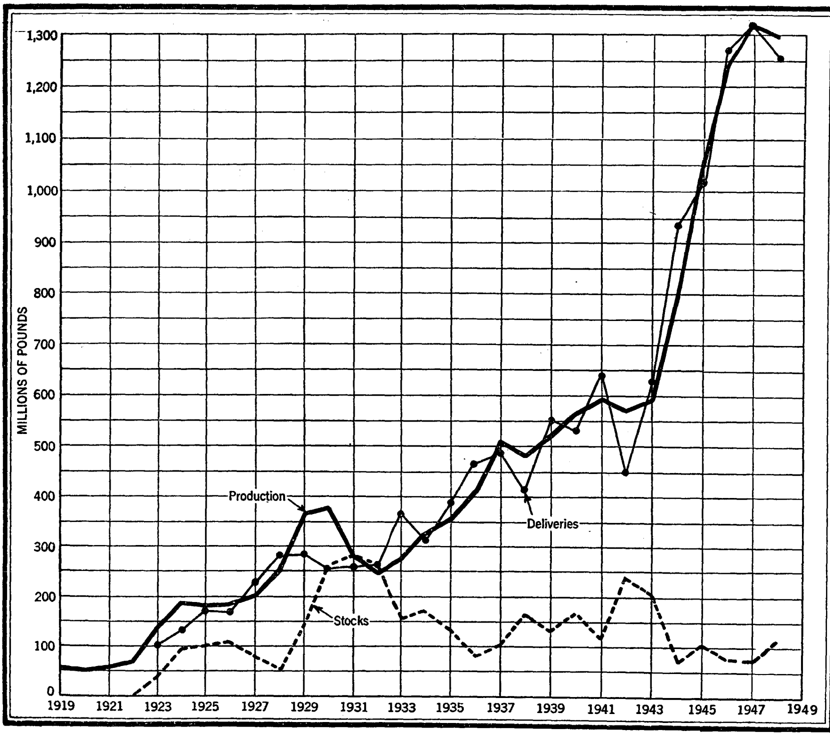

FIGURE 1.—Production, stocks, and deliveries of carbon black, 1919–48.

PRODUCTION

By States.—The first decline in production since 1942 had its severest effect on operations in Louisiana. The production of Texas continued to increase. Texas thus regained a small part of the supremacy in carbon-black manufacture that it lost during the wartime expansion program. Louisiana production in 1948 decreased by 13 percent to 165,032,000 pounds, 13 percent of the country's total manufacture. Texas Panhandle production rose 3 percent over 1947 to 653,480,000 pounds, but the production rate of the rest of the State declined 5 percent, resulting in a net increase of 1 percent for the entire

State. Texas accounted for 70 percent of the Nation's total production. The small producing States, Oklahoma and New Mexico, had large percentage changes in their production rates, a decrease of 17 percent and an increase of 29 percent, respectively. The declines in Louisiana and Oklahoma doubtless reflect the active demand in those States for natural gas for fuel uses.

Carbon black produced from natural gas and liquid hydrocarbons in the United States, 1944–48, by States and districts, in thousands of pounds

[1] In counting the total number of producers reporting, a producer operating in more than 1 State, district, or county is counted but once.
[2] Includes carbon black made from liquid hydrocarbons.

By Months.—The production of all types of carbon black in 1948 was 1,297,729,000 pounds, a decrease of 2 percent from the record high of 1947, due to the 7-percent decline in furnace-black production. Contact blacks were produced in new record quantities, 677,133,000 pounds for the year, 4 percent greater than in 1947.

Manufacture of carbon black slumped in the middle of 1948 but by December had risen again to within 1 percent of the January 1948 production rate. The major production decline took place in the manufacture of furnace blacks. In the third quarter of the year furnace-black production dropped 5 million pounds per month below the first quarter average but rose to within 6 percent of the January rate by the end of 1948. The slump in contact-black production was less-pronounced. Third-quarter production of this type was less than 1 million pounds per month below the first-quarter average and by the end of the year had risen to 3 percent above the January rate.

Production, shipments, and exports of carbon black in the United States in 1948, by months, in thousands of pounds

[1] Compiled from reports of the National Gas Products Association and of producing companies not included in the association figures.
[2] U. S. Department of Commerce.

Methods and Yields.—The average yield of carbon black from natural gas in 1948 dropped to 2.41 pounds per thousand cubic feet. This is the first time that the yield had dropped since the expansion of the furnace process. It was caused by a reduction in the percentage of furnace-type black produced and by a decrease in the average yield of black obtained from the furnace process. In 1948, 48 percent of all carbon black was produced by furnace processes compared to 50 percent in 1947. The over-all yield from these processes dropped from 8.27 pounds per thousand cubic feet of gas in 1947 to 8.07 pounds in 1948. Lower yields resulted from increased production of the new types of highly reinforcing furnace blacks.

Contact processes accounted for 52 percent of the carbon black produced in 1948, and the yield was again improved slightly to 1.61 pounds per thousand cubic feet of gas processed. The contact plants used 420,939 million cubic feet of natural gas and furnace plants 59,707 million cubic feet.

A better understanding of the yields can be had by examining the percentage of recovery by the different processes. Natural gas contains about 35 pounds of carbon per thousand cubic feet, varying slightly with the composition of the gas. The yield of 1.61 pounds per thousand cubic feet for contact plants represents a recovery of 4.6 percent of the total carbon fed to the plant. A yield of 8.07 pounds per thousand cubic feet for furnace plants is a recovery of 23 percent of the carbon. A process using all liquid hydrocarbons achieves a 50-percent carbon recovery, according to trade information.

The production of carbon black from liquid hydrocarbons increased in 1948 by over 50 percent to nearly 139 million pounds, consuming 44,600,000 gallons of feedstock. The yields from processes using liquid feeds are not available in all cases because both liquid and gas may be fed simultaneously. However, 3 pounds of black per gallon of liquid is thought to be an average yield.

Yield of carbon black, quantity and value of natural gas used, and number of producers of carbon black in the United States, 1944–48

Number of plants	54	59	60	63	63

Number and Capacity of Plants.—The total number of operating plants remained unchanged at 63 in 1948—44 contact-type and 19 furnace-type. Two plants began operation: one, the small channel type plant of Carbon Blacks, Inc., which was moved from Texas to Richland Parish, La.; the other, a new contact-type plant of 30,000 pounds per day capacity in Reagan County, Tex., operated by a new producer Witco Hydrocarbon Corp.

Two plants were removed from operation—the Pontotoc County, Okla., plant of Charles Eneu Johnson Co. was dismantled, and the Columbian-Phillips plant in Moore County, Tex., was dismantled and is to be merged with the Seminole 66 plant of Columbian Carbon Corp. in Gaines County, Tex.

Total operating capacity decreased slightly to 4,031,800 pounds per day. Furnace-plant capacity is rated at 2,140,200 pounds per day, and 1948 production averaged 79 percent of this figure. Contact-plant capacity is 1,891,600 pounds per day, and production was 98 percent of the rating.

It is notable that the rated capacity to produce furnace types of carbon black is greater than that for the older contact types. Furnace grades are produced in 19 plants with an average capacity of 113,000 pounds per day, while the average contact plant has a capacity of 43,000 pounds per day. The capacity of a furnace plant varies with the type of black produced, being materially less when producing the newer-type, highly reinforcing black than when producing a coarser black. It is assumed that the capacity reported for each plant is consistent with grades of black usually produced by that plant.

Producers.—The number of producers increased from 21 in 1947 to 24 in 1948. Moore County Carbon Co. sold its plant to United Carbon Co. Carbon Blacks, Inc., resumed operations, having been out of production in 1947 while moving its plant from Texas to Louisiana. Witco Carbon Co., Witco Hydrocarbon Corp., and Sid Richardson Carbon Co. entered the industry as producers in 1948.

[1] 1 plant in both Carson and Hutchinson Counties tabulated under Hutchinson County.

DEMAND—SALES

Domestic consumption as indicated by manufacturers' sales decreased 7 percent in 1948 to 932,433,000 pounds. Export sales increased 1 percent to 321,915,000 pounds to make the year's total demand 1,254,348,000 pounds, compared with 1,319,760,000 pounds in 1947. The trend toward increasing consumption of furnace black was reversed in 1948, as demand fell 9 percent. Contact-black sales declined only 1 percent.

The month-to-month trend in sales of contact blacks showed a gradual decline throughout 1948. Sales of furnace blacks declined through September, after which there was a sharp increase.

The rubber industry consumed 93 percent of all carbon blacks sold domestically in 1948. This is a slight decrease from the 94-percent consumption of 1947. Consumption of virgin rubber in the United

States decreased 5 percent in 1948, while carbon-black consumption by the rubber industry at the same time decreased 8 percent. If 95,000,000 pounds of carbon black are allowed for use in reclaimed rubber during 1948, the over-all domestic use of carbon black in virgin rubber dropped from 752 pounds to 706 pounds per long ton of virgin rubber used. This decline reflects the increasing use of natural rubber, which requires a lighter carbon-black loading than do synthetics. Of the total virgin rubber processed in this country during 1948, natural rubber comprised 58 percent compared with 50 percent in 1947. This swing to natural rubber is also responsible for the increasing amount of channel blacks being used.

Carbon-black usage by the ink-manufacturing industry remained essentially unchanged in 1948, increasing by 176,000 pounds to 32,436,000 pounds. This maintains the record high established in 1947 but does not continue the correlation established with newsprint

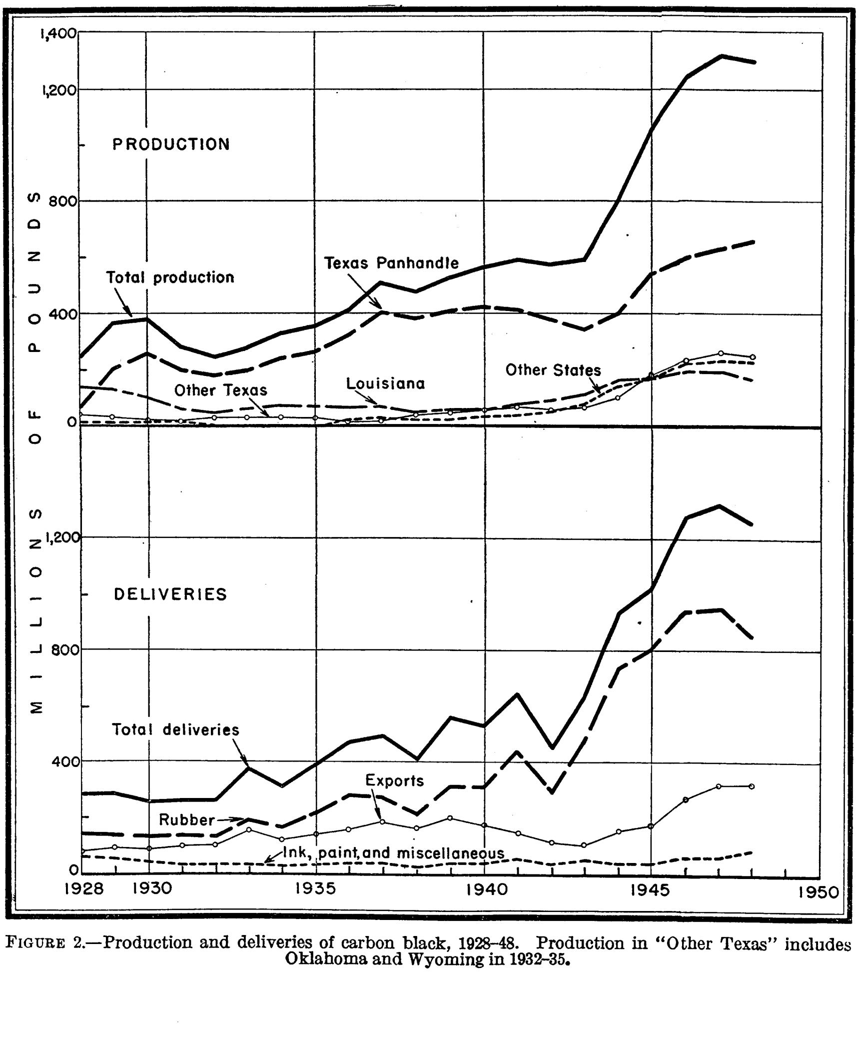

FIGURE 2.—Production and deliveries of carbon black, 1928–48. Production in "Other Texas" includes Oklahoma and Wyoming in 1932–35.

consumption. The American Newspaper Publishers Association reports that newsprint consumption in this country increased 8 percent to 5,141,000 short tons in 1948.

The greatest proportionate decline in consumption took place in the paint industry, which used 6,799,000 pounds of carbon black in 1948, 16 percent less than in 1947. Sales of paint products as a whole, after correction for change in price index, increased 5 percent in 1948. The decline in carbon-black consumption by this industry is a continuation of last year's trend, when consumption was 13 percent below that of 1946. This brings usage almost back to the prewar level of approximately 6 million pounds per year.

Sales of carbon black for domestic consumption in the United States, by uses, 1944–48, in thousands of pounds

Use	1944	1945	1946	1947	1948
Rubber	738, 029	804, 386	941, 464	943, 580	870, 564

Paint	5, 315	7, 421	9, 312	8, 137	6, 799
Miscellaneous	12, 616	11, 631	18, 318	16, 707	22, 634
Total	780, 439	846, 262	998, 655	1, 000, 684	932, 433

STOCKS

Producers' stocks of carbon black increased from 75,112,000 pounds on January 1, 1948, to 118,243,000 on December 31. Contact-black stocks increased throughout the year from an inadequate minimum on January 1 to a 16-day supply of 27,646,000 pounds at the end of the year. The stock of furnace blacks, which was satisfactory at the end of 1947, increased 25 million pounds during the first half of 1948 and leveled off for the remainder of the year close to 90 million pounds. This stock is equivalent to a 54-day supply based on December shipments.

Producers' stocks of carbon black, although not well-balanced by principal grades, were not abnormally high in 1948, being approximately the size of stocks held in the late 1930's when demand was less than half as great as at present. Stocks of contact and furnace type held by producers as of December 31, 1944–48, were as follows, in pounds:

Year	*Contact types*	*Furnace types*	*Total*
1944	58, 036, 000	11, 207, 000	69, 243, 000
1945	64, 956, 000	37, 049, 000	102, 005, 000
1946	17, 006, 000	59, 222, 000	76, 228, 000
1947	8, 619, 000	66, 493, 000	75, 112, 000
1948	27, 646, 000	90, 597, 000	118, 243, 000

PRICES

The average value of all carbon blacks produced in the United States in 1948 was 5.88 cents per pound f. o. b. producing plants. This is a rise of 0.52 cent per pound from the 1947 average. Contact blacks advanced 0.94 cent per pound to 7.28 cents, while the average value of furnace types declined 0.04 cent to 4.35 cents per pound. The rise in natural-gas average cost from 3.57 to 4.73 cents per thousand cubic feet accounts for 0.68 cent per pound of the rise in value of contact types, but furnace-black value declined despite rising gas costs. Furnace-black prices are less influenced by gas costs because of the higher yields obtained. The spread between the average unit value of contact and furnace blacks has now widened to 2.93 cents per pound.

The published market prices of ordinary rubber grades of channel blacks increased 1 cent per pound in 1948, according to Oil, Paint and Drug Reporter, and the prices of the common furnace blacks (that is, semireinforcing and high-modulus) remained unchanged throughout the year. The rubber grades of channel black increased 0.5 cent per pound on January 1, 1948, and a like amount on April 1 to a price of 7.32 cents per pound for carloads in bags f. o. b. plant. Fine-furnace-black prices increased on the same dates by 0.50 and 0.82 cent per pound, respectively, to make its price equal to that of the rubber channel blacks.

Prices of carbon black in carlots, f. o. b. plant, 1940–48, in cents per pound

[1] Chiefly easy-processing (EPC) and medium-processing (MPC) but also includes hard-processing (HPC) and conductive (CC) channel blacks.
[2] Office of Price Administration ceiling prices. Average realization on sales to the Rubber Reserve Company was generally higher.

FOREIGN TRADE [1]

Imports.—Imports of carbon black in 1948, except for 40 pounds from Germany, came exclusively from Canada. The quantity of "gas black and carbon black" imported from Canada in 1948 was 74,100 pounds compared with only 25 pounds in 1947. The declared value of this material was 12.2 cents per pound. Acetylene-black imports reached a record high of 10,145,681 pounds, valued at $1,284,539, an average value of 12.7 cents per pound compared with a 1947 value of 10.9 cents per pound when imports were 7,639,716 pounds.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Exports.—Exports of carbon black in 1948 gained 1 percent to 321,915,000 pounds. The unit value of the exported blacks was 8.86 cents per pound compared with 8.41 cents per pound in 1947. Shipments to Russia and Poland were cut off entirely in 1948, and Germany received carbon black from the United States this year for the first time since the war. Japan's imports have increased sharply since it began receiving shipments in 1947.

Carbon-black exports to individual countries fluctuate so widely from year to year that it is difficult to generalize concerning their usage trends. However, among those countries whose purchases from the United States are still increasing are Austria, Chile, Indonesia, Mexico, Peru, and Switzerland. The United Kingdom is still the largest export customer, and its purchases increased by 10.5 million pounds to 102 million pounds. Those countries with a decreasing purchasing trend are China, Czechoslovakia, Portugal, and Yugoslavia.

TECHNOLOGY

The return of natural rubber to the domestic rubber market permitted an increase in the percentage used relative to the synthetic product. This reversion to natural rubber was accompanied in 1948 by a growing consumption of contact blacks in preference to the furnace blacks which became so important in synthetic compounding. With compounding following this pattern, a major factor in the future course of the carbon-black industry will be the ability of synthetic rubber to compete, on its own merits, with the natural product.

Regardless of merit, a certain quantity of synthetic material must be incorporated in rubber products to maintain our rubber self-sufficiency; but beyond this, synthetic rubber production will depend upon the price and service competition it can offer.

The brightest hope of synthetic rubber standing on its own has been the excellent properties shown by so-called "cold rubber." This is a synthetic rubber manufactured under refrigerated temperature conditions. Tire tread compounded from this material apparently wears longer than that made of natural rubber. The other properties of "cold rubber" fall between those of ordinary synthetic and natural rubber. The Reconstruction Finance Corporation has authorized that half of the operating synthetic rubber capacity be converted to this process, which will give a "cold-rubber" capacity of nearly 200,000 tons per year by the middle of 1949.

Paralleling the development of "cold rubber" has been an improvement in the reinforcing properties of furnace blacks. The particle size of these new blacks has been reduced to that of easy-processing channel black, and their surface characteristics are such that they are more highly reinforcing than channel black of the same fineness. These highly reinforcing blacks, called "very fine furnace," "reinforcing furnace," and "high-abrasion furnace," increase the abrasion resistance of both natural and synthetic rubber above that obtainable with easy processing channel. Channel blacks give so excellent a product with natural rubber that their use in natural should not be materially affected by the new furnace types. However, both standard and low-temperature GR–S have given their best performance when compounded with the new types of furnace blacks, and demand for synthetics and these blacks should be closely related.

The coarser type of furnace black, semireinforcing furnace, now enjoys an economic advantage over channel black because of the high yield of this furnace process. The yield from natural gas of the fine furnace blacks, however, is less than one-third that obtained when semireinforcing grades are produced. Because of the low yield of the fine grades of furnace black and the reduced rate at which they can be produced, the cost advantage over channel black tends to disappear. At the end of 1948, rubber grades of channel black and fine furnace black were quoted at the same price.

Two methods have developed for producing these highly reinforcing furnace blacks. One, just discussed, uses natural gas as feedstock. To realize a reasonable yield from this method, additional equipment must be installed at the furnace plant to preheat the gas, and the process is difficult to control. The other procedure is to use an oil feed or a combination of gas and oil. This method has been gaining in favor, and higher yields and throughputs have been obtained than with gas alone. Gas is still a cheaper source of carbon than oil. The growth of this process will depend in large measure upon the relative price of natural gas and petroleum fractions in the future.

The practicability of producing carbon blacks from liquid-petroleum fractions will have a decentralizing effect on the industry because transportation and storage is a lesser problem for oil in many areas than for gas. One plant is operating in Wales and two are now scheduled for construction in England, our largest export customer for blacks. Both of these will be furnace-type plants and will use a liquid feedstock. One, to be operated by Philblack, Ltd., under a licensing agreement with Phillips Petroleum Corp., will be financed privately and produce 20 million pounds per year of carbon black. The other plant, the first to be approved under the guaranteed investment plan of the Economic Cooperation Administration, will be operated by Cabot Carbon, Ltd., a subsidiary of Godfrey L. Cabot, Inc. This plant is scheduled to produce 10 million pounds of black per year and to be in full operation by the end of 1950.

Cement

By D. G. RUNNER AND ESTHER V. BALSER

GENERAL SUMMARY

PRODUCTION and apparent consumption, as indicated by mill shipments of cement in 1948, increased sharply over the preceding year's totals. The efforts of the industry to pace demands resulted in the greatest output of cement in history. Total production of 208,888,511 barrels of hydraulic cements was 10 percent greater than in 1947. The gains were reflected in all types (portland cement and other hydraulic cements—natural, masonry, puzzolan, and hydraulic lime). The portland-cement industry operated at 81 percent and the remainder of the hydraulic cement industry at 99 percent of productive capacity during 1948. Mill shipments of portland cement, which totaled 204,304,662 barrels, represented an increase of 9 percent over the 1947 figures—an all-time record. Shipments of other hydraulic cements increased 15 percent. Stocks of all hydraulic cements at mills on December 31, 1948, amounted to 11,365,729 barrels, 12 percent greater than at the end of 1947.

The average net mill realization per barrel of portland cement reached $2.18—an increase of 28 cents over the 1947 price. Other hydraulic cements, as a group, reported a gain of 32 cents a barrel to $2.29.

The long-term trend, as indicated by the moving 12-month total of production of finished portland cement in the Bureau of Mines Monthly Cement Reports, continued the climb started in 1945 and reached a record high in December 1948.

Monthly production during 1948 totaled 14.5 million barrels in January, declined slightly in February, increased gradually through August, declined again slightly in the following month, and reached a high for the year of 19.3 million barrels in October. From this point production gradually declined to a year-end output of 17.4 million barrels. The monthly average for the year exceeded 17 million barrels.

Salient statistics of the cement industry in the United States, 1944–48 [1]

	1944	1945	1946	1947	1948
Production of finished cement:

[5] Subject to revision.
[6] 198,723 barrels, valued at $839,916, shipped under the U. S. Army Civilian Supply Program, is excluded from exports shown but is deducted from apparent consumption.
[7] Shipments from domestic mills plus net imports.

Monthly shipments from mills in 1948 followed the prewar seasonal pattern, but at a much higher level. With the exception of 2 months, February and October, monthly shipments were higher in 1948 than in the preceding year. Mill shipments amounted to 9.2 million barrels in January, declined in February, increased gradually to 21.4 million barrels in June, and declined again in the following 3 months until another peak of 20.3 million barrels was reached. Shipments then declined to 12.7 million barrels in December.

Consumption trends of portland cement in 1948, as indicated in figure 1, are about the same as in the previous year. The Middle States [1] were the leading consuming region.

The improvement and expansion program of the cement industry continued in 1948, as three new wet-process plants were put into operation. The Ideal Cement Co., of Denver, Colo., started operation during the year of its "twin" plants at two locations where it also operates two dry-process plants—the Colorado Portland Cement Division, Portland, Colo., which began operating in June, and the Union Portland Cement Division, Devils Slide, Utah, which started producing in October. The Carolina Giant Cement Co., Philadelphia, Pa., started production in December from its new plant at

[1] The States comprising each region are found in Minerals Yearbook, 1945, p. 1222.

Harleyville, S. C. Other developments include the proposal of the Lehigh Portland Cement Co., Allentown, Pa., to build a new plant on a 9,500-acre site near Flagler Beach, Fla. The raw material will be coquina limestone found near the site. Although final details have not been concluded, a new 10-million-dollar wet-process plant is proposed for construction near Banning and Palm Springs, Calif. Action is delayed, however, by a zoning ordinance which would bar construction of the plant. Existing installations were improved by numerous cement companies during the year. The Portland Point, N. Y., plant of the Pennsylvania-Dixie Cement Corp. remained inactive during 1948, and the dry-process Northampton, Pa., plant of the Universal-Atlas Cement Co., after being kept in a stand-by condition for a number of years, was dismantled during the year.

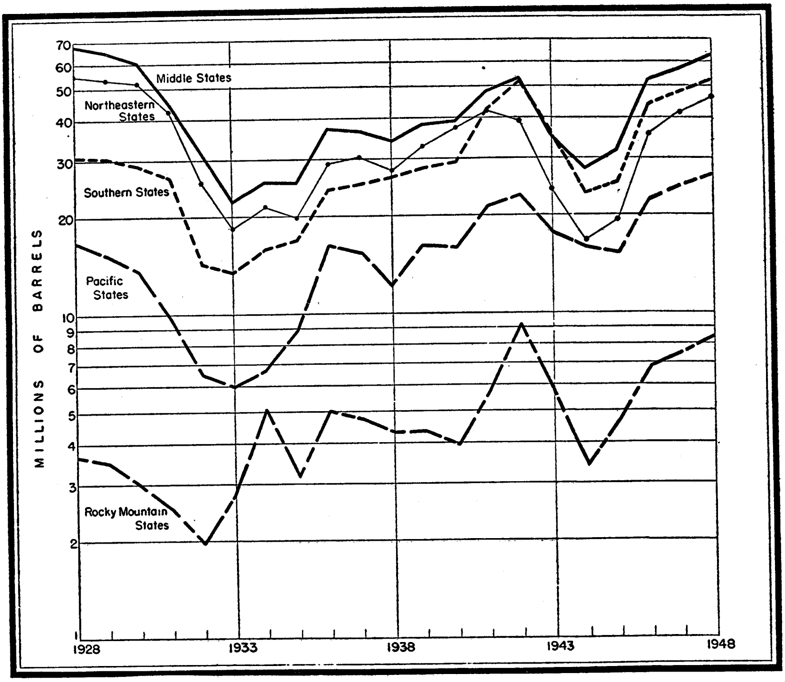

FIGURE 1.—Trends of indicated consumption of portland cement in continental United States, 1928–48, by regions.

The United States Supreme Court decision of April 26, 1948, on the basing-point price system has apparently left much confusion and many interpretations in its wake. The cement companies, in general, have abandoned the multiple-basing-point delivered price and are selling their product at prices f. o. b. the shipping point or, if the purchaser desires, at a delivered price reflecting full freight charges from shipping point to destination. At least one company, it is reported, is adhering to the competitive sales policy in effect before the multiple-basing-point system was outlawed. The United States Senate named a special committee to study the effect of the Supreme Court's decision.

PRODUCTION, SHIPMENTS, AND STOCKS

PORTLAND CEMENT

In 1948 the output of portland cement constituted 98 percent of the total output of hydraulic cements. This production came from 150 active plants located in 35 States and Puerto Rico. One new plant began operating in December 1948, but no shipments were made from it during the year.

Production in 1948 was greater in all districts, as grouped by the Bureau of Mines, than in 1947. In continental United States the increases ranged from 4 percent in the Alabama district to 19 percent in the Colorado-Wyoming-Montana-Utah-Idaho district. The Puerto Rico district production increased 30 percent over the preceding year. Quantitywise, the Eastern Pennsylvania-Maryland district led with an output of 33,589,877 barrels, followed by California with a 24,601,-892-barrel production. The following districts produced more than 10 million barrels in 1948: Texas, New York-Maine, Indiana-Kentucky-Wisconsin, Michigan, and Ohio. These seven districts supplied 58 percent of the total output.

Shipments of finished portland cement were also greater in all districts in 1948 than in 1947. The increases ranged from 4 percent in the Indiana-Kentucky-Wisconsin district to 17 percent in the Oregon-Washington district, while a gain of 28 percent was registered in the Puerto Rico district.

Stocks of finished cement were 11 percent greater on December 31, 1948, than on the same date of the preceding year. Seven districts (including Puerto Rico) show decreases in stocks from the 1947 total, and 12 reported increases ranging from 1 percent in the Eastern Missouri-Minnesota-South Dakota and Kansas districts to 116 percent in the Colorado-Wyoming-Montana-Utah-Idaho district. The trend of month-end stocks of clinker in 1948 varied slightly from the preceding year's pattern. The peak was reached in March instead of May, as in the previous year. The decreases continued gradually to the low for the year in November.

NATURAL, MASONRY (NATURAL), AND PUZZOLAN CEMENTS

In 1948, as in the previous year, nine cement plants produced hydraulic cements other than portland. Output, shipments, and stocks in 1948 were, respectively, 17, 15, and 45 percent greater than in the previous year. Producers reported the consumption of 47,609 short tons of coal and of gas equivalent to approximately 3,927 short tons of coal. Statistics for the 5-year period 1944–48 are shown in the following table.

Natural, masonry (natural), and puzzolan (slag-lime) cements produced, shipped, and in stock at mills in the United States, 1944–48

Year	Production		Shipments		Stocks on Dec. 31
	Active plants	Barrels (376 pounds)	Barrels (376 pounds)	Value	Barrels (376 pounds)
1944	9	1,246,703	1,320,274	$1,638,892	166,889
1945	9	1,483,763	1,479,513	2,093,848	170,324
1946	9	2,474,674	2,533,106	4,155,171	112,031
1947	9	2,951,098	2,927,885	5,764,398	[1] 145,408
1948	9	3,440,248	3,375,135	7,734,289	[2] 210,521

[1] Revised figure.
[2] Subject to revision.

TYPES OF CEMENT

A break-down of the total production of portland cement by various types for the 1944–48 period is shown in the accompanying table. With the exception of high-early-strength cement, the output of all types increased in 1948 over that reported in the previous year. The quantity of air-entrained cement produced and shipped, first reported separately to the Bureau of Mines in 1945, showed substantial gains over the previous year's figures. Increases in sales of sulfate-resisting, type V, and white cements are noteworthy.

Prepared Masonry Mortars.—Production of these mixed materials in 1948 was reported by 86 plants and totaled 10,523,545 barrels.

Shipments reached 10,321,781 barrels valued at $26,226,385—an average of $2.54 per barrel. These data are not included in the statistical tabulations in this chapter, but the portland cement used in manufacturing these mixtures is included.

Portland cement produced and shipped in the United States,[1] 1944–48, by types

Type and year	Active plants	Production (barrels)	Shipments		
			Barrels	Value	
				Total	Average
General use and moderate heat (types I and II):					
1944 [2]	151	83, 576, 685	86, 933, 387	$135, 564, 313	$1. 56
1945	145	89, 922, 894	93, 379, 480	148, 653, 647	1. 59

[1] Including Puerto Rico and Hawaii.
[2] Includes air-entrained and Vinsol resin cements classed as modified cements by producers.
[3] Figures reported separately for the first time in 1945.
[4] Includes hydroplastic, plastic, and waterproofed cements.

CAPACITY OF PLANTS

The aggregate annual capacity of all portland-cement plants in 1948, as reported to the Bureau of Mines, increased 2 percent over that reported in 1947.

The over-all rate of operation in 1948 was at 81 percent of total capacity. As indicated in the following table, the percentage of capacity utilized gained in all but two operating districts—Virginia-Georgia-Florida-Louisiana-South Carolina and Colorado-Wyoming-Montana-Utah-Idaho. In the continental United States the increases in percentage points ranged from 1 in the Iowa district to 17 in the Eastern Pennsylvania-Maryland district. An increase of 21 percent was recorded in the Puerto Rico district. The percentage of capacity used in each month of 1948 was higher than in the corresponding months of 1947 and—with the exception of a slight decrease in February from January figures—followed the seasonal pattern of low rates in the first quarter and a steady increase to a peak in September and October, with a decline at year end.

Portland-cement-manufacturing capacity of the United States, 1947–48, by districts

District	Estimated capacity (barrels)		Percent of capacity utilized	
	1947	1948	1947	1948

June	81	89	74	80	December	79	84	78	84

Total capacity of wet-process plants, as indicated in the accompanying table, increased slightly in 1948, in contrast to dry-process plants, whose capacity declined. The percentage of cement produced by wet-process plants in 1948, however, was maintained at about the same level as in 1947.

A grouping of the cement plants based on their estimated annual capacity is shown in the following table. Gains were registered in the 1,000,000- to 2,000,000-, and 2,000,000- to 3,000,000-barrel-capacity groups, whereas the number of plants in the less-than-1,000,000-barrel class declined.

Number of portland-cement plants in the United States (including Puerto Rico), by size groups, in 1948

Estimated annual capacity, barrels:	*Number of plants*
Less than 1,000,000	26
1,000,000 to 2,000,000	96
2,000,000 to 3,000,000	18
3,000,000 to 10,000,000	11
	151

[1] Includes Puerto Rico and Hawaii.

CLINKER PRODUCTION

The output of clinker, the intermediate product of the industry, was 11 percent greater in 1948 than in 1947. Peak production was reached in October, while stocks reached their greatest accumulation in March. Stocks of clinker on December 31, 1948, were 5 percent greater than those reported for the year-end 1947.

RAW MATERIALS

For a great many years the principal raw materials for the manufacture of portland cement in the United States have been limestone and clay or shale. In 1948, 71 percent of the output was made from this combination compared with 69 percent in 1947. Cement rock and pure limestone furnished 23 percent in 1948, while the combination of blast-furnace slag and limestone in 1948 supplied 5 percent of the output. As in the past several years, marl and clay supplied a minor part of the raw materials utilized by the cement industry in 1948, accounting for only 1 percent of the total quantity used.

Production and percentage of total output of portland cement in the United States,[1] 1900–14, 1926, 1929, 1933, 1935, and 1941–48, according to raw materials

Year	Cement rock and pure limestone		Limestone and clay or shale [2]		Marl and clay		Blast-furnace slag and limestone

[1] Includes Puerto Rico and Hawaii, 1941–48.
[2] Includes output of 2 plants using oystershells and clay in 1926; 3 plants in 1929, 1933, and 1935; 4 plants in 1941–45; and 5 plants in 1946–48.

The tonnages of raw materials (exclusive of fuels and explosives) required for the production of portland cement in 1946–48 are given in the following table. Limestone, cement rock, and clay and shale constitute 94 percent of the total materials consumed. Except for sand and sandstone and miscellaneous items, which show decreases, all types of raw materials consumed in 1948 show gains over the preceding year's figures.

Raw materials used in producing portland cement in the United States,[1] 1946–48

Raw material	1946	1947	1948
	Short tons	*Short tons*	*Short tons*
Cement rock	10,781,078	11,728,062	13,046,856
Limestone (including oystershells)	34,579,673	40,034,322	43,489,837
Marl	860,798	563,148	601,716
Clay and shale [2]	4,845,224	5,373,591	6,440,584
Blast-furnace slag	706,986	864,617	896,474
Gypsum	1,157,324	1,445,622	1,507,876
Sand and sandstone (including quartz)	460,910	821,017	723,769
Iron materials [3]	218,634	257,048	318,106
Miscellaneous [4]	144,139	147,056	133,716
Total	53,754,766	61,234,483	67,158,934
	Pounds	*Pounds*	*Pounds*
Average total weight required per barrel (376 pounds) of finished cement	655	657	654

[1] Including Puerto Rico and Hawaii.
[2] Includes bentonite, diatomaceous shale, and fuller's earth.
[3] Includes iron ore, pyrite cinders and ore, and mill scale.
[4] Includes diatomite, fluorspar, pumicite, flue dust, pitch, red mud and rock, hydrated lime, tufa, cinders, calcium chloride, sludge, grinding aids, and air-entraining compounds.

FUEL AND POWER

As a result of the increased output of cement in 1948, all types of fuel consumed by the portland-cement industry increased over the report for 1947, except byproduct gas. The percentage changes in consumption are: Coal, 8 percent; fuel oil, 1 percent; natural gas, 16 percent; and byproduct gas, a decrease of 56 percent. Average monthly consumption of these fuels in 1948 compared to that reported in 1947 (1947 averages in parentheses) was: Coal, 712,804 (661,465) short tons; fuel oil, 388,196 (385,344) barrels; natural gas, 6,109,433 (5,264,974) thousand cubic feet; and byproduct gas, 97,865 (223,457) thousand cubic feet.

The number of plants using electric energy, the kilowatt-hours generated and purchased, and the average electric energy used per barrel of cement compared with 1947 figures are shown in an accompanying table. The percentage of electricity generated declined, and the quantity purchased increased.

Finished portland cement produced and fuel consumed by the portland-cement industry in the United States,[1] 1947–48, by processes

Process	Finished cement produced			Fuel consumed [2]		
	Plants	Barrels of 376 pounds	Percent of total	Coal (short tons)	Oil (barrels of 42 gallons)	Natural gas (M cubic feet)

[1] Including Puerto Rico.

TRANSPORTATION

The quantity and proportion of cement shipped by each of the major methods of transportation for the 1946–48 period are given in the following table. The proportions shipped by railroad, truck, and boat in 1948 varied little from the previous year. In 1948 railroads carried most of the shipments—81 percent of the total tonnage. The trend during the past few years is toward bulk shipments, as indicated by the 5-percent increase in this mode of shipment for 1948.

Shipments of portland cement from mills in the United States,[1] 1946–48, in bulk and in containers, by types of carriers

[1] Includes Puerto Rico and Hawaii.
[2] Includes steel drums and iron and wood barrels.
[3] Includes cement used at mills by producers as follows—1946: 584,224 barrels; 1947: 813,830 barrels; 1948: 645,420 barrels.
[4] Less than 0.05 percent.

CONSUMPTION

The following table shows that the indicated consumption of portland cement in 1948 increased in all but seven States—Kentucky, Nevada, New Hampshire, Tennessee, Vermont, Virginia, and West Virginia. Variation of percentages for the various States compared with 1947 ranges from a decrease of 10 for West Virginia to an increase of 51 for Wyoming. California, New York, Texas, Pennsylvania, Illinois, Ohio, and Michigan, in that order, were the largest consumers of cement in 1948. These seven States accounted for 44 percent of the total consumption, while the 14 non-cement-producing States, including the District of Columbia, accounted for 13 percent of the total consumption.

Destination of shipments of finished portland cement from mills in the United States, 1946–48, by States

[1] Shipments by producers to foreign countries and to noncontiguous Territories of the United States (Alaska, Hawaii, Puerto Rico, etc.), including distribution from Puerto Rican mills.

LOCAL SUPPLY

The surplus or deficiency in the quantity of cement locally available is indicated in the following table. The comparison is based on shipments from mills and on consumption as shown by State receipts of mill shipments. The 1948 deficiencies occurred in two States and four districts.

The total surplus of producing States in 1948 was distributed as follows: 26,479,265 barrels to non-cement-producing States, Alaska, and Hawaii; 5,670,838 barrels to destinations outside continental United States (excluding local consumption of Puerto Rican production); and 35,141 barrels to unspecified destinations.

Estimated surplus or deficiency in local supply of portland cement in cement-producing States, 1947–48, in barrels

PRICES

The average net mill realization of all portland cement shipped from mills in 1948 advanced to $2.18 per barrel from $1.90 per barrel in 1947. The average net mill realization in each quarter of 1948 was: First, $2.12; second, $2.11; third, $2.21; and fourth, $2.28.

The composite wholesale price of portland cement, f. o. b. destination, according to the Bureau of Labor Statistics index (1926=100) was 130.4 in 1948, whereas in 1947 it was 115.7.

883326—50——16

Average mill value per barrel, in bulk, of portland cement in the United States,[1] 1944–48

Year	Value	Year	Value
1944	$1.59	1947	$1.90
1945	1.63	1948	2.18
1946	1.72		

[1] Includes Puerto Rico and Hawaii.

FOREIGN TRADE [2]

Imports.—Imports of hydraulic cement increased greatly in 1948, amounting to 282,852 barrels compared with 4,606 barrels in the previous year, and for the most part represent purchases from Belgium and Luxembourg, Mexico, and the United Kingdom. Imports of all hydraulic cement, except white nonstaining portland cement for the years 1946–48, are listed by country of origin in the second following table. Imports of white nonstaining cement in 1948 totaled 223 barrels valued at $718.

Hydraulic cement imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Barrels	Value	Year	Barrels	Value
1944	169	$418	1947	4,606	$28,668

[1] Excludes "white nonstaining, and other special cement."

Exports.—Exports of cement in 1948 totaled 5,922,163 barrels valued at $20,917,176. As indicated in the following table, shipments were divided about equally between countries in North America and South America. The largest purchasers were Canada, Cuba, Dominican Republic, Brazil, and Venezuela.

Shipments of hydraulic cement to noncontiguous Territories of the United States for the 1946–48 period are shown in an accompanying table. Shipments to Guam, Samoa, and the Virgin Islands increased over the previous year's figures, while shipments to Puerto Rico declined.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Hydraulic cement exported from the United States, 1944–48

[U. S. Department of Commerce]

Year	Barrels	Value	Percent of total shipments from mills

TECHNOLOGY

The portland cement industry in 1948 expanded its use of improved raw grinding by closed-circuits, uniform kiln feed with new grinding system, and efficient dust collection by electrical precipitators.[3 4] A review and discussion of the control of portland cement raw mixtures has been released,[5] as well as a report on the results obtained in a study of fineness of cements made to determine gain or loss of cementing value in concrete from extreme fines.[6]

During the year new developments in the use of slag in cement were noted. A report recommended separate grinding of lime and slag in the manufacture of lime-slag cements. Formulas are given for obtaining cement strength after 7, 28, and 68 days.[7] According to another report, lime has been replaced by barium oxide in the manufacture of portland cement. Proportions corresponding to monobarium, dibarium, and tribarium silicate produced cements unstable in plain water but were resistant to a 1-percent solution of magnesium sulfate. The investigations are being continued.[8]

Recognizing that concrete walls and floors are possible sources of certain types of germ activity, an antiseptic cement has been developed. Tests have indicated that sections containing antiseptic cement remained free of germs. This process is covered by United States Patent 2,439,440.[9]

Two patents relating to waterproofing agents for cement have been released. One, United States Patent 2,428,785, granted October 14, 1947, provides for a mixture of CrO_3 and pumicite to be heated together until it turns black. Proper proportions of this product are then ground while hot and mixed with a suitable quantity of finely powdered aluminum. After being properly ignited, this second mixture is mixed with portland cement to provide the final product, suitable for making concrete surfaces impervious to water.[10] United States Patent 2,434,695, granted January 20, 1948, provides for addition of a suitable proportion of $CaCl_2$, glucose, and water to portland cement to seal cracks in old concrete, and as a bonding mortar for cement blocks. By adjusting the proportion of sand to cement, greater consistency is attained, and waterproofing properties are increased.[11]

During 1948 the American Society for Testing Materials revised some of its specifications for cement—one for air-entraining portland cement (C175–48T) and one for portland blast-furnace-slag cement (C205–48T). Tentative methods of chemical analysis of portland cement (C114–48T) were revised in June 1948. The following tentative definition of the term "addition", as applied to hydraulic cements (C219–48T), was adopted by the society during 1948:

> In the manufacture of portland cement, any material, other than water and/or untreated calcium sulfate, which is interground with the clinker.

Victoria	(4)	127,971	133,407	152,763	194,777	(4)
New Zealand	226,800	229,200	237,600	229,900	219,409	247,205
Total [20]	71,188,000	53,875,000	48,812,000	73,533,000	84,565,000	97,130,000

[1] In addition to countries listed, hydraulic cement is produced in Albania, Hong Kong, Queensland, and South Australia, but data are not available.
[2] Estimate.
[3] Beginning in 1943, white cement is included.
[4] Data not available; estimate by senior author of chapter included in total.
[5] Excludes portland-cement data, which are not yet available.
[6] Slovakia only.
[7] Includes Sudetenland.
[8] Excludes Russian Zone.
[9] Bizonal area.
[10] Data represent Trianon Hungary after October 1944.
[11] January to June, inclusive.
[12] June to December, inclusive.
[13] April to December, inclusive.
[14] Data represent area designated as Free China during the period of Japanese occupation, and Manchuria.
[15] Beginning September 1947, excludes Pakistan.
[16] Production in Government-operated mines.
[17] Fiscal year ended Mar. 20 of year following that stated.
[18] South Korea only.
[19] Data revised in some instances to cover production rather than shipments.
[20] Estimated by senior author of chapter; excludes estimates for countries listed in footnote 1.

NORTH AMERICA

Canada.—Shipments of cement from the eight producing plants reached 11,936,245 barrels (valued at $21,968,909) in 1947 and totaled 14,127,123 barrels (valued at $28,264,987) in 1948. These plants—6 of which are owned by the Canada Cement Co., Ltd., and 1 each by the St. Mary's Cement Co. and the British Columbia Cement Co.—have 19 kilns. The capacity used in 1947 was 38,000 and in 1948 40,300 barrels per day. Imports of cement in 1948 amounted to 1,120,671 barrels valued at $3,995,173 compared with 1,248,625 barrels—valued at $3,843,652—in the preceding year. Atlantic Chemicals Co., Ltd., has developed plans for a plant to manufacture portland cement and sulfur dioxide. The plant will be on the Petitcodiac River, New Brunswick, and will have a single kiln with a capacity of about 1,200 barrels per day. Local anhydrite and shale will be used in the process.[13]

Mexico.—The cement market declined during part of 1947 and 1948. Shortage of funds has forestalled the active start of such public construction as dams, irrigation, and highway projects. According to one report, these factors have caused the cement prices to vary somewhat. The outlook for most of 1948 was that production and requirements would be in balance. In 1947 the distributor's price at the five plants that had been in operation a year and at the four new plants under construction was raised to 120 pesos per ton. The industry has agreed to furnish the Federal Government with up to 30 percent of its capacity output when called upon.

[13] Cement Manufacturing Industry, 1948, Department of Trade and Commerce, Dominion Bureau of Statistics, Ottawa, Canada, April 21, 1949, 5 pp.

Negotiations have been undertaken to increase the capacity of various plants, notably Cementos Hidalgo, S. C. L. (increase of 300 tons per day); Cementos Del Pacifico, S. A. (increase of 150 tons per day); Cementos Del Bajio, S. A. (increase of 100 tons per day); Cementos La Cruz Azul, S. C. L., the Lagunas unit (increase of 400 tons per day); and Cemento Mexicano Portland (increase of 300 tons per day). A new 80-ton-per-day unit of Cemento Portland Blanco de Mexico, S. A., for the manufacture of white cement has also been placed in operation.

Central America.—New plants are being planned for El Salvador, Honduras, and Guatemala. The shortage of cement supply in the latter country has occasioned the freeing of gray, white, and industrial cements from customs duties, allotted revenues tax, consular fees, and the custom-house reconstruction tax.

SOUTH AMERICA

Argentina.—The backlog of construction accumulated during the recent war has stimulated the building of a new plant and the planned extension of four other plants. The industry has returned to the use of fuel oil at cement plants. During the recent war, asphaltites, wood charcoal, petroleum coke, wood gas, and linseed oil were burned. To step up industrial expansion, imports of portland cement have been freed from customs duties and a number of handling charges. The Argentine National Economic Council has agreed to authorize the importation of 500,000 tons of cement for building up a stock against the requirements of the Five Year Plan.

Bolivia.—The local cement plant, which produced 185,000 barrels in 1946, increased production in the first half of 1947 to 103,000 barrels. The average monthly production was 17,250 barrels.

Brazil.—Two new cement plants, Belo Horizonte of the Cia de Cemento Portland and Esteio plant of Cia Brasihera di Cement Portland, started operations in 1947. The Lone Star Cement Corp., a United States firm, is planning to add a third kiln to its plant at Guaxandiba. It was expected that the new kiln will be in operation by middle of 1948.[13a]

Chile.—The Juan Soldado cement plant at La Serena has made some improvements in plant equipment designed to increase the output. The construction of the Polpaico plant of the Sociedad Minera e Industrial Polpaico, Ltda., which has an ultimate capacity of 200,000 metric tons, has gone forward. A United States firm has offered the Chilean Government a modern cement plant for $1,800,000. If accepted, the plant will be erected near lime deposits at San Jose de Maipo.

EUROPE

The backlog of essential construction work in Europe has created a great demand for cement. The lack of coal, manpower, and suitable equipment has been partly responsible for the continuing demand for this commodity. Among the chief types of cement manufactured in Europe are ordinary portland, high-early-strength, low-heat cement, and in some instances sulfate-resisting cement. Blended cements, in which blast-furnace slag is used, are also produced.

[13a] Pit and Quarry, vol. 40, No. 1, July 1947, pp. 106–107.

Belgium.—The cement industry has overcome the coal shortage to some extent by utilizing slag cements, which require less clinker and thus smaller quantities of coal for domestic consumption; portland cement is exported to obtain more foreign exchange. In 1947 the firm of Cimenteries et Briquiteries, Reunies, Belgium, was constructing a cement plant of 1,000 metric tons capacity per day, which has two 11½- by 475-foot rotary kilns. Raw grinding by open circuit and clinker grinding by closed circuit were included.

Finland.—The demand for cement in Finland is growing. The firm of Pargas Kalkbergs Aktiebolag—the largest cement-manufacturing company in Finland—has an output of about half the country's total. This company operates three kilns and is planning to install a fourth as soon as available. Coal for operating is obtained from the United Kingdom and Poland and gypsum from Cyprus and French North Africa.

Germany.—The cement industry in Germany is hampered by lack of coal of the necessary quality and of iron ore for use in the cement batch. The Hanover portland-cement plant, Teutonia A. G., has obtained premission to manufacture cement for export. The plant in 1947 was running at about 40 percent of prewar capacity, about 10,000 metric tons monthly. The output will go chiefly to Latin America.

Poland.—The total production of Polish cement plants in the first 7 months of 1948 amounted to 1,078,000 tons. Exports to Brazil, Argentina, Malaya, and the U. S. S. R. amounted to about 151,000 tons.

Spain.—Thirty-one plants produced portland cement in Spain in 1947 from 51 rotary kilns and 25 vertical kilns. The wet process is used in 26 plants. A plant with an annual capacity of 50,000 metric tons of portland cement was to be built in 1948 at Villaneuva del Rio, Seville Province. The production, distribution, and price of cement are controlled by the Government. The price in the first quarter of 1947 was 183 pesetas per metric ton, f. o. b. plant.

Sweden.—A second long kiln which increases the annual capacity 1 million barrels, has been installed at the Koping plant of the Shanke Cement Co. The total annual capacity is now 2 million barrels. The kilns were designed to burn coal but have been using oil because of the continued shortage of coal. At the present rated capacity of 2,600 barrels per day per kiln, clinker is being produced using oil with a heat utilization of 1,300 calories or 880,000 B. t. u. per barrel. The Skansa Cement Co., Malmo, Sweden, produced 936,000 tons of cement in 1947, considerably over that of the preceding year.

Switzerland.—Fifteen cement companies in Switzerland have a total maximum annual output of approximately 1,200,000 metric tons of portland cement. Coal is used as fuel, and because of the shortages of this material, efforts have been made to develop a kiln fired by electricity. The largest plant in Switzerland is the Jura-Cement-Fabriken, in Wildegg, with an annual capacity of 150,000 metric tons.

United Kingdom.—Shortages of coal and of paper bags for packaging cement have seriously retarded the cement industry in England. In turn, the cement shortage is hampering the building industry and causing unemployment. The Associated Portland Cement Manufacturers state that the industry is at liberty to export large quantities and that a target of 1½ million tons has been fixed.

According to a recent report, the combined capacity of the four plants in Scotland represents less than one-third of the normal demand. The balance of the needed cement is shipped in from England. Blast-furnace-slag cements are produced at all four plants.

ASIA

China.—The three cement plants in Formosa—(1) Suo, (2) Takao, and (3) Chikuto—are now producing 200,000 tons a year. With American technical assistance and new equipment the output is expected to reach 360,000 tons in 1949.

India.—Before August 1947 there were 24 cement plants in undivided India, with an approximate capacity of 2 million tons. In view of the present requirement of about 3 million tons per year, the Indian Government has sanctioned establishment of five new plants. Four, with an annual capacity of 150,000 tons each, will be built in Baroda, Bombay, Rewa, and Jaipur. The fifth, with an annual production of 400,000 tons, will be located in the United Provinces. Additional expansion is also projected for other plants in Bihar. Cement production in India amounted to 1.5 million long tons in the fiscal year ended March 31, 1939. For the same period ending in 1946, the output was 2 million tons, and by 1952 plans call for a cement-manufacturing capacity of 5.6 million tons.

Indonesia.—The plant of the Netherlands Indies Portland Cement Co. near Padang, Sumatra, has been found to be nearly intact, with some semiprocessed cement on hand. It is reported that one kiln, nearly 400 feet long, is capable of operating now. Other kilns will soon be operating, and the company hopes to produce 6,000 tons per month.

Iraq.—The Iraq Cement Co. is planning to build a complete cement plant on the banks of the Tigris River a few miles from Baghdad. The production capacity, using local limestone and clay and the wet process, will be about 87,000 tons per year.

Japan.—The productive capacity of the Japanese cement industry for the 1931–47 period exceeded home consumption and export demands. The designed annual capacity of the entire industry is approximately 8,000,000 metric tons. In 1947 the industry operated at about 20 to 25 percent of capacity because of shortages of coal of the required quality and lack of new parts for worn-out equipment. The major equipment items, such as kilns and raw and finish grinding mills, have been replaced, but small necessary parts, such as motors, haulageway equipment, and motor parts, were not yet available. Five types of cement are normally made—ordinary, high-early-strength, silica, slag, and nonconstructive (low-grade for floors and plastering).

The production, consumption, stocks, prices, and exports of cement in Japan and occupied areas before and during World War II were described.[14]

[14] Gwinn, G. Richards, What Has Happened to the Cement Industry in Japan?: Rock Products, vol. 51, No. 1, January 1948, pp. 108–112.

Republic of Philippines.—Cebu Portland Cement Co. is again operating at the rate of about 3,500 barrels per day. Present plans call for the addition of two kilns during 1948 to supplement the two already in use.

Turkey.—The plant at Sivas will be doubled in capacity to meet the rising demand for cement. Two new plants are planned, one at Izmir and the second at Zonguldak. The present production of 400,000 tons is insufficient to meet the 600,000 tons annual requirement.

AFRICA

Mozambique.—A new cement plant, equipped with American machinery, is planned by the Companhia de Cimentos de Mozambique. Operations are scheduled to begin this year, and the cement is intended to supply Portuguese Africa territory.

Union of South Africa.—The Union, like most other areas throughout the world, experienced a cement shortage in 1948. This condition has resulted in slowing the housing boom, and to alleviate the situation a voluntary allocation plan was worked out. There are nine plants already in the Union, but four more are under construction at Lichtenburg, Klerksdorp, Kimberley, and Port Shepstone. According to one report, cement was imported from Yugoslavia, Belgium, Poland, and Denmark to help relieve the shortage.

OCEANIA

Australia.—The Metropolitan Cement Party, Ltd., Sydney, Australia, plans to reassemble the 1,000,000-barrel-capacity River Rouge cement plant of the Ford Motor Co. in the Sydney area. The Great Barrier Reef supplies the Queensland Cement & Lime Co. with enough material to manufacture 15,000 bags of cement per day. Other raw materials used in the production of coral cement and supplied locally are aluminous clay, siliceous clays, and ironstone.

Chromium

By ROLAND D. PARKS [1]

GENERAL SUMMARY

CHROMITE imports into the United States during 1948 were at the record level of over 1.5 million short tons and exceeded consumption in all grades—chemical, refractory, and particularly metallurgical. Industry stocks improved in each group. Domestic production, though higher than in 1947, totaled only 3,619 short tons with operating mines confined to Oregon and California.

The bulk of United States chromite imports in 1948 came from the U. S. S. R., Union of South Africa, Turkey, Republic of the Philippines, Cuba, and Southern Rhodesia, listed in order of importance—unchanged from 1947.

Imports from Turkey, largely metallurgical-grade, increased markedly from 1947, as did shipments of this grade from New Caledonia, a minor source. Supplies of chemical-grade ore from the Union of South Africa—main source of this grade—continued steady. Although total imports of refractory-grade ore dropped slightly from the previous year, supplies continued steady from the principal sources—Republic of the Philippines and Cuba.

The U. S. S. R., leading world producer, again supplied one-quarter of the total expanded United States imports, largely in metallurgical-grade ore.

Among the smaller suppliers, Brazil, Cyprus, and Guatemala resumed shipments during the year, whereas none was reported from India.

Metallurgical and refractory grades of chromite remained, during the year, on the list of strategic and critical materials for which stockpiling was considered necessary. Purchases for the National Strategic Stock Pile are made by the Bureau of Federal Supply, as outlined in the 1947 chapter of this series.

Salient statistics of chromite in the United States, 1944–48, in short tons

	1944	1945	1946	1947	1948
Total supply	894,019	928,738	761,498	1,107,128	1,545,744
Imports for consumption	848,390	914,765	757,391	1,106,180	1,542,125
Domestic production	45,629	13,973	4,107	948	3,619
Consumption by industry	848,449	808,120	734,759	833,357	875,033
Exports	1,019	12,366	2,158	3,435	2,894

Total new supply of chromite available in 1948 for industry and stock piling increased 40 percent over 1947 to an all-time record with the supply of metallurgical-grade ore up over 90 percent. Supply of

[1] Consulting Mining Engineer, U. S. Bureau of Mines. Chapter prepared under supervision of Norwood B. Melcher.

chemical-grade increased 18 percent, whereas 5 percent less refractory ore was available. Total supply was 77 percent over industrial consumption for the year, with metallurgical-grade showing an excess of 129 percent, refractory, 37 percent, and chemical, 27 percent.

Consumers' stocks totaled 602,491 short tons of all grades at the end of the year; 256,770 tons were metallurgical-grade; 108,997 tons were chemical; and 236,724 tons were refractory. These industry stocks represented net gains of 34, 44, and 64 percent, respectively, from the previous year.

DOMESTIC PRODUCTION

Domestic production revived slightly in 1948 after declining uninterruptedly from the all-time peak of 160,120 short tons in 1943 to less than a thousand tons in 1947.

All of the 1948 output of 3,619 short tons was believed to have been used for metallurgical purposes. Over 80 percent of the 1948 production was made during the first half of the year but with an uptrend noted again in the fourth quarter.

William S. Robertson, operating the Oregon Chrome Mines, Inc., Selma, Josephine County, Oreg., was the largest producer. A new 700-foot haulage crosscut is reported to have been driven into the ore body at this property, some 500 feet below the surface.[2] Other producers included Lockhart & Messinger and Sam J. Wilson from their operations in Del Norte County, Calif.; Eugene Brown, O'Brien, Oreg.; and Tyrrell Transportation Co., Stockton, Calif.

Of the domestic shipments, 1,744 short tons were known to contain over 45 percent Cr_2O_3 and 1,684 tons contained between 35 and 45 percent Cr_2O_3; analysis of the balance was not reported.

Chromium Mining and Smelting Corp., Ltd., leased a War Assets Administration electric furnace plant at Mead, Wash., for production of exothermic (self-melting) chromium alloying metals, development and production of which were interrupted during the war when facilities at Sault Ste. Marie were converted to making ferrosilicon.[3] For raw material the company is drawing on domestic chromite from California and Oregon, as well as on foreign ores.

Chromite production (shipments) in the United States, 1944–48, by States in short tons, and number of producers in 1948

State	1944	1945	1946	1947	1948	
					Number of producers	Short tons
Alaska	1,845					
California	34,715	9,607	[1] 4,107	948	3	274
Montana	1,251					
Oregon	7,818	4,366	(1)		2	3,345
Total	45,629	13,973	4,107	948	5	3,619

[1] California and Oregon production combined. Bureau of Mines not at liberty to publish separate State totals for 1946.

1894	4,122	1914	662	1932	174	Total	847,719
1895	1,949	1915	3,675	1933	944		
1896	880	1916	52,679	1934	413		

[1] Production of chromite before 1880 was "about 200,000 long tons" (224,000 short tons), all from Maryland and Pennsylvania, according to Mineral Resources, 1908, pt. 1, p. 760. Most of the figures for 1880–95 represent conversion to short tons from rounded long tons.

CONSUMPTION AND USES

Consumption of chromite during 1948 increased 5 percent in total tonnage over 1947. By industries, metallurgical consumption was up 2 percent, refractory 5 percent, and chemical 11 percent for the year. Both refractory and chemical consumption was at new highs again in 1948. Metallurgical consumption, although showing steady increase since 1946, remained below the figures for 1941–45 and 29 percent below the peak war year 1943.

For 1940–48, inclusive, data for which are given in an accompanying table, the metallurgical industry has used one-half of the total tonnage consumed, refractory uses have taken one-third, and chemicals have consumed one-sixth of the total. This distribution is on a tonnage basis, without regard to the chromic oxide content of the several grades. Chemical consumption was steadier than either refractory or metallurgical during this period. Ores used for refractory purposes in 1948 averaged lower in chromic oxide content than in any recent year.

Consumption of chromite and tenor of ore used by primary consumer groups in the United States, 1940–48 in short tons

Year	Metallurgical		Refractory		Chemical		Total	
	Gross weight (short tons)	Average tenor (percent Cr_2O_3)	Gross weight (short tons)	Average tenor (percent Cr_2O_3)	Gross weight (short tons)	Average tenor (percent Cr_2O_3)	Gross weight (short tons)	Average tenor (percent Cr_2O_3)
1940	259,113	50.5	186,386	35.8	117,416	47.2	562,915	45.0
1941	402,208	50.1	270,947	34.8	127,135	46.3	800,290	44.3
1942	479,615	48.5	294,092	34.0	118,245	44.8	891,952	43.2
1943	555,259	48.5	282,178	34.0	127,163	44.7	964,600	43.8
1944	456,171	49.4	264,053	34.2	128,225	45.7	848,449	44.1
1945	429,644	49.1	252,407	34.2	126,069	45.0	808,120	43.8
1946	376,848	48.3	228,641	33.9	129,270	44.9	734,759	43.2
1947	385,983	47.4	311,018	35.2	136,356	44.7	833,357	41.1
1948	395,417	48.2	327,795	33.8	151,821	45.5	875,033	42.7

Consumption of ferrochromium in the United States in 1948 was 122,753 short tons, up 8 percent from the 1947 figure of 113,491 short tons. Companies canvassed by the Bureau of Mines use about 85 percent of the total.

Uses of chromite divide rather sharply into three main groups—metallurgical, refractory, and chemical. Each class of use calls for certain qualities in the raw material.

Specifications.—The mineral chromite does not have a fixed chemical composition. It is usually spoken of as $Cr_2O_3 \cdot FeO$ but also contains varying proportions of iron, alumina, magnesia, lime, and silica. These additional elements, while lowering the grade of the material in terms of chromium content, are essential to certain applications as may be seen from the usual trade specifications outlined below.

For metallurgical use, such as the manufacture of ferrochrome, chromite generally must contain a minimum of 48 percent Cr_2O_3, with a chromium : iron ratio of not less than 3 : 1. Further, the ore must be of hard, lumpy structure. Usual specifications call for 6-inch maximum size of piece, with not more than 10 to 15 percent through a ½-inch screen. Silica is undesirable, and combined alumina and magnesia of over 25 percent may be objectionable.

Refractory-grade chromite usually contains about 63 percent combined Cr_2O_3 and Al_2O_3, with 57 percent a common minimum. Iron and silica should be low, usually around 10 and 5 percent, respectively. Hard lump ore is desirable for making bricks, and ground material is suitable for cement. Magnesia content ranges around 15 percent.

Chemical-grade chromite should contain a minimum of 45 percent Cr_2O_3. High iron is not harmful within reasonable limits; a common chrome : iron ratio is 1.6 : 1. Silica must be less than 8 percent and sulfur low. Fines and concentrates are often preferred because they disintegrate readily in processing.

Metallurgical Uses.—The principal metallurgical use of chromite is for production of ferrochromium, the usual form in which chromium is added to the bath to make chrome alloy steels. Ferrochromium usually contains 66 to 72 percent chromium. Two grades are standard—high-carbon ferrochrome of 4 to 7 percent carbon content and low-carbon ferrochrome of less than 2 percent carbon content. Chromite is used also in the metallurgical industry to make exothermic chromium alloys, such as chrom-X, as well as chromium briquets. Chrom-X is made in both high- and low-carbon grades. Briquets are used largely in ferrous foundries. Each briquet contains 2 pounds of chromium.

Chrome alloy steel may be made in the electric furnace directly from scrap and chromite.

Chromium, when alloyed with steel, even in small proportions, improves hardness and tensile strength without serious loss of ductility. Its use permits greater depth of hardness—an advantage, for instance, in armor plate. The added strength of chrome steels favors use of lighter shapes and gages wherever reduction in weight is desirable. Stainless steel, with its corrosion resistance, is the most important of the chromium-alloy steels.

Chemical Uses.—Sodium bichromate is the primary chrome chemical from which other compounds are made. The largest consumption of chrome chemicals is in pigments; tanning and electroplating also require important quantities. Minor uses include dyeing, bleaching, alloys, and prevention of corrosion. During World War II, plating requirements expanded so rapidly that restriction of other less essential uses was needed to keep within industry capacity. Approximately 1.5 tons of chemical-grade chromite is consumed per ton of chemicals produced. High-temperature alloys are of especial interest at this time for jet engines and other applications. These alloys have a low iron content and hence are not true steels. Chromium, one of the major constituents, is introduced as pure metal in making the alloy. Any substantial increase in production of high-temperature alloys would need to be accompanied by corresponding output of chromium metal, which, in turn, uses chemical-grade chromite as the raw material.

Refractory Uses.—As a neutral refractory, resistant to different types of slag, chrome bricks and patching cement are used in lining and repairing furnaces for both ferrous and nonferrous metals.

A new refractory concrete of high strength was reported [4] to have been developed in 1948. Withstanding temperatures up to 3,100° F. with volume stability, this new chrome-base concrete may be poured in the usual manner or applied under pressure. The material is reported to be especially adaptable to construction or repair of vertical walls and arches.

PRICES

Prices of imported chromite are quoted on the long-ton basis, f. o. b. cars at eastern or southern ports with freight differentials for delivery to the west coast. Domestic shipments are sold f. o. b. nearest railroad point. Quoted prices, as shown in the accompanying table from the magazine Steel, remained steady during 1948.

Ferrochromium and chromium-metal prices rose during 1948. High-carbon ferrochromium advanced in price during the year from 18.6 to 20.5 cents per pound of contained Cr for packed lump alloy, contract. Low-carbon ferrochromium (0.06 percent carbon), on the same basis, was quoted at 26.5 cents in January 1948 and 28.75 cents a year later. Chromium metal (97 percent Cr minimum, 0.50 percent C maximum) advanced in price during the year from 93 cents to $1.03 per pound of contained Cr.

Prices of basic chrome brick, according to the magazine Steel, increased during 1948 from $59 to $69 per short ton, f. o. b. works, Baltimore, Md., or Chester, Pa.

FOREIGN TRADE [5]

Imports of chromite in 1948 increased 39 percent over 1947 to a total of 1,542,125 short tons containing 680,723 tons of Cr_2O_3; the value was $33,050,888, up 75 percent. Shipments from the Soviet Union, largest supplier, increased 49 percent from the previous year and were almost entirely of metallurgical grade. The Union of South Africa, second source, increased shipments of all grades 12 percent and provided more than four-fifths of the chemical-grade ore. Shipments from Turkey, largely metallurgical grade, increased nearly 300 percent to place Turkey third among total suppliers and second among metallurgical. The Republic of the Philippines, fourth in tonnage, was again the leading supplier of refractory ore. Cuba, fifth in total, was second in refractory grade. Imports from Cuba declined 1 percent for the year. Southern Rhodesia increased shipments (mainly metallurgical grade) 78 percent.

Imports of ferrochromium in 1948 (all from Canada) totaled 9,019 short tons, containing 4,714 tons of Cr, and were valued at $1,470,653. Exports of this product were 6,754 short tons valued at $2,371,367. Exports of chrome ore and concentrates were 2,894 short tons valued at $81,671; chromic acid exports totaled 1,580,792 pounds valued at $529,077.

[5] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Chromite imported for consumption in the United States, 1947–48, by countries and by grades

WORLD REVIEW

Australia.—The Australian Council for Scientific and Industrial Research is said to have developed a new process for extracting chromic oxide for which either low-grade chromite or the usual standard ores will serve as raw material.[6]

World production of chromite, 1941–48, by countries, in metric tons

[Compiled by B. B. Mitchell]

Country	1941	1942	1943	1944	1945	1946	1947	1948

[1] Estimate.
[2] Planned production as reported.
[3] Data not available; estimates by author of chapter included in total.
[4] Fiscal year ended March 20 of year following that stated.
[5] January to October, inclusive.
[6] Data revised in some instances to cover production rather than shipments.

Cuba.—Development work was in progress early in 1948 at the Cayoguan, Delta No. 2, and Narciso mines to aid in meeting production schedules.[7]

Cyprus.—Cyprus Chrome Co., Ltd., at present sending hand-sorted lump ore to Sweden, is installing a gravity concentrator.[8] Sorted grade as shipped is reported to run 46–48 percent Cr_2O_3 with a Cr : Fe ratio of 2.8. Ore is trucked some 14 miles from the concentrator at Kakapetria to the railroad leading to the port of Farmagustis. Annual shipments of 10,000 tons are hoped for.

[8] Engineering and Mining Journal, vol. 149, No. 1, January 1948, p. 127.

India.—Mineral policy planning in India, reportedly, is looking toward the use of chromite for domestic extraction of chromium metal and manufacture of alloys rather than for export, as heretofore.[9] Reserves of high-grade chromite are thought to be limited. The bulk of the production to date has been for refractory bricks.

Chromite reserves in Baluchistan and Kalat are reported under investigation by Pakistan authorities.[10] These deposits currently produce some 2,000 tons annually. Exchange of this chromite for iron from India is reported under consideration.

New Caledonia.—Most of the chromite produced in New Caledonia is of metallurgical grade. Output of all grades was up 48 percent from 1947, but United States imports of metallurgical in 1948, which constituted total receipts, were nearly four times the previous year's receipts of this grade. The Cr_2O_3 content of metallurgical ore received in 1948 was 53.6 percent compared with 50.8 percent in 1947.

It was reported in mid-1948 that two mines—Claudette I and Claudette II—near Coulee, were to be worked.[11]

Republic of the Philippines.—The Acoje Mining Co. began producing in June 1948 from its metallurgical chromite mine east of Santa Cruz, Zamboles.[12] Ore is being stocked for grading. The Misamis Chromite Co., Inc., began producing in July. Reserves were estimated as of January 1948 at 26,000 metric tons of positive ore with large indicated tonnage.[13] As of mid-1948, no rehabilitation work was reported in progress at Zambales Chrome Mining Co., near the Acoje mine, or at the Filipinas Mining Co. property, Zambales.

Rhodesia.—Some 300,000 tons of chromite were reported early in 1948 in stock waiting rail movement, one-half at Selukave.[14] Rhodesian deposits were described in the 1947 chapter of this series.

Rumania.—Reserves of chromite in the Turnu-Severin area, southwest Rumania, are reported at 2 to 10 million metric tons of 30 to 50 percent Cr_2O_3 content.[15]

Sierra Leone.—Sierra Leone Chrome Mines Co., Ltd., is reported to have exclusive prospecting rights to a belt extending some 70 miles northeast from Pujehun to the Gori Hills.[16] All known occurrences in Sierra Leone are stated to be in this area. Mining to date has been from a deposit some 6 miles north of Hangsha, where the grade is stated to be 43–44 percent Cr_2O_3. The ore can be beneficiated to about 50 percent Cr_2O_3, still retaining a suitable chrome : iron ratio. Inadequate rail facilities are reported to have held back shipments.

Southern Rhodesia.—Inadequate rail facilities to the port of Beira were reported early in 1948 to be the main factor preventing increase of export of chromite from Southern Rhodesia to an estimated capacity level of around 800,000 tons per year.[17]

The possibility of domestic manufacture of ferrochrome was reported under study.

Turkey.—Chromite mining in Turkey expanded rapidly in 1948. Recent changes in mining regulations are reported [18] to have encouraged private business to mine chromite. During World War II all Turkish chromite was purchased and exported by the Eti Bank, still the largest producer, and stated [19] to control two-thirds of the deposits. Exploration licenses are understood now to be convertible into concessions without the former limits on production, with the result that many chromite properties are being exploited on the basis of export contracts.

Output of the Eti Bank mines was being expanded in 1948 by installation of equipment from the United States to aid in filling reported contracts with United States importers for over 100,000 tons for delivery by mid-1949.

The port of Antalya (Adalia) was used for the first time in July to ship chromite from the Tefenni mine, Burdur. It is reported that a jig and table concentrator are being planned for beneficiating the Guleman ore. Spiral concentrators are stated to be in use at the Kavak mine to beneficiate the low-grade ore. The product is exported through the port of Izmit, mainly to Norway and Sweden.

Private chromite mines in the Islahiye district near the Syrian border are in production, at a rate estimated at 25,000 tons per year. Private production during the first quarter of 1948 was 21,762 short tons with an additional 11,347 tons from the Guleman district.[20]

Union of South Africa.—Chrome Mines of South Africa, Ltd., is reported [21] as a newly formed company combining the chromite mining activities of the Union Corp., Ltd., and the African Mining and Trust Co. (Pfy.), Ltd. This consolidation includes the Zwartkop and Tweelaagte mines, Rustenburg district and the Groothoek mine, Lydenburg district. These deposits, which are in the Transvaal, were described in the 1945 chapter of this series. A recent estimate [22] places reserves of all grades at 200,000,000 tons down to a depth of 500 feet along the dip.

Beneficiation of chromite is under investigation in South Africa. Laboratory tests as reported [23] improved the Cr_2O_3 content substantially in two of ten instances. Tests by a new method for reducing iron in chromite are said [24] to have concentrated Transvaal ore up to 58 percent Cr_2O_3 content with 3 : 1 chrome : iron ratio at low treatment cost.

Clays

By R. W. METCALF AND A. LINN[1]

GENERAL SUMMARY

GREATLY increased private and public building programs and a higher level of general business activity, particularly in steel operations, resulted in a 12-percent increase in the volume of all clay produced in 1948 and large increases in shipments of the principal types of structural clay products. Record years were achieved in five of the six chief classifications of clay discussed herein—kaolin or china clay, ball clay, fire clay, bentonite, and fuller's earth; also there was a substantial increase in the output of miscellaneous clays.

The building boom in 1948 was chiefly responsible for the 14-percent increase in output of common clays and shales (miscellaneous clays) used in heavy clay products and in cement. Common clay and shale comprised 84 percent of the clay used for heavy clay products and virtually all of that consumed in portland and other hydraulic cements.

Augmented pottery output in 1948 stimulated the ball- and china-clay industries to record heights. Major factors in the expansion of kaolin volume were sizable increases in shipments for paper coating and rubber.

Salient statistics of the clay industry in the United States, 1947–48

	1947		1948	
	Short tons	Value	Short tons	Value
Domestic clay sold or used by producers:				
Kaolin or china clay	1,425,106	$17,107,963	1,568,848	$19,756,738
Ball clay	269,050	2,923,760	298,979	3,342,647
Fire clay, including stoneware clay	9,038,680	26,208,602	9,849,914	29,424,034
Bentonite	763,889	5,949,586	921,560	7,136,308
Fuller's earth	329,068	4,660,614	342,081	5,273,851
Miscellaneous clays	21,773,680	17,422,962	24,746,599	20,414,694
Total sold or used by producers	33,599,473	74,273,487	37,727,981	85,348,272
Imports:				
Kaolin or china clay	82,628	1,330,001	99,930	1,650,102
Common blue and Gross Almerode	25,849	342,711	32,195	460,422
Fuller's earth	155	3,001	129	2,092
Other clay	3,768	43,450	3,687	29,454
Total imports	112,400	1,719,163	135,941	2,142,070
Exports:				
Kaolin or china clay	18,686	234,707	19,074	319,294
Fire clay	110,193	780,993	102,482	935,232
Other clay (including fuller's earth)	138,244	3,587,489	145,292	3,883,050
Total exports	267,123	4,603,189	266,848	5,137,576

[1] Figures on imports and exports complied by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Especially large sales of bentonite for use in rotary drilling mud and substantial gains in consumption as a foundry sand bond and as a filtering and decolorizing medium gave bentonite its tenth year of record-shattering production.

An increasing demand for fuller's earth as oil or grease absorbent and other uses, such as insecticides, fungicides, and rotary drilling muds, contributed to a new high in fuller's earth output, surpassing the former record established in 1930.

Stimulated by activity in the metallurgical and other high-temperature industries, and also by the demand for heavy clay products, the output of fire clay in 1948 rose to a new high for the second year in succession.

Price quotations of clay and clay products in 1948 followed the general upward trend.

Imports of kaolin or china clay and blue clay, including Gross Almerode, increased 21 and 25 percent, respectively, in 1948 compared with 1947. By far the greater part of the tonnage of both classes of clay originated in the United Kingdom (99 percent of the kaolin or china clay and 90 percent of the common blue and Gross Almerode clays). Total exports of clay remained at approximately the same level in 1948 as in 1947. Exports of kaolin or china in 1948 were slightly larger, whereas exports of fire clay decreased compared with 1947. Average export unit values rose somewhat.

CONSUMPTION AND USES

The clay-consumption data shown in the accompanying table are comparable with similar information published in Minerals Yearbooks covering the period 1944 to date. Figures relating to kaolin, ball clay, bentonite, and fuller's earth are comparable for previous years also. The fire clay and miscellaneous clay data beginning with 1944 include captive tonnage, which was not requested from the producers in earlier years. A more detailed explanation of these differences appeared in the Clays chapter of Minerals Yearbook 1944.

Clay consumed in the manufacture of heavy clay products was 10 percent greater than in 1947 and comprised 56 percent of the total tonnage. Clays used in refractories and in portland and other hydraulic cements each consumed 17 percent of the total; paper filler and coating, 2 percent; rotary drilling mud, filtering and decolorizing oils, and pottery, 1 percent each. The remainder was used for a variety of other purposes.

Many uses showed large gains in 1948 over figures reported in 1947. The proportional increases for some of the more important classifications were as follows: Rotary drilling mud, 24 percent; cement, 19 percent; paper filler and coating, 12 percent; refractories, 11 percent; filtering and decolorizing oils, 9 percent; pottery, 7 percent; and high-grade tile, 6 percent.

Clay sold or used by producers in the United States in 1948, by kinds and uses, in short tons

CHINA CLAY OR KAOLIN

In 1948 the output of china clay or kaolin for the third successive year established a new peak for the industry, reaching 1,568,848 short tons valued at $19,756,738, or 10 percent greater than in 1947, the next highest year. The accompanying chart shows the growth of kaolin output, highlighting the increasing demands of the major consuming industries.

The chief uses of kaolin in 1948 were for the manufacture of paper, 872,128 short tons (56 percent of the total sales); rubber, 176,965 tons (11 percent); refractories, 145,916 tons (9 percent); and pottery, 145,797 tons (9 percent). The remainder (15 percent) was consumed for a wide variety of purposes, including cement, high-grade tile, fertilizers, chemicals, insecticides, paint filler or extender, calcimine and linoleum. Large relative increases in consumption over 1947 were reported for pottery, 21 percent; high-grade tile, 29 percent; paper filler and coating combined, 12 percent; and cement, 36 percent. Newer uses attracting attention were fertilizers and insecticides.

Kaolin sold or used by producers in the United States, 1947–48, by States

[1] Included with "Other States."
[2] Includes States indicated by footnote 1 and Illinois, Utah, and Virginia.

Georgia produced more kaolin than any other State, again furnishing 72 percent of the total output. South Carolina was second in rank and Alabama, Florida, and North Carolina combined, third. Other States producing kaolin in 1948 were California, Illinois, Pennsylvania, Utah, and Virginia. No production was reported for Maryland in 1948. All States or groups of States for which statistics are published in the accompanying table showed small to substantial gains in output in 1948 compared with 1947.

Imports of kaolin in 1948 rose 21 percent to 99,930 short tons and were the highest since 1940. Of the 1948 total, 98,469 tons came from

United Kingdom and small tonnages each from Canada, France, and Czechoslovakia.

Exports of kaolin in 1948 rose 2 percent compared with 1947. Canada was the principal country of destination, accounting for 86 percent of the total. Small tonnages also were shipped to Mexico, several South American countries, Europe, Africa, and Asia.

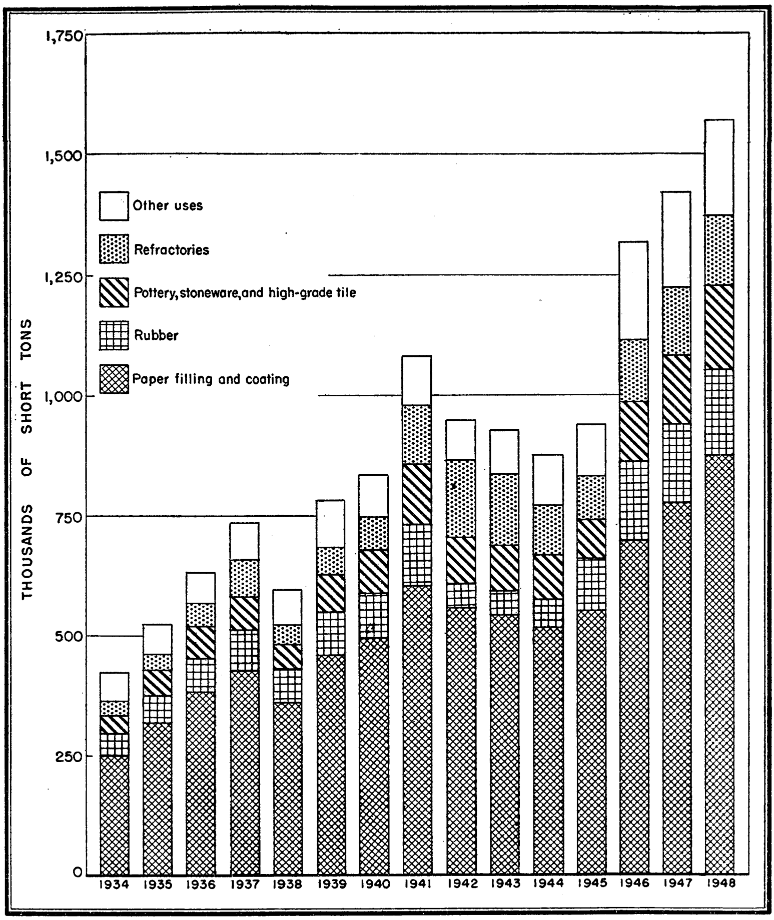

FIGURE 1.—Kaolin sold or used by domestic producers for specified uses, 1934–48.

Quotations on Georgia, South Carolina, Virginia, and North Carolina kaolins, as reported in E&MJ Metal and Mineral Markets, at the beginning of 1948 ranged from $2.50 to $3.50 per short ton for sagger clays up to $20 or $30 per ton for certain prepared grades. Beginning in July, these quotations rose to $3.50 to $4.50 for sagger clays, with increases generally of 75 cents to $1 per ton for the various other grades quoted. The higher levels remained in effect during the balance of the year. In early 1948 Florida kaolins were quoted as follows: Washed and crushed in bulk, $16.75 per ton; washed and

Georgia kaolin sold or used by producers, 1944–48, by uses

air-floated, $20.75; and air-floated enamel clay, $30 to $35. The latter grade was raised to $35 per ton in March 1948. According to Oil, Paint and Drug Reporter, imported china clay ex dock at the end of 1948 was quoted at $16 to $35 for white lump in bulk and $45 for powdered material in carlots. Powdered kaolin, ex warehouse, l. c. l., was quoted by the same source at $50 to $55 per ton. The average value per ton of domestic kaolin as reported to the Bureau of Mines by the producers in 1948 was $12.59, compared with $12 in 1947 and $10.25 in 1946.

BALL CLAY

Sales of ball clay in 1948 rose 11 percent to a new high, reaching nearly 300,000 tons (298,979 short tons). This is an increase of over 100,000 tons in 7 years. As in all of the last 5 years, Tennessee supplied the larger part of the output—173,797 tons (58 percent of the total); Kentucky furnished 103,426 tons (35 percent), or a combined total of 93 percent in 1948 for these two States compared with 91 percent in 1947. The remainder was mined in Maryland, Mississippi, and New Jersey.

Whiteware and stoneware mixtures consumed 251,229 short tons (84 percent of the total); high-grade tile, 23,842 tons (8 percent); refractories, 12,636 tons (4 percent); and paint filler, enamel, linoleum, paper filler, and other uses, the remaining 4 percent. Increases in 1948 over 1947 for whiteware mixtures and refractories were 13 and 17 percent, respectively; ball clay used in high-grade tile declined 7 percent.

Quotations on ball clay in 1948, from E&MJ Metal & Mineral Markets, were as follows: Kentucky and Tennessee crude ball clay, which ranged from $5 to $12 per short ton at the beginning of the year, were raised to $7 to $12 in February, and changed to $10 in September; air-floated and pulverized material, which ranged from $11 to $21 at the start of the year, was raised to $15.50 to $20.50 in February and changed to $19.50 to $20.50 in September and again to $19.50 in October for Tennessee clays only. Maryland ball clay, shredded, in bulk was quoted at $7 to $9 per ton throughout 1948; air-floated material, in bags, which was quoted at $17 to $21 at the beginning of the year, had a range of $14 to $17.50 after September. The average realization reported by producers to Bureau of Mines in 1948 rose to $11.18, compared with $10.87 in 1947 and $9.85 in 1946.

Imports of common blue and Gross Almerode clays in 1948 rose 25 percent in quantity and 34 percent in value compared with 1947. By far the greater portion of these receipts was unmanufactured common blue clay. The United Kingdom supplied 90 percent of the imports in this classification, Canada about 7 percent, Germany almost 3 percent, and Brazil less than half of 1 percent. Imports of Gross Almerode clays comprised about 1 percent of the combined common blue and Gross Almerode clays. Exports, if any, are not separately shown in official foreign trade returns.

FIRE CLAY

A continued heavy demand for refractories, particularly in the steel industry, and the exceptional market for new building construction again resulted in a record year in production of fire clay, which rose 9 percent over 1947 and nearly reached 1 million tons in 1948.

As above indicated, the two major uses of fire clay were in refractories and heavy clay products. They consumed 61 and 35 percent, respectively, of the total fire clay in 1948. About 1 percent each was used in high-grade tile and in chemicals, and the remainder in a wide variety of other uses. The increases in four principal classifications over 1947 were refractories, 11 percent (over 600,000 tons); heavy clay products, 7 percent (over 200,000 tons); high-grade tile, 25 percent; and chemicals, 6 percent.

Both quality and proximity to market influence the location of fire-clay operations. Thus, in 1948, Ohio was first in order of output of fire clay and supplied 28 percent of the total tonnage, followed by Pennsylvania, 19 percent of the total; Missouri, 15 percent; California, 6 percent; and Kentucky, 5 percent. The remainder (27 percent) was produced in 30 States and Alaska, which for the first time reported output of fire clay. Of the 17 principal fire-clay-producing States, 14 had a larger output in 1948 than in 1947, and 3 reported decreases.

Quotations on fire clay are not given in trade journals. However, reports from producers to the Bureau of Mines indicated that the average sales value of fire clay sold in 1948 rose to $2.90, compared with $2.77 in 1947 and $2.64 in 1946. The average value of all fire clay, including both sales and captive tonnage, was $2.99 in 1948, compared with $2.90 in 1947 and $2.63 in 1946.

Official foreign trade statistics do not show imports of fire clay separately. Exports, however, are listed and in 1948 totaled 102,482 short tons valued at $935,232, a small decrease in tonnage (7 percent) but a substantial gain in value (20 percent) compared with 1947.

The chief country of destination was Canada, which took 86 percent of the total exports. Mexico received 7 percent, and the remaining 7 percent represented small shipments to 57 destinations in North and South America, Europe, Africa, Asia, and Oceania.

[4] Includes Alaska (1948), Delaware, Idaho, Iowa, Kansas, Massachusetts, Michigan (1947), Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oregon, South Carolina, Virginia, and States indicated by footnote 2 above.

The active market for fire-clay products was reflected in the quotations for fire-clay brick during 1948. Quotations on Missouri, Kentucky, and Pennsylvania fire-clay brick, which started the year at $87 per thousand for first quality and $70 for second quality, rose in March to $92 for first quality and $73 for second quality and again in September to $100 for first-quality and $80 for second-quality brick. In the same journal, E&MJ Metal and Mineral Markets, Ohio fire brick—which at the beginning of 1948 were quoted at $64 per thousand for first quality, $56 for intermediate grade and $51 for second grade—rose in March to $67 per thousand for intermediate grade and $59 for second grade, and again in September to $74 per thousand for intermediate-grade and $66 for second-grade brick (quotations on first quality Ohio fire brick were not reported in March and subsequent months).

BENTONITE

Production of bentonite in 1948 totaled 921,560 short tons valued at $7,136,308, higher by 21 percent in tonnage and 20 percent in value than in the previous record year 1947. This industry has experienced rapid expansion. As recently as 1938, annual sales were less than 200,000 tons. Production was reported in nine States in 1948 compared with eight States in 1947.

The most important markets for bentonite in 1948, as for many years, were the foundry and petroleum industries, as a foundry-sand bond, as rotary drilling mud, and in filtering and decolorizing. These three uses combined employed 92 percent of the total bentonite sold in 1948, compared with 90 percent in 1947. The remainder was consumed for a wide variety of purposes. Compared with 1947, increases in tonnage in 1948 for filtering and decolorizing oils, foundry-sand bond, and rotary drilling mud were 17, 11, and 39 percent, respectively.

[1] Included with "Other States."
[2] Includes Arizona, California (1946), Colorado (1946 and 1948), Mississippi, Montana, Nevada (1946 and 1948), Oklahoma (1946), and Utah.

The Wyoming-South Dakota area furnished 59 percent of the total tonnage in 1948—42 percent from Wyoming and 17 percent from South Dakota. Texas supplied 3 percent and California 2 percent of the total, and the remainder was produced in Mississippi, Arizona, Utah, and Colorado.

Quotations on Wyoming bentonite throughout 1948, as given in E&MJ Metal and Mineral Markets, remained at the same levels as in the last half of 1947—dried, crushed in bulk, $8 per ton; and 200-mesh, pulverized, in 100-pound bags, $11. The average value per ton as reported by the producers to the Bureau of Mines in 1948 declined slightly to $7.74 from the $7.79 reported in 1947, which compares with $7.25 in 1946.

Imports of bentonite in 1948 were small and originated almost wholly in Mexico. Exports of bentonite are not separately shown in foreign trade statistics but are included under the blanket classification of "other clays or earths, n. s. p. f." However, various bentonite producers reported to the Bureau of Mines that in 1948 they exported 41,400 short tons, compared with about 41,000 tons in 1947. Sales were distributed widely throughout the world. They included shipments destined for Canada, Mexico, Arabia, Australia, New Zealand, South Africa, Philippines, and most of the countries in Europe and South and Central America.

The operations of a large bentonite mining and processing firm in Wyoming were described.[2] Origin, occurrence, and uses were mentioned briefly. Utilization of the blue-gray subsurface Wyoming bentonite, heretofore rejected in mining, may become possible by allowing it to oxidize, thus changing it into the form now marketed.[3] Wyoming is studying the natural resources of the State, including location of deposits and quantities available.[4]

The use of bentonite in the filtration of molten sulfur to remove impurities was described.[5] A dehydrating agent prepared from montmorillonite was reported.[6] The preparation of an expanded light-weight bentonite suitable for use as a filter medium, an insulating material, or an oil absorbent was patented.[7] Properties of ben-

tonite suitable for use in Bureau of Reclamation projects and satisfactory test procedures were determined.[8] The results of using montmorillonite as a catalyst in cracking and X-ray diffraction studies were reported.[9] The occurrence and utilization of swelling and nonswelling bentonites in Australia were described.[10]

FULLER'S EARTH

The output of fuller's earth in 1948 totaled 342,081 short tons valued at $5,273,851, an increase of 4 percent in quantity and 13 percent in value over 1947. The 1948 production was a new high and surpassed the previous record year, 1930 (335,644 tons), by 2 percent. The accompanying chart (fig. 3) shows a considerable expansion in output since 1940. Sales for filtering and decolorizing minerals, the principal use, in recent years have scarcely been holding their own, while more recently developed markets such as absorbents for oily floors and insecticides have resulted in larger over-all shipments.

Consumption of fuller's earth in mineral-oil refining in 1948 comprised 57 percent of the total production. Absorbent uses consumed 22 percent of the total output; vegetable oils and rotary drilling mud, each 7 percent; insecticides and fungicides, 5 percent; other filtering and clarifying, 2 percent; and binders, chemicals, foundries, and various other uses, less than 1 percent.

Increases in output were reported from all producing States except Texas. Texas, however, supplied 27 percent of the total output. The Georgia-Florida area produced 55 percent of the total tonnage, and Illinois 11 percent.

Fuller's earth sold or used by producers in the United States, 1946–48, by States

State	1946		1947		1948	
	Short tons	Value	Short tons	Value	Short tons	Value
Florida and Georgia	144,214	$2,100,652	168,557	$2,699,660	188,014	$3,224,169
Illinois	33,134	296,637	37,740	388,955	37,942	410,678

Total	298,752	3,702,993	329,068	4,660,614	342,081	5,273,851

[1] Includes California, Mississippi (1947–48), Nevada, Tennessee, and Utah.

Quotations on Georgia and Florida fuller's earth in 1948, according to E&MJ Metal and Mineral Markets, were as follows: 30- to 60-mesh, $14.50 per short ton; 15- to 30-mesh, $14; 200-mesh up, $10; and 100-mesh up, $7. Average realization as reported to the Bureau of Mines by producers rose in 1948 to $15.42, compared with $14.16 in 1947 and $12.39 in 1946.

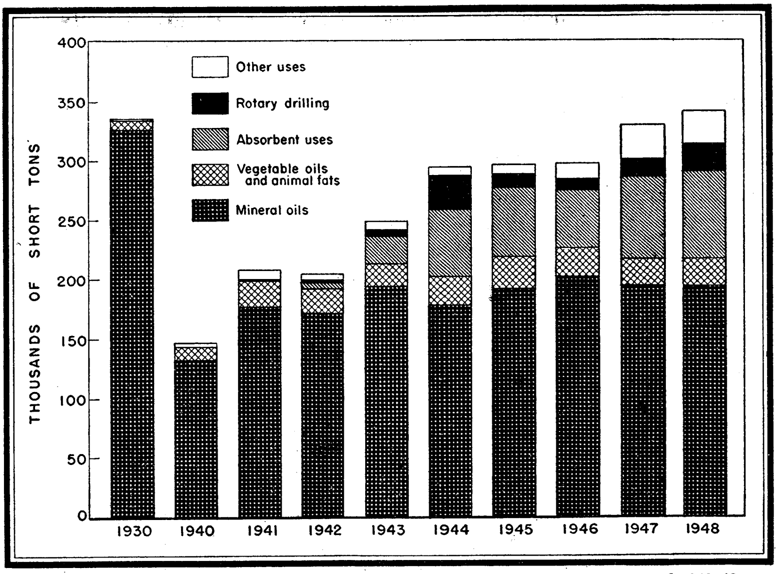

FIGURE 3.—Fuller's earth sold or used by producers for specified uses, 1930 and 1940–48

Imports of fuller's earth are small, totaling only 129 short tons in 1948. Exports are not separately reported in official foreign trade statistics. As compiled from reports by the producers to the Bureau of Mines, however, exports of fuller's earth in 1948 approximated 10,600 short tons, compared with 9,500 tons in 1947. Among the destinations reported were Canada, Venezuela, Peru, other South American countries, three or four European nations, Bahrein Island, and Saudi Arabia.

MISCELLANEOUS CLAYS

This section includes statistics for clays and shales (large tonnages of which are used in the manufacture of heavy clay products and portland cement) other than those treated in the foregoing pages. With these also are grouped comparatively minor tonnages of slip clay, oil-well drilling mud, pottery clay, and others that cannot be clearly identified as belonging to one of the types discussed separately in this chapter.

The construction boom in 1948 resulted in an increase of nearly 3,000,000 tons in output of miscellaneous clays, up 14 percent compared with 1947. The manufacture of heavy clay products consumed 71 percent of the total and cement 26 percent. Tonnages used in heavy clay products and in cement in 1948 were 11 and 19 percent, respectively, greater than in 1947.

Most of this clay or shale (96 percent in 1947 and 1948) was captive tonnage, which was mined by the manufacturing companies near their processing plants and was first marketed in the form of brick, cement, tile, or other finished products. The average value of the miscellaneous clay sold as raw or prepared clay in 1948 declined slightly to $1.89 from the $1.99 reported in 1947 and compares with $1.79 in

1946. Some of the special types of clay included under this classification, however, sold for much higher values. The value of the captive clay, largely mined by mechanized methods, was computed from individual estimates that generally are $1 or less per ton.

[1] Includes slip clay as follows—1947: Michigan, New York, and Pennsylvania, 3,051 tons, $35,122; 1948: Michigan and New York, figures cannot be shown. Purchases by cement companies of common clay and shale—1947: 431,498 tons, estimated at $365,676; 1948: 472,556 tons, estimated at $362,853.
[2] Includes the following: Common clay and shale used by producers in portland-cement manufacture—1947: 4,913,997 tons, estimated at $2,476,998; 1948: 5,888,962 tons, estimated at $3,761,284.
[3] Included with "Undistributed."
[4] Figures include Arizona, Delaware, District of Columbia, Florida, Idaho, Mississippi, Nevada, North Dakota, Puerto Rico, South Carolina, South Dakota, Vermont, Virginia, and States indicated by footnote 3.
[5] Figures include Alaska, Arizona, Delaware, District of Columbia, Florida, Idaho, Mississippi, North Dakota, Puerto Rico, South Dakota, Vermont, Virginia, and States indicated by footnote 3.

Miscellaneous clays, including the so-called common or surface clays, are of widespread occurrence, and virtually all States contribute to the national total. In 1948; States reporting a production of over 1 million tons were, in order of output: Ohio, Illinois, California, Pennsylvania, New York, Michigan, Texas, North Carolina, Georgia, and Alabama.

HEAVY CLAY PRODUCTS

With construction moving at an accelerated pace, shipments of clay products in 1948 continued to expand; the total value of the principal classes of structural products rose 22 percent to $268,000,000, compared to $219,000,000 in 1947, according to the Bureau of the Census. The active market for private houses particularly was reflected in the 16-percent increase in shipments of both common brick and floor and wall tile over 1947 levels. Shipments of vitrified clay sewer pipe and drain tile and structural and hollow facing tile all were higher in 1948 than in 1947, percentages of increase in quantity ranging from 2 percent for unglazed structural tile to 8 percent for vitrified-clay sewer pipe.

A record output of refractories during World War II years resulted from the urgent demands for military equipment and civilian goods, leading to industrial expansion, particularly in metalworking and glass industries. After the war the demand for refractories declined as industry reconverted to peacetime production and studied its future capacity requirements. As the postwar boom developed, expansion and high production became general, and demand for refractories for both maintenance and new construction increased again.

TECHNOLOGY

Lightweight clay products received a great deal of attention during the last year or two. The results of studies of the bloating characteristics of clays, shales, slates, and other materials undertaken at three experiment stations of the Bureau of Mines were published.[11] The compounds necessary to the bloating reaction (carbonates, sulfides, sulfates, and carbonaceous materials) need be present in only small percentages to be effective and may be added to a nonbloating material to produce an expanded product. A series of lightweight clay products has been developed at the University of North Carolina from combinations of clay with coal silt, sawdust, or peat.[12] Methods of testing clays for use in lightweight aggregate were reported.[13] An article on expanded clay and shale aggregate, including discussions of economics and methods of production, appeared toward the end of 1948.[14]

Interest in clay and shale deposits and their utilization is continuing, and many States and research organizations are planning investigations of their clay resources or actually have embarked upon such projects. The ceramic possibilities of Washington, Oregon, and Idaho clays were studied.[15] The clay deposits in central and northwestern Kansas [16] and in southwestern Oklahoma [17] were investigated, and

uses for clays in Texas [18] and Louisiana [19] and shales in South Carolina [20] were reported.

The large-scale research program into all phases of the clay-products industries, sponsored by the Structural Clay Products Institute, is to concentrate its activities under three main phases—end-use research, product development, and production research. Two projects under this comprehensive program have been completed and the results published—one, a study of lightweight aggregates at the University of North Carolina (mentioned elsewhere in this section) and a study of soft-mud brick manufacture at the New York State College of Ceramics.[21]

A detailed summary of recent progress in most branches of the ceramic industry was published.[22] The following ceramic fields were covered: Porcelain enamel, electrical porcelain, china tableware, glass, chemical ware, structural clay products, refractories, and sanitary ware.

Coal—Bituminous and Lignite [1]

By W. H. YOUNG, R. L. ANDERSON, and E. M. HALL

SURVEY OF THE BITUMINOUS-COAL AND LIGNITE INDUSTRY IN 1948

THE production of soft coal in 1948—an estimated output of 594,000,000 tons [2]—decreased 6 percent from the all-time record of 630,623,722 tons produced in 1947. Decreased production was due to a work stoppage in March and April and to reduced exports and domestic demand during the latter half of the year. The estimated loss of production due to strikes in 1948 was 47,000,000 tons, compared to only 19,000,000 tons in 1947, computed at the going rate of production immediately before the strikes. According to the Bureau of Labor Statistics, there were 562 strikes in soft-coal mines in 1948, with 584,000 workers involved and 9,580,000 man-days lost (an average of 16 days per man on strike).

Production.—Production was very high during the first 6 months of 1948, generally exceeding 13,000,000 tons per week, except during strikes. During the last 6 months output remained close to the 12,000,000-ton-per-week level.

Consumption.—Electric power utilities, coke ovens, and cement mills used more coal in 1948 than in 1947. The total consumption in 1948 was approximately 26,000,000 tons less than in 1947. Table 5 shows trends in consumption for the major classes of consumers.

[1] Data for 1948 are preliminary; detailed statistics with final revisions will be released later. Data for 1947 are final.

[2] Throughout this chapter, "tons" refers to net tons of 2,000 pounds, unless otherwise indicated.

Changes in Stocks.—The reserve supply of bituminous coal and lignite in the hands of industrial consumers and retail coal yards increased from 52,161,000 tons at the beginning of 1948 to 69,373,000 tons at the close. The days' supply of stocks increased from 33 to 46. Stocks on the upper Lake docks increased 1,662,758 tons from January 1 to December 31, 1948.

Mechanization.—The quantity of coal loaded mechanically at underground mines in the United States was less in 1948 than in 1947. However, the percentage mechanically loaded increased from 61 percent of the total underground output in 1947 to 63 percent in 1948. Sales of underground loading equipment, in terms of capacity, were 55 percent more in 1948 than in 1947.

Mechanical Cleaning.—The total capacity of mechanical-cleaning equipment sold for use at bituminous-coal mines in 1948 was estimated at 17,700 tons of cleaned coal per hour, an increase of 2 percent over the previous year.

Trend of Employment.—The average number of men working daily at bituminous-coal and lignite mines in 1948 increased to 435,000 men from 419,182 in 1947.

Index to Capacity.—As it is not possible for all mines to operate every working day in the year, a conservative figure of 280 days for calculating potential capacity was suggested some years ago by the coal committee of the American Institute of Mining and Metallurgical Engineers. (See Minerals Yearbook, 1935, pp. 631–632.) The average output per day worked in 1947 was 2,694,973 tons, which (if applied to 280 days) gives an annual potential output of 755,000,000 tons compared with the actual total production of 630,623,722 tons.

Trend of Fuel Efficiency.—Since 1942 there has been no definite trend in fuel efficiency for the various consuming industries. During 1948 railroads and electric public-utility power plants attained increased fuel efficiency, while coke ovens used more coal per net ton of pig iron.

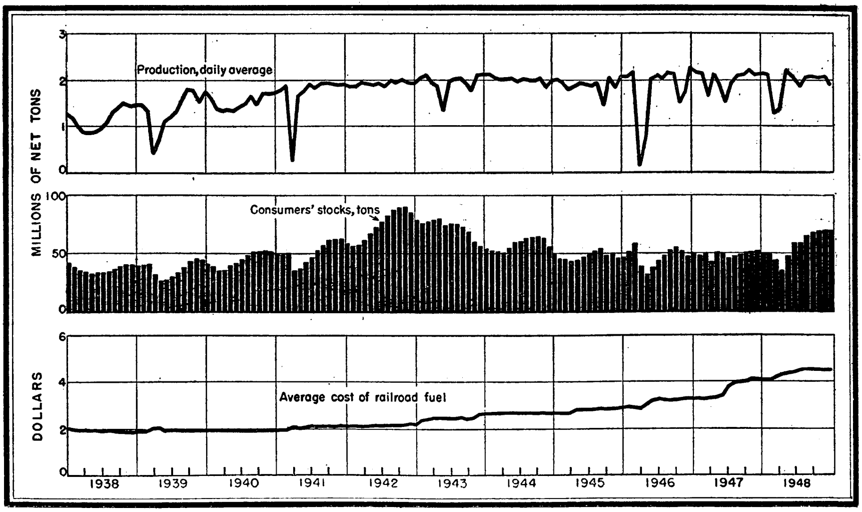

FIGURE 1.—Trends of production, stocks, and prices of bituminous coal and lignite in the United States, 1938–48.

Competition with Oil and Gas.—Soon after the close of the war, increased competition among the fuels developed, with numerous reports of conversion from coal to fuel oil and gas.

Electric power utilities consumed 11 percent more bituminous coal, 6 percent less fuel oil, and 28 percent more gas in 1948 than in 1947.

Class I railroads decreased their consumption of coal 13 percent in 1948 and their purchases of fuel oil 7 percent from 1947 purchases.

The manufacture of domestic coal-burning equipment is reflected in statistics published by the Bureau of the Census. Factory sales of domestic stokers for burning bituminous coal increased from 53,372 in 1947 to 61,359 in 1948. Shipments of domestic oil burners, boiler-burner units, and furnace-burner units decreased from 1,078,576 (revised figure) in 1947 to 392,864 in 1948.

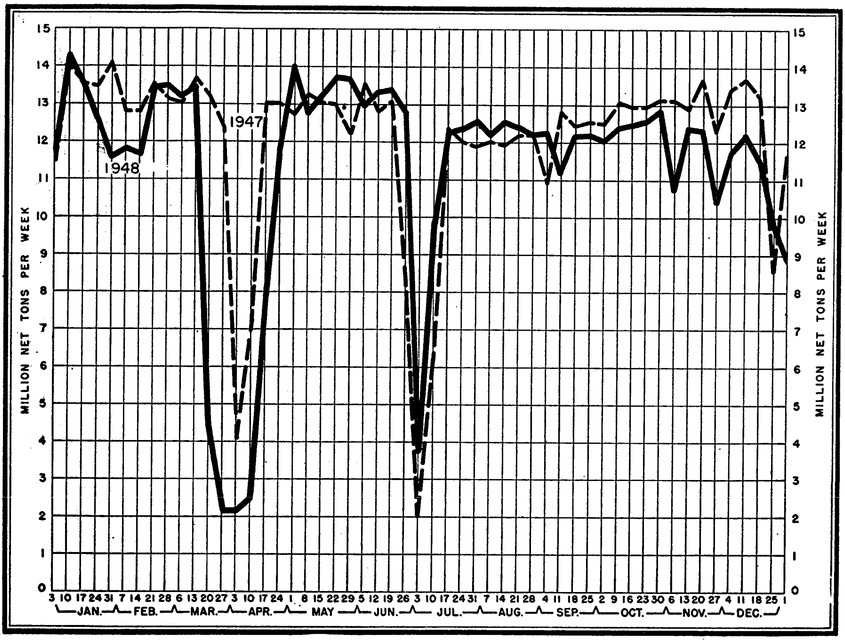

FIGURE 2.—Production of bituminous coal and lignite in the United States, by weeks, 1947–48.

SOURCES OF DATA

Bituminous-coal- and lignite-production statistics for 1948 are preliminary estimates based upon (1) weekly or monthly reports of railroad carloadings of coal and beehive coke by all the important carriers, (2) shipments by river as reported by the United States Army Engineers, (3) direct reports from a number of mining companies, and (4) monthly production statements compiled by a number of local operators' associations and State mine departments. In the estimates for 1948, allowance has been made for commercial truck shipments, local sales and colliery fuel, and small trucking or wagon mines producing 1,000 tons a year or more.

Data for 1947 are final and based upon detailed annual reports of production and mine operation furnished by the producers. As in previous years, all but a small percentage of the output was covered by the reports submitted. For the remaining output not directly reported—consisting chiefly of small mines—it has been possible to obtain reasonably accurate data from the records of the State mine departments, which have statutory authority to require such reports or, in a few instances, from railroad carloadings.

In accordance with the practice followed by the Bureau of Mines in previous years, the statistics in this report relate to mines having an output of 1,000 tons a year or more and do not attempt to include many small mines producing less than 1,000 tons a year.

These data include, for convenience and historical comparison, the small output of anthracite and semianthracite produced outside Pennsylvania and the production of lignite.

SALIENT STATISTICS

TABLE 1.—Salient statistics of the bituminous-coal and lignite industry in the United States, 1947–48

[All tonnage figures represent net tons]

	1947	1948 (preliminary)	Change in 1948
			Percent
Production	630,623,722	594,000,000	−5.8
Consumption in the United States [1]	557,243,000	531,161,000	−4.7
Stocks at end of year:			
Industrial consumers and retail yards	52,161,000	69,373,000	+33.0
Stocks on upper Lake docks	5,626,219	7,288,977	+29.6
Imports and exports: [2]			
Imports	290,141	291,337	+.4
Exports	68,666,963	45,925,325	−33.1
Price indicators (average per net ton):			*Dollars*
Average cost of railroad fuel purchased, f. o. b. mines [3]	$3.64	$4.34	+.70
Average cost of coking coal at merchant coke ovens [4]	$7.43	$8.74	+1.31
Average retail price	$12.99	$15.40	+2.41
Average railroad freight charge per net ton [5]	$2.49	$2.71	+.22
Average value, f. o. b. mines [6]	$4.16	$4.95	+.79
Underground loading machinery sold: [7]			*Percent*
Mobile loading machines (number)	485	723	+49.1
Scrapers (number)	12	17	+41.7
Conveyors, including those equipped with duckbills (units)	846	1,025	+21.2
"Mother" conveyors (units)	200	230	+15.0
Surface stripping	139,395,011	138,000,000	−1.0
Mechanically loaded underground	298,157,281	286,000,000	−4.1
Mechanically cleaned	174,435,937	175,000,000	+.3
Number of mines [8]	8,700	8,000	−8.0
Average number of days worked [8]	234	210	−10.3
Average number of men working daily [8]	419,182	435,000	+3.8
Production per man per day [8]	6.42	6.50	+1.2
Fuel-efficiency indicators:			
Pounds of coal per kilowatt-hour at electric power plants [9]	1.31	1.30	−.8
Pounds per 1,000 gross ton-miles—railroads [10]	114	111	−2.6

[1] Represents certain classes of consumers only.
[2] U. S. Department of Commerce.
[3] Interstate Commerce Commission (class I steam railways, including class I switching and terminal companies). Excludes freight charges.
[4] As reported by coke operators.
[5] Average receipts per net ton of revenue bituminous coal and lignite originated, as reported by the Interstate Commerce Commission.
[6] Average gross realization, selling cost not deducted.

[8] Based upon reports of mine operators producing 1,000 tons and over.
[9] Federal Power Commission.
[10] Interstate Commerce Commission; includes coal equivalent of fuel oil consumed.

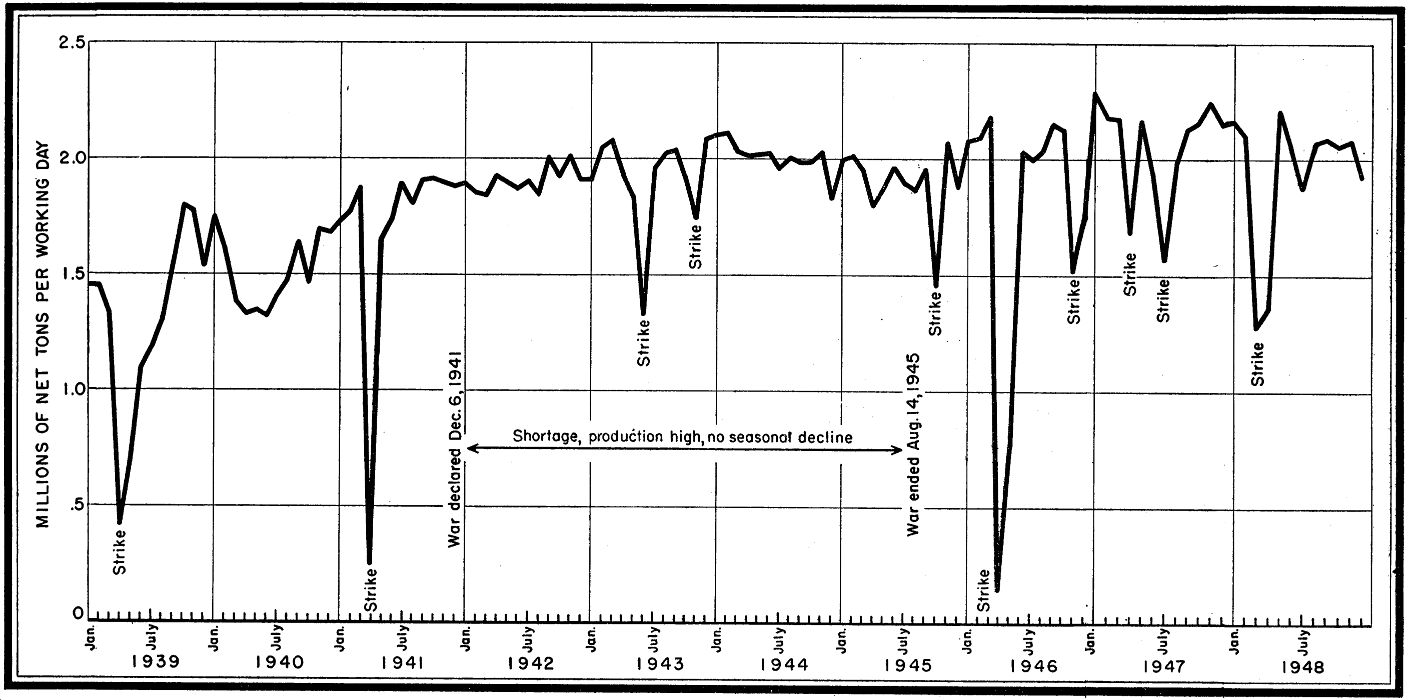

Figure 3.—Average production of bituminous coal and lignite in the United States per working day in each month, 1939–48.

PRODUCTION BY WEEKS AND MONTHS

The following tables summarize the preliminary statistics of weekly and monthly production of bituminous coal and lignite in 1948. The estimates given are based upon the latest information available and differ in some instances from the current figures previously published in the Weekly Coal Reports.

For the method used in counting holidays, see the chapter on Coal in Mineral Resources of the United States, 1930 (p. 631).

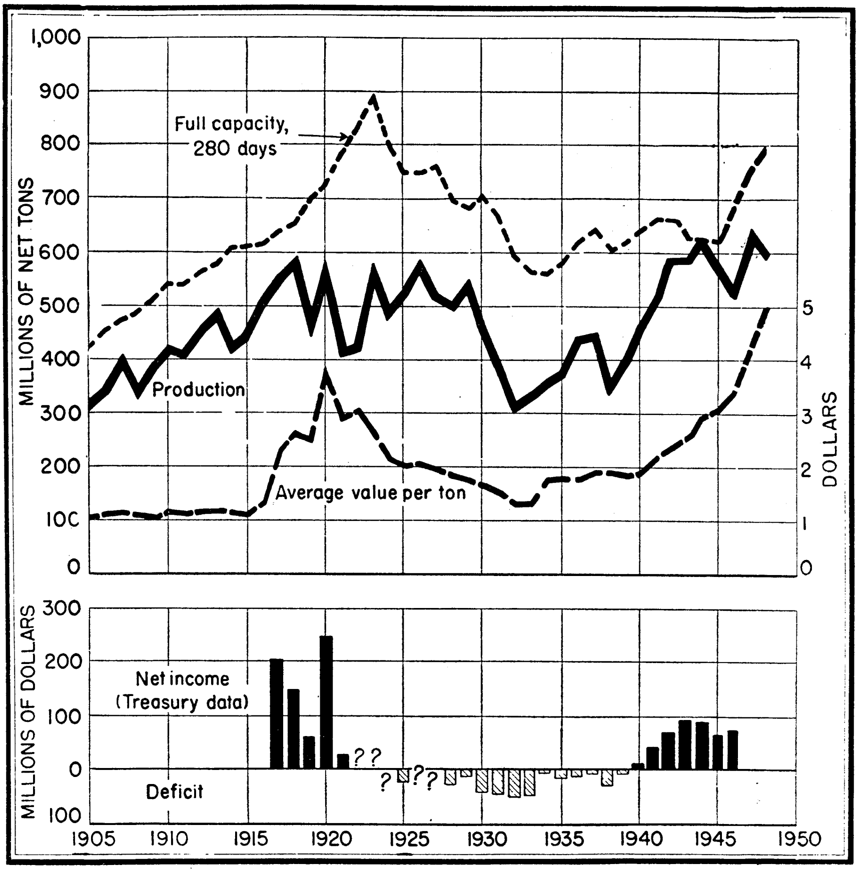

FIGURE 4.—Trends of bituminous-coal and lignite production, realization, mine capacity, and net income or deficit in the United States, 1905–48.

[1] Federal Power Commission. Represents bituminous coal and lignite consumed by public-utility power plants in power generation, including a small quantity of coke amounting to approximately 100,000 tons annually.
[2] Bureau of Census, U. S. Department of Commerce.
[3] Association of American Railroads. Represents consumption of bituminous coal and lignite by class I railways for all uses, including locomotive, powerhouse, shop, and station fuel. The Interstate Commerce Commission reports that in 1947 consumption for all uses by class I line-haul railways, plus purchases for class II and class III railways, plus purchases by all switching terminal companies combined was 112,819,388 tons of bituminous coal and lignite.
[4] Includes a small amount of anthracite.
[5] Estimates based upon reports collected from a selected list of representative manufacturing plants and retail dealers.
[6] Included in "Other industrials."
[7] Subject to revision.

FUEL EFFICIENCY

TABLE 6.—Indicators of effect of fuel economy on consumption of coal in the United States per unit of performance since the World War of 1914–18

	Pounds	Reduction from base period (percent)
Steam railroads:		
Pounds per 1,000 gross ton-miles freight service:		
Average:		
1919–20	170	
1947	114	32.9
1948	111	34.7
Pounds per passenger-train car-mile:		
Average:		
1919–20	18.5	
1947	15.9	14.1
1948	15.7	15.1
Electric public-utility power plants:		
Pounds per kilowatt-hour:		
1919	3.20	
1947	1.31	59.1
1948	1.30	59.4
Iron and Steel Plants:		
Pounds coking coal per net ton of pig: [1]		
1918	3,194	
1947	2,755	13.7
1948	2,783	12.9
Coke manufacture: Savings of heat values through recovery of gas, tar, light oils, and breeze by extension of oven coke in place of beehive, 1913–14, expressed as percent of coal used for all coke in 1948 [2]		18.7

[1] Includes only savings through higher yields of merchantable coke per ton of coal charged and lower consumption of coke per ton of iron and ferro-alloys. Excludes economies through recovery of coal-chemical materials which are covered in next item.

[2] These coal-chemical materials are used in part for boiler fuel, in part for metallurgical purposes, in part for domestic heating and cooking, and to a small extent for automotive fuel.

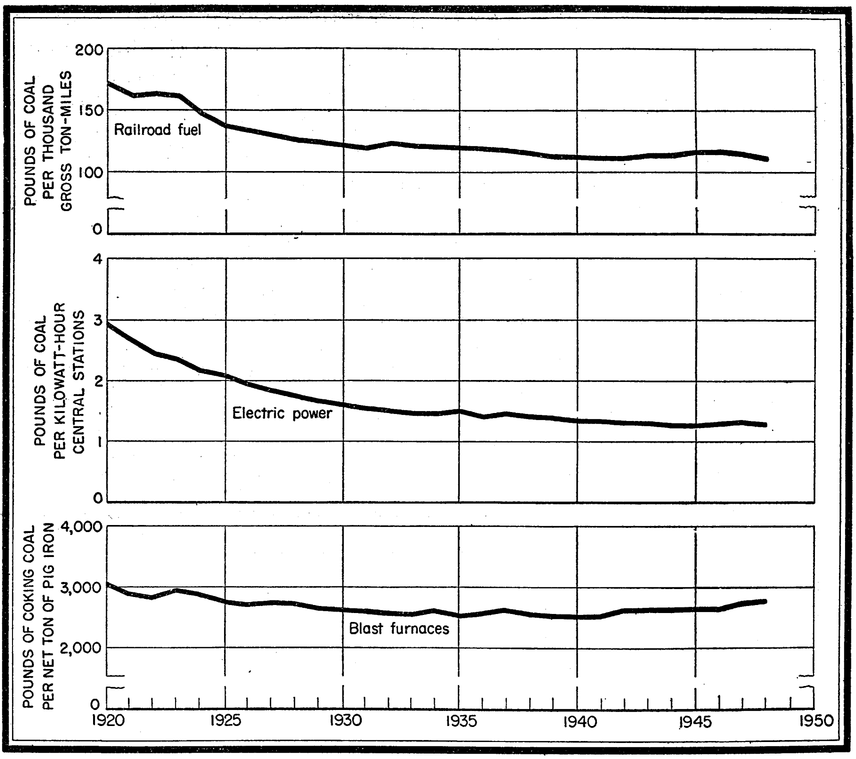

FIGURE 6.—Trends in fuel efficiency in the United States, 1920–48

RELATIVE RATE OF GROWTH OF COAL, OIL, AND WATER POWER, 1889–1948

The total supply of available energy in the form of coal, oil, natural gas, and water power in 1948 was 36,703 trillion B. t. u.—a 1.9-percent increase over 1947.

The figures are expressed in British thermal units because some common denominator is necessary for such unlike quantities as tons of coal, barrels of oil, and cubic feet of gas. Table 7 summarizes the equivalent of each of the fuels in trillions of British thermal units. Water power is represented by the equivalent fuel required to perform the same work. The table covers the years 1889 and 1899 to 1948.

In converting water power to its equivalent of fuel required to perform the same work, the *prevailing* or average performance of all fuel-burning central electric stations for each year in question has been used. This average has declined from about 7.05 pounds of coal per kilowatt-hour in 1899 to 1.3 in 1948, which shows the influence of improving fuel efficiency. The *prevailing* fuel equivalent closely approximates the quantity of fuel that would have been needed in any one year to generate the same power in a steam-electric station. It should be noted, however, that the ultimate use of the water power generated often displaces fuel burned much less efficiently than in central stations and that, in any instance, no other important branch of fuel consumption has made advances in fuel efficiency approaching that of the central stations. As these tables attempt to determine the total energy from all fuels and from water power, the ideal factor for converting water power into fuel equivalent would be the average efficiency of all forms of fuel consumption in each year. No basis for determining such an all-embracing average exists at present, but enough is known to make certain that it would show much less reduction from 1899 to 1948 than do the central stations.

The figures for oil and natural gas represent the entire production of crude petroleum and of gas. Most of this production does not come into direct competition with coal. Much of the supply of both oil and gas is used in regions of the country, such as California and portions of the Southwest, where coal is available only at unusually high cost because of heavy transportation charges. Nearly half of the natural gas is used in the field for drilling or operating oil and gas wells and pipe lines or for the manufacture of carbon black. More than half of the oil is used in the form of gasoline, kerosine, and lubricants, for which purposes coal cannot well compete, except at very much higher levels of oil prices. Even these refined products,

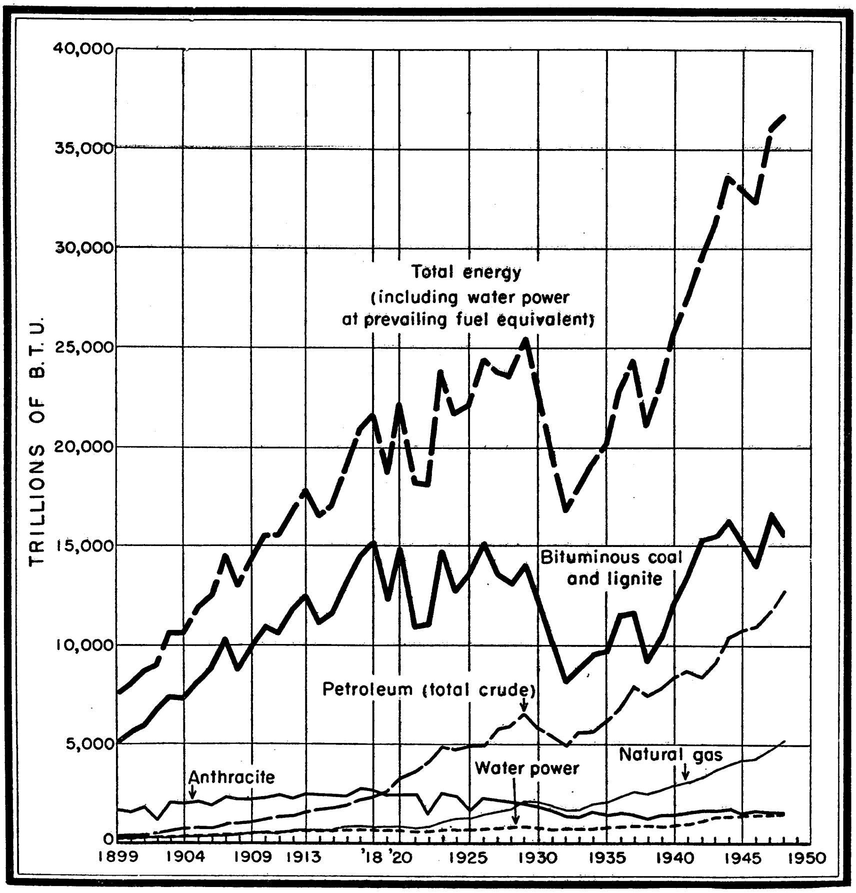

FIGURE 7.—Annual supply of energy from mineral fuels and water power in the United States, 1899–1948.

however, involve a certain measure of indirect competition with coal, for the energy market of the country is becoming more fluid and competitive, and a demand that cannot be met by one source of supply tends to fall back on the others.

The subject of interfuel competition is exceedingly complex, and an elaborate analysis and the accumulation of data not now available would be required to determine even approximately how much of any one fuel actually has been displaced either by other fuels or by water power. The present tables do not permit determination of such displacement; their purpose is rather to measure the long-time trends in the total demand for energy.

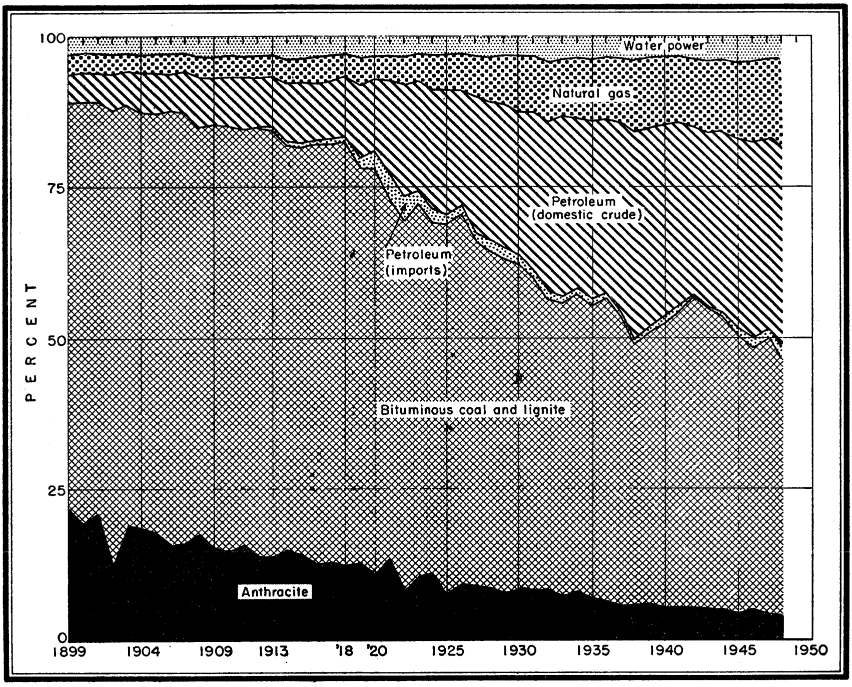

FIGURE 8.—Percentage of total British thermal units equivalent contributed by the several sources of energy in the United States, counting water power at the prevailing fuel equivalent of central stations in each year, 1899–1948.

TABLE 7.—Annual supply of energy from mineral fuels and water power in the United States, 1889 and 1899–1948, in trillions of British thermal units [1]

Year	Pennsylvania anthracite	Bituminous coal and lignite	Total coal	Petroleum (total crude) Domestic production	Petroleum (total crude) Imports	Natural gas (marketed production)	Total petroleum and natural gas	Total mineral fuels	Water power [2]	Grand total

[1] The unit heat values employed are: Anthracite, 13,600 B. t. u. per pound; bituminous coal and lignite, 13,100 B. t. u. per pound; petroleum, 6,000,000 B. t. u. per barrel; natural gas, 1,075 B. t. u. per cubic foot. Water power includes installations owned by manufacturing plants and mines, as well as Government and privately owned public utilities. The fuel equivalent of water power is calculated from the kilowatt-hours of power produced wherever available, as it is true of all public-utility plants since 1919. Otherwise, the fuel equivalent is calculated from the reported horsepower of installed water wheels, assuming a capacity factor of 20 percent for manufacturers and mines and of 40 percent for public utilities.

[2] Fuel equivalent calculated by assuming the average central-station practice for each of the years for which data are available.

[3] Data not available.

[4] Subject to revision.

TABLE 8.—Index numbers for relative rate of growth of coal, oil, and water power in the United States, 1889 and 1899–1948

[Figures are expressed as percentage of 1918 rate]

Year	Pennsylvania anthracite	Bituminous coal and lignite	Total coal	Petroleum (total crude) Domestic production	Petroleum (total crude) Imports	Natural gas (marketed production)	Total petroleum and natural gas	Total mineral fuels	Water power[1]	Grand total

FINAL BITUMINOUS-COAL AND LIGNITE STATISTICS FOR 1947

Tables 11 to 50 give the final detailed statistics of bituminous-coal- and lignite-mine operations in 1947. The subjects covered include production, number and size of mines, employment, value, mechanization, exports, and world production.

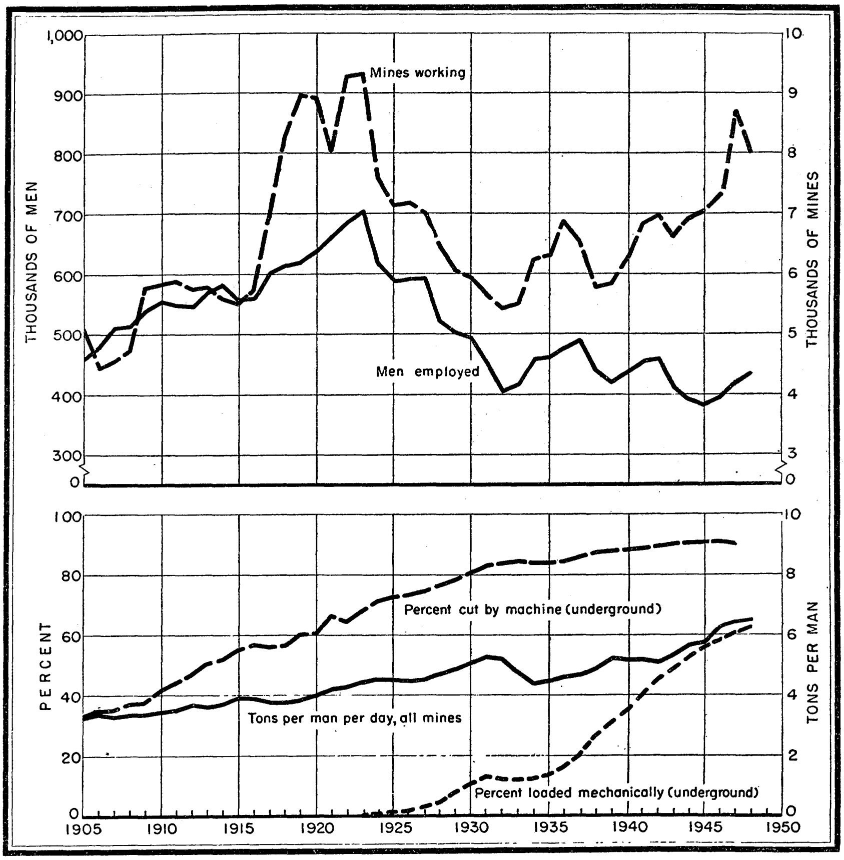

FIGURE 9.—Trends of employment, mechanization, and output per man at bituminous-coal and lignite mines in the United States, 1905–48.

TABLE 11.—Salient trends in bituminous-coal and lignite-mining industry in the United States, 1940–47

	1940	1941	1942	1943	1944	1945	1946	1947
Production:								
Loaded at mine for shipment by rail.....net tons..	380, 387, 674	425, 184, 319	482, 814, 042	495, 863, 581	527, 135, 489	490, 471, 988	450, 615, 524	527, 281, 632
Loaded at mine for shipment by water.....do....	29, 493, 058	30, 240, 489	34, 018, 025	30, 188, 093	31, 518, 334	27, 547, 679	24, 641, 533	29, 802, 779
Shipped by truck or wagon.....do....	35, 540, 476	40, 055, 638	45, 154, 432	42, 432, 667	40, 123, 023	41, 477, 428	42, 730, 884	55, 859, 262
Taken by locomotive tenders at tipple.....do....	939, 058	1, 099, 582	920, 213	779, 154	807, 679	694, 555	731, 748	
Shipped by conveyor or tram to point of consumption.do....	5, 887, 994	6, 067, 697	7, 121, 116	7, 476, 717	7, 206, 392	6, 416, 327	5, 700, 870	
Used by mine employees.....do....	2, 035, 201	1, 872, 026	2, 180, 077	2, 549, 775	2, 545, 343	2, 660, 039	2, 464, 300	17, 680, 049
Used at mines for power and heat.....do....	2, 442, 989	2, 488, 950	2, 708, 312	2, 701, 828	2, 713, 073	2, 442, 398	1, 950, 645	
Made into beehive coke at mines.....do....	4, 045, 050	7, 140, 544	7, 776, 720	8, 185, 254	7, 526, 907	5, 906, 913	5, 086, 564	
Total production.....do....	460, 771, 500	514, 149, 245	582, 692, 937	590, 177, 069	619, 576, 240	577, 617, 327	533, 922, 068	630, 623, 722
Number of active mines of commercial size:								
Class 1 (200,000 tons or more).....number..	636	730	811	855	828	753	706	801
Class 2 (100,000 to 200,000 tons).....do....	432	437	484	464	559	591	560	618
Class 3 (50,000 to 100,000 tons).....do....	371	402	445	481	540	629	637	704
Class 4 (10,000 to 50,000 tons).....do....	1, 157	1, 305	1, 492	1, 544	1, 776	1, 920	2, 016	2, 665
Class 5 (1,000 to 10,000 tons).....do....	3, 728	3, 948	3, 740	3, 276	3, 225	3, 140	3, 414	3, 912
Total number 1,000 tons and over.....do....	6, 324	6, 822	6, 972	6, 620	6, 928	7, 033	7, 333	8, 700
Average number of men employed at mines active:								
Underground.....men...	365, 013	376, 765	374, 654	326, 763	301, 461	290, 001	[1] 296, 030	[1] 311, 369
Surface:								
In strip pits.....do....	8, 983	10, 861	12, 893	16, 643	21, 035	23, 261	[1] 25, 408	[1] 29, 783
All others.....do....	65, 079	69, 355	74, 444	72, 601	70, 851	69, 838	[1] 74, 996	[1] 78, 030
Total.....do....	439, 075	456, 981	461, 991	416, 007	393, 347	383, 100	[1] 396, 434	[1] 419, 182
Average number of days mines operated.....	202	216	246	264	278	261	214	234
Capacity of active mines with existing labor force:								
Per year of 308 days.....net tons..	703, 000, 000	733, 000, 000	730, 000, 000	689, 000, 000	686, 000, 000	682, 000, 000	768, 000, 000	830, 000, 000
Per year of 280 days.....do....	639, 000, 000	666, 000, 000	663, 000, 000	626, 000, 000	624, 000, 000	620, 000, 000	699, 000, 000	755, 000, 000
Per year of 261 days.....do....	595, 000, 000	621, 000, 000	618, 000, 000	583, 000, 000	582, 000, 000	578, 000, 000	651, 000, 000	703, 000, 000
Output per man per day.....do....	5. 19	5. 20	5. 12	5. 38	5. 67	5. 78	6. 30	6. 42
Output per man per year.....do....	1, 049	1, 125	1, 261	1, 419	1, 575	1, 508	1, 347	1, 504
Underground output cut by machine.....do....	369, 227, 277	408, 510, 296	462, 344, 719	461, 051, 743	469, 458, 349	424, 726, 432	382, 133, 540	442, 101, 535
Percent of underground output cut by machine.....	88. 4	89. 0	89. 7	90. 3	90. 5	90. 8	90. 8	90. 0
Underground output mechanically loaded.....net tons..	147, 870, 252	186, 667, 250	232, 902, 920	249, 805, 214	274, 189, 132	262, 512, 729	245, 340, 768	298, 157, 281
Percent of underground output mechanically loaded.....	35. 4	40. 7	45. 2	48. 9	52. 9	56. 1	58. 4	60. 7
Quantity mined by stripping.....net tons..	43, 167, 336	55, 071, 609	67, 202, 663	79, 685, 175	100, 898, 376	109, 986, 865	112, 963, 717	139, 395, 011
Percent mined by stripping.....	9. 4	10. 7	11. 5	13. 5	16. 3	19. 0	21. 1	22. 1
Quantity cleaned by wet or pneumatic process [2].....net tons..	102, 269, 753	117, 539, 522	142, 187, 346	145, 575, 849	158, 727, 129	147, 885, 936	138, 669, 837	174, 435, 937
Percent cleaned by wet or pneumatic process [2].....	22. 2	22. 9	24. 4	24. 7	25. 6	25. 6	26. 0	27. 7

[1] Average number of men working daily.

[2] Includes central washeries operated by consumers.

TABLE 12.—Coal produced in the United States, by States, 1937–47 with production of maximum year and cumulative production from earliest record to end of 1947, in thousands of net tons

State	Maximum production		Production by years											Total production from earliest record to end of 1947
	Year	Quantity	1937	1938	1939	1940	1941	1942	1943	1944	1945	1946	1947

[2] Data not available.
[4] Percentages for 1890 to 1913, inclusive, are of total production, as a separation of strip-mine and underground production is not available for those years.
[5] For 1906 to 1926, inclusive, these percentages are exclusive of coal cleaned at central washeries operated by consumers; after 1926, when data became available on the tonnage cleaned by consumer-operated plants, the percentages include the total tons cleaned at the mines and at consumer-operated washeries.
[6] One-half day or less.

TABLE 14.—Growth of strip mining at bituminous-coal and lignite-mines in the United States, 1914–47

Year	Production (thousands of net tons)			Percent of total production mined by stripping	Average tons per man per day			Average value per ton, f. o. b.			Number of strip mines	Number of power shovels and draglines

[1] Includes power strip pits proper and excludes horse stripping operations and mines combining stripping and underground in the same operation for the years 1914–42, inclusive. The years 1943–47, inclusive, include data on all strip mines.
[2] Computed by deducting "Strip mines" data from "Total all mines."
[3] Data not available.
[4] Exclusive of horse stripping operations.

TABLE 15.—Growth of mechanical loading at underground bituminous-coal and lignite mines in the United States, 1923–47

[Production in thousands of net tons]

Year	Underground production mechanically loaded								Total underground production	Percent of underground production mechanically loaded	Number of mechanical loading units in actual use					
	Loaded by machines				Handled by conveyors			Total mechanically loaded								
	Mobile loading machines	Scrapers	Conveyors equipped with duckbills or other self-loading heads	Total	Pit-car loaders	Hand loaded conveyors	Total				Mobile loading machines	Scrapers	Conveyors equipped with duckbills or other self-loading heads	Pit-car loaders	Hand loaded conveyors	Total all types

Grand total	8,700	508,306,904	48,777,507	55,859,262	17,680,049	630,623,722	4.16	311,369	29,783	78,030	419,182	234	98,297,424	6.42

[1] Includes coal used by mine employees, taken by locomotive tenders at tipple, used at mine for power and heat, coal transported from mine to point of use by conveyor or tram, coal made into beehive coke at mine and all other uses at mine.

[2] Value received or charged for coal f. o. b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked [not coke] as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

PRODUCTION BY WEEKS AND MONTHS

TABLE 17.—Bituminous-coal and lignite production (final figures) in the United States in 1947, with estimates by weeks

Week ended—	Production (net tons)	Number of working days	Average production per working day (net tons)	Week ended—	Production (net tons)	Number of working days	Average production per working day (net tons)

July 12	6, 262, 000	6	1, 044, 000				

[1] Figures represent output and number of working days in that part of week included in the calendar year shown. Total production for the week ended Jan. 4, 1947, was 11,661,000 net tons; week ended Jan. 3, 1948, 11,689,000 net tons.
[2] Average daily production for entire week and not for working days in calendar year shown.

TABLE 18.—Bituminous-coal and lignite production (final figures) in the United States in 1947, with estimates by months

Month	1947			Month	1947

July	40, 647, 000	26	1, 563, 000	Total	630, 624, 000	306. 4	2, 058, 000

TABLE 19.—Coal production in the United States, in 1947, by States (final figures), with estimates by months, in thousands of net tons

[Totals for year are based on final complete returns from all operators known to have produced 1,000 tons and over per year. Apportionment of known yearly total among the 12 months is based upon best information available; in some States upon direct tonnage reports by operators to State mine departments; in most cases upon current records of railway carloadings and waterway shipments]

State	January	February	March	April	May	June	July	August	September	October	November	December	Total

TABLE 21.—Bituminous coal and lignite loaded for shipment by railroads and waterways in the United States, as reported by mine operators, in net tons, in 1947 [1]—Continued

Route	State	Net tons	
		By State	Total for route
WATERWAYS—continued			
Monongahela River	Pennsylvania	23,215,118	24,717,214
	West Virginia	1,502,096	
Ohio River	Kentucky	322,835	877,610
	Ohio	193,150	
	West Virginia	361,625	
Tennessee River	Tennessee	52,496	52,496
Youghiogheny River	Pennsylvania	20,640	20,640
Total waterway shipments		29,802,779	29,802,779
Total loaded at mines for shipment by railroads and waterways.		557,084,411	557,084,411
Shipped by truck		55,859,262	55,859,262
Used at mine [2]		17,680,049	17,680,049
Total production, 1947		630,623,722	630,623,722

[1] Includes coal loaded at mine directly into railroad cars or river barges, hauled by truck to railroad siding for shipment by rail, and hauled by truck to waterway for shipment by water. In general, figures show the quantity of bituminous coal and lignite originated for each railroad and waterway as reported by mine operators. It must be noted that in one year an operator may report coal loaded on subsidiary railroad and in another year same operator may report coal loaded on the parent railroad system.

[2] Includes coal used by mine employees, taken by locomotive tenders at tipple, used at mine for power and heat, transported from mine to point of use by conveyor or tram, made into beehive coke at mine, and all other uses at mine.

METHODS OF RECOVERY

TABLE 22.—Bituminous coal and lignite mined by different methods in the United States, by States, in 1947

State	From underground workings							From strip pits		Grand total production (net tons)
	Mined by hand		Shot from solid		Cut by machines		Total underground (net tons)	Net tons	Percent of grand total	
	Net tons	Percent of total underground	Net tons	Percent of total underground	Net tons	Percent of total underground

MINING METHODS

Figure 10 shows the percentage of total production of bituminous coal and lignite, by methods of mining and underground loading in the United States, 1938–47. Data are based on total production of mines and are not comparable with the percentage of underground production mechanically loaded, as given in table 13.

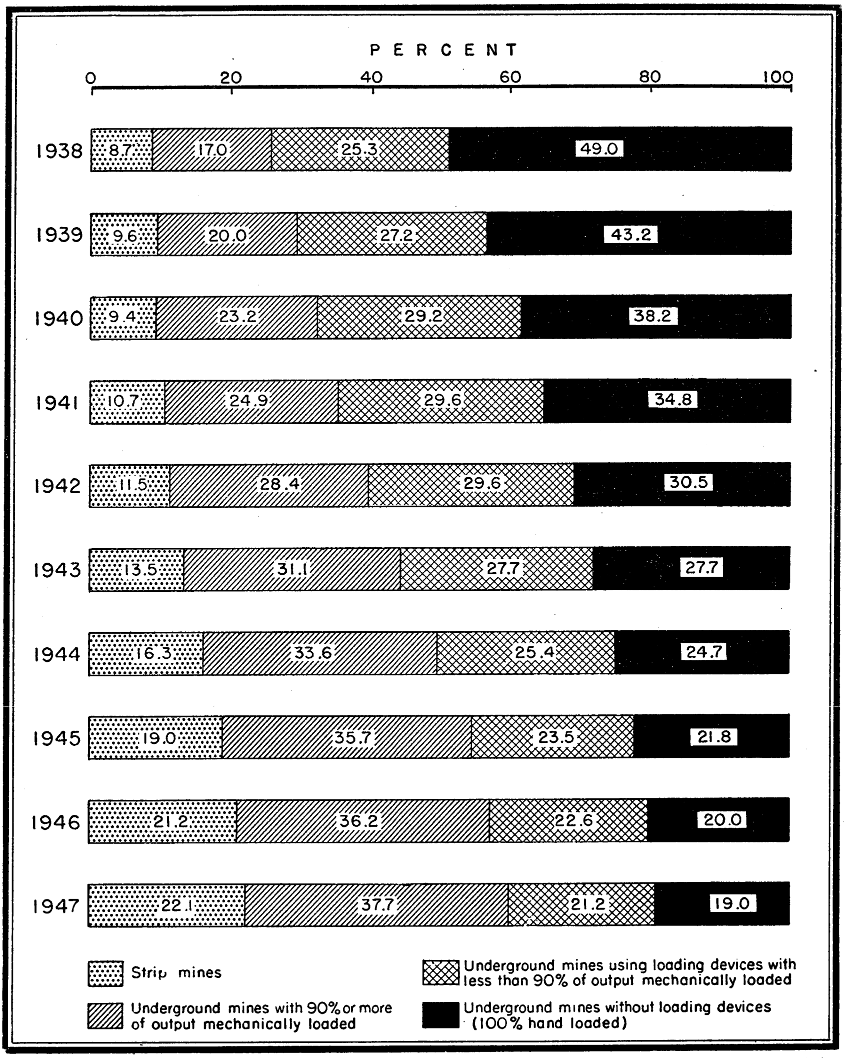

FIGURE 10.—Percentage of bituminous coal and lignite produced in the United States, by methods of mining and underground loading, 1938–47

MECHANICAL LOADING

Bituminous coal and lignite mechanically loaded in underground mines amounted to 298,157,281 tons in 1947, or 61 percent of the total underground output.

Mechanical loading equipment used in underground bituminous-coal and lignite mines is divided into two types: Devices that virtually eliminate hand shoveling (known as mobile loaders, scrapers, and self-loading conveyors) and those that greatly reduce the labor in hand shoveling (known as hand-loaded face conveyors and pit-car loaders). Devices in the first category are designated as "machines" and those in the second category as "conveyors."

Sales of Mechanical Loading Equipment in 1948.—The estimated capacity of mechanical loading equipment sold for underground use in all coal mines was 55 percent greater in 1948 than in 1947. Table 26 shows the sales reported to bituminous-coal and lignite operators, by type of equipment, and the number of manufacturers reporting for 1941–48.

Sales of conveyors to bituminous-coal and lignite mines in 1948 totaled 1,025 units. The figures for 1942–48 exclude duckbills, which were included in all previous years. Therefore, these sales are not comparable with those for 1941 or earlier years.

The number of mobile loaders, scrapers, and conveyors shipped into various States in 1948 and the number of units in actual use in 1947 are shown in table 28.

Statistics on Mechanical Loading in Bituminous-Coal and Lignite Mines.—More than three-fourths of the underground, mechanically loaded tonnage was handled by mobile loaders in 1947. Table 29 shows the tonnage and percentage handled by each type of equipment in 1946 and 1947.

During 1947, in underground bituminous-coal and lignite mines, 3,569 mobile loaders handled 229,836,006 tons, an average of 64,398 tons per mobile loader per year; self-loading conveyors averaged 14,318; scrapers, 12,748; hand-loaded face conveyors, 11,358; and pit-car loaders, 4,966 per year per unit for the same period.

Mechanical Loading by States.—West Virginia has been the leading producer of mechanically loaded coal since 1939. During 1947 West Virginia produced 99,749,277 tons of mechanically loaded coal, followed by Pennsylvania with 55,387,355, Illinois with 44,402,843, Kentucky with 30,325,756, and Ohio with 14,469,873. These five States produced 82 percent of the total output of underground, mechanically loaded bituminous coal in the United States in 1947.

Detailed data, by States, on the number of mines and machines and the production of mechanically loaded coal compared with the total production at mines using mechanical loading devices are given in table 30. Comparative changes in underground mechanical loading in 1946–47, by States, are shown in table 31.

Table 32 shows bituminous-coal and lignite tonnage mined by stripping compared with underground hand-loaded and machine-loaded tonnage, as well as productivity at strip and underground mines, by States, for 1947.

TABLE 26.—Units of mechanical loading equipment sold to bituminous-coal and lignite mines for underground use in the United States, as reported by manufacturers, 1941–48

	1941	1942	1943	1944	1945	1946	1947	1948	Change 1948 from 1947 (percent)
Type of equipment:

MECHANICAL CLEANING

Bituminous coal mechanically cleaned in 1947 amounted to 174,435,-937 tons, or 28 percent of the total output.

Mechanical cleaning by wet methods include jigs, concentrating tables, classifiers, launders, dense-medium processes, and any combinations of these five methods.

Pneumatic methods of coal cleaning include air tables, air flow, air sand, and any combination of these three methods.

Tables 33, 34, 37, and 38 include mechanical cleaning data on all coal mined in the United States except Pennsylvania anthracite. Tables 35 and 36 are on the same basis but do not include consumer-operated plants. There are no mechanical cleaning plants at lignite mines.

Consumer-operated plants include plants owned by steel companies which receive coal from various mines (but usually from affiliated companies), clean it, and then consume it directly at the plant.

Table 33 compares bituminous coal cleaned in 1944–47 by method of cleaning. Both wet and pneumatic methods increased in 1947 over 1946.

Mechanical Cleaning, by Types of Equipment.—The tonnage of bituminous coal cleaned by wet methods was 156,083,452 tons in 1947—an increase of 28 percent over 1946. The quantity cleaned by pneumatic methods was 18,352,485 tons—an increase of more than 10 percent.

Table 34 compares the number of cleaning plants and the tons of cleaned coal, by types of equipment, for 1946 and 1947. During 1947, 440 wet-washing and 84 pneumatic cleaning plants were in operation. Sixty-three tipples used both wet and dry methods at the same plant; deducting these duplications gives a net total of 461 plants that cleaned coal in 1947, an increase of 16 plants over 1946.

Mines served by cleaning plants, exclusive of those that ship to washeries operated by steel companies, produced 244,511,541 tons or 39 percent of the total bituminous output in 1947. In this same group of mines, 164,310,898 tons were mechanically cleaned; therefore 67 percent of the coal produced at mines with cleaning plants in 1947 was cleaned at the mine. The remainder of the output from these mines (33 percent) presumably represents the larger sizes commonly picked by hand. (See tables 36 and 38.)

Relation Between Raw Coal, Clean Coal, and Refuse.—For every 100 tons of raw coal cleaned during 1947 at the mines, 84 tons of clean, merchantable coal, on an average, were obtained and 16 tons of refuse discarded. Table 38 shows the total production of mines with cleaning plants and results of cleaning operations, by States.

Methods of Mining at Mines Served by Cleaning Plants.—Underground mechanical loading appears to be closely related to mechanical cleaning. Underground coal loaded mechanically in 1947 totaled 298,157,281 tons, of which 158,507,079 tons (53 percent) passed through tipples equipped with mechanical cleaning devices. Production of coal from strip mines in 1947 was 139,395,011 tons, of which 42,016,524 tons (30 percent) came from strip mines having mechanical cleaning tipples. Hand-loaded underground coal production in 1947 totaled 193,071,430 tons of which 23 percent passed through tipples equipped with cleaning plants. (See tables 32 and 36.)

TABLE 33.—Bituminous coal mechanically cleaned by wet and pneumatic methods, in the United States, in net tons of clean coal, 1944–47

Method of cleaning	1944	1945	1946	1947	Change 1947 from 1946 (percent)
By wet methods:					
At mines	128,390,547	121,418,585	115,120,292	145,958,413	+26.8
At consumer-operated cleaning plants	10,272,142	9,051,154	6,938,347	10,125,039	+45.9
Total wet methods	138,662,689	130,469,739	122,058,639	156,083,452	+27.9
By pneumatic methods	20,064,440	17,416,197	16,611,198	18,352,485	+10.5
Grand total	158,727,129	147,885,936	138,669,837	174,435,937	+25.8

TABLE 34.—Bituminous coal cleaned in the United States, by types of equipment in actual operation, 1946–47

[Coal cleaned and plants operated by consumers at central washeries in Colorado and Pennsylvania included]

Type of equipment	Plants in operation		Net tons of clean coal		Cleaned by each type (percent of total)	
	1946	1947	1946	1947	1946	1947
Wet methods:						
Jigs	226	234	64,702,238	85,931,353	46.7	49.3
Concentrating tables	10	9	1,447,200	2,980,368	1.0	1.7
Classifiers	68	67	13,883,088	14,647,771	10.0	8.4
Launders	18	19	16,020,328	17,902,394	11.6	10.3
Dense-Media	59	70	14,172,428	17,702,322	10.2	10.1
Jigs and concentrating tables	14	14	3,776,190	4,302,422	2.7	2.5
Other combinations of methods 1, 2, 3, 4, and 5	21	27	8,057,167	12,616,822	5.8	7.2
Total wet methods	416	440	122,058,639	156,083,452	88.0	89.5
Pneumatic methods	88	84	16,611,198	18,352,485	12.0	10.5
Grand total	[1] 504	[1] 524	138,669,837	174,435,937	100.0	100.0

[1] Number of plants using both wet and pneumatic methods was 59 in 1946 and 63 in 1947.

TABLE 35.—Total production of all coal at bituminous mines in the United States having cleaning plants, in net tons, 1946–47

[Does not include any estimate for mines that may ship to consumer-operated plants]

Type of equipment	1946	1947	Change 1947 from 1946 (percent)
Wet methods:			
Jigs	98, 228, 966	123, 267, 688	+25. 5
Concentrating tables	884, 813	945, 919	+6. 9
Classifiers	29, 727, 885	33, 176, 301	+11. 6
Launders	14, 978, 052	19, 721, 354	+31. 7
Dense-Media	29, 329, 451	34, 901, 017	+19. 0
Jigs and concentrating tables	4, 137, 840	4, 697, 185	+13. 5
Other combinations of methods 1, 2, 3, 4, and 5	12, 566, 806	17, 953, 150	+42. 9
Total wet methods	189, 853, 813	234, 662, 614	+23. 6
Pneumatic methods	52, 939, 443	59, 917, 199	+13. 2
Grand total	242, 793, 256	294, 579, 813	+21. 3
Less duplications [1]	42, 519, 334	50, 068, 272	+17. 8
Net total	200, 273, 922	244, 511, 541	+22. 1
United States, total production [2]	533, 922, 068	630, 623, 722	+18. 1
Percent produced at mines having cleaning plants	37. 5	38. 8	

[1] Mines using both wet and pneumatic methods.
[2] For purposes of historical comparison and statistical convenience, the figures include the output of lignite and of anthracite and semianthracite outside of Pennsylvania. There are no mechanical cleaning plants at lignite mines.

TABLE 36.—Method of mining at bituminous-coal mines in the United States served by cleaning plants, 1944–47

[Does not include any estimate for mines that may ship to consumer-operated plants]

Method of mining in use	Total net tons produced from mines that move coal to cleaning plants				Change 1947 from 1946 (percent)
	1944	1945	1946	1947	
Mined from strip pits	32, 444, 227	35, 910, 050	33, 221, 819	42, 016, 524	+26. 5
Mechanically loaded underground	137, 926, 900	129, 733, 226	125, 521, 189	158, 507, 079	+26. 3
Hand-loaded underground	62, 564, 653	48, 614, 794	41, 530, 914	43, 987, 938	+5. 9
Total	232, 935, 780	214, 258, 070	200, 273, 922	244, 511, 541	+22. 1

TABLE 37.—Bituminous coal mechanically cleaned by wet and pneumatic methods in the United States, by States, 1946–47

[Coal cleaned and plants operated by consumers at central washeries in Colorado and Pennsylvania included]

State	Plants in operation		Net tons of clean coal		Output mechanically cleaned (percent)	
	1946	1947	1946	1947	1946	1947

Washington	1,209,200	954,734	254,466	21.0	1,015,285
West Virginia [3]	46,723,648	41,227,011	5,496,637	11.8	71,451,156
Total at mines only [4]	195,342,931	164,310,898	31,032,033	15.9	244,511,541
Consumer plants [5]	11,277,037	10,125,039	1,151,998	10.2	----------
Grand total 1947	206,619,968	174,435,937	32,184,031	15.6	----------

[1] In Alabama (for example) for every 100 tons of raw coal cleaned in 1947, an average of 25.6 tons of refuse was discarded and 74.4 tons of clean marketable coal was obtained.
[2] Includes some coal mined in Pennsylvania and cleaned in Ohio.
[3] Includes some coal mined in West Virginia and cleaned in Ohio and Pennsylvania.
[4] Includes all mechanical cleaning other than washeries operated by consumer steel companies.
[5] Includes central washeries in Colorado and Pennsylvania operated by consumer steel companies.

DETAILED STATISTICS, BY STATES AND COUNTIES

Detailed production and employment statistics are given in table 39 for each coal-producing county in the United States from which three or more operators submitted reports for 1947. Statistics on counties with less than three reporting producers have been combined with data for other counties in the same State to avoid disclosing individual figures, unless the operators have granted permission to publish them separately. Production of mines on the border between two States has been credited to the State from which the coal was extracted rather than to that in which the tipple was situated. If the coal is mined from lands in both States, the tonnage has been apportioned accordingly.

The data in the present report, as in those published for many years by the Bureau of Mines, relate only to mines with an annual output of 1,000 tons or more. That fact should be borne in mind when the statistics in this report are compared with similar data compiled by State mine departments. Differences arise largely from variations in coverage by State reports, some of which include data for all mines regardless of size, and others only data for mines employing more than a specified minimum number, ranging from 2 to 10 men.

Because of a change in method of reporting, beginning with 1946, statistics of average production per man per day are not precisely comparable with those for other years. The figures since 1946 were based on the average number of men working daily, while the figures for previous years were based on the average number of men on the rolls per pay period.

TABLE 39.—Production, value, employment, days active, man-days, and output per man per day at bituminous-coal and lignite mines in the United States, by States and counties, in 1947

[Exclusive of mines producing less than 1,000 tons]

County	Production (net tons)				Average value per ton [3]	Average number of men working daily				Average number of days mines were active	Number of man-days worked	Average tons per man per day
	Shipped by rail or water [1]	Shipped by truck	Used at mine [2]	Total		Underground	Surface		Total

[1] Includes coal loaded at mine directly into railroad cars or river barges, hauled by truck to railroad siding for shipment by rail, and hauled by truck to waterway for shipment by water.

[2] Includes coal used by mine employees, taken by locomotive tenders at tipple, used at mine for power and heat, coal transported from mine to point of use by conveyor or tram, coal made into beehive coke at mine and all other uses at mine.

[3] Value received or charged for coal, f. o. b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked [not coke] as estimated by producer at average prices that might have been received if such coal had been sold commercially.)

[4] Output obtained chiefly from strip pits and by use of mechanical loading devices in which type of operation production per man per day is large.

[5] Output obtained chiefly from strip pits in which the production per man per day is large.

[6] Output obtained chiefly by use of mechanical loading devices in which type of operation production per man per day is large.

STATISTICS ON LIGNITE IN 1947[3]

PRODUCTION

The production of lignite in 1947 totaled 2,873,653 net tons, an increase of 8 percent over the 2,667,619 tons produced in 1946. These figures do not include tonnage from small mines producing less than 1,000 tons. The average value per ton in 1947 was $1.92, compared with $1.68 per ton in 1946. The average number of men working daily in 1947 totaled 747, a slight decrease from the 752 men employed in 1946. The output per man per day, based upon calculated man-days, was 15.38 tons. The industry worked an average of 250 days in 1947 compared with 236 in the previous year. North Dakota produced 96 percent of the total United States output of lignite; Montana, South Dakota, and Texas together produced the remaining 4 percent.

All data are submitted on a voluntary basis by producers of lignite, and the Bureau of Mines appreciates their cooperation in supplying the information without which this report would not have been possible.

TABLE 40.—Summary of production, value, employment, days operated, man-days of labor, and output per man per day at lignite mines in the United States in 1947, by States [1]

	Montana [2]	North Dakota	South Dakota	Texas	Total
Production (net tons):

NUMBER AND SIZE OF LIGNITE MINES

For 1947 the Bureau of Mines received reports from 59 mines producing 1,000 tons or more annually. Seven mines produced 81 percent of the total lignite mined; 4 mines accounted for 9 percent; and 48 mines, 10 percent.

TABLE 42.—Number and production of lignite mines in the United States, in 1947, classified by size of output

Class	Mines		Production		
			Net tons		Percent of total
	Number	Percent	Total	Average per mine	
100,000 tons and over	7	12	2,338,488	334,070	81
50,000 and under 100,000	4	7	262,177	65,544	9
10,000 and under 50,000	6	10	111,249	18,542	4
Under 10,000 tons	42	71	161,739	3,851	6
Total	59	100	2,873,653	48,706	100

METHODS OF RECOVERY

TABLE 43.—Lignite mined by different methods in the United States in 1947, by States, in net tons

	Montana	North Dakota	South Dakota	Texas	Total
From underground workings:					
Shot off the solid	37,098	27,872	1,100		66,070
Cut by machines [1]	550	444,318			444,868
Total underground	37,648	472,190	1,100		510,938
From strip pits	1,021	2,287,672	13,518	60,504	2,362,715
Grand total production	38,669	2,759,862	14,618	60,504	2,873,653

[1] A total of 11 machines was used—6 "permissible" and 5 other types.

STRIPPING OPERATIONS

Strip-pit operations were the source of 82 percent of the total production of lignite in 1947. Of the 2,362,715 tons of lignite produced by this method of mining, 97 percent came from pits in North Dakota. The output from stripping operations in Montana, South Dakota, and Texas totaled only 75,043 tons.

TABLE 44.—Summary of stripping operations that produced lignite in the United States in 1947, by States

	Montana	North Dakota	South Dakota	Texas	Total
Number of strip pits [1]	1	30	3	1	35
Number of shovels, dragline excavators, and coal-loading machines [2]		46	3	2	51
Coal produced by stripping	1,021	2,287,672	13,518	60,504	2,362,715
Total value at mines	$2,961	$4,405,241	$33,127	$59,293	$4,500,622
Average value per ton	$2.90	$1.93	$2.45	$0.98	$1.90
Average number of men working daily:					
In strip pits	2	279	11	15	307
All others		197	1		198
Total	2	476	12	15	505
Average number of days mines operated	121	249	194	240	247
Man-days of labor	242	118,536	2,331	3,600	124,709
Average tons per man per day	4.22	19.30	5.80	16.81	18.95

[1] Includes some pits in which stripping is done by hand.
[2] In some cases the same equipment was used for stripping or excavating and for loading coal; this duplication has been eliminated. In some cases coal was excavated by machine and loaded by hand.

CONSUMPTION

According to the Federal Power Commission, 975,566 tons of lignite were consumed in generating electric energy in 1947; this amounts to 34 percent of the total lignite mined in the United States in that year. The consumption in the West North Central States was 951,821 tons; the West South Central States and the Mountain States consumed 2,466 and 21,279 tons, respectively.

[1] Coal is also mined in British Borneo, Faroe Islands, and formerly Italian East Africa, but production figures are not available and no estimate is included in the total.
[2] A change from previous years has been made in the classification adopted by the American Society for Testing Materials. (Alberta is the only Province affected.)
[3] Data not available; estimate included in total.
[4] In addition, the following quantities (metric tons) of asphaltite were produced and used as solid fuels: 1941, 16,646; 1942, 56,387; 1943, 105,625; 1944, 106,300; 1945, 135,300; 1946, 83,800; 1947, 80,900.
[5] Production less than 1,000 tons.
[6] Estimate.
[7] Data represent Trianon Hungary subsequent to October 1944.
[8] January to October, inclusive.
[9] Includes that part of Germany which is under Polish administration (east of the Oder and Neisse Rivers).
[10] Includes open-cast coal as follows, in thousands of tons: 1942, 1,332; 1943, 4,498; 1944, 8,786; 1945, 8,245; 1946, 9,053; 1947, 10,407; 1948, 11,916.
[11] Estimated production of Croatia.
[12] January to June, inclusive.
[13] Excludes production of Ombilin mines in Sumatra.
[14] Fiscal year ended March 20 of year following that stated.
[15] Fiscal year ended March 31 of year following that stated.
[16] South Korea only.
[17] January to September, inclusive.
[18] Output from U. S. S. R. in Asia included with U. S. S. R. in Europe.
[19] Planned production.
[20] Local sales and exports.

Coal—Pennsylvania Anthracite

By J. A. CORGAN AND MARIAN I. COOKE

GENERAL SUMMARY

THE PRODUCTION of Pennsylvania anthracite in 1948 totaled 57,139,948 net tons compared with 57,190,009 tons in 1947. A sharp decline in exports of anthracite to European countries and strong competition from other fuels will contribute to a decline in production and demand for anthracite in 1949.

According to the United States Weather Bureau, the 1948–49 winter season in the primary anthracite market area was one of the warmest on record. For example, the number of degree-days reported for New York City, a large consumer of anthracite (6,296,000 tons in 1948), was 15 percent less for the period September 1 to December 26, 1948, than for the similar period in 1947 and 19 percent less than normal. Inasmuch as about 80 percent of the anthracite shipments is normally consumed for space-heating purposes, the over-all consumption is affected directly by the intensity of the weather. The full impact of the warm weather in the 1948–49 winter season will be reflected in decreased production for the calendar year 1949 due to stocks probably accrued by consumers in 1948.

Although exports of anthracite to Canada increased about 10 percent over 1947, European shipments declined about 57 percent, reresulting in an over-all decline in exports of about 22 percent, or 1,834,000 tons.

Deep mines increased production slightly in 1948, accounting for 65 percent of the total output. Strip pits contributed 23 percent, a 6-percent increase over 1947, whereas culm banks accounted for only 10 percent of the production, a 12-percent decline from the 1947 output and 41 percent less than the wartime high in 1944. The remaining 2 percent was recovered from the rivers draining the anthracite fields.

The mines worked 265 days in 1948; the average number of employees totaled 76,215 men, producing an average of 2.81 tons per man per day.

Although anthracite was distributed widely during the 1948–49 coal year, the New England and Middle Atlantic States, Maryland, Delaware, and the District of Columbia received 83 percent of the total shipments; other States received 4 percent; and shipments to Canada and other foreign countries accounted for 13 percent.

Statistical Trends.—Tables 1 and 2 present pertinent statistical data on the Pennsylvania anthracite industry.

TABLE 1.—Salient statistics of Pennsylvania anthracite industry, 1944–48

[3] Association of American Railroads.
[4] Ore and Coal Exchange, Cleveland, Ohio.
[5] Buffalo Branch, Ore and Coal Exchange, Cleveland, Ohio.
[6] U. S. Engineer Office, Duluth, Minn.
[7] Includes all commercial docks on Lake Superior and west shore of Lake Michigan as far south as Kenosha. Based on data courteously supplied by Maher Coal Bureau and direct reports to the Bureau of Mines.
[8] Furnished by Commonwealth of Massachusetts, Division on the Necessaries of Life.
[9] U. S. Department of Commerce.
[10] Federal Power Commission.
[11] Anthracite Committee. Represents coal in storage nearest available date to the end of the month.
[12] Bureau of Labor Statistics.

Anthracite Committee.—The Anthracite Committee, supported by producers representing a large percentage of the total anthracite output, in addition to its regular activities which include the compilation of current data on production, employment, requirements, and other important phases of the industry, kept the operators informed on "bootleg" mining operations. Since the passage of the Anthracite Standards Law, P. L. 168, by the 1947 Legislature of the Commonwealth of Pennsylvania, the Anthracite Committee's activity on coal inspections has broadened to include all producers in the anthracite industry. This law applies to the sizes of anthracite commonly known as Broken, Egg, Stove, Chestnut, Pea, Buckwheat, and Rice. The act fixes standards for these sizes of anthracite, including the maximum amount of undersize permitted in any of these sizes and the maximum amount of the ash content or, in the case of Broken, Egg, Stove, Chestnut, and Pea sizes, the maximum percentage of slate and bone. The committee is making every effort to encourage preparation of anthracite which meets the specifications set forth in the act. Standard anthracite specifications approved and adopted by the Anthracite Committee, effective July 28, 1947, are shown in Minerals Yearbook, 1947, p. 342.

Anthracite Institute.—The Anthracite Institute, through its information services, continued to keep anthracite producers apprised of the many facts relating to competitive fuels, as well as matters relating to freight rates, State legislation, and many other subjects of interest to the industry. Representatives of the institute appeared before various Government agencies to oppose extension of natural-gas pipe lines into the anthracite markets and increased freight rates on anthracite shipments. A large advertising and promotion campaign, to stimulate buying of anthracite and anthracite-burning equipment, was begun by the institute in 1948. Consumer advertisements appeared in leading newspapers of the anthracite-marketing area throughout the year, and these were supplemented by advertising in magazines and trade journals. This advertising campaign was largely responsible for anthracite consumers filling their coal bins during the spring and summer months of 1948. Dealer training, a program of the institute concerned chiefly with retail merchandizing, including thermostats, anthracite stokers, heater conditioning, etc., was continued and expanded in 1948. Extensive research on various phases of the utilization of anthracite was carried on in the institute's large laboratory at Wilkes-Barre, Pa. For details on research by the institute see the Research and Technology section of this chapter.

Labor Relations.—There was no major labor disturbance in the anthracite fields in 1948. The wage agreement between the anthracite operators and the United Mine Workers of America dated June 7, 1946, which was amended July 10, 1947, was amended further, effective July 16, 1948, to provide for a wage increase of $1 a day (doubling to 20 cents the royalty on each ton of anthracite produced for use or for sale) and to provide for a pension program under the Anthracite Health and Welfare Fund. The contract stated that the 1949 vacation period shall commence at the beginning of the morning shift on Saturday, June 25, 1949, and end at the beginning of the morning shift on Tuesday, July 5, 1949. The payment of $100 for the vacation was continued in 1949.

The first payment of the $100-a-month pension was made September 17, 1948, in a ceremony at Hazelton, Pa., when three anthracite miners, one each from United Mine Worker districts 1, 7, and 9, received their $100-a-month pension checks from John L. Lewis, president of the United Mine Workers.

Research and Technology.—The fluidized bed process for producing fuel and synthesis gas from anthracite silt and the pelletization or the upgrading of fine sizes of anthracite by extrusion under great pressure were two research projects receiving considerable attention by the Anthracite Institute. Pilot plants for this work have been designed and constructed. The Anthracite Institute estimates that there is well over 100,000,000 tons of silt above ground in the anthracite region that can be used for producing fuel and synthesis gas and that over 6,000,000 tons are produced annually. Work on the control of mine dust was continued by the industry, a modern dust laboratory being installed in the institute building to assist in this work.

The Joint Technical Committee of the Anthracite, Bituminous Coal, and Coke Industries continued its research work on common objectives and through the University of Illinois prepared and disseminated to home builders designs showing approved architectural methods of adapting homes to the use of coal or coke.

The Anthracite Institute, in cooperation with the Commonwealth of Pennsylvania, continued its sponsorship of research on new and improved uses for anthracite at the Mineral Industries Experiment Station of Pennsylvania State College. Problems associated with the recovery, upgrading, and utilization of fine sizes and fundamental investigations in long-range problems on utilization of the larger sizes have been stressed in the experimental work. Field studies on proposed and established processes for the recovery and cleaning of fines are being made, the primary objective being evaluation and comparison of various performances with respect to recovery and size limitations for effective cleaning and over-all efficiency.

Studies have been continued on the blending of anthrafines in coke manufacture to determine the strength and size degradation of commercial cokes made with anthrafines; the work includes also studies on methods of reducing pressures developed during carbonization and investigation of the blending compatibility of anthrafines. Investigations on the use of anthracite as cupola fuel were extended to obtain new information on the best conditions for the use of the larger sizes in high-speed melting operations.

The Bureau of Mines continued investigative work begun in 1944 in the anthracite fields on increasing the underground output per man per day of anthracite through new and improved methods of mining anthracite mechanically. In 1948, 42 percent of the total underground production was loaded mechanically. The coal beds in the Wyoming region are relatively flat and are more adaptable to present mechanical mining methods than the pitching seams in the Lehigh and Schuylkill regions; accordingly, 59 percent of the underground output of the Wyoming region was mechanically loaded in 1948, whereas only 15 percent of the combined output of the last two regions was so loaded. The first and second progress reports on anthracite mechanical mining investigations were released in August

1949.[1] These reports contain many illustrations and describe in some detail preliminary underground tests of the Bureau of Mines scraper-shaker loading machine for driving gangways and the Eickhoff shearing machine, model DEK.

The Bureau of Mines began research on underground water pools in the anthracite region in 1945 as part of its technologic investigations of the anthracite mine-water problem; the Bureau's work in this field has expanded greatly since that time. For many years a number of companies did considerable independent work on the control of mine water and flood prevention. To be successful generally, however, a program of this type should have the cooperation of the Federal Government, the Commonwealth of Pennsylvania, and the producers, as conservation of coal reserves and other benefits derived concern all three parties. The ultimate aim of the Bureau's anthracite-mine flood-prevention projects is to prevent as much water as possible from entering the mines to improve safety conditions, preserve valuable reserves of coal, and reduce operating costs by cutting the cost of pumping water to the surface. Investigations are also being conducted on the unwatering of flooded mines—a costly, difficult, and hazardous procedure requiring considerable knowledge of formations and skill in surveying, drilling, pumping, and protecting operations against rapid infiltration or inrushes of water or gas. Bureau of Mines Technical Paper 727,[2] released in 1949, contains detailed information on the water problem in the anthracite mines. The report includes maps, plans, cross sections of the underground water pools, the number of water pools in each field, the altitude of the surface of the water, the volume of the water in each pool, and many other pertinent data on the anthracite-mine water problem.

The Bureau of Mines research program for the anthracite industry is expected to be facilitated considerably upon completion of the Bureau's anthracite research laboratory at Schuylkill Haven, Pa., during the latter part of 1949. Investigations and research to be conducted through facilities thus afforded will relate particularly to the mining, preparation, and utilization of anthracite and to safety, health, and sanitation in mining operations.

Many fine papers on various matters pertaining to research in the anthracite industry are contained in Transactions of the Seventh Annual Anthracite Conference at Lehigh University, Bethlehem, Pa., May 1949.

Imports and Exports.—Despite the sharp decline in exports of anthracite from the record 8,509,995 net tons established in 1947, the 1948 total (6,675,914 tons) exceeded that for any year before 1947. The decrease in exports was due almost entirely to a drop in European shipments from 3,918,463 tons in 1947 to 1,692,967 tons in 1948. Shipments to Canada totaled 4,931,918 net tons, a 10 percent increase over 1947. The decline in shipments to European countries may be attributed largely to increased output of coal in Great Britain, Germany, Poland, and France, which enabled these countries to sus-

tain their needs more adequately and, in some instances, to export coal to other European countries. Sweden and Norway, which together received 779,134 tons of anthracite in 1947, received none in 1948. Most of the anthracite shipped to those two countries in 1947 was Egg size, which was used principally for metallurgical purposes. Belgium and Luxembourg together received 1,367,636 tons of anthracite in 1947 but took only 209,400 tons in 1948. France continued to be the largest consumer of Pennsylvania anthracite in Europe, receiving approximately 1,400,000 net tons in each of the 2 years. About 80 percent of the European tonnage consisted of Buckwheat No. 1 and smaller sizes, which were not in great demand in this country in 1948. The embargo placed on shipments of Pea and larger sizes of anthracite to Europe by the Office of International Trade on October 1, 1947, was lifted on April 1, 1948, when supplies of domestic coal again became plentiful. Canada normally consumes about 9 percent of the anthracite shipped and is, therefore, rightly considered the anthracite industry's secondary market. One of the principal reasons for greatly increased exports to Canada in recent years has been the inability of Great Britain to export anthracite to the Dominion in amounts approaching prewar levels. In 1948, Canada received 175,754 net tons of anthracite from Great Britain, compared with average annual shipments of about 1,200,000 tons before the war. The inordinately warm weather in Canada during the 1948–49 heating season had a direct bearing on the consumption of anthracite in that country. Decreased consumption during the winter of 1948–49 resulted in some coal being stock-piled and will be reflected also in a decrease in our exports to Canada in 1949.

Imports of anthracite into the United States are negligible and constitute an insignificant part of our total consumption. Details of imports and exports are given in tables 38 and 39.

SOURCES AND ACKNOWLEDGMENTS

Statistics on the Pennsylvania anthracite-mining industry as published in this chapter are based on reports furnished voluntarily by the producers and shippers of anthracite in answer to the regular annual canvass conducted by the Bureau of Mines by mail. About 99 percent of the tonnage is reported direct, and the remainder is collected by personal visits or from reliable collateral evidence. The data on individual operations are held in strict confidence.

In assembling available detailed information, free use has been made of pertinent figures prepared by the Anthracite Institute, the Anthracite Committee, the Association of American Railroads, and the Pennsylvania Department of Mines. The Bureau of Mines wishes to acknowledge gratefully the cordial and continued cooperation of these agencies and of the producers and shippers who reported so promptly and so fully on their 1948 operations.

PRODUCTION

Production of Pennsylvania anthracite in 1948 totaled 57,139,948 net tons compared with 57,190,009 tons in 1947. These statistics include deep-mined and strip-pit output, coal recovered from culm banks, anthracite purchased by the industry from "bootleggers," and river or creek coal recovered from the streams draining the anthracite fields. Also included is a small tonnage of semianthracite (62,324 tons in 1948) produced in Sullivan County. See tables 3 to 8 for production and shipments by fields, regions, and counties. Tables 9 and 10 show percentages, by regions, of various sizes in relation to total breaker product.

TABLE 3.—Pennsylvania anthracite produced, 1944–48, by fields, in net tons

[The figures of breaker product include a certain quantity of culm-bank coal, which amounted to 3,989,580 tons in 1948]

[1] Value given for shipments is value at which coal left possession of producing company and does not include margins of separately incorporated sales companies.

[2] For purposes of historical comparison and statistical convenience, the mines of Sullivan County are grouped with the Pennsylvania anthracite region, although the product is classified as semianthracite according to the American Society for Testing Materials Tentative Standard.

[1] Quantity of Lump included is insignificant.
[2] Less than 0.005 percent.

Before 1930 anthracite was produced only by companies who owned or leased the coal lands. During the depression in the early 1930's, unemployed miners began to mine anthracite in the Lehigh and Schuylkill regions from lands of the operating companies and transported the coal to market by truck. Before 1941 this coal, generally referred to as "bootleg coal", was not included in the production statistics of the Pennsylvania anthracite industry compiled by the Bureau of Mines. In 1941, however, the anthracite industry began to purchase run-of-mine coal from the so-called "bootleggers" for preparation and shipment to market. In 1948 these purchases totaled 544,475 net tons. As it has been ruled impractical to segregate the purchased anthracite from the output of the industry proper, it is included in the various production tables in the Minerals Yearbook chapters on Pennsylvania anthracite for 1941–48. As a result, the production statistics for the last 8 years are not exactly comparable with those of previous years. To compute the output per man per day for the anthracite industry, it was necessary to deduct these purchases from the total tonnage shipped by the recognized industry, because adequate data on man-days required to produce the "bootleg" coal are not available. Details on this procedure are discussed in the Employment section of this chapter.

By Weeks and Months.—Tables 11 and 12 summarize weekly and monthly production of anthracite in 1948. Statistics on current output are estimated from records of carloadings and from reports obtained from trade sources. The weekly and monthly figures have been adjusted to the annual total as ascertained by direct mail canvass of the operators.

TABLE 11.—Estimated weekly production of Pennsylvania anthracite in 1948

Week ended—	Net tons	Week ended—	Net tons
Jan. 3	[1] 264,000	July 17	1,071,000

December	4,271	4,639	4,996	4,518	3,998	5,065	4,879	4,506
Total	56,368	60,328	60,644	63,701	54,934	60,507	57,190	57,140

[1] Production is estimated from weekly carloadings as reported by the Association of American Railroads and includes mine fuel, coal sold locally, and dredge coal. Includes in 1941–48 some "bootleg" coal purchased by legitimate operators and prepared at their breakers.

Culm-Bank Coal.—Output of culm-bank coal totaled 5,623,779 tons in 1948, a decline of 12 percent from the production from this source in 1947. The production of coal from culm banks has been declining consistently since the record output of 9,600,180 tons in 1944. As the available supply of culm-bank coal is limited, it can be expected that the tonnage of anthracite recovered from this source will drop substantially in the next few years. Tables 13 and 14 give details on culm-bank output.

TABLE 13.—Production of Pennsylvania anthracite from culm banks, by regions, 1933–48, in net tons

Year	Lehigh	Schuylkill	Wyoming	Sullivan County	Total
1933	301, 222	1, 662, 959	1, 074, 059		3, 038, 240

[2] Before 1913 the figures of consumption take no account of producers' stocks, there being no data available for this item.
[3] Data first collected in 1911.
[4] Data first collected in 1915.
[5] Data first collected in 1929.
[6] As reported by the Commonwealth of Pennsylvania, Department of Mines.
[7] Data not available.
[8] Includes some bootleg coal purchased by legitimate operators and prepared at their breakers.
[9] Output per man per day calculated on legitimate tonnages only; "bootleg" purchases excluded.

"Bootleg" Coal.—A survey by the Anthracite Committee in March 1949, revealed that 772 "bootleg" mines employing 2,617 men were active, whereas, on the same date in 1948, 835 mines employing 2,825 men were operating. There were 12 fatal accidents in 1948 compared with 15 in 1947. The production of anthracite from these operations totaled 1,839,227 tons, an increase of 13 percent over 1947. This output was the highest from this kind of mining since 1943. The record "bootleg" production was 6,300,000 tons in 1941. Details on "bootleg" mining for the period 1941–48 are given in tables 16 and 17.

TABLE 16.—Production, purchases by recognized operators, and fatalities at "bootleg" operations in the Pennsylvania anthracite industry, 1941–48

Year	Production (net tons)[1]	Purchased for preparation by recognized operations (net tons)[2]	Number of fatalities[1]	Year	Production (net tons)[1]	Purchased for preparation by recognized operations (net tons)[2]	Number of fatalities[1]
1941	6,300,000	1,902,481	61	1945	1,026,000	260,342	16

Oct. 14, 1943	791	2,725	Mar. 31, 1949	772	2,617
Mar. 31, 1944	652	2,220			

VALUE OF SALES

An amended agreement between the anthracite operators and the United Mine Workers of America, effective July 1948, granted a substantial wage increase to the mine workers; and, largely because of increased mining costs occasioned by this increase, the average sales realization on breaker shipments advanced from $7.65 per net ton in 1947 to $8.67 in 1948. When colliery fuel, washery coal, local sales, and river coal are included, the average per ton value of the 1948 production is $8.17 compared with $7.22 in 1947. The average sales-realization figures in this study represent value at the breaker, washery, or dredge reported by the producing companies. The company is requested to "estimate value of the product not sold," and to "exclude selling expenses" in making its report. From this it will be seen that, when a producing concern sells its output to a separately organized sales company, the value reported will exclude the margin of the sales company and may therefore be somewhat less than the circular price at which the coal is placed on the general market. This fact should be borne in mind in considering the variations in value among different regions for the same sizes of coal, as shown in the tables. See tables 18 to 20 for sales-realization and value data.

[1] Value given for shipments is value at which coal left possession of producing company and does not include margins of separately incorporated sales companies.

SHIPMENTS

The data shown in table 21 were furnished voluntarily to the Bureau of Mines by producers, wholesalers, and dock operators and represent the seventh in a series of reports on the distribution of Pennsylvania anthracite. Distribution data are collected on a coal-year basis, as it more nearly corresponds with the heating season; therefore, no direct comparison is possible with annual statistics presented elsewhere in the chapter on production, method of movement, etc.

Reported shipments of anthracite in the 1948–49 coal year totaled 48,407,035 net tons, as compared with 55,362,344 tons for the 1947–48 coal year. The sharp decline was due largely to the fact that the winter of 1948–49 was one of the warmest on record, to competition of other fuels, and to a marked decrease in shipments to Europe. The Canadian market remained virtually unchanged, however, as is evidenced by the 4,389,355 net tons reported for the 1948–49 coal year. As indicated in the table, all consuming areas except the Lake States show a decline in tonnages received during the 1948–49 coal year; however, due to influence exerted by the drop in exports to Europe, the percentages shown for areas in the United States and Canada are higher than for the 1947–48 coal year.

TABLE 21.—Distribution of Pennsylvania anthracite, Apr. 1, 1948, to Mar. 31, 1949, by States, Provinces, and countries of destination, in net tons

[1] Includes "local sales."
[2] Shipments to other States generally referred to as being in the South Atlantic area are included in "All other States."
[3] Shipments to Indiana are included in "All other States."

Anthracite shipments from the mines to destinations in the United States declined less than 1 percent in 1948 as compared with 1947, according to data compiled from records of the Pennsylvania State Department of Mines. In 1948, 83 percent of the shipments destined to points in this country moved from the mines by rail and 17 percent by truck, as compared to 85 and 15 percent, respectively, in 1947. Pennsylvania received 84 percent of the truck shipments in 1948, New Jersey 8 percent, and New York 6 percent. Anthracite rail shipments, by States of destination for 1945–48, are shown in table 22 and the movement of anthracite by truck in 1948, by months and States of destination, in table 23.

[1] Compiled from reports of Pennsylvania Department of Mines.
[2] Less than 0.05 percent.

In the past, the regular annual schedule of the Bureau of Mines covering production statistics of the Pennsylvania anthracite industry has requested data for "local sales" only on total tonnages sold locally within the anthracite region. However, the Bureau received so many requests for local sales data on a size basis that it was deemed advisable to insert an item in the 1948 form requesting the industry to report local sales by sizes. As indicated in the tables, sales of anthracite within the region totaled 4,795,721 tons in 1948. It is of interest to note that, of the total local sales shipped (excluding river coal), 53 percent consists of domestic sizes, while 47 percent was steam sizes. These percentages compare with 60 and 40 percent, respectively, for the same size groups of shipments (excluding river coal) to points outside the local sales area. In other words, on a percentage basis more domestic coal is shipped outside the region than is used locally. This is probably accounted for by the fact that virtually all industries within the anthracite-producing area use steam-size anthracite to generate power.

Data compiled from records of the Massachusetts Division on the Necessaries of Life and the Anthracite Emergency Tidewater Bureau indicate that rail receipts of Pennsylvania anthracite in New England increased 3 percent over 1947; tidewater receipts increased 10 percent. Details on anthracite movement to New England are given in table 24. Loadings at Lake Erie ports and receipts at upper Lake docks increased 20 and 24 percent, respectively, over 1947. The substantial gain in Lake Erie loadings in 1944–48 over previous years can be attributed largely to the increased use of the smaller steam sizes of anthracite by briquet manufacturers in the Great Lakes region.

Shipments of anthracite from the Lehigh, Schuylkill, and Wyoming regions, 1850–1948, inclusive, are presented graphically in figure 1.

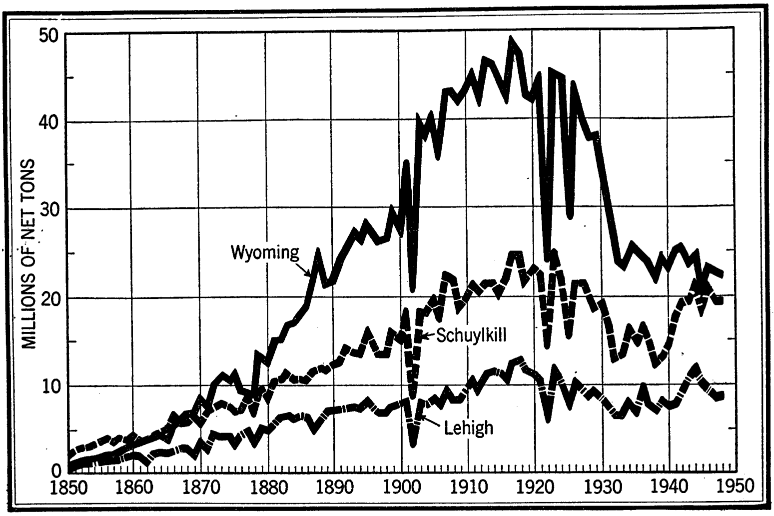

FIGURE 1.——Anthracite shipped from the Lehigh, Schuylkill, and Wyoming regions, 1850–1948.

[3] Total receipts by rail and by tidewater less imports.
[4] Data not available.
[5] Less than 1,000 tons.

CONSUMPTION

Apparent consumption of anthracite in the United States in 1948 totaled 50,200,000 tons, an increase of 4 percent over 1947. Apparent consumption is calculated on the basis of production, plus imports, minus exports, and changes in producers' stocks, but no attempt is made to reflect changes in retail dealer stocks, as data for this group are incomplete. In the absence of complete data on dealers' stocks, it is obviously impossible to measure actual consumption; however, in view of the extremely mild weather prevailing throughout the winter of 1948–49, it must be concluded that actual consumption was considerably lower than apparent consumption. Consumption by class 1 railroads in 1948 totaled 905,063 tons, a decline of 4 percent from 1947; electric power utilities consumed 3,965,965 tons, an increase of almost 13 percent. Anthracite used in the manufacture of fuel briquets and packaged fuel increased to 1,151,752 tons in 1948, a gain of 8 percent over 1947.

Competitive Fuels in the United States and Principal Markets.—Of the total shipments of anthracite to points in the United States in 1948, about 96 percent was destined to the New England and Middle Atlantic States, Maryland, Delaware, and the District of Columbia. Data on the consumption of all fuels in this market are not available; however, apparent consumption of anthracite, domestic coke, briquets, and heating and range oils, in terms of anthracite, totaled 95,927,000 net tons in 1948, an increase of 5 percent over 1947. All of the gain was the result of increased consumption of heating and range oils. Fuel oil surpassed anthracite consumption in this area for the first time in 1947 on an equivalent B. t. u. or heating-value basis and, in 1948, accounted for 52 percent of the total consumption of the fuels indicated in table 25.

As indicated in table 26, supplies of various fuels generally used for space-heating purposes in the United States in 1948 increased over 1947, a substantial gain being indicated in sales of heating and range oils.

OIL (BARRELS OF 42 GALLONS)					
Oil sales for heating buildings:					
Range oil	32,259,000	51,021,000	60,564,000	74,114,000	84,163,000
Heating oils (domestic and commercial) [9]	116,617,000	165,216,000	189,371,000	234,761,000	258,663,000
Liquefied petroleum gases (domestic)	972,000	12,697,000	18,059,000	27,394,000	35,078,000
GAS (MILLION CUBIC FEET)					
Natural-gas consumption for domestic and commercial use [10]	489,234	837,499	902,622	1,087,363	[9] 1,232,770
Manufactured-gas sales for: [11]					
Domestic use	193,325	311,043	335,369	[7]	[7]
House heating	45,200				

[1] A considerable part of the smaller steam sizes is used by industries, railroads, and public utilities.
[2] U. S. Department of Commerce.
[3] Production plus imports less exports.
[4] Partly estimated.
[5] Data not available.
[6] An estimated one-half of total production shown is used for domestic purposes.
[7] Data not yet available.
[8] Exact data not available.
[9] Includes all grades of fuel oil used for heating buildings.
[10] Includes gas used for heating offices, hotels, apartments, hospitals, stores, and other large buildings, as well as houses.
[11] American Gas Association.

Mechanical Stokers.—According to the Bureau of the Census, United States Department of Commerce, factory sales of class 1 mechanical stokers for burning anthracite (capacity under 61 pounds of coal per hour) increased from 3,364 units in 1947 to 9,524 units in 1948. Sales of class 2 stokers (capacity 61 to 100 pounds of coal per hour) increased from 391 units in 1947 to 761 units in 1948. Stokers for burning anthracite have been improved greatly in the past 2 or 3 years, and the industry expects sales to increase substantially in the future.

STOCKS

Producers' stocks, which totaled 510,610 tons in January 1948, declined to a low of 51,043 tons in July but reached 963,839 tons in December. Most of the coal in storage was Buckwheat No. 1 and smaller, although some domestic sizes were stored in the closing months of the year. Stocks on the upper Lake docks totaled 380,024 net tons on December 31, 1948, an increase of 19 percent over those held on the same date in 1947. Stocks held by electric power utilities increased 12 percent over 1947, while stocks of class 1 railroads declined 16 percent.

PRICES

Saward's Journal quoted f. o. b. mine prices for anthracite at the beginning of 1948 varying from $10.95 to $11.50 per net ton on Broken and Egg; $11.00 to $11.50 on Stove and Chestnut sizes; $9.00 to $9.55 on Pea; $6.50 to $7.00 on Buckwheat No. 1; $5.35 to $5.95 on Rice; and $4.10 to $4.35 on Barley size. The mine workers were granted a wage increase in July, and to compensate the producers for the added costs of production (caused principally by the wage increase), circular prices were advanced. At the end of the year, the quoted price per ton f. o. b mine on Egg was $12.15 to $12.85; Stove and Chestnut varied from $12.25 to $12.85; Pea $10.20 to $10.75; Buckwheat No. 1 $6.95 to $8.25; Rice $5.95 to $6.65; and Barley $4.60 to $4.90. A number of companies normally sell coal from some mines or of certain grades at a small premium over the quoted circular prices. Details on prices are given in table 27.

Data compiled from reports of the Bureau of Labor Statistics, United States Department of Labor, showing retail prices of anthracite, bituminous coal, coke, and heating oils in selected cities, by months, for 1948, are shown in table 28.

EMPLOYMENT

The average number of men employed in the Pennsylvania anthracite industry in 1948 totaled 76,215, a decline of 3 percent from the number employed in 1947. The men worked an average of 265 days, and the average annual output per man was 745 net tons, a slight increase over the annual per man output of 720 tons in 1947. Of the total employees, 54 percent were employed in operations in the Wyoming region, 17 percent in the Lehigh, and 29 percent in the Schuylkill region.

Data on employment, as shown in this study, do not include workers employed in "bootleg" coal-mining operations, conducted principally in the Schuykill region. According to the Anthracite Committee, 2,617 men were working 772 "bootleg" holes in March 1949. Although these workers are not included in the employment data, the coal produced by some (544,475 net tons in 1948) was purchased by the recognized industry for preparation and shipment to market, and the coal so purchased is included in the production tables of this chapter. Complete employment data on the "bootleg" holes from which this coal was produced are not available. Therefore, the purchased coal was deducted from the total tonnage reported by the operators and the resulting net production was then used to calculate the output per man per day. Although it is true that men employed at preparation plants of the recognized companies were engaged part time in the preparation of this purchased coal for market, the omission of such time will not detract materially from the validity of the per-ton figure obtained. See tables 29 and 30 for details on labor statistics.

TABLE 29.—Men employed and days worked at operations producing Pennsylvania anthracite in 1948, by regions [1]

[Includes operations of strip contractors]

MINING METHODS AND EQUIPMENT

Mechanical Loading.—The quantity of anthracite loaded mechanically underground in 1948 totaled 15,742,368 tons, a decline of 2 percent from that of 1947. Virtually all of the decreases took place in the Western Middle and Southern fields, as slight increases are shown for the Northern and Eastern Middle fields. The relatively flat coal seams of the Northern fields are more adaptable to present-day mechanical loading methods than the sharply pitching seams in the other three fields, and for this reason 86 percent of the total tonnage mechanically loaded underground was produced in the former field whereas only 14 percent was produced in the other fields. Mechanically loaded coal accounted for 42 percent of the total underground production in 1948; coal loaded by hand comprised 58 percent. Details on anthracite loaded mechanically underground are given in tables 31 to 33.

The trend in underground mechanical-loading, hand-loading, and in stripping in the Pennsylvania anthracite regions, 1928–48, is illustrated graphically in figure 2.

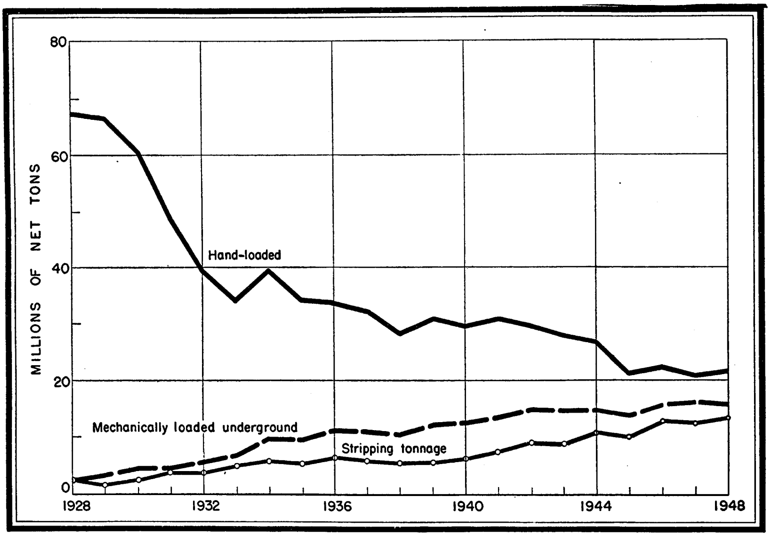

FIGURE 2.—Relative trend of mechanical-loading, hand-loading, and stripping of Pennsylvania anthracite, 1928–48.

[1] As reported by Commonwealth of Pennsylvania, Department of Mines.

Strip-Pit Operations.—Strip-pit activities throughout the anthracite region have expanded greatly since 1940, reaching a peak production in 1948 of 13,352,874 tons (26 percent of the total fresh-mined output), a gain of 6 percent over 1947. The Lehigh and Schuylkill regions are the scenes of the largest strip-pit operations in the anthracite fields, having supplied 80 percent of the total 1948 strip-pit output, the Wyoming region supplying the remaining 20 percent. The high proportionate tonnage obtained by stripping in the Lehigh and Schuylkill regions is due largely to the relative ease of mining thick-bed outcrops, whereas the beds in the Wyoming region are thinner, limiting the quantity of coal recoverable by strip-pit operations. Draglines are used extensively in removing overburden and, at some pits, in loading coal. Details of strip-pit operations are given in tables 34 and 35. Figure 3 illustrates graphically the production of anthracite from strip pits, by regions, 1928–48.

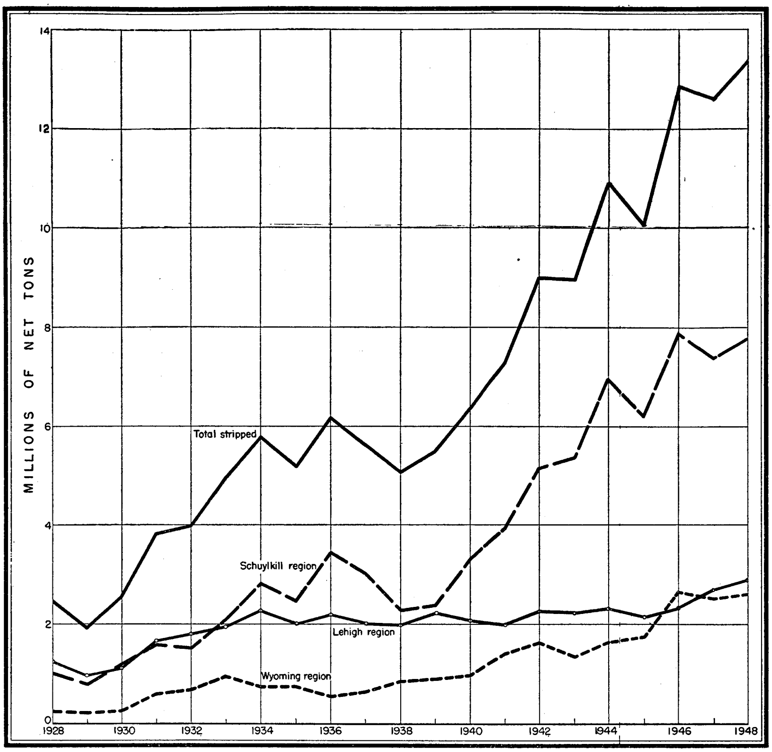

FIGURE 3.—Pennsylvannia anthracite mined from strip pits, by regions, 1928-48.

All other	6		6	4		4	3		3
Total	262	318	580	284	325	609	304	310	614

Cutting Machines.—The quantity of anthracite cut by machines declined from 1,209,983 tons in 1947 to 1,016,757 tons in 1948. The number of cutting machines in use in 1948 were 177 "permissible" and 28 "all other types," compared with 184 "permissible" and 27 "all other types" in 1947.

Dredge Coal.—Dredging anthracite from the rivers and creeks is an important industry to many operators along the banks of the streams that drain the anthracite region. The output of anthracite from this source of mining reached a peak of 1,517,563 tons in 1941, and declined to 988,004 tons by 1948. Most of the coal drained from the streams is Buckwheat No. 3, and smaller sizes used principally for industrial purposes at points relatively near the streams from which the coal is dredged. Details on river coal production are shown in tables 36 and 37.

TABLE 36.—Pennsylvania anthracite produced by dredges, 1909–48, by rivers (including tributaries)

FOREIGN TRADE [3]

Although shipments of Pennsylvania anthracite to foreign countries in 1948 declined 22 percent from the all-time record established in 1947, the total (6,675,914 net tons) was the highest for any year except 1947. Canada and Europe received virtually all of the tonnage—4,931,918 and 1,692,967 net tons, respectively. Because of the unusually mild weather in Canada during the last 3 months of 1948, consumption was considerably below normal, and this no doubt will be reflected in the quantity imported from the United States in 1949. Production of coal in European countries has been increasing considerably; as a consequence, exports of anthracite to Europe probably will show a decline in 1949. Statistics on United States imports and exports are shown in tables 38 and 39.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

CANADA

The production of coal in Canada totaled 18,406,938 net tons in 1948, a gain of approximately 16 percent over the 1947 output. Although all of the coal-producing Provinces shared in the increased output, Nova Scotia accounted for 91 percent of the gain and 35 percent of the total coal production in 1948. Coal and coke statistics for Canada are shown in tables 40 and 41.

[5] South Korea only.
[6] Quality in doubt; may be bituminous.

Cobalt

By HUBERT W. DAVIS

GENERAL SUMMARY

CONSUMPTION of cobalt in the United States exceeded 5,000,000 pounds for the first time in 1948 and was 21 percent more than in 1947. Usage of cobalt for all important purposes was larger than in 1947. However, permanent-magnet alloys and high-temperature alloys continued to lead in the postwar demand for cobalt; these two outlets accounted for 40 percent of the total quantity of cobalt consumed in 1948. Despite the much greater demand for cobalt in 1948, supplies substantially exceeded industry requirements, chiefly because of the record output of 4,322 metric tons from Belgian Congo ores.

Sales of cobalt metal in the United States were 36 percent greater in 1948 than in 1947; sales to industry were 17 percent larger, but those to the national strategic stock pile were 60 percent greater. The metal was supplied chiefly by imports but partly by withdrawals from suppliers' stocks and by production in the United States. Imports and domestic production of metal declined 13 and 6 percent, respectively, in 1948 from 1947, and suppliers' stocks in the United States dropped 45 percent.

The demand for cobalt oxide was also greater in 1948 than in 1947, chiefly because of greater use in ground-coat frit for porcelain enamel and pigments. Despite a 69-percent gain in output of oxide in the United States, it was inadequate for requirements. The deficit was met by imports, which were 5 percent greater.

Production of cobalt hydrate, salts, and driers and shipments of hydrate were smaller in 1948 than in 1947, but sales of salts and driers were larger.

The bulk of the cobalt metal, oxide, hydrate, and other cobalt products sold in the United States is made from crude cobalt (alloy) produced in the Belgian Congo. Imports of alloy from Belgian Congo were 33 percent more in 1948 than in 1947. Some of the cobalt products sold are made from domestic and Canadian ores. Output of domestic ore was slightly greater than in 1947, and imports of Canadian ore by refiners were up 66 percent. Consumption of cobalt alloy and ore was 2 percent larger.

A noteworthy contribution to the literature on cobalt was made by Roland S. Young,[1] chief research chemist, Rhokana Corp. Ltd., who

[1] Young, R. S., Cobalt: Reinhold Publishing Corp., New York, 1948, 181 pp.

assembled and reviewed critically existing data and presented certain unpublished features and developments which had come within his experience with this metal and its compounds.

DOMESTIC PRODUCTION

Despite the fact that the United States is the largest consumer of cobalt in the world, only a small part of its requirements has been furnished by domestic ore, as is evident from the next table, which shows production and shipments through 1946; the Bureau of Mines is not at liberty to publish figures for 1947 and 1948.

Cobalt ore produced and shipped in the United States through 1946 [1]

Year	Produced		Shipped from mines	
	Gross weight (short tons)	Cobalt content (pounds)	Gross weight (short tons)	Cobalt content (pounds)
Previous to 1921 (partly estimated)	(2)	730,000	(2)	730,000

	(2)	5,303,950	(2)	5,154,308

[1] Bureau of Mines not at liberty to publish figures for 1947 and 1948.
[2] Data not available.

Production of cobalt ore in the United States in 1948 was slightly greater than in 1947, but shipments declined.

The Bethlehem Steel Co. was the only producer of commercial cobalt ore in the United States in 1948. The cobalt-bearing material (averaging 1.3 percent cobalt in 1948) is contained in the sulfides that accompany the magnetite mined at Cornwall, Pa. The cobalt-bearing material is shipped to the Pyrites Co., Wilmington, Del., where it is processed to metal and other cobalt products.

The Sullivan Mining Co., Kellogg, Idaho, continued to recover cobalt at its electrolytic zinc plant in 1948 but, as in previous years, made no shipments. In 1948 it recovered 140 short tons of residues containing 9,962 pounds of cobalt.

Underground development and exploratory work were continued in 1948 at the Blackbird mine near Forney, Idaho, by the Calera Mining Co., a wholly owned subsidiary of the Howe Sound Co. A development crew of about 35 men was maintained. Underground development comprised 3,120 feet of drifts and crosscuts, 601 feet of raises.

and 1,248 feet of diamond drilling. A 30-ton pilot mill was constructed and operated for a few months to produce cobalt concentrates for test work. The ore carries copper and gold, as well as cobalt. According to the Howe Sound Co.:[2]

Research to determine the best process for separating the metals contained in this complex ore and for refining the cobalt product has been practically concluded. Based on results so obtained, design of the necessary plants will be undertaken by our organization. Preliminary construction will begin in the summer of 1949 and it now seems possible that this work may be completed by the end of 1950. At agreement has been made with the Idaho Power Co. to furnish necessary power for this project. Mine development and exploration is continuing.

A summary of the results of Bureau of Mines laboratory and small-scale pilot-plant investigations of beneficiation of the Blackbird ore has been published.[3]

There was again no commercial production of cobalt in Missouri. However, the St. Louis Smelting & Refining Division of National Lead Co., which has been studying the problem of making a successful recovery of separate products of cobalt and nickel, continued this investigation in 1948 and reported that the work thus far done indicated satisfactory technical progress. Investigation will proceed along the economic phases of the work.

CONSUMPTION

Refiners or Processors.—Consumption by refiners or processors of cobalt contained in alloy and ore was 2,715,605 pounds in 1948, an increase of 2 percent over 1947. However, usage of cobalt intermediates by refiners or processors was 20 percent smaller. Of the alloy and ore consumed in 1948, much the greater part was utilized in making cobalt metal. The remainder of the alloy and ore and all of the other cobalt raw materials were used in manufacturing the cobalt products shown in the accompanying table.

Cobalt consumed [1] by refiners or processors in the United States, 1945–48

Cobalt material	Pounds of cobalt			
	1945	1946	1947	1948
Alloy and ore	4,808,825	2,009,018	2,672,991	2,715,605
Fines and granules	453,538	499,737	528,544	393,725
Rondelles	64,872	148,197	128,937	107,520
Hydrate	133,831	128,740	152,102	150,826
Carbonate	18,460	19,243	6,904	4,608

[1] The fines, granules, rondelles, hydrate, and carbonate consumed originated from alloy and ore; therefore, combining alloy and ore with these materials would result in duplication.

Industrial Consumers.—Consumption of cobalt by industrial consumers established a new record in 1948; it was 5,049,597 pounds, a gain of 21 percent over 1947. Permanent-magnet alloys continued

[1] In addition, cobalt metal (rondelles, granules, fines, and powder) was produced, but the Bureau of Mines is not at liberty to publish figures on production and shipments.

to be the largest single use for cobalt and accounted for 24 percent of the total quantity consumed in 1948; moreover, usage for this purpose was 33 percent greater than in 1947. Each year brings improvements in permanent-magnet alloys and new applications. A new method of sintering Alnico 5 permits the design of intricate shapes with higher external energy than was previously possible and allows economical production of small parts, finer grained and less brittle, with smooth surfaces and close dimensional tolerances.[4] The new sintered material is now being used in relays, meters, fountain pens, electronic reproducers, and compasses. The manufacture of permanent magnets by powder metallurgy has been described.[5] Among the applications for permanent magnets announced in 1948 was a wall-type can opener; the magnet is attached to an adjustable arm on the side of the can opener, and after the lid is cut off the magnet snaps it up and holds it tight until the can is removed.[6] To eliminate ink-stained pockets and to faciliate closing, a permanent magnet has been molded into the cap of a fountain pen to hold the cap firmly in place and permit it to be flicked off by the touch of the thumb.[7] Permanent magnets have improved television; they control electronic action and thus eliminate blurring of the television picture.

The peacetime demand for cobalt-base high-temperature alloys continued to expand; as a consequence, the quantity of cobalt utilized in cast cobalt-chromium-tungsten alloys was 29 percent greater in 1948 than in 1947. Moreover, this usage accounted for the second-

[7] Nickel Topics, vol. 1, No. 2, March 1948, p. 4.

largest quantity or 16 percent of the total cobalt consumed in 1948. Informative articles on high-temperature alloys were published.[8] [9]

Noteworthy gains in the use of cobalt in high-speed and other steels, alloy hard-facing rods and materials, and cemented carbides were also recorded in 1948. Utilization of cobalt in ground-coat frit for porcelain enamel continued its upward trend but the gain (1 percent) in 1948 was less than in 1947 and 1946. Similarly, the gain in usage of cobalt in pigments was less pronounced than in recent years.

Much publicity was given to the testing at four institutions of radioactive cobalt from an atomic pile for treatment of cancer patients. Experiments at the University of California College of Pharmacy were reported to show that penicillin action can be greatly increased by the presence of cobalt.

Cobalt consumed in the United States, 1946–48, by uses

Use	Pounds of cobalt		
	1946	1947	1948
Metallic:			
High-speed steel	224,049	223,148	289,391
Magnet steel	1,463,539	121,223	165,698
Permanent magnet alloys		894,924	1,186,673
Other steel	201,949	386,354	503,082
Cast cobalt-chromium-tungsten alloys	526,504	642,452	826,329
Alloy hard-facing rods and materials	53,874	71,545	116,313
Cemented carbides	45,100	62,734	115,687
Other metallic	81,988	99,476	115,255
Total metallic	2,597,003	2,501,856	3,318,428
Nonmetallic (exclusive of salts and driers):			
Ground-coat frit	412,766	607,316	613,745
Pigments	170,662	207,928	232,725
Other nonmetallic	39,596	51,439	66,699
Total nonmetallic	623,024	866,683	913,169
Salts and driers: Lacquers, varnishes, paints, inks, pigments, enamels, glazes, feed, electroplating, etc. (estimate)	885,000	797,000	818,000
Grand total	4,105,027	4,165,539	5,049,597

PRICES

Since July 1, 1947, the price of cobalt metal (97–99 percent, in kegs of 550 pounds) has been \$1.65 a pound delivered east of Chicago; and for quantities under 100 pounds, \$1.72 a pound. The price of oxide to ceramic plants was \$1.27½ a pound.

FOREIGN TRADE [10]

Imports.—Imports of cobalt into the United States established a new record in 1948; they were 7 percent greater than in 1947, the previous record year. The Belgian Congo continued to be the chief

source of imports; in 1948 it supplied 3,541,746 pounds of metal and 4,879,413 pounds of alloy containing 2,179,473 pounds of cobalt. Belgium supplied 1,724,725 pounds of metal and 790,300 pounds of oxide containing 561,116 pounds of cobalt; both the metal and oxide were produced from Belgian Congo alloy. Canada supplied 8,167,545 pounds of ore containing 870,519 pounds of cobalt, of which 7,054,500 pounds containing 742,000 pounds of cobalt were imported by the United States Government; this ore had been stored at Deloro, Ontario, Canada. The United Kingdom furnished 1,374 pounds (gross weight) of salts and compounds and 50 pounds of metal.

Cobalt imported for consumption in the United States, 1944–48, by classes

[1] Reported by importer to Bureau of Mines; not separately classified by U. S. Department of Commerce. Value not available.
[2] Data for 1944 and 1946 adjusted by Bureau of Mines to exclude alloy.
[3] Adjusted by Bureau of Mines.
[4] Revised figures.

The accompanying table shows the imports of cobalt for 1923–48, by classes. Corresponding figures for earlier years are not available. However, imports of cobalt apparently did not exceed 500,000 pounds annually until 1926; from that year they increased steadily through 1929, when they reached 1,212,000 pounds. Imports declined abruptly during 1930–32, dropping to 303,000 pounds in 1932. Since 1933, however, imports of cobalt have increased almost steadily and reached an all-time high of 8,821,000 pounds in 1948.

During the 26 years, 1923–48, the receipts of alloy comprised about 43 percent of the total imports and virtually all was from Belgian Congo. Imports of cobalt metal represented the second-largest quantity (39 percent), most of which was supplied by Belgium and Belgian Congo. Smaller quantities of metal have been received from Austria, Canada, Finland, France, Germany, Japan, Sweden, and United Kingdom. About 13 percent of the imports of cobalt have been in the form of oxide, which came chiefly from Belgium. Substantial quantities of oxide have also been received from Germany and Canada, and smaller quantities from Australia, Finland, and France. Receipts of cobalt ore have accounted for about 5 percent of the total imports; Canada has been the largest source; most of the remainder came from Australia and French Morocco.

Cobalt imported for consumption in the United States, 1923–48, in pounds

Year	Gross weight					Total	
	Alloy	Ore	Metal	Oxide	Sulfate and other compounds	Gross weight	Cobalt content (estimated)
1923	----------	58,719	225,639	258,574	45,644	588,576	426,000
1924	----------	28,786	118,952	226,703	797	375,238	283,000
1925	----------	34,782	198,669	287,265	13,256	533,972	408,000

1947	3,751,452	751,438	6,035,153	752,150	530	11,290,723	8,206,000
1948	4,879,413	8,167,545	5,266,521	790,300	1,374	19,105,153	8,821,000

[1] In addition to classes shown, 4,796,000 pounds of Burmese speiss containing 335,721 pounds of cobalt were imported.

Exports.—Exports of cobalt from the United States are small; 435 pounds of metal valued at $1,520 and 134,763 pounds (gross weight) of ore and concentrates valued at $182,480 were exported in 1948. Some oxide, salts, and driers are also exported, but the figures are not separately recorded by the United States Department of Commerce.

Tariff.—The duty on cobalt oxide continued to be 10 cents a pound, sulfate 5 cents a pound, linoleate 10 cents, and other salts and compounds 30 percent ad valorem. Cobalt metal and ore entered the United States duty free.

WORLD REVIEW

Virtually all cobalt is found associated with other minerals, such as copper, nickel, iron, arsenic, lead, zinc, manganese, silver, and gold. Belgian Congo and Northern Rhodesia, where cobalt occurs associated with copper, have been the chief producing countries in recent years, followed by the United States, French Morocco, and Canada. These five countries have contributed about 94 percent of the world output of cobalt in recent years. Iron pyrites from Finland, Germany, Greece, Italy, Norway, Spain, and Sweden contains cobalt, some of which is recovered. Although the quantities of cobalt present in iron pyrites are generally very small—often only 0.05 percent—and its recovery is only 50 to 60 percent, the very large tonnage treated during and preceding the war contributed greatly to the cobalt production in Germany. It is reported [11] that about 10 tons of cobalt concentrates are obtained from 100,000 tons of cinder. A complete record of output of cobalt from iron pyrites is lacking.

World mine production of cobalt, by countries, 1940–48, in metric tons [1]

[Compiled by B. B. Mitchell]

Country [1]	Cobalt content								
	1940	1941	1942	1943	1944	1945	1946	1947	1948

Belgian Congo.—The world's premier source of cobalt continues to be Belgian Congo, where the Union Minière du Haut Katanga is the sole producer. Output was 4,322 metric tons in 1948, a new record and 21 percent greater than in 1947. Production of cobalt in Belgian Congo was begun in 1924, when 273 metric tons were produced; since that year output has increased almost without interruption and total production through 1948 has been about 33,500 metric tons. The company has a cobalt mine and a cobalt-concentrating plant at Kabolela and a cobalt mine and ore-treatment plant at Kamoto. At Jadotville the company has six single-phase electric furnaces (monthly capacity about 300 tons) for smelting cobalt-bearing ores and slags. The cobaltiferous red alloy from the electric furnaces is refined in two rotary furnaces; and the resultant crude cobalt, which is cast into ingots, is shipped chiefly to company refining plants at Niagara Falls, N. Y., and Oolen, Belgium, for processing the crude cobalt to metal, oxide, salts, and driers. The solutions used in the electrolytic plants contain cobalt, recovered by precipitation. The precipitates are treated by electrolysis in a refining plant (also at Jadotville) capable of producing about 225 tons a month of granules of high purity. The total refining capacity of the company plants at Niagara Falls, N. Y., Oolen, Belgium, and Jadotville, Belgian Congo, is about 7,500 tons annually. On the basis of a rate of production of 4,000 metric tons annually, the company reported developed reserves of cobalt adequate for 40 to 50 years, and it anticipates that these reserves will increase as a result of further development of its copper deposits.

Canada.—Production of cobalt in Canada is measured by the quantities of Canadian ores processed and exported, irrespective of the year when mined, plus the cobalt content of oxide made by the International Nickel Co. of Canada, Ltd., at Port Colborne, Ontario. During the war substantial quantities of cobalt ores were mined and stock-piled in Canada for the United States Government, and concurrently the Deloro Smelting & Refining Co., which treated African ores, accumulated Canadian ores. In 1948 the ore stocked by the United States Government was shipped to the United States, and the entire quantity has been included in the production figure for 1948. Similarly, the quantity of Canadian ores processed by Deloro Smelting & Refining Co. in 1948 has likewise been included. Canadian production figures, however, do not include the cobalt recovered by the Mond Nickel Co. at its Clydach (Wales) nickel refinery from the nickel-copper ores of the Sudbury district.

According to the Dominion Bureau of Statistics, production of cobalt (content) in Canada was 1,544,852 pounds in 1948 compared with 572,673 pounds in 1947. The major portion of the output credited to Canada in 1948 came from accumulations during the war years rather than from ores hoisted during the year. According to the United States Department of Commerce, ore containing 870,519 pounds of cobalt was imported into the United States from Canada in 1948.

The International Nickel Co. of Canada, Ltd., at its Canadian nickel refinery, continued the recovery of cobalt as oxide from the nickel-copper ores of the Sudbury district. Output of cobalt in oxide was reported as 15 short tons monthly, but an increase was contemplated.

In the cobalt area of northern Ontario, the Silanco Mining & Refining Co., Ltd., was again the chief producer. It operated the Colonial concentrator, which treated ore from the reopened Agaunico mine and tailings from the Temiskaming mine. The construction of a smelter by this company, noted in previous chapters of this series, remained uncompleted in 1948.

Falconbridge Nickel Mines, Ltd., has begun construction of a plant to recover the cobalt contained in the matte produced from Sudbury nickel-copper ores. The cobalt plant, which is being erected at the company nickel refinery at Kristiansand, Norway, will produce cobalt oxide and electrolytic cobalt; production of several hundred thousand pounds of cobalt annually is expected to begin in 1951.

French Morocco.—Production of cobalt ore in French Morocco was 2,094 metric tons containing 278 tons of cobalt in 1948 compared with 2,660 tons containing 370 tons of cobalt in 1947. The ore, which also contains nickel, gold, and silver, is shipped to Belgium for processing to oxide and speiss, which are exported to France, where the speiss is refined to metal. Indicated shipments of cobalt ore from French Morocco were 3,349 metric tons containing 483 tons of cobalt in 1948. Stocks of ore at the mines were 1,437 tons on December 31, 1948, compared with 2,692 tons at the end of 1947.

The deposits were described as follows: [12]

> The cobalt deposits of French Morocco lie in a rocky desert region in the south of the Atlas Mountains near Bou-Azzer about 250 kilometers (155 miles) east of the port of Agadir. They are the property of La Société Minière de Bou-Azzer et du Graara, whose head office is at Casablanca. The deposits of cobalt and nickel are found in veins at or near the contact of serpentine and diorite rocks. The gangue is principally carbonate. Smaltite, skutterudite, and safflorite are the cobalt minerals, while niccolite and other nickel-arsenic minerals are also present. Gold, varying from 3 to 300 grams per ton, is found in smaltite-skut-

[12] Young, R. S., work cited in footnote 1, pp. 14–15.

terudite minerals. Silver is also found in varying quantities but always less than 50 grams per ton. In general the commercial ore of Morocco does not have nickel or iron exceeding 20 percent of the cobalt, although some deposits have more nickel than cobalt. Bou-Azzer is about 186 miles from the railroad at Marrakech and this limits its development. Proved resources are 36,000 metric tons. At present the mine has several levels, the deepest being 175 meters (574 feet). The average cobalt content of commercial ore is 11 to 12 percent, although there are other commercial-grade ores with a cobalt content as low as 0.75 to 1.25 percent.

Northern Rhodesia.—The second-largest producer of cobalt in the world continues to be Northern Rhodesia; but, chiefly because of shortage of coal deliveries, output has declined regressively since 1945. The output of alloy was 1,081 short tons containing 405 short tons of cobalt in the year ended June 30, 1948, compared with 1,225 tons containing 463 tons of cobalt in 1947. The Rhokana Corp., which has been producing cobalt since 1933, is the sole producer; total output through June 30, 1948, has been 12,053 metric tons.

The Rhodesian occurrences were described thus: [13]

> In Northern Rhodesia the cobalt occurs chiefly as carrollite, but an oxidized form of cobalt is also found and forms a small and varying proportion of the cobalt content in the mill feed of Rhokana Corporation. The carrollite is closely associated with the copper minerals throughout the sediments of the ore horizon, but it is not evenly distributed and the cobalt content of the ore varies from a trace to over 3 percent, with an average of 0.25 in the Nkana North and South orebodies and 0.07 percent in the Mindola orebody. This gives an average mill feed to Rhokana concentrator of about 0.13 percent Co. Where the cobalt content is low, around 0.07 percent, it appears to be fairly evenly distributed throughout the ore. Where the cobalt content is high, around 0.50 percent, the carrollite tends to be concentrated in the porous sandstone and cherty ore which are the two upper members of the ore horizon, and to some extent in the lowest part of the argillite forming the hanging wall. * * * Practically all of the cobalt present in the copper and cobalt concentrates at Nkana is free and unattached. It is possible by gravity concentration to produce a high grade cobalt concentrate with a good recovery from the flotation middlings if the product is classified and the sands treated on tables.

Uganda.[14]—Deposits of copper near Kilembe on the eastern slope of the Ruwenzori Mountains were discovered by Tanganyika Concessions in 1927; and a license to exploit the area was held by it until 1940, when it was relinquished because development was considered uneconomic. During the war the Uganda Government Department of Mines produced small quantities of copper concentrates from this area for manufacture of copper sulfate in Kenya. Meanwhile, preliminary geological and geophysical surveys were made. Development of the Kilembe deposits has been retarded by transportation and power problems. The deposits are 250 miles from the railroad

[13] Young, R. S., work cited in footnote 1, pp. 13-14.
[14] Hyland, Frances, Foreign Service Clerk, Nairobi, Kenya, Development of Kilembe Copper Deposits, Uganda Protectorate: U. S. Cons. Rept., Oct. 19, 1948, 5 pp.

and 170 miles from the nearest lake port. These problems are to be solved eventually by a hydroelectric plant at Jinga, which is now under way, and the Katonga Canal from a point near Kilembe to Lake Victoria.

Economic exploitation of the deposits is now considered feasible; in 1947 additional investigation was undertaken by Frobrican Exploration Co., Ltd., which has acquired exclusive control of all copper deposits in this district, and development of the Kilembe mines has begun. A 2- to 2½-year diamond-drilling program, now under way, is proposed to complete at least 20,000 feet and possibly 50,000 feet of drilling. The major program, which would bring the property into production on a 3,000-ton daily basis, will extend over 5 years at least. Estimates of ore reserves in the five known ore bodies vary widely. Average grade of the ore reserves in the five ore bodies—over a strike length of 2,000 feet and an average width of 55 feet—is estimated to be 3.5 percent copper and 0.13 percent cobalt. A large tonnage of ore already developed on three levels over a length of 800 feet averaged 0.25 percent cobalt. Metallurgical tests have indicated an over-all recovery of 90 percent of the copper and 80 percent of the cobalt. If the project can be developed to the proposed capacity of 3,000 tons of ore daily, an annual production of 52,000,000 pounds of copper is indicated.[15]

[15] The anticipated production of cobalt was not stated, but an annual output of 1,500,000 to 2,000,000 pounds is indicated.

Coke and Coal Chemicals

By J. A. DeCARLO, J. A. CORGAN, and MAXINE M. OTERO

GENERAL SUMMARY

THE coke industry shared in the high tempo of industrial activity in the United States in 1948 and produced the largest quantity of coke on record. Total output of oven and beehive coke—74,861,928 tons—was 2 percent greater than the 1947 figure and 824,111 tons (1 percent) higher than the previous record set in 1944. This outstanding performance was due largely to a substantial increase in oven-coke output, which more than compensated for a slight decline in beehive production. Production of oven coke, after dropping slightly in April because of a work stoppage in the bituminous-coal mines, increased steadily thereafter, reaching a peak in December when the rate of production averaged 196,800 tons per day. Beehive output normally fluctuates more than oven-coke production because work stoppages at mines immediately curtail production as beehive operators do not carry stock piles of coal. Interruptions in coal mining during parts of March, April, and July reduced production drastically during those months. However, by December the rate of beehive-coke production had reached

883326—50——27

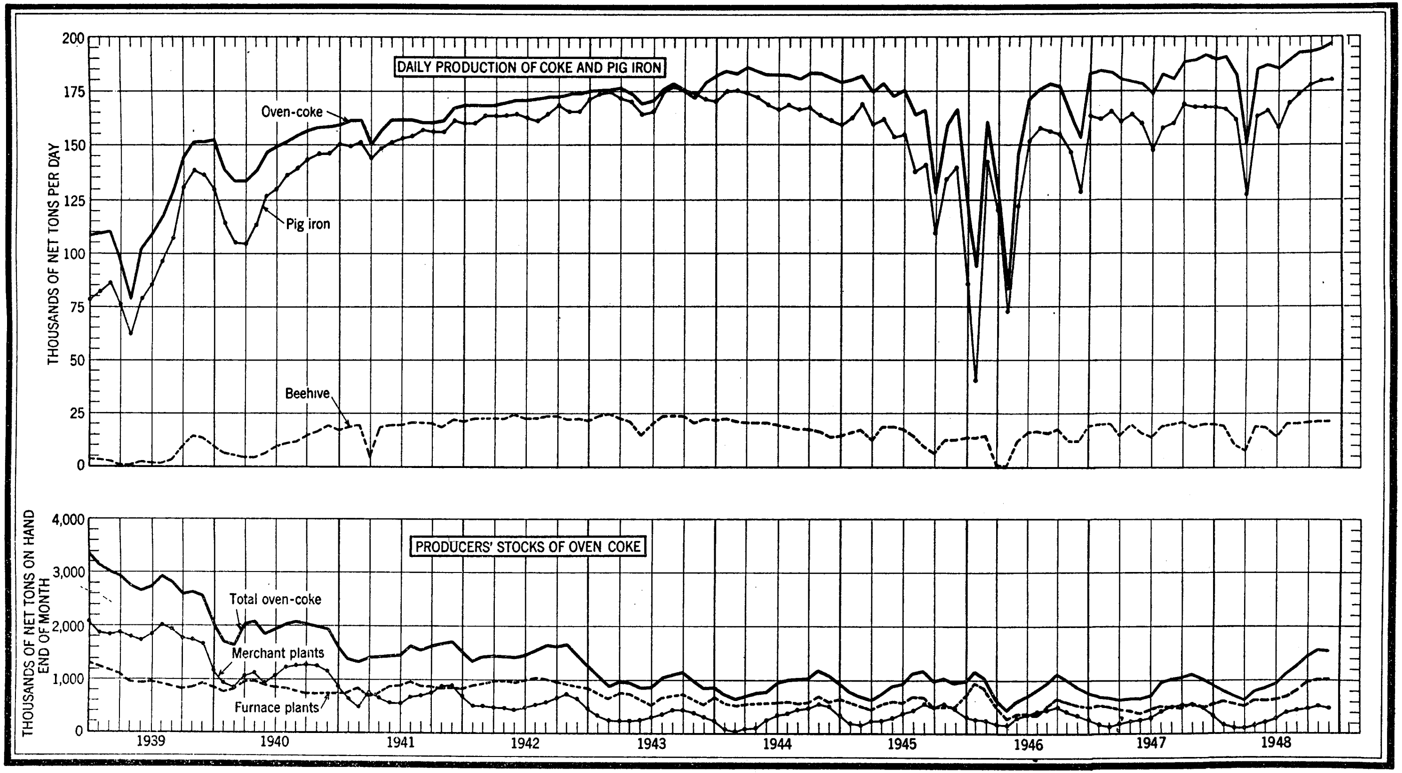

FIGURE 1.—Average daily production of beehive and oven coke and pig iron and producers' stocks of oven coke, 1939–48, by months.

the highest level since February 1944. The upward trend in oven-coke production noted at the close of 1948, if continued, should soften the demand for beehive coke.

The coke industry has been particularly concerned with the quality and supply of coking coal in recent years. One of the bright spots in the industry in 1948 was the marked improvement in these factors during the latter part of the year. Although coke-plant operators had a better selection of coal, much inferior coal was stocked during the first half of the year; as a result, a large amount of poor coal was carbonized. Carbonization of this inferior coal had a marked effect on the yield of coke. Thus, while the total quantity of coal carbonized in 1948 increased 2 percent over the 1947 total, the relative yield of oven and beehive coke decreased from 69.91 percent of the coal charged into the ovens in 1947 to 69.60 percent, the lowest since 1935, whereas the yield of breeze increased from 5.68 to 5.80 percent.

Costs of coal continued to rise in 1948, reaching new levels. The sharp rise at oven-coke plants was due not only to increase in mining costs but also to advances in transportation charges. The average cost of coal delivered at oven-coke plants increased $1.35 per ton (20 percent) over 1947, and the average cost of coal at beehive plants advanced $0.68 per ton (15 percent).

The enormous requirements of coke for industrial purposes in the United States during 1948 encouraged the expansion of coke-making facilities, and 495 new ovens were completed. In addition, extensive repairs were made on many ovens, and several old batteries were rebuilt. Although some old ovens were taken out of production, the annual coke capacity of oven plants at the end of the year increased 1,950,800 tons over 1947, and totaled nearly 74.5 million tons. Demand for beehive coke in 1948 also made it necessary for many operators to reactivate old plants, and the number of beehive ovens totaled 14,078 at the end of the year—an increase of 635.

Coke prices depend directly upon the cost of coal and have shown marked increases since the end of the war. This upward trend in coke prices continued throughout 1948. Average receipts per ton of oven coke sold (merchant sales) advanced $2.83 for blast-furnace coke, $3.99 for foundry, $2.28 for water-gas, $2.45 for other industrial, and $1.98 for domestic. For beehive coke, gains of $2.54 were registered for blast-furnace, $3.12 for foundry, $2.05 for water-gas, $2.08 for other industrial, and $1.81 for domestic.

The use pattern of coke in 1948 varied only slightly from that of 1947, with the metallurgical industries consuming an increasing proportion at the expense of "other industrial" and "domestic" coke. Blast furnaces used 80 percent of the oven and beehive coke shipped from the ovens; iron foundries, 5 percent; producer gas and water gas combined, 6 percent; other industrial, 4 percent; and domestic heating, 5 percent. The total sold for domestic heating was the lowest in 24 years.

Coke requirements in the United States made it necessary to curtail shipments to foreign countries; as a consequence, exports in 1948 decreased 128,869 tons (15 percent) from 1947. Canada, which has always been an important market for a number of the coke producers, received 79 percent of the total exported. Shipments to European countries declined about 55 percent, and exports to South America decreased nearly 61 percent. Imports, although increasing 55 percent over 1947, were small, representing only 0.2 percent of indicated national consumption.

There were no significant changes in employment at coke plants during the year. According to preliminary data from the Bureau's 1948 annual survey of employment at coke plants, 21,900 men were employed at oven-coke plants, working 63,590,000 man-hours—increases over 1947 of 1,122 men and 3,318,174 man-hours. The number of men employed at beehive plants increased from 2,927 in 1947 to 3,100 in 1948, and man-hours worked increased from 5,846,933 to 5,950,000.

The markets for coal-chemical materials in 1948 continued to show the tendency to expand so manifest in recent years. All coke co-products registered moderate quantitative increases over 1947. However, the gains made by crude tar, ammonia, and light oil were not proportionate with the increase made in the output of oven coke, as the relative yield of these products per ton of coal charged has continued to decrease more sharply than that of coke. Whereas the production of coke-oven gas increased at a slightly higher rate than coke, the relative yield of this product also declined. Prices on virtually all coal chemicals increased substantially in 1948 owing to advances in the costs of manufacture and to the stimulation created by a strong demand. Thus, the total realized from the sales of all coal-chemical materials increased 20 percent over 1947, reaching $267,126,556 for an all-time high. The gross value of all coke, breeze, and coal-chemical materials combined increased 20 percent over the 1947 figure.

TABLE 1.—Salient statistics of the coke industry in the United States in 1948

	Coke ovens	Beehive ovens	Total
Coke produced—			
At merchant plants:			
Net tons	13,332,499	[1]	[1]
Value	$191,564,563		
At furnace plants:			
Net tons	54,951,858		
Value	$657,154,520		
Total:			
Net tons	68,284,357	6,577,571	74,861,928
Value	$848,719,083	$79,562,771	$928,281,854
Screenings or breeze produced:			
Net tons	5,765,576	108,267	5,873,843
Value	$20,017,861	$241,290	$20,259,151
Coal charged into ovens:			
Bituminous:			
Net tons	96,984,143	10,321,568	107,305,711
Value	$788,778,359	$52,738,368	$841,516,727
Average per ton	$8.13	$5.11	$7.84
Anthracite:			
Net tons	256,175		256,175
Value	$1,672,248		$1,672,248
Average per ton	$6.53		$6.53
Total:			
Net tons	97,240,318	10,321,568	107,561,886
Value	$790,450,607	$52,738,368	$843,188,975
Average per ton	$8.13	$5.11	$7.84
Average yield in percent of total coal charged:			
Coke	70.22	63.73	69.60
Breeze (at plants actually recovering)	5.93	2.72	5.80
Ovens:			
In existence January 1	14,728	13,443	28,171
In existence December 31	15,139	14,078	29,217
Dismantled during year	84	485	569

See footnotes at end of table.

TABLE 1.—Salient statistics of the coke industry in the United States in 1948—Continued

	Coke ovens	Beehive ovens	Total
Ovens—Continued.			
In course of construction December 31	350	----------	350
Annual coke capacity December 31 ---- net tons	74, 499, 900	9, 076, 200	83, 576, 100
Coke used by producer—			
In blast furnaces:			
Net tons	38, 995, 137	261, 789	39, 256, 926
Value	$466, 383, 833	$4, 109, 360	$470, 493, 193
In foundries:			
Net tons	91, 670	----------	91, 670
Value	$1, 144, 099	----------	$1, 144, 099
To make producer gas:			
Net tons	800, 056	----------	800, 056
Value	$9, 107, 026	----------	$9, 107, 026
To make water gas:			
Net tons	1, 511, 310	----------	1, 511, 310
Value	$16, 657, 979	----------	$16, 657, 979
For other purposes:			
Net tons	414, 157	3, 160	417, 317
Value	$4, 090, 125	$39, 225	$4, 129, 350
Coke sold—			
To financially affiliated companies—			
For blast-furnace use:			
Net tons	12, 021, 531	1, 554, 780	13, 576, 311
Value	$140, 842, 993	$14, 479, 032	$155, 322, 025
For foundry use:			
Net tons	62, 056	----------	62, 056
Value	$1, 402, 291	----------	$1, 402, 291
For manufacture of water gas:			
Net tons	685, 197	----------	685, 197
Value	$9, 024, 330	----------	$9, 024, 330
For other purposes:			
Net tons	247, 144	5, 752	252, 896
Value	$3, 102, 754	$83, 318	$3, 186, 072
To other consumers—			
For blast-furnace use:			
Net tons	2, 936, 675	3, 515, 594	6, 452, 269
Value	$40, 468, 842	$43, 554, 897	$84, 023, 739
For foundry use:			
Net tons	3, 100, 181	496, 752	3, 596, 933
Value	$58, 209, 845	$7, 482, 338	$65, 692, 183
For manufacture of water gas:			
Net tons	1, 546, 592	204, 254	1, 750, 846
Value	$20, 264, 943	$2, 665, 553	$22, 930, 496
For other industrial use:			
Net tons	1, 847, 245	468, 515	2, 315, 760
Value	$25, 389, 694	$6, 316, 072	$31, 705, 766
For domestic use:			
Net tons	3, 398, 696	46, 613	3, 445, 309
Value	$44, 759, 620	$553, 744	$45, 313, 364
Disposal of screenings or breeze:			
Used by producer—			
For steam raising:			
Net tons	3, 625, 109	15, 623	3, 640, 732
Value	$11, 829, 909	$38, 291	$11, 868, 200
To make producer or water gas:			
Net tons	147, 131	----------	147, 131
Value	$732, 761	----------	$732, 761
For other purposes:			
Net tons	773, 636	6	773, 642
Value	$2, 470, 888	$103	$2, 470, 991
Sold:			
Net tons	1, 121, 611	43, 384	1, 164, 995
Value	$4, 612, 058	$100, 544	$4, 712, 602
Average receipts per ton sold (merchant sales):			
Furnace coke	$13. 78	$12. 39	$13. 02
Foundry coke	$18. 78	$15. 06	$18. 26
Water-gas coke	$13. 10	$13. 05	$13. 10
Other industrial coke	$13. 74	$13. 48	$13. 69
Domestic coke	$13. 17	$11. 88	$13. 15
Screenings or breeze	$4. 11	$2. 32	$4. 05
Stocks on January 1, 1949:			
Furnace coke ---- net tons	940, 727	30, 629	971, 356
Foundry coke ---- do	7, 003	964	7, 967
Domestic and other ---- do	612, 851	1, 267	614, 118
Screenings or breeze ---- do	1, 485, 710	6, 231	1, 491, 941
Exports ---- do	(1)	(1)	706, 190
Imports ---- do	(1)	(1)	161, 400
Indicated consumption ---- do	(1)	(1)	73, 755, 934

SCOPE OF REPORT

This chapter is based on data supplied to the Bureau of Mines by coke-plant operators. The statistics are confined to oven and beehive coke and their related products. In accordance with usual procedure, most of the tables herein include comparable data for 3 or 4 preceding years. In recent years, commercial operation of a few low- and medium-temperature carbonization plants has placed coal products on the market that are different in character from those mentioned above. The chief products of these processes are semicokes and tar. The semicoke ranges from 3 to 16 percent in volatile content and is suitable as a smokeless fuel. The tar, which is in demand for distillation, contains a high percentage of light fractions and tar acids. The difference in characteristics of these products compared with those produced by other carbonizing processes is attributed to the lower temperature and to different coking-chamber and heating-flue design, which causes less alteration of the volatile matter expelled during carbonization. In order to follow the progress made in low- and medium-temperature carbonization, a separate table containing salient statistics for this group of plants has been prepared (table 4). Retort coke, as the name infers, is the product made by city-gas companies in coal-gas retorts and has limited application to industrial needs. For this reason, it is used mainly for heating retorts, steam raising, gas manufacture, and domestic heating. Pertinent statistics on retort coke are given in table 5. Coke is made by other processes not covered in this report, including the refining of petroleum and of crude tar. Preliminary figures for 1948 indicate that the production of coke at petroleum refineries totaled 2,898,800 net tons and coal-tar pitch coke 47,000 net tons. The standard unit of measurement in the coke industry in the United States is the short or net ton of 2,000 pounds.

MEDIUM- AND LOW-TEMPERATURE COKE

TABLE 4.—Salient statistics of medium- and low-temperature carbonization plants in the United States in 1948

	Quantity	Value
Coke produced net tons	127,218	$1,335,022
Coal carbonized do	224,975	779,907
Average per ton		3.47
Average yield of coke in percent of coal carbonized	56.55	
Ovens and retorts:		
In existence December 31	56	
Annual coke capacity December 31 net tons	288,900	
Tar produced gallons	1,921,696	
Yield per ton of coal do	8.54	
Value of coke and breeze produced and coal-chemical materials sold		1,661,366

RETORT COKE

TABLE 5.—Salient statistics of the coal-gas industry in the United States in 1948 [1]

	Horizontal retorts	Vertical retorts	Total
Coke produced:			
Net tons	164, 651	364, 723	529, 374
Value	$1, 897, 891	$3, 953, 327	$5, 851, 218
Screenings or breeze produced ... net tons	19, 272	58, 545	77, 817
Coal charged into retorts:			
Net tons	269, 826	627, 352	897, 178
Value	$2, 893, 238	$6, 627, 618	$9, 520, 856
Average per ton	$10. 72	$10. 56	$10. 61
Average yield in percent of coal charged:			
Coke	61. 02	58. 14	59. 00
Breeze (at plants actually recovering)	8. 62	10. 00	9. 62
Retorts:			
In existence December 31	694	382	1, 076
In operation December 31	543	346	889
Annual coal capacity ... net tons	294, 900	711, 400	1, 006, 300
Coke used by producers:			
Net tons	99, 305	222, 138	321, 443
Value	$1, 095, 746	$2, 247, 598	$3, 343, 344
Coke sold to other consumers:

[1] Value for tar up to and including 1917 represented that of tar "obtained and sold" which did not always include value of tar used by producer. Beginning with 1918, tar used by producer is specifically included. Value of breeze produced at oven-coke plants is included for those years for which it was reported, namely, 1916, 1917, and 1919–48. For other coal-chemical materials, only value of those sold is included. Value of breeze produced at beehive plants is not included, as it has usually been much less than a million dollars.

[2] No accurate data on value of the coal-chemical materials available.

MONTHLY AND WEEKLY PRODUCTION

Monthly data on oven and beehive coke, shown in tables 7 to 9, are based upon reports received from producers after minor adjustments have been made. Weekly production of beehive coke is estimated from reports of carloadings received from all coke-carrying railroads. The totals shown in table 10 have been adjusted to the annual total, ascertained by direct canvass of the producers. Data on weekly production of beehive coke are published by the Bureau of Mines in the Weekly Anthracite and Beehive-Coke Report, and monthly data for both oven and beehive coke are published in the Monthly Coke Report. These reports are distributed, free of charge, upon request to the Publications Distribution Section, Bureau of Mines, Washington 25, D. C.

[1] Before 1941 daily average production of beehive coke was calculated by subtracting Sundays and holidays in each month; 1942–48 daily average has been calculated by dividing total monthly production by total number of days in month.

PRODUCTION BY FURNACE AND MERCHANT PLANTS

The criteria used by the Bureau of Mines for classifying "furnace" and "merchant" oven-coke plants were given in detail in the 1947 coke chapter and therefore need not be repeated here.

The total number of active plants in 1948 was the same as in 1947; however, the plant at Fairmont, W. Va., formerly owned and operated by the Domestic Coke Corp., was purchased by the Sharon Steel Corp. on February 1, 1948, and the classification was changed from merchant to furnace plant, as shown in table 11. This change naturally decreased the output from merchant plants, but the sharp increase in furnace output was not due entirely to this transfer. The growth in output of furnace plants in the past decade is due largely to the increased demand for blast-furnace coke. To meet these mounting requirements, expansion of carbonizing capacity at integrated iron and steel works has been necessary. As a result, a greater proportion of coke is being produced by furnace plants. For example, in 1937 furnace plants supplied slightly over 73 percent of the total production, whereas in 1948 the proportion had risen to over 80 percent. Furnace and merchant plants operated at a uniform rate throughout the year, except for a 2-week period in April. Monthly and daily average production data for both types of plants are shown in table 12.

TABLE 11.—Number and production of oven-coke plants connected with iron furnaces and of other plants in the United States, 1913, 1918, 1937, and 1946–48

Year	Number of active plants		Coke produced (net tons)		Percent of production	
	Furnace plants	Merchant plants	Furnace plants	Merchant plants	Furnace plants	Merchant plants
1913	20	16	9, 277, 832	3, 436, 868	73.0	27.0
1918	36	24	19, 220, 342	6, 777, 238	73.9	26.1
1937	43	42	36, 134, 209	13, 076, 539	73.4	26.6
1946	53	32	41, 540, 962	12, 388, 485	77.0	23.0
1947	54	32	52, 860, 850	13, 897, 699	79.2	20.8
1948	55	31	54, 951, 858	13, 332, 499	80.5	19.5

PRODUCTION BY STATES AND DISTRICTS

Oven coke was produced in 22 States in 1948, the same number that reported production in 1947. Increases in production over that of 1947 were reported by 13 States, and decreases up to 12 percent occurred in the 9 remaining States. Production increases are as follows: Texas led with a gain of 145 percent; West Virginia, 17 percent; Colorado, 15 percent; Maryland and Utah, 9 percent each; and Ohio, 5 percent. The largest tonnage increases were reported by Ohio, West Virginia, and Texas. These States combined accounted for 89 percent of the gain in output over 1947.

Production of oven coke by geographic areas is shown in table 14. This tabulation proves that the Middle Atlantic area, which includes Maryland, New Jersey, New York, and Pennsylvania, contributed the largest share of the Nation's output, supplying 38 percent of the total. Illinois, Indiana, and Missouri combined furnished 18 percent, and Ohio ranked third with 16 percent of the total. The rapid expansion of the iron and steel industry in the Western States has greatly increased the requirements for metallurgical coke, and total production in this area has increased more than fourfold since 1937.

In 1948 Pennsylvania continued to surpass all other States combined in the production of beehive coke, supplying 87 percent of the national output. Closing of the only beehive-coke plant in Colorado in 1947 removed that State from the list of producers, leaving only five States in 1948. Production declined in three States, gained slightly in Kentucky, and increased 179 percent in Utah. The tremendous gain in Utah was due to rehabilitation of the large plant at Columbia by Kaiser & Frazer Parts Corp.

[3] Beaver, Greene, and Indiana Counties.

NUMBER AND TYPE OF OVENS

Coke Ovens.—Modernization of existing facilities and construction of new ovens continued at a rapid pace in 1948. In all, 495 new ovens with an annual coke capacity of 2,571,700 tons were built during the year. In addition, 28 old ovens were completely rebuilt in Alabama, and minor repairs were made on a number of ovens in various other places. One battery of 17 ovens in Ohio and another of 61 in Pennsylvania were demolished; failure of 2 ovens in Alabama and 4 in Illinois brought the total number abandoned to 84. The net gain in ovens in 1948 was 411, which raised the total number in existence at the end of the year to 15,139, a new record. In spite of the extensive construction activity of the past several years, the proportion of ovens more than 25 years old is still high. Table 18 shows the number and capacity of all ovens in existence on December 31, 1948, according to age groups. It is evident from the large number of overage ovens shown in this tabulation that extensive construction work must be continued if the current rate of production is to be maintained. Coke-plant operators are endeavoring to meet rising coke requirements by constructing new ovens. At the close of the year 350 new ovens were under actual construction, and contracts were let for erecting several additional batteries.

Beehive Ovens.—Beehive ovens played an important part in meeting blast-furnace coke requirements during World War II, and a large number continued to operate in 1948 to help supply the insatiable demand for metallurgical coke. The average number of beehive ovens in blast during the year ranged from a low of 9,965 in April to a peak of 12,403 in December. The decline in average number of active ovens in April was due to the closing of 1,310 ovens in Pennsylvania by the H. C. Frick Coke Co. Beehive ovens require comparatively less time and money to rehabilitate than slot-type ovens and therefore offer a quick way of adding to the total carbonizing capacity. Hence, the number of beehive ovens needed to satisfy excess metallurgical-coke requirements may be expected to fluctuate more directly with the demand for steel.

CAPACITY OF OVEN-COKE PLANTS

The potential annual coke capacity of oven-coke plants, as reported by operators, was 3 percent higher on December 31, 1948, than at the end of the preceding year. This increase was due principally to the addition of new ovens, as there was but little change in the capacity of ovens reported in existence on December 31, 1947. The basis for calculating the potential annual capacity of a coke plant is the minimum coking time necessary to produce a coke with qualities suitable for the intended use. Thus, the potential capacity of a plant is subject to change from year to year, depending on the age and condition of ovens, character and quality of coal charged, type of coke required, and related economic conditions. The potential capacity, reported by operators to the Bureau of Mines may differ, therefore, from the rated capacity estimated by the builders at the time of construction. It is believed, though, that the potential capacity, as shown in table 21, serves to keep the practical operating capacity up to date.

The coke producers were forced to operate ovens as close to potential capacity as possible throughout 1948 to meet the intense demand for coke. As a consequence, the rate of coke production averaged 92.0 percent of productive capacity, the highest since 1944. The rate of production undoubtedly would have been higher had it not been for the mine shut-down in April. The operators lengthened the coking periods during that time to conserve their coal stocks.

TABLE 21.—Potential maximum annual coke capacity of all oven-coke plants in existence in the United States, 1937 and 1944–48

Year	Plants	Ovens	Potential maximum annual coke capacity (net tons)	Percent of change from 1937

[1] Capacity of all ovens in existence, whether active or idle, based upon maximum daily capacity times days in month.

QUANTITY AND COST OF COAL CHARGED

The coke industry ranked first among the consumers of bituminous coal in the United States in 1948 and carbonized about one-fifth of all bituminous coal produced. The quantity charged into ovens in 1948 increased 2.5 million tons (2 percent) over 1947 and was 2,197,825 tons higher than the 1944 peak. In addition, 256,175 tons of anthracite fines were used at nine oven-coke plants for blending purposes. The feasibility of using anthracite for blending has been known for many years; but it was not until the early 1940's, when the shortage of low-volatile bituminous coal became acute, that the practice was established at a number of plants.

States that led in coking-coal consumption are those in which large iron and steel plants are concentrated. Pennsylvania, Ohio, Indiana, Alabama, and New York are the principal consuming States, in the order named. These five States used 71 percent of the total coking coal carbonized in 1948. Other States using large quantities annually are Illinois, West Virginia, and Michigan, which combined charged 14,509,755 tons, or 13 percent of the Nation's total in 1948.

The cost of coal has been rising rapidly in the past 10 years, and the 1948 average was 116 percent higher than the 1937 figure. The average cost of coal at oven-coke plants in 1948 increased 20 percent over 1947 and established an all-time peak. A large part of the coal used at oven-coke plants is "long-haul" coal, which necessarily increases the cost at ovens. West Virginia, which obtains coal from nearby fields, had the lowest average cost in 1948, while Minnesota, because of its distance from sources of supply, had the highest. Details on the quantity and cost of coal at the ovens are shown in table 24.

Although coal costs at beehive plants rose to a new high, they are not generally so great as at oven-coke plants, as beehive ovens usually are located in the immediate vicinity of the mines. However, some beehive operators have been burdened with an additional cost in trucking part of their coal requirements. The average cost of coal charged into beehive ovens was 15 percent higher than in 1947, being lowest in Pennsylvania and highest in Kentucky and Utah.

PREPARATION AND SOURCE OF COAL

Washed and Unwashed Coal.—The quantity of coal mechanically cleaned for use in the manufacture of coke during 1948 increased 6 percent over 1947 and was the largest in the history of the industry. Mechanical mining of coal, although increasing productivity with a consequent reduction in mining costs, often results in an increase in the refuse content of the run-of-mine coal, so that mechanical cleaning is essential in some areas for the production of satisfactory coke. A number of large and efficient coal-cleaning plants are being erected to bring the coal up to the high standard required for the manufacture of metallurgical coke. One of the principal advantages of clean coal (especially for metallurgical coke) is its consistent quality, resulting in higher uniformity in the physical and chemical properties of the coke.

In 1948, more than 29 percent of the bituminous coal charged into slot-type ovens and 18 percent of the coal for beehive ovens was washed, compared with 26 and 14 percent, respectively, in 1940. Pneumatic cleaning and wet washing methods usually are employed in preparing coal for charging into the ovens, depending upon local conditions. All coal mined and used for the manufacture of coke in Colorado in 1948 was washed; most of Tennessee's and Alabama's and about one-third of Pennsylvania's were also washed before being carbonized. Data in table 28 include coal cleaned at the mines by coal producers, as well as that cleaned at coke plants by coke-plant operators. Bituminous coal cleaned at the mines was used by 41 oven-and 8 beehive-coke plants and comprised 73 percent of the washed coal carbonized; the remainder (8,204,596 tons) was washed at 7 plants having cleaning installations at the ovens.

Sources.—The greatest concentration of coking coal in the United States is found in the Appalachian region, extending from Alabama to Pennsylvania. States in this region supplied 94 percent of all coal used in the manufacture of oven coke in 1948. West Virginia and Pennsylvania are by far the largest suppliers and in 1948 furnished 36 and 32 percent, respectively, of the total coal obtained for coke making by oven-coke-plant operators. Coking coal originating in Kentucky comprised 15 percent of the total, and Alabama contributed 9 percent. The combined tonnages of coking coal supplied by all other States in the Appalachian region (Virginia, Tennessee, Ohio, and Maryland) amounted to 3 percent of the total. The blending of midwestern coals with high-rank eastern coal (both high and low volatile) is receiving more attention, and 641,156 tons of Illinois coal and 154,519 tons of Indiana coal were purchased for this purpose by midwestern oven-coke-plant operators in 1948. States west of the Mississippi River supplied 1 percent of the total in 1937 but furnished 5 percent in 1948. This sharp increase was due to the large expansion in coal-carbonizing capacity in Texas, Colorado, Utah, and California.

Many of the coke-producing companies, especially those connected with the iron and steel industry, own or control "captive" mines that supply them with coking coal. In 1948 annual reports submitted by coke-plant operators showed that more than 56 percent of the total carbonized by oven-coke plants was received from such mines. Plants connected with the iron and steel industry—those classified by the Bureau as "furnace" plants—obtained 81,436,423 tons of coal in 1948, of which 63 percent came from captive mines. For the nonfurnace or merchant segment of the oven-coke industry, only 30 percent of the 18,936,304 tons of coal received was "captive." Tables 29 and 30 contain statistics on the origin of the coal used and on States of consumption in 1948.

Blending.—The practice of mixing or blending various types of coals before charging into the ovens is widely used in the oven-coke industry as an important part of coal preparation. Blending has several aims and considers many factors important to the oven-coke-plant operators. The primary objective is to produce, economically, a quality coke satisfactory for the use intended. It also permits the use of coals that have good coking properties but otherwise may be objectionable from the standpoint of excessive ash, sulfur, or phosphorus content and that could not be used alone as a 100-percent charge. Thus, in addition to providing a means of controlling the quality and strength of the coke and the yield of coproducts, blending permits flexible operations at oven-coke plants and use of a wider variety of coking coal.

Although virtually all oven-coke plants mix or blend coals before charging them into the ovens, the blending of coals of different volatile content was practiced at 77 oven-coke plants in 1948, of which 45 used high- and low-volatile coal; 26, high-, medium-, and low-; 2, high- and medium-; and 4, low- and medium-volatile. Of the plants that did not blend coals of different volatile content, 5 plants used straight high-volatile and 4 medium-volatile. The proportion of the different kinds of coals mixed before charging into ovens, where practiced, varies widely from plant to plant according to local conditions. Classification of all coal purchased for coking in slot-type ovens in 1948 showed, however, that 65 percent was high-volatile, 13 percent medium-volatile, and 22 percent low-volatile.

TABLE 29.—Coal received for manufacturing oven coke in the United States in 1948, by fields of origin

State and district where coal was produced	Quantity received (net tons)	States where coal was consumed, in order of importance

[1] Computed by dividing production of breeze by coal charged at plants actually recovering.
[2] Included with "Undistributed."
[3] As reported; quantity produced but not used was undoubtedly greater. See Mineral Resources of the United States, 1922, pt. II, pp. 726–727.

SHIPMENTS BY RAIL, WATER, AND TRUCK

The bulk of the oven coke produced in the United States was consumed in integrated metallurgical operations in 1948, and only about 38 percent of the total output was loaded for shipment outside the producing plant. The principal method of movement is by rail, which accounted for 88 percent of the total shipments in 1948, the same as in 1947. Truck shipments declined slightly from 1947 and represented 8 percent of the total. Shipments by boat are relatively small and were equivalent to only 4 percent of the total.

Unlike oven coke, which is mostly consumed at the points of production, beehive coke is made in the vicinity of the mines, and nearly all is loaded for shipment to centers of consumption. Railroads transport virtually all of the beehive coke shipped and handled 99 percent of all shipments in 1948. The remainder moved either by truck or barge.

TABLE 33.—Coke and breeze sold and loaded at plants in the United States for shipment in 1948, in net tons

DISTRIBUTION OF OVEN AND BEEHIVE COKE

The largest tonnage of coke on record was distributed by coke-plant operators in 1948. Total shipments exceeded the 1947 figure by 922,231 tons and were 526,044 tons higher than the previous peak in 1944. There were no significant changes in the use pattern of coke or in the States of destination when compared with 1947. Pennsylvania, as usual, was the ranking coke-consuming State, accounting for 27 percent of all coke distributed. Ohio maintained its position as second-largest consumer, with 17 percent of the total. Indiana, New York, Illinois, and Alabama followed in that order and combined, took 32 percent of the total. The large tonnage of coke consumed in the six States mentioned is attributable to the centralization of heavy industries in those States.

Coke was used as blast-furnace fuel in 18 States in 1948, and the quantity utilized for that purpose (excluding exports) was equivalent to 80 percent of the total shipments. Iron foundries are located in all of the States but one, hence the movement of foundry coke is widespread. A large demand for castings existed in 1948; and the quantity of coke shipped to foundrymen was the highest on record, amounting to 5 percent of total shipments. Although consumption of coke for use in the manufacture of producer gas dropped below the 1947 figure, the increase in shipments for water-gas production offset this decline to the extent that total shipments for all gas making increased only 121 tons and constituted 6 percent of the total. The distribution of coke for other industrial purposes in 1948 declined 11 percent from 1947 while shipments for domestic or household heating were the lowest in 24 years. These two consumer classes used 4 and 5 percent, respectively, of the 1948 shipments as compared with 3 and 14 percent in 1940.

Table 36 shows the comparative consumption of coke by geographic regions, for 1940 and 1948. The Southwest, Mountain, and Pacific region shows the largest percentage increase in consumption, with a gain of 244 percent during this period because of the new coking facilities in Texas, Colorado, Utah, and California, which were built to supply metallurgical coke to integrated blast furnaces in those States. This region reported less than 2 percent of the national coke consumption in 1940 but utilized almost 5 percent in 1948. The Southeast region showed the second-largest relative gain in consumption, with an increase of 44 percent over 1940. This marked rise in consumption was due to the substantial increase in the use of blast-furnace and "other industrial" coke in West Virginia, Alabama, Kentucky, and Tennessee. The Middle Atlantic region surpassed all others in consumption, with 40 percent of the national total in 1948. This region showed the largest quantitative increase over 1940, with a gain of 5,567,103 tons, most of which was used in blast furnaces. The marked reduction in the use of coke for domestic heating in the New England, Michigan, Missouri Valley, and Lake Dock regions was the principal reason for the decreased consumption in those regions since 1940.

[1] Revised figure. Difference of 67,718 tons reported for furnace use in 1940 transferred to other industrial use.

CONSUMPTION OF COKE

The indicated consumption of coke in the United States in 1948—allowing for imports, exports, and changes in producers' stocks—was the greatest on record, surpassing the mark established in 1944 by 784,533 tons. Although stocks increased 561,204 tons during 1948, the rise in consumption was made possible by the gain in production. Blast furnaces, as might be expected, were the largest consumers of coke, accounting for 80 percent of the indicated consumption. The ratio of net tons of coke used to each net ton of pig iron and ferro-alloys produced increased for the fourth straight year. This decline in fuel efficiency has been attributed largely to deterioration in the quality of coal used in manufacturing blast-furnace coke. Fuel efficiency should improve in the future, because coke-plant operators undoubtedly will have a better selection of coking coals as demand slackens in this country and abroad and because more preparation plants are scheduled to be placed in operation. The quantity of coke consumed for other purposes (in foundries and for gas making, chemical processes, nonferrous smelting, and household heating) dropped slightly from 1947. The decline was due chiefly to a further curtailment in domestic coke sales because of diversion to iron blast furnaces.

TABLE 37.—Coke consumed in manufacture of pig iron and for other purposes in the United States, 1913, 1918, 1937, and 1946–48, in net tons

[1] Production plus imports minus exports, plus or minus net changes in stocks.
[2] American Iron and Steel Institute; figures include coke consumed in manufacture of ferro-alloys.
[3] Data not available.

TABLE 38.—Coke and coking coal consumed per net ton of pig iron made in the United States, 1913, 1918, 1937, and 1946–48

Year	Coke per net ton of pig iron and ferro-alloys [1] (pounds)	Yield of coke from coal (percent)	Coking coal per net ton of pig iron and ferro-alloys (pounds calculated)	Year	Coke per net ton of pig iron and ferro-alloys [1] (pounds)	Yield of coke from coal (percent)	Coking coal per net ton of pig iron and ferro-alloys (pounds calculated)
1913	2, 172. 6	66. 9	3, 247. 5	1946	1, 894. 0	70. 0	2, 705. 7
1918	2, 120. 7	66. 4	3, 193. 8	1947	1, 926. 0	69. 9	2, 755. 4
1937	1, 830. 6	70. 3	2, 604. 0	1948	1, 937. 2	69. 6	2, 783. 3

[1] American Iron and Steel Institute; consumption per ton of pig iron only, excluding furnaces making ferro-alloys, was 2,172.6 pounds in 1913, 2,120.7 in 1918, 1,806.7 in 1937, 1,868.0 in 1946, 1,900.0 in 1947, and 1,908.0 in 1948.

The accompanying tables summarize the disposal of coke by principal end uses during 1948. A large proportion of the oven-coke output is used by the producers at the point of production, whereas nearly all beehive coke is shipped to points of consumption. Iron blast furnaces are the largest users of coke in the United States and are supplied mainly by "furnace" and beehive plants. The proportion of blast-furnace requirements supplied by "furnace" plants has been increasing in recent years because of the substantial expansion of coke-making facilities at those plants. For example, "furnace" plants supplied 96 percent of all oven coke distributed to blast furnaces in 1948, compared with 91 percent in 1940. "Merchant" plants supply the bulk of the coke used for all other industrial purposes and domestic heating. In 1948, this type of plant furnished 82 percent of the total sold for foundry use, 81 percent for other industrial (including gas making), and 79 percent of the domestic coke.

Normally, beehive ovens supply a greater proportion of their production to blast furnaces than slot-type ovens. In 1948, 81 percent of all beehive coke produced was shipped to blast furnaces. Sales of beehive coke in 1948 for foundry use, other industrial, and domestic heating varied only slightly from 1947.

[3] Includes 5,752 tons valued at $83,318 sold to financially affiliated companies for other industrial use and 204,254 tons, $2,665,553 for manufacture of water gas.

STOCKS OF COKE AND COKING COAL

Coke.—In spite of the extremely large demand for coke in 1948, year-end stocks increased 54 percent over reserves carried at the end of 1947. This marked increase was due to a gain of 585,078 tons (151 percent) of "furnace" coke, as stocks of "foundry" and all other kinds decreased slightly. The total quantity in stock at producers' plants, however, was not abnormal and, when calculated on the basis of the production rate prevailing at the end of the year, was equivalent to 7.3 days. Most of the coke stocks were at oven-coke plants (98 percent), as beehive producers customarily carry but a few tons at any time.

Coal.—Coal stocks are of extreme importance to oven-coke producers because the ovens must operate continuously. Any disruption in coal production or in the delivery of coal to the plant can cause serious damage to the coke ovens if they cool too rapidly because of a lack of coal. For this reason, oven-coke producers attempt to maintain at least a 30-day supply of coking coal in reserve at the plants. Stocks of coal at oven plants averaged about 31 days' supply in the first quarter of 1948 but dropped sharply in April due to work stoppages in the bituminous coal industry. Stocks increased substantially in

May and June but declined in July because of the vacation period of the bituminous-coal miners. However, in succeeding months, stocks of coal at oven-coke plants increased steadily and at the close of the year were the highest on record. At that time, quantity on hand was sufficient for 43.4 days' supply at the rate of consumption prevailing in December.

TABLE 41.—Summary of total stocks of coke on hand at all coke plants in the United States on Jan. 1, 1937 and 1945–49, in net tons

VALUE AND PRICE

The term "value," as used in this report, represents the value of the coke at the ovens as reported by producers. For that part of the output sold, the value is the amount received for the coke f. o. b. ovens. However, the greater part of the coke produced in the United States is made in ovens operated by corporations which not only mine the coal used in the manufacture of coke but also operate blast furnaces and steel mills consuming the entire output of their ovens. Under such conditions, fixing a value for coal charged and for coke produced is purely arbitrary. For example, at some plants the cost of coke to the furnace department equals the cost of production; at others, a margin of profit is added; or the reported value is based on what the coke would cost if purchased. The line between sales and interdepartmental transfers is difficult to draw among such affiliated interests, as a large part of the furnace coke reported as sold actually goes to iron furnaces that are in some way connected with the coke producers. The average value of all coke produced, measured in this way, increased $1.83 to $12.40 per ton, the highest figure ever recorded and a gain of 17 percent over 1947 (table 45).

The average price received for each ton of coke sold f. o. b. ovens (merchant sales) in 1948 established a new record and was 15 percent over the 1947 figure. Table 46 shows average receipts from sales, classified by uses and by States. It will be noted that prices vary notably with the distances from the mines. Thus, the highest average prices are those reported for the New England and Lake Dock States, where the coal must be hauled great distances.

TABLE 45.—Average value per net ton of coke produced and average receipts per net ton from coke sold in the United States, 1937, and 1944–48

FOREIGN TRADE [1]

Exports.—The shipment of coke to foreign countries in 1948 decreased 15 percent in quantity and 2 percent in value from 1947. Although the United States has always exported a larger tonnage than it has imported, exports have generally accounted for less than 2 percent of the total production. Exports averaged 534,400 tons annually for the period 1937–39 and 924,200 tons during 1946–48 (table 47). Despite heavy foreign demand for metallurgical coke during and since the end of World War II, exports have been limited because of domestic shortages. The exportation of metallurgical coke, the grade in

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

shortest supply, has been restricted to the Western Hemisphere by Government export controls. A quota of 50,000 long tons per quarter was established in 1948 for countries in the Western Hemisphere other than Canada; the Dominion was not limited to a quota. In the immediate prewar years, 90 percent of the coke exported from the United States went to Canada; in 1948, exports to that country comprised 79 percent of the total.

Imports.—Imports of coke fill but a small part of the Nation's requirements and are restricted to a few localities. Statistics on United States imports do not distinguish between coal coke and petroleum coke, although the two varieties are listed separately in export statistics. Total imports of all types of coke comprise only a fraction of 1 percent of the indicated consumption of the United States. In the prewar years 1937–39, imports averaged 187,800 tons annually and were received principally from Canada, Belgium, Germany, and the United Kingdom. During the 3-year period (1946–48) the average was 105,900 tons, all of which came from Canada in 1946 and 1947 and all but 605 tons in 1948 (table 48). Most of the imported coke enters the United States by rail through the Montana-Idaho customs district where the coke is probably used for smelting nonferrous metals. Significant tonnages also enter the Michigan, Buffalo, and Wisconsin customs districts, where it is used principally for domestic heating.

TECHNOLOGY

Considerable scientific and technical work was done in 1948 by the Federal Government and State agencies, coal-research laboratories, colleges, and individual companies in the field of coal technology. The Federal Bureau of Mines, which has conducted scientific and technologic investigations on coal and related products since its creation by the Congress in 1910, continued its research work in these fields during 1948. The work done by the Bureau of Mines in 1948 was highlighted by the initiation of a long-range program to augment the coking-coal resources of the United States as of January 1, 1948. This study is being conducted in three phases:

1. The investigation of known minable coking-coal reserves.
2. Upgrading of marginal coking coals by improved coal preparation methods.
3. Extension of coking-coal reserves by carbonization studies.

The field work of investigating the known coking-coal reserves consists of contacting owners of coal lands and the operators of coal mines to explain the purpose of the study and to secure, if possible, the following: (*a*) A map of the property, (*b*) maps of mines showing extent of workings, (*c*) thickness of the coal beds and location of outcrops, (*d*) maps giving locations of drill holes, (*e*) logs of drill holes giving bed sections and bed names, (*f*) chemical analyses of the coals, and (*g*) life production of each mine. Maps are prepared from the date obtained, and the average thickness of coal and the remaining coal reserves are computed from them. Where the productive life of a mine and the average thickness of the coal bed are known, the percentage of recovery may be calculated. Estimates are made of the removable reserves by quadrangles as the work progresses and will be regrouped and reported by counties or other suitable geographic areas. This work started simultaneously in western Pennsylvania, southern West Virginia, and eastern Kentucky and later will spread to other States until all coking-coal deposits have been investigated.

An intensive study was undertaken to investigate the washing characteristics of that part of the Pittsburgh bed in southwestern Pennsylvania and northern West Virginia, the last large reserve of Pittsburgh coal available to the steel industry of Pittsburgh. Work was also started to determine the washing characteristics of the Pocahontas No. 6 coal bed in the smokeless field of West Virginia. Low-volatile Pocahontas coals are of major importance in the manufacture of metallurgical coke, and more attention is being given the lesser-known Pocahontas beds, such as No. 6, because Nos. 3 and 4 seams are becoming depleted.

Progress continued on the extension of potential reserves of readily usable coking coals by the accumulation of data on the carbonizing properties of untested coals and coal blends. A brief résumé of the special studies by Bureau engineers on the carbonizing properties, plasticity, expansion, and oxidation of coal in the fiscal year ending July 1, 1948, is given in a report released in 1949.[2]

The research program of the Illinois Geological Survey on the use of Illinois coal in the production of metallurgical coke was actively pursued and has been extended to include investigation of the blending of

[2] Fieldner, A. C., and Gottlieb, Sidney, Annual Report of Research and Technologic Work on Coal, Fiscal Year 1948: Bureau of Mines Inf. Circ. 7518, 1949, 87 pp.

inerts, especially char from Illinois coal. Comprehensive reports of the work done on this subject by the Survey have been published.[3]

The outstanding work initiated by E. J. Gardner and his associates for Inland Steel Co. in 1944 on the effect of coke quality on blast-furnace performance was continued in 1948.[4]

The importance of properly sizing, screening, and preparing blast-furnace coke was established in studies made by Cromwell and Covington at the Campbell plant of the Youngstown Sheet & Tube Co.[5]

The American Iron and Steel Institute, in cooperation with the American Coke and Coal Chemicals Institute, is sponsoring research on the quality of coke currently being produced and its effect on blast-furnace operation. One of the main objectives of this work is to select or determine sampling and test procedures that will adequately identify essential coke properties. It is planned to correlate the results of these tests with those on the iron-smelting properties of the coke in the blast furnace.

The influence of blending anthrafines on the quality of commercially produced cokes was summarized.[6]

The Koppers Co. made studies on the expansion properties of coal, blends, and the correlation of plasticity with coking properties in its laboratories at Kearny, N. J.[7] The Russell movable-wall oven, which provides reliable data on the quality of the coke, was used in determining expansion. The oven has been widely adopted by steel companies, and the Bureau of Mines uses a similar oven in its experimental work.

WORLD PRODUCTION

Production of coke is a good barometer for measuring the industrial activity of a country. Thus, the rise in production of coke in 1948 in virtually all countries of the world indicated that progress was being made in most countries in industrial production. Estimated world production in 1948 was 11 percent higher than in 1947, but it was 13,910,000 tons (8 percent) below the record wartime output in 1943. The decrease in 1948 from the 1943 total may be attributed to the huge reduction in German output, which has been under control of the Allied Nations since the end of World War II. The United States continued to lead the world in coke production, supplying 42 percent of the estimated world total in 1948. German output increased substantially over 1947 and equaled 12 percent of the total. Precise data on the production of coke in the Soviet Union are not available, but it is known that this country has substantial coal-carbonizing capacity and doubtless ranks second to the United States in metallurgical coke production. Other important coke-producing countries in 1948 were Great Britain, France, Czechoslovakia, Poland, Belgium, and Canada, which combined furnished 24 percent of the total.

[1] Excludes gas-house coke.
[2] Coke is also produced in New Zealand, but data are not available.
[3] Data not available; estimate by senior author of chapter included in total.
[4] Revised; previous figure included gas-house coke.
[5] Estimate.
[6] Exports.
[7] Areas designated as Free China during the period of Japanese occupation.
[8] Includes Silesian production.
[9] Excludes French and Russian zones.
[10] Revised; previous figure excluded French zone.
[11] Preliminary data for fiscal year ended March 31 of year following that stated.
[12] South Korea only.
[13] Subject to revision.
[14] Production of Siberia and Urals only.
[15] In Great Britain production of gas-house coke is especially important: 10,770,130 tons in 1938, averaged 11,000,000 tons per year 1941-45, and increased 15 percent for 1946 and 1947.

COAL-CHEMICAL MATERIALS

GENERAL SUMMARY

The importance of coal-chemical materials cannot be adequately measured by the volume of production or by the revenue derived from their sale. The value of these materials to the industrial economy of the Nation is difficult to estimate because the various coal products enter many fields; the finished product of one industry may become the raw material for another in a chain of processes leading to the manufacture of the final commodity. The starting point in the creation of this wide variety of materials, so essential to the public welfare, is the carbonization of bituminous coal. The materials to grow our foods, clothe our bodies, and heal our ills are made from the

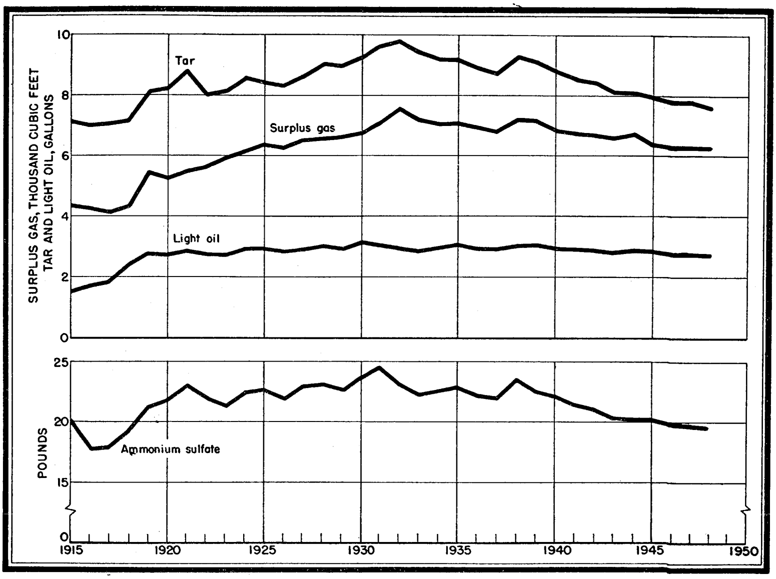

FIGURE 2.—Average yield of principal coal-chemical materials per net ton of coal carbonized in coke ovens, 1915–48. Yields of light oil and ammonium sulfate equivalent represent average for plants recovering these products.

gases and vapors recovered from the hundreds of coke ovens scattered throughout our land. Coke-plant operators are placing more emphasis on the recovery of basic products such as tar, light oil, and ammonia than ever before to meet rising demand and are processing them into benzol, toluol, xylol, creosote oil, naphthalene, pyridine, ammonium sulfate, and a host of other products. Although coke-oven gas is a potential source of chemical raw materials, such as hydrogen, methane, ethylene, etc., it is not being processed to any appreciable extent in this country, as virtually all of the production is used as industrial and domestic fuel. In spite of the emphasis being placed on the recovery of basic products, the relative yields of each has declined markedly in the past decade. For example, the yield of crude tar per ton of coal carbonized has dropped from 9.27 gallons in 1938 to 7.60 in 1948, a

[1] Includes products of tar distillation conducted by coke-oven operators under same corporate name.
[2] Softening point less than 110° F. Includes some medium pitch of tar reported by 2 producers.
[3] Softening point over 160° F.
[4] Cresols, cresylic acid, crude anthracene, fuel oil, pitch coke, road tar, tar paint, and refined tar.
[5] Excludes value of sulfate made from purchased synthetic ammonia.
[6] Excludes sulfate made from purchased synthetic ammonia.
[7] Includes gas used for heating ovens and gas wasted.
[8] Refined on premises to make derived products shown: 242,956,216 gallons.
[9] Benzol still residue, dicyclopentadiene, orthoxylene, and vented vapors.
[10] Ammonium thiocyanate, cyanogen sludge, picolines, secondary oil, and sodium prussiate.

decline of 18 percent; ammonium sulfate equivalent, from 23.36 pounds to 19.52 (16 percent); crude light oil, from 2.99 gallons to 2.73 (9 percent); and coke-oven gas, from 11.04 M cubic feet to 10.23 (7 percent). These marked reductions in yield have been due to a number of factors, the principal ones being the deterioration in the quality of coal available to the coke-plant operators and the higher oven temperatures and shorter coking periods employed for maximum coke production since the beginning of World War II.

The market for coal chemicals in 1948 was unusually good, and prices on all commodities increased sharply. As a consequence, the gross receipt from the sale of coal-chemical materials was the highest on record, exceeding the 1947 total by $45,032,905 (20 percent). Although total realization from sales of all coke-oven products reached a new level because of the spectacular gains made by some, the percentage of revenue obtained by the sale of the coal-chemical materials did not change from 1947 and was far below the proportion credited to them in 1929. In that year, the revenue obtained from the sales of coal-chemical materials was equivalent to 36 percent of the total value of all products, whereas in 1948 it was only 23 percent. Of the coal-chemical materials, surplus coke-oven gas supplied the greatest income in 1948, followed in order by tar (sold and used), light oil and derivatives, and ammonia and its compounds. Details on the value of coal-chemical materials and of coke (including breeze), on the basis of each ton of coke produced, are shown in table 52. Table 50 summarizes data on the production, sales, value, and stocks of the various coal-chemical materials at coke plants.

TABLE 51.—Coal equivalent of coal-chemical materials produced at oven-coke plants in the United States, 1913, 1914, 1918, 1937, and 1946–48

Year	Quantity of coal-chemical materials				Estimated equivalent in heating value (billion B. t. u.)					Coal equivalent	
	Coke breeze (thousand net tons)	Surplus gas (billion cubic feet)	Tar produced (thousand gallons)	Light oil produced (thousand gallons)	Coke breeze	Surplus gas	Tar	Light oil	Total	Net tons	Percent this forms of coal made into coke

COKE-OVEN GAS

Coke-oven gas is an important product of coal carbonization. Approximately 17 percent by weight of the coal charged into high-temperature slot-type ovens is recovered in the form of fuel gas. About one-third of the gas recovered is employed to heat the coke ovens, and the remainder (surplus gas) is used in allied metallurgical works, by neighboring industries, or is pumped through city mains for public consumption. The volume of gas produced in 1948 increased 2 percent over that of 1947 because of the larger quantity of coal charged; but, due to a decline in yield, was 13,947,300 M cubic feet below the 1944 peak output. The increase over 1947 made available larger quantities of surplus gas, and the increases in manufacturing costs were reflected in higher prices; hence gross value increased by 12 percent. The iron and steel industry is the largest consumer of coke-oven gas and in 1948 used about two-thirds of the surplus gas as boiler fuel or in metallurgical furnaces. Public utilities are the second-largest consumer and took about 28 percent of the total. Information on sales of surplus coke-oven gas for industrial purposes has been collected by the Bureau of Mines from coke producers since 1922, and in 1948 such sales amounted to 6 percent of the total. Unquestionably, however, a considerable part of the quantity sold to public utilities was used for industrial purposes, in addition to the amount specified above. Gas distribution through city mains brings higher prices than that sold or used by producers for industrial purposes; in 1948, the average unit value of this gas was the highest reported since 1925.

Table 55 shows the distribution of surplus gas, by type of plant. Furnace plants produce and distribute by far the largest amount of coke-oven gas; however, merchant plants contribute the largest part of the gas distributed through city mains. Public utilities or city-gas plants, built primarily to supply gas, receive the largest unit value for their product.

CRUDE COAL TAR

Production of crude coal tar increased slightly over 1947 but was about 29,052,065 gallons (4 percent) less than the record output in 1944. The yield of tar per ton of coal charged began to decline at the beginning of World War II and in 1948 was the lowest since 1918. The yield varies greatly from plant to plant, depending upon the kind of coal used, the temperature of oven operation, the completeness of tar recovery, and other factors. In modern plants using selected grades of coal for oven-coke manufacture, the tar yield is 6 to 8 gallons per ton of coal carbonized. There are, of course, a few plants where considerably higher yields are obtained, especially in the Western States where the practice is to use a larger proportion of high-volatile coals in their coal mixes. Details on production, quantities used by producers, and sales, by States, are shown in table 57. As indicated in this table, the operators of merchant or nonfurnace plants generally sell all tar produced. At plants integrated with iron and steel works more than half of the crude tar recovered is used by the producers. A number of furnace plants process a portion or all of their tar output to make tar products, while others use the tar advantageously in integrated open-hearth or other metallurgical operations. The quantity of tar processed by producers declined slightly from 1947, but the amount used as fuel increased. Sales of tar declined in quantity but increased sharply in value owing to an increase of 3 cents in the average price per gallon. Most of the coke-oven tar sold is shipped to tar distillers for refining into a number of tar products. Coke-oven tar comprises about 75 percent of the total processed in the United States; the remainder is made up of low-temperature coal tar, retort coal tar, water-gas tar, and oil-gas tar.

[1] Comprises 27,613,138 gallons sold to affiliated companies and 7,064,239 gallons to other purchasers.
[2] Included with "Undistributed."

The principal commercial tar products produced at coke plants are creosote oil and tar-acid oil. Creosote oil, a tar derivative used in the United States mainly for wood preservation, usually brings in about 50 percent of the revenue obtained by coke-plant operators from the sale of tar derivatives. Although the quantity of creosote oil produced (distillate, as such and in coal-tar solution) in 1948 decreased 14 percent from 1947, receipts from sales did not decline proportionately because the unit price increased 12 percent. Tar-acid-oil sales increased 14 percent in quantity and 85 percent in value, while sales of phenol reached almost a million dollars. Details on the production and sale of cresols, cresylic acid, anthracene, and other derivatives cannot be disclosed, as less than three producers reported these products to the Bureau. Virtually all of the pitch output, which decreased 3 percent from 1947, was used by the producers. The soft- or medium-melting-point pitches are cut back (usually with virgin tar) to the desired viscosity and used as metallurgical fuel. The hard pitch produced at several plants is pulverized and mixed with the coal charged into the ovens to improve the quality of the coke.

COKE-OVEN AMMONIA

All but 5 of the 86 active coke plants recovered ammonia in 1948; 64 converted the ammonia to ammonium sulfate, and 19 recovered it as ammonia liquor (2 plants produced both sulfate and liquor). In addition, purchased synthetic anhydrous ammonia was converted into sulfate at five coke plants in 1948. Data on production and sales of sulfate from purchased synthetic ammonia are shown separately in table 50 to avoid distorting the Bureau's series on coke-oven sulfate. The total production of coke-oven ammonia (NH_3 equivalent of all forms) in 1948 advanced 2 percent over the 1947 output but was 7,605,039 pounds lower than the record established in 1944 because of the decline in yield per ton of coal carbonized. An extremely heavy demand existed for nitrogenous materials for industrial and agricultural purposes in the United States as well as abroad; as a consequence, stocks of sulfate and liquor at the end of the year were 17 and 46 percent lower, respectively, than at the beginning of the year. Two laws were in force during 1948 which limited exports of chemical nitrogen and regulated distribution in the United States. Nitrogenous fertilizer materials for export purposes were controlled by the Second Decontrol Act, as extended by Public Law 606. To alleviate shortages of nitrogenous fertilizers in the United States, the Congress passed section 205 of Public Law 793, which provided that a portion of the anhydrous ammonia produced in plants operated by or for the Department of the Army be distributed to converters for the manufacture of nitrogenous fertilizer materials for use in the United States.

Prices of sulfate increased greatly in 1948 and reached the highest average unit level in 22 years, while the average price of the liquor (NH_3 content) was the highest since 1943. Data on the production and sales of coke-oven ammonia by States are given in table 58.

CRUDE LIGHT OIL AND DERIVATIVES

Crude light oil is the basic raw material from which benzol, toluol, xylol, etc., are made. These hydrocarbons are of vital importance; and, although toluol and xylol are recovered in larger quantities from petroleum-refining processes, coal carbonization remains the principal source of benzol. The yield of crude light oil per ton of coal carbonized, as is the case with tar and ammonia, varies widely from plant to plant. There has been a gradual decline in yield in the past few years, and the yield in 1948 was the lowest since 1923. Production, although increasing over 1947, fell considerably short of equaling the wartime peak of 1944. Most of the crude light oil produced at coke plants is refined by the operators in adjacent facilities, and only about 5 percent of the annual output is sold to tar refiners for processing. In refining crude light oil, over 60 percent of the total quantity charged into the stills is recovered as pure benzol. In the years immediately preceding World War II, the demand for pure benzol was not large enough to absorb all that could be recovered from the available light oil. Consequently, the light oil was refined only into "motor benzol." Requirements for pure benzol increased rapidly during World War II, and the refining process was altered to produce the purer grades. This practice has continued, with every indication that it will continue in the future. Pure benzol is converted into about six chief derivatives, such as phenol, aniline, styrene, etc. These materials are the basis for many secondary and tertiary derivatives, namely, synthetic rubber, nylon, plastics, and some explosives. The demand for pure benzol influenced prices; the average unit value increased 2.9 cents per gallon (18 percent) over 1947, and the total realization from this product represented 72 percent of the total revenue obtained by coke-plant operators from the sale of all light-oil derivatives. Toluol production increased more than 2 million gallons (8 percent) over 1947. Production of xylol and solvent naphtha increased slightly, indicating a good demand for these aromatic solvents. Prices on toluol, xylol, and solvent naphtha advanced substantially over 1947 but were still below wartime levels.

COKE OVENS OWNED BY CITY GAS COMPANIES (PUBLIC UTILITIES)

The accompanying table comparing statistics on the operations of coke plants owned by gas utilities with those not so owned is presented by the Bureau of Mines for the information of those who may wish to follow the activities of public utility plants. The adaptation of the coke oven to the needs of city-gas manufacture had induced a number of public utilities to install coke ovens to supplement—or even replace—their coal-gas plants at the end of World War I. In ensuing years a number of plants installed coke ovens, and the number so equipped reached a peak of 23 in 1934. In that year, gas utility companies produced 11 percent of the Nation's oven coke, 12 percent of the coke-oven gas and tar, 9 percent of the coke-oven ammonia, and 4 percent of the crude light oil. The development of long-distance pipe lines for transmitting natural gas and improved technology in the manufacture of water gas have reversed the trend in recent years, and a number of companies have substituted natural gas for coke-oven gas. As a result, coking operations at a number of locations have been discontinued; and the number of gas plants operating coke ovens has steadily declined until, by the end of 1948, only 12 such plants were in operation. These plants contributed 5 percent of the total production of oven coke, 5 percent of the gas, 5 percent of the crude tar, 4 percent of the ammonia, and 3 percent of the crude light oil. The reason that the proportion for crude light oil is lower than for other products is that some of the gas companies, to increase the calorific value of the gas, do not scrub out this product.

[1] Coke ovens built by city gas companies some of which are operated in conjunction with coal- and water-gas plants. Does not include independent oven-coke plants which may sell gas to public-utility companies for distribution.
[2] Revised figure.

Copper

By CHARLES WHITE MERRILL AND HELENA M. MEYER

GENERAL SUMMARY

CONTINUATION of peak peacetime domestic consumption and determination of the United States Government to proceed toward its strategic stock-pile objective kept the copper-producing industry under pressure again in 1948 to meet the over-all demand. Ever since the period of work stoppages in mid-1946, domestic production rates had been close to what may be considered optimum capacity levels (nearly 875,000 tons annually). Prevailing conditions favored high production. Actual consumption plus stock-pile needs promised to take all copper made available, prices had risen sharply so that the annual average for 1948 established a 30-year peak, and inadequate labor supplies were largely overcome in most areas.

A strike of locomotive engineers inside the pit at the Kennecott Copper Corp's. Utah Copper mine, West Mountain (Bingham) district, Utah, largest producer in the United States, beginning October 24 and continuing beyond December 31, was almost entirely responsible for 1948 mine production falling short of the anticipated 875,000 tons; output was 834,813 tons. About 50,000 tons were lost from the 1948 supply as a result of the strike. The drop below the practical maximum in 1947 was due chiefly to a similar but briefer strike at the end of that year; production was 847,563 tons. Smelter output from domestic ores dropped only 2 percent to 842,477 tons in 1948, the full weight of changes in mine rates being reflected, as was natural, later in smelter than in mine totals.

883326—50——31

Imports of crude and refined copper rose to 507,251 tons from 413,894 tons in 1947, or 23 percent, and were at a new peacetime peak rate, although still far below tonnages entered during World War II. The quantity of foreign copper made available for domestic use was further increased by a small drop in exports of refined copper (from 147,642 tons in 1947 to 142,598 tons in 1948). The shortage of dollar exchange continued to deter normal exportation of copper and copper products. Export controls in 1948 still limited the shipment from the United States of copper and copper products made from domestic ores, but no quantitative restrictions were imposed on the exportation of copper from foreign ores and blister. In addition to foreign trade in copper, copper ore, and copper products there are always large but unmeasured net exports of copper in such manufactures as automobiles and electric motors. Industry and Government stocks (except the National Stock Pile) at the end of 1948 appeared to be close to an irreducible minimum considering the high rate of domestic consumption, but there was evidence that some stocking had taken place as a safeguard against difficulties in obtaining prompt delivery of the metal.

The price for electrolytic copper, delivered Connecticut Valley, was 21½ cents a pound at the end of 1947. In mid-1948, the price was advanced 2 cents a pound. Throughout 1947 and until the end of July 1948, the United States price for copper in the domestic market was below the United States export price and usually was considerably under the price of the British Ministry of Supply. Following the rise of 2 cents at the end of July, the United States price continued below the export price but was higher than that in the United Kingdom. The temporary excess over the United Kingdom figure was reversed again with the advance of £8 per long ton, to £140 (equivalent to 25.15 cents a pound), in the British Ministry of Supply price, effective October 1.

Congress adjourned in June 1948 without agreeing on any metal subsidy legislation. Copper mining had been a beneficiary under the metal subsidies that ceased June 1947.

World production in 1948, like that in the United States, appeared to be at practical capacity rates under prevailing conditions but at levels below peaks attained in World War II. Mine output is estimated as 2,558,000 short tons in 1948 compared with 2,436,000 tons in 1947.

Some of the plans in progress or prospect for major expansion or maintenance of present production rates are outlined in the following paragraphs.

Late in 1947 the Anaconda Copper Mining Co. announced that it would undertake a 5-year, $20,000,000 program to mine low-grade copper ore above the 3,400-foot level in the Butte Hill mines, called the "greater Butte project." An eventual output of 15,000 tons a day of the low-grade ore is anticipated, and the concentrator at Anaconda is being extended to treat the larger tonnages. Investigations indicate that more than 130,000,000 tons of ore, from which 20 pounds or more of copper a ton can be recovered, are available for treatment. Work in 1948 was reported to be proceeding according to schedule.

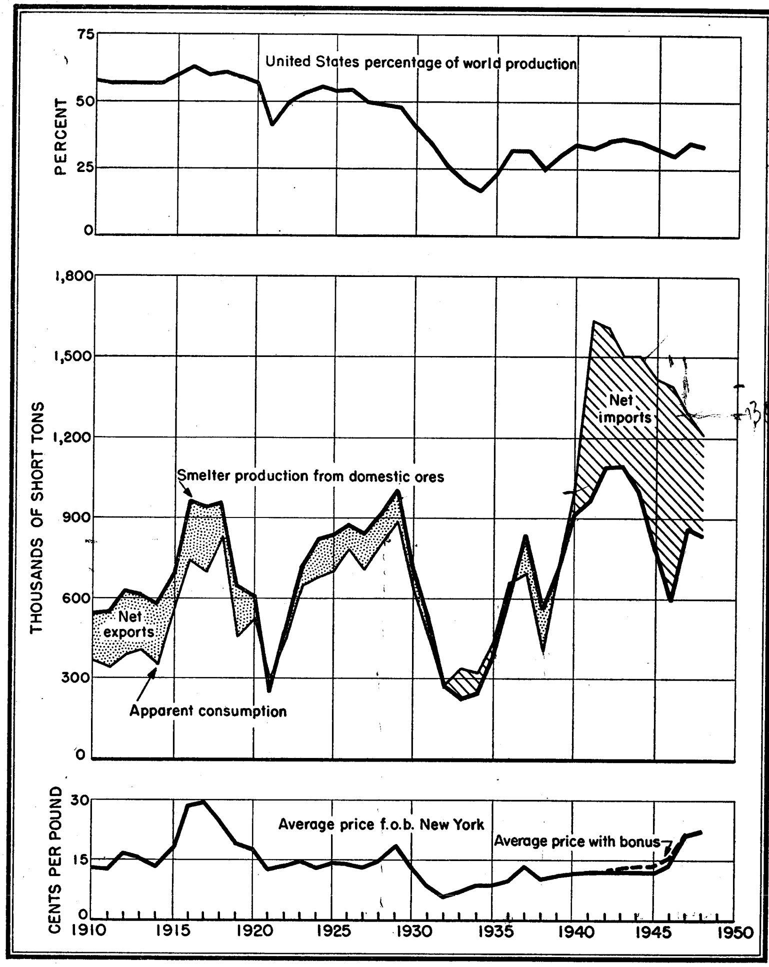

FIGURE 1.—Trends in production, consumption, and price of copper in the United States, 1910–48.

In addition to the large project in Montana, Anaconda is making even larger expenditures in Chile, where the oxide ores that have been worked to date are approaching exhaustion and where alterations must be made to treat the vast underlying reserves of sulfide ores.

The Kennecott Copper Corp. is constructing a copper refinery in the vicinity of the Magna mill, on the southern shore of Great Salt Lake. The company report for 1948 indicated that building foundations were nearing completion. The plant was planned originally to refine 12,000 tons a month but is being so constructed that the capacity can be increased quickly to 16,000 tons.

During the year the Phelps Dodge Corp. purchased from the Government facilities built and installed at Government expense during World War II and operated under lease by the corporation. These facilities included additions to the mine equipment and extensions to the concentrator and smelter plants at Morenci, Ariz., an extension to the refinery at El Paso, Tex., and a fabricating plant at Los Angeles, Calif. The company is constructing a new smelter at Ajo, Ariz.

This report for 1947 indicated that drilling of the San Manuel, Ariz., ore body was suspended indefinitely on February 23, 1948, following a campaign during which 123,499,580 tons of oxide ore, containing 0.767 percent copper, and 339,284,920 tons of sulfide ore, containing 0.788 percent copper—a total of 462,784,500 tons averaging 0.782 percent copper—were developed. Thus one of the largest copper ore bodies in the United States had been proved. During 1948 the necessary construction was undertaken and practically completed to provide power and other facilities for underground mining there.

In Northern Rhodesia plans included expansion of plant facilities; efforts continued to overcome rail and harbor conditions which had restricted transportation serving the mines. Expansion of present refinery capacity and new plants are said to be in prospect for the Belgian Congo.

Salient statistics of the copper industry in the United States, 1939–43 (average) and 1944–48, in short tons

World smelter production, new copper	2,853,000	2,848,000	2,409,000	2,046,000	2,481,000	2,581,000

[1] Includes old tailings.
[2] Data include copper imported for immediate consumption plus material entering country under bond.
[3] Revised figure.
[4] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufactures of copper," for which figures of quantity are not recorded.
[5] Excludes rods.
[6] Exclusive of bonus payments of the Office of Metals Reserve; Premium Price Plan covered the period February 1, 1942, to June 30, 1947, inclusive.

The following Bureau of Mines reports of investigations, published recently, relate to copper in whole or in part.

4341. Ore Knob Copper Mine, Ashe County, N. C.
4344. Cape Rosier Zinc-Copper-Lead Mine, Hancock County, Maine.
4349. Rush & Brown Copper Mine, Kasaan Bay, Prince of Wales Island, southeastern Alaska.
4357. Sutherland Copper Prospect, Floyd County, Va.
4358. Salt Chuck Mine, Kasaan Peninsula, Prince of Wales Island, southeastern Alaska.
4362. Toncrae-Howard Copper Deposits, Floyd County, Va.
4364. Union Copper Mine, Cabarrus and Rowan Counties, N. C.
4378. Majuba Hill Copper-Tin Mine, Pershing County, Nev.
4384. Virgilina Copper District, Virginia and North Carolina.
4395. Ely Mine Copper Deposit, Orange County, Vt.
4397. Chestatee Copper and Pyrite Deposit, Lumpkin County, Ga.

DOMESTIC PRODUCTION

Statistics on copper production may be compiled upon a mine, smelter, or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better than mine figures for showing the actual recovery of metal and more accurate than refinery figures for showing the source of production; and refinery statistics are best for showing recovery of metal but indicate only in a general way the source of crude materials treated. The chapter on Copper in Mineral Resources of the United States, 1930, part I, discusses differences among the three sets of figures.

Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1944–48, in short tons

Year	Mine	Smelter	Refinery
1944	972, 549	1, 003, 379	973, 852
1945	772, 894	782, 726	775, 738
1946	608, 737	599, 656	578, 429
1947	847, 563	862, 872	909, 213
1948	834, 813	842, 477	860, 022

PRIMARY COPPER

Mine Production.—The figures for mine production are tabulated from reports supplied by all domestic mines that produce copper. These data are classified geographically, by metallurgical methods, and by types of ore. Tables presenting the information in detail are to be found in the State chapters of this volume.

Arizona, as usual, easily led all other States in production in 1948, supplying 45 percent of the total for the United States, followed by Utah, with 27 percent. Arizona's output comes from a number of important copper-producing districts and mines, whereas Utah's is predominantly from one mine, the largest copper producer in the United States. Production from New Mexico, Montana, Nevada, and Michigan, ranking next in importance as copper producers in 1948, made up 25 percent of the total. The six States mentioned thus produced 97 percent of the United States total.

Classification of production by mining methods shows that approximately 68 percent of the total copper and 76 percent of the copper ore came from open pits in 1948. Most of the domestic copper ore was treated by flotation at or very near the mine of origin, and the resulting concentrates were shipped for smelting. Some copper ores were direct-smelted either because of their high grade or because of their fluxing qualities.

Mine production of recoverable copper in the United States, in 1948, by months [1]

Month	Short tons	Month	Short tons
January	73, 643	August	74, 042
February	69, 419	September	70, 298
March	74, 578	October	69, 141
April	74, 827	November	52, 239
May	75, 264	December	53, 462
June	76, 076		
July	71, 824	Total	834, 813

[1] Monthly figures adjusted to final annual mine production total.

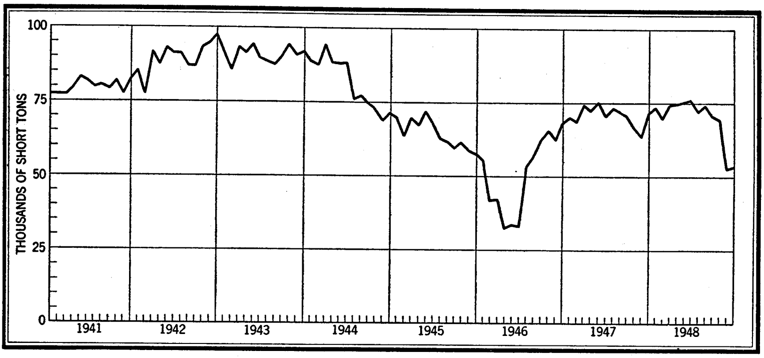

FIGURE 2.—Mine production of recoverable copper in the United States, 1941–48, by months, in short tons.

Mine production of recoverable copper in the United States, 1938–48, with production of maximum year, and cumulative production from earliest record to end of 1948, by States, in short tons

[1] For Missouri and States east of the Mississippi, maximum since 1905.
[2] Small quantity for Wisconsin included with Missouri.
[3] Data not available.
[4] The 1908 volume of Mineral Resources credits this figure to Massachusetts and New Hampshire; the 1909 volume credits it to New Hampshire alone.
[5] Bureau of Mines not at liberty to publish figure.
[6] Tennessee includes other States indicated by footnote 6; Bureau of Mines not at liberty to publish separate figures.
[7] Less than 1 ton.
[8] For States other than Michigan, figures represent largely smelter output. Excludes small quantity, not separable, for Wisconsin shown with Missouri.
[9] Largely smelter production for States east of the Mississippi except Michigan.

Mine production of copper in the principal districts [1] of the United States, 1944–48, in terms of recovered copper, in short tons

District or region	State	1944	1945	1946	1947	1948

[3] Bureau of Mines not at liberty to publish figure.
[4] Not listed in order of output.

Twenty-five leading copper-producing mines in the United States in 1948, in order of output

Rank	Mine	District	State	Operator	Source of copper
1	Utah Copper	West Mountain (Bingham)	Utah	Kennecott Copper Corp	Copper ore.
2	Morenci	Copper Mountain (Morenci)	Arizona	Phelps Dodge Corp	Do.
3	Chino	Central	New Mexico	Kennecott Copper Corp	Do.
4	Butte Mines	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co	Copper, zinc-lead ores.
5	New Cornelia	Ajo	Arizona	Phelps Dodge Corp	Copper ore.
6	Inspiration	Globe-Miami	do	Inspiration Consolidated Copper Co	Do.
7	Ruth and Copper Flat Pit	Robinson (Ely)	Nevada	Kennecott Copper Corp	Do.
8	Castle Dome	Globe-Miami	Arizona	Castle Dome Copper Co., Inc	Do.
9	Miami	do	do	Miami Copper Co	Do.
10	Calumet and Hecla Cons	Lake Superior	Michigan	Calumet and Hecla Cons. Copper Co	Copper ore and tailings.
11	Copper Queen	Warren (Bisbee)	Arizona	Phelps Dodge Corp	Copper, zinc-lead, gold-silver ores.
12	Magma	Pioneer (Superior)	do	Magma Copper Co	Copper ore.
13	Ray Mines	Mineral Creek (Ray)	do	Kennecott Copper Corp	Do.
14	United Verde	Verde (Jerome)	do	Phelps Dodge Corp	Copper, zinc-copper ores.
15	Consolidated Coppermines Group	Robinson (Ely)	Nevada	Consolidated Coppermines Co	Copper ore.
16	Bagdad	Eureka (Bagdad)	Arizona	Bagdad Copper Corp	Do.
17	Burra Burra, Eureka, Boyd, Mary, Calloway.	Polk County	Tennessee	Tennessee Copper Co	Copper-bearing pyrites.
18	Holden	Chelan Lake	Washington	Howe Sound Co	Zinc-copper ore.
19	Cornwall	Lebanon County	Pennsylvania	Bethlehem Steel Co	Magnetite-pyrite-chalcopyrite ore.
20	Isle Royale	Lake Superior	Michigan	Isle Royale Copper Co	Copper ore.
21	Quincy	do	do	Quincy Mining Co	Copper-ore tailings.
22	Elizabeth	Orange County	Vermont	Vermont Copper Co	Copper ore.
23	Bonney and Miser's Chest Group	Lordsburg	New Mexico	Banner Mining Co	Do.
24	Treasury Tunnel Mines	Upper San Miguel	Colorado	Idarado Mining Co	Zinc-lead-copper ore.
25	United States and Lark	West Mountain (Bingham)	Utah	U. S. Smelting, Refining & Mining Co	Gold-silver, lead, silver, zinc-lead ores.

The first 5 mines in the foregoing table produced 67 percent of the United States total, 10 produced 84 percent, and the entire 25 furnished 98 percent.

Quantity and Estimated Recoverable Content of Copper-Bearing Ores.—The following tables list the quantity and estimated recoverable copper content of the ore produced by mines in the United States in 1947; complete details for 1948 are not yet available. Of the total copper produced from copper ores in the United States during 1947, 92 percent was obtained from ores concentrated before smelting, 4 percent from direct-smelting ores, and 4 percent from ore treated by straight leaching. These percentages for 1947 compared with 91 percent obtained from concentrated ore, 4 percent from direct-smelting ores, and 5 percent by straight leaching in 1946.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that estimated recoverable tenor is close to actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only all those that contain 2.5 percent or more recoverable copper but also those that contain less than this percentage if they are valuable chiefly for copper, notably the "porphyry ores." Mines report considerable copper from ores mined primarily for other metals. These include siliceous gold and silver ores, lead and zinc ores, and pyritic ores.

Copper ore, old tailings, etc., sold or treated in the United States in 1947, with copper, gold, and silver content in terms of recovered metals

State	Ore, old tailings, etc., sold or treated (short tons)	Copper produced		Gold produced (fine ounces)	Silver produced (fine ounces)	Value of gold and silver per ton of ore
		Pounds	Percent

[1] Includes old tailings, etc.
[2] Includes ore from Washington classed as zinc-copper ore.

Smelter Production.—The recovery of copper by smelters in the United States from ores of domestic origin totaled 842,477 short tons in 1948, a decrease of 2 percent from the total of 862,872 tons for 1947. Such output constituted 51 percent of the world production during 1925–29 but dropped sharply in the succeeding years until 1934, when it was only 17 percent. From 1936 to 1940 it fluctuated between 25 and 33 percent, in 1942–44 it was slightly above 35 percent, and in 1945–48 it ranged from 29 to 35 percent.

The figures for smelter production are based upon returns from all smelters handling copper-bearing materials produced in the United States. For Michigan the sum of furnace-refined copper and copper cast into anodes for electrolytic refining is included. The figures for blister copper represent the fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production. Metallic and cement copper recovered by leaching is included in smelter production.

The quantity, in pounds, of copper produced by smelters in the United States and its value are shown by years for 1845–1930 in the Copper chapter of Mineral Resources of the United States, 1930, part 1.

Copper produced (smelter output) in the United States, 1939–43 (average) and 1944–48, and total, 1845–1948

Year	Short tons	Value [1]
1939–43 (average)	953,752	$219,276,000
1944	1,003,379	236,797,000
1945	782,726	184,723,000
1946	599,656	172,701,000
1947	862,872	360,680,000
1948	842,477	365,635,000
Total, 1845–1948	34,736,590	10,315,249,000

[1] Excludes bonus payments of Office of Metals Reserve; Premium Price Plan in effect Feb. 1, 1942, to June 30, 1947.

Refinery Production.—The refinery output of copper in the United States in 1948 was made by 12 plants; 8 of these employed the electrolytic method only, 2 the furnace process on Lake Superior copper, 1 the furnace process on western ores, and 1 both the electrolytic and the furnace methods.

Five large electrolytic refineries are on the Atlantic seaboard, three Lake refineries on the Great Lakes, and three electrolytic refineries west of the Great Lakes—one at Great Falls, Mont.; one at Tacoma, Wash.; and one at El Paso, Tex. In 1942 fire-refined copper was produced for the first time at the Hurley, N. Mex., plant of the Kennecott Copper Corp., and virtually all of the plant output was treated by this method in 1948. The El Paso plant of the Phelps Dodge Refining Corp. produced fire-refined copper in addition to the usual electrolytic grade. Of the plants specified above, the Lake refinery of the Copper Range Co. has been idle since October 9, 1945. That of the Quincy Mining Co., idle since 1933, was reopened in the final quarter of 1948.

In addition to the plants in the preceding paragraph, but included in the 12 active refineries noted, is the plant at Inspiration, Ariz., which is equipped to make electrolytically refined copper direct from the liquors obtained from leaching. Usually all of this copper is shipped as cathodes to other refineries, where it is melted and cast into merchant shapes; but in 1946 more than one-third went directly to consuming plants. The latter practice was continued in 1947 and 1948 but on a considerably reduced scale.

Primary and secondary copper produced by primary refineries in the United States and imported, 1939–43 (average) and 1944–48, in short tons

	1939–43 (average)	1944	1945	1946	1947	1948
Primary:						
Domestic: [1]

Grand total	1,657,912	1,799,980	1,736,628	1,138,605	1,578,537	1,601,946

[1] The separation of refined copper into metal of domestic and foreign origin is only approximate, as accurate separation at this stage of manufacture is not possible.
[2] Some copper from Michigan is electrolytically refined at eastern refineries and is included as electrolytic copper.
[3] Data include copper imported for immediate consumption plus material entering country under bond.
[4] Includes some secondary Lake copper.
[5] Copper from scrap at Lake refineries included under "casting" copper in 1945–48.

The 13 plants indicated constitute what commonly are termed "regular refineries." Of these plants, eight employ the electrolytic process, four the furnace process, and one both methods. The electrolytic plants, exclusive of the one at Inspiration, have a rated capacity of 1,509,000 tons of refined copper a year. They produced at the rate of 81 percent of capacity in 1948.

The accompanying tables show the production of refined copper at regular refining plants, classified according to source, grade, and form in which cast.

Copper cast in forms at primary refineries in the United States, 1946–48

Form	1946		1947		1948	
	Short tons	Percent	Short tons	Percent	Short tons	Percent
Wire bars	502,000	51	885,000	62	783,000	58
Billets	112,000	11	160,000	11	187,000	14
Ingots and ingot bars	102,000	10	99,000	7	148,000	11
Cakes	142,000	15	178,000	13	134,000	10
Cathodes	115,000	12	87,000	6	76,000	5
Other forms	11,000	1	20,000	1	25,000	2
Total	984,000	100	1,429,000	100	1,353,000	100

In addition to the regular refineries, many plants throughout the country operate on scrap exclusively, producing metallic copper and a variety of alloys. The output of these plants is not included in the statements of refined-copper production in the preceding tables but is included in the following statement on secondary-copper production.

Copper Sulfate.—The production of hydrous copper sulfate or bluestone by copper refineries in the United States was 24,500 short tons having a copper content of 6,132 tons in 1948 compared with 24,600 tons containing 6,161 tons in 1947. The output of copper sulfate by plants other than the regular primary refineries totaled 72,200 tons with a reported content of 18,054 tons in 1948 compared with 64,500 tons containing 16,115 tons of copper in 1947. Producers held 10,200 tons of copper sulfate at the beginning of 1948, total production was 96,700 tons, and shipments amounted to 93,100 tons. Some small purchases were made by producers during the year, and producers used a quantity equivalent to 2 percent of shipments. Inventories at the year end were 11,800 tons.

SECONDARY COPPER

Secondary copper includes material recovered from remelting old copper and copper scrap and from copper alloys or alloys treated without separation of the copper. The following table summarizes the production of secondary copper during 1939–48. Detailed information appears in the Secondary Metals—Nonferrous chapter of this volume.

Secondary copper produced in the United States, 1939–43 (average) and 1944–48, in short tons

	1939–43 (average)	1944	1945	1946	1947	1948
Copper recovered as unalloyed copper	142,122	102,135	112,856	136,909	303,092	284,026
Copper recovered in alloys [1]	612,267	848,807	893,660	666,637	658,649	688,762
Total secondary copper	754,389	950,942	1,006,516	803,546	961,741	972,788
From new scrap	376,763	494,232	509,421	397,093	458,365	467,324
From old scrap	377,626	456,710	497,095	406,453	503,376	505,464
Percentage equivalent of domestic mine output	80	98	130	132	113	117

[1] Includes copper in chemicals, as follows: 1939–43 (average), 10,582; 1944, 13,357; 1945, 18,666; 1946, 19,192; 1947, 18,838; 1948, 17,612.

CONSUMPTION

The following table gives figures on apparent consumption of copper in the United States, and data for a long period are available on this basis. In estimating apparent consumption it has been assumed that copper used in manufacturing primary fabrications of copper is consumed. The method of calculating the quantity of copper available for consumption is shown in the accompanying table. It should be noted that exports and stocks include some refined secondary copper that cannot be determined separately and also that actual consumption of new copper would differ from the figures shown in the table by changes in consumers' stocks. Actual consumption of new copper has been at virtually constant rates, at peacetime peak levels, in the postwar period. The apparent consumption calculation is distorted in 1947 and 1948 by the fact that during this period unusual quantities of copper were imported in the form of scrap and reexported in refined form. Because refined exports cannot be broken down to show new and old copper, deductions were made from apparent consumption without making corresponding additions to supply.

New refined copper withdrawn from total year's supply on domestic account 1944–48, in short tons

	1944	1945	1946	1947	1948
Total supply of new copper	1,713,582	1,639,966	1,033,033	1,309,448	1,356,570
Stock at beginning of year	68,500	81,000	130,000	96,000	60,000
Total available supply	1,782,082	1,720,966	1,163,033	1,405,448	1,416,570
Copper exported [1]	68,373	48,563	52,629	147,642	142,598
Stock at end of year	81,000	130,000	96,000	60,000	67,000
Total	149,373	178,563	148,629	207,642	209,598
Withdrawn on domestic account [2]	1,504,000	1,415,000	1,391,000	1,286,000	[3] 1,214,000

[1] Includes refined copper in ingots, bars, or other forms.
[2] Adjusted for Office of Metals Reserve stock changes.
[3] Includes copper delivered to the National Strategic Stock Pile.

The Bureau of Mines began to compile figures on actual consumption of copper in 1945. Details for 1946 to 1948, inclusive, are shown in the accompanying table. Unlike the foregoing table, which attempts to eliminate all but new copper from measurement, the following one does not distinguish between new and old copper. It covers copper consumed in refined form.

The heavy consumption of wire bars in 1947 and 1948 is noteworthy.

Refined copper consumed in 1946–48, by classes of consumers, in short tons

Class of consumer	Cathodes	Wire bars	Ingots and ingot bars	Cakes and slabs	Billets	Other	Total
1946:							
Wire mills	1, 803	484, 004	15, 238				501, 045

[1] Revised figure.

STOCKS

The following table gives domestic stocks of copper as reported by primary smelting and refining plants. Stocks of blister and anode copper in transit from smelters to refineries are included with blister copper.

Over-all industry stocks continued to drop in 1948 as new supplies again fell short of large consumer needs.

Stocks of copper at primary smelting and refining plants in the United States at end of year, 1944–48, in short tons

Year	Refined copper	Blister and materials in process of refining [1]	Year	Refined copper	Blister and materials in process of refining [1]
1944	81, 000	311, 000	1947	60, 000	213, 000
1945	130, 000	331, 000	1948	67, 000	183, 000
1946	96, 000	254, 000			

[1] Includes copper in transit from smelters in the United States to refineries therein.

Producers' (smelters and refineries) inventories of crude and refined copper, of which only about one-quarter was in the form of refined metal, fell 8 percent, aggregating 250,000 tons at the end of the year.

At the end of 1947 the Office of Metals Reserve held 9,986 tons of electrolytic and fire-refined copper in cathodes, shapes, and in-process copper. No copper remained in Metals Reserve hands at the end of 1948, having been sold to industry or shipped to the National Strategic Stock Pile.

Fabricators held 379,346 tons of refined copper (including in-process metal and primary fabricated shapes) at the end of 1948, according to the United States Copper Association, a decline of 10 percent compared with inventories when the year began. Working stocks were reported as 295,958 tons, or virtually unchanged from those on hand a year before. After accounting for unfilled purchases of metal, the deficiency of stocks in relation to unfilled orders was found to be 151,060 tons compared with 104,922 at the end of 1947.

Figures compiled by the Copper Institute show that domestic stocks of refined copper increased from 76,035 tons at the end of 1947 to 96,080 tons at the end of 1948. Inventory data of the Bureau of Mines and the Copper Institute always vary owing to somewhat different bases. Before 1947, a primary reason was that the Copper Institute coverage was limited to duty-free copper. The inclusion by the Copper Institute of all copper after January 1, 1947, reduced the differences chiefly to variations in individual interpretation. In the Bureau of Mines classification, cathodes to be used chiefly for melting and casting into shapes are considered stocks in process and not refined stocks.

Stocks of copper in fabricators' hands at end of year, 1944–48, in short tons

	Stocks of refined copper [1]	Unfilled purchases of refined copper from producers	Working stocks	Unfilled sales to customers	Excess stocks over orders booked
1944	334,017	53,538	289,160	285,654	−187,259
1945	375,618	44,100	268,490	362,436	−211,208
1946	411,013	59,421	286,418	526,648	−342,632
1947	423,432	103,765	293,859	338,260	−104,922
1948	379,346	81,496	295,958	315,944	−151,060

[1] Includes in-process metal and primary fabricated shapes. Also includes small quantities of refined copper held at refineries for fabricators' account.

PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 1,377,000 short tons of copper were delivered to domestic and foreign purchasers in 1948 at an average price (f. o. b. refinery) of 21.7 cents a pound or 58 percent above that prevailing for 1942–47. The averages for 1942–47 exclude bonuses paid for overquota outputs of individual mines, which were first applicable to February 1942 tonnages; the Premium Price Plan ended June 30, 1947. The history of the Premium Price Plan is given briefly in the report of this series for 1947.

883326—50——32

Average monthly quoted prices of electrolytic copper for domestic and export shipments, f. o. b. refineries, in the United States, 1947–48, in cents per pound

[4] Average for 8 months; thereafter, London Metal Exchange dealings suspended.
[5] No quotations. See text for official price changes.

Copper was in strong demand throughout 1948, but the price remained at 21.2 cents a pound for electrolytic copper, f. o. b. refinery, until the end of July. Sharp advances in prices for lead and zinc were followed by a rise for copper of 2 cents a pound in small producers' prices on July 29. By August 11 all producers were quoting the higher price, which prevailed throughout the remainder of the year. The average monthly price for export copper, f. o. b. refinery, was 0.3 to 0.5 cent higher than the domestic price in the first 8 months of the year, dropped to 0.225 cent in September–November, and was 0.254 cent in December.

London Price.—The official maximum price of the British Ministry of Supply for electrolytic copper in the London market was established at £132 per long ton (equivalent to 23.73 cents a pound) on July 14, 1947, and remained at that level until late in 1948. Following several advances in the United States price, the British price was raised to £140 per long ton (25.15 cents a pound), effective October 1, at which level it continued beyond the end of the year.

FOREIGN TRADE [1]

Before World War II United States imports and exports of copper constituted a well-balanced trade through which the smelting, refining, and manufacturing facilities of this country were utilized to treat foreign materials and to return refined copper and manufactures of copper abroad. Because of the excise tax on copper imported into the country, virtually no foreign metal was consumed in the United States, the imported copper being treated under bond and thus not subject to payment of the tax. This situation was changed during the war, when all copper imported had to be retained for the war program; because the Government became the importing agent during this period, the tax was ineffective. In the postwar period industry and Government again required all imported as well as domestic copper to fill above-normal requirements for the metal, and most of the imported copper again was consumed here. To encourage imports the excise tax was suspended, effective April 30, 1947—March 31, 1949.

IMPORTS

Total imports of unmanufactured copper gained 23 percent and were at a peacetime peak rate but continued well below records established in 1941–45. Total entries of the lower-grade imports were little changed in 1948 as compared with 1947; but the more important unrefined class dropped 7 percent, while the refined class rose 67 percent to lead other items by a substantial margin. Quantities of ores and concentrates received from the larger suppliers in 1948 differed somewhat from 1947; but totals for the two were similar, the greatest change being the drop in imports from Peru. In the unrefined grade, receipts from Northern Rhodesia were reported in 1948 but not in 1947; entries from Chile were larger but those from Mexico, Peru, Yugoslavia, and the Union of South Africa dropped, and Turkey disappeared from the list. Chile's shipments of refined copper to the United States rose sharply in 1948, Canada's likewise gained markedly, the unusual entry from Japan in 1947 was not repeated in 1948, and receipts from Peru dropped.

Copper (unmanufactured) imported into the United States, 1939–43 (average) and 1944–48 [1]

[U. S. Department of Commerce]

Year	Short tons	Year	Short tons
1939–43 (average)	608,835	1946	393,275
1944	785,211	1947	[2] 413,894
1945	853,196	1948	507,251

[1] Data include copper imported for immediate consumption plus material entering country under bond.

[2] Some copper in "ore" and "other" from Republic of the Philippines is not separately classified and is included with "concentrates"
[3] Revised figure.
[4] Tonnages credited to Southern Rhodesia by the U. S. Department of Commerce have been added to Northern Rhodesia.

EXPORTS

Refined copper continued in its usual position as by far the chief copper export class; shipments in 1948 were slightly smaller than in 1947. Of the larger recipients in 1947, United Kingdom, Netherlands, Sweden, and Italy obtained less in 1948, and India, Switzerland, France, and Germany received more. Sweden was shipped virtually none in 1948. Of the other export classes, the negligible ore and concentrates class gained, as did rods, pipes and tubes, wire (insulated), and old and scrap. On the other hand, smaller quantities of plates and sheets and wire (except insulated) were exported.

WORLD REVIEW

The leading copper-producing countries of the world, with the exception of the United States, had larger outputs in 1948 than in 1947. There is, as usual, question regarding the U. S. S. R., for which precise data are not obtainable, but doubtless production rose in that country also. The drop in the United States resulted from the strike at the country's leading mine—the Utah Copper—from October 24 through the remainder of the year. Altogether a small increase in world production is indicated.

World mine production of copper, 1942–48, in metric tons

[1] Copper content of blister produced.
[2] Smelter output from domestic and foreign ores, exclusive of scrap. Production from domestic ores only, exclusive of scrap, was as follows: 1942, 987,004; 1943, 991,492; 1944, 910,245; 1945, 710,073; 1946, 543,996; 1947, 782,780; 1948, 764,278. The diversion during the war of Belgian Congo matte from its previous destination, Belgium, for resmelting in the United States resulted in some duplication. The movement ended in 1945.
[3] United States imports.
[4] Figures represent blister copper only. Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from Belgian Congo and would therefore duplicate output reported under the latter country.
[5] Data not available; estimate by authors of chapter included in total.
[6] Exclusive of material from scrap.
[7] Approximate production.
[8] Includes scrap.
[9] Bizonal area.
[10] Output from U. S. S. R. in Asia included with U. S. S. R. in Europe.
[11] Data represent areas designated as Free China during the period of Japanese occupation.
[12] Preliminary data for fiscal year ended Mar. 31 of year following that stated.
[13] South Korea only.

Canada.—Mine and smelter output of copper in Canada rose 6 and 7 percent, respectively, in 1948. The gains marked continuations from low points reached in 1946. Following decontrol in June 1947, the price of copper rose to 21½ cents a pound, delivered Toronto or Montreal. On August 3, 1948, the price was raised to 23½ cents, which remained in effect through the remainder of the year. Labor supplies more nearly filled needs in 1948 than in a number of preceding years. Consumption of refined copper was 107,353 tons in 1948 compared with 109,210 tons in 1947, or more than double the prewar rate.

Copper produced (mine output) in Canada, 1944–48, by Provinces, in short tons

Province	1944	1945	1946	1947	1948 (preliminary)
British Columbia	18,152	12,876	8,750	20,900	21,855
Manitoba	21,939	20,563	19,251	15,316	19,403
Ontario	142,654	119,726	89,712	113,934	118,795
Quebec	54,027	51,342	34,899	42,561	48,348
Saskatchewan	36,757	32,950	31,356	33,151	31,479
Northwest Territories	6				
Total	273,535	237,457	183,968	225,862	239,880

More than half of the mine output of copper in Canada usually comes from the nickel-copper ores of the Sudbury district, Ontario; in 1948 the proportion was 50 percent. The International Nickel Co. of Canada, Ltd., is the largest copper producer in Canada. Inasmuch as nickel is the chief value in the ore, conditions in the nickel market have an important bearing on the company rate of copper production. Heavy demand for copper in the war and postwar years constituted a drain on reserves, and plans were made for economic recovery and use of lower-grade underground ore. The tonnage of ore mined in 1948 (10,866,862) was slightly more than in 1947 and nearly double the 1938 rate. Proved ore reserves, nonetheless, rose to 246,177,000 short tons at the end of 1948 from 221,843,000 at the end of 1947. The nickel-copper content at the end of 1948 was 7,503,000 tons, a gain over 7,171,000 tons a year earlier. Underground development totaled 84,152 feet in 1948 compared with 54,790 in 1947, bringing the total footage of underground development to 1,323,660 (250 miles). Copper sales amounted to 109,565 tons compared with 110,336 in 1947. About 52 percent in 1948 was sold in Canada and 48 percent was exported. The Falconbridge Nickel Mines, Ltd.—the other important producer in Ontario—hoisted 821,284 tons in 1948 compared with 730,965 in 1947. Ore reserves at the Falconbridge mine were 8,098,500 tons, averaging 1.63 percent nickel and 0.88 percent copper, and at outside holdings (including the McKim mine) were 5,909,000 tons, averaging 1.88 percent nickel and 1.02 percent copper. The McKim mine is expected soon to become a regular shipper of ore to company treatment plants.

Quebec was as usual the second most important copper-producing Province in 1948, supplying, however, considerably less than half as much copper as Ontario. Noranda Mines, Ltd., is an outstanding producer in Quebec. A total of 977,403 tons of ore was hoisted at the Horne mine; 603,516 tons were milled, and 509,401 tons of ore and concentrates were smelted. The smelter also treated 327,049 tons of custom material. Copper output for the Horne mine was 21,866 tons out of a total smelter output of new copper of 48,878 tons. In addition to copper, the Horne mine produced 142,273 ounces of gold and 437,493 ounces of silver. Developed ore reserves above the 2,975-foot level were 4,528,000 tons of sulfide ore averaging 7.16 percent copper, 14,000,000 tons of sulfide ore averaging 0.67 percent copper, and some siliceous fluxing ore. The property of the Quemont Mining Corp., Ltd., which adjoins the Horne mine and in which Noranda has a substantial interest, it is said, will soon be a large-scale producer of gold, copper, and silver. A total of 236,844 tons of ore, containing 2.85 percent copper, 8.12 percent zinc, and 0.035 ounce of gold and 2.66 ounces of silver per ton, were milled by Normetal Mining Corp., Ltd. The copper concentrate produced was smelted at Noranda, and the zinc concentrate was shipped to the United States. Estimated ore reserves were 1,625,900 tons of ore containing 3.51 percent copper and 7.67 percent zinc. Waite Amulet Mines, Ltd. (controlled by Noranda), milled 422,785 tons of ore in 1948, containing 22,256 tons of copper, 14,521 tons of zinc, 12,460 ounces of gold, and 418,826 ounces of silver. A small quantity of ore was hoisted from the Waite mine, reported exhausted the year before. Completion of mining of known ore at the "C" and "F" shafts was reported to be expected by the end of 1949. Reserves at Amulet Dufault were reported as 1,251,204 tons of ore averaging 5.67 percent copper and 4.06 percent zinc, and 113,200 tons averaging 1.8 percent copper and 6.5 percent zinc. Canadian Copper Refiners, Ltd., controlled by Noranda, produced 95,410 tons of copper compared with 88,930 tons in 1947. The extension program, which will increase refinery capacity by about one eighth and provide for production of special shapes, was scheduled for completion in June 1949.

The copper produced in Saskatchewan and Manitoba comes from the Hudson Bay Mining & Smelting Co., Ltd. (Flin Flon mine), and Sherritt Gordon Mines, Ltd. A total of 1,865,835 tons of ore, averaging 2.30 percent copper, 5.0 percent zinc, and 0.084 ounce of gold and 1.32 ounces of silver to the ton, was mined and milled at the Hudson Bay property. The copper smelter treated 371,181 tons of Hudson Bay ores and concentrates and 45,182 tons of custom concentrates. Shipments to the refinery for company account were 39,799 tons of copper, 127,007 ounces of gold, 1,889,718 ounces of silver, and 138,597 ounces of selenium. Life of the mine of Sherritt Gordon Mines, Ltd., at Sherridon was prolonged by prevailing high prices for copper and zinc, making it possible to mine certain narrow and low-grade sections of the ore body not included in ore reserves. Company estimates place exhaustion of the ore body at about the end of 1950. Ore milled totaled 458,325 tons yielding 9,988 tons of copper, 5,352 ounces of gold, 171,856 ounces of silver, and 11,159 tons of zinc concentrate. No new ore was found, so ore reserves were reduced by the tonnage of ore produced minus the mined marginal ore not counted as reserves. Reserves were 762,100 tons, averaging 2.55 percent copper and 1.99 percent zinc. Development work at the Lynn Lake property was continued. No new reserves were developed, the total at the end of 1948 remaining 8,300,000 tons, averaging 1.514 percent nickel and

0.687 percent copper, plus 153,000 tons, averaging 1.113 percent copper and 2.491 percent zinc.

Chief producers in British Columbia are the Granby Consolidated Mining, Smelting & Power Co., Ltd., and the Britannia Mining & Smelting Co., Ltd.

Exports of ingots, bars, and billets from Canada in 1948 as compared with 1947 were as follows, by countries of destination, in short tons:

Destination:	*1947*	*1948*
United Kingdom	55, 740	63, 493
United States	1, 054	18, 085
France	12, 152	14, 098
Czechoslovakia	3, 579	6, 411
Switzerland	1, 903	4, 120
India	2, 992	2, 936
Netherlands	2, 904	2, 497
Poland	--------	2, 295
Sweden	6, 243	60
Other countries	911	2, 174
Total	87, 478	116, 169

Exports of copper in ore totaled 28,555 tons, of which 22,624 went to the United States, 5,346 to Norway, and 585 to the United Kingdom, compared with 29,093, 23,092, 5,499, and 502 tons, respectively, in 1947. In addition, 28,639 tons of rods, strips, sheet, and tubing and 5,236 tons of scrap were shipped from the country compared with 20,484 and 5,694 tons, respectively, in 1947.

Chile.—Mine output of copper rose 8 percent in 1948, and smelter production likewise was higher, gaining 4 percent; the former was the largest since 1944 and the latter since 1945. There was a growing shortage of all classes of underground labor and skilled workmen. Under martial law which continued in effect at all the larger mining centers, labor relations were said [2] to have remained peaceful throughout the year. An improvement in discipline and efficiency was noted.

At the Braden mine of the Kennecott Copper Corp., 9,603,379 short tons of ore, assaying 2.22 percent copper, were mined and milled. Smelter output was 164,252 tons of copper, an increase of 25,780 tons over 1947. A planned pipe line, 6 feet in diameter, to carry water discharged from the Pangal power plant turbines to the Coya power plant, a distance of 7 miles, will permit generation of several thousand kilowatts and make possible materially increased copper production in periods when power is a factor controlling output. Converter capacity is another limiting factor, but the planned installation within a few months of mechanical tuyère punchers, recently developed at Kennecott's Nevada unit, should relieve this condition in part.

The Chuquicamata mine of the Chile Exploration Co., a subsidiary of the Anaconda Copper Mining Co., produced 229,285 short tons of copper in 1948 compared with 243,565 tons in 1947. The 1948 report of the latter company outlined plans for the installation of new mining and reduction methods at the mine, necessitated by the change in the nature of ore to be treated in the future. The report states as follows:

[2] Kennecott Copper Corp. 1948 Annual Report to Stockholder

The ore occurs in three general subdivisions namely oxide, sulphide, and a mixture of both. From the beginning of operations in 1915 to the present, the recovery of copper has been exclusively by leaching from oxide ore and from the oxide content of mixed ore. The copper bearing solutions are electrolyzed and the cathodes are melted and cast into wirebars and cakes of the weights and sizes demanded by the trade.

While substantial tonnages of oxide ore remain in the mine, in order to provide for the future operation of the property it has become necessary to begin the construction of plant facilities to process the extraction of copper from sulphide ores and the sulphide content of mixed ores from which the principal future production of copper will come.

The processes to be used in this operation are standardized and the first units of the plant will consist of a concentrator, a smelter and a converting plant. These plants, together with 12 miles of railroad lines, a 45-mile water supply line capable of delivering 40,000 tons of water per day, additional housing for employees and miscellaneous facilities are estimated to cost $70,000,000. Operations should begin in 1952. These units coupled with the operation of the oxide plant will maintain the rated capacity of 540,000,000 pounds of copper per year.

The plants are so designed that future extensions may be made to maintain or increase production as the available supply of oxide ore diminishes and as economic conditions and metal demand may require.

At the Andes property 74,529 short tons of copper were produced, compared with 65,075 in 1947.

Difficulties in obtaining deliveries of equipment are delaying construction of the Paipote smelter.

Exports of the chief copper classes, by countries, are shown as follows, in metric tons:

	Electrolytic	*Standard (furnace refined)*	*Total*
United States	143, 162	124, 769	267, 931
France	19, 897	10, 516	30, 413
Great Britain	3, 301	26, 671	29, 972
Italy	11, 364	18, 239	29, 603
Czechoslovakia	3, 960	8, 103	12, 063
Argentina	12, 031	--------	12, 031
India	4, 514	5, 354	9, 868
Brazil	7, 161	--------	7, 161
Switzerland	2, 843	3, 433	6, 276
Poland	1, 000	2, 185	3, 185
Netherlands	2, 438	--------	2, 438
Germany	--------	1, 000	1, 000
China	272	--------	272
Sweden	253	--------	253
Other countries	1, 134	1, 000	2, 134
Total	213, 330	201, 270	414, 600

Finland.—Mine production of copper was at a high rate during the war and gained in postwar years, reaching a new all-time peak in 1948. Smelting and refining operations were curtailed by the war but rose markedly thereafter, establishing a new high record in 1947. The Finnish Government-owned company, Outokumpu Oy., operates, in addition to certain minor mines, the Outokumpu copper mine, near Joensuu in eastern Finland, one of the largest copper deposits in Europe. According to a recent report,[3] reserves at the Outokumpu deposit are thought to be large enough to support production at the present rate for 35 years. The company is integrated, having facilities to handle production from ore through the manufacture of semi-

[3] Kaukokallio, E., Operations of Finnish Mining Company, Outokumpu Oy., 1939-47: American Legation Rept. 52, Helsinki, Finland, May 12, 1948, 4 pp.

finished products. Capacity was increased in the fall of 1945 to 2,000 metric tons of crude and electrolytic copper a month. Capacity at the Outokumpu mine is 600,000 tons of ore annually; output was 441,300 tons in 1945, 436,400 in 1946, and 511,496 in 1947. Production of copper is shown in the world tables. Copper produced in 1947 was distributed as follows: 9,187 tons for the war-reparations industries, 2,328 tons for export, and 4,625 tons for domestic consumption. The latter, according to the report, was far below normal demand; consumption approximated 9,000 tons before 1939.

Germany.—According to a recent report,[4] the output of electrolytic copper in Bizonia is to be doubled from the current rate of about 50,000 tons annually to 100,000 tons in 1952–53. These figures compare with 209,700 tons for all of Germany in 1936, of which 126,900 were from Bizonia. Consumption in 1952–53 is expected to be 150,000 tons compared with 292,300 tons in all of Germany in the base period and 137,500 in the Bizone area. Imports in the 1952–53 year are expected to be 50,000 tons compared with 127,500 and 10,700 tons, respectively, for all of Germany and for Bizonia in 1936.

Japan.—A comprehensive report covering copper resources in Japan was published [5] in 1948. The report was summarized as follows:

> Japan has been the chief copper producer in the Orient for 1,200 years. Until World War I, it was the second largest producer in the world, although production was seldom more than one-tenth as much as in the United States. When huge, cheap producers were developed in Chile, Africa, Canada, and other countries, the relative position of Japan dropped to seventh, but its trade in the Orient was maintained. Japan's total copper production from antiquity through 1946 is estimated at 4,500,000 metric tons, plus-or-minus 25 percent.
>
> Unstable economic conditions in Japan since the end of World War II make it difficult to determine the true position of the Japanese copper industry. Lack of coal and coke has reduced copper smelting to one third of capacity, and inflation makes any quotation of prices and costs of temporary interest only. The limitation of foreign trade and the lack of a foreign currency exchange rate make impossible the conversion of prices into terms of more stable currencies. Therefore, this investigation has utilized the long-term records of Japan's copper industry to evaluate its competitive position in the world and the possibilities for the future.
>
> Before World War II, copper was produced by the largest units in Japan at a net cost generally below the New York price. This was due chiefly to the devaluation of the yen; but these copper-producing units benefited also from tariff protection, and they realized tremendous profits for many years. For several years the income of one large unit was double the sum of its expenses.
>
> The reason for Japan's mining success has been the efficiency of Japanese manual labor on the basis of cost per unit of output. Manual labor is particularly suited to the narrow veins common to Japanese copper mines. The attitude of the new labor unions will be a large factor in determining whether Japan continues to produce copper. With their new power, if unchecked, the unions could price themselves out of the copper industry.
>
> The importance of cartels and subsidies in the Japanese copper industry has been overemphasized. A cartel (the Suiyokai) did exist, but its price-fixing activities were distinctly limited by the overwhelming weight of the world market. It did, however, eliminate underselling among the five large Japanese producers.
>
> Most of the copper is obtained from three main types of deposits—pyritic replacement, quartz or chloritic veins, and complex sulfide-sulfate replacement deposits called "kuroko" (black ore) or "kuromono." The last type is believed unique among the world's mineral deposits.

[4] Metal Bulletin (London), Proposed Expansion of German Nonferrous Metals Production Under Marshall Plan: No. 3356, Jan. 7, 1949, p. 8.

[5] Bureau of Mines, Mineral Trade Notes: Copper in Japan, vol. 26, No. 5, Spec. Supp 26, May 1948, 72 pp. Taken from Copper in Japan, SCAP report 106, Tokyo, 1948.

Total ore reserves have been estimated as follows for 1946:

Class	Crude ore, metric tons	Percent copper	Copper content, metric tons	Percent accuracy, plus-or-minus
Proved	36,000,000	1.3	480,000	20
Probable	25,000,000	1.4	350,000	35
Possible	31,000,000	1.4	420,000	55
Exploration prospects	68,000,000	2.2	1,500,000	80
Total	160,000,000	1.7	2,750,000	45

The proved reserves are adequate for 7 years' production at the average rate of the 1920's and early 1930's.

The treatment processes for Japanese copper are notable for the proportion obtained by hand picking, although flotation mills are common. Smelter feed is low-grade, compared to American standards, but blast furnaces require coarse sizes, which has favored hand-sorted ore even though the average grade is only 5 percent copper.

Northern Rhodesia.—Mine production rose 15 percent and smelter output 11 percent in 1948; the former was the largest since 1943 and the latter since 1944. Inadequate rail facilities, leading to coal shortages, continued to impede capacity operation, and a number of total or partial shut-downs were experienced during the year. Labor relations, however, improved and efforts toward solving the rail problem continue.

Rhodesia Copper Refineries, which now operates the electrolytic refinery originally erected and operated by Rhokana Corp., Ltd., expects to complete its present expansion plans by the middle of 1950.[6] Its original capacity of 32,000 long (36,000 short) tons was increased to 62,000 (69,000) in 1940; and, when present extensions are completed, capacity is planned to be about 124,000 (139,000) tons—large enough for both Rhokana and Nchanga to have their entire output for sale in the form of electrolytic copper.

A total of 2,899,000 short dry tons of ore, containing 2.26 percent copper, was mined at the Roan Antelope mine in the fiscal year ended June 30, 1948, or 19 percent more than in the preceding 12 months. Production of blister copper amounted to 57,968 short tons in 1947–48 compared with 55,598 tons in 1946–47. Ore reserves at the end of June 1948 were estimated at 95,017,471 tons, containing 3.26 percent copper, a reduction of the entire production during the year.

The Rhokana Corp., Ltd., produced 106,254 (98,275 in 1946–47) short tons of copper in the year ended June 30, 1948, of which 13,108 (12,700 in 1947) tons were Nkana blister copper, 28,843 (24,096) were Nchanga blister copper, and 64,573 (61,479) were Nkana electrolytic copper. Ore reserves at the end of June 1948 totaled, in the Nkana north ore body, 32,879,700 short tons containing 3.23 percent copper, in the Nkana south ore body 20,165,000 tons containing 2.78 percent copper, and in the Mindola ore body 57,128,200 tons containing 3.67 percent copper—a grand total of 110,172,900 tons containing 3.37 percent copper.

The extension program at Nchanga—to increase production from 27,000 to 64,000 long (30,000 to 72,000 short) tons—according to the company report to stockholders, may reasonably be expected to be

[6] Mining Journal (London), Rhokana Corporation: Annual Review Number, 1949, April 1949, p. 149.

completed by the end of 1950. According to the Yearbook of the American Bureau of Metal Statistics for 1948, reserves at the Nchanga mine in 1948 were 140,866,000 short tons, averaging 4.66 percent copper.

Mufulira Copper Mines, Ltd., produced 59,763 short tons of copper n the year ended June 30, 1948, compared with 53,198 tons in the previous 12-month period. Ore reserves on June 30 totaled 148,060,600 short tons, averaging 3.85 percent copper, in the Mufulira, Chambishi, and Baluba mines. The company plans construction at Mufulira of an electrolytic refinery with an initial capacity of 36,000 long (40,000 short) tons. Production of cathodes in 1952 is anticipated.

Peru.—Production (mine) of copper declined from 22,492 metric tons in 1947 to 18,068 tons in 1948. The new electrolytic refinery of the Cerro de Pasco Copper Corp. at La Oroya was completed during the year, and cathode production was begun in October. The corporation produced 16,810,037 pounds of copper from corporation ores and 11,428,442 pounds from other sources, a total of 28,238,479 pounds, in 1948 — declines from 21,565,664, 17,354,759, and 38,920,423 pounds, respectively, in 1947. The absorption of 5,000,000 pounds of copper as basic inventory in the new refinery, a nonrecurring item, and other factors (including a furnace failure at the smelter), are said by the corporation to explain the drop in output in 1948. A substantial expansion appeared in prospect for 1949. The corporation operates mines at Cerro de Pasco, Morococha, San Cristobal, Casapalca, Yauricocha, and Julcani; concentrators at Cerro de Pasco, Morococha, Casapalca, and Mahr; and copper and lead smelters at La Oroya, where also are plants for the production of refined silver, refined lead, electrolytic copper, bismuth, and antimony.

South-West Africa.—The only copper producer in the territory is the Tsumeb mine, whose reopening was mentioned in the report of this series for 1947. The new selective flotation mill was placed in operation in May 1948.[7] Designed in three sections to have a capacity of 300 tons each daily, the mill was found to have a total capacity of 1,050 to 1,200 tons daily. Because of exhaustion of the supplies of suitable surface dump ore, the jig plant, placed in operation in 1947, was closed in April 1948. The over-all production of the company in the fiscal year ended June 1948 was 68,290 dry short tons of copper-lead concentrates assaying 31.35 percent lead, 9.53 percent copper, and 13.28 percent zinc; 5,187 tons of zinc flotation concentrates; 1,191 tons of residues, assaying 28.05 percent lead, 10.66 percent copper, and 7.14 percent zinc; and a few hundred tons of flue dust and pig lead. Copper-lead concentrates were contracted to be shipped half to El Paso, Tex., and half to Hoboken, Belgium. Metals accounted for by smelters during the fiscal year ended June 30, 1948, were 32,242,043 pounds of lead, 10,461,298 pounds of copper, 59,869 pounds of cadmium, and 321,796 ounces of silver. In the 6 months ended December 31, 1948, production was 32,745,458 pounds of lead,

[7] Fuess, John C., Copper Mining in South-West Africa: Consular Rept. 26, Capetown, South Africa, Apr. 28, 1949, 6 pp.

7,596,953 pounds of copper, 4,645,960 pounds of zinc, 232,861 pounds of cadmium, and 225,301 ounces of silver. The major difficulty encountered by the company is inadequate transportation from the mine to the port at Walvis Bay. Concentrates must now be shipped 258 miles on a 24-inch-gage track before reaching the main railroad line whence shipment continues to Walvis Bay. The limited capacity of the railroad (7,000–8,000 short wet tons of concentrate monthly) has caused the flotation mill to be operated at only two thirds capacity. Obtaining adequate labor, equipment, and supplies has also presented problems.

Uganda.—Prospects for developing long-known copper deposits in Uganda were outlined [8] recently. Copper was discovered in the Ruwenzori Mountains in 1906 and since has been reported in various localities in this range. The deposits near Kilembe on the eastern slope were discovered by Tanganyika Concessions in 1927. Early estimates of ore reserves varied widely, but those apparently most dependable gave 4 million tons of ore, assaying 4.21 percent copper, 0.37 percent cobalt, and 0.02 percent nickel. Later surveys indicate possibilities of 10 to 15 million tons of copper-cobalt ore. Development of the Kilembe deposits has been discouraged by distance of the property from transportation—250 miles to railhead and 170 miles to nearest lake port. Lack of fuel has been another deterrent. To solve these problems, construction of a hydroelectric plant at Jinja is actually under way, and the Katonga Canal to provide a waterway from a point near Kilembe to Lake Victoria is in the survey stage. Additional investigations of the deposits were undertaken by the Frobrican Exploration Co., Ltd., associated with the Canadian firm—Frobisher, Ltd. As a result Frobisher, Ltd, acquired exclusive control of all copper deposits in this district. A diamond-drilling program is under way. Proposals to bring the property into production are anticipated to require a minimum of 5 years.

United Kingdom.—The United Kingdom stands second only to the United States among copper-consuming countries. Consumption of 538,655 long tons in 1948 (of which 356,793 were virgin copper and 181,862 scrap) was virtually unchanged from the 540,886 tons (350,119 virgin and 190,767 scrap) used in 1947. Of the totals shown for 1948, 316,155 tons were used in unalloyed form, 214,995 as alloys (chiefly brass), and 7,505 tons in copper sulfate. Stocks of virgin blister and of refined copper (Government and industry) in the United Kingdom totaled 120,721 tons at the end of 1948 compared with 110,231 tons at the beginning of the year. These inventories cover electrolytic (including rods), fire-refined, and blister, and also stocks in transit in the United Kingdom.

The British Ministry of Supply continued bulk purchasing of copper in 1948. During most of the year the maximum prices maintained by the Government were considerably above corresponding United States prices in cents per pound (see section on Prices). Supplies of copper

[8] Hyland, Frances, Development of Kilembe Copper Deposits, Uganda Protectorate: Consular Rept. 151, Nairobi, Kenya, Oct. 19, 1948, 5 pp.

came again from Northern Rhodesia, Canada, United States, and Chile. Imports of the important classes in 1948, in long tons, were as follows:

Source:	Electrolytic	Standard	Total
Northern Rhodesia	33, 283	124, 174	157, 457
Canada	55, 601	-------	55, 601
Belgium	23, 447	-------	23, 447
Belgian Congo	16, 099	-------	16, 099
United States	58, 097	-------	58, 097
Chile	3, 002	30, 095	33, 097
Other countries	12, 983	3	12, 986
Total	202, 512	154, 272	356, 784

The gross weight of copper ore imported—all from Canada—was 26,403 tons. Exports in 1948 were as follows:

	Long tons
Copper ingots, etc	21, 243
Plates, sheets, etc	15, 499
Wire in coils	25, 187
Tubes	5, 777
Other manufactures	4, 085
Total	71, 791

According to a recent report,[9] overseas sales of copper sulfate by the British Sulphate of Copper Association, Ltd., in the fiscal year 1947–48 were the lowest in the 24 years of the association's existence. Doubtless the war years were excluded from consideration. Exports were 52,698 long tons in 1945–46, and 30,103 in 1946–47, and fell to 24,666 in 1947–48. The drop was attributed to import restrictions in various countries, the shortage of pounds sterling, carry-over inventories from the previous season, and weather conditions unfavorable to maximum consumption of copper sulfate. A total of 36,000 long tons was the export target for 1949.

Feldspar

By ROBERT W. METCALF

GENERAL SUMMARY

SALES of ground feldspar by merchant mills in 1948 rose 5 percent to a new record and topped a half million tons for the first time, totaling 506,451 short tons valued at $6,462,231. Production of crude feldspar increased slightly compared with 1947. Production of aplite declined. Imports of Canadian crude feldspar in 1948 (31,047 long tons) were 86 percent higher than in 1947 and were the largest since 1924. Crude nepheline syenite imported in 1948 decreased slightly, although imports of ground material were much higher than in recent years.

Salient statistics of the feldspar industry in the United States, 1940–44 (average), and 1945–48

Sales of crude feldspar in Maine in 1948 increased 11 percent over 1947, and Colorado and Arizona sales were 43 and 34 percent, respectively, more than in 1947. Most of the other producing States showed moderate declines in tonnage. Sales of ground feldspar in 1948 in North Carolina–Tennessee increased 1 percent over 1947; sales from Colorado and Maine were about one-fifth greater; and those from New Hampshire and Arizona were approximately 50 percent higher than in 1947. Shipments of ground feldspar from New York, South Dakota, and New Jersey–Connecticut were less in 1948 than in 1947.

DOMESTIC PRODUCTION

CRUDE FELDSPAR

Output of crude feldspar in 1948 was 0.2 percent over that of 1947. The total value increased 6 percent and the average value per ton in

1948 rose to $5.57, the highest realization since 1931. Production was reported from 12 States. No tonnage was reported in 1948 from Maryland or Texas.

Crude feldspar sold or used by producers in the United States, 1943–48

Total	508,380	2,594,099	459,910	2,410,940	460,713	2,564,387

[1] Includes Arizona, Georgia, New Hampshire, and New York; also California in 1947–48, Maryland in 1947, and Texas in 1946–47.

Production of crude feldspar in Arizona, Colorado, Maine, and New Hampshire was considerably higher in 1948 than in 1947. Most other States, including North Carolina, South Dakota, Virginia, and Wyoming, showed small to substantial losses in feldspar output in 1948 compared with 1947. North Carolina in 1948 produced 44 percent of the total feldspar mined. Colorado attained second place in 1948, followed by South Dakota, New Hampshire, and Virginia.

GROUND FELDSPAR

Sales of ground feldspar by merchant mills in 1948 topped the former record year (1947) by 5 percent in tonnage and 10 percent in value, rising to 506,451 short tons valued at $6,462,231. Feldspar marketed in New York, South Dakota, and Tennessee in 1948 was somewhat under the 1947 tonnage. All other States showed small to appreciable gains over 1947. Sales in North Carolina-Tennessee mills accounted for 43 percent of the total feldspar ground by merchant mills, compared with 45 percent in 1947 and 37 percent in 1945. Colorado mills supplied 16 percent of the total in 1948, compared with 14 percent in 1947 and 11 percent in 1945.

[1] Excludes potters and others who grind for consumption in their own plants.
[2] Corrected figure.

As for many years, North Carolina was the largest producer of ground feldspar. Colorado and South Dakota ranked second and third, respectively, followed by Virginia, Tennessee, and New Hampshire. Ground spar sold by North Carolina-Tennessee mills in 1948 totaled 219,720 short tons, a new high, 1 percent greater than in 1947, the former record year. Arizona, Colorado, Maine, and New Hampshire made large increases in 1948 compared with 1947, and Illinois and Virginia showed small gains over 1947. Small declines were reported for New York and Connecticut-New Jersey mills.

[1] Excludes potters and others who grind for consumption in their own plants.
[2] Includes (number of active mills in parentheses) Arizona (1), Georgia (1 in 1948), Illinois (1), New Hampshire (2 in 1946–47, 3 in 1948), New York (3), South Dakota (2 in 1946, 3 in 1947–48), and Virginia (2).

The new froth-flotation plant of the Feldspar Flotation Co. at Spruce Pine, N. C., was reported to have been completed, and operations started in the latter part of the year.[1] Officers of the company are associated with the Feldspar Milling Co., Burnsville, N. C., and Feldspar Producing Co., Erwin, Tenn. Since the latter part of 1947, the Whitehall Co., Inc., 17 Battery Place, New York, N. Y., has been searching for feldspar in the Kingman and Wickenburg districts,

[1] Engineering and Mining Journal, vol. 149, No. 7, July 1948, pp. 125–126.
Rock Products, vol. 51, No. 9, September 1948, p. 65.

Ariz., and in adjacent California, utilizing airplanes in its initial explorations and ground crews for more detailed work. Several promising properties have been discovered.[2] A brief description was published of the mining and milling operations of the new flotation plant of the Consolidated Feldspar Corp., at Parkdale, Colo.[3] Extraction and preparation of glass and pottery spar by the same company's dry-process plant at Custer, S. Dak., also was described.[4] A new firm, the Ray Sanders Development Co., was reported to have been organized to develop claims near Keystone, S. Dak.[5]

Feldspar possibilities in the Topsham, Maine, area were studied.[6] Papers on the pegmatites of Jasper County, Ga.,[7] and the pegmatite resources in Southwestern States[8] were reported. Possible resources of ceramic raw materials in New Jersey were investigated, particularly certain granitic rocks said to be rich in high-grade feldspar.[9]

CONSUMPTION AND USES

Crude Feldspar.—Many of the merchant grinders also mine feldspar, either themselves or through affiliated firms. A large part of the crude feldspar mined, however, is obtained from small operators who sell their product principally to the merchant mills. The tonnage of feldspar and feldspathic rocks treated in flotation plants is increasing.

Most of the consumers of feldspar buy material already ground, sized, and ready for use in their products from the merchant grinders. Some pottery and enamel manufacturers and soapmakers, however, purchase all or part of their requirements in crude form and crush or grind it to their own specifications in their own mills. Some Canadian crude spar is purchased direct by consumers in this country. Manufacturers of artificial teeth annually consume a small tonnage of very carefully selected crude spar, which must be free from grit and is marketed at a considerable premium over No. 1 grade commercial feldspar.

Ground Feldspar.—As in 1947, 98 percent of the total feldspar ground in merchant mills in the United States was consumed in the glass, pottery, and enamel industries. Shipments to glass factories increased 1 percent to 270,065 short tons in 1948; shipments to potteries rose 10 percent to a new high, reaching 202,905 tons; and shipments to enamel manufacturers were 5 percent higher than in 1947. Consumption of ground feldspar in soaps and abrasives in 1948 also was greater than in 1947.

Total	470,199	100.0	482,700	100.0	506,451	100.0

Ground feldspar shipped from merchant mills in 1948 reached at least 24 States and 5 foreign countries. The larger volume, however, was concentrated in six States—Pennsylvania (17 percent of the total shipments), Illinois and Ohio (13 percent each), West Virginia (12 percent), New Jersey (10 percent), and Indiana (8 percent)—totaling 73 percent of all sales. Shipments to virtually all of the more important consuming States showed moderate increases in 1948 compared with 1947, except for Illinois, Indiana, and Tennessee.

Ground feldspar shipped from merchant mills in the United States, 1943–48, by destinations, in short tons

Destination	1943	1944	1945	1946	1947	1948
California	8,669	9,788	8,735	8,641	7,395	8,406
Illinois	49,302	49,434	53,114	68,737	72,212	66,064
Indiana	40,873	40,057	47,321	47,756	44,864	37,774
Maryland	9,028	7,593	9,411	18,374	19,531	19,832
Massachusetts	3,855	3,508	3,258	3,009	3,906	4,437
New Jersey	40,259	38,158	35,735	41,340	43,969	52,587
New York	18,024	21,886	19,005	19,420	20,279	20,887
Ohio	42,536	41,208	48,151	47,031	63,939	64,805
Oklahoma	(1)	(1)	(1)	14,411	13,248	13,315

Wisconsin	8,718	7,993	7,058	10,317	9,958	11,741
Other destinations [2]	26,739	25,132	35,189	36,096	37,981	49,061
Total	335,810	343,201	381,728	470,199	482,700	506,451

[1] Included with "Other destinations"; separate figure for State not available.
[2] Includes Arkansas, Colorado, Connecticut, District of Columbia, Hawaii, Kentucky, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Oklahoma (1943–45), Puerto Rico, Rhode Island, South Carolina, Texas, and Washington, and shipments that cannot be segregated by States; also small shipments to Canada, England, Mexico, and other countries.

Names and addresses of merchant grinders of feldspar in the United States are listed below:

Abingdon Potteries, Inc., Abingdon, Ill.
Appalachian Minerals Co., Monticello, Ga.
Black Hills Tin Co., Tinton, S. D.
Carolina Mineral Co., Inc., Kona, N. C. (mills in North Carolina and Virginia).
Clinchfield Sand & Feldspar Corp., 618 Mercantile Bldg., Baltimore, Md. (mill in Virginia).
Consolidated Feldspar Corp., Trenton Trust Bldg., Trenton, N. J. (mills in Arizona, Colorado, Maine, New York (2), South Dakota (2), and Tennessee).
Eureka Mica Mining & Milling Co., Portland, Conn. (Eureka Flint & Spar Co., Inc., New York Ave., Trenton, N. J., sales agent.)

Feldspar Flotation, Inc., Spruce Pine, N. C.
Feldspar Milling Co., Burnsville, N. C.
Genesee Feldspar Co., 360 Boxart St., Rochester 12, N. Y.
Golding-Keene Co., Box 2151, Trenton, N. J. (mill in New Hampshire).
Interstate Feldspar Corp., 707 Kayser Bldg., Baltimore 2, Md. (mill in North Carolina).
J. F. Morton & Co., Walpole, N. H.
North Carolina Feldspar Corp., Erwin, Tenn.
Northern Feldspars Corp., West Rumney, N. H.
Standard Flint & Spar Corp., New York Ave., Trenton 7, N. J.
Topsham Feldspar Co., Brunswick, Maine.
United Feldspar & Minerals Corp., 10 E. 40th St., New York, N. Y. (mills in Maine and North Carolina).
Western Feldspar Milling Co., 1333 W. Maple Ave., Denver, Colo.
Worth Spar Co., P. O. Box 763, Middletown, Conn.

APLITE

Carolina Mineral Co., Inc., Kona, N. C. (mill in Virginia).
Dominion Minerals, Inc., Piney River, Va.

PRICES

Trade papers do not carry quotations for crude feldspar. Average values per ton, however, are computed from the returns of producers reporting their output annually to the Bureau of Mines. The average realization for all feldspar mined in the United States in 1948 rose to $5.57 per long ton, an increase of 6 percent over the 1947 figure ($5.24). Increases in average values occurred in most States, especially in the East. Colorado and Wyoming were the only important States showing decreases in realization in 1948 compared with 1947.

The average value per short ton for ground feldspar in 1948 was $12.76, 5 percent higher than that for 1947, and nearly reached the realization reported for 1936 ($12.99). Virtually all States had higher average values in 1948 than in 1947, the increase varying from 1 to 15 percent. The realization for the combined shipments of North Carolina and Tennessee showed a very small decrease. Average values ranged from $10.18 in Colorado to $23.43 in New York.

Quotations on ground feldspar appearing in E&MJ Metal and Mineral Markets in 1948 were: Potash feldspar, in bulk, 200-mesh white, f. o. b. North Carolina, $17 per short ton, and f. o. b. Maine, $18; and soda spar, f. o. b. North Carolina or Maine, 200-mesh, white in bulk, $19. Quotations on Maine feldspar were discontinued early in March 1948, and North Carolina spar, bulk, carlots, was quoted as follows: 200-mesh, $17 per ton; 325-mesh, $21. In early December, these quotations were raised $1.50 per ton. North Carolina glass spar remained throughout the year at $12.50 for No. 17 grade and $11.75 for semigranular material. (Bags and bagging added $3 per ton to bulk quotations.)

Quotations on Virginia feldspar at the beginning of 1948, as reported by the same source, were: No. 1, 230-mesh, $18 per short ton; 200-mesh, $17; No. 17 glassmakers' spar, $11.75; and No. 18, $12.50. Enamelers' spar was quoted at $14 to $16 per ton either on Spruce Pine, N. C., or Keene, N. H., basis. In early December, quotations on 230- and 200-mesh spars were raised 50 cents per ton, and enamelers' spar, $1 per ton. Glass feldspars remained at the same levels throughout the year.

FOREIGN TRADE [10]

Feldspar.—Imports for consumption of crude feldspar in 1948 totaled 31,047 long tons and were higher than in any recorded year since 1924 (35,139 tons). The value of imports was the highest since 1929. All the crude feldspar imported in 1948 originated in Canada. Very small quantities of ground spar were imported in 1948 from Canada, United Kingdom, and Netherlands.

Feldspar imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Crude		Ground		Year	Crude		Ground	
	Long tons	Value	Short tons	Value		Long tons	Value	Short tons	Value
1944	11,686	$95,956	10	$203	1947	16,685	$124,587		
1945	14,924	114,917			1948	31,047	219,785	(1)	$328
1946	16,365	127,654	(1)	2					

[1] Less than 1 ton.

Ground feldspar exported from the United States, as reported by the merchant grinders in 1948, totaled 1,434 short tons, compared with 1,750 tons in 1947 and 2,822 tons in 1946. Destinations in 1948 were listed as Canada, Cuba, Mexico, Switzerland, and United Kingdom.

Cornwall Stone.—Cornwall stone imported for consumption in 1948 amounted to 1,124 long tons, a substantial increase in both quantity and value over 1947, although much smaller than in most prewar years. The only source of imports of crude or ground material is the United Kingdom.

Cornwall stone imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Unmanufactured		Ground		Year	Unmanufactured		Ground	
	Long tons	Value	Long tons	Value		Long tons	Value	Long tons	Value

1946	456	6,031	80	1,806					

NEPHELINE SYENITE

Nepheline syenite is a quartz-free crystalline rock consisting largely of nephelite and albite and microcline feldspar. Impurities may be the iron-bearing minerals, black mica and magnetite, and other minerals such as zircon and corundum. Used originally almost entirely in glass manufacture, substantial quantities now are consumed in the making of pottery.

[10] Figures on imports are compiled by M. B. Price, of the Bureau of Mines, from records of the U. S Department of Commerce.

Domestic Deposits.—Domestic deposits of nepheline syenite have not proved suitable for the manufacture of ceramic ware, although a large roofing-granule plant has been established in Arkansas, utilizing the extensive reserves of this material occurring in that State. Efforts are being made to reduce the iron content of Arkansas syenite to make it more suitable for ceramic purposes.

Uses.—An article on the advantages of the use of nepheline syenite in sanitary ware, floor and wall tile, electrical porcelain, semivitreous bodies, and low-temperature vitreous bodies was presented. In general, lower firing temperatures, increased firing range, increased strength, and savings in fuel consumption, refractories, and losses from excessive warpage were effected.[11]

Nepheline syenite was studied as a major component of various fluxes and the results published.[12] The higher alumina content introduced into porcelain enamels through the use of nepheline syenite is said to result in a reduction of solubility and a lighter-color ground coat.[13]

Prices.—Price quotations on crude nepheline syenite are not reported in trade journals; however, crude values for this material may be approximated in the average values per ton of imports for consumption in the United States. These values for the last 5 years were: 1944, $3.50; 1945, $3.77; 1946, $3.98; 1947, $3.57; and 1948, $4.01. According to the Oil, Paint and Drug Reporter, quotations on ground nepheline syenite during the whole of 1948 were as follows: Glass grade (24-mesh), bulk, f. o. b. Rochester, N. Y., $14.25; and pottery grade (200-mesh), bulk, f. o. b. Rochester, N. Y., $18.25. Nepheline syenite in bags was $3 per ton higher than bulk.

Foreign Trade.—Imports for consumption of crude nepheline syenite were slightly less in 1948 than in 1947, although the total value rose 11 percent. Imports in 1948 were higher than in any other year except 1947. Imports of ground nepheline syenite totaled 7,577 short tons, a record, and judging by the reported average value per ton ($17.27) apparently consisted largely of higher-grade material. All imports of both crude and ground nepheline syenite came from Canada.

Nepheline syenite imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Crude		Ground		Year	Crude		Ground	
	Short tons	Value	Short tons	Value		Short tons	Value	Short tons	Value
1944	39,043	$136,664			1947	54,382	$194,283		
1945	51,785	194,975	1,073	$11,461	1948	53,570	214,747	7,577	$130,860
1946	51,852	206,613	1,018	11,137					

[11] Ceramic Industry, Nepheline Syenite Cuts Firing Heat: Vol. 51, No. 2, August 1948, pp. 78, 80.
[12] Ceramic Industry, Report on Flux Studies: Vol. 50, No. 1, January 1948, p. 62.
[13] Ceramic Industry, vol. 51, No. 2, August 1948, p. 63.

Canada.—A record output of nepheline syenite in Canada, and unusually large exports were indications of the active ceramic market for this material. The ceramic industry in the United States has obtained nepheline syenite almost wholly from the deposits of American Nepheline, Ltd., near Lakefield, Ontario, Canada, at Blue Mountain. Detailed descriptions of the mining, processing, and utilization of this product, including data relative to the new plant at Lakefield, were published.[14] Both open-cut and underground mining methods are used and high-intensity magnetic separation combined with dry-processing in the milling operations.

Europe and Asia.—Deposits of nepheline syenite on the Kola Peninsula, U. S. S. R., in northern Europe, have been mined, and considerable research has been expended on this product in that country, particularly in the field of glass and enamel manufacture and as a source of alumina. Statistics regarding output are not available. Deposits in India and Finland also are known.

APLITE

Production of aplite in 1948 declined compared with 1947. The average value per ton remained unchanged. Virtually all of the aplite produced was consumed in the manufacture of glass, particularly container glass, and the decline in 1948 reflected the slackened activity in this field. The only producers of aplite are Dominion Minerals, Inc., Piney River, Va., and Carolina Mineral Co., Inc., Kona, N. C., in Amherst and Nelson Counties, Va., near Piney River. The Bureau of Mines is not at liberty to publish output or sales data.

TECHNOLOGY

The use of finely crushed feldspar mixed with carefully measured quantities of magnesium oxide and magnesium fluoride to manufacture synthetic mica at the Colorado School of Mines, Golden, Colo., has been revealed by the War Department.[15] The ingredients are melted in a special furnace to temperatures up to 2,700° F. and allowed to cool slowly. Mica crystals form as the melt cools. Crystals obtained so far have been small.

Another interesting development is the coating of seeds with powdered feldspar or volcanic ash to add bulk so that even microscopically small seeds can be planted one at a time and spaced. This procedure eliminates thinning, and certain seeds may be planted 2 weeks earlier without danger of damage by cold. Chemicals included in the coating are said to keep the seeds alive and to make the plants grow faster.[16]

Factors determining the desired properties of artificial teeth and the influence of the relative amounts of feldspar and other raw materials were discussed.[17] An analysis of the changes in composition

of container glass during the period 1932 to 1946 was published.[18] The use of feldspar in chemical stoneware and the properties and applications of this product were presented.[19] The physical properties of various whiteware bodies, including many containing feldspar, were studied by the Committee on Classification and Nomenclature of the White Wares Division of the American Ceramic Society.[20] A classification of whiteware bodies and a table giving general batch compositions of typical bodies, showing the average content of feldspar and other ingredients were published.[21] A rapid quantitative spectrographic method of analysis of powdered ceramic materials, applicable to quality control of pulverized industrial chemicals and minerals including feldspar, was discussed.[22] The use of fire clay, feldspar, feldspathic sands, pegmatite, and other materials as sources of alumina in the manufacture of Fourcault window glass in Russia during periods of raw-material shortages was described.[23]

Employment of chemical staining methods on samples of crushed pegmatite and on products of mineral-dressing tests proved effective in detecting potash and soda feldspar.[24] The results of experimental work on the effect of acidity, temperature, and concentrations of aluminum and potassium on the formation of sericite, kaolin, and pyrophyllite were presented in the form of phase diagrams.[25] A Finnish investigation of the decomposition of potash feldspar was reported.[26]

WORLD REVIEW

The estimated known world output of feldspar in 1948 rose to 800,000 metric tons, or 13 percent higher than in 1947. Not included in the total is production in Brazil, China, and U. S. S. R., where feldspar is known to be produced; no actual or estimated data are available for these countries.

Countries showing large increases in output of feldspar in 1948 compared with 1947 include Canada, Germany (Bavaria), Italy, Japan, Spain, and Uruguay.

Because of the greater output in foreign countries and only a slightly larger production in this country, the ratio of United States output to known world production declined in 1948 to 59 percent.

Australian resources of feldspar were described—two reports included discussions of occurrence, mining and utilization.[27] Discovery

Ferro-Alloys

By NORWOOD B. MELCHER

GENERAL SUMMARY

FERRO-ALLOYS are in-process materials that do not reach the ultimate consumer as such. The term "ferro-alloys" is used in referring both to alloys and to compounds whose principal use is to add various elements to iron and steel in their manufacture. Some ferro-alloys contain elements that are employed as scavengers for removing impurities or rendering their presence harmless. This type includes silicon, which is used mainly in removing oxygen from steel, and manganese, which combines with sulfur in steel and eliminates the objectionable quality of hot-shortness which results when sulfur is combined with iron rather than manganese. The other ferro-alloys are used mainly to obtain desired properties in steel that result from addition of the alloying elements. Consequently, the demand for the latter group depends upon the rate of alloy-steel production, whereas the former group, which is used in all steels, both carbon and alloy, will follow a use-trend dependent upon the rate of total steel production. During 1948 ferro-alloy production increased 4 percent over the previous year; shipments from producing plants increased 6 percent in quantity and 24 percent in value. Total steel production increased 4 percent over 1947, while alloy-steel output increased 15 percent.

The United States depends upon imports for most of the ores used in the manufacture of ferro-alloys; molybdenum and silicon are produced domestically in tonnages sufficient to meet all requirements, and the bulk of vanadium requirements is produced domestically. Manganese, chromium, tungsten, nickel, columbium, and zirconium, however, are supplied to the United States steel industry chiefly from foreign mines. As the ores from which ferro-alloys are produced are considered essential for national security, those which are obtained from foreign sources are given special consideration in strategic stock piling. All are classified by the Munitions Board in group I, comprising those strategic and critical materials for which stock piling is deemed necessary to insure an adequate supply for a future emergency.

The ferro-alloying ores and metals are discussed in detail in chapters of this volume dealing with particular metals. These chapters are Chromium, Manganese, Molybdenum, Titanium, Tungsten, Vanadium, and Minor Metals.

PRODUCTION AND SHIPMENTS

The production of ferro-alloys in 1948 totaled 1,892,521 net tons compared with 1,813,783 net tons in 1947, an increase of 4 percent. In 1948 ferro-alloys were made at 13 blast-furnace plants, 19 electric-furnace plants, and 2 aluminothermic-furnace plants; in addition, 2 plants using electric furnaces produced ferrosilicon, and 6 produced ferrophosphorus as a byproduct. Shipments of all classes of ferro-alloys from furnaces increased 6 percent in quantity and 24 percent in value over 1947. Pennsylvania again led all other States in production and shipments of ferro-alloys, having produced 33 percent of the United States total tonnage and 40 percent of the value, compared with 31 and 36 percent, respectively, in 1947. This State increased its production 20 percent over 1947. New York was second, supplying 19 percent of the tonnage, which represented 24 percent of the value. Production and shipments of ferro-alloys also were reported from Alabama, California, Florida, Indiana, Iowa, Montana, New Jersey, Ohio, Oregon, South Carolina, Tennessee, Virginia, Washington, and West Virginia.

Ferro-alloys produced and shipped from furnaces in the United States, 1947–48

Alloy	1947			1948		
	Production (net tons)	Shipments		Production (net tons)	Shipments	
		Net tons	Value		Net tons	Value
Ferromanganese	614,626	614,647	$79,972,673	647,617	659,193	$90,126,657

Other ferro-alloys [1]	239,133	231,601		253,610	260,757	
Total	1,813,783	1,841,682	220,021,974	1,892,521	1,952,246	273,450,420

[1] Silicomanganese, manganese briquets, ferrochromium, ferrocolumbium, ferroboron, zirconium-ferrosilicon, and miscellaneous ferro-alloys.

Ferromanganese.—The ferromanganese produced in 1948 averaged 78 percent manganese and came from four electric and six blast-furnace plants. Of the manganese ore used in 1948 for the manufacture of ferromanganese, 92 percent was foreign compared with 91 percent in 1947. In all, 670,774 short tons of ferromanganese were consumed during 1948, virtually by the iron and steel industries alone. During the year steel producers used 12.7 pounds of metallic manganese as ferro-alloys per ton of steel produced. Of this quantity 11.3 pounds were in the form of ferromanganese.

Spiegeleisen.—The production of spiegeleisen in 1948 decreased 16 percent from 1947, and shipments from furnaces decreased 12 percent. The output came from three blast-furnace plants and averaged 24.6 percent manganese compared with 21.9 percent in the previous year.

Shipments from furnaces in 1948 totaled 108,960 tons valued at $5,261,650 f. o. b. furnaces, or $48.29 per ton, compared with $39.99 per ton in 1947 and $32.99 per ton in 1946. Three-tenths pound of metallic manganese in the form of spiegeleisen was used per ton of steel produced in 1948.

Ferrosilicon.—Shipments of ferrosilicon from furnaces during 1948 accounted for 42 percent of the tonnage of ferroalloys shipped during the year, and the value of shipments represented 26 percent of the total. The production of ferrosilicon increased 6 percent over 1947. Of the 814,297 tons of ferrosilicon produced, 35 percent (283,556 tons) were made in blast furnaces and 65 percent (530,741 tons) in electric furnaces. The latter figure includes 585 tons of ferrosilicon produced as a byproduct in the manufacture of artificial abrasives. The ferrosilicon made in blast furnaces (silvery pig iron) contained an average of 9.8 percent Si. Electric-furnace output, mostly ferrosilicon containing over 20 percent Si, averaged 40 percent. Shipments of all grades of ferrosilicon (including silvery pig iron) totaled 818,974 net tons valued at $71,711,831. Of the 298,651 net tons of ferrosilicon and miscellaneous silicon alloys consumed in the manufacture of steel ingots and castings, 52 percent or 156,033 net tons were of the standard 50-percent grade, 57, 608 net tons silvery pig iron, and 43,894 the 75-percent grade. "Other grades" constituted the remaining 41,116 net tons. The most important grade of ferrosilicon is the standard 50-percent, which is employed as a deoxidizer and solidifier in manufacturing most grades of killed and semikilled steel. Only a small quantity of this alloy is used in iron foundries and other industries. Alloys containing 75 percent silicon and miscellaneous silicon alloys are used as ladle additions in gray-iron foundries and in the manufacture of high-silicon steel for use in electrical equipment and high-silicon spring steel. The accompanying table shows the consumption of the various grades of silicon alloys according to major consuming industry groups.

Consumption of ferrosilicon, silicon metal, and miscellaneous silicon alloys in the United States in 1948, by industries, in net tons

Alloy	Steel ingots and castings [1]	Steel castings [1]	Miscellaneous	Total
Silvery pig iron:				
5–20 percent silicon	57, 608	19, 476	331, 302	408, 386
Ferrosilicon:				
50 percent silicon	156, 033	15, 525	15, 132	186, 690
75 percent silicon	43, 894	278	2, 991	47, 163
Other grades [2]	41, 116	299	78, 156	119, 571
Total	298, 651	35, 578	427, 581	761, 810

[1] Data for castings made by companies that also produce steel ingots are included with "Steel ingots and castings" and excluded from "Steel castings."
[2] Includes grades of ferrosilicon not listed separately, silicon metal, and miscellaneous silicon alloys.

Ferrophosphorus.—All ferrophosphorus in 1948 was produced in electric furnaces as a byproduct in the manufacture of phosphate fertilizers and other chemicals. Shipments of ferrophosphorus decreased 11 percent from 1947 as a result of a drop in demand for ferrophosphorus for metallurgical and chemical uses. Production totaled 32,297 tons—a decrease of 2 percent from 1947. Shipments from plants totaled 72,453 tons at a value of $2,006,254, most of which was exported.

Ferrotungsten.—The ferrotungsten produced in the United States during 1948 was made in electric furnaces using both foreign and domestic ores. Total consumption of tungsten concentrates in the United States in 1948 was 9,300 net tons (60-percent WO_3 basis), 4,100 tons of which was consumed in the manufacture of ferrotungsten. The domestic material was obtained from eight States and Alaska in 1948, but three States—Nevada, North Carolina, and California—supplied 94 percent of the total. Imports for consumption of tungsten ores and concentrates in 1948 were equivalent to 7,931 net tons of 60-percent WO_3, a 25-percent increase over 1947. These ores and concentrates came from 17 foreign countries in 1948 but four—Bolivia, Brazil, China, and Korea—supplied 80 percent of the total.

Ferrochromium.—All of the ferrochromium output in the United States in 1948 was produced in electric furnaces, mainly from foreign ores. Reported consumption of ferrochromium in the United States during 1948 totaled 122,753 net tons, an increase of 8 percent over the 1947 consumption of 113,491 net tons. The consumption of ferrochromium canvassed by the Bureau of Mines represents about 85 percent of the total. Exports in 1948 increased 119 percent over 1947 and amounted to 6,754 net tons valued at $2,371,367. Imports amounted to 9,019 net tons, compared with 10,680 net tons in 1947.

Ferromolybdenum.—The ferromolybdenum produced in 1948 was made by the aluminothermic process and in electric furnaces using domestic ores. This alloy was produced at Langeloth and Washington, Pa., and Niagara Falls, N. Y.

Molybdic Oxide, Calcium Molybdate, and Molybdenum Compounds.—Molybdenum compounds used as alloying agents in the production of iron and steel are included with ferro-alloys. These materials are much less expensive than ferromolybdenum and consequently are used to a greater extent. As with ferromolybdenum, virtually all these compounds are made from domestic raw materials.

Producers of ferro-alloys in the United States in 1948

Producer	Plant	Alloy
American Agricultural Chemical Co.	South Amboy, N. J.	Ferrophosphorus (byproduct).
Anaconda Copper Mining Co.	Black Eagle, Mont.	Ferromanganese.
Bethlehem Steel Co.	Johnstown, Pa.	Do.
Climax Molybdenum Co.	Langeloth, Pa.	Ferromolybdenum, calcium molybdate, molybdenum oxide, oxide briquets, molybdenum trioxide, sodium molybdate, ferrotungsten, molybdenum silicide, ammonium molybdate, molybdenum sulphide.
Electro Metallurgical Co.	Alloy, W. Va. Columbiana, Ohio Holcomb Rock, Va. Niagara Falls, N. Y. Portland, Oreg. Sheffield, Ala.	Ferromanganese, silicomanganese, manganese briquets, ferrosilicon, silicon briquets, zirconium-ferrosilicon, ferrochromium, chromium briquets, ferrotungsten, ferrovanadium, ferroboron, ferrocolumbium, ferrotitanium, ferromolybdenum.
General Abrasive Co., Inc.	Niagara Falls, N. Y.	Ferrosilicon (byproducts).
Globe Iron Co.	Jackson, Ohio	Silvery pig iron.
Hanna Furnace Corp.	Buffalo, N. Y.	Do.
Jones & Laughlin Steel Co.	Aliquippa, Pa.	Spiegeleisen.
Jackson Iron & Steel Co.	Jackson, Ohio	Silvery pig iron.
Keokuk Electro-Metals Co.	Keokuk, Iowa	Ferrosilicon, silvery pig iron.

Producers of ferro-alloys in the United States in 1948—Continued

Producer	Plant	Alloy
E. J. Lavino & Co.	Reusens, Va.; Sheridan, Pa.	Ferromanganese.
Metal & Thermit Corp.	Carteret, N. J.	Ferrotitanium.
Molybdenum Corp. of America	Washington, Pa.	Ferrotungsten, ferromolybdenum, calcium molybdate, molybdic oxide, ferroboron, manganese boride.
Monsanto Chemical Co.	Anniston, Ala.; Columbia, Tenn.	Ferrosilicon (byproduct), ferrophosphorus (byproduct).
New Jersey Zinc Co.	Palmerton, Pa.	Spiegeleisen.
Ohio Ferro-Alloys Co.	Philo, Ohio; Tacoma, Wash.	Ferrosilicon, simanal, ferrochromium.
Oldbury Electro-Chemical Co.	Niagara Falls, N. Y.	Ferrophosphorus (byproduct).
Permanente Metals Corp.	Permanente, Calif.	Ferrosilicon, silicon briquets.
Pittsburgh Metallurgical Co.	Charleston, S. C.; Niagara Falls, N. Y.	Ferrosilicon, silvery pig iron, ferrochromium.
Sloss-Sheffield Steel & Iron Co.	N. Birmingham, Ala.	Ferromanganese.
Tennessee Products & Chemical Corp. (Southern Ferro-Alloys Div.).	Chattanooga, Tenn.	Ferromanganese, ferrosilicon, silicon briquets.
Tennessee Valley Authority	Muscle Shoals, Tenn.	Ferrophosphorus (byproduct).
Titanium Alloy Mfg. Div., National Lead Co.	Niagara Falls, N. Y.	Ferrotitanium.
U. S. Steel Corp. subsidiaries	Clairton, Pa.; Etna, Pa.; Gary, Ind.	Ferromanganese, spiegeleisen.
Vanadium Corp. of America	Niagara Falls, N. Y.; Bridgeville, Pa.	Ferrosilicon, silicon briquets, alsifer, ferrochromium, ferrovanadium, ferrotitanium, grainals, aluminum vanadium, ammonium meta vanadette, titanium aluminum, cupro vanadium, mangano vanadium.
Victor Chemical Works	Mt Pleasant, Tenn.	Ferrophosphorus (byproduct).
Virginia-Carolina Chemical Corp.	Nichols, Fla.	Do.

Ferrotitanium.—In 1948 most of the ferrotitanium was produced in electric furnaces, but a small quantity was made by the aluminothermic process. The ferrotitanium produced in 1948 averaged 19.5 percent titanium, and both foreign and domestic ores (ilmenite and rutile) were consumed in its manufacture. Ferrotitanium is used as a deoxidizer and scavenger in steel manufacture. When employed as a deoxidizer, ferrotitanium is charged in combination with silicon or some other deoxidizing agent, the titanium alloy being added as a final purifier. As an alloying agent, ferrotitanium prevents intergranular corrosion.

Ferrovanadium.—All ferrovanadium produced in 1948 was made in electric furnaces, and both foreign and domestic ores were used in its manufacture. The alloy averaged 48 percent vanadium in 1948, compared with 45 percent in 1947.

Ferroboron.—Shipments of ferroboron in 1948 averaged 11.6 percent boron. Ferroboron is used in special steels as a hardening agent, but it is also a highly efficient deoxidizer.

Ferrocolumbium.—Ferrocolumbium is used in stainless steels to prevent intergranular corrosion. It also reduces air hardening and oxidation at high temperatures in chromium steels. In 1948 the output of ferrocolumbium averaged 55 percent columbium and was produced in electric furnaces.

Zirconium-Ferrosilicon.—The zirconium-ferrosilicon produced in 1948 averaged 14 percent Zr. Zirconium, a powerful deoxidizer and scavenger, reduces age hardening, and thereby improves deep drawing properties of sheet steel. It is used instead of ordinary ferrosilicon and is more effective.

Silicomanganese.—The silicomanganese produced in 1948 averaged 67 percent manganese and was made in electric furnaces. This alloy is used mainly in the steel industry in the manufacture of steel ingots.

Manganese Briquets.—The foundry industry is the principal user of manganese briquets, which are added to molten iron to overcome the harmful effects of sulfur and to act as a deoxidizer and scavenger. The briquets produced in 1948 averaged 57 percent manganese.

FOREIGN TRADE[1]

Ferromanganese was by far the chief ferro-alloy import in 1948, although important quantities of ferrochromium and ferrosilicon were received. The ferromanganese is largely manufactured in Canada and Norway from Gold Coast ore, which in effect added nearly 200,000 tons of manganese ore equivalent to United States receipts from Gold Coast.

Ferro-alloys and ferro-alloy metals imported for consumption in the United States, 1947–48,[1] by varieties

[U. S. Department of Commerce]

Variety of alloy	1947			1948		
	Gross weight (net tons)	Content (net tons)	Value	Gross weight (net tons)	Content (net tons)	Value

Fluorspar and Cryolite

By HUBERT W. DAVIS

FLUORSPAR

GENERAL SUMMARY

SHIPMENTS of fluorspar from mines in the United States established a peacetime record and imports an all-time high in 1948. Moreover, consumption of fluorspar in the United States in 1948 was only 1 percent under the all-time record established in 1944. However, production of finished fluorspar declined moderately. The continued high level of operations in the steel and hydrofluoric-acid industries was chiefly responsible for the accelerated activity in fluorspar in 1948.

Illinois maintained its rank as the premier producer of fluorspar in 1948 by supplying 52 percent of the total domestic shipments. Furthermore, shipments from Illinois were 3 percent greater than in 1947. Shipments from mines in Nevada and Utah established new records in 1948, and shipments from Montana were reported for the first time. However, Arizona, Colorado, Kentucky, New Mexico, and Texas shipped less fluorspar in 1948 than in 1947.

For the eighth consecutive year Mexico has continued to be the largest source of foreign fluorspar to the United States, and in 1948 it supplied 71 percent of the total imports. Moreover, imports of fluorspar from Mexico were 53 percent greater than in 1947. For the first time since 1939, fluorspar was received from Germany. Substantially larger imports were also received from Newfoundland.

The steel industry continued to be the predominant user of fluorspar and absorbed proportionately more (57 percent) of the total consumed in 1948 than in 1947 (55 percent). The average consumption of fluorspar per long ton of basic open-hearth steel produced increased for the second consecutive year; it was 5.86 pounds in 1948 compared with 5.54 pounds in 1947. The hydrofluoric-acid industry, the second largest utilizer of fluorspar, consumed 7 percent more than in 1947—26.4

percent of the total in 1948 compared with 26.7 percent in 1947. Larger quantities of fluorspar were also used in 1948 than in 1947 at iron foundries, nonferrous smelters, and plants making ferro-alloys, cement, and special fluxes. However, consumption of fluorspar by the glass and enamel trades in 1948 dropped 10 percent from the all-time high established in 1947.

Deliveries of fluorspar to consumers in the United States totaled 442,336 short tons in 1948 (331,105 tons from domestic mines and 111,231 tons from foreign sources). In 1947, deliveries to consumers had totaled 397,465 tons (319,195 tons from domestic mines and 78,270 tons from foreign sources); in addition, 9,109 tons of finished fluorspar from domestic mines were delivered to the Government stock pile. Total deliveries to steel plants in the United States advanced to 269,304 tons (230,224 tons in 1947), and those to hydrofluoric-acid plants increased to 106,857 tons (102,013 tons in 1947); however, sales to glass and enamel plants fell to 45,602 tons (50,054 tons in 1947).

Salient statistics of fluorspar in the United States, 1939–48, in short tons

Year	Shipments from domestic mines	Foreign trade		Consumption	Industry stocks at end of year		
		Imports for consumption	Exports		Domestic mines [1]	Consumers' plants	Total
1939	182,771	16,302	2,976	176,800	38,619	90,400	129,019
1940	233,600	11,873	8,482	218,500	43,866	102,100	145,966
1941	320,669	7,524	12,184	303,600	31,997	108,900	140,897
1942	360,316	2,151	9,020	360,800	19,429	96,000	115,429
1943	406,016	43,769	9,068	388,885	19,026	105,933	124,959
1944	413,781	87,200	1,980	410,170	19,021	98,446	117,467
1945	323,961	104,925	1,420	356,090	19,863	103,148	123,011
1946	277,940	29,852	1,729	303,190	18,957	98,663	117,620
1947	329,484	78,725	1,180	376,138	33,101	114,150	147,251
1948	331,749	111,626	666	406,269	37,344	146,869	184,213

[1] Finished fluorspar only.

The average composite selling price ($32.14 a short ton) of all grades of fluorspar (both domestic and foreign) delivered to consumers in the United States in 1948 was $0.34 less than in 1947.

Hourly wage increases of 7 to 10 cents were made by many fluorspar-mining companies in 1948.

The total quantity of fluorspar shipped in and imported into the United States from about 1870 through 1948 was approximately 8,809,000 short tons, comprising about 83 percent from domestic mines and 17 percent from foreign sources.

RESERVES

Information on reserves of fluorspar in the United States, prepared by the Bureau of Mines and Geological Survey, was published in hearings before a Subcommittee of the Committee on Public Lands, United States Senate, Eightieth Congress, first session, 1947 (pp. 242–245); an abstract is contained in the chapter of this series for 1947 (pp. 498–499).

PRODUCTION AND SHIPMENTS

Production of finished fluorspar totaled 336,000 short tons in 1948, including 156,246 tons of flotation concentrates; however, the output also included 2,100 tons of finished fluorspar recovered from milling crude ore that had been mined before 1948. Thus, total production (expressed in terms of finished fluorspar) was 333,900 tons in 1948 compared with 338,600 tons in 1947. Of the mine output in 1948, 11 mines (producing over 10,000 tons each) supplied 167,500 tons or 50 percent, 7 mines (producing 5,000 to 10,000 tons each) supplied 58,700 tons or 18 percent, 29 mines (producing 1,000 to 5,000 tons each) supplied 76,300 tons or 23 percent, and 12 mines (producing 500 to 1,000 tons each) supplied 8,300 tons or 2 percent; thus, 59 mines produced 310,800 tons or 93 percent of the total. Of the remaining output (23,100 tons or 7 percent), some (in quantities ranging from a few tons to 500) came from an undetermined number of small mines and prospects, but much was derived from treated tailings from previous milling operations.

In 1948 mines operated by consumers produced 89,600 tons of finished fluorspar compared with 99,300 tons in 1947.

Fluorspar shipments from domestic mines in 1948 aggregated 331,749 short tons valued at $11,227,452, increases of 0.7 percent in quantity and 2.5 percent in value over 1947. Of the 1948 total, 71,696 tons were shipped by river or river-rail for delivery to consumers compared with 60,630 tons in 1947.

Illinois (52 percent) and Kentucky (26 percent) supplied 78 percent of the fluorspar shipped in 1948 compared with 78 percent also in 1947. Shipments from Illinois and Kentucky were virtually the same in both years compared with a gain of 3 percent from other producing States.

The average value of all grades of domestic finished fluorspar shipped in 1948 ($33.84) established a new peak and was $0.59 more than the previous high of 1947.

Fluorspar shipped from mines in the United States, by States, 1947–48

State	1947			1948

[1] Fluxing gravel includes (and flotation concentrates exclude) the following quantities of flotation concentrates blended with fluxing gravel: 1947, 19,110 tons; 1948, 16,666 tons.
[2] Revised figure.
[3] Includes pelletized gravel.

Fluorspar shipments in 1948 comprised 174,749 tons of fluxing gravel (including 16,666 tons of flotation concentrates which were blended with fluxing gravel) and foundry lump, 156,999 tons of ground and flotation concentrates, and 1 ton of acid lump. The bulk of the fluxing-gravel and foundry-lump fluorspar was shipped to steel plants and iron foundries; but a comparatively small tonnage moved to plants making cement, ferro-alloys, nickel, basic refractories, and fluxing compounds, and to smelters of secondary metals. Of the ground and flotation concentrates shipped in 1948, hydrofluoric-acid plants took 62 percent and glass and enamel plants 29 percent; the remainder went chiefly to aluminum- and magnesium-reduction works; to manufacturers of steel, ferro-alloys, and welding rods; and to smelters of secondary metals.

SHIPMENTS, BY USES

As is evident from the accompanying table and figure 1, the predominant purchaser of fluorspar is the steel industry, which also consumes substantial quantities of hydrofluoric acid and sodium fluoride, for which fluorspar is the basic material.

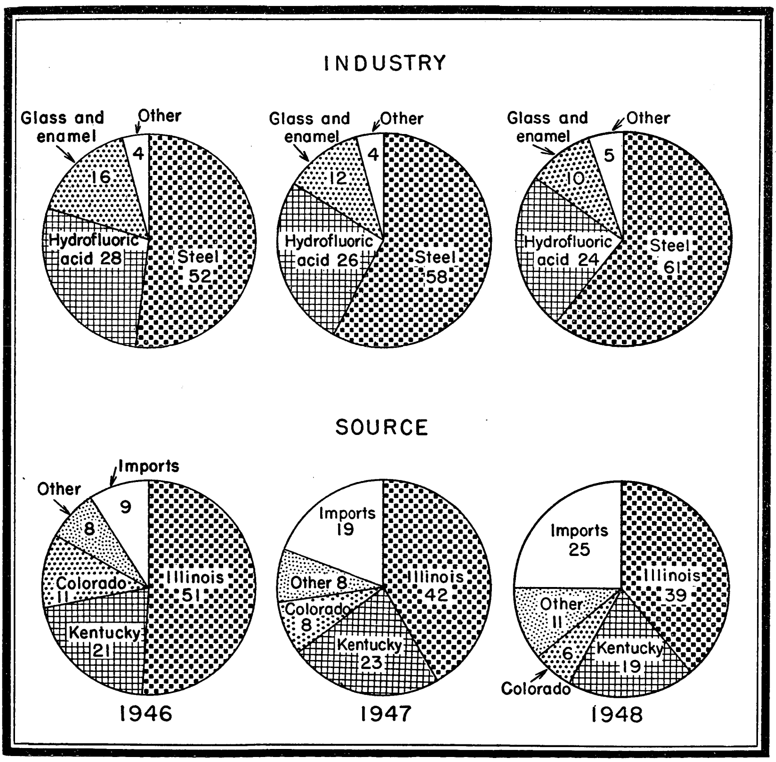

FIGURE 1.—Fluorspar sales (domestic and foreign) to consumers in the United States, 1946–48, by consuming industries and sources, in percent.

STOCKS AT MINES OR SHIPPING POINTS

According to the reports of producers, the quantity of fluorspar in stock at mines or shipping points at the close of 1948 totaled 100,286 tons, or 10 percent more than in 1947. These stocks comprised 37,344 tons of finished fluorspar and 62,942 tons of crude fluorspar (calculated to be equivalent to 27,000 tons of finished fluorspar).

Stocks of fluorspar at mines or shipping points in the United States, by States, Dec. 31, 1946, 1947, and 1948, in short tons

State	1946		1947		1948

1947	209,395	100,363	42,130	8,938	6,567	8,745	376,138
1948	232,687	107,280	37,247	8,871	8,817	11,367	406,269

Fluorspar was reported consumed in 40 States and the District of Columbia in 1948, but 3 States—Illinois, Ohio, and Pennsylvania—used 228,693 tons or 56 percent of the total consumption. Pennsylvania was again the chief consuming State; it ranked first in consumption of fluorspar in both steel and glass and advanced to third from seventh place in hydrofluoric acid. Illinois maintained its rank as the largest consumer of fluorspar in hydrofluoric acid in 1948.

The accompanying table shows, so far as possible without revealing the figures of individual companies, the consumption of fluorspar, by States, in 1947 and 1948.

Fluorspar (domestic and foreign) consumed in the United States, by States, 1947–48, in short tons

State	1947	1948	State	1947	1948
Alabama Georgia	10,076	12,435	Kentucky Maryland	6,179	7,483
Arkansas Florida Louisiana Mississippi North Carolina South Carolina	21,740	17,269	Maine Massachusetts Rhode Island	1,441	1,503

REVIEW BY STATES

Arizona.—Production of fluorspar in Arizona was 1,271 short tons in 1948 compared with 1,601 tons in 1947. The 1948 output came chiefly from Cochise County, but some came from Greenlee, Maricopa, and Yuma Counties. The fluorspar from Cochise County was from the Lone Star mine operated by Cooper Shapley, Jr., and was shipped to steel plants. The fluorspar from Maricopa County, which was also shipped to steel plants, was from the Queen mine operated by Isaac Campbell and the Jumbo mine operated by J. A. Campbell. A small quantity of fluorspar was recovered as a by-product of the Sonora lead mine in Yuma County and shipped to a steel plant and a nonferrous smelter. The fluorspar from Greenlee County was shipped to a flotation plant; the concentrates recovered from the fluorspar, rather than the milling ore, have been credited to Arizona in the statistics.

California.—The Industrial Minerals & Chemical Co., West Berkeley, ground some Nevada fluorspar, which it sold to an iron foundry, an enamel plant, and a Canadian customer. The company also ground some Nevada fluorspar on a toll basis for Balfour, Guthrie & Co., Ltd., which sold it to an enamel plant. A carload of Nevada fluorspar was also ground by Kennedy Minerals Co., Inc., Los Angeles, for L. H. Butcher Co. The ground fluorspar has been credited to Nevada in the statistics.

Colorado.—Production of finished fluorspar in Colorado decreased to 27,800 short tons in 1948 from 32,200 tons in 1947. However, the 1948 production includes 700 tons of finished fluorspar recovered from milling crude ore mined before 1948. Consequently, production (expressed in terms of finished fluorspar) totaled 27,100 tons in 1948 compared with 33,600 tons in 1947. Output in 1948 came from Boulder, Chaffee, Jackson, and Mineral Counties.

Shipments of fluorspar from Colorado were 27,698 tons in 1948 compared with 32,153 tons in 1947. The 1948 shipments comprised 18,449 tons of flotation concentrates and 9,249 tons of metallurgical-grade fluorspar.

The Ozark-Mahoning Co., operating a flotation mill near Jamestown, produced 9 percent more flotation concentrates in 1948 than in 1947. The flotation-mill feed comprised ore chiefly from the Emmett and Blue Jay mines, but some was also contributed by the Argo mine. These mines are in Boulder County and were operated by Harry M. Williamson & Son. The shaft at the Argo mine was sunk an additional 100 feet and that at the Blue Jay was being sunk an additional 150 feet, of which 80 feet had been completed December 31. The Ozark-Mahoning Co. also operates a flotation mill at Rosiclare, Ill.

The flotation mill of the General Chemical Division, Allied Chemical & Dye Corp., near Jamestown, produced 13 percent more concentrates than in 1947. The flotation-mill feed comprised ore chiefly from the company-operated Burlington and Yellow Girl mines in Boulder County, but a small quantity was purchased from other Colorado mines. On March 30, 1948, the company added to its holdings in Chaffee County by purchasing the mine and flotation-jig mill of Colorado Fluorspar Mines, Inc., but they were not operated. The General Chemical Division, Allied Chemical & Dye Corp., also has a flotation mill at Deming, N. Mex.

Colorado Fluorspar Mines, Inc., operated its combination flotation-jig mill and mine near Salida, Chaffee County, until March 30, when they were sold to the General Chemical Division, Allied Chemical & Dye Corp. During the period January 1 to March 30 it produced 881 tons of flotation concentrates and 60 tons of fluxing-gravel fluorspar.

The Aksarben mine near Salida, Chaffee County, was under development by Fluorspar, Inc., which produced some ore that it treated at the flotation mill formerly operated by United States Fluorspar, Inc. Operation of the flotation mill was begun in December 1948.

The Wagon Wheel Gap mine of the Colorado Fuel & Iron Corp., in Mineral County, produced 6 percent more fluxing-gravel fluorspar in 1948 than in 1947. The company made general repairs and improvements to its mill in 1948.

The heavy-medium mill built on its property near Northgage, Jackson County, in 1943 by the Defense Plant Corp. was purchased by the Colorado Fluorspar Corp., effective November 1, 1948. The mill was formerly operated by the Western Fluorspar Corp. and was closed on August 26, 1945. The mill was not operated in 1948.

Illinois.—Illinois maintained its premier position as a fluorspar-producing State. Production of finished fluorspar was 169,700 short tons in 1948; about 95 percent came from Hardin County and the remainder from Pope County. In addition, some crude ore equivalent to 3,000 tons of finished fluorspar was mined but not milled in 1948. Thus, total mine production (expressed in terms of finished fluorspar) was 172,700 tons in 1948 compared with 169,300 tons in 1947. Some Kentucky fluorspar is milled in Illinois, and some Illinois fluorspar is milled in Kentucky; the finished fluorspar so recovered, as well as that shipped, is credited in the statistics to the State of origin. The Argo, Austin, Blue Diggings, Crystal, Deardorff, Douglas, East Green, Fairview, Geely Shaft, Hawkins Shaft, Interstate, Knox, Mahoning Shaft No. 2, Mahoning Shaft No. 3, Midway-North Boundary-Air Shaft-Hillside, Minerva, Pell Shaft, Redd, Rosiclare, South Boundary, Victory, and West Green properties supplied about 97 percent of the fluorspar produced in Illinois in 1948. Most of the remainder came from many mines and prospects, chiefly the Empire, Eureka, Humm, Jefferson, Lead Hill, Rose Creek, and Stewart; some was recovered from tailings from previous milling operations.

Shipments of fluorspar from Illinois (172,561 tons) were 3 percent more than in 1947 and contributed 52 percent of the total domestic shipped. Of the 1948 total, 50,441 tons were shipped by river or river-rail to consumers compared with 41,319 tons in 1947.

The Alcoa Mining Co. produced 3 percent less flotation concentrates in 1948 than in 1947. The mill feed comprised ore from the company-operated Argo, Blue Diggings, and Fairview mines. The ore from these mines is first treated in the company heavy-medium unit, which supplies an enriched product for flotation feed. The Argo-Blue Diggings vein system was worked through the Blue Diggings-Fairview shafts on the Argo 240-, 500-, 600-, 700-, and 800-foot levels; the Fairview-Blue Diggings vein was worked on the 400-, 500-, 600-, 700-, 800-, and 900-foot levels and on the 300-foot level of vein "J," a minor vein of this system. Thirty-pound rail was laid for operation of larger mine locomotives and cars on the main haulageways of the Fairview-Blue Diggings mines, and signal lights to control traffic on the single track on the 500- and 700-foot levels between the Fairview shaft and Argo-Blue Diggings vein intersection were installed.

The Crystal Fluorspar Co. produced 20 percent less finished fluorspar in 1948 than in 1947. The loss in output resulted partly from a strike of employees from June 9 to July 6 at the Crystal mine and from June 16 to July 6 at the Jefferson mine, and partly from mining lower-grade ore. Production in 1948 was obtained from the Crystal and Jefferson mines and from re-treating log-washer fines at the Patton flotation mill. At the Crystal mine 600 feet of drifting and 150 feet of raising were done in 1948. At the Jefferson mine, which has been under development since 1945, 538 feet of drifting, 147 feet of raising, and 38 feet of crosscutting were done in 1948. A new heavy-medium Mobil mill, to replace the present gravity-concentrating mill, was delivered late in December; it will be erected at the Crystal mine to serve it and the Jefferson mine.

The Inland Steel Co. discontinued fluorspar mining and milling operations at Rosiclare, and the mineral and mining rights of the Hillside mine were sold to the Rosiclare Lead & Fluorspar Mining Co. The Hillside mine and gravity-concentrating mill had been brought into operation about May 1, 1922, by Hillside Fluor Spar Mines. Future fluorspar production by Inland Steel Co. will be centered chiefly in its Keystone mine near Marion, Ky. Some ore was mined in 1948 at the Hillside mine by Inland Steel Co. before its disposition, and a small quantity of concentrates was produced at the company flotation plant. Its gravity-concentrating mill at Rosiclare, however, did not operate. Some ore from the Rosiclare mill was transferred to and treated at the company heavy-medium mill at the Keystone mine.

The Ozark-Mahoning Co. produced 28 percent more fluorspar flotation concentrates in 1948 than in 1947. The mill feed in 1948 comprised ore from the Deardorff, East Green, Mahoning Shaft No. 2, Mahoning Shaft No. 3, and West Green mines near Cave in Rock, Ill., the Delhi-Babb and Commodore mines near Salem and Marion, Ky., respectively, and some purchased ore, chiefly from the Mineral Ridge mine also near Salem. Production of finished fluorspar in 1948 comprised 76 percent acid grade, 12 percent pelletized gravel, and 12 percent filter cake; most of the filter cake was sold to local producers for blending with fluxing gravel. Production and shipments of finished fluorspar from the Delhi-Babb, Commodore, and Mineral Ridge mines have been credited to Kentucky in the statistics. The Ozark-Mahoning Co. displaced the Rosiclare Lead & Fluorspar Mining Co. as the largest producer of fluorspar in the United States in 1948.

The Rosiclare Lead & Fluorspar Mining Co. operated the Eureka, Geely, Hawkins, Interstate, Midway-North Boundary-Air Shaft-Hillside, Pell, Rosiclare, and South Boundary properties in 1948, but the Rosiclare mine was again the chief producing mine of the company. The ore from the company mines is mill feed for its heavy-medium, jig, and flotation mills. Production of finished fluorspar of all grades was 12 percent less in 1948 than in 1947 but shipments were 4 percent more. Denver mineral jigs were added in the company mill for the reclamation of the fractional lead content in the gravel fines. A sizable ore body was being developed on the Interstate property about 4 miles northwest of Rosiclare. The ore body, which has been opened to a length of 250 feet, showed widths up to 16 feet at the 70-foot level; a stope started above the 70-foot level showed a maximum width of about 22 feet. The fluorspar is gravel in character and of very good grade. Sinking of the shaft to 140 feet to develop the downward extension of the ore body is contemplated.

Operations at the mine and flotation mill of Minerva Oil Co. continued on a 6-day week in 1948; but, chiefly because of a 17-day strike by employees in June, output of fluorspar flotation concentrates was 6 percent less than in 1947. The company was sinking a 6-foot air and escape shaft at its mine and was continuing prospect drilling on or near its properties.

Production in 1948 at the Douglas mine in Pope County, operated by the Hicks Creek Fluorspar Mining Co., was seven times that in 1947. The Redd mine, also in Pope County, operated by the H. C. B. Mining Co., the Knox, Rose Creek, and Austin mines in Hardin County, operated by Knox Fluorspar Co., Yingling Mining Co., and J. F. E. Austin, respectively, were the largest of the many smaller mines worked in Illinois in 1948.

Kentucky.—Production of finished fluorspar in Kentucky in 1948 was 7 percent less than in 1947 and 5 percent under the average for the 5 years 1943–47. Output in 1948 was 91,800 short tons. In addition, some crude ore equivalent to 1,700 tons of finished fluorspar was mined but not milled in 1948. Thus, total mine production (expressed in terms of finished fluorspar) was 93,500 tons in 1948 compared with 101,100 tons in 1947. Shipments were also less; they were 84,889 tons—a 6-percent decline from 1947. Of the 1948 shipments, 21,255 tons were shipped by river or river-rail compared with 19,311 tons in 1947.

Reflecting greatly accelerated activity at the Hughett mine, operated by the C & L Fluorspar Co., output in Caldwell County increased to 5,200 tons in 1948 from 1,700 tons in 1947. The Crowder mine contributed virtually all of the remainder of the output in the county.

The major part of the 1948 output in Crittenden County came from the Blue, Davenport, Delhi-Babb, Hicks, Keystone, Pigmy, Tabb No. 1, and Yandell No. 22 mines. Most of the remainder came from many smaller producing mines, including the Ainsworth, Crystal, Hickory Cane, Krausse, La Rue, Mary Belle, Reiter, Tabb No. 2, and Watkins; and some was recovered from tailings from previous milling operations.

Production and shipments of fluorspar in 1948 by the United States Coal & Coke Co., the largest producer in Kentucky, were 21 and 28 percent, respectively, less than in 1947. Output came from the Tabb No. 1, Tabb No. 2, and Yandell No. 22 mines. Its Big Four mine was idle, and the Asbridge No. 21 and Tabb No. 2 mines have been exhausted of known ore.

The Kentucky Fluor Spar Co. and affiliates shipped 19 percent less fluorspar and "fluorbarite" than in 1947. The company operates a mill at Marion and, through its mining division (Roberts & Frazer), operated the Carr and Wright mines in Livingston County. Only about one-fifth of the supply came from company mines in 1948; most of it was supplied by the Austin, Blue, Crowder, Hughett, Keystone, Knox, Krausse, Lead Hill, Redd, and Rose Creek mines and the flotation mills of Butler & Moodie, C & L Fluorspar Co., Crider Bros. Fluorspar Co., and Minerva Oil Co.

The Keystone mine and new heavy-medium mill of Inland Steel Co. were operated throughout 1948. Output at the Keystone mine was about double that in 1947. Production at its heavy-medium mill was 3.7 times that in 1947, when it was only operated a little over 4 months. The company completed a barge-loading station on the Kentucky bank of the Ohio River, opposite Elizabethtown, Ill.

Output of fluorspar at the Pigmy mine of the Pigmy Corp. (subsidiary of the Rosiclare Lead & Fluorspar Mining Co.) declined for the fourth consecutive year and was 37 percent less in 1948 than in 1947.

In 1948 the Delhi Fluorspar Corp. made a small production at its Hickory Cane mine but it was inadequate for its needs. Consequently, the company purchased fluorspar from many local producers, as well as some Mexican fluorspar, which was blended with domestic fluorspar. The domestic fluorspar came chiefly from the Austin, Douglas, Knox, and Redd mines in Illinois. The Mexican fluorspar so blended and shipped has not been included in the statistics for

Kentucky. Total shipments by Delhi Fluorspar Corp. were 107 percent greater than in 1947.

L. Conyer shipped 18 percent less fluorspar in 1948 than in 1947. He operates a jig mill near Marion and depends on purchases of local ore and tailings for his mill feed. Most of his output of finished fluorspar in 1948 was derived from milling tailings purchased from various mills in Illinois and Kentucky.

Ben E. Clement sold 22 percent more fluorspar in 1948 than in 1947. He purchased fluorspar from local producers and some acid-grade fluorspar from Mexico. The Mexican fluorspar was used to raise the grade of locally purchased fluorspar. The Mexican fluorspar has not been included in the statistics for Kentucky.

Crider Bros. Fluorspar Co. worked the Blue mine near Mexico, Ky., and the Jameson mine near Lola, reclaimed some fluorspar from the Haffaw dump, and purchased fluorspar from local producers. The ore from the company mines is mill feed for its gravity-concentrating and flotation mills. Output in 1948 comprised 70 percent metallurgical-grade fluorspar and 30 percent flotation concentrates. The company reopened the No. 1 shaft at the Blue mine and hoisted a substantial tonnage of ore from the 300-foot level. A new gravity-concentrating mill was erected at the Blue mine. Sales of fluorspar by the company were 10 percent smaller than in 1947.

The C & L Fluorspar Co., which operated the Hughett mine in Caldwell County, purchased the flotation mill of Minerals Flotation Corp. at Marion during the second quarter of 1948 and operated it the remainder of the year. The mill feed comprised tailings from local mines.

Davenport Mines, Inc., operated the Davenport and Hicks mines near Salem in 1948. It did much underground exploratory work in anticipation of completion of its new heavy-medium mill to serve these mines. The mill was completed in November. As a consequence of exploratory work and mill construction, output of fluorspar by the company declined 36 percent from 1947.

The Aluminum Ore Co. (Alcoa Mining Co. beginning January 1, 1949) did not mine any fluorspar in Kentucky in 1948, but its Mary Belle mine was leased to and operated by F. B. Moodie, Jr. However, the company did prospect core drilling on the Eagle-Butler, Eagle-Babb, Klondike-Schoolhouse, Coker, Danakay, Grassham, Tyner, Trabue-Skelton, F. W. Davis, Lewis Heirs, Haynes, Snyder, Howard Damron, George Damron, Alonzo Watson, and Eagle-Hutson properties.

In Livingston County production of finished fluorspar declined to 9,800 tons in 1948 from 17,200 tons in 1947. The output in 1948 came chiefly from the Carr and Mineral Ridge mines and from reworking the Klondike tailings.

Output at the Carr and Wright mines of Roberts & Frazer was 56 percent less than in 1947.

The Mineral Ridge mine was operated by Alco Lead Corp. throughout 1948; output was at about the same as in 1947. The heavy-medium mill completed at this mine in early 1948 was later dismantled and moved to the company lead mine in Illinois.

Butler & Moodie continued to reclaim fluorspar from Klondike tailings at its flotation mill near Mullikin.

In the Central Kentucky district production and shipments of finished fluorspar declined to 2,476 and 2,717 tons, respectively, in 1948 (5,771 and 6,030 tons in 1947). In addition to the finished fluorspar shipped in 1948, 250 tons of milling ore was shipped to a mill at Marion, Ky. The largest producer in this district is Hageman Properties, Inc.; in 1948 it operated the Faircloth and Haydon mines in Woodford County near Wilmore. A small quantity of fluorspar was produced at the Lone Oak mine in Mercer County near Harrodsburg by Albert Brauer in 1948; the mine has been abandoned.

Montana.—The first commercial production of fluorspar in Montana was reported made in 1948; it totaled 318 tons and was produced by Jay Bettles at the property of Coeur d'Alene Extension Mines, Inc., in Mineral County near Superior. The fluorspar was uncovered by bulldozing operations; it was reported to have averaged 94.6 percent calcium fluoride and was shipped to Pacific coast steel plants.

Nevada.—Shipments of fluorspar from Nevada established a new high in 1948; they were 9,615 short tons, an increase of 20 percent over 1947 and 7 percent greater than in 1941, the previous record year. Most of the 1948 output went to steel plants; but some was shipped to cement, glass, and enamel plants, iron foundries, and nonferrous smelters, and a little was exported to Canada. The fluorspar moving to glass and enamel plants and to Canada was ground by Industrial Minerals & Chemical Co., West Berkeley, Calif., and Kennedy Minerals Co., Inc., Los Angeles, Calif.

The chief producing mine in Nevada in 1948 was the Daisy in Nye County, operated by J. Irving Crowell, Jr.; its production was 129 percent more than in 1947. The Baxter mine in Mineral County, operated by V. S. Baxter, was the second-largest producing mine in Nevada in 1948; its output, however, declined 23 percent from 1947. A car of fluorspar was produced at the Cirac Review Group in Churchill County by C. P. Cirac.

New Mexico.—Production of finished fluorspar in New Mexico was 24,900 short tons in 1948, a loss of 10 percent from 1947. However, the 1948 production includes 6,200 tons of finished fluorspar recovered from treating some crude ore mined before 1948. Consequently, total mine production (expressed in terms of finished fluorspar) was 18,700 tons in 1948 compared with 22,000 tons in 1947. The 1948 output came from Dona Ana, Grant, Hidalgo, Luna, Sierra, and Valencia Counties. The Zuñi and Mirabal mines in Valencia County, Shrine mine in Grant County, and Howard (White Eagle) mine in Luna County supplied about 86 percent of the fluorspar produced in New Mexico in 1948. Most of the remainder came from many mines and prospects, and some was recovered from tailings from previous milling operations.

Shipments of fluorspar from New Mexico likewise decreased and totaled 24,968 tons in 1948, a loss of 9 percent from 1947.

The flotation mill of General Chemical Division, Allied Chemical & Dye Corp., at Deming produced 1 percent less concentrates in 1948 than in 1947. The mill feed comprised ore from the company Shrine mine in Grant County and Florida mine in Luna County and purchased ore from local mines, chiefly the Howard (White Eagle) mine in Luna County.

The flotation mill of Zuñi Milling Co. at Los Lunas produced 80 percent more concentrates than in 1947. The mill feed comprised ore from the company mines near Grants in Valencia County, tailings from previous milling operations, and purchased ore from local mines, chiefly the Howard (White Eagle) mine in Luna County and the Mirabal mine in Valencia County. Output of milling ore at the company mines almost tripled that in 1947.

The Howard (White Eagle) mine in Luna County, operated by J. H. Harrison, was the second-largest producing mine in New Mexico in 1948; except for a carload to a cement plant, the fluorspar was sold to local flotation mills.

Texas.—Production of finished fluorspar in Texas was 805 short tons in 1948, a loss of 28 percent from 1947; shipments (906 tons) were 11 percent smaller. Production was from the Eagle Mountains mine in Hudspeth County near Van Horn, operated by J & L Fluorite Co. until April 10, when it was sold to Texas Fluorspar Mines, Inc., which operated the remainder of the year. The new operator did much development at the mine and overhauled its mill, to which a second ball mill was added, increasing milling capacity to 80 tons per 24 hours. Geologic mapping covering some 5 square miles is reported to have resulted in a substantial increase in inferred ore reserves. The fluorspar deposits controlled by the Texas Fluorspar Mines, Inc., were described.[1]

Utah.—Production of fluorspar in Utah established a new high in 1948; it was 9,523 short tons, an increase of 481 percent over 1947 and 173 percent greater than in 1944, the previous record year. The bulk of the production came from Juab County near Delta, where there was a short-lived mining "boom" in 1948. George Spor & Sons, who first mined fluorspar in the Delta area, again operated, and Chesley & Black, Willden Bros., and Ward Leasing Co. made initial outputs. All the ore produced, which was reported to average about 85 percent calcium fluoride and less than 2 percent silica, was shipped to the steel plant at Geneva. A car of fluorspar was shipped from a property in Beaver County by Fred Staats, and a few tons were shipped from the Blue Spar prospect in Grand County near Grand Junction by N. B. Knight, Jr. The fluorspar deposits in Juab County were described.[2]

MILL DEVELOPMENTS

Davenport Mines, Inc., completed a heavy-medium separation plant near Salem, Ky., to serve its Davenport and Hicks mines. A heavy-medium mill was delivered in late December to the Crystal Fluorspar Co., Elizabethtown, Ill.; it will be erected at the Crystal mine to serve it and the Jefferson mine. The heavy-medium mill installed by Alco Lead Corp. at the Mineral Ridge mine near Salem, Ky., in early 1948 was later dismantled and moved to its Patrick lead mine in Illinois. The heavy-medium mill built on the property of Colorado Fluorspar Corp. near Northgate, Colo., by the Defense Plant Corporation in 1943 was purchased by the former company effective November 1, 1948. A new gravity-concentrating mill to serve the Blue mine near Mexico, Ky., was completed by Crider Bros. Fluorspar Co. A second ball mill was added to the flotation

[2] Fitch, C. A., Jr., and Barker, C. S., Utah's New Mining District: Eng. and Min. Jour., vol. 150, No. 3, March 1949, pp. 63–66.

plant, which was overhauled, of Texas Fluorspar Mines, Inc., near Van Horn, Tex., thus increasing milling capacity to 80 tons per 24 hours.

A report [3] on Bureau of Mines flotation work on samples from nine fluorspar properties in western Kentucky was published. Two new processes for obtaining selectivity in floating fluorite with oleic acid were described.[4]

Output of flotation concentrates from domestic ore totaled 156,246 short tons in 1948 compared with 151,110 tons in 1947. No Mexican ore was treated in flotation mills in the United States in 1948.

PRICES

Metallurgical-grade fluorspar containing 70 percent or more effective calcium fluoride content was quoted at $35 a short ton f. o. b. Illinois-Kentucky mines until October 14, when the price was advanced to $37. Corresponding increases were made in the prices for other grades of metallurgical-grade fluorspar. On April 15 the selling price, f. o. b. Illinois mines, of acid-grade fluorspar containing a minimum of 97 percent calcium fluoride was advanced from $40 a ton to $42; and on October 14 it was raised to $44.

The average selling price of all grades of domestic fluorspar shipped in 1948 was $33.84 a short ton—a new peak—compared with $33.25 in 1947.

FOREIGN TRADE [5]

Imports.—Receipts of imported fluorspar into the United States established a new record of 111,626 short tons in 1948, a gain of 42 percent over 1947 and of 11 percent over 1945, the previous peak.

Fluorspar imported for consumption in the United States, which represents the quantity on which the duty was paid, also established a new record of 111,626 tons, a gain of 42 percent over 1947 and of 6 percent over 1945, the previous peak. The imports in 1948 comprised 20,196 tons containing more than 97 percent calcium fluoride and 91,430 tons of lower grade. They were valued [6] at $1,825,094. The value assigned to the higher-grade foreign fluorspar averaged $26.31 a ton in 1948 and that to the lower grade $14.15. The cost to consumers in the United States also includes duty, loading charges, insurance, consular fee, and freight to consuming plants. The duty on fluorspar containing not more than 97 percent calcium fluoride continued at $5.625 a short ton and on fluorspar containing more than 97 percent calcium fluoride $3.75.

In 1948, 3,776 tons of Mexican fluorspar were blended with fluxing-gravel fluorspar from the Illinois-Kentucky district. The Mexican fluorspar so blended has been excluded from the statistics on shipments from mines in the United States and included in the figures on imports.

1 Less than 1 ton.

The following table, compiled from data supplied to the Bureau of Mines by importers and domestic companies milling foreign fluorspar, shows the quantities of imported fluorspar delivered to consumers in the United States in 1947 and 1948, irrespective of the year of importation into the United States. It differs from the preceding table, which shows the quantity and grade imported into the United States. The quantities in the following table are based upon the actual outturn weights and include the finished fluorspar recovered from milling and drying foreign ore, rather than the ore milled or concentrate dried.

Imported fluorspar delivered to consumers in the United States, 1947–48, by uses

Use	1947			1948		
	Short tons	Selling price at tidewater, border, or f. o. b. mill in the United States, including duty		Short tons	Selling price at tidewater, border, or f. o. b. mill in the United States including duty	
		Total	Average		Total	Average
Steel	64,797	$1,665,629	$25.71	98,671	$2,458,384	$24.91
Hydrofluoric acid	12,346	506,497	41.03	10,009	468,861	46.84

Other	403	13,377	33.19	2,059	69,033	33.53
	78,270	2,215,305	28.30	111,231	3,013,957	27.10

Exports.—Producers of fluorspar reported exports of 644 short tons of fluorspar valued at $24,819 in 1948 compared with 1,180 tons valued at $43,679 in 1947. The exports (all ceramic ground and flotation concentrates) by producers in 1948 comprised 536 tons to Canada, 57 tons to Brazil, 50 tons to Cuba, and 1 ton to Mexico. In addition to the fluorspar exported by producers in 1948, dealers exported 12 tons to Chile, 10 tons to Colombia, and 550 pounds to Turkey.

Fluorspar reported by producers as exported from the United States, 1943–48

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average			Total	Average
1943	9,044	$246,973	$27.31	1946	1,729	$63,797	$36.90
1944	1,980	65,909	33.29	1947	1,180	43,679	37.02
1945	1,420	45,939	32.35	1948	644	24,819	38.54

WORLD REVIEW

The accompanying table shows world production of fluorspar, by countries, 1943–48, insofar as statistics are available.

World production of fluorspar, by countries, 1943–48, in metric tons [1]
[Compiled by P. Roberts]

Country [1]	1943	1944	1945	1946	1947	1948
Argentina (shipments)	1,713	2,674	3,012	2,133	2,400	(2)
Australia:

[1] In addition to countries listed China, South-West Africa, Soviet Zone of Germany, and U. S. S. R. produce fluorspar, but data of output are not available; estimates by author of chapter included in total.
[2] Data not available; estimates by author of chapter included in total.
[3] Estimate.
[4] Bizonal area.

Canada.—According to the Dominion Bureau of Mines, production of fluorspar in Canada was 9,556 metric tons [7] (all from Ontario) in 1948 compared with 6,519 tons in 1947. In Canada output falls short of consumption, and the greater part of the deficiency is met

[7] 1 metric ton is equivalent to 1.10231 short tons.

by importations, chiefly from Mexico, Newfoundland, and the United States. Imports into Canada were 38,829 metric tons during the first 10 months of 1948 compared with 29,031 tons in the entire year 1947.

Mexico.—Chiefly as a result of a near-record demand by the United States, production of flourspar (as measured by exports) in Mexico established a high of 75,381 metric tons, an increase of 65 percent over 1947 and 34 percent greater than in 1944, the previous peak. About 2,200 tons of Mexican fluorspar are used in local metallurgical plants, and some is exported to Canada.

Newfoundland.—The St. Lawrence Corp. of Newfoundland, Ltd., and Newfoundland Fluorspar, Ltd. (a subsidiary of Aluminum Co. of Canada, Ltd.), are the only producers of fluorspar in Newfoundland. Shipments of fluorspar from Newfoundland were 47,833 metric tons in 1948 compared with 36,191 tons in 1947.

The St. Lawrence Corp. of Newfoundland, Ltd., which has developed and opened several mines, has a gravity-concentrating mill and a flotation mill in Newfoundland for treating the ore; and a subsidiary, St. Lawrence Fluorspar, Inc., has a plant at Wilmington, Del., for drying the flotation concentrate. Shipments by the St. Lawrence Corp. of Newfoundland, Ltd., and St. Lawrence Fluorspar, Inc., were 16,963 metric tons in 1948 compared with 16,151 tons in 1947.

Newfoundland Fluorspar, Ltd., has two mines and ships crushed fluorspar principally to Arvida, Quebec, where the Aluminum Co. of Canada, Ltd., has a flotation plant. Shipments by Newfoundland Fluorspar, Ltd., were 30,870 metric tons in 1948 (20,040 tons in 1947) and comprised 26,976 tons to Arvida and 3,894 tons to other customers. Production was resumed in 1948 at the reopened Director mine, where development was continued on the 250-foot level, from which came all ore hoisted. Development was also continued at the Tarefare mine until May.

The fluorspar deposits of Newfoundland were described in much detail.[8]

South-West Africa.—During 1948 the Tsumeb Corp. did geologic mapping, trenching, and diamond drilling on company claims at Okurusu, 90 miles southwest of Tsumeb, where surface outcrops give promise of an important fluorspar deposit.[9] The fluorspar deposit of the Tsumeb Corp. was described by the Department of Mines, Union of South Africa, as follows: [10]

> The deposit is situated on the farm Marburg I about 12 miles northwest of Otjikango station in the Otjiwarongo district and about 36 miles from the village of Otjiwarongo. The fluorspar occurrence is located in the Marburg mountain, a large hill of metamorphosed sedimentaries of the Damara system surrounded by granites of the Salem type. The fluorspar, which is locally associated with a very pure hematite, is light green in color and occurs in steeply dipping parallel bands striking almost due north and south. These bands, of which there are three, are reported to have been traced over a strike of more than a mile and are individually of the order of 100 to 150 feet wide.
>
> On the southern flank of the hill one of these bands has been opened up by means of an adit driven about 150 feet into the hillside. Near the end of this adit a winze has been sunk to a depth of 100 feet. All this work was accomplished in massive fluorspar, which indicates the extensive nature of the body.

[9] South African Mining and Engineering Journal, vol. 59, No. 2910, part II, Nov. 20, 1948, p. 347.
[10] Kent, L. E., and others, Fluorspar in the Union of South Africa and South-West Africa: Union of South Africa, Dept. of Mines, Geol. Series Bull. 14, 1943, 69 pp.

Apart from the hematite mentioned above, the only other mineral present in quantity is quartz which is seen disseminated in certain sections of the ore body. As, however, fluorspar is principally used for fluxing the presence of quartz cannot be considered a serious drawback.

The grade of massive ore varies from about 70 percent to over 90 percent depending on the quantity of quartz. No doubt selected portions of the ore body will yield almost pure fluorspar but such rich pockets have not as yet been encountered. Beneficiation of the low grade ores could be tried out but will be wasteful on account of the small difference in specific gravity between the fluorspar and the quartz and the generally intimate intermixture of these two minerals.

The deposit, while not of high grade, is certainly the largest of its kind in Southern Africa and the reserves must run into millions of tons. Should there be a considerable expansion of the iron and steel industry in the Union, this deposit will be exploited.

CRYOLITE

Cryolite occurs in commercial quantity and is mined at only one place—Ivigtut, Greenland. The mine at Ivigtut, the grades of ore produced, methods of processing and purification, and various uses of cryolite have been described.[11]

Synthetic cryolite was manufactured in the United States in 1948 by the Aluminum Ore Co. at East St. Louis, Ill., and the Reynolds Metals Co. at Bauxite (Hurricane Creek), Ark.

The chief use of cryolite is in the reduction of aluminum; comparatively small quantities are used in glass, enamels, abrasives, and insecticides.

Imports of cryolite into the United States were 2,101 long tons valued at $210,050 in 1948 compared with 19,650 tons valued at $1,564,380 in 1947. The cryolite imported in both years came from Greenland.

Exports of cryolite from the United States were 637 long tons valued at $139,027 in 1948 compared with 836 tons valued at $216,357 in 1947. Of the 1948 exports, 543 tons went to Canada, 61 tons to Brazil, 24 tons to Mexico, and 9 tons elsewhere.

Production of synthetic cryolite by the fluoboric acid process was summarized [12] as follows:

Formation of fluoboric acid by the interaction of calcium fluoride, boric acid and sulfuric acid in an aqueous medium, offers a simple and attractive method of winning fluoride values from fluorspar. Fluoboric acid obtained in this manner has a high fluoride content and does not have the disagreeable fuming characteristics of hydrogen fluoride or its aqueous solutions. This key reaction can serve as the starting point for the formation of fluoborates, cryolite and other fluorides.

This investigation covers the study and development of a simplified cyclic process for the production of cryolite from fluorspar, through the intermediate formation of fluoboric acid. The term, fluoboric acid cryolite process, has been used to identify this method of forming cryolite. Specifically, cryolite is formed by the interaction of fluoboric acid with hydrated alumina and sodium carbonate, boric acid being regenerated and then recycled to form more fluoboric acid.

Cyclic process studies were carried out on a 40-gal. scale. The encounter of a number of unforeseen difficulties emphasized the importance of not depending too much on reaction studies made with pure synthetic solutions, but rather operating with the same liquor for a large number of cycles and with various lots of raw materials so that cumulative effects of accidental and unavoidable impurities can be investigated and overcome at an early stage of the development—at least before too large a scale of operation is adopted.

Fuel Briquets and Packaged Fuel[1]

By GERTRUDE S. GOODMAN

GENERAL SUMMARY

THE production of fuel briquets, after rising steadily for 10 years, dropped slightly in 1948 to 3,128,477 net tons. Packaged fuel declined in 1948 to 157,013 tons, the lowest annual output since 1937.

The fuel-briquetting industry in the United States consists of a relatively few large plants (36 in 1948), producing a small, hard, pillow-briquet suitable for shipment. The packaged-fuel industry, on the other hand, consists of a large number of small plants (62 in 1948), producing 3- to 4-inch, more or less friable cubes wrapped (usually 6 to a package) in sturdy paper sealed with gummed tape, suitable for local consumption but not as a rule for transportation over long distances; the cubes are designed for burning in the package.

In 1940, packaged fuel equaled 27 percent of the fuel-briquet production; by 1948 it had declined to 5 percent. The packaged-fuel industry (begun about 1928 but canvassed only since 1935) expanded spectacularly from 1935 to its peak in 1940; however, further growth was interrupted by World War II shortages and high costs of labor, raw fuels, and critical materials. Labor shortages and high manufacturing costs continue to be cited by some operators as causes of lowered production in 1948.

The total supplies of solid fuels commonly used for space heating in the United States in 1948 (see Coal—Pennsylvania Anthracite chapter, Minerals Yearbook, 1948, table 26) in order of their importance were as follows: Bituminous coal (including lignite), exact tonnage not available; Pennsylvania anthracite, 55,300,000 tons; coke (all kinds), 6,700,000; fuel briquets, 2,900,000 tons; and packaged fuel, 157,000.

An interesting 100-page booklet entitled "Fuel Briquetting" (by R. A. Strong, E. Swartzman, and E. J. Burrough), was published in 1937 by the Department of Mines and Resources, Ottawa, Canada. The principal subjects include history of briquetting, processes, binders, equipment, investigations of briquetting in North America, economics of the industry, and an appendix review of patent literature.

The Bureau of the Census, United States Department of Commerce, in its 1947 Census of Manufactures, has covered the fuel-briquetting and packaged-fuel industries, data for which are included in the

[1] Briquets made from charcoal, wood scrap, and fruit pits not included in Bureau of Mines review.

chapter "Petroleum and Coal Products."[2] The report includes data on employment and cost of materials, fuels, etc., consumed in the manufacture of fuel briquets and packaged fuel.

Costs of packaged-fuel manufacture by various processes were analyzed a few years ago.[3]

FUEL BRIQUETS

Statistics of the fuel-briquetting industry from 1944 to 1948 are summarized in table 1. Production by regions from 1917 to 1948 is shown in figure 1.

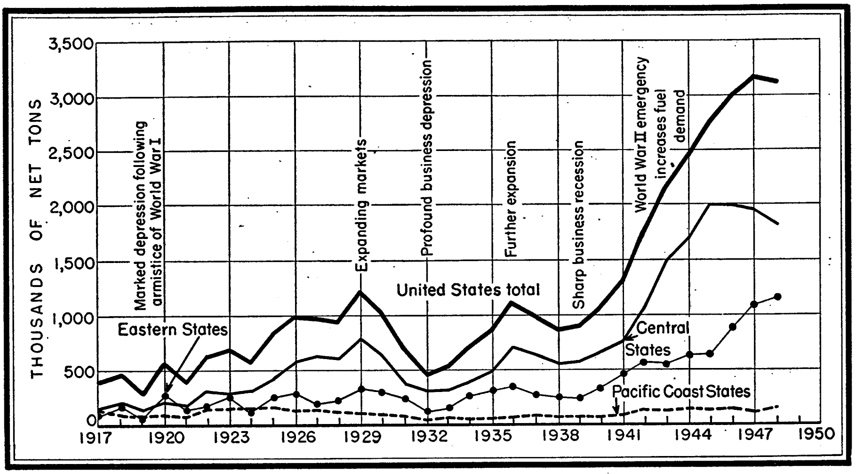

FIGURE 1.—Production of fuel briquets in the United States, by regions, 1917–48.

[3] Parry, V. F., Technical and Economic Study of Packaged Fuel: Bureau of Mines Rept. of Investigations 3757, 1944, 45 pp.

DOMESTIC PRODUCTION

The output of fuel briquets in 1948 totaled 3,128,477 tons, with a total sales value at the plant of $36,011,322—a 1.4-percent decrease in tonnage but a 17-percent increase in value as compared with 1947.

As fuel briquets are used almost entirely for house heating, their manufacture is highly seasonal; decreased production in 1948 may therefore be attributed largely to the unusually mild weather which prevailed in the winter months in most sections of the United States.

Production rose in the Eastern and Pacific Coast States but declined in the Central States (table 2).

Briquets were made in 17 States in 1948, with production centered in Wisconsin, followed by Pennsylvania, West Virginia, Missouri, and Illinois, in that order. Production in Wisconsin (11 plants totaling 1,218,699 tons valued at $16,203,556) declined 9 percent since 1947. Pennsylvania's four plants produced 675,880 tons valued at $6,326,305 (a 16-percent increase in production and 32-percent increase in value over 1947). Increases in three of the Central States did not offset decreases in the other producing States in this region. Production for the other producing States cannot be shown without revealing individual plant data.

TABLE 2.—Production of fuel briquets in the United States, 1947–48

	1947			1948				
	Plants[1]	Net tons	Value	Plants[1]	Net tons	Value	Percent of change from 1947 in— Tonnage	Percent of change from 1947 in— Value

Total	35	3,171,596	30,762,253	36	3,128,477	36,011,322	−1.4	+17.1

[1] 10 plants in 1947 and 11 plants in 1948 in Wisconsin; 4 plants in Pennsylvania; 3 plants in 1947 and 2 plants in 1948 in Illinois; 2 each in Arkansas, Kansas, Michigan, Missouri, and West Virginia; and 1 each in California, Massachusetts, Minnesota, Nebraska, New York, North Dakota, Oregon, Washington, and Wyoming (1948 only).

Twenty-one plants operated every month of the year, accounting for 80 percent of the total output. Production for the last 4 months of 1948 in the Eastern and Central States regions was 21 and 20 percent less, respectively, than in the corresponding months in 1947.

Number of Plants.—Thirty-six plants reported production in 1948; 32 of these were also active in 1947.[4] The four new briquetting

[4] Years plants (active in 1948) started producing are given in the 1948 Fuel Briquet Directory (which also shows type of raw fuel used), M. M. S. 1722, obtainable on request from the Bureau of Mines, Washington 25, D. C.

plants (three of which were reported under construction in 1947 and which started commercial operations in 1948) were Arko Briquettes, Inc., Fort Smith, Ark.; Chicago Briquet Co., Hanna, Wyo.; D. & M. Manufacturing Corp., Rutherford Heights, Pa.; and Arthur Kuesel Coal Co., Milwaukee, Wis. However, the new plant at Hanna, Wyo., which started operating in January 1948, reported operations permanently abandoned in September 1948. A briquetting plant of approximately 100,000 tons annual capacity was reported under construction at McComas, W. Va., by the Chicago Briquet Co.

The DeAngelis Coal Co., of Carbondale, Pa., whose briquetting plant at Buena Vista, Calif., was reported under construction in 1946 and 1947, has abandoned the idea of making lignite briquets and in June 1948 changed its name to the American Lignite Products Co., Division of DeAngelis Coal Co., and is engaged in the recovery of montan wax, sap brown, etc., from lignite by distillation methods of extraction at its California location.

The Lehigh Briquetting Co., engaged in the manufacture of lignite briquets since 1929 at Dickinson, N. Dak., changed hands January 1, 1949, being succeeded by Dakota Briquets & Tar Products, Inc. The plant of the Dunnebacke Co., Kenosha, Wis., active since 1937, was taken over July 1948, and operations were continued by the Haas Coal & Dock Co.

Four plants were idle in 1948; of these, the American Briquet Co. plant at Lykens, Pa. (operating from 1919 to May 1947), reported lack of raw coal as cause of idleness, and the Great Lakes Carbon Corp. plant at Casper, Wyo. (operating 1935–42; 1944–45), reported briquetting operations permanently abandoned in 1948.

The Super-Heat Fuel Co., Inc., Belleville, Ill., also permanently abandoned operations after a fire burned its plant to the ground January 5, 1948 (this was the only fire reported at briquetting plants during 1948).

Of the 36 plants active in 1948, 22 reported their equipment (employing various processes) installed by Komarek-Greaves & Co., Chicago, Ill., 3 by the Webb Corp., Webb City, Mo., and 3 by Glenn Smith, Chicago, Ill. Eight plants reported installation of additional equipment in 1948.[5]

Capacity.—Annual capacities of 100,000 tons or more were reported by 5 out of 8 plants in the Eastern States, by 10 out of 25 in the Central States, and by 1 out of 3 in the Pacific Coast States. The largest annual capacities as well as the largest production in 1948 were reported by the Berwind Fuel Co. and the Stott Briquet Co., Inc., for their plants at Superior, Wis. Table 3 gives comparative data for the past 5 years on capacity and relative production for the United States as a whole.

[5] A revised list of manufacturers of machinery used in making fuel briquets and packaged fuel, M. M. S. 1715, is obtainable on request from the Bureau of Mines, Washington 25, D. C.

100,000 or more	12	3,601,000	2,608,212	72.4	83.4
Total	36	4,670,510	3,128,477	67.0	100.0

Raw Fuels.—Nine kinds of raw fuels entered into the manufacture of 11 types of briquets in 1948 (tables 4 and 5). Pennsylvania anthracite, bituminous low-volatile, and Arkansas hard coals, in the order cited, were the principal fuels used in the manufacture of fuel briquets in 1948 and accounted for 87 percent of the total raw fuels used. The use of bituminous low-volatile declined 12 percent since 1947.

In the Eastern States region Pennsylvania anthracite fines and bituminous low- and high-volatile coals were the raw fuels used by plants near mines in Pennsylvania and West Virginia. In the Central States region—with plants in 10 States and production concentrated in the Lake dock territory—all fuels except residual carbons were used. In the Pacific coast region residual carbons from the manufacture of oil gas and pyrolysis of natural gas were the raw fuels used.

Briquet production at coal mines in the Eastern States has more than doubled in the past 6 years—from 544,671 tons at three plants in 1943 to 1,149,533 tons at six plants in 1948 (table 6).

Raw fuels, other than yard screenings, accounted for 91 percent of the total raw fuels used in the manufacture of fuel briquets in 1948 (table 4).

TABLE 4.—Raw fuels used in making fuel briquets in the United States, 1948

Character of raw fuels used	Plants	Net tons	Plants using—	Plants	Raw fuels used (net tons): Yard screenings	Raw fuels used (net tons): Other raw fuels	Raw fuels used (net tons): Total
Pennsylvania anthracite	16	1,151,752	Yard screenings exclusively (from own or other yards)	5	25,263	----------	25,263
Arkansas hard coals	8	310,812					
Bituminous low-volatile	17	1,090,286					
Bituminous high-volatile	5	180,158	Raw fuels (other than yard screenings) exclusively	24	----------	1,841,919	1,841,919
Semicoke (lignite char)	1	174,705					
Residual carbon from pyrolysis of natural gas	1		Both yard screenings and other raw fuels	7	232,751	847,928	1,080,679
Residual carbon from manufacture of oil gas	2						
Petroleum coke	3	40,148					
Total	[1] 36	2,947,861	Total	36	258,014	2,689,847	2,947,861

[1] 17 plants used 1 kind of fuel only, 3 plants used 2 kinds (separately), and 16 used mixtures of 2 kinds; hence the sum of the items shown exceeds the total number of plants.

TABLE 5.—Classification of plants and production of fuel briquets in the United States, by kinds of raw fuel used, 1947–48

Raw fuel used	1947: Plants	1947: Briquets produced: Net tons	1947: Briquets produced: Percent of total	1948: Plants	1948: Briquets produced: Net tons	1948: Briquets produced: Percent of total
Pennsylvania anthracite	3	146,995	4.6	2	1,380,122	44.1
Mixture of Pennsylvania anthracite and bituminous low-volatile	10	1,366,417	43.1	11		
Mixture of Pennsylvania anthracite and bituminous high-volatile	2	443,896	14.0	3	558,275	17.8
Mixture of Pennsylvania anthracite and bituminous high- and low-volatile	1			----------	----------	----------
Semianthracite	[1] 6	400,491	12.6	6	336,502	10.8
Arkansas hard coals (mixture)	[1] 2			2		
Bituminous low-volatile	4	518,644	16.4	6	496,108	15.9
Bituminous high-volatile	2	121,535	3.9	2	157,007	5.0
Semicoke (lignite char)	1			1		
Residual carbon from pyrolysis of natural gas	1	115,057	3.6	1	157,362	5.0
Residual carbon from manufacture of oil gas	2			2		
Petroleum coke	2	58,561	1.8	3	43,101	1.4
Mixture of petroleum coke and bituminous low-volatile	1			----------	----------	----------
Total	[2] 35	3,171,596	100.0	[2] 36	3,128,477	100.0

[1] 1 of these plants also used Oklahoma semianthracite.
[2] In 1947, 2 plants made 2 kinds of briquets; in 1948, 3 plants made 2 kinds; hence the sum of the items shown exceeds the total number of plants active in the respective years.

Binders.—Asphalt binders predominate in briquetting practice in the United States (table 7). In 1948, 34 operators used approximately 198,000 tons of asphaltic types and small quantities of coal-tar pitch, oil-gas tar pitch, rosin, and wax; and 2 operators used no binder (1 of these briquetted the carbon residue from the manufacture of oil gas, and 1 used low-volatile bituminous coal—the latter has been in operation since 1936 and the entire production, relatively small, is consumed locally).

TABLE 6.—Production of fuel briquets, grouped according to location of plants with reference to supply of raw fuel, 1947–48

Location of plant	1947		1948		Change in 1948	
	Plants	Production (net tons)	Plants	Production (net tons)	Net tons	Percent
Near lake coal docks:						
Lake Superior	4	927,452	4	840,864	−86,588	−9.3

Total United States	35	3,171,596	36	3,128,477	−43,119	−1.4

[1] Fall River, Mass.; Flint, Mich.; Omaha, Nebr.; and Syracuse, N. Y.

The percentage of binder in the briquets (by weight) ranged from less than 5 to 9 percent or more. Fifteen plants, accounting for 49 percent of the total 1948 production, used binders ranging from 5 to 7 percent; 2 used less than 5 percent; 12, 7 to 9 percent; and 5, 9 percent or more.

TABLE 7.—Classification of briquetting plants in the United States by type of binder used, 1945–48

	1945		1946		1947		1948

Production (net tons)	------	2,762,204	------	3,004,027	------	3,171,596	------	3,128,477

[1] Residual carbon from manufacture of oil gas and bituminous coal were raw fuels used at plants employing no binder.

Weight and Shape.—Briquets in the United States in 1948 (pillow-, barrel-, cube-, and log-shaped) ranged in weight from 1½ to 32 ounces, Pillow shapes under 5 ounces (except for an 11-ounce bituminous, high-volatile pillow by Coal Processing Corp., Buckner, Ill.) were made at 32 plants and accounted for 83 percent of the total production in 1948; 2½-ounce cylindrical (barrel-shaped) briquets were made at 2 plants; 18- and 20-ounce cubes at 1 plant; and 32-ounce logs at 1 plant.

Commercial production of the log-shaped briquet (called "Cologs") was reported by the D. & M. Manufacturing Corp., Rutherford Heights, Pa. The round logs—12 inches long and 2 inches in diameter—weigh 2 pounds each (32 ounces), are packed 12 to a carton, and are sold by the carton for fireplace use. The tonnage reported for 1948 was small.

The plant making cubes reported wrapping several hundred tons—a small part of its total production—in 10-pound packages suitable for burning in the package if desired.

Seven plants reported bagging or packing a part of their production in bags or cartons; but as a rule, this is merely a merchandising feature for delivery purposes only.

SHIPMENTS

The tonnage produced in 1948 was distributed widely, being shipped to 37 States and the District of Columbia, and exported principally to Canada (tables 8 and 11). The major proportion of the output at most of the briquetting operations entered markets outside the States of manufacture, but six plants producing 3 percent of the total sales disposed of their output entirely within the States of origin.

Fifty-nine percent, more than half of the total shipments within the United States, was destined for Wisconsin, Minnesota, Missouri, and Michigan, which apparently are the largest briquet-consuming States.

Shipments from each producing State cannot be shown, because there are only one or two producers in each of the States (except Wisconsin and Pennsylvania) and individual operations would thus be revealed. However, figure 2 presents graphically the centers of production, with corresponding States of destination for 1948; similar graphs for 1928 and 1936 are shown on page 965 of Minerals Yearbook, 1937.

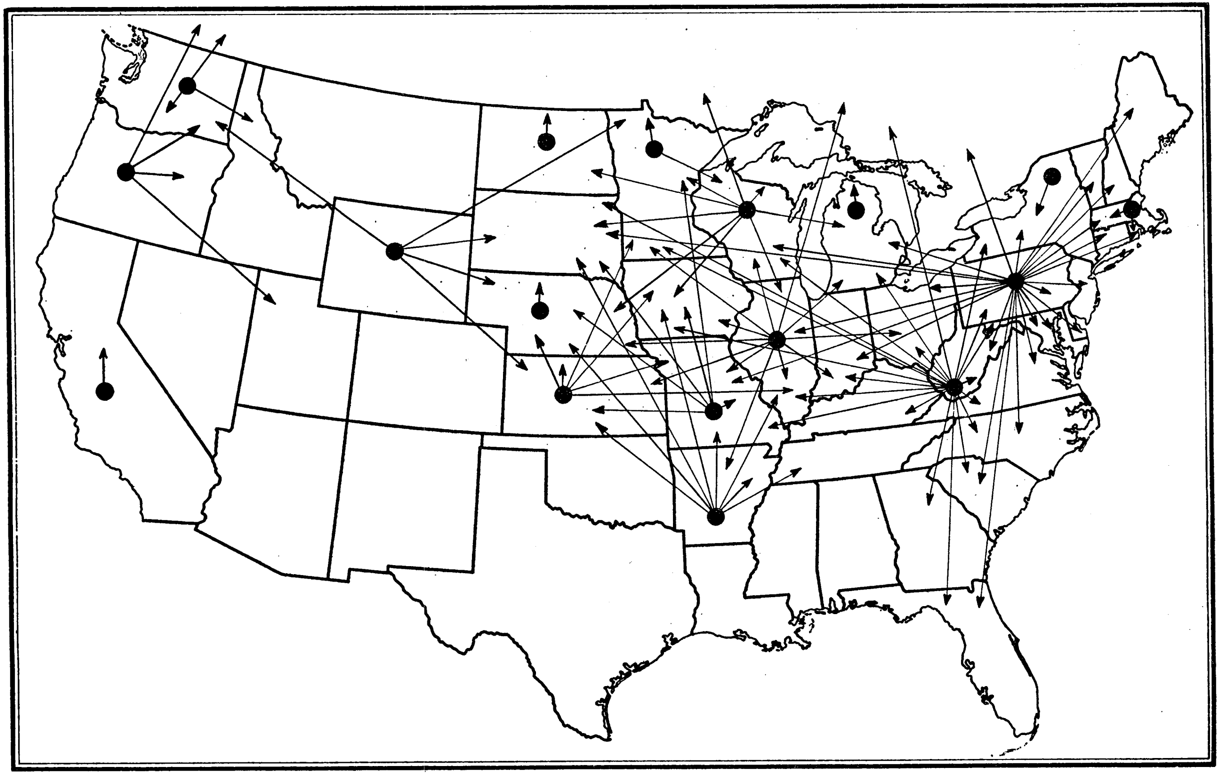

FIGURE 2.—Distribution of fuel briquets in 1948. Solid circles indicate States in which briquets were produced, and arrowheads indicate States into which fuel briquets were shipped from each producing State.

883326—50——36

The difference between production in 1948 (3,128,477 tons) and shipments within the United States (2,810,246 tons), amounting to 318,231 tons, represents briquets exported, used at plants for power or heat, and variation in year-end stocks.

Briquets are used almost entirely for domestic heating, but four operators reported a total of 22,283 tons used for power or heat at their plants in 1948.

TABLE 8.—Shipments of fuel briquets of domestic manufacture in the United States, by States of destination, as reported by producers, 1947–48, in net tons[1]

State of destination	1947	1948	State of destination	1947	1948

Nebraska	59, 719	42, 056	Total	2, 885, 658	2, 810, 246

[1] For shipments outside the United States see export statistics, table 10.

Generally, rail movement represents shipments to considerable distances and shipments by truck, local, and nearby consumption (table 9). Eighty-two percent of the total shipments of fuel briquets moved by rail and 18 percent by truck in 1948. In the Eastern States region nearly all the briquets were shipped by rail; in the Central and Pacific coast regions 73 percent moved by rail and 27 percent by truck.

TABLE 9.—Direct shipments of fuel briquets by rail and truck, as reported by producers, 1947–48, in net tons[1]

Produced in—	1947			1948		
	Rail	Truck	Total	Rail	Truck	Total
Eastern States	1, 068, 409	20, 349	1, 088, 758	1, 118, 492	32, 826	1, 151, 318
Central States	1, 516, 103	549, 456	1, 958, 439	1, 421, 330	534, 041	1, 812, 736

[1] Includes shipments outside the United States.
[2] Includes small tonnage shipped by scow.
[3] An additional 14,807 tons were used by 6 producers as fuel at their plants in 1947 and 22,283 tons by 4 producers in 1948.

PRICES

Monthly retail prices of fuel briquets from 1941 to 1945 for 21 cities, published in yearbooks of this series, were compiled from data collected by the Bureau of Labor Statistics, United States Department of Labor.[6] Collection of briquet-price data has, however, been discontinued, except for the following cities, for which the December prices are quoted for 1944 to 1948 (prices for Pittsburgh are not available before 1948). Retail briquet prices increased from 45 to 63 percent in these cities during the 5-year period 1944–48. The marked increases after 1946 followed termination of Government price control on all commodities (except sugar and rice) effective November 10, 1946.

TABLE 10.—Retail briquet prices in selected cities, December 1944–48

Year	Chicago, Ill.	Milwaukee, Wis.	Minneapolis, Minn.	St. Louis, Mo.	Pittsburgh, Pa.
1944	$12.97	$12.88	$14.35	$11.76	
1945	13.17	13.13	14.59	12.06	
1946	14.99	14.13	15.69	13.69	
1947	18.54	16.85	18.88	16.12	
1948	21.19	18.70	21.83	17.14	$17.48
Percent change, 1944–48	+63	+45	+52	+46	

The trend in prices in the Eastern, Central, and Pacific Coast States is indicated by the average values shown in table 1; these are values received by producers and not the retail prices (table 10) which include transportation costs to markets and wholesalers' margins. Sales values received by producers (f. o. b. plant) vary widely because of the different local conditions under which briquets are manufactured and sold. The outstanding factors influencing the value per ton realized at any plant are cost of raw materials and labor and prices of competing fuels.

In the Eastern States nearly all the output comes from plants in the anthracite region of Pennsylvania and the bituminous low-volatile fields of southern West Virginia, where the cost of raw fuel does not involve freight charges; the value f. o. b. plant is therefore relatively low. Of the 1948 production in the Central States 71 percent came from plants at coal docks on the Great Lakes; the raw fuel for these plants involves a considerable freight charge, reflected in higher values per ton f. o. b. plant. In the Pacific Coast States (where the raw fuels used were residual carbons from manufacture of oil gas and pyrolysis of natural gas), the average per ton represents the highest value f. o. b. plant in the United States.

FOREIGN TRADE [7]

Imports of fuel briquets into the United States before 1922 were negligible. The anthracite shortages of 1922–23 and 1925–26, however, created a demand for European briquets (mostly from Germany,

[6] Bureau of Labor Statistics, U. S. Department of Labor, Retail Prices of Fuels by Cities (monthly reports).

[7] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Belgium, and France and mainly for consumption in the anthracite-consuming States), which in 1926 reached a record of 123,593 net tons. Imports continued at a comparatively high level in the following years through 1932, when they amounted to 80,288 tons, but thereafter they dropped sharply and during the recent war period virtually ceased. Since 1941, imports have amounted to but a few hundred tons a year, virtually all from Canada; in 1948 they amounted to 329 tons valued at $3,301.

Exports of briquets, nearly all to Canada, were reported separately by the Bureau of Foreign and Domestic Commerce for the first time in 1937. The lowest year on record was 1939, with 12,576 tons exported; the highest 1947, with 248,760 tons. In 1948, the United States exported 207,885 tons valued at $2,653,982, a decrease of 40,875 tons, or 16 percent less than in 1947 (tables 1 and 11).

TECHNOLOGIC DEVELOPMENTS

Interest in research on coal briquetting continues active, particularly on coals of Illinois, North Dakota, Pennsylvania, Utah, and Wyoming.

Research on the briquetting of Illinois coals, initiated by the Illinois State Geological Survey in 1931, has been in continuous progress since that time—in laboratory-scale stage from 1931 to 1939 and pilot-plant stage since 1939. A complete report of its experimental work recently published by the Illinois Geological Survey [8] consists of eight extensive articles, as follows: (1) Design and Operation of Commercial-Scale Equipment; (2) Factors Affecting Characteristics of Briquets; (3) Smoke-Index Method of Measuring the Smokiness of Fuel; (4) Influence of Fusain on Smoke-Index of Briquets; (5) Smokeless Briquets from Hot Partially Volatilized Illinois Coals; (6) Preliminary Study of Cleaning Illinois Coal Sludges by Oil Flotation; (7) Relative Importance of Volatile Matter and Fixed Carbon in High-Volatile Coals and Briquets; (8) Mathematical Analysis of Briquetting Phenomena.

In 1945 the Pennsylvania State College and the Anthracite Institute joined in investigating the possibilities of producing fuel briquets or pellets by extrusion methods, utilizing accumulations of anthracite silt available in enormous quantities in the Pennsylvania anthracite region.[9] The program has progressed from laboratory experiments to full-scale pilot plants near the institute at Wilkes-Barre, Pa. The process is not considered universally applicable to all fines but a possible beneficiation process for many of the silts and culm now available and being made available. The most suitable applications for the pellets (which range from ⅛ to ¾ inch in diameter) appear to be for commercial and industrial traveling-grate stokers for the ⅛- and $\frac{3}{16}$-inch-diameter pellets and for small domestic equipment for the ⅜- to ¾-inch-diameter pellets.

A lignite research laboratory under construction at Grand Forks, N. Dak., for the Bureau of Mines, at a cost of $750,000, is scheduled for completion in 1949.[10] The Bureau of Mines is also cooperating with the Wyoming Natural Resources Research Institute, Laramie, Wyo., in its research studies on the briquetting of low-rank coals of the Rocky Mountain region.[11]

Improvement of the physical qualities of weakly coking Utah coals through briquetting was reported as the result of experiments at the University of Utah, Salt Lake City.[12]

Experiments in the briquetting of coke breeze were conducted at a foundry of one of the General Motors divisions and reported as highly successful.[13]

WORLD PRODUCTION

Data compiled and published since 1913 on world production of briquets are included in annual volumes of Minerals Yearbook and its predecessor, Mineral Resources.

In addition to the countries listed in table 12, briquets are also produced in U. S. S. R. and in small quantities in a few other countries,

but production figures for them are not available. According to the records at hand, world production of fuel briquets was lowest in 1917 with about 33,000,000 metric tons, and highest in 1943, with 80,000,000. Although data for 1948 are incomplete, Germany appears to lead in production, with approximately 46,000,000 metric tons, followed by France, with 6,000,000, and the United States, with 3,000,000.

PACKAGED FUEL

Packaged fuel is the trade name applied by the industry to a combination of briquetting and packaging of screenings or other raw fuels compressed into 3- to 4-inch cubes, wrapped (generally six to the package) in sturdy paper sealed with gummed tape, designed primarily for local consumption and to be burned in the package.

The growth of the packaged-fuel industry from 1935 (year of first survey) through 1940 and its decline during the following years of World War II are illustrated in figure 3. A study of the development of the packaged-fuel industry from its beginning in 1928 to its peak in 1940 was made by V. F. Parry [14] of the Bureau of Mines; this study includes brief discussions of the various processes employed in the manufacture of packaged fuel and analysis of costs in typical plants.

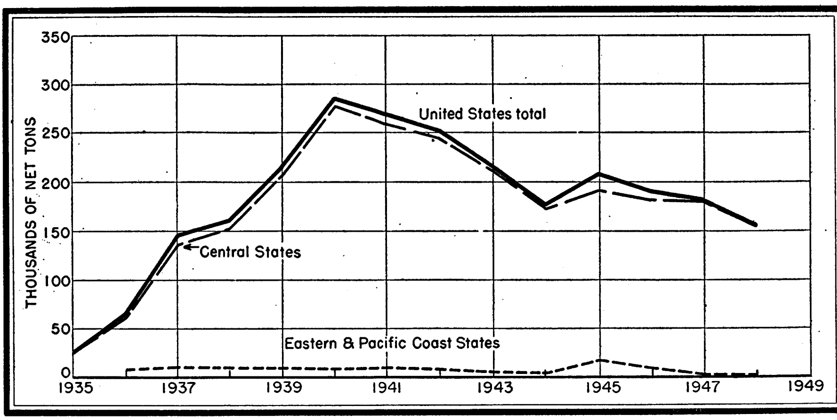

FIGURE 3.—Production of packaged fuel in the United States, by regions, 1935–48. (No production in Pacific Coast States, 1943–48.)

TABLE 13.—Salient statistics of the packaged-fuel industry in the United States, 1935–39 (average), 1940, and 1944–48

DOMESTIC PRODUCTION

The 62 plants active in 1948 produced 157,013 net tons of packaged fuel with a total sales value at the plant of $2,735,861 (table 14). This is the lowest production recorded since 1937. Production in 1948 decreased 14 percent in tonnage and 5 percent in value from the preceding year. Output declined in 8 of the 12 producing states. Michigan, Wisconsin, and Ohio led in production; and the largest

[14] Parry, V. F., Technical and Economic Study of Packaged Fuel: Bureau of Mines Rept. of Investigations 3757, 1944, 45 pp.

individual producers were Johnson Coal Cubing Co., Inc., Detroit, Mich., and Cleveland-Cliffs Iron Co., Green Bay, Wis.

High manufacturing costs were cited by operators as a major cause of decreased output. Although the production of packaged fuel decreased so markedly in 1948, interest in this type of fuel is still keen. At its June 1948 annual meeting, the National Association of Packaged Fuel Manufacturers[15] discussed new and more economical equipment for the manufacture of packaged fuel, which has been in process of development for several years and now is in pilot-plant stage. This machinery is not yet on the market.

Forty-nine plants operated 9 to 12 months of the year, accounting for 95 percent of the total production; 23 plants operated every month.

TABLE 14.—Production of packaged fuel in the United States, 1947–48, by States

States	1947			1948		
	Plants	Net tons	Value	Plants	Net tons	Value
Eastern States	[1] 3	2,153	$35,705	[1] 3	1,859	$32,794
Central States:						
Illinois	2	(2)	(2)	2	(2)	(2)
Indiana	2	(2)	(2)	2	(2)	(2)
Iowa	1	(2)	(2)	1	(2)	(2)
Kentucky				1	(2)	(2)
Michigan	24	66,156	1,036,844	22	55,559	897,647
Minnesota	4	24,155	416,084	4	17,401	372,507
Missouri	1	(2)	(2)	1	(2)	(2)
Nebraska	1	(2)	(2)	1	(2)	(2)
Ohio	15	27,704	443,106	17	27,776	509,169
Wisconsin	9	42,392	634,694	8	35,143	600,658
Undistributed [2]		20,321	315,672		19,275	323,086
Total Central States	59	180,728	2,846,400	59	155,154	2,703,067
Total United States	62	182,881	2,882,105	62	157,013	2,735,861

[1] Maine, 1; and Virginia, 2.
[2] Data which the Bureau of Mines is not at liberty to publish separately are combined as "Undistributed."

The values received by the operators comprise cost of coal at the mine, freight rate, direct and indirect manufacturing costs, and profit.

The trend in per ton value received by the packaged-fuel operators in the Eastern States and Central States regions, shown in table 13, reveals a 44-percent increase in the Eastern and 49 percent in the Central States for the 5-year period 1944–48. However, increases in the individual States for this 5-year period ranged from 75 percent in Illinois to 31 percent in Maine, as follows:

	Percent		Percent
Illinois	+75	Virginia	+50
Ohio	+68	Wisconsin	+49
Iowa	+63	Michigan	+38
Minnesota	+61	Nebraska	+35
Indiana	+51	Maine	+31

The average sales values in 1948 received by individual producers (f. o. b. plant) ranged from $13 to $22.58 per ton. It should be pointed out that the packaged-fuel values f. o. b. plant reported by the operators vary considerably, as they may represent small pick-up purchases of packages at the plant by passenger cars, sales in ton lots to homes or small dealers, or a combination of such sales.

[15] Black Diamond, Iverson Elected by Packaged Fuel Makers: Vol. 120, No. 13, June 19, 1948, p. 21c.

Number of Plants.—Sixty-two plants produced packaged fuel in 1948 (the same number as in 1947);[16] 57 of these plants were also active in 1947. Twenty-three plants are located in the Detroit and Cleveland areas and contributed 40 percent of the total production. The Chicago Packaged Fuel Co., Chicago, Ill., reported under construction in 1947, began commercial operations in February 1948, using equipment by Blaw-Knox Co.[17] Twelve plants were idle and 8 went out of business. One plant was reported under construction in 1948 with equipment by Eberling at Universal, Pa., and expected to start operating in 1949.

Capacity of Plants.—Table 15 points out the large number of small plants in the packaged-fuel industry. In 1948, 28 plants produced less than 1,000 tons each, contributing 12,111 tons, or 8 percent of the total production, and utilizing 18 percent of the combined capacity of this group. There were 43 plants, each with an annual capacity under 5,000 tons, that produced 35,791 tons, or 23 percent of the total production and utilized 32 percent of their combined capacity. Conversely, among the larger plants, eight produced 82,861 tons—53 percent of the total 1948 production and 41 percent of their combined capacity. The largest annual capacities in 1948 were reported for the plants of the Johnson Coal Cubing Co., Inc., Detroit, Mich., and the Cleveland-Cliffs Iron Co., Green Bay, Wis.

TABLE 15.—Annual capacity and production of packaged-fuel plants in the United States, 1944–48

	Active plants		Production

[16] Years plants (active in 1948) started producing are given in the 1948 Packaged-Fuel Directory (which also shows type of raw fuel used), M. M. S. 1721, obtainable on request from the Bureau of Mines, Washington 25, D. C.

[17] Black Diamond, Open Modern Coal-Packaging Plant: Vol. 120, No. 6, Mar. 13, 1948, pp. 24–25.

Processes.—Fifty-six of the 62 active operations used the Eberling process;[18] 2 used Glenn Smith equipment;[19] 2 used equipment designed by Johnson Coal Cubing Co., Inc.;[20] 1 used Leemon equipment;[21] and 1 (the new plant of the Chicago Packaged Fuel Co., Chicago, Ill.) used Blaw-Knox equipment.[22] (These processes are briefly discussed by V. F. Parry in Bureau of Mines Report of Investigations 3757, previously cited.) Additional machinery was installed at two plants in 1948.

Raw Fuels.—Five kinds of raw fuels (table 16) entered into the manufacture of six types of packaged fuel in 1948 (table 17). Bituminous low-volatile coal at 57 plants in the Eastern and Central States (used exclusively at 55 plants and in combination with other fuels at 2 plants) accounted for 94 percent of the total packaged fuel produced. Bituminous high-volatile (in Michigan and Ohio) was used exclusively at three plants. Semianthracite (in Iowa, Missouri, and Nebraska), petroleum coke (in Illinois, Minnesota, Nebraska, and Wisconsin), and a small tonnage of Pennsylvania anthracite (in Virginia) were the other raw fuels used. Raw fuels, other than yard screenings, accounted for two-thirds of the raw fuels made into cubes in 1948.

The cubes measure approximately 3 to 4 inches. Fifty-six plants wrapped 6 cubes to a package, 5 plants 8 to a package, and 1 wrapped 4 to a package; 21 plants reported wrapping by machine, 10 by hand, and 31 a combination of machine and hand. The packages weigh 9 to 15 pounds, depending on the number and size of cubes contained; 10-pound packages predominate and were made at 47 plants. Several hundred tons of cubes were sold in bulk (unwrapped); these were made by one of the larger producers, using bituminous low-volatile and asphalt binder.

TABLE 16.—Raw fuels used in making packaged fuel in the United States, 1948

Character of raw fuels used	Plants	Net tons
Bituminous low-volatile	57	146,821
Bituminous high-volatile	5	3,526
Pennsylvania anthracite	1	3,603
Semianthracite	3	
Petroleum coke	6	2,184
Total	[1] 62	156,134

Plants using—	Plants	Raw fuels used (net tons): Yard screenings	Raw fuels used (net tons): Other raw fuels	Raw fuels used (net tons): Total
Yard screenings exclusively (from own or other yards)	33	36,310		36,310
Raw fuels (other than yard screenings) exclusively	12		77,643	77,643
Both yard screenings and other raw fuels	17	15,908	26,273	42,181
Total	[1] 62	52,218	103,916	156,134

[1] 53 plants used 1 kind of fuel only, 7 used 2 kinds (separately), 1 used a mixture of 2 kinds, and 1 used a mixture of 3 kinds; hence the sum of the items shown exceeds the total number of active plants.

TABLE 17.—Classification of plants and production of packaged fuel in the United States, by kinds of raw fuel used, 1947–48

Raw fuel used	1947			1948		
	Plants	Packaged fuel produced		Plants	Packaged fuel produced	
		Net tons	Percent of total		Net tons	Percent of total
Bituminous low-volatile	56	165,936	90.7	55	146,600	93.4
Bituminous high-volatile	4			3		
Mixture of bituminous low- and high-volatile	-------			1		
Mixture of bituminous low- and high-volatile and Pennsylvania anthracite	-------	10,589	5.8	1	4,776	3.0
Mixture of bituminous low-volatile and petroleum coke	1			-------		
Semianthracite	3	3,977	2.2	3	3,453	2.2
Petroleum coke	6	2,379	1.3	6	2,184	1.4
Total	[1] 62	182,881	100.0	[1] 62	157,013	100.0

[1] In 1947, 2 types were made at 8 plants and in 1948, 2 types were made at 7 plants; hence the sum of the items shown exceeds the total number of plants active in the respective years.

Binders.—In 1948 the percentage of binder in packaged fuel, by weight, ranged from 0.5 to 6.7. Starch, totaling 859 tons and averaging about 15 pounds per ton of packaged fuel produced, is the principal type of binder used and was employed exclusively at 57 plants producing 125,343 tons, or 80 percent of the total output. Asphalt, totaling 1,936 tons and averaging about 125 pounds per ton of packaged fuel produced, was employed exclusively by three plants making bituminous low-volatile cubes. A combination of asphalt and starch in the manufacture of petroleum-coke cubes was used at one plant, and cement was used at two plants making bituminous low-volatile cubes. Data on binders used at packaged-fuel plants for 1945–48 are given in table 18.

TABLE 18.—Classification of packaged-fuel plants in the United States by type of binder used, 1945–48

	1945		1946		1947		1948	
	Plants	Percent of total packaged-fuel production	Plants	Percent of total packaged-fuel production	Plants	Percent of total packaged-fuel production	Plants	Percent of total packaged-fuel production
Type of binder used:								
Starch	58	72.5	65	72.7	58	77.9	57	79.8
Asphalt	3	27.5	3	26.0	2		3	19.5
Starch and asphalt	1		1	1.3	1	22.1	1	.7
Cement	------	---------	2		2		2	
Total	[1] 61	100.0	[1] 70	100.0	[1] 62	100.0	[1] 62	100.0
Production (net tons)	-------	208,143	-------	190,919	-------	182,881	-------	157,013

[1] In 1945–48, 1 plant making 2 types of packaged fuel used starch binder for 1 and asphalt and starch for the other; hence the sum of the items shown exceeds the number of active plants.

SHIPMENTS

Local sales (called for by passenger car or delivered by truck) amounted to 128,661 tons and comprised 82 percent of the 1948 total sales; other than local (shipped by truck to points in Wisconsin, Minnesota, Indiana, and Michigan), 11 percent; and shipments by rail (to points in Wisconsin, Minnesota, and Michigan), 7 percent (table 19).

TABLE 19.—Shipments of packaged fuel in the United States by method of transportation, 1944–48, in net tons

Year	Shipped by truck			Shipped by rail	Total
	Local sales [1]	Other than local sales	Total truck		
1944	139,026	24,302	163,328	12,389	175,717
1945	171,621	23,381	195,002	11,713	206,715

Gem Stones

By SYDNEY H. BALL [1] AND G. W. JOSEPHSON

THE JEWELRY INDUSTRY IN 1948

AMERICAN jewelers found that in 1948 competition for consumers' dollars was increasing from dealers retailing other durable goods, long unobtainable, and further found their customers more discriminating. In consequence, sales ($1,203,000,000) were below those enjoyed in 1947. The 1948 Christmas trade was satisfactory; but expensive items, particularly large diamonds, moved slowly. Retailers' stocks decreased somewhat in the latter part of 1948; and although wholesale jewelers' sales ($530,000,000) were slightly higher than those of 1947, this fact is accounted for by extremely heavy sales in the first half of the year, which overbalanced slack sales in the latter half.

The industry operated under an exceptionally prosperous national economv, high industrial wages, a record national income and large exports especially to Latin American countries. The marriage rate, while high, was lower than in 1947.

FASHIONS IN JEWELS

Interest in jewels increased in 1948. Jewelry is yearly becoming more individualistic. On the whole, jewelry designs are becoming more delicate, graceful, and lacy, and the old compact, solid look is passing. In 1948 the dominant motifs were flowers, leaves, and, to a smaller extent, birds, bowknots, and butterflies.

Clips, brooches, and pins were approximately as popular as necklaces, earrings, and ear clips. Bracelets, rings, and tiny watches hidden in bracelets or rings were also frequently seen.

A large number of gem stones were mounted—diamonds notably, then emeralds, rubies, and sapphires. Among some 20 other gem stones used, amethysts, pearls, and aquamarines ranked high. Few "fancies" (decidely colored diamonds) were mounted; but, of course, such stones are rare.

[1] Deceased April 8, 1949. This chapter was compiled principally from an incomplete manuscript and notes left by Mr. Ball.

Wide use of the diamond and a certain popularity of pearls, real and cultured, caused colorless gems to be by far the most widely used, followed by green, red, and blue and then by purple and yellow stones.

Sets of jewels of the same design and set with the same stone are still popular, as are "utility" jewels, which can be separated into two or more components. Pendants commonly hang from necklaces or dangle from earrings. Odd cuts of diamonds support the brilliant and square cut more frequently. Scatter pins became popular late in the year. They were even used on sandals, as were other stones, and the latter were even set in spectacle frames.

Forty years ago the possession of a diamond-set ring indicated that the American man had attained financial success; now he rarely wears a diamond, although he may wear a star sapphire. A definite attempt last year to interest Americans in masculine jewelry apparently met but little success.

DOMESTIC PRODUCTION

In the past 129 years or thereabouts, the United States has produced a large number of different gem stones but has never been an important factor in world gem production. Exceptions might be the Maine tourmaline deposits over 125 years ago, the turquoise deposits of the Southwest in prewhite days, agate and variscite deposits in the recent past, and jade deposits in the present and near future. But gem mining has been and probably will be one of our minor mining industries.

No large gem-mining companies exist in the United States, but several prospectors in a number of instances have banded together to work certain deposits for a time; a few small companies have been formed to mine jade; and certain professional lapidary shops employ a few miners. In addition, amateur lapidaries spend many weekends searching for material, particularly of the agate family, to feed their lathes. If they are not collectors the product goes to the local jeweler or to one of a host of roadside curio shops, particularly in the Northwestern States, California, Arizona, New Mexico, Utah, and the Black Hills, stocked with souvenirs of local or of pretended local origin. The chief customers are automobile tourists. As a fad or a quasi-business, the lapidary craft is spreading rapidly.

No reliable statistics exist as to the value of the domestic output of gem stones; in the rough, it may approximate $400,000 to $500,000 and more than double that after cutting.

The many forms of agate, attractive and widely distributed, led the field, with jade second and turquoise a poor third. Of the States and Territories, Oregon, Wyoming, and Washington were the leaders.

Agate.—Agate production in Oregon, including "thunder eggs," is holding its own, and interest in the lapidary craft grows. The well-known Yellowstone River moss-agate locality in Montana is still producing but appears yearly to be nearer exhaustion. Production is falling, and good material is getting scarce; prices consequently are rising. Much of it is cut locally and sold in roadside shops. The Black Hills lapidaries are reported to depend on Montana for their rough moss agate, claiming that it is better than their own.

Considerable agate is produced in west Texas, although some authorities state that intensive exploitation in recent years has reduced the reserves markedly. Most of it is sent to California for cutting.

Washington produces considerable agate of several varieties.

A relatively large amount of agatized wood is collected on the borders of the Petrified Forest National Monument, Ariz. Other localities in Arizona have furnished agate for cutting.

Apparently the Wyoming moss-agate deposits and the plume-agate deposits of New Mexico were not vigorously exploited in 1948.

Utah produces considerable agate. In the past year or two, fine moss agate has been coming from a locality east of Park City.

Georgia reports a new locality for heliotrope in Catoosa County.

Jade.—Allan Branham of Lander, Wyo., stated that the old Wyoming deposits furnishing light-green jade have been largely depleted, although three or four individuals hold some. He further reported that the tremolite-jade mine changed hands and that, in the summer of 1948, it was vigorously worked, the product being sent to Denver in truck loads.

"Thunder," said to be the largest statuette ever carved in jade (20 inches high, weight 104 pounds) portrays an American Indian sitting cross-legged on rain clouds and pulling thunder from a small drum suspended from his shoulder. Donald Hord of San Diego, Calif., was the sculptor. The rough was found by Marcia Branham near Lander, Wyo., and the original boulder weighed 460 pounds.

Bert Rhodes produced considerable jade from a property 60 miles southeast of Lander. Some was said to have been exported to Shanghai, China.

Robert M. Hawk, a manufacturing jeweler of Denver, reports that in 1946, while on a fishing trip, he and two companions found a large jade deposit north of Lander. This was producing during the summer of 1948. The jade is in place; it is claimed that there are 50,000 tons of it. It varies in color from light green to black and is said to be worth $3 to $50 a pound. Some will be cut in Denver into lamp bases, book ends, etc., while some has been exported to China.

Although the Alaska jade deposits of the Kobuk River region were not worked in 1948, considerable was reported to have been exported during the year from Pacific ports to China.

Some nephrite was sold from Monterey County, Calif. A nephrite dike in place is said to have been recently found in San Benito County near King City, Calif.

Green-stained quartz is reported to have been produced somewhere in Colorado and sold under names such as "king jade."

Turquoise.—In 1948 the Southwest probably produced less turquoise than in recent years. The Southwest Gem & Jewelry Co. in 1948 produced about 200 pounds from its Mineral Park, Ariz., deposit. Dr. G. M. Butler reported that, as depth is attained at the Castle Dome Copper Co. property, the quantity of turquoise decreases. In 1948 the company ceased trying to recover turquoise as a byproduct, but some recovery by miners probably continued. Dr. Butler stated that much of the Arizona turquoise is artificially colored and that even a clever imitation of matrix turquoise is on the market.

Some turquoise was produced at Battle Mountain and Tonopah, Nev. The King mine at Manassa, Conejos County, Colo., was operated on a small scale; in addition, some turquoise was sorted from the dump. The Cerrillos mine, New Mexico, was not operated during 1948.

Other Gem Stones.—Alfred M. Buranek reported that Utah mines in 1948 produced about the normal amount of variscite. Most of it came from the Clay Canyon deposit but a little from Grantsville and Lucin.

Utah, according to Prof. Junius J. Hayes, produced a new gem stone, a transparent yellow labradorite which occurs as phenocrysts in an andesite from Clear Lake, Millard County. Stones are small, and cut stones seldom exceed 1 carat; stones weighing as much as 10 to 15 carats are very rare. They are being sold cut at Salt Lake City for $3 to $6 per carat.

The Barton Mines Corp., North Creek, Warren County, N. Y., miners of abrasive garnet, produced a few gem garnets. Pyrope garnets late in 1947 and early in 1948 were cut at Moab, Utah, in considerable quantities.

Montana reported no sapphire production in 1948, either from its dredges or from its lode mine. The latter, Yogo Gulch, Judith Basin County, was up for sale in 1948 but so far as known no transfer of title resulted. Guy B. Ellermeier of Denver reported that at the old sapphire locality near Turret, Colo., first discovered in 1886, the stones occur in a bed of corundum schist 1 foot thick lying on garnetiferous metamorphic limestone. While the corundum stones are a fine blue, they are too small to be of commercial interest.

Arkansas continued to produce some rock crystals, and the sale of these—largely to mineral collectors—continued to be an important source of revenue to a few of the individuals.

It was hoped in 1947 that changes of ownership in certain gem mines in the Pala area near San Diego would increase the California production of tourmaline, aquamarine, kunzite, and topaz in the Aguanga Mountain area nearby. The hope has only partly been fulfilled, although a little kunzite, aquamarine, garnet, and topaz has been produced.

Other gem stones produced in small amounts in 1948 in the United States follow: Plume agate, New Mexico; agate, Illinois; amethyst, Georgia (Union County); apatite, yellow, Mesilla Park, N. Mex.; aquamarine, Pikes Peak, Colo.; carnelian, New Mexico; rose quartz, South Dakota; satin spar, Perry Peak, Colo.; and topaz, Pikes Peak and Tarryall Mountains, Colo., and Topaz Mountain, Utah.

CANADIAN GEM STONES

Again in 1948 Canada produced little in the way of gem stones. Rock crystal (Black Rapids, Ontario), peristerite (Lyndoch Township, Ontario), and some other attractive gem-stone material is either exported to the United States or sold to an enthusiastic coterie of amateur lapidaries in Toronto. The Labrador labradorite, the finest in the world, can now be credited to Canada.

The annual value of Canada's gem-stone production probably does not exceed a few hundred dollars.

GOVERNMENT REGULATIONS

The jewelry industry doubtless has never been subject to as many regulations as at present. Most of the laws attempt to increase national revenue, keep currency at home, or obtain dollar exchange. A few examples follow.

Both Canada and the United States continued their luxury sales taxes. Exports of certain industrial diamonds from the United States required a special export license and customs inspection. Some countries, such as the Union of South Africa, prohibited import of jewelry from nonsterling areas. Importation of diamonds into India, Pakistan, and Ceylon was subject to various restrictive rules. There were severe limitations on any movement of jewelry over the borders of Hungary.

IMPORTS [2]

Imports of gem stones, exclusive of industrial diamonds, in 1948, as reported by the United States Department of Commerce, totaled $115,990,280, about 5 percent more than in 1947. Of the total, diamonds comprised 87 percent.

Precious and semiprecious stones (exclusive of industrial diamonds) imported for consumption in the United States, 1947–48 [1]

DIAMOND

The year 1948 was a good one for diamond producers and wholesalers, fair for retailers, and poor for cutters.

World production was about 3 percent greater than in 1947. Output in the Union of South Africa was approximately the same as in the previous year, but the Belgian Congo registered an increase. In Tanganyika, production also increased markedly percentagewise.

Sales of rough by the principal wholesalers, the subsidiaries of the Diamond Corp., were a little over £38,000,000 in 1948 as compared with about £24,500,000 in 1947. In July the corporation took over marketing of Tanganyika Territory's production and that of French Equatorial Africa; and its buyers sometimes purchase in the "outside" alluvial fields of South Africa, Brazil, and British Guiana.

Retail sales in the United States were only fair, and retail prices declined. High-price articles moved very sluggishly.

Prices of rough were strong during the early part of the year but weakened considerably during the latter part.

Share Dealings.—From 1944 to date the diamond shares have lacked sparkle as market performers. In 1948 the four principal quoted shares had an average gain of 5½ percent but only fluctuated between 100 and 110 percent. Quotations were at their peak early in May and then declined. All the principal diamond-mining companies except Premier paid dividends in 1948.

Cutting.—In 1948 the cutting industry expanded its world-wide personnel to 29,500–31,000, a 10- to 12-percent increase over 1947. Half the cutters were Belgians. The Palestine industry had a hectic year. The number of cutters was too great for the rough available and the demand for cut; hence black markets, unemployment, reduced wages, and price deterioration of cut followed.

Netherlands, the United States, and South Africa are considered most firmly established as cutters of large stones, and Belgium and perhaps Palestine of small.

Imports.—Imports of gem-grade diamonds into the United States increased from $96,061,131 (revised figure) in 1947 to $100,705,299 in 1948, an increase of 5 percent. The dollar value of both rough and cut increased. The quantity of cut increased, whereas that of rough decreased. Belgium furnished 56 percent of the cut (value) in 1948.

[1] In the corresponding table in Minerals Yearbook, 1947, p. 537, revisions for 1946 are as follows: Cut but unset—Cuba is deleted. Total—carats, 566,313; value, $110,465,703; average value, $195.06. For 1947. imports were erroneously reported for Belgian Congo, Belgium, France, and Mexico.

[2] Revised figure.

World Production.—Accurate figures on diamond production are not available for all countries, but the figures in the accompanying table are believed to be close approximations. World production (gems and industrials) is estimated to have been 10,028,000 carats (2.21 short tons) in 1948, worth at the mine some $70,000,000, which compares with 9,742,000 carats (2.15 short tons) and $75,000,000 in 1947. Therefore, as compared with 1947, production in 1948 increased 3 percent in weight and decreased 7 percent in value. It is estimated that, by weight, 2,244,600 carats or 990 pounds were gem stones and 7,783,400 carats or 3,432 pounds industrials.

Belgian Congo was the leading producer by weight (58 percent), although it represented only 13 percent of the value. On the other hand, the British Commonwealth produced 29 percent by carats and over 66 percent by value of the total.

Among noteworthy developments were the increases in output in the Belgian Congo and Tanganyika. With few exceptions, production in French territories compared favorably with the previous year.

World production of diamonds, 1945–48, by countries, in metric carats

[5] Includes India, Russia, Borneo, New South Wales, and United States.

Industrial Diamonds.—Sales of industrial diamonds in 1948 were very large. American and other industries purchased normal quantities, and in addition Government missions to London purchased large quantities for the American strategic stock pile. Prices slashed by the Diamond Corp. at the outbreak of the war were again increased. Its present stocks are small. For economy's sake, the trend is toward the use of smaller stones wherever possible.

The use of diamond drills in exploring for and breaking ore (blasthole drilling) and in developing oil fields where the rock is hard is expanding. The use of diamond-impregnated wheels, particularly the vitrified type, for shaping carbide tools is increasing.

Figure 1 shows the tremendous increase in quantity and the sharp decline in the price per carat of American imports of industrial diamonds in the past 26 years.

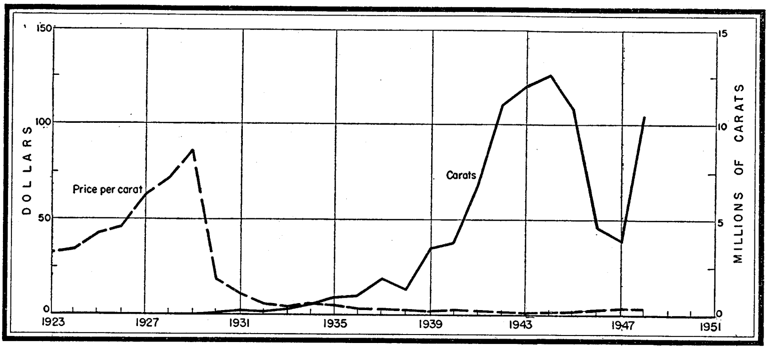

FIGURE 1.—United States imports and average price per carat of industrial diamonds, 1923–48.

In 1948 imports of industrials into the United States were much greater than in 1947. Imports of industrial diamonds during the past 5 years are shown in the accompanying table.

Industrial diamonds (glaziers', engravers', and miners') imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Carats	Value		Year	Carats	Value	
		Total	Average			Total	Average
1944	12, 614, 507	$22, 894, 244	$1. 81	1947 [1]	3, 999, 119	$13, 312, 668	$3. 33
1945	10, 733, 411	12, 823, 962	1. 19	1948	10, 418, 316	32, 521, 501	3. 12
1946	4, 625, 282	14,297, 536	3. 09				

[1] Revised figures.

In 1948 the United States exported 47,747 carats of industrial diamonds valued at $312,364.

RUBY, SAPPHIRE, AND EMERALD

These fine gem stones are increasing in price due to short supply of fine newly mined stones. Notwithstanding the excellence of the synthetic star sapphires and rubies introduced to the market in September 1947, natural stones are more popular then ever, and prices are more than holding their own.

The Anakie sapphire field, Queensland, whose principal center is now Rubyvale, was described.[3] The gravel, up to 50 feet thick, is worked either by open-cuts or shafts with drifts. The gravel is dry-sieved and hand-picked. Dark blues predominate; but fine yellows, greens, and particolored stones also occur. Zircon, pleonaste, tourmaline, and jasper are associated. The years from 1907 to 1925, except

[3] Squires, S. J., Commonwealth Jeweler and Watchmaker, Dec. 11, 1948, pp. 104–105.

for the First World War years, were the most productive and at times 1,000 diggers worked the field. The Rubyvale miners in 1947 sold gems to the value of £3,540.

The Black Star of Queensland widely exhibited in 1948 by American jewelers came from this field. It weighed rough 1,156 carats and cut 733 carats.

In 1948 a giant blue sapphire (1,958 carats) was found in the same general region by a digger's wife on a picnic. It was sold to the manager of a nearby claim.

A water shortage restricted production at the Willow Fields sapphire field.

South Africa continues to produce a few emeralds (1946, 11,533 carats; 1947, 7,753 carats). Six thousand, four hundred and ninety-two carats were exported in 1946 valued at £3,101, or 9s. 6.6d. per carat. A few are mounted locally.

Interesting data regarding Colombian emeralds were presented.[4] Emeralds of good color but of poor water occur in Mewar, India. The association is the frequent one, biotite schist intercalated in hornblende schist.[5]

According to Guhler's (see Bibliography) valuable study of Siamese gem stones, a few rubies have been mined for 500 or more years at several places. The sapphire deposits of Bo Ploi are described in some detail. Large sapphires are rare. Most gems are cut in Bangkok by Siamese, Chinese, or Gulas. Guhler considers the future of the industry bright. Siam ships considerable quantities of gems to the United States.

Ceylon produces not only ruby and sapphire but also alexandrite and cat's eye and a variety of stones of lesser value. All except moonstone are recovered from gravels by placer mining including some dredging. Singhalese are the only miners; dealers buy the stones in the field at auctions or private sales and Moslems then cut them. A half million dollars worth of gems is produced in a year.

LESSER GEMS

The Australian Government is to study whether, by pushing the production of its opal fields, by far the most important in the world, its supply of dollars can be increased.

At present only about 100 men are engaged in Australian opal mining; and the 1947 production—practically all of which came from South Australia (Coober Pedy and Andamooka)—was valued at only A£63,000. At Lightning Ridge, New South Wales, only a score of men mine and cut the black opal. The gem occurs as seams or nodules in a Cretaceous sandstone, beneath conglomerate and quartzite. The opal bearing layer is from a few inches to 2 feet thick.[6] A little opal is coming from Quilpi, Queensland. Most foreign gem purchasers buy from dealers in Sydney, Brisbane, or Melbourne, who visit the fields periodically.

There are three zircon-mining centers in French Indo-China (Bokeo, Pailin, and Cheon-Ksam). Burmans mine the stones, which occur

[4] Apolmor, Hermano Maria, Acad. Colomb. Rev. 7, No. 27, 1947, pp. 324–327.
[5] India Geological Survey, Minerals, vol. 1, No. 1, 1947, pp. 28–30.
[6] Squires, S. J., The Commonwealth Jeweler and Watchmaker, (Sydney, Australia), July 10, 1948.

almost at the surface, so little equipment is required. The stones are heat-treated and cut locally. They range in value from $0.50 to $660. Annual production, according to the Department of Commerce, is about $140,000. The mines are close to the Siamese border. The zircon production of Cambodia is large.

The Lithuanian amber industry with its center at Palanga was almost destroyed during the war but is recovering.

Brazil continued to produce a large caratage of the lesser gems Madagascar is producing little owing to the effects of war and rebellion. Because of the war damage to Pforzheim, where the stones were cut and mounted, the production of South-West Africa has declined.

Before the war, Turkey exported meerschaum crude to Germany and Austria but now makes it into smoking utensils and souvenirs.

The turquoise deposits of Southern Sinai were described.[7] The author believes that the flat-lying deposits were formed by post-Tertiary meteoric waters. Even today the Arabs produce a little, either re-sorting the ancient dumps now over 2,000 years old, or doing a little gouging.

TECHNOLOGY

Tourmaline is being used in piezo-electric gages for measuring blast pressures in air and under water. It has recently been synthesized.[8]

Mullite refractories can be made from topaz.

Synthetic spinel watch jewels heated after shaping are apparently as satisfactory as synthetic sapphire jewels, quicker to make, and cheaper to produce.

Synthetic sapphire bearings, acid proof and having great hardness, are finding wide application in industry. There is also a continuing interest in the use of natural sapphire in precision instruments.

The California (Chatham, San Francisco) method of making synthetic emerald has been described.[9] The crystal grows from seed in about 10 months. They are now on the market. The German method was described.[10]

There may come on the market in the near future synthetic rutile, supposedly as a cheap substitute for the diamond. These products have high dispersion and birefringence. They have a hardness of 6½ on Mohs' scale, and careful polishing is required to eliminate scratching; careful crystallographic orientation in cutting is required.

A film of fluoride on zircon has recently been detected in some stones in the trade. This appears to be a new method to "doctor" gems. The film is inert to most acids and to fairly high temperatures. In strong daylight or bright artificial light, the coating becomes a dull iridescent film.

Education and Laboratories.—Not only are the universities of America enlarging their courses in the study of gems but the City College of New York has this year an evening course in lapidary, said to be the sole course of its kind in America.

The excellent correspondence courses and resident lectures of the Gemological Institute of America (Los Angeles and New York) are

open to qualified students. Similar institutes exist in England and Australia. It and the American Gem Society work together on a number of problems. They have decided to substitute "flawless" for "perfect" in diamond grading.

The Diamond Council of America was organized early in 1949 to further the study of gemology. Prof. Paul J. Storm of the University of Pennsylvania is to conduct the classes.

The Gem Trade Laboratory, 36 West Forty-seventh Street, New York, was established to furnish identification of gem stones and pearls. Dr. A. E. Alexander is director.

During 1948 the Cincinnati branch of the Gemological Institute of America established a laboratory for gem identification under the direction of Edward Herschede, Jr.

A Diamond Trading Club similar to the New York Diamond Dealers Club was organized in Los Angeles. There are about 40 local members and additional members from San Francisco and San Diego. Los Angeles is said to be the third largest jewelry manufacturing city in the United States and second in retail diamond sales.

It is stated that over 15,000 veterans of World War II are studying, with Government aid, to become jewelers.

Gold and Silver

By CHARLES WHITE MERRILL AND HELENA M. MEYER

GENERAL SUMMARY

UNITED STATES mine production of gold in 1948 decreased 5 percent compared with 1947, thus reversing the uptrend from the low reached in 1945. The 1948 output of 2,014,257 fine ounces was only 41 percent of the all-time high of 4,869,949 ounces set in 1940. Silver production in 1948 increased for the second successive year, but the output of 38,096,031 fine ounces was far below the level prevailing at the beginning of World War II. The gold-mining industry had returned to unrestricted operations when War Production Board Order L-208 was rescinded, effective July 1, 1945; but many mines producing in prewar years did not resume work or did so on a restricted scale only. Higher prices for equipment and supplies and higher wages, combined with the difficulties of recruiting efficient labor forces, made former operators reluctant to reopen mines with narrow prewar profit margins. Continued inflation during 1948, with little evidence that inflationary forces soon would be arrested, discouraged those who might otherwise have promoted new gold-producing enterprises. Moreover, in many instances the years of idleness had resulted in deterioration of plants and mine workings which required very large capital outlays for rehabilitation.

The expanding silver production was largely explained by the unprecedented peacetime demand for the base metals, particularly lead and copper, from the ores of which most United States silver is recovered as a byproduct. In addition, the higher Treasury buying price for silver domestically mined after July 1, 1946, continued to encourage production expansion.

California remained in first place as a gold producer, but outputs in South Dakota and Utah were very nearly as large. Although each of the three States showed a decline from 1947, nevertheless together they furnished 58 percent of domestic mine production. California output came principally from straight gold mines (both placer and lode), South Dakota production came almost entirely from gold ore produced at the Homestake mine, and Utah production was recovered mainly from copper ore mined in the West Mountain (Bingham) district. Idaho continued to be the leading silver producer, followed in importance by Utah and Montana. These three States supplied 69 percent of the domestic output. About one-half of the Idaho production was recovered from dry ores, but most of the rest from the three States was a byproduct of ores treated principally for base metals.

The recovery of gold was divided fairly evenly among smelting of crude ores and concentrates (only a very small part of which was recovered by the direct smelting of ore), placer methods, and amalgamation-cyanidation mills. Over 85 percent of the domestic silver output was recovered by the smelting of concentrates and nearly all of the remainder by the direct smelting of ore.

Outside of the United States, production of gold increased slightly, more than offsetting the drop in this country and causing a small gain for the world as a whole. Both the United States and the remainder of the world had greater outputs of silver in 1948 than in 1947, but the over-all rise was only 3 percent. Current gold and silver world-production rates are far below prewar averages.

Shaft sinking and continued exploratory drilling in the vicinity of Odendaalsrus, Orange Free State, 150 miles southwest of Johannesburg, in 1948 brought encouraging results. A large gold field was forecast, and a boom of major proportions continued.

Owing to restrictions on the international movement of gold and silver and to measures taken by governments to stabilize the exchange value of currencies, gold and silver have lost much of their monetary significance in recent years. International Monetary Fund policies continue to affect the economics of the monetary metals, particularly gold. The Fund in its Annual Report,[1] April 30, 1948, presented the following analysis of the world situation particularly its activities concerning gold sales at premium prices and the payment of subsidies to producers.

The Fund is pledged to the promotion of exchange stability as one of its primary objectives. The par values of the currencies of all members are expressed in terms of gold as a common denominator or in terms of the United States dollar of the weight and fineness in effect on July 1, 1944, and variations may only be made in accordance with the Fund Agreement. The Fund has, accordingly, been concerned over external gold transactions at prices in excess of the gold values of member currencies.

Private gold transactions consummated in United States dollars have been reported at various times at prices ranging up to US $50 per fine ounce and occasionally reports appear of transactions at even higher premia. International gold transactions for which high premia are quoted frequently take place in inconvertible currencies, particularly in countries where confidence in the future value of the national currency is lacking or where political conditions are disturbed. When a United States dollar price is quoted for such transactions in inconvertible currencies, it is merely the figure arrived at by converting the local currency price at the official rate of exchange, regardless of the fact that the local currency proceeds can only be converted into hard currency through black markets at substantial rates of discount.

[1] International Monetary Fund, Annual Report of the Executive Directors for the Fiscal Year ended Apr. 30, 1948: Washington, 1948, pp. 39-44.

On June 18, 1947, the Fund addressed to all members a statement, reproduced in full in last year's Annual Report, in which it deprecated external purchases or sales of gold at prices which directly or indirectly produce exchange transactions at depreciated rates. It was the Fund's view that this practice if not checked might become extensive and might as a consequence tend to undermine the exchange relationships among the members of the Fund. Moreover, transactions of this kind involve a wasteful use of gold since much of the metal goes into private hoards rather than into central holdings. In reply to a member's inquiry, the Fund has stated that its opposition to external gold transactions at premium prices extends not only to transactions between members of the Fund but also to transactions between members and non-members.

Some countries, including certain major gold producers, indicated that their practices were in accord with the Fund's policy. Others explained that their gold sales had been authorized before the Fund defined its policy but that they were ready to change their policy to conform to the Fund's views. Certain other countries revised their regulations in order to meet the Fund's policy.

Mexico informed the Fund that in compliance with the Fund's policy it had discontinued external sales of gold at premium prices. Canada's Minister of Finance stated that the policy of his Government was to prohibit exports of gold to "free markets" and to refuse to permit exports at prices above parity. Immediately after the receipt of the Fund's letter, the United States National Advisory Council on International Monetary and Financial Problems announced it was in full accord with the Fund's views. After a public hearing, the United States Treasury Department announced that its Provisional Regulations under the Gold Reserve Act of 1934 would be amended, effective November 24, 1947, with a view to curbing international gold transactions at premium prices in accordance with the Fund's request. The Bank of England advised bullion dealers that the prohibition on transactions at premium prices was extended to cover dealings as agents for non-residents. Transactions by London bullion dealers as principals had never been allowed except at prices within 1 per cent of US $35 per fine ounce.

In spite of the encouraging reaction of members to the Fund's letter of June 18, 1947, there is ample room left for greater support of the Fund's policy. There should be more vigorous enforcement of the gold regulations in certain countries, especially importing countries. It has been noted that international transactions in fabricated gold articles or jewelry with a fine gold content just below the minimum legal fineness of monetary gold have assumed increasing importance. Some countries have no legal basis for the effective supervision of trans-shipped gold; in most cases trans-shipped or bonded goods attract certain conditions and privileges which include freedom from import or export licensing, especially where it can be shown that the commodity is foreign-owned. In other instances, where exchange controls place little or no restrictions on gold dealings or shipments, a revision of existing gold regulations may be necessary in order that gold may be treated as a part of the potential national monetary reserves, rather than as an article of trade. Furthermore, some gold transactions at premium prices are being conducted by or through non-member countries or their nationals.

In order to enable the Fund to consider what further action may be called for, a letter has been sent to all members, requesting the text of their laws, decrees, and regulations (together with particulars of changes made since June 18, 1947), and a statement of the administrative practices they follow regarding international transactions in gold and in articles having a large content of gold, as well as data on international movements of gold.

* * * * * * *

Countries in balance of payments difficulties have sought ways and means of encouraging gold production. After consultation with the Fund, Canada announced on December 11, 1947, its intention of instituting a new program to stimulate gold production. The Canadian proposal provides for a payment to individual gold mines, designed to assist the mines in defraying part of their increased costs of production. The subsidy payment will be determined by taking half of the amount by which the current cost of gold production of any mine exceeds $18 an ounce and applying this to the amount by which production in the current year exceeds two-thirds of the production in the base year July 1, 1946, to June 30, 1947. Assistance will be given for a three-year period, effective January 1, 1948.

* * * * * * *

In its general statement the Fund asked member countries to consult with it prior to introducing any new measures to subsidize their gold production. The Fund took the position that a subsidy in the form of a uniform payment per ounce for all or part of the gold produced would constitute an increase in price which would not be permissible if the total price paid by the member for gold were thereby raised to any amount in excess of parity plus the prescribed margin of one quarter of one per cent. The Fund emphasized that other types of subsidy may constitute an increase in the price of gold and that each proposal for subsidy must be examined on its merits with regard to its specific provisions and in the light of surrounding circumstances. The Fund stated that any subsidy on gold production, regardless of its form, is inconsistent with * * * the Fund Agreement if it undermines or threatens to undermine exchange stability. The Fund promised to study and review with its members their gold policies and any proposed changes with a view to determining if they are in accordance with the provisions of the Fund Agreement and conducive to a sound international policy regarding gold.

In March 1948, the Government of Australia, in conformity with the Fund's general policy statement, consulted the Fund regarding a proposal to grant temporary assistance to certain gold mines in desert areas in Western Australia which were threatened with abandonment. The measure was designed to enable some marginal and isolated mines to continue operations despite rising costs, so as to sustain the population of certain communities whose existence is wholly dependent on the gold mining industry. The proposed aid was to be determined for each gold mine individually according to its costs, ore reserves, values, and dependent population, and would not affect the price of gold. The plan was not intended to increase gold production. The measures proposed by Australia were deemed not to contravene the obligations of members under the Fund Agreement to engage only in gold transactions at prices based on the par values of members' currencies and to collaborate with the Fund in promoting exchange stability. Neither were the measures proposed by Australia considered to violate the policy enunciated by the Fund on December 11, 1947, regarding gold subsidies.

A 15-percent rise in Canadian gold production in 1948 compared with 1947 reflected, at least in part, the stimulating effect of the first full year of that country's recently initiated subsidy program.

The International Monetary Fund prepared a document "Information on Silver as Submitted by Member Countries," which Herbert Bratter digested [2] in a recently published article.

Information by countries covering a number of years is presented on silver stocks, coinage, coinage debasement, demonetization, international movements, and other economic aspects.

A clarification of Treasury regulations promulgated under the Gold Reserve Act of 1934 governing the sale of gold with regard to transactions in unprocessed or "natural" gold came late in 1948. The legality of domestic trade and holding of "natural" gold, under section 19 of the Provisional Regulations issued under the act, was established in these terms:

> Gold in its natural state may be acquired, transported within the United States * * * without the necessity of holding a license therefor.

As a result, much publicity was given to the possibilities of producers developing a premium market for their product among hoarders preferring gold to currency and speculators anticipating a rising price for the metal. Production that could qualify as "natural" gold suitable for trading was limited. Most placer gold was disqualified because of amalgamation during recovery—neither amalgam nor sponge gold was termed "natural." Some placer gold is recovered without mercurcy, and some operators could recover a "natural" gold product with a very small change in the washing methods. In addition to "natural" gold recovered from gravels, a few lode-mine operators found it practicable to recover from their ores free gold that would qualify as "natural" gold.

A special canvass was made of 1948 gold producers to determine the quantity of "natural" gold sold at premium prices and the total amount of the premiums. Most of the respondents reported no such sales. Not all those reporting sales were willing to furnish data on quantities sold and premiums received. However, "natural" gold containing approximately 10,000 fine ounces was reported as reaching the premium market, and it was estimated that the total may have reached 25,000 fine ounces. Premium prices were variously reported up to $43 per fine ounce or possibly a little higher.

To facilitate the "natural" gold trade, methods were devised for packaging and providing acceptable assays of lot finenesses. The use of sealed-leather pokes and the casting of predetermined quantities of gold dust of known fineness in lucite blocks were reported among the methods of preparing suitable hoarding and trading units. At least one large New York brokerage firm [3] dealing in securities and commodities developed a standard contract for the sale and delivery of gold. Although the sales of natural gold at premium prices were very small compared with the total domestic mine output, there was evidence that additional quantities of gold were involved where producers were delaying shipments through normal channels to the Bureau of the Mint in the hope of participation in the premium market.

International trade in silver was dominated by the regulations of various governments. The United States Treasury continued to purchase silver domestically mined after July 1, 1946, at $0.9050505+ per fine ounce, a price substantially above the New York price for metal that could not qualify for Treasury acceptance. Import duties imposed in India resulted in the Bombay silver market operating almost completely on an internal basis. Late in 1948 the Mexican Government imposed a 15-percent ad valorem tax on exports including silver. Other markets also were restricted by silver and exchange regulations. The New York market experienced

[3] Bache & Co., Gold Versus Uncertainty: New York, 1948, 8 pp.

a remarkable degree of stability during 1948, with a range from a high of $0.7775 to a low of $0.7025 per ounce of silver 0.999 fine.

Silver consumed for coinage, particularly for Mexico, Saudi Arabia, Sweden, and the United States, totaled well over 50,000,000 ounces in 1948 and was greatly in excess of the quantities returning to the world markets from demonitization programs

The Treasury buying price for gold and silver throughout 1948 continued at $35 and $0.9050505+ per fine ounce, respectively. The price for silver that could not qualify for Treasury purchase fluctuated.

The net inflow of gold and silver, reestablished in 1946 after a period when war expenditures had depleted the United States holdings, increased in volume in 1947 and continued nearly unabated in 1948. The gain in gold, which was only 10 percent less in 1948 than in 1947, carried the total United States stock to a new all-time high by the end of January 1948, exceeding the former high set at the end of October 1941. Thereafter the end of each month set a new all-time record.

DOMESTIC PRODUCTION

Production of gold and silver in the United States is measured at mines and at refineries. Both measures are tabulated by States of origin, but there is a small annual variation between them explained largely by time lag. Over a period of years, the deviations are found to be negligible. Compared with the mine reports compiled by the Bureau of Mines, the refinery reports compiled by the Bureau of the Mint in cooperation with the Bureau of Mines for the 44 years, 1905–48, shows a total excess of gold of 254,197 ounces (a difference of 0.17 percent) and a total excess of silver of 15,562,876 ounces (a difference of 0.65 percent).

Gold and silver produced in the United States, 1905–48, in fine ounces, according to mine and mint returns, in terms of recovered metals

Year	Mine		Mint	
	Gold	Silver	Gold	Silver
1905–43	141, 727, 251	2, 252, 464, 669	142, 041, 568	2, 264, 726, 370
1944	998, 394	34, 473, 540	1, 022, 238	35, 651, 049
1945	968, 062	29, 024, 197	928, 893	29, 063, 255
1946	1, 574, 505	22, 914, 604	1, 462, 354	21, 103, 269
1947	2, 109, 185	35, 823, 563	2, 165, 318	38, 587, 069
1948	2, 014, 257	38, 096, 031	2, 025, 480	39, 228, 468
Total 1905–48	149, 391, 654	2, 412, 796, 604	149, 645, 851	2, 428, 359, 480

MINE PRODUCTION

During the war years 1943–45, for the first time on record, over half of the domestic gold output was recovered from base-metal ores, but in the years since both dry ores and placer gravels exceeded base-metal ores in yield of gold. This recovery in gold mining, however, has not restored the industry to its prewar level. High wages, difficulties in recruiting labor forces, and high prices for equipment and supplies, together with an unchanged gold price, retarded recovery. The postwar production rate has not yet returned to half of the all-time peak established in 1940, and 1948 output compared with that for 1947 showed a downward trend.

Silver production, which had declined without interruption from 1940 to 1946, reversed the trend in 1947 and by 1948 had recovered to 38,096,031 ounces from the 1946 low of 22,914,604 ounces. An analysis of silver production, by ores, shows that almost three-fourths was recovered as a byproduct from base-metal ores in both 1947 and 1948. Moreover, all of the silver recovered at placers and part of that produced from dry ores were byproducts of operations carried on chiefly for gold.

All tonnage figures used in this report are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. Figures in cubic yards used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before excavation. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated upon the basis of recovered and recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced.

Mine production of gold and silver in the United States, in 1948, by months, in fine ounces

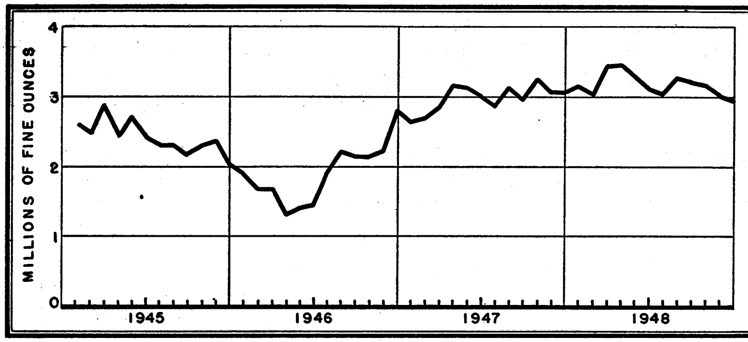

FIGURE 2.—Mine production of silver in the United States, 1945–48, by months, in terms of recovered silver.

Mines are grouped into two main classes—placers and lodes. The placers are those in which gold and silver as native metals or in natural alloy and, in a few placers, platinum are recovered from gravel. Except for such small-scale hand methods as those utilizing the gold pan, the rocker, or the dry washer, all placer recovery methods employ sluice boxes; methods are distinguished by the means used for delivering the gravel to the sluices. Those methods where gravel is delivered mechanically include bucket-line dredging, dragline dredging, and treatment in nonfloating washing plants of gravel delivered by power shovel, dragline excavator, truck, slackline scraper, or other mechanical means. In the hydraulic method the gravel is mined from the bank by a powerful jet of water; in some small-scale hand methods the gravel is shoveled into sluices; and in drift operations the gravel is mined underground and delivered to sluices at the surface. The lode mines are those yielding gold and silver from ore (as distinguished from gravel), mainly from underground workings and, in addition to those worked chiefly for one or both of the precious metals, include those that yield ore mined chiefly for copper, lead, zinc, or other metals but contribute the precious metals as byproducts. As far as possible, the mine unit used is not the operator but the mining claim or group of claims.

PRINCIPAL MINING DISTRICTS AND LEADING MINES

One of the anomalies of the war economy was the emergence of a copper district—West Mountain (Bingham), Utah—as the leading gold producer in the United States, surpassing Lawrence County (Lead), S. Dak., in 1943, 1944, and 1945. In 1946, however, Lawrence County regained the lead, a position held through 1948. Almost half of the domestic mine output was mined in the four leading districts in 1948. Included in the first four districts is the Yukon River Basin, Alaska, with 189,143 ounces.

The leading silver districts for many years have included many more noted for base-metal output than silver yield, and this condition was unchanged in 1948. The three leading districts accounted for more than half of the total United States output of silver in 1948.

Mine production of recoverable gold in the United States by districts that produced 10,000 fine ounces or more during any year, 1944–48, in fine ounces [1]

[1] Exclusive of Alaska.
[2] Bureau of Mines not at liberty to publish figure.

Of the 25 leading gold-producing mines, 9 were lode gold mines, 5 were placers worked by bucket-line dredges, 4 were copper mines, 2 were lead-zinc mines, 1 was a copper-zinc mine, and 1 was a gold-antimony mine; 3 produced more than 1 type of ore. The 3 leading mines contributed 39 percent of the total gold produced in the United States in 1948 and the 25 on the list, 69 percent.

Only 3 of the 25 leading silver-producing mines depended exclusively on silver ore; ores valuable chiefly for copper, lead, zinc, and gold supplied most of the silver production. The 8 leading mines each producing over 1,000,000 ounces of silver in 1948 contributed 49 percent of the United States total. The list of 25 mines accounted for over two-thirds of the United States output. As several operators worked more than one of the leading silver mines as well as smaller producers, the output of silver by companies was substantially more concentrated than by mines.

Mine production of recoverable silver in the United States by districts and regions that produced 200,000 fine ounces or more during any year, 1944–48, in fine ounces

[1] States east of the Mississippi figures are peaks since 1896, except New York and Pennsylvania which are peaks since 1905. The Illinois figure is the peak since 1907. Alaska, California, Nevada, and Oregon are peaks since 1880.

[2] Includes a small quantity by New Hampshire.

ORE PRODUCTION, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

The following tables give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that yielded gold and silver in the United States in 1948. These tables were compiled from the individual State chapters in this volume, in which more detailed data are presented.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and metal recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in metallurgy and the lowering of the grade of complex ores treated. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present); or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; and ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) had ranged from 16 to 45 percent zinc, but with the development of slag fuming, which permits some oxidized ore in the charge and with high zinc prices, the minimum has declined to as low as 5 percent recoverable zinc; zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated.

[1] Missouri excluded.
[2] Includes 48,131 tons of old lead-smelter slag.
[3] Includes 22,727 tons of zinc slag fumed.
[4] Includes 34,818 tons of zinc slag.
[5] Excludes magnetite-pyrite-chalcopyrite ore and gold and silver therefrom.

Gold, gold-silver, and silver ores containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed base-metal ores are called "dry" ores, regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes its name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry ores" thus are ores, chiefly siliceous, valuable for their gold and silver content and, in some instances, for their fluxing properties, regardless of method of treatment. Dry gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made on a basis of value, using the rule that the bimetal classification is not used unless the metal of lower value equals or exceeds one-quarter of the combined value of the gold and silver.

The lead, zinc, and zinc-lead ores in most districts in the States east of the Rocky Mountains carry no appreciable quantity of gold or silver; such ores are excluded from this report unless otherwise indicated.

Mine production of gold in the United States, 1939–43 (average) and 1944–48, by percent from sources and in total fine ounces

[1] Chiefly sands and slimes from ore first roasted and amalgamated.
[2] Gold and silver produced by cyanidation included with amalgamation.

PLACERS

Almost one-third of the gold produced in 1948 was derived from placer mines. Of the 600,500 ounces of placer gold, 473,366 ounces or 79 percent was recovered by bucket-line dredges. Although this dredge output was over fourfold that of 1944, the wartime low, it was far below the all-time high of 904,149 ounces established in 1940. A number of dredge properties remained idle during 1948 because of the unfavorable economic situation for gold production. As gold dredges are not converted readily to other uses, many idle properties had much of their operating equipment intact. It appeared probable, therefore, that gold output from this type of mining would be expanded if the ratio of gold price to dredging cost improved appreciably.

The quantity of gold recovered by bucket-line dredges from the inception of the industry as a commercial factor in 1896 to the end of 1948 is recorded as 20,901,485 (revised) ounces, originating by States as follows: California, 12,560,173 ounces; Alaska, 5,744,783 (revised) (including the production from single-dipper dredges and some gold by hydraulicking); Montana, 774,715; Idaho, 660,393; Oregon and Colorado together, 993,803; and other States, 167,618.

The second most important source of placer gold was the nonfloating-washing-plant method, with mechanical earth-moving equipment for gravel delivery. This was the only one of the more productive methods to show increased output in 1948 compared with 1947. Production by this method has shown an uninterrupted rise since 1944. Dragline dredging, a method that had had a phenomenal rise from 1933 until World War II, dropped from second to third place in 1948. Of the other methods, hydraulicking was the most productive, although a sharp decrease in 1948 as compared with 1947 reduced output to less than twice that recorded for small-scale hand methods.

California produced 48 percent of the United States placer gold in 1948 and Alaska, 40 percent. Other larger producers named in order of importance were Idaho, Montana, Colorado, Oregon, and Nevada. In 1948 California was the leader in all but three methods of placer-gold production. Alaska led in hydraulic and nonfloating-washing-plant production and Nevada in dry placering.

The accompanying table shows the placer gold produced in the United States, classified by mining methods, in 1944–48.

Additional information on placer mining may be found in the State reviews in this volume.

Gold production at placer mines in the United States, by classes of mines and methods of recovery, 1944–48 [1]

Class and method	Mines producing	Washing plants (dredges)	Material treated (cubic yards)	Gold recovered: Fine ounces	Gold recovered: Value	Gold recovered: Average value per cubic yard

Gold production at placer mines in the United States, by classes of mines and methods of recovery, 1944-48 [1]—Continued

Class and method	Mines producing	Washing plants (dredges)	Material treated (cubic yards)	Gold recovered: Fine ounces	Gold recovered: Value	Gold recovered: Average value per cubic yard
Grand total placers:						
1944	[5] 367		[3] 27, 721, 522	123, 322	$4, 316, 270	$0. 146
1945	382		44, 148, 269	184, 663	6, 463, 205	. 146
1946	689		122, 652, 566	590, 604	20, 671, 140	. 169
1947	778		138, 681, 690	678, 845	23, 759, 575	. 171
1948	724		133, 385, 493	600, 500	21, 017, 500	. 158

[1] Most of the detailed figures for 1944-47 are revised to reflect a reclassification of certain outputs in Alaska and Idaho; grand totals are unchanged.
[2] Data for Alaska not separately available; included with "Unclassified placers."
[3] Data for Alaska not available and not included.
[4] Data not available.
[5] A mine using more than one method of recovery is counted but once in arriving at total for all methods.

REFINERY PRODUCTION

The accompanying table contains official estimates of production of gold and silver in the United States, made by the Bureau of the Mint, based upon arrivals at United States mints and assay offices and at privately owned refineries. The mints and assay offices determine the State source of all newly mined unrefined material at the time deposits are received. The State source of material received by privately owned refineries is determined from information submitted by them and by intervening smelters, mills, etc., involved in the reduction processes.

Gold and silver refined in the United States,[1] 1944-48, and approximate distribution of source, by States, in 1948, in fine ounces

[U. S. Bureau of the Mint]

State or Territory	Gold	Silver
1944	1, 022, 238	35, 651, 049

[1] From Report of the Director of the Mint. The estimates for 1792–1873 are by R. W. Raymond, Commissioner of Mining Statistics, Treasury Department, and since then, by the Director of the Mint.
[2] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto, at $20.67+ per fine ounce.
[3] Silver valued in 1934 and thereafter at Government's average buying price for domestic product.

CONSUMPTION AND USES IN INDUSTRY AND THE ARTS

Monetary use has claimed by far the largest part of the gold and silver output through the years, but this use to a large extent takes the form of stock piling in Government and private hoards that can be made available to industry and the arts without smelter or refinery preparation. In contrast, the gold and silver that enter industry and the arts are consumed much as are other metals, any return as secondary metal requiring the usual channels of collection, smelting, and refining. The consumption of gold and silver in the arts antedates written history, but industrial use of these two metals is a comparatively recent development.

Gold.—The arts require a much larger quantity of gold than does industry, but its corrosion-resistant and other properties have resulted in some industrial demand. Consumption in the arts increased rapidly during the war. A high marriage rate and widespread prosperity have increased the sale of jewelry, watches, and many luxury items made from gold. Comparison of 1948 gold figures with those for 1947 shows an 8-percent decrease in the return from industrial use, in issue for industrial use, and in net consumption. The issue for industrial use and the net use in 1948 both are far below the levels prevailing in 1944–46. Despite the decline, nevertheless, the net absorption by industry and the arts comprised nearly two-thirds of the total new gold produced from domestic mines during 1948.

Net industrial consumption of gold and silver in the United States, 1939–43 (average) and 1944–48

[U. S. Bureau of the Mint]

883326—50——39

Silver.—The 1948 consumption of silver in industry and the arts, though below the average for the war years, was well above that for 1946 and 1947. The consumption exceeded any annual output ever achieved by domestic mines.

Widespread prosperity and a high marriage rate sustained the demand for sterling and plated silverware, jewelry, watch cases, church articles, pens, pencils, and other items largely in the luxury class. Consumption was large in photography, particularly for motion pictures. The industrial uses of silver had grown greatly during the war and have continued to absorb much silver since.

MONETARY STOCKS

Gold holdings of the United States rose $1,490,000,000 (7 percent) from $22,754,000,000 on January 1, 1948, to $24,244,000,000 on January 1, 1949, according to the Federal Reserve Bulletin. Total world reserves are not positively known, inasmuch as data are not available from some countries, including Germany, Japan, Australia, and U. S. S. R. Currency stabilization funds secretly held add to the difficulties in reaching an approximation.

Foreign gold reserves increased rapidly after the United States entry into the war late in 1941, largely because United States war purchases abroad so greatly exceeded commercial exports in value. During the war period foreign reserves increased nearly $5,000,000,000, and United States reserves decreased over $2,500,000,000. Sharing prominently in the increase were Switzerland, Sweden, Turkey, Iran, Spain, Union of South Africa, and Latin American countries. In 1946, however, there was a reversal in the direction of the flow of gold, and the United States net increase in 1948 substantially exceeded world mine output.

United States Treasury silver holdings decreased 1,000,000 fine ounces during 1948 to 1,952,000,000 ounces. The holdings do not include 410,553,011 ounces released under lend-lease agreements that provide for return of the silver.

PRICES

Since January 1934 the price of gold at the United States Mint has been $35 per fine troy ounce. The Treasury buying price for silver domestically mined after July 1, 1939, was fixed at $0.711+ per ounce on July 6, 1939; on July 31, 1946, the President approved an act (Public Law 579, 79th Congress) which provided that the seigniorage to be deducted for silver mined after July 1, 1946, and delivered to the Treasury be reduced from 45 percent to 30 percent. The effect was to raise the price of domestically mined silver to 90.50505+ cents an ounce; there has been no price change since.

According to the Director of the Mint, the following prices for silver prevailed in London and New York (exchange-free-New York on London, $4.03) in 1947 and 1948: London price, per ounce, 0.999 fine, opened in 1947 at 55.5d., receded irregularly to a low of 37d. at midyear and recovered to 45d. late in the year, a level maintained past midyear 1948 when after a short upward movement the price fell to 42.5d. by the year end. New York price per ounce, 0.999 fine, established a high of $0.8375 in January 1947, after which, except for a briefly held peak in March, it declined irregularly to set the year's low of $0.5975 near midyear and then recovered to $0.74625 late in the year, a level held past midyear 1948. Thereafter a rise took place followed by a sharp decline to an average of $0.70000 for December.

FOREIGN TRADE [4]

The excess of gold imports over exports in 1948, though smaller than in 1947, nevertheless approach 1¾ billion dollars. The gains from imports plus the output from domestic mines greatly exceeded consumption in the arts and industries, and thus gold monetary stocks increased. Consumption of silver, however, exceeded the supply from mine output plus net imports, with the result that stocks were drawn upon.

Value of gold and silver imported into and exported from the United States, 1947–48, by classes

[U. S. Department of Commerce]

[1] Excess of exports over imports indicated by minus sign.

[4] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

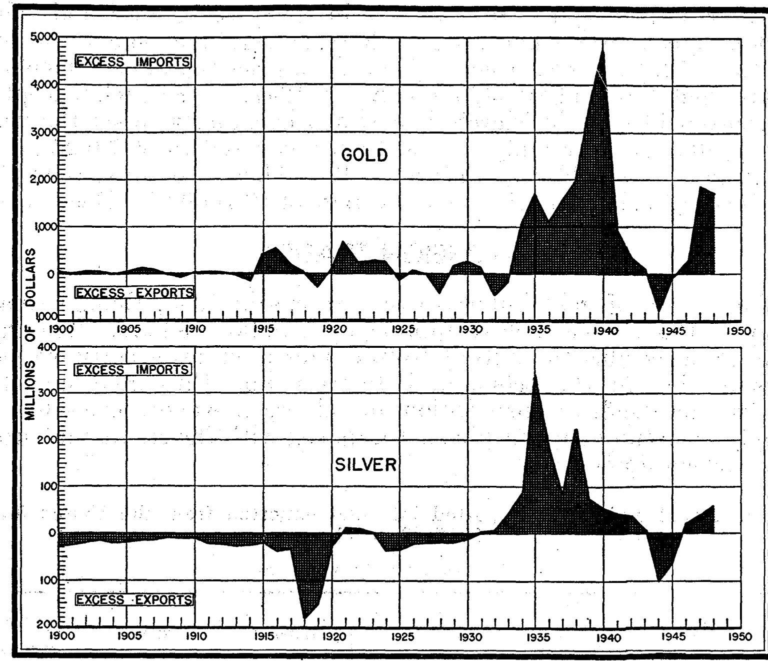

FIGURE 3.—Gold and silver imports and exports, with net movements, 1900–48.

WORLD REVIEW

World gold output gained in 1948, continuing the movement in progress since 1946, but the greater quantities produced replaced only in small part the loss in production sustained from 1940 to 1946.

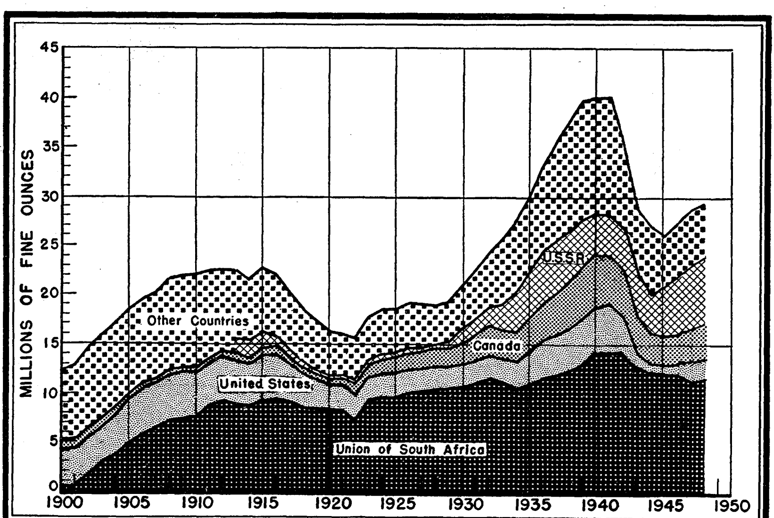

FIGURE 4.—World production of gold, 1900–48.

The decline in silver production, uninterrupted since 1940, was reversed in 1947, and a further small rise is indicated in 1948. World silver output, like that for gold, continued far below prewar averages.

[1] Silver is also produced in Bulgaria, Greece, Hong Kong, Federation of Malaya, Indonesia, Poland, Portugal, Sarawak, Sierra Leone, Turkey, U. S. S. R., and Yugoslavia; production data are not available, but estimates are included in totals.
[2] Excludes the Philippines.
[3] Imports into the United States. Scrap is included in this figure in many instances, most notably in the case of Cuba.
[4] Estimate.
[5] Data not available; estimate included in total.
[6] Bizonal area.
[7] Data represent Trianon Hungary after October 1944.
[8] January to March, inclusive.
[9] South Korea only.
[10] Exports.
[11] Recovered from an accumulation of refinery slimes.
[12] Fiscal year ended May 31 of year following that stated.

Canada.—Gold production gained 15 percent in 1948, continuing the rise in progress since 1945. Silver output likewise increased in 1948 (17 percent), reversing the downtrend in progress since 1940. Output of gold in 1947 and 1948 was as follows, in fine ounces:

Province or Territory:	*1947*	*1948*
Alberta	78	72
British Columbia	249, 011	311, 711
Manitoba	72, 906	(1)
Northwest Territories	62, 517	101, 346
Nova Scotia	1, 271	189
Ontario	1, 944, 819	2, 090, 414
Quebec	598, 127	767, 026
Saskatchewan	93, 747	[1] 196, 211
Yukon	47, 745	60, 605
Total	3, 070, 221	3, 527, 574

[1] Manitoba included with Saskatchewan.

Canada exported 5,434,364 ounces of refined silver and 3,294,691 ounces in ores and concentrates in 1948 compared with 7,514,373 and 2,722,261 ounces, respectively, in 1947.

Mexico.—Mexico continued to be by far the leading silver-producing nation in the world. In July the Mexican Government decided [5] to allow the peso, for many years pegged at 20.62 cents U. S. currency, to seek its own level. It soon settled at about 14.5 cents, although no official rate was fixed. The coinage of 1-peso pieces was halted following exportation of some to the United States, presumably for melting and sale as bullion. Since October 21 silver exports, whether in coins or bars, have been subject to approval of the Banco de Mexico. The director general of the bank announced [6] recently that the Government bought and used 28,393,000 fine ounces of silver, almost half of the year's output, for making one- and five-peso coins in 1948.

Republic of the Philippines.—Gold production in the Philippines was estimated as 209,225 ounces in 1948 or sharply above the 64,441 ounces in 1947. The amount received for sales of bullion was reported [7] to be possibly 20–30 percent over the statutory price, as the open market for gold in Manila during the year varied from 86 to 100 pesos an ounce; pesos were convertible in unlimited amounts into United States dollars at 2 to 1. Largest producer of the year was Benguet-Balatoc mine group, credited with 80,556 ounces, followed by Atok-Big Wedge mine with 65,972, and Mindanao Mother Lode mine with 32,963 ounces.

Union of South Africa.—Although gold production in 1948 was above that in 1947, there was actually a continuing drop in the rate of output; production in the latter year was adversely affected by a lengthy labor strike said to have reduced the total about 500,000 ounces. The production rate has been downward since 1941. The year 1948 was marked also by a decreasing labor supply and rising costs. Monthly output dropped during 1948, being 992,185 ounces in January and 945,727 ounces in December.

Dividends	£13, 056, 263	£13, 406, 349	£11, 845, 035	£13, 419, 443

The shortage of native labor has become the producers' principal problem. At the end of 1948 the native labor force was 254,964 compared with 273,902 and 278,048 at the end of 1947 and 1946, respectively. Favorable factors include further substantial progress on the Far East Rand in developing the Kimberly Reef by mechanical loaders. On the Far West Rand development results of both producers and nonproducers were said to be highly encouraging in many cases. The Venterspost mine produced the highest quantity in its history, and the Libanon mine was expected to begin production soon. In the Orange Free State, horizontal development began from the first completed shaft—the St. Helena incline. The company's vertical shaft was down 1,450 feet at the end of 1948. In addition to seven other shafts already being sunk, four more were planned in the district. Electric power reached the area during the year and greatly facilitated shaft sinking. Water supply from the Vaal River, however, was not expected to reach the gold field before the first mines are ready for production.

Gypsum

By JOSEPH C. ARUNDALE AND MAY G. DOWNEY

GENERAL SUMMARY

THE year 1948 saw new records established in all important phases of the gypsum industry. Domestic mine production of 7,254,535 short tons and imports of 2,859,209 short tons of crude gypsum were all-time highs. Improved supply and labor conditions, extensive modernization of existing facilities, and development of new capacity and expansions in response to very heavy demand made possible record production of most gypsum products. The residential building and industrial construction boom and the general effort at maximum industrial output during the year were reflected in substantial increases in production of such items as portland-cement retarder, fillers, and gypsum for bedding plate glass, gaging and molding, and other plasters, and the principal types of gypsum board. Most plants were operated at or near practical capacity. Although shortages of some gypsum products were reported, these had largely disappeared by the end of the year. Gypsum board and lath continued to be exported under license control; but demand from foreign consumers declined, as many new foreign deposits of gypsum were developed and new plants erected.

Wholesale prices for gypsum board and lath were increased moderately during the year.

During the winter of 1948–49, for the first time in several years, distributors were able to accumulate stocks of gypsum board and lath during the normal lull in building activity.

World production of gypsum and gypsum products was also at a record level. However, as more and more countries develop their domestic gypsum resources and become self-sufficient in the manufacture of gypsum products, exports of gypsum products from the United States have declined.

RESERVES

Domestic gypsum deposits are so extensive and abundant that reserves are considered virtually inexhaustible. Gypsum is widely distributed throughout the world; and, although many countries import gypsum, as a general rule they do so for economic reasons, such as cost of production, transportation, or utilization of available material and not for lack of resources.

In the past few years, many countries have intensified the survey of their gypsum reserves and economic research in the development and utilization of these reserves. In the United States an example of this is the intensive geologic investigation of Kansas gypsum deposits undertaken by the Kansas State Geological Survey in cooperation with the University of Kansas, with the expectation that this research program will aid in exploiting the State's high-quality deposits.[1]

Exported	$489,980	$1,502,668	$1,065,248	[4] $1,599,578	$1,317,042

[1] Each mine, plant, or combination mine and plant is counted as 1 establishment.
[2] Excludes byproduct gypsum.
[3] Made from domestic, imported, and byproduct crude gypsum.
[4] Revised figure.

DOMESTIC PRODUCTION

Crude.—Of the 64 active domestic mines producing gypsum during 1948, 40 were open-pit operations, 17 were underground, and 7 were combinations of these two types. Great improvement in labor and supply conditions, increased mechanization, expansions, and development of new deposits permitted total mine production to increase approximately 17 percent over the previous record year of 1947.

Calcined.—The tonnage of gypsum calcined, a good barometer of the condition of the industry because it includes imported as well as domestically mined material, was nearly 25 percent greater in 1948 than in 1947.

Mine and Calcining Plant Developments.—The National Gypsum Co. mine at Akron, N. Y., was being dismantled after more than 40 years of operation. The processing plant on the site will continue to operate on material from the Clarence Center mine.[2]

An expansion program designed to increase the production capacity of the mill and enlarge its office facilities was underway at the Certain-teed Products Co. plant at Blue Rapids, Kans.[3]

The Northwest Gypsum Co. has developed a deposit of gypsum on the Snake River near Weiser, Idaho. The capacity of the open-pit operations is expected to reach 1,000 to 3,000 tons per day.[4]

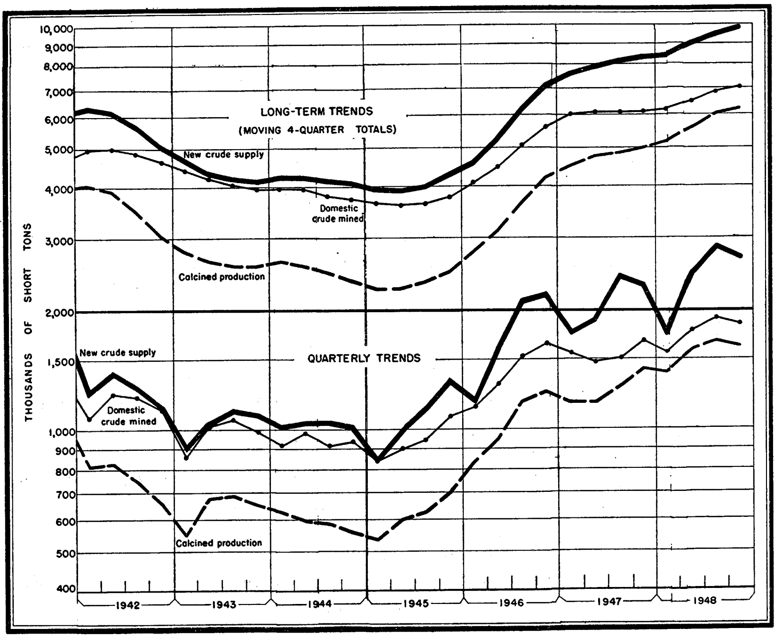

FIGURE 1.—Trends of new crude supply, domestic crude mined, and production of calcined gypsum, 1942–48, by quarters.

National Gypsum Co. is making plant and office additions at Fort Dodge, Iowa,[5] and also planned to expand capacity of its plant at Medicine Lodge, Kans.[6]

The U. S. Gypsum Co. announced plans to construct a new gypsum mill in northern Nevada, probably near Lovelock.[7]

[1] Includes rotary and beehive kilns, grinding-calcining units, and hydrocal cylinders.
[2] Comprises calcining plants in 1946–48: 1 each in Arizona (none in 1946), Connecticut, Florida, Georgia, Indiana, Maryland (none in 1946), Massachusetts, New Hampshire, New Jersey, New Mexico (none in 1946–47), Oklahoma, Pennsylvania, South Dakota, and Wyoming; 2 each in Colorado, Kansas, Montana, Nevada, Ohio, Utah (3 in 1948), and Virginia (3 in 1947).

CONSUMPTION AND USES

Gypsum products were consumed during 1948 at a record rate. The enormous amount of residential and nonresidential building and maintenance created a strong demand for such building materials as gypsum lath, wallboard, sheathing, and the various building plasters. During the first part of the year it was still necessary for some producers to allocate shipments of lath and wallboard to distributors. However, by the end of the year, only local shortages were being reported, and some inventories were built up during the winter season of normally slower building activity.

The portland-cement industry consumed a record tonnage of gypsum as a retarder.

Several of the larger producers of lath and board notified the Government of their decision to decline to enter into a voluntary agreement to allocate their future output to users specified by the Government as "essential." Their reason for rejecting this proposal was that such an agreement was unnecessary in view of the expectation that output, as a result of expansions and improved methods and conditions, would be adequate to meet the estimated housing requirements for 1948.[8]

Gypsum-Products Plant Developments.—The National Gypsum Co. completed its expansion program at Clarence Center, N. Y. This new modern plant will turn out about 17,000,000 square feet of such gypsum products as wallboard, lath, and sheathing, plus about 6,000 tons of plaster monthly.[9] The company announced plans for a west coast factory. Its engineers have discovered a large high-grade gypsum deposit in Imperial County, Calif. The plant to be built will produce gypsum board, lath, plaster, and other gypsum products.[10]

The United States Gypsum Co. began production of plaster and wallboard at its new plant at Norfolk, Va., using raw gypsum from Nova Scotia. Expected output is about 120 tons of plaster and 350,000 square feet of board daily.[11] The company completed a major enlargement of its plant at Plaster City, Calif., in the Imperial Valley.[12]

The Western Gypsum Co. of Salt Lake City completed a new plant at Sigurd, Utah, and output was begun in April 1948. This plant will produce a full line of gypsum products.[13]

[1] Per M square feet, f. o. b. producing plant.
[2] Laminated board included with wallboard.
[3] Average value per M square feet of wallboard.
[4] Includes partition, roof, floor, soffit, shoe, and all other gypsum tiles and planks.
[5] Area of component board and not of finished product.
[6] Per M square feet, f. o. b. producing plant of partition tile only.
[7] Bureau of Mines not at liberty to publish figure.

PRICES

The average value of crude gypsum as mined was $2.63 per short ton as reported by producers. Only about one-fourth of the total gypsum mined is marketed in the crude or uncalcined form, and most of this is sold as portland-cement retarder or as agricultural gypsum. Average value of retarder remained unchanged from the previous year at $3.31 per short ton. Average value of agricultural gypsum was increased slightly to $3.97 per short ton. The prices of lath and wallboard were increased moderately during the year. Average values of most industrial and building plasters were also increased.

FOREIGN TRADE[14]

Imports of crude gypsum from Canada into the Eastern United States continued to increase rapidly and in 1948 represented one-fourth of the apparent domestic supply. A smaller but increasing tonnage was imported from Mexico (Lower California) to ports along the Pacific coast.

[14] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[1] Revised figure.

TECHNOLOGY

The committee on gypsum, American Society for Testing Materials, plans to consider the need for a specification on artificial or synthetic gypsum. Action on standards included recommendations for discontinuing the specifications for gypsum pottery plaster and calcined gypsum for dental plasters, while a tentative revision has been recommended in the specifications for gypsum plaster that would change the strength requirements from tensile to dry compressive on 2-inch cubes.[15]

WORLD REVIEW

Australia.—The new gypsum wallboard plant of Concord Plaster Mills, Division of Colonial Sugar Refining Co., Ltd., at Sydney, Australia, was described. This plant will produce approximately 20 million square feet of wall board per year and will supply plaster of various grades. Gypsum is obtained from the company's leases in western New South Wales.[16]

Canada.—The National Gypsum Co. has acquired long-term leases on 440 acres of gypsum deposits at Brierly's Brook in Antigonish County, Nova Scotia. The operations of National Gypsum in Nova Scotia now include extensive quarry and harbor facilities at Dingwall and a fleet of freighters used to carry the Nova Scotia gypsum rock to the company's eastern seaboard plants in the United States.[17]

Handling of gypsum at Hantsport, Nova Scotia, was described.[18]

[1] In addition to the countries listed gypsum is produced in Angola, Brazil, Ethiopia, Iraq, Luxembourg, Mexico, Republic of the Philippines, U. S. S. R., and Yugoslavia, but production data are not available. No estimates for these countries are included in the total.
[2] Data not available; estimate by author of chapter included in total.
[3] Rail and river shipments.
[4] Estimate.
[5] Data represents areas designated as Free China during period of Japanese occupation.
[6] Exports.
[7] Russian zone only.
[8] Bizonal area.
[9] Includes 1,200 tons produced in Spanish Morocco.

Columbia Gypsum Products, Inc., Spokane, Wash., acquired a newly discovered gypsum property near Lake Winedmere in northeastern British Columbia and plans to begin working on it immediately. The property is reported to contain at least 40 million tons of high-grade gypsum. A processing plant to treat this material is being completed in Spokane.[19]

Ecuador.—In December 1947 the Minister of Economy and Mines of Ecuador was authorized to sign, on behalf of his Government, a contract granting a concession to La Cemento Nacional, C. A., and Canteras Nacionales, C. A.—affiliated cement producers—to exploit gypsum deposits in Guayas Province. The concession covers an area of approximately 3,970 hectares in the Parishes of General Villamil, Morro, and Progreso, of Guayaquil Canton, Guayas Province. The concessionaires are bound by the contract to exploit only the deposits of gypsum in the area. The material will be used solely for the manufacture of cement by the concessionaires.[20]

Ethiopia.—Gypsum occurs rather extensively on the Danakil salt plain in Ethiopia, in association with the salt. However, transportation difficulties have hindered its exploitation. The main source in this country is Dawale, on the railway between Diredawa and Jibuti. The production is believed to be about 1,000 tons per year and the chief use is as a retarding agent in cement. At Diredawa, gypsum is calcined separately and sold as plaster of paris. An alabaster variety occurs as a replacement in limestone in the Fiche area of Shoa Province and is used for ornamental carving.[21]

[19] Rock Products, vol. 51, No. 5, May 1948, p. 67.
[20] Bureau of Mines, Mineral Trade Notes: vol. 26, No. 3, March 1948, pp. 36–37.
[21] Mining Magazine (London), vol. 78, No. 5, May 1948, p. 309.

India.—Gypsum deposits are widespread in the Indian State of Bikaner, occurring at Jamsar, Khichian, Jalalsar, Jaimalser, Kaoni, Bearru, Harkasar, and Dholera, and at a few recently discovered deposits in the Surakgarh and Nohar tehsils. It is estimated that total reserves in the State are 25 million tons. Most of the deposits are at or near the surface in horizontal beds averaging 12 feet thick. Selenite is found at Kunkaransar. It is estimated that 500,000 tons can be obtained by working the first 20 feet of depth.[22]

It was reported that a reserve of about 40 million tons of gypsum was discovered in the latest geological survey of the Rajputana States of Cooch and Sirmur in the central Himalayas. It is also believed that a reserve of about 30 million tons is available in the States of Jodhpur and Jaipur.

The reconnaissance map of the Ministry of Industry and Supply, Government of India, shows nine areas in which gypsum resources are known to be extensive and capable of utilization as a result of the recent investigation. The principal areas are in Rajputana, Kathiawar, Cutch, Nellore district (Madras Province), and Trichinopoly district (Madras Province) and at several points in the Himalayan foothills from near Naini Tal (United Provinces) west to Simla. It is expected that the Rajputana and Kathiawar deposits will be the first to be developed for utilization by the fertilizer and cement industrial plants in northern India, and the Nellore and Trichinopoly districts deposits will be more extensively utilized than before to supply south Indian requirements.

Before the partition of the country, India relied greatly on the Salt Range (in West Pungab, now in Pakistan) as a source of gypsum for use in the country's fertilizer and cement industries, both of which it was planned should undergo expansion in the postwar period. Future requirements for gypsum are estimated at about 700,000 tons a year to satisfy the Indian cement and fertilizer industries.[23]

Iraq.—There are large deposits of gypsum throughout Iraq, many of which might be easily exploited. The mineral is sawed by hand in open quarries and is used for both ornamental and ordinary stone. It is also processed to form a plaster known as Juss, a type of mortar used as building material.[24]

Poland.—According to the Warsaw press in April, exploratory work by the Mineral Raw Materials Industry Combine of the Polish Government at Jelenia Gora has led to the discovery of important gypsum seams at Nowy Lad, near Lwowek, Lower Silesia. The importance of the new discovery lies in the fact that the known seams virtually have been exhausted and because the new seams yield an excellent quality of alabaster gypsum. A branch railway to the deposits has been built, and exploitation of the seams was said to be beginning.[25]

[24] Bureau of Mines, Mineral Trade Notes: vol. 26, No. 6, June 1948, p. 33.
[25] Bureau of Mines, Mineral Trade Notes: vol. 27, No. 1, July 1948, p. 52.

Poland has a rich area of mineral deposits in the Kielce Province, especially in the region of Kielce, Miechow, Nowy Karozyn, the Basin of the River Nida, and Opatow. This region will be developed industrially, including a building materails industry. Research by the Mining Academy at Cracow has shown that along the River Nida there are enormous deposits of crystalline gypsum of the highest quality, mostly near the surface. Provisional estimates assess these at about 200,000,000 tons.

A standard-gage railway line will be built between New Karczyn and Kielce, will connect the new industrial district with the rest of the country, and will shorten the route from Gdansk to the Balkan Peninsula. In the vicinity of the gypsum quarries, a factory for production of gypsum building materials and a chemical factory will be built, the latter to utilize gypsum byproducts. Work on all these industrial enterprises is expected to start early next year.[26]

Helium

By H. S. KENNEDY AND R. A. CATTELL

General Summary.—The preceding report in this series covered the period from July 1, 1941, to June 30, 1947, with some data extended to December 31, 1947. For security reasons, no reports of the production, distribution, or use of helium were published during the war. Beginning with this report for 1948, the series will cover calendar-year periods.

By act of Congress approved March 3, 1925, the Bureau of Mines was authorized to carry out the conservation, production, and exploitation of helium gas for national defense. The act of Congress approved September 1, 1937, directed the Bureau to administer regulations for the sale of helium for medical, scientific, and commercial purposes. Such sales had not been possible previously. Amended regulations governing such sales were approved by the President on January 2, 1947.

The Exell, Tex., helium plant continued to supply the total helium requirements in 1948 with a production of 63,143,513 cubic feet, a reduction from the 70,297,700 cubic feet produced in 1947. Total shipments to Federal agencies in 1948 were 34,877,490 cubic feet compared to 37,351,175 cubic feet in 1947. Sales to non-Federal users in 1948 increased to 16,037,856 cubic feet from the 1947 total of 14,971,175 cubic feet. Prices for sales for non-Federal use in 1948 continued at the levels set by the amended regulations of January 2, 1947.

Reserves.—The main helium reserves of the Nation are in the Cliffside gas field, near Amarillo, Tex., and the Rattlesnake gas field in San Juan County, N. Mex. The Government-owned Cliffside field still is the largest helium reserve known, capable of producing more than 2 billion cubic feet of helium. In addition, the Government owns full rights in the gas reserves of the Rattlesnake field, from which at least 800 million cubic feet of helium can be produced. Both these fields are shut in, and helium will be produced from them only in time of need. There are 11 gas wells in the Cliffside field and 2 wells in the Rattlesnake field.

Helium is produced at present from natural gas going to fuel markets from the Channing area of the Panhandle gas field in Texas, and this area contains enough gas reserves to supply 1½ billion cubic feet of helium. The Otis, Kans., helium plant, in standby status, is connected to gas reserves in the Otis area from which 400 million cubic feet of helium can be extracted. These reserves are entirely adequate for present needs for helium, but the Bureau of Mines continues to analyze gas samples from all parts of the United States, seeking new sources of helium-bearing gases in anticipation of all possible future requirements.

Domestic Production.—The Exell helium plant in the Texas Panhandle gas field near Amarillo, Tex., continued to be the only operating helium-production plant in the world. Total production for 1948 was 63,143,513 cubic feet. Since the beginning of production in March 1943, this plant has produced 340,541,593 cubic feet of helium. The table below indicates the total helium production by Government plants for the period 1921–48.

Helium production in the United States, 1921–48

Calendar year	Plant	Cubic feet
1921–January 1929	Fort Worth, Tex., plant	46,088,787
1929 (April)–1941	Amarillo, Tex., plant	131,887,380
1942	do	33,252,582
1943	All plants	116,307,437
1944	do	126,933,130
1945	do	94,733,744
1946	Amarillo and Exell, Tex., plants	58,236,385
1947	Exell, Tex., plant	70,297,700
1948	do	63,143,513
Total 1921–48		[1] 740,880,658

[1] Includes 81,475,525 cubic feet extracted at the Exell plant from gas from the Channing area and injected into the Cliffside gas reservoir for conservation in calendar years 1945–48.

Helium Plants.—The Amarillo, Tex., helium plant, which began operation in April 1929 and was the sole producing plant from that time until the Exell, Tex., plant began production in 1943, has produced to date a total of 252,451,982 cubic feet of helium. It is connected to the Cliffside gas field, and both plant and field now are in standby status. The Exell plant now supplies all helium requirements from natural gas produced for commercial use from the Panhandle gas field. A commercial pipe line carries the gas to fuel markets after it passes through the helium-extraction process; and, if this helium were not extracted, it would be lost forever.

The Otis, Kans., plant began operating in October 1943 and produced 56,633,755 cubic feet of helium before it was shut down and placed in standby status in August 1945. The Cunningham, Kans., plant began production in January 1944 and produced until July 1945. It since has been dismantled, because the reserve of helium-bearing natural gas supplying the plant was not large enough to warrant keeping it in standby condition. The Cunningham plant produced 43,049,000 cubic feet. The Navajo, N. Mex., plant, connected to the Rattlesnake gas field, was placed in operation in March 1944 for a trial period of 18 days, then was shut down and now is in standby status. At the time this plant was finished, the wartime helium demand was decreasing, and the other plants were able to supply all demands.

Shipments and Uses.—The Navy continues to use more helium than any other agency, although shipments for Navy use dropped about 5 million cubic feet in 1948. Shipments for commercial and scientific use increased 800,000 cubic feet for the year, and an encouraging increase of 250,000 cubic feet was purchased for medical use. The accompanying table lists yearly shipments to both Federal agencies and non-Federal users since 1941. The figures for medical use are approximate, because accounting for medical use is on a fiscal-year basis.

Shipments of helium in the United States, 1941–48 (calendar years), in cubic feet

Calendar year	Shipments to Federal agencies				Sales for non-Federal use			Grand total, shipments
	Navy	Weather Bureau	Army and other Federal agencies	Total	Scientific and commercial	Medical	Total	
1941	11, 187, 440	4, 408, 505	5, 313, 610	20, 909, 555	789, 396	442, 604	1, 232, 000	22, 141, 555
1942	25, 402, 000	5, 090, 715	4, 787, 550	35, 280, 265	359, 085	416, 392	775, 477	36, 055, 742
1943	107, 243, 085	5, 633, 950	2, 434, 695	115, 311, 730	806, 646	513, 282	1, 319, 928	116, 631, 658
1944	111, 075, 569	7, 035, 515	2, 443, 150	120, 554, 234	2, 445, 405	562, 990	3, 008, 395	123, 562, 629
1945	38, 091, 234	8, 010, 210	11, 759, 285	57, 860, 729	2, 362, 028	565, 477	2, 927, 505	60, 788, 234
1946	15, 735, 690	9, 705, 790	9, 287, 750	34, 729, 230	7, 960, 473	1, 233, 817	9, 194, 290	43, 923, 520
1947	26, 511, 005	6, 347, 670	4, 492, 500	37, 351, 175	12, 914, 075	2, 057, 100	14, 971, 175	52, 322, 350
1948	21, 531, 788	6, 478, 931	6, 866, 771	34, 877, 490	13, 735, 645	2, 302, 211	16, 037, 856	50, 915, 346

Helium is used both by Federal agencies and commercial concerns for the inflation of airships; in meteorology; for welding magnesium, aluminum, stainless steel, and other metals and alloys; in medicine for administering anaesthetics and in admixture with oxygen for the relief of severe respiratory ailments; and as a tracer for following the movement of gas in underground petroleum reservoirs. Also, helium is used to establish a neutral atmosphere in the reaction chamber in the Kroll process for producing titanium by powder metallurgy at the Boulder City, Colo., laboratory of the Bureau of Mines. Scientifically, progress continues in the development and production of apparatus for liquefying helium, and liquid helium is used in fundamental studies of importance in physics and thermodynamics.

The excess helium produced by the Exell plant continues to be conserved by injection into the Cliffside gas field through a pipe line connecting the plant to the field. Since 1945 more than 81 million cubic feet have been conserved by this practice.

Prices.—The Bureau of Mines continues to supply helium to Federal agencies at the cost of production, as required by the Helium Act. Prices for non-Federal use of helium are in accordance with the amended regulations of January 2, 1947, and are as follows: Helium sold for medical use and delivered in tank cars or trailers—$11 per thousand cubic feet; helium sold for medical use and delivered in standard cylinders containing about 200 cubic feet each—$13 per thousand cubic feet; helium sold for scientific and commercial use and delivered in tank cars or trailers—$13 per thousand cubic feet; and helium sold in standard cylinders for scientific and commercial use—$15 per thousand cubic feet. These prices are for delivery at the plant.

World Review.—The Helium Act sets up rigid standards governing the export of helium, and very little is used in foreign countries except for scientific purposes, largely within the field of cryogenics. As far as is known, helium is not produced from natural gas any place outside the United States. Some small amount may be extracted from air for scientific uses.

Iron Ore

By ROLAND D. PARKS [1]

GENERAL SUMMARY

PUBLIC concern over future supplies of iron ore for the steel-producing centers of the United States appeared to be rising in 1948. The iron-ore-mining industry itself, however, was able to report major progress toward making new supplies available. The over-all iron-ore situation at the end of 1948 brought recognition of the fact that new ores had been found to offset the trend toward depletion of ore bodies on which the Chicago-to-Pittsburgh iron- and steel-producing area has depended in the past. This came about as the result of several programs initiated in the late war and early postwar period. Prominent among these drives against depletion were the discovery and rapid proving of major tonnages of high-grade open-pit hematite in Quebec and Labrador, other explorations and developments abroad by United States capital (as in Venezuela and Liberia) and progress made in meeting the problems of concentrating Lake Superior region magnetic taconite. Without the St. Lawrence seaway there remains some question as to the extent to which these foreign ores can compete in the Lower Great Lakes region; but potential sources of supply, at least, are now known. Throughout the iron-ore industry recognition of the iron-ore supply problem of the future was reflected in the construction of new research facilities.

Salient Statistics.—In terms of crude ore, domestic production in 1948 set a peacetime record at 126,225,172 gross tons, only 0.25 percent less than the all-time peak established in the war year 1942. Shipments of crude ore approached the 1942 all-time peak of 126,794,970 tons. In terms of usable ore, however, the 1948 output of 101,003,492 gross tons, while 8 percent greater than for 1947, was 4 percent below the 1942 output and slightly below 1943. Crude ore is mine-run product before treatment. Usable ore includes direct-shipping ore (mine product requiring no treatment), washed ore, concentrates, sinter, and byproduct pyrites cinder and sinter.

Each of the major producing districts in the United States showed increased output in 1948, and imports of foreign ores were up 25 percent from 1947. Chile was again the major source of imports, Sweden replaced Canada as second source, and imports from Algeria increased notably.

[1] Consulting mining engineer, Bureau of Mines. Chapter prepared in cooperation with Norwood B. Melcher.

Salient statistics of iron ore in the United States, 1945–48

	1945	1946	1947	1948
Crude iron ore:				
Production by districts:				
Lake Superior ---- gross tons	85,451,692	67,014,550	[1] 88,420,140	[1] 94,465,955
Southeastern ---- do	9,616,593	9,278,832	11,031,102	13,292,770
Northeastern ---- do	7,686,338	5,136,313	8,698,983	10,379,799

Value ----	$3,513,666	$3,126,711	$3,447,149	(4)

[1] Includes production of brown crude iron ore from Fillmore County, Minn., which is not in the true Lake Superior district: 218,833 tons in 1947; and 512,987 tons in 1948.
[2] Includes production of concentrates from brown crude ore from Fillmore County, Minn.: 147,787 tons in 1947; and 352,979 tons in 1948.
[3] Revised figure.
[4] Bureau of Mines not at liberty to publish figure.

A trend showing the Lake Superior district becoming relatively less important in terms of the total domestic production continued during 1948. That district supplied 85 percent of the United States total in 1945, 83 percent in 1946, 82 percent in 1947, and 81 percent in 1948. The steady increase in imports during this period accentuates the indicated trend. Accordingly, including imported ores, the Lake Superior district furnished 83 percent of the total supply in 1945, 80 percent in 1946, 78 percent in 1947, and 77 percent in 1948.

Production of usable ore from the Western States (California, Missouri, Nevada, Texas, Utah, Washington, Wyoming), mainly from Utah, increased from 3 percent of the domestic total for 1945 and 1946 to 5 percent of the total for 1947 and 1948 and exceeded the tonnage output, not considering iron content, of the Northeastern States (Pennsylvania, New Jersey, and New York) for the latter 2 years.

In terms of the total United States supply for the postwar period, the decline, percentagewise, of the Lake Superior district has been offset by increased imports and by higher outputs from the Western and Northeastern States. The Southeastern States (Alabama, Georgia, Virginia) have maintained a fairly constant percentage of the total output during this period.

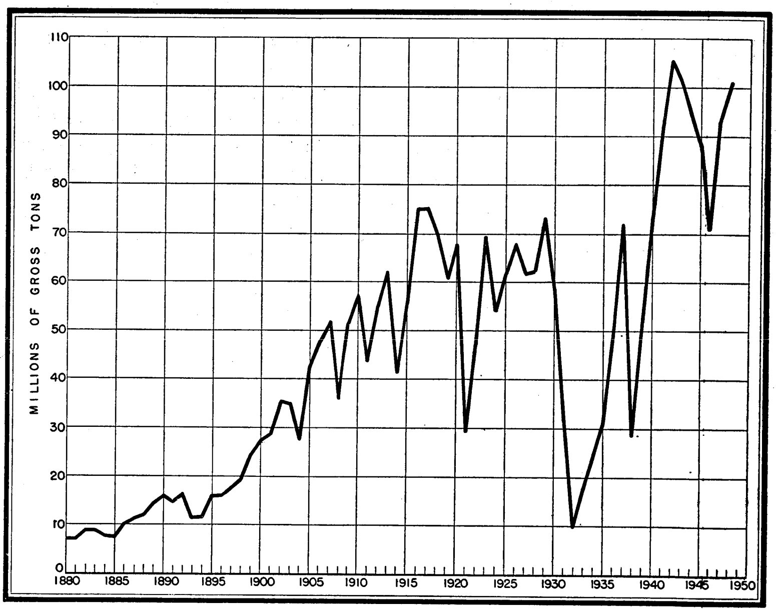

FIGURE 1.—Trends in production of iron ore in the United States, 1880–1948.

With the growth of iron- and steel-producing centers outside the Lower Great Lakes region, the decline of the Lake Superior district as a national source of supply may be expected to continue under normal transportation conditions because these outside centers, as in Utah, California, Texas, and Maryland, can be supplied more economically by local and imported ores. Local production, as from the Cedar City district, Utah, and the Eagle Mountain district, Calif., is immediately tributary to regional steel centers. Developments in Canada and Venezuela portend increasing imports. Expansion of production of iron ore from taconite will tend to retard if not arrest the decline of the Lake Superior district.

PRODUCTION AND SHIPMENTS

Domestic iron-ore mines produced crude ore totaling 126,225,172 gross tons and shipped 126,123,731 tons in 1948, increases of 11 percent in both cases from 1947. Of the 1948 shipments, 39 percent was sent to beneficiating plants, and 61 percent went direct to consumers, compared with 37 and 63 percent, respectively, in 1947. From the crude ores shipped to beneficiating plants, 19,055,357 tons of concentrates and 4,585,799 tons of sinter were produced. In addition, 479,998 tons of byproduct ore in the form of cinder and sinter were produced by the pyrites industry during the year. The ore from which this byproduct was produced is not included in the crude ore totals given above. In all, 101,003,492 gross tons of usable iron ore, including byproduct, were produced at mines and mills in 1948, an increase of 8 percent from 1947. Of this quantity, 76,882,338 tons were suitable for consumption as mined without requiring further treatment in the form of beneficiation.

The output in 1948, excluding byproduct material noted above, came from 215 mines, of which 36 mined over 1,000,000 tons of crude ore each. Minnesota, with 68,035,740 tons, and Michigan, second-largest producer, with 13,102,086 tons, again supplied, respectively, 67 and 13 percent of the total usable ore, as in the previous year. These two States and Wisconsin, with 1,492,604 tons, constitute the Lake Superior region, which supplied 81 percent of the domestic output.

Open-pit mines furnished 78 percent of the crude iron ore mined in 1948 compared with 75 percent in 1947. In production of crude ore, the Alabama, New York-Pennsylvania, and Texas-Utah areas showed gains in 1948, percentagewise, over 1947, whereas Minnesota and Michigan declined in percentage of total output.

Shipments of usable ore from mines and mills totaled 100,821,714 gross tons in 1948, an increase of 8 percent from 1947. Of this quantity, 76,610,537 tons (76 percent) were direct-shipping ore for use in iron and steel furnaces. Total shipments also include 43,693 tons of ore for cement manufacture, 8,490 tons for paint, and 10,022 tons for miscellaneous purposes. Shipments of byproduct ore for use in iron and steel included in the total shipments amounted to 546,749 tons in 1948, valued at $3,230,867.

[3] Cinder and sinter obtained from pyrites treated in, but not necessarily mined in, States indicated.

PRINCIPAL MINES

Listed below in descending order and in some detail are the iron mines of the United States that produced over 500,000 gross tons of crude ore each in 1948. The order of listing is based on ore tonnage, not iron content of product, and thus mines producing low-grade crude ore that requires concentration are considered comparable in size to mines producing similar tonnages of direct-shipping ore.

Thirty-six mines, each producing more than 1,000,000 gross tons of crude ore, supplied 60 percent of the United States output in 1948. Of these, 22 were in Minnesota, 5 in Alabama, 4 in New York, and 1 each in Michigan, Pennsylvania, Texas, Utah, and Wisconsin; 24 were open-pit mines, 8 underground, and 4 combined operations. Except for 5 mines that produced magnetite, 1 producing semialtered magnetite, and 2 producing brown ore, all of the million-ton mines produced hematite in 1948. In 1947, 35 mines of more than 1,000,000 gross tons of crude ore each produced 59 percent of the United States output.

Output of 12 mines producing 50,000 to 100,000 tons of crude ore each					897,838	735,262
Output of 47 mines producing under 50,000 tons of crude ore each					872,474	610,459
Grand total United States (215 mines)					126,225,172	100,523,494

[1] Includes output from 1 plant treating tailings.

Thirty-eight mines producing 500,000 to 1,000,000 gross tons of crude ore each, supplied 21 percent of the United States total output of crude ore in 1948. Of these, 18 are in Minnesota, 12 in Michigan, 2 each in Alabama and Utah, and 1 each in Georgia, New York, Texas, and Wyoming. In summary, 81 percent of the total domestic output of crude ore came from the 74 mines listed in the accompanying table.

SINTER

Domestic sintering plants in 1948 used 13,091,069 gross tons of iron ore, 4,815,631 tons of flue dust, 580,204 tons of pyrites cinder, 227 tons of manganiferous ore, and 392,601 tons of mill cinder and roll scale to produce 17,210,555 gross tons of sinter—a conversion yield of 91 percent.

Sinter production in 1948 came from plants at mines, blast-furnace plants, and custom mills. Of the sinter produced in the United States, 29 percent was made at mine plants in 4 States, and 71 percent was produced at blast-furnace plants and custom mills in 13 States.

Production and consumption of sinter in the United States in 1948, by States, in gross tons

State	Sinter produced	Sinter consumed	
		In blast furnaces	In steel furnaces
Alabama	1,631,167	1,789,357	90,660

Total	17,210,555	14,417,491	994,671

REVIEW OF LAKE SUPERIOR DISTRICT

Production and Shipments.—Production of usable iron ore from mines and mills in the Lake Superior district in 1948 was 8 percent greater than in 1947, amounting to 81 percent of the United States total. This district—which includes the Marquette, Menominee, Gogebic, Vermilion, Mesabi, and Cuyuna ranges—has produced over half of the total domestic output each year for 60 years. The Mesabi range, which alone has produced over half the United States total each year since 1909 (except in 1932) supplied 78 percent of the district total and 63 percent of the United States total compared with percentages of 77 and 63, respectively, in 1947. A total of 82,277,451 gross tons of usable iron ore was reported produced from the six ranges of the Lake Superior district during 1948. In addition, 352,979 gross tons of brown ore concentrates were produced and shipped from Fillmore County in southeastern Minnesota, which is not considered part of the true Lake Superior district, and 1,093,359 tons of ore containing (natural) over 5 percent manganese (all from Minnesota) were produced, making the total output of all grades 83,723,789 gross tons. Shipments consisted of 1,070,110 tons of manganiferous ores and 81,935,689 tons of hematite from the six ranges of the Lake Superior district proper, plus 352,979 tons from brown ores in Fillmore County—total shipments from mines of 83-358,778 gross tons.

Production and shipments from Canadian mines in the Lake Superior region are not included in these statistics. Shipments from these mines in 1948 totaled 1,208,448 gross tons. Of this quantity, 522,063 tons came from the Helen mine in the Michipicoten district, and 686,385 tons were shipped from the Steep Rock mine in the Steep Rock district, Atikokan range.

The Lake Superior Iron Ore Association reported 81,739,165 gross tons of iron and manganiferous ores shipped to upper Lake ports from United States mines in 1948, an increase of 7 percent over 1947. All-rail shipments totaled 1,745,397 tons in 1948 compared with 1,722,739 tons in 1947. The 1948 shipping season was of longer duration than average, opening on April 5 and closing December 9.

The brown, bog-type limonite ore of the Spring Valley area, Fillmore County, southeastern Minnesota, is of different origin than the ores of the Lake Superior district. After washing, the Spring Valley product is shipped all-rail to Granite City, Ill.

Iron ore produced in the Lake Superior district, 1854–1948, by ranges, in gross tons

[Exclusive after 1905 of ore containing 5 percent or more manganese]

Technologic Developments.—Iron ore, relatively, is a low-value material. Ordinarily it must be mined and moved in enormous quantities to be profitable. To be marketable, it must meet specifications, not only as to iron content, but also as to several minor constituents. Tolerances are narrow. A high degree of operational efficiency is essential to attain the low costs in iron-ore mining to meet competition.

With gradual depletion of the large high-grade open-pit deposits of the Mesabi range, two fields of development will confront the industry, particularly in the Lake Superior region. Underground mines will be called upon to provide an increasing share of the total output of high-grade crude ores; and the mining of taconite, whether by open-pit methods or underground, will present problems because of its hardness and abrasive qualities and because of the additional tonnage of crude taconite that will be needed to produce the required output of concentrate. Mining will tend to become less flexible unless means can be found to permit more rapid expansion of output from underground mines and from concentrating plants. Storage capacities at critical points may offer a partial solution to this problem. When called upon to do so, the large open pits could increase their production of direct-shipping ore very rapidly.

Efficient handling of iron ore and waste rock in the pits and in underground mines has been studied for many years. Recent developments in power shovels, conveyors, and mobile transportation equipment in the open-pit mines of the Lake Superior district were reviewed.[2] Possible transport of ore by water through pipe lines is being given consideration.[3]

Shaker conveyors have been applied underground at the Sherwood mine of Inland Steel Co., Iron River, Mich.,[4] where the ore, which is semihard, is mined by the sublevel-stoping method. Application of this type of equipment to the block-caving method of mining, which finds use in some underground iron mines, has been outlined.[5] A special belt-conveyor system [6] has been devised to aid in stock-piling concentrates.

Patents were issued early in 1948 on the equipment and processes used for jet-piercing hard-rock formation.[7]

Analyses.—The accompanying table shows the average analyses of all ores shipped from the Lake Superior district for the past 5 years. Since the analyses from year to year have been remarkably consistent in the past, despite an increasing percentage of concentrated product, the decline in iron content and the increase in silica in 1947 and 1948 are perhaps noteworthy.

Average analyses of total tonnages (bill-of-lading weights) of all grades of iron ore from all ranges of Lake Superior district, 1944–48

[Lake Superior Iron Ore Association]

Year	Gross tons	Content (natural), percent				
		Iron	Phosphorus	Silica	Manganese	Moisture
1944	81,039,404	51.72	0.088	8.42	0.74	11.02
1945	75,206,781	51.69	.089	8.52	.72	10.96
1946	58,975,188	51.32	.087	8.83	.74	11.22
1947	77,210,278	50.91	.093	9.09	.75	11.28
1948	82,655,757	50.49	.093	9.30	.76	11.35

Reserves.—The accompanying table shows reserves of iron ore in Michigan and Minnesota, by ranges. It should be borne in mind that these data represent only taxable and State-owned reserves and do not represent the total that may be expected to become available. Tonnages are added to the reserve figures each year, and undoubtedly ultimate production in the Lake Superior district will greatly exceed that indicated by present reserve tonnages.

The Wisconsin Department of Taxation estimated reserves of iron ore in Wisconsin to be 6,000,000 tons on January 1, 1949.

A recent review[8] of iron mining in Wisconsin describes the several iron formations in the State and notes the exploratory work done in

MINING BY STATES

Alabama.—Production of crude iron ore in Alabama, third largest producing State, increased 24 percent over 1947, twice the percentage increase for the country as a whole. Output of crude red ore, seven-eighths from underground mines, increased 18 percent while that of brown ore, all from open-pit operations, was up 41 percent for the year. All of the underground hematite mines in Alabama are in Jefferson County, centering around Birmingham. Tennessee Coal, Iron & Railroad Co., largest producer, shipped red hematite from its Red Mountain mines—the Muscoda, Ishkooda, and Wenonah groups. After crushing and blending, four-fifths of this ore was shipped direct; the balance was sintered before use. Woodward Iron Co. produced direct-shipping hematite from its Pyne, Red Ore, and Redding (Songo) underground mines. Sloss-Sheffield Steel & Iron Co. mined direct-shipping hematite from its Sloss and Ruffner underground properties and shipped concentrates from their La Grange open-pit operation, Colbert County, in the northwest corner of the State. Its Sadler Gap mine has been abandoned. Republic Steel Corp. shipped hema-

Iron ore mined in the United States in 1948, by States and counties, in gross tons

[1] Excludes undetermined number of pits. Estimated output of these mines included in tonnage given.
[2] Includes output of 1 plant reprocessing tailings.

tite directly from its Edwards underground mine and produced concentrates from its combined open-pit and underground Spaulding mine. Hewitt Contract Co. produced concentrates from open-pit operations in Jefferson County. The unweighted average grade of hematite shipped from Alabama mines and mills during 1948 was 35.12 percent Fe (natural), 0.15 percent Mn, 0.30 percent P, 17.35 percent SiO_2, 15.83 percent CaO, and 1.77 percent H_2O.

All of the brown ore produced in Alabama in 1948 came from open-pit mines, and all was concentrated by washing.

The occurrence of these deposits and their productive history were summarized.[11]

Product as shipped during 1948 contained 42.31 percent Fe (natural) and 0.76 percent Mn, by unweighted average. Shook & Fletcher Supply Co. was the largest producer of brown ore from the Warner-Auxford pit near Russellville, Franklin County, northwest of the Birmingham district. Sloss-Sheffield Steel & Iron Co. operated its Russellville No. 14 mine in the same area. Hooper Construction Co. worked the Ruffner property, Jefferson County. Operations in Cherokee County, northeast of Birmingham, included the Sidhart mine of the Arrington Mining Co. and production by C. L. Erwin.

California.—The Eagle Mountain iron mine, Riverside County, Calif., was put into production [12] on November 10, 1948, by Kaiser Co., Inc., to supply ore to its Fontana steel plant 145 miles west and tributary to the Los Angeles area.

The Vulcan mine, San Bernardino County, a previous supplier, ceased production in mid-1947 but continued to ship from stocks throughout 1948.

The Eagle Mountain iron deposits, known for many years, were drilled and trenched by the Bureau of Mines and Geological Survey in 1941. Based on this work, reserves in the eastern part of the district were estimated [13] at 21,629,000 tons of positive ore averaging 51.2 percent iron with 0.40 percent sulfur and 15,000,000 tons additional of probable ore. Potential reserve for the entire district, considering numerous small deposits to the west, was placed at 70,000,000 tons of an iron content over 40 percent. Reserves of direct-shipping ore in the southern and Bald Eagle deposits of the eastern area have been given recently [14] at 7,071,000 tons containing 53.75 percent iron, 0.095 percent sulfur, 0.043 phosphorus, and less than 8 percent silica. This represents an increase of 2,000,000 tons over the earlier estimate on this class of ore.

Georgia.—Iron-ore production of Georgia consists entirely of brown ore mined by open-pit methods and concentrated by washing. Principal producers in 1948 included Hodge Mining Co., Taylorsville, Bartow County; Arrington Mining Co., Cartersville, Bartow County, and Cedartown, Polk County; E. L. Gammage, near Grady, and the Albea-York Mining Co., near Aragon, both in Polk County. These localities are in the northwestern part of the State. Much of the ore is loaded by power shovels without blasting. Mobile equipment,

such as power scrapers and trucks, is used to move the crude ore and concentrates.

Michigan and Minnesota.—See Review of Lake Superior District in this chapter.

Missouri.—The entire production of iron ore from Missouri in 1948 came from the Iron Mountain open-pit mine, St. Francois County, operated by the Ozark Ore Co. Crushing and jigging were used to concentrate the crude hematite before shipment. Grade of product shipped averaged 52.1 percent natural iron.

Nevada.—Magnetite was mined by open-pit methods in the Humboldt River Basin, Pershing County, during 1948 for direct shipment to customers. Roy S. Blair worked the Iron Horse and Iron Wonder mines near Woolsey, and Segerstrom & Heizer operated near Lovelock.

New Jersey.—Output of iron ore in New Jersey during 1948 came entirely from underground mines and very largely from Morris County, where the Alan Wood Steel Co. operated its Scrub Oaks mine, the Warren Pipe & Foundry Corp. its Mount Hope mine, and the Richard Ore Co. its Richard mine. The Alan Wood Steel Co. also worked the Washington mine, Morris County. One-sixth of the total mine output was shipped direct; the balance was concentrated by magnetic methods for all of the properties and also by gravity methods for the Scrub Oaks and Washington mines. Magnetite and some martite are the iron-bearing minerals. Shipments for the year averaged 63.3 percent iron content.

New York.—The Republic Steel Corp. shipped magnetite sinter and and concentrates and hand-sorted high-grade lump ore during 1948 from its New Bed-Harmony-Old Bed group at Mineville, Essex County. Shipments from the Fisher Hill mine in the same district and from the Chateaugay mine at Lyon Mountain, Clinton County, were almost entirely magnetite sinters. All mining was by underground methods. These operations were described.[15] Jones & Laughlin Ore Co. operated its Benson open-pit mine and its concentrator at Star Lake, St. Lawrence County, to ship sinter and some concentrates made from its magnetite and martite ores. Operating practices at this property were described and reserves estimated at 65,000,000 tons of crude magnetite ore and 38,000,000 tons of crude martite ore in the open-pit area.[16] Concentration ratio is approximately 3: 1 for each type of ore. National Lead Co. shipped magnetite sinter and concentrates from its MacIntyre development at Sanford Lake, Essex County. The ore, a titaniferous magnetite, is mined by open-pit methods. Hanna Coal & Ore Corp. worked its Clifton underground mine at Degrasse, St. Lawrence County, and shipped magnetite sinter. The average grade of shipments noted above was 63.14 percent iron. Except for the New Bed-Harmony-Old Bed group, all of the ores shipped were of Bessemer grade as to phosphorus content. Clinton hematite was mined in Oneida County for use as pigments.

Pennsylvania.—Bethlehem Steel Corp. produced crude magnetite

[15] Gillies, D. B., Adirondack Iron-Ore Mining: Steel, vol. 123, No. 9, Aug. 30, 1948, pp. 72–73, 77.

ore from its underground and open-pit mines at Cornwall, Pa., during 1948. All of the mine output was concentrated and sintered at Lebanon. The underground ore was mined by the block-caving method.

Texas.—Lone Star Steel Co., principal producer, worked its limonite open-pit in the Daingerfield area, Morris County, to make concentrates by a washing, sintering, and calcining process. Sheffield Steel Co. produced brown-ore concentrates by washing from two open-pit mines—the North Basin at Linden, Cass County, and the Mount Haven at Jacksonville, Cherokee County. Valencia Iron & Chemical Corp. mined brown ore underground near Rusk, Cherokee County. This ore was dried and screened before shipment. Average unweighted analysis of ores shipped was 45 percent Fe (natural), 0.08 percent Mn, 0.20 percent P, 11.3 percent SiO_2, 14 percent CaO, and 7 percent H_2O.

Utah.—All iron ore produced in Utah during 1948 consisted of direct-shipping semialtered magnetite from open-pit mines in the Cedar City district, Iron County, in the southwest part of the State. Columbia Iron Mining Co. worked the Iron Mountain mine; Colorado Fuel & Iron Corp., the Blowout mine; Utah Construction Co., the Excelsior; and Helene E. Beatty, the Great Western. Shipments averaged 53.9 percent Fe (natural), 0.06 percent Mn, 0.18 percent P, 8.8 percent SiO_2, 1.7 percent CaO, and 3.2 percent H_2O.

Potential reserves of Iron County, Utah, have been estimated by the Bureau of Mines [17] at 500,000,000 gross tons of iron-bearing material, of which 100,000,000 tons may be classed as measured and indicated reserves containing 45 to 50 percent iron.

Virginia.—Iron ore was mined by open-pit method in Pulaski County during 1948 for use as pigment.

Washington.—The Spokane Portland Cement Co. produced hematite by open-pit methods from the Napoleon mine during 1948 for use in making cement.

Wisconsin.—See Review of Lake Superior District in this chapter.

Wyoming.—Colorado Fuel & Iron Corp. produced direct-shipping hematite for its Pueblo furnaces from the Sunrise underground mine in the Hartville district, Platte County. Shipments averaged 47 percent natural iron content.

CONSUMPTION

A total of 100,498,557 gross tons of iron ore was reported consumed in 1948. Of this, 82 percent was consumed in iron blast furnaces, 13 percent in sintering plants, 4 percent in steel furnaces, and the remaining 1 percent in ferro-alloy furnaces and in the manufacture of cement, ballast blocks, paint, and other items. In addition to the iron ore used in blast and steel furnaces, blast furnaces consumed 14,417,491 tons of iron-ore sinter, and steel furnaces used 994,671 tons of sinter.

[1] Shipments from domestic mines.
[2] Consumption for paint (except in Pennsylvania) and for "other" uses (except in Texas and Utah) excluded from State totals but included in United States total.
[3] Included with "Undistributed."
[4] Includes States indicated by footnote 3 plus the following: For cement—Arkansas, Florida, Kansas, Louisiana, Maine, Montana, Oklahoma, Oregon, South Carolina, and South Dakota. For paint—Georgia, North Dakota, and Wisconsin. For "other"—no additional.

STOCKS

Stocks of usable iron ore at mines on December 31, 1948, increased 4 percent over 1947. Of the quantity in stock piles, 52 percent was at mines in Minnesota, 29 percent in Michigan, and 11 percent in New York and Pennsylvania. Including Wisconsin, the Lake Superior district held 83 percent of the total stocks at the end of the year. Stocks of crude ore at mines totaled 4,662,648 gross tons on December 31, 1948, compared with a revised figure of 4,561,207 gross tons in 1947.

Stocks of iron ore, including sinter, at consuming plants totaled 37,144,933 gross tons on December 31, 1948, compared with 33,393,171 tons (adjusted figure) at the end of 1947.

Stocks at Lake Erie Ports.—On December 1, 1948, just before navigation stopped, the Lake Superior Iron Ore Association reported 5,689,828 gross tons of iron ore at Lake Erie ports, compared with 4,815,635 tons in 1947. At the opening of the 1949 season (May 1, 1949), 2,033,169 tons of ore were in stock at these ports, compared with 1,953,179 tons on May 1, 1948. Thus, withdrawals from stock during the 5-month period in 1948–49 were 28 percent more than during the previous year.

Stocks of usable iron ore at mines, Dec. 31, 1947–48, by States, in gross tons

State	1947	1948	State	1947	1948
Alabama	37,881	102,493	Texas	28,539	130,645
California	344,659	152,480	Utah	17,653	17,943

New York, Pennsylvania	[1] 750,726	682,468			

[1] Revised figure.

PRICES

Factors Affecting Price.—Iron ores vary widely in chemical composition and physical structure. These qualities affect the usefulness of an ore and its value or price. There is no uniform basis throughout the United States for selling iron ore; contracts are used widely, and in certain areas—notably the Lake Superior district—there are published schedules of prices. In general, the value of an ore is related to its chemical content of iron to other constituents (silica, moisture, phosphorus, sulfur, refractories, etc.) and to its structure, whether hard or soft, lump or fine. Moisture and silica reduce net iron content and add to freight costs. A minimum phosphorus content and lump structure are desirable; sulfur, refractory elements, and fine structure are undesirable qualities. Ores are sold on guaranteed analyses with price adjusted by freight and handling charges to point of delivery. Market prices are quoted [18] in terms of cents per unit of iron for some domestic eastern ores and foreign ores of specified iron content delivered at certain destinations.

In the Lake Superior region, where numerous producers forward a variety of ores of similar types to the many furnaces in the Lower Great Lakes area, standard specifications have been established; and published price schedules, known as Lake Erie base prices, are referred to in determining comparative prices of the various ores delivered at Lower Lake ports. Much ore is sold on contract below published prices.

Value at Mine.—The average value per gross ton of iron ore at mines was $3.91 in 1948 compared with $3.44 in 1947 and $3.07 in 1946.

The accompanying table gives the average value at mines of the different classes of iron ore in 1948 for each of the producing States or groups of States except where there are fewer than three shippers of a certain class of ore in a State and permission has not been given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately. In general, the delivered cost less transportation costs to the consuming plants is given. In the Lake Superior district the mine value is the Lake Erie price less freight from mines to Lower Lake ports. This value appears to be applied also to ore that is not sold on the open market.

Prices of Lake Superior Iron Ore.—Lake Erie base prices for Lake Superior iron ores were increased, effective March 27, 1948, by 65

[2] Includes California, Missouri, Nevada, Texas, Virginia, Washington, Wisconsin, and Wyoming.
[3] Cinder and sinter obtained from pyrites treated in, but not necessarily mined in, States indicated.

cents per gross ton.[19] Prices were then $6.20 for Mesabi non-Bessemer and $6.45 for Old Range non-Bessemer, with the respective Bessemer grades 15 cents higher. Prices were again increased by $1 per gross ton, effective December 30, 1948, making the prices as follows: Old Range Bessemer, $7.60; Old Range non-Bessemer, $7.45; Mesabi Bessemer, $7.35; Mesabi non-Bessemer, $7.20; and High-Phosphorus $7.20 per gross ton.

Lake Erie prices are based on 51.5 percent natural iron content with 0.045 percent phosphorus (dry) the dividing line between Bessemer and non-Bessemer grades. High-Phosphorus ores contain 0.18 percent phosphorus or more. Standard schedules[20] are used for determining the payment for iron content, including penalty deductions for iron below 50 percent natural and for premiums for phosphorus below 0.045 percent, dry basis. Premiums for lump structure and for high manganese content and deductions for high silica are negotiated between buyer and seller.

Freight Rates.—Upper Lake rail freight rates and dock handling charges were raised 11 and 2 cents, respectively, per gross ton, effective May 6, 1948, making the transportation costs from the Minnesota ranges to upper Lake ports $1.05 per ton—92 cents for rail movement, and 13 cents for dock loading. Boat rates were increased at the beginning of the 1948 season, with fractional cent adjustment effective May 6, to bring the charges from ports at the head of Lake Superior to lower Lake ports to $1.33 per gross ton, of which $1.15 was boat freight and 18 cents dock charge. These rates reflected increases of 15 and 2½ cents, respectively, over the 1947 season. Lower Lake rail freight rates, from ports to consuming districts, were raised 20

[19] Wade, H. H., Mining Directory of Minnesota, 1949: University of Minnesota, Mines Exper. Sta. Bull. vol. 52, No. 20, May 1, 1949, table 14, p. 234.
[20] Work cited in footnote 19, pp. 235–238.

cents per gross ton effective January 5, 1948, and an additional 8 cents per ton effective May 6. Further adjustments, but on an individual route basis, became effective August 21. These varied from a reduction of 8 cents per ton (to the May 6 level) for shipment from Lake Erie to the Mahoning and Shenango Valleys, Canton, and Massillon to an increase of 6 cents per ton for several routes from Lake Erie to specified points in southern Pennsylvania, Virginia, and Maryland. Total increases for the year thus ranged from 20 to 34 cents per ton. In addition, dock charges of 10 cents per ton in 1947 were increased to 11½ cents effective February 19, 1948, and to 12 cents per ton effective May 6. Certain rates for all-rail shipment to consuming districts were increased during the year; for instance, the rate from Fillmore County, Minn., to Granite City, Ill., was raised from $2.12 per ton in 1947, by three successive increases, to $2.46 per gross ton, effective August 21, 1948.

FOREIGN TRADE [21]

Imports of iron ore increased nearly 25 percent over 1947 and were double the quantity exported. Imports, by countries, are given in the accompanying table. Among the major sources, the drop in receipts from Canada was more than offset by increases from Chile and Sweden. Notable among minor sources were the increased receipts from Algeria and Brazil and the decline in imports from Cuba. Exports to Canada were three times imports, due in large measure to reduced shipments from the Steep Rock Lake district.

BENEFICIATION

About 60 percent of the iron ore mined in the United States is shipped directly to furnaces; the balance is treated before shipment to improve some quality, either chemical or physical. Such treatment is spoken of broadly as beneficiation. In the statistics given here, however, only those crude ores improved in chemical analysis are included.

The usual procedure in beneficiation is to separate and discard undesirable elements. Although the quantity of crude ore beneficiated has increased more or less steadily for the past 40 years or so, the types of crude treated and the problems of concentration have remained much the same. Beneficiation now, however, is entering a new phase brought about by the different structural and chemical qualities of the great bulk of low-grade iron formation that is being looked toward as the source of future iron supplies. Heretofore, the crude ores treated have been made up of iron and gangue constituents more or less readily separable as free pieces in relatively coarse sizes. Treatment, generally, has been by simple means, such as crushing, washing, and magnetic and gravity separation. This class of crude ore is often referred to as "intermediate" ore. By distinction, the crudes of the future, especially the taconites (unaltered iron formation) of the Mesabi range and similar formations elsewhere, have the iron associated more intimately with other constituents, even to chemical combinations as complex iron silicates in some cases. Fine grinding and agglomeration of the concentrate into a usable product are but two of the new problems.

In considering concentration methods, taconites are generally grouped into two types, magnetic and nonmagnetic, depending upon the preponderance or lack of magnetite as the iron-bearing mineral. Magnetic taconite is being given more attention at this time, since concentration of the magnetite, once liberated, can be effected by well-

Iron ore shipped from mines in the United States, 1925–29 (average) and 1930–48, in gross tons, and percentage of beneficiated ore compared to total shipped

[Exclusive of ore containing 5 percent or more manganese]

known low-cost magnetic methods. A recent review [22] states that gravity methods flotation, magnetic roasting, and magnetic concentration will be needed for nonmagnetic taconite.

Reserves of taconite in Minnesota are given by Tartaron [23] at 60,000,000,000 tons of 30 percent iron content of which 5,000,000,000 tons are magnetic taconite at the eastern end of the Mesabi range. The Michigan ranges also contain substantial reserves of somewhat higher grade.

Three tons of taconite, approximately, will be mined to produce 1 ton of concentrate. Reserves of magnetic taconite, thus, add about 1,700,000,000 tons to present reserves of equivalent high-grade ore on the Mesabi range, enough to extend the mining life about 25 years at current rates, providing that mining and treatment of such enormous tonnages can be worked out economically. Mining will be by open-pit methods, using techniques well-established in the area except that the extreme hardness of the formation compared with the bulk of the ores now being mined will require significant changes in blast-hole drilling and blasting.

Significant progress was made during 1948 when Pickands, Mather & Co. began operating its new concentrator at Aurora, Minn., in the latter part of the year. Capacity of the plant is understood to be 2,000 tons of pellets per day from 6,000 tons of crude ore treated. Significant of the contemplated size of future taconite operations, this plant has been referred to as a pilot plant.[24]

Oglebay, Norton & Co. is in the preliminary stages of constructing a magnetic separation plant to produce 5,000,000 tons of concentrate per year. A 48-mile railroad and a new port at Beaver Bay, on Lake Superior, are included in the project.

[23] Tartaron, F. X., Iron-Ore Beneficiation Shows Healthy Growth: Eng. & Min. Jour., vol. 149, No. 2, February 1948, pp. 110–113.

[24] Harbaugh, M. D., Iron Ore—Annual Review and Forecast: Min. Cong. Jour., vol. 35, No. 2, February 1949, pp. 76–80.

In the foreign field at Kirkenes, in the northeastern part of Norway on Varanger Inlet, the Sydvadranger firm is rebuilding [25] its war-destroyed plant for production of magnetite from taconite. The new plant is expected to process 2,000,000 tons of crude per year, about equivalent to the 1938 peak output for the old plant of 880,000 metric tons of concentrate from 1,982,600 tons of crude ore. Typical analysis of the concentrate is stated to be 66 percent iron, 6 percent silica, 0.01 percent phosphorus, and 0.01 percent sulfur. Reserves are given at some 200,000,000 tons, averaging 34 to 35 percent iron content.

Laboratories equipped for taconite research are either in final stages of construction or in use by Oliver Iron Mining Co., Duluth, Minn.; Jones & Laughlin Steel Corp., Negaunee, Mich.; and the M. A. Hanna Co., Hibbing, Minn. Cooperative research on taconite is being carried on by Battelle Memorial Institute, Columbus, Ohio.

EMPLOYMENT

Complete data on employment in iron mines are not yet available. Preliminary figures indicate a 1-percent increase in the number of workers over 1947. The average number employed is estimated at 30,200 men working 69,140,000 man-hours to produce 101,616,853 tons of usable iron and manganiferous ores, an average of 1.470 tons per man-hour. This compares with 1.442 tons per man-hour in 1947 and 1.422 in 1946. The above data and the table that follows include, in the Lake Superior district, manganiferous ore, which is considered by the trade as a special grade of iron ore.

[1] In addition to countries listed Bulgaria, Burma, Egypt, Eritrea, French West Africa, Greece, Madagascar, Portugal, and South-West Africa report production of iron ore, but quantity produced is believed insufficient to affect estimate of world total.
[2] Data not available; estimate by author of the chapter included in total.
[3] Production of Tofo mines.
[4] Including Moselle (Lorraine).
[5] Exclusive of manganiferous iron ore carrying 12 to 30 percent manganese.
[6] Excluding Russian zone.
[7] Bizonal area.
[8] Data represent Trianon Hungary subsequent to October 1944.
[9] January to June, inclusive.
[10] June to December, inclusive.
[11] Estimate.
[12] U. S. S. R. in Asia included with U. S. S. R. in Europe.
[13] Exclusive of bog ore, which is used mainly for purification of gas.
[14] Croatia only.
[15] Manchuria only.
[16] Includes iron sand production as follows: 1941–42, 233,000 tons; 1942–43, 368,000 tons; 1943–44, 427,000 tons; 1944–45, 858,782 tons; 1945–46, 235,094 tons; 1946, 10,470 tons; 1947, 1,648 tons.
[17] Fiscal year ended March 31 of year following that stated.
[18] Data revised in some instances to cover production rather than shipments.
[19] Exports.

CANADA

British Columbia.—Magnetite deposits on Texada Island, in Georgia Strait, east of Vancouver Island, were being investigated late in 1948 for early production. Freyn Engineering Co., Chicago, is reported [26] to have estimated the proved reserves of the Prescott property at 5,136,000 tons with additional probable tonnage of 4,000,000. Other magnetite deposits are known at Upper Quemsaim Lake in the Campbell River region of Vancouver Island, nearby.

Ontario.—Steep Rock Iron Mines, Ltd., has exposed additional ore at the southeast end of its "B" ore body,[27] from which over 3,000,000 tons have been produced through 1948. To date, the "A" deposit, 1½ miles north of "B", has been drilled but not uncovered enough for mining. "C" deposit, 1½ miles east of "A", still covered by several hundred feet of water in East Bay, has been indicated only by scattered drill holes.[28] Reserves were estimated [29] by the operators as of May 1, 1947, at some 21,500,000 tons of proved ore and 51,000,000 tons of probable ore. Of this total the, "A" deposit area was estimated to contain over 7,000,000 tons proved and 46,000,000 probable, the "B" deposit area at 14,000,000 proved and nearly 5,000,000 probable.

Production declined in 1948; additional stripping was undertaken during the shipping season to permit higher output later.

[29] Engineering and Mining Journal, vol. 149, No. 8, August 1948, pp. 84–85.

Algoma Ore Properties, Ltd., subsidiary of Algoma Steel Corp., Ltd., is enlarging its sinter plant at the Helen mine, Wawa, Michipicoten district, northeast of Lake Superior, to 1,000,000 gross tons annual sinter capacity.[30] Underground block-caving development, in the deep siderite deposits beneath the Helen open pit, neared completion in 1948. After primary crushing underground, belt conveyors will bring the siderite ore to the surface for further treatment. The Victoria pit, opened in 1948, will provide ore for the sinter plant until the underground mine reaches the necessary capacity.

Reserves of siderite in the Michipicoten district are known to be large. A recent review,[31] notes that 100,000,000 tons were indicated to moderate depth in the Helen mine before 1921. Substantial tonnages, undoubtedly, have been added by recent drilling, but exact data are not yet available.

The Britannia (formerly Bartlett) deposit of Algoma Ore Properties, Ltd., 9 miles northeast of the Helen mine, has shown increased width at depth and higher iron and manganese content than the Helen deposit. No work was done here in 1948. The Lucy and Ruth siderite deposits, held by Jones & Laughlin Steel Corp., lie midway along the range, some 5 miles northeast of the Helen. Drilling of the Ruth deposit was completed in 1948. The Josephine hematite mine, west of the Bartlett, remained flooded.

A typical analysis of the Helen siderite ore, as given by Bonham,[32] indicates that the natural iron content of 35 percent is improved to 51 percent by calcining. The treatment, which includes sintering, reduces sulfur from 1.76 percent to 0.06 and raises manganese from 2 percent to 3.

No further work was done by Algoma Ore Properties, Ltd., on its Goulais Magnetite deposits some 40 miles northeast of Sault Ste. Marie. Magnitude of these deposits has been given [33] at 150,000,000 tons.

Quebec.—Noranda Mines, Ltd., is testing possible production of iron and sulfur from pyrites. Deposits underlying present mine workings are reported [34] to contain 100,000,000 tons of material of 50 percent or more pyrite content. Scale of iron output contemplated is about 1,000 tons per day.

Iron will be a byproduct of the titanium-mining operations initiated in 1948 at Allard Lake, Quebec, by Kennecott Copper Corp. and New Jersey Zinc Co. Mine product is to be smelted in electric furnaces at Sorel, east of Montreal, to produce pig iron and titanium slag. Proved reserves of ore (known as the Lake Tio deposits) have been given at 125,000,000 tons averaging 35 percent iron and 40 percent titanium dioxide.

Quebec-Labrador.—Exploration of the Labrador trough continued throughout 1948. The Burnt Creek area, served by the airport at Knob Lake, was the center of prospecting activity extending northwest to the Koksoak River and southeast to the Hamilton River. The iron range is now considered to be some 350 miles long by 10 to

60 miles wide.[35] Twenty-eight separate high-grade hematite deposits of economic size were reported [36] drilled and proved to the end of 1948, all on concessions held by subsidiaries of Hollinger Consolidated Gold Mines, Ltd., in association with The M. A. Hanna Co. Melcher [37] has described the district in detail in a recent economic report. Reserves estimated to the end of the 1948 season are given at 323,828,000 tons, including 38,394,000 tons of manganiferous ore averaging, on dry analysis, 50.23 percent iron, 7.68 percent manganese, and 7.75 percent silica content. Of the iron ore, 185,527,000 tons are listed as Bessemer grade, containing 60.69 percent iron, 0.028 percent phosphorus, and 8.58 percent silica on dry analysis. The balance of 98,907,000 tons is classed as non-Bessemer ore of 57.78 percent iron content, 0.112 percent phosphorus, and 7.84 percent silica. Reserves, as estimated, exclude all material of less than 50 percent iron content and ore at the bottom of deposits where the width is less than 125 feet. The largest deposit, Goodwood No. 1, contains 47,000,000 tons of iron ore and 4,500,000 tons of manganiferous ore.

A railroad location has been surveyed from the Burnt Creek area to Seven Islands, the port site selected on the St. Lawrence Gulf. A water-power site is reported to have been located within 25 miles of one of the deposits. A minimum annual production rate of 10,000,000 tons is considered necessary.

Iron occurrences in the Gilbert Bay area, southeastern shore of Labrador, are reported [38] being prospected by Westland Mining Co., Ltd., holder of a 500-square-mile concession.

OTHER COUNTRIES

Australia.—Iron deposits on Cockatoo Island, Yampi Sound, Western Australia, are being developed [39] by Australian Iron & Steel, Ltd., to provide increased ore supplies for steel plants at Newcastle, New South Wales, and Whyalla, South Australia, now supplied from mines at Iron Knob and Iron Monarch, near Whyalla.[40] The Cockatoo Island deposits, estimated from preliminary data at 20,000,000 tons of 66 percent iron content, [41] require no initial stripping in the area under development, while those on nearby Koolan Island, estimated at 76,000,000 tons of similar quality, are not so well exposed. H. A. Brassart & Co., Ltd., London, is assisting with the development.

The Yampi Sound iron deposits are being looked to as a base for establishment of an iron and steel industry in Western Australia. Three companies were reported late in 1948 to have been registered there for this purpose, that is, Western Steel Enterprises, Westeel, Pty., and W. A. Coal Mines.[42]

Shallow iron deposits in the Darling range near Wundowie, 41

miles east of Perth, Western Australia, are reported [43] supplying ore for local charcoal iron production.

Brazil.—Problems of finance confronting large-scale development of known iron deposits in the State of Minas Gerais have been under discussion [44] by the Joint United States-Brazil Technical Commission. Exports of 1,500,000 tons are looked for by 1950 by Brazilian authorities using the present narrow-gage railroad from Itabira to the port of Victoria. An additional 1,500,000 tons could be obtained by improvement of present mine, rail, and port facilities. Rebuilding of the railroad with broad-gage track and choice of a new port, it is said, would increase the capacity for export some tenfold.

Ceylon.—Iron deposits located in recent years in the southwest part of Ceylon are stated [45] to contain some 6,000,000 tons averaging 50 percent iron content. These occurrences of lateritic origin are in well-defined belts suitable for open-pit mining and, though not extensive, are thought sufficient for the island's needs for many years.

Chile.—With 18,000,000 tons, or 40 percent of the original reserve, yet to be mined in El Tofo, Bethlehem Chile Iron Mines is reported [46] to have acquired the Romeral iron deposit northeast of La Serena for early development.

Reserves at Romeral are given at 18,000,000 tons of grade and composition similar to the ores of El Tofo. New rail and port facilities will be needed.

Deposits of sedimentary magnetite and hematite of 30 to 40 percent grade are reported to have been discovered some 300 miles south of Santiago along the boundary between Aranco and Mallico Provinces. The deposits are stated [47] to cover some 300 square miles [48] and to consist of three horizontal beds close to the surface and some 20 meters thick, of which 11 meters represent the iron deposits.

Colombia.—The Colombian Government, together with Koppers Co., Pittsburgh, and Freyn Engineering Corp., Chicago, are reported [49] forming a new pig-iron concern at Bogota to be called Empresa Siderurgica Paz del Rio. Capacity of 500 tons per day is expected [50] by 1951. The Paz del Rio iron deposits in Boyaca Province, which will be drawn upon, are stated [51] to have about 45 percent iron content with 10 percent silica, 1 percent phosphorus, and less than 0.05 percent sulfur.

Cuba.—The Mayari open-pit mine of Bethlehem Steel Corp., in Oriente Province, produced direct-shipping ore during the first half of 1948 for experimental use.

Iron ore shipped from mines in the Province of Oriente, Cuba, 1884–1948, in gross tons

	Juragua, Daiquiri, and Estancia (hematite and magnetite)	Sigua (hematite)	Mayari (brown ore)	Guama (hematite)	El Cuero (hematite)	Total
1884–1946	22,651,554	20,438	3,989,940	41,241	903,103	27,606,276
1947	88,727		55,193			143,920
1948			34,025			34,025
Total	22,740,281	20,438	4,079,158	41,241	903,103	27,784,221

India.—M. S. Krishrian, of the Geological Survey of India, has estimated[52] reserves of good-grade iron ore in the Salem district, Madras, at some 600,000,000 tons. Another estimate[53] of the iron deposits in Salem and Trichinopoly, based on a survey conducted in 1940–44, places reserves at 304,650,000 tons to a depth of 100 feet. The Government of Madras is planning for an iron and steel plant to be located in the Salem district.

Japan.—Over 400,000 tons of iron ore was scheduled in the latter part of 1948 for shipment[54] from the United States to Japan; an additional 250,000 tons was expected from Brazil.[55] Contracts were announced earlier in the year for import of 250,000 tons of iron ore from the Chinese island of Hainan.[56]

Luxembourg.—Iron-ore reserves of Luxembourg, as of the end of 1947 have been estimated[57] at 405,000,000 metric tons; one-half is of the higher grades currently mined, one-quarter of lower grades usable without treatment, and one-quarter of lower grades requiring concentration before use. Reserves are thought to be completely outlined. The higher-grade ores (above 25 percent iron for calcareous ores and above 28 percent for siliceous ores) are expected to last 40 years at recent production levels. Plans are under way to extend the life by mining all grades, with provision for the necessary concentration treatment.

New Caledonia.—Iron deposits formerly exploited by Japanese companies and productive of 500,000 tons during the period 1938–44, are now idle.[58]

New Zealand.—An experimental electric furnace plant was scheduled to be set up at Onekaku, Nelson district, late in 1948 to test the feasibility of smelting the titaniferous iron sands occurring extensively on the west coast of the North Island.[59] In sponsoring this work, the Government of Onekaku is looking toward a possible future iron and steel industry to supply domestic needs.

Spain.—Export of iron ore, mainly to the United States and Great Britain, was resumed at the beginning of 1948. Shipments [60] for the first 3 months totaled 173,400 metric tons.

U. S. S. R.—Low-grade iron deposits of the Kola Peninsula and Karelio-Finnish Republic are being looked to as sources of supply for the 4,000,000-ton-per-year pig-iron capacity now in the planning stage for the Leningrad region.[61] The project is stated to be considered uneconomic by ordinary standards. Magnitude of the Kola Peninsula known deposits is of the order of a billion tons. The Yeno-Kovdar deposits, 50 miles west of Zasheyek, principal ones in the area, are said to average 33 percent iron, 2.7 percent phosphorus, and 0.08 percent sulfur. These deposits vary widely in composition and may be difficult to concentrate to the desired content of 63 percent iron with 0.5 percent phosphorus. Methods being tested include grinding, magnetic separation, and agglomeration. The Olenogorsk deposits in Primandrovsky district, 5 miles east of Oleneya on the railroad to Murmansk, are reported to average 35 percent iron and 45 percent silica, with low phosphorus and sulfur content. Both magnetite and hematite are present. The Kirivogorsk deposits in the same area are understood to have a greater proportion of magnetite and higher iron content, but analyses are not reported. The titaniferous magnetites in the Pudozhgora district on the west shore of Lake Onega, with 23 to 29 percent iron content, are a possible future source, as are the titaniferous magnetites of the Belimeki district with 30 to 45 percent iron content.

Venezuela.—Exploration and development of iron deposits in eastern Venezuela by mining subsidiaries of the two largest steel companies in the United States continued through 1948.

Development at El Pão by Iron Mines of Venezuela, subsidiary of Bethlehem Steel Corp., progressed to the point where at least small shipments to blast furnaces at Sparrows Point, Md., could be looked for before the end of 1949. Eventual rate from El Pão is forecast [62] at 1,700,000 tons of ore per year. The ore is known to be high-grade hematite carrying some magnetite. The best-quality ore averages close to 69 percent in iron content and is mostly of Bessemer grade with phosphorus content less than 0.045 percent. Mining will be by open-pit methods. Reserves at El Pão have been estimated [63] variously from preliminary work at upwards of 50,000,000 tons, with 68 percent average iron content.[64]

[63] Work cited in footnote 62, p. 118.
[64] Davey, J. C., Venezuela—the Guayana Highlands: Mining Mag. (London), vol. 73, No. 3, September 1945, pp. 137–151.

Rail facilities from the mine to the new river port, Palua, and an ocean-loading installation at Puerto Hierro were described in Minerals Yearbook, 1947 (p. 624) and Minerals Yearbook, 1946 (pp. 1602–1603).

Oliver Iron Mining Co., mining subsidiary of U. S. Steel Corp., has concessions covering, among others, the La Piacoa deposit (formerly known as Colon Mines), near the head of the Orinoco Delta and El Parido (Cerro Bolivar) deposit, south of Ciudad Bolivar. La Piacoa was classed by Davey [65] among the medium-grade deposits of Venezuela in referring to the previous estimate of reserves by Zuloaga and Tello [66] of 600,000,000 tons averaging 45.7 percent iron content. El Parido, at the western extremity of the known iron deposit area of Bolivar State, was discovered in 1948, reportedly, and data are not yet available as to its economic possibilities.

Zuloaga and Tello, from their field work of 1939, cited above, estimated the reserves of the Orinoco iron deposits in northern Bolivar State and the Amacuro Delta Territory to the east to be over 1,000,000,000 tons available above river level. There have been widespread discoveries since this estimate was made. Although known for iron occurrences since 1883, when the Orinoco Iron Co. was formed, and long recognized as a possible major source of open-pit iron ore close to water transportation, large-scale development of the Imataca region was delayed until the inroads of World War II demand on sources close to the steel centers made it apparent that new supplies would be needed within a relatively few years. Up to 1945, according to Davey, only a small part of the area had been prospected. La Represalia, a high-grade deposit reported [67] to contain 7,000,000 tons of 68-percent iron content in the exposed outcrops, was discovered in 1939 a few miles south of the Orinoco River in Delta Territory. Manoa, some 40 miles to the east and similar in grade and reported tonnage, was discovered in 1887 and was a producer, at times, from 1901 to 1913. The Iron Hat deposit, farthest east, was discovered in 1944.

Iron and Steel

By NORWOOD B. MELCHER

GENERAL SUMMARY

THE steel industry in 1948 experienced its highest peacetime market demand. The industry operated at an average rate of 94 percent of capacity during the year, a rate above that for 1945–47 but lower than for any year, 1941–44, inclusive. The lower rate was partly explained, however, by production-capacity increases during 1948 approximating 3 million tons. The 88,640,470 net tons produced was exceeded only in the peak war years 1943–44. Moreover, the conversion loss from ingots to finished steel products was lower than in any previous year; and shipments of steel products, amounting to 65,973,138 net tons, set an all-time high. At no time in 1948 could the steel industry meet the full demand for steel products. The highest rate of steel production was attained during the fourth quarter. There were indications, however, during the latter months of the year that the demand for steel by desperate buyers, apparent in 1947 and early in 1948, was coming to an end. For example, conversion transactions, which prevailed in 1948 and earlier, had declined sharply at the end of the year. Under conversion agreements—a practice undertaken only during severe shortages—consumers buy steel ingots, at prices that early in 1948 reached $100 and more per net ton, and employ a company with rolling facilities only to roll the ingots into desired shapes. During recent experience, this practice cost consumers up to $250 per ton for steel products.

The gray market, where steel products were purchased at prevailing rates and resold at exorbitant prices, became relatively unimportant late in the year.

The automotive industry was the largest single consumer of steel products during 1948, as in 1947. That industry, with a production of 3,909,270 passenger cars and 1,376,155 trucks, used 10.2 million tons of steel products or more than 15 percent of the total consumed during the year. The demand for passenger automobiles during 1948 was phenomenal; and it was impossible, in most instances, for buyers to obtain immediate delivery on any but the highest-priced models. The production performance in 1948 was only slightly less than in the record year 1929. At the close of the year it appeared that the industry would experience this high demand for at least another year and thus would do much to maintain a high steel-production rate in 1949. In view of the easing of requirements for steel in some other industries, the automobile industry undoubtedly will use an even higher proportion of total steel than in 1948. The data on shipments of steel products to the automobile industry as well as those that follow are from the records of the American Iron and Steel Institute. The construction industry obtained more steel, as well as other construction materials, in 1948 than in 1947. This, plus increases in available labor, resulted in a 26-percent greater construction rate (in terms of dollars) and a substantial increase in physical volume. The value of new construction was 17.7 billion dollars during 1948, or 26 percent more than in 1947. This high rate, however, resulted from large construction activity during the first and second quarters of 1948, which were above the similar periods of 1947. After the second quarter of 1948, construction dropped progressively during the rest of the year, and in the fourth quarter it decreased considerably below that which would be expected as a seasonal decline. Many construction materials were available in adequate quantities by the end of 1948, but iron and steel products were still in short supply. Including contractors' products, such as plumbing and heating equipment, the construction industry obtained 9.8 million tons in 1948 or 15 percent of the total shipments. The container industry—the third largest—used slightly more steel in 1948 than in 1947, as did the railroads, the fourth largest consuming industry. Rails represented the largest tonnage of steel used by the railroads, with freight cars second in 1948—a reversal of the use pattern from 1947. The production of freight cars in 1948 totaled 114,204 compared with 80,711 in 1947.

[3] Average annual capacity as of Jan. 1 and July 1.

The first major change in the pricing structure of iron and steel was effected in 1948 in reverting from the multiple basing-point system, which had been in effect since 1924, to the f. o. b. mill price. This change was made as a result of a United States Supreme Court decision in 1948, ordering cement companies to abandon a similar pricing system. In March 1947 the Supreme Court agreed to review the Federal Trade Commission findings that numerous cement producers had conspired to restrict competition by the use of a delivered price system. On April 26, 1948, the Supreme Court ordered the cement companies to cease and desist quoting or selling cement on the multiple-basing-point delivered-price system or to discriminate among customers by charging different mill net prices on orders going to different destinations. The steel industry decided that the cement decision would also apply to it and was prompt in converting to an f. o. b. mill price system. Iron Age [1] pointed out that steel was sold exclusively on an f. o. b. mill basis, before 1880. During that year the Pittsburgh plus system of pricing was first introduced by the Carnegie Steel Co. Under this new system, all steel, regardless of the location of the producing plant, was sold at a price equivalent to the Pittsburgh price plus the equivalent freight rate from Pittsburgh to the point of consumption. This system continued until 1924 when it was outlawed. Thereafter, the multiple-basing-point system was introduced. Under this system, the consumer paid the quoted price at his nearest basing point, plus the equivalent freight rate from that point to his plant. This system continued until July 1948, when the present f. o. b. mill price was accepted by the industry. Many companies, both producers and consumers, dissatisfied with the new pricing system, have requested Congress to enact legislation that would authorize the steel industry to change back to the basing-

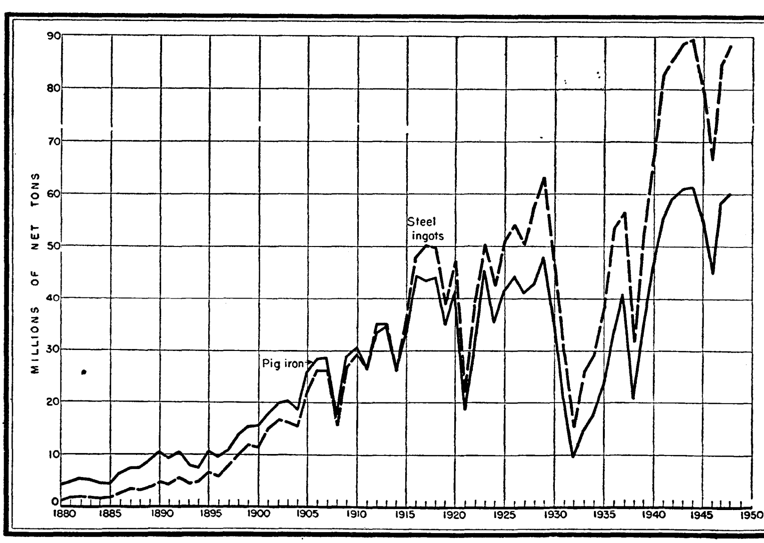

FIGURE 1.—Trends in production of pig iron and steel ingots in the United States, 1880–1948.

[1] Brown, D. I., F. O. B. Mill: Iron Age, vol. 163, No. 1, Jan. 6, 1949, p. 170.

point system. The Senate referred the problem for further study to a subcommittee of its Interstate and Foreign Commerce Committee.

Steel production was restricted somewhat during 1948 by work stoppages, particularly at coal mines, and by shortages of steel scrap. Approximately 1 million tons of steel production were lost owing to work stoppages at coal mines during April and July. Purchased scrap, although being used in record high tonnages throughout 1948, failed to meet total demands; and the composite price, as published by Steel, continued to increase during the year. An all-time high of $43.33 per long ton was reached in August, and this rate continued until October, when a slight decline to $43.25 was recorded; this price continued for the balance of the year. Receipts of iron ore at furnaces were limited by Great Lakes shipping capacity, and manganese ore became increasingly tight during the year. However, no substantial tonnage of steel production was lost owing to shortage of these materials. Imports of iron ore in 1948 were the largest in history.

The steel industry operated on a 40-hour-week basis during 1948, and the average weekly earnings for steel workers increased. Wages in January averaged $60.58 per week and reached a high of $67.02 in October but dropped to $65.73 in December.

PRODUCTION AND SHIPMENTS OF PIG IRON

Domestic production of pig iron, exclusive of ferro-alloys, increased 3 percent over 1947 but was nearly 1 million tons less than in 1944, the record year. Pennsylvania and Ohio retained the same relative position with respect to pig-iron production and for the fourth consecutive year, produced 30 and 21 percent, respectively, of the total. Of the pig iron manufactured in 1948, it is calculated that 2,358,000

Pig iron produced and shipped in the United States, 1947–48, by States

tons, valued at $87,647,000, were made from 4,634,416 tons of foreign ore from Africa, Brazil, Canada, Chile, Cuba, India, Mexico, Palestine, and Sweden. Domestic ore (88,684,594 tons) and sinter (16,139,976 tons) and 8,572,591 tons of miscellaneous materials were reported used in the manufacture of 57,715,140 tons of pig iron. In addition, 1,440,494 tons of home scrap and 142,743 tons of flue dust were consumed in making pig iron in 1948.

Shipments of pig iron increased 3 percent in quantity and 26 percent in value over 1947. The values given in the accompanying table represent the approximate amounts received for the pig iron, f. o. b. furnaces, and do not include freight costs, selling commissions, and other items normally included in market prices for pig iron as published by trade journals.

Pig iron shipped from blast furnaces in the United States, 1947–48, by grades

Grade	1947			1948

All other (not ferro-alloys)	263,586	7,828,458	29.70	139,599	5,625,668	40.30
Total	58,367,510	1,770,658,663	30.34	60,051,350	2,232,121,837	37.17

Metalliferous Materials Used.—The production of pig iron in 1948 required 109,458,986 short tons of iron ore, sinter, and manganiferous iron ore, 3,073,224 tons of mill cinder and roll scale, 3,997,172 tons of open-hearth and Bessemer slag, 1,460,096 tons of purchased scrap, and 42,099 tons of miscellaneous materials—an average of 1.965 tons of metalliferous materials (exclusive of home scrap and flue dust) per ton of pig iron made.

Alabama furnaces used red hematite from the Birmingham district, Alabama; brown ores from Alabama and Georgia; and some hematite from Missouri and the Lake Superior region. Pyrites cinder from Tennessee and Virginia and foreign iron ore from Brazil and Sweden were also used. Domestic manganese-bearing ores were used in addition to foreign material from Africa, Chile, India, and Mexico. Because of the preponderance of relatively low-grade ore used in the Alabama furnaces, the consumption of ore per ton of pig iron is higher than in any other State.

The furnace at Fontana, Calif., used iron ore from the Eagle Mountain and Vulcan mines, California, and from the Excelsior mine, Utah. The manganese ore used came from Mexico.

The iron ore consumed in furnaces at Pueblo, Colo., originated from the Blowout mine, Iron County, Utah, and the Sunrise mine, Platte County, Wyo. Ferruginous manganese ore from the Boston Hill mine, Grant County, N. Mex., was also used.

The blast furnaces at Sparrows Point, Md., used domestic iron ore as well as ore from Africa, Chile, Cuba, and Sweden. Manganiferous ores from Africa, Palestine, and South Africa and domestic ore from the Cuyuna range in Minnesota were used.

Blast furnaces in Illinois, Indiana, Kentucky, Michigan, and Minnesota used Lake Superior iron ore and manganiferous iron ore exclusively. West Virginia furnaces used Lake Superior iron ore from mines in Canada and the United States.

The Everett, Mass., blast furnace used iron ore from Africa and Sweden as well as from the Lake Superior region.

In New York the blast furnaces in the Buffalo district used magnetite from the Mineville district in New York and hematite from the Lake Superior district (United States and Canada) as well as manganiferous ores from Minnesota. The Troy furnace consumed magnetite from the Chateaugay mine at Lyon Mountain, N. Y., and manganese ore from South Africa.

Ohio blast furnaces consumed magnetite sinter from New York and domestic and Canadian hematite from the Lake Superior district.

Most of the ore consumed in western Pennsylvania furnaces came from the Lake Superior district. Furnaces in the eastern part of the State used some Lake ore and some magnetite ore from New Jersey, New York, and Pennsylvania. Eastern Pennsylvania furnaces used iron ore from Africa, Chile, Cuba, and Sweden, and western Pennsylvania used foreign ores from Canada only; small quantities of pyrites cinder (both domestic and foreign) were used at eastern Pennsylvania furnaces.

Texas blast furnaces used brown iron ore from eastern Texas and manganese-bearing ores from both domestic and Mexican sources.

Utah furnaces used semialtered magnetite from the Iron Mountain mine near Cedar City, Utah; some of it was sintered before being used. Manganiferous ores from Nevada and Utah were also employed.

Iron ore and other metallic materials consumed and pig iron produced, 1947–48, by States in net tons

PRODUCTION OF STEEL

Steel production increased 4 percent in 1948 over 1947, while capacity increased 3 percent. Capacity, at the end of 1948, totaled 94,233,460 tons, second only to the peak reached in 1945. Of the total tonnage of steel ingots and castings produced in the United States in 1948, 89 percent was made in open-hearth furnaces compared with 91 percent in 1947. Five percent was made in Bessemer converters as during the previous year, and 6 percent was made in electric furnaces compared with 4 percent in 1947. Included in the electric furnace production is an extremely small quantity of steel made in crucible furnaces, which amounted to only 18 tons in 1947 but was not measured separately in 1948.

In 1948, 89.8 percent of domestic steel output was made in furnaces in the Northeastern district, 4.9 percent in the Southern district, and 5.3 percent in the Western district, compared with 90.3, 4.6, and 5.1 percent, respectively, in 1947.

The data concerning steel production used by the Bureau of Mines are furnished by the American Iron and Steel Institute. The output from steel foundries that do not produce steel ingots is not included in the production data.

Steel capacity, production, and percent of operations, 1944–48, in net tons [1]

[American Iron and Steel Institute]

Year	Annual capacity [2] as of Dec. 31	Production

[2] Includes a very small quantity of crucible steel.

Alloy Steel.—The steel output for 1948 includes 8,481,114 net tons of alloy-steel ingots and castings, which represents 10 percent of the total compared with 9 percent in 1947. This figure includes steels in which the minimum of the range specified, in one or more of the elements named, exceeds the following percentages: Manganese, 1.65 percent; silicon, 0.60 percent; copper, 0.60 percent, or aluminum, boron, chromium, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, and other alloying elements, any percent. The output of alloy steels in 1948 increased 14 percent over 1947, whereas total steel increased only 3 percent. Of the alloy steel produced in 1948, 74 percent was made in basic open-hearth furnaces, 2 percent in acid open-hearths, and 24 percent in electric furnaces and crucibles. None was produced in Bessemer converters.

Electric furnaces produced proportionately less alloy steel in 1948 than in 1947; only 40 percent of the steel made in electric furnaces was alloy compared with 47 percent in the previous year. Typically, steels with higher alloy content are made in electric furnaces and steels with lower content by the open-hearth process.

Alloy-steel ingots and castings manufactured in the United States, 1944–48, by processes, in net tons [1]

Metalliferous Materials Used.—During 1948 steel furnaces used 3,808,155 net tons of domestic iron ore and 1,064,513 tons of foreign ore; the latter originated in Brazil, Canada, Chile, Spanish Morocco, and Sweden. Also used were 1,114,032 tons of sinter made from both foreign and domestic ores. Scrap and pig iron used in steel furnaces in 1948 totaled—99,757,885 net tons. Of this, 52 percent was pig iron, 25 percent home scrap, and 23 percent purchased scrap. Both charge ore and feed ore are employed in the basic open-hearth process. Charge ore is used to add oxygen to the charge before it is melted. This ore should be low in combined and uncombined moisture, silica, and fines. Ore with a high silica content requires large additions of limestone and consequently produces large volumes of slag, which reduces furnace efficiency. Iron-ore sinter has been found to be a good charge ore in open-hearth practice.

Feed ore, which is added to the heat during the working period, should be hard, dense, coarse, and low in moisture. Although moderately high silica ore can be used as feed, it is undesirable as a charge ore because of the large quantity of slag resulting. Lump ore, which is preferred as a feed ore, is high-priced, and the supply is limited. The Vermilion range in Minnesota is the largest single source of this grade in the United States.

Metalliferous materials consumed in steel furnaces in the United States, 1944–48, in net tons

[1] Corrected figure.

CONSUMPTION OF PIG IRON

Consumption of pig iron in 1948 increased 3 percent over 1947. Pig iron, a product of the blast furnace, is a semiraw material; and, except for a small quantity used in direct castings, moves to steel- or iron-melting furnaces for further refining, alone or mixed with other ingredients. In 1948, 87 percent of the pig iron went to steel-making furnaces (open-hearth, Bessemer, and electric) to be processed into steel. Direct castings took 4 percent; and the remaining 9 percent was consumed in iron-making furnaces, of which the cupola is the most important. Gray-iron foundries used 3 percent less pig iron in 1948 than in 1947, but this was 9 percent of total pig iron in 1948, as in 1947.

Consumption of pig iron in the United States, 1945–48, by type of furnace

[1] Less than 0.05 percent.

Plants using pig iron in 1948 were located in all 48 States and in the District of Columbia, but consumption is concentrated largely in the steel-making centers of the North Central, Middle Atlantic, and the Southeastern States. These areas in 1948 used 95 percent of the pig iron; Pennsylvania (the leading consumer) took 29 percent of the total and Ohio (the second largest consumer) 19 percent.

PRICES

The average value of all grades of pig iron given in the accompanying table is compiled from reports of producers to the Bureau of Mines. The figures represent value f. o. b. blast furnaces and do not include the value of ferro-alloys. The general average value for all grades of pig iron at furnaces was $37.17 a net ton in 1948 compared with $30.34 in 1947.

Average value per net ton of pig iron at blast furnaces in the United States, 1944–48, by States

State	1944	1945	1946	1947	1948

FOREIGN TRADE [2]

A resumption of imports of pig iron from European and trans-Pacific sources resulted in a sevenfold increase of imports into the United States during 1948. The largest supplier was Netherlands, followed in order by Belgium-Luxembourg, Australia, Germany, and Norway.

Pig iron imported for consumption in the United States, by countries, 1944–48, in net tons

Imports and exports of iron and steel products are given in detail in the following tables. As in the case of pig iron, exports of most of these commodities were under control in 1948, and dropped sharply in quantity from 1947. Most of the imports of semimanufactures consisted of rolling stock in the form of ingots, blooms and slabs, and plates. Of the manufactures, the bulk of the tonnage consisted of structural shapes. The bulk of the exports consisted of tin plates, black sheet, other plates, and steel bars. In the manufactures the largest tonnage consisted of railroad rails, structural shapes, and tubular products for the petroleum industry.

[1] Revised figure.

WORLD PRODUCTION

World production of steel in 1948 set a peacetime high and ranked third largest on record. The increase over 1947 was due to some extent to an increase in the United States output, but more important were the increases in European as well as Japanese production. German output nearly doubled in 1948 over the previous year and exceeded 6,000,000 tons. Luxembourg increased nearly a million tons, United Kingdom 2,000,000, and Belgium 1,000,000, and substantial increases were reported from the smaller producing nations.

The following table shows pig-iron production from records of the Bureau of Mines and production of steel by most of the important producing nations as compiled by the American Iron and Steel Institute.

World production of pig iron (including ferro-alloys), by countries, 1942–48, in metric tons [1]

[Compiled by Pauline Roberts]

[1] Revised figure.
[2] American, British, and French Zones.
[3] Includes Korea and Manchuria.
[4] Author's note: Total world production was about 170,200,000 tons. This included the following outputs, as reported by the United Nations, in thousands of net tons: Australia 1,360; Brazil 508; India 1,346; Mexico 296; Turkey 109; and Union of South Africa 660. China produced a small unreported quantity.

Belgium.—At the beginning of 1948 Belgium had a total of 38 furnaces in blast.[3]

A strike of Belgian iron and steel workers during June 1948 reduced output of pig iron and steel sharply. Production of pig iron (including ferro-alloys) totaled only 231,000 metric tons in June compared with 320,000 tons in May. Steel ingots and castings decreased from 306,000 tons to 231,000 tons and rolled products from 260,000 tons to 204,000 tons during June. South America continued to be the most important foreign customer for Belgian steel products. However, financial problems restricted shipments; Argentina has large orders with the Belgian iron and steel industry, but reserves of Belgian francs in Argentina were low. Consequently, the fulfilment of orders will depend, to a large extent, on whether a new trade agreement can be concluded by the two countries.[4]

France.—A new company, Sollac, formed by eight French steel concerns, opened negotiations late in 1948 to purchase steel rolling-mill equipment in the United States worth $50,000,000, using ECA funds. The mills were planned to be erected at Hayange and Edange. Included were a blooming mill, a 10-stand, hot-strip mill, a 5-stand cold mill, and a 3-stand, tandem, cold-strip mill.

Germany.—The Governments of the United States, United Kingdom, and France have drawn up a statute establishing an international authority to control the Ruhr. This statute will be effective after ratification by these countries and the three Benelux countries. It will have power to allocate coal, coke, and steel from the Ruhr for German consumption and the export markets.[5]

[3] Metal Bulletin (London), No. 3260, Jan. 23, 1948, p. 12.
[4] Iron & Coal Trades Review, vol. 107, No. 4197, Aug. 20, 1948, p. 430.
[5] Metal Bulletin (London), No. 3354, December 1948, p. 19.

The steel-production rate in Germany at the close of 1948 was approximately 600,000 metric tons per month.

Poland.—Late in 1948 Poland announced a 6-year plan to begin in 1950 with a goal of doubling its prewar steel production.

Southern Rhodesia.—The first iron and steel plant in Southern Rhodesia was opened officially in April 1948 to produce pig iron and in June poured the first ingots from an open-hearth furnace. The plant, known as the Riscom Works (Rhodesian Iron and Steel Commission), is at Que Que, the geographic center of Southern Rhodesia. The blast furnace is small, having a daily capacity of only 75 tons; it is using iron ore produced from an open-pit mine at Que Que and coke which must be hauled 370 miles from Wankie. The iron ore used is a banded hematite said to be unusually low in silica.

Sweden.—The market for Swedish iron and steel attained a record high during 1948. Requirements during much of 1948 averaged 120,000 tons per month—50 percent higher than during the previous period and 33 percent more than the average for the previous 10-year period. A large domestic demand restricted exports greatly, but the steel industry expected that exports to European markets would increase on a barter basis. A shortage of charcoal and scrap in 1948 restricted production somewhat, and a switch from charcoal to coke as a fuel was progressing as rapidly as possible.[6]

Switzerland.—The only blast furnace in Switzerland, at Choindez, was blown in after having been idle for several years. The furnace was constructed in 1846.

U.S.S.R.—The Chelyabinsk Iron and Steel Works, under construction in the Urals during World War II, is reported already to have reached the production goal of the postwar 5-year plan, which ends in 1950. The plant produces electric steel and is said to be working on orders for ball-bearing steel. The second section of its power station began functioning recently, and the third was scheduled to begin operation in May. A new battery of coke ovens was scheduled for operation in future, and plans were being made for constructing an open-hearth furnace.[7]

Under the present 5-year plan Russia has a steel production goal of 25,400,000 tons in 1950.

United Kingdom.—The steel industry in the United Kingdom has not yet been nationalized, but a bill to bring the industry under public ownership was introduced in 1948. The bill covers iron mining, pig-iron smelting, steel production, and hot rolling.

Preliminary construction work was begun late in 1948 to construct a new steel plant at Margram, Wales, to be completed in 1951. The cost of the plant is estimated at the equivalent of $240,000,000; it will have a weekly capacity of 20,000 tons of pig iron and 15,000 tons of steel.[8]

Iron and Steel Scrap

By NORWOOD B. MELCHER AND JAMES E. LARKIN

GENERAL SUMMARY

A RECORD peacetime production of steel ingots and castings in 1948 resulted in a 5-percent increase in the use of ferrous materials (scrap and pig iron) over 1947 to establish an all-time record. In spite of this consumption rate, purchased iron- and steel-scrap stocks were 60-percent higher on December 31 than at the beginning of the year, equivalent to a 55-day supply at the 1948 average daily consumption rate of 88,919 short tons. Consumption of purchased scrap in 1948 established a new record; home-scrap consumption (representing 26-percent of the total melt) was the largest since 1944. Pig-iron consumption during 1948 showed a 3-percent increase over 1947 and reached a peacetime high. Work stoppages in coal mines occurred during March 15 through April 25, 1948, resulting in curtailment of the use of ferrous materials and loss of approximately 1,000,000 tons in steel production during April. During July there was a work stoppage for 9 days at the captive mines, but this did not curtail steel production to a large extent.

The proportions of scrap and pig iron used in 1948 were virtually unchanged from the previous year. The steel-furnace melt comprised 48 percent scrap and 52 percent pig iron during 1948, compared with 47 percent scrap and 53 percent pig iron during 1947. The charge of scrap and pig iron used in iron foundries (mainly cupola furnaces) comprised 67 percent scrap and 33 percent pig iron, compared with 64 and 36 percent, respectively, in 1947.

The continued increase in the use of purchased scrap during the year was effected by a record-breaking monthly consumption (March) and a record monthly average use of 2,700,000 short tons for the year. October and November were the peak steel-producing months, although less purchased scrap was used than in March; 23 percent of the total charge in steel-making furnaces for these months was purchased scrap, compared with 24 percent in March.

Salient statistics of ferrous scrap and pig iron in the United States, 1947–48

	1947 (short tons)	1948 (short tons)	Percent of change from 1947

[1] Includes open-hearth, Bessemer, and electric furnaces.
[2] Includes cupola, air, Brackelsberg, puddling, crucible, and blast furnaces; also direct castings.
[3] Includes rerolling, reforging, copper precipitation, nonferrous, and chemical uses.
[4] Revised figure.
[5] Iron Age.

During November, the Secretary of Commerce appointed a Scrap Drive Committee to assist the Office of Industry Cooperation in its efforts to increase the flow of ferrous scrap from industry, farms, and auto-wrecking yards to mills and foundries through a Nation-wide industrial iron- and steel-scrap drive. The committee was composed of leading trade-association executives representing industries that are potential sources of large quantities of obsolete iron and steel machinery and equipment. Unlike wartime scrap drives, this iron and steel drive did not extend to the Nation's households. Emphasis was placed on high-grade heavy scrap in the form of heavy pieces, such as obsolete industrial equipment, old tractors and plows, and junked automobiles.

An Industry-Government Scrap Mission to Germany, headed by John L. Haynes, Department of Commerce, made a study in Germany of potential scrap supplies there from December 30, 1947, to February 26, 1948, and recommended that "the collection, processing, and export of this material should be pursued under Military Government directives." This mission found that by far the largest scrap supply in Germany and the most difficult to assess in quantitative terms is rubble scrap. Estimates, not made by the mission but included in its report, placed rubble scrap at 3,000,000 to 10,000,000 tons, of which the most readily accessible portion is railway, bridge, and industrial type. The gathering of rubble scrap, however, was considered extremely difficult because of the problems involved in identifying or locating owners and then inducing them to sell, owing to the fact that the returns paid in reichsmarks had very little value. The mission also reported that dealers' yards contained large tonnages of unprepared scrap, but they were unable to prepare and ship more than 50,000 to 70,000 tons per month, because of currency and price problems, and inadequacy or bad state of repair of dealers' equipment.

Robert W. Wolcott, president, Lukens Steel Co., at the request of the Secretary of Commerce studied the German scrap market from June 29 to July 29, 1948, and upon his return said "there was enough scrap in Germany to support an extensive export program as well as to supply the needs of the German steel industry." He stated further that "a lack of understanding between the American and British Military Governors on several important points is one retardant to the immediate exportation of scrap from Germany." These points were the proper percentages of scrap that should go to the United States, consideration of future allocations, the definition of booty scrap, and the proper prices for scrap export sales. Upon settlement of these points there could be a substantial flow of scrap from Germany to the United States. Plans made to establish a private corporation under Government sponsorship to serve as a single buying agency for German scrap were abandoned in November.

Imports of iron and steel scrap in 1948 totaled 415,072 short tons, of which 179,725 short tons originated in Germany.

CONSUMPTION

A continued large use of scrap as compared with that of pig iron was noticeable in the New England, Southwestern, and Pacific Coast districts in 1948. These districts together, as in 1947, used 7 percent of the total scrap consumed in the United States but only 2 percent of the pig iron. The average ratio of scrap to pig iron in these three districts was 3.8:1, whereas for the United States at large it was 1.1:1.

Open-hearth furnaces are by far the largest consumers of ferrous scrap and pig iron. The proportions of the total scrap and pig-iron supply used in open-hearth furnaces have remained relatively constant, although considerably less purchased scrap was used in 1948 than previously; open-hearth consumption accounted for 63 percent of the total scrap in 1948, 65 percent in 1947, and 66 percent in 1946; 68 percent of the home scrap in 1948 and 69 percent in both 1947 and 1946; and 57 percent of the purchased scrap in 1948, 60 percent in 1947, and 61 percent in 1946. Pig-iron consumption in open hearths accounted for 79 percent of the total pig iron consumed in 1948 and 78 percent in 1947.

Cupola-furnace consumption in 1948 was as follows: Home scrap, 16 percent of the total, compared with 17 percent in both 1947 and 1946; purchased scrap, 19 percent compared with 18 percent in both 1947 and 1946; pig iron, 9 percent in both 1948 and 1947 compared with 10 percent in 1946.

Bessemer converters consumed 8 percent of the pig iron for the past 3 years compared with 9 percent in 1945 and 1944, and 0.4 percent of the scrap in both 1948 and 1947 compared with 0.5 percent in 1946.

Electric furnaces consumed 10 percent of the total scrap compared with 9 percent in 1947 and 7 percent in 1946, and 0.2 percent of the pig iron in both 1948 and 1947 compared with 0.3 percent in 1946.

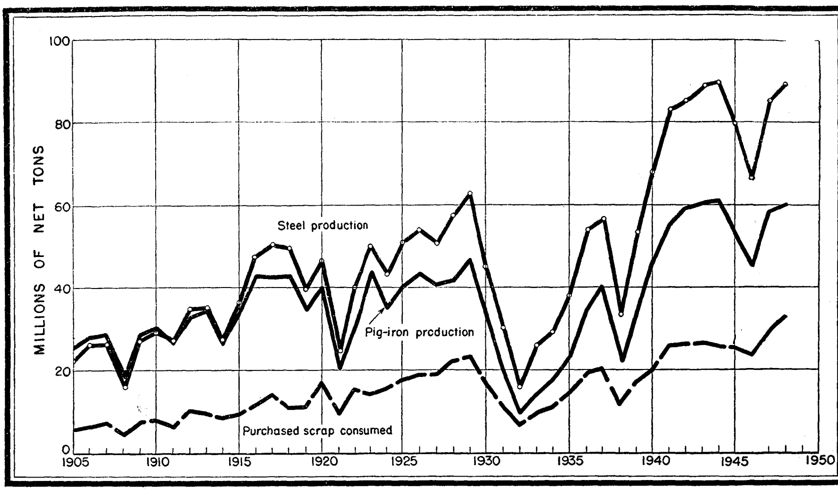

FIGURE 1.—Consumption of purchased scrap and output of pig iron and steel in the United States, 1905–48. Figures on consumption of purchased scrap for 1905–32 are from State of Minnesota vs. Oliver Iron Mining Co., et al., Exhibits, vol. 5, 1935, p. 328; those for 1933–34 are estimated by authors; and those for 1935–48 are based on Bureau of Mines reports. Data on output of steel are as given by the American Iron and Steel Institute.

Ferrous scrap and pig iron consumed in the United States and percent of total derived from home scrap, purchased scrap, and pig iron, 1947–48, by districts

District	1947					1948

[1] Where 2 or more separate departments, such as blast furnace, open hearth, foundry, etc., are situated at the same place and are operated by 1 establishment, each department is counted as 1 plant.

CONSUMPTION BY DISTRICTS AND STATES

During 1948 iron and steel scrap and pig iron were used in all 48 States and the District of Columbia; none was used in Alaska. As in 1947, the largest consuming districts were the North Central, Middle Atlantic, and Southeastern. All districts increased over 1947 in total scrap; pig iron increased in all districts except New England and the Pacific Coast. The States having the largest consumption of scrap, with the percentage consumed, were: Pennsylvania 24, Ohio 18, Illinois 10, Indiana 9, Michigan-Wisconsin 8, New York 5, Alabama 4, Maryland 3, and California 3. This order is unchanged from 1947.

Consumption of ferrous scrap and pig iron in the United States, 1944–48, by districts

CONSUMPTION BY TYPE OF FURNACE

Open-Hearth Furnaces.—Ferrous scrap and pig-iron consumption in open-hearth furnaces in 1948 totaled 87,890,481 short tons, an increase of 4 percent over 1947. This was the greatest quantity consumed in open-hearth furnaces during peacetime and has been exceeded only by 1944, a war year, when 89,089,225 short tons were used. The use of home scrap increased 2 percent, purchased scrap 5 percent, total scrap 3 percent, and pig iron 4 percent. The open-hearth furnace melt in 1948 consisted of 46 percent scrap and 54 percent pig iron, unchanged from 1947. Of the total scrap consumed, 46 percent was purchased compared with 45 percent in 1947 and 44 percent in 1946.

Pennsylvania again led in the use of scrap in the open hearth in 1948, followed in order by Ohio, Indiana, and Illinois; this rank has remained unchanged since 1936. In 1935, the first year data were compiled on iron and steel scrap, Ohio consumed the largest quantity, followed by Pennsylvania, Indiana, and Illinois.

Bessemer Converters.—The 5,029,587 short tons of ferrous raw materials used in Bessemer converters in 1948 exceeded the use of these materials in this type of furnace during any previous peacetime year and represent a 1-percent increase over 1947. The proportion of scrap in the metal charges was 1 : 20, and of the scrap used, 79 percent was home scrap.

Following the usual pattern, Pennsylvania was the principal consumer of converter scrap in 1948.

Electric Steel Furnaces.—The total melt of ferrous scrap and pig iron used in electric furnaces in 1948 amounted to 6,837,817 short tons, an increase of 28 percent over the 5,351,699 tons used in 1947 and the largest quantity used in a peacetime year, exceeded only by the 7,308,240 tons used in 1943. The use of scrap increased in all districts and of pig iron in all except Middle Atlantic and New England.

Cupolas.—Preliminary figures released by the Bureau of the Census, United States Department of Commerce, indicate that shipments of gray iron castings in 1948 exceeded 1947 by 2 percent. Accordingly, requirements for scrap and pig-iron cupola consumption increased in 1948 as in 1947. Scrap consumption in cupolas totaled 11,467,007 short tons, setting a new record for consumption in this type of furnace during any year since the beginning of the collection of these data by the Bureau of Mines in 1935. Cupola furnaces used 16,747,964 short tons (a record high) of scrap and pig iron, a 5-percent increase over the 15,996,366 tons used in 1947. The use of home scrap increased 2 percent, purchased scrap 16 percent, and total scrap 9 percent; pig iron decreased 3 percent.

Charges to cupolas consisted of 32 percent home scrap, 37 percent purchased scrap, and 31 percent pig iron compared with 33 percent for both home and purchased and 34 percent for pig iron in 1947.

As in 1947, Michigan continued to be the largest consumer of cupola scrap, followed in order by Ohio, Illinois, Pennsylvania, Alabama, Indiana, Wisconsin, New York, and New Jersey.

[1] Some scrap and pig iron consumed during 1947 in California, Illinois, Kentucky, Maryland, New Jersey, Ohio, and Pennsylvania—not separable—are included with "Undistributed."

Air Furnaces.—Scrap and pig iron consumed in air furnaces (including 2 Brackelsbergs) in 1948 amounted to 1,748,978 short tons, an increase of 1 percent over the 1,724,004 tons melted in these furnaces in 1947. The use of home scrap increased 2 percent and of purchased scrap 13 percent; pig iron decreased 11 percent.

There was no change in the position of the principal consuming States; Ohio led in the use of scrap in air furnaces, followed in order by Illinois, Pennsylvania, Indiana, Michigan, Wisconsin, and New York.

[1] Includes 2 Brackelsberg furnaces, 1 each in Indiana and Ohio.

Crucible and Puddling Furnaces.—Crucible furnaces used 1,329 short tons of scrap and 1,013 tons of pig iron in 1948 compared with 2,265 and 1,312 tons, respectively, in 1947. Puddling furnaces used 19,781 tons of scrap and pig iron, a decrease of 2 percent from 1947. Of the total puddling-furnace melt in 1948, 4,802 tons were scrap compared with 3,691 tons during the previous year. The bulk of the scrap and pig iron consumed in puddling furnaces was in Pennsylvania.

[1] Included with total for United States.

Blast Furnaces.—Materials other than scrap constitute by far the largest proportion of the blast-furnace charge and in 1948 consisted of 109,458,986 short tons of iron ore, sinter, and manganiferous ores; 3,073,224 tons of mill cinder and roll scale; 3,997,172 tons of open-hearth and Bessemer slag; and 42,099 tons of miscellaneous materials.

Total consumption of scrap in 1948 by 74 plants operating blast furnaces was 2,931,508 short tons, a 9-percent increase over 1947. The scrap charged to blast furnaces was 49 percent home and 51 percent purchased, compared with 52 and 48 percent, respectively, in 1947 and 51 and 49 percent, respectively, in 1946. The proportion of scrap used to pig iron produced was 4.9 percent compared with 4.6 percent in 1947; home scrap 2.4 percent and purchased scrap 2.5 percent in 1948.

USE OF SCRAP IN FERRO-ALLOY PRODUCTION

The production of ferro-alloys (by other than blast furnaces) in 1948 consumed 351,926 short tons of scrap, an 11-percent increase over 1947. Of this total, 471 tons were used in the aluminothermic process and the balance in electric furnaces. Scrap used in blast furnaces in the manufacture of ferro-alloys is included in this chapter with blast furnaces. Purchased scrap accounted for 97 percent of the quantity used and home scrap 3 percent; in 1947 the percentages were the same.

Eighteen ferro-alloy plants used ferrous scrap in 1948 compared with 19 in 1947. Of these plants, 17 operated electric furnaces. One of this group employed both the electric and aluminothermic process, and one additional plant used the aluminothermic process only.

Consumption of ferrous scrap by ferro-alloy producers in the United States in 1948, by districts and States, in short tons

MISCELLANEOUS USES

Scrap consumed in 1948 for miscellaneous purposes, such as rerolling, nonferrous metallurgy, and as a chemical agent, remained at slightly less than 2 percent of the total consumption. This percentage has been unchanged for the past 4 years. The quantity so used—1,246,228 short tons—was an increase of 4 percent over that used for these purposes in 1947. Of the quantity used, 95 percent was purchased and 5 percent home scrap.

[1] In addition, 90 tons and 5 tons of pig iron were consumed in miscellaneous uses in Montana and Ohio, respectively, during 1948.

STOCKS

Complete iron- and steel-scrap stock figures covering 1948 year-end stocks are not available; producers (railroads and manufacturers) were not canvassed. Dealers and automobile wreckers reporting to the Bureau of Mines had 193,108 short tons of materials on hand December 31, 1948, compared with 228,614 short tons at the end of 1947, a decrease of 35,506 short tons or 16 percent. Shipbreakers reported having 34,368 short tons of material on hand December 31, 1948. Total stocks of iron and steel scrap on hand December 31, 1948 (exclusive of producers), totaled 6,685,612 short tons compared with 4,810,984 short tons on December 31, 1947, an increase of 1,874,628 short tons.

The increase in total stocks in 1948 reflected the 60-percent increase in consumers' stocks of purchased scrap. Home scrap stocks increased from 1,400,719 short tons on December 31, 1947, to 1,598,673 short tons on December 31, 1948.

Consumers' Stocks.—Consumers' stocks of home and purchased iron and steel scrap on December 31, 1948, totaled 6,458,136 short tons—an increase of 2,027,196 short tons or 46 percent from the beginning of the year. Stocks of home scrap (1,598,673 tons) increased 14 percent, and purchased scrap (4,859,463 tons) increased 60 percent. Stocks of pig iron on December 31, 1948, amounted to 1,606,160 short tons, an increase of 62 percent over the 988,435 short tons on hand December 31, 1947.

[1] Some scrap and pig-iron stocks on Dec. 31, 1947, in California, Illinois, Kentucky, Maryland, New Jersey, Ohio, and Pennsylvania—not separable—are included with "Undistributed."

Suppliers' Stocks.—Stocks of iron and steel scrap in the hands of dealers (188,746 tons) and automobile wreckers (4,362 tons) totaled 193,108 short tons on December 31, 1948, compared with 228,614 tons on December 31, 1947—a drop of 16 percent. Stocks held by shipbreakers amounted to 3,244 short tons on December 31, 1948.

PRICES

The prices of iron and steel scrap continued to rise during 1948, despite industry efforts to curb the upward trend through a strong buyers' resistance during early months of the year. No. 1 Cast scrap at Chicago was selling at $68.00 per gross ton during January 1948, an increase of $24.62 per ton over January 1947; a peak price of $74.30 per ton was reached during August 1948. No. 1 Heavy-Melting steel at Pittsburgh and Chicago was quoted by Iron Age at $42.75 and $41.75 per gross ton, respectively, from August through December.

The previous high at Pittsburgh was $41.88 in November 1947, and at Chicago, $40.50 in October 1947. However, steel production continued at a rate of more than 7,000,000 short tons per month throughout the year, with the exception of February and April, and at the end of the year the scrap market appeared stronger than it had for some months. Shipments were moving in large tonnages, and mills were buying all the scrap offered at the current higher price levels.

FOREIGN TRADE [1]

Imports.—Imports of iron and steel scrap in 1948 increased 11-fold in quantity (415,072 short tons compared with 36,191 tons in 1947) and 16-fold in value ($10,453,480 compared with $668,790 in 1947). Of the 1947 imports, 179,725 tons came from Germany, 65,856 tons from Japan, 38,804 tons from the Netherlands, 31,567 tons from Cuba, and the remainder from other countries. In addition, 46,014 tons of tin-plate scrap were imported in 1948 compared with 34,492 tons in 1947, mostly from Canada.

Exports.—Exports of ferrous scrap from the United States in 1948 were 242,025 short tons valued at $12,515,668, a 25-percent increase in tonnage over 1947 and a 27-percent increase in value. Imports exceeded exports by 209,751 short tons (not counting 46,014 tons of imported tin-plate scrap). The tonnage exported amounted to 7 percent of the 5-year prewar average (for 1935–39) of 3,298,326 tons a year, compared with 6 percent during 1947. The 1948 exports included 36,704 tons of tin-plate scrap, circles, strips, cobbles, waste-waste, and terneplate clippings and scrap valued at $5,829,476. The same materials in 1947 amounted to 29,805 tons valued at $5,574,243. The accompanying table shows the principal countries to which scrap was exported during the period 1944–48.

Ferrous scrap exported from the United States, by countries, 1944–48, in short tons

Lead[1]

By RICHARD H. MOTE AND EDITH E. DEN HARTOG

GENERAL SUMMARY

ACCENTUATED by the threat of possible lead shortages resulting from unpredictable work stoppages, an accelerated program of defense construction, and Government requirements for the strategic stock pile, consumer demand for lead remained high throughout 1948. As a result, the market quotation for lead advanced three times during the year to establish new record highs, and a sellers' market continued to prevail within the industry. With elimination of a 30,000-ton potential gain in domestic mine production in 1948 through work stoppages in certain mining areas which in turn limited domestic refinery output, there was increasing demand for lead from secondary and foreign sources. Recovery from secondary sources remained above 500,000 tons and surpassed domestic mine output for the third successive year. Total imports of lead were 52 percent greater in 1948 than in 1947 owing in part to the desire for American dollars abroad and to the suspension of lead import duties beginning July 1, 1948.

The total consumption of primary, antimonial, and secondary lead in the United States in 1948 was 1,115,995 tons. Lead stocks (physical inventory) at primary smelters and refineries rose 113 percent during 1948, and consumers' inventories at the end of the year were 30 percent greater than on January 1.

Government regulations requiring a license for the exportation of pig lead and lead semimanufactures remained operative throughout the year.

[1] This report deals primarily with the smelting, refining, and consuming phases of the industry. For details of mining operations, see various State chapters of this volume.

Salient statistics of the lead industry in the United States, 1939–43 (average) and 1944–48, in short tons

	1939–43 (average)	1944	1945	1946	1947	1948
Production of refined primary lead:						
From domestic ores and base bullion	439,692	394,443	356,535	293,309	381,109	339,413

[2] Revised figures.
[3] Includes less than 1 ton of foreign lead reexported in 1944, 377 tons in 1945, 103 tons in 1946, 102 tons in 1947, and none in 1948, according to records of the U. S. Department of Commerce.
[4] Figure not available.

DOMESTIC PRODUCTION

Statistics on lead output may be prepared on a mine or smelter and refinery basis. The mine-production data compiled on the basis of lead content in ore and concentrates and adjusted to account for average losses in smelting are the most pertinent measure of production from year to year. The pig-lead output, as reported by smelters and refiners, presents a more precise figure of actual lead recovery but generally differs from the mine figure owing to the lag between mine shipments and smelter consumption of ore and concentrates. These inequities, however, tend to balance over a period of years.

MINE PRODUCTION

Despite a continued high industrial demand for lead and an all-time high-record market price, domestic mine output of recoverable lead (including that made into pigments) in 1948 increased less than 2 percent over 1947. Work stoppages due to labor-management disputes curtailed lead outputs in certain areas and were the greatest single factor to impêde the obtaining of greater supplies from domestic mines in 1948. The work stoppage which shut down the St. Joseph Lead Co. mines, mills, and smelter in southeastern Missouri for 11 weeks was estimated to have been responsible for the loss of 25,000 tons of lead production. Work stoppages during the year curtailed lead outputs in other areas, notably the Tri-State district and northeastern Washington.

Of the total lead produced at United States mines in 1948, 63 percent came from the output of 25 properties. Missouri continued to rank first among the States in the production of lead, and the Southeastern Missouri district continued to be the largest lead-producing area, supplying 26 percent of the total domestic output. The St. Joseph Lead Co., as in the past, produced the bulk of the output from its Bonne Terre, Desloge, Federal, and Leadwood mine groups in St. Francois County and the Mine La Motte mine in Madison County. Each mine is equipped with a mill; the five have a combined daily capacity of about 24,000 tons. In the Tri-State district the production of lead concentrates, stimulated by the record high price, increased 11 percent over 1948 despite the loss of operating time caused by a labor strike in July and August. The Tri-State area produced 7 percent of the total domestic output in 1948 compared with 6 percent in 1947.

The combined Western States contributed 65 percent of the total domestic production and recorded a 14-percent gain over 1947. Idaho was again the largest producer of lead in the Western States and second only to Missouri in the United States. In 1948, 93 percent of the State total lead came from the Coeur d'Alene region. Six properties in Idaho produced 60 percent of the State total lead, and of the total more than 77 percent came from zinc-lead ore and old tailings. Lead production in Utah in 1948 responded strongly to the record high market price of lead, and the State output rose to the highest level since 1943. The United States & Lark property of the United States Smelting, Refining & Mining Co. in the West Mountain (Bingham) district remained first among the State lead producers. Of the State total lead in 1948, 88 percent was recovered from zinc-lead ore. Uninterrupted operation of lead and zinc-lead mines in Arizona in 1948 resulted in an output of 29,899 short tons of recoverable lead, the largest in the history of the State, and 5 percent greater than the previous record production in 1947. The Copper Queen mine of the Phelps Dodge Corp. at Bisbee continued to be the largest Arizona lead producer in 1948; about 90 percent of the State total lead was recovered from zinc-lead ore. In Colorado the value of lead recovered from ores in 1948 was higher than in any previous year and exceeded that of gold for the first time since 1891. In quantity the mine production of lead increased 34 percent over 1947 and was the largest since 1928. The leading producer in the State in 1948 was the American Smelting & Refining Co. Kokomo unit in Summit County. Zinc-lead ore yielded 63 percent of the State total lead during the year. Lead production in Montana gained 14 percent over 1947 and was the largest yearly output since 1942. The four leading producers, which contributed 84 percent of the State total in 1948, were the Butte Hill mine and dumps, the Emma, Mike Horse, and Jack Waite mines. Of the Montana total output of lead in 1948, 89 percent was recovered from zinc-lead ore.

Mine production of recoverable lead in the United States, 1939–43 (average) and 1944–48, by States, in short tons

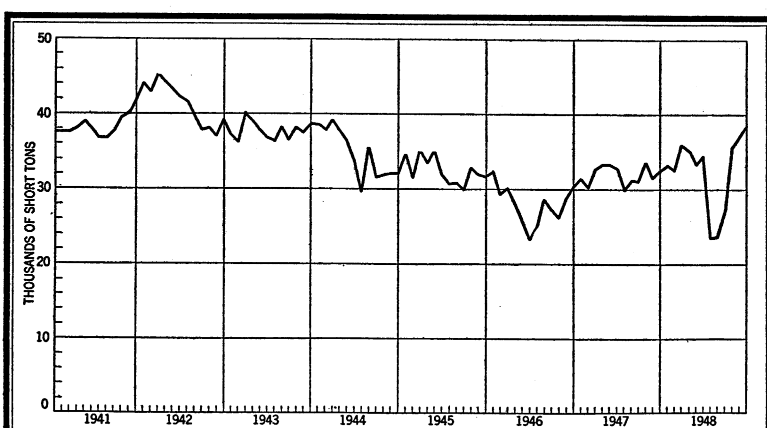

FIGURE 1.—Mine production of recoverable lead in the United States, 1941–48, by months.

The 25 leading lead-producing mines in the United States in 1948, listed in the following table, yielded 63 percent of the total domestic lead output; the 10 leading mines produced 45 percent, and the 4 leading mines 31 percent.

Detailed information on the production of mines and districts in the United States may be found in the chapters of this volume dealing with the mine production of gold, silver, copper, lead, and zinc in the various States.

Twenty-five leading lead-producing mines in the United States in 1948, in order of output

Rank	Mine	District	State	Operator	Type of ore

SMELTER AND REFINERY PRODUCTION

Pig lead in the United States is derived from three main sources—domestic mine production, imports of foreign ore and base bullion, and secondary smelter output from scrap material—and is produced at primary plants that treat ore, base bullion, and small quantities of scrap and at secondary plants that process scrap exclusively. Of the eight primary smelters operating in the Western States, only two (Selby, Calif., and Bradley, Idaho) produce refined merchant lead. The other six plants produce only base bullion (containing approximately 98 percent lead plus gold, silver, and small quantities of impurities recovered from the ore smelted), which is shipped to refineries in the Middle Western and Eastern States for recovery of the gold and silver and purification of the lead to meet commercial requirements. Both primary and secondary smelting plants may make refined lead or antimonial lead. Because of the large quantity of hard lead—such as battery scrap—melted at secondary smelters, the output from this type of operation is essentially antimonial lead alloys. Statistics on the production of refined lead and alloys at secondary plants are given in the Secondary Lead section of this chapter. The 14 primary smelters and refineries in operation in the United States in 1948 consumed 432,543 short tons (lead content) of ore and concentrates, 16 percent of which was of foreign origin, compared with 448,703 tons in 1947, 14 percent of which was foreign.

ACTIVE LEAD SMELTERS AND REFINERIES

Primary lead smelters and refineries operating in the United States in 1948 were as follows:

California: Selby—Selby plant, American Smelting & Refining Co. (smelter and refinery).
Colorado: Leadville—Arkansas Valley plant, American Smelting & Refining Co. (smelter).
Idaho: Bradley—Bunker Hill Smelter, Bunker Hill & Sullivan Mining & Concentrating Co. (smelter and refinery).
Illinois: Alton—Federal plant, American Smelting & Refining Co. (smelter and refinery).
Indiana: East Chicago—U. S. S. Lead Refinery, Inc. (refinery).
Kansas: Galena—Galena plant, Eagle-Picher Co. (smelter and refinery).
Missouri: Herculaneum—Herculaneum plant, St. Joseph Lead Co. (smelter and refinery).
Montana: East Helena—East Helena plant, American Smelting & Refining Co. (smelter).
Nebraska: Omaha—Omaha plant, American Smelting & Refining Co. (refinery).
New Jersey: Barber—Perth Amboy plant, American Smelting & Refining Co. (smelter and refinery).
Texas: El Paso—El Paso plant, American Smelting & Refining Co. (smelter).
Utah:
- Midvale—Midvale plant, United States Smelting, Refining & Mining Co. (smelter).
- Murray—Murray plant, American Smelting & Refining Co. (smelter).
- Tooele—Tooele plant, International Smelting & Refining Co. (smelter).

REFINED LEAD

Primary refineries in the United States in 1948 produced 411,646 short tons of refined lead, a decline of 10 percent from the 1947 output of 456,672 tons.

Of the 406,694 tons of primary lead produced in 1948, domestic ores and base bullion supplied 83 percent and foreign ores and imported base bullion 17 percent. In 1947 the origin was 86 percent domestic and 14 percent foreign. The quantity of refined lead produced from foreign base bullion, which has been negligible since 1942, advanced over one hundredfold in 1948. The following tables give the production of refined lead by sources and by country of origin of the ore. Details of the sources of lead from domestic ores are given in the Mine Production section of this chapter.

Refined lead produced at primary refineries in the United States, by sources, 1944–48, in short tons

Source	1944	1945	1946	1947	1948
Refined lead:					
From domestic ores and base bullion	394,443	356,535	293,309	381,109	339,413
From foreign ores	70,225	86,932	44,790	59,838	60,829

ANTIMONIAL LEAD

Antimonial lead output at primary refineries in 1948 reached the highest level in history as production advanced 17 percent over 1947. Distribution of the lead according to source is shown in the following table. The average antimony content of antimonial lead produced in 1948 remained unchanged from 1947 at 5.7 percent. Although antimonial lead is an important byproduct of the refining of base bullion, the quantity derived from this source is only a small part of the annual domestic output. The major production is recovered from the smelting of antimonial lead scrap at secondary smelters. Production data from lead-smelting plants treating scrap materials exclusively are summarized in the following section and discussed in detail in the Secondary Metals—Nonferrous chapter of this volume.

Antimonial lead produced at primary lead refineries in the United States, 1944–48

Year	Production (short tons)	Antimony content		Lead content by difference (short tons)			
		Short tons	Percent	From domestic ore	From foreign ore	From scrap	Total
1944	57,902	4,670	8.1	13,280	5,477	34,475	53,232
1945	56,495	4,148	7.3	7,286	2,695	42,366	52,347
1946	50,480	3,285	6.5	11,196	2,149	33,850	47,195
1947	86,075	4,933	5.7	14,836	9,850	56,456	81,142
1948	100,764	5,760	5.7	29,561	15,918	49,525	95,004

SECONDARY LEAD

Some scrap lead is treated at primary smelters and refineries, but the greater part is received at a large number of plants that treat secondary materials exclusively. Secondary lead is recovered in the form of refined lead, antimonial lead, and other alloys. Recovery at primary and other plants in 1944–48 is shown in the following table. Secondary lead recovery in 1948 exceeded the total domestic refined primary lead production by 23 percent and surpassed the domestic mine output of recoverable lead for the third successive year. Further details appear in the Secondary Metals—Nonferrous chapter of this volume.

Secondary lead recovered in the United States, 1944–48, in short tons

	1944	1945	1946	1947	1948
As refined metal:					
At primary plants	11,368	18,525	8,013	15,662	4,952
At other plants	43,678	42,598	65,691	95,843	126,951

LEAD PIGMENTS

The principal lead pigments are litharge, white lead, red lead, sublimed lead, leaded zinc oxide, and orange mineral. These products are manufactured for the most part from metal, but some ore and concentrates are converted directly to pigments. Details of the production of lead pigments are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

CONSUMPTION AND USES

Domestic lead consumption (including lead in lead ore used directly in the manufacture of lead pigments and salts) totaled 1,133,895 short tons in 1948. Of the total consumed, 680,516 tons were refined soft lead, 280,952 tons antimonial lead, 55,426 tons unmelted white scrap, 52,719 tons percentage metals, 21,897 tons copper-base scrap, 24,485 tons drosses and residues, and 17,900 tons from lead ores used directly in the manufacture of lead compounds. During the year 77 percent of the total lead consumed was used in the manufacture of metal products. Production of the three largest lead-consuming items—batteries, cable covering, and tetraethyl fluid—used nearly 53 percent of all the lead consumed in 1948. Batteries took 31 percent of the total, cable covering 15 percent, and tetraethyl fluid 7 percent.

Consumption of lead in the United States in 1948

	Short tons

[1] Excludes 17,900 tons of lead contained in leaded zinc oxide.

STOCKS

Producers' Stocks.—Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in the following table. Stocks of refined and antimonial lead include metal held by all primary refiners and by some of the refiners of secondary material who produce soft lead. According to monthly reports released by the American Bureau of Metal Statistics, stocks of refined lead and antimonial lead declined in the first quarter of the year to a low of 14,837 tons at the end of March. Inventories gained sharply to 19,453 tons during April and continued to advance through May and June. Stocks on

Lead stocks at end of year at smelters and refineries in the United States, 1944–48, in short tons

[American Bureau of Metal Statistics]

	1944	1945	1946	1947	1948
Refined pig lead	15,602	37,584	40,870	13,634	29,050
Antimonial lead	3,934	7,283	6,717	7,694	9,594
Total	19,536	44,867	47,587	21,328	38,644
Lead in base bullion—					
At smelters and refineries	7,333	8,618	8,453	7,652	9,697
In transit to refineries	3,331	4,889	4,911	5,447	4,101
In process at refineries	14,473	15,097	16,042	16,328	17,939
Total	25,137	28,604	29,406	29,427	31,737
Lead in ore and matte and in process at smelters	80,461	89,462	111,836	77,199	76,373
Grand total	125,134	162,933	188,829	127,954	146,754

July 1 totaled 23,246 tons, declined slightly during the month, and dropped sharply in August to 18,971 tons on September 1. During the remainder of the year the inventories advanced steadily to the peak 1948 level of 38,644 tons—a net gain of 81 percent from January 1.

The Bureau of Mines annual survey of primary lead smelters and refiners indicated stocks of 13,634 tons (lead content) of refined lead at plants on January 1, 1948, and 29,048 tons on December 31, 1948. Primary antimonial lead stocks at these same plants increased from 7,009 short tons (lead content) at the beginning of 1948 to 9,258 tons at the end of the year. In terms of lead content, stocks of ore at the 14 operating smelters and refineries decreased 5 percent—from 46,313 tons to 44,038 tons during the same period. The inventory of base bullion at refineries that receive base bullion as a raw material and at smelters that produce base bullion for shipment to refineries totaled 4,912 tons at the beginning of January and 4,290 tons at the end of December 1948. Stocks of in-process base bullion or work lead at five combination smelter-refinery plants are not included in reports to the Bureau of Mines. No direct comparison can be made between these data and the figures of the American Bureau of Metal Statistics. Figures reported to the Bureau of Mines represent physical inventory at the plants, irrespective of ownership, and do not include material in process or in transit.

Consumers' Stocks.—Consumers' stocks of lead gained 30 percent during 1948. Inventories of refined lead and antimonial lead increased 20 percent and 57 percent, respectively, from the levels prevailing at the first of the year. Total stocks, which on January 1, 1948, were 91,344 tons, dropped to 80,897 tons by January 30 but showed a general upward trend thereafter and reached 119,198 tons on December 31, the highest point of the year.

Reconstruction Finance Corporation Stocks.—Refined-lead stocks (mostly corroding grade) of 4,996 short tons held by the RFC on January 1, 1948, were transferred during the year to the Treasury Department, Bureau of Federal Supply.

Consumers' stocks of lead at the end of 1947 and 1948, by types of materials, in short tons

Date	Refined soft lead	Antimonial lead	Unmelted white scrap	Percentage metals	Copper-base scrap	Drosses, residues, etc.	Total
Dec. 31, 1947	51,619	22,402	3,514	6,247	1,938	5,624	91,344
Dec. 31, 1948	62,077	35,088	4,828	7,932	2,301	6,972	119,198

PRICES

The two major markets for lead in the United States are New York and St. Louis; much of the lead produced domestically is sold at prices normally based upon quotations in these markets. Since suspension of trading on the London Metal Exchange in September 1939, the London market has had no direct influence on New York quotations, and the differential between St. Louis and New York prices has remained 0.2 cent a pound, an amount approximating the freight charges between the two points.

The market price for common lead, New York, was quoted at

$0.15 per pound until April 5, when the price advanced to $0.175. Continued heavy demands for lead from consumers and sales of foreign metal at premiums reportedly as high as 5 cents a pound resulted in a further advance on July 28 to $0.195 per pound. An additional increase on November 1 raised the quotation to an all-time record of $0.215 per pound at which level it remained the balance of the year.

The official London maximum price of £90 per long ton, duty paid, for Empire and foreign soft lead, fixed by the British Ministry of Supply March 31, 1947, was advanced to £112 on October 1, 1948, but remained unchanged the remainder of the year. Quotations of the London Metal Exchange, discontinued at the outbreak of the war in September 1939, were not resumed during 1948.

Average monthly and yearly quoted prices of lead at St. Louis, New York, and London, 1946–48, in cents per pound [1]

Month	1946			1947			1948

[2] Average price of foreign lead, converted to cents per pound with the pound sterling at $4.02½. Official maximum price raised on June 11, 1945; Jan. 15, 1946; Apr. 8, 1946; July 1, 1946; Jan. 1, 1947; Mar. 31, 1947; and October 1, 1948.

FOREIGN TRADE [2]

Tariff.—The import duty set by the Tariff Act of 1930 on lead-bearing ores, flue dust, and mattes (lead content) was 1½ cents per pound, and on lead bullion, pigs, bars, scrap lead, antimonial lead, type metal, babbitt metal, solder, and alloys not specifically provided for, 2⅛ cents per pound. In accordance with the Mexican Trade Agreement of January 30, 1943, these rates were reduced to ¾ cent and 1 1/16 cents per pound, respectively. A provision of the agreement permits the increase in the tariff on lead-bearing ores, flue dust, and mattes to 1⅕ cents per pound (lead content) and lead bullion, pigs, bars, scrap lead, etc., to 1 7/10 cents per pound 30 days after the war emergency is officially terminated. The import duty of 1 1/16 cents per pound on pig lead and ¾ cent a pound on lead in ores and concentrates was suspended in June 1948 until June 30, 1949, by act of Congress.

Imports.—Imports of lead increased sharply in 1948 but remained well below the peak level established in 1942. As in previous years,

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

the greater part of the lead imported was in the form of pigs and bars, 40 percent of which came from Mexico, 22 percent from Canada, 12 percent from Australia, 9 percent each from Peru and Italy, and 8 percent from 20 other countries. Imports of lead in base bullion increased almost fivefold in 1948 to reach the highest level since 1942. Nearly 90 percent of the bullion originated in Mexico. Receipts of of lead in ore, concentrate, and matte—principally from Bolivia, Union of South Africa, Australia, Peru, Newfoundland, and Canada—increased 26 percent.

Total lead imported into the United States in ore, matte, base bullion, pigs, bars, and reclaimed, by countries, in short tons, 1944–48 [1]

1948	257	184	213,614	14,346	12,797	5,162,168

Exports.—Total exports of pig lead (excluding reexports of foreign refined lead) declined from 1,514 tons in 1947 to 399 tons in 1948. Export restrictions imposed under the Export Control Act of 1940 remained in force throughout 1948.

[1] In addition less than 1 ton of foreign lead was reexported in 1944, 377 tons in 1945, 103 tons in 1946, 102 tons in 1947, none in 1948.
[2] Less than 1 ton.

WORLD REVIEW

Lead is produced in many countries, but four—United States, Mexico, Australia, and Canada—have accounted for nearly three-quarters of the world output in recent years, as is apparent from the accompanying table, which shows world production by countries, 1942–48, insofar as statistics are available.

World smelter production of lead, by countries where smelted, 1942–48, in metric tons [1]

[Compiled by B. B. Mitchell]

[7] Bizonal area.
[8] January to June, inclusive.
[9] Data represent Trianon Hungary subsequent to October 1944.
[10] Preliminary data.
[11] Figures cover lead refined from domestic and foreign ores; refined lead produced from foreign base bullion not included.
[12] Includes estimate for Yugoslavia by author.

Argentina.—The chief lead-producing district in Argentina is the Aguilar, where the Compania Minera Aguilar, S. A., a subsidiary of the St. Joseph Lead Co., operates the Aguilar group of mines. Over 80 percent of the annual Argentine mine output of lead is produced at this property. Output in 1948 was at a rate approximately 40 percent under the installed mill capacity owing to extremely poor transportation facilities, which interrupted incoming shipments of machinery, Diesel oil, and mine timber, as well as shipments of concentrates to the smelter. The production of lead concentrates in 1948 totaled 24,068 metric tons compared with 25,834 tons in 1947. On December 31, 1948, 1,744 tons of lead concentrates and 84,496 tons of zinc concentrates were stock-piled at the mine awaiting shipment.

Australia.—Shortages of labor and material continued to hamper mining operations in Australia in 1948. Steel was in particularly short supply; as a result, deliveries of mining and milling machinery were being delayed 18 months to 2 years.

Lead and zinc production was emphasized during the year at the Mount Isa mines in northwest Queensland, the copper section of the mine being idle until the new copper milling and smelting plant is completed. Production of lead-zinc ore totaled 571,706 tons; ore reserves in the lead-zinc lodes were estimated at 9,608,400 tons assaying 6.4 ounces of silver per ton, 8.7 percent lead, and 7.3 percent zinc. During 1948 the Zinc Corp., Ltd., treated 454,717 tons of ore compared with 408,648 tons in 1947. At the New Broken Hill Consolidated property, adjoining the Zinc Corp. on the south and managed by that company, ore output was increased from 62,367 tons in 1947 to 103,567 tons in 1948, the grade of ore being silver 1.9 ounces per ton, lead 9 percent, and zinc 12.6 percent.

The Lake George Mining Corp., Ltd., at Captain's Flat, New South Wales, produced 12,644 tons of lead concentrates in the year ended June 30, 1948. Ore reserves on that date were estimated at 1,576,721 tons assaying 1.17 dwt. gold and 1.46 ounces of silver per ton, 6.65 percent lead, 11.85 percent zinc, and 0.65 percent copper. Mine output of Electrolytic Zinc Co. of Australasia in 1948, totaled 125,226 tons assaying 2.0 dwt. gold and 7.05 ounces of silver per ton, 19.5 percent zinc, 6.2 percent lead, and 0.48 percent copper.

A shortage of skilled miners and reduced working hours were named by North Broken Hill, Ltd., as the principal factors limiting mine production in 1948. The grade of ore mined was the lowest for many years, but recoveries of lead, silver, and zinc were the highest ever obtained. At Broken Hill South, Ltd., production for the year ended June 30, 1948, totaled 236,950 tons of ore assaying 7.8 ounces of silver per ton, 13 percent lead, and 12 percent zinc, from which 39,866 tons of lead concentrates containing 74.8 percent lead were recovered.

Burma.—Rehabilitation of the Burma Corp., Ltd., Bawdwin mine, which was severely damaged by Japanese occupation during the war, continued in 1948. The mine was unwatered to 40 feet below the 11th level—668 feet below the 6th level—and operations were continued in an effort to gain access to the 12th level. After this is accomplished, the electric pump on that level will be put into operation, and the prewar method of controlling mine water will have been reestablished. Additional electric power provided by three 400-kw. Diesel engines installed in May 1948 enabled resumption of smelting and refining operations. Production of refined lead began at the end of May and continued until early September, when it was discontinued because of shortage of essential mining supplies caused by interruption of traffic over the Burma Railway due to insurgent activities. Traffic and production were resumed early in October. A total of 4,890 tons of refined lead was produced before operations were suspended in September.

Chile.—Exceptionally high grade lead-zinc ore was reported occurring at the Compania Minera Aysen mine on the north shore of Lago Buenos Aires in Aysen Territory of southern Chile. Preliminary exploration has developed enough ore reserves to justify erection of a mill with the financial aid of the Chilean Miners' Credit Bank. Metallurgical tests conducted in the laboratories of the Credit Bank produced high-grade lead and zinc flotation concentrates with excellent separation and recoveries. Until Chilean roads are improved sufficiently to permit economical transportation to a Chilean port, concentrates will be shipped from Puerto Deseado, an Argentine port on the Atlantic coast.

French Morocco.—Mine output of lead in French Morocco increased in 1948 and surpassed the prewar production levels. Principal producing centers were Zellidja, Aouli, Touissit, Haut-Guir, and Bab Cedra. The Société Nord Africaine du Plomb, owned jointly by Société des Mines de Zellidja (51 percent), Newmont Mining Corp. (33 percent), and St. Joseph Lead Co. (16 percent) acquired ownership and conducted exploration of mineral lands formerly held by the Zellidja Co. in both Morocco and Algeria, adjacent to the main Zellidja property.

Greece.—Rehabilitation of the Laurium lead-zinc mine 35 miles south of Athens was in progress during the latter part of 1948 by the Mediterranean Mines, Ltd. The company plans to erect a 200-ton flotation mill to treat an indicated sulfide-ore reserve of 260,000 tons carrying 5 to 8 percent lead and an estimated 2,500,000 tons of tailings and slimes assaying 2.5 to 4.5 percent lead.

Greenland.—In the summer of 1948 a Danish Government geological survey party headed by Dr. Lange Koch discovered a lead deposit on the east coast of Greenland at Mesters Vig in the area around King Oscar Fjord and Davy Sound (73° 15′ N. Lat., 24° W. Long.). The deposit included 3 quartz veins 5 to 10 meters wide and 8 kilometers long extending from the coast to a mountain pass at an elevation of 600 meters. Ore samples taken from the outcrops assayed 80 percent lead and some samples contained as high as 300 grams of silver per ton. No zinc, bismuth, or other minerals were found which might complicate the recovery of the lead. On the basis of data obtained from exploration conducted in 1948 the area is thought to contain an estimated one million tons of lead. More detailed development and exploration are planned for the summer season of 1949.

Peru.—Lead production from Peru comes from a large number of mines, the most productive being the Cerro de Pasco, Casapalca, Huaron, Volcan, Atacocha, Cercapuquio, and Colquijirca mines. Lead output in 1948 at Cerro de Pasco was greater than in the previous year, due partly to the fact that throughout 1948 the Paragsha mill at Cerro de Pasco was used exclusively for lead-zinc ores, making possible expansion of mining operations in the Cerro de Pasco lead-zinc ore body. Production was halted at the Casapalca mine on April 19, 1948, by a fire which began in the underground hoist room of the Aguas Calientes shaft, killing 52 mine employees.

During the year the Compania Minero Atacocha began erecting the first of three 330-ton units of a new 1,000-ton flotation mill. The new plant is expected to be operating by the middle of 1950.

The Peruvian Government took action during 1948 to aid in expanding mineral production and early in the year made the first substantial reduction in tax load granted by any Latin American country by lowering the export tax.

South-West Africa.—The Tsumeb mine is the only important source of lead in South-West Africa. During 1948 shipments of lead-copper ores and concentrates totaled 74,837 short tons, containing 29,428 tons of lead and 7,483 tons of copper. Development included unwatering the mine to the twentieth level (1,900 feet below the surface), where mine workings of the former German owners were found to be in good condition. Diamond drilling below the twentieth level disclosed new and substantial ore tonnages. To provide additional productive capacity from the lower levels of the mine and to permit handling 1,800 to 2,000 tons of ore per day, the company plans to sink a new shaft at an estimated cost of $2,000,000. The new 1,200-ton-per-day selective flotation mill began producing in March 1948.

Tanganyika.—There were many conflicting reports during 1948 as to the importance of the lead deposit at Mpanda. Some releases indicated proved ore reserves of 25 million tons, containing 15.5 percent lead, in addition to copper, silver, gold, tungsten, nickel, and cobalt. Other more conservative reports indicate a much lower proved tonnage averaging 6.5 percent lead. Exploration and pilot-plant construction at the property proceeded under the supervision of Uruwira Minerals, Ltd., with technical direction by the Union Corp., Ltd. Late in the year the Union Corp. withdrew from participation in the development for the stated reason that the reserves disclosed did not indicate an ore body of enough magnitude to justify the expensive development that would be necessary before the deposit could be exploited.

Turkey.—Metallurgical tests on ore from the Bolkardag mine, owned by the Turkish Government agency—Etibank—were made during 1948. The property in the Taurus Mountains in the Province of Nigde, 257 kilometers from the Mediterranean port of Iskenderon, has a known ore reserve of 250,000 tons containing 6 percent lead 5 percent zinc, and some gold and silver.

A flotation plant, power plant, and repair shops were completed during 1948 at the Keban mine in the Province of Elazig, 548 kilometers from Iskenderon. The concentrator is designed to treat 18,000 tons of ore annually. Proved ore reserves total 100,000 tons, averaging 10 percent lead. It is planned to build a smelter at Iskenderon to treat concentrates from both the Keban and Bolkardag mines.

Lead and Zinc Pigments and Zinc Salts

By HELENA M. MEYER and ALETHEA W. MITCHELL

GENERAL SUMMARY

SMALLER quantities of all of the lead and zinc pigments covered by this report were shipped in 1948 than in 1947, declines ranging from a low of 6 percent for zinc oxide to a high of 33 percent for white lead (dry and in oil). Again, as in several immediately preceding years, the quantities shipped were not a true measure of demand. Large pigment users, such as the automobile, construction, storage battery, and rubber industries, operated at or above the high levels of 1947, so that requirements for pigments were unabated in 1948. The manufacture of passenger automobiles and trucks, for example, rose 9 percent following the sharp advance in 1947; new private and public construction was 26 percent larger in value, and the value of paint, varnish, and lacquer materials rose slightly over the previous all-time peak in 1947. Gains in unit values, of course, played an important part in raising total values for construction and paint. Consumption of natural rubber increased 11 percent, whereas that of the synthetic type dropped 20 percent, causing an over-all decrease. Natural rubber, however, requires considerably more zinc oxide than the synthetic type.

Shortages of crude materials used for pigment manufacture, notably pig lead, continued to be a limiting factor in the pigments picture. The inadequate supplies of pig lead in recent years and the inflationary trend of prices in general caused the price of pig lead to reach new peaks in 1947 and again in 1948. Lead-pigment prices responded by establishing new tops of their own in both years. These high prices played a part, no doubt, in reducing demand for some of the pigments covered by this report. The price for slab zinc gained markedly but did not exceed records set in World War I. Zinc-pigment prices in 1947 and 1948 were the highest in many years and in some instances may have reached new all-time heights.

Shipments of white lead (dry) dropped 32 percent and were the smallest since 1934. Those of the "in oil" variety fell 34 percent and were smaller even than the 1945 total, itself below all previous totals since considerably before the beginning of the present century. Red-lead shipments declined 15 percent and were the lowest since 1938. The total for litharge was 7 percent below the record performance in 1947 but second only to shipments in that year.

Salient statistics of the lead and zinc pigments industry of the United States, 1943–48

[1] Reported as shipments, 1945–48.
[2] Data for basic lead sulfate in 1946 included under white lead; Bureau of Mines not at liberty to show separately.
[3] Excludes value of basic lead sulfate; Bureau of Mines not at liberty to publish.
[4] Less than $500.

Zinc oxide shipments were 6 percent under those for 1947 but lower than in only five other preceding years, 1946, 1925, and 1927–29, inclusive. Shipments of leaded zinc oxide fell 17 percent in 1948 but were smaller only than the previous peaks in 1947 and 1941; they were relatively the same as the 1946 tonnage. Lithopone shipments dropped 15 percent and were the smallest since 1945.

Zinc chloride evidently established a new high record in 1948, although there are a few gaps in the statistical record. Shipments of zinc sulfate approximated those for 1947 and lagged only behind the peak for 1946.

Titanium pigments were shipped in greater quantity than ever before in 1948, continuing the establishment of peak rates for the fifth successive year. Even greater heights would have been reached in recent years had production capacity permitted. Capacity was expanded again in 1948 to close to 10 percent above 1947. The record high tonnages made available, however, again failed to fill all demand, and further plant extensions were in prospect for 1949.

High lights in the distribution of pigments and salts covered by this report are outlined in the following discussion. Ceramics continued to make noteworthy gains as a consumer of pigments. The second-largest outlet for litharge, ceramics took more of this pigment than ever before, rising 9 percent over previous peaks in 1947 and 1941.

Zinc oxide was shipped for ceramic manufacture in new high record quantities for the third successive year, and red lead was shipped at a record high rate, except for 1941. The use of white lead by ceramic makers, on the other hand, has been gaining for several years but dropped, at least temporarily, in 1948. All pigments were shipped in smaller quantities for paint manufacture than in 1947; shipments of white lead for this purpose doubtless were the smallest since many years before the present century began. Shipments of red lead for paint manufacture, however, were 6 percent above the prewar (1935–39) average rate. Those of zinc oxide were relatively unchanged from that average, of leaded zinc oxide were 72 percent higher, and of lithopone were 11 percent lower than the prewar period. White-lead shipments for paint fell to considerably below half of the prewar average rate. Storage-battery manufacture took less litharge and red lead in 1948 as compared with 1947 but used more litharge than in any other year, or almost three times the prewar average quantity; red lead amounted to 27 percent less than the prewar average. The insecticidal use of litharge has been hardest hit of this pigment's uses, falling 17 percent from 1947, amounting to only 23 percent of the all-time high record in 1944, and falling 60 percent below the prewar average. Consumption of zinc sulfate for agricultural purposes likewise made a poor showing in 1948, falling 31 percent (dry basis) from 1947 and amounting to only about half of its peak tonnage in 1946. The manufacture of rubber took greater quantities of the pigments covered by this report in 1948 than in 1947 and also showed to advantage in relation to earlier years. Zinc oxide was used for rubber at a record rate except for 1941 and 1946, lithopone was the highest since 1937, and litharge the largest since 1944, being 53 percent above the prewar level. A new high record was established in 1948 by shipments of zinc sulfate for rayon manufacture. This use has climbed continuously since 1942.

Batteries.—There has been publicity [1] recently in connection with the nickel-cadmium battery, new to the United States but long-known in Europe. Arguments both in favor of and against the battery were contained in the literature.

Paints.—A lead-free exterior house paint, with a titanium base, was introduced [2] in 1948. Late in 1947 a new basic silicate white-lead pigment, which was said to contain 45 percent lead by weight as compared to 80 percent in basic carbonate white lead, was announced.[3] The characteristic of basic silicate white lead, it was said, results from pigment particles having a central core of silica so that whereas the pigment has the characteristics of lead compounds, less lead is required. Prospects for the development of improved finishes (paints, varnish, etc.) were outlined [4] briefly.

PRODUCTION

The value of lead and zinc pigments in 1948 (exclusive of that for basic lead sulfate, which cannot be shown) was $156,462,000—an increase of 2 percent despite the 13-percent decline during 1948 in the total tonnage of the lead and zinc pigments covered. Higher average values in 1948, of course, made the foregoing situation possible. Lead pigments and zinc pigments comprised 58 and 42 percent, respectively, of the total value in 1948, compared with 59 and 41 percent, respectively, in 1947.

For many years, figures on sales were used in this series of reports as a better guide to activity in the pigments industry than production. Beginning with 1945, the base was changed to shipments to conform with data compiled on Bureau of Mines lead and zinc schedules. Available information for 1945 (the year of change) indicated that there was little difference between sales and shipments in that year. In reporting tonnages of pigments, an attempt is made to avoid all duplication. One of the chief problems is that finished pigments frequently are blended to make another product. Basic lead sulfate and zinc oxide, for example, are blended to make leaded zinc oxide, and in this instance the pigment weights appear in the total for the last-named class only. Pigments consumed by producing companies to make products beyond those covered by this report—that is, paints, storage batteries, and other articles—are considered as shipments.

LEAD PIGMENTS

Lead pigments shipments dropped 15 percent in quantity but, owing to higher average values, rose 1 percent in total value as compared with 1947. (Shipments of basic lead sulfate, which the Bureau of Mines is not at liberty to publish, are excluded from the figures shown.) All lead pigments covered by the totals played a part in reducing the 1948 tonnage—white lead, dry, falling 32 percent; the "in-oil" variety, 34 percent; red lead, 15 percent; and litharge 7 percent.

Quoted lead pigment prices were higher than ever before, and average values reported by producers likewise showed gains. Total values for red lead and litharge were 1 and 15 percent, respectively, higher than in 1947 despite quantity losses already indicated.

Lead pigments [1] shipped by manufacturers in the United States, 1947–48

Pigment[1]	1947			1948		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)

[2] Bureau of Mines not at liberty to publish figure.

ZINC PIGMENTS AND SALTS

Zinc-pigment shipments declined 12 percent in total quantity in 1948 from the record established in 1947, but increased 3 percent in total value to a new high peak. Higher average values for the three pigments covered accounted for the contrasting movements. Shipments of zinc oxide (lead-free) fell 6 percent from the high performance in 1947 but were smaller only than in 5 earlier years—1946, 1927–29, and 1925. Although shipments of the leaded variety decreased 17 percent, they failed to exceed only the previous peaks for 1947 and 1941, being relatively the same as the 1946 tonnage. Lithopone shipments dropped 15 percent and were the smallest since 1945.

Zinc chloride shipments, so far as can be ascertained, established a record in 1948, although the statistical picture for this product is somewhat incomplete. Zinc sulfate shipments were relatively unchanged from 1947 and second only to those for 1946.

Zinc pigments and salts shipped by manufacturers in the United States, 1947–48

Pigment or salt	1947			1948		
	Short tons	Value (at plant, exclusive of container)		Short tons	Value (at plant, exclusive of container)	
		Total	Average		Total	Average
Zinc oxide [1]	160,771	$29,873,882	$186	150,958	$32,862,368	$218

1947	160,771	81,459	165,024	65.521	21,547
1948	150,958	67,441	140,033	68,701	21,513

[1] Includes a small quantity containing less than 5 percent lead.

CONSUMPTION BY INDUSTRIES

WHITE LEAD

The down trend in use of white lead, in progress for many years, was extended in 1948. Shipments of white lead (dry) fell 32 percent from 1947 and were the smallest since 1934; those of the "in-oil" variety were 34 percent below 1947 and less even than shipments in 1945, themselves the lowest since considerably before the beginning of the present century. Total white-lead shipments, likewise, hit a new bottom since many years before the present century began. Continued scarcity of pig lead and all-time record prices were chiefly responsible for the poor showing. Paint took at least 89 percent of total shipments in 1948; a more precise break-down of the "Other" class doubtless would add more to "paint" than to any other use. Progress and expansion in the use of white lead for ceramics were halted, at least temporarily, in 1948.

Production of white lead (dry) amounted to 25,955 tons and of white lead in oil to 17,672 tons, compared with 39,337 and 32,677 tons, respectively, in 1947.

Distribution of white lead (dry and in oil) shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945	1946 [2]	1947	1948
Paints	79,948	46,418	60,943	61,265	40,892
Ceramics	946	839	1,367	1,665	1,369
Other	4,832	3,913	4,191	5,857	3,809
	85,726	51,170	66,501	68,787	46,070

[1] Reported as sales.
[2] Data for basic lead sulfate included with white lead; Bureau of Mines not at liberty to show separately.

BASIC LEAD SULFATE

The Bureau of Mines is not at liberty to publish figures on basic lead sulfate for 1946–48. Shipments in 1946 were included with those of "white lead" (dry), but 1947 and 1948 data are not shown in any way. Basic lead sulfate is used almost entirely in paints. Substantial quantities are used as an intermediate product in the manufacture of leaded zinc oxide. Such quantities have always been shown in this series under leaded zinc oxide rather than basic lead sulfate.

Distribution of basic lead sulfate shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945	1946	1947	1948
Paints	5,496	3,009	(2)	(3)	(3)
Rubber	268	200			
Storage batteries	2	----------			
Other	567	686			
	6,333	3,895	(2)	(3)	(3)

[1] Reported as sales.
[2] Data for basic lead sulfate included with white lead; Bureau of Mines not at liberty to show separately.
[3] Bureau of Mines not at liberty to publish figures.

RED LEAD

Shipments of red lead dropped 15 percent from 1947 and were the smallest since 1938, exceeding that year by a narrow margin. The manufacture of storage batteries—the chief use of red lead—took 29 percent less than in 1947, when shipments were 31 percent below the all-time peak rate of 1944, but substantially the same as in late prewar years. Shipments for paint manufacture declined 4 percent, but this use about approximated prewar levels. Ceramics took 31 percent more red lead in 1948 and doubtless consumption was higher than in any previous year except 1941, being 20 percent below that year.

Production of red lead amounted to 29,698 tons in 1948 compared with 36,041 tons in 1947.

Distribution of red-lead shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945	1946	1947	1948
Storage batteries	30, 211	26, 725	19, 115	20, 883	14, 854
Paints	18, 074	16, 438	9, 318	11, 362	10, 863

Color pigments	7	8	205	151	18
Other	28	22	23	16	27
	128	79	284	230	123

[1] No shipments reported for 1947–48.
[2] Reported as sales.

LITHARGE

Litharge gave the best performance in 1948 of all pigments covered by this report. Although shipments dropped 7 percent, compared with 6 percent for zinc oxide, they were smaller only than the all-time peak in 1947, whereas zinc oxide shipments were lower than in five earlier years. Storage batteries, as always by far the leading use and responsible for the 1947 peak record, took 10 percent less than the record tonnage, or more than the average decline. In 1947 and 1948, two-thirds of total litharge shipments went to storage-battery manufacturers, compared with an average of 44 percent in the 5-year period 1935–39. In addition to the litharge used to make batteries, the storage-battery manufacturers themselves produce from pig lead a black or suboxide of lead which they use as a substitute for litharge. The quantity for 1948—69,000 tons—was unchanged from the high record established in 1947 and was 13 percent above the previous peaks in 1944 and 1941. Black oxide production required 66,000 tons of pig lead in both 1948 and 1947. The black oxide tonnages are not included in Bureau of Mines totals for litharge.

Ceramics, which have been taking increasing quantities since 1945, established a new peak in 1948, exceeding the previous peaks for 1947 and 1941 by 9 percent. The manufacture of chrome pigments has been falling since 1945 and had the sharpest percentage drop (19 percent) among the uses of litharge. This use took not much more than half of the peak established in 1941. The quantity of litharge shipped for oil-refining use decreased 6 percent as compared with 1947; the latter, however, was the largest since 1937. The insecticidal use of litharge has made the poorest showing in recent years of the various outlets. The 17-percent decline in this use in 1948, on top of successive drops since the all-time record for 1944, made the tonnage shipped for this purpose only 23 percent of the 1944 peak. Varnish and rubber manufacture both gained in 1948, the former 4 and the latter 29 percent. Sales to varnish makers were the largest ever, so far as it is possible to ascertain, and those to rubber manufacturers were the greatest since 1944.

Litharge production totaled 159,489 tons in 1948 compared with 174,341 tons in 1947.

Distribution of litharge shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945	1946	1947	1948
Storage batteries	72, 342	79, 981	75, 836	111, 840	100, 645

[1] Reported as sales.

ZINC OXIDE

Shipments of zinc oxide (lead-free) dropped 6 percent in 1948 but were greater than in all other earlier years except five, that is, 1946, 1927–29, and 1925. The manufacture of rubber took 55 percent of all shipments, slightly exceeded 1947, and except for 1941 and 1946 was probably the greatest on record; distribution data for years before 1929 are not available. Consumption of zinc oxide for paint manufacture declined for the second successive year. The tonnage for 1948 differed little from the average for the prewar period, 1935–39, inclusive. Use of zinc oxide for ceramics rose 9 percent to a new peak for the third successive year. This use did not maintain its proportionate importance during the war. Since the war-time low point was reached in 1942, however, shipments to ceramic manufacturers have been continuously upward. Coated fabrics and textiles dropped to fourth place among users of zinc oxide in 1947, having been displaced by ceramics, and continued below the latter use in 1948. Coated fabrics and textiles, chiefly the manufacture of rayon, took 4 percent more zinc oxide in 1948 than in 1947. Floor coverings, likewise, used 4 percent more zinc oxide in 1948.

883326—50——47

Production of lead-free oxide totaled 146,565 tons compared with 159,149 tons in 1947. Closing of the plant of the American Zinc Oxide Co. by a labor strike for several months in 1948 was principally responsible for the disparity between production and shipments. Of the 1948 total, 76 percent was made by the American process from ores and primary residues, 15 percent by the French process from metal and scrap, and 9 percent by other processes compared with 73, 17 (revised), and 10 (revised) percent, respectively, in 1947.

Distribution of zinc oxide shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945	1946	1947	1948
Rubber	59,518	63,447	83,776	82,248	82,895
Paints	24,999	28,014	34,785	32,867	26,779
Ceramics	3,653	5,086	9,056	11,350	12,327
Coated fabrics and textiles [2]	9,563	12,177	10,022	9,100	9,474
Floor coverings			2,848	4,735	4,938
Chemical warfare	27,686	2,053	-	-	-
Other	15,256	17,178	17,364	20,471	14,545
	140,675	127,955	157,851	160,771	150,958

[1] Reported as sales. [2] Includes the following tonnages for rayon: 1946—9,363; 1947—7,302; 1948—8,209

The varied uses of zinc oxide recently were reported in Zinc Bulletin 5, published by the Zinc Development Assoc., Oxford, England. Purposes served by zinc oxide in natural and synthetic rubber production, as given in the aforementioned bulletin, were outlined in the technical press.[5]

LEADED ZINC OXIDE

The use of leaded zinc oxide has continued at high levels in recent years. Shipments established a new high record in 1941, were close to record levels in 1944–46, inclusive, and established a new peak in 1947. Shipments in 1948 were 17 percent less than the 1947 peak but were smaller only than in 1947 and 1941, being approximately the same as in 1946. Of the total shipments in 1948, 96 percent was reported for paint. Doubtless a better break-down of the "Other" class would add to the paint classification. Figures for basic lead sulfate used in blending to make leaded zinc oxide are included in tonnages for the latter pigment.

Leaded zinc oxide production totaled 67,480 tons in 1948 compared with 78,799 tons in 1947. The totals comprise grades as follows (1947 for comparison in parentheses): 53,915 (68,413) tons of 35 percent lead and under, and 13,565 (10,386) tons of over 35 percent lead.

Distribution of leaded zinc oxide shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945	1946	1947	1948

Rubber	119	200	166	131	218
Other	2,053	3,546	2,989	3,334	2,311
	64,395	62,598	67,971	81,459	67,441

[1] Reported as sales.

[5] Chemical Age (London), Varied Uses of Zinc Oxide: Vol. 60, No. 1538, Jan. 1, 1949, p. 22.

LITHOPONE

Shipments of lithopone dropped 15 percent in 1948 and were the smallest since 1945; the 1948 tonnage was larger than in only 3 years (1945, 1943, and 1942) since 1938. Paint, varnish, and lacquer manufacturers took 23 percent less lithopone than the high quantity for 1947, which was smaller than in only two earlier years, that is 1928 and 1929. Paints, etc., which regularly use three-quarters or more of the total shipments, took 75 percent in 1948 compared with 82 percent in 1947. Other broad classifications of uses showed gains in 1948. Consumption for rubber, which has made sharp gains since 1944, rose 36 percent and was the largest since 1937. Floor coverings and coated fabrics and textiles together rose 19 percent to the highest total since 1941. The gain was due entirely to floor coverings, which took 12,423 tons compared with 9,048 tons in 1947, whereas the totals for coated fabrics were 8,436 and 8,421 tons, respectively. The use of lithopone by paper manufacturers was at the highest level since 1944; it was 4,814 in 1948, 4,069 in 1947, 3,011 in 1946, 3,086 in 1945, and 6,488 in 1944. Shipments for use in the manufacture of ink continued in 1948 at about the 1947 rate—727 and 720 tons, respectively. Sales for this use have been falling; the tonnages were 1,216 in 1944, 864 in 1945, and 830 in 1946. One manufacturer regularly includes tonnages for ink as not separable from those sold for paint, but the tonnages in the foregoing sentences are for identical companies. Exports are included mainly under "Other," but at least one company classifies part of its exports according to end use.

The lithopone statistics in this report are given on the basis of ordinary lithopone sold as such plus the ordinary lithopone content of the high-strength product. This method of publication is used to conceal the operations of one company that always dominates the output of the high-strength product and has been the only producer in some years. In 1948, as in 1947, one company operating two plants produced high-strength lithopone.

Production of lithopone amounted to 151,005 tons in 1948 compared with 162,685 tons in 1947. Plant capacity for the manufacture of lithopone was reported to be 157,000 tons in 1948, or unchanged from 1947.

Distribution of lithopone shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945	1946	1947	1948
Paints, varnishes, and lacquers [2]	108,800	109,398	123,279	134,830	104,441
Floor coverings and textiles	14,746	15,821	15,167	17,469	20,859
Rubber	726	977	1,607	3,085	4,192
Other	18,633	9,965	6,948	9,640	10,541
	142,905	136,161	147,001	165,024	140,033

[1] Reported as sales. [2] Includes a quantity, not separable, used for printing ink.

Consumption of ordinary lithopone in the production of titanated lithopone has trended downward almost continuously since the peak—19,400 tons—was used in 1937. There was a further drop in 1948 to 1,700 tons or only 9 percent of the peak tonnage. The lithopone figures in the following table are included in the totals for ordinary lithopone in the preceding table.

Titanated lithopone produced in the United States and ordinary lithopone used in its manufacture, 1944–48, in short tons

Year	Titanated lithopone produced	Ordinary lithopone used	Year	Titanated lithopone produced	Ordinary lithopone used
1944	9,800	8,300	1947	2,600	2,200
1945	9,200	7,800	1948	2,100	1,700
1946	7,500	6,350			

ZINC SULFIDE

In 1948, as in several preceding years, only one company produced zinc sulfide; the Bureau of Mines is not at liberty to publish figures for this pigment.

ZINC CHLORIDE

A new high record doubtless was established by zinc chloride shipments (50° B. solution) in 1948; they were 5 percent higher than those in 1947, believed to have been the previous peak. The record for 1935–41 is somewhat incomplete, making a more precise statement impossible. The figures shown here include the zinc chloride equivalent of zinc ammonium and chromated zinc chloride produced. Complete figures covering distribution of zinc chloride shipments by uses are not available.

Production amounted to 67,908 tons in 1948 compared with 67,475 tons in 1947.

ZINC SULFATE

Zinc sulfate shipments in 1948 continued at the high level of 1947, second only to the peak in 1946. Rayon, which was displaced by agriculture in the record year, continued in the first place regained in 1947 and required 19 percent more zinc sulfate (dry basis) than in that year. This use established a new top in 1948, whereas agriculture, in second place, dropped 31 percent from 1947 and took little more than half of its peak tonnage for 1946. Chemicals, regularly in third place, continued to decline in 1948, decreasing 17 percent from

Distribution of zinc sulfate shipments, by industries, 1944–48, in short tons

Industry	1944 [1]	1945		1946		1947		1948

	17,156	20,854	15,841	24,931	18,427	21,547	15,997	21,513	16,168

[1] Reported as sales.

1947. (The lowering of tonnages for chemicals reflects in part more precise separation of distribution data.) Shipments for the manufacture of flotation reagents nearly doubled in 1948 and probably established a new high record, although data on classification of shipments are somewhat incomplete. The other uses shown separately increased notably in 1948 but accounted for a relatively small part of total shipments.

In 1948, 20,125 tons of zinc sulfate were produced, compared with 23,423 tons in 1947.

RAW MATERIALS USED IN MANUFACTURE OF LEAD AND ZINC PIGMENTS AND ZINC SALTS

Figures covering the raw materials used in making pigments and salts in 1948 were not available when this report was prepared. Data for 1947 are given below, and those for 1948 will appear in the next annual issue of this volume.

Lead pigments and zinc pigments and salts are manufactured from a variety of materials, including ore, refined metal, and such secondary materials as scrap. In 1947, roughly 92 percent of the lead in pigments was derived from pig lead and the remainder from ore. Of the lead in ore used to make leaded zinc oxide, about 11 percent was from foreign sources. The proportion for zinc pigments in 1947 was 72 percent from ore and concentrates, 9 percent from slab zinc, and 19 percent from secondary materials; about 18 percent of the ore used was foreign.

The following tables give the source of the metal used in manufacturing each pigment and salt. Pig lead is employed exclusively, either directly or indirectly, in the manufacture of white lead, litharge, red lead, and orange mineral and is used also in the manufacture of basic lead sulfate. The lead content of leaded zinc oxide made from basic lead sulfate, which in turn was made from pig lead, is credited to pig lead in the table. Zinc oxide is the only pigment in which considerable slab zinc is used. Ore is employed in the manufacture of zinc oxide, leaded zinc oxide, lithopone, zinc sulfide, zinc sulfate, and basic lead sulfate. A substantial proportion of the zinc in lithopone (63 percent in 1947) and most of that in zinc chloride made in the United States are derived from secondary material. For a number of years before the United States entered the recent World War, there had been a large increase in the quantity of secondary zinc used in the manufacture of zinc oxide. The scarcity of supplies of both metal and scrap caused the proportion of the total oxide made by the French process, which uses only metal and scrap, to drop sharply in 1942 and to continue comparatively low in 1943–46, despite the fact that the percentage from metal and scrap rose in 1943 and continued upward in 1944–47. The production of zinc oxide from metal and scrap accounted for the following percentages in relation to total production: 41 percent in 1939, 16 percent in 1942, 19 percent in 1943, 22 percent in 1944, 25 percent in 1945, 26 percent in 1946, and 28 percent in 1947.

Lead content of lead and zinc pigments produced by domestic manufacturers, by sources, 1946–47, in short tons

[1] These figures are higher than those shown in the report on Secondary Metals—Nonferrous because they include zinc recovered from byproduct sludges, residues, etc., not classified as purchased scrap material.
[2] Excludes zinc sulfide, data for which Bureau of Mines not at liberty to publish.

PRICES

Total and average values received by producers for lead and zinc pigments and zinc salts are given in the tables in the first part of this report. For the second successive year, average values for lead pigments for 1948 were the highest ever recorded, and those for zinc pigments and salts were again the highest in many years and in some instances probably for all time.

Quoted prices for lead pigments repeated the 1947 performance. They were at all-time peaks at the beginning of the year, and all changes during the year were upward, the quotations following the movement of pig-lead prices. All price changes for the zinc pigments likewise were upward during 1948 as in 1947.

Range of quotations on lead pigments and zinc pigments and salts at New York (or delivered in the East), 1945–48, in cents per pound

[Oil, Paint and Drug Reporter]

FOREIGN TRADE [6]

Imports of lead and zinc pigments are insignificant in relation to domestic shipments of the items. The total value of the lead group more than quadrupled in 1948 owing to sharp gains in average prices for the various constituents, and to the more than doubling in receipts

Value of foreign trade of the United States in lead and zinc pigments and salts, 1947–48

[U. S. Department of Commerce]

	1947		1948

[6] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

of litharge, the chief item. Despite rising prices, zinc pigments fell to less than one-fourth of the small total for 1947.

Total values of exports of lead pigments, zinc pigments, and lead and zinc salts all dropped in 1948 despite higher prices characteristic of that year. All lead pigments except red lead were shipped abroad in smaller quantities in 1948 than in 1947. Of the two larger zinc-pigment classes, exports of the higher-valued zinc oxide were cut almost in half, while those of lithopone were more than half again as large as in 1947.

Lead pigments and salts imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Short tons					Total value
	Basic carbonate white lead	Red lead	Litharge	Suboxide of lead	Other lead compounds

Beginning January 1, 1946, none of the foregoing classes separately recorded.

WORLD REVIEW

Australia.—The Glidden Co. is said [7] to have licensed the Euston Lead Co., Ltd., of Australia, to use the Euston process for the manufacture of white lead. The Australian company was stated to have constructed a plant at Melbourne, expected to be in production by the end of the year or the beginning of 1949. An earlier report [8] said the plant was to have an initial capacity of 7,000 tons a year.

Canada.—A report of the Dominion Bureau of Statistics of Canada published in 1949 gave data on pigments consumed by the paint and varnish industry in Canada in 1946 and 1947. The figures for 1947 are as follows (1946 figures for comparison in parentheses): Basic carbonate white lead (dry) 3,264 (2,989) short tons, basic carbonate white lead in oil 1,741 (2,087) tons, basic sulfate white lead 7 (20) tons, red lead including orange mineral 625 (567) tons, litharge 312 (413) tons, zinc oxide (lead-free) 5,209 (4,923) tons, leaded zinc oxide 1,546 (700) tons, lithopone (30 percent zinc sulfide) 9,712 (8,078) tons, titanium dioxide 4,117 (3,416) tons, extended titanium dioxide pigments 7,199 (6,442) tons, and "other white pigments" 710 (1,354) tons.

Canada's imports of lithopone, 12,736 and 8,858 tons, respectively, in 1947 and 1946, were large enough to more than cover use in the 2 years. Imports of zinc white (zinc oxide) were 2,205 and 925 tons, respectively. Imports of the other items given in the preceding paragraph are very small, although titanium pigments are not shown separately. According to United States records for titanium dioxide and pigments, 13,274 tons were exported to Canada in 1947 and 12,020 tons in 1946.

Union of South Africa.—According to the February 14, 1949, issue of Foreign Commerce Weekly, a branch factory for the production of red lead, white lead, and litharge is being constructed at Durban, South Africa, by Associated Lead Manufacturers, Ltd., of the United Kingdom.

[7] Chemical Industries, vol. 63, No. 3, September 1948, p. 522.

Lime[1]

By G. W. JOSEPHSON AND F. D. GRADIJAN

GENERAL SUMMARY

ALL of the major industries—including chemicals, refractories, and construction—that are the principal markets for lime were operating at high rates in 1948; consequently, sales of lime increased to a record total of 7,263,976 short tons—7 percent greater than the previous record set in 1947.

Quicklime comprised 75 percent of the total sales and hydrated 25 percent. The output of quicklime increased somewhat more percentagewise than did hydrated—8 and 4 percent, respectively. Costs continued to rise, and the average value per short ton for quicklime increased from \$9.04 in 1947 to \$9.96 in 1948 and hydrated from \$10.50 to \$11.50. The declining trend in the number of active plants that has been noted in recent years was interrupted in 1948.

Salient statistics of the open-market lime industry in the United States, 1925–29 (average), 1935–39 (average), and 1946–48

	1925–29 (average)	1935–39 (average)	1946	1947	1948

[1] Selling value, f. o. b. plant, excluding cost of containers.

Lime is used so widely throughout the Nation's economy that its sales are affected by developments in a number of different fields. Figure 1 shows the correlation between the use of open-market lime and trends of activities in various markets. Sales of building lime generally follow the index of new construction; but there are exceptions, particularly during a war period in which temporary construction becomes an important factor. The quantity of refractory and chemical lime follows in general the curve in industrial production.

[1] Figures in this chapter pertain to open-market lime and exclude coverage of most captive lime operations.

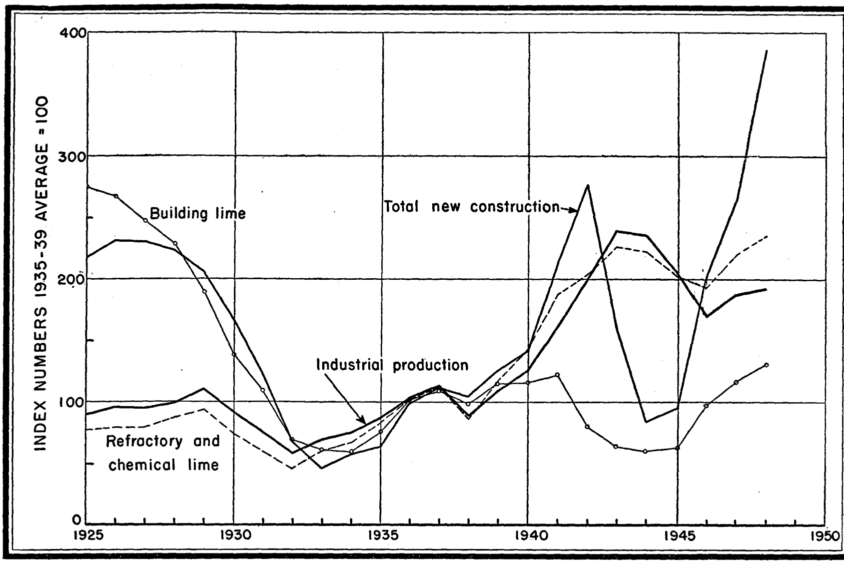

FIGURE 1.—Sales of refractory and building lime compared with total new construction and industrial production, 1925–48. Units are reduced to percentages of the 1935–39 average. Statistics on value of construction from the Bureau of Foreign and Domestic Commerce and on industrial production from the Federal Reserve Board.

Trends in sales of open-market lime sold for specified uses during the past 24 years are shown in figure 2. The growth in importance of the chemical market is noteworthy. The curve would, of course, show a much greater increase if all of the captive lime as well as the open-market were included.

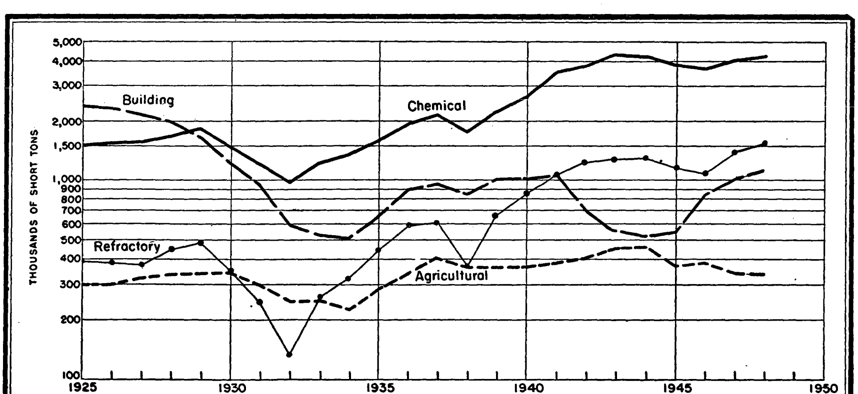

FIGURE 2.—Trends in major uses of lime, 1925–48.

DOMESTIC PRODUCTION

Production of open-market lime increased to a record total of 7,263,976 tons in 1948—7 percent above the previous high set in 1947. Production of lime for each of the major uses except agricultural advanced over the 1947 tonnages. Stocks reportedly are small and relatively constant, so in this chapter sales statistics are considered to be the equivalent of production of open-market lime.

Captive Tonnage.—Although the lime statistics included in this chapter are limited almost entirely to open-market lime, a relatively small quantity of captive tonnage is included in certain instances where it is particularly desirable to show complete figures for consumption by use. In 1948, 362,368 short tons of captive tonnage is included as follows: 14,528 tons for building, 242,074 for metallurgical uses, 61,478 for miscellaneous chemical uses, and 44,288 tons of refractory lime. If it is desired to obtain a more comprehensive view of lime production, a figure of approximately the proper order of magnitude can be obtained by calculations from limestone tonnages (shown in the Stone chapter of this volume) consumed in the uses in which limestone is generally calcined.

Lime sold by producers in the United States, 1947–48, by types and major uses

	1947				1948					
	Quantity		Value [1]		Quantity		Value [1]		Percent change from 1947 in—
