Size of Plants.—In 1925 there were approximately 450 active lime plants in the United States, and in the intervening years there has been a general trend toward the elimination of smaller units and concentration of production in the larger, more efficient plants. However, there was a small increase in the total number of active open-market lime plants in 1948—181 as compared with 179 in 1947. During the past year 20 plants that each produced more than 100,000 tons supplied over half of the total output.

Distribution of open-market lime (including refractory) plants, 1946–48, according to size of production

PRODUCTION BY STATES

In 1948 open-market lime was produced in 32 States and 2 Territories. Ohio was again the principal producing State, followed by Pennsylvania and Missouri in that order. These three contributed about 56 percent of the Nation's output.

Lime (quick and hydrated) sold by producers in the United States, 1947–48, by States

Hydrated Lime.—Hydrated lime in 1948 comprised 25 percent of the total lime output, which compares with 26 percent in 1947 and 20 percent in 1944. Hydrated-lime output was reported by 116 plants (same as in 1947) in 32 States and 2 Territories.

[1] Included with "Other States."
[2] Includes the following States and numbers of plants in 1948 (1947 same as 1948 unless shown differently in parentheses): Arizona 2 (1), Arkansas 1, Colorado 1, Connecticut 1, Florida 1, Indiana 1, Maine 2, Michigan 1, Minnesota 1, Montana 1, Nevada 1, New Jersey 3, New York 2 (3), Oklahoma 1, Puerto Rico 3 (2), South Dakota 1, Utah 2, Washington 1, and Wisconsin 6; 1947 totals also include 2 plants in Vermont.

CONSUMPTION AND USES

Lime, which was once considered to be primarily a building material, is still used as such in substantial quantity but now finds its largest markets in the chemical and industrial field. As shown in the accompanying table, sales of lime to the chemical and other processing industries continued to increase in 1948. The boom in building was reflected in a 13-percent increase in demand for building lime. Dead-burned dolomite, used as a refractory, increased 11 percent, and agricultural lime decreased 5 percent, which compares with a 12-percent decline in 1947. Other important markets that expanded during the year are calcium carbide and cyanamide, paper mills, sewage and trade-wastes treatment, and water purification.

The accompanying table of lime sales classified by uses provides considerable additional data on current markets, and the table of sales by States and uses indicates the major markets of the lime produced in individual States.

Lime sold by producers in the United States in 1948, by States and uses

[1] Included with "Undistributed."
[2] Bleach used in paper mills excluded from "Bleach" and included with "Paper mills."
[3] Includes baking powders, citrates, fruit juices, tartrates, and unspecified food products.
[4] Includes flotation, cyanidation, bauxite purification, and magnesium manufacture.
[5] Includes mold coating and unspecified metallurgical uses.
[6] Includes acid neutralization, alcohol, magnesia (85 percent), polishing compounds, retarder, sulfur, tobacco, and miscellaneous industrial uses; in addition, asphalts and other bitumens and calcium carbonate (precipitated) in 1947 and alkalies, chromates and bichromates, and wood distillation in 1948.
[7] Includes lime used by producers (captive tonnage) as follows—1947: 392,223 tons, valued at $2,821,404; 1948: 362,368 tons, $2,843,972.

Hydrated lime sold by producers in the United States, 1947–48, by uses

Grand total hydrated lime	1,757,823	18,449,182	10.50	1,822,663	20,962,879	11.50

[1] Includes glass, glue, grease (lubricating), magnesia (85 percent), medicines and drugs, rubber, and miscellaneous industrial uses.

The table of agricultural lime and other liming materials includes oystershells, limestone, and marl, as well as lime, to provide a more comprehensive picture.

Agricultural lime and other liming materials sold by producers in the United States, 1947–48, by kinds

Kind	1947				1948			
	Short tons		Value		Short tons		Value	
	Gross weight	Effective lime content [1]	Total	Average	Gross weight	Effective lime content [1]	Total	Average
Lime:								
Quicklime	106,364	90,410	$913,992	$8.59	103,039	87,580	$932,871	$9.05
Hydrated lime	233,999	163,800	2,243,846	9.59	220,261	154,180	2,363,200	10.73
Oystershells (crushed) [2]	46,447	21,830	189,164	4.07	48,505	22,800	333,787	6.88
Limestone	22,605,500	10,624,590	35,075,883	1.55	20,941,530	9,842,520	32,034,698	1.53
Calcareous marl	176,187	74,000	235,190	1.33	114,759	48,200	145,712	1.27
Total		10,974,630	38,658,075			10,155,280	35,810,268	

[1] Calculated upon basis of average percentages used by the National Lime Association, as follows: Quicklime (including lime from oystershells), 85 percent; hydrated lime, 70 percent; pulverized uncalcined limestone and oystershells, 47 percent; calcareous marl, 42 percent.
[2] Figures compiled by Fish and Wildlife Service.

Apparent Consumption.—Although the production of lime is widely distributed throughout the United States and most of it is used near the point of production, there is a considerable interstate trade in this commodity. The principal States that "export" to other States are Ohio, Missouri, Pennsylvania, and West Virginia. The pattern of the interstate movement of lime, as well as the consumption totals in each State, are indicated in the following three tables.

Apparent consumption of open-market lime in continental United States in 1948, by States, in short tons

State	Sales by producers	Shipments from State [1]	Shipments into State	Apparent consumption		
				Quicklime	Hydrated lime	Total

Virgin Islands	80	2,100	142	3,160	57	1,603	100	2,313

[1] Figure not available.

PRICES

Lime prices continued to rise in 1948. In 1947 the average valuation of all lime sold was $9.42 per ton, and in 1948 it had increased to $10.35. Quicklime was valued at an average of $9.96 in 1948 ($9.04 in 1947) and hydrated lime at $11.50 ($10.50 in 1947).

FOREIGN TRADE [2]

Imports.—As shown in the accompanying tables, only a relatively small quantity of lime was imported into the United States. Most of this entered from Canada and served local needs in the border area. The largest tonnage enters through the Washington customs district.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Lime imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Hydrated lime		Other lime		Dead-burned dolomite [1]		Total	
	Short tons [2]	Value	Short tons [2]	Value	Short tons [2]	Value	Short tons [2]	Value

TECHNOLOGY

The use of lime as a road-stabilizing agent has been receiving increasing attention recently, and the industry believes that the prospect of expansion in this market is promising. A report on the subject was published.[3]

Work on radioisotopes is beginning to throw more light on the processes by which liming of soil aids plant growth. Radioactive calcium is used as a tracer element.[4]

Whereas limestone is considered to be one of the most widely distributed and easily available minerals, industry is learning that properly located deposits having the magnitude and quality required for various high-specification uses are becoming harder to find. During the past few years, a number of firms have carried on extensive exploration programs and found the search surprisingly difficult. On the basis of such experience, the lime industry has proposed that depletion-allowance laws be liberalized.

The problems of stream and air pollution have become serious in the United States; consequently, widespread efforts are being made to improve the conditions. As it is one of the materials used in pollution control, lime is benefiting from this development. During 1948 Public Law 845 was passed, providing for Federal assistance in water-pollution control.

A description of the application of the Fluosolids method of calcination to the production of lime was described.[5]

Magnesium

By RICHARD H. MOTE AND HORACE F. KURTZ

GENERAL SUMMARY

ALTHOUGH the apparent consumption of primary magnesium nearly doubled in 1948 owing to new and expanded uses of magnesium, the quantities required for these uses failed to create a demand for the metal large enough to stimulate production. As a result, the domestic outputs of primary and secondary magnesium dropped 19 and 18 percent, respectively, from 1947. As in 1947, the entire production of primary magnesium was obtained by undercapacity operation of the Dow Chemical Co. Magnesium Division plant at Freeport, Tex. Overshadowing the comparatively unimpressive record of production and consumption, however, were the important metallurgical and manufacturing advances in 1948 which served further to establish the practical usage of magnesium as a common commercial metal rather than a premium aircraft material.

Salient statistics of the magnesium metal industry in the United States, 1939–43 (average) and 1944–48

	1939–43 (average)	1944	1945	1946	1947	1948
Production of primary magnesium [1] short tons	51,691	157,100	32,792	5,317	12,344	10,003
Quoted price per pound [2] cents	23.9	20.5	20.5	20.5	20.5	20.5
Exports [3] short tons	8,837	21,001	518	207	315	274
World production do	103,500	[4] 231,000	54,900	12,900	[4] 21,800	20,900

[1] Ingot equivalent.
[2] Lowest nominal price (New York) for primary metal ingot, 99.8 percent pure, carlots.
[3] Magnesium metal and alloys, 1940 and 1943–45; metal, 1939, 1941–42, and 1946–48.
[4] Revised figure.

Domestic virgin ingot, commercially pure, was priced at 20.5 cents per pound throughout 1948. Estimated world production of magnesium totaled 20,900 short tons, a slight reduction from the 1947 output.

PRODUCTION

Primary.—The domestic output of primary magnesium in 1948 totaled 10,003 short tons, a decrease of 19 percent from the previous year. The rate of production declined from 883 short tons in January to a low level of 766 tons in June, but then increased to 932 tons per month by December. The entire 1948 output was produced from sea water by the electrolytic process at the Freeport, Tex., plant of the Dow Chemical Co. This plant has been the only primary magnesium metal producer in the United States since July 1946. The plant was operated at the minimum economic level, but output exceeded demand, as evidenced by sales. Total sales reached 8,489 tons, a gain of 61 percent over 1947, and the first increase since the wartime peak in 1943.

Production of primary magnesium (ingot equivalent), in the United States, 1942–48, by months, in short tons [1]

[2] Excludes crystal equivalent of magnesium content of incendiary bomb mixture ("goop")—460 tons in 1943 and 6,473 tons in 1944.

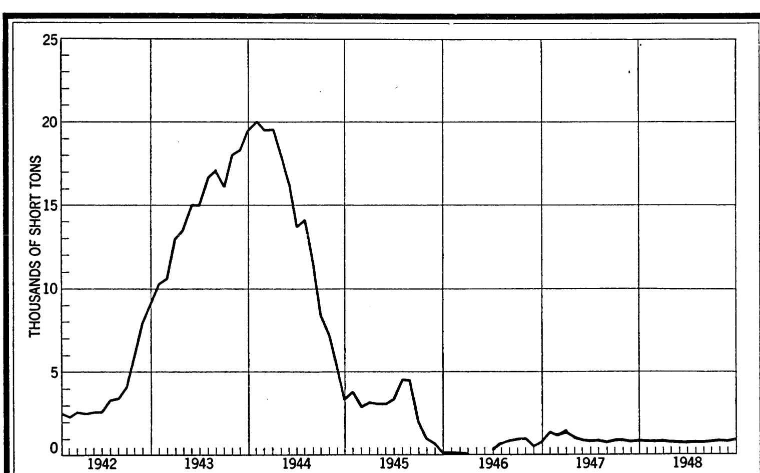

FIGURE 1.—Domestic production of primary magnesium, 1942–48.

Six primary magnesium plants, including two electrolytic reduction plants at Velasco, Tex., and Painesville, Ohio, and four ferrosilicon reduction plants at Luckey, Ohio, Canaan, Conn., Manteca, Calif., and Wingdale, N. Y., were being reconditioned by the Public Buildings Administration at the end of 1948. The object of this program was to put plants in stand-by condition, except for the replacement of missing equipment, and to provide for procurement of such equipment so that production could begin on 120 days' notice. Portions

Production, sales, exports, and apparent consumption of primary magnesium in the United States, 1944–48, in short tons

Year	Production		Sales	Exports [1]	Apparent consumption [2]
	Raw, crude, and pure ingot	Ingot equivalent			
1944	[3] 161,935	[3] 157,100	146,585	4,830	141,755

[1] Primary metal only. Alloy exports in addition: 16,171 tons in 1944, 22 tons in 1945, and none in 1946–48.
[2] Does not consider fluctuations in consumers' stocks and metal derived from scrap. Withdrawals from producers' stocks totaled 10,704 tons in 1945 and 3,599 in 1946. Additions to producers' stocks totaled 10,515 tons in 1944, 7,080 tons in 1947, and 1,514 tons in 1948.
[3] Does not include magnesium content of incendiary mixture produced direct.

of the ferrosilicon reduction plant at Spokane, Wash., held by the War Assets Administration, were leased to the Chromium Mining & Smelting Co. and the Pend Oreille Mining Co. for experimental production of ferrosilicon, ferro-alloys, and metallic zinc.

In April 1948 the War Assets Administration announced disposal of its Basic Magnesium plant at Henderson to the State of Nevada. With a rated annual capacity of 56,000 tons, this electrolytic plant was the largest of the 13 plants constructed by the Government during World War II for the production of magnesium. At the end of the year it was indicated that the sale of the Government-owned half of the Freeport, Tex., plant to the Dow Chemical Co. might soon be consummated. Operating at full capacity, a production level of 20,000 tons per year could be attained at this plant.

Despite the fact that 1948 production totaled only 5 percent of the 1943 peak wartime year, output was sustained at a higher level than prewar, and the industry generally looked forward to long-term growth in use of the metal. A deterrent to the increased production of primary magnesium was the availability of scrap, also considerably greater than before the war. Classified as a strategic metal, magnesium presented problems to the Government which resolved chiefly into maintaining enough operable facilities for immediate expansion, rather than in the supply of raw material.

Secondary.—Recovery of secondary magnesium, including alloying ingredients and secondary magnesium incorporated in primary ingot, totaled 7,834 short tons in 1948 compared with 9,503 tons from the same sources in 1947. Of this quantity, 7,417 tons were recovered from 8,163 tons of magnesium-base scrap in 1948. Old scrap constituted about 54 percent of the scrap consumed compared with 42 percent (revised figure) in 1947 and 24 percent in 1946. Of the 1948 recovery, 4,604 tons were in ingot form, 1,301 tons in castings, 1 ton in magnesium-alloy shapes, 1,388 tons in aluminum-base alloys, 6 tons in zinc-base alloys, 450 tons in anodes and strip for cathodic protection, and 84 tons in chemicals and other nonrecoverable forms. Additional information on secondary magnesium may be found in the Secondary Metals—Nonferrous chapter of this volume.

CONSUMPTION AND USES

Since the close of World War II, the consumption pattern of magnesium has undergone radical changes. Magnesium was the first major metal removed from wartime priority controls. Following this action in October 1945, the use of scrap became an important source of the metal, and the quantities and types of products made from primary magnesium were severely altered, as indicated in the accompanying table. Actual consumption of primary magnesium declined steadily from 1944 until mid-1948. The use of magnesium increased thereafter, however, and total consumption in 1948 was 41 percent above that in the preceding year. Consumers expressed the opinion that the consumption trend was reversed as a result of the rearmament program and the increasing awareness of the advantages of magnesium for lightweight castings.

Actual domestic consumption of primary magnesium (ingot equivalent and magnesium content of magnesium-base alloys) in 1944–48, by uses, in short tons

[1] Figures are incomplete owing to lack of returns from a number of wartime companies whose operations terminated during the year.
[2] Revised figures.
[3] Less than 1 ton.
[4] Includes primary metal consumed in making secondary alloy.

Consumption of magnesium in structural products in 1948 rose 53 percent, while use in all other products gained 25 percent. The most noteworthy advances were made in castings, extrusions, aluminum alloys, chemicals, and cathodic protection. Use of magnesium for sheet, forgings, other alloys, and scavenger and deoxidizer remained virtually unchanged, and consumption for magnesium powder was virtually nonexistent.

Sand castings, comparatively high priced, were largely confined to applications where lightness commanded a premium, but totaled 90 percent of the magnesium castings produced in 1948 and registered the greatest gain of all the items recorded. On the other hand, permanent mold and die castings, which were more competitive on a price basis, comprised only 10 percent of the total output of castings. Chief remedy for furthering magnesium's competitive position with aluminum and gray iron in the casting industry was thought to lie in demonstrations to manufacturers.[1] The Bureau of the Census, U. S. Department of Commerce, reported that shipments of magnesium castings and wrought products increased 7 and 22 percent, respectively, in 1948.

The aircraft industry remained the largest consumer of structural magnesium in 1948; the much discussed B–36 bomber probably required the greatest tonnage per plane, but new high-speed planes were also employing large quantities. Of the many other applications of magnesium in the transportation field, development of truck bodies and parts played a leading role during the year. The increased use of magnesium engraved plates to eliminate stereotype and electrolytic plates in printing was apparent in 1948. Magnesium was used in previous years as an anode to prolong the life of underground pipe lines where conditions leading to electrolytic corrosion were present, but the huge increase in its use for cathodic protection during 1948 resulted from its almost universal adoption as an anode in hot-water tanks. Other new uses for the metal included improvements in such consumers' goods as furniture, wheelbarrows, and small boats, and numerous items in which magnesium was substituted for aluminum.

As a result of the Air Force expansion program, the magnesium industry appeared to have a much larger market than at any time since the close of World War II. Enlargement of the industry for civilian consumption awaited reduction in fabrication costs. However, efforts of industry to inform consumers of the advantages of the metal in lightness, machinability, stability, strength, versatility, and availability apparently have brought some results.

STOCKS

Producer stocks at the Freeport, Tex., plant increased by the end of 1948 to nearly the equivalent of 1 year's production. Stocks at consumers' plants decreased slightly during the year.

About 50,000 tons of magnesium remained in the hands of Federal agencies at the close of 1948. Approximately half was in the form of incendiary bomb bodies made of low-zinc magnesium alloy.[2] Although regulations issued by the War Assets Administration did not permit release of this material in quantities greater than 375 tons per month, the fact that it was available constituted a threat to the magnesium market. Plans were discussed by interested Government agencies for demilitarizing the bomb bodies, but no action was taken during 1948. A stipulation that this metal, if used, must remain identifiable as magnesium, prevented aluminum companies from using it as an alloying ingredient. The remainder of the 50,000 tons of magnesium was held by the Bureau of Federal Supply in ingot form. Storage of the magnesium ingots in a manner that would prevent

[1] American Metal Market, American Magnesium Corp. Official Discusses Marketing of Castings: Vol. 56, No. 86, May 4, 1949, pp. 9, 12.

deterioration persisted as one of the foremost problems relative to stock-piling this material.

PRICES

Throughout 1948 the base price of standard virgin magnesium ingot remained unchanged at 20.5 cents a pound, the price established in January 1943. Reductions of approximately 10 percent on extrusions were announced early in 1948 as a result of processing improvements. Prices of principal primary casting alloys and secondary magnesium ingot, however, were virtually unchanged during the year.

The price of primary ingot in United Kingdom was quoted at 1s. 2d. per pound in 1948. In the latter part of the year, the French Price Directorate released magnesium from price control.

FOREIGN TRADE[3]

Imports.—Magnesium imports during 1948 increased 237 percent over the 201 tons received in 1947. Although statistics on magnesium imports were not recorded separately before 1918 and although the United States obtained all its magnesium from Germany prior to World War I, demand for the metal was so small in the earlier years that the 1948 total of 678 tons was probably an all-time record. Except for a negligible quantity of alloys and sheets from Canada, all of the 1948 receipts were reported as metal and scrap. Part of the tonnage consisted of high-purity ingot made by the Pidgeon process in Canada. Of the total imports, 270 tons were from United Kingdom, 253 tons from Canada, 98 tons from Egypt, 36 tons from Australia, 12 tons from Belgium and Luxembourg, and 9 tons from the Bahamas. The tariff rates on magnesium in 1948 were as follows: Metallic—20 cents per pound, scrap—20 cents per pound (duty suspended until June 30, 1949), and alloys, sheets, etc.—20 cents per pound on magnesium content and 10 percent ad valorem.

Magnesium imported for consumption in the United States, 1946–48

[U. S. Department of Commerce]

Magnesium content	1946		1947		1948	
	Short tons	Value	Short tons	Value	Short tons	Value
Metallic and scrap [1]	241	$110,983	201	$87,499	678	$184,066
Alloys	(2)	3			(2)	57
Sheets, tubing, etc	(2)	621	1	11,902	(2)	943

[1] Gross weight.
[2] Less than 1 ton.

Exports.—Magnesium exports in 1948 totaled 444 tons, a gain of 25 percent over 1947. Mexico received 249 tons of the exports of metal in primary form; Canada received 18 tons; Germany, 6 tons; Brazil, 1 ton; and Netherlands and Finland, each less than 1 ton.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Increased shipments of powder and metal in other forms more than compensated for the decline in exports of metal in primary form, as 57 tons went to Venezuela, 54 to Saudi Arabia, 35 to Canada, 7 to Colombia, 7 to Finland, 6 to the Netherlands, and the remainder to 10 other countries.

Exports of magnesium from the United States, 1946–48

Powder	12	6,104				

TECHNOLOGY

Many new metallurgical developments were revealed by the magnesium industry in 1948. Among the more outstanding was a new process for electroplating magnesium.[4] The method consists of preparing a reactive surface, immersing it in a solution that deposits a thin zinc coating, and plating with the usual finishes in a standard bath. The process involves the same number of steps used in electroplating other metals, and finished products proved satisfactory to physical tests. Notable advances were also made during the year in joining methods. Furnace, flux dip, and torch brazing were made applicable to magnesium by processes announced by the Dow Chemical Co. The method employs Dowmetal C as the filler and conventional gas-welding type fluxes and requires temperatures within the range of 1,075°–1,180° F. Another develpoment was the successful arc welding of heavy magnesium plates in one pass. The new welding procedure, which employs alternating current, enables single-pass butt welds to be made in plates over ½ inch thick without previous beveling.

The results of further experimental work on magnesium batteries was disclosed during 1948. Using magnesium in the negative electrode of dry cells patterned after the conventional Leclanché flashlight unit, greater voltages and higher capacities than comparable zinc batteries were reached. Acceptance of magnesium for such cells would mean lighter and smaller units or more powerful units of like sizes. Other significant advancements throughout the year were made in the fields of grain refinement, annealing, and rolling.

It was discovered that, by alloying small quantities of magnesium with gray cast iron, important gains in ductility and strength of the finished product could be achieved. Numerous experimentations were carried out on other alloys in 1948, with particular attention to cerium-, zirconium-, and lithium-containing magnesium-base alloys. Additions of zirconium or lithium tended to increase strength and

[4] Journal of Metals Technology Practice, Magnesium Industry: Vol. 1, No. 3, March 1949, pp. 86-87.

toughness, while cerium improved the properties of alloys at high temperatures. Early in the year, the American Society for Testing Materials drew up plans for revising the code designations of magnesium alloys, with the view toward eliminating small differences in classifications and devising a code applicable to all alloys currently in commercial production.

WORLD REVIEW

The world production of primary magnesium in 1948 was estimated at slightly less than 19,000 metric tons or about 4 percent below the 1947 total. Most of the decline was attributed to lower output in the United States, the world's largest producer. No appreciable gain in civilian demand was noted during the year, and, to a large extent, world markets continued to rely upon military consumption.

World production of magnesium metal, 1942–48, by countries, in metric tons

[1] Data not available; estimate by author of chapter included in total.
[2] January-February only. Planned production for March, 2,830 tons.
[3] Bizonal area.
[4] Estimated figure.
[5] Includes secondary metal.

Canada.—The ferrosilicon plant of Dominion Magnesium, Ltd., at Haley, Ont., produced calcium and small quantities of strontium and barium in 1948. The company had large enough stocks of magnesium, produced before the switch to calcium, to supply its markets during the year, but it appeared that magnesium production would have to be resumed in 1949 to replenish this inventory. Better market conditions were expected to follow, as a result of the installation of an extrusion press by the subsidiary, Light Alloys, Ltd. The Dominion Magnesium plant, constructed in 1942, utilizes the Pidgeon process, which produces magnesium of very high purity. The method is also unique in that it can readily be converted to production of several other base metals.

The Aluminum Co. of Canada continued to operate its magnesium plant at Arvida, Quebec, during 1948. The production process at this plant is a variation of the Dow electrolytic method. Brucite ore from the company mine in the Gatineau Valley is converted to magnesium chloride at Wakefield, Quebec, and shipped to Arvida for recovery of the metal.

China.[5]—It is believed that there has been no commercial production of magnesium in China since the close of the war. The Chinese National Government reported that it had no immediate plans for developing the industry because of the small demand for the metal. The Japanese are understood to have exploited deposits of magnesite in Liaoning Province and to have constructed plants at Yingkow and Shih-Ho for the production of magnesium ingot. Rated capacity for the two plants, which were believed to have been destroyed, was about 2,500 tons per year, but total output during 1939–44 did not exceed 700 tons.

France.—Production of magnesium in France declined about 19 percent in 1948. Because of large magnesia requirements in the steel industry and increasing demand for magnesium metal, consideration was given to the possibility of erecting an electrolytic magnesium plant for production from sea water. Construction of such a plant would eliminate the need for imports.

Japan.—During World War II, the annual magnesium productive capacity of the Japanse Empire was rated at 16,200 tons; but actually, output was never greater than 5,500 tons per year. Approximately half of the 1944 total came from Korea, Formosa, and Manchuria.

Japanese magnesium consumption in 1948 was estimated to be between 1,000 and 1,500 tons. The chief products were coins, telephone receivers, flashlights, printing blocks, portable tools, fireworks, and transportation equipment.

United Kingdom.—J. Freeman, Joint Parliamentary Secretary to the Ministry of Supply, stated that the three Government-owned plants that produced magnesium in 1945 were still Government property in 1948 but that production was considered uneconomical at current world prices. Existing stocks of metal were considered adequate for some time to come.

Magnesium Compounds[1]

By JOSEPH C. ARUNDALE AND F. M. BARSIGIAN

GENERAL SUMMARY

WITH the Nation's industry operating near capacity and expanding during 1948, consumer demand for such materials as refractory magnesia, dead-burned dolomite, and 85-percent magnesia insulation raised sales to new records.

Salient statistics of magnesite, magnesia, and dead-burned dolomite in the United States, 1944–48

	1944	1945	1946	1947	1948
Crude magnesite:					
Mined:					
Short tons	561,450	336,458	324,640	375,993	(1)
Value [2]	$4,407,461	$2,324,957	$2,225,850	$2,596,747	(1)
Caustic-calcined magnesia:					
Sold or used by producers:					
Short tons	139,243	43,270	45,178	[3] 26,831	33,209
Value	$6,481,963	$2,503,544	$2,854,538	[3] $2,508,624	$3,380,528
Average per ton [4]	$46.55	$57.86	$63.18	[3] $93.50	$101.80
Refractory magnesia:					
Sold or used by producers:					
Short tons	278,490	254,994	244,824	314,921	330,069
Value	$8,426,049	$7,414,218	$7,231,869	[3] $10,127,585	$13,444,587
Average per ton [4]	$30.26	$29.08	$29.54	[3] $32.16	$40.73
Dead-burned dolomite:					
Sold by producers:					
Short tons	1,290,790	1,187,334	1,007,983	1,395,203	1,544,755
Value	$11,441,612	$10,613,711	$10,101,707	$14,295,359	$17,847,182

[1] Bureau of Mines not at liberty to publish figure.
[2] Partly estimated; most of crude is processed by mining companies, and very little enters open market.
[3] Revised figure.
[4] Average receipts f. o. b. mine shipping point.

RESERVES

United States reserves of most of the magnesium minerals are large. Sea water and underground brines may be considered inexhaustible sources of magnesium. High-grade dolomite is available in enormous amounts, although no actual estimate of reserves is available. Reserves of high-grade magnesite in Washington and Nevada have been estimated at 8,000,000 tons, with probably 85,000,000 additional tons of lower-grade inferred ore as of 1944. Reserves of brucite in Nevada have been estimated at more than 70,000,000 tons. Although serpentine and olivine are not at present commercial sources of magnesia, they have been utilized to make other magnesium salts and are considered potential sources of refractory magnesia. When echnology makes this feasible, vast reserves are available.

[1] Former editions of this chapter included a section on miscellaneous salines, which now appears as a separate chapter titled "Salines—Miscellaneous."

883326—50——49

DOMESTIC PRODUCTION

Magnesite.—The tonnages of both caustic-calcined and refractory grades of magnesia sold or used by producers in the United States in 1948 were appreciably greater than in the previous year. Refractory magnesia was at an all-time high, whereas sales of caustic-calcined magnesia were less than in several past years. Statistics on output of crude magnesite during 1948 cannot be published by the Bureau of Mines, as they would reveal the production of individual companies.

Magnesia sold or used by producers in the United States, 1947–48, by kinds and sources

Magnesia	From magnesite, brucite, and dolomite [1]		From well brines, raw sea water, and sea-water bitterns [1]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1947						
Caustic-calcined	10,850	$1,005,920	[2] 15,981	[2] $1,502,704	[2] 26,831	[2] $2,508,624
Refractory	209,581	5,794,636	105,340	[2] 4,332,949	314,921	[2] 10,127,585
Total	220,431	6,800,556	[2] 121,321	[2] 5,835,653	[2] 341,752	[2] 12,636,209
1948						
Caustic-calcined	11,548	996,713	21,661	2,383,815	33,209	3,380,528
Refractory	214,628	7,954,089	115,441	5,490,498	330,069	13,444,587
Total	226,176	8,950,802	137,102	7,874,313	363,278	16,825,115

[1] Magnesia made from a combination of dolomite and sea water is included with that from sea water.
[2] Revised figure.

Dolomite.—The high level of industrial activity was reflected in record sales of dead-burned dolomite for use as a refractory in steel furnaces and other metallurgical furnaces.

The installation of a large kiln at the Maple Grove, Ohio, plant of Basic Refractories, Inc., was reported to have increased this company's capacity for burning dolomite by 40 percent.[2] A history and description of this operation were presented.[3]

Additional information on dolomite may be found in the Stone and Lime chapters of this volume.

Dead-burned dolomite sold in and imported into the United States, 1944–48

Year	Sales of domestic		Imports [1]		Year	Sales of domestic		Imports [1]	
	Short tons	Value	Short tons	Value		Short tons	Value	Short tons	Value
1944	1,290,790	$11,441,612	40	$691	1947	1,395,203	$14,295,359	53	$2,194
1945	1,187,334	10,613,711	(2)	7	1948	1,544,755	17,847,182	2,427	91,613
1946	1,077,983	10,101,707							

[1] Reported as "Dead-burned basic refractory material."
[2] Less than 1 ton.

[2] Rock Products, vol. 51, No. 11, November 1948, p. 65.
[3] Pit and Quarry, vol. 40, No. 11, May 1948, pp. 82–85, 100.

Other Magnesium Compounds.—Production of both the light and heavy high-grade magnesias in 1948 was substantially greater than in the previous year. The heavy demand for 85-percent magnesia insulation, created by the large volume of industrial expansion, largely accounted for an increase in production of "technical carbonate."

An article was published describing a new sulfite pulping process being put into operation by the Weyerhaeuser Timber Co. at its Longview, Wash., plant. This process involved substitution of magnesium oxide for the calcium chemicals in the pulp mill digesters. A cyclic magnesia-base sulfite process eliminates the waste-liquor disposal problem.[4]

Specified magnesium compounds produced, sold, and used by producers in the United States, 1947–48

Product [1]	Plants [1]	Produced (short tons)	Sold [2]		Used (short tons)
			Short tons	Value	
1947 [3]					
Specified magnesias (basis 100 percent MgO), U. S. P. and technical:					
Extra-light and light	6	1,591	1,575	$792,026	(4)
Heavy	4	726	682	285,554	
Total	[5] 6		2,257	1,077,580	(4)
Precipitated magnesium carbonate	12	58,142	8,045	885,255	49,740
1948					
Specified magnesias (basis 100 percent MgO), U. S. P. and technical:					
Extra-light and light	6	1,826	1,837	909,697	(4)
Heavy	3	1,386	1,289	717,549	
Total	[5] 6		3,126	1,627,246	(4)
Precipitated magnesium carbonate	11	60,898	7,315	939,306	52,798

[1] In addition in 1947–48, magnesium chloride was produced by 4 plants and magnesium sulfate by 1 plant.
[2] Sales by a producer to an affiliated consumer for immediate use are not included with "Sold" but are with "Used."
[3] Revised figures.
[4] Bureau of Mines not at liberty to publish figure.
[5] A plant producing more than 1 grade is counted but once in arriving at total.

REVIEW BY STATES

The following review summarizes the activities of firms producing magnesium minerals (except dolomite) and compounds.

California.—Johns-Manville Products Corp., 22 East Fortieth Street, New York 16, N. Y., produced magnesium carbonate from purchased magnesium hydroxide at Redwood City, Calif., for use in 85-percent magnesia insulation. Marine Magnesium Products Corp., South San Francisco, Calif., recovered precipitated magnesium carbonate, magnesium hydroxide, and specialty magnesias, using lime, dolomite, and water from San Francisco Bay as raw materials. The Paraffine Co., Inc., 1550 Powell Street, Emeryville 8, Calif., produced magnesium carbonate from purchased magnesium hydroxide for use in 85-percent magnesia. The Permanente Metals Corp., Oakland, Calif., operated its magnesia-from-sea-water plant at Moss Landing, producing refractory and caustic-calcined magnesias. Westvaco

[4] Chemical Age (London), vol. 59, No. 1533, Nov. 27, 1948, pp. 724–725.

Chemical Division of Food Machinery & Chemical Corp., 405 Lexington Avenue, New York 17, N. Y., recovered magnesite from its Western mine near Livermore. At its Newark plant, the firm produced refractory- and caustic-grade magnesia from sea-water bitterns and dolomite and caustic-calcined magnesia from magnesite. It also recovered magnesium chloride from sea-water bitterns at Chula Vista.

Illinois.—Johns-Manville Corp., 22 East Fortieth Street, New York 16, N. Y., produced precipitated magnesium carbonate by the Pattinson process at its Waukegan, Ill., plant for use in 85-percent magnesia insulation.

Michigan.—The Dow Chemical Co., Midland, Mich., produced magnesium chloride and epsom salts from well brines, dolomite, and lime. Michigan Chemical Corp., St. Louis, Mich., produced magnesium carbonate, hydroxide, and magnesia from well brines, dolomite, and lime. The Morton Salt Co., 120 South LaSalle Street, Chicago 4, Ill., produced precipitated magnesium carbonate from well brines and lime at its Manistee, Mich., plant. Standard Lime & Stone Co., 2000 First National Bank Bldg., Baltimore 3, Md., at its plant at Manistee, produced refractory-grade magnesia from well brines and lime.

Nevada.—Basic Refractories, Inc., 845 Hanna Building, Cleveland 15, Ohio, produced brucite at its quarry at Gabbs. Most of this material was shipped to its plant at Maple Grove, Ohio, where it is processed into a line of refractories. Sierra Magnesite Co., Box 8–A, Newark, Calif., mined magnesite at Gabbs for caustic-calcined uses.

New Jersey.—The J. T. Baker Chemical Co., Phillipsburg, N. J., produced magnesia and magnesium chloride and nitrate from purchased magnesium carbonate. Johns-Manville Corp., at its Manville plant, produced precipitated magnesium carbonate by the Pattinson process for use in 85-percent magnesia insulation. Northwest Magnesite Co., 1916 Farmers Bank Building, Pittsburgh 22, Pa., recovered refractory-grade magnesia from sea water and dolomite at its Cape May, N. J., plant.

Ohio.—The Diamond Alkali Co., 300 Union Commerce Building, Cleveland, Ohio, produced refractory magnesia from dolomite at Fairport.

Pennsylvania.—Both The Philip Carey Manufacturing Co., Cincinnati 15, Ohio, plant at Plymouth Meeting, Pa., and Keasbey & Mattison Co., Ambler, Pa., produced magnesia and precipitated magnesium carbonate. Ehret Magnesia Manufacturing Co., Valley Forge, Pa., produced precipitated magnesium carbonate. All three firms used the Pattinson process, and the magnesium carbonate was for use in 85-percent magnesia insulation.

Texas.—The Dow Chemical Co., at Freeport, Tex., recovered magnesium chloride from sea water as an intermediate in the production of magnesium metal.

Washington.—Northwest Magnesite Co., 1916 Farmers Bank Building, Pittsburgh, Pa., produced refractory magnesite near Chewelah. This operation remained the largest magnesite producer in the United States.

West Virginia.—The Standard Lime & Stone Co., continued its recovery of refractory magnesia by leaching calcined dolomite at its Millville plant and produced magnesium carbonate from dolomite by the Pattinson process.

PRICES

According to E&MJ Metal and Mineral Markets, the price of dead-burned grain magnesite, per ton, f. o. b. Chewelah, Wash., in bulk, was increased to $31 during the year. The Westvaco Chemical Division of Food Machinery & Chemical Corp. quoted prices of its magnesias (carlots, f. o. b. California) as follows: Bulk and powdered caustic-calcined magnesite remained at $64 in bulk and $70 powdered in bags. No change occurred in the price of calcined sea-water magnesia, which remained at $64 per ton in bags, powdered. On April 1, 1948, kiln-run 90-percent sea-water periclase was advanced to $50.50 per ton.

According to the Oil, Paint and Drug Reporter, magnesium hydroxide, medicinal grade, was quoted at 29 to 30 cents per pound, as for the past few years; magnesium carbonate, technical grade, bags, carlots, freight equalized, was quoted at 9 cents per pound, and magnesium carbonate, U. S. P. grade, at 10¾ cents per pound at the end of 1948. Magnesium carbonate is quoted freight allowed to New Jersey (except to Atlantic, Burlington, Cape May, Cumberland, Gloucester, Ocean, and Salem Counties) and to Philadelphia County, Pa. Freight equalized with New York City on all other destinations. Magnesium chloride, flake, barrels, carlots, works, was quoted at $40 per ton in December. Epsom salts, technical, bags, carlots, remained at $2.30 per 100 pounds. At the end of the year, magnesia, calcined, technical cartons, works, was quoted at 32 cents per pound; synthetic, rubber grade, cartons, works, at 29 cents per pound; U. S. P. light, cartons, at 34 cents per pound; heavy, barrels, at 36 cents per pound.

FOREIGN TRADE [5]

The accompanying tables showing imports of the various grades and types of magnesite and magnesium compounds indicate the degree of self-sufficiency of the United States as regards these materials. In recent years imports have been very small compared with domestic consumption.

---

[5] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Magnesite imported for consumption in the United States, by countries, 1946–48

[1] Unless otherwise stated, quantities in this table represent crude magnesite mined. In addition to countries listed, magnesite is also produced in Anglo-Egyptian Sudan, Brazil, Canada, China, Cuba, Czechoslovakia, Egypt, U. S. S. R., and Yugoslavia, but data on tonnage of output are not available; estimates by senior author of chapter included in total.
The Canadian production was actually magnesitic dolomite and brucite, valued as follows: 1942: C$1,059,374; 1943: C$1,260,056; 1944: C$1,139,281; 1945: C$1,278,596; 1946: C$1,225,593; 1947: C$1,201,457 1948: C$1,722,341.
[2] Data not available; estimate by senior author of chapter included in total.
[3] Estimate.
[4] January to June, inclusive.
[5] Bureau of Mines not at liberty to publish figure, included in total.

U. S. S. R.—According to *Ogneupory* (February 1948), material progress was made in Russian output of refractories in 1947, and it was expected that production would be augmented during 1948. The production of "magnesite materials" during 1947 was said to have increased 17 percent over 1946 and calcined dolomite, 14 percent. Total refractory output during 1948 was expected to increase 14 percent.[7]

Manganese

By NORWOOD B. MELCHER

GENERAL SUMMARY

HIGH requirements for manganese ore, coupled with dwindling supplies from some of the important world sources of this strategic commodity, caused increasing alarm in industry and Government during 1948. The demand was met only by reducing industry stocks by 27 percent. Without an early remedy to this situation, serious losses in steel production will result. All possible sources of manganese ore were reappraised during the year to determine what actions could be taken to increase supply to meet industrial demand, with a surplus large enough to permit the increase of industry inventories and accumulation in the National Strategic Stock Pile.

A review of the statistics for 1948 discloses that the total supply of manganese ore during 1948 was inadequate to meet industrial demands. Industry stocks of metallurgical ore, which were reduced by 239,705 short tons during the year, amounted to a bare 4-month supply on December 31, 1948. The seriousness of the diminishing supplies was emphasized when it was realized that 34 percent of receipts came from Russia, a nation that supplied none during several of the World War II years when the total receipts were considerably above the 1948 total. In most of the large producing nations of the world, transportation deficiencies constituted the chief obstacle to increasing exports of manganese ore during 1948. India, which has large reserves of manganese ore, was reorganizing its railroad transportation system, which had deteriorated owing to the heavy traffic of World War II; imports from India in 1943 totaled 575,839 short tons, whereas less than half as much was shipped to the United States during 1948. Exports of manganese ore from India were placed under a licensing system in 1948, and negotiations with that country resulted in a quota for 1949 of 400,000 gross tons, or twice the 1948 performance. At the close of 1948 it appeared that many years would elapse before exports to the United States exceeding 400,000 tons per year would be possible owing to domestic difficulties in India, particularly those connected with rail transportation.

The Union of South Africa, which shipped manganese ore to the United States at about the same rate as India in 1948, was also in a position to ship larger quantities if its railroad car capacity could be expanded. A program was undertaken in 1948 to supply 4,000 new railway cars to the Union from Canada, using steel from the United States allocated for that purpose. Further capacity would be realized in 1949 through shipments of wheel and axle sets from the United States. Ore shipments from Brazil are not expected to exceed 200,000 tons per year until large deposits in the State of Matto Grosso or the Territory of Amapa are put into production. Shipments from present sources, particularly Minas Gerais, are limited by transportation shortages, inadequate reserves, and a desire by the Brazilian Government to maintain production in that area for domestic use. Manganese-ore production facilities in Gold Coast operated at a high rate during 1948, but the bulk of the ore was shipped to the United Kingdom, Canada, and Norway. However, much of the manganese from the two latter countries was converted to ferromanganese for shipment to the United States. Of the Gold Coast ore shipped direct to the United States, approximately half was of battery grade. Cuba, which was a large supplier of metallurgical ore before 1947, has become relatively unimportant owing to exhaustion of reserves. Mexico supplied over 60,000 tons to the United States in 1948, but its reserve position will not support large increases of these exports.

Salient statistics of the manganese industry in the United States, 1944–48, gross weight in short tons

	1944	1945	1946	1947	1948
Manganese ore (35 percent or more Mn):					
Mine shipments:					
Metallurgical ore	241,170	174,295	134,381	125,428	119,828

Consumption	160,497	148,087	112,700	120,019	102,392

[1] A small quantity of miscellaneous ore is included with battery ore.
[2] Revised figure.

Shipments from domestic mines during 1948 were virtually unchanged from the previous year, although a slightly larger proportion was battery ore. As in 1947, nearly all of the production originated in Montana, while small shipments of metallurgical ore were made from Arizona, Arkansas, and Tennessee, and chemical ore was shipped from Virginia.

Prices of manganese ore in the United States increased only slightly in 1948 in spite of the high demand. The import duty continued unchanged throughout 1948 at one-fourth cent per pound of contained manganese, a rate established in October 1947 (effective January 1, 1948), as a result of the Geneva conference of the International Trade Organization, when the rate was cut in half.

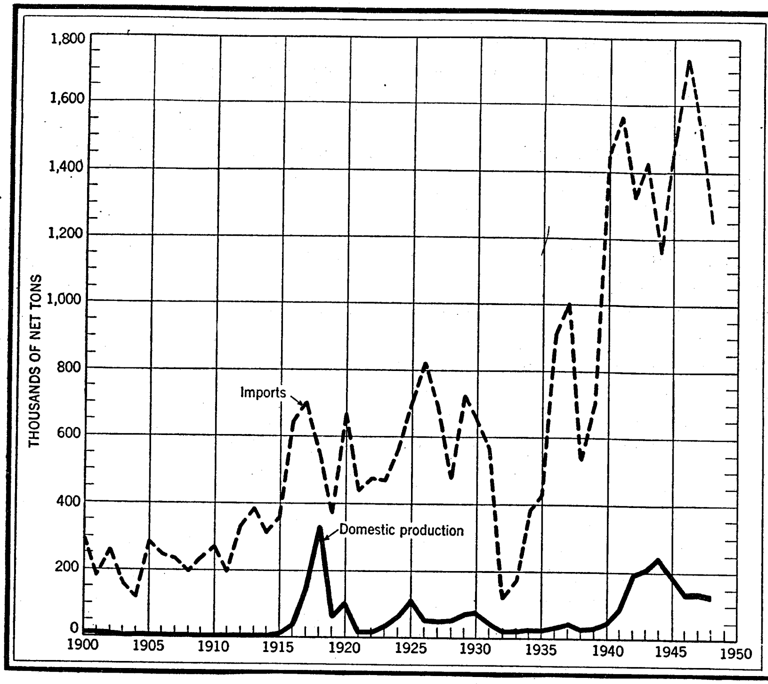

FIGURE 1.—General imports and domestic production (mine shipments) of manganese ore, 1900–48.

DOMESTIC PRODUCTION

The following table shows the various types of manganiferous materials shipped by domestic producers from 1944 to 1948.

Manganiferous raw materials shipped by producers in the United States, 1944–48, in short tons

Year	Metallurgical ore				Battery ore (35 percent or more Mn)	Miscellaneous ore	
	Manganese ore (35 percent or more Mn)	Ferruginous manganese ore (10 to 35 percent Mn)	Manganiferous iron ore (5 to 10 percent Mn)	Manganiferous zinc residuum		35 percent or more Mn	10 to 35 percent Mn
1944	241, 170	296, 981	1, 190, 476	247, 402	6, 224	222	155
1945	174, 295	114, 327	1, 408, 527	224, 331	8, 042		
1946	134, 381	100, 402	1, 070, 694	205, 786	[1] 8, 295	[1] 959	87
1947	125, 428	128, 562	1, 044, 961	227, 547	6, 189	10	832
1948	119, 828	139, 580	1, 198, 523	291, 383	10, 845	427	2, 462

[1] A small quantity of miscellaneous ore is included with battery ore.

Shipments of various grades of manganese-bearing ores during the last 5 years are given by States in the following tables. In addition, battery and miscellaneous ores were produced intermittently in Montana, South Carolina, and Virginia, and manganiferous zinc residuum was produced from New Jersey zinc ores.

Manganiferous iron ore shipped from mines in the United States, 1944–48, by States, in short tons

State	1944	1945	1946	1947	1948
Michigan	45, 689	1, 680	-------	-------	-------
Minnesota	1, 144, 787	1, 406, 847	1, 070, 694	1, 044, 961	1, 198, 523
Total	1, 190, 476	1, 408, 527	1, 070, 694	1, 044, 961	1, 198, 523

Arizona.—The Denison Manganese Co. shipped manganese ore containing (natural) 48 percent Mn from the Long Valley and Heber mines in Coconino County.

Arkansas.—Manganese ore containing 49 percent Mn (natural) and ferruginous manganese ore containing less than 35 percent Mn were shipped by the Denison Manganese Co. from the Pfeiffer and Cushman mines during 1948.

Minnesota.—The Hanna Coal & Ore Corp. and Pickands, Mather & Co. shipped manganiferous iron ore from mines in Crow Wing County from the Cuyuna range. This ore, used mainly in the manufacture of manganiferous pig iron, averaged (natural) only 6.03 percent Mn during 1948.

Montana.—The Anaconda Copper Mining Co. shipped 91 percent of the total manganese ore from United States mines in 1948, and all but a fraction of 1 percent of the metallurgical ore. The product shipped by that company during the year consisted of nodules averaging 59.21 percent Mn from its operations at Anaconda, Mont. Much of this material was shipped to consuming plants in the eastern United States, but some was shipped to Great Falls, Mont., where Anaconda began the production of ferromanganese in electric furnaces.

Ore for the Anaconda operations came from the Alice, Anselmo, Emma, Badger State, and Travona mines—all in the Butte district.

The Taylor-Knapp Co. and the Trout Mining Division of American Machine & Metals, Inc., produced battery-grade concentrates from the Moorlight and Trout groups of mines, respectively, in the Philipsburg district. The battery material shipped from these properties averaged (natural) 66.23 percent MnO_2. The Trout mining division also produced a lower-grade middling to be used for metallurgical purposes.

Nevada.—The Charleston Hill National Mines shipped ferruginous manganese ore averaging 26 percent Mn from the Black Diablo mine in Pershing County to blast furnaces at Geneva, Utah.

New Mexico.—Ferruginous manganese ore averaging (natural) 10 percent Mn was shipped by the Luck Mining & Construction Co. from the Boston Hill mine in Grant County. This ore was shipped to blast furnaces at Pueblo, Colo.

Tennessee.—A small quantity of high-grade (57.96 percent Mn) ore was shipped by the Consolidated High-Grade Ore Co. from the Hambright mine in Bradley County. This ore was shipped to the Birmingham, Ala., area for consumption.

Utah.—Ferruginous manganese ore was shipped by the Blackbird Mining Co. from the Blackbird mine in Piute County and by Fred Staats from the Staats mine in Juab County during 1948. Other shipments from mines (names unreported) were made by Art Sessions from Grand County, American Mines from Juab County, and Manganese, Inc., from Piute County. All of the ore from Utah mines was shipped to blast furnaces at Geneva and Provo, Utah.

Virginia.—The manganese-bearing material shipped from Virginia in 1948 consisted mainly of products obtained from reworking tailings of the Dominion Manganese Corp. mine in Augusta County. Shipments consisted of manganese ore and ferruginous manganese ore for chemical purposes.

Manganese and manganiferous ores shipped from mines in the United States in 1948, by States

[4] Containing 5 to 10 percent manganese (natural).
[5] Bureau of Mines not at liberty to publish figure.

CONSUMPTION AND STOCKS

The consumption of manganese ore in 1948 increased 8 percent over the 1,419,131 tons used in 1947. In 1948, 92 percent was of foreign origin compared with 91 percent in 1947. Three percent was used in the manufacture of dry cells, 1 percent in the manufacture of chemicals, and 96 percent for metallurgical purposes. Industrial stocks of manganese ore decreased sharply during 1948 and totaled 640,842 tons on December 31 compared with 880,547 tons on December 31, 1947.

The following table shows ores available for consumption in the United States in 1948 without adjustment for changes in consumer or Government stocks.

Indicated consumption of manganiferous raw materials in the United States in 1948

	Ore containing 35 percent or more Mn		Ore and residuum containing 10 to 35 percent Mn		Ore containing 5 to 10 percent Mn	
	Short tons	Mn content (percent)	Short tons	Mn content (percent)	Short tons	Mn content (percent)
Domestic shipments	131,100	57.68	433,425	16.9	1,198,523	6.03

[1] Excluding Government stocks.
[2] Data not available.
[3] Includes only that part of castings made by companies that also produce steel ingots.
[4] Revised figure.
[5] Excludes companies that produce both steel castings and steel ingots.
[6] The greater part of the consumption of ore was used in the manufacture of ferromanganese and silicomanganese. Combining consumption of ore with that of ferromanganese and silicomanganese would result in duplication.
[7] Excludes small tonnage of producers' stocks.

The use of manganese in steel making decreased from 13.2 pounds (revised figure) per short ton of steel ingots in 1947 to 12.7 pounds in 1948. Of the manganese used in steel during 1948, 11.3 pounds was in the form of ferromanganese, 0.3 pound as spiegeleisen, 1.0 pound as silicomanganese, and 0.1 pound as manganese ore used directly. In 1947 the consumption of manganese contained in ferromanganese, spiegeleisen, silicomanganese and manganese ore amounted to 11.7 pounds, 0.4 pound, 1.0 pound, and 0.1 pound, respectively, per ton of steel. These data apply to consumption of manganese in the manufacture of steel ingots and that part of steel castings manufactured by companies that also produce steel ingots. The companies reporting in this part of the survey are the same as those reporting production of ingots and castings to the American Iron & Steel Institute.

Electrolytic Manganese.—The Electro Manganese Corp., Knoxville, Tenn., was the only producer of electrolytic manganese in 1948. The Bureau of Mines continued its research on the production of electrolytic manganese using chloride as an electrolyte.[1]

Ferromanganese.—The domestic output of ferromanganese increased 5 percent over 1947 and totaled 647,617 short tons. This alloy was produced in the following plants during the year: Bethlehem Steel Co., Johnstown, Pa.; Anaconda Copper Mining Co., Black Eagle, Mont.; Electro Metallurgical Co., Niagara Falls, N. Y., Columbiana,

Ferromanganese and spiegeleisen imported into and made from domestic and imported ores in the United States, 1947–48, in short tons

	1947		1948	
	Alloy	Manganese content	Alloy	Manganese content

[1] Jacobs, J. H., and Churchward, P. E., Electrowinning of Manganese from Chloride Electrolytes: Jour. Electro-Chem. Soc. vol. 94, No. 3, September 1948, pp. 108–121.

Ohio, and Alloy, W. Va.; E. J. Lavino & Co., Reusens, Va., and Sheridan, Pa.; Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.; Tennessee Products & Chemical Corp., Rockwood, Tenn.; and Carnegie-Illinois Steel Corp., Clairton and Etna, Pa. Of the 1,287,951 short tons of manganese ore used in the production of ferromanganese during 1948, 6 percent was of domestic origin compared with 9 percent in 1947. However, on a basis of the relative manganese content of the foreign and domestic ore, 8 percent was made from domestic ore in 1948, compared with 11 percent in 1947. The recovery of manganese from ore in making ferromanganese was 84.60 percent in 1948 compared with 84.75 percent in 1947 and 85.01 percent in 1946.

Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1944–48

Year	Ferromanganese produced			Materials consumed (short tons)			Manganese ore used per ton of ferromanganese made (short tons)
	Short tons	Manganese contained		Manganese ore (35 percent or more Mn, natural)		Iron and manganiferous iron ores	
		Percent	Short tons	Foreign	Domestic		
1944	702,632	78.62	552,429	1,224,878	130,886	1,985	1.930

Shipments of ferromanganese from producing furnaces in 1948 increased 7 percent in quantity and 13 percent in value over 1947. The record of shipments for the past 5 years follows.

883326—50——50

Ferromanganese shipped from furnaces in the United States, 1944–48

Year	Short tons	Value	Year	Short tons	Value
1944	715,059	$91,406,229	1947	614,647	$79,972,673
1945	610,376	78,907,189	1948	659,193	90,126,657
1946	493,808	61,355,778			

Spiegeleisen.—Production of spiegeleisen in 1948 decreased 16 percent from 1947. Shipments decreased 12 percent in quantity but increased 6 percent in value over 1947. Spiegeleisen was produced in the following plants during 1948: New Jersey Zinc Co., Palmerton, Pa., and Carnegie-Illinois Steel Corp., Clairton, Pa., and Gary, Ind. All of the spiegeleisen manufactured in 1948 was made from domestic materials.

Spiegeleisen produced and shipped in the United States, 1944–48

Year	Produced (short tons)	Shipped from furnaces		Year	Produced (short tons)	Shipped from furnaces	
		Short tons	Value			Short tons	Value
1944	165,530	155,325	$4,851,490	1947	134,329	124,517	$4,980,030
1945	139,039	157,774	5,108,144	1948	112,610	108,960	5,261,650
1946	111,696	114,982	3,793,673				

Manganiferous Pig Iron.—Pig-iron blast furnaces used 9,852 short tons of manganiferous zinc residuum and 752,140 tons of manganese-bearing ores containing (natural) over 5 percent manganese in 1948. Of the ore used, 666,943 tons were domestic and 85,197 tons of foreign origin. Of the domestic material used, 526,979 tons contained (natural) 5 to 10 percent Mn, 139,136 tons contained 10 to 35 percent Mn, and 828 tons contained more than 35 percent manganese. Of the foreign material used, 24,074 tons contained less than 10 percent Mn, 10,428 tons contained 10 to 35 percent Mn, and 50,695 tons contained more than 35 percent.

Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1945–48, in short tons

Source of ore	Ferruginous manganese ore				Manganiferous iron ore			
	1945	1946	1947	1948	1945	1946	1947	1948
Africa							44,227	24,074
Australia							1,558	
Mexico	800	257		52		5,854		
Palestine				10,376				
Total	800	257		10,428		5,854	45,785	24,074

Battery and Miscellaneous Industries.—During 1948 manufacturers of dry cells used 48,000 tons of manganese ore, of which 5,747 tons were of domestic origin and 42,253 were imported. Chemical plants used 686 tons of domestic ore and 16,453 tons of foreign ore containing (natural) more than 35 percent manganese. Most of this ore was used in the manufacture of manganese sulfate for fertilizer and in the manufacture of hydroquinone, a photographic chemical.

Manganese ore for battery use should have a high content of available oxygen with minimum iron and be relatively free from such metals as arsenic, nickel, copper, and cobalt, which are electronegative to zinc.

PRICES

Manganese Ore.—Prices of manganese ore containing 48 percent Mn, as quoted by E&MJ Metal and Mineral Markets, at the beginning of 1948 ranged from 65.0 to 67.0 cents per long-ton unit, including duty, f. o. b. eastern and southern ports. At the end of the year comparable prices ranged from 70.6 to 72.6 cents per unit. The long-ton unit upon which the price of manganese ore is based is 1 percent of a long ton, or 22.4 pounds, of contained manganese. Prices of chemical ore are given on a per ton basis, with a minimum requirement of manganese dioxide. A duty of one-fourth cent per pound of contained manganese was imposed on all ores imported in 1948, except those from Cuba and the Republic of the Philippines, which entered duty-free.

Manganese Alloys.—The average value, f. o. b. producers' furnaces, for ferromanganese shipped during 1948 was $136.72 per short ton compared with $130.11 in 1947. According to Iron Age, the selling price of ferromanganese in car lots at eastern centers rose from $145.00 per gross ton, which had been in effect since October 1947, to $161.71 in October 1948; the average for the year was $149.18. The value of spiegeleisen, f. o. b. domestic furnaces, was $48.29 per short ton compared with $39.99 in 1947; and the quoted price, as given by Iron Age, rose uninterruptedly from $47.00 per gross ton at the beginning of the year to $62.00 in October, then remained unchanged during the balance of the year. The average quoted price per gross ton was $54.15 for 1948.

FOREIGN TRADE [2]

Imports of all grades of manganese ore are shown by countries in the accompanying table. These data include imports of battery-grade ore totaling 81,769 short tons in 1948. Of this quantity, 68,053 tons came from Gold Coast, 8,949 tons from U. S. S. R., 1,707 tons from India, 1,008 tons from Belgian Congo, 684 tons from Cuba, 672 tons from Chile, 560 tons from the Republic of the Philippines, and 136 tons from Mexico. This ore averaged 55.84 percent Mn, or 88.33 percent MnO_2. Imports for consumption of battery ore totaled 79,388 short tons, of which 63,566 tons came from Gold Coast, 11,055 tons from U. S. S. R., 1,707 tons from India, 1,008 tons from Belgian Congo, 684 tons from Cuba, 672 tons from Chile, 560 tons from the Republic of the Philippines, and 136 tons from Mexico. The value of these entries amounted to $2,130,006, or $26.83 per short ton, f. o. b. foreign ports.

Imports for consumption of ferromanganese in 1948 increased 21 percent over 1947; exports decreased 2 percent. Exports of manganese ore and concentrates amounted to 9,236 short tons valued at $687,314.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[1] In addition to countries listed, Belgium, Bulgaria, Costa Rica, Eritrea, Iran, Spanish Morocco, and Yugoslavia produce manganese ore, but data of output are not available. Czechoslovakia reports production of manganese ore, but as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in the table.

[2] Dry weight.

[3] Shipments by rail and river.

[4] Data not available; estimate by author of chapter included in total.

[5] Figures represent French zone only; no output in American-British zone or Saar.

[6] January to June, inclusive.

[7] June to December, inclusive.

[8] Estimate.

[9] January to September, inclusive.

[10] Estimate excludes Ukraine.

[11] Incomplete data.

[12] Exports.

[13] Fiscal year ended March 31 of year following that stated.

Australia.—A description of the manganese industry of Australia has been published recently.[3]

Belgian Congo.—Production was resumed at the Kasokelesa Mines in Katanga on February 17, 1947, after having been idle since 1944. Ore produced and transported by truck from the mine to Lufupa station on the Benguela Railroad amounted to 17,646 metric tons, of which 227 tons were shipped to the Sermikat foundry at Lubudi and 11,090 tons to Lobito for export.[4]

Chile.—The Department of Mines and Petroleum announced that recent studies have disclosed an estimated manganese ore reserve of 300,000 tons of 35 percent Mn, and 1,200,000 tons of 30 percent, the principal deposits occurring in the Provinces of Atacama and Coquimbo.[4]

Cuba.—Chemical-grade manganese ore is produced at about 24 mines in Oriente Province. The production of this grade ore during the first quarter of 1948 amounted to 985 long tons compared with a quarterly average of 1,192 tons during 1947. Virtually all of the metallurgical ore production comes from the Charco Redondo mine. The Canada and Lago mines of the Taranta group, which produced during 1947, were inactive during 1948 and have been closed indefinitely owing to exhaustion of reserves.[5] All of the production in Cuba is from the south coast of Oriente Province.

France.—French manganese ore requirements for 1948 were estimated at 240,000 metric tons based on a steel output of 8,000,000 tons, considerably under earlier estimates given in the 1947 chapter of this series. In 1947, when 5,700,000 tons of steel were produced, imports of manganese ore totaled 175,000 tons, of which 107,000 tons originated in Morocco.[6]

Hungary.—Hungary is virtually self-sufficient with respect to manganese. In 1947 reported production of all grades of ore totaled 112,310 metric tons, and consumption was 109,970 tons. Imports were 123 tons and exports only 9 tons.[7]

India.—At the opening of 1948, the Indian Government proposed an export duty on manganese ore of 20 rupees per ton, which in some cases would have exceeded 50 percent ad valorem. However, the government recognized immediately that such a rate virtually would stop exports of manganese ore, and the rate was promptly reduced to 25 percent ad valorem and on March 1 was reduced further to 15 percent. The latter rate, which prevailed during the balance of 1948, affected all contracts made after March 1, 1948. The cost of Indian manganese ore was also increased by a rise in freight rates effective January 1 which affected many commodities.[8] Manganese ore was placed on an export-licensing system during 1948.

Indonesia.—There are two manganese mines in Java, one in west and the other in central Java. The western mine is 50 kilometers south of Tasikmalaja, the other near Djocjakarta. When the owners of the western deposit returned after World War II, they found that

damage during the Japanese occupation was heavy. All buildings had been removed or destroyed. A report by the operating company on future production possibilities from this mine is expected in the near future. No details are yet available regarding the status of the mine in central Java. Some crude ore was found at the Port of Batavia after the Japanese withdrew. Former customers in the United States rejected the ore, as the quality was low, and the material was then shipped to the Netherlands. This ore presumably originated at the west Java mine, the only one operated by the Japanese during the war.[9]

Japan.—The Japanese reserves of high-grade manganese ore are inadequate to meet domestic needs. Consequently, Japan has turned to the production of metallic manganese to overcome, in part, dependence upon imported high-grade material. Processes for producing metallic manganese were described.[10]

Mexico.—The manganese deposits of Chihuahua were described.[11]

Republic of the Philippines.—Most of the manganese production in the Philippines in 1947 came from Busuanga Island, Palawan group. Development work and reconstruction were in progress in several islands of the Republic in 1948.[12]

Union of South Africa.—Problems of increasing exports of manganese ore from the Union of South Africa are discussed in the General Summary of this chapter. The two main companies producing manganese—Associated Manganese Mines of South Africa, Ltd., and South African Manganese, Ltd.,—are reported to employ 300 European supervisors and 3,500 native laborers.[13]

Mercury

By HELENA M. MEYER AND ALETHEA W. MITCHELL

GENERAL SUMMARY

FACTORS unfavorable to the domestic mercury-mining industry continued to accumulate in 1948 and culminated by the end of the year in virtual cessation of domestic mine production. Output for the year was 38 percent lower than in 1947, amounted to only 33 percent of the annual average for the 5-year period 1941–45, and in December was at a rate lower than that for any year since production records were begun 98 years ago. Only two of the larger producers—Mount Jackson and Bonanza mines—were in operation at the year end.

It has been pointed out in previous reports of this series that the world market shrank sharply after the defeat of Germany and Japan, two of the leading mercury-consuming nations before the end of World War II. During the war, producers everywhere had geared output to the record requirements for the metal. Postwar production exceeded total needs, and large stocks accumulated. Stocks were on hand also in the two defeated countries at the war's end, and these inventories sought a market. The attention of sellers focused on the United States as an outlet for their product. The need for dollar exchange, moreover, accentuated the desire to sell in this country. The world situation of oversupply in 1947 continued in 1948, and production over needs plus above-normal stocks were depressing factors. The resultant extension of the price drop was to be expected. The average price in New York—$76.49—was 9 percent below 1947, amounted to only 39 percent of the 1942–43 average, was the smallest since and approximately the same as in 1938, and (in terms of purchasing power) was equivalent to only about half of the prewar selling price. A mark-up approximating $14 took place in the latter part of December, following the Spanish-Italian cartel (Mercurio Europeo) price rise. Presumably the cartel did not anticipate that this rise would revive the domestic mining industry.

Imports for consumption rose 146 percent above those in 1947 and were the largest in times of peace in the entire history of the industry, falling below only those in 1945, 1943, and 1942. Exports and re-exports again were only a small fraction of imports.

Meanwhile, consumption, from the point of view of producers, was about the only cheering item in the picture. Thirty percent more mercury was used in 1948 than the relatively high rate for 1947, and only in 3 war years—1942, 1943, and 1945—was consumption greater. As explained in the Consumption and Uses section, equipping two new chlorine and caustic soda plants was an important factor in establishing the peacetime record. This use, of course, is nonrecurring. Mercury was accumulated in large quantities in 1948 for use in three mercury boilers. This metal, however, will not be utilized until 1949.

Salient statistics of the mercury industry in the United States, 1944–48

[Flasks of 76 pounds]

	1944	1945	1946	1947	1948

Consumption flasks	42,900	62,429	31,552	35,581	46,253

[1] Revised figure.

The improved reserve situation at mercury mines in 1948, assuming prewar price-cost relationships, and some problems involved in reopening shut mines, were outlined by S. H. Williston, vice president of the Cordero Mining Co., in testimony before the House Subcommittee on Mines and Mining of the Committee on Public Lands, May 20, 1948, as follows:

> * * * In spite of the fact that at the present time proven ore reserves on the basis of prewar grade, prewar prices, and prewar costs, are probably in a more favorable situation than at any time since 1890, the producing mines are being closed and allowed to fill. In the case of the largest producer, the New Idria mine, the present ore bodies are being extracted through considerable distances of old workings. Once maintenance ceases and these openings cave, it would take years to reopen the property. The Hermes mine in Idaho, with relatively large proven moderate grade reserves, is in an area of exceedingly bad ground. It takes constant watching to keep the haulage ways open. Even a short abandonment would cause extensive loss and require considerable time to be reopened, if at all. The industry's second largest mine, the Cordero mine in Nevada, is one of the deepest operating mines in the country at the present time. The water encountered has an average temperature of over 110 degrees. If this property is closed damage from hot water and the loss of the shaft would probably require 2 to 3 years to reopen. * * *

Both Williston and Schuette [1] recommended means of maintaining or reviving domestic mining.

DOMESTIC PRODUCTION

Before 1948 and continuing in that year mercury prices had returned to low prewar levels, whereas costs of labor and supplies were at virtual postwar peaks. Under these conditions death of the mercury-mining industry was threatened. Complete closure of the mines did not eventuate in 1948, but the largest producer for many years—the New Idria mine, San Benito County, Calif.—was closed at the year end, as were almost all other large as well as small producers. The Mount Jackson (including Great Eastern) mine, Sonoma County, Calif., second-largest producer for the year and leading producer in the final quarter, and the Bonanza mine, Douglas County, Oreg., third largest producer in 1948, were the only important mines in operation as the year ended; it is doubtful that as many as a half-dozen mines altogether were active at that time.

Production of 14,388 flasks in 1948 was 38 percent below 1947, was only 28 percent of the war peak of 51,929 flasks in 1943, and was the smallest since 1933; output in the final quarter was at an annual rate in excess of only five years in the 98 years covered by production records, 1850, 1921, 1922, 1923, and 1926. The greatest drop was 69 percent in Nevada; Idaho declined 39 percent, California 35 percent, and Alaska 21 percent; Oregon recorded the only gain—14 percent.

The principal producing mines in 1948 were as follows:

Alaska—Decoursey Mountain mine.
California—Napa County, Knoxville mine; San Benito County, Juniper and New Idria mines; San Luis Obispo County, La Libertad mine; Sonoma County, Mount Jackson (including Great Eastern) mine; Yolo County, Reed mine.
Idaho—Valley County, Hermes mine.
Nevada—Humboldt County, Cordero mine.
Oregon—Douglas County, Bonanza mine.

In 1948, those 10 mines produced 98 percent of the total for the United States; in 1947, 16 mines supplied 99 percent; in 1946, 18 mines produced 98 percent; but in 1942, 34 mines produced only 89 percent.

Mercury produced in the United States, 1945–48, by States

Year and State	Producing mines	Flasks of 76 pounds	Value [1]
1945:			
California	39	21,199	$2,859,533
Idaho	1	627	84,576

In recent years (before 1948) the trend in grade of mercury ore treated in the United States was upward, against the long-time trend. In 1948 the normal downtrend was resumed; and 10.2 pounds of mercury were recovered for each ton of ore treated, compared with 12.5 pounds in 1947, 12.0 in 1946, and 5.1 in 1942.

Mercury ore treated and mercury produced therefrom in the United States, 1927–48 [1]

[That material from old dumps which is not separable is included with ore]

Year	Ore treated (short tons)	Mercury produced: Flasks of 76 pounds	Mercury produced: Pounds per ton of ore	Year	Ore treated (short tons)	Mercury produced: Flasks of 76 pounds	Mercury produced: Pound per ton

[1] Excludes mercury produced from placer operations and from clean-up activity at furnaces and other plants.
[2] Corrected figure.

In addition to mercury produced at the mines in 1948, at least 2,170 flasks were reported as produced from battery plates, scrap, and calomel, compared with 3,500 in 1947. Additional unreported quantities are believed to have been recovered.

REVIEW BY STATES

Alaska.—The Decoursey Mountain mine, 24 miles from Crooked Creek, was the only producer of mercury in Alaska in 1948 as in 1947. A total of 50 tons of ore was treated in two D retorts, and 100 flasks of metal were recovered. About 450 feet of development drift were driven, with low-grade showings along most of the distance. Backs of 140 to 190 feet, all unmined, exist above this development drift.

A report [2] on the Rainy Creek mercury prospect, which lies at the western base of the Kilbuck Mountains, about 80 miles southeast of Bethel, in southwestern Alaska, was published in 1948. According to Rutledge the deposits are believed to have been discovered between 1910–20. Production of mercury from the area has been solely from cinnabar concentrates recovered as a result of gold placer operations. About 2,000 pounds of high-grade concentrate were said to have been shipped.

California.—The 35-percent drop in output of mercury was slightly smaller than the average decline for the United States, and California bettered its position as the leading mercury-producing State by a substantial margin, supplying 78 percent of the country's total compared with 74 percent in 1947. As in 1947, eight counties contributed to California output—Del Norte, Lake, Napa, San Benito, San Luis Obispo, Santa Clara, Sonoma, and Yolo. San Benito County and the New Idria mine were again leading mercury-producing county and leading mercury-producing mine, respectively, in the United States. The New Idria mine likewise was preeminent in the entire Western Hemisphere. This property closed at the end of the year, the shut-down having been threatened for several months.

Shults Bros. produced 5 flasks of mercury near Crescent City in a newly installed 30-ton Lacy rotary furnace. The plant, which uses oil for fuel, was completed in August and replaced a wood-burning retort at the property.

A small quantity of mercury was produced from clean-up operations at two properties in Lake County.

Mercury was produced in a furnace at the Knoxville mine, Napa County, by lessees.

The New Idria, Juniper, and Aurora mines produced in San Benito County, the first in furnaces and the last two in retorts. The New Idria mine, again the largest producer in the Western Hemisphere, has four Gould rotary furnaces. Production was from newly mined ore and dumps. The property was closed at the year end, but by the end of the first quarter the company announced that it was withdrawing from the market because of the price-cost relationship and that the mine was being prepared for a shut-down.

Production of mercury at the La Libertad and Buena Vista (Mahoney) mines, San Luis Obispo County, was in furnaces. The Moapa Mining Co. operated the former property.

The Almaden Dumps were drawn on for Santa Clara County's relatively small output.

At the end of 1948 two substantial producers continued in operation. These were the Mount Jackson (including Great Eastern) mine, of the Sonoma Quicksilver Mines, Inc., Sonoma County, and the Bonanza mine, of the Bonanza Mines, Inc., Douglas County, Oreg. The Mount Jackson mine was the second largest mercury producer in 1948 and stood first in the final quarter of the year. Ore is treated in a Gould rotary furnace. No other property in Sonoma County reported production in 1948, but H. G. Walker announced that an extension of the drainage tunnel for the Riley Contact (Old Contact)

[2] Rutledge, F. A., Investigation of the Rainy Creek Mercury Prospect, Bethel District, Kuskokwim Region, Southwestern Alaska: Bureau of Mines Rept. of Investigations 4361, 1948, 7 pp.

and Socrates mines was planned, with operation of the mines in prospect. A 50- by 4-foot rotary furnace is on the Contact property.

Clean-up operations at the Reed mine yielded the mercury credited to Yolo County.

Idaho.—The Hermes mine of Bonanza Mines, Inc., Yellow Pine district, Valley County, was again the only producer of mercury in the State. Owing to the low price for mercury, the property was closed on July 16; but the mine, nonetheless, became the fifth largest producer in the United States for the year as a whole compared with sixth in 1947.

Nevada.—The sharpest drop in output among mercury-producing States occurred in Nevada in 1948; the decline was 69 percent. Closing of the Cordero mine, third largest producer in the United States in 1947, during the first quarter of 1948 accounted very largely for the poor showing for the State Three counties—Esmeralda, Humboldt, and Pershing—shared in production for the State in 1948.

W. F. Dunnigan produced mercury in retorts at the Red Rock mine, Fish Lake Valley district, Esmeralda County, in 1948. He was the only producer in the county as in 1947.

The Cordero mine of the Cordero Mining Co., Opalite district, Humboldt County, was the second-largest producer of mercury in the United States in the first quarter of 1948, as in the preceding quarter; it was nonproductive in the final three quarters of 1948, ranking, nonetheless, as the fourth largest producer in the country for the year as a whole. A total of 1,155 flasks of mercury was produced from 5,771 tons of ore, indicating a tenor of ore of 0.76 percent recovered mercury. The ore was treated in the 80-ton Nichols-Herreshoff furnace at the mine. Early in 1949 the company stated:

> We have been maintaining a small maintenance crew to prevent complete loss of the underground workings but we cannot continue this expense for long without some evidence that it will again be profitable to produce mercury in the United States.

A small output came from another property in Humboldt County.

A small production came from a property in Pershing County in 1948.

Oregon.—Contrary to the trend in all other mercury-producing States, Oregon produced 14 percent more mercury in 1948 than in 1947. The Bonanza mine of Bonanza Mines, Inc., Sutherlin district, Douglas County, is the only property known to have produced in 1948 and, consequently, is entirely responsible for the gain. Output of 1,351 flasks of mercury, from treatment of 8,119 tons of ore in a Gould rotary furnace, indicated a tenor of 0.63 percent recovered mercury. Bonanza ranked third among mercury-producing properties in 1948 and was one of only two large mines operating at the year end.

The Amity Mining Co., operator of the Amity mine, Ochoco district, Crook County, reported completion during the year of a 25-ton Nichols-Herreshoff furnace but no production of mercury.

CONSUMPTION AND USES

Consumption of mercury increased 30 percent in 1948 to a record high peacetime rate; in only three war years—1942, 1943, and 1945—was use of the metal greater. Features of the mercury market were the construction late in 1947 and early in 1948 of two chlorine and caustic soda plants and the withdrawal from supplies of large quantities of metal for these plants during the second quarter of 1948. The mercury for these installations—at Syracuse, N. Y., and Wyandotte, Mich.—is covered by "Other" in the tabulation that follows. During 1948 mercury was accumulated for use in three boiler plants under construction at Portsmouth, N. H., Pittsfield, Mass., and Hartford, Conn. (a replacement plant). The accumulated mercury for the two new plants will remain a part of industry inventories until the latter part of 1949. Much of the metal for the Hartford plant was reclaimed from the earlier plant at that location. The part of the metal that was reclaimed will not be considered as consumption in the records for 1949 to avoid duplication. This Hartford plant was put into operation in January 1949. Other than the new chlorine and caustic soda plants, the greatest expansion in use of mercury in 1948 was for agricultural purposes. The rise of 25 percent in 1948 followed a gain of 79 percent in 1947. The new mercury cell failed to require anticipated expanded quantities of metal, and the total for electrical manufactures, which includes the new cell, declined 4 percent compared with 1947. Makers of the mercury cell continued their efforts to perfect manufacturing techniques, to develop improved structures, and to reduce costs. As stated in previous reports of this series, a low price for mercury is claimed to be essential if the cell is to establish and maintain a place as one of the important uses of mercury.

The Hartford installation, in the South Meadow Station of the Hartford Electric Light Co., is the first mercury-unit power-plant equipment placed in operation since before World War II. Designed and supplied by the General Electric Co., the equipment uses mercury vapor at 113 pounds per square inch gage at 945° F. to drive a mercury turbine at 720 r. p. m. The unit generates 15,000 kw. while also supplying about 200,000 pounds of steam per hour at 400 p.s.i.g. at 700° F. to drive existing steam turbines. The system combines the mercury-vapor cycle and a steam cycle into a binary system for producing power from fuel with greater thermal economy than is possible with the steam cycle alone. The mercury-steam cycle consists of a mercury boiler, in which liquid mercury is vaporized at a comparatively low pressure; a mercury turbine, powered by the vaporized mercury; a generator, driven by the mercury turbine; and a mercury-condenser boiler, where the heat given up by the condensing mercury is used to convert water to steam, which is used to drive the existing steam turbines. The new installation replaces a smaller unit that had been in service 20 years, the first large mercury unit installed in this country.

A new organic mercury compound, a combination of phenyl mercury chloride and acetate in a completely soluble dry, powdered form, suggested for insecticidal and fungicidal uses, is said [3] to be stable, to

Final					62,429	31,552	35,581	46,253

be amenable to indefinite storage, to be easy to handle, and to be unaffected by climatic conditions.

A new type of mercury manometer which, according to report,[4] can operate at 1,500 pounds per square inch working pressure and is available in ranges of 10–400 inches of water. It is built for use on indicating, recording, or controlling instruments. Two manometers can be mounted on a single case for recording two flows or ratio flow control.

A new method of transforming bluish-white mercury light into a warmer color without sacrificing high efficiency was recently disclosed.[5] It was predicted that the lamp would expand the use of high-intensity mercury lighting, since in most places warmer colors of light are desirable. Lighting television and movie studios and general lighting of certain factories, sports areas, and other places were given as prospective uses.

A number of other articles regarding the use of mercury in lamps were published [6] during the year, some of which are listed.

According to a recent report,[7] the Monsanto Chemical Co. made a

tentative arrangement with an Italian company for the use and sale of the De Nora mercury cell for the manufacture of chlorine, caustic soda, and hydrogen.

A discussion of diaphragm and mercury cells was recently published.[8]

STOCKS

Industry inventories of mercury expanded sharply in 1948. Much of the gain was caused by accumulation of metal for use in new mercury boiler plants, and the anticipated completion of these plants—one in January and two in the latter part of 1949—will cause a noteworthy reduction in the stocks. Data on mercury held in the Government strategic stock pile are confidential; consequently, such stocks are not covered by the accompanying table.

Stocks of mercury in hands of producers, consumers and dealers, and Office of Metals Reserve, 1944–48, in flasks of 76 pounds

End of year	Producers [1]	Consumers and dealers	Office of Metals Reserve	Total
1944	2,714	10,400	67,812	80,900
1945	3,243	17,000	63,638	83,900
1946	2,599	16,400	20,884	39,900
1947	3,084	16,200		19,284
1948	5,165	25,000		30,165

[1] Operators that account for roughly 95 percent of output.

PRICES

The downtrend in mercury quotations generally in progress since March 1945 continued through May, when the monthly average was $74.16 a flask, or the lowest in almost 10 years. Gradual strengthening took place after May and continued until the latter part of December, when the Spanish-Italian cartel boosted its price $14 a flask and the New York quotation was raised similarly. In the final week of the year, the domestic quotation was $90–93 a flask, or about the level that prevailed in November 1946. The cartel price advance came at a time when the domestic mining industry virtually had collapsed. More than one market commentator remarked that evidently the amount of the price rise was what the market was expected to bear without reviving the United States mining industry.

The report of this series for 1947 pointed out that the downtrend in mercury prices was in contrast to price movements in general. The average price for mercury in 1948 was the lowest since 1938. The Bureau of Labor Statistics index price for all commodities, meanwhile, including many items affecting cost of producing mercury, has more than doubled, causing the $76.49 average price for 1948 to represent closer to $38 in terms of prewar purchasing power. Early in 1948, S. H. Williston, vice president of the Cordero Mining Co., in commenting on the unfavorable price-cost relationship before

[8] Industrial and Engineering Chemistry, Modern Production of Chlorine and Caustic Soda, A staff-industry collaborative report: Vol. 40, No. 11, Nov. 1948, pp. 2002–2010.

the National Resources Subcommittee of the Senate Interior and Insular Affairs Committee, Denver, Colo., February 3, 1948, stated:

> * * * It is quite safe to say that the industry as a whole is losing money. It is equally safe to say that no individual mine could show a profit if it were to carry on anything approaching normal exploration and development work. It is my opinion, although I cannot be certain, that no mercury mine in operation in the United States today is making a profit. * * *

There is a tariff on mercury of 25 cents a pound, or $19 a flask of 76 pounds. Normally, therefore, there is a price differential favoring the New York market as compared with foreign markets. During World War II, however, the differential almost invariably favored foreign markets. In December 1946 a small excess of New York over London was resumed; and since May 1947 the differential in favor of the New York market has been similar to the prewar years, at no time, however, amounting to the full tariff.

Average monthly prices per flask (76 pounds) of mercury at New York and London, and excess of New York price over London price, 1946–48

Month	1946			1947			1948		
	New York [1]	London [2]	Excess of New York over London	New York [1]	London [2]	Excess of New York over London	New York [1]	London [2]	Excess of New York over London

[1] Engineering and Mining Journal, New York.
[2] Mining Journal (London) prices in terms of pounds sterling are converted to American dollars by using average rates of exchange recorded by Federal Reserve Board.
[3] London excess.

The British quotation was £16 0s. 0d. from the latter part of August 1947 through the third week in May 1948, falling thereafter to £15 0s. 0d. and remaining at that level until the last days of December, when it was raised to £18 5s. 0d.

The year-end price mark-up of the cartel was $14 a flask to $70 a flask ex European ports, or about $72.50 in bond in the United States. With the $19 tariff the quoted price was equivalent to about $91.50.

FOREIGN TRADE [9]

Imports.—Receipts of mercury for consumption in the United States in 1948 were almost 2½ times those in 1947 and were slightly more than 3½ times the average annual entries in the 10-year period 1930–39; in only three earlier years (1945, 1943, and 1942) had imports

[9] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

been larger. Much more metal was received from abroad in 1948 than was required to supplement the reduced domestic production in filling consumption (which was substantially above prewar rates), resulting in augmented inventories. This situation indicates that need for United States currency in foreign countries was a greater motive in the expanded shipments of metal to the United States than United States demand for mercury.

General imports, which are a better measure of metal actually arriving in the country in a given period than imports for consumption, amounted to 41,732 flasks in 1948, or more than four times the 10,228 flasks received in 1947. Of the 1948 imports (comparisons with 1947 in parentheses), 27,114 (2,161) flasks came from Spain, 4,994 (1,516) from Italy, 4,063 (1,824) from Mexico, 3,746 (3,107) from Japan, 1,691 (1,500) from Yugoslavia, 75 (none) from Sweden, 49 (none) from the United Kingdom, and none (120) from Chile. Doubtless the quantities credited to Sweden and the United Kingdom are reexports.

Of "imports for consumption"—31,951 (13,008) flasks—which include imports for immediate consumption plus withdrawals from warehouse for consumption, 19,384 (3,498) were from Spain, 3,947 (2,900) from Italy, 3,675 (3,107) from Japan, 3,489 (1,783) from Mexico, 1,256 (1,400) from Yugoslavia, 200 (none) from Czechoslovakia, none (270) from Chile, and none (50) from Canada.

[1] Revised figure.

Imports of mercury compounds generally are insignificant; none was reported in 1948.

Exports.—Of the exports of 786 flasks (884 in 1947), 259 (28) went to Austria, 230 (92) to Canada, 81 (25) to Venezuela, 32 (less than ½) to Belgian Congo, 31 (31) to Colombia, 28 (53) to Brazil, 17 (10) to Cuba, 15 (none) to Korea, and the remainder in smaller quantities to 22 other countries.

Mercury exported from the United States, 1944–48

1945	78,877	1,038	121,713	1948	59,713	786	121,420
1946	68,932	907	113,817				

Reexports amounted to 921 flasks in 1948 (a drop from 3,095 in 1947) and were destined chiefly as follows: 416 (1,405) to Canada, 349 (71) to Brazil, 45 (22) to Curacao, 33 (51) to Belgium, 27 (31) to Colombia, and 19 (12) to Saudi Arabia; the remainder went to seven other countries.

WORLD REVIEW

Available data for 1948 indicate that production declined markedly in that year owing to lower outputs in all leading mercury-producing areas. Despite the fact that less metal was produced, more mercury than needed was available owing to large stocks on hand at the beginning of the year.

Germany.—One of the chief world consumers before the end of World War II, Germany not only ceased to purchase after the war but added some metal on hand to world markets. According to the Metal Bulletin of January 21, 1949, the first Spanish delivery to Germany, amounting to 150 metric tons (nearly 4,400 flasks), had just left Barcelona. The delivery was being made, it was stated, under the trade agreement, concluded recently, between Spain and Western Germany.

Italy.—Unsatisfactory conditions for the sale of Italian mercury caused the Italian Government to take steps aimed at alleviating the problem.[10] The reports stated that the Treasury duty of 500 lire per flask on quicksilver and of 13 lire per kilogram on ore, to which levels it was reduced in July 1947, had been abolished. The Government was said to have promised to represent fully the industry's interests within existing trade agreements, as well as at all forthcoming foreign trade negotiations. Efforts were made to obtain credits for the mines and more favorable treatment as regards taxes and transportation fees.

Production in Italy was reduced sharply as the year progressed.

Spain.—The history of the Almaden mine was summarized recently.[11] The author said that, after more than 20 centuries of exploitation,

intensive throughout the last 4, ore from Almaden is about five times as rich as that of its closest competitor. Over 228,000 tons of metal, not allowing for production of the Romans, Visigoths, and Moors, is estimated to have been produced. Ore occurrence and reserves were described as follows:

* * * The ore-bearing veins are three; the principal and most productive is the San Pedro-San Diego, seven to nine meters wide; the San Francisco, four meters; and the San Nicolas, three meters, where seen on the lower levels. They are separated by ten to twenty meters of barren slate. The strike is west northwest and the dip ranges from vertical to 70° N. Vein material is massive recemented quartzite breccia.

Silicification and movement along the fault preceded and accompanied deposition of ore, which followed the fresh fracture planes and penetrated the less silicified sandstones in their process of becoming quartzites. Rich zones of one to three meters' width, of a deep red hue, occur in mid-vein, tapering in values toward the walls. Mining activity, and apparently the richer mineral, is confined to a zone between two cross faults, of which the easterly one is well defined, with a twenty-meter horizontal throw. The west fault is irregular, echeloned, and in places is rather a sharp bend in the vein. Both are pre-mineral. This zone was about 200 m long at the surface, but extended to 300 m at 200-m depth, and is only 110 m long on the fourteenth, or lowest working level, 400 m below the shaft collar.

The great stopes of the middle levels are caved and inaccessible. Records show that ore hoisted was 20 to 25 percent grade, which must have entailed sorting in the stopes. It is likely, therefore, that these stope fills contain a great deal of now valuable ore. From the twelfth down to the fourteenth levels, a distance of 50 m, there is notable diminution of grade and vein width and the three veins converge. It appears probable that the oreshoot will bottom 50 m or so below the fourteenth level. The ore mineral is invariably cinnabar, rather coarsely crystalline, with free mercury in the richer ores oozing out and forming pools in the stopes. Pyrite, calcite, sericite, and barite are also found.

In 1945, the visible proved reserves were enough for twenty years' operation at the current rate. Recent exploration beyond the end faults has disclosed considerable ore. During the Fuggar lease, shallow workings extended some 6000 m beyond the east fault, in the fracture zone, so it is likely that a great deal of ore will be found adjoining these old workings beyond these faults. In the process of extracting it, the old stope fills may also be drawn.

At Almadenejos, 11 km east of the mine, on the strike, an eight-meter vein is being explored with promising results. At Las Minetas, eighteen kilometers east of Almaden, is an old working with ruins of Bustamante furnaces, also on the strike. The Almaden reserve extends over a circle of 25 km radius with the San Teodoro shaft as a center. The mine is by no means depleted except as regards the fabulously rich ores once worked. On the other hand, statements that there are millions of tons are likewise inaccurate. The program of systematic exploration and development of new ore, recently undertaken by the Council, is definitely to assure a future ore supply. * * *

United Kingdom.—Foreign trade data for the United Kingdom for 1947 indicated that consumption of mercury was returning to prewar levels, and figures for 1948 marked continuation of the 1947 condition. Imports of mercury were 30,627 flasks in 1948 compared with 25,665 flasks in 1947, reexports were 7,146 and 2,276 flasks, respectively, and net imports (a measure of consumption) were 23,481 and 23,389, flasks, respectively.

The British quotation was £16 0s. 0d. from the latter part of August 1947 through the third week in May 1948, falling thereafter to £15 0s. 0d. It remained at the lower level until the last days in December, when it was raised to £18 5s. 0d.

The Belfast, Ireland, mercury battery plant of P. R. Mallory & Co., Inc., was said to have made progress during 1948.

Mica

By JOSEPH C. ARUNDALE AND E. M. TUCKER

GENERAL SUMMARY

DOMESTIC production of sheet mica continued to decline during 1948. The output of ground mica again reached a new record volume, and there was a shortage of high-grade scrap. The consumption of sheet, punch, film, and splittings declined. Reports were current of the development of several materials which are alternates or substitutes for mica in some uses. The synthesis of a fluorine-phlogopite type of mica advanced to the pilot-plant stage of production in a coordinated research program, and investigation of the commercial possibilities continued.

A cooperative investigation of mica deposits in South Carolina was conducted by the State Research, Planning and Development Board and the Tennessee Valley Authority.[1] Reports on mica deposits in Georgia [2] and North Carolina [3] and a report on methods for recovering scrap mica [4] were published during the year.

Import duties on mica and certain mica products were reduced as a result of the General Agreement on Tariffs and Trade at Geneva.

A mica-splitting machine was described by the National Bureau of Standards.

Important new mica deposits in the Northern Territory of Australia were described.

DOMESTIC PRODUCTION

Sheet Mica.—The production of sheet and punch mica in the United States continued to decline in 1948, and a total of only 270,042 pounds was reported for the year. Of this total, North Carolina produced 257,926 pounds. In compiling the statistics on domestic production of sheet mica, the Bureau of Mines must depend largely on reports by purchasers because many small producers fail to report. The high cost of extracting and processing sheet mica is the ultimate cause of the depressed condition of the domestic sheet mica producing industry.

The problems of the mica industry were discussed.[5]

Value	$1,089,072	$812,322	$1,041,423	$1,095,578	$1,091,698
Average per pound	$21.05	$19.78	$19.43	$22.00	$20.93
Total sheet and scrap: [1]					
Short tons	52,489	41,709	54,141	50,005	52,292
Value	$4,351,783	$1,549,664	$1,259,378	$1,211,688	$1,137,638
Total ground: [1]					
Short tons	52,713	51,806	62,113	64,540	64,642
Value	$1,914,709	$1,995,969	$2,516,018	$2,967,713	$3,232,632
Consumption of splittings:					
Pounds	8,816,965	7,897,402	7,815,989	9,309,981	7,917,365
Value	$4,657,730	$3,415,696	$4,259,478	$6,680,753	$6,300,581
Imports for consumption:					
Total uncut sheet and punch:					
Pounds	5,032,983	4,208,130	4,499,672	1,754,419	2,829,335
Value	$3,921,078	$4,148,737	$2,288,897	$1,150,958	$2,477,598
Scrap:					
Short tons	2,412	3,612	6,207	5,109	7,124
Value	$32,688	$41,950	$75,846	$66,408	$107,540
Total sheet and scrap:					
Short tons	4,929	5,716	8,457	5,986	8,539
Value	$3,953,766	$4,190,687	[2] $2,364,743	$1,217,366	$2,585,138
Manufactured:					
Short tons	2,314	3,695	5,487	5,699	9,357
Value	$3,707,718	$2,173,133	$4,754,583	$6,251,613	$12,960,918
Total imports:					
Short tons	7,243	9,411	13,944	11,685	17,896
Value	$7,661,484	$6,363,820	[2] $7,119,326	$7,468,979	$15,546,056
Exports (all classes of mica):					
Short tons	619	981	1,542	1,493	1,403
Value	$526,824	$377,473	$709,109	$970,326	$720,359

[1] Includes mica recovered from kaolin and mica schists as follows: 1944, 22,107 tons, $485,567; 1945, 15,046 tons, $324,515; 1946, 15,197 tons, $290,540; 1947, 14,598 tons, $385,833. The Bureau of Mines is not at liberty to publish the corresponding figure for 1948.
[2] Revised figure.

Scrap Mica.—Domestic production of scrap mica in 1948 totaled 52,157 short tons valued at $1,091,698. This figure includes mine scrap, mica reclaimed as a byproduct of kaolin washing, and mica recovered from schist. A shortage of domestic high-grade scrap from which the better grades of ground mica are produced made it necessary for grinders to import large quantities of scrap, principally from India.

An article was published summarizing the history of the mica industry in New Mexico and describing the mining and milling methods being tested. This new procedure involves underground mining of a pegmatite from wall to wall, and the material is milled for the recovery of scrap mica only.[6]

[6] Jahns, Richard H., Milling Improves Northern New Mexico Scrap-Mica Outlook; Eng. and Min. Jour., vol. 149, No. 5, May 1948, pp. 96–100.

[1] Bureau of Mines is not at liberty to distribute total because of too few producers of reclaimed.

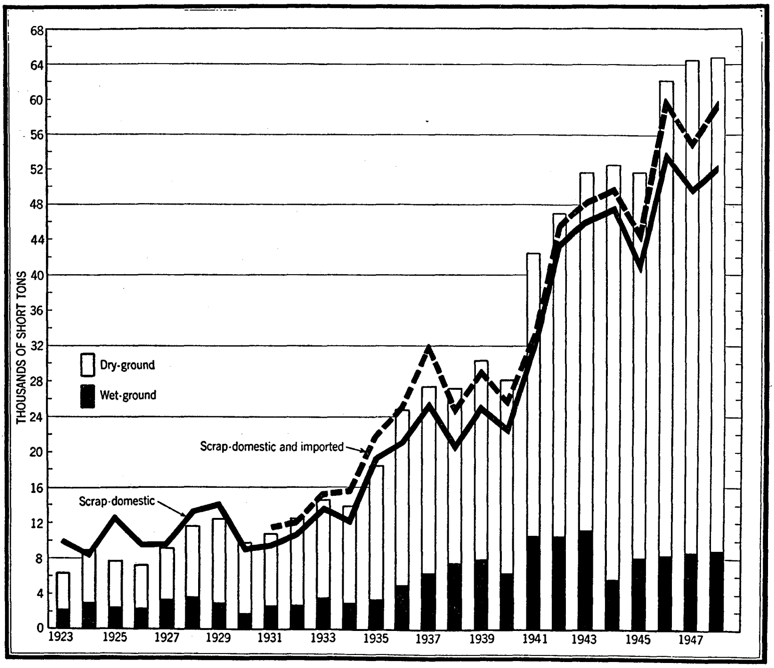

FIGURE 1.—Scrap and ground mica sold in the United States, 1923–48.

Ground Mica.—Domestic production of 64,642 short tons of ground mica valued at $3,232,632 was a new record. In the accompanying table, production is shown for both wet and dry processes.

The Wet Ground Mica Association, Inc., 420 Lexington Avenue, New York 17, N. Y., is reported to have retained the Centro Research Laboratories, Inc., Briarcliff Manor, N. Y., to conduct a research program to develop new and improved methods of utilizing the special characteristics of wet-ground mica.[7]

The Diamond Mica Co. began production of wet-ground mica at its new modern grinding plant at Spruce Pine, N. C., utilizing local scrap mica. The process was described in considerable detail.[8]

[7] Chemical and Engineering News, vol. 26, No. 32, Aug. 9, 1948, pp. 2363-2364.
[8] Engineering and Mining Journal, vol. 149 No. 6, June 1948, pp. 86-88.

National Grinding Corp. procured a permit to erect a plant near Lawrence, Colo. The mica to be ground probably will be obtained from mines being developed between Grand Junction and Glade Park, Colo.[9] Consolidated Feldspar Corp. completed a new plant at Parkdale, Colo., where mica will be recovered as a byproduct in the flotation of feldspar.[10]

The Mica Co. of Canada announced the transfer of its operations at Massena, N. Y., to Newport News, Va. The move was made to bring the plants closer to seaport facilities, as much of the material used comes from India and Madagascar.[11]

The Rubber Asphalt Co., Los Angeles, Calif., announced plans to erect a mill in which mica from company mines in New Mexico will be both wet- and dry-ground.[12]

Ground mica (including mica from kaolin and schist) sold by producers in the United States, 1944–48, by methods of grinding

	Dry-ground		Wet-ground		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	47,023	$1,382,147	5,690	$532,562	52,713	$1,914,709
1945	43,686	1,243,075	8,120	752,894	51,806	1,995,969

CONSUMPTION

Sheet, Punch, and Film Mica.—The consumption of sheet, punch and film mica continued to decline, as the accompanying table shows. Some of the decrease may be ascribed to reduced demand for household electrical appliances and other electrical equipment, of which this material is a component, but increasing use of alternate or substitute insulating materials, such as fiber glass, ceramics, and plastics, undoubtedly accounts for a portion. Certain grades and classes of block and film were acquired for the National Strategic Stock Pile.

Production of sheet and punch mica and apparent consumption of sheet and punch mica and mica splittings in the United States, 1937–48, in pounds

Year	Production	Apparent consumption	Year	Production	Apparent consumption
1937	1,694,538	7,160,616	1943	3,448,199	17,296,196

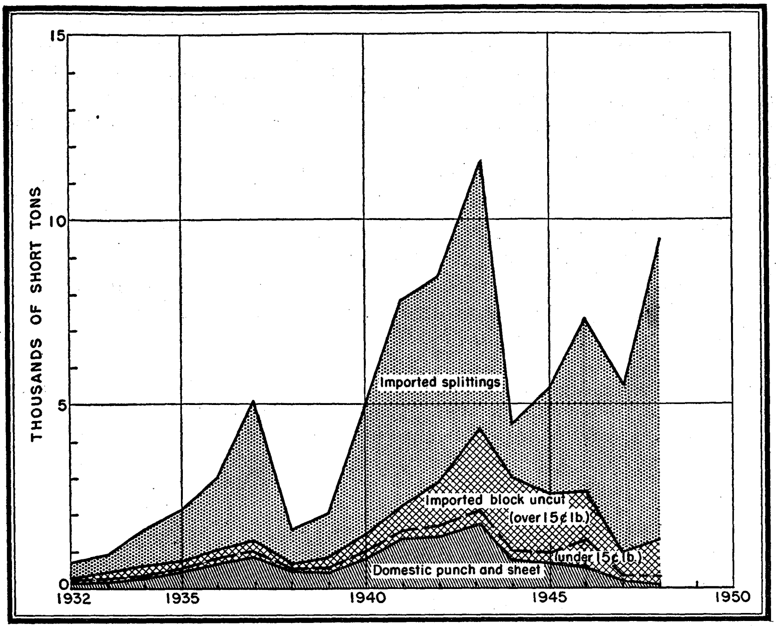

FIGURE 2.—Block mica and splittings imported for consumption in the United States and sales of domestic sheet and punch mica, 1932–48.

Consumption of block and film muscovite and phlogopite mica in the United States in 1948, in pounds [1]

Type	Block	Film	Total
Muscovite:			
Clear and slightly stained	1,620	100	1,720
Fair stained	5,538	30,865	36,403
Good stained	41,257	37,619	78,876
Stained	845,783		845,783
Heavy stained	285,680		285,680
Other	120,649	40,859	161,508
Total muscovite	1,300,527	109,443	1,409,970
Phlogopite (all qualities)	2,081		2,081
Grand total	1,302,608	109,443	1,412,051

[1] Partly estimated.

Mica Splittings.—Consumption of mica splittings in the United States in 1948, as reported by consumers, totaled 7,917,365 pounds valued at $6,300,581. This was a decrease from the previous year of approximately 15 percent in pounds consumed, but the increase in price of splittings left the total value of consumption only slightly less than the previous year. A sharp reduction in stocks was reported, most of which was in muscovite splittings and apparently indicates the determination of domestic consumers to resist the prevailing high prices of Indian splittings. Splittings also were being acquired during the year for the National Strategic Stock Pile.

Consumption and stocks of mica splittings in the United States, 1944–48, by sources, as reported by consumers

[1] Mexican included with domestic.
[2] Mexican included with Canadian.

Built-Up Mica.—Built-up mica products in 1948 were characterized by a substantial decrease in consumption and a sharp increase in value. This decrease in consumption reflected the softening of demand for many types of industrial electrical equipment of which these products are components, and the use of alternate materials. Since mica is the component of chief value in built-up mica products, the increased value is attributable to the increased cost of splittings.

Built-up mica produced in the United States, 1946–48, by kinds of product

Product	1946		1947		1948	
	Pounds	Value	Pounds	Value	Pounds	Value
Molding plate	1,742,835	$2,061,588	1,660,883	$1,832,779	1,545,401	$2,435,709

Ground Mica.—The roofing industry continued to be the largest consumer of ground mica, utilizing dry ground mica principally as a coating material. The paint industry consumes largely the finer and purer grades of both wet- and dry-ground mica. Growing acceptance of ground mica as a filler and binder in rubber products and as a mold dust in their manufacture has made the rubber industry an increasingly important consumer—more than one-fifth of the total went to this industry in 1948. Increased tonnages were used in oil-well drilling and pipe-line enamels during the year.

Ground mica (including mica from kaolin and schist) sold by producers in the United States to various industries, 1947–48

Industry	1947			1948		
	Short tons	Percent of total	Value	Short tons	Percent of total	Value
Roofing	40,012	62	$1,228,972	25,066	39	$775,297
Wallpaper	1,724	3	205,454	1,256	2	148,311
Rubber	3,900	6	429,570	12,275	19	773,319
Paint	8,151	13	560,336	9,172	14	703,558
Plastics	1,374	2	72,836	590	1	63,428
Miscellaneous [1]	9,379	14	470,545	16,283	25	768,719
Total	64,540	100	2,967,713	64,642	100	3,232,632

[1] Includes mica used for molded electric insulation, house insulation, Christmas-tree snow, manufacture of axle greases and oil, annealing, pipe-line enamel, oil-well drilling, welding, and other purposes.

PRICES

Prices received for domestic sheet and punch mica vary widely and are generally determined by direct negotiation between buyer and seller after agreement as to quality of particular lots. Hence, the following quotations from E&MJ Metal and Mineral Markets are largely nominal and represent the range of prices during 1948: North Carolina district, punch, 6 to 22 cents per pound, according to size and quality; sheet, 1½ by 2 inches, 60 to 75 cents per pound; 2 by 2 inches, 95 cents to $1.20; 2 by 3 inches, $1.35 to $1.65; 3 by 3 inches, $1.80 to $2.10; 3 by 4 inches $2.25 to $2.65; 3 by 5 inches, $2.75 to $3.25; 4 by 6 inches, $3.50 to $4; 6 by 8 inches, $4 to $6.

Prices for scrap ranged from $25 to $35 per short ton. Wet-ground mica sold at prices between $90 and $175 per ton and dry-ground between $32.50 and $80, depending on mesh size and quantity.

FOREIGN TRADE [13]

Imports.—In 1948 imports of mica of all types totaled 17,896 short tons valued at $15,546,056 compared with 11,685 short tons valued at $7,468,979 in 1947. The largest single item imported was muscovite splittings from India, which comprised nearly half the total tonnage and represented three-fourths of the total value. The trade in nearly every type of mica increased over the previous year, with the exception of films from India. Brazil assumed the leading role in films and, as for several years, was the leading supplier of muscovite block.

The competition of the Brazilian mica industry has been the subject of a controversy in India for some time. For several years Brazilian block mica has been shipped to India for splitting and reexportation. During 1948 the Mica Advisory Committee established by the Indian Government recommended continuance of this practice.[14] However, on September 1, the Indian Ministry of Commerce announced that no licenses for the imports of mica from Brazil or any other country would be issued in future.[15]

Substantial reduction of import duties on mica and mica manufactures resulted in 1948 from the General Agreement on Tariffs and Trade, concluded at Geneva, Switzerland, October 30, 1947. The effective date regarding Indian mica was July 9, 1948, and for Brazilian mica July 31, 1948.

Exports.—The quantity of mica products exported from the United States in 1948 continued to decrease, although exports of ground mica were only slightly less than the previous year. A slight increase in exports of unmanufactured block and sheet is attributed to a marked increase in shipments to Canada.

TECHNOLOGY

The quality classification of mica long has depended mainly on visual tests and therefore is largely a matter of personal judgment of the examiner. Inadequate descriptions of impurities and imperfections and the lack of standard techniques and methods of examining mica have caused considerable wastage of mica, monetary risk, and confusion to miners, dealers, fabricators, and users of mica. To meet the urgent need for universal standardization acceptable to all concerned, the American Society for Testing Materials was engaged in a project designed to provide sets of reference standards in the form of color negatives for use in classifying mica.[16]

The National Bureau of Standards made available plans for a mechanical mica splitter that represents an important step forward in mica splitting. It is reported that an untrained operator can produce 60 films per minute with this machine, whereas the average rate of hand splitting is 15 to 20 films per minute.[17]

It was announced that synthetic mica of the fluorine-phlogopite type is being produced on a pilot-plant scale under a coordinated research program involving the Federal Bureau of Mines, Colorado School of Mines, Signal Corps, Owens-Corning Fiberglass Corp., and the Office of Naval Research.[18] Technical data are available from the Office of Naval Research.

[4] Data not available; estimate by senior author of chapter included in total.
[5] Estimate.
[6] Less than 1 ton.
[7] Northern Territory only.

Australia.—A Government survey of the Hart's Range mica field of Northern Territory of Australia indicates that mica is an important national resource awaiting development. The field includes, in addition to the Hart's Range area, the Plenty River, Undippa, and Bundey areas. It has been reported that this field is comparable in size, concentration of mica-bearing pegmatites, and grade and quality of mica with the Indian deposits. Much of the area is rugged, and access is difficult. At present, most of the mines are relatively small, mining methods are crude, and output is limited. Mica production from mines operating in the Hart's Range and Plenty River areas from July 1, 1945, to March 31, 1948, totaled 230,296 pounds. Prices are controlled by the Commonwealth Prices Commission. The National Security Regulations administered by the Controller of Minerals Production, Department of Supply and Development, empowers the Commonwealth Government to purchase and distribute all mica produced.

India.—The International Organization for Standardization entrusted the Indian Standards Institution with the responsibility of devising international standards for grade and class of mica. The scope of this work includes preparing an agreed set of standard samples of mica which could be duplicated and supplied to all interested parties.[19]

The grant of additional wages, attendance bonus, annual bonus, housing and water-supply facilities, and free rations was announced by the Central Government's Industrial Tribunal, Dhanbad (Bihar), in its decision regarding the industrial dispute between workers in the mica mines of Bihar and their employers. The ruling was effective July 1, 1948.[20]

Madagascar.—Near the beginning of 1948 the Director of Mines estimated the monthly production of phlogopite block and splittings at about 35 to 40 tons and stocks at about 250 to 300 tons, either at the port of Fort Dauphin or at the mines. The producers reported a steady demand for splittings, either ordinary trimmed or book form, from the United States. A new classification system for phlogopite and new minimum export prices were announced. New regulations concerning the granting of prospecting and mining permits were summarized.[21] An order of the High Commissioner, February 27, 1948, slightly increased the basic value of mica, on which a 5-percent ad valorem mining tax is levied.[22]

Molybdenum

By HUBERT W. DAVIS

GENERAL SUMMARY

PRODUCTION of molybdenum concentrates was 1.3 percent smaller in 1948 than in 1947, but shipments were 34 percent larger. The decline in output resulted chiefly from a strike (beginning October 24 and continuing the remainder of the year, by employees of the railroad serving the mines and concentrators, which were closed during this period) of the Utah Copper Division of Kennecott Copper Corp., and partly from a strike of much briefer duration by employees of the Questa mine of the Molybdenum Corp. of America in New Mexico. Colorado regained first place as a molybdenum-producing State, and California ascended from sixth to fourth place.

The high rate of operations in the steel industry, which utilizes about 70 percent of the total molybdenum consumed in the United States, was partly reflected in gains of 20 and 22 percent, respectively, in production and shipments of molybdic oxide, calcium molybdate, and ferromolybdenum in 1948 over 1947. Also partly responsible for the gains were greater export demand and increased purchases in the last quarter, following the announced price advance effective January 1, 1949. Output and shipments of ammonium molybdate and sodium molybdate were less in 1948 than in 1947, as also were shipments of molybdenum metal. Production of metal, however, was slightly greater. As a consequence of the greater demand for molybdenum products in 1948, the quantity of molybdenum concentrates converted to oxide was 24 percent larger than in 1947.

No molybdenum concentrates were imported into the United States in 1947 and 1948. Exports, however, were 38 percent greater in 1948 than in 1947.

Salient statistics of molybdenum concentrates in the United States, 1944–48

	Molybdenum contained, thousands of pounds				
	1944	1945	1946	1947	1948
Production	38,679	30,802	18,218	27,047	26,706

[2] 10 pounds.
[3] At mines and at plants making molybdenum products.

Reversing an upward trend that had persisted for two consecutive years, industry stocks of molybdenum concentrates turned downward in 1948 and were 10 percent less at the end of 1948 than at the close of 1947. Stocks of molybdenum products held by producers declined 7 percent.

The published prices of molybdenum concentrates and molybdenum products remained unchanged throughout 1948.

DOMESTIC PRODUCTION—HISTORICAL REVIEW

Molybdenum ores were produced sporadically in the United States before 1915, but few data are available as to quantity of output. In 1898, 16,000 pounds of molybdenite assaying 42 to 56 percent molybdenum were mined in New Mexico and Arizona, and about 12 short tons of wulfenite assaying 90 percent $PbMoO_4$ were shipped from the Mammoth mine, Pinal County, Ariz.[1] From the Castleman mine in the Mount Baker district, Whatcom County, Wash., occasional shipments of molybdenite ore were made.[2] In 1901 and 1902 production of molybdenum ores, presumably from a deposit worked by the Crown Point Mining Co. in Chelan County, Wash., was 10 to 15 tons a year.[3] In 1903, 795 short tons of wulfenite concentrates (estimated to contain 10 percent molybdenum) valued at $60,865 were produced at the Mammoth mine, Pinal County, Ariz.[4] In 1904, 1905, and 1906, production was about 15 tons annually. The 1906 output included one lot of crude ore mined at Homestake, Mont., and a small quantity of comparatively pure molybdenite shipped from Lucerne, Wash. There was no reported production of molybdenum in the United States from 1907 until 1914, when 1,297 pounds of molybdenum were produced in Arizona, New Mexico, and Washington. The total output of molybdenum in the United States to 1914 probably did not exceed 350,000 pounds.

During the next decade developments were undertaken that were eventually to establish the United States as the premier producer of molybdenum in the world.

In 1917 active exploration was begun by the Climax Molybdenum Co. and the Molybdenum Products Corp. on different parts of the same large molybdenite deposit at Climax, Lake County, Colo. During 1918 the two companies made rapid strides in developing their holdings; mills were built, and toward the end of the year the Climax Molybdenum Co. had increased the capacity of its plant to 250 tons of ore a day. Meanwhile, the Primos Chemical Co. began developing the molybdenite deposit at Camp Urad on Red Mountain in Clear Creek County, Colo. Chiefly as a consequence of these developments, the center of molybdenum production moved from Arizona to Colorado, where production jumped to 663,386 pounds in 1918 and the State supplied 77 percent of the United States total. However, the end of World War I and the consequent break in the market made it necessary to suspend production at the Climax mine April 1, 1919, and at the Urad mine July 1. The Molybdenum Products Corp. ceased

operations in the latter part of 1918. Operations were resumed at the Climax mine in 1924.

The Questa mine of the Molybdenum Corp. of America near Questa, Taos County, N. Mex., was opened in 1919, and made small outputs in that year and in 1920, after which production was suspended. Operations were resumed in 1923, since which time it has been an annual producer.

The results of the Climax Molybdenum Co. research campaign to develop the use of molybdenum began to show results in 1925, when output in the United States exceeded 1 million pounds for the first time. As the demand for molybdenum was growing constantly, additional milling facilities were needed to pace requirements; and, as a consequence, by 1942 the new constructions by the Climax Molybdenum Co. had raised the daily milling and treating capacity of its plant to 18,000–20,000 tons of ore. Despite labor shortages and curtailment of operations at the end of 1943, molybdenum production of the Climax Molybdenum Co. rose to an all-time high of 46,133,715 pounds. Meanwhile, operation at the Questa mine of the Molybdenum Corp. of America was greatly expanded, and in 1930 production of molybdenum reached a peak of 639,852 pounds.

The Climax and Questa mines have been consistent producers of molybdenum since 1924 and were the only producers in 1924–26. Since the beginning of operations through 1948 these mines have yielded 356,474,000 pounds of molybdenum or 72 percent of the United States total.

Previous to 1936 by far the greater part of the production of molybdenum in the United States had come from mines operated solely for their molybdenum content. In 1936, however, recovery of molybdenum as a byproduct of copper ores was begun in the United States by the Utah Copper Division of the Kennecott Copper Corp. from the Bingham deposit in Utah. The following year the Nevada Consolidated Copper Corp., now the Chino Mines Division of the Kennecott Copper Corp., became a producer of molybdenum from the Chino copper property in New Mexico; in 1938 the Miami Copper Co. began recovering molybdenum as a byproduct of its copper operations at Miami, Ariz.; and in 1941 the Nevada Mines Division of the Kennecott Copper Corp. inaugurated the recovery of molybdenum as a byproduct of its Ruth and Copper Flat operations and custom copper ore from the Emma Nevada group of Consolidated Copper Mines Corp. Meanwhile, the Bagdad Copper Corp. and the Squaw Peak Copper Mining Co. recovered small quantities of molybdenum as byproducts of their copper operations at Bagdad and Camp Verde, Ariz., respectively. However, molybdenum recovery by the former company was discontinued in 1945 and by the Squaw Peak Copper Mining Co. in 1946. In 1939 the United States Vanadium Corp. began the recovery of molybdenum as a byproduct of its tungsten operation at the Pine Creek mine in Inyo County, Calif.

From 1936 through 1948 byproduct molybdenum production in the United States has totaled 124,890,000 pounds and has comprised 29 percent of the total.

The spectacular growth of the molybdenum industry in the United States is shown in the accompanying table. Of the total production through 1948, it is estimated that 73 percent has come from mines operated solely or almost solely for molybdenum, 25 percent as a byproduct of copper and tungsten operations, and 2 percent from wulfenite deposits.

Production and shipments of molybdenum ore and concentrates in the United States through 1948, in pounds of contained molybdenum

[1] Estimate

Arizona.—Arizona was the principal producer of molybedenum ores in the United States before 1918, when it was surpassed by Colorado. The State has many deposits of molybdenite and wulfenite. Despite the fact that more deposits have been worked there than in any other State, Arizona has produced a relatively small proportion of total output. For example, during the 35 years 1914–48, shipments of molybdenum contained in molybdenite and wulfenite from Arizona were 13,425,000 pounds or 2.8 percent of the United States total. Of this total (13,425,000 pounds), about 95 percent was contributed by the wulfenite deposits (Mammoth, Mohawk, and adjoining claims) in Pinal County, the Childs molybdenite property also in Pinal County, and the copper operation of Miami Copper Co. in Gila County, where since 1938 molybdenite has been recovered as a byproduct. The remaining output was mined at a number of widely scattered properties, including the Leviathan, Helvetia, Grand Reef, Rowley, Total Wreck, Santo Niño, Kullman McCool, Garnet Group, Squaw Creek, and Bagdad Copper.

California.—Except for 666 pounds of molybdenum contained in molybdenite hand-picked from a deposit near Bishop, Inyo County, in 1916, 499 pounds by Amigo & Maclean in Mono County, and 2,652 pounds from the Parker & Loftus property in Shasta County in 1917, and 634 pounds recovered from slime middlings of the Pine Creek mine in Inyo County in 1933, output of molybdenum in California has come from the Pine Creek tungsten mine, where both molybdenite and powellite are molybdenum minerals accessory to scheelite.

Colorado.—In 1918–19, 1924–46, and 1948 Colorado was the premier molybdenum-producing State. In 1947, however, it yielded first place to Utah, where output of molybdenite is a byproduct of copper operations; consequently, production is governed largely by the rate of copper mining, whereas in Colorado production is almost solely for the content of molybdenite and in general is geared to world molybdenum demand. From 1914 through 1948 Colorado has contributed about 70 percent of the total molybdenum shipped from mines in the United States. Colorado output has come chiefly from the Climax deposit in Lake County; virtually all of the remainder has been produced at the Urad mine in Clear Creek County.

Idaho.—A small quantity (1,044 pounds of molybdenum) of molybdenite was produced (but not shipped) at a property in Boundary County in 1938.

Nevada.—Except for a small quantity of high-grade molybdenite concentrates produced near Lovelock in 1915, a smaller quantity mined near Golconda in 1917, and 77,779 pounds of molybdenum contained in wulfenite mined at the Shenandoah claim at Goodsprings in 1934–36, molybdenum in Nevada has been recovered since 1941 as a molybdenite concentrate at the McGill mill of the Nevada Mines Division of Kennecott Copper Corp., treating copper ore mined at its Ruth and Copper Flat mines, and custom copper ore from the Emma Nevada group of Consolidated Coppermines Corp.

New Mexico.—In 1918 the Stephenson-Bennett mine at Organ produced 43,328 pounds of molybdenum contained in wulfenite. Since 1919 the entire New Mexico output has come from the mine near Questa, Taos County, and as a byproduct of mining copper ore at the Chino mines at Santa Rita, Grant County. The Questa mine, which is mined for molybdenum only and is outstanding in the richness of the ore, was opened in 1919, has been an annual producer since 1923 and was the only producer in New Mexico from 1919–36. In 1937 the recovery of molybdenite as a byproduct of mining copper ore at the Chino mines was begun and since 1939 the output of molybdenite from this operation has exceeded that at Questa.

Utah.—Except for several hundred pounds of molybdenum contained in molybdenite mined near Alta in 1916 and a few hundred pounds produced near Gold Hill in 1917, the output of molybdenum in Utah has come from the mining of copper ore at Bingham, where commercial recovery of molybdenite as a byproduct was inaugurated in 1936. From 1937 through 1946 and in 1948 Utah ranked second as a producer of molybdenite concentrates in the United States. In 1947, however, it ascended to first place, temporarily displacing Colorado.

Washington.—In the latter part of the nineteenth century and the early part of the present century, sporadic shipments of molybdenite were reported made from the Crown Point mine in Chelan County, the Castleman mine in Whatcom County, and a property near Lucerne, Chelan County. The Deertrail Monitor mines in Stevens County made small outputs between 1936 and 1941.

Wisconsin.—The only reported production of molybdenite in Wisconsin was in 1939, when 3 short tons of concentrates averaging 79.78 percent MoS_2 and containing 2,917 pounds of molybdenum were produced at a property in Marinette County.

DOMESTIC PRODUCTION IN 1948

The total production of molybdenum concentrates was 26,706,000 pounds (contained molybdenum) in 1948, a decrease of 1.3 percent from 1947. The loss in output resulted chiefly from a strike at the

Utah Copper Division of the Kennecott Copper Corp. and partly from a strike by employees of the Questa mine of the Molybdenum Corp. of America in New Mexico. The chief mineral of molybdenum is molybdenite (MoS_2), which comprised virtually the entire output in 1948; powellite [$Ca(Mo,W)O_4$] contributed a relatively small quantity. Wulfenite ($PbMoO_4$), once mined from several deposits in southwestern United States, has not been produced since 1944.

Molybdenum was produced in six States in 1948; Colorado led, followed in order by Utah, New Mexico, California, Arizona, and Nevada. Output of concentrates at mines operated solely or almost solely for molybdenum was 13,387,000 pounds in 1948, an increase of 15 percent over 1947, whereas byproduct concentrates from copper and tungsten operations totaled 13,319,000 pounds, a decrease of 13 percent. Byproduct molybdenum represented nearly 50 percent of the total concentrates produced in 1948 compared with 57 percent in 1947.

Shipments of molybdenum concentrates were 29,669,000 pounds (contained molybdenum) in 1948, an increase of 34 percent over 1947. The shipments in 1948 comprised 26,144,100 pounds to domestic consumers and 3,524,900 pounds for export.

Molybdenum in ore and concentrates produced and shipped from mines in the United States, 1939–48

Year	Production (pounds)	Shipped from mines		Year	Production (pounds)	Shipped from mines	
		Pounds [1]	Value [2]			Pounds [1]	Value [2]
1939	30,324,000	32,415,000	$22,157,000	1944	38,679,000	39,423,000	$27,999,000
1940	34,313,000	25,329,000	17,189,000	1945	30,802,000	33,683,000	23,976,000
1941	40,363,000	38,377,000	25,996,000	1946	18,218,000	16,786,600	11,529,000
1942	56,942,000	66,437,000	47,275,000	1947	27,047,000	22,189,800	15,178,000
1943	61,667,000	53,955,000	38,500,000	1948	26,706,000	29,669,000	20,418,000

[1] Figures for 1939–44 represent shipments from mines, plus concentrates converted to oxide by producer at Miami, Ariz.; those for 1945–48 represent shipments to domestic and foreign customers, plus concentrates converted to oxide at Miami, Ariz., and Langeloth, Pa.

[2] Largely estimated by Bureau of Mines.

REVIEW BY STATES IN 1948

Arizona.—The Miami Copper Co. was the sole producer of molybdenum in Arizona in both 1947 and 1948. Since 1938 the company has been a regular producer of molybdenite, which is recovered as a byproduct of its copper operations at Miami, Ariz. The concentrates are converted to molybdic oxide at Miami; output declined for the second consecutive year and was 28 percent less in 1948 than in 1947.

California.—California ascended from last to fourth place as a producer of molybdenum in 1948. The only producer in California was the United States Vanadium Corp. at Bishop, where the metal is recovered as a byproduct of tungsten production. The treatment plant of the company was operated at a greatly increased rate in 1948; as a consequence, recovery of molybdenum was four times that of 1947. Molybdenum occurs as molybdenite and powellite, which comprised 77 and 23 percent, respectively, of the output in 1948.

Colorado.—Colorado, which after 23 consecutive years lost the lead to Utah in 1947 as the largest molybdenum-producing State, regained its premier rank in 1948. The ore deposits of Colorado are exploited chiefly for their molybdenum content; and, in general, production is geared to demand, whereas in Utah output of molybdenum is a byproduct of copper operations and consequently is governed largely by the rate of copper mining.

The Climax Molybdenum Co., operating the world-famous deposit at Climax, Colo., was the sole producer of molybdenum concentrates in Colorado in both 1947 and 1948; output was 14 percent greater in 1948 than in 1947. The Climax deposit heretofore has been exploited solely for molybdenum, but in 1948 recovery of tungsten as a byproduct was inaugurated. Most of its 1948 output of molybdenite concentrates was shipped to its processing plant at Langeloth, Pa., where the company produces ferromolybdenum, calcium molybdate, molybdic oxide, and other molybdenum products, as well as ferrotungsten.

A shortage of manpower in 1947 and 1948 prevented carrying out of adequate mine repair and development at the Climax mine. To meet the development problem the driving of a level, situated 300 feet below the Phillipson Level, was begun in November 1948.

Montana.—A report on the Big Ben molybdenum deposit has been published.[5] There has been no commercial production of molybdenum from this deposit.

Nevada.—Since 1941 the Nevada Mines Division of the Kennecott Copper Corp. has been the lone producer of molybdenite concentrates in Nevada. The concentrates are recovered as a byproduct of the McGill concentrator, where copper ores from the company Ruth and Copper Flat operations and from the Emma Nevada group of Consolidated Coppermines Corp. are milled. Output of concentrates was 39 percent less than in 1947 and was the smallest since recovery was inaugurated in 1941.

New Mexico.—The Chino Mines Division of the Kennecott Copper Corp., Hurley, and the Molybdenum Corp. of America, Questa, continued to be the only producers of molybdenite in New Mexico in 1948. The output of these producers was 64 and 36 percent, respectively, greater than in 1947; State output was 58 percent larger. A strike of employees from March 23 to May 15 resulted in some delay in output at the Questa mine. The Questa mine, which is operated for molybdenum only, was opened in 1919 and since 1923 has been a regular producer. Discovery of a vein of ore averaging 5 to 6 percent MoS_2 on the lowest level of the Questa mine was reported. The concentrates produced at Questa are shipped to the processing plant of the Molybdenum Corp. of America at Washington, Pa., where the company produces ferromolybdenum, calcium molybdate, molybdic oxide, and other molybdenum products. At Hurley molybdenite has been recovered as a byproduct of copper operations since 1937.

Utah.—Utah dropped to second place as a producer of molybdenum in 1948. The sole producer in Utah is the Utah Copper Division of the Kennecott Copper Corp., which since 1936 has been recovering molybdenite as a byproduct of copper at its Arthur and Magna concentrators. Output of molybdenite concentrates in Utah was 19 percent less in 1948 than in 1947. The loss in output resulted chiefly

[5] Herdlick, J. A., Investigation of Big Ben Molybdenum Deposit, Neihart District, Cascade County, Mont.: Bureau of Mines Report of Investigations 4406, 1949, 22 pp.

from a strike by employees of the railroad serving the mine and concentrators, which were closed from October 24, 1948, to February 5, 1949.

RESERVES

Information on reserves of molybdenum in the United States, prepared by the Bureau of Mines and Geological Survey, was published in hearings before a Subcommittee of the Committee on Public Lands, United States Senate, Eightieth Congress, first session, 1947, pp. 267–269. An abstract is contained in the Molybdenum chapter of Minerals Yearbook, 1947 (p. 796).

CONSUMPTION AND USES

Consumption (as measured by shipments to domestic consumers) of molybdenum products in the United States was 20 percent greater in 1948 than in 1947. The largest single use for molybdenum is as an alloying element in the manufacture of steels, to which it is added as molybdic oxide, calcium molybdate, or ferromolybdenum. In general, when an entire open-hearth heat is to be alloyed to a degree not exceeding 0.8 percent molybdenum, the addition is in the form of molybdic oxide or calcium molybdate; ferromolybdenum is used when higher percentages of molybdenum are desired. Of the total molybdenum used in the United States, it is estimated that about 70 percent is in steels. The addition of molybdenum to various grades of stainless steel increases resistance to most chemical attacks. Molybdenum is finding an expanding market in the high-temperature alloys developed for various components of gas turbines, as well as in jet aircraft engines and turbosuperchargers. The development of high-temperature ceramic coatings for molybdenum has been described.[6]

Much smaller quantities (about 20 percent of the total) of molybdenum, chiefly in the form of ferromolybdenum and molybdic oxide, are employed in gray iron and malleable castings. Molybdenum in various forms finds limited employment in the chemical, electrical, and ceramic industries, which account for about 10 percent of the total. A relatively small quantity of concentrates (50,000 to 75,000 pounds of contained molybdenum annually) is used by a few steel companies as an addition to the molten metal in the ladle to raise the sulfur content to improve machinability, in addition to gaining the benefit of the contained molybdenum. Molybdenum has been tested as a fertilizer for deficient soils.

The following information concerning the research and development program of the Climax Molybdenum Co. has been quoted from its annual report: [7]

Metallic molybdenum.—A large proportion of current research effort has been devoted to the development of methods of fabricating molybdenum and molybdenum-base alloys. The potential new applications for these materials depend largely upon the exceptionally high melting point of molybdenum which is about 4,750° F. as compared, for example, with a melting point of 2,800° F. for pure iron. Considerable progress was made during 1948 in the production of larger size

[6] Steel, High-Temperature Ceramic Coatings Developed for Molybdenum: Vol. 124, No. 4, January 24, 1949, p. 59.

[7] Climax Molybdenum Co., Annual Report: 1948, p. 3.

ingots and harder alloys. Field tests are under way for developing new uses for these materials.

Molybdenum steel for springs.—A substantial proportion of alloy steel production is used for vehicle springs. During 1948 our research work has been continued on the development of improved molybdenum alloy steels, and the efforts of our engineers have contributed to the more extensive use in this field. Special attention is being directed toward the European market where until recently there has been little use of molybdenum for this purpose.

Molybdenum sulfide.—There has been increased interest in the use of molybdenite as a lubricant. Our field engineers are continuing their efforts in this field and a program of research has been started.

Ceramics.—The use of molybdenum in vitreous enameling, on which we have been working for several years, has commenced in a small way, especially in "low-temperature" enamels.

Production and shipments of molybdenum products [1] in the United States, 1944–48, in pounds of contained molybdenum

Year	Production	Shipments		
		To domestic consumers	Exports [2]	Total
1944	30, 579, 800	31, 138, 500	1, 577, 500	32, 716, 000
1945	32, 406, 300	26, 977, 200	1, 327, 000	28, 304, 200
1946	15, 039, 100	16, 501, 700	442, 400	16, 944, 100
1947	20, 659, 700	19, 878, 500	866, 400	20, 744, 900
1948	24, 445, 300	23, 808, 900	1, 215, 800	25, 024, 700

[1] Comprises ferromolybdenum, molybdic oxide, and molybdenum salts and metal.
[2] Reported by producers to the Bureau of Mines.

STOCKS

The accompanying table shows industry stocks of molybdenum concentrates and products, 1944–48.

Industry stocks of molybdenum concentrates and products, Dec. 31, 1944–48

[Thousands of pounds]

Year	Molybdenum content			
	Concentrates [1]	Products [2]		Total
		Producers	Consumers	
1944	19, 321	6, 069	2, 671	28, 061
1945	16, 883	10, 176	2, 653	29, 712
1946	19, 275	8, 211	2, 582	30, 068
1947	23, 661	8, 126	2, 695	34, 482
1948	21, 206	7, 547	(3)	[4] 28, 753

[1] At mines and at plants making molybdenum products.
[2] Comprises ferromolybdenum, molybdic oxide, and molybdenum salts and metal.
[3] Figure not available.
[4] Excludes stocks of molybdenum products at consumers' plants.

PRICES

Since 1938 the published price, f. o. b. mines, of molybdenite in concentrates containing 90 percent MoS_2 has been 45 cents a pound (equivalent to 75 cents a pound of molybdenum contained). Molybdenite concentrates are shipped largely to processing plants for conversion to molybdic oxide, the form in which most molybdenum is employed in iron and steel plants. Some oxide, however, is employed in making ferromolybdenum and calcium molybdate, which are also used in the manufacture of iron and steel. The prices of the principal molybdenum products are based on a pound of contained molybdenum, f. o. b. producer's plant. Throughout 1948 molybdic oxide and calcium molybdate were quoted at 80 cents a pound and ferromolybdenum at 95 cents. Effective January 1, 1949, the price of molybdenite concentrates was increased to 54 cents a pound of MoS_2 (equivalent to 90 cents a pound of molybdenum contained); molybdic oxide and calcium molybdate were raised to 95 cents a pound of contained molybdenum and ferromolybdenum to $1.10.

FOREIGN TRADE [8]

Imports of molybdenum ore and concentrates into the United States for consumption are normally small, and in 1947 and 1948 none was received. Some molybdenum ore and concentrates are occasionally imported for conversion to molybdenum products, which are exported; no ore or concentrates were so imported in 1947 and 1948.

Exports of molybdenum concentrates were 4,132,341 pounds (contained molybdenum) in 1948 compared with 2,989,251 pounds in 1947. Taking 46 and 38.5 percent, respectively, the United Kingdom and France were the chief foreign markets in 1948.

Exports of ferromolybdenum were 1,188,949 pounds (gross weight) in 1948 compared with 953,034 pounds in 1947, and those of molybdenum metal and alloys were 56,303 pounds compared with 133,106 pounds in 1947.

Tariff.—The duty on molybdenum ores and concentrates continued to be 17½ cents a pound on the metallic molybdenum contained; and on ferromolybdenum, molybdenum metal and powder, calcium molybdate, and other compounds and alloys of molybdenum it was 50 cents a pound of molybdenum contained plus 15 percent ad valorem.

Molybdenum ore and concentrates exported from the United States, 1946–48, by countries

[U. S. Department of Commerce]

Country	1946		1947		1948

WORLD REVIEW

Despite the fact that molybdenum is produced in many parts of the world, the combined output of all countries other than the United States is less than 15 percent of the world total, and most of that comes from a few countries.

World production of molybdenum in ores and concentrates, by countries, 1940–48, in metric tons [1]

[1] Molybdenum is also produced in Greece, Rumania, Turkey, U. S. S. R., and Yugoslavia, but production data are not available. Estimates by author of chapter are included in total.
[2] Less than 1 ton.
[3] Data not yet available; estimate by author of chapter included in total.
[4] Exports to Japan proper.
[5] Data represent areas designated as Free China during the period of Japanese occupation.
[6] Preliminary data for fiscal year ended Mar. 31 of year following that stated.

Canada.—According to the Dominion Bureau of Statistics, production of molybdenite in Canada was 291,150 pounds in 1948 compared with 759,795 pounds in 1947. The output in both years came from Quebec, presumably from the La Corne mine.

Chile.—Since 1939 Chile has been a regular producer of molybdenite concentrate. Output of molybdenite in Chile was 887 metric tons in 1948 compared with 669 tons in 1947.

Finland.—Operations at the Mätäsvaara molybdenum mine in Pielisjarvi were discontinued in July 1947 and the equipment has been sold and moved to the Aijala copper mine of Outokumpu Oy.[9] Presumably the Mätäsvaara mine was the only producer of molybdenum ore in Finland.

French Morocco.—French Morocco had a small but regular annual production of molybdenite in 1929–30 and from 1933 through 1941, but from 1942 through 1945 there was little or no output. Operation was resumed in 1946, when 79 metric tons of concentrates were produced; output was 60 tons averaging 88 percent MoS_2 in 1947. The deposits are in the Atlas Mountains, Azegour district, 12 miles from Amismiz.

[9] Kaukokallio, Elvi, American Legation, Helsinki, Finland, June 7, 1948.

Japan.[10]—Production of molybdenum in Japan reached a peak in 1944, when an average monthly output of 26.2 metric tons of concentrates containing 80 percent MoS_2 was recorded. Mining of molybdenum was temporarily suspended at the end of the war but was resumed on a small scale in October 1945, and 113 tons of concentrates were produced in 1946. The average monthly output dropped to 2.1 tons in 1947, and in February and in March 1948 production was only 0.7 ton. The Japanese molybdenum deposits are small and of low grade, and high Government subsidies have been paid in the past.

Mexico.—During 1947 mining of the deeper ores, in which molybdenum is a constituent, was discontinued by the Greene Cananea Copper Co., Cananea, Sonora, which had been recovering molybdenite concentrate since 1933. Consequently, there was no production of molybdenite by this company in 1948 compared with 344,668 pounds in 1947.

Norway.—Production of molybdenite in Norway was 132 metric tons in 1948 compared with 172 tons in 1947. The Knaben deposits, 40 miles east of Stavanger, are the principal sources of production.

United Kingdom.—Imports of molybdenum concentrates into the United Kingdom were 2,287 long tons in 1948 compared with 2,309 tons in 1947.

[10] Mining Journal (London), vol. 231, No. 5908, November 13, 1948, p. 842.

Natural Gas

By F. S. LOTT, J. G. GROSSMAN and H. BACKUS

GENERAL SUMMARY

RESPONDING to an ever-growing demand, marketed production of natural gas expanded 12 percent to an all-time high of 5,148 billion cubic feet in 1948. These figures are estimated to include gas stored and gas lost in transmission and reflect the sale at wells rather than at points of ultimate consumption, as in past practice. All major classes of consumers except carbon-black manufacturers used more gas during 1948. Domestic sales soared 12 percent to 896 billion cubic feet, influenced by record sales of gas ranges, refrigerators, and near-record sales of water heaters. At the same time that the Federal Reserve Board index of industrial production rose 3 per-

[1] Figures exclude in 1944–46 and include in 1947–48 gas stored and lost in transmission.
[2] This statistical series, compiled by the Federal Power Commission, includes manufactured gas and is therefore shown separately. However, the natural gas portion is assumed to be included with "Other industrial" consumption shown above.
[3] Figure not available.
[4] Exclusive of oil- and gas-field operators

cent over the 1947 performance, commercial and industrial consumption of natural gas increased 13 and 12 percent, respectively. Gas used in the manufacture of carbon black was 1 percent below the 1947 record, the first decline since 1943. Gas used as fuel at petroleum refineries, electric-public utility power plants, and portland-cement plants was 21, 28, and 19 percent, respectively, over the 1947 volumes.

The average value of natural gas at the wells is estimated to have risen from 6.0 cents per thousand cubic feet in 1947 to 6.5 cents in 1948. The strong market for natural gas resulted in gains in field prices in many areas.

The number of domestic meters increased from 12,204,000 in 1947 to 13,508,000 in 1948 and commercial customers from 1,039,000 to 1,145,000. The small movement of natural gas to Canada continued, amounting to 193 million cubic feet in 1948 compared with 207 million in 1947. Deliveries to Mexico increased from 17,942 million cubic feet in 1947 to 18,511 million in 1948.

OUTLOOK

The trend toward relatively lower prices of natural gas compared with other fuels and the concomitant increase in public demand forecast continuance of the vigorous growth of the natural-gas industry in the immediate future. Although the amount spent on construction in 1948 (chiefly for interstate transmission lines) was more than eight times the combined amount spent for natural, manufactured, and mixed gas 10 years ago, pipe-line construction will not have its full effect on 1949 consumption because of the 3 or 4 years required for completing projects. Planned expenditures will gradually taper off; but shortages, particularly of large-diameter steel pipe, are still expected to delay completion of expanded distribution and production projects.

The present importance of the natural-gas industry is attested to by the fact that its pipe-line system exceeds railroad mileage in the Nation and far exceeds oil-pipe-line mileage. Although sales and number of customers gained materially in 1948, reserves increased faster than gas consumed or lost. Much of this gain was due to the record exploration and development under way in the oil industry, which had an important auxiliary result in the discovery of more gas. The accumulation of increased stocks of petroleum in 1948, followed by the curtailment of production, may affect exploration and incidental discovery of gas.

A factor tending to conserve existing supplies is the interest shown in certain quarters—particularly by the Texas Railroad Commission—in ending all gas flaring where economically possible. Gas-transmission companies are working with producers to tie more casinghead production into their lines.

Change-overs to straight natural gas resulted in decreases in sales and number of consumers of manufactured and mixed gas. In view of the continuation of high construction costs, this tendency to convert from manufactured to natural or mixed gas rather than to expand existing plants to meet increased demands may be expected to continue.

Another factor tending to increase gas consumption is the continued expansion of use in appliances and equipment. The sale of water heaters and central heating units, which declined in 1948, should gain as the steel shortage eases.

Some price changes may be expected as a result of several factors. Higher costs of materials and labor have already resulted in raises in field prices by a few producers. Transmission-line construction costs are almost double the prewar level. The Supreme Court decision holding that the Federal Power Commission could not regulate the disposal of a natural-gas company's field properties may facilitate the upward revision of gas rates. Some of the higher costs for labor and materials have been met by extending the trend toward automatic control devices to every phase of the gas industry.

Underground storage has already proved its usefulness in expanding effective peak-load capacity, and new process equipment with considerably increased capacity will likewise help to augment winter capacity. New domestic applications of natural gas, recently developed, promise sustained demand at high levels. In the industrial field, the savings in labor cost and processing time likewise insure further progressive development in the applications of natural gas as a source of heat. Completion of unfinished and planned long-distance pipe lines will consolidate the position of Texas and contiguous States as the heart of the natural-gas arteries of the Nation.

GOVERNMENT REGULATIONS

The United States Department of the Interior announced in 1948 the first agreement under legislation enacted in 1946, authorizing it to permit the subsurface storage of oil or gas on Federal land. Though covering but a small portion of the Michigan gas fields, this established an important precedent, and several other applications are pending.

In May 1948, the United States Supreme Court dismissed Republic Natural Gas Co.'s appeal from a decision of the Oklahoma Supreme Court requiring it to take gas ratably from a well owned by the Peerless Oil & Gas Co. in the Hugoton field. The Oklahoma commission found that Republic, which has a pipe line, was draining gas from underneath the section where the Peerless well was drilled, thus preventing Peerless, which has no pipe line or market, from taking its proportionate share. The commission, sustained by the court, said

Oklahoma law required Republic to buy gas from Peerless under such circumstances.

The Texas Railroad Commission continued its efforts to reduce flaring by ordering operators in 17 Texas oil fields to shut-in all wells where the produced gas was not being put to "lawful use," effective in December 1948. The commission cited operators in 26 more fields for hearing January 25, 1949. Operators obtained injunctions for a court test in fields previously ordered closed in.

The United States Circuit Court of Appeals set aside an order of the Federal Power Commission making the Border Pipe Line Co. of Texas subject to regulations of the commission, ruling that the FPC did not have power to regulate natural-gas companies which sell intrastate or for export. The FPC continued to find it necessary to allocate inadequate pipe-line capacities. It also issued new and amended regulations effective December 1, 1948. In December 1948, the FPC stated that the statutes of Missouri do not confer jurisdiction upon the Missouri Public Service Commission in cases involving Missouri sales by an interstate pipe-line company.

In June 1948, a United States Court of Appeals upheld a FPC order rejecting a company's claim that it had exclusive rights to service the Detroit and Ann Arbor markets under the grandfather clause of the Natural Gas Act and under well-established public utility law. The court held that nothing in the Natural Gas Act suggests that the Congress preferred monopoly to competition.

The Senate Commerce Committee rejected the Moore-Rizley bill, which would have changed the Natural Gas Act of 1938 by limiting the powers of the Federal Power Commission.

In June 1949 the Supreme Court, in an important decision, ruled that the Federal Power Commission could not regulate disposal of a natural-gas company's reserve fields.

RESERVES

The Committee on Natural Gas Reserves of the American Gas Association reported reserves of 173,869,340 million cubic feet at the end of 1948. This represented a 4.8-percent increase over the 1947 figure in spite of a record production year. The proved reserves of natural gas in the United States have increased more than 700 percent since 1925 and more than 230 percent in the past 10 years. The following table lists the committee's estimates of changes during 1948 and totals as of December 31, 1948, by States.

American Gas Association estimates of the proved reserves of natural-gas liquids (including condensate, natural gasoline, and liquefied petroleum gases) in the United States total 3,540,783,000 barrels as of December 31, 1948. This represents a gain of 286,808,000 over the 1947 year-end figure of 3,253,975,000 barrels.

Estimated proved recoverable reserves of natural gas in the United States, 1947–48, in millions of cubic feet [1]

[1] Volumes are reported at a pressure base of 14.65 pounds per square inch absolute and at a standard temperature of 60° F.
[2] Excludes shrinkage caused by recovery of natural gas liquids.
[3] The net difference between gas stored in and gas withdrawn from underground storage reservoirs.
[4] Net production equals gross withdrawals less gas injected into underground reservoirs; changes in underground storage are excluded.
[5] Nonassociated gas is free gas not in contact with crude oil in the reservoir.
[6] Associated gas is free gas in contact with crude oil in the reservoir.
[7] Dissolved gas is gas in solution with crude oil in the reservoir.
[8] Gas held in underground reservoirs for storage purposes only.
[9] Alabama, Florida, Missouri, Nebraska, and Virginia.

PRODUCTION

GROSS PRODUCTION

The estimated gross production of natural gas in the United States in 1947 increased 9 percent over 1946—from 6,190,200 million to 6,733,230 million cubic feet. Continuing an earlier trend, straight gas-well production declined 1 percent from 3,807,500 million cubic feet in 1946 to 3,769,768 million in 1947, while gas obtained from oil wells increased 24 percent to 2,963,462 million feet in 1947. The States with the greatest total production in 1947 were Texas, Louisiana, California, and Oklahoma. Mississippi experienced the largest proportionate gain, 65,980 million cubic feet compared with 22,700 million in 1946. Texas made the largest gain in 1947. A few States, mainly in the Appalachian area (including New York, Pennsylvania, and West Virginia), showed declines. Much of the production from the Gulf States was transported to the east and to California.

Gross production and disposition of natural gas in the United States in 1947, by States, in millions of cubic feet

State	Production [1]			Disposition		
	From gas wells	From oil wells	Total	Marketed production [2]	Repressuring	Losses and waste [3]

[1] Marketed production plus quantities used in repressuring, lost, and wasted (see footnote 3).
[2] New basis; includes gas stored and lost in transmission.
[3] Includes gas (mostly residue) blown to the air but does not include direct waste on producing properties, except where data are available.
[4] Florida, North Dakota, South Dakota, Tennessee, and Virginia.

An aggregate of 5,640,438 million cubic feet was withdrawn from reserves and consumed or lost in 1947. This figure was obtained by subtracting from estimated gross production the amounts returned to underground reservoirs for repressuring, pressure maintenance, and storage. The increase in withdrawals of 10 percent over 1946 indicates the rate at which the Nation's reserves of gas are being depleted.

Underground storage of natural gas increased 28 percent from 75,458 million cubic feet in 1946 to 96,316 in 1947. In the Eastern States, increasing reliance on gas from interstate pipe lines continued. In West Virginia large quantities of gas were stored in old pools for peak-load delivery, and three underground storage projects were completed or planned. Several liquefied-petroleum-gas storage plants were built to store some of the heavier and richer fractions of natural gas, such as propane and butane, in liquid form to be regassified as the need occurs. Expanded transportation facilities brought increased quantities of Texas gas directly to consuming centers in Ohio, New York, and Pennsylvania.

Natural gas stored underground in and withdrawn from storage fields, by States of location, 1946–47, in millions of cubic feet

State	1946			1947		
	Total stored	Total withdrawn	Net stored	Total stored	Total withdrawn	Net stored
Arkansas	1,189		1,189	7		7
California	14,173	9,731	4,442	9,297	11,291	−1,994
Illinois	451		451	294	5	289
Indiana	345	67	278	544	433	111
Kansas	7,527	7,866	−339	11,323	8,790	2,533
Kentucky	1,361	914	447	1,149	1,932	−783
Michigan	1,118	2,481	−1,363	4,712	8,804	−4,092
Montana	621	186	435	1,377	608	769
New Mexico	1,417	83	1,334	261	87	174
New York	2,293	780	1,513	2,668	2,702	−34
Ohio	14,534	10,571	3,963	18,136	15,979	2,157
Oklahoma	4,098	1,314	2,784	4,987	3,776	1,211
Pennsylvania	12,147	9,667	2,480	19,230	15,297	3,933
Texas		425	−425	4,012	27	3,985
West Virginia	14,180	12,053	2,127	17,692	16,907	785
Wyoming	4		4	627	5	622
Total	75,458	56,138	19,320	96,316	86,643	9,673

Total gas withdrawn from storage increased 54 percent from 56,138 million cubic feet in 1946 to 86,643 million in 1947. The figures show steady growth in storage and withdrawal, and there is little doubt that the practice of storing gas to assure steady supplies during peak seasonal periods will continue to expand.

Losses and waste other than gas lost in transmission totaled 1,067,938 million cubic feet in 1947. Although casinghead-gas conservation projects saving millions of cubic feet daily were completed, under construction, or planned in Texas, that State still led the Nation in gas waste with 538,994 million cubic feet, followed by Oklahoma with 214,170 million.

After decreasing 23,709 million cubic feet in 1946 (2 percent), the amount of gas used for repressuring and pressure maintenance increased 4 percent to 1,083,119 million in 1947, mainly due to gains in Louisiana and Texas. Texas accounted for 65.6 percent, Louisiana

15.2, and California 12.5 percent of the total volume of gas used for repressuring.

The growth in repressuring and pressure maintenance is closely related to cycle-plant operation. Texas, California, and Louisiana (where 93.3 percent of all gas returned to formations was reported in 1947) were also leading in natural-gasoline and cycle-plant production during that year.

MARKETED PRODUCTION

Marketed production in 1947 is reported on a new basis and includes gas stored and lost in transmission, in order to reflect more accurately actual field conditions. Figures therefore are not comparable with 1946 and earlier records, which include only gas used by the ultimate consumer. In all 4,582,173 million cubic feet of gas were marketed in 1947. Texas, Louisiana, California, and Oklahoma being the four leading producing States.

The average wellhead value of natural gas in the United States increased from 5.3 cents per thousand cubic feet in 1946 to 6.0 cents in 1947, reflecting sustained demand. The average in the Gulf States was 3.7 cents in 1947 compared with 3.3 cents in 1946. California experienced a sharper increase from 7.4 to 10.2 cents in the same period, and the combined average for New York, Ohio, Pennsylvania, and West Virginia declined from 21.3 to 20.8 cents.

Marketed production of natural gas in the United States, by States, 1943–47, in millions of cubic feet

[1] New basis; includes gas stored and lost in transportation.
[2] Less than 0.05 percent.
[3] Less than $500.
[4] Includes 3,077 million cubic feet piped to Mexico.
[5] Includes 28 million cubic feet piped to Canada.
[6] Includes 179 million cubic feet piped to Canada.
[7] Includes 14,865 million cubic feet piped to Mexico.

NUMBER OF WELLS

Gas-well completions dropped from 3,353 in 1947 to 2,897 in 1948, with sharp drops in Michigan, Ohio, Pennsylvania, and West Virginia. Declines also occurred in some of the Rocky Mountain States, including Montana, Wyoming, and New Mexico. Casing and line-pipe shortages at the Bowdoin and Cedar Creek fields caused most of the decline in Montana. Texas continued to lead in number of completions, with 542. California drilled only 21 wells, compared to 45 in 1947.

The number of producing gas wells increased during 1947 from 62,740 to 63,670 at the close of the year. States with large total increases included Kansas and Oklahoma (550), West Virginia (500), Texas (200), and Louisiana (100).

The total number of gas wells (net) abandoned or shut-in during 1947 was 2,423. Of this number 1,400 were in the Ohio-Pennsylvania-New York area, and 337 were in Texas.

Gas wells in the United States, 1946–48, by States

State	Producing Dec. 31, 1946	Drilled during 1947 [1]	Producing Dec. 31, 1947	Drilled during 1948 [1]
Arkansas	180	10	160	5
California	310	45	350	21
Colorado	20	7	20	10
Illinois	90	9	100	11
Indiana	840	35	830	40
Kansas	2,400	400	2,700	382
Kentucky	[2] 3,390	110	[2] 3,350	151

[2] Tennessee included with Kentucky.

DEVELOPMENT AND PRODUCTION BY STATES

Arkansas.—Data supplied by J. W. Saunders, Arkansas Oil and Gas Commission, indicate that the increased gas production in 1948 was due primarily to additional development in established fields. The output of the controlled oil and condensate fields in south Arkansas declined slightly from 65,984 million cubic feet in 1947 to 65,636 million in 1948. About 6,000 million cubic feet were vented. In the dry-gas fields of north Arkansas, where the White Oak field was extended in 1948, 4,812 million cubic feet of gas were produced in 1947 and 5,703 million in 1948. The Columbia pool remained shut-in during 1948 because of the lack of a market for the gas. No dry-gas discoveries were reported.

California.—According to the California State Department of Natural Resources, total withdrawals of gas in California for 1948 were 571,643 million cubic feet compared with 551,145 for 1947, a gain of 4 percent. Production totaled 189,682 million cubic feet of gas from dry-gas fields, 415,735 million cubic feet of wet gas from oil fields, and 26,480,000 barrels of natural-gas liquids (including condensate). Losses due to processing at gasoline plants aggregated 33,774 million cubic feet.

In northern California, during 1948, the Pacific Gas & Electric Co. added approximately 30 miles of high-pressure transmission mains. Its gathering system in the Rio Vista field is connected to a total of 145 active gas wells. In southern California, the Southern California Gas Co. completed approximately 73 miles of transmission mains in

Riverside and Imperial Counties, extending from the 30-inch Texas-California line to the United States-Mexico border. This service will reach several communities not heretofore supplied with utility gas, some of which have converted to natural gas from liquefied petroleum gas. Other pipe lines constructed included 14 miles of 30-inch in the Pasadena area and 6 miles of expanded gathering lines in the Trico field area to connect with recently developed production in the northwest extension of the field.

A 1,000-horsepower compressor unit was installed in Playa del Rey underground storage field, where a maximum withdrawal of about 100 million cubic feet per day was attained—an increase over the 1945 rate of 72 million. Owing to the strategic location of this storage structure near the heart of the Los Angeles load center, it has been used to a great degree in hourly load equation in addition to daily and seasonal equation, for which it was originally planned. Another storage reservoir, in Santa Barbara County, operated for the purpose of daily and seasonal load equation only, is in the La Goleta field. It has increased its maximum daily delivery capacity from 215 million in 1945 to 222.5 million cubic feet as of January 10, 1949.

The great demand for natural gas in southern California during the severe winter of 1948–49 caused increased withdrawal from storage. Measures are being taken to provide additional pipe lines to the San Diego area to preclude a recurrence of the shortages experienced during the past winter. Utilization of natural gas by domestic and commercial consumers increased 17 percent and by industrial users 19 percent.

The California subcommittee on statistics of exploratory drilling, Graham B. Moddy, chairman, recorded nine new fields and pools discovered in 1948, none rated as a major discovery. Together with extensions, these added 8 million barrels to natural-gas-liquids reserves and 240 billion cubic feet to gas reserves. Of 488 completions in 1948, only 33 were drilled primarily to find gas. Of these, eight were successful, including two wildcats. Three outposts were finished as discovery wells of new pools. Wildcats discovered three gas fields and one gas pool.

Among the new field wildcats, a Solano County discovery had a rated initial production of 7 million cubic feet a day in the Denverton field. Another, in Yolo County, rated 6.45 million cubic feet from the Martinez. A successful new-pool wildcat in Santa Barbara County showed an initial production of 2,155 thousand cubic feet per day from the Seape formation. Among the deeper and shallower pool tests, one Cretaceous well in Solano County yielded an initial production of 4.7 million cubic feet.

Estimated natural-gas-liquids reserves totaled 307,908,000 barrels on December 31, 1948, a decrease of 4,243,000 barrels during 1948. Gas reserves at the end of the year were 10,192,593 million cubic feet, an increase of 28,237 million over 1947.

Rio Vista led in activity among dry-gas fields, with 9 completions out of a total of 23 completions for all dry-gas fields.

Colorado.—New discoveries increased in Colorado in 1948, according to J. R. Schwabrow, Federal Geological Survey. An 8,286-foot well at Dove Creek produced 5,200,000 cubic feet of gas and 528 barrels of condensate per day from the Hermosa or Paradox sand at

5,910–5,934 feet. Another (an extension of a New Mexico field) at Barker Creek produced 113,000,000 cubic feet after acidizing in the Paradox. An old McElmo well, deepened, flowed 40,000,000 cubic feet of carbon dioxide gas from the Devonian at 6,805–6,965 feet. A 4,902-foot well at Pagoda, which had an initial production of 7,700,000 cubic feet in the Shinarump at 3,957–4,047 feet, was shut in for the winter. Drill-stem tests in the Dakota and Entrada formations indicated 7 to 8 million cubic feet, with a CO_2 content of 57 percent in the Entrada. Further tests are planned.

Development wells were completed at the Douglas Creek (2), Hiawatha, West Hiawatha, and Powder Wash fields. The combined open flow of nine wells, exclusive of the McElmo well, was 183,780,000 cubic feet. At North Callum, 9,709,634,000 cubic feet of carbon dioxide gas were returned to the oil-producing sand, and the loss was reduced to 110,537,000 cubic feet. At Wilson Creek 371,277,000 cubic feet of gas were recycled, 106,839,000 used in the field, and 102,787,000 lost.

Marketed production in Colorado (exclusive of CO_2 gas and field use) increased from 6,030,492,000 cubic feet in 1947 to 6,489,621,000 in 1948. All fields except Powder Wash shared the gain. Production by fields in thousands of cubic feet was: Powder Wash, 2,678,850; East Hiawatha (Colorado side only) 2,530,303; West Hiawatha, 910,469; Thornburg, 331,790; Berthoud, 34,064; and Craig, 4,145. The Piceance Creek, White River, and Douglas Creek fields remained shut in for lack of pipe-line connections to markets.

Gross production (other than marketed) was divided as follows (in thousands of cubic feet): Repressured and recycled, 371,277; field use, 1,118,262; and losses 1,394,415. Field use declined 34 percent owing mainly to completion of drilling operations in the Rangely field. A gasoline plant was under construction there. Stripped gas will be returned to the producing formation in 1949 for pressure maintenance.

Illinois.—A. H. Bell and D. H. Swann of the Illinois State Geological Survey reported 10 gas completions in Illinois in 1948. Nine of these were drilled in the Waverly, Dubois, Herald, and Roland pools. These were shut-in during 1948.

Almost 16 billion cubic feet of casinghead gas were processed in gasoline plants during the year, compared with 18.23 billion in 1947. In addition, approximately 45 billion cubic feet of unmetered gas were produced during 1948.

Estimated total lease utilization of the unmetered gas was 7 to 15 billion cubic feet. The unused excess was flared.

Of the 13 billion cubic feet of residue gas remaining after extraction, approximately half served as plant fuel or in generating electricity for field use, about 4.1 billion cubic feet were injected for pressure maintenance or repressuring, and approximately 2 billion cubic feet were used for lease fuel. Minor amounts were sold and flared.

It is estimated that approximately 61 billion cubic feet of gas were produced in Illinois in 1948, an increase of 12.6 billion over the 1947 figure. Distributing companies marketed 9 million cubic feet of gas from the Ayers gas field, 49 million from the Russellville gas field, 110 million from the Storms gas-cap field plus 14 million from residue gas, and 136 million from the gas wells of the Louden field. These figures indicate a decline of 465,000 million cubic feet from 1947 figures.

Indiana.—Figures obtained from the Bulletin of the American Association of Petroleum Geologists show that five gas discovery wells were drilled in 1948, including two Pennsylvanian extensions in Posey County. Wells drilled in new fields include two in Harrison County and one in Martin County (all Devonian). The combined production for these five wells was 3,952 thousand cubic feet. R. E. Esarey and B. E. Brooks reported that a gas well flowing 3 million cubic feet daily was drilled in the Devonian New Albany shale. Three new gas wells were also drilled in Jay County.

Kansas.—Earl K. Nixon of the State Geological Survey reported that gas-well completions numbered 351 in 1948 compared with 417 in 1947. A total of 325 gas wells was drilled in the Hugoton field, a decline of 45 from 1947. These resulted in a slight enlargement of the field along the western boundary.

A new gas pool, the Richfield, was discovered in Morton County, within the general area of the Hugoton field, with a production of 3.9 million cubic feet per day and 20 barrels of condensate from the basal Pennsylvanian Atoka horizon.

Two other new pools were reported in 1948 as follows: Producing from the Arbuckle dolomite, the Bradbridge field in Stafford and Edwards Counties; and producing from the Simpson, the Cottonwood Creek field in Barber County.

Gas production increased 17 percent from 205 billion cubic feet in 1947 to 240 billion cubic feet in 1948. The Hugoton field increased production 18 percent to 186 billion cubic feet in this period. Producing wells in the Kansas portion of this field increased to 1,134 in 1948 from 928 at the end of 1947.

Kentucky.—New gas wells declined in number from 316 in 1947 to 195 in 1948. No new pools were discovered during the year. In eastern Kentucky, completions in the Big Sandy field numbered 158, compared to 228 in 1947. The total open-flow capacity of 226 million cubic feet, of which 166 million were obtained from the Silurian Big Six sand, exceeded the 1947 total by 5,428 million.

In the South Central area, four wells in Pulaski County encountered gas in amounts ranging from 100 to 200 thousand cubic feet with a rock pressure of 50 pounds. Gas was shut-in awaiting a market. Producing wells drilled in this area dropped from 40 in 1947 to 6 in 1948.

In western Kentucky, drilling activity declined and gas completions fell to 7. In Magoffin County a well which came in at 10 million cubic feet extended an earlier Big Six field to the head of Bee Tree Creek. Six wells totaled almost 75 million cubic feet. Production is expected to be spotty and characterized by large initial flows. Exhaustion of Bee Tree field gas is expected in a comparatively short time.

Louisiana.—Arnold Chauviere, Louisiana Geological Survey, reported 250 gas and condensate completions in 1948, including 163 in the northern part of the State and 87 in the south. Fourteen of the 18 discoveries were in south Louisiana. Those showing promise of developing into major fields are Cote Blanche Island in St. Mary Parish; Pointe-a-la Hache in Plaquemines Parish; and, in the Gulf of Mexico, Breton Island Block 38, Vermillion Area Block 71, Ship Shoals Area Block 72, and Eugene Island Area Block 45. Other new gas and condensate fields (with parish locations) are Downsville in Union, Milhaven and Calhoun in Ouachita, Castor in Bienville, Lottie in Pointe Coupee, Bell City and East Bell City in Calcasieu, Holly Beach in Cameron, Edna in Jefferson Davis, Melville in St. Landry, and West Bivens and North Gordon in Beauregard.

In the Hico-Knowles field, Lincoln Parish, a considerable gas reserve was discovered by the extension of Jurassic production approximately 1 mile northwest and 2½ miles northeast.

During 1948, a total of 972,992 million cubic feet of natural gas was produced, a 16-percent increase over 1947.

Michigan.—Information on gas developments in Michigan was furnished by G. E. Eddy, State geologist. Gas completions declined from 191 in 1947 to 108 in 1948, owing to a decrease in the number of wells drilled in older fields for underground storage. Five gas fields were discovered, of which only the Newark in Gratiot County added important reserves. A second, the Jennings pool in Missaukee County, holds some promise.

The Howell field had a total production of 3,362,694 thousand cubic feet of gas and 12,357 barrels of condensate at the end of 1948. The limits of this Salina-Guelph discovery of 1947 are not defined.

Expansion of storage featured developments at the Austin, Goodwell, Reed City, Cranberry Lake, and Marion fields. These accounted for 71.4 billion cubic feet, or 93 percent of the total State sales of gas.

Before May 1948, all gas stored in the State was Michigan gas. Since then, all stored gas has come from Texas, Kansas, and Oklahoma through a 24-inch line from Detroit to the Austin field. A projected 22-inch line will also deliver gas to the Austin reservoir. The Michigan Gas Storage Co. is constructing a 20-inch line to connect with Panhandle's 20-inch line in southwestern Washtenaw County.

A unique dry-gas storage project at the Cranberry Lake and Winterfield reservoirs involved mixing 12 million gallons of butane with dry gas and air and injection under pressure to furnish supplies during the peak winter months and to prevent avoidable bottom and edgewater advance.

A total of 21,369,587 thousand cubic feet of gas was produced from reserves in place in 1948. This 10-percent decline from 1947 reflects the influence of larger imports from midcontinent sources through newly constructed pipe lines and the unusually mild fall and winter weather.

Mississippi.—A communication from H. M. Morse, supervisor, Mississippi State Oil and Gas Board, discloses increased production at the Gwinville field from 26,699,327 thousand cubic feet in 1947 to 35,310,842 thousand in 1948. A new gas field, Sandy Hook, was discovered in Marion County, where no pipe line was available. Two companies have applied to take gas from the Baxterville field to points east of the State. Several other gas fields still lacked facilities for marketing. The Carthage Point field, however, marketed 7,779,526 thousand cubic feet in 1948.

Gross production in Mississippi soared to 90,307,901 thousand cubic feet in 1948, almost three times the 1947 total of 32,810,564 thousand cubic feet.

883326—50——54

Missouri.—Frank C. Greene geologist, Missouri Geological Survey, reported that production increased slightly from 30,035,000 cubic feet in 1947 to 31,110,000 in 1948.

A new pool was discovered in Platte County, but the discovery well had an initial open flow of only 98,000 cubic feet. A second well, completed early in January 1949, yielded 1,108,000 cubic feet. The Platte County Gas Co., discoverers of the new pool, has a pipe line in this area, and further development is anticipated.

Montana.—Information from J. R. Schwabrow, Federal Geological Survey, indicates that about 48 gas wells with a combined open flow of 123,660,000 cubic feet were completed in 1948 compared with 92 wells with 141,816,000 cubic feet in 1947. Casing and line-pipe shortages reduced drilling to 22 wells in the Bowdoin field and one at Cedar Creek. Completions by fields were: Cut Bank (11), Kevin-Sunburst (4), Bowes (3), Utopia (2), Hardin (2), and Apex, Cassady, and Reagan (1 each). No new discoveries were made. Gas storage to meet winter demands continued at Cedar Creek and Cut Bank, and field use increased at Cut Bank and Kevin-Sunburst.

A pipe line was laid from the Reagan field to a sweetening plant under construction at Cut Bank to utilize the flared gas from the two fields.

Total marketed production of major fields, in thousands of cubic feet, was: Bowdoin, 7,149,977; Cedar Creek (Montana side only), 3,464,820; Cut Bank, 17,323,809; Dry Creek, 1,703,714; Kevin-Sunburst, 2,179,153; and Whitlash, 1,037,106.

Gross production was 40,616,918 thousand cubic feet (38,234,656 in 1947) divided as follows: Marketed production, 34,724,670; repressuring, 411,568; field use, 3,676,350; and losses 1,804,330.

New Mexico.—Information furnished by R. E. Canfield, Federal Geological Survey, reveals no major gas-field discoveries in southeastern New Mexico in 1948. There were 35 gas-well completions in Lea County and 5 in Eddy County as compared with the same number for Lea and 2 in Eddy in 1947.

Gas wells drilled in the San Juan Basin in northwestern New Mexico numbered 16 in 1948, a decline from 22 in 1947, distributed as follows: Kutz Canyon field (5), Fulcher Basin field (8), Rattlesnake field (Indian) (1), and Ute Dome field (Indian) (2).

Permission was requested by the El Paso Natural Gas Co. to construct a pipe line from this area to the Arizona-California border. Such a development would undoubtedly stimulate future drilling and exploration in this region.

In central and east-central New Mexico, 73 million cubic feet of natural carbon dioxide were produced from the Bueyeros field in Harding County. The only carbon dioxide completion, in Colfax County, was shut-in because no solidified carbon dioxide plant was in operation as yet.

In southeastern New Mexico an estimated 1947 production of 151,675 million cubic feet rose to 207,852 million in 1948. Of this amount, 53,270 million cubic feet were dry gas and 154,582 million casinghead gas. Natural-gasoline and repressuring plants handled 152,902 million cubic feet of gas (including 17,652 million cubic feet of dry gas) in 1948. Residue gas from these plants was distributed as follows: Domestic, commercial, and industrial, 87.27 billion cubic feet; carbon-black manufacture, 27.75 billion; plant and lease fuel, 11.56 billion; shrinkage, 6.77 billion; vented at plants, 17.47 billion; returned to ground, 2.097 billion.

In northwestern New Mexico, 9.3 billion cubic feet of natural gas were delivered to domestic, commercial, and industrial markets in 1948 compared to 8.2 billion in 1947.

New York.—Information supplied by Philip Donnerstag, New York State Geological and Natural History Surveys, indicates that 24 wells were completed to the Oriskany or below and 3 additional wells were still being drilled at the end of 1948. This compares with 21 and two additional abandoned wells for 1947. Of the 24, 6 were storage wells, 8 extensions, and 10 wildcats. Three of the extension wells, in Erie and Chautauqua Counties, had a combined open flow of 810 thousand cubic feet from the Medina sandstone. None of the wildcats was productive.

Total estimated production for 1948 was 4.5 billion cubic feet, of which 2,185,102,000 were from deep Oriskany wells.

Increased geophysical prospecting for gas included an airborne magnetic survey over the east-central part of the State and seismic shooting along the Pennsylvania border from the Hudson River westward to Allegany County. Several wells to test the results of this work are expected in the near future.

North Dakota.—A report from Wilson M. Laird, State geologist of the North Dakota Geological Survey, indicated a 45-percent gain in the total volume of gas produced from 442,213,000 in 1947 to 642,687,000 cubic feet in 1948. Production was from the Eagle sand in Bowman County. The number of wells (25) remained the same as in 1947, and no new permits to drill for gas were issued. A well being drilled near Carpio encountered appreciable quantities of gas, but drilling for oil continued.

Ohio.—K. C. Cottingham, chief geologist, Ohio Fuel Gas Co., supplied the following information on gas developments in 1948:

Gas-well completions decreased from 582 in 1947 to 428 in 1948. Of these, 262 were in the Clinton, 86 in the Berea, 38 in the Shallow sands, 21 in the Oriskany, and 21 in other sands. No unusually large gas wells were completed. The largest, the Pfeiffer-Guspyt, had an initial open flow of 6,018,000 cubic feet from the Clinton sand at 4,205 feet. Perry County was the most active, with 68 gas wells completed, followed by Stark, with 62, and Muskingum, with 34.

About 2,000 acres were proved in new gas pools compared with 1,850 acres in 1947. Another 7,500 acres were added to proved acreage in older pools, chiefly from Clinton territory. The depth of average drilling (oil and gas) was 2,382 feet compared to 2,751 feet in 1947. For gas wells the average daily initial production declined to 708 thousand cubic feet. Production was 60,732,000 thousand cubic feet, and natural-gas reserves at the end of 1948 amounted to 581,108,-000 thousand cubic feet; an additional 48,345,000 thousand cubic feet was held in underground reservoirs for storage purposes only.

Oklahoma.—Information was furnished by Elmer Capshaw, gas engineer, Oklahoma Corporation Commission. Casinghead-gas production increased 8 percent in 1948 to a total of 178,751,567 thousand cubic feet. Dry-gas output increased 3 percent to 276,542,084 thousand cubic feet. Residue gas decreased 29,085,648 thousand cubic feet to 27,307,846 thousand. This decline is not certain because of irregularities in reporting such gas.

The Texas County portion of the Hugoton field, which is the greatest single source of gas in the State, expanded production 11 percent to an aggregate of 120,354,134 thousand cubic feet in 1948. Wells tied in to pipe lines numbered 114, bringing the number of connected wells up from 564 to 678 as of January 1, 1949. Virtually all the gas from Texas County is consumed outside the State. Production in the rest of the State has paced local consumption. No new reserves of great importance were opened up during the year, although the Elk City-Sayre area shows some promise. Gas completions declined slightly from 269 in 1947 to 258 in 1948.

Estimates published by the American Gas Association indicate that total reserves of natural gas at the end of 1948 were 11,332,445 million cubic feet, about the same as the 1947 figure.

Pennsylvania.—Of 802 completions in the shallow-sand fields in 1948, 481 were producers, according to J. G. Montgomery, Jr., vice president, United Natural Gas Co.

The combined initial daily open-flow capacity of 102,615,000 cubic feet compares with 71,667,000 for 502 shallow-sand producers in 1947. Shallow drilling in the west-central district resulted in 245 producers, Armstrong County leading with 105. In the southwestern area, 110 wells were drilled, Washington County contributing 38. The northwest, with a total of 122 producers, was paced by McKean County with 56.

Five small pools were discovered, one each in Cambria, Clearfield, Elk, Jefferson, and Potter Counties.

Oriskany-sand developments centered in the East Fork-Wharton field, where 8 wells yielded daily initial flows ranging from 2,100,000 to 10,600,000 cubic feet. Six tests in Potter County and three in Tioga were dry holes. There were four dry holes in Fayette County and one producer with a daily initial flow of 1,500,000 cubic feet.

Six deep tests in Erie County, including three through the Medina sands, failed to locate new reserves. A deep Cambro-Ordovician test being drilled in Bedford County, east of the Allegheny Front, attracted interest.

Storage continued to be important, and at least 51 wells were drilled for underground storage purposes. The increasing supply of gas brought into the Appalachian area by large pipe-line companies resulted in intensive programs of pipe-line and compressor-station construction and improvement.

South Dakota.—J. R. Schwabrow, Federal Geological Survey, reported that no new developments occurred in 1948. An estimated 8,140,000 cubic feet were marketed and 4,092,000 lost from gas-water wells at Pierre compared with 9,061,000 cubic feet marketed and 4,531,000 lost in 1947.

Tennessee.—The following information is from a report by H. C. Milhous, assistant geologist, Tennessee Department of Conservation: Total gas production for 1948 was 157,500,000 cubic feet, of which 145,000,000 were from Scott and Morgan Counties and the remainder from Fentress County. No new commercial gas wells were brought in during the year, and none was abandoned.

Tennessee's 1947 estimated production of 80,000,000 cubic feet came from 14 wells, 8 in Morgan and 6 in Fentress County fields.

Texas.—Total production of natural gas approximated 3,277,845 million cubic feet in 1948, including 2,519,410 million cubic feet of dry and 758,435 million of wet gas. Residue gas aggregated approximately 2,734 billion cubic feet, including: Repressured, 191.8 billion; pipe line, 546 billion; and vented, 102.3 billion. The following information was obtained from the Bulletin of the American Association of Petroleum Geologists (Vol. 33, No. 6):

In the Panhandle district, gas production increased 48 billion cubic feet over 1947. Drilling activities declined slightly to 154 wells, and no new fields were discovered.

Four gas discoveries in West Texas in 1948 included two in Pecos County and one each in Crockett and Winkler Counties. One Pecos wildcat had an initial production of 6.4 million cubic feet plus 186 barrels of distillate from the Ellenburger limestone.

Discoveries drilled in north and west-central Texas numbered 12, including 4 in Stephens and 3 in Jack County. A Wise County well made over 4 million cubic feet and 174 barrels of distillate initially.

There were 36 gas discoveries in south Texas in 1948. Liquids recovered from casinghead gas and free gas totaled 12,296,755 barrels. The number of oil wells connected with casinghead-gas processing systems increased to 36 percent at the close of 1948, and the percentage is expected to increase as additional transmission lines are extended.

A total of 585.8 billion cubic feet of gas was produced in south Texas in 1948, of which 54 percent was returned to the formation for pressure maintenance or cycling purposes and 26 percent was delivered to transmission lines. Twelve gas-producing areas were found in the lower Eocene. Another large gas reserve was uncovered in the Wilcox formation in the Government Wells-Wilcox field. Field development resulted in 41 gas producers and 4 new gas reserves.

Wells drilled in south Texas in 1948 included 243 gas producers and 93 dual completions. Sixty-five new gas pools were found. In the upper Eocene 593 tests resulted in 38 gas wells and 4 reservoirs. In the lower Oligocene, 41 new reservoirs were found by tests in proved areas. In the upper Oligocene-lower Miocene, 17 wildcats resulted in the discovery of 3 gas fields, none a major reserve as yet.

East Texas recorded 88 gas completions. A reworked test in Harrison County had an initial production of 1,270 thousand cubic feet. This indicates a new field and is evidence of productive stratigraphic traps along the flanks of the Sabine uplift, thus opening a large area for exploration. A Beckville-field well was completed through lower Pettit perforations for an initial potential of 36 million cubic feet of gas per day, with 32 barrels of distillate per million. A Marion County completion had an initial potential of 10 million cubic feet from Travis Peak sand at 7,984 feet.

Ten gas-condensate fields and 3 gas fields, all of minor importance, were discovered in southeast Texas in 1948. Condensate production amounted to 14,792,000 barrels. In new sands, new reservoirs, and extensions were 20 gas wells, including 1 perforated at 7,556–7,580 feet in Newton County with initial production of 5.9 million cubic feet from a new sand and 38 condensate completions, 1 of which, in

Orange County, had an initial production of 5 million cubic feet per day.

More casinghead conservation projects to reduce the volume of gas flared or lost were planned or were already under construction.

Utah.—New discoveries of gas increased in 1948, according to J. R. Schwabrow, Federal Geological Survey. A well rich in carbon dioxide in the Bar-X field had an initial open flow of 4,700,000 cubic feet. Two completions in southeastern Boundary Butte field showed initial flows of 25,000,000 and 9,000,000 cubic feet, respectively, from the Hermosa formation.

Dry-ice manufacture utilized 156,105,000 cubic feet of carbon dioxide gas in 1948 compared with 183,309,000 cubic feet (including liquid CO_2) for 1947. (These figures are not included in the natural-gas statistics.) No drilling occurred in the Clay Basin or Farnham fields, the only commercial producing areas. A deep test at South Last Chance and a wildcat at North Last Chance were unsuccessful. The only well at South Last Chance was depleted and the area ready for abandonment. Metered production from the Clay Basin field was 6,609,774 thousand feet. In addition, 22,250,000 cubic feet were used in the field, and 500,000 were lost. Comparable figures for 1947 are 6,036,372, 28,000,000, and zero, respectively.

Virginia.—Prospecting in southwestern Virginia uncovered a small gas field in Scott and Washington Counties and scattered indication of possible production in Buchanan and Wise Counties, according to David B. Reger, consulting geologist.

An upper Mississippian Maxton sand completion with a capacity of 14,000,000 cubic feet at a depth of 2,301 feet was reported near Dwight. Prospecting on 1,000,000 acres in Buchanan, Dickenson, and Wise Counties was planned, and drilling progressed in Tazewell County. In the early Grove field seven wells continued to supply gas to the city of Bristol.

West Virginia.—David B. Reger, consulting geologist, Morgantown, W. Va., reported that new gas pools discovered or brought into assured production in 1948 included two in Wayne County and one each in Barbour, Kanawha, McDowell, Mason, Jackson, Raleigh, and Upshur Counties. Of 37 wildcats drilled, 20 discovered gas. Deep-drilling operations extended the Charleston gas field northward into Wirt and Wood Counties, enlarged the Terra Alto pool, and assured extension of the Blackwater pool by an early 1949 well. Approximately 42,600 acres of new territory were proved. In all, 888 new wells were drilled in the State, resulting in 561 gas wells with 475,798,000 cubic feet of daily open flow and 180 dry holes. Sixty-three which were drilled deeper yielded 21,382,000 cubic feet. The daily average capacity of the new wells was 848,125 cubic feet per well, initial production increasing 21 percent over 1947. Estimated marketed production in 1948 was 203,681 million cubic feet as compared with 192,233 million (the Federal Bureau of Mines figure for 1947).

Approximately 139 billion cubic feet of Texas gas were received in 1948 at an average rate of about 380 million per day.

Exploration in the lower Devonian and deeper horizons declined somewhat from 1947, with 28 wells drilled in the Oriskany sand or overlying Huntersville chert. In the Charleston field, 26 completions produced 120,338,000 cubic feet and extended proved acreage northward about 10,000 acres. At the end of 1948 there had been 24 White Clinton sand tests in the State, of which only two (in Kanawha) were producers.

United Fuel Gas Co. completed a Girbotol gas-purification plant at Frame, Kanawha County, with a capacity of 15,000,000 cubic feet per 24 hours.

Wyoming.—J. R. Schwabrow, Federal Geological Survey, reported 10 gas wells completed in 1948 with a combined open flow of 84,000,000 cubic feet. Newly discovered fields included the Heart Mountain (two wells) and North Danker (one). Old fields with completions (one each) were: Beaver Creek, Big Sand Draw, Church Buttes, Little Buffalo Basin, Pine Mountain, Sand Creek, and South Sand Draw. The Heart Mountain wells had an initial capacity of about 12,000,000 cubic feet from Frontier sands at 1,970 and 2,492 feet. The North Danker discovery was drilled to the Madison limestone at 6,306 feet and plugged back to a Frontier sand at 2,810–2,840 feet, with an initial capacity of 2,946,000 cubic feet. The field is just north of the Polecat gas field but may have separate closure. Gas from these new areas may supplement supply for local markets when connected to pipe lines. The large Church Buttes field had four completions, which were connected to a pipe-line system for a testing period.

Fields producing over a billion cubic feet in 1948 were (in thousands of cubic feet): Baxter Basin, 8,909,166; Beaver Creek, 7,314,628; Big Sand Draw, 3,939,400; Elk Basin, 1,330,178; Garland, 1,804,359; Hiawatha (Wyoming side only), 1,230,066; Lance Creek, 3,118,872; Little Buffalo Basin, 2,970,627; Oil Springs, 1,808,264; Salt Creek, 3,692,796; and South Elk Basin, 1,793,501. Baxter Basin field declined 10 percent from 1947, while Beaver Creek advanced from 4,766,784,000 to 7,314,628,000 cubic feet. South Elk Basin was added to the list of large gas-producing areas.

Metered production increased from 39,511,874 thousand cubic feet in 1947 to 44,233,041 in 1948. Gross production was 72,071,725 thousand cubic feet (57,739,666 in 1947), gas returned to sands totaled 11,008,777, field use accounted for 983,479, and losses were 15,846,428 (5,824,539 in 1947).

In spite of the reduction of waste at Oregon Basin, the more complete development of new fields with increased oil production (especially at Worland) resulted in increased losses of natural gas exceeding the large gain in marketed production. It is expected that these will be reduced as soon as new gas-handling and sulfur-extraction plants are completed in 1949.

INTERSTATE SHIPMENTS AND EXPORTS

The growth in interstate and export movements of natural gas continued in 1947. Figures for the year include gas stored or lost in transportation and therefore are not comparable with 1946 records. The total for 1947 aggregated 1,402,157 million cubic feet, over one-third of the total marketed production in the United States.

By far the greatest proportion of the total interstate movements came from the Gulf coast and midcontinent areas in 1947. Texas

(39 percent of the total interstate shipments), Louisiana (18 percent), Oklahoma (12 percent), Kansas (9 percent), and West Virginia (9 percent) were the principal exporters of natural gas in 1947.

States using the largest amounts of gas from outside sources during the year, with the quantities involved in billions of cubic feet, were: Ohio 163.4; Kansas 122.1; Illinois 116.9; Pennsylvania 113.6; and Missouri 79.3.

Exports to Mexico increased from 17,475 million cubic feet in 1946 to 17,942 million in 1947. Exports to Canada were 207 million cubic feet in 1947 compared with 200 million in 1946.

PIPE LINES

The continuing steel shortage, especially in large-diameter pipe, hampered natural-gas pipe-line expansion but not plans for further development. Of 89 pipe-line projects under Federal Power Commission jurisdiction, 48 were delayed by various shortages as of September 1, 1948.

The Federal Power Commission authorized the construction of approximately 8,500 miles of new pipe line during the year, and pending applications call for 14,600 miles additional. The largest new authorization was for construction of an 1,840-mile pipe line from Texas to New York City, consisting of 1,210 miles of 30-inch, 558 miles of 26-inch, and 71 miles of 20-inch, which, with 411 miles of 6- to 16-inch lateral lines, would have an ultimate capacity of 500 million cubic feet daily. Estimated to be the largest and costliest (almost $200,000,000) natural-gas pipe line in the world, its initial capacity of 340 million cubic feet daily will supply metropolitan markets in New York, New Jersey, and Pennsylvania. Other important authorizations include an addition of 1,400 miles to the Texas Eastern Transmission Corp. system and a 1,387-mile Texas-to-Pittsburgh line.

An application to the Federal Power Commission for a 20-inch line from upper Gulf coast gas fields in Texas and southwest Louisiana to Danville, Va., was based on plans to achieve a capacity of 215 million cubic feet per day for sale in North Carolina, South Carolina, and Virginia.

East Tennessee Natural Gas Co. received Federal Power Commission approval to lay 186 miles of 16-inch line from the Tennessee Gas Transmission Co. system to Chattanooga and 112 miles of 12-inch line to Knoxville, Tenn. Work progressed on a Michigan-Wisconsin pipe line which will run from the Hugoton field near the Texas-Oklahoma border to Wisconsin and Michigan. Begun at the end of 1947, the first phase of the project, costing $88,000,000 and permitting sales at the rate of 75 billion cubic feet annually, is to be completed by the spring of 1950. Underground storage in the depleted fields of Michigan is planned, and sales are expected to reach 108 billion cubic feet during 1952. Several other pipe lines over 400 miles in length and reaching into every corner of the Nation are on the planning boards.

The total construction expenditure for 1948 was $675,000,000 compared to $623,612,000 in 1947. The 1947 figure showed $423,537,000 for transmission, including $143,127,000 for the Big Inch system. An American Gas Association survey indicates that a total of about $1,900,000,000 will be spent on natural-gas construction during the next 4 years.

Throughout the Nation, 251,330 miles of pipe line (including authorized construction) serve, or will serve consumers in 34 States and District of Columbia with natural gas originating in 22 States.

CONSUMPTION

Consumption of natural gas in the United States increased 10 percent from 4,012,930 million cubic feet in 1946 to a record 4,426,544 in 1947. All the major classes of consumers in the United States participated in the increase.

Domestic (residential) consumption expanded 21 percent, commercial 18 percent, and industrial 7 percent, the latter owing chiefly to large gains in the miscellaneous industrial group.

Natural gas consumed in the United States, 1943–47

Year	Domestic and commercial consumption							
	Consumers (thousands) [1]			Billion cubic feet			Average M cubic feet used per consumer	Average value at point of consumption (cents per M)
	Domestic	Commercial	Total	Domestic	Commercial	Total		
1943	10,354	811	11,165	529	205	734	65.8	62.4

Virginia	1,610	1,694	1,791	2,101	3,055
West Virginia	94,315	88,953	88,757	100,733	106,105
Wisconsin				86	267
Wyoming	20,842	21,426	21,642	23,143	26,351
Total United States	3,403,479	3,696,463	3,900,479	4,012,930	4,426,544

The three leading consuming States took more than half of the United States total in 1947 as follows: Texas, 33 percent; California, 12 percent, and Louisiana, 9 percent.

Treated for Natural Gasoline.—The quantity of natural gas processed at natural-gasoline and cycle plants increased 11 percent from 3,663,760 million cubic feet in 1946 to 4,070,150 in 1947, again setting a new record. States with the largest gains in this period were Texas, California, Louisiana, Oklahoma, and Kansas in the order named. Only Kentucky, Michigan, Illinois, and Wyoming registered declines. Mississippi began processing for the first time, with 8,079 million cubic feet treated.

After declining from 0.94 to 0.91 in 1946, the ratio of gas treated to total natural-gas consumption rose slightly to 0.92 in 1947. The number of cycling plants increased from 36 to 38 in the same period, but natural-gasoline production increased at a slower rate than gas treated.

Domestic and Commercial.—The use of natural gas for household purposes expanded 21 percent in 1947, or from 660,820 million cubic feet in 1946 to 802,150 million cubic feet. At the same time, the number of domestic users increased 6 percent, from 11,472,000 to 12,204,000. Domestic meters added (net) have averaged 403,722 to lines of distributors of natural and mixed gas annually during the past 9 years. The average amount of gas used per consumer increased from 57,605 cubic feet in 1946 to 65,730 cubic feet in 1947.

Natural gas treated at natural-gasoline and cycle plants in the United States, by States, 1943–47, in millions of cubic feet

State	1943	1944 [1]	1945	1946	1947
Arkansas	43,309	53,539	55,725	53,246	60,474

Ratio to total consumption	.89	.89	.94	.91	.92

[1] Partly estimated.

Commercial consumption totaled 285,213 million cubic feet in 1947, a gain of 18 percent over the 1946 figure of 241,802. At the same time, the number of commercial consumers increased 8 percent to 1,039 thousand, and consumption per meter increased from 250,000 to 274,000 cubic feet.

Field.—Reversing a brief decline, gas consumed in field operations of the petroleum and natural-gas industry increased from 897,809 million cubic feet in 1946 to 933,761 million in 1947. The principal gains were (in the order named) in Texas, Louisiana, New Mexico, and California. With the exception of Louisiana, all of these States showed gains in natural-gasoline production. Oklahoma declined again, with a drop of 4.6 billion cubic feet accompanied by a fall of 34.5 million gallons in liquefied-petroleum-gas production.

Carbon-Black Manufacture.—A record total of 484,882 million cubic feet of gas was used in carbon-black manufacture in 1947, 6,533 million cubic feet over the comparable 1947 figure. Continuing a 10-year trend, the average value of gas at these plants increased from 3.02 cents in 1946 to 3.57 in 1947. The growing use of the high-yield furnace process has resulted in a steady increase in the yield of carbon black per thousand cubic feet of gas consumed from 1.63 pounds in 1941 to 2.44 in 1946 and 2.51 pounds in 1947. In addition to gas, over 31 million gallons of liquid hydrocarbons were used in 1947.

Petroleum Refineries.—A 10-percent increase in the volume of gas used as fuel at petroleum refineries was reported, from 331,520 million cubic feet in 1946 to 363,892 million in 1947. The greatest gains (in billions of cubic feet) were in Texas, 14.9; California, 8.1; Louisiana, 6.7; and Oklahoma, 2.1.

Electric Public-Utility Power Plants.—The Federal Power Commission reported that gas consumption at electric public-utility power plants expanded from 306,924 million cubic feet in 1946 to 373,037 million in 1947. These figures—which include, as usual, a small percentage of manufactured gas—reversed a 2-year downward trend.

Domestic and commercial consumption of natural gas in the United States in 1947, by States [1]

[1] Federal Power Commission. These figures include natural and manufactured gas. However, Bureau of Mines figures on consumption of gas by electric public-utility power plants (combined with other industries under "Other industrial") comprise only natural gas.

[2] Gas used in portland-cement plants included under "Unclassified by States," for United States total and under "Other industrial" for State total to avoid disclosing figures of individual operators.

[3] Gas used in carbon-black manufacture included under "Unclassified by States" for United States total and under "Other industrial" for State total to avoid disclosing figures of individual operators.

[4] Less than $500.

[5] Less than 500 M cubic feet.

California, which had suffered heavy declines for 2 years, gained 21,340 million cubic feet to lead the national gain of 22 percent.

Scattered decreases, mainly in a few Western and Midwestern States, were outweighed by gains in Texas, Louisiana, Arkansas, Oklahoma, and Tennessee. Three leading States—Texas, Louisiana, and California—alone accounted for 56 percent of the United States total in 1947.

Portland-Cement Plants.—A 14-percent growth in cement production in 1947 contributed to the 4-percent increase in the volume of natural gas used in that industry. The aggregate of 60,499 million cubic feet consumed in 1947 represents a gain of 2,495 million feet over the corresponding figure for 1946.

Other Industrial.—The increase in gas used by miscellaneous industrial plants in 1946 continued in 1947. Some 1,496,147 million cubic feet were consumed in 1947 compared to 1,344,626 million in 1946, a 11-percent gain. California, Texas, and Louisiana—all States that use large amounts—showed the greatest gains over 1946, offsetting smaller losses mainly centered in the Missouri-Illinois-Indiana area.

Mixed Gas.—Natural gas sold in mixtures with manufactured gas totaled 124,265 million cubic feet in 1947 compared with 105,863 in 1946. This gain of 17 percent compares with the 11-percent gain in 1946. The main growth, both in total volume and in number of consumers, was in the domestic field. Domestic consumption gained 11.8 billion, industrial 3.7 billion, and commercial 2.9 billion cubic feet in 1947. Illinois and New York continued their lead of several years standing. Together these two States consumed approximately 49 percent of all the mixed gas in the United States in 1947.

Consumption of natural gas used with manufactured gas in the United States in 1947, by States

State	Domestic		Commercial		Industrial (millions of cubic feet)	Total	
	Consumers	Millions of cubic feet	Consumers	Millions of cubic feet		Millions of cubic feet	Value at point of consumption (thousands of dollars)

TECHNOLOGY

Recently developed gas appliances broadened sales of gas in such domestic fields as automatic laundry drying, incineration, and all-year air conditioning. A gas heat pump using latent heat in earth or water as a source for house heating has been developed.

Recent adaptations of the Fischer-Tropsch synthesis permit the use of dry natural gas as a starting chemical raw material in the manufacture of liquid fuels and chemicals. A plant now under construction at Brownsville, Tex., will be in operation by 1950.

Catalytic cracking of propane, butane, and lower grades of gasoline, already in commercial use by at least one gas company, may provide added flexibility for meeting seasonal demand patterns. Enrichment of gas to produce any desired B. t. u. content results, in effect, in greatly increasing the capacity of the delivering natural-gas line. It is reported that the relatively low production cost may extend its use to supply the base load in plants built for new areas. Additional catalytic re-forming plants are already being installed in Pennsylvania.

Centrifugal compressors were used for the first time to move large volumes of gas under high pressure over long distances through the Big Inch and Little Big Inch lines. Studies indicate that, excluding fuel or power, the operating costs will be about one-half of the corresponding costs for reciprocating equipment.

Detailed studies of physical and chemical means of removing nitrogen from natural gas have been made with a view to increasing transmission capacity of natural-gas pipe lines and improving the marketability of natural gas containing incombustible nitrogen. A nitrogen-removal pilot plant has been completed, permitting test runs. Prospective means for solution of the problem involve liquefaction and fractionation.

Several types of gas-fired lumber kilns have been developed which greatly shorten the seasoning of green lumber. Bureau of Mines research on direct reduction and distillation of zinc ores by the use of natural gas resulted in the first use of this method for the salvage of zinc residue and scrap in 1948. Utility companies have been helped by research in the removal of nitrogen and sulfur from gas and by studies of corrosion and pipe-line coatings.

Natural Gasoline

and Liquefied Petroleum Gases[1]

By G. W. CALE, E. M. SEELEY, A. T. COUMBE, AND I. F. AVERY

GENERAL SUMMARY

PRODUCTION in 1948 of light liquid products totaled an all-time high of 6,110 million gallons, equivalent to a 10-percent gain over the previous year. The increment was uniform throughout the year, as each month showed a substantial increase over the corresponding period of 1947. Notwithstanding a heavy product demand, total stocks of light hydrocarbons increased 53.9 million gallons in 1948 to reach 234 million gallons.

Export sales declined nearly 40 million gallons during 1948 to 216 million gallons, reversing the trend established during the past few years. Nearly half of the natural-gasoline shipments went to the United Kingdom; Canada received approximately a third. Canada was the largest importer of LP-gases,[2] with 59 percent of total exports, while Mexico was second with 34 percent.

The total value of all light products at plants soared to a record high of $463,618,000 in 1948 contrasted with $294,994,000 in 1947, an increase of 57 percent. Reflecting an unusually strong market, the average price of all light hydrocarbons jumped to 7.6 cents per gallon compared with 5.3 cents in 1947.

[1] Data for 1948 are preliminary.

[1] Subject to revision.
[2] For comparison with 1945.
[3] Estimated.
[4] Liquefied refinery gases.

The production of all light hydrocarbons in 1948 was equivalent to approximately 7 percent of the total domestic crude-oil output. Demand for both natural gasoline and LP-gases continued strong at the end of the year. The expansion program of the industry continued satisfactorily during 1948, with Texas accounting for the greatest number of new cycling plants. California increased capacity of its plants principally by installing additional facilities at existing plants. The total capacity of the industry at the year's end for light liquid products was nearly 20 million gallons daily. Based on current information, it is evident that this accelerated building program will extend through 1949.

During 1948 natural gasoline represented 48 percent of the gallonage of light hydrocarbons, with a value of 57 percent of the total. The relative position of natural gasoline remained practically the same as in 1947, when it represented 49 percent of total production and 58 percent of the value. LP-gases were responsible for 36 percent of total output in 1948 compared to 34 percent in 1947, while the percent of the value of this product increased to 24 percent compared to 23 percent the previous year. Other products (including finished gasoline, condensate, kerosine, distillate fuel, "special naphtha," etc.) maintained a relatively important position. During 1948 these products contributed 16 percent of the total output, identical to the 1947 proportion; likewise the percentage of value remained the same for both years at 19 percent.

A total of 4,400 billion cubic feet of natural gas was processed in 1948 at natural-gasoline and cycle plants, an increase of 8 percent over 1947. The average yield of all light products per thousand cubic feet of gas treated rose from 1.36 gallons in 1947 to 1.39 gallons in 1948. Although the average yield of natural gasoline remained unchanged at 0.67 gallon per thousand cubic feet in 1948 compared with 1947, the average yield of LP-gases increased to 0.50 gallon from 0.46 gallon. Continuing the trend of recent years, production of propane increased 35 percent in 1948 over the previous year, while commercial butane-propane mixture gained 8 percent and normal butane 6 percent.

Sales to consumers of liquefied gases produced in oil refineries (LR-gases) totaled 971 million gallons in 1948 compared with 761 million gallons in 1947 and 665 million in 1946. However, a large volume of LR-gas fractions is utilized by the refineries in processing other products, in addition to the sales for consumption outside the petroleum-refining industry.

It is apparent that the uses for LP-gases will continue to expand in the foreseeable future. Already many industrial firms are utilizing LP-gases as stand-by fuel, while others use it to supplement their normal supply during peak load periods. LP-gases are also used to a great extent to augment both natural- and manufactured-gas supplies during peak loads.

RESERVES

A report compiled by the American Petroleum Institute and the American Gas Association indicates total proved reserves of natural-gas liquids in the United States of 3,540,783,000 barrels as of December 31, 1948. This figure includes condensate, natural gasoline, and LP-gases, and is an increase of 286,808,000 barrels over 1947.

Arkansas, California, Kentucky, Mississippi, New Mexico, Ohio, and West Virginia showed declines in reserves totaling 15,137,000 barrels. The largest increases in reserves were reported in Colorado, Louisiana, Oklahoma, Texas, and Wyoming. Texas led all States with an addition of 117,611,000 barrels to reserves; Louisiana was second with 61,282,000 barrels.

Natural-gas reserves are estimated at 173,869,340 million cubic feet as of December 31, 1948, an increase of 7,942,426 million cubic feet over the previous year. The comparable reserve of 3,540,783,000 barrels of natural gas liquids would therefore indicate an average yield of 0.86 gallon per thousand cubic feet of gas reserves.

Estimated proved recoverable reserves of natural-gas liquids [1] in the United States, in thousands of barrels

[1] Includes condensate, natural gasoline, and LP-gases.
[2] Not allocated by types, but occurring principally in column shown.

PRODUCTION

The production of light products reached the record total of 6,110,127 thousand gallons in 1948. The daily average output for December was 18,200 thousand gallons, a record for the industry. Total gain for the year was 10 percent over 1947.

This gain represented a material increase each month in 1948 over the comparable 1947 month. Natural-gasoline production totaled 2,950,925 thousand gallons, an 8-percent increase over 1947. The output of LP-gases continued to shatter all former records, with a production of 2,180,698 thousand gallons in 1948—an increase of 15 percent over the previous year. Other light hydrocarbons made a moderate increase of 7 percent for the year, with a production of 978,504 thousand gallons.

Texas continued to lead all States in production of light products with California second and Louisiana third.

REVIEW BY STATES

California.—The total production of light products increased 5 percent in 1948 over 1947, to 1,112,069 thousand gallons. The increase in natural gasoline was 2 percent and in liquefied petroleum gas 17 percent; however, other products declined 4 percent.

Louisiana.—The combined production of all light hydrocarbons rose to 706,178 thousand gallons in 1948, a gain of 12 percent over the previous year. Production in the Louisiana Gulf dropped slightly, but output in the rest of the State showed a phenomenal increase and outstripped the Gulf production. For Louisiana as a whole, natural-gasoline output gained 10 percent, LP-gases were up 22 percent, and other products increased 7 percent in 1948 as compared to 1947.

Oklahoma.—In Oklahoma the general trend was similar to 1947; that is, an over-all increase of 5 percent in the production of light hydrocarbons. Natural-gasoline output was off nearly 2 percent, whereas LP-gases gained 19 percent.

Texas.—Texas continues to expand rapidly in the manufacture of light liquid products, as evidenced by an output of 2,984,389 thousand gallons in 1948, almost half of the entire domestic production. Natural gasoline gained 12 percent over 1947, and LP-gases increased 14 percent to a record total of 1,123,225 thousand gallons. The over-all gain was 13 percent for all allied products for the year.

Other States.—Mississippi led all States, with a gain of 128 percent in 1948 over the previous year due to the addition of a large new plant. West Virginia and New Mexico likewise made substantial gains in production of light hydrocarbons in 1948 compared to 1947. Illinois had a moderate decline, whereas Kansas and Arkansas maintained the same position they established in 1947.

YIELDS, PROCESSES, AND NUMBER OF PLANTS

Cycle Plants.—During 1948 cycle plants produced approximately 1,659,245 thousand gallons of light hydrocarbons from 1,040,000 million cubic feet of processed natural gas, an indicated yield of 1.60 gallons per thousand cubic feet. This compares with 1.60 gallons per thousand cubic feet in 1947 and 1.50 gallons in 1946.

Yields.—The average yield of all light products in 1948 increased slightly over the previous year. The 1948 yield was 1.39 gallon per thousand feet of natural gas treated compared to 1.36 gallon per thousand cubic feet in 1947. The yield of natural gasoline in 1948 remained unchanged from the previous year at 0.67 gallon per thousand cubic feet.

The average yield of LP-gases in 1948 increased to 0.50 gallon per thousand cubic feet in contrast to a yield of 0.46 in 1947. The average yield of all light products except LP-gases was 0.89 in 1948 as against 0.90 for the previous year. The production of propane established a record in 1948 of 750,503 thousand gallons, indicating a gain of 35 percent compared to 1947. Commercial butane-propane mixture and normal butane made moderate increases of 8 and 6 percent, respectively, in 1948 over the previous year.

The average value of light products recovered per 1,000 cubic feet of natural gas processed increased to 10.5 cents per gallon in 1948 compared to 7.2 cents in 1947. The increase was due primarily to much higher product prices. Extending the trend established in 1947, natural gasoline continued to be the most valuable of all products recovered, contributing 6 cents per 1,000 cubic feet of gas processed. LP-gases accounted for 2.5 cents and other products 2 cents in 1948 compared to 1.6 and 1.4 cents, respectively, the previous year.

Production by Processes.—During 1947 the number of natural-gasoline plants and cycle plants declined to 546, indicating a net loss of 22 plants for the year. Compression-type plants were reduced by 24, although there was no change in the number of absorption plants, which totaled 373. Cycle plants increased from 36 to 38. The huge plant at Katy, Tex., is an example of the trend both in construction and operation of present industry technique. This plant is adjacent to an enormous gas field, and although there are many individual operators of the gas wells, the plant is operated by one company acting for and responsible to the others. Much of the stripped gas is returned to producing sands for repressuring. Cotton Valley, La., is another example of unitized operation on a large scale. The net result of present technique is to increase materially the average daily output per operating plant. This has risen from 27,900 gallons daily in 1947 to 30,600 gallons in 1948.

Natural gasoline and allied products produced in the United States in 1947, by States and by methods of manufacture [1]

[1] Figures for 1948 not yet available.
[2] Includes 15 plants manufacturing LP-gases.
[3] Includes combination of absorption process with compression and charcoal processes. Includes 202 plants manufacturing LP-gases; and 3 charcoal plants in Ohio and West Virginia with 1,586,000 gallons produced in 1947 and 3 charcoal plants with 1,638,000 gallons in 1946.
[4] Includes 29 plants manufacturing LP-gases.
[5] Includes 24,444,000 gallons, of field condensate.
[6] Drip gasoline.

Technologic Trends.—In 1948, 506 natural-gasoline plants and 41 cycling plants were in operation. The capacity of these plants was nearly 20 million gallons daily. In addition, about 50 large-scale projects for new plants or expansion of existing facilities were under construction or planned. Completion of this program will increase present production by approximately 12 percent. There has been a definite trend in the industry toward producing more LP-gases. Due to the higher prices for propane and butane as well as the expanding markets for these products, many plants which heretofore produced only natural gasoline have been modernized to manufacture LP-gas fractions.

New plants being erected average considerably larger than the older ones, and some installations will have capacity to handle 500,000,000 cubic feet daily. New technique is being developed to extract more propane and where possible to design new plants for almost complete propane extraction.

An article in Oil and Gas Journal (March 25, 1948), entitled "Modern Process Methods to Improve LP-Gas Recovery," states:

> It is predicted that the present trend toward deep extraction of propane and eventually ethane will alter future plant processes from the absorption-oil types to low-temperature liquefaction.
>
> The original purpose of the natural-gasoline plant was to remove the "wet" or heavy gasoline ends, but the present-day trend is to make the separation not at the bottom but at the top, removing the light gases from the liquefiable hydrocarbons. This objective, it seems, should be accomplished more efficiently by straight low-temperature fractionation of the inlet gas.

MARKET DEMAND—SHIPMENTS

The total demand for light products processed at natural-gasoline and cycle plants reached the huge total of 6,232,536 thousand gallons, an increase of 9 percent over 1947 and an all-time record. Deliveries of natural gasoline gained 6 percent in 1948 over the previous year, and LP-gases increased 17 percent. Deliveries of condensate dropped 12 percent in 1948, but finished gasoline and naphtha showed an 18-percent gain. It is to be noted that the figures for LP-gases in the table do not include LR-gases.

[1] Subject to revision.

Shipments to Refineries.—Total shipments of light hydrocarbons to refineries equaled 3,682,816 thousand gallons, which is equivalent to 59 percent of total demand in 1948. This continues the downward trend of the refinery market in relative importance established over recent years, as shipments to refineries represented 60 percent of total demand on the industry in 1947 and 65 percent in 1946. Shipments of natural gasoline to refineries totaled 2,729,193 thousand gallons in 1948, a 7 percent increase over the previous year. LP-gases shipped to refineries equaled 457,908 thousand gallons in 1948, a 12-percent gain over 1947. However, shipments of condensate declined to 348,551 thousand gallons or 12 percent.

Shipments of isopentane to refineries in 1948 represented a 42-percent increase over the previous year, while normal butane gained 19 percent and isobutane 4 percent.

Natural gasoline and allied products utilized at domestic refineries in 1948 equaled 3,201,954 thousand gallons compared to 2,969,064 thousand gallons in 1947.

Percentage of natural gasoline and allied products in refinery gasoline in the United States, 1944–48, by districts

Year	East Coast	Appalachian	Indiana, Illinois, Kentucky	Oklahoma, Kansas, Missouri	Texas Inland	Texas Gulf Coast	Louisiana Gulf Coast	Arkansas, Louisiana Inland	Rocky Mountain	California	Total
1944	2.3	1.7	6.3	7.1	17.8	11.6	12.6	16.5	5.7	13.6	9.3
1945	1.7	1.7	5.8	7.3	20.5	10.9	7.5	19.3	6.9	14.2	9.1
1946	1.2	1.9	5.0	7.9	22.7	8.8	5.1	16.6	4.7	15.4	8.4
1947	.8	2.0	5.5	7.7	22.6	8.8	5.3	10.3	3.9	17.4	8.7
1948 [1]	.8	2.4	5.0	8.9	25.0	8.3	4.8	7.1	3.8	17.2	8.5

[1] Subject to revision.

The percentage of natural gasoline and allied products used in refinery gasoline in the United States equaled 8.5 percent in 1948, 8.7 percent in 1947, and 8.4 percent in 1946. There is wide variation in the use of these products in different areas. For instance, the Texas Inland refining district utilizes 25 percent and California 17.2 percent, whereas Oklahoma-Kansas-Missouri consumes 8.9 percent and Louisiana Gulf Coast 4.8 percent.

"Direct" Sales.—Jobbers and other trade outlets purchased 172,579 thousand gallons of natural gasoline in 1948, a decline of 3 percent compared with 1947. However, finished gasoline and naphtha purchases totaled 371,333 thousand gallons, a 3-percent gain. Sales of LP-gases for fuel amounted to the record total of 1,466,085 thousand gallons in 1948, an increase of 18 percent over the previous year. Likewise sales of LP-gases to chemical plants gained 18 percent in 1948 totaling 285,165 thousand gallons. There is every indication that the sales of LP-gases to jobbers will continue the upward trend in the future.

883326—50——56

SALES OF LP-GASES

During 1948 LP-gas sales continued the steady growth they have consistently shown during the past decade. There were 2,736,801,000 gallons of LP-gases delivered to consumers in the United States during 1948, a total representing a 24-percent increase over sales of 2,209,797,000 gallons in 1947. The increase in 1948 in marketed LP-gas over that sold in 1947 was greater than the total quantity of LP-gases delivered during 1941. Records compiled by the Bureau of the Census, United States Department of Commerce, show exports of 45,520,000 gallons of LP-gases in 1948 compared with 53,233,000 gallons in 1947.

The tendency toward the greater use of propane gas shows a remarkable increase, as 1,279,744,000 gallons were delivered in 1948, comprising 47 percent of total sales. Comparing 1948 sales of propane with propane sales in 1944, the first year in which LP-gas was widely used as a synthetic rubber component, the proportion of propane sales was 32 percent of the 1944 total of 335,884,000 gallons. Using the same year as a comparison, the proportions for butane declined from 26 percent in 1944 to 19 percent in 1948, and those for butane-propane mixture also decreased from 43 percent in 1944 to 35 percent in 1948.

Sales of LP-gases in the United States, 1944–48

Year	Butane		Propane		Butane-propane mixture		Total	
	Thousand gallons	Percent of total	Thousand gallons	Percent of total	Thousand gallons	Percent of total	Thousand gallons	Percent increase over previous year
1944	273, 116	25.8	335, 884	31.7	451, 156	42.5	1, 060, 156	(1)
1945	325, 140	25.5	444, 581	34.8	507, 045	39.7	1, 276, 766	20

[1] No comparable figure for 1943.

With the cooperation of the LP-gas industry, distribution of the sales of LP-gas is shown by five marketing districts for the first time in 1948. Forty-one percent of the national sales (1,122,870,000 gallons) were made in States comprising district 3, where the largest proportion of LP-gas was marketed. Sales in district 2 followed, with 788,142,000 gallons (29 percent). Sales in district 1 amounted to 454,555,000 gallons or more than 16 percent of the total, while in district 5 sales were 12 percent of the total deliveries. Only less than 2 percent of the total was marketed in district 4.

Sales of LP-gases in the United States in 1948, by district and use, in thousands of gallons

[1] The States in each district are as follows:
DISTRICT 1.—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida.
DISTRICT 2.—North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Wisconsin, Illinois, Indiana, Michigan, Ohio, Kentucky, Tennessee, Missouri, Kansas, and Oklahoma.
DISTRICT 3.—New Mexico, Texas, Arkansas, Louisiana, Mississippi, and Alabama.
DISTRICT 4.—Idaho, Montana, Wyoming, Utah, and Colorado.
DISTRICT 5.—California, Oregon, Washington, Arizona, and Nevada.
[2] Over 500 percent.

Domestic and Commercial Sales.—The volume of LP-gas sold for domestic and commercial purposes was 1,473,289,000 gallons in 1948. This represents 54 percent of the total LP-gas marketed and is an increase of 28 percent over the 1,150,538,000 gallons delivered for the same purpose in 1947.

The total quantity sold for domestic and commercial uses in 1948 is greater than the total quantity of LP-gas sold for all purposes in 1945, just 3 years before. The large demand for this product for homes, farms, institutions, and commercial establishments located beyond the gas mains is clearly indicated. According to a report by K. W. Rugh and E. O. Mattocks entitled "LP-Gas Sales Continue to Gain in 1948", released by the Phillips Petroleum Co., more than 25 percent of the gas ranges produced in 1948 went into the LP-gas market. Also, the demand for LP-gas automatic water heaters and refrigerators continued to increase along with LP-gas space heaters. They also estimated that about 5½ million homes are now using LP-gas and that one-third of these use LP-gas for space heating as well as for other household purposes. The report adds that there are at present more than 3,000 bulk plant installations, a number about equal to the counties in the United States.

The greatest relative increase in domestic sales was for butane, as the 113,001,000 gallons sold in 1948 were an 82-percent gain over the 62,092,000 marketed for domestic use in 1947. However, propane sold for domestic purposes comprise 52 percent of the LP-gas used in domestic trade, and 765,953,000 gallons of propane were sold for the domestic and commercial uses in 1948, which is 52 percent above 1947 sales of 503,448,000 gallons. Butane-propane mixture increased only 2 percent, as 594,335,000 gallons were marketed in 1948 compared with 584,998,000 sold for domestic and commercial purposes in 1947. District 3 is reported as having the largest market for LP-gas in the domestic trade, as 37 percent of the national demand for LP-gas for domestic and commercial use was sold in that area. There was 31 percent in district 2; 17 percent in district 1; 12 percent in district 5; and 3 percent in district 4. However, in district 4 over 88 percent of all LP-gas sold was for domestic use.

Sales of LP-gases in the United States, by uses, 1940–48, in thousands of gallons

Year	Domestic	Chemical	Synthetic rubber	Industrial	Gas manufacturing	Internal combustion	All other	Total
1940	134,018	34,671		69,892	20,285	53,918	672	313,456
1941	220,722	44,206		98,728	25,255	66,871	7,070	462,852
1942	299,559	53,038		114,132	31,366	82,456	4,889	585,440
1943	339,380	55,356	(1)	149,429	37,519	87,834	5,715	675,233

[1] Included in "All other."

Gas-Manufacturing-Plant Use, for Distribution Through Mains.—The use of LP-gas in gas-manufacturing installations continues to increase rapidly. It is reported that 237,638,000 gallons were sold for this purpose in 1948, an increase of 40 percent over the sales of 169,332,000 gallons in 1947. The wider distribution of natural gas throughout the country has, in many instances, resulted in excessive space-heating demands during the winter months. LP-gas is used to a great extent to augment both natural and manufactured gas supplies during peak loads. The largest proportion of LP-gas used in the gas-manufacturing installations is reported in district 2, amounting to 127,325,000 gallons, or 54 percent of the total demand for LP-gas for this purpose. District 1 follows with 29 percent, and 12 percent was reported in district 5. Less than 5 percent was used by gas-manufacturing companies in districts 3 and 4. The total sales of LP-gas used by gas-manufacturing companies represent about 9 percent of the total LP-gas marketed.

Data regarding the distribution of LP-gases by manufactured-gas companies, according to the American Gas Association, are as follows: Liquefied gas, as of June 1, 1949, was being delivered through mains in 476 communities by 195 companies in 41 States. During 1948, an average of 318,100 customers were served with LP-gas by utilities. Butane-air gas and propane-air with heating value ranging from 525 to 1,600 B. t. u. per cubic foot were supplied to 399 communities in 38 States.

A mixture of undiluted butane and propane gases with a heating value of 2,800 to 3,500 B. t. u. per cubic foot was supplied to 18 communities in Arizona, California, Iowa, Nevada, New Mexico, and North Carolina. Undiluted propane gas with a heating value of 2,515 to 2,550 B. t. u. per cubic foot was supplied to 59 communities in Connecticut, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Jersey, New Mexico, South Carolina, Virginia, and Wisconsin.

Industrial-Plant Use.—The volume of LP-gas marketed for industrial use during 1948 was 213,904,000 gallons, an increase of 23 percent over the 1947 sales of 173,601,000 gallons. The total sales of LP-gas for industrial use represents 8 percent of the total LP-gas marketed.

One of the most rapid-growing uses for LP-gas by industrial plants is as a standby for other fuels, generally manufactured or natural gas. Greatly increased domestic and commercial space-heating requirements have resulted in demands that frequently exceed the capacity of the natural-gas transmission lines or that of manufactured-gas producing plants. To meet the increased demand, it has been necessary to force more industrial-gas consumers to accept a smaller volume of gas during peak-load periods. To insure against interruption of gas supply, a large number of industries have installed LP-gas as a standby fuel.

The quantity of propane sales for this purpose increased 35 percent in 1948 over 1947 sales, and the proportion of propane amounted to over 50 percent of the total demand for LP-gas sold for industrial use. Butane-propane mixture, used by industrial plants, increased about 23 percent in 1948 over the same period in 1947, and the butane increase was only 7 percent. Industrial plants in district 2 purchased more than 43 percent of the total and district 1's proportion was 26 percent, followed by district 3 with 17 percent, district 5 with 13 percent, and district 4 with less than 1 percent.

Synthetic Rubber Components.—LP-gas sold for synthetic rubber components in 1948 totaled 225,641,000 gallons. This represents an increase of 12 percent over that marketed for the same purpose in 1947. Butane gas is principally used for this purpose, and the sales of this gas amounted to 86 percent of the total LP-gas sold for synthetic rubber manufacture. Butane sales increased from 187,733,000 gallons in 1947 to 194,777,000 gallons in 1948, an increase of 4 percent.

Synthetic rubber plants in district 3 purchased 83 percent of the Nation's demand for this purpose, followed by district 2 with 9 percent and district 5 with almost 8 percent. A small amount was reported in district 1.

Raw Material and Solvents for Chemical Plants.—LP-gas is an intermediate for producing finished chemicals. The volume used amounted to 490,964,000 gallons in 1948, which was 19 percent above the 1947 delivery of 414,267,000 gallons. Sales of LP-gases for chemical raw material rank second among the principal uses, using 18 percent of the national demand for all LP-gases. Large quantities of LP-gases in gaseous form are furnished to chemical companies through pipe lines direct from the source of production. Propane sold for chemical use amounts to 51 percent of the total demand of LP-gas for this purpose. Sales in 1948 of 249,653,000 gallons increased 37 percent over the 182,388,000 gallons purchased in 1947.

Butane-propane mixtures delivered for chemical raw material decreased about 12 percent in 1948, from 213,083,000 gallons in 1947 to 186,925,000 in 1948. The butane sales more than doubled in 1948, rising from 18,796,000 gallons in 1947 to 54,386,000 in 1948. The sales of LP-gas for chemical solvents, by districts, show 65 percent in district 3, 16 percent in district 1, and about 9 percent in district 2 and in district 5.

Used as Fuel in Internal-Combustion Engines and Other Uses.—The quantity of LP-gases sold for these purposes is almost 4 percent of the national demand. The volume sold for internal-combustion engines dropped 7 percent in 1948 compared with 1947, and the sales reported for all miscellaneous rose from 738,000 gallons in 1947 to 2,424,000 gallons in 1948. The largest proportion of engine fuel is reported in district 2 as 46 percent, while 31 percent was reported in district 5.[3]

STOCKS

Total stocks of light hydrocarbons increased nearly 54 million gallons or approximately 30 percent in 1948 over the previous year. However, at the year end, total stocks were reduced 30 million gallons from the maximum in August. LP-gases represented the largest gain with 46 percent over 1947, while natural-gasoline stocks increased 28 percent and other products were up 21 percent. Notwithstanding the large increase in consumption of light liquid products during 1948, it is evident that stocks on hand at the end of 1948 were adequate.

[3] The survey covering sales of LP-gases in the Pacific Coast marketing area (district 5) was made by E. T. Knudsen, supervising economist, Bureau of Mines, Los Angeles, Calif.

Stocks of natural gasoline and allied products in the United States, 1944–47, and 1948, by months, in thousands of gallons

PRICES

The Mid-Continent (group 3) price of 26–70 natural gasoline remained constant at 8.5 cents per gallon f. o. b. refineries or natural gasoline plants throughout 1948. This was an increase of 2.515 cents per gallon above the average price of 5.985 cents per gallon in 1947.

Likewise for shipments of this material f. o. b. Breckenridge, Tex., the price remained unchanged at 8.0 cents per gallon. The average price of 26–70 natural gasoline in 1947 was 5.483 cents per gallon. This indicates an increase of 2.517 cents per gallon in 1948 over the previous year.

The Oklahoma spot price for 73–75 octane motor gasoline moved in a narrow range during 1948. The highest monthly average price prevailed in June and the lowest in December—11.6875 and 10.6006 cents per gallon, respectively. It is apparent that the demand for gasoline as well as the price held unusually firm throughout the year. In fact, these were the highest prices paid in nearly 25 years.

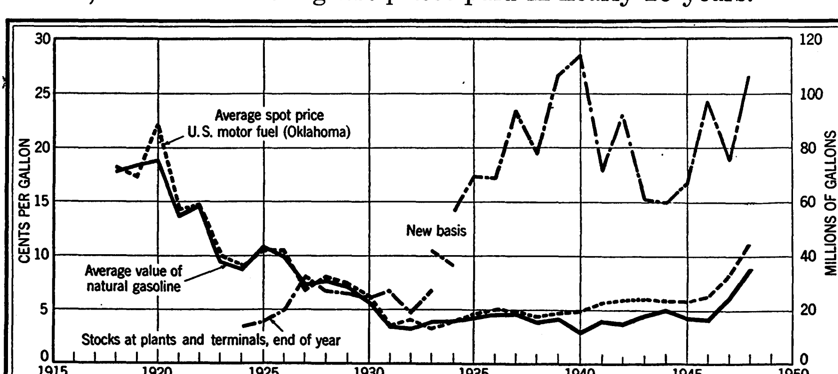

FIGURE 2.—Trends in average value of natural gasoline, spot price of gasoline, and stocks of natural gasoline, 1918–48.

With respect to LP-gases, the market was exceedingly strong during 1948. The average price for commercial propane and industrial propane in tank cars or transport trucks f. o. b. New York Harbor was 9 cents per gallon. Likewise, the prices for commercial butane and industrial butane held firm at New York Harbor. The price range for these products remained between 8.0 cents per gallon and 9.0 cents per gallon during 1948. At New Orleans, La., the average price for commercial propane was 6.12 cents per gallon for the year; moreover the price range was narrow, the low being 5.375 cents and the high 6.5 cents per gallon. The price of butane continued to advance, while propane remained fairly constant during 1948.

Average monthly refinery price quotations for commercial grades of LP-gases for several important distribution centers are shown in the accompanying table. After a slight increase early in the year, prices for LP-gases changed little through the remainder of 1948.

Monthly average price of LP-gases at refineries in the United States in 1948, in cents per gallon

FOREIGN TRADE [4]

Shipments of natural gasoline to foreign countries in 1948 totaled 170,774,142 gallons valued at $20,126,140. This compares with exports of 202,927,494 gallons valued at $17,111,425 in 1947 and 128,-784,432 gallons valued at $7,506,921 in 1946. This is a decline of 32 million gallons in 1948 from the previous year. Almost half of the shipments were made to the United Kingdom, while Canada received 33 percent, Curaçao 15 percent, and Australia 7 percent.

Exports of LP-gases originating at natural-gasoline plants and refineries were 45,520,181 gallons valued at $5,259,048, in 1948. This is a decrease of nearly 8 million gallons in 1948 compared to 1947. Canada received 59 percent of these products, while Mexico received 34 percent and Brazil 4 percent. Shipments were made in smaller

[4] Figures on exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

quantities to 48 other countries, reaching virtually every corner of the globe.

LP-gases exported from the United States, 1944–48, by countries, in thousands of gallons[1]

Nickel

By HUBERT W. DAVIS

GENERAL SUMMARY

CONSUMPTION of nickel in the United States established a peacetime record in 1948 and was 16 percent larger than in 1947. This unprecedented peacetime demand for nickel was met largely by accelerated operations in Canada, where output was 10 percent greater than in 1947. Although demand for nickel in 1948 put pressure on the supply available, it is believed that the supply of all forms of nickel, except nickel salts, met actual consumption needs. At times, however, the supply of nickel salts was inadequate to satisfy requirements. Imports of nickel into the United States reversed a 4-year downward trend in 1948; they were 20 percent more than in 1947. Because of the closing on March 31, 1947, of the United States Government-owned nickel mining and processing facilities in Cuba, Canada supplied about 96 percent of the total imports in 1948 compared with 91 percent in 1947. However, receipts of nickel from Norway and the United Kingdom were also much larger than in 1947. Shortage of coal continued seriously to hamper production of nickel in New Caledonia. Domestic output of nickel was, as heretofore, small in 1948.

[1] Figure not available.
[2] Excludes "All other manufactures of nickel"; weight not recorded.
[3] Excludes "Manufactures"; weight not recorded.
[4] Price quoted to United States buyers by International Nickel Co., Inc., for electrolytic nickel in carlots f. o. b. Port Colborne, Ontario; price includes duty of 2½ cents a pound 1944–47 and 1¼ cents 1948.

The steel industry continued to be the chief consumer of nickel in the United States. Usage of nickel in stainless steels was 6 percent more in 1948 than in 1947, but that for other steels was 25 percent greater. Consumption of nickel in high-temperature and electrical-resistance alloys was up 20 percent, and that for anodes gained 58 percent.

The use of nickel in cast irons increased 7 percent over 1947. Most of the nickel consumed in 1948 was in the form of new metal, but proportionately more oxide and oxide sinter were used than in 1947.

Effective July 22, 1948, the contract price to United States buyers for electrolytic nickel in carlots f. o. b. Port Colborne, Ontario, was increased to 40 cents a pound, including duty of 1¼ cents a pound; the former price was 33¾ cents a pound.

Effective January 1, 1948, the rate of duty on refined nickel imported into the United States was reduced 50 percent to 1¼ cents a pound.

PRODUCTION

Domestic production of nickel is small and comprises metals recovered from scrap-nickel anodes, nickel-silver, and copper-nickel alloys (including Monel metal) and primary nickel recovered in copper refining and produced from ore and as a byproduct of talc production. Domestic primary nickel production totaled 1,765,000 pounds in 1948 and comprised both crude and refined nickel sulfate recovered as a byproduct of copper refining at Baltimore, Md.; Carteret and Perth Amboy, N. J.; Laurel Hill, N. Y.; and Tacoma, Wash. Shipments were 1,879,000 pounds, the bulk of which was crude nickel sulfate sold to refiners for use as an intermediate in the manufacture of refined nickel salts. Although all the nickel recovered as a byproduct of copper refining is credited to domestic production, some is recovered from imported blister copper. There has been no production of nickel from ore or as a byproduct of talc production since 1945.

In addition to the nickel recovered as a byproduct of copper refining in 1948, 4,075,000 pounds (nickel content) of refined nickel salts (chiefly sulfate) were produced in the United States from Canadian cobalt-nickel ore and nickel residues, from domestic crude nickel sulfate, and from nickel shot and nickel scrap.

The total production of refined nickel salts in the United States was 4,492,000 pounds (nickel content) in 1948; shipments to consumers for electroplating, catalysts, and ceramics were 4,673,000 pounds.

Nickel produced in the United States, 1944–48

Year	Primary (short tons) [1]		Secondary [2]	
	Byproduct of copper refining [3]	Other [4]	Short tons	Value
1944	697	291	4,321	$3,024,700
1945	719	436	6,483	4,538,100
1946	352		8,248	5,801,600
1947	646		9,541	7,188,189
1948	883		8,850	6,966,720

[1] Bureau of Mines not at liberty to publish value.
[2] Nickel recovered as metal and in alloys and salts.
[3] Nickel content of nickel salts and metallic nickel.
[4] Nickel content of concentrates and matte produced from ore and of concentrates produced as byproduct of talc.

CONSUMPTION AND CONSUMERS' STOCKS

The accompanying tables give data on consumption and consumers' stocks of nickel. The data cover all known consumers of nickel in the form of primary, secondary, matte, and oxide. The figures for nickel salts, however, fall short of the total and probably represent only 43 percent of the total in 1948.

Nickel (exclusive of scrap) consumed and in stock in the United States, 1947–48, by forms, in pounds of nickel

Form	1947			1948		
	Consumption	Stocks at consumers' plants Dec. 31 [1]	In transit to consumers' plants Dec. 31	Consumption	Stocks at consumers' plants Dec. 31	In transit to consumers' plants Dec. 31

[1] Revised figure.

FOREIGN TRADE [1]

Imports of nickel into the United States in 1948 reversed a 4-year downward trend and were 20 percent more than in 1947. Imports in 1948 comprised chiefly metallic nickel, matte, oxide, and nickel residues. As heretofore, Canada was the chief source of the imports; it supplied 134,974,975 pounds of metallic nickel (pig, ingot, and shot), 25,681 pounds of bars, rods, etc., 27,708,041 pounds of roasted and sintered matte (averaging about 68 percent nickel), 43,028,224

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

pounds of oxide and oxide sinter (averaging about 74 percent nickel), and an undetermined quantity of nickel residues. The matte is refined to "Monel" metal at the plant of the International Nickel Co., Inc., Huntington, W. Va. In 1948, 2,185 short tons of nickel pig were refined at Huntington from Canadian oxide sinter. In 1948 Norway furnished 6,225,281 pounds of metallic nickel, the United Kingdom 1,665,247 pounds, and the U. S. S. R., Union of South Africa, Italy, India, and the Netherlands 114,483, 56,384, 28,532, 20,342, and 18,474 pounds, respectively. The United Kingdom supplied 1,508 pounds of bars, rods, etc., Germany 3,719 pounds, the Netherlands 97 pounds, and Sweden 7 pounds in 1948.

The nickel content of the unmanufactured nickel products imported into the United States is estimated at 193,760,000 pounds in 1948, compared with 161,435,000 pounds in 1947.

Effective January 1, 1948, the rate of duty on refined nickel imported into the United States was reduced 50 percent to 1¼ cents a pound. Nickel ore, matte, and oxide entered the United States duty free.

Exports of nickel comprise largely products manufactured from imported raw materials. Exports of alloys and scrap (including Monel metal), which comprise the bulk of the foreign shipments, were 31 percent less in 1948 than in 1947; those of metallic nickel, nickel-chrome electric-resistance wire, and nickel-silver were 0.3, 46, and 60 percent, respectively, smaller.

The United Kingdom (10,353,894 pounds) and Canada (2,612,241 pounds) were the chief foreign markets for nickel, Monel metal, alloys, and scrap in 1948.

Nickel products imported for consumption in the United States, 1926–48, in pounds

Year	Gross weight				Total	
	Ore and matte	Pigs, ingots, shot, bars, rods, tubes, etc.	Oxide	Nickel-silver	Gross weight	Nickel content (estimated)
1926	14,635,651	29,408,950	1,485,386	6,476	45,536,463	38,600,000

WORLD REVIEW

The accompanying table shows world production of nickel by countries, 1940–48, insofar as statistics are available. Despite the fact that nickel is produced in many countries, four—Canada, Cuba, New Caledonia, and the U. S. S. R.—have furnished about 96 percent of the world output since 1943, and one country—Canada—has supplied about 77 percent of the total.

Canada.—Virtually all the Canadian nickel output is derived from the copper-nickel ores of the Sudbury district, Ontario. Some nickel is also recovered as a byproduct from silver-cobalt ores of Cobalt. Two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Nickel production in Canada was 131,075 short tons in 1948 compared with 118,627 tons in 1947. Exports of nickel from Canada were 131,840 short tons in 1948 compared with 117,056 tons in 1947.

Sales of nickel in all forms by the International Nickel Co. of Canada, Ltd., in 1948 were the highest in any peacetime year; they were 240,098,274 pounds compared with 205,278,868 pounds in 1947 and with 207,700,943 pounds in 1937, the previous peacetime high.[2]

1 Data not available; estimate by author of chapter included in total.
2 Data cover 9 months ended March 31, 1942.
3 Estimate.
4 Preliminary data for year ended March 31 of year following that stated.
5 Byproduct in electrolytic refining of copper. In 1941 includes also production from ore and as byproduct of talc; in 1944 and 1945 includes also production from ore.

Over 90 percent of the 1948 total was sold in the United States, Great Britain, and Canada; sales outside these three countries were only a small fraction of prewar volume. To continue a large and steady supply of nickel, the company has been forced to mine ores of lower grade during the past decade; this is illustrated by the fact that 43 pounds of nickel were obtained from each ton of ore mined in 1938, whereas in 1948 this figure had dropped to 27 pounds. As a consequence of the heavy demands on its ore reserves in the war and postwar years, the company has been forced to give more detailed attention to the mining of lower-grade underground ores; and it has decided upon a mine-development program that will make possible, with improved mining, concentrating, and smelting methods, the economic recovery and use of lower-grade ore. Ore mined was 10,866,862 short tons in 1948 compared with 10,406,644 tons in 1947. Underground development totaled 84,152 feet in 1948, bringing the total footage to 1,323,660 or 251 miles at the year end. Proved ore reserves at the end of 1948 were 246,177,000 short tons containing 7,503,000 tons of nickel-copper compared with 221,843,000 tons containing 7,171,000 tons of nickel-copper at the end of 1947. The new process plant at Copper Cliff for the production of nickel in the form of oxide sinter for the market and for intermediate refinery products was completed and put into operation in 1948.

Concerning virtual replacement of the Orford process of copper-nickel separation by the matte casting and flotation operations in the new nickel oxide sinter plant, R. C. Stanley, chairman of the board of directors of the International Nickel Co. of Canada, Ltd., reported to stockholders as follows on April 27, 1949:

Our Orford process served well for many years in the production of the major portion of the world's nickel requirements. However, we have developed a better process. A plant has been built for the separation of copper, nickel and platinum metals in matte by subjecting the matte to controlled cooling, flotation and magnetic separation. The matte flotation operations in the new oxide sinter plant commenced in September and are rapidly approaching full-scale production, practically replacing the Orford process. This has been a process change of major significance. The transfer of sintering operations from Port Colborne to Copper Cliff will soon be completed.

Falconbridge Nickel Mines, Ltd.,[3] reported an unprecedented peacetime demand for nickel in 1948; and operations were pushed to the maximum permitted by power, equipment, supplies, and labor. During 1948 one blast furnace operated 5½ months and two furnaces operated 6 months. As a result of the increased operations, 821,259 short tons of ore were treated in 1948 compared with 731,925 tons in 1947. Ore hoisted and treated in 1948 was only slightly below that in the peak year 1944 (830,254 tons). At the Falconbridge mine exploration attention was focused mainly on preparation for and beginning the internal shaft for depth development, drifting and drilling on the 3,150-foot level, and drilling on upper levels for extensions of the footwall ore bodies found on the bottom levels. At the McKim mine the shaft was completed to 1,421 feet by August, and at year end all major buildings and installations were either in use or nearing completion. Drifting toward the ore zone was in progress on four levels. In December 1948 the Rexora nickel prospect, 32 miles north of Minaki, was optioned and exploration work begun. Ore reserves of the company were 14,007,500 short tons averaging 1.74 percent nickel on December 31, 1948. Since February 4, 1930, when the smelter was blown in, through 1948 Falconbridge Nickel Mines, Ltd., has treated 9,261,692 short tons of ore, and the smelter has produced 285,575,301 pounds of nickel and 145,194,178 pounds of copper in matte.

The Sherritt Gordon Mines, Ltd.,[4] continued its program of exploration and development of nickel-copper ores in the Lynn Lake area of northern Manitoba in 1948. A total of 36,408 feet of diamond drilling in 89 holes was done. Shaft sinking of the "A" shaft was started in June and at the year end 567 feet had been sunk. A total of 47,510 cubic feet of station had been cut in four main stations and three smaller substations. The mining plant at the "A" shaft was completed. All concrete foundation work was completed for the pilot mill, including the foundation for the Diesel-electric generator to supply power for the pilot mill operation. This Diesel and generator were also set up. At the "EL" shaft one 33,000-gallon fuel-storage tank was erected, and concrete foundations were completed for the hoist, Diesel and compressor, shaft collar and head-frame piers, and base for the boilers. During 1948 laboratory investigations were continued at the University of British Columbia and at Sherridon with a view to finding the most economical method of reducing the nickel concentrate to a salable product. As a result of this work, a chemical process using oxygen and ammonia was invented which shows considerable promise. The process will be developed further in 1949 on a larger scale in a pilot plant, as soon as concentrates can be obtained from underground development. Some other reduction methods are also being tested.

Cuba.—The United States Government-owned nickel-mining and processing facilities in Cuba, which were closed on March 31, 1947, remained inactive throughout 1948. The facilities were declared surplus and transferred to the War Assets Administration on July 11, 1947, but they had not been disposed of on December 31, 1948. A report, PB 97271, Review of the Nicaro Nickel Project, Nicaro, Oriente, Cuba, Plancor 690, 159 pages, is available at $20 a copy in photostat or $6 in microfilm from the Library of Congress, Photoduplication Service, Publication Board Project, Washington, D. C.

Egypt.—The history and geologic features of the ancient "Ab Swayel" copper mine, in which the presence of nickel was discovered, has been described.[5]

New Caledonia.[6]—Only two nickel concessions—Pin-Pin at Moindah, 130 miles north of Noumea, and the Thio Group at Thio, on the east coast, both belonging to La Société le Nickel—were in production in 1948. Output of ore was 96,415 metric tons and comprised 59,465 tons averaging 3.55 percent nickel at the Thio Group and 36,950 tons averaging 7.5 percent nickel at the Pin-Pin concession.

The hydroelectric plant of La Société le Nickel at Yate was worked throughout 1948, except for a few weeks when the water level was too low, keeping four electric furnaces in operation which produced 4,049 metric tons of ferronickel averaging 41.5 percent nickel, of which 1,235 tons were exported to France, 1,891 tons were shipped to the smelters at Noumea, and 923 tons remained in stock at Yate.

The smelters at Noumea were worked irregularly during 1948 because of lack of coal and as a consequence production of matte was only 2,208 metric tons averaging 77 percent nickel. Exports of matte, all to France, were 2,435 tons in 1948. Stocks of matte at Noumea were 60 tons on December 31, 1948.

Much progress was made during 1948 on the construction of the Yate-Noumea power line. All the pylons were set in place, the three lines were strung, and a trial transmission of electricity was made. Work on installing the new electric furnaces at the Noumea plant was well under way by the end of the year.

Norway.[7]—The Falconbridge Nickel refinery at Kristiansand continued to be hampered by shortage of power, materials, and supplies and during the summer by insufficient skilled and unskilled labor. Despite these difficulties, the refinery operated at a rate of 92 percent of its peak production in 1939. Nevertheless, refinery operations failed to pace smelter production, but it was possible to sell the surplus nickel matte produced by the smelter. Good progress was achieved in 1948 on the modernization and expansion program. Erection of the new roaster building was completed, and the foundations for other additions were mostly completed.

U. S. S. R.—The U. S. S. R. is the second-largest producer of nickel in the world, but precise figures on production are not available.

Output is variously estimated at 20,000 to 40,000 metric tons annually. Nickel is produced at Petsamo, which was ceded by Finland to the Soviet Government in 1944, and at Ufalei, Chelyabinsk region; Orsk, Chalhov region; and Monchegorsk, Kola Peninsula.

The development of the nickel deposits in the Petsamo district has been described[8] as follows:

> Finland received the Petsamo area in the Treaty of Dorpat after World War I. In the Geological Survey of this district conducted as early as 1921, traces of ores containing considerable contents of nickel and copper were found on the Petsamo mountain. The Finnish Geological Commission investigated the deposit and localized several ore lenses, the most important of which was on the Kaulatunturi mountain, and subsequent drilling showed that the mining of this ore would be profitable.
>
> On the other hand, the Petsamo region was thinly populated and the ore lay in a barren mountain with no communication with what is known as the "Arctic Highway" which leads from Rovaniemi to the Arctic port of Lünahamari, the nearest railway being several hundred miles to the south. Lünahamari, however, is a harbour situated on a fjord on the Arctic Ocean and is ice-free for most of the year. It lacked, however, any heavy handling equipment.
>
> In view of the fact that a considerable amount of capital was required to exploit the Petsamo nickel-copper ores in such a remote locality, an agreement was concluded with the Mond Nickel Company in London (the European subsidiary of the International Nickel Company of Canada). This led to the formation of a subsidiary Finnish company, Petsamon Nikkeli O/Y, which was responsible for exploiting the concession area in Petsamo.
>
> During the years 1935–36 initial development work was in progress including the prospecting and mapping of the deposit in the Kaulatunturi mountain. Living quarters for the staff were built and a small diesel-electric D. C. set was installed for the power supply.
>
> In 1936 it was decided to construct an adit into the mountain. Adjoining the entrance to the adit was an area of level ground where it was decided to build the smelter and auxiliary plant. The erection of buildings for the personnel was begun on a large scale in 1937 at Kolosjoki which adjoined the site for the smelter plant.
>
> The need for electricity and compressed air for the buildings as well as for the operations on the mine led to the erection of a small power station which included four diesel sets having a total capacity of 610 h. p.
>
> During 1938 it was decided that the ore which proved difficult to concentrate by flotation, should be smelted direct in electric furnaces and for this purpose alone a demand of 26,000 kv. a. would be required. There were several water power potentialities in the district and after a detailed examination was made of these, it was decided to erect a power station at Jäniskoski, some 53 miles to the south-west of the smelter plant and about 2 miles from the "Arctic Highway."
>
> This involved the building of a dam 1,640 yd. long with a head of 71 ft. This dam created a lake 1,200 yd. wide with an upstream length of 5½ miles. Two Kaplan vertical turbines were installed running at 187 r. p. m. with a nominal output of 20,000 hp. each. Power was generated at 6.6 kv. and transformed up to 110 kv. for transmission to the smelter plant at Kolosjoki.
>
> The power plant was well under construction in 1939 but was not put into commission until 1942. During 1943–44 the German Todt organization installed a huge air-raid bunker over the power station constructed of reinforced concrete averaging 15 ft. thick.
>
> The smelting plant consisted of two electric furnaces which consumed 85 to 90 per cent of the whole of the electricity consumed at Kolosjoki. The furnaces were similar in form to the rectangular reverberatory furnaces in use for nickel smelting at Copper Cliff, Ontario, but they were heated by six electrodes of the Soderberg type 41 in. in diameter and located at 9 ft. 10 in. centres. The internal dimensions

[8] Nordin, W., Petsamo Nickel: Metal Ind. (London), vol. 73, No. 10, Sept. 3, 1948, pp. 183–185.

of the furnaces were 70 ft. 6 in. long and 18 ft. wide, and 10 ft. 6 in. high to the crown of the arch.

From an electrical point of view they were resistance furnaces, the generation of heat taking place in the semi-molten slag. Some current, however, flowed through the refractory hearth which became impregnated with the matte and formed a good conductor. The heat developed in the hearth, therefore, was small owing to the low electrical resistance.

Each furnace was supplied with a 12,000 kv. a. transformer bank consisting of three 4,000 kv. a. single-phase units. The primary of the transformers was connected to a 10 kv. supply while the secondary gave a series of low tension voltages variable on a tapping switch so that the most suitable tapping could be selected for the furnace electrodes.

These latter were of the continuous Soderberg type which were built up from sheet steel and carbon paste which was rammed in from an upper platform. Each electrode weighed approximately 30 tons and was suspended from chains and raised and lowered by means of winches which were controlled from the furnace control station.

The power input to the furnaces was controlled manually from a desk type control panel from which the electrode voltage could be regulated and the electrodes raised and lowered. This panel was fully instrumentated to indicate the power input, power factor, current, voltage, as well as the kilowatt hours consumed.

There was also a temperature-measuring panel which recorded the temperature at various points of the furnace by means of built-in thermocouples.

The starting of the first furnace at the smelter plant was accompanied by an unfortunate mishap. In the first place the operators were unaccustomed to working a furnace of this type and difficulties arose when tapping the furnace. In order to reduce the pressure on tapping the slag level was kept low and the furnace operated with electrodes very close to the hearth. This had disastrous consequences; it was found after a time that deep channels had been worn in the magnesite bottom bricks. This was due to a very heavy concentration of current underneath the electrodes causing over-heating of the hearth, while excessive turbulence of the matte was produced by the electromagnetic effect of the current. It was found that with the furnace operating with electrodes in a raised position, obtained by raising the level of the slag, this difficulty was overcome, and it was also found that with a higher operating voltage of 210 and the electrodes in a raised position, the furnace worked satisfactorily and no difficulties were encountered in starting up the second furnace.

Some interesting operating data are given in the accompanying table, and it was found from the experience over the period recorded (one year) that the power consumption could be reduced on further operation.

Operating Data for Electric Furnaces

Total power consumption	180,000 million w-hr.
Mean load per furnace	10,400 kw.
Charge smelted per day per furnace, approx.	310 tons (metric).
Consumption electrical energy:	
Per ton charge	806 kw-hr.
Per ton ore	870 kw-hr.
Per ton stone (as mined)	2,000 kw-hr.
Per ton crushed stone	15,000 kw-hr.
Per ton nickel	26,000 kw-hr.
Consumption of electrode material:	
Per ton charge	8 lb.
Per million w-hr	9.5 lb.
Consumption of sheet metal electrode casing:	
Per ton charge	0.38 lb.
Per million w-hr	0.44 lb.

The matte produced in the electric smelting furnaces was transferred by ladle to large converters which were served by a high-speed overhead crane of 40 tons capacity with a 10-ton auxiliary hoist. All the cranes and converter controls were operated from a 220-volt D. C. supply with a series of motors of the robust rolling mill type. The converters were supplied with air from two electrically driven turbo-compressors. These turbo-compressors operated at 585 r. p. m. through gear boxes from 1,700 kv. a. synchronous motors. The blast pressure was 14 lb./in.[2] These compressors were also used for heating purposes in the smelter as the blast was delivered at 80° C.

The slag from the smelting furnaces was granulated with the result that a large volume of water was required and a pump-house was installed capable of delivering 10,800 L/min. of water.

Compressed air was supplied to the mine by electrically driven reciprocating compressors of Bellis & Morcom manufacture. They compressed the air in two stages to a pressure of 7 atmospheres, and each compressor was capable of delivering 2,000 cu. ft./min. of free air.

Both the vertical and the inclined shafts in the mine had winding machinery, the former being served by two balanced skips running between guide rails. There were two winding drums 9 ft. 10 in. in diameter and these were driven by a 150 kw. synchronous motor. The winch for the inclined shaft was a temporary one and was equipped with a single drum.

The haulage on the plant was carried out by electric locomotives of which there were two 8-ton locos, two 7-ton locos and four smaller accumulator locos.

It is interesting to note that for the hardening and forging of the drill steel required in the mine, two high frequency furnaces were installed and the smithy was built in the mine itself between the main shafts.

Nitrogen Compounds

By BERTRAND L. JOHNSON

GENERAL SUMMARY

THE United States is the largest producer and importer of nitrogen in the world. Some is exported. The 1948–49 allotment for the United States set the export requirements at 61,000 short tons—the same as the previous year. Public Law 606 (80th Congress), which amended the Second Decontrol Act of 1947 (Public Law 188), extended the expiration date to June 30, 1949. It also provided that the Army supply at least 50 percent of the nitrogen in the nitrogenous fertilizer materials that go into the fertilizer export program. This nitrogen, amounting to about 30,000 short tons, is to be diverted from the amount now going to occupied areas or made up from increased production at Army ordnance plants.

The supply of nitrogen in the United States in 1948 was inadequate to meet the demand. The only United States controls over nitrogen in 1948, however, were those on exports in accordance with the world allocations of the International Emergency Food Committee. There was no allocation of nitrogen fertilizers for domestic agriculture.

Ammonia solutions (including liquid anhydrous ammonia), ammonium sulfate, ammonium nitrate, and sodium nitrate constitute the principal part of our domestic production of ammonia and its compounds. In recent years a trend favoring the domestic use of solutions is reported. Export nitrogen is mostly in the form of ammonium sulfate and ammonium nitrate, with much smaller amounts of ammonium phosphate and nitrogenous solutions.

DOMESTIC PRODUCTION

Ammonium Compounds.—At the beginning of 1948 the Army nitrogen fertilizer program was based upon (1) the output of three anhydrous ammonia plants: Cactus Ordnance Works, Etter, Tex., in the Texas Panhandle; Morgantown Ordnance Works, Morgantown, W. Va., and the Ohio River Ordnance Works, West Henderson, Ky.; (2) four other plants used for converting the ammonia into ammonium nitrate solutions, at Lawrence, Kans.; Joliet, Ill.; Radford, Va.; and Charlestown, Ind., and (3) five plants processing the ammonium nitrate solution into solid ammonium nitrate at Grand Island, Nebr.; Burlington, Iowa; Carbondale, Ill.; Fremont, Nebr.; and Apco, Ohio. No part of the commercial supply was taken by the Army. Later the Cactus Ordnance Works was leased by the Army to the Phillips Chemical Co., a wholly owned subsidiary of the Phillips Petroleum Co., and on August 16, 1948, this company took possession of the plant under the terms of the lease. The Army, late in 1948, made arrangements to transfer two lines of anhydrous-ammonia production equipment at the Louisiana Ordnance Works, Louisiana, Mo., to its San Jacinto Ordnance Depot, on the ship channel near Houston, Tex., where the plant will be operated for the Army by the Hercules Powder Co., with a production of 2,000 tons of anhydrous ammonia per month.

Nitrogen compounds produced in the United States, 1945–48, in short tons

	1945	1946	1947	1948
Ammonia (NH_3):				
Synthetic plants: Anhydrous ammonia [1]	548,655	725,537	1,117,212	1,089,786
Byproduct coking plants (NH_3 content):				
Aqua ammonia	27,607	24,991	25,718	24,753
Ammonium sulfate	191,073	160,938	202,360	207,671
Total	218,680	185,929	228,078	232,424
Ammonium sulfate:				
Synthetic plants [1]	88,863	156,653	197,027	205,531
Byproduct coking plants [2]	764,293	643,752	809,440	830,683
Total	853,156	800,405	1,006,467	1,036,214
Ammonium nitrate, original solution 100 percent NH_4NO_3 [1]	421,487	724,899	1,047,792	988,342

[1] Data from Bureau of the Census monthly Facts for Industry series.
[2] Does not include ammonium sulfate produced at byproduct coking plants from purchased anhydrous ammonia as follows: 1945–46 (no data); 1947—11,070 short tons; 1948—30,749 short tons.

Late in 1948 the Mathieson Chemical Corp. (formerly the Mathieson Alkali Works) officially received title to the Government-owned Lake Charles, La., ammonia plant from the War Assets Administration, acting for the Reconstruction Finance Corporation. This plant, built and operated by Mathieson for the Government during World War II, had been leased by the company before its purchase.

The sale of the war-surplus synthetic-ammonia producing Jayhawk Ordnance Works, Galena, Kans., to the Spencer Chemical Co., Kansas City, Mo., was approved on May 12, 1948, by the War Assets Administration. The synthetic ammonia plant formerly known as the Ozark Ordnance Works, El Dorado, Ark., was purchased on March 3, 1948, from the War Assets Administration, by the Lion Oil Co., which had previously been operating the plant under a long-term lease.

The Government-owned war-surplus synthetic ammonium sulfate plant at Salem, Oreg., was offered for sale to the highest bidder on December 9, 1948, by the War Assets Administration.

Sodium Nitrate.—The synthetic nitrate of soda consumed in the United States in 1948 was produced domestically. None is known to have been imported. The sole commercial producer was the Hopewell, Va., plant of the Allied Chemical & Dye Corp. It is reported that in 1947 the industry operated at less than half capacity, the domestic production being limited in that year by a shortage of soda ash. A step-up in the production of the domestic synthetic sodium nitrate was expected late in the year, with a total production in excess of that in 1947, when 210,000 tons was reported.

Deposits of soluble nitrate minerals, none of present economic importance, are scattered throughout the United States. (See Minerals Yearbook 1942, p. 1522.)

CONSUMPTION AND USES

Anhydrous ammonia was in wide demand throughout 1948, and general shortages existed for both agricultural and industrial uses. The commercial supply available for agriculture was augmented by some from Army ordnance plants. By Public Law 793, 80th Congress, approved June 28, 1948, the Army was directed to make available 10 percent of its anhydrous ammonia production to the fertilizer industry to relieve the shortage. This would amount to about 27,000 tons, or a nitrogen equivalent about equal to what private industry would have to export. Congress stated that this supply of anhydrous ammonia was to be made available to those producers of ammonium sulfate who have been forced to shut down because of lack of the material or face imminent shut-down for the same reason. Any balance was to be distributed to the rest of the industry.

Ammonium nitrate is reported forging ahead of all other types of nitrogenous fertilizers now being used on American farms. It is said to have been used first in mixed fertilizers about 1930 and was first applied as a top dressing for crops in the 1942–43 season. In the 1947 season, 374,613 tons are stated to have been used for top dressing alone.

The shortage of synthetic sodium nitrate continued into the first part of 1948. Later in the year, however, the supply became more abundant and at about the end of the year was easily available. A considerable portion of the production is said to go to industrial uses.

PRICES

Chilean Nitrate.—On December 17, 1947, prices for imported Chilean nitrate of soda at the usual ports of importation had been fixed at $44.50 per ton for bulk material, carlots at port warehouse, plus loading and terminal charges and charges for fertilizer tags and attaching if required. The bagged material was set at $48 per ton. These prices held over into 1948 until early in August 1948, when an increase of $3.50 per ton was applied to both bulk and bagged material, bringing the base rate to $48 per ton for the bulk product and $51.50 per ton for the bagged material. No further price change occurred during the rest of the year.

Synthetic Nitrate.—Price for domestic synthetic "Arcadian" nitrate of soda in bulk on January 1, 1948, was $37 per ton and for the bagged material $40.50 for carlot shipments f. o. b. Hopewell, Va., according to the Oil, Paint and Drug Reporter. In July 1948 the contract prices were advanced $5 per ton, establishing the market at $42 per ton for bulk sodium nitrate and $45.50 for shipments in bags in carlots. The prices of this domestic product were again advanced, this time $3 per ton, effective October 1, 1949, making the new price $45 per ton for bulk and $48.50 for the bagged nitrate of soda. These prices were in effect for the balance of the year.

FOREIGN TRADE [1]

Chilean Nitrate.—Imports of natural sodium nitrate from Chile still bulk large in the domestic economy. The amount brought into the United States in 1948—720,764 short tons—was much larger

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

than in 1947 and larger than in any year since 1945. In spite of this increase, however, domestic demand is reported to have greatly exceeded the material available, and the market was tight throughout the year. The total value of the imports reached $23,400,075, a much greater value than in recent years. Imports of sodium-potassium nitrate into the United States in recent years have been small and irregular. In 1947 only 2,500 tons entered, and in 1948 there were no known imports of this commodity. The accompanying tables show the imports of these commodities in 1944–48.

Nitrogen compounds imported into and exported from the United States, 1945–48, in short tons

	1945	1946	1947	1948
Imports:				
Industrial chemicals:				
Anhydrous ammonia	4	7		209
Ammonium nitrate	(1)		27	80
Fertilizer materials:

WORLD REVIEW

The critical world shortage of nitrogen continued throughout 1948. A gradually increasing demand for nitrogen in that year continued to outrun an increased supply. Shortages existed in the supply available for both agriculture and industry. The world production of fertilizer nitrogen in the fiscal year 1948–49 (exclusive of the U. S. S. R.) was estimated by the International Emergency Food Committee (IEFC) at 3,353,000 metric tons compared with 2,918,000 tons in 1947–48. World requirements are much greater than this: requests for nitrogen submitted by participating governments to the IEFC were nearly a million tons more than production. The deficiency is said to have been nearly as great as during the past 3 years. Control of world nitrogen exports continued during 1948 under the auspices of IEFC of the Food and Agricultural Organization of the United Nations. All of the above production will be distributed under allocation to more than 100 countries or areas. Most of the nitrogen distributed by the 1948–49 allocations was produced within countries using it. Supplementing this, more than a million tons were imported by claimants from recommended sources, principally Belgium, Canada, Chile, Italy, Norway, United Kingdom, and the United States. Not included in the distributions referred to above are the Allied occupation areas, to which the United States War Department shipped large tonnages.

World production and consumption of nitrogen compounds, by principal countries, fiscal years 1947–49, in metric tons of contained nitrogen [1]

Chile.—Experiments are in progress in Chile looking to extraction of a million tons of sodium nitrate in the waste dumps of the nitrate plants by leaching and subsequent solar evaporation, a process reportedly not hitherto tried out in Chile. An experimental evaporation pond at Maria Elena has been built by the research departments of the Lautaro Nitrate Co. and the Anglo-Chilean Nitrate Co. If the results are favorable, it is expected that 70 ponds—each 410,000 square feet in area, but only 1.5 feet deep—will be constructed. Water which has flowed through the now useless waste would be used to fill the ponds, and the heat of the sun would concentrate the resultant solution to a point suitable for extracting the salts.

Conveyor belts are being installed at one Chilean port to decrease the present high cost of loading the nitrate.

Peat

By J. A. CORGAN AND GOLDEN V. CHIRIACO

PRODUCTION

PEAT production in the United States dropped about 5 percent in 1948, when a total of 129,581 short tons valued at $929,560 was reported to the Bureau of Mines, as compared with 136,232 tons valued at $868,979 in 1947.

Forty-one producers operating in 19 States accounted for the 1948 production. Eleven plants active in 1947 were designated inactive in 1948; one was reported closed permanently, whereas the others indicated temporary inactivity, several expressing plans for reopening in 1949.

The average value per ton in 1948 was $7.17, a 12-percent increase over the 1947 value of $6.38.

Peat produced in the United States, 1944–48

Year	Short tons	Value	
		Total	Average per ton
1944 (estimated)	97,000	$878,000	$9.05
1945 (estimated)	107,000	821,000	7.67
1946	140,707	1,006,231	7.15
1947	136,232	868,979	6.38
1948	129,581	929,560	7.17

Florida, New Jersey, and Ohio, respectively, retained the position established in 1947 as the highest peat-producing States. The following States ranked next highest in the order named: Michigan, Illinois, California, Pennsylvania, Connecticut, Iowa, Minnesota, Wisconsin, Georgia, Indiana, Colorado, Alabama, Texas, Maine, Washington, and Massachusetts.

Peat humus, produced in 12 States, comprised about 69 percent of the total production in 1948; reed or sedge, produced in 12 States, 21 percent; and moss peat and other, produced in 11 States, 10 percent.

Peat produced in the United States in 1948, by kinds

Kind	Short tons	Value	
		Total	Average per ton
Moss peat	12,685	$128,960	$10.17
Reed or sedge	27,566	262,475	9.52
Peat humus	88,949	536,993	6.04
Other	381	1,132	2.97
Total	129,581	929,560	7.17

Reserves.—Peat is found in about half of the States. An estimate of 13,827,000,000 tons has been calculated as air-dried peat.[1] Minnesota, Wisconsin, and Michigan combined contain 75 percent of the reserves; 14 percent of the country's total is in Florida; and the rest is distributed through the New England and Pacific Coast States.

USES

In 1948, as in preceding years, the most prevalent use for peat in this country was for soil improvement. Of the total sales reported for 1948, 67 percent was for soil improvement, 28 percent for mixed fertilizers, and 5 percent for other purposes, including litter for barns and poultry yards, in nurseries and greenhouses, and as packing material for plants, fruits, vegetables, eggs, and other fragile articles. No sales of peat for fuel were reported for 1948. Although some European countries utilize peat for fuel and power purposes, it is not used in this country for fuel purposes because of the competition of higher-grade fuels.

Peat sold in the United States in 1946–48, by uses

Year	Soil improvement		Mixed fertilizers		Other uses		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1946	99,733	$664,565	32,471	$263,542	6,684	$66,286	138,888	$994,393

IMPORTS[2]

Imports of moss peat continued to increase, totaling 91,073 short tons in 1948, an increase of 16 percent over the 1939 prewar figure of 78,611 tons and 15 percent more than the quantity imported in 1947 (79,567 short tons). As no exports of peat were reported, the quantity available for domestic consumption in 1948 totaled 220,654 tons.

Peat moss imported for consumption in the United States in 1948, by kinds and by countries

[1] In addition to countries listed, Argentina, Australia, Poland, and U. S. S. R. produce peat, but data of production are not available; estimates for these are not included in total. U. S. S. R. produced approximately 20,000,000 tons in 1945.
[2] Data not available, estimate included in total.
[3] Estimate.
[4] United States zone only.
[5] Bizonal area.
[6] Data represent Trianon Hungary subsequent to October 1944.
[7] Figures for 1942 relate to production by holders of agricultural land only; those for 1943–47 cover tota production.
[8] January to June, inclusive.
[9] Negligible.
[10] Data for 1942–43 are as reported to the Bureau of Mines by producers and probably represent only about ⅔ of total production. Data for 1944–48 believed to represent reasonably complete coverage.

Petroleum and Petroleum Products

By A. G. WHITE, F. S. LOTT, A. T. COUMBE, AND A. L. CLAPP

GENERAL SUMMARY

THE outstanding feature of the oil situation in 1948 was a transition from tight supply and local product shortages at the beginning of the year to abnormally high stocks of refined products and oversupply at the end of the year. Additions to refinery capacity and a flattening in the rate of increased demand restored the essential flexibility to adjust operations to abnormal seasonal changes in demand. With the expansion in the heating-oil market, weather has become a more dominant factor in the seasonal fluctuations in demand. The cold winter of 1947–48 resulted in an unexpectedly large demand for heating oils and necessitated the use of refinery capacity to the limit, with maximum yields of light fuel oils, and a strain on distribution facilities from the refinery to the consumer that caused serious temporary shortages in the east coast and parts of the Middle West. The abnormally mild winter of 1948–49 cut the expected demand for heating oils by possibly 10 percent. Before this situation had become apparent, supply had exceeded requirements in the last quarter of 1948, and stocks of heating oils were far above normal seasonal levels. The whole pattern of subsequent operations in the first half of 1949 had to be adjusted to meet this abnormal situation. Refinery operations were sharply reduced below the level of 1948, the yields of fuel oils were cut to a minimum, and the seasonal yield of gasoline was increased by about 3 percent, as that product was the only one for which demand continued to increase at the anticipated rate.

During each of the past 3 years, the annual and seasonal patterns of oil demand have varied sharply. In 1946 the transition from war requirements to civilian demand took place without the substantial decline in demand that had been expected. The total demand for all oils in 1946, compared with 1945, declined only 0.5 percent owing to a sharp drop in exports, while domestic demand showed a small increase of 1 percent.

In 1947, both the total demand and the domestic demand for all oils gained 11 percent compared with 1946. To supply this high demand, refinery and transportation facilities were used to capacity, and there was a small reduction of about 5 million barrels in total stocks of refined oils.

Both demand and supply exceeded all previous records in 1948. Compared with 1947, the total demand for all oils increased about 4 percent with a decline of 18 percent in exports and a gain of about 6 percent in domestic demand.

Demands for all oils in the United States, 1939–48

[Millions of barrels]

Year	Domestic demand	Exports	Total demand	Year	Domestic demand	Exports	Total demand
1939	1,231.1	188.9	1,420.0	1944	1,671.3	207.6	1,878.9
1940	1,326.6	130.5	1,457.1	1945	1,772.7	183.0	1,955.7
1941	1,485.8	108.8	1,594.6	1946	1,792.8	153.1	1,945.9
1942	1,449.9	116.9	1,566.8	1947	1,989.8	164.5	2,154.3
1943	1,521.4	150.0	1,671.4	1948 [1]	2,108.4	134.9	2,243.3

[1] Subject to revision.

Total exports and shipments to noncontiguous Territories declined from 164.5 million barrels in 1947 to 135 million in 1948. Exports of crude oil decreased 6.5 million barrels or 14 percent and exports of refined products 23.0 million barrels or 20 percent during the year. Exports of refined products were restricted in the early part of 1948 during the period of domestic shortage and were later affected by increases in outside world supply and problems of monetary exchange. A net export of about 5 million barrels in 1947 changed to a net import of about 53 million in 1948.

Domestic demand in continental United States rose from 1,989.8 million barrels in 1947 to a record level of 2,108.4 million in 1948, exceeding 2 billion barrels for the first time. Compared with 1947, domestic demand increased 6 percent in 1948—including gains of 9 percent in motor-fuel demand, 14 percent in distillate fuel-oil demand, 9 percent in kerosine demand, and 3 percent in the demand for miscellaneous products and a 4-percent decline in the demand for residual fuel oil. The increase in domestic demand in 1948 was considerably less than had been expected and resulted in an excess of supply in the latter half of the year.

Stocks of all oils increased 106.5 million barrels in 1948—including gains of 25.6 million in crude stocks, 1.3 million in natural-gasoline stocks, and 79.6 million barrels in stocks of refined products.

The supply of all oils in 1948 totaled 2,349.8 million barrels, a total increase of 9 percent on a daily average basis compared with 1947. Production of crude oil set a new record of 2,016.3 million barrels, or 5,509,000 barrels daily—a gain of 8 percent compared with 1947. The production of light oils from natural gas, including a small amount of motor benzol, amounted to 145.8 million barrels in 1948, a daily average increase of 9 percent. The total imports of all oils rose from 159.4 million barrels in 1947 to 187.7 million in 1948—a daily average gain of 18 percent, including an increase of 32 percent in imports of crude oil and a decline of 5 percent in imports of refined oils.

[4] New basis, excluding distributors' stocks in California.

In considering the general relation between supply and demand in 1948, the increase of 106.5 million barrels in total stocks represented an excess supply of about 4.5 percent over actual requirements. While part of this gain in stocks can be considered a normal increase incident to the larger demand, a very substantial part of the increment represented excess stocks that would require subsequent readjustments in supply to return to a normal seasonal balance. As originally estimated, the same supply in 1949 would have met most of the expected gain in demand, but actually the indications for 1949 indicate an increase considerably less than 4.5 percent in total demand and consequently will result in a substantial reduction in total new supply below the record levels of 1948.

In the following sections of this general review, the position of the major products is discussed, and the trends of demand in 1948 are indicated by quarters. A brief review of the four major products—motor fuel, residual fuel oil, distillate fuel oil, and kerosine—will indicate the principal changes in demand and stocks of refined products that occurred in 1948. These four products represented almost 85 percent of the total demand for all oils in 1948.

The record demand for motor fuel in 1948 amounted to 908.6 million barrels, including exports of 37.4 million and a domestic demand of 871.2 million barrels. Compared with 1947, total demand increased 66.1 million barrels, including a decline of 10.1 million in exports and a gain of 76.2 million in domestic demand or 9 percent on a daily average basis. Stocks of finished gasoline increased 12.3 million barrels in 1948 with a gain of 15.1 million in areas east of California and a decline of 2.8 million in the California district. According to the Public Roads Administration, the highway demand for motor fuel amounted to 725.3 million barrels in 1948 or 8 percent greater than in 1947. This highway demand represented 83.3 percent of total domestic demand, as computed by the Bureau of Mines, in 1948 compared with 84.5 percent in 1947—the relative decline being due primarily to the gain of about 15 million barrels in the domestic demand and for aviation gasoline in 1948.

The total demand for residual fuel oil in 1948 amounted to 513.3 million barrels, including exports of 12.5 million and a domestic demand of 500.8 million barrels. Compared with 1947, total demand decreased 15.8 million barrels, including a gain of 1.9 million in exports and a decline of 17.7 million in domestic demand or a loss of 4 percent on a daily average basis. Stocks of residual fuel oil increased 29.8 million barrels in 1948, with a gain of 13.5 million barrels in areas east of California and an increase of 16.3 million in the California district. Current reports available indicate a decline in railroad consumption of 7.0 million barrels in 1948, a decline in the bunkering of ships in the foreign trade of 8.1 million barrels, and a decline in the consumption by public-utility electric plants of 3.3 million barrels.

The record demand for distillate fuel oil in 1948 amounted to 361.9 million barrels, including exports of 21.8 million and a domestic demand of 340.1 million barrels. Compared with 1947, total demand increased 33.7 million barrels, including a decline of 8.1 million in exports and a gain of 41.8 million in domestic demand or 14 percent on a daily average basis. Stocks of distillate fuel oil increased 24.9 million barrels in 1948, with almost all the gain occurring in areas east

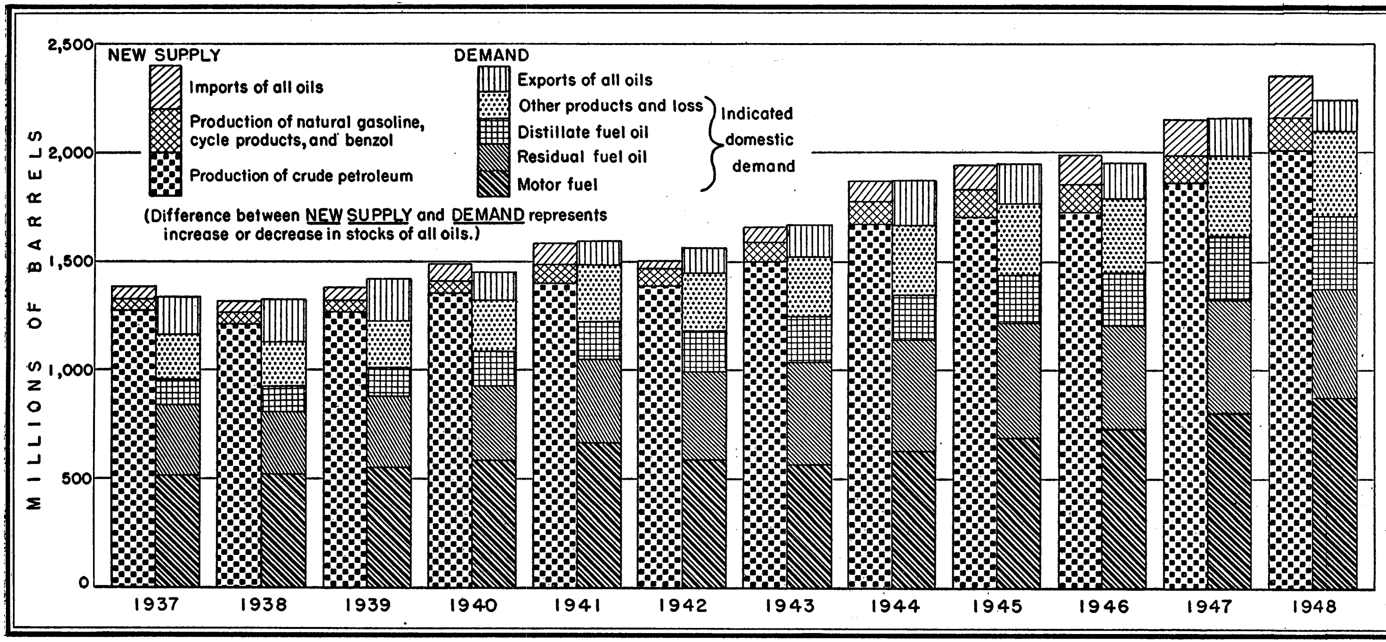

FIGURE 1.—Supply and demand of all oils in the United States, 1938–48.

of California, including 9.6 million in the East Coast district and 7.3 million in the Gulf Coast districts. Part of the increase in stocks was essential restocking, but a material excess in seasonal stocks resulted from the mild weather at the end of the year. Current figures available indicate an increase in 1948 of 9.7 million barrels in Diesel-oil demand by railroads.

The total demand for kerosine in 1948 amounted to 115.7 million barrels, including exports of 3.5 million and a domestic demand of 112.2 million barrels. Compared with 1947, total demand increased 5.9 million barrels, with a decline of 3.7 million in exports and an increase in domestic demand of 9.6 million or a gain of 9 percent on a daily average basis. Stocks of kerosine increased 6.3 million barrels in 1948, including an increase of 3.2 million in the East Coast district. A considerable part of the demand for kerosine is in small space-heating units where it competes with No. 1 distillate fuel oil.

Excluding the four major products already reviewed, the total demand for all other products in 1948 amounted to 343.9 million barrels in 1948 compared with 344.8 million in 1947, a decline of 0.4 percent on a daily average basis. Exports included in this group declined from 69.3 million barrels in 1947 to 59.7 million in 1948, including declines of 6.5 million in crude oil exports and 3.1 million barrels in the exports of other refined products. The domestic demand for these other products increased from 275.5 million barrels in 1947 to 284.2 million in 1948—a daily average gain of 3 percent. Of the total increase of 8.7 million barrels in 1948, the principal gains were 11.4 million barrels for liquefied gases, 2.8 million for asphalt, 1.6 million for coke, 1.4 million for other miscellaneous products, and 1.0 for road oil. The principal declines in domestic demand were 4.8 million barrels for losses (refinery shortage and crude losses) and 4.4 million for still gas.

Review of the trends of 1948 by quarters will clarify the most important changes in supply and demand during the year.

The first quarter of 1948 was characterized by cold weather, heavy demands for heating oils, local shortages of distillate fuel oil and kerosine, emergency transportation arrangements, and restrictions in export licenses for the products in critical supply. The situation was particularly acute in the East Coast States, where products are moved by boat and where the stocks of distillate fuel oil had declined sharply in 1947 in the refinery district serving this area. Crude runs to stills were maintained at a high level, the yield of gasoline from crude oil was reduced, and yields of distillate fuel oil and kerosine were raised to a maximum. Compared with 1947, the total demand for all oils in 1948 increased almost 7 percent on a daily average basis, total exports declined 26 percent, and domestic demand was 9 percent greater. Increases in domestic demand by product showed gains of 19 percent for kerosine, 18 percent for distillate fuel oil, almost 10 percent for motor fuel, and about 5 percent for all other products.

In the second quarter of 1948, crude runs were at record levels, averaging 5,614,000 barrels daily in the effort to meet demand and to replenish heating-oil stocks that has been reduced to minimum levels at the end of March. A total of 33.6 million barrels was added to stocks of refined oils during the quarter. Compared with the second quarter of 1947, total demand gained almost 7 percent, exports decreased about 16 percent, and domestic demand gained about 9 percent. Increases in domestic demand by products included 20 percent for distillate fuel oil, 11 percent for motor fuel, 3 percent for kerosine, 1 percent for residual fuel oil, and 9 percent for other products. Early restocking of light heating oils by distributors and consumers was indicated.

A slowing in the upward trends of demand was evident in the third quarter of 1948. Total demand, compared with the third quarter of 1947, increased less than 3 percent, total exports were about 15 percent lower, and domestic demand gained less than 5 percent. Domestic demand by products showed gains of over 13 percent for distillate fuel oil, 10 percent for gasoline and kerosine, and 2 percent for miscellaneous products, while the domestic demand for residual fuel oil was almost 8 percent less. Total crude runs to stills averaged 5,544,000 barrels daily and were reduced by a strike that lasted through September and part of October in California. Total stocks of refined products increased 38.2 million barrels in the third quarter.

A combination of abnormally warm weather, earlier seasonal stocking of heating oils by distributors and consumers, and a sharp drop in the demand for residual fuel oils resulted in an unexpectedly small demand in the fourth quarter of 1948. Compared with the same period in 1947, total demand declined 0.4 percent, exports were reduced over 16 percent, and domestic demand gained only 0.7 percent. Although the domestic demand for motor fuel gained over 7 percent, the increase for distillate fuel oil was only 5 percent and for kerosine 2 percent, while the domestic demand for residual fuel oil declined over 10 percent and the demand for miscellaneous oils was reduced about 3 percent. In spite of the relative decline in demand, crude runs to stills reached an all-time record of 5,662,000 barrels daily in the fourth quarter; and stocks of refined oils, instead of declining, increased 21.2 million barrels during the quarter.

With a total increase of almost 80 million barrels in refined stocks during 1948 and continuation of an abnormally mild winter, supply greatly exceeded demand in the first quarter of 1949. Compared with the first quarter of 1948, total demand was down 1.4 percent, exports gained about 13 percent, and domestic demand was 2 percent less. The domestic demand for motor fuel was 5.5 percent higher, but distillate fuel oil and residual fuel oil demands were about 4 percent less. The demand for kerosine declined 15 percent and for other miscellaneous products dropped 10 percent. As a result of the low demand for heating oils combined with excessive inventories, yields of gasoline were much above normal, and fuel-oil yields were reduced to a minimum.

Demand in Noncontiguous Territories.—In order to compute domestic demand in continental United States, the shipments from the United States to the Territories are included in exports, and any imports from foreign countries to the Territories are deleted from total imports. The major part of such shipments from the United States goes to Hawaii, Alaska, and Puerto Rico, and Puerto Rico is normally the chief Territorial importer of foreign oils.

The accompanying table has been prepared to show shipments to the Territories from the United States and the foreign imports received by them. No crude oil is involved in these movements. The receipts of products from the United States plus the imports indicate the total supply available in the Territories and, minus some minor reexports, indicate their total demand.

Imports and exports of crude petroleum and petroleum products

[1] United States Department of Commerce: 1947 final data; 1948 preliminary data.
[2] Bureau of Mines data.

The figures for 1948 indicate that shipments to the Territories from the United States totaled 12,310,000 barrels and that total direct imports from foreign countries were 2,530,000 barrels, making a total new supply of 14,840,000 barrels. Reexports to foreign countries amounted to 234,000 barrels (see table of exports, by countries of destination, in the next to the last section of this chapter). There is indicated a total set demand for oil products in the noncontiguous Territories of about 14.6 million barrels in 1948 compared with 15.1 million barrels in 1947. If these figures are added to the domestic demand figures for continental United States, the sum will show the total domestic demand within the political boundaries of the United States.

World Oil Supply.—World production of crude petroleum in 1948 again exceeded all previous records, increasing from 3,022 million barrels in 1947 to 3,425 million in 1948. The total increase of 403 million barrels represents a gain of 159 million for the United States and 244 million for the rest of the world, including gains of 55 million for Venezuela, 53 million for Saudi Arabia, 35 million for Iran, 31 million for Russia, 30 million for Kuwait, and 24 million for Indonesia. The United States produced 61 percent of the world total in 1947 and 59 percent in 1948.

According to Bureau of Mines data for 1948, exports of all oils from continental United States totaled 135 million barrels and imports about 188 million, resulting in a net import of about 53 million barrels in 1948. As total stocks of all oils increased almost 107 million barrels in 1948, the production of all oils (including crude oil and liquid products from natural gas) exceeded domestic demand in continental United States by about 54 million barrels.

RESERVES

The Committee on Petroleum Reserves, American Petroleum Institute, estimated proved reserves of crude oil in the United States on December 31, 1948, at 23,280 million barrels, compared with 21,488 million on December 31, 1947. These estimates refer solely to proved or blocked-out reserves, including only oil recoverable under existing economic and operating conditions.

The increase in total net crude reserves in 1948 was 1,792 million barrels. In arriving at this net figure, the total of estimated new reserves added in 1948 was 3,795 million barrels—including an upward revision of 3,399 million of reserves due to extensions and revisions during 1948 and an estimate of 396 million for new reserves discovered in new fields or in new pools in old fields during 1948. From this estimate of total reserves added in 1948 was deducted an estimated production of 2,002 million barrels of crude oil during 1948 to determine the net gain in total reserves.

The principal changes in net crude reserves in 1948 were gains of 707 million barrels for Texas, 469 million for California, 297 million for Oklahoma, 111 million for Kansas, 78 million for Louisiana, 61 million for Mississippi, 38 million for Illinois, 37 million for Wyoming, and 22 million for New Mexico. The principal declines were 16 million barrels for Colorado and 13 million for Pennsylvania.

As of December 31, 1948, Texas had 54 percent of the total estimated reserves, California 16 percent, Louisiana 8 percent, and Oklahoma 5 percent—83 percent of the total for the four States combined.

The total proved reserves of natural-gas liquids, not included in the crude-oil reserves, were 3,541 million barrels on December 31, 1948. This figure, combined with the crude-oil reserves, made a proved reserve for all liquid hydrocarbons of 26,821 million barrels on December 31, 1948.

[1] From reports of Committee on Petroleum Reserves, American Petroleum Institute, of the amount of crude oil that may be extracted by present methods from fields completely developed or sufficiently explored to permit reasonably accurate calculations. The change in reserves during any year represents total new discoveries, extensions, and revisions, minus production.

[2] New basis; excludes condensate.

CRUDE PETROLEUM

SUPPLY AND DEMAND

The total demand for crude petroleum in 1948 set another new record amounting to 2,119.8 million barrels, an average of 5,792,000 barrels daily, that was 8 percent greater than in 1947. The demand for domestic crude oil rose to 1,994.8 million barrels, an average of 5,450,000 barrels daily and an increase of 7 percent compared with 1947. The demand for foreign crude oil amounted to 125.0 million barrels in 1948—a daily average of over 341,000 barrels and an increase of 28 percent compared with 1947.

The new supply of crude petroleum in 1948 included a record domestic production of 2,016.3 million barrels and imports of 129.1 million barrels. The average production of 5,509,000 barrels daily represented a gain of 8 percent compared with 1947 and imports of 353,000 barrels daily, an increase of 32 percent compared with 1947. Stocks of domestic crude petroleum increased by 21.5 million barrels during the year, and stocks of foreign crude gained 4.1 million.

The gain of 25.6 million barrels in total crude stocks in 1948 and the increase in total stocks of refined products of 79.6 million barrels indicate that the new supply of crude oil in 1948 was almost 5 percent greater than the total demand for all oils. In other words, the new supply of crude oil in 1948 was adequate to take care of a 5-percent increase in total demand in 1949 with no changes in stocks. If demand in 1949 should increase less than 5 percent or if stocks were substantially reduced, a sharp decline in new requirements of crude would be indicated.

The total increase in the indicated demand for crude oil (consumption plus export) of 165.8 million barrels in 1948 represented a gain of 178.5 million in total runs to stills and a decline of 12.7 million in the other demands for crude, including declines of 6.5 million in exports, 3.0 million in transfers to fuel oil, and 3.2 million in losses and unaccounted-for crude oil.

PRODUCTION

GENERAL

Production of crude petroleum in the United States set a new record of 2,016.3 million barrels in 1948. Crude production first reached the 1-billion-barrel mark in 1929, and 1948 is the first year in which it has amounted to 2 billion barrels or more.

The increase of 159.3 million barrels in crude production in 1948 compared with 1947 represented gains in every important producing State except Illinois, Pennsylvania, Kentucky, and New York. The principal gains were 83.1 million barrels for Texas, 21.1 million for Louisiana, 13.0 million for Oklahoma, 10.9 million for Mississippi, 9.2 million for Wyoming, 7.0 million for New Mexico, and 5.7 million barrels for Kansas. The chief declines were 1.8 million barrels for Illinois, 0.8 million for Kentucky, and minor decreases in New York and Pennsylvania.

There were 13 States that produced over 10 million barrels in 1948. Six States produced 87.0 percent of the total crude output in 1948 compared with 87.6 percent in 1947 and 88.0 percent in 1946. Texas ranked first with 45 percent of the total in 1948, California second with 17 percent, Louisiana third with 9 percent, Oklahoma fourth with nearly 8 percent, Kansas fifth with over 5 percent, and Illinois sixth with 3 percent.

The next seven States in importance produced a total of 225.8 million barrels in 1948 or 11.2 percent of the total production compared with 10.5 percent in 1947 and 9.8 percent in 1946. Mississippi, Wyoming, New Mexico, Arkansas, Colorado, and Michigan increased their production, while production in Pennsylvania was static.

The production of all other States has been comparatively unchanged and represents a relative decline from 1.8 percent of the total production in 1948, 1.9 percent in 1947, and 2.2 percent in 1946.

PRODUCTION BY STATES [1]

Alabama.—Crude production in Alabama in 1948 totaled 466,000 barrels, which represents an increase of 70,000 barrels over 1947. Twenty wildcat wells were drilled during the year; all were abandoned. One oil well was completed in the Gilbertown field, bringing the total number of producers to 34. The majority of the wells produce from the Eutaw at 3,300 feet, although there is some production from the Selma chalk at 2,700 feet. The Humble Oil & Refining Co. discovered the State's first piercement-type salt dome in Washington County.

Arkansas.—Production of nearly 31.7 million barrels in Arkansas in 1948 compared with approximately 30 million barrels during the previous year indicates a gain of 6 percent. During 1948, 301 wells were drilled, a moderate decline from the previous year. However, the number of wildcat wells drilled increased from 76 in 1947 to 106 in 1948.

[2] Subject to revision.

[1] Exploration data are largely from the Bulletin of the American Association of Petroleum Geologists, June 1949.

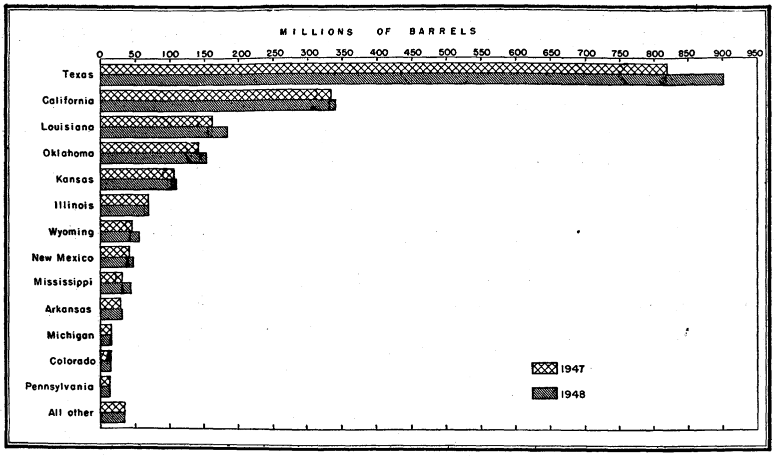

FIGURE 3.—Production of crude petroleum in the United States, 1947-48, by States.

No new gas or distillate fields were discovered; but four new oil fields were found, namely, Felsenthal in Ashley County, College Hill in Columbia County, and Cairo and Bear Creek in Union County. It is believed that Cairo and Bear Creek offer the best possibilities of the four fields. Drilling activity was greatest in the Wesson, Smackover, and Village fields, with 67 oil wells.

California.—All California production records were shattered in 1948, with a crude total of 340 million barrels, an increase of 7 million barrels over 1947. San Joaquin Valley gained over 0.9 million barrels, Los Angeles Basin increased over 2.7 million barrels, and the Coastal district made the largest gain, with approximately 3.3 million barrels.

The accelerated drilling program continued unabated during 1948, with 2,876 wells completed, contrasted with 2,053 the previous year. Oil-well completions totaled 2,395—an increase of 46 percent compared with 1947—and 488 exploratory wells were drilled contrasted with 352 in 1947. Kern County continued to lead in the number of exploratory wells with 201, while Los Angeles County was second with 58 and Santa Barbara County third with 49.

[3] Includes a revision of 30,000 barrels not yet distributed by fields and districts.
[4] Includes Costa Mesa.

Wildcat wells resulted in the discovery of 13 oil fields in 1948 compared with 11 during the previous year. Moreover, 19 oil pools, 3 gas fields, and 1 gas pool were opened during 1948. The Russell Ranch field in Cuyama Valley with 43 producing wells was the most important field discovered during the year. This discovery revealed large reserves in a district that had for many years been regarded as unpromising territory for commercial oil production. Other promising discoveries included the Guijarral Hills field in Fresno County and the Campbell pool in the San Ardo field in Salinas Valley. According to estimates of the American Petroleum Institute, 58 million barrels of crude were added to the State's reserves in 1948 by new fields and new pools and 149 million barrels from extensions.

Colorado.—Crude production in Colorado in 1948 totaled 16.8 million barrels compared with 15.7 million barrels in 1947, an increase of 1.1 million barrels. As in other recent years, this gain was due to increased production in the Rangely field. The second-largest field, Wilson Creek, registered a small decline in production for the year. Changes in other fields were comparatively small, the Moffat and Hiawatha fields making slight gains whereas the Iles, Price, and Walden fields showed losses.

Production of crude petroleum in Colorado, 1944–48, by fields

[Thousands of barrels]

Year	Fort Collins-Wellington	Hiawatha	Iles	Moffat	Price	Powder Wash	Rangely	Tow Creek	Walden	Wilson Creek	Other fields[1]	Total

During 1948 oil-well completions totaled 149 compared with 152 the previous year. Drilling activity continued at approximately the same rate as in 1947. During the year two oil fields and two gas fields were discovered in the State, surpassing the two discoveries made in 1947. The most interesting well was drilled by Western Natural Gas Co. and Byrd-Frost at Dove Creek, Montezuma County, which made 200 barrels of high-gravity oil and 5 million cubic feet of gas on a production test.

Florida.—Crude production of Florida equaled 290,000 barrels in 1948 contrasted with 259,000 barrels in 1947, a gain of 12 percent. All production came from the State's only field, Sunniland, in Collier County, where three producers and one dry hole were completed. Exploration activity continued at approximately the same rate in 1948, with 24 dry holes compared to 25 failures the previous year.

Illinois.—Production in Illinois continued to decrease in 1948, with a total of 64.7 million barrels in contrast with 66.5 million barrels in 1947. Declines were largest in the Bridgeport, Centralia, Louden, Patoka, and Salem fields, while the biggest gains were made in the Bible Grove, Clay City, Johnsonville, Phillipstown, Roland, Rural Hill, and Sailor Springs fields.

Twenty-eight new pools were discovered in 1948, identical to the number located in the previous year. Extensions to pools totaled 47 in contrast with 69 in 1947, and the number of oil wells completed in the State rose from 1,054 in 1947 to 1,262 in 1948. Wildcat wells drilled during the year totaled 628 compared with 536 in 1947, an increase of 17 percent. The largest number of wells were drilled in Wayne, Wabash, Clay, Gallatin, and White Counties, a continuation of the trend established over the past few years.

Except for the Assumption pool in Christian County, virtually all of the new oil pools were found close to established pools. In the northern part of the Illinois Basin, the Rosiclare sandstone in the Ste.

Genevieve formation of the Lower Mississippian appears to have excellent possibilities for good producers of about 400 barrels initial capacity, according to industry reports.

Indiana.—In 1948 Indiana petroleum production totaled 6.7 million barrels compared with 6.1 million barrels in 1947, a gain of 10 percent. Drilling activity was greatly accelerated during the year, with 518 wells completed as oil producers in contrast with 312 in 1947. Discovery of new fields increased over twofold, totaling 23 compared with 11 new fields the previous year. Wildcat wells drilled during the year totaled 307, a large increase compared with 1947. With respect to noteworthy developments during 1948, R. E. Esarey and B. E. Brooks, writing in the June 1949 Bulletin of American Association of Petroleum Geologists, report as follows:

The most significant development in Indiana was the opening of three new Devonian fields in Sullivan and Vigo Counties. Two of the fields, Wilfred and Marts in Sullivan County, were discovered on the basis of surface structure determined from coal drilling, and the Spring Hill field in Vigo County was located by non-technical means. Oil in these fields is produced from three zones in the Devonian limestones and dolomites at depths between 1,800 and 2,300 feet.

Kansas.—The upward trend in Kansas crude production continued in 1948 with a total of 110.8 million barrels, a gain of 5.7 million barrels over the previous year. The State continued to rank fifth among the oil-producing States of the country. Drilling activity was accelerated materially, with 3,252 wells completed in comparison with 2,667 in 1947. During 1948, 69 new oil and gas fields were discovered, classified as follows: 59 new oil fields, 5 revivals of old pools, and 5 new gas discoveries. Rooks County led the State, with 11 new pools or fields compared with 9 in 1947. The Hugoton field, largest gas field in the State, accounted for 77 percent of total gas produced during 1948.

Of the 69 new fields discovered in 1948, 58 were opened up in western Kansas and 11 in eastern Kansas. The greatest drilling activity centered in Rooks County, where the strikes were unusually successful; the 11 discovery wells averaged 948 barrels of oil per day. Of particular significance was the discovery well in the Northampton pool, with a maximum potential of 3,000 barrels daily. Important discoveries were also made in the following counties—Barton, Barber, Sedgwick, Nemaha, Kiowa, Morton, and Seward.

Kentucky.—Production of 8.6 million barrels in Kentucky during 1948 indicated a 9-percent decline from the 1947 total of 9.4 million barrels. Twelve new fields and 17 new pools were discovered during 1948, and 903 wells were drilled compared with 660 the previous year, according to the Oil and Gas Journal.

The total included 349 oil wells, 151 gas wells, and 403 dry holes drilled during 1948. There was a noticeable increase in the number of deep tests drilled. One of the most promising deep horizons is the St. Peter sandstone in the Furnace field, where 8 gas wells have been completed.

Although drilling activity declined during the year in Western Kentucky, the area remains by far the most important in the State, accounting for 9 new fields, 11 new pools, 8 new producing horizons in old fields, and 4 extensions.

South Central Kentucky witnessed a marked decline in drilling activity during 1948, with only 152 wells drilled in contrast with 222 in 1947. Exploration resulted in the discovery of 3 new fields, 5 new pools, and one new horizon. Likewise, drilling operations decreased in eastern Kentucky from 355 in 1947 to 330 in 1948, and only 1 new pool was discovered during the year.

Louisiana.—Production in Louisiana in 1948 soared to a new record of 181.2 million barrels, an increase of 21.1 million barrels compared with the previous year. Largest gain was made in the Gulf Coast—an increase of 14 million barrels—whereas the rest of the State increased 7 million barrels. In Northern Louisiana individual fields that made the largest gains were Caddo, Haynesville, Lake St. John, and Ora. In all, 33 new fields and new producing horizons in old fields were discovered in 1948 contrasted with 35 in 1947. The new strikes included 3 new oil fields, 1 distillate field, and 4 gas fields. The total number of wells drilled increased to 1,550 compared with 975 in 1947, and oil wells completed increased from 593 to 1,095 in 1948. Drilling was extensive and very successful in such old fields as the Caddo and Haynesville; however, none of the new discoveries appeared to have major importance. The number of wildcat wells drilled in northern Louisiana declined from 161 in 1947 to 114 in 1948.

[3] Includes Hemphill, Trout Creek, and Jena.
[4] Includes Little Creek and Summerville.

In the Gulf Coast area the fields that made the biggest increases in production were Avery Island, Barataria, Bay St. Elaine, Bayou Sale, Caillou Island, Delta Farms, Golden Meadows, and Venice. During the year 769 wells were drilled, an increase of 18 percent over 1947. The results from wildcat wells were highly successful, as 129 wildcats opened up 28 new fields, which included 13 oil fields, 11 condensate fields, and 4 gas fields. Seven new fields were discovered in the Gulf of Mexico (three oil fields, two condensate fields, and two gas fields). Discovery of these seven fields in open water was the outstanding drilling feat of the year. Although the crude reserves found offshore are generally believed to be of considerable extent, no exact estimate of the total quantity of oil is possible at this time. Owing to the large outlay of capital involved in such complex drilling operations, development of these fields will necessarily be slow. The picture is complicated further by the legal battle being waged with respect to ownership of the tidelands.

Michigan.—A moderate increase of 655,000 barrels in Michigan's production reversed the trend of the past 5 years, as total crude output for 1948 equaled nearly 16.9 million barrels compared with approximately 16.2 million barrels in 1947. The Deep River field continued to lead in output with approximately 2.9 million barrels with no appreciable change from 1947. The Coldwater, Kawkawlin, and Kimball Lake fields gained in production, while the Reed City and Adams fields declined.

A total of 820 wells was drilled in the State during 1948 in comparison with 769 the previous year; of 330 wildcats completed, 22 were productive in contrast with 15 in 1947. A break-down of the 22 successful wildcats discloses the discovery of 10 new oil fields, 4 new gas fields, and 8 oil-field extensions. The most significant field discovered during 1948 was the Pentwater field in Oceana County, where 52 oil wells were completed, including 44 producing from the Dundee horizon. Of major importance is the discovery of production from the Dundee in western Michigan, as this strike opens up a large area of potential production.

Mississippi.—Petroleum production of Mississippi soared to 45.8 million barrels in 1948, surpassing the record year of 1947 by 10.9 million barrels. The leading producing fields, in order of their importance, are Baxterville, Cranfield, Mallalieu, Tinsley, and Heidelberg.

In all, 250 oil wells were completed in 1948 in proved fields compared to 319 the previous year. The number of dry holes totaled 161, and wildcats drilled totaled 109 in contrast with 81 in 1947. Five new fields were discovered, and four shallow piercement salt domes found compared with three new fields and five salt domes in 1947. None of the discoveries appeared to have major importance, although more intensive drilling will be required to determine whether the salt domes have important possibilities.

Montana.—The Montana crude production in 1948 totaled almost 9.4 million barrels contrasted with 8.7 million barrels the previous year.

Largest production was recorded in the Cut Bank field, which totaled over 4 million barrels, although production declined moderately from the 1947 level. The best gain was registered in the Montana portion of the Elk Basin field, with 2.4 million barrels in 1948 in comparison with 1.7 million barrels the previous year. The production in the Kevin-Sunburst field remained virtually unchanged. Declines were recorded in the Cat Creek, Dry Creek, and Gage fields.

In all, 57 wildcats were drilled during 1948 which resulted in the discovery of 3 new fields, 1 new pool, and 10 outposts. The most interesting discoveries were made in Musselshell County, and these strikes were responsible for considerable leasing activity in the central part of the State. These discoveries were the Texas Co. basal Amsden production at Big Wall and the Amerada Petroleum Corp. strike at Melstone. Later in the year, the Texas Co. extended the Big Wall discovery one-half mile northeast and three-quarters of a mile southwest.

Nebraska.—Crude production in Nebraska increased slightly from 229,000 barrels in 1947 to 240,000 barrels in 1948. Nine dry holes were drilled in the State during the year.

New Mexico.—An all-time production record of nearly 48.0 million barrels of crude oil was established in New Mexico in 1948 compared with approximately 41.0 million barrels the previous year. The principal oil fields, with production in millions of barrels, were: Monument 6.9, Drinkard 6.2, Eunice 5.4, Vacuum 4.5, Hobbs 3.8, and Maljamar 2.0.

In Southeast New Mexico, 456 development tests were drilled, of which 404 were successful. Wildcat wells opened up 10 new fields, 7 new pools, and 7 outposts. Of major significance was the discovery of Devonian oil in northern Lea County, where the Mid-Continent Petroleum Co. opened up the Crossroad field. This discovery was responsible for a large new area becoming prospective territory for wildcatting.

Another important strike was discovery of the Cary field, where oil was found for the first time in the area in the Montoya horizon of Ordovician age.

In western and northern New Mexico virtually all drilling activity was in the San Juan Basin, where 11 fields produced approximately 370,000 barrels of oil in 1948. A total of 28 wildcats was drilled in this area during the year, 5 of which were small gas wells.

[1] World Oil. [2] Bureau of Mines.

New York.—Crude production in New York declined slightly in 1948 from the previous year, as the total dropped from approximately 4.8 million barrels to 4.6 million. Approximately 95 percent of the year's production was from secondary-recovery operations, and 5 percent was natural production. In all, 18 shallow wildcats were drilled in 1948. All were dry holes. In proved oil fields 675 oil wells were completed during 1948, and active geophysical work was carried on in the southwestern, central, and eastern parts of the State. There was a noticeable increase in leasing activity related to the possibilities of deeper production.

Ohio.—A slight gain in Ohio oil production was reported during the year, as the total output increased to 3.3 million barrels in 1948 contrasted with 3.1 million barrels in 1947. No important oil discoveries were made during the year, although drilling activity continued about normal, with 1,522 wells completed, exclusive of wells for gas storage.

Oil-well completions equaled 416 compared with 307 during 1947. In addition, 407 gas wells and 481 dry holes were drilled in 1948. The greatest activity in shallow drilling continued to be in Meigs County, while the largest number of deep tests was drilled in Muskingum and Perry Counties.

[1] Subject to revision.

Oklahoma.—A sizable gain of 13 million barrels in production was made in Oklahoma during 1948, with a total crude output of 154 million barrels compared with 141 million barrels the previous year. Gains in production were reported from the following fields: Apache, Cement, Healdton, Sholem-Alechem-Tatums-Tussy, and Velma; the Velma field increased output by 5.0 million barrels, whereas losses were noted in Burbank, Cache Creek, Oklahoma City, Pauls Valley, South Burbank, and West Edmond. The West Edmond field declined 5.6 million barrels during 1948 compared with 1947; however, the many smaller fields in the State showed a total increase of 11.5 million barrels.

In Oklahoma 4,263 wells were drilled during 1948, the largest number in any State except Texas. Of the 713 wildcats drilled, 94 were successful, resulting in a discovery ratio of 13 percent. The intensive drilling campaign resulted in the discovery of significant crude reserves, although no new field of paramount importance was indicated. However, the posted price for Oklahoma crude was attractive enough to warrant drilling many wells in old fields, which heretofore would not have been profitable.

The largest number of successful wildcats was in the north central, central, and south central parts of the State. Of particular significance was successful completion of the Union Producing Co.'s well in the Elk City field area on the southwest flank of the Anadarko Basin. This well was located 2 miles southeast of a Shell Oil Co. discovery well, and these two wells were responsible for the largest leasing and exploration activity in the State. Another important discovery well was drilled by Gulf Oil Co. in the southeastern embayment of the Anadarko Basin, extending production 5 miles northwest. This well shattered all previous records for depth by producing from the Bromide and

Tulip Creek sandstones at 12,855 to 13,611 feet, with an initial daily potential of 1,068 barrels.

The discovery well of Carter Oil Co., which opened the North Foster pool, and the Carter and Continental Oil Cos.' wildcat, which opened up the Southwest Panther Creek pool by finding production in the Deese sand, contributed materially to the addition of crude reserves in the area.

The strike of Superior Oil Co., 20 miles northwest of the West Edmond field, was especially significant. This well had a total depth of 9,026 feet and was a dual completion, producing through perforations opposite the Hunton group from 8,050 to 8,080 feet, and the Simpson dolomite from 8,565 to 8,640 feet. Initial production was 81 barrels of distillate in 9 hours and 4,665,000 cubic feet of gas per day from the Hunton, and 43 barrels of distillate in 15 hours and 3,854,000 cubic feet of gas per day from the Simpson dolomite. This discovery is in the center of Kingfisher County and opened up possibilities for future production in the northern part of the Anadarko Basin.

[3] Included Sapulpa before 1945.
[4] Included in other fields.
[5] Includes Pearson before 1947.

Pennsylvania.—A slight decline of 23,000 barrels in Pennsylvania crude production was reported in 1948; however, the total output was almost 12.7 million barrels. The Bradford field was the source of approximately 80 percent of the State's production. Drilling activity in 1948 remained virtually unchanged from the previous year, as 1,889 wells were completed compared with 1,975 in 1947. This total included 1,595 oil wells, 228 gas wells, and 66 dry holes. In all 30 deep wells (testing Middle Devonian or deeper formations) were drilled—9 gas wells, 2 for gas storage, and 19 failures. Five new gas fields and one oil pool were discovered during 1948; however, none appeared to have major importance.

In the Bradford oil field, which includes the Bradford, Guffey, and Burning Well pools, 2,270 wells were completed, approximately half being water-intake wells, in contrast with 2,140 wells drilled in 1947. There was considerable drilling activity in the East Fork Oriskany sand pool of north central Pennsylvania, where eight gas wells were completed, resulting in renewed interest in the possibilities of the Oriskany sand in the central part of the State.

Production of crude petroleum in Pennsylvania, 1944–48, by months

[1] Subject to revision.

Tennessee.—In all, 58 wells were drilled in 1948, including 13 oil wells and 1 gas well, contrasted with 17 dry holes drilled during 1947. Since discovery of commercial production in the Knox dolomite in 1947, 18 wells were drilled into this formation in 1948, 2 of which were successful. Both of these were in Fentress County. Magnolia Petroleum Co. drilled the State's deepest well during the year in Grundy County. However, it was a failure and was abandoned at 4,413 feet.

The most intensive drilling activity was centered in the Kettle Creek-Pine Branch area of Clay County, where 13 wells were drilled, including 6 producers. These wells were extremely shallow—less than 700 feet.

Texas.—Crude production in 1948 in Texas soared to an all-time high of 903.3 million barrels, a gain of 83.1 million barrels over the preceding year. All districts increased production over 1947, with West Texas gaining 51.9 million barrels. The second largest increase was made in the Gulf Coast area, with 14.4 million barrels, followed by North Texas 8.3, Central Texas approximately 3.0, South Texas 2.9, Panhandle over 2.1, and East Texas district—the smallest gain—about 0.6 million barrels.

North and West Central Texas led the State in total number of wells drilled in 1948 with 3,823, while West Texas was second with 3,251 and South Texas third with 1,932. In all, 12,172 wells were drilled in the State in 1948.

Gulf Coast.—Oil production in the Gulf Coast district increased from 259.3 million barrels in 1947 to 273.7 million barrels in 1948, a gain of 14.4 million barrels. Largest increases were made by Thompsons, Sugar Valley, Oyster Bayou, Humble, Chocolate Bayou, and

Bloomington fields, but declines were reported in Conroe, Fannette, Fig Ridge, Friendswood, Markham, and Stowell fields.

[1] Subject to revision.
[2] Includes crude oil consumed on leases and net change in stocks held on leases for entire district.
[3] Joiner, Kilgore, Lathrop, and other pools in Cherokee, Gregg, Rusk, Smith, and Upshur Counties.
[4] Includes other fields in Falls, Freestone, Limestone, and Navarro Counties.
[5] Includes the fields in and between Wilbarger, Wichita, Clay, Montague, and Cooke Counties on the north and Runnels, Coleman, Brown, and Comanche Counties on the south.
[6] Includes crude oil consumed on leases and net change in stocks held on leases for East (exclusive of East Texas proper), Central, North, and South Texas.
[7] Carson, Gray, Hutchinson, Moore, and Wheeler Counties.
[8] Includes fields in Brooks, Duval, Hidalgo, Jim Hogg, Jim Wells, La Salle, Live Oak, McMullen, Starr, Webb, and Zapata Counties.
[9] Includes the part of Jordan pool in Crane County.

The district reported 1,878 wells drilled in 1948 compared with 1,499 in 1947. The 1948 total is broken down as follows: 1,057 oil wells, 133 gas wells, and 688 dry holes. No outstanding discoveries were made during the year. The East Long Mott field in Calhoun County and the Sarita field in Kenedy County appear to have the best possibilities.

East Texas.—Crude production in 1948 totaled 172.3 million barrels, a gain of only 0.6 million barrels over the preceding year. Output in the huge East Texas field was 4.1 million barrels less than in 1947, whereas the Van field increased output 1.7 million barrels, the Merigale field gained 1 million barrels, and the Hawkins, New Hope, and Quitman fields had smaller increases.

In 1948, 629 wells were drilled, representing an increase of 6 percent compared with the previous year. One hundred and forty-seven wildcats and field extension wells were drilled and 21 discoveries made during the year, which included 12 new-field wildcats, 6 shallower-pool discoveries, and 3 deeper-pool discoveries. The 21 new strikes included 16 oil wells and 5 gas-distillate wells. None of the discoveries appears to have major significance, with the possible exception of the Mitchell

Creek field in Hopkins County, producing from the Paluxy sand at 4,480 to 4,600 feet.

Central Texas.—A gain of approximately 3 million barrels was made over 1947, as output rose to over 18.7 million barrels. The largest increase was made by the Charlotte field, with a production of approximately 1.9 million barrels, a gain of 1.3 million barrels contrasted with 1947.

North Texas.—Crude production in north Texas continued to climb and established a record total of 70.0 million barrels, an increase of 8.3 million barrels compared with 1947. The largest production during the year was in Wichita County, with Archer County in second place. Drilling activity continued at a high level, increasing over 30 percent from 1947.

Panhandle.—Oil production in 1948 totaled approximately 31.7 million barrels, 2.1 million barrels more than in the preceding year. Drilling activity was greatly accelerated in 1948, 659 wells being drilled or 34 percent more than in 1947. Of the total, 471 were oil wells, 143 gas wells, and 45 dry holes. No new fields were found.

South Texas.—Continuing the trend of recent years, oil production increased to 62 million barrels in 1948, a gain of almost 3 million barrels. Intensive drilling activity continued throughout the year, showing a marked increase over 1947. The most important new fields discovered during 1948 were the South Long Horn field in Duval County, the San Pablo field in Jim Hogg County, and the Quien Sabe field in Webb County. Of particular significance is the tremendous development and utilization of casing-head gas and free gas in the production of light hydrocarbons. It is anticipated that this type of operation will continue to show even greater gains in future.

West Texas.—Crude production soared to 274.8 million barrels in 1948, a gain of 51.9 million barrels contrasted with 1947. Many counties scored large gains in production; the leaders, with increases in millions of barrels, were: Ector 17.1, Hockley 9.7, Andrews 8.6, Gaines-Yoakum 5.5, Pecos 2.6, and Winkler 1.7.

Drilling activity increased sharply in 1948. Oil-well completions totaled 2,756, representing an increase of approximately 40 percent over 1947. Dry holes drilled numbered 464. However, wildcats were responsible for 107 discoveries, as follows: 46 new fields, 20 new pools, 4 deeper pools, 5 shallow pools, and 32 outposts. Greatest drilling activity was centered in the Levelland oil field in Cochran and Hockley Counties, where 531 wells were producers. Next in importance were the Toborg and Sharon Ridge fields.

Virginia.—Crude production in Virginia dropped abruptly from 61,000 barrels in 1947 to 33,000 barrels in 1948, as production declined in the Rose Hill field in the southwestern part of the State, the only commercial producing oil field. An important discovery was made in Buchanan County, where the Union Producing Co.–Ritter Lumber V–1 obtained gas from Mississippian rocks at a depth of 2,301 feet.

West Virginia.—Oil production in West Virginia increased slightly in 1948, when output totaled almost 2.7 million barrels, a gain of 70,000 barrels over the preceding year. Wells drilled in 1948 totaled 843 in contrast with 880 during 1947. Of the 843 wells drilled, 535 were completed as gas wells, 148 oil wells, and 160 dry holes. During the year, 1,132 wells were abandoned. There are approximately 40 producing wells in the Silverton oil field in Jackson County, discovered in 1947, and the daily initial production averaged 40 barrels.

Production of crude petroleum in West Virginia, 1944–48, by months

[Thousands of barrels]

Year	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total
1944	259	254	270	249	280	258	224	293	252	264	248	219	3,070

[1] Subject to revision.

Wyoming.—All previous Wyoming production records were shattered in 1948, when 54.0 million barrels were produced, surpassing the 1947 total by 9.2 million barrels. Largest gains were registered in the Big Sand Draw, Elk Basin, Hamilton Dome, Lost Soldier-Ferris-Wertz, and Steamboat Butte fields.

During 1948, 584 wells were drilled, including 394 oil wells. A break-down of the exploratory wells indicates the following: 14 new fields, 3 new pools, 3 shallower pools, 13 deeper pools, 11 outposts, and 183 dry holes. During 1948 Wyoming was the center of intensive exploratory drilling in the Rocky Mountain region.

Three outstanding discoveries were made in 1948. The Seaboard Oil Co. discovery in Park County found production in the Phosphoria formation at 8,496–8,550 feet; two other pay horizons were located later in the Frontier and Tensleep formations. Pure Oil Co. struck oil in the West Poison Spider field in Natrona County in the Frontier formation at 14,309 feet—the deepest producer in the Rocky Mountain region. An extension one-half mile northwest of the strike located oil in the Mesa Verde formation at 9,230 feet, opening up new possibilities in the area.

The Sinclair Wyoming Oil Co. discovered deeper pay horizons on the Lost Soldier and Wertz structures in Sweetwater County. Of special importance was the finding of oil in the Deadwood formation, which is reported as the first commercial production in the Rocky Mountain area from rocks of Cambrian age.

WELLS

The number of wells drilled in the United States, including oil and gas wells and dry holes, increased from 30,842 in 1947 to 37,508 in 1948.

Oil-well completions rose 25 percent from 17,999 in 1947 to 22,585 in 1948, dry holes increased from 9,538 in 1947 to 12,026 in 1948, and the number of gas wells completed declined from 3,305 in 1947 to 2,897 in 1948. The number of oil wells completed in 1948 represented about 60 percent of the total wells drilled, dry holes constituted 32 percent, and gas wells completed were about 8 percent of the total.

The increase of 4,586 in total oil wells completed in 1948 compared with 1947 included increases of 1,807 in oil wells completed in Texas, 756 in California, 516 in Louisiana, 428 in Oklahoma, and 374 in Kansas.

The annual survey of the total number of producing oil wells in the United States indicated 426,280 wells on December 31, 1947, compared with 421,460 wells on December 31, 1946.

CONSUMPTION AND DISTRIBUTION

The increase of 9 percent in domestic crude production and the gain of 32 percent in the amount of crude oil imported provided a new supply in 1948 sufficient to cover an increase of 25.6 million barrels in crude stocks and meet an indicated demand for 2,119.8 million barrels or 8 percent more crude than in 1947. Furthermore, the increase of 79.6 million barrels of refined stocks in 1948 indicated that the demand for crude oil was inflated above actual requirements.

The indicated demand for domestic crude oil rose from 1,856.5 million barrels in 1947 to 1,994.8 million in 1948—a gain in average requirements of 364,000 barrels daily or 7 percent compared with 1947. The indicated demand for foreign crude oil rose from 97.6 million barrels in 1947 to 125.0 million in 1948—a gain of 28 percent. The demand for foreign crude oil represented 6 percent of the total in 1948 compared with 5 percent in 1947.

Of the total demand for crude oil in 1948—2,119.8 million barrels—the quantity of crude run to stills at refineries was 2,030.7 million barrels, or 96 percent of the total, and all other crude used amounted to 89.1 million barrels, or 4 percent of the total. Crude exports declined from 46.4 million barrels in 1947 to 39.8 million in 1948; crude transfers to fuel oils decreased from 30.4 million in 1947 to 27.4 million in 1948; and other crude used for fuel or lost declined from 25.1 million barrels in 1947 to 21.9 million in 1948.

Runs to Stills.—Total crude oil run to stills amounted to 2,030.7 million barrels in 1948, an average of 5,548,000 barrels daily, compared with 1,852.2 million barrels (5,075,000 barrels daily) in 1947. The increase in total runs amounted to 178.4 million barrels (473,000 barrels daily) and was 9 percent above the previous record in 1947.

Every refinery district except the Appalachian showed a substantial

[1] Subject to revision.

gain in total crude runs in 1948 compared with 1947. The principal increases by refinery districts in 1948 were gains of 72.6 million barrels in the Texas Gulf, 30.9 million in the Indiana-Illinois district, 19.9 million in the East Coast, 19.3 million in the Louisiana Gulf, 12.2 million in the Oklahoma-Kansas district, and 8.8 million barrels in the California district.

Distribution.—The demand for domestic crude petroleum is affected by total imports, the production of other light oils, and the relation of indicated crude demand to actual requirements that must be considered in the light of changes in stocks of refined oils. The total demand for domestic crude petroleum set a new record in 1948, increasing from 1,856.5 million barrels in 1947 to 1,994.8 million in 1948. This demand was met by a production of 2,016.3 million barrels of domestic crude oil, 21.5 million of which was added to stocks. The supply of domestic crude oil was supplemented by a consumption of 125.0 million barrels of foreign crude oil—a gain of 27.4 million compared with 1947. Imports of refined products, mostly residual fuel oil, decreased from 61.9 million barrels in 1947 to 58.6 million in 1948. Stocks of refined products, however, increased 79.6 million barrels in 1948 compared with a decline of 4.8 million in 1947. The production of light liquids from natural gas increased from 132.9 million barrels in 1947 to 145.8 million in 1948.

[2] Missouri, Tennessee, and Virginia.

The Bureau of Mines collects data relating to the receipts of domestic and foreign crude petroleum at refineries in the United States. These receipts provide the crude run to stills at refineries, small amounts of crude used for refinery fuel, and the changes in crude stocks at refineries. Classification of the receipts by States of origin shows the amount received from local production (intrastate), receipts from other States (interstate), and receipts of imported crude. The classification of receipts by methods of transportation indicates the final receipts by boat, pipe line, or tank cars and trucks. The domestic receipts by boat were in most instances originally moved by pipe line from the point of production to the point of shipment by boat.

Receipts of domestic and foreign crude petroleum at refineries increased from 1,855.6 million barrels in 1947 to 2,046.6 million in 1948—a gain of 191.0 million barrels.

These receipts provided for total runs to stills of 2,030.7 million barrels, fuel use and losses of 7.3 million, and an increase of 8.6 million barrels in crude stocks. Receipts of foreign crude oil increased from 97.5 million barrels in 1947 to 129.1 million in 1948 and represented 5.3 percent of total receipts in 1947 and 6.3 percent in 1948; interstate receipts of domestic crude rose from 716.8 million in 1947 to 787.9 million in 1948 and represented 38.6 percent of the total receipts in 1947 and 38.5 percent in 1948; and intrastate receipts of domestic crude were 1,041.3 million barrels in 1947 and 1,129.6 million in 1948 and represented 56.1 percent of the total receipts in 1947 and 55.2 percent in 1948.

Refinery receipts of crude petroleum in 1948, by methods of transportation, indicated that 72.0 percent of the total was delivered by pipe lines in 1948 compared with 73.4 percent in 1947; that 25.2 percent was delivered by boat compared with 24.1 percent in 1947; and that 2.8 percent was delivered by tank cars and trucks in 1948 compared with 2.5 percent in 1947.

Receipts of crude petroleum at refineries in the United States, 1944–48, by methods of transportation

[Millions of barrels]

Method of transportation	1944	1945	1946	1947	1948 [1]
By boat:

Grand total	1,688.5	1,723.9	1,737.2	1,855.6	2,046.6

[1] Subject to revision.

Total deliveries to refineries by boat were 515.1 million barrels in 1948. The delivery of foreign crude totaled 129.1 million barrels, of which 123.6 million went to the east coast and 5.5 million to the Gulf coast. The interstate movement of domestic crude oil by boat amounted to 265.1 million barrels, including 193.0 million barrels shipped from the Gulf coast to the east coast, 56.6 million barrels of exchanges by boat between the Texas Gulf and Louisiana Gulf coast ports, and a balance of 15.5 million barrels for all other interstate boat shipments, of which 13.4 million represented river shipments to Kentucky refineries. The intrastate deliveries by boat amounted to 120.9 million barrels in 1948, including 48.0 million barrels in California, 44.5 million barrels delivered by boat in the Texas Gulf, 25.4 million delivered in the Louisiana Gulf, and only 3.0 million barrels of intrastate deliveries by boat in all other districts.

East coast refineries received 321.7 million barrels of crude oil in 1948, of which 123.6 million was foreign crude and 198.1 million domestic crude. The receipts of domestic crude oil included 193.0 million barrels by interstate boat movements and 5.1 million barrels by pipe line and tank car from Pennsylvania, New Mexico, and Florida. Receipts by interstate boat movements included 172.1 million barrels of Texas crude, 10.5 million of Louisiana crude, 6.9 million of Mississippi crude, 2.2 million of Oklahoma crude, and 1.3 million New Mexico crude. The east coast refineries are predominantly supplied by boat movements of crude oil; the east coast is the primary area in which domestic crude oil from the Gulf Coast States comes into direct competition with imports of foreign crude oil. The output of refineries in the east coast was further supplemented by large shipments of products from the Gulf coast refineries; this region also received most of the imports of refined products.

The total demand for domestic crude oil in 1948 was 1,994.8 million barrels, an increase of 138.3 million compared with 1947. The principal changes in the market demand for domesic crude petroleum by States of origin (computed from production and changes in crude stocks by origin) in 1948 compared with 1947 were gains of 87.4 million barrels for Texas, 18.8 million for Louisiana, 10.5 million for Mississippi, 8.9 million for Oklahoma, 6.5 million for New Mexico, 5.7 million for California, and 3.3 million barrels for Kansas. The principal declines in demand were 10.4 million barrels for Illinois, 1.5 million for Kentucky, and 0.6 million for Pennsylvania.

The market demand for Texas crude oil increased from 810.6 million barrels in 1947 to 898.0 million in 1948, and 5.3 million barrels were added to stocks of Texas crude oil. The relative contribution of Texas to the total demand for domestic crude oil was 43.8 percent in 1946, 43.7 percent in 1947, and 45.0 percent in 1948. The wide distribution of Texas crude oil means a large increase in demand in periods of rising demand and, if total demand declines sharply, Texas probably would suffer most of it. In 1948 deliveries of Texas crude oil to domestic refineries totaled 883.5 million barrels, including 495.6 million delivered to refineries within the State and 387.9 million moved to refineries in other States. Shipments to east coast refineries amounted to 172 million barrels and declined about 1 percent compared with 1947. Deliveries to refineries in Indiana, Illinois, Ohio, and Michigan were about 130 million barrels in 1948 compared with 107 million in 1947. Almost 52 million barrels of Texas crude was delivered to Louisiana refineries in 1948; about 26 million barrels were sent to refineries in Missouri, Oklahoma, and Kansas and about 7 million barrels to refineries in the Appalachian district.

California ranked second as a source of crude-oil supply in the United States, with a market demand of 336.6 million barrels in 1948 and an increase of 3.5 million barrels in crude stocks of California origin. California supplied 17.9 percent of the total demand for domestic crude oil in 1946, 17.8 percent in 1947, and 16.9 percent in 1948. The total distribution of California crude in 1948 included deliveries of 315 million barrels to refineries within the State and transfers of 19 million barrels for use directly for fuel without refining; the balance represented exports of crude oil to Canada and losses. California oil supplies most of the requirements in the Pacific Coast States and some exports to foreign markets in the Pacific. A substantial proportion of the naval requirements for fuel oil is purchased in California, and much of the fuel oil used by railroads crossing the mountains to the east is supplied from there. Within the State, oil competes with natural gas and power from hydroelectric plants.

Louisiana was the third-largest source of domestic crude-oil supply in 1948, with a production of 181.2 million barrels, increase in stocks of 2.0 million, and a market demand of 179.1 million. Louisiana contributed 8.4 percent of the total market demand for domestic crude in 1946, 8.6 percent in 1947, and 9.0 percent in 1948. Of the total deliveries of Louisiana crude to refineries in 1948, about half was sent to refineries within the State, and the balance was delivered to refineries in other States The largest outside market was in Texas, with deliveries of 59 million barrels in 1948, and the remaining interstate shipments of Louisiana crude are divided about equally between the east coast and the upper Middle West.

Oklahoma ranked fourth in supplying the demand for domestic crude oil in 1948. The relative percentage of the total, however, declined from 8.1 percent in 1946 to 7.8 percent in 1947 and 7.7 percent in 1948. Production in 1948 amounted to 154.0 million barrels, with an increase in stocks of 0.8 million and a market demand of 153.2 million. Of the 148 million barrels delivered to refineries in 1948, almost 66 million went to refineries within the State. The principal shipments of crude to other States were 25 milloin barrels to refineries in Illinois-Minnesota-Wisconsin, 24 million to Indiana, 13 million to Ohio, and 7 million to Kansas-Nebraska. Considering the fact that there is a large northward pipe-line movement of crude oil from Texas, Louisiana, Arkansas, Mississippi, and New Mexico, the demand for Oklahoma crude oil is primarily in the upper Middle West and adjacent sections of Canada.

Kansas ranked fifth as a source of domestic crude supply in 1948. The percentage of the total demand for domestic crude oil supplied by the State rose from 5.6 percent in 1946 to 5.7 percent in 1947 and declined to 5.5 percent in 1948. Crude production amounted to 110.8 million barrels in 1948, with 1.3 million barrels added to stocks and a market demand of 109.5 million barrels. About 54 million barrels of Kansas crude were delivered to refineries within the State, and the most important shipments to refineries in other States were 18 million barrels to Illinois, 13 million to Indiana, and 9 million to refineries in Oklahoma.

Daily average demand for total crude petroleum in the United States in 1947–48 by States of origin and by months

[1] Subject to revision. [2] American Petroleum Institute.

Illinois was the sixth-largest supplier of domestic crude oil in 1948. Production totaled 64.7 million barrels, with an increase in stocks of 3.3 million and a market demand of 61.4 million in 1948. The sharp drop in the State's production has resulted in a decline in the market demand for Illinois crude from 4.4 percent of the national total in 1946 to 3.9 percent in 1947 and 3.1 percent in 1948. Deliveries to refineries in Illinois amounted to 24 million barrels in 1948, and deliveries to other States were 37 million barrels, including delivery of 26 million barrels to refineries in Ohio, 4 million to New York, and most of the remainder to Indiana, Kentucky, and Michigan.

Wyoming was the seventh State in importance as a source of domestic crude oil in 1948 and for the first time was included in the group of States producing more than 50 million barrels a year. Production in 1948 totaled 54.0 million barrels, with 3.0 million added to stocks and 51.0 million representing market demand. Wyoming supplied 2.6 percent of the total demand for domestic crude in 1948 compared with 2.1 percent in 1946. Deliveries to refineries in 1948 included 27 million barrels to refineries within the State and 24 million to refineries in other States. About half of the total outside shipments went to adjacent States and the other half to Illinois, Indiana, and Michigan.

The seven States included in this review supplied 90.4 percent of the total market demand for domestic crude in 1946, 89.9 percent in 1947, and 89.7 percent in 1948.

STOCKS

Changes in the stocks of all oils are an essential indication of the relation between supply and demand. The increase of 43.5 million barrels in total stocks in 1946 indicated the necessity of a larger supply of oil to rebuild depleted stocks required in the distribution of civilian requirements. At the same time, surplus stocks in military custody, not included in stocks reported to the Bureau of Mines, were in process of liquidation. In 1947 the decline of 5.0 million barrels in total stocks reflected the rapid expansion in demand and the limitation of available refinery capacity. The increase of 106.5 million barrels in total stocks in 1948 was related to the improvement in facilities available for production and refining and a slower relative rate of growth in total oil demand accentuated by abnormally mild weather at the end of the year.

Stocks of crude petroleum, natural gasoline, and refined products in the United States at end of year, 1944–48

[Thousands of barrels]

Product	1944	1945	1946	1947	1948 [1]

[1] Subject to revision.
[2] New basis comparable with succeeding years.

Total stocks of all oils totaled 607.3 million barrels on December 31, 1948, compared with the new basis of 500.8 million barrels on December 31, 1947. The increase of 106.5 million barrels during the year included an increase of 25.6 million in crude stocks, a gain of 1.3 million in natural-gasoline stocks, and an increase of 79.6 million in stocks of refined products.

Stocks of refined products amounted to 345.5 million barrels on December 31, 1948, compared with the new basis of 265.9 million on December 31, 1947. The total increase of 79.6 million barrels during the year included gains of 29.8 million barrels in residual fuel-oil stocks, 24.9 million in distillate fuel-oil stocks, 12.3 million in stocks of finished gasoline, 6.3 million in kerosine stocks, and 6.3 million barrels in all other stocks.

Stocks of crude petroleum in the United States in 1948, by location and by months [1]

[1] Excludes stocks of California heavy crude.
[2] Subject to revision.
[3] Final figures.

Total stocks of crude petroleum amounted to 256.3 million barrels on December 31, 1948. The increase of 25.6 million barrels during the year included a gain of 4.1 million in stocks of foreign crude oil and an increase of 21.5 million in stocks of domestic crude oil. The principal gains in domestic crude stocks in 1948, by States of origin, were 5.3 million barrels for Texas, 3.5 million for California, 3.3 million for Illinois, 3.0 million for Wyoming, 2.0 million for Louisiana, and 1.3 million for Kansas. A very unusual factor was an increase in crude stocks originating in every important producing State.

PRICES AND VALUE

The average value of crude petroleum at the well, as reported in the annual survey of the Bureau of Mines, rose from $1.41 per barrel in 1946 to $1.93 per barrel in 1947. The results of the 1948 survey are not yet available, but the average value at the well in 1948 is estimated at $2.58 per barrel. There were no general changes in the posted prices of crude oil except a reduction in some types of Pennsylvania Grade oil in December. The posted price per barrel for the Bradford and Allegany districts was reduced from $5.00 to $4.50 on December 11, 1948, and the posted price in Southwest Pennsylvania pipe lines was reduced from $4.79 per barrel to $4.29 on December 11 and further reduced to $4.10 per barrel on December 31, 1948.

REFINED PRODUCTS

GENERAL REVIEW

The total demand for all oils averaged 6,129,000 barrels daily in 1948, an increase of 4 percent compared with 1947. This increase was substantially less than had been expected, particularly in the latter half of the year, when there was a relative decline in the rate of increase accentuated by abnormally mild weather in the last quarter. Crude runs to stills reached a peak in the last quarter of 1948 and, combined with a much lower demand than expected, resulted in an abnormal increase in refined stocks of 21.2 million barrels in the last quarter.

Runs to stills and production at refineries in the United States of the various refined petroleum products, 1944–48

[1] Subject to revision.
[2] Conversion factors: 280 pounds of wax to the barrel, 5.0 barrels of coke to the short ton, 5.5 barrels of asphalt to the short ton, 3,600 cubic feet of still gas to the barrel.
[3] Negative quantity; represents net excess of unfinished oils rerun over unfinished oils produced.

The 4-percent increase in total demand in 1948 included an 8-percent gain in motor-fuel demand compared with 1947, a 3-percent decline in residual fuel-oil demand, a 10-percent increase in distillate fuel-oil demand, a 5-percent gain in kerosine demand, and a 0.4-percent decline in the demand for all other products.

A decline of almost 20 percent in the exports of refined products substantially changed the relative gains in domestic demand. With a total increase in domestic demand of 6 percent compared with 1947, the domestic demand for motor fuel increased 9 percent, residual demand declined 4 percent, distillate demand increased 14 percent, kerosine demand rose 9 percent, and the domestic demand for all other oils gained 3 percent.

The supply of refined products is directly related to the volume of refinery output from crude oil, the production of light products derived from natural gas at natural-gasoline and cycle plants, and the imports of refined products.

Refineries operated close to capacity during most of 1948, with total crude runs to stills averaging 5,548,000 barrels daily compared with 5,075,000 barrels daily in 1947—a gain of 9 percent. Runs in the first quarter averaged 5,372,000 barrels daily, rose to 5,614,000 barrels daily in the second quarter under the stimulus of rebuilding stocks of heating oils depleted by the cold winter of 1947–48, were cut back to 5,544,000 barrels daily in the third quarter due largely to an extended strike at refineries in California in September, and reached a record level of 5,662,000 barrels daily in the fourth quarter. This high rate of refinery operations was stimulated by the determination to avoid any possibility of a shortage in oil supply such as occurred, at least locally, in the first quarter of 1948. An unexpected drop in the rate of increasing demand occurred in the latter part of the year, accentuated by abnormally warm fall and winter weather. Stocks of refined products increased by 79.6 million barrels during the year. A decrease of 13.4 million barrels in the first quarter was followed by increases of 33.6 million in the second quarter, 38.2 million in the third quarter, and 21.2 million in the fourth quarter. The large gain in stocks of refined products in the last quarter, when normally a substantial decline may be expected, resulted in such a large surplus of stocks at the end of the year as to distort normal runs and yields during much of 1949.

The output of light products at natural-gasoline and cycle plants increased from 132.2 million barrels in 1947 to 145.5 million in 1948—a gain of about 10 percent on a daily average basis. In addition, some motor benzol from coke-oven operations was blended with motor fuel, amounting to 0.7 million barrels in 1947 and 0.4 million in 1948. The light products in this group marketed in 1948 amounted to 144.6 million barrels, with about 70 percent of the total included in motor fuel, 29 percent sold as liquefied petroleum gases (LP–gases) for fuel and chemical uses, and 1 percent transferred to other products.

Salient statistics of the major refined petroleum products in the United States, 1944–48

[1] Subject to revision.
[2] Figure on new basis that excludes distributors' stocks in California and is comparable with 1948 total. Figures for 1947 on the old basis and comparable with preceding years are as follows, in thousands of barrels: Lubricating oil, 8,624; asphalt, 4,021; and other finished products, 1,107.
[3] Liquefied refinery gases.
[4] Liquefied petroleum gases.
[5] Negative quantity; represents net excess of unfinished oils produced over unfinished oils rerun.

Imports of refined products into continental United States declined from 61.9 million barrels in 1947 to 58.6 million in 1948. Residual fuel oil is the major product imported, amountng to 54.2 million barrels in 1947 and 53.2 million in 1948. Most of this residual fuel oil is withdrawn from bond duty free for use in bunkering ships engaged in the foreign trade. Other imports in 1948 included 2.5 million barrels of distillate fuel oil, 1.4 million barrels of asphalt, 1.0 million barrels of unfinished oils, 0.3 million barrels of gasoline, and small amounts of kerosine, lubricating oils, and wax.

The yields of refined products from crude oil are normally the resultant of the amount of crude oil run and the shift in the relative demand for the various refined products. In 1948 the unusual increase of almost 80 million barrels in the stocks of refined products

[2] Not separated in 1947–48.
[3] Less than 0.1 percent.
[4] Negative percentage; represents excess rerun over produced.
[5] Added to finished gasoline production in computing yields in 1947–48.
[6] Added to crude runs in computing yields in 1947–48.

tended to distort yields to meet an expected rather than an actual demand. There was a small increase in the yield of gasoline from 40.2 percent in 1947 to 40.3 percent in 1948; the yield of residual fuel oil declined from 24.1 percent in 1947 to 23.0 percent in 1948; the yield of distillate fuel oil increased from 16.8 percent in 1947 to 18.7 percent in 1948; and the yield of kerosine remained at 6.0 percent for both years. If crude runs had been better-adjusted to actual demand, allowing for a moderate increase in refined stocks, the principal adjustments in yields would have been an increase for gasoline and a decrease for distillate fuel oil.

The average increase in the value of crude oil at the well—about 65 cents per barrel in 1948—was reflected in price increases for the principal refined products. The average price of Regular Grade gasoline at Oklahoma refineries rose from 8.42 cents per gallon in 1947 to 11.19 cents in 1948. The average tank-wagon price of kerosine at Chicago rose from 13.40 cents per gallon in 1947 to 15.85 cents in 1948. The average price of a selected bright at Oklahoma refineries rose from 28.84 cents per gallon in 1947 to 31.67 cents in 1948. The price of Bunker "C" oil at New York rose from $2.29 per barrel in 1947 to $3.00 in 1948. The price of No. 2 distillate heating oil at New York rose from 7.02 cents per gallon in 1947 to 9.71 cents in 1948.

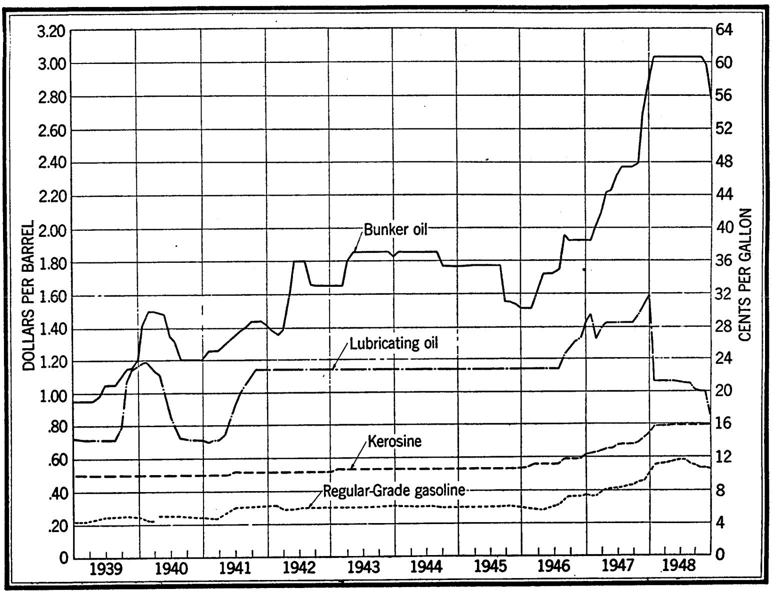

FIGURE 7.—Prices of Bunker "C" oil at New York Harbor, bright stock at Oklahoma refineries, tank-wagon prices of kerosine at Chicago, and Regular Grade gasoline at refineries in Oklahoma, 1939–48, by months.

[4] Subject to revision.

The total reported crude-oil capacity of refineries increased from 6,034,252 barrels daily on January 1, 1948, to 6,438,995 barrels daily at the end of the year—a gain of 404,743 barrels daily. The total capacity in operation rose from 5,825,566 barrels daily on January 1, 1948, to 6,230,505 at the end of the year. The capacity of all shutdown units on January 1, 1948, was 208,686 barrels daily and 208,490 at the end of the year. The total capacity being built on January 1, 1948, was reported at 367,250 barrels daily compared with 341,500 barrels daily at the end of the year. These figures indicate a gain of almost 7 percent on total crude-oil capacity during 1948. Considering this increase in capacity, the large increase in the stocks of refined products in 1948, and the program for further building, there would appear to be ample refinery capacity to meet all requirements in the next few years.

Petroleum-refinery capacity in the United States, Jan. 1, 1944–49

Year	Number of refineries				Capacity (barrels per day)			
	Operating	Shut down	Total	Building	Operating	Shut down	Total	Building
1944	384	68	452		4,709,382	383,641	5,093,023	118,270
1945	380	33	413	1	5,077,690	223,463	5,301,153	36,075
1946	364	29	393	1	5,086,165	229,691	5,315,856	53,100
1947	361	38	399		5,336,399	233,083	5,569,482	162,200
1948	352	38	390	2	5,825,566	208,686	6,034,252	367,250
1949	336	39	375	3	6,230,505	208,490	6,438,995	341,500

Pipe Lines.—Crude-oil lines up to 24 inches in diameter are adding to the efficiency of trunk systems connecting the fields of the Southwest to the refining centers of the Middle West and East. The Big Inch lines, with their specially designed pumping equipment, are establishing new standards in operation, and eventually there will be general replacement of the 6-, 8-, and 10-inch lines on which the industry's transportation was founded and expanded for many years.

One of the largest crude pipe lines completed in 1948 was that of Magnolia Pipe Line Co. It is a 20-inch line from Corsicana, Tex., to Patoka, Ill., a distance of 648 miles, and has a daily capacity of 100,000 barrels. Of special significance is the simplicity of the station design, coupled with efficient and reliable operation. The entire line is operated as a closed system, with oil movements directed by the chief dispatcher using telephone communication exclusively. This and other 1948 crude-oil pipe-line construction projects provided a significantly increased capacity to transport oil from southwestern producing fields to refineries in the Great Lakes region. By this means a condition of scarcity of crude-oil supplies that developed in 1947 as a result of declining local production and rapidly growing consumption of refined products in the area was eliminated.

883326—50——62

A decided trend toward construction of products pipe lines by many oil companies has been evident in recent years to facilitate distribution of refined petroleum products to markets. A typical example is the 2,800-mile products line system of Sinclair Refining Co. from Houston, Tex., to Marcus Hook, Pa. The system is so designed that the direction of flow in certain portions of the line may be reversed at will to balance efficiently variations in demand for products, due to seasonal and other factors, and the supply from refining centers.

AVIATION GASOLINE

The total demand for aviation-grade gasoline rose from 15.2 million barrels in 1946 to 26.7 million in 1947 and 43.0 million in 1948. Exports increased from 2.3 million barrels in 1946 to 5.1 million in 1947 and 6.3 million in 1948. Domestic demand in continental United States increased from 12.9 million barrels in 1946 to 21.6 million in 1947 and 36.6 million in 1948. Domestic demand included reported deliveries to all military agencies of 1.0 million barrels in 1946, 7.1 million in 1947, and 17.6 million in 1948. As reported stocks represent only those in the custody of producers, indicated demand covers only new sales to consumers. Large stocks in military custody at the end of 1945 were in process of liquidation during 1946 and part of 1947.

The total demand for grades of 100-octane and above amounted to 5.8 million barrels in 1946, 16.5 million in 1947, and 33.2 million in 1948. Virtually all of the increase in demand has been in these grades, as the total demand for all other grades (including components marketed as such) amounted to 9.4 million barrels in 1946 and showed a small gain to 10.2 million in 1947 and a slight decline to 9.8 million in 1948.

The total demand for all motor fuel increased 66.1 million barrels in 1948 compared with 1947; this increase included the gain of 16.3 million barrels in the total demand for aviation grades of gasoline.

Aviation gasoline is discussed separately because of the special interest in this type of fuel. All aviation-gasoline figures are included in the total figures for motor fuel and gasoline in this report. The figures for aviation gasoline represent the amounts so identified and reported by the producing companies and do not include the consumption of regular automotive types of gasoline that may be used by many small planes. It should be noted that, in the production figures for aviation gasoline, the item "transfers out" represents rejected materials returned to regular grades of gasoline and that this item is subtracted from the gross production figure to determine net production of marketable grades.

MOTOR FUEL

The total demand for motor fuel set a new record of 908.6 million barrels in 1948 compared with 842.5 million in 1947—an increase of 66.1 million or 8 percent on a daily average basis. Exports declined sharply from 47.4 million barrels in 1947 to 37.4 million in 1948, but domestic demand in continental United States rose from 795.0 million barrels in 1947 to 871.2 million in 1948—a gain of 76.2 million or 9 percent on a daily average basis.

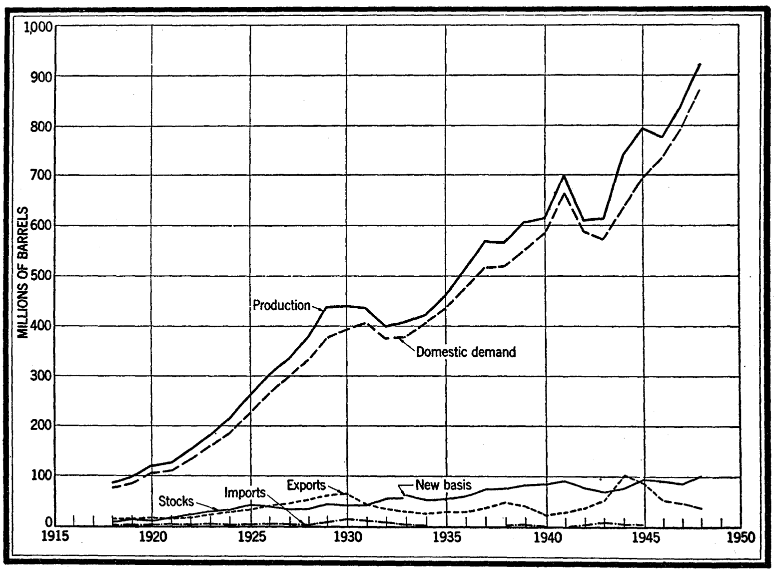

FIGURE 8.—Trends of production, domestic demand, exports, imports, and stocks of motor fuel in the United States, 1918–48

Production.—The total production of motor fuel rose from 840.0 million barrels in 1947 to 921.9 million in 1948. Production in 1948 included an output of 819.7 million barrels of gasoline and naphtha from crude oil at refineries at a yield of 40.3 percent and an output of motor fuel from other light oils amounting to 102.2 million barrels. The latter figure was obtained by adding the total production of light oils from natural gas to the small amount of motor benzol derived from coke ovens and subtracting the amounts of light oils sold as LP–gases and transferred to miscellaneous products, and a relatively small amount of other products transferred to unfinished oils. The production of these other light oils totaled 145.8 million barrels in 1948, and transfers to products other than motor fuel totaled 43.6 million barrels, leaving the net production included in motor fuel of 102.2 million barrels.

Refinery output of gasoline and naphtha in 1948 totaled 895.9 million barrels, including the output of 819.7 million barrels from crude oil and 76.2 million barrels of the other light oils shipped to refineries for blending.

The remainder of the light oils included in motor-fuel production (26.0 million barrels) were used as motor fuel or blended with gasoline outside refineries, exported, added to storage, or represented losses or shrinkage in production.

Yields.—The average refinery yield of gasoline and naphtha from crude oil reached a high of 45.0 percent in 1939. The yield was reduced substantially during the war to a minimum of 37.1 percent in 1943 but rose to 40.9 percent in 1945, when the output of aviation gasoline was at a maximum. It dropped to 39.6 percent in 1946 and rose to 40.2 percent in 1947 and 40.3 percent in 1948.

The domestic demand for motor fuel showed a relatively greater gain in 1948, whereas the demand for all other major products showed smaller relative gains than in 1947. The increase of 15.0 million barrels in the domestic demand for aviation grades of gasoline in 1948 was an essential factor in the larger demand.

[1] Subject to revision.

[2] Based on crude runs to stills adjusted for net unfinished.

Domestic Demand.—The domestic demand for motor fuel set a new record in 1948, increasing from 795.0 million barrels in 1947 to 871.2 million in 1948. Demand in 1947 represented a gain of 8 percent compared with 1946, and demand in 1948 increased 9 percent compared with 1947 on a daily average basis.

The average domestic demand for motor fuel rose from 2,178,000 barrels daily in 1947 to 2,380,000 barrels daily in 1948. Domestic demand in the first quarter of 1948 averaged 2,044,000 barrels daily (an increase of 10 percent compared with the first quarter of 1947) and represented 21 percent of total domestic demand in 1948. Domestic demand in the second quarter averaged 2,499,000 barrels daily (an increase of 11 percent compared with 1947) and represented 26 percent of the total for 1948. Domestic demand in the third quarter of 1948 averaged 2,586,000 barrels daily (an increase of 10 percent compared with 1947) and was 27 percent of the year's total. In the fourth quarter of 1948 domestic demand for motor fuel averaged 2,390,000 barrels daily (a gain of 7 percent compared with the same period of 1947) and amounted to 25 percent of the total domestic demand in 1948.

The annual survey of the Public Roads Administration includes an analysis of civilian motor-fuel consumption based on the tax returns of the various States. In 1947, this survey showed a total civilian usage of 762.8 million barrels, including a highway use of 671.8 million, nonhighway uses of 82.5 million, and losses of 8.5 million barrels. The increase in highway use was 10 percent compared with 1946. This survey for 1948 showed a total civilian usage of 826.4 million barrels, including a highway use of 725.3 million barrels, nonhighway uses of 92.1 million, and losses of 9 million. The increase in highway use was 8 percent compared with 1947 on a daily average basis. The difference between the total usage shown in these surveys and the Bureau of Mines domestic demand was 32.2 million barrels in 1947 and 44.8 million in 1948. The additional amounts in the Bureau's figures include total deliveries to the armed forces, any losses in production and transportation to the point of tax incidence, and probably some commercial and industrial uses of gasoline and naphtha, not recorded in the exemptions from State taxes.

Production and Consumption by States.—The accompanying table showing the production and consumption of gasoline by States is designed to indicate roughly the areas of surplus production and deficit supply. The refinery production used is compiled from reports to the Bureau of Mines, and the consumption figures are compiled from State tax reports by the American Petroleum Institute. The production figure employed does not include the natural gasoline blended or used outside refineries; and the consumption figure, while including military deliveries, was 25 million barrels less than the total domestic demand figure for 1948.

In 1948 the refinery production figure amounted to 895.9 million barrels and the consumption figure by States to 846.0 million barrels. The production figure includes a considerable part of the gasoline for export and also a considerable volume of gasoline added to storage in 1948.

The Gulf Coast States were the largest surplus producers of gasoline in 1948, with a refinery output of about 348 million barrels and a

6 Idaho and Utah included with Wyoming.
7 Minnesota and Wisconsin included with Illinois.
8 Missouri and Nebraska included with Kansas.
9 Tennessee included with Kentucky.
10 Rhode Island included with Massachusetts.

consumption of only 94 million. The surplus of 254 million barrels give rise to the Gulf to east coast tanker movement (amounting to 146 million barrels in 1948), to some of the largest pipe-line movements to the Middle Western States and to a major part of the gasoline exports.

The Atlantic Coast States produced only 125 million barrels in 1948 but consumed 265 million, with a deficit of 140 million barrels, primarily supplied by the Gulf to east coast tanker movement.

The Mountain States produced 27 million barrels of gasoline in 1948 and consumed 30 million, the deficit being supplied from the East or from California.

The Pacific Coast district, including five States, produced 126 million barrels of gasoline in 1948 and consumed 119 million, the surplus being available for export or shipment to the Mountain States.

The Central States, lying between the districts already discussed, produced 270 million barrels of gasoline in 1948 and consumed 338 million barrels, the deficit being supplied by pipe-line movements, river shipments, and tank-car shipments from other districts.

Methods of Distribution.—Motor fuel delivered from pipe lines in 1948 totaled 290.3 million barrels compared with 244.1 million in 1947. These totals represent about 30 percent of the total refinery production of gasoline in 1947 and over 32 percent in 1948. In the accompanying table, data are presented on a new basis, eliminating intersystem transfers. The total stocks of gasoline held by pipe lines, including working tanks and line fill, were 9.0 million barrels at the beginning of 1948 and 11.3 million at the end of the year. The indicated shortage or loss resulting from the pipe-line movement was

Movement of petroleum products by pipe lines between P. A. W. districts in 1948

[1] The quantities turned into lines and delivered from lines are on a net basis, eliminating intersystem transfers, and are not comparable with data published for previous years.

1.1 million barrels in 1947 and 0.8 million in 1948. The tanker and barge movement of gasoline from the Gulf coast to east coast ports amounted to 132.6 million barrels in 1947 and 145.8 million in 1948.

Stocks.—Stocks of gasoline, as reported, include stocks held at refineries and bulk terminals and by pipe lines but do not include stocks in secondary distribution tanks, in consumers' hands, or in military custody.

Stocks of finished gasoline increased 12.3 million barrels in 1948—from 83.1 million on the first of the year to 95.4 million on December 31, 1948. Stocks of natural gasoline and cycle products increased 1.3 million barrels in 1948—from 4.3 million barrels to 5.6 million on December 31, 1948. Stocks of unfinished gasoline decreased from, 9.2 million barrels on January 1 to 8.3 million on December 31, 1948, a decline of 0.9 million barrels.

The change in finished-gasoline stocks in 1948 by quarters indicates a fairly normal seasonal gain of 20.3 million barrels in the first quarter, a decline of 7.2 million in the second quarter, a rather large decline of 14.0 million in the third quarter, and an unusually large increase of 13.2 million barrels in the fourth quarter. The increase in the last quarter was due primarily to relatively high crude runs combined with large surplus stocks of fuel oils, an abnormally low demand for heating oils, and the maintenance of high gasoline yields.

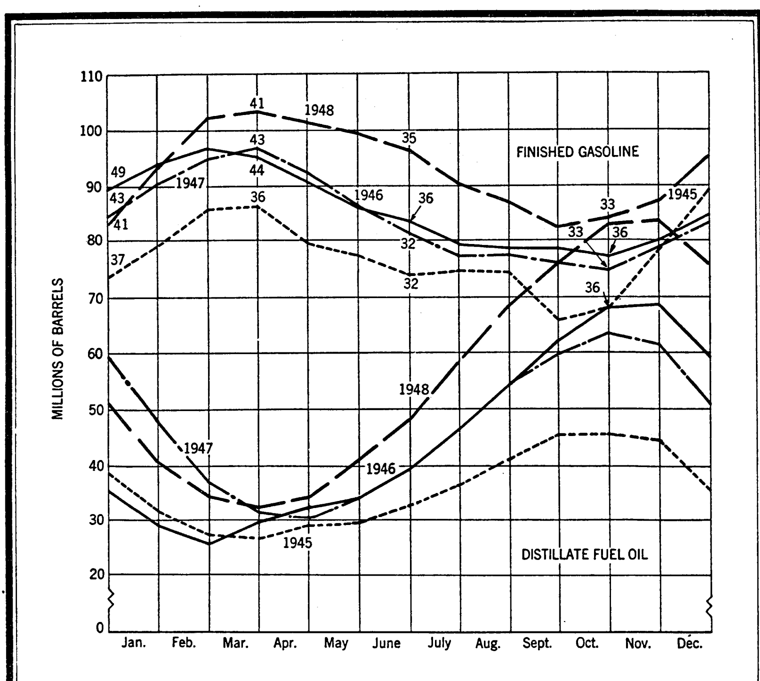

FIGURE 9.—Stocks of finished gasoline in the United States, 1945–48, by months, with figures representing days' supply at certain periods, also stocks of distillate fuel oil, 1945–48, by months.

[1] Subject to revision.

[2] Includes stocks of finished gasoline at refineries, bulk terminals, and in pipe lines.

Stocks of finished and unfinished gasoline increased from 92.3 million barrels on the first of the year to 103.7 million on December 31, 1948—an increase of 11.4 million barrels. The principal changes by refinery districts were gains of 5.3 million in the Indiana-Illinois district, 3.2 million in the East Coast, 2.2 in the Oklahoma-Kansas district, 1.7 million in the Louisiana Gulf district, 1.0 in the Arkansas-Louisiana Inland district, and 0.8 in the Texas Inland district. The only declines were 3.4 million barrels in the California district and 0.4 million in the Texas Gulf district.

Stocks may be expressed in terms of days' supply by dividing the stocks at the end of a month by the daily average total demand for the succeeding month. Using this basis, the stocks of finished gasoline represented 43.4 days' supply in December 1946, 40.5 days' supply in December 1947, and 44.1 days' supply in December 1948.

Days' supply of motor fuel on hand in the United States at end of month, 1946–48 [1]

[2] Subject to revision.

Prices.—Gasoline prices followed the upward trend in crude-oil value in 1948. The average price of 73–75 octane gasoline at Oklahoma refineries rose from 6.31 cents per gallon in 1946 to 8.42 cents in 1947 and to 11.19 cents in 1948. The average in December 1947 was 10.30 cents per gallon; in January 1948 it rose to 11.13 cents and continued a steady rise to a peak of 11.69 cents in June 1948. It then declined to 10.75 cents in October and November, with a further decline to 10.60 cents per gallon in December.

The average dealers' net price for Regular Grade gasoline (exclusive of tax) in 50 representative cities in the United States supplies an index of gasoline prices at the wholesale level. This average price, according to the American Petroleum Institute, rose from 10.40 cents per gallon in 1946 to 12.33 cents in 1947 and 14.55 cents in 1948. Starting at 13.14 cents on December 1, 1947, it rose to 14.42 cents per gallon on January 1, 1948, and reached a peak of 14.66 cents per gallon on December 1, 1948. In this same series, the average service station price, including State and local taxes but not the Federal tax, rose from 19.27 cents per gallon in 1946 to 21.61 cents in 1947 and to 24.38 cents per gallon in 1948. Including the Federal tax of 1.50

cents per gallon, the total average price to the consumer for Regular Grade gasoline rose from 20.77 cents a gallon in 1946 to 23.11 cents in 1947 and to 25.88 cents per gallon in 1948. The average of all taxes for the year, shown in the survey of 50 cities, was 6.08 cents per gallon in 1946, 6.18 cents in 1947, and 6.34 cents in 1948. Since there was no change in the Federal tax during the period, the small increase was in State and local taxes.

Average monthly prices of gasoline in the United States, 1947–48, in cents per gallon

[1] National Petroleum News.
[2] American Petroleum Institute; compiled by the Texas Co.

Exports.—Exports of motor fuel, including shipments to noncontiguous Territories, rose from 45.3 million barrels in 1946 to 47.4 million in 1947 and declined sharply to 37.4 million in 1948. The exports of aviation gasoline, included in the total, amounted to 5.1 million barrels in 1947 and 6.3 million in 1948. Shipments to noncontiguous Territories, also included in the total, were 5.0 million barrels in 1947 and 4.8 million in 1948. Gasoline exports to foreign countries were 32.6 million barrels in 1948 compared with 42.5 million in 1947—a decline of 9.9 million barrels.

KEROSINE AND RANGE OIL

The production of kerosine in 1948 was not only sufficient to satisfy an expanded domestic demand and export market, but enough was also made to add a considerable quantity to storage. Only 135,000 barrels of kerosine were imported during the year.

Kerosine produced in 1948 totaled 121,853,000 barrels, a sharp upward trend over the 1947 output of 110,412,000 barrels. The large increased production of kerosine in 1948 was due chiefly to the increased runs of crude at refineries, as there was no improvement in the percentage yield, which has remained at 6.0 percent since 1946.

All refinery areas reported gains, except the California district, where the reduction in output was due largely to the strike in September and October 1948, and the Texas Inland district. The more important percentage increases were noted in the East Coast, Indiana–Illinois–Kentucky, and the Texas Gulf Coast refinery districts. The largest gain of 1948 was reported for the East Coast area, where the output of kerosine increased 19 percent. Other big increases in kerosine production were recorded for the Indiana–Illinois–Kentucky district—a gain of almost 19 percent—and for the Texas Gulf Coast district where the 1948 total was 11 percent over the output for 1947. Texas Gulf Coast continued to lead in the volume of kerosine production with about 38 million barrels, followed by Indiana–Illinois–Kentucky, with an output of about 22 million barrels. The Louisiana Gulf Coast area is also a source of relatively important quantities of kerosine with over 18 million barrels, and East Coast area, with 17 million barrels in 1948.

Salient statistics of kerosine in the United States, 1947–48, by months and districts

[1] Subject to revision.
[2] Figures not available.

A 15-percent increase in the domestic demand for kerosine reported for 1947 declined to 9 percent in 1948, when indicated deliveries were 112,165,000 barrels compared with 102,519,000 barrels in 1947. However, the kerosine market declined in early 1949. The annual demand for kerosine cannot be presented by refinery districts, because data on shipments and receipts, as well as the imports and exports for each respective area, are not available.

Exports of kerosine have declined noticeably in the past 2 years, as the 1948 total (3,535,000 barrels) was 51 percent less than the corresponding foreign demand of 7,252,000 barrels in 1947, which in turn was 16 percent below the peak demand in 1946.

Stocks of kerosine, which increased slightly on 1947, continued to increase sharply in 1948, when the year-end total of 24,010,000 barrels was 35 percent above the 17,722,000 held in storage at the close of 1947. About 59 percent of kerosine stocks are reported at refineries, and these reserves increased by about 41 percent—from 9,940,000 barrels in 1947 to 14,064,000 at the end of 1948.

Supplies carried at bulk teminals rose from 7,782,000 barrels in 1947 to 9,946,000 in 1948, about a 28-percent gain over the supplies held at bulk terminals at the close of 1947. The days of supply represented by kerosine held in storage at the year end increased from 42 days for 1947 to 57 days for 1948 at the subsequent January rate of total demand.

All refinery districts except California, whether predominantly supply or consumption areas, showed increases in kerosine stocks in 1948. The increase in kerosine inventories was largely attributed to the East Coast district, a major market with a gain of 3,153,000 barrels, and to Indiana–Illinois–Kentucky, with 1,440,000, out of the total increase in stocks of 6,288,000 barrels, due to mild winter in these areas. Relatively smaller increases in kerosine stocks are reported from the remaining refinery districts, except California, where stocks declined from 1,172,000 barrels in 1947 to 815,000 in 1948, due principally to the slow-down in the refineries by the strike.

Sales of kerosine continued their sharp upward trend in 1947, when reported sales of 102,703,000 barrels were 17 percent over the 1946 total of 88,090,000 barrels, according to the annual survey of the Bureau of Mines. This rapidly expanding market for kerosine, evident in 1946 and 1947, is due largely to the rapidly growing demand for range oil. All marketing areas of the country reported a higher volume of kerosine deliveries in 1947. Sales of kerosine in the East Coast area, where nearly 59 percent of the national demand is located, increased 18 percent from 51,315,000 barrels in 1946 to 60,547,000 in 1947. The larger share of these totals was reported for the New England States, where sales totaled 26,293,000 barrels in 1947—12 percent over the 1946 total of 23,433,000 barrels. The Middle Atlantic States continued as the second important market for kerosine, and deliveries in the area increased 15 percent from 19,925,000 barrels in 1946 to 22,827,000 in 1947. Sales of kerosine in the remaining section of the Atlantic Coast area—the South Atlantic States—are relatively less important in volume; however, the 1947 quantity for the area was 44 percent above the 1946 demand of 7,957,000 barrels. Dealers distributed 22,077,000 barrels of kerosine in the North Central States in 1947—a 16 percent gain over the 1946 total of 18,959,000 barrels. Considerable quantities of kerosine are also consumed in the South Central States, and the increase in sales in 1947 was 10 percent. Rocky Mountain area continues to consume the smallest amount of kerosine—about 1 percent of the national demand. However, there was an increase of about 11 percent in 1947 over 1946. The market for kerosine on the Pacific coast declined from 2,894,000 barrels in 1943 to 2,166,000 in 1946; however, in 1947 there was an increase to 2,844,000 barrels.

The kerosine delivered for range oil has gradually increased from 56 percent of the kerosine total in 1943 to a 61 percent share in 1947, and quantities sold for this purpose increased 20 percent from 52,-105,000 barrels in 1946 to 62,482,000 in 1947. About 8 percent of all kerosine deliveries is used as tractor fuel, and the demand went from 7,544,000 barrels in 1946 to 8,209,000 in 1947. Sales of kerosine for various sundry uses, such as lamp fuel, insecticides, orchard heating, weed burning, tobacco curing, etc., rose from 28,441,000 barrels in 1946 to 32,012,000 in 1947.

Representative kerosine prices continued an upward trend in 1948 over the 1947 prices. The average quotation for 41°–43° gravity, water-white kerosine at refineries in Oklahoma rose from 9.09 cents a gallon in December 1947 to a high of 9.63 cents in July 1948. The price remained at that level through October 1948, then declined to 9.47 cents per gallon in December 1948, which brought the weighted average for 1948 to 9.58 cents a gallon, compared with 7.11 cents for 1947. The average price of kerosine, including No. 1 fuel oil at New York Harbor, increased from 9.31 cents a gallon in December to high of 11.15 cents in February 1948, remained at this level for 3 months, then declined gradually to 10.57 cents a gallon in December 1948, making the average quotation for the year 10.96 cents a gallon compared with 7.91 cents in 1947.

Monthly average prices of kerosine in the United States, 1947–48

Very little kerosine is shipped from the west coast marketing area to other parts of the United States. Rail and truck shipments to other Western States totaled 25,000 barrels in 1948 compared with 16,000 in 1947. There were no tanker shipments of kerosine from California to the east coast in either 1947 or 1948. The California area received 4,000 barrels of kerosine in 1948 (none in 1947) from other States.

Records compiled by the Oil and Gas Division, United States Department of the Interior, show that some kerosine is shipped from the Gulf coast up the Mississippi River and its tributaries by barges to terminals in district 2. The volume of this movement increased from 4,244,000 barrels (385,000 barrels from Texas, 3,132,000 from Louisiana, and 727,000 from Arkansas and Mississippi) in 1947 to 4,826,000 (388,000 barrels from Texas, 3,290,000 from Louisiana, and 1,148,000 from Arkansas and Mississippi) in 1948. Barge and tanker shipments of kerosine from the Gulf to the east coast increased from 34,222,000 barrels in 1947 to 40,020,000 in 1948. The quantity credited to Texas increased from 27,542,000 barrels in 1947 to 31,-024,000 in 1948, while the totals originating in Louisiana were 6,680,-000 barrels in 1947 and 8,996,000 in 1948.

The fixed tanker rate on kerosine shipped from the Gulf coast to North Atlantic ports—not east of New York—of 36 cents a barrel ($2.85 a long ton) dating from October 15, 1945, held until the final days of December 1947. As the United States Maritime Commission sold all the tankers under its control during the latter part of 1947 and in 1948 and as there was an unusual demand because of extremely cold weather for vessels to move petroleum products in this traffic in early 1948, the tanker rate was removed from control. The rate quoted for kerosine in the Gulf coast-east coast movement rose to 90.3 cents a barrel on the last day of 1947 and reached peaks of $1.084 a barrel on January 2 and February 8, 1948. However, there was a net downward trend in tanker rates all during 1948 and final quotations were 30.7 cents a barrel on December 17 and 32.3 cents on December 24. The average for 1948 was 47.9 cents a barrel.

The tank-wagon prices of kerosine at Chicago moved upward from 15.60 cents a gallon in January 1948 to 15.90 cents in June 1948 and remained at this level throughout the year, raising the weighted average price in 1948 to 15.85 cents a gallon—an increase of 2.45 cents over the 1947 average. At New York the tank-wagon price quotation for kerosine moved upward from an average in January 1948 of 14.08 cents a gallon to a high of 14.50 cents in August, remaining at this level until December, when the quotation dropped to 14.31 cents a gallon. The weighted average for all of 1948 was 14.31 cents a gallon.

DISTILLATE FUEL OIL

Substantially increased production of distillate fuel oil, including Diesel fuel, together with slightly higher transfers and lower imports and exports, enabled oil companies not only to satisfy an increased domestic demand in 1948 but to add a large surplus to storage. The

[1] Figures represent crude oil used as fuel on pipe lines.
[2] Subject to revision.
[3] Figures not available.

domestic demand of 340,048,000 barrels of distillate fuel oil in 1948 was 14 percent over 1947 requirements of 298,273,000 barrels. Foreign shipments of light-grade fuel oils have decreased sharply from 29,877,000 barrels in 1947 to 21,808,000 barrels in 1948, a 27-percent decrease.

A review of the domestic demand in 1948, by quarters, reveals that peak requirements of 114,483,000 barrels came in the first 3 months when the need for heating oils was a factor and that the total for the period was 19 percent over the corresponding item of 96,264,000 barrels in 1947.

Usually requirements in the final quarter of any year are somewhat below the total for the first 3 months of the same year. However, in 1947 requirements of 92,587,000 barrels in the fourth quarter were only 4 percent less than the indicated demand in the opening period. Compared with the same two periods in 1948, the requirement of 97,483,000 barrels for the last 3 months was 15 percent less than that in the first quarter. It was warmer in the fourth quarter of 1948 than in the same months of 1947 in the New England, North Central, and Middle Atlantic regions, where about 81 percent of the heating oil is consumed. The rapidly growing requirements for light heating oils and Diesel fuel is strongly evident in the second and third quarters of 1948, when the domestic demand increased 17 percent over the same period in 1947.

A definite break-down of the domestic demand for distillate fuel oils in 1948 is not available, as the annual survey covering sales of fuel oil by the Bureau of Mines was incomplete when this manuscript was prepared. There are, however, some monthly data and other information upon which estimates of the several demands for light oil can be made. The records of the Interstate Commerce Commission show that railroads purchased 28,724,000 barrels of Diesel fuel in 1948; and it is believed that the total demand, including other distillate fuel oils, probably was 32,200,000 barrels for 1948. Monthly releases of the Bureau of the Census, United States Department of Commerce, indicate that 6,236,000 barrels of Diesel fuel were sold to vessels in foreign trade. This item does not cover other light fuel oils, including Diesel fuel, sold to boats operating in coastal or inland waters, and it estimated that total vessel demand for distillate grades reached 15,000,000 barrels in 1948. No figures are available showing the demand for light fuel oils by gas and electric power utilities; however, statistics released by the Federal Power Commission indicate a decline in the demand for all grades of fuel oils in 1948, and it is possible that the light-fuel-oil total for both the gas and electric power industries will not exceed 15,000,000 barrels for the year. The index of manufacturing for 1948 as computed by the Federal Reserve Board was 192 compared with 187 in 1947. However, this index reflects the need for fuel of all kinds by the manufacturing industries and not that for oil alone. It is believed that the demand by industrial plants for distillate fuel oil, including Diesel fuel, will continue a sharp upward trend in 1948.

[1] Includes Diesel fuel.
[2] Figures for 1948 not yet available.
[3] Revised figure.

The changing demand for distillate fuel oils by various uses is shown graphically in figure 10. All light fuel oils and Diesel fuel are included.

A downward trend in exports of distillate fuel oil was reported in 1948, when the total of 21,808,000 for the year was 27 percent below the 29,877,000 total for 1947. Exports of distillate fuel oil to the United Kingdom were drastically reduced from 8,973,000 barrels in 1947 to 4,934,000 in 1948. Shipments of light fuel oil to Sweden also show a big decrease—from 2,716,000 barrels in 1947 to 853,000 in 1948. Shipments to some other countries also declined; however, the quantities involved were not relatively important. The decreased demand for distillate fuel oil in foreign countries was due principally to postwar construction and the rebuilding of the war-destroyed refineries.

The production of distillate fuel oil in 1948—380,639,000 barrels—was about 22 percent over the 1947 total of 312,173,000 barrels. The percentage yield for distillate fuel oils rose sharply from 16.9 percent in 1947 to 18.7 percent in 1948. This gain in the percentage output of light fuel oils was, however, at the expense of a lower yield for residual fuel oil—23.0 percent in 1948 compared with 24.2 percent in 1947.

All refinery districts of the country reported increased production of distillate fuel oils in 1948. Refineries operating in the Texas Gulf Coast district produced over 30 percent of the distillate fuel oils, the total for 1948 being 115,928,000 barrels, or 40 percent over the 1947 total of 82,850,000 barrels. This larger volume of light fuel oil for the area was the result of both an increase in crude runs and a higher percentage yield—22.7 percent in 1948 compared with 19.0 percent in 1947. The East Coast district was the source of 18 percent of the distillate fuel oils produced in the country, and the output there increased by 18 percent from 57,111,000 barrels in 1947 to 67,377,000 in 1948. Although the crude runs in the district increased in 1948, most of the expanded light-fuel-oil production must be credited to a stepped-up yield—21.6 percent in 1948 compared with 19.2 percent in 1947.

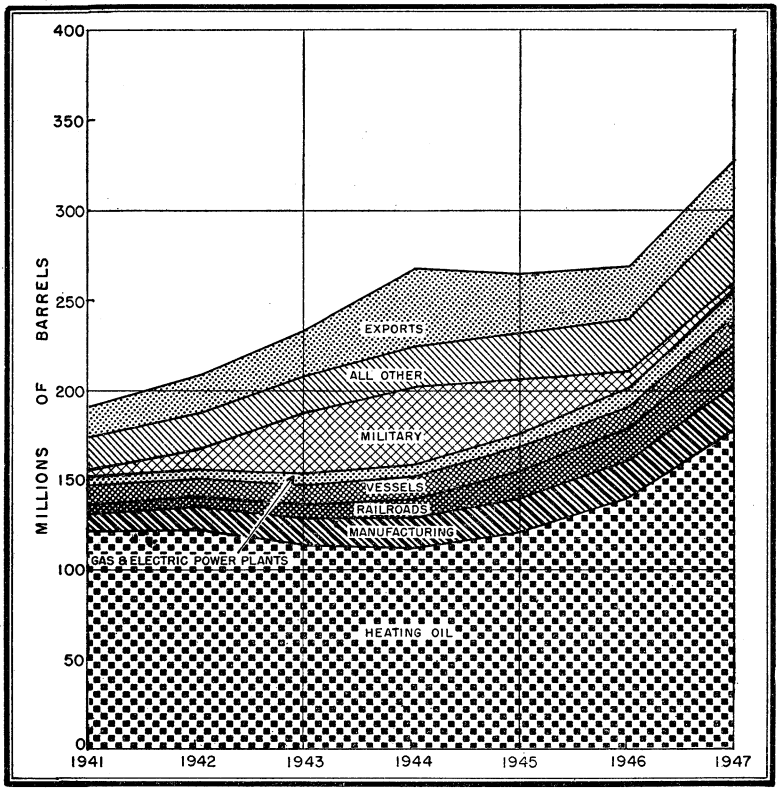

FIGURE 10.—Sales of distillate fuel oil, including Diesel oil, and range oil in the United States, 1941–47, by uses

The California refinery district continued to increase its light-fuel-oil production in 1948 and was the source of 13 percent of the Nation's production. The output increased 8 percent from 46,498,000 barrels in 1947 to 50,235,000 barrels in 1948 with a higher yield—16.2 percent in 1948 against 15.4 in 1947. The Indiana-Illinois-Kentucky refinery district produced 13 percent of all distillate fuel oils in 1948, and the quantity rose from 45,749,000 barrels in 1947 to 49,486,000 in 1948. This was the only district, however, where the yield decreased, dropping from 15.2 in 1947 to 14.9 in 1948. The higher production can be attributed solely to the 10-percent increase in runs.

An appreciable amount of light fuel oil originates in the Louisiana Gulf Coast refinery district, where the quantity increased from 27,512,000 barrels in 1947 to 35,489,000 in 1948. This gain was due to both increased yield and runs. The yield rose from 19.7 percent in 1947 to 22.3 percent in 1948, and the runs increased 20 percent. Production of distillates also rose in the Oklahoma-Kansas-Missouri district in 1948 (30,760,000 barrels or 17 percent over the 1947 quantity of 26,230,000 barrels) as the yield also increased from 17.1 percent in 1947 to 18.6 percent in 1948.

[1] Includes Diesel fuel oil.
[2] Figures for 1948 not yet available.
[3] States are grouped according to petroleum-marketing territories rather than to conventional geographic regions.
[4] Revised figure.
[5] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government

The remaining refinery districts do not produce large amounts of distillate fuel oil. The quantities reported for the Rocky Mountain area and Texas Inland continue to show big gains (24 percent) in 1948, while the Appalachian district also increased (3 percent) in 1948.

Light crude petroleum used as fuel by pipe lines is reported as "transfers" to the distillate fuel oils; the quantities involved were 3,543,000 barrels in 1948 and 3,263,000 in 1947. Such "transfers" supply a little less than 1 percent of the total demand for all light fuel oils. The larger shares of these items were credited to Texas Inland (1,217,000 barrels) and the Oklahoma-Kansas-Missouri (660,000 barrels) refinery district. No transfers were reported for East Coast and Appalachian areas.

Imports of distillate fuel oils into continental United States continues to decline, as the quantity reported for 1948 was 2,546,000 barrels, a reduction of about 39 percent from the 1947 total of 4,175,000 barrels. Less than 1 percent of total demand for light fuel oils is made up of supplies received from foreign countries. The largest share of the imported distillate fuel oil came from Curaçao in the West Indies; however, several other countries, such as Venezuela, Mexico, and Bahrein, were credited with smaller amounts.

Stocks of distillate fuel oils in 1948 increased over the record volume of 59,620,000 barrels in 1946 by 27 percent and exceeded the year-end total in 1947 by about 49 percent to a new high of 75,953,000 barrels at the end of 1948. The light fuel oil in storage at the close of 1948 was equivalent to about a 56-day supply at the subsequent January rate of total demand; this compares with a 38-day quantity available at the end of 1947.

Both refinery and bulk-terminal stocks of light fuel oils showed outstanding increases in 1948. Quantities reported as stored at refineries rose from 32,413,000 barrels at the end of 1947 to 46,924,000 for 1948—a 45-percent gain compared with a 16-percent shrinkage of the same stock in 1947. Distillate inventories at bulk terminals—29,029,000 barrels at the close of 1948—were 56 percent over the 1947 quantity (18,668,000 barrels), and this gain contrasts with a loss of 11 percent in 1947.

All refiniery districts reported higher distillate-fuel-oil stocks at the end of 1948 compared with 1947. Light-fuel-oil inventories more than doubled in the Rocky Mountain and Arkansas-Louisiana Inland-Mississippi districts, which comprise about 3 percent of the total stock held. Supplies in the important east coast area rose from 27 percent of the national total in 1947 to a 30-percent share in 1948. The quantity at the end of 1948 (23,158,000 barrels) was 71 percent above the 1947 total (13,540,000 barrels). About 18 percent of the light-fuel-oil stocks are found in the Texas Gulf Coast area, where the total rose from 7,782,000 barrels in 1947 to 13,636,000 at the close of 1948.

The California refinery area reports a large inventory of distillate fuel oil (a little less than one-fifth of the national total), and the volume of 13,849,000 barrels in December 1948 was only 0.5 percent over the 13,785,000 barrels held at the close of 1947. The quantity of light fuel oil stored in the Indiana–Illinois–Kentucky refinery district increased 56 percent in 1948—11,395,000 barrels—over 1947 stocks of 7,297,000 barrels. The 1948 item represents a 15-percent share of the national inventory. Quantities of distillates stocks reported from Louisiana Gulf Coast region are relatively less important; however, they expanded from 2,803,000 barrels in 1947 to 4,159,000 in 1948, an increase of 48 percent. About 7 percent of the distillate stocks are carried in the Oklahoma-Kansas-Missouri group of States, and the total reported rose from 3,151,000 barrels in 1947 to 5,279,000 in 1948. Only small quantities of distillate-grade fuel oils are reported as held in the Appalachian and Texas Inland refinery districts; nevertheless, the year-end stocks all gained in 1948 over 1947.

Tanker shipments of distillate fuel oil from California to the east coast increased from 161,000 barrels in 1947 to 1,177,000 in 1948. The 1948 quantity was all moved during the January–June period and was intended to relieve an east coast shortage in distillate-fuel-oil supplies, which had resulted from a prolonged cold spell in January of that year. Rail and truck movements of distillate fuel oil from the Pacific coast marketing area (California, Oregon, Washington, Arizona, and Nevada) to other Western States totaled 1,131,000 barrels in 1947 and 1,250,000 in 1948. The California area in return also received some light fuel oil from other States—333,000 barrels in 1948 compared with 309,000 in 1947.

There is an important movement of distillate fuel oil by barge and tanker from the Gulf coast area to terminals on the Atlantic coast, and the volume increased from 80,533,000 barrels (67,286,000 barrels from Texas and 13,247,000 from Louisiana) in 1947 to 102,-609,000 (83,190,000 barrels from Texas and 19,419,000 from Louisiana) in 1948, according to the Oil and Gas Division, United States Department of the Interior. There is also a minor barge movement of distillate fuel oil from the Gulf coast up the Mississippi River to consuming areas in district 2. The total of 4,444,000 barrels for 1948 was slightly under the 1947 figure of 4,698,000 barrels. Most of this light fuel oil is credited to Louisiana, although small quantities also originate in Texas, Arkansas, and Mississippi.

Tanker rates were uncontrolled during the early months of 1948, and the freight on No. 2 distillate fuel oil brought from the Gulf coast to North Atlantic ports—not east of New York—rose from a fixed charge of 38 cents a barrel prevailing until the final few days of 1947 to $1.138 on January 2, 1948. This unusually high rate was reached again on February 8, but thereafter declined steadily to the year low of 28.6 cents a barrel on August 20 and a year-end rate of 34.0 cents on December 24. The average freight cost on No. 2 light fuel oil in the Gulf coast-east coast run was 50 cents a barrel for 1948.

The upward trend in distillate fuel-oil prices, evident since the close of price control, leveled off somewhat during 1948. The price of 9.28 cents a gallon for No. 2 Straw fuel oil at refineries in Oklahoma increased to 11.08 cents by March 1948. The average quotation then started to decline over the summer and fall months to 8.87 cents a gallon in December 1948. The average for 1948 was 9.67 ceuts per gallon compared with a 6.74-cent average for 1947. A price of 8.34 cents a gallon for No. 2 fuel oil at New York Harbor, effective December 1947, rose to a high in March 1948, when the average quotation was 10.15 cents per gallon. The price dropped to 9.75 cents per gallon in April and remained at about that level until December. The 1948 average price was 9.71 cents per gallon. Diesel oil at shore plants around New York Harbor, selling at 8.63 cents a gallon average in December 1947, was marked upward to 9.73 cents in January 1948, and this value held fairly steady for the balance of 1948. The average price for Diesel oil at shore plants for 1948 was 9.77 cents per gallon. Ships loading Diesel oil for bunkers in New York Harbor paid an average price of $3.02 a barrel in 1947, and subsequent advances

Monthly average prices of distillate fuel oil and Diesel fuel in the United States, 1947–48

resulted in a 1948 year-end quotation of $4.02 a barrel. Ships loading Diesel fuel at Gulf ports paid $3.20 a barrel in December 1947. The price increased to $3.66 in January 1948 and reached a high of $3.83 a barrel in June–October 1948. The year-end price in December 1948 was $3.77 a barrel. Quotations for Diesel fuel for ships likewise advanced at the California ports from $2.75 a barrel in December 1947 to $3.35 in December 1948.

Representative retail prices for light fuel oils in 1948 followed the trend noted in wholesale quotations. Records of retail fuel price for a number of cities, as published monthly by the Bureau of Labor Statistics, United States Department of Labor, list a quotation of 13.90 cents a gallon for No. 2 distillate fuel in New York for January and February; however, subsequent decreases in monthly quotations lowered the price to 12.49 cents a gallon in June 1948. There was slight increase in the summer months to 13.04 cents a gallon in September 1948, and then a drop to 12.71 cents in December 1948. A retail posting in Chicago for No. 2 distillate—13.36 cents a gallon—dating from January 1948 held until May 1948, when there was an advance to 13.57 cents. This quotation held for the balance of the year.

RESIDUAL FUEL OIL

The production of residual fuel oil increased in 1948 and was more than adequate to satisfy a lower domestic and export demand; as a result, there was a large surplus to add to inventory. The indicated domestic demand for heavy fuel oils in 1948 (500,759,000 barrels) was 3 percent below 1947 requirements of 518,510,000 barrels, while exports increased slightly from 10,623,000 barrels in 1947 to 12,539,000 in 1948, an 18-percent gain.

The drop in demand for residual fuel oils in 1948 was not evident throughout the year, as the total for the first and second quarters was above the corresponding periods of 1947. However, the relative shrinkage in quarterly requirements in 1948 increased as the year advanced. The indicated domestic demand for heavy fuel oils in the first quarter of 1948 (142,226,000 barrels) was 3 percent above the comparable 1947 total (137,459,000 barrels). The 1948 second-quarter total of 121,637,000 barrels was 1 percent over the comparable 120,385,000-barrel demand in 1947. However, in the third quarter of 1948, requirements for residual grades (111,681,000 barrels) were 8 percent below the demand in the same 3 months of 1947 (120,954,000 barrels). In the final period, when the need for heavy heating oils is a factor, total deliveries of 125,215,000 barrels in 1948 were 10 percent below the 1947 comparable item of 139,712,000 barrels. A declining market for residual fuel oil was still evident in the opening quarter of 1949, when the indicated demand of 135,352,000 barrels was 5 percent under the corresponding 1948 requirements of 142,226,000 barrels.

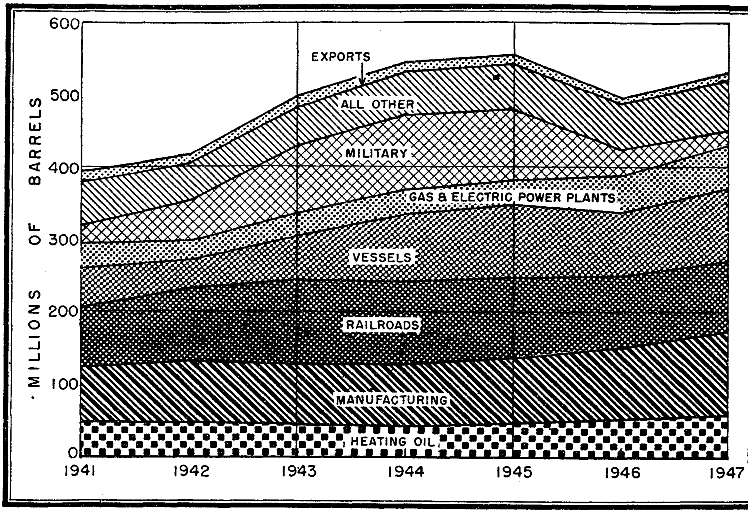

FIGURE 11.—Sales of residual fuel oil in the United States, 1941-47, by uses.

Sales of heavy fuel oil by principal uses in 1948, as reported in the annual survey conducted by the Bureau of Mines, have not been released; however, estimates of the several requirements, based on available monthly figures and other information, have been made and are as follows: Railroads, 89,700,000 barrels; bunkering of vessels, 96,000,000 barrels (of which amount 54,813,000 barrels were loaded at continental ports of the United States on ships engaged in foreign trade, according to the Bureau of the Census, United States Department of Commerce); and gas and electric power plants, 56,812,000 barrels.

Figure 11 showing sales of residual oil represents the fluctuating annual demand for residual fuel oils by principal uses in recent years. All heavy fuel oils, including Navy grade and crude petroleum used as fuel, are included.

A gradual decline in exports of residual fuel oil, evident in 1944–1946, was not repeated in 1947 and 1948. In 1948 the foreign shipments (12,539,000 barrels) were 18 percent above the 1947 total (10,623,000 barrels).

The exports of residual fuel oil to European countries reported by the Bureau of the Census, United States Department of Commerce, dropped sharply from 2,044,000 barrels in 1947 to 896,000 in 1948, showing Denmark and Sweden importing the larger shares. Exports of heavy fuel oils to Canada increased from 2,407,000 barrels in 1947 to 3,767,000 in 1948. Cuba and Mexico continued to import large quantities of residual fuel oil in 1948. Various countries received the following quantities of American heavy fuel oil in 1948: Canal Zone, 874,000 barrels; Chile, 109,000 barrels; Guatemala, 584,000 barrels; and Philippine Republic, 142,000 barrels.

[1] Includes Navy grade and crude oil burned as fuel.
[2] Figures for 1948 not yet available.
[3] Revised figure.

The volume of crude run through refineries in 1948 increased about 10 percent compared with 1947; however, the yield of residual fuel oils was cut from 24.2 percent in 1947 to 23.0 percent in 1948 to make more of the distillate grades. The output of residuals increased 4 percent from 447,795,000 barrels in 1947 to 466,141,000 in 1948. All refinery districts except the East Coast and Appalachian reported increases in production. About 18 percent of the heavy fuel oil made in the country is credited ot the East Coast States, and the quantity dropped 3 percent from 86,769,000 barrels in 1947 to 84,111,000 in 1948. The crude petroleum processed in the area was up slightly in 1948 compared with 1947; however, the yield for residual fuel oils was only 26.5 percent in 1948 against 29.2 percent in 1947, and hence production was lower. Runs of foreign crude (usually of high residual fuel-oil content) decreased in volume in 1948, an added factor in the lower yield reported.

The Texas Gulf Coast region is an important source of residual fuel oils, and the production (about a fifth of the national total) increased from 88,592,000 barrels in 1947 to 95,385,000 in 1948. Increased runs (17 percent over 1947) in this district were sufficient to counteract a lower yield (18.7 percent in 1948 compared with 20.3 percent in 1947), hence the gain in the output of heavy fuel oils. The California district produced more residual fuel oil than any other area, or 26 percent of the national production. The quantity increased 5 percent from 115,171,000 barrels in 1947 to 120,686,000, owing both to a 2-percent gain in crude runs and a slightly increased yield—38.9 percent in 1948 compared with 38.2 percent in 1947.

The Indiana-Illinois-Kentucky refinery district is also the source of an important quantity of heavy fuel oil; however, the total increase was less than 0.5 percent, or from 57,259,000 barrels in 1947 to 57,521,000 in 1948. The gain was due to a 10-percent increase in crude runs, as the yield dropped from 19.0 percent in 1947 to 17.3 percent in 1948. A higher yield and an increase in crude runs in the Oklahoma-Kansas-Missouri group of States resulted in a greater production of residual—from 25,246,000 barrels in 1947 to 27,667,000 in 1948. Similar operating conditions also prevailed in the Louisiana

[1] Includes some crude oil burned as fuel.
[2] Figures for 1948 not yet available.
[3] States are grouped according to petroleum-marketing territories rather than to conventional geographic regions.
[4] Revised figure.
[5] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government.

Gulf Coast district, where heavy fuel oil realized rose from 24,324,000 barrels in 1947 to 27,790,000 in 1948. Crude petroleum processed in the Texas Inland district gained (5 percent over 1947); however, as the yield for residual grades of fuel oil dropped from 24.9 percent in 1947 to 24.7 percent in 1948, the output was only 22,203,000 barrels in 1948 compared with 21,064,000 barrels in 1947. The remaining refinery districts—Appalachian, Arkansas-Louisiana Inland, and the

Rocky Mountain—do not produce large quantities of heavy fuel oils; the Appalachian area was the only one of this group to report a decline in 1948.

Considerable quantities of heavy crude petroleum are used directly as fuel on leases and for general industrial purposes. Such crude oils are credited to the fuel-oil account as "transfers" and totaled 23,847,000 barrels in 1948—12 percent under the 1947 item of 27,091,000 barrels. This crude used as fuel represented about 5 percent of the total supply of heavy fuel oil in 1948 and approximately 6 percent in 1947. The larger share of the transfers is reported from the California refinery district—19,283,000 barrels in 1948 compared with 22,163,000 in 1947. Quantities in the other refinery areas declined from 4,928,000 barrels in 1947 to 4,564,000 in 1948. No transfers of this kind are made in the east coast and Appalachian districts.

Imports of residual fuel for consumption in continental United States declined 2 percent in 1948 or from 53,161,000 barrels compared with 54,244,000 in 1947. Heavy fuel oil received from foreign sources made up 11 percent of the total supply in 1948, compared with 10 percent in 1947. Virtually all of the residual fuel oil received from abroad in 1948 came from Curaçao, Netherlands West Indies, while relatively smaller amounts were credited to a number of other countries, including Canada, Mexico, Venezuela, Trinidad, Saudi Arabia, and Bahrein.

A lower domestic demand, although coupled with lower imports and expanded exports, together with the mild winter in the New England, Middle Atlantic, and South Atlantic areas, were factors that resulted in a greatly improved residual fuel-oil stock situation in 1948 compared with 1947, even though the percentage yield was unfavorable. The volume of year-end stocks of heavy fuel oils expanded from 47,091,000 barrels in 1947 to 76,942,000 in 1948—a 63-percent gain in contrast to a slight decrease in similar inventories in 1947. Quantities reported at refineries jumped from 38,807,000 barrels at the close of 1947 to 64,664,000 in 1948—a 67-percent gain—while those held at bulk terminals were up 48 percent from 8,284,000 barrels in 1947 to 12,278,000 in December 1948.

During 1947, 3,000,000 barrels of heavy fuel oil were withdrawn from storage to meet the demand, while in 1948 the supply situation was more favorable, as there was an addition to inventory of 29,851,000 barrels. Residual grades of fuel oil held at refineries and bulk terminals at the end of 1948 were adequate for 50 days of supply at the subsequent January rate of indicated demand, and this volume compares with a 30-day supply at the close of 1947.

Nearly half of the residual fuel-oil stocks are carried in the California refinery district, and the quantity reported increased 77 percent from 21,267,000 barrels in 1947 to 37,596,000 in December 1948. Important inventories of heavy fuel oil are also held in the East Coast and Texas Gulf Coast areas, or about 15 percent of the Nation's total in each area. The East Coast quantity expanded 63 percent from 7,302,000 barrels in 1947 to 11,917,000 in December 1948, while in the Texas Gulf Coast supply area, the year-end totals were 7,412,000 barrels in 1947 and 11,791,000 in 1948. Heavy fuel-oil inventories in the Indiana-Illinois-Kentucky group of States rose from 5,072,000 barrels (11 percent of the national total in 1947) to 5,465,000—7 percent of all stocks in 1948. The heavy fuel oil stored in the remaining refinery districts is not relatively important and represented only 15 percent of the total stock in 1948. Inventories in all of these areas—Appalachian, Oklahoma-Kansas-Missouri, Texas Inland, Louisiana Gulf Coast, Arkansas–Louisiana Inland, and Rocky Mountain—were higher at the end of 1948 compared with 1947.

Very little residual fuel oil is being shipped from the West Coast area to other parts of the country. Tanker movements of this heavy grade to the east coast totaled 97,000 barrels in 1948 compared with 1,000 in 1947, while rail and truck shipments to other Western States increased from 85,000 barrels in 1947 to 243,000 in 1948. Other Western States shipped 592,000 barrels of heavy fuel oil to the California marketing area (California, Oregon, Washington, Arizona, and Nevada) in 1947 and 511,000 in 1948.

The tanker and barge movement of residual fuel oil from the Gulf area to the Atlantic coast increased from 61,189,000 barrels in 1947 to 68,662,000 in 1948, according to published records compiled by the Oil and Gas Division, United States Department of the Interior. The largest share of these shipments were credited to Texas—51,728,000 barrels in 1947 and 55,325,000 in 1948—while smaller quantities came from Louisiana—9,461,000 barrels in 1947 and 12,907,000 in 1948. Alabama shipped 430,000 barrels in this eastward movement in 1948. Some residual fuel oil is shipped by barge from the Gulf Coast area to distributing points on the Mississippi River and its tributaries in district 2. The annual total in this traffic has fluctuated from 642,000 barrels in 1946 to 1,021,000 in 1947 and then down to 658,000 barrels in 1948. Most of this residual fuel oil came from Louisiana, although some of it was credited to Texas, Arkansas, and Mississippi.

The fixed tanker rate of 43.8 cents a barrel on heavy fuel oil (Bunker C) shipped from the Gulf to the east coast, not east of New York, rose suddenly to $1.096 in the final days of December 1947. In this period and in early 1948, the United States Maritime Commission disposed of all its tankers; and, with a shortage of fuel-oil supplies in the East Coast area, tanker rates went out of control to peak levels of $1.315 a barrel on January 2 and February 8. As the seasonal demand for heavy fuel oil on the east coast tapered off, the tanker rate dropped to 32.9 cents a barrel on August 20. The fourth quarter demand in this traffic pushed up the tanker charge to 49.3 cents a barrel November 12, but it dropped thereafter to 39.5 cents a barrel in late December.

The price of representative grades of residual fuel oil moved upward in the first quarter of 1948. No. 6 was quoted at $2.55 a barrel at refineries in Oklahoma in December 1947, and the price rose each month during the first quarter of 1948 to $2.87 a barrel in March 1948. The price declined during the balance of the year, and the December average price was $1.87 a barrel, a 27-percent decrease from the comparable price in December 1947.

Market quotations on No. 5 fuel oil at New York Harbor, which averaged $3.60 a barrel in January 1948, rose slightly in February and March, reached $3.82 a barrel in April, and remained at this level until August. The price was shaded several cents a barrel during the balance of the year, and in December the quotation stood at $3.39 a barrel. The weighted price for 1948 was $3.71 a barrel.

Monthly average prices of residual fuel oil in the United States, 1947–48

Bunker "C" fuel oil for ships followed the general trend of other heavy fuel oils, with a quotation of $3.03 a barrel at New York Harbor for January 1948. This price held fairly steady until December 1948, when the price dropped to $2.78 a barrel. A price of $2.88 a barrel for Bunker "C" at Gulf ports, effective January 1948, remained in force until May and after several changes reached a low of $2.49 a barrel in December 1948 compared with $2.60 in the same period of 1947.

Bunker "C" for ships loading in the California area was quoted at $2.10 a barrel during the first 10 months of 1948, after which it rose to a year-end price of $2.18 a barrel.

LUBRICATING OIL

The refinery production of lubricating oils dropped from 51.8 million barrels in 1947 to 51.4 million in 1948—a decline of 1 percent in 1948 compared with gains of 13 percent in 1947 and 9 percent in 1946. The principal gain in production in 1948 was 1.1 million barrels in the Texas Gulf district, and the largest declines were 0.7 million barrels in the California district, 0.5 million in the Appalachian district, and 0.4 million in the Louisiana Gulf district.

OTHER PRODUCTS

Wax.—Refinery production of petroleum wax declined for the first time since 1938. The production in 1948 amounted to 3,515,000 barrels (converted at the rate of 280 pounds to the barrel) compared with 3,624,000 in 1947.

All the producing districts except the Indiana-Illinois-Kentucky and the Rocky Mountain showed declines in 1948. Of the total decrease in production (109,000 barrels), the Texas Gulf district accounted for 65,000 barrels, the East Coast for 45,000, and the Oklahoma–Kansas–Missouri for 35,000. The principal gain in production was 51,000 barrels in the Indiana–Illinois–Kentucky district.

Total demand for wax dropped from 3,585,000 barrels in 1947 to 3,342,000 in 1948. Exports of wax decreased from 1,107,000 in 1947 to 994,000 in 1948, and domestic demand was reduced from 2,478,000 barrels in 1947 to 2,348,000 in 1948.

Coke.—The production of petroleum coke increased from 12.1 million barrels (converted at the rate of 5 barrels to the short ton) to 14.5 million in 1948. The principal gain in production was in the Indiana–Illinois–Kentucky refinery district, with an increase of almost 2 million barrels in 1948 compared with 1947. This district is the largest producer, contributing 49.6 percent of the total in 1948 compared with 43.1 percent in 1947 and 48.7 percent in 1946.

The total demand for petroleum coke increased from 12.2 million barrels in 1947 to 14.2 million in 1948. The gain of 2.0 million barrels in 1948 represented an increase of 0.4 million in exports and 1.6 million in domestic demand.

[3] Figures not available.

Asphalt and Road Oil.—The total demand for asphalt increased from 50.3 million barrels in 1947 (converted at the rate of 5.5 barrels to the short ton) to 51.4 million in 1948—a gain of 1.1 million barrels, representing a decline of 1.6 million in exports and an increase of 2.7 million in domestic demand. The gain in domestic demand was 6 percent in 1948 compared with gains of 9 percent in 1947 and 13 percent in 1946. The domestic demand for road oil amounted to 8.0 million barrels in 1948 compared with 7.1 million in 1947—a gain of 14 percent in 1948 compared with an increase of 19 percent in 1947.

Still Gas.—The production of still gas continued to decline from 317 billion cubic feet in 1946 to 308 billion in 1947 and to 292 billion in 1948. The principal declines compared with 1947 were about 8 billion cubic feet in the East Coast district and 5 billion in the Texas Gulf district.

Miscellaneous Finished Oils.—The annual survey of miscellaneous finished oils produced at petroleum refineries was resumed for 1948, after a lapse since 1943. Liquefied gases have been omitted from the 1948 survey because these materials are now reported separately on a monthly basis.

Other oils classified in the miscellaneous group in 1943 amounted to 3,381,000 barrels. The comparable total for 1948 increased to 6,188,000 barrels.

The refinery output by classes is shown for 1948. The difference between the refinery production shown in this table, in comparison with other published production figures for the year, is due to reclassification of products.

INTERCOASTAL SHIPMENTS [2]

Shipments of mineral oils, crude and refined, from Gulf coast ports to east coast ports were 10 percent larger in 1948 than in 1947. Crude petroleum was the largest single item in these shipments; it constituted 35 percent of the total shipments in 1948, compared with 38 percent in 1947. Gasoline occupied second place in importance; shipments constituted 26 percent of the whole, both in 1947 and in 1948. With the exception of crude-petroleum shipments, which remained virtually level from 1947 to 1948, shipments of mineral oils from the Gulf coast to the east coast were appreciably larger in 1948 than in 1947.

Mineral oils, crude and refined, shipped commercially from Gulf-coast to east-coast ports of the United States, 1947–48, by classes [1]

FOREIGN TRADE [3]

IMPORTS

Imports of mineral oils, crude and refined, into continental United States increased 18 percent from 1947 to 1948. They constituted 7 percent of the total new supply in continental United States in 1947 and 8 percent in 1948. For the first year since 1922, total imports of mineral oils exceeded total exports.

Crude petroleum, distillate fuel oil, and residual fuel oil together made up 98 percent of the total mineral-oil imports into continental United States, both in 1947 and in 1948. Venezuela supplied 50 percent of the total imports into all the United States both in 1947 and 1948; the Netherlands Antilles 34 percent in 1947 and 30 percent in 1948; Colombia 7 percent in 1947 and 5 percent in 1948; and Mexico 7 percent in 1947 and 3 percent in 1948. A new source of supply has been found in the Middle East; the countries surrounding the Persian Gulf furnished 2 percent of the total in 1947 and 12 percent in 1948.

[1] Imports of crude as reported to Bureau of Mines; imports of refined products compiled from records of U. S. Department of Commerce; figures may differ slightly from those used throughout other sections of this report.
[2] Subject to revision.

[3] By A. H. Redfield, Petroleum Economics Branch, Bureau of Mines.

Of the crude petroleum imported into continental United States, Venezuela furnished 77 percent of the total in 1947 and 69 percent in 1948; Netherlands Antilles 5 percent in 1947 and 4 percent in 1948; Colombia 11 percent in 1947 and 7 percent in 1948; and Mexico less than 6 percent in 1947 and less than 3 percent in 1948. The most significant change was in imports from the Middle East. Countries of the Persian Gulf which supplied less than 0.5 percent of the total in 1947 furnished 18 percent of the whole in 1948.

The Netherlands Antilles provided 90 percent of the residual fuel oil imported into continental United States and the noncontiguous Territories in 1947 and 94 percent in 1948. Mexico and Caribbean countries furnished an additional 2 percent in 1948, and the Middle East 3 percent.

Caribbean countries and Mexico, which had shipped 97 percent of the distillate fuel oil received in continental United States and the noncontiguous Territories in 1947, accounted for 76 percent of such imports in 1948. Middle Eastern countries, which had supplied 3 percent of the total distillate imports in 1947, furnished 24 percent in 1948.

EXPORTS

Continental United States in 1948 ceased to be a net exporter of mineral oils. The excess of all petroleum exports over all petroleum imports—5 million barrels in 1947—was replaced in 1948 by an excess of imports totaling 53 million barrels, as more crude petroleum was imported and exports were restricted by Federal license and the general shortage of dollar credits in foreign countries. In refined oils, however, with the exception of residual fuel oil, more was exported than imported; but the excess of exports was reduced from 56 million barrels in 1947 to 36 million barrels in 1948.

Exports and Territorial shipments of crude petroleum decreased 14 percent from 1947 to 1948. Shipments to the major consumers were reduced in 1948. Canada received 84 percent of the exports both in 1947 and in 1948. France received 9 percent of the total in 1947 and 8 percent in 1948. Cuba and Argentina obtained somewhat larger shipments in 1948 than in 1947.

Exports and Territorial shipments of refined oils were 19 percent lower in 1948 than in 1947. Shipments to Europe, Australasia, and the noncontiguous Territories were considerably decreased. The only exception to the general trend was in outward shipments to other North American countries, notably to Canada and the Netherlands Antilles.

Outward shipments of motor fuel were 26 percent lower in 1948 than in 1947. There was a notable shift from 1947 to 1948 in the destinations of motor fuel shipped out of continental United States. Europe, which took 48 percent of the total in 1947, received only 36 percent of the reduced shipments of 1948. On the other hand, other North American countries, notably Canada, accounted for 41 percent of the outward shipments of motor fuel in 1948 compared with 24 percent in 1947.

Exports and Territorial shipments of kerosine were 53 percent less in 1948 than in 1947. The principal decreases were in exports to other North American countries, notably Canada, and to Europe, especially the United Kingdom.

Distillate fuel oil exported and shipped to noncontiguous Territories declined 27 percent from 1947 to 1948. Europe, the principal foreign market for distillate fuel oil, took 46 percent less in 1948 than in 1947. Exports to the Netherlands Antilles and to smaller North American countries counteracted the general decline in shipments to the major North American consumers.

On the other hand, residual fuel oil exported and shipped to noncontiguous Territories increased 18 percent from 1947 to 1948. Increased deliveries to Canada, Cuba, and the Canal Zone raised these exports to North America 48 percent in 1948 over 1947. Europe decreased its receipts in 1948 to 43 percent of those in 1947.

Exports and Territorial shipments of lubricating oils decreased 9 percent from 1947 to 1948. The chief decrease was in exports to Oceania, which were 39 percent less in 1948 than in 1947. In spite of greater imports by the United Kingdom, the Netherlands, Spain, Portugal, and Switzerland, Europe as a whole took 3 percent less of lubricating oils from the United States.

Crude petroleum exported from the United States, 1940–48, by countries, in thousands of barrels

WORLD PRODUCTION

The steadily growing demand for petroleum products in all parts of the world was reflected in an increase of 13 percent in production of crude petroleum from 1947 to 1948, as far as these totals can be calculated from incomplete data. The Western Hemisphere supplied 81 percent of the total in 1947 and 78 percent in 1948. The United States alone furnished 61 percent of the world output in 1947 and 59 percent in 1948. Venezuela, the second-largest producing country, supplied 14 percent of the total both in 1947 and in 1948. The Middle East (Bahrein Island, Iran, Iraq, Kuwait, Saudi Arabia, and Egypt) increased its share in the world output from 10 percent in 1947 to 13 percent in 1948.

The United States raised its production 9 percent from 1947 to 1948. Canada had a high proportional increase in the same period—57 percent. Mexico's production was 4 percent larger in 1948 than in 1947. Trinidad produced 2 percent less in 1948 than in 1947.

Venezuela was chiefly responsible for the increase of 12 percent in South America from 1947 to 1948. Increases in the other South American countries were large in proportion but small in quantity.

Western Europe also showed a pattern of recovery and new development as well. Petroleum production in Germany was 10 percent larger in 1948 than in 1947. The Netherlands, a comparative newcomer in petroleum production, obtained from the Schoonebeek field 133 percent more oil in 1948 than in 1947. Austria, however, produced 2 percent less petroleum in 1948 than in 1947.

For eastern Europe exact statistical data are generally lacking. The best estimates that can be made at this time indicate that the U. S. S. R. increased its production 16 percent from 1947 to 1948. Rumanian output was 8 percent larger in 1948 than in 1947. Hungary, however, produced 18 percent less petroleum in 1948 than in 1947. But Poland increased its small petroleum production 5 percent from 1947 to 1948.

The most spectacular gains in petroleum production were in the Middle East. This group of six countries increased its output 36 percent from 1947 to 1948. The Burghan field in Kuwait produced nearly three times as much in 1948 an in 1947. In Saudi Arabia the output of the Abqaiq field doubled from 1947 to 1948, so that the production of the country was 59 percent larger in 1948 than in 1947. Iran, with its production virtually controlled at the source, expanded its output 23 percent to meet the rising demand for petroleum products. In contrast, Iraq, in consequence of closing of the Haifa refinery and suspension of pipe-line shipments to Palestine in April 1948, reduced its production of crude 27 percent from 1947 to 1948. In Egypt the new Sudr field was chiefly responsible for a 55-percent increase in crude production from 1947 to 1948.

Eastern Asia showed a general pattern of recovery from war damages and political unrest. Indonesia nearly quadrupled in 1948 the diminished production of 1947, but still attained little more than half of its 1939 output. In British Borneo increased production in the Seria field of Brunei in particular boosted the output 55 percent from 1947 to 1948.

World production of crude petroleum, 1942–48, by countries, in thousands of barrels

Phosphate Rock

By BERTRAND L. JOHNSON AND E. M. TUCKER

GENERAL SUMMARY

MINED production of phosphate rock in the United States made a new high record in 1948, according to the reports submitted by producers to the Bureau of Mines; the total reached 9,388,160 long tons, more than a quarter of a million tons above the 1947 record high. Of this, 7,184,297 tons were mined in Florida, over 800,000 tons more than in 1947; 1,499,547 tons in Tennessee, only slightly more than in 1947; and only 704,316 tons in the Western States, about half a million tons less than in the previous year.

Sales decreased from 9,027,030 tons in 1947 to 8,668,769 tons in 1948 (see fig. 1), and the increase in Florida failed to counterbalance

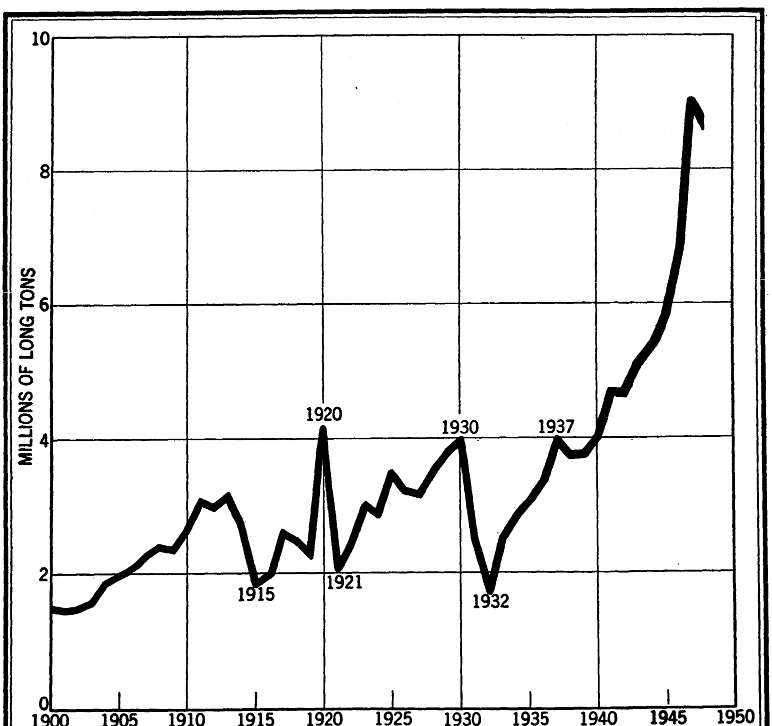

FIGURE 1.—Marketed production of domestic phosphate rock, 1900–48.

the large decrease in sales of Western States rock. The total value of the phosphate rock sold or used rose to $50,501,598 in 1948, nearly $4,000,000 above the 1947 level. The P_2O_5 content of the rock sold or used in 1948 declined from the record high of 1947 (2,903,082 tons) to 2,810,206 tons in 1948. Imports increased both in quantity and value. Exports were less in 1948 by over 600,000 tons in quantity and about $3,000,000 in value. Apparent domestic consumption increased to 7,700,081 long tons in 1948. Stocks rose sharply to 1,819,000 tons at the end of 1948, due chiefly to a large increase to those in Florida.

The Congress passed a law in June 1948 that increased the maximum acreage of phosphate leases on public lands that can be held within a State from 2,560 to 5,120 acres and fixed the national maximum holding at 10,240 acres.

1 Data not available.
2 Includes sintered matrix.
3 Includes small quantity from Virginia.
4 Includes Utah.
5 Revised figure.
6 Market value (or price) at port of shipment and time of exportation to the United States
7 Exports as reported by producers.
8 Quantity sold or used by producers plus imports minus exports.
9 Includes brown-rock matrix of sinter grade, sintered brown rock, blue rock, and some matrix of washer grade.

Several general papers relating to the phosphate-rock industry have been published recently.[1]

PRODUCTION

Mined production in the United States in 1948 bettered the record high production of 1947 by 277,171 long tons. The new record of 9,388,160 long tons was made as a result of an increase of over 800,000 tons in Florida and in spite of a decrease of over 500,000 tons in the mined production of the Western States. Phosphate rock was mined in 1948 in Florida, Tennessee, Idaho, Montana, Utah, and Wyoming.

Phosphate rock mined in the United States, 1939–48, by States, in long tons

Year	Florida	Tennessee[1]	Western States	United States	Year	Florida	Tennessee[1]	Western States	United States

[1] Includes small quantity of apatite from Virginia (none produced in 1948) and in 1939–43 some matrix of washer grade.
[2] Revised figure.

SALES

A marked decline occurred in 1948 in the quantity of phosphate rock sold or used by producers—from 9,027,030 long tons in 1947 to 8,668,769 tons in 1948, a drop of 358,261 tons, owing largely to the sharp drop in sales of Idaho phosphate rock. The total value of the sales in 1948, as reported by the producers, was \$50,501,598, nearly \$4,000,000 greater than in 1947.

Phosphate rock sold or used by producers in the United States, 1944–48

PRICES

Prices for both Florida and Tennessee phosphate rock were raised early in 1948. It is reported (Oil, Paint and Drug Reporter, April 26, 1948) that the new Florida prices are based on costs of oil at $2.89 a barrel and labor at 98 cents an hour and that in Tennessee the prices are adjusted to costs of coal at $6 per net ton, and a labor price of 82 cents an hour. The accompanying table gives the price quotations of the Oil, Paint and Drug Reporter, at the beginning, middle, and end of 1948 for Florida and Tennessee phosphate rock. The Tennessee quotations are now given on a P_2O_5 basis instead of the B. P. L. content formerly used. Quotations for Western States phosphate rock are not given in the trade journals.

Prices per long ton of Florida and Tennessee unground, washed, and dried phosphate rock, in bulk, f. o. b. cars at mine, by grades, in 1948

[Oil, Paint and Drug Reporter]

Grades (percent) [1]	Florida land pebble			Tennessee brown rock		
	Jan. 5	June 28	Dec. 27	Jan. 5	June 28	Dec. 27

[1] B. P. L. signifies bone phosphate of lime.

REVIEW BY STATES

SOUTHERN STATES

Arkansas.—No development work is known to have been in progress in 1948 in the Batesville area, Independence County, Ark., where drilling operations by the State Division of Geology in 1947 proved 141,540 long tons of phosphate rock averaging 40.97 percent tricalcium phosphate.

Florida.—A new high record was made in 1948 in the total quantity of Florida phosphate rock, sold or used—6,539,258 long tons—but only slightly higher than the 1947 record. The total value of this rock—$37,732,894—was nearly $5,000,000 greater than the value of the phosphate rock sold or used in 1947. Increases occurred only in the quantity and value of the land-pebble phosphate rock sold or used.

The land-pebble phosphate-rock-mining companies in operation in 1948 were the American Agricultural Chemical Co. (Pierce); American Cyanamid Co. (Brewster); Coronet Phosphate Co. (Plant City); Davison Chemical Corp. (Ridgewood); International Minerals & Chemical Corp. (Mulberry); Pembroke Chemical Corp. (Pembroke); Swift & Co. (Agricola); and the Virginia-Carolina Chemical Corp. (Nichols).

Two papers on phosphate-rock mining and milling practices in Florida appeared in the latter part of the year.[2]

Florida phosphate rock sold or used by producers, 1944–48, by kinds

[1] Includes material from waste-pond operations.

The International Minerals & Chemical Corp. operated its Achan, Peace Valley, and Noralyn mines and washers and its Prairie drier in 1948; the Achan, however, was closed for 3 months. According to the annual report of the company for the fiscal year ended June 30, 1948, the Peace Valley mine operated at capacity throughout the fiscal year, and the Noralyn mine commenced production late in that year and met expectations in tonnage and quality of output. Several articles descriptive of the Noralyn mine were published in 1948.[3] This mine, located about 3½ miles south of Bartow, is reported to be the largest in the world, with a designed capacity of 1,500,000 tons of phosphate rock annually. After the overburden is stripped off, the matrix is mined by a walking dragline excavator and sluiced to a pump which forces the material in suspension to the top of the washer. The washer makes the first separation into two particle sizes, elevating the larger to pebble phosphate bins, and sending the smaller to the desliming section. The desliming section rejects the minus 200-mesh material (mainly clay) and separates the remaining solids into two portions, the smaller-mesh material going to the flotation cells and the larger to

spiral concentrators. At present all products are sent to Mulberry for drying. Construction of this plant was begun early in 1947, and it went into operation in March 1948.

The American Agricultural Corp. operated its mines Nos. 3 and 11, its tabling plant, and its drier at Pierce. The American Cyanamid Co. reports that phosphate rock was recovered from its Saddle Creek mine, washer, and flotation unit and dried at Brewster. The Coronet Phosphate Co. operated its Eleanor mine, washer, and flotation plant and dried the phosphate-rock production at the Coronet drier. A description of the Eleanor operations was published during the year.[4] The Davison Chemical Corp. mined phosphate rock from its Bonny Lake, Pauway No. 3, and Pauway No. 4 mines and dried the washed rock at its Ridgewood drying plant. The Pembroke Chemical Corp. operated its mine, washer, and drier at Pembroke.

The Armour Fertilizer Works new triple superphosphate plant development at Bartow is said to have begun early in December 1947 with the grading of a double-track spur into the property from the Seaboard Air Line and to have continued in 1948.

Swift & Co. operated its Swift No. 5 and Swift No. 6 mine and washer, drying the phosphate rock produced at its Agricola drier. The Virginia-Carolina Chemical Corp. operated its Homine mine and washer and mined feed from the Phosmico debris dumps. The Phosmico and Nichols drying plants and the company calcining kiln were also in operation. A description of the Homeland property of the Virginia-Carolina Chemical Corp. was published.[5]

In the hard-rock phosphate field, C. & J. Camp (P. O. Box 608, Ocala, Fla.) and J. Buttgenbach & Co. (P. O. Box 67, Lakeland, Fla.) operated jointly, as in recent years, and both mined and shipped hard-rock phosphate from the Section 12 mine near Dunnellon. All the shipments were for foreign consumption.

Several soft-phosphate companies were operating in the waste ponds of the hard-rock phosphate field, and one company mined and shipped a phosphatic clay from Bartow.

Tennessee.—The quantity of phosphate rock sold or used by Tennessee producers in 1948 dropped over 100,000 tons—from 1,411,884 long tons (including a small quantity of apatite from Virginia) in 1947 to 1,307,507 tons in 1948. The total value in 1948, however, was nearly $500,000 more than in 1947, according to reports from producing companies, and rose to $8,231,251.

Tennessee brown-rock phosphate was mined in 1948 by the Tennessee Valley Authority (Columbia, Tenn.) and by several private companies: Armour Fertilizer Works (Room 350, Hurt Building, Atlanta, Ga.); Federal Chemical Co. (Room 634, Starks Building, Louisville, Ky.); Harsh Phosphate Co. (Route 1, Murfreesboro Road, Nashville, Tenn.); Hoover & Mason Phosphate Co. (8 Michigan Avenue, Chicago, Ill.); International Minerals & Chemical Corp. (20 North Wacker Drive, Chicago, Ill.); Monsanto Chemical Co. (1700 South Second Street, St. Louis, Mo.); Owens Agricultural Co. (Centerville, Tenn.); and Virginia-Carolina Chemical Corp. (P. O. Box 1797, Richmond 14, Va.).

1946	1,362,600	7,014,490	5.15				

1 Includes in 1944–47 small quantity of Tennessee blue rock and also Virginia apatite.

According to the annual report of the TVA for the fiscal year ended June 30, 1948, the TVA chemical plant at Muscle Shoals produced 153,000 tons of triple superphosphate, 6,000 tons of calcium metaphosphate, and 27,000 tons of fused tricalcium phosphate for use as plant nutrients in a program of soil and water conservation.

Because most of the remaining brown-rock phosphate deposits in Tennessee are sands mixed with clay and silica, TVA has developed washing methods in connection with mining operations that have resulted in improved recovery of the phosphate. In the fiscal year 1948, data compiled on large-scale tests of the use of caustic soda dispersant in the washing operation to improve phosphate recovery showed an increase of about one-fourth of the amount recovered and a reduction in the cost of the recovered material by about one-eighth. Means of reducing dispersant consumption and improving control methods, developed in the laboratory, were being tested at the field plant near Columbia, Tenn.

Phosphate sands ordinarily have to be made into lumps for a suitable furnace charge. TVA explorations have indicated that pelletizing or briquetting will prove cheaper and simpler than present methods of sintering and nodulizing. An experimental shaft kiln for calcining pellets in order to give them strength was developed during the year and proved considerably more economical than the rotary kiln previously used.

Tests during the 1948 fiscal year showed phosphate briquets to be an excellent low-cost charge for fused tricalcium phosphate furnaces, promising to produce a substantial saving in the cost of making this fertilizer. Equipment was being installed for the two furnaces at TVA's fused tricalcium phosphate plant near Columbia, Tenn.

A radically new type of electric furnace, having a crucible that rotates slowly, was placed in pilot-plant operation during the 1948 fiscal year. The primary objective was to develop a method for smelting phosphate sands directly, as elimination of the costly agglomeration step would significantly reduce the cost of producing concentrated fertilizers. The first phase of pilot-plant investigation showed not only that phosphate sands could be used satisfactorily as a charge but that the new furnace operates more efficiently than conventional furnaces.

During the fiscal year 1948 TVA began a study to perfect technical improvements in the wet process of triple superphosphate production, particularly for recovery of sulfuric acid from the byproduct calcium sulfate.

In the fiscal year 1948 TVA began to build a furnace of new design in which it is expected to produce calcium metaphosphate, containing about 60 percent available P_2O_5, at a cost per unit of P_2O_5 as low or lower than that for manufacturing concentrated superphosphate. The new process permits the use of pulverized rock phosphate for a large part of the furnace charge in place of lump rock or agglomerated phosphate.

Several projects were under way with respect to improvements in the TVA process for producing fused tricalcium phosphate, a fertilizer material of about 50 percent greater concentration than ordinary superphosphate. A small pilot furnace at Muscle Shoals was used during the fiscal year to test natural gas as a fuel in place of oil and to investigate the use of Florida and western phosphate rock, which would be more plentiful and economical to use in most localities. Preliminary tests showed that natural gas would be a suitable fuel. Florida ores proved amenable to processing by this method, but the western material tested proved more difficult to defluorinate. Pilot-plant tests looking toward increasing the concentration of fused tricalcium phosphate above the 27 percent average for the Columbia plant were made. With a furnace charge of high-grade phosphate rock with low silica content, a concentration of nearly 33 percent was obtained with a fuel consumption about 18 percent higher than at Columbia. In other pilot-plant tests, borax was added to the furnace charge to produce fused tricalcium phosphate containing boron, one of the "trace elements" recognized in recent years as deficient in many soils.

During the fiscal year 1948 TVA resumed studies begun several years ago for making dicalcium phosphate fertilizer by mixing pulverized phosphate rock and phosphoric acid and subjecting the mixture to moderately high temperature and pressure. The process of production of dicalcium phosphate by treating lime with phosphoric acid was still carried on by TVA. TVA's studies of the production of phosphate nitrogen fertilizers as well as potassium phosphate fertilizers were continued.

Two papers on TVA's studies (in addition to those referred to later under Technology) were published during the year.[6]

Its fifth and largest electric furnace for the production of elemental phosphorus at Monsanto, Tenn., was dedicated by the Monsanto Chemical Co. in October 1948.[7] Rated at over 20,000 kilowatts, the new furnace is reported to add nearly 50 percent to the plant's output of elemental phosphorus. Plans for constructing a washing unit to eliminate fluorine gas present in smoke emitted from the Monsanto phosphorus plant were announced at the dedication. Excavation of a large settling pond, reported one-half mile in length and averaging 20 feet in depth to prevent phosphate-bearing mud from flowing into the Duck River, was started during the summer of 1948. A new railroad spur, expected to double shipping capacity, was completed on the plant grounds.

Manufacturers Record, Another Furnace Added to World's Largest Phosphorus Works in Tennessee: Vol. 117, No. 12, December 1948, pp. 46–47.

The Victor Chemical Works continued production of elemental phosphorus at its electric-furnace plant in the brown-rock phosphate field.

Virginia.—No apatite was produced at the apatite-ilmenite deposit of the Calco Chemical Division, American Cyanamid Co., Piney River, Va., in 1948. No sales were made from the stocks on hand, and none of the apatite was used by the company. The shut-down of the mine and plant is reported permanent by the company.

WESTERN STATES

Sharp declines in both quantity and value featured the total marketed production of Western States phosphate rock in 1948, according to reports from producers to the Bureau of Mines. The great drop in Idaho shipments, caused by cessation of United States Army purchases in 1948 for overseas shipments to occupied territories, was not counterbalanced by the increases in shipments of Montana and Wyoming phosphate rock. (See fig. 2.) The output in 1948 came from all four States of the western field—Idaho, Montana, Utah, and Wyoming.

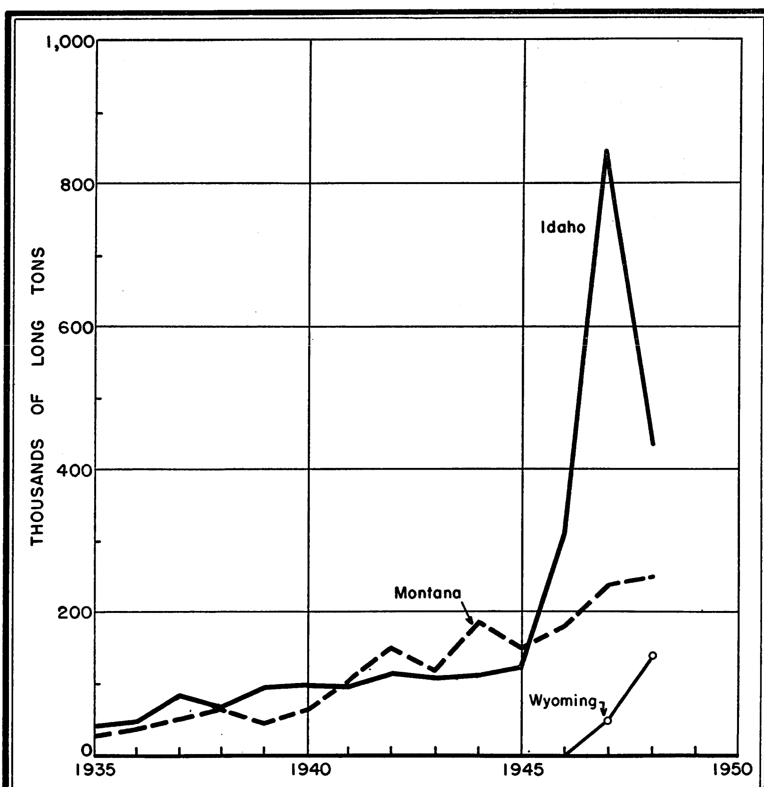

FIGURE 2.—Idaho, Montana, and Wyoming phosphate rock sold or used by producers, 1935–48

The average value per ton of the Western States phosphate rock sold or used, as reported by producers, increased slightly for the year—rising from $5.24 in 1947 to $5.52 in 1948.

In the early part of 1948 Permanente Metals Corp. was producing its fused calcium-magnesium-phosphate fertilizer, made from serpentine and Idaho phosphate rock, at its Permanente, Calif., electric-furnace plant, but it is said to have ceased operations later in the year. Manganese Products, Inc., Seattle, Wash., began production at Seattle in 1948 of an electric-furnace fused calcium-magnesium-phosphate fertilizer, using olivine from Cypress Island, Wash., and phosphate rock from the Philipsburg district, Mont. A description of the plant was published late in the year.[8]

Detailed geologic mapping of known deposits in some of the most important areas of the Idaho-Utah-Wyoming area have been completed by the Geological Survey, and work is going forward in other areas. Reconnaissance surveys are being made throughout the region. New deposits that may have commercial value have been discovered in western Montana. Mining-cost studies have been made by the Bureau of Mines, which is also experimenting with beneficiation of raw rock phosphates in its Salt Lake City laboratory. Recovery of the vanadium content of the phosphate rock by electrothermal processing is being studied by the Bureau of Mines at Albany, Oreg.

[1] Includes Utah in 1946–48.
[2] Revised figure.

Idaho.—Idaho retained its position as the leading phosphate-rock producer of the Western States in 1948; but its output, both in quantity and value, was cut to nearly half that of 1947. Its shipments (in-

[8] Granberg, W. J., Electric Furnace Combines Olivine and Phosphate: Rock Products, vol. 51, No. 10, October 1948, pp. 108, 110.

cluding a small quantity from Utah) were only 434,375 long tons, valued at $2,122,089. At that, however, they were greater than in any year before 1947.

As in 1947, three companies operating in Idaho reported sales of phosphate rock in 1948. The largest producer was again the Simplot Fertilizer Co., Pocatello, Idaho, which continued its mining operations at the Gay mine, Fort Hall Indian Reservation, Bingham County. Much of the output was exported. A smaller amount was used domestically, largely in the manufacture of superphosphate; but a considerable quantity was sold for direct application to the soil as a fertilizer. This firm obtained in 1948 a Government lease on 1,124 acres of phosphate rock land suitable for strip mining in Caribou County, north of Bingham County, where the company is now operating. High-grade rock is to be used in the company Salt Lake City plant. The low-grade rock is to go to the elemental phosphorus electric-furnace plant being erected at Pocatello, Idaho. This lease is the first ever issued by the Government in which development of the lower-grade phosphate rock is contemplated through stipulation for payment of royalties not only on production of 30-percent material but also "on any phosphate rock of lower grade which may be utilized."

The Westvaco Chemical Division, Food Machinery & Chemical Corp. in 1948 began the erection near Pocatello, Idaho, of an electric-furnace plant for producing elemental phosphorus, the first in the West. The initial furnace is expected to be completed early in 1949. Electric power will be obtained from the Idaho Power Co. The Union Pacific Railroad has completed a 23-mile spur linking the phosphate-rock mine with the electric-furnace plant and the Simplot superphosphate operations at Pocatello. It is expected that initially the elemental phosphorus will be shipped in tank cars to Westvaco's plant at Carteret, N. J., where it will be burned to phosphorus pentoxide and phosphoric acid. It is planned to process the phosphorus to phosphates at the company plant at its natural sodium sesquicarbonate mine at Trona, Wyo., at a later date.

The Anaconda Copper Mining Co. operated its No. 3 mine at Conda, Caribou County, Idaho. The rock mined was used largely for the production of superphosphates; a smaller quantity went into phosphoric acid and phosphate chemicals, and a yet smaller amount for direct application to the soil. None was exported.

The San Francisco Chemical Co., Montpelier, Idaho, did not operate its Waterloo mine near Montpelier, Bear Lake County, Idaho, in 1948. A considerable tonnage, already in stocks, was used domestically, and some was exported.

Montana.—Montana phosphate-rock production continues to increase; the State, however, remained in second place among the producers of the Western States. Shipments from Montana mines in 1948 totaled 248,683 long tons valued at $1,720,254. Both quantity and value exceeded those of 1947. The Montana Phosphate Products Co., Trail, British Columbia, was, as usual, the largest producer in Montana. It operated its Anderson, Anaconda, and Graveley mines, as well as several Government leases, all in the Garrison district, Powell County. All of the rock shipped was exported to the plant of the parent company at Trail, British Columbia. Mining operations were also carried on by George Relyea, Garrison, Mont., at the Relyea mine also in the Garrison district, and the production was shipped also to Trail, British Columbia. The Silica Products Co., Inc., 433 Provident Bldg., Tacoma, Wash., reported no production in 1948 at its phosphate-rock mine in the Elliston district in Powell County, but expected to operate sometime in 1949.

In the Philipsburg district, Granite County, only Manganese Products, Inc., Seattle, Wash., shipped any phosphate rock in 1948. It operated but one mine in 1948—the Edgar mine at Hall. The shipments of phosphate rock were to its own plant in Seattle, Wash., for the production of a fused calcium-magnesium phosphate fertilizer.

Utah.—The Garfield Chemical & Manufacturing Corp., Salt Lake City, Utah, mined and shipped phosphate rock from the Diamond Canyon phosphate mine on a Federal lease near Springville, Utah County, Utah, in 1948, for use in iron blast furnaces. The Utah Phosphate Co., Morgan, Utah, is reported to have a phosphate-rock mine and mill near Morgan, Morgan County, Utah; but the company did not report any operations in 1948. The phosphate rock deposit in Old Laketown Canyon in northeastern Utah is reported under lease to Idaho operators and is expected to be in production in 1949.

Wyoming.—Wyoming became an increasingly important phosphate-rock producer in 1948, more than doubling its 1947 production. Shipments totaled 138,946 long tons, valued at $695,110. Most of this output came from the Leefe mine of the San Francisco Chemical Co., Montpelier, Idaho (a subsidiary of a British copper mining company, Mountain Copper Co., Ltd.). The company mined phosphate rock in the Beckwith Hills syncline west of Sage, Wyo., on land leased from the owners, the Stauffer Chemical Co., San Francisco, Calif. Construction of a large crushing plant is reported to have been in progress during 1948 at the Leefe operations.

Phosphate Mines, Inc., continued in 1948 development of its phosphate-rock mine, 7 miles north of Kemmerer, Wyo. Two mills are said to have been installed during the year and at the end of September were about ready to operate. Sales of ground rock were made for direct application to the soil.

The John M. Thomas claims and the Thomas-Walker-Doerr Co. leases (H. F. Chaney claims) on the Sublette Range anticline in western Lincoln County are reported to have been under development in 1948.

FOREIGN TRADE [9]

Data on imports and exports of phosphate rock and other phosphatic materials are shown in the following tables:

[9] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce. Phosphate-rock export figures do not include Army shipments to occupied territories in 1946.

Phosphate rock and phosphatic fertilizers imported for consumption in the United States, 1944–48

Fertilizer	1944		1945		1946		1947		1948

[1] In addition to countries listed, Angaur Island, China (including Formosa), Christmas Island (near Singapore), Madagascar, New Caledonia, Republic of the Philippines, Poland, and Rumania produce phosphate rock, but data of output are not available, and no estimates have been included in the total.
[2] Data not available; estimate by author of chapter included in total.
[3] Estimate.
[4] Bizonal.
[5] Fiscal year ended June 30 of year stated.

BASIC SLAG

Basic slag forms a small source of agricultural phosphorus in the United States. Domestic production is limited to a single producing company smelting the phosphatic iron ore of the Birmingham, Ala., district; no figures of production or sales have been released for publication by this company. Annual imports are negligible. In 1948 only 29 long tons were imported. None had been imported in 1944–47.

Platinum-Group Metals

By HUBERT W. DAVIS AND CHARLOTTE R. BUCK

GENERAL SUMMARY

SUBSTANTIALLY smaller demand (chiefly by the chemical and jewelry industries), adequate supplies, and higher prices were features of platinum in 1948. Sales of platinum were the smallest since 1940. The quotation of $101 an ounce for platinum that prevailed from April 14 to June 3 was the highest since April 7, 1927. Demand for palladium was at a much higher level than in 1947, and sales in 1948 were only 6 percent less than those of platinum. Moreover, sales of palladium in 1948 have been exceeded in only two other years. Purchases of palladium by the electrical industry established a new peak in 1948. Noteworthy were the imports of 62,241 ounces of palladium from the U. S. S. R. in 1948.

Salient statistics of platinum-group metals in the United States, 1947–48, in troy ounces

	1947	1948
Production:		
Crude platinum from placers	13,836	13,741
New metals:		
Platinum	54,011	33,520
Palladium	4,156	4,408
Other	2,690	1,663
	60,857	39,591
Secondary metals:		
Platinum	54,190	58,527
Palladium	27,492	28,418
Other	5,406	6,956
	87,088	93,901

	1947	1948
Stocks in hands of refiners, importers, and dealers, Dec. 31:		
Platinum	133,300	146,823
Palladium	167,364	142,211
Other	36,859	34,540
	337,523	323,574
Imports for consumption:		
Unrefined materials	51,209	33,654
Refined metals	257,656	239,302
	308,865	272,956
Exports:		
Ore and concentrates	42	5
Refined metals and alloys, including scrap	25,549	36,465
Manufactures (except jewelry)	6,327	4,874

Platinum was refined in the United States in 1948 at a rate 15 percent lower than in 1947 and greatly below the substantially smaller demand. The refined-metal deficiency was met by imports of 103,939 ounces, chiefly from Canada (66,557 ounces), Switzerland (16,528 ounces), United Kingdom (11,559 ounces), and Palestine (4,204 ounces). The jewelry trade was again by far the largest outlet for platinum, taking 46 percent of the total sold to domestic consumers. However, sales to the jewelry industry declined for the second consecutive year and were 29 percent smaller in 1948 than in 1947. Less platinum was also sold to the chemical and dental industries, but sales to the electrical industry were up 39 percent.

Palladium was refined in the United States at a slightly higher rate in 1948 than in 1947. The quantity refined in 1948, however, was 82 percent less than sales, which were 30 percent more than in 1947. The deficit in palladium was partly met by imports of 119,949 ounces of refined metal, chiefly from U. S. S. R. (62,241 ounces), Canada (38,003 ounces), and United Kingdom (13,320 ounces), and partly by withdrawals from stocks of refiners and dealers. The larger sales of palladium in 1948 were shared by all domestic consuming industries, except the dental industry; moreover, the export demand for palladium was six times that in 1947.

More osmium and ruthenium but less iridium and rhodium were refined in the United States in 1948 than in 1947. More iridium and rhodium but less osmium and ruthenium were imported than in 1947. Sales to domestic consuming industries of iridium and ruthenium were 30 and 28 percent, respectively, less than in 1947, but those of osmium and rhodium were up 32 and 14 percent, respectively; sales of iridium, osmium, rhodium, and ruthenium for export were substantially greater than in 1947.

Imports of platinum-group metals into the United States in 1948 were 12 percent less than in 1947.

Figure 1 shows graphically the trend in world production of platinum-group metals since 1914.

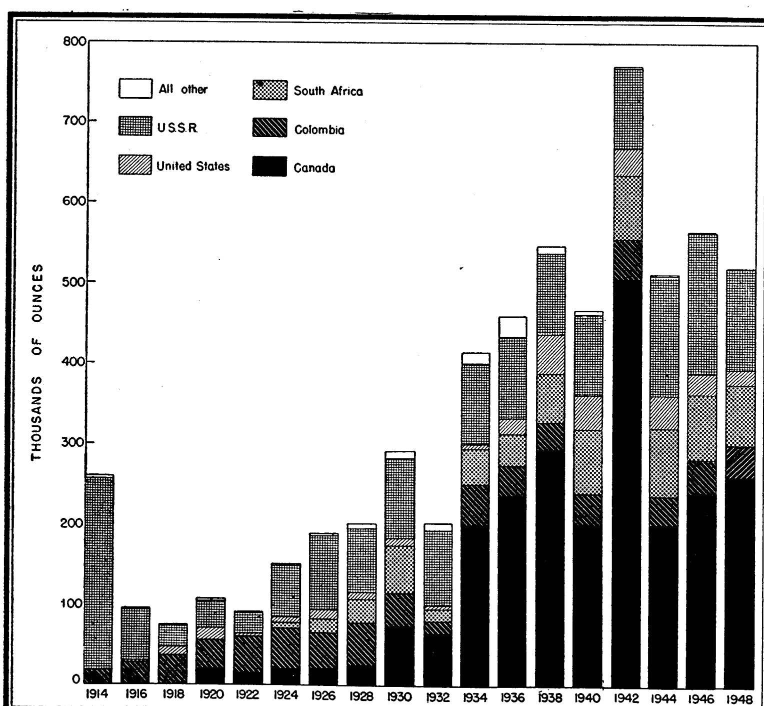

FIGURE 1.—Trend in world production of platinum-group metals, 1914–48.

CRUDE PLATINUM PRODUCTION

Crude platinum-group metals were produced in Alaska and California in 1948 and totaled 13,741 ounces, compared with 13,836 ounces in 1947. The Alaskan production came from placer deposits in the Goodnews Bay district of southwestern Alaska, and the California output was a byproduct of gold placers in Butte, Mariposa, Merced, Sacramento, San Joaquin, Shasta, Siskiyou, and Yuba Counties.

Many gold and copper ores in the United States contain small quantities of platinum-group metals. In 1948, 5,512 ounces of platinum-group metals were recovered as byproducts of refining gold and copper ores compared with 4,570 ounces in 1947.

Source of Purchases.—Purchases of domestic crude platinum-group metals by buyers in the United States were reported from Alaska, California, and Oregon in 1948 and totaled 13,871 ounces (13,795 ounces in 1947). Domestic buyers also reported purchases of 23,020 ounces of foreign crude platinum-group metals from Colombia and 225 ounces from Canada in 1948—a total of 23,245 ounces (41,239 ounces in 1947).

RECOVERY OF REFINED PLATINUM-GROUP METALS

New Metals Recovered.—Reports from refiners of crude platinum-group metals, gold bullion, nickel, and copper indicate that 39,591 ounces of platinum-group metals were recovered in the United States from such sources in 1948—a decrease of 35 percent from 1947. Of the new metals recovered in 1948, 57 percent was chiefly from crude from Colombia, 29 percent was from domestic crude (chiefly Alaska), and 14 percent was a byproduct of domestic gold and copper ores.

New platinum-group metals recovered by refiners in the United States, 1944–46, and 1947–48 by sources, in troy ounces

	Platinum	Palladium	Iridium	Osmium	Rhodium	Ruthenium	Total
1944	132,452	10,966	4,406	463	3,256	1,502	153,045
1945	162,032	28,649	5,783	845	4,731	2,466	204,506

Total recovery	33,520	4,408	1,009	349	156	149	39,591

Secondary Metals Recovered.—In 1948, 93,901 ounces of secondary platinum-group metals were recovered from the refining of scrap metal, sweeps, and other waste products of manufacture that contain platinum-group metals—an 8-percent increase over 1947.

Substantial quantities of worn-out catalysts, spinnerets, laboratory ware, and other products are returned by consumers to refiners for refining. The refined platinum-group metals recovered from these products (or their equivalent in refined metals) are returned to the consumers. The platinum-group metals so recovered are not included in the statistics of secondary metals.

Secondary platinum-group metals recovered in the United States, 1944–48, in troy ounces

Year	Platinum	Palladium	Iridium	Others	Total
1944	85,942	29,684	965	2,805	119,396
1945	58,942	32,968	812	3,400	96,122

1947	54,190	27,492	2,089	3,317	87,088
1948	58,527	28,418	2,214	4,742	93,901

CONSUMPTION

As pure metals, combined, clad, or alloyed with other metals, the platinum-group metals are utilized in the electrical and chemical industries, in dentistry and jewelry, and for numerous miscellaneous purposes. Uses of the platinum-group metals are tabulated on page 801 of the Platinum and Allied Metals chapter in Minerals Yearbook, 1943.

Sales of platinum-group metals to consumers in the United States were 366,848 ounces in 1948 compared with 387,454 ounces in 1947. No platinum-group metals were sold to the National Strategic Stock Pile in 1948; some platinum was so sold in 1947, but the quantity was not included in the figures on sales.

Platinum continued to be the most widely used metal of the group, but in 1948 sales were only 6 percent greater than those of palladium. Sales of platinum constituted 177,441 ounces (48 percent) of the total platinum-group metals sold to domestic consumers in 1948. The jewelry trade was again the chief buyer of platinum, taking 46 percent of the total, but its purchases (81,756 ounces) were 29 percent less in 1948 than in 1947. The electrical industry, which dropped to third place in 1947, purchased 42,306 ounces of platinum in 1948 and displaced the chemical industry as the second-largest buyer. Sales of platinum to the chemical industry declined 36 percent from 1947, and those to the dental industry were 3 percent less.

Next to platinum, palladium is the most extensively used metal of the group, and in 1948 sales to domestic consumers were only 6 percent less than those of platinum. Sales of palladium to domestic consumers in 1948 were 21 percent more than in 1947 and constituted 167,610 ounces (46 percent) of the total platinum-group metals sold. The electrical industry retained first place as a buyer of palladium in

1948 by taking 105,033 ounces (63 percent) of the total palladium sold to domestic consumers. Sales of palladium to the electrical industry established a new record in 1948 and were 29 percent greater than in 1947. More palladium was also sold to the chemical and jewelry industries in 1948 than in 1947, but sales to the dental industry were less.

Sales of the other platinum-group metals—iridium, osmium, rhodium, and ruthenium—were comparatively small; they made up 6 percent of the total platinum-group metals sold in 1948. Domestic demand for osmium and rhodium was 32 and 14 percent, respectively, greater than in 1947, but that for iridium and ruthenium was 30 and 28 percent, respectively, less.

The accompanying table shows sales of platinum-group metals to consuming industries in the United States in 1947 and 1948.

Platinum-group metals sold to consuming industries in the United States in 1947 and 1948, in troy ounces

Industry	Platinum	Palladium	Iridium, osmium, rhodium, and ruthenium	Total
1947				
Chemical	65,743	6,899	3,580	76,222
Electrical	30,469	81,528	2,906	114,903
Dental and medical	9,774	20,876	74	30,724
Jewelry and decorative	114,768	28,523	15,172	158,463
Miscellaneous and undistributed	2,696	443	4,003	7,142
	223,450	138,269	25,735	387,454
1948				
Chemical	41,778	13,816	5,722	61,316
Electrical	42,306	105,033	2,784	150,123
Dental and medical	9,494	16,740	171	26,405
Jewelry and decorative	81,756	31,783	10,589	124,128
Miscellaneous and undistributed	2,107	238	2,531	4,876
	177,441	167,610	21,797	366,848

STOCKS

Stocks of platinum-group metals in all forms in the hands of refiners, importers, and dealers totaled 323,574 ounces on December 31, 1948, compared with 337,523 ounces at the close of 1947.

Stocks of platinum-group metals held by refiners, importers, and dealers in the United States, Dec. 31, 1944–48, in troy ounces

Year	Platinum	Palladium	Iridium, osmium, rhodium, and ruthenium	Total
1944	159,173	123,448	39,866	322,487
1945	138,839	119,757	43,376	301,972
1946	187,624	132,523	41,876	362,023
1947	133,300	167,364	36,859	337,523
1948	146,823	142,211	34,540	323,574

PRICES

Buyers reported purchases at $31.16 to $83.78 an ounce for domestic and foreign crude platinum-group metals in 1948. This price range results chiefly from variations in iridium content of crudes and from market fluctuations for refined platinum and ruthenium in 1948.

As a result of four advances totaling $32, the retail prices of platinum and ruthenium reached $101 an ounce on April 14, where they remained until June 4, when they were reduced to $91. On June 15 the quotations were lowered to $78, but on July 1 they were again raised to $91; and on July 26 they were advanced to $96, where they remained throughout the remainder of 1948. Iridium was quoted at $80–$85 an ounce on January 1, 1948; subsequently, several advances were made, and on April 14 the price reached $110–$120 an ounce. On June 15 the quotation on iridium was lowered to $100–$110 an ounce, but on July 26 it was raised to $110–$115, where it remained throughout the remainder of 1948. Quotations on palladium, osmium, and rhodium remained unchanged at $24, $100, and $125 an ounce, respectively, throughout 1948.

FOREIGN TRADE [1]

Imports.—Imports of platinum-group metals into the United States in 1948 were 12 percent less than in 1947. The principal sources of imported platinum-group metals in 1948 were Canada (112,301 ounces), U. S. S. R. (66,642 ounces), United Kingdom (29,127 ounces), Colombia (25,621 ounces), and Switzerland (20,713 ounces). Imports of refined metals (239,302 ounces), which comprised 88 percent of the total, were 7 percent less than in 1947, whereas those of unrefined material (33,654 ounces) were 34 percent smaller. Imports of refined platinum, palladium, osmium, and ruthenium were 6, 10, 39, and 24 percent, respectively, less than in 1947, but imports of iridium and rhodium were 9 and 176 percent, respectively, more.

Platinum-group metals imported for consumption in the United States, 1944–48 [1]

Year	Troy ounces	Value	Year	Troy ounces	Value
1944	356,212	$10,675,303	1947	308,865	$11,792,076
1945	[2] 383,658	[2] 11,591,390	1948	272,956	14,971,817
1946	407,210	14,696,320

[1] On the basis of detailed information received by the Bureau of Mines from importers, certain items recorded by the U. S. Department of Commerce as "ores and concentrates," "grains and nuggets," and "sponge and scrap" have been reclassified and included with other groups in this table.

[2] The concentrates imported from Canada contain platinum, palladium, iridium, rhodium, and ruthenium, and the crude sponge imported from Canada contains platinum and palladium. Although the U. S. Department of Commerce records "platinum content" for these entries, the Bureau of Mines has determined from the importers of these materials that most of the entries reflect the platinum-group metals content. The Bureau of Mines has also determined from the largest importer of crude platinum from Colombia that the entries for his material, recorded as "platinum content" by the U. S. Department of Commerce, represent the gross weight of the material.

[3] Adjusted by Bureau of Mines.

Platinum-group metals [1] (unmanufactured) imported for consumption in the United States, 1947–48

[U. S. Department of Commerce]

Material	1947 Troy ounces	1947 Value	1948 Troy ounces	1948 Value
Unrefined materials: [2]				
Ores and concentrates of platinum metals	1,176	$90,771	1,893	$162,573
Grains and nuggets (including crude, dust, and residues)	42,203	1,816,454	27,630	1,787,225
Sponge and scrap	7,431	384,817	3,474	261,730
Osmiridium	399	22,354	657	45,488
Total	51,209	2,314,396	33,654	2,257,016
Refined metals:				
Platinum	110,745	5,890,132	103,939	8,627,955
Palladium	133,962	2,585,115	119,949	2,578,589
Iridium	5,011	352,601	5,472	502,327
Osmium	2,189	239,605	1,338	159,232
Rhodium	2,122	239,625	5,864	672,979
Ruthenium	3,627	170,602	2,740	173,719
Total	257,656	9,477,680	239,302	12,714,801
Grand total	308,865	11,792,076	272,956	14,971,817

[1] On the basis of detailed information received by the Bureau of Mines from importers, certain items recorded by the U. S. Department of Commerce as "ores and concentrates," "grains and nuggets," and "sponge and scrap" have been reclassified and included with other groups in this table.

[2] The concentrates imported from Canada contain platinum, palladium, iridium, rhodium, and ruthenium, and the crude sponge imported from Canada contains platinum and palladium. Although the U. S. Department of Commerce records "platinum content" for these entries, the Bureau of Mines has determined from the importers of these materials that most of the entries reflect the platinum-group metals content. The Bureau of Mines has also determined from the largest importer of crude platinum from Colombia that the entries for his material, recorded as "platinum content" by the U. S. Department of Commerce, represent the gross weight of the material.

Exports.—Exports of refined platinum (including scrap) declined to 15,471 ounces in 1948 (17,766 ounces in 1947), but exports of the other platinum-group metals (including scrap) increased to 20,994 ounces (7,783 ounces in 1947). In 1948 the chief foreign markets for platinum were France (4,311 ounces), Palestine (3,513 ounces), Germany (2,800 ounces), Argentina (1,531 ounces), and Brazil (1,081 ounces) and for the other platinum-group metals Germany (12,278 ounces), France (3,446 ounces), Switzerland (2,046 ounces), and Austria (1,023 ounces).

WORLD REVIEW

Canada.—According to the Dominion Bureau of Statistics, production of platinum-group metals from the nickel-copper ores of the Sudbury district, plus a small quantity from placers in British Columbia, was 116,578 ounces of platinum and 143,822 ounces of other platinum-group metals in 1948 compared with 94,570 ounces of platinum and 110,332 ounces of other platinum-group metals in 1947.

Sales of platinum-group metals by the International Nickel Co. of Canada, Ltd., were 199,560 ounces in 1948 compared with 191,761 ounces in 1947.

Colombia.—The South American Gold & Platinum Co. produced 22,779 ounces of crude platinum-group metals in 1948 (25,241 ounces in 1947). The crude material contains about 85 percent platinum-group metals. The production of crude platinum-group metals by other operators was 17,268 ounces in 1948 (13,474 ounces in 1947).

Union of South Africa.—According to the Department of Mines, 68,926 ounces of platinum-group metals were produced in South Africa in 1948 compared with 78,740 ounces in 1947. Exports (all to England) were 64,579 ounces in 1948 compared with 56,288 ounces in 1947. The platinum-group metals are produced in the Rustenburg district in the form of crude metallics and as matte containing approximately 43 ounces per ton of platinum-group metals and gold, plus nickel and copper. The approximate proportions of the different metals of the platinum group and gold recovered from the Rustenburg ores are as follows:

Metal:	*Percent*
Platinum	77.08
Palladium	16.70
Iridium	.06
Osmium and osmiridium	.14
Ruthenium	.51
Gold	5.51

Osmiridium is recovered in the treatment of gold ores on the Rand. Sales were 5,774 ounces in 1948 (6,402 ounces in 1947).

The expansion of the plant of Rustenburg Platinum Mines, Ltd., proceeded satisfactorily in 1948 and it was expected that certain portions of the new plant would be in operation in early 1949.[2] During 1949 the furnaces for smelting concentrates will be dismantled and reerected. It is anticipated that by the end of 1949 metallics and concentrates will be shipped at a rate double the 1948 output.

The Union Platinum Mining Co., which acquired a lease to mine precious metals in the Rustenburg district, was reported [3] to have begun treating about 150 tons of ore daily in early 1949. A plant to treat 500 tons daily was being erected.

[1] Data not available.
[2] Recovered from nickel-copper mattes. The figures for 1945–48 represent the platinum-group metals contained in the concentrates actually recovered, whereas those for 1939 and 1943–44 represent the metals refined from Canadian concentrates at Acton, England, plus the platinum-group metals content of concentrates sold.
[3] Includes certain adjustments to account for metals produced in Canada in 1938–44 but not previously accounted for in the statistics.
[4] Exports for year ended Sept. 10 of year stated.
[5] Year ended June 30 of year stated.
[6] Produced from platinum ores.
[7] Produced from treatment of gold ores on the Rand.
[8] Recovered from nickel-copper ores.
[9] New platinum-group metals recovered in gold and copper refining of domestic materials.

Potash

By BERTRAND L. JOHNSON AND E. M. TUCKER

GENERAL SUMMARY

AGAIN new records have been made in the potash industry of the United States, according to producers' reports. In 1948 both production of marketable potassium salts and sales reached new highs, each exceeding 2 million tons. Production in 1948 was 232,717 short tons greater than in 1947; the equivalent potash content (K_2O) was 110,006 tons greater. (See fig. 1.) Sales in 1948 topped those of 1947 by 195,500 tons, with the K_2O content 90,073 tons larger. The value of the sales in 1948 was over 1¼ million dollars more than in 1947. The average value per ton of potassium salts sold in 1948 was $1.02 less than in the previous year. Stocks in producers' hands at the end of 1948 declined from the previous year and reached the low figure of 11,211 short tons K_2O. Both imports and exports of potash materials were greater in quantity in 1948 than in 1947, but the value of the imports alone increased. A new high was reached in 1948 in the

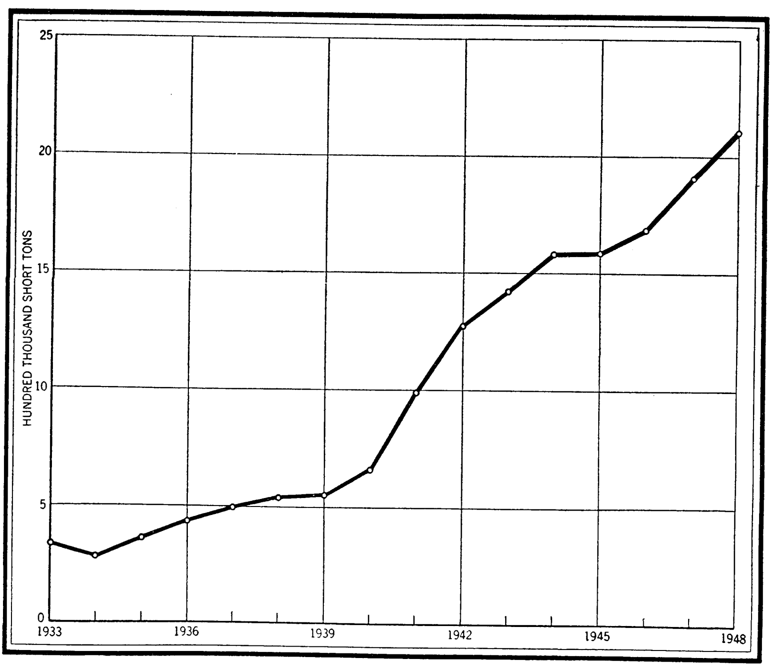

FIGURE 1.—Production of marketable potash salts in the United States, 1933–48.

apparent domestic consumption of potash (K_2O)—nearly 90,000 tons greater than in 1947.

Several articles on the potash industry were published in 1948.[1]

[1] Estimate by Bureau of Mines.
[2] Quantity sold by producers, plus imports, minus exports.

RESERVES

The world's known reserves of high-grade soluble potash salts have been estimated to total over 37,000 million metric tons K_2O. More than 99 percent of these reserves are in western Eurasia, principally in Germany and the U. S. S. R. The reserves in Germany alone have been estimated (by Fulda) to be 20,000 million tons K_2O, and those in Russia (by Poppe) at 15,000 million tons. The combined reserves of the other Eurasian countries—Spain, France, Israel, and Trans-jordan—are placed at only 2,200 million tons. In the Western Hemisphere the United States contains the only presently known economic deposits, although substantial reserves may exist in western Canada. The potash reserves of the United States are a relatively small part of the world total—less than 0.3 percent. Latest commercial estimates place the net recoverable reserves at only 73 million short tons K_2O.

PRODUCTION AND SALES

The upward trends in the production and sales of domestic marketable potassium salts in evidence since 1934 were continued in 1948, and both were considerably larger than in 1947. Production of potassium salts in 1948 totaled 2,138,493 short tons, with an equivalent K_2O content of 1,139,881 tons. Sales were 2,148,807 tons, with an equivalent K_2O content of 1,143,339 tons. Sales of potassium salts exceeded the production in 1948, and stocks in producers' hands at the end of the year decreased from those on December 31, 1947. The value of the sales reached nearly 36 million dollars. The average value per ton of the potassium salts sold in 1948 was $16.75, $1.02 less than in 1947.

Production of both grades of muriate of potash and manure salts was larger in 1948 than in 1947. The production of sulfate of potash and sulfate of potash-magnesia continued to decline from the recent peak of 1946. (See fig. 2.)

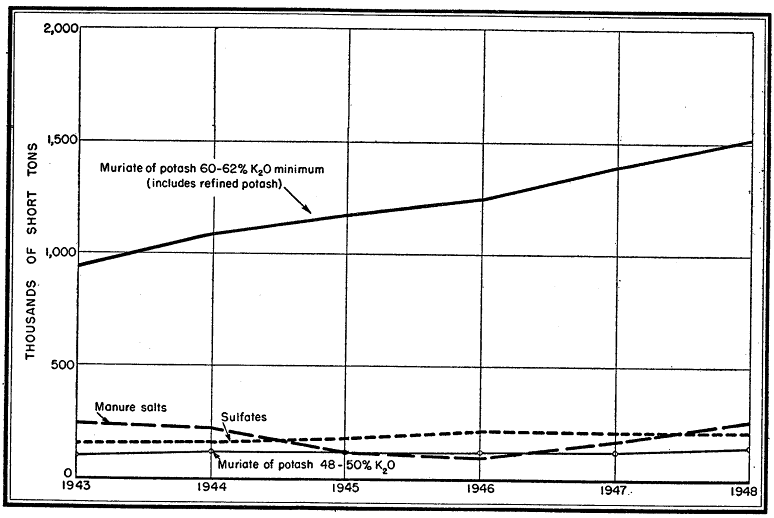

Figure 2.—Potassium salts produced in the United States, 1943–48, by grades, in short tons.

The production of the Western States remains the dominant factor in the domestic potash industry. California, New Mexico, and Utah furnished virtually all of the 1948 output, the largest part coming from the deeply buried deposits of sylvite and langbeinite, of Permian age, in the Carlsbad region, southeastern New Mexico. The eastern United States supplied only a small quantity—from well brines in Michigan and as a byproduct of cement operations in Maryland.

Potassium salts produced in the United States, 1946–48, by grades, in short tons

Grade	1946	1947	1948
Muriate of potash:			
60–62 percent K_2O minimum [1]	1,251,088	1,394,202	1,523,937
48–50 percent K_2O minimum	122,257	125,120	145,675
Manure salts	98,333	174,145	260,339
Sulfate of potash and sulfate of potash-magnesia	216,057	212,309	208,542
Total	1,687,735	1,905,776	2,138,493

[1] Includes refined potash and some 93–96 percent KCl.

Production and sales of marketable potassium salts and stocks in the hands of producers for the last 5 years are summarized in the accompanying table. (See fig. 3.)

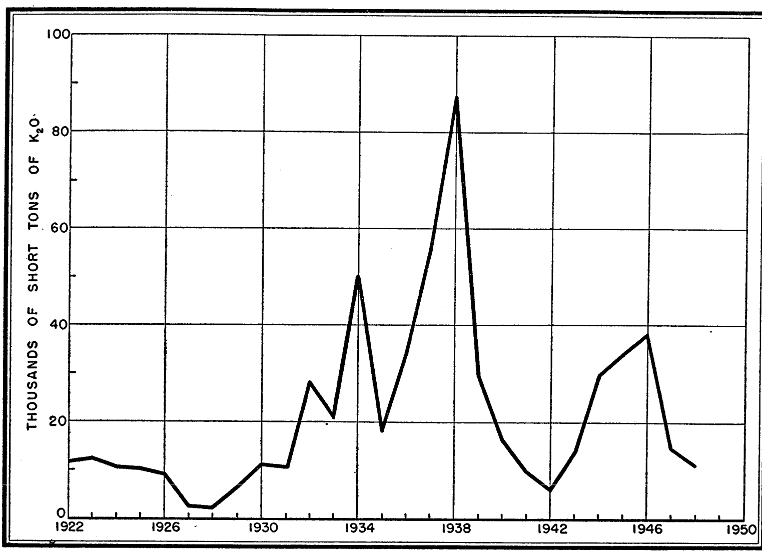

FIGURE 3.—Equivalent potash (K_2O) content in producers' stocks at end of year, 1922–48, in short tons.

Potassium salts produced, sold, and in producers' stocks in the United States, 1944–48

Year	Production			Sales				Producers' stocks, Dec. 31	
	Operators	Potassium salts (short tons)	Equivalent potash (K_2O) (short tons)	Operators	Potassium salts (short tons)	Equivalent potash (K_2O) (short tons)	Value f. o. b. plant	Potassium salts (short tons)	Equivalent potash (K_2O) (short tons)
1944	6	1,578,498	834,568	6	1,543,420	817,892	$29,487,413	76,123	29,763
1945	7	1,588,305	874,243	6	1,597,160	870,370	30,313,919	68,796	34,253

The potash-producing companies in the United States in 1948, by States, were as follows:

California:
- The American Potash & Chemical Corp., 3030 West Sixth St., Los Angeles 54, Calif. (plant at Trona, on Searles Lake, Calif.).

Maryland:
- North American Cement Corp., 41 East Forty-Second St., New York, N. Y. (plant at Security, Md.).

Michigan:
- The Dow Chemical Co., Midland, Mich. (brine wells and plant near Midland, Mich.).

New Mexico:
- International Minerals & Chemical Corp., 20 North Wacker Drive, Chicago, Ill. (mine and plant near Carlsbad, N. Mex.).
- Potash Company of America, Carlsbad, N. Mex. (mine and plant near Carlsbad, N. Mex.).
- United States Potash Co., Inc., 30 Rockefeller Plaza, New York, N. Y. (mine and plant near Carlsbad, N. Mex.).

Utah:
- Bonneville, Ltd., 540 West Seventh South, Salt Lake City 4, Utah (plant near Wendover, Utah).

REVIEW BY STATES

California.—The American Potash & Chemical Corp. remains the only potash-producing company in the Pacific Coast States. It recovers potash from the brines saturating the crystalline salt mass of Searles Lake in southeastern California; potassium chloride and potassium sulfate are marketed.

Maryland.—Maryland has but one producing potash company, the North American Cement Corp., which at its plant at Security, Washington County, near Hagerstown, recovers byproduct potash from the cement-kiln flue dust. The product, an impure sulfate of potash of low potash content, was sold for agricultural use. This operation was the only one of its kind reported in the United States in 1948.

Michigan.—The Dow Chemical Co. was the only potash-producing company in Michigan in 1948. It obtained potassium chloride from natural brine from wells at Midland, Mich.

New Mexico.—The Carlsbad region of New Mexico continued to increase its mine production of potash. Another record was made in 1948. The three companies operating in this area mined 5,108,372 short tons of sylvinite and crude langbeinite combined—an increase of 452,640 tons over 1947. The equivalent K_2O content of the mined production in 1948 was 1,069,675 short tons. The average equivalent K_2O contents of the mined salts increased from 20.74 percent in 1947 to 20.94 in 1948.

All three of the producing companies—International Minerals & Chemical Corp., Potash Company of America, and United States Potash Co.—mined sylvite (potassium chloride) and one—International Minerals & Chemical Corp.—also mined langbeinite (a potassium-magnesium sulfate). The greater part of the mine production of the region was sylvite, most of which was processed to yield 60-percent or higher-grade muriate. The production of merchantable potash salts in New Mexico in 1948 was 1,841,054 short tons, with an equivalent K_2O content of 964,940 tons. Sales were 1,850,976 tons of salts (967,945 tons K_2O) valued at $29,177,328. Muriate of potash was produced by all three companies. Potassium sulfate and potassium-magnesium sulfate (sulfate of potash-magnesia) were produced from langbeinite by the International Minerals & Chemicals Corp., in the refinery at its mine near Carlsbad. All three producing companies had construction programs under way during 1948 to increase their output of potash salts.

Early in 1948 the Potash Company of America [2] started an extensive expansion and improvement program to include a new shaft (No. 3), a larger hoist at the No. 1 shaft, and added underground equipment—undercutter, loaders, rotary dump cars, and mine cars. The refinery is being enlarged and the flow sheet changed to include a new flotation process developed by the company staff. Apparatus to be installed include new crushing and grinding units, agitator plants, flotation machines, filters, driers, and tailing-disposal equipment. The plant for the production of high-grade potassium chloride is being enlarged. A 26-mile pipe line for fresh-water supply is to be laid.

An information circular of the Bureau of Mines [3] published in 1948 described current mining practices at the mine of the Potash Company of America.

At the mine of the United States Potash Co.,[4] a new and larger loader was put in operation underground in 1948; and a 75-foot thickener, for desliming ahead of tabling where sylvite is separated from halite, was added to the tabling plant. Haulage with a 70-ton Diesel locomotive was installed on the 16-mile company railroad between the mine and refinery.

The International Minerals & Chemical Corp. started construction early in 1948 on a new refinery at its mine near Carlsbad for the production of chemical-grade potassium chloride and for the production of an improved grade of potassium sulfate for agricultural and industrial uses. In addition, present facilities were improved to yield higher recoveries and increased capacities for all existing grades of potash salts. The new output of chemical-grade potassium chloride will serve industrial users of this grade and will also be used as the principal raw material for the firm's own potassium chlorate plant near Cincinnati. The new facilities are expected to be in operation by the spring of 1949. This will mark the entry of the company into the heavy and industrial potash chemical fields. According to the company annual report, the tonnage of potash produced in the fiscal year ended June 30, 1948, was increased over the previous year. Although the plant operated with higher wages and other increased costs, larger volume and greater efficiency provided a profit exceeding that of the previous year.

[3] Storms, Walter R., Mining Methods and Practices, Potash Company of America, Eddy County, N. Mex.: Bureau of Mines Inf. Circ. 7445, 1948, 18 pp.

[4] See footnote 2.

The underground operations of this company[5] are now completely mechanized and obtain a production of 33 to 34 tons per man per day underground. The mine is laid out on a checkerboard pattern. The face is drilled by rotary electric drills, undercut with a modified shortwall machine mounting a 9-foot bar, and blasted using "fast-delay" caps; the potash salt is loaded by machine into shuttle cars for panel haulage to main-line haulage by steel cars and electric locomotives. The mine cars are dumped by a rotary dump into a feeder hopper followed by a single-roll crusher. The crushed ore is transferred to skips by an automatic measuring pocket. This operation is more or less typical of the local practice.

The Duval Texas Sulphur Co. is reported to have drilled 32 holes in the New Mexico potash field in 1948. The Southwest Potash Co. and Wills & Weaver were new companies active in the Carlsbad area. The Continental Potash Co. continued experiments in solution mining of potash deposits by subsurface leaching methods.

The work of the Bureau of Mines, United States Department of the Interior, was described in an article published early in 1948.[6]

Utah.—Commercial production of potash in Utah in 1948 was restricted to the potassium-bearing brines of Salduro Marsh, where Bonneville, Ltd., continued to produce potassium chloride at its plant near Wendover, Tooele County, northwestern Utah. The output of the plant is reported[7] to have been about 60,000 tons of potassium chloride in 1948, and 60 persons are said to have been employed in the operations. The crude evaporated material contains potassium chloride and common salt. After separation, the potassium chloride is sent to southern and western markets, and the salt is hauled away as waste.

Prospecting for potash is reported to have continued in eastern Utah in connection with oil-well drilling, and the old Defense Plant Corporation well near Crescent Junction is said to have been sunk a little deeper.

There was no production of alunite in the Marysvale district.

CONSUMPTION

Apparent consumption of potash (K_2O) in the United States and its possessions increased from 1,011,142 short tons in 1947 to 1,100,787 tons in 1948, as determined by subtracting exports from the sum of the imports and the producers' sales. The relationship of the apparent consumption to sales of domestic producers, as reported to the Bureau of Mines, for a period of years is shown in figure 4.

[7] Engineering and Mining Journal, Utah: Vol. 150, No. 4, April 1949, pp. 125–126.

According to the American Potash Institute,

Deliveries of potash in North America continued their upward trend during 1948, when the five leading producers and three importers delivered 2,202,036 tons of potash salts containing an equivalent of 1,173,842 tons K_2O. * * * European potash salts of French and German origin totaling 69,455 tons of salts, with an equivalent of 40,069 tons K_2O, delivered in the United States and Canada, are included in these figures. Importations of potash of Russian origin are not included.

Deliveries for agricultural purposes in the continental United States for 1948 were 977,381 tons K_2O, an increase of 79,231 tons over 1947. Canada received 62,198 tons K_2O, Cuba 3,982 tons, Puerto Rico 19,471 tons, and Hawaii 9,153 tons. Exports to other countries amounted to 13,631 tons K_2O.

In this country the potash was delivered to 45 States and the District of Columbia. Georgia and Ohio were practically tied for the leading position in deliveries of agricultural potash at about 88,550 tons K_2O, followed in order by Illinois, Virginia, North Carolina, and Florida, each taking more than 60,000 tons K_2O during the year. Due to shipments across State lines consumption does not necessarily correspond to deliveries within a State.

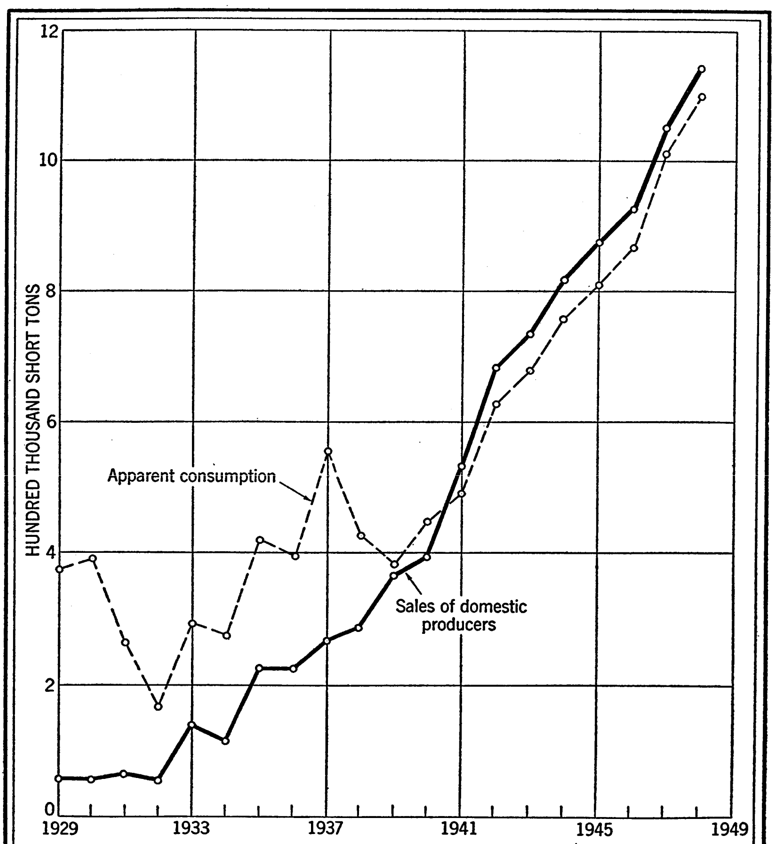

FIGURE 4.—Comparison of apparent domestic consumption of potash (K_2O) and sales by domestic producers of potash in the United States, 1929–48.

The 60 percent muriate of potash continued to be by far the most popular material, comprising 79 percent of the total K_2O delivered for agricultural purposes. The 50 percent muriate of potash made up 7 percent of the total, manure salts 6 percent, and sulphate of potash and sulphate of potash magnesia 8 percent. This was about the same pattern of distribution as in 1947.

Deliveries for chemical purposes [in 1948 in United States and Canada] were 132,787 tons of muriate of potash containing an equivalent of 83,353 tons K_2O and 9,031 tons of sulfate of potash containing 4,673 tons K_2O. The total chemical deliveries of 88,026 tons K_2O were 5,319 tons or 6 percent more than in 1947.

Deliveries of agricultural potash salts in 1948, by States of destination, in short tons of K_2O

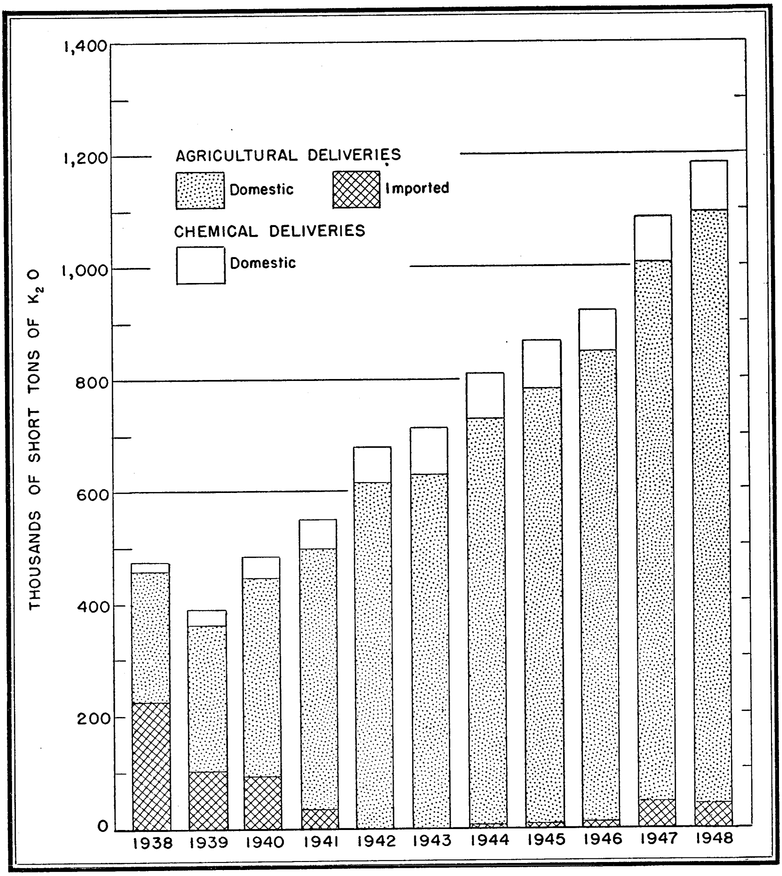

FIGURE 5.—Potash deliveries, by use groups, in North America, 1938–48 (American Potash Institute).

Deliveries of agricultural and chemical potash in North America from 1938 to 1948 are shown in the accompanying diagram (fig. 5) furnished by the American Potash Institute.

PRICES

Prices for potash at the beginning of 1948 were those listed in the producers' price schedules for the 1947–48 season (see Potash chapter, Minerals Yearbook, 1947 pp. 1013–1014.). On February 6, 1948, however, the American Potash & Chemical Corp. announced an increase in the price of Trona muriate of potash from 45.5 to 48.5 cents per unit K_2O, in bulk, f. o. b. cars Trona, Calif., effective February 10, 1948, the first increase reported in 7 years. On March 9, 1948, this company withdrew and canceled the above increase and announced that the price, terms, and conditions in its price schedule dated May 1, 1947, for Trona muriate of potash (45.5 cents per unit K_2O) would remain effective until May 31, 1948. On May 3, 1948, the company issued its regular price schedule for the period June 1, 1948, to May 31, 1949, for Trona muriate of potash for agricultural purposes, retaining its price at 45.5 cents per unit K_2O. On February 6, 1948, the American Potash & Chemical Corp. issued a supplementary price schedule raising the price of Trona sulfate of potash 95–98 percent K_2SO_4, from 74 to 79 cents per unit K_2O in bulk, f. o. b. cars, Trona, Calif., effective February 10, 1948. The regular schedule, issued on May 3, 1948, continued this price from June 1, 1948, to May 31, 1949.

Regular price schedules for New Mexico potash for agricultural purposes for the 1948–49 season were issued in April and May 1948 by the three producing companies. The quotations, based f. o. b. cars seller's plant Carlsbad, N. Mex., in bulk per ton of 2,000 pounds, minimum carlots of 40 tons, were:

Muriate of potash (62 to 63 percent K_2O)	37.5 cents per unit K_2O.
Muriate of potash (60 percent K_2O minimum)	
Muriate of potash (48 to 52 percent K_2O)	
Muriate of potash (50 percent K_2O minimum)	
Manure salts (22 percent K_2O minimum)	20 cents per unit K_2O
Manure salts (run-of-mine 20 percent K_2O minimum)	
Sulfate of potash (90 to 95 percent K_2SO_4, basis 90 percent K_2SO_4)	\$32.50 per short ton
Sulfate of potash-magnesia (basis 40 percent K_2SO_4, 18.50 percent MgO)	\$14.50 per short ton.

Sales of imported potash were reported in trade journals at 95 cents to \$1.20 per unit K_2O at Atlantic coast ports.

FOREIGN TRADE [8]

Imports.—Imports of potash salts in 1948 were only slightly larger than in 1947, rising from 51,043 short tons in 1947 to 52,890 tons in 1948, as a result of increased importations of potassium bitartrate. The total value of imports also increased, rising from \$2,475,351 in 1947 to \$3,063,577 in 1948. Russia, Germany, France, and Belgium-Luxembourg, in the order given, were the principal sources of the imports in 1948.

Potash for fertilizer use constituted 96 percent of the total K_2O imports in 1948, slightly less than in the previous year. Imports for chemical use rose from 3 percent in 1947 to 4 percent of the total in 1948.

The principal potash salt imported in 1948 for fertilizer use was the muriate (chloride), which came from the U. S. S. R., France, Belgium-Luxembourg, Germany, and Canada. A large tonnage of crude potassium sulfate came from Germany in 1948, a little more than in the previous year. Imports of the bitartrate increased markedly.

---

[8] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of U. S. Department of Commerce.

Early in 1948 the officers and the directors of the Pioneer Potash Corp., vested as an alien concern in 1943, were ordered by the Office of Alien Property Custodian to complete proceedings under a certificate of dissolution issued by Delaware. The order called for the payment of current and closing expenses and all accruing taxes and the setting aside of $25,000 as a reserve for legal fees owed. All remaining funds and property are to be transferred to the Attorney General.

[2] Less than 1 ton.

Exports.—The total value of the export trade in potash materials declined from $8,686,107 in 1947 to $8,288,955 in 1948, the increase in the value of the fertilizer materials failing to compensate for the decline in value of exports of potash chemicals. The exports of both fertilizer and chemical potash salts were widely distributed. Fertilizer materials went largely to Canada, with much smaller quantities to numerous other countries, mostly in the Western Hemisphere. Exports of chemical potash salts were more uniformly distributed.

Canada was the leading recipient, but large quantities went to several European countries—Belgium-Luxembourg, Italy, Netherlands, Switzerland, and Germany.

[1] In addition to countries listed, Eritrea, Iran, Italy, Poland, and U. S. S. R. are reported to produce potash salts, but statistics of production are not available; estimates by senior author of chapter included in total.
[2] Data not available; estimate by author of the chapter included in total.
[3] Estimate.
[4] Exports plus consumption, 1943–44; exports only, 1945–46.
[5] Extracted from waters of Dead Sea.
[6] Data not available.
[7] Bizonal area only.

Canada.—The Provincial Department of Natural Resources, Saskatchewan, announced early in 1948 that it was prepared to receive applications from companies wishing to develop the recently discovered potash deposits in that Province. The leasable area covers 350,000 acres. A description of the deposits was published.[9]

France.—Exploitation has started of the extensive potash deposits discovered several years ago near Dax in southwestern France. The output is reported to be about 100 metric tons daily.

Palestine and Israel.—Potash operations in the Dead Sea area were interfered with in 1948 by the conflict between the newly created State of Israel and that of Trans-Jordan. The 25-year mandate over Palestine, which Great Britain had held since 1923, was ended at midnight May 14, 1948. The Jewish State of Israel was established in Palestine and immediately recognized by the United States. A few weeks before this mandate terminated, the Palestine Government discontinued its convoys of motor traffic from the Dead Sea to Jerusalem. Without convoys, it was impossible for Palestine Potash, Ltd., to transport supplies and fuel from the railhead at Jerusalem to its works at the north end of the Dead Sea and to transport its finished products from the Dead Sea to the railhead at Jerusalem, and production operations had to be suspended. Meetings of representatives of the Trans-Jordan Government and Palestine Potash, Ltd., were held at the north end of the Dead Sea on May 13 and May 17, 1948. At the second meeting the representatives of the Trans-Jordan Government insisted that the company employees and plant, including the installations and personnel at the south end of the Dead Sea, should be put into their hands. The Israeli Government declined to accept the proposed terms, and instructed the company employees to evacuate the northern plant. This was done, and before withdrawal, supplies were destroyed, machinery rendered unusable, and the company motorboats and barges taken to the south end of the sea. The armed forces of Trans-Jordan occupied the northern works 2 days later and were still in control of the area at the end of the year. It is reported that these works have been looted and dismantled by the Arabs after their occupation of the area. The southern plant is in the territory allocated to Israel by the partition decision of the General Assembly of the United Nations in 1948. This plant at the end of that year was in the hands of the Israeli army. It has been damaged only slightly. Its fresh-water supply system, which is located in Trans-Jordan, has been put out of operation by the Arabs.[10]

United Kingdom.—Drilling operations in a search for potassium-bearing brines are being carried on at Lowdale, Sleights, Yorkshire, England, for the Imperial Chemical Industries, Ltd. The brine, if found, will be conveyed 20 miles by pipe line to the new I. C. I. works at Wilton.

Salines—Miscellaneous[1]

By JOSEPH C. ARUNDALE AND F. M. BARSIGIAN[2]

GENERAL SUMMARY

OPERATION of industry at high levels during 1948 brought sales of calcium chloride, soda ash, and salt cake to new records. Sales of bromine were below the wartime rate, but volume was large for peacetime. Iodine imports were greatly reduced, but domestic production supplied an increasing proportion of domestic demand. Production of boron minerals declined slightly as demand slackened.

CALCIUM CHLORIDE

A new record again was established in 1948 in sales of calcium chloride (and calcium-magnesium chloride) produced from natural brines.

No accurate use pattern is available for calcium chloride. However, its hygroscopic and antifreeze properties are utilized in stabilizing gravel or soil road surfaces, dustproofing coal, assisting the curing of concrete, in ice control on roads, as an antifreeze for ores and other material in stock piles or in transit, in refrigeration brines, and as a dehumidifier in storage areas, basements, etc. The use of calcium chloride for dust control in coal mines has increased considerably during the past few years.

Calcium chloride and calcium-magnesium chloride from natural brines sold by producers in the United States, 1944–48

[In terms of 75 percent (Ca, Mg) Cl_2]

Year	Short tons	Value	Year	Short tons	Value
1944	200,964	$1,621,227	1947	271,206	$2,650,205
1945	218,320	1,818,219	1948	301,936	3,902,788
1946	262,147	2,278,954			

[1] Former editions of this chapter included a section titled Magnesium Compounds, which now appear as a separate chapter.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

The following companies produced calcium chloride (and calcium-magnesium chloride) from natural brines in 1948: California Rock Salt Co., 2436 Hunter Street, Los Angeles 21, Calif., plant at Amboy, Calif.; Hill Bros. Chemical Co., 2159 Bay Street, Los Angeles 21, Calif., plant at Amboy, Calif.; Desert Properties Co., Frank Thomas, receiver, 374 Court Street, San Bernardino, Calif., plant at Amboy, Calif.; Michigan Chemical Corp., 500 North Bankson, St. Louis, Mich.; Rademaker Chemical Corp., Eastlake, Mich.; Dow Chemical Co., Midland, Mich.; Pomeroy Salt Corp., Pomeroy, Ohio, plant at Minersville, Ohio; Westvaco Chemical Division, Food Machinery & Chemical Corp., South Charleston 3, W. Va.; and Liverpool Salt Co., Hartford, W. Va.

Calcium chloride imported for consumption in and exported from the United States, 1944–48

[U. S. Department of Commerce]

Year	Imports		Exports	
	Short tons	Value	Short tons	Value
1944	2,761	$35,125	8,535	$234,329
1945	4,040	51,409	6,871	188,141
1946	1,313	14,587	10,073	367,993
1947	250	5,514	11,955	502,818
1948	5	249	11,456	437,763

BROMINE

Sales of bromine compounds were moderately lower but still well above the prewar rate. The bulk of the bromine sold was in the form of the compound ethylene dibromide for use in gasoline antiknock compounds.

A booklet describing a long list of bromine products was published by the Dow Chemical Co.[3] The Bureau of Entomology and Plant Quarantine amended its regulations to permit the use of methyl bromide as a fumigant for the treatment of cottonseed from certain counties in Texas, Oklahoma, and New Mexico that were found to be lightly infested with the pink bollworm. The chemical treatment would be in lieu of the heat treatment used in the past.[4]

The Ethyl-Dow Chemical Co. recovered bromine from sea water at Freeport, Tex., and the Westvaco Chemical Division of Food Machinery & Chemical Corp. recovered bromine from sea water at Newark, Calif. American Potash & Chemical Corp. produced bromine from the brine of Searles Lake at Trona, Calif. The following recovered bromine from well brines: Michigan Chemical Corp., St. Louis, Mich.; Great Lakes Chemical Corp., Filer City, Mich.; Morton Salt Co., Manistee, Mich.; Rademaker Chemical Corp., Eastlake, Mich.; Dow Chemical Co., Midland, Mich.; Westvaco Chemical Division, Food Machinery & Chemical Corp., South Charleston, W. Va.

[3] Dow Chemical Co., Bromine and Bromine Products: Midland, Mich., 1947, 103 pp.
[4] Oil, Paint and Drug Reporter, vol. 153, No. 25, June 21, 1948, p. 3.

According to Oil, Paint and Drug Reporter, potassium and sodium bromides, U. S. P., barrels, were quoted at 33–34 cents a pound at the end of 1948. This represented no change from the previous year. Bromine in lead-lined drums, carlots, delivered, was 19 cents a pound.

Imports of bromine and bromine compounds totaled 102 pounds, whereas 1,054,523 pounds valued at $432,992 were exported.

Bromine and bromine in compounds sold or used by producers in the United States, 1944–48

Year	Pounds	Value	Year	Pounds	Value
1944	102,112,462	$19,712,819	1947	78,177,650	$14,837,104

[1] Calculated as theoretical bromine content present in compound.

IODINE

Dow Chemical Co., Midland, Mich., and Deepwater Chemical Co., Ltd., Compton, Calif., recovered iodine from waste oil-well brines in California. As there were only two producers during 1948 statistics on domestic production of iodine may not be published. In 1937 domestic output totaled nearly 300,000 pounds and in recent years has supplied an increasing proportion of the iodine consumed in the United States.

The other important source of iodine is Chile, where crude iodine is recovered as a byproduct in the nitrate operations. Iodine from Chile is imported and distributed by Chilean Nitrate Sales Corp.

Exports of iodine and its compounds during 1948 totaled 271,459 pounds valued at $550,493. Imports of crude iodine are characteristically erratic and generally bear little relation to current consumption rates. Large stocks of crude iodine are maintained in consuming countries, principally the United States, and consumption is reflected only in long-term averages of imports. Imports of crude iodine are shown in the accompanying table.

Crude iodine imported for consumption in the United States, 1944–48

[U. S. Department of Commerce]

Year	Pounds	Value	Year	Pounds	Value
1944	1,204,303	$1,321,274	1947	2,260,506	$2,756,888
1945	220,526	232,070	1948	592,136	847,752
1946	886,578	976,190			

The results of a Bureau of Mines survey of iodine consumption are shown in an accompanying table.

Crude iodine consumed in the United States in 1948

Compound manufactured	Number of plants	Crude iodine consumed	
		Pounds	Percent of total
Resublimed iodine	5	96,472	10
Potassium iodide	7	799,619	80
Sodium iodide	3	37,898	4
Other [1]	[2] 5	59,072	6
Total	[2] 8	993,061	100

[1] Includes ammonium iodide, cadmium iodide, and other iodine products.
[2] A plant producing more than 1 product is counted but once in arriving at total.

Some interesting results of tests of the combined effect of potassium iodide and streptomycin against tuberculosis in guinea pigs were published.[5] A large amount of technical data and other information on iodine is available from the Iodine Educational Bureau, 12 Stone House, Bishopsgate, London, E. C. 2. The organization is sponsored by the principal Chilean iodine producers.

According to the Oil, Paint and Drug Reporter, the price of crude iodine, kegs, ex-warehouse Staten Island, remained at $1.729 per pound throughout the year. The price of resublimed iodine in bottles or jars ranged from $2.35 to $2.65 per pound.

SODIUM COMPOUNDS

Sodium Carbonate.—The serious shortage of alkalies that had existed for several years continued into the first part of 1948. However, later in 1948, demand lessened somewhat, and completion of most of the proposed expansions in the alkali-producing industry brought a condition of local oversupply to the market.

Sales of natural sodium carbonate by producers in California were slightly less than in the previous year. Production from Wyoming, statistics on which the Bureau of Mines is not at liberty to publish, added to the total available.

The problem of export control of soda ash, which was extremely serious at the first of 1948, largely disappeared by the end of the year. Quota restrictions on natural soda ash were lifted in the second quarter, and those on manufactured soda ash were removed several months later, although both products were still exported under license control.

[5] Woody, Edgar, Jr., and Avery, Roy C., The Combined Effect of Potassium Iodide and Streptomycin on Established Tuberculosis in Guinea Pigs: Science, vol. 108, No. 2810, Nov. 5, 1948, pp. 501–502.

Natural sodium sulfates and sodium carbonates sold or used by producers in the United States, 1944–48

Year	Sodium sulfates [1]		Sodium carbonates [2]	
	Short tons	Value	Short tons	Value
1944	168,923	$1,577,982	184,826	$2,869,243
1945	178,196	1,525,159	194,045	3,034,118
1946	198,781	1,695,413	215,625	3,427,086
1947	257,294	3,329,094	293,051	5,862,178
1948	265,862	4,248,613	[3] 288,769	[3] 6,623,280

[1] Tonnage figures for sulfates include Glauber's salt converted to 100 percent Na_2SO_4 basis.
[2] Soda ash and trona.
[3] Exclusive of production in Wyoming.

Natural soda ash was produced in California by the following companies in 1948: American Potash & Chemical Corp., Trona, Calif.; Natural Soda Products Co., 506 Central Tower Building, San Francisco 3, Calif., plant at Keeler; Permanente Metals Corp., Kaiser Building, Oakland 12, Calif., plant at Lone Pine; Pittsburgh Plate Glass Co., Columbia Chemical Division, Bartlett, Calif.; and West End Chemical Co., 608 Latham Square Building, Oakland 12, Calif., plant at Westend. Westvaco Chemical Division, Food Machinery & Chemical Corp., Box 872, operated its underground trona mine at Green River, Wyo.

The price of soda ash, light, calcined, bags, carlots, works, was quoted at $1.30 to $1.40 a hundredweight in 1948, according to Oil, Paint and Drug Reporter. The 1947 price was $1.20 to $1.30.

Although a new record was established in 1948, the relatively small increase does not fully reflect the magnitude of expansion in the industry. It has been estimated that capacity would approximate 5,000,000 tons in 1948. Output of some plants was restricted by strikes and a shortage of fuel for a time during the year.

The bulk of the soda ash produced is manufactured by the ammonia-soda process. Production of that type sodium carbonate, according to the Bureau of the Census, was: 1944, 4,538,398 short tons; 1945, 4,375,017; 1946, 4,284,231; 1947, 4,519,144; and 1948, 4,575,452 tons.

The consumption pattern of sodium carbonate, as estimated by Chemical Engineering, is shown in the accompanying table.

Estimated consumption of sodium carbonate in the United States, 1944–48, by industries, in short tons

[Chemical Engineering]

Industry	1944	1945	1946	1947	1948
Glass	1,290,000	1,320,000	1,400,000	1,440,000	1,370,000
Soap	162,000	150,000	120,000	135,000	127,000
Caustic and bicarbonate	1,033,000	1,114,000	1,128,000	[1] 1,127,000	1,137,000
Other chemicals	1,025,000	960,000	910,000	1,030,000	1,030,000
Cleansers and modified sodas	100,000	110,000	125,000	130,000	135,000
Pulp and paper	170,000	175,000	190,000	220,000	230,000
Water softeners	110,000	100,000	90,000	100,000	110,000
Petroleum refining	22,000	24,000	20,000	22,000	24,000
Textiles	61,000	68,000	77,000	71,000	69,000
Nonferrous metallurgy	320,000	200,000	140,000	190,000	210,000
Exports	79,000	70,000	67,000	[1] 107,000	230,000
Miscellaneous	320,000	290,000	223,000	[1] 228,000	208,000
Total	4,692,000	4,581,000	4,490,000	4,800,000	4,880,000

[1] Revised figure.

Sodium Sulfate.—Sales of 265,862 short tons of natural sodium sulfates by domestic producers was a new record. Production of salt cake (including natural sodium sulfate) was at an all-time high. Due to the critical shortage of soda ash during 1947 and part of 1948, glass manufacturers made more extensive use of salt cake as a source of soda in the glass batch. However, the kraft pulp and paper industry continued to consume the largest portion, and substantial quantities were consumed in "soapless" detergents.

The following firms reported production of natural sodium sulfates in 1948: American Potash & Chemical Corp., Trona, Calif.; Arizona Chemical Co., 30 Rockefeller Plaza, New York 20, N. Y., plant at Brownfield, Tex.; Dale Chemical Industries, Inc., P. O. Box 319, Twenty Nine Palms, Calif., plant at Dale Lake, Calif.; Iowa Soda Products Co., P. O. Box 476, Council Bluffs, Iowa, plant at Rawlins, Wyo.; Ozark-Mahoning Co., P. O. Box 449, Tulsa 1, Okla., plant at Monahans, Tex.; and Wm. E. Pratt, P. O. Box 738, Casper, Wyo.

Production of sodium sulfate in the United States, 1944–48, in short tons

[U. S. Bureau of the Census]

Year	Glauber's salt (100 percent $Na_2SO_4 \cdot 10H_2O$) [1]	Salt cake (crude) [1]	Anhydrous refined (100 percent Na_2SO_4)
1944	231, 200	564, 889	69, 997
1945	200, 782	543, 371	91, 340
1946	167, 153	527, 746	122, 573
1947	197, 963	627, 331	135, 088
1948	183, 630	656, 438	169, 018

[1] Includes natural sodium sulfate as shown in table in sodium carbonate section of this chapter.

According to the Oil, Paint and Drug Reporter, at the end of 1948, price quotations on domestic salt cake were $25–$28 a short ton, bulk, works; anhydrous sodium sulfate was unchanged at $2.10 per hundred pounds, works; and Glauber's salt, $2.25–$2.50 per hundred pounds, less than carlots, bags, works.

Sodium sulfate imported for consumption in the United States, 1944–48

Year	Crude (salt cake)		Crystallized (Glauber's salt)		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	31, 305	$466, 935			31, 305	$466, 935
1945	20, 293	289, 940			20, 293	289, 940
1946	22, 446	352, 407			22, 446	352, 407
1947	49, 157	583, 377	91	$1, 760	49, 248	585, 137
1948	29, 612	468, 561			29, 612	468, 561

Sodium Metal.—Statistics on output of sodium metal cannot be published, as it is produced by only two companies in the United States. The Ethyl Corp., 405 Lexington Avenue, New York, N. Y., produces sodium at Baton Rouge, La.; and E. I. du Pont de Nemours & Co. produces sodium at Niagara Falls, N. Y. Important uses of this metal are as a reagent in the preparation of tetraethyl lead, in the production of sodium peroxide, sodium cyanide, and other compounds, in the refining of metals, and as a reducing agent in organic synthesis.

A paper was published describing the properties and inorganic applications of sodium.[6]

The price of sodium metal was increased at midyear to 16½ cents per pound, drums, works.

BORATES

Domestic production of boron minerals during 1948 decreased approximately 10 percent from the previous year.

In 1948 the following firms reported production of boron minerals: American Potash & Chemical Corp., Trona, Calif., on Searles Lake; Pacific Coast Borax Co., 510 West Sixth Street, Los Angeles 14, Calif., mine at Boron; Pittsburgh Plate Glass Co., Columbia Chemical Division, Bartlett, Calif.; United States Borax Co., 510 West Sixth Street, Los Angeles 14, Calif., mine near Shoshone; and West End Chemical Co., 608 Latham Square Building, Oakland 12, Calif., plant at Westend, on Searles Lake.

According to Oil, Paint and Drug Reporter, the price of technical borax, 99½ percent, granular, bulk, carlots, freight split, was \$44.50–\$47.50 a short ton in 1948.

Producers announced a new price policy to become effective January 1, 1949, involving an f. o. b. works basis for price schedules, and elimination of the 1 percent cash discount, making terms net 30 days.[7]

[1] Borax, anhydrous sodium tetraborate, kernite, boric acid, and colemanite.
[2] Quantity sold or used by producers plus imports minus exports.

Sale of the Western Borax mine of Borax Consolidated, Ltd., in Kern County, Calif., to Pacific Alkali Co., of Los Angeles, was approved as one of the moves in the dissolution of the borax trust, as ordered in a consent decree to the civil antitrust suit filed in Federal Court in September 1947.[8]

A series of articles was published on the chemistry and role of boric oxide in glass technology.[9]

The market for boron compounds in fertilizers and as a weed killer was described in an article.[10]

Salt

By FLORENCE E. HARRIS AND E. M. TUCKER

GENERAL SUMMARY

PRODUCTION of common salt of all types continued its upward trend in 1948. Thirteen States and Puerto Rico contributed a total of 16,403,293 short tons valued at $54,331,782 in 1948 compared with 16,053,882 tons valued at $52,191,688 in 1947. This is an increase of 2 percent in volume and 4 percent in value. The accompanying table shows an increase in apparent domestic consumption as well as larger exports.

Salient statistics of the salt industry in the United States, 1935–39 (average), and 1944–48

	1935–39 (average)	1944	1945	1946	1947	1948
Sold or used by producers:						
Dry salt:						
Evaporated (manufactured) short tons	2,507,374	3,448,578	3,182,570	3,249,457	3,158,718	3,207,403
Rock salt do	1,947,254	3,448,238	3,505,740	3,412,008	3,754,353	3,846,846
Total do	4,454,628	6,896,816	6,688,310	6,661,465	6,913,071	7,054,249
Value	$21,730,339	$37,355,192	$37,335,488	$38,294,396	$43,032,621	$46,430,927
Average per ton	$4.88	$5.42	$5.58	$5.75	$6.22	$6.58

[1] Revised figure.
[2] Values are f. o. b. mine or refinery and do not include cost of cooperage or containers.
[3] Includes salt in bags, sacks, barrels, or other packages—1938: 93 tons, $673.
[4] 96,479 short tons valued at $2,347,679, shipped under the U. S. Army Civilian Supply Program, is excluded from the exports shown but is deducted from apparent consumption.
[5] Quantity sold or used by producers plus imports minus exports.

The output of evaporated salt, rock salt, and brine each increased 2 percent. Comprising both rock and evaporated salt, 143,119 short tons of table salt and 70,262 tons of livestock salt were iodized in 1948. This represents an increase in iodized table salt but a decrease in iodized livestock salt.

Figure 1 compares the indexes of production of salt in brine and dry salt (evaporated and rock) with the index of industrial activity. The first two—with a 3-point rise each—did not keep pace with the 5-point rise in industrial production. However, the salt-in-brine curve, which advanced from 219 in 1947 to 222 in 1948, is still above that for industrial production, which rose from 187 in 1947 to 192 in 1948. The dry-salt curve rose from 155 in 1947 to 158 in 1948.

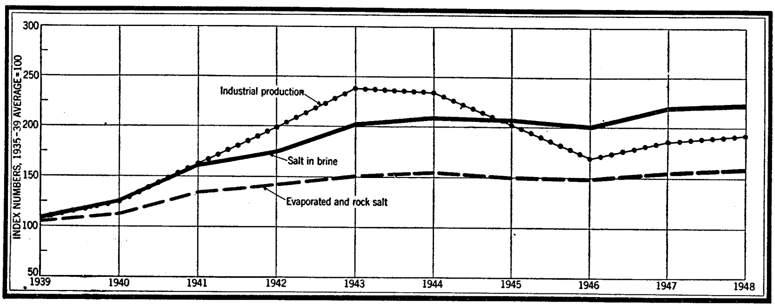

FIGURE 1.—Index of salt in brine and of evaporated and rock salt sold or used compared with industrial production, 1939–48. Index of industrial production from Federal Reserve Board.

Relative quantities of the three types of salt produced in the United States are shown in figure 2 for the 1939–48 decade.

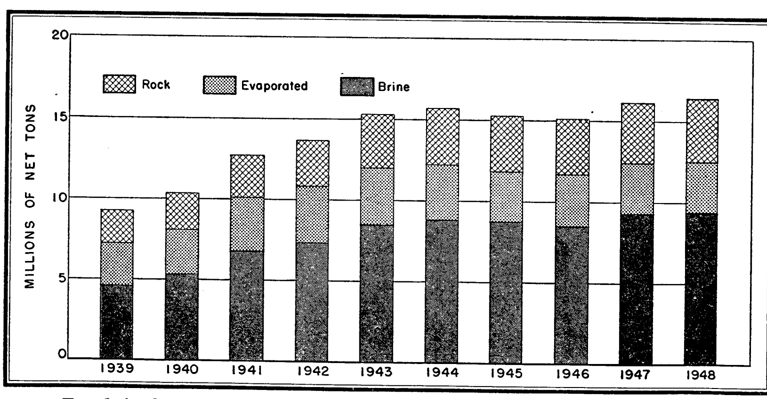

FIGURE 2.—Trends in the quantity of rock salt, evaporated salt, and brine (in terms of salt content) sold or used by producers in the United States, 1939–48.

PRODUCTION

Salt was produced by 43 companies in 71 plants in 1948. Of the total companies producing dry salt in continental United States, about 20 are small; six are medium size; and 6 may be placed in the "Large" category, which includes 5 parent companies composed of subsidiaries or divisions with large composite tonnages and 1 concern that has a large output at a single location. Of the parent companies in the "Large" classification, 1 company has 11 companies or divisions under it; 2 other companies have 5 each. Eight chemical companies operate 12 plants. Solar salt was produced in Puerto Rico in 1948 by three operators at five works.

PRODUCTION BY STATES

California.—The unique pinnacles of salt that occur in this State were described and illustrated in an article on salt lands in the Searles Lake area.[1] Imperial Salt Co., operated by Western Salt Co., San Diego, produced no salt in 1948, closed the plant, and moved the machinery. C. C. Miller's salt operation on Mono Lake, which has operated on an experimental basis, was idle during 1948.

Louisiana.—Myles Salt Co., a wholly owned subsidiary of the Morton Salt Co., was merged with the parent company October 1, 1948. Jefferson Island operations in Louisiana were described and illustrated in an article.[2]

[1] Revised figure.
[2] Less than 0.5 percent.
[3] Included in "Other States."
[4] Comprises Nevada, New Mexico (1948 only), Oklahoma, and Virginia.

Michigan.—The great salt resources of Michigan were described in an article.[3] The Mulkey Salt Co., which before March 25, 1948, was an independent subsidiary of the Morton Salt Co., was merged and made a division of the parent company.

New York.—The Worcester Salt Co., a wholly owned subsidiary of the Morton Salt Co., was merged with the parent company January 1, 1949.

Ohio.—Salt deposits in Ohio were described in 1947.[4] The Ohio Salt Co., Wadsworth, Ohio, was merged with the Morton Salt Co. on

[1] Packard, Charles, Mysterious Giants of the Desert: Rocks and Minerals, vol. 23, No. 2, February 1948, pp. 99–104.
[2] Chemical Engineering Progress, Salt: Vol. 44, No. 2, February 1948, pp. 22, 24.
[3] Mineralogist, Enormous Salt Deposits in Michigan: Vol. 16, No. 11, November 1948, pp. 540–542.
[4] Pepper, J. F., Areal Extent and Thickness of the Salt Deposits of Ohio: Ohio Jour. Science, vol. 47, No. 6, 1947, pp. 225–239.

December 31, 1948. In May 1948 the Morton Salt Co. closed the Cleveland plant that had been acquired from the Union Salt Co.

Texas.—The facilities of the Dow Magnesium Corp. at Velasco, Brazoria County, purchased by the Dow Chemical Co., Midland, Mich., February 8, 1947, were inactive as regards salt production in 1948. The Imperial Salt Co., Missouri City (formerly at Henderson), was building an evaporation plant; it was not yet in operation in 1948. Development work on the brine wells was described.[5] The Diamond Alkali Co. of Cleveland, Ohio, opened an extension of its plant in Houston, Tex.[6]

West Virginia.—The Ohio River Salt Corp. plant at Mason was idle all of 1948 and is now being dismantled.

A railroad surveyed [7] the salt region of New York, Ohio, Pennsylvania, and West Virginia.

To summarize the corporate changes in the Morton Salt Co. to effect economies in 1948, the parent company consolidated several of its wholly owned subsidiary companies and closed one. By the end of 1948 it had 10 producing divisions in various parts of the country. In addition, it also merged the Mulkey Salt Co., a heretofore independent subsidiary, with the parent company, making it a division. The Mulkey Co. in recent years has been a distributing company only and has not been considered a producer.

PRODUCTION BY METHODS OF RECOVERY

By far the greatest percentage of salt operations in the United States is at wells. Mines are next, followed by solar salt works using sea water, salt brine of the Great Salt Lake, and various sources in desert areas that are worked by simple methods. The early salt wells were simple wells through which connate brine was pumped. In 1883 the first well into which fresh water was introduced and salt brine pumped up was installed in New York. Today connate brine is a comparatively minor source of salt in the United States. Certain modern wells supplying artificial brine are as much as 7,000 feet deep.

Salt sold or used by producers in the United States, 1947–48, by method of recovery

Method of recovery	1947		1948

[7] Salt in the Area Served by the Baltimore & Ohio R. R., 1948.

A discussion of the term "open pans" as used in the accompanying table seems in order, inasmuch as there is a little confusion regarding it. For many years the term "open pan" meant the type of salt pan used in the early days of salt making in the United States. Those pans were heated directly by fuel underneath the pans. Later, open pans of oblong form were made, with steam pipes running through the inside of the pans near the bottom. They became commonly known as "grainers," because of the type of the crystal produced. Although old-type pans heated by fuel underneath are still used in many salt-producing plants abroad, they are no longer used in the United States. According to W. G. Wilcox,[8] the Mulkey Salt Co., which was the last company to use them, discarded them 20 years ago. Another type of open pan is part of the Alberger process, used exclusively by one salt company. It consists of a connected pair of circular evaporator pans. The brine is first heated under high pressure and passed through flashers that reduce the pressure and temperature. No heat is applied either in or under this type of pan.

Evaporated Salt.—Plants producing evaporated salt totaled 48 in 1948, operating in 12 States and Puerto Rico.

Evaporated salt sold or used by producers in the United States, 1947–48, by States

State	1947		1948

Total	3,158,718	27,042,941	3,207,403	29,460,185

[1] Includes Nevada, New Mexico, Oklahoma, Texas, and Utah.

For several years the Salt Producers Association reported monthly output of evaporated table salt by the majority of producers. Beginning July 1, 1948, the reports represented a wider coverage. Evaporated-salt producers (whether or not members of the association) reported monthly shipments to a firm of accountants, which compiled the figures and submitted a report only of totals to the association and those receiving the service. This arrangement applies to evaporated salt only and not to rock salt or brine production.

Rock Salt.—The 1948 output of rock salt from 19 mines in 8 States increased 92,493 short tons over that of 1947.

Rock salt sold by producers in the United States, 1944–48

Year	Short tons	Value	Year	Short tons	Value
1944	3,448,238	$12,225,057	1947	3,754,353	$15,989,680
1945	3,505,740	12,964,391	1948	3,846,846	16,970,742
1946	3,412,008	13,308,001			

[8] Managing director, Salt Producers Association, Detroit, Mich.

Pressed Blocks.—In 1948 the increase in pressed blocks made from evaporated salt in 22 plants was more than offset by the decrease in blocks made from rock salt in 9 plants, which reduced the total 6,221 short tons.

Pressed-salt blocks sold by original producers of the salt in the United States, 1944–48

Year	From evaporated salt		From rock salt		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	274, 216	$2, 797, 015	79, 063	$724, 456	353, 279	$3, 521, 471

1947	260, 399	2, 708, 857	69, 163	638, 958	329, 562	3, 347, 815
1948	274, 511	2, 933, 694	48, 830	459, 986	323, 341	3, 393, 680

Salt Content of Brine.—Eight chemical companies operating 12 plants in 7 States reported production of salt in brine. In addition, small quantities of brine were produced by other firms for use principally in the chemical industry. Salt in brine constituted 57 percent of the total salt output in the United States in 1948.

DISTRIBUTION AND MARKETING

The accompanying table shows primary shipments of salt by the producers in the various States.

Distribution (shipments) of evaporated and rock salt in the United States, 1947–48, by States of destination, in short tons

Destination	1947		1948

[1] Shipping weight.
[2] Data not available.

After March 1948, shippers were not required to declare manifests on merchandise shipped to Alaska or Hawaii; this is why such figures for salt do not appear in the table on noncontiguous shipments.

CONSUMPTION AND USES

Total consumption of salt increased in 1948 from 1947, but decreases were noted for most of the uses shown in the accompanying table. Increases occurred in salt used for chlorine, soda ash, dyes and organic chemicals, other chemicals, livestock, table and other household and agriculture. The largest increase was in the undistributed item, due chiefly to inclusion of most of the augmented exports.

In 1948, much was written about chlorine, the second-largest use for domestic salt. In the United States, where all chlorine is produced from sodium chloride, chlorine production approached the peak record of 1944. A concise review traces the growth of the industry for a number of years.[9] Where chlorine is made and used is given in another article.[10] The sewage and water-processing season was prolonged in 1948 by the mild weather.[11] It is reported [12] that the Grosvenor-Miller process, which has been tested successfully in pilot plants, may enable soda-ash producers to utilize hydrogen chloride, now a waste product, in the manufacture of chlorinated and certain other organic chemicals.

Salt sold or used by producers in the United States, 1947–48, by classes and uses, in short tons

Use	1947				1948			
	Evaporated	Rock	Brine	Total	Evaporated	Rock	Brine	Total
Chlorine, bleaches, chlorates, etc	368,430	711,439	1,661,943	2,741,812	336,180	705,315	1,796,533	2,838,028

[1] Data for evaporated salt included with "Undistributed."
[2] Revised figure.
[3] Data for salt in brine included with "Undistributed."
[4] Comprises miscellaneous uses and data not presentable by classes (footnotes 1 and 3), including most exports.

With detergent materials coming on the market, a shift in the use of salt for soap has already become apparent. Salt is used as a precipitant in soap making and is also the basic raw material for soda needed for soap, but caustic soda also is used in making the detergents.

Most of the salt used in making chemicals is brine from wells; but, as evidenced by the tables on uses, appreciable quantities of evaporated and rock salt are utilized for the purpose.

Exclusive of chlorine, the quantity of salt used for rubber making (included in "Undistributed") was less in 1948 than in 1947. However, indications are that salt still has a place in synthetic rubber making, and this use may increase if certain applications tested extensively in 1948 are made. One of the rubber companies found that salt added to the material developed for recapping automobile tires

[12] Chemical Industries, "Waste" Hydrogen Chloride?: Vol. 63, No. 3, September 1948, pp. 371–372.

was highly successful. Rock crystals are mixed into the stock. As the tread wears down, the salt is released, and surface pores are formed which grip the road. According to an official of one company, "cold" synthetic rubber was the most important rubber development of 1948; it increases the tread wear of passenger-car tires 30 percent over the best natural rubber tires.[13]

Progress was reported in the development of new types and improvement in old types of insecticides, for some of which chloral is needed as the intermediate.

A new method of stripping nylon by use of a sodium chlorite bath was announced.[14]

Miscellaneous uses of the salt produced in 1948 included ceramics, synthetic rubber, brick and tile, paper and pulp, tobacco, and oil-well drilling. Twelve plants contributed to the total sold to the United States Government for miscellaneous purposes including exportation. Other uses were coal treatment, laundry, and cleaning.

Motorists have sometimes complained of the corrosive effects on automobiles of salt used for deicing city streets. To inhibit these effects, a company that has been experimenting and testing mixtures for some time has found that a mixture of sodium chromate or sodium dichromate with the deicing salt is successful.[15]

Federal Specification SS–S–31c on "Salt: Table and Tablets" was issued on January 22, 1948,[16] superseding SS–S–31b, issued June 8, 1944. This new guide, for use of all departments and establishments of the Government, was made effective April 15, 1948. Salt covered by this specification shall be of the following types and classes, as may be specified in the invitation for bids:

Type I. Fine ground salt.
Type II. Evaporated salt (free runing).
Type III. Salt tablets:
  Class A. Plain.
  Class B. Enteric coated.
  Class C. Impregnated.

PRICES

Unless otherwise stated, the listings in the following table are quotations on large lots, f. o. b. New York City.

Prices of bagged salt in the United States in 1948
[Oil, Paint and Drug Reporter]

	Jan. 1–18	Jan. 19–Oct. 10	Oct. 11–Nov. 7	Nov. 8–Dec. 31
	Per short ton		Per 100 pounds	
Rock salt, delivered New York:				
Carlots	$17.50	$18.10	$0.88–$0.98	$0.88–$0.98
Less than carlots	21.70	22.40–23.00	1.09–1.22	1.09–1.22
Table salt, vacuum fine:				
Carlots, works	[1] 18.60	[1] 19.60–21.60	[2] 19.60–21.60	.98–1.08
Less than carlots, delivered New York	25.10	24.40–26.40	[2] 24.40–26.40	1.20–1.32

[1] Delivered New York. [2] Per short ton.

[16] Obtainable from the Superintendent of Documents, Washington 25, D. C. (5 cents).

In the San Francisco area the price of undried stack-run solar salt in 1948 was $5.30 per short ton, in carlots, f. o. b. plant.

In a decision handed down by the Supreme Court April 26, 1948, for a cement case, the basing-point pricing practice was declared illegal. This affects all companies that sell their commodities with freight included in the price or absorb freight charges therein.

On November 2, 1948, the Federal Trade Commission (Docket 4319) issued a Modified Order To Cease and Desist, in which all of the Commissioners concurred. The original order was issued on July 28, 1944. The modified order, made to conform to the opinion announced on May 3, 1948, by the Supreme Court of the United States, was as follows:

NOW THEREFORE IT IS HEREBY ORDERED that respondent, Morton Salt Company, a corporation, and its officers, representatives, agents, and employees, directly or through any corporate or other device in the sale of Morton's Free Running Table Salt, plain or iodized, or other grades of table salt in commerce as "commerce" is defined in the aforesaid Clayton Act, do forthwith cease and desist from discriminating directly or indirectly in the price of such products of like grade and quality as among wholesale or retail dealers purchasing said salt when the differences in price are not justified by difference in the cost of manufacture, sale or delivery, resulting from differing methods or quantities in which such products are sold or delivered,

(*a*) By selling such products to some wholesalers thereof at prices different from the prices charged other wholesalers who, in fact, compete in the sale and distribution of such products.

(*b*) By selling such products to some retailers thereof at prices different from the prices charged other retailers who, in fact, compete in the sale and distribution of such products.

(*c*) By selling such products to a retailer at prices lower than prices charged wholesalers whose customers compete with such retailer.

For the purpose of comparison, the term "price" as used takes into account discounts, rebates, allowances, and other terms and conditions of sale.

FOREIGN TRADE [17]

Imports.—Although small in 1948, imports of salt were the highest since 1942, when they were 7,754 short tons.

Fish-curing salt reappeared among the imports in 1948 after an absence in 1947. It came from Jamaica entirely. In 1946 such salt was reported after an absence of 3 years.

Salt imported for consumption in the United States, 1944–48, by classes

[U. S. Department of Commerce]

Year	In bags, sacks, barrels, or other packages (dutiable) [1]		Bulk			
			Dutiable		Free (used in curing fish)	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	14	$700	[2] 5,540	[2] $31,459		
1945	1,572	36,343	2,981	37,047		
1946	275	4,456	2,571	20,161	1,407	$5,011
1947	377	8,571	1,533	14,322		
1948	1,591	20,971	3,262	17,033	768	2,744

[1] Includes 9,001 pounds valued at $356 imported free in 1944, 1,500 pounds valued at $40 in 1945, and 2,000 pounds valued at $20 in 1946.
[2] Includes 3,818,644 pounds valued at $9,244 imported free.

[17] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Imports of Canadian packaged salt, totaling 1,586 short tons, were received chiefly through Maine and New Hampshire customs (1,480 tons). Of Canada's bulk salt, 292 tons were received by Michigan. The Bahamas shipped salt again to the United States, although not in large quantity. In the past decade (1939–48), the Bahamas supplied salt imports only one other year—97 tons valued at $298 in 1944. In 1948 the salt, all bulk, entered through the Massachusetts and Virginia customs. Leeward and Windward Islands again appeared as suppliers in 1948, the 5 tons having gone to Hawaii. They supplied salt only one other year of the decade—133 tons valued at $1,014 in 1945. Jamaica sent salt to the United States in the decade, excepting 1943 and 1944. However, although the quantity in 1948 was largest since 1942, it did not bring the average for 1945–48 (1,533 short tons valued at $5,866) up to the average for 1939–42 (10,648 tons valued at $21,770). In 1948 all Jamaica salt came in bulk through the Virginia customs.

Salt imported for consumption in the United States, 1947–48, by countries

WORLD REVIEW

North America.—Plans announced for expanding the salt industry in *Canada* included operations of Alberta Salt Co., Lindberg, Alta., to produce all regular packages of salt; Prairie Salt Co., Unity, Sask., to market its output in the Province; Nappan, Nova Scotia, output to supply the fishing trade; Windsor Salt Works to enlarge; and Brummer Mond Ltd., Ambustburg, Ont.—Canada's only producer of soda ash—to add substantially to its capacity. The largest company producing coarse solar salt in the *Bahama Islands* began developing a new area which it is expected will increase output considerably in 1949.

South America.—The sea-salt industry in *Brazil* was described.[18] Great efforts are being made to expand Brazil's salt production, and the alkalies industry and developments in other countries are being studied. Several other South American countries are expanding their output of salt and endeavoring to attain new markets.

[1] In addition to the countries listed, salt is produced in Albania, Bolivia, British Somaliland, Gold Coast, Leeward Islands, Madagascar, Pakistan, Republic of the Philippines, Portugal, Southern Rhodesia, U. S. S. R., Yugoslavia, and other Australian States (Victoria and Western Australia), but figures of production are not available. Russian production is known to exceed 4,000,000 metric tons annually. Estimates by the author of the chapter are included in the total.

[2] Data not available; estimates by the author of the chapter are included in the total.

[3] Estimate.

[4] Exports.

[5] Excludes Sub-Carpathia, ceded to Hungary and U. S. S. R.

[6] Bizonal area.

[7] Data represents Trianon Hungary subsequent to October 1944.

[8] Data represents areas designated as "Free China" during the period of Japanese occupation.

[9] Incomplete data.

[10] Fiscal year ended March 31 of year following that stated.

[11] South Korea only.

[12] Fiscal year ended June 30 of year stated.

[13] Estimated by senior author of chapter.

Europe.—An historical account of *Great Britain's* salt industry was given.[19] Recent shortages of potash there also have brought to attention studies by British scientists of the application of salt to sugar-beet cultivation, and for other crops for which common salt was used formerly as a fertilizer.[20] A report [21] described in detail an unusual system in *Germany* for dissolving salt in a salt mine and for treating the brine. In *Italy* efforts were made to expand salt output and trade of a leading salt operation.[22] The *Polish* Salt Monopoly operated four plants producing salt of various types.[23] *Rumania*, which, it is said, ranks next to the Soviet Union in salt deposits in Europe, was optimistically planning chemical industries based on these and other available basic requirements.[24] Salt production in *Switzerland*, by works and types, for 1900–47 was reported.[25]

Asia.—The *Ceylon* salt industry reported by the Government salt commissioner [26] was reviewed.[27] *China's* industry and barter agreements with *Japan* for salt were noted.[28] The salt situation in *French Indochina* [29] and *Indonesia* [30] and *Thailand's* plans [29] for salt production were reported. *India* is seeking to improve the size and quality of the output of salt and methods of obtaining it. Salt is now tax-free, the late Mohandas K. Gandhi having effected cancellation of taxes in April 1947. Miscellaneous facts on salt in *Angola, Iran, Iraq,* and *Syria* were reported briefly.[31] *Pakistan* planned to utilize salt deposits in Northwest Province and western Punjab for a chemical industry.

Africa.—In 1948, *Italian Somaliland* produced salt chiefly for local consumption.[32] Details of some of the 1948 production of salt by types were reported for *South-West Africa* and the *Union of South Africa*.[33]

Sand and Gravel

By D. G. RUNNER AND G. E. TUCKER

GENERAL SUMMARY

THE continued high-level construction activity of all types in 1948 resulted in heavy demands for sand and gravel. As shown in figure 1, the output of sand and gravel exceeded, by a considerable amount, the former production record established in 1942. For the second time in history, the value passed the 200-million-dollar mark.

As stocks of sand and gravel are relatively small and constant from year to year, production virtually equals sales. Thus these terms are used interchangeably in this chapter.

As indicated in the accompanying salient statistics table, sales in 1948 of building, paving, railroad ballast, and "other" sands by commercial operators increased over those reported for 1947; sales of gravel by this class of operators increased for all types. The combined total of sand and gravel used on Government-and-contractor operations also showed substantial increases over the previous year's totals. In general, industrial sands declined in output for 1948, but average unit values increased substantially over the previous year's figures.

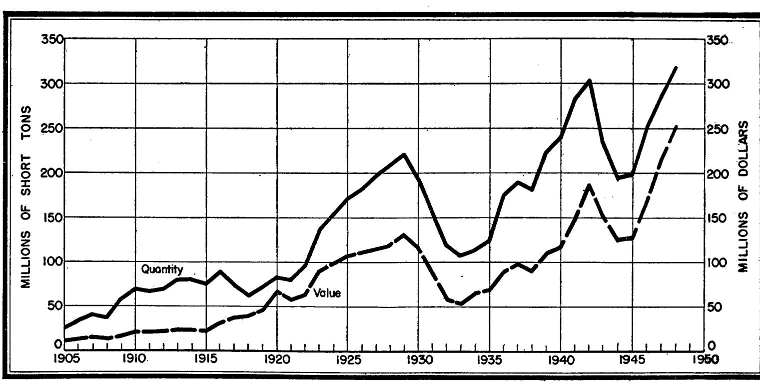

FIGURE 1.—Production of sand and gravel in the United States, 1905–48.

Sand and gravel sold or used by producers in the United States, 1947–48, by commercial and Government-and-contractor operations and by uses

[1] Includes blast sand as follows—1947: 308,128 tons valued at $958,023; 1948: 381,455 tons, $1,189,530.
[2] Includes ballast sand produced by railroads for their own use as follows—1947: 5,760 tons valued at 450; 1948: 87,684 tons, $7,321.
[3] Includes some sand used by railroads for fills and similar purposes as follows—1947: 159,983 tons valued at $31,886; 1948: 197,379 tons, $34,213.
[4] Includes ballast gravel produced by railroads for their own use as follows—1947: 5,424,388 tons valued at $1,813,184; 1948: 5,126,293 tons, $1,823,741.
[5] Includes some gravel used by railroads for fills and similar purposes as follows—1947: 1,058,333 tons valued at $298,249; 1948: 1,145,673 tons, $478,907.
[6] Approximate figures for States, counties, municipalities, and other Government agencies directly or under lease.

PRODUCTION

The production of sand and gravel in 1948 totaled 319,266,000 short tons valued at $252,498,000, an increase of 11 percent quantity-wise and 16 percent in value over the 287,659,000 tons valued at $216,869,000 reported in 1947. Reflecting the construction activity, substantial increases were recorded for sand and gravel in the building and paving industry.

In 1948, as in the previous year, California was the largest producer, and Michigan, Wisconsin, Illinois, New York, Ohio, Texas, Minnesota, and Pennsylvania followed in that order. These nine States, each with an output exceeding 12,000,000 tons, accounted for 51 percent of the total production.

The following tables show details of production, by States and uses, in 1948.

Sand and gravel sold or used by commercial and Government-and-contractor producers in the United States, 1944–48

Year	Sand		Gravel (including railroad ballast)		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	68, 978, 000	$54, 054, 000	125, 805, 000	$71, 110, 000	194, 783, 000	$125, 164, 000

[1] Figures that may not be shown separately are combined as "Undistributed."
[5] Includes 5,126,293 tons of ballast gravel valued at $1,823,741, produced by railroads for their own use.
[6] Includes 1,145,673 tons of gravel valued at $478,907, used by railroads for fills and similar purposes.

Government-and-Contractor Production.—As shown in the accompanying chart and tables, the output of sand and gravel from noncommercial or Government-and-contractor operations in 1948 comprised 27 percent of the total tonnage, compared with 26 percent in 1947. The value of this tonnage in 1948 represented 16 percent of the total for the industry. The increase in quantity is mainly accounted for by sand and gravel utilized in paving construction, and gravel also showed a sizable gain for building purposes.

States reported 53 percent of the total Government-and-contractor output in 1948, counties 38, municipalities 2, and Federal agencies 7. In 1948, contractors furnished 50 percent of the Government-and-contractor tonnage compared with 49 percent in 1947. The average value increased 2 cents per ton in 1948.

DEGREE OF PREPARATION

The bulk of the sand and gravel shipped by commercial plants is prepared material, whereas most of the output of Government-and-contractor operations is unprepared material. The accompanying table shows this relationship in the past 2 years. Prepared sand and gravel (commercial and Government-and-contractor) represented 73 percent of the total production in 1948 compared to 72 percent in 1947. This slight gain resulted from the increase in preparation of material by Government-and-contractor operations during 1948.

Sand and gravel (prepared or unprepared) sold or used by producers in the United States, 1947–48, by commercial and Government-and-contractor operations

	1947			1948		
	Quantity		Average value per ton	Quantity		Average value per ton
	Short tons	Percent		Short tons	Percent	
Commercial operations:						
Prepared	192,619,538	91	$0.89	212,072,878	91	$0.95
Unprepared	19,942,879	9	.51	21,430,644	9	.50
Total	212,562,417	100	.86	233,503,522	100	.90

Total	75,097,000	100	.46	85,763,000	100	.48
Grand total	287,659,000		.75	319,266,000		.79

SIZE OF PLANTS

The average plant output of commercial operators, excepting railroad plants, approximated 96,000 short tons in 1948 compared with 92,000 tons in the previous year. Plants producing 100,000 to 200,000 tons in 1948 accounted for 20 percent of the total output, the largest quantity produced by any one group. Plants producing more than 500,000 tons annually increased from 58 to 63 and supplied 25 percent of the production. The less-than-25,000-ton group showed the greatest expansion in number of plants—from 869 to 916. Details of output, by size groups, are shown in the accompanying table.

Comparison of number and production of commercial sand and gravel plants in the United States, 1947–48, by size groups [1]

Size group, in short tons	1947				1948			
	Plants [2]		Production		Plants [2]		Production	
	Number	Percent of total	Short tons	Percent of total	Number	Percent of total	Short tons	Percent of total
Less than 25,000	869	38.9	8,366,000	4.1	916	38.6	8,975,000	4.0
25,000 to less than 50,000	388	17.4	14,098,000	6.8	395	16.7	14,486,000	6.4
50,000 to less than 100,000	404	18.1	28,729,000	14.0	429	18.1	30,277,000	13.3
100,000 to less than 200,000	298	13.3	41,655,000	20.2	324	13.7	45,203,000	19.9
200,000 to less than 300,000	136	6.1	33,165,000	16.1	148	6.3	36,078,000	15.9
300,000 to less than 400,000	56	2.5	19,395,000	9.4	60	2.5	20,505,000	9.0
400,000 to less than 500,000	27	1.2	12,065,000	5.9	36	1.5	15,909,000	7.0
500,000 to less than 600,000	25	1.1	13,614,000	6.6	20	.8	10,871,000	4.8
600,000 to less than 700,000	3	.1	1,934,000	.9	11	.5	7,076,000	3.1
700,000 to less than 800,000	7	.3	5,139,000	2.5	3	.1	2,202,000	1.0
800,000 to less than 900,000	3	.1	2,517,000	1.2	8	.3	6,782,000	3.0
900,000 to less than 1,000,000	5	.2	4,690,000	2.3	4	.2	3,826,000	1.7
1,000,000 and over	15	.7	20,547,000	10.0	17	.7	24,756,000	10.9
Total	2,236	100.0	205,914,000	100.0	2,371	100.0	226,946,000	100.0

[1] Excludes operations by or for States, counties, municipalities, and Federal Government agencies as follows—1947: 759 with an output of 75,097,000 tons of sand and gravel; 1948: 774 operations, 85,763,000 tons. Excludes operations by or for railroads as follows—1947: 163 with an ouput of 6,648,000 tons of sand and gravel; 1948: 147 operations, 6,557,000 tons.

[2] Includes a few companies operating more than 1 plant but not submitting separate returns for individual plants.

METHOD OF TRANSPORTATION

Truck transportation in 1948 moved 56 percent of shipments from commercial plants. Railroads carried most of the remainder, but their portion of the total decreased from 38 percent in 1947 to 35 in 1948. The amount shipped by waterway, a method important in a few areas, decreased 1 percent in 1948. As shown in the accompanying table, the percentage of total shipments (including Government-and-contractor material as well as the output of commercial plants) moved by truck is greater than indicated in the above figures. In 1948 truck movements comprised 68 percent of the grand total.

Sand and gravel sold or used by commercial producers in the United States, 1947–48, by methods of transportation [1]

Method of transportation	1947		1948	
	Short tons	Percent of total reported	Short tons	Percent of total reported
Truck	107,380,870	53.1	125,468,383	56.2
Rail	75,941,543	37.5	78,888,488	35.4
Waterway	19,003,120	9.4	18,838,840	8.4
Total reported	202,325,533	100.0	223,195,711	100.0
Percent of total commercial production covered		95.2		95.6

[1] For practical purposes, the entire output of Government-and-contractor operations commonly is moved by truck. Including Government-and-contractor production, sand and gravel moved approximately as follows—1947: truck 66 percent, rail 27 percent, and waterway 7 percent; 1948: truck 68 percent, rail 26 percent, and waterway 6 percent.

CONSUMPTION TRENDS

Sand and Gravel for Construction.—The demand for sand and gravel by the construction industry in 1948, as measured by shipments from commercial plants, increased sharply over 1947. Building sand reached a total of 59,357,062 short tons, a figure 13 percent above that reported for 1947. Paving sand likewise showed a strong increase over the preceding year's figure, as did gravel for building and paving. The heavy building program, both public and private, and paving projects accounted for the substantial increase in sand and gravel consumption.

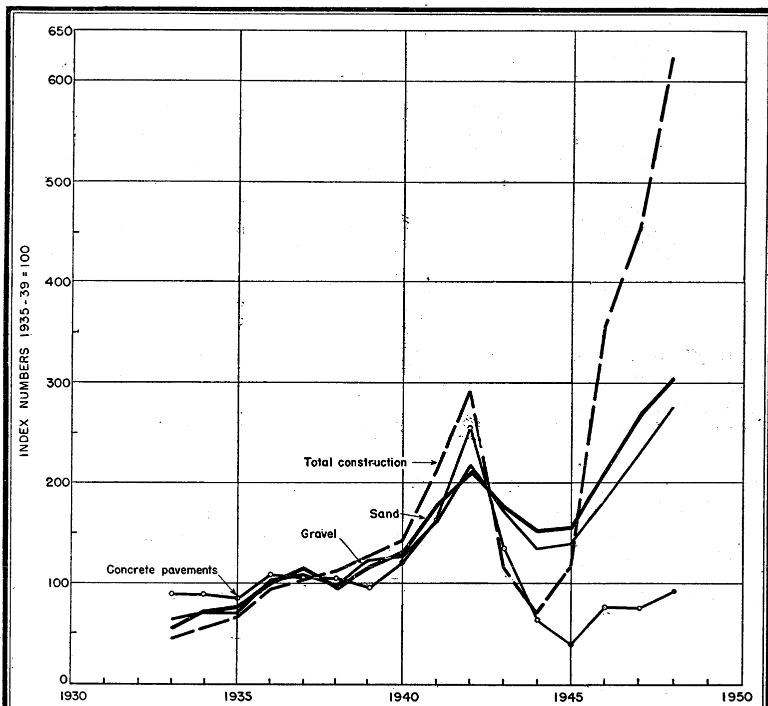

FIGURE 3.—Value of sand and gravel production compared with total construction (contract awards, value) and concrete pavements (contract awards, square yards) in the United States, 1933–48. Data on construction and pavements from the Bureau of Foreign and Domestic Commerce.

Industrial Sands.—The output of industrial sands in 1948 suffered declines ranging from 0.5 percent for molding sand to 25 percent for filter sand. The percentage decreases for glass, fire or furnace, and engine sands were 15, 14, and 9, respectively. However, the output for grinding and polishing uses increased 2 percent. The volume output of these sands depends largely on industrial production; consequently, their output is governed by industry trends.

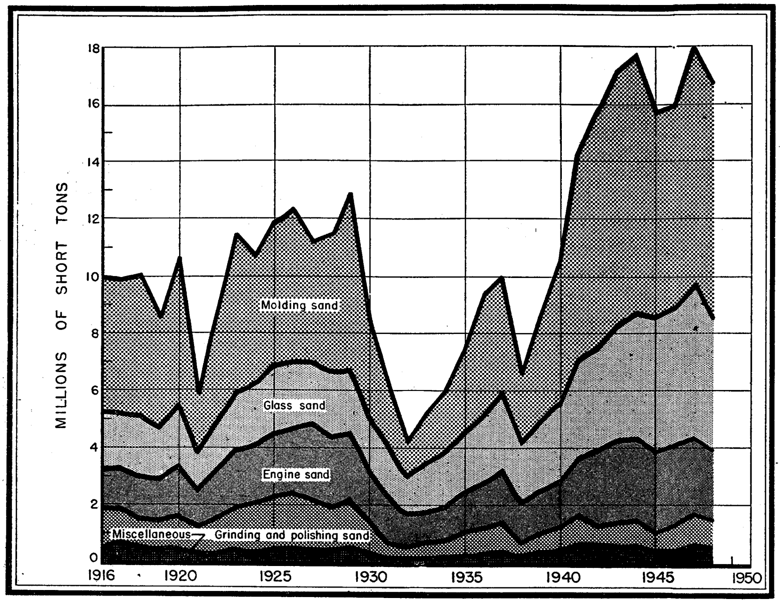

FIGURE 4.—Production of industrial sands in the United States, 1916–48.

Employment and Productivity.—In 1948 the total number of men employed in the commercial sand and gravel industry averaged more than 25,000, or about the same as in 1947. As the following table indicates, the average number of days worked (246) was the same as in the preceding year, and the average production per man per shift increased from 34.4 to 37.2 short tons. The accompanying table, showing a break-down of employment and production, by regions, of all commercial plants (except those operated by railroads) indicates that the California-Nevada region, as in 1947, employed the greatest number of men. The highest production per man per hour and shift was reported from the Michigan-Wisconsin region.

Employment in the commercial sand and gravel industry and average output per man in the United States, 1944–48, by regions [1]

	Employment: Average number of men	Employment: Time employed: Average number of days	Employment: Time employed: Total man-shifts	Employment: Time employed: Man-hours: Average per man per day	Employment: Time employed: Man-hours: Total	Production (short tons): Commercial sand and gravel	Production (short tons): Average per man: Per shift	Production (short tons): Average per man: Per hour	Percent of commercial industry represented

[1] Excludes plants operated by or directly for States, counties, municipalities, and Federal Government agencies.

PRICES

The average value for all shipments of sand and gravel in 1948 increased 5 percent over the previous year's figure. For commercial plants the average value increased 5 percent compared with 12 percent in 1947, thus reflecting the rise in labor and other production costs. The change for Government-and-contractor operations amounted to a 4-percent increase over 1947. Higher prices were the rule rather than the exception. Increases of 3 and 6 cents per ton were recorded for building and paving sand, increases for other types ranged from 12 cents for molding sand to 69 cents per ton for filter sand. Sand for railroad ballast decreased 2 cents per ton compared with 1947, whereas gravel for building and paving showed increases of 7 cents and 1 cent per ton, respectively. With the exception of gravel for building, the unit values of Government-and-contractor output also increased in 1948.

FOREIGN TRADE [1]

Imports of sand and gravel in 1948 amounted to 441,456 short tons, 9 percent in quantity and 14 percent in value lower than in 1947. Belgium-Luxembourg supplied virtually all of the glass sand, while Canada furnished 328,224 short tons of "other sand" with Belgium-Luxembourg, Iceland, United Kingdom, France, Turkey, Australia, and Egypt supplying the balance. The gravel imported amounted to 89,174 short tons and came from Canada and the United Kingdom.

Sand and gravel imported for consumption in the United States, by classes, 1939–48

[U. S. Department of Commerce]

Year	Sand				Gravel		Total	
	Glass sand [1]		Other sand [2]

TECHNOLOGY

The sink-float process is used extensively in the mineral separation of metallic ores. The possibility of using this method in the sand and gravel industry for separating aggregate of different specific gravities and for the removal of such deleterious matter as clay-balls, coal, wood chips, etc., has been suggested.[2]

One method of solving the problem of blending different-size aggregates has been developed by a sand-and-gravel plant in the Northwest. A reclaiming belt serves 10 steel storage silos in such a manner as to blend the materials to meet almost any specification.[3] Another plant in the Northwest features a blending system with belt conveyors, radial stock pilers, and other features to produce many sizes of aggregate.[4]

Two aids for determining the moisture content of sand for use in connection with ready-mixed concrete have been developed. These charts, used in conjunction with the Chapman flask method will aid in producing uniform concrete.[5] A method of freeing glass sands from ferruginous impurities by two-stage flotation is described in United States Patent 2,433,633.[6] Two articles on foundry sands have been recently released.[7] The American Society for Testing Materials has published a report dealing with the characteristics and uses of mineral aggregates.[8] The use of sand and emulsified asphalt for airport runway bases has been discussed.[9]

Secondary Metals—Nonferrous

By ARCHIE J. McDERMID[1]

GENERAL SUMMARY

PLANTS recovering secondary metal from nonferrous scrap had a busy year in general in 1948. Secondary production of most metals was not as large in 1948 as in 1947, but prices received for all but magnesium were higher. Demand for metal products did not fluctuate as much as in 1947, and this was reflected in steadier operation of plants consuming scrap. Activities of aluminum ingot makers, contrary to the general trend, were severely restricted because of the dwindling supply of military aircraft scrap, so plentiful immediately after World War II. Demand for aluminum ingot by foundries was firm all year. Primary producers offered the ingot makers strong competition for available plant scrap during the year.

Salient statistics of nonferrous secondary metals recovered in the United States, 1947–48

Metal	From new scrap		From old scrap		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1947

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Recovery of aluminum from scrap decreased 58,060 tons compared with 1947. Decreases in lead, magnesium, antimony, and nickel from scrap, totaled 15,651 tons, and copper, zinc, and tin from scrap made an aggregate gain of 24,963 tons. All types of aluminum- and lead-base scrap were scarce throughout 1948. The supplies of copper-base and zinc-base scrap were relatively more abundant than those of lead-base and aluminum-base, and consumption of both was a little greater than in 1947. Scrap prices reached their peaks in November and declined in December. There were numerous advances in the prices of the metals discussed in this chapter and no reductions.

The value of metals recovered in 1948 from both old and new scrap was $856,545,087 compared with $785,700,686 in 1947. The increase, as in 1947, was attributable to higher unit values. The value of metals recovered from old scrap in 1948 increased for the sixth successive year, totaling $478,956,016 compared with $446,362,049 in 1947. The new scrap recovery value increased a comparable amount and totaled $377,589,071.

The figures for the values of secondary metals recovered are calculated on the basis of replacement of primary metals by secondary; that is, it is assumed that if the plants involved had not been able to use scrap in their operations they would have had to use primary metals worth the figures quoted above. The amounts are useful for year-to-year comparisons but do not represent actual receipts by the secondary plants for their products. As a matter of fact, the unit prices of secondary metals usually are somewhat less than those of primary metals of the same purity and composition. Secondary smelters operate through their ability to remelt scrap items of different composition in the proper proportions to form ingot of specified grade at such a price that foundries will buy it instead of producing their own alloys from primary metals or scrap.

Secondary metals recovered as unalloyed metal, in alloys, and in chemical compounds in the United States, 1944–48, in short tons

Metal	1944	1945	1946	1947	1948
Aluminum	325, 645	298, 387	278, 073	344, 837	286, 777
Antimony	15, 886	17, 148	19, 115	22, 984	21, 592
Copper	950, 942	1, 006, 516	803, 546	961, 741	972, 788
Lead	331, 416	363, 039	392, 787	511, 970	500, 071
Magnesium	14, 185	9, 247	5, 117	9, 503	7, 834
Nickel	4, 321	6, 483	8, 248	9, 541	8, 850
Tin	32, 589	35, 133	27, 671	30, 054	30, 124
Zinc	345, 469	360, 444	300, 682	310, 793	324, 639

SCOPE OF REPORT

Plants canvassed in nonferrous secondary metal surveys include all known consumers of purchased nonferrous scrap metals, as well as consumers of refined copper and brass ingot. The accompanying table classifies the plants canvassed by type of operation and kind of material consumed. Secondary smelters have been recorded in more than one column if they used more than one kind of material; otherwise, there is no duplication. The tabulation of the number of plants in some categories is subject to limitations. The large number of foundries and the small size of many of them makes it impossible to obtain reports from all units. On the other hand, a few large corporations operating more than one plant prefer to file consolidated reports, in which the number and location of plants are not given, with the result that only one plant is credited. These limitations, however, do not affect seriously the validity of the data presented.

Number and classification of plants consuming nonferrous scrap metals, refined copper, and copper-alloy ingots in 1948

Kind of plant	Type of material used				
	Aluminum	Copper	Lead and tin	Zinc	All nonferrous types
Primary producers	[1] 26	17	8		
Secondary smelters	[2] 67	[3] 106	267	136	
Distillers				[4] 23	
Chemical plants	17	46		21	
Brass mills		50			
Wire mills		[5] 14			
Foundries and miscellaneous manufacturers			35	[6] 14	[7] 2,900

[1] Includes aluminum reduction plants and rolling mills.
[2] Includes 57 aluminum-alloy ingot makers, 5 army airfields, and 5 naval air stations.
[3] Includes 74 secondary copper smelters and 32 smelters using copper scrap in other than copper alloys.
[4] Includes 18 secondary plants, including zinc-dust plants, and 5 primary producers which used scrap in addition to ore.
[5] Refers to companies operating wire mills. Some companies operate more than 1 plant.
[6] Includes galvanizers, die casters, and zinc rolling mills.
[7] Chiefly brass foundries, but some aluminum foundries, iron foundries, steel plants, and miscellaneous manufacturers. Any or all types of nonferrous scrap were used by these consumers. Excludes plants not established in Bureau of Mines scrap surveys.

The statements from industry, on which data in this chapter are based, were received monthly from the larger smelters, chemical plants, and manufacturers and from brass and wire mills. Foundries, primary aluminum producers, and smaller plants of other types were canvassed on an annual basis.

Definitions of terms used in this chapter are as follows:

"Secondary metals" are metals or alloys recovered from scrap and residues. The term "secondary" applies only to the source of the metal and has no relation to the type of product recovered, either as to quality, degree of purity, or physical characteristics.

Scrap metals are divided into three main categories: Old scrap, process or plant scrap, and defective finished or semifinished articles returned by purchasers to be reworked.

"Old" scrap is defined as consisting of metal articles that have been discarded because of wear, damage, or obsolescence, usually after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, fired cartridge cases, automobile crank cases, used pipe, lithographers' plates, and obsolete military equipment (frequently unused).

"Process" scrap is that generated during the manufacture of articles for ultimate consumption. Typical examples of process scrap are clippings, turnings, borings, skimmings, slags, and drosses.

"Process" scrap is divided into two classifications: "Home" scrap, consumed in the plant of generation, and "new" scrap, which is consumed elsewhere, either after sale to another company or shipment to another plant of the same company. Defective articles, the third main class of scrap, are classed as new scrap for tabulation purposes. In this chapter consumption of old and new scrap only is tabulated, no record being kept, in nonferrous metal canvasses, of home scrap. Consumption of scrap is always measured at the point where it loses its identity as scrap and becomes secondary metal.

Borings and turnings and other items of process scrap when consumed outside the plant of generation are new scrap, whether clean, rusty, or oily and whether generated recently or long before reclamation. Residues are new scrap if generated in processing scrap or refined metal. For example, flue dust from smelting brass scrap is new scrap. Zinc chemical residues resulting from the consumption of zinc dust in the manufacture of sodium hydrosulfite are also new scrap. Residues generated in processing ore or concentrates are not scrap but primary residue. Old mine tailings are primary residue because generated in processing ore.

SECONDARY ALUMINUM

The recovery of secondary aluminum from scrap totaled 286,777 short tons, valued at $83,165,330, a decrease of 17 percent in quantity from the record 344,837 tons valued at $97,450,936 reclaimed in 1947. Values were calculated on the basis of the average market price of primary pig, which was 14.13 cents in 1947 and 14.50 cents a pound in 1948.

Secondary aluminum [1] recovered in the United States, 1947–48, in short tons

Secondary aluminum recovered			Recoverable aluminum-alloy content of scrap		
Form of recovery	1947	1948	Kind of scrap processed	1947	1948
As metal	5,105	2,384	New scrap:		
Aluminum alloys	338,200	282,302	Aluminum-base [2]	180,782	190,736
In brass and bronze	307	455	Copper-base	67	99
In zinc-base alloys	624	776	Zinc-base	93	95
In magnesium alloys	222	354	Magnesium-base	48	199
In chemical compounds	379	506	Total	180,990	191,129
Grand total	344,837	286,777	Old scrap:		
			Aluminum-base [3]	163,110	95,101
			Copper-base	84	93
			Zinc-base	346	292
			Magnesium-base	307	162
			Total	163,847	95,648
			Grand total	344,837	286,777

[1] In accordance with common usage, the term "aluminum" covers aluminum alloys, and the figures include all constituents of the alloys recovered from aluminum-base scrap.
[2] Recoverable aluminum content of new aluminum-base scrap was 166,269 tons in 1947 and 179,516 tons in 1948.
[3] Recoverable aluminum content of old aluminum-base scrap was 150,219 tons in 1947 and 86,028 tons in 1948.

The drop in recovery in 1948 is attributable to the decline in supplies of scrapped military aircraft which had been plentiful since 1942. The last important concentrations of this material were at five airfields where the Army had gathered obsolete and damaged aircraft and later sold them to contractors who melted them into alloy ingot or broke them up for shipment to smelters. All but a small fraction of this scrap had been disposed of in 1947 and the remainder in the first few months of 1948. As a result of the short supply of aircraft scrap, which is old scrap, the recovery of aluminum alloy from old aluminum-base scrap declined from 163,110 tons in 1947 to 95,101 tons in 1948. There was a moderate increase in recovery from new aluminum-base scrap. Secondary aluminum recovered as metal and in aluminum alloys decreased from 5,105 and 338,200 tons, respectively, in 1947 to 2,384 and 282,302 tons in 1948, but secondary aluminum recovered in brass and bronze, in zinc-base alloys, in magnesium alloys, and in chemical compounds increased 48, 24, 59, and 34 percent, respectively.

Production of aluminum-alloy ingot by secondary smelters (ingot makers), naval air stations, and contractors melting obsolete army planes totaled 190,039 tons in 1948, representing a decrease of 27 percent from 1947. The output of the ingot makers alone was 176,263 tons in 1948, 4,122 tons less than in 1947. The primary plants produce alloy ingot to be made into castings by foundries and into wrought products by fabricators; but the purchased scrap, home scrap, and primary aluminum from which the ingot is made are so intermingled that the quantities of scrap used in castings cannot be measured or calculated separately from those used in wrought products. Secondary production by primary producers is therefore reported as "Secondary aluminum at primary plants" in the production table. The total for this item increased from 84,074 tons in 1947 to 93,159 tons in 1948.

Production of secondary aluminum and aluminum-alloy products in the United States, 1946–48, gross weight in short tons

Product	1946	1947	1948
Secondary aluminum ingot: [1]			
Pure aluminum (98.5 percent)	2,075	5,052	2,328
Silicon (max. Cu, 1 percent)	15,700	12,370	11,786
Silicon (Cu, 1 to 2.5 percent)	7,268	5,108	4,694
No. 12 aluminum	38,286	27,605	19,509
Other aluminum-copper (max. Si, 2.5 percent) alloys	23,714	89,642	[2] 17,612
Copper-silicon (each over 2.5 percent) alloys	67,540	72,286	80,940
Aluminum-copper- or aluminum-silicon-nickel alloys	2,603	2,101	3,791
Deoxidizing and other destructive uses	31,011	28,965	34,143
Aluminum hardeners	2,242	2,695	3,989
Al-Mg and Al-Zn alloys	17,135	3,833	2,860
Miscellaneous		10,258	8,387
Total	207,574	259,915	190,039
Secondary aluminum at primary plants [3]	73,388	84,074	93,159
Aluminum powder		[4] 53	[4] 56
Aluminum-alloy castings	4,444	7,645	5,289
Aluminum in chemicals	563	379	506

[1] Gross weight of alloys, including copper, silicon, and other added elements; total secondary ingot contained 1,025 tons of primary aluminum in 1946, 1,525 tons in 1947, and 3,033 tons in 1948.
[2] Of the total, 13,776 tons produced at naval air stations and plants of contractors melting down army planes.
[3] Combined with primary aluminum for the production of wrought products and castings.
[4] Does not include production measured as ingot for graining, powder, atomizing, or chemical purposes.

Production from aircraft scrap, when melted separately, is assigned to "Other aluminum-copper" alloys. Output of this alloy declined sharply from 89,642 tons in 1947 to 17,612 tons in 1948 as a result of decreased consumption of aircraft scrap at secondary smelters from 135,795 tons in 1947 to 43,196 in 1948. Production of copper-silicon alloys (each over 2.5 percent) increased 12 percent to 80,940 tons, and that of deoxidizing ingot, after a 3-year decline, increased 18 percent to 34,143 tons. Output of No. 12 aluminum decreased to 19,509 tons in 1948. The recovery and production tables of the Secondary Copper and Brass section are compared in detail in that section, and the observations made there apply in general to the same tables in the Secondary Aluminum section.

Aluminum was reported to be gaining as a competitor of zinc in die casting in 1948.[2] Aluminum die castings can be made from a number of types of aluminum alloys, all of which can be made from scrap, but the composition of zinc die castings must be held within narrow limits. Special high-grade zinc is generally used, and the allowable maximums for tin, cadmium, and lead are less than 0.01 percent. Because of this limitation in specifications, zinc die-casting manufacturers will use only scrap castings returned by their own customers. Zinc is preferred for die casting because it has a lower melting point than aluminum and has better casting qualities, but aluminum is lighter and stronger.

The consumption of aluminum scrap in 1948 was limited to 324,495 tons because more was not available. There was strong demand for both primary and secondary aluminum that was only partly satisfied, and the shortage was accentuated by lack of water power for operating aluminum reduction works, brought on by dry weather in many areas of the country. Early in the year the Reynolds plant at Longview Wash., suspended operations because of water-power shortage, and in June this company's plant at Troutdale, Oreg., was idle as a result of floods. Primary producers and rolling mills competed with secondary smelters for scrap. Fabricators and foundries with scrap to return had an advantage in the buying of scarce ingot. The secondary smelters, which had no primary metal to sell but only the ingot they made from scrap, were at a disadvantage. The fabricators, needing primary ingot, favored the primary producers in the sale of their scrap. This situation was thoroughly discussed by Carl H. Burton, secretary of the Aluminum Research Institute.[3]

Consumption of old and new aluminum scrap in the United States in 1948, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries: Reduction plants and aluminum rolling mills		Manufacturers and foundries: Foundries and other manufacturers		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
Pure clippings, wire, and foil	11,018	490	28,627	97	573	77	40,882
Castings and forgings	17,846	23,638	1,949	7,713	1,012	2,025	54,183
Alloy sheet	40,546	4,952	48,130	219	12	5	93,864
Scrap sheet and sheet utensil		5,652		376	1,555	386	7,969
Borings and turnings	29,271		1,966		256		31,493
Aircraft scrap		43,196		11,360			54,556
Miscellaneous aluminum and dross	22,418	18,639	5	12	474		41,548
Total	121,099	96,567	80,677	19,777	3,882	2,493	324,495

[2] Kenly, R. G., The Outlook for Zinc Markets: Am. Met. Market, vol. 56, No. 71, Apr. 12, 1949, p. 5.
[3] Burton, Carl H., Address before the Die Casting Institute: Am. Met. Market, vol. 55, No. 208, Oct. 28, 1948, pp. 1, 6.

Aluminum rolling mills consumed 100,454 tons of aluminum scrap in 1948, 10,445 tons more than in 1947; smelters and airfields consumed 217,666 tons in 1948, 94,421 tons less than in 1947. Total consumption of old scrap other than aircraft scrap decreased slightly in 1948, but treatment of new scrap increased 9,018 tons to 205,658 tons. The construction industry is currently the largest consumer of aluminum, but this metal cannot be expected to return to secondary smelters as old scrap for a considerable time. More aluminum probably will continue to be recovered from new scrap than from old for several years at least.

Stocks of aluminum scrap in the hands of consumers totaled 28,698 tons at the end of 1948 compared with 44,139 tons at the end of 1947 and 52,386 at the end of 1946. All types of scrap participated in the 1948 decline, the greatest drop being 5,945 tons or 53 percent in castings and forgings.

Consumers' stocks of aluminum-base scrap in the United States at end of year, 1947–48, gross weight, in short tons

Scrap item	Dec. 31, 1947	Dec. 31, 1948
Castings and forgings	11,296	5,351
Sheet, turnings, clippings, etc.	21,054	16,428
Aircraft scrap	6,331	2,716
Miscellaneous aluminum and dross	5,458	4,203
Total	44,139	28,698

Dealers' buying prices for cast aluminum scrap increased from an average monthly price of 7.11 cents a pound in January to 8.84 cents in June. In July it increased to 10.87 cents, then declined to 9.95 cents in October. Average prices in November and December were 12.41 and 13.25 cents, respectively, and the average for the year was 9.44 cents. The price for new aluminum clippings averaged 9.11 cents in January and 9.25 cents in February and March, then increased in each of the succeeding months of the year and was 16.75 cents in December, the average for the year being 11.82 cents. The Aluminum Co. of America advanced the price of primary aluminum pig from 14 to 15 cents a pound on June 28, 1948, because wage increases to its employees had increased the cost of production. The price was raised an additional cent on October 11.

Imports of aluminum scrap in 1948 were 71,728 tons compared with 15,719 tons in 1947. Exports were 438 tons in 1948 and 788 tons in 1947.

SECONDARY ANTIMONY

Recovery of secondary antimony from lead- and tin-base scrap totaled 21,592 short tons valued at $15,835,573, a 6-percent decrease from the 22,984 tons valued at $15,376,296 reclaimed in 1947. The value was computed at 36.67 cents a pound in 1948 and at 33.45 cents in 1947, the average New York selling price for primary antimony.

Secondary antimony recovered in the United States, 1947–48, in short tons

Secondary antimony recovered			Recoverable antimony content of scrap		
Form of recovery	1947	1948	Kind of scrap processed	1947	1948
In antimonial lead	16,638	14,163	New scrap:		
In other lead alloys	6,168	[illegible],225	Lead-base	3,794	3,594
In tin-base alloys	178	204	Tin-base		
Grand total	22,984	21,592	Total	3,794	3,594
			Old scrap:		
			Lead-base	19,035	17,816
			Tin-base	155	182
			Total	19,190	17,998
			Grand total	22,984	21,592

In 1948, 56 percent of all antimony recovered from scrap came from old battery plates, always the principal source of secondary antimony.

The quantity of battery plates treated in 1948 decreased 6 percent; correspondingly, antimony recovered from this source decreased 6 percent, from 12,950 tons in 1947 to 12,111 tons in 1948. Antimony recovered from scrap in all antimonial lead decreased at both primary and secondary plants but gained in both lead- and tin-base alloys. Remelters, smelters, and refiners recovered 95 percent of the antimony reclaimed, and bearing manufacturers and foundries the remaining 5 percent. Data on consumption of purchased scrap from which antimony was recovered will be found in the tables on consumption of lead- and tin-base scrap in the sections of this chapter devoted to those metals. Products in which antimony was recovered are included in the lead- and tin-products tables.

Production of unalloyed lead from scrap in 1948 was reported as 135,071 tons, gross weight. Of this total, at least 65,000 tons were probably obtained by softening antimonial lead scrap, because the only other scrap from which secondary unalloyed lead would ordinarily be obtained was soft lead scrap from which 70,470 tons of lead were recovered in 1948. The high-antimony drosses resulting from the softening operation were consumed in other products. Of the 15,455 tons of primary antimony consumed in 1948, 9,381 tons emerged chiefly in lead and tin alloys, the balance being used in nonmetal products. Thus the secondary antimony recovered was more than twice the primary antimony used in metal products and 40 percent more than the total primary antimony consumed. As far as could be determined, all antimony recovered remained in the alloyed state, none being reclaimed as unalloyed metal or in chemical compounds.

Domestic demand for antimony nearly balanced supply in 1948, but to insure purchases for the National Strategic Stock Pile, General Preference Order M–112, controlling allocation, exports, and imports of antimony, was continued through the year.

The price of primary antimony in January 1948 was 34.61 cents a pound f. o. b. New York, according to the American Metal Market. Five increases during the year raised the New York selling price to 40.17 cents, where it remained throughout November and December.

SECONDARY COPPER AND BRASS

The recovery of secondary copper from scrap totaled 972,788 short tons, valued at $422,189,992, in 1948—an increase of 1 percent in quantity over the 961,741 tons valued at $402,007,738 recovered in 1947. Value was computed at 20.9 cents a pound in 1947 and 21.7 cents a pound in 1948, the yearly average weighted prices of all grades of refined copper sold by producers in the 2 years, exclusive of bonus payments under the Premium Price Plan terminated June 30, 1947.

Secondary copper output data are presented in two accompanying tables, the first of which is double and shows secondary copper recovered according to composition on the left and according to class of scrap processed on the right side. The data on the left side are compiled from individual plant outputs and those on the right by calculating the copper that could be recovered from the quantities of the different kinds of scrap reported used. The totals so derived for each side of the table emerge different because of slight errors introduced by the necessity of assuming recovery factors. As presented here, however, the items have been adjusted to effect the exact balance theoretically to be expected. The word "recovery" thus may be applied to both sides of the table.

The copper recovered from scrap falls mainly into two categories—that recovered as unalloyed copper and that recovered in brass and bronze. The other items are minor. Copper recovered from scrap in unalloyed form declined to 284,026 tons in 1948 from 303,092 tons in 1947 but was still well above the 136,909 tons reclaimed in this form in 1946. On the other hand, copper recovered in brass and bronze rose 5 percent to 653,281 tons in 1948 compared with 1947. The scrap from which the recovery is made is classified as new and old. Both types of scrap yielded more recoverable metal in 1948 than in 1947.

Total copper production consists of copper recovered from old and new scrap plus copper produced from primary materials. The 1,107,446 tons produced by refineries from domestic and foreign primary materials in 1948, as reported in the Copper chapter, is obviously an addition to the available supply. The reason for considering the 505,464 tons recovered from old scrap an addition to supply is more obscure. Old scrap consists of obsolete and discarded articles and equipment, returned to industry for reprocessing. These articles were subtracted from the available supply when first manufactured and therefore are an addition to it when they return in worn-out condition for reuse. The 467,324 tons of copper recovered from new scrap in 1948 is not an item to be added in arriving at total supply because it consists of material already accounted for. However, data on consumption of new scrap have significance as indicators of business activity in copper and copper-alloy fabrication and as a part of the metal-reclamation industry.

Secondary copper recovered in the United States, 1947–48, in short tons

Secondary copper recovered		
Form of recovery	1947	1948
As unalloyed copper:		
At primary plants	269,085	245,376
At other plants	34,007	38,650
Total	303,092	284,026
In brass and bronze	619,576	653,281
In alloy iron and steel	2,830	2,911
In aluminum alloys	16,962	14,678
In other alloys	443	280
In chemical compounds	18,838	17,612
Total	658,649	688,762
Grand total	961,741	972,788

Recoverable copper content of scrap		
Kind of scrap processed	1947	1948
New scrap:		
Copper-base	449,900	458,892
Aluminum-base	7,426	7,231
Nickel-base	1,037	1,192
Lead-base		7
Zinc-base	2	2
Total	458,365	467,324
Old scrap:		
Copper-base	495,789	500,872
Aluminum-base	6,686	3,831
Nickel-base	789	569
Lead-base	21	87
Tin-base	90	104
Zinc-base	1	1
Total	503,376	505,464
Grand total	961,741	972,788

The accompanying production table, unlike the recovery table which gives total recovery of copper from all types of scrap and in all products, shows only copper-base secondary products and excludes such items as copper recovered in iron and steel and aluminum alloys. The products are divided into seven groups as shown.

It will be noted that the total for the first group in the production table is the same as for the first group in the left side of the recovery table but is broken down differently. Of the total secondary refined and casting copper shown, primary refiners in 1948 produced 245,376 tons, 9 percent less than in 1947 but more than in any other year on record.

The figures for copper-alloy ingot and brass-mill billets made by ingot makers, the second and third groups in the production table, unlike the items in the recovery table and all the other entries in the production table, include both primary and secondary material. They represent the copper, zinc, and other metals recovered from all kinds of scrap, as well as added primary metals. The scrap constitutes such a large percentage of the input that the entire output is tabulated as secondary production even though a small proportion represents primary material. The total production of copper-alloy ingots, after declining for 3 years, increased 6 percent in 1948 to 302,278 tons. Changes in individual types of ingot, however, were not exceptional, the largest being a 6,670-ton rise in output of No. 1 composition ingot. The increase in brass-mill output from 404,135 tons of brass and copper products in 1947 to 437,402 tons in 1948 and the gain in brass-ingot production accounts for the rise in total secondary copper recovered; the gain would have been larger except for the drop in output of secondary refined copper.

Analysis and production of secondary copper and copper-alloy products in the United States, 1947–48

Item produced from scrap	Approximate analysis (percent)						Gross weight produced (short tons)	
	Cu	Sn	Pb	Zn	Ni	Al	1947	1948
Unalloyed copper products:								
Refined copper (electrolytic grade)	100						[1] 275,415	231,899
Casting copper	99						[2] 3,919	25,349
Copper sheet, rod, tubing, etc	99						20,346	20,989
Copper powder	98						2,991	2,324
Copper castings	98						421	3,465
Total							303,092	284,026
Brass and bronze ingots:								
Tin bronze	88	10		2			19,391	18,256
Leaded-tin bronze	88	6	1.5	4.5			16,253	17,934
Leaded red brass	85	5	5	5			113,508	120,178
Leaded semired brass	81	3	7	9			46,522	46,521
High-leaded-tin bronze	80	10	10				22,215	24,875
Do	84	6	8	2			8,074	8,137
Do	75	5	20				8,109	11,412
Leaded yellow brass	66	1	3	30			20,912	22,535
Manganese bronze	62			27		5	13,017	13,826
Aluminum bronze	89					10	1,674	2,063
Nickel silver	58	2	7	18	14		4,800	4,811
Do	65	4	3	5	22			
Low brass	80			20			1,960	2,642

Conductor bronze	94	2	2	2			831	685
Hardeners and special alloys	81						5,461	5,936
Total							284,868	302,278
Brass mill billets made by ingot makers							3,329	6,881
Brass and bronze sheet, rod, tubing, etc							[3] 383,789	[3] 416,413
Brass and bronze castings							[4] 139,880	[4] 135,092
Brass powder							1,425	1,333
Copper in chemical products (content)							[5] 18,838	17,612

[1] Total includes 19,525 tons of casting copper produced at primary plants and 255,890 tons of refined copper.
[2] Production at secondary plants only.
[3] Gross weight of secondary brass and bronze in commercial shapes. Includes 269,408 tons of copper, 2,702 tons of nickel, 3,483 tons of lead, 276 tons of tin, 107,795 tons of zinc, and 125 tons of aluminum in 1947; and 290,430 tons of copper, 3,052 tons of nickel, 4,137 tons of lead, 354 tons of tin, 118,338 tons of zinc, and 102 tons of aluminum in 1948.
[4] Gross weight of secondary metal in brass and bronze castings. Includes 110,624 tons of copper, 95 tons of nickel, 14,228 tons of lead, 5,676 tons of tin, 9,216 tons of zinc, and 41 tons of aluminum in 1947; and 107,323 tons of copper, 39 tons of nickel, 13,635 tons of lead, 5,441 tons of tin, 8,535 tons of zinc, and 119 tons of aluminum in 1948.
[5] Corrected figure.

All the items in the production table except those for the second and third groups are the outputs, chiefly, of primary producers, brass mills, foundries, and chemical plants. These producers melt so much refined copper or copper-alloy ingot with their scrap that their secondary production cannot be measured separately, like that of the ingot makers, but must be calculated as a part of the total. The calculation is made by using average recovery percentages to obtain recoverable metal content of the scrap used. The secondary output of primary producers is refined copper; but that of the brass mills and foundries includes other metals recovered from scrap such as zinc, lead, aluminum, etc., as well as copper, which are contained in brass products.

Total consumption of copper-base scrap in 1948 was 1,489,358 tons, slightly greater than in 1947, as was the case with secondary copper production and for the same reason—the increased activity by ingot makers and brass mills and despite reduced activity by primary producers. The latter consumed 500,679 tons of scrap in 1948 compared with 393,717 tons by the secondary smelters, but the output of the smelters was greater because the grade of the scrap they consumed averaged higher than that of the scrap used at primary plants. The increased consumption of scrap by the ingot makers was due to a 13-percent rise in their use of composition scrap, and the use of yellow brass scrap by brass mills increased from 263,649 tons in 1947 to 287,946 tons in 1948. The percentage of old scrap in the total used decreased from 55 percent in 1947 to 53 percent in 1948.

Consumption of old and new copper scrap in the United States in 1948, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Brass mills		Foundries and other manufacturers		
	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
No. 1 wire and heavy	[1] 43,416	[1] 47,463	19,772	39	2,485	16,473	129,648

Low-grade scrap and residues	[1] 129,626	[1] 263,446	--------	--------	--------	293	393,365
Total	297,158	597,238	366,286	59,238	30,977	138,461	1,489,358

[1] Of the totals shown primary refiners reported the following: Unalloyed copper scrap 92,524 tons of new and 60,616 tons of old; and of low-grade scrap and residues 103,641 tons of new and 243,898 tons of old.

Demand for copper and brass scrap, especially copper scrap, exceeded the supply during most of 1948. One of the large chemical plants, facing a scarcity of refined copper and scrap, further developed a method for separating zinc from brass scrap by distillation. Commercial-grade zinc and copper suitable for use in making copper sulfate were produced. Much of the experimental work on this process had been done previously at another plant.[4]

The accompanying table stresses the relative importance of scrap in comparison with other copper raw materials in the operations of the principal consumers of copper materials. The primary producers used more scrap than any other group but recovered only the copper, and much of their scrap was low-grade material. The temperatures at which primary copper smelters operate are so high that the zinc, lead, and other metals in brass scrap except copper, are vaporized. The brass mills use plant scrap from brass fabricators as an auxiliary raw material to supplement refined copper and zinc in making brass and copper sheet, rod, tubing, and wire. According to figures recently published,[5] shipments of brass-mill products in 1948 totaled 1,075,966

tons, of which 42 percent was copper and brass sheet, 27 percent rod, 26 percent pipe and tubing, and 5 percent wire. The last item does not include wire for transmission purposes, which is considered to be a wire-mill product.

Consumption of copper and brass materials, by principal consuming groups, in 1948, in short tons

Item consumed	Primary producers	Brass mills	Wire mills	Foundries and miscellaneous	Secondary smelters
Copper-base scrap	500,679	425,524	------------	169,438	393,717
Primary material	[1] 1,107,446	------------	------------	------------	------------
Refined copper	------------	614,314	765,849	30,387	6,805
Brass ingot	------------	4,322	------------	298,770	------------
Slab zinc	------------	109,140	------------	------------	------------
Miscellaneous	------------	1,125	------------	------------	13,723

[1] Recoverable copper content; gross weight not available.

The secondary smelters' or ingot makers' chief raw material is scrap, which they do not separate into its constituent metals but remelt to form alloys of specified composition for use in foundries. Billets are made for brass mills by a few ingot plants but in relatively small quantities. The ingot maker must be able to treat scrap of all compositions to produce alloys that will compete with those made by mixing refined metal. Each new alloy that is introduced provides a new type of scrap that must be fitted into his scheme of operations. A recent innovation is the addition of small quantities of iron to cupronickel alloys used in condenser tubes. Although more expensive than other alloys commonly used for tubing in marine condensers, it is preferred for use on warships in which the wide-spread use of electric current increases galvanic corrosion. Under such conditions, brass condenser tubes are subject to severe dezincification. The purpose of adding iron to the alloy is to provide resistance to erosion and wear from impingement. Under less rigorous conditions, aluminum brass consisting of 76 percent copper, 22 percent zinc, and 2 percent aluminum is a satisfactory and less expensive alloy for condenser tubes, the aluminum preventing dezincification. Admiralty metal is lower in price than either cupronickel or aluminum brass and is more economical to use for condenser tubes under some conditions. Secondary smelters consumed 5,509 tons of brass pipe and tubing scrap, most of it old, in 1948 and brass mills 1,789 tons, all new scrap. Another innovation in 1948 was the addition of small percentages of lead to aluminum bronze to improve machinability. It was found [6] that this alloy, containing 1 percent of lead, after heat treatment, was more easily machined and had nearly the same mechanical properties as lead-free aluminum bronze.

Brass foundries used nearly all of the brass ingot produced by the secondary smelters and in addition consumed subordinate quantities of scrap and refined copper. Foundry consumption of brass ingot was tabulated for 1948 for the first time by the Bureau of Mines and was reported at 225,298 tons. Foundries and brass mills are virtually

[6] Grodsky, V. A., Improving the Machinability of Aluminum Bronze: Metal Progress, vol. 55, No. 3, March 1949, pp. 340-341.

the only consumers of this product, and the 4,322 tons which the mills used brought the total for the year to 229,620 tons. Ingot makers sold 302,910 tons of brass ingot in 1948; and, so far as can be determined, all of it went to the above groups of consumers except for a few hundred tons that were exported. If the consumption of ingot by these plants equaled their purchases, as is probable, the 229,620 tons reported to the Bureau of Mines as consumed account for 76 percent of the 302,910-ton total. In all, 3,433 foundries were canvassed on consumption of copper materials in 1948 but not all were established as plants permanently covered by the copper materials survey.

The accompanying table shows the consumption of nine types of ingot, by States, arranged in groups according to quantities used. The East Central group, which contains the Chicago area, used the greatest total—104,060 tons—and Ohio of the same group used more than any other State—34,838 tons. The group consuming the next largest total, 65,124 tons, was the Middle Atlantic, in which the New York area is located. These two groups between them consumed 74 percent of the entire quantity used by foundries in the country. Consumption of leaded red brass, which is chiefly No. 1 composition, amounted to 123,489 tons or 54 percent of the total.

Foundry consumption of brass ingot in 1948, by States

Total	518	963	838	68	10	178	5		78	2,658
Grand total	12,596	39,268	123,489	16,901	14,185	9,412	2,639	2,435	4,373	225,298

Consumers' stocks of unalloyed copper scrap were about the same at the end of 1948 as they were at the end of 1947, but the brass mills, which were the largest holders of alloy scrap, decreased their stocks, causing a drop in the total for that category. The primary refiners, chief repositories of low-grade scrap, had the same experience with that class of material.

Consumers' stocks of copper-base scrap in the United States at end of year, 1947–48, gross weight in short tons

Scrap item	Dec. 31, 1947	Dec. 31, 1948
Unalloyed copper	15,830	15,241
Copper-base alloy	72,780	59,924
Low-grade scrap and residues	66,936	47,574
Total	155,546	122,739

The demand for both refined copper and copper-base scrap increased during the first 11 months of 1948. In December there were signs that supply was catching up with demand; and scrap prices began to decline, although the price for refined copper remained firm at 23½ cents a pound. This illustrates the greater market sensitivity of scrap metal compared to primary metal, as discussed in a recently published article.[7] Dealers' buying prices for No. 1 Heavy copper scrap were relatively stable during the first 6 months at a little under 17 cents a pound, then rose to 18.99 cents in December, the average for 1948 being 17.31 cents. The price of No. 1 Composition scrap moved along a parallel line, a little under 13 cents in the first half of the year and up to 15.35 cents in November. The average for the year was 13.45 cents.

Brass and copper scrap imported into and exported from the United States, 1944–48, in short tons

	1944	1945	1946	1947	1948
Imports for consumption:					
Brass scrap	6,226	7,727	24,008	112,393	59,984
Scrap copper	1,055	1,348	1,030	5,957	9,334
Exports:					
Brass scrap	38	421	1,184	3,157	6,584
Scrap copper	99	133	909	969	2,266

SECONDARY LEAD

The secondary lead industry maintained a high rate of recovery in 1948, reclaiming 500,071 tons of lead valued at $179,025,418 compared with 511,970 tons valued at $146,423,420 in 1947. The quantity of lead recovered decreased only 2 percent, but the value increased 22 percent, being computed at 17.9 cents a pound in 1948 and 14.3 cents in 1947, the yearly average weighted price of all grades of refined lead sold by producers. Again in 1948, as was the case in the preceding 3 years, recovery of lead from scrap, as metal and in alloys, exceeded production of refined primary lead from domestic ores and base bullion and for the third successive year was greater than domestic mine production.

Secondary lead recovered in the United States, 1947–48, in short tons

Secondary lead recovered			Recoverable lead content of scrap		
Form of recovery	1947	1948	Kind of scrap processed	1947	1948
As metal:			New scrap:		
At primary plants	15,662	4,952	Lead-base	60,277	59,618
At other plants	95,843	126,951	Copper-base	7,115	7,720
Total	111,505	131,903	Total	67,392	67,338
In antimonial lead [1]	265,935	243,552	Old scrap:		
In other lead alloys	103,799	102,603	Battery lead plates	273,952	256,193
In copper-base alloys	30,137	21,499	All other lead-base	151,111	156,019
In tin-base alloys	594	514	Copper-base	19,494	20,497
Total	400,465	368,168	Tin-base	21	24
Grand total	511,970	500,071	Total	444,578	432,733
			Grand total	511,970	500,071

[1] Includes 56,456 tons of lead recovered in antimonial lead from secondary sources at primary plants in 1947 and 49,525 tons in 1948.

[7] Merrill, Charles White, Scrap Prices in the Metal Markets: Waste Trade Jour., vol. 87, No. 1, Apr. 2, 1949, pp. 94–95, 99.

More scrap went into the production of refined lead in 1948 and less into antimonial lead. Production of refined soft lead increased 20 percent—from 112,664 tons in 1947 to 135,071 in 1948—but the secondary lead content of antimonial lead produced fell 8 percent—from 265,935 tons to 243,552. Secondary lead recovered in solder increased for the third successive year whereas lead reclaimed in type metals declined for the second year and in lead babbitt remained almost unchanged. Total production of the secondary lead industry was slightly higher in 1948 than in 1947 entirely owing to the use of more primary metals with scrap and secondary.

Shipments [1] of secondary lead, tin, and lead- and tin-alloy products in the United States in 1948, gross weight in short tons

Product	Gross weight of product [2]	Secondary metal content			
		Lead	Tin	Antimony	Copper

[1] Most of the figures herein represent shipments rather than production of the items involved. However, it has been necessary to record actual production figures in some instances.
[2] Difference between gross weight of products and secondary metal content represents added primary metals or impurity content.

Many problems of the secondary lead smelters differ from those of smelters of other types of nonferrous scrap metals. Lead refining is simpler than other types of metal refining and is not confined, as in the case of copper, to the larger plants. Refined lead is produced from scrap at numerous secondary lead smelters as well as at primary plants, whereas secondary refined copper is produced chiefly at 17 primary copper refineries in combination with primary metal. There are relatively few kinds of lead-base scrap, as the only other metals that are generally used in lead alloys are tin, antimony, and copper. Lead up to about 30 percent is used as an alloying ingredient in tin bronze (a copper-base alloy) and may outweigh copper in packing metal but is not used in zinc or aluminum alloys.

The product of the secondary smelters and the primary plants is about the same; but the secondary smelters, by using mainly scrap, have the elements for most products already combined. Antimonial lead can, in general, be made more economically from scrap battery plates, which contain both lead and antimony, than from primary lead and primary antimony. In 1948 lead recovered from scrap in antimonial lead at secondary smelters was 194,027 tons, whereas the lead content of antimonial lead output at primary plants totaled 100,764 tons, including 49,525 tons from scrap and 51,239 tons from primary material.

A rough approximation of the competitive positions of the secondary and primary lead industries with respect to several kinds of alloys may be obtained by comparing total lead consumption, as indicated in the Lead chapter, with the secondary lead content of metals and alloys produced, as shown in the accompanying table. The total 1948 consumption of lead for bearing metals (babbitt), solder, and type metals was 42,594, 71,025, and 26,279 tons, respectively, and the corresponding quantities of secondary lead contained were 31,444, 37,111, and 31,620 tons. The comparison indicates that production of the three products is principally secondary. On the other hand, 411,646 tons of lead were produced as metal at primary plants in 1948 compared with 126,951 tons at other plants. No scrap was used directly in either pigments or chemicals, these being made only from ores and refined lead.

Of the 500,071 tons of secondary lead recovered in 1948, 471,854 short tons were reclaimed from lead- and tin-base scrap, while the remaining 28,217 tons was reclaimed from copper-base scrap. In all, 2,820 tons of lead in lead- and tin-base scrap were added to brass and bronze to bring the total recovery of secondary lead in copper-base alloys to 21,499 tons.

Consumption of old and new lead scrap in the United States in 1948, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Soft lead		69,600	15	1,567	71,182
Hard lead		20,621	2	328	20,951
Cable lead		30,675	5	44	30,724
Battery-lead plates		384,270		161	384,431
Mixed common babbitt		11,573	377	7,806	19,756
Solder and tinny lead		9,580	1,180	228	10,988
Type metals		17,056		474	17,530
Dross and residues	87,994		4		87,998
Total	87,994	543,375	1,583	10,608	643,560

The quantity of lead-base scrap consumed in 1948 totaled 643,560 tons, a decrease of 4 percent from the peak 1947 consumption of 671,282 tons. Treatment of battery-lead plates decreased 26,657 tons (6 percent), soft lead 1,120 tons (2 percent), common babbitt 4,465 tons (18 percent), type metals 616 tons (3 percent), and drosses 5,113 tons (5 percent). The only increases in use over the preceding year were a 51-percent gain in the treatment of cable lead scrap and a very small increase in use of solder scrap. Highest operations of the year occurred in December, January, and March, in the order named, and the lowest in July.

The lead-scrap market did not weaken at any time in 1948. Lead scrap was not plentiful at the beginning of 1948 and grew scarcer as the year advanced. Smelters, in bidding for the limited supply during 1948, progressively reduced their charges on battery plates from $50 a ton to nothing. High consumption of all types of lead by manufacturers and the Government stock-piling program sustained the demand for both primary and secondary lead.

Percentage and remelt metals circulated among remelters, smelters, and refiners in 1948 totaled 53,104 short tons, consisting of 3,029 tons of solder, 3,945 tons of lead-base babbitt, 12,724 tons of soft lead, 30,517 tons of antimonial lead, 1,582 tons of type metals, 714 tons of cable lead, 512 tons of tin-base babbitt, 78 tons of remelt tin, and 3 tons of pewter.

Smelters' stocks of scrap, which had shown an almost constant decline during 1947, increased 25 percent during 1948, from 56,929 to 70,984 tons. Year-end inventories of unalloyed lead were 9 percent higher, and stocks of lead-base alloys 44 percent higher, whereas drosses and residues decreased 4 percent. Inventories of secondary pig, bar, and ingot held by smelters also increased during 1948 from 22,591 to 29,900 tons.

Consumers' stocks of lead-base scrap in the United States at end of year, 1947–48, gross weight in short tons

Scrap item	Dec. 31, 1947	Dec. 31, 1948
Unalloyed lead	2,878	3,124
Lead-base alloy	33,388	47,952
Drosses and residues	20,663	19,908
Total	56,929	70,984

The price of primary lead, which had advanced to 15 cents on March 3, 1947, remained at this level until April 5, 1948, when it was raised to 17.5 cents. Two additional rises of 2 cents each (on July 28 and November 1) brought the price to 21.5 cents, where it continued throughout the remainder of the year. With each price rise for primary metal, scrap and secondary prices were adjusted accordingly.

Imports of lead scrap totaled 15,693 tons (revised lead content) in 1947 and 28,301 tons (lead content) in 1948.

SECONDARY MAGNESIUM

Secondary magnesium (including alloying ingredients) recovered from scrap in 1948 totaled 7,834 short tons valued at $3,211,940 compared with 9,503 short tons valued at $3,896,230 in 1947. Values were calculated for both years at 20.5 cents a pound, which has been the price of magnesium since January 1943. Primary production in 1948 was 10,003 tons, all from the Freeport, Tex., plant of Dow Chemical Co. Consumption of primary magnesium was 9,661 tons compared with 6,869 tons (revised) in 1947.

Secondary magnesium recovered from scrap in magnesium alloy ingot totaled 4,604 tons, as shown in the accompanying table. Of this, 2,420 tons were secondary ingot, and the remaining 2,184 tons were incorporated in primary ingot and so, although recovered from scrap, lost its identity as secondary metal. Of the three other major items containing secondary magnesium, recovery from scrap made into anodes for cathodic protection was 45 percent less in 1948 than in 1947, recovery in aluminum alloys was 26 percent less, and recovery in magnesium-alloy castings was 6 percent less.

Secondary magnesium recovered in the United States, 1947–48, in short tons

Secondary magnesium recovered			Recoverable magnesium-alloy content of scrap		
Form of recovery	1947	1948	Kind of scrap processed	1947	1948
Magnesium-alloy ingot [1] (gross weight)	5,138	4,604	New scrap: Magnesium-base	4,907	3,376
Magnesium-alloy castings (gross weight)	1,377	1,301	Old scrap:		
Magnesium-alloy shapes	85	1	Magnesium-base	3,622	4,041
In aluminum alloys	1,883	1,388	Aluminum-base	974	417
In zinc alloys	3	6	Total	4,596	4,458
Chemical and other destructive uses	199	84	Grand total	9,503	7,834
Cathodic protection	818	450			
Grand total	9,503	7,834			

[1] Figures include secondary magnesium incorporated in primary magnesium ingot.

Consumption of secondary magnesium ingot was 2,647 tons, or 227 tons more than was produced. Of the total, 1,323 tons was used in making castings, 1,314 tons in aluminum alloys, 3 tons in zinc alloys, and 7 tons for cathodic protection. There is no duplication between these quantities and those in the preceding paragraph. The total weight of metal used in cathodic protection, for example, included 450 tons of anodes made from scrap, 7 tons from secondary alloy ingot, 85 tons from primary alloy ingot, and 309 tons from pure primary magnesium—851 tons in all. The scrap used in making the 7 tons of secondary ingot was additional to that used in making the 450 tons of anodes. It was reported that magnesium alloy had been found to be more suitable for cathodic protection than unalloyed metal.[8] If so, that fact should increase the use of scrap for such purposes because it is chiefly alloy and is cheaper than pure magnesium.

There were indications that magnesium might replace zinc for die castings used in some automobiles.[9] Magnesium die castings are lighter and have higher yield strength than zinc die castings. Perhaps its greatest weakness is its inadequate corrosion resistance,[10] but the Dow Chemical Co. has developed a plating method to overcome this defect.[9] Only strictly segregated, new die-cast scrap can be used in zinc die castings but there are no unusual restrictions on the use of magnesium scrap in magnesium die castings.

The decrease in consumption of magnesium-base scrap from 9,420 tons in 1947 to 8,163 tons in 1948 was due to a 970-ton reduction in use of cast scrap and a 477-ton reduction in borings, drosses, etc., which were partly counterbalanced by a 190-ton increase in wrought

scrap. The percentage of old scrap used, however, increased from 42 percent of the total magnesium scrap consumed in 1947 to 54 percent in 1948. The price of remelt magnesium ingot was unchanged at 18 to 18.5 cents a pound (carlots) throughout 1948.

Stocks and consumption of magnesium scrap in the United States in 1948, gross weight in short tons

Scrap item	Stocks		Consumption in 1948
	Dec. 31, 1947	Dec. 31, 1948	
Cast scrap	3,659	3,008	4,575
Solid wrought scrap	638	898	3,321
Borings, grindings, drosses, etc	300	45	267
Total	4,597	3,951	8,163

SECONDARY NICKEL

The recovery of secondary nickel from nonferrous scrap in 1948 totaled 8,850 short tons, valued at $6,966,720, a decrease of 7 percent from the 9,541 tons valued at $7,188,189 recovered in 1947. The total value was calculated at 39.36 cents a pound in 1948 and 37.67 cents in 1947, the average spot-delivery prices of Grade F nickel ingots and shot in 10,000-pound lots at New York. The decreased recovery in 1948 was occasioned because one of the chemical plants, usually a large producer of secondary nickel salts, did not use any nickel scrap during the year. This caused recovery of secondary nickel in chemical compounds to decline from 1,765 tons in 1947 to 235 tons in 1948. Recovery of secondary nickel in iron and steel increased 25 percent, probably because production of stainless steel, of which nickel is an ingredient, reached an all-time peak [11] in 1948. Most of the 22-percent rise in recovery in copper-base alloys was in brass mill products.

Secondary nickel (nonferrous) recovered in the United States, 1947–48, in short tons

Secondary nickel recovered		
Form of recovery	1947	1948
As metal	121	99
In nickel-base alloys	2,000	1,850
In copper-base alloys	[1] 2,844	3,467
In aluminum-base alloys	[1] 955	889
In lead-base alloys	13	6
In cast iron and steel [2]	1,843	2,304
In chemical compounds	1,765	235
Grand total	9,541	8,850

Recoverable nickel content of scrap		
Kind of scrap processed	1947	1948
New scrap:		
Nickel-base	3,750	2,581
Copper-base	2,447	2,875

Total	6,734	5,944
Old scrap:		
Nickel-base	1,949	1,935
Copper-base	433	567
Aluminum-base	418	398
Lead-base	7	6
Total	2,807	2,906
Grand total	9,541	8,850

[1] Corrected figure.
[2] Includes only nonferrous nickel scrap added to cast iron and steel.

[11] Stanley, R. C., Address to Stockholders of International Nickel Co.: Metals (Daily l Reporter Monthly Suppl.), vol. 19, No. 11, May 1949, pp. 7, 9, 12.

Production of secondary Monel metal pig, shot, and castings, which had risen from 450 tons in 1945 to 1,922 tons in 1947, dropped back to 1,318 tons in 1948. Output of nickel-copper pig and shot decreased from 279 tons averaging 55 percent nickel in 1947 to 263 tons in 1948, and the nickel content fell to 50 percent. Aside from that obtained from scrap, the only production of nickel in the United States was as a byproduct of the copper refining.

Consumption of nickel scrap totaled 26,688 tons in 1948 compared with 27,001 tons in 1947, but if nickel silver (a copper-base scrap item) is excluded, the totals are 6,543 tons in 1948 and 9,619 tons in 1947. Use of nickel silver, including cupronickel, increased 16 percent or 2,763 tons, but there were declines in the other items except miscellaneous nickel alloys, a minor classification. Nickel can be incorporated in steel as an alloying ingredient by the addition of nickel oxide as well as by the addition of metallic nickel and nickel alloys. This method of introducing nickel into steel was more extensively used during the war than before and increased in 1948 compared with 1947. During 1948 a plant at Copper Cliff, Ontario, for sintering nickel oxide made from ore was placed in operation. Primary nickel oxide has been used occasionally by chemical plants in the manufacture of nickel salts, but none was so consumed in 1948. However, a little nickel oxide scrap obtained from worn-out nickel-iron storage batteries was consumed in the manufacture of nickel salts.

Consumption of old and new nickel scrap in the United States in 1948, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Pure nickel	174	460	232	292	1,158
Monel metal	408	1,386	2,946	274	5,014
Nickel silver	1,227	2,611	15,697	610	20,145
Miscellaneous nickel alloys	53				53
Nickel residues	31			287	318
Total	1,893	4,457	18,875	1,463	26,688

According to the American Metal Market the spot-delivery price of Grade F nickel ingots and shot in 10,000-pound lots at New York stood at 36.49 cents a pound from the beginning of 1948 until the middle of March, when it was increased to 36.56 cents. On July 22 the price was raised again to 42.9 cents, where it remained for the rest of the year. Scrap-metal dealers' buying prices at New York were quoted at 17 cents a pound for nickel sheet and clippings and 12.5 cents a pound for Monel clippings for the first 7 months of 1948. The increase in price for primary nickel resulted in scrap price rises at the end of July to 19 and 15 cents, respectively, and at the end of August they increased again to 24 and 16 cents. The nickel scrap price was reduced in September to 21 cents, where it remained for the rest of the year. The Monel clippings price did not change after the August rise.

No imports of nickel scrap were reported in 1947 or 1948, but exports in 1948 totaled 5,826 tons compared with 8,424 tons in 1947 and 5,597 tons in 1946.

Consumers' stocks of nonferrous nickel scrap[1] in the United States at end of year, 1947–48, gross weight in short tons

Scrap item	Dec. 31, 1947	Dec. 31, 1948
Unalloyed nickel	488	261
Nonferrous nickel alloys	3,233	2,758
Nickel residues	2,032	2,262
Total	5,753	5,281

[1] Includes nickel-silver scrap.

SECONDARY TIN

Secondary tin recovered from scrap in 1948 totaled 30,124 tons valued at $59,796,140 compared with 30,054 tons valued at $46,848,175 in 1947. Values were computed at 99.25 cents per pound in 1948 and 77.94 cents in 1947, the average selling prices for Straits tin.

Detinning plants produced 3,284 tons of pig tin from old tin cans and new tin-plate clippings and 20 tons from tin-base scrap and residues. Recovery, as metal, at secondary smelters was 204 tons. The 3,508 tons of unalloyed tin reclaimed from scrap was 7 percent greater than in 1947. Total recovery of tin, as metal and in alloys and compounds, increased 0.2 percent; but, owing to the increased price, the value increased 28 percent over the preceding year. Recovery in lead- and tin-base alloys and in chemical compounds increased, but these gains were partly offset by a 15-percent decrease in brass and bronze. Shipments of secondary tin and lead-tin alloys are presented in the Lead section of this chapter.

Secondary tin recovered in the United States, 1947–48, in short tons

Secondary tin recovered			Recoverable tin content of scrap		
Form of recovery	1947	1948	Kind of scrap processed	1947	1948
As metal:			New scrap:		
At detinning plants	3,144	3,304	Tin plate	3,313	3,561
At other plants	145	204	Tin-base	2,356	1,281
			Lead-base	2,122	1,970
Total	3,289	3,508	Copper-base	3,264	3,222

In brass and bronze	14,951	12,782	Tin-base	2,887	3,346
			Lead-base	5,318	5,349
Total	26,765	26,616	Copper-base	10,660	11,289
Grand total	30,054	30,124	Total	18,999	20,090
			Grand total	30,054	30,124

Consumption of tin-base scrap decreased 19 percent in 1948 owing entirely to less use of drosses and residues, for more block-tin pipe, pewter, and high-tin babbitt were consumed than in 1947. From lead- and tin-bearing scrap, two companies produced 90 tons of tin in chemical residues which were later reduced to pig tin at detinning plants.

Consumption of old and new tin scrap in the United States in 1948, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Block-tin pipe, scrap, and foil		1,002	2	81	1,085
Tin scruff and dross	1,899		4		1,903
No. 1 pewter		133	3		136
High-tin babbitt		2,438		144	2,582
Residues	296		1		297
Total	2,195	3,573	10	225	6,003

An advance on June 1 from 94 cents to $1.03 per pound for primary tin was reflected in prices of tin-bearing scrap. However, supply of such scrap was reported to be not overabundant.

Supplies of tin more nearly approached demand in 1948, but restrictive measures were felt necessary because of the need for metal in the National Strategic Stock Pile. Therefore, continuation of General Preference Order M-43, controlling the distribution and use of tin, was effected early in June.

Consumers' stocks of tin-base scrap in the United States at end of year, 1947–48, gross weight in short tons

Scrap item	Dec. 31, 1947	Dec. 31, 1948
Unalloyed tin	145	121
Tin-base alloys	445	585
Drosses and residues	467	615
Total	1,057	1,321

Smelters' total stocks of tin scrap increased 25 percent in 1948. Inventories of unalloyed tin declined 17 percent, but tin-base alloys and drosses each gained 31 percent. Dealers' buying price for scrap block-tin pipe was 77.5 cents a pound through May, at which time it advanced (with the rise in the price of primary tin) to 83.5 cents and remained there for the last 7 months of the year.

Detinning Plants.—Seven detinning plants reported recovery operations in 1948: Johnston & Jennings Co., Cleveland, Ohio; Metal & Thermit Corp., South San Francisco, Calif., East Chicago, Ind., and Carteret, N. J.; Standard Metal Refining Co., Baltimore, Md.; and Vulcan Detinning Co., Sewaren, N. J., and Neville Island, Pittsburgh, Pa.

Average delivered cost of clean tin-plate scrap ... per long ton	$29.43	$37.48
Average delivered cost of old tin-coated containers ... do	$22.37	$27.45

[1] Includes a small tonnage of pig tin of less than standard purity and, consequently, subject to further refining or alloying.

[2] Recovery from tin-plate clippings and old containers only. In addition, detinners recovered 98 tons of tin as metal and 80 tons of tin in compounds from tin-base scrap and residues in 1947, and 127 tons of tin as metal and in compounds from these sources in 1948.

Secondary tin recovered by detinning plants, as metal and in chemical compounds, increased 6 percent in 1948. Recovery of tin from tin-plate clippings and old cans was 3,667 short tons in 1948 compared with 3,447 tons in 1947. Of the total recovered, 3,284 tons was reclaimed as metal in the form of pigs and 383 tons in the form of tin compounds.

The tonnage of tin-plate clippings treated in 1948 was the largest on record. The industry treated 376,620 long tons of tin-plate clippings in 1948—17 percent more than in 1947 and 10 percent more than the previous peak of 341,075 tons used in 1941. Old cans processed decreased 10 percent to only 15,079 long tons in 1948 compared with 16,741 tons in 1947 and a record use of 175,870 tons in 1943. Tin recovered from tin-plate clippings was 3,561 short tons in 1948, an increase of 7 percent, while that from old cans was 106 tons (mostly in the form of pig tin), a decline of 21 percent.

The average quantity of tin recovered per long ton of tin-plate scrap used declined from 20.65 pounds in 1947 to 18.91 pounds in 1948. Lower recoveries per unit reflect the treatment of a larger tonnage of electrolytic tin plate carrying a much thinner coating of tin than the heavier coated hot-dipped tin plate. The use of electrolytic tin plate has been expanding in the manufacture of cans (both general line, and packers' or sanitary) and closures. Favorable market conditions prevailed for iron and steel scrap during 1948, with the average quoted composite price for No. 1 Heavy-Melting steel scrap (according to Iron Age) at $41.66 per gross ton—the highest recorded. Steel scrap is one of the byproducts of the detinning industry, being sold to open-hearth mills in hydraulically compressed billets. The average quantity of tin recovered per long ton of old tin-coated containers used declined further to 14.10 pounds in 1948, compared with 16.02 pounds in 1947.

In addition to the tin from tin-plate clippings and old cans, detinners recovered 127 tons of tin as metal and in compounds from the treatment of other tin bearing materials in 1948. These figures are comparable to the 98 tons of tin as metal and 80 tons of tin in compounds from similar sources in 1947.

Imports of tin-plate scrap increased from 30,797 long tons in 1947 to 41,084 tons in 1948. Exports of terne-plate scrap, circles, waste-waste, and clippings also increased—from 26,558 long tons to 31,646 tons in 1948.

SECONDARY ZINC

Secondary zinc recovered in 1948 from purchased scrap and residues totaled 324,639 short tons, with a value of $86,353,974, calculated at 13.3 cents a pound, the yearly average weighted price of all grades of refined zinc sold by producers, not including bonuses paid under the Premium Price Plan terminated June 30, 1947. This tonnage was 4 percent higher than in 1947, when 310,793 tons with a value of $66,509,702 at 10.7 cents a pound were recovered.

Secondary zinc recovered [1] in the United States, 1947–48, in short tons

Secondary zinc recovered		
Form of recovery	1947	1948
As metal:		
By distillation:		
Slab zinc	58,987	59,109
Zinc dust	27,770	29,457
By remelting	10,356	10,988
Total	97,113	99,554
In zinc-base alloys	10,383	12,884
In brass and bronze	146,866	162,384
In aluminum-base alloys	906	822

Total	235,814	250,449
Old scrap:		
Zinc-base	29,262	26,199
Copper-base	45,356	47,663
Aluminum-base	361	328
Total	74,979	74,190
Grand total	310,793	324,639

[1] Zinc content.

Zinc is unique among secondary nonferrous metals in that about half of it is recovered from copper-base scrap, whereas nearly all secondary aluminum, lead, and copper is recovered from scrap of which it is the chief constituent. In 1945, the last year of the war, 61 percent of the total secondary zinc produced was recovered from copper-base scrap compared with 52 percent in 1946 (a year of transition from war to peace), 47 percent in 1947, and 49 percent in 1948. The variations in this sequence of percentages may be explained as follows: The ratio of zinc used in brass and bronze to that used in galvanizing is greater in wartime than in peace, which causes generation of brass scrap to increase with respect to generation of zinc scrap. In years of normal industrial activity, consumption of scrap—and consequently recovery of secondary metal—varies with the availability of scrap.

Nearly all secondary zinc, aside from that recovered from copper-base scrap, is produced from zinc scrap. Of the total recovery from zinc scrap in 1948, 84 percent—about the usual proportion—was produced from new scrap. Recovery of zinc from old scrap is not as important as in other major nonferrous metals, because the uses of zinc are such that few zinc products are returned in worn-out condition for reprocessing. Usually more zinc is consumed for galvanized products than for any other purpose, and from these products the zinc is virtually unreclaimable. In the galvanizing process, however, valuable byproduct residues, including dross, skimmings, and sal skimmings, are generated from which important quantities of secondary zinc are recovered. So far as is known, only one plant recovers zinc from galvanized-steel clippings classed as new scrap.

Other zinc products from which, after being used and discarded, no zinc can generally be reclaimed are zinc oxide, zinc dust, and zinc chemicals. Zinc dust, the only one of these from which valuable byproduct residues are sometimes recovered, is used in considerable quantities in the manufacture of sodium hydrosulfite. It is not an element of the product but may be reclaimed from the residues of the process as zinc carbonate or lead-free zinc oxide of commercial grade. When sold for use as zinc oxide, as in rubber manufacturing, it is tabulated statistically as a finished product; but when sold for reprocessing, as when made into zinc chloride, it is tabulated as new scrap. Most of the chemical residues from which secondary zinc is recovered come from this source.

Production of secondary zinc and zinc-alloy products in the United States, 1945–48, gross weight in short tons

Products	1945	1946	1947	1948
Redistilled slab zinc	49, 242	44, 516	59, 542	59, 679
Zinc dust	23, 892	26, 002	28, 334	29, 932
Remelt spelter [1]	8, 090	8, 212	7, 443	7, 796
Remelt die-cast slab	4, 727	7, 829	8, 595	10, 543
Zinc-die and die-casting alloys	2, 281	3, 002	2, 698	3, 377
Galvanizing stock	701	876	774	580
Rolled zinc	3, 054	2, 729	2, 341	2, 778
Secondary zinc in chemical products	41, 866	45, 029	55, 525	48, 995

[1] Contains small tonnages of bars, anodes, etc.

In 1948, 50 percent or 162,384 tons of the secondary zinc produced was recovered as an element in brass and bronze. This was 15,518 tons more than was so recovered in 1947 and substantially exceeded the 59,109 tons recovered in redistilled slab zinc. Secondary recovery in lead-free zinc oxide declined 33 percent to 12,327 tons in 1948. Recovery from scrap in this product represents only about 10 percent of the total, as most zinc oxide is made from ore.

An important zinc product, most of which is recovered from scrap, is zinc dust. The output of dust from secondary sources in 1948 increased for the sixth straight year and totaled 29,932 tons. In 1942 this recovery was 18,101 tons. The output of redistilled slab, the largest secondary zinc product, totaled 59,679 tons in 1948.

Production in zinc chemicals, although 6,530 tons less than the 55,525 tons produced in 1947, was still higher than for any other year since 1939. The figures for redistilled slab zinc and zinc dust in the production table are slightly greater than those for slab zinc and zinc dust in the recovery table because the former table represents gross weight produced and the latter zinc content of production.

Of the 22 zinc-distillation plants producing secondary zinc in 1947, 21 were still in operation in 1948, 1 producer of slab zinc having closed during the year. Two other plants were added to the list of smelters recovering secondary zinc in 1948. One, the Eagle Picher Co. smelter at East Chicago, added zinc dust to its list of products. This company had previously developed a muffle furnace for production of zinc and zinc oxide from die-cast scrap.[12] Another distillation plant to start operations in 1948, bringing the total to 23, produced slab zinc from brass scrap, the residue being copper of enough purity for use in the manufacture of copper sulfate.

Consumption of old and new zinc scrap in the United States in 1948, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Clippings	4,591		4,714		9,305
Sheet and strip		6,474		121	6,595
Engravers' plates		1,537		72	1,609
Skimmings and ashes	62,795		33,988		96,783
Dross	61,684		134		61,818
Die castings		20,659	393	213	21,265
Rod and die scrap		2,653			2,653
Flue dust	10,453		10,917		21,370
Chemical residues	11,281		13,322		24,603
Total	150,804	31,323	63,468	406	246,001

As usual, the bulk of the zinc scrap consumed in the secondary zinc industry was byproduct residues which accounted for 83 percent of the total used in 1948. The largest item was skimmings and ashes, chiefly the result of galvanizing operations, use of which rose from 86,168 tons in 1947 to 96,783 tons in 1948. Consumption of dross, entirely a galvanizing byproduct, increased from 57,453 tons in 1947 to 61,818 tons in 1948. The most important metallic scrap item was die castings, of which 21,265 tons were used in 1948. In spite of reports that aluminum and magnesium were gaining as competitors of zinc in the die-casting field, a record 234,628 tons of slab zinc—20,159 tons more than in 1947—were used in zinc alloys, mainly for die castings, in 1948. Consumption of die-cast scrap was about the same in each year. Consumers' stocks of zinc-base scrap were virtually the same at the end of 1948 as at the end of 1947.

[12] Johnson, Gunnard E., Development of Muffle Furnaces for the Production of Zinc Oxide and Zinc at East Chicago, Ind.: Jour. Metals, vol. 1, No. 2, sec. 3, February 1949, pp. 118–124.

Consumers' stocks of zinc-base scrap in the United States at end of year, 1947–48, gross weight in short tons

Scrap item	Dec. 31, 1947	Dec. 31, 1948
Metallic zinc scrap	3,459	3,878
Dross	8,013	8,560
Skimmings and residues	23,805	23,337
Total	35,277	35,775

Dealers' buying prices for new zinc clippings averaged 9.42 cents a pound in 1948, compared with 7.16 cents in 1947. The price increased from an average of 7.48 cents in January to 8.25 cents in February and stayed at that level until August, when it advanced to 10.25 cents. A further increase to 11.99 cents occurred in November and another in December to 12.75 cents. The price for old zinc scrap followed the same trend as that for clippings in 1948 and increased from an average of 5.29 cents in January to 10.25 cents in December, the average for the year being 7.01 cents.

United States imports of old zinc scrap totaled 1,636 tons in 1948, compared with 714 tons in 1947. Imported drosses and residues totaled 8,637 tons in 1948, an increase of 4,246 tons over the 4,391 tons (revised) imported in 1947. Large quantities of fume from a primary smelter in Canada were imported by one company for the manufacture of zinc sulfate and lithopone; the zinc reclaimed from this material was not counted as secondary zinc but as recovered from material other than scrap.

Slag—Iron Blast Furnace

By D. G. RUNNER

GENERAL SUMMARY

CONTINUED demands by the construction industry resulted in another prosperous year in 1948 for the iron-blast-furnace slag industry. High level activity in highway and building construction during the year was reflected in increases of slag sold or used by processors. Inasmuch as processed slag stocks are comparatively small and constant from year to year, production virtually equals sales; therefore, these terms are used interchangeably in this chapter. As indicated in the accompanying salient statistics table, sales in 1948 of all types of slag increased materially over those reported in 1947.

PRODUCTION

The output of slag from iron blast furnaces in 1948 amounted to an estimated 39,000,000 short tons compared with 32,284,000 short tons in 1947 and indicates the increased tempo at which the steel industry operated during the year.

The quantity of slag processed for commercial use in 1948, as reported by the National Slag Association, reached a record high of 21,131,000 short tons valued at $22,360,000 representing increases of 8 and 15 percent, respectively, over the 19,581,679 short tons valued at $19,525,482 in 1947. The output of slag in 1948 came from 42 companies operating 68 slag plants. One new company started operations in 1948—the Gifford-Hill Co., Dallas, Tex., with plant at Daingerfield, Tex.

During 1948, iron blast-furnace slag was processed in the following States: Alabama, California, Colorado, Illinois, Indiana, Kentucky, Maryland, Michigan, New York, Ohio, Pennsylvania, Texas, and West Virginia. It will be noted that the majority of the plants are east of the Mississippi River. In 1948, as in 1947, Ohio was the largest processor of slag, and Alabama and Pennsylvania follow in that order. These three States supplied 66 percent of the total tonnage reported in 1948. The accompanying table shows the available details on processed slag, by States, in 1948.

Iron blast-furnace slag processed in the United States, by States, in 1948

[National Slag Association]

State	Screened air-cooled			All types		
	Quantity		Value	Quantity		Value
	Short tons	Percent of total		Short tons	Percent of total	
Alabama	4,203,000	24	$3,947,300	4,765,800	22	$4,735,800
Ohio	5,091,300	29	6,044,000	6,073,800	29	6,460,000

[1] California, Colorado, Illinois, Indiana, Kentucky, Maryland, Michigan, New York, Texas, and West Virginia.

PREPARATION

Processed blast-furnace slag is commonly marketed as air-cooled (screened or unscreened), granulated, or lightweight slag. Slag produced in blast furnaces and allowed to air-cool either in the pit or a modified bank is the chief form in which slag is processed.

Air-cooled slag is generally processed while hot. Iron is recovered by magnetic methods while the slag is being processed. The product is excavated from the pit or bank and crushed or screened, as with natural aggregates, for concrete aggregate, railroad ballast, roofing aggregate, and many other uses. Granulated slag is commonly prepared by pouring the molten material into pits in which enough water is present to cool the material quickly. Lightweight slag is prepared by processing the material in the molten condition by either the machine or pit process.

TRANSPORTATION

As in 1947, the bulk of the slag processed in 1948 was moved by rail and truck. Negligible quantities were moved by waterway. As indicated in the accompanying table, railroads handled 54 percent and trucks 45 percent of the total quantity shipped compared with 59 and 40 percent, respectively, in 1947. Trends in the methods of shipment indicate decreases in the rail shipments, while truck shipments have increased correspondingly during the past few years.

Shipments of iron blast-furnace slag in the United States, by methods of transportation, 1947–48

[National Slag Association]

Method of transportation	1947		1948	
	Short tons	Percent of total	Short tons	Percent of total
Rail	11,217,642	59	11,066,400	54
Truck	7,640,384	40	9,215,500	45
Waterway	283,697	1	145,200	1
Total shipments	19,141,723	100	20,427,100	100
Percent of total processed slag		98		97

CONSUMPTION

Screened air-cooled slag was the major product of the industry, representing 84 percent of the total slag processed. Granulated slag comprised 7 percent, lightweight 6 percent, and unscreened air-cooled slag 3 percent.

Screened Air-Cooled Slag.—Consumption of screened air-cooled slag reached an all-time high of 17,656,200 short tons, 944,000 tons above the previous record year 1947. The use of screened air-cooled slag as aggregate in portland-cement concrete construction, bituminous construction, and other road-construction uses and as railroad ballast took 15,477,400 short tons or 88 percent of the total consumption of this type of slag. Other principal uses for this material were in the manufacture of concrete block, mineral wool, and roofing.

Unscreened Air-Cooled Slag.—In 1948 the quantity of unscreened air-cooled slag processed totaled 604,100 short tons valued at $370,000. These figures represent increases of 35 and 44 percent, respectively, over the 1947 totals. Road construction consumed the bulk of this material in 1948.

Granulated Slag.—Consumption of granulated slag in 1948 totaled 1,517,500 short tons, 18 percent above the 1,290,958 tons reported in

Air-cooled iron blast-furnace slag sold or used by processors in the United States, by uses, in 1948

[National Slag Association]

Use	Screened		Unscreened	
	Short tons	Value	Short tons	Value
Aggregate in:				
Portland-cement concrete construction	1,636,000	$1,813,700		
Bituminous construction (all types)	4,141,500	4,928,100		
Highway construction [1]	5,467,700	6,388,000	260,800	$174,900
Airport construction [1]	168,400	192,700	25,000	12,500
Manufacture of concrete block	801,700	880,000		
Railroad ballast	4,232,300	3,579,200	13,300	5,700
Mineral wool	578,800	726,200		
Roofing (built-up and granules)	211,800	314,700		
Sewage trickling filter medium	10,800	14,000

Other uses	363,500	362,000	305,000	176,900
	17,656,200	19,254,900	604,100	370,000

[1] Other than in portland-cement concrete and bituminous construction.

1947. The principal uses for this slag were in the manufacture of cement and as road fill. These two uses consumed 98 percent of the total processed. The granulated slag used in roads and streets was utilized chiefly as blanket courses and as fill material.

Lightweight Slag Aggregate.—The consumption of lightweight slag aggregate manufactured from molten slag in 1948 amounted to 1,353,200 short tons valued at $2,550,400, representing increases of 20 percent over the 1,130,636 tons valued at $2,127,692 reported in 1947. It is reported that the bulk of the output was utilized as aggregate in the manufacture of concrete block.

Granulated and lightweight iron blast-furnace slag sold or used by processors in the United States, by uses, in 1948

[National Slag Association]

Use	Granulated		Lightweight	
	Short tons	Value	Short tons	Value
Road fill, etc.	448,700	$152,100		
Agricultural slag, liming	28,800	30,900		
Manufacture of hydraulic cement	1,034,900	(1)		
Aggregate for concrete block manufacture			[2] 1,353,200	$2,550,400
Other uses	5,100	1,700		
	1,517,500	[3] 184,700	1,353,200	2,550,400

[1] Data not available.

[3] Excludes value of slag used for cement manufacture.

PRICES

Average prices for the various types of slag processed in 1948 are indicated in the accompanying table. Values for screened air-cooled slag ranged from 85 cents per ton for railroad ballast to $1.49 per ton for slag used in the roofing industry. Unscreened air-cooled slag values ranged from 43 cents per ton for railroad ballast to 67 cents for that utilized in highway construction (other than concrete or bituminous types). Available value figures on granulated-slag products ranged from 33 cents to $1.07 per ton, and lightweight aggregate averaged $1.88 per ton. A value for granulated slag used in the manufacture of cement could not be obtained.

Average value per short ton of iron blast-furnace slag sold or used by processors in the United States, by uses, in 1948

[National Slag Association]

Use	Air-cooled		Granulated	Lightweight
	Screened	Unscreened		
Aggregate in:				
Portland-cement concrete construction	$1.11			
Bituminous construction (all types)	1.19			
Highway construction [1]	1.17	$0.67		
Airport construction [1]	1.14	.50		
Manufacture of concrete block	1.10			$1.88
Railroad ballast	.85	.43		
Mineral wool	1.25			
Roofing (built-up and granules)	1.49			
Sewage trickling filter medium	1.30			
Agricultural slag, liming	1.29		$1.07	
Road fill, etc.			.34	
Other uses	1.00	.58	.33	

[1] Other than in portland-cement concrete and bituminous construction.

IRON RECOVERY

Iron recovered in processing slag totaled 215,848 short tons, an increase of 2 percent over the 212,575 tons reclaimed in 1947. Iron is recovered from slag either by magnetic methods or by hand picking. This recovery of iron represents an important contribution to the iron and steel industry.

EMPLOYMENT

A total of 2,087 plant and yard employees were reported by the slag industry in 1948 compared to 2,216 in 1947. The total number of man-hours utilized in 1948 was 5,419,000, representing an increase of 4 percent over the 5,212,930 hours reported in 1947.

TECHNOLOGY

The demand for lightweight aggregate resulted in further development of techniques for expanding slag. This is especially true in the pit process. In 1948, about 30 percent of all expanded slag was done by the pit method. Various companies experimented with modifications of the pit process. These ranged from methods in which the water and slag are brought together in mid air to one in which slag, water, steam, and air are brought together in equipment designed to improve control and efficiency. A method called the foaming-bed process was introduced into the United States by an English group, and a commercialized experimental unit was built at a steel plant.

Dust in slag plants has long been a problem in the industry, and dust elimination received considerable attention during 1948.

Slate

By D. G. RUNNER AND M. G. DOWNEY

GENERAL SUMMARY

SALES of slate as a whole decreased 9 percent in quantity and increased 10 percent in value in 1948 compared with 1947. Slate sold as dimension stone—that is, in the form of roofing slate, mill stock, etc.—increased 25 percent in quantity and 35 percent in value over the preceding year's figures.

Sales of roofing slate increased 28 percent in quantity and 48 percent in value and indicate the continued upward trend in the production and sales of this material. The average value per square in 1948 was $20.88, or 15 percent greater than that reported in 1947 ($18.14). In the Pennsylvania area roofing-slate sales were 21 percent greater in quantity and 43 percent higher in value than in 1947. Total values of roofing-slate sales in New York, Vermont, and Maine, although still at a relatively low level, were 54 percent greater than those in 1947. In the Buckingham region of Virginia, sales increased 53 percent quantitywise and were much greater in total value than in the previous year.

Sales of mill stock suffered a slight decline in quantity but gained 11 percent in value. Structural and sanitary slate, blackboards, and school slates showed considerable gain in quantity and value in 1948, while grave vaults and covers and billiard-table tops declined 40 and 54 percent, respectively, in quantity and 29 and 51 percent in value.

Sales of electrical slate also dropped considerably. Flagstones, stepping stones, and similar products gained 29 percent in quantity and 30 percent in value over 1947 totals.

Statistics on slate granules and flour are included in this chapter, although they have little in common with the above-mentioned slate products. Most of the slate employed in manufacturing granules and flour is unsuitable for other slate products. Granules and flour declined 14 percent quantitywise and 9 percent in value compared with 1947. Figures for sales of granules of all types, including slate, are given in the Stone chapter of this volume.

The accompanying table presents the principal statistical data for the slate industry in 1947 and 1948.

Salient statistics of the slate industry in the United States, 1947–48

	1947			1948

[1] Revised figure.
[2] Square feet approximate. Number of pieces: 1947, 510,340; 1948, 751,760.
[3] Includes slate used for walkways, stepping stones, and miscellaneous uses.

SALES

Dimension Slate.—The term "dimension slate" usually is applied to slabs or blocks of specified sizes and shapes. It includes all slate products except granules and flour. The following table indicates sales of dimension slate for the latest 5-year period.

Dimension slate sold by producers in the United States, 1944–48

Year	Roofing			Mill stock		Other [1]		Total	
	Squares	Approximate equivalent short tons	Value	Approximate short tons	Value	Approximate short tons	Value	Approximate short tons	Value
1944	89,090	32,750	$802,179	12,440	$715,689	15,760	$203,090	60,950	$1,720,958
1945	101,300	38,240	976,122	11,520	742,345	19,900	253,273	69,660	1,971,740
1946	146,790	56,240	1,982,928	12,150	1,032,584	27,860	403,990	96,250	3,419,502
1947	170,590	64,350	3,094,780	13,550	1,444,835	34,610	537,705	112,510	5,077,320
1948	218,650	82,090	4,566,056	11,950	1,600,019	46,490	700,477	140,530	6,866,552

[1] Includes flagstones, walkways, stepping stones, and miscellaneous slate.

Inasmuch as roofing slate is used chiefly in residential building, it is interesting to follow the trend of roofing-slate sales in comparison with the number of new dwelling units. The relationship is shown in figure 1. From 1929 to 1938, sales of roofing slate compared favorably with the normally expected requirements of the building programs of those years. However, during and after the recent war, lack of experienced labor somewhat impeded the return to normal operating conditions. Other factors tending to restrict the sale of roofing slate are the inroad made by prepared roofing materials, and strikes at some of the producing quarries.

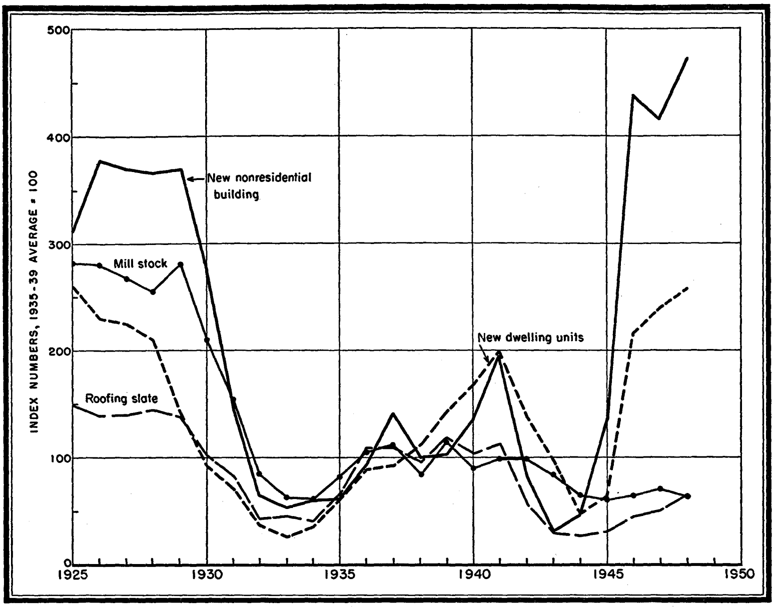

FIGURE 1.—Sales of roofing slate and mill stock compared with number of new dwelling units and value of new nonresidential construction, 1925–48. Data on number of new dwelling units (actual starts) in nonfarm areas from U. S. Department of Labor, Monthly Labor Review; on value of nonresidential construction activity from U. S. Department of Commerce, Survey of Current Business.

Mill-stock slate is used extensively for equipment in nonresidential buildings, and in general sales have closely paralleled construction activity in this field. The relationships for 1925 to 1948 are indicated in figure 1.

Figure 2 presents a graphic summary of the slate industry from 1915 to 1948, by uses. In 1925 the value of production reached a peak, followed by relative inactivity during the depression, with some gains registered prior to World War II. Some decline was noted during the early war years but since about 1944, the industry has been improving rapidly.

Figure 3 presents a statistical summary of slate production, by uses, on a quantity basis. As indicated in the figure, granules and flour assume a dominant place in the industry not only from the value of production, but quantitywise as well.

Granules and Flour.—Granules are used chiefly in surfacing prepared roofing, while flour, a byproduct of the granule industry, is used in paints, roofing mastic, linoleum, and as a filler in asphaltic road surface mixtures. Sales of granules decreased 16 percent quantitywise and 10 percent in value in 1948 as compared with 1947, while sales of flour decreased slightly in quantity but increased in value over the preceding year's figures. Granules were produced in Vermont, Pennsylvania, New York, Maryland, and Georgia, with smaller quantities from Virginia, Arkansas, and California. Sales of granules and flour for the latest 5-year period are indicated in an accompanying table.

Crushed slate (granules and flour) sold by producers in the United States, 1944–48

Year	Granules		Flour		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1944	309,170	$2,861,014	107,720	$422,223	416,890	$3,283,237
1945	374,800	3,299,593	107,430	387,580	482,230	3,687,173
1946	513,780	4,851,314	149,740	573,290	663,520	5,424,604
1947	593,560	5,911,151	169,940	697,083	763,500	6,608,234
1948	499,440	5,306,568	159,430	707,809	658,870	6,014,377

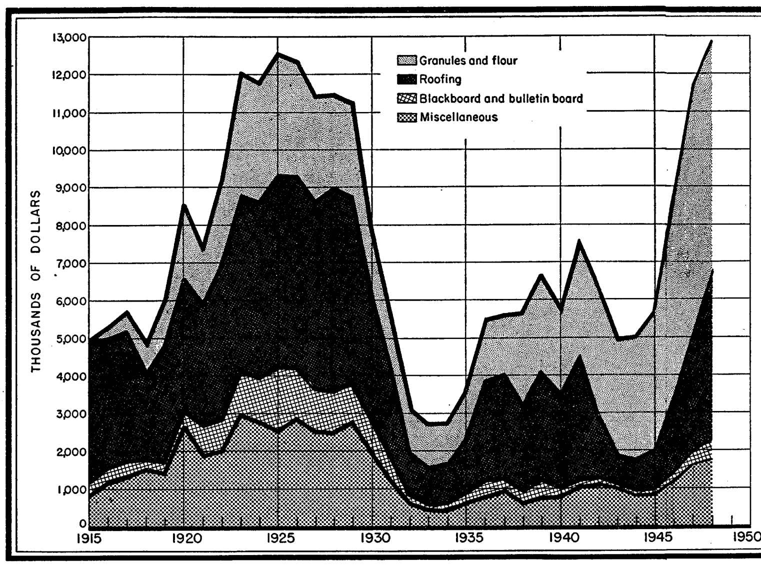

Figure 2.—Value of slate sold in the United States, 1915–48, by uses.

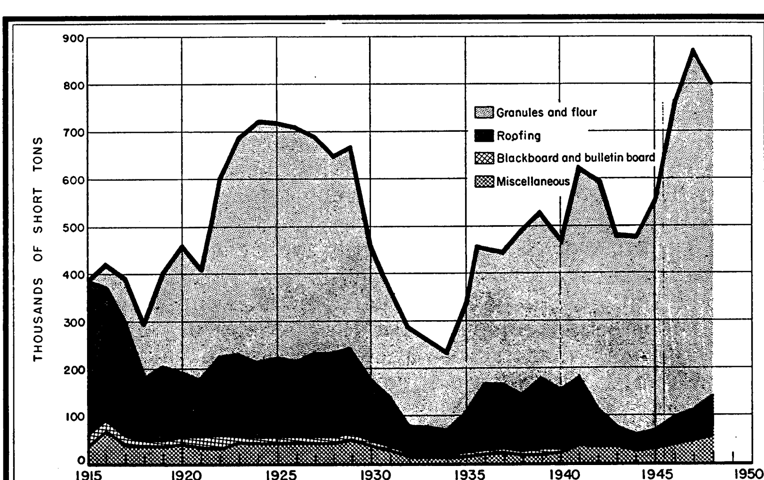

Figure 3.—Quantity of slate sold in the United States, 1915–48, by uses.

REVIEW BY STATES AND DISTRICTS

As indicated in the salient statistics table, the total domestic production of slate declined 9 percent in 1948 compared with 1947 figures. A total of 83 operators reported production in 1948, an increase of 7 compared with 1947. The accompanying table shows sales of slate in 1948, by States and uses.

Slate sold by producers in the United States, by States and uses, 1944–48

	Operators	Roofing		Mill stock		Other uses (value) [1]	Total value
		Squares (100 square feet)	Value	Square feet	Value		
1944	44	89,090	$802,179	2,041,210	$715,689	$3,486,327	$5,004,195
1945	46	101,300	976,122	2,107,780	742,345	3,940,446	5,658,913

[1] Flagging and similar products, granules, and flour. [2] Revised figure. [3] Included with "Undistributed."

Maine.—The principal product of the quarries near Monson is electrical slate and a small quantity of vaults and covers. As in 1947, only one company was active.

New York.—The total number of slate operators decreased 2 and the total value of slate products decreased 3 percent below 1947 figures. The chief commodities produced and sold in this State were granules, flour, and flagging, and minor quantities of roofing slate. The value of these products, exclusive of roofing slate, decreased 7 percent in 1948.

Pennsylvania.—The quarries of Lehigh and Northampton Counties furnish all types of slate products and comprise the most productive slate area in the United States. Slate produced in York County in the Peach Bottom district, on the Maryland-Pennsylvania border between Cardiff, Md., and Delta, Pa., may not be shown separately and is included with Northampton County in the accompanying table giving detailed figures for Pennsylvania.

The total value of all slate products sold in Pennsylvania in 1948 increased 24 percent compared with 1947. Sales of roofing slate increased 21 percent quantitywise and 43 percent in value. The total value of mill stock rose 8 percent compared with 1947. The percentage changes in 1948 over 1947 were as follows: Electrical slate, decrease of 75 percent in quantity and 65 percent in value; structural and sanitary slate, increases of 8 and 39 percent in quantity and value, respectively; vaults and covers, decrease of 39 percent quantitywise and 29 percent in value; bulletin and blackboards, 18-percent increase in quantity and 43 percent in value; billiard-table tops, decrease of 55 percent quantitywise and 52 percent in value; school slates showed increases of 48 percent and 45 percent, respectively, in quantity and value. The value of miscellaneous products (granules, flour, flagstones, etc.) increased 7 percent. Most of the slate in this area is a blue-black "soft-vein" well-adapted for structural products as well as for roofing. Detailed figures for production in Pennsylvania are given in an accompanying table.

Slate sold by producers in Pennsylvania in 1948, by counties and uses

County	Operators	Roofing slate		Mill stock					
				Electrical		Structural and sanitary		Vaults and covers	
		Squares (100 square feet)	Value	Square feet	Value	Square feet	Value	Square feet	Value
Lehigh	7	10,010	$201,155	34,040	$27,336	(1)	(1)		
Northampton and York [2]	19	136,850	2,645,216	3,230	3,821	518,210	$371,595	24,000	$15,817
Total: 1948	26	146,860	2,846,371	37,270	31,157	518,210	371,595	24,000	15,817
1947	21	121,480	1,988,255	150,660	89,242	478,810	267,828	39,500	22,140

County	Mill stock—Continued						Other uses (value)	Total value
	Blackboards and bulletin boards		Billiard-table tops		School slates			
	Square feet	Value	Square feet	Value	Square feet	Value		
Lehigh	226,140	$108,821			402,940	$13,036	$401	$350,749
Northampton and York [2]	702,200	426,433	192,960	$117,754			1,419,768	5,000,404
Total: 1948	928,340	535,254	192,960	117,754	402,940	13,036	1,420,169	5,351,153
1947	786,130	373,421	424,940	243,856	273,160	8,991	1,324,463	4,318,196

[1] Small amount of slate for structural and sanitary use produced in Lehigh County included under Northampton and York Counties.
[2] York County produced granules and flour only.

Vermont.—To avoid revealing the output of an individual firm, Maine has been included with Vermont in the accompanying table. The total value of slate products sold in 1948 in Vermont and Maine was 3 percent greater than in 1947. Gains of 46 percent and 17 percent, respectively, were made in total sales value of roofing slate and mill stock in 1948, while value of other uses (flagging, granules, flour) decreased 13 percent.

Virginia.—The principal product of the Buckingham County quarries is roofing slate. The high-quality Virginia slate, which is dark gray or slightly greenish, has been produced for many years. In 1948, 17,360 squares of roofing slate, valued at $424,335, were produced in this district, representing increases of 53 percent in quantity and 63 percent in value over 1947 totals. Substantial amounts of granules were produced in 1948 but details cannot be given because of the small number of operations.

Other Districts.—Slate products, chiefly granules and flour, were produced in Montgomery County, Ark., near Glenwood; near Placerville, Eldorado County, and in Inyo County, Calif.; and near Fairmount, Bartow County, Ga.

PRICES

The average price of roofing slate, f. o. b. quarry or mill, as reported to the Bureau of Mines, increased $2.74 per square to $20.88 per square in 1948. In Pennsylvania it was $19.38 per square, in New York $24.66, in Vermont and Maine $23.73, and in Virginia $24.44.

The average value of mill stock rose to 63 cents per square foot in 1948, an increase of 6 cents over 57 cents in 1947. The average value of electrical slate increased 24 cents (to $1.21), structural and sanitary slate 16 cents ($0.75), grave vaults and covers 10 cents ($0.67), blackboards and bulletin boards 10 cents ($0.58), and billiard-table tops 4 cents per square foot (to $0 61), compared with 1947. The average sales value of granules a short ton increased 67 cents while flour increased 34 cents.

Price History.—The trend of annual average value of roofing slate and mill stock compared with wholesale prices of all building materials over a 34-year period is indicated in figure 4. From 1915 to 1920 slate prices (compared with 1935–39 base period) have been somewhat below the general average for building materials, while from 1921 to 1936 they were above. Fairly close agreement with the general average was maintained from 1936 to 1945, at which time a persistent uptrending began in the values of roofing slate.

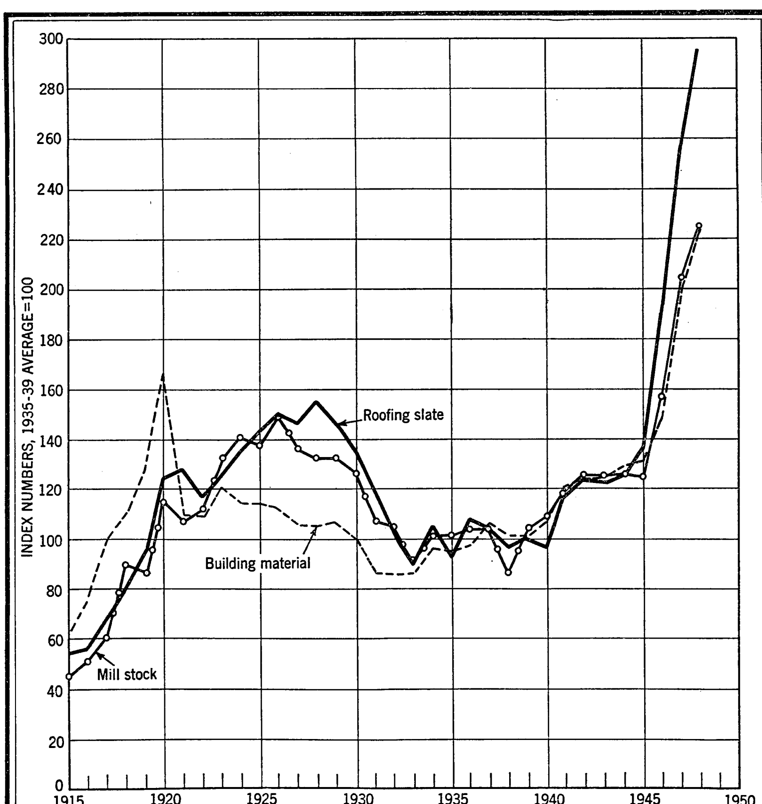

FIGURE 4.—Average value of slate compared with wholesale prices of building materials in general, 1915–48. Wholesale prices from U. S. Department of Labor.

FOREIGN TRADE

Imports.[1] —The value of slate imported for consumption has been increasing somewhat during recent years, amounting to $616 in 1946, $5,747 in 1947, and $13,652 in 1948. Of this latter figure $182 (2,790 square feet) was for roofing and $13,470 was classified as "other." Details are shown in an accompanying table.

Slate imported for consumption in the United States, by countries, 1942–48 [1]

[U. S. Department of Commerce]

Country	1942	1944	1946	1947	1948
Canada	$177		$23	$16	$1,078
China				39	66
Italy			83	5,688	11,584
Japan					89
Mexico		$50	64

Total	304,356	414,605	508,462	605,144	587,328

[1] Figures collected by the Bureau of Mines from shippers of products named.
[2] Includes slate used for pencils and educational toys.

TECHNOLOGY

The use of lightweight aggregates in the building construction industry has become of prime interest in the past few years. Two recent reports covering the utilization of slate in the manufacture of this aggregate have been released.[2]

UNION OF SOUTH AFRICA

Shortage of steel and cement in the Union of South Africa has given impetus to production of slate in the Transvaal. Annual production from all quarries is reported to exceed a value of £100,000 annually.[3]

Stone

By D. G. RUNNER, NAN C. JENSEN, AND M. G. DOWNEY

GENERAL SUMMARY

OUTPUT of crushed and dimension stone combined (225,535,390 short tons) in 1948 increased substantially over the 1947 total. Production in 1948 was up 9 percent, and the total value ($328,-984,571) was 14 percent greater than the value reported in 1947. Sales of crushed and broken stone in 1948 were 9 percent greater in quantity and 13 percent greater in value than in 1947, while dimension-stone production increased 18 percent quantitywise and 17 percent in value. In common with the general trend of prices, the average unit values for some classes of dimension stone showed increases over 1947 figures.

As in the past, the tables in this report give the quantities sold or used by producers and the values f. o. b. quarries and mills. Stone quarried and used by producers is considered as sold and is included in the statistics of sales. The data, however, do not include stone made into abrasives (such as grindstones) or that material used in making lime and cement. These materials are reported in terms of finished products in the Abrasive Materials, Lime, and Cement chapters of this volume. The following tables show the total sales of stone by kinds, uses, and States.

Stone sold or used by producers in the United States, 1944–48, by kinds

Year	Granite		Basalt and related rocks (trap rock)		Marble		Limestone	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1944	7,395,390	$17,200,247	14,043,290	$17,158,774	152,710	$4,374,722	115,506,130	$118,550,317

[1] Included with "Undistributed."
[2] To avoid disclosing confidential information certain State totals are incomplete, the figures not included being combined with "Undistributed." The class of stone omitted from such State totals is noted in the State tables in the Statistical Summary chapter of this volume.

DIMENSION STONE

The term "dimension stone" is applied to blocks or slabs of natural stone, most of which are cut to definite shapes and sizes. The principal uses of dimension stone are for the construction of masonry walls and for memorials. Crushed and broken stone, on the other hand, consists primarily of irregular fragments sized chiefly by mechanical screening. The main uses of crushed and broken stone are as concrete aggregate, railroad ballast, furnace flux, and various industrial uses.

Dimension-stone producers may be divided into three main groups on the basis of method of operation. The first group quarries stone and sells it as rough blocks or slabs; the second quarries stone and also manufactures it into finished products; and the third buys sawed slabs or rough blocks of stone and manufactures them into finished products but does not operate quarries. The Bureau of Mines statistical canvass covers the first and second groups but not the third. Bureau of Mines statistics are compiled from reports of quantities and values of original sales; as a result, they include some material sold as rough blocks and some sold as finished products.

Total sales of dimension stone in 1948 increased 18 percent in quantity and 19 percent in value compared with 1947. These over-all figures include slate, but detailed statistics of this branch of the industry appear in the Slate chapter of this volume.

Dimension stone sold or used by producers in the United States, 1947–48, by kinds and uses

Kind and use	1947	1948

Value	$45,969,842	$54,890,671	+19

[1] Includes soapstone, mica schist, volcanic rocks, argillite, and other varieties that cannot be classified in the principal groups.
[2] Details of production, by uses, are given in the Slate chapter of this volume.

BUILDING STONE

The largest use of dimension stone is for building purposes. Continued building activity in 1948 resulted in an output of 12,701,220 cubic feet of stone—an increase of 32 percent in quantity and 34 percent in value over the 1947 figures. With the exception of basalt, gains were registered in all kinds of building stone. The following table gives the quantity and value of the major types of building stone sold or used in 1948.

Building stone sold or used by producers in the United States in 1948, by kinds

Kind	Rough			
	Construction		Architectural	
	Cubic feet	Value	Cubic feet	Value
Granite	1,652,600	$421,178	165,410	$305,664

Total	[1] 3,775,860	[1] 6,641,438	1,714,500	11,599,445	12,701,220	24,909,143

[1] Sawed miscellaneous stone included with construction stone.
[2] Sawed stone corresponds to dressed stone for construction work (walls, foundations, bridges) and cut stone to architectural stone for high-class buildings.

GRANITE

In 1948 sales of granite increased 23 percent in quantity and 16 percent in value compared with 1947. The greatest value gains were in the building-stone branch of the industry—architectural stone sales showed an increase of 123 percent, while sales of rough construction and dressed stone increased 31 and 32 percent, respectively, compared with 1947. Rubble increased 26 percent in quantity and sales value increased 11 percent over the previous year. Monumental-stone sales values registered gains of 12 and 10 percent, respectively, for rough and dressed material. The output of paving blocks was 43 percent less in quantity; and correspondingly, value decreased 42 percent compared with 1947. The number of cubic feet and value of curbing increased about a fourth and a third, respectively, over the previous year's totals. Unit prices in the building and monumental categories were higher for rough architectural and both classes of monumental stone.

Granite (dimension stone) sold or used by producers in the United States in 1948, by States and uses

Estimated value of dark stock	1,621,442	1,606,878	1,447,618
Estimated polishing cost	2,236,418	1,865,681	2,099,965
Estimated sawing cost	1,750,240	1,460,098	1,644,234
Total value of granite	14,514,381	13,717,237	15,873,101

[1] Through cooperation of the Granite Manufacturers' Association, Barre, figures covering the entire granite industry of the Barre district are given in this table to supplement figures of sales reported by quarrymen.

BASALT AND RELATED ROCKS (TRAP ROCK)

Owing to their dark color, basalt and related rocks are not used widely as building stone. Sales in 1948 increased 50 percent in quantity and 9 percent in value. Rubble—a crude form of building stone—increased 247 percent quantitywise, while rough construction decreased 85 percent, carrying value fluctuations of 427 and 72 percent, respectively. Basalt and associated rocks are used to some extent for memorials, but such stones are normally classed in trade as "black granite" and are therefore included with statistics for monumental granite.

Basalt and related rocks (trap rock) (dimension stone) sold or used by producers in the United States in 1948, by States and uses

State	Active plants	Building stone				Total	
		Rough construction		Rubble			
		Short tons	Value	Short tons	Value	Short tons	Value

Average unit value			$5. 00		$1. 10		$1. 33

[1] Included with "Undistributed."
[2] 39,290 cubic feet (approximate).

MARBLE

In 1948 the total output of marble suffered slight declines in quantity and value compared with 1947. Marble for building stone increased 15 percent in quantity and 17 percent in value, while monumental-stone sales decreased 22 and 18 percent in quantity and value, respectively. The gain in building-marble sales reflects the continued construction activity throughout the country. The average unit values for building and monumental marble increased 18 and 54 cents, respectively, to $8.71 and $10.28, while the total average unit value was increased 21 cents to $9.35.

LIMESTONE

Limestone is widely used in such public buildings as post offices, churches, museums, schools, and commercial buildings. Since the war, the industry has been climbing steadily in production. The year 1948 was no exception, as building stone, both rough and finished, showed substantial increases in tonnage and value. The output of rubble declined in quantity and value, while sales value of flagging increased one-third over the 1947 figure.

The average unit values for all classes increased in 1948. The over-all average unit value of all dimension limestone increased to $17.43 a short ton in 1948 compared with $13.31 in 1947.

The area in the United States most productive of dimension limestone is in the vicinity of Bedford and Bloomington, Ind. This area supplied 80 percent of the rough architectural and finished (sawed and cut) limestone sold in 1948. Accompanying tables show production in the Bedford-Bloomington, Ind., and Carthage, Mo., areas over a 5-year period.

Purchased Indiana limestone sold by mills in the Indiana oolitic limestone district, 1944–48, by classes

SANDSTONE

The total production of sandstone in 1948 increased 9 percent in quantity and 14 percent in value over the 1947 figures. Stone for rough construction decreased 2 percent in quantity and increased 10 percent in value, whereas the output of rough architectural virtually trebled in quantity and sales value. Dressed sawed material decreased n quantity and increased slightly in value, while cut stone doubled in quantity and increased 52 percent in value. Rubble, curbing, and flagging decreased both in quantity and value compared with 1947 totals.

As in previous years, Ohio was the principal producer. Its quarries contributed 51 percent of the total output in 1948. Other producing States, in order of output, were Pennsylvania, Tennessee, and New York.

Short tons (approximate)		(3)		29,190		74,010		23,050				5,220		25,080			

[1] Included with "Undistributed."
[2] Includes 144,320 cubic feet of bluestone (approximately 12,210 tons) valued at $126,528 sold for construction, curbing, and flagging.
[3] 320,890 cubic feet (approximate).

The accompanying table shows the sales of bluestone in 1944–48. Bluestone is a type of sandstone that splits readily into thin, uniform slabs. It is particularly well adapted for flagging but is also used for building stone and curbing. The output of bluestone in 1948 increased 19 percent in quantity and 42 percent in value compared with 1947 figures.

Bluestone (dimension stone) sold or used in the United States, 1944–48 [1]

Year	Cubic feet	Value	Year	Cubic feet	Value
1944	156, 160	$108, 732	1947	274, 680	$326, 168
1945	109, 330	89, 448	1948	325, 940	462, 716
1946	273, 720	274, 517			

[1] New York and Pennsylvania were the only States that produced bluestone.

MISCELLANEOUS STONE

Types of stone other than those included in the major groups already discussed are covered in the following table. The principal types in this classification are mica schist, argillite, light-colored volcanic rocks (such as rhyolite), soapstone, and greenstone. The quantity sold in 1948 increased 91 percent while the value increased 24 percent compared with 1947 figures.

Miscellaneous varieties of stone (dimension stone) sold or used by producers in the United States in 1948, by States and uses

[1] Included with "Undistributed."
[2] Approximately 910,030 cubic feet.
[3] Approximately 13,600 cubic feet.

TRENDS IN USE OF DIMENSION STONE

A 33-year history of the output of dimension stone by kinds is indicated in figure 1. Since the period 1920–30, depression, war, and the competition of other building materials have combined to keep demand at relatively low levels. However, since the low of 1944 the curve has been upward and indications are good for continued increases.

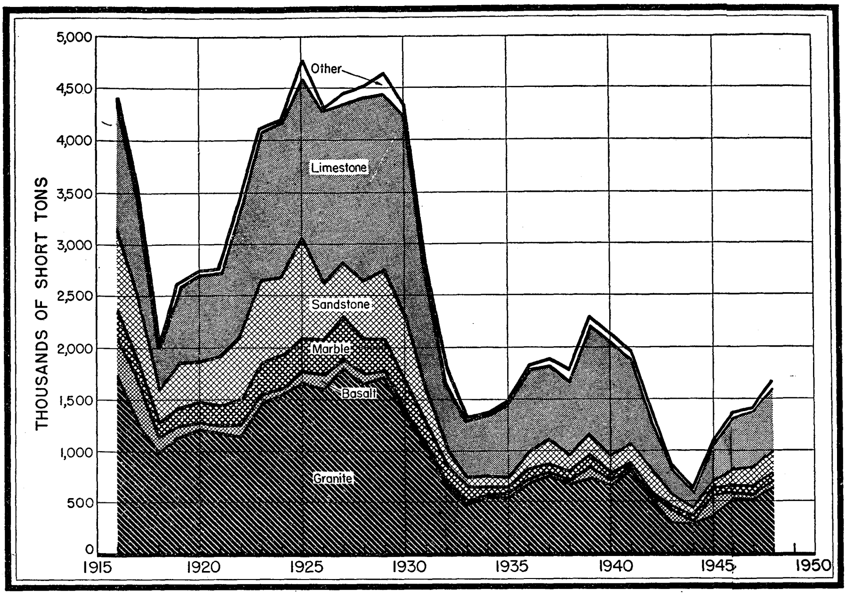

FIGURE 1.—Sales of dimension stone in the United States, by kinds, 1916–48.

Figure 2 traces for a 34-year period the history of production of all building stones and of the principal variety—limestone—in their relation to nonresidential building, the class of construction using stone most extensively. Activity in building-stone production in peacetime generally follows the trend of nonresidential construction, but wartime construction that reached a peak in 1942 failed to use the products of the building-stone industry to a comparable degree. The industry since 1944 is following the general trend but at a lower level.

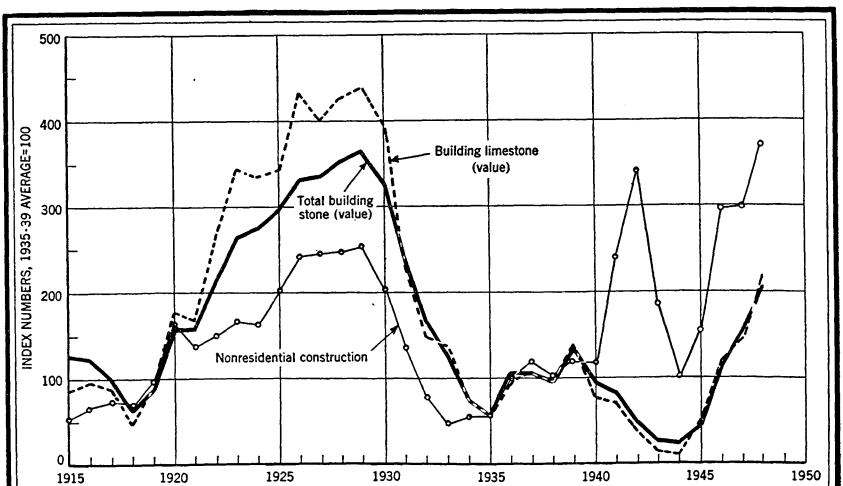

FIGURE 2.—Sales of all building stone and building limestone compared with nonresidential construction (public and private), 1915–48. Data on nonresidential building construction from Bureau of Foreign and Domestic Commerce.

TECHNOLOGY

In 1948 the American Society for Testing Materials, through its Committee C–18, issued two new tentative methods for testing building stone and slate and a new set of tentative definitions of natural building stone terms. The complete titles of these are: Tentative Method of Test for Combined Effect of Temperature Cycles and Weak Salt Solutions on Natural Building Stone,[1] Tentative Method of Test for Durability of Slate for Roofing,[2] and Tentative Definitions of Terms Relating to Natural Building Stone,[3] The last specification includes definitions of granite, limestone, marble, greenstone, and sandstone, with their many type variations. A paragraph on rock textures, such as porphyritic, clastic, etc., is also included.

A project that promises to be valuable to building-stone producers is the stone-wall exposure panel erected in 1948 at the National Bureau of Standards. This masonry wall contains building stones from 47 States and 16 foreign countries, and the chief purpose is to study the effect of natural weathering processes on the various rock types. Other items under investigation include watertightness of joints, durability of mortars, waterproofing, and structural movements. It is expected that a great many years exposure will be required before definite conclusions can be drawn.

A process for the production of artificial stone, covered by British Patent 593,648, has been announced. The method calls for comminuted CaO to be partly hydrated by water vapor and then mixed with argillaceous material and water into a moldable state. The molded shape is then hardened by the action of steam under pressure.[4]

CRUSHED AND BROKEN STONE

Over 223 million short tons of crushed and broken stone were produced in 1948, in addition to that used for making cement and lime. Output increased 9 percent in quantity and 13 percent in value over 1947 totals. Chief tonnage gains were in concrete and road metal, railroad ballast, and stone for metallurgical purposes. The average value at the quarry increased 5 cents to $1.26 per ton.

The accompanying table of salient statistics shows the quantity sold and the value of the output during 1947 and 1948, by uses. Detailed data on asphaltic stone and slate granules and flour are given in the Asphalt and Slate chapters of this volume.

COMMERCIAL AND NONCOMMERCIAL OPERATIONS

In contrast with strictly commercial operations, noncommercial operations represent tonnages reported by States, counties, municipalities, and other Government agencies produced by themselves or by contractors for their consumption. The accompanying table shows the production of crushed stone for concrete and road metal during recent years by both types of operations. For a number of years before 1940, Government-sponsored enterprises produced 29 to 46 percent of the total output. Many of these enterprises served make-work projects designed to relieve unemployment. However, the war changed this situation, and unemployment virtually disappeared.

Consequently the output of crushed stone by noncommercial agencies dropped to 7 percent of the total production in 1945 and 1946. In 1947 and 1948 the tonnage increased to 11 percent.

Crushed stone for concrete and road metal sold or used by commercial and noncommercial operators in the United States, 1944–48

[Figures for "noncommercial operations" represent tonnages reported by States, counties, municipalities, and other Government agencies, produced either by themselves or by contractors expressly for their consumption, often with publicly owned equipment; they do not include purchases from commercial producers. Figures for "commercial operations" represent tonnages reported by all other producers.]

Year	Commercial operations				Noncommercial operations				Total

[1] Manufactured from stone, slate, slag, and brick.
[2] Revised figure.

SIZE OF PLANTS

In 1947 the average crushed-stone plant produced approximately 120,000 short tons; in 1948 this average was increased to about 131,000 tons. During the year 538 of the plants reported less than 25,000 tons, but they produced only 3 percent of the total output. On the other hand, the 29 plants that produced 900,000 tons or over contributed 26 percent of the total. The accompanying table shows additional details of the size pattern of the industry.

Number and production of commercial crushed-stone [1] plants in 1947–48, by size of output

Size of output	1947 Number of plants	1947 Total production of plants (short tons)	1947 Percent of total	1947 Cumulative total (short tons)	1948 Number of plants	1948 Total production of plants (short tons)	1948 Percent of total	1948 Cumulative total (short tons)
Less than 1,000 tons	71	28, 490	0. 02	28, 490	45	19, 910	0. 01	19, 910
1,000 to 25,000	524	5, 673, 240	2. 96	5, 701, 730	493	5, 312, 260	2. 56	5, 332, 170

[1] Exclusive of marble, which is primarily a dimension-stone industry.

METHODS OF TRANSPORTATION

As shown in the accompanying table, truck transportation is the principal method used in the crushed-stone industry, closely followed by rail. As in the past years, waterways provide relatively minor but locally important transportation facilities. In previous years the table included only transportation statistics on the commercial stone used for concrete and road metal. However, since 1946, the table has included all commercial crushed stone.

Crushed stone sold or used in the United States in 1948, by methods of transportation

Method of transportation	Commercial operations: Short tons	Commercial operations: Percent of total	Commercial and noncommercial [1] operations: Short tons	Commercial and noncommercial [1] operations: Percent of total
Truck	92, 286, 380	44	108, 743, 640	49
Rail	80, 114, 420	39	80, 114, 420	36
Waterway	25, 243, 290	12	25, 243, 290	11
Unspecified	9, 762, 430	5	9, 762, 430	4
	207, 406, 520	100	223, 863, 780	100

[1] Entire output of noncommercial operations assumed to be moved by truck.

GRANITE

Sales of crushed and broken granite increased 9 percent in quantity and 11 percent in value in 1948, while the average sales value per ton increased 1 cent to $1.26. Sales of riprap increased substantially as did crushed stone for concrete and road metal. Stone for railroad ballast declined 21 percent in quantity and 25 percent in value compared with 1947 figures. Sharp declines were recorded in the output and value of stone for "other uses." Unit values increased slightly for riprap and "other uses," while decreases of 4 and 6 cents were noted for concrete and road metal and railroad ballast, respectively. North Carolina was the principal producer in 1948, followed by Georgia, South Carolina, California, and Virginia, in that order.

From the reports submitted, the number of individual operations supplying noncommercial crushed stone cannot be determined with any degree of accuracy. Therefore, in the accompanying tables covering granite and most kinds of crushed and broken stone, the number of active plants is not given. For many years before 1939, when noncommercial production was less important, such figures appeared in the tables.

BASALT AND RELATED ROCKS (TRAP ROCK)

Commercial trap rock normally includes basalt, gabbro, diorite, and other dark igneous rocks and is widely used in industry for concrete and road metal and for railroad ballast. Other uses include riprap, fill material, roofing granules, and unspecified uses. In 1948 Washington was the leading producer, followed by New Jersey, Oregon, Pennsylvania, Massachusetts, Connecticut, and California in that order. Sales of crushed and broken trap rock were 5 percent greater in quantity and 16 percent greater in value than in 1947. The average unit value increased 14 cents to $1.45 in 1948. See second table following for details.

Granite (crushed and broken stone) sold or used by producers in the United States in 1948, by States and uses

[2] Included with "Undistributed."

MARBLE

Marble producers, in the course of their manufacturing processes, accumulate large quantities of waste material consisting of either defective blocks or cuttings and spalls from marble-dressing operations. This byproduct material usually is marketed for the wide variety of uses listed in the footnote of the accompanying table. The average value varies from State to State because in certain States a large portion of this material is marketed for such high-priced products as terrazzo or marble flour, whereas in others a considerable amount is sold for roadstone, concrete aggregates, or for other low-priced uses. The average unit value decreased 34 cents in 1948 to $6.81.

Marble (crushed and broken stone) sold by producers in the United States in 1948, by States [1]

State	Active plants	Short tons	Value	State	Active plants	Short tons	Value
Alabama	2	(2)	(2)	Texas	1	13,400	$160,800

New York	1	22,840	230,176	Average unit value			$6.81
Tennessee	5	36,830	116,324				

[1] Includes stone used for agriculture, asphalt filler, cast stone, composition flooring, crushed stone, magnesia, mineral food, plaster, poultry grit, shingles, spalls, stucco, terrazzo, tile, whiting (excluding marble whiting made by companies that purchase their marble), and unspecified uses.
[2] Included with "Undistributed."

LIMESTONE

Because of its wide distribution and relatively moderate production costs, limestone is used more extensively than any other type of crushed and broken stone. Sales of limestone were reported to the Bureau of Mines from 44 States and 2 Territories in 1948. In 1948, limestone (excluding that used in the manufacture of cement and lime) constituted 74 percent of the total crushed and broken stone produced in the United States. With the exception of stone for agriculture, all classes showed increases in quantity and value. The tonnages consumed in "Miscellaneous uses," which as a group gained 4 percent in output, are shown in an accompanying table.

Limestone (crushed and broken stone) sold or used by producers in the United States in 1948, by States and uses

Sugar factories	649,420	1,349,886	471,030	1,098,933
Other uses [3]	579,450	955,037	1,164,220	1,642,181
Use unspecified	414,440	586,909	517,740	663,115
Total	16,858,050	26,151,258	17,527,710	27,476,000

[1] Includes stone for filler for asbestos products, calcimine, caulking compounds, ceramics, chewing gum, explosives, floor coverings, foundry compounds, glue, grease, insecticides, leather goods, paint, paper, phonograph records, picture-frame moldings, plastics, putty, roofing, rubber, tooth paste, wire coating, and unspecified uses.
[2] Includes stone for refractory magnesia.
[3] Includes stone for acid neutralization, athletic-field marking, carbon dioxide, chemicals (unspecified), concrete blocks and pipes, dyes, fill material, light bulbs, motion-picture snow, oil-well drilling, patching plaster, pharmaceuticals, rayons, roofing granules, spalls, and water treatment.

Dolomite (calcium-magnesium carbonate) has a variety of uses, some of which are distinct from those of high-calcium limestone. Dead-burned dolomite is used as a refractory lining for metallurgical furnaces, and statistical data on this product (which is closely allied to lime) are given in the Lime chapter of this volume. Raw dolomite is also used as a refractory, particularly for patching furnace floors.

Sales of dolomite and its primary product of calcination—dolomitic lime—for certain uses are covered in the accompanying table.

Dolomite and dolomitic lime sold or used by producers in the United States for specified purposes, 1947–48

	1947		1948	
	Short tons	Value	Short tons	Value
Dolomite for—				
Basic magnesium carbonate [1]	358,320	$458,075	229,200	$315,680
Refractory uses	1,540,740	1,728,623	1,323,090	1,497,285
Dolomitic lime for—				
Refractory (dead-burned dolomite)	1,395,200	14,295,359	1,544,760	17,847,182
Paper mills	48,000	453,000	56,000	554,000
Total (calculated as raw stone)	4,785,000		4,754,000	

[1] Includes dolomite for refractory magnesia.

The following table shows the tonnages and values of fluxing stone sold for use in various metallurgical operations.

Sales of fluxing limestone, 1944–48, by uses

Year	Blast furnaces		Open-hearth plants		Other smelters [1]		Other metallurgical [2]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1944	24, 045, 890	$18, 954, 798	6, 158, 870	$5, 251, 987	557, 830	$547, 277	317, 740	$376, 051	31, 080, 330	$25, 130, 113
1945	21, 901, 820	17, 111, 472	5, 038, 140	4, 286, 889	502, 230	491, 178	197, 330	186, 854	27, 639, 520	22, 076, 393
1946	19, 674, 130	15, 803, 857	4, 869, 300	4, 342, 467	449, 050	490, 566	165, 280	154, 943	25, 157, 760	20, 791, 833
1947	25, 817, 270	22, 000, 942	6, 059, 440	5, 862. 292	512, 880	593, 811	180, 680	230, 905	32, 570, 270	28, 687, 950
1948	26, 339, 790	24, 721, 052	7, 873, 410	8, 695, 137	503, 490	609, 354	185, 250	224, 465	34, 901, 940	34, 250, 008

[1] Includes flux for copper, gold, lead, zinc, and unspecified smelters.
[2] Includes flux for foundries and for cupola and electric furnaces.

As the statistics of the lime and cement industries are presented in separate chapters of the Minerals Yearbook, they are not covered in the Stone chapter. However, a commodity review of limestone would be incomplete without suitable recognition of the large tonnage of limestone consumed by these industries. Consequently, the following table shows the total tonnage of limestone consumed for all purposes.

Limestone sold or used for all purposes in the United States, 1946–48, in short tons

Use	1946	1947	1948
Limestone (as given in this report) (approximate)	134, 717, 000	150, 409, 000	166, 742, 000
Portland and natural cement and cement rock [1]	43, 877, 000	49, 530, 000	54, 513, 000
Lime [2]	11, 985, 000	13, 558, 000	14, 528, 000
Total	190, 579, 000	213, 497, 000	235, 783, 000

[1] Reported in terms of cement in Cement chapter of this volume.
[2] Reported in terms of lime in Lime chapter of this volume.

SANDSTONE

Sales of crushed and broken sandstone increased 7 percent in quantity and value in 1948 compared with 1947. Increases in tonnage were registered for refractory stone, concrete and road metal, and "other uses," whereas riprap and railroad-ballast output declined. Average unit values increased for refractory stone, riprap, and railroad ballast and decreased for all others. California, Pennsylvania, and Colorado were principal producers.

MISCELLANEOUS STONE

Crushed and broken stone, other than the five principal varieties already discussed, includes light-colored volcanic rocks, schists, boulders from river beds, serpentine, and flint. The following table shows sales of stone of these types in 1948. Total sales decreased 7 percent in quantity and about one percent in value in 1948 compared with the preceding year. California was the principal producer in 1948. Other States producing more than a million tons were Kansas, Missouri, and Oklahoma. The average unit value increased 6 cents in 1948 to $0.87. See second table following for details.

Sandstone (crushed and broken stone) sold or used by producers in the United States in 1948, by States and uses

State	Refractory stone (ganister)		Riprap		Crushed stone				Other uses [1]		Total

[1] Includes stone used for agriculture, asphalt filler, concrete blocks, fill material, refractory, road base, roofing granules, spalls, stucco, and unspecified uses.
[2] Included with "Undistributed."
[3] Chats; figures collected by Denver, Colo., office of the Bureau of Mines. Missouri figures also include chert aggregates.
[4] Includes a small quantity of stone.

MARKETS

As has been shown in preceding sections of this chapter, the principal utilization of crushed stone is as aggregate in concrete and road metal used in the construction of buildings and highways. It follows, therefore, that crushed stone sales should more or less parallel the trends of portland-cement shipments, the area of new concrete pavements, and the value of new construction. These relationships are shown in figure 3.

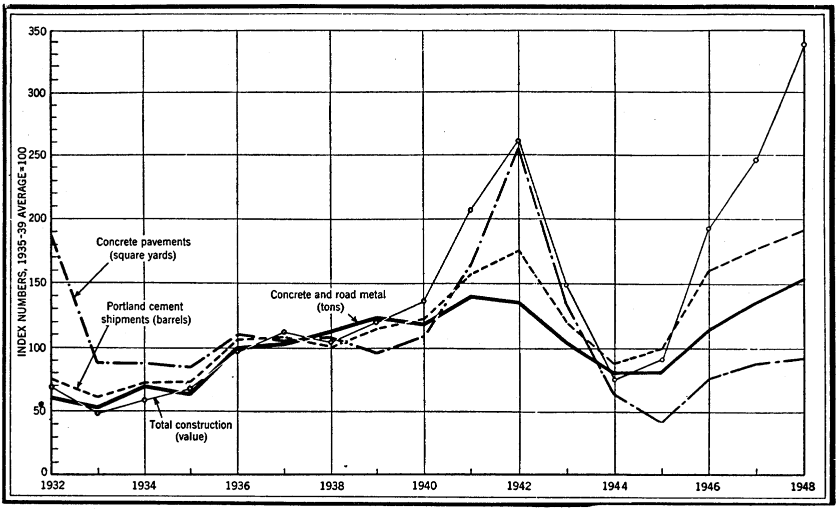

FIGURE 3.—Crushed-stone aggregates (concrete and road metal) sold or used in the United States compared with shipments of portland cement, total construction (value), and concrete pavements (contract awards, thousands of square yards), 1932–48. Data on construction and concrete pavements from Bureau of Foreign and Domestic Commerce.

The metallurgical industries operated at high rates during 1948. Pig-iron production—more than 60 million short tons—was 3 percent greater than in 1947; and steel production—more than 88 million tons—was 4 percent greater than in the previous year. As a result of these increases, metallurgical stone sales increased 7 percent over 1947. The correlations of fluxing-stone output with pig-iron production and of refractory stone with steel-ingot production are shown in figure 4.

TECHNOLOGY

It has been known for some time that marble is adversely affected by temperature differentials and that permanent growth is sometimes induced by these cycles. The expansion is normally accompanied by decreases in such structural properties as strength, elasticity, and coherence. A granulated effect (commonly called "sugaring") in various marbles appears to be attributed to the unusual thermal expansion of the component calcite crystals. This unequal expansion tends to loosen the inherent bond between the crystals thereby resulting in crumbling or disintegration. Tests are being made at the National Bureau of Standards to determine the basic reasons for marble weathering.[5]

[5] National Bureau of Standards, Technical News Bulletin: Vol. 32, No. 3, March 1948, pp. 28–29.

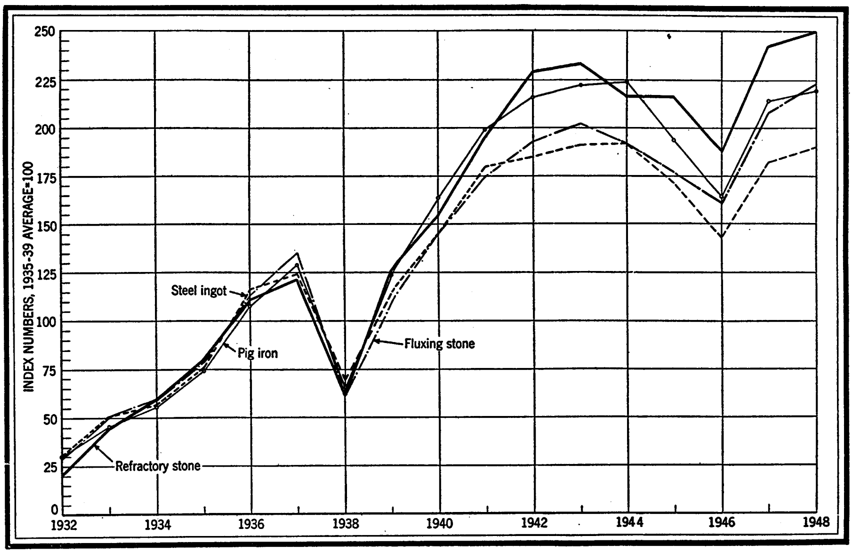

FIGURE 4.—Sales (tons) of fluxing stone and refractory stone (including that used in making lime) compared with production of steel ingot and pig iron, 1932–48. Statistics of steel-ingot production compiled by American Iron and Steel Institute.

The use of limestone to neutralize acid wastes has recently been reported.[6]

During 1946 the Bureau of Mines examined several high-grade limestone deposits in Washington. A report covering examination of the Sauk Mountain deposit has been released.[7]

In connection with the preparation of crushed stone for marketing, a method for washing finer sizes of the material is being used. The method includes the use of a series of nozzles of ¾-inch pipe slightly flattened and using a high velocity of water trained on the crushed aggregate.[8]

The use of "skull crackers" in quarrying operations was mentioned in the 1946 and 1947 Stone chapters. A recent report describes the use of a skull breaker for secondary breaking in a limestone quarry.[9]

Extenders are widely used in the paint industry. A study of the commercial possibilities of using finely ground limestone for this purpose has been recently reported.[10]

FOREIGN TRADE[11]

Importation of stone into the United States in 1948 suffered a decline in value compared with 1947. Decreases in total value were registered for marble, granite, and quartzite but travertine imports

almost doubled over those reported for the preceding year. A slight increase in value was recorded for "other" stone.

The export trade in 1948, although relatively small, increased slightly in quantity and value for marble and other building and monumental stone. The bulk is shipped to Canada with most of the remainder to other countries in the Western Hemisphere. The value of "other manufactures of stone" decreased slightly in 1948.

Sulfur and Pyrites

By G. W. JOSEPHSON AND M. G. DOWNEY [1]

GENERAL SUMMARY

THE high level of industrial activity was reflected in the sulfur production of 1948. In the United States a native-sulfur production record was established as the industry tried to satisfy the unprecedented requirements of domestic consumers and a great foreign demand. Italian sulfur producers were in a less favorable position because of cost disadvantages. Their output increased slightly and their export situation was improved somewhat through governmental assistance programs, but many basic difficulties remain to be solved.

The rate of consumption of native sulfur has become so great that reserve problems are receiving serious attention. No outstanding discoveries were revealed in 1948 but exploration is very active.

International trade in pyrites, particularly in Europe, gradually is resuming its prewar pattern; consequently, production in the exporting countries, such as Spain, Portugal, and Cyprus, increased. In the United States pyrite output declined slightly but was still near the record rate.

The trend of sulfur prices continued upward, but increases have been much less than those for most other commodities.

Salient statistics of the sulfur industry in the United States, 1935–39 (average) and 1945–48

	1935–39 (average)	1945	1946	1947	1948

SULFUR

DOMESTIC PRODUCTION

Production of sulfur continued at a high rate throughout 1948; and a new record, 10 percent above the previous high, was established. Demand from both domestic and foreign consumers was so great that shipments from the mines—4,978,912 tons—exceeded production (4,869,210). These tonnages apply only to the output of Frasch-process mines. Relatively small quantities of sulfur were also produced by conventional mining methods in California, Colorado, Nevada, Texas, and Wyoming. This material is consumed principally in treating alkaline soils.

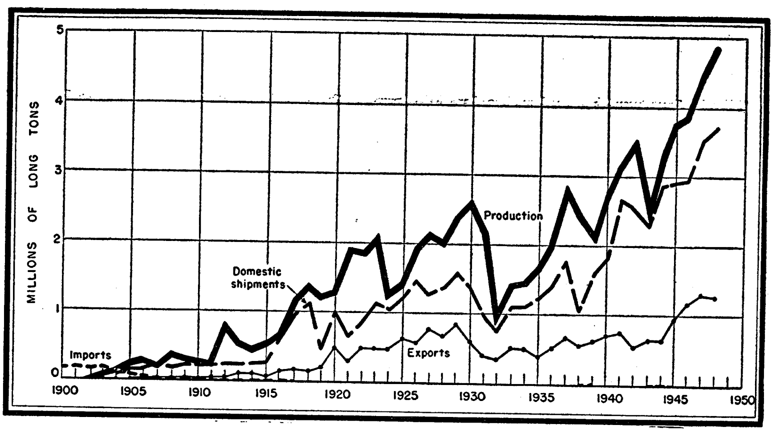

FIGURE 1.—Domestic production, shipments for domestic consumption, exports, and imports of crude sulfur, 1900–48.

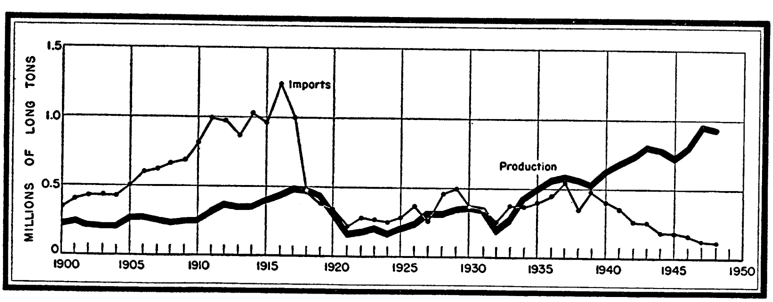

FIGURE 2.—Domestic production and imports of pyrites, 1900–48.

Mines in Texas produced 79 percent and those in Louisiana nearly 21 percent of the native sulfur output of the United States in 1948.

California.—Sulfur ore was produced at the Crater Claims in Inyo County by Roy Kitching, and at Leviathan, Alpine County, by the Siskon Mining Corp.

Colorado.—General Agricultural Products Co. mined sulfur ore in Delta County.

Louisiana.—In 1948, for the first time, annual production of sulfur in Louisiana from the Grande Ecaille mine of the Freeport Sulfur Co.

in Plaquemines Parish exceeded 1,000,000 tons. A $7,000,000 program of improvement and expansion was completed in 1948. Experiments in the transportation of molten sulfur by barge from the mine to Port Sulphur have been successful.

Nevada.—In Humboldt County, W. S. Peterson produced sulfur at the Oscar Streeter mine.

Texas.—In 1948 sulfur was produced in Texas by the following firms: Duval Texas Sulfur Co., at Orchard Dome, Fort Bend County; Freeport Sulphur Co., at Hoskins Mound, Brazoria County; Jefferson Lake Sulphur Co., Inc., at Clemens Dome, Brazoria County, and at Long Point Dome, Fort Bend County; Texas Gulf Sulphur Co., at Boling Dome, Wharton County, and at Moss Bluff Dome, Liberty County; and the Pecos Orla Sulphur Co., Inc., at Michigan Claims, Culberson County.

The construction program of the Texas Gulf Sulphur Co. at Moss Bluff Dome was completed in 1948 and the first production was reported in June. Sulfur from this dome will be shipped by barge to Galveston.

Wyoming.—Development work on a sulfur mine at Afton, Wyo., was carried on by Star Valley Mines, Inc. Near Cody, Wyo., the Cody Sulfur Co. was active, and the Interstate Chemical Co. was preparing to produce sulfur from local geyser deposits. The market for material from this area is primarily in soil conditioner, but experimental work looking toward its use in the preparation of phosphatic fertilizer is being carried on.

Sulfur produced and shipped in the United States, 1944–48 [1]

Year	Produced (long tons)			Shipped	
	Texas	Louisiana	Total	Long tons	Approximate value
1944	2,582,238	635,920	3,218,158	3,519,083	$56,300,000
1945	2,969,778	783,410	3,753,188	3,833,294	61,300,000
1946	2,975,472	884,170	3,859,642	4,128,212	66,100,000
1947	3,561,214	880,000	4,441,214	4,828,103	85,200,000
1948	3,867,545	1,001,665	4,869,210	4,978,912	89,600,000

[1] In addition to the refined sulfur shown, native sulfur ore (10–70 percent S) for agricultural use was produced in Colorado and Texas in 1944–48 and in California and Nevada in 1946–48. Total shipments of this material were as follows, in long tons: 1944—1,639 ($8,950); 1945—1,615 ($12,170); 1946—6,344 ($95,531); 1947—4,303 ($65,124); 1948—1,700 ($30,220).

Sulfur produced in Texas in 1948, by companies, in long tons

Company	First quarter	Second quarter	Third quarter	Fourth quarter	Total
Texas Gulf Sulphur Co	742,403	782,364	797,761	797,424	3,119,952
Freeport Sulphur Co	85,620	96,605	95,330	90,390	367,945
Jefferson Lake Sulphur Co., Inc	60,840	51,522	51,399	48,357	212,118
Duval Texas Sulphur Co	30,285	47,410	41,480	48,355	167,530
Total	919,148	977,901	985,970	984,526	3,867,545

RECOVERY AS BYPRODUCT

The major sulfur requirements of the United States are supplied by native sulfur and pyrites that are mined specifically for that purpose. However, considerable quantities of sulfur are also obtained as byproducts of other operations. A large tonnage of pyrites is recovered as a flotation concentrate in milling copper and zinc ores and a comparatively modest tonnage as coal brasses in the washing of midwestern coal. Statistics of these materials are included in the Pyrites section of this chapter.

Large volumes of sulfur-bearing gases are evolved in smelting metal sulfide ores. During 1948 the equivalent of 187,000 long tons of sulfur was recovered from this source in the form of sulfuric acid. The following table shows the output of acid at smelters during the past 5 years.

Byproduct sulfuric acid (basis, 100 percent) produced at copper, zinc, and lead plants in the United States, 1944–48, in short tons

	1944	1945	1946	1947	1948
Copper plant [1]	248, 988	231, 697	171, 687	126, 494	111, 967
Zinc plants	652, 001	610, 938	544, 529	598, 703	529, 478
Total	900, 989	842, 635	716, 216	725, 197	641, 445

[1] Includes sulfuric acid produced as byproduct at a lead smelter.

In many other industrial operations sulfur fumes are also available, but only a small fraction of the total is recovered in useful form. However, the movement toward more complete utilization of this resource has gathered impetus in recent years as more attention has been directed toward the substantial quantities of sulfur that can be obtained from sour natural gases, and toward the smog that has become a serious problem in many cities. As sulfur compounds in the air are said to contribute to the formation of smog, serious efforts are being made in Los Angeles and other cities to reduce the quantities of sulfur released into the air by oil refineries and other industrial plants.

During 1948 construction was progressing on two natural-gas cleaning plants in Wyoming (one by Texas Gulf Sulphur Co. and one by Stanolind Oil & Gas Co.) and one (a Simon-Carves plant being built for the Hancock Chemical Co.) in California for the treatment of oil refinery gases in the Los Angeles area. The Freeport Sulphur Co. was preparing to construct a plant near Westville, N. J., to recover sulfur from refinery gases.

During 1948 coke-oven, refinery, natural, and other industrial gases produced in nine States provided a total of 44,369 tons of elemental sulfur (calculated as 100 percent sulfur) when treated by the Thylox, Sasco, and other processes. Shipments totaled 54,349 long tons, of which 94 percent was sold as brimstone and the remainder as paste containing 40 to 51 percent sulfur. In addition, 27,953 tons of hydrogen sulfide (containing 25,792 long tons of sulfur) were recovered in 1948 in four States by the Phenolate, Phosphate, and Girbotol processes.

CONSUMPTION AND USES

Consumption of sulfur, as shown in the accompanying table, again reached a new record in 1948—7 percent above the previous high established in 1947. Apparent sales, a calculated figure which includes exports, were also at a record level—5,015,230 long tons.

Apparent consumption of sulfur in the United States, 1944–48, in long tons

	1944	1945	1946	1947	1948
Shipments to consumers (apparent)	3,580,058	3,849,591	4,094,191	4,839,548	5,015,230
Imports	32	33	35	15	38
Total	3,580,090	3,849,624	4,094,226	4,839,563	5,015,268
Exports:					
Crude	653,686	918,691	1,189,072	1,299,060	1,262,913
Refined	21,546	23,971	56,748	50,477	32,630
Total	675,232	942,662	1,245,820	1,349,537	1,295,543
Apparent consumption	2,904,858	2,906,962	2,848,406	3,490,026	3,719,725

The pattern of sulfur consumption, by industries, has been estimated by Chemical Engineering as follows:

Sulfur consumed in the United States, 1944–48, by uses, in long tons

[Chemical Engineering]

Use	1944	1945	1946	1947	1948
Chemicals [1]	1,585,000	1,605,000	1,460,000	1,760,000	1,790,000
Fertilizer and insecticides	580,000	600,000	620,000	740,000	800,000
Pulp and paper	300,000	297,000	305,000	370,000	380,000
Explosives [1]	88,000	90,000	90,000	100,000	110,000
Dyes and coal-tar products	75,000	75,000	80,000	95,000	98,000
Rubber	55,000	58,000	65,000	65,000	63,000
Paint and varnish	90,000	94,000	105,000	190,000	240,000
Food products	7,000	7,000	7,000	8,000	8,000
Miscellaneous	140,000	135,000	175,000	212,000	211,000
Total	2,920,000	2,961,000	2,907,000	3,540,000	3,700,000

[1] To avoid disclosing estimated consumption of sulfur in direct war applications, such as military explosives, sulfur so used is included with "Chemicals."

Large quantities of elemental sulfur are consumed in such products as rubber and insecticides, and the paper industry converts a considerable tonnage into liquors used in manufacturing paper. However, the largest percentage (approximately three-fourths) is converted into sulfuric acid. A publication of interest to sulfur consumers is being prepared by J. R. West of the Mellon Institute. It is to contain a comprehensive compilation of the known properties of sulfur and will be published by the American Chemical Society. Chemical Engineering has estimated the consumption of sulfuric acid by the major consuming industries as follows:

Sulfuric acid (basis, 100 percent) consumed in the United States, 1944–48, by industries, in short tons

[Chemical Engineering]

Industry	1944 [1]	1945 [1]	1946 [2]	1947 [2]	1948
Fertilizer	2,640,000	2,850,000	3,020,000	3,515,000	3,650,000
Chemicals	2,490,000	2,220,000	1,760,000	2,000,000	2,070,000
Petroleum refining	1,020,000	1,020,000	1,000,000	1,065,000	1,070,000
Paints and pigments	510,000	520,000	550,000	665,000	680,000
Coal products	625,000	600,000	510,000	640,000	650,000
Rayon and cellulose film	450,000	495,000	556,000	610,000	650,000
Iron and steel	560,000	570,000	475,000	550,000	570,000
Other metallurgical	350,000	330,000	280,000	315,000	315,000
Industrial explosives	120,000	100,000	105,000	125,000	130,000
Textiles	75,000	70,000	75,000	73,000	70,000
Miscellaneous	350,000	400,000	320,000	372,000	370,000
Total	9,190,000	9,175,000	8,651,000	9,930,000	10,225,000

[1] To avoid disclosing estimated consumption of acid in direct war applications, such as military explosives, acid so used is combined with "Chemicals."
[2] Revised figures.

As indicated in the table, the market for sulfuric acid was strong in almost all uses in 1948 and a record was attained.

The sulfuric acid production capacity of the United States was expanded greatly during the war, and a postwar oversupply was expected. Since the war, some ordnance plants have been idle and some old plants dismantled but demand for acid has been so great that much new construction has been required and in 1948 it was estimated that the total United States capacity had increased to more than 12,000,000 tons.[2]

In Minerals Yearbook, 1946, statistics showing distribution of sulfuric acid production by market areas were published. Exactly comparable data are not available for subsequent years, but the accompanying table provides somewhat similar information that was obtained by the Bureau of the Census in its census of manufacturers.

Production and shipment of sulfuric acid[1] (100 percent H_2SO_4), by regions and by States, in 1947

[Bureau of the Census]

STOCKS

During 1948 sales were so great that, despite record production, producers' stocks of native sulfur declined 4 percent to 3,225,014 long tons, 2,694,449 of which were held at the mine and 530,565 at ports, consuming centers, or in transit.

PRICES

The price of crude sulfur quoted during 1948 was $18 per long ton f. o. b. mines for the domestic market, and $20–$22 for export. Refined-sulfur prices were also advanced during the year.

FOREIGN TRADE

In recent years imports of elemental sulfur into the United States as shown in the accompanying table, have been negligible. Foreign producers of native sulfur find it difficult to compete with the low-price output of Frasch mines. Byproduct sulfur produced in Canada is no longer exported to the United States but is used in that country. It is reported that relatively small quantities of crude sulfur ore are imported from Mexico into southern California from time to time for use as soil conditioner.

On the other hand, exports are very large. In 1948, 1,262,913 long tons of crude and 32,630 tons of crushed and refined sulfur were shipped out of the United States. This is nearly as large a movement as in the record year 1947.

An accompanying table shows the wide distribution of American sulfur in the world market.

Sulfur imported into and exported from the United States, 1944–48

[U. S. Department of Commerce]

WORLD REVIEW

Native sulfur is a mineral that is found in a great many countries, but in most instances the deposits are relatively small in size or low in grade. The bulk of the production comes from a few countries, but many countries maintain a small output for local needs. At present complete official statistics of a number of countries are not available, but it is estimated that in 1948 the world output of native sulfur totaled approximately 5,300,000 long tons—a new record. A notable trend is the increasing use of elemental sulfur obtained from sources other than native sulfur deposits. These include various by-product sources and sulfur obtained from pyrites by such methods as the Orkla process. It is estimated that the total world sulfur production, including both native and elemental sulfur derived from other sources, reached a record total of over 5,500,000 long tons in 1948.

Chile.—Sulfur deposits owned by Nicolas Yutronic & Co., located near the town of San Pedro de Atacama at an altitude of 17,000 feet, were described.[3] The deposits are of volcanic origin and are estimated to contain about 7,500,000 tons of sulfur.

After the war sulfur output declined in Chile, and no substantial recovery was noted in 1948.

World production of native sulfur, by countries,[1] 1942–48, in long tons

[1] Native sulfur believed to be produced also in China, Cuba, Egypt, India, Indonesia, Iran, and U. S. S. R., but complete data are not available; estimates by senior author of chapter included in total.
[2] Estimate.
[3] Data not available; estimate by senior author of chapter included in total.
[4] In addition, 30,734 tons of sulfur rock was reported in 1942. Similar data not available for later years.
[5] Preliminary data.
[6] Fiscal year ended March 31 of year following that stated.
[7] Incomplete data.
[8] Estimated by senior author of chapter.

France.—Sulfur deposits in France are said to exist in four regions: Apt, Narbonne, Marseille, and Manosque. Reserves for one concession of 355 hectares at Apt are said to total 25,000 tons. Seven beds, ranging in thickness from 0.3 to 1.2 meters, are known in the Manosque area. Reserves are estimated at 3,000,000 tons. The

[3] Bureau of Mines, Mineral Trade Notes: Vol. 27, No. 3, September 1948, pp. 53–56.

Narbonne region is said to have reserves of over 10,000,000 tons. Here a plant having an ore crushing capacity of 1,500 tons per day beneficiates sulfur by flotation.[4] In general, the sulfur ore mined in France is lean—apparently about 10 percent sulfur in 1947. It is beneficiated to a product containing 30–38 percent sulfur.

Germany.—Byproduct sulfur recovery is being revived in Germany. In the Anglo-American zone it was expected that about 20,000 tons would be derived from gases in 1948.[5]

Greece.—Nisyros, Dodecanese Islands, has substantial deposits of sulfur. One survey indicated reserves of 2 million tons of ore containing 337,000 tons of sulfur in a single region. Sulfur has been mined on Nisyros in the past and there is some prospect of development to supply Greek needs now purchased abroad.[6]

India.—At Sindhri, Bihar, a plant is being constructed in which gypsum will be used as a raw material in the manufacture of ammonium sulfate. The waste sludge may be used in the manufacture of cement.

Italy.[7]—Italian sulfur production and exports increased in 1948 but the industry—particularly the Sicilian portion—is not considered to be in a healthy condition. Operations on the mainland are in better condition because they fit into the major domestic manufacturing industries, whereas Sicilian producers must export most of their raw sulfur output. Sicilian sulfur is at a disadvantage in the international market because its price is much higher than that of American sulfur mined by the Frasch process. Production costs of five representative mines are said to range from 28,000 to 42,250 lire per ton. Early in 1948 the Government raised the price of raw sulfur to an average of about 29,000 lire per ton (superior yellow, 30,000; inferior yellow, 29,500; good Sicily, 28,500; common, 28,300). A Government-sponsored marketing organization, Ente Zolfi Italiani, purchased sulfur at the above prices and sold it at a loss abroad at a price of about 23,000 lire through compensation agreements. (American sulfur is said to be sold at the equivalent of 18,000 lire c. i. f. Europe.) This practice apparently enabled most of the producers to break even, but many said that they were still operating at a loss. Exports from Sicily, almost all of which were placed through compensation agreements, increased from 34,550 metric tons in 1947 to 60,209 in 1948. France was the principal buyer, taking 51,717 tons. Warehouse stocks rose to about 110,000 tons and if production is maintained at a 100,000-ton rate (1948 production in Sicily was 108,300), without a substantial increase in exports, stocks are expected to continue to increase sharply in 1949.

Under these conditions, there is pressure on the Government to increase the price paid the miners, whereas foreign purchasers call for reductions to competitive levels. Some efforts are also being made to reduce costs of production. These include efforts to reduce financing costs, improve mining practice, reduce power costs, and improve transportation. Probably the most notable action toward cost reduction in 1948 was the purchase by the Cozzo Disi mine of Ameri-

[7] Harris, Raymond J., Production Costs—The Gordian Knot of Sicilian Sulphur: Consular Rept. 7, Palermo, Italy, Mar. 15, 1949, 37 pp.

can equipment for beneficiating sulfur by flotation. It is anticipated that flotation will increase greatly the efficiency of recovery, as the losses in standard Calcarone and Gill furnace methods are large.

Mexico.—The existence of sulfur domes in Mexico have been known for many years but no commercial production has come from them. In 1948 interest in this area increased considerably. The Mexican Gulf Sulphur Co., which has carried on an exploration program over a period of years, entered into an agreement with the Jefferson Lake Sulphur Co. looking toward further exploration and eventually commercial production from the San Cristobal Dome.

An extensive exploration program is also reported to have been carried out in the State of Veracruz by the Pan American Sulphur Co.

Rumania.—Sulfur is said to occur near the village of Varilou, Prahova, about 20 miles from Ploesti in the oil area.[8]

Turkey.—From the Keciburlu mines Turkey produced 12,470 metric tons of sulfur ore in 1947 and refined about 2,600 tons of sulfur. This is less than requirements; about 7,000 tons were imported.[8]

PYRITES

DOMESTIC PRODUCTION

In 1948 domestic production of pyrites continued at a high level—only 1 percent lower than the record established in 1947.

Pyrites (ores and concentrates) produced in the United States, 1944–48

Year	Quantity: Gross weight (long tons)	Quantity: Sulfur content (percent)	Value	Year	Quantity: Gross weight (long tons)	Quantity: Sulfur content (percent)	Value
1944	788, 530	42. 2	$2, 598, 000	1947	940, 652	41. 7	$4, 070, 000
1945	722, 596	41. 0	2, 700, 000	1948	928, 531	41. 8	3, 950, 000
1946	813, 372	41. 5	3, 228, 000				

As shown in the accompanying table, pyrites output has increased considerably during the past several years. However, it is in no position to make a strong bid for the major part of the American sulfur market owing to the comparatively low cost of native sulfur. Pyrites, therefore, is used in those areas in which it has some local advantage, such as a low shipping cost or availability as a byproduct in an area of good sulfuric acid demand. The bulk of the production is converted into sulfuric acid by the producing companies before being sold in the open market. In 1948 producing companies consumed 738,227 long tons and sold only 176,370 tons.

California.—Output from the Hornet mine of the Mountain Copper Co., Shasta County, made California the third-largest pyrites-producing State in 1948

[8] Bureau of Mines, Mineral Trade Notes: Vol. 26, No. 5, May 1948, p. 54.

Colorado.—The Rico Argentine Mining Co., Dolores County, and the Empire Zinc Division of the New Jersey Zinc Co., Eagle County, produced pyrites in Colorado in 1948.

Indiana.—Output of pyrite (coal brasses) by the Snow Hill Coal Corp. at the Tallydale mine, Vigo County, decreased in 1948.

Montana.—The Anaconda Copper Mining Co. recovered a substantial tonnage of pyrite in 1948 as a byproduct of its copper-plant operations at Anaconda, Deer Lodge County.

New York.—The St. Joseph Lead Co. shipped pyrites from the Balmat Mine, St. Lawrence County, in 1948.

Pennsylvania.—The Bethlehem Steel Co. produced pyrites in Lebanon County.

Tennessee.—As in past years, Tennessee led all other States in the production of pyrites. Output came from mines operated by the Tennessee Copper Co. and was converted by that company to sulfuric acid and iron sinter.

Virginia.—Pyrites were produced by the General Chemical Co. at the Gossan mine to supply its sulfuric acid plant at Pulaski. Virginia was the second-largest pyrites-producing state in 1948.

Wisconsin.—The Vinegar Hill Zinc Co. recovered pyrites and converted them into acid in Layfayette County.

PRICES

Pyrites prices vary greatly according to the local demand and distance from competitive sources of sulfur. The average value f. o. b. mine of pyrites produced in the United States was reported by producers to be $4.25 per ton in 1948, the range being from less than $1.50 to as much as $6.00. Oil, Paint and Drug Reporter quoted Spanish pyrites at about $8–$10 per ton c. i. f. Atlantic ports. E&MJ Metal and Mineral Markets quoted nominal prices of 14–16 cents per unit of sulfur delivered to United States ports. Sources in the industry estimate that Spanish pyrite delivered to the east coast of the United States was valued during the past year for its sulfur content at approximately 15 cents per unit.

FOREIGN TRADE

The United States has no export trade in pyrites but imports substantial tonnages to the east coast consuming areas. The quantity, however, has declined greatly from the totals common before the War. Canada is now our principal source of foreign pyrites, a position held formerly by Spain. Imports from both Canada and Spain declined in 1948, and the total was 15 percent lower than in 1947.

As shown in an accompanying table, nearly all pyrites entered through the Buffalo and Philadelphia custom districts.

WORLD REVIEW

Pyrites deposits of commercial size have world-wide distribution; and in many important industrial countries, particularly in Europe, pyrites constitute the major source of sulfur. World production statistics for recent years are shown in the accompanying table.

From the incomplete information available, it is estimated that total world output of pyrites in 1948 increased to approximately 9,000,000 metric tons.

Australia.—Plans for the erection of sulfuric acid plants by the Zinc Corp., New Broken Hill Consolidated, and Imperial Smelting Corp. have been announced.[9]

It is reported that about £A 1,500,000 will be spent in an attempt to develop the use of some 3,000,000 tons of pyrites at Mount Morgan mines for the production of sulfuric acid.[10]

Canada.—Two major Canadian companies are showing active interest in the sulfur business. The International Nickel Co. of Canada, Ltd., proposes to recover liquid sulfur dioxide as a byproduct of its smelter operations, and Noranda Mines, Ltd., carried on plant-

scale tests of a method of recovering elemental sulfur from pyrites. If successful, these sources are capable of eventually making Canada self-sufficient in sulfur.[11]

Finland.—Sulfur for Finland's domestic consumption is obtained as a flotation pyrite byproduct of the copper-zinc ore from the Outokumpu field. Recovery commonly exceeds 100,000 tons a year.[12]

France.—The three principal deposits of pyrites in France are said to be at Saint-Bel, near Lyons, Chizeuil in Saone-et-Loire, and Soulier at Ales Aubenas and Privas. French industry is said to be hampered by lack of sulfur minerals. Its domestic sources of sulfur and pyrites are too small to supply the need and some interest has been shown in byproduct sulfur from coal and in gypsum.[13]

Germany.—It was reported that production of pyrites in the British and American zones of Germany was to be increased to about 360,000 tons per year, which compares with an estimated requirement of 930,000.[14] Apparently this production goal was attained in 1948. During the war the Meggan mine in the British zone produced as much as a million tons of pyrite per year.

An electrolytic method of recovering zinc from pyrite cinders has been used in Germany. The process simultaneously produces free chlorine.[15]

Greece.—In 1947 the Kassandra mine supplied 47,264 tons of pyrite and the Ermioni mine 11,261 tons. Exports totaled 20,416 metric tons, valued at £2.0.8 per ton.[16]

Rumania.—A decline in pyrite production in Rumania is indicated by a report that the first-quarter output in 1948 totaled 4,012 tons as compared with 12,363 in the first quarter of 1947.[17]

Spain.—The export trade of the Spanish pyrites industry improved in 1948. Exports went chiefly to Belgium, Bizonal Germany, Netherlands, and the United Kingdom.

Resumption of shipments of Spanish pyrites to France in exchange for phosphates was reported.[18]

Spanish pyrites appears to have some price advantage in the European market as one trade report indicated the Spanish price to be 40 shillings per ton as compared to 70–80 shillings for Italian.[19]

Production of pyrites has been limited by want of replacement parts, oil, and general supplies needed for operations.

Union of South Africa.—Although some domestic pyrites are used in manufacturing sulfuric acid in South Africa, the country still depends in part upon imported sulfur. To improve their techniques and increase the degree of self-sufficiency, investigations were in progress of methods of flash-roasting pyrites.[20]

Talc and Pyrophyllite[1]

By BERTRAND L. JOHNSON AND F. M. BARSIGIAN

GENERAL SUMMARY

MINE production of talc, pyrophyllite, and ground soapstone made a new high record in 1948, according to reports by producers. All-time records were also made in both total quantity and value of these commodities sold or used. (See fig. 1.) Total imports were slightly higher in quantity in 1948 than in 1947, and considerably higher in value. Exports of "talc, steatite, soapstone, and pyrophyllite, crude and ground" decreased slightly in quantity and increased slightly in value; but the exports of "powders—talcum (in packages), face, and compact" were cut sharply in value, dropping from $4,681,964 in 1947 to $2,661,132 in 1948.

Pyrophyllite (a hydrous aluminum silicate) is included with talc (a hydrous magnesium silicate) in this chapter because of its resemblance to talc in certain physical properties and because it is interchangeable with talc in some uses, although certain specialized uses for pyrophyllite have been developed in recent years. Statistical details on the mining and sales of pyrophyllite, given before the 1947 chapter in footnotes to various tables, are shown in tabular form in the 1947 and the 1948 talc chapters.

Eleven States reported sales of talc, pyrophyllite, or ground soapstone in 1948. The greater part of the total sales was made in the Eastern States.

Pyrophyllite recently discovered (1947) in the South Mountain area of Pennsylvania has been described in recent articles.[2] The deposit is at Gargol in Adams County on the eastern flank of the broad South Mountain uplift in pre-Cambrian volcanic rocks (aporhyolites), exposed at the surface by erosion cutting into the core of the South Mountain anticline. The deposit appears to strike northeasterly for at least 450 feet and to dip steeply southeast. It is at least 75 feet wide. The deposit appears to have been formed through the replacement of the acid volcanic rocks by hot ascending waters. Diamond drilling is being carried on to appraise the volume and quality of the pyrophyllite deposit. Preliminary tests have proved that

[2] Stephenson, R. C., Occurrence of Pyrophyllite in Adams County, Pennsylvania: Paper read at Am. Inst. Min. and Met. Eng. meeting in New York, Feb. 15–19, 1948; abs. in Rock Products, vol. 51, No. 4, April 1948, p. 144.
Stephenson, R. C., Pyrophyllite Discovery Adds New Mineral Resource: Pennsylvania Dept. of Internal Affairs Bull., Harrisburg, Pa., vol. 16, No. 3, February 1948, pp. 3–5.

material from the Gargol deposit is comparable to North Carolina pyrophyllite. The large areal extent of the aporhyolite rocks of the South Mountain region suggest that there may be additional pyrophyllite reserves of possible commercial value.

Maps of the Watertown talc mine, Moretown, Vt., were released, as Strategic Minerals Investigations Preliminary Maps 3–225, by the Geological Survey in September 1948. These maps, resulting from surveys in 1944 and 1945, include a geologic surface map, underground maps, and structure sections.

A description of steatite-grade talc deposits in California was published early in 1948.[3] Steatite is known to occur in California in many places, especially in Inyo County. Studies of the deposits showed that steatite is not invariably formed by the hydrothermal alteration of dolomite, although this applies to the Talc City deposit. Some other steatite deposits have resulted from hydrothermal alteration of a silica rock resembling quartzite. Talc samples have been obtained from occurrences in altered granite, altered andesite, altered limestone, and altered phyllite.

A brief illustrated description[4] of the Gerhardt pyrophyllite deposit, about 4 miles west of Staley, Randolph County, N. C., appeared late in 1948. The original 200-foot-high pyrophyllite knob has been mined away on one side. The open pit at the base of the cliff is reached by a deeply cut and tunneled road. The pyrophyllite occurs as massive, as flake, and as very fine radiating fibrous masses, usually white to buff, but in places green or stained brown or red by iron oxides.

PRODUCTION AND SALES

The quantity of domestic talc, pyrophyllite, and ground soapstone sold or used in 1948 was slightly greater than in 1947, according to reports of the producers to the Bureau of Mines. This output—518,746 short tons—was a new record. The total value of $8,265,363 was over one-half million dollars greater than in 1947 and again reached an all-time high. The average value per ton rose from $14.89 in 1947 to $15.93, an increase of over $1 per ton.

Talc, pyrophyllite,[1] and ground soapstone sold by producers in the United States, 1944–48, by classes

1948	468,702	7,629,214	16.28	518,746	8,265,363	15.93

[1] Includes pinite; no sales in 1945–46.

Pyrophyllite[1] produced and sold by producers in the United States, 1944–48

Year	Production (short tons)	Sales					
		Crude		Ground		Total	
		Short tons	Value	Short tons	Value	Short tons	Value
1944	67,252	5,683	$52,343	60,560	$504,739	66,243	$557,082
1945	77,716	6,215	38,166	71,379	613,034	77,594	651,200
1946	97,765	10,716	85,002	85,835	913,301	96,551	998,303
1947	108,450	6,204	27,626	97,536	1,135,100	103,740	1,162,726
1948	107,885	5,175	25,766	102,152	1,313,266	107,327	1,339,032

[1] Exclusive of pinite.

Sales by States.—In 1948 New York was still the leading producing State by a considerable margin, with North Carolina in second place and California third. Sales of each of these leading States and Georgia reached new levels. Sales of pyrophyllite, most of which comes from North Carolina, increased in 1948.

Talc, pyrophyllite, and ground soapstone, sold by producers in the United States, 1947–48, by States

State	1947		1948	
	Short tons	Value	Short tons	Value
California	91,537	$1,595,422	98,681	$1,773,764
Georgia	49,441	673,251	53,602	624,694
Maryland, Pennsylvania, and Virginia	47,111	401,599	[1] 40,276	[1] 341,875
Nevada [2]	9,767	175,489	8,019	107,730
New York	(3)	(3)	119,716	2,613,935
North Carolina	97,484	1,186,463	104,052	1,455,691
Vermont	77,327	999,704	70,922	1,014,718
Other States [4]	143,427	2,650,553	23,478	332,956
Total	516,094	7,682,481	518,746	8,265,363

[1] Pennsylvania reported no sales in 1948.
[2] Includes pinite.
[3] Included with "Other States"; Bureau of Mines not at liberty to publish figure.
[4] Montana, New York (1947 only), Texas, and Washington.

CONSUMPTION AND USES

Five industries—paint, ceramics, rubber, insecticides, and roofing—consumed 80 percent of the sales of domestically produced talc, pyrophyllite, and ground soapstone in 1948, according to reports from the producers. Increases were reported in the ceramics, insecticides, and paper industries. The paint industry was the leading consumer by a narrow margin—ceramic use was almost as great. Each took 21 percent of the total. The insecticides, rubber, and roofing industries were in close competition for third place.

Talc, pyrophyllite, and ground soapstone sold by producers in the United States, 1947–48, by uses [1]

Use	1947		1948	
	Short tons	Percent of total	Short tons	Percent of total
Paint	112,101	22	108,505	21
Ceramics	94,755	18	107,907	21
Rubber	71,840	14	66,226	13
Insecticides	66,952	13	72,740	14
Roofing	63,545	12	54,990	11
Paper	31,772	6	32,430	6
Toilet preparations	13,147	3	7,431	1
Foundry facings	7,496	1	6,764	1
Crayons	603	(2)	400	(2)
Other uses [3]	36,120	7	37,995	7
Unclassified	17,763	4	23,358	5
Total	516,094	100	518,746	100

[1] Partly estimated. Includes pinite.
[2] Less than 0.5 percent.
[3] Refractory, textile, asphalt filler, plaster, plastics, and miscellaneous other uses.

PRICES

Prices of ground talc per ton, carlots, bags, f. o. b. works, quoted by the Oil, Paint and Drug Reporter showed little change throughout 1948. These prices for weeks near the beginning, midyear, and end of the year are shown in the following table.

Ground talc prices in 1948, carlots, bags, tons

[Oil, Paint and Drug Reporter]

Class	Jan. 5	May 31	Dec. 27
Domestic, f. o. b. works:			
Ordinary:			
California	$22.00–$30.00	$22.00–$30.00	$22.00–$30.00
New York	21.00	21.00	21.00
Vermont	14.00	14.00	14.00
Fibrous (New York):			
Off color	24.00	24.00	24.00
325 mesh:			
88.95–99.95 percent	21.00	21.00	21.00
98–99.5 percent	25.00	23.00–28.00	23.00–28.00
Imported (Canadian)	35.00–45.00	35.00–45.00	35.00–45.00

Prices for pyrophyllite, bulk, carlots, mines, according to Oil, Paint and Drug Reporter, remained as follows throughout the year:

Standard:	
200 mesh	$11.00–$11.50
230 mesh	12.00
325 mesh	14.00
No. 3: 200 mesh	9.50
Insecticite grade: 200 mesh	9.00–10.00
Rubber grade: 140 mesh	7.00

FOREIGN TRADE [5]

Imports.—Increases occurred in 1948 over 1947 in both total quantity and value of "Talc, steatite or soapstone, and French chalk" imported for consumption in the United States—673 tons in quantity and $93,902 in value. As usual by far the greater part of the imports was the "ground, washed, powdered, or pulverized" material. The value of the imports of "Manufactures, n. s. p. f. except toilet preparations" increased in 1948 a little more than $1,000 over 1947; the greater part of this material came from China. Italy was the principal source of the ground material, with Canada in second place and France third. (See fig. 2.)

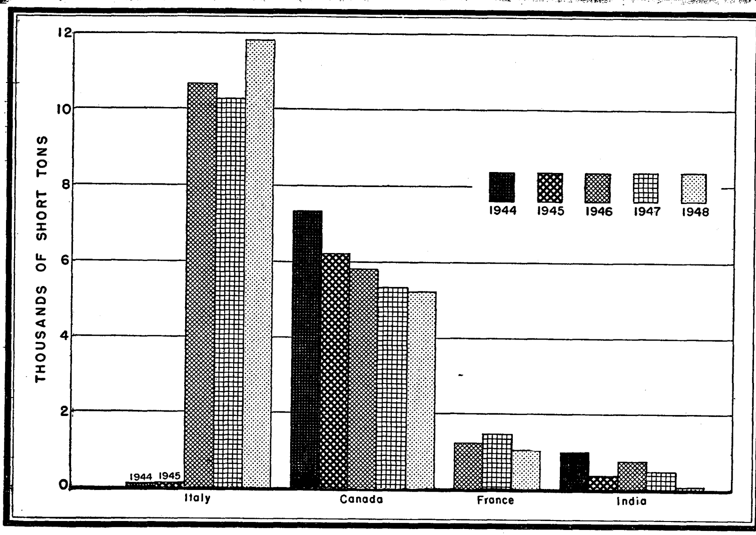

FIGURE 2.—Talc, steatite or soapstone, and French chalk imported for consumption in the United States, 1944–48, by principal countries.

[1] Less than 1 ton.

Exports.—The quantity of "Talc, steatite, soapstone, and pyrophyllite, crude and ground" exported from the United States in 1948 dropped over 1,000 tons from the 1947 record. The value of these exports increased, however, over $2,000 to $432,176, a new record. The value of the exports of "Powders—talcum (in packages), face and compact" decreased about 2 million dollars, nearly half of the 1947 value.

Talc, pyrophyllite, and talcum powders exported from the United States, 1944–48

[U. S. Department of Commerce]

Year	Talc, steatite, soapstone, and pyrophyllite, crude and ground		Powders—talcum (in packages), face and compact (value)
	Short tons	Value	
1944	10,709	$229,293	$1,328,890
1945	11,314	280,590	2,276,758
1946	16,373	394,799	3,517,827
1947	[1] 17,557	[1] 429,803	4,252,161
1948	16,327	432,176	2,228,956

[1] Excludes 599 short tons, valued at $30,589, sent to Japan under the Army Civilian Supply Program.

Tariff.—The import duties on talc—both those set by the act of 1930 and those which became effective in 1948 are given in the following table.

United States import duties on talc

Description	Act of 1930	Modified rate in effect June 15, 1948
Talc, steatite or soapstone, and French chalk:		
Crude and unground	¼ cent per pound	⅛ cent per pound.
Ground, washed, powdered, or pulverized (except toilet preparations):		
French chalk	35 percent ad valorem	35 percent ad valorem.
Other:		
Valued at not more than $14 per ton	do	10 percent ad valorem.
Valued at more than $14 per ton	do	35 percent ad valorem.
Cut or sawed, or in blanks, crayons, cubes, disks, or other forms	1 cent per pound	1 cent per pound.
Manufactures (except toilet preparations) of which talc, steatite, or soapstone, or French chalk is the component material of chief value, wholly or partly finished and n. s. p. f.:		
If not decorated	35 percent ad valorem	17½ percent ad valorem.
If decorated	45 percent ad valorem	22½ percent ad valorem.

Importers of high-grade talc valued at more than $14 a ton asked late in 1948 that tariffs on this product be removed because they report that it does not compete with any domestic product. The chief supplier of high-grade talc to this country is said to be Italy; it is stated that 95 percent of all the Italian talc imported is used for the production of cosmetics and baby powder, and the remaining 5 percent is reported to be used in the rubber-thread industry, where no substitute has been found for the unique "slip" of Italian talc.[6]

TECHNOLOGY

Numerous articles on the technology of talc have been published recently.[7]

[1] In addition to countries listed, talc or pyrophyllite is reported produced in Brazil, Bulgaria, French Morocco, Tanganyika, and U. S. S. R., but data on production are not available; no estimate included in total.
[2] Data not available; estimate by author of chapter included in total.
[3] Estimate.
[4] United States zone only.
[5] Bizonal area.
[6] South Korea only.
[7] Less than 1 ton.
[8] Excludes soapstone.
[9] Includes steatite as follows—1941: 18,948 tons; 1942: 24,859; 1943: 9,741; 1944: 7,369; 1945: 15,577; 1946: 19,541; 1947: 20,835; 1948: 14,439.
[10] Excludes talc.
[11] Talc, pyrophyllite, pinite, and ground soapstone sold by producers.

Canada.—The Canadian talc and soapstone industry in 1947 was described as follows: [8]

During 1947 the shipments of talc and soapstone by Canadian producers amounted to 26,709 tons valued at $266,377, compared with 29,353 tons worth $303,684 in 1946. The operators in Quebec shipped 13,279 tons of talc and soapstone worth $123,467, and mines in Ontario sold 13,430 tons, mostly high-grade milled talc, valued at $142,910.

[8] Deir, A. R., The Talc and Soapstone Industry in Canada, 1947: Canada Dept. Trade and Commerce, Dominion Bureau of Statistics, Mining, Metallurgical, and Chemical Statistics, Ottawa, Canada, 1948, 6 pp.

Imports of talc and soapstone in 1947 amounted to 8,472 tons valued at $196,-697, and the exports of talc totaled 5,807 tons worth $68,394.

The 5 operating firms employed 73 persons, to whom $110,527 were paid in salaries and wages. Fuel and electricity cost $22,786 and the expenditure for freight and process supplies amounted to $18,904.

The Bureau of Mines, Ottawa, has given the following information on the talc industry:

The Quebec talc and soapstone bodies occur in highly metamorphosed basic rocks, mainly serpentine and pyroxenite. The talcose material is rather high in iron due to the presence of residual chlorite, and there is often considerable carbonate present. It yields a slightly off-color, grey powder.

In Ontario, output of prime white foliated talc products from the Madoc area during the 41 years since operations were commenced is estimated at about 460,000 tons. Since 1937, Canada Talc, Limited, which operates the adjoining Conley and Henderson mines, now combined into a single operation, has been the only important producer. The company's new grinding mill, with a capacity of about 5 tons an hour of finished products, came into operation early in 1945. About 75 percent of the mill feed is from the Conley mine and 25 percent from the Henderson. Coarse rejects are screened and dedusted for the production of granular roofing grades.

The Madoc talc occurs in a series of closely spaced veins traversing white Grenville crystalline dolomite limestone, and varies from coarsely foliated, to massive compact material. Tests by the Bureau of Mines, Ottawa, several years ago, showed that the carbonate content can be reduced by flotation to below the tolerance demanded for even the most exacting uses, including steatite insulators, but no commercial use of beneficiation has been made.

In British Columbia, some ground soapstone for local roofing and building use is produced in Vancouver by George M. Richmond and Company, 4190 Blenheim Street, from waste imported from the State of Washington.

Domestic grey talc suitable for roofing, rubber, and paper use, sold in 1947 for $7.50 to $10 a short ton, according to fineness, similar talc from Vermont was quoted at $11.50 to $12.50 in bulk. White talc from Madoc, Ontario, continued to be quoted at from $8.50 for the coarser, roofing grade, $9.50 to $28 for finer mesh sizes, to $44 for minus 400-mesh material. New York fibrous talc, 325-mesh, sold for $18.50 to $20. Imported superfine Italian and French cosmetic talcs may cost as high as $80 per ton delivered.

Average value of the ground talc produced in Ontario in 1947 was $10.65 per ton, and of the ground material (comprising both talc and soapstone) supplied by Quebec, $8.34 per ton. Average value of sawn soapstone furnace blocks was $30 per ton, or $2.70 per cubic foot, and of talc crayons about $250 per ton, or $1.06 per gross. Soapstone waste for grinding sold for $2 per ton, f. o. b. mine. Average declared unit value of exports of ground talc was $11.60 per ton.

Under the new Multilateral Trade Agreement, effective January 1, 1948, the duty on ground talc exported to the United States was reduced from 17½ percent to 10 percent ad valorem on material valued at not over $14 a ton. On material valued at over $14 a ton, the duty remains at 35 percent. The duty on crude material is ¼ cent a pound,[9] whereas cut soapstone or talc in the form of bricks, crayons, blanks, etc., is dutiable at 1 cent a pound. Talc, ground or unground, enters Canada under the British Preferential tariff at 15 percent: imports from the United States are dutiable at 20 percent.

Additional statistical details are contained in the report as well as the names and addresses of the five operating firms in Ontario and Quebec.

[9] According to the U. S. Tariff Commission the modified rate on United States imports is now ⅛ cent a pound.

Tin

By SAMUEL A. GUSTAVSON AND JOHN B. UMHAU

GENERAL SUMMARY

WORLD mine output of tin increased 39,000 long tons (34 percent) in 1948 over 1947, a rate of increase exceeded only in 1936 and 1940. Most of this gain was in Malaya and Indonesia, where output expanded 66 and 92 percent, respectively. World smelter production increased 28,600 tons (23 percent), mostly due to the output of Malaya, which resumed its prewar rank as the world's leading producer. For the first time since 1943, world consumption, though still limited by Combined Tin Committee allocations and national controls, was exceeded by production. The International Tin Study Group met twice during 1948, continuing its investigation of means for stabilization of the tin industry through international cooperation as prescribed under the Havana Charter.

Consumption of tin in 1948 in the United States increased 3 percent over 1947; primary tin increased 1 percent and secondary 7 percent. The Government retained control of distribution and use of the domestic supply for the seventh consecutive year and fixed the price. Controls were retained in 1948 chiefly to minimize consumption, thereby providing a larger share of the new supply of tin for strategic stock-piling. Domestic primary smelter output, virtually all from the Government-owned smelter at Texas City, increased 10 percent. Secondary production was little changed in 1948 compared to 1947. On a tonnage basis pig-tin imports resumed the dominant position in the foreign tin trade of the United States in 1948 for the first time since 1941. Imports of metal nearly doubled and exceeded the tin content of concentrates by nearly a third. Receipts of concentrates in terms of metal were, nevertheless, 32 percent greater than in 1947. The increase was chiefly from Indonesia and from war-accumulated stocks in Thailand. Bolivian imports decreased 3 percent. Domestic stocks of pig tin and tin in ore and concentrates at the year's end were 99,870 long tons, a 19-percent increase over year-end stocks in 1947. Most of this increase was in Government stocks, while consumers' stocks remained virtually unchanged. The domestic price for grade A tin was $0.94 a pound until raised to $1.03 on June 1. The average price for grade A was $0.9925 in 1948, the highest on record.

Salient statistics of tin in the United States, 1939–43 (average) and 1944–48

GOVERNMENT CONTROLS

Tin controls were continued during 1948 for the seventh consecutive year, mainly to permit the Government to hold consumption to a minimum and thereby promote strategic stock piling. Control was administered by the Office of Materials Distribution and Office of Domestic Commerce, United States Department of Commerce, under Conservation Orders M–43 (tin) and M–81 (cans) as embodied in the Second War Powers Act as amended.[1] An amendment to M–43 December 31, 1947, amplified restrictions on imports of tin and derivatives. Amendments to M–43, effective May 11, announced May 7, included stronger control of delivery, use, and small-order provisions, simplification of schedules, additional specifications to guide tin-plate manufacturers, revision of import-export provision to cover all forms of tin, and restriction of tin coating on general purpose crowns to 0.25 pound per base box whether for domestic or export use.

Manufacturers were not permitted to use more tin for cans in 1948 than in 1947 and were restricted on the type of cans for packaging certain products. Amendments to M–81 during 1948 were issued effective February 29, May 7, and May 18. The amendment of February 29 set forth in direction 10 was, in general, to effect savings in tin consumption to increase the quantity of metal available for stock piling and to improve distribution among and within the various groups of can users. The May 7 amendment incorporated provisions formerly contained in direction 10. The use of 0.25-pound electrolytic tin plate for cans containing soluble coffee and 2-pound and larger cans of regular coffee was permitted by the May 18 amendment.

On December 30, 1948, the Office of Domestic Commerce announced that the present tin-conservation program would continue essentially unchanged, with M–43 and M–81 in effect through June 30, 1949.

[1] The Second War Powers Act was amended by act of Feb. 28, 1948 (Public Law 427, 80th Cong.), and extended (90 days) until May 31, 1948, and again extended by act of June 4, 1948 (Public Law 606, 80th Cong.), made retroactive to June 1, to June 30, 1949.

Purchase of tin metal, ore, and concentrates and pricing were again centered in the Reconstruction Finance Corporation.[2] RFC also has authority to improve, develop, maintain, and operate by lease or otherwise the Government-owned tin smelter (Longhorn smelter) at Texas City, Tex., and to finance research in tin smelting and processing. The law requires RFC to submit semiannual reports.

DOMESTIC PRODUCTION

MINE OUTPUT

Domestic mine production of tin was only 5.8 long tons in 1948. Virtually the entire production was derived from placer deposits in Alaska. The Northern Tin Co. (formerly the Arctic Tin Co.) operating a placer on Buck Creek, Seward Peninsula, Alaska, reported treating 2,100 cubic yards of material from which 7.5 short tons of cassiterite concentrates, assaying about 70 percent tin, were recovered. Cleary Hill Mines Co. recovered a small quantity of tin in the course of gold placer mining at the Tofty placer, Hot Springs district, Yukon River Basin region, Alaska. About 3,000 pounds of tin concentrates were recovered from placer operations by Peggy Keenan on the Parrot claims in Pennington County, S. Dak. A small portable washing, screening, and jigging plant on the property has been treating gravel to recover tin, tungsten, gold, tantalum, and columbium. Early in 1948, about 2.5 tons of alluvial tin concentrates originating in Alaska were purchased by the Office of Metals Reserve. The year of production is not known, but this output has been credited to 1947. In the program for recovery of other minerals contained in ore mined chiefly for molybdenum at Climax, Colo., the Climax Molybdenum Corp. expects to obtain some tin. None was produced in 1948.

Reports of investigations made in previous years of the Morelock Creek and the Tozimoran Creek[3] tin placer deposits in the Fort Gibbon District, Alaska;[4] churn drilling at Cape Mountain tin placer deposits, Seward Peninsula, Alaska;[5] and sampling methods and results at the Sullivan Creek tin placer deposits, Manley Hot Springs, Tofty, Alaska,[6] were published by the Bureau of Mines during 1948.

The Bureau of Mines analyzed a selected group of trench and core samples from the outermost pegmatite zone of the old Mateen deposit[7] in the Black Hills, S. Dak., which were found to contain 0.05 percent or less of tin. Two additional core samples analyzed by the South Dakota State School of Mines and Technology showed 0.45 and 0.25 percent tin.

Mine production of tin (content) in the United States, 1944–48, by States, in long tons

Year	Alaska	South Dakota	Other States [1]	Total	
				Long tons	Value
1944		(2)	(2)	5.4	$6,200
1945–46					
1947	1.3			1.3	2,200
1948	[3] 5.8	(3)		5.8	12,780

[1] Comprises California, New Mexico, and North Carolina.
[2] Bureau of Mines not at liberty to publish separately.
[3] A very small quantity from South Dakota is included with Alaska.

SMELTER OUTPUT

Production of refined tin from ores and concentrates smelted in the United States was essentially that of the Government-owned smelter at Texas City. This smelter (Longhorn smelter) produced 36,678 long tons of tin in 1948 and 33,292 tons in 1947. As the result of experimenting on processes to recover tin from low-grade complex tin ores and concentrates, the Vulcan Detinning Co. recovered a small tonnage of tin metal. The company annual report for 1948 contains the following statement:

> During the year work was begun on the construction of a plant for the recovery of tin from low-grade tin concentrates by a novel method developed by our Research Department after years of experimentation as referred to several times in past reports. This plant is expected to have a minimum capacity of twenty-five to fifty tons of concentrates per day, depending on the grade, equivalent to five tons of metallic tin, and is designed so as to permit ready expansion by the addition of multiple units should results so warrant.
>
> The cost of this plant will be approximately $750,000.00 and working capital required to finance the purchase of supplies of concentrates and to carry the necessary inventories of tin will be considerable and are expected to employ most or all of the funds retained from past earnings.

During 1948 the Longhorn smelter treated concentrates chiefly from Bolivia, Indonesia, and Thailand. The tonnage treated from Indonesia tripled, while that from Bolivia decreased both in quantity and grade. RFC ore-purchase program discussions have included the possibility of obtaining concentrates from Malaya with Economic Cooperation Administration assistance. RFC has advised ECA that it will purchase up to 16,000 tons of tin contained in concentrates from Yunnan and Kwangsi Provinces in connection with the ECA China program. Part of the accumulated middling rejects have been treated by the smelter; and about 3,600 tons were shipped to the Capper Pass smelter, Hull, England, with the return to this country of the tin content in the form of high-grade electrolytic tin. Of the total tin produced at the Longhorn smelter in 1948, 62 percent was 3–Star grade; 8 percent, 2–Star–B; 16 percent, 2–Star–C; 7 percent 2–Star–D, and 7 percent, No–Star–G. In 1947 the percentages of total production of the various grades were, respectively, 58, 20, 13, 6, and 3.

The Longhorn smelter is operated on a cost-plus-fixed-fee agreement by Tin Processing Corp., a subsidiary of N. B. Billiton Maatschappij. The annual fixed fee during the fiscal year ended June 30, 1948, and

June 30, 1949, was $200,000. Before June 30, 1947, the annual fee was $150,000.

A contract for constructing a waste acid plant was let to the Chemical Construction Corp. on a cost-plus-fixed-fee basis. The estimated cost is $2,655,000. Actual plant construction was started during October 1948. Preparatory work—access roads, railway spurs, etc.—commenced earlier in the year. Progress on plant construction during 1948 was slow owing chiefly to delays in deliveries of machinery and materials, and completion was not expected until the latter part of 1949. Water consumption by industrial plants in the Texas City area has resulted in a marked lowering of the water table. Wells have shown much reduced capacity or have failed completely. The addition of the waste acid plant will bring an even more acute shortage in the water supply. To remedy this, the smelter began changing its piping system to permit reuse of water, and RFC plans to purchase from the Galveston County Water Co. enough water to make up any remaining shortage. The source of this additional water will probably be the Brazos River.

The total cost of the smelting program at Texas City from June 1940 through June 1948 amounted to $346,821,585, including fixed assets ($8,641,688) and the cost of concentrates ($311,433,293) at United States port. Total sales to June 30, 1948, amounted to $247,716,810. The June 30 inventory of tin was 18,797 long tons and 77,089 tons of concentrates containing an estimated 24,785 tons of tin.

Longhorn tin-smelter production, by months, 1942–48, in long tons

Month	1942	1943	1944	1945	1946	1947	1948
January		2,611	2,153	3,114	3,812	3,024	3,172
February		2,334	2,419	3,162	3,823	2,815	2,800

December	2,343	2,037	2,907	3,676	3,209	3,041	3,153
Total	15,696	20,727	30,619	40,591	43,468	33,292	36,678

SECONDARY TIN

Secondary tin recovered from all sources totaled 26,900 long tons in 1948, an increase of less than 0.5 percent over 1947. However, due to increase in price, the value was 28 percent greater than in 1947. Detinning plants supplied 12 percent of the total recovered during the year. To maintain comparability the quantities shown in the columns entitled "Tin recovered at detinning plants" in the accompanying table include that recovered from tin-plate clippings and old containers only. Detinning plants also recovered 113 long tons from other sources. During 1948 a 6-percent increase in tin recovered by detinning plants, a 30-percent increase in all types of babbitt, and a 17-percent increase in solder offset a 15-percent decrease in secondary tin in bronze and brass. The tonnage of tin-plate clippings treated in 1948 was the largest of record. The industry treated 376,620 long tons of tin-plate clippings in 1948—17 percent more than in 1947 and exceeding by 10 percent the previous peak of 341,075 tons used in 1941. The average quantity of tin recovered per long ton of tin-plate scrap used declined from 20.65 pounds in 1947 to 18.91 pounds in 1948. Lower recoveries per unit reflect the treatment of a larger tonnage of electrolytic tin plate carrying a much thinner coating of tin than hot-dipped tin plate. For additional data concerning the secondary tin industry, see Secondary Metals—Nonferrous chapter of this volume.

Secondary tin recovered in the United States, 1939–43 (average) and 1944–48, in long tons

Year	Tin recovered at detinning plants			Tin recovered from all sources			
	As metal	In chemicals	Total	As metal	In alloys and chemicals	Total: Long tons	Total: Value
1939–43 (average)	4,080	510	4,590	4,740	27,440	32,180	$36,973,844
1944	3,350	310	3,660	3,800	25,300	29,100	33,892,560
1945	3,150	400	3,550	3,300	28,100	31,400	36,538,320
1946	2,480	330	2,810	2,600	22,100	24,700	30,205,663
1947	2,720	360	3,080	2,900	23,900	26,800	46,848,175
1948	2,930	340	3,270	3,100	23,800	26,900	59,796,140

CONSUMPTION

APPARENT CONSUMPTION

Apparent consumption, derived by adding net imports of pig tin to domestic smelter production, increased 49 percent in 1948 over 1947. As changes in consumer, dealer, and Government stocks are not taken into account, apparent consumption may vary greatly from actual consumption as measured in finished products. In 1948, it was considerably in excess of actual consumption chiefly as a result of stock piling by the Government. The accompanying table gives the data for 1939–48. A comparable series for 1910–38 was published in Minerals Yearbook, 1939 (p. 680).

Apparent consumption of tin, 1939–48, in long tons [1]

1939	67,997
1940	123,537
1941	141,618
1942	42,512
1943	31,638
1944	43,379
1945	48,086
1946	58,144
1947	57,771
1948	85,808

[1] Exports of domestic tin are not included in 1939–41. They are included in the figures for 1942–48 and are 244, 398, 405, 708, 859, 415, and 78, respectively.

CONSUMPTION BY USES

Total domestic consumption of tin was 3 percent more in 1948 than in 1947 and 17 percent above the 1935–39 average. Primary tin use increased only 1 percent, whereas secondary use increased 7 percent. The consumption of primary tin was 59,863 long tons, the greatest since the extraordinary peak of 1941 (103,086 tons), but was

4 percent less than the 1935–39 average. Consumption of secondary tin in 1948 was 30,925 tons.

The use pattern was virtually unchanged from 1947. The five largest tin-consuming items—tin plate and terneplate, bronze, solder, babbitt, and tinning—accounted for 93 percent of the total tin consumed in 1947 and 1948. Tin plate and terneplate used more than half the total primary tin consumed and 2 percent more than in 1947. This was about 470 tons (1 percent) less than in the prewar (1935–39) period, but tin and terneplate output was about 70 percent greater. The large increase in tin-plate output against a comparably small increase in the use of tin is chiefly due to the progressive increase in use of electrolytic tin plating, which requires less tin. In 1948, for the first time in history, electrolytic tin-plate production exceeded that of hot-dipped. Of the total tin plate produced in 1948, electrolytic lines accounted for 51 percent (48 percent in 1947) and hot-dipped operations accounted for 49 percent (52 percent in 1947). Hot-dipped tin plate has been used chiefly to make sanitary or packers' cans (57 percent in 1948), while about 90 percent of electrolytic has been divided between general line and sanitary cans and also a sizable tonnage for crowns and closures. In 1948, electrolytic tin plate used for sanitary cans increased more than 10 percent and amounted to about 40 percent of total tin plate used for that purpose. The demand for tin mill products for cans of all kinds increased 10 percent in 1948. The greatest proportion of all cans produced is for the food pack, which use increased 8 percent. Use for packing nonfood products increased 15 percent. Exports of tin cans increased 40 percent.

Use of primary tin for solder in 1948 was 6 percent greater than in 1947 and was exceeded only in 1941. Consumption in babbitt decreased for the fourth consecutive year and was 5 percent less in 1948 than in 1947. Bronze and brass again ranked third in use of virgin metal, but consumption was 13 percent less than in 1947.

Consumption of primary and secondary tin in the United States, 1939–43 (average) and 1944–48, in long tons

	1939–43 (average)	1944	1945	1946	1947	1948

STOCKS

Stocks of pig tin and tin in ore were 99,870 long tons at the end of 1948, or 19 percent more than the 83,672 tons at the beginning of the year. In addition, about 12,400 tons (11,710 tons at beginning of year) were in process in scrap, and as secondary tin. Stocks of virgin pig tin held by consumers were virtually unchanged. Government stocks of pig tin increased 41 percent, but tin in ore declined 6 percent. The inventory of tin contained in low-grade rejects at the Texas City smelter was less than 6,600 tons. At the beginning of 1948, there were on hand about 38,000 tons of these rejects, containing over 8,000 tons of tin. Defense stocks held by the Navy and Bureau of Federal Supply were augmented by the transfer of 24,077 long tons, so that the National Strategic Stock Pile of pig tin was 36,217 long tons at the end of 1948.

Stocks of virgin pig tin in the United States, Dec. 31, 1944–48, in long tons [1]

[1] Excludes Government purchases delivered for stock piling or at Texas City smelter. Also excludes tin in process and secondary pig tin.

PRICES

Tin prices continued to be set by Government acts in 1948. The price changed only once in the United States, when RFC announced a new price of $1.03 a pound for grade A tin on June 1. This was a 9-cent increase per pound over the previous price of 94 cents which had been in effect since December 19, 1947. The 1948 average price of 99.25 cents per pound was the highest of record and was 27 percent above the 1947 average of 77.94 cents. It was almost two-and-a-half times what it was before the war. The price of \$1.03, however, was exceeded in 1918, when the market reached \$1.10 a pound for a very short period. Brass and bronze ingot makers advanced their prices of ingots 1 cent a pound effective June 3, as a direct result of the price increase June 1.

On January 1, 1948, a new tin-plate price became effective at \$6.80 per base box, responding to the 94-cent pig-tin price of December 19, 1947. Some producers of tin plate reduced prices 10 cents on May 1, 1948. As a result of the increase in the tin price to \$1.03, the 1949 price per base box for 1.50-pound hot-dipped tin plate was raised to \$7.75 in December 1948. Higher tin prices were expected to accelerate the trend in the use of more electrolytic tin plate. Tin-can prices (No. 2 sanitary), stable since 1939, rose to \$21.63 per thousand, in carlots f. o. b. factory, January 2, 1947; to \$24.61 on January 2, 1948; and to \$27.29 on January 3, 1949.

In the United Kingdom the price of common tin (99 percent minimum, up to and under 99.75 percent tin) was increased £9 to £519 per long ton on January 6, 1948; and £50 to £569 on June 1, 1948. The average price was £548 0s. 11d. in 1948. The January 6 price change resulted from settlement of the price under the United States-Bolivian contract. Coincident with the January increase, the official buying price for Nigerian tin concentrates was raised from £477 to £485 10s. per ton of tin-in-ore f. a. s. Nigerian port. The buying price for Malayan tin remained unchanged at £500, at that time. Effective April 7, 1948, however, the British Ministry of Supply announced that the Malayan buying price had been adjusted to £504 per ton and selling price to £505 10s. from £504, both ex smelter Penang and Singapore. The June increase followed discussions between a Malayan delegation, the Tin Study Group, the British Colonial Office, and the Ministry of Supply. With the June price increase, the price paid for Malayan metal was increased from £504 to £554 per ton; and for Nigerian concentrates from £485 10s. to £535 10s. The selling price of Malayan metal was raised from £505 10s. to £555 10s., thus reducing from £4 to 30s. per ton the differential between buying and selling price, seemingly to a great extent to resolve the dissatisfaction of producers.

In Canada, bulk purchasing of metal by the Government ceased in the fall of 1947, and price controls were suspended May 1948.

FOREIGN TRADE [8]

Imports of pig tin and ore and exports of tin plate are the main items in the foreign trade of the United States in tin. Of less importance has been the foreign trade in tin plate and terneplate scrap, circles, strips, waste-waste, miscellaneous tin and manufactures, and compounds. Tin contained in the babbitt, solder, type metal, and bronze imported and exported is accounted for in the Lead and Copper chapters of this volume. Exports of tin cans were 40,824 short tons in 1948 compared with 29,189 tons in 1947.

Tin has been one of the principal imports of the United States, ranking sixth in value among all commodities before the war (1935–39 average), and eighth in 1948. The relative position of tin in value among minerals imported (net imports) in 1948 was exceeded only by gold.

On a tonnage basis pig-tin imports resumed the dominant position in the foreign trade of the United States in tin in 1948 for the first time since 1941. Imports of metal increased 98 percent over 1947 and exceeded tin content of concentrates by 31 percent. Malaya, with nearly 70 percent of the total, was the principal source. Smelting plants in Belgium and the Netherlands shipped substantial quantities for the first time since 1940. Imports of tin in concentrates increased 32 percent as compared with 1947, mainly due to a large gain (217 percent) in receipts from Indonesia. Imports from Thailand, mostly from war-accumulated stocks, increased 37 percent. Bolivia, the main source, accounting for 54 percent of the total, furnished 3 percent less than in 1947. Bolivia has been the source of 73 percent of the tin in concentrates imported from 1941 to 1948, inclusive.

Since 1941 the United States has been the world's principal source of tin plate. In 1948, exports of tin plate, etc., decreased slightly (1 percent) from the high level attained in 1947. Tin-plate exports as such in 1948 were 539,945 long tons against the record high of 542,274 in 1947 and nearly 3 percent more than the previous high of 525,377 in 1942. In 1948 ground was lost in the export markets of Australia–New Zealand, Canada, and Latin America (chiefly Argentina, Brazil, and Mexico). A gain of 26 percent recorded in Europe was mostly accountable to ECA. In some instances the decline in exports was greater than the decline in consumption of tin plate in a

[8] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

particular market. Consumption in Argentina declined 18 percent, but United States exports thereto declined 29 percent. Exports of tin plate from the United Kingdom to Argentina increased 37 percent in 1948. Significantly, consumption in Australia–New Zealand increased 10 percent, whereas United States exports thereto decreased more than a third, but shipments from the United Kingdom were nearly double the previous year's. The decline in exports to Canada exceeded Canada's decline in consumption.

According to the American Iron and Steel Institute, producers in 1948 shipped for export 601,697 short tons (565,817 in 1947) of tin plate, of which 508,474 (506,347 in 1947) were hot-dipped and 93,223 (59,470 in 1947) electrolytic.

Under the Second Decontrol Act, exports were controlled by fixed quotas and Office of International Trade, United States Department of Commerce, license, and import purchase of tin was exclusively by the Government. Shipments to Canada are exempt from export control. Tin ores and concentrates may be imported freely. The tinplate export-quota program was conducted with assistance of industry Tin Plate Advisory Committee. Quarterly tin-plate export allocations (excluding Canada) were 514,000 short tons in 1948.

TECHNOLOGY

The Tin Research Institute released for publication several technical reports [9] on varied subjects relating to tin and its industrial applications. The Jones & Laughlin Steel Corp. revealed a magnetic method for separating sheets of tin plate to prevent feeding "doubles." A magnetic field causes the sheets to repel each other with enough force to spread them; then an air blast completes separation. Emery Industries, Inc., and the Armour Research Foundation of Illinois Institute of Technology were developing dimers as substitutes for palm oil used in hot dipping practices.

United States patents issued during 1948 relative to tin include the following:

Muskat, Irving E., Method of Treating Tin-Containing Materials: U. S. Patent 2,434,283–4, Jan. 13, 1948.
Lebedeff, Yurri E., Recovering Metallic Tin and Antimony—Tin Alloy from Sb-Sn-As Bearing Materials: U. S. Patent 2,436,010, Feb. 17, 1948.
Lebedeff, Yurri E., Recovering Tin from Stannic Chloride: U. S. Patent 2,436,868, Mar. 2, 1948.
Richter, Hartmut W., Preparing Potassium Stannate: U. S. Patent 2,436,974, Mar. 2, 1948.
Jordan, James F., Method of Refining Tin Metal: U. S. Patent 2,441,768, May 18, 1948.
Harris, Elmer F., Electrodeposition of Tin: U. S. Patent 2,450,794–5, Oct. 5, 1948.
Herbert, William S., and Francis, H. T., Apparatus for Electrolytically Determining the Thickness of Metal Coatings: U. S. Patent 2,457,234, Dec. 28, 1948.

An article was published on methods of determining the weight of tin coatings on tin plate.[10]

WORLD REVIEW

INTERNATIONAL TIN STUDY GROUP

Representatives of eight major tin-producing and consuming countries met in London in October 1946 and agreed that a study group should be established. The International Tin Study Group was organized at a metting in Brussels in April 1947. A brief report on the meetings held by the Study Group through 1948 has been published as follows:[11]

At the first meeting of the International Tin Study Group held in Brussels in April, 1947, terms of reference for the Group were agreed. The principal features of these terms of reference are (1) that membership shall be open to all countries principally interested in the production, consumption or trade in tin; (2) that the Group shall have the functions of considering possible solutions to any problems or difficulties which are unlikely to be resolved by the ordinary development of world trade in tin; and (3) that the Group should establish a permanent secretariat.

The second Group Meeting was held in Washington in April, 1948. The Group reviewed the world tin position and agreed to recommend to member-governments the setting up of a Working Party to examine the appropriateness and practicability of framing an intergovernmental agreement on tin conforming to the general spirit and principles of the Charter of the International Trade Organization. The meeting of this Working Party was held in The Hague in June, 1948.

[9] Information concerning the institute's work and publications can be obtained in the United States from Tin Research Institute, Inc., 429 West Sixth Ave., Columbus 1, Ohio.
[10] Mackenzie, H. A., Determination of Tin Coating Weights on Tin Plate: Soc. Chem. Ind., September 1947, pp. 312–319.
[11] International Tin Study Group, Statistical Bulletin: Vol. 2, No. 6, June 1949, inside coverage page.

The Group held its third meeting in The Hague on October 25th/29th, 1948. 55 delegates and advisers were present from the 14 member governments. The Group had before it the report of the Working Party. The purport of this report was that it would be appropriate and practicable to conclude an international tin agreement on the lines set out in the report. The Group modified these proposals in certain respects and forwarded to the member-governments a recommendation that, after certain preparatory steps have been taken the member-governments should be asked to inform the Secretary whether they would be disposed to enter into an agreement on the broad lines proposed, and are willing to attend a conference to put the agreement into final form and to conclude it. If a sufficient number of affirmative replies is received, the Secretary-General of the United Nations will be asked to convene an inter-governmental tin conference in the spring of 1949.

A Management Committee supervises the work of the Secretariat. The following are represented on that Committee: Belgium, Bolivia, British Colonies, France, Netherlands, United Kingdom and United States of America.

The Secretariat has been established at 7, Carel van Bylandtlaan, The Hague, Holland, to which all communications should be addressed.

The present membership of the Group is:

Australia	France
Belgium	India
Bolivia	Italy
British Colonies	Netherlands
Canada	Thailand
China	United Kingdom
Czechoslovakia	U. S. A.

WORLD MINE PRODUCTION

World mine production of tin increased 34 percent in 1948. Of the total, Asia supplied 56 percent, South America 25 percent, Africa 16 percent, and other sources 3 percent. Most of the gain was provided by Malaya and Indonesia. Production in 1948 was 39,000 long tons more than 1947—a single year's advance in world output exceeded only in 1936 and 1940, when the increase over the preceding year was 44,000 tons and 69,500 tons, respectively. Production in 1948 was 94 percent of the 1925–29 average and 89 percent of the 1935–39 average, but was less than two-thirds of the 1941 peak. The estimated world production of 163,000 tons for 1948 by the Statistical Committee of the first Tin Study Group meeting in April 1947 was not realized by 9,800 long tons. It was revised downward to 150,000 tons at the second meeting of the group held in Washington in April 1948, which proved to be underestimated by only 3,200 tons.

WORLD SMELTER PRODUCTION

World smelter production increased 23 percent in 1948. Excluding strategic stock-pile accumulations, smelter production exceeded world consumption by nearly 19,000 long tons. The Malayan tin-smelting plants at Penang and Singapore resumed their prewar rank as the world's most important sources of pig tin. Next in rank as important smelting centers are the United States, United Kingdom, Netherlands, and Belgium. More than half (51 percent) of world smelter output in 1948 was acquired by the United States. Allocations of tin metal to the United States by the Combined Tin Committee amounting to 42,160 long tons had been acquired before the close of 1948.

REVIEW BY COUNTRIES

Bolivia.—Exports of tin in concentrates and ore by Bolivia (37,336 long tons) in 1948 were 12 percent more than in 1947. The increase was chiefly due to higher tin prices, no serious labor disturbances, and larger shipments by the Patiño group. Extraordinarily large shipments were made in December—14 percent larger than the monthly average for the peak year 1929. Of the total exported in 1948, the United States was the destination of 54 percent, and virtually all of the remainder went to the United Kingdom. Argentine imports of tin metal in 1948 produced by the Oruro smelter amounted to only 27 tons. No ores or concentrates were shipped to Argentina, which was entitled to receive concentrates containing 8,000 metric tons of tin—a large part of Bolivia's tin production—under the Argentine-Bolivian tin contract of March 6, 1948.[12]

Until a joint Bolivian-Argentine Commission is established for handling the various problems connected with the contract, plans for delivering tin ore and concentrates to Argentina will not be set. As 1948 closed, there were reports from La Paz indicating that public opinion in Bolivia favored abrogation of the basic 5-year trade pact with Argentina which included the tin provision. There was a great shortage of dollars in Argentina, making it impossible to carry out the agreement. Of significance in the Argentine dollar shortage was the inclusion in a trade agreement between Argentina and the United Kingdom, signed by representatives of the two governments at Buenos Aires on February 12, 1948, of a provision that provided for the British

[12] A translation of the text of the contract was given in American Metal Market, vol. 55, No. 53, Mar. 18, 1948, p. 6. Subsequent agreement on payments was reached on July 26, 1948.

Government to accomplish the purchase for Argentine consumption, during 1948, through usual trade channels 1,000 metric tons of tin and 34,000 tons of tin plate. The tin was to be subject to allocation by the Combined Tin Committee, and of the tin plate 26,000 tons was to be for the British food pack.

The 2-year (1948–49) tin contract between the United States and the Bolivian tin producers of December 31, 1947,[13] established a new base price of 90 cents per pound (the 1947 price was 76 cents) for payable tin in concentrates, f. o. b., vessel, South American ports. The price is to vary directly with fluctuations in the RFC selling price of grade A tin at New York. Effective June 1, 1948, the RFC advanced its selling basis for grade A 9 cents, following a rise effected by the British Ministry of Supply in London. Consequently, a corresponding increase to 99 cents became available to the Bolivian producers. Under contract terms it was possible for them to obtain this higher price on material they delivered to RFC agents in South America during March, April, and May.

Relatively high wage levels and other factors favorable to labor kept the mines free for the most part from strife and work stoppages. However, late in the year a reorganized local labor union, affiliated with the Federacion Sindical de Trabajadores Mineros de Bolivia (FSTMB) and an allegedly independent union vied with each other for representation of the Catavi miners. There was difficulty on the part of both in meeting the Bolivian Labor Law requiring at least 50 percent representation of the workmen in an industry the union is to represent. Nevertheless, the Government apparently recognized both unions. In January 1949 both had submitted petitions for wage increases. Mediation boards were set up for each union.

New export taxes were imposed in Bolivia in 1948, and the portion of foreign exchange that miners must sell to Banco Central was increased. A large group of medium-size miners were reclassified as small miners, with the result that they were no longer able to retain as large a share of their foreign exchange as formerly. A July decree raised the surtax on tin exports from 120 percent to 500, or roughly from 1 to 4½ U. S. cents per pound. A decree of July 29 modified existing regulations covering the obligatory sale to the Banco Central of foreign exchange derived from tin exports. Until July 1, exporters were required to sell only 60 percent of their foreign exchange, and this percentage will still be applied when the price of tin does not exceed 90 cents. However, when the price exceeds 90 cents, exporters may retain 40 percent of the first 90 cents but must sell 100 percent of the exchange received over 90 cents. This had the effect of reducing the exporters' share of their foreign exchange 36 percent because tin has been selling at 99 cents since April. Under the law of February 20, 1948, a tax of ¼ cent per pound was levied on tin produced, for use by certain universities of Bolivia to finance the employment of foreign technicians and the acquisition of laboratory equipment for the Oruro and Potosi Schools of Mines. Under the same law there was also an export tax levy of 1 cent per pound of fine tin, the proceeds to be used for recreational and social benefits of mine workers.

[13] Text of this 1948–49 supplemental Bolivian Tin Contract given in American Metal Market, vol. 55, No. 20. Jan. 29, 1948, p. 6.

Small miners were permitted to retain 20 percent of their foreign exchange receipts, the remainder to be sold to the Banco Minero as previously. Banco Minero was scheduled to enter more energetically into the development of minerals in Bolivia. Part of the profits Banco Minero earned from operating the San Jose mine were planned for use in building a cement factory and for developing copper mining in the Carangas district. Also, the Bolivian Congress authorized Banco Minero to negotiate for a $6,000,000 loan to construct a tin-concentrating plant in Oruro. Banco Minero proposed negotiating the loan with the Export-Import Bank.

During 1948 shipments by the Patiño group (amounting to 46 percent of the Bolivian total) increased 3,404 tons or 25 percent; those of the Hochschild group (23 percent—excluding output of leased San Jose mine) were 4 percent lower; those of Aramayo (6 percent) were 17 percent lower; and medium, small, and Banco Minero operations (25 percent) were 19 percent higher. Of the Hochschild Group, Cia. Unificado del Cerro de Potosi increased its output 2 percent, and Compania Minera de Oruro (Colquiri) increased 7 percent. These two operations accounted for 97 percent of the production by Hochschild in 1948, as compared with 88 percent in 1947. More than 12 percent of Hochschild's 1947 operations were not producing or showed substantial declines in 1948. The San Jose mine of Compania Minera de Oruro (Hochschild—operating under lease by Banco Minero) virtually doubled its shipments in 1948. Empressa Minera Santa Fe, the larger of the direct exporters of the "medianos," decreased its shipments 17 percent from a total of 1,230 tons in 1947 to 1,020 in 1948. The International Mining Co. increased its shipments 9 percent from 413 long tons in 1947 to 450 in 1948. Bolivian International Mining shipped small tonnages in June, September, October, and November for a total of about 37 long tons, before closing down in mid-November preliminary to the appointment of receivers. Tin-ore buying by Banco Minero from small miners apparently was on a reduced scale, as the tonnage shipped from this source declined 25 percent in 1948. The Oruro smelter (Fundicion de Oruro—M. Pero) shipped 104 long tons of fine tin in bars in 1948 compared with 22 tons in 1947.

The results of wartime beneficiation studies by the Bureau of Mines at the request of the Metals Reserve Co. on a sample of complex tin-tungsten ore from the Urania mine, a property owned by H. I. Altshuler of Bolivia, were published.[14]

Burma.—Tin mining in Burma continued on a reduced scale in 1948, with production at about one-third the prewar rate. Exports of tin in concentrates, however, were about 3 percent above 1947; some of this had been mined and processed before the war. Internal disorders continued, with armed conflict in some parts of the country. Mining operations on an important scale were handicapped by dacoity and shortages of mining equipment, explosives, and labor. Mawchi Mines, Ltd., which supplied half the tin mined in Burma before the war, was greatly curtailed, producing only about 820 long tons of mixed tin-wolfram concentrates or one-sixth its prewar annual output. The company rebuilt mill, which began operations on a small scale in February 1948, had reached 130 tons of mixed concen-

trates per month by August. However, thereafter, output was reduced to less than half, as the mine was in the area held by the insurgent Karens. The Burmese Government embargoed explosives into the area, and communication and transport facilities were interrupted.

Anglo-Burma Tin Co., Ltd., almost doubled its output compared with 1947, as operations at Heinda in the Tavoy district were uninterrupted. Tavoy Tin Dredging Corp. reported three dredges working, but output was considerably below the prewar level. Thalbawleik Tin Dredging, Ltd., was operating in Lower Burma on a much reduced scale.

In January 1948 Burma became an independent nation with a constitution containing a clause providing that development of natural resources of the country be by the State or corporations having a majority of Burmese capital.

China.—Tin mining in China appears to have produced proportionally better results in 1948 than was the case in some other minerals. Production of tin may have been as much as 25 percent more than is shown in the world table. World trade in Chinese tin was nearly 10 percent greater than in 1947. Production of metallic tin by National Resources Commission was 1,606 long tons or about 11 percent more than in 1947. The general situation has been much confused. With Government controls relaxed since 1946, the gathering of statistical data has been more difficult without knowledge of the output of private or provincial operations. In Kwangtung and Kwangsi Provinces, where ore is processed and the products used locally, unofficial trade returns indicated that exports of slabs and ingots were 700 tons in first half of 1948 compared with 480 in corresponding period of 1947.

The principal tin-mining district of China is near Ko-chiu, Yunnan Province, where mining has been carried on for centuries. The Yunnan Consolidated Tin Corp. (a joint enterprise of NRC, Bank of China, and Yunnan Provincial Government) has been exploiting and developing the mines and smelters of the area. The company used some modern equipment to produce half the district's output, while poorly financed private operators using primitive methods mined the other half. Some Yunnan tin was being transported by air to Haiphong, where most of it moved over the French Railroad before the war. Now, however, the greater portion moves by a 50- to 75-day overland-water route to Shanghai, or via Canton to Hong Kong for marketing. China has large tin resources. In a description of the Chinese tin-mining industry, Dickerman [15] states:

> It would not be difficult with modern mining, concentrating, and smelting methods to produce 15,000 to 20,000 tons of tin a year.

During the latter part of October 1948, ECA announced that $3,000,000 had been allocated for rehabilitation of tin, tungsten, and antimony mines in China as part of a $37,750,000 provisional allotment of $70,000,000 for a China reconstruction and replacement program. Owing to the rapidly deteriorating military and economic situation in China, this was suspended in December, except where there would be total loss of investment on work nearing completion.

[15] Dickerman, Nelson, Mineral Resources of China: Bureau of Mines, Foreign Minerals Survey, vol. 2, No. 7, January 1948, pp. 81–88.

ECA also aided in accelerating shipments of supplies of tin, antimony, and tungsten to the United States.

Indonesia.—The mines of Indonesia set a postwar record in 1948 with a production of 30,562 long tons of tin. This was almost double the output of 1947 and 5 percent more than the 1935–39 annual average. This was accomplished with less equipment than was available in 1941, being attributable to the eight new dredges that were active most of 1948. Minor mechanical troubles experienced with the two new American-made dredges, satisfactorily repaired late in the year, retarded further increased production. There were no labor troubles. The islands of Banka (56 percent), Billiton (36 percent), and Singkep (8 percent) represent the principal sources. The best postwar month for production on Banka was November (2,021 tons) and on Billiton and Singkep, August (1,401 tons). During 1948, 40 percent of the total tin shipped was sold to the United States (the remaining 60 percent went to Arnhem, Netherlands) under a contract that expired December 31, 1948. Renewal terms had been agreed upon for another year for 25 percent, with a maximum of 20,000 tons of tin in concentrates.

In 1941 there were in operation 114 pumps, monitors, and suction and bucket dredges and 1 lode mine. The lode mine was destroyed during the war by the Japanese. At the end of 1948, alluvial mining was being conducted with 75 pumps, monitors, and suction and bucket dredges—Banka about 43 and Billiton 32. A number of profitable but small diggings or private mines were also being worked. In addition there were five or six dredges and four small placers, including two new bucket dredges that had been brought into full operation early in 1948 on Singkep. Singkep suffered war damage more heavily than the other tin islands, and rehabilitation of installations has not been as rapid. Production in 1948 was, however, expanded beyond the prewar record.

The prewar smelters on Banka (annual capacity, 30,000 tons) have not been repaired, and the Netherlands operators do not intend to resume operations in the near future. Plans for eventual resumption of tin smelting in Indonesia, however, are being studied by the Tin Council.

The Netherlands Indian Tin Council was established by a Government decree of February 14, 1948. The Tin Council is charged with coordination, under Government supervision, of exploitation, production, and selling policies of Indonesian tin. The Council also formulates long-time plans for future exploitation, including eventual resumption of tin smelting in Indonesia. On March 5, 1948, an agreement was made between the Government of Indonesia and the Billiton Co. (N. V. Gemeenschappelijke Mijnbouwmaatschappij Billiton) by which Bankatinwinning will be managed by Billiton Co. for 5 years. As of March 1, Billiton Co. also entered into agreement with the Sales Department of Government Mining Products of the Government of Indonesia for cooperating in tin sales.

On January 17, 1948, Netherlands Government and Indonesian Republic signed an agreement on principles of political settlements and truce looking toward a United States of Indonesia. The tin islands are excluded, as they have been set apart as autonomous territories. Following military action in December 1948, all of

Indonesia, except for some parts of Sumatra, was brought under Netherlands control.

Malaya, Federation of. [16]—The tin-mining industry in Malaya showed a steady and progressive increase during 1948, in spite of lawlessness and prevalence of banditry. Malaya resumed its prewar rank as the leading source of tin in the world, both in mining and smelting operations. During the year 145 mining properties resumed operations, bringing the total worked to 633 when the year closed (there were more than 1,000 before the war). The labor force employed in tin mining had been increased from 39,362 at the beginning of 1948 to 46,858 at the year's end. Mine production of tin in ore was 44,815 long tons in 1948, compared with 27,026 tons in 1947; 84,082 in the peak year of 1940; and an average of 55,309 per year during the prewar period 1935–39. An output of 4,267 tons was made in December, the highest postwar rate, due mainly to increased output at Chinese mines.

Mining operations suffered temporary set-backs owing to labor disputes and generally unsettled conditions. Over-all industrial relations in the mining industry began to show considerable improvement near the end of the first half of 1948. Subsequently, however, political disturbances retarded expansion of production facilities. Terrorists (roving bands of Chinese bandits) failed in their efforts to drive European miners away. In general, dredging companies were able to maintain full working time, but many opencast operations were running only during the daylight hours in the latter part of the year. Insofar as known, no dredge had been sunk or damaged by terrorists. Prospecting in new areas was almost at a standstill owing to danger of bandits. During the latter part of 1948 (for several months beginning in July) terrorists greatly increased their activities, seemingly directing their efforts toward intimidation of miners and killing from ambush keymen, mostly Europeans in charge of tin or rubber operations. By mid-November security forces appeared to have the situation under control and were progressively exterminating bandit gangs.

Rehabilitation of prewar equipment progressed with some improvement in supply of steel and machinery, although delivery of electrical equipment was too slow to be satisfactory. Rehabilitation has been confined mainly to dredges requiring a minimum of replacements; present plans call for 80 dredges and 550 gravel pumping mines to be in operation by 1950. There has been no indication of any plans for expanding production facilities beyond prewar capacity. The large dredges in operation at present use 18-cubic-foot buckets with a maximum digging depth of 130 feet. Eventually, dredges for mining to 170- to 180-foot depths are scheduled. Under the rehabilitation program, capital has been made available to dredging companies in the form of payments on war damage claims and special loans paid in installments as the work progresses. Similarly, Chinese operations were being financed and special loans were made to operators on recommendation of the Tin Mines Loan Committee. This was being done by the Government without the necessity of an increase in industry capitalization.

[16] The Federation of Malaya became effective February 1, 1948, succeeding the Malayan Union set up on April 1, 1946, Penang being incorporated in the Malayan Union and Federation. Singapore became a separate crown colony April 1, 1946.

The main tin-producing areas are in the State of Perak, which accounted for 65 percent of the total output in 1948, and the State of Selangor, with 26 percent. In 1948 production in Perak increased 64 percent, and Selangor increased 70 percent. Dredging and gravel pumping accounted for 85 percent of the tin mined in 1948; this was about the same proportion as before World War II. Dredging accounted for 49 percent of the tin mined in 1948 compared with an annual average of 47 percent before the war and 52 percent in 1940, the peak year. Compared with 1947, dredging operations increased 72 percent in 1948 and gravel pumping 85 percent. However, tonnagewise dredging and gravel pumping together were 16 percent below the prewar annual average—dredging 12 percent lower and gravel pumping 21 percent. Dredging units operating were expanded from 56 at the beginning to 67 at the close of the year. In January, 57 dredges averaged 36 tons of concentrate per dredge, and during October–November 67 were producing at the same monthly rate. Before the war (1935–38), production per dredge averaged 46 tons per month. In 1939, the Ayer Hitam Tin Dredging, Ltd., dredge, situated in Selangor, had the most outstanding production of any in the Federation of Malaya; it worked a little over 1,000,000 cubic yards of gravel in an aggregate running time of approximately 4 months, with production of 12,971 piculs of tin ore, equivalent to about 580 tons of tin. During 1948 the number of gravel pumping mines increased from 323 in January to 445 in December, with production of 16,254 tons of tin—95 percent of the Storke report estimate of 17,000 for 1948. In January 1941 there were 104 dredges and 745 gravel-pumping mines operating.

In 1948 the smelting plants at Penang (Eastern Smelting Co., Ltd.) and Singapore (Straits Trading Co.) produced 49,707 tons of tin metal (29,318 in 1947), reestablishing their prewar position as the principal source of pig tin in the world. Concentrates treated were derived mostly from Malaya, with smaller tonnages from Burma, French Indochina, and Thailand. The tin content of concentrates from Malaya was 44,792 long tons (about the same as mine production) compared with 26,380 in 1947. Imports originating elsewhere contained 3,517 tons of tin in 1948 against 3,413 in 1947. The plants shipped 47,214 tons of metal (about 61 percent from Penang and 39 percent from Singapore). Nearly 63 percent was sold to the United States in 1948. Stocks of tin metal increased from 4,711 tons at the beginning of 1948 to 7,148 at the end, while stocks of tin in concentrates (including mine stocks) decreased from 5,220 tons at the beginning to 5,045 at the end.

All pig tin produced in Malaya was sold direct to the British Ministry of Supply, which set the price. The price of refined tin, ex smelter at Penang and Singapore, was raised from £500 per long ton to £504 on April 6, 1948, and £554 on June 1, 1948 (guaranteed by MOS until June 30, 1949). At this price the miner probably gets the equivalent of about 61½ U. S. cents per pound ex mine, which seemed attractive enough to stimulate production.

There was in effect an export tax of about 15 percent on mine shipments, and for the first time an income tax of 20 percent on corporation earnings, modified or graduated from 10 to 30 percent on personal earnings. An export tax amounting to U. S. $243 per ton is levied on all tin shipped from Malaya regardless of destination. From June 30, 1948, the S$30.00 per picul (equivalent to about 10.3 U. S. cents per pound) special tax, which had been in effect since 1903 on all ore exported for smelting elsewhere than in the British Empire, was removed, in accordance with the Geneva Tariff Agreement.

Mexico.—According to the Federal Geological Survey, the large placers containing tin, mercury, and minor quantities of silver and gold found near Guadalcazar, State of San Luis Potosi, Mexico, cannot be mined commercially at 1946 metal prices.[17]

Nigeria.—Tin production in Nigeria increased 1 percent in 1948, despite the trend toward lower-grade ore and a decrease in mine shipments. All Nigerian concentrates go to the United Kingdom, where receipts increased from 8,916 long tons (tin content) in 1947 to 9,207 tons in 1948. There was no serious labor trouble in Nigeria in 1948 comparable to the 2-week strike in the first part of June 1947. The average value of gravel worked dropped from 2.26 pounds of cassiterite per cubic yard in 1939 to 0.96 pound in 1947. Total reserves of cassiterite for all companies was 111,402 tons at the beginning of 1948. Operations by the main producer—Amalgamated Tin Mines of Nigeria, Ltd.—increased 5 percent with the output of 5,755 tons of cassiterite in 1948, compared with 5,495 in 1947. The company ore reserves were increased after an intensive prospecting program. The Ministry of Supply continued to take all tin concentrate, f. a. s. Nigerian ports. The price paid for metal content was £477 per long ton when 1948 opened, rising to £485 10s. on January 6 and to £535 10s. June 1. Legislation in 1947 removed all restrictions on the mining and export of tin ore in effect under the Tin Ordinance.

Thailand.—With progressive rehabilitation, production of tin in concentrates by the mines of Thailand rose to 4,240 long tons in 1948 against 1,403 in 1947. At the end of 1948, 10 bucket dredges were in operation, producing about 900 long tons of ore per month. Twenty-one were being rehabilitated, and 10 have been abandoned, dismantled, or scrapped. About 41 dredges were operating in 1941, producing 1,500 long tons per month. Before the war, 75 percent of the output was worked by the British (chiefly Australian) with modern equipment and the rest by Chinese. All the ore was sent to Penang and Singapore for smelting. The war-produced stocks of 7,528 long tons of tin metal and 8,684 tons of ore, registered with the Thailand Government on January 1, 1947, were disposed of by early 1948. Of the ore, 4,319 tons were allocated for purchase to the United States and 4,365 to the United Kingdom. In 1947, the RFC acquired and shipped to the United States 4,824 tons of metal and 4,287 tons of ore. In 1948, RFC purchased and shipped 5,752 tons of ore and 2,194 tons of metal from the remainder of these stocks and from current production.

Siamese Tin Syndicate began dredging at Ngow on February 9, 1948. Bangrin Tin Dredging Co., Ltd., restarted a dredge in April on the Sydney area, with expectations of starting another (No. 1) by the year's end. Operations were resumed on Puket Island by Kamra Tin Dredging on May 21 and by Puket Tin Dredging, Ltd., in mid-November.

[17] Fries, Carl, Jr., and Schmitter, Eduardo, Tin-Bearing Placers Near Guadalcazar, State of San Luis Potosi, Mexico: Geol. Survey Bull. 960-D, 1948, pp. 109-147.

Under a Thailand-Japan agreement, Japan will supply, among other things, rolling stock, railway and electrical equipment, aluminum, and iron ware. Thailand's shipments will include tin and tin ore. Export control over tin ore was lifted in June 1948. There were reports that Russia was making bids for substantial quantities of Thailand's tin ore.

Under exchange priority restrictions, tin exporters had to surrender 50 percent of their foreign exchange to the Central Bank.

United Kingdom.—Seventy-five years ago the mines of the United Kingdom were the world's leading source of tin. They produced less than 1 percent of the world total in 1948. Geevor and South Crofty continued to be the only mines active. Geevor's mill treated 49,839 tons to recover 542 tons of tin concentrates (black tin containing about 65 percent tin), against 45,537 tons in 1947 for a recovery of 530 tons. The company contract with the Ministry of Supply ended April 19, 1948, and the former practice of selling direct to the smelter on basis of the ruling price was resumed. South Crofty has been working on a reconstruction program which includes driving a new section for the purpose of abandoning old drifts and reconditioning a shaft to improve ventilation. The old Basset mine dumps continue to be worked by the British Malayan Tin Syndicate. The dewatering of New Consols, an old mine at Luckett village near Gunnislake, suffered some delay owing to pump trouble. Some small operators were working "tin-streams."

There are important tin-smelting plants in the United Kingdom. Smelter production increased 8 percent in 1948. Most of the material treated comes from Bolivia and Nigeria. Imports of concentrates (tin content) increased from 23,736 long tons in 1947 to 28,777 in 1948. Stocks of tin increased 16 percent, being 18,019 at the beginning of 1948 and 20,937 at the end. Of the year-end stocks 61 percent was in metal and 39 percent in concentrates—metal stocks increased 39 percent whereas concentrates declined 8 percent. Consumers' stocks of pig tin decreased from 3,016 tons to 2,225 at the year end. The Government's reserve of pig tin was 10,592 tons at the close of 1948 compared with 6,188 when the year opened. Stocks of tin in concentrates in the United Kingdom were 6,386 tons at the end of 1948—virtually unchanged from the beginning of the year. Concentrates afloat had declined from 2,458 tons at the opening to 1,734 at the year's close. The United Kingdom export trade in metal was only 2,216 tons in 1948 (licenses are necessary for exports of metal). Small tonnages were reported shipped to the United Kingdom, mostly from Malaya and Hong Kong. Foreign trade in metallic tin was but a fraction of prewar transactions.

The United Kingdom is the second-largest tin consumer in the world. Restrictions on the use of tin continued to be relaxed in 1948. It was, however, necessary to obtain a license from the Nonferrous Metals Directorate of the Ministry of Supply to purchase tin. Consumption of virgin tin (25,241 long tons) was 8 percent less in 1948, mostly due to decreases in 62 percent used for solder, other alloys, etc. The remaining 38 percent used in tin plate increased 7 percent in 1948. Tin-plate production increased 10 percent, being 610,100 long tons in 1948 (802,560 long tons, 1935–39) compared with 553,200 in 1947. For the first time, statistics of electrolytic production (38,352 long tons) were included in the total for 1948. A third of the tin plate produced in the United Kingdom in 1948 was exported. Shipments to Australia, New Zealand, and Argentina, accounting for 54 percent, increased 80 percent over 1947. The bulk of the tin-plate industry was scheduled to be absorbed by the Government under the Iron and Steel Bill, the details of which were released early in November 1948.

Britain's Four-Year Plan submitted to the Organization for European Economic Cooperation on October 1, 1948, for reaching a balance of payments by 1952–53, proposes or forecasts expansion of tin production to 94,500 tons of concentrates (70,000 tons tin) in 1950 for Nigeria and Malaya. ECA authorized $15,700,000 for purchase of Bolivian tin concentrates by the United Kingdom. Russia agreed to supply Great Britain with 750,000 tons of coarse grain between February and September 1948, under a major trade agreement signed December 27, 1947. Thereunder, the two countries were to discuss the question of British supply of tin to Russia. The trade agreement of February 12, 1948, between Argentina and the United Kingdom provides, among other things, for the British Government to facilitate the purchase (for Argentina consumption) during 1948 of 1,000 metric tons of tin and 34,000 tons of tin plate through usual trade channels. The tin was to be subject to Combined Tin Committee allocation, and 26,000 tons of the tin plate was for the British food pack.

The London average price of tin (minimum 99 percent) was £548 0s. 11d. in 1948. The official price was raised £9 on January 6, 1948, and £50 on June 1, 1948. The price was at £569 when the year closed, with 99.75 percent at £572½.

Titanium

By HELENA M. MEYER

GENERAL SUMMARY

PUBLIC interest in titanium has been stimulated by recent developments that foreshadow large-scale use of the metal as a structural material. The popular (as well as technical) press has given much space during the past year or more to information on titanium and predictions as to its future. Despite the very recently acquired public awareness of this metal, the paint pigment—titanium dioxide—has been an important article of commerce for years; since the late nineteen thirties it has been manufactured in greater quantities than any other white pigment. Production of titanium pigments has followed annual expanding plant capacity and has established new peaks each year since 1943. Production facilities, however, have been inadequate to supply the total extra tonnages required for war and subsequently for swollen postwar consumer needs.

The titanium industry in 1948 was featured by the new record high production and shipments of pigments for the fifth consecutive year, by new peak domestic production and shipments of ilmenite for the second successive year, by new maximum consumption for the sixth year, by higher domestic shipments of rutile than ever before, by imports of ilmenite that were smaller than in only two preceding years—1947 and 1939 (being about the same as in 1946) and by extensive research in connection with titanium metal and alloys.

The United States postwar titanium supply differed markedly from the prewar balance. Before World War II India was supplying United States consumers with most of their needs for ilmenite, chief source of titanium. War disruption to sea-borne trade gave impetus to the search for alternate supplies, with the result that the United States now has the largest single ilmenite-producing mine in the world, the property of the National Lead Co. at Tahawus, N. Y., and that other new properties are in production, plan to produce in the near future, or are being investigated. Doubtless the prospective need for nearby sources, capable of assuring large tonnages of titanium-bearing ores, for the time when the metal will come into large-scale production, was a contributory factor in the development of new sources of supply. In this connection the announcement in 1948 that the Kennecott Copper Corp. and the New Jersey Zinc Co. were to exploit a very large deposit of ilmenite in Quebec, Canada, was an outstanding event of the year. Titanium from this property is destined for pigment purposes in the early days of production, but the operators are looking forward to an eventual large market for reduction to metal.

Production and shipments of ilmenite in the United States were both 14 percent greater than in 1947. Imports were 20 percent below 1947 but were above all earlier years except 1939, approximating those for 1946. Shipments and imports together were 10 percent more than consumption; stocks in industry hands gained 17 percent and were equivalent to nearly 1 year's needs at the peak consumption rate maintained in 1948. Consumption of ilmenite increased 18 percent in 1948 to a new top.

Earlier reports of this series have discussed the extensive Bureau of Mines investigations in connection with the production of ductile titanium, resulting in the development of at least one method applicable to large-scale operation. Later technologic advances are discussed under Technology.

Rutile production declined 14 percent from the all-time peak in 1947, but shipments rose 92 percent over the low postwar rate in 1947 and exceeded all earlier years. Imports fell 31 percent from 1947 owing to curtailment in receipts of rutile in mixed zircon-rutile-ilmenite concentrates from Australia. Industry stocks dropped 34 percent in 1948 and at the end of the year would support consumption at the 1948 rate for nearly 1 year.

Quotations for ilmenite were virtually unchanged throughout the year, a slight downward revision during the year coinciding with a drop in the content of titanium dioxide specified. Concentrates (57–60 percent TiO_2) per gross ton, f. o. b. Atlantic seaboard, according to grade and impurities, were quoted at the beginning of the year at \$19–\$20, and at the end of the year 56–59-percent concentrates were \$18–\$20. All the quotations were reported to be nominal. Rutile quotations continued to be nominally 8–10 cents a pound for concentrate guaranteed minimum 94 percent TiO_2, unchanged for a number of years, until December when they were given as 6–8 cents.

DOMESTIC PRODUCTION

Both production and shipments of ilmenite were 14 percent above 1947, and both established new all-time peaks for the second successive year. Rutile production was 14 percent lower than the all-time top in 1947. Shipments, on the other hand, were nearly double the relatively low rate for 1947, were one-third larger than production, and were the largest in the industry's history. Shipments of ilmenite ranged from 44 to 60 percent TiO_2 and of rutile from 93 to 94 percent TiO_2.

California.—Live Oak Mines and Ferro-Titan Minerals Co., operating in Los Angeles County, produced small quantities of ilmenite and of mixed ilmenite-magnetite concentrates in 1948. Production expansion appeared to hinge on the development of a larger market on the west coast or on sufficient reduction in production costs to justify entering more distant markets.

Florida.—The report of this series for 1947 discussed the approaching advent of a new producer of titanium-bearing material in Florida. The E. I. duPont de Nemours & Co., Inc., operation near Starke did

Production and mine shipments of titanium concentrates from domestic ores in the United States, 1944–48, in short tons

Year	Ilmenite				Rutile			
	Production	Shipments			Production	Shipments		
		Gross weight	TiO_2 content	Value		Gross weight	TiO_2 content	Value
1944	278,610	280,791	128,095	$7,371,279	6,922	6,770	6,312	$1,088,112
1945	308,516	308,518	141,852	7,359,170	7,179	6,837	6,414	869,920
1946	282,447	282,708	130,624	4,878,917	7,453	7,514	7,046	996,989
1947	336,533	336,061	157,328	5,029,490	8,562	5,157	4,813	533,548
1948	383,745	381,508	177,447	5,793,973	7,380	9,907	9,226	647,334

not get into production in 1948 but was expected to begin early in 1949. Production of ilmenite and rutile in Florida in 1948 came from the Rutile Mining Co. of Florida near Jacksonville and the Riz Mineral Co. near Vero Beach. The latter property was operated under the name as given and under the name of the Florida Ore Processing Co., Inc.

New York.—Production of titanium-bearing ore at Tahawus, Essex County, by the National Lead Co. continued to break records in 1948 and was again the predominating reason for the record performance of the United States as a whole. The mine continued to lead all others in the world in production of ilmenite. Drilling and blasting at Tahawus were recently described.[1]

North Carolina.—The Yadkin Mica & Ilmenite Co., subsidiary of the Glidden Co., produced 28,990 tons of ilmenite (averaging 51 percent TiO_2) at Finley, Caldwell County, and shipped 28,790 tons. The 1948 output was 6 percent above 1947, itself 60 percent higher than in 1946.

Virginia.—Ilmenite and rutile were produced in Virginia again in 1948 near Roseland, Nelson County, by the American Rutile Corp., subsidiary of the Metal & Thermit Corp. The Calco Chemical Division of American Cyanamid Co. continued to produce ilmenite at Piney River, Nelson County. The Roseland property was closed from January through August, there being no mine nor mill activity during this period.

CONSUMPTION AND USES

The consumption of ilmenite in 1948 was 18 percent higher than in 1947, marking continuation of the establishment of new high record rates of use for the sixth consecutive year. The manufacture of pigments, as usual, took 99 percent of all ilmenite consumed. Rutile consumption, which had dropped notably since the end of the war, gained 28 percent in 1948 and was the highest since 1944. Welding-rod coatings took 80 percent of the total compared with 84 percent in 1947.

Miscellaneous	30	17	851	800
Total consumption	565,000	300,408	9,863	9,144

[1] "Pigments" include all manufactured titanium dioxide, consumption of which in welding-rod coatings was 1,257 tons in 1947 and 1,338 tons in 1948.

Titanium Pigments.—Production and shipments of titanium pigments in 1948 were greater than ever before, establishing new peaks for the fifth successive year. Recent production has been dictated largely by pigment plant capacities, because for a number of years over-all demand has called for even larger tonnages than the record quantities made available. Figures on this industry are supplied in confidence and, consequently, are not given here. The annual increases in pigment-plant capacities for several years were inadequate, owing to difficulties in obtaining structural and other materials. Total capacity was expanded another 10 percent approximately in 1948, and still further gains are expected in 1949. Consumption of ilmenite was at a new maximum in 1948. Earlier reports of this series have pointed out that use of titanium pigments, whereas rising largely on merit, have been influenced also by shortages of competitive products, notably those made from lead.

According to information received from a leading manufacturer, the use pattern for titanium pigments in 1948 was as follows: 78 percent was for paint, varnish, and lacquer, 7 percent for paper, 3 percent for rubber and plastics, 2½ percent for textiles and leather, 2 percent for floor coverings, 1½ percent for welding rods, and 6 percent for other purposes.

Paint capable of resisting temperatures of more than 1,000° F. have been developed as a result of research by the Australian Council for Scientific and Industrial Research.[2] Basis of the new paints is butyl titanate.

[2] Metal Bulletin (London), Titanium: No. 3346, Nov. 30, 1948, p. 17.

According to the November 5, 1948, issue of Chemical Trade Journal and Engineer (London), titanium dioxide is being made from rutile on a pilot-plant scale at Melbourne, Australia, by Zircon Rutile, Ltd. If the pilot-plant results justify it, consideration is to be given it was said, to the erection of a larger plant.

Welding-Rod Coatings.—Production of titanium-coated welding rods was 188,000 short tons in 1948, a gain of 23 percent over 1947, itself 15 percent above 1946; 267,000 tons were produced in 1945, 382,000 in 1944, and 481,000 in 1943. In 1948, 56 percent of the rods were coated with natural rutile, 32 percent with manufactured titanium dioxide, and 6 percent each with both varieties and with ilmenite.

Other Uses.—Titanium metal, a laboratory curiosity until recently, has become a widely discussed subject with the advent of production on a commercial basis and with publicity that production at costs that would invite large-scale operations is an early possibility. The metal is discussed under Technology.

Developments in titanium enamels were discussed[3] in a recent article, which said that the superior performance of titanium enamels has enabled them to make inroads into the zircon business, despite higher cost. Antimony enamels were said still to lead where acid resistance is the principal requirement and where low opacity is no draw-back. Another article[4] discussed the improved physical properties of titanium enamels.

STOCKS

Inventories of ilmenite rose 17 percent in 1948 and those of rutile fell 34 percent. Totals for each closely approximated 1 year's needs at the consumption rates maintained in 1948.

Stocks of titanium concentrates in the United States at end of year, 1947–48, in short tons

Stocks	1947				1948			
	Ilmenite		Rutile		Ilmenite		Rutile	
	Gross weight	Estimated TiO_2 content	Gross weight	Estimated TiO_2 content	Gross weight	Estimated TiO_2 content	Gross weight	Estimated TiO_2 content
Mine	1,706	776	3,953	3,687	3,983	1,800	1,500	1,399

Consumers	[2] 446,052	[2] 229,128	1,342	1,232	522,077	250,559	3,493	3,255
Total stocks	[2] 453,442	[2] 233,030	13,937	13,042	530,559	254,168	9,211	8,640

[1] Includes ilmenite and rutile content of mixed zirconium-titanium concentrates.
[2] A large quantity previously counted as stocks was written off company books in 1947.

PRICES

Quotations in E&MJ Metal and Mineral Markets covering ilmenite were virtually unchanged throughout the year. A slight downward

[3] Chemical Industries, Titania on Top: Vol. 63, No. 5, November 1948, pp. 770–771.
[4] King, Burnham W., Titanium Enamels: Steel, vol. 122, No. 25, June 21, 1948, pp. 108, 111, 128, and 130.

revision coincided with a drop in content of titanium dioxide specified, from a range of 57–60 percent TiO_2 content to 56–59 percent. Quotations for 57–60 percent TiO_2 concentrates, per gross ton, f. o. b. Atlantic seaboard, according to grade and impurities, were \$19–\$20 when the year began; beginning January 14 the titanium dioxide content specified was dropped to 56–59 percent, and the price was reported as \$18–\$19; and from September 15 on the price was \$18–\$20 with no change in grade indicated. The quotations were all reported as nominal. Nominal quotations for rutile have been 8–10 cents a pound for concentrate guaranteed minimum 94 percent TiO_2 for a number of years until December 1948, when a range of 6–8 cents was reported.

At the beginning of the year, Steel quoted ferrotitanium, Eastern Zone, contract, ton lots at \$1.35 and less-ton lots at \$1.40 per pound of contained Ti for 20 to 25 percent, Al 3 percent, Si 4 percent, and C 0.10 percent, the last three all maximums. The quotations were \$1.23 and \$1.25, respectively, for ton and less-ton lots, for 40–45 percent Ti, with the following maximums: Al 7 percent, Si 4 percent, and C 0.10 percent. For the Central Zone, 4 cents should be added for 20–25 percent Ti grade and 2.1 cents for 40–45 percent grade; Western, 13.5 cents for 20–25 percent and 7.2 cents for 40–45 percent. For high-carbon ferrotitanium, 15–20 percent, contract basis, per net ton, f. o. b. Niagara Falls, N. Y., freight allowed to destination east of Mississippi river and north of Baltimore and St. Louis, 6.8 percent C, the quotation was \$142.50; 3–5 percent C, \$157.50. These quotations held until October 4 when they were changed and continued for the remainder of the year as follows:

Ferrotitanium, Low-Carbon: (Ti 20–25 percent, Al 3.5 percent maximum, Si 4 percent maximum, C 0.10 percent maximum) contract, ton lots, 2″ x D, \$1.40 per pound of contained Ti; less ton \$1.45. (Ti 38–43 percent, Al 8 percent maximum, Si 4 percent maximum, C 0.10 percent maximum). Ton lot \$1.28, less ton \$1.35, f. o. b. Niagara Falls, N. Y., freight allowed to St. Louis. Spot add 5c.

Ferrotitanium, High-Carbon: (Ti 15–18 percent, C 6–8 percent). Contract \$160 per net ton, f. o. b. Niagara Falls, N. Y., freight allowed to destination east of Mississippi river and north of Baltimore and St. Louis.

Ferrotitanium, Medium-Carbon: (Ti 17–21 percent, C 3–4.5 percent). Contract, \$175 per ton, f. o. b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

Titanium metal, 96–98 percent, was quoted at \$6–\$7 a pound at the beginning of the year, dropping to \$5–\$6 in mid-September, at which level it continued for the remainder of the year. E. I. du Pont de Nemours' production was available in limited quantities as sponge metal and in ingots of 10 and 100 pounds.

Manufactured titanium dioxide (anatase), chalk-resistant, plain, and (rutile) nonchalking, in bags, carlots, delivered, were quoted in the Oil, Paint and Drug Reporter at 17½, 17½, and 19½ cents a pound, respectively, when the year began. The first two were raised to a range of 17½–18 cents in midyear, continuing at that level until early in September, when they were established at 18 cents and the nonchalking grade moved to 20 cents. Early in December the chalk-resistant and plain grades were quoted at 18–19½ cents and the nonchalking at 20–21½; they were then established at the higher part of the range, where they continued for the remainder of the year.

FOREIGN TRADE [5]

Imports.—Receipts of ilmenite were only 80 percent of the peak quantity imported in 1947 but were smaller only than that year and 1939, approximating the total for 1946. India continued to be by far the chief source of imported concentrates, supplying 76 percent of the total compared with 87 percent in 1947. Norway continued to ship increasing quantities to the United States, the total for 1948 being 37 percent above that in 1947; Norway supplied 17 percent of total imports. A noteworthy gain was made in receipts of ilmenite from Brazil, and British Malaya appeared in the import declaration as a supplier for the first time. Australia was the only country to ship rutile of the United States in 1948. Receipts dropped, owing to discontinuation of entries of mixed zircon-rutile-ilmenite concentrates from that country. Imports of ferrotitanium for consumption, all from the United Kingdom, were 28 short tons.

Titanium concentrates [1] imported for consumption in the United States, 1944–48, by countries, in short tons

[U. S. Department of Commerce]

Country of origin	1944	1945	1946	1947	1948

Grand total	10,019	10,602	5,864	12,637	8,771
Value of "as reported"	$272,283	$98,170	$213,795	$468,810	$588,713

[1] Classified as "ore" by the U. S. Department of Commerce.
[2] Most of the imports of titanium from Australia in 1944–47 were in mixed zircon-rutile-ilmenite concentrates. Totals of mixed concentrates are derived by addition of the U. S. Department of Commerce figures for imports of ilmenite, rutile, and "zirconium ore" from Australia. These totals are apportioned by the Bureau of Mines (on the basis of surveys of importers) into the 3 component minerals. The excess quantities of ilmenite and rutile over the quantities reported by the U. S. Department of Commerce in those specific categories are entered as "In 'zirconium ore.'"
[3] Most of the ilmenite, rutile, and zircon from Australia in 1947 was imported in the form of zircon-rutile or zircon-rutile-ilmenite mixed concentrates. These concentrates (including separated concentrates of a single mineral) totaled 36,074 short tons, of which 1,659 were ilmenite, 12,521 rutile, and 21,894 zircon. For statistical convenience, it can be assumed that 5,061 tons of the material reported by the Department of Commerce as ilmenite was actually rutile; the value of this 5,061 tons of rutile, however, is inseparable from the ilmenite as reported.
[4] Less than 1 ton.
[5] Includes 309 tons not recovered from mixed concentrates.
[6] Includes quantities reported by the U. S. Department of Commerce as originating in French Equatorial Africa, from which no rutile production has been recorded.

[5] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Exports.—Of the concentrates exported in 1948, 631 tons went to Canada, 474 to Netherlands, 141 to Belgium, and 138 to the Union of South Africa. Of the pigments, 19,787 tons went to Canada, 1,061 to Netherlands, 1,005 to Belgium, 848 to Brazil, 700 to Cuba, and 660 to Mexico. Virtually all of the ferro-alloys exported was shipped to Canada. Total titanium products exported were valued at $7,400,000; tetrachloride and other compounds are no longer classified separately and are not included in this total.

Exports of titanium products from the United States, 1944–48, by classes

[U. S. Department of Commerce]

Year	Concentrates		Ferro-alloys		Dioxide and pigments		Tetrachloride and other compounds	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1944	291	$51,828	[1] 793	[1] $127,145	10,925	$1,851,457	375	$215,696
1945	609	121,951	744	122,887	12,824	2,315,552	75	46,718
1946	1,385	200,866	550	63,723	16,314	3,092,607	(2)	(2)

[1] Includes metal and nonferrous alloys.
[2] Beginning Jan. 1, 1946, not separately classified.

TECHNOLOGY

Many reports on titanium technology were published during the year.

The interest of the Department of the Navy in titanium because of its promise as a structural material led to a symposium on the subject, sponsored by the Office of Naval Research, on December 18, 1948, in Washington, D. C. The papers submitted were combined in a report entitled "Titanium" and included the following:

The Bureau of Aeronautics' Titanium Program, by N. E. Promisel, Chief, Materials Branch, Bureau of Aeronautics, Navy Department.

The Program of the Air Matériel Command on Titanium Alloys, by Richard R. Kennedy, Wright-Patterson Air Force Base.

The Titanium Program of Army Ordnance, by Laurence S. Foster, Watertown Arsenal Laboratory.

Production of Titanium Powder at Boulder City, by F. S. Wartman, Metallurgist, Bureau of Mines, Boulder City, Nevada.

Fabrication of Titanium and Investigations of Titanium-Nickel Alloys in the Bureau of Mines Laboratories, by J. R. Long, College Park Branch, Metallurgical Division, Bureau of Mines.

Physical and Mechanical Properties of Commercially Pure Titanium, by C. I. Bradford, J. P. Catlin, and E. L. Wemple, Remington Arms Co.

Production and Properties of Iodide Titanium, by Bruce W. Gonser, Research Supervisor, Battelle Memorial Institute, Columbus, Ohio.

Properties of Iodide-Type Titanium, by F. B. Litton, Foote Mineral Co.

Induction Melting of Titanium Metal in Graphite, by J. B. Sutton, Pigments Department, E. I. DuPont de Nemours & Co.

The Production and Arc Melting of Titanium, by C. T. Greenidge and L. W. Eastwood, Battelle Memorial Institute.

Some Preliminary Tests to Determine Applications for Titanium, by W. Lee Williams, U. S. Naval Engineering Experiment Station, Annapolis, Md.

Some Preliminary Data on Alloys of Titanium, by E. I. Larsen, E. F. Swazy, L. S. Busch, and R. H. Freyer, P. R. Mallory & Co., Inc.

Titanium-Base Alloys, by Howard C. Cross, Battelle Memorial Institute.

883326—50——79

Some Aspects of the Metallurgy of Titanium Alloys, by P. H. Brace, Westinghouse Research Laboratories.

The Titanium-Base Alloys Program of the Naval Research Laboratory, by E. J. Chapin, Metallurgy Division, Naval Research Laboratory.

First Progress Report on Titanium-Carbon and Titanium-Nitrogen phase Diagrams, by J. P. Nielsen, College of Engineering, New York University.

Long's paper summarized two recently completed reports, subsequently published,[6] and concerned the fabrication of titanium and the studies of titanium-rich alloys being conducted in the laboratories of the Bureau of Mines. Titanium is active chemically and at high temperatures reacts readily with the atmosphere, making it extremely difficult to produce a pure metal by melting and casting, as with most other metals. However, the Bureau developed a process in which titanium powder can be heated to elevated temperatures while sealed in ductile, gastight containers. Hot-rolling the complete assembly produces a solid, nonporous metal for working into construction members, machinery parts, and other materials. As a byproduct of research on pure metallic titanium, Bureau metallurgists also are investigating the possibilities of titanium alloys for engineering purposes, as pure metals in general show relatively large improvements in properties when alloyed with other metals. The titanium-nickel series is the first of several alloys to be tested in Bureau laboratories. The report describes experiments on alloys containing up to 40 percent nickel.

The article by Bradford and others stated that Remington's program has progressed to the point where 20- to 25-pound ingots are being cast and small quantities of narrow sheet and round rod are being produced. Most of the company's effort was said to be devoted to research on titanium-rich alloys. Preliminary work indicated that the machinability of titanium is similar to that of austenitic stainless steel. The General Electric Co. River Works at West Lynn, Mass., and several other companies were said to be conducting preliminary welding experiments with Remington titanium. The experiments indicate that titanium can be readily spot-welded, seam-welded, and inert-arc-welded to other pieces of titanium. Titanium's sea-water and marine atmospheric corrosion resistance were said to be truly outstanding, being better than austenitic stainless, Monel, and the cupronickel alloys, and as good as the best-known materials—platinum and Hastelloy C.

In his paper, Gonser says that interest in the production of titanium by the iodide process is broader than merely the production of a relatively pure metal as a base for investigations, almost regardless of cost. It is a method for making a high-quality metal in a compact form, which can be processed directly without smelting or without compacting and sintering into ingots by powder metallurgy. Essentially, he says, the process depends upon the formation of a volatile iodide by reacting crude titanium with iodine in the absence of any other reactive gas, then depositing the titanium on a hot filament by thermal decomposition of the iodide. This action is cyclic, as the gaseous product of decomposition reacts with more crude metal;

[6] Long, J. R., Hayes, E. T., Root, D. C., and Armantrout, C. E., A Tentative Titanium-Nickel Diagram: Bureau of Mines Rept. of Investigations 4463, 1949, 13 pp.
Long, James R., and Hayes, Earl T., Sheath Working of Metal Powders: Bureau of Mines Rept. of Investigations 4464, 1949, 13 pp.

so the action in its simplest form is refining in a closed container. At present iodide titanium is still on a laboratory scale. The metal produced by this method, Gonser states, forms an excellent base for alloying and for studies of fundamental properties.

E&MJ Metal and Mineral Markets of September 30, 1948, quotes the Northern Miner as stating that Dominion Magnesium, Ltd., is producing a few pounds of titanium metal at Haley, Ontario. Pilot-plant production, using a process said to differ from United States practice, points to a price of around $1.50 a pound. The process used by the Canadian company was developed by L. M. Pidgeon and D. W. Rostrom.

An article [7] recently published discussed experiments with the metal in Australia. It commented on the large-scale production of crude titanium tetrachloride from rutile sand during the war. Reduction of purified titanium tetrachloride with magnesium has been tried on a small scale and reasonably pure metal, which may be worked either cold or at 500° to 600° C., has been made. This type of process, it is stated, could easily be modified so as to yield certain alloys directly, for example, alloys of titanium with zirconium, iron, silicon, and tantalum.

WORLD REVIEW

Available data on world production of ilmenite and rutile in recent years are shown in the accompanying table. Notes on operations in certain important producing and consuming countries follow the world table.

World production of titanium concentrates (ilmenite and rutile), 1941–48, by countries, in metric tons

[1] Data not available.
[2] Includes 26 tons of garnet-ilmenite.
[3] January to September, inclusive.
[4] Exports.
[5] Approximately 20 percent of ilmenite concentrates is zircon.

[7] Worner, H. W., Titanium and Zirconium, New Metals in Australian Metallurgy: Chem. Eng. and Min. Rev. (Melbourne), vol. 40, No. 7, Apr. 10, 1948, pp. 254–262.

AUSTRALIA

Details covering heavy mineral production and other data were made available [8] in the latter part of the year. The most extensive known deposits of black sands were said to occur along the coast near the border of New South Wales and Queensland, largely between Southport, 17 miles north of the border, and Ballina, 50 miles below the border. (See fig. 1.) Information on reserves is fragmentary, but

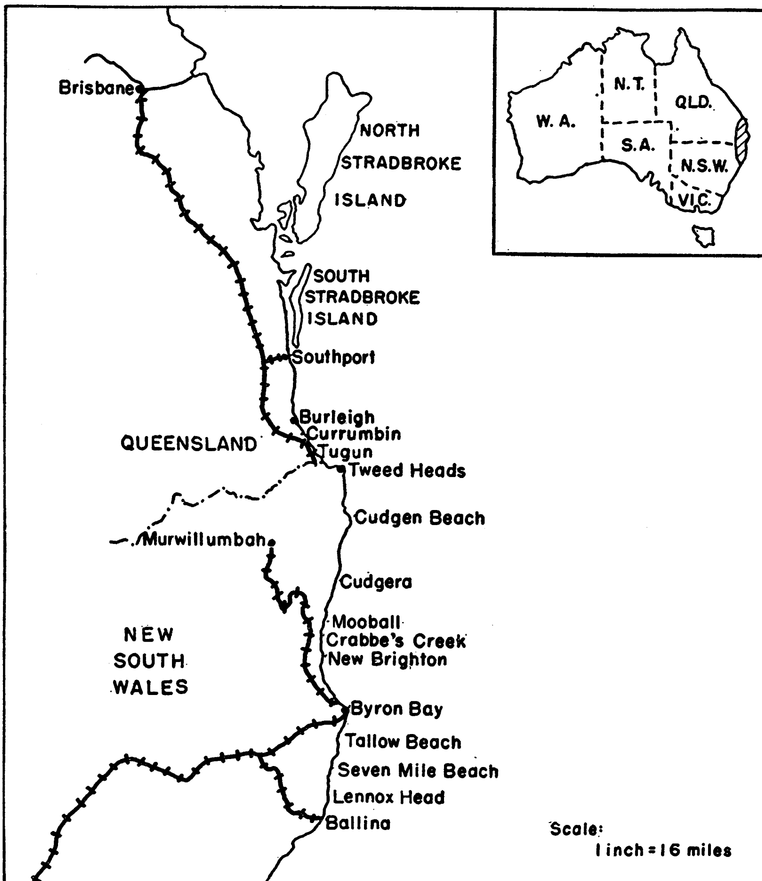

FIGURE 1.—Map showing location of heavy mineral deposits in Northern New South Wales and Southern Queensland.

investigations of all deposits are in progress in connection with the question of the probable amount of monazite available. In the areas close to the beach along the New South Wales-Queensland coast, now being worked, it has been estimated that reserves of high-grade sands are sufficient to last only 10 to 20 years at the current rate of production. Much larger unworked deposits, however, are said to occur in

[8] Lamm, Donald W., Heavy Minerals of the Australian Beach Sands: Consular Rept. 86, American Embassy, Canberra, Australia, Sept. 9, 1948, 17 pp.

the sand dunes behind the present beaches, particularly in the Byron Bay, New Brighton—Cudgera, Cudgen, and Currumbin—Southport areas. The report states that competent geologists have described as "very large" reserves of sands on the east coast of North Stradbroke Island. The average mineral content is low and the sands are not workable by methods now being used in Australia.

Production figures are given in the accompanying world table. Domestic demand for rutile and zircon is very small. Thus, foreign markets are necessary to keep production going. Companies evidently refrain from expanding production to ultimate limits to prevent the accumulation of cumbersome surpluses.

In the fiscal years 1945–46 and 1946–47, exports of rutile were 5,857 and 11,090 long tons, respectively, and of ilmenite, 804 and 938 tons, respectively. The United States was the destination of 78 and 81 percent and the United Kingdom 21 and 12 percent, respectively, of the rutile shipped from the country.

The ilmenite produced on the east coast has too high a chrome content to be usable for pigment purposes, chief use of ilmenite, and ilmenite stock piles are said to have accumulated.

In earlier years Australian rutile, ilmenite, and other minerals were shipped from the country chiefly in the form of mixed concentrates for separation in the importing country. The requirement that the monazite content of the concentrates be sold to the Government, however, has made exportation of mixed concentrates no longer possible.

Seven firms are actively engaged in commercial mining operations for zircon and rutile; another company has discontinued operations temporarily, and two others were planning operations soon. Information on these companies, given in the report, is briefed as follows:

Mineral Deposits Syndicate.—Deposits in the Broadbeach-Burleigh area and plant at Southport, Queensland. Average monthly output of mixed concentrates is 600 long tons. Mining is done by stripping the overburden with a bulldozer and selective hand loading into motor trucks, the overburden being replaced. The sands are treated at the plant by the use of Wilfley tables, draining, and rotary drier. Rotary magnetic separators are used to eliminate the ilmenite, followed by electrostatic separation of the zircon-rutile and cleaning by a magnetic separator. Products are zircon and rutile concentrates of 85- and 95-percent purity, respectively.

Associated Minerals.—Deposits in the Southport-Broadbeach area and plant at Southport. Average monthly production is 500 long tons. Mining methods same as foregoing. The sands are treated by Wilfley and curvilinear tables, rotary drier, then electromagnetic and electrostatic separation of the zircon and rutile, with further cleaning of each product by both electrostatic and electromagnetic methods. Products are zircon (93-percent purity) and rutile (96 percent) concentrates.

Rutile Sands Pty.—Deposits on the Tugen-Currumbin beaches and plant at Currumbin, Queensland. Average monthly production is 650 long tons. Mining methods same as previous two companies. The sands are treated by Wilfley tables, draining, and rotary drier, followed by electrostatic and electromagnetic separation. Zircon concentrates of 90 percent and rutile of 96-percent purity are produced.

Tweed Rutile Syndicate.—Deposits at Cudgen and the adjacent beach area and plant at Cudgen, N. S. W. Monthly output is 500 long tons. The sands are mined by stripping the overburden with horse-drawn scoops, then loading the black sands on motor trucks by use of a small Diesel shovel. The sands are treated by the use of Wilfley tables, then moved by conveyor to the drier and separated and cleaned by electrostatic and electromagnetic methods. Products are zircon and rutile concentrates of 95- and 96-percent purity, respectively.

Titanium Alloy Manufacturing Co., Ltd.—Deposits and plant the same as Tweed. Average monthly production is 900 long tons. The overburden is removed by power scoops, and the heavy minerals are then piled, and loaded by use of a small drag scraper into 2-foot-gage railway trucks drawn by a Diesel locomotive. The sands are treated by using Wilfley tables, draining, rotary drier, then electrostatic treatment (the company has six units). The ilmenite is removed by a magnetic separator. Products are zircon and rutile concentrates of 98- and 94-percent purity, respectively.

Metals Recoveries, Ltd.—Deposits in the area between Cudgera and New Brighton and plant at Crabbe's Creek and Mooball Landing, N. S. W. Approximate monthly production is 250 long tons. The overburden is removed by horse-drawn scoops, and there is selective hand loading of the black sands into trucks. The sands are treated by the use of Wilfley and curvilinear tables at Crabbe's Creek and carted to Mooball where they are dried, passed through a electromagnetic separator, and through an electrostatic separator. Products are zircon and rutile concentrates of 97-percent purity each.

Zircon Rutile, Ltd.—Deposits at Seven Mile and Tallow Beach, Byron Bay, and plant at Byron Bay. Largest of the operating firms with an average monthly output of 1,000 long tons. Mining by removing overburden with bulldozers and stacking the heavy mineral sands, then loading on trucks by an overloader. A dragline loader is also used. The Wilfley tables are at the beach, and the concentrates are carted to the main plant at Byron Bay. The zircon is removed by flotation, the tailings, being passed over cleaner curvilinear tables then through the drier. The ilmenite and other slightly magnetic minerals are removed magnetically, and the zircon concentrate is dried and cleaned magnetically. The zircon concentrate is graded at 99.5 percent and the rutile at 96-percent pure.

Swansea Minerals.—Deposits and plant at Swansea Beach, N. S. W. when firm was producing, average monthly output was 300 long tons, but operations closed temporarily at end of June 1948. The black sands were hand-loaded into trucks and only Wilfley tables used in treating them. The firm marketed a mixed concentrate consisting of 44 percent zircon, 41 percent ilmenite, 10 percent rutile, and 5 percent other heavy minerals.

Alluvial Gold, Ltd.—Leases covering about 590 acres in the Murwillumbah district, N. S. W. Preliminary borings indicate that the area contains 130,000 tons of rutile and 250,000 tons of zircon ore.

Zinc Corp.—Large mining firm investigating deposits on North Stradbroke Island, for which it has important lease holdings. Leases apparently taken in the name of Australian Mining & Smelting Co., Ltd., and later transferred to the Titanium & Zirconium Industries

Pty., Ltd., which is doing preliminary boring. Both companies are subsidiaries of the Zinc Corp.

James Scott-Moffatt.—He has applied for dredging leases for an 80-acre area on South Stradbroke Island, requesting a 21-year lease. Plans to concentrate heavy minerals on island and transport them to Brisbane to be separated.

Rare Metals Pty., Ltd.—Had just commenced operations on commercial scale when report was prepared. Deposit at Cheyne Beach, 40 miles east of Albany, Western Australia. Sample shipment of 100 tons of sand sent to England had an over-all mineral yield of 69 percent. Concentrating plant will be at Albany, and the company planned soon to send 10,000 long tons there for processing. Ilmenite in this deposit is virtually free of chrome (which characterizes much of Australia's ilmenite) and is thus suitable for commercial use. Zircon and rutile will also be marketed.

British Titan Products.—A subsidiary of Imperial Chemical Industries (British). No information available regarding firm's plans.

CANADA

Announcement was made during the year of an extensive development program in new titanium-iron ore fields in the Allard Lake area of eastern Quebec. The work has been in progress for several years and has been carried on jointly by the Kennecott Copper Corp. and the New Jersey Zinc Co. According to the Northern Miner,[9] upwards of 125,000,000 tons of high-grade, easily accessible titanium-bearing ore has been outlined by diamond drilling at Tio Lake. The report credits discovery of the deposit to J. A. Retty of the Quebec Bureau of Mines, who carried out in 1941 the first geological work to be done in the Lower Romaine River area, in Saguenay County, on the north shore of the Gulf of St. Lawrence, about 400 miles below Quebec City. Dr. Retty called attention to the presence of several large masses of anorthosite rocks, some of which were rich in ilmenite, and indicated that ore bodies of considerable size well might be developed.

The Quebec Iron & Titanium Corp.—owned two-thirds by Kennecott and one-third by New Jersey Zinc—was organized to equip and operate the property, according to the 1948 annual report to stockholders of the Kennecott Copper Corp. A railroad 27 miles in length will be required to transport the ores to the St. Lawrence River at Havre St. Pierre, and grading for 4½ miles of the distance had been completed early in 1949. From Havre St. Pierre the ore will be moved up the St. Lawrence about 600 miles to Sorel, where the smelting operation will be conducted utilizing the hydroelectric power available in that area. Production on a small scale is scheduled to begin late in 1950, and the company hopes to be treating 1,500 tons of ore a day by the end of 1951. An over-all expenditure of $25,000,000, about two-thirds in the Sorel area, is expected to be needed to bring the operation to the initial capacity indicated. Through extended research an electric smelting method for separating the ore into mer-

[9] Northern Miner, New Titanium-Iron Ore Fields Add Impulse to Industry: Vol. 34, No. 22, Aug. 19, 1948, pp. 1, 8-9.

chantable iron and high-grade titanium oxide slag was developed. In speaking of the market for their product, Kennecott stated:

> At the beginning of operations the principal demand for the titanium slag will be for conversion into titanium oxide for use in the paint, white rubber, paper and ceramic industries. Eventually, however, there should be a substantial market for the slag to process into titanium metal, which, because of its strength, corrosion resistance and relatively light weight, should be superior to other metals for many purposes. As research is currently being carried on by many organizations to find a low-cost process for producing the metal, it is quite possible that developments in this direction will be realized within a reasonable length of time.

According to the Northern Miner of January 20, 1949, plans cover an initial 1,500-ton unit, but the plant is laid out to accommodate four such units. The annual treatment of 550,000 tons of ore is expected to yield 175,000 tons of high-grade iron and 250,000 tons of TiO_2 slag.

OTHER COUNTRIES

Czechoslovakia.—Production of titanium oxide at Aussig was discussed in a recent report.[10] The data were given entirely from memory. The plant was said to have had a capacity of 600 to 900 metric tons of titanium oxide before the war. Planned extensions to 1,200–1,500 tons were not completed. Supplies of ilmenite had come from Travancore, Portugal, and Norway and just before the war were largely from Malaya. Norwegian ilmenite was used solely during the war. Another report [11] stated that a deposit of ilmenite of excellent quality had been located near Pilsen.

United Kingdom.—The British Titan Products Co., Ltd., which has operated a titanium pigments plant at Bellingham since 1934, planned [12] to complete a new plant at Grimsby before the end of 1948. Production was expected to begin early in 1949 and to expand to 10,000 tons of rutile-grade titanium oxide pigment annually. The Grimsby works will have its own sulfuric acid plant, which is expected to produce 110 tons of sulfuric acid a day and is said to be the largest single contact unit in the country. Imports of titanium ores into the United Kingdom totaled 57,493 long tons in 1948 compared with 71,250 tons in 1947.

Tungsten

By HUBERT W. DAVIS

GENERAL SUMMARY

GREATLY expanded domestic production and imports, higher level of consumption, reduction in the rate of duty, and lower prices were features of the tungsten industry in 1948.

Despite a 24-percent reduction in the rate of duty, domestic output and shipments of tungsten concentrates reversed a 4-year downward trend. Production and shipments of tungsten concentrates (60 percent WO_3 basis) were 4,210 and 4,005 short tons, respectively, in 1948, increases of 32 and 29 percent over 1947. California displaced Nevada as the premier tungsten-producing State in 1948. The Climax Molybdenum Co. began commercial recovery of tungsten concentrate as a byproduct of molybdenite production at the Climax mine in Lake County, Colo., in May 1948.

Salient statistics of tungsten ores and concentrates in the United States, 1944–48, in pounds of contained tungsten

Year	Production	Shipments from mines	Imports for consumption	Consumption	Industry stocks at end of year		
					Producers	Consumers and dealers	Total
1944	9,764,647	9,786,537	18,396,277	19,165,000	435,634	1,510,419	1,946,053
1945	5,388,639	5,266,818	4,773,861	14,146,000	557,042	3,784,429	4,341,471
1946	4,671,042	4,942,282	6,869,438	6,458,000	285,865	3,694,256	3,980,121
1947	3,026,470	2,944,622	6,018,005	7,812,000	368,316	[1] 3,343,392	[1] 3,711,708
1948	4,006,741	3,811,639	7,548,101	8,853,000	563,418	5,284,901	5,848,319

[1] Revised figure.

Imports of tungsten ores and concentrates for consumption in the United States were also larger in 1948; they were 7,931 short tons (60 percent WO_3 basis), an increase of 25 percent over 1947. Asia, chiefly China, supplied 68 percent of the total imports in 1948 and 123 percent more than in 1947. Imports from South America, however, were 28 percent smaller in 1948 than in 1947. Of the total imports, 1,792 tons (60 percent WO_3 basis) were received from China duty free for the United States Government.

Consumption of tungsten concentrates (60 percent WO_3 basis) in the United States was 9,300 short tons in 1948, compared with 8,200 tons in 1947. The quantity of concentrates converted to ferrotungsten was 8 percent greater in 1948 than in 1947. A much greater export

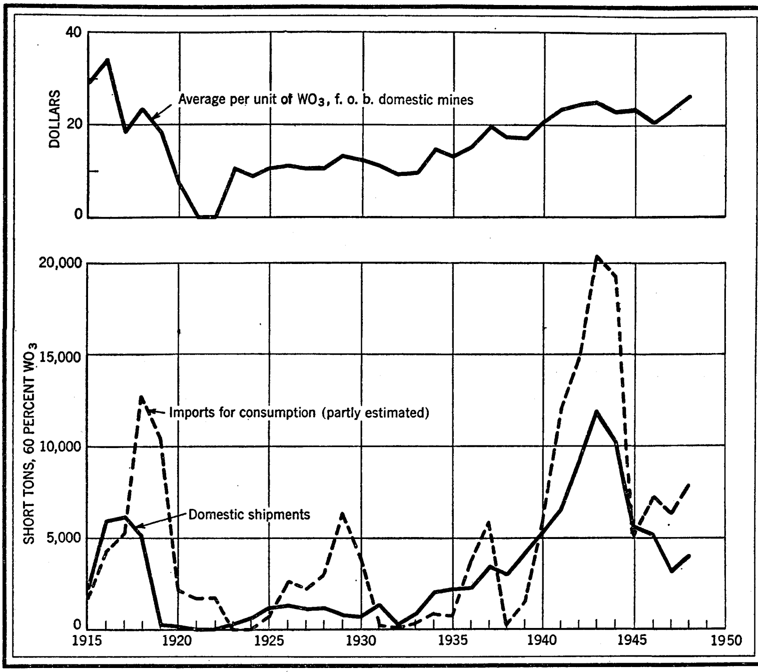

FIGURE.—Trends in domestic shipments, imports, and average price of tungsten ores and concentrates, 1915–48.

demand for ferrotungsten, which increased to 1,255,435 pounds (gross weight) in 1948 from 81,983 pounds in 1947, was more than enough to account for the larger quantity of concentrates used in making ferrotungsten in 1948. Usage of tungsten concentrates charged directly to the steel bath was 32 percent greater than in 1947. Consumption of concentrates in tungsten-metal powder and other tungsten products gained 12 percent.

Industry stocks of tungsten concentrates (60 percent WO_3 basis) were 6,145 short tons on December 31, 1948, compared with 3,900 tons at the end of 1947.

Effective May 22, 1948, the rate of duty on tungsten ores and concentrates was reduced to \$6.03 a short-ton unit of WO_3; the former rate was \$7.93 a unit.

RESERVES

Information on reserves of tungsten ore in the United States, prepared by the Bureau of Mines and Geological Survey, was published in hearings before a subcommittee of the Committee on Public Lands, United States Senate, Eightieth Congress, first session, 1947 (pp. 300–303); an abstract is contained in the chapter of this series for 1947 (p. 1187).

DOMESTIC PRODUCTION

The tungsten ore mined and milled in the United States, in general, contains 0.5 to 2.5 percent WO_3 and is beneficiated to a concentrate containing 60 percent or more WO_3. The leading tungsten producers and many small operators depend on ore carrying tungsten only as scheelite (calcium tungstate). Hübnerite (manganese tungstate), wolframite (iron-manganese tungstate), and ferberite (iron tungstate), in the order listed, contributed smaller quantities of the tungsten in domestic ore mined in 1948. Most of the concentrates are converted to ferrotungsten and tungsten metal. Some high-purity concentrates, however, are charged directly to the steel bath.

Despite a 24-percent reduction in the rate of duty and substantially lower price, production of concentrates (60 percent WO_3 basis) reversed a 4-year downward trend in 1948, when 4,210 short tons were produced compared with 3,180 tons in 1947. Output in 1948 was obtained from many widely scattered operations in eight States and Alaska, but three States—California, Nevada, and North Carolina—supplied 94 percent of the total; and six operators—Climax Molybdenum Co., Nevada-Massachusetts Co., Nevada Scheelite, Inc., Surcease Mining Co., Tungsten Mining Corp., and United States Vanadium Corp.—produced 90 percent of the United States total. California displaced Nevada as the premier tungsten-producing State in 1948. Despite a 63-percent gain in output in North Carolina, it dropped to third place in 1948.

Tungsten concentrates produced and shipped in the United States, 1947–48, by States

State	Produced				Shipped from mines			
	1947		1948		1947		1948

1 Less than half a ton.
2 Less than 0.01 percent.

Alaska.—J. H. Scott Co., operating the Riverside mine near Hyder, produced (but did not ship) a small quantity of concentrate averaging 50 percent WO_3 in 1948. The Yukon Corp. did some prospecting at the Big Chief mine near Fairbanks in 1948.

The tungsten deposits in Alaska have been described.[1]

Arizona.—Production and shipments of tungsten concentrates in Arizona were 20 short tons averaging 69.4 percent WO_3 in 1948 compared with 16 tons averaging 50.3 percent WO_3 in 1947. The outputs in both years came from several widely scattered operations.

California.—California ascended from third to first place as a tungsten-producing State in 1948, chiefly because of greatly increased operations at the Pine Creek mine and concentrator and partly to a much higher rate of activity at the Spud Patch placer and to reopening of the Strawberry mine. Output of concentrates was 1,542 short tons averaging 69.2 percent WO_3 in 1948, compared with 521 tons averaging 54.8 percent WO_3 in 1947. Shipments of tungsten concentrates totaled 1,549 tons averaging 68.4 percent WO_3 in 1948, compared with 515 tons averaging 45.9 percent WO_3 in 1947. Although concentrates were produced at a number of widely scattered operations, six producers (Alpine Mining Co., Consolidated Tungsten, Strawberry Tungsten Mine, Surcease Mining Co., Tulare County Tungsten Mines, and United States Vanadium Corp.) supplied 96 percent of the State total. The bulk of the remainder was contributed by Embree & Eliason Mining Co., Sheridan & Bennett, Hanging Valley Tungsten Co., W. C. Thompson, and O. A. Kittle Mining & Exploration Co.

1 Thorne, R. L., and others, Tungsten Deposits in Alaska: Bureau of Mines Rept. of Investigations 4174, 1948, 51 pp.

The Pine Creek mine and concentrator of United States Vanadium Corp. near Bishop were operated at greatly increased rates in 1948; and the company output of tungsten concentrates, which was nearly 12 times more than in 1947, was the largest in the United States. The driving of a 7,240-foot low-level adit, which was begun in 1945, was completed in 1948, and installation of 36-inch gage track in the tunnel was begun.

Surcease Mining Co. continued to work the Spud Patch and other placers in San Bernardino County, and its output of concentrate in 1948 was 121 percent greater than in 1947.

The Harrel Hill mine in Tulare County, operated by Consolidated Tungsten, and the Alpine mine in Alpine County, operated by Alpine Mining Co., were worked at much higher rates in 1948 than in 1947.

About half as much tungsten concentrate was produced in 1948 as in 1947 by Tulare County Tungsten Mines, operating the Big Jim mine in Tulare County.

The Strawberry mine in Madera County was reopened in 1948 by the Strawberry Tungsten Mine, which drove two new adits 190 feet, deepened the shaft 40 feet, and rebuilt the mill.

The O. A. Kittle Mining & Exploration Co., which leased the Round Valley mine in Inyo County, found an ore body by diamond drilling.

The Tungstar Corp. leased the Black Rock mine in Mono County and began development in December 1948. The mill to serve the mine was being rehabilitated for operation in 1949. The Tungstar Corp. also plans to diamond-drill its Tungstar mine in Inyo County.

The tungsten occurrences in the Darwin district have been described briefly.[2]

Colorado.—Production and shipments of tungsten concentrates (60 percent WO_3 basis) in Colorado were 198 and 208 short tons, respectively, in 1948 compared with 61 and 68 tons, respectively, in 1947.

The Climax Molybdenum Co., operating the world's largest known molybdenite deposit at Climax, Lake County, began recovery of the very small tungsten content of its ore in May 1948.

The Firth-Sterling Steel & Carbide Corp. (Wolf Tongue Division), Tanner & Smith, and George H. Teal & Associates were the chief producers of tungsten concentrates in Boulder County in 1948. The Firth-Sterling Steel & Carbide Corp. discontinued mining and milling tungsten ore December 24, 1948, and was liquidating its tungsten holdings. This company has been active in mining tungsten ore in the Boulder County field since 1905.

Idaho.—A new concentrator to serve the Ima mine in Lemhi County was under construction in 1948 by Bradley Mining Co. The mill, which replaces one destroyed by fire December 10, 1947, was completed and put into operation in January 1949. Development was done at the Ima mine during 1948.

Missouri.—The And-Mor Mining Co., Inc., operated the Apex mine in Madison County, near Fredericktown, in 1948.

Nevada.—Nevada, which for three successive years had been the premier tungsten-producing State, surrendered the lead to California in 1948. Production of concentrates was 1,076 short tons averaging

[2] Butner, D. W., Investigation of Tungsten Occurrences in Darwin District, Inyo County, Calif.: Bureau of Mines Rept. of Investigations 4475, 1949, 6 pp.

70 percent WO_3 in 1948 compared with 3,550 tons averaging 32 percent WO_3 in 1947. Shipments were also smaller and were 874 tons averaging 65 percent WO_3 in 1948 compared with 3,576 tons averaging 34 percent WO_3 in 1947.

The Nevada-Massachusetts Co., the largest producer of tungsten concentrates in the United States in 1947, dropped to second place in 1948; its output was 19 percent smaller than in 1947. The mill and the Stank, Humboldt, and Sutton No. 2 mines were operated steadily. Work was discontinued at the O'Byrne mine after March 1. Very little underground development was done in 1948. Open-pit mining continued to yield satisfactory tonnages in 1948.

The second-largest producer of tungsten concentrates in Nevada in 1948 was Nevada Scheelite, Inc., operating a mine of the same name in Mineral County; output was four times that in 1947.

The chief smaller producers of concentrates in 1948 were the Atolia Mining Co., operating the Lincoln mine in Lincoln County; Minerva Scheelite Mining Co., operating the Scheelite Chief mine in White Pine County; Tungsten Minerals, Inc., operating the Tungstonia mine also in White Pine County; United States Vanadium Corp., operating the Riley mine in Humboldt County; and the Cherry Creek Mining Co., operating the Cherry Creek mine in White Pine County. The Lincoln mine was closed in July 1948, and operations at the Riley mine were discontinued for an indefinite period in early 1948. The Scheelite Chief mine, formerly worked by Tungsten Metals Corp., was rehabilitated, and a mill of 25-ton daily capacity was built to serve it. Much development was done at the Tungstonia mine in 1948.

North Carolina.—Despite a 63-percent gain in production of tungsten concentrates, North Carolina dropped from second to third place as a tungsten-producing State in 1948. Output was 969 short tons averaging 58.3 percent WO_3 in 1948 compared with 585 tons averaging 59.2 percent WO_3 in 1947. Shipments were also much larger and totaled 990 tons averaging 58.5 percent WO_3 in 1948 compared with 542 tons averaging 59.6 percent WO_3 in 1947.

The Tungsten Mining Corp., operating the Hamme mine in Vance County, continued to be the only producer of tungsten concentrates in North Carolina. The major development program, which was inaugurated by the company in June 1947, was continued in 1948; as a result, 17,382 feet of diamond drilling and 7,526 feet of underground development were done; a 215-foot shaft was sunk to open the Sneed No. 2 ore body, and from this shaft a 500-foot drift was driven to open the Sneed No. 1 ore body. The sinking of a central shaft was begun to facilitate mining operations and to free shaft ore pillars. Winzes were sunk to the 400- and 500-foot levels, respectively, of veins No. 2 and No. 3. To increase milling capacity, a rod mill for regrinding was added, and for upgrading concentrates a six-pole magnetic separator was installed.

The Seminole Rock & Sand Co. did no development at its property in Vance County in 1948. However, it shipped a small quantity of concentrate which was produced in 1944.

The tungsten deposits in Vance County have been described.[3]

Utah.—Small quantities of tungsten concentrates were produced in Tooele County, Utah, in 1948 by the Star Dust Mines, Inc., operating the Star Dust mine; C. H. Wilson, operating the Yellow Hammer mine; and Fred Cook (property not reported).

CONSUMPTION

Consumption of tungsten concentrates (60 percent WO_3 basis) in the United States was about 9,300 short tons in 1948 compared with 8,200 tons in 1947. Of the total consumed in 1948, about 4,100 tons (44 percent of the total) were converted to ferrotungsten, the form in which most of the tungsten is introduced into steel. However, high-purity tungsten concentrates are charged directly to the steel bath; and 1,850 tons (20 percent) were so used in 1948. Tungsten-metal powder and other tungsten products, chiefly the former, utilized about 3,350 tons or 36 percent of the total concentrates consumed in 1948.

PRICES

Prices on tungsten concentrates were, in general, downward in 1948. According to the Engineering and Mining Journal, quotations on imported concentrates had declined from \$30 a short-ton unit of WO_3, duty paid, on January 1 to \$23.50–\$24 a unit on September 9; thereafter prices firmed somewhat and at the year end had advanced to \$24.25–\$24.75 a unit. Domestic scheelite of good known analysis, in carlots, delivered, was quoted at \$30 a short-ton unit of WO_3 from January 1 to June 16, at \$28 a unit from June 17 to November 3, and at \$28.50 a unit from November 4 to December 31. The use of high-purity scheelite for direct smelting has placed a premium on this type of concentrate. As reported to the Bureau of Mines, the average price for domestic concentrates shipped to consumers was \$26.27 a short-ton unit of WO_3 in 1948.

FOREIGN TRADE[4]

Domestic production is inadequate for requirements, and the United States imports both tungsten concentrates and products, chiefly the former. General imports (receipts) of ores and concentrates into the United States totaled 9,763,761 pounds (tungsten content), equivalent to 10,259 short tons of 60 percent WO_3 in 1948, an 8-percent gain over 1947. This quantity represents the ores and concentrates received in the United States, irrespective of final disposition. Although ores and concentrates were received from 17 foreign countries in 1948, 4—China (50 percent), Korea (18 percent), Brazil (9 percent), and Bolivia (5 percent)—supplied 82 percent of the total.

[1] Comprises ores and concentrates received in the United States; part went into consumption during year, and remainder entered bonded warehouses.
[2] Comprises ores and concentrates withdrawn from bonded warehouses during year (irrespective of time of importation) and receipts during year for consumption.

Imports of ores and concentrates for consumption in the United States were 7,548,101 pounds (tungsten content), equivalent to 7,931 short tons of 60 percent WO_3 in 1948, a gain of 25 percent over 1947. Imports for consumption represent ores and concentrates on which the duty has been paid and which have thereby entered into the domestic commerce of the United States and concentrates which enter duty free for the United States Government. China (49 percent), Korea (13 percent), Brazil (11 percent), and Bolivia (7 percent) supplied 80 percent of the total. Of the total imports, 1,705,831 pounds (tungsten content), equivalent to 1,792 short tons of 60 percent WO_3, from China were duty-free for the United States Government.

In 1948, 972 short tons (60 percent WO_3) of ores and concentrates were withdrawn from warehouses for smelting, refining, and export (954 tons in 1947), and 391 tons (gross weight) were reexported (933 tons in 1947). Ores and concentrates withdrawn for smelting, refining, and export and for reexport are free of duty.

Effective May 22, 1948, the rate of duty on tungsten ores and concentrates was reduced to 38 cents a pound on the metallic tungsten contained therein. This is equivalent to $6.03 a short-ton unit.[5] The former rate was 50 cents a pound or $7.93 a short-ton unit.

Exports of tungsten ores and concentrates from the United States were 415 short tons (gross weight) in 1948 compared with 155 tons in 1947. Of the 1948 exports, 180 tons went to the United Kingdom, 108 tons to Germany, 54 tons to Sweden, 35 tons to India, 20 tons to Italy, 18 tons to France, and 19 pounds to Canada.

Imports of tungsten metal were 224 pounds in 1948 (10,890 pounds in 1947). No tungstic acid was imported in 1948 (4 pounds in 1947). There were no imports of ferrotungsten, tungsten carbide, or combinations containing tungsten or tungsten carbide in 1947 or 1948.

Exports of tungsten metal, stellite, wire, shapes, and alloys other than ferrotungsten were 181,956 pounds in 1948 (243,741 pounds in 1947). Exports of ferrotungsten were 1,255,435 pounds (gross weight) in 1948 (81,983 pounds in 1947).

WORLD REVIEW

Argentina.—Argentina formerly ranked as the second-largest producer of tungsten in South America; but in 1944 it was displaced by Brazil, and in 1946 it was displaced by Peru as the third-largest producer. Output in Argentina comes from the Provinces of Catamarca, Córdoba, Mendoza, San Juan, and San Luis. Production of tungsten (60 percent WO_3 basis) in Argentina advanced uninterruptedly from 392 metric tons in 1934 to reach a peak of 2,390 tons in 1943. During the three following years output declined progressively and had dropped to 457 tons in 1946. Except for a small tonnage mined in the course of maintenance work, production was virtually suspended in 1947 and 1948. The marked decline in tungsten operations was attributed to termination of war contracts, increase in cost of production, lack of a home market, and uncertainty of getting working permits promptly.[6] To promote tungsten production in Argentina, it has been proposed that a law be introduced that would cover such points as setting a reasonable price for the producer under different circumstances, permitting the state to collect a stock of tungsten minerals for emergency, and controlling employer-employee relationships.

---

[5] A unit, as applied to tungsten ores, is 1 percent of a ton of contained tungsten trioxide (WO_3). Thus, a short-ton unit is 20 pounds of WO_3 or 15.86 pounds of tungsten (W).

[1] In addition to countries listed, tungsten ore is produced in U. S. S. R., but data on production are not available; no estimate included in total.
[2] Data not available; estimates by author of chapter included in total.
[3] Less than 1 ton.
[4] Preliminary data for the fiscal year ended Mar. 31 of year following that stated.
[5] January to September, inclusive.

Australia.—During the year ended October 31, 1948, the King Island Scheelite, N. L., milled 142,641 long tons of scheelite ore averaging 0.6 percent WO_3, which yielded 591 tons of concentrate. In the corresponding year 1947 it milled 128,628 tons of ore averaging 0.652 percent WO_3, which yielded 613 tons of concentrate averaging 64.7 percent WO_3. The mine, which is on King Island in Bass Strait, is worked by the open-pit method and is served by a treatment plant (capacity 20,000 tons of ore monthly) comprising gravity units for recovery of the coarse mineral and a flotation section for recovery of slimed material.

Bolivia.—Bolivia continued to be the largest tungsten producer in South America. Most of the deposits are in the Departments of La Paz, Oruro, Potosí, and Cochabamba. Output (as indicated by exports) was 2,485 metric tons (60 percent WO_3 basis) in 1948 compared with 2,635 tons in 1947.

Brazil.—Brazil continued to be the second-largest producer of tungsten in South America. The principal deposits are in the States of Paraíba and Rio Grande do Norte. Continuing a downward trend that has persisted for four successive years, exports of tungsten concentrates (65 percent WO_3) were 1,056 metric tons in 1948 compared with 1,226 tons in 1947.

Burma.—Before World War II Burma ranked second to China as a tungsten-producing country. The chief producing mines have been the Mawchi in the southern part of Karenni State, and the Hermingyi, in the Tavoy District. Mining of tungsten was resumed in the Tavoy and other districts of Lower Burma in 1947.

Production of tungsten concentrates in Burma in 1947, by districts, in long tons

District	Wolframite concentrates	Mixed tin and wolframite concentrates
Amherst		2
Mergui	154	73
Tavoy	180	935
Thatôn		163
Yamèthin	15	47
Total	349	1,220

Mining and milling operations were resumed at the Mawchi mine in March 1948. However, because of the political unrest in Karenni, the Government of Burma placed an embargo on supplies of explosives for the Mawchi mine, and as a consequence full-scale production was not attained in 1948; only 836 long tons of mixed tin-wolfram concentrates were produced. On reoccupation of the property, which was captured by the Japanese during World War II, 589 tons of mixed tin-wolfram concentrates were recovered and shipped to Great Britain.

Canada.—Production of tungsten concentrate (WO_3 content) in Canada was 962,000 pounds in 1948 compared with 496,023 pounds in 1947. Output in both years was from British Columbia, presumably from the Emerald mine.

Chile.—Chile ranks last among the five South American countries that produce tungsten. The deposits are in the northern part of central Chile and near Santiago. The deposits in the northern part of the country have been described.[7]

China.—In 1948, as in 1947, China was the premier producer of tungsten. Exports of tungsten from China increased phenomenally in 1948 and were the largest since 1942; they were about 11,300 metric tons in 1948 compared with 6,109 tons in 1947; the average WO_3 content was about 65 percent.

France.—The entire production of tungsten concentrate in France is from the Montmins mine in the Department of Allier.[8] Outputs were 227 metric tons averaging 75.54 percent WO_3 in 1946 and 350 tons (WO_3 content not stated) in 1947.

Korea.—Production of tungsten concentrates (60 percent WO_3 basis) in South Korea was 1,300 metric tons in 1948 compared with 1,227 tons in 1947.

Peru.—Production of tungsten concentrates in Peru declined markedly in 1948 and was the smallest since 1939; nevertheless, it has displaced Argentina as the third-largest tungsten producer in South America. Output (60 percent WO_3 basis) was 227 metric tons in 1948 compared with 579 tons in 1947. The principal deposits are in the Departments of La Libertad and Ancash; there are other deposits in the Departments of Puno and Huancavelica.

Portugal.—Portugal is the largest producer of tungsten in Europe, and the Panasqueira, Ribeira, and Borralha mines are the chief producers. As a result of greatly increased demand and competitive buying by the Allies and Germany during World War II, production reached a peak of 7,477 metric tons (60 percent WO_3 basis) in 1943. However, on the eve of the invasion (June 6, 1944) of France by the Allies, Portugal prohibited the exportation, circulation, and transit of tungsten and also suspended the operation of existing mines and the development of new ones. As a consequence, the smaller mines were closed completely, whereas the larger mines went on a maintenance basis. In late 1945 the prohibition on mining of tungsten was lifted; likewise, the restrictions on sales were removed, but half of the exports were required to be supplied from the Government's stock. As a result of this requirement and of greatly lessened demand following the end of hostilities, output in Portugal was at a low rate in 1946. Greatly accelerated world demand and much higher prices in 1947 were accompanied by increased operating schedules; as a result, Portugal regained its position as the leading tungsten-producing country in Europe. Output (60 percent WO_3 basis) increased from 630 metric tons in 1946 to 3,149 tons in 1947 but declined to 2,930 tons in 1948.

The three largest producing tungsten mines in Portugal have been described[9] as follows:

> **Panasqueira Mine.**—The British Beralt Tin and Wolfram Limited operates this mine located about 800 meters above sea level 28 kilometers west of Fundao which is 308 kilometers by road northeast of Lisbon on the flank of the Serra da Estrela. At present, it is producing about 170 tons per month of concentrate containing 73 percent WO_3 and 10 tons of cassiterite concentrate containing 70 percent tin. The Panasqueira mine is believed to be the largest individual producer of wolframite in operation today anywhere in the world. The ore deposits con-

[8] Mining and Metallurgy, vol. 29, No. 501, September 1948, p. 499.

[9] Kelsey, E. T., Portuguese Tin and Tungsten Industries: Am. Embassy, Lisbon, Portugal, Rept. 7, Feb. 18, 1949, 12 pp.

sist of numerous irregular veins which represent the filling of a system of flat dipping fracture planes in slates with interbedded quartzite and are situated near a granite contact. Largely hydrothermal in origin, the veins are up to 50 centimeters thick and contain wolframite or cassiterite or mixtures of the two along with arsenopyrite, pyrite, chalcopyrite, apatite, and various carbonates, in a quartz gangue. Ore currently being mined analyzes approximately 0.63 percent WO_3 and 0.05 percent Sn. Mining through adits is done by long wall stopping with pack walls of waste or shock packs. Hand sorting in the stopes eliminates half the volume. The balance goes to a mill where sulphides are floated off, after grinding, and wolframite ultimately recovered by magnetic separation after passing through jigs for preliminary gravity separation. Mechanical equipment is electrically operated with power supplied by the Serra da Estrela company and in addition to well equipped shops includes air compressors delivering 6,000 cubic feet of free air per minute. Besides drills, small air hoists and pumps only are used. Mules are used for tramming in the main haulageway. Concentrates are trucked to rail at Fundao, thence sent by train 250 kilometers to Lisbon or, occasionally, trucked direct to Lisbon whence shipment is made by sea to the United Kingdom. Employees at present total 2,500. Approximately 500 tons of mixed pyrites are also recovered every month. These are sold in Portugal and their arsenic content recovered.

Ribeira Mine.—The American owned Ribeira mine, now under option to the Empresa Tecnica e Administracoes of Lisbon, controlled by Mr. John C. Allan, Director of Panasqueira mine, is situated about 25 kilometers southeast of Braganca near the Spanish frontier. The deposit, located four miles east of a granite contact, consists of eight quartz veins, 30 to 80 centimeters in width, containing wolfram and scheelite with some chalcopyrite and arsenopyrite in slates and quartzite. Mining is done through adits over a vertical range of 150 meters and 200 meters on strike. Ore now being mined averages 1 percent Sn and 0.2 percent WO_3. Mining is by open stope and milling at present is a rudimentary mixture of hand dressing and gravity concentration followed by magnetic separation. A new mill now under construction is expected to more than double present monthly production which averages seven tons of cassiterite concentrate containing 70 percent Sn and two tons of wolfram minerals concentrate containing 65 percent WO_3. Although this property has been intermittently mined for 60 years or more, development work has not been sufficient to make an accurate forecast of reserves but in the manager's opinion they should be substantial. At present, 200 men are employed, including those constructing the new mill.

Minas da Borralha.—The French owned Minas de Borralha S. A., operates the Minas de Borralha near Venda Nova in the Braga District almost equidistant between Braga and Chaves and some 15 miles south of the Spanish frontier. Present monthly production is given as 40 tons of concentrate containing 65 percent WO_3. When development work and mill enlargement now under way is completed late in 1949, monthly production should average 100 tons of concentrate. The wolframite with a little scheelite occurs in quartz veins in schists or granite near a granite-schist contact. An analysis of the ore is not available but some chalcopyrite, pyrite and arsenopyrite occur. No cassiterite is present. Mining is by open stope reached through adits. Mechanical equipment includes an air compressor. Concentration is by magnetic separation. Ore is shipped by truck to Oporto, thence by boat principally to France. Some 400 workmen are employed underground and on the surface.

South-West Africa.—The O'Okiep Copper Co. continued development and stope preparation of the ore body in its wolframite mine in Namaqualand. A mill to serve the mine was completed and put into operation in October 1948, and the company anticipates that by the summer of 1949 it will be working on a basis of 125 tons of milling ore per day.

United Kingdom.—The production of tungsten in Great Britain is a byproduct of tin mining in Cornwall. The comparatively small domestic output, however, is insufficient for requirements, and the country imports ores and concentrates from many sources. Portugal, Burma, Bolivia, and China, in the order listed, were the chief sources of supply for Great Britain in 1948.

Uranium, Radium, and Thorium

By ALLAN F. MATTHEWS

GENERAL SUMMARY

OPERATION of the first nuclear reactor outside of the American-British-Canadian sphere was announced in France toward the close of 1948. This indication of worldwide atomic developments was noted apprehensively, as it was not paralleled by any perceptible progress in international control of atomic energy.

In the United States a domestic-ore purchase program was launched, a major overhaul of the Hanford reactors was completed, three atomic weapons were tested (at Eniwetok), and nearly 3,000 orders for isotopes were shipped. Expenditures by the Atomic Energy Commission in the fiscal year ended June 30, 1949, were $631,000,000 (338 million for plant and equipment and 293 million for operations), bringing total United States expenditures on atomic energy to $3,474,000,000. The number of scientists and engineers in Atomic Energy projects was 7,000 to 8,000 in July 1945; 3,500 to 4,000 in July 1946; 4,000 to 4,500 in July 1947; and 7,000 to 7,500 in July 1948. By the end of 1948 the AEC had a larger technical staff than the Manhattan District (its predecessor) ever had, although the new team contained fewer prominent men and was composed largely of younger scientists and engineers.

The first uranium–233 ever produced, a few hundred milligrams prepared in a Hanford reactor, was announced by Dr. Glenn T. Seaborg March 5, 1948. The following month the Atomic Energy Commission declared that it considered U–233, which is derived by transmutation of common thorium, to be a fissionable material. However, the AEC added that it was interested in monazite and thorium only for experimental purposes, according to an October 14 statement, quoted in full in the Monazite section of the Minor Nonmetals chapter of this volume.

An interpretation of the Atomic Energy Act of 1946 [1] was published by two lawyers who participated in its drafting. The Atomic Energy Commission, from its inception January 1, 1947, through 1948, comprised David E. Lilienthal (chairman), Robert F. Bacher,

[1] Newman, James R., and Miller, Byron S., The Control of Atomic Energy: McGraw-Hill Book Co. Inc., New York, 1948, 434 pp.

Sumner T. Pike, Lewis L. Strauss, and William W. Waymack (except that Waymack resigned effective December 21, 1948). The first terms of office of these five members were to expire August 1, 1948, and the second terms were to be 1 to 5 years so as to stagger future 5-year terms, according to the Atomic Energy Act. However, the Congress amended the act on June 19, 1948, and merely extended the original terms to June 30, 1950. President Truman reluctantly signed the bill July 3 and stated it was "not in the best public interest, since it invests the atomic energy program with an aura of uncertainty * * *."

MINE AND MILL PRODUCTION

The uranium exploration program of the Geological Survey by 1948 included diamond drilling at a rate of 200,000 feet a year. The drilling is concentrated in public lands that the United States Department of the Interior withdraws from entry at the request of the Atomic Energy Commission. Such areas withdrawn in 1948 totaled approximately 155 square miles and comprised portions of Mesa, Montrose, and San Miguel Counties, Colo., and of Grand County, Utah. This is part of the Colorado Plateau region, a long-established source of carnotite (a radium-bearing potassium-uranium vanadate). Of the lands withdrawn, those found to contain no uranium will again be open for entry, and those showing uranium will become available for development and mining by private operators under special arrangement with the Government.

According to an Atomic Energy Commission statement December 17, 1948, the Colorado Plateau is the only region in the United States where uranium is now mined, and the output is very small compared to total United States requirements and to supplies available from foreign sources. A vein of pitchblende was discovered by Consolidated Caribou Silver Mines, Inc., in its Caribou mine, Grand Island district, Boulder County, Colo.

The United States Vanadium Corp. roscoelite mill at Rifle, Garfield County, Colo., and the Vanadium Corp. of America carnotite mill at Naturita, Montrose County, Colo., yield uranium precipitates. Contracts for Atomic Energy Commission procurement of these precipitates were extended in 1948. Furthermore, the AEC initiated plans to put three idle vanadium mills back to work, with production of uranium as their primary purpose. Toward this end, it purchased the plant at Monticello, Utah, in June 1948, from the War Assets Administration. The ore-purchasing agent is the American Smelting & Refining Co. By the end of the year negotiations were nearly complete for rehabilitation and operation of the plants at Durango and Uravan, Colo., by private companies. All five mills were expected to be operating before the end of 1949. The Vanadium Corp. of America may build a plant in the White Canon district, San Juan County, Utah, to process copper-uranium ores of Arizona and Utah.

Monazite was separated in a mill at McCall, Idaho, from black sands recovered as a byproduct of gold placering. The operator—Rare Earths, Inc.—reportedly shipped 40 tons of monazite in 1948. Monazite is expected to be a byproduct of titanium-zirconium operations from Florida dune and beach sands.

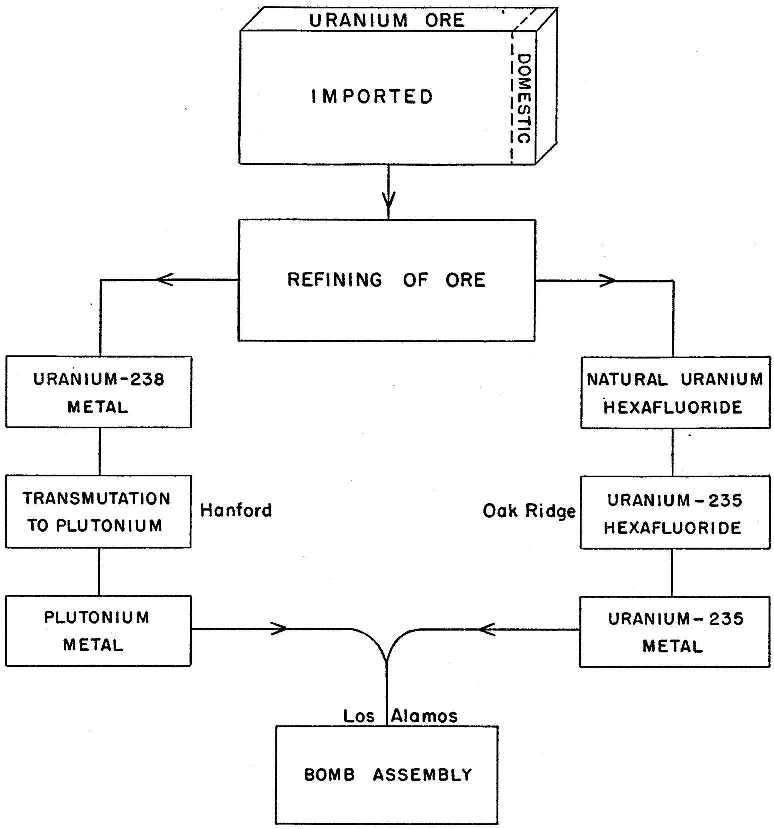

FIGURE 1.—Flow sheet of production of fissionable materials. (The division between domestic and imported ores is schematic and not based on actual data.)

REFINERY AND REACTOR PRODUCTION

Uranium.—During 1948 a new plant for producing uranium dioxide (brown oxide) was completed, and construction of a uranium-metal refinery estimated to cost $2,500,000 was begun. The operating costs per unit of uranium product have been reduced substantially, as shown by the following Atomic Energy Commission index numbers:

Year	Dioxide	Tetrafluoride	Hexafluoride	Metal
1946	100	100	100	100
1947	83	91	97	79
1948	79	84	87	75

Uranium hexafluoride is treated at Oak Ridge, Tenn., by a gaseous diffusion process to separate fissionable uranium (U–235) from common inert uranium (U–238). The Oak Ridge plant is operated by the Carbide & Carbon Chemical Corp., subsidiary of Union Carbide & Carbon Corp. At Hanford, Wash., the General Electric Co. operates uranium-graphite reactors (piles), in which a small portion of the common uranium is transmuted into fissionable plutonium. Both companies are contractors for the Atomic Energy Commission. A major overhaul of the Hanford reactors was undertaken in late 1947 and the first half of 1948. By the end of 1948 the production rate of the original reactors was greater than any achieved in wartime, according to the Atomic Energy Commission. Furthermore, new reactors were under construction in 1948.

Isotopes.—Shipments of isotopes from Oak Ridge, Tenn., exceeded 5,000 by the end of 1948. Data on the weight and radioactivity of such shipments are seldom published. A typical shipment of carbon-14, for example, is 1 millicurie.[2]

Isotopes shipped by the U. S. Atomic Energy Commission, by kinds, 1946–48, in number of shipments

Kind of isotope	1946[1]	1947		1948	
	Second half	First half	Second half	First half	Second half
Iodine-131	68	208	287	454	524
Phosphorus-32	48	212	325	422	479
Carbon-14	47	41	67	67	57
Sodium-24	1	31	49	64	55
Sulfur-35	12	19	20	15	26
Cobalt-60	4	20	12	10	20
Iron-55 and -59	5	21	20	14	19
Calcium-45	5	17	25	15	18
Potassium-42	6	17	14	10	14
Gold-198 and -199	17	46	6	17	12
Strontium-89 and -90	3	4	5	10	8
Others (49)	30	63	123	140	174
Total radioactive	246	699	953	1,238	1,406
Deuterium oxide (heavy water)		31	60	55	58
Deuterium (heavy hydrogen)		22	58	39	30
Boron-10		2	22	13	10
Oxygen-18			14	9	3
Electromagnetic concentrated				37	61
Total stable		55	154	153	162
Grand total isotopes	246	754	1,107	1,391	1,568

[1] Shipped by Manhattan District, Corps of Engineers, U. S. Army Service Forces.

Radium and Polonium.—Production of primary refined radium in the United States in 1948 was 7 grams, all by International Rare Metals Refinery, Inc., Mount Kisco, N. Y. An approximately equal quantity was refined by the company from waste and scrap during the year. Vitro Manufacturing Co., Pittsburgh, Pa., shipped 709 milligrams of radium from stocks. International Rare Metals Refinery, Inc., shipped several thousand millicuries of polonium and several hundred millicuries of radium D in 1948. Its sole distributor is Canadian Radium & Uranium Corp., New York, N. Y.

Thorium.—Thorium compounds are produced from monazite by Lindsay Light & Chemical Co., West Chicago, Ill., and Wolff-Alport, Brooklyn, N. Y. Thorium metal, 99.5 percent, is produced by Westinghouse Electric Corp., Pittsburgh, Pa., and by Metal Hydrides, Inc., Beverly, Mass. (subsidiary of Ventures, Ltd.).

[2] 1 millicurie is the quantity of a radioactive substance having the same alpha radiation as 1 milligram of radium.

Shipments of primary radium refined in the United States, 1941–43 (average) and 1944–48 [1]

Year	From domestic ores		From Canadian ores		Total	
	Milligrams	Estimated value	Milligrams	Estimated value	Milligrams	Estimated value
1941–43 (average)	2,042	$51,600			2,042	$51,600
1944	200	3,700	21,800	$403,300	22,000	407,000
1945	200	3,700	31,400	580,900	31,600	584,600
1946	200	3,700	17,400	321,900	17,600	325,600
1947	16,400	303,400			16,400	303,400
1948	4,219	77,980	3,510	63,200	7,729	141,180

[1] Excludes confidential figures representing certain shipments in October 1943 to May 1944.

CONSUMPTION AND USES

Weapons.—The center for development of atomic weapons is the Los Alamos Scientific Laboratory, Los Alamos, N. Mex., operated for the AEC by the University of California. A branch is the Sandia Laboratory, near Albuquerque, N. Mex., which works closely with the armed forces. Two small research reactors—one of enriched U–235 and the other plutonium—operate at Los Alamos to provide data for weapon development. Three atomic weapons were detonated at the AEC proving ground on Eniwetok Atoll, Marshall Islands, in April and May 1948.

Possible effects of the atomic bombardment of American cities and some aspects of atomic defense were discussed.[3]

Industrial Power.—Construction of two reactors for the experimental production of atomic power is expected to be completed in 1950 or 1951. One in Saratoga County, N. Y., will be operated by the General Electric Co. as part of the Knolls Atomic Power Laboratory and the other at the Argonne National Laboratory, Cook County, Ill., by the University of Chicago. These forerunners may lead to practical reactors that in 5 to 15 years will enter into competition with other sources of power, according to an estimate by AEC Commissioner Sumner T. Pike May 1, 1948. The present cost of a reactor approximates $50,000,000. The AEC announced December 29, 1948, that it had contracted for the Westinghouse Electric Corp., Pittsburgh, Pa., to construct an experimental nuclear reactor meeting specifications for the propulsion of naval ships.

A report to the AEC by its General Advisory Committee (J. Robert Oppenheimer, chairman)[4] included the following statements of the prospects for useful power from nuclear energy and of the principal factors involved:

> In anticipation of a rapidly growing shortage of uranium, great attention has been given to "breeding," a process in which plutonium or uranium 233 is pro-

duced by the power reactor at a rate greater than its consumption. It is theoretically possible—but in practice will be very difficult—to build an industrial reactor that will cause excess neutrons to be absorbed in a blanket of either U 238 or thorium, producing plutonium or U 233 which can serve as new fuel to continue the operation indefinitely as long as new natural uranium or thorium is supplied. This greatly increases the availability of fuel, for most of the uranium, not just the small 235 fraction of it, is consumable, and moreover the larger resources of thorium can be used. It might even be possible by these means to build up fissionable material faster than it is consumed.

Nevertheless, the engineering difficulties associated with breeding are enormous. The conditions which have to be fulfilled to obtain high neutron economy are difficult to reconcile with those needed to obtain a high power output for a given material investment * * *.

Another very important factor in the possibility of widespread use of atomic power will be the cost of uranium. At the price of uranium compounds before the war, the cost of uranium fuel would compete with coal under almost any condition * * *.

If unfavorable assumptions are made about the cost of uranium and the technical practicability of breeding, the result is that atomic power would not compete with coal power in the United States except in regions where the cost of transportation of the fuel from the mine is the determining factor, or under other special conditions where the small bulk and weight of the uranium fuel are particularly valuable. On the other hand, if favorable assumptions are made about the cost of uranium and the technical practicability of breeding, the ultimate capacity may become comparable to and even larger than the present coal industry and will operate at a lower cost, at least as far as fuel expenditure is concerned. At the present time, sufficient knowledge does not exist to make a definite choice between these two alternative possibilities. It should be pointed out that, in either case, the cost of a nuclear-fuel power plant will be substantially greater than that of a coal-burning plant of similar capacity * * *.

We do not see how it would be possible under the most favorable circumstances to have any considerable portion of the present power supply of the world replaced by nuclear fuel before the expiration of 20 years.

Economic data pertaining to the development of atomic power were presented in a University of Chicago report.[5] Some of the basic problems were outlined.[6]

Radiography.—Almost half of the radioactive isotopes shipped to date are used in medical therapy, notably iodine-131 for treating hyperthyroidism (overactivity of the thyroid gland) and phosphorus-32 for

Isotopes shipped by the U. S. Atomic Energy Commission by uses, 1946–48, in number of shipments

[6] Pike, Sumner T., Metallurgical and Economic Problems of Atomic Power Plants: Metal Prog., vol. 53, No. 6, June 1948, pp. 823–826.

polycythemia (overproduction of red blood corpuscles). Other isotopes are used largely in a wide variety of research projects, described in detail in the AEC Fourth Semiannual Report. The diffusion of metals and the chemistry of steelmaking are being investigated with "tracer" isotopes at the Carnegie Institute of Technology, Pittsburgh, Pa., and at the Stevens Institute of Technology, Hoboken, N. J.[7] Studies on cobalt-60, according to the AEC, show considerable promise that it may be a cheap and plentiful substitute for radium.

About half of the radium (primary and secondary) sales in 1948 were for medical use, and the remainder was divided almost equally among luminous compounds, industrial radiography, and research.

Nonenergy Uses.—Consumption of uranium compounds for purposes unrelated to atomic energy was restricted in 1948 to less than 2 short tons for the second successive year.

Consumption of uranium compounds for nonenergy purposes in the United States, 1943–48, in pounds of contained U_3O_8

PRICES

Uranium Ore.—A scale of commercial prices paid for uranium-vanadium ores during most of 1947 and early 1948 was quoted in Minerals Yearbook, 1947, page 1206. To stimulate domestic production of uranium ores, the Atomic Energy Commission in April and June 1948 announced guaranteed minimum prices at which it would purchase ores. The provisions of the program [8] are outlined below.

CARNOTITE AND ROSCOELITE IN COLORADO PLATEAU AREA (COLORADO, UTAH, NEW MEXICO, AND ARIZONA)

Buyer.—U. S. Atomic Energy Commission, P. O. Box 270, Grand Junction, Colo. Deliveries will be accepted at depots at Monticello, Utah, beginning July 1948 and at Durango, Colo., soon thereafter. The buyer is not obligated to, but may, purchase in excess of 5,000 short tons annually from ony one seller.

Specifications.—Minimum 0.10 percent uranium oxide (U_3O_8). Maximum 3 parts of lime ($CaCO_3$) to 1 part vanadium pentoxide (V_2O_5); maximum 6 percent lime. Must not contain other impurities harmful to buyer's extraction process. Maximum lump size 12 inches. Minimum quantity 10 short tons (dry weight) of ore or concentrate.

Discovery Bonus.—None.

Payment for Uranium.—The uranium content of carnotite and roscoelite ores and concentrates will be paid for at the rate of 30 cents per pound of contained U_3O_8 for ore containing 0.10 percent U_3O_8, plus 30 cents for each 0.01 percent

[7] Harwood, Julius J., Tracers in Metallurgy: Nucleonics, vol. 2, No. 1, January 1948, pp. 57–61.

[8] Atomic Energy Commission Regulations, part 60, Domestic Uranium Program Circ. 1, Ten-Year Guaranteed Minimum Price, Apr. 9, 1948; Circ. 2, Bonus for the Discovery and Production of High-Grade Domestic Uranium Ore, Apr. 9, 1948; Circ. 3, Guaranteed Three-Year Minimum Price for Uranium-Bearing Carnotite-Type or Roscoelite-Type Ores of the Colorado Plateau Area, Apr. 9, 1948; Circ. 4, Temporary Additional Allowances, Colorado Plateau Area Carnotite-Type and Roscoelite-Type Ores, June 15, 1948. Reprinted in AEC 5th Semiannual Rept., 1949, pp. 160–165.

above 0.10 percent up to and including 0.14 percent U_3O_8. Ores assaying 0.15 percent or more U_3O_8 will be paid for at the rate of $1.50 per pound of contained U_3O_8; plus a development allowance of 50 cents per pound of contained U_3O_8; plus a premium of 25 cents per pound for each pound of U_3O_8 in excess of 4 pounds U_3O_8 per short ton, and an additional premium of 25 cents per pound for each pound in excess of 10 pounds U_3O_8 per short ton; plus a facilities allowance of 50 cents per pound of U_3O_8 contained in ore and concentrates assaying 0.20 percent or more U_3O_8. The following table shows what these prices amount to, per ton, for various grades.

Prices established in April and June 1948 by the U. S. Atomic Energy Commission for uranium in Colorado Plateau carnotite and roscoelite

Content		Price per short ton of ore or concentrate				
Percent U_3O_8	Pounds U_3O_8 per short ton	Base price	Development allowance [1]	Premium	Facilities allowance [2]	Total price [3]
0.10	2	$0.60				$0.60
.11	2.2	1.32				1.32
.12	2.4	2.16				2.16
.13	2.6	3.12				3.12
.14	2.8	4.20				4.20
.15	3	4.50	$1.50			6.00
.20	4	6.00	2.00		$2.00	10.00
.25	5	7.50	2.50	$0.25	2.50	12.75
.30	6	9.00	3.00	.50	3.00	15.50
.40	8	12.00	4.00	1.00	4.00	21.00
.50	10	15.00	5.00	1.50	5.00	26.50
.75	15	22.50	7.50	4.00	7.50	41.50
1.00	20	30.00	10.00	6.50	10.00	56.50
1.25	25	37.50	12.50	9.00	12.50	71.50
1.50	30	45.00	15.00	11.50	15.00	86.50
1.75	35	52.50	17.50	14.00	17.50	101.50
2.00	40	60.00	20.00	16.50	20.00	116.50

1 To be spent only for maintaining and increasing the developed reserves of uranium ores.
2 To be spent only for reopening and equipping closed mines and increasing the production facilities of mines in operation.
3 In addition, there is payment for continued vanadium and a haulage allowance (described below). The base price, development allowance, and premium are guaranteed until Jan. 1, 1952, and the facilities allowance is guaranteed until July 1, 1949. There is no discovery bonus.

Payment for Vanadium.—The vanadium content of carnotite and roscoelite ores and concentrates will be paid for at the rate of 31 cents per pound of contained V_2O_5. But no payment will be made for V_2O_5 in excess of 10 pounds for each pound of U_3O_8 contained.

Haulage Allowance.—A haulage allowance of 6 cents per ton-mile for transporting ore or concentrate from the mine to the Commission's purchasing depot will be paid. The maximum allowance is limited to a haulage of 100 miles.

Other Domestic Uranium Ores and Concentrates

Buyer.—U. S. Atomic Energy Commission, Attention: Division of Raw Materials, P. O. Box 30, Ansonia Station, New York 23, N. Y. Prices are guaranteed until Jan. 1, 1960.

Specifications.—Minimum 10 percent uranium oxide (U_3O_8). Minimum quantity 10 short tons (dry weight) of ore or concentrate. The Atomic Energy Commission will negotiate for delivery of particularly high-grade ores and concentrates in quantities smaller than those specified as the minimum.

Discovery Bonus.—A bonus of $10,000 will be paid for delivery of the first 20 short tons of uranium ore or concentrate assaying 20 percent or more U_3O_8 from any single mining location, lode, or placer that has not previously been worked for uranium.

Payment for Uranium.—Domestic uranium ores and concentrates (other than Colorado Plateau carnotite and roscoelite) will be purchased at a minimum price of $3.50 per pound of recoverable uranium oxide (U_3O_8), f. o. b. mine or mill, less buyer's cost of refining. The Atomic Energy Commission may negotiate higher prices for any acceptable material in quantities substantially in excess of the minimum quantity. It may negotiate higher prices where special conditions prevail, taking into consideration milling costs, transportation costs, and other applicable factors.

Payment for Accessory Metals.—Consideration will be given to recoverable gold, silver, radium, thorium, and other valuable constituents.

Uranium Metal and Compounds.—No official figures have been released indicating the cost of refining uranium metal on a large scale. One scientist estimated in 1947 that metal from concentrates of 1 percent or higher would approximate $5 a pound and from concentrates of 0.1 percent, $50 a pound.[9] Black uranium oxide was quoted by Oil, Paint and Drug Reporter at $2.55 a pound and uranium yellow (sodium uranate) at $1.65 a pound throughout 1948. Canadian Chemistry and Process Industries listed sodium uranate (yellow or orange) at $2.20 a pound in 1948.

Radium and Polonium.—The leading domestic refiner reported the average 1948 price of radium at $18 a milligram, radium D at $75 a millicurie, and polonium at $5 a millicurie.

Isotopes.—The prices of the principal isotopes distributed by the Atomic Energy Commission were unchanged in 1948 from 1947. For 1947 quotations, see Minerals Yearbook, 1947, pages 1206–1207.[10]

Thorium.—Monazite concentrates, 70 percent rare-earth oxides, c. i. f. Atlantic ports, were quoted at $140–$150 a short ton in January to March 1948, $175–$185 in April to October, $170 in November and early December, and $200 in late December, According to E&MJ Metal and Mineral Markets. The slight price dip in November coincided with the first significant domestic shipment in many years. The Metal Bulletin (London) listed thorium metal as "nominal" during 1948. Oil, Paint and Drug Reporter quoted thorium nitrate at $3.50 a pound throughout 1948.

FOREIGN TRADE[11]

A substantial part of the uranium used in the American atomic energy program has come from the high-grade ore deposits of the Belgian Congo and Canada, with the greater quantity from the Belgian Congo, according to the Atomic Energy Commission. Statistics on United States imports and exports of uranium and thorium are withheld from publication at the request of the Atomic Energy Commission.

Uranium and thorium are in a group of minor metals and alloys whose tariff rate was reduced from 25 to 12½ percent ad valorem, effective January 1, 1948, in accordance with the General Agreement on Tariffs and Trade concluded at Geneva October 30, 1947. Thorium compounds are dutiable at 35 percent. Uranium ores and concentrates, uranium compounds, radium, radium salts, radioactive substitutes, monazite, and other thorium ores are on the free list.

Exports of radioactive isotopes, according to the AEC, have totaled 355 shipments (20 in 1947 and 335 in 1948). Of these, 68 went to the United Kingdom (including overseas territories), 62 to Sweden,

[9] Menke, J. R., work cited in footnote 5, p. 323.

[10] The first sentence of footnote 3, page 1207, of Minerals Yearbook, 1947, should be corrected to read: Not quoted with potassium chloride in March to December 1947.

[11] Figures on imports and exports (unless otherwise indicated) compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Radium salts imported for consumption and exported from the United States, 1944–48

[U. S. Department of Commerce]

Year	Imports: Radium salts: Grams	Imports: Radium salts: Value: Total	Imports: Radium salts: Value: Average per gram	Imports: Radioactive substitutes (value)	Exports: Radium salts: Grams	Exports: Radium salts: Value: Total	Exports: Radium salts: Value: Average per gram
1944	101.290	$1,374,933	$13,600	$128,010	4.752	$120,086	$25,300
1945	67.342	991,979	14,700	122,178	10.774	229,632	21,300
1946	17.229	326,450	18,900		(1)	(1)	(1)
1947	76.681	1,504,814	19,600		(1)	(1)	(1)
1948	76.118	1,385,337	18,200	6,273	(1)	(1)	(1)

[1] Not separately classified.

60 to Australia, 35 to Belgium, 25 to the Netherlands, 24 to Denmark, 21 to Argentina, and 60 to twelve other countries. No stable isotopes have been exported by the Commission.

The AEC announced July 30, 1948, issuance of the first export licenses for particle accelerators. The licenses were for shipping high-voltage x-ray generators to the National Physical Laboratory, Teddington, England, and to the Sheffield National Centre for Radiotherapy, Sheffield, England.

TECHNOLOGY

An explanation of atomic principles, notable for its simplicity of presentation, was published.[12]

Exploration methods for uranium ores were outlined,[13] and the Geiger-Müller counter was described in detail.[14] Procedures for refining uranium and thorium were reviewed.[15]

Scientists at Iowa State College, Ames, Iowa, are studying the properties of uranium, thorium, beryllium, and rare-earth metals and are developing better processes for producing them in extremely pure form. The Atomic Energy Commission announced in mid-1948 that it will establish at New Brunswick, N. J., a chemical laboratory for quality control of the processing of uranium, beryllium, and other materials of importance in developing atomic energy. The AEC also stated, at the end of 1948, that E. I. du Pont de Nemours & Co.,

Inc., Wilmington, Del., will survey plutonium chemical problems with a view to improving production processes.

Industrial diamonds are used in laboratories as counters to measure atomic radiation.

The biological effects of radioactivity, particularly regarding permissible levels of exposure, are under detailed study.[16]

WORLD REVIEW

Uranium reserves were commented on by David E. Lilienthal, chairman, United States Atomic Energy Commission, December 17, 1948, as follows:

> An unwarranted impression that a shortage of uranium will drastically limit the possibilities of atomic energy has been caused by estimates that known reserves of uranium would last perhaps only 30 years or not more than 40. Estimates of the total world supply of uranium have run from 30,000 tons to 500,000 tons, seventeen times as much. Estimates of rates of potential consumption of the fissionable material derived from uranium have also varied considerably.
>
> The people of the United States are entitled to know that these estimates of a short-lived atomic enterprise are not correct * * *. The Atomic Energy Commission of the United States is responsible for one of the most extensive and intensive searches for a mineral that has ever been conducted, and on a world-wide basis. We do not expect that there will be an unlimited supply but there is no sound basis for a conclusion that usable uranium ore supplies will not be available for the indefinite future.

The United Nations Atomic Energy Commission reported [17] in 1948 that it had reached an impasse. It recommended that negotiations in the Commission be suspended until the General Assembly finds that there exists a basis for agreement on the international control of atomic energy. The principal difficulty confronting the commission was rejection by the Soviet Union of a control plan, approved by most members of the commission, on the ground that such a plan constituted an unwarranted infringement of national sovereignty. In the fall of 1948 Canada proposed that the General Assembly approve the Atomic Energy Commission's control plan, and the United States recommended a six-power discussion to find a means for continuing the Commission's work.[18]

Problems of international control were discussed during 1948 by J. Robert Oppenheimer, chairman, General Advisory Committee, United States Atomic Energy Commission [19]; Frederick Osborn, chairman and deputy United States representative to the United Nations Atomic Energy Commission [20]; Philip C. Jessup, deputy United States representative in the United Nations Security Council [21]; and P. M. S. Blackett, British physicist.[22] Representatives of Canada,

the United Kingdom, and the United States held the First International Conference on Declassification November 14–16, 1947, at Washington, D. C., and the second such conference September 6–9, 1948, at Harwell, England. The three countries also continued their wartime cooperation in raw-materials procurement and in exchange of certain technical information regarding extraction chemistry, low-power reactors, isotopes, and health. In 1948 the United Nations issued an international bibliography on atomic energy [23] and a five-language glossary of technical terms pertaining to atomic energy.

WESTERN HEMISPHERE

Argentina.—The National Government has been exploring uranium occurrences in Mendoza Province, 20 kilometers from the capital city, and at the Santa Ana mine (formerly worked for beryl), San Luis Province. Technologists of the University of Cuyo found uranium in the asphaltite and petroleum of Tupungato, Mendoza.[24] A deposit of autunite, torbernite, and gummite in the Cañada de Alvarez area, Córdoba Province, has been known for more than a decade.

British Guiana.—The British Guiana Government drafted a bill to control prospecting, mining, and export of radioactive minerals.[25] Specimens of euxenite have been found in the Kanuku Mountains.

Canada.—Canada is overtaking the Belgian Congo as the world's greatest producer of uranium ore, according to Arvid Thunaes, Radioactivity Division, Canadian Bureau of Mines in a statement September 2, 1948.[26] All—or nearly all—uranium mining in the Dominion in 1948 was at Port Radium, Great Bear Lake, Northwest Territories, by Eldorado Mining & Refining (1944), Ltd., a Crown corporation. Promising pitchblende occurrences in the Lake Athabaska, Black Lake, and Lac la Ronge regions of northern Saskatchewan were explored. Uranium-ore development was continued in 1948 at Contact Lake, Northwest Territories, and deposits were discovered at Theano Point, near Sault Ste. Marie, Ontario, and at Gun Lake, Bridge River district, British Columbia.

C. D. Howe, Minister of Trade and Commerce, said in a statement in parliament March 16, 1948, "the Government is now satisfied that it is in the best interest of Canada that restrictions against private prospecting and private development of radioactive minerals should be removed." The Government will purchase uranium concentrates on the following basis:

1. A minimum uranium content equivalent to 10 percent by weight of uranium oxide (U_3O_8) in the ores or concentrates will normally be required.
2. Prices will be based upon the uranium content of the ores or concentrates, and will be at the minimum rate of $2.75 per pound of contained (U_3O_8) f. o. b. rail and will be guaranteed for a period of five years.
3. This price includes all radioactive elements in the ores or concentrates, but consideration will be given to the commercially recoverable value of non-radioactive constituents by adjustment of price or by the redelivery of the residues containing such constituents.
4. Under special circumstances, consideration may be given to payment of a higher price or to acceptance of ores or concentrates of lower grade.

5. All operations will be carried on subject to the provisions of the atomic energy regulations of Canada.[27]

Greenland.—A rich and large deposit of galena, with uranium and silver in association, was reported found at King Oscar's Fjord, eastern Greenland, by a Danish geological expedition under the leadership of Dr. Lauge Koch.[28]

Venezuela.—Pitchblende and other radioactive minerals have been noted in a pegmatite dike, near Merida, worked for scrap mica, and in a quarry near Timotes.[29]

AFRICA

Belgian Congo.—Both concentrates and untreated ores were sold in 1947, according to the annual report of the dominant uranium producer, Union Minière du Haut Katanga. Construction of a plant for treating uranium ores near the Shinkolobwe mine was begun and is expected to begin operations at the end of 1950.[30]

Mozambique.—A deposit of samarskite was discovered near Tete, capital of the district of that name, Mozambique. Fifty tons of hand-cobbed concentrate, analyzing 8 to 12 percent uranium oxide plus thorium, tantalum, columbium, etc., were exported to the United Kingdom, and a permit for shipment of an additional 100 tons was procured.[31]

Union of South Africa.—The discovery of low concentrations of uranium in most of the gold mines on the Witwatersrand and in boreholes in the Orange Free State was announced by Governor General Gideon Brand Van Zyl, January 16, 1948. This led J. W. Musset, South African Minister for Economic Development, to declare, April 21, "We believe we have more uranium in this country than in any other country in the world." [32] Production and use of fissionable materials and radioisotopes were brought under Government control by the Union Parliament September 7, 1948.

EUROPE

Czechoslovakia.—Absolute control of the production of the Jachymov (Joachimsthal) uranium mines was given to the U. S. S. R. in a secret treaty between that country and Czechoslovakia signed in Prague, October 1945, according to Ivo Duchacek, former chairman of the foreign relations committee of the Czechoslovak Parliament.[33]

France.—The Commissariat à l'Énergie Atomique announced July 23, 1948, that mining of uranium ore would begin immediately on a commercial scale at Grury, near Autun, Department of Sâone-et-Loire, and near Lachaux, along the border of the Departments of Allier and Puy-de-Dôme. Development of uranium deposits near Antsirabé, Madagascar, and explorations in lower Ivory Coast (French West Africa) and Middle Congo (French Equatorial Africa) were in

progress. Construction of an ore concentrator at Lachaux was expected to be completed by the end of 1948.[34]

Uranium compounds are refined on a limited industrial scale at Le Bouchet, 30 miles from Paris. France has obtained from Norway a quantity of heavy water probably nearly equal to 2 years of Norwegian output, according to Lew Kowarski,[35] scientific director of the French commissariat. The total staff of the commissariat in early 1948 was about 500 persons (exclusive of miners). The first French nuclear reactor, built of uranium oxide and heavy water and having a power output of a few watts, began operation at Fort de Châtillon, near Paris, December 15, 1948.[36]

Germany.—The extent of atomic energy developments in Germany in 1940–44 was unknown to scientists and officials in the United States until November 1944, 6 months before the end of the European phase of World War II. It was assumed in the United States that German progress had paralleled ours and probably was leading. This supposition caused considerable concern among those who knew something of American-British progress on the atomic bomb. Allied troops invading the continent of Europe were equipped with special detectors for radioactive materials, but fortunately such precautions proved to be entirely unnecessary. Not only were no facilities for making atomic bombs built or under construction in Europe, but German scientists had been unable to figure out even the theoretical approach to such a bomb. This information on German uranium efforts, and that in the following paragraphs, was revealed by Dr. Samuel A. Goudsmit[37] professor of physics at Northwestern University, who was appointed by the United States War Department as scientific head of the Alsos Mission. The principal duty of the Alsos Mission was to follow immediately in the wake of the Allied armies in the invasion of Europe to determine precisely how much the Germans knew about the atomic bomb and how far they had progressed in its construction. It was classified a "top-top-secret" intelligence job, the military head of which was Col. Boris T. Pash, United States Army.

Secret atomic bomb research was found to have begun in Germany early in 1939 under the supervision of Erich Schumann, chief of the Ordnance Department. He directed small-scale experiments in an underground shelter at the proving ground at Kummersdorf, near Berlin. Unaware of Schumann's army group, Abraham Esau, president of the German Bureau of Standards, called a meeting of half a dozen physicists in April 1939 and formed the "Uranium Club," with headquarters at the Kaiser Wilhelm Institute for Physics, Berlin. The two groups became aware of each other when they collided in efforts to procure uranium; after a quarrel, they agreed to divide such uranium supplies as were available. The uranium metal used in German experiments was produced by Auergesellschaft A. G., subsidiary of Deutsche Gold und Silber Scheideanstalt, Berlin. Considerable difficulty was encountered preparing uranium in slabs instead of powdered form, and success in producing suitable metal apparently was not achieved until a short time before the German defeat.

The administrative chief of all war research in German universities, including the work of the Reich's Research Council and the Uranium Club, was Rudolph Mentzel, who Goudsmit describes as "only a second-rate chemist who had climbed to his high post through the devious channels of Nazi party politics." Esau,

called "incompetent," remained in charge of physics until replaced at the beginning of 1944 by a first-class physicist, Walther Gerlach of the University of Munich, who did much to bring unity among the various groups. Actual scientific work on nuclear physics was under the leadership of Werner Heisenberg.

Nuclear physics research facilities existed at a number of localities in Germany, but they were meager compared with Allied establishments. There was only one German cyclotron in operating condition (compared with about 20 in the United States at the time); it was in Walther Bothe's physics laboratory at the Kaiser Wilhelm Institute for Medical Research, Heidelberg. The Germans also utilized Frederic Joliot-Curie's cyclotron in Paris. Research on heavy water and on uranium-isotope separation by gaseous diffusion was conducted by P. Harteck at the University of Hamburg. A small centrifuge project was set up at the same university by Will Groth and, after several moves to avoid bombings, finally was established in the town of Celle, north of Hannover. By means of the centrifuge it was hoped to prepare some uranium slightly richer in U–235 than natural uranium and thus facilitate pile experiments, but Goudsmit states that, with the single centrifuge in working order, it would have taken a hundred years to produce any useful results. A nuclear physics laboratory was installed in a wing of the Strasbourg Hospital. There, upon liberation of that French city in November 1944, the Alsos Mission found papers revealing the scope of German work in nuclear physics. Another such laboratory was under the direction of Otto Hahn (discoverer of the principle of uranium fission in December 1938) at the Institute for Physical Chemistry in Berlin; it was later moved to the village of Tailfingen, southeast of Hechingen.

There were two German efforts to construct uranium piles. One was at Gerlach's laboratory in the village of Thuringen, where the Alsos Mission found blocks of pressed uranium oxide. Additional uranium used there was also discovered in Munich. The other pile was erected by Heisenberg at the Kaiser Wilhelm Institute for Physics, Berlin. There in July 1945 the Alsos Mission found in the back yard uranium oxide blocks and pieces of nulcear apparatus, and in the subbasement a pit in which the pile had been constructed. Metal containers and frames for the pile arrangement were still standing nearby. To escape Allied bombings of Berlin, Heisenberg moved his principal laboratory to Hechingen, 30 miles southwest of Stuttgart, and rebuilt his uranium pile in a cave in the nearby town of Haigerloch. Goudsmit quoted an Associated Press interview with Heisenberg to the effect that the Alsos Mission found there (after the town's capture by French troops in April 1945) all the carefully buried materials—2 tons of uranium, 2 tons of heavy water, and 10 tons of carbon. However, Goudsmit added that he was prohibited from divulging how much uranium and heavy water were found in Germany or what was done with it.

German uranium-pile work did not get beyond a very early stage. Its scientists never succeeded in producing a chain reaction, and they did not think of using plutonium in a bomb. To the very end they labored under the misapprehension that a bomb could be made like a pile. Although the work had high priority, it never evolved beyond a very small scale. Heisenberg told a news reporter that he had been building a uranium pile to create energy for machines and not for bombs. However, Goudsmit found ample documentary evidence to the contrary and interprets the statement as an attempt to explain the failure to keep pace with Allied physicists and to ward off the attendant blow to the prestige of German science.

Norway.—Uranium ore mined at Evje in Setesdal and heavy water produced by Norsk Hydro-Elektrisk Kvaelstofaktieselskab at Rjukan will be adequate for Norway's first atomic pile. It will be part of the atomic center under construction at Kjeller, near Oslo.[39] The Norwegian Government has applied to United States occupation authorities in Germany for return of 8 flasks of heavy water, each containing about 21 pints, stolen by German scientists early in 1945.[40]

U. S. S. R.—Uranium and thorium deposits are known to occur in the Caucasus Mountains, the Central Asia region (Tashkent, Tadzhik,

[39] Chemical age (London), vol. 59, No. 1535, Dec. 11, 1948, p. 781.
[40] Chemical Age (London), Nazis looted Heavy Water: Vol. 58, No. 1504, May 8, 1948, p. 644.

and Fergana), and Tannu Tuva and uranium deposits also in the Kola Peninsula (near Kirovsk) and the Altai Mountains. Uranium-ore treatment plants are reported to be in the northern Ural Mountains and the Altai Mountains, and atomic research centers at Leningrad, Moscow, Kharkov, and Sverdlovsk.[41] Exiled Estonian diplomats claimed in July 1948 that Russia was refining uranium from oil shale mined in Esthonia. The Soviet Union continued to import uranium concentrates from mines it controlled in Czechoslovakia, Saxony, and possibly Bulgaria.

United Kingdom.—The British Ministry of Supply announced that its second atomic pile, "Bepo" (British experimental pile), began operating July 3, 1948, at low power. The location was the Atomic Energy Research Establishment, Harwell, near Didcot, Berkshire. The new pile was expected to operate at a power level of several thousand kilowatts and to yield useful isotopes and a small quantity of plutonium for experimental work.[42]

ASIA AND AUSTRALIA

Australia.—Uranium ore was discovered in an abandoned copper-silver mine in New South Wales.[43] An exhaustive study was made of Queensland beach sands, which yield a heavy-mineral concentrate of zircon, rutile, ilmenite, and about 0.5 percent monazite.[44] An amount of £150,000 was allocated for exploration of radioactive mineral resources in 1947–48 by the Commonwealth Bureau of Mineral Resources in cooperation with State mines departments.

China.—Uranium was discovered near Chungshan and Hoshein in eastern Kwangsi Province.[45] Dr. C. Y. Yang, research director of Wah Chang Trading Corp., credited the report because it came from Dr. Wong Wen Hao, prominent geologist.[46]

India.—Uranium occurs in scattered pegmatite localities in India, but no deposits of commercial importance have been reported. The beach sands of Travancore, however, are estimated to contain more than 2,000,000 tons of monazite averaging 8 to 9 percent thorium dioxide.[47] Following an embargo on exports of monazite, Travancore reportedly entered into a 5-year agreement for delivering several thousand tons of monazite annually to Great Britain; but if such an agreement actually existed, it did not become effective. The new Government of India, inaugurated August 15, 1947, began negotiations with the State of Travancore for joint control of thorium. Meanwhile, a joint committee, comprising six members of the Indian Board of Atomic Research and three members of the Travancore Government, was formed to advise Government officials on research, development, and use of thorium.[48] The Board of Atomic Research

(Dr. Homi J. Bhabha, chairman) was formed under the auspices of the Indian Council of Scientific and Industrial Research. The country's principal atomic research center is the Tata Institute of Fundamental Research, Bombay, which in 1947 developed a new economical method of extracting thorium nitrate from monazite, measured cosmic rays, and planned construction of a betatron generating 200 million electron-volts.[49] Atomic research is conducted also at two institutions in Calcutta—Bose Research Institute and Calcutta University.

Korea.—Monazite was continued on the approved export list, effective April 1, 1948, issued by the Department of Commerce, South Korean Interim Government.[50]

Malaya, Federation of.—As a byproduct of alluvial tin mining, 1,187 metric tons of monazite and zircon concentrates were produced in Malaya in 1942–45, the period of Japanese occupation. This quantity comprised 224 tons of monazite, 210 tons of mixed monazite-zircon, and 753 tons of zircon.[51]

Vanadium

By HUBERT W. DAVIS

GENERAL STATEMENT

FOR security reasons, publication of figures on production and consumption of vanadium ore in the United States in 1948 has been suspended.

DOMESTIC PRODUCTION

The center of domestic vanadium-ore mining in the United States is the Colorado-Utah region. Small outputs are made in Arizona, Nevada, and New Mexico, and vanadium-bearing phosphate rock is mined in Idaho.

Vanadium in ores and concentrates produced in the United States, 1938–47 [1]

Year	Vanadium, pounds	Year	Vanadium, pounds
1938	1,613,155	1943	5,586,492
1939	1,984,068	1944	3,527,054
1940	2,162,916	1945	2,963,913
1941	2,513,051	1946	1,272,148
1942	4,439,130	1947	2,117,962

[1] Data for 1940–47 are receipts at mills and Government purchasing depots.

USES

Vanadium is used in various forms; but about 90 percent is consumed as ferrovanadium in the manufacture of tool steels, engineering steels, high-strength structural steels, nonaging rimming steels, and special wear-resistant cast irons. Some ferrovanadium is used in welding-electrode coatings and as a deoxidizer, and some metal is utilized in magnets. Some vanadium oxide is also used in the production of tool steel. The largest uses for vanadium oxide and ammonium metavanadate are as catalysts, in glass and ceramic glazes, for driers in paints and inks, and for laboratory research.

PRICES

For many years vanadium ore has been quoted at 27½ cents a pound of V_2O_5. This quotation, however, disregards the grade of the ore or the presence or absence of objectionable impurities—matters of importance to the refiners, inasmuch as they vitally affect recovery. Throughout 1948 vanadium pentoxide (technical grade) was quoted at \$1.20 a pound of V_2O_5 and ferrovanadium at \$2.90–\$3.10 a pound of contained vanadium (depending upon the grade of the alloy).

FOREIGN TRADE[1]

Imports of vanadium concentrates (all from Peru) were 1,051,675 pounds (contained vanadium) in 1948, a gain of 7 percent over 1947. There were no imports of flue dust containing vanadium or of ferrovanadium or vanadium oxide. Vanadium ore and concentrates enter the United States free of duty. However, the rate of duty on ferrovanadium is 12½ percent ad valorem and on vanadic oxide, anhydride, salts, and compounds and mixtures of vanadium 40 percent ad valorem.

Vanadium ore or concentrates and vanadium-bearing flue dust imported for consumption in the United States, 1939–48

Year	Vanadium ore or concentrates			Vanadium-bearing flue dust		
	Pounds		Value	Pounds		Value
	Gross weight	Vanadium content		Gross weight	Vanadium content	
1939	31,387,722	2,132,548	$991,511	(1)	(1)	(1)
1940	45,102,004	2,574,951	1,216,705	(1)	(1)	(1)
1941	24,645,686	2,138,608	1,012,991	(1)	(1)	(1)
1942	36,492,268	2,422,376	1,274,483	624,423	154,028	$29,545
1943	22,117,131	2,052,620	1,080,150	748,749	64,393	53,553
1944	4,247,490	1,284,603	633,719	191,901	40,171	28,059
1945	8,776,328	1,550,479	725,362	133,795	26,293	19,378
1946	2,784,349	791,057	390,077	97,750	20,931	13,480
1947	3,274,548	983,869	448,076	143,124	71,819	15,483
1948	4,034,509	1,051,675	534,374	----------	----------	----------

[1] Not separately recorded.

Exports of vanadium ore and concentrates were 13,180 pounds (contained vanadium) valued at $32,263 in 1948, compared with 7,661 pounds valued at $15,788 in 1947. The 1948 exports comprised 8,140 pounds to Switzerland and 5,040 pounds to Canada. Exports of ferrovanadium were 238,824 pounds (gross weight) valued at $390,428 in 1948 compared with 178,198 pounds valued at $266,040 in 1947.

WORLD REVIEW

World production of vanadium ores is limited almost entirely to four countries—Northern Rhodesia, Peru, South-West Africa, and the United States. From 1939 through 1947 output from these sources has ranged from 1,400 to 4,400 metric tons, and from 1941 through 1947 the United States has been the leading producer.

Vanadium has also been recovered commercially from phosphate rock, iron ore, chrome ore, magnetite beach sands, caustic-soda solution employed in Bayer process of refining bauxite, naphtha soot collected from the smokestacks of ships and industrial plants, and vanadiferous ashes derived from asphaltites.

Because complete information on the quantity of vanadium recovered as byproducts of iron ore and other raw materials is lacking, it is not possible to determine world production of vanadium from

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines ,from records of the U. S. Department of Commerce.

all sources. Consequently, the accompanying table reflects only the production of vanadium in ores and concentrates for the countries listed, plus the quantity recovered in the United States as a byproduct of phosphate rock.

World production of vanadium in ores and concentrates, 1939–48, in metric tons

[Compiled by B. B. Mitchell]

Country	1939	1940	1941	1942	1943	1944	1945	1946	1947	1948
Argentina	15	1	6			4	3	6	7	(1)
Mexico	80	32	(2)							
Northern Rhodesia	384	368	342	388	426	254	219	68	56	173
Peru	1,016	1,214	1,017	1,010	847	514	688	322	435	511
South-West Africa	514	428	269	453	577	385	420	430	282	187
United States (shipments) [3]	900	981	1,140	2,014	2,534	1,600	1,344	577	961	(4)
Total [5]	2,909	3,024	2,774	3,865	4,384	2,757	2,674	1,403	1,741	(4)

[1] Figure not available.
[2] Less than 1 ton.
[3] Includes also vanadium recovered as a byproduct of phosphate-rock mining.
[4] Bureau of Mines not at liberty to publish figure.
[5] Total represents data only for countries shown in table and excludes vanadium in ores produced in French Morocco, Spain, and U. S. S. R., for which figures are not available; also excluded from the total are the quantities of vanadium recovered as byproducts from other ores and raw materials.

Argentina.—Vanadium occurs in small deposits widely scattered in the Provinces of Córdoba and San Luis. A small quantity of ore is mined for the production of 3 to 4 metric tons of vanadium pentoxide annually.

Northern Rhodesia.—The Rhodesia Broken Hill Development Co., Ltd., was again the only producer of vanadium in Northern Rhodesia. Output of vanadium oxide was 331 long tons averaging 92.06 percent V_2O_5 in 1948 compared with 108 tons averaging 92.04 percent V_2O_5 in 1947. During 1948 the feed to the gravity concentrating plant was 48,770 short tons of material averaging 1.08 percent V_2O_5, which consisted largely of vanadium-bearing laterites from old surface dumps. Leach-grade material produced at the gravity plant was 6,918 short tons containing 287 tons of V_2O_5, the recovery being 54.5 percent. Feed to the vanadium leach plant was 10,944 short tons of materials assaying 4.08 percent V_2O_5, and the recovery was 76.8 percent and the acid factor 15½ pounds of sulfuric acid per pound V_2O_5 in fused vanadium pentoxide produced.

Peru.—The famous Mina Ragra mine of the Vanadium Corp. of America in the Andes near Ricran, Department of Junin, has been an important source of vanadium since 1907, when production was begun. Output in Peru was 913 metric tons V_2O_5 in 1948 compared with 776 tons V_2O_5 in 1947. The gain in output was attributed to the installation of two additional rotary kilns, which permitted the concentrating plant to treat more tonnage.

South-West Africa.—The Abenab West lead-vanadium mine of the South West Africa Co., Ltd., was the only producer of vanadium in South-West Africa in 1948. Output of ore and concentrates (V_2O_5 content) was 368 short tons in 1948 compared with 556 tons in 1947. Exports of ores and concentrates (V_2O_5 content) were 515 short tons, of which 57 percent went to France, 27 percent to the United Kingdom, and 16 percent to the Netherlands. Research work undertaken upon samples taken from the mine was sufficiently promising to justify the installation of a flotation plant, which was under construction at the end of 1948. The vanadium deposits of South-West Africa, of which the Grootfontein occurrences are the most important yet exploited, have been described [2] in some detail.

Zinc [1]

By RICHARD H. MOTE AND ESTHER B. MILLER

GENERAL SUMMARY

ALTHOUGH fewer primary zinc smelters operated in 1948 than in 1947 and production at several plants was curtailed owing to work stoppages and other causes, the domestic slab-zinc production in 1948 dropped only 1 percent from the peacetime record high output established in 1947. Production from domestic ores rose 5 percent to the highest level since 1944, but the use of foreign ore declined. Redistilled slab-zinc output increased 5 percent in 1948 and was the greatest annual production on record. Domestic mine production of recoverable zinc dropped slightly more than 1 percent, despite a gain of 6 percent from mines in the combined Western States that placed zinc output in that region at the highest point in mining history. Idaho continued to lead the States in mine production of zinc.

A gain in slab-zinc imports was insufficient to offset a drop in imports of zinc in ores and concentrates, with the result that total imports declined 3 percent. Exports of slab zinc dropped 38 percent from 1947.

The demand for slab zinc remained heavy in 1948, as use of the metal for galvanizing and die casting advanced to new record highs. Total domestic slab-zinc consumption gained 4 percent over 1947.

[1] This report deals primarily with the smelting branch of the industry. Full details of zinc mining are given in the various State reports of this volume. As some zinc ore is used directly in the manufacture of zinc pigments, see also the chapter on Lead and Zinc Pigments and Zinc Salts.

Producers' stocks of slab zinc were sharply reduced during the year, whereas consumers' inventories gained and at year end were higher than at any time since July 1946.

During 1948 the market price for Prime Western grade slab zinc, East St. Louis, rose from 10.50 cents a pound to 17.50 cents.

Government regulations requiring a license for the exportation of slab zinc and zinc semimanufactures remained operative throughout the year.

DOMESTIC PRODUCTION

Statistics on zinc production are compiled both on a mine basis and on a smelter basis. The mine-output data, based upon the zinc content of ores and concentrates produced (adjusted to account for average smelting losses), are the most precise measure of zinc output from year to year. Smelter production of slab zinc presents a more accurate figure of actual zinc recovery but usually differs from the mine figure owing to overlap or lag between mine shipments and smelter receipts and treatment of ores and concentrates. Over a period of years, however, these variations tend to balance within the limits of statistical error.

MINE PRODUCTION

Zinc mining is centered largely in five areas—the Tri-State area of southeastern Kansas, southwestern Missouri, and northeastern Oklahoma; Tennessee-Virginia; Sussex County, N. J.; St. Lawrence County, N. Y.; and the Western States (principally Idaho, Montana, Arizona, Colorado, New Mexico, Utah, Nevada, and Washington, in descending order of productivity in 1948).

Mine production in the combined Western States gained 6 percent over 1947 to reach the highest point in mining history. Over 58 percent of the total domestic output of zinc in 1948 (54 percent in 1947) was produced in the Western States. Idaho continued to be the largest producer of zinc in the United States. More than 97 percent of the Idaho zinc output in 1948 came from the Coeur d'Alene region; zinc-lead ores and old tailings concentrated yielded nearly 91 percent of the total zinc. Among the Western States, Montana displaced Arizona as the second-largest zinc producer. Output advanced 29 percent over 1947 to reach the highest level since 1941. For the second year in Montana history, zinc production exceeded copper output. Zinc-lead ore yielded 93 percent of Montana's zinc in 1948, and 6 percent was from zinc ore and old slag. Each year from 1940 through 1947, Arizona had succeeded in establishing a new record in zinc output, but in 1948 the production dropped slightly, leaving 1947 as the all-time record high. About 88 percent of the zinc output in 1948 was recovered from zinc-lead ore, 10 percent from zinc-copper ore, and nearly all the remainder from zinc-lead-copper ore and zinc ore. Zinc production in Colorado increased 17 percent in 1948. Eagle County again ranked first among Colorado counties in zinc output. Zinc ore yielded 40 percent of the Colorado total zinc, and zinc-lead ore 54 percent. New Mexico zinc production declined 6 percent from the 1947 output. As usual, the Central district, Grant County, produced most (85 percent) of the State output of zinc. Zinc ore yielded 85 percent of the total zinc produced. Of the 10 leading zinc producers in Utah in 1948, only 4 succeeded in increasing their outputs of recoverable zinc above 1947 figures. Output at the Butterfield property doubled, and increases were made at the United States & Lark group and at properties of the New Park Mining Co. and the Park Utah Consolidated Mines Co. Production of zinc in Nevada gained sharply in 1948 to approach the record level attained in 1946. About 92 percent of the 20,288 tons produced in 1948 was mined in the Pioche district, Lincoln County; nearly 98 percent of the zinc recovered was from zinc and zinc-lead ore. But for the 6-month work stoppage at the Grandview mine of the American Zinc, Lead & Smelting Co., Washington zinc output in 1948 probably would have established an all-time record. The Holden mine of the Howe Sound Co. in Chelan County produced over three times as much zinc in 1948 as in 1947, and the Deep Creek mine in Stevens County also made a large gain.

Mine production of recoverable zinc in the United States, 1939–43 (average) and 1944–48, by States, in short tons

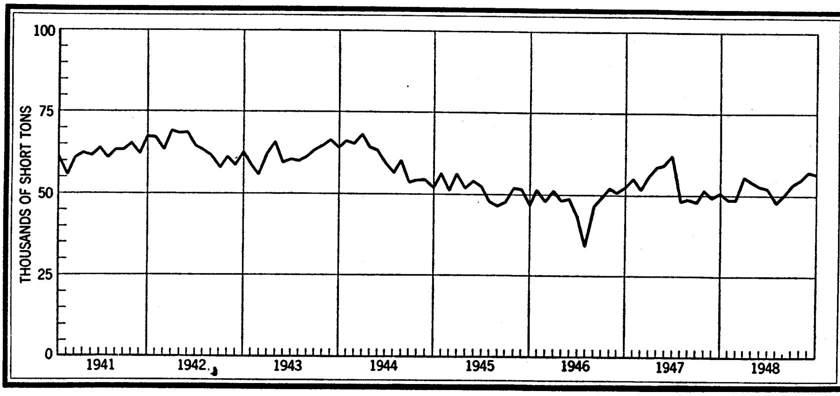

FIGURE 1.—Mine production of recoverable zinc in the United States, 1941–48, by months, in short tons.

Mine production of recoverable zinc in Arkansas, Kansas, Missouri, and Oklahoma decreased 22 percent to the lowest level since 1896 despite a higher annual average concentrate market price than in any year prior to World War II. The output of zinc concentrates in the Tri-State district dropped from 204,068 tons in 1947 to 159,609 tons in 1948. Some of the marginal mines and tailing mills that contributed to the output in the first half of 1947, while Federal premiums were being paid, were nonproductive in 1948. From July 1 to September 5 the mines and mills of the Eagle-Picher Mining & Smelting Co. were shut down by a work stoppage, and other mines that shipped ore to the Eagle-Picher Central mill could not operate during this period.

The total production in States east of the Mississippi River decreased 2 percent in 1948; zinc output from this region accounted for 28 percent of the total domestic output.

The 25 leading zinc-producing mines in the United States in 1948, listed in the following table, yielded 60 percent of the total domestic zinc output; the 3 leading mines produced over 23 percent and the 6 leading mines nearly one-third.

Twenty-five leading zinc-producing mines in the United States in 1948, in order of output

Rank	Mine	District	State	Operator	Type of ore
1	Franklin & Sterling Hill	New Jersey	New Jersey	The New Jersey Zinc Co	Zinc.

[1] Includes very small quantity produced elsewhere in State.
[2] No production in Iowa since 1917.

SMELTER PRODUCTION

During 1948, 19 primary zinc-reduction plants were in operation, of which 10 operated with horizontal retorts exclusively, 1 with both horizontal and vertical retorts, 3 with vertical retorts exclusively (1 electrothermic), and 5 with electrolytic methods.

Horizontal-Retort Plants.—The total number of retorts reported at active horizontal-retort primary plants in 1948 was 59,168, a 15-percent decrease from the 69,950 retorts on December 31, 1947, at plants that operated during that year. Of the total retorts reported, 53,332 (90 percent) were in use at the close of 1948, compared with 51,668 (74 percent) in operation at the end of 1947.

Vertical-Retort Plants.—Four vertical-retort continuous distilling plants operated during 1948. The St. Joseph Lead Co. operated its 13 electrothermic units at Josephtown, Pa., at about 87 percent capacity throughout the year. Of the 66 vertical retorts at the remaining 3 plants, 61 were in operation on December 31, 1948.

Electrolytic Plants.—Five electrolytic plants were in operation during 1948, as in 1947. There were 3,370 cells at the plants on December 31, 1948, of which 3,310 (98 percent) were in operation; the number of cells at the end of 1947 was 3,210, of which 3,176 (99 percent) were operating.

Smelting Capacity.—Irrespective of additions or subtractions of smelter recovery units, statistics on domestic smelting capacity vary from year to year owing to changes in metallurgical practices among the various plants. According to reports to the Bureau of Mines, the zinc-reduction plants in the United States on December 31, 1948, had a stated annual capacity to produce 1,010,933 tons of slab zinc under normal operating conditions, allowing for necessary shut-downs for repairs. This figure, which compares with a 998,087-ton reported capacity at the end of 1947, indicates that the 1948 output was 84 percent of the capacity, as compared with 86 percent in 1947. Horizontal- and vertical-retort plants operated at 82 percent of a stated 610,697-ton capacity (88 percent of a 599,502-ton capacity in 1947), electrolytic plants at 91 percent of a 345,172-ton capacity (86 percent of a 341,701-ton capacity in 1947), and secondary smelters at 58 percent of a 55,064-ton capacity (66 percent of a 56,884-ton capacity in 1947).

Waelz Kilns.—Waelz plants have been installed in recent years at several midwestern and eastern smelters to facilitate recovery of additional metals from the ore and to reduce over-all smelting losses. The following companies operated Waelz kilns in 1948:

Arkansas:
- Fort Smith—The Residue Co.

Illinois:
- Fairmont City—American Zinc Co. of Illinois.
- La Salle—Matthiessen & Hegeler Zinc Co.

Kansas:
- Cherryvale—National Zinc Co., Inc.

Oklahoma:
- Henryetta—Eagle-Picher Mining & Smelting Co.

Pennsylvania:
- Donora—American Steel & Wire Co.
- Palmerton—New Jersey Zinc Co.

Slag-Fuming Plants.—The following companies operated slag-fuming plants in 1948 and produced impure zinc oxide, which was further treated for the recovery of slab zinc:

Idaho:
- Bradley—Bunker Hill & Sullivan Mining & Concentrating Co.

Montana:
- East Helena—Anaconda Copper Mining Co.

Texas:
  El Paso—American Smelting & Refining Co.
Utah:
  Tooele—International Smelting & Refining Co.

The American Smelting & Refining Co. slag-fuming plant at El Paso, Tex., under construction during 1947, was completed and began operating in August 1948. During 1948 these four plants treated 510,581 tons of hot and cold slag, which yielded 87,104 tons of oxide fume containing 53,394 tons of recoverable zinc. Corresponding figures for the three operating plants in 1947 were 587,364, 94,996, and 56,025 tons, respectively.

The St. Joseph Lead Co. continued experimental operation of its slag-fuming plant at Herculaneum, Mo., in 1948 and recovered slab zinc as a direct product of the operation that treats lead blast-furnace slag containing 12 to 16 percent zinc.

Active Zinc-Reduction Plants.—Operations at active primary zinc smelters and electrolytic plants in 1948 were below capacity, due in part to labor-management difficulties that precipitated strikes at smelters at Forth Smith, Ark., in August, September, and October, and at East St. Louis and Hillsboro, Ill., in August through December. The Donora, Pa., smelter was shut down temporarily in November to determine the cause and extent of noxious fumes that were reported to have caused illness and death among residents of Donora. A list of the zinc-reduction plants operating in the United States in 1948 follows:

Primary zinc distillers

Horizontal-retort plants

Arkansas:
  Fort Smith—Athletic Mining & Smelting Co.
Illinois:
  Fairmont City—American Zinc Co. of Illinois.
  La Salle—Matthiessen & Hegeler Zinc Co.
Oklahoma:
  Blackwell—Blackwell Zinc Co.
  Henryetta—Eagle-Picher Mining & Smelting Co.
  Bartlesville—National Zinc Co., Inc.
Pennsylvania:
  Donora—American Steel & Wire Co.
  Palmerton—The New Jersey Zinc Co. of Pennsylvania.
Texas:
  Amarillo—American Smelting & Refining Co.
  Dumas—American Zinc Co. of Illinois.

Vertical-retort plants

Illinois:
  Depue—The New Jersey Zinc Co.
Pennsylvania:
  Palmerton—The New Jersey Zinc Co. of Pennsylvania.
  Josephtown—St. Joseph Lead Co.
West Virginia:
  Meadowbrook—E. I. du Pont de Nemours & Co., Inc.

Electrolytic plants

Idaho:
  Kellogg—Sullivan Mining Co.
Illinois:
  East St. Louis—American Zinc Co. of Illinois.

Montana:
- Anaconda—Anaconda Copper Mining Co.
- Great Falls—Anaconda Copper Mining Co.

Texas:
- Corpus Christi—American Smelting & Refining Co.

Secondary zinc distillers

Alabama:
- Fairfield—W. J. Bullock, Inc.

California:
- Los Angeles—American Smelting & Refining Co., Federated Metals Division.
- Torrance—Pacific Smelting Co.

Illinois:
- Beckemeyer—American Smelting & Refining Co., Federated Metals Division.
- Hillsboro—American Zinc, Lead & Smelting Co.
- Sandoval—Sandoval Zinc Co.

Maryland:
- Baltimore—Brooklyne Chemical Works, Inc.

New York:
- Rome—Rome Smelting & Refining Corp.

Pennsylvania:
- Bristol—Superior Zinc Corp.
- Philadelphia—General Smelting Co.

West Virginia:
- Wheeling—Wheeling Steel Corp.

PRIMARY AND REDISTILLED SECONDARY SLAB ZINC

The output of primary slab zinc in 1948 dropped nearly 2 percent from the 1947 production. The use of foreign concentrates declined, and the slab zinc produced from this source fell 15 percent. Output from domestic ore, largest since 1944, rose 5 percent.

Production of redistilled slab zinc from zinc scrap increased 5 percent in 1948 to the highest level on record. Of the 62,320 short tons of redistilled secondary slab zinc produced, 28,070 tons (45 percent) were derived from primary smelters and 34,250 tons (55 percent) were produced at secondary plants. Data on output of remelted secondary slab zinc are not included with those for redistilled metal. In 1948 the production of slab zinc recovered by remelting purchased scrap was 7,796 tons (7,443 tons in 1947). Zinc rolling mills and other substantial consumers of slab zinc recover large quantities of zinc from their own plant scrap; but such metal is not measured statistically, for it seldom enters the market as scrap.

Primary and redistilled secondary slab zinc produced in the United States, 1939–43 (average) and 1944–48, in short tons

Year	Primary			Redistilled secondary	Total (excludes zinc recovered by remelting)
	Domestic	Foreign	Total		
1939–43 (average)	591,570	176,172	767,742	52,052	819,794
1944	574,453	[1] 294,849	869,302	49,037	918,339
1945	467,084	[1] 297,477	764,561	49,242	813,803
1946	459,205	269,057	728,262	44,516	772,778
1947	510,058	292,437	802,495	59,542	862,037
1948	537,966	249,798	787,764	62,320	850,084

[1] Includes a small tonnage of foreign slab zinc further refined into high-grade metal in the United States.

DISTILLED AND ELECTROLYTIC ZINC

Of the 1948 output of primary zinc, 60 percent was distilled and 40 percent was produced electrolytically, compared with 63 and 37 percent, respectively, in 1947.

Production of Intermediate grade and Regular High Grade rose 6 percent and 3 percent, respectively, in 1948. Output of Special High Grade increased for the third consecutive year and was nearly 4 percent above the 1947 production. Owing to the substantial supply of brass scrap available for the manufacture of brass products and a drop in demand for Brass Special grade zinc, smelter output fell 25 percent. Declines of 2 percent and 63 percent were recorded in the production of Prime Western and Selected grades, respectively. Of the total 1948 production (comparable 1947 figures in parentheses), 37 percent (37 percent) was Prime Western, 29 percent (28 percent) Special High Grade, 23 percent (22 percent) Regular High Grade, 5 percent (7 percent) Brass Special, 5 percent (4 percent) Intermediate, and 1 percent (2 percent) Selected.

Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1944–48, in short tons

CLASSIFIED ACCORDING TO METHOD OF REDUCTION

Year	Electrolytic primary	Distilled	Redistilled secondary [1]		Total
			At primary smelters	At secondary smelters	
1944	317,388	551,914	24,673	24,364	918,339
1945	269,924	494,637	21,205	28,037	813,803
1946	281,295	446,967	18,408	26,108	772,778
1947	295,520	506,975	22,093	37,449	862,037
1948	312,477	475,287	28,070	34,250	850,084

CLASSIFIED ACCORDING TO GRADE

Year	Grade A		Grade B (Intermediate)	Grades C and D		Grade E (Prime Western)	Total
	Special High Grade (99.99% Zn)	Regular High Grade (Ordinary)		Brass Special	Selected		
1944	251,210	251,595	55,928	54,396	24,396	280,814	918,339
1945	220,241	191,639	49,106	75,749	17,367	259,701	813,803
1946	236,184	180,366	32,294	75,296	13,697	234,941	772,778
1947	239,274	190,429	36,812	61,104	12,844	321,574	862,037
1948	248,346	196,482	38,892	45,946	4,723	315,695	850,084

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

PRIMARY SLAB ZINC, BY STATES

Montana continued to be the leading producer of primary slab zinc in 1948; Pennsylvania and Oklahoma remained in second and third places, respectively. Of the States for which production figures may be shown separately, Illinois, Idaho, and Arkansas occupied the next three positions. As usual, in Montana and Idaho slab zinc was produced by electrolytic methods only. In Illinois and Texas both electrolytic and distilled zinc metal was recovered, whereas in all other States zinc was recovered by distillation alone.

Primary slab zinc produced in the United States, by States where smelted, 1939-43 (average) and 1944-48, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Texas and West Virginia [1]	Total	
								Short tons	Value
1939-43 (average)	35,357	35,247	140,071	173,134	92,318	200,571	91,044	767,742	$115,681,000
1944	31,350	36,562	155,362	224,391	107,364	206,315	107,958	869,302	149,520,000
1945	29,391	33,110	124,904	179,251	106,115	200,709	91,081	764,561	131,504,492
1946	18,720	34,832	104,002	186,662	104,125	178,811	101,110	728,262	129,630,636
1947	17,158	41,801	113,192	197,453	128,398	193,524	110,969	802,495	171,894,429
1948	15,586	42,064	93,229	207,717	137,844	171,276	120,048	787,764	209,860,330

[1] Includes Missouri 1943-44 and 1947-48.

SECONDARY ZINC

In addition to the redistilled secondary slab zinc (unalloyed) already reported herein, some remelted slab zinc is produced, and a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in the Secondary Metals—Nonferrous chapter of this volume.

BYPRODUCT SULFURIC ACID

Sulfuric acid made from the sulfur dioxide gases produced in roasting zinc blende (sphalerite) is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consume large quantities of native sulfur. The production of sulfuric acid at zinc-blende roasting plants decreased 12 percent in 1948.

Sulfuric acid (basis, 100 percent) made at zinc-blende roasting plants in the United States, 1944-48

Year	Made from zinc blende [1]		Made from native sulfur		Total [1]		
	Short tons	Value [2]	Short tons	Value [2]	Short tons	Value [2]	
						Total	Average per ton
1944	652,001	$8,344,143	201,109	$2,573,734	853,110	$10,917,877	$9.94
1945	610,938	7,944,478	235,594	3,063,603	846,532	11,008,081	10.10
1946	544,529	6,842,541	160,886	2,021,696	705,415	8,864,237	9.76
1947	598,703	8,001,205	266,104	3,556,281	864,807	11,557,486	10.38
1948	529,478	7,478,271	233,099	3,292,261	762,577	10,770,532	10.97

[1] Includes acid from foreign blende.
[2] At average of sales of 60° B. acid.

ZINC DUST

All previous records for production of zinc dust were broken in 1948, the total output being 5 percent above the former high point reached in 1947. Zinc powder and blue powder are not included in the Bureau of Mines production totals; the zinc dust statistically reported is restricted to commercial grades that comply with severe specifications as to percentage of unoxidized metal, evenness of grading, and fineness of particles. The zinc content of the dust produced in 1948 ranged from 95.00 to 99.74 percent and averaged 97.73 percent. Shipments of zinc dust, which totaled 31,389 tons—2 percent of which went to foreign countries—were slightly lower than production. The quantity consumed at manufacturers' plants (2 percent of output) was smaller than the difference between production and shipments with the result that producers' stocks increased from 1,156 tons at the beginning to 1,205 tons at the close of the year.

The average price of zinc dust shipped to domestic consumers in 1948 was 15.55 cents a pound compared with 12.4 cents in 1947. The raw materials used to manufacture zinc dust are reviewed in the Secondary Metals—Nonferrous chapter of this volume. Most of the production is from zinc scrap (principally galvanizers' dross), but some is recovered from zinc ore, slab zinc, and as a byproduct of zinc refining.

Zinc dust [1] produced in the United States, 1939–43 (average) and 1944–48

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average per pound			Total	Average per pound
1939–43 (average)	22,158	$4,090,688	$0.092	1946	28,574	$6,057,688	$0.106
1944	26,511	5,408,244	.102	1947	30,602	7,589,296	.124
1945	25,877	5,227,154	.101	1948	32,217	10,051,704	.156

[1] All produced by distillation.

ZINC PIGMENTS AND SALTS

The principal zinc pigments are zinc oxide and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinc-bearing materials, including ore, metal, scrap, and residues. Details of the production of zinc pigments and salts are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

CONSUMPTION AND USES

According to reports from 589 plants, 817,735 tons of slab zinc were put in process in 1948, a 4-percent increase over the 1947 total but 8 percent below the record level of 888,626 tons in 1944. Receipts at consumers' plants in 1948 were 833,464 tons. A comparison of the calculated figure of slab zinc available to consumers and the actual measured consumption since 1943 indicates that coverage of the plant survey was approximately 97 percent.

Galvanizing continued as the principal use of slab zinc, and the quantity consumed for this purpose in 1948 was the greatest in the history of the zinc industry. Consumption of slab zinc for the manufacture of brass products continued to decline. The quantity of zinc used for zinc-base alloys reached an all-time high of 234,628 tons, a gain of 9 percent over the previous record of 214,469 tons in 1947.

Consumption of slab zinc in the United States, 1944–48, by industries, in short tons [1]

Industry and product	1944	1945	1946	1947	1948
Galvanizing: [2]					
Sheet and strip	119,381	135,383	113,816	115,147	120,360
Wire and wire rope	44,350	46,083	43,667	49,726	49,906
Tubes and pipe	50,472	63,163	62,460	77,238	81,874
Fittings	14,113	10,014	10,593	10,467	14,037
Other	87,675	82,538	89,223	108,749	104,792
Total galvanizing	315,991	337,181	319,759	361,327	370,969

[1] Excludes some small consumers.
[2] Includes zinc used in electrogalvanizing and electroplating, but excludes sherardizing.
[3] Includes zinc used in making zinc dust, bronze powder, alloys, chemicals; castings, and miscellaneous uses not elsewhere mentioned.
[4] Includes 6,982 tons of remelt zinc in 1944, 5,111 tons in 1945, 3,912 tons in 1946, 3,577 tons in 1947, and 3,141 tons in 1948.

The quantity of slab zinc consumed for rolled products in 1948 increased 8 percent over the 1947 figure. In addition to slab zinc, the rolling mills remelt and reroll the metallic scrap produced from their fabricating operations. The scrap so treated in 1948 amounted to 15,032 tons—a slight increase from the 14,952 tons processed in 1947. Purchased zinc scrap in the form of zinc clippings, old zinc scrap, and engravers' plates totaling 3,689 tons were melted and rolled in 1948 (3,050 tons in 1947). Production of rolled zinc from slab zinc and purchased scrap was 77,669 tons, an increase of 9 percent over the 1947 total. Inventories of rolled zinc were 1,968 tons on December 31, 1948, compared with 1,852 tons on the same date in 1947. In addition to the actual shipments of 54,386 tons of rolled zinc in 1948, the rolling mills processed 38,200 tons of rolled zinc (including that which was remelted and rerolled) in manufacturing 23,851 tons of semifabricated and finished products.

Rolled zinc produced and quantity available for consumption in the United States, 1947–48

	1947			1948		
	Short tons	Value		Short tons	Value

[1] Figures represent net production. In addition 14,952 tons of strip and ribbon zinc in 1947 and 15,032 tons in 1948 were rerolled from scrap originating in fabricating plants in connection with zinc rolling mills.
[2] Revised figure.
[3] Allowances made for change in producers' stocks of rolled zinc.

The following table shows the six commercial grades of refined slab zinc and purchased remelt spelter consumed by the various industries in 1948. Of the 817,735 tons of domestic and foreign zinc consumed, 40 percent was Prime Western, 33 percent Special High Grade, and 16 percent Regular High Grade, compared with 42, 31, and 15 percent, respectively, in 1947. All grades of zinc were used for galvanizing and in the manufacture of brass. Prime Western was the principal grade used in the hot-dip process of galvanizing, the higher grades being used chiefly for electrogalvanizing. Rigid specifications in brass manufacture necessitate the use of high-purity metal, 75 percent of the total used in this industry being of the two highest grades.

Consumption of slab zinc in the United States in 1948, by grade and industry, in short tons

Industry	Special High Grade	Regular High Grade	Intermediate	Brass Special	Selected	Prime Western	Remelt	Total
Galvanizers	13,903	12,446	13,798	15,180	520	312,949	2,173	370,969

CONSUMPTION OF SLAB ZINC BY GEOGRAPHIC AREAS [2]

The geography of slab zinc consumption is available in detail only since 1940. During the 9-year period through 1948 substantial shifts are observable, largely the result of conversion to war production in

[2] This section is based partly on a detailed study by Ransome, Alfred L., Consumption of Slab Zinc in the United States by Industries, Grades, and Geographic Divisions, 1940–45: Bureau of Mines Inf. Circ. 7450, 1948, 30 pp.

1940–41 and reconversion to peacetime consumption in 1945–46. The distribution of total slab zinc consumed for all uses according to geographic divisons and by States and for individual uses is shown in the following tables.

Consumption of Slab Zinc for All Uses.—During the period 1940–45 Illinois ranked first among the 42 zinc-consuming States and the District of Columbia with an annual average of 123,677 short tons. The use of zinc in Illinois has increased in the years following and the State has maintained its lead in zinc consumption. Connecticut, which averaged second during the war period owing to the large quantities of zinc consumed in the brass plants of that State, has since dropped to fifth place. Since 1940 Pennsylvania has held either second or third place. The greatest concentration of slab-zinc consumption is in the region comprising Illinois, Indiana, Michigan, Ohio, and Wisconsin. This area, which has consistently ranked first in zinc consumption since 1940, uses nearly half the total quantity of slab zinc consumed annually in the United States. The region of least consumption is the Mountain States, including Arizona, Colorado, Idaho, Nevada, New Mexico, and Utah, which has accounted for less than 0.3 percent of the total.

Consumption of slab zinc in the United States, 1940–45 (average) and 1946–48, by geographic divisions and States

Consumption of Slab Zinc for Galvanizing.—The iron and steel industry is the largest consumer of slab zinc, which it uses for galvanizing or rustproofing sheets, wire, tubes and pipes, building and pole-line hardware, railway-signal equipment, chains, bolts, screws, and a multitude of other items. It is, therefore, quite understandable that the principal iron and steel producing States are also the principal consumers of zinc for galvanizing. From 1940 through 1943, Pennsylvania ranked first among the 34 States which consumed zinc for this purpose. In 1944 Ohio displaced Pennsylvania and retained the top position in the succeeding years through 1948. The greatest concentration of zinc consumption for galvanizing is the region comprising Illinois, Indiana, Pennsylvania, and Ohio, which accounted for 62 percent of the average annual domestic consumption for this use in the period 1940–45. In 1946, total zinc used for galvanizing in these States rose to 65 percent, but declined to 63 percent in 1947 and 1948.

Consumption of Slab Zinc for Brass Products.—From 1940 through 1948 Connecticut has ranked first among the States consuming slab zinc for brass products; but, owing to the wartime demand for brass and the construction of new plant facilities, there has been some change in the rank of the other leading States. In 1940 Michigan was in second place, followed by New York, Illinois, Ohio, and Pennsylvania among the top six, whereas in 1948 Illinois ranked second, with Michigan in third place, followed by New York, Ohio, and Wisconsin.

Consumption of Slab Zinc for Zinc-Base Alloys.—The automobile industry is the largest user of zinc-base alloys, principally for die-cast parts and assemblies such as fuel pumps, carburetors, radiator grilles, windshield wipers, and a wide variety of both interior and exterior hardware. Thus the region embracing Illinois, Indiana, Michigan, Ohio, and Wisconsin in which the automobile industry is centered is the area of greatest concentration of slab zinc consumed for zinc-base alloys. Nearly 61 percent of the zinc used for die-castings and other zinc-base alloys in 1948 was consumed in this region.

Consumption of slab zinc for zinc-base alloys in the United States, 1940–45 (average) and 1946–48, by States

Consumption of Slab Zinc for Rolled Zinc.—During the period 1940–48, although the quantity of slab zinc consumed for rolled zinc changed widely, the geographic pattern and rank of the consuming States varied but little. Illinois and Indiana ranked first and second, respectively, and accounted for the greater quantity of slab zinc consumed for rolling in the United States. Pennsylvania held third place through 1946 but was displaced in 1947 and 1948 by Iowa, which moved up from fourth position. Except for 1943 through 1945, New York has been the fifth-ranking State in the consumption of zinc for rolling.

Consumption of slab zinc for rolled zinc in the United States, 1940–45 (average) and 1946–48, by States

State	Geographic division	1940–45 (average annual)		1946		1947		1948

[1] Bureau of Mines not at liberty to publish figure.

Consumption of Slab Zinc for Zinc Oxide.—Because of the small number of companies consuming slab zinc in the manufacture of zinc oxide and to prevent disclosure of individual company figures, it was impossible to prepare a table showing specific quantities consumed. A table is included, however, to show the relative rank of each State and the totals for each year.

Consumption of slab zinc for zinc oxide in the United States, 1940–45 (average) and 1946–48, by States

STOCKS

Producers' Stocks.—Inventories of slab zinc at producers' plants fell 70 percent in 1948 to the lowest year-end level since 1940, owing mainly to substantial quantities shipped for Government account.

Stocks of zinc at zinc-reduction plants in the United States at end of year, 1939–43 (average) and 1944–48, in short tons

	1939–43 (average)	1944	1945	1946	1947	1948
At primary reduction plants	75,685	233,044	254,692	175,513	67,046	19,179
At secondary distilling plants	1,595	652	1,451	756	1,601	1,669
Total	77,280	233,696	256,143	176,269	68,647	20,848

Consumers' Stocks.—Consumers' stocks on December 31, 1948, were 15,741 tons (19 percent) greater than at the beginning of the year. At the average monthly rate of consumption in 1948, consumers' stocks on hand December 31 were nearly 1½ months' requirements.

Consumers' stocks of slab zinc at plants at the beginning and end of 1948, by industries, in short tons

	Galvanizers	Brass mills [1]	Die casters [2]	Zinc rolling mills	Oxide plants	Others	Total
Dec. 31, 1947	[3] 40,004	[3] 12,846	[3] 19,188	6,590	[3] 996	[3] 1,225	[3 4] 80,849
Dec. 31, 1948	45,764	18,539	24,582	5,983	258	1,464	[4] 96,590

1 Includes brass mills, brass ingot makers, and brass products.
2 Includes producers of zinc-base die castings, zinc-alloy dies, and zinc-alloy rods.
3 Revised figure.
4 Stocks on Dec. 31, 1947 and 1948, exclude 319 tons (revised figure) and 307 tons, respectively, of remelt spelter.

Reconstruction Finance Corporation Stocks.—Slab zinc stocks of 29,446 tons and stocks of zinc concentrates totaling 65,851 tons of recoverable zinc held by the RFC on January 1, 1948, were transferred during the year to the Treasury Department Bureau of Federal Supply.

PRICES

The market price for Prime Western grade slab zinc, f. o. b. East St. Louis, was quoted at 10.5 cents per pound until January 21, 1948, when it advanced to 12 cents. A further advance to 15 cents occurred on July 28, and on October 18 another rise to 15.5 cents was announced. An additional increase on November 12 raised the quotation to 17.5 cents, at which level it remained the balance of the year. The weighted average price received by the producers for all grades of zinc sold in 1948 was 13.3 cents a pound, f. o. b. plants, compared with 10.7 cents in 1947.

The official London maximum price of £70 0s. per long ton for foreign zinc delivered to consumers, duty paid, fixed by the British Ministry of Supply on January 2, 1947, was advanced to £75 0s. on January 30, 1948. Another rise to £92 0s. occurred on October 1, and on December 1 the price was fixed at £106 0s., at which level it remained for the remainder of the year.

All grades	8.6	8.6	8.88	10.71	13.32
Prime Western; spot quotation at St. Louis	8.25	8.25	8.73	10.50	13.58

[1] Does not include overquota premium payments made by Office of Metals Reserve in 1944–47.

In Canada, the price for High Grade zinc delivered at Toronto or Montreal was 11 cents per pound until January 21, 1948, when it was advanced to 12.5 cents. On July 30 the price increased to 15.5 cents and nearly 3 months later on October 25 the quotation was raised to 16 cents. The fourth and final advance during 1948 occurred on December 1 when the price was quoted at 18 cents.

The Australian price of £A22 per long ton, f. o. b., Risdon, Tasmania, for zinc for consumption, fixed in February 1940, continued throughout 1948. At the beginning of 1949 the quotation was raised to £A40.

FOREIGN TRADE [3]

Imports.—Total imports of zinc in ores and concentrates in 1948 declined 11 percent from 1947. Of the 264,218 tons of contained zinc so imported, 54 percent came from Mexico, 21 percent from Canada, 9 percent from Peru, 4 percent each from Italy and Newfoundland, 3 percent from Spain, and 5 percent from (in order of decreasing importance) Japan, Bolivia, Union of South Africa, Korea, Australia, Argentina, Saudi Arabia, and Honduras.

Zinc imported for consumption in the United States, 1944–48, by classes

[U. S. Department of Commerce]

Year	Ores (zinc content)		Blocks, pigs, slabs		Sheets		Old, dross, and skimmings [1]		Zinc dust		Total value [2]
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	
1944	415,004	$18,678,957	63,626	$6,132,877	15	$2,540	5,603	$300,188			$25,114,562
1945	331,533	15,021,771	96,760	12,173,525	(3)	2	7,299	476,920	362	$39,789	27,712,007
1946	166,885	8,122,471	104,015	16,474,850	(3)	10	4,137	300,429	77	4,942	24,902,702

1948	133,814	11,737,624	92,547	24,932,488	120	32,871	10,273	1,181,495	41	5,370	37,889,848

[1] Includes dross and skimmings as follows—1944: 4,694 tons, $224,995; 1945: 4,291 tons, $230,973; 1946: 2,851 tons, $188,972; 1947: 4,391 tons, $353,415 (revised figures); 1948: 8,637 tons, $873,099.
[2] In addition, manufactures of zinc imported as follows—1944: $14,223; 1945: $8,077; 1946: $1,929; 1947: $4,429; 1948: $16,056.
[3] Less than 1 ton.
[4] Revised figures.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Slab-zinc imports totaled 93,283 tons and were 29 percent greater than the quantity imported in 1947. Canada accounted for 83 percent of the total and Mexico ranked second with 6 percent. The first substantial imports from Europe since 1939 originated in Norway, Italy, and Belgium.

Zinc imported into the United States, in ores, blocks, pigs, or slabs, by countries, 1946–48, in short tons [1]

[U. S. Department of Commerce]

Country	1946	1947	1948
Ores (zinc content):			
Argentina	8,295		77
Australia	3,780	864	495
Bolivia	26,207	17,176	4,515
Canada	57,298	42,430	55,386
Italy		11,613	11,288
Japan			5,018
Korea			1,902
Mexico	127,685	163,726	142,134
Newfoundland and Labrador		8,873	9,753
Peru	48,791	49,952	22,475
Spain		3,321	9,101
Union of South Africa		4	2,035
Other countries	(2)		39
Total ores	272,056	297,959	264,218
Blocks, pigs, or slabs:

Mexico	15,777	332	5,737
Norway			2,240
Other countries	551	96	110
Total blocks, pigs, or slabs	104,743	72,312	93,283

[1] Data include zinc imported for immediate consumption plus material entering country under bond.
[2] Less than 1 ton.

Exports.—The value of exports of zinc ores, concentrates, and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) amounted to $19,910,911 in 1948, compared with $27,714,840 (revised figure) in 1947. In addition to the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. Export data on zinc pigments and chemicals are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume. Much of the zinc used in the manufacture of such products is of foreign origin, and when they are exported a drawback of 99 percent of the import duty is refunded upon the basis of zinc contained in the finished product. Draw-back refunds were made on 29,738 tons in 1944 and on 7,494 tons in 1945; corresponding 1946–48 data are not yet available.

Slab zinc was exported in 1948 to 24 foreign countries representing shipments to every continent except Australia and Africa. United Kingdom was the destination of nearly 57 percent of the 65,757 tons of slab zinc exported during the year. Over 17 percent was shipped to India, and Belgium and France received 8 and 3 percent, respectively.

Zinc ores and manufactures of zinc, exported from the United States, 1944–48

[U. S. Department of Commerce]

[1] Less than 1 ton.

Tariff.—Action taken at the Geneva Trade Conference of 1947 made permanent as of January 1, 1948, the import duties on slab zinc, zinc ore, and the principal zinc products established under the Mexican Trade Agreement of January 30, 1943, and reduced the rates on zinc oxide and lithopone. Thus the tariff on zinc-bearing ores in 1948 remained at ¾ cent per pound (zinc content); the rate on zinc in blocks, pigs, or slabs, and dust continued at ⅞ cent per pound, and zinc sheets remained dutiable at 1 cent a pound. The import duty on zinc oxide and leaded zinc oxides containing not more than 25 percent lead was lowered from 1.1 cents to 0.6 cent per pound, and the rate on lithopone containing less than 30 percent zinc sulfide was set at 0.875 cent a pound.

WORLD PRODUCTION

World smelter production of zinc in recent years, insofar as data are available, is shown in the following table.

World production of zinc, 1942–48, by countries where smelted, in metric tons

Minor Metals

By JACK W. CLARK [1]

BARIUM AND STRONTIUM

THE 1948 output of barium metal amounted to a few thousand pounds, being little changed from 1947. Production was reported by Kemet Laboratories Co., Inc. (unit of Union Carbide & Carbon Corp.), Cleveland, Ohio, and King Laboratories, Inc., Syracuse, N. Y. The latter company also produced barium "getter" alloys and strontium metal. Cooper Metallurgical Associates, Cleveland, Ohio, produced strontium metal only. Metal Hydrides, Inc., Beverly, Mass., reported production of barium and strontium hydrides on a small scale.

The principal raw materials from which barium and strontium are derived are the minerals barite and celestite (see the Barite and Minor Nonmetals chapters of this volume).

Consumption and Uses.—Apparent consumption of barium in 1948 amounted to several thousand pounds, that of strontium to less than 100 pounds.

Barium and strontium are used principally as "getters" [2] in the electronics industry, both the pure metals and alloys with aluminum or magnesium being employed. "Gettering" is the process of removing the last traces of gas from an enclosed space, as in an electronic tube that has already been evacuated to a high degree by other means. To achieve this final evacuation small bits of barium or strontium metal or their alloys are introduced into the nearly evacuated tubes; upon heating, the residual traces of gas are removed by chemical combination with the highly reactive hot metal. Barium has been used also in spark-plug electrode alloys to increase discharge efficiency and as a hardening agent in lead-base bearing alloys, only 0.4 percent barium being required for this purpose.

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines. from records of the U. S. Department of Commerce.
[2] Light Metals (London), Gettering and Getters: Vol. 7, Nos. 72-73, January-February 1944, pp. 34-52, 77-94.

Prices.—Barium metal, over 99 percent pure, ranged in price from about \$5 per pound up to nearly \$10, according to quantities purchased; strontium prices varied from under \$7 per pound up to about \$35, depending upon purity. It has been estimated the cost of producing barium could be reduced below \$1 per pound if specialized uses requiring ton lots could be found.[3] Similar possibilities exist for strontium.

Technology.—During the year a patent was granted on a process for making barium, strontium, calcium, or magnesium by thermal reduction of the oxides with aluminum, using various moderating agents, such as aluminum nitride and ferrosilicon.[4]

Canada.—The most noteworthy development in barium metal supply was the initiation of production on a large scale by Dominion Magnesium, Ltd., Haley's Station, near Ottawa, Ontario, Canada. Production of barium had begun there in 1947 with an output of 1,040 pounds and rose sharply in 1948 to 10,652 pounds (\$9,483). In addition, about 100 pounds of strontium metal were produced. Canadian output of both metals in 1948 exceeded severalfold that of all United States producers combined.

BERYLLIUM

The only primary commercial source of beryllium to date has been the mineral beryl, which is characteristically found in the coarsely crystalline pegmatite dikes of some granite regions. The beryllium oxide content of beryl ranges from about 11 to 14 percent. The complex silicate, helvite (BeO content similar to beryl), has been found erratically distributed in a lime silicate (tactite) zone at Iron Mountain, north of Winston, N. Mex. The superficial resemblance of helvite to garnet suggests the possibility that it may have been overlooked elsewhere.

Mine Production.—Interest in mining domestic beryl was keen in 1948, and prices reached an all-time high; but, surprisingly, output dropped nearly 50 percent below that reported for 1947. With a few exceptions, domestic beryl is normally produced as a byproduct or coproduct in the mining of feldspar, quartz, mica, or lithium minerals.

Beryllium concentrates (beryl) shipped from mines in the United States, 1942–48, by States, in short tons

The Sitting Bull and Ingersoll mines of the Black Hills Keystone Corp., both near Keystone, S. Dak., produced beryl during 1948 but were shut down in October, reportedly because of the poor demand for lithium ores. The largest production for the year from any individual property was that from the Palermo mine, near West Rumney, N. H., operated by the Ashley Mining Co. A small quantity of beryl was produced by Joe Grover from the Grover mine near Idaho Springs, Colo. Small lots reached ore buyers from many other properties of uncertain identity, principally in South Dakota, New Hampshire, Colorado, and Maine. Michael Lyons of the Beryl Ores Co., Loveland, Colo., was active during the year as a buyer of small lots of beryl ore and held leases on a number of properties in Colorado and South Dakota. The Hyatt Beryl mine, Drake, Colo., was operated in 1948 to obtain fine-grained beryliferous rock for use in the development of milling methods applicable to low-grade beryl ores. The Bureau of Mines and the Geological Survey were active during 1948 in exploring and evaluating beryl pegmatites and in developing beneficiation methods.

The Black Hills region of South Dakota continued to be the principal domestic source of beryl, total production to date being about 1,800 tons. Important shipments have been made from Colorado (total production, about 500 tons), Maine, New Hampshire, and New Mexico. Small shipments have been recorded from Connecticut, Idaho, Massachusetts, New York, North Carolina, Virginia, and Wyoming. Specimens of beryl have been found in many other States. Total reserves of inferred and indicated beryl ore in Colorado are estimated at 2,000 to 5,000 tons;[5] the beryl pegmatites of the Eight Mile Park area were described.[6] Reserves of beryl at the Muscovite mine between Avon and Deary, Latah County, Idaho, have been estimated at 150 to 450 tons. The Geological Survey estimated indicated and inferred beryl reserves for Connecticut at about 860 tons.[7] The Bureau of Mines published a report of investigations on Beryl Mountain, Sullivan County, N. H.[8]

Refinery Production.—As in previous years, the producers of beryllium metal, alloys, and compounds in 1948 were the Brush Beryllium Co., Cleveland and Lorain, Ohio; Beryllium Corp., Temple, near Reading, Pa.; and Clifton Products, Inc., Painesville, Ohio. The Ceramic Division, Champion Spark Plug Co., Detroit, Mich., consumes beryl solely for dielectric manufacture. On September 21, 1948, the Brush Beryllium Co. plant at Lorain suffered a serious fire, damage being confined to the oxide production facilities. It was reported that Clifton Products Co. did not operate in the latter part of the year.

Output of all types of beryllium products in 1948 was up sharply over the previous year and consumption was correspondingly higher. Because of the apparent importance of beryllium to the atomic energy program, the activities of all refiners were necessarily partly secret.

Several reports were published in 1948 treating beryllium toxicology.[9]

Uses.—Beryllium finds its most important commercial application as an alloying agent with copper. The usual alloy contains a little over 2 percent beryllium and is outstanding because of its fatigue, corrosion, and wear resistance, hardness, tensile strength, high electrical and thermal conductivity, low-creep tendency, and nonmagnetic and nonsparking properties. Beryllium-copper is widely used for current-carrying springs, pressure-responsive elements, switches, welding tips, disks, platers' bars, matrix metal in diamond-drill bits, valve guides, nonmagnetic ball bearings, nonsparking tools and parts, and tubing subjected to vibration or repeated flexing.

Beryllium-nickel possesses much higher tensile strength than the copper alloy. It has been used for watch balance wheels and in airplane parts. Beryllium added to aluminum in small quantities imparts high strength, thermal stability, and unusual oxidation resistance. A large manufacturer of camera shutters is reported to have discontinued using spring steel in favor of beryllium-aluminum.

Addition of 0.005 to 0.01 percent beryllium to magnesium has a marked effect in reducing oxidation.[10] Beryllium confers to zinc alloys reduced creep, increased tensile strength, and improved corrosion resistance.[11]

As the pure metal, beryllium is used in X-ray tube windows and in radium-beryllium neutron sources. The metal finds numerous applications in the atomic energy field as a moderator and reflector of neutrons, similar to graphite and heavy water. It has been estimated that about 100 tons of beryllium would be needed for a reactor of 100,000 kw. output, using enriched uranium as a fuel. Beryllium oxide was used as a neutron reflector in the Los Alamos "water boiler," which consisted essentially of a stainless steel sphere filled with an ordinary water solution of an enriched uranium salt. The high refractoriness of beryllium oxide, fusion point 2,520° C., together with its exceedingly low neutron absorption, excellent heat transmission, and resistance to thermal shock, suggest its possible use in nuclear-energy power-plant design. The use would apparently be a nonrecurring one for any given installation. Beryllium oxide has many special applications in the refractories field[12] and has been used experimentally as a liner for rocket combustion chambers.[13] Use of the oxide in phosphor compounds for fluorescent lamps and in television screens has been and continues to be of importance. However, cases of beryllium poisoning allegedly resulting from accidental inhalation of the oxide liberated from broken lamps indicate that beryllium oxide phosphors may soon be supplanted by nontoxic materials. Beryllium glasses have special characteristics, such as high light-transmission speed.[14] The mineral beryl is employed directly in

the production of high-grade dielectrics for uses such as are used in airplane sparkplugs. Beryllium nitrate finds application as a strengthener in gas mantles, and various other compounds have value as catalytic agents.[15]

Stocks.—In 1948, imported and domestically produced beryl combined were again inadequate to meet processors' requirements. The shortage was alleviated by transfers to industry from the dwindling stock pile of the Office of Metals Reserve. In the absence of a marked upsurge in imports of beryl, stocks of the agency could become exhausted in 1949 if the 1948 consumption rate should continue. Beryl was actively sought for the National Strategic Stock Pile throughout 1948. This factor probably was important in keeping prices at a high level, aside from the normal market influence of increased consumer demand. Figures on beryl stocks in the strategic stock pile are not available for publication.

Stocks of beryllium metal, alloys, and compounds in producers' hands as of December 1948 were apparently below those of the equivalent 1947 period.

Prices.—E&MJ Metal and Mineral Markets quoted domestic beryl, f. o. b. mines, 10–12 percent BeO, in January 1948 at \$16–\$18 per short-ton unit; increases during the year raised prices as follows: July 8, \$18.75–\$22; July 15, \$20–\$24; September 16, \$20–\$26; and October 7, \$24–\$26. The last quotation remained unchanged the rest of the year and represented an all-time high. Imported beryl was quoted in November at \$22–\$23 per unit BeO, c. i. f. Atlantic ports. The master alloys beryllium-copper, 4 percent Be, and beryllium-aluminum, 5 percent Be, opened the year at \$20.50 and \$40, respectively, per pound of contained beryllium and increased to \$24.50 and \$52 in the fall. In the sale of these and other beryllium master alloys, usual practice is to quote a price per pound of beryllium contained, the current market price for the other alloy components being added at the time of sale. Master alloys of beryllium (50 percent Be) with nickel, iron, or cobalt were quoted at \$70 per pound contained beryllium. The low-beryllium copper alloys were quoted in August 1948 at a flat price per pound of alloy, in ton lots or more, at the following figures: 2.5 percent Be–1.1 percent Ni, \$1.00 per pound; 0.35 Be–1.5 Ni, \$0.60; 0.5 Be–2.5 Ni, \$0.70. Pure beryllium metal in the form of lumps, pebbles, chips, and turnings was quoted in May 1948 at prices ranging from \$65–\$85 per pound, pound lots, the price depending on purity. The powdered metal was priced at \$95–\$103 per pound. High-fired beryllium oxide, minus 200-mesh, was quoted near the end of 1948 at \$10–\$11.50 per pound, depending on quantity; same grade, minus 325-mesh was \$16, any quantity. The price of fluorescent-grade oxide was apparently a little below that for the minus 200-mesh high-fired type. Beryllium sulfate (tetrahydrate) quotations varied from \$0.85–\$1.45 per pound, depending on quantity and grade. The fluoride, double ammonium fluoride, and nitrate (trihydrate) were priced, respectively, per pound at \$7.50–\$12.00, \$2.50–\$4.65, and \$2.00–\$3.30, the price prevailing depending upon the quantity ordered.

Foreign Trade.—An encouraging rise in the volume of beryl imports was noted for 1948, in comparison with the meager receipts in 1947.

[15] Bond, George R., Jr., and Mills, George A. (assigned to Houdry Process Corp.), Cracking of Hydrocarbons with a Beryllium Phosphate Catalyst: U. S. Patent 2,435,196, Feb. 3, 1948.

Larger shipments from Brazil accounted for the over-all increase, but significant quantities were recorded from Mozambique, Argentina, and the Union of South Africa.

United States shipments of beryllium metal, alloys, and scrap to other countries in 1948 totaled 25,923 pounds with a value of $48,305, the quantity figure being less than one-tenth that for 1947. Principal recipient countries were United Kingdom, 9,207 pounds; Netherlands, 8,713; Canada, 2,302; Mexico, 2,212; Argentina, 1,618; Switzerland, 693; Australia, 672; Belgium, Italy, Sweden, and Philippine Republic combined, 506. Exports of ore were negligible, being only 185 pounds valued at $587.

Beryllium ore (beryl concentrates) imported for consumption in the United States by countries, 1944–48, in short tons

[U. S. Department of Commerce]

Country	1944	1945	1946	1947	1948
Anglo-Egyptian Sudan	1

[1] Less than 1 ton.
[2] Revised figure.

On June 16, 1948, the Office of International Trade added beryllium alloys, scrap, ore, and concentrates to the positive list of products requiring export licenses to foreign destinations (excepting Canada). Beryllium metal and compounds were already included on the positive list.

Export restrictions continued in effect during 1948, notably in India and the French dependencies (principally Madagascar). The Indian embargo, established in June 1946, was not relaxed in 1948. Madagascan beryl was reserved for France. Complications which had hindered the export of beryl from Argentina in 1947 may have been resolved in part, judging from the shipments of 55 tons of beryl to the United States in 1948 compared with none in 1947.

Technology.—Several articles were published treating with methods for producing beryllium metal and alloys,[16] fabrication of beryllium

metal shapes,[17] chlorination[18] and flotation[19] of beryl, and the spectrochemical analysis of beryllium metal, compounds,[20] and ores.[21]

WORLD REVIEW

South and Middle America.—The pegmatities of northeastern *Brazil* are reported to have yielded about 8,000 metric tons of beryl in 1937–44.[22] Most of the output came from the Picuí-Parelhas area in the states of Paraíba and Rio Grande do Norte. Another productive section is near Berilândia, southeast of Quixeramobim, in the central part of the state of Ceará. Exports of beryl ore during the first half of 1948 were about 75 percent of total 1947 exports; 100 metric tons of beryl were reported shipped in early 1948 to Produits Chimiques et Electro-Metallurgique, Marseilles, France.

Beryl has been found in *British Guiana* [23] and with columbite occurs in pegmatite in the regions of Timotes and Chachopo, State of Merida, *Venezuela*.[24] Reserves of several thousand tons of beryl have been estimated in *Mexico* in pegmatite dikes of the Sierra de Oposura, Municipality of Moctezuma, State of Sonora.

Africa.—A large occurrence of beryl was discovered and mined in the Machokos district, *Kenya*, but such deposits are said to be rare.[25] Production of beryl ore on a commercial scale was expected to begin in *French Morocco* in 1949. Beryl occurs in a zone of pegmatite dikes about 120 miles long extending across central *Nigeria* from Jemaa in Plateau Province to the Egbe district in Kabba Province. Crystals up to 15 inches in diameter were recorded from a deposit near Okere, Kabba Province. An experimental shipment of 20 tons of beryl was made from a dike south of Okere.[26]

Producers of beryl in *Portuguese East Africa* are Boror Commercial, Lda., P. O. Box 26, Mozambique; and Esteveo Guerreiro A. Lima, Muiane, Alto Molocue, Quelimane.[27] Beryl is produced from pegmatite deposits of the Omaruru and Karabib districts, *South-West Africa*, and from the Oorlogskloof pegmatite deposits on the farm Border 155, 26 miles from Makop Siding, Warmbad district.[28] Beryl is recovered in *Tanganyika* in the mica-mining operations of Masasi in the Southern Province and in the Bundali Hills in the Southern Highlands Province;[29] 1½ long tons were produced in 1948. Beryl occurs in two pegmatites in the Buganda area, *Uganda*.[30]

Europe.—The beryllium industries of Germany and Italy were described in detail.[31] Beryllium alloys are produced by Beryllium Smelting Co., Ltd., London, from imported master alloys. Several British companies were reported giving serious consideration to the manufacture of beryllium metal, alloys, and salts.[32]

Asia and Australia.—The embargo in *India* on export of beryl ore, which was instituted in June 1946, continued throughout 1948. Beryl is produced principally in central and southern Rajputana, and a small quantity has come from Kashmir. Beryl ore is included by the interim government of *South Korea* on the new list of approved export commodities.[33] Beryl is mined at Ryukado, Shihori, Kogen-do. White alkali beryl occurs in eastern Kazakhstan, *U. S. S. R.* (see Cesium and Rubidium section of this chapter). New Metals (Aus-

tralia), Ltd., and Amalgamated Metallurgical Corp., Ltd., have been organized in *Australia* to produce beryllium and other metals and chemicals.[34]

BORON

Production.—Elemental amorphous boron is produced by the F. W. Berk Co., Inc., Woodridge, N. J., Cooper Metallurgical Associates, Cleveland, Ohio, and the Norton Co., Worcester, Mass. The last two concerns also produce the nitride and the carbide, respectively. Producers of various alloying agents are the Electro Metallurgical Co., New York, N. Y. (ferroboron, nickel-boron, manganese-boron, Silcaz); Molybdenum Corp. of America, Washington, Pa. (ferroboron, manganese boride); Vanadium Corp. of America, Bridgeville, Pa. (Grainal alloys); Titanium Alloy Mfg. Co., Niagara Falls, N. Y. (Bortam, Carbortam); and Ohio Ferro-Alloys Co., Philo, Ohio (Borosil). (For discussion of boron minerals, see Borates in the Salines—Miscellaneous chapter of this volume.)

Apparent consumption of boron alloys in 1948, based on producers' shipments, was up slightly over the previous year.

Uses.—Elemental boron finds its chief use in the metal industry as a degasifier in metallurgical reactions. Boron added to steel, usually in master-alloy form, markedly increases its hardenability.[35] The boron content of the final product can be exceedingly small, 0.0005–0.003 percent being sufficient in thoroughly deoxidized steels. Too much boron causes hot-shortness to such an extent that the steel will disintegrate upon rolling. Boron is employed in the production of malleable iron castings as well as wrought steel. Up to 0.05 percent boron is used to insure the chill-depth of rolls used in the steel industry and in grain milling. Certain alloys used for cutting tools and hard-facing contain boron in substantial percentages.

Boron carbide is the hardest known substance, other than diamond. It is used in powder form as an abrasive in lapping very hard materials and in molded form as parts for glass cutters, sand-blast nozzles and masks, mortars and pestles, plug, ring and snap gages, micrometers, grinding-wheel molds, rug-weaving needles, and extrusion dies. Its applications in metal-working have been described.[36] The abrading efficiency of boron carbide has been determined as 6.5 compared to 10 for diamond and 0.2 for silicon carbide.[37] Boron nitride is used as a ladle-lining and mold-coating in the casting of jet-engine turbine buckets. Being possessed of graphitic crystal structure, high refractoriness, and excellent dielectric properties at high temperature, the nitride has shown promise as a lubricant [38] both by itself and in a silicone base for the lubrication of moving parts exposed to high temperatures.

The high absorption capacity of boron for thermal neutrons has been responsible for many applications of the element in the atomic energy program. Boron^{10} is the neutron-absorbing isotope. Boron^{10}

constitutes only about 20 percent of natural boron; this isotope, 96 percent pure, is now produced by the Atomic Energy Commission.[39] Boron trifluoride is employed in neutron counters [40] but its most important applications are as a catalytic agent and raw material in the chemical industry. Boron steel is used for the control of nuclear reactors; however, the quantity of boron required is apparently small, only 100 pounds being estimated as the quantity required for the controls of an enriched 100,000-kw. reactor.[41] The presence of boron in a moderator such as graphite is undesirable even to the extent of 1 part in a million.

The borides of the ferro-alloy metals chromium, molybdenum, titanium, tantalum, and columbium are very hard and refractory, some being used in tools and dies; they have much in common with metals in electrical and thermal conductivity. The borides in pure form have melting points exceeding 5,000° F.; they may be used alone or cemented with ferro-alloy metals for applications in high-temperature installations, such as gas-turbine and jet-engine combustion chambers. Much attention has been accorded the borides and boron carbide in the NEPA (Nuclear Energy for Propulsion of Aircraft) program and related research.[42]

The hydrides of boron are colorless liquids or gases, easily oxidized with consequent large energy liberation. Boron hydride has been intensively studied under Office of Naval Research contracts because of its desirable characteristics as a rocket fuel. The highest jet velocities are attained with elements of low atomic weight, one of the best appearing to be boron. For a propellant combination of reasonably high bulk density, very high jet velocities may be expected from reacting boron hydride with fluorine oxide (F_2O) [43] or water; boron hydride is a water-reaction fuel being highly explosive when exposed to moist air or traces of water.[44]

Prices.—The price of amorphous boron (82–86 percent B) in 1947 and 1948 averaged about $13 per pound in 100-pound lots or more; high-purity material (98 percent) was about $250 per pound. Prices of boron additive alloys as quoted in Iron Age, f. o. b. plant, ton lots, were generally unchanged throughout 1948 as follows: Ferroboron (17.5 percent B), $1.21 per pound; Bortam, 45 cents per pound; Grainal 1, 2, and 3, 45, 63, and 93 cents per pound, respectively; Silcaz, 39 cents per pound; nickel boron, $1.82½ cents per pound, less than ton lots; Borosil, $6.25 per pound of contained boron; manganese-boron, $1.92 per pound, declining to $1.67 on October 7, unchanged thereafter; Carbortam, 8 cents per pound, increased slightly at midyear to cover augmented titanium and boron content. The isotope of boron, B^{10}, is sold by the Atomic Energy Commission for $15 per gram.

Technology.—Boron carbide is made by fusing anhydrous boric acid with petroleum coke at 2,800° C.[45] Pilot-scale methods of preparing diborane were developed.[46] Techniques were described for the production of metallic borides by the electrolysis of the corresponding borates.[47]

Foreign Trade and World Review.—Boron carbide, boron carbide shapes, and calcium boride are produced in Canada. United States imports of the carbide from Canada in 1947 and 1948 were 18,427 and 29,644 pounds, valued at $23,228 and $30,822, respectively. Ferroboron imports from Canada in 1948 totaled 5,700 pounds, valued at $1,378. Ferroboron is produced at the Rainham Works of Murex, Ltd., Essex, United Kingdom.

CALCIUM

Production.—The Electro Metallurgical Co., Sault Ste. Marie, Mich., and the New England Lime Co., Canaan, Conn., produced calcium metal during the year. The hydride and nitride were made by Metal Hydrides, Inc., Beverly, Mass. The 1948 output of the metal, which amounted to several tens of thousands of pounds, declined sharply, being only slightly more than half that for 1947. Pure varieties of limestone constitute the basic raw material of calcium.

Consumption and Uses.—Apparent consumption of calcium metal for 1948 nearly equaled output and was almost double apparent consumption for 1947. Calcium has numerous uses, some important applications being debismuthizing of lead; preparation of lead alloys for battery grids and plates, bearings, and sheathing for telephone cable and electric lines; deoxidizing of copper, iron, and various alloys; decarburizing and desulfurizing of ferrous metals and alloys; grain refining of cast iron and steel; alloying of aluminum, copper, beryllium, and magnesium; dehydrating certain organic liquids; desulfurizing petroleum fractions; "gettering" (see Barium and Strontium section of this chapter) in the production of high vacuum; and in purifying argon gas.

Calcium metal or calcium hydride is used principally in producing metals such as uranium, vanadium, thorium, zirconium, tantalum, columbium, titanium,[48] and chromium. The hydride constitutes a convenient source of hydrogen because it is able to absorb 850 times its own volume of hydrogen; during World War II it was used by the armed forces in ton quantities for balloon inflation and similar purposes. The hydride also serves as a dehydrating agent and reduction catalyst. Calcium nitride has application in foundry work for introducing nitrogen into metal baths. Calcium-silicon is used as a deoxidizer in steel production. Calcium chemicals are discussed in the Lime, Salines—Miscellaneous, and Stone chapters of this volume.

Prices.—In January 1948, E&MJ Metal and Mineral Markets quoted calcium metal at $1.85 per pound in ton lots, cast in slabs and

small pieces. This price was increased on April 15 to $1.95 where it remained for the balance of the year. January prices for calcium turnings and distilled metal in 100-pound lots were $2.70 and $3.40 per pound, respectively. Iron Age for January 8, 1948, quoted calcium-silicon (28–35 percent Ca), carlots, f. o. b. at 16.25–18.80 cents per pound; similarly, calcium-manganese-silicon (16–20 percent Ca) was quoted at 17.50–20.05 cents. The quotations on Graphidox No. 4 alloy (5 percent Ca) in June 1948 was 17.9 cents per pound, ton lots.

Foreign Trade.—Calcium metal imported in 1948 came from Canada. Canada also accounted for 396,920 pounds of calcium-silicon ($51,599); 30,363 pounds ($492) were received from Australia and 2,205 pounds ($287) from France.

Calcium metal and calcium-silicon imported for consumption in the United States, 1944–48 [1]

[U. S. Department of Commerce]

Commodity	1945		1946		1947		1948	
	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value
Calcium metal	17,086	$15,845			354	$675	796	$2,483
Calcium-silicon	164	22	661,200	$87,647			429,488	52,378

[1] No transactions reported for 1944.

World Review.—Beginning in 1945, Dominion Magnesium Ltd., at Haley's Station near Ottawa, Ontario, Canada grew through 1948 to become one of the major calcium-metal producers of the world. Production in 1947 and 1948 easily eclipsed previous output. Metal production for the 4 years was as follows: 1945, 29,543 pounds; 1946, 53,548 ($68,720); 1947 (revised figures), 723,461 ($1,121,388); 1948, 1,104,562 ($1,779,405). Before World War II, most of the calcium metal and alloys consumed in the United States were produced in Europe, notably in France and Norway.

CERIUM AND OTHER RARE-EARTH METALS

Elements of the rare-earth group are monotonously similar in chemical behavior, a fact that long delayed thorough investigation of their properties. The approximate relative abundance of the various rare earths, in percent, is estimated as follows: Cerium 31, neodymium 18, lanthanum 7, samarium 7, gadolinium 7, dysprosium 7, ytterbium 7, erbium 6, praseodymium 5, lutecium 1.5, terbium 1, holmium 1, thulium 1, europium 0.2. Isotopes of samarium, and lutecium, Sa^{148} and Lu^{176}, are naturally radioactive. Several of the rare earths are excellent absorbers of slow neutrons, gadolinium having by far the largest cross section of all the elements in the periodic system. Over thirty rare-earth isotopes have been found to be produced in the course of uranium fission.[49] This fact, combined with the high degree of neutron absorption of the rare earths, has subjected the group as a whole to intensive scientific study by the

[49] Siegel, J. M., and others, Nuclei Formed in Fission: Jour. Am. Chem. Soc., vol. 68, No. 11, 1946, pp. 2411–2442.

Atomic Energy Commission because of their "poisoning" effect on the action of a nuclear-energy pile.

Production.—Several hundred thousand pounds of misch metal (cerium master alloy) and ferrocerium were produced in 1948. Misch metal producers are General Cerium Co., Edgewater, N. J., and Cerium Metals Corp., Niagara Falls, N. Y. Ferrocerium is made by Cigalite Flint Co., New York, N. Y., and by Kent Metal & Chemical Works, Edgewater, N. J. New Process Metals Co., Newark, N. J., and Matchless Metals Co., Flushing, N. Y., produce both misch metal and ferrocerium. Imported monazite sand constitutes the basic raw material source of the rare-earth metals.[50] (See Monazite section of Minor Nonmetals chapter.) Idaho became a monazite producer in 1948, a shipment of 40 tons being reported by Rare Earths, Inc., McCall, Idaho. Small quantities of monazite are recovered incident to the production of titanium and zirconium minerals from coastal sands of eastern Florida (see Zirconium, this chapter). Monazite is processed principally by Lindsay Light & Chemical Co., West Chicago, Ill.; Maywood Chemical Co., Maywood, N. J.; Wolff-Alport Chemical Corp., Brooklyn, N. Y.; and Rare Earths, Inc. (not connected with Idaho company), Paterson, N. J. Mixed chlorides of the various rare-earth metals are sold by the first three of these companies to the misch metal producers, the misch metal being deposited electrolytically from the anhydrous chlorides.

High-purity rare-earth compounds are produced by the monazite processors mentioned above and by F. A. Lewis, Hempstead, N. Y.; Research Chemicals Inc., Burbank, Calif.; and Edmond C. Botti, Brooklyn, N. Y. Cerium, lanthanum, neodymium, and praseodymium metal are produced by Cooper Metallurgical Associates, Cleveland, Ohio. The Ames Laboratory of the United States Atomic Energy Commission, Iowa State College, Ames, Iowa, has produced a number of the rare-earth salts and appreciable quantities of spectrographically pure lanthanum, cerium, neodymium, and praseodymium metal. Small quantities of pure lutecium and ytterbium metal, as well as various quantities of other heavy rare earths, have also been prepared. Basic raw materials used as sources of erbium, holmium, and yttrium have been the minerals risorite, blomstrandine, and gadolinite, respectively. The Ames Laboratory, under the supervision of F. H. Spedding, produces rare-earth metals and compounds incident to research projects undertaken for the Atomic Energy Commission; the laboratory's rare-earth products are for use only within the Commission and are not available for outside distribution or sale. Dr. Spedding and coworkers have made notable contributions to the chemistry of the rare earths in the development of ion-exchange methods for the separation and production of high-purity compounds.[51]

Ketelle, B. H., and Boyd, G. E., The Exchange Absorption of Ions from Aqueous Solutions by Organic Zeolities. IV. The Separation of the Yttrium-Group Rare Earths: Jour. Am. Chem. Soc., vol. 69, No. 11, 1947, pp. 2800–2812.

Spedding, F. H., and others, Improved Ion-Exchange Method for Separating Rare Earths in Macro Quantities: Jour. Am. Chem. Soc., vol. 70, No. 4, April 1948, pp. 1671–1672.

Consumption and Uses.—Large quantities of rare-earth alloys and compounds are consumed annually in the United States. The important alloy, misch metal (a mixture of all the rare-earth elements with cerium predominating), is combined with iron (15–40 percent) to form pyrophoric alloys which find worldwide use as "flints" in devices such as cigarette lighters, miners' lamps and gas lighters. Ferrocerium and master alloys of misch metal combined with other elements are used in deoxidizing, grain refining, carbide stabilization, and in enhancing the creep and oxidation resistance of steels at high temperatures. An important new application showing much promise in the field of light metals is the use of about 3 to 5 percent cerium (aotually misch metal) to improve appreciably the strength and creep resistance of magnesium alloys in the temperature range up to 600° F. These cerium-magnesium alloys are readily weldable and have good machinability. Addition of 0.05–1.0 percent cerium to low-iron nickel-chromium alloys markedly prolongs their life at elevated temperatures. These alloys, as well as those of cerium-magnesium and cerium-aluminum, have numerous applications in the construction of jet planes, gas turbines, aircraft supercharger parts, and other equipment demanding great tensile strength at high temperatures.

Stocks.—Figures are not available on stocks of misch metal, alloys, or rare-earth compounds. Monazite is included among the minerals being acquired for the National Strategic Stock Pile. Quantities accumulated in the stock pile are confidential.

Prices.—Misch metal prices in 1948 averaged about $4 per pound and for ferrocerium flints about $8. Prices of cerium, lanthanum, neodymium, and praseodymium metal, per pound, were about $50, $175, $200, and $750, respectively. The most important rare-earth materials sold in quantities constitute mixed chlorides and oxides designated as "rare-earth chloride," "rare-earth oxide," and cerium hydrate and oxide. These products are priced from about $0.75–$2.00 per pound in large lots. Prices for high-purity oxides of the rare-earth group elements are approximately as follows: Lanthanum, 99.9 percent, $10 per pound, 100-pound lots; neodymium, 99, $75 per pound; praseodymium, 99.9 $3 per gram, 100-gram lots; samarium, 99.9, $7 per gram, 100-gram lots; yttrium, 99, $2.50 per gram, 100-gram lots; gadolinium, 99.9, $40 per gram; europium, 99.5, $400–$850 per gram. Oxalates of the remaining members of the rare-earth group have been quoted by F. A. Lewis, Hempstead, N. Y., at the following prices: Terbium, 99.7 percent, $75 per 50 mg.; holmium, 90, $65 per 100 mg.; erbium, 95, $500 per gram; lutecium, 99.8, $160 per 100 mg.; ytterbium, 99.8, $200 per gram; and thulium, 99.9, $1,500 per gram.

Foreign Trade.—1948 imports of ferrocerium and other alloys amounted to 1,600 pounds valued at $12,380 in comparison to 665 pounds in 1947 with a value of $3,708. Virtually all receipts originated in Canada.

Exports of misch metal and alloys in 1948 showed a precipitous drop in volume in contrast to the peak year 1947. Shipments for 1948 were 55,133 pounds with a value of $323,582, in sharp contrast to the 182,204 pounds in the previous year valued at $1,053,936. Exports in 1948 were distributed as follows: Canada, 2,190 pounds, value $10,260; United Kingdom, 4,630, $19,556; Belgium, 4,815, $28,049;

France, 275, $1,595; Czechoslovakia, 5,000, $29,000; Switzerland, 35,801, $222,406; Portugal, 2,422, $12,716.

On October 13, 1948, the Economic Cooperation Administration, under the European Recovery Program, authorized the expenditure by Austria of $20,000 in counterpart funds for the purchase of 5,000 pounds of misch metal in the United States.

World Review.—A steady demand for misch metal and alloys was reported in the United Kingdom.[52] Monazite is processed by Thorium, Ltd., London. Misch metal and pyrophoric alloys are made by Imperial Chemical Industries, Ltd., Liverpool; Chemo Metals, Ltd., London; British Flint and Cerium Mfrs., Ltd., Tonbridge, Kent; and Sibor Hard Metals, Ltd., London. Rare-earth compounds, miceh metal and alloys are produced in France by Société de Produits Chimiques des Terres Rares, Paris, and in Austria by Treibacher Chemische Werke, Treibach. Producers of misch metal and alloys in Germany, Belgium, and Portugal are, respectively, Promethus, A. G., Kempten, Bavaria; Société Anonyme de Pont Brulé, near Brussels; and Monocerium, Ltd., Lisbon. In Canada, misch metal is made by Shawinigan Chemicals, Ltd., Shawinigan Falls, Quebec; ferrocerium is produced by the Belgo Canadian Mfg. Co., Montreal. Results of combined laboratory and pilot-plant studies devoted to processing of Australian monazite were outlined in the 21st annual report of the Australian Council for Scientific and Industrial Research for the year ending June 1948.[53]

CESIUM AND RUBIDIUM

Cesium and rubidium are almost invariably found closely associated in nature; with one notable exception, rubidium usually predominates. The richest ore mineral of cesium is pollucite, a cesium-aluminum silicate resembling quartz, and containing about 34 percent Cs_2O; this mineral has been found in ton quantities in pegmatites in the Black Hills of South Dakota, in Maine, and in South-West Africa; its rubidium content is low—about 0.1–2.5 percent Rb_2O. Lepidolite mica carries an average Rb_2O content of about 1.5 percent with a variation of 0.24–3.0 percent being reported; Cs_2O content of lepidolite has been reported as 0.08–0.72 percent. Some varieties of beryl contain up to several percent cesium and rubidium. Cesium and rubidium also occur in feldspars, biotite and muscovite mica, carnallite, leucite, and sea water. Rubidium is one of the few naturally radioactive elements, the isotope Rb^{87} emitting beta radiation.

Production.—Cesium and rubidium metal and compounds are produced by De Rewal International Rare Metals Co., Philadelphia, Pa.; Maywood Chemical Works, Maywood, N. J. (Cs metal, Cs and Rb salts); City Chemical Corp., New York, N. Y. (Cs and Rb compounds); Foote Mineral Co., Philadelphia, Pa. (Cs compounds); Fairmount Chemical Co., Newark, N. J. (Cs and Rb metals and compounds); and Dow Chemical Co., Midland, Mich. (Cs bromide).

Uses.—Cesium and rubidium are used principally as the electron-emitting agent in photoelectric cells employed in alarm and signal systems, automatic counters, sorters, color matchers, time recorders,

[52] Metal Bulletin (London), No. 3306, July 9, 1948, p. 11.
[53] Chemical and Engineering News, vol. 26, No. 48, Nov. 29, 1948, p. 3581.

door openers, and in television equipment. During 1948 a comprehensive book on the practical applications of photoelectric cells was published.[54] An important electronic device being developed is the cesium vapor rectifier which is superior to the mercury vapor type for certain applications. Crystals of the various halide compounds of cesium and rubidium find application in infrared spectrometry, particularly in the longer wave-length bands. The range of sensitivity of cesium cells in visible light is said to correspond closely to that of the human eye. During World War II an infrared lamp employing cesium vapor was developed for ship-to-shore and ship-to-ship signaling.[55] Cesium and rubidium have been used as "getters" (see Barium and Strontium section of this chapter) and have been proposed as hydrogenation catalysts. Their salts are used as reagents in microchemistry. Rubidium iodide has been used for syphilis therapy and in certain cases as a substitute for potassium iodide in goiter treatment.

Prices.—Recent quotations on chemically pure cesium and rubidium metal, double distilled, in sealed glass ampoules were $3 and $4 per gram, respectively, in 10-gram lots; cesium chloride, 10-pound lots, $60 per pound; rubidium chloride, kilogram lots, about $135 per pound; cesium bromide, 500-pound lots, $27 per pound.

Technology.—Efforts to separate rubidium and cesium salts by ion exchange proved unsuccessful.[56] Methods for the separation and determination of cesium and rubidium [57] and for the preparation of the hydrides [58] were described.

World Review.—Pollucite occurs 18 miles south of Karabib, South-West Africa. Unsold stocks were reported as about 60 tons in 1947; it was estimated several hundred tons of ore could be produced. About 3 tons, averaging 28 percent Cs_2O were shipped to the United States, being sold at £140 per ton.[59] Cesium and rubidium metal and salts were produced in Germany, from pollucite and lepidolite, before World War II by E. Merck, Chemische Fabrik, Darmstadt.[60] Cesium and rubidium have been recovered as byproducts from the carnallite of the Solikamsk potash deposits, U. S. S. R.; Soviet production of cesium salts in 1937 was reported as 800 grams per month. Pollucite occurs 90 kilometers southeast of the city of Ust-Kamenogorsk, eastern Kazakhstan.[61] Associated minerals are lepidolite, amblygonite, spodumene, petalite, white alkali beryl, and microlite. Cs_2O content averages 26.61 percent. Important quantities of cesium and rubidium ores are reported at the Boliden mines, Varuträsk, Sweden. Plans were reportedly under way to produce cesium and other metals in Western Australia.[62]

COLUMBIUM AND TANTALUM

The commercially important sources of columbium and tantalum are the minerals columbite and tantalite. Both minerals are normally recovered incident to other mining operations, principally tin in the case of columbite, and tin and beryl in the case of tantalite. The minerals microlite and simpsonite have occasionally been found in sufficient quantities to be used as tantalum ore.

Mine Production.—Operations at the Harding mine near Dixon, N. Mex., and at the Brown Derby mine, near Ohio City, Colo., were suspended in 1948, with the result that domestic tantalum-ore output was essentially at a standstill throughout the year. Either or both of these properties have operated since 1943, producing the tantalum mineral, microlite, in commercial quantities at the rate of several thousand pounds annually. A few hundred pounds of columbite and tantalite are accumulated each year in the United States in the mining of feldspar, quartz, mica, beryl, and lithium minerals.

Columbium and tantalum concentrates shipped from mines in the United States, 1944–48

[Compiled by R. W. Metcalf]

Year	Columbium concentrates		Tantalum concentrates	
	Pounds	Value	Pounds	Value
1944	3,208	$917	7,204	$23,317
1945	1,149	287	5,500	13,366
1946			3,475	8,793
1947			3,259	8,677
1948	100	(1)	500	(1)

1 Bureau of Mines not at liberty to publish figure.

Domestic Refiners.—Tantalum and columbium metals, chemicals and fabricated metal shapes, and equipment are produced by Fansteel Metallurgical Corp., North Chicago, Ill. Metal Hydrides, Inc., Beverly, Mass., produces tantalum and columbium metal powder and tantalum hydride powder. The Electro-Metallurgical Co. is the principal consumer of imported columbite and is the sole producer of ferrocolumbium alloys at its Niagara Falls, N. Y., plant and possibly other locations.

Consumption and Uses.—Figures on quantities of columbium and tantalum products consumed in the United States are not available. The major use for columbium is as a stabilizer in stainless steels, decreasing their susceptibility to intergranular corrosion, improving weldability, and increasing creep and impact strength. It is also becoming an increasingly important constituent of ferrous and nonferrous alloys being developed for parts exposed to high temperatures generated in jet engines, gas turbines,[63] and other equipment, imparting greater creep and fatigue strength.[64] The properties of columbium and tantalum alloys have been reviewed.[65] Tantalum

65 Myers, R. H., The Constitution and Properties of Alloys Containing Tantalum and Columbium: Metallurgia, vol. 39, December 1948, pp. 57–63.

finds use principally as the pure metal. It is readily shaped into various objects and is highly corrosion-resistant. Considerable quantities are used in the chemical industries for heat exchangers, condensers, absorption towers, and other devices subject to corrosive attack. Tantalum metal also finds wide application in surgery for skull plates and sutures and in electronics as a structural component in many types of vacuum tubes. Tantalum carbide is used for cutting tools, dies, and wear-resisting parts and is a component of the alloy Tantung. Potassium-tantalum fluoride was of critical importance during World War II as a catalyst in the production of synthetic rubber. Tantalum oxide is an important constituent of silica-free optical glass used for the lenses of aerial cameras.

Prices.—The Metal Bulletin (London) quoted columbite ore, 50–55 percent combined oxides, January 13, 1948, at 65s. per unit, c. i. f. Thereafter quotations increased as follows, February 13, 67s. 6d.–70s.; November 16, 67s. 6d.–72s. 6d.; and December 31, 70s.–75s. The successive increases in price apparently were due to the growing shortage of columbite created by strategic demands being superimposed upon normal industrial requirements, coupled with the fact that columbite was being actively purchased during the year for the United States Government strategic stock pile. E&MJ Metal and Mineral Markets for January 1, 1948, quoted tantalum ore, 60 percent Ta_2O_5, at $2–2.50 per pound contained Ta_2O_5; the quotation rose in August to $2.25–$2.75, then declined again in September to $2–$2.75, remaining unchanged thereafter. Prices for columbium metal per kilogram were $280 for rod and $250 for sheet, unchanged throughout 1948. Similarly, tantalum metal per kilogram was $160.60 for rod and $143 for sheet, also unchanged during the year. The American Metal Market quoted columbium and tantalum metal powder, per pound, at $62.75 and $65–$73, respectively, in 1948. Ferrocolumbium alloy, 50–55 percent Cb, Eastern Zone, per pound contained Cb, was $2.50–$2.60 in January 1948 increasing successively to $2.75–$2.80 on October 7 and $2.90 on December 23, the increments reflecting the rise in the price of columbite ore.

Stocks.—Inventory figures of tantalum and columbium ores, metal, alloys, and compounds in private and Government hands are not available for publication. Both columbite and tantalite are on the list of materials to be acquired for the National Strategic Stock Pile; however, tantalite was not in active demand in 1948.

Foreign Trade.—In 1948, for the first time since 1942, columbite imports fell below 2,000,000 pounds, this despite the fact that demand for columbite remained at a near-record level. Diversion of part of the total supply to consuming countries other than the United States was not a significant factor in explaining the decline; instead, it is believed that accumulated columbite-rich dumps, which had been worked in Nigeria during the war years to supplement the normal byproduct output from contemporary tin production, were becoming depleted.

Tantalite imports slumped to the lowest level since 1939, the decline being reflected strongly in United States-destined shipments from both the Belgian Congo and Brazil, the major producing countries. Annual imports from Brazil ranged from about 162,000 to 440,000 pounds in 1941–44 and about 68,000 to 98,000 in 1945–47, in marked contrast to 9,202 pounds in 1948. Imports from the Belgian Congo during the years 1941–47 varied from about 147,000 to 486,000 pounds annually as compared to 83,137 pounds in 1948. Despite the marked overall decline, imports were recorded from Argentina in 1948, the first year since 1944, and receipts of tantalite from Nigeria were nearly double those for 1947. Exports of columbium ore in 1948 totaled 660 pounds to Switzerland, valued at $1,980. Tantalum metal and alloys were shipped to the amount of 867 pounds, value $33,995; principal recipients were the United Kingdom, Germany, and Austria. Exports of columbium metal and alloys and of tantalum ore were negligible.

Columbium and tantalum ores (columbite and tantalite concentrates) imported for consumption in the United States, 1946–48, by countries, in pounds

[U. S. Department of Commerce]

Country	Columbium ore			Tantalum ore		
	1946	1947	1948	1946	1947	1948
Argentina						1,074
Australia				500	9,468	
Belgian Congo		2,734	113,813	263,097	311,526	83,137

Southern Rhodesia					14,928	8,914
Union of South Africa			1,821	1,884		
United Kingdom			1,200			
Total: Pounds	2,426,246	2,821,634	1,966,802	363,553	418,753	116,886
Value	$742,804	$857,550	$655,916	$302,397	$386,934	$79,189

[1] Classified by U. S. Department of Commerce as from Chile, which is believed to have been the country of transshipment rather than the country of origin.

Technology.—Patents were issued outlining methods for separating columbium and tantalum by chlorination,[66] and for determining columbium carbide in stainless steel.[67] A technique for plating tantalum and columbium on nonferrous and ferrous metals and ceramic bases was developed.[68] Principles of mechanically shaping tantalum were reviewed.[69]

WORLD REVIEW

Australia.—Under a recent decision of the Department of Commerce, exports of tantalite are to be reserved for the United Kingdom. Tantalite exports were brought under Commonwealth control early in May 1948, licensing to be administered under the Department of Supply and Development. Total Australian production of tantalite (65 percent Ta_2O_5) for the years 1905–47, inclusive, was 295 tons.[70] Two new companies were formed to produce tantalum and columbium

metal, Amalgamated Metallurgical Corp., Ltd., and New Metals (Australia), Ltd.[71] The first company reportedly had acquired plant space at Finsbury, near Adelaide, while the second planned to operate at Welshpool, Western Australia (see Beryllium, Cesium and Rubidium, Zirconium—World Review, this chapter).

Belgian Congo.—Most of the world output of intermediate-grade tantalite (about 35 percent Ta_2O_5 and 30 percent Cb_2O_5) comes from the Belgian Congo. The main producing company is the Compagnie Geologique et Miniére des Ingenieurs et Industriels Belges Soc. Anon. (Geomines); tantalite is recovered as a byproduct in the mining of cassiterite which occurs in deeply decomposed pegmatite dikes. Output in 1948 was about 320,000 pounds, a 16-percent decline below the approximately 380,000 pounds of 1947. Tantalite concentrates were being stocked in 1948, there being virtually no market.

Belgium.—The Société Générale Métallurgique de Hoboken, near Antwerp, is a producer of tantalum and columbium alloys and carbides.

Brazil.—The world's principal production of high-grade tantalite (60 percent Ta_2O_5) is derived as a coproduct of beryl mining in the states of Paraiba and Rio Grande do Norte; production in 1937–44 totaled about 600 metric tons. Exports in 1948 were only 9,183 pounds, representing a decline of 87 percent below the 72,753 pounds reported for 1947. The sharp drop was attributed to lack of interest on the part of American consumers, who ordinarily constitute the principal market. Buyers indicated that attempts were being made by producers to dispose of tantalite by making its purchase contingent to that of beryl which remained in strong demand.

Canada.—Peg Tantalum Mines, Ltd., with properties and a 100-ton concentrating plant at Ross Lake northeast of Yellowknife, N. W. T., filed a bankruptcy petition in the summer of 1947 in the Edmonton courts. Consolidation with an affiliated company, Tantalum Refining & Mining Corp. of America, Ltd., was under consideration.[72] During 1948 the latter company acquired title to tantalite claims at Ross Lake and to a refining laboratory in Edmonton.

Germany.—The production of tantalum and columbium alloys and compounds [73] and tantalum metal [74] in Germany during World War II was described. Total output in Germany of ferrocolumbium during the war was about 1 ton per month. Two tantalum-refining plants were in operation, at least one of which was later dismantled and removed by the Russians.

A deposit of the columbium mineral, koppite, disseminated in limestone, was reported as occuring about 500 meters east of the village of Schelingen in the Kaiserstuhl, near Freiberg.[75] Reserves of 500,000 to 700,000 metric tons, containing under 0.50 percent columbium, were estimated. Experimental mining of columbium ore in the Kaiserstuhl, presumably from the above deposit, was reported.[76]

[76] Metal Bulletin (London), No. 3311, July 27, 1948, p. 14.

Nigeria.—Nearly 99 percent of the world output of high-grade (65 percent Cb_2O_5) columbite concentrates originates as a byproduct of tin mining in northern Nigeria. Total Nigerian production in 1948 was 1,238 long tons, being essentially unchanged from 1947 output of 1,286 tons. The major producers were Amalgamated Tin Mines of Nigeria, Ltd., 347 long tons; Bisichi Tin Co., Ltd., 122 tons; and Jantar Nigeria Co., Ltd., 264 tons. The latter two companies reported, near the year end, proven columbite reserves of 811 and 2,439 tons, respectively. The columbite contract between Jantar Nigeria Co., Ltd., and American buyers was renewed for the calendar years 1949–50 at an increased price. Shipments were principally to the United States, as in past years, but exports to the United Kingdom rose from 269 tons in 1947 to 407 in 1948. Norway received 100 tons in 1947, none in 1948. Important deposits of high-grade tantalite occur [77] in central Nigeria.

Portuguese East Africa (Mozambique).—A uranium-bearing mineral resembling samarskite has been reported as occurring in quantity in the vicinity of Tete.[78] The mineral contains tantalum and columbium and other elements which may constitute its greatest value; 50 tons have been shipped to the United Kingdom and a permit obtained for shipment of 100 more.

Southern Rhodesia.—Production of tantalite was about 14 tons in 1947 and 8 in 1948. Energetic prospecting for tantalite was reported in the Bikita district, east of Salisbury.[79]

South-West Africa.—Total output of tantalite for a 20-year period through 1948 was about 20 tons.

United Kingdom.—Ferrocolumbium and ferrotantalum are produced at the Rainham Works of Murex, Ltd., Essex.[80]

Other Countries.—Uganda produced a few thousand pounds of high-grade columbite in 1948. A few tons of low-grade columbite-tantalite (25 percent Cb_2O_5, 12 percent Ta_2O_5) were recovered in Malaya [81] during the Japanese occupation as a byproduct of tin dredging in the states of Johore and Kedah. Columbite-tantalite concentrates are obtained as a byproduct from gold mining in the Mayoko region, French Equatorial Africa,[82] a few tons being recovered in 1945–46.

GALLIUM

Despite its great rarity in nature in concentrations of economic importance, gallium is one of the most widely distributed elements in the earth's crust. Granitic rocks almost invariably contain about 0.001 percent of the element. Traces of gallium are found in essentially all aluminum minerals, a high proportion of zinc minerals, in lepidolite, tourmaline, ores of iron, manganese, and tin, in coal, and in aluminum, iron, and zinc metal. Up to 1.85 percent gallium has been reported in germanite, the richest known gallium-bearing mineral (see Germanium in this chapter).

82 Bureau of Mines, Mineral Trade Notes: Vol. 26, No. 4, April 1948, p. 4.

Gallium becomes concentrated to a varying degree in intermediate products and residues formed in processing aluminum and zinc ores and in burning coal and is recovered commercially from these sources.

Production.—Gallium metal was produced in 1948 by the Eagle-Picher Lead Co., Joplin, Mo., from cadmium plant residues and lithopone sludge; by the Aluminum Ore Co. (Aluminum Co. of America subsidiary), East St. Louis, Ill., from Bayer process liquors; and by Saratoga Laboratories, Inc., Saratoga Springs, N. Y. The latter company began output late in the year and constituted a new producer. Total production of gallium metal by all producers for 1948 is estimated to have been about 200 pounds. Shipments probably did not exceed 100 pounds.

A great deal of public interest in gallium was evidenced in 1948 because of its rumored atomic energy applications. The Atomic Energy Commission and, to a lesser extent, the Office of Naval Research, sponsored several projects in 1947 and 1948 devoted to the study of gallium metal, alloys, and compounds. Under military auspices, the Bureau of Mines carried on an intensive survey of the naturally occurring and byproduct gallium resources of the United States and conducted research in the extractive metallurgy of gallium.

Prices.—Near the end of 1948, gallium metal, 99.9 percent pure, was offered by the Aluminum Co. of America at the prices below.

Quantity:	*Per gram*	Quantity—Continued:	*Per gram*
Less than 100 grams	$5.00	5,000–9,999 grams	$3.50
100–999 grams	4.50	10,000–24,999 grams	3.00
1,000–4,999 grams	4.00	25,000 grams and over	2.50

The above quotations, converted to dollars per pound, range from $2,270 downward to $1,135.

Uses.—The principal practical application for gallium metal has been as a component in the construction of direct-reading fused quartz thermometers[83] used for measurements up to 1,200° C., gallium filling the role played by mercury in lower range instruments. Small quantities of gallium have found use in dental amalgams, optical mirror backings, gallium-vapor lamps, and low-melting alloys. Some of the alloys of gallium with indium, tin, and aluminum are noteworthy in being liquid below room temperature.

The favorable range between its melting and boiling points (about 30°–2,000° C.), combined with low vapor pressure and other desirable properties, suggest that gallium metal would be a highly efficient heat-exchange medium. The principal deterrents to such use are its high cost and avidity for alloying with other metals. If these difficulties can be resolved, gallium metal may find bulk application as a heat-exchange fluid or coolant, in installations such as nuclear-energy power plants, which must operate at temperatures considerably transcending those of conventional steam-power plants if they are to make available even a small part of their potential energy.

World Review.—It has been estimated that as much as 1,000 tons of gallium per year may be lost in the British Isles through discard or dissipation into the air of gallium-rich flue dusts and ashes derived from burning British coals. Gallium is produced in the United

[83] Smithells, C. J., A German Thermometer for Use in the Range 400°–1200° C.: British Intelligence Objectives Subcommittee Final Rept. 345, February 1946, 11 pp.

Kingdom by the Chemical Research Laboratory, Teddington, Middlesex.

Several years before World War II, gallium was produced in Germany at the rate of about 300 pounds per year. Raw materials were germanite ore from the Tsumeb mine in South-West Africa and wastes from the treatment of the copper ores of Mansfeld in eastern Germany.

Gallium has been reported in flue dusts from the combustion of Australian coals, the coal ashes of Asturia, Spain, in Russian electrolytic zinc, and in Indian bauxite ores.

GERMANIUM

Germanium is found in significant traces in some zinc and tin ores, in enargite, topaz, beryl, lepidolite, spodumene, tourmaline, alkali feldspars, and in coal. The mineral germanite has been found to contain up to about 10 percent germanium. Bolivian pyrargyrite has shown 1 to 3 percent, and a few exceedingly rare minerals contain germanium to the extent of a few percent.

Commercial production of germanium has come from germanite ore on occasion, but its recovery as a byproduct of zinc smelters treating germaniferous ore has afforded the largest and most dependable supply. Ultimately the most important source of germanium may be the flue dusts and ashes saved from burning of germaniferous coals by industry.

Production.—The Eagle-Picher Lead Co., Joplin, Mo., which had been the sole domestic producer of germanium and its compounds, was joined by two newcomers in 1948—the American Steel & Wire Co. (subsidiary of U. S. Steel Corp.), Donora, Pa., and Saratoga Laboratories, Inc., Saratoga Springs, N. Y. Output of germanium in 1948, mostly as the oxide, exceeded 1,000 pounds and reached an all-time high mainly as a result of record output of zinc by the Eagle-Picher Lead Co. from the germaniferous zinc ores of the Tri-State district. With the exception of 1945, domestic production of germanium has shown an uninterrupted rise since its beginning in 1942.

Consumption and Uses.—Consumption, mainly by the electronics industry, kept closely abreast of production. Concern was expressed by consumers as to the adequacy of future supplies in view of probable expanding requirements, combined with the possibility that Tri-State district zinc output, from which most germanium comes as a byproduct, seemed certain to continue to decline.

Germanium is employed in the electronics industry as the key component in diminutive crystal units used for the rectification of radio-frequency currents ranging up to about 100 megacycles. The diode, or two-element type, was developed during World War II, together with similar silicon crystal rectifiers, for application in radar microwave circuits and was proven in several years service. Large numbers of germanium diodes are now used in the video detector circuits of television sets, electrical test equipment, Geiger counters, crystal sets, electronic computers, and telephone circuits. Several thousand diodes are used in some of the larger electronic computers. It is believed that the telephone industry is one of the largest potential users and that hundreds of thousands of units may eventually be required. The quantity of germanium metal needed in a single unit is exceedingly small, measuring only about 3 mm. by 3 mm. by 0.6 mm.

In 1948 Bell Telephone Laboratories, Princeton, N. J., announced development of a triode unit or transistor.[84] Similar in size to the diode, the transistor may be employed as an oscillator or amplifier, or for other purposes for which vacuum tubes are ordinarily used. Despite its apparently bright future, the transistor is still in the experimental stage, difficulty being experienced in producing units of uniform electrical characteristics. Nor is it yet competitive in price with the vacuum tubes it might displace. Its advantages over vacuum tubes center around its wide frequency range, small size, light weight, longevity, low current requirements, and freedom from hum. Basic research in the semiconductors, such as germanium and silicon, has been carried on for several years at Purdue University, South Bend, Ind., by K. Lark-Horovitz and associates. Cyclotron bombardment of germanium was employed recently by this group to produce new types of semiconducting crystals,[85] and a patent issued and assigned to the Purdue Research Foundation covering a germanium-helium "alloy" which, it is claimed, will resist higher voltages than untreated crystals.[86]

Germanium has been used in special optical glass and in phosphors.[87] Film resistors of germanium are made by depositing the metal on ceramic bodies from the volatile compound germanium hydride. Germanium (12 percent) and gold form a low melting eutectic that may have eventual applications in jewelry as a gold solder and in dentistry for inlays. The alloy melts at 673° F. compared with 1,945° F. for pure gold, expands slightly upon solidification, and resembles standard 18-carat gold in color.

Stocks and Prices.—Strong demand kept stocks pared to a low level. Demand and increased costs appeared to be the main factors in bringing about an increase in prices in 1948, the average for the year being about $65 a pound for the spectrographically pure oxide and $230 for high-purity metal. Averages for 1947 were $50 per pound for the oxide and $200 for the metal. Purchased in small lots, both metal and compounds bring appreciably higher prices.

World Review.—It has been estimated that up to 2,000 tons of germanium per year may be present in stack gases, flue dusts, and ashes of plants burning germaniferous coals in the United Kingdom (see Gallium, this chapter). The Chemical Research Laboratory, Teddington, Middlesex, produces germanium from such residues.[88] Germanium has been studied in the coal ashes and flue dusts of Spain, Australia, and the U. S. S. R. Germanite, the richest known ore of germanium, has been found only at the Tsumeb mine, South-West Africa. Very pure specimens of the mineral have shown a germanium content exceeding 10 percent. H. DeWitt Smith, managing director of Tsumeb Corp., Ltd., states:[89]

[89] Letter to Bureau of Mines, June 16, 1949.

When Tsumeb Corporation took over the assets of the old German company, there were on hand at Tsumeb approximately 26 tons of germanium-gallium ore, which represented a pre-war accumulation by the old company from the upper levels. Three shipments, totalling 11 tons, have been made by Tsumeb Corporation . . . . , leaving a balance of 15 tons of material carrying approximately 38% copper, 8% lead, 9% zinc, 2 to 4% germanium, and .25–.50% gallium.

The old records indicate that this material was mined during the years 1922–23 from the 6th level, of which a careful inspection shows no indication of additional germanium-gallium ore.

Germanium metal has been produced in Germany and its use in high-frequency current rectification studied;[90] 50 tons of germanite ore were reported to have been in a Hanover warehouse at the beginning of World War II.

HAFNIUM

Hafnium metal is reported to be about as soft as copper and similar to zirconium in properties except for a higher melting point and specific gravity, being in the latter respect about as heavy as mercury. The metal can be hammered cold, drawn into wire, and rolled into sheet and is said to be superior to zirconium in cold-working properties. All commercial zirconium metal and compounds produced up to the present time contain hafnium, in amounts that may exceed 2 percent. Hafnium oxide and carbide are among the most refractory of compounds, with melting points of 2,664° and 3,787° C., respectively.

Hafnium is almost identical with zirconium in chemical behavior and is invariably found in zirconium minerals in nature; with the exception of the rare mineral, thortveitite, zirconium is always present in appreciably larger quantity than hafnium. The hafnium oxide content of commercial and potentially commercial zirconium minerals is approximately 0.5–2.0 percent for zircon, 0.5–1.2 in baddeleyite, and 0.17–0.7 in eudialyte. (See the Zirconium section of this chapter.) Certain altered varieties of zircon, such as alvite and cyrtolite, are the richest sources of hafnium, up to as high as 15 percent HfO_2 being positively reported; however, the average would probably not exceed a few percent. Minerals containing hafnium are radioactive owing to the presence of either uranium or thorium, or both. The quantity of hafnium in a mineral is apparently roughly proportional to the intensity of radioactivity of the mineral. Almost 4.5 percent of uranium oxide has been found in cyrtolite. It has been suggested that the fluorescence of some zirconium minerals may be related to the hafnium content.

The hafnium-rich mineral cyrtolite has been found in quantities of hundreds of pounds at a feldspar quarry near Bedford, Westchester County, N. Y., and at Baringer Hill, Llano County, Tex. The latter locality is no longer accessible, being flooded by a reservoir. Other less important cyrtolite occurrences in the United States are listed in comprehensive early publications.[91] Cyrtolite has also been recorded from India, Madagascar, Italy, Sweden, and from the Hybla and Parry Sound district, Ontario, Canada. The hafnium-rich mineral,

[90] Taylor, J. E., and others, German Research on Rectifiers and Semiconductors: British Intelligence Objectives Subcommittee (BIOS) Final Rept. 725, July 1, 1946, pp. 20–25.
[91] Lee, O. Ivan, The Mineralogy of Hafnium: Chem. Revs., vol. 5, No. 1, February 1928, 37 pp. Tyler, Paul M., Hafnium: Bureau of Mines Inf. Circ. 6457, 1931, 11 pp.

alvite, occurs in Norway. The occurrence of hafnium in zirconium minerals of the U. S. S. R. has been studied.[92]

Production.—Hafnium metal, oxide, and other compounds are produced by De Rewal International Rare Metals Co., Philadelphia, Pa. The Fairmount Chemical Co., Newark, N. J., produces hafnium oxide. Hafnium metal and compounds are available from Chemical Commerce Co., Newark, N. J., and from A. D. McKay, New York, N. Y. Hafnium-nickel alloy (50 percent Hf–50 percent Ni) has been prepared by Metal Hydrides, Inc., Beverly, Mass.

Uses.—To date, hafnium metal and compounds have found application only in chemical and physical research devoted to further study of their properties. In view of the current intense interest in the development of superrefractories for jet engines, nuclear reactors, and other high-temperature devices, the compounds of hafnium, such as the oxide and carbide, have received renewed attention. The absorption cross section of hafnium for thermal neutrons is substantially greater than that for zirconium (which is very low), suggesting that if zirconium metal or compounds are to be utilized effectively in any atomic energy applications where neutron conservation is critical, as in nuclear reactors, the hafnium content must first be removed.

Because of its high ductility, melting point, and electron emissivity hafnium shows promise in the electronics industry for filaments and cathode surfaces. The oxide and salts exhibit catalytic properties similar to the zirconium homologs in the dehydration and dehydrogenation of ethyl alcohol.

Should specific applications be developed for hafnium, requiring the element in quantity, it appears possible that 100 tons per year or more could be recovered from zircon concentrates. However, much more economical methods of separation from zirconium than those presently known would have to be developed to effect such large-scale output.

Prices.—Hafnium metal powder, 98 percent, was recently quoted at \$32 per gram in 100-gram lots; quotations for the oxide, 99 percent, were \$23 per gram, 100-gram lots; the basic nitrate of similar purity was offered at \$17 per gram, 10-gram lots.

Technology.—The application of ion-exchange [93] and other methods [94] to the problem of separating hafnium from zirconium give promise of supplanting the once tedious procedure of fractional crystallization. Hafnium metal is prepared by methods nearly identical to those employed for zirconium. In 1948 the Bureau of Mines investigated the ion-exchange method for hafnium separation and developed spectrochemical methods for its determination. In Australia the Division of Industrial Chemistry of the Council for Scientific and Industrial Research is reported to have investigated the problem of hafnium and zirconium separation for several years [95] and to have studied preliminary separations on a fairly large scale.

INDIUM

Commercial indium is recovered as a byproduct in the production of zinc, cadmium, and lithopone.

Production.—Output of indium in 1948 tripled that for the low year 1947 but was still negligible in comparison with the late years of World War II, when annual production approached 100,000 troy ounces. Small quantities of the metal were produced during the year by National Zinc Co., Bartlesville, Okla., and the American Steel & Wire Co. (subsidiary of U. S. Steel Corp.), Donora, Pa.; the Perth Amboy, N. J., plant of the American Smelting & Refining Co., reported production of the chloride. Shipments of indium and compounds were made by the above-mentioned concerns and by Anaconda Copper Mining Co., Great Falls, Mont., and the Denver, Colo., plant of the American Smelting & Refining Co. The latter two plants, while inactive in 1948, are normally the largest producers. The indium content of 1948 shipments totaled 12,202 troy ounces compared to 13,908 in 1947 and 9,667 in 1946.

Uses.—The chief use of indium to date has been as a plating for lead-coated machinery bearings and gears, imparting improved corrosion resistance, better oil-film retention, and higher surface hardness and strength.[96] This application reached a peak during the last years of World War II in aircraft production but has declined since that time. Indium alloys with many of the nonferrous metals, indium-zinc alloy having been used to plate hollow-steel aircraft propeller blades, and indium-gold finds application in dentistry. As a backing for mirrors and headlights indium forms brilliant, nontarnishing reflecting surfaces. A tin-free indium-lead alloy has been developed to fill the demand for a solder with a melting point intermediate between that of tin-lead solders and brazing alloys.[97] A patent was granted for a tin-free silver-brazing alloy [98] containing indium. Indium foils have been employed for the measurement of neutron density in nuclear physics experimentation. The wide range between the melting point (157° C.) and boiling point of indium (2,000° C.),[99] plus other favorable characteristics, suggests its possible use, like gallium, as a liquid metal for high-temperature thermometry or as a heat-exchange medium in high-temperature devices. Indium forms alloys with gallium and tin that are liquid at room temperature and below (see Gallium, this chapter). Indium-bismuth alloy is sold commercially under the trade name Cerrolow; one type of this alloy melts at 46.8° C. and may be applied molten to the skin of the body without injury. Suggested uses are as casts replacing plaster of paris, and in the arts as facial casts which may be plated with copper and the underlying low-temperature alloy subsequently removed. Indium has been proposed as a plating metal for the manufacture of tarnish-proof silverware. The oxide imparts yellow and amber shades to glass.

[99] Kohlmeyer, E. J., and Spandau, H., [The Boiling Point of Indium]: Ztschr. anorg. Chemie, vol. 253, Mar. 15, 1945, pp. 37–40.

Stocks.—With a negligible output of metal and compounds in 1948, the decline in producers' stocks at the year end, compared to the same period in 1947, was about equal to shipments reported. Large stocks of unprocessed indium-rich residues were believed to be held by producers who awaited signs of an upturn in the demand for indium before incurring the expense of extracting the metal.

Prices.—Indium metal, 99.9 percent, was quoted nominally at $2.25 per troy ounce. The continuing doldrums of the indium market is reflected by the fact that this price has remained unchanged since September 1945. Prior to that time, back to about 1940, indium prices ranged from $3–$15 per troy ounce, with figures in the higher range generally prevailing.

Technology.—A spectrochemical method for the determination of indium in ores was developed by the Bureau of Mines.[1] Methods for the recovery of indium [2] and for its electrodeposition [3] were published.

World Review.—Indium is produced in Peru as a byproduct of zinc smelting at the Oroya plant of the Cerro de Pasco Corp. Exports of Peruvian indium in 1948 totaled 500,000 grams,[4] most of which went to the United States. Peru's exports in previous years were: 1947, 304,000 grams; 1946, 155,000; 1945, 41,457. Indium is produced in Belgium by the Société Belgochimie and at Okar, near Goslar, in Germany.[5]

LITHIUM

The brines of Searles Lake, near Trona, Calif., are the most important commercial source of lithium. Lithium minerals of commercial importance are spodumene, lepidolite, amblygonite, and petalite. (Ores and compounds of lithium are discussed in the Minor Nonmetals chapter of this volume.)

Production and Consumption.—Lithium metal and alloys are produced by the Metalloy Corp. (subsidiary of Lithium Corp. of America), Minneapolis, Minn., and by the Maywood Chemical Works, Maywood, N. J. Output of metal in 1948 was less than one-third that of 1947, but production of lithium alloys remained essentially unchanged from the earlier level. A wide variety of lithium chemicals is prepared by the above mentioned companies and by the Foote Mineral Co., Philadelphia, Pa. A promising compound, lithium-aluminum hydride, is now produced in commercial quantities by Metal Hydrides, Inc., Beverly, Mass.

Consumption and Uses.—Apparent consumption of lithium metal and alloys in 1948 amounted to several thousand pounds each.

Metallic lithium is employed for removing sulfur, oxygen, and other gases from molten metals, particularly copper, and in addition, it has a grain-refining action. Lithium is finding expanded use in the light metals field, particularly in alloys of aluminum, zinc, and magnesium [6]

to which are conferred, variously, better tensile strength, ductility, and corrosion resistance. Lead-base bearing alloys are hardened with small additions of lithium.

Lithium amide and lithium-aluminum hydride are proving of increasing value in organic synthesis. The amide is reportedly used in the production of several allergy specifics of the antihistamine type; the double hydride offers many possibilities, among which are the reduction of carbon dioxide to derivatives of methanol [7] or formaldehyde.

Stocks and Prices.—Year-end producers' stocks of lithium metal and alloys for 1948 were substantially less than for the same period in 1947.

Published quotations for lithium metal, 98–99 percent in E&MJ Metal and Mineral Markets were $10–$15 per pound in January 1948, with increases in mid-March to $12–$15 and in early July to a flat $15, remaining unchanged thenceforth.

Technology.—Various methods for the production of lithium metal were described in 1948.[8]

RHENIUM

Molybdenite has proven to be the richest mineral source of rhenium, from less than 0.0001 percent of the element, up to 0.05 having been reported in domestic deposits. One isotope of rhenium, Re^{187}, is naturally radioactive, emitting beta particles.[9] The principal commercial source of rhenium is flue dust collected from plants engaged in the roasting of molybdenite concentrates; the rhenium content of such flue dusts may be as high as several percent.

Production.—Rhenium and potassium perrhenate have been produced since 1942 by the Chemistry Department of the University of Tennessee (Knoxville), under the supervision of A. D. Melaven, the raw material used being molybdenite roaster flue dust containing up to 1.5 percent rhenium. Anticipated output of 150 to 200 pounds of the perrhenate in the period 1947–48 fell far short of realization because of delays incurred in building a new pilot plant and a shortage of full-time employees to operate the facility. Production was resumed in mid-1948 and continued through the rest of the year. The new plant has an annual capacity of 30 to 50 tons of flue dust. A survey for new sources of rhenium is continuing.

Uses.—Being very similar to tungsten in physical and chemical characteristics, rhenium can be readily substituted for it in many applications. Rhenium wire has been used as filaments in incandescent lamps and thermionic tubes and is said to be less volatile in vacuum and to show greater emissivity than tungsten. Superior pen nibs, make-and-break electrical contact points, and thermocouples have been made from rhenium metal and alloys. Rhenium metal in powder or colloidal form has proved to be a valuable catalyst in the production of chloroform, ethane, and antiknock compounds. Aside

from its use as a catalyst, where recovery and reuse are possible, rhenium is obtainable in too small quantity to show much promise in any large-scale industrial application.

Prices.—The University of Tennessee Chemistry Department offered rhenium metal, 99.9 percent, and potassium perrhenate during 1947–48 at the following prices, per gram:

Quantity:	*Potassium perrhenate*	*Rhenium metal*
First 10 grams at	$2.00	$3.25
Next 90 grams at	1.50	2.50
Each gram over 100 grams at	1.00	1.75

These prices remained unchanged from the 1946 quotations. During 1948 an excellent résumé of rhenium technology was published [10] and a new method of colorimetric determination described.[11]

World Review.—Molybdenites from the Kounrad, Tyznyanz, and Chikok deposits in the Kazakh S. S. R. were studied and found to contain 0.00012–0.015 percent rhenium; 86–90 percent of rhenium contained in these ores is reported recovered in the roaster flue dusts.[12] Molybdenite from Lainejaur, Sweden, was reported to contain about 0.25 percent Re, this being easily the highest rhenium content ever reported for any mineral.[13] Before World War II, Germany was the only producer of rhenium; an output of several hundred pounds per year was reached in the mid-1930's. Raw materials consisted principally of molybdenum wastes from copper ore dressing and refining.

SCANDIUM

Scandium is a silvery metal with a melting point of 1,400° C. and a computed boiling point of 2,400° C.; its nitride is dark blue, is a good conductor, and melts at 2,600° C. Scandium weighs only slightly more than aluminum.

While scandium is sometimes classified with the rare-earth metals, it has many affinities in nature, as well as peculiar physical and chemical properties, which amply justify its being considered apart from the rare earths. The element is widely distributed in the earth's crust, being present in at least trace quantities in many rock-forming minerals. Pyroxenes and amphiboles average about 0.01 percent; muscovite, lepidolite, and beryl contain scandium, up to 1 percent being reported in the case of beryl.[14] Recent studies in which scandium oxide was artificially introduced into the mineral beryl suggest the blue varieties found in nature may be richest in scandium.[15] The mineral thortveitite, $(Sc, Y)_2 Si_2O_7$, is the only known species in which scandium is a major constituent, containing up to 42 percent Sc_2O_3; thortveitite has been reported in pegmatites at Satersdalen, Norway; Befanamo, Madagascar, and, possibly in Iceland. Monazite is reported to sometimes contain up to a few percent of the oxide. Titanite, columbite, tantalite, zircon and many of the less common rare-

[15] Borovik, S. A., [Laboratory Experiments on Introduction of Scandium into the Crystal Lattice of Beryl]: Compt. rend. acad. sci. (U. R. S. S.), vol. 53, 1946, pp. 65–66.

earth minerals contain scandium. Tin-tungsten ores are said to contain as much as 1 to 2 percent Sc_2O_3. Fergusonite from near Sappington and Laurin, south of Butte, Mont., is reported rich in scandium.[16]

Production and Uses.—At present, scandium and its compounds are of interest only in research; however, should commercial applications be developed, possibly several hundred pounds of the element per year might become available as a byproduct of other industries, notably those engaged in the processing of tungsten, beryllium, tantalum, columbium, and rare-earth minerals. Scandium compounds are produced in the United States by Fairmount Chemical Co., Newark, N. J., and F. A. Lewis, Hempstead, N. Y.

Prices.—Scandium oxide exceeding 99 percent in purity is quoted at $50 per gram; high-purity scandium sulfate has been recently offered in 10-gram lots at $17.50 per gram. The metal is not known to be procurable at present.

Technology.—Scandium is recovered from thortveitite, from residues left from the purification of tungstic oxide used in the preparation of high-purity tungsten metal, and from rare-earth processing residues. The metal is prepared by electrolysis of a fused bath of ScF_3 plus NaF, using a graphite anode and additions of Sc_2O_3 as a depolarizer. New methods applicable to the analysis of scandium and to the refining of its salts were described in 1948.[17]

SELENIUM AND TELLURIUM

Production.—The output of selenium in 1948 rose for the second successive year, being 89 percent above the average for the period 1935–39 but still 12 percent below the peak year 1943. Tellurium production also increased for the second year since 1946, showing a small gain over 1947.

Both selenium and tellurium are recovered for the most part from anode muds accumulated in the electrolytic refining of domestic and imported blister copper. Production of electrolytic copper was maintained at a high rate both in 1947 and 1948, assuring a large output of selenium- and tellurium-rich raw material during the same period.

Producers of refined selenium and tellurium in the United States are the American Smelting and Refining Co., Baltimore, Md.; United States Metals Refining Co., Chrome, N. J.; and the International Smelting & Refining Co., Perth Amboy, N. J. Tellurium is produced from lead bullion by the United States Smelting, Refining & Mining Co., East Chicago, Ind. Phelps Dodge Refining Corp., Laurel Hill, Long Island, N. Y., and El Paso, Tex., produces large quantities of selenium- and tellurium-bearing silver slimes, which are custom-refined for the company's account by the United States Metals Refining Co. The latter company produced selenium and tellurium alloys in 1948. Selenium alloys were produced by the American Smelting & Refining Co. and tellurium alloys by the United States Smelting, Refining & Mining Co.

Consumption and Uses.—Apparent domestic consumption (producers' domestic shipments plus imports) of selenium and tellurium in 1948 was 837,836 pounds and 78,788 pounds, respectively.

Salient statistics of elemental selenium and tellurium in the United States, 1944–48, in pounds

Year	Selenium					Tellurium [1]		
	Production	Producers' shipments [2]	Producers' stocks at end of year	Imports [3]		Production	Producers' shipments [2]	Producers' stocks at end of year
				Pounds	Value			
1944	485,446	423,906	517,217	97,800	$170,582	69,025	45,323	163,105
1945	458,486	604,445	371,258	216,793	395,934	80,750	60,328	183,527

[1] Includes tellurium content of small quantity of oxide.
[2] Bureau of Mines not at liberty to publish value.
[3] Includes selenium salts.
[4] Revised figure.

Large quantities of selenium are used yearly by the glass, rubber, and electronics industries for decolorizing, acceleration, and for rectifier components, respectively. Selenium rectifiers have been extensively used in industry for many years, but the period 1947–48 witnessed a phenomenal growth in their use, due principally to development by the Federal Telephone & Radio Corp., Harrison, N. J., of new miniature, inexpensive types ideally suited to radio and television circuits. These diminutive rectifiers used in voltage multiplier circuits of radio or television sets can deliver 200 to 500 volts d. c. from a 117-volt a. c. source, eliminating a heavy and bulky transformer and rectifier tube.[18] The newly introduced xerographic process of "dry" photography employs selenium-coated metal disks from which the photographic image is reported transferred by static electricity.[19] Selenium is used in ruby glass,[20] photoelectric cells, protective coatings for nonferrous metals, orange-red pigments, phosphor base materials,[21] lubricants,[22] and as an additive to steel for refining grain and improving ductility.[23] Selenium and tellurium added to steel or copper improve their machinability, a high degree of electrical conductivity being retained in the case of copper. Tellurium is extensively used as a core wash in foundries as a chill inducer for iron castings.[24]

Stocks.—Producers' stocks of metallic selenium and tellurium were down at the year end of 1948 compared to the same period in 1947. Selenium is included in group B of the list of strategic and critical

materials to be procured for the National Strategic Stock Pile; materials in this category are recommended for acquisition only to the extent they may be available for transfer from nonstrategic stock piles of Government agencies. Data concerning quantities of selenium held in the strategic stock pile are confidential.

Prices.—In January 1948, E&MJ Metal and Mineral Markets quoted selenium, black, 99.5 percent, at $2.00 per pound and tellurium at $1.75 per pound, these prices remaining unchanged the balance of the year.

Foreign Trade.—Imports of selenium and compounds in 1948 totaled 267,118 pounds with a value of $489,762. Contributing countries were Canada, 265,118 pounds and Norway, 2,000. In 1947 receipts amounted to 529,175 pounds, Canada accounting for 526,970. No imports of tellurium were recorded. Export figures on selenium and tellurium are not available.

World Review.—Large quantities of selenium and tellurium are recovered as a byproduct of electrolytic copper-refining operations by the International Nickel Co. of Canada, Ltd., Copper Cliff, Ontario, and by Canadian Copper Refiners, Ltd., Montreal East, Quebec. The rated annual production capacity of the latter operation is 450,000 pounds for selenium and 50,000 pounds for tellurium. Production of selenium and tellurium in 1948 was 327,500 and 32,100 pounds, valued at C$655,000 and C$56,175, respectively. Output of both commodities was below that of the previous year, with selenium registering its second successive decline below the peak year 1946, when 521,867 pounds were produced. The lowered output of selenium and tellurium, at least in 1948, is believed to have been caused partly by the summer and autumn drought in eastern Canada, which resulted in a shortage of electric power for the production of electrolytic copper. The International Nickel Co. of Canada, Ltd., reported sales of selenium and tellurium in 1948 as 103,687 and 12,608 pounds, respectively, compared with 225,362 and 16,420 pounds in 1947.

Selenium is produced in Australia by the Electrolytic Refining & Smelting Co. of Australia Proprietary, Ltd., Melbourne; in Sweden by the Boliden Mining Co., and in Belgium by the Société Générale Métallurgique de Hoboken, near Antwerp. In the United Kingdom, copper alloys of selenium and tellurium are produced by British Copper Refiners, Ltd., Prescot, Lancashire.

THALLIUM

Traces of thallium are found in many zinc sulfide ores and in cupriferous pyrites, the roasting and subsequent treatment of which give rise to the commercial production of thallium as a byproduct. The bulk of the thallium in the earth's crust is contained as traces in the potash minerals, principally feldspars and micas;[25] however, thallium recovery is not economically feasible at present from these sources.

Production.—The Globe cadmium refinery of the American Smelting & Refining Co. at Denver, Colo., continues to be the sole producer of thallium metal in the United States, reporting an annual output of a few thousand pounds. Production of thallium increased for the third

[25] Ahrens, L. H., The Unique Association of Thallium and Rubidium in Minerals: Jour. Geology, vol. 56, No. 6, November 1948, pp. 578–590.

consecutive year, being about 30 percent higher than in 1947 but substantially below the average for the war years 1940–45.

A Bureau of Mines survey of domestic thallium resources, made at the request of the Army Engineer Corps, showed the existence of relatively large quantities of thallium in the ores, processing streams, and finished products of the Salt Lake Valley.[26] Methods were developed by the Bureau of Mines for the detection and determination of thallium in various raw materials and products. As a result of the Bureau of Mines survey, the American Smelting and Refining Co. began construction of a pilot plant for thallium recovery from Cottrell dust at its Murray, Utah, silver-lead smelter. The same company also had under construction in 1948 a new thallium recovery plant at its Globe smelter in Denver with an anticipated monthly production capacity of 2,000 pounds of thallium. The ores of the Mercur district near Marysvale, Utah, are rich in thallium, the tailings accumulations of the Mercur mill reportedly containing nearly 2,000,000 pounds of the element. The owners of the tailings were engaged in developing an effective means of recovery.

Consumption and Uses.—Producers' shipments of thallium metal and sulfate in 1948 indicate an apparent consumption of both commodities nearly twice that for 1947. Rodent control campaigns promoted by public agencies in 1948 are believed to have aroused some additional interest in rodenticides.

The major part of thallium metal produced is consumed in the preparation of thallium sulfate, which in turn is used principally as a rodenticide, being added to grain and other media for this purpose. A new use for thallium, developed during World War II, is based on the ability of thallium bromoiodide crystals to transmit infrared radiation of very long wave length.[27] Such crystals find important application in military equipment designed for sniper detection, signaling, and similar operations where visible radiation must be absent. Bromoiodide crystals, in the form of lenses, plates, and prisms, are of great importance in the optical systems of spectrometers used for fundamental research in molecular structure and for analysis of organic preparations by infrared absorption methods. Thallium oxysulfide is used in photoelectric cells [28] similar to selenium. Mercury–thallium (8.5 percent Tl) amalgam has a much lower freezing point than mercury alone, permitting temperature measurement with glass-type thermometers in the range of 2° to minus 60° C. Thallium has also found limited use in high-density liquids, special glasses, selenium rectifiers, silver-bearing alloys, corrosion-resistant and fusible lead alloys, and mold- and insect-proofing, and as a phosphor activator.

Prices.—Thallium sulfate was offered by the American Smelting & Refining Co. in 1947 at $18 per pound, 10-pound lots, up to November 1947, when the price declined to $15, remaining unchanged throughout 1948. Thallium metal, 99.9 percent, 10-pound lots, was quoted at $15 per pound by the same company in 1948.

[27] Plyler, Earle J., Infrared Prism Spectrometry from 24 to 40 Microns: Nat. Bureau of Standards Jour. Research, vol. 41, No. 2, August 1948, pp. 125–128.

[28] Hewlett, C. W., High-Sensitivity Photoconductive Cell: General Electric Rev., vol. 50, No. 4, April 1947, pp. 22–25.

Foreign Trade.—Before World War II thallium and its compounds are believed to have been imported in significant quantities from Belgium, France, Germany, and Poland. In 1945 and 1946 several thousand pounds of thallium sulfate were received from Belgium and France but probably represented old stocks rather than new production. Imports and exports of thallium metal and chemicals are now included in a group classification by the United States Department of Commerce and can no longer be differentiated from other associated items.

World Review.—Thallium production at Okar near Goslar, Germany, has been described.[29] Thallium sulfate is produced as a byproduct of zinc smelting in Belgium by the Société des Mines et Fonderies de Zinc de la Vielle-Montagne, Liège, Belgium. Imperial Smelting Corp., Ltd., London, United Kindgom, produces thallium.

ZIRCONIUM

Production.—The most important zirconium mineral, zircon, is recovered in the United States, as in most other countries, as a coproduct or byproduct in the production of ilmenite, rutile, and monazite from the sands of present day or ancient elevated beaches. Ever-increasing demand in recent years for titanium minerals has, in consequence, greatly expanded the output of zircon. The principal producer of zircon in 1948 was the Humphreys Gold Corp., operating under contract for the Rutile Mining Company of Florida at a site near South Jacksonville, Fla. The plant, which commenced recoveries in April 1944, was reported to have processed about 9,000, 000 tons of sand since that time; current operations are said to be at the rate of 7,500 tons of sand per day. Combined weight of the monthly output of zircon, rutile, and ilmenite concentrates was reported as approximately 4,000 tons.[30]

In December 1948 E. I. du Pont de Nemours & Co. signed a long-term lease on State-owned ilmenite-bearing property near Starke, Fla. It was anticipated operations would begin early in 1949 at the rate of about 25,000 tons of sand per day. The heavy-mineral fraction of the sand was reported as 4 to 4.5 percent by weight, containing, in turn, 45 percent ilmenite and 14 percent zircon. Leucoxene (altered ilmenite and rutile) and rutile will be the principal minerals sought, with zircon being produced as a lesser coproduct. The Humphreys Gold Corp. will operate the property under contract to the du Pont firm and will recover the zircon for its own accouut in a separate plant designed to treat the ilmenite-free tailings.

Assets of the Riz Mineral Co., which had previously recovered zircon from contemporary beach sands near Vero Beach, Indian River County, Fla., were acquired by the Florida Ore Processing Co. in 1948. The latter company concentrated beach sands near Melbourne, Fla., for a period of about 3 months in 1948, recovering zircon, ilmenite, rutile, garnet, and monazite.

[29] Aitkenhead, W. C., Vertical Retort Zinc and Byproducts: Off. Military Govt. for Germany (U.S.) FIAT Final Rept. 733, Mar. 6, 1946, 36 pp.

[30] Hubbard, Judson S., Ilmenite, Rutile, and Zircon: Mining World, vol. 10, No. 10, September, 1948, p. 41.

The Bureau of Mines published the results of its extensive investigations of the heavy-mineral sands near Trail Ridge, Fla.[31] Low-level airplane reconnaissance of the marine shoreline of the Carolinas and Georgia indicated a wider distribution of heavy mineral sands than previously recorded.[32]

A large prospective tonnage of zircon was reported available from stream placers at various localities in western Idaho, an estimated 45,000 tons being contained in recently dredged gravels.[33] Zircon occurs in the chromite-bearing black sands of the California-Oregon coast, a few tons of crude concentrate having been won in connection with experimental chromite recovery during World War II.

Interest in the production of zirconium metal was keen throughout 1948; however, the combined output of all producers probably did not exceed a few thousand pounds. The Bureau of Mines continued its pioneering investigations into the production and properties of zirconium at the Albany, Oreg., experiment station. Output of zirconium metal sponge, 99.5 percent pure (including hafnium content), in 1948, by the Bureau of Mines pilot plant was 2,150 pounds or about two-thirds capacity. An enlarged pilot plant was under construction, with an estimated annual capacity of about 15,000 pounds of metal. Zirconium metal and compounds are produced by the Foote Mineral Co., Philadelphia, Pa.; this company's output includes small quantities of very high purity, high-ductility zirconium metal produced by the iodide process. Powdered and fused metal, zirconium hydride and nitride, and a variety of zirconium master alloys are produced by Metal Hydrides, Inc., Beverly, Mass. Westinghouse Electric Corp., Pittsburgh, Pa., has produced zirconium metal.[34] The Titanium Alloy Manufacturing Division, National Lead Co., Niagara Falls, N. Y., makes zirconium alloys, stabilized-zirconia refractories, and a wide variety of zirconium compounds. Control of the Titanium Alloy Manufacturing Co. was acquired in October 1948 by the National Lead Co. The Electro Metallurgical Co. produces zirconium ferrosilicon alloy at its Sheffield, Ala., Niagara Falls, N. Y., and Alloy, W. Va., plants. Zirconium-copper, zirconium compounds, and zirconia refractories are produced by the Beryllium Corp., Reading, Pa.; Rohm & Haas Co., Philadelphia, Pa., and F. W. Berk & Co., Woodridge, N.J., are important producers of zirconium compounds. The last-named company entered the zirconium field as an integrated producer in 1948. The concern has its own raw material sources in Australia and eventually plans to make zirconium metal and alloys in addition to compounds. The Norton Co., Worcester, Mass., initiated production of fused stabilized-zirconia refractories in 1948 at its Chippawa plant, Ontario, Canada, and planned to expand capacity.

Consumption and Uses.—Annual consumers' requirements for zirconium minerals in the United States are estimated to range between 20,000 and 30,000 tons. The major share is used in the ceramics industries, an important, but lower percentage being required

[31] Spencer, Robert V., Titanium Minerals in Trail Ridge, Fla.: Bureau of Mines Rept. of Investigations 4208, 1948, 21 pp.
[32] McKelvey, V. E., and Balsley, Jr., J. R., Distribution of Coastal Black Sands in North Carolina, South Carolina and Georgia, as Mapped from an Airplane: Econ. Geol., vol. 43, No. 6, September–October 1948, pp. 518–524.
[33] Staley, W. W., Distribution of Heavy Alluvial Minerals in Idaho: Idaho Bureau of Mines and Geology Mineral Resources Rept. 5, March 1948, 12 pp.
[34] American Metal Market, Westinghouse Surveys Future of Zirconium in Industry Fields: Vol. 55, No. 5, January 8, 1948, p. 3.

for alloy production. Consumption of zirconium alloys amounts to several thousand tons a year. A few thousand pounds of zirconium metal were shipped in 1948.

The chief use of zirconium metal has been in powder form for flashlight powders, flares, fireworks, and detonators. The small quantity of ductile metal available to date has been used in the electronics industry for getters and vacuum-tube parts; however, when it becomes available in quantity as a result of improved processes recently developed, it is expected to find extensive use in surgery, corrosion-resistant chemical equipment, electrical parts, jewelry, and perhaps tableware. Zirconium master alloys have been used for many years in the steel industry as scavengers or for conferring desirable properties, such as refining the grain and increasing the strength of high-chromium steels. The zirconium stainless steels are creep- and corrosion-resistant at very high operating temperatures, and thus have been of peculiar interest in gas-turbine construction and analogous applications. An important new magnesium-zirconium alloy (0.5 percent Zr minimum), ZK-60, has been developed by the Dow Chemical Co., Midland, Mich.; the addition of zirconium confers added strength, impact toughness, creep resistance at high temperatures, and corrosion resistance.[35] Several binary zirconium alloys (usually 50–50) with magnesium, copper, titanium, and nickel are commercially available as ladle additions.

Ground zircon finds a multiplicity of applications wherever acid-type refractory materials are required for very high operating temperatures. The mineral is employed in the form of bricks, cements, molded objects, or as loose sand. The sand is used extensively for molding in foundries. Possessing a high degree of nonwettability, zircon refractories are widely used in aluminum-melting furnaces and in the electric furnace manufacture of calcium metaphosphate.[36] Baddeleyite likewise is used as a refractory but apparently is most important as a zirconium source for the production of alloys. Zirconia, the commercially prepared oxide, is a very refractory material, melting at 2,715° C., but has not been extensively used because of poor resistance to thermal shock; however, recent work has shown it may be stabilized with small additions of lime or magnesia with only slight loss in refractoriness. Zirconia and zircon are extensively employed in ceramics [37] for enamels, porcelains, and glazes. The one-time large use of zirconia as an opacifier in vitreous enamels has been reported partially supplanted by other materials, notably titanium dioxide; however, it continues to be important in porcelains and glazes. Zirconium nitride has found interest chiefly as a refractory, being extremely stable and impervious to attack by most metals and alloys. The unusual refractory nature of certain zirconium compounds combined with the low neutron absorption of zirconium is suggestive of their possible application in nuclear-energy-pile construction and in stationary parts of jet-engine and gas-turbine combustion chambers. Basic zirconyl sulfate is finding increasing use in tannage for the production of fine-

[36] Baldwin, W. J., Zircon and Zircon Refractories: Chem. Eng. Progress, vol. 44, No. 11, November 1948, pp. 875–878.

[37] Gershuns, A. L., Use of Zircon in Ceramic Insulators for Spark Plugs: Jour. Am. Ceram. Soc., vol. 31, No. 1, January 1948, p. 16.

quality white leathers,[38] several million feet of leather per year reportedly being processed in this way. Zirconium compounds are used in the preparation of brilliant dyes,[39] water repellants, and catalytic agents. Zirconia is becoming important as an optical-glass polishing agent.

Stocks.—Inventories of zircon concentrates (65 percent ZrO_2) and baddeleyite, undifferentiated, held by importers and consumers totaled about 6,500 short tons at the end of 1948 compared with about 6,000 tons for the 1947 year-end. Similarly, stocks of mixed ilmenite-rutile-zircon concentrates were about 5,700 tons (zircon content, 4,100 tons) on December 31, 1948, against about 12,600 (zircon content, 9,300 tons) for the same date in 1947. Supplies of zirconium metal in producers' hands probably did not exceed 1,000 pounds.

Zircon and baddeleyite are included by the Munitions Board in the list of mineral commodities to be acquired for the National Strategic Stock Pile. Both minerals are in the group A classification, which includes those materials for which stock piling is deemed the only suitable means of insuring supplies for an emergency. The recent proving of very large reserves of zircon in Florida and the impending development of these deposits suggests that zircon may become relegated to a less urgent stock-piling classification. Data on quantities of zircon and baddeleyite in the strategic stock pile are confidential.

Prices.—Zircon concentrate, 55 percent ZrO_2 minimum, f. o. b. Atlantic seaboard was quoted by E&MJ Metal and Mineral Markets on January 1, 1948, at $45–$47 per ton. Increased quotations were registered later in the year as follows: August 5, $48–$52 per ton; August 12, $50–$52. On the latter date, concentrate of 65 percent minimum ZrO_2 content was quoted at $65.50–$67.50, rising on December 9 to $67.50–$70.50, only to be followed by a sharp drop December 23 to $45–$48. The decline at the year end is believed to have been caused by Australian companies reducing their prices to levels competitive with Florida producers, in view of lowering demand for zircon. Quotations on zirconium metal powder were unchanged in 1948 at $7–$8 per pound, depending on quantity; the ductile, iodide process metal was much more costly, being priced at up to $300 per pound. Iron Age listed zirconium-copper (6 percent Zr) on January 8, 1948, at $8.75 per pound of contained zirconium; on June 10, the same price prevailed, but for alloy of 20-percent zirconium content; November 1 figures indicated a price increase to $12 per pound of contained zirconium, but in alloy reported as containing 10–12 percent Zr. Zirconium-ferrosilicon alloys, 12–15 and 35–40 percent Zr, were quoted in January at 6 and 18.4 cents, respectively, per pound of alloy, f. o. b. plant, carlots; October prices were 6.6 and 21 cents delivered. The low-zirconium SMZ (Zr 0.75–1.75 percent, 45–56 Cr) and CMSZ (Zr 5–7 percent, 60–65 Si) alloys in January were quoted at 15.75–18.8 and 18–21.05 cents per pound, ton lots, f. o. b., changing to 17.25 and 19.75 cents in October, delivered. Oil, Paint and Drug Reporter listed zirconium compounds, carlots, works, at the following prices per pound which remained unchanged

[38] Turley, Harold G., Zirconium Tannage: Chem. Industries, vol. 63, No. 3, September 1948, p. 393.
[39] Chemical Engineering, Zirconium Produces Promising Pigments: Vol. 55, No. 10, October 1948, pp. 274–276.

throughout the year: Hydride, \$7.00; oxide, ground, 88–92 percent, \$0.25; oxide, 98½–99, ground, \$1.50; oxychloride, 5 ton lots, \$0.29½; basic sulfate, \$0.37½; basic carbonate, \$0.30½.

Foreign Trade.—Most of the zircon consumed in the United States has ordinarily been received from Australia in the form of mixed zircon (50–90 percent zircon)-ilmenite-rutile-monazite concentrates; however, further export of mixed concentrates was banned by the Commonwealth Government in March 1948 (see World Review) with the result that receipts of such material in the United States totaled only about 16,000 tons in 1948 compared to slightly over 36,000 tons in the year previous. Much-enlarged shipments of high-grade Australian zircon concentrates (65 percent ZrO_2) were received, compensating in part for the cessation of mixed sand imports.

Exports of zirconium ore and concentrates in 1948, principally to Canada, were 312 tons valued at \$24,137 compared to shipments of 330 tons in 1947. Zirconium metal and alloy exports in 1948 totaling 21,966 pounds, more than doubled those of 1947 and were valued at \$7,911. The United Kingdom was the major recipient.

Zirconium ore (concentrates) [1] imported for consumption in the United States, 1944–48, by countries, in short tons

Year	Australia [2]	Brazil	Canada	French West Africa (Senegal)	India	Total	
						Short tons	Value
1944	21,701	2,332				24,033	\$576,299
1945	25,672	792		6		26,470	554,400
1946	14,379	2,431	4			16,814	453,458
1947	21,894	4,619	3		4,181	30,696	891,161
1948	12,965	3,553	2		279	16,799	536,522

[1] Concentrates from Australia are zircon or mixed zircon-rutile-ilmenite, and those from Brazil are baddeleyite or zircon. All other imports are zircon.

[2] Imports of zircon, rutile, and ilmenite from Australia until early 1948 were generally in the form of mixed concentrates. These mixed concentrates were classified by the U. S. Department of Commerce arbitrarily as "zirconium ore," "rutile," or "ilmenite." Total zircon contents of the "zirconium ore" (as shown in this table) and of the "rutile" and "ilmenite" concentrates (see Titanium chapter) are estimated as follows: 1944, 11,317 tons; 1945, 17,138 tons; 1946, 11,535 tons; 1947, 22,727 tons; and 1948, 13,873 tons.

Technology.—Methods were described for the preparation of ductile zirconium,[40] beneficiation of zircon-bearing sands,[41] and the purification of zirconium compounds.[42] Several patents were issued in 1948 covering the preparation of magnesium-zirconium alloys,[43] zirconium lakes,[44] zirconium chloride,[45] and zirconia catalysts.[46]

WORLD REVIEW

Australia.—The world's richest and perhaps largest deposits of zirconiferous sands occur in Australia, particularly near the border of New South Wales and Queensland; important deposits also exist on the coast of Western Australia. During 1948 seven firms were reported mining on the east coast, with another temporarily shut down and two about ready to enter the field. The United States firm of E. I. du Pont de Nemours, Inc., was reported planning to work titaniferous sands at Cheyne Beach, east of Albany, Western Australia, from which zircon would presumably be recovered as a coproduct.[47] Rare Metals Pty., Ltd., began operations in 1948 in the Cheyne Beach area, recovering zircon and titanium minerals. New Metals, Ltd., a new company, plans to produce zirconium metal and salts at a proposed smelting works to be located at Welshpool, near Perth, Western Australia.[48]

Before the spring of 1948, most of the zircon exported from Australia was shipped as a black-sand mixture containing zircon (50–90 percent), ilmenite, rutile, and monazite. Such mixed concentrates were subsequently beneficiated in the importing country, mainly the United States. Upon the declared intent of the Commonwealth Government to purchase and stockpile monazite, the exportation of mixed concentrates was forbidden after March 1948 under the provisions of the Atomic Energy Act of 1946. Thereafter essentially all exports of zircon were shipped in the form of high-grade (65 percent ZrO_2) concentrates with the monazite and titanium minerals removed. The anticipated near-future self-sufficiency of the United States, their principal customer, with respect to zircon, caused much concern to Australian producers of the commodity. It was felt, however, that restoration of western European economies would provide enlarged demand in that area.

Brazil.—The only known commercial deposits of baddeleyite (natural zirconium oxide) in the world occur in the state of Minas Gerais.[49] Reserves were estimated at 2,000,000 tons in 1936. Important deposits of zircon occur in the beach sands of the States of Bahia, Espirito Santo, and Rio de Janeiro in association with monazite; the mineral is recovered as a coproduct in the production of monazite. In September 1948 the Economic Cooperation Administration, under the European Recovery Program, authorized the expenditure by France of about $17,000 for the purchase of 130 metric tons of baddeleyite from Brazil.

Ceylon.—The beach sands at Pulmoddai and Tirukkovil, eastern Ceylon, are estimated to have a heavy mineral content of about 4,000,000 tons, containing about 25 percent zircon. Deposits in the western part of the island are thought to contain equally large reserves of heavy minerals.[50]

French West Africa (Senegal).—Production of 191 metric tons of zircon was reported in 1948; 71 tons were exported.

Malaya.—During the Japanese occupation 741 tons of zircon and 207 tons of mixed monazite and zircon concentrates were recovered as a byproduct of alluvial tin mining.[51]

Poland.—Zirconiferous black sand deposits of the Baltic seacoast were described.[52]

United Kingdom.—The new high-strength magnesium-zirconium alloys are made by Magnesium Elektron, Ltd., Clifton Junction, near Manchester. Zirconal, Ltd., formed in conjunction with Silicon Developments, Ltd., II Cavendish Place, London, reportedly will manufacture zircon refractories.[53] Murex, Ltd., Essex, produces zirconium hydride, hoping to fill domestic demands formerly met by imports from the United States.

U. S. S. R.—The potentially commercial zirconium mineral eudialyte (about 14 percent ZrO_2), occurs in large tonnages in the Kola Peninsula in conjunction with presently operated apatite deposits.

Minor Nonmetals

By D. G. RUNNER and J. C. ARUNDALE[1]

GRAPHITE

PRODUCTION and sales of domestic graphite in 1948 increased substantially over the preceding year's totals. Due to greater demands of industry, production of crystalline and amorphous graphite totaled 9,949 short tons and shipments amounted to 9,871 short tons valued at $450,759. The figures on shipments and value represent increases of 90 and 104 percent, respectively, over those reported for the preceding year. Producers' stocks totaled 525 short tons at the end of 1948. The manufacture of artificial graphite increased considerably during the year, but the Bureau of Mines is not at liberty to publish detailed figures for graphite of this type. Manufactured material competes with natural graphite for many uses, including paints, polishes, pencils, and lubricating products. There are too few domestic producers to allow publication of separate statistics on natural crystalline and amorphous graphite. However, the accompanying table shows combined figures for the 1944–48 period.

Production and shipments of natural graphite in the United States, 1944–48

Year	Production (short tons)	Shipments		Year	Production (short tons)	Shipments	
		Short tons	Value			Short tons	Value
1944	5,408	5,768	$349,663	1947	4,387	5,207	$221,260
1945	4,888	5,334	289,207	1948	9,949	9,871	450,759
1946	5,575	4,844	252,596				

A report on the flake-graphite deposits in Alabama has recently been released.[2]

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[2] Pallister, H. D., and Thoenen, J. R., Flake-Graphite and Vanadium Investigation in Clay, Coosa, and Chilton Counties, Ala.: Bureau of Mines Rept. of Investigations 4366, 1948, 84 pp.

As indicated in the accompanying table, imports of all kinds of graphite totaled 52,259 short tons valued at $2,046,248 in 1948, representing increases of 20 percent in quantity and 35 percent in value from 1947. As in 1947, natural amorphous shows the greatest change, increasing from 40,703 tons valued at $1,236,734 to 48,117 tons valued at $1,529,312. An increase in imports from Mexico was responsible for the bulk of this change.

Graphite (natural and artificial) imported for consumption in the United States, 1944–48

[1] Less than 1 ton.

A canvass of graphite consumption has been started by the Bureau of Mines. The coverage of the canvass is not yet complete, but the statistics shown in the accompanying table give some conception of the use pattern of this mineral. The "amorphous" class comprises the largest percentage of total consumption and value. Foundry facings compose the largest single use, followed by lubricants, batteries, and crucibles in that order.

Consumption of natural graphite in the United States in 1948, by uses

Use	Short tons	Value	Use	Short tons	Value
Crucibles	2,308	$526,418	Pencils	1,144	$237,433
Retorts	407	99,747	Paints and polish	807	21,904
Stoppers, sleeves, and nozzles	940	183,529	Packings	133	50,107
Foundry facings	8,212	542,034	Bearings	26	10,568
Batteries	2,485	102,792	Other [1]	1,634	198,269
Lubricants	2,674	404,014	Total	20,770	2,376,815

[1] Includes brake lining, carbon brushes, electrodes, etc.

Before 1947 Madagascar could produce more than 12,000 metric tons a year of graphite of various grades, including about one-third in powder (fines). During 1947 internal disorders on the island closed most of the operations, so that production and shipments declined greatly. Labor troubles and lack of jute bags continued to plague the mine operators during 1947 and 1948; moreover, on March 7, 1949, a cyclone struck Tamatave and inland, doing untold damage to mine operations, bridges, and warehouses. Latest estimates state that it will take at least 3 years to replace some of the railroad bridges damaged during the cyclone. The fluctuation in prices that began in 1946 continued through 1948. A new schedule of minimum export prices for graphite was made effective October 1, 1948. The new prices f. o. b. Madagascar and the former prices are shown in an accompanying table.

Minimum export price of graphite, f. o. b. Madagascar, 1947–48, per metric ton

Carbon, percent	Flake			Carbon, percent	Powder (fines)		
	1947	1948 (effective January 17)	1948 (effective October 1)		1947	1948 (effective January 17)	1948 (effective October 1)
85.0–87.5	$110	$132	$150	72.5–77.5			$82
87.6–89.5	114	137	156	75.0–77.5	$60	$66

92.6–94.9	135	165	185	82.6–87.5	85	100	116
95.0 and over	(1)	(1)	(1)	87.6–89.9	105	125	143
				90.0 and over	(1)	(1)	(1)

[1] No fixed price.

The continued need for certain types of graphite for the national stock-piling program and the uncertainty of obtaining this material from Madagascar have stimulated interest in graphite production in other areas. It has been reported that graphite of suitable quality for industrial uses and for stock-piling purposes has been found in Kenya Colony, British East Africa. Present indications are that graphite will be imported from Kenya beginning in 1950.

The United States tariff rates on graphite, effective January 1, 1948, are: Amorphous natural and artificial, 5 percent ad valorem;

crystalline flake, 15 percent ad valorem, with a specific minimum of 0.4125 cent per pound and a specific maximum of 0.825 cent per pound; crucible flake and dust and other crystalline lump and chip, 7½ percent ad valorem.

Exports of natural graphite, 1944–48, were: 1944, 2,230 tons, $248,257; 1945, 1,308 tons, $134,414; 1946, 2,313 tons, $267,137; 1947, 1,546 tons, $171,607. Data for 1948 are shown in an accompanying table.

Graphite exported from the United States in 1948

[U. S. Department of Commerce]

1 Less than 1 ton.

Price quotations for graphite varied some during 1948, and at the year end the trade-journal listings were as follows, f. o. b. New York: Ceylon lump, 10–14 cents per pound; carbon lump, 10–11 cents; chip, 8–9 cents; dust, 4–6 cents. Madagascar, c. i. f. New York, standard-grade, 85 to 87 percent carbon, $200 per ton; special mesh, $250–$300; special grade, 99 percent carbon, $700. Amorphous graphite, Mexican, f. o. b. point of shipment (Mexico), per metric ton, $9–$16, the price varying with grade.

Available statistics on the world production of graphite for 1942–48 are shown in the accompanying table. Comparable figures for 1915–39 were published in Minerals Yearbook, Review of 1940 (p. 1414), and for 1938–46 in Minerals Yearbook, 1946 (p. 1287).

World production of natural graphite, by countries, 1942–48, in metric tons [1]

GREENSAND

A total of 8,236 short tons of greensand were produced during 1948 by the following companies: Permutit Co., 330 West Forty-second St., New York 18, N. Y.; Zeolite Chemical Co., Medford, N. J.; Inversand Co., 226 Atlantic Ave., Clayton, N. J. All production was from open-pit operations in Burlington and Gloucester Counties, N. J., and was sold for use in water softening and water purification.

Price of refined greensand f. o. b. shipping point ranged from approximately $38–$114 per short ton.

Greensand marl sold or used by producers in the United States, 1944–48

Year	Short tons	Value	Year	Short tons	Value
1944	4,908	$505,651	1947	8,337	$432,980
1945	4,986	477,919	1948	7,269	392,959
1946	5,140	424,900			

KYANITE, ANDALUSITE, AND SILLIMANITE

Domestic production of kyanite in 1948 reached an all-time high, exceeding by a considerable margin the former record attained in 1946. Imports from India in 1948 increased 80 percent over those reported the previous year. Although the Indian Government reimposed control over the export of kyanite, effective September 9, 1948, future imports should not fall below the existing level indicated for 1948. The quantity of kyanite received from Kenya Colony, British East Africa, continued to increase and in 1948 totaled 8,108 short tons compared with 7,226 tons in 1947. The quality exhibited by Kenya kyanite has resulted in plans to increase imports to the United States during the next few years for industrial uses and for stockpiling purposes, although there is the possibility that slight changes may have to be made in the specifications for the latter purpose. The receipt of 1,619 short tons of sillimanite valued at $23,861 from Australia was also reported. The tonnage, value, and consumption

Consumption and stocks of imported kyanite in the United States, 1944–48

[5] Less than 1 ton.

of imported kyanite in recent years are shown in the accompanying table.

Detailed statistics on the domestic kyanite industry are not available for publication, because there are too few producers. Data on shipments of domestic kyanite were last published in 1943, and statistics for the 1940–43 period were published in Minerals Yearbook, 1943 (p. 1579).

Three companies reported production of kyanite in 1948. The A. P. Green Firebrick Co., Mexico, Mo., produced material from an operation in Habersham County, Ga., and used it for the manufacture of refractories. Kyanite Mining Corp., Cullen, Va., produced kyanite near Farmville, Prince Edward County, Va. Its material was sold to refractory, pottery, and brick manufacturers. Commercialores, Inc., 39 Cortlandt Street, New York, N. Y., began operations in September 1948 near Clover, York County, S. C. The entire output was sold for the manufacture of high-temperature fire brick, cement, etc. Kyanite, from an unworked deposit on Willis Mountain, Va., is being tested by the Bureau of Mines to determine its suitability as a superduty refractory. The Technical Porcelain & Chinaware Co., El Cerrito, Calif., produced a small amount of andalusite from its Mineral County, Nev., mine and used this material in the manufacture of chinaware. No dumortierite was produced during the year.

Investigations on the possibility of using domestic sillimanite for making high-grade aluminum silicate refractories are being conducted by the Norris, Tenn., station of the Bureau of Mines. A report on the sillimanite minerals of Montana has been released.[3]

The uncertainty of continued large imports of kyanite from India has focused attention on other sources, notably Kenya Colony, British East Africa. Latest reports indicate that Kenya kyanite is acceptable for high-duty refractories and for the national stock-piling program. The reserves of kyanite in India are substantial; and this source, together with Kenya Colony, should provide the United States with ample supplies for superduty refractories.

Trade-journal quotations for domestic kyanite in December 1948, per ton f. o. b. point of shipment Virginia, were: 35-mesh, carload lots, in bulk, $29; in bags, $32; for 200-mesh, in bags, carlots, $40. Imported kyanite, in bags, c. i. f. Atlantic ports, was $42 per ton, nominal.

Separate classification of exports of kyanite and associated minerals started in 1945. Exports for 1945 were 307 short tons valued at $20,205; 1946, 342 tons ($17,881); and 1947, 239 tons ($20,533). Data for 1948 are shown in the accompanying table.

Kyanite and allied minerals exported from the United States in 1948

[U. S. Department of Commerce]

	Short tons	Value
Canada	330	$15,001
Mexico	111	4,577
Nicaragua	1	135
Netherlands	20	2,100
Total	462	21,813

LITHIUM MINERALS

The lithium industry in 1948 was characterized by development of new lithium compounds and expansion of the industrial applications of those developed over the past few years. As a result of the favorable outlook for a considerable increase in the use of lithium and its compounds, exploration for new sources of ores was speeded, production facilities were expanded, and research was intensified.

Although the tonnage of lithium ores consumed was well below the peak during the war, it was several times the prewar average.

The Lithium Corp. of America constructed a new sink-and-float concentrator for beneficiating spodumene at its Edison mine, Keystone, S. Dak.[4]

The Black Hills-Keystone Corp. discontinued operations in October at its Ingersoll mine in Pennington County, S. Dak.

Lithium Corp. of America completed a new unit for production of lithium amide, reportedly an efficient and stable agent for certain organic reactions. Much of this material is reportedly used in the synthesis of antihistamine drugs.[5]

It was reported that lithium salts of fatty acids were finding a new market in the cosmetics industry for use in face and other types of powders. It is claimed that this material has low bulk density and high oil absorbency. Foote Mineral Co. offers a mixture of lithium fatty-acid salts to the industry.[6]

Northern Chemicals, Ltd., a subsidiary of the Lithium Corp. of America, is proceeding with development of its spodumene deposit in the Cat Lake area northeast of Winnipeg, Canada.

A preliminary report on the geology of the Cat Lake-Maskwa Lake area has been issued by the Manitoba Department of Mines and Natural Resources.[7]

Two papers on lithium were read at the meeting of the Canadian Institute of Mining.[8]

No sales of either lepidolite or amblygonite were reported by domestic producers.

A discussion of lithium compounds in porcelain enamels was published.[9]

The Bureau of Mines issued a report on the recovery of lithium from various ores and salts.[10]

The Bureau of Mines issued two reports on spodumene deposits in the Black Hills, S. Dak.[11]

It was reported that 1,716 long tons of lithium minerals (lepidolite, petalite, and amblygonite) were produced in South-West Africa during 1948. In all, 1,629 long tons of lepidolite and 183 tons of petalite were exported to the United States, according to the Union

Shipments of lithium ores and compounds from mines in the United States, 1935–39 (average) and 1944–48

Year	Ore (short tons)	Value	Li_2O (short tons)	Year	Ore (short tons)	Value	Li_2O (short tons)
1935–39 (average)	1,327	$48,280	88	1946	3,065	$303,892	323
1944	13,319	552,977	848	1947	2,441	151,113	199
1945	2,446	285,520	274	1948	3,191	185,952	246

of South Africa Department of Mines. Production was by Jooste Lithiumyne (Eiendoms), Beperk, Karibib.

Trade-journal quotations of prices for lithium ores were as follows: Amblygonite, per ton, air-floated, carlots $110; lepidolite, per ton, 4 percent Li_2O, powdered, carlots, $80 (increased from $56 early in 1948); spodumene, per unit lithium oxide contained, $6–$8 on 6-percent grade, carlots.

The American Potash & Chemical Corp., Trona, Calif., reported the price of dilithium sodium phosphate at about $191 per ton.

MINERAL-EARTH PIGMENTS

Although the mineral-earth pigments industry was generally active during the year, sales of most items, both synthetic and natural, were somewhat lower than in the previous year. A moderation of demand noted in the latter part of 1948 reflected the trend of construction activity. Sales of synthetic earth pigments accounted for more than one-third of the tonnage and more than 60 percent of total value.

Imports of the major mineral-earth pigments continued to decline,

Natural mineral pigments and manufactured iron-oxide pigments sold by processors in the United States, 1947–48, by kinds

Pigment	1947		1948

[1] Included with "Other."

and the supply situation in Spanish and Persian Gulf oxides was particularly tight.

The Minnesota Mining & Manufacturing Co. introduced a new synthetic red iron oxide pigment which is said to have exceptional properties.[11a]

In recent years the natural pigments industry in the Union of South Africa has become increasingly important. Ochers, umbers, other iron oxides, and graphitic shales are mined in the Union. Yellow and red ochers are recovered from deposits of altered shale in the Riversdale district of the Cape Province. The value of these deposits was first realized about 1922. Small-scale mining followed and gradually extended as the ocher gained favor in overseas markets. The ore is found at depths generally greater than 15 feet and mined by stripping and trenching the deposit. No estimate of reserves has been made because of the irregular size and scattered occurrence of the ocher bodies.

Umbers are mined periodically from deposits near Krugersdorp, Brits, and the village of Sabie in the Eastern Transvaal. The umber occurs in irregular pockets in dolomite and is a residual earth resulting from the removal of the more soluble calcium and magnesium carbonate of the dolomite.

Dry ocher, sienna, umber, and other forms of iron oxide for paint exported from the United States, 1945–48, by countries

The demands for umber and graphitic pigments, which are obtained from the Zoutpansberg and the Pretoria districts, are small, and most sales are local. Most of the output of ochers is exported to United Kingdom.[12]

A deposit of red ocher in the Hammersley Range Australia, 40 miles southwest of Roy Hill, is being worked superficially. It is shoveled direct into bags and drums, and transported by truck to Meekatharra.[13]

Yellow, red, and gray varieties of ocher are found together in the districts of Cuddapah, Kurnool, and Bellary of the ceded districts, Madras Province, India. Large deposits of yellow ocher occur near Madhavaram (Cuddapah) and of gray ocher in Nallakonda (Kurnool). The annual production of red ocher from Bellary district is about 10,000 tons.[14]

Developments in the British pigment manufacturing and using industries during the war were reviewed in an article.[15]

A review of the iron oxides (ocher) industry in Canada during 1947 was published.[16]

Prices of some mineral pigments were moderately advanced during the year. According to the Oil, Paint and Drug Reporter, prices were quoted as follows during December 1948 (in cents per pound, bags, works, carlots, unless otherwise noted):

Synthetic iron brown (l. c. l.), 12½.
Metallic oxide brown, 3–3¼.
Sap brown, crystals, 12.
Sap brown, powdered, 13.
Sienna, burnt, 3¾–14¾.
Sienna, raw, 4–12½.
Umber, burnt, American (barrels), 4¾–5¾.
Umber, Turkey type, 5¾–7¾.
Vandyke (barrels), 9¾–12.
Synthetic red iron oxide, 5¼–9¼.
Special, high color, synthetic red iron oxide, $1.
Persian Gulf oxide, 6¾–7.
Spanish oxide, Grade 1 (barrels), ex dock, 5½–5¾.
Spanish oxide, Grade 2 (barrels), ex dock, 5¼–5½.

Natural yellow iron oxide, 1¾–2¾.
Natural yellow iron oxide, French type, 4½.
Synthetic yellow iron oxide, 9.
Golden American yellow ocher, 1¼–2¾.
Metallic red (barrels), 2½–2¾.
Synthetic iron oxide black, 10¾.
Mineral black, 1.6–6.75.
Venetian reds, 3.5–4.9.

MINERAL WOOL

Shipments of mineral wool—made from rock, slag, and glass—were valued at $79,094,000 in 1947, according to the Bureau of the Census. Details, by kind of product, are shown in an accompanying table. Estimates by the National Mineral Wool Association indicate that sales of structural insulation totaled $45,819,000 in 1948 as compared with $44,264,000 in 1947. The Industrial Mineral Wool Institute has estimated 1948 sales for "industrial power and process equipment and cold storage structures," and "domestic and commercial equipment, cargo, freight and passenger end uses" at about $21,000,000. No comparable figure for 1947 is available.

Some new plants and improved manufacturing techniques are still being added to the industry. Plants at Paul's Spur, Ariz.; Omaha, Nebr.; and Phoenix, Ariz., began operations in 1948. Expansion of the rock-wool plant at Mankato, Minn., was also reported.

The Bureau of Mines, Rolla, Mo., has done some cooperative re-

Mineral-wool shipments in the United States in 1947, by kinds

[U. S. Bureau of the Census]

Kind of product	Unit of area	Shipments and interplant transfers		
		In area units	Short tons	Value
Structural insulation (for insulating homes and commercial and industrial buildings):				
Loose wool (shipped as such)			101,525	$6,000,000
Granulated wool			490,973	20,001,000
Building batts, blankets, and rolls:				
Full thick (3 inches or more)	M sq. ft.	345,544	136,758	12,994,000
Less than 3 inches thick	do	198,055	44,090	5,269,000
Total			773,346	44,264,000
Industrial insulation (for insulating installed industrial equipment, such as boilers, hot ducts, etc.):				
Loose wool (shipped as such)			26,768	3,208,000
Granulated wool			3,167	134,000
Felts and felted products	M board ft.	24,973	6,480	658,000
Industrial batts	do	4,723	748	90,000
Industrial blankets (with wire mesh or other facings)	do	11,865	5,973	1,099,000
Blocks and boards	do	46,853	25,053	3,975,000
Pipe insulation				1,472,000
Acoustical pads and boards	M sq. ft.	13,378	(1)	2,061,000
Insulating cements			10,965	944,000
Total				13,641,000
Equipment insulation (for installation as integral part of such domestic and commercial equipment as refrigerators, hot-water heaters, etc.)			107,847	18,170,000
Mineral-wool insulation, not specified by use				3,019,000
Grand total				[2] 79,094,000

[1] Figure not available.
[2] For comparison, production in 1939 was valued at $10,469,000, of which $10,265,000 represented 332,792 short tons of rock-wool and slag-wool insulation.

search to determine methods of control of mineral-wool fiber size. The study included determining relationships of fiber size to viscosity, fusions of various compositions, and steam impact velocities. Factors influencing fiber length and fiber size distribution remain to be studied.[17] Experiments have indicated that rock wool made from copper slag has some advantageous properties.[18] A review of problems in rock-wool manufacture [19] and in preheating combustion air have been recently released.[20] A mineral-wool cement-base roofing, having high insulating qualities and ability to withstand tropical weather, has been developed. This prepared roofing material, reinforced with 12-gage wire mesh, is expected to outlast metal roofs when used for petroleum storage tanks in tropical areas.[21]

MONAZITE

For the first time in many years, production of an appreciable tonnage of monazite was reported by domestic producers. Rare Earths, Inc., is reported to have shipped 40 tons of monazite to Lindsay Light & Chemical Co., Chicago, Ill. This material was recovered from placer sands and gravels in central Idaho. The company has announced that several dredges in this area will be recovering heavy sands containing monazite for separation in its mill at McCall, Idaho, and production is expected to increase greatly during the next 2 years.[22]

On October 14, 1948, the United States Atomic Energy Commission described its current interest in monazite, the principal source of thorium, as follows:

> While a strict control of exports and a complete record of domestic movements of thorium-bearing materials, including monazite ore, is maintained by the Commission, pursuant to the Atomic Energy Act of 1946, the usefulness of thorium and its principal source in nature, monazite ore, so far as the Commission's program is concerned, is limited for the present time to research. Accordingly, the only thorium the Commission purchases is for experimental purposes, chiefly in the form of thorium salts, and the Commission has no purchase program for monazite ore as such.
>
> Thorium has long been recognized as a potential source of fissionable material. Consequently, like uranium, it was placed under the control of the Atomic Energy Commission by the Atomic Energy Act of 1946. Solving the many complex research problems in the way of the large-scale utilization of thorium may take a decade or two. The possibility, however, cannot be excluded that the time may be shorter. When the research problems are solved, thorium may become of great significance in the atomic energy program. Until these problems have been solved, however, thorium will not be in large demand for use in nuclear reactors.

Statistics on imports and consumption of monazite are considered confidential and cannot be published for 1948.

Brazil was the principal source of monazite for domestic consumers. Export restrictions were maintained by the Indian Government.

The University of Idaho is conducting experiments in the chemical separation and purification of the rare-earth metals from Idaho monazite, using ion-exchange methods. It is estimated that Idaho and Boise Counties contain 200,000,000 cubic yards of gravel containing 0.2 to 0.3 percent monazite.[23]

A new cerium-magnesium alloy containing 6 percent Ce has been developed for use in jet engines.[24]

An article was published comparing the radioactive mineral policy of the Union of South Africa with those of other nations in the Commonwealth.[25]

OLIVINE

Shipments of olivine in 1948 totaled 4,766 short tons valued at $86,230, representing decreases of 56 and 33 percent, respectively, compared with 1947 figures. As in previous years, the bulk of this material shipped was consumed in refractories for furnace linings and in refractory cements, but some olivine was used in the production of calcium-magnesium phosphate fertilizer.

Olivine sold or used by producers in the United States, 1944–48

Year	Short tons	Value	Year	Short tons	Value
1944	3,270	$35,207	1947	10,838	$129,094
1945	(1)	(1)	1948	4,766	86,230
1946	7,649	92,868			

1 Data not available for publication.

Reports on olivine as a source of magnesium for fertilizers have recently been released.[26]

Aside from its use for refractory purposes, some utilization has been made of olivine as molding material. It is reported in Norway that olivine is superior to quartz sand in foundry work and in such practice does not induce silicosis.[27]

PERLITE

The production of perlite in 1948 amounted to 13,530 short tons compared with 10,810 tons in 1947. Shipments of crude and refined perlite in 1948 totaled 9,868 short tons valued at $184,306. Salient statistics covering the last 3 years are indicated in the accompanying table.

Production and shipments of perlite in the United States, 1946–48

Year	Production crude, (short tons)	Shipments (crude and refined)		
		Short tons	Value	Average value 1
1946	4,206	3,022	$46,103	$37.22
1947	10,810	9,265	94,309	24.11
1948	13,530	9,868	184,306	19.54

1 Refined material only.

Sciences, vol. 23, No. 3, July 1948, p. 180. Granberg, W. J., Electric Furnace Combines Olivine and Phosphate: Rock Products, vol. 51, No. 10, October 1948, pp. 108, 110.

27 Mine & Quarry Engineering, vol. 15, No. 1, January 1949, p. 2.

Nine companies reported production or sales in 1948: Chemi-Cote Perlite Corp., Phoenix, Ariz.; Western Perlite Corp., Phoenix, Ariz.; The Perlite Corp., Tempe, Ariz.; National Perlite Corp., Campbell, Calif.; AleXite Engineering, Colorado Springs, Colo.; Dant & Russell, Inc., Portland, Oreg. (quarry at Frieda, Oreg.); Perlite Mfg. Co., Carnegie, Pa. (processing plant); Christensen Construction Co., Salt Lake City, Utah (quarry at Delta, Utah); and Wilson Research, Engineering & Exploration Co., Veyo, Utah (quarry at Enterprise, Utah). In addition, the following companies reported experimental or developmental output: Standard Perlite Corp., 202 North Euclid Ave., Pasadena 1, Calif.; United States Perlite Co., 609 S. Grand Ave., Los Angeles 14, Calif.; F. E. Schundler Co., Joliet, Ill.; and Structolite Corp., 1825 San Pablo Ave., Berkeley, Calif. The Sno-Lite Products Co., Reno, Nev., successor to High Grade Products Co., has built a new plant and plans to produce in 1949.

Among the uses for expanded perlite are acoustical plaster, concrete aggregates, loose fill insulation, prefabricated industrial buildings, roofdecks, pipe covering, and plaster aggregate. In 1948, as in 1947, the principal use for perlite was for aggregates in plaster and concrete.

RADIO-GRADE QUARTZ

The most significant developments in the quartz-crystal industry during 1948 were the favorable progress in the synthesis of quartz crystals and other piezoelectric crystals and the improvement in utilization of the available natural crystals, which is reflected in the increased number of units produced per pound of crystal consumed.

Although the bulk of the quartz crystal imported during 1948 came from Brazil, small quantities were imported from Madagascar, India, and China. Recorded imports from United Kingdom and France probably originated in India and Madagascar.

The excess of imports over consumption is attributable to material rejected after inspection by consumers, stocks, and purchases for the National Strategic Stock Pile.

As a national defense measure, the Signal Corps Engineering Laboratories, Fort Monmouth, N. J., has launched a program to promote public interest in locating additional domestic (continental) sources for piezoelectric-grade quartz and other piezoelectric minerals. This program is intended to be coordinated with those of other

Imports of uncut quartz crystal, consumption of radio-grade quartz, and production of piezoelectric units in the United States, 1944–48

Year	Imports of uncut quartz crystal [1]		Consumption of radio-grade quartz (pounds)	Production of piezoelectric units [2] (number)
	Pounds	Value		
1944	2,300,506	$11,178,643	[3] 1,858,000	[3] 29,939,000
1945	1,329,798	6,190,621	1,040,000	18,918,000
1946	370,556	2,376,598	172,400	1,744,100
1947	473,788	1,815,468	[4] 68,100	[4] 1,052,400
1948	1,236,520	4,206,977	61,600	1,225,400

Government organizations concerned, such as the Geological Survey and the Bureau of Mines. The Signal Corps is also involved in extensive sponsorship of synthesis of piezoelectric materials. Many colleges, companies, Government agencies, and other organizations are contributing to the synthesis program. In addition to the practical aspects, from the academic viewpoint these projects also are contributing to knowledge regarding crystal growth. This knowledge is potentially valuable in the study of ore deposits. The Frequency Control Branch, Squier Signal Laboratory, is the organization of Signal Corps Engineering Laboratories responsible for development of new and improved quartz or other piezoelectric frequency-control units. Geologists participate actively in the direction of planning and functioning of this branch.[28]

The need for piezoelectric crystalline quartz was outlined in an article.[29] The Bureau of Mines issued a report on a quartz crystal prospect in west-central Idaho.[30] Recent developments in the commercial synthesis of piezoelectric crystals were summarized in an article.[31]

A promising deposit of high-grade quartz crystal in the Hatlefjell Valley, Norway, was investigated.[32]

STRONTIUM MINERALS

No domestic production of strontium minerals was reported during 1948; however, imports for consumption were at a record rate for a peacetime year.

The discovery of an exceedingly high-grade deposit of celestite in the Mianwali district, Punjab, India, was reported. A reserve of 500,000 tons is reported proved with an average $SrSO_4$ content of 97 percent.[33] An estimated 1,000,000 long tons of celestite is said to be found in the Trichinopoly district of South India.[34] The Royal Institute of Science, Bombay, has studied the optimum conditions for the manufacture of strontium carbonate. The economics of the process have been investigated and the possibilities of utilizing local

Celestite imported for consumption in the United States, 1946–48, by countries, in short tons

34 Bureau of Mines, Mineral Trade Notes: Vol. 26, No. 1, January 1948, p. 36.

raw materials and the recovery of byproducts have been considered, and a pilot plant is reported under construction.[35]

Two articles were published on the conversion of celestite to strontium carbonate. The process involves fusing with sodium chloride, additions of sodium carbonate, and cooling and leaching to remove soluble salts, leaving a residue of pure strontium carbonate.[36]

Trade-journal quotations of prices for celestite, in carlots, 92 percent $SrSO_4$, finely powdered, advanced in 1948 to $54; crude, 90-percent grade, f. o. b. cars Calif., remained at $19. Strontianite, per ton lump, in carlots, minimum 84–86 percent $SrCO_3$, remained at $55, nominal.

TOPAZ

Shipments of topaz in 1948 by the Carolina Mining & Exploration Corp., Naples, N. C., were much lower than in the previous year (2,294 short tons). The material was sold as crude in lump or crushed form for use in refractories and as flux for thinning slag in open-hearth furnaces.

VERMICULITE

The construction industry in 1948 continued to place large demands on vermiculite producers. Sales reached 138,635 short tons valued at $1,387,233, representing a 6-percent increase over the previous high of 131,385 tons established in 1947.

Production in 1948 was reported by the following companies: Zonolite Co., 135 South LaSalle St., Chicago, Ill. (mines at Libby, Mont., and Travelers Rest, S. C.); Vercalite Industries, Inc., Franklin, N. C. (mine at Franklin, N. C.); Bee Tree Vermiculite Mines, Inc., Asheville, N. C. (mine at Tigerville, S. C.); Mikolite Mining & Development Co., office and mines at Encampment, Wyo.; Lewis Smith and H. B. Line, office and mine at Glenrock, Wyo. Building Materials, Inc., Canon City, Colo., acquired the Custer County, Colo., mine from the Consolidated Feldspar Corp., Trenton, N. J., in December 1948. This company manufactures "Insuplast," a plastic mineral cork made from vermiculite and other mineral ingredients. As in previous years, the bulk of vermiculite production came from the Zonolite Co. mine at Libby, Mont.

In addition to the record domestic output of vermiculite in 1948, considerable quantities of this material were imported from Transvaal, Union of South Africa. Large deposits of vermiculite have been discovered at Ponte Nova, State of Minas Gerais, Brazil, and numerous other deposits are known to exist. The Brazilian firm of Cepema, Importadora e Exportadora, Ltda., Rio de Janeiro, is reported to be the largest miner and exporter of vermiculite in Brazil.[37] Deposits of vermiculite have been reported in the Tumkur and Hassam districts of Mysore, South India, and in Kenya Colony, British East Africa. These two sources are potential suppliers of vermiculite to the industry of this country. Minor production of this material has been recorded from Western Australia, mainly from Young River, west of Esperance.[38]

[38] Queensland Government Mining Journal, vol. 49, No. 561. July 1948. p. 222.

On the domestic scene, a recent report states that North Carolina has untapped vermiculite resources in at least six counties [39] and that vermiculite has been found associated with feldspar in a granite pegmatite dike in Kiowa County, Okla. Further exploration is in prospect.[40]

Among the uses for vermiculite are: Insulation, fireproofing, soundproofing, aggregate for lightweight plaster and concrete, pipe covering, boiler insulation, oilless bearings in large tanks, soil amendment, insulating firebrick, and insulation for subfloors. The use of vermiculite in the building industry has been discussed in recent literature.[41] Expanded vermiculite thermal insulating cement was advanced to a standard specification in 1948 by the American Society for Testing Materials.[42]

A new type of insulating brick for use up to temperatures of 2,100° F. has been reported. This brick is made from vermiculite bonded with clay, bentonite, or colloidal magnesium silicate and fired to a high temperature.[43] A British patent covering the manufacture of thermal insulation compound in which expanded vermiculite, asbestos, processed fuller's earth, and a small amount of ball clay are used has been released.[44] Pulverized vermiculite for foundry use has also been reviewed.[45]

The tonnage and value of screened and cleaned vermiculite shipped in recent years are shown in the accompanying table. Domestic screened and cleaned vermiculite in 1948 averaged $10 per short ton f. o. b. mines and South African crude vermiculite $28 to $30 per ton f. o. b. Atlantic seaports. Assuming an average price of $75 per ton for exfoliated material and a 5-percent loss of weight in exfoliating, the total value of exfoliated vermiculite sold in 1948 would be approximately $9,878,000.

Screened and cleaned vermiculite sold or used by producers in the United States, 1941–48

Year	Short tons	Value	Year	Short tons	Value
1941	23,438	$125,444	1945	64,808	$648,077
1942	57,848	319,931	1946	86,390	867,973

PART III. STATE REVIEWS

The Mineral Industry of Alaska

(MINE REPORT)

By ALFRED L. RANSOME

GENERAL SUMMARY

PRODUCTION of coal in Alaska reached an all-time high level in 1948, but an unexpected decline in output of gold—the leader as the mineral produced in greatest value—resulted in a decrease in the total value of all minerals produced in the Territory from $18,458,000 in 1947 to $13,201,000 in 1948. Thus an upward trend in progress since 1944, when the value of mineral output was at the wartime low point of $6,903,000, was reversed.

Mineral production of Alaska, 1946–48

	1946		1947		1948	
	Quantity	Value	Quantity	Value	Quantity	Value
Antimony ore short tons			40	$16,056	68	$29,336

[3] Comprises value of sand and gravel, clay (1948), pumice (1948), and items indicated by "(1)."

883326—50——87

The steady rise and subsequent decline in over-all value is almost entirely a reflection of the partial recovery of the gold-mining industry since recision of War Production Board Limitation Order L-208 in 1945 followed by the unexpected slump in 1948. Gold mining, which maintains its position as the backbone of the mining industry in Alaska, has been seriously hampered in postwar development by adverse economic conditions, the principal factors being steadily rising costs, poor supply of labor available in areas with highly competitive wage scales, and the United States Treasury price for gold that has remained unchanged since 1934. A few operators took advantage of the limited market for "natural" gold and sold at least a portion of their output at prices that were several dollars in excess of the official buying price of $35 per fine ounce.

Lode metal mining in the Territory remained virtually at a standstill; and, with the exception of coal, limestone, and sand and gravel, nonmetalliferous activity was negligible.

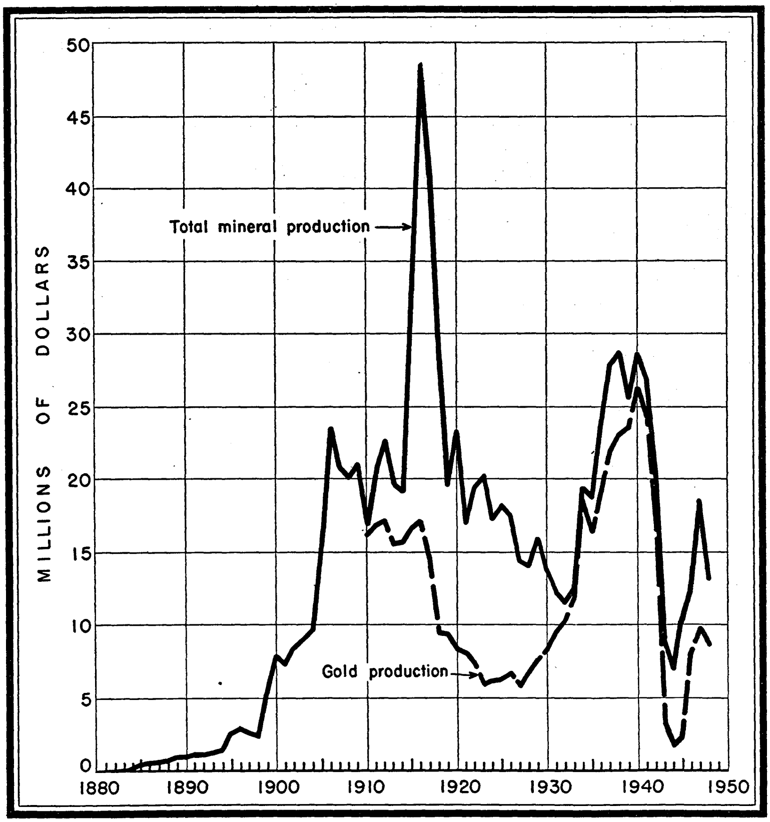

FIGURE 1.—Trends in value of total mineral production (1880–1948) and gold production (1910–48) in Alaska. From 1911 to 1931 copper production accounted for most of the value of minerals other than gold.

GOLD, SILVER, COPPER, LEAD, AND ZINC

The accompanying tables show the mine production of gold, silver, copper, lead, and zinc in Alaska, 1944–48, and 1880–1948, in terms of recovered metals; the gold production at placer mines, by classes of mines and methods of recovery; mine production of gold, silver, copper, lead, and zinc, by regions; ore and old tailings sold or treated and various metallurgical compilations based on output in 1948.

A small proportion of the production shown in the tables following was mined before 1948 but not shipped or sold until that year.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of gold, silver, copper, lead, and zinc production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946; $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for overquota production.

Gold.—The recorded production of gold in Alaska in 1948 was 11 percent below the output in 1947, despite the fact that a greater number of bucket-lined dredges (which since the war produced the greater proportion of gold recovered from all types of mining, lode as well as placer) were in operation. Few new companies have entered the field of gold mining and a number of properties established before the war—which showed increasing activity during the past few years—either did not operate or curtailed operations during 1948. In an attempt to raise the economic cut-off point, some operators withheld sale of their gold in the hope of benefiting from an official price rise that did not materialize. Clarification of regulations governing sale of gold with regard to transactions in unprocessed or "natural" gold came late in 1948; and, although the over-all volume was relatively small, a number of placer operators legally made sales of natural gold through well-defined channels to buyers in the United States who wished to obtain gold on speculation at a price ranging from $37.50 to $43.00 per fine ounce of contained gold. Thirteen producers specifically reported that natural gold produced in 1948 had been sold for a price in excess of $35 per fine ounce. Included with the recorded production for 1948 are 6,095 fine ounces of gold and 971 fine ounces of silver contained in natural gold sold on the open market.

In addition, 2,501 ounces of natural gold bullion was reported sold by seven producers on the open market for prices ranging from $28 to $35 per ounce of bullion; information on fineness was insufficient for calculating the recoverable gold and silver content for inclusion with the 1948 statistical record. Available information indicated that an unknown quantity of natural gold was sold by 17 producers who did not report specifically, and an undetermined quantity of gold from six properties was reported produced but not sold. Assuming that the quantity of unreported natural gold bullion sold equaled the known quantity, the total involved would approximate 18,000 ounces, the probability being that the actual figure is somewhat less.

Mine production of gold, silver, copper, lead, and zinc in Alaska, 1944–48, and total, 1880–1948, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, (etc. short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	9	198	381,574	49,296	$1,725,360	13,362	$9,502
1945	18	143	6,512	68,117	2,384,095	9,983	7,099

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Figure not available.
[3] Short tons.

Monthly production of gold in 1948, as shown in an accompanying table, is indicative of striking seasonal limitations to mining activity in the Territory. The data are based on mint and smelter receipts, and actual production is probably considerably less than shown for the first 4 months and the last 2 months of the year but correspondingly higher for the period May through October.

The 15 leading gold-producing mines (all placer) in Alaska in 1948, listed in the accompanying table, yielded 72 percent of the total recorded gold output of the Territory; the leading 5 mines produced 58 percent. The Fairbanks district in the Yukon River Basin region ranked first in gold production in the Territory by a wide margin, owing to the bucket-line dredging operations of the United States Smelting, Refining & Mining Co.

Active lode-gold mining was limited to a few relatively small-scale operations. The greatest proportion of gold recovered from lode sources was from mill clean-ups at mines that were inoperative during 1948.

Fifteen leading gold-producing mines in Alaska in 1948, in order of output [1]

Rank	Mine	District	Region	Rank in 1947	Operator	Source of gold

1948	[6] 274		16,744,000	242,802	8,498,070	.508

[1] Data for 1945–47 revised owing to reclassification of several mines based on additional information received; totals of all placers remain unchanged.
[2] Data not available separately according to method; included with "Other placers."
[3] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[4] Includes all placer operations (dragline dredges, nonfloating washing plants, hydraulic, small-scale hand, and drift) for which separate figures are not available.
[5] Figure not available.
[6] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

Silver.—Of the silver produced in Alaska in 1948, 55 percent was a byproduct of gold mining (66 percent in 1947), and 38 percent came from lead ore (including a small quantity from zinc-lead and copper ores); 7 percent was credited from silver ore mined at some time before 1948, but not shipped until that year. The most important producer of silver in Alaska in 1948 was the J. H. Scott Co., which recovered silver as a byproduct from lead ore produced from the Riverside mine in the Hyder district, Southeastern Alaska region. The United States Smelting, Refining & Mining Co. (Fairbanks department), which dropped from first place in 1947 to second in 1948, recovered silver as a byproduct of bucket-line gold-dredging operations in the Fairbanks district.

Copper, Lead, and Zinc.—Production of the base metals (copper, lead, and zinc) was limited almost entirely to output from two mines in the Southeastern Alaska region. Of the total copper output, 28,000 pounds were recovered as a byproduct from lead concentrate shipped from the Riverside mine near Hyder, operated by J. H. Scott Co. Also credited to the Riverside mine were 634,000 pounds of the total lead produced and 21,000 pounds of zinc. The balance of the total zinc production was recovered from zinc-lead concentrate produced from ore mined from the Mahoney mine, on George Inlet, Ketchikan district, in 1947; the concentrate was shipped in 1948 to a smelter in Canada.

Mine production of gold, silver, copper, lead, and zinc in Alaska in 1948, by months, in terms of recoverable metals [1]

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	1,866	1,290	(2)	9	(2)

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual output.
[3] Includes value of 32,000 pounds of copper ($6,944), 658,000 pounds of lead ($117,782), and 44,000 pounds of zinc ($5,582).
[4] Includes value of 24,000 pounds of copper ($5,040), 528,000 pounds of lead ($76,032), and 50,000 pounds of zinc ($6,050).

MINING INDUSTRY

Bucket-line dredges (30 in 1948 compared with 28 in 1947) washed 67 percent of the total gravel mined in Alaska in 1948 and recovered 70 percent of the total placer gold and 68 percent of the total Alaska gold (lode and placer). No dragline dredges (which include all operations using a floating washing plant and a power excavator) were reported in operation during 1948; two (revised) were operated in 1947. Placer operations using combinations of bulldozer and hydraulic methods—in many cases supplemented with dragline equipment—are becoming more numerous in the Territory because of the distinct advantages of relatively low initial cost of equipment in proportion to the small labor crews necessary and the large volume of material that can be handled. In general, the mining method is to bulldoze the goldbearing material to bedrock sluice-boxes and use hydraulic giants to wash the gravel through. Dragline equipment—when used—is generally utilized for removing overburden or disposing of tailings, and in some cases for transporting gravel to elevated sluice boxes or washing plants. Combination methods of this type, in which the gravel is moved mechanically to the washing plant (classified as nonfloating washing plants), washed 26 percent of the total gravel mined and recovered 24 percent of the placer gold, an increase over comparable totals in 1947. Operations in which gold was recovered primarily by hydraulic methods showed a decrease in the number of mines (partly because of reclassification from hydraulic to nonfloating washing plant), gravel washed, and gold produced. Gold output from a larger number of small-scale hand operations was less than in 1947, whereas a minor quantity of gold recovered from four drift mines was nevertheless an increase over 1947. The total yardage of gravel washed at gold placer mines increased 21 percent, whereas production declined 12 percent. The average recoverable gold content of gravels decreased 27 percent.

The tonnage of material from lode mines (gold, silver, copper, lead, and zinc) in Alaska treated in 1948 decreased 57 percent. The output of lode gold increased 58 percent, largely because of mill clean-ups at inactive mines, but the gold from this source comprised only 2 percent of the Territory total.

ORE CLASSIFICATION

Of the 6,014 tons of ore (including 166 tons of old tailings) sold or treated in 1948, 29 percent was gold ore, 67 lead ore, and the remainder zinc-lead ore (including a negligible quantity of copper ore). Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in Alaska in 1948, with content in terms of recovered metals

Source	Material sold or treated: Ore (short tons)	Material sold or treated: Old tailings (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	1,549	166	4,850	1,254	1,200	2,000	
Dry silver ore	[1] 80			4,640			
Copper ore	14		5	25	2,800		
Lead ore	4,005		736	25,290	28,000	634,000	21,000

1947	7,891	6,000	279,988	66,150	24,000	528,000	50,000

[1] Produced before 1948.
[2] Estimated figure.
[3] Includes 80 tons of ore produced before 1948.

METALLURGIC INDUSTRY

During 1948, 71 percent of the total ore and old tailings handled was treated at concentration mills and 26 percent by amalgamation. Smelters in the United States and Canada received 965 tons of flotation concentrates, 40 tons of gravity concentrates, and 177 tons of ore for direct smelting from Alaska operations of mines producing gold, silver, copper, lead, or zinc. Of the total concentrates shipped, 91 percent was lead concentrate, and 97 percent came from Southeastern Alaska.

Mine production of metals in Alaska in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)

REVIEW BY REGIONS AND DISTRICTS

COOK INLET–SUSITNA REGION

Valdez Creek District.—Production from the Valdez Creek district in 1948 was limited to a relatively small quantity of placer gold recovered from two operations. H. L. Ernst and O. Nicklie operated a bulldozer-hydraulic combination on Valdez Creek during a 5-month period in the summer of 1948. John E. Carlson recovered a small quantity of gold from Valdez Creek.

Willow Creek District.—The Fern Exploration Co., Inc., Al Dodson, manager, operated the Fern mine on Archangel Creek throughout the year; 350 tons of gold ore were treated in a 60-ton amalgamation-flotation mill to recover 419 ounces of gold and 22 ounces of silver as bullion and an additional 47 ounces of gold and 3 ounces of silver contained in 9 tons of concentrate shipped to a smelter in the United States. Lloyd Hill recovered a small quantity of gold from gold ore treated by amalgamation at the Lonesome mine (Gold Mint property) on the Little Susitna River 22 miles north of Palmer. Development work was in progress during the 1948 season at the Snowbird mine on Reed Creek, the Webfoot mine on Archangel Creek, and the Gold Cord mine on Fishhook Creek, but no gold was reported recovered.

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 10 and their output included with "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Sources of total silver as follows: 31,376 ounces from lode mines, and 35,965 from placers.
[4] Included with "Other districts."
[5] Exclusive of placer output, which is included with "Other districts."
[6] Gold not sold.
[7] Cleanup.
[8] Output from property not classed as a mine.
[9] Exclusive of lode output which is included with "Other districts."
[10] Includes following: Valdez Creek and Willow Creek (placer) districts in Cook Inlet-Susitna region; Nelchina (placer) and Prince William Sound (lode) in Copper River region; Moose Pass-Hope in Kenai Peninsula region; Goodnews Bay in Kuskokwim region; Kiana in Northwestern Alaska region; Nome (lode) in Seward Peninsula region; Windham Bay (lode) in Southeastern Alaska region; Chandalar, Chisana, Kantishna (lode) and Marshall in Yukon River Basin region.
[11] Includes 80 tons of ore produced before 1948.

Yentna-Cache Creek District.—The largest producer in the district in 1948 was Collinsville Mines (dry-land dredge with dragline equipment) operating on Twin Creek; 3,694 ounces of gold and 579 ounces of silver were recovered from 183,000 cubic yards of material handled during the period June 1 to September 15. A number of other smaller producers recovered placer gold by hydraulicking and the widely used bulldozer-hydraulic combination method.

COPPER RIVER REGION

Chistochina District.—The Slate Creek Gold Placers, operated by J. M. Elmer from June 20 to September 20, 1948, was the largest producer in the district; 316 ounces of gold and 30 ounces of silver were recovered by hydraulicking.

Nizina District.—Dan Creek Gold Mines hydraulicked 47,000 cubic yards on Dan Creek from May 1 to September 22 and recovered 741 ounces of gold bullion, which had not been sold by the end of 1948. The Chititu Mines reportedly was in operation during 1948 on Chititu Creek using hydraulic equipment; no record of production was received.

Yakataga District.—B. B. Watson recovered 87 ounces of gold and 10 ounces of silver from his placer operation on the beach at Cape Yakataga from April 27 to August 30, 1948.

KENAI PENINSULA REGION

Moose Pass—Hope District.—The greatest production of gold from the district came from two lode mines—the Skeen-Leckner (Falls Creek) mine, operated by the Falls Creek Mining Co., and the Marigold, by George Lindsay; gold ore from both mines was treated by amalgamation. Boe & Sorenson hydraulicked on Resurrection Creek during the summer of 1948.

KUSKOKWIM REGION

Goodnews Bay District.—The only gold produced in the district in 1948 was recovered as a byproduct from platinum mined by the Goodnews Bay Mining Co. on the Salmon River using a Diesel-electric bucket-line dredge (equipped with 93 8-cubic-foot buckets) and 2 1¼-cubic-yard dragline excavators. The Bristol Bay Mining Co., the largest producer of gold in the district in 1947, did not operate in 1948.

McGrath District.—Placer operations were almost nonexistent in the district during 1948. E. M. Whelen recovered 23 ounces of gold and 3 ounces of silver from his claim No. 1 in Holmes Gulch by small-scale operation from 700 cubic yards of gravel. A small quantity of gold was recovered in similar fashion from the John E. Strand placer during the summer of 1948. Although the Nixon Fork lode mine did not operate in 1948, R. A. Mespelt & Co. recovered 181 ounces of gold and 38 ounces of silver from a clean-up of the stamp mill.

Tuluksak-Aniak District.—The New York-Alaska Gold Dredging Corp., the largest gold producer in the region and the second largest in the Territory in 1948, operated 2 floating bucket-line dredges (electrically powered, equipped with 67 6½-cubic-foot and 66 2-cubic-foot buckets, respectively) and 2 dragline excavators with nonfloating washing plants on the Tuluksak River and Bear Creek. Two other important producers at placer properties were Marvel Creek Mining Co., using a dragline-bulldozer-hydraulic combination with nonfloating washing plant, on Marvel Creek, and the Canyon Creek Mining Co. (Jens Kvamme & Sons), using a bulldozer-hydraulic combination with a nonfloating washing plant to recover 377 ounces of gold and 46 ounces of silver from 18,666 cubic yards of gravel.

NORTHWESTERN ALASKA REGION

Kiana District.—The Lammers Exploration Co., the only gold producer in the district in 1948, operated its Diesel-electric bucket-line dredge (with 56 3-cubic-foot buckets) on Klery Creek from July 1 to October 5.

SEWARD PENINSULA REGION

In the Seward Peninsula region, 14 floating bucket-line dredges were in operation during 1948 (13 in 1947); in addition, numerous operations used hydraulic giants, bulldozers, and dragline excavators either separately or in combination. There was one producing lode gold mine.

Council-Bluff District.—The principal producers in the district were the Alaska Placer Co., which operated a bucket-line dredge (with 60 3-cubic-foot buckets) on the Niukluk River benches from June 11 to September 25, and the Sourdough Dredging Co., which operated a bucket-line dredge equipped with 62 3½-cubic-foot buckets on Ophir Creek (1,415 ounces of gold and 149 ounces of silver were recovered from 120,000 cubic yards of gravel washed during an 82-day operating period). C. L. Dempsey operated a small bucket-line dredge during the 1948 season on Casa de Paga River and Willow Creek. Other operators in the district who recovered a moderate quantity of gold, principally by hydraulicking, included B & T Mines (on Ophir Creek and Niukluk River), Chester Milligan (on Ophir Creek), L. E. Ost and Wallace McIver (on Crooked Creek), and Swanberg & Sons (Amocat claim on Niukluk River).

Fairhaven District.—The Arctic Circle Exploration Co., operating one of 2 dredges (each with 64 4-cubic-foot buckets) on Candle Creek, ranked first in production of gold in the district and sixth in the Territory with 4,711 ounces of gold and 648 ounces of silver recovered from 200,000 cubic yards of gravel. The Casa de Paga Gold Co. operated two bucket-line dredges on the Inmachuk River from July 4 to October 20 and recovered 3,638 ounces of gold and 434 ounces of silver from 168,000 cubic yards of gravel. The company had operated a dredge on Pajara Creek, Nome district, during the 1947 season. Other producers of a moderate quantity of gold from placers worked hydraulically and in combination with bulldozers, pumps, or other types of mechanical equipment included N. B. Tweet & Sons (hydraulic on Humboldt Creek), Wallace Porter (bulldozer-hydraulic combination on Bear Creek; 178 ounces of gold and 16 ounces of silver recovered from 8,000 cubic yards), M. J. Walsh (on Humboldt Creek), and Fred Weinard (hydraulic on Jump Creek).

Kougarok District.—The North Fork Dredging Co. operated its bucket-line dredge (with 2½-cubic-foot buckets) on Harris Creek, tributary of North Fork Kougarok River, June through September 1948, and Kougarok Consolidated Placers, Inc., operated a Diesel-powered dredge (with 76 2¼-cubic-foot buckets) on claims 31 and 32 above, Kougarok River, from August 2 to October 7. Other mining in the district in 1948 was limited to placer operations, principally by hydraulicking and with combinations of mechanical equipment using nonfloating washing plants. The large operators were Grant Mining Co. on Coffee Creek (hydraulic), Trinity Mining Co. on Kougarok River (bulldozer), Atlas Mines on Atlas Creek (hydraulic lift, bulldozer, and dragline), M. J. Walsh on Mascot Gulch, Lyman H. Madden on Garfield Creek (bulldozer-hydraulic; 115 ounces of gold and 11 ounces of silver recovered from 3,000 cubic yards), and Midnight Sun Mines, No. 2 Discovery on Boulder Creek (bulldozer-hydraulic; 104 ounces of gold and 17 ounces of silver recovered from 3,000 cubic yards).

Koyuk District.—The Ungalik Syndicate operated a bucket-line dredge on the Ungalik River during the 1948 season and was the largest producer of gold in the district.

Nome District.—The United States Smelting, Refining & Mining Co., operating one of its fleet of four bucket-line dredges in the vicinity of Nome from June 21 to November 6, was the largest producer of gold in the district and the Seward Peninsula region and ranked third in the Territory; all operations of the company in the Nome area had been idle—with the exception of maintenance—since 1942. The dredge in operation was equipped with 134 9-cubic-foot buckets. Lee Bros. Dredging Co., the second largest gold producer in the district in 1948, operated 2 bucket-line dredges (equipped with 75 5-cubic-foot and 65 3½-cubic-foot buckets) on the Solomon River and Little Hurrah Creek during the 1948 season. A dredge was operated also by Gold Beach Dredging Co. on the Childberg claim (Nome Beach), and one by Tolbert Scott & Son on Iron Creek; the latter was a Kimball-type open-link dredge equipped with 2½-cubic-foot buckets.

Among the larger producers of gold from placers worked by hydraulic giants and in combination with bulldozers and pumping equipment were: Glacier Creek Mines, Rainbow claim on Glacier Creek (hydraulic), Herbert Engstrom on Basin Creek (bulldozer-hydraulic), Earl Towner on Buster Creek, Rocky Mountain Mining Co. on Rocky Mountain Creek (hydraulic), and E. W. Quigley on Solomon River (hydraulic).

C. O. Roberts operated the Big Hurrah mine on Hurrah Creek—the only active lode gold mine in the region in 1948—and recovered a moderate quantity of gold by amalgamation.

Port Clarence District.—Placer gold mining in the district during 1948 was limited to a few operations, largely hydraulic; the output from no one property exceeded 100 ounces. Cannon & Washburn operated on Burke Creek, H. H. Mining Co. worked the Lone Wolf claims on Million Creek, Rice & Muncy used hydraulic-bulldozer equipment on Sunset Creek, and Benard Vogen operated a bulldozer and washing plant on Quartz Creek.

Serpentine River District.—George Bodis worked the Dick Creek Placers (No. 11 above Discovery) from June 10 to September 30.

Using a bulldozer-hydraulic combination with a bed-rock flume; 128 ounces of gold and 12 ounces of silver were recovered from 5,000 cubic yards of gravel.

SOUTHEASTERN ALASKA REGION

Three-fourths of the total Alaska lode-gold output came from five operations in the Hyder, Juneau, and Ketchikan districts; a few other lode-gold mines were active, but output was relatively small. Nearly all of the lode silver and all of the copper, lead, and zinc came from this region. Placer mining during 1948 was virtually nonexistent.

Hyder District.—The J. H. Scott Co. operated the Riverside mine from May 15 to June 15 and again from August 1 to December 15, treating lead ore (containing scheelite) in its increased-capacity 100-ton combination flotation-gravity concentration mill. From 4,005 tons of lead ore milled, 916 tons of lead concentrate (containing 736 ounces of gold, 23,290 ounces of silver, 33,488 pounds of copper, 647,798 pounds of lead, and 28,343 pounds of zinc) were produced and shipped to a smelter in the United States. These shipments were made almost entirely during the latter half of the year.

Juneau District.—Although the Alaska Juneau mine remained inactive during 1948, a large proportion of the gold from the district came from a clean-up of the Alaska Juneau mill. Howard Hayes & Stan Whitely recovered a substantial quantity of gold from the retreatment of Alaska Juneau mill tailings, and George A. Fleek similarly recovered a small quantity of gold from the Thane mill tailings.

Ketchikan District.—The Mahoney mine, 15 miles northeast of Ketchikan at the mouth of Mahoney Creek on George Inlet, was purchased in June from the Big Four Mining Co. by Arthur J. Theis, trustee, for the Montana Zinc & Lead Co. Although neither the mine nor mill was operated in 1948 after the change in ownership, 38 tons of zinc-lead concentrate, previously milled from ore mined for the most part in 1947, was shipped by Theis to a smelter in Canada. The material contained 1 ounce of gold, 167 ounces of silver, 23,381 pounds of lead, and 23,704 pounds of zinc. Wendell Dawson worked the Dawson mine on Prince of Wales Island during 1948; gold ore was treated by amalgamation, and a small tonnage of concentrate was shipped to a smelter in the United States.

Windham Bay District.—Kloss & Davis worked the K & D mine during 9 months of 1948 and recovered a small quantity of gold from ore treated by amalgamation in a 2-ton mill. Antimony, which occurred with the gold, was not recovered. A small tonnage of gold ore was shipped to a smelter in the United States by Don Thomas from a property in the Thomas Bay area. Stan Price recovered 30 ounces of gold and 6 ounces of silver from a placer operation on Spruce Creek; 6,000 cubic yards of gravel were moved to sluice boxes by a bulldozer.

YUKON RIVER BASIN REGION

Of the total Alaska gold produced in 1948, the Yukon River Basin region accounted for 76 percent from 165 placer mines and 5 lode mines in 16 districts. Sixty-nine percent of the 188,866 ounces of placer gold produced in the region came from 12 bucket-line dredges. Five percent of the total Alaska gold from lode mines came from the region. The Fairbanks district continued to be the most important.

Bonnifield-Nenana District.—Only a few placer operations were active in the district during 1948, and individual output was under 100 ounces of gold. Nels Jackson operated on the Totatlanika River (bulldozer-hydraulic), Wagers Bros. on Gold King Creek (hydraulic), and Arthur B. and M. O. Wise on Thistle Creek (bulldozer).

Circle District.—Three bucket-line dredges were active in the district in 1948. Alluvial Golds, Inc., operated its Diesel-powered dredge equipped with 72 4½-cubic-foot buckets on Woodchopper Creek. Gold Placers, Inc., ran a dredge with 60 4½-cubic-foot buckets on Coal Creek. The C. J. Berry Dredging Co., operating its dredge on Mammoth Creek, washed 362,000 cubic yards of gravel to recover 3,186 ounces of gold and 680 ounces of silver. The output from these dredges accounted for nearly four-fifths of the gold from the district (80 percent in 1947) and placed the district third in gold produced in the Yukon River Basin region. The larger producers of placer gold in the district by other methods were the Deadwood Mining Co. operating on Deadwood Creek (hydraulic with dragline and bulldozer equipment); Kelly & Wilkinson, on Miller Creek (bulldozer-hydraulic); Frasca & Gibson, on Eagle Creek (bulldozer-hydraulic); Hedla Bros., on Kethum Creek (dragline-bulldozer); and A. A. Zimmerman, on Independence Creek (hydraulic).

Eagle District.—The Crooked Creek Placer Co. (Bauer & Celich) hydraulicked on Crooked Creek from April 15 to September 20, and Amund L. Hagen similarly worked his property on Fox Creek from May 15 to September 26, recovering 26 ounces of gold and 3 ounces of silver from 2,000 cubic yards of gravel. Yukon Placer Mining Co. and Hansen & Hendricksen, using bulldozer equipment, worked placer ground on Fourth of July Creek and Alder Creek, respectively.

Fairbanks District.—There is no official record for a considerable quantity of natural gold produced in the district in 1948 and sold on the open market, inasmuch as some producers did not submit reports and the purchasers are holding such gold on speculation. The recorded production of gold from the Fairbanks district in 1948 is probably lower than the actual output by several thousand ounces, and there is some question as to the relative rank in production.

The United States Smelting, Refining & Mining Co., operating six bucket-line dredges in the Fairbanks district, was—as in previous years—by far the largest producer of gold, not only in the district but in the Territory. The company operated 3 6-cubic-foot Bethlehem dredges (1 with 68 buckets and 2 with 78 buckets each), 2 10-cubic-foot Bethlehem dredges (with 93 and 111 buckets, respectively), and 1 10-cubic-foot Yuba dredge (with 106 buckets); all dredges are electrically operated. Other equipment used (chiefly for removing overburden) included 200 Joshua Hendy hydraulic giants, a Bucyrus 10–W power shovel, and 4 Caterpillar bulldozers and carry-alls.

The Brinker-Johnson Co., the second-largest producer in the Fairbanks district, recovered 5,272 ounces of gold and 629 ounces of silver from 606,170 cubic yards of gravel handled by a Walter Johnson Diesel-powered bucket-line dredge equipped with 78 4½-cubic-foot buckets on Caribou Creek.

Of those producers of gold from placers worked hydraulically and in combination with bulldozers, draglines, and pumping equipment, the Alder Creek Mining Co. was the largest with 4,165 ounces of gold and

667 ounces of silver from 305,555 cubic yards of gravel and overburden handled. Two dragline excavators and three bulldozers were used by the company during the 1948 season on Fairbanks Creek from April 21 to October 5. Other producers of a substantial quantity of placer gold in the district using similar combinations of equipment were F. C. Bleecker on First Chance Creek, Four A. Mining Co. on Pedro Creek, Helmer Johnson on Cleary Creek, Ernest Maurer on First Chance Creek, P. R. H. Mining Co. on Ester Creek, A. B. Richardson & G. B. Martin on Pedro Creek, Russel Williams & Milo Jackovich on Gilmore Creek, and Wolf Creek Mining Co. on Wolf Creek.

Kaye Bros., operating the Sanford mine on Ester Dome under a program of development during 1948, was the leading producer of lode gold in the district. The Cleary Hill Mines Co., the largest producer in 1947, did not operate the Cleary Hill mine during the 1948 season. Also on Ester Dome, Earl H. Beistline & Associates worked the Irishman No. 1 lode gold mine (O. M. Grant property) on Happy Creek during a 3-month period. The Cheechako Mining Co. operated its mine (Greenback claims) at the head of Little Eldorado Creek from July to October 1948; 59 ounces of gold and 10 ounces of silver were recovered from 38 tons of ore treated by amalgamation at the Cleary Hill Mines Co. mill on Cleary Creek. A small quantity of gold was recovered by J. H. Martin from operations at the Tolovana mine on Willow Creek, Pedro Dome, during a short period in 1948; the ore was treated by amalgamation.

Fortymile District.—Of the placer gold reported recovered in the district during 1948 (excluding natural gold concerning which records are incomplete), 64 percent came from properties operated by the Yukon Placer Mining Co. on Walker's Fork (bulldozers and sluice boxes), Poker Creek, and Canyon Creek (bucket-line dredge), the Wade Creek Dredging Co. on Jack Wade Creek (bulldozers and sluice boxes), and George E. King on Turk Creek. A substantial quantity of gold also was produced by Attwood & Granger on Stonehouse Creek (bulldozer-hydraulic), Franklin Mining Co. on Franklin Creek (bulldozer), and Uhler Creek Mining Co. on Jack Wade Creek (bulldozer-hydraulic). Several other producers in the area, using similar equipment, reported outputs of less than 200 ounces of gold.

Hot Springs District.—The largest producer of gold in the district in 1948 (on the basis of reported output for all producers excluding natural gold sold; quantity unreported) was the Iditarod Operating Co., which recovered 1,372 ounces of gold and 193 ounces of silver from 85,000 cubic yards of gravel, using bulldozers and bedrock sluice boxes, on Golden Creek, 30 miles south of Tanana during a period from May to October. Others of the larger producers of placer gold using various combinations of bulldozers, hydraulic equipment, and draglines with bedrock sluice boxes were Cleary Hill Mines on Tofty and Sullivan Creeks, Enstrom & McDougal on American Creek, Pioneer Mining Co. on Pioneer Creek, Johnson & Johnson (Breakoff claim) on Glenn Gulch, Cable & Francis on lower Eureka Creek, and A. W. Pringle on Eureka Creek. Tom Dean worked a small drift mine on Miller Gulch during a 40-day period in 1948.

Iditarod District.—The North American Dredging Co.—operating its Diesel-powered bucket-line dredge equipped with 70 3½-cubic-foot buckets on the Mohawk Association property on Flat Creek—was the largest producer of gold in the Iditarod district in 1948. Retaining its rank as second largest producer of gold in the district, the Awe Mining Co., recovered 2,330 ounces of gold and 355 ounces of silver from 125,000 cubic yards washed on Chicken Creek from May 22 to October 2, 1948; equipment included three bulldozers, two dragline excavators (for moving overburden and disposing of tailings), and two hydraulic giants. Uotila & Ogriz and Hatton & Turner operated on Slate Creek and Willow Creek, respectively, using similar placer mining methods and equipment; the last-named operator recovered 986 ounces of gold and 143 ounces of silver from 95,000 cubic yards of gravel. The Alpha Mining Co. operated on the Alpha Association property on Flat Creek using a hydraulic-bulldozer-dragline combination, and Pete Miscovich hydraulicked on Otter Creek. Five giants and two hydraulic elevators were used; mechanical equipment included three bulldozers and a dragline excavator.

Innoko District.—In 1948, as in the previous year, the Cripple Creek Mining Co. (Strandberg & Sons), operating a dragline and moveable dry-land washing plant in conjunction with bulldozers on Cripple and Utopia Creeks, was the largest producer of gold in the district. Rosander & Reed, using similar equipment, operated on Yankee Creek from April 20 to October 1 and was the second-largest producer in the district. Uotila & Hard (Gus Uotila, manager) recovered a substantial quantity of gold from lower Ophir Creek from April 12 to September 30, and Hard & Uotila (Eric Hard, manager) operated on Forgotten Bench, Cripple Creek, from April 16 to September 30; similar equipment, including hydraulic giants, dragline, and bulldozers, was used at both operations. Beaton, Zaiser & McFarland operated a nonfloating washing plant on Spruce Creek during a 4-month period in 1948 and produced a substantial quantity of gold. Claims on Helena Gulch, Fifteen Pup, a tributary of Little Creek, were worked by Hubbard & McFarland, under lease from Robert Jacquemi, during a 4-month period in 1948. The Goodnews Bay Mining Co., one of the district's principal gold producers in 1948, operated a dragline in conjunction with bulldozers and elevated sluice boxes on Colorado Creek from July 26 to October 1. With the use of similar equipment, Savage & Matheson recovered 794 ounces of gold and 103 ounces of silver from 115,000 cubic yards of gravel washed on Spruce Creek, and N. J. Vibe operated on Little Creek (Discovery and Gold Run Association). Also, by the use of the widely utilized hydraulic-bulldozer-dragline combination, smaller quantities of gold were reported produced in 1948 by Anvil Creek Mining Co., on Anvil Creek, J. A. Degnan on Little Creek, and Waino F. Puntila on Little Creek (No. 15 above Gold Run, leased from Robert Jacquemi).

Kantishna District.—Caribou Mines, again as in 1947, was the largest producer of gold in the district. The company continued to operate on Caribou Creek using a 1½-cubic-yard dragline, bulldozer, and a dry-land washing plant. Hosler Mines operated on Moose Creek during a short period in 1948, and Hunter & Burnett recovered a moderate quantity of gold from its property on Crooked Creek; bulldozer-hydraulic combinations were used at both localities.

Koyukuk District.—The South Fork Mining Co. operated its dragline-bulldozer combination on the South Fork, Koyukuk River, from April 15 to September 20; 1,561 ounces of gold and 153 ounces of silver were recovered from 200,000 cubic yards of gravel washed through bedrock sluice boxes. Using the same type of equipment, the Myrtle Creek Mining Co. operated on Myrtle Creek in 1948. Among other producers of smaller quantities of gold in the district were Midnight Sun Gold Mining Co. on Smith Creek (Hugh Boyle claims—bulldozer-hydraulic), Frank J. Miller on Sheep Creek (bulldozer-hydraulic), R. H. Jones on Nolan and Smith benches (hydraulic), and J. B. Blundell, who recovered 52 ounces of gold and 4 ounces of silver by drift mining on the Beaver Association property on Wakeup Creek.

Marshall District.—The Yukon Mining Co. operated a dragline-bulldozer combination on Buster Creek during a short period in 1948. Production from the district was relatively small.

Rampart District.—The Little Minook Mining Co. operated on Little Minook Creek during the 1948 season and recovered 1,331 ounces of gold and 45 ounces of silver from 103,000 cubic yards of gravel, using a dragline-bulldozer-hydraulic combination. The Hunter Creek Mining Co. recovered gold as a result of hydraulic stripping operations on Hunter Creek during 1948. Frank J. Dinan recovered a small quantity of gold from claim No. 2 below on Florida Creek by drift mining.

Ruby District.—Peter Miscovich & Sons, hydraulicking on Flat Creek, June through September, was the largest gold producer in the district in 1948; mechanical equipment used included a dragline excavator and bulldozers. Other producers of substantial quantities of gold in the district using this or similar type of equipment were Coyle & Rassmussen, operating the Midnight claim on Midnight Creek (Fox Association); Iver M. Johnson & Co., on Trail Creek; and the Long Creek Mining Co., on Long Creek.

Tolovana District.—Olive Creek Mines, the largest producer in the Tolovana district in 1948, operated a dragline-bulldozer combination on the N. R. Hudson property on Olive Creek near Livengood from May 15 to September 13. Warwick Mines, using a bulldozer-hydraulic combination on the Lucky Strike claim on Glenn Gulch, tributary of Gertrude Creek, from May 10 to September 17, recovered 504 ounces of gold and 48 ounces of silver from 100,000 cubic yards of gravel. The left limit of Amy Creek bench was worked by the Amy Creek Mining Co. from April 15 to October 5; gravel was handled by a bulldozer-hydraulic combination and washed in bedrock sluice boxes; the tailings were moved with a dragline. Wilbur Mines hydraulicked on Wilbur Creek in conjunction with bulldozers during a 4-month period. Hydraulicking was used by Jurich & Car on Lillian Creek and by John Radok on Ruth Creek.

OTHER MINERALS

Antimony.—Stampede Mines, Inc., operated the Stampede mine in Kantishna district and was the only company reporting shipments of antimony ore or concentrates from Alaska during 1948. Shipments were 68 tons of concentrates containing 88,359 pounds of antimony. Near Rampart the Sawtooth Mining Co. was active in developing an antimony occurrence, and a considerable tonnage of ore was reportedly ready for shipment. In the Fairbanks district the Alaska Antimony Mining Co. was developing a lode property on Boulder Creek near Tok-Salinas Road.

Clays.—Small quantities of clay suitable for local manufacture of common brick and fire brick were produced in 1948 from deposits near Anchorage and at Sheep Mountain east of Palmer on the Glenn Highway. A small-capacity brick plant was operated at Anchorage in 1948 by Clay Products Co., Inc.

Coal.—Alaska mined 410,000 short tons (preliminary figure) of bituminous coal and lignite in 1948—a new record production. The output was 14 percent greater than in 1947 and 12 percent higher than the previous record production of 366,809 tons in 1946, due largely to full-scale stripping operations at three properties in the Nenana field, about 75 miles southwest of Fairbanks. Of interest in connection with these operations—of which the Usibelli mine was the largest—was the removal of gravel and sandstone overburden by the use of bulldozers and hydraulic giants before extraction of coal by the usual power shovels. The principal underground mines include the Suntrana in the Nenana field operated by the Healy River Coal Corp., and the Evan Jones Coal Co. Jonesville mine in the Matanuska field, 45 miles northeast of Anchorage.

Gem Stones.—No jade (nephrite) was reported produced in the Kobuk River area in 1948. Arctic Circle Exploration Co., Inc., has been the principal producer and fabricator of this material.

Graphite.—Although no production was reported, a graphite deposit on the south shore of Imuruk Basin was prospected and sampled in 1948 by the Alaska Graphite Syndicate.

Limestone.—The Permanente Cement Co. made regular shipments of limestone during 1948 from its quarry on Dall Island in the Ketchikan District, Southeastern Alaska, to Washington State for the manufacture of cement.

Mercury.—The Decoursey Mountain mine, 24 miles from Crooked Creek, was the only producer of mercury in Alaska in 1948. A total of 50 tons of ore was treated in two D retorts, and 100 flasks of metal were recovered. About 450 feet of development drift were driven with low-grade showings along most of the distance. Backs of 140 to 190 feet, all unmined, exist above this development drift.

A report [1] on the Rainy Creek mercury prospect, which lies at the western base of the Kilbuck Mountains, about 80 miles southeast of Bethel, in southwestern Alaska, was published in 1948. The deposits are believed to have been discovered between 1910–20. Production of mercury from the area has been solely from cinnabar concentrates recovered as a result of gold placer operations. About 2,000 pounds of high-grade concentrate were said to have been shipped.

Platinum Metals.—Placer deposits in the Goodnews Bay district in the Kuskowim region in 1948 continued to yield a substantial quantity of crude platinum containing a small percentage of gold.

[1] Rutledge, F. A., Investigation of the Rainy Creek Mercury Prospect,' Bethel District, Kuskowim Region, Southwestern Alaska: Bureau of Mines Rept. of Investigations 4361, 1948, 7 pp.

Pumicite.—The Alaska Katmalite Corp. was active during 1948 in the manufacture of building blocks at its small plant at Anchorage. The pumicite raw material used as aggregate in the blocks was mined from deposits developed on Augustine Island, Iliamna district, on the west side of Cook Inlet.

Sand and Gravel.—Production of sand and gravel in Alaska was reported by R. J. Sommers Construction Co., Juneau, Alaska; the Alaska Road Commission; and the Corps of Engineers, Department of the Army.

Tin.—The Arctic Tin Co. developed tin placers in the York area (Port Clarence district) near the western tip of the Seward Peninsula in 1948, using dragline-bulldozer equipment. The Cleary Hill Mines Co. recovered a small quantity of tin concentrate as a byproduct of its placer-gold operations near Tofty in the Hot Springs district.

Tungsten.—The J. H. Scott Co., operating the Riverside mine near Hyder, Southeastern Alaska, produced a small quantity of concentrate from ore mined chiefly for its lead content in 1948.

Miscellaneous Minerals.—There was no recorded production of asbestos, chromite, or petroleum in Alaska in 1948.

Arizona
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. NEEDHAM AND PAUL LUFF

GENERAL SUMMARY

THE MINING of copper ore, the most important part of Arizona's mining industry, rose to 39,072,204 tons in 1948, the largest annual output in the history of the State, exceeding the record established in 1947 by 1,261,756 tons (3 percent). The State also made a record output (664,603 tons—40,206 tons more than in 1947) of zinc-lead ore. These increases in ore output in 1948 resulted in a record production of lead, the greatest output of silver and copper since 1943, and the greatest yield of gold since 1944; the output of zinc declined only 332,000 pounds from the record output of 1947. The State remained the largest producer of copper in the United States, ranked third in zinc, and again ranked first in total value of the five metals. Production in 1948 (in terms of recoverable metals) was 109,487 fine ounces of gold, 4,837,740 fine ounces of silver, 750,242,000 pounds of copper, 59,798,000 pounds of lead, and 108,956,000 pounds of zinc, indicating increases over 1947 of 14 percent in gold, 6 percent in silver, 2 percent in copper, and 5 percent in lead; zinc declined slightly (about 0.3 percent). The total value of the five metals was $196,207,948 in 1948, the highest value since 1918 and a 7-percent gain over 1947. The total value of the gold was $3,832,045—2 percent of the State total value; silver, $4,378,399—2 percent; copper $162,802,514—83 percent; lead $10,703,842—6 percent; and zinc, $14,491,148—7 percent. The value of the metals recovered from copper ore was $166,494,997 in 1948 ($157,260,992 in 1947) or 85 percent of the State total. About 90 percent of the State gold production and 75 percent of the silver in 1948 came from six districts—Ajo, Big Bug, Copper Mountain (Morenci), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 99 percent of the copper came from eight districts—Ajo, Copper Mountain (Morenci), Eureka (Bagdad), Globe-Miami, Mineral Creek (Ray), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 84 percent of the lead came from five districts—Big Bug, Harshaw, Old Hat, Pima, and Warren (Bisbee); and 94 percent of the zinc came from seven districts—Big Bug, Cochise (Dragoon), Eureka (Bagdad), Harshaw, Old Hat, Pima, and Warren (Bisbee).

Outstanding features of Arizona's mining activities in 1948 were completion in March of open-pit development and construction at the Inspiration copper property at Inspiration in Gila County, development and construction of an open pit at the Ray copper property of the Kennecott Copper Corp. in Pinal County, and installation of a power plant and construction of other facilities by the Magma Copper Co. for underground exploration at the San Manuel property, also in Pinal County.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944-47: price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Arizona, 1944–48, and total, 1860–1948, in terms of recovered metals

Year	Mines producing: Lode	Mines producing: Placer	Ore (short tons)	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value
1944	226	17	35,900,641	112,162	$3,925,670	4,394,039	$3,124,650
1945	202	18	31,266,904	77,223	2,702,805	3,558,216	2,530,287
1946	194	33	31,058,179	79,024	2,765,840	3,268,765	2,641,162
1947	315	30	38,636,280	95,860	3,355,100	4,569,084	4,135,021
1948	360	39	39,925,686	109,487	3,832,045	4,837,740	4,378,399
1860–1948	-------	-------	(1)	11,073,506	275,067,865	302,094,238	225,778,119

Year	Copper: Pounds	Copper: Value	Lead: Pounds	Lead: Value	Zinc: Pounds	Zinc: Value	Total value
1944	716,606,000	$96,741,810	33,414,000	$2,673,120	58,154,000	$6,629,556	$113,094,806
1945	574,406,000	77,544,810	45,734,000	3,933,124	80,462,000	9,251,980	95,963,006
1946	578,446,000	93,708,252	47,860,000	5,216,740	87,330,000	10,654,260	114,986,254
1947	732,436,000	153,811,560	57,132,000	8,227,008	109,288,000	13,223,848	182,752,537

1860–1948	[2] 11,919,431	3,625,890,876	[2] 432,522	67,291,982	[2] 386,592	81,088,917	4,275,117,759

[1] Figure not available.
[2] Short tons.

The average price of copper, lead, and zinc rose in 1948—copper to \$0.217 per pound, lead to \$0.179 per pound, and zinc to \$0.133 per pound. The price of gold remained at \$35 per fine ounce and silver at \$0.905+ per fine ounce. The average price of copper in 1948 was the highest since the war year 1918, when it was 24.7 cents per pound;

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1948, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	8,942	383,900	31,335	2,095	3,960
February	8,340	362,750	29,430	2,285	4,370
March	9,370	410,975	31,565	2,735	5,050

1947	9	200	39	1,365	6.83
1948	11	135	16	560	4.15
Grand total placers:					
1944	17	3,070	242	8,470	2.76
1945	18	3,580	540	18,900	5.28
1946	33	168,200	398	13,930	.08
1947	30	9,400	314	10,990	1.17
1948	39	100,895	838	29,330	.29

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

the average price of lead was the highest of any year since average metal prices were established in 1850; and the average price of zinc was virtually the same as that in 1916 (13.4 cents per pound), when it was the highest average price ever recorded.

Gold.—Most of the gold produced in Arizona is a byproduct of copper ore and zinc-lead ore; and due to a substantial increase in both classes of ore in 1948, the State output of gold rose to 109,487 ounces, a 14-percent gain over 1947. In 1948, 77 percent of the State gold output was recovered from copper ore, 14 percent from zinc-lead ore, 6 percent from siliceous ores, and most of the remainder from lead ore and zinc-copper ore and from placers. Gold from copper ore increased 8,680 ounces, that from siliceous ores 2,326 ounces, and that from zinc-lead ore 1,722 ounces. Gold from placers increased from 314

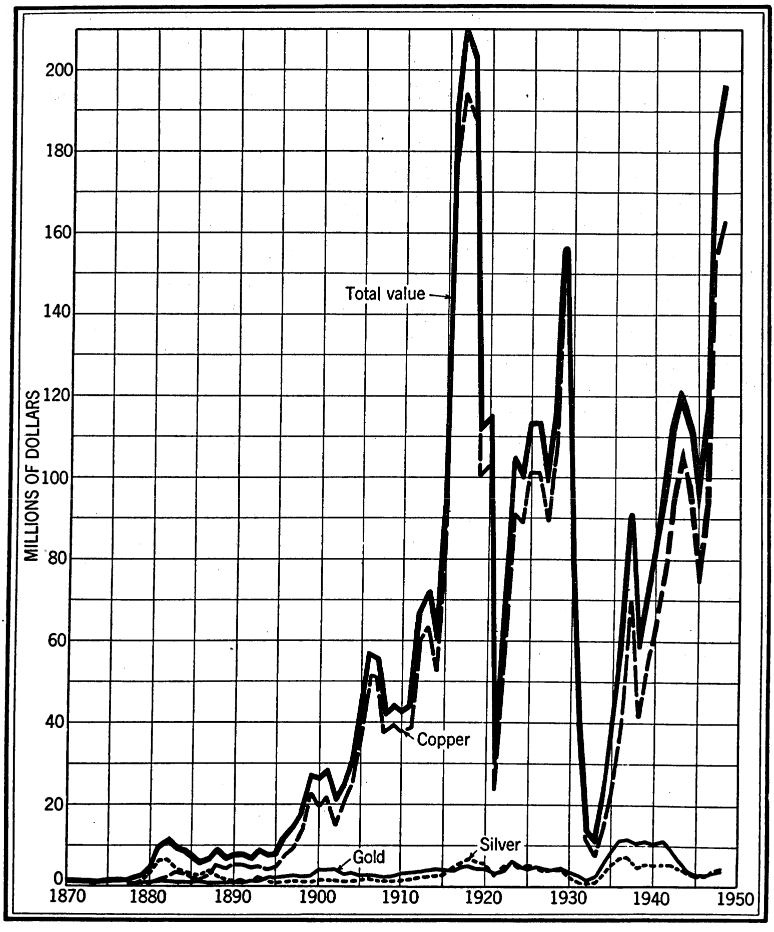

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1948. The value of lead and zinc has been less than $2,000,000 annually, except in a few years.

ounces to 838 ounces. The New Cornelia mine of the Phelps Dodge Corp. in Pima County continued to be the leading gold producer in Arizona; it was followed by the Copper Queen (Bisbee) branch of the Phelps Dodge Corp. in Cochise County, the Iron King mine in Yavapai County, the Magma mine in Pinal County, the Morenci branch of the Phelps Dodge Corp. in Greenlee County, the United Verde branch of the Phelps Dodge Corp. in Yavapai County, and the Verde Exploration property, also in Yavapai County; these seven properties (all copper mines except the Iron King and Verde Exploration) produced 90 percent of the State total gold.

Silver.—Most of the silver produced in Arizona is a byproduct of copper ore and zinc-lead ore, and in 1948 these two classes of ore yielded 4,358,986 ounces of silver (90 percent of the State total) compared with 4,181,916 ounces in 1947. Copper ore yielded 2,814,833 ounces of silver (58 percent of the State total) and zinc-lead ore 1,544,153 ounces (32 percent); the remainder came principally from siliceous ores, lead ore, zinc-copper ore, and zinc-lead-copper ore. Silver from copper ore increased 231,569 ounces or 9 percent, but that from zinc-lead ore declined 54,499 ounces or 3 percent; silver from siliceous ores increased 93,999 ounces or 43 percent. The Phelps Dodge Corp. continued to be the chief silver producer in Arizona, and its output was about 100,000 ounces more than in 1947; its four properties (Copper Queen, Morenci, New Cornelia, and United Verde) produced 67 percent of the State gold output, more than 59 percent of the silver, and 63 percent of the copper; and its Copper Queen branch also produced nearly 38 percent of the State's lead and 51 percent of the zinc. Other large silver producers in Arizona in 1948 were Iron King, Magma, Flux-January-Norton, and San Xavier (Eagle-Picher Mining & Smelting Co.) properties.

Copper.—With no work stoppages and a rise in the price of copper in 1948, Arizona's output of recoverable copper rose to 750,242,000 pounds, the largest output since 1943 and a 2-percent gain over 1947. The Copper Mountain (Morenci) district, with an output of 296,632,000 net pounds of copper, remained the leading copper-producing area in the State; it was followed by the Globe-Miami district with 176,956,200 pounds, Ajo with 111,230,400, Warren (Bisbee) with 38,407,300, Mineral Creek (Ray) with 37,505,400, Pioneer (Superior) with 37,440,700, Verde (Jerome) with 29,087,800, and Eureka (Bagdad) with 14,494,000. Substantial increases in copper output were made in each of these districts except the Globe-Miami, Mineral Creek (Ray), and Verde (Jerome). Copper ore and its products yielded 741,906,998 pounds of copper as follows: 34,632,227 tons of copper ore treated by concentration yielded 80.1 percent; 686,780 tons of copper ore shipped crude to smelters 8.2 percent; and 3,753,197 tons of copper ore leached and 11,783 tons of cement copper (from mine-water precipitates and underground leaching operations) 11.7 percent. The Morenci branch of the Phelps Dodge Corp. was again the largest copper producer in Arizona; it was followed in order by the New Cornelia branch of the Phelps Dodge Corp., Inspiration, Castle Dome, Miami, Copper Queen branch of the Phelps Dodge Corp., Magma, Ray (Kennecott Copper Corp.), United Verde branch of the Phelps Dodge Corp., and Bagdad properties.

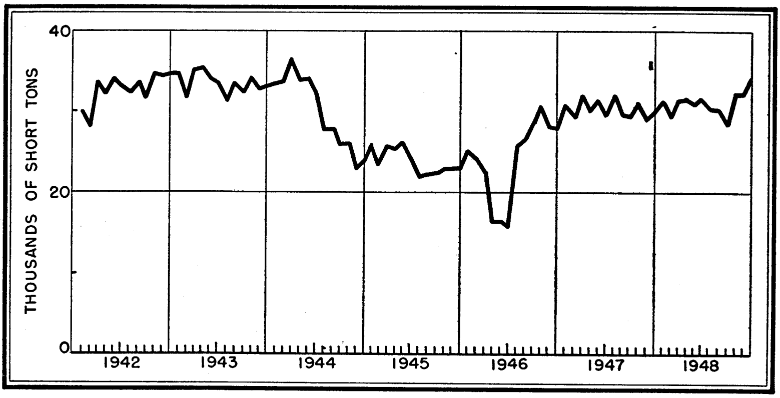

FIGURE 2.—Mine production of copper in Arizona, 1942–48, by months, in terms of recovered metal.

Lead and Zinc.—In 1948 Arizona exceeded its 1947 record output of lead and nearly equaled its 1947 record output of zinc. The production of lead in 1948 (59,798,000 pounds) was the largest for any year in the history of the State, and the production of zinc (108,956,000 pounds) was only 332,000 pounds less than the record output in 1947; the lead output exceeded that of 1947 by 2,666,000 pounds or nearly 5 percent. Arizona mines have succeeded in setting a record lead output each year since 1944. Despite a 16-percent decrease in lead production and 15-percent in zinc production, the Copper Queen mine of the Phelps Dodge Corp. at Bisbee remained by far the largest producer of lead and zinc in Arizona in 1948. Other large producers of lead, in order of output, were the St. Anthony property at Tiger, San Xavier mine near Sahuarita, Iron King mine at Humboldt, and Flux-January-Norton group near Patagonia. Other large producers of zinc, in order of output, were the Iron King, San Xavier, St. Anthony, Republic & Mammoth (Coronado Copper and Zinc Co.), Flux-January-Norton, and Old Dick properties. Of the State total, 38 percent of the lead and 51 percent of the zinc came from the Warren (Bisbee) district in Cochise County. Other large producing districts of both lead and zinc were the Old Hat in Pinal County, Big Bug in Yavapai County, Pima in Pima County, Harshaw in Santa Cruz County, Aravaipa in Graham County, and Wallapai in Mohave County. About 90 percent of the total lead and 88 percent of the total zinc came from zinc-lead ore; 9 percent of the total lead came from lead ore, and most of the remainder of the lead from zinc-lead-copper ore and zinc-copper ore; and 10 percent of the total zinc came from zinc-copper ore, and nearly all the rest from zinc-lead-copper ore and zinc ore.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1948, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Cochise	29		20,385	$713,475	1,557,818	$1,409,904

MINING INDUSTRY

The upward trend of Arizona's mining industry that began in 1947 continued throughout 1948 at an accelerated pace; with no work stoppages at the mines in 1948 and with substantial increases in the prices of copper, lead, and zinc, mining of all classes of ore reached a record output of 39,925,686 tons, 1,289,406 tons more than the record output of 1947. The outputs of copper ore (39,072,204 tons) and zinc-lead ore (664,603 tons) were the highest in the history of the State; copper ore increased 3 percent from 37,810,448 tons in 1947 and zinc-lead ore 6 percent from 624,397 tons. Zinc-copper ore increased to 101,405 tons—a 23-percent gain; but siliceous ores declined to 56,090 tons—a 23-percent loss; lead ore to 23,231 tons—a 5-percent loss; and zinc ore and zinc-lead-copper ore to 7,911 tons—a 63-percent loss. Of the State total ore, 38,967,623 tons (97.6 percent) was copper ore mined in the Copper Mountain (Morenci), Globe-Miami, Ajo, Mineral Creek (Ray), Eureka (Bagdad), Verde

(Jerome), Warren (Bisbee), and Pioneer (Superior) districts, and 656,763 tons (98.8 percent) of the State total zinc-lead ore was mined in the Warren (Bisbee), Big Bug, Old Hat (Oracle), Pima, Harshaw, Aravaipa, and Wallapai (Chloride) districts. Mining operations at five open pits—Ajo, Bagdad, Inspiration, Miami (Castle Dome), and Morenci—produced 29,638,873 tons of copper ore in 1948 compared with four open pits in 1947, which produced 26,818,513 tons. Labor was more plentiful in 1948 than in 1947, but at the close of the year a shortage still existed at some of the underground copper mines and at some zinc-lead mines.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Arizona in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	67	13,117	5,523	22,254	138,874	27,521	23,320
Dry and siliceous gold-silver ore	9	15,265	770	38,205	51,517	2,091	----------
Dry and siliceous silver ore	36	27,708	605	251,826	29,889	19,373	----------
	112	56,090	6,898	312,285	220,280	48,985	23,320
Copper ore	104	39,072,204	84,391	[1]2,814,833	[2]741,906,998	----------	----------
Lead ore	123	23,231	1,045	80,464	119,720	5,518,805	78,991
Lead-copper ore	6	242	10	1,607	11,922	49,728	2,035
Zinc ore	4	3,966	17	2,895	19,450	19,350	518,750
Zinc-copper ore	9	101,405	926	65,811	3,585,415	207,037	11,270,128
Zinc-lead ore	52	664,603	15,361	1,544,153	4,288,582	53,713,595	96,339,476
Zinc-lead-copper ore	3	3,945	1	15,556	89,633	240,500	723,300
Total lode mines	[3]360	39,925,686	108,649	[1]4,837,604	[2]750,242,000	59,798,000	108,956,000
Placers	39	----------	838	136	----------	----------	----------
Total: 1948	399	39,925,686	109,487	[1]4,837,740	[2]750,242,000	59,798,000	108,956,000
1947	345	38,636,280	95,860	[4]4,569,084	[5]732,436,000	57,132,000	109,288,000

[1] Includes 80 ounces recovered from underground mine-water precipitates.
[2] Includes 86,709,683 pounds recovered from ore leached and mine-water precipitates.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 255 ounces recovered from underground mine-water precipitates.
[5] Includes 83,310,570 pounds recovered from ore leached and mine-water precipitates.

METALLURGIC INDUSTRY

Of the 39,925,686 tons of ore produced in 1948 in Arizona, 35,412,392 tons (89 percent) were treated at 34 milling plants and 3,753,197 tons (9 percent) at 2 leaching plants; the remainder, 760,097 tons (2 percent), was shipped crude to smelters.

Ore treated at milling plants in 1948 comprised chiefly 34,632,227 tons of copper ore, 659,936 tons of zinc-lead ore, and 101,405 tons of zinc-copper ore. Copper ore from the Miami property was treated by a combination of leaching and concentration, copper ore from the Inspiration mine was treated by straight leaching and by leaching and concentration, and copper ore from the Emerald Isle mine was treated by straight leaching. The large copper-concentration plants at Morenci (45,000-ton a day), Ajo (25,000-ton), Miami (18,000-ton), Inspiration (18,000-ton), Castle Dome (10,000-ton), Hayden (10,000-ton), Bagdad (3,000-ton), Clarkdale (2,100-ton), and Superior (1,150-

ton); the copper-leaching plants at Inspiration (9,000-ton) and Miami (3,000-ton); and the zinc-lead concentration mills at Bisbee (Copper Queen 900-ton and Shattuck Denn 150-ton), Sahuarita (Eagle-Picher 500-ton), Humboldt (Iron King 470-ton), Tiger (St. Anthony 500-ton), Patagonia (Trench 200-ton), and Chloride (Tennessee 150-ton) were operated continuously in 1948, most of them at a higher rate than in 1947. The copper smelters of the Phelps Dodge Corp. at Clarkdale, Douglas, and Morenci, the International Smelting & Refining Co. copper smelter at Miami, the American Smelting & Refining Co. copper smelter at Hayden, and the Magma Copper Co. copper smelter at Superior operated continuously throughout the year. Most of the copper concentrates produced at mills in Arizona are treated at smelters in Arizona, but all the lead concentrates produced at mills in Arizona in 1948 were shipped to the smelter at El Paso, Tex., and all the zinc concentrates were shipped to smelters at Amarillo and Dumas, Tex.; Fort Smith, Ark.; Henryetta, Okla.; and Great Falls, Mont.

The following tables give details of the treatment of ores produced in Arizona in 1948.

Mine production of metals in Arizona in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	213	46	22			
Concentrates smelted	1,502,513	78,047	3,314,406	602,299,717	53,994,566	108,771,346
Ore smelted	760,097	30,556	1,523,096	61,232,600	5,803,434	184,654
Copper precipitates smelted	11,783		80	[1] 16,874,713		
Copper ore leached	[2] 3,753,197			69,834,970		
Placer		838	136			
Total: 1948		109,487	4,837,740	750,242,000	59,798,000	108,956,000
1947		95,860	4,569,084	732,436,000	57,132,000	109,288,000

[1] Distributed as follows: Cochise County, 423,470 pounds; Gila County, 8,220,218 pounds; Greenlee County, 1,115,730 pounds; Mohave County, 581,268 pounds; Pinal County, 6,342,027 pounds; and Yavapai County, 192,000 pounds.
[2] Treated by straight leaching at 1 plant in Gila County and 1 plant in Mohave County.

Gross metal content of Arizona ore treated at mills in 1948, by classes of ore[1]

Class of ore	Ore (short tons)	Gross metal content of mill feed				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold	1,813	230	3,954	3,150	30,350	50,000

REVIEW BY COUNTIES AND DISTRICTS

COCHISE COUNTY

California District.—Portal Mines Development Co. operated the King-Ainsworth group near Portal and shipped 501 tons of ore, containing 4 ounces of gold, 800 ounces of silver, 2,400 pounds of copper, 60,000 pounds of lead, and 110,000 pounds of zinc, to custom flotation mills in Arizona. The rest of the district output was mainly 208 tons of zinc-lead ore produced from the Pine-Zinc mine and 166 tons of lead ore from the Leadville group.

Cochise District.—The Republic and Mammoth mines of the Coronado Copper & Zinc Co. near Dragoon were the only producers in the Cochise district in 1948. The company reported that 67,150 tons of zinc-copper ore were treated in its 150-ton flotation mill, which yielded 3,095 tons of copper concentrate and 6,042 tons of zinc concentrate.

Dos Cabezas and Tevis District.—Output in 1948 was 36 tons of zinc-lead ore produced from the LeRoy Consolidated Mines.

Hartford (Huachuca Mountains) District.—Short Bros. worked the Armistice group nearly all year and shipped 156 tons of lead ore to the smelter at El Paso, Tex.

Swisshelm (Elfrida) District.—Edwin Larson operated the Scribner mine throughout the year and shipped 6,148 tons of lead ore containing 409 ounces of gold, 22,198 ounces of silver, 12,366 pounds of copper, 1,388,413 pounds of lead, and 163,043 pounds of zinc. Similar ore (1,230 tons) was produced also from the Chance mine by the Chance Mining Co. In addition, the company shipped 267 tons of zinc-lead ore to a custom flotation mill at Bisbee, Ariz.

Tombstone District.—The output of the Tombstone district in 1948 was 19,229 tons of ore and old tailings containing 686 ounces of gold, 68,820 ounces of silver, 96,784 pounds of copper, 260,072 pounds of lead, and 140,000 pounds of zinc. The largest output was 13,865 tons of old tailings (containing 595 ounces of gold, 33,375 ounces of silver, and 76,361 pounds of copper) shipped from the Grand Central dump near Fairbank. Lessees worked the Tombstone group, shipped 892 tons of silver ore and 558 tons of gold-silver ore, and milled 730 tons of lead ore. The rest of the district output was principally 1,500 tons of zinc-lead ore produced from the Mary Jo mine by the Charleston Lead Mines Co. and 1,369 tons of silver ore produced from the San Pedro mine by the Allison Mines, Inc.

Turquoise (Courtland, Pearce, Gleeson) District.—Nearly all the output of the Turquoise district in 1948 was 3,798 tons of zinc ore containing 3 ounces of gold, 3,720 ounces of silver, 26,775 pounds of copper, 27,215 pounds of lead, and 668,018 pounds of zinc. The Billingsley Machinery Co. worked the San Juan group and milled 2,584 tons of zinc ore, and the Shattuck Denn Mining Corp. worked the Abril group and hauled 1,214 tons of similar ore to its custom flotation mill at Bisbee.

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1948 by counties and districts, in terms of recovered metals

[1] Pioneer district lies in both Gila and Pinal Counties.
[2] White Picacho district lies in both Maricopa and Yavapai Counties.
[3] Old Hat district lies in both Pima and Pinal Counties.

Warren (Bisbee) District.—Despite a decrease of 6 percent in silver output, 16 percent in lead, and 15 percent in zinc in 1948 compared with 1947, the Warren district continued to be the largest producer of silver, lead, and zinc in Arizona, and in 1948 ranked second in gold and fourth in copper; the gold output declined 5 percent, but the copper output increased 13 percent. The value of the metal output of the district increased from $20,988,948 in 1947 to $21,686,724 in 1948, owing principally to a rise in copper output. The only producer in the district in 1948 was the Copper Queen mine of the Phelps Dodge Corp. The corporation reported that the Copper Queen branch produced 302,941 tons of copper ore and 218,466 tons of zinc-lead ore in 1948 compared with 270,719 and 286,730 tons, respectively, in 1947. In addition, 402 tons of copper precipitates and 570 tons of waste-dump ore were shipped to smelters. The zinc-lead ore was treated in the corporation 900-ton flotation mill at Bisbee, and the copper ore was shipped direct to the corporation smelter at Douglas.

According to the corporation annual report for 1948, a shortage of underground miners continued at the Copper Queen branch; however, the copper produced in 1948 totaled 36,587,178 net pounds compared with 32,304,614 net pounds in 1947; lead produced totaled 17,550,887 net pounds compared with 21,241,846 net pounds; and zinc produced totaled 46,868,961 net pounds compared with 56,572,604 net pounds.

The Shattuck Denn Mining Corp. 150-ton flotation mill at Bisbee continued to be used entirely for treating custom ores; in 1948 it handled 8,338 tons of ore containing 482 ounces of gold, 21,208 ounces of silver, 90,183 pounds of copper, 1,226,736 pounds of lead, and 855,459 pounds of zinc. About 53 percent of the material treated was lead ore produced from the Scribner mine near Elfrida in Cochise County.

COCONINO COUNTY

Leasing operations at the open pit of the Petoskey mine in the Jacob Canyon (Warm Springs) district produced 2,140 tons of carbonate copper ore containing 4 ounces of gold, 1,264 ounces of silver, and 307,170 pounds of copper.

GILA COUNTY

Banner and Dripping Springs District.—High-lime fluxing ore (32,715 tons), containing an average of 2.22 percent copper, was shipped throughout the year to the smelter at Hayden from the Christmas mine near Winkelman by the Sam Knight Mining Lease, Inc. The remainder of the district output was principally 1,716 tons of lead ore (containing 6 ounces of gold, 4,193 ounces of silver, 41,151 pounds of copper, and 516,487 pounds of lead), produced from the "79" mine by the 79 Lead-Copper Co.

Globe-Miami District.—The Globe-Miami district, with a production of 176.956,200 net pounds of copper in 1948 (182,064,100 net pounds in 1947), continued to rank second among the important copper-producing areas in Arizona; the Copper Mountain (Morenci) district in Greenlee County remained in first place. The Inspiration property, with a yield of 76,705,570 net pounds of copper (73,812,725 net pounds in 1947) was the leading copper producer in the district and ranked third in the State. The Inspiration Consolidated Copper Co.

reported that 3,978,373 tons of copper ore were treated in 1948 compared with 3,926,772 tons in 1947. Of the total ore, 3,719,197 tons, averaging 1.063 percent copper—0.622 percent copper as oxide and 0.441 percent as sulfide—from which the slimes had been removed, were treated by acid ferric sulfate in the main leaching plant. Slimes (255,766 tons averaging 1.608 percent copper) removed from ore at the main leaching plant were treated in the company flotation concentrator for extraction of the sulfide copper content, and the tailings from the operation were leached by sulfuric acid solution for extraction of oxide copper content. In addition, 3,410 tons of crude copper ore were sent direct to the smelter at Miami. The total copper production per ton of ore treated in 1948 was 19.193 pounds.

According to the annual report of the company for 1948, the outstanding feature of the year's mining activities was the completion, late in March, of the open-pit development and construction program. Open-pit mining began in March and continued throughout the year—2,652,084 tons of ore were mined from underground and 1,338,440 tons from the open pit. Preparations are being made to institute leaching in place certain mined-out and caved areas in the property to recover part of the remaining copper. Production from this source is expected to begin in a small way in the latter part of 1949.

The Castle Dome Copper Co., Inc. (a wholly owned subsidiary of the Miami Copper Co.), and the Miami mine of the Miami Copper Co. ranked second and third, respectively, in copper production in the district. The Miami Copper Co. reported that 99,004,662 net pounds of copper were produced from the two properties in 1948 (49,585,565 net pounds from the Castle Dome mine and 49,419,097 net pounds from the Miami mine) compared with 106,796,369 net pounds in 1947.

According to the annual report of the Miami Copper Co. for 1948, the Castle Dome open pit and 10,000-ton concentrator were operated continuously throughout the year. The mill treated 3,890,126 tons of ore averaging 0.724 percent copper. In addition to copper, the concentrate contained 1,219 ounces of gold and 80,075 ounces of silver. Operations were also carried on in preparation for mining approximately 6,000,000 tons of ore underlying Red Hill. Ore reserves, as of January 1, 1949, were estimated to be 13,610,594 tons, including the 6,000,000 tons at Red Hill, averaging 0.713 percent copper. In addition, a block of approximately 3,665,000 tons averaging 0.54 percent copper is known to lie between the 4,040- and 4,085-foot levels of the Castle Dome ore body.

The Miami Copper Co. 18,000-ton concentrator and 3,000-ton leaching plant at the Miami mine treated 4,197,695 tons of ore averaging 0.679 percent copper, and 1,771 tons of copper precipitates were produced from leaching of ore in place. In addition to copper, the concentrate contained 1,292 ounces of gold and 58,704 ounces of silver, and the re-treatment of copper concentrate recovered 385,606 pounds of molybdenum. The cost of production continued to increase during the year, largely because of additional wage increases, rising costs of materials and supplies, and higher charges for smelting, refining, and transportation. Ore reserves, as of January 1, 1949, were estimated to be 27,279,000 tons averaging 0.893 percent copper.

The rest of the district output was mainly 1,297 tons of copper ore produced from the Carlota, Copper Hill, Hoosier & Grey, and Superior & Boston properties and 453 tons of silver ore from the Rescue mine.

GRAHAM COUNTY

Aravaipa District.—Operations in 1948 at the Aravaipa group of the Athletic Mining Co. near Klondyke included construction of a 100-ton flotation plant. During the year 25,708 tons of ore were treated, which contained 50 ounces of gold, 25,000 ounces of silver, 100,000 pounds of copper, 1,249,409 pounds of lead, and 3,213,500 pounds of zinc. In addition, 4,417 tons of similar ore were shipped direct to the smelter at El Paso. The remainder of the district output was 1,021 tons of lead ore produced principally from the Sein Fein mine.

GREENLEE COUNTY

Ash Peak District.—Fluxing ore (14,768 tons), averaging 0.036 ounce of gold and 9.165 ounces of silver to the ton and 81 percent silica, were shipped in 1948 to the International copper smelter at Miami from the Ash Peak mine and Hardy mine dump near Duncan by the Ash Peak Lease.

Copper Mountain (Morenci) District.—The Copper Mountain district, with a production of 296,632,000 net pounds of copper in 1948 (295,798,000 net pounds in 1947), remained the chief copper-producing area in Arizona, as the Morenci mine of the Phelps Dodge Corp. continued to be the outstanding producer of copper in the State. The corporation reported that 15,567,480 tons of copper ore from the Morenci mine were treated in the 45,000-ton concentrator and that 560,897 tons of copper concentrate, 70,448 tons of crude copper ore, and 995 tons of copper precipitates were shipped direct to the Morenci smelter. In addition to copper, the mine was an important producer of gold and silver, and progress was made in 1948 in experimental work in commercial recovery of the small quantity of molybdenite in Morenci ore.

According to the annual report of the Phelps Dodge Corp. for 1948, full-scale operations prevailed at the Morenci branch throughout the year. Copper ore mined totaled 15,637,928 tons, and waste and leach material removed 20,368,908 tons, or a waste-to-ore ratio of 1.30 : 1. Copper produced in 1948 totaled 296,030,696 net pounds compared with 296,504,460 net pounds in 1947.

The remainder of the district output was 150 tons of gold-silver ore produced from the Climax Lode claim and 6 tons of copper ore from the X. I. V. claim.

MARICOPA COUNTY

Big Horn District.—Output in 1948 was 44 tons of copper ore produced from the Silver King mine 15 miles south of Aguila and 9 tons of lead ore from the Lead Dike group.

Cave Creek and Camp Creek District.—The principal output in 1948 was 97 tons of ore (containing 19,199 ounces of silver and 34,080 pounds of copper) shipped to a smelter from the Red Rover mine by Red Rover Copper Co.

New River District.—The Orizaba Copper Co. worked the Orizaba mine, 45 miles north of Phoenix, nearly all year and shipped 3,436 tons of copper ore to the smelter at Hayden.

MOHAVE COUNTY

Bentley (Grand Wash) District.—Lessees operated the Grand Gulch and Savannic claims in 1948 and shipped 38 tons of copper ore.

Cedar Valley District.—Development at the Antler mine, 12 miles east of Yucca, by the Faire Mining Corp. produced 910 tons of ore containing 9 ounces of gold, 951 ounces of silver, 67,979 pounds of copper, 9,021 pounds of lead, and 144,091 pounds of zinc. The rest of the district output was mainly 715 tons of similar ore produced from the Copper World mine by the Omega Metals Co.

Maynard District.—Leasing operations at the Gold King group south of Kingman produced 32 tons of gold ore and 11 tons of lead ore rich in gold, and 4 tons of silver-lead ore were produced from the Mary Nevada claim.

Owens (McCracken and Potts Mountain) District.—A. M. Short worked the old McCracken mine, 45 miles southeast of Yucca, in 1948 and shipped 404 tons of ore averaging 1.82 ounces of silver to the ton and 18 percent lead. The rest of the district output was principally 73 tons of gold ore produced from the Esperanza mine and 60 tons of lead ore from the Double Cross and Lead Pill properties.

Wallapai (Cerbat, Chloride, Mineral Park, Stockton Hill) District.—Sixteen mines in the Wallapai district produced 51,734 tons of ore containing 874 ounces of gold, 38,733 ounces of silver, 761,488 pounds of copper, 1,030,695 pounds of lead, and 2,032,296 pounds of zinc. The most important output was zinc-lead ore produced from the Tennessee mine at Chloride by the Miners Cooperative Association. The company reported that 13,231 tons of ore, containing an average of 0.024 ounce of gold and 1.48 ounces of silver to the ton, 2.74 percent lead, and 6.04 percent zinc, were treated in its 150-ton flotation mill; however, the mine was closed in December. The open pit at the Emerald Isle mine was worked by Lewin-Mathes Co. until June 1, when operations ceased. During the period of operation, 34,000 tons of copper ore were treated by sulfuric acid in a 300-ton leaching plant, which yielded 411 tons of copper precipitates. The 100-ton flotation mill at Mineral Park, owned by the Mineral Park Milling Co., was taken over in April by the Mohave Lead & Zinc Co. During the year the company treated 3,660 tons of zinc-lead ore—1,724 tons from the El Oro mine, 1,001 tons from the Kane and Silver Hill mine dumps, 620 tons from the Summit group, and 315 tons from the New Moon mine. The Arizona Metals Co., operator of the Summit group, also shipped 277 tons of zinc-lead ore to a custom mill in Utah. The remainder of the district output was largely 361 tons of zinc-lead ore from the Mary Bell, Manzanita, St. Louis, and Samoa properties and 101 tons of gold ore from the Golden Gem mine.

PIMA COUNTY

Ajo District.—The New Cornelia copper mine of the Phelps Dodge Corp. was, as usual, the only producer in the Ajo district. The district continued to rank first in gold and third in copper output in the State, and in 1948 it ranked third in silver. According to the annual report of the Phelps Dodge Corp. for 1948, full-scale operations prevailed at the New Cornelia branch throughout the year, except for the usual 2-week vacation shut-down in August. Production in 1948 was 7,733,070 tons of copper ore and 5,970,732 tons of waste, or a waste-to-ore ratio of 0.77:1. The New Cornelia 25,000-ton concentrator treated 7,734,952 tons of copper ore in 1948 compared with 7,095,446 tons in 1947, and smelter production from the concentrate totaled 110,062,421 pounds of copper compared with 101,105,513 pounds. Site preparation and preliminary work were done in connection with a smelter that is to be constructed at Ajo.

Arivaca District.—Output in 1948 was 87 tons of silver-lead ore produced from the Tiger claim.

Empire District.—Two cars (91 tons) of lead ore were shipped in 1948 from the Lone Mountain group, 38 miles southeast of Tucson.

Greaterville District.—The Pima Placers worked the Hummel and Richardson properties on Louisiana Gulch from January to October 29, when operations terminated. During the year a dragline and dry-land washing plant treated 90,000 cubic yards of gravel.

Helvetia (Rosemont) District.—The output of the Helvetia district in 1948 comprised 11,324 tons of copper ore, 218 tons of zinc-copper ore, 107 tons of lead ore, and 46 tons of zinc-lead ore. The copper ore, averaging 0.43 ounce of silver to the ton and 2.73 percent copper, came largely from the Rosemont (6,641 tons) and Narragansett Bay (3,197 tons) properties. Other producers of copper ore were the Helvetia (725 tons), Daylight (316 tons), Mohawk (313 tons), and Newman (132 tons) properties. Lessees at the King in Exile mine shipped 218 tons of zinc-copper ore to the Eagle-Picher custom mill near Sahuarita. Lead ore (107 tons) was produced from the Crown and Dimple claims and zinc-lead ore (46 tons) from the Daylight mine.

Old Hat (Oracle) District.—The Hartman mine, 25 miles south of Oracle, was worked most of the year by Shanklin & Adams—109 tons of copper and 38 tons of lead-copper ore were shipped to smelters, and 390 tons of zinc-lead-copper ore were hauled to the Eagle-Picher mill for custom treatment. The rest of the district output in Pima County was 200 tons of copper ore produced from the Giant and Leatherwood mines.

Pima (Sierritas, Papago, Twin Buttes) District.—The Pima district again ranked third in output of lead and zinc in Arizona, owing to the large production of zinc-lead ore from the San Xavier mine near Sahuarita. This mine and its 500-ton flotation mill were operated continuously by the Eagle-Picher Mining & Smelting Co. The mill treated 76,539 tons of ore, of which 72,314 tons, averaging 2.44 ounces of silver to the ton, 0.48 percent copper, 5.96 percent lead, and 10.28 percent zinc, came from the San Xavier mine, and the remainder—4,225 tons—comprised various classes of ore received from custom shippers. The rest of the district output consisted largely of 349 tons of zinc-lead ore produced from the Marconi mine and 123 tons of lead ore and 61 tons of zinc-lead ore from the Whitcomb property.

Silver Bell District.—The principal output of the Silver Bell district in 1948 was 1,392 tons of zinc-lead ore (containing 7,066 ounces of silver, 36,929 pounds of copper, 139,127 pounds of lead, and 228,664 pounds of zinc) produced from the Arizona-Indiana mine by the Indiana-Arizona Mining Co.

PINAL COUNTY

Bunker Hill District.—T. P. Lane operated the Red Bird mine in 1948 and milled 288 tons of lead ore. The remainder of the district output was 27 tons of copper ore produced from the Battle Ax claim and 7 tons of lead-copper-silver ore from the Blue Bird mine.

Casa Grande District.—Sherwood B. Owens operated under lease the Silver Reef mine near Casa Grande and shipped 8,079 tons of ore containing 10 ounces of gold, 62,169 ounces of silver, and 1,664 pounds of copper. The rest of the district output was mainly 83 tons of silver-lead ore produced from the El Camino claim.

Cottonwood District.—Output in 1948 was 193 tons of silver ore shipped from the Old Sample mine 2 miles southeast of Romero Wash.

Mineral Creek (Ray) District.—Output of copper ore from the Ray property of the Kennecott Copper Corp. increased from 1,493,309 tons in 1947 to 1,535,015 tons in 1948. The crude ore, averaging 1.181 percent copper, was hauled by rail 26 miles to the corporation 10,000-ton flotation mill at Hayden, where it was reduced to 66,112 tons of concentrate containing 396 ounces of gold, 22,516 ounces of silver, and 30,578,849 pounds of copper. In addition, 3,963 tons of copper precipitates were produced, which contained 6,470,567 pounds of copper. According to the annual report of the Kennecott Copper Corp. for 1948, good progress was made in stripping the Ray ore body preparatory to mining the larger part of it by open-pit methods. The crushing plant at the mine was increased to 12,000 tons of ore a day, and more grinding units were installed in the mill to prepare for the extra tonnage, which will come from the pit.

The remainder of the district output was principally 16,401 tons of oxide copper ore produced from an open pit at the Copper Butte property, 2,319 tons of oxide lead ore from the Ray Silver-Lead mine, and 739 tons of silver-copper ore from the Monitor group.

Mineral Hill District.—Twelve mines in the Mineral Hill district produced 546 tons of ore in 1948; most of it was 239 tons of lead ore from the Galena, Gorham & Hall, Pacific Lead, Iron Wood, Victor Lamb, and Woodpecker properties, 132 tons of gold-copper ore from the Tom Thumb mine, 76 tons of gold-silver ore from the Woodpecker mine, and 59 tons of gold ore from the Herring and Thanksgiving properties.

Old Hat (Oracle) District.—The Mammoth-Collins group at Tiger, one of the most important producers of zinc-lead ore in Arizona, was operated throughout the year by the St. Anthony Mining & Development Co. The company reported that 109,801 tons of ore, averaging 0.016 ounce of gold and 1.00 ounce of silver to the ton, 0.50 percent copper, 5.54 percent lead, and 5.60 percent zinc, were treated in its 500-ton gravity-flotation mill in 1948 compared with 88,975 tons in 1947. The property ranked second in production of lead in Arizona in 1948 and fourth in zinc. The rest of the district output was mainly 904 tons of copper ore produced from the Copper Rose mine, 331 tons of zinc-lead ore from the Stove Lid claim, and 227 tons of silver ore and 44 tons of silver-lead ore from the Amphitheater group. No ore was produced in 1948 from the San Manuel property south of Tiger, owned by the Magma Copper Co.; but, according to the company annual report for 1948, the program for underground exploration is well under way. No. 1 shaft had been sunk to a depth of 125 feet and No. 2 shaft to a depth of 190 feet by the end of the year. Twenty-one dwelling houses, two dormitories, and a mess hall have been completed for the employees, and shops, office, warehouse, and change rooms have been erected. Estimated ore reserves, calculated from drill-hole data, are 462,784,500 tons averaging 0.782 percent copper. The ore body is probably the second largest tonnage of copper ore in any known deposit in the United States.

Owl Head District.—Output in 1948 was 172 tons of copper ore produced from the Blue Copper, Busy Bee, and Copper Glance claims south of Florence.

Pioneer (Superior) District.—The Magma mine, one of the most important producers of gold, silver, and copper in Arizona, was operated continuously in 1948 and at a greater rate than in 1947. During the year 265,766 tons of copper ore were milled in the company 1,150-ton concentrator, and 34,833 tons of similar ore were sent direct to the company 450-ton smelter at Superior. The total ore averaged 0.028 ounce of gold and 1.04 ounces of silver to the ton and 6.38 percent copper. According to the company annual report for 1948, the net metal produced from Magma crude ore and concentrates comprised 10,318 ounces of gold, 310,755 ounces of silver, and 37,766,405 pounds of copper. The average cost of producing copper (after gold and silver values were deducted) was 18.11 cents a pound in 1948 compared with 16.74 cents in 1947. The labor supply continued to improve during the year, but additional men are still needed for full production and development. The major construction work at the property was completed during the year—the new mine-cooling plant began operating in October, but operations at the new milling plant were delayed until January 1949.

The remainder of the district output was principally 83 tons of copper ore produced from the Junction mine.

Riverside District.—Output in 1948 was chiefly 472 tons of copper ore shipped from the Peg Leg waste dump near Kelvin.

SANTA CRUZ COUNTY

Harshaw District.—In 1948 seven properties in the Harshaw district produced 62,205 tons of ore containing 83 ounces of gold, 240,567 ounces of silver, 252,038 pounds of copper, 4,420,213 pounds of lead, and 7,242,660 pounds of zinc. Most of the output was 61,653 tons of zinc-lead-silver ore produced from the Flux-January-Norton group, near Patagonia, by the American Smelting & Refining Co. This tonnage, along with 3,855 tons of ore received from custom shippers, was treated in the company 200-ton flotation mill, which yielded 3,321 tons of lead concentrate and 6,541 tons of zinc concentrate. The remainder of the district output was principally 342 tons of lead ore produced from the Hardshell and Worlds' Fair mines and 106 tons of zinc-lead ore from the Humboldt mine.

Oro Blanco (Ruby) District.—Output in 1948 comprised 594 tons of zinc-lead ore produced from the Lucky Shot, Montana, and Choctaw properties, 155 tons of gold ore from the Oro Blanco mine, and 31 tons of zinc-copper ore and 23 tons of copper ore from the Horn Gold claim.

Patagonia (Duquesne) District.—A. R. Byrd, Jr., worked the Duquesne group all year and hauled 3,298 tons of ore, averaging 4.72 ounces of silver to the ton, 1.50 percent copper, 3.07 percent lead, and 11.92 percent zinc, to the flotation mill of the American Smelting & Refining Co. near Patagonia. Similar ore (257 tons) was produced also from the Pride of the West mine and treated in the same mill. The rest of the district output was 451 tons of lead ore and 86 tons of zinc ore produced from the Mowry mine and 86 tons of lead ore from the Golden Gate claim.

Redrock District.—Output in 1948 was 47 tons of zinc-lead ore produced from the Frisco Fair claim 10 miles east of Patagonia.

Tyndall District.—In 1948 six mines in the Tyndall district produced 1,051 tons of ore containing 53 ounces of gold, 6,589 ounces of silver, 31,013 pounds of copper, 200,570 pounds of lead, and 17,901 pounds of zinc. Lead ore (425 tons) was produced from the Amado and Wilkins properties; zinc-lead ore (333 tons) from the Bland, Braathen, and Jefferson mines; and copper ore (161 tons), lead-copper ore (105 tons), and silver-lead ore (27 tons) from the Royal Blue mine.

YAVAPAI COUNTY

Agua Fria District.—High-silica copper ore shipped direct to smelters continued to be the output of the Agua Fria district. In 1948 nearly all (1,249 tons) of it came from the Stoddard mine, 5 miles southeast of Mayer.

Big Bug District.—In 1948 the Big Bug district ranked second in zinc production in the State, fourth in gold and silver, and third in lead. The Iron King mine of the Shattuck Denn Mining Corp. continued to be the principal producer; output was 145,824 tons of zinc-lead-iron ore and 85 tons of copper ore. The zinc-lead-iron ore, which averaged 0.117 ounce of gold and 3.709 ounces of silver to the ton, 0.155 percent copper, 2.350 percent lead, 6.526 percent zinc, and 21.850 percent iron, was treated in the company 470-ton flotation mill as well as 490 tons of custom ore. The mill yielded 12,027 tons of lead concentrate, 12,428 tons of zinc concentrate, and 9,810 tons of iron-gold concentrate.

The rest of the district lode output was mainly 613 tons of copper ore produced from the Henrietta and Lone Pine mines and 82 tons of zinc ore from the Up Shot claim. Placer gold (187 ounces) and silver (21 ounces) were recovered from three properties—Jane, Shanks, and O. K. No. 1.

Black Canyon District.—Output in 1948 was principally 42 tons of gold ore produced from the Golden Turkey, Gray Goose, and Richinbar properties and 28 tons of silver ore from the Thunderbolt claim.

Black Hills District.—High-silica silver-copper ore (566 tons) was shipped from the Yeager Canyon dump, and a small lot of copper ore was produced from the Skyline claim.

Black Rock District.—Output in 1948 was principally 226 tons of gold-copper ore produced from the Monte Cristo mine 13 miles northeast of Wickenburg.

Blue Tank District.—E. Nutter continued working the Camp B. mine near Wickenburg and shipped 84 tons of copper ore to a smelter.

Copper Basin District.—Fred D. Schemmer continued to operate the Commercial mine near Skull Valley and shipped 13,676 tons of high-silica copper ore to the smelter at Clarkdale. The rest of the district output was mainly 162 tons of zinc-lead ore produced from the Silver Gulch and "U. S. Navy" properties.

Copper Creek District.—Lessees worked the Copper Queen mine in 1948 and shipped 594 tons of copper ore to the smelter at Clarkdale.

Eureka (Bagdad) District.—Eleven mines in the Eureka district produced 1,054,725 tons of ore in 1948; 98 percent (1,037,427 tons) was copper ore produced from the open pit at the Bagdad property by the Bagdad Copper Corp. The ore, averaging 0.883 percent copper, was treated in the company 3,000-ton flotation mill, which yielded 25,406 tons of copper concentrate. The Old Dick mine was worked the first 2 months of the year by the Hillside Mining & Milling Co. and the remaining 10 months by the Goodwin Mining Co.; total output was 15,034 tons of zinc-copper ore, most of which was shipped to custom mills in Arizona and Utah. The rest of the district output was largely 1,500 tons of gold-lead-zinc ore produced from the Hillside mine and 512 tons of zinc-lead ore from the Copper King mine.

Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) District.—The principal output of the Hassayampa district in 1948 was 736 tons of lead ore produced from the Bodie mine in Crook Canyon; the ore averaged 0.14 ounce of gold and 4.67 ounces of silver to the ton, 0.72 percent copper, 19.55 percent lead, and 0.50 percent zinc. The remainder of the district output was largely 269 tons of gold ore produced from the Gold Charm and Sacramento mines, 208 tons of zinc-lead ore from the Sacramento and Sun Dance mines, and 109 tons of lead ore from the Buzzard, Lead Queen, P. K., and Ruth properties.

Lynx Creek District.—Dragline dredging at the Fitzmaurice placer near Prescott by the Minona Mining Co. recovered 55 ounces of gold and 10 ounces of silver.

Peck District.—In 1948 three mines in the Peck district produced 330 tons of ore containing 1 ounce of gold, 6,098 ounces of silver, 948 pounds of copper, and 129 pounds of lead; most of it was 302 tons of silver ore produced from the Swastika mine near Cleator.

Pine Grove (Crown King) District.—Mining and milling zinc-copper ore from the Crown King mine by the Golden Crown Mining Co. were continuous until April 30, when the mine was closed. During the remainder of the year the company worked the Tiger mine in the Tiger district. From the Crown King mine, the company 75-ton flotation mill treated 4,070 tons of ore, averaging 0.055 ounce of gold and 4.11 ounces of silver to the ton, 1.00 percent copper, 0.61 percent lead, and 4.48 percent zinc. The rest of the district output was mainly 12 tons of high-grade gold ore produced from the Del Pasco group.

Tiger District.—The Tiger mine, 5 miles southwest of Crown King, was worked in 1948 by the Golden Crown Mining Co.; 1,825 tons of zinc-lead ore were treated in the Crown King flotation mill. The remainder of the district output was 60 tons of gold ore produced from the Arizona Mascot and Oro Belle properties.

Turkey Creek District.—Output in 1948 was 44 tons of silver ore produced from the Domicile and Trinity claims near Cleator.

Verde (Jerome) District.—For the first time in its history, zinc was produced in 1948 in the Verde district; it came from the United Verde mine of the Phelps Dodge Corp. However, copper ore from the mine remained by far the most important output in the district, although production declined 3 percent from that in 1947. The corporation reported that 147,862 tons of copper ore and 14,235 tons of zinc-copper ore were treated in its 2,100-ton concentrator in 1948 and that 185,062 tons of copper ore and 136 tons of copper precipitates were shipped direct to its smelter at Clarkdale. Production of gold was about the same as in 1947, but production of silver and copper increased slightly.

According to the annual report of the corporation for 1948, the United Verde branch produced 348,048 tons of ore. Prospecting and development comprised 4,060 feet of drifting and raising, 633 feet of calyx drilling, and 13,468 feet of diamond drilling. This work proved generally disappointing, and unless new discoveries are made the outlook is that the mine will have to be shut down in a year or two because of ore exhaustion.

The remainder of the district output was chiefly 10,322 tons of siliceous ore shipped to the smelter at Clarkdale from the Verde Exploration property; the ore averaged 0.43 ounce of gold and 1.61 ounces of silver to the ton and 0.677 percent copper.

Walker District.—Output in 1948 was principally 60 tons of high-grade gold-lead ore produced from the Oro Plata mine and 27 tons of zinc-lead ore from the Pine Mountain claim.

Walnut Grove (Kirkland) District.—The Continental Engineering & Mining Co. worked the Zonia mine in 1948 and shipped 708 tons of copper ore to smelters in Arizona. The rest of the district output was chiefly 12 tons of high-grade gold ore produced from the Bale and Stud claims.

Weaver (Octave) District.—Output in 1948 was principally 96 tons of gold ore shipped to smelters from the Monica and Octave mines.

YUMA COUNTY

Castle Dome District.—All the output of the Castle Dome district in 1948 was 910 tons of oxide lead ore and 2,520 tons of old lead tailings. The old tailings, treated by gravity concentration, came from the Rialto waste dump; and most of the crude ore, treated also by gravity concentration, came from the DeLuce, Sonora, Big Jim, and "81" properties.

Cienega District.—Output in 1948 was 57 tons of copper ore produced from the Black Mesa, Mammon, and Yarlanda claims near Parker.

Ellsworth (Harqua Hala) District.—Two cars (68 tons) of gold-lead ore were shipped in 1948 from the Rio Del Monte property and one car (49 tons) of copper ore from the Yuma Copper mine. The remainder of the district output was numerous small lots of ore sold to the Wickenburg Ore Market.

Eureka (Silver Camp) District.—Output in 1948 was 114 tons of lead ore and 4 tons of copper. The principal producers were the Silver King, Red Cloud, and Hardscrable properties, 50 miles north of Yuma.

Kofa Mountains District.—The most important output in the Kofa Mountains district in 1948 was 4 tons of ore (containing 73 ounces of gold and 21 ounces of silver) produced from the Oakland claim.

Plomosa District.—Lessees continued working the R. & A. mine near Vicksburg and shipped 103 tons of siliceous silver ore and 33 tons of silver-lead ore. The rest of the district output was largely 79 tons of lead ore produced from the Leadville group, 51 tons of gold ore from the Mohave Mining Co. property, and 28 tons of zinc-lead ore from the Surprise claim.

883326—50——90

California
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. MAURER

GENERAL SUMMARY

CALIFORNIA zinc production in 1948, rallying after virtual cessation of output late in 1947, was slightly below the previous year's yield in quantity but 8 percent higher in value. Gold output in 1948 was down 2 percent compared with 1947, owing to curtailed placer mining. Despite the stimuli of a strong demand and a higher average price for lead in 1948, its production was substantially below the 1947 output in quantity, although the value of the lower yield exceeded the corresponding 1947 figure. Silver and copper, both largely byproduct metals in 1948, were, respectively, 55 and 80 percent below the 1947 outputs. The total value of the five metals in 1948 was $20,294,093, or 7 percent below 1947.

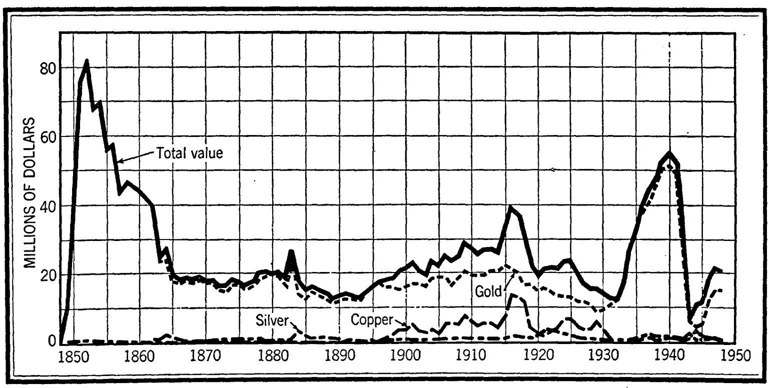

FIGURE 1.—Value of mine production of gold, silver, and copper, and total value of gold, silver, copper, lead, and zinc in California, 1848–1948. The value of lead and zinc has exceeded $1,000,000 in only a few years.

Comparing 1948 with 1947, gold decreased 2 percent in quantity and value; silver decreased 55 percent in quantity and value; copper decreased 80 percent in quantity and 79 percent in value; lead decreased 10 percent in quantity but advanced 12 percent in value; and zinc decreased 2 percent in quantity, whereas it increased 8 percent in value. Due largely to lead and zinc production, as well as to noteworthy quantities of gold, silver, and copper, Inyo County was the largest contributor to metal-mining output in California by a substantial margin; the county supplied 25 percent of the State total value of the five metals. Sacramento County ranked second in 1948 as the result of large-scale gold dredging and produced 20 percent of the total value of the five metals. Nevada County (largely from gold ore) contributed 18 percent of the total value of the five metals. Thus almost two-thirds of the State's output was centered in 3 of the 58 counties.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold (per fine ounce) [1]	Silver (per fine ounce) [2]	Copper (per pound) [3]	Lead (per pound) [3]	Zinc (per pound) [3]
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payment by Office of Metals Reserve for overquota production.

Gold.—Production of 421,473 ounces of gold (including a relatively small quantity in "natural gold" sold in the open market) from California mines in 1948 was 2 percent below the 1947 output, owing to lower production from placer operations—principally bucket-line dredging and dragline dredging. In contrast, gold from lode mines in 1948 registered a moderate gain over 1947. In Nevada County the Empire Star Mines, Ltd., successfully operated the Empire Star group under a system of leasing in 1948, and the neighboring Idaho-Maryland Mines Corp. instituted leasing on a limited scale late in the year. Revival of large-scale lode mining in Amador County was initiated with the reopening in 1948 of the Central Eureka Mining Co. property (inactive since 1942).

The 25 leading gold-producing mines in California in 1948, listed in an accompanying table, yielded 88 percent of the total gold.

Mine production of gold, silver, copper, lead, and zinc in California, 1944–48, and total, 1848–1948, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	109	66	925, 953	117, 373	$4, 108, 055	778, 936	$553, 910
1945	87	99	717, 969	147, 938	5, 177, 830	986, 798	701, 723
1946	150	172	627, 767	356, 824	12, 488, 840	1, 342, 651	1, 084, 862
1947	210	210	648, 789	431, 415	15, 099, 525	1, 597, 442	1, 445, 685
1948	241	195	526, 776	421, 473	14, 751, 555	724, 771	655, 954

[1] For historical data by years, see Minerals Yearbook, Review of 1940, p. 219.
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Includes all placer operations using suction pump for delivering gravel to floating washing plants except those producing less than 100 ounces of gold, which are included with "small-scale hand methods."
[4] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[5] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, plans, rockers, dry washers, etc.
[6] From property not classed as a "mine."
[7] Complete data not available.

Twenty-five leading gold-producing mines in California in 1948, in order of output

Rank	Mine	District	County	Rank in 1947	Operator	Source of gold
1	Natomas Co	Folsom	Sacramento	1	Natomas Co	Dredge.
2	Yuba unit	Yuba River	Yuba	2	Yuba Consolidated Gold Fields	Do.

25	Brush Creek	Downieville	Sierra	21	Alfred L. Merritt	Gold ore.

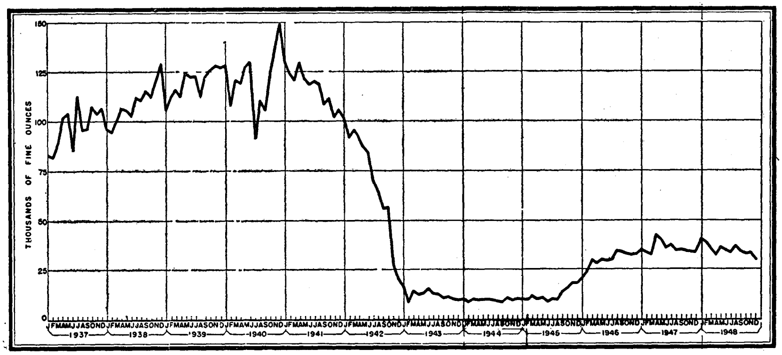

FIGURE 2.—Mine production of gold in California, 1937–48, by months, in terms of recovered gold.

Silver.—The 10 leading silver-producing mines listed in the accompanying table yielded 83 percent of the State total recoverable silver in 1948; the 3 leading mines yielded 65 percent. Of the 10 leading silver-producing mines, 5 derived their silver from argentiferous base-metal ores, 2 from gold ore, and 1 each from gold-silver ore (including some lead ore), gold-silver ore, and tungsten ore.

Output from the Anaconda Copper Mining Co. Darwin group of mines, Coso district, Inyo County, establishes the trend in State silver production as shown by months in 1948.

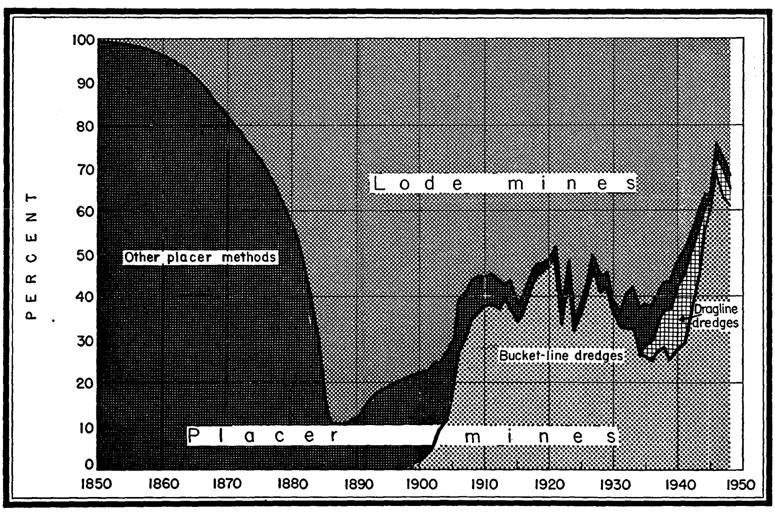

FIGURE 3.—Percentage of total California gold produced at lode and placer mines and by various methods of placer mining, 1850–1948.

Ten leading silver-producing mines in California in 1948, in order of output

Rank	Mine	District	County	Rank in 1947	Operator	Source of silver
1	Darwin group	Coso	Inyo	1	Anaconda Copper Mining Co	Zinc-lead and lead ores.
2	Shoshone group (Columbia No. 2).	Resting Springs	do	3	do	Gold-silver and lead ores.
3	Defense	Modoc	do	21	Foreman & Skinner	Lead ore.
4	Pine Creek	Bishop Creek	do	18	United States Vanadium Corp	Tungsten ore.
5	Santa Rosa	Cerro Gordo	do	7	Santa Rosa Mining Co. and Louis Warnken, Jr.	Lead ore.
6	Mohawk	Clark Mountain	San Bernardino	14	Mohawk Mines, Inc	Do.
7	New Brunswick-Idaho Maryland.	Grass Valley-Nevada City	Nevada	10	Idaho Maryland Mines, Corp	Gold ore.
8	Kelly	Randsburg	San Bernardino	4	F. W. Royer	Gold-silver ore.
9	Empire-Star group	Grass Valley-Nevada City	Nevada	12	Empire Star Mines, Ltd	Gold ore.
10	Carbonate King Zinc	Clark Mountain	San Bernardino	6	Crystal Cave Mining Co. and J. Q. Little.	Zinc ore.

Mine production of gold, silver, copper, lead, and zinc in California in 1948, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	40,752	68,921	40	842	85
February	39,074	65,315	42	703	95
March	35,467	64,112	41	822	70
April	32,213	69,021	21	871	100
May	36,377	48,285	19	663	348
June	35,164	60,706	50	802	523
July	33,850	49,186	52	624	547
August	37,165	61,007	30	832	687
September	34,689	45,380	40	545	533
October	33,042	48,285	32	673	596
November	33,567	64,112	42	723	806
December	30,113	80,441	72	1,010	935
Total: 1948	421,473	724,771	481	9,110	5,325
1947	431,415	1,597,442	2,407	10,080	5,415

Copper.—The copper produced in California in 1948 was largely a byproduct of ores mined primarily for other metals. Output for the year was 80 percent below the 1947 production. The leading producers of copper in the State were the United States Vanadium Corp., Pine Creek mine, Bishop Creek district, Inyo County (tungsten ore); Anaconda Copper Mining Co., Darwin group, Coso district, Inyo County (zinc-lead and lead ores); and Coronado Copper & Zinc Co., Afterthought mine, Cow Creek district, Shasta County (zinc ore).

Lead.—Lead continued to be the second most valuable of the five metals in California in 1948, although the output was 1,940,000 pounds (10 percent) below 1947. Maximum monthly output for lead—1,010 tons—was attained in December, and the monthly lead-production figures given in the accompanying table follow a trend which is allied to the two leading lead-producing mines in the State—the Anaconda Copper Mining Co., Darwin and Shoshone properties, Inyo County, respectively in the Coso district and the Resting Springs district. Other important producers of lead in California, in order of output, were Foreman & Skinner, Defense mine, Modoc district, Inyo County; Mohawk Mines, Inc., Altana Corp., and Huston Mining Co., operators of the Mohawk group (including the Wilshire mine), Clark Mountain district, San Bernardino County; and Santa Rosa Mining Co., and Louis Warnken, Jr., lessee, Santa Rosa mine, Cerro Gordo district, Inyo County.

Zinc.—Zinc output of 10,650,000 pounds in 1948 was only 2 percent below the 1947 yield, despite continued suspension of operations by the State's two leading zinc-producing mines of the previous year. The year's lowest monthly output of 85 tons in January was followed throughout the remainder of the year by progressively greater production, which reached the 1948 maximum monthly yield (935 tons) in December—improved metallurgical methods at existing mills in the State were a factor. The four leading producers of zinc in the State (which in 1948 supplied 99 percent of the total output) were: The Darwin group of mines, Coso district, Inyo County (Anaconda Copper Mining Co.); the Afterthought mine, Cow Creek district, Shasta County (Coronado Copper & Zinc Co.); the Carbonate King Zinc mine, Clark Mountain district, San Bernardino County (J. Q. Little under contract from Crystal Cave Mining Co.); and the Shoshone group, Resting Springs district, Inyo County (Anaconda Copper Mining Co.).

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in California in 1948, by counties, in terms of recovered metals

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual output.

MINING INDUSTRY

The tonnage of material from lode mines in California treated in 1948 decreased 19 percent compared with 1947, and the yardage at placer mines decreased 4 percent. The output of lode gold advanced 14 percent; but the gold from this source comprised only 32 percent of the State total, whereas production from placer mines decreased 9 percent and represented 68 percent of the total. The drop in gold-ore output was less than the decrease in base-metal ore production. The average recoverable gold content of gravel decreased 6 percent.

Dredges of the bucket-line type washed 96 percent of the total gravel mined in the State in 1948 and recovered 90 percent of the total placer gold. Dragline dredging declined in 1948; equipment of this type (used at 27 properties) washed 3 percent of the total gravel handled and recovered 6 percent of the placer gold. Six suction dredges operated in 1948. A greater number of hydraulic mines were operated in 1948 compared with 1947, and 49 percent more gold was recovered in 1948 than in the previous year. More drift mines were operated in 1948 than in 1947; however, the larger quantity of gravel yielded only 2 percent more gold than in 1947.

ORE CLASSIFICATION

Of the 526,776 tons of ore (including 10,883 tons of old tailings) sold or treated in 1948, more than 76 percent was gold ore and old tailings, 14 percent zinc-lead ore, 4 percent lead ore and old tailings, 3 percent gold-silver ore, 1 percent zinc ore, 1 percent silver ore and old tailings, and less than 1 percent copper ore. Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in California in 1948, with content in terms of recovered metals

Source	Material sold or treated: Ore (short tons)	Material sold or treated: Old tailings (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	395,640	7,220	133,927	61,854	218,000	30,800	----------
Dry and siliceous gold-silver ore	16,680	--------	680	45,788	3,800	1,278,700	102,300
Dry and siliceous silver ore	1,074	3,613	103	25,521	7,200	331,300	----------
	413,394	10,833	134,710	133,163	229,000	1,640,800	102,300

Total: 1948	[1] 515,893	10,883	[3 4] 421,473	[3 4] 724,771	[2 3 4] 962,000	18,220,000	10,650,000
1947	[1] 628,224	20,565	[3 4] 431,415	[3 4] 1,597,442	[3 4] 4,814,000	[3 4] 20,160,000	[4] 10,830,000

[1] Excludes tungsten ore.
[2] Includes 52,000 pounds from precipitates.
[3] Includes metal recovered from pyritic ore (residue).
[4] Includes metal recovered from tungsten ore.

METALLURGIC INDUSTRY

During 1948, 93 percent of the total ore and old tailings handled was treated at mills, and 7 percent was shipped for direct smelting. Of the 22,156 tons of concentrates received by smelters, more than 53 percent was lead concentrate, nearly 38 percent zinc and zinc-lead-copper together, nearly 6 percent copper, and about 3 percent gold concentrate. A negligible quantity of gold-silver concentrate was shipped. The tonnage of crude ore and old tailings smelted decreased 55 percent, whereas the quantity of ore and old tailings milled decreased 14 percent.

Companies producing most of California's lode gold in 1948 owned and operated their own metallurgical plants. Included with the few mills that did receive custom ore were: Burton Bros., Inc., Rosamond (treatment by cyanidation), and Butte Lode Mining Co., Randsburg (cyanidation and amalgamation), both in Kern County. The Empire Star Mines Co., Ltd., Grass Valley, Nevada County, cyanided some lots of concentrates. The lead plant of the American Smelting & Refining Co. at Selby, Contra Costa County—the State's only smelter treating principally nonferrous primary material—operated throughout the year.

Mine production of metals in California in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and old tailings amalgamated	307, 280	73, 921	13, 304

[1] Clean-up.
[2] Content of copper ore from Shasta County includes gold, silver, and copper from pyritic ore (residue) not included with material treated.
[3] Includes 52,000 pounds contained in precipitates.
[4] Includes 8,800 pounds contained in precipitates.

REVIEW BY COUNTIES AND DISTRICTS

AMADOR COUNTY

East Belt District.—Belden Amador Mines, Inc., worked the Belden mine throughout 1948. A substantial tonnage of gold ore was amalgamated, and flotation concentrate was shipped to a custom cyanide mill for treatment. Earnest L. Lilly operated a dragline dredge (with 2½ cubic-yard bucket) on the Cosumnes River 7 miles northwest from Plymouth from March 17 to November 15, 1948.

Mother Lode District.—The Central Eureka Mining Co. resumed operation of the Old Eureka mine in 1948 (inactive except for maintenance work since late in 1942); the gold ore treated by amalgamation and cyanidation in the company 200-ton mill yielded a substantial quantity of gold and some silver. The Alpine Gravel Plant operated a dragline dredge from June to December 1948 on the middle fork and north fork of Jackson Creek, and McDonald, Ordway & McDonald washed gravel with similar equipment during May 1948 on Dry Creek. F. L. Shevlin and Frank Fuller treated the Kennedy mine tailings during 1948; flotation concentrate, yielding gold and some silver, was shipped to a smelter.

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 13 and their output grouped as "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Sources of total silver as follows: 703,289 from lode mines and 21,482 ounces from placer mines.
[4] Camanche district lies in Amador, Calaveras, and San Joaquin Counties.
[5] East Belt district lies in Amador, Calaveras, El Dorado, Mariposa, and Tuolumne Counties.
[6] Included with "Other districts."
[7] Exclusive of placer output which is included with "Other districts."
[8] From property not classed as a mine.
[9] Mother Lode district lies in Amador, Calaveras, El Dorado, Mariposa, and Tuolumne Counties.
[10] Chidago district lies in Inyo and Mono Counties.
[11] Randsburg district lies in Kern and San Bernardino Counties.
[12] Exclusive of lode output which is included with "Other districts."
[13] Includes following: East Belt [5] and Mother Lode [9] districts in Amador County: Yankee Hill in Butte County; Friant in Fresno County; Orleans in Humboldt County; Big Pine and Bishop Creek in Inyo County; Clear Creek, Keyes (Pioneer), and Randsburg [11] in Kern County; Raymond in Madera County; Hunter Valley in Mariposa County; Snelling in Merced County; Homer in Mono County; French Corral in Nevada County; Auburn in Placer County: Camanche [4] in San Joaquin County; Julian in San Diego County; Cow Creek and Flat Creek in Shasta County; Alleghany and Sierra City in Sierra County; Callahan in Siskiyou County; La Grange in Stanislaus County; Lewiston and New River in Trinity County; Smartville and Yuba River in Yuba County.
[14] Excludes tungsten ore.
[15] Includes metal recovered from tungsten ore.
[16] Includes metal recovered from pyritic ore (residue).
[17] Includes 52,000 pounds contained in precipitates.

BUTTE COUNTY

Butte Creek District.—Lancha Plana Gold Dredging Co. operated its bucket-line dredge No. 5 (with 65 4½ cubic-foot buckets, electrically powered) 8 miles southeast of Chico for 363½ days of 1948. Shawnee Mines worked the Shawnee drift mine throughout 1948; 53 ounces of gold and 7 ounces of silver were recovered.

Oroville District.—Yuba Consolidated Gold Fields, Butte unit, operated two bucket-line dredges (Biggs No. 1 and Biggs No. 3) on land adjoining the Feather River throughout 1948; both dredges were of the Yuba type and electrically powered, one having 84 and the other 87 9-cubic-foot buckets. The Gold Hill Dredging Co. worked its Kister dredge on the east side of the Feather River about 7 miles south of Oroville throughout the year; the electrically powered, bucket-line dredge has 72 9-cubic-foot buckets.

CALAVERAS COUNTY

Copperopolis District.—Sky Rocket Mine and J. E. Boland worked the Sky Rocket mine during 1948 amalgamating gold ore. A small quantity of concentrate was shipped to a smelter for treatment.

East Belt District.—Blackstone Mine (L. A. Sanchez), operating the Blackstone mine throughout 1948, treated 5,421 tons of gold ore by amalgamation at the company 30-ton mill; flotation concentrate and slimes were shipped to a smelter. Other lode-gold mines worked during 1948 included the Best, Louise Margaret, Dubois, and Robert A. mines; Centennial (New Champion); Fine Gold; Lockwood; Mexican; and Never Sweat. John O. Cleveland operated a dragline and trommel at the Ohio mine for 97 days of 1948; 31 ounces of gold and 2 ounces of silver were recovered from 2,207 cubic yards of gravel handled.

Jenny Lind District.—Allen W. Doe (deceased) and Jose Paltor, lessees, treated gold ore from the Royal mine by amalgamation and flotation during 1948; concentrate was shipped to a smelter.

EL DORADO COUNTY

East Belt District.—Cosumnes Mines, Inc., operated the Cosumnes mine from January 1 to December 1, 1948, and treated gold ore in a 60-ton flotation mill; concentrate was shipped to a smelter.

Mother Lode District.—The Morning Star Mining Corp. worked the Pioneer-Lilyama mine in 1948; flotation copper concentrate from gold ore treated was shipped to a smelter. Volo Mining Co., operating the Shaw mine during 1948, recovered gold and silver by amalgamation. Knight Placer Mining Co. operated a dragline dredge on the Baldwin and Burks properties during 2 months of 1948.

West Belt District.—El Dorado Placer Mining Corp. operated a Northwest Diesel dragline excavator (with 2-cubic-yard bucket) and a Bodinson washing plant on the north fork of the American River from August 16 to November 20, 1948; 150,000 cubic yards of gravel washed yielded 939 ounces of gold and 103 ounces of silver.

FRESNO COUNTY

Friant District.—Gold and some silver was recovered in 1948 as byproducts from commercial sand and gravel operations by Pacific Coast Aggregates, Inc., from its Rockfield plant.

HUMBOLDT COUNTY

Orleans District.—The Pearch hydraulic mine was operated from January 1 to June 1, 1948, by Pearch Mine.

IMPERIAL COUNTY

Cargo Muchacho District.—Holmestake Mining Co. worked the Padre and Madre mine during 1948, shipping gold ore to a smelter.

INYO COUNTY

Bishop Creek District.—The United States Vanadium Corp. produced, by flotation, a copper concentrate containing a substantial quantity of silver and some gold as a byproduct from ore treated primarily for tungsten.

Cerro Gordo District.—Santa Rosa Mining Co., operating the Santa Rosa mine, and Louis Warnken, Jr., under lease agreement, working the Santa Rosa dump together, shipped lead ore and dump material (5,539 tons containing 93 ounces of gold, 21,678 ounces of silver, 25,900 pounds of copper, and 541,100 pounds of lead) to smelters in 1948. C. W. James operated the Old Timer mine from January to April 1948, shipping lead ore to a smelter.

Coso District.—The Darwin group of mines (the largest producer of silver, lead, and zinc in the State) was operated by the Anaconda Copper Mining Co. throughout 1948. The 300-ton mill (enlarged from a 140-ton plant) was equipped to treat sulfide zinc-lead ore by differential flotation and has provisions for alteration with oxide treatment. The lead concentrate and zinc concentrate produced were shipped to smelters. In addition, lead ore was shipped direct to a smelter for treatment. Joe-McCulley, operating the Empress group under lease and bond, shipped 136 tons of zinc-lead ore containing 2 ounces of gold, 2,824 ounces of silver, 5,000 pounds of copper, 61,300 pounds of lead, and 16,000 pounds of zinc to a smelter. L. D. Foreman & Co. shipped to smelters silver ore, containing substantial quantities of lead, from the Custer, Lane-Eagle, and Last Chance mines.

Modoc District.—Foreman & Skinner operated the Defense mine (third-largest producer of silver and lead in California) during 1948, shipping lead ore to a smelter. Finley & Vignich operated the Minnietta mine from January 15 to December 31, 1948, and shipped lead ore (1,020 tons containing 5 ounces of gold, 5,086 ounces of silver, 1,000 pounds of copper, and 256,800 pounds of lead) to smelters. Foss & Osborne shipped lead ore, containing values in gold, silver, and copper, to smelters from the Surprise mine in 1948.

Resting Springs District.—Anaconda Copper Mining Co. worked the Shoshone group of mines (second-largest producer of silver and lead in the State) the entire year. Gold-silver ore (including dump material) containing substantial quantities of lead and zinc and some copper was shipped direct to a smelter. Lead ore treated at the company 90-ton flotation mill yielded a lead concentrate (with some values in gold, silver, copper, and zinc), which was shipped to a smelter.

Ubehebe District.—Ubehebe Mines, Inc., Ralph Liole, lessee, operated the Ubehebe mine during 1948 and shipped zinc-lead ore to a smelter. George Lippincott worked the Lippincott mine in 1948 and shipped lead and zinc-lead ores to smelters.

KERN COUNTY

Mojave District.—Burton Bros., Inc., operated its cyanide mill on ore from the Cactus Queen, Tropico, and Trailer Wheel mines and, in addition, treated ores from other mines in the Mojave district (including the Standard, Whitmore, Hilltop, Elephant-Eagle, and Bob Tail) and outlying districts on a custom basis.

Randsburg District.—Butte Lode Mining Co. operated the Butte Lode mine in 1948 and treated gold ore and old tailings by amalgamation and cyanidation in the company mill, which also handled small tonnages of custom ore from neighboring mines, including the Double 13 (Milmax Mining Co.), G. B. (M. J. Edsall), and Minnesota (Harris Hall Quick). Hatton & Lamley operated the K. C. N. claim from January 1 to March 31, 1948; 212 tons of gold ore treated at the Butte Lode Mining Co. mill yielded 127 ounces of gold and 31 ounces of silver. Foley Bros., Inc., operated a dragline excavator and floating washing plant at Kern Placers from January 1 to August 7, 1948.

LASSEN COUNTY

Hayden Hill District.—The Lassen Eagle Co. operated the Hayden Hill mine from January 1 to August 25, 1948; 9,002 tons of dump ore cyanided at the company 25-ton plant and 1 ton of slag shipped to a smelter together yielded 105 ounces of gold and 92 ounces of silver.

LOS ANGELES COUNTY

San Gabriel District.—Consolidated Rock Products Co. recovered 151 ounces of gold and 26 ounces of silver as byproducts of its commercial sand and gravel plant on the San Gabriel River. The Azusa Rock & Sand Co. similarly recovered 53 ounces of gold and 7 ounces of silver.

MADERA COUNTY

Raymond District.—Howell Bros. operated a suction dredge on the Chowchilla River from November 20 to December 31, 1948.

MARIPOSA COUNTY

East Belt District.—Schroeder Mines worked the Schroeder group throughout 1948; 52 tons of ore treated by amalgamation yielded 142 ounces of gold and 19 ounces of silver.

Hunter Valley District.—Mount Gaines Mining Co. operated the Mount Gaines mine the entire year and amalgamated 10,382 tons of gold ore, from which were recovered bullion (containing 2,883 ounces of gold and 879 ounces of silver) and 214 tons of flotation concentrate (including a small quantity of table concentrate) containing 2,092 ounces of gold and 758 ounces of silver. Thurman & Wright operated Dredge No. 3 (an electrically powered Bucyrus-Erie dragline excavator and Bodinson floating washing plant) on Burns Creek from March 19 to August 18, 1948.

Mother Lode District.—James H. Henry worked the Upper Bear Creek mine from April 26 to June 16, 1948, using Diesel dragline dredging equipment. Gold ore from a number of mines worked in the district during 1948 (including the Texas Gulch, Speciman, Malone, Lonesome Pine, French, and Diltz Oro Grande) was treated by amalgamation.

MERCED COUNTY

Chowchilla River District.—Midstate Equipment & Dredging Co. operated a dragline dredge on Mariposa Creek from January to July 1948.

Snelling District.—Merced Dredging Co. operated its dredge No. 1 (electrically powered and equipped with 60 9½-cubic-foot buckets) on the Merced River bottom ¾ mile from Snelling throughout 1948. The Snelling Gold Dredging Co. operated its two Yuba-type, electric, bucket-line dredges (each with 7-cubic-foot buckets) the entire year.

MODOC COUNTY

Hi-Grade District.—Wellman M. Smith and J. H. Causten, lessee (deceased), worked the Moonlight mine during 1948 and shipped to a smelter 11 tons of gold ore which yielded 141 ounces of gold and 73 ounces of silver.

MONO COUNTY

West Walker River District.—Topaz Lead-Silver Mines operated the Topaz Lead-Silver mine during January 1948; 7 tons of antimonial lead ore shipped to a smelter yielded 259 ounces of silver and 2,100 pounds of lead.

NEVADA COUNTY

Grass Valley-Nevada City District.—The Idaho-Maryland Mines Corp. worked the New Brunswick-Idaho-Maryland property throughout 1948; 196,232 tons of ore treated by amalgamation, followed by cyanidation of concentrates, yielded 49,024 ounces of gold and 14,212 ounces of silver. The Empire Star Mines Co., Ltd., operated the company 500-ton mill and cyanide plant the entire year treating ore from the Empire, North Star, and Pennsylvania mines at Grass Valley and the company properties at Browns Valley in Yuba County by amalgamation and cyanidation; concentrates from several neighboring mines also were treated at the plant. Other mines worked in the district included the Aetna, Baltic, Spring Hill, Gates-Stockton Hill, and Sugarloaf.

North Bloomfield District.—Mellott & Mellott, lessees, hydraulicked the Waukashau mine from February 15 to June 15, 1948; 8,000 cubic yards of material washed yielded 88 ounces of gold and 8 ounces of silver. Landburg, Massera, and Swazey hydraulicked the Relief Hill mine 72 days of 1948 under lease from Western Gold Co.

Washington District.—The Ancho Erie Mining Co. operated the Ancho and Erie groups throughout 1948. A substantial tonnage of gold ore was treated at the company 200-ton flotation mill and 6-ton cyanide plant. Tonopah Divide Mining Co. worked the Gaston mine from January 1 to October 25, 1948, amalgamating gold ore and shipping concentrate to a custom-cyanide mill for treatment.

PLACER COUNTY

Auburn District.—Virginia Town Placer Mine operated a dragline dredge in Auburn Ravine from May to November 1948.

Penryn District.—Mary Len Mine (a partnership) worked the Mary Len mine throughout 1948; 491 tons of ore amalgamated and a small quantity of concentrate cyanided at a custom mill together yielded 342 ounces of gold and 604 ounces of silver.

PLUMAS COUNTY

La Porte District.—R. & M. Mining Co. operated a dragline dredge at the First Chance mine on Slate Creek from June to December 1948.

Virgilia District.—Klau Mine, Inc., (R. S. Croxen, lessee) worked the Virgilia mine intermittently in 1948; 86 tons of ore amalgamated yielded 74 ounces of gold and 12 ounces of silver.

SACRAMENTO COUNTY

Cosumnes River District.—Thurman & Wright operated dredge No. 4 (electrically powered, bucket-line, equipped with 86 6-cubic-foot buckets) 3 miles southeast of Sloughhouse from January 1 to December 24, 1948. Mountain Gold Dredging Co. worked the Van Veck property at Michigan Bar, using dragline dredging equipment, during 9 months of 1948; 160,000 cubic yards of gravel washed yielded 655 ounces of gold and 66 ounces of silver. The Cosumnes Gold Dredging Co. operated its bucket-line dredge near Sloughhouse during 1948.

Folsom District.—Capital Dredging Co. operated its Yuba electric bucket-line dredges No. 4 and No. 3 south of Folsom. Dredge No. 4 was worked the entire year, and dredge No. 3, shut down since October 14, 1942, operated from May 15 to December 31, 1948. Dredge No. 4 of the Lancha Plana Gold Dredging Co. worked for 364 days of 1948 on the American River 5 miles south of Folsom; the dredge has 84 6-cubic-foot buckets. The General Dredging Co. operated its 3-cubic-yard Diesel dragline excavator and electrically powered Bodinson floating washing plant on the south side of the American River intermittently during 1948. The Natomas Co., leading California gold producer in 1948, operated seven bucket-line dredges (six units the full year and one unit 2 months) in 1948 on property near the American River. The Fair Oaks Gravel Co. recovered as a byproduct of gravel-washing operations 144 ounces of gold and 11 ounces of silver from 52,620 cubic yards of material handled.

SAN BERNARDINO COUNTY

Buckeye District.—Donald F. Love shipped gold ore containing substantial quantities of gold, silver, and copper from the Bagdad-Chase mine to a smelter during 1948.

Clark Mountain District.—The Carbonate King Zinc mine was operated in 1948 by J. Q. Little under contract from the Crystal Cave Mining Co.; zinc ore containing some gold, silver, and lead was shipped to a smelter. Mohawk Mines, Inc., worked the Mohawk mine throughout the year; 1,951 tons of lead ore shipped to a smelter yielded 19 ounces of gold, 14,170 ounces of silver, 27,500 pounds of copper, and 489,900 pounds of lead. Huston Mining Co. and the Altana Corp., operating the Wilshire claim of the Mohawk group from April 1 to December 31, 1948, together shipped to smelters 1,087 tons of lead ore from which was recovered 7 ounces of gold, 3,447 ounces of silver, 6,200 pounds of copper, and 244,300 pounds of lead.

Randsburg District.—Frank W. Royer operated the Kelly mine during 1948 and shipped gold-silver ore to smelters. Surcease Mining Co. recovered 158 ounces of gold and 24 ounces of silver from 125,686 cubic yards of gravel, handled chiefly for scheelite, at the Spud Patch mine by dryland dredging throughout 1948.

SAN JOAQUIN COUNTY

Camanche District.—The Gold Hill Dredging Co., working on low benches along the Mokelumne River, operated its Lower Camanche bucket-line dredge (with 76 8½-cubic-foot buckets) from January through April and its Upper Camanche dredge (with 64 7½-cubic-foot buckets) approximately 2 months of 1948.

SHASTA COUNTY

Cow Creek District.—The Coronado Copper & Zinc Co., second largest producer of zinc in the State, operated the Afterthought mine from October through December 1948. Zinc concentrate and zinc-lead-copper concentrate produced from the complex zinc ore milled at the company plant were shipped to smelters for treatment.

Flat Creek District.—The Mountain Copper Co., Ltd., made final clean-up at the Iron Mountain mine cyanide plant which yielded gold and silver. Some gold, silver, and copper were recovered from smelting cinder derived from burning pyrites in sulfuric acid plants; the pyrites was produced at the Hornet-Richmond mine.

Redding District.—The Thurman Gold Dredging Co. operated its bucket-line dredge (with 72 9-cubic-foot buckets) on Clear Creek throughout 1948. Roy S. Olson worked the Williamson property on Newton Creek, using dragline dredging equipment, from January 5 to May 1, 1948.

Shasta District.—The Lincoln Gold Dredging Co. operated its 2-cubic-yard Diesel dragline excavator and floating washing plant on Clear Creek from January 1 to October 6, 1948; 338,733 cubic yards of gravel washed yielded 2,841 ounces of gold and 476 ounces of silver.

SIERRA COUNTY

Alleghany District.—The Original Sixteen to One Mine, Inc., operated its Original Sixteen to One mine throughout 1948, recovering a substantial quantity of gold and some silver by amalgamation and from gold concentrate shipped to a smelter.

Downieville District.—Best Mines Co. worked the Gold Point mine from January 1 to December 27, 1948, when its option was canceled. Gold and silver was produced from concentrate shipped to a smelter, and a small quantity of bullion was recovered by amalgamation of ore. Alfred L. Merritt operated the Brush Creek mine in 1948 and treated a substantial tonnage of gold ore by amalgamation.

SISKIYOU COUNTY

Callahan District.—Yuba Consolidated Gold Fields (Siskiyou unit) operated its Callahan dredge (Yuba electric bucket-line, equipped with 72 9-cubic-foot buckets) throughout the year on Scott River.

Deadwood District.—The French Gulch Dredging Co. operated its Washington Iron Works electric bucket-line dredge throughout 1948; 1,227,632 cubic yards of gravel handled yielded 6,651 ounces of gold and 903 ounces of silver.

Klamath River District.—Reeves Ranch Dredging Co. operated its bucket-line dredge (equipped with 68 4-cubic-foot buckets) on the Klamath River 1 mile east of Happy Camp from July 25 through December 1948. Scandia Mines operated a Diesel dragline dredge on Horse Creek during January 1948; 80,000 cubic yards of gravel treated yielded 328 ounces of gold and 55 ounces of silver. Yreka Gold Dredging Co. operated its Johnson electric bucket-line dredge (with 67 6-cubic-foot buckets) in Seiad Valley from January 1 to September 1, 1948.

Liberty District.—Hydraulicking was carried on during 1948 at the Boulder Gulch group by Vest Mining Co. and Alfred W. Peeler and at the Joubert mine by Alex Markon, lessee.

Scott Bar District.—R. B. McGinnis and the Quartz Hill Mining Co. worked the Quartz Hill open-pit mine sporadically in 1948, treating gold ore by amalgamation.

STANISLAUS COUNTY

La Grange District.—The La Grange Gold Dredging Co. operated its bucket-line dredge No. 4 (with 62 10-cubic-foot buckets) on the Tuolumne River bottom throughout 1948. The Tuolumne Gold Dredging Corp. operated its bucket-line dredge throughout the year; the dredge is equipped with 100 12-cubic-foot buckets.

TRINITY COUNTY

Coffee Creek District.—Arthur B. Ferl recovered 30 ounces of gold and 2 ounces of silver from 2,600 cubic yards of gravel handled by dragline dredging on Buckeye Creek during November 1948.

Hayfork District.—The Thomas Kelly Co. worked the Kelly mine intermittently in 1948; gold and silver were recovered by amalgamating the high-grade ore and from concentrate shipped to a smelter.

Junction City District.—The Goldfield Consolidated Mines Co. hydraulicked the Northern California Mines Co. placer claims at Junction City throughout 1948. The Junction City Mining Co. operated its bucket-line dredge on the same property in 1948.

Lewiston District.—Brown Bear Gold Mines, Inc., worked the Brown Bear mine during 1948, recovering a substantial quantity of gold and some silver from concentrate shipped to a smelter.

Salyer District.—Thomson Divide Mining Co. operated the Long Bar mine, using dragline dredging equipment, in 1948. Salyer Syndicate hydraulicked the Swanson mine during the year and recovered a moderate quantity of gold and some silver.

Weaverville District.—Perry T. Bennett hydraulicked the Rex mine from January 4 to June 20, 1948; 7,000 cubic yards of gravel washed yielded 146 ounces of gold and 13 ounces of silver. Other properties hydraulicked during the year included the Browns Creek (C. O. Arbuckle), Democrat Gulch (A. V. Tindell), and Dry Placer (Indian Creek Industries, Inc., and S. L. Kimball).

TUOLUMNE COUNTY

East Belt District.—Tapley & Tapley, lessees, worked the Ford Pocket mine throughout 1948 and recovered 169 ounces of gold and 9 ounces of silver, reducing the ore by hand mortar. Gibson & Keenan operated the Hidden Treasure mine from January 4 to December 30, 1948; a small tonnage of ore amalgamated and approximately 1 ton of tailing shipped to a smelter together yielded 342 ounces of gold and 81 ounces of silver. Several other lode mines (mostly pocket mines) were worked on a small scale during 1948, including the Eureka, Fidelity, Golden Star, Indian Girl, Lucky Strike, and Wind Wheel; most of the gold from each property was recovered by amalgamation.

Mother Lode District.—Louis Warnken, Jr., worked the Eagle-Shawmut mill tailings during 1948, recovering gold and silver from material shipped to a smelter. Transierra Gold Mining Co. operated the North Star-Laura mine and Mohawk claim the first 6 months of 1948; flotation concentrate was shipped to a smelter.

YUBA COUNTY

Camptonville District.—J. E. Clark, lessee, operated a dragline dredge on Willow Creek during 4 months of 1948; 5,000 cubic yards of gravel washed yielded 46 ounces of gold and 9 ounces of silver.

Smartville District.—Rose Bar Development Co. hydraulicked the Blue Point mine from July 1 to December 31, 1948.

Yuba River District.—Yuba Consolidated Gold Fields (Yuba unit) operated dredges Nos. 14, 15, 17, 19, and 20 in the Yuba River Basin throughout 1948. The dredges are of the Yuba type, electrically operated, and had the following number and capacity of buckets: Two with 100 18-cubic-foot buckets; 1 with 87 18-cubic-foot buckets; 1 with 126 18-cubic-foot buckets; and 1 with 135 18-cubic-foot buckets.

Colorado
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

UNDER stimulus of the highest yearly average price on record for lead and the second highest for zinc, the Colorado output of these metals rose sharply in 1948. The value of the lead output was higher than in any previous year and exceeded that of gold for the first time since 1891. The value of the zinc was the highest since 1917. There were large increases in production of lead and zinc in Summit and San Miguel Counties and smaller increases in most of the other producing counties. The State output of gold decreased, owing mainly to lower output from lode mines in the Cripple Creek, Animas, and Sneffels districts and placer mines in Park County, which more than offset substantial increases in Lake, Eagle, and Clear Creek Counties. Silver production was the highest since 1942 but was still only slightly more than half the annual average for the 10-year period, 1932–41. The copper output, largely a by-product or accessory product of the mining of other metals, increased 7 percent over 1947. The total value of the 1948 output of the five metals was $30,155,337—a 26-percent increase over 1947 and the highest since 1918.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: Price includes bonus payments by Office of Metals Reserve for overquota production.

Colorado ranked second among the States in total production of both gold and silver from the time of first recorded output through 1948; California ranked first in gold and Montana first in silver.

Mine production of gold, silver, copper, lead, and zinc in Colorado, 1944–48, and total, 1858–1948, in terms of recovered metals

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	196	13	1, 550, 422	111, 455	$3, 900, 925	2, 248, 830	$1, 599, 168
1945	195	41	1, 357, 551	100, 935	3, 532, 725	2, 226, 780	1, 583, 488
1946	235	28	1, 463, 496	142, 613	4, 991, 455	2, 240, 151	1, 810, 042
1947	290	33	1, 544, 694	168, 279	5, 889, 765	2, 557, 653	2, 314, 676
1948	271	23	1, 438, 119	154, 802	5, 418, 070	3, 011, 011	2, 725, 117
1858–1948			(1)	39, 381, 024	872, 212, 804	735, 995, 342	572, 609, 918

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1944	1, 048	$282, 960	17, 698	$2, 831, 680	39, 955	$9, 109, 740	$17, 724, 473
1945	1, 485	400, 950	17, 044	2, 931, 568	35, 773	8, 227, 790	16, 676, 521
1946	1, 754	568, 296	17, 036	3, 713, 848	36, 147	8, 819, 868	19, 903, 509
1947	2, 150	903, 000	18, 696	5, 384, 448	38, 745	9, 376, 290	23, 868, 179

[1] Figure not available.

Gold.—The mine production of gold in Colorado was 154,802 fine ounces in 1948 compared with 168,279 in 1947. The output in 1948 came largely from the Cripple Creek, Upper San Miguel, California (Leadville), Animas, and Fairplay districts. Dry gold and silver ores yielded 66 percent of the State total gold, placers 9 percent, zinc-lead ore 15 percent, and other classes of ore 10 percent. The leading gold-producing properties, in order of rank, were: The Smuggler Union group (Telluride Mines, Inc.) at Telluride; Cresson mine at Cripple Creek; United Gold Mines Co. Portland-Vindicator group, Cripple Creek; Resurrection Mining Co. group at Leadville; and Golden Cycle Corp. Ajax mine, Cripple Creek.

Silver.—Colorado mines produced 3,011,011 fine ounces of silver in 1948—an increase of 453,358 ounces over 1947. The yearly average output during the five prewar years 1937–41 was 7,940,336 ounces. In 1948 dry gold and silver ores yielded 41 percent of the State total silver, zinc-lead ore 33 percent, lead ore 6 percent, and other classes of base-metal ores and placers 20 percent. The leading producers of silver were the Eagle mine at Gilman; Idarado Mining Co. Treasury Tunnel-Black Bear group, San Miguel County; Shenandoah-Dives group near Silverton; Emperius group at Creede; and Kokomo unit of the American Smelting & Refining Co., Summit County.

Gold and silver produced at placer mines in Colorado, 1944–48, in fine ounces in terms of recovered metals

Year	Small-scale hand methods [1]		Hydraulic		Gravel mechanically handled						Total	
					Nonfloating washing plants [2]		Dragline dredges		Bucket-line dredges			
	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver
1944	66	8	28	8	249	74					343	90
1945	147	35	49	11	409	72			7,296	1,277	7,901	1,395
1946	89	15			1,047	169	(3)	(3)	[3] 19,036	[3] 3,514	20,172	3,698
1947	243	52			930	156	(3)	(3)	[3] 16,400	[3] 3,243	17,573	3,451
1948	106	29			662	103	(3)	(3)	[3] 12,479	[3] 2,680	13,247	2,812

[1] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[2] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[3] Production by dragline dredges included with that by bucket-line dredges; Bureau of Mines not at liberty to publish separately.

Copper.—The Colorado output of copper in 1948 was recovered largely as a byproduct or accessory product of the mining of lead, zinc, and precious metals; the quantity recovered was 2,298 short tons compared with 2,150 tons in 1947. Only 8 percent of the State total was derived from copper ore. The only substantial producer of copper in the State was the Idarado Mining Co., which makes a copper concentrate from its complex gold-silver-copper-lead-zinc ore mined in San Miguel County.

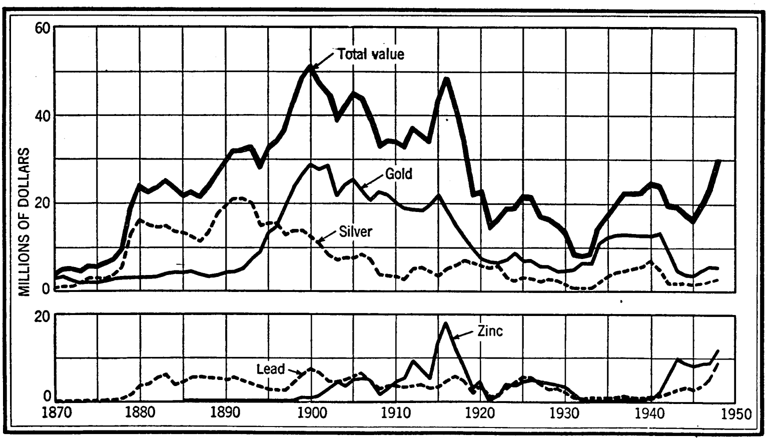

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1948. The value of copper has been less than $2,000,000 annually, except in a few years.

Lead.—The price of lead, which was 15 cents a pound (New York) January 1, 1948, advanced to 17.5 cents April 5, to 19.5 cents July 28, and to 21.5 cents November 1. Each advance set a new high price record. With the assistance of high market prices, the State output of recoverable lead rose to 25,143 short tons (largest since 1928) from

18,696 tons in 1947. Production in Summit County increased 197 percent over 1947 and represented 19 percent of the State total. Other large producing counties included Lake (19 percent), San Miguel (15 percent), San Juan (12 percent), and Dolores (10 percent). Zinc-lead ore yielded 63 percent of the State total lead; dry gold and silver ores 15 percent; lead, lead-copper, and zinc-lead-copper ores 17 percent; and copper and zinc ores 5 percent. The larger lead-producing mines, in order of rank, were: American Smelting & Refining Co. Kokomo unit; Resurrection group at Leadville; Rico Argentine at Rico; Smuggler Union group at Telluride; and Callahan Zinc-Lead Co. Akron-Erie group, White Pine.

Zinc.—During 1948 the market price of zinc rose by stages from 10.5 cents a pound (East St. Louis) January 1 to 17.5 cents November 13 and averaged 13.3 cents; in 1947 the average price (including Federal premiums paid to mine operators until June 30) was 12.1 cents. The advances in price stimulated production, and the State output of zinc increased from 38,745 short tons in 1947 to 45,164 tons in 1948. The principal producing counties, in order of output, were Eagle, Summit, Lake, San Miguel, Dolores, Gunnison, San Juan, and Ouray. Zinc and zinc-lead ores yielded 91 percent of the State total zinc. The leading zinc-producing mines, in order of rank, were: Eagle mine at Red Cliff, American Smelting & Refining Co. Kokomo unit, Resurrection group at Leadville, Rico Argentine group at Rico, and Idarado Mining Co. Treasury Tunnel-Black Bear group, San Miguel County.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1948 by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

MINING INDUSTRY

New activity in mining and exploration in Colorado in 1948 centered mainly in the districts producing base metals along with gold and silver. Interest in straight gold mining waned because of the high cost of labor and materials compared with the fixed price of gold. The quantity of gold ore mined, including that from dumps in the Cripple Creek district, decreased from 804,673 tons in 1947 to 430,178 tons in 1948. The total for other classes of ore increased from 740,021 tons in 1947 to 1,007,941 tons in 1948. Individual mines averaging more than 500 tons of ore daily (6 days a week) comprised the Smuggler Union, Shenandoah-Dives, and Eagle mine groups. Placer gravel washed (excluding minor quantities handled at small operations for which figures were not reported) totaled 4,560,000 cubic yards, a 17-percent decrease from 1947.

The Bureau of Mines and Geological Survey continued to investigate sources of strategic minerals. The work done on copper, lead, and zinc included exploratory drilling in the Aspen (Pitkin County), Monarch (Chaffee County), and Kokomo (Summit County) districts; road work preparatory to drilling in the Ross Basin area (San Juan County); field examinations in these and other counties; and metallurgical tests.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Colorado in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	70	430,178	85,769	190,704	166,620	3,848,190	1,887,550
Dry gold-silver ore	8	215,023	16,829	605,048	404,814	2,587,265	614,145
Dry silver ore	22	38,842	365	424,982	37,223	988,130	173,272
Total	100	684,043	102,963	1,220,734	608,657	7,423,585	2,674,967
Copper ore	3	5,831	538	123,877	364,748	36,107	262
Lead ore	73	69,601	2,467	181,857	73,257	4,673,081	241,214
Lead-copper ore	2	15	1	686	1,909	2,781	----------
Zinc ore	14	168,365	1,948	131,800	79,108	2,453,090	34,885,593
Zinc-lead ore	74	363,179	22,977	988,184	992,445	31,772,322	47,316,042
Zinc-lead-copper ore	5	147,085	10,661	361,061	2,475,876	3,925,034	5,209,922
Total	171	754,076	38,592	1,787,465	3,987,343	42,862,415	87,653,033
Total lode mines	[1] 271	1,438,119	141,555	3,008,199	4,596,000	50,286,000	90,328,000
Placers	23	----------	13,247	2,812	----------	----------	----------
Total: 1948	294	1,438,119	154,802	3,011,011	4,596,000	50,286,000	90,328,000
1947	323	1,544,694	168,279	2,557,653	4,300,000	37,392,000	77,490,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

Thirty-seven mills, with daily capacities ranging from 25 to 1,500 tons and averaging 200 tons, operated in Colorado all or part of 1948 on ores of gold, silver, copper, lead, and zinc. Ore treated in these mills totaled 1,416,321 tons, mostly complex ores treated by flotation to produce a lead and a zinc concentrate and in some mills a copper or an iron concentrate also, all carrying gold and silver. Some Colorado ore was milled in Utah. A number of the Colorado mills used supplementary gravity concentration, including small jigs in the ball mill-classifier circuit, to recover gold for amalgamation and shipment direct to the mint. The Camp Bird mill (Ouray County) continued to amalgamate ore on plates before flotation. The 1,500-ton Golden Cycle custom mill, handling largely Cripple Creek sulfotelluride gold ore, treated average-grade crude ore by the roast-amalgamation-cyanidation process and flotation concentrates produced from low-grade ore.

Because in the early days of mining a large proportion of the ore was treated in straight amalgamation or amalgamation-cyanidation mills, reports of this series in Mineral Resources and Minerals Yearbook from 1909 through 1947 contained tables showing ore treated in these mills separate from that treated in straight concentrating mills. As amalgamation and cyanidation mills now generally have concentrating equipment and many concentrating mills recover part of the gold by amalgamating high-grade jig concentrates, the distinctive features of the two types of mills have largely disappeared. Therefore, beginning with 1948, a consolidated table showing production of metals from all mills has replaced the separate tables giving output by types of mills.

The Arkansas Valley smelter at Leadville purchases most of the State gold-silver and lead concentrates and silver, lead-copper, and lead ores shipped to smelters. The Golden Cycle mill at Colorado Springs offered a market for gold ores shipped for treatment. This mill is to be dismantled in 1949 and a new mill built in the Cripple Creek district. Smelters and custom mills in the Salt Lake Valley, Utah, are important as a market for Colorado zinc-lead ores and concentrates. Amarillo and Dumas, Tex.; Depue, Ill.; Palmerton, Pa.; and Anaconda and Great Falls, Mont., offer markets for zinc concentrates.

Mine production of metals in Colorado in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and concentrates amalgamated [1]	208,277	33,665	10,177			
Sands and slimes cyanided	229,074	41,087	5,286			
Concentrates smelted	168,025	62,492	2,534,908	4,137,078	47,721,254	89,969,765
Ore smelted	21,798	4,311	457,828	458,922	2,564,746	358,235
Placer		13,247	2,812			
Total: 1948		154,802	3,011,011	4,596,000	50,286,000	90,328,000
1947		168,279	2,557,653	4,300,000	37,392,000	77,490,000

[1] Includes estimates for gold jig concentrates amalgamated at some mills, for which complete data are not available.

REVIEW BY COUNTIES AND DISTRICTS

ADAMS COUNTY

In 1948 gold and silver were recovered by Kerkling & Slensker as byproducts from the Brannan Sand & Gravel Co. washing plants Nos. 8 and 10 and the Superior Sand & Gravel Co. pit, all on gravel bars of Clear Creek northwest of Denver.

BOULDER COUNTY

Central (Jamestown) District.—A car of high-grade gold ore from the John Jay-Last Chance group and a ton of gold ore from the Kicking Horse mine were shipped to the Golden Cycle mill at Colorado Springs. Harrison S. Cobb shipped several cars of gold-silver ore from an old millsite. The Ozark-Mahoning Co. mill at Jamestown recovered lead-silver-gold-copper concentrates as a byproduct in the beneficiation of fluorspar.

Gold Hill District.—Shippers of ore to the Golden Cycle mill in 1948 included Harrison S. Cobb (Ingram mine), James Pastore (American), Henna Mines, Inc. (Cash), Fred Magor (Great Britain), and Ross L. Benson (Parker No. 1).

Grand Island District.—The Consolidated Caribou Silver Mines, Inc., continued developing the Caribou mine and milled several thousand tons of dump ore for testing. The mill product was silver-lead-gold concentrates, shipped to the Leadville smelter. In December the company announced that a vein containing pitchblende was encountered on the bottom or 1,040-foot level of the mine. The Red Wing and Straight Flush claims produced some silver-lead ore.

Magnolia District.—A 3-ton lot of gold ore was shipped from the Keystone mine in 1948.

Sugar Loaf District.—Gold ore was shipped from the Melvina, Poorman, and Wood Mountain mines to the Golden Cycle mill.

CHAFFEE COUNTY

Chalk Creek District.—Small tonnages of lead-silver-zinc ore were shipped from the Stonewall group and Polly No. 4 claim.

Granite District.—The Gold Basin placer was operated by the Good Hope Mining Co., Ltd., from June 1 to September 23; the equipment used included a power shovel, bulldozer, and sluices.

Monarch District.—S. E. & W. E. Burleson continued development at the Garfield mine and shipped 292 tons of ore containing 133 ounces of gold, 864 ounces of silver, 86,563 pounds of lead, 11,854 pounds of zinc, and 317 pounds of copper. The Lilly and Fraction mines were worked under lease by C. C. Carathers part of 1948 and yielded lead-silver ore. Some ore was shipped from the Neglected claim and another property.

CLEAR CREEK COUNTY

Alice District.—Lombard Mines, Inc., operated the Lombard mine and 100-ton flotation mill most of 1948. The mill product was gold-silver-lead-copper concentrates, shipped to the Leadville smelter.

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1948, by counties and districts, in terms of recovered metals

[1] Includes St. Kevin district.

Argentine District.—The Grizzly Gulch mine, operated by the Lupton Mining Co. throughout 1948, was the principal producer of lead in Clear Creek County. The ore, which also carries gold, silver, zinc, and copper, was treated in the company mill near Georgetown. Some ore was shipped from the Hamill Tunnel, and some development was done on the Stephens group.

Cascade District.—Ore was shipped from the Tyone prospect and the Kitty Emmet mine in 1948.

Dailey and Atlantic District.—A truckload of silver-lead ore was shipped from the Doctor Lode.

Empire District.—The Conqueror mine, operated by Chas. T. Worthington from January 1 to April 6, 1948, shipped 650 tons of gold-silver ore to a custom mill. Other small producers were the Gold Fissure and Minnesota groups.

Griffith District.—The Smuggler mine (C. O. Parker, agent) operated throughout 1948 and was again the principal silver producer in Clear Creek County, as well as a substantial producer of lead and zinc. The ore was treated in the nearby Silver Leaf mill. The old Terrible-Dunderberg group, under rehabilitation and development since 1945, was put in steady operation in August 1948 by Gold Mines Consolidated, Inc. The ore, containing silver, lead, and zinc as the principal metals, was concentrated in the Silver Spruce mill at Idaho Springs. Small lots of direct-smelting ore were shipped from the Anglo Saxon, Capital Prize, and Teagarden groups. Some ore from the Zero dump was treated in the John A. Smith mill.

Idaho Springs District.—The Dixie mine of LeRoy Giles & Co. was again the leading gold producer in Clear Creek County. During 1948 the company acquired and remodeled the Idaho Springs custom mill (renamed the Dixie mill) on Clear Creek east of Idaho Springs. An unusually rich pocket of ore encountered during the year raised the output above that in 1947. The Franklin Mining Co., operating the Mary F.-Oro Fino-Franklin group, shipped 2,483 tons of lead-zinc-silver-gold ore to custom mills. Other small producers included the Consolidated Park, Lexington, and Oregon mines and the Williams dump. Colorado Minerals, Inc., reopened the Black Eagle mine and mill late in the year. Arthur Portenier operated the Clear Creek-Gilpin mill part of the year, mostly on custom ore.

Montana District.—Shipments in 1948 included several lots of ore from the Bellevue-Hudson mine, small lots of concentrates from the Red Elephant property, and clean-up material from the Joe Reynolds mine.

Trail Creek District.—The Harrison-Croesus Mining Co. continued to operate the Ben Harrison mine until May 15, 1948. The ore produced was shipped to custom mills at Leadville. The Victoria Mining Co. worked most of 1948 on reconditioning the Victor Lode group but also mined and shipped 730 tons of lead-silver-gold-copper ore.

CUSTER COUNTY

Hardscrabble District.—Output from this district in 1948 totaled 1,067 tons of lead-silver-zinc and lead-silver ores, shipped to the smelter or custom mills at Leadville. Nearly all the ore came from the Defender and Lady Franklin mines.

DOLORES COUNTY

Pioneer (Rico) District.—In 1948 the Rico Argentine Mining Co. group of mines continued to be the principal producer of metals in Dolores County and one of the major zinc-lead-silver producers in the State. Output was approximately the same as in 1947. Mine development during the year totaled 7 feet of shaft, 4,556 feet of drifts, 1,312 feet of raises, and 6,995 feet of diamond drilling. The mine is equipped with a 135-ton selective-flotation mill. Other producers at Rico shipped ore to custom mills in Utah; they comprised the Badger and Hidden Treasure tunnels, Forest mine, Wellington group, and Woods Hole mine.

DOUGLAS COUNTY

Three ounces of gold were recovered from a placer in Newlin Gulch.

EAGLE COUNTY

Red Cliff (Battle Mountain) District.—Every year from 1937 through 1948 the Red Cliff district ranked first among Colorado districts in total value of its production of the five metals; the Cripple Creek gold district previously ranked first. The Red Cliff output was predominantly silver and copper in the first years of the period and zinc and lead after 1941. The Eagle mine group of the New Jersey Zinc Co. Empire Zinc Division, equipped with a 600-ton underground selective-flotation mill, operated continuously in 1948. Some ore from the Gold Park claim was shipped to the Leadville smelter.

EL PASO COUNTY

The Golden Cycle mill at Colorado Springs treated 229,074 tons of ore in 1948 compared with 420,026 tons in 1947. The mill feed in 1948 comprised 225,749 tons of company and custom gold sulfotelluride ore from mines and dumps in the Cripple Creek district (Teller County) and 3,325 tons of gold and gold-silver ores from various shippers in Boulder, Clear Creek, Gilpin, Park, and Summit Counties.

During the year the Golden Cycle Corp. decided to transfer its milling operations from Colorado Springs to the Cripple Creek district and abandon the Midland Terminal Railway, which hauled ore from the district to the Golden Cycle mill. The mill continued to receive ore over the railroad until February 20, 1949. Work then began on dismantling the mill and railroad and constructing a new custom mill in the Cripple Creek district.

FREMONT COUNTY

The Horseshoe Mining Co. operated its 75-ton flotation mill on the Arkansas River at Parkdale 2 months in 1948 on stockpiled ore from the Cotopaxi and Horseshoe mines. Other county output included a truckload of copper-silver ore from the Guffey property and 69 tons of old zinc-lead slag shipped from the former River smelter site at Florence.

GILPIN COUNTY

Southern (Blackhawk, Central City, Nevadaville, Russell Gulch) Districts.—The Federal Mining & Milling Co. drove 500 feet of drifts on its Federal-Santiago group and installed more equipment in its mill. About 150 tons of dump material put through the mill for testing equipment yielded lead-gold-silver concentrates. Small tonnages of ore were shipped from the Elesinore (Globe), Central Mining & Development Corp., and West Notaway properties. Individuals recovered some placer gold on Clear Creek. Chain O'Mines Operators, Inc., nearly completed construction of a 1,000-ton unit of a proposed 6,000-ton mill, designed to treat low-grade ore from the old "Patch" glory hole.

Northern Districts.—The Cliff mine, under development during 1948, produced 188 tons of lead and zinc-lead ores, of which 172 tons were milled in the Gold Ridge mill at Central City and 16 tons were shipped crude to smelters. Some gold ore was shipped from the We Got Em mine.

GUNNISON COUNTY

Elk Mountain District.—A 3-ton sample of silver-lead ore was shipped from the Red Cloud group, and several tons of silver-gold concentrate were shipped from the Forest Queen mill.

Gold Brick District.—A little ore was shipped from the Climax and Gold Links properties, and some gold-silver-lead concentrate was shipped from the Raymond group, which is equipped with a mill.

Quartz Creek District.—Twenty-one tons of zinc-lead-silver ore previously stock-piled at the Complex mine were shipped in 1948.

Rock Creek District.—About a car of zinc-silver ore was shipped from the Lead King mine.

Taylor Park (Tin Cup) District.—A truckload of zinc-lead-silver ore was shipped from the Thunderbird claim.

Tomichi District.—The Callahan Zinc-Lead Co. operated its Akron-Erie mines at White Pine at an expanded production rate in 1948. The company flotation mill, built in 1947, operated continuously. Ore treated totaled 18,158 tons yielding 2,511 tons of lead concentrates containing 34 ounces of gold, 60,359 ounces of silver, 9,108 pounds of copper, 3,235,389 pounds of lead, and 649,278 pounds of zinc; and 4,379 tons of zinc concentrates containing 55 ounces of gold, 24,953 ounces of silver, 22,360 pounds of copper, 780,904 pounds of lead, and 4,504,407 pounds of zinc. Development during 1948 totaled 1,966 feet of drifts, 610 feet of crosscut, 1,198 feet of raises, and 2,724 feet of diamond drilling.

HINSDALE COUNTY

Galena District.—At the old Yellow Medicine mine near the Hinsdale-Ouray County line J. R. Brown drove 200 feet of drifts in 1948 and shipped 22 tons of lead-zinc-copper-silver ore. Rowland Ewart worked on development at the Independence mine and shipped a truckload of lead-silver ore.

JEFFERSON COUNTY

Some copper ore was shipped from the Malachite mine, and 3 ounces of placer gold were recovered from gravel bars of Clear Creek in 1948.

LAKE COUNTY

Box Creek District.—The General Gold Corp. operated its Hayden-Mount Elbert group of placers during 1948 from April 20 to November 7, the end of the placer-mining season. Equipment used included two dragline dredges and a caterpillar bulldozer.

California (Leadville) District.—In 1948, as in other recent years, the Resurrection Mining Co. group was the principal producer of metals in the Leadville district. The mine is opened by a 1,323-foot vertical shaft, six levels, and a 4-mile tunnel (old Yak) which intersects the shaft. The company 600-ton flotation mill continued to operate largely on company ore but also treated custom ores from Lake, Clear Creek, Park, Saguache, and Summit Counties.

The American Smelting & Refining Co. operated the Ibex-Garbutt-Cora-Sunday group. Mine development included 2,310 feet of tunnel and 3,710 feet of diamond drilling. The ore produced was treated in the company 400-ton Leadville milling unit flotation mill. The mill also handled ore from the company Kokomo unit in Summit County and custom ore from mines in Chaffee, Clear Creek, Custer, Gilpin, Gunnison, Lake, Mineral, Saguache, San Juan, and Summit Counties.

The John Hamm Mining & Milling (Ltd.) mill continued to operate on dump ore, mostly from the New Monarch, Henriett, Hibschle, and Fortune dumps, until it was closed in October. The Cloud City mill operated part of the year on ore from the Rock & Dome dumps.

Among the larger shippers of newly mined ore to smelters or custom mills were the Dolly B (McCaughan & Co.), Fanny Rawlings (Dahl-Shirk Lease), Fortune Mine, New Monarch (New Monarch Lease, Triple "J" Lease, Harry Sundstrom), Valley, and Winnie mines. Other small-scale mining and dump operations shipped a substantial aggregate tonnage of ore.

The Arkansas Valley smelter of the American Smelting & Refining Co. at Leadville operated throughout 1948. The smelter treats lead, lead-copper-gold-silver, and gold and silver ores and concentrates purchased from operators in nearly all the active mining districts of Colorado, and ores, concentrates, residues from zinc smelters, and other material from various States and foreign countries. Receipts in 1948 totaled 97,150 tons compared with 113,929 tons in 1947.

St. Kevin District.—The Lakewood mine, operated by Markus Thuren during the summer of 1948, shipped gold-silver ore.

Weston Pass District.—The Little Ruby mine shipped 102 tons of ore containing 1 ounce of gold, 85 ounces of silver, and 16,504 pounds of lead.

LA PLATA COUNTY

California (La Plata, Hesperus) District.—The Bessie G. mine, a small-scale gold producer each year since 1939, continued to operate in 1948. The Muldoon, Neglected, and Nonpariel claims produced small lots of gold and silver ores, and the Tip Top shipped a truckload of silver-lead ore.

MINERAL COUNTY

Creede District.—The groups of mines operated by the Emperius Mining Co. contributed the bulk of the output of metals from the Creede district from 1941 through 1948. Most of the ore was treated in the 100-ton flotation mill acquired by Emperius from Creede Mills, Inc., September 1, 1940. The producing groups in 1948 included the Amethyst, Equinox, Del Monte-Aspen (Volunteer), New York, and Commodore. The mill was operated steadily except for a shutdown of several weeks required to replace a broken main bearing in the Diesel engine. While the mill was shut down ore was shipped to a custom mill at Leadville. High-grade ore mined during the year was shipped direct to the Leadville smelter. The Ridge mine (Mexico group) was under development in 1948 and shipped ore to the Leadville smelter late in the year.

MONTROSE COUNTY

Placer miners on San Miguel River produced a little gold in 1948.

OURAY COUNTY

Red Mountain District.—In 1948 the American Zinc, Lead & Smelting Co. operated the Koehler-San Antonio property in Ouray and San Juan Counties from January 1 to September 20 and the Mountain King in Ouray County from June through December. The ore was treated in the company flotation mill at Ouray and yielded zinc-lead-copper, lead-silver, and zinc concentrates. Other producers included the Beaver-Belfast, Ida L., Lost Day, and Monte Cristo mines. The Idarado mill treated ore from the claims of the Treasury Tunnel property in San Miguel County.

Sneffels District.—The Camp Bird mine, operated by King Lease, Inc., was again the leading producer of the five metals in Ouray County. Development in 1948 included 621 feet of raises, 718 feet of drifts, and 1,342 feet of diamond drilling. A new skip cable was installed, 2,000 feet of ditch sprags were replaced, and a battery locomotive and generator set were put on the twelfth level. The ore, treated in the company 125-ton amalgamation-flotation mill (changed to selective-flotation in 1948), yielded gold-silver bullion, lead-silver-gold-copper concentrates, and zinc concentrates. Lessees on the Atlas group shipped mine and dump ore. Other small producers included the Atomic Silver, Monster Lode, and Tom Patterson properties.

Uncompahgre District.—The American Zinc, Lead & Smelting Co. operated its custom mill at Ouray and the Bachelor group of mines throughout 1948. Mine development on the Bachelor, largest individual shipper to the mill, included 761 feet of raises, 47 feet of drifts, and 574 feet of diamond drilling. The Mickey Breen mine, operated steadily by Southwest Metals, was the second-largest district shipper. Other Uncompahgre district shippers to the mill were the Connie and Ideal claims. The mill also received ore from mines in San Juan, San Miguel, and Hinsdale Counties. The Mineral Farm mine at Ouray shipped 74 tons of direct-smelting ore. The Silver Shield

Mining & Milling Co. acquired the Wanakah group and worked on building a 200-ton custom mill near Ouray.

PARK COUNTY

Alma Placers-Fairplay District.—The South Platte Dredging Co. operated its electrically powered bucket-line dredge (108 12-cubic-foot buckets) on the Black Forest and Gold Pan placers from January 1 to December 21. Gravel washed totaled more than 3,800,000 yards. Charles M. Hambelton washed 20,000 cubic yards of bench gravel in a stationary washing plant on the P. & H. placer. Individuals using hand methods produced some gold from the Snowstorm placer.

Beaver Creek District.—Detwiler Bros. recovered small lots of gold from the Beaver Creek placer.

Buckskin District.—Operations of the Buckskin Joe Mines, Ltd., on the Phillips group of mines in 1948 comprised mostly cleaning up ore in old workings and drifting along known veins exploring for other commercial ore shoots. The drifting totaled 1,000 feet. The ore shipped (1,887 tons) contained gold and zinc as the principal minerals, with accessory values in lead and silver. The American Flag, Criterion, and Sweet Home mines each shipped small tonnages of ore.

Consolidated Montgomery District.—The 4H Mine Lease (Star-Cresskill group) shipped 80 tons of gold-silver ore to the Golden Cycle mill at Colorado Springs for testing. A 7-ton lot of gold-silver ore was shipped from the Magnolia mine.

Horseshoe District.—The Leadville Lead Corp. built roads, constructed surface buildings, installed machinery, and reopened and examined old lead-silver-zinc mine workings on the Hilltop and other properties acquired and consolidated from 1945 to 1948. The company also shipped some ore in 1948. The other district producer was the Peerless Maud mine.

Mosquito District.—M. J. Krolicki shipped 115 tons of zinc-gold-silver-lead ore from the Orphan Boy mine. The London Butte property was under development.

PITKIN COUNTY

Independence District.—Two tons of gold-silver ore were shipped from the Mount Hope property in 1948.

Roaring Fork (Aspen) District.—The Midnight Mining Co. operated its Midnight silver-lead mine and 50-ton flotation mill at the same daily average ore production rate as in 1947. General mining operations were moved from areas below the main tunnel level to the older upper workings between the seventh and third levels. The original 500-foot Midnight shaft extending from the surface to the seventh level was rehabilitated and equipped with an electric hoist. The Herron Bros. operated its gravity-concentration mill on material from the Smuggler dumps, which were being sampled by other companies. J. C. Bray and F. Swerengen each shipped some silver-lead ore. The Bureau of Mines did exploratory drilling near Aspen.

RIO GRANDE COUNTY

Summitville District.—In 1948 the Summitville mine and mill were idle until September, when Jones & Nylene reopened the flotation section of the mill to treat gold-copper ore from surface outcrops and dumps. Some ore was milled but the concentrate produced was not shipped in 1948. Underground development was also carried on and resulted in finding another good vein of copper ore.

SAGUACHE COUNTY

Kerber Creek (Bonanza) District.—Mines near Bonanza shipped 3,366 tons of ore to smelters and custom mills outside the county in 1948. The largest producer was the Antoro mine, operated by S. E. & W. E. Burleson, which shipped 1,979 tons of ore containing 41 ounces of gold, 12,081 ounces of silver, 450,380 pounds of lead, 455,954 pounds of zinc, and some copper. The Rawley mine (Costello Lease) shipped 737 tons of ore containing 11 ounces of gold, 10,408 ounces of silver, about 20,000 pounds of copper, 349,596 pounds of lead, and 186,537 pounds of zinc. Other shippers were the Bonanza mine (Nicholas Keserich), Brighton (Earl Wise), Cora group (Walter Timney), Superior (P. M. Wallin), Little Jenny (Tom Raymond & Sons), Josephine (Marvisa Mining Co.), Silver Creek (John D. Bird), and Warwick group (Warwick Mines, Inc.).

SAN JUAN COUNTY

Animas District.—Operations of the Shenandoah-Dives Mining Co. on the Shenandoah-Dives-Mayflower and Silver Lake groups were continuous in 1948. Mine development during the year included 859 feet of raises, 1,732 feet of drifts, 968 feet of crosscuts, and 663 feet of diamond drilling. Ore produced from the two groups and milled totaled 165,283 tons yielding 3,317 tons of combined lead-copper, iron, and zinc concentrates containing altogether 11,241 ounces of gold, 302,686 ounces of silver, 336,966 pounds of copper, 2,198,225 pounds of lead, and 829,017 pounds of zinc. Besides company ore, the mill (capacity 700 tons daily) treated 17,509 tons of custom ore containing 501 ounces of gold, 62,774 ounces of silver, 191,951 pounds of copper, 2,122,340 pounds of lead, and 2,215,725 pounds of zinc.

The Highland Mary mine, equipped with a 100-ton flotation mill, was the second-largest district producer of gold and silver and a substantial producer of lead. The Osceola mine operated from August through December; the ore was trucked to the Lackawana mill at Silverton for treatment. The principal Animas district shippers of custom ore to the Shenandoah-Dives mill were the Lark Lease of the United States Oil & Development Corp., Little Nation Lease, and Sterling claim of the Gary Owen group. Other shippers included the Little Ida, Silver Ledge, Mighty Monarch, May Day, Trilby, Little Fannie, King, Mystery, South Mineral, and Tennyson mines.

Eureka District.—The Lead Carbonate mine and 40-ton flotation mill operated throughout 1948 except about 6 weeks when heavy winter snows and slides interfered. Other important producers (more than 1,000 tons of ore) were the Foursome Mining Co. (Columbus and

Silver Coin mines), Great Eastern Mining Co. (Great Eastern-Sioux City-Klondike group), Koehler-San Antonio group (partly in Ouray County), and Harry G. Knapp (Burrows and Caledonian mines). The Sunbank Corp., which purchased the Sunnyside properties in July, shipped concentrates, ore, and other material obtained in cleaning up the ore bins and dismantling the mill. Other producers included the Hermes, London, Lucky Jacks, Mountain Queen, Queen Ann, and Silver Wing mines.

Ice Lake Basin District.—The Esmeralda Lease (Bandora mine) shipped 139 tons of ore containing 15 ounces of gold, 1,462 ounces of silver, 2,082 pounds of copper, 24,026 pounds of lead, and 19,565 pounds of zinc.

SAN MIGUEL COUNTY

Iron Springs District.—The Silver Bell Mines Co. operated its Silver Bell group and 150-ton flotation mill throughout 1948. The mill product was bulk gold-silver-lead-copper concentrates. The mine development and exploration program was expanded. A new vein (called the Lookout Vein) was discovered by diamond drilling and was opened by extending the main tunnel and drifting. Another vein was discovered by a short crosscut into the hanging wall. A. A. McCluskey shipped several tons of clean-up material containing silver, lead, and gold.

Lower San Miguel District.—A 4-ton trial shipment of lead-silver-gold ore was made from the Champion-Robin Red Breast group near Placerville. Some gold and silver were recovered from the Verna Lois placer on San Miguel River.

Upper San Miguel District.—In 1948 the Upper San Miguel district again ranked second among Colorado districts in gold production and had a large gain in output of silver, copper, lead, and zinc. Much of the gain was due to an increase in the output of the Idarado Mining Co. Treasury Tunnel-Black Bear group of mines. The portal of the tunnel and the Idarado mill are in Ouray County; the ore is hauled 12,000 feet through the tunnel from mine workings (mostly on the Black Bear vein) in San Miguel County. During the year the company completed a 1,100-foot raise on the Black Bear vein and did other extensive development work, and enlarged the capacity of the mill from 300 tons daily to 500 tons. The mill products were gold-silver amalgam (recovered mostly from gold jig concentrate), flotation copper-gold-silver concentrate, lead-silver-gold-copper concentrate, and zinc concentrate.

The Smuggler Union-Montana group and 550-ton mill of Telluride Mines, Inc., operated continuously. Work progressed on driving and equipping the new mill-level adit from the mill to the Pandora-Smuggler Union veins; the adit (about a mile long) tapped the veins at an elevation of 9,070 feet, or 1,100 feet below the lowest workings of present mining operations. Development during the year totaled 450 feet of raises, 6,116 feet of drifts, 2,148 feet of tunnel, and 500 feet of diamond drilling. Part of the company gold output was recovered by amalgamating concentrates from jigs in the ball mill-classifier circuit, and part was recovered in iron gravity concentrate and lead-copper and zinc flotation concentrates shipped to smelters.

The Alta-St. Louis mine and mill operated from January to June; the mill was destroyed by fire in November. The Tomboy Gold Mines, Inc., and the Nordlander lease on the Japan Flora mine shipped some zinc-lead-silver-gold ore to the American custom mill at Ouray.

SUMMIT COUNTY

Breckenridge District.—W. L. Davenport worked the Wellington mine and shipped to custom mills at Leadville 1,478 tons of ore averaging 16.8 percent zinc, 9.16 percent lead, and 3.15 ounces of silver and 0.03 ounce of gold per ton. The Monte Cristo mine, producing lead ore and operated from July 2 to November 25, was the second largest district shipper. Other small producers included the Bowery-Chatham, Fredonia, Juno, Laurium, Morning Star, and Mountain Pride lode mines and the B. & B. placer.

Green Mountain District.—Mrs. Frances L. McDaniel worked her Big Four mine all of 1948 and shipped zinc-lead-silver-gold ore.

Montezuma District.—The Florado Mining Co. operated its Pinnicle mine and 100-ton flotation mill. Ore treated totaled 4,200 tons yielding 430 tons of lead concentrates containing 1 ounce of gold, 42,914 ounces of silver, 6,673 pounds of copper, and 541,853 pounds of lead; and 39 tons of zinc concentrates containing 433 ounces of silver, 223 pounds of copper, 228 pounds of lead, and 46,294 pounds of zinc. The Summit Mining & Milling Co. mill treated 450 tons of lead-silver-zinc ore from the Silver King Mine. Substantial tonnages of ore were shipped to custom mills at Leadville from the Ida Bell (Ulibarri & Jeffrey) and New York (Teller Basin) mines. Small shippers included the Rose, Bell of California, Cross, Erickson, Mohawk, Radical, Silver Wing, and Wauneita mines.

Ten Mile (Kokomo, Robinson) District.—Mining in this district in 1948 was featured by gains over 1947 of 258 percent in lead production, 125 percent in zinc, 155 percent in silver, 47 percent in gold, and 116 percent in copper. Higher output by the Kokomo Unit (Victory-Wilson-McKinley group) of the American Smelting & Refining Co. led to the exceptionally large gains. This group was among the five leading Colorado producers of lead and zinc in both 1947 and 1948 and of silver in 1948. The ore was trucked to the company Leadville milling unit for concentration. The company continued its exploration and development campaign; the work done during the year included sinking a new 435-foot shaft and extensive diamond drilling and drifting.

The Wilfley Leasing Co. operated the Wilfley mine throughout 1948 and shipped to custom mills at Leadville 3,437 tons of ore averaging 15.81 percent zinc, 0.86 percent lead, and 2.20 ounces of silver and 0.027 [1] ounce of gold a ton. The company reconditioned the Wilfley mill and made test runs on dump ore. The Clark-Mackey Development Co., operating the Michigan-Snowbank group, and lessees on the Kimberly and Colonel Sellers mines were substantial shippers of zinc-lead-silver-gold ore to custom mills at Leadville. Some ore was shipped from the Queen of the West and Silver Cloud properties. The Bureau of Mines continued its exploratory drilling project near Kokomo.

[1] Owing to a misplaced decimal point, the 1947 report of this series (Minerals Yearbook, 1947, p. 1373) gives the gold assay for that year as 0.62 ounce a ton, rather than 0.062 ounce, the correct figure.

TELLER COUNTY

Cripple Creek District.—The Cripple Creek district contributed 35 percent of the State total gold output in 1948, the same percentage as in 1947 and the prewar years 1940 and 1941. The bulk of the district output in 1948 came from the Cresson mine, United Gold Mines Co. group (Vindicator and Portland shafts), Golden Cycle Corp. Ajax mine, and Markley Mining & Exploration Co. Tenderfoot group. All the ore produced from these and other Cripple Creek mines was shipped to the Golden Cycle mill for treatment. (See El Paso County.)

An important event of 1948 affecting the future of mining in the Cripple Creek district was the announcement by the Golden Cycle Corp. that it would abandon the Midland Terminal Railway and move the Golden Cycle mill from Colorado Springs to the Cripple Creek district. The reasons for the move and a review of operations in 1948 are given in the company annual report to stockholders. The following data are abstracted from the report:

The Golden Cycle mill was originally built in Colorado Springs in 1905. The reason for locating it 50 miles by rail from the ore-production area was that large tonnages of coal and other heavy materials were needed to operate the mill and to treat the ore. It was more economical to transport ore down hill than to transport coal and other supplies up hill to the Cripple Creek district. Metallurgical changes in the treatment process developed during the past 5 years eliminated the need for large quantities of coal and other heavy supplies.

The new mill will be located midway between Cripple Creek and Victor and called the Carlton mill. New types of equipment will be used to obtain maximum efficiency and to reduce manual labor to the minimum. The daily capacity will be 600 tons; enough space will be provided to increase the capacity to 1,000 tons if future conditions warrant. The final product will be gold bullion, as in our present operation.

The tonnage and value of ore treated at the Golden Cycle mill during 1948 were less than in 1946 and 1947 because of a decrease in the quantity of dump ore handled. Since it was decided in the early part of 1948 to move the mill to the Cripple Creek district, it seemed advisable to save dump ore to treat at a later date more economically and efficiently in the new mill. Cripple Creek ore handled comprised 129,730 tons of dump ore, with an average per ton gross value of $3.45, and 96,019 tons of mine ore, with an average per ton value of $16.08. Other Colorado districts shipped to the mill 3,325 tons, with an average per ton value of $15.05. Wrecking of the mill began the latter part of 1948 and should be completed in 1949.

Ajax Mine.—Company and lessees shipped 22,758 tons of ore, with a total gross value of $462,211. A total of 2,310 feet of drifts, crosscuts, and raises was completed during 1948, and several ore bodies were opened. Hoisting from the Carlton drainage tunnel level began about March 1.

Anchoria Leland Mine.—This mine operated until May 1, when it was closed because of a shortage of split-check lessees. Ore shipped totaled 1,588 tons with a total gross value of $15,621.

Index Mine.—Lessees shipped 287 tons of dump ore, with a total gross value of $1,300.

During construction of the new Carlton mill all mining operations in the Cripple Creek district will be suspended.

The annual report to stockholders of the Cresson Consolidated Gold Mining & Milling Co. for the calendar year 1948 includes the following data on mining operations:

Net gain for the year was $16,548 against a net loss of $37,719 for 1947. Experienced and capable miners are still lacking in the Cripple Creek district. The company employed about 25 men underground during the year, and 24 sets of lessees accounted for an additional 30 to 40 men. The Cresson lateral of the Carlton tunnel was driven 1,437 feet during the year.

Production of Cresson Consolidated Gold Mining & Milling Co., 1903–48

Period	Dry short tons	Gross value [1]	Freight and treatment	Net value	Dividends
1903–47	3,283,325	$47,226,216	$15,645,267	$31,580,949	$13,564,673
1948:					
Company ore	15,986	184,004	75,905	108,099	
Lessee ore	34,617	545,811	196,011	[2] 349,800	
1903–48	3,333,928	47,956,031	15,917,183	32,038,848	[3] 13,564,673

[1] Settlement value.
[2] Lessees received $167,149 as their share.
[3] Represents 28.29 percent of gross value and 42.34 percent of net value.

Data abstracted from the annual report of the United Gold Mines Co. for the year ended December 31, 1948, follow:

Net loss for 1948 was $7,127 against a net gain in 1947 of $528. Mining costs increased considerably over 1947, owing mainly to higher prices for labor and materials. The selling price of gold remains at $35 a fine ounce. It is impossible to operate profitably unless we have a large number of lessees working the entire area; we had too few lessees in 1948 to make a profit. A lateral was begun on the Carlton tunnel level at the Portland shaft heading towards the Vindicator-Cycle group of mines and was driven 1,298 feet during the year. About 3,700 feet remain to be driven to prospect and drain this group.

Production of properties of United Gold Mines Co. in 1948, and before and after organization of the company (May 15, 1902) to Dec. 31, 1948

Mine	Net tons	Gross value [1]	Company ore cash receipts	Royalties received	Lessees' receipts
1948:					
Vindicator:					
Company ore	122,382	$413,325	$62,048		
Lessee ore	10,956	106,831		$22,537	$27,598
Portland: Lessee ore	2,422	57,257		22,850	22,127
Rose Nicol: Lessee ore	100	1,743		257	870
Miscellaneous	473	7,377		971	3,669
Total 1948	136,333	586,533	62,048	46,615	54,264
Ore mined before consolidation	26,310	456,806	(2)	(2)	(2)
Production under operation of United Gold Mines Co.	3,166,710	28,381,004	(2)	(2)	(2)
Total to Dec. 31, 1948	3,193,020	28,837,810	(2)	(2)	(2)

[1] Settlement value.
[2] Figure not available.

The Markley Mining & Exploration Co., operating the Tenderfoot-Sangre de Cristo-Mollie Kathleen group, shipped 3,048 tons of ore containing 2,597 ounces of gold and 149 ounces of silver; the gross value was $87,050; the net value after deductions for freight and treatment was $63,232.

The Free Coinage, Jerry Johnson, El Paso, Elkton, LeClair, and Front Range mines were among the other producers. All operations on the Stratton estate were suspended in March 1948; the only output during the year was 40 tons of ore from the Proper mine.

East of the Mississippi River Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By SAMUEL A. GUSTAVSON

GENERAL SUMMARY

PRODUCTION of gold, silver, copper, lead, and zinc was reported from mines in 11 of the States east of the Mississippi River during 1948. Virtually all the major producing mines in the region reported continuous operations during the year. The cessation of operations in the latter part of 1947 and in 1948 caused by the expiration of the Premium Price Plan June 30, 1947, was confined chiefly to marginal mines in Northern Illinois and Wisconsin. Demand for copper, lead, and zinc was strong throughout 1948, and prices rose from opening quotations of 21.2 cents per pound, domestic refinery, to 23.2 cents for copper; 15.0 cents per pound, New York, to 21.5 cents for lead; and 10.5 cents per pound to 17.5 cents for zinc, establishing a record high price for lead, the highest price for copper since 1918, and the highest price for zinc since 1916.

Production of the five metals (recoverable) in the region was 2,479 fine ounces of gold, 101,171 fine ounces of silver, 42,025 tons of copper, 10,706 tons of lead, and 177,787 tons of zinc, with a total value of $69,946,807. The region's output represented only a minor share of the United States production of gold and silver but accounted for about 3 percent of the lead, 5 percent of the copper, and 28 percent of the zinc.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported, except that of zinc in New Jersey, has been calculated at the prices in the following table. The value of the New Jersey output is the total value of the zinc recoverable as metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver, 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.

[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: Price includes bonus payments by Office of Metals Reserve for overquota production.

Annual figures for the 5 years ended with 1948 and data showing the production of gold, silver, copper, lead, and zinc by months in terms of recoverable metal are given in the accompanying tables. The figures for tonnage of ore sold or treated do not include magnetite ore

Mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1944–48, in terms of recovered metals

Year	Mines producing		Material sold or treated [1]		Gold (lode and placer) [2]		Silver (lode) [3]	
	Lode	Placer	Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value	Fine ounces	Value
1944	123	2	7, 162, 687	3, 256, 812	2, 595	$90, 825	180, 661	$128, 470
1945	111	--------	6, 335, 831	3, 820, 946	1, 857	64, 995	106, 044	75, 409
1946	108	5	5, 451, 340	3, 763, 871	1, 432	50, 120	79, 266	64, 047
1947	120	--------	6, 293, 007	3, 411, 070	1, 997	69, 895	137, 780	124, 691
1948	110	--------	6, 544, 541	2, 349, 877	2, 479	86, 765	101, 171	91, 565

Year	Copper		Lead		Zinc		Total value
	Pounds	Value	Pounds	Value	Pounds	Value	
1944	114, 940, 000	$15, 516, 900	19, 644, 000	$1, 571, 520	398, 958, 000	$41, 256, 192	$58, 563, 907
1945	85, 712, 000	11, 571, 120	20, 138, 000	1, 731, 868	360, 644, 000	37, 052, 932	50, 496, 324
1946	69, 026, 000	11, 182, 212	22, 254, 000	2, 425, 686	323, 752, 000	35, 472, 314	49, 194, 379
1947	73, 750, 000	15, 487, 500	18, 052, 000	2, 599, 488	363, 584, 000	42, 810, 934	61, 092, 508
1948	84, 050, 000	18, 238, 850	21, 412, 000	3, 832, 748	355, 574, 000	47, 696, 879	69, 946, 807

[1] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.
[2] Includes placer gold as follows: 1944, 5 ounces; 1945, none; 1946, 22 ounces; 1947–48, none.
[3] No placer silver was produced during 1944–48.

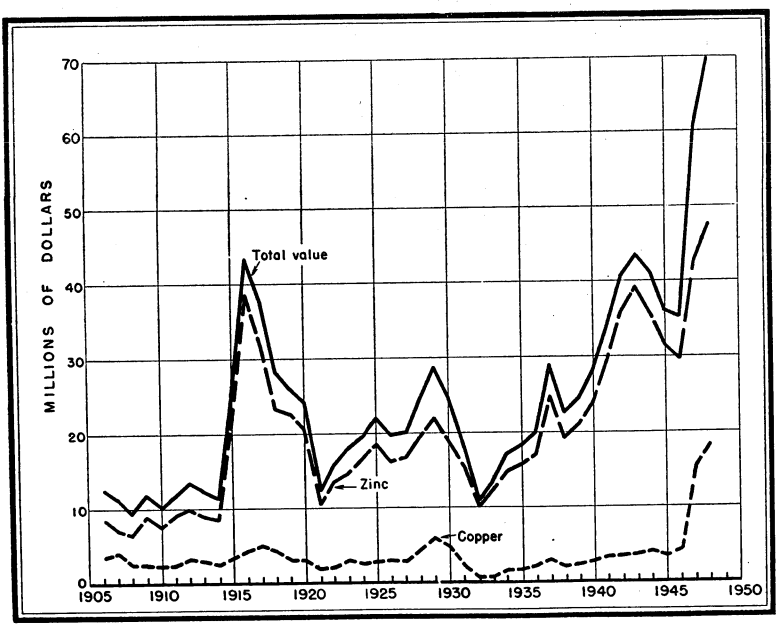

FIGURE 1.—Value of mine production of zinc and copper and total value of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1906–48.

containing pyrite and chalcopyrite, from which copper, gold, and silver were recovered as byproducts. Minerals Yearbook, 1947, page 1379, contains a historical table showing mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River by years for the period 1906 through 1947. The 1947 volume also contains a table (p. 1380) showing production of gold, silver, copper, lead, and zinc by months for the years 1943 through 1947. Monthly production data for earlier years are not available.

Mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1948, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	188	7,662	3,243	913	14,285
February	195	7,680	3,103	858	14,032
March	257	8,486	3,467	869	15,770
April	210	7,210	3,208	1,204	15,529
May	196	8,506	3,929	954	14,622
June	201	9,150	4,286	989	15,387
July	183	9,080	3,710	866	14,538

September	201	8,178	3,553	777	14,821
October	169	7,679	3,322	836	14,545
November	220	9,866	3,352	769	14,947
December	189	8,807	3,083	858	15,007
Total: 1948	2,479	101,171	42,025	10,706	177,787
1947	1,997	137,780	36,875	9,026	181,792

Gold.—Gold was recovered from mines in Georgia, Pennsylvania, Tennessee, and Vermont during 1948. In Georgia, two mines—the Calhoun and the Brand Estate—produced 19 ounces from gold ore. All other gold was a byproduct from copper-bearing ores and was recovered from slimes from the electrolytic refining of the copper. Sources during 1948, as in 1947, were: Magnetite-pyrite-chalcopyrite ore from the Cornwall mine, Lebanon County, Pa.; copper ore from the Elizabeth mine, Orange County, Vt.; and copper-iron-zinc ore from the Tennessee Copper Co. mines, Polk County, Tenn. Total gold recovered during 1948 from mines in the region was 2,479 fine ounces valued at $86,765 compared with 1,997 fine ounces valued at $69,895 in 1947. No placer gold was reported in 1948 or 1947.

Mine production of gold in the Southern Appalachian States, 1799–1948

State	Period	Fine ounces	Value	State	Period	Fine ounces	Value
Alabama	1830–1948	49,495	$1,198,985	South Carolina	1829–1948	318,801	$7,562,125
Georgia	1830–1948	870,642	18,088,317	Tennessee	1831–1948	21,424	497,470
Maryland	[1] –1948	6,102	163,940	Virginia	1828–1948	167,558	3,577,509
North Carolina	1799–1948	1,164,588	24,327,843				
				Total	1799–1948	2,598,610	55,416,189

[1] Year of first production not recorded.

Silver.—All silver produced from mines in States east of the Mississippi River was recovered as a byproduct. Output in 1948 totaled 101,171 fine ounces compared with 137,780 ounces in 1947. Production was from mines in Georgia, Illinois, New York, Pennsylvania, Tennessee, and Vermont. Michigan copper producers usually recover some silver, but reported no output in 1948. Considerable silver in Michigan copper ores not reported as mine production is retained in copper bullion to raise annealing temperatures, prevent brittleness, facilitate soldering, and increase hardness and conductivity. The quantity of silver in this bullion ranges from about 16 to 26 ounces per ton, or as specified, of which about 10 ounces is derived from the ore.

Copper.—Copper was produced from 18 mines and at 3 tailings reclamation operations in 4 States east of the Mississippi River during 1948. Output was 14 percent more than in 1947 and totaled 84,050,000 pounds valued at $18,238,850. The producing States in order of output were Michigan, Tennessee, Pennsylvania, and Vermont. Mines in these four States accounted for about 5 percent of the output for the United States.

Lead.—Mines in States east of the Mississippi River produce lead chiefly as a byproduct of zinc or fluorspar mining. In 1948 output for the region totaled 21,412,000 pounds valued at $3,832,748, an increase of 19 percent in output and 47 percent in value over 1947.

The principal producers were the Austinville mine in Virginia, Ozark Mahoning Co. mines in Hardin County, Ill., and the Balmat mine, New York. Together, these mines accounted for 75 percent of the total lead produced in the region in 1948.

Zinc.—Zinc production in States east of the Mississippi River was 177,787 tons in 1948, a decrease of 4,005 tons from the 1947 production of 181,792 tons. However, the value of the zinc produced in 1948 was 11 percent higher than in 1947. Mines in the region accounted for 28 percent of the total United States mine output of recoverable zinc. States reporting production in the region include Illinois, Kentucky, New Jersey, New York, Tennessee, Virginia, and Wisconsin. New Jersey was the leading zinc-producing State in the region and New York, second. Increases in zinc output over the 1947 rate were reported for New York, Illinois, and Kentucky. Expiration of the Premium Price Plan in June 1947 did not greatly reduce the zinc output or the number of mines operating in 1948 except in Wisconsin and in the Northern Illinois district.

MINING INDUSTRY

Prices for copper, lead, and zinc were higher in 1948 than in 1947, as were also labor, material, and freight costs.

Virtually the same mines as in the preceding year were operated in Michigan, New Jersey, New York, Pennsylvania, Tennessee, Vermont, and Virginia in 1948, the first year since the ending (June 30, 1947) of the Premium Price Plan for copper, lead, and zinc. Exceptions include the Gaither Chemical Co. operations in Tennessee and the Toncrae Mining Co. operation of the Toncrae mine in Virginia; both of these companies ceased operations in 1947. The Isle Royal Copper Co. in Michigan ceased operations for lack of ore in December 1948. Lead and zinc output from mines in Southern Illinois and Kentucky depends chiefly on demand for and the price of fluorspar. Output from this area was larger in 1948 than in 1947, and there was little change in the number of mines reporting production. In Wisconsin fewer mines (11 less) reported shipments in 1948, and current output of lead and zinc decreased 45 and 67 percent, respectively, from that of 1947. Tri-State Zinc, Inc., operated three properties in 1948 compared with two in 1947 and, except for shipments totaling 28 tons from four other operators, accounted for all the reported production from the Northern Illinois district in 1948.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in States east of the Mississippi River in 1948, with content in terms of recovered metals

Source	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Gold ore: Georgia	36	19	3			
Total	36	19	3			
Copper ore:						
Michigan	4,490,236			55,554,000		
Tennessee	1,086,810	156	39,692	[1] 28,496,000		(2)
Vermont	144,914	104	24,910	(1)		
Total	5,721,960	260	64,602	[3] 84,050,000		(2)
Magnetite-pyrite-chalcopyrite ore: Pennsylvania	(4)	2,200	13,731	(1)		
Total	(4)	2,200	13,731	(1)		
Zinc ore:						
Illinois	74,567				24,000	5,214,000
Kentucky	10,351				124,000	378,000
New Jersey	488,701					152,664,000
New York	154,361		1,903		242,000	21,672,000
Tennessee	1,078,356					[2] 59,048,000
Wisconsin	32,040				14,000	2,950,000
Total	1,838,376		1,903		404,000	[2] 241,926,000
Zinc-lead ore:						
Illinois	313,950		4,047		7,366,000	20,746,000
Kentucky	35,323				308,000	900,000
New York	309,688		16,885		2,220,000	47,460,000
Virginia	519,899				9,406,000	31,764,000
Wisconsin	155,186				1,708,000	12,778,000
Total	1,334,046		20,932		21,008,000	113,648,000
Grand total:						
1948	[5] 8,894,418	2,479	101,171	84,050,000	21,412,000	355,574,000
1947	[5] 9,704,077	1,997	137,780	73,750,000	18,052,000	363,584,000

[1] Data for copper in Pennsylvania and Vermont included with Tennessee; Bureau of Mines not at liberty to publish separate figures.
[2] Zinc from copper ore included with that from zinc ore; Bureau of Mines not at liberty to publish separate figures.
[3] Includes copper produced in Pennsylvania from magnetite-pyrite-chalcopyrite ore.
[4] Bureau of Mines not at liberty to publish separate figures for ore.
[5] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

METALLURGIC INDUSTRY

During 1948, as in former years, most of the ore and virtually all of the old tailings were treated at concentrating mills at or near the mines and the product shipped to smelters, refineries, or oxide plants. Of the 8,894,418 tons of ore (6,544,541 tons) and tailings (2,349,877 tons) mined in 1948, exclusive of pyrite ore from Pennsylvania, only 9,910 tons were shipped for direct smelting. All ore mined in Pennsylvania was concentrated. Comparable figures for 1947 were 9,704,077 tons of ore and tailings mined, of which 16,420 tons were shipped for direct smelting. In 1948 about 36 tons of gold ore was treated by amalgamation.

The methods of treatment used in the mills and other operating details, including the tonnage and grade of concentrates produced at some mills, are given in the Review by States that follows.

Active smelters and refineries in States east of the Mississippi River that treated primary materials include copper plants at Hubbell and Hancock, Mich., Carteret, N. J., Laurel Hill, N. Y., Copperhill, Tenn., Baltimore, Md., and Barber, N. J.; lead plants at Barber, N. J., East Chicago, Ind., and Federal Hill, Ill.; zinc plants at Hillsboro, Fairmont City, La Salle, East St. Louis, and Depue, Ill., Donora, Palmerton, and Josephtown, Pa., Columbus, Ohio, and Meadowbrook, W. Va.

REVIEW BY STATES

GEORGIA

The Calhoun Mines, Inc., operating the Calhoun mine in Lumpkin County, and the Cooperative Mining & Developing Co., operating its property in Cherokee County, were the only producers of gold and silver in Georgia during 1948. No production of copper, lead, or zinc was reported.

State output, all sold to the Philadelphia Mint, was 19 fine ounces of gold and 3 fine ounces of silver.

A report on diamond drilling at the Tallapoosa copper mine, Haralson County, Ga., was published.[1]

ILLINOIS

Zinc and lead are produced in Jo Daviess County, northern Illinois; and silver, lead, and zinc are produced as a byproduct or coproduct with fluorspar in southern Illinois, principally in Hardin County. During 1948 recoverable output of all three metals in Illinois increased—silver 126 percent, lead 59 percent, and zinc 29 percent—both districts contributing to the increase.

Northern Illinois.—During 1948 production was reported from seven mines and from ore previously stock-piled by the Office of Metals Reserve (OMR). Total output in terms of recoverable metal was 946 short tons of lead and 6,197 tons of zinc. This compares with 650 tons of lead and 4,853 tons of zinc in 1947.

OMR stock-piled ore from northern Illinois and Wisconsin mines is credited as production only after it has been milled. The Vinegar Hill Zinc Co. reported milling the remainder of this stock pile during 1948, and 6,975 tons of ore yielding 30 tons of lead and 463 tons of zinc have been credited to mines in Illinois. This is somewhat less than the calculated balance shown in the 1947 chapter; the loss can be attributed chiefly to the difference between initial and final assay and to physical and oxidation losses resulting from storage and handling.

[1] Excludes lead-bearing material mined with fluorspar and from which some lead was recovered as a byproduct of the mining and milling of the fluorspar.
[2] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania from which gold, silver, and copper are recovered; Bureau of Mines not at liberty to publish figures for ore and copper separately.
[3] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[4] Data for copper in Pennsylvania and Vermont included with Tennessee; Bureau of Mines not at liberty to publish separate figures.

Tri-State Zinc, Inc., accounted for most of the current production of Illinois during 1948. It operated the Bautsch, Heer, and Black Jack mines. The Bautsch and Heer were operated throughout the year, whereas the Black Jack, last worked in 1927, was dewatered during the year and produced only in November and December.

The Bautsch mine was operated through two shafts, one 282 feet and the other 291 feet deep. Development at this property during the year included 3,932 feet of churn drilling. The Heer mine was operated through one shaft 278 feet deep; development included 1,315 feet of churn drilling. The Black Jack mine was operated through one shaft 158 feet deep; development included 565 feet of diamond drilling and 3,190 feet of churn drilling. Ore from all three mines was treated in the company's Gray mill. Small shipments to the Vinegar Hill Zinc Co. custom mill were reported from four other properties.

Reports on the Blewett zinc-lead deposit [2] and the Skene zinc mine[3] were published.

Southern Illinois.—Production from Southern Illinois, in terms of recoverable metal, in 1948 was 4,047 fine ounces of silver, 2,749 short tons of lead, and 6,783 tons of zinc compared with 1,790 ounces of silver, 1,675 tons of lead, and 5,220 tons of zinc in 1947.

The Ozark-Mahoning Co., with fluorspar-zinc-lead mines near Cave in Rock, was the largest producer of silver, lead, and zinc in the district. Producing shafts (1948 depths in parentheses) were the Deardorff No. 2 (310), Mahoning mine shaft No. 2 (161), Mahoning mine shaft No. 3 (146), East Green (230), and West Green (363). During the year the company began sinking the North Green shaft and did 12,623 feet of churn drilling. The company mill at Rosiclare operated continuously throughout the year, treating company and custom ores from Illinois and Kentucky. Ore treated totaled 137,660 tons. Mill products were fluorspar, zinc and lead concentrates. Zinc concentrates were shipped to Fort Smith, Ark., and lead concentrates to Federal, Ill.

The Minerva Oil Co. operated its fluorspar-zinc mine and 200-ton mill throughout 1948 except for the period of a labor strike, June 10–27. Development of the property included 320 feet of drifts, 46 feet of raise, 1,478 feet of diamond drilling, and 21,757 feet of churn drilling. Improved loading and drilling equipment were added to the mine. No major changes were made in milling operations. Zinc concentrates were shipped to Fort Smith, Ark. Among other producers in Southern Illinois were the Alcoa Mining Co., Crystal Fluorspar Co., and the Rosiclare Lead & Fluorspar Mining Co. Most of the ore produced by these companies from which zinc and lead were recovered was treated in the Ozark Mahoning Co. mill. The Bureau of Mines published a report giving the results of ore-dressing tests on oxidized ore from the Alco Lead Co., Golconda, Ill.[4]

KENTUCKY

Lead and zinc are produced chiefly as a byproduct or coproduct with fluorspar in Kentucky. The fluorspar-lead-zinc operations are situated principally in Crittenden and Livingston Counties. One zinc-lead mine was operated in Owen County. Production (in terms of recoverable metal) reported from 14 mines was 216 short tons of lead and 639 tons of zinc, an increase of 1 percent for lead and 26 percent for zinc over the 1947 totals. The Ozark-Mahoning Mining Co. operated the Babb and Commodore mines in Crittenden and Livingston Counties. Development at these properties during 1948 included 250 feet of shaft, 150 feet of drifts, and 4,234 feet of diamond drilling. The Alco Lead Co. operated the Mineral Ridge and Babb mines. The United States Coal & Coke Co., fluorspar division, operated the Tabb No. 1 and treated the ore produced in its fluorspar mill at Mexico, Ky. The K. T. Dome Mining Syndicate operated its zinc-lead mine and mill in Owen County. Other fluorspar producers shipped material containing zinc, lead, and fluorspar to the Ozark-Mahoning mill at Rosiclare, Ill.

MICHIGAN

The output of recoverable copper from mines in Michigan was 15 percent larger in 1948 than in 1947. No silver recovery was reported in 1948. Of the total material treated during the year, 2,165,112 short tons was ore and 2,325,124 tons was old tailings. Copper recoverable from ore averaged about 18.7 pounds per ton and from tailings about 6.5 pounds per ton. Producing companies included the Calumet & Hecla Consolidated Copper Co., Copper Range Co., Isle Royal Copper Co., and the Quincy Mining Co.

Calumet & Hecla Consolidated Copper Co. operated the Ahmeek, Douglass, Iroquois, Kearsarge, Peninsula, Allouez, Centennial, and Seneca No. 2 mines throughout 1948. Ore from these properties was treated in the company Ahmeek 6,000-ton concentration mill. Old tailings were treated throughout the year at the Tamarack reclamation plant, and from May through December at the Lake Linden reclamation plant. All concentrates were shipped to the company smelter.

The Isle Royal Copper Co. operated its mine and 2,000-ton stamp mill from January until the early part of December, when all operations ceased. During the year the company mined and treated 264,949 tons of copper ore, which yielded 3,349 tons of copper concentrates containing 2,604 tons of copper from which 2,578 tons of fine copper were recovered. The copper was refined for the Isle Royal Copper Co. by Calumet & Hecla Consolidated Copper Co.

The Copper Range Co. operated the Champion mine throughout the year. The White Pine mine was operated from January to August 1, when operations were suspended. All ore was concentrated at the company Freda 2,000-ton flotation mill. Extracts from the company annual report follow:

> This year marks the fiftieth anniversary of the company and of its subsidiary the Copper Range Railroad Company. Space prevents even a brief outline of the history and growth of the Copper Range Company since its beginning, and it will not be covered in this report. There are, however, several significant accomplishments that are appropriate to mention at this time.
>
> The Copper Range Company was organized on January 20, 1899, and throughout the fifty years of its existence has continued to follow the concepts of its founders—the production of copper and development of the natural resources of the Upper Peninsula of Michigan, together with the construction and operation of a railroad and other services necessary for these objectives and for the public welfare.
>
> Since incorporation, several important properties have been acquired, and extensive mineral timber lands have been added to our ownership either by purchase or merger. Among these acquisitions was the C. G. Hussey & Company, fabricators of copper. This division of the company was founded in 1848 and celebrated its centennial anniversary last year with appropriate ceremonies.
>
> A total of 1,233,570,000 pounds of copper have been produced from our mines in Northern Michigan, for which the company received an over-all average price of 15.7 cents per pound, and the company has paid a total of $34,590,000.00 in dividends to its stockholders.
>
> The acquisition and exploration of the White Pine ore body is an outstanding development which will play an important part in the future of the company and Northern Michigan. The total estimated positive plus probable ore reserves of the White Pine mine stand to date at 199,610,000 tons of ore carrying 22.3 pounds of copper per ton. This includes 106,770,000 tons of parting shale ore averaging 25.3 pounds per ton. Plans for the development of this ore body are progressing satisfactorily. * * *
>
> The net income of the company for the year 1948 was $1,016,559.22 after depre-

ciation and provision for all taxes. This compares with a net income of $991,052.43 for the preceding year. Dividends were paid during the year in the amount of $423,696 equivalent to 75 cents per share. * * *

The program of exploration, development and mining initiated last year has been continued in the East Vein of the Champion mine. The work in the early part of the year consisted largely of stoping on the 12th level south of No. 4 shaft. During the latter part of the year stoping was started on the 9th level in the No. 1 shaft area. Development work was carried on throughout the year at a rate sufficient to balance the tonnage of ore broken. A total of 119,912 tons of ore were mined during the year and produced 1,885,603 pounds of copper. Approximately 106,000 tons of ore were held in broken ore reserves at the close of the year. Although the grade of ore from the East Vein has proved disappointing, this work has carried its full share of the costs, and prospects for improvement justify the work being continued. This success was due in great measure to the excellent over-all operating efficiencies obtained by the management under the disadvantage of a power shortage during the last half of the year as well as of higher labor, material, and supply costs.

There was no drilling or development work at the White Pine property during the year, as no immediate advantage was to be gained by adding to the proven ore reserves. We have sufficient information and data to indicate the important structural features of the ore body as well as to confirm the continuity and grade of ore.

Tailings were treated by the Quincy Mining Co. at its reclamation plant at Mason, Mich., throughout 1948. Concentrates were shipped to the Calumet & Hecla Consolidated Copper Co. smelter during the early part of the year, then to the Quincy Mining Co. smelter at Hancock, Mich. First production of refined copper from the rehabilitated Quincy smelter was reported in October.

NEW JERSEY

The output of recoverable zinc as metal or oxide from mines in New Jersey was virtually the same in 1948 as in 1947. However, the value in 1948 was 19 percent greater. New Jersey contributed 43 percent of the recoverable zinc produced in States east of the Mississippi in 1948.

Mines operated were the Mine Hill at Franklin and the Sterling Hill at Ogdensburg, both in Sussex County. The ore minerals are chiefly franklinite, willemite, and some zincite. In beneficiating the ore the franklinite is removed from the crushed ore by magnetic separators, and the willemite and zincite are concentrated on jigs and tables. Franklinite concentrates are used in the manufacture of zinc oxide and spiegeleisen, and the willemite-zincite concentrate is smelted to produce high-grade zinc. Concentrates are refined in smelting and manufacturing plants at Palmerton, Pa.

The value of the New Jersey output of zinc given in the tables of this chapter is the combined value of the zinc recoverable in both metal and oxide after freight, haulage, smelting, and manufacturing charges have been added.

NEW YORK

New York mines produced and treated 464,049 tons of ore, an increase of 6 percent over 1947. However, the output of recoverable zinc increased only 1 percent, and silver and lead output decreased 16 and 18 percent, respectively. State production in 1948 in terms of recoverable metal was 18,788 fine ounces of silver, 1,231 short tons of lead, and 34,566 tons of zinc.

The producing mines were the Balmat and the Edwards, operated by the St. Joseph Lead Co., and the Hyatt, operated by the Universal Exploration Co.—all in St. Lawrence County. Both companies operated throughout 1948. The Balmat mine is worked through a single inclined shaft, and the ore is concentrated in a 1,200-ton flotation mill. Lead, zinc, and iron concentrates are made. Zinc concentrates were sent to the American Steel & Wire Co., Donora, Pa., and to the St. Joseph Lead Co., Josephtown, Pa. Lead concentrates were shipped to the St. Joseph Lead Co., Herculaneum, Mo. Development in the mine during 1948 included 1,753 feet of drift and 51,166 feet of diamond drilling. The Edwards mine is worked through one vertical shaft 1,560 feet deep and one underground shaft 1,538 feet on a 42° slope. Development in the mine in 1948 included 312 feet of shaft, 583 feet of drifts, and 8,132 feet of diamond drilling. A zinc flotation concentrate was made in the 600-ton mill and was shipped to the Josephtown smelter.

The Hyatt mine is worked through an inclined shaft 450 feet deep and has approximately 8,500 feet of drifts. During 1948 development included 250 feet of drift. The ore is treated in a flotation mill, which has a daily capacity of 200 tons. The lead concentrate is shipped to Herculaneum, Mo., and the zinc concentrate to Donora, Pa., or Josephtown, Pa.

PENNSYLVANIA

The output of gold, silver, and copper in Pennsylvania increased 45, 39, and 48 percent, respectively, in 1948 over 1947. Production was from the Cornwall mine of the Bethlehem Steel Co. in Lebanon County. The ore (magnetite-pyrite-chalcopyrite) is treated in the company combined magnetic concentration and flotation plant at Lebanon, which operated on a 24-hour schedule 6 days per week during the year.

Pennsylvania zinc mines have been idle for many years. However, the New Jersey Zinc Co. of Pennsylvania was rehabilitating and developing its property in the Friedensville district and contemplates production in 1949. A report on the Bamford zinc mine was published by the Bureau of Mines.[5]

Zinc smelters at Donora, Josephtown, and Palmerton, Pa., treat most of the zinc concentrates produced in New York, Pennsylvania, and Tennessee as well as large tonnages from other States and from foreign countries.

TENNESSEE

During 1948 Tennessee mines produced gold, silver, copper, and zinc, but no lead. The gold and silver outputs, byproducts of copper ores, were only about half those of 1947; copper production decreased 2 percent and zinc 5 percent. Production was reported from 11 mines operated by 3 companies.

The American Zinc Co. of Tennessee operated the Grasselli, Jarnagin, and Mossy Creek mines in Jefferson County and the Mascot No. 2 in Knox County during the entire year. Development in the Gras-

[5] Mosier, McHenry, Bamford Zinc Mine, Lancaster County, Pa.: Bureau of Mines Rept. of Investigations 4247, 1948, 3 pp.

selli mine included 1,830 feet of drifts, 527 feet of incline shaft, 35,149 feet of diamond drilling, and 12,573 feet of churn drilling; in the Jarnagin mine, 549 feet of drift, 5,635 feet of diamond drilling, and 3,264 feet of churn drilling; in the Mascot No. 2 mine, 2,177 feet of drift, 235 feet of incline shaft, 20,407 feet of diamond drilling, and 425 feet of churn drilling; and in the Mossy Creek mine, 503 feet of drifts. All ore was concentrated at the Mascot mill. Concentrates were shipped to several smelters and oxide plants.

All producing mines of the Tennessee Copper Co. in Polk County were operated at capacity throughout 1948. They were the Burra Burra, Boyd, Calloway, Eureka, and Mary. Development during the year included 819 feet of shaft, 13,087 feet of drift, 3,374 feet of raises, and 6,573 feet of diamond drilling. The ore produced—a sulfide containing iron, copper, zinc, and small quantities of gold and silver—was concentrated in the London and Isabella mills. Copper, iron, and zinc concentrates are made. Zinc concentrates were sent to the New Jersey Zinc Co., Palmerton, Pa., and to the American Zinc Co., East St. Louis, Ill. Copper concentrates are reduced to blister copper in the company smelter at Copperhill, Tenn. Part of the copper blister is shipped to the electrolytic plant of the Phelps Dodge Copper Corp., Laurel Hill, N. Y., and the remainder is used to manufacture copper sulfate. The Bureau of Mines published a report giving data on blast-hole drilling with diamond drills at the Tennessee Copper Co. mines.[6]

The Davis-Bible group of claims and 800-ton flotation mill near Jefferson City in Jefferson County were operated throughout 1948 by Universal Exploration Co. A total of 208,499 tons of ore was mined in 1948, from which 10,380 tons of zinc concentrates were made. Development in the mine included 188 feet of shaft, 1,553 feet of drift, 6,312 feet of diamond drilling, and 2,336 feet of churn drilling. Concentrates were shipped to the American Steel & Wire Co., Donora, Pa., and to the St. Joseph Lead Co., Josephtown, Pa.

The Bureau of Mines published reports on the Howard Lynch [7] and the D. W. Harris (O'Dell)[8] zinc prospects, both in Claiborne County, Tenn.

VERMONT

The Vermont Copper Co. produced gold, silver, and copper from the Elizabeth mine in Orange County throughout 1948. The ore, carrying chalcopyrite and pyrrhotite with a small quanity of gold and silver, is concentrated in the company 500-ton flotation mill. During the year 144,914 tons of ore were treated, and 9,679 tons of copper concentrates were made. The concentrates made are shipped chiefly to the Phelps Dodge Corp. smelter and refinery at Laurel Hill, N. Y. The output of recoverable copper during 1948 was about 2 percent less than in 1947.

VIRGINIA

Mines in Virginia recorded an increase of 24 percent in output of recoverable lead and a decrease of 5 percent in output of zinc in 1948 compared with 1947. No copper production was recorded in 1948.

The Austinville zinc-lead mine operated continuously during 1948; the ore is treated in a 2,000-ton flotation mill at the mine.

The Bureau of Mines published reports on the Sutherland copper prospect [9] and the Toncrae-Howard copper deposits,[10] both in Floyd County, Va.

WISCONSIN

During 1948 Wisconsin mines produced and treated 97,595 tons of ore and tailings containing, in terms of recoverable metal, 577 short tons of lead and 3,224 tons of zinc. In addition, 89,631 tons of ore from the stock pile of the Office of Metals Reserve (OMR), mined prior to 1947, was treated and credited to 1948 production from Wisconsin mines. This ore contained in terms of recoverable metal, 284 tons of lead and 4,640 tons of zinc. This output compares with 454,659 tons of ore produced and treated in 1947, which yielded 1,054 tons of lead and 9,883 tons of zinc, and 43,351 tons of OMR stock-piled ore treated in 1947, which yielded 112 tons of lead and 2,341 tons of zinc. There were 41 producing mines compared with 52 in 1947.

The OMR reported that all lead-zinc and zinc ores purchased from mines in Northern Illinois and Wisconsin on hand at the beginning of 1948 were sold to the Vinegar Hill Zinc Co. during the year. This ore, totaling 96,606 tons containing 533,548 pounds of lead and 12,289,026 pounds of zinc, was treated by the Vinegar Hill Zinc Co. during the year, and the quantity of metal recovered was prorated according to records of purchases, to Illinois or Wisconsin mines and was credited as part of the 1948 output for each State. The difference between the calculated balance shown in the 1947 chapter and the actual balance can be attributed chiefly to the difference between the initial and final assay and to physical and oxidation losses from storage.

Most of the ore produced in Wisconsin in 1948 and some ore from Northern Illinois was beneficiated at the Vinegar Hill Zinc Co. custom mill at Cuba City. The mill operated throughout the year and treated current and stock-piled ore totaling 114,125 tons, and 3,353 tons of tailings. Galena concentrates made averaged 72.01 percent lead, and sphalerite concentrates averaged 62 percent zinc. Principal shippers to the mill were Kittoe Mining Co., Cuba Mining Co., Meekers Grove Mining Co., Little Mullen Mining Co., William A. Reed, and Frank Mullikin—all in Wisconsin. The Dodgeville Mining Co., the largest producer in the State, and the mentioned shippers accounted for 89 percent of the value of the current output from lead and zinc mines in Wisconsin during 1948.

The Dodgeville Mining Co. operated its mine and 50-ton flotation mill throughout 1948 and mined and concentrated 49,023 tons of ore

producing 375 tons of galena concentrates, which averaged 69.213 percent lead, and 1,932 tons of sphalerite concentrates which averaged 61.814 percent zinc. Development during the year included sinking the Dodgeville No. 2 shaft 122 feet, 281 feet of drifts, and 17,000 feet of churn drilling.

Development and exploration by the Calumet Corp. (subsidiary of Calumet & Hecla Consolidated Mining Co.) continued on its properties near Shullsburg. Reports of investigations of several mines and mining areas made prior to 1948 were published by the Bureau of Mines during the year.[11]

OTHER STATES

No production of gold, silver, copper, lead, or zinc was reported from mines in other States in the region during 1948. Reports of investigations of mines in Alabama, Maine, New Hampshire, and North Carolina made by the Bureau of Mines prior to 1948 were published.[12]

Idaho

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. NEEDHAM AND PAUL LUFF

GENERAL SUMMARY

SILVER and lead outputs in Idaho in 1948 were the highest since 1943, and for the first time since 1943 the lead output exceeded the zinc output, despite the fact that the latter was the highest since 1944. The silver output increased from 10,345,779 fine ounces in 1947 to 11,448,875 in 1948 (an 11-percent gain); lead from 157,888,000 pounds to 177,088,000 (a 12-percent gain); and zinc from 166,138,000 pounds to 172,534,000 (a 4-percent gain). However, the gold output dropped from 64,982 fine ounces to 58,454 (a 10-percent loss) and copper from 3,280,000 pounds to 3,248,000 (a 1-percent loss). The total value of the five metals rose from $55,164,670 in 1947 to $67,758,290 in 1948—the greatest value in any year in the State's history and a 23-percent gain over 1947. The total value of the gold was $2,045,890—3 percent of the State total value; silver, $10,361,810—15 percent; copper $704,816—1 percent; lead, $31,698,752—47 percent; and zinc, $22,947,022—34 percent. In 1948 the State remained the largest producer of silver and zinc in the United States and the second-largest producer of lead (exceeded only by Missouri). More than 92 percent of the State silver production, 85 percent of the copper, 93 percent of the lead, and 97 percent of the zinc came from the Coeur d'Alene region of Shoshone County; the rest of the silver, copper, lead, and zinc came largely from the Warm Springs district in Blaine County and the Bayhorse and Alder Creek districts in Custer County.

More than 46 percent of the State gold production in 1948 came from a lode mine in the Yellow Pine district, Valley County; the remainder came largely from dredging operations in the Boise Basin district, Boise County; Elk City district, Idaho County; and Yankee Fork district, Custer County.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Idaho, 1944–48, and total, 1863–1948, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	112	20	3,271,038	25,008	$875,280	9,931,614	$7,062,481
1945	116	27	3,139,286	17,780	622,300	8,142,667	5,790,341

1947	99	4,467,931	19,776	692,160	.155
1948	78	4,042,245	20,776	727,160	.180

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."
[2] A mine using more than one method of recovery is counted but once in arriving at total for all methods.

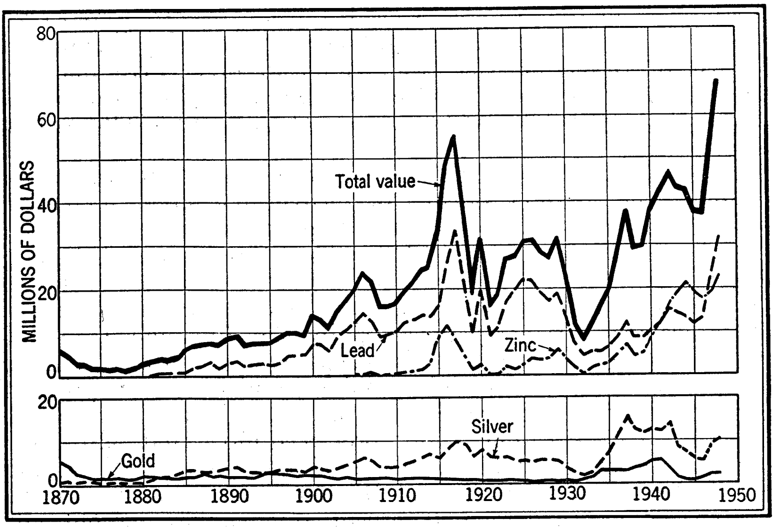

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1948. The value of copper has been less than $2,000,000 annually, except in a few years.

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1948, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	5,809	1,055,110	144	8,020	7,140
February	4,595	890,095	133	7,325	6,420
March	4,614	1,070,600	160	7,875	7,841
April	4,248	1,110,110	149	7,345	7,302
May	4,247	974,305	128	6,970	7,162
June	4,823	889,500	123	6,825	7,273
July	4,677	885,990	128	6,755	7,252
August	6,054	955,490	133	7,300	7,573
September	4,788	964,400	129	7,335	7,247
October	5,260	829,685	131	7,330	6,927
November	5,964	901,890	135	7,620	7,327
December	3,375	921,700	131	7,844	6,803
Total: 1948	58,454	11,448,875	1,624	88,544	86,267
1947	64,982	10,345,779	1,640	78,944	83,069

Gold.—The output of recoverable gold in Idaho declined 10 percent in 1948, owing to a decrease of 7,528 ounces from lode mines, especially from the Boise-Rochester-Monarch group at Atlanta and from the Yellow Pine mine at Stibnite. Gold recovered from placer properties increased from 19,776 ounces to 20,776. The Yellow Pine lode mine in Valley County worked by the Bradley Mining Co. continued to be by far the largest producer of gold in Idaho, although its output declined 12 percent; it was followed by a bucket-line dredge at Idaho City worked by the Idaho-Canadian Dredging Co., a dragline dredge on Jordan Creek worked by Jordan Placers, Inc.; a bucket-line dredge near Elk City worked by the Warren Dredging Corp.; a lode property at Atlanta worked by Talache Mines, Inc.; and a bucket-line dredge near Centerville worked by Baumhoff-Marshall, Inc. Of the total gold produced in Idaho in 1948, 54 percent came from gold ore, 25 percent from bucket-line dredging, 9 percent from dragline dredging, and most of the remainder from zinc-lead ore. Five bucket-line dredges and 7 dragline dredges treated 3,996,738 cubic yards of gravel in 1948 and recovered 20,244 fine ounces of gold and 5,769 fine ounces of silver.

Silver.—Stimulated by higher prices for lead and zinc and a steady price for silver, Idaho's output of recoverable silver increased to 11,448,875 fine ounces in 1948, the largest output since 1943 and 1,103,096 ounces more than in 1947. The State remained the largest producer of silver in the United States—a place it has held since 1933. The gain in 1948 resulted mainly from a substantial increase in output of silver ore from property operated by the Sunshine Mining Co., from an increase in output of zinc-lead-silver ore from the Bunker Hill & Sullivan, Page, and Sidney mines, and from new production of silver ore from the Silver Summit mine, all in the Coeur d'Alene region. The Coeur d'Alene region produced more than 92 percent of the State total silver in 1948; the remainder came largely from the Warm Springs, Yellow Pine, and Bayhorse districts. Of the State total silver, silver ore yielded 50 percent, zinc-lead ore and old tailings 39 percent, lead ore 8 percent, and gold ore most of the remainder. The recovery of silver from silver ore increased 614,725 ounces, owing chiefly to the rise in output of ore from property operated by the Sunshine Mining Co.; the recovery of silver from lead ore increased 302,085 ounces and that from zinc-lead ore 246,610 ounces, but that from gold ore declined 49,244 ounces.

Eleven mines—the Sunshine, Bunker Hill & Sullivan, Polaris, Silver Dollar, Page, Osburn tailing dump, Sherman, Triumph, Sidney, Yellow Pine, and Star—produced 81 percent of the silver output of the State in 1948. Six properties near Kellogg, operated by the Sunshine Mining Co., produced 5,726,863 ounces of silver in 1948, or 50 percent of the State total.

Copper.—The output of copper in Idaho declined slightly to 3,248,000 pounds in 1948, a 1-percent loss from 1947. About 82 percent of the State copper output in 1948 was recovered as a byproduct in the treatment of zinc-lead ore and silver ore from mines in the Coeur d'Alene region; the remainder was recovered largely from zinc-lead ore produced in the Warm Springs district.

The Sunshine mine near Kellogg in the Coeur d'Alene region continued to be the largest producer of copper in Idaho. It was followed by the Bunker Hill & Sullivan, Polaris, Silver Dollar, and Triumph properties.

Lead.—In 1948 the mines in Idaho produced 177,088,000 pounds of recoverable lead, the largest output since 1943 and the first time since 1943 that the lead output exceeded the zinc output; however, it was only 3 percent greater, but the value of the lead in 1948 was 38 percent greater than the value of the zinc, owing principally to the difference in price. Higher prices for lead and zinc in 1948 and a steady price for silver caused a greater output of silver-lead ore and zinc-lead-silver ore from mines in the Coeur d'Alene region, the chief source of silver, lead, and zinc in Idaho. In 1948, 93 percent of the

State total lead came from the Coeur d'Alene region; most of the remainder was produced in the Bayhorse, Warm Springs, Alder Creek, and Clark Fork districts. Zinc-lead ore and old tailings (2,751,561 tons) from the Coeur d'Alene region yielded more than 77 percent of the State total lead; and lead ore and silver ore, chiefly from the Coeur d'Alene region, yielded 18 percent. The remainder came largely from lead ore in the Bayhorse, Alder Creek, and Clark Fork districts, zinc-lead ore in the Warm Springs district, and old zinc slag in the Coeur d'Alene region. Lead recovered from lead ore increased 8,410,043 pounds, that from zinc-lead ore and old tailings 8,310,464 pounds, and that from silver ore 2,729,456 pounds.

The Bunker Hill & Sullivan mine at Kellogg was by far the largest producer of lead in Idaho in 1948, and its output increased nearly 52 percent over 1947. In 1948 the combined lead output of the six largest producing mines (each producing more than 7,600,000 pounds—the Bunker Hill & Sullivan, Page, Star, Sherman, Sidney, and Morning—was 106,897,467 pounds or 60 percent of the State total. Other important producers in 1948 were the Osburn tailing dump, Tamarack, Bunker Hill & Sullivan mill tailing dump, Frisco, Dayrock, and Sunshine properties.

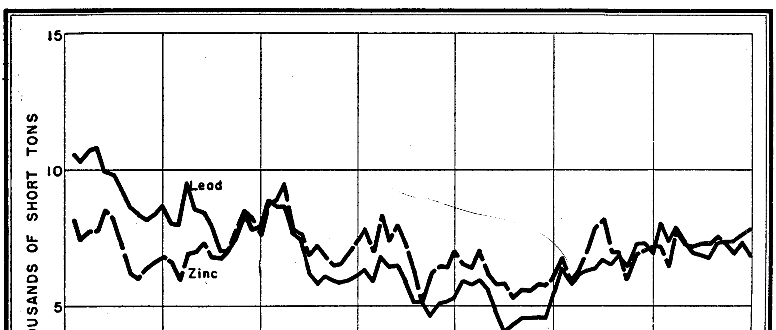

FIGURE 2.—Mine production of lead and zinc in Idaho, 1942–48, by months, in terms of recovered metals.

Zinc.—Idaho's output of recovered zinc increased to 172,534,000 pounds in 1948, the largest output since 1944, when the State reached its peak production of 182,744,000 pounds. Most of the increase in 1948 came from four mines—Sidney, Highland-Surprise, Spokane-Idaho, and Page—in the Pine Creek area of the Coeur d'Alene region. About 97 percent of the State total zinc in 1948 came from the Coeur d'Alene region and most of the remainder from the Warm Springs district. Zinc-lead ore and old tailings concentrated yielded nearly 91 percent of the State total zinc; old zinc slag smelted and fumed, 5 percent; and zinc ore concentrated, lead ore concentrated, silver ore concentrated, zinc-lead ore smelted, and zinc ore smelted, nearly all the remainder.

Twelve properties (each producing more than 7,000,000 pounds of zinc)—the Star, Page, Sidney, Bunker Hill & Sullivan, Bunker Hill smelter slag dump, Frisco, Highland-Surprise, Osburn tailing dump, Morning, Amazon-Carlisle, Spokane-Idaho, and Tamarack—produced 84 percent of the State total zinc in 1948.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1948, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

MINING INDUSTRY

The upward trend of Idaho's mining industry continued throughout 1948, especially during the last quarter of the year when the price of copper, lead, and zinc advanced and a greater supply of labor became available. However, gold mining was far below what it was during the years before World War II. The increase in the price of copper, lead, and zinc and the improvement in the labor supply during the year stimulated greater activity at mines in the Coeur d'Alene region, Shoshone County—the chief source of silver, copper, lead, and zinc in Idaho. As a result, the State had the highest value of the five metals and the greatest output of ore in its history. Although the State made a record output of ore in 1948, production was retarded owing to a lack of experienced miners and to a large labor turn-over. The output of zinc-lead ore and old tailings (by far the chief ore output of the State) increased from 2,716,251 tons to 2,824,758, gold ore from 618,877 tons to 672,681, lead ore from 165,218 tons to 253,648, silver ore from 146,259 tons to 149,691, and zinc ore and old slag from 67,133 tons to 79,674. More than 97 percent of the gold ore mined in Idaho in 1948 came from the Yellow Pine mine at Stibnite, Valley County, where the output increased from 584,483 tons in 1947 to 655,682 tons in 1948. About 99 percent of the silver ore, 99 percent of the zinc ore and old slag, 97 percent of the zinc-lead ore and old tailings, and 74 percent of the lead ore came from various properties in the Coeur d'Alene region. Placer mining indicated greater activity in the Boise Basin, Elk City, and Yankee Fork districts, where dredges were operated, but activity in the Gibbonsville and Kirtley Creek districts declined considerably owing to suspension of dredging operations. Fifteen dredges (7 dragline, 5 bucket-line, and 3 suction) recovered 20,264 fine ounces of gold in Idaho in 1948, compared with 25 dredges (12 dragline, 8 bucket-line, and 5 suction) in 1947 that recovered 19,386 fine ounces of gold.

ORE CLASSIFICATION

Details on ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Idaho in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	34	672,681	31,905	250,298	594	4,704	172
Dry and siliceous gold-silver ore	1	6	3	80	----------	----------	----------
Dry and siliceous silver ore	17	149,691	188	5,735,954	1,371,582	7,427,305	468,238
	52	822,378	32,096	5,986,332	1,372,176	7,432,009	468,410
Copper ore	11	1,383	38	2,464	170,674	600	----------
Lead ore	73	253,648	717	939,500	160,335	24,483,704	1,966,307
Lead-copper ore	1	5	----------	21	300	1,000	----------
Zinc ore	4	[1] 79,674	20	24,021	11,546	2,161,236	13,235,447
Zinc-lead ore	75	2,824,758	4,807	4,490,618	1,532,969	143,009,451	156,863,836
Total lode mines	[2] 194	[1] 3,981,846	37,678	11,442,956	3,248,000	177,088,000	172,534,000
Placers	78	----------	20,776	5,919	----------	----------	----------
Total: 1948	273	[1] 3,981,846	58,454	11,448,875	3,248,000	177,088,000	172,534,000
1947	282	[3] 3,717,697	64,982	10,345,779	3,280,000	157,888,000	166,138,000

[1] Includes 48,131 tons of old lead-smelter slag.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[3] Includes 65,409 tons of old lead smelter slag.

METALLURGIC INDUSTRY

Of the 3,981,846 tons of ore produced in 1948 in Idaho, 3,903,183 tons (98 percent) were treated at milling plants, and the remainder, 78,663 tons (2 percent), was shipped crude to smelters.

Milling plants in 1948 treated principally zinc-lead ore and old tailings (2,813,534 tons), gold ore (672,404 tons), lead ore (236,470 tons), silver ore (149,585 tons), and zinc ore (30,832 tons). Current hot zinc slag totaling 126,885 tons was fumed, and 48,131 tons of old dump lead-smelter slag were delivered for smelting and fuming in 1948. Metals recovered from the old dump slag were credited to the Bunker Hill smelter dump, and metals recovered from the hot slag were credited to various producers of the ores and concentrates that contributed during the year to the slag-making material.

The Bunker Hill & Sullivan Mining & Concentrating Co. operated its Bradley lead smelter and refinery at a greater rate than in 1947 on ore and concentrates, chiefly from mines and mills in the Coeur d'Alene region. The company also operated its antimony and cadmium plants, 2,000-ton flotation mill (including a sink-and-float unit), 300-ton tailing-treatment plant for recovery of silver, iron, lead, and zinc from old jig tailings, and 450-ton zinc slag-fuming plant at Bradley. According to the company annual stockholders' report for 1948, the smelter produced 7,928 ounces of gold, 10,266,544 ounces of silver, 150,577 pounds of cadmium, 1,166 tons of copper, 1,297 tons of antimony, 14,365 tons of zinc, and 61,151 tons of lead. The slag-fuming plant yielded 21,491 dry tons of deleaded zinc fume and 2,931 dry tons of lead fume; the production of lead and zinc in 1948 was about the same as that in 1947. The Sullivan Mining Co. operated at capacity throughout the year its 100-ton electrolytic zinc plant near Bradley, producing 42,065 tons of high-grade slab zinc. This is the largest yield for any of its 21 years of continuous operation, according to the annual report of the Bunker Hill & Sullivan Mining & Concentrating Co. During the year the Sullivan Mining Co. completed 150 additional electrolytic cells and other necessary facilities for increasing the capacity of its zinc plant from 100 to 150 tons of slab zinc a day. The Bradley Mining Co. operated its 2,000-ton flotation mill at Stibnite, Valley County, continuously on gold-silver-antimony ore from the Yellow Pine mine and proceeded during the year to construct a smelter at Stibnite for reduction of the antimony and gold concentrates.

Mine production of metals in Idaho in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	13,719	1,608	923			
Concentrates smelted	313,663	34,863	11,254,623	3,032,365	169,744,626	162,562,361
Ore smelted	78,663	1,207	187,410	215,635	7,343,374	9,971,639
Placer		20,776	5,919			
Total: 1948		58,454	11,448,875	3,248,000	177,088,000	172,534,000
1947		64,982	10,345,779	3,280,000	157,888,000	166,138,000

Gross metal content of Idaho ore treated at mills in 1948, by classes of ore

Class of ore	Ore (short tons)	Gross metal content of mill feed				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold	672,404	53,576	331,947		2,300	
Dry and siliceous gold-silver	6	4	100

REVIEW BY COUNTIES AND DISTRICTS

ADAMS COUNTY

About 13 tons of carbonate copper ore were produced in 1948 from the Helena claim north of Cuprum in the Seven Devils district.

BLAINE COUNTY

Little Wood River (Muldoon) District.—The Garfield Silver-Lead Mines, Inc., worked the Eagle Bird mine most of the year and shipped 411 tons of zinc-lead ore and 302 tons of lead-silver ore to reduction plants in Utah. Lead-silver ore (64 tons) was also shipped from the Idaho-Muldoon property 7 miles northeast of Muldoon.

Mineral Hill and Camas District.—Lessees worked the Snoose mine near Hailey in 1948 and shipped 137 tons of zinc-lead ore and 36 tons of lead-silver ore to reduction plants in Utah. The rest of the district output was 88 tons of lead-silver ore from the Apache, Croesus, Edres, Fourth of July, Memorial, and Ohio properties, and 25 tons of gold ore from the Bellevue mine.

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1948, by counties and districts, in terms of recovered metals

Warm Springs District.—Despite a substantial decline in output of zinc-lead-silver ore from the Triumph Mining Co. property at Triumph in 1948, the company remained the most important producer of gold, silver, copper, lead, and zinc in southern Idaho. The company reported that 35,552 tons of ore (52,169 tons in 1947), containing 3,645 ounces of gold, 320,633 ounces of silver, 296,396 pounds of copper, 2,947,888 pounds of lead, and 3,982,649 pounds of zinc, were shipped to milling plants in Utah. In addition, lessees shipped 744 tons of zinc-lead ore from the Triumph mine dumps. The rest of the district output comprised 124 tons of zinc-lead ore and 34 tons of zinc ore from the Lucky Boy mine, 51 tons of zinc-lead-silver ore from the Blue Kitten and Homestake mines, and 6 tons of lead-silver ore from the New Hope, Duquette, and Blue Kitten properties.

BOISE COUNTY

Boise Basin District (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—Increased activity in 1948 at both lode and placer properties in the Boise Basin district pushed the output of gold to 11,732 ounces and silver to 4,466 ounces. The most important output was 11,109 fine ounces of gold and 2,514 fine ounces of silver recovered by two bucket-line dredges; the Idaho-Canadian Dredging Co. operated its 6-cubic-foot bucket dredge all year on Moores Creek near Idaho City, treating 1,800,000 cubic yards of gravel, and Baumhoff-Marshall, Inc., operated its 6-cubic-foot bucket dredge the first 7 months of the year on Granite Creek near Centerville, treating about 550,000 cubic yards of gravel. Ground sluicing recovered 32 fine ounces of gold and 10 fine ounces of silver from the Elliott, Fountain Spring, Gold Hill, Ophir Creek, and Taku properties. The lode output was mainly 28 tons of high-grade gold ore produced from the Come-Back mine near Pioneerville by the American Mining & Refining Corp.

Summit Flat District.—Gold ore (91 tons) was produced in 1948 from the Jessie and Rock Creek mines and treated in amalgamation mills.

BONNER COUNTY

Clark Fork District.—The Hope Silver-Lead Mines, Inc., operated its mine and 150-ton flotation mill throughout the year. The company reported that 18,665 tons of ore were treated containing 27,000 ounces of silver, 1,500 pounds of copper, 1,045,500 pounds of lead, and 85,000 pounds of zinc. Leasing operations at the Whitedelf mine produced 1,524 tons of lead ore; most of it (1,490 tons) was treated in a 50-ton flotation mill. Lessees also worked the Lawrence mine and shipped 150 tons of lead-silver ore to a smelter.

Lakeview District.—About 1,200 tons of silver ore, containing a little copper, lead, and zinc, were produced in 1948 from the Idaho-Lakeview mine and treated by flotation.

Pend d'Oreille District.—Output in 1948 was 24 tons of silver ore produced from the Katherine and Peak claims, 9 tons of zinc-lead ore from the Gold Coin claim, and 7 tons of lead ore from the Silver Fox claim.

BOUNDARY COUNTY

The Continental Mining Co. operated its 500-ton heavy-medium separation plant and 100-ton flotation mill 5 months of the year on crude lead ore and old jig tailings from the Idaho-Continental property 27 miles west of Porthill. The company reported that 28,667 tons of old tailings and 330 tons of crude ore were treated containing 12,000 ounces of silver, 9,000 pounds of copper, 600,000 pounds of lead, and 90,000 pounds of zinc. In addition, 278 tons of lead-silver ore were shipped direct to a lead smelter.

BUTTE COUNTY

Dome District.—Leasing operations at the Wilbert mine near Howe produced 773 tons of ore containing 3 ounces of gold, 776 ounces of silver, 876 pounds of copper, 243,886 pounds of lead, and 21,762 pounds of zinc. The rest of the district output was virtually all zinc-lead ore (35 tons) from the Sentinel mine and lead ore (31 tons) from the Great Western mine.

Hamilton District.—Lead ore (71 tons) was produced in 1948 from the Badger, Big Horn, Cliff Ridge, and Whitebird properties north of Howe.

CAMAS COUNTY

Beaver Creek District.—J. R. Davies & Sons operated the Princess-Blue Ribbon mine near Fairfield most of the year, treated 191 tons of zinc-lead-gold ore in a gravity concentration mill, and shipped 105 tons of gold-lead ore to smelters in Utah.

CLARK COUNTY

In 1948 the Valley View and Pocahontas properties in the Birch Creek district produced 37 tons of copper ore.

CLEARWATER COUNTY

The principal output in Clearwater County in 1948 was placer gold recovered by dragline dredging on Moose and Independence Creeks by Painter & Vincent; 150,000 cubic yards of gravel were treated, which yielded 302 fine ounces of gold and 43 fine ounces of silver. However, operations ceased August 31.

CUSTER COUNTY

Alder Creek District.—In 1948 four mines in the Alder Creek district produced 6,474 tons of ore, which contained 100 ounces of gold, 49,447 ounces of silver, 75,493 pounds of copper, 1,634,683 pounds of lead, and 556,162 pounds of zinc. The principal output was 5,082 tons of lead-silver ore and 711 tons of zinc ore from the Homestake mine near Mackay operated by the White Knob Mining Co. The rest of the district output was 431 tons of copper ore from the Empire mine and 250 tons of lead-silver ore from the Champion and Horseshoe properties.

Alta District.—Zinc-lead-silver ore (46 tons) was produced in 1948 from the Alta Silver and Phi Kappa claims north of Hailey.

Bayhorse District.—The output of the Bayhorse district in 1948 was 38,159 tons of ore containing 132 ounces of gold, 179,785 ounces of silver, 40,641 pounds of copper, 4,027,965 pounds of lead, and 1,097,906 pounds of zinc. Zinc-lead ore from the Clayton mine, owned by the Clayton Silver Mines, continued to be the most important production in the district. The company reported that 29,077 tons of ore were treated in 1948 in its 120-ton flotation mill, which yielded 1,306 tons of lead concentrate and 892 tons of zinc concentrate. The concentrates contained 40 ounces of gold, 96,461 ounces of silver, 18,524 pounds of copper, 1,751,723 pounds of lead, and 848,273 pounds of zinc. According to the annual stockholders' report of the company for 1948, all known ore above the 300-foot level had been broken at the end of the year. By the time this ore is depleted, shaft sinking to the 400-foot level will be under way. It is expected that a large tonnage of new ore in the south end will be developed through the deeper shaft.

The remainder of the district output comprised 7,213 tons of lead ore from the Red Bird mine and waste dumps, 1,439 tons of lead-silver ore from the Beardsley, Clayton View, Ellis, McGregor, Red Top, Rob Roy, and South Butte properties, 356 tons of zinc-lead ore from the Saturday and Silver Rule groups, and 74 tons of high-grade lead-copper-silver ore from the Ramshorn mine.

Boulder District.—The Livingston Mines, Inc., operated its mine throughout the year and shipped 2,172 tons of ore containing 29 ounces of gold, 13,949 ounces of silver, 4,400 pounds of copper, 404,837 pounds of lead, and 264,751 pounds of zinc to reduction plants in Utah. Toward the end of the year, the company purchased a 100-ton flotation mill, which will be operated in 1949.

Seafoam (Greyhound) District.—Lessees operated the Mountain King mine 4 months in 1948 and shipped 467 tons of ore containing 58 ounces of gold, 6,734 ounces of silver, 2,426 pounds of copper, 91,594 pounds of lead, and 136,241 pounds of zinc. The rest of the district output comprised 32 tons of gold ore from the Parkin group, 24 tons of zinc-lead-silver ore from the Hopeful claim, and 1 ton of lead ore from the Hard Scrabble claim.

Yankee Fork District.—Placer gold and silver continued to be the most important output in the Yankee Fork district. Jordan Placers, Inc., operated its dragline on Jordan Creek 5 months and treated 200,000 cubic yards of gravel, which yielded 3,603 fine ounces of gold and 2,285 fine ounces of silver. The 8-cubic-foot bucket dredge of the Snake River Mining Co., a large producer of gold in 1947, was idle in 1948. The remainder of the district output in 1948 was mainly placer gold recovered by sluicing at the Horse Trail claim, lode gold recovered by amalgamation from Lucky Boy dump ore, and silver recovered by smelting ore from the Mulcahy claim.

ELMORE COUNTY

As a result of a marked decline in the output of gold ore in 1948 from the Boise-Rochester-Monarch group in the Middle Boise (Atlanta) district, the production of gold and silver in Elmore County was much less than that in 1947. The Talache Mines, Inc., operator of the group, reported that 10,370 tons of gold ore were treated in its 400-ton amalgamation and concentration mill in 1948 compared with 27,539 tons in 1947; recovered gold dropped to 2,563 fine ounces and silver to 11,227 fine ounces. The remainder of the county output was largely 42 fine ounces of placer gold recovered from claims along the Boise River and School House Gulch.

GEM COUNTY

Two mines in the West View (Pearl) district produced 57 tons of ore in 1948; 32 tons of gold ore were produced from the Black Pearl mine and 25 tons of zinc-lead ore from the Checkmate-Hecla group.

IDAHO COUNTY

Burgdorf-Marshall Lake District.—Hydraulicking and sluicing at the Golden Rule and Laughing Water properties recovered 165 fine ounces of gold and 31 fine ounces of silver. The rest of the district output was principally small lots of gold ore produced from the Golden Queen and Treasure Knob claims.

Dixie District.—George Grebe continued to work the Mammoth mine and recovered 233 fine ounces of gold and 64 fine ounces of silver from treating 135 tons of ore in a 15-ton amalgamation mill.

Elk City District.—In 1948 two dragline and two bucket-line dredges recovered 4,254 fine ounces of gold and 738 fine ounces of silver. The principal producers were the Warren Dredging Corp., which operated a 4-cubic-foot bucket-line dredge on American River from July 6 to November 3, and the H. & H. Mines, which operated a 2-cubic-foot bucket-line dredge on Red Horse Creek from January 1 to December 9. The two bucket dredges recovered 3,752 fine ounces of gold and 650 fine ounces of silver from treating 779,168 cubic yards of gravel. Draglines were operated on American River by the Tyee Mining Co., and on Deadwood Gulch by the Hawk Placer. The two dredges recovered 502 fine ounces of gold and 88 fine ounces of silver from treating 207,000 cubic yards of gravel.

Ten Mile District.—The South Fork Placers operated a dragline and floating washing plant on the South Fork of the Clearwater River from June to November; the plant treated 200,000 cubic yards of gravel, which yielded 617 fine ounces of gold and 126 fine ounces of silver. The rest of the district output was 98 ounces of gold and 31 ounces of silver recovered from treating 400 tons of gold ore from the Bob and Lone Pine mines near Golden.

LEMHI COUNTY

Birch Creek District.—Frank G. Worthing worked his Cabin claim and shipped 50 tons of lead-silver ore to a smelter in Utah.

Blackbird District.—The Blackbird mine on Meadow Creek was operated continuously by the Calera Mining Co., a wholly owned subsidiary of the Howe Sound Co. The company reported that 352 tons of copper-cobalt ore were treated in 1948 in a 25-ton pilot flotation mill for testing purposes. The rest of the district output was 29 tons of copper ore produced from the Victory group.

Eureka District.—The principal output of the Eureka district in 1948 was 473 tons of copper ore produced from the old Pope Shenon mine near Salmon.

Gibbonsville District.—The output of gold in the Gibbonsville district dropped from 3,441 ounces in 1947 to 104 ounces in 1948, owing to suspension early in 1948 of all dredging operations. The Idaho-Warren Dredging Co., a large producer of gold in 1947, ceased operating its 4-cubic-foot bucket dredge on Hughes Creek, February 5, 1948, and Smith Bros. & Courtis, Inc., also a large producer of gold from dredging operations in 1947, was idle throughout 1948. During the spring the 4-cubic-foot bucket dredge on Hughes Creek was dismantled by the Warren Dredging Corp. and moved to approperty near Elk City in Idaho County.

Junction District.—Lessees worked the Plymouth group near Leadore and shipped 175 tons of lead ore to a smelter in Utah. Lead ore (61 tons) was produced also from the Blue Lead and Galena claims and copper ore (6 tons) from the Blue Jay claim.

Mineral Hill District.—Gregor Mines, Inc., operated its Monolith mine and 50-ton concentration mill near Shoup during the summer months and shipped 23 tons of concentrate containing 760 ounces of gold, 284 ounces of silver, and 1,876 pounds of lead.

Nicholia District.—The output of the Nicholia district in 1948 was 2,273 tons of old smelter slag and 1,771 tons of ore. All the smelter slag, containing 1,303 ounces of silver, 386,210 pounds of lead, and 165,472 pounds of zinc, came from the dump at Nicholia, and 1,753 tons of zinc-lead ore came from the Clear Grit, Good Luck, Nicholia, and Viola properties. The Viola mine also produced 18 tons of lead ore.

Spring Mountain District.—Three cars (84 tons) of oxide lead ore were shipped in 1948 from the Lemhi Union mine south of Gilmore.

Texas District.—Oxide lead-silver ore (589 tons) was produced in 1948 from the Alex Stevens mine near Gilmore, and similar ore (430 tons) was produced also from the Green Meadow, Lady Franklin, Latest Out, Mountain Boy, and Valley View properties.

OWYHEE COUNTY

The output in Owyhee County in 1948 comprised 29 tons of silver ore from the Hope claim, 7 tons of rich gold ore from the Perseverance claim, and 10 ounces of placer gold and 21 ounces of placer silver from the Blue Gulch, Jordan Creek, and Orofino properties—all in the Carson (Silver City) district.

SHOSHONE COUNTY—COEUR D'ALENE REGION

Although the output of each metal, except zinc, in the Coeur d'Alene region (Shoshone County)—the chief source of silver, copper, lead, and zinc in Idaho—was greater in 1948 than in any year since 1943, most of the large producers reported that production was retarded, owing to a shortage of underground miners and to high labor turn-over. However, during the last quarter of the year, more labor became available, and prices of lead and zinc advanced, resulting in capacity production by some of the principal producers. In 1948 the output of gold increased 20 percent over 1947, silver 15, copper 6, lead 13, and zinc 6. The value of the metal output of the region was $62,168,955 (92 percent of the State value), the highest ever recorded for any year and a 26-percent gain over 1947. The region remained the largest silver-producing area in the United States and ranked second in lead and zinc; it produced more than 92 percent of Idaho's silver, 85 percent of the copper, 93 percent of the lead, and 97 percent of the zinc. The chief producers of zinc in the region in 1948, according to rank, were the Star, Page, Sidney, Bunker Hill & Sullivan, Bunker Hill smelter-slag dump, Frisco, Highland-Surprise, Osburn tailing dump, and Morning properties. The chief producers of lead, according to rank, were the Bunker Hill & Sullivan, Page, Star, Sherman, Sidney, Morning, and Osburn tailing properties. The chief producers of silver, according to rank, were the Sunshine, Bunker Hill & Sullivan, Polaris, Silver Dollar, and Page properties.

Of the total material (3,165,780 tons—a record output) produced in 1948 in the Coeur d'Alene region, 87 percent was zinc-lead ore and old tailings, 6 percent silver-lead ore, 5 percent silver ore, and 2 percent zinc ore and slag. Thirty-one mills, with an aggregate capacity of 13,700 tons of ore a day, operated in the region in 1948.

Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1947–48, and total 1884–1948, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
	Lode	Placer							
1947	61	4	2,957,143	2,808	9,234,906	2,624,000	146,120,000	158,502,000	$49,226,932
1948	65	7	3,165,780	3,362	10,598,338	2,775,000	165,174,000	167,601,000	62,168,955
Total 1884–1948			(1)	399,236	452,120,668	(2) 68,064	(2) 5,687,714	(2) 1,359,918	1,234,321,269

(1) Figures not available.
(2) Short tons.

Beaver District.—The output of the Beaver district in 1948 was 144,145 tons of ore containing 254 ounces of gold, 121,704 ounces of silver, 124,300 pounds of copper, 5,638,582 pounds of lead, and 12,920,584 pounds of zinc. In addition, 257 fine ounces of placer gold and 53 fine ounces of silver were recovered mainly by a dragline and dry-land washing plant at the Potosi property. The principal output was 92,989 tons of ore—containing an average of 0.71 ounce of silver to the ton, 1.74 percent lead, and 4.81 percent zinc—produced from the Amazon-Carlisle groups by Day Mines, Inc.; the ore was treated in the Carlisle 500-ton flotation mill. Lessees worked the Parrott and Silver Tip mines, owned by Day Mines, Inc., and hauled 3,834 tons of zinc-lead ore to the Hercules custom flotation mill near Wallace. According to the annual stockholders' report of Day Mines, Inc., for 1948, production increased over 1947 because more underground workers were available, and exploration and development continued at a high rate. However, that portion of the Carlisle mine below the 2,800 main haulage level yielded only low-grade ore, and its operation was terminated at the end of the year. The Sunset Lease operated the Sunset mine throughout the year and hauled 25,611 tons of ore—averaging 1.25 ounces of silver to the ton, 2.93 percent lead, and 5.63 percent zinc—to the Golconda custom flotation mill near Wallace. Late in the year a majority interest in the Sunset Lease was acquired by Day Mines, Inc. Zanetti Bros. worked the Interstate and Callahan mine dumps and hauled 21,634 tons of low-grade zinc-lead-silver ore to the Rex flotation mill.

Evolution District.—The output of the Evolution district in 1948 comprised 919,268 tons of zinc-lead old tailings, 143,715 tons of silver-lead ore, 10,171 tons of silver ore, 5,257 tons of silver-copper-antimony ore, 3,886 tons of lead ore, and 160 tons of zinc-lead ore. Most (719,068 tons) of the old tailings came from the Osburn dump, operated by the Hecla Mining Co. and Zanetti Bros.; all the silver-lead ore and 4,624 tons of silver ore from the Chester vein, Silver Syndicate fault zone, Yankee Girl vein, and Sunshine vein, operated by the Sunshine Mining Co.; all the silver-copper-antimony ore from the Mineral Point mine, operated by the Coeur d'Alene Mines Corp., and virtually all the lead ore from the Western Union mine. The Chester vein and Silver Syndicate fault zone (known as Rambo, Omega, and Rotbart areas) include property owned by the Sunshine Mining Co., Polaris Mining Co., Silver Dollar Mining Co., and Silver Syndicate, Inc., and the Yankee Girl vein includes property owned by the Sunshine Mining Co., Sunshine Consolidated Mining Co., and the Metropolitan Mines Corp.; but all exploration, development, mining, and milling of ore are done by the Sunshine Mining Co. The Sunshine Mining Co. reported that the total output of ore in 1948 was 148,339 tons (84,588 tons for Sunshine account and 63,751 tons for account of Polaris, Silver Dollar, Silver Syndicate, Sunshine Consolidated, and Metropolitan) compared with 114,878 tons in 1947; the ore averaged 39.13 ounces of silver to the ton, 3.06 percent lead, and a little copper and zinc. The tailings averaged 0.64 ounce of silver to the ton and 0.08 percent lead; lead recovery was 97.9 percent and silver 98.6 percent. Lead-silver concentrates (16,297 tons) contained 5,725,545 ounces of silver, 1,418,036 pounds of copper, 8,892,447 pounds of lead, and 631,867 pounds of zinc, of which the net for Sunshine account was 2,818,348 ounces of silver, 748,208 pounds of copper, and 3,690,321 pounds of lead. The average operating costs for the year per ton were $11.32 for mining, $1.00 for ore treatment, $0.17 for depreciation, and $4.06 for general expense—a total of $16.55 compared with $14.74 in 1947. According to the annual report of the Sunshine Mining Co., a seasonal reduction in underground man-shifts during the spring, summer, and early fall, caused by a flow of workers to other employment, held down production in 1948, with a corresponding decrease in expected earnings. A return of workers during the late fall raised the number of employees to the extent that at the end of the year it was the largest since March 1943. Development in 1948 comprised 2,905 feet of drifting, 903 feet of raising, and 2,744 feet of crosscutting. Work in general was directed toward further development of three important geological subdivisions of the Sunshine mine—the Silver Syndicate fault zone north of the Jewell shaft, the south side of the mine including the Yankee Girl vein, and the eastern extensions at depth of the Sunshine-Polaris vein system. Developed ore reserves are estimated at 1,147,000 tons above the 3,700-foot level. This estimate includes the total estimated reserves in areas in which other companies share the production.

The Hecla Mining Co. operated its Osburn tailing plant (2,500-ton sink-and-float plant and 500-ton flotation mill) continuously until December 26, when it was destroyed by fire. The company reported that there was not enough tailings left in the deposit to justify rebuilding. During the year the plant treated 596,068 tons of old tailings, containing an average of 0.66 ounce of silver to the ton, 0.88 percent lead, 0.78 percent zinc, and a little copper. Zanetti Bros. worked another part of the Osburn tailing deposit and hauled 123,000 tons of zinc-lead old tailings to the Polaris and Galena (Zanetti) flotation mills. Zanetti Bros. also worked the DeBlock tailing deposit at the mouth of Lake Gulch and hauled about 60,000 tons of zinc-lead old tailings to the Galena mill. About 63,000 tons of similar tailings from the Burlett-Heller property were treated in the Mineral Point flotation mill near Osburn by the Shoshone Leasing Co. The Federal Mining & Smelting Co. worked a tailing deposit along Big Creek and hauled 37,290 tons of material, containing 36,000 ounces of silver, 870,000 pounds of lead, and 970,000 pounds of zinc, to the Polaris mill at Osburn. Several thousand tons of zinc-lead old tailings were treated also from the Cove, Winter, Inland Power, and Pastore properties.

Development and exploration at the Silver Summit mine of the Silver Summit Mining Co. were done in 1948 by the Polaris Mining Co. on a cooperative basis between the two companies. During the year 5,547 tons of silver ore were produced from the mine and treated in the Hecla mill, which yielded 201 tons of concentrate containing 51 ounces of gold, 156,290 ounces of silver, 81,557 pounds of copper, and 5,153 pounds of zinc.

The Coeur d'Alene Mines Corp. worked its Mineral Point mine near Osburn throughout the year, but the company 600-ton flotation mill treated only 5,257 tons of silver-copper-antimony ore, which yielded 140 tons of concentrate containing 2 ounces of gold, 48,330 ounces of silver, 80,443 pounds of copper, and 49,467 pounds of antimony. According to the corporation annual report, operations in 1948 resulted in a loss of $22,371. During the first part of the year 3,702 tons of ore were mined from stopes on the 2,000- and 2,200-foot levels, but no stoping was done after April 30, and during the remainder of the year the work done was confined to development, exploration, and maintenance. The rest of the district output was principally 3,880 tons of lead ore from the Western Union mine dump treated in the Silver Crescent flotation mill.

Hunter District (Mullan).—The output of the Hunter district in 1948 was 325,830 tons of zinc-lead ore, 36,716 tons of lead ore, and 4,906 tons of old zinc-lead tailings. The Star mine of the Sullivan Mining Co. continued to be the principal producer, and in 1948 it remained the largest producer of zinc in Idaho and ranked third in lead. The company operated the mine and its 1,000-ton flotation mill continuously during the year; the mill treated 237,098 tons of zinc-lead ore, yielding 9,514 tons of lead concentrate and 36,388 tons of zinc concentrate, which together contained 221 ounces of gold, 229,612 ounces of silver, 117,000 pounds of copper, 16,023,575 pounds of lead, and 37,829,285 pounds of zinc.

The Morning mine of the Federal Mining & Smelting Co. was operated continuously, but operations were still handicapped by a shortage of labor. The company reported that 71,261 tons of mine ore and 5,774 tons of waste-dump ore were treated in its 1,250-ton flotation mill at Mullan; the mine ore contained an average of 1.8 ounces of silver to the ton, 5.9 percent lead, and 6.3 percent zinc. According to the annual stockholders' report of the company for 1948, the Morning mine operated at a loss of $124,583 during the first 9 months of the year, but at a profit of $68,255 during the last 3 months of the year, when more labor became available and prices of lead and zinc advanced. Development and exploration in 1948 proved disappointing; when known ore reserves above the 4,850-foot level are exhausted, operation of the Morning mine probably will be limited to ore that may be mined below the 4,850 level. Ore reserves at the end of the year—above the 4,850 level—were estimated at 305,444 tons.

Gold Hunter Mines, Inc., worked the Gold Hunter mine and its 500-ton flotation mill throughout 1948. The company reported that 38,097 tons of mine ore and 3,980 tons of waste-dump ore were treated in the mill in 1948; the content averaged 1.83 ounces of silver to the ton, 1.95 percent lead, and 0.35 percent zinc.

Development at the Lucky Friday mine near Mullan produced 8,146 tons of zinc-lead-silver ore, which was hauled to the Golconda custom flotation mill for treatment. Zinc-lead-silver ore (3,525 tons) was produced also from the Golconda mine and treated in the Golconda mill. The rest of the district output was 4,906 tons of zinc-lead old tailings from the Hirte and Hultner properties.

Lelande District (Burke, Mace, Frisco).—The output of the Lelande district in 1948 comprised 70,740 tons of zinc-lead old tailings, 55,812 tons of zinc-lead ore, 54,910 tons of lead ore, 30,798 tons of zinc ore, 1,011 tons of lead old tailings, and 110 tons of old mill cleanings. The principal producer was the Frisco mine of the Federal Mining & Smelting Co. at Gem; the lower levels of the mine were worked by the company and the upper levels by the Hull Lease. From the lower levels, 49,033 tons of zinc-lead ore (containing an average of 1.39 ounces of silver to the ton, 4.31 percent lead, and 5.82 percent zinc) were hauled to the Morning mill at Mullan for treatment. From the upper levels, the Hull Lease treated in its own 90-ton flotation mill 30,798 tons of ore, containing an average of 0.4 ounce of silver to the ton, 1.3 percent lead, and 8.9 percent zinc. The Federal Mining & Smelting Co. estimated the ore reserves at the Frisco mine at the end of 1948 to be 193,766 tons.

Day Mines, Inc., operated its Sherman mine and 300-ton flotation mill near Burke continuously in 1948; the mill treated 54,535 tons of ore containing an average of 6.52 ounces of silver to the ton, 9.66 percent lead, and 1.70 percent zinc. About 60,000 tons of zinc-lead old tailings from the Elgin property above Wallace were treated in the 140-ton Formosa flotation mill by the Small Leasing Co.; however, the company ceased operations at the end of the year. The rest of the district output was mainly 10,740 tons of zinc-lead old tailings from the Hercules dump and 6,779 tons of zinc-lead ore from the Hercules and Mace mines.

Placer Center District.—The output of the Placer Center district in 1948 comprised 91,223 tons of zinc-lead-silver ore, 56,587 tons of lead ore, and 37,710 tons of zinc-lead old tailings. Nearly all the zinc-lead-silver ore was produced from the Tamarack mine, all the lead ore from the Dayrock mine, and nearly all the zinc-lead old tailings from the Tomsche property. Day Mines, Inc., operated its Tamarack mine and 400-ton flotation mill at Dorn continuously; the mill treated 87,595 tons of ore containing an average of 1.07 ounces of silver to the ton, 3.22 percent lead, and 4.53 percent zinc. Day Mines, Inc., also operated its Dayrock mine at Bunn continuously and increased the capacity of the flotation mill to 350 tons of ore a day. The mill treated 56,587 tons of ore containing an average of 2.32 ounces of silver to the ton, 3.81 percent lead, and 0.38 percent zinc. Old tailings (36,210 tons), containing an average of 1.43 ounces of silver to the ton, 1.95 percent lead, and 2.80 percent zinc, from the Tomsche property above Wallace, were hauled to the Hercules custom flotation mill at Wallace for treatment. The remainder of the district output was principally 3,628 tons of zinc-lead ore from the Success and Tamarack No. 5 mines operated by lessees.

Summit District (Murray).—Leasing operations at the Anchor and Silver Strike mines produced 1,107 tons of zinc-lead ore and 370 tons of lead ore respectively. High-grade gold ore (55 tons) and lead ore (80 tons) were shipped from the Golden Chest mine; in addition, 29 fine ounces of gold and 10 fine ounces of silver were recovered from sluicing 330 cubic yards of gravel. The rest of the district output was chiefly 110 tons of zinc-lead ore from the Black Horse claim.

Yreka District (Kellogg).—The value of the metal output of the Yreka district was $29,297,119 in 1948, the highest ever recorded and more than double that of any other district in Idaho The district remained by far the chief lead- and zinc-producing area in Idaho and ranked second in silver. In 1948 material produced from the district comprised 760,413 tons of zinc-lead-silver ore, 267,511 tons of old zinc-lead tailings, 72,647 tons of old zinc-lead-iron tailings, 48,131 tons of old zinc slag, 22,383 tons of lead ore, and 5 tons of old mill cleanings—a total of 1,171,090 tons compared with 1,054,629 tons in 1947. Of the total ore, old tailings, and old slag, 431,047 tons (containing 1,761 ounces of gold, 1,023,435 ounces of silver, 479,470 pounds of copper, 38,976,438 pounds of lead, and 63,565,817 pounds of zinc) were zinc-lead-silver ore from eight mines in the Pine Creek area of the district—the greatest output by far ever recorded in the area; the Page and Sidney mines were the chief producers. However, the Bunker Hill & Sullivan mine at Kellogg, with an output of 329,360 tons of zinc-lead-silver ore and 22,228 tons of lead ore in 1948, continued to be the most important producer of ore in the district and the largest producer of lead in the State. The company main 2,000-ton (increased from 1,700-ton) flotation mill, equipped with a sink-and-float unit, treated 329,366 tons of zinc-lead-silver ore from the Bunker Hill & Sullivan mine and 259,279 tons of old zinc-lead tailings from the Bunker Hill & Sullivan mill tailing dump. The ore contained an average of 5.475 ounces of silver to the ton, 7.463 percent lead, and 1.886 percent zinc, and the old tailings 0.746 ounce of silver to the ton, 1.384 percent lead, and 0.691 percent zinc. John George continued leasing operations in the upper levels of the Bunker Hill & Sullivan mine and treated about 22,000 tons of lead ore in his mill. The Bunker Hill & Sullivan Mining & Concentrating Co. also treated 72,647 tons of old jig tailings (containing 0.68 ounce of silver to the ton, 1.65 percent lead, 1.16 percent zinc, and some iron) in its 300-ton gravity-flotation plant and shipped 48,131 tons of old Bunker Hill smelter slag (containing 0.35 ounce of silver to the ton, 1.81 percent lead, and 12.68 percent zinc) to its lead smelter at Bradley. The resulting hot slag was sent to the company slag-fuming plant, also at Bradley, to recover the zinc. According to the company annual report to stockholders, there were produced and recovered from Bunker Hill & Sullivan mine ore (including lessee ore) 1,723,131 ounces of silver, 48,600,000 pounds of lead, and 10,064,000 pounds of zinc. An improvement in the supply of mine labor during the year resulted in more metals being produced in 1948 than in any year since 1943. During 1948 ore reserves were substantially increased by the extension of the Truman ore shoot. This major ore body has been opened but not fully developed. Ore reserves fully developed and ready for mining January 1, 1949, totaled 3,026,884 tons of zinc-lead-silver ore, an increase of 155,939 tons over January 1, 1948. With the exception of 3 weeks in October when it was closed for repairs, the zinc slag-fuming plant of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley ran continuously. In 1948 the plant received 126,885 tons of current hot slag from the lead furnaces of the Bunker Hill smelter at Bradley; the resulting lead fume (2,931 tons) was sent to the Bunker Hill lead smelter, and the zinc fume (21,491 tons) was shipped to a smelter at Coffeyville, Kans. All of the lead and zinc produced at the plant in 1948 was credited to the mines and an old slag dump furnishing the slag-making material.

Output of zinc-lead-silver ore from the Page mine of the Federal Mining & Smelting Co. increased from 129,276 tons in 1947 to 158,179 tons in 1948. The ore, treated in the Page 500-ton flotation mill, contained an average of 3.53 ounces of silver to the ton, 5.98 percent lead, and 6.10 percent zinc. The mine ranked second in lead and zinc production in Idaho in 1948 and fifth in silver. According to the company annual report to stockholders, operations at the Page mine were maintained at near capacity despite a shortage of experienced miners and a large labor turn-over. Development in 1948 included sinking the main shaft an additional 114 feet and exploring the Tony vein on the 2,770-foot level. Ore reserves at the end of the year were estimated at 852,682 tons, an increase of 366,682 tons over the estimated tonnage at the end of 1947.

Output of zinc-lead-silver ore from the Sidney mine of the Sidney Mining Co. on Denver Creek increased from 70,865 tons in 1947 to 89,724 tons in 1948. The ore, treated in the company 250-ton flotation mill, contained an average of 2.78 ounces of silver to the ton, 5.69 percent lead, and 10.51 percent zinc. The mine ranked third in zinc production in Idaho in 1948 and fifth in lead. The flotation mill of the Highland-Surprise Consolidated Mining Co. on Stewart Creek was increased during the year to 300 tons of ore a day. In

1948 the mill treated 72,925 tons of Highland-Surprise ore (40,888 tons in 1947), containing an average of 0.77 ounce of silver to the ton, 2.17 percent lead, and 6.85 percent zinc. Mining and milling of zinc-lead ore from the Spokane-Idaho mine on Pine Creek were continuous throughout the year. The company 175-ton flotation mill treated 54,917 tons of zinc-lead ore in 1948 compared with 38,468 tons in 1947. The Sunset Minerals, Inc., operated the Liberal King mine and its 100-ton flotation mill also on Pine Creek continuously; the mill treated 24,586 tons of zinc-lead ore, which yielded 1,072 tons of zinc-lead concentrate and 2,466 tons of zinc concentrate. Mining and milling of zinc-lead ore from the Little Pittsburg mine on Denver Creek were continuous by the Denver Development Co.; but the output of ore declined from 43,626 tons in 1947 to 22,139 tons in 1948. The rest of the district output was mainly 8,120 tons of zinc-lead ore produced from the Douglas mine on Pine Creek by the Douglas Leasing Co.

VALLEY COUNTY

Thunder Mountain District.—The Dewey mine near Stibnite was operated 3 months in 1948 by the Gateway Gold & Copper Co., Inc. The company reported that 2,500 tons of gold ore were treated by amalgamation and concentration and that the concentrates produced were treated by amalgamation. The remainder of the district output was principally 23 ounces of gold recovered from old mill cleanings.

Yellow Pine District.—The 2,000-ton flotation mill at the Yellow Pine mine of the Bradley Mining Co. operated all year. The company reported that in 1948 the mill treated 655,682 tons of ore containing 0.075 ounce of gold and 0.485 ounce of silver to the ton, and 1.211 percent antimony. The antimony concentrates and gold concentrates contained 27,158 ounces of gold, 236,031 ounces of silver, and 12,678,776 pounds of antimony. The mine was again by far the largest producer of gold and antimony in the State. Work of constructing a smelter at Stibnite, Idaho, for reduction of the antimony and gold concentrates, proceeded during the year.

WASHINGTON COUNTY

All the output in Washington County in 1948 was 40 tons of copper-silver ore produced from the Silver Still mine near Still in the Washington (Iron Mountain) district.

Missouri, Oklahoma, Kansas, and Arkansas
Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

DESPITE the impetus to mining afforded by advances in market prices of lead and zinc during 1948, the output of these metals in Missouri, Oklahoma, Kansas, and Arkansas as a whole again decreased in quantity. This annual decrease was the sixth in succession for lead and the seventh for zinc; lead production was the lowest since 1934 and zinc since 1896. The decline in 1948 from 1947, amounting to 17 percent for lead and 22 percent for zinc, was due mainly to work stoppages and idleness of marginal mines previously supported by Federal premium payments, but the most important factors in the recent continuous yearly declines were the depletion of high-grade ore reserves and the necessity for carrying on large development campaigns to restore and maintain reserves of commercial grade. Increases in the price of zinc concentrate at Joplin in January, July, October, and November 1948 enabled some of the mines and tailing mills that had closed when the Premium Price Plan expired June 30, 1947, to resume operations, and production rates of both lead and zinc in November and December were the highest of the year. The value of the lead output, enhanced by the record high lead price, exceeded that in any year since 1926.

Silver and copper were recovered as byproducts in smelting lead concentrates from Southeastern Missouri, and copper and a little silver were recovered from lead-copper ore mined in the same region.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of silver, copper, lead, and zinc in Arkansas, Kansas, Missouri, and Oklahoma in 1944–47 and, by States, in 1948, in terms of recovered metals

	Mines producing	Material sold or treated		Silver	
		Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value
1944	289	15, 730, 407	12, 293, 010	92, 243	$65, 595

December	12, 591	270	14, 579	8, 790
Total 1948	114, 187	2, 370	127, 614	85, 892

Silver.—Silver was recovered as a byproduct by smelters treating Southeastern Missouri lead concentrates. These concentrates usually contain 1 to 2 ounces of silver a ton. A large part of the lead derived from the concentrates is not desilverized, and this silver is not recorded as recoverable production. The copper concentrates made from lead-copper ore also contain a little silver. The total silver recovered in 1948 was 114,187 fine ounces, compared with 93,600 ounces in 1947.

Copper.—The increase in the Missouri output of copper from 1,760 tons in 1947 to 2,370 tons in 1948 resulted from a larger production of copper concentrates by the Madison mill at Fredericktown, Madison County, which treated lead-copper ore. The quantity of copper contained in byproduct matte shipped from smelters treating lead concentrates was a little less than in 1947.

Lead.—Production of recoverable lead in the Southeastern Missouri region was 100,654 tons in 1948, the lowest since 1935 but still considerably higher than that of any other domestic region or State. The decrease from 1947 (22 percent) was due mainly to work stoppages. The Tri-State zinc-lead district (Southwestern Missouri, Oklahoma, Kansas) produced 26,901 tons of lead in 1948, an increase of 11 percent over 1947 despite a low output in July and August caused by a work stoppage. The Central Missouri district produced 37 tons of lead and Arkansas 22 tons in 1948.

Zinc.—The Tri-State district produced 84,839 tons of recoverable zinc in 1948 compared with 109,338 tons in 1947. The decrease resulted from a work stoppage and the idleness of some of the marginal mines and tailing mills that contributed to the output in 1947 until Federal premium payments ceased June 30. A general review of mining and milling in this district is in the Tri-State District section of this chapter. The Southeastern Missouri region produced 1,022 tons of zinc in 1948 (part recovered from zinc concentrates and part from lead-smelter slag) and Arkansas 31 tons.

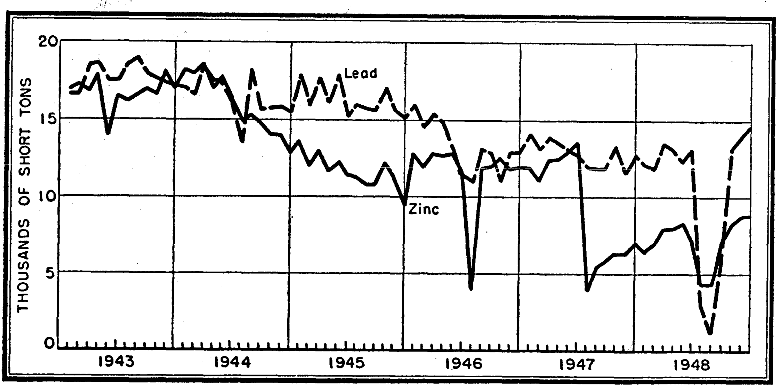

FIGURE 1.—Mine production of lead and zinc in Arkansas, Kansas, Missouri, and Oklahoma, 1943–48, by months, in terms of recoverable metals.

MINING AND METALLURGIC INDUSTRY

The extraordinary rise in the price of lead before the Premium Price Plan expired June 30, 1947, enabled the straight lead mines to readjust operations within that year to competitive open-market conditions. The readjustment period for the zinc and zinc-lead mines, however, continued through 1948. The moderate increase in the price of zinc concentrates at Joplin in January and further substantial advances in July and November led to reopening of many of the Tri-State mines that had closed when premium payments ceased. The extent of the renewed activity was not reflected in production figures until the last 3 months of the year, owing to the time required to reopen the mines, and the work stoppage in July and August at the mines and mills of the Eagle-Picher Mining & Smelting Co. The high lead price stimulated selective mining of Tri-State ore bodies relatively high in lead and revived small-scale shallow lead mining by individuals. In the Southeastern Missouri region there was a large increase in the quantity of old lead tailings re-treated, but the tonnage of crude ore milled decreased materially because of labor strikes and continued demands on manpower and equipment for development work postponed during the war.

The Bureau of Mines, in cooperation with the Geological Survey, continued exploratory drilling, field examinations, and metallurgical tests on copper, lead, and zinc ores.

Fifty-two mills (5 less than in 1947) operated all or part of 1948 on lead and zinc ores and old tailings in the four States. The daily capacity of the mills ranged from 25 to 15,000 tons and averaged 1,457 tons. Most of the mills used gravity concentration and flotation. Flotation concentrates comprised 46 percent of the total lead concentrates and 64 percent of the zinc concentrates produced. The active smelters were the lead smelters at Galena, Kans., and Herculaneum, Mo.; the zinc smelters at Bartlesville, Blackwell, and Henryetta, Okla., and Fort Smith, Ark.; and the oxide plant at Coffeyville, Kans. Waelz plants were operated in conjunction with the zinc smelters at Henryetta and Fort Smith.

ORE CLASSIFICATION

The following table classifies the combined ore and old tailings produced in Arkansas, Kansas, Missouri and Oklahoma in a manner comparable to the classes shown in the tables on ore classification in the chapters devoted to mining in the Western States. The basis for classification is given in the Gold and Silver chapter of this volume. Additional details of the tenor of ore and old tailings milled and the concentrates produced in Kansas, Missouri, and Oklahoma are given in tables in the Review by States section that follows. Such tables for Arkansas are omitted because only small-scale intermittent mining of lead and zinc was done there from 1918 through 1948.

Ore and old tailings sold or treated in Arkansas, Kansas, Missouri, and Oklahoma in 1948, with content in terms of recoverable metals

Source	Mines producing	Ore, etc. (short tons)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
Lead ore [1]	51	5,586,683	114,187	2,370	104,010	1,540
Zinc ore [2]	73	3,980,436			2,904	38,385
Zinc-lead ore	170	2,730,936			20,700	45,967
Total: 1948	294	12,298,055	114,187	2,370	127,614	85,892
1947	254	17,879,186	93,600	1,760	153,838	109,651

[1] Includes lead-copper ore from 1 mine; also 1,166,456 tons of old tailings remilled, concentrates from which were mixed with those from crude ore.
[2] Includes 2,593,803 tons of old tailings yielding 6,116 tons of recoverable zinc and 65 tons of lead.

TRI-STATE DISTRICT

The output of zinc concentrate in the Tri-State district totaled 159,609 tons valued at $13,929,151 in 1948 compared with 204,068 tons valued at $21,792,921 (including $8,463,806 in Federal premiums) in 1947. The quantity of zinc produced in 1948 was the lowest since 1896, but the value was slightly higher than the average for the 5 years 1935–39. The sharp decrease in production in 1948 was due mainly to the idleness of some of the marginal mines and tailing mills that operated while Federal premiums were being paid the first half of 1947, and a 9-week work stoppage at the mines and mills of the Eagle-Picher Mining & Smelting Co.

Production of lead concentrate, stimulated by the record high price, increased from 32,006 tons valued at $6,090,622 in 1947 to 35,862 tons valued at $8,302,564 (highest since 1927) in 1948. The district production, in terms of recoverable metals, was 84,839 tons of zinc and 26,901 tons of lead in 1948 compared with 109,338 and 24,239 tons, respectively, in 1947.

Production of lead and zinc concentrates in the Tri-State district (Kansas, Oklahoma, and Southwestern Missouri), 1944–48

The weekly quoted price for 60-percent zinc concentrates at Joplin in 1948 was $70.35 a ton from January 3 through January 17, $78 from January 24 through July 24, $95 from July 31 through October 16, $98 from October 23 to November 13, and $110 from November 20 through December. The quoted price for 80-percent lead concentrates was $195.65 a ton from January 3 to April 3, $231.65 from

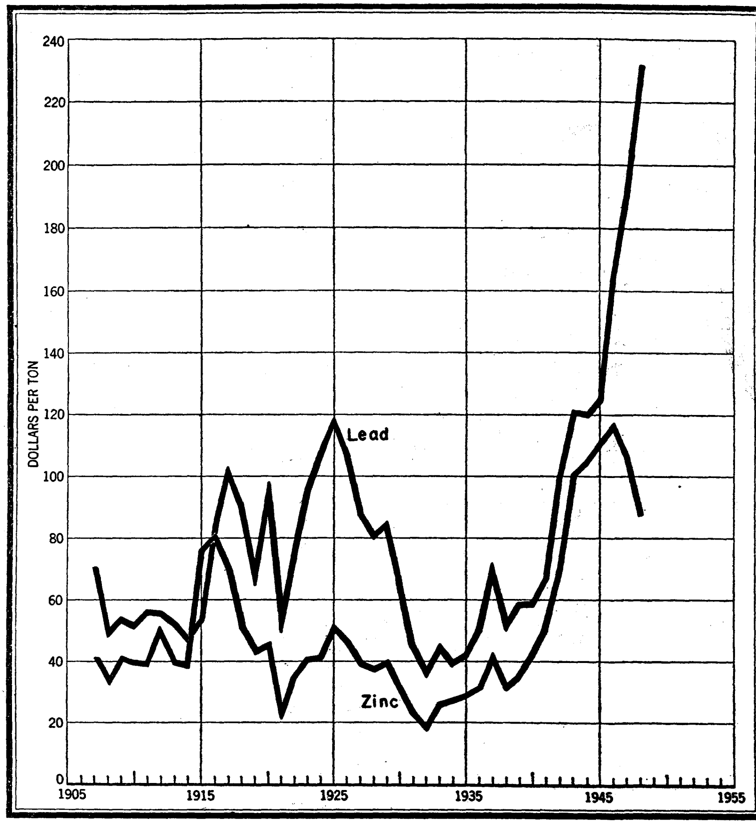

FIGURE 2.—Average prices received by sellers per ton of concentrates in the Tri-State district, 1907–48

FIGURE 3.—Quantity of crude ore milled in the Tri-State district, 1907–48.

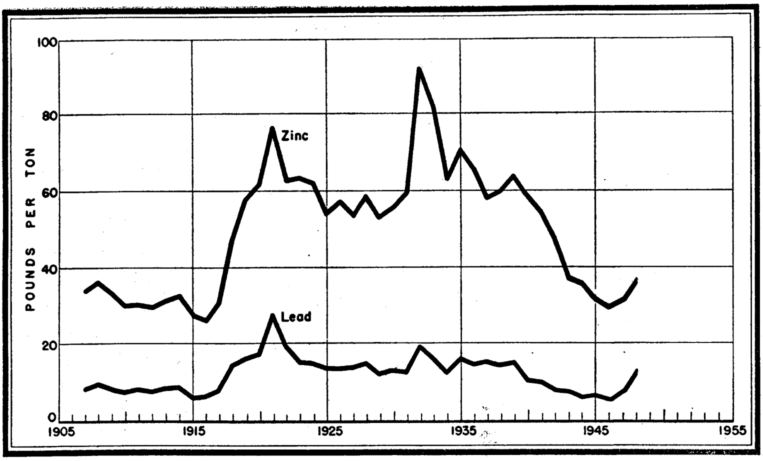

FIGURE 4.—Metal recovered per ton of crude ore (rock) milled in the Tri-State district, 1907–48.

April 10 to July 24, $257.37 from July 31 to October 30, $286.17 from November 6–27, and $290.92 the rest of the year.

The advances in prices of lead and zinc concentrates during 1948 resulted in the reopening of many Tri-State mines that had closed when the Premium Price Plan expired, as well as other old mines, particularly those that had produced considerable lead in the past. There were numerous small-scale, shallow lead operations by individuals. Hand jigs were seen in operation for the first time in recent years. In December about 120 mines, 29 mine mills, 4 tailing mills, and 3 slime and clean-up mills were operating compared with 75, 22, 3, and 1, respectively, in December 1947. These mines do not include many small intermittent producers; the total producing mines, gouges, and mill and dump clean-ups active all or part of 1948 was 270 compared with 234 in 1947. The depth of the operating shafts ranged from 30 to 450 feet; open-pits, worked at depths ranging from a few feet to 90 feet, yielded 165,000 tons of ore or 4 percent of the district total output of crude ore from mines and dumps.

There was less activity in exploratory drilling in the Tri-State district and nearby areas in 1948 than in most past years when metal prices were high. The Anaconda Mining Co. did considerable drilling in Crawford County, Kans., north of the areas that have been productive in the past. The Bureau of Mines had drilling projects in the South Carthage, Lone Elm, Canyon Diggings, and North Empire areas. Data on certain drilling projects were published during the year.[1]

REVIEW BY STATES

MISSOURI

Missouri has been the chief lead-producing State for 41 consecutive years and until 1918 had ranked first in zinc production for many years. In 1948 operations at the principal lead mines were interrupted about 11 weeks by work stoppages, and the output of recoverable lead decreased to 102,288 tons compared with 132,246 tons in 1947. Zinc production decreased heavily after Federal premium payments ceased June 30, 1947, and was only 6,463 tons in 1948 compared with 17,074 tons in 1947. The principal lead mines are in the Southeastern Missouri region. Silver and copper are recovered as byproducts in smelting lead concentrates produced in this region, and copper and a little silver have been recovered in some years (including 1944–48) from lead-copper-(cobalt-nickel-iron) ore mined in Madison County. Silver recovered in 1948 totaled 114,187 fine ounces and copper 2,370 tons compared with 93,600 and 1,760 tons, respectively, in 1947. In the sale of the lead concentrates, no value is attached to the silver and copper, as the quantity recovered per ton of concentrates is very small. The zinc output comes largely from zinc-lead mines in Southwestern Missouri. The Central district of Missouri had a small output of lead in 1947 and 1948 and of both zinc and lead in 1944–45; the figures are included with those of Southeastern Missouri in the table that follows.

Southeastern and Central Missouri.—The mine production of recoverable lead in Southeastern Missouri decreased from 129,516 tons in 1947 to 100,654 in 1948. Most of the decrease resulted from work stoppages at the mines of the St. Joseph Lead Co., largest producer of lead in the United States, and the Madison mine of the National Lead Co. St. Louis Smelting & Refining Division. Zinc production totaled 1,022 tons, part of which was recovered from zinc concentrates derived from lead ore and part from lead-smelter slag.

In St. Francois County the St. Joseph Lead Co. operated its Bonne Terre, Desloge, Federal (including Doe Run), and Leadwood mine groups and mills. The daily capacity of the four mills at the end of 1948 ranged from 2,800 to 14,000 tons and totaled 26,400 tons. Treatment is by table concentration followed by flotation. Each mine group has an underground, electrified, rail haulage system, which moves the ore from the working faces to a central ore-hoisting shaft. The four ore-hoisting shafts at the mills are 326, 276, 497, and 541 feet deep; the Doe Run shaft is 160 feet deep. Other shafts are used for men, supplies, and poor rock. Development on the four groups in 1948 totaled 179 feet of shaft, 64,390 feet of drifting, 2,134,945 feet of diamond drilling, and 63,789 feet of churn drilling. The following information was extracted from the company's eighty-fifth annual report to stockholders.

The expanded exploration program initiated in 1947 was aggressively carried forward [in 1948]. The lag in development which had resulted from forced curtailment during the depression and war years has now been largely overcome, and continued maintenance of a proper balance between the rate of mining and development work in the mines of this Division can now be foreseen. Good progress has also been made in modernizing underground equipment and facilities, which will contribute to greater over-all efficiency in present and future operations.

The Desloge mill operated during the entire year on tailings, and a total of 1,164,000 tons of old tailings were milled at this, and at the company's other Lead Belt plants; thus fully utilizing the installed mill capacity of the district during a period when the demands on both manpower and equipment for the development program resulted in some curtailment in the rate of underground mining.

The lead bonus of 25 cents per shift worked for each one cent increase in the price of lead above 12 cents per pound New York remains in effect at this division, and each employee receives the same amount of lead bonus per shift.

At Herculaneum, one-third of the company's lead concentrates was smelted, with satisfactory recovery and at a reasonable cost; the balance of the production will continue, until 1953, to be smelted at East Alton, Illinois when the present toll contract terminates with the American Smelting & Refining Company. * * *. The operation of the electrothermic furnace for the recovery of zinc and lead from blast furnace slag supports the belief that the system has considerable promise. * * *.

The 2½ months' Lead Belt strike contributed materially to the lower lead production. * * *.

In Madison County the St. Joseph Lead Co. operated the Mine La Motte mine and mill. The daily capacity of the mill was increased from 1,500 to 2,000 tons, a 75-foot shaft was reopened, and the 136-foot shaft sunk in 1947 was put in operation. Two other shafts, 307 and 116 feet deep, were operated. Mine development in 1948 included 4,570 feet of drifts, 68,024 feet of diamond drilling, and 24,675 feet of churn drilling.

The National Lead Co. St. Louis Smelting & Refining Division operated its Madison mine and all-flotation mill continuously in 1948, except during a work stoppage in July and part of August. Four shafts, averaging 400 feet in depth, were used. Equipment was added to raise the capacity of the mill from 800 tons daily to 1,200. The mine contains ore bodies that yield considerable iron, cobalt, and nickel with lead and copper, but operations in 1948 were confined chiefly to the mining of lead-copper ore; the output of copper increased sharply over 1947, and that of lead increased slightly.

The Park City Consolidated Mines Co. operated its Ruth mine from January 1 to July 14 and the adjoining St. Louis No. 3 from January 1 to May 15. In August the company leased the Fleming-Catherine group from the Fredericktown Lead Co. and operated that group from September 1 through December. The ore was trucked to the Park City 400-ton all-flotation mill for treatment. The Fredericktown Lead Co. operated the Fleming-Catherine from January 1 until the miners went out on strike February 25.

In Jefferson County the Fredericktown Lead Co. continued underground development work on the Valle Mine group and operated the 200-ton jig and table mill on lead ore from the mine and dumps; the recovery from 41,587 tons milled was 356 tons of concentrates assaying 72.48 percent lead, valued at $82,178. Some lead ore was shipped from the Casey mine, and 188 tons of galena were shipped from barite diggings in Washington and Jefferson Counties. Certain data on drilling by the Bureau of Mines in previous years were published in 1948.[2]

Ballinger, Homer J., Investigation of the Krueger Zinc Deposit, Washington County, Mo.: Bureau of Mines Rept. of Investigations 4292, 1948, 49 pp.
McMillan, W. D., Fine, M. M., and Kenworthy, H., Investigation of the Dempsey Zinc-Lead Mine, Washington County, Mo.: Bureau of Mines Rept. of Investigations 4332, 1948, 16 pp.

The Central district of Missouri produced 37 tons of recoverable lead in 1948 and 65 tons in 1947. The depth of mining at the Glover open-pit mine at Russellville, Cole County, was below the lead-bearing clay in 1948; and the ore contained only a small percentage of lead, with barite the principal product.

Mine production of lead and zinc in Southeastern and Central Missouri, 1944–48

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite) [1]		Metal content [2]			
					Lead		Zinc	
	Short tons	Value [3]	Short tons	Value	Short tons	Value	Short tons	Value
1944	243,279	$19,920,200	3,206	$112,485	169,962	$27,193,920	[4] 1,508	$343,824
1945	245,805	21,870,243	1,335	45,706	173,053	29,765,116	[5] 595	136,850

1948	145,364	30,396,488	567	55,231	100,691	36,047,378	[6] 1,022	271,852

[1] Includes zinc-lead carbonate concentrates.
[2] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.
[3] Values given are to a certain extent arbitrary, as part of the lead concentrates are smelted by the producer.
[4] Includes 776 tons recovered from lead-smelter slags and byproduct matte from lead smelting.
[5] Includes 240 tons recovered from byproduct matte from lead smelting.
[6] Includes zinc recovered from lead-smelter slag.

Tenor of lead ore and concentrates in Southeastern Missouri disseminated-lead district, 1944–48

	1944	1945	1946	1947	1948
Total lead ore [1] short tons	6,535,874	6,675,767	5,491,239	5,856,334	5,384,861
Galena concentrates in ore percent	3.72	3.68	3.44	3.12	2.70
Average lead content of galena concentrates do	71.02	71.66	73.09	72.22	70.60
Average value per ton of galena concentrates	$81.78	$88.95	$114.39	$173.49	$209.11

[1] Includes lead-copper ore. Includes old tailings remilled: 1944–46—none; 1947—301,324 tons; 1948—1,164,356 tons.

Southwestern Missouri.—The Tri-State district, which includes Southwestern Missouri, is described in an earlier section of this chapter.

In Southwestern Missouri production of zinc concentrates decreased 67 percent and lead concentrates 40 percent in 1948 compared with 1947. The principal producers (combined zinc and lead concentrates), in order of output, were the Kansas Explorations (Inc.) Buckingham mine north of Oronogo (closed in August); the Goldfield Consolidated Mines Co. Navy Bean and other properties in the Wentworth area acquired from the Century Lead & Zinc Co. during the year; the Dale Mining Co. Dungy mine at Stark City (company also operated the Ryder mine at Pioneer); the Federal Mining & Smelting Co. Duenweg mine; the Little Ben Mining Co. High Five mine at Waco; and the Glen Richey Shinn mine at Stark City. All the foregoing mines produced more than 500 tons of concentrates each and were served by mills at or near the mine. The Federal Granby-American mill treated 26,071 tons of lead ore from the mine and an open pit. The St. Louis Mining & Milling Co. mill at Thoms Station treated custom ore. The Northside mill at Chitwood, acquired by the Wildwood Mining Co., treated some company ore. The Kansas Explorations (Inc.) Jasper mill west of Joplin was reopened in December to treat custom ore. The Swartz mill at Lone Elm ran part time from May to December. The Playter mill at Waco handled ore from the Reynolds group at Waco and the Quick Seven near Neck City until June, when it was leased to Glen Richey and used to treat ore from the Grasselli Mine in Kansas. The Magajupa mine at Duenweg operated during January and February. Ore was shipped from the Oronogo Circle dump to the Central mill at Cardin, Okla. Other shippers to custom mills included the Big Cave west of Joplin, Crawford near Seneca, Little Beaver near Diamond, N. Y. C. at Lone Elm, O'Keefe near Thoms Station, Olson (I. N. Clark) near Spurgeon, and Rex (1,000-acre tract) at Joplin. Numerous small-scale operations (mostly lead mining) in the Jasper and Newton County areas produced a considerable aggregate tonnage of concentrates. In Christian County Jones & Webster worked the Mary Arnold mine at Ozark part of the year. In Greene County the H. & H. Mining Co., working the Two Sons mine at Ash Grove, washed and hand-jigged 350 tons of ore that yielded 14 tons of 81-percent lead concentrates worth $3,446.

Mine production of lead and zinc in Southwestern Missouri, 1944–48

Year	Lead concentrates				Zinc concentrates				Metal content [1]

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

OKLAHOMA

Mines and tailing mills in Oklahoma produced 52 percent of the total Tri-State output of zinc and 63 percent of the lead in 1948 compared with 47 percent and 59 percent, respectively, in 1947. Only three Oklahoma tailing mills were in operation in 1948 compared with nine when Federal premium payments ceased June 30, 1947. The State output of recovered zinc decreased 14 percent and lead increased 18 percent from 1947. Details of the Tri-State district, which includes Oklahoma, are presented in an earlier section of this chapter.

Mine production of lead and zinc in Oklahoma, 1944–48, and total, 1891–1948

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

Operations at the mines and mills of the Eagle-Picher Mining & Smelting Co., largest producer of zinc and lead in Oklahoma and the Tri-State district, were interrupted by a labor strike from July 1 to September 5, 1948, and a number of other mines that shipped ore to the company Central mill could not operate during this period. During the rest of the year the Central mill (capacity 15,000 tons daily) operated at one-half to two-thirds capacity. The mill is equipped with differential-density (sink-and-float) preliminary-concentration units, which furnish an enriched product for treatment by jigging and flotation. Of the 2,138,093 tons of ore treated in 1948, 62 percent came from Oklahoma. Eagle-Picher mines in Oklahoma shipping to the mill were the Blue Goose mines, Buffalo, Crawfish, Goodeagle No. 3, Goodwin, Gordon, Grace Walker, Hum-bah-wat-tah mines, John Beaver No. 2, Kenoyer No. 1 (formerly American Zinc No. 7), Lottson No. 2, Netta, Piokee, Royal, See Sah, Slim Jim-Bankard, Southside No. 2, Swift, Vantage, Wilson, and White. Other large Oklahoma shippers to the mill (in order of tonnage) included the Federal Mining & Smelting Co. (Gordon, Lucky Syndicate-Howe-Ohimo), F. W. Evans (Shorthorn-Craig), and the Mahutska (Jeff City No. 2, Eudora), W. M. & W. (Velie, Little Greenback), Carpenter (New York, Oko, Grace Walker), C. G. & C. (Lucky Bill), Jake Dryer (Southside), Tongaha (Anna Beaver, Tongaha), Hunt (Netta), Frank Hudson (Bingham), Little Bill (DeWitt), Cardinal, Hudson (Craig), and Bob White (Little Greenback-Mehunka) mining companies. The Eagle-Picher Bird Dog mill operated from May through December on slimes.

The Nellie B. Mining Co., a new operating company in the Tri-State district, became the second-largest district producer of zinc and lead during the last few months of 1948. In January the company acquired the Marcia K (Lawyers) and Davis-Big Chief (Skelton) properties, in July the Rialto Mining Corp. properties, and in September the Evans-Wallower properties, comprising altogether about two sections of mining property and three active mills with a total capacity of 2,500 tons daily.

The American Zinc Co. No. 7 mine and mill operated until July 30, when the mill was struck by lightning and burned; in October the mining lease and equipment were sold to the Eagle-Picher Mining & Smelting Co. The C. & M. Mining Co. operated its No. 4 (Imbeau) mine and mill throughout the year. The Harris Mining Co. Oklahoma operations included the Lucky Jenny mill and the Farmington mine. Cameron & Henderson, Inc., continued to operate the Admiralty mine and Romo mill. The Scott Mining Co. operated its mill and the Scott and Mary Ann mines from August through December. The Mission mill treated custom ore. The United Zinc Smelting Corp. Royal mill handled mostly custom ore but also treated company ore from the Waxahachie mine. The Melrose Mining Co. Park Walton mine continued to operate. Other important shippers of ore to custom mills were the Federal Mining & Smelting Co. Quapaw-Davenport mine, Baird (Admiralty Douthat), Blackhawk, Dobson, Pelican (Dewey Sims), Shallow Mineral, Gray Wolf (Golden Hawk), and Wesa Greenback, The small Lancaster mill near Lincolnville ran intermittently. The Big Chief and Sooner tailing mills operated nearly all the year and the Britt & Britt mill a few months.

KANSAS

The mine output of recovered zinc in Kansas decreased 14 percent and lead increased 15 percent in 1948 from 1947. Conditions affecting production in the Tri-State district as a whole, which includes the Kansas zinc-lead mining areas, are reviewed in a foregoing section.

Mine production of lead and zinc in Kansas, 1944–48, and total, 1876–1948

Year	Mines producing	Lead concentrates		Zinc concentrates		Metal content [1]			
						Lead		Zinc	
		Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1944	85	12,176	$1,418,781	117,827	$11,959,317	9,394	$1,503,040	63,703	$14,524,284

Average value per ton:				
Galena concentrates	$189.51	$144.68	$233.77	----------
Sphalerite concentrates	$102.03	$75.73	$87.64	$94.89

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.
[2] Revised figure.

The Baxter Springs-Blue Mound-Treece area produced 91 percent of the total Kansas output of zinc concentrates and 88 percent of the lead concentrates in 1948 compared with 90 and 92 percent, respectively, in 1947. About 43 percent of the crude ore mined in the area was concentrated in the Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin, Okla. Most of the ore was transported to the mill over the Northeast Oklahoma Railroad, which has spur tracks to the princial ore-hoisting shafts. Producing Eagle-Picher mines in this area were the Big John, Foley Mullen, Leopard-Youse Slaughter, Webber, Westside No. 2, and Wilbur.

The Walter Hartley mine of the National Lead Co. St. Louis Smelting & Refining Division near Baxter Springs was again the largest individual producer of zinc concentrates in Kansas and the Tri-State district. The ore was milled in the company No. 8 (Ballard) central mill, which also handled other company ore from the Ballard, Moore, and Shanks mines.

The Dines Mining Co., operating its mill and the Hartley No. 1 and Stoskopf mines, was a large producer. Besides company ore, the mill treated custom ore from the Blue Mound, C. K. & E. (Stebbins, Karcher), and Roanoke (Homestake) mines. The Harris Mining Co. operated the Golden Rod (E. W. No. 24) mine throughout the year. The MacArthur mines, the Swalley (Beck) mine, and the Beck No. 3 mill—all closed the latter part of 1947—were reopened and operated a large part of 1948. Other important producers shipping ore to custom mills included the Bilharz (Muncie), Contact, Grace Jarrett (Wright), Mark Twain (Blue Mound, Naylor), Robinson (Douthit, Jarrett), Bob White (Chubb), A. & H. (Bendelari), and Linda Lou (Northern). The Captain tailing mill operated seven months, the Barr Cleanup (Lucky Seven) mill ran most of the year, and the Wade-Rea mill operated on company and custom ore all the year. The M. & W. Mill operated intermittently, mostly on ore from the F. & G. (Lindsey) mine. The Vanatta mine near Melrose remained idle. The Lavrion Mining Co. installed pumps in the Garrett shaft and nearly completed unwatering it during the year.

In the Crestline area F. W. Evans unwatered extensive old mine workings on the Crutchfield and American properties and installed mining equipment, including hoists on three shafts. Ore shipments to the F. W. Evans mill at Waco began in August and continued through December. In the Badger-Peacock area some ore was shipped from the Peacock and Williams properties.

At Galena the principal producer was the Murphy open-pit mine, operated most of the year by the Childress-Murphy Mines, Inc. The L. & S. Mining Co. shipped considerable ore from the Cooper Hollow open pit. Other producers included the Oliphant & Abbey, Rummery, Shaw-Davis, Owens-Turner, and Alexander leases and many small-scale individual operations. All the Galena output of milling ore was shipped to custom mills in other areas. The Eagle-Picher lead smelter and lead- and zinc-pigment plant at Galena purchases most of the lead concentrates produced in the Tri-State district.

At Waco the Little Ben Mining Co. operated the Oscar Bennett mine from April 1 through December, shipping the ore to the F. W. Evans mill. Glen Richey shipped ore from the Grasselli mine to the Playter mill in Missouri.

ARKANSAS

Shipments of crude zinc ore and concentrates from mines in Arkansas in 1948 totaled 98 tons of combined carbonate and sulfide averaging 33.67 percent zinc and yielding 31 tons of recovered zinc. Lead ore and concentrates shipped totaled 30 tons averaging 71.70 percent lead and yielding 22 tons of recovered lead. In 1947 the output (in terms of recovered metals) was 18 tons each of zinc and lead. In 1948 the Lucky Dog Mining Co. shipped five truckloads of zinc concentrates from its mill at the Lucky Dog mine in Searcy County. C. W. Allen & Co. worked the Brewer mine near Ponca, Newton County, on a small scale and shipped both lead and zinc ore. Small lots of ore were shipped from four other mines and prospects in Marion County. The results of investigation of several zinc deposits in Northern Arkansas by the Bureau of Mines during the war were published in 1948.[3]

Montana
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. NEEDHAM and PAUL LUFF

GENERAL SUMMARY

OUTPUTS of zinc, lead, and silver in Montana in 1948 continued the uptrends established in 1947—zinc yield rose 29 percent, lead 14, and silver nearly 10; copper output, after declining for five consecutive years, rose less than 1 percent; gold fared badly, and yield dropped 19 percent. Advances in the average prices of base metals, coupled with gains in production of zinc, lead, silver, and copper, pushed the total value of the five metals to the highest figure since 1942. Lead and zinc each rose 42 percent in value, silver nearly 10, and copper 4; the value of gold dropped 19 percent, to give an over-all gain of 15 percent in total value—from $48,890,964 in 1947 to $56,422,609 in 1948. Of the total value in 1948, copper contributed 45 percent, zinc 28, lead 12, silver 11, and gold 4.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Montana in 1944–48 and total, 1862–1948, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	188	24	6,049,462	50,021	$1,750,735	7,093,215	$5,044,064

October	4,476	593,369	4,546	1,561	5,371
November	4,137	642,186	4,506	1,802	6,001
December	4,196	627,026	5,068	1,843	6,054
Total: 1948	73,091	6,930,716	58,252	18,411	59,095
1947	90,124	6,326,190	57,900	16,108	45,679

Gold.—Yields of both placer and lode gold declined sharply in 1948, but placer output proportionately more than lode. These marked drops resulted mainly from curtailment or closing of operations at a number of lode and placer properties, among which were the Jardine mine in Park County, Canusco, Inc., dredge in Missoula County, Douglas Placers dredge in Broadwater County, Granite-Bimetallic tailings operation at Philipsburg, Winston Bros. dredge in Jefferson County, and Perry & Schroeder dredge in Lewis and Clark County. The Drumlummon mine at Marysville and the U. S. Grant mine near Virginia City were the only major gold producers in the State that reported increases over 1947 figures. Of Montana's gold in 1948, 40 percent was derived from gold and silver ores (38 percent in 1947), 37 percent from base-metal ores (32 percent in 1947), and 23 percent from placers (30 percent in 1947). Ores milled yielded 59 percent of the State gold, and ores shipped to smelters 18 percent.

Gold producers in Montana that produced 2,000 ounces or more in 1948 were the properties of the Anaconda Copper Mining Co. (copper ore and waste materials and zinc-lead ore and dumps) at Butte, Porter Bros. (dredge) at Helena, Jardine mine (gold ore) at Jardine, Drumlummon mine (gold ore) at Marysville, Estelle-New Year's Gift group (copper ore) in Park County, Ruby mine (gold ore) in Phillips County, Winston Bros. (dredge) in Jefferson County, Golden Sunlight mine (gold ore) near Whitehall, H. & H. Mines (dredge) in Granite County, and U. S. Grant mine (gold-silver ore) near Virginia City. From these 10 properties came 79 percent of the State gold in 1948.

Silver.—The Butte Hill mine and dumps of the Anaconda Copper Mining Co. supplied the greater part of the State increase of 604,526 ounces of silver in 1948; yield was greater from both copper ore and zinc-lead ore. The Butte Hill mine and dumps contributed 81 percent of the State silver in 1948, followed in order by the Emma mine at Butte and the Mike Horse mine at Flesher. These three furnished nearly 88 percent of the total silver.

Zinc-lead ore supplied 63 percent of the State silver in 1948, copper ore 27, gold and silver ores 8, and lead and zinc ores together 2 percent. Ores milled yielded 91 percent of the total silver and smelting ores nearly 9 percent; minor sources were placers and old slag fumed.

Copper.—After declining for 5 consecutive years, copper output in Montana reversed the trend in 1948 and rose 0.6 percent above the 1947 level. Yield of the metal increased from both copper ore and zinc-lead ore produced at the Butte Hill mine and dumps of the Anaconda Copper Mining Co. and was great enough to balance the losses at a number of smaller operations. This company contributed 98 percent of the State copper in 1948.

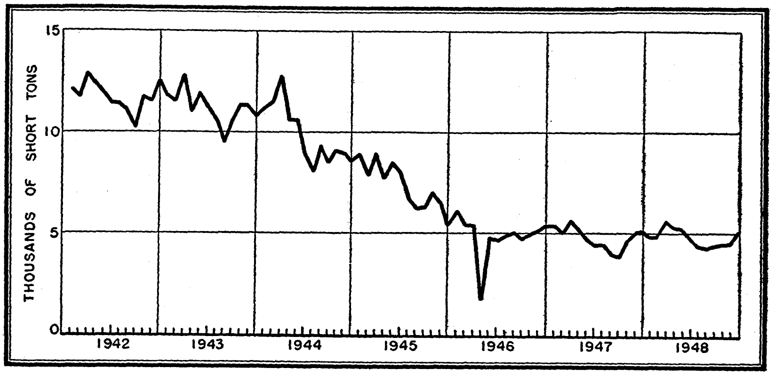

FIGURE 2.—Mine production of copper in Montana, 1942–48, by months, in terms of recovered metal.

Lead.—Lead output in Montana in 1948 was the highest since 1942. The bulk of the increase over 1947 yield was supplied by zinc-lead ore from the Butte Hill mine and dumps, the Emma mine, also at Butte, and the Jack Waite mine in Sanders County; lead output from the Mike Horse mine was 7 percent less than in 1947. The Anaconda Copper Mining Co. produced 53 percent of the State lead in 1948; other operations that produced more than a million pounds of recoverable lead each were the Emma, Mike Horse, and Jack Waite mines. These four furnished almost 84 percent of the total lead in 1948. Of the State total lead, 89 percent was recovered from zinc-lead ore, over 6 percent from lead ore, 2 percent from gold and silver ores, and over 2 percent from zinc ore and slag.

Zinc.—Production of recoverable zinc in Montana in 1948 passed 100,000,000 pounds for the first time since 1942 and for the second year in State history exceeded copper in output. Virtually all of the increase over 1947 yield came from the Butte Hill mine and dumps, the Emma mine, and old zinc slag from the East Helena dumps. Production of the metal declined at the Poulin mine at Butte and at the Mike Horse mine at Flesher. Leading State zinc producers in 1948, each producing more than a million pounds of recoverable metal, were the Butte Hill mine and dumps (72 percent of the State total), Emma mine, East Helena old slag dumps, and the Mike Horse, Poulin, and Travona mines, which together furnished 97 percent of the total zinc. Of Montana zinc in 1948, 93 percent was derived from zinc-lead ore, 6 percent from zinc ore and old slag, and nearly all of the remainder from lead ore and gold and silver ores.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Montana in 1948, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

MINING INDUSTRY

No work stoppages affected the mining industry in Montana in 1948; but many mines, especially those at Butte, needed more man-wer to reach capacity production. Under the stimulus of higher -s for base metals, active lode mines in the State in 1948 increased -ent over the number in 1947; the number of placer mines de- -7 percent. Copper ore mined in the State in 1948 declined -t, but the loss was nearly balanced by increased output of -e, chiefly from the Butte Hill mine and dumps. Of the

3,020,307 tons of ore treated during the year (3,100,013 tons in 1947), 50 percent was copper ore (59 percent in 1947), 43 percent was zinc-lead, zinc, and lead ores (32 percent in 1947), and 7 percent was gold and silver ores (9 percent in 1947).

Of much significance to the mining industry of Montana was the starting of the Kelly shaft at Butte on April 17, marking the beginning of the "Greater Butte project" of the Anaconda Copper Mining Co. to develop at least 130,000,000 tons of low-grade copper ore for future mining.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Montana in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	56	156, 296	23, 148	59, 794	14, 890	21, 745	33, 833
Dry and siliceous gold-silver ore	26	32, 200	5, 813	283, 816	88, 025	290, 438	144, 779
Dry and siliceous silver ore	46	28, 752	445	190, 117	161, 770	473, 873	560, 602
	128	217, 248	29, 406	533, 727	264, 685	786, 056	739, 214
Copper ore	19	1, 511, 069	10, 888	1, 894, 759	[1] 111, 143, 134	222	295
Lead ore	102	25, 398	1, 282	136, 135	97, 364	2, 365, 869	432, 715
Zinc ore	6	[2] 34, 048	32	14, 520	53, 336	808, 253	7, 045, 946
Zinc-lead ore	42	1, 232, 544	14, 942	4, 348, 858	4, 945, 481	32, 861, 600	109, 971, 830
Total lode mines	[3] 250	3, 020, 307	56, 550	6, 927, 999	[1] 116, 504, 000	36, 822, 000	118, 190, 000
Placers	34		16, 541	2, 717			
Total: 1948	284	3, 020, 307	73, 091	6, 930, 716	[1] 116, 504, 000	36, 822, 000	118, 190, 000
1947	297	3, 100, 013	90, 124	6, 326, 190	[4] 115, 800, 000	32, 216, 000	91, 358, 000

[1] Includes 5,503,688 pounds recovered from precipitates.
[2] Includes 22,727 tons of zinc slag fumed.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 6,004,223 pounds recovered from precipitates.

METALLURGIC INDUSTRY

The 3,020,307 tons of ore produced from Montana lode mines in 1948 were treated as follows: 2,893,171 tons (96 percent) at mills (2,939,293 tons in 1947); 104,409 tons (3 percent) shipped to smelters (153,317 tons in 1947); and 22,727 tons (1 percent) of old lead-smelter slag fumed (7,403 tons in 1947).

The 12,320-ton copper concentrator and the 2,000-ton zinc concentrator of the Anaconda Copper Mining Co. at Anaconda operated continuously in 1948. The company copper smelter (annual capacity, 1,300,000 tons of charge) and the two electrolytic-zinc plants at Anaconda and Great Falls (combined capacity, 233,400 tons of slab zinc per year) also were operated throughout the year. The zinc plants treated 511,119 tons of zinc concentrates containing 543,164,009 pounds of zinc, compared with 429,756 tons containing 453,575,671 pounds of zinc in 1947. The concentrates were received from Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and several foreign countries. The company slag-fuming plant at East Helena was operated throughout the year and treated 221,754 tons of hot slag and old cold slag compared with 226,668 tons in 1947 output of zinc-lead fume decreased from 38,229 tons in 1947 to 35,781 tons in 1948; nearly all of it was treated at the Great Falls electrolytic zinc plant.

The lead smelter of the American Smelting & Refining Co. at East Helena operated throughout 1948 and treated chiefly lead-silver concentrates from Idaho, residues from the electrolytic zinc plants at Anaconda and Great Falls, and crude ores, concentrates, and old tailings from various districts in Montana.

Mine production of metals in Montana in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	54, 447	9, 867	4, 415			
Ore cyanided	90, 160	3, 661	8, 060			
Concentrates smelted [1]	425, 768	29, 557	6, 318, 126	110, 049, 541	33, 146, 727	110, 143, 059
Copper precipitates smelted	4, 267			5, 503, 688		
Ore smelted	104, 409	13, 465	588, 597	950, 771	3, 167, 203	3, 290, 733
Old slag fumed	22, 727		8, 801		508, 070	4, 756, 208
Placer		16, 541	2, 717			
Total: 1948		73, 091	6, 930, 716	116, 504, 000	36, 822, 000	118, 190, 000
1947		90, 124	6, 326, 190	115, 800, 000	32, 216, 000	91, 358, 000

[1] Includes zinc concentrates treated at electrolytic plants.

Gross metal content of Montana ore treated at mills in 1948, by classes of ore[1]

Class of ore	Ore (short tons)	Gross metal content of mill feed				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold	139, 657	18, 243	47, 811	15, 200	15, 000	42, 500
Dry and siliceous gold-silver	4, 500	830	7, 000	64, 000		
Copper	1, 500, 008	14, 188	1, 978, 605	113, 692, 875		
Lead	16, 232	243	. 79, 900	76, 850	541, 200	153, 290
Zinc	758	2	732	2, 000	28, 500	240, 000
Zinc-lead	1, 232, 016	23, 651	5, 637, 529	6, 607, 258	40, 402, 347	126, 834, 401

REVIEW BY COUNTIES AND DISTRICTS

BEAVERHEAD COUNTY

Argenta District.—Ida B. Hand and John Hand, owners, and Ellis & Cummins, lessees, worked the Louis Phillip mine and shipped to smelters 221 tons of gold-silver ore containing 16 ounces of gold, 611 ounces of silver, 2,877 pounds of copper, 12,140 pounds of lead, and 8,129 pounds of zinc; and 2,198 tons of lead ore containing 227 ounces of gold, 10,322 ounces of silver, 23,189 pounds of copper, 593,467 pounds of lead, and 72,000 pounds of zinc. Shafer Bros. and lessees produced 2,604 tons of gold smelting ore from the Shafer group; the ore contained 1,752 ounces of gold and 9,079 ounces of silver. Several other properties produced smaller tonnages of lead ore and zinc-lead ore.

Bald Mountain District.—Lessees produced 133 tons of lead smelting ore from the Alice claim.

Bryant District.—Output from the Hecla mine and dumps comprised 2,306 tons of old silver slag, 152 tons of gold-silver ore, and 38 tons of lead ore.

Horse Prairie Creek (Colorado) District.—W. C. McLeod operated a dragline dredge and nonfloating washing plant on the Golden Leaf placer from May to October and recovered 194 ounces of gold and 31 ounces of silver from about 90,000 cubic yards of gravel.

Vipond District.—Quartz Hill Mines group was operated all year and produced 2,713 tons of silver smelting ore containing 28 ounces of gold and 57,578 ounces of silver.

BROADWATER COUNTY

Backer District.—White's Gulch Placer Co. operated a dragline excavator and nonfloating washing plant from May through September and washed 4,000 cubic yards of gravel. Howard Perkins worked the Superior mine and treated several hundred tons of gold ore by amalgamation and concentration.

Beaver District.—Largest output came from lessees' operations at the East Pacific and No. 4 Tunnel claims—about 1,800 tons of zinc-lead milling ore and 82 tons of lead smelting ore. Production from the Little Bonanza mine was 138 tons of lead smelting ore containing 6 ounces of gold, 3,562 ounces of silver, 1,188 pounds of copper, 108,318 pounds of lead, and 12,804 pounds of zinc.

Cedar Plains District.—William Zimmerman operated the North Home mine from March to August and shipped 362 tons of lead smelting ore containing 5 ounces of gold, 2,413 ounces of silver, 824 pounds of copper, 41,178 pounds of lead, and 25,446 pounds of zinc. Remaining district production was mainly lead ore from several small properties.

Park or Indian Creek District.—Douglas Placers operated its dragline dredge and nonfloating washing plant from April until June and recovered 574 ounces of gold and 53 ounces of silver from 100,000 cubic yards of gravel. Palmer Engh operated the Diamond Hill mine for 5 months and treated several hundred tons of gold ore by amalgamation.

CASCADE COUNTY

Montana District.—The Bennett Mining Co. worked the Dacotah group throughout the year and treated 4,237 tons of zinc-lead ore in the company 75-ton flotation mill. The Lexington Silver-Lead Mines, Inc., produced about 2,865 tons of lead milling ore from the Tom Hendricks claim. Remaining district output was zinc-lead ore from the Galt, Star, and Silver Dyke properties.

GRANITE COUNTY

Boulder and South Boulder District.—The Brooklyn group of the Saranac Mining Co. was the source of several hundred tons of zinc-lead ore, which was treated in the company 150-ton flotation mill; in addition, 11 tons of zinc-lead ore, 10 tons of zinc ore, and 9 tons of lead ore were shipped to smelters. Sanderson Bros., lessees, shipped 170 tons of gold smelting ore from the Gold King claim.

Flint Creek District.—American Machine & Metals Co., Inc., operated its Trout group throughout the year and shipped to smelters 245 tons of silver ore containing 4 ounces of gold and 3,723 ounces of silver; and 146 tons of lead ore containing 3 ounces of gold, 1,558 ounces of silver, 398 pounds of copper, 28,732 pounds of lead, and 16,200 pounds of zinc. Remaining district production was mainly 2,105 tons of old gold-silver tailings from the Granite-Bimetallic dump and 368 tons of silver smelting ore from the Silver Prince claim.

Henderson District.—H. & H. Mines operated its bucket-line dredge on Henderson Creek until November 21, when the dredge was lost through accidental sinking. During its period of operation the dredge washed 701,978 cubic yards of gravel. Remaining district output was small.

JEFFERSON COUNTY

Big Foot and State Creek District.—The Mountain Queen claim produced 343 tons of lead smelting ore.

Boulder and Little Boulder District.—District output was mainly 623 tons of silver smelting ore from the Ida claim.

Clancey District.—Winston Bros. operated its bucket-line dredge on Prickly Pear Creek until June 26 and washed 604,480 cubic yards of gravel. Remaining district production was 64 tons of silver ore from the Free Coinage dump.

Colorado District.—Minah Development Co. operated its Minah mine during all of 1948 and shipped 849 tons of gold-silver smelting ore containing 93 ounces of gold, 9,168 ounces of silver, 3,570 pounds of copper, 54,885 pounds of lead, and 22,602 pounds of zinc. Remaining district output was principally 907 tons of gold-silver smelting ore from the Mount Washington mine.

Elkhorn District.—The Elkhorn mine was operated for a month by the Elkhorn Mining Co., then for the remainder of the year by the Associated Mines Development Co. Output for the year was 1,188 tons of gold-silver ore containing 223 ounces of gold, 14,831 ounces of silver, 1,859 pounds of copper, 21,364 pounds of lead, and 46,644 pounds of zinc. Other district production included 2,361 tons of old silver tailings from the Elkhorn property and 333 tons of lead ore from the Elkhorn Queen claim.

Warm Springs District.—District output was 119 tons of lead smelting ore from the Nellie Grant claim.

Whitehall District.—Lester Lindquist operated the Carbonate mine all year and shipped 567 tons of lead smelting ore containing 14 ounces of gold, 1,121 ounces of silver, 1,556 pounds of copper, 119,919 pounds of lead, and 36,206 pounds of zinc. Marvin Riebhoff shipped 10,840 tons of gold ore from the Golden Sunlight mine. Albert Critchfield operated the Iron Side mine for 6 months and shipped 168 tons of lead smelting ore containing 2 ounces of gold, 544 ounces of silver, 545 pounds of copper, 34,589 pounds of lead, and 6,104 pounds of zinc. George Wolfe worked the Lucky Hit claim throughout 1948 and shipped 315 tons of gold smelting ore containing 189 ounces of gold, 483 ounces of silver, 2,026 pounds of copper, 1,010 pounds of lead, and 2,520 pounds of zinc. Other district production was mainly 247 tons of lead ore from the Perhaps mine, 144 tons of gold-silver ore from the Parrott claim, and 88 tons of copper ore, also 48 tons of gold-silver ore, from the Inspiration claim.

JUDITH BASIN COUNTY

Barker District.—Thorson & Brazee worked the Wright-Edwards group all year and shipped 146 tons of zinc-lead smelting ore containing 6 ounces of gold, 4,000 ounces of silver, 605 pounds of copper, 79,710 pounds of lead, and 47,136 pounds of zinc. Remaining district output was 47 tons of lead ore and 13 tons of zinc-lead ore from the Glendennin (Tiger) group.

LEWIS AND CLARK COUNTY

Heddleston District.—The Mike Horse Mining & Milling Co. operated the Mike Horse mine for a full year and treated in the company 230-ton flotation mill 51,375 tons of zinc-lead ore containing 33 ounces of gold, 107,888 ounces of silver, 503,400 pounds of copper, 4,336,050 pounds of lead, and 3,483,225 pounds of zinc. Remaining district production was small.

Helena District.—Porter Bros. Corp. operated its 6-cubic-foot Yuba bucket-line dredge on Last Chance Gulch throughout 1948 and washed 2,128,848 cubic yards of gravel. O. A. Barnes operated a dragline excavator and nonfloating washing plant on the Caswell placer from June 1 to October 20, and washed 4,000 cubic yards of gold-bearing gravel. Remaining district production was principally siliceous gold and gold-silver material from the Peck Concentrator dump, Springhill property, and Whitlatch Union tailing pile.

Lincoln District.—Otis Williams & Co. operated a dragline dredge and nonfloating washing plant on Poorman and McClellan Creeks and washed about 500,000 cubic yards of gravel.

Marysville District.—The Montana Rainbow Mining Co. operated the Drumlummon mine and treated 15,106 tons of gold ore in its 150-ton amalgamation-flotation mill. Operations were largely halted after August because of damage to the shaft, caused by the caving of heavy ground. Remaining district production was mainly lead ore—48 tons from the Larson claim, 60 tons from the Towsley mine, and 172 tons, as well as 82 tons of silver ore, from the Shakopee mine.

Missouri River District.—Perry & Schroeder Mining Co. operated its 6-cubic-foot bucket-line dredge on French Bar only in January; 88,000 cubic yards of gravel were washed. Two other placer operations in the district reported production during the year.

Rimini District.—Lessees operated the Red Mountain Consolidated Mining Co. group and shipped dump and crude ore to smelters—265 tons of gold-silver ore and 776 tons of lead ore. Finnish-American Mining Co. operated the Armstrong mine and shipped 285 tons of gold-silver smelting ore. Remaining output from the district was mainly dump ore—188 tons of gold-silver ore from the Eureka dump and 228 tons of lead ore from the Stanton and Little Sampson dumps.

Scratch Gravel District.—Principal production was dump ore from the Silver Coin property—553 tons of silver ore and 3 tons of lead ore.

Smelter District.—Nearly all the metals credited to the Smelter district came from 33,250 tons of old zinc slag, 22,727 tons of which went direct to the East Helena slag-fuming plant of the Anaconda Copper Mining Co.; the remainder went to the East Helena lead smelter.

MADISON COUNTY

Rochester District.—Jacobson & Keene, lessees, worked the Calvin mine and shipped 211 tons of lead smelting ore containing 15 ounces of gold, 2,040 ounces of silver, 758 pounds of copper, 61,065 pounds of lead, and 11,838 pounds of zinc. Lessees operated the Emma group part of the year; 22 tons of lead ore were shipped to a smelter, and about 1,060 tons of lead dump ore were milled. Remaining district output was small.

Sheridan District.—Victoria Mines, Inc., treated a substantial tonnage of zinc-lead ore in the company mill and produced 418 tons of lead concentrate, 358 tons of zinc concentrate, and 73 tons of copper concentrate; in addition, 150 tons of gold-silver ore were shipped to a smelter. Considerable gold was recovered from the Ihde placer. Remaining district output included small shipments of lead ore and silver ore from various properties.

Silver Star District.—Bulk of production was about 450 tons of copper ore from the Victoria and American Pit claims, 110 tons of zinc-lead ore from the Robin claim, and 232 tons of old tailings from the Schmidt property.

Tidal Wave District.—Lessees operated the Corncracker group throughout the year and shipped 98 tons of gold ore containing 178 ounces of gold and 131 ounces of silver. Remaining district production likewise was nearly all gold ore—86 tons from the High Ridge and High Ridge Fraction claims, 8 tons from the Smith claim, and 55 tons (as well as 10 tons of lead ore) from the Granger group.

Virginia City District.—The U. S. Grant Mining Co. operated its U. S. Grant mine and shipped to smelters 12,431 tons of gold-silver ore containing 2,168 ounces of gold and 147,017 ounces of silver. The company also operated the Easton-Pacific group and shipped 3,033 tons of gold-silver ore containing 531 ounces of gold and 20,820 ounces of silver. Henry Shute operated the Cornucopia mine and shipped 4,933 tons of gold-silver smelting ore. Remaining lode production was mainly 152 tons of gold ore from the Garrison group. Russell Unrue operated a dragline dredge on the Barton Gulch placer from late June to the middle of October and washed 31,400 cubic yards of gravel.

MINERAL COUNTY

Hunter District.—Dykstra & Johnson, lessees, operated the Silver Cable mine and produced 758 tons of zinc ore and 248 tons of zinc-lead ore.

Keystone District.—Lessees milled a substantial tonnage of lead ore from the Nancy Lee mine, which yielded 367 tons of lead concentrate.

MISSOULA COUNTY

Copper Cliff District.—The Hecla Mining Co. operated the Blacktail mine and produced 207 tons of lead milling ore and 7 tons of lead smelting ore.

Nine Mile District.—Canusco, Inc., operated a dragline dredge on the Imperial placer during May, then turned the property back to the owners. During the period of its operation, the dredge recovered 95 ounces of gold from 26,000 cubic yards of gravel.

PARK COUNTY

New World District.—McLaren Gold Mines Co. operated the Estelle-New Year's Gift group and milled a large quantity of copper ore, which yielded 2,070 tons of copper-gold concentrate and 2 tons of gold concentrate. Ex-Cello Mines, lessee, worked the Homestake mine until February 15; on April 1 the property was sold to the Parkmont Corp., which operated it from July 15 to October 15. During the year, the mine produced 4,500 tons of gold-silver ore treated by flotation-amalgamation and shipped 27 tons of lead smelting ore. Irma Mines, Inc., milled zinc-lead ore from the Irma mine and produced 89 tons of lead concentrate and 194 tons of zinc concentrate. In addition, 324 tons of lead dump ore were shipped to a smelter. Other district production was small.

Sheepeater District.—The Jardine Mining Co. closed its Jardine mine on July 15, following a fire that destroyed the cyanide plant of the cyanidation-flotation mill on May 8. During the period of its operation, the mill treated 33,416 tons of gold ore, which yielded 6,498 ounces of gold and 1,421 ounces of silver.

PHILLIPS COUNTY

Little Rockies District.—The Ruby Gulch Mining Co. operated the Ruby group until November 20 and treated in the company 300-ton cyanide leaching plant 90,115 tons of gold ore containing 4,300 ounces of gold and 9,400 ounces of silver. In addition, 18 tons of gold-silver ore were shipped to a smelter.

POWELL COUNTY

Big Blackfoot District.—John B. Hopkins & Associates conducted hydraulicking and drift mining on the Hopkins group and recovered 48 ounces of gold from about 750 cubic yards of gravel.

Nigger Hill District.—Hopkins & Sons Mining Co. operated the Charter Oak mine throughout 1948 and produced 735 tons of zinc-lead ore containing 33 ounces of gold, 3,853 ounces of silver, 827 pounds of copper, 52,430 pounds of lead, and 15,500 pounds of zinc. Part of the ore was treated in the company 35-ton flotation mill. Remaining district output was principally 36 tons of gold-silver ore and 34 tons of zinc-lead ore from the Lilly group, 42 tons of lead ore from the Negros claim, and 49 tons of gold-silver ore from the Blackfoot claim.

Zozell District.—The Bonanza Leasing Co. operated the Bonanza group from May through December and produced 556 tons of gold ore and 5 tons of lead ore. The gold ore contained 208 ounces of gold, 1,185 ounces of silver, 93 pounds of copper, 7,768 pounds of lead, and 4,533 pounds of zinc. The Deer Lodge Mining Co. worked the Emery group until June 30, then liquidated the operation. During the period of operation, 8,070 tons of zinc-lead ore were treated by flotation. Remaining district output was small.

RAVALLI COUNTY

Curlew District.—The Victor Development Co. worked the Whippoorwill mine and milled zinc-lead ore, which yielded 32 tons of lead concentrate and 36 tons of zinc concentrate. Remaining district output was small lots of lead and zinc-lead ore shipped from the Curlew claim.

SANDERS COUNTY

Eagle District.—The American Smelting & Refining Co. operated the Jack Waite mine throughout 1948 and produced 3,904 tons of zinc-lead milling ore and 93 tons of lead smelting ore. The milling ore contained 15 ounces of gold, 6,442 ounces of silver, 23,000 pounds of copper, 1,162,600 pounds of lead, and 294,360 pounds of zinc.

Plains District.—F. R. Walkley shipped 139 tons of copper smelting ore from the Mascot claim.

Revais Creek District.—The Drake group was operated all year by the Green Mountain Mining Co. Production was 694 tons of copper ore containing 121 ounces of gold, 590 ounces of silver, and 151,637 pounds of copper. Part of the ore was treated in the company flotation mill.

SILVER BOW COUNTY

Ore production in Silver Bow County in 1948 was 12,564 tons greater than in 1947, and outputs of silver, copper, lead, and zinc gained 16, 1, 24, and 29 percent, respectively; gold production declined 3 percent. The total value of the five metals in 1948 was 18 percent greater than in 1947 and represented nearly 89 percent of the State total value. The following table gives the output of mines in the County, which includes the Summit Valley (Butte) district, in 1947–48 and the total from 1882 to the end of 1948.

Production of gold, silver, copper, lead, and zinc in Silver Bow County, Montana, 1947–48, and total, 1882–1948, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer) (fine ounces)	Silver (lode and placer) (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1947	32	2,624,915	19,801	5,252,011	114,374,000	21,269,500	81,425,000	$42,379,878
1948	22	2,637,479	19,163	6,100,232	115,423,500	26,448,900	105,250,800	49,971,332
1882–1948		(1)	2,065,161	557,137,222	(2) 6,658,718	(2) 258,721	(2) 1,664,107	2,691,763,222

[1] Figure not available.
[2] Short tons.

Summit Valley (Butte) District.—Company material treated at the copper concentrator of the Anaconda Copper Mining Co. at Anaconda comprised 1,277,349 tons of copper ore from the main Butte Hill mine (1,178,845 tons in 1947), 15,164 tons from the Greater Butte project (none in 1947), 95,579 tons of Adams ore (286,550 tons in 1947), 63,327 tons of special waste (59,926 tons in 1947), and 7,308 tons from the Tramway dump (none in 1947). Direct smelting ore totaled 10,859 tons (21,391 tons in 1947), and mine-water precipitates 4,267 tons (4,050 tons in 1947).

Production of zinc-lead ore from the Butte Hill mine of the Anaconda Copper Mining Co. reached 748,957 tons in 1948 (465,385 tons in 1947) and that from the Butte Hill dumps 345,539 tons (298,654 tons in 1947). This marked increase in ore production was the main factor in pushing State yield of zinc to the highest level in recent years, as well as supplying important increases in lead, copper, gold, and silver from this operation. The company-operated Emma mine had an output of 36,150 tons of zinc-lead dump ore, mine ore, and middling from the treatment of manganese ore (27,254 tons in 1947). Zinc-lead middling (4,548 tons) was also produced in milling manganese ore from the Travona mine; the middling was treated further at the Anaconda zinc concentrator. The Poulin mine, operated under lease from the Anaconda Copper Mining Co., was the remaining large zinc producer in the district; output was 6,497 tons of zinc-lead milling ore and 573 tons of copper smelting ore. From the Montana Ore Purchasing Co. dump near Butte, 10,361 tons of old copper tailings were shipped to a concentrator and 1,740 tons of old silver tailings to a smelter.

Remaining district production was nearly all siliceous silver ore shipped to smelters; 10,138 tons came from the Bluebird tailing dump, 231 tons from the Burlington mine, 1,483 tons from the Amazon mine, 73 tons from the Fredonia mine, 377 tons from the Little Darling dump, 175 tons from the Magna Charta mine, 487 tons from the Maria claim, and 447 tons from the Nettie mine.

Nevada
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. MAURER

GENERAL SUMMARY

STIMULATED by a strong demand combined with higher average prices for the base metals, zinc and lead production in Nevada in 1948 rose substantially over the 1947 output. In contrast, the production of copper in 1948 dropped below the level attained the previous year, owing largely to lower yield of the metal from ore mined in the principal copper-producing district in the State. Gains in both gold and silver output in 1948 reflected to some degree the larger production of the two precious metals as byproducts from lead, zinc, and fluxing ores, but important increases were attained at open-cut mines that produced ores solely for their gold and silver values. The total value of gold, silver, copper, lead, and zinc recovered from ores, old tailings, and gravels mined at 350 lode and 36 placer properties in Nevada in 1948 was $34,055,480 compared with $31,366,282, the output of 276 lode and 31 placer mines in 1947—an increase of 9 percent.

Comparing 1948 with 1947, gold output increased 25 percent in quantity and value; copper decreased 9 percent in quantity but only 6 percent in value; silver increased 30 percent in quantity and value; lead increased 37 percent in quantity and 70 percent in value; and zinc increased 20 percent in quantity and 31 percent in value. Of the total value of the five metals, copper comprised 58 percent; zinc, 16 percent; gold, 11 percent; lead, 10 percent; and silver, 5 percent.

As in 1947, White Pine County led the other counties by producing 63 percent of the State total value of the five metals in 1948; it stood first in output of copper and gold, second in silver and lead, and third in zinc. Lincoln County ranked second to White Pine County, with 25 percent of the State total value, and led the State in production of silver, lead, and zinc.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Nevada, 1944–48, and total, 1859–1948, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	146	11	6,863,505	119,056	$4,166,960	1,259,636	$895,741
1945	163	12	5,374,673	92,265	3,229,275	1,043,380	741,959

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] From 1904 (when first satisfactory annual canvass of mine production was made) to 1948, inclusive, the output was as follows: Gold, 13,910,719.51 ounces valued at $334,194,303; silver, 304,358,462 ounces, $206,435,146; copper, 1,875,587 tons, $545,525,182; lead, 326,327 tons, $43,173,489; zinc, 384,746 tons, $64,991,864; total value, $1,194,319,984.
[3] Figure not available.
[4] Short tons.

Gold.—Gold production in Nevada in 1948 rose 25 percent over the 1947 output and was the highest in quantity and value since 1944. Despite the established and unchanged price of gold and the continuing high costs of mine operation, there was increased activity in the exploitation of gold ore in 1948. The output from placer mines increased 17 percent above the total for 1947, owing principally to dragline dredging. Gold from lode mines—which accounted for 93 percent of the State total gold production—increased 26 percent. Monthly production of gold, as shown in the accompanying table, was fairly uniform and slightly above the 1947 average from January through July, but increased sharply in August, and a higher rate of production was maintained through December. Reversing the pattern of the previous year, byproduct gold from base-metal ores comprised only 38 percent of the output of gold in 1948 whereas gold recovered from precious-metal ores was 55 percent of the total.

The 10 leading gold-producing mines in 1948 contributed 84 percent of Nevada's output, the 3 leaders producing 48 percent.

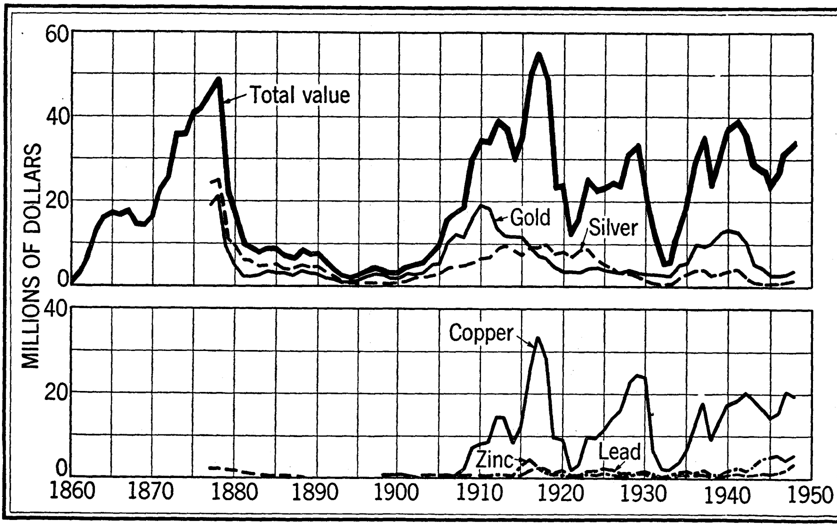

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value of Nevada, 1860–1948.

Silver.—Production of silver in Nevada in 1948 was up 30 percent compared with 1947; as in preceding years, a large percentage of the silver output was a byproduct of ore mined chiefly for other metals. Base-metal ores were the source of 52 percent of the State silver production in 1948 (71 percent in 1947), whereas 21 percent (13 percent in 1947) was from straight silver ore. The monthly production figures in the accompanying table follow closely the pattern set by lead and zinc output in 1948—a gradual increase in production the first 10 months followed by successive sharp drops in November and December occasioned by severe late fall and winter weather.

Ten leading gold-producing mines in Nevada in 1948, in order of output

Rank	Mine	District	County	Rank in 1947	Operator	Source of gold
1	Ruth and Copper Flat	Robinson	White Pine	1	Kennecott Copper Corp. (Nevada Mines Division).	Copper ore.
2	Goldacres	Bullion	Lander	2	Consolidated Goldacres Co. and London Extension Mining Co.	Gold ore.

November	10,102	171,435	4,307	1,064	2,432
December	10,780	144,402	3,930	988	1,643
Total 1948	111,532	1,790,020	45,242	9,777	20,288

Copper.—Nevada copper production was centered in the Robinson (Ely) district, White Pine County, where the State's two leading producers supplied a preponderant percentage of the total 1948 output; these were: The Kennecott Copper Corp. (Nevada Mines Division), working the Ruth and Copper Flat mines, and the Consolidated Coppermines Corp., working the Coppermines group at Kimberly. Other producers of copper in Nevada included the Bristol Silver Mining Co., Bristol Silver mine, Jack Rabbit district, and the Ely Valley Mine, Ely Valley mine, Pioche district, both in Lincoln County; and lessees of the Copper Canyon Mining Co., Copper Basin mine, Battle Mountain district, Lander County.

Lead.—Of the recoverable lead produced in Nevada in 1948, 57 percent was mined in the Pioche district, Lincoln County, where the leading properties were: The Combined Metals Reduction Co., working the Pioche groups; the Ely Valley mine, operated by Ely Valley Mine; and the Prince Consolidated Mining Co. Prince mine. Other important lead producers in the State were: R. K. Hamilton and L. F. Jacobson, operating the Yellow Pine mine, Yellow Pine district, Clark County (second largest producer of lead in Nevada); Fred C. Farnsworth, Farnsworth mine, Ward district, White Pine County; McFarland & Hullinger, Cleveland mine (Delano district, Elko County); Bristol Silver Mines Co., Bristol Silver mine (Jack Rabbit district, Lincoln County); and Lee H. Bayliss, Delno mine (Delano district, Elko County).

Zinc.—In 1948, as in recent years, zinc production in Nevada was centered in the Pioche district, Lincoln County, where 92 percent of the State total for the year was mined. The Combined Metals Reduction Co., Ely Valley Mine and Prince Consolidated Mining Co., were the State's leading producers, in the order named; all are in the Pioche district. Other important zinc producers in the State were the Comet Mining Co., Comet mine, Comet district, Lincoln County, and R. K. Hamilton and L. F. Jacobson, Yellow Pine mine, Yellow Pine district, Clark County.

MINE PRODUCTION BY COUNTIES

MINING INDUSTRY

The 10-percent increase in total tonnage of ores and old tailings sold or treated in 1948 compared with 1947 reflects an increase in total dry and siliceous ores and an increase in all the base-metal ores except zinc-lead ore and zinc-lead-copper ore. Higher average prices for the base metals permitted exploitation of larger tonnages of lower-grade copper ore and stimulated the production of zinc and lead ores. Increased demand for fluxing ores at base-metal smelters and renewed interest ...ld and silver mining accounted for the rise in output of dry and ...s ores.

...8, the dragline dredge of the Natomas Co., in the Battle

Mountain district, Lander County, produced 78 percent of Nevada's placer gold and was the sixth largest producer of gold in the State. Except for this dredge, Nevada placer mines were almost entirely limited to operations that handled gravel on a relatively small scale.

ORE CLASSIFICATION

The accompanying table classifying ores sold or treated in Nevada in 1948 shows that 87 percent of the tonnage (including old tailings) was copper ore, 7 percent gold ore and old tailings, nearly 3 percent zinc ore, 2 percent gold-silver ore and old tailings, and the remainder silver ore and old tailings, lead ore and old tailings, zinc-lead ore, and lead-copper ore.

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in Nevada in 1948, with content in terms of recovered metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry and siliceous gold ore	487,148	13,065	46,954	73,682	26,000	3,400	----------
Dry and siliceous gold-silver ore	165,276	93	13,093	414,157	9,000	40,100	----------
Dry and siliceous silver ore	32,033	939	609	370,756	432,900	1,469,000	680,500
Total	684,457	14,097	60,656	858,595	467,900	1,512,500	680,500
Copper ore	6,209,049	--------	37,385	142,435	[1] 89,305,200	200	----------
Lead ore	32,143	455	973	245,239	91,900	6,176,400	201,400
Lead-copper ore	102	--------	1	1,053	8,100	52,600	----------
Zinc ore	186,286	--------	1,332	140,081	517,400	1,490,600	32,989,200
Zinc-lead ore	45,923	99	3,007	401,154	93,500	10,321,700	6,704,900
Total lode mines	7,157,960	14,651	103,354	1,788,557	[1] 90,484,000	19,554,000	40,576,000
Placers	----------	--------	8,178	1,463	----------	----------	----------
Total: 1948	7,157,960	14,651	111,532	1,790,020	[1] 90,484,000	19,554,000	40,576,000
1947	6,524,803	16,832	89,063	1,377,579	[2] 99,206,000	14,322,000	33,940,000

[1] Includes 2,055,200 pounds of copper from precipitates.
[2] Includes 2,607,400 pounds of copper from precipitates.

METALLURGIC INDUSTRY

Of the 7,172,611 tons of lode material (including 14,651 tons of old tailings) from Nevada mines sold or treated during 1948, 99 percent went to mills and 1 percent to smelters.

The 1,500-ton selective-flotation mill operated by the Combined Metals Reduction Co. at Pioche, Lincoln County, treated zinc and zinc-lead ores on a custom basis for several neighboring mines and also milled company zinc and zinc-lead ores. The Kennecott Copper Corp. treated all the copper ore produced by the Consolidated Coppermines Corp. on a contract basis, in addition to milling its own ore at the McGill 20,000-ton concentrator. It also operated the McGill copper smelter, Nevada's only smelter, treating in addition to copper ore and copper concentrate, siliceous gold and silver ores used for fluxing. Custom ores were treated by W. F. Donovan at his 100-ton cyanide mill in the Silver City district, Lyon County, and at the Dayton Consolidated Mining Co. 150-ton cyanide plant, operated in conjunction with a 200-ton flotation mill in the Comstock district, Storey County.

Mine production of metals in Nevada in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and old tailings amalgamated	39,152	3,816	2,790	----------	----------	----------

REVIEW BY COUNTIES AND DISTRICTS

CHURCHILL COUNTY

Broken Hills District.—The Broken Hills Mining & Milling Co., incorporated May 23, 1948 (formerly Broken Hills Mine), developed the Broken Hills mine during 1948; 43 tons of silver ore shipped to a smelter yielded 1,759 ounces of silver and 1,900 pounds of lead.

Sand Springs District.—Summit King Mines, Ltd. (second-largest producer of silver in Nevada in 1948) worked the Summit King Group during 10 months of the year; 2,633 ounces of gold and 163,313 ounces of silver was recovered from 11,763 tons of ore cyanided at the company 60-ton mill.

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 4 and their output included with "Other districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 1,788,557 ounces from lode mines and 1,463 ounces from placers.

[4] Includes following districts: El Dorado Canyon in Clark County; Contact (Salmon River) and White Horse in Elko County; Goldfield in Esmeralda County; Diamond in Eureka County; Potosi in Humboldt County; Hilltop in Lander County; Atlanta in Lincoln County; Pilot Range in Lyon County; Garfield in Mineral County; Reveille in Nye County; and Eagle and Hunter in White Pine County.

CLARK COUNTY

Searchlight District.—The Desert Milling Co. recovered 380 ounces of gold and 870 ounces of silver from 13,000 tons of old tailings and dump material cyanided at the Quartette mine 100-ton mill from January 1 to June 20 and from October 10 through December 31, 1948. Morse & Graves, operating the Valley mine during 1948, shipped concentrate containing a substantial amount of gold and some silver to a smelter.

Yellow Pine District.—J. W. Stewart worked the Anchor mine throughout 1948 and shipped 478 tons of lead ore containing 3 ounces of gold, 1,679 ounces of silver, 900 pounds of copper, 325,900 pounds of lead, and 38,700 pounds of zinc to a smelter. R. K. Hamilton and L. F. Jacobson worked the Yellow Pine mine in 1948. Zinc-lead concentrate and zinc-lead ore containing some gold, silver, and copper were shipped to a smelter.

ELKO COUNTY

Cope (Mountain City) District.—Knowles Bros. operated the Protection mine throughout 1948 and shipped 1,107 tons of gold-silver ore containing 412 ounces of gold, 44,776 ounces of silver, 1,600 pounds of copper, and 11,800 pounds of lead to a smelter.

Delano District.—Lead ore was shipped to smelters during 1948 by McFarland & Hullinger (Cleveland mine) and Lee H. Bayliss (Delno mine).

Merrimac District.—Rip Van Winkle Consolidated Mining Co. operated the Rip Van Winkle mine throughout 1948; 484 tons of zinc-lead ore shipped to a concentrator-smelter yielded 3 ounces of gold, 4,944 ounces of silver, 43,400 pounds of lead, and 41,400 pounds of zinc.

Railroad District.—Gregory Bros. & R. A. Kinne, lessees, developing the Sweepstakes mine from January 1 to November 10, 1948, shipped to smelters 131 tons of copper and lead ores together containing 1 ounce of gold, 1,067 ounces of silver, 11,900 pounds of copper, and 4,900 pounds of lead.

Spruce Mountain District.—Nevada Monarch Consolidated Mines Corp. completed 3,572 feet of diamond drilling at its claims during 1948; lessees (Cleghorn & Boundy, E. C. Gibson, and M. Woodward) shipped lead ore from the Monarch and Black Forest mines and silver ore from the Spruce Standard mine to smelters for treatment.

Van Duzer District.—The M. P. M. Mining Co. operated a Diesel dragline and Judson-Pacific washing plant on Van Duzer Creek and Cobb Creek from January 1 to November 6, 1948; 60,000 cubic yards of gravel washed yielded 548 ounces of gold and 132 ounces of silver.

ESMERALDA COUNTY

Divide (Gold Mountain) District.—Lessees working the Tonopah Divide mine during 1948 shipped gold ore to smelters.

Goldfield District.—The Deep Mines Operation continued development of the Florence, White Rock, and Laguna mines (the latter owned by Goldfield Consolidated Mines Co.) and constructed a 100-ton flotation and cyanidation plant during 1948.

Lone Mountain District.—Wells & Fabbi and Stewart & Leid operated the Sally Louise, Gossin Prince, and Nevada Silver claims during 1948; 198 tons of lead and zinc-lead ores shipped to various smelters yielded 3 ounces of gold, 1,467 ounces of silver, 1,900 pounds of copper, 41,300 pounds of lead, and 3,200 pounds of zinc.

Montezuma District.—E. S. Perry, working the Bullion and Benton claims from June 15 to October 15, 1948, shipped silver, lead, and zinc-lead ores totaling 176 tons to smelters; 8 ounces of gold, 3,439 ounces of silver, 300 pounds of copper, 22,000 pounds of lead, and 11,800 pounds of zinc were recovered.

EUREKA COUNTY

Cortez District.—The Cortez Lease Co. operated the Queen (Cortez) mine during 6 months of 1948, shipping 640 tons of silver ore containing 19 ounces of gold, 22,838 ounces of silver, 1,700 pounds of copper, and 26,700 pounds of lead to a smelter.

Diamond District.—Lowell Thompson shipped a substantial quantity of lead ore containing some silver, copper, and zinc to smelters during 1948. Steel Galena Mine operated the Steel Galena mine throughout 1948; lead ore yielding some silver and copper was shipped to a smelter.

Eureka District.—The Lone Mountain Lease operated the Mountain View, the No. 1, and No. 2 claims from October 1 to December 31, 1948; 91 tons of zinc ore shipped to a smelter yielded 9 ounces of silver, 8,200 pounds of lead, and 37,500 pounds of zinc.

HUMBOLDT COUNTY

Awakening District.—The Austin Bros. Gold Mining Co. and its successor, the Red Ledge Mining Co., treated a substantial tonnage of gold ore from the Jumbo (Austin) open-pit mine by amalgamation during 1948.

Potosi District.—Getchell Mine, Inc. (fourth largest producer of gold in Nevada in 1948), operated its mill during the year principally as an experimental plant to work out a carbon cyanidation process; doré bullion and carbon concentrates produced from Getchell mine and Pinson & Ogee open-pit lease gold ores yielded a substantial quantity of gold and some silver.

LANDER COUNTY

Battle Mountain District.—The Copper Canyon Mining Co. opened for production the Hornfels ore body of the Copper Canyon mine in August 1948 after an extensive development program, treating 11,621 tons of silver ore (including development ore) in the company 350-ton revamped flotation mill; 737 tons of zinc-lead concentrate containing 135 ounces of gold, 22,949 ounces of silver, 14,500 pounds of copper, 389,600 pounds of lead, and 157,500 pounds of zinc was shipped to a smelter. From January to March 1948 ores from company leases and other neighboring mines were treated experimentally on a custom basis at the mill. Lessees worked the Copper Canyon Mining Co. Copper Basin property during 1948, shipping gold and copper ores to the company concentrating mill and copper, gold, and gold-silver ores directly to a smelter for treatment. The Natomas Co. (largest producer of placer gold in Nevada in 1948) operated a dragline dredge at Greenan Placers from January 1 to September 28, 1948; 602,833 cubic yards of gravel treated yielded 6,376 ounces of gold and 940 ounces of silver.

Bullion District.—The Consolidated Goldacres Co. and its successor, the London Extension Mining Co., operated the Goldacres mine during 1948. Gold ore was treated in the company 300-ton cyanide plant.

New Pass District.—The Reorganized Silver King Mining Co. operated the New Pass and Thomas W. mines during 1948. Gold and some silver were recovered from gold ore amalgamated at the company mill and from gold ore and gold concentrate shipped to smelters.

LINCOLN COUNTY

Comet District.—Comet Mines, Inc., operated the Comet mine (fourth-largest producer of zinc in Nevada) throughout 1948 and shipped zinc-lead ore (4,960 tons containing 114 ounces of gold, 27,282 ounces of silver, 29,700 pounds of copper, 155,500 pounds of lead, and 821,100 pounds of zinc) to the Combined Metals Reduction Co. mill at Pioche for treatment.

Groom District.—Dan Sheahan, lessee, operated the Groom mine throughout 1948. Lead ore and lead concentrate containing some gold, silver, and copper were shipped to a smelter for treatment.

Jack Rabbit District.—The Bristol Silver Mines Co. worked the Bristol mine the entire year, shipping silver ore containing some gold and substantial quantities of copper, lead, and zinc to a smelter.

Pioche District.—The Combined Metals Reduction Co. operated its 1,500-ton flotation mill on company and custom ore throughout 1948. Company zinc-lead and zinc ores were derived from the Abe Lincoln group, the Pioche 802 mine, and the Pan American, Pioche, and Wenlock Free leases. Custom zinc and zinc-lead ores came principally from the Ely Valley Mine Ely Valley mine and the Prince Consolidated Mining Co. Prince mine (respectively second- and third-largest producers of zinc in Nevada in 1948). The mill products were lead and zinc concentrates, which were shipped to smelters. In addition, the Prince Consolidated Mining Co. shipped substantial tonnages of silver ore and lead ore for direct smelting. The Salt Lake-Pioche Mining Co. shipped silver ore from the Apex mine and lead ore from the Financier mine to smelters during 1948.

LYON COUNTY

Silver City District.—W. M. Donovan operated his custom cyanide mill in Silver City during 1948 on ores from his own open-pit mines—the Silver Hill and the Hartford (Storey County) and from a number of small neighboring properties. The Dayton Consolidated Mines Co. and lessees worked the Dayton, Wedge, and Oest open-pit mines during the year; ore was treated at the company mill in Storey County. A number of small mines in the district were active during 1948.

MINERAL COUNTY

Columbus (Candelaria) District.—G. A. Peterson operated the New Potosi mine throughout 1948 and shipped 1,054 tons of lead ore containing 488 ounces of gold, 10,907 ounces of silver, 400 pounds of copper, and 202,500 pounds of lead to a smelter.

Silver Star District.—F. Williams and J. Cantwell operated the Mindoro group throughout 1948; 165 tons of gold-silver ore shipped to a custom cyanide mill yielded 52 ounces of gold and 725 ounces of silver.

NYE COUNTY

Bruner District.—Erwin & Chisholm operated the Golden Eagle group from March 15 to December 31, 1948; 147 tons of gold ore cyanided at a custom mill yielded 177 ounces of gold and 454 ounces of silver.

Mammoth District.—Obie LeFavor shipped lead ore containing some gold, silver, and copper to a smelter from the San Rafael mine on Quartz Mountain during the year.

Manhattan District.—C. H. Fehn and R. E. Johnson, operating a power shovel and stationary washing plant in Manhattan Gulch in 1948, recovered 170 ounces of gold and 60 ounces of silver from 4,000 cubic yards of gravel washed.

Tonopah District.—The Tonopah Mining Co. of Nevada and lessees operated the Mizpah and Valley View mines during 11 months of 1948, shipping gold-silver ore to a smelter.

Troy District.—The Old English Gold Corp. worked the Old English mine throughout 1948; 500 tons of gold ore amalgamated yielded 180 ounces of gold and 25 ounces of silver. In addition, gold ore (18 tons containing 12 ounces of gold and 15 ounces of silver) and concentrate (5 tons containing 36 ounces of gold and 47 ounces of silver) were shipped to smelters.

PERSHING COUNTY

Echo (Rye Patch) District.—The Standard Cyaniding Co. treated ore from its Standard (Lally) open-pit mine in the company 600-ton cyanide plant throughout 1948, recovering substantial quantities of gold and silver.

Rochester District.—The Southwest Dredging Co. operated two dragline excavators, two power shovels, and a dryland washing plant at Spring Valley Placers from October 1, to December 31, 1948; 42,000 cubic yards of gravel washed yielded 221 ounces of gold and 59 ounces of silver.

STOREY COUNTY

Comstock District.—The Consolidated Chollar Gould & Savage Mining Co. worked the Overman open-pit mine throughout 1948 treating 147,210 tons of gold-silver ore (containing 8,938 ounces of gold and 146,647 ounces of silver) in the company 500-ton cyanide plant. In addition, a small quantity of concentrate was shipped to a smelter. Dayton Consolidated Mines Co. operated its cyanide plant and flotation mill from August 1 to December 31, 1948, on custom ores from nearby mines, in addition to treating ore from the company Keystone open-pit mine and the Dayton, Wedge, and Oest mines in Lyon County. W. M. Donovan worked the Hartford and Silver Hill open-pit mines during 1948 and treated the ore by cyanidation in his mill at Silver City.

WASHOE COUNTY

White Horse (Olinghouse) District.—Emile Cabanne, lessee, operated the Hutchinson mine throughout 1948; 30 tons of ore amalgamated yielded 55 ounces of gold and 20 ounces of silver.

WHITE PINE COUNTY

Aurum (Silver Mountain) District.—The Grand Deposit Mining Co. operated the Grand Deposit mine throughout 1948 and shipped 268 tons of lead ore containing 3 ounces of gold, 646 ounces of silver, 1,600 pounds of copper, 76,200 pounds of lead, and 18,800 pounds of zinc to smelters.

Osceola District.—The Gilded Age Mining Co. shipped from the Gilded Age mine 2,802 tons of gold ore containing 1,264 ounces of gold and 686 ounces of silver to a smelter during 1948.

Robinson (Ely) District.—The Kennecott Copper Corp. (Nevada Mines Division) operated the Ruth and Copper Flat pit throughout the year and worked the Ruth underground mine from January to August 1948. The ore from these mines and the copper ore produced by the Consolidated Coppermines Corp. was treated at Kennecott's McGill flotation concentrator and copper smelter. Kennecott was the leading producer of copper and gold in the State. The Consolidated Coppermines Corp., second-largest copper and third-largest gold producer in Nevada in 1948, worked the Coppermines group throughout 1948. In addition to the copper ore produced, substantial quantities of lead ore and zinc ore were shipped to smelters by lessees.

Ward District.—M. A. Crafts, operating the Ward mine from April 10, to December 1, 1948, shipped 1,111 tons of lead ore containing 8 ounces of gold, 2,764 ounces of silver, 2,800 pounds of copper, 215,600 pounds of lead, and 21,100 pounds of zinc to a smelter. Fred Farnsworth shipped a substantial quantity of lead ore containing some gold, silver, and copper to a smelter during the year from the Farnsworth property.

White Pine District.—P. C. Fraser, working the Seligman Lead-Zinc mine from June through December 1948, shipped zinc-lead and lead ores (143 tons containing 2 ounces of gold, 606 ounces of silver, 800 pounds of copper, 33,400 pounds of lead, and 5,500 pounds of zinc) to a concentrator-smelter for treatment. Nevada Sunshine Silver Mines, Inc., shipped zinc-lead, lead-copper, and copper ores to smelters from the Grand Prize mine during 1948.

New Mexico
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

METAL mining in New Mexico in 1948 was featured by increases in production of copper and lead and further advances in base-metal prices, which together raised the total value of the State output of gold, silver, copper, lead, and zinc to a new record high of $46,799,576. The previous high was $38,374,269 in 1947. Zinc production decreased 6 percent in quantity but rose slightly in value because of the advance in the metal price. The output of gold and silver—nearly all a byproduct of the mining of base metals—varied little from 1947 and represented only 1 percent of the total value of the five metals. As usual, the Central district, Grant County, produced most of the State output of copper, lead, and zinc and also considerable silver. The Magdalena zinc-lead-silver district, the Lordsburg copper-silver-gold-lead district, and the Burro Mountain copper district were important producers. Other districts together contributed a small part of the State total output of the five metals.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35	$0.711+	$0.135	$0.080	$0.114
1945	35	.711+	.135	.086	.115
1946	35	.808	.162	.109	.122
1947	35	.905	.210	.144	.121
1948	35	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for overquota production.

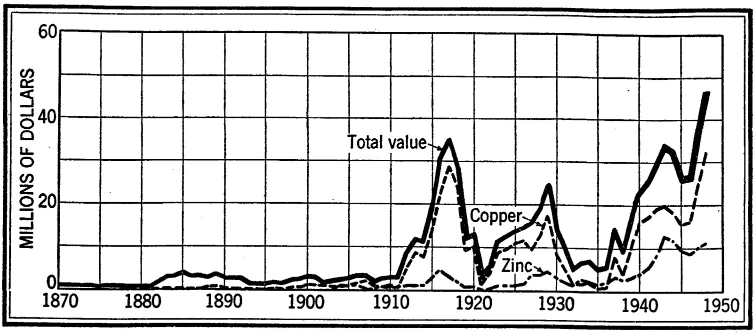

FIGURE 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1948. The value of gold, silver, and lead produced annually has been relatively small.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, by months, in 1948, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	249	41, 030	6, 331	524	3, 306
February	283	40, 450	5, 953	499	3, 274
March	219	41, 330	6, 100	605	3, 425
April	238	40, 130	6, 394	616	3, 553
May	244	46, 526	6, 449	603	3, 220
June	186	44, 372	7, 227	638	3, 336
July	374	48, 689	6, 172	676	3, 155
August	362	45, 033	5, 992	734	3, 002
September	298	44, 563	6, 070	684	3, 880
October	316	48, 302	5, 908	693	3, 716
November	354	49, 634	6, 260	685	3, 742
December	291	47, 615	5, 831	696	3, 893
Total: 1948	3, 414	537, 674	74, 687	7, 653	41, 502
1947	3, 146	515, 833	60, 205	6, 383	44, 103

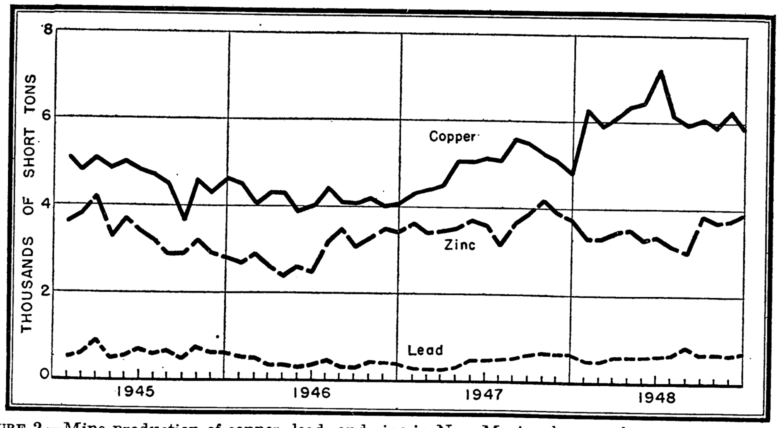

FIGURE 2.—Mine production of copper, lead, and zinc in New Mexico, by months, 1945–48, in terms of recovered metals.

The following table shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc and their annual output of ore and metals from 1944 to 1948, as well as the total production from 1848 to 1948. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent records, year by year, may be found in annual issues of Mineral Resources and Minerals Yearbook.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1944–48, and total, 1848–1948, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	55	3	7, 943, 846	6, 918	$242, 130	535, 275	$380, 640
1945	46	4	6, 843, 327	5, 604	196, 140	465, 127	330, 757
1946	50	4	6, 594, 890	4, 009	140, 315	338, 000	273, 104
1947	82	3	7, 352, 945	3, 146	110, 110	515, 833	466, 829
1948	91	2	7, 733, 163	3, 414	119, 490	537, 674	486, 622
1848–1948	-----------	-----------	(1)	2, 189, 395	49, 963, 018	68, 808, 238	53, 898, 649

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1944	69, 730	$18, 827, 100	7, 265	$1, 162, 400	50, 727	$11, 565, 756	$32, 178, 026
1945	56, 571	15, 274, 170	7, 662	1, 317, 864	40, 295	9, 267, 850	26, 386, 781
1946	50, 191	16, 261, 884	4, 899	1, 067, 982	36, 103	8, 809, 132	26, 552, 417
1947	60, 205	25, 286, 100	6, 383	1, 838, 304	44, 103	10, 672, 926	38, 374, 269
1948	74, 687	32, 414, 158	7, 653	2, 739, 774	41, 502	11, 039, 532	46, 799, 576
1848–1948	1, 485, 091	456, 128, 975	288, 877	33, 133, 977	930, 545	147, 740, 650	740, 865, 269

[1] Figure not available.

Gold and silver produced at placer mines in New Mexico, 1944–48, in terms of recovered metals

Year	Gold		Silver		Total value	Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value			Fine ounces	Value	Fine ounces	Value	
1944	8	$280	--------	--------	$280	1947	23	$805	10	$9	$814
1945	15	525	7	$5	530	1948	9	315	2	2	317
1946	10	350	2	2	352						

Gold.—Of the 3,414 fine ounces of gold produced in New Mexico in 1948, only 6 percent was recovered from straight gold and silver ores and placer gravel. Copper ore yielded 59 percent of the total gold, zinc ore 25 percent, and lead and zinc-lead ores 10 percent. The Atwood mine in Hidalgo County was the only producer of more than 1,000 ounces of gold in the State.

Silver.—The output of silver in New Mexico in 1948—537,674 fine ounces—came largely from base-metal mines. Zinc and zinc-lead ores yielded 63 percent and copper ore 31 percent of the State total silver. The principal producers of silver were the Atwood mine in Hidalgo County, the Ground Hog and Bayard in Grant County, and the Waldo in Socorro County.

Copper.—The increase in copper production in New Mexico from 60,205 tons in 1947 to 74,687 tons in 1948 was due mainly to expanded mining and dump leaching operations at the Chino open-pit mine of the Kennecott Copper Corp. in Grant County. This property was much the largest producer in the State. Other important producers, in order of output, were the Bonney-Miser's Chest group in Hidalgo County, the leaching operation of the Phelps Dodge Corp. at its Burro Mountain mine at Tyrone, Grant County, and the Atwood mine in Hidalgo County. The foregoing four mines produced 99 percent of the State total production of copper in 1948.

Lead.—Most of the New Mexico output of lead in 1948 was recovered from zinc and zinc-lead ores mined in the Central and Magdalena districts. The high price of lead stimulated small-scale mining of scattered lead deposits that had not been commercial at prices prevailing in previous years. The quantity of lead ore mined (12,671 tons) was slightly larger than in 1947, but the average grade of the ore was lower, and lead ore yielded only 7 percent of the State total lead output compared with 13 percent in 1947. The principal producers of lead, in order of output, were the Bayard and Ground Hog groups in the Central district and the Kelly group (including Lynchburg mine) and Waldo mine in the Magdalena district.

Zinc.—Zinc production in New Mexico in 1948 did not pace the rise in copper and lead. Output from the Central district, which produced 85 percent of the State total zinc, decreased 8 percent from 1947. The decline in output was due, in part, to utilization in 1948 of considerable labor and equipment in developing deep zinc-lead ore bodies found in the district in recent years. In addition the Pewabic mine, closed August 12, 1947, was not reopened until July 31, 1948. Production in the Magdalena district, which contributed 12 percent of the State total zinc, decreased slightly from 1947. The State output of recoverable zinc was 41,502 tons compared with 44,103 tons in 1947. The five leading zinc producers, in order of output, were: American Smelting & Refining Co. Ground Hog unit, Kennecott Copper Corp. Oswaldo mine, United States Smelting, Refining & Mining Co. Bayard group, Empire Zinc Co. Hanover mine unit, and Peru Mining Co. (and subsidiary) Pewabic and Kearney mines.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in New Mexico, by counties, in 1948, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Dona Ana	4	----------	2	$70	1,548	$1,401
Grant	24	----------	1,490	52,150	249,047	225,400
Hidalgo	20	----------	1,700	59,500	178,853	161,871
Lincoln	1	1	1	35	854	773

MINING INDUSTRY

The bulk of the ore mined in New Mexico in 1948 was copper ore produced at a daily rate of 20,000 to 22,500 tons from the Chino open-pit mine in the Central district. None of the underground metal mines averaged more than 400 to 500 tons of ore daily. During the year good progress was made in developing several zinc-lead deposits in the Central district at greater depth. Shafts sunk by the individual companies are described briefly, along with other operating details, in the following Review by Counties and Districts. The high price of lead stimulated activity in districts containing lead deposits. The districts producing chiefly gold or gold and silver generally remained idle. The Bureau of Mines continued its exploratory drilling, field examinations, and metallurgical tests on ores of copper, lead, and zinc. Certain data on drilling were published.[1]

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in New Mexico in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	5	662	185	1,757	2,000	3,351	2,000
Dry gold-silver ore	4	33	18	726	71	43	
Dry silver ore	7	735	6	12,201	4,434	4,481	
	16	1,430	209	14,684	6,505	7,875	2,000
Copper ore	8	7,139,147	1,998	166,018	[1] 147,952,805	76,645	
Lead ore	39	12,671	48	15,396	33,088	1,124,130	25,650
Lead-copper ore	1	103		236	5,823	17,482	
Zinc ore	8	454,891	861	201,259	1,064,539	7,560,869	70,705,551
Zinc-lead ore	19	124,921	289	140,079	311,240	6,518,999	12,270,799
	75	7,731,733	3,196	522,988	[1] 149,367,495	15,298,125	83,002,000
Total lode mines	[2] 91	7,733,163	3,405	537,672	[1] 149,374,000	15,306,000	83,004,000
Placers	2		9	2			
Total: 1948	93	7,733,163	3,414	537,674	[1] 149,374,000	15,306,000	83,004,000
1947	85	7,352,945	3,146	[1] 515,833	[1] 120,410,000	12,766,000	88,206,000

[1] Silver and copper contained in precipitates recovered from mine water and leached dumps are included with that in copper ore as follows: 1948, 38,937,830 pounds of copper; 1947, 55 ounces of silver and 30,306,293 pounds of copper.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

Twelve flotation mills were operated in New Mexico all or part of 1948. The largest mill was the 20,000- to 22,500-ton concentrator of the Kennecott Copper Corp. Chino Mines Division at Hurley, Grant County, which treated copper ore from the company open-pit mine at Santa Rita. The other mill treating copper ore was the 500-ton Banner Mining Co. plant near Lordsburg, Hidalgo County. The 10 flotation mills that treated zinc and lead ores had capacities ranging from 35 to 1,000 tons daily and averaged 321 tons. Of these mills, four are in Grant County, two in Socorro County, and one each in Hidalgo, Luna, Santa Fe, and Sierra Counties. A 25-ton amalgamation and gravity concentration mill was run a few months in Santa Fe County.

Because, in the early days of mining, a large proportion of the ore was treated in straight amalgamation or amalgamation-cyanidation mills, reports of this series in Mineral Resources and Minerals Yearbook from 1909 through 1947 contained tables showing ore treated in these mills separate from that treated in straight concentrating mills. As amalgamation and cyanidation mills now generally have concentrating equipment and many concentrating mills recover part of the gold by amalgamating high-grade jig concentrates, the distinctive features of the two types of mills have largely disappeared. Therefore, beginning with 1948, a consolidated table showing production of metals from all mills has replaced the separate tables giving output by types of mills.

The only smelter operating in the State was the Chino smelter of the Kennecott Copper Corp. at Hurley, which treats concentrates and siliceous copper ore (used as a flux) from the Chino mill and mine and copper precipitates from company operations at Chino and at Ray, Ariz. The smelter produces fire-refined copper. Direct-smelting ore and lead and copper concentrates from other New Mexico operations were shipped to smelters in Texas, Arizona, and Kansas. Zinc concentrates were shipped to smelters in Illinois, Montana, Pennsylvania, and Texas.

Mine production of metals in New Mexico in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)

REVIEW BY COUNTIES AND DISTRICTS

DONA ANA COUNTY

Organ District.—From June 1 through December 1948, J. H. Brown unwatered and equipped the Merrimac mine and shipped 104 tons of zinc-lead-silver ore to the Peru mill at Deming; he also shipped some surface clean-up material from the Stephenson-Bennett group, which was under development by E. J. Longyear and the Empire Zinc Co. until November 1. Some silver-lead ore mined in development was shipped to the El Paso smelter. Small lots of lead-silver ore were shipped from the Barahoni and Morning Star properties.

GRANT COUNTY

Burro Mountain (Tyrone) District.—The leaching operations of the Phelps Dodge Corp. at the Burro Mountain mine continued to yield a substantial tonnage of copper. Water is percolated through subsided areas of former mine workings, and copper is precipitated from the return solutions in wooden precipitating tanks that can handle about 600 gallons per minute. The Malone Darhasana Mining Co. did development work on its properties from April through December and recovered some gold-silver bullion in an experimental cyanide leaching plant. Some gold ore was amalgamated at the Osmer mine.

Central (Bayard, Fierro, Georgetown, Hanover, Santa Rita) District.—In 1948, as usual, the open-pit mining and dump-leaching operations of the Kennecott Copper Corp. Chino Mines Division at Santa Rita yielded the bulk of the State production of copper. The output increased materially over 1947. The company flotation mill at Hurley, with a rated daily capacity of 22,500 tons, was operated 6 days a week at daily rates ranging from 20,000 to 22,500 tons. Molybdenite is recovered in the mill as a byproduct. The copper concentrates produced were smelted in the company smelter adjacent to the mill. The smelter also treated the precipitates derived from dump leaching and siliceous copper ore used in the converter as a flux. The copper bullion contains minor quantities of gold and silver, which are not recovered from fire-refined copper, the normal product of the smelter; in 1948, however, some blister copper was shipped to an electrolytic refinery which recovered gold and silver. The company continued to operate its Oswaldo zinc mine, shipping the ore to the Empire Zinc Co. mill at Hanover. The mine was one of the major zinc producers in the State. Development in 1948 included 568 feet of drifts, 45 feet of raises, and 620 feet of sinking on a new 850-foot shaft. Total development at the end of the year (not including the new shaft) was a 475-foot vertical shaft, 7,768 feet of drifts, and 595 feet of raises.

The American Smelting & Refining Co. operated its Ground Hog zinc-lead mine group and the leased 400-ton Hanover (formerly Combination-Blackhawk) mill; the mill treated company ore from the Ground Hog, Ivanhoe, and Lucky Bill claims and custom ore from other mines in Grant and Santa Fe Counties. Development at the Ground Hog group in 1948 included 3,852 feet of drifts, 13,787 feet of diamond drilling, and 1,729 feet of sinking on a new 2,000-foot four-compartment vertical shaft. The new shaft will tap additional ore bodies proved by diamond drilling. The present shaft is vertical to the 600-foot level and has a winze from there to the 1,800-foot level.

The Bayard mine group of the United States Smelting, Refining & Mining Co. was a large producer of zinc and a substantial producer of lead and silver. The ore was treated in the company selective-flotation mill (capacity 25 tons an hour in 1948). Articles on the geology and mining and milling practice at the Bayard property were published.[2] Besides its mining operations, the company carried on extensive exploration and development work, which included sinking on the new 1,800-foot Princess shaft, the sixth shaft on the Bullfrog section of the property.

The Empire Zinc Co. Hanover mine group, a large producer of zinc for many years, operated steadily throughout 1948. The ore was treated in the company mill, which also handled custom ore from the Kelly-Lynchburg group in Socorro County and the Oswaldo mine in Grant County.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, by counties and districts, in 1948, in terms of recovered metals

[1] Includes Burro Mountain district gold, silver, and copper, figures for which Bureau of Mines is not at liberty to publish separately.
[2] Includes copper recovered from precipitates.

The Peru Mining Co. operated the Pewabic mine from July 31 through December, and the New Mexico Consolidated Mining Co. (subsidiary of the Peru Mining Co.) worked the Kearney group all the year. Development during the year included 60 feet of drifts and 1,217 feet of diamond drilling on the Pewabic and 1,655 feet of drifts and 5,374 feet of diamond drilling on the Kearney. Ore from the two mines, totaling 98,864 tons, was treated in the Peru 1,000-ton selective-flotation mill at Wemple, near Deming, Luna County.

Eureka District (see also Hidalgo County).—Mineral Operations, Inc., operated the Hornet mine throughout 1948. The ore was treated in the company 100-ton mill completed in January. The mill products were zinc concentrate and lead-silver concentrate. The American mine produced a car of silver-lead ore.

Pinos Altos District.—The Houston-Thomas mine, operated by Mathis & Mathis, shipped 13,185 tons of zinc-lead ore containing also gold, silver, and copper to custom mills at Deming and Hanover. The Langston mine shipped ore of a similar type. The Cleveland mine was operated under lease by Douglas B. White from October through December. Five other properties shipped small tonnages of ore.

Steeple Rock District.—The Carlisle group was worked by L. A. & Ben F. Billingsley from March to September and by Liberty Mines, Inc., the rest of the year. The ore produced was shipped to smelters and custom mills outside the district.

Swartz (Carpenter, Camp Monarch) District.—Shipments of ore from the Royal John mine in 1948 totaled 1,308 tons containing 1,427 ounces of silver, 2,972 pounds of copper, 100,036 pounds of lead, and 213,353 pounds of zinc. The operators were A. L. Owen the first few months of the year, Strong & Harris for a short period, and L. Yacomo, Inc., from May 8 to December 2. Strong & Harris operated the Grand Central mine 3½ months and the Grand View 8 months; the ore was shipped to a custom mill at Hanover.

Telegraph District.—The Tracer mine shipped 4 tons of ore containing 33 ounces of silver and 2,541 pounds of lead.

HIDALGO COUNTY

Eureka (Sylvanite) District.—Shipments of ore in 1948 comprised 454 tons (silver-copper ore) from the Rincon mine, 80 tons from the Lone Tree-Last Chance group, and 1 ton from the Tunnel property.

Fremont District.—Juan Pacheco shipped 90 tons of silver-lead ore from the Yucca claim 20 miles southeast of Hachita.

Lordsburg District.—Operations at the Banner Mining Co. Bonney-Miser's Chest group, principal producer of copper in the Lordsburg district since 1936, were interrupted about 2 months in 1948 by a work stoppage, but the output of copper was larger than in 1947. The mine is opened by a 1,500-foot vertical shaft and a 1,000-foot incline shaft and equipped with a 500-ton flotation mill. C. H. & S. A. McIntosh continued to operate the Atwood group,[3] second-largest district producer of copper and the principal producer of gold and silver; the ore was shipped crude to smelters. The Lordsburg Mining Co. shipped 1,615 tons of zinc-lead-silver ore from the Millsite group to the Peru mill at Deming. Small tonnages of ore were shipped from the Ruth mine dump, Tom group, and other properties.

San Simon District.—Still Bros. shipped zinc-lead-silver-ore from the Silver Hill mine to the Peru mill at Deming in 1948. The McGhee mine and mill were operated intermittently, until June 17, when the shaft head frame and timbers and adjacent surface buildings burned, stopping underground work for several months. Some ore was shipped from the Clark, Crystal, and Lost Boy properties.

---

[3] Storms, Walter R., Mining Methods and Costs At the Atwood Copper Mine, Lordsburg Mining District, Hidalgo County, N. Mex.: Bureau of Mines Inf. Circ. 7502, 1949, 11 pp.

LINCOLN COUNTY

Jicarilla District.—A prospector panning on the Rico No. 3 placer recovered 1.33 fine ounces of gold in 1948.

Red Cloud (or Gallinas Mountains) District.—Drunzer and Casner, leasing on the Red Cloud group, shipped ore containing lead, zinc, copper, and silver from the mine and dumps.

LUNA COUNTY

Cooks Peak District.—Output from this district in 1948 totaled 408 tons of lead-silver ore, shipped from the Good Will, Rimrock, and Montezuma mines.

Deming District.—The 1,000-ton selective-flotation mill of the Peru Mining Co. at Wemple, 5 miles north of Deming, operated throughout 1948. The ore treated comprised 98,864 tons from the company's Kearney and Pewabic mines in Grant County and 22,366 tons of custom ore from other mines in Grant, Hidalgo, Sierra, Socorro, and Dona Ana Counties.

Florida Mountains District.—Rhea & Moore shipped a 2-ton lot of lead-silver ore in 1948.

Tres Hermanas District.—Lessees at the Calumet mine shipped 55 tons of silver ore. Milton Benjamin (Blackhawk mine), John W. Clark, and Jesus Numez each shipped a truckload of lead-silver ore.

Victorio District.—Some lead-silver-copper ore was shipped from dumps on the Mahoney property, and a small tonnage of lead-silver ore was produced from the Victorio mine.

OTERO COUNTY

Sacramento District.—Drunzer & Casner shipped 335 tons of copper ore from the Courtney mine, and M. F. Drunzer shipped 309 tons of lead-copper ore from the Warnock.

SANDOVAL COUNTY

Cochiti District.—The Cochiti Mining Co. shipped 9 tons of gold-silver ore from the Iron King mine.

SANTA FE COUNTY

Cerrillos District.—Lessees operated the Cash Entry-Franklin group intermittently. About 1,000 tons of lead-silver-gold ore were treated in the 35-ton mill on the property, and 24 tons were shipped to the American Smelting & Refining Co. mill at Magdalena. Some ore was shipped from the Bonanza Trust group.

San Pedro or New Placers District.—The Shamrock Gold Mining Co. treated 205 tons of gold ore in its 25-ton amalgamation and gravity-concentration mill. A lessee at the Golden placer recovered a little gold.

883326—50——100

SIERRA COUNTY

Chloride (Apache, Cuchillo Negro) District.—The Deming Mining Co. shipped 117 tons of lead-silver-copper ore from the Denver-Little Bonanza group. Some lead-silver ore was shipped from the Alta Vista, Carbonate, M. S. Hall, and United States Treasury properties.

Hermosa (Lower Palomas Creek) District.—A truckload of copper ore was shipped from the Vulture claim in 1948.

Kingston District.—The producing mines were the Dove, Iron King, and Miner's Dream, all of which shipped ore direct to smelters.

Las Animas (Hillsboro) District.—Small lots of gold-silver ore were shipped from the Bonanza and Snake mines.

Pittsburg and Caballos Mountains District.—Lead ore was shipped from the Adobe and Badger mines in 1948.

SOCORRO COUNTY

Hansonberg District (17 miles southeast of Carthage).—The Portales Mining Co. operated the Portales lead mine throughout 1948. The ore produced (5,725 tons containing 239,151 pounds of lead) was trucked 30 miles to the company mill at San Antonio for treatment. The Royal Flush mine shipped 354 tons of lead ore. The Mex-Tex Mining Co. shipped some lead-silver ore from the Mountain Canyon group.

Magdalena District.—The American Smelting & Refining Co. operated continuously its Waldo zinc-lead-silver mine and 200-ton selective-flotation mill. In June the mill began treating custom ore in addition to company ore. The custom ore included much oxidized dump material (mostly from the Kelly group), from which lead was floated by using a sulfidization method. Lessees at the Kelly group (including the Lynchburg mine) shipped a large tonnage of newly mined zinc-lead ore to the Empire Zinc Co. mill at Hanover (Grant County) for treatment. McDonald & Dobson continued to ship zinc-lead-silver ore from the Nitt group. Other shippers were the Juanita, Queen, and Old Soldier mines.

Salinas Peak District.—Latham & Chenowth shipped 331 tons of lead and lead-silver ores from the Night Hawk claim. Some lead ore from the Harding mine was milled at the Hanson mill at Hot Springs.

VALENCIA COUNTY

A car each of copper ore was shipped from the Belvidere and Senora de Milagros groups in Hell Canyon in the Manzano Mountains 16 miles southeast of Albuquerque.

Oregon
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. MAURER

GENERAL SUMMARY

PRODUCTION of gold, silver, copper, lead, and zinc in Oregon in 1948 each failed to equal output in 1947; gold production was off 23 percent, and silver output dropped 55 percent in 1948 compared with 1947. Copper and lead production was not stimulated by the rise in prices of the base metals in 1948, and the output—byproducts of ores mined primarily for the precious metals—fell below the relatively small production attained the previous year. The small output of zinc in 1947 did not continue in 1948.

The total value of the gold, silver, copper, and lead (in terms of recovered metals) produced in Oregon was $527,064 in 1948 compared with $701,336 (including a small quantity of zinc) in 1947 and $4,148,271 in the peak year 1940. It was divided among the metals as follows: Gold, 97 percent; silver, 2 percent; and copper and lead combined, 1 percent. Baker County continued to be the leading metal producer, owing largely to placer operations, and contributed 56 percent of the State total value. Grant County was again in second place and, with Curry County, supplied 35 percent.

Placer mines contributed 86 percent and lode mines 14 percent of the gold produced in Oregon in 1948. In 1947 the ratio was placer mines 93 percent and lode mines 7 percent.

Oregon and California Railroad revested lands and reconveyed Coos Bay Wagon Road grant lands, comprising about 2½ million acres in western Oregon and closed to exploration, location, entry, and disposal under the mineral land laws of the United States since August 28, 1937 (50 Stat. 874), were reopened April 8, 1948 (Public Law 477). Notices were filed during 1948 with the Oregon District Land Office for 344 lode claims and 456 placer claims located before 1948—a total of 27,607 acres in 12 counties; 104 lode and 118 placer claims, comprising 2,951 acres in 6 counties and located during 1948, also were filed.[1]

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

[1] Data from Bureau of Land Management, U. S. Department of the Interior.

The value of metal production herein reported has been calculated at the prices in the accompanying table.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price of newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for over-quota production.

Mine production of gold, silver, copper, lead, and zinc in Oregon, 1944–48, and total 1852–1948, in terms of recovered metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	13	10	4,217	1,369	$47,915	20,243	$14,395
1945	9	10	1,378	4,467	156,345	10,461	7,439

1852–1948	[3] 12,359	4,647,311	[3] 767	82,743	[3] 142	14,318	137,921,618

[1] Excludes itinerant prospectors, snipers, high-graders, and others who have no evidence of legal right to property.
[2] Figures not available.
[3] Short tons.

Gold.—Production of gold in Oregon in 1948 (including a small quantity in "natural gold" sold on the open market) was down 23 percent compared with 1947. Placer mines contributed 86 percent of the gold output; of the placer total, bucket-line dredges and nonfloating washing plants (with mechanical excavators) recovered 79 percent, dragline dredges 16 percent, hydraulicking 3 percent, and small-scale hand methods and drift mining together 2 percent. All the lode gold was derived from dry and siliceous ores, and most of it was from one mine. A large part of the gold came from a relatively few mines, although 61 properties produced in 1948 (69 in 1947);

the following 4 producers, listed in order of output, supplied 85 percent of the State total: Baker Dredging Co. (successors to Sumpter Valley Dredging Co.) and Porter & Co. (bucket-line dredges); Calhoun & Howell of Oregon Ltd. (dragline dredge); and R. G. Amidon, Buffalo mine (lode).

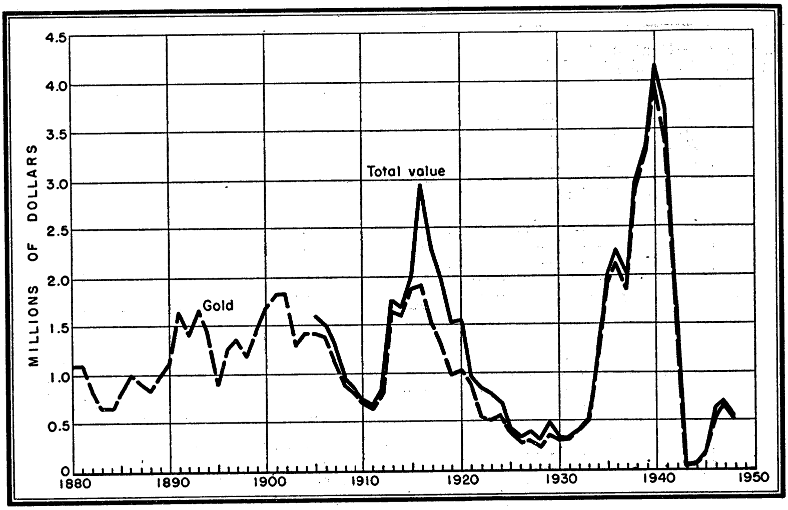

FIGURE 1.—Value of mine production in Oregon of gold, 1880–1948, and total value of gold, silver, copper, lead, and zinc, 1905–48.

1947	49	5,150,000	17,648	617,680	.120
1948	38	4,012,750	12,522	438,270	.109

1 Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
2 Data for nonfloating washing plants included with those for bucket-line dredges to avoid disclosure of individual output.
3 Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.
4 Gold from terminal clean-up; property and equipment not counted as producing.
5 Includes all placer operations using suction pump for delivering gravel to floating washing plant, except those producing less than 100 ounces of gold, which are included with "small-scale hand methods."
6 Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
7 Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc.

The monthly production figures given in the accompanying table show a relatively high output for January and February, despite winter conditions, with fairly constant production through October followed by a sharp drop in output in November and December, owing to unusually severe fall and winter weather.

Mine production of gold and silver in Oregon in 1948, by months, in fine ounces of recovered metal

Month	Gold	Silver	Month	Gold	Silver
January	1,380	464	August	1,249	333
February	1,007	1,785	September	1,410	1,513
March	1,228	1,432	October	1,531	1,997
April	1,430	1,755	November	906	746
May	1,218	232	December	705	333
June	1,178	1,634			
July	1,369	1,372	Total	14,611	13,596

Silver.—Oregon silver production in 1948 decreased 55 percent compared with 1947. More than four-fifths of the State total came from Grant County and most of the remainder from Baker County; 80 percent was yielded by lode mines (largely from one mine) principally from dry gold ore. Monthly output for 1948—shown in the accompanying table—was variable, reflecting the sporadic yield from the major mine.

Copper, Lead, and Zinc.—The small output of copper in 1948 came from ores mined at two properties primarily for their gold and silver content. The entire lead output was from one mine and was recovered from gold ore. No zinc was produced from Oregon ores in 1948.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Oregon in 1948 by counties, in terms of recovered metals

County	Mines producing [1]		Gold					
			Lode		Placer		Total	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value	Fine ounces	Value
Baker	8	5	345	$12,075	8,019	$280,665	8,364	$292,740
Curry and Grant [2]	3	8	1,412	49,420	3,557	124,495	4,969	173,915
Jackson	7	10	121	4,235	290	10,150	411	14,385
Josephine and Wheeler [2]	5	12	211	7,385	299	10,465	510	17,850
Malheur		3			357	12,495	357	12,495
Total: 1948	23	38	2,089	73,115	12,522	438,270	14,611	511,385
1947	20	49	1,331	46,585	17,648	617,680	18,979	664,265

County	Silver (lode and placer) [3]		Copper		Lead		Zinc		Total value
	Fine ounces	Value	Pounds	Value	Pounds	Value	Pounds	Value	
Baker	2,277	$2,061							$294,801
Curry and Grant [2]	11,109	10,054	2,000	$434	14,000	$2,506			186,909
Jackson	66	60							14,445
Josephine and Wheeler [2]	85	77	2,000	434					18,361
Malheur	59	53							12,548
Total: 1948	13,596	12,305	4,000	868	14,000	2,506			527,064
1947	30,379	27,493	28,000	5,880	24,000	3,456	2,000	$242	701,336

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual output.
[3] Sources of total silver as follows—1948: 10,939 ounces from lode mines and 2,65 from placers; 1947: 26,852 ounces from lode mines and 3,527 from placers.

MINING INDUSTRY

Only one lode mine operated consistently during 1948, and that on a small scale. Of the 3,119 tons of ore (including 16 tons of old tailings) sold or treated in 1948, Grant County produced 1,652 tons or about 53 percent, Baker County produced 1,187 tons or 38 percent, Josephine County 130 tons or 4 percent, Jackson County 107 tons (including all the old tailings) or nearly 4 percent, and Wheeler County 43 tons or about 1 percent. Ninety-seven percent of the total (including old tailings) was dry gold ore and 3 percent was dry gold-silver ore.

The two properties worked by bucket-line dredge had one dredge each; one operated throughout the year, and the other was idle 3 months of 1948. Six dragline dredges washed gravel during various periods in 1948, but only one operated at the close of the year.

Ore and old tailings sold or treated in Oregon in 1948, with content in terms of recovered metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry and siliceous gold ore	3,003	16	2,065	10,490	4,000	14,000	
Dry and siliceous gold-silver ore	100		24	449			
Total lode mines	3,103	16	2,089	10,939	4,000	14,000

METALLURGIC INDUSTRY

Of the State total ore and old tailings (3,119 tons), about 53 percent was treated in concentration mills, 42 percent (including all the old tailings) was amalgamated and cyanided, and 5 percent was shipped crude to smelters. Ultimate recovery of 48 percent of the total lode gold was from smelting of concentrates, 26 percent was as bullion from amalgamation and cyanidation of ore, and 26 percent was from the smelting of ore. Of the lode silver recovered, 86 percent was from concentrates smelted, 13 percent from the direct smelting of ore, and 1 percent from ore amalgamated and cyanided. All material requiring smelting was shipped out of the State, as Oregon has no smelters.

Mine production of metals in Oregon, by methods of recovery, in 1948, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and old tailings amalgamated and cyanided	1, 296	546	116

REVIEW BY COUNTIES AND DISTRICTS

BAKER COUNTY

Baker District.—J. J. Davis worked his Washington Gulch and John Day placer claims intermittently during 10 months of 1948; 48 ounces of gold and 4 ounces of silver were recovered from 3,500 cubic yards of material hydraulicked.

Sumpter District.—Sumpter Valley placers on Powder River was worked by Sumpter Valley Dredging Co. in January 1948 and by its successor—Baker Dredging Co., largest producer of gold in Oregon in 1948—during the remainder of the year. A Yuba-type electric bucket-line dredge with seventy 9-cubic-foot buckets was operated.

[1] Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 6 and their output included with "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of silver: 10,939 ounces from lode mines and 2,657 ounces from placers.
[4] Greenback district is in Jackson and Josephine Counties.
[5] Includes value of 2,000 pounds of copper from Waldo district, Josephine County.
[6] Includes Sparta and Sumpter districts in Baker County, Granite and Greenhorn districts in Grant County, and Spanish Gulch district in Wheeler County.
[7] Includes value of 2,000 pounds of copper from Granite district, Grant County.

Upper Burnt River District.—Progress Mining Co. operated its dragline dredge sporadically during 6 months of 1948; a small quantity of gold and some silver were recovered from the gravel handled. L. M. McCullough and B. Cole hydraulicked the Theresa K and Patsy D claims from January 1 to May 10, and L. M. McCullough worked the same properties from May 15 to November 22, 1948. A total of 500 cubic yards of material washed yielded 36 ounces of gold and 5 ounces of silver. Vinson and Leonhardy amalgamated 665 tons of ore from the Showdown and Lucky Boy mines from May 20 to September 30, 1948; 93 ounces of gold and 12 ounces of silver were recovered.

GRANT COUNTY

Granite District.—Porter & Co., second-largest producer of gold in Oregon in 1948, operated its Yuba-type electric bucket-line dredge with sixty 4½-cubic-foot buckets on Olive Creek during 9 months of the year. The Buffalo mine was operated throughout 1948 by R. G. Amidon under lease from Bruce Dennis. Gold ore was treated in a 35-ton flotation mill, and concentrate containing gold, silver, and some copper and lead was shipped to a smelter. In addition, smaller quantities of gold ore were shipped to smelters for treatment.

Greenhorn (North Fork) District.—Calhoun & Howell operated its Bucyrus-Monighan Diesel dragline excavator with 3-cubic-yard bucket and a Bodinson floating washing plant on the North Fork of John Day River for 7 months in 1948; a substantial quantity of gold and some silver were recovered.

JACKSON COUNTY

Gold Hill District.—R. E. McManus (Abbie mine), Homer Harrison (Black Channel mine), and R. E. Cook (Lance-Cook mine), hydraulicked intermittently during 1948. Oregon Dredging operated on Pleasant Creek from January 1 through February 1948 and recovered a small quantity of gold and some silver.

Jacksonville District.—The C & D Mining Co. operated its dragline dredge from December 1947 to May 26, 1948; a small quantity of gold and some silver were recovered.

Upper Applegate District.—Paul Pearce hydraulicked the Sterling mine (formerly a drift mine) from April 1 to July 1, 1948; 5,000 cubic yards of material washed yielded 39 ounces of gold and 6 ounces of silver.

JOSEPHINE COUNTY

Galice District.—C. W. Gray (Butte Creek mine), Cecil Conley (Conley mine) and Bert Pankey (Maloney mine) hydraulicked during January and February 1948.

Greenback District.—M. H. Davis hydraulicked the Blue Channel mine from January 1 to June 1, 1948, and recovered a small quantity of gold and some silver.

Waldo District.—Takilma Dredging Co. operated a high-line excavator with 2½-cubic-yard bucket and a portable Bodinson Diesel washing plant ¼ mile north of Takilma intermittently during 1948; 3,000 cubic yards of gravel treated yielded 25 ounces of gold and 2 ounces of silver.

MALHEUR COUNTY

Mormon Basin.—G. M. Whitney operated a gasoline-powered shovel with a ¾-cubic-yard bucket and a dry-land washing plant at the Boswell property on Basin Creek from March to May 1948; 218 ounces of gold and 39 ounces of silver were recovered from 10,000 cubic yards of material treated. Progress Mining Co. operated its dragline from May 9 to June 20, 1948. A small quantity of gold and some silver was recovered.

WHEELER COUNTY

Spanish Gulch District.—R. T. New treated ore from the Rosa D mine by amalgamation and recovered a substantial quantity of gold and some silver.

South Dakota

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

ACTIVITY in gold mining—South Dakota's chief mineral industry—continued at a subnormal level throughout 1948. The State output of gold was 377,850 fine ounces compared with 407,194 ounces in 1947 and the peak of 618,536 ounces (valued at $21,648,760) in 1939. Shortage of underground labor and the high cost of labor and materials compared with the price of gold continued to be the principal factors in limiting output. The Homestake mine at Lead, Lawrence County, with current productive capacity for gold exceeding that of any other mine in the United States, operated at about two-thirds capacity. The Bald Mountain mine at Trojan, an important gold producer, also operated at less than capacity.

Nearly all the State silver output was incidental to the production of gold. The output of lead and zinc was contained in lead and zinc concentrates carrying gold and silver produced during mill test runs on ore removed in development at the Belle Eldridge mine near Deadwood. No production of copper was reported in South Dakota in 1948 or 1947.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price included bonus payments by Office of Metals Reserve for overquota production.

The South Dakota output of gold, silver, copper, lead, and zinc has come largely from Lawrence County, in the mountain group known as the Black Hills. The adjoining Custer and Pennington Counties generally produce some gold and silver; but Custer County had no output from 1942 through 1948, and Pennington County had only a small production from 1945 through 1948 and none in 1943 and 1944.

Mine production of gold, silver, copper, lead, and zinc in South Dakota, 1944–48, and total, 1876–1948, in terms of recovered metals [1]

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)

	Short tons	Value	Short tons	Value	
Lawrence	16	$5,728	29	$7,714	$13,323,404
Pennington					490
Total: 1948	16	5,728	29	7,714	13,323,894
1947	8	2,304	19	4,598	14,359,766

MINING AND METALLURGIC INDUSTRY

Gold ore mined and treated in South Dakota in 1948 totaled 1,003,859 tons, yielding, in recovered metals, 377,780 ounces of gold and 93,769 ounces of silver. A break-down by methods of treatment shows that 896,862 tons of ore, yielding 360,716 ounces of gold and 72,100 ounces of silver, were treated by amalgamation followed by cyanidation of sands and slimes; 106,927 tons, yielding 17,050 ounces of gold and 21,669 ounces of silver, were treated by cyanidation only; and 70 tons, yielding 14 ounces of gold, were treated by amalgamation only. The zinc-lead ore (1,480 tons) that resulted from development work was treated by selective flotation in mill tests during the year. The ore yielded, in recovered metals, 70 ounces of gold, 924 ounces of silver, 16 tons of lead, and 29 tons of zinc, all contained in concentrates shipped to smelters.

No recovery of gold or silver has been reported from placer operations in the State since 1942.

Gold and silver bullion produced at mills in South Dakota by amalgamation, 1944–48

Year	Ore treated (short tons)	Gold in bullion (fine ounces)	Silver in bullion (fine ounces)	Quicksilver used (pounds)
1944				
1945	298,830	35,398	7,254	1,500
1946	793,034	197,425	35,498	(1)
1947	849,123	262,257	52,057	(1)
1948	896,932	250,782	72,100	(1)

REVIEW BY COUNTIES

LAWRENCE COUNTY

Homestake Mine.—The Homestake mine and mills operated steadily throughout 1948. Ore treated averaged 2,450 tons daily, 7 days a week, compared with 2,326 tons in 1947 and 4,110 tons in 1941, the last year of full-scale operations before wartime restrictions on gold mining caused curtailment of production in 1942 and a complete shut-down from June 8, 1943, to July 2, 1945. Since the end of the war enough men have not been available for underground work to operate the mine at normal capacity. The mine has three vertical shafts, the deepest being 4,245 feet, and an inside winze to the 5,000-foot level. Development in 1948 included 22,935 feet of drifts, 10,712 feet of raises, and 27,592 feet of diamond drilling. The primary crushing plants are at the hoists. Other surface plants include the 180-stamp South mill (the main secondary crushing, grinding, and amalgamating plant), two cyanide plants, and the refinery at Lead, and the slime plant at Deadwood. At the refinery silver is parted from the gold, and virtually pure metals are shipped to the Denver Mint. Regarding the gold-mining operations of the Homestake Mining Co., the annual report of the general manager for the year ended December 31, 1948, says—

Ore mined in 1948 was 896,862 tons which compares with 849,023 tons in 1947. Bullion with value of $12,658,138.55 was produced, which is $1,138,581.70 less than in 1947. Average realization was $14.11 per ton and metallurgical recovery was 96.85 percent, which is the highest recovery ever achieved by the company.

Output of ore was continuously limited by the number of men available for underground work. The average number of men employed in the mine department during 1948 was only about one percent greater than in 1947. There was, however, a substantial increase in the number of mine department employees in the last two months of the year. On December 31, the total was 104 more than at the end of 1947.

Operating expense per ton, exclusive of taxes, was 3.52 percent higher than in 1947 because of the continued increase in wages and cost of supplies. Such expense was 56.58 percent higher than in 1941.

The reserve of developed ore including 340,000 tons of broken ore in shrinkage stopes is 21,454,000 tons as compared to 21,524,000 tons at the end of 1947.

The mine and plant are in excellent condition and there were no interruptions of operations during the year.

An employee housing program begun in 1947 was continued. Ten houses, which are being sold to employees on an easy payment plan, were completed. Six apartment units with a total of fifty-five apartments were started and the first unit is nearly ready for occupancy. These will be rented to employees. It is expected that they will help to attract new employees for the mine.

Ore milled, receipts, and dividends, Homestake mine, 1944–48 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1944	(2)	$402,591.29	(2)	
1945	298,828	1,873,872.64	$6.2707	
1946	792,994	10,458,896.22	13.1891	$2,812,992
1947	849,023	13,796,720.25	16.2501	4,018,560
1948	896,862	12,658,138.55	14.1138	4,018,560

[1] From 1876 to 1948, inclusive, this mine yielded bullion and concentrates that brought a net return of $478,429,992 and paid $160,655,914 in dividends.
[2] No ore milled; bullion product recovered in clean-up of launders, pipe lines, mill liners, and other machinery during course of mill maintenance.

Other Mines.—The Bald Mountain Mining Co. operated continuously its group of mines and 370-ton mill at Trojan. Ore treated in 1948 averaged 291 tons daily compared with 237 tons in 1947 and 370 tons in 1941, before operations were disrupted by war conditions. The producing claims in 1948, as in 1947 and 1946, were the Portland, Dakota, and Clinton. Mine development in 1948 comprised 5,652 feet of drifts and crosscuts and a 1,773-foot raise. The ore-treatment process includes crushing to ⅝-inch size, ball milling in cyanide solution, thickening and agitation, countercurrent washing in four stages, Merrill-Crowe zinc-dust precipitation, and reduction of precipitate in a gas-fired reverberatory-type tilting furnace. Sulfide ores, when available, are bypassed from the crushing circuit, dry rod-milled to 10-mesh, roasted, and returned to ball mills. Gold recovered in 1948 totaled 17,036 ounces and silver 21,636 ounces.

Operations of the Belle Eldridge Gold Mines, Inc., on the Belle Eldridge group near Deadwood centered on development in 1948. With a crew of only seven men, the company drove 1,866 feet of drifts, did 2,410 feet of diamond drilling, made additions to mill equipment, and operated the mill occasionally on a test basis while the flow sheet was being corrected. The company reported that a large and very consistent ore body was contacted by diamond core drilling at the

883326—50——101

250- to 285-foot level below present workings. The body contains zinc, gold, silver, and lead—zinc representing the greatest assay values to date. Drilling was being continued to estimate the extent of the ore body. Ore treated for test purposes in 1948 totaled 1,480 tons, yielding 50 tons of lead concentrate assaying 1.29 ounces of gold and 15.4 ounces of silver to the ton, 31.4 percent lead, 5.7 percent zinc, and 22.1 percent iron; and 80 tons of zinc concentrate assaying 0.105 ounce of gold and 1.55 ounces of silver to the ton, 1 percent lead, 43.73 percent zinc, and 14.15 percent iron.

The Frerichs Mining Co. developed its mine near Deadwood, remodeled its mill, and shipped a small quantity of gold-silver bullion to the Denver Mint.

PENNINGTON COUNTY

The Golden Arrow Mines, Inc., shipped a little gold bullion and a ton of gold concentrates from the Golden Arrow mine. R. E. Nelson recovered a small quantity of gold bullion from his mine. Both properties are in the Hill City area.

Texas

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

ORES mined in Texas in 1948 yielded gold, silver, copper, and lead valued altogether at $75,611 compared with $50,478 (including zinc also) in 1947. Lead represented 80 percent of the total value in 1948 and 45 percent in 1947. Five small-scale operations in Culberson, Hudspeth, and Presidio Counties contributed to the output of two or more of the metals in 1948; in 1947 there were eight operations, including one that produced zinc also.

The new slag-fuming plant built by the American Smelting & Refining Co. at its El Paso Smelting Works began operating in August 1948. The plant is expected to produce about 25,000 tons of zinc annually after the trial-run period is completed. In the mine-production statistics the metals (principally zinc) recovered from domestic current hot slag are credited to the various shipping mines on the basis of the assay content of the ore and are thus apportioned to the States from which they came. Specific data on the quantity of metals recovered in 1948 from old slag accumulated in earlier years are not available, and this output is not included in the mine-production statistics.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices:

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price included bonus payments by Office of Metals Reserve for overquota production.

MINE PRODUCTION

In total mine production from 1885 through 1948, silver was the principal metal produced in Texas, although the output has been small since large-scale operation of the Presidio mine at Shafter ceased in 1942. The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1944 to 1948, as well as the total metal production from 1885 to 1948.

Mine production of gold, silver, copper, lead, and zinc in Texas, 1944–48, and total, 1885–1948, in terms of recovered metals

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1944	4,160			5,355	$3,808
1945	2,693			23,265	16,544
1946	6,705	9	$315	42,922	34,681
1947	4,552	45	1,575	20,547	18,595
1948	1,850	57	1,995	3,065	2,774
1885–1948	(1)	8,392	227,665	33,291,975	23,436,430

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1944	115	$31,050					$34,858
1945	55	14,850					31,394
1946	3	972	47	$10,246	44	$10,736	56,950
1947	6	2,520	78	22,464	22	5,324	50,478
1948 [2]	23	9,982	170	60,860			75,611
1885–1948	1,338	382,545	5,083	583,019	810	122,551	24,752,210

[1] Figure not available.
[2] Does not include zinc and lead that were recovered by the new slag-fuming plant at the El Paso smelter from old accumulated slag resulting from operations in previous years.

Mine production of gold, silver, copper, lead, and zinc in Texas in 1948, by counties, in terms of recovered metals

County	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Texas in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
Copper ore	3	957		180	22	1	
Lead ore	2	893	57	2,885	1	169	
Total: 1948	5	1,850	57	3,065	23	170	
1947	8	4,552	45	20,547	6	78	22

SMELTING AND REFINING PLANTS IN TEXAS

Smelters in Texas treat large tonnages of ore and concentrates from several Western States and foreign countries, as well as substantial tonnages of smelter residues and secondary material from plants in Texas and other States east of the Rocky Mountain region.

The copper and lead smelters of the American Smelting & Refining Co. at El Paso had an annual capacity of 600,000 and 250,000 tons, respectively, of furnace charge in 1948. During the year an additional lead blast furnace was being constructed to raise the plant capacity to the level required for steady operation of the new slag-fuming plant put in operation in August. Ores and concentrates received in 1948 came from mines in Arizona, Colorado, New Mexico, Texas, Central America, Mexico, the Netherlands, South-West Africa, Tasmania, and Argentina. Other material treated included zinc-smelter residues, matte, and clean-up material from plants in various States and foreign countries.

The Phelps Dodge Corp. Nichols electrolytic copper refinery at El Paso treats blister-copper anodes cast at corporation smelters in Arizona. The plant, which employs about 800 men, operated steadily throughout 1948. A copper sulfate (blue vitriol) section and a slime plant (for recovery of rare metals and gold, silver, and lead) are operated in connection with the electrolytic plant.

The three zinc-reduction plants in the State operated throughout 1948. The horizontal-retort smelter of the American Smelting & Refining Co. at Amarillo received concentrates from mines in Arizona, Colorado, New Mexico, and Utah and fume from the new slag-fuming plant at El Paso. The same company operates the electrolytic zinc plant at Corpus Christi (annual capacity, 30,000 tons of cathode zinc), which also treats both foreign and domestic concentrates. The horizontal-retort smelter of the American Zinc Co. of Illinois at Dumas purchased concentrates from mine operators in Arizona, Colorado, New Mexico, Oklahoma, South Dakota, and foreign countries and zinc fume from a slag-fuming plant in Utah.

REVIEW BY COUNTIES

Culberson County.—The Mary Ellen mine 25 miles north of Van Horn was worked on a small scale in 1948 by J. J. Trepanier, owner. Development totaled 40 feet of shaft and 160 feet of drifts. The output was a car of copper-lead-silver ore, shipped to the El Paso smelter.

Hudspeth County.—The Black Shaft and Sancho Panza mines, 9 and 7 miles, respectively, northeast of Allamoore, were operated during the last few months of 1948 by A. P. Williams. Several cars of copper-silver ore were shipped from each mine.

Presidio County.—R. I. Carr continued to ship lead ore from the Sullivan deposits, 7 miles west of Shafter, to the El Paso smelter. The ore is mined from shallow pits and contains, besides lead, some silver and gold and a little copper. The Marfa Mining Co. shipped a car of lead-silver ore from the Jones claims (Silver Dome group) 25 miles northwest of Presidio.

The Montezuma zinc-lead deposit in the Shafter district was investigated by the Bureau of Mines; the work included diamond drilling and exploratory development.

Utah
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. NEEDHAM AND PAUL LUFF

GENERAL SUMMARY

LEAD held the spotlight in Utah metal mining in 1948 with a gain of 11 percent over 1947 output. Silver production rose 3 percent, but copper output declined 15 percent, gold 13, and zinc 5. Lead increased 40 percent in value, zinc 4, and silver 3, but the value of gold dropped 13 percent and that of copper 12. The 1948 total value of $149,763,677 was nearly 6 percent less than that of $158,624,849 in 1947. Of the total value in 1948, copper contributed 66 percent, lead 13, gold nearly 9, zinc 7, and silver almost 5 percent. Compared with 1947, the value of the five metals produced in the West Mountain (Bingham) district slumped 8 percent, but it rose 24 percent in the Park City region and 6 in the Tintic district.

All tonnage figures are short tons and "dry weight," that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)

1947	421,662	7,780,032	266,533	49,698	43,673

Gold.—The decline of over 53,000 ounces of gold in State output in 1948 resulted almost entirely from a work stoppage at the Utah Copper mine at Bingham. Copper ore remained the principal source of gold, contributing 85 percent of the State gold; zinc-lead supplied 10 percent and other base-metal ores about 1 percent; and gold and silver ores, 4 percent. Two placer operators reported production in 1948.

Of the State gold in 1948, 90 percent came from the West Mountain (Bingham) district, where gold output was 13 percent less than in 1947; the Park City region, second in position, gained 12 percent; and the Tintic district, in third place, dropped 28 percent.

The leading gold producers in Utah in 1948, each with an output of more than 1,000 ounces of recoverable metal, were as follows: Utah Copper mine and the United States & Lark group, both in the West Mountain (Bingham) district; New Park Mining Co. property in the Park City region; Tintic Bullion mine, Chief Consolidated Mining Co. property, and the Eureka Lilly mine, all three in the Tintic district; Calumet mine in the Rush Valley district; Oro Del Rey mine in the Willow Springs district; old pyritic tailings of the Combined Metals Reduction Co. at Bauer; Butterfield property in the West Mountain (Bingham) district; and the Park Utah Consolidated Mines Co. property in the Park City region. These 11 properties furnished over 98 percent of the State gold in 1948.

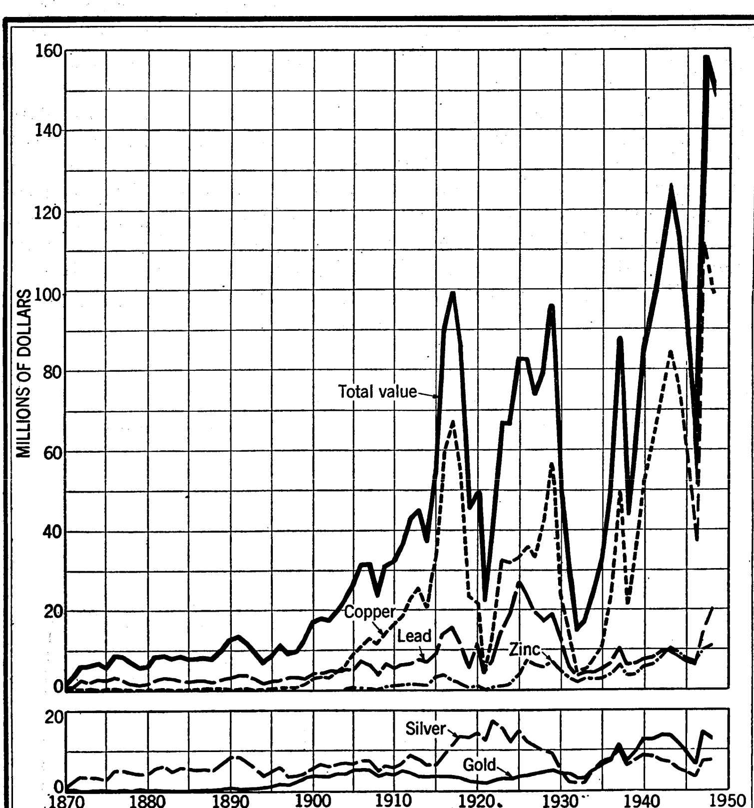

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc, and total value in Utah, 1870–1948

Silver.—With the exception of the Utah Copper mine and the old tailings operation of the Pacific Bridge Co. at Park City, all the larger producers of silver in Utah reported gains in 1948. Because of the work stoppage at the Utah Copper mine, output of silver in the West Mountain (Bingham) district in 1948 was 3 percent below that in 1947; increases were made in the Park City region and in the Tintic district.

Utah properties that produced more than 100,000 ounces of recoverable silver each in 1948 were as follows: Utah Copper mine, United States & Lark group, properties of the Chief Consolidated Mining Co., Silver King Coalition Mines Co., Park Utah Consolidated Mines Co., and New Park Mining Co., Calumet mine, Butterfield group, Pacific Bridge Co. property, Daly No. 1 dump, and Eureka Lilly mine. These 11 producers supplied 94 percent of the State's total silver in 1948.

Zinc-lead ore, zinc ore, lead ore, and zinc-lead-copper ore together furnished 57 percent of the State silver in 1948; copper ore 33 percent, and gold and silver ores nearly 10 percent; the remainder came principally from zinc slag fumed.

Copper.—The work stoppage at the Utah Copper mine was the sole factor in bringing about the 15-percent decline in State output of copper in 1948. Based on average production rates of copper at the mine until the strike began October 24, the loss in yield of the metal during that part of the strike in 1948 is estimated at 100,000,000 pounds. The United States & Lark group increased its copper output 10 percent and was the only other Utah property to produce more than a million pounds of recoverable copper in 1948. These two producers contributed 99 percent of the State copper.

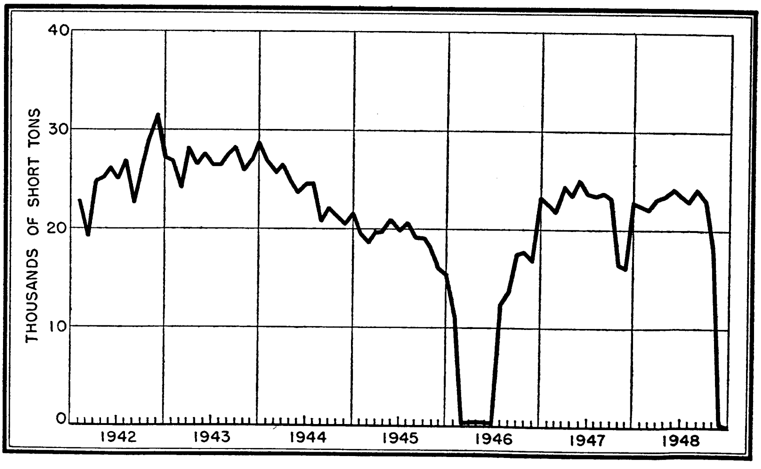

FIGURE 2.—Mine production of copper in Utah, by months, 1942–48, in terms of recovered metal

Lead.—Yield of lead in Utah in 1948 rose to the highest figure since 1943. Output of the metal from the Butterfield property at Lark was nearly double that in 1947, and gains of a third were made at the Calumet mine and the property of the Silver King Coalition Mines Co. Among the larger producers, only the Hidden Treasure mine and the New Park Mining Co. property reported declines in production of recoverable metal, and these were small.

The leading State lead producers in 1948, each with an output of more than a million pounds of recoverable metal, were the United States & Lark group, properties of Chief Consolidated Mining Co., Silver King Coalition Mines Co., and Park Utah Consolidated Mines Co., Calumet mine, New Park Mining Co. property, Butterfield group, Pacific Bridge Co. property, and Hidden Treasure mine. These nine producers supplied 93 percent of the State lead in 1948.

Of the total lead in 1948, 88 percent was recovered from zinc-lead ore, and most of the remainder from lead ore, gold and silver ores, and zinc slag.

Zinc.—Of the 10 leading zinc producers in Utah in 1948 only four succeeded in increasing their outputs of recoverable zinc beyond 1947 figures. Output at the Butterfield property doubled, and increases were made at the United States & Lark group and at the properties of the New Park Mining Co. and the Park Utah Consolidated Mines Co.

Leading producers of the metal in 1948 in order were the United States & Lark group, the properties of the New Park Mining Co., Chief Consolidated Mining Co., Park Utah Consolidated Mines Co., and Pacific Bridge Co., old slag pile at Tooele, Calumet mine, Silver King Coalition Mines Co. property, Butterfield property, and Hidden Treasure mine. The 10 producers, each with an output of more than a million pounds, supplied 96 percent of the total zinc.

Zinc-lead ore was the source of 94 percent of the total zinc in 1948; old zinc slag furnished most of the remainder.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Utah in 1948, by counties, in terms of recovered metals

County	Mines producing		Ore (short tons)	Gold		Silver

MINING INDUSTRY

The 15-percent decline in ore production in Utah in 1948, with accompanying heavy losses in outputs of copper and gold, was directly traceable to a work stoppage at the open-pit mine of the Kennecott Copper Corp. in Bingham Canyon. All work at the mine and mills was halted on October 24 by 311 locomotive operators inside the pit over the wage differential between them and the operators of the larger engines on the main ore-haulage line to the Arthur and Magna mills; settlement was not reached until February 1949. Most of the remaining large State producers reported increased tonnages for the year.

In spite of higher prices for base metals, active lode mines in the State in 1948 remained at 118, the same as in 1947.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Utah in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	8	4,949	5,686	12,362	53,783	27,785	
Dry and siliceous gold-silver ore	23	125,084	7,573	327,249	827,760	2,544,665	5,756
Dry and siliceous silver ore	32	85,679	1,964	432,575	227,599	2,678,312	
	63	215,712	15,223	772,186	1,109,142	5,250,762	5,756
Copper	13	24,458,362	312,536	2,649,771	[1] 449,117,454	94,372	840
Lead	62	27,416	3,003	273,487	132,529	6,562,950	198,452
Lead-copper	1	3		4	413	385	
Zinc	4	[2] 46,136	144	23,921	199,089	920,827	4,324,414
Zinc-lead	45	992,717	37,482	4,302,847	3,338,971	98,602,941	78,106,542
Zinc-lead-copper	1	1,565	20	23,113	116,402	467,763	343,996
Total lode mines	[3] 118	25,741,911	368,408	8,045,329	[1] 454,014,000	111,900,000	82,980,000
Placers	2		14				
Total: 1948	120	25,741,911	368,422	8,045,329	[1] 454,014,000	111,900,000	82,980,000
1947	120	30,383,114	421,662	7,780,032	[4] 533,066,000	99,396,000	87,346,000

[1] Includes 15,658,743 pounds recovered from mine-water precipitates.
[2] Includes 34,818 tons of zinc slag.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 21,149,066 pounds recovered from mine-water precipitates.

METALLURGIC INDUSTRY

The 25,741,911 tons of ore produced in Utah in 1948 were treated as follows: 25,517,522 tons (over 99 percent) at mills (30,145,074 tons in 1947); 189,571 tons (0.74 percent) shipped crude to smelters (171,618 tons in 1947); and 34,818 tons (0.14 percent) of old slag fumed (66,422 tons in 1947).

The 11 mills active in Utah in 1948 treated Utah ore and tailings as follows: Three plants (Arthur, Magna, and Prosper), 24,454,125 tons of copper ore; six mills (Bauer, Midvale, Pacific Bridge, Silver King, Tooele, and Horn Silver), 989,492 tons of zinc-lead ore and old tailings, and lead ore; one plant (Bauer), 62,500 tons of old pyritic gold-silver tailings; one flotation mill in Summit County, 11,000 tons of current zinc tailings; one gravity mill in Utah County, 200 tons of lead ore; and one mill (Midvale), 205 tons of gold-silver ore.

The Midvale 1,700-ton concentrator of the United States Smelting, Refining & Mining Co. operated all year and continued to treat largely zinc-lead ore, most of which came from company-owned properties in the West Mountain (Bingham) district and from the property of the New Park Mining Co. in the Park City region. The 1,500-ton concentrator of the International Smelting & Refining Co. at Tooele operated mainly on zinc-lead ore supplied by the Chief Consolidated Mining Co. in the Tintic district and the Park Utah Consolidated Mines Co. in the Park City region; the copper unit at the concentrator remained idle. The 700-ton concentrator of the Combined Metals Reduction Co. at Bauer operated continuously largely on zinc-lead ore from company-owned or -operated mines in Utah and Idaho. The 800-ton concentrator of the Silver King Coalition Mines Co. at Park City was active throughout the year and treated only zinc-lead-silver ore from the company mine. The tailing plant of the Pacific Bridge Co. at Park City operated all year, but at a considerably lower rate than in 1947.

The Garfield copper smelter of the American Smelting & Refining Co. curtailed operations on October 24, when the work stoppage became effective at the Utah Copper mine, then closed on November 19; operations were not resumed until February 1949. The Murray lead smelter of the American Smelting & Refining Co. operated all year and treated lead concentrates, crude lead ores, and gold and silver ores chiefly from Utah and Idaho. The Midvale lead smelter of the United States Smelting, Refining & Mining Co. treated similar materials mainly from company properties in Utah. The Tooele lead plant of the International Smelting & Refining Co. operated in conjunction with the company zinc slag-fuming plant and treated zinc-lead ores and old slag, lead ores and concentrates, and zinc ores from both company and custom sources. The slag-fuming plant treated a total of 127,550 tons of current hot slag, old cold slag, and crude ore in 1948, compared with 160,482 tons in 1947; output was 19,560 tons of zinc fume, averaging 74.71 percent zinc, and 2,842 tons of lead fume, averaging 48.19 percent lead. The company copper smelter at Tooele remained idle throughout the year.

Grading was begun at Garfield late in the year for the construction of the $16,000,000 copper refinery of the Kennecott Copper Corp.; the first structural steel was erected early in 1949, and completion of the plant is expected in 1950.

Mine production of metals in Utah in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Concentrates smelted	929,030	351,029	6,953,487	435,809,613	98,128,283	77,392,987

REVIEW BY COUNTIES AND DISTRICTS

BEAVER COUNTY

Beaver Lake District.—A. M. Bealer operated the O. K. mine from June to December and produced about 165 tons of copper ore containing 7 ounces of gold, 192 ounces of silver, and 15,721 pounds of copper.

Granite District.—R. A. Glenny, lessee, operated the Beaver View group throughout the year and shipped to smelters 199 tons of zinc-lead ore containing 31 ounces of gold, 526 ounces of silver, 992 pounds of copper, 41,178 pounds of lead, and 50,870 pounds of zinc; and 52 tons of lead ore containing 9 ounces of gold, 190 ounces of silver, 382 pounds of copper, and 14,094 pounds of lead.

San Francisco District.—Lessees worked the Horn Silver mine and produced 5,016 tons of zinc-lead ore, 197 tons of lead ore, 78 tons of dump silver ore, and 27 tons of dump gold-silver ore. The 5,016 tons of zinc-lead ore, which was mined by Metal Producers, Inc., contained 65 ounces of gold, 13,659 ounces of silver, 11,881 pounds of copper, 477,907 pounds of lead, and 492,787 pounds of zinc. The bulk of this ore was treated in the company new 500-ton flotation mill. Remaining district output was 147 tons of copper smelting ore from the Cactus mine and 85 tons of zinc-lead milling ore and 40 tons of gold-silver smelting ore from the Frisco Lead-Silver mine.

Star and North Star District.—The Harrington-Hickory mine was operated throughout 1948 by James D. Williams, lessee. Production was 2,036 tons of silver smelting ore containing 29 ounces of gold, 8,704 ounces of silver, 8,286 pounds of copper, and 123,527 pounds of lead; 579 tons of gold smelting ore containing 151 ounces of gold, 1,465 ounces of silver, 1,424 pounds of copper, and 16,961 pounds of lead; 117 tons of gold-silver smelting ore containing 5 ounces of gold, 430 ounces of silver, 561 pounds of copper, and 9,404 pounds of lead; 640 tons of zinc-lead milling ore containing 6 ounces of gold, 1,804 ounces of silver, 15,707 pounds of lead, and 22,028 pounds of zinc; and 29 tons of lead smelting ore containing 273 ounces of silver, 249 pounds of copper, and 6,024 pounds of lead. Lead ore constituted the bulk of remaining district production—199 tons came from the Wild Bill mine, 27 tons from the St. Mary group, and 17 tons from the Florence claim; in addition, 45 tons of silver ore and 27 tons of lead ore were produced from the Rebel claim, and 12 tons of copper ore from the Gold Bar claim.

BOX ELDER COUNTY

Lucin District.—Principal production in 1948 was from the Copper Mountain (Salt Lake Copper) group which yielded 515 tons of copper smelting ore containing 1 ounce of gold, 130 ounces of silver, 90,596 pounds of copper, and 2,944 pounds of zinc; and 46 tons of lead smelting ore containing 1 ounce of gold, 685 ounces of silver, 695 pounds of copper, 14,703 pounds of lead, and 2,532 pounds of zinc. Lessees worked the United Metal Mine and shipped 52 tons of lead smelting ore containing 18 ounces of silver, 29,724 pounds of lead, and 7,571 pounds of zinc.

Mine production of gold, silver, copper, lead, and zinc in Utah in 1948, by counties and districts, in terms of recovered metals

[1] Tintic district is in both Juab and Utah Counties.

[2] Properties not counted as mines; material credited to district came from slag dump, clean-ups, and railroad yards.

[3] Includes production from Smelter district; Bureau of Mines not at liberty to publish separate figures.

JUAB COUNTY

Fish Springs District.—Principal production in 1948 was from the Utah Mine group—26 tons of lead ore containing 1 ounce of gold, 1,754 ounces of silver, and 12,250 pounds of lead; and 3 tons of silver ore containing 16 ounces of silver, and 317 pounds of lead.

Tintic District.—The Tintic district, lying in both Juab and Utah Counties, is reviewed here. The following table gives metal production in each section of the district in 1948, a comparison with the total in 1947, and the grand total from 1869 to 1948.

Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1947–48, and total, 1869–1948, in terms of recovered metals

	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1948

1 Figure not available.

The Chief Consolidated Mining Co. operated its Chief No. 1, Gemini, and Eureka Hill mines throughout the year and exceeded its 1947 tonnage by 26 percent. Output from the mines comprised 83,740 tons of zinc-lead milling ore containing 1,574 ounces of gold, 615,420 ounces of silver, 80,535 pounds of copper, 7,399,410 pounds of lead, and 9,613,455 pounds of zinc; 24,814 tons of silver smelting ore containing 626 ounces of gold, 162,532 ounces of silver, 47,253 pounds of copper, and 1,950,443 pounds of lead; and 9,529 tons of lead smelting ore containing 201 ounces of gold, 119,574 ounces of silver, 11,645 pounds of copper, 2,210,971 pounds of lead, and 115,642 pounds of zinc.

At the Tintic Standard mine, most of the year was spent in moving surface equipment to the No. 1 shaft. During the period of its operation, the mine produced 1,549 tons of zinc-lead milling ore, 187 tons of gold-silver smelting ore, and 168 tons of silver smelting ore. The zinc-lead ore contained 51 ounces of gold, 15,870 ounces of silver, 5,247 pounds of copper, 304,910 pounds of lead, and 45,109 pounds of zinc. The company Iron Blossom mine produced 1,024 tons of gold-silver smelting ore, 1,451 tons of silver smelting ore, and 95 tons of lead milling ore.

The Eureka Lilly mine was operated until November 11; shipments totaled 14,023 tons of gold-silver smelting ore containing 1,674 ounces of gold, 112,283 ounces of silver, and 613,443 pounds of copper. From the Colorado mine of the Colorado Consolidated Mines Co. 802 tons of gold-silver ore, 39 tons of silver ore, 287 tons of lead ore, and 194 tons of zinc-lead ore were shipped to smelters.

Other operations in the district that produced more than 1,000 tons of ore each were the Yankee mine (gold-silver and zinc-lead ores), Tintic Bullion and Coyote group (gold, gold-silver, and zinc-lead ores), North Lily group (zinc-lead ore), Mountain View group (gold-silver, zinc-lead, and lead ores), Eureka Bullion mine (copper ore), Godiva mine and dump (gold-silver ore), Eagle and Blue Bell mine (gold-silver and lead ores), and Centennial-Beck-Victoria mine (gold, gold-silver, silver, and lead ores).

SALT LAKE COUNTY

Big Cottonwood District.—The Cardiff mine was the principal producer, shipping 1,144 tons of zinc-lead ore containing 13 ounces of gold, 8,519 ounces of silver, 16,989 pounds of copper, 386,788 pounds of lead, and 436,542 pounds of zinc; 368 tons of lead ore containing 4 ounces of gold, 4,081 ounces of silver, 11,147 pounds of copper, 148,323 pounds of lead, and 50,000 pounds of zinc; and 179 tons of zinc ore containing 34 ounces of silver, 179 pounds of copper, 2,572 pounds of lead, and 130,854 pounds of zinc.

Little Cottonwood District.—The Columbus-Rexall group led the district in ore production in 1948 with 208 tons of zinc-lead ore and 204 tons of lead ore. Lessees worked the properties of the Wasatch Mines Co. and shipped to smelters 199 tons of copper ore, 92 tons of lead ore, and 18 tons of silver ore.

Smelter District.—Output credited to the Smelter district comprised lead-plant dump slag and yard cleanings.

West Mountain (Bingham) District.—In 1948 the West Mountain (Bingham) district produced 90 percent of the State gold, 58 percent of the silver, 99 percent of the copper, 55 percent of the lead, and 53 percent of the zinc; total value of the five metals represented 87 percent of the State total value.

Output of copper at the Utah Copper mine of the Kennecott Copper Corp. was 14 percent less in 1948 than in 1947, owing to the previously mentioned work stoppage. In spite of this, the mine remained the largest copper mine in the United States and contributed about 27 percent of the Nation's mine production of copper in 1948. The Arthur and Magna mills operated 296 days and treated ore in 1948 at an average daily rate of 82,615 tons, compared with 81,775 tons in 1947. In addition, large quantities of copper were leached from waste dumps and precipitated in the company plant at the mouth of Bingham Canyon.

Mine production of gold, silver, copper, lead, and zinc in West Mountain (Bingham) district, Salt Lake County, Utah, 1947–48, and total, 1865–1948, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1947	5	29, 306, 718	384, 414	4, 816, 611	528, 630, 200	52, 325, 500	40, 892, 800	$141, 308, 766
1948	6	24, 889, 134	332, 588	4, 694, 674	450, 450, 800	61, 343, 900	44, 153, 300	130, 490, 268
Total 1865–1948		(1)	6, 561, 031	152, 635, 808	[2] 5, 159, 861	[2] 1, 618, 864	[2] 522, 220	2, 074, 225, 899

[1] Figure not available.
[2] Short tons.

Lead production increased 14 percent at the United States & Lark property of the United States Smelting, Refining & Mining Co., silver and copper each 10, zinc 7, and gold 3 percent, compared with 1947 figures. About 88 percent of the ore produced in 1948 was zinc-lead ore, nearly all of which was treated at the company Midvale concentrator; the remaining 12 percent was gold-silver, silver, and lead ores shipped direct to smelters.

Combined Metals Reduction Co. and lessees operated the Butterfield group throughout the year and increased the ore output nearly 76 percent above the 1947 level. Production comprised 31,117 tons of zinc-lead milling ore containing 1,926 ounces of gold, 277,866 ounces of silver, 111,500 pounds of copper, 6,575,260 pounds of lead, and 2,442,960 pounds of zinc; and 32 tons of gold-silver ore containing 1 ounce of gold, 88 ounces of silver, 1,248 pounds of lead, and 1,811 pounds of zinc.

Remaining district output was principally 1,287 tons of zinc-lead ore and 174 tons of lead ore produced by lessees from the Apex-Delaware group and 205 tons of gold-silver ore produced from exploration and development by the Ohio Copper Co. at its Columbia group.

SAN JUAN COUNTY

Output credited to San Juan County in 1948 consisted of mill cleanings from the Big Indian property operated by the Ohio Copper Co. until November 1947.

SUMMIT AND WASATCH COUNTIES

PARK CITY REGION

The Park City region includes the Uintah district in Summit County and the Blue Ledge and Snake Creek districts in Wasatch County. The following table shows the production and total value of the five metals in 1948 compared with 1947 and the total from 1870 to 1948.

Mine production of gold, silver, copper, lead, and zinc in Park City region. Summit and Wasatch Counties, Utah, 1947–48, and total, 1870–1948, in terms of recovered metals

Year	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1947	10	657,496	17,052	1,352,748	1,139,800	21,973,500	21,912,400	$7,875,999
1948	10	506,671	19,087	1,703,864	1,193,300	25,339,400	20,639,700	9,749,907
Total 1870–1948	--------	(1)	597,945	237,831,312	70,970,513	2,455,756,834	728,363,211	384,810,227

1 Figure not available.

Silver King Coalition Mines Co. produced 52,012 tons of ore in 1948, compared with 42,102 tons in 1947. The company 800-ton flotation mill treated 50,892 tons of zinc-lead ore containing 911 ounces of gold, 574,062 ounces of silver, 366,400 pounds of copper, 9,781,440 pounds of lead, and 4,091,720 pounds of zinc. The remaining ore, shipped to smelters, comprised 881 tons of lead ore and 239 tons of silver ore.

Park Utah Consolidated Mines Co. operated its property throughout the year and shipped 44,753 tons of zinc-lead ore, compared with 41,460 tons in 1947. The ore in 1948 contained 1,527 ounces of gold, 502,880 ounces of silver, 168,368 pounds of copper, 7,625,586 pounds of lead, and 7,055,731 pounds of zinc.

Pacific Bridge Co. operated its 1,000-ton flotation mill and treated 292,358 tons of old zinc-lead tailings from the Graselli dump, compared with 459,944 tons in 1947. Concentrates comprised 5,635 tons of lead concentrate containing 224 ounces of gold, 98,546 ounces of silver, 76,264 pounds of copper, 1,816,229 pounds of lead, and 569,849 pounds of zinc; and 4,611 tons of zinc concentrate containing 121 ounces of gold, 69,404 ounces of silver, 41,345 pounds of copper, 402,768 pounds of lead, and 4,818,599 pounds of zinc.

New Park Mining Co. produced 72,831 tons of ore in 1948—a new high—compared with 68,256 tons in 1947. Of the ore output in 1948, 62,951 tons came from the Mayflower fissure and 9,880 tons from the Pearl fissure. All was zinc-lead milling ore and contained 19,272 ounces of gold, 417,064 ounces of silver, 866,196 pounds of copper, 7,255,644 pounds of lead, and 10,084,961 pounds of zinc.

The Silver King Western mine came into production in September and shipped 342 tons of lead ore to smelters. McFarland & Hullinger, lessees, operated the Daly No. 1 waste dump until August and shipped 32,745 tons of siliceous silver ore to a smelter. Reuben Garbet produced zinc middling in a small flotation mill by re-treating current tailings from the Silver King Coalition mill. Remaining district production was principally 564 tons of dump silver ore from the Crescent property and 58 tons of copper ore from the West Park mine.

TOOELE COUNTY

Blue Bell District.—Output in 1948 was all lead ore—133 tons from the Blackhawk claim and 67 tons from the International group.

Camp Floyd District.—The New Mercur mine produced 748 tons of gold ore and the Rover group 34 tons of zinc-lead ore.

Clifton District.—Principal production was made by lessees working the Rube Lead group. Output was 289 tons of lead smelting ore containing 8 ounces of gold, 422 ounces of silver, 809 pounds of copper, 70,684 pounds of lead, and 6,115 pounds of zinc.

Dugway District.—The bulk of production was 234 tons of lead ore and 59 tons of zinc-lead ore from the Dugway claim, 90 tons of zinc-lead ore and 82 tons of lead ore from the Four Metals group, and 173 tons of zinc-lead ore from the Cannon property.

Erickson District.—Principal output came from the Esther group—984 tons of zinc-lead milling ore.

Ophir District.—Lessees at the Hidden Treasure mine produced 3,926 tons of zinc-lead ore, 1,565 tons of zinc-lead-copper ore, 414 tons of lead ore, and 42 tons of zinc ore. The Ophir Development Co. worked its Ophir Hill mine all year and shipped 203 tons of zinc-lead ore containing 2 ounces of gold, 1,173 ounces of silver, 2,926 pounds of copper, 29,732 pounds of lead, and 26,906 pounds of zinc. Lessees operated the Shoo Fly group of the Treasure Hill Mines Co. and shipped 423 tons of silver ore and 58 tons of zinc-lead ore. From the Ophir unit of the United States Smelting, Refining & Mining Co., lessees shipped 575 tons of zinc-lead milling ore.

Rush Valley District.—Ore production at the West Calumet (Calumet) mine of the Combined Metals Reduction Co. rose from 31,294 tons in 1947 to 38,396 tons in 1948. Of the ore produced in 1948, 38,342 tons were zinc-lead milling ore containing 2,716 ounces of gold, 308,186 ounces of silver, 7,890,711 pounds of lead, and 3,838,606 pounds of zinc; 54 tons of lead ore went direct to a smelter. From the company Honorine-Galena King group, 1,423 tons of zinc-lead ore and 333 tons of lead ore were produced. The company flotation mill at Bauer treated about 62,500 tons of pyritic gold-silver tailings, which yielded 20,886 tons of iron concentrate valuable chiefly for its gold and silver. Other district output was 708 tons of zinc-lead ore from the Silver Eagle group and 70 tons of lead ore from the Circle Amended claim.

Smelter District.—Output credited to producers in the Smelter district comprises the metals recovered from 1,036 tons of old copper slag shipped to a copper smelter by the International Smelting & Refining Co. at Tooele and 34,818 tons of old zinc slag treated at the company slag-fuming plant.

Willow Springs District.—Lessees operated the Oro Del Rey group and shipped to smelters 781 tons of lead ore containing 1,346 ounces of gold, 4,157 ounces of silver, 1,282 pounds of copper, 345,765 pounds of lead, and 253 pounds of zinc, and 63 tons of gold ore containing 177 ounces of gold, 193 ounces of silver, 109 pounds of copper, and 5,181 pounds of lead.

UTAH COUNTY

American Fork District.—Dutchman Mine Leasers operated the Dutchman group throughout 1948 and shipped 2,559 tons of zinc-lead milling ore containing 37 ounces of gold, 18,449 ounces of silver, 9,671 pounds of copper, 463,259 pounds of lead, and 1,147,095 pounds of zinc. Remaining district production was 200 tons of lead ore from the Blue Rock mine and 90 tons of zinc-lead ore from the Live Yankee claim.

Tintic District.—Mines in the Utah County section of the Tintic district are reviewed under Juab County.

WASHINGTON COUNTY

Tutsagubet District.—E. L. Cox worked the Dixie (Apex) mine and shipped to smelters 959 tons of lead ore containing 7 ounces of gold, 12,061 ounces of silver, 8,167 pounds of copper, and 269,995 pounds of lead; and 175 tons of copper ore containing 1 ounce of gold, 61 ounces of silver, and 57,599 pounds of copper. Wayne Snow shipped 113 tons of lead ore from the Black Warrior claim.

Washington
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. NEEDHAM AND PAUL LUFF

GENERAL SUMMARY

COPPER, with an output 153 percent greater than in 1947, far surpassed the gains made by gold, silver, and lead in Washington in 1948. Gold yield rose 100 percent, lead 33, and silver 28; zinc reversed the trend and dropped 8 percent. Higher average prices for copper, lead, and zinc, coupled with increased yields of gold, silver, copper, and lead, pushed the value of the five metals in 1948 to an all-time high of $11,171,715, or nearly 53 percent greater than the value in 1947, and 37 percent greater than the previous high of $8,172,609 established in 1942. Of the total value in 1948, zinc contributed 30 percent, lead 23, copper 22, gold 22, and silver 3 percent.

Chelan County returned to first place among Washington counties in 1948 in both tonnage of ore treated and value of metals produced, owing to a full year of normal production at the Holden mine of the Howe Sound Co.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905: 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Washington, 1944–48, and total, 1860–1948, in terms of recovered metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1944	25	3	1,180,662	47,277	$1,654,695	321,608	$228,699
1945	21	3	968,246	57,860	2,025,100	281,444	200,138

December	6,013	32,780	442	599	867
Total: 1948	70,075	375,831	5,665	7,147	12,638
1947	34,965	293,736	2,240	5,359	13,800

Gold.—Gold output in Washington in 1948 was the highest since 1942, mainly as a result of a very large increase in production of the metal at the Holden mine. The Knob Hill mine in second place and the Aurum group in third place, both in Ferry County, also reported substantial gains. These three properties contributed all but a few ounces of the total State gold in 1948. Placer production was very small and came from one producer. Of the State total gold in 1948, 60 percent was recovered from zinc-copper ore and most of the remainder from gold ore.

Silver.—All four leading silver producers in the State gained appreciably in output of the metal in 1948, and yield was the highest since 1941; the Holden mine reported an especially large increase. The Knob Hill mine (gold ore) remained in the lead, followed by the Holden mine (zinc-copper ore), the Aurum group (gold ore), and the Bonanza mine (lead ore). These four producers furnished 90 percent of the State silver in 1948.

Gold ore was the leading source of State silver in 1948, supplying about 48 percent, followed by zinc-copper ore with 37 percent; most of the remainder came from lead and zinc-lead ores.

Copper.—After seven consecutive years of declines in copper output in Washington, the trend was reversed in 1948, and yield of the metal returned almost to the 1945 level. The large gain over 1947 output resulted from steady output throughout the year of zinc-copper ore from the Holden mine, the only important copper producer in the State.

Lead.—Lead output in Washington in 1948 was the highest in the history of the State, being 23 percent greater than the previous record of 11,650,000 pounds reached in 1944. Increases were large at the Deep Creek and Bonanza mines, both in Stevens County, and at the property of the Pend Oreille Mines & Metals Co. in Pend Oreille County. Owing to a 6-month labor strike at the Grandview mine of the American Zinc, Lead & Smelting Co. in Pend Oreille County, lead output from the property was only 85 percent of that in 1947. Leading State producers of lead in 1948 in order were the property of the Pend Oreille Mines & Metals Co., and the Grandview, Bonanza, and Deep Creek mines. From these four properties came 95 percent of the total lead in 1948. Of the total lead, 78 percent was derived from zinc-lead ore; nearly all the remainder came from lead ore.

Zinc.—But for the 6-month work stoppage at the Grandview mine, zinc, like lead, probably would have established an all-time production record for the State. The Holden mine produced over three times as much zinc in 1948 as in 1947, and the Deep Creek mine also made a substantial increase; output of the metal declined at the Grandview mine and at the property of the Pend Oreille Mines & Metals Co. The Holden mine was the leading State producer of zinc in 1948, followed in order by the Grandview and Deep Creek mines and the property of the Pend Oreille Mines & Metals Co., which together supplied 98 percent of the total zinc. Zinc-lead ore furnished 73 percent of the zinc in 1948, zinc-copper ore 26, and zinc ore nearly 1 percent.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Washington in 1948, by counties, in terms of recovered metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Chelan	3		41,833	$1,464,155	137,242	$124,211

1948	1	2,900	10	350	.121
Small-scale hand methods:					
1944	2	75	4	140	1.867
1945	3	275	14	490	1.782
1946	3	115	5	175	1.522
1947	2	400	7	245	.613
1948					
Grand total placers:					
1944	3	5,575	59	2,065	.370
1945	3	275	14	490	1.782
1946	5	25,115	101	3,535	.141
1947	6	8,600	77	2,695	.313
1948	1	2,900	10	350	.121

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

MINING INDUSTRY

The number of producing lode properties in Washington in 1948 increased 20 percent over the number in 1947; ore output for the year rose 44 percent, mainly as a result of uninterrupted production at the Holden mine. Owing to the work stoppage at the Grandview mine, ore production from that property was about 60 percent of that in 1947, but most other State producers reported increases for the year.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Washington in 1948, with content in terms of recovered metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry and siliceous gold ore	5	70,742	28,209	178,653			
Dry and siliceous silver ore	2	1,501		4,676	2,000	33,800	1,800
Copper ore	3	52	2	157	5,100		
Lead ore	5	15,350	8	23,358	4,200	3,074,735	12,851
Zinc ore	1	364		54	182	2,780	183,205
Zinc-copper ore	2	608,863	41,826	137,832	11,315,600	2,000	6,609,200
Zinc-lead ore	12	277,385	20	31,101	2,918	11,180,685	18,468,944
Total lode mines	30	974,257	70,065	375,831	11,330,000	14,294,000	25,276,000
Placers	1		10				
Total: 1948	31	974,257	70,075	375,831	11,330,000	14,294,000	25,276,000
1947	31	676,176	34,965	293,736	4,480,000	10,718,000	27,600,000

METALLURGIC INDUSTRY

Of the 974,257 tons of lode material sold or treated in Washington in 1948, 954,502 tons (98 percent) went to mills and 19,755 tons (2 percent) to smelters, compared with 98 and 2 percent, respectively, in 1947. The 954,502 tons treated at mills were distributed as follows: 2 plants, 608,863 tons of zinc-copper ore; 10 plants, 277,100 tons of zinc-lead ore; 3 plants, 51,174 tons of gold ore; 3 plants, 15,237 tons of lead ore; 1 plant, 1,500 tons of silver ore; and 1 plant, 364 tons of zinc ore. In addition, 264 tons of zinc-lead ore were shipped to a custom flotation mill in Utah.

Mine production of metals in Washington in 1948, by methods of recovery, in terms of recovered metals

Method of recovery	Material treated (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	83	10				
Ore cyanided	51,091	3,879	25,376			
Concentrates smelted	59,480	60,551	314,327	11,324,900	14,155,787	25,266,194
Ore smelted	19,755	5,625	36,128	5,100	138,213	9,806
Placer		10				
Total: 1948		70,075	375,831	11,330,000	14,294,000	25,276,000
1947		34,965	293,736	4,480,000	10,718,000	27,600,000

CHELAN COUNTY

Chelan Lake District.—The Howe Sound Co. operated its Holden mine and 2,000-ton concentration mill throughout 1948 and treated 608,431 tons of zinc-copper ore containing 49,412 ounces of gold, 207,475 ounces of silver, 11,975,000 pounds of copper, and 9,600,000 pounds of zinc. The mill yielded 24,590 tons of copper concentrate, 6,709 tons of zinc concentrate, and 8 tons of gold concentrate.

Peshastin Creek (Blewett) District.—District output was 19 tons of gold ore from the Polepick claim.

FERRY COUNTY

Orient District.—The Talisman Mining & Leasing Co. operated its Laurier mine and a mill part of the year. The mill produced 19 tons of copper concentrate and 35 tons of zinc concentrate.

Republic (Eureka) District.—Knob Hill Mines, Inc., operated its mine and 400-ton flotation-cyanidation mill on gold ore during all of 1948 and treated 5 percent more ore than in 1947. The ore was ground to 100-mesh with a rougher jig in the grinding circuit, followed by flotation; the flotation tailing was treated by cyanidation. The Aurum group of the Aurum Mining Co. was operated by the company and by lessees; production in 1948 was 19,557 tons of gold ore compared with 14,951 tons in 1947.

OKANOGAN COUNTY

Total county production in 1948 came from the Kaaba mine operated by the Kaaba Silver-Lead Mines, Inc., which produced ore only in January, then spent the remainder of the year in shaft sinking and development.

PEND OREILLE COUNTY

Metaline District.—The Grandview mine and 600-ton flotation mill of the American Zinc, Lead & Smelting Co. closed on July 1 because of labor difficulties and remained inoperative for the balance of the year. As a result, lead and zinc production at the property was much below the 1947 level.

The Pend Oreille Mines & Metals Co. operated its property and 700-ton mill throughout 1948 and treated 133,755 tons of zinc-lead ore compared with 116,695 tons in 1947. Gross metal content of the ore in 1948 was 8,025 ounces of silver, 6,200,000 pounds of lead, and 6,300,000 pounds of zinc.

The Metaline Mining & Leasing Co. conducted development during all of the year.

SNOHOMISH COUNTY

Total county production in 1948 was 49 tons of copper smelting ore shipped from the Wilbur-Index group by the Lake Serene Mining Co., Inc.

STEVENS COUNTY

Bossburg (Clugston Creek) District.—Bonanza Lead operated its Bonanza mine throughout the year and treated in the company 100-ton mill 12,386 tons (7,764 tons in 1947) of lead ore containing 15 ounces of gold, 26,000 ounces of silver, 7,500 pounds of copper, 2,950,000 pounds of lead, and 70,000 pounds of zinc. Remaining district output was zinc-lead ore from the Young America and High Cliff mines.

Deer Trail District.—The Cleveland mine of Basic Metals, Inc., closed on January 15, then passed into receivership. W. R. Borkey operated the Deer Trail mine from April to October and treated about 175 tons of zinc-lead ore in a 30-ton flotation mill on the property.

Northport (Aladdin) District.—The Deep Creek mine and 260-ton flotation mill of the Goldfield Consolidated Mines Co. operated throughout the year. The mill treated 50,421 tons of zinc-lead ore containing 20 ounces of gold, 5,000 ounces of silver, 3,000 pounds of copper, 3,002,593 pounds of lead, and 7,040,419 pounds of zinc. The Admiral mine of the Admiral Consolidated Mining Co. produced 364

883326—50——103

tons of zinc ore, part of which was treated in the 75-ton flotation mill on the property and part shipped to a concentrator in Utah. Gross metal content of the ore was 63 ounces of silver, 274 pounds of copper, 3,700 pounds of lead, and 240,000 pounds of zinc. Leadpoint Electric Mining Co. operated its Electric Point property, treated 2,155 tons of dump lead ore in a gravity mill, and shipped 52 tons of high-grade lead ore to a smelter. The Gladstone Mountain mine produced 696 tons of dump lead ore, which was treated at the mill of the Leadpoint Electric Mining Co., and 21 tons of high-grade lead smelting ore. Last Chance Consolidated Mines, Inc., operated the Last Chance group and treated about 800 tons of zinc-lead ore in the company 100-ton gravity-flotation mill. Remaining district production was principally zinc-lead ore—about 160 tons from the Lucille claim, 40 tons from the Farmer group, and 6 tons from the Morning mine.

Wyoming
Gold, Silver, Copper, and Lead

(MINE REPORT)

By A. J. MARTIN

GENERAL SUMMARY

GOLD mining in Wyoming in 1948, as in 1947, was active only in the South Pass district, Fremont County. Operations at the Carissa mine, which in 1947 produced 98 percent of the State total output of gold, were confined largely to development work in 1948, and the mill was not run until November. Output from the Carissa mine and that from two small-scale placer operations comprised the State total output of 115 fine ounces of gold and 11 fine ounces of silver during the year. The output in 1947 was 1,486 ounces of gold and 95 ounces of silver. No recoverable copper or lead was produced in the State in 1948 or 1947. Only a small output of lead and no output of zinc have been reported in Wyoming in the past.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1944–48

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1944	$35.00	$0.711+	$0.135	$0.080	$0.114
1945	35.00	.711+	.135	.086	.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1944 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers; 1944–47: price included bonus payments by Office of Metals Reserve for overquota production.

MINE PRODUCTION

The following table shows the annual output of ore from lode mines producing gold, silver, copper, and lead and the quantity and value of the metals recovered from both lode and placer mines in Wyoming from 1944 to 1948; it also gives the total production of metals from 1867 to 1948.

Mine production of gold, silver, copper, and lead in Wyoming, 1944–48, and total, 1867–1948, in terms of recovered metals

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total value
		Fine ounces	Value	Fine ounces	Value	Short tons	Value	Short tons	Value	
1944	6	20	$700	3	$2					$702
1945	52	2	70	31	22			3	$516	608
1946	61	105	3,675	26	21	[1] 1	$324			4,020
1947	6,059	1,486	52,010	95	86					52,096
1948	867	115	4,025	11	10					4,035
1867–1948	[2]	79,642	1,895,798	74,798	51,893	16,326	5,684,372	14	1,486	7,633,549

[1] Includes less than ½ ton of recoverable copper produced in 1945 from the Bartlett (Copper King) mine in Laramie County.
[2] Figure not available.

Mine production of gold and silver in Wyoming in 1948, by months, in terms of recovered metals

Month	Gold (fine ounces)	Silver (fine ounces)
January-February		
March	3	
April-September		
October	2	
November	19	5
December	91	6
Total: 1948	115	11
1947	1,486	95

REVIEW BY COUNTIES

The entire output of gold and silver in Wyoming in 1948 came from Fremont County.

Milling operations at the Carissa mine at South Pass City, suspended October 1, 1947, were not resumed until November 1948. While the mill was idle a shaft was sunk to a lower level, and other mine development work was done. A shipment of crude ore was made to the Garfield (Utah) smelter in October. The mill had a capacity of 100 tons daily at the end of 1948 and uses the amalgamation and cyanidation processes; it operated at less than capacity during November and December. On September 27, 1948, a new company—Carissa Gold Mines, Inc.—was formed and took over operation of the Carissa property, succeeding Mica Mountain Mines, Inc.

A few ounces of placer gold were shipped to the Denver Mint from the Las Vegas and Gold Meadow claims in the South Pass district.
