Mr. Richard C. Sinclair  
Project Manager  
Howard, Needles, Tammen & Bergendoff  
6815 West Capitol Drive  
Milwaukee, WI 53216

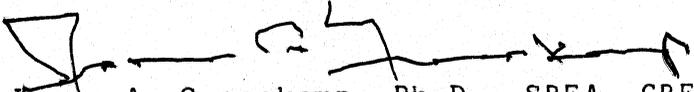

Dear Mr. Sinclair:

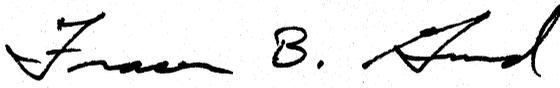

We are transmitting to you our report as per our Subcontract Agreement for Professional Services. There are five bound copies of the final report. Additionally, we have taken the liberty of providing one set of the exhibits printed on plain white paper as a convenience to you.

We remain available to attend the public information meeting on January 11, 1984, as well as to respond to questions you may have with regard to our work.

We wish to thank Howard, Needles, Tammen & Bergendoff, and particularly, you and Mr. Peter Riese, for your cooperation and assistance. We appreciate the opportunity to have been of service.

### SUMMARY CONCLUSIONS

1. There can be immediate short-term diminution of residential real estate property values due to fears triggered by the perceived presence of the prison. The perception of the prison's presence is largely visual, and therefore the viewshed is the primary impact area. Other cities in Wisconsin and elsewhere in the country reveal no impact on industrial and commercial property adjacent to new urban jail centers.

2. The impact is short term in nature. The fears associated with a neighboring prison gradually give way as they are replaced by the facts of actual experience.

3. In the long run, property values in close proximity to the prison are typically unaffected, particularly in areas such as the subject property which is in an area of basic warehouses, manufacturing, and minimum rent apartments.

4. In the probable case, in our best judgment, residential property values would be moderately affected (approximately -2%) in the short term, and total property values would be slightly affected (approximately -1%) in the short term by the presence of a medium security prison at the Trostel site.

In the worst case, in our best judgment, residential property values would be significantly affected (approximately -6%) in the short term, and total property values would be

moderately affected (approximately -4%) in the short term by the presence of a medium security prison at the Trostel site.

In either the probable or worst case situation, short-term property value reductions would only last five or six years. Property values would then have caught up with comparable property values outside of the prison impact area.

5. The potential magnitude of short-term property value diminution is probably much less than the effects of socio-economic factors which have already accomplished out-migration of those with higher incomes and led to increasing percentages of lower income households in a declining residential population. The impact on values is expected to fall primarily on a few concentrations of properties with clear views of the Trostel warehouse from higher topography.

## I. PROPERTY VALUE IMPACT OF PRISONS

### A. Degree and Timing

It is generally assumed that locating a prison in a community will adversely affect the resale price and market value of properties in proximity to the prison. Presumably, property owners initially anticipate a loss of status, imagine some physical threat from escapees, perceive an aesthetic affront from the prison structure, and resent the potential increased traffic generated through the neighborhood by officials and visitors related to the prisoners. This study investigates the issue of the degree to which these adverse impacts affect the property values near the prison. The study does not investigate any ambient adverse effect brought about by identification of the community as a whole with the prison. These indirect and non-specific effects cannot be measured or differentiated from the many other factors which affect property values.

When the conventional wisdom is that property values will fall as the result of locating of a prison in the neighborhood, lower property values will, in fact, result. Since it is a perceptual matter, the more apparent the prison, the more likely fears of buyers and residents, in general, will cause market transactions to occur at lower values.

Therefore, the visual presence of the prison is the appropriate way of differentiating between general, unattributable effects on property values and those which may be attributed to the prison. The methodology of this study follows this differentiation by delineating the impact area as the viewshed.

The immediate drop in property values caused by a panic reaction to a prison site selection is certainly short run in nature. The two Wisconsin communities studied in the 1978 Stanley Study were both cases where the communities grew up to and around existing prisons over a period of many years. In both Green Bay and Waupun, there was no drop in property values nearer the prisons. The transition from the immediate reaction and impact on property values to the long-run community accommodation will depend on the extent of initial depressed values or weak value appreciation, and the degree to which the fears of having a prison in the community are realized over time.

#### B. Previous Studies

##### 1. The Stanley Study

The Impact of Prison Proximity on Property Values in Green Bay and Waupun, Wisconsin, Professor Craig E. Stanley, University of Wisconsin School of Business, 1978, is cited nationally as being one of the more specific investigations

into the relationship between prison proximity and property values.

The results of the study have been surprising to some. The conclusions were that proximity to the reformatories had no measurable deleterious affect on either the assessed value or the market prices of homes studied. Actually, all other things held constant, there was a weak tendency for homes to increase in assessed value the closer they were located to the reformatories in the studied communities. In general, other variables were much more important in determining assessed value or market value than were the variables associated with distance and topography defining "within sight of" the prison.

Both Green Bay and Waupun may represent the long-run relationship between prisons and their immediate residential neighborhoods. In both cases, the prisons were located on their present sites in the 19th Century when the immediate neighborhood was "a featureless plain" so that there was not likely any immediate or panic effect on residential property values.

## 2. U.S. and Canadian Prison Impact Studies

The impact of prison location on neighboring property values does not usually get much space in typical prison impact studies. (See Bibliography in Appendix A.) A convenience sample of prison impact studies found that the discussion of economic

impact generally was comprised of a socio-economic discussion with brief discussions of the area population and employment characteristics, housing, and income together with brief descriptions of area crime characteristics, provision for police and fire protection, and some set of statements as to the quality of human life and the assumed impact on it, which the prison is thought to make. The distinction is often made between unavoidable adverse impacts, mitigation measures, and short-term impacts.

Since the reports are often limited in their scope, they typically include the record of public hearings on the impact of prison location on the community.

### 3. Conclusion to State-of-the-Art Discussion

Following Tully, et al, "Correctional Institute Impact and Host Community Resistance", the five major areas of public apprehension are:

1. Concerns regarding personal and public security.
2. Economic impact of and employment opportunities provided by the correctional industry.
3. Source credibility-manipulation of data and conclusions with respect to impact assessment.

4. Policy credibility

- a. Why are unused facilities not put to use?
- b. If rehabilitation doesn't work--why keep building prisons?
- c. Prisoners are better off than people on the street.
- d. Fear of future expansion.
- e. Other industry driven away.
- f. Increased development.
- g. Increased road traffic.

5. Fear

- a. Fear of fear itself.
- b. Tied to overall negative psychological impact--a place of fear, hostility, and tension.
- c. Fear of change.
- d. Fear of the unknown.
- e. Fear of the idea of living in constant fear as a result of hosting an institution.
- f. Fear of friends and family of prisoners moving into the area and forming a prison subculture with drug trafficking and welfare dependencies.
- g. Fear that undesirable publicity would cause a jailtown stigma which would adversely affect the collective personality of the area.

While these issues are dealt with in the process of locating a prison in a community by virtue of the issues being raised at public meetings, impact studies, per se, usually remain brief and descriptive in nature and do not, themselves, adequately address the five major areas of public apprehension. On the other hand, the mindset of the public toward prisons may be such that it can only be recognized, accorded an outlet at public meetings, and mitigated by sensitivity in design and public administration.

C. Recent Comparable Urban Prison Projects

To investigate the economic impacts, real and perceived, of locating a medium security prison in an urban environment, the consultant attempted to locate as many recently constructed prisons in major urban areas as possible to use as analogies to the proposed Trostel prison.

Most prisons are still built in outlying areas to control development costs and avoid political resistance. Of the few that were identified as having been recently constructed in urban areas, all were in downtown commercial or warehouse districts, primarily as a part of a larger criminal justice complex such as police station, courthouse, etc. Additionally, none were adjacent to or near a residential area, or noticeably within view of a residential area. Therefore, the direct analogy to the Trostel situation could not be obtained as had been hoped.

Although the residential impact analogy was not to be found, the visual impact of the prisons on surrounding business neighborhoods had been of considerable importance in the design of prisons in urban locations.

In each case, considerable attention had been given to making the prison appear to be a conventional building, not a prison. The functions of bars, wire fences, spotlights, and guard towers are accomplished effectively but more subtly.

Screening with solid or decorative walls is used to block views of prison activities and security measures and equipment.

The Justice Center, Portland, Oregon, is a current example of the multi-use urban jail development. The center is occupied by the district attorney, state parole and probation, the police administrative offices, police central precinct, the state crime laboratory, two circuit courts, two district courts, and street-level retail establishments. The project looks and operates as an office building. The jail is efficiently integrated with a number of other uses. The inclusion of retail shops at ground level was planned in order that the building look and act like other buildings in the area. The jail area fenestration disguises its use and hides the prisoners from public view.

Examples such as the brand new Portland facility demonstrate that it is important to integrate the building into its neighborhood. The building must fit in with surrounding buildings--looking essentially like an office building. This is easier to do when there are a number of other buildings in the area. This is not the case with the Trostel building which sits relatively alone in the river valley. There is much figure-ground contrast in the Trostel instance.

As a result of being a bit isolated, although within an urban environment, the Trostel site is conspicuous in that all

activity around it will be attributed to it. Traffic to and from the site will be that of staff, prisoners, or visitors. The activity will not be softened by surrounding urban activity. In the Portland example, the heterogeneity of pedestrian and vehicular traffic, not only in the immediate area but also to the site itself, very much softens the identification of prison activities (and stigma) to the casual observer. More development in the area, such as the old Schlitz buildings to the southwest, would therefore help to integrate the prison into the neighborhood, lessening any impact.

The visual impact is the key element in the perception and, therefore, impact of an urban prison on its neighbors. As well as having the prison blend into the surroundings, the impact is greatly reduced when the prisoners cannot be readily seen from the outside. The lighting of the Baltimore Reception, Diagnostic and Correctional Center was revamped when complaints arose that prisoners were visible to the people in the neighborhood at night. The change in lighting has reportedly eliminated the irritation and no other adverse impacts were identified.

## II. TROSTEL PRISON SITE

### A. Description of the Site and the Structure's Height, Mass, and Orientation

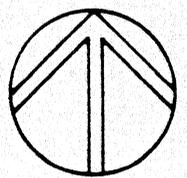

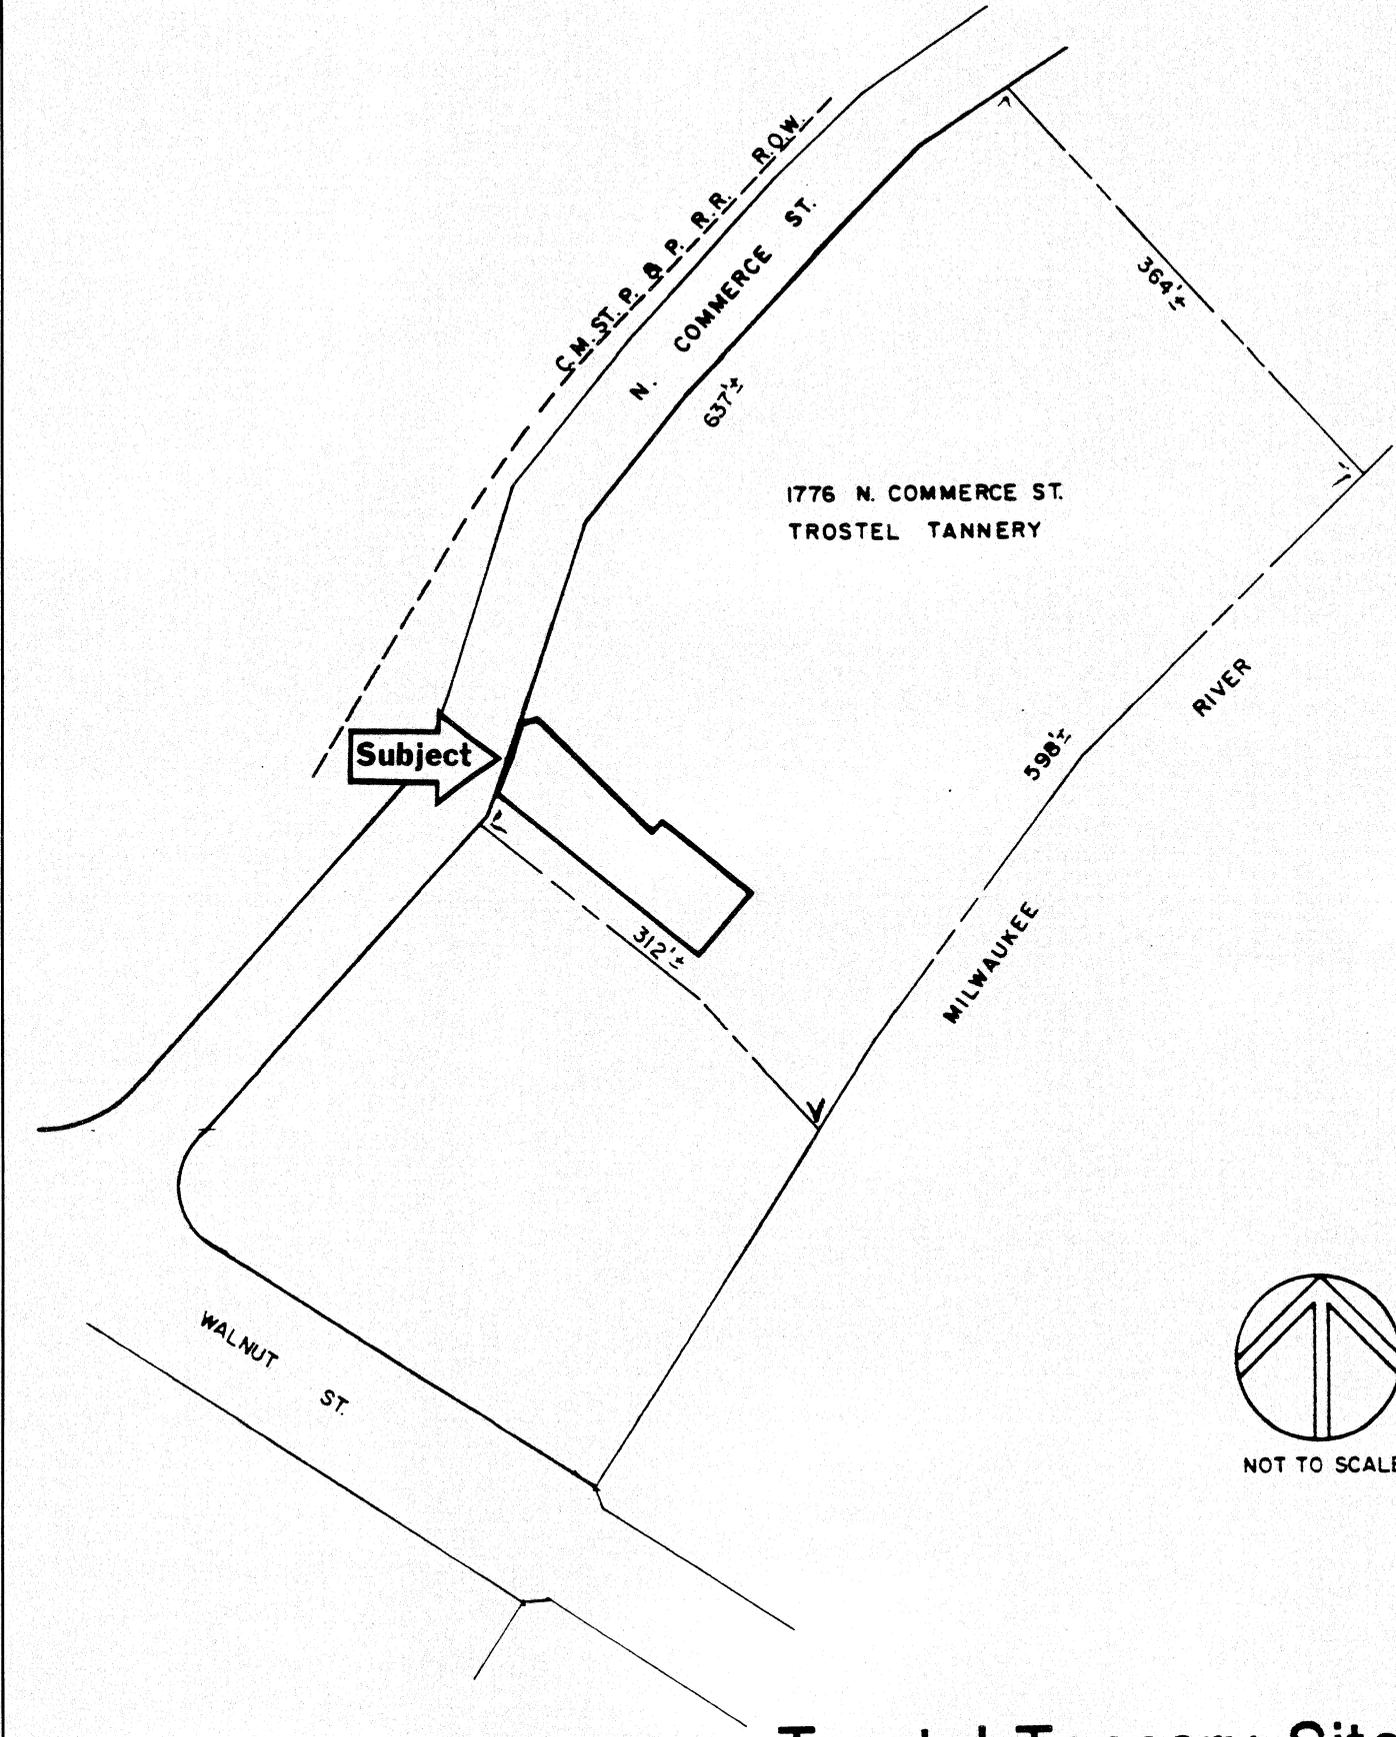

The site for the proposed medium security prison is the former Trostel Tannery at 1776 North Commerce Street, Milwaukee, which is currently occupied by the Loop Cartage Company. The structure is an eight-story industrial, elevatored, steel and concrete building. Sheds appropriate to the trucking and transfer business also occupy the site. The main structure, pictured in Exhibit 2, is an irregular shape with basically rectangular axes running northwest to southeast in the long axis direction and southwest to northeast in the short axis direction (see Site Plan, Exhibit 1).

### B. Definition of the Impact Area As the Viewshed

As was stated earlier, the impact of a prison on neighboring property values is not a long-term one. Over time the community fears are replaced with the actual experience of living with the prison. The immediate emotional reaction which reduces property values in the short run is replaced by a history which demonstrates that most of the fears are unfounded in most instances.

Since the impact on property values is caused by the perception of the prison, the areas affected are best defined as those areas from which the prison can be seen--the viewshed.

EXHIBIT 1

NOT TO SCALE

# Trostel Tannery Site

C. Non-Controllable Factors in the Viewshed

1. Proximity

Generally there is some limit to the distance from which we can differentiate objects. Since people cannot be well seen or readily differentiated beyond 1/4 mile, that distance could be used as a limit to the viewshed. Obviously, a building as large as the Trostel building can be seen from a greater distance than 1/4 mile, particularly if you look for it. Since people often feel the presence of a building when they are able to differentiate windows and doors, that distance, which is about 1/2 mile, is a more appropriate radius to define the limit of the impact area.

Within the 1/2 mile radius of the site, an area entirely within quarter sections 353, 354, 360, and 361 (see Exhibit 5), there are several factors which modify the shapes of the impact area. These other factors are topography, street sightlines, height of intervening structures, and prison bulk, as mentioned previously.

2. Topography

Since it is in a river valley, the Trostel site and building can be seen from many places in the immediate area as well as from the hillsides. The site cannot, however, be seen

from positions beyond the hill crest where the sightline is interdicted by the topography.

### 3. Height of Intervening Structures

Just as the area of impact is modified by intervening topography blocking sightlines to the prison, structures such as buildings, walls, and bridges block the view and eliminate or reduce the perception of proximity to the prison.

### 4. Street Sightlines - Brady, Ogden, etc.

A systematic absence of intervening structures is caused by streets, particularly those which coincide, or nearly so, with sightlines in the direction of the prison. These sightlines, plus a long upward grade in topography, allow the prison to be visible for a mile east along Brady Street and, because of demolition for a discontinued highway project, beyond Ogden Street to the south and southeast.

### 5. Prison Bulk

There are few buildings approaching the height of the eight-story Trostel structure immediately adjacent to the Trostel building which would serve to shield it from the view of the adjacent neighborhoods. Since the southwest and northeast sides of the building are 220 plus feet in length, the apparent prison bulk appears considerable since it stands alone.

The northwest and southeast sides of the building, which are only about a quarter of the length of the longer sides, do not provide a great deal of apparent bulk if viewed straight on. From many angles, however, the view of the Trostel prison involves looking at a mix of the long and short sides of the building.

D. Controllable Factors in Visual Impact

1. Architectural Treatment

Currently, the visual impact of the building is reinforced by five and eight foot high letters spelling "TROSTEL". The name (in five foot letters) can be seen for a mile down Brady Street if you look for it. Without a sign or other clear figure-ground identification, the building ceases to be discernable from its background at about 1/2 mile which is why the 1/2 mile limit is given to the impact area.

It follows that the exterior of the prison should be designed in such a way that in line, texture, and color the building is not set off greatly from its surroundings. Although it would be the most modern structure for some distance around, the architectural finish should allow it to blend in as much as possible to those surroundings.

## 2. Subtlety of Security Measures

In urban locations, prison security measures must and need not be obvious. Bars, chain link, and barbed wire must be replaced by non-cage-like design and materials. Indeed, most of the modern urban prisons look like office buildings. Perhaps it is in that respect that a Trostel prison would look out of place.

## 3. Views from the Prison

One of the fear of fears is that neighboring residential properties can be observed by prisoners. Under law, every cell must be windowed. Certainly the gross intrusion by binoculars, for instance, can be eliminated by not allowing binoculars or the like in the prison.

The extreme example aside, however, some residents of the Brewers Hill neighborhood might feel as if they can be observed from the few prison cells on the northwest side of the building. In other places, the design of the windows and view control devices such as horizontal louvers have been brought to bear to solve the problem. Similarly, individual window or large building-high vertical louvers or screens could control the view from the northeast and southwest wall windows.

## 2. Subtlety of Security Measures

In urban locations, prison security measures must and need not be obvious. Bars, chain link, and barbed wire must be replaced by non-cage-like design and materials. Indeed, most of the modern urban prisons look like office buildings. Perhaps it is in that respect that a Trostel prison would look out of place.

## 3. Views from the Prison

One of the fear of fears is that neighboring residential properties can be observed by prisoners. Under law, every cell must be windowed. Certainly the gross intrusion by binoculars, for instance, can be eliminated by not allowing binoculars or the like in the prison.

The extreme example aside, however, some residents of the Brewer's Hill neighborhood might feel as if they can be observed from the few prison cells on the northwest side of the building. In other places, the design of the windows and view control devices such as horizontal louvers have been brought to bear to solve the problem. Similarly, individual window or large building-high vertical louvers or screens could control the view from the northeast and southwest wall windows.

#### 4. Views of Prisoners

The test of whether neighborhood residents feel that they can be seen and observed by prisoners is whether or not they can see the prisoners--or feel that they could see the prisoners.

Tinted or reflective glass can handle the problem to a degree by eliminating daytime visibility of prisoners in their cells. Night time is much harder with the backlighting effect which might be stronger than the effect of window tinting, etc. Appropriate exterior architectural lighting might be able to overcome this to a large extent.

Since the perception of seeing someone in a window is often controlled by how strongly the window is perceived rather than actually seeing someone in it, the windows should blend in as much as possible with the rest of the exterior.

These architectural solutions serve to reduce the maximum radius of direct perceptual impact on surrounding neighborhoods by the prison. Their success in reducing the area of impact would reduce the extent of short-term impact on aggregate property values in neighboring areas.

#### 5. Traffic Access Routes

An additional reminder of the existence of the prison would be avoided if regular service and prisoner transfer traffic used routes to the south and west of the site to avoid

traveling through the Brewer's Hill and Brady Street Residential neighborhoods.

Screening and landscaping of on-site circulation and parking areas would further control the adverse visual impact.

#### 6. Approach Zone for Visitors to the Prison

Similarly the flow of visitors to the prison, together with a parking lot should be managed in an efficient manner so as not to disrupt public use of the roadways nor place extra burden for parking on streets in the surrounding neighborhood.

### III. VIEWSHED DELINEATION

Any impact on property values due to locating a prison in the area represents the effect of an emotional impact. Obviously the effect of an emotional reaction cannot be measured before the fact. What we are able to do, and have done, however, is to determine by logical process the areas which would feel such an impact and, in relative terms, which would feel it the most, less, and least.

#### A. Perceptual Basis

The purpose of the definition of the Trostel viewshed is to determine which areas perceive the presence greatly, moderately, or slightly. The greater the perception of the presence of the prison, the greater the impact on value.

##### 1. General Methodology

The viewshed mapping was carried out by a landscape architect with considerable experience in developing this sort of data base. The base map used was a composite of Southeast Wisconsin Regional Planning Commission (SEWRPC) topographic maps with overlays of City of Milwaukee tax parcel map sheets, land use map sheets, and official maps sheets. A collection of vertical aerial photography, low and high oblique aerial photography, photos of the Trostel building from various points in the impact area, a series of photographs from the main roof

of the Trostel building, and several visits to the area provided the basis for the viewshed delineations.

#### B. Steps in Viewshed Delineation

The general steps involved in delineating the viewshed are:

1. Mapping a one-half mile maximum radius.
2. Mapping the topographic elevation limit within which the Trostel building can be seen.
3. Identifying intervening structures which serve to limit and modify the viewshed by obstructing the view of or from the Trostel building.

The following section discusses the methodology more specifically.

#### C. Viewshed Delineation Procedure

The corner common to Milwaukee quarter sections 353, 354, 360, and 361 is on the subject property just to the southwest of the Trostel building. Since it had been determined that a one-half mile radius was appropriate to include all areas of direct impact, and since quarter sections are one-half mile on a side, it was concluded that a master map which was comprised of quarter sections 353, 354, 360, and 361 was appropriate for the viewshed delineation and identification of the level of impact incurred by each property in the viewshed.

EXHIBIT 2  
PHOTOGRAPHS

Trostel Site

These and the following photos were taken from the main roof of the Trostel Building

View to the Southwest and West

View to the South and Southwest

Brewers Hill and view  
to the North

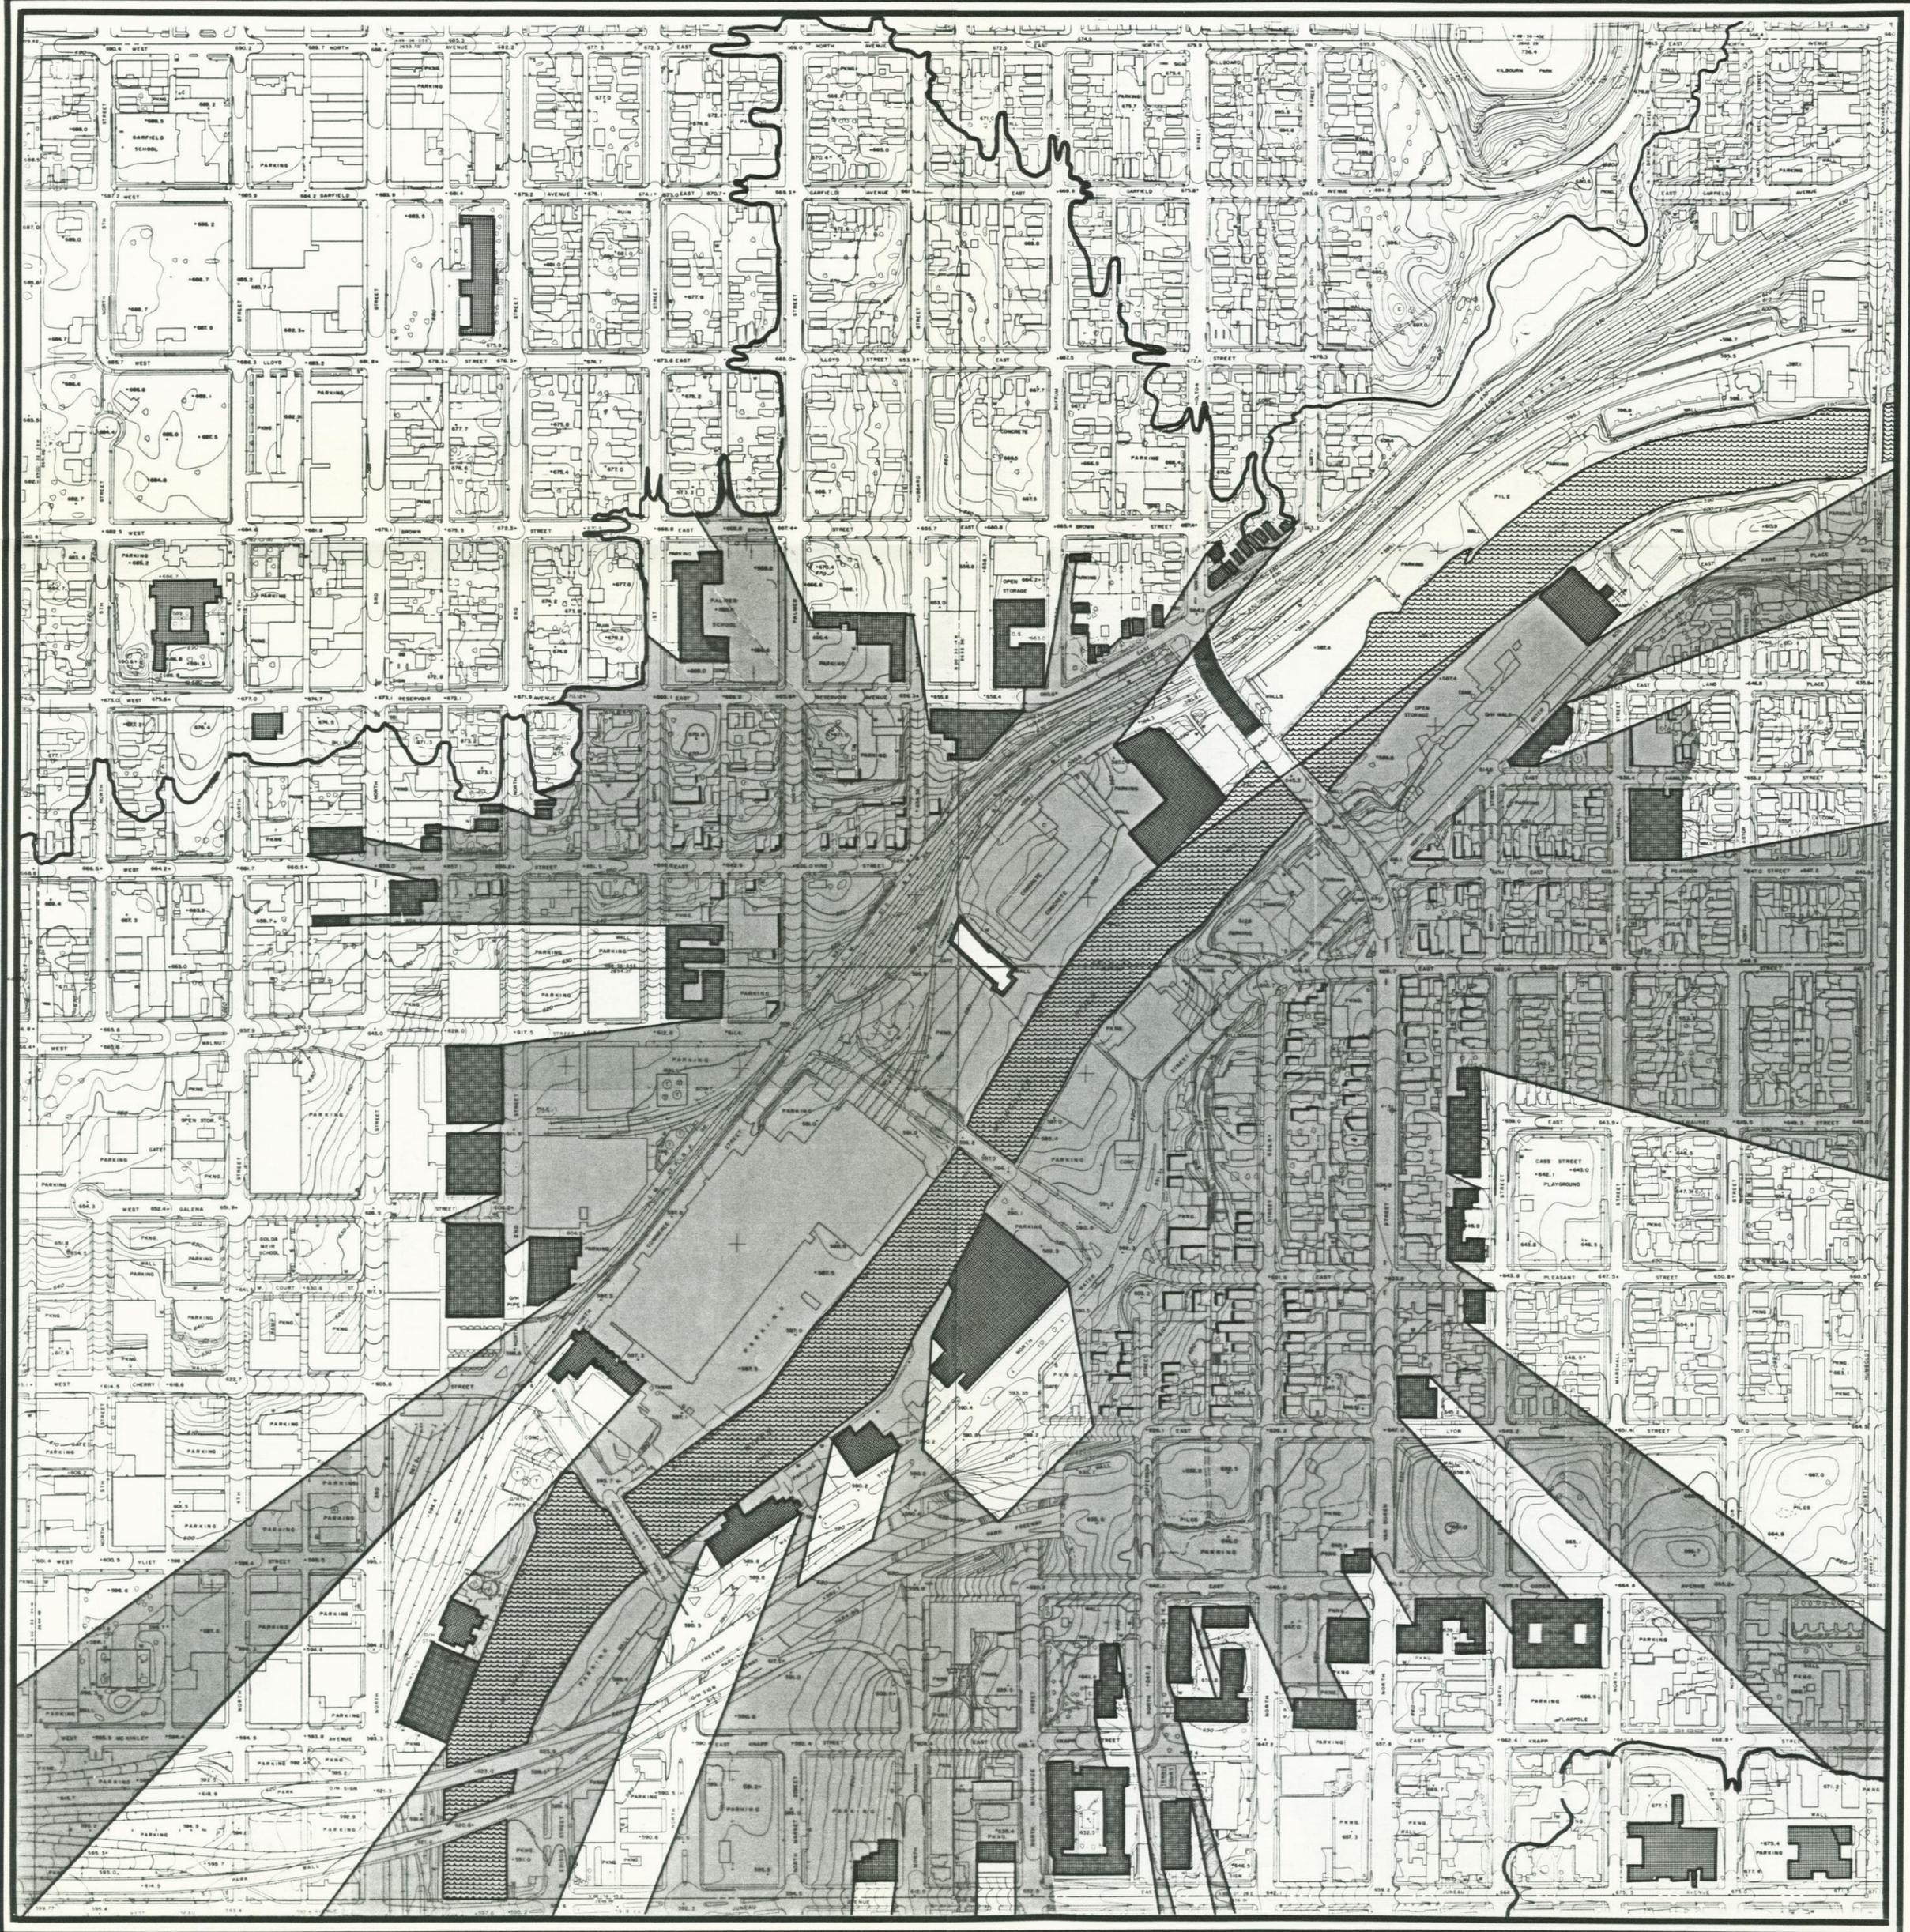

View to the Northeast and East

View to the East and Southeast

View to the Southeast and South

The base map for the master map was created by joining together the SEWRPC two foot interval topographic maps for quarter sections 353, 354, 360, and 361. The SEWRPC maps were selected because of their accuracy, their being up-to-date, their topographic detail, and their inclusion of building outlines which were important in relating photographic data to the map. Since the area described by a half mile radius from the Trostel site included almost all of the four quarter section areas except for the corners, no absolute half mile radius circle was drawn at this point.

The next major cut was made on the basis of topography alone, for the moment ignoring the landscape of buildings and other structures, with the exception of the Trostel building. Some of the areas of the master map could be ignored on the basis of being at a higher elevation than the main roof of the Trostel building. As a result, a small portion of the area at the southeast corner and more of the area in the northwest and northeast areas of the master map fell out of the potential impact area by virtue of being over the horizon, so to speak.

The rest of the process of impact area delineation and the assessment of the relative level of impact was accomplished by a lengthy analysis involving all of the properties within the remaining area involving properties that could be seen from the Trostel site, properties that had views of the Trostel

EXHIBIT 3

VIEWSHED MAP KEY

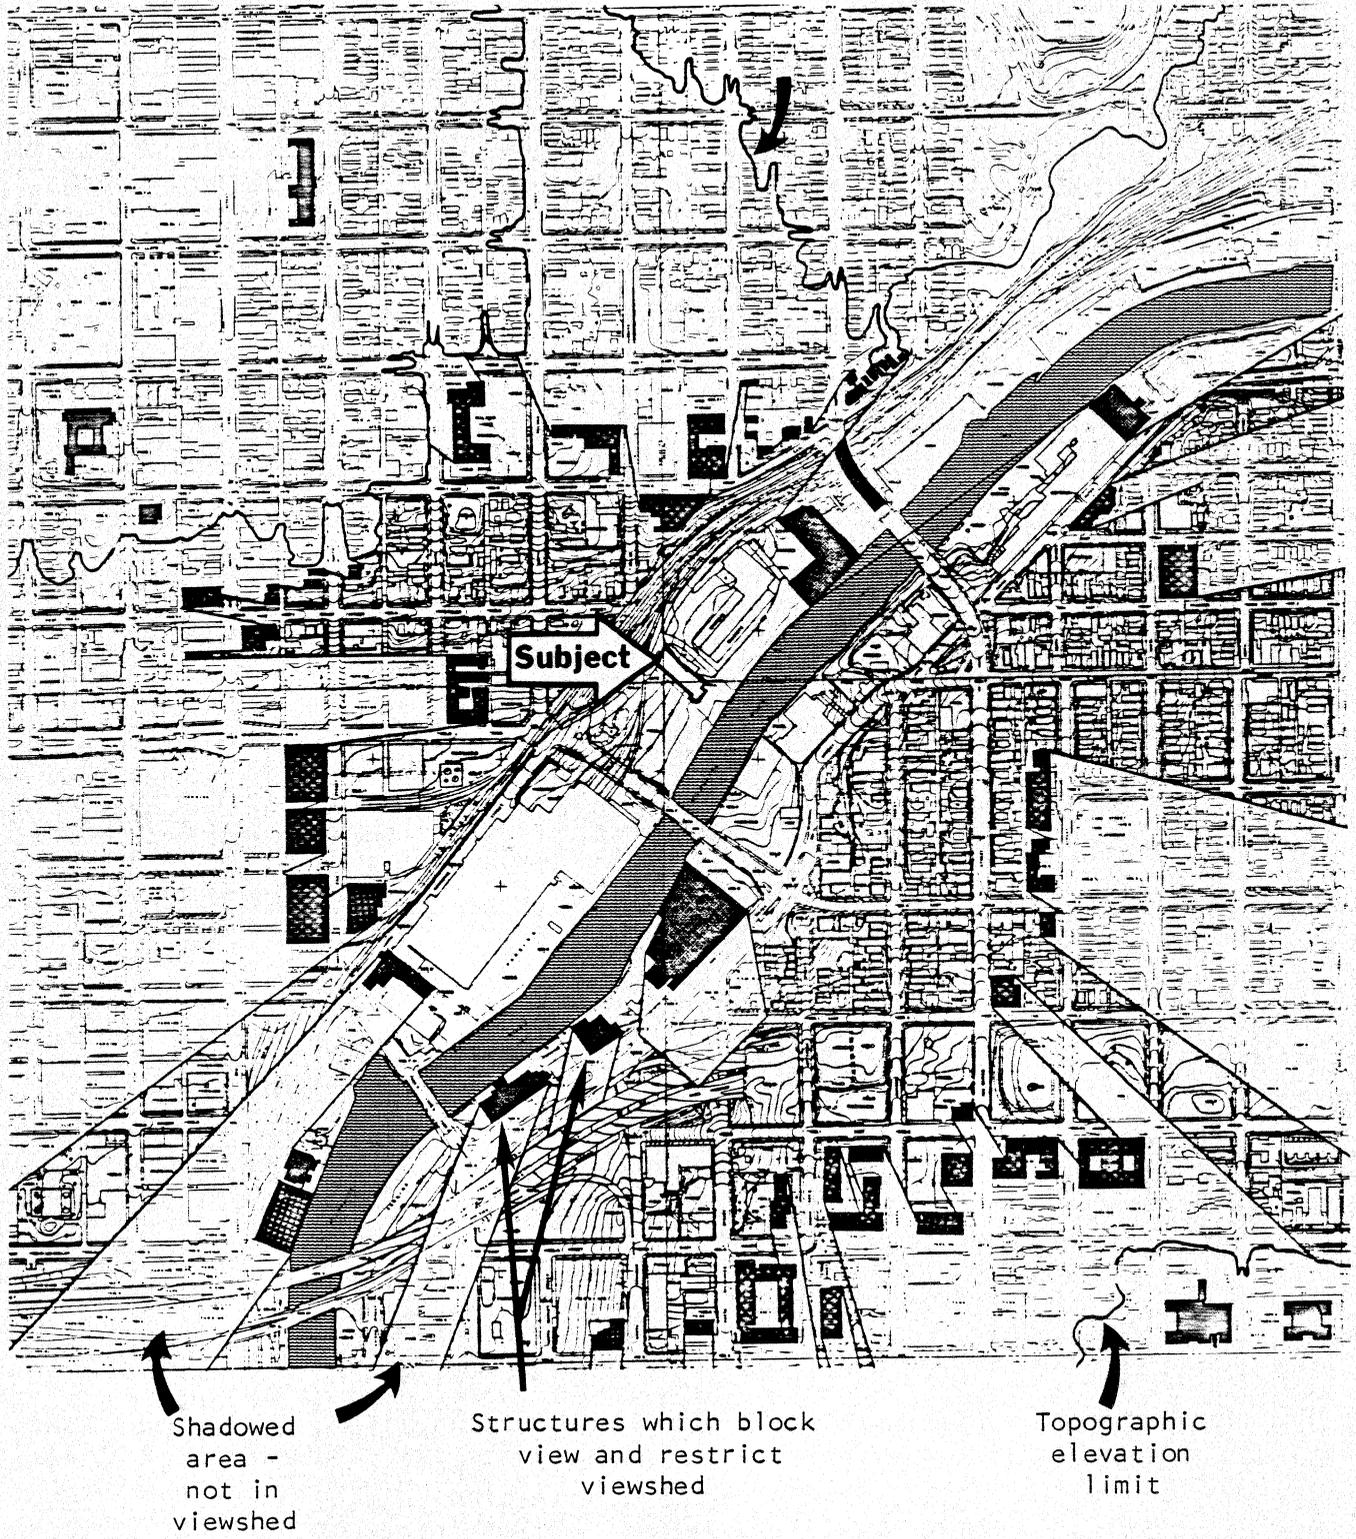

EXHIBIT 4  
VIEWSHED MAP

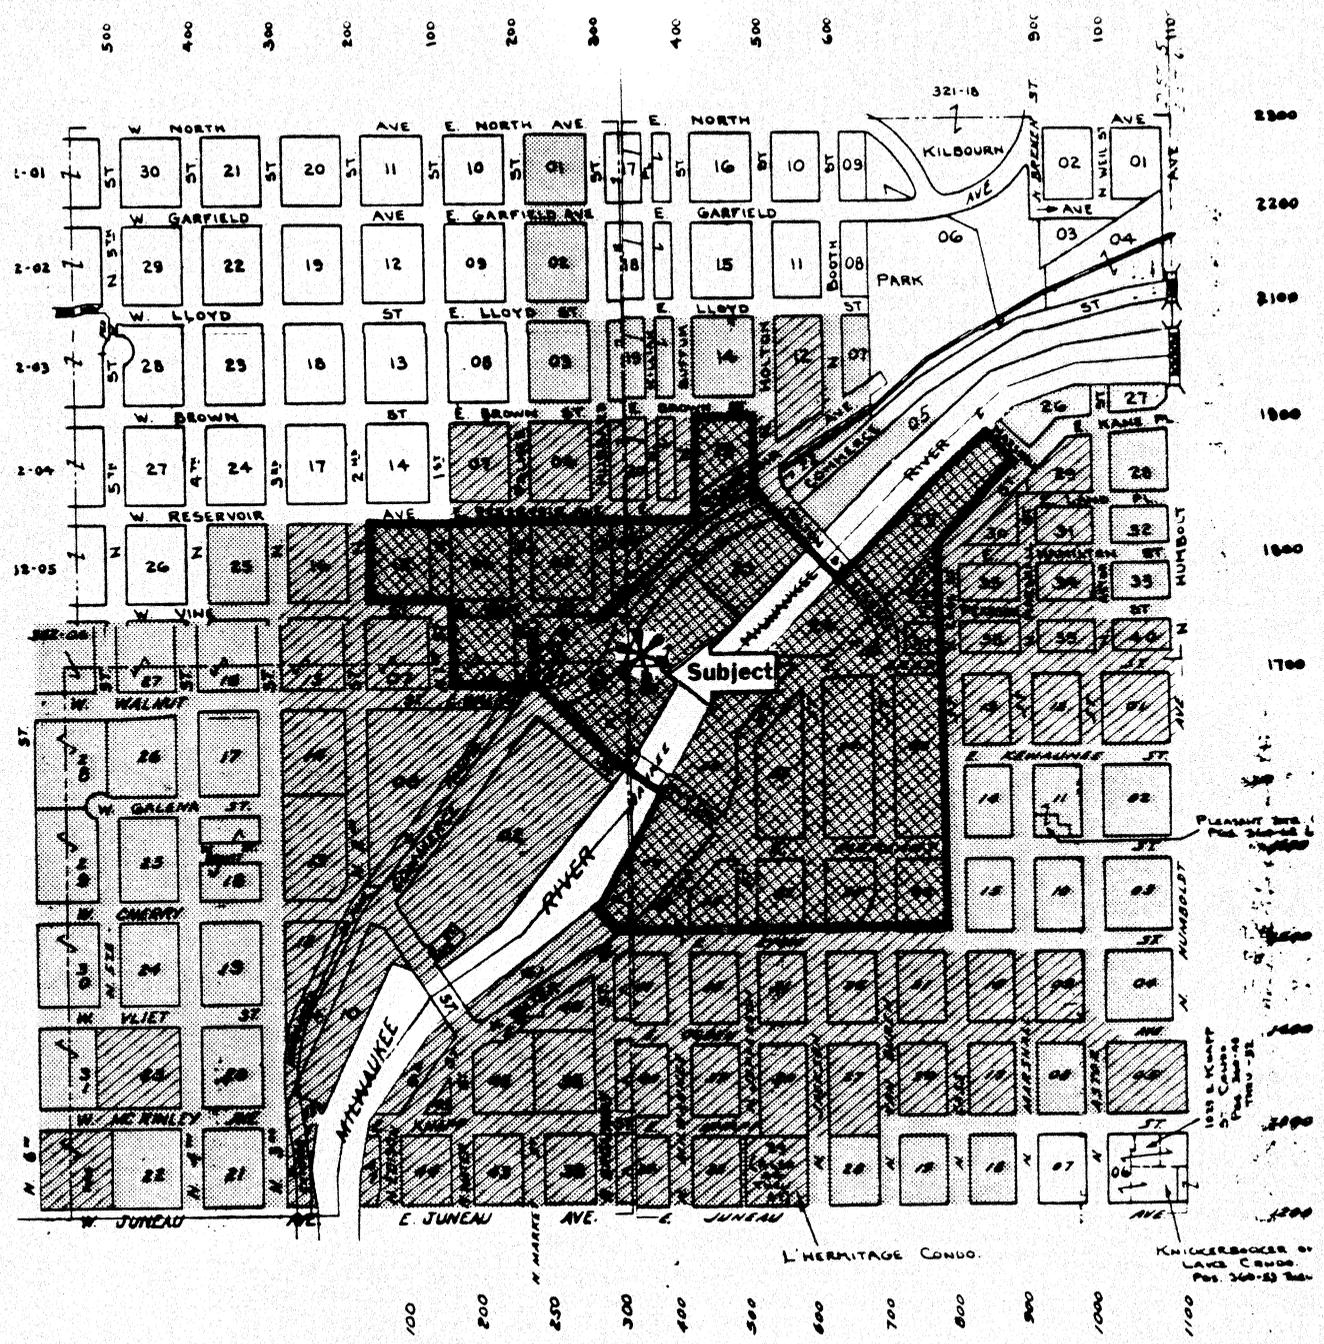

building, and buildings and structures that blocked views of the Trostel site and building.

The resulting viewshed map, Exhibit 4, shows which city blocks do not appear to have a view of the Trostel building, which blocks had little but nonetheless some view of the Trostel building, and which blocks have properties with a head-on view of the Trostel site and building. The landscape architect did a careful job of identifying which properties particularly have partial and full-face views of the Trostel site and building.

The consultants were then able to delineate areas of differing impact intensity based on the viewshed map and the general neighborhood dynamics. These delineations were made on a whole block basis to coordinate with the collection of property tax assessment data which was more readily accomplished on a whole block by block basis. The map of the impact areas is in Exhibit 5.

IV. PROJECTION OF VALUE IMPACT WITHIN  
MAP AREA USING CITY OF MILWAUKEE ASSESSMENT DATA

Real property tax assessment data for all parcels within the potential impact area (quarter sections 353, 354, 360, and 361), were contained in printouts provided by the Office of the City of Milwaukee Tax Commissioner. (See Appendices B through E). The area covered by this data is indicated in Exhibit 6. The organization of the data is in the following example:

PLAT PAGE	TAXKEY NUMBER	CURRENT ASSESS. CLASS.	BLDG. TYPE	NR UNIT	NR STORY	CURRENT ASSESS. TOTAL
35301	3530123000	1	10	0001	1.0	\$3,700

Where:

Plat Page: The plat page 35301 refers to Block 01 of Quarter Section 353, hence 353 01.

Taxkey Number: The Taxkey Number is the unique identifier for each parcel of real property.

Current Assessment Class:

- 1 = Residential
- 2 = Mercantile
- 3 = Manufacturing
- 4 = Special Mercantile
- 5 = Condominium
- 7 = Apartments
- 9 = Exempt

Building Type: The type of building is indicated by a two-digit code for residential properties and a four-place code for commercial properties.

Number of Units: This is the number of residential units on the property.

Number of Stories: The number of stories in the structure on the property.

Current Assessment Total: This is the 1983 Total Assessment, Land and Improvements.

The assessment data had been sorted by Current Assessment Class, Number of Units, and Plat Page so that the Current Assessment Total for each block (Plat Page) could be arrived at for the following categories:

Residential Properties:

Single Family Homes and Condominium units  
2- and 3-unit Dwellings  
4- to 7-unit Dwellings  
Apartment Buildings of 8 or more units  
Vacant Residential Land

Mercantile:

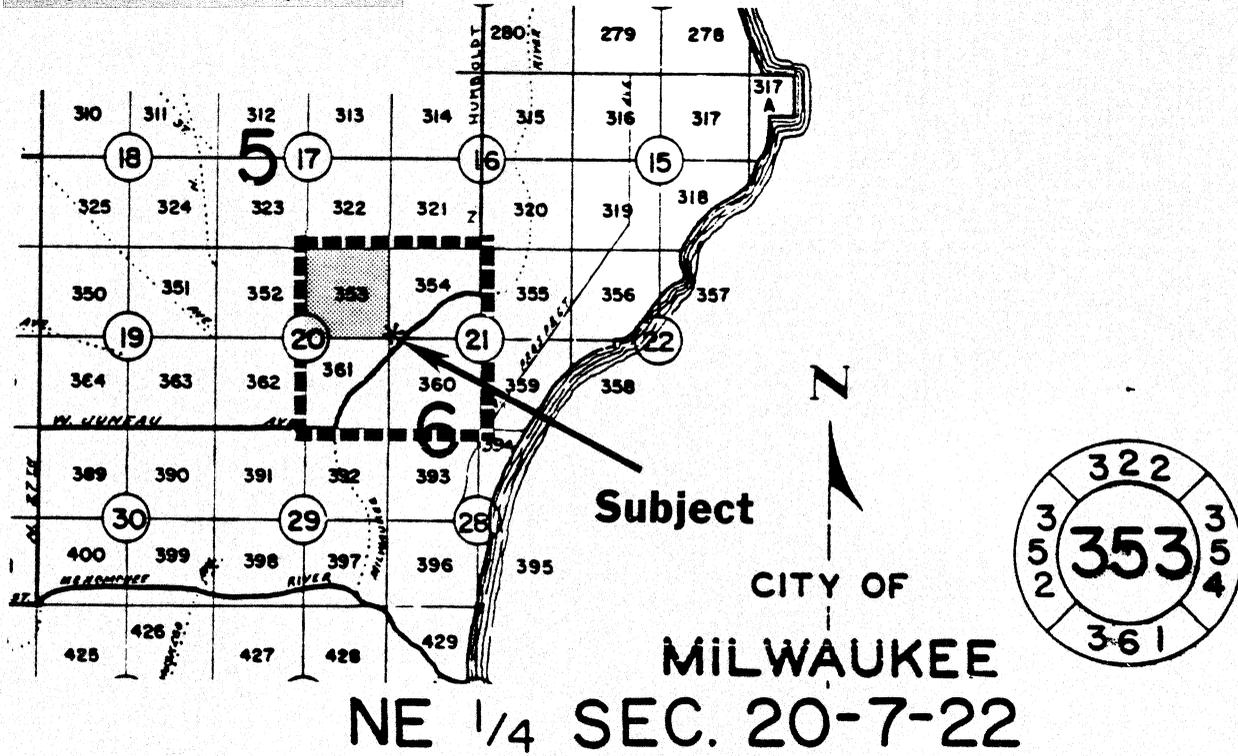

Current Assessment Classes 2 and 4  
Mercantile and Special Mercantile

Manufacturing: All

Exhibits 8, 10, 12, and 14 are the assessment data by block and land use class corresponding to the quarter sections indicated in Exhibits 7, 9, 11, and 13, respectively.

This data was reorganized to correspond to the impact area delineation made previously (see Exhibit 5). The assessment data for the primary, secondary, and peripheral impact areas, organized by block and by land use class, is found in Exhibits 15, 16, and 17, respectively.

Various use classes of property exhibit differing value reactions as a result of the market anxiety generated by a prison being located in a community. While the exact amount of reduction in any particular property use class is speculative, the relative amounts of change and the maximum likely or "worst case" reductions can be reasonably estimated.

For the purpose of study, the effects of the worst case and probable case, which is approximately mid-way between no change and a worst case situation, are examined to demonstrate the possible changes in assessed valuation which the primary, secondary, and peripheral impact areas might experience.

The cash adjustments to assessed value due to prison impact in the probable case are set forth in Exhibit 18. Single family homes and condominiums are most sensitive to neighborhood effects and, as a result, have larger potential reductions to market value than other types of real estate. Two and three unit structures also have high levels of owner occupancy and, therefore, are also expected to be affected by the introduction of a prison into the neighborhood. Apartment buildings, both small and large, are valued based upon their rent potential. The rent potential is a function of other area rents and the general vacancy rate in the community, and therefore, the market value or assessed value of these types of property are not expected to be very sensitive to the prison. Manufacturing

property values are generally unaffected by proximity to a prison and the value of mercantile and real property would only be diminished if the prison would reduce the trade market area of neighborhood mercantile establishments. We find no convincing support for this notion.

Exhibits 19, 20, 21, and 22 show the probable initial dollar impact by land use class and in total for the entire impact area, and the primary, secondary, and peripheral market areas, respectively.

The probable initial dollar impact for the entire impact area shows a moderate temporary impact on residential values and slight impact overall. The graph in Exhibit 23 shows schematically that over perhaps five or six years, the market values in the impact areas will catch up with the market which would have existed had the prison not been located in the area.

The worst case cash adjustments to assessed value due to prison impact are set forth in Exhibit 24. The worst case situation has larger reductions to assessed value of single family, condominium units, and two and three unit properties. Additionally, a negative impact would be felt, to some extent, by apartment properties and mercantile real estate. While the impact would be greater under a worst case situation, it is expected that the effects would, nonetheless, be short term and

EXHIBIT 28

## V. SOCIAL DYNAMICS

As can be seen in Exhibit 29, Selected Census Data, Census Tracts 114, 113, 111, and 112, which correspond closely with the entire Trostel impact area (see 1980 Milwaukee Census Tract Map, Appendix H), have undergone significant changes in recent years.

The population of most of the impact area declined dramatically from 1970 to 1980. Some of the population loss in Tract 111 is certainly due to the clearance of buildings for the now abandoned highway extension. Tract 113 also experienced this urban demolition but gained population through new housing in the Juneau Village Projects. Nonetheless, the area, as a whole, has experienced population losses far greater than the introduction of a prison could possibly cause.

The area, with the exception of Tract 113, which has the Juneau Village effect, is poorer than it was ten years ago. This is particularly true for Tract 114 where the Trostel site is located and which also experienced the most dramatic population drop. The lowest income groups, in general, have the least mobility and, therefore, rent levels and residential prices cannot be further depressed by any significant out-migration.

Most of the other social indicators reflect national social trends in household size, increased relocation and the

\* Milwaukee (City)

resulting demand for less densely occupied housing had already occurred by the 1980 Census.

The drop in property values and, certainly, the lessened future potential for market rate appreciation, which go hand in hand with substantial loss of population and increased poverty, has already occurred and left little margin for amenity values which could be diminished to basic shelter values by the intrusion of a prison image on the immediate neighborhood. The only exception may be the blocks known as Brewers Hill where rehabilitation has begun with the amenities of historic nostalgia and the romance of urban pioneering. Both are fragile, dynamic elements of value easily undermined by exaggerated perceptions of stigma associated with proximity of the prison.

## STATEMENT OF LIMITING CONDITIONS

### 1. Contributions of Other Professionals

- . Information furnished by others in the report, while believed to be reliable, is in no sense guaranteed by the consultants.

### 2. Facts and Forecasts Under Conditions of Uncertainty

- . Inferences of market demand which combine census data estimates and other sources are always subject to an unknown degree of error due to the time differences in underlying economic conditions and other circumstances as well as variations in definitions and research frame of reference of the various types of study inputs.
- . The presentation and analysis of data in this report has been done in a craftsmanlike manner but the results suggested are only intended to scale the potential market effect since the outcome is conditional on so many intervening factors.

### 3. Controls on This Report

- . Possession of this report or any copy thereof does not carry with it the right of publication nor may the same be used for any other purpose by anyone without the previous written consent of the appraisers or the applicant, and in any event, only in its entirety.
- . Neither all nor any part of the contents of this report shall be conveyed to the public through advertising, public relations, news, sales, or other media without the written consent and approval of the authors, particularly regarding the market conclusions, and the identity of the analysts, or of the firm with which they are connected or any of their associates.

- . The report shall not be used in the client's reports unless: (1) prior to making any such reference in any report or statement or any document filed with any governmental agency, the consultants are allowed to review the text of such reference to determine the accuracy and adequacy of such reference to the report prepared by the consultants; (2) in the consultants' opinion the proposed reference is not untrue or misleading in light of the circumstances under which it is made; and (3) written permission has been obtained by the client from the consultants for these uses.

J A M E S A. G R A A S K A M P

PROFESSIONAL DESIGNATIONS

SREA, Senior Real Estate Analyst, Society of Real Estate Appraisers

CRE, Counselor of Real Estate, American Society of Real Estate  
Counselors

CPCU, Certified Property Casualty Underwriter, College of Property  
Underwriters

EDUCATION
