The emerald deposit at Lake Manyara was discovered in 1970, and was operated by the Galai Mining Co. Ltd. until April 1972 during which time approximately 1 million carats of beryl classified as gem grade were mined.[11] The mine was nationalized in February 1973, and continued to operate on a small scale. The tanzanite mine, about 50 miles southeast of Mt. Kilimanjaro near Moshi, has also been nationalized and continued to operate on a small scale.

*Soda Ash.*—A feasibility study was finished in 1974 for the development of a natural soda ash plant at Lake Natron.[12] Five Japanese companies and the Government of Tanzania, in a joint venture, proposed an output of about 30,000 tons per year starting in 1980. The project would require the construction of roads and railways extending from Lake Trona to the east coast of Africa either to the port of Mombasa in Kenya or to Tanga in Tanzania. Half the output will be shipped to Japan and half to other countries in Europe and the Middle East.

**Mineral Fuels.**—*Coal.*—Coal reserves have been delineated by PRC geologists along the Uhuru Railway at Ruhuhu, Mchuchuma, and Ketewaka.[13] The State Mining Corp. announced that these deposits would be developed with the help of West Germany.

*Petroleum.*—Azienda Generale Italian Petroli (AGIP) S.p.A., a subsidiary of Italy's Ente Nazionale Idrocarburi (ENI), completed drilling of two offshore wells, one north of Bagamayo and the other in the delta of the Rufiji River. One of the wells showed gas but of insufficient quantity to justify further work in the selected areas. The Oceanic Exploration Co. of Denver, Colo., conducted discussions during 1974 with the Tanzanian Petroleum Development Corp. concerning seismic work in deeper waters off Tanzania from approximately latitude 4° 30' S to latitude 8° S, and ranging from 40° 15' E to 41° E.

## UGANDA [14]

The mainstay of the economy of Uganda is agriculture, from which over 90% of the population derive their livelihood. The mineral industry is a small part of the remaining segments of the economy and reports of the industry were not obtainable from the Government of Uganda on a regular basis. Most of the information for this chapter was derived indirectly from other sources such as the East African Community Monthly Trade Statistics.[15]

[14] Prepared by Robert G. Clarke.
[15] East African Community (Mombasa, Kenya). East African Customs and Excise Monthly Trade Statistics for Tanzania, Uganda, and Kenya, 1974. Monthly issues.

## COMMODITY REVIEW

**Metals.**—*Copper.*—According to the monthly trade statistics of the East African Community, the amount of blister copper exported was slighly less in 1974 than in 1973. The indications, therefore, were that production problems still dominated the copper industry.

*Tungsten.*—Exports of tungsten ore and concentrate were about the same in 1974 as in previous years according to trade statistics. From this, it may be deduced that the industry continued operations in spite of government management problems.

**Nonmetals.**—Information was not available on nonmetallic mineral industry activities.

**Table 8.—Uganda: Exports and reexports of mineral commodities [1]**

[5] Includes oxygen and nitrogen.

# The Mineral Industry of North Korea

By Richard H. Singleton [1]

In 1974 North Korea completed the first 4 years of its 6-year plan. Under the plan, industrial output had increased 17% per year on the average, according to government statements. The reported 1974 increase was 17.2%. During the 4 years, iron and steel furnaces were rebuilt and expanded; more large, modern sintering ovens and coke batteries were built at iron and steelworks; the Musan mine and other iron mines were further expanded; ore-dressing plants were modernized; and several new chemical fertilizer plants were built. Also the country's first oil refinery was reported to have been built and placed in operation.

Requirements laid down for 1974 included improvement of mining methods, greater production from the moderate-sized integrated steel industry, and accelerated development of the cement and chemical fertilizer industry. Greater emphasis on foreign trade continued, but this caused a large increase in North Korea's trade deficit.

For the mineral industry, objectives were listed as follows, in million tons:

| Commodity | 1970 output e | 1973 output e | 1976 goal of 6-year plan |
|---|---|---|---|
| Steel ingot and castings | 2.2 | 2.6 | 3.8–4.0 |
| Nonferrous metals | .16 | .24 | .45 |
| Coal | 27.5 | 37.2 | 50–53 |
| Cement | 4.0 | 5.8 | 7.5–8.0 |
| Chemical fertilizers | 1.5 | 2.0 | 2.8–3.0 |

e Estimated.

## PRODUCTION

North Korea produced a variety of mineral commodities in 1974, with coal, iron ore, lead, zinc, tungsten, barite, graphite, magnesite, and talc considered to be significant by world production standards. It was reported that more than 70% of the country's mineral raw material requirements was met domestically.

Production of iron and steel reportedly increased significantly in 1974. Production of phosphate fertilizer reportedly doubled. Production of hydraulic cement increased greatly. However, production statistics on these commodities were not released. Greatly accelerated production was planned for 1975 so that the 6-year plan goal could be realized one year early, in October 1975 to commemorate the 30th anniversary of the establishment of the Korean Worker's Party.

[1] Physical scientist, Division of Nonmetallic Minerals.

Table 1—North Korea: Estimated production of mineral commodities

| Coal: | | | |
| Anthracite ---------- | 27,300 | 30,000 | 33,000 |
| Bituminous [3] ---------- | 6,700 | 7,000 | 7,900 |
| Total ---------- | 34,000 | 37,000 | 40,900 |
| Coke ---------- | 2,200 | 2,200 | 2,200 |

[p] Preliminary. [r] Revised.
[1] In addition to the items listed, a number of other mineral commodities apparently are produced, but information is inadequate to make reliable estimates of output levels. These include (but are not limited to) antimony, arsenic (in arsenopyrite), asbestos, beryl, bismuth, boracite, china clay (kaolin), chromium, cobalt, columbite, germanium, indium, lithium minerals (lepidolite), manganese ore, mica (phlogopite), molybdenite, monazite, selenium, tellurium, titanium minerals (ilmenite and rutile), zircon, and a variety of crude construction materials including miscellaneous clays, glass sand, building sand, stone, and gravel.
[2] Includes granulated iron.
[3] Includes lower-rank coal including lignite.

## TRADE

Despite its goal of chuche (self-sufficiency), North Korea maintained its trade with the outside world. Japanese researchers claimed that the chuche policy has been disappointing and has caused North Korea to lag behind its southern neighbor technologically. North Korea's trade deficit quadrupled during 1974, to $430 million according to the Japan External Trade Organization. This was caused primarily by price rises of oil imported from the People's Republic of China (PRC) and the U.S.S.R., and by price decreases for raw mineral products exported by North Korea. This deficit may cause the country to look again to its central economy neighbors for support.

North Korea's mineral-industry exports to Japan increased by approximately 30% in 1974, to a total of approximately $60 million. Trade with Japan accounted for 40% of the trade with market economy countries. Commodities exported to Japan during 1974 were, in decreasing monetary value, pig iron, zinc, silver, anthracite coal, iron ore, lead, and magnesite. Japan received only 61% of the 500,000 tons of iron ore that they sought from North Korea during 1974. Mineral-industry imports from Japan during 1974 increased sharply, to $55 million, and comprised, principally, steel shapes such as sheet and rod. North

Korea reportedly attempted to procure 500,000 tons of structural steel shapes from Japan in 1974 for their burgeoning industry but were able to receive only one-third of this amount. Further trade growth with Japan and the remainder of the market economy world was hampered by North Korea's growing trade deficit.

North Korea's mineral-industry exports to the U.S.S.R. increased 8% in 1974, to a total value of $111 million. The principal commodities exported were, in descending order of monetary value, iron and steel products, magnesite, zinc, cement, lead, barite, talc, and nitrogen fertilizers. Iron and steel products comprised over 50% of these exports, and 90% of the products was rolled steel. Major mineral-industry commodities imported during 1974 from the U.S.S.R. were, in descending order of monetary value, petroleum, bituminous coal, coke (from coal), ferroalloys, steel products, aluminum, and asbestos. These imports had a total value of $53 million, 81% of which was mineral fuels.

North Korea's trade with the West had shown a phenomenal growth since the early 1970's, and during 1974 reportedly accounted for nearly 50% of its total trade. Imports of plant and machinery from the West increased greatly with the inception of the 6-year plan in 1970. A trade protocol was signed in 1974 with Iran involving $700 million over a 5-year period. Exports, including cement, steel, chemical fertilizers, and minerals, would be exchanged for Iranian oil. Certain credits would be extended to North Korea by Iran. A trade protocol was signed with Poland increasing trade by 15%. Trade was to include shipments of coke and chemicals to North Korea in exchange for items including calcined magnesite and steel.

**Table 2.—North Korea: Apparent exports of selected mineral commodities [1]**
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |
| Cadmium | 33 | 34 | All to U.S.S.R. |
| Copper and alloys, all forms | 1,040 | 2,731 | West Germany 1,721; Belgium-Luxembourg 894. |

## COMMODITY REVIEW

### METALS

**Iron Ore and Steel.**—Work continued on building the 60-mile pipeline from the Musan mine to the Kimchaek steelworks in North Hamgyong Province, to transport iron concentrates now carried by rail. Capacity of the Musan mine was expanded to 4.5 million tons per year. Further expansion of this mine, one of the largest in Asia, continued with a reported goal of 5.5 million tons capacity by 1975. Other reported large iron ore mines were Chaeryong, Unyul, and Hasong in South Hwanghae Province, and Tokhyon in North P'yongan Province. Magnetite was mined in the eastern coastal area and northern inland areas, limonite and siderite in the western coastal area, and hematite in South Hamgyon Province. Reportedly, the capacity of the Tokhyon mine was increased and new mines were developed at Toksong and Sohae-ri. Prospecting had, reportedly, roughly doubled the estimated iron ore reserves in North Korea to about 5 billion tons. The Musan complex alone had an estimated reserve of over 1 billion tons of high-grade magnetite ore.

North Korea's exports of iron ore to Japan decreased to 305,000 tons in 1974, from an average of over 500,000 tons per year between 1969 to 1973.

The iron and steel industry expanded considerably in 1974, and attainment of the 6-year plan goal of 3.8 million to 4.0 million tons of steel per year will reportedly be met 1 year early, in 1975. Annual production of pig iron, granulated iron, and steel reportedly each increased significantly in 1974. Exports of pig iron to Japan increased slightly in 1974, to 85,000 tons. Exports of iron and steel products to the U.S.S.R. increased in 1974 by 5%, to 133,000 tons, nearly 80% of which was in the form of rolled steel. Imports of steel shapes from Japan approximately doubled in 1974, to 140,000 tons.

A large blast furnace with a capacity of 1 million tons of pig iron per year was installed at the Kimchaek works, on the northeastern coast. The U.S.S.R. provided assistance on this project. The Kimchaek expansion, one of the largest construction projects in North Korea, included a continuous-sintering furnace, a coking furnace, a large electric converter, and a continuous-casting bay. Expansion of this complex was continuing with installation of an ore-concentrate conveyer system, a fourth coking furnace, and a mill to produce hot- and cold-rolled products.

There were a number of other developments in the steel industry. At the major Hwanghae steel complex south of P'yongyang, production of sintered ore, pig iron, and steel increased by approximately 50% during 1974. In another leading complex, the Kangson steelworks near P'yongyang, a No. 2 steel shop, including a large blooming mill, was built and a cableway with a capacity of transporting more than 100,000 tons of coal per year from a mine to the ironworks was constructed. Both the Hwanghae and the Kangson steelworks improved control and efficiency through automation and were undergoing further modernization.

Production at the Ch'ongjin steelworks during 1974 reportedly reached the 1976 goal through innovations, better control, and automation. A No. 3 steel shop, including rolling and forging equipment, was built. Output of the major crude product, granulated iron, increased by 74% in 1974.

**Nonferrous Metals.**—Rich deposits of gold, silver, copper, nickel, zinc, lead, cadmium, tin, molybdenum, and tungsten were reported to exist in North Korea and all of these, except tin and molybdenum, were known to have been converted to metal. Production of lead and zinc each comprised 2% and 3%, respectively of world production. About one-tenth each of lead and zinc production was exported to Japan and about one-sixth each to the U.S.S.R. in 1974. Production of tungsten equaled about 6% of world production and almost all of this was consumed domestically. Most of the cadmium produced apparently was exported to the U.S.S.R. during 1974.

Plans to build a new nonferrous mining and smelting complex near T'anchon and a mine near Hyesan were reported. Mines at Sohung, Komdock, and Songch'on and smelters at Nampo, Haeju, and Munp-yong were being expanded. Tonnages of beneficiated ore increased 40% at Munp'yong in 1974.

### NONMETALS

**Cement.**—A 3-million-ton-per-year cement production complex was reportedly in full operation in 1974 at Sunch'on in South P'yongan Province. This accounted

for nearly one-half of domestic cement production. Construction of extensive cement production facilities throughout North Korea was begun or planned. A doubling of production at the Sunch'on facility was planned for 1975 through plant enlargement. A similar 3-million-ton-per-year expansion was planned in 1975 on the West coast at Haeju. Construction of a larger 5-million-ton-per-year plant in the Ch'onnae-ri area of Kangwon Province was planned. Smaller cement plants at Pongsan, Komusan, and Majong, were being enlarged. These expansions would provide sufficient capacity to exceed the 1976 annual planned production goal of 7.5 million tons. Approximately 5% of domestic production was exported to the Soviet Far East during 1974.

**Fertilizer Materials.**—Production of phosphate fertilizers during 1974 nearly doubled compared with 1973 and North Korea reportedly had become self-sufficient in this commodity. Six new phosphate mines were activated, at Chungsan, Pungnyon, Sangnyong, Taedaeri, Unsan, and Yongyu. Phosphate production was increased at the Chongsi plant and ammonium phosphate production was increased at the Aoji plant through expansion of facilities. A further 50% increase in phosphate fertilizer production was scheduled for 1975.

One million tons of various types of fertilizers was produced during 1974 at the Hungnam fetrilizer complex. This accounted for nearly one-half of fertilizer production in North Korea. Production capacity of the ammonia synthesizing tower at Hungnam was increased 50% through redesign. Nitrogenizing-kiln capacity was doubled by process innovations and remodeling and lime-nitrogen fertilizer production was expanded at the Sunch'on plant. Two new urea plants were partially built, one at the Ch'ongnyon chemical plant and a 360,000-ton-per-year-capacity unit at the Youth Chemical Factory in west North Korea.

Total fertilizer production in North Korea during 1974 reportedly increased 40% above the 1973 level. It was stated that the 1976 6-year plan production goal of 3 million tons per year would be reached in 1975, and that 2.15 million tons of fertilizer would be supplied to the countryside during 1975. Planned investments in 1975 were stated to be more than double that of 1974.

**Magnesite.**—Magnesite mining, beneficiation, and sintering continued as a major industry yielding approximately 2 million tons of material in 1974. Approximately 20% of this was exported to the U.S.S.R. and 3% to Japan. Exports to Poland were planned in 1975 as part of a trade agreement. A 200,000-ton-per-year magnesite beneficiation and sintering plant, to be built in Chongjin, was reportedly ordered from a West German-Austrian consortium. Startup for the $51 million plan was scheduled for 1977.

**Other Nonmetals.**—A significant quantity of graphite, equivalent to approximately 20% of world production, continued to be produced. Much of this output was a low-grade amorphous material that was burned as fuel. Approximately 25% of this graphite, mostly the low-grade material, was exported to Japan. Barite production equaled 3% of world output and approximately two-thirds of this was exported to the U.S.S.R. The talc-group minerals were mined in amounts equivalent to 2% of world production. About 75% of the talc-group minerals was exported, to the U.S.S.R. and Japan. Production of fluorspar probably did not exceed 30,000 tons. Shipments of metallurgical-grade fluorspar were made to Japan.

## MINERAL FUELS

**Coal.**—Modest gains were made in the coal mining industry in 1974 with an overall production increase of approximately 10% over that of 1973, to 41 million tons. The large Anju anthracite mine, South P'yongan Province, was expanded and the Sinch'ang mine, the Nation's leading coal producer, was similarly expanded and rebuilt. Six-year plan production goals were reached 2 years ahead of schedule at the Yongmun mine in the western area and at the Chollima Sinch'ang mine where significant progress was made in modernization. Many new mines were opened in 1974.

Anthracite exports to Japan increased by a factor of 5, to 237,000 tons, in 1974. Approximately 230,000 tons of bituminous coal and 110,000 tons of coke, from coal, were imported from the U.S.S.R. during 1974.

The 1976 target for coal output remained at 50 million to 53 million tons, of which over 10 million tons is to be produced by medium- and small-size mines.

**Petroleum.**—Approximately 1 million tons of petroleum was imported from the U.S.S.R. and the PRC, respectively, during

1974 and these presumably met domestic requirements. The country's first oil refinery was reported to have been put into operation and a petrochemical plant was reportedly built in the western part of the country. A trade protocol was signed with Iran in Pyonyang late in 1974. The agreement would involve oil exports to North Korea valued at approximately $200 million per year over a 5-year period. It was reportedly planned to build a 2-million-ton-per-year oil refinery by 1976.

# The Mineral Industry of the Republic of Korea

By Harold J. Drake [1]

The rapid expansion of the economy of the Republic of Korea in recent years cooled off somewhat in 1974. The gross national product (GNP), at current prices, rose 41% to 6,943 billion won ($17.2 billion)[2] but much of the increase was due to higher prices. Real growth, as measured in constant 1970 prices, amounted to 8.2% and sent the GNP up to 3,810 billion won ($9.4 billion) from 3,523 billion won ($8.8 billion) in 1973. The value of manufacturing, in constant 1970 prices, rose 16% to 1,160 billion won ($2.9 billion), and the value of mining and quarrying operations rose 5% to 38.6 billion won ($96 million). With 1970 equal to 100, the index for industrial production stood at 225 compared with 176 in the preceding year. Similar gains were reported for the manufacturing component of industrial production, which rose to 238 from 184, and for the mining component, which rose to 125 from 114.

The principal mining sectors reporting increased outputs were anthracite, tungsten, copper, gold, kaolin, and limestone. Those sectors reporting declines were zinc, talc, fluorspar, lead, and refined silver. Producers of fertilizers, petroleum products, iron and steel, cement and nonferrous smelter products all reported increased output.

Production indexes (1970=100) for some of the major mining and mineral processing sector components for the last 2 years, are as follows:

| | 1973 | 1974 |
|---|---|---|
| Petroleum products | 139 | 138 |
| Industrial chemicals | 135 | 152 |
| Cement | 141 | 153 |
| Anthracite coal | 110 | 123 |
| Metal mining | 102 | 106 |
| Nonmetal mining | 158 | 150 |
| Tungsten mining | 102 | 141 |

Inflation accelerated in 1974. The wholesale price index (1970=100) for all commodities rose 42% to 188 compared with the 7% increase that occurred in 1973. The index for all minerals stood at 213 in 1974 compared with 126 in 1973; for metallic ores, at 219 compared with 134 in 1973; and for nonmetallic ores, at 203 compared with 112 in the preceding year.

The Government of the Republic of Korea sought to assist the heavy and chemical industries, including the mining industry and the electric power industry, by enacting legislation that established the National Investment Fund (NIF). The 1974 NIF plan was set at 90 billion won, approximately one-half of which was for the heavy and chemical industries. The mining industry was allotted one-half billion won under the plan. The Government planned investment of $1 billion between 1973 and 1981 in a major expansion of its machinery industry should provide additional incentives to the mining industry. The plan calls for the establishment of large new industrial complexes throughout Korea. For the machinery industry, the site chosen was Changwon near the port city of Pusan. The first project in 1974 was the construction of a special alloy steel plant.

Progress continued on the Government's planned expansion of its major heavy and chemical industries. Capacity of the iron and steel plant at Pohang was to be increased from 1,032,000 tons of crude steel to 2,600,000 tons, and to this end, construction of an ironmaking plant, a coke plant, and certain supportive facilities

[1] Physical scientist, Division of Nonmetallic Minerals.

[2] Where necessary, values have been converted from Korean won (W) to U.S. dollars at the rate of W398.3=US$1.00 (1973) and W404.5=US $1.00 (1974).

were begun. In addition, loans were approved for a hot strip and continuous casting project and a blooming and slabbing plant. Expansion of the nonferrous metal industry by the establishment of copper, zinc, lead, and aluminum smelters was in its first stage. Project planning for a 100,000-ton copper smelter and an 80,000-ton zinc smelter at the Onsan Industrial Complex was completed and approved by the Government. The lead and aluminum smelters are to be established in the second stage of the expansion program. Onsan was also the location for the establishment of two new oil refineries, each with a first stage capacity of 150,000 barrels per stream day and a similar capacity for their second stage. Both projects, one by Sunkyong Development Co., Ltd., the other by Cho Yang Shipping Co., Ltd., were still in the planning and negotiating stages in 1974.

A major petrochemical complex at Yosu was under development with the design of a naphtha-cracking plant and a caprolactum plant. A new fertilizer plant with a capacity of 100,000 tons of ammonia and 100,000 tons of complex fertilizers, included in the industrial and chemical expansion plan, was being designed, and land was being reclaimed at the plant site. Preliminary approval was granted by the Government for Ssangyong Cement Manufacturing Co., Ltd., to erect a cement plant at Onsan with a first stage capacity of 100,000 tons and a second stage capacity of 50,000 tons. Construction began in 1974 and was to be completed in 1976.

The Government of the Republic of Korea recently revised its long-term energy plan. The new plan called for the investment of $7.5 billion through 1981 to develop domestic energy resources and nuclear power. Construction of atomic and electric powerplants and a sharp expansion of coal mining and transportation facilities will be emphasized. New oil refineries are planned, but their output would be for the petrochemical industry rather than for energy uses. Coal production is to rise to 24 million tons by 1981, and imports, to 10 million tons.

## PRODUCTION

In 1974, declining export demand, one of the principal markets for Korean minerals, led to a reduced rate of expansion of output for the mining industry as a whole. In contrast to the 1973 growth of 18%, in constant 1970 prices, output increased only 5% to 38.6 billion won ($96 million). Inflation was readily apparent in the 47% growth in value of output based on current prices.

Production of anthracite coal increased 13% to 15.3 million tons, and production of tungsten was up 37% to 2,793 tons. Shipments of tungsten ore, however, declined 4% to 4,433 tons because export demand waned during most of 1974. Production of amorphous graphite increased 142% to 103,201 tons. As in past years, the Republic of Korea was one of the world's leading producers of these commodities.

Significant products of nonferrous metal mining and processing were copper, lead, and zinc. Mine output of copper ore increased 35%, whereas that of lead ore declined 15%, and that of zinc ore declined 13%. Refining operations fared somewhat better than mining operations. Production of copper ingot increased 34%, and shipments, 27%. Output of pig lead declined only 1%, and shipments, only 5%. Zinc refining operations fared the worst of the three. Output was off 8%, shipments were down 22%, and inventories were 8 times the level of 1973.

In response to higher prices, output of gold increased 64% but silver was off 12%. Iron ore output rose 6%, and production of pig iron nearly doubled. Of the principal products of nonmetallic mining, output of kaolin was up 30%; limestone, up 13%; agalmatolite, off 7%; and talc, off 8%. Products of the processing sector of the nonmetallic mineral industry were generally produced at a rate well above that of 1973. Urea fertilizer production was up 16%; fused magnesium phosphate fertilizer, up 10%; and compound fertilizer, up 4%. Nearly every fertilizer plant was reported operating in 1974 at between 115% and 120% of design capacity. Production of hydraulic cement was 8% above that of 1973.

Petroleum refining operations were curtailed somewhat by turbulent conditions in the world petroleum industry upon

which the Republic of Korea depends for its feedstock. Production of residual fuel oil was up 2%, and production of distillate fuel oil up 3%. Gasoline production declined 32% while that of jet fuel and kerosine was off 2%.

**Table 1.—Republic of Korea: Production of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 [p] |

## TRADE

The Republic of Korea in 1974 was a net importer with regard to trade in minerals, fuels, and related commodities. Exports, exclusive of iron and steel products, totaled about 2.5 million tons valued at $182 million, whereas imports, on the same basis, totaled 21 million tons valued at $1.5 billion.

Overseas shipments of metalliferous ores and concentrates totaled 145,351 tons valued at $31.2 million compared with 349,151 tons valued at $23.8 million in 1973. The sharp decline in tonnage was accounted for by reduced shipments of iron ore and concentrates. Exports of tungsten ore and concentrates accounted for only 2% of the quantity but 52% of the value. Exports of ores and concentrates of zinc accounted for 37% of the quantity and 25% of the value, and exports of lead ore and concentrates accounted for 5% of the quantity and 9% of the value. Each of these metallic commodities recorded export declines in quantity and rises in value compared with those of 1973.

Exports of nonmetallic minerals totaled about 1.2 million tons valued at $30.2 million compared with 1.1 million tons valued at $17.3 million in 1973. Dimension stone exports rose to 117,417 tons valued at $10.3 million, most of which was granite and sandstone. Crushed stone, sand, and gravel shipments totaled 268,541 tons valued at $5.9 million. Nearly 85% of this value was accounted for by quartz and quartzite. Exports of clay totaled 191,436 tons valued at $5.3 million, and exports of graphite totaled 69,959 tons valued at $2.5 million. Most of the clay was kaolin, and most of the graphite was amorphous graphite containing not less that 75% fixed carbon. Talc exports consisted of 47,567 tons of powders valued at $3.4 million and unground talc and steatite totaling 2,124 tons, valued at $433,694. Agalmatolite shipments totaled 198,062 tons valued at $1.5 million.

Exports of processed mineral products were generally higher in 1974. Petroleum and petroleum products shipments reached 974,110 tons valued at $101 million. The tonnage increase was minor contrasted to the more than triple increase in value. Exports of cement totaled 978,045 tons valued at $28.2 million, while that of cement clinker totaled 971,683 tons valued at $20.7 million. Exports of manufactured fertilizers were not reported in official statistics. Mineral exports in 1973, the latest year for which detailed information is available, are shown in table 2.

Imports of crude and semiprocessed minerals continued to rise. Metalliferous ores and scrap metal, imported to feed the burgeoning metal refineries sector of the mining industry, doubled in tonnage and value to 2.7 million tons and $256 million. Iron ore, concentrates, and ferrous scrap imports to feed new iron and steel mills totaled 2.5 million tons valued at $195 million. Imports of nonferrous ores and concentrates totaled 111,376 tons valued at $16.6 million along with 38,482 tons valued at $44.1 million of nonferrous scrap metal. Principal items were copper ore, concentrates, and scrap and manganese ore and concentrate. Most of these imports were destined for nonferrous smelters.

Imports of petroleum and petroleum products were valued at $1.0 billion, a level nearly threefold higher than that in 1973. Nearly all of the imports were crude petroleum. Principal nonmetallic mineral imports were asbestos, 64,847 tons valued at $14.6 million, chemical-grade salt, 260,947 tons valued at $7.4 million, and sulfur, 213,446 tons valued at $11.9 million. Imports of portland cement totaled 57,700 tons valued at $1.6 million. Mineral imports in 1973, the latest year for which detailed information is available, are shown in table 3.

## COMMODITY REVIEW

### METALS

**Copper.**—Construction of the 100,000-ton-per-year copper refinery at Onsan was delayed when a major partner deferred participation because of rising construction costs.

**Iron and Steel.**—New contracts were signed for the construction of a sintering plant, a lime calcining plant, and a complete cold-rolling mill at the Pohang iron and steel plant. Other steel projects under consideration include the Second Steel Corp. steel mill with a 7-million-ton-per-year capacity; the Korea Heavy Machine Industries Ltd., alloy steel plant; and the Inchon Iron and Steel Co., Ltd., direct reduction iron plant.

**Tungsten.**—Production of ammonium paratungstate totaled 900 tons in 1974, but domestic consumption was still negligible. Korean Tungsten Mining Co., Ltd., which also operated the Sangdong tungsten mine, was the producer. Tungsten carbide and tungsten powder were also produced in 1974, but consumption was negligible.

### NONMETALS

**Cement.**—The Korean cement industry is expected to increase its production capacity from about 9 million tons per year to 20 million tons per year by about 1980.[3] The industry is dominated by Ssangyong Cement Manufacturing Co., Ltd., which accounts for about 45% of capacity and production and 90% of the large export trade. The company plans to more than double capacity by 1977. Hanil Cement Manufacturing Co. plans to raise capacity at its Seoul plant by 1 million tons per year.

[3] Cho, Hai-Hyung. Korean Cement Industry Expands to Meet Domestic and Export Demand. Rock Products, v. 77, No. 5, May 1974, pp. 80–81, 125–126.

## MINERAL FUELS

**Petroleum.**—The nation's three major refineries operated at less than capacity in 1974, which was attributed to declining demand resulting from price increases for foreign crude petroleum and unstable international petroleum conditions. The Government's new energy plan envisions four new refineries, improving the Kyon In refinery, and constructing storage facilities. Since the Republic of Korea depends on foreign sources for its crude oil, the plan also called for improved supply arrangements and a broader supply base.

A billion-dollar expansion of the petrochemical industry is being planned, with a new petrochemical complex at Yosu, the heart of the expansion. The complex would triple the capacity of the Republic of Korea's chemical industry that is based on petroleum. Again, the unsettled petroleum supply situation caused planning and implementation to be delayed.

**Uranium.**—The National Geological and Mining Institute processed uranium ore for fuel use. Korea reportedly has known uranium reserves of 6 million tons. Westinghouse Electric Corp., Pittsburgh, Pa., was reportedly awarded a contract for the construction of a 600-megawatt nuclear powerplant near Pusan for Korea Electric Co. The plant was to be operational by 1979.

# The Mineral Industry of Kuwait and Saudi Arabia

By John L. Albright [1]

## CONTENTS

The former Kuwait-Saudi Arabia Neutral Zone has been partitioned into two equal administrative areas since December 1969; the northern half has been administered by Kuwait, and the southern half, by Saudi Arabia. Petroleum has been the only marketable mineral obtained both onshore and offshore in the partitioned zone, and the two countries have shared the revenue from the production of crude oil. In 1974, three oil companies worked concessions in the former Neutral Zone: Arabian Oil Co., Ltd. (AOC), American Independent Oil Co. (Aminoil), and Getty Oil Co. AOC was the concessionaire for both Kuwait and Saudi Arabia offshore operations, Aminoil was the onshore concessionaire for Kuwait, and Getty was the onshore concessionaire for Saudi Arabia. AOC and Aminoil activities will be discussed under Kuwait, and Getty activities will be discussed under Saudi Arabia, although many Getty facilities were located in the Kuwait-administered area.

## KUWAIT

Oil production and shipments fell during 1974, but Kuwait strengthened its hold on the country's petroleum industry by becoming the dominant owner of the Kuwait Oil Co., Ltd. (KOC), one of the largest oil producers in the Middle East. The Government formed the Kuwait Oil, Gas, and Energy Corp. (KOGEC) to take charge of the country's energy interests. KOGEC was capitalized at $507 million,[2] and the Government owned all but 240 of the 3 million shares in the firm. The balance was distributed equally among Kuwaiti companies.[3] KOGEC's responsibilities included marketing the State's share of participation crude oil.

A Supreme Petroleum Council was established within the Kuwaiti Council of Ministers and charged with formulating policies that would lead to the development of a fully integrated national oil industry and associated, oil-based industries. Members of the new Council included the President of the Council of Ministers and the Ministers of Finance and Oil, Foreign Affairs, Trade and Industry, and State for Council of Ministers Affairs.[4]

Egypt and Kuwait issued a joint communiqué in December that discussed joint projects valued at more than $1.3 billion, which included constructing a jointly owned, export-oriented cement plant in Egypt, rated at 1 milllion tons per year;

[4] Middle East Economic Survey (Beirut, Lebanon). Kuwait Established Supreme Petroleum Council. V. 17, No. 46, Sept. 6, 1974, pp. 7–8.

Kuwaiti financing of up to $150 million for the Abu Tartur phosphates project; and the establishment of a jointly owned maritime transport company. Kuwait and Libya signed an agreement with Yugoslavia whereby the two Arab States would financially assist Yugoslavia in construction of a petroleum refinery at Koper, on the Adriatic coast.

## PRODUCTION

In 1974, Kuwait was the world's sixth largest crude oil producer and the third largest in the Middle East. Crude oil output totaled 894.8 million barrels during the year, of which nearly 90% was produced in Kuwait by KOC, and the remainder was produced by Aminoil and AOC in the former Kuwait-Saudi Arabia Neutral Zone. Crude oil output by the KOC, which averaged 2.6 million barrels per day in January, fell to 2.0 million barrels per day during the month of July and averaged 2.3 million barrels per day for the year, off 17.5% from the company's 1973 oil output. Kuwait's share of oil production from the Neutral Zone oilfields increased 3.8% from that of 1973 and averaged 271,500 barrels per day during 1974.

Large quantities of natural gas were produced in association with the crude oil production operations, but gross gas production declined 22.2% to 452.8 billion cubic feet in 1974. KOC produced 92% of the total, and the remainder came from fields in the Neutral Zone. Utilization of gas during the year was 57.9% of the total production, an improvement of 9.4% from 1973.

## TRADE

The country realized a favorable balance of trade during 1974; the estimated value of exports and reexports was $10.7 billion that of imports was $1.5 billion. Petroleum was the most important export commodity. Despite difficulties in marketing mainly because of price disagreements with potential purchasers, crude oil shipments to foreign markets totaled 828.7 million barrels in 1974, down 21.4% from the 1,054.0 million barrels exported during 1973. Western Europe continued to be Kuwait's largest oil market, but Japan imported more Kuwaiti crude oil than any other country. Exports of refined petroleum products increased in 1974 totaling 140.1 million barrels during the year including bunkers, compared with 101.4 million barrels in 1973.

Kuwait held several unsuccessful auctions of government crude oil in 1974. During the first quarter, the Government offered 85 million barrels of oil to international bidders, but Kuwait refused all offers. Some companies rebid, and the Government was able to complete some sales. In June, Kuwait announced that it would auction its share of KOC-produced crude oil for the remainder of 1974, 1.25 million barrels per day. Bidding in the June oil auction was apparently below the minimum level of 93% of the posted price expected by the Government, and Kuwait reportedly rejected all bids.

Kuwait and Lebanon negotiated an economic cooperation agreement during 1974 that should stimulate trade between them, and discussions were held with Bangladesh that may lead to expanded trade and joint mineral-industry projects. Iraq and Kuwait reached an agreement whereby Iraq may use Kuwait's ports for unloading goods destined for Iraq. Preliminary talks were also held concerning the construction of a railroad from Umm Qasr port to Iraq.

## COMMODITY REVIEW

**Metals.**—*Iron and Steel.*—Kuwait Metal Pipe Industries ordered two spiral-weld steel pipe plants from a West German firm. The plants will produce pipes for agricultural and petroleum usage.

Kuwaiti Governmental and private interests formed a large joint stock iron and steel company, capitalized at $50.7 million. The company will invest in mines and quarries, import and market raw materials utilized in the iron and steel industry, establish iron and steel production and processing plants, and market iron and steel products. Citizens of Bahrain and the United Arab Emirates may hold shares in the Kuwait company.[5]

**Nonmetals.**—*Fertilizer Materials.*—Kuwait and Syria agreed to establish a joint investment company to engage in numerous economic projects, including the production of superphosphates in Syria. In August, the Kuwaiti Council of Ministers approved the amalgamation of the Petrochemical Industries Co. and its wholly owned subsidiary, the Kuwait Chemical Fertilizers Co.

**Mineral Fuels.**—*Natural Gas.*—The Government launched an extensive project, called Kuwait Gas Utilization Project (KGUP). KGUP calls for processing large volumes of natural gas and recovering over 5 million tons per year of natural gas liquids (NGL); that is, butane, natural gasoline, and propane. Costs will probably exceed $300 million for the transmission, processing, and storage facilities required. The first part of the project has been scheduled to be commissioned in 1977.

*Petroleum.*—In January 1974, the Government of Kuwait concluded a participation agreement with BP (Kuwait) Ltd. and Gulf Kuwait Co. under which the Government acquired 60% of the KOC operations and facilities in Kuwait. The Government had failed to ratify a 1973 agreement that had called for the State's initial share of 25% in KOC. The 1974 agreement included KOC's oil exploration and production installations and their output, as well as company's petroleum refinery, gas liquefaction plant, and its oil shipping facilities. Under the agreement that was ratified by Parliament in May 1974, the Government acquired the controlling interest in KOC at a cost of $112 million, and BP and Gulf each retained 20% interest in the oil company.[6] The agreement was for 5 years from January 1974 and granted the Government the right to raise its participation 7% per year, reaching 95% by yearend 1979.[7] BP, Gulf, and government officials held lengthy negotia-

[5] Middle East Economic Survey (Beirut, Lebanon). Kuwait Participates in a New Iron and Steel Company. V. 17, No. 40, July 26, 1974, p. 8.
[6] World Oil. Kuwait. V. 179, No. 3, Aug. 15, 1974, pp. 148–149.
[7] Wall Street Journal. Kuwait to Buy 60% of Oil Firm There Owned by Gulf, BP. V. 183, No. 23, Feb. 1, 1974, p. 4.

tions concerning the buy-back price for the Government's share of oil, and in July, BP and Gulf accepted the Government's buy-back price of $10.95 per barrel of oil, or 94.85% of the posted price, for 350,000 barrels per day of crude oil, which was to be lifted during the third quarter of the year. The agreement was reached only after the Government threatened to leave the oil in the ground if it did not get its requested buy-back price. The Government also informed BP and Gulf that if they failed to purchase substantial quantities of the Government's oil during the third quarter of 1974, future liftings of the Government's share of KOC oil would be denied to them.[8] Effective October 1, Kuwait raised royalty and tax rates to 16.67% from 14.5% and to 65.75% from 55%, respectively, and reduced the buy-back price to $10.74 per barrel for fourth-quarter 1974 sales to BP and Gulf. At the same time, the Government increased BP's and Gulf's fourth-quarter liftings to 450,000 barrels per day each. The average cost per barrel to the companies for the last quarter of 1974 was $9.44, $8.27 on 500,000 barrels per day each of equity oil and $10.74 on 450,000 barrels per day each of buy-back oil. In December, the Government announced that it would charge BP and Gulf a single price of $10.147 per barrel for all oil lifted during the first quarter of 1975. The new prices were set in line with the November 1974 Organization of Petroleum Exporting Countries (OPEC) recommended pricing formula.[9] Buy-back prices for AOC's Neutral Zone crude oil were set at $10.66 per barrel for Khafji oil and $10.88 per barrel for Hout crude, retroactive to January 1.

In August, Japan's AOC agreed to Kuwait's demand for 60% participation in AOC's oil operations in Kuwait, retroactive to January.[10] The Government also reportedly sought 85% ownership in Aminoil, Kuwait's remaining oil producer. Aminoil did not export any crude oil in 1974 but processed it at the company's Mena Abdulla refinery and exported most of the output as fuel oil and naphtha.

Kuwait's oil revenues from income tax and royalties reached $8.3 billion during the financial year April 1974 to March 1975, more than four times as large as the $1.98 billion collected during the previous year.

An Italian engineering firm was engaged in expanding the Kuwait National Petroleum Co. (KNPC) Shuaiba petroleum refinery during 1974. The refining capacity was being enlarged to about 180,000 barrels per day from 140,000 barrels per day. KNPC also assumed the responsibility of marketing the Government's share of KOC-refined petroleum. KOC processed 47.5 million barrels of oil during 1974 (averaging 130,000 barrels per day), off 17.5 million barrels from 1973. The 1974 refinery operations included 4.2 million barrels of oil for the Government. KOC increased the capacity of its bitumen plant to 70,000 tons per year from 48,000 tons per year. The company produced 1.9 million long tons of gas liquids in 1974, nearly the same level as the 2.0 million long tons produced in 1973.

Kuwait expressed interest in establishing an asphalt refinery in the country, and an Indian firm offered to prepare a feasibility study on a lubricating oil plant for Kuwait. Along with Libya, Kuwait agreed to assist in financing the construction of a 160,000-barrel-per-day petroleum refinery in Yugoslavia. Most of the output from the $300 million plant will be marketed outside of Yugoslavia.[11]

Plans were finalized for the construction of 325 kilometers of natural gas and 214 kilometers of condensate pipelines to serve the country's natural gas utilization project. Kuwait financed the construction project for a 850-kilometer petroleum pipeline in Sudan and held discussions with Yugoslavia concerning Kuwaiti financing of a planned oil pipeline in that country.

AOC had two drilling rigs working in its offshore concession and reportedly had scheduled 25 wells to be drilled in 1974. In 1973, the company drilled 20 wells in the offshore Khafji oilfield. KOC carried out geological mapping in Raudhatain, Sabiriyah, and Umm Gudair oilfields. A Spanish firm began services during January against a 2-year contract for drilling and workover operations for the KOC and drilled an appraisal well in the Bahrah Field. KOC reported that 123 wells were

worked over during 1974, nearly double the number worked over in 1973. The company had 691 producing oil wells in 1974.

Kuwait Oil Tanker Co. (KOTC) completed its first year under Kuwaiti management; previously the company had been managed by a British firm. During the year, KOTC placed an order with a Japanese shipyard for a 261,000-deadweight-ton tanker for delivery in mid-1977 and ordered four 70,000-cubic-meter liquid gas carriers from a French shipbuilder. A 360,000-deadweight-ton tanker was under construction in a Spanish shipyard for KOTC, scheduled for delivery in mid-1975.

The Middle East Gas and Petrochemical Co., a privately owned liquefied petroleum gas (LPG) tanker company formed in Kuwait in 1974, reportedly ordered the construction of a number of ocean tankers from foreign shipyards. Four 70,000-cubic-meter LPG carriers were ordered from France at a total cost of $196 million, and several smaller LPG tankers were ordered from a Spanish firm.

## SAUDI ARABIA

Dissatisfied with its 1973 agreement with the Arabian American Oil Co. (Aramco) that provided for 51% government participation in the company's operations by 1982, the Saudi Arabian Government early in 1974 initiated talks for expanded government participation in Aramco's operations. Saudi Arabia had obtained a 25% share in the company's oil operations in 1973. In June 1974, the U.S. companies in Aramco reached an interim agreement with the Government giving Saudi Arabia a 60% share in Aramco's Saudi Arabian operations retroactive to January 1, 1974.[12] Under the new agreement, Exxon Corp., Standard Oil Co. of California, and Texaco Inc. will each hold 12% and Mobil Oil Corp. 4% of the giant oil company's operations in Saudi Arabia. Discussions were held during the second half of the year for Saudi Arabia's complete control of Aramco's oil operations, but the negotiations were not completed by the yearend. In 1974, Aramco remained the world's largest petroleum producing and exporting company.

Saudi Arabia's oil revenues increased by more than 430% in 1974 to $22.6 billion,[13] compared with $4.2 billion in 1973; Aramco was the largest contributor to the Government oil income (99% of the total), and most of the remainder was paid by the Arabian Oil Co. Ltd. (AOC) and Getty Oil Co.[14]

Two Saudi Arabian tanker companies were formed during 1974, and both included foreign interests. Saudi Maritime Co. was formed by Saudi Arabian and U.S. investors, including the Mobil Oil Corp., to engage in international shipments of petroleum and dry cargo. Mitsui OSK Lines Ltd. of Japan together with Saudi interests formed the Saudi Arabian Shipping Co. The Government announced that it would give preference to Saudi-owned tanker companies for exporting its petroleum.[15]

### PRODUCTION

Saudi Arabia was the largest oil producer in the Middle East and the third largest in the world in 1974, behind the U.S.S.R. and the United States. Aramco was Saudi Arabia's largest producer, accounting for about 97% of the total production. Aramco's crude oil output remained below the 8-million-barrel-per-day level during the first quarter of the year and reached a record rate of 8.8 million barrels per day during the month of October. The company's oil production averaged 8.2 million barrels per day for the year 1974, an increase of 0.9 million barrels per day from 1973. Aramco estimated its probable crude oil reserves at 172.5 billion barrels at yearend 1974 (up 4.9% from the yearend 1973 estimate), enough to last more than 57 years at the 1974 rate of production. The probable reserves included 103.5 billion barrels of proved oil reserves.

Saudi Arabian petroleum refinery output remained steady, and gross production of natural gas was estimated at 1,570.0 billion cubic feet, an increase of 9% from 1973. No significant increases in production were recorded by Saudi Arabia's nonpetroleum mineral commodities.

[e] Estimated. [p] Preliminary. [r] Revised. NA Not available.

[1] Includes Saudi Arabia's one-half share of crude oil and natural gas production in the Kuwait-Saudi Arabia partitioned zone, and Saudi Arabia share of refinery output by its concessionaires in that area.

[2] Data presented are for Hejira calendar year 1392 (February 16, 1972-February 3, 1973).

[3] Naphtha apparently included in gasoline.

## TRADE

Crude oil and refined petroleum products were the major exports, and Saudi Arabia maintained its position as the world's largest oil exporter. Aramco was the dominant exporting company, and more than one-half of the company's petroleum shipments went to European markets. The fourth-quarter 1973 oil embargo by Saudi Arabia and the other Arab oil exporters against selected countries continued into 1974. Saudi Arabia lifted the embargo on oil shipments to the United States on March 18, 1974; the first post-embargo Saudi Arabian oil reached the United States on April 30.

Aramco loaded 4,470 tankers with 2,659 million barrels of crude oil and 204.8 million barrels of refined petroleum products in 1974, an increase in ships loaded of 8.2% from that of 1973. More than one-half of the company's petroleum exports went to Europe. Of Aramco's 2,997 million barrels of crude oil produced in 1974, 2,656.4 million (or 88.7%) was destined for export at Saudi Arabia's Persian Gulf ports. Only 87.5 million barrels (2.9% of the total) went to Al Qaysumah to be exported by the Trans-Arabian Pipeline (TAPline), down 69.8 million barrels or 44.4% from 1973. Nearly 64.8 million barrels (2.2% of the total) was destined for Bahrain, and the remaining 187.9 million barrels (6.3%) of the crude oil was for field use or sent to the Ras Tanura refinery for processing.

Crude oil shipments to the Mediterranean Sea through the TAPline declined steadily during 1974, from 290,559 barrels per day in the first quarter of the year to 86,825 barrels per day in the fourth quarter (only 17.4% of the pipeline's 500,000-barrel-per-day capacity) and averaged only 175,555 barrels per day for the year. Reduced shipping rates on supertankers had made it more economical to transport oil to Europe from Ras Tanura than to pump it through TAPline to be loaded onto tankers on the Mediterranean Sea.

Table 5.—Saudi Arabia: Exports of crude petroleum and petroleum refinery products [1]
(Thousand 42-gallon barrels)

| Commodity | 1972 | 1973 | 1974 |
|---|---|---|---|
| Crude petroleum | 1,992,487 | 2,560,342 | 2,897,924 |

| Total | 100.0 | 100.0 | 100.0 |

## COMMODITY REVIEW

Exploration for nonpetroleum minerals continued in 1974 by the Directorate General of Mineral Resources (DGMR). Licenses were issued to several foreign companies to develop copper reserves at Jabal Sa'id and to explore for copper, gold, lead, mercury, silver, and zinc in the Negrah area.[16] DGMR test drilling was reportedly underway at a gold-zinc deposit at Al Amar, 200 kilometers southwest of Riyadh.[17] Saudi Arabia and Sudan signed an agreement to develop the natural resources along a 480-kilometer stretch of the Red Sea between the two countries. The area is rich in seabed and subsoil minerals.[18] Settlement of a long-standing border dispute was negotiated by Saudi Arabia and Abu Dhabi. The disputed area included a potentially rich oilfield.

**Metals.**—A discovery of massive sulfides at Al Masani was announced by the Arabian Shield Development Co. Initial drilling revealed over 30 meters of sulfides with an average grade of 2.0% copper and 5.0% zinc with traces of gold and silver. Arabian Shield continued exploratory operations in the nearby Wadi Qatan area where nickel was discovered in 1972.[19]

*Copper.*—Saudi Arabia issued a license to the French Bureau de Recherches Géologiques et Minières and the United States Steel Corp. to explore for copper in the Jabal Sa'id deposit, approximately 140 kilometers southeast of Yanbu'. Terms of the license included development rights if copper is discovered.[20]

*Iron and Steel.*—Early in 1974 a feasibility study was carried out concerning the establishment of a major steel production plant at Al Jubayl on the Persian Gulf, and in March the Government approved the project. The $500 million project, a joint venture between the General Petroleum and Mineral Organization (Petromin) and a group of foreign concerns headed by the Marcona Corp. of the United States, will have an initial yearly production capacity of 3.5 million tons of prereduced pellets and 1 million tons of crude steel.[21] Two Japanese firms, Sumitomo Metal Industries, Ltd. and Sumitomo Shoji Kaisha, Ltd., have joined a group of Saudi Arabian investors in forming the National Pipe Co., which will produce spiral steel pipes for the petroleum indus-

try.[22] The $26.6 million plant will be built near the port of Ad Dammam and will turn out approximately 80,000 tons of pipes per year, beginning in 1976.

**Nonmetals.**—*Cement.*—Saudi Arabia negotiated contracts during the year to purchase large quantities of cement from Japan, South Korea, and Taiwan. Saudi Cement Corp. signed an $80 million turnkey contract with a West German firm to expand the Al Hufuf plant by 1 million tons per year, in an effort to satisfy the country's growing demand for cement.[23] Three new cement plants may be built in Saudi Arabia, one at Al Qasim, the second at Yanbu' and the third at an undisclosed location in the southern part of the country.

**Mineral Fuels.**—*Natural Gas.*—Petromin approved an extensive natural gas project, which will utilize large quantities of natural gas to produce LPG and natural gasoline for domestic industries and export. Costs of the project may exceed $3 billion for gathering, separation, and treatment facilities, and the volume of gas to be processed will be about 5.2 billion cubic feet per day. Saudi Arabia's natural gas reserves were estimated to be 55 trillion cubic feet at yearend 1974. Houston Natural Gas Corp. revealed plans to build a methanol plant in Saudi Arabia that would produce the fuel at a rate of 12,500 tons per day, and a West German firm was negotiating a $100 million nitrogenous fertilizer project with Saudi Arabia.[24] A Taiwan fertilizer company expressed interest in building a plant in Saudi Arabia that would produce 1,000 tons of urea per day, also using natural gas feedstocks.

*Petroleum.*—At the beginning of 1974, the posted price of Saudi Arabia's Arabian Light Crude Oil f.o.b. Ras Tanura was $11.651 per barrel. During the year OPEC recommended changes to the oil pricing formula, and in November, Saudi Arabia notified Aramco of its decision to implement the OPEC decisions. The posted price of crude oil was cut 40 cents, income tax rates were increased to 85% from 65.75%, and royalty rates were raised to 20% from 16⅔%. The Government also set the price of buy-back oil at 94.85% of the posted prices, instead of 93%.[25]

*Arabian American Oil Co. (Aramco).*—Exploration activities increased from the 1973 level, and a new oil discovery was made at Rimthan, 95 kilometers east of Al Qaysumah. Four offshore and 17 onshore drilling rigs were employed during the year, and company crews drilled 300 wells for oil exploration, production, and pressure maintenance. Twelve water injection facilities were constructed and placed in service at Berri and Ghawar oilfields. At the yearend, Aramco's water-injection facilities had a total daily capacity of 9.3 million barrels of nonpotable water. Company gas-oil separator plant facilities were expanded significantly during the year. An additional compression plant was completed at the Abqaiq NGL complex, and Aramco commenced the construction of yet a larger compression plant at Abqaiq. A gas compression-treatment plant capable of producing NGL at rates up to 31,000 barrels per day was completed at Ras Tanura. Butane vapor recovery and propane auto-refrigeration plants were built nearby. NGL production totaled 50.2 million barrels in 1974, an increase of 14.8 million barrels or 41.8% over that of 1973. Aramco reported the construction of 471 kilometers of major crude oil and petroleum pipelines in 1974, compared with a total 565 kilometers of major pipelines laid in 1973.

Although crude oil runs to the Ras Tanura petroleum refinery fell to 176.1 million barrels in 1974 (482,411 barrels per day) from 189.2 million barrels in 1973 (518,300 barrels per day), the refinery's total 1974 throughput increased 0.6% to 224.3 million barrels (614,532 barrels per day) because of increased NGL throughput, excluding NGL produced from the crude oil processed at the refinery. The refinery's output totaled nearly 217.1 million barrels, at the average daily rate of 594,786 barrels. Output comprised diesel oil 12.51%, fuel oil 42.12%, gasoline 3.14%, jet fuel 3.6%, kerosine 3.4%, naphtha 11.21%, NGL 23.14%, and others 0.88%. Ras Tanura's refinery output had totaled 199.4 million barrels (544,925 barrels per day) in 1972 and 217.2 million barrels (595,145 barrels per day) in 1973.

Aramco's asphalt production capacity was nearly doubled when a 5,000-barrel-

[25] Petroleum Intelligence Weekly. Saudi "Bombshell" To Sharply Increase World Oil Costs. V. 13, No. 46, Nov. 18, 1974, pp. 1–3.

per-day plant went onstream at Ras Tanura increasing the company's asphalt producing capacity to 11,000 barrels per day.[26]

Ju'aymah, Aramco's newest deepwater tanker terminal located about 33 kilometers north-northwest of the Ras Tanura terminal, was completed and placed in service in November. The second phase of construction was in progress at Ju'aymah during 1974 and was scheduled to be completed in 1975.[27] It included an additional offshore single-buoy mooring and onshore storage tanks for 3.8 million barrels of crude oil.

Aramco employees totaled 15,657 at yearend 1974, of which 11,995 or 76.6% were Saudi Arabians. The remaining employees included 1,418 U.S. citizens.

*General Petroleum and Mineral Organization (Petromin).*—A Japanese firm completed the construction of a small 15,000-barrel-per-day petroleum refinery for Petromin near Riyadh, and the new plant was placed onstream in September. A 30-centimeter, 141-kilometer crude oil pipeline was built from Aramco's Khurays oilfield to the refinery. Production from the Riyadh refinery will include bitumen, diesel oil, fuel oil, kerosine, LPG, and motor gasoline. Earlier in the year Petromin signed an agreement with Mobil Oil Corp. to build a $36 million lubricating oil refinery at Jidda. The 2,740-barrel-per-day plant will be a joint Mobil-Petromin project and is expected to be onstream in 1977. Petromin also approved plans to increase the capacity of the Jidda Petrolube blending plant from its present yearly capacity of 70,000 barrels to 300,000 barrels.

Petromin held separate discussions with several foreign oil companies during the year to jointly build large petroleum export refineries in Saudi Arabia. Mobil Oil Corp. and Royal Dutch/Shell Group each proposed building large refinery/petrochemical complexes in the country, but neither project had been approved by yearend. Each of the proposed refineries would have a capacity to process about 500,000 barrels of crude oil per day. Gulf Oil Corp. also negotiated with Saudi Arabia to build a jointly owned refinery and petrochemical complex in the country that would have an initial capacity of 250,000 barrels per day.

The Mitsubishi Industrial Group of Japan reached an agreement with Saudi Arabia to build a $3 billion petroleum refinery and petrochemical complex at Al Jubayl as a joint venture with Petromin. The refinery's initial throughput capacity was set at 250,000 barrels per day.

*Getty Oil Co. (Getty).*—Oil production in the Neutral Zone ranged from 53,000 to 68,000 barrels per day from October 1973 to March 1974, the period of the oil embargo. More normal production rates resumed after the curtailments were lifted, and the company's 1974 oil production from the Neutral Zone averaged 82,000 barrels per day.

Getty held discussions with the Aminoil (oil producer in Kuwait's section of the Neutral Zone) regarding exploration and development programs that would involve expenditures of approximately $5 million by each company. A proposed field development program would involve drilling eight additional development wells in the Ratawi reservoir.[28]

# The Mineral Industry of Liberia

By Janice L. W. Jolly [1]

The mineral industry of Liberia consisted primarily of iron ore and diamond production, which together accounted for an estimated $292 million [2] in exports in 1974. The Liberian Bureau of Mines reported that interest in gold mining had gained momentum with fees being collected from 57 prospecting and 32 gold mining licenses.[3] Growth was also reported in petroleum refining and cement production. Offshore petroleum exploration continued and the Liberia Refining Co. (LRC) reported production of petroleum products worth $28.4 million for the first 8 months of 1974 compared with $10.2 million for the same period in 1973. The depressed world diamond market resulted in a decline in the quantity and value of diamond exports and of revenues accrued from this industry. Iron ore continued to enjoy favorable market conditions despite global energy and monetary crises. Improved export performance in 1974 was due almost entirely to higher prices and increased volume of iron ore. In November 1974, the Association of Iron Ore Exporting Countries met in Geneva, Switzerland. Liberia had observer status in the organization.

Liberian iron ore producers incurred large cost increases as a result of higher refined oil prices, which had almost quadrupled since 1973. The average cost increase for imported oil to the iron ore, rubber, and timber concessions, which together account for 85% of Liberia's exports, was a staggering 411%.[4] Inflation abroad also affected Liberia's manufacturing industries since most raw materials were imported. Imports increased about 48% in value over those of 1973, with little change in volume. The gross domestic product gained 8.5% over the $521.2 million in 1973. However, population growth (3.2% per year) and inflation (19.5%) continued to effectively reduce this gain. The 1973 population was estimated at 1.67 million.

A new investment code was announced and was already being used by the Government in matters concerning new investments in all economic activities of Liberia.[5] The ultimate authority for approving, disapproving, or granting investment incentives would be vested in the Concessions and Investment Commission of the Ministry of Finance. The code superseded that of March 21, 1966. The Revenue and Finance Laws of 1956 (Title 35, Liberian Code of Laws) were also revised. A 43% increase in revenues in the first half of 1974 came mainly from consular invoice fees, maritime revenues and direct taxes. The revised tariff schedules developed in 1973 were enacted into law in 1974. The National Bank of Liberia was established by an Act of Legislature on May 27, 1974, and formally opened on July 22. The bank was to handle all government accounts and will license, inspect, supervise, and regulate commercial banks and other financial institutions.[6] Air Liberia came into operation in April 1974. On August 15, 1974, the Engineering School of the T.J.R. Faulkner College of Science and Technology came into being with departments in geology, civil engineering, mining, and electrical and architectural engineering.

The Mano River Declaration signed in October 1973 by Sierra Leone and Liberia

provided economic agreements between the two countries designed to remove some of the constraints imposed in their economic developments by the small size of their domestic markets. In 1974 Liberia participated in a number of conferences with Sierra Leone on produce inspection and grading, hydropower and irrigation, and transportation. A joint standards bureau would be established, and bulk purchasing of crude oil and fertilizers were also discussed. A draft treaty creating the Economic Community of West African States (ECOWAS) was scheduled for approval at a Ministerial Conference in Monrovia to be held in January 1975. Ratification by seven States would bring ECOWAS into existence. The seventh meeting of the Technical Exports Committee on Liberian/Ivorian Cooperation met and agreed upon an exchange of experts, students, and businessmen. Technical experts from Gambia and Liberia also met in Monrovia to examine and clarify the trade agreement between them.

During 1974, draft trade agreements were exchanged with Argentina, Ghana, Czechoslovakia, and Romania. Romania agreed to undertake joint projects with Liberia which would include: (1) Iron and steel manufacturing; (2) a fertilizer plant; (3) participation in the development of the Wologisi iron ore concession; (4) geological studies and prospecting; and (5) training of Liberian students in the University of Bucharest. A special office staffed by four Romanian and two Liberian geologists was set up in Monrovia to conduct a wide range of research exploration and feasibility studies.[7] A $700 million investment is visualized for the iron and steel industry, with $490 million being provided by foreign capital and $210 million by domestic capital. The project is expected to commence in 1976 and to continue for 7 years. Rolled steel products would be made from 1 million tons per year of raw steel. A Sri Lanka industrial company was also reportedly interested in setting up a galvanized sheet factory.

The U.S. Export-Import Bank authorized credit of $1.7 million to finance part of a $5.7 million sale of U.S. mining equipment to Bong Mining Co. (BMC). Another credit of $3.1 million would come from private sources. It was expected that $3 million would be spent on the establishment of a free zone in Liberia. The project was approved by the United Nations Industrial Development Organization (UNIDO) in 1974. UNIDO contracted Sir Alexander Gibb and Partner (United Kingdom) to conduct a feasibility study on two areas. The funding would be made through the Special Services Program (SIS) of UNIDO.[8] Maintenance, improvement, and rehabilitation of 700 miles of roads were being financed through the World Bank and the International Development Association (IDA), with technical aid from the Federal Republic of Germany. Allgemeine Bau Union (ABU) of Frankfurt was to build a bridge over the Mano River at a cost of $2.9 million. The German Team for Public Utilities Authority (GKW) continued to make feasibility studies to provide water for several Liberian cities. The African Development Bank (ADB) authorized a loan of $1.2 million for waterworks expansion. Gas or diesel turbines were being considered for expansion, by early 1976, of the Liberian Public Utilities Authority's (PUA) generator capacity to cope with increased demand and have reserve power for emergencies.

The Liberian Geological Survey was undertaking groundwater surveys in cooperation with the Hydrological Services. The Geochemical Laboratory continued to provide assistance to prospectors and the public with rock identifications. The Geological Survey formulated a 5-year plan for improving the effectiveness of the Survey in conducting a long-range mineral resources evaluation program. Gold exploration was to be given foremost consideration, and a gold quantification program was launched during 1974 as a precursor to the more extended 5-year mineral evaluation program. The following commodities were to be examined on a priority basis to quantify deposits located during the Geological Exploration and Resource Appraisal (GERA) project conducted by the Liberian and U.S. Geological Surveys, and completed in 1972: (1) eastern region—gold, base metals, bauxite; (2) western region—gold, chromite, bauxite; and (3) central region—gold, tin, base metals. As a result of GERA, several geological quad-

Annual Report to the Fourth Regular Session of the Forty-Seventh Legislature of the Republic of Liberia on the Operation and Activities of the Ministry of Commerce, Industry and Transportation, for the period Jan. 1, 1974, to Dec. 31, 1974, p. 24.

rangle maps [9] were scheduled for release in 1975, including the Zwedru, Harper, Juazohn, Monrovia, Gbanka, Zorzor, Buchanan, Sonohele, Bopolu, Vinjama, and Sanniquelle quadrangles.

A total of 73 new mining claims were surveyed by the Liberian Bureau of Mines, of which 10 were for gold. LAMCO J.V. Operating Co. applied for a mining concession for all minerals within 10 miles of the railway line from Buchanan to Nimba. Liberian Beach Sands Exploitation Co. (LIBSEC) prospecting for heavy minerals relinquished all but 55 square miles of its area after completing the required 1 year of exploration. Globex Minerals (Liberia) Inc. applied for a concession to explore for heavy mineral concentrates along the Grand Bassa-Grand Cape Mount County coastline. Clayco Petroleum Corp., a United States firm, reportedly [10] also explored for minerals in the coastal sands between Grand Cape Mount and Grand Bassa Counties in 1973.

## PRODUCTION AND TRADE

Liberia's export earnings valued at $400.3 million in 1974 were heavily dependent on two commodities—iron ore (65%) and rubber (19.3%). Diamonds accounted for 7% of the total export value. Iron ore production increased 1% in 1974 to 23.8 million tons valued at $212.4 million. This compares with the 23.5 million tons produced in 1973 valued at $182 million. A total of 18 countries imported Liberian iron ore with West Germany, the Netherlands, Italy, the United States, France, Belgium, and Japan as the leading importers, listed in decreasing order.

A total of 635,719 carats of diamonds valued at $29.9 million were exported during 1974, representing a decrease from the 812,257 carats valued at $49.3 million exported in 1973. Diamond exports went to Belgium, the United Kingdom, Israel, the United States, and the Netherlands.

Total import costs in 1974 were estimated at $286 million, up 48.1% over those of 1973. The value of mineral fuel imports increased to $42.4 million in the first three quarters of 1974 compared with 9.9 million in the same period of 1973. Most Liberian crude oil was from Saudi Arabia which supplied 3.9 million barrels of the total 4.2 million barrels of crude oil imported in 1974 by LRC.

Liberia's trade with the rest of Africa registered an increase of 7% in the first 8 months of 1974 over the same period in 1973. The 1974 value amounted to an estimated $3.1 million. Mauritania, Ghana, Mali, and the Ivory Coast were the largest trading partners. The European Economic Community (EEC) accounted for 65% and the United States 25.4% of the total Liberian trade for 1974.

Table 1 shows production and tables 2 and 3, trade data.

# COMMODITY REVIEW

## METALS

**Gold.**—With the price of gold at record highs on the free market, a number of gold miners were reported to be shifting from diamond to gold mining. The Ministry of Lands and Mines commenced a campaign to persuade more investment in gold mining. During 1974, however, the Government was unable to purchase gold through the Bank of Liberia. Reportedly, all gold recovered from mining operations was sold to jewelers. There are no statistics available on production and consumption of gold even though this mineral was mined. The Ministry was expected to reestablish the vendor's certificate system for all gold sales in 1975.[11] African Mining Partners (AMP) started exploration for gold in Grand Cape Mount County when its 25-year agreement with the Government became effective on August 1, 1973. Exploration was centered mainly around Weaju and Butter Hill, with some reconnaissance and auger tests around the Mano Godua area and in Grand Gedeh County near Zia Town. Analytical results have been reported as encouraging. In January 1974 AMP applied for exploration rights in the following areas: (1) Juazohn, Sinoe County—75 square miles; (2) Zwedru, Grand Gedeh County—91 square miles; and (3) Bopolu, Lofa County—75 square miles. Senwein Mining Corp. also applied for a gold mining concession in 1974. The Liberian Geological Survey launched a gold quantification program, collecting samples in the Kokoya District, Beng-Gola-Todee District, and the Gbarsee Giah area. Of 263 heavy mineral concentrate samples collected from western and central Liberia, a total of 119 contained native gold. One sample from Kokoya area assayed $274.50 gold per ton of gravel. None of the three creeks investigated in the Gume section of Uahun showed significant gold values.

**Heavy Minerals.**—Exploration by LIBSEC for heavy minerals in Sinoe County west of Harper and Garawe and near Greenville gave discouraging results. It was thought that a small-scale operation might be feasible depending on mineral dressing studies and market demand. Preliminary estimates by LIBSEC indicated 900,000 tons of heavy minerals consisting of rutile, ilmenite, zircon, and monazite.

**Iron Ore.**—Liberian Iron and Steel Corp. (LISCO) subsidiary of the New York-based Liberian International American Corp. (LIAC), with Romanian interests, signed a formal agreement on Oct. 11, 1974, with the U.S. firm American Metals Climax, Inc. (AMAX) and a group of Japanese companies including Kawasaki Steel Corporation, C. Itoh and Co., Ltd., Nisaho-Iwai Co., Ltd., Marubeni Corporation, and Toyo Menka Kaisha, Ltd. Under the agreement, the Japanese group and AMAX, after acquiring an initial block of LISCO shares, would have the right to purchase a 51% interest in LISCO and was to provide the estimated $600 million needed to develop the deposit and pelletize the ore. LISCO had its concession agreement for the Wologisi Mountain range reviewed. It was passed by the Liberian Legislature on July 19, 1974. The new agreement set the date of commercial production to September 1981. Full production was for 10 million tons or more of iron ore pellets per year. Feasibility studies were being made by a group from the Bechtel Corp. (United States). The facilities of the LISCO geological section were being upgraded in preparation for premining activities. Ore reserves were reported as being adequate to make the project viable, and thus efforts were being made toward proving the inferred ore reserves of the Balagizi ore body, clarifying the structural complexity of the main ore body, and extending the Maasoh Road for better access to drilling sites at Balagizi. The estimated minable ore reserves are nearly 900 million tons, ranging in grade from 35% to 54% iron, with about 40-micron grain size, and a probably additional reserve of 250 million tons of low-grade ore in Lofa County near the border with Guinea. Transportation and port facilities must also be constructed. A pelletizing plant is to be built at the port.

The Guinean Iron Mining Co. of Guinea (MIFERGUI) was set up in June 1973 to mine the iron deposits of Mount Nimba, located astride the Guinean–Liberian border. The basic agreement was signed by Guinea (holding 50% of the shares and chairmanship of the board) and Nigeria, Algeria, Zaire, and Liberia, as well as the

[11] Pages 30–31 of work cited in footnote 3.

following companies: Rudi and Energoprojekt (Yugoslavia), Nichimen Trading Co. and Mitsubishi (Japan), Instituto Nacional de Industria (INI) (Spain), and Intermaritime Bank, ALUSUISSE (Switzerland). The Belgian firm Becsa pulled out of the arrangements in August 1973, and the shares were taken up by Nichimen. United States Steel Corp. was reportedly considering participation. Nigeria is reported to have invested $100,000 and is expected to obtain a minimum of 1 million tons per year of iron ore for its planned iron and steel industry. Now joining the effort is Romania, which will build the ironworks for Guinea. Annual production was expected to be 15 million tons, and reserves were estimated to be between 300 million and 600 million tons. In addition, the MIFERGUI-Simandou mine was to start operating in 1982 with a production of 25 million tons. Both MIFERGUI-Nimba and MIFERGUI-Simandou planned to export ore via the Liberian American–Swedish Minerals Co. (LAMCO) transportation facilities through Buchanan in Liberia, as well as through Conakry, Guinea.

In November 1974, the LAMCO-Joint Venture (LAMCO–JV) Operating Co. restructured its organization to include two Liberians on the managerial staff for the first time. LAMCO holds 75% of LAMCO–JV, Liberia's largest iron mine. Bethlehem Steel (The Liberian Bethlehem Iron Mines Co.) owns 25%. LAMCO itself is 50% owned by the Government and 50% by Liberian Iron Ore Ltd. (LIO). LIO is a Canadian mining company that is 74.8% owned by Trafik A. B. Grängesberg Oxelosund (TGO) and 25.2% by an American group. Gränges International Mining (Gränges) manages LAMCO. A wildcat strike in February and March 1974 caused a production loss of about 250,000 tons, but the target of 12 million tons was still exceeded for the year. Reserves were estimated to be 100 million tons proven with 53% iron in addition to 150 million tons of high-grade 64% iron, with another 33 million tons probable. The new Tokadeh mine began production in 1973, and there were still an estimated 15 years of reserves at the Nimba mine. Forty thousand tons per day is mined and shipped by company railroad to Buchanan where it enters the $51.4 million pelletizing and washing plant. LAMCO exploration activities were concentrated on the deposits of Betton, Yelliton, Gangra, and South Nimba.

The country's first iron mine, in the Bomi Hills, was expected to close late in 1975. Expansion projects at BMC's Bong Mine and at the LAMCO–JV's Nimba and Tokadeh mines were hoped to compensate for the eventual Bomi Hills mine closure. BMC is engaged in a $6 million expansion project for increasing mine and concentrating plant capacity to 7 million tons per year, an increase of about 600,000 tons over present capacity. A loan for mining equipment was obtained from the U.S. Export-Import Bank and private European sources. A second pelletizing plant and an 11th concentrate silo has been proposed, costing between $50 and $60 million, to bring pelletizing capacity of the Bong mine to 6.4 million tons per year. The possibility of mining ore deposits in the Putu Range in the southeastern part of the country was also being considered by BMC and would require an initial investment of more than $400 million. BMC exported 6.7 million tons, of which 2.4 million tons were pellets. This is a joint effort by the Government and West German and Italian steel producers.

Mine Management Associates, Ltd., a Liberian corporation owned 70% by the Government and private Liberian citizens, continued as managing agents for National Iron Ore Co. (NIOC). The exploration program on Hill "A," which began in 1973, showed satisfactory progress. Access roads were constructed making it possible to begin mining operations on two bench levels simultaneously. Ore reserve calculations and classification for final program evaluation were expected to be completed in 1975.

At NIOC's Mano River Mine, production and shipments continued at near normal levels during the first 6 months of 1974 despite continued difficulties. Problems associated with Mano II expansion continued to plague operations, dropping output by an estimated 400,000 tons over the comparable first 6 months in 1973. The mine was planned to produce 4 million tons per year, and in 1974 produced only 3.6 million tons. Mano II expansion included improvements for dewatering tailings, a tailings storage system, and tailings flow. The conveyor belt system and shiploading facilities were also improved.

The Liberia Mining Co. Ltd. (LMC), 59.18% owned by Republic Steel Corp., exported 2.1 million tons in 1974 and traded 20,394 tons of fines to NIOC. The firm also produced 15,798 cubic yards of crushed rock for construction purposes. Production costs were affected by shortages of materials in 1974 and long delays in delivery, as well as by the high cost of fuels. LMC's usable reserves were approximately 1.4 million tons of direct shipping ore and 1.7 million tons of mill feed, expected to produce approximately 600,000 tons of concentrate. LMC is approaching exhaustion of minable ore in the main Tubmanburg deposit. LMC continued exploration work near the Sierra Leone border where substantial ore reserves have been established in the Bie Mountain iron deposits. LMC has 50% interest in the Bie Mountain project, and the remainder is held by NIOC, which is 50% owned by the Government. A 3-month drilling program in the Bie Mountains was completed in March 1974, with further work needed to be done on metallurgical properties of the ore. The work force and equipment from Bomi Hills might be utilized in this mine development, and only a short spur line would be needed to connect Bie Mountain with the existing Mano River-Bomi Hills-Monrovia iron ore railway. The road from Monrovia to Tubmanburg is an unpaved all-weather road maintained by LMC.

**Tungsten.**—The Liberian Geological Survey encountered stolzite, a lead tungstate in one of the concentrates from the Gondaja area. It was found associated with gold and scheelite. The presence of stolzite and scheelite indicates that a further investigation should be made in this area for lead and tungsten mineralization.[12]

## NONMETALS

**Barite.**—Universal Mineral and Oil Co., Ltd. (Universal) applied for a concession in 1973 to mine barite deposits near Totota. Their plan of operation called for a complete gravity survey of potential areas followed by pitting and trenching.

**Cement.**—The Liberia Cement Corp. (CEMENCO) was in the process of experiments for improving the durability of its cement. Fineness and setting time of the cement were observed to be in line with ASTM type 1 cement. A Liberian standard on portland cement has been elaborated. Chemical and physical subcommittees of the technical committee for portland cement were reviewing the standard.

**Diamond.**—Late in 1972, the Government canceled an agreement with Diamond Mining and Management Inc. (DMM) because the company failed to post a performance bond as required. DMM's concession area along the Lofa River in western Liberia was then transferred to Globex Minerals (Liberia) Inc. Globex was operating on a yearly basis rather than a seasonal one in 1974 and exploration was increased by auger drilling, testing, and prospecting. Exploration was planned for the entire concession of 31 exploration blocks, each consisting of approximately 50 acres. From January to December 1974, 10,611.09 carats were retrieved at the average rate of 1.29 carats per cubic yard of gravel. Phoenix Mining Corp. applied for a diamond mining concession during 1974. The Diamond Corp. of West Africa (DCWA), a subsidiary of De Beers of London, continued to operate the Diamond Appraisal Office. The first of two Liberian trainees was scheduled to leave for London early in 1975 for training by the DCWA. The Government levies a 15% tax on 20% of the export value of diamonds. This is a revenue-only measure, and there are no restrictions on the number of stones or carats which may be exported. The law is designed to encourage local production. Smuggling of diamonds into Liberia from neighboring Sierra Leone continued, and it was estimated that the actual sales are probably about five times the published figures. The Liberian diamond market was very sluggish in 1974.

## MINERAL FUELS

**Petroleum.**—Universal Mineral and Oil, Ltd. of the British West Indies (a Cayman Islands Co.) was granted a 2-year permit to conduct petroleum exploration in an 18,000-square-kilometer (6,950-square-mile) area in offshore Blocks "B" and "C" and an onshore part between Buchanan and the Sierra Leone border. Universal was expected to drill two wells in the next 18 months. Chevron Oil Co. and Frontier International Petroleum Co. re-

[12] Page 44 of work cited in footnote 3.

linquished rights to these areas in August 1973. Oxoco and MacClellen and Associates applied for an oil concession to explore for oil on Block "A." Crystal Oil Co. relinquished Block "D–1" because the basement was shallow and the drillable structures were located in deep waters. Aracca Petroleum Corp. completed a study and reinterpretation of seismic data on Block "D–2." Aracca plans to shoot additional lines in December 1974 to determine drilling targets. Merchants Petroleum in Los Angeles reported that it had purchased a 5% interest in acreage held by Aracca Petroleum in 1972. The Ashland-Amoco group relinquished its acreage in Liberia in August 1973.

# The Mineral Industry of Libya

By John L. Albright [1]

During 1974 the Libyan Government tightened its control on the petroleum industry, secured settlements with several foreign oil companies for nationalized facilities, marketed large volumes of crude oil, placed new emphasis on oil exploration by issuing production-sharing contracts to nine foreign companies, and developed plans for expansion of the country's petroleum refineries. Although Libya's oil prices were considered high by many potential customers and were pared somewhat during the year, numerous direct sales contracts were negotiated for the country's oil.

Libya's oil producers and exporters recorded a gradual decline in crude oil output and shipments during the year, attributable largely to an international slump in demand for petroleum and to the relatively high prices of Libyan oils. Despite the reduced production and shipments of oil during 1974, Libya's petroleum revenues reportedly escalated to $4.5 billion,[2] up 95% from 1973.[3] The Government's receipts from the oil exports averaged $8.25 per barrel in 1974, an increase of 184.7% over that of 1973.

A petrochemical complex based on natural gas will be built at Marsá al Burayqah. Ammonia and methanol plants being built there will begin operations in 1976 and 1977, respectively, and Libya may also build ethylene and urea plants at Marsá al Burayqah. The ethylene plant would be rated at 400,000 tons per year, and the urea facility would have a production capacity of 365,000 tons per year.

## PRODUCTION

Sales of liquefied natural gas (LNG) to European customers by Esso Standard Libya, Inc. (Esso), a subsidiary of Exxon Corp., were interrupted in October because of a price dispute; most of the company's gas output was in association with its crude oil production. The Government refused to allow Esso to flare its natural gas when the shipments fell off, and the company's crude oil and natural gas production was shut down for a period of 3 weeks until a new sales contract was signed and production activities resumed.

Crude oil production declined 30% during the year, attributable mainly to reduced demand and the relatively high costs of Libyan oil in world markets. Libya's crude oil output, which had averaged 2.2 million barrels per day during 1973, fell to 1.8 million barrels per day in June 1974, and declined further to average 1.5 million barrels per day for the year. Occidental of Libya, Inc., and Oasis Oil Co. of Libya, Inc., accounted for more than one-half of the total oil production.

| Crude | thousand 42-gallon barrels | 819,619 | 793,839 | 555,291 |
| Refinery products: | | | | |
| Gasoline | do | 606 | 511 | 618 |
| Kerosine and jet fuel | do | 374 | 516 | 345 |
| Distillate fuel oil | do | 717 | 840 | 760 |
| Residual fuel oil | do | 1,360 | 1,168 | 1,219 |
| Other | do | 103 | 172 | -- |
| Refinery fuel and losses | do | 158 | 42 | 51 |
| Total | do | 3,318 | 3,249 | 2,993 |

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, construction materials such as sand, gravel, crushed stone, brick and tile are produced. but information is inadequate to make reliable estimates of output levels. Natural gas liquids are also produced, but are blended with crude oil and are reported as a part of that total.

[2] Includes gas injected to reservoirs for repressuring.

## TRADE

While significant quantities of metal and nonmetal commodities were imported, Libya's mineral trade was dominated by crude oil and natural gas exports. Crude oil exports totaled 544 million barrels in 1974, or 1.5 million barrels per day, off 31.5% from 1973. More than 65% of Libya's oil exports were from the Ras es-Sidr and Az Zuwaytinah tanker loading facilities, and the remaining oil exports were made from Marsá al Burayqah, Ras Lanuf, and Tobruk. Oil shipments to Europe accounted for 84.3% of the total, with 10.4% to the Western Hemisphere and 5.3% to other countries. Libyan crude oil shipments to the United States in 1974 totaled 0.5 million barrels, off 99.4% from the 74.9 million barrels shipped during 1973. While oil exports decreased considerably during the year to most European refineries, oil shipments to Brazil increased by 165.6%, to 24.7 million barrels. Those to Japan totaled 23.6 million barrels in 1974, an increase of 266% from that of 1973. The Libyan National Oil Corp. (LINOCO) was the country's largest exporter, with 247.4 million barrels of crude oil, and Occidental of Libya, Inc., was second largest with 54.9 million barrels.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Libya signed an agreement with Guinea under which the two countries would develop bauxite reserves in Guinea. In 1974 Libya held discussions with Brazil, which included the construction of an aluminum facility in Libya.

### NONMETALS

**Cement.**—In an effort to reduce the country's growing dependence on foreign supplies of building materials, Libya during 1974 expanded its cement production capacity and developed plans to construct several new facilities. In 1974 a new plant began production at al Imgariaf with a yearly capacity of 365,000 tons. The yearly capacity of the al Khums cement plant was being expanded to 500,000 tons, after reaching 430,000 tons per year during 1973. Plans were finalized to construct a 1-million-ton-per-year cement plant at Souk el Khamis, in northwest Libya in the Tarabulus area. This $109 million plant will be built by two West German firms and placed in service in 1976. Plans were studied for the construction of a 525,000-ton-per-year plant to be built on the northeastern coast between Banghazi and Tobruk.

### MINERAL FUELS

**Natural Gas.**—The Libyan Methanol National Corp., a jointly owned venture of LINOCO and the Occidental Petroleum Corp., awarded a contract to Friedrich Uhde GmbH of West Germany to build a 1,000-ton-per-day-capacity methanol plant at Marsá al Burayqah. During the year construction began on the new plant, which was scheduled to be completed during 1977. It will cost approximately $88 million. Natural gas feedstocks will be processed at a rate of 50 million cubic feet per day. A contract was also awarded to Uhde for the construction of a 1,000-ton-per-day ammonia plant near the methanol

production facility; the ammonia plant will be completed in 1976, according to the terms of the contract.

Early in 1974 Occidental was planning a feasibility study for a $500 million natural gas processing plant in Libya, but abandoned the study later in the year. Occidental's management reportedly decided that it would be more profitable to reinject the gas to increase crude oil production from the firm's North African oil wells.

Libya's gross production of natural gas totaled 425 billion cubic feet in 1974, of which 345 billion cubic feet (81.2%) was consumed by the producing companies or marketed, and the remainder was flared.

**Petroleum.**—In February 1974 Libya announced the total nationalization of two U.S. oil companies operating in the country, American Overseas Petroleum, Ltd., (Amoseas), owned 50% by California Asiatic Oil Co. (an affiliate of Standard Oil Co. of California) and 50% by Texaco Overseas Petroleum Co., and the Libyan American Oil Co. (a subsidiary of Atlantic Richfield Corp.).[4] Mobil Oil Corp. and Exxon Corp. signed agreements with Libya in April 1974, each relinquishing 51% of their crude oil production operations to Libya. The agreements did not affect Esso's liquefied natural gas plant at Marsá al Burayqah.[5] Shell Exploratie en Productie Maatschappij (Libya) N.V. accepted Libya's 100% nationalization of its interest in the Oasis Oil group's Libyan concession and dropped all legal actions against the Government.[6] Libya nationalized the Shell operations after the company had rejected the Government's 51% nationalization order of 1973. Under the agreement, Shell will receive Libyan crude oil in compensation for its nationalized assets.

In November Libya reached final settlement with BP Exploration Company (Libya) Ltd., for all outstanding issues arising from the Government's December 1971 takeover of the BP concession in Libya. BP and the Nelson Bunker Hunt Petroleum Co. had jointly developed the Sarir oilfield.[7]

Libya encountered difficulties marketing its crude oil at January's $16 to $20 per barrel prices and reduced its contract prices to $14.50 to $14.80 per barrel, effective April 1, and further to $12.75 to $13.30, effective May 1.[8] Libya lowered its fourth-quarter 1974 contract prices for sales of government crude oil by about $0.80 per barrel, and the new contract prices averaged about $12.25 for the various grades of Libyan crudes.

During 1974 Libya signed seven production-sharing agreements with nine foreign oil companies, under which the companies will carry out offshore and onshore exploration over the next 4 to 6 years. According to the signed contracts, oil companies from Brazil, France, Italy, the United States, and West Germany will invest more than $500 million in searching for oil in Libya, and in all cases Libya will receive the major share of oil produced under these agreements.

Azienda Generale Italiana Pétroli S.p.A. (AGIP), a subsidiary of the Italian State oil concern Ente Nazionale Idrocarburi (ENI), signed an agreement covering one offshore and three onshore areas totaling nearly 144,000 square kilometers.[9] Production will be shared 85% to 15% from the onshore and 81% to 19% from the offshore areas.

Brazil's state-owned Petrobrás Internacional S.A. (Braspetro) signed an agreement with Libya under which the Brazilians will invest $35 million in two onshore areas in the Murzuk and Sirte Basins totaling 20,000 square kilometers. Libya will claim 85% of any commercial quantities of oil produced and Braspetro 15%.[10]

Esso Standard Libya, Inc., will invest $90 million in several offshore and onshore areas totaling 98,000 square kilometers, according to an agreement signed with LINOCO late in September. The onshore area covered 15,000 square kilometers and two offshore tracts covered 83,000 square kilometers.

During 1974 two production-sharing contracts were signed with several French companies. Cie. Française des Pétroles

(CFP) will spend $90 million exploring for oil in Libya in an area of approximately 100,000 square kilometers, of which about one-half is onshore near the Tunisian border and the remaining area is offshore Eastern Libya in the Mediterranean Sea. Production will be shared 81% to 19% in LINOCO's favor offshore and 85% to 15% onshore.[11] Essence et Lubrificiant de France (Elf) and Société Nationale des Pétroles d'Aquitaine (SNPA) signed an agreement with Libya for offshore and onshore exploration areas. The companies agreed to invest $45 million over a period of 4 years. In the event of commercial oil production, Libya will own 81% of the offshore and 85% of the onshore output.

Mobil and West Germany's Gelsenberg AG negotiated a production-sharing contract involving 6.75 million acres in seven onshore and two offshore areas. Production will be divided between the oil companies and Libya by the same percentages as in the AGIP-Libyan agreement. Mobil (75% interest in the venture) and Gelsenberg (25% interest) will spend a combined $70 million in their search for oil in Libya.

Occidental negotiated a production-sharing contract with LINOCO on 19 blocks covering about 45,000 square kilometers onshore. According to the terms of the agreement, LINOCO and Occidental will share all production from the area on a 81% to 19% basis. Production costs will be shared on the same basis. Most of the blocks are in the Sirte Basin, and some cover concessions previously relinquished by other companies.[12]

Both Mobil and Occidental reported oil discoveries in 1974. Mobil's A–1 well in Concession 13 tested 1,718 barrels per day of 34° gravity crude oil from a ¾-inch choke. The producing zone was at 2,575 meters. Occidental's well flowed 2,260 barrels per day of 48.6° gravity crude oil from about 2,900 meters through a 1-inch choke.

Oilfield drilling activity declined somewhat in 1974, when a total of 72 wells was drilled, compared with 82 wells during 1973. A total of 150,248 meters was drilled in 1974, off 4.3% from that of 1973. In 1974 oil production wells drilled totaled 46; 1 natural gas, 3 dry, and 22 other wells were also drilled. Crude oil producing wells totaled 599 during the year, of which 226 were flowing, 252 pumping, and 121 were assisted by gas injection.[13]

LINOCO took delivery of three oil tankers from foreign manufacturers in 1974, one from Japan and two from Spain. In June a Japanese shipyard completed the 86,000-deadweight-ton *Ras Lanuf* and delivered it to Libya; the ship had been ordered in 1972. LINOCO had also placed orders with Spain in 1972 for the construction of two 47,000-deadweight-ton oil tankers. Spanish shipyards finished constructing these two vessels, the *Hariga* and the *Sarir*, and delivered them to LINOCO during the first half of 1974.

Domestic consumption of petroleum products averaged 37,500 barrels per day in 1974, an 84% increase from the country's 1971 average daily consumption of 20,400 barrels.[14] Libya's petroleum refining capacity will be expanded to better serve domestic and foreign markets. An Italian construction firm completed building the $110 million petroleum refinery at Az Zawiyah, on Libya's west coast near Tarabulus, and the plant began commercial operations in the third quarter of the year at the initial rate of 40,000 barrels per day. The refinery's capacity will be increased to 60,000 barrels per day in 1975 and then doubled to 120,000 barrels per day under a $54 million contract which was awarded to the same Italian firm that built the original plant.

Contracts were also awarded to an Italian firm for the construction of an export petroleum refinery at Tobruk, to be onstream in 1978. The throughput capacity of the refinery has been raised to 220,000 barrels per day from the original plan of 130,000 barrels per day.

Preliminary discussions were held by Libya and Cyprus concerning the construction of a jointly-owned petroleum refinery on Cyprus. The proposal called for a 50,000-barrel-per-day plant which would market the plant's output in Cyprus and in Europe. Libya approved a project to share with Yugoslavia in the construction of a $300 million petroleum refinery at Koper, on the Adriatic coast. The project called for the plant to have a throughput capacity of 160,000 barrels per day.

# The Mineral Industry of Malaysia

By Keith L. Harris [1]

The Malaysian economy continued to grow in 1974 with the real gross national product (GNP) increasing by 6.3%. The export sector only increased 30%, compared with a 52% growth in 1973. A slumping demand in the second half of 1974 for timber and rubber, in reaction to the recession in industrial countries, lessened exports. Without the spectacular price increases for tin and petroleum, the value of exports would have been far lower. Imports increased 60%, primarily under inflationary pressures, causing the trade surplus to decline to $75 million [2] compared with $614 million in 1973.

The mineral industry provided 6% of the gross domestic product (GDP), up 1% over 1973, although the real growth of the mineral industry declined 9% because of reduced output.

Even with production down 6%, Malaysia continued to lead the world in tin output. At 67,048 long tons, Malaysian tin mine output was more than twice the output of the next largest tin producing country.

Until 1974, all of Malaysia's petroleum production came from Sarawak. However, in late 1974, the Exxon Oil Co. (Exxon) began production offshore Sabah. Although Exxon's initial output of only about 3,000 to 5,000 barrels per day was insufficient to stem declining production in Sarawak during 1974, the new field will have a capacity of 100,000 barrels per day after installation of a new production platform.

The Petroleum Development Act of 1974, enacted by the Malaysian Government in August, established a national oil company and vested in it the ownership of all Malaysian petroleum. Petroleum Nasional Berhad (Petronas) will control the exploration and exploitation of petroleum and all downstream operations such as refining and petrochemical manufacture.

The Malaysian Government announced a goal of at least 30% indigenous holdings in commercial and industrial firms by 1990. To achieve that goal, guidelines applying to any acquisitions by foreign interests of fixed assets in Malaysia were established.

## PRODUCTION

The production of all of Malaysia's major minerals declined substantially in 1974. Tin production declined 6% from 1973 owing to higher mining costs and depletion of tin deposits. Crude petroleum production declined 11% owing to technical difficulties at Sarawak's major oilfield, West Lutong. Bauxite and iron ore production declined 17% and 7%, respectively.

e Estimate. r Revised. p Preliminary. NA Not available.

[1] All production is from West Malaysia unless otherwise indicated in commodity table.

[2] In addition to the commodities listed, a variety of crude construction materials (clays, sand, gravel and stone), salt and fertilizer is produced, but production is not reported and available information is inadequate for the formulation of reliable estimates of output levels.

[3] Estimates based on exports of copper concentrates.

[4] Based on export figures.

[5] Includes concentrates imported for refining and reexport. These imports yielded 11,743 long tons of metal in 1972.

## TRADE

Tin, second only to rubber as a major foreign exchange earner, was the leading export among mineral commodities. A 5% increase in the volume of tin exports and a spectacular 66% rise in the average value combined to give tin more than 15% of the total export value in 1974. The United States (29%) and Japan (22%) were the major recipients of Malaysian tin.

The volume of petroleum exports decreased because of production difficulties but the value of exports increased 176% to $315 million, or about 8% of the total export value.

## COMMODITY REVIEW

### METALS

**Tin.**—Malaysia continued to lead the world in production, smelting, and exports of tin in 1974. A total of 67,048 long tons of tin-in-concentrate was mined, the lowest level since 1965 and down 6% from 1973 production because of depletion of tin deposits and higher mining costs. At yearend there were 56 tin dredges, 932 gravel pump mines, and 37 opencast, underground and other miscellaneous mines in operation, reflecting a 5% increase in total active mines through the year. Gravel pump operations, worked for the most part by the same families that own the mines, accounted for 53% of the concentrates produced, while dredging by corporations furnished another 33%. Opencast mines brought in 4% of the ore produced, underground mines accounted for 4%, and the remaining 6% came from miscellaneous sources. The tin mining labor force increased to 44,050 workers at yearend from 41,744 yearend 1973.

Metal production, at 85,748 long tons, was 7% above the 1973 level. Exports of metal increased to 83,883 long tons from 80,256 long tons in 1973.

In a move to increase domestic control over its economy and correct racial economic imbalance, the Malaysian Government announced a policy of regulating foreign investment in future company mergers and takeovers. The goal for the tin industry would be 70% domestic ownership by 1990. The Malaysian national's (*Bumiputra*) share will be increased from 2% to 30%, with the Chinese and Indian share at 40%, and foreign ownership at 30%. Tin production has been dominated by Chinese-owned gravel pumps and European-controlled dredging operations. No takeovers or expropriations were envisioned. *Bumiputra* will secure a larger share of new mining areas for gravel pump ventures. The flow of foreign investment capital into the Malaysian economy will continue to be promoted to supplement capital requirements for rapid development.

In April, the Government imposed a variable surcharge on tin as part of a broad-based antiinflation program. The tax ranged from 0% to 5% depending upon the price, starting when the price went above M$700 per picul (218 cents per pound) and increasing to 5% when the price went above M$1,200 per picul (374 cents per pound).

Perbadanan Nasional Bhd. (Pernas), Malaysia's national mining corporation, announced two tin finds, one off the coast of Malacca and the other offshore from Perak, in its 41,000-square-kilometer concession off Malaysia's west coast. The size of the finds was not published although the Malacca find was termed substantial. Further drilling was undertaken to establish the size of the Perak deposit. Pernas was negotiating with overseas companies to exploit the deposits.

A $500,000 feasibility survey of Selangor's Kuala Langat forest reserve indicated rich, deep-seated deposits spread over 16,000 hectares. Many deposits occur below 60 meters, well below the maximum operating depth of existing dredges, indicating that the mining of the deposits will cost more than mining the shallow alluvial deposits of the Kinta Valley, the area contributing most to Malaysia's tin output during this century. Four dredges operated in the Kuala Langat District at yearend, Selangor Dredging Bhd. operated two, and Petaling Tin Bhd. and Conzinc Riotinto Malaysia Sdn. Bhd. each operated one. The Selangor State Government planned to operate three dredges in the area, the first, costing over $5 million, to go into operation in mid-1976.

Pahang State made available about 100,000 hectares for tin prospecting in the Pahang Tenggara Development area. The State of Kelantan signed an agreement with Anglo-Oriental (Malaysia) Sdn. Bhd. for mineral prospecting of an area larger than 20,000 hectares. Kelantan has not been a major mining state.

Production of tin-in-concentrate by Berjuntai Tin Dredging Bhd. increased 7% to 3,701 long tons during its fiscal year. Building of the No. 8 dredge continued on schedule with launching of a pontoon in November. The dredge will replace the No. 1 dredge which has been operating in Selangor for about 50 years. The estimated cost of the dredge, at $7 million, was about half the total cost for the seven other dredges the company owned.

Southern Kinta Consolidated Ltd., with an output of about 1,600 long tons of concentrate in 1974, was refused renewal of a mining title to 40 hectares in the Rasa sec-

tion of Selangor by the Selangor State Government. Upon appeal, Southern Kinta was informed that the title had been granted to another company. The dredgable portions of the area would have provided up to 2 years of production for the Rasa dredge.

Tronoh Mines, Ltd. and Perak State Development Corp. (PSCD) formed a joint venture to exploit tin reserves in the Batang Padang area adjacent to Tronoh's existing leases. The company, owned 70% by Tronoh and 30% by PSDC, was the first joint venture between the private sector and a State government. A dredge of 600,000 cubic meters monthly capacity will be ordered to mine the area estimated to have reserves of about 100 million cubic meters grading 0.16 kilogram per cubic meter.

Tronoh later was included in another joint venture in which the Selangor State Development Corp. holds 55%, Charter Consolidated (Malaysia), Ltd. 36%, and Tronoh 9%, that will develop deep-seated reserves in southern Selangor. Substantial work will be necessary to complete a feasibility study and mining plan but if findings are acceptable, mining operations could start in 5 years.

Gopeng Consolidated Ltd. acquired 225 hectares of mining land in the Mukim area, Chenderiang district of Batang Padang, Perak, subject to 30% *Bumiputra* participation required by Malaysia's new economic plan. The need to replenish reserves was evident from Gopeng's declining production, down 12% from 1973 to 2,377 long tons of concentrate in 1974.

Conzinc Riotinto Malaysia Sdn. Bhd., a joint venture between The Rio Tinto-Zinc Corp. Ltd. (41.25%), Cozinc Riotinto of Australia Ltd. (CRA) (13.75%), and Bethlehem Steel Corp. (45%), experienced numerous production problems with its new dredge requiring modifications to the treatment plant and the design of the dredge itself. Production in 1974 was 350 long tons below its designed capacity of 1,000 long tons of concentrate per year.

Pacific Tin Consolidated Corp., the only U.S. company mining tin in Malaysia, showed decreases in total yardage treated and tin recovered in 1974. Dredge No. 8 was shutdown from May to November because of structural failure and collapse of the dredge's digging ladder.

Syarikat Eastern Smelting Bhd. will move its smelting facilities from Penang Island to the mainland. Although the move would allow expansion of the facilities, the main reason for the move was to allow redevelopment of the present 5-hectare site into a building complex.

**Titanium.**—The Trengganu State Economic Development Corp. announced the formation of Syarikat Lombong Titanium Trengganu Sdn. Bhd., a joint venture with local industry, which began mining ilmenite in February at Bukit Payong. Production of 10,000 tons per year was expected.

## NONMETALS

**Cement.**—The Perlis State Government was studying the feasibility of establishing a second cement plant because of a cement shortage. The State's first cement plant at Chuping, a joint venture between the State Development Corp. and the private sector, was expected to go into full production by late 1975 with an output of 20,000 tons per month.

A new cement plant with a capacity of 300,000 tons per year to be located in Sarawak to supply the needs of both Sarawak and Sabah was under study.

## MINERAL FUELS

**Petroleum.**—In August, the Malaysian Government established a national oil company Petronas giving it ownership of all oil deposits, exclusive rights for petroleum exploration and exploitation, control of downstream activities, and licensing powers. All companies engaged in these activities were given 6 months from October 1 to obtain permission to continue their activities. Although terms of the new contracts were not finalized, the renegotiated contracts will become production-sharing contracts in which the production costs will be recovered from the first 40% of the production and the remainder will be split two-thirds for the Government and one-third for the companies.

Crude oil production, which up to late 1974 had all come from long established Shell Oil Co. (Shell) Sarawak operations, averaged about 80,000 barrels per day. In late 1974, Exxon began production at its Tembungo Field, about 85 kilometers northwest of Kota Kinabala, Sabah, at a rate of 3,000 to 5,000 barrels per day.

Production of 100,000 barrels per day was anticipated after installation of a new production platform.

Shell's two Sabah Fields, Semarang and Erb West, were rated commercial and production plans to bring Semarang onstream by mid-1975 at an initial rate of 30,000 barrels per day via a 30-mile submarine pipeline to a Labuan Island terminal were formulated. Production at the Erb West Field will follow at about 120,000 barrels per day. The Labuan terminal will have a 150,000-barrel-per-day capacity with a single-buoy mooring system 5 miles offshore. Jetty and mooring facilities for tankers up to 200,000 tons will be provided. Total reserves for the Semarang and Erb West Fields were placed at 200 million barrels.

The Continental Oil Co. (Conoco) group, consisting of Conoco (50%), Broken Hill Pty Co., Ltd. (BHP) (25%), and El Paso Natural Gas Co. (25%), continued to explore the Sotong structure, 160 kilometers off Kuantan on West Malaysia's east coast, making additional discoveries of oil and gas.

North of Conoco's Field, and about 260 kilometers northeast of Kuala Trengganu, Exxon struck oil at its Pulai 1 wildcat well. The well tested over 2,500 barrels per day. Two 24-slot drilling and production platforms were ordered. The field was expected to come onstream in late 1975.

# The Mineral Industry of Mexico

By Ronald J. DeFilippo [1]

Despite declining world metal and mineral prices, Mexico continued to expand its mining industry. Much of the Government's share of profits from its partial or complete ownership in various phases of the mineral industry was reinvested for further development. Furthermore, the Government provided investment capital and support to small- and medium-sized mining operations through the governmental Mining Development Commission (Comision de Fomento Minera).

The mineral industry contributed 1.6% of the gross domestic product (GDP). Banco de Mexico, S.A., estimated the growth rate of the mining industry at 11% in 1974 and that of the petroleum industry at 15%, compared with 1973 growth rates of 8.8% and 1.4%, respectively. Most mineral commodities showed modest to significant gains in production over that of 1973. As a whole, Mexico's economy has shown steady progress since 1972 through a series of investments in key sectors such as mining, petroleum, and fertilizers.

In the late 1960's, Mexico began the policy of "Mexicanization," which required that all mining ventures be at least 51% Mexican owned, or at least 66% Mexican owned if the company wished to bid for concessions owned by the Ministry of National Patrimony. This policy was put into effect gradually but, by the end of 1974, 98% of the country's mineral output (almost 800 mining companies) was controlled or owned by Mexicans. Nationalist sentiment regarding control of the mining industry was relatively moderate; foreign interests still had a role if they were willing to comply with article 27 of the Mexican Constitution regarding the exploitation and use of mineral resources.

On the international level, representatives of Mexico's mercury producers met with those of other major world producers in an attempt to set a floor price for mercury. However, Mexico's internationalism centered largely on other Latin American countries. The Mexicans were promoting the Latin American Free Trade Association, which was envisioned as a combination common market and producer cartel of Latin American countries, with Mexico providing the leadership.

## PRODUCTION

Of 12 selected metals produced in 1974, only the mine production of nickel, silver, tungsten, and zinc showed lower output than that of 1973. The largest gainers among the major metals were copper, up 3%; iron, 7%; lead, 22%; and manganese, 11%. Among the lower volume metals, cadmium gained 33%; gold, 1%; mercury; 20%, and tin; 37%. Silver and zinc mine production dropped 3% each, while tungsten and nickel dropped 11% and 22%, respectively.

The total production of nonmetallic minerals rose 4% over 1973. Major increases were posted by barite, up 6%; clays, 5%; diatomite, 21%; feldspar, 91%; fluorspar, 2%; dolomite, 4%; quartz, quartzite, and glass sand, 25%; strontium minerals, 62%; sulfur, 44%; talc, 26%; and wollastonite, 25%. Losses in production of major nonmetallic minerals were sustained by graphite, down 4%; magnesite, 23%; perlite, 10%; and sodium sulfate, 15%. Production of bituminous coal increased 21% over 1973, while crude pertoleum production increased 27%.

[1] Physical scientist, Division of Nonferrous Metals.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, lime, pumice, and additional types of crude construction materials are also produced, but output is not reported, and available information is inadequate to make reliable estimates of output levels.

[2] Calculated white-arsenic equivalent of metallic-arsenic content of products reported.

[3] For export.

[4] Calculated on the basis of ore containing 60% iron, from reported metal content of mine production.

[5] Calculated on the basis of ore containing 36% manganese, from reported metal content of mine production.

[6] Exports.

[7] Series revised to include tin recovered from imported ores; smelter tin output from ores of Mexican origin was as follows, in long tons: 1972—348, 1973—287, and 1974—394.

[8] Excluding that for cement production.

## TRADE

Preliminary data indicated that the 1974 mineral export value was over twice that of 1973. Metals experienced a two-fold increase in value, while fuels increased about fourfold. The following mineral exports increased twice or more in value: bismuth, lead, refined zinc and zinc in concentrate, sulfur, and petroleum. The export values of copper and natural gas were lower than those in 1973.

| Asbestos | 34 | 16 | Mainly to Guatemala. |
| Barite and witherite | 132,263 | 132,565 | All to United States. |
| Cement | 267,647 | 170,400 | United States 168,928; Costa Rica 753. |
| Clays and clay products: | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite | 211 | 23 | New Zealand 20; United States 2. |
| Fuller's earth and other earth | 10,259 | 11,586 | Brazil 4,079; United States 2,451; Peru 1,132. |
| Kaolin (china clay) | 94 | 259 | Cuba 178; Venezuela 55; Colombia 16. |
| Other | 132 | 179 | Peru 44; Panama 44; Colombia 24. |
| Products: | | | |
| Refractory | 142 | 20 | Guatemala 19; United States 1. |
| Nonrefractory | 81,664 | 173,406 | United States 172,806; Guatemala 200. |
| Diamond, industrial carats | 5,000 | 5,000 | All to United States. |
| Diatomite and other infusorial earth | 9,339 | 9,081 | Argentina 2,316; Brazil 1,980; Venezuela 1,367. |
| Feldspar | 102 | -- | |
| Fertilizer materials: | | | |
| Crude, phosphatic | 6,482 | 1,973 | All to United States. |
| Manufactured: | | | |
| Nitrogenous, including urea | 134,978 | 77,899 | Nicaragua 20,889; Peru 17,340; Guatemala 9,494. |
| Phosphatic | 124,625 | 98,754 | United States 44,505; Chile 18,000; Brazil 14,992. |
| Potassic | 525 | 289 | Mainly to Guatemala. |
| Other, including mixed | 942 | 446 | United States 394; El Salvador 25. |
| Ammonia | 190 | 3,466 | Guatemala 3,038; United States 384. |
| Fluorspar: | | | |
| Acid grade | 390,180 | 382,810 | United States 378,845; Netherlands 3,702. |
| Metallurgical grade | 631,793 | 635,537 | United States 504,829; Canada 120,099; Italy 6,671. |
| Graphite, natural | 44,359 | 57,228 | Mainly to United States. |
| Gypsum: | | | |
| Crude thousand tons | 1,464 | 1,187 | United States 958; Canada 74; Japan 73. |
| Calcined | 17 | 53 | All to United States. |
| Lime | 1,167 | 1,205 | United States 855; Costa Rica 120; El Salvador 100. |
| Mica | 10 | -- | |
| Perlite | 916 | 1,183 | Venezuela 314; Colombia 276; Brazil 247. |
| Precious and semiprecious stones, except diamond kilograms | 289 | 3,050 | Australia 2,265; United States 299; Italy 198. |
| Salt thousand tons | 4,969 | 3,929 | Japan 2,861; United States 780. Canada 274. |
| Sodium and potassium compounds: | | | |
| Sodium compounds: | | | |
| Sodium carbonate | 833 | 797 | Chile 221; Argentina 200; Honduras 200. |
| Sodium hydroxide | 3,202 | 5,060 | Argentina 4,934; El Salvador 75; Guatemala 29. |
| Sodium sulfate: | | | |
| Natural (bloedite) | 253 | -- | |
| Other | 47,716 | 65,785 | Brazil 47,044; Venezuela 7,439; Colombia 4,608. |
| Potassium compounds | 4 | 28 | Guatemala 21; Belize 5. |

See footnotes at end of table.

## Table 2—Mexico: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Stone, sand and gravel: | | | |
| Dimension stone | 10,719 | 15,210 | Mainly to United States. |
| Crushed rock | 13,703 | 25,504 | All to United States. |
| Limestone, dolomite, calcite | 4,067 | 4,403 | Mainly to United States. |
| Quartz and quartzite | 3,386 | 5,735 | All to United States. |
| Sand: | | | |
| Construction | 439 | 3,371 | United States 3,319; West Germany 52. |
| Glass | 26,555 | 28,074 | Guatemala 28,029. |
| Stone, industrial, not specified | 20 | -- | |
| Strontium minerals | 24,332 | 21,358 | All to United States. |
| Sulfur: | | | |
| Elemental, all forms | 479,407 | 842,962 | United States 365,944; United Kingdom 171,475; France 71,482. |
| Sulfuric acid | 4,572 | 3,906 | Guatemala 3,851; Costa Rica 24; United States 15. |
| Talc, steatite, soapstone, pyrophyllite | 4 | 542 | All to United States. |
| Wollastonite | 544 | 2,102 | United States 1,786; Guatemala 225. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural (including gilsonite) | 31 | 37 | Spain 21; Denmark 10. |
| Carbon black | 1,306 | 789 | Costa Rica 505; Trinidad and Tobago 165; Brazil 54. |
| Coal and coke | (2) | 2 | All to United States. |
| Gas, natural -- million cubic feet | 9,830 | 1,971 | Do. |
| Petroleum refinery products: | | | |
| Gasoline thousand 42-gallon barrels | -- | 158 | Mainly to Chile. |
| Kerosine do | -- | 109 | All to Chile. |
| Distillate fuel oil thousand 42-gallon barrels | 40 | 192 | United States 147; Greece 11; United Kingdom 5. |
| Residual fuel oil do | 5,055 | 4,826 | United States 4,463; Canada 263; Liberia 46. |
| Lubricants do | 1 | 1 | Mainly to Guatemala and United States. |
| Other: | | | |
| Liquefied petroleum gas do | 8 | (2) | Mainly to United States and Belize. |
| Mineral jelly and wax do | 12 | 37 | Mainly to United States. |
| Asphalt do | 4,086 | 2,629 | Do. |
| Total do | 9,202 | 7,952 | |

r Revised.

## Table 3.—Mexico: Imports of mineral commodities [1]

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 25,986 | 17,950 | Mainly from United States. |
| Oxide and hydroxide | 88,996 | 91,922 | United States 82,628; West Germany 4,257; Switzerland 3,955. |
| Metal, including alloys, all forms | 13,672 | 36,971 | United States 30,372; Yugoslavia 2,512; Canada 997. |
| Antimony metal, including alloys, all forms kilograms | 266 | -- | |
| Arsenic: | | | |
| Natural sulfides | -- | 58 | All from United States. |
| Trioxide, pentoxide, acids | 3 | 1 | Mainly from United States. |
| Metal, including alloys, all forms | 11 | 6 | Mainly from France. |
| Beryllium metal, including alloys, all forms kilograms | 3,044 | 2,600 | Mainly from United States. |
| Bismuth metal, including alloys, all forms do | 1,783 | 4,636 | United States 3,631; Italy 1,005. |
| Cadmium metal, including alloys, all forms do | 56 | 33 | West Germany 20; United States 13. |
| Chromium: | | | |
| Chromite | 26,144 | 36,793 | All from United States. |
| Oxide and hydroxide | 330 | 4 | Mainly from United States. |

See footnotes at end of table.

## Table 3—Mexico: Imports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Cobalt: | | | |
| Oxide and hydroxide | 88 | 134 | Belgium-Luxembourg 104; United States 30. |
| Metal, including alloys, all forms | 27 | 44 | Belgium-Luxembourg 40; United States 3. |
| Copper metal, including alloys: | | | |
| Scrap | 392 | 1,531 | United States 583. |
| Copper sulfate | 2 | 2 | NA. |
| Unwrought | 116 | 495 | United States 392; Italy 79; West Germany 17. |
| Semimanufactures | 964 | 1,535 | United States 815; West Germany 279; United Kingdom 78. |
| Gold metal, unworked or partly worked troy ounces | 3,524 | 4,598 | West Germany 850; United States 200; Netherlands 199. |
| Iron and steel: | | | |
| Ore and concentrate, gross weight | 109,667 | 74,671 | Panama 73,615; United States 555; France 500. |
| Metal: | | | |
| Scrap | 527,380 | 966,854 | United States 960,164; Canada 2,517. |
| Pig iron, including cast iron | 11,795 | 119,141 | United States 85,718; Switzerland 32,091; Brazil 1,064. |
| Sponge iron, powder, shot | 977 | 1,606 | United States 1,220; Sweden 138; France 130. |
| Ferroalloys | 3,115 | 4,419 | United States 3,582; Brazil 315; Republic of South Africa 312. |
| Steel, primary forms | 8,197 | 12,233 | United States 6,764. |
| Semimanufactures [3] | 210,295 | 374,219 | United States 201,743; Canada 44,207; West Germany 26,149. |
| Lead: | | | |
| Oxides | 183 | 90 | United States 15. |
| Metal, including alloys, all forms | 127 | 118 | United States 29; United Kingdom 4. |
| Magnesium metal, including alloys, all forms | 1,655 | 2,791 | United States 2,036; West Germany 355; Norway 250. |
| Manganese: | | | |
| Ore and concentrate, gross weight | 2,789 | 8,342 | Mainly from United States. |
| Oxides | 1,937 | 1,417 | United States 657; Japan 553; Belgium-Luxembourg 201. |
| Mercury 76-pound flasks | 25 | 26 | Netherlands 8; United States 8; West Germany 6. |
| Molybdenum: | | | |
| Ore and concentrate, gross weight | 433 | 522 | United States 423; Canada 63; Chile 33. |
| Metal including alloys, all forms | 6 | 9 | United States 6; West Germany 2. |
| Nickel: | | | |
| Matte, speiss, similar materials | 1,147 | 400 | United States 189; Cuba 94; France 82. |
| Metal including alloys, all forms | 1,241 | 1,613 | United States 1,234; France 84; West Germany 69. |
| Platinum-group metals, all forms: | | | |
| Palladium troy ounces | 6,900 | 6,809 | United States 5,200; Switzerland 994; U.S.S.R. 294. |
| Platinum do | 794 | 848 | United States 675; U.S.S.R. 107; West Germany 60. |
| Other do | 447 | 657 | United Kingdom 354; West Germany 168; United States 102. |
| Rare-earth metals: | | | |
| Oxides and fluorides | 49 | 50 | United States 23; Canada 9; France 8. |
| Metals including alloys kilograms | 26 | 48 | All from United States. |
| Selenium, elemental do | 442 | 3,807 | United States 1,846; Canada 1,222; United Kingdom 800. |
| Silver metal, including alloys troy ounces | 15,071 | 43,111 | Sweden 29,112; United States 11,791; West Germany 1,048. |
| Tantalum metal, all forms kilograms | 26 | -- | |
| Tellurium, elemental do | 192 | 278 | All from United States. |
| Tin: | | | |
| Ore and concentrate, gross weight long tons | 1,455 | 2,963 | United States 2,719; Bolivia 218. Australia 26. |
| Oxides do | 77 | 88 | United Kingdom 61; United States 19; West Germany 7. |
| Metal including alloys, all forms do | 458 | 212 | United States 203. |
| Titanium: | | | |
| Ore and concentrate, gross weight | 1,183 | 1,724 | Australia 1,595; United States 108; West Germany 20. |
| Oxides | 337 | 169 | West Germany 21; United States 1. |
| Slag and residues | 23,411 | 28,379 | All from Canada. |

See footnotes at end of table.

## Table 3—Mexico: Imports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Titanium—Continued | | | |
| Metal, including alloys, all forms | 9 | 22 | Mainly from United States. |
| Tungsten metal, including alloys, all forms | 26 | 37 | Do. |
| Uranium and thorium oxides kilograms | 15 | [3]1 | All from United States. |
| Vanadium pentoxide | 25 | 110 | United States 94; Switzerland 15. |
| Zinc: | | | |
| Oxides | 64 | 44 | United States 41. |
| Metal including alloys, all forms | 134 | 88 | United States 32; West Germany 19; Canada 14. |
| Zirconium ore and concentrate, gross weight | 3,367 | 5,216 | United States 4,302; Australia 913. |
| Other: | | | |
| Ore and concentrate, n.e.s | 302 | 8 | Mainly from United States. |
| Ash and residue containing nonferrous metals | 75 | 100 | United States 92. |
| Oxides, hydroxides, and peroxides of metals, n.e.s | 578 | 735 | United States 657; France 42; West Germany 10. |
| Metals, including alloys, all forms: | | | |
| Metalloids: | | | |
| Phosphorus, elemental (white, black, red) | 18,815 | 19,400 | United States 19,169; Canada 96; United Kingdom 85. |
| Silicon | 639 | 1,059 | United States 405; France 352; United Kingdom 297. |
| Other, n.e.s | 4 | 21 | United States 10. |
| Alkali and alkali earth | 2,981 | 3,355 | United States 3,249. |
| Pyrophoric alloys kilograms | 1,778 | 1,925 | United States 1,270; Austria 100; France 44. |
| Base metals, including alloys, all forms, or n.e.s | 166 | 274 | United States 260; Belgium-Luxembourg 6; West Germany 5. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s. | | | |
| Pumice, emery, natural corundum, etc | 1,153 | 1,659 | United States 1,118; West Germany 109; Netherlands 91. |
| Dust and powder of precious and semiprecious stones, except diamond kilograms | 389 | 14 | Switzerland 9; United Kingdom 3; United States 2. |
| Grinding and polishing wheels and stones | 226 | 177 | United States 121; United Kingdom 24; West Germany 11. |
| Asbestos, crude | 39,448 | 51,400 | Canada 25,814; United States 13,091; Republic of South Africa 7,900. |
| Barite and witherite | 140 | 63 | United States 16. |
| Boron materials: | | | |
| Crude natural borates | 66 | 58 | United States 18; Argentina 10. |
| Oxide and acid | 1,610 | 1,686 | United States 1,623; United Kingdom 50. |
| Bromine | 192 | 200 | United States 108; United Kingdom 5. |
| Cement | 2,609 | 61,699 | United States 4,654; West Germany 979. |
| Chalk kilograms | -- | 182 | Japan 174; United States 8. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s.: | | | |
| Fuller's earth | 537 | 639 | United States 132. |
| Kaolin (china clay) | 28,980 | 34,569 | United States 33,760; United Kingdom 341; Canada 203. |
| Refractory | 96,440 | 111,095 | United States 107,990; France 1,350; United Kingdom 268. |
| Other | 1,283 | 1,949 | United States 1,067. |
| Products: | | | |
| Refractory (including nonclay bricks) | 3,333 | 4,347 | United States 2,394; West Germany 162; France 129. |
| Nonrefractory value, thousands | $317 | $211 | United States $6; Italy $3. |
| Cryolite and chiolite | (4) | 11 | Denmark 3. |
| Diamond: | | | |
| Gem, not set or strung carats | 24,985 | 12,810 | Belgium-Luxembourg 5,490; United States 3,460; Israel 1,490. |
| Industrial thousand carats | 2,040 | 5,200 | United States 4,355; Netherlands 575; Spain 250. |
| Powder do | 405 | 3,065 | United States 1,965; Ireland 80; Belgium-Luxembourg 50. |

See footnotes at end of table.

## Table 3—Mexico: Imports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Diatomite | 156 | 258 | West Germany 20; United States 2. |
| Feldspar and nepheline syenite | 1,902 | 2,724 | United States 2,349; Canada 375. |
| Fertilizer materials: | | | |
| Crude: | | | |
| Nitrogenous [5] | 15,398 | 10,998 | Chile 10,640; United States 358. |
| Phosphatic rock, thousand tons | 1,147 | 1,290 | United States 829; Morocco 432; West Germany 20. |
| Manufactured: | | | |
| Nitrogenous | 248,750 | 218,869 | United States 96,346; Netherlands 42,104; Belgium-Luxembourg 29,978. |
| Phosphatic | 1,519 | 4 | All from United States. |
| Potassic | 82,717 | 98,244 | Mainly from United States. |
| Other, including mixed | 5,137 | 2,361 | Chile 2,093; United States 226; Canada 37. |
| Ammonia | 150,759 | 206,714 | United States 193,261; Australia 11,952. |
| Fluorspar | 4 | 10 | Mainly from West Germany. |
| Graphite, natural | 709 | 294 | United States 238; Canada 55. |
| Gypsum | 20,369 | 28,904 | United States 450; Italy 60; United Kingdom 11. |
| Iodine | 154 | 150 | Chile 77; Japan 39; West Germany 27. |
| Lime | 3,138 | 4,736 | United States 2,440. |
| Magnesite | 952 | 7,066 | Brazil 6,011; United States 1,036. |
| Mica: | | | |
| Crude, including splittings and waste | 213 | 257 | Brazil 204; United States 28; Argentina 22. |
| Worked, including agglomerated splittings | 39 | 28 | United States 25; West Germany 2. |
| Pigments, mineral: | | | |
| Natural, crude | 45 | 18 | United States 3; West Germany 1. |
| Iron oxides, processed | 24 | 84 | United States 80; West Germany 3. |
| Precious and semiprecious stones, except diamond: | | | |
| Natural, kilograms | 360 | 444 | United States 216; West Germany 208. |
| Manufactured, do | 4,558 | 2,492 | Switzerland 1,300; France 1,069; United States 100. |
| Pyrite, unroasted | 9 | 32 | West Germany 25; United States 7. |
| Salt | 640 | 654 | United States 523. |
| Sodium and potassium compounds, n.e.s.: | | | |
| Caustic soda | 15,026 | 36,277 | United States 33,749. |
| Caustic potash, sodic and potassic peroxides | 1,385 | 2,002 | United States 1,419; West Germany 469. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked | 5,897 | 7,085 | Italy 5,393; Guatemala 1,011; United States 177. |
| Worked: | | | |
| Slate | 584 | 692 | Italy 683; Spain 8. |
| Paving and flagstone | 59 | 133 | NA. |
| Other | 5,684 | 6,796 | United States 1,045; Brazil 282; Argentina 126. |
| Dolomite, chiefly refractory grade | 6 | 9 | Mainly from United States. |
| Gravel and crushed rock | 6,574 | 5,287 | United States 3,011; Belgium-Luxembourg 126; Italy 55. |
| Limestone | 55 | -- | |
| Quartz and quartzite | 1,554 | 1,582 | Belgium-Luxembourg 1,180; United States 288; Switzerland 53. |
| Sand, excluding metal bearing | 216,000 | 287,391 | United States 283,077; Canada 1,660; Japan 845. |
| Strontium | 11 | (4) | All from United States. |
| Sulfur: | | | |
| Elemental: | | | |
| Other than colloidal | 333 | 518 | United States 200. |
| Colloidal | 176 | 105 | United States 83; Canada 14; West Germany 3. |
| Sulfur dioxide, kilograms | 233 | 212 | United States 52. |
| Sulfuric acid and oleum | 2,451 | 21,244 | Switzerland 14,850; Venezuela 4,686; United States 554. |
| Talc, steatite, soapstone, pyrophyllite: | | | |
| Pyrophyllite | 269 | 315 | All from United States. |
| Steatite | 80,918 | 89,253 | United States 84,734; Italy 2,686; Canada 1,191. |
| Talc | 210 | 368 | United States 216; Italy 80. |
| Vermiculite | 504 | 591 | United States 405. |

See footnotes at end of table.

## Table 3—Mexico: Imports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Other nonmetals, n.e.s.: | | | |
| Crude: | | | |
| Meerschaum, amber, jet kilograms | 26 | | |
| Other do | r 5,651 | 130,028 | Australia 125,830; United States 205. |
| Slag, dross, and similar waste, not metal bearing: | | | |
| From iron and steel manufacture do | 55 | 5,040 | All from United States. |
| Slag and ash, n.e.s do | 20,300 | 93,120 | Mainly from United States. |
| Oxides and hydroxides of magnesium, strontium, and barium | 488 | 533 | United States 457; Canada 51; France 14. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | 1,068 | 511 | United States 8. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 701 | 1,013 | All from United States. |
| Carbon black and gas carbon: | | | |
| Carbon black | 1,557 | 2,114 | United States 874; Canada 831; West Germany 174. |
| Gas carbon | 3 | 226 | All from United States. |

r Revised. NA Not available.
[1] Includes free trade materials in totals but excluded in principal sources.
[2] Does not include ingots of high carbon and alloy steel.
[3] Uranium oxide.
[4] Less than ½ unit.
[5] May include a small quantity of manufactured materials.
[6] Includes that derived from natural gas plants.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Alumínio S.A. de C.V., located in Veracruz remained Mexico's only primary aluminum producer. Production of aluminum ingot totaled 40,862 tons, up 4.3% from that of 1973. The plant was reported to be operating at 92.5% of rated capacity. Work proceeded on doubling the plant capacity by 1977. In December, Mexico and Jamaica signed an agreement to establish a joint industrial complex to produce bauxite, alumina, and primary aluminum. The bauxite and alumina plants would be located in Jamaica and would be 51% Jamaican owned. The aluminum plant, with a capacity of 120,000 tons per year of aluminum ingot, would be located in southeastern Mexico and would be 51% Mexican owned.

**Copper.**—Copper mine production increased 3% over that of 1973 to 82,670 tons, whereas refinery production increased 19% to 68,201 tons.

Industria Minera Mexico, S.A. (formerly Asarco Mexicana, S.A.), continued work on the vast La Caridad project in Nacozari, Sonora, where reserves were estimated at 700 million tons grading 0.7% copper. An initial production of 83,000 tons per year was expected by 1976. A new consortium, Cobre de Sonora, S.A., was formed in October to exploit the Santa Rosa and Pilares properties located in Sonora; The Anaconda Company and Phelps Dodge Corp. own a minority interest, with a Mexican majority interest. Comision de Fomento Minera, which owns 13%, encouraged the formation of the consortium. Cobre de Sonora took over Industria Minera's ownership in the La Caridad project late in the year. The Santa Rosa and Pilares properties have ore reserves of 160 million tons grading about 0.8% copper with molybdenum and silver values; the properties should eventually produce 37,000 tons of copper annually. Investment will be about $130 million.[2]

A major copper-mining project was started at Uruapan, Michoacan on the Pacific coast by Minera Cuprifera la Verde, S.A. Ore reserves were estimated at 120 million tons grading 0.7% copper. Lytton Minerals Ltd., jointly owned by Anglo-American Corporation of Canada Ltd. and Hudson Bay Mining & Smelting Company Ltd., hold a 48% interest.

Aerial and geochemical surveys for copper mineralization were underway near San Isidro, Territorio Baja California Norte. In the south, a major copper deposit in the State of Chiapas was officially announced.

A shortage of refinery capacity was a major obstacle to increased copper production. To alleviate the situation, two major electrolytic copper refineries were being planned. Earlier in the year, Industria Minera was planning a complex at San Luis Potosi. Mexicana de Cobre, S.A., was planning a 140,000-ton-per-year refinery at the port of Guaymas, Sonora, for completion in 1978.

The Minister of National Patrimony announced in October that Mexico's copper production should be about 500,000 tons by 1977. This would enable Mexico to reach seventh or eighth place in world copper production.

**Iron.**—The iron and steel industry was growing in both size and sophistication of its facilities. Ore production of 3.3 million tons of iron increased 7% over that of 1973, considerably higher than the 2% increase of 1973 production over that of 1972. Plans called for raising capacity to 9 million tons by 1976 and to 20 million tons by 1984. The value of expansion programs amounted to $80 million.

Privately owned Fundidora Monterrey, S.A., shipped a record high of 1,587,807 tons of iron ore, a 20% increase over that of 1973. Ore was sent by rail to the Fundidora steelworks in Monterrey, Nuevo León from four mining properties. An open pit mine in Durango, 395 miles west of Monterrey, provided 67% of the ore, followed by shipments from the Hercules mine in Coahuila, 350 miles northwest of Monterrey. The Zaniza mine in Oaxaca and the El Mamery mine near Manzanillo, Colima accounted for 4% of the mine production. Fundidora was also involved in a Mexican-French joint venture to establish the first stainless-steel plant in Latin America.

[2] Where necessary, values have been converted from Mexican pesos (Mex$) to U.S. dollars at the rate of Mex$1=U.S.$0.08.

Las Encinas, S.A., an affiliate of Hojalata y Lamina, S.A. (HYLSA), Mexico's second-largest steelmaker, shipped a record high of 1,523,600 tons of iron ore pellets from its Alzada, Colima, plant. This was a 30% increase over 1973 pellet production. The major consumers were HYLSA's two sponge-iron plants at Monterrey, Nuevo León and Puebla, Puebla; together they consumed 71% of the pellet production for 1974.

HYLSA was very active in the research and development of a direct-reduction method for making steel from iron ore. In this process, patented as the HyL process, natural gas is used in place of coal as the reducing agent. The process is particularly significant to countries such as Mexico with small or nonexistent coal resources. Patent rights were sold to Iran, Venezuela, and Indonesia; 12 other countries also expressed interest.

The government-owned Altos Hornos de Mexico, S.A., Mexico's largest steel producer, had an output of 2,359,397 tons of iron ore from its subsidiary, La Perla Minas de Fierro, S.A., in Chihuahua. Pellet production, began in May, amounted to 54,006 tons. This production was from the world's first circular-grate pelletizing system. The plant has an annual capactiy of 600,000 tons of pellets grading 63% iron. The existing heavy-media and jig plant produced 1,898,506 tons of beneficiated ore. All iron-ore products were shipped by rail 114 miles to the Altos Hornos plant at Monclova, Coahuila.

The Las Truchas and Pluton iron deposits are located on the Pacific coast near Melchar Ocampo, Michoacan, and consist mostly of magnetite and hematite. Total reserves of the Las Truchas deposit were estimated at about 130 million tons of ore, and those of the Pluton, at about 42 million tons. Two other ore bodies in the same region have combined reserves of about 50 million tons. All these deposits are relatively close to the Siderúgica Lázaro Cárdenas - Las Truchas, S.A., iron and steel development.

**Lead.**—Lead production increased 22% over that of 1973, and the value increased 64%. Met-Mex Peñoles, S.A., continued work on the first stage of a $32 million improvement to its lead-ore sintering and refining plant at Torreon, Coahuila. The improvements will include a new sintering machine for lead ore and concentrate, a sulfuric acid plant, new smelting furnaces, and a new lead-silver refining plant with a capacity of 190,000 tons of lead bullion annually. Completion of the first stage was scheduled for mid-1975. Because of the large capacity of the plant, long-term contracts for the processing of 100,000 tons per year of lead concentrate were signed with Minero Peru, S.A., and C. Tennant Sons & Company Ltd. Processing of lead concentrate was scheduled to begin in July 1975.

Industria Minera, S.A., was modernizing its lead smelter in Chihuahua to increase its capacity to 130,000 tons per year by yearend 1975.

**Manganese.**—Production of manganese increased 11% from that of 1973. Cía. Minera Autlan, S.A., Mexico's most important manganese producer, was spending $4 million on its manganese properties at Molango, Hidalgo to increase production 30% by 1976. The company continued construction of its 50,000-ton-per-year plant at Tamos, Veracruz, at a cost of $30.4 million.

**Silver.**—Mexican silver production declined 3% from that of 1973. However, several new projects were underway that could result in Mexico's becoming the world's leading silver producer. Projects underway in 1974 by Industrias Peñoles, S.A., Mexico's largest producer, could provide an additional 20 million troy ounces of silver per year.

A $50 million development of one of the world's richest silver mines at Las Torres near Guanajuato was near completion. Peak annual production at the mine should reach 7 million troy ounces of silver and 40,000 troy ounces of gold. Drill holes showed reserves of at least 2.1 million tons of ore averaging 500 grams per ton in silver and 0.8 gram per ton in gold. Sinking the shafts was essentially completed and work on the mill was progressing well. The development stage of the 1.5-million-troy-ounce-per-year Lampozos mine in Sonora was completed. Throughout the country, expansion of lead and zinc mines in which silver is a coproduct is expected to provide an additional 8 million to 9 million troy ounces per year of silver.

The Canadian joint venture between Avino Mines & Resources, Ltd., and the

Pat Sheridan Group of Toronto, Ltd., began production at its silver-copper mine 60 miles north of Durango, Durango. The concentrating plant has a capacity of 500 tons per day.

**Uranium.**—A small mill was under construction at the beginning of the year at the El Nepal mine in the State of Chihuahua. This mill was designed to be mobile and will provide the nuclear fuel for the 650-megawatt Laguna Verde nuclear powerplant located near Alto Lucero, Veracruz. Reserves were established at about 4,000 tons of $U_3O_8$, up substantially from previous estimates.

**Zinc.**—Mexican zinc production declined 3% from that of 1973, Industria Minera Mexico, S.A., planned to commit a major share of its $160 million investment to integration of its zinc operations. The company slated $96 million for a 110,000-ton-per-year electrolytic zinc refinery to be completed in 1976 at San Luis Potosi, San Luis Potosi. This added capacity would bring Mexico's zinc-refining capacity to 300,000 tons, sufficient to smelt its zinc mine production. The plant, which uses a continuous leaching process, will have an annual capacity of 900 tons of cadmium and 130,000 tons of sulfuric acid. Industria Minera also installed a 2,200-ton-per-day mill at its Taxco, Guerrero, silver-lead-zinc mine. At the San Martin mine in Zacatecas, facilities were being expanded to double production of silver, zinc, and copper by 1976.

## NONMETALS

**Cement.**—Cement production in Mexico rose to a record high in 1974 with output totaling 10.5 million tons, up 8.2% from that of 1973. The largest production was from the Federal District and Nuevo León. This was a reflection of increased activity in the construction industry as well as a 3.7% increase in cement-making capacity. Early in the year, the Mexican cement industry compiled statistics that indicated that production would double by 1982.

Cemento Apasco, S.A., completed installation of a new 2,000-ton-per-day kiln. Cruz Azul, S.C.L., was in the midst of major expansion projects at its plants in Jasso, Hidalgo, and Laguna, Oaxaca. When completed in 1975, the expansion will increase capacity by 3,500 tons per day. Cementos del Pacífico, S.A., had a 2,000-ton-per-day plant under construction at Marmol, Sinaloa; Cementos Mexicanos, S.A., completed a 1,200-ton-per-day expansion at its Monterrey, Nuevo León plant; Cementos Veracruz, S.A., was increasing its capacity by 1,200 tons per day through the installation of a new kiln at its Orizaba plant; and Cementos Anahuac de Golfo, S.A., was expanding capacity at its Tamuiun, San Luis Potosi plant by an additional 3,000 tons per day by mid-1975.

**Fluorspar.**—Mexico was the world's largest producer and exporter of fluorspar in 1974. Production rose 2% over that of 1973 and comprised almost one-third of the total world production of fluorspar. Mexico exported most of its fluorspar, providing about 75% of U.S. requirements. Fluorspar exports accounted for 10% of the total value of Mexico's mineral exports.

Late in the year, Mexican producers won a 28% increase in price for fluorspar, largely through the efforts of the Mexican Fluorspar Institute, a trade association organized late in the year.

Minera Frisco, S.A., commissioned a flotation mill with an annual capacity of 70,000 tons at San Francisco del Oro, Chihuahua. The mill output fed the Matamoros hydrofluoric acid plant started by Quimica Fluor, S.A., near yearend.

**Phosphate Rock.**—Guanos y Fertilizanzantes, S.A., the government-owned fertilizer plant at Coatzacoalos, Veracruz announced the exploitation of phosphate rock in the State of Hidalgo. Imports of phosphate rock from Florida and Morocco had been supplying the plant. The Hidalgo deposits of 35% $P_2O_5$ assure Mexico of self-sufficiency in phosphate. New reserves of up to 3 billion tons of crude phosphate rock discovered in Baja California Sur may induce Mexico to become an exporter of the mineral product.

**Sulfur.**—Sulfur production increased 44.4%. Desulfurization plants operating in conjunction with petroleum refineries were contributing about 5% of the country's total sulfur production.

## MINERAL FUELS

**Petroleum.**—Petróleos Mexicanos, S.A. (Pemex), the government-owned organization with exclusive control over the Mexican petroleum industry, produced 27.3%

more crude oil than in 1973. This compares with an increase of 2.2% registered in the previous year. The increased production was due largely to the development of oilfields in southeastern Mexico. During the second half of 1974, Mexico reentered the crude oil export market. The total value of all petroleum exports amounted to about $120 million, almost four times the 1973 value. Pemex was able to reduce its volume of imports to about 26.5 million barrels, about one-half the imports for 1973. Mexico ceased importing crude oil by the fourth quarter.

The focal point of Mexican petroleum production is the Reforma area in the southern States of Chiapas and Tabasco. The Sitia Grande and Cactus Fields were the most important producers. By yearend, about 276,000 barrels per day, or 41% of Mexican oil production, was coming from the 54 wells of this area. Mexico's total hydrocarbon reserves during 1974 increased by 341 million barrels to a yearend total of 5,573 million barrels.

Pemex investments in diverse projects amounted to $779 million, 36% greater than in 1973. An additional 176 projects representing a total investment of almost $2 billion were under construction. At the Cactus Field, Pemex was constructing a 115-cubic-foot-per-day sour-gas treatment plant. Three other plants were in a construction or engineering-design phase. The combined daily capacity of all four plants will be 600 million cubic feet of gas and 480 tons of sulfur. At the same site, a 200,000-barrel-capacity oil tank was completed and two 55,000-gallon tanks were under construction. It was also announced that construction would begin on a cryogenic propane and ethane plant in 1976.

The recent discoveries in the Chiapas-Tabasco region represented less than one-third of the potential oil-producing area of Mexico. Pemex was also enthusiastic about the hydrocarbon reserve prospects at San Sebastian Vizcaina near Guerrero Negro in Baja California Sur, in the Papaloapan Basin, and off the coast of Campeche.

Mexico was considering joining the Organization of Petroleum Exporting Countries (OPEC), but no firm decision was made in 1974. However, Mexico did honor the OPEC price. Mexico's position as a petroleum exporter was an important factor in effecting a more favorable balance of trade for the country.

# The Mineral Industry of Morocco

By W. F. Stowasser [1]

Although 1974 was a good mineral production year for Morocco, principally caused by a strong international demand for phosphate rock and another large increase in phosphate rock selling prices, it appeared there would be a softening of demand in the commodity markets in the first half of 1975, not only for phosphate rock but also for lead and copper. It is probable that stocks of Moroccan phosphate rock and metal concentrates will increase in 1975 as world demand for these commodities declines.

The Office Cherifien des Phosphates (OCP), after increasing the price of 75% bone phosphate of lime (BPL) phosphate rock in 1973 from $14 to $42 [2] per ton, raised the price of equivalent grade rock to $68 per ton on January 1, 1975, free-along-side (f.a.s.) Casablanca or Safi. The rationale for these rapid price increases was that phosphate rock was undervalued on the world market and that exports of phosphate rock were not generating sufficient revenue to permit the buildup of a broadly based economy. As a result, revenues from phosphate rock exports in 1974 increased 486% over those of 1973. It is not probable that a rise of this order in revenues will occur in 1975.

Shipments to Asia and Western Europe declined in the first half of 1975. A combination of factors that include wet weather, buyer resistance to selling prices, and the higher cost of petroleum imports was responsible for the decline in exports in early 1975. The world supply of phosphate rock, responding to 1974 price levels, increased, creating additional competition for Moroccan phosphate rock exports. Phosphates in 1974 represented 90.8% of the total mineral revenues of Morocco, 55% of the total export receipts, and about 20% of the gross national product.[3] The 5-year plan depends on these revenues to finance growth in other sectors as well as expand the phosphate mines, plants, and fertilizer plants. Investments were planned, based on continuing high revenues from phosphate rock exports, to increase production to over 50 million tons per year in the mid-1980's.

There were no announced changes in current government minerals policy, with the exception of the plan announced in November 1973 to extend phosphate credits to developing countries. This plan, to become effective with the new contract cycle in July 1975, will return half of the proceeds of the sales of phosphate rock to developing countries in the form of long-term loans at low rates of interest, or in the form of investments in the processing industries of those countries. Only Bangladesh, India, and Mexico, in this category, purchase significant quantities of rock from Morocco.

To stimulate growth in the mineral sector, the scheduled public sector outlay, under the 5-year plan was $91 million. Of this total, about $14.2 million will be used to finance basic geological studies with emphasis on petroleum exploration. There was no formal revision of this allocation for 1975 despite several official press releases promising "whatever is necessary" to promote desperately needed petroleum production. Faced with increasing costs of imported petroleum, more may be expended than was originally planned. Over and above the public sector outlays, the plan projects private and bank investments of $210 million for an estimated total of public and private investment of $300 million during the 5-year plan period.

[1] Physical Scientist, Division of Nonmetallic Minerals.

[2] Where necessary, values have been converted from Moroccan Dirhams (DH) to U.S. dollars at the rate of DH3.80=US$1.00.

[3] U.S. Embassy, Rabat, Morocco. Department of State Airgram A-85, July 9, 1975, p. 2.

The government-controlled Bureau de Recherches et de Participations Minières (BRPM) is Morocco's chief mining operator in the nonphosphate field. BRPM currently participates in more than 24 mines and, in addition, is involved in the search for both minerals and petroleum.

Moroccan investment policy related to mining remained unchanged during 1974, with one exception. The distribution of refined petroleum products was subjected to the "Moroccanization" laws and the government-owned Société Nationale des Produits Pétrolieres (SNPP) has more than 50% control. With this exception and OCP's phosphate monopoly, minerals production and marketing are controlled by the Investment Code of August 1973.

## PRODUCTION

Moroccan mineral production, excluding water, natural gas, and crude oil, increased from 20.6 million tons in 1973 to 24.4 million tons in 1974, a gain of 19%. Phosphate rock production increased from 17.1 million tons in 1973 to 19.7 million tons in 1974; this 2.6-million-ton increase accounted for most of the 3.8-million-ton increase for the country. The increase in phosphate rock prices during 1974 for both Khouribga and Youssoufia production was 62% for all grades. The increase in phosphate rock exports, coupled with the price advance in 1974, increased Morocco's income and represented 90.8% of the total mineral revenue.

Mineral production other than phosphates was mixed in 1974. Although production increased for several important minerals, with gains registered for iron ore, copper, and manganese, production decreased for lead, zinc, crude oil, and natural gas.

## TRADE

The principal commodity exported from Morocco was phosphate rock. Exports increased from 13.6 million tons in 1972 to 16.1 million tons in 1973, and to 18.9 million tons in 1974 The destinations of significance in 1974 were Belgium 1.5 million tons, France 2.4 million tons, Italy 1.4 million tons, the United Kingdom 1.5 million tons, Poland 1.7 million tons, and Spain 1.1 million tons. Exports of copper concentrate increased modestly from 13,598 tons in 1972 to 14,319 tons in 1973. Exports of lead concentrate declined slightly from 138,194 tons in 1972 to 136,144 tons in 1973. Shipments of zinc concentrate increased from 21,649 tons in 1972 to 26,195 tons in 1973. France, Belgium-Luxembourg, and West Germany received most of this mineral. Exports of silver declined markedly from 67,483,000 troy ounces in 1972 to 895,000 troy ounces in 1973.

Exports of barite and witherite increased from 84,934 tons in 1972 to 94,159 tons in 1973. Shipments were made to the United Kingdom, the United States, and France. Increases in exports of fuller's earth, refractory bricks, nitrogenous and phosphatic fertilizers, gypsum and plasters were noted in 1973. A significant increase in exports of precious and semiprecious stones to Belgium-Luxembourg, West Germany, and Libya developed in 1973 when 8,599 kilograms were reported, compared with only 557 kilograms in 1972. Exports of dimension stone, sand, and other building materials increased in 1973. Exports of sulfur, gravel, and crushed rock declined in 1973.

Export revenues increased for nonphosphate minerals by 40% over those of 1973. There were indications in the second half of 1974 that several of these export markets were reflecting a softening of demand. It is probable that expansion plans will be deferred and stockpiles will grow in 1975.

The largest tonnages of imports in 1973 were steel shapes.

## COMMODITY REVIEW

### METALS

**Copper.**—The 5-year plan projected a threefold rise in copper production by 1977. This goal probably will not be achieved because revenues have not been adequate to finance the expansions. Production of copper concentrate increased from 14,660 tons in 1973 to 16,504 tons in 1974, a 13% gain. This was much less than the 28,000 tons forecast for 1974. The expansion plans for new copper washing plants at both Ouansimi and Tazallaght did not materialize. Production from the largest Moroccan copper mine at Bou Skour did increase and unit extraction costs declined. The production increase in 1974 was justified with a favorable contract. It is probable that the market will not support the current production level from this mine. Although the open pit mine at Ouaouizerte has low production costs, output has been curtailed because of the weak international market. The investment in the 30,000-ton-per-year copper foundry was continuing on schedule.

**Iron Ore.**—The BRPM-owned Société d'Exploitation des Mines du Rif (SEFERIF) pelletizing plant near Nador increased production from 374,149 tons in 1973 to 531,287 tons in 1974. Although this was a 42% increase, the rated capacity of the plant, 850,000 tons, will not be reached until 1976. Present production is exported to Europe. Plans for a steel mill and a new port at Nador are scheduled, and construction will start before 1977. Exports of iron ore pellets will decline after the mill is operational.

**Lead.**—Production of lead concentrate decreased 11% in 1974, compared with production in 1973. The production decline from 158,830 to 141,430 tons was attributed to reduced output from mines at Touissit and Aouli and a prolonged strike at Aoum. The largest mine at Zeïda in the province of Meknès produced 40,000 tons of concentrate in 1974, about the same as that produced in 1973. If world demand increases, this mine could produce additional lead concentrate for the export market. Production of lead concentrate was expected to increase in 1975 to supply the export market and the modernized lead foundry at Oued el Heimer. The projected capacity of the foundry was 35,000 tons of lead and 27 tons of silver per year. This plant will be supplied by the Touissit mine. A new lead foundry was planned at Meknès to utilize the production of several small mines in the area.

**Manganese.**—Production of chemical-grade manganese ore increased from 146,149 tons in 1973 to 174,781 tons in 1974. The 20% increase was obtained from the Imini mine operated by the French-BRPM firm Société Anonyme Chérifienne d'Etudes Minières (SACEM). With proven reserves of 1.5 million tons, production may well increase substantially in 1975, if world demand and prices continue at current levels. The United States is the largest importer of Moroccan manganese ore and Western Europe consumes most of the balance. Eventually, a new mill will be constructed near Quarzazate.

**Zinc.**—The production decline of zinc concentrate from 32,677 tons in 1973 to 27,354 tons in 1974 reflects depletion of reserves at operating mines. Although new zinc deposits have been discovered in scattered areas, and deeper mineralized zones are known to exist, it is not clear if BRPM will act to increase production of zinc in a market with declining demand.

### NONMETALS

**Fluorspar.**—Production from the El Hamman deposit in central Morocco started in 1974 with a reported 19,050 tons of 50% $CaF_2$ ore. It is planned to expand the mine and mill to 80,000 tons per year of 50% $CaF_2$ ore and 60,000 tons per year of 98% $CaF_2$ ore. The reserve is of the order of 5 million tons.

**Phosphate Rock.**—Morocco produced 19,721,000 tons in 1974, an increase of 15% over that reported in 1973. Most of Morocco's production was exported to Western Europe, Eastern Europe, and Asia. Morocco exported 18.7 million tons of phosphate rock in 1974, an increase of 16% over that of 1973. Morocco was the world's leading exporter of phosphate rock. Deliveries to Western Europe in 1974 were 11.2 million tons, while 4.6 million tons went to Eastern Europe, 1.3 million tons to South America, and 1.2 million tons to Asia. The rate of shipments to Western Europe started to slow toward the latter part of 1974. Shipments to both the People's Republic of China (PRC) and Spain were each about 0.5 million tons less than in 1973. France, Poland, and Romania together received more than the drop in exports to PRC and Spain.

The price of Moroccan phosphate rock was increased significantly in January and July of 1974, and to a lesser degree on January 1, 1975. Export price increases by grade and mining area in $US per metric ton f.a.s. Casablanca or Safi, are shown in the following tabulation:

| Grade percent BPL | January 1974 | July 1974 | January 1975 |
|---|---|---|---|
| Khouribga: | | | |
| 77/79 (calcined) | 47.25 | 71.00 | 76.50 |
| 75/77 | 42.00 | 63.00 | 68.00 |
| 70/72 | 40.00 | 60.00 | 65.00 |
| Youssoufia: | | | |
| 70/72 | 37.50 | 56.26 | 60.75 |

Source: British Sulphur Corporation, Ltd. Phosphorus and Potassium. No. 75, January/February 1975, p. 6.

Interestingly, OCP established prices considerably higher than the price published by the Florida Phosphate Rock Export Association. For comparison purposes these prices in $US per metric ton f.o.b. Tampa or Jacksonville, follow:

| Grade percent BPL | January 1974 | July 1974 | October 1974 |
|---|---|---|---|
| 77/76 | 29.53 | 46.75 | 62.00 |
| 75/74 | 27.07 | 41.34 | 55.00 |
| 72/70 | 23.62 | 35.43 | 48.00 |
| 70/68 | 21.65 | 32.48 | 43.00 |
| 68/66 | 19.68 | 29.53 | 39.00 |
| 66/64 | 17.72 | 27.07 | 36.00 |

OCP planned to increase phosphate rock production for export markets and processing rock into fertilizers, which may be more profitable in the export market. Production of phosphoric acid and triple superphosphate started in 1965. Ammonium phosphate capability was added and a nitrogen, phosphorus, potash (NPK) plant was started in 1972. Maroc Chimie converted 600,000 tons of rock into fertilizer in 1973. Investment from 1973 onward will increase rock capacity and processed phosphate capacity, with the latter based on lower grade rock. The fraction of rock output absorbed for further processing will rise from 3.5% in 1973 to an estimated 33% in 1985, reflecting the new orientation in OCP policy.

At the Khouribga complex, two 160-ton-per-hour dryers were added in 1974 at Beni Idir, raising the total capacity to 8.75 million tons per year. Khouribga production totaled 14 million tons in 1974, and production is expected to increase to 17 million tons in 1975. A new drying plant located between Kerkour Rih and Oued Zem reportedly will be completed by 1977, with the installation of six 1-million-ton-per-year dryers similar to those at Beni Idir. Production reportedly will increase to 20 million tons per year or more in 1977.

The new calcination plant at Youssoufia was to be completed in 1975. Recette 7 is producing black phosphate rock from below the water table at the rate of 400,000 tons per year. Overall production at Youssoufia will be increased from both underground and surface mines. In 1977, 4.1 million tons from underground mines and 1.5 million tons from surface mines are scheduled. The black rock from Recette 7, and that planned from Recettes 8 and 9, will be calcined and consumed in Moroccan fertilizer plants.

Development work at the new mine at Ben Guerir was started in 1974. Ben Guerir 1 production is expected to grow to 2.65 million tons per year and be consumed by Maroc Phosphore 2, which will be located on the rail line connecting Youssoufia and Maroc Phosphore 1, south of Safi. Ben Guerir 2 will start producing in 1981, and is scheduled to increase production to 9.75 million tons per year by 1990. This production will probably supply the petrochemical and fertilizer complex planned at Jorf Lasfar.

The deposit at Sidi Hajjaj is also scheduled to start producing in 1981. It will eventually reach a production level of 10 million tons per year. It is considerably different from the ore at Ben Guerir, where only screening is required to upgrade the ore to an acceptable quality. At Sidi Hajjaj, the ore will be mined and shipped to a plant near the port of Jorf Lasfar and washed in sea water. Each ton of product analyzing 65% to 66% BPL from this ore will require disposal of more than a million tons (6 to 8 million cubic meters) of slimes. The final concentrate will be washed with fresh water.

Sampling the Meskala deposit to assess the reserve and product grade has not been completed. Preliminary results appear encouraging and intergovernmental discussions with the U.S.S.R. on mine development are continuing. With or without U.S.S.R. participation, OCP plans to start production in 1986 and attain a production of 23 million tons per year by the year 2000.

OCP plans to produce more than 30 million tons per year in 1980, over 40 million tons per year by 1985, and expects world demand to support a production level of 100 million tons by 2000.

## MINERAL FUELS

**Coal.**—Production from the Government-controlled mine at Jerada increased from 565,000 tons of anthracite coal in 1973 to 574,000 tons in 1974. Although the increase in production was small, the Government considers maintenance of this production level a major accomplishment because of the difficulties in mining this deposit. The modernization program at the mine will include a new gallery, a new crushing and screening station, and a new conveyor system, which will permit production to increase to 830,000 tons in 1977. This mine will continue to supply fuel to the onsite powerplant, sugar mills, and area homes. Jerada exported 34,000 tons to Western Europe and Romania.

**Natural Gas.**—Production declined from the Société Chérifienne des Pétroles (SCP-50% BRPM and 50% French ownership) Field near Essaouira and the Gharb Field. Production declined from 2,302 million cubic feet (65 million cubic meters) in 1973 to 2,081 million cubic feet (59 million cubic meters) in 1974. Although production was sufficient to furnish power for the phosphate mines at Youssoufia and the Sidi Kacem refinery, additional demand for industrial projects in eastern Morocco, particularly the steel mill to be constructed at Nador, may require a pipeline to supply gas from Algeria. After the pipeline to Kenitra is completed, new gasfields will be opened in the Gharb to tap an estimated 750-million-cubic-meter reserve. This will provide additional energy for future demands. Discussions were in progress to define the route of a proposed pipeline from Algeria that will cross Morocco and Spain, and terminate in France.

**Oil Shale.**—Deposits of oil shale at Timahdit are estimated to contain 10% oil in 5 billion to 7 billion tons of rock. Recently discovered deposits at Tarfaya were under study by BRPM. Because the oil shales are the only proven resource of petroleum in Morocco, and with increasing cost for imported oil, the deposits are being intensively studied. Since similar deposits exist in the United States and Brazil, the technology and cost of extraction in these countries are followed closely. A process has not been selected and the timetable to extract hydrocarbons from the oil shales has not been established.

**Petroleum.**—The level of onshore seismic exploration increased in 1974. Soundings by BRPM, in association with private companies, were concentrated in the basin of Essaouira, and Tarfaya, and in the pre-Riffian region between Sidi Kacem and Taza. These basic studies will continue until two-thirds of the country are geologically mapped in 1977. The Ministry of Mines, however, attaches more importance to offshore exploration and the potential of oil shales. Sun Oil Co. was granted offshore exploration rights in 1974 for the Atlantic area between Ifni and Agadir. Practically the entire Atlantic area is covered under exploration contracts. Burmah Oil Company Ltd. has the area between Tanger and Rabat, and Esso and Shell have areas between Agadir and Tarfaya.

An oil exploration concession was, for the first time, granted in the Mediterranean with Standard Oil Co. of California being the recipient. More exploration activity is expected in the Mediterranean in 1975, although problems will develop where the Spanish enclaves of Ceuta and Melilla cut across areas that probably will be sounded.

# The Mineral Industry of the Netherlands

By Norman A. Matthews [1]

The Netherlands economy during most of 1974 was one of the strongest in Europe, which was largely attributable to increasing availability and exports of natural gas. However, in November, the onset of strong recessionary trends became apparent. The Government applied strong measures to sustain the economy, including temporary reductions in taxes on individual income and social services, increases in investment deductions, and accelerated writeoff for buildings and equipment for small- and medium-size businesses.

Gross national product (GNP) increased 3.5% in real terms to $64 billion.[2] The increase was moderated by the after effects of the oil embargo and a substantial reduction in domestic processing of crude petroleum and consumption of petroleum products. In general, industry operated at near-capacity levels through October, but the Western European malaise developed suddenly thereafter and export demand declined rapidly. The construction industry remained the most sluggish of all major industry segments, and was influenced strongly by a 20% decline in housing starts compared with the already depressed level in 1973. The textile industry also operated at a lower rate than that of 1973.

Although inflation persisted at a rate of about 10% during the year, the Government budget for 1975 increased 20% compared with that of 1974. The expansionary budget was designed primarily to ameliorate unemployment, which reached 3.8% at yearend and was expected to increase to 4.2% in the early months of 1975.

The Government energy policy announced in September emphasized nuclear powerplants, energy conservation to slow annual consumption growth, to 4.5% by 1980 and 2.2% by 1985, restrictions on natural gas exports, and the establishment of a state agency (Dutch Energy Agency) to administer energy research and development.

Although the foreign trade balance deteriorated to a modest deficit in 1974, the balance of payments achieved a record surplus of $1.3 billion. Value of imports from the United States increased 37% to $2.9 billion in 1974 compared with that of 1973. The increase was principally due to higher prices of feed grains, coal, and high-technology goods.

For the first time, the Government introduced a budget specifying multiyear commitments, including an increase amounting to 1½% of the national income to be contributed to economically weak countries beginning in 1976, and provision for a national disablement insurance plan benefiting low-income groups. The total tax and social insurance burden in 1974 was 49.2% of the net national income and a small increase was projected for 1975.

The Netherlands continued to undertake projects to promote trade and increase land resources. The Port Authority of Rotterdam is planning to develop and install a new radar control system for all sea traffic throughout the greater Rotterdam port area within 10 years. Projected cost is $80

[1] Physical scientist, Division of Ferrous Metals.
[2] Where necessary, values have been converted from the Netherlands guilders (f.) to U.S. dollars at the rate of f.2.69=US$1.00, the floating average for the year.

million. The last stage of the battle to control the sea off South Holland is nearing completion with the closing of the 5-mile-wide Oosterschelde eastern estuary. The delta plan involves a complex of dams, locks, water barriers, and bridges that will render 440 miles of dikes obsolete and protect a 1,900-square-mile region. Technology is being developed for the more difficult tasks involved in closing the deeper channels. The project is expected to cost more than $1 billion and require at least an additional 5 years.

The Ministry of Transport, Water Control, and Public Works proposed a 250-acre artificial island 30 kilometers off the Hook of Holland to provide sites for nuclear powerstations, natural gas regasification facilities and a repair terminal for large tankers. The island will be made of material dredged from the oceanway, which is being deepened. The oceanway serves offshore unloading facilities for tankers too large to enter the inner harbor at Rotterdam. Cost was estimated at $75 million.

## PRODUCTION

Production of most mineral commodities was at record levels during the first 9 to 10 months of 1974. During the last quarter, however, sharp declines occurred in many segments of the manufacturing economy owing to the sudden decrease in export demand. Coal production declined to 758,000 tons or 44% of the tonnage produced in 1973 as the last state-owned coal mine was closed. Natural gas production was 83,725 million cubic meters, a 17% increase over that of 1973. More than 50% of the volume (43,600 million cubic meters) was exported; this represented a 33% increase in export volume compared with that of 1973. Exports were to West Germany, Belgium-Luxembourg, France, and Italy. The pipeline to Italy was inaugurated at midyear and a relatively small volume of natural gas was transmitted in 1974.

Considerably less crude petroleum was processed during the year, which resulted in production of 60.9 million tons of products. This was a decline of 12% compared with the tonnage of products produced in 1973. Domestic consumption of products approximated 21 million tons, a 16% decline compared with consumption in 1973. At yearend, most refineries were operating at 50% to 70% of capacity. There was also a substantial reduction in crude petroleum transshipped by pipeline to Belgium and West Germany through the Port of Rotterdam. On the other hand, the amount of container freight traffic through Amsterdam and Rotterdam increased 11% over the 1973 volume to 422,800 containers. Total electrical energy generated in 1974 approximated 55,459 gigawatt-hours, a 5% increase over that of 1973 whereas prior annual increases had exceeded 7%.

Steel, pig iron, and coke production increased modestly compared with production in 1973; facilities operated at near capacity through yearend. Although shipments declined during the last 8 to 10 weeks of the year, production was sustained to build inventories of slabs, blooms, hot-rolled coils, and other semifinished products. Raw steel production was 5.84 million tons and exceeded that in 1973 by 4%; 92% of the product was produced by the basic oxygen process, with most of the balance produced in electric arc furnaces. Scrap consumption totaled 1.93 million tons and constituted 24% of the charges of the basic oxygen furnaces. Product shipments declined slightly to 3.86 million tons, whereas semifinished products for inventory and sale totaled 1.22 million tons, an 8% increase over those of 1973. Shipments of iron castings (310,000 tons) increased 16% compared with 1973 shipments. However, the order backlog at yearend declined substantially, as was the case in the steel industry generally.

Nonferrous metals production generally increased in 1974 compared with that of 1973. Specific comparisons follow, with 1974 production figures related to those of 1973 by a percentage increase (+) or decrease (−) for the individual metals or alloys: Primary aluminum, 252,000 tons (+32%); aluminum rolled and extruded products, 99,658 tons (+4%); copper wrought products, 63,174 tons (+8%); lead and lead alloys, 26,410 tons (+5%); and wrought lead and alloys, 13,297 tons (−16%).

In the nonmetallic minerals and products sector, production generally equaled that of 1973; growth was impaired by the construction industry, which experienced the lowest operating rate of any major industrial segment. Housing starts and completions were lower than those of 1973 by 12% in value and 20% in number of units. Housing starts in 1974 totaled 111,960 units compared with 141,135 units in 1973, which was also a decrease from that of 1972. Only in the heavy industrial building sector, such as chemical plants and metal manufacturing and processing plants, was investment in new construction higher in 1974 than in 1973. Total investment in industrial manufacturing facilities approximated $472 million in 1974, a 5% decline compared with that of 1973. Production of brick, tile, cement (4,088,000 tons), and concrete were the same as those of 1973. Production of 1,520,000 tons of concrete ware was 8% less than the tonnage produced in 1973.

Growth continued in the chemicals and plastics area, but it did not equal the 15% to 20% annual growth rate of recent years. Consumption of materials in manufacturing plastics increased 6% to 1.68 million tons. However, some of the raw materials consumed resulted in an increase in plastic inventories. Production of fertilizer intermediate materials, such as nitrogen, ammonia, sulfuric acid, ammonium sulfate, and phosphate, increased modestly in 1974. Total production of fertilizer intermediates was 1,937,000 tons, a 5% increase over that of 1973. However, a significant decrease in the production rate occurred for most chemical and fertilizer commodities in the last 2 months of the year because markets throughout Western Europe became saturated.

The rapid decline in industrial activity that developed late in 1974 can be shown most clearly by the following indices:

| Industry | Industry production indices in 1974 by quarters | | | |
|---|---|---|---|---|
| | 1st | 2d | 3d | 4th |
| Minerals extraction | 143 | 124 | 117 | 111 |
| Chemicals | 147 | 168 | 163 | 140 |
| Chemical exports | 155 | 179 | 174 | 150 |
| Rubber | 125 | 130 | 115 | 105 |
| Metals | 118 | 141 | 135 | 110 |
| Metal exports | 117 | 146 | 142 | 115 |
| Textile | 116 | 111 | 95 | 91 |
| Fabricated metals | 108 | 122 | 115 | 107 |
| Fabricated metal exports | 113 | 134 | 124 | 120 |
| Machinery | 110 | 121 | 123 | 118 |
| Machinery exports | 114 | 126 | 127 | 121 |
| Overall industry | 117 | 127 | 124 | 120 |

Changes in price for several industrial commodities compared with 1973 prices were as follows: Coal, +27%; domestic crude petroleum, +4%; domestic natural gas, +4%; textiles, +8%; chemical products, +16%; petroleum products, +27%; and primary metals and products, +9%. Overall, the price for industrial products increased about 13% during 1974. The overall productivity increase for industry during the year was estimated as 7%.

| Refinery fuel and losses | do | 34,129 | 34,274 | 30,176 |
| Total | do | 518,898 | 544,447 | 478,911 |

[e] Estimate. [p] Preliminary. [r] Revised.
[1] In addition to the commodities listed, the Netherlands presumably produces a variety of crude construction materials (clays, sands, stone and gravel) but production is not reported and available information is inadequate to make reliable estimates of output levels.
[2] Coke oven and blast furnace gas only.

## TRADE

The foreign trade of the Netherlands increased substantially in value in 1974 because of generally higher prices. Export and import values increased 24% and 25%, respectively, compared with those of 1973. The balance of trade showed a modest deficit of $1.17 billion in 1974, whereas export and import values were essentially in balance in 1973. The dominating factor in 1974 was the great increase in cost of crude petroleum imports, although higher prices also applied to many other raw material imports such as feed grains, coal, and iron ore. Export and import trade values in 1974 were $32.9 billion and $34.1 billion, respectively.

Among the broad categories of industrial products, the Netherlands maintained trade surpluses in 1974 in mineral products (including metals and fuels), $0.02 billion, and chemical products, $1.56 billion. Deficits persisted in machinery (electrical and mechanical), $0.47 billion; fabricated products, $1.67 billion (of which textiles accounted for $0.52 billion and metal products accounted for $0.48 billion); and transportation equipment (aircraft, boats, automobiles, etc.), $0.74 billion.

The European Economic Community (EEC) accounted for approximately 65% of total exports. The principal trading partners were West Germany, Belgium-Luxembourg, France, the United Kingdom, and the United States. The United States ranked third in exports to the Netherlands with a total value of approximately $2.9 billion, principally in animal feed grains and supplements, coal, and high-technology material.

Foreign trade showed a modest surplus through the second quarter of 1974, but a deficit developed unexpectedly in the third quarter, which prompted the Government to reassess projections for 1975 and formulate policy accordingly. The importance of exports to the Netherlands economy is shown in the following tabulation, which compares the value of domestic sales and exports for major segments of the manufacturing industry in the third quarter of 1974, in million dollars:

| Industry [1] | Domestic sales | Exports | Total |
|---|---|---|---|
| Mining | 237 | 212 | 449 |
| Food products | 2,409 | 935 | 3,344 |
| Textiles and products | 216 | 172 | 388 |
| Paper and paper products | 254 | 148 | 402 |
| Petroleum products | 630 | 776 | 1,406 |
| Chemical products | 627 | 1,357 | 1,984 |
| Building materials | 262 | 72 | 334 |
| Metals | 215 | 407 | 622 |
| Metal fabrications | 524 | 141 | 665 |
| Machinery | 363 | 353 | 716 |
| Overall industry total (except utilities) | 7,512 | 5,858 | 13,370 |

[1] Not all industry segments listed individually.
Source: Maandstatistiek van de Industrie, March 1975.

Crude mineral imports constituted one of the most significant deficit groups in the Netherlands foreign trade balance. Higher prices, rather than volume increases, influenced the overall trade deficit in 1974. Quantities and values of the most significant items imported through September 1974 were as follows: Crude petroleum, 49.8 million tons ($3.89 billion); coking coal, 3.2 million tons ($110 million); iron ore, 5.6 million tons ($80 million); zinc concentrates, 151,000 tons ($29 million); and molybdenum ore and concentrates, 220,000 tons ($76 million). In contrast, the value of the principal natural resource exported during the same period was $595 million for 33,760 million cubic meters of natural gas.

Overall export categories were as follows, in order of value: (1) petroleum products, (2) chemicals, (3) electrical machinery, (4) mechanical machinery, (5) iron and steel products, and (6) plastic products. Import categories were as follows, in order of value: (1) crude petroleum, (2) mechanical machinery, (3) electrical machinery, (4) transportation equipment, (5) grains and supplements, (6) iron and steel products, (7) chemicals, and (8) nonferrous metals.

**Table 2.—Netherlands: Exports of mineral commodities**

## Table 2.—Netherlands: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Other nonmetals, n.e.s.: | | | |
| Slag, dross and similar waste, not metal-bearing: | | | |
| From iron and steel manufacture ____ thousand tons | 160 | 71 | West Germany 51; Belgium-Luxembourg 20. |
| Other ____ do ____ | 45 | 52 | Belgium-Luxembourg 30; France 10; West Germany 7. |
| Other, n.e.s ____ do ____ | 186 | 218 | West Germany 94; France 54; Belgium-Luxembourg 45. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 108 | 116 | West Germany 105. |
| Carbon black | 77,875 | 87,282 | France 37,753; West Germany 20,578; Belgium-Luxembourg 11,600. |
| Coal and briquets: | | | |
| Anthracite and bituminous coal thousand tons | 1,701 | 1,513 | West Germany 576; Belgium-Luxembourg 512; France 363. |
| Briquets of anthracite and bituminous coal ____ do ____ | 376 | 259 | Belgium-Luxembourg 122; West Germany 72; France 54. |
| Coke and semicoke ____ do ____ | 760 | 680 | France 299; Belgium-Luxembourg 244; West Germany 116. |
| Gas, manufactured ____ do ____ | 107 | 110 | Belgium-Luxembourg 95. |
| Gas, natural ____ billion cubic feet | 1,104 | 1,294 | West Germany 659; Belgium-Luxembourg 343; France 292. |
| Hydrogen, helium, rare gases | 4,800 | 9,662 | Belgium-Luxembourg 4,490; West Germany 3,376; France 1,113. |
| Peat, including peat briquets and litter | 60 | 69 | Belgium-Luxembourg 53; France 13. |
| Petroleum:[6] | | | |
| Crude thousand 42-gallon barrels | 134,418 | 157,067 | Belgium-Luxembourg 54,698; West Germany 42,416; United Kingdom 21,934. |
| Refinery products: | | | |
| Gasoline ____ do ____ | 60,444 | 66,640 | West Germany 42,415; United Kingdom 12,733; Belgium-Luxembourg 5,440. |
| Kerosine and jet fuel ____ do ____ | 23,134 | 26,334 | West Germany 8,688; United Kingdom 7,069; Denmark 2,645. |
| Distillate fuel oil ____ do ____ | r 107,272 | 123,411 | West Germany 84,731; ship stores 9,874; Belgium-Luxembourg 7,866. |
| Residual fuel oil ____ do ____ | 167,206 | 163,590 | Ship stores 64,209; United Kingdom 30,822; West Germany 16,530. |
| Liquefied petroleum gas ____ do ____ | 5,391 | 6,780 | Belgium-Luxembourg 2,823. |
| Lubricants ____ do ____ | 3,857 | 3,302 | Belgium-Luxembourg 551. |
| Mineral jelly and wax ____ do ____ | 489 | 697 | West Germany 291; Morocco 164. |
| Bituminous mixtures ____ do ____ | 231 | 340 | West Germany 111; Sweden 70; Norway 66. |
| Other ____ do ____ | 2,893 | 2,410 | United Kingdom 721; West Germany 586; Belgium-Luxembourg 309. |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals ____ thousand tons | 316 | 427 | West Germany 165; United Kingdom 77; Belgium-Luxembourg 47. |

r Revised. NA Not available.

[1] Excludes monetary gold.

[2] Includes sponge iron, shot, grit, pellets, powder, spiegeleisen, and ferromanganese.

[3] Includes some scrap.

[4] Exports of ash and residue containing aluminum to Belgium-Luxembourg are included with other ash and residue.

[5] Excludes exports to Belgium-Luxembourg not reported in source publication.

[6] Includes bunkers.

## Table 3.—Netherlands: Imports of mineral commodities

r Revised. NA Not available.
[1] Excludes monetary gold.
[2] Includes spiegeleisen, sponge iron, shot, grit, and pellets.
[3] Imports of bentonite from Belgium-Luxembourg are included with other clay.
[4] Excludes imports from Belgium-Luxembourg which are not reported in source publication.
[5] Less than ½ unit.
[6] Includes bunkers.

## COMMODITY REVIEW

### METALS

**Iron and Steel.**—ESTEL N.V. Hoesch-Hoogovens announced early in 1974 that it planned to spend $65 million at its Ijmuiden complex to increase capacity from the current 6.1 million tons per year to 8 million tons per year by 1978 or 1979. Further details were not reported.

Three of the principal West German steel producers, August Thyssen-Hüettenwerke AG, Mannesmann AG, and Friedr. Krupp GmbH, announced the construction of an iron ore pelletizing plant adjacent to the Maasvlakte bulk transshipment terminal in the Europoort outer harbor at Rotterdam. The facility, estimated to cost $126 million, will have an annual capacity of 4 million tons of pellets. In the first year of operation, the Maasvlakte transshipment facility handled imports of 10.5 million tons of iron ore and coal, principally destined for West Germany, Belgium, and the Netherlands by river and canal shipments. The largest bulk shipment to the European Continent through 1974 involved a 228,000 ton shipment of Brazilian iron ore.

**Zinc.**—Capacity operation of the new zinc refinery of Zinc de la Campine at Budel, originally scheduled for late 1974, was delayed by technical problems. Capacity operation of the 165,000-ton-per-year facility was rescheduled for mid-1976, but may be delayed further by the current oversupply position of zinc in Western Europe.

## NONMETALS

**Fertilizer Materials.**—Production of fertilizer materials reached a record high in 1974 of 1.94 million tons; facilities operated at near capacity. N.V. Zuid Chemie announced that capacity of the new phosphate fertilizer plant at Sas van Gent would be expanded from 280,000 to 390,000 tons per year; completion of the expansion program was scheduled for late in 1975. Dutch State Mines (DSM) announced plans to construct a large fertilizer complex in Limburg Province at a total estimated cost of $670 million. The complex will include a 1,500-ton-per-day ammonia plant, a urea plant, and a 440,000-ton-per-year fertilizer facility. Completion is projected for mid-1978.

The Selective Investment Law was passed by Parliament in 1974 but was not implemented because of the recession. The law provides for licensing and special taxation of fixed investment in the industrialized western sector (the triangle bounded by Amsterdam-Rotterdam-Utrecht). Its purpose is to promote investment in outlying areas currently plagued with unemployment and to avoid further buildup of pollution levels from heavy industry in the crowded industrial sector. Most large chemical complexes are already being planned in Groningen Province in the north or Limburg Province in the south as a result of the Government policy.

## MINERAL FUELS

**Coal.**—Coal production declined 56% in 1974. The last coal mine operated by DSM in Limburg Province closed late in the year. Current indications are that no further coal production will be considered in the near future. However, debate continues in this regard because of the energy-plan proposals indicating the desirability of increasing the amount of coal burned for electrical energy generation. Other features of the energy plan are as follows:

(1) Doubling domestic crude petroleum production from old, onshore fields by secondary recovery methods to meet a goal of 2.8 million tons per year (approximately 10% of domestic consumption);

(2) Constructing three 1,000-megawatt nuclear powerplants by 1985 to provide (with the existing smaller unit) 30% of projected electrical energy needs;

(3) Additional coal imports for power generation, probably from Poland;

(4) Limitation on natural gas exports to levels to be negotiated but not to exceed 45 to 50 billion cubic meters per year or 50% of annual production;

(5) Governmental control of all decisions on electrical power generation;

(6) Deliberate controls to reduce the rate of energy consumption growth to 4.5% annually by 1980 and 2.5% annually by 1985;

(7) Promotion of diesel fuel for automobiles; and

(8) Legislation requiring effective heating insulation on new and old homes and commercial buildings.

**Petroleum**—*Petrochemicals.*—Despite the preceding measures, expansion continued in the petrochemical industry because petrochemical exports are a major revenue source and the products are vital to the domestic economy. DSM announced plans for a large complex in Groningen Province on the Ems River estuary. The complex would include a catalytic cracker with ethylene capacity of 450,000 tons per year and plants for 75,000 tons of polypropylene and 150,000 tons of polyvinyl chloride annually. Projected cost is $370 million; completion is expected by 1980. A second cracker at the existing Geleen site in Limburg Province was also announced with provision for caprolactam expansion to 200,000 tons annually and melamine capacity expansion to 100,000 tons annually.

Shell Nederland Chemie, at the Moerdijk complex, announced a $150 million expansion to provide 330,000 tons of styrene and 125,000 tons of propylene oxide annually from ethylene and benzine feed stocks. Completion is expected in 1978.

Late in the year, the Health Minister announced restrictions on the sulfur content of all fuels as follows: heavy fuel oil, 2.9%; No. 2 heating oil, 0.9%; No. 1 heating oil, 0.7%; and 1.5% maximum

for all other fuels, including coal. The permissible sulfur content was to be further reduced in 1975 and 1976.

**Nuclear.**—During 1974, the first uranium enrichment by the centrifuge method was accomplished by Ultra Centrifuge Nederland N.V. at Almelo. Subsequently, uranium oxide fuel pellets were fabricated and are under test in a commercial reactor.

# The Mineral Industry of New Zealand

By Robert A. Clifton [1]

The value of New Zealand's mineral production increased 31% in 1974 to $172 million.[2] This was the first time it surpassed the $NZ100 million mark. Metals, with nearly an eightfold increase in iron sand production value, climbed to 9.4% of total mineral value. Nonmetallic minerals, with a general increase in value, dropped to 64.9% of the total value. Fuels, with a 38% increase, climbed to 25.7% of the mineral value.

Value of total mineral production by year and the percent contributed by each sector are shown in the following tabulation:

| Year | Percent | | | Total value, million U.S. dollars |
|---|---|---|---|---|
| | Metals | Nonmetals | Fuels | |
| 1972 | r 10.1 | 61.0 | 29.0 | 93.6 |
| 1973 | 1.3 | 76.5 | 22.2 | 131.0 |
| 1974 | 9.4 | 64.9 | 25.7 | 172.1 |

r Revised.

The year 1974 was a year for reevaluation of New Zealand's energy situation and its potential to harm or help the nation's economy. With no domestic capacity, a country that derives 62.5% of its primary energy consumption from oil can be seriously hurt by embargos.

## PRODUCTION

Sand, rock, and gravel (including serpentine and glass sand) was the most valuable category of New Zealand mineral production, with 36% of the value. Cement was next with 20%, followed by iron ore and iron sand at 9%, and limestone at 7%.

[1] Physical scientist, Division of Nonmetallic Minerals.

[2] Unless otherwise indicated, values herein are in U.S. dollars converted from New Zealand dollars at the rate of $NZ1 = US$1.4619.

[3] Includes that contained in lead-copper concentrate.
[4] Average 60% iron.
[5] Crushed rock for building aggregate, roads and ballast is included with sand and gravel.
[6] Excludes carbon dioxide component of natural gas, which is reported separately.
[7] Actually field condensate except for 1,000 barrels in 1972.

## TRADE

The only major export product of a mineral nature from New Zealand is the titanomagnetite iron sands. A total of 1,179,904 tons was shipped to Japan in 1974 by Waipipi Iron Sands Ltd. from their dredging operations near Waverly. New Zealand Steel Mining Ltd. was producing and exporting from Taharoa. Both companies and operations had handled better than 3,500,000 long dry tons of ore during a 30-month period.

The major mineral import was Australian alumina to be processed at the Bluff smelter of New Zealand Aluminum Smelters Ltd.

Subject to government approval, West Coast Resources Ltd. announced plans to mine and export 7.5 million tons of coal from the Mt. Davy, Greymouth area of South Island.

## COMMODITY REVIEW

### METALS

**Aluminum.**—The Bluff smelter plan to expand initial capacity from 110,000 long tons per year to 150,000 long tons got underway early in 1974. Completion was scheduled for early 1976. The New Zealand Government disapproved a proposal by Otago Metal Industries Ltd. for a second aluminum smelter at Aramoana on Otago harbor. The rejection was based on the proposition that because the aluminum would be exported, this would virtually be an exportation of energy at an inappropriate time.

**Gold.**—New Zealand's South Island was the center of the search for gold deposits, but no major finds were reported. Dredging by Kanieri Gold Dredging Ltd. on the Taramakua River ceased in October 1974, but may resume. Gold production volume in 1974 was less than half of that of 1973.

**Iron and Steel.**—Waipipi Iron Sands maintained full production at Waipipi during 1974. New Zealand Steel Mining continued its export operation at Taharoa, and increased its operation at Waikato North Head to supply the demands of an enlarged Glenbrook steelworks.

The 1973 and 1974 data for Glenbrook show iron production up 64%, steel billets up 29%, galvanizing line products up 6%, and pipe products up 120%. Production figures in tons are as follows:

| | 1973 | 1974 |
|---|---|---|
| Iron and concentrate | 649,576 | 1,210,049 |
| Iron | 62,570 | 102,569 |
| Steel billets | 83,772 | 108,080 |
| Galvanizing line products | 129,422 | 137,602 |
| Pipe products | 16,793 | 36,968 |

Process costs have been reduced by a new technology that permits direct iron sand feed without the prior need to pelletize.

**Molybdenum.**—Drilling was started by New Zealand Cities Service Ltd. on the Taipo molybdenum prospect in northwest Nelson. Cities Service is associated with Lime and Marble Ltd. of Nelson on this project.

**Silver.**—The volume of silver produced in 1974 was just 37% of that in 1973.

### NONMETALS

**Asbestos.**—Cassiar Asbestos Corporation Ltd. of Canada has abandoned its exploration program of the Pyke Asbestos property,

West Coast, South Island. Reserves were reportedly too little for economic viability.

**Feldspar.**—The feasibility of producing sodium feldspar from beach sand deposits on the east coast of Northland was under study.

## MINERAL FUELS

**Coal.**—Coal has been contributing 16.5% of the primary energy needs of New Zealand, but it is due to replace oil in many areas in the near future. The 2.6 million tons produced in 1974 represented a 4% increase over that of 1973.

The Huntley powerstation being built in the Waikato Valley will be New Zealand's largest and produce 40% more electricity in 1981 than is currently provided by the eight nearby hydro stations. It will be powered by subbituminous coal from newly discovered deposits in the valley that now have a proved 150-million-ton reserve with exploratory drilling still being done. With several other finds in the Huntley District available, the government-owned State Coal Mines plans to double its output by opening three new mines whose output will eventually total more than 2 million tons per year. Eighty percent of the output is scheduled to go to the Huntley powerstation.

Sufficient coking coal exists for New Zealand's steel industry and there are 13 plants making producer gas, mainly on South Island.

**Natural Gas.**—Natural gas, at present only from the Kapuni Field, provides a nominal 3% of the country's energy needs. Industry and commerce get about 58% of the available gas, homes 8%, and 34% is reserved for the Otahuhu gas turbine generator and the new New Plymouth powerstation. The latter will be supplied from Kapuni only until gas from the new Maui Field is available. A third gas treatment plant will increase Kapuni capacity in 1976.

Of the Government share of the Maui Field gas, 60% is destined for the New Plymouth, Auckland, and Huntley powerstations, and 10% for industry. The remainder will go for fuel, another powerstation, or as feedstock for a petrochemical complex.

The condensate from both fields will replace some of the oil for New Zealand's transportation industry.

## ENERGY

**General.**—New Zealand has some real, but not insurmountable, problems in the energy area. Contrary to what might be expected from a country with a largely pastoral economy, it has a larger than average per capita energy consumption that has grown at an average of 3.7% per year since 1951. Oil, not a domestic product, is the primary source accounting for 62.5% of the total energy consumed and is the basis of the problem. Hydroelectric power provided 18%, coal 16.5%, and natural gas 3% of energy consumption.

About two-thirds of the oil supply is used in internal combustion engines, and oil provides one-third of the energy for industry and commerce, all the energy for the transportation industry, a direct 9.5% of the home energy, and some portion of the electricity that supplies 73% of the energy used in homes. Fifty-eight percent of the thermally produced electricity came from oil burning generators. During the 3-month period ending in March 1974, oil costs increased 91%.

**Geothermal.**—During the 5-year period between 1958 and 1963, 13 geothermal wells were brought on-stream. These units produced 8% of the country's electricity needs in 1971–72. The Broadlands geothermal field is being assessed and the first of four wells has been brought in with very promising results. A 150-megawatt powerstation is in the planning stage as is a low-boiling-point binary system which could increase the Warakei station from 165 megawatts to 190 megawatts.

**Hydropower.**—In 1971, hydropowered generators provided about 85% of the electricity consumed in New Zealand. The shortage of rainfall over the last few years has reduced this capacity. Hydropower's share of electricity-generating capacity is expected to be only 64% in 1981 as coal and natural gas plants come on-stream. Conservationist resistance to some proposed hydroelectric schemes has been effective, but production at the eight stations on the Waikato River will be increased 18% by the Tongariro scheme.

**Nuclear Energy.**—The high initial costs and environmental opposition have combined to delete consideration of nuclear energy as a source for the near future.

# The Mineral Industry of Nigeria

By Keith L. Harris [1]

The importance of the petroleum sector to the Nigerian economy continued to be overwhelming in 1974. Increased production combined with a price boost from $8.310 [2] per barrel to $14.691 per barrel resulted in petroleum providing 93% of export earnings, 92% of foreign exchange earnings, about 90% of government revenues, and 45% of the gross domestic product (GDP). Total output reached 823 million barrels, making Nigeria the world's sixth largest oil producer, and second leading supplier of crude oil to the United States.

GDP in 1974 dollars increased 9.7%, the favorable balance of trade reached $6.6 billion, and foreign exchange reserves climbed to $5.6 billion.

Inflation rose at a high rate during the year, mostly due to increased costs of imports. The Government decreased tariff and excise duties on many raw materials and consumer goods during the year. To further reduce the cost of imports, the naira was revalued upwards 7% against the dollar.

Under the Indigenization Decree of early 1972, selected commercial, service, and light manufacturing activities had to have full or partial (40%) Nigerian equity participation. By April 1, 1974, the effective date, most of the stipulated industries had complied. Along with indigenization of other sectors of the economy, the Government continued its objective of increased public participation in oil production by acquiring 55% equity in all oil producing companies in Nigeria at a cost to the Government of $1.7 billion.

## PRODUCTION

Petroleum continued to dominate Nigeria's mineral output during 1974. Total production was up 8% from that of 1973, to 823 million barrels. Refinery production stabilized as the nation's one plant reached capacity. Gross natural gas output was up 38% from the 1973 level, but marketed production was less than 2% of gross production. Tin mine and smelter production decreased 6% and 7%, respectively, from the 1973 levels. Production of most other minerals declined.

[1] Physical scientist, Division of Nonferrous Metals.
[2] Where necessary, values have been converted from Nigerian naira (N) to U.S. dollars at the rate of N1.00=US$1.62.

## TRADE

Nigeria's foreign trade continued to grow in 1974. Exports increased 155% while imports increased only 42%, resulting in an overall rise in the favorable balance of trade to $6.55 billion in 1974, a 288% increase over the 1973 trade surplus. Total value of exports was $9.37 billion. Imports rose from $1.98 billion in 1973 to $2.81 billion in 1974.

As in the past, exports of petroleum dominated Nigerian trade. A modest 2% increase in tonnage shipped was magnified by a 177% increase in unit value resulting in about a twofold increase in total export value. Petroleum exports accounted for 93% of the total export value. Tin exports remained about the same as in 1973, but increased tin prices caused a 70% rise in export value to $43 million.

The United States continued as the leading purchaser of Nigerian exports. The value of shipments to the United States totaled $2.57 billion, up 188% from the 1973 level, and accounted for 27% of Nigeria's exports. Nigeria's imports from the United States totaled $345 million.

## COMMODITY REVIEW

**Metals.**—*Tin.*—Production of tin in Nigeria declined for the 6th consecutive year to 5,369 long tons in 1974, the lowest level since 1934. Over the past several years, spiraling production costs have lowered the profit margin of operators to a point where significant reinvestment and exploration programs had to be curtailed, forcing rapid depletion of minable ore bodies. Decreased royalties and high prices through the middle of 1974 gave operators a much needed opportunity to make a profit.

Amalgamated Tin Mines of Nigeria Ltd., Nigeria's largest producer, increased profits to $4.35 million during its fiscal year ending March 1974, compared with $0.99 million in 1973. Over $1.5 million of the profits was invested in much needed earth moving equipment—two bucket wheel excavators—to begin operating in 1975. The investment, one of the largest in the Nigerian tin industry in many years, could be a precursor to increasing mechanization of Nigerian tin mining as increasing labor costs force mechanization if the mines are to remain competitive in the international market.

**Mineral Fuels.**—*Natural Gas.*—Production of natural gas in association with crude oil averaged 2.8 billion cubic feet per day in 1974, a 38% increase over the 2.0-billon-cubic-foot-per-day average for 1973. About 99% of the output was flared at the wellhead. The remainder was used by petroleum companies to generate electric power for their own needs, reinjected into wells, or sold to industrial consumers, including the Nigerian Electric Power Authority for power generation. Early in the year, Gulf Oil Company (Nigeria) Ltd. proposed to build a $1 billion plant to process 500 million cubic feet per day of gas for export as liquefied natural gas. At yearend the Government was still discussing the Gulf proposal as well as those of three other companies.

*Petroleum.*—Petroleum output continued to increase through June when it peaked at 2.34 million barrels per day. Declining world demand and government induced production cutbacks reduced output to 2.06 million barrels per day by December. Total production reached 823 million barrels. Exports of crude, at 719 million barrels, were up 3% from the 1973 level. The United States, which received 29% of the exports, continued to be the largest market for Nigerian crude oil. Deliveries to the Nigerian Petroleum Refining Co., Ltd.'s Port Harcourt refinery totaled 20.9 million barrels and the refinery worked at capacity. The refinery capacity reportedly will be expanded to 75,000 barrels per day in 1975.

Effective April 1, the Government-owned Nigerian National Oil Co. (NOC) acquired 55% interest in all the producing companies—The Shell-BP Petroleum Development Co. of Nigeria Ltd.; Gulf; Mobil Exploration Nigeria Ltd.; Nigerian AGIP Oil Company Ltd.-Phillips Petroleum Company (Nigeria) Ltd.; Elf-Nigeria Ltd. (formerly Safrap (Nigeria) Ltd.); and Texaco Overseas (Nigeria) Petroleum Company–Chevron Oil Co. (Nigeria). NOC gave the companies the right to buy back half of NOC's production at $13.00 per barrel plus an option on half of the remaining oil at $13.25 a barrel compared with the posted price of $14.691. The prices were subject to quarterly review. The availability of NOC oil to the companies would decrease from January 1975 through January 1976 until the companies would have only their 45% equity oil and no buy-back privileges. NOC retained its 51% ownership of nonproducing offshore exploration firms—Occidental Petroleum Nigeria, Deminex (Nigeria) Ltd., and Japan Petroleum Co. (Nigeria) Ltd.

In May, the Government ordered Texaco-Chevron to cease production at its offshore Pennington Field indefinitely because the 4,000-barrel-per-day production rate was uneconomic. Texaco-Chevron continued exploration and expansion of production facilities with a 25,000-barrel-per-day production rate expected by mid-1975 from the Pennington Field, and the undeveloped Apoi and Middleton Fields.

Late in the year, the Government ordered the two largest producers to cut production. Shell-BP, Nigeria's largest producer, was ordered to cut production to 1.3 million barrels per day. Gulf reduced production about 150,000 barrels per day, to 230,000 barrels per day. Production of crude oil and associated natural gas for the five active producing companies during December is given in table 4.

Ashland Oil (Nigeria) Co., which has

a 35% interest in a production-sharing agreement with NOC, discovered two oilfields at its onshore tract south of Oguta Lake in East Central State. The Ossu discovery well flowed at a combined rate of 4,000 barrels per day from two zones. At the Izombe Field, 4 miles east of the Ossu Field, one well tested at a combined rate of 4,900 barrels per day of high-gravity, low-sulfur crude oil from multiple zones. Another well tested at the rate of 3,475 barrels per day from two zones. Initial production of 12,000 barrels per day rising to 20,000 barrels per day was expected in 1975.

Japan Petroleum found oil in four of eight wells drilled in 1974. Deminex continued exploratory drilling and made one discovery in 1974. Mobil made a wildcat discovery near Warri that tested at 2,000 barrels per day. Additional drilling was planned to evaluate the commercial potential. Occidental Petroleum resumed exploratory drilling after terminating an exploration agreement with Deminex. However, by December, Occidental suspended all drilling operations to review geologic and economic conditions.

**Table 4.—Nigeria: Production of crude petroleum and natural gas in December 1974**

| Company | Number of producing fields | Number of producing wells | Crude petroleum production | | Natural gas production | | Gas-oil ratio |
|---|---|---|---|---|---|---|---|
| | | | Total (barrels per day) | Percent | Total (thousand cubic feet per day) | Percent | (thousand cubic feet per barrel) |
| The Shell-BP Petroleum Development Co. of Nigeria Ltd | 73 | 696 | 1,338,025 | 64.9 | 1,380,454 | 63.7 | 1.032 |

# The Mineral Industry of Norway

By F. L. Klinger [1]

The Norwegian mineral industry continued to grow in 1974 despite rapidly rising wages and prices. Production of some major commodities, such as ilmenite, aluminum, ferroalloys, and crude oil, increased substantially; output of other commodities was not significantly different from 1973. A marked decrease in output of pyrite resulted from emphasis on recovery of copper and zinc at Løkken. New plants were completed, planned, or under construction for iron ore, aluminum, titanium pigment, magnesium chloride, olivine, cement, coal, petroleum products, and other materials.

The level of investment was relatively high in the mining and manufacturing sectors, but it was small compared with investments in offshore oil and gas production and transportation facilities. A dramatic increase in output of oil and gas was expected in 1975 and this, along with discovery of another large oil- and gasfield in 1974, may be the most far-reaching and promising development of the Norwegian mineral industry during the 1970's.

## PRODUCTION

Indices of production for the full year of 1974 were not available. The following tabulation shows preliminary indices for the first 10 months, (January to October) of each year for various sectors of the mineral industry:

| Industry sector | (1970=100) | |
|---|---|---|
| | 1973 | 1974 |
| Mining and quarrying: | | |
| Coal mines | 92 | 91 |
| Metal mines | 111 | 105 |
| Other mining and quarrying | 108 | 109 |
| All mining and quarrying [1] | 134 | 128 |
| Manufacturing: | | |
| Iron, steel, ferroalloys | 108 | 120 |
| Nonferrous metals | 118 | 125 |
| Ceramics, glass, glassware | 107 | 117 |
| Chemical raw materials | 115 | 118 |
| Refining of petroleum and coal | 116 | 111 |
| Electric power | 122 | 129 |

[1] Includes production of crude oil and natural gas.

Source: Statistisk Sentralbyrå (Oslo). Statistisk Månedshefte (Monthly Bulletin of Statistics). V. 92, No. 12, December 1974, pp. 18–20.

The overall decline in output of the mining and quarrying industry appeared to be generated by reduced output of pyrite, although production of iron and copper ores was also less than in 1973. Output of ilmenite ore and crude oil were substantially greater than in 1973.

Indices for the manufacturing industry showed strong gains in production of primary metals and nonmetallic commodities. The principal increases were registered in ferroalloys and aluminum; however, output of pig iron, steel, and slab zinc were less than in 1973. Production of nitrogen increased, but output of cement declined.

Production of mineral commodities is shown in table 1.

## TRADE

Norway's exports of mineral commodities in 1974 were valued at about $2.17 billion.[2] Imports of mineral commodities were valued at $2.6 billion. The apparent deficit of approximately $430 million was several times larger than in 1973 and appeared to be principally due to the higher cost of crude oil and petroleum products in 1974. However, increasing Norwegian production of crude oil was expected to generate a surplus in mineral commodity trade in 1975.

Nonferrous metals (principally aluminum and nickel), ferroalloys, rolled steel, and liquid fuels were the major export items in 1974 and accounted for 75% of the total value of all mineral commodity exports. Imports of liquid fuels, iron and steel, basic chemicals (mainly aluminum oxide and hydroxide), and metallic ores (mainly nickel-copper matte) accounted for 83% of the value of mineral commodity imports in 1974.

Trade in mineral commodities in 1972 and 1973 is detailed in tables 2 and 3.

2 Values in Norwegian kroner (NKr) were converted to U.S. dollars at the rate of NKr5.542=US$1.00 for 1974 and NKr5.76=$1.00 for 1973. Source of 1974 conversion rate was International Monetary Fund; the rate for 1973 was derived from exchange rates published in Statistisk Månedshefte, v. 92, No. 2, 1974, p. 72.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Production of primary aluminum in 1974 was 4% more than in 1973. Output was equivalent to about 93% of Norway's annual production capacity. Production of semimanufactures (110,000 tons) increased 10% and was equivalent to about 70% of production capacity.[3]

Exports of unwrought aluminum and alloys in 1974 amounted to 555,000 tons valued at about $410 million. The average export value of ingot in 1974 was about 28% higher than in 1973. Exports of semimanufactures totaled 39,000 tons in 1974, about 28% less than in 1973.

Imports of raw materials in 1974 included 1,287,000 tons of aluminum oxide and hydroxide and 6,600 tons of bauxite. Imports of metal totaled 56,000 tons, which was about evenly divided between ingot and semimanufactures. Domestic consumption of primary aluminum was 122,700 tons in 1974 compared with 108,000 tons in 1973.

There was no new production capacity for primary aluminum installed in 1974. Total capacity at yearend was about 690,000 tons per year. The smelter at Eydehavn, which had an output capacity of 15,000 tons per year and was owned jointly by Alcan Aluminium Ltd. and British Aluminum Co. Ltd., was closed in 1974. This left eight primary smelters operating in Norway. Production capacity for superpure aluminium was increased 33%, to 4,700 tons per year, by Vigeland Metal Refinery A/S.

New extrusion plants were started up in 1974 by I/S Aluminiumprofiler, A/S Årdal og Sunndal Verk (ASV), and Norsk Hydro a.s. Karmøy Fabrikker (formerly Alnor Aluminum Norway A/S). The latter company increased production capacity for extrusion bolts at Karmøy 70% to 56,000 tons per year. Norsk Hydro A/S, the sole owner of Alnor since mid-1973, operated semifabricating plants in the United Kingdom and Austria, and opened new plants in France and Belgium in 1974. The company also applied to Norwegian authorities in 1974 for permission to build a new aluminum smelter on Karmøy. The proposed plant would have a production capacity of 80,000 tons per year.

Alcan Aluminium sold one-half of its 50% interest in ASV to the Norwegian Government for $62 million. This will increase government ownership of ASV to 75%, effective January 1, 1975. ASV is the largest Norwegian producer of primary aluminum, with a production capacity of about 300,000 tons per year.

In other developments, Norsk Hydro decided to participate in a project to mine bauxite in the Amazon Basin of Brazil. The project was expected to provide the company with about 350,000 tons of bauxite per year, by 1979. The Federation of Norwegian Industries awarded its 1974 prize for environmental control to the Mosjøen smelter, which is owned jointly by the Aluminum Company of America and Elkem-Spigerverket A/S.

**Copper and Zinc.**—Mine output and exports of copper concentrate in 1974 were 10% to 15% less than in 1973. The decline appeared to be related to a sharp drop in copper prices that occurred in 1974. Zinc prices were more stable, and output and exports of zinc concentrate increased. Copper and zinc are coproducts at most Norwegian base-metal mines. Preliminary data on output of copper and zinc concentrates in 1974, by mine, is shown in the accompanying tabulation, in metric tons:

[3] Aluminium (Duesseldorf). V. 51, No. 1, January 1975, p. 62.

| Company | Mine | Concentrates | |
|---|---|---|---|
| | | Copper | Zinc |
| A/S Sulitjelma Gruber | Sulitjelma | 19,129 | 1,127 |
| Grong Gruber A/S | Grong | 16,620 | 4,120 |
| Folldal Verk A/S | Tverrfjellet | 17,008 | 11,868 |
| Do | Repparfjord | 9,356 | -- |
| Orkla Industrier A/S | Løkken | 4,548 | 928 |
| A/S Røros Kobberverk | Lergruvbakken | 2,094 | 8,630 |
| A/S Bleikvassli Gruber | Bleikvassli | 1,100 | 8,200 |
| Bergverksselskapet Nord-Norge A/S | Mofjellet | 1,150 | 6,900 |
| A/S Bidjovagge Gruber | Bidjovagge | 4,640 | -- |
| Killingdal Grubeselskab | Killingdal | 1,746 | 1,935 |
| Total | | 77,391 | 43,526 |

A new flotation plant of Orkla Industrier A/S (formerly Orkla Grube-Aktiebolag) came onstream in October 1974. As a result, production of copper and zinc concentrates by the firm was expected to increase in 1975 to about 21,000 tons and 6,000 tons, respectively. Exports of copper in 1974 included 6,300 tons of blister produced by A/S Sulitjelma Gruber and 26,000 tons of refined copper produced by Falconbridge Nikkelverk A/S. Nearly 50% of the metal was shipped to West Germany. Exports of slab zinc totaled 45,000 tons, of which about 19,000 tons was shipped to Sweden.

**Iron Ore.**—Production and exports of iron ore in 1974 were slightly less than in 1973; however, average product quality increased when A/S Sydvaranger brought a second pelletizing line into production in May. The new pelletizing line has a production capacity of 1.5 million tons per year and raised the company's output capacity for pellets to 2.7 million tons per year. Production of pellets in 1974 included 1.9 million tons by Sydvaranger at Kirkenes and an estimated 500,000 tons by A/S Norsk Jernverk near Mo-i-Rana.

In the Rana mine area, stripping operations were begun in late 1974 at the Ortfjell ore body, about 5 miles east of the crushing station at Storforshei. Open pit production from the Ortfjell deposit was scheduled to begin in 1976, and will provide the bulk of Rana ore by 1980. Ore reserves at Ortfjell total about 150 million tons averaging 32% iron and 4% magnetic iron. Recovery of this quantity of ore will require stripping 380 million tons of waste rock. Ultimate pit dimensions indicated by the mining plan are about 2 miles in length, ½-mile in width, and up to 1,500 feet in depth. Concentrate production at the Rana mine in 1974 included 705,000 tons of sinter feed and 292,000 tons of pellet feed.

Owing to a subsidence problem which developed in 1973, production of vanadium-bearing magnetite concentrate at the Rødsand mine was only 98,000 tons in 1974, but planned output for 1975 (142,000 tons) indicated that a return to normal operations was expected. The mine is owned by Elkem-Spigerverket A/S.

Elsewhere, Fosdalens Bergverks A/S produced 472,000 tons of magnetite concentrate, and A/S Titania produced 46,000 tons of byproduct magnetite from ilmenite operations at Tellnes. About 12,000 tons of hematite ore were produced at the Bråstad mine of Elkem-Spigerverket A/S.

Exports in 1974 totaled 2,657,000 tons of iron ore valued at about $45 million and 152,000 tons of roasted pyrite valued at about $500,000.

**Iron and Steel.**—Production and exports of pig iron and steel in 1974 were less than in 1973, but consumption of steel appeared to increase about 25% to 2 million tons. The largest increases in apparent consumption occurred in plate, sheet, and tubular products. This was related to strong demand from the shipbuilding industry (including construction of offshore rigs) and for pipe to be used in offshore drilling operations and laying oil and gas pipelines in the North Sea.

Production and exports of ferroalloys increased substantially in 1974 because foreign demand was strong and prices were relatively high. Total output of ferroalloys was 882,000 tons. Exports totaled 837,000

tons with an aggregate value of about $300 million. Exports included 309,000 tons each of ferrosilicon and ferromanganese, 190,000 tons of ferrosilicomanganese, 27,400 tons of ferrochrome, and 658 tons of ferrovanadium. The principal destinations of ferroalloy exports were West Germany and the United Kingdom. Imports of manganese ore and chromite in 1974 totaled 1,033,000 tons and 86,000 tons, respectively.

**Magnesium.**—Deliveries of magnesium and magnesium alloys by Norsk Hydro totaled 43,000 tons in the year ended June 30, 1974. A price increase of about 15% compared with the previous financial year was reported by the company.[4] Exports of unwrought magnesium during calendar 1974 were valued at approximately $44 million.

Norsk Hydro was building a new plant at Herøya for the production of anhydrous magnesium chloride. The plant will use a new process developed by the company and is scheduled to begin production in early 1977. The plant will provide raw materials for production of 15,000 tons of primary magnesium per year. The company was also finalizing plans to produce premium-grade magnesia in northern Norway. The planned facilities would be completed near Sørfold in Nordland by late 1977 and would have a production capacity of 200,000 tons per year of magnesia.

**Nickel, Cobalt, and Platinum-Group Metals.**—A/S Titania continued to account for all mine production of nickel, which was contained in sulfide concentrates recovered from ilmenite ore at Tellnes. Output of concentrates was 13,000 tons in 1974, and exports totaled 13,515 tons valued at about $1.4 million.

Stavanger Staal A/S continued exploration for nickel in the Ballangen area south of Narvik. The company reportedly has outlined 40 million to 50 million tons of material containing an average of 0.35% Ni and very small quantities of copper. The exploration program was to be completed in 1975.

Imports of copper-nickel matte from Canada by Falconbridge Nikkelverk A/S totaled 93,243 tons in 1974, about 4% more than in 1973. Production and exports of refined nickel and cobalt from the refinery at Kristiansand were also increased. Exports in 1974 inclued 43,810 tons of nickel, 1,172 tons of cobalt, and 30,736 troy ounces of platinum-group metals, having an aggregate value of approximately $180 million. The principal destinations of nickel exports in 1974 were the United States (15,775 tons), West Germany (6,657 tons), Sweden (4,170 tons), the United Kingdom (4,130 tons), and the Netherlands (3,930 tons).

**Silicon.**—Production and exports of elemental silicon continued to increase. Exports in 1974 totaled about 64,000 tons valued at nearly $55 million, more than twice the value of silicon exports in 1973.

**Titanium.**—Production and exports of ilmenite concentrate continued to increase in 1974. A/S Titania, which accounts for more than 99% of Norwegian production of ilmenite, increased output 12% compared with that of 1973. Exports of concentrate in 1974 totaled 777,000 tons valued at about $12.5 million.

NL Industries, Inc., the parent company of A/S Titania, announced plans to increase production capacity for titanium pigment at Fredrikstad, Norway, and Nordenham, West Germany. Capacity of the Fredrikstad plant (operated by Kronos Titan A/S) will be increased 20% to 25,000 tons per year by early 1976. Capacity at Nordenham (Kronos Titan GmbH) will be increased 50% to 60,000 tons per year, also in 1976. Both plants are supplied by A/S Titania.

Exports of titanium dioxide and titanium white in 1974 were valued at $12 million.

## NONMETALS

**Cement and Other Construction Materials.**—The level of activity in the construction industry in 1974 appeared not very different from that of 1973. There was a slight increase in the number of building starts and the number of buildings under construction, but the number of completions was less. The index of wholesale prices for cement and brick-factory products for the first 11 months of 1974 was 23% higher than for the corresponding period of 1973.[5]

Production of cement was slightly less than in 1973, but exports declined 15% to 876,000 tons. Imports of cement from Norway by the United States in 1974

[4] Norsk Hydro A/S. Annual Report 1973–74, p. 19.

[5] Statistisk Sentralbyrå (Oslo). Statistisk Månedshefte (Monthly Bulletin of Statistics). V. 92, No. 12, December 1974, pp. 75–76.

totaled about 668,000 tons valued at $11.6 million; this was about the same tonnage imported by the United States in 1973, but the total value was 7.6% higher.

Exports of building stone in 1974 were valued at $19.1 million, nearly 19% more than in 1973. As usual, most of the stone consisted of gray syenite ("labrador") (92,500 tons) and slate (45,100 tons). During the last 13 years, most "labrador" has been shipped to France, Italy, and West Germany; most of the slate has been shipped to the Netherlands and Denmark.

Production of olivine in 1974 included 116,500 tons by K/S Norrdal Olivin A/S & Co. and 149,462 tons of olivine sand by A/S Olivin. The latter company was investing $6 million in new production facilities at Åheim, including a 100-meter tunnel kiln and four 38-meter sand silos. The company's output in 1974 (including 14,000 tons of refractory brick) was valued at $4 million; output planned in 1975 was 230,000 tons of olivine sand and 27,000 tons of refractory brick with a combined value of over $7 million.

Exports of other construction materials in 1974 included 1.2 million tons of gravel and crushed stone. Imports included 150,000 tons of clays and 242,000 tons of gypsum.

**Feldspar.**—Production and exports of feldspar continued to increase in 1974. Exports were valued at approximately $7.5 million, with nepheline syenite accounting for about 60% of the total. Output of nepheline syenite by Norsk Nefelin division of Elkem-Spigerverket A/S increased for the 14th consecutive year. The syenite is produced at Stjernøy in the Lofoten Islands.

**Fertilizer Materials.**—Norsk Hydro continued to account for the bulk of Norway's production and trade in crude and manufactured fertilizer materials. The company reported output of 710,000 tons of ammonia during the year ended June 30, 1974, along with sales of 660,000 tons of calcium nitrate, 220,000 tons of urea, and 1.2 million tons of complex fertilizers. These totals were slightly higher than those reported during 1973.

Norsk Hydro planned to expand its production capacity for fertilizer. Construction of a fertilizer plant was planned at Mongstad, where the company is building a petroleum refinery. The company was also studying the feasibility of constructing ammonia plants based on natural gas in southwestern Norway (Karmøy) and Scotland.

In addition to manufacturing ammonia in Norway, Norsk Hydro began production of ammonia and urea in Qatar in 1974. The company owned 20% of Qatar Fertilizer Co., and was operator and sales agent for the plant. The first shipment of ammonia was made in March. Production capacity of the plant was stated to be 900 tons of ammonia and 1,000 tons of urea per day.

Imports of fertilizer materials during 1974 included 418,000 tons of crude phosphate valued at $26 million, and 268,000 tons of potassium compounds valued at $18 million. Norsk Hydro reported that prices for fertilizer in Norway remained steady despite rising prices for raw materials. However, export prices appeared to increase substantially. Exports of manufactured fertilizer (including calcium nitrate) in 1974 totaled 1.6 million tons valued at about $153 million. The unit value of exports was more than 50% higher than in 1973.

**Pyrite and Sulfur.**—Production and exports of pyrite declined in 1974. This was mainly due to changes in production at Løkken. By late 1974, the mine was producing only copper and zinc concentrates for shipment; the pyrite concentrate was to be stored underwater until further notice. The last cargo of cupriferous pyrite was shipped from Thamshavn on May 25. Exports of pyrite (including cupriferous pyrite) from Norway in 1974 totaled 407,000 tons valued at about $6.4 million.

Production of pyrite at principal mines in 1973 and 1974 and planned production for 1975 is shown in the following tabulation, in metric tons:

| Mine | Production 1973 | Production 1974 | Planned production for 1975 |
|---|---|---|---|
| Tverrfjellet | 225,207 | 260,311 | 225,000 |
| Løkken [1] | 243,622 | 93,148 | -- |
| Skorovas | 159,120 | 152,570 | 141,000 |
| Sulitjelma | 82,078 | 58,903 | NA |
| Fosdalens | 24,958 | 24,238 | 25,200 |
| Bleikvassli | 17,900 | 19,300 | 21,000 |
| Mofjellet | 7,400 | 9,000 | 12,000 |
| Killingdal | 503 | 4,500 | 12,000 |
| Total | 760,788 | 621,970 | [2] 436,200 |

Source: Bergverks-Nytt (Trondheim). V. 22, No. 2, February 1975, pp. 10–13.

Norwegian production of sulfuric acid in 1974 was slightly more than in 1973. Most sulfuric acid is made at Sarpsborg by A/S Borregaard, parent company of the Tverrfjellet mine, and at Odda by Det Norske Zinkkompani A/S. Production of acid by the latter company in 1974 was 81,150 tons, a record high. A new plant for manufacturing sulfuric acid was under construction at Odda, with completion scheduled for mid-1975.

Exports of sulfuric acid in 1974 were valued at about $2.5 million; imports totaled 57,746 tons valued at about $2 million. Imports of elemental sulfur totaled 22,000 tons.

## MINERAL FUELS

**Coal and Coke.**—Production of coal from Svalbard (Spitzbergen) in 1974 changed little from that of 1973. Most of the coal continued to be shipped to the state-owned steelworks in northern Norway, where it was mixed with imported coal for the manufacture of coke. Only 49,600 tons of coal were exported in 1974; imports totaled 543,000 tons. Imports of metallurgical coke increased to 706,000 tons in 1974, and imports of petroleum coke rose to 342,000 tons.

Store Norske Spitsbergen Kullkompani A/S (SNSK), the only Norwegian producer of coal, continued to develop the Svea deposits on Van Mijnen-fjord, about 25 miles south of Longyearbyen. About $90 million is being spent to develop the Svea deposits, where coal seams are up to 5 meters thick, compared with a thickness of only about 0.7 meter at Longyearbyen. Mining at Sveabyen will be mechanized. Facilities being built there include a washing plant, accommodations for vessels up to 60,000 deadweight tons, and living quarters for 400 employees. Anticipated production is 800,000 tons per year beginning in 1978 or 1979, which can be increased to 1.2 million tons per year if market conditions permit. Coal reserves at Sveabyen were reported to be at least 20 million tons compared with about 8 million tons at Longyearbyen.

**Petroleum and Natural Gas.**—*Exploration.*—In August 1974, discovery of a major oil- and gasfield in the Norwegian sector of the North Sea was announced by the Statoil/Mobil Oil consortium.[6] Ownership in the consortium is Den Norske Stats Oljeselskap A/S (Statoil), 50%; Mobil Exploration Norway, 15%; Conoco Norway, 10%; Esso Exploration Norway, 10%; A/S Norske Shell, 10%; Saga Petroleum A/S & Co., 45/24ths; and Amoco Norway, Amerada Hess Norway, and Texas Eastern Norway, 25/24ths each. The field, named "Statfjord," lies about 95 miles west of the Sognefjord estuary, close to the British-Norwegian boundary. Recoverable reserves were initially estimated at 2 billion barrels of oil and 50 billion cubic meters of natural gas. The discovery was made in Jurassic (Dogger and Lias) sandstones at a depth of about 8,500 feet. Three wells had test yields of 10,000 barrels per day or more of low-sulfur, 37° to 41° API gravity oil.

Seven exploratory wells were drilled by the Phillips Group in the Ekofisk Area during 1974. Five wells were drilled by the Petronord Group, mostly in the Frigg-Heimdal Area. This exploration resulted

[6] The Petroleum Economist. V. 41, No. 10, October 1974, p. 367. World Petroleum Report '75. V. 21, p. 75.

in discovery of the Northeast Frigg Field. The Heimdal gasfield was declared commercial in April 1974; recoverable reserves of at least 40 billion cubic meters of gas were indicated. Esso Exploration also found gas north of the Frigg Field.

Late in the year, the Government awarded eight concession areas south of 62° latitude to various company groups operated by Amoco, Chevron, Conoco, Norsk Hydro, or Statoil. Areas north of 62° latitude continued to be reserved for the Government.

*Production.*—Development of the Ekofisk Field was continued by the Phillips Group. Thirteen development wells were completed, and major components of oil and gas processing equipment were installed on top of the million-barrel storage tank, which was set in place in 1973. By yearend, the first of two compressors was installed and reinjection of gas was proceeding.[7] Production capability for crude oil in the Ekofisk Field was increased to about 180,000 barrels per day during 1974, and expansion to 300,000 barrels per day was expected during 1975.

The 220-mile, 34-inch crude oil pipeline from Ekofisk to Teesside, England, was completed in 1974. The terminal to receive the oil was scheduled for completion by mid-1975. Another major development was completion of the 274-mile, 36-inch gas pipeline from Ekofisk to Emden, West Germany.

During 1974, the Phillips Group arranged for $116 million in additional financing for development of fields in the Ekofisk Area, and $314 million for oil and gas transportation systems. According to the Norwegian Government,[8] investments in development of oil- and gasfields in the Ekofisk Area were estimated to total $1,765 million as of February 1, 1974.

Total production of oil for sale from the Ekofisk, West Ekofisk, Tor, and Cod Fields was expected to reach 200 million barrels per year in 1978, after which output would decrease to about 35 million barrels per year in 1987. Production of natural gas for sale from these fields was forecast at about 12 billion cubic meters per year in 1978, declining to about 10 billion cubic meters per year by 1987.

Development of the Frigg gasfield, which straddles the boundary between the Norwegian and British sectors, was proceeding more slowly. In mid-1974, the Norwegian Parliament approved the sale of gas from the Norwegian part of the field to the British Gas Corporation, and a pipeline was being laid from the British part of the field to Scotland. Production of gas was expected to begin by mid-1976. Agreements between concessionholders on both sides of the boundary, concerning the proportion of gas reserves owned by each group, have not yet been negotiated. Recoverable gas reserves in the Frigg Field have been tentatively estimated at 200 billion cubic meters, and another 80 billion cubic meters may be recoverable from the East Frigg and Heimdal Fields nearby. The production license for the Norwegian sector is held by the Petronord Group, of which Norsk Hydro owns 32.87%.

Recoverable reserves in the Norwegian Continental Shelf south of 62° latitude were estimated at 300 million tons of crude oil and 500 billion cubic meters of natural gas. This estimate applied to early 1974 and does not include reserves in the Statfjord Field. Total potential reserves south of 62° latitude were estimated by the Norwegian Petroleum Directorate at 1 to 2 billion tons of oil and 1 to 2 trillion cubic meters of gas.

*Trade, Refining, and Consumption.*—Gradually increasing production of crude oil from the Ekofisk Field led to exports of 1.98 million tons of crude oil in 1974, 29% more than in 1973. The oil was valued at $152 million. Exports of petroleum products totaled 2.06 million tons, of which fuel oils made up 80%.

Despite rising crude oil production, Norway continued to import crude oil for refining in addition to large quantities of petroleum products. Imports of crude oil in 1974 totaled 6.7 million tons, about 5% less than in 1973. Imports of petroleum products totaled 3.9 million tons, including 2 million tons of fuel oil and 745,000 tons of gasoline.

Construction of the petroleum refinery at Mongstad continued; completion was scheduled during the first half of 1975. Refining capacity will be 4 million tons per year of crude oil. A/S Rafinor, the operating company, is owned 60% by

[7] Phillips Petroleum Co. 1974 Annual Report. Pp. 5–10.

[8] Ministry of Industry (Oslo). Report No. 30 to the Norwegian Storting, 1973–74—Operations on the Norwegian Continental Shelf. P. 14.

Norsk Hydro and 40% by Norsk Braendselolje A/S. When this refinery is completed, refining capacity in Norway will be 12 million tons of crude oil per year.

Statoil and Norske Shell A/S made an agreement by which the Shell refinery at Sola was to process 410,000 tons of crude oil for the Government during 1974. The crude oil was to be delivered by the Phillips Group in lieu of cash royalties for production in the Ekofisk Field.

In June 1974, the Government approved plans for development of a petrochemicals industry in Norway, based on wet natural gas to be produced from the Frigg Field. Production facilities planned at Frierfjord, in Bamble, include an ethylene cracker and plants for chlorine-alkali and vinyl chloride. These plants will be operated by Norsk Hydro and are planned for completion by 1977. Plants for production of polyolefins, to be built later, will be operated by Saga Petroleum A/S & Co., with Saga, Norsk Hydro, and Statoil each owning one-third.

Inland consumption of refinery products in 1973 and 1974 was as follows, in thousand metric tons:

| Refinery product | 1973 | 1974 |
|---|---|---|
| Aviation fuels | 281 | 254 |
| Gasoline | 1,128 | 1,049 |
| Kerosine | 466 | 294 |
| Gas and diesel oil | 3,131 | 2,569 |
| Residual fuel oil | 1,927 | 1,869 |
| Other | 1,062 | 1,034 |
| Total | 7,995 | 7,069 |

# The Mineral Industry of Pakistan

By Frank B. Fulkerson [1]

Pakistan was placing greater emphasis on the development of its mineral resources. In 1974 the Central Government increased financial allocations for exploration of copper, iron ore, phosphate, and other mineral deposits. More attention was being given to the extreme northern areas of Gilgit, Chitral, Dir, and Swat, where mineral wealth is largely unexplored.

Two government-owned corporations were formed to promote the development of mineral resources. The Resources Development Corp. (RDC) was given responsibility for drilling and developing the Saindak copper deposit in western Baluchistan. The Mineral Development Corp. (MDC), formed by merging several government-owned coal and salt mining firms, has the responsibility for mineral prospecting and development activities of the Government except for Saindak copper, uranium, natural gas, and petroleum. The MDC's first project was to be an evaluation of Indus River gold placer deposits in Gilgit.

Under a high government priority, the public sector Oil & Gas Development Co. (OGDC) and several U.S. oil companies continued to explore for oil in Pakistan. In 1974 Pakistan imported 88% of its petroleum requirements at a cost of over $150 million.[2]

Natural gas is the principal product of Pakistan's mining industry. In 1974, Pakistan ranked sixth in Asia in marketed production of natural gas. All the gas was consumed domestically in power generation, fertilizer and cement manufacturing, other industrial uses, and commercial and household uses. Pakistan's reserves of natural gas were estimated to be 15.4 trillion cubic feet, enough for 100 years at the 1974 rate of production.

The country's first steel plant was under construction in 1974, and capacity for refining oil and producing cement and chemical fertilizers was being greatly expanded.

The gross national product (GNP) at current prices increased 27.7% in fiscal year 1973–74 to $7,860 million. Most of the increase was due to higher prices caused by devaluation, international inflation, and monetary factors. GNP at constant prices gained 6.1% in 1973–74.

Except for extraction of crude oil and natural gas, private sector mining continued to be of limited significance. The main operations in the private sector were chromite mining at Muslimbagh, Baluchistan; quarrying of dimension stone; and some coal mining. In 1974 Pakistan Petroleum Ltd., and the Government of Baluchistan began a joint venture for mining and processing barite.

## PRODUCTION

Sizable quantities of the following mineral commodities were produced in the four provinces of Pakistan: Natural gas, crude oil, coal, chromite, barite, clays, gypsum, sand, gravel, dimension stone, crushed stone, and salt. Also, such finished mineral products as chemical fertilizers and refined petroleum were produced. Requirements for iron and steel and nonferrous metal products were met by imports.

e Estimate. p Preliminary. r Revised.
[1] As reported in source, types of products not specified.
[2] Sind Province only; additional quantities may be produced in other provinces, but are not reported.
[3] Data are for urea and ammonium sulfate only; ammonium nitrate presumably is still produced, but recent data are not available owing to Pakistan Government restrictions. In the year ending June 30, 1965 (latest data available), ammonium nitrate output totaled 76,086 tons (gross weight) with an indicated nitrogen content of 26,630 tons.
[4] As reported by North-West Frontier Province only; no details on the nature of this sand are available.
[5] Punjab and Sind Provinces only; additional quantities may be produced in other provinces.
[6] Punjab, Sind, and North-West Frontier Provinces only; additional quantities may be produced in other provinces.
[7] Aragonite and marble are reported inseparably, and the combined figure has been entered under aragonite.
[8] Reported in source as ordinary stone.
[9] Produced in Baluchistan Province only; type of sulfur not reported.

## TRADE

Pakistan's foreign trade was hurt by world inflation and recession. The country's trade balance changed from a small surplus of $20 million in 1972–73 to a record deficit of $344 million in 1973–74. Value of exports increased 26% to $1,026 million, but value of imports rose much faster and climbed 72% to $1,371 million. Rice and cotton manufactures were the principal exports. Wheat, fertilizers, petroleum, iron and steel, machinery, and transportation equipment were the leading imports.

An Indo-Pakistan protocol was signed in November that lifted the embargo on trade between the two countries. The protocol noted that there might be immediate possibilities of commencing trade in iron ore and other commodities.

Pakistan further liberalized its import policy. Eighteen new items were added to the duty-free import list. Most of the new items were industrial raw materials or capital goods, including iron and steel plates and sheets, lubricants and greases, nonferrous metal manufactures, and mining equipment.

The following tabulations list the value of Pakistan's mineral-industry exports and imports. In addition, table 2 supplies quantitative data for mineral industry exports.

| Commodity or commodity group | Value of exports and reexports (million dollars) | |
|---|---|---|
| | 1972–73 r | 1973–74 |
| Chromite | 1.1 | (1) |
| Other metallic ores | (1) | (1) |
| Metals including scrap | .9 | 1.6 |

## COMMODITY REVIEW

### METALS

**Bauxite.**—A small tonnage of bauxite was produced in Punjab Province. Deposits of bauxitic clays in the Salt Range and Kala Chitta areas of the province were being investigated.

**Chromite.**—Production of chromite declined from 17,046 tons in 1973 to 9,586 tons in 1974. The bulk of the output, from the Muslimbagh area of Baluchistan, was exported. Pakistan Chrome Mines Ltd., was studying the feasibility of setting up a ferrochrome plant based on the Muslimbagh chromite.

**Copper.**—Work completed in 1974 by the RDC and the Geological Survey of Pakistan indicated the Saindak copper deposit near the Pakistan-Iran border in Chagai District, Baluchistan, contains 250 million tons of ore with average copper content of 0.5%. Difficulties encountered in this project include remoteness of the area and lack of water. The search continued for nearby underground water sources.

**Iron and Steel.**—A large steel mill was under construction, and a small one was in the planning stage. Progress was reported to be good on a 1.1-million-ton-capacity mill being built outside Karachi by the government-owned Pakistan Steel Mills Corp. with extensive financial and technical assistance from the U.S.S.R. The mill was to reach full capacity by 1980. A bulk cargo port was being built at Quasim to handle iron ore and coking coal imports for the plant. The new port will avoid further congestion at the port of Karachi.

Work continued on evaluating iron ore reserves in Chagai District, Baluchistan Province. If reserves of iron ore are adequate, a ministeel mill will be established in the district by the Pakistan Government, reportedly with financial assistance from the People's Republic of China.

In 1974 Pakistan produced a limited quantity of steel in scrap-fed electric furnaces. Requirements for steel were met mainly by imports. The cost of imported iron and steel in fiscal year 1973–74 was $105 million.

**Uranium.**—Pakistan's Atomic Energy Commission revealed ambitious plans for nuclear energy. According to the commission, Pakistan has discovered enough deposits of uranium in the Dera Ghazi Khan area of Punjab and elsewhere to meet all domestic requirements in the foreseeable future. By yearend 1975, Pakistan will be able to provide nuclear fuel for its nuclear powerplant in Karachi. Also, construction on the 600-megawatt Chashma Barrage nuclear powerplant was to begin in 1975. The plan was to build several similar plants during the 1980's.

### NONMETALS

**Barite.**—Pakistan Petroleum Ltd. and the Government of Baluchistan Province began a joint venture called Bolan Mining Enterprises for mining and processing barite from a deposit near the village of Khuzdar in the Central Makran Mountain Range. The deposit was estimated to contain over 1.3 million tons of ore. It was expected that the bulk of the output would be exported. This new project should significantly increase Pakistan's barite production. Barite was used mainly as a weighting material in oil- and gas-well drilling fluids. Other barite deposits have been located in the North-West Frontier Province (NWFP).

**Cement.**—Cement production continued to increase to meet rising local demand as well as export commitments to a number of countries in the Middle East. The State Cement Corporation of Pakistan was reported to have undertaken four projects, each of 300,000-ton-per-year capacity, to expand the cement industry. All the cement plants in the country were under State control. Seven plants were under the State Cement Corp., and the remaining two were under the Ministry of Production.

**Fertilizer Materials.**—Extensive deposits of phosphate rock that reportedly could provide all of Pakistan's requirements for phosphate were being developed near Abbottabad in Hazara District, NWFP. A fertilizer complex based on these deposits was being planned. The plant, which would be under the jurisdiction of the NWFP Sarkand Development Authority, would produce superphosphate, diammonium phosphate, and phosphoric acid. A plant to produce urea also was to be built in the same area. Presumably the phosphate plant would be able to use the urea plant's ammonia facilities.

A $100 million project was begun to expand the Multan fertilizer plant. The new plant, a joint venture of Pakistan and Abu Dhabi, will produce nitric acid, calcium ammonium nitrate, and ammonia. Natural gas will be secured from the Sui gasfield.

Pakistan plans to become self-sufficient in chemical fertilizers by 1980. The cost of importing these fertilizers in 1973–74 was $90 million.

**Sulfur.**—A small tonnage of native sulfur was produced in the Koh-i-Sultan range, Baluchistan. Production was entirely by hand labor, using open pit methods.

## MINERAL FUELS

**Coal.**—The Government proposed to establish a 250-megawatt thermal power-plant near large coal deposits that have been discovered at Lakra, Dadu District, Sind.

**Natural Gas.**—Production of natural gas from the Dhulian oilfield and the Mari and Sui gasfields increased over that of 1973. Pakistan has large reserves of natural gas in these fields and in fields still lying dormant. A shortage of gas at the Karachi industrial complex was to be relieved by the end of 1976 when a new 300-mile Sui-Karachi pipeline is completed. The pipeline is being financed by the Asian Development Bank.

**Petroleum.**—Crude oil production, from the Potwar Plateau in northwestern Punjab, totaled 400,000 tons, which met only 12% of Pakistan's oil requirements. Rising prices for imported oil was a serious problem. Cost of imported crude and refined products reached $151 million in the fiscal period 1973–74. Several international oil companies and the OGDC were looking for oil in Pakistan. Also, a number of oil well service companies established offices in the country. The petroleum potential of the Indus and Baluchistan Basins and offshore areas was believed to be good.

Abu Dhabi and Pakistan are participating in a joint venture called Pak-Arab Refinery Ltd., to construct a new petroleum refinery at Multan. The refinery will cost $42 million and will have a capacity of 40,000 barrels per day. Crude oil will be imported from Abu Dhabi through the port of Karachi. The refinery was expected to be completed by 1977. There were three petroleum refineries in Pakistan in 1974, two at Karachi, and one at Rawalpindi.

Pakistan was constructing a new oil berth at Karachi, which handles all the country's seaborne imports and exports. The berth will accommodate 75,000 deadweight-ton tankers. The $23.9 million project will enable the port to handle expected oil traffic until the early 1980's.

In March, Pakistan Texasgulf Inc., a subsidiary of Texasgulf Inc., of Houston, Tex., signed a concession agreement for a 11,200-square-mile area, primarily in Sind but with portions in Punjab and Baluchistan. Also, Trend Pakistan Corp., a subsidiary of Trend Exploration, Ltd., Denver, Colo. signed a concession agreement on almost 15,000 square miles in Baluchistan.

# The Mineral Industry of Peru

By F. W. Wessel [1]

Peru's mineral industry contributed $543 million [2] to the national gross domestic product (GDP) in 1974, according to the Sociedad Nacional de Minería. This amount accounted for 7.0% of the GDP; the revised figure for 1973 was 7.3%. However, the value of mineral production was 3.2% greater than in 1973. Peru's mineral exports totaled $841 million, representing a 46.4% increase from the 1973 level. In both years mineral exports accounted for about 55% of total exports.

Peru received external loan commitments of $1.55 billion from January 1, 1973, through September 30, 1974. This amount included loans for the Transandean pipeline, the Empresa Siderúrgica del Perú (SIDERPERU) steel mill at Chimbote, and Cuajone copper development. In November an $8 million loan was obtained from Canada for development of 15 medium-sized mines in Peru. In all, Peru has borrowed from 17 countries over a 2-year period.

By Decree Law 20488, the Government of Peru, in December 1973, established the Ministry of Commerce, whose main responsibility was defined as development of domestic and foreign trade. Included in the new ministry were the existing marketing organizations which handled, among other items, minerals and metals, petroleum, and fertilizers. Decree Law 20784, of November 5, 1974, created an agency named "Minero-Perú Comercial" (MINPECO). This agency was to be responsible for all sales of Peruvian mineral products, including those of private mining companies; as such, it relieves Empresa Minera del Perú (Minero Perú) of this function.

There were 38 strikes in the mining industry during 1974. This was less than half as many as occurred in 1973; nevertheless, losses amounted to 1.8 million man-hours and 1.2 billion soles worth of production.

The Peruvian Times, a weekly English-language magazine which was a major source of mineral information on Peru, was lost indefinitely when, as a result of publication of details of a $330 million contract between Empresa Petróleos del Perú (Petroperú) and several Japanese companies involved in building the Transandean pipeline, it was closed down in November by the Government. This action received general approval by other Lima newspapers, which were taken over by the Government in July.

Decree Law 20492, issued on December 29, 1973, effected the expropriation of the assets, within Peru, of the Cerro de Pasco Corp. The company was renamed Empresa Minera del Centro del Perú (CENTROMIN) and will be headed by an Administrator, Victor Miro Quesada, a retired army general, who will report to the Minister of Energy and Mines. The investments of the parent corporation, Cerro Corp., in other Peruvian mining companies were not affected.

Cerro de Pasco Corp. held, as its principal assets, several developed and operating mines, hydroelectric powerplants, and the smelter complex at La Oroya. In 1973 the company's production included 67,500 tons of zinc; 83,500 tons of lead; 58,000 tons of copper; 95,000 tons of zinc concentrate; 18.1 million troy ounces of silver; and 36,600 troy ounces of gold.

The matter of compensation for assets at an estimated book value of $145 million was settled in an agreement reached in February. Under its terms, Cerro Corp. re-

[1] Physical scientist, Division of Nonferrous Metals.
[2] Where necessary, values have been converted from Peru soles (S/) to U.S. dollars at the rate of S/38.7=US$1.00.

ceived $58 million and will probably receive an additional $8 million to $12 million about February 1975. The company will also have a $138 million loss applicable against its U.S. taxable income over a 10-year period.

In December 1974, it was reported that Marcona Corp. and the Peruvian Government were discussing the sale of Marcona Mining Co. to Peru. Marcona Corp. is controlled by Cyprus Mines Corp. and Utah International Inc., each of whom owns 46%. Up for sale is a package which includes Marcona's iron ore concessions in Ica, 250 miles southeast of Lima, with reserves estimated at 300 million to 400 million tons, plus substantial quantities of lower grade material. These concessions expire in 1982. Also included are the nearby La Justa deposit, with 40 million tons reserve; the San Nicolas processing complex of 10.5 million tons of yearly capacity; the transportation facilities between the mine and San Nicolas; and shiploading facilities at San Nicolas.

## PRODUCTION

In terms of 1974 mine output, Peru's copper production increased 1.9%, lead production increased 1.0%, and zinc production decreased 5.4%. Gold production, responding to active government assistance, increased 28.8%, but silver production decreased 4.2%. Refinery production of copper remained unchanged from 1973. Zinc refinery production increased 2.4%. Lead smelter production decreased 3.6% and mercury production decreased 9.1%.

In the ferrous area, iron ore production increased 6.3%, steel production increased 27.7%, but manganese ore production decreased 64.6%.

Cement production was 9.2% higher than in 1973, and estimated barite production was slightly higher.

Crude petroleum production was 9.6% greater than in 1973, and refinery throughput increased 4.1%. Gross natural gas output increased 9.1%, but marketed gas was 7.1% less. Marketed gas was 45% of the total produced.

2 Includes hexane.

## TRADE

In 1974 Peru's total exports reached $1,520 million in value, a 46% increase over 1973 levels. Of this total, mineral exports amounted to $841 million, accounting for 55% of total exports and recording an increase over 1973 also of 46%. Copper at 186,000 tons remained Peru's principal mineral export, although 2% less in quantity than in 1973. Exports of lead and iron ore were 1% and 7% less than in 1973, respectively, but silver exports were 18% higher and zinc exports 5.5% higher.

Minero Perú began shipping 100,000 tons of copper concentrates to North Korea, pursuant to a trade agreement. The shipments will extend through 1975.

Peru's total imports in 1974 were $1,530.5 million. Imports of minerals, mineral products, and mineral fuels, at $123.1 million, accounted for 8% of the total.

Peru imported 11.9 million barrels of crude oil during the year, and 3.7 million barrels of refinery products; this was 8% less crude and 48% more products than in 1973.

Table 2.—Peru: Quantity and value of selected major mineral commodity exports, 1972–74

| Commodity | Quantity (metric tons) | | | Value, f.o.b. (millions) | | |
|---|---|---|---|---|---|---|
| | 1972 | 1973 | 1974 | 1972 | 1973 | 1974 |
| Copper content of ores, concentrates and smelter products | 218,467 | 190,319 | 185,937 | $183 | $284 | $284 |

## COMMODITY REVIEW

### METALS

**Copper.**—Minero Perú announced plans to expand copper output to 1.1 million tons per year by 1980. In addition to Toquepala and other sources now producing, and Cuajone and Cerro Verde, which are being prepared to operate, another eight porphyry copper deposits will contribute to the total; these are Tintaya, Santa Roso, Chalcobamba, Ferrobamba, Antamina, Quellaveco, Michiquillay, and Toromocho.

At the end of November it was announced that four members of the Conseil Intergouvernemental des Pays Exportateur de Cuivre (CIPEC) would reduce annual production by 224,500 tons. Peru's share of the total was to be 9,500 tons.

At the beginning of the year, Southern Peru Copper Corp. (SPCC) was owned by American Smelting and Refining Co. (51.5%), Cerro Corp. (22.25%), Phelps Dodge Corp. (16%), and Newmont Mining Corp. (10.25%.

SPCC geologists have defined a body of ground water underlying the boundary between Moquegua and Tacna. The quantity was considered ample to supply all requirements at the Cuajone mine. Reenforced plastic pipe to carry the water and also mill tailings was being fabricated on the site; an estimated 56 miles of pipe will be needed. Nineteen miles of new railroad, 17 of them in tunnels, were under construction, to connect Cuajone to the line between Toquepala and the smelter at Ilo. Overburden was being stripped from the mine site at the rate of 130,000 tons per day.

In September a group of Japanese firms invested $24 million in Cuajone. A further agreement was made to earmark 30,000 tons of blister copper per year for purchase by Japanese consumers over a 15-year period beginning in 1978.

Cerro Verde is an oxide deposit located directly above the Santa Rosa sulfide body, in the State of Arequipa. Development of Cerro Verde is of highest priority to Minero Perú, but initial output has been deferred until Santa Rosa has been thoroughly drilled; the sulfide body was discovered to be much larger than originally assumed. Cerro Verde's reserves are estimated at 67 million tons at an average grade of 0.673% copper. Reserves at Santa Rosa are now estimated at 1,172 million tons at an average grade of 0.545% copper. Production at the rate of 30,000 tons per year of copper was rescheduled to begin in 1977; an electrowinning process will be used.

Negotiations with Placer Development, Ltd., for design and installation of the Cerro Verde plant were broken off, and arrangements were made instead, about midyear, with Dowa Mining Co. Ltd. and Marubeni Corp. The two Japanese companies were to conduct a feasibility study, not only on production from Cerro Verde and Santa Rosa, but also from the Tintaya deposit, and perhaps including processing of phosphate at Bayovar, using sulfuric acid generated from the Santa Rosa sulfides.

Mitsui Mining & Smelting Co. Ltd. and Furukawa Mining Co., Ltd. continued construction of the refinery at Ilo; the scale of intended operations was increased from 150,000 to 225,000 tons per year, with eventual expansion to 300,000 tons per year.

Minero Perú and CENTROMIN began small-scale development of the deposit at Toromocho, where reserves are estimated at 200 million tons at an averaging grade of 0.78% copper. This pilot operation is expected to yield the engineering data required for mining and concentration. CENTROMIN will simultaneously drill the deposit; almost 150,000 feet of hole will be core-drilled to measure reserves more accurately and to determine the ultimate location of pit and concentrator.

In November final approval was given for the contract between Minero Perú and Michiquillay Copper Corp. of Japan for a feasibility study of the Michiquillay deposit. Completon of the study was expected about mid-1975, and the decision as to a major undertaking will be made at yearend 1975.

Cia. Minera del Madrigal, a Homestake Mining Co. subsidiary, was producing 600 tons per day of oxide ore. Concentrates were being shipped to various smelters in Japan at yearly rates of 10,000 tons of 30% copper content, 18,000 tons of 60% zinc content, and 6,500 tons of 65% lead content. Volume is expected to double by 1976.

SPCC's Toquepala mine contributed 55% of Peru's copper output in 1974. The mine's production, in terms of blister copper, reached 121,935 tons. Northern Peru Mining Co.'s Quiruvilca mine produced

6,700 tons of copper, some lead and zinc, and 1.39 million troy ounces of silver.

The Peruvian Government has been offered, as a gift, the Condestable mine, in the Department of Lima about 100 kilometers south of the capital. The mine was opened in 1963 by Cia. Minera Condestable, S.A., a subsidiary of Nippon Mining Co., Ltd., and has already paid back the initial investment. About 750,000 tons of 2% copper ore remains to be mined.

Discovery of a large copper deposit at Cañariaco, in northern Peru, was announced late in December 1973. The deposit, in the Department of Piúra, was estimated to contain 330 million tons of ore at grades between 0.45% and 0.80% copper.

Mitsui Mining & Smelting Co. drilled an area in the Department of Cuzco in which reserves of 60 million tons of ore at an average grade of 0.6% copper were present. Mitsui was granted mining rights by the Peruvian Government as a result. Japanese interests also sought an agreement with the Government to evaluate the porphyry copper deposits of Corohuayco and Huacollo, both in Cuzco.

**Gold.**—Production of gold in 1974 increased substantially over the 1973 output. About half of Peru's annual production was a byproduct of the operations of CENTROMIN. The remainder came from two gold mines in the Department of Puno and from many small operations in the jungle areas of Puno, Cuzco, and Madre de Dios. In the jungle areas, gold was found in both the fine gravels and sands of the lower elevations, and in the coarser gravels characteristic of the higher elevations. In both areas, lack of transportation facilities inhibited expanded production, and not enough was known about the region's gold reserve to warrant road construction.

Nevertheless, the Banco Minero sold 21,000 troy ounces of gold to Canada for $3.5 million in May.

**Iron Ore.**—Early in the year a shortage of residual fuel oil caused Marcona Mining Co. to suspend shipments of iron ore, and later to require their fleet of ore carriers to reduce ocean speed by 25%. At about the same time, Marcona, Mitsui Mining Co., and Marubeni Corp. found it expedient to review their agreement to build an additional 3.5 million-ton-per-year pelletizing plant. The oil shortage did not affect mine output, which was 6% greater than in 1973.

Feasibility studies on two iron deposits were undertaken by Canadian Minerals and Resources. Minero Perú contracted for one such study on a deposit near Acari, and Apurimac Mining Co. bought a similar study on their deposits further inland.

**Iron and Steel.**—Plans for expansion of the national steel works at Chimbote, 250 miles north of Lima, became more definite at yearend. Already underway was a project to increase yearly output from 425,000 to 700,000 tons of raw steel by late 1975. Further expansion to increase capacity to 2,350,000 tons by 1981 was planned. To accomplish this, two blast furnaces, each of 940,000-ton-per-year capacity, will be built to supply a new basic-oxygen steel plant of ultimate 1.6-million-ton-per-year capacity. The present basic oxygen plant will be expanded to 600,000-ton-per-year capacity. Continuous casting facilities will be installed to handle most of the raw steel output. A hot rolling mill, a cold rolling mill, and a plate shop will be added. A coking plant was scheduled to produce 1.3 million tons of coke per year. Limestone furnaces and an oxygen-producing facility will be built. Finally, port facilities at Caleta will be expanded.

Feasibility studies of a possible steel plant at Nazca, Department of Ica, were in progress during the year. SIDERPERU, the Government steel monopoly, also was planning to erect about 100,000 tons of sponge iron capacity to replace scrap, now imported and sometimes unobtainable.

**Zinc.**—Minero Perú asked for bids on construction of a 100,000-ton-per-year zinc refinery. A Belgian company, Sybetra, was selected; contracts have been signed and are awaiting government approval. The cost was estimated at $170 million. The plant will also produce yearly 335 tons of cadmium, 1,630 tons of cement copper, and 176,000 tons of sulfuric acid. Financing was being sought.

## NONMETALS

**Fertilizer Materials.**—In the Sechura desert, in the southern part of the Department of Piúra in northern Peru, is a phosphate deposit with reserves estimated at 38 billion tons of 30% phosphorus pentoxide ($P_2O_5$) content. Minero Perú was given the responsibility of planning and building a mining and processing complex. Kaiser Aluminum & Chemical Corp. had relinquished its option on the deposit after extensive exploration. Minero Perú began feasibility studies this year, leading to eventual production of

2 million tons of phosphate concentrate. The first experimental shipment was made in May. Initial production was to be 3,000 tons per day.

A large new deposit of phosphate rock was discovered in the Department of Ica; estimates of tonnage were not available.

A plant was under construction in Talara to produce 300 tons of ammonia per day. Based on the local natural gas, the plant will be operated by Petroperú.

In October, Decree-Law 20194 established a State corporation, Fertiperú, whose responsibilities included production, marketing, and trade in fertilizers, and technologcal development of the industry.

## MINERAL FUELS

**Coal.**—The feasibility study of anthracite coal production in the Alto Chicama Valley, conducted by the Polish governmental company KOPEX, was completed. An estimated 50 million tons was available. The KOPEX company was continuing a similar study in the Oyon Valley.

**Petroleum.**—No further service contracts, of the sort concluded between Petroperú and 18 oil companies in the 3 previous years, were written in 1974. Petroperú was working on a new format, giving Peru a 60% share of production.

Production of crude oil in 1974 was 50% from offshore wells, 47% from wells in the northwestern coastal area, and 3% from the jungle. Total production was 9.6% greater than in 1973.

In April official sources announced that Peru would explore the possibility of joining the Organization of Petroleum Exporting Countries (OPEC), since Peru expects to be a net exporter by 1976.

Exploratory wells drilled during the year on the eastern slope are as follows:

| Company | Total wells | Producing wells | Maximum depth (feet) | Yield (barrels per day) |
|---|---|---|---|---|
| Petroperú | 11 | [1]10 | 14,514 | 31,562 |
| Occidental Petroleum Co | 9 | 8 | 13,034 | 27,156 |
| Arco Peru Co | 2 | -- | 13,806 | -- |
| British Petroleum Co | 3 | -- | 14,709 | -- |
| Amoco Peru Petroleum Co | 2 | 1 | 12,300 | 807 |
| Getty Oil (Peru) | 1 | -- | 16,768 | -- |
| Phillips Petroleum Co | 1 | -- | 17,034 | -- |
| Peruvian Sun Oil Co | 1 | -- | 16,799 | -- |
| Union Oil Co | 3 | [2]2 | 12,780 | 859 |

[1] Includes eight confirmatory wells and one well abandoned because of mechanical problems.
[2] Low-gravity crude (API 10.5 to 11).

Oceanic Exploration Co., Amerada Hess Corp. of Peru, Dominex, Petroperú, Signal Petroleum Co. of Peru, Hispanoil, Total-Peru, Andes Petroleum Co., and Peru Cities Service Corp. continued seismic programs during the year.

Occidental del Peru Petroleum Co. received authorization from the Peruvian Government to ship 10,000 barrels per day to Iquitos for export to Manaos, Brazil. Occidental accordingly built 47 kilometers of 10-inch pipeline from Shiviyacu to the Tigre River, where barges will carry the crude oil to Iquitos.

Petroperú drilled 82 wells, totaling 450,000 feet, along the northwest coastal areas. Of these, 74 were development wells and 8 were exploratory; 75% of each type were producers. Two secondary recovery projects began at Verdum Alto and Ancha.

Tenneco Corp. returned to its offshore exploration program after a year of data reevaluation. Two wells were drilled and found barren; a third was begun.

Belco Petroleum Corp. del Perú drilled 6 exploratory wells, 3 being producers, and 38 development wells, of which 27 were producers and 3 were being evaluated.

In January contracts for 146,000 tons of 36-inch pipe were concluded between Indústria Peruana de Alambre, S.A. (ALAMBRESA), and Pipeline Joint Venture Hoesch-Salzgitter of West Germany. In May similar contracts for 24-inch pipe were reported concluded between ALAMBRESA and an unnamed Japanese company. The pipeline, 531 miles in length, will extend from San José de Saramuro, Department of Loreto, westward up the Marañon River, crossing the Continental Divide at 2,400 meters through Porculla Pass, and thence to the marine terminal to be built at Bayovar. Initial throughput is to be 200,000 barrels per day. Additional

pumping power can raise this to a maximum figure of 500,000 barrels per day.

A loan of $330 million for the pipeline ($230 million) and jungle oil exploration ($100 million), made by the Japan Petroleum Development Corp. and the Japan Peru Oil Co., was approved by both governments early in May.

Refinery throughput in 1974 was 108,700 barrels per day, for a total product production of 39.69 million barrels. Refined product output by plant, was as follows, in thousand 42-gallon barrels:

| | Motor gasoline | | Kerosine | | Diesel | | Residual fuel | | Other | |
|---|---|---|---|---|---|---|---|---|---|---|
| | 1973 | 1974 | 1973 | 1974 | 1973 | 1974 | 1973 | 1974 | 1973 | 1974 |

At yearend, the Ganso Azul refinery at Pucallpa was receiving 2,000 barrels per day from Petroperú Corrientes wells and some crude from the Maquia Field, while the J. L. Diaz refinery at Iquitos was shut down for inspection and maintenance.

A new catalytic cracker went on-stream at Talara in December to increase the refinery's gasoline output. At La Pampilla, Cie. Française d'Etudes et de Construction contracted to build a 65,000-barrel-per-day primary distillation unit and supporting facilities.

Just north of the Talara refinery, a nitrogenous fertilizer plant was nearing completion at yearend. It was built by Toyo Construction Co. Ltd. and is expected to produce 300 tons per year of liquid ammonia, 510 tons per year of urea, and some carbon dioxide.

In June, construction of a carbon-black plant of 7,700-ton annual capacity began. The plant, also in the Talara area, was being built by Technología y Procesos Industriales, S.A., and Ingeniería Panamericana, S.A., and was expected on-stream in the last half of 1975.

A contract with Lurgi Mineraltechnik GmbH was concluded in August, providing for construction of a solvents plant to produce acetone and isopropyl alcohol.

# The Mineral Industry of the Philippines

By Richard H. Singleton [1]

In 1974 Philippine mineral production increased 33% to a record value of $706 million,[2] and represented 5% of the gross national product (GNP). Real mineral production, based on 1973 prices, increased only 1%. Ores and concentrates containing copper, gold, iron, chromium, silver, and zinc comprised 74% of mineral production value and were smelted overseas. Copper continued to dominate the mineral industry, providing more than one-half of mineral output value. Installation of domestic smelter capacity was frustrated by lack of energy and capital. The country was entirely dependent on foreign oil for energy except for some coal and hydroelectric sources. The 1974 expenditures for oil totaled $650 million.

Copper production increased 1% in 1974 but expansion was impeded at yearend by high production costs and low world prices. The country produced 3% of the world's copper. Production of cement, the second most valuable mineral commodity, decreased 14% due to a government export ban early in the year to conserve oil. Iron ore production decreased 29% due to high production costs and lack of demand overseas. Chromium ore and concentrate production decreased 9% but the country supplied 8% of the world's chromium raw materials. Gold and silver production decreased 6% and 10%, respectively. The Philippines produced 1% of the world's gold. Zinc production increased 45%.

A new nickel mine and refinery came onstream late in the year, increasing nickel metal capacity to 5% of the world production. Plans for other nickel facilities were finalized. The Government stated that nickel would likely surpass copper as the leading domestic mineral commodity.

An agreement to build a 100,000- to 200,000-ton-per-year aluminum smelter was signed. The agreement was contingent on development of a geothermal energy source. An agreement to develop domestic bauxite resources was signed.

Fertilizer production increased 38% but 85% of demand was still met by importation.

The Philippine economy performed surprisingly well in 1974 in spite of the oil crisis, worldwide inflation, and falling export demand due to recessions in major markets. GNP, at $13.8 billion, showed a real growth of 5.9% compared with 9.9% in 1973. The volume of oil imports decreased by 2%, but oil import costs increased by a factor of 3.5. Substantial drops in export prices for copper concentrate, coconut oil, and timber were offset by record export prices for sugar. Export returns rose 48% to $2,725 million, but imports nearly doubled to $3,143 million for a 1974 trade deficit of $418 million. Oil comprised 21% of imports. Thanks to inflows of $528 million in nonmerchandise (mainly tourist receipts and transfer payments) and capital accounts (borrowings and net foreign investments), the 1974 balance of payments ended with a surplus of $80 million, and gross international reserves rose to $1.6 billion, up 33% from 1973.

Consumer and wholesale prices for all

[1] Physical scientist, Division of Nonmetallic Minerals.

[2] Where necessary, values have been converted from Philippine pesos (₱) to U.S. dollars at the rate of ₱6.85=US$1.00.

goods increased 34% and 55%, respectively, in 1974. Average mineral prices increased 32%. The exchange rate of the Philippine peso (P) with the U.S. dollar increased 5%, to P7.07=US$1.00 by year-end.

The Philippine Government began a 12-year program to reduce oil imports by exploring for domestic oil and by development of geothermal, coal, hydroelectric, and nuclear energy resources. Most of the contemplated smelters were determined to be dependent on the availability of nearby energy sources. A contract was signed in May with Burns & Roe, Inc. (United States) for the initial phase of a nuclear installation scheduled for initial operation in 1983. National Power Corp. stated that a geothermal energy source found in Makiling in Laguna (steam temperature 570° F) appeared more promising than the one at Tiwi, Albay (steam temperature 520° F). The Albay governor revealed plans in December to develop a 1,000-megawatt power source. A huge waterfall discovered on Negros Island reportedly may determine the location of a copper smelter because of its hydroelectric power potential. The Pantabangan dam, largest in the Philippines, was inaugurated in 1974, primarily for irrigation and flood control but a 100-megawatt generating capacity was planned. Oil well drilling was encouraged by the Government, particularly offshore. Encouraging traces were found in the Sulu Sea but all domestic wells drilled to date have been dry.

Foreign investment in natural resources development was encouraged and domestic mineral production was encouraged through a mineral depletion allowance. Total foreign investment was determined to be $1.4 billion, 70% of which was by the United States. Japanese and European investment was actively pursued, particularly in nickel and copper smelting but also in iron and steel, fertilizer, pulp and paper production, and shipbuilding. A presidential directive was proposed late in 1974 to reduce maximum foreign equity on mining investment to 30% from the current 40%, in corporations exploiting natural resources.

Expiration of the Laurel-Langley Agreement in July, which gave U.S. citizens preferential rights in the Philippines, had no perceptible effect on the continued development of commercial and economic relations with the United States.

The mineral depletion allowance was reduced from 50% to 25% in 1974. The flat export duty of 4% to 6% which had been imposed late in 1973 on most mineral commodities was supplemented in 1974 by a 20% to 30% export tax on value above an established commodity price. At year-end, the mineral industry was asking for relief from the 6% and 4% export taxes on copper concentrate and bunker fuel oil, respectively, and an increase in the mineral depletion allowance back to 50%.

In their review of the 1974 Philippine economy, the U.S. Embassy in Manila stated that the economy of the Philippines has good prospects in meeting its 5% future annual growth target and that the potential for U.S. investment and exports remains attractive.

## PRODUCTION

Mineral production value, excluding petroleum products, increased 33%, to $706 million, but the increase was only 1% in terms of 1973 prices. Approximately 74% of this mineral value was shipped as ore or concentrate to foreign countries, primarily Japan, for smelting. Copper dominated with 58% of mineral production value followed by gold at 11%, iron at 1.7%, chromium at 1.6%, silver at 0.9%, and zinc at 0.4%. Portland cement dominated nonmetallic mineral production, accounting for 15% of the country's total mineral output value, and was second to copper. Other nonmetallic minerals of major importance were fertilizers at 2%, clays at 1.2%, salt at 0.9%, gypsum at 0.7%, and lime plus marble at 0.3%. Value of coal production equaled 0.2% of mineral production.

## TRADE

Value of mineral exports during 1974 increased 20% to an estimated $510 million. However, the value increase based on 1973 prices was less than 1%. Nearly three-quarters of the produced mineral value was exported, mostly as ore and concentrate, mainly to Japan, 70%, with 7% going to the United States. Copper ore and concentrate accounted for 75% of mineral export value, with 85% of copper exports going to Japan. Copper exports were 33% lower in the second half of the year than in the first, primarily because of the depressed Japanese market. Other major exports were gold, cement, chromite, iron ore, silver, and zinc, most of which went to Japan, except for cement and chromium. The United States and Japan received nearly equal amounts of Philippine chromite ore and concentrate, as the major importers of this commodity from the Philippines. Minor exports were nickel ore, marble, mercury, platinum and palladium, iron pyrites, and manganese ore. Japan received most of each of these materials in 1973 except the manganese ore went to Taiwan.

Value of total exports during 1974 increased 48%, to $2,725 million. Copper ore and concentrate was the second most valuable commodity exported, accounting for 16% of the total. The No. 1 exported commodity was sugar at 26%. Value of total imports in 1974 increased 97%, to $3,143 million, with petroleum accounting for 21% of the total. Imports were 18% higher during the second half than in the first, mostly because of increased costs of petroleum procurement due to unit price increases. The 1974 trade deficit was $418 million. It rose from $128 million during the first half to $293 million during the second half. This increase was also caused primarily by increased oil importation costs during the second half. The large 1974 trade deficit with the Organization of Petroleum Exporting Countries (OPEC), Nations, $565 million, was partially offset by the large surplus with the United States, $421 million. A trade surplus of $24 million (revised) had been realized in 1973.

The United States was the Philippines No. 1 trading partner during 1974, with Japan a very close second. The two countries accounted for 63% of 1974 trade. Japan was the leading 1974 exporter to the Philippines, although the latter enjoyed a trade surplus with Japan of $85 million. Trade with Europe equaled 12% of total trade. Trade with countries with controlled economies was less than 2% of the total. Trade with the People's Republic of China (PRC) began with the arrival in the Philippines in October of a shipment of petroleum. Trade missions were made to the Soviet Union during the year. The text of a new trade agreement with Australia was approved in November. Increased trade with Canada was encouraged.

**Table 2.—Philippines: Exports of mineral commodities**
(Metric tons unless otherwise specified)

## Table 2.—Philippines: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Stone, sand and gravel—Continued | | | |
| Dimension stone—Continued | | | |
| Worked: | | | |
| Marble | 1,845 | 897 | Japan 615; Australia 143; Singapore 41. |
| Other | 6 | 4 | All to Guam. |
| Gravel and crushed stone | 10 | 70 | Hong Kong 57; Guam 13. |
| Quartz and quartzite | -- | 3,600 | All to Japan. |
| Sand: | | | |
| Natural (river and sea) | 138 | 265 | Japan 73; Netherlands 71; United Kingdom 30. |
| Silica | -- | 99 | All to Guam. |
| Other | 15 | 3 | All to Italy. |
| Sulfur, elemental, all forms | 6 | 8,251 | Japan 8,246; Guam 5. |
| Other nonmetals, n.e.s.: | | | |
| Crude | 167 | 332 | Thailand 331. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | 1,382 | 3,746 | Indonesia 3,327; Netherlands 222; Hong Kong 141. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Carbon black | 16 | 207 | Thailand 136; Indonesia 45; Taiwan 26. |
| Gas, manufactured | [3] 6,452 | -- | |
| Petroleum refinery products: | | | |
| Gasoline: | | | |
| Aviation thousand 42-gallon barrels | -- | 1 | Mainly to United States. |
| Motor (includes motor spirits) do | 115 | 270 | Guam 137; United States Trust Territory of the Pacific Islands 63; United States 62. |
| Kerosine do | 52 | 457 | United States 312; Japan 57; Sweden 19. |
| Jet fuel do | 566 | | |
| Distillate fuel oil do | 1,568 | 1,828 | United States 1,058; United Kingdom 388; United States Trust Territory of the Pacific Islands 63. |
| Residual fuel oil do | 563 | 322 | Liberia 97; United Kingdom 47; United States 44. |
| Lubricating oil (includes grease) do | 15 | 43 | Denmark 15; United States 4; Taiwan 3. |
| Other: | | | |
| Asphalt do | 39 | 23 | Guam 20; United States Trust Territory of the Pacific Islands 3. |
| Petroleum pitch and coke do | 477 | 164 | All to Japan. |
| Naphtha do | 6 | 39 | Mainly to Hong Kong. |
| Liquefied petroleum gas do | ([4]) | 233 | Hong Kong 162; United States Trust Territory of the Pacific Islands 54; Guam 8. |
| Total do | [r] 3,401 | 3,380 | |

[r] Revised.
[1] Included in other nonferrous base metals.
[2] Less than ½ unit.
[3] Includes liquefied petroleum gas.
[4] Included in manufactured gas.

## Table 3.—Philippines: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |

| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | 1,850 | 274 | Norway 150; Japan 101; Taiwan 8. |

r Revised. NA Not available.
1 Ores and concentrates of base metals for 1972 are included in rutile ores and concentrates. See footnote 2.
2 Includes ores and concentrates of titanium, vanadium, molybdenum, tantalum, and zirconium.
3 Includes plasters.
4 Included in gypsum.
5 Included in other sand.
6 Includes silica sand.
7 Includes pharmaceutical grade talc.
8 Less than ½ unit.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Reynolds International, Inc., and the Philippine Government signed an agreement to build a 100,000- to 200,000-ton-per-year smelter in Western Leyte. This first Philippine venture into primary aluminum production was to be contingent on the availability of economic power. The plant was scheduled to use government-supplied geothermal power if current exploration proved resources exist in sufficient magnitude. Preference was designed to be given to domestic sources for raw materials, which included bauxite deposits in Samar, aluminous clay deposits in Leyte, and aluminous laterite deposits in Mindanao. However, it was agreed that alumina or bauxite could be supplied by Reynolds from foreign sources such as Australia.

A consortium of aluminum companies headed by Commonwealth Aluminium Corp. Ltd. of Australia considered locating a 1.5-million-ton-per-year alumina plant on Mindanao using bauxite imported from Australia.

**Chromite.**—The Philippines produced 8% of the world's chromite in 1974 although production decreased 9% under 1973 to a total of 530,000 tons. Unit value increased 21%, primarily during the second half of the year. Chromite contributed 2% to the value of mineral production.

Refractory-grade chromite was mined in Masinloc, Zambales, by Benguet Consolidated, Inc. for Consolidated Mines, Inc. This was the only source of this material. Production decreased 11% to 429,000 tons. All material was exported, primarily to the United States, Japan, the United Kingdom, and Italy, in that order. Open pit mine reserves were becoming depleted according to Benguet. Consequently, they were developing an underground mine at Masinloc. Total reserves at Masinloc were estimated at 2.7 million tons with possible depletion within a decade.

Metallurgical-grade chromite was produced exclusively by Acoje Mining Co. Inc. also in Zambales. Production increased 5% to 100,000 tons. All material was exported to Japan.

Total chromite exports reached 605,000 tons in 1974, 1% over those of 1973. Exports to the United States were 43% less in the second half than in the first half of 1974. Exports during the second half of 1974 increased to the United Kingdom, Italy, Brazil, and Australia.

Table 4.—Philippines: Production and exports of chromite, 1974

[1] Exchange rate: P6.72=US$1 in 1st half of 1974; P6.85=US$1 in 2d half of 1974.

**Copper.**—The Philippines produced 3% of the world's copper as concentrate for shipment to foreign smelters. Production increased 1% over that of 1973 to 224,000 tons of contained copper. Total value equaled $408 million or 58% of the country's total mineral production value. Total value of copper exports was $393 million, an increase of 17% over that of 1973. Ninety-three percent of the concentrate was exported to Japan and 3% was shipped to the United States. The remainder went to the Republic of Korea, Taiwan, and Belgium.

Most of the copper concentrate was from low-grade, 0.5% porphyry ore, usually with gold and silver byproducts. Atlas Consolidated Mining & Development Corporation, the leading producer, operated the largest copper mine in southeast Asia and produced, in Cebu, 38% of the Philippine's material. Known reserves at that location, 617 million tons of 0.47% ore, were estimated to allow operation for 30 years at current production rates. Production by Marcopper Mining Corp., the country's second largest producer, at 20% of national volume, was down 40% in the second half of 1974. However, early in the year, a mill expansion was scheduled for completion late in 1975 at their main facility in Marinduque. Marinduque Mining & Industrial Corp. continued as the third largest producer with 15% of the total volume and early in 1974 planned to expand their Sipalay mine. Philex Mining Corp. became the country's fourth largest producer with 12% of the total volume and early in 1974 planned further expansion. Production of Lepanto Consolidated Mining Co. fell to 6% of the total volume and became the country's fifth largest producer because of environmental difficulties encountered by their only customer, American Smelting & Refining Company (ASARCO), in processing their high-arsenic ore. Production was 43% below that of 1973. It was reported that environmental regulations may cause complete closure of ASARCO's smelter at Tacoma, Wash.

Early in 1974, plans were revealed to build two smelters in the Philippines as a means of increasing national productivity and broadening the copper market. Marinduque Mining and Lepanto Consolidated planned a 100,000-ton smelter, using the

Outokumpu Oy flash-smelting method, and a refinery in Northern Luzon as a joint venture with the Government. Atlas planned to construct a flash smelter on Cebu near its mine. Both smelters were contingent on the availability of electrical power. The Government planned to develop a geothermal facility on Cebu. Both facilities were scheduled for operation in 1977 or 1978 at the earliest.

Benguet discovered sizable deposits of porphyry ore containing 0.55% to 0.6% copper in Abra and Benguet Provinces. Another very large deposit was discovered in eastern Mindanao.

Plans for expansion in the domestic copper industry were generally shelved late in 1974 because of rising production costs and drastically lowered world prices which fell from $1.40 per pound early in 1974 to $0.50 per pound early in 1975. Atlas claimed production costs of $0.60 to $0.65 per pound in October 1974. Many marginal mines closed and one small company folded late in the year. Atlas announced late in 1974 that its scheduled new mine and mill expansion in Cebu would not materialize until a dramatic turn for the better was observed in the world market. The tight situation was further aggravated by a 6% export tax on concentrate and by announced cutbacks in Japanese imports.

In February the Government began extracting a 30% premium duty on concentrate valued over an established basic price. However, in view of the depressed market, the 6% export tax was reduced to 2% in December. In the meantime, Japan requested in December a 10% to 40% reduction in copper concentrate shipments in view of its increasing stockpile and announced a 25% cutback in copper production.

**Table 5.—Philippines: Copper production by major producers [1]**
(Thousand dry metric tons)

| Company | Concentrate | | Direct-shipping-grade ore | | Copper content |
|---|---|---|---|---|---|
| | 1974 | 1974, 2d half only | 1974 | 1974, 2d half only | |
| Acoje Mining Co. Inc | 12.8 | 4.8 | -- | -- | 2.2 |
| Atlas Consolidated Mining & Development Corp | 313.7 | 164.0 | -- | -- | 87.4 |
| Baguio Gold Mines | 15.6 | 8.3 | -- | -- | 3.5 |
| Benquet Consolidated Inc | 8.5 | 4.5 | -- | -- | 2.4 |
| Black Mountain Inc | 12.0 | 5.8 | -- | -- | 2.9 |
| Consolidated Mines Inc | 6.9 | 2.8 | -- | -- | 1.5 |
| Lepanto Consolidated Mining Co | 47.6 | 19.2 | -- | -- | 14.7 |
| Marcopper Mining Corp | 164.6 | 64.3 | -- | -- | 46.9 |
| Marinduque Mining and Industrial Corp.: | | | | | |

| Western Minoleo | 19.9 | 13.1 | -- | -- | 5.4 |
| Total | 824.7 | 399.5 | 18.7 | 12.5 | 224.4 |

[1] Companies producing less than 1,000 tons copper content excluded from list.

**Gold.**—Gold continued as an important commodity equaling 1.3% of world production. However, production continued to drop, decreasing 6% in volume, to 536,000 troy ounces, although it increased 54% in value due to a dramatic 64% increase in selling price to a 1974 average of approximately $151 per troy ounce. Gold production provided 11% of total mineral value.

Production was dominated by five companies which together provided 83% of 1974 total production. Although Benguet, the largest producer, mined 25% of the country's gold, 135,000 troy ounces, production fell 27% becuase of its depleting ore reserves. Nevertheless, Benguet's gold output boosted company earnings to an alltime high and provided 55% of their 1974 income. The gold was taken from two mines, Acupan and Antamok, on Luzon. Benguet's gold production had declined steadily since 1968 and plans were made to conduct a 10-year exploration and ore body development project, on a tax-free basis. Unit production costs incurred by

Benguet increased due to inflation and higher energy costs, to a reported $107 per ounce.

Gold produced by the other four major companies was contained in copper concentrate which was shipped abroad, primarily to Japan, where the gold was recovered through smelting and credited to the Philippine Government. High production by Philex Mining continued. It was the country's second largest producer with gold accounting for 40% of company sales. Marcopper Mining's output increased 82% and it became the country's third largest producer with 15% of the country's production. Atlas Consolidated decreased production 10% and was the fourth largest producer with 11% of total output. Production by Lepanto Consolidated declined 44% because of curtailed copper production and Lepanto became the country's fifth largest producer with 10% of total output. Lepanto planned to put a new 10,000-ton-per-day copper concentrator into operation. The associated deposit has a reserve of 94 million tons of ore containing 0.5% copper and 0.004 ounce per ton of gold. Intensive exploration was being undertaken by Lepanto in promising districts of Paracale (Camarines Norte) and Surigao.

Exports totaled 542,000 troy ounces in 1974. Japan received 55% of this total, the United Kingdom purchased 31%, and the United States received 10%.

A decision was finalized by the Central Bank to set up a gold refinery with sufficient capacity to process all domestic gold-silver bullion production. Plant operation was scheduled for early in 1975. The plant was to have provisions for future expansion to refine byproduct gold as soon as a copper smelter was built in the country. The capability would enable the Government to stockpile gold more readily. During 1974, gold production was encouraged by the Government's guarantee to purchase all private output at a price above production cost. The producers were free to sell on the world market if they preferred.

Government support and high prices stimulated new gold-mining ventures and mine reopenings. Twelve small operators produced 17% of the country's 1974 output. Baquio Gold Mining Co. and Black Mountain Inc. both increased production 25%. Omico Mining and Industrial Corp. undertook a $560,000 mill expansion to a 500-ton-per-day capacity. Paracale-Gumaus Mining Co. reopened a mine in the Paracale District of Camarines Norte. Golden River Mining Corp. planned a $3.3 million facility in Paracale District, scheduled to produce 13,000 troy ounces of gold over a 10-year period. Acoje Mining produced 1,200 troy ounces in 1973.

The outlook at the end of the year was that gold production would increase as long as world prices remained steady.

**Iron Ore.**—Iron ore production decreased 29% to 1.6 million tons, due to high production costs. Total value, which decreased 26%, provided approximately 2% of total mineral production. Inco Mining Corp., through facilities expansion, became the leading producer. Filmag (Philippines) Inc. continued to operate at near full capacity producing 610,000 tons. These two largest producers provided 79% of total production. The other major producer, Philippine Iron Mines Inc., closed all facilities midway through the year except for a small iron sand operation. The three other smaller producers closed completely during the first half of the year. Production during the second half decreased 28% compared with the first half of the year.

Exports of iron decreased 23% to 1.5 million tons and went entirely to Japan, except for 111,000 tons which were shipped to the United States by Long Beach Mining Corp., during the first half of the year.

Kawasaki Steel Corporation signed a letter of intent to build a 5-million-ton iron ore sintering plant in Northern Mindanao at an estimated cost of $220 million. The ore would be imported from Australia and the sintered product would be exported to Japan.

Table 6.—Philippines: Production and export of iron ore, 1974
(Thousand dry metric tons and thousand dollars)

| | Production | | Export | | | |
|---|---|---|---|---|---|---|
| | | | Quantity | | Value[1] | Country of destination |
| | 1974 | 1974, 2d half only | 1974 | 1974, 2d half only | 1974 | |
| Anglo-Phil Oil & Mining Co | 41 | -- | 36 | -- | 236 | Japan. |
| Atlas Consolidated Mining & Development Corp | 21 | -- | -- | -- | -- | |
| Filmag (Philippines) Inc | 610 | 311 | 450 | 185 | 3,295 | Japan. |
| INCO Mining Corp | 668 | 361 | 713 | 355 | 5,387 | Do. |
| Long Beach Mining Corp | 63 | -- | 111 | -- | 614 | United States. |
| Philippine Iron Mines | 205 | 7 | 199 | -- | 1,717 | Japan. |
| Total | 1,608 | 679 | 1,509 | 530 | 11,249 | |

[1] Exchange rate: ₱6.72=US$1 in 1st half of 1974; ₱6.85=US$1 in 2d half of 1974.

**Nickel.**—Acoje Mining, the country's only nickel producer, continued to operate a small mill in Santa Cruz, Zambales, and produced nickel-cobalt sulfide concentrate containing 326 tons of nickel which was shipped to Japan for smelting. Ore reserves in Acoje's small dunite deposit were estimated to be sufficient for approximately 15 years at current extraction rates.

A $270 million mine and refinery complex with a capacity of 34,000 tons of nickel was put into operation in December on Nonoc Island by Marinduque Mining and Industrial Corp. Using the Sherritt-Gordon hydrometallurgical extraction process the operation was scheduled to produce annually 31,000 tons of pure nickel in powder or briquet form and a mixed sulfide concentrate byproduct containing 3,000 tons of nickel and 1,500 tnos of cobalt which was to be shipped to Japan for smelting. Full plant operation was scheduled before the end of 1975 and would produce the world's first commercially refined nickel directly from lateritic ores. New nickel laterite reserves were discovered boosting the country's huge nickel laterite reserves to 33 million tons of contained nickel at an average concentration of 0.93%. Most Philippine nickel ores were determined to be lateritic. It was observed that the new Marinduque operation would make the Philippines the second largest producer in Asia with approximately 5% of the world's nickel production.

The Philippine Government suggested that nickel would likely replace copper as the country's primary mineral commodity. Although encouraging development to produce shipping-grade concentrate to Japan, the Government insisted that private exploiters plan facilities for conversion to metal. Atlas Consolidated was given permission to build a 34,000-ton mine-refinery complex on Palowan in a joint venture with Mitsubishi Metal Corporation. Atlas had discovered three laterite deposits on Palowan and a laterite deposit in Davao containing a total of 4.8 million tons of nickel at an average concentration of 1.3%. Engineering studies to recover metal by the Freeport ammonia-leach process were completed. New Frontier Mines and Hochmetals of Panama were given permission to install a 15,000-ton smelter in northern Luzon.

Rio Tuba Nickel Mining Corp. announced plans to build a mine-concentrator complex on Palowan using a silicate ore containing an average of 2.19% nickel. The joint operation, with Pacific Metals Co. Ltd., a Japanese firm, was scheduled to begin in 1976. Olympic Mines and Development Corp. announced plans to mine lateritic ore at Pulot and Toronto on Palowan and ship it to Japan for smelting. Blue Ridge Mineral Corporation acquired mineral rights to certain laterite deposits in southern Mindanao near Davao. Reserves were estimated to contain 1.5 million tons of nickel at an average concentration of 1.29%. Exploration for nickel laterites was begun by Benguet Consolidated.

**Silver.**—Silver production decreased 10% to 1.7 million troy ounces but increased 80% in total value due to a doubling in unit value. Most of the silver values were in copper concentrates which were smelted

in Japan, and the Philippine Government was credited for the silver content. All of the major copper producers provided this silver- and gold-containing copper concentrate with the exception of Marinduque Mining and Industrial Corp. Silver output value equaled 1% of total Philippine mineral value. Production equaled 0.6% of world silver production. Hong Kong was the major importer of Philippine silver receiving 308,000 troy ounces of rolled material. Exports of silver in other forms including gilt, alloys, and platinum-plated material went to Japan, 134,000 troy ounces; the United Kingdom, 51,000 troy ounces; and France, 16,000 troy ounces.

**Other Metals.**—Production of zinc ore and concentrate increased 45% to 7,772 tons of contained metal. It was mostly smelted in Japan. A smaller amount of lead ore was produced. Small quantities of platinum and palladium were produced, exclusively by Acoje Mining. The values were contained in nickel concentrate which was smelted in Japan. Smelting credits reportedly decreased 45% in volume but only 13% in value. A small quantity of mercury was produced and exported to Japan; production decreased 62%. Approximately 2,000 tons of manganese concentrate was shipped to Taiwan and Japan; production decreased 78%. The country's reserves of high-grade manganese were reported to be small.

## NONMETALS

**Cement.**—Cement produced and used decreased 14% to 3.5 million tons but increased 52% in total value. Volume equaled 0.5% of world production and value equaled 15% of Philippine mineral production making cement the country's second most important mineral commodity. Capacity did not change significantly remaining at 6 million tons. Inventories increased approximately one-third. The ban placed on exports near the end of 1973 was lifted in June. Exports decreased 24% to 756,000 tons. The OPEC nations received 39% of 1974 cement exports; Hong Kong, 18%; Bangladesh, 17%; and Indonesia, 7%. The remainder went to Oceania and other southeast Asian countries.

Midland Cement Corp. built a 600,000-ton plant at Balingbing near Tanay in Rizal Province and became the country's third-ranking producer; production began in April.

**Clays.**—Clay production increased slightly in volume and considerably in value but firm data were unavailable. Clay production in 1973 totaled 256,000 tons. A 45,000-ton bentonite mine and crushing and drying plant was built as a joint venture of Lepanto Exploration (Asia) Inc. and Filmag (Philippines) Inc. The plant was scheduled to start in February 1975.

**Fertilizer Materials.**—Total production of fertilizer materials increased 38% to 172,000 tons but did not meet domestic demand. Value equaled 1.5% of total mineral value. Eighty-five percent of fertilizer demand was met by imports, primarily from Japan, Spain, and the United States. Japan exported approximately 300,000 tons of fertilizer material including 200,000 tons of urea to the Philippines.

Production of phosphate rock increased 117% to 26,500 tons and increased 170% in value, but this met only 10% of domestic demand for phosphate fertilizers. Imports from the United States included 154,000 tons of phosphate rock, 19,000 tons of superphosphate, and 20,000 tons of ammonium phosphate. Spain supplied 150,000 tons of superphosphate.

Guano production increased greatly to about 14,000 tons. Potassium fertilizers, totaling 90,000 tons, were imported from the United States and Canada. Ammonium sulfate totaling 160,000 tons was imported from Japan, West Germany, and other countries.

Pyrites production increased 24% to 253,000 tons and equaled 1% of world output. Approximately 90% of this material was a byproduct concentrate from copper ore flotation produced by Atlas Consolidated and by Marinduque Mining and Industrial Corp. Most of this production was converted to ammonium sulfate by domestic fertilizer producers and a smaller quantity was shipped to Japan. The other 10% was mined by Benguet Consolidated for shipment to Japan. Japan imported a total of 66,000 tons of unroasted pyrites from the Philippines. The Republic of Korea imported 5,000 tons of this material.

**Gypsum.**—Byproduct gypsum was produced by the phosphate fertilizer industry. Only 1% of the gypsum output was mined. Gypsum production increased 24% to 126,000 tons and all was used domestically. Value reportedly increased by a factor of

4.6 and equaled 0.7% of total domestic mineral production. Imports from Australia from July 1, 1973 to June 30, 1974 totaled 40,000 tons. During 1973, 99% of gypsum imports had come from Australia.

**Lime.**—Lime production decreased 33% to 101,000 tons after having suffered a 46% drop in 1973. Value reportedly increased by a factor of 2.4 and equaled 0.2% of total domestic mineral production. World trade had been negligible during 1973.

**Salt.**—Salt production, by evaporation of sea water, decreased 3% to 214,000 tons. Total value increased 44% and equaled 1% of total domestic mineral value. Nearly 10% of salt demand had been met by importation in 1973, from India and Ethiopia.

**Sand and Gravel.**—Production of glass sand increased 36% to 689,000 tons. Total value of silica sand increased 58% and equaled 0.2% of domestic mineral value. Production data on common sand and gravel were not available.

**Stone.**—Stone production, 99% of which was limestone, totaled 6.7 million tons and total value equaled 0.6% of domestic mineral production. Limestone use was 77% for cement and 4% for lime production. Use of limestone for cement production increased 13% in volume and 44% in value.

Production of unfinished marble decreased 28% to 6,500 tons, and total value decreased 7%. Production of finished marble increased 63% to 100,000 square meters but did not change in total value. Finished marble was exported, primarily to Japan.

**Other Nonmetals.**—Feldspar production suffered a 59% decrease to approximately 10,000 tons, and a total value decrease of 6%. Production had decreased 46% in 1973. Barite demand was met by an estimated production of 3,300 tons supplemented by imports totaling 2,400 tons. Production of an additional 1,000 tons per month in a new $1 million mill at Mansalay, Mindoro, was scheduled to begin by midyear. The operator, Falcon Rare Metals and Industrial Minerals, estimated its barite reserve at 80,000 tons. Production of perlite continued to grow increasing 37% to about 1,150 tons. Talc production increased 3% to approximately 1,700 tons and increased 32% in total value in partial fulfillment of demand. Six-thousand tons of talc had been imported in 1973, mostly from the Republic of Korea. In 1974, 2,100 tons was imported from the Republic of Korea.

## MINERAL FUELS

**Coal.**—Coal production increased 30% to 51,000 tons and increased 330% in value. All production was consumed domestically. Imports of coke, primarily from Japan, totaled 22,000 tons. Imports of coal totaled 5,000 tons, primarily from North Vietnam.

**Petroleum.**—The Philippines continued to meet its oil demands by importation, 94% from the Middle East. Imports of crude oil plus finished petroleum products decreased 2% in 1974. Imports of crude oil decreased 9% in volume, to 62.2 million barrels, but increased in value by a factor of 3.4, to $573 million. Imports of petroleum finished products increased in volume by a factor of 3.7, to 6.4 million barrels, and increased in value by a factor of 3.9, to $77 million. The breakdown of finished products was gas and diesel fuel, newly introduced from Bahrain, 59%; naphtha, mainly from Singapore, 15%; lubricants, from Singapore, the United States, and other countries, 14%; gasoline, from Iran, Bahrain, and Singapore, 10%; and other products.

Saudi Arabia supplied 55% of all petroleum products imports and became the Philippines' third largest trading partner. Other Mideast sources were Kuwait, 24%; Iran, 7%; Bahrain, 4%; and Qatar, 4%. Nearly all of the remainder came from Asiatic countries, including Sarawak, 3%; PRC, 1%; and Singapore, 1%.

Filoil's refinery in Cavite was closed during the first quarter because crude deliveries from Kuwait were suspended. It was announced in February that Kuwait would deliver 5.4 million barrels of crude to Filoil over the following 6 months at $11.54 per barrel. Import deliveries were somewhat sporadic during the first quarter because of the unsettled status of the Philippines in the opinion of OPEC. However, total import volume during the first half of 1974 were not significantly different from the second half.

The first shipment of Chinese petroleum arrived in October and total imports from the PRC during 1974 were valued at $6.8

million for crude and $0.4 million for petroleum products. The waxy, low-sulfur crude was directed for use as bunker fuel.

A trade pact was made with Mexico for importation of 10,000 barrels per day during 1975, equal to 5% of expected total petroleum imports. A trade mission visited the Soviet Union with an aim to import petroleum. Imports during 1975 were expected to total 70 million barrels.

Consumption of finished petroleum products, mostly produced in Philippine refineries, decreased 12% in volume but increased 104% in value. During the first half of 1974, consumption totaled 30.4 million barrels of finished products consisting of the following: Residual fuel oil, 48%; motor gasoline, 24%; distillate fuel oil, 20%; and jet fuel and kerosine, 8%.

Taxes on most oil products were raised in February and again in April. However, rationing was ended in March because of the easing of import supply problems. Fuel oil prices to industry, including cement producers, were cut 5% in October. Plans were made to increase tariffs on lubricants from 30% to 50% in January 1975 to protect the local manufacturer, Mobil Oil Philippines Inc. Finished products were produced at five refineries: Caltex (Philippines), Inc., at Bauan in Batangas, the largest; Mobil in Bataan; Shell Philippines Inc. in Tabango; Philippines National Oil Co. in Bataan; and Filoil Refinery Corporation in Cavite. The country's main powerplant, operated by Manila Electric Co., consumed 25,000 barrels of fuel oil per day. Most of the crude imported from the PRC was consumed directly at this plant.

A total of 1.1 million barrels of finished products, equaling 1.7% of production and totaling $17.3 million in value, were exported. These products and their destinations were: Gas and diesel oil, 32%, to the United States, Pacific Islands, Guam, and other countries; residual fuel oil, 21%, to the United Kingdom, Panama, Liberia, and other countries; kerosine, 26%, to the United States and other countries; and motor gasoline, 10%, to the Pacific Islands, Guam, and other countries; plus smaller quantities of lubricants and asphalt.

Exploration for petroleum, and oil well drillings in the Philippines continued at a slow pace. About eight wells were drilled by foreign companies during the 3-year period, 1972–74. All wells were dry. The Government encouraged application of foreign capital and technical expertise to exploration, particularly offshore. It was reported in April that Superior Oil Co. had found traces of oil and gas in the Sulu Sea. Offshore petroleum had been found north of Borneo near the Sulu Sea. In July, six regions of the country were opened to gas exploration. Drilling of seven offshore wells, five in the southern Philippines and two in southern Luzon, and one onshore well in northern Luzon was scheduled for 1975. Involved foreign companies were Amoco Philippines, Inc., Mobil, Oriental Petroleum and Minerals Corporation, Seafront Petroleum and Mineral Resources Inc., Sun Oil Co., and Trend Corp. The PRC was invited to participate. Despite active government encouragement, participation by foreign countries was limited by certain government-imposed conditions such as inclusion of a Philippines partner, with the Government taking the largest share of the profits.

# The Mineral Industry of Poland

By Tatiana Karpinsky [1]

In 1974 Poland ranked 10th among the world's industrial nations and accounted for about 2.2% of global industrial output. Poland accounted for approximately 2.2% of world fuel output, 3% of the total production of sulfuric acid, 2.2% of cement and steel production, and 1.4% of the world output of electric power.

Poland was the world's 5th largest producer of coal in 1974, and ranked 4th in the production of sulfur, 8th in zinc production, 10th in the production of cement, 10th in the production of refined copper, and 22d in the production of aluminum.

Poland's estimated share of the total industrial production of all the Council for Mutual Economic Assistance (CMEA)[2] countries was about 8.1% in 1974 and was exceeded only by the U.S.S.R. According to Polish sources, in terms of output per capita, Poland ranks 17th among the world's industrialized nations. The total value of gross industrial production in 1974 amounted to Zl 1573.3 billion,[3] compared with Zl 1409.9 billion in 1973, an increase of 11.6%. Among branches of industry, the electrical and manufacturing industries are the most important. In 1974 they contributed 30% of Poland's total industrial output. The metallurgical industry contributed 11%; the chemical industry contributed 9.4%; the mining industry, 6%; mineral processing, 3.9%; and the fuel industry, about 9.1%.

Poland has large reserves of coal, lignite, sulfur, copper ore, salt, lead and zinc ores, and smaller amounts of aluminum ores. Reserves of iron, crude oil, natural gas, chromium, manganese, mercury, tin, and potassium salts are relatively modest.

## PRODUCTION

Coal is important to Poland since it is the major fuel used for development of its industry. The increase in the production of hard (bituminous) coal in Poland in 1974 was 5.4 million tons, or 3.4%, as compared with its production in 1973. Brown coal output increased 610,000 tons, or 1.5%. Brown coal production was being developed so that more hard coal could be released for export, and thus improve the balance of trade. In 1974 there were 69 mines producing hard coal, and 2 underground and 7 surface mines producing brown coal.

Over the recent past, coal production has followed the planned steadily rising trend which is to be extended into the future. Two new coal mines came into operation in December 1974 which, when fully developed, are expected to add 22,000 tons per day productive capacity at Upper Silesian mines. These two mines, the Slask and Pniowek, are located respectively west and south of Katowice. The Slask mine initially extracted 1,500 tons per day, and in 1978 the output is to be 7,000 tons per day. The Pniowek mine in 1981 is to extract 15,000 tons of coking coal per day.

In 1974 a preliminary decision was made to develop a complex of underground coal mines at newly discovered deposits in the Lublin region. It was also planned to con-

[1] Foreign mineral specialist, International Data and Analysis.

[2] CMEA-Council for Mutual Economic Assistance comprising the following countries: Bulgaria, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and U.S.S.R.

[3] Where necessary values have been converted from Polish Zolty (Zl) to U.S. dollars at the official exchange rate of Zl 13.32=US$1.00 (basic rate), Zl 19.92=US$1.00 (special commercial rate).

struct a full-power complex in the Belchatow region, which will consist of a brown coal open pit and two electric powerstations. It is assumed that mines in the Lublin Basin will produce about 25 million tons of hard coal per year and the open pits in the Belchatow region will produce 40 million tons of brown coal per year.

In 1974 production of iron ore (1.3 million tons) remained far below expanding national requirements. An additional 15.6 million tons was imported during the year. Imports of iron ore increased 13.9% in 1974 compared with 1973. Production of pig iron amounted to 7.9 million tons, a decline of less than 1% as compared with that of 1973. About 1.7 million tons of pig iron was imported.

Crude steel production in 1974 reached 14.6 million tons as compared with 14.1 million tons in 1973. Despite the increase, there were shortages of rolled steel products which required imports of about 2.3 million tons of rolled steel. In order to expand its steel industry in 1974, Poland continued to modernize the Lenin steel plant and began building a metallurgical works in Katowice. According to present plans, the Katowice plant is to produce 4.5 million tons of steel and 3.9 million tons of semifinished ferrous products in 1976.

In 1974 copper ore output amounted to 13.9 million tons, an increase of 1.3 million tons, or 10.3% as compared with that of 1973. Production of electrolytic copper amounted to 195,000 tons, an increase of 25% over the 1973 level. Copper and copper product manufacturing was being developed rapidly for export markets. During 1974 there were five copper mines in operation. The first stage of the Rudna copper mine, with an ultimate planned capacity of 7.5 million tons per year of copper ore, was put into operation in 1974.

The production of refined zinc was 233,000 tons, approximately the same as in 1973, and that of refined lead increased from 68,400 tons in 1973 to 71,600 in 1974, or by 4.7%. During 1974 there were seven operating lead-zinc mines in Poland. The new Pomorzany mine was put into operation during the year. This mine's planned production of 2.1 million tons per year of ore will not be reached until 1977. The initial output, however, resulted in an approximate 25% decrease in zinc concentrate imports.

In 1974 sulfur production reached 4.1 million tons, up 548,000 tons over that of 1973, largely due to the output from mines using the Frasch process.

Crude oil production was 550,000 tons in 1974 and could not meet national demand which required an additional 10.6 million tons of crude oil imports from the U.S.S.R. Poland also received 2.1 billion $m^3$ of Soviet gas in 1974. The production of electric power was 91.6 billion kilowatt-hours, an increase of 8.7% over that of 1973. In 1974, the country exported 4.5 billion kilowatt-hours and imported 1.7 billion kilowatt-hours of electric power.

**Table 1.—Poland: Production of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity [1] | 1972 | 1973 | 1974 [p] |
|---|---|---|---|
| **METALS** | | | |
| Aluminum metal, primary | 102,000 | 102,000 | 102,000 |

• Estimate. [p] Preliminary. [r] Revised.
[1] In addition to the commodities listed, antimony, cobalt, germanium, gold, a variety of crude nonmetallic construction materials, and carbon black are also produced in Poland, but information is inadequate to make reliable estimates of output levels. Poland may also produce alumina in small quantities, but details on such an operation, if it exists, are not available.
[2] Includes content of multigradient fertilizers.
[3] Total of listed commodities only, excluding products not reported individually in official sources, as well as refinery fuel and losses.

## TRADE

Poland was a significant exporter of manufactured products, coal, and minerals in 1974. The main Polish imports were machinery, complete plant installations, semifinished products, natural gas, crude oil, and metallic ores.

In 1974 total exports were valued at Zl 27.6 billion, an increase of Zl 6.2 billion or 29% over that of 1973. The total value of Polish imports increased to Zl 36.1 billion, an increase of Zl 9.2 billion or 34% compared with the 1973 level.[4] The trade balance shows that the deficit increased from Zl 5.5 billion in 1973 to Zl 8.5 billion in 1974; an increase of 55%. Most of the deficit was incurred in trade with non-CMEA countries and was attributed to increased prices.

In 1974 exports of engineering and electrical industries products contributed 40% of the total national export value; coal, coke and electric power, 15%; chemical products, 11%; steel products and other metal products, 8%; and products of remaining industries, about 26%.[5] Fuel and electric power exports increased their share of the total export value from 14% in 1973 to 15% in 1974. The import value of manufacturing and electrical industries products accounted for 41%; steel products, 17%; chemical products, 13%; and petroleum and electric power for 4.5% of the total value of imports. Poland also imported iron ore, nonferrous metals or ores, zinc concentrates, alumina, and aluminum. The share of petroleum and electric power in total imports decreased from 7.6% in 1973 to 4.5% in 1974 and that of metals increased from 15% to 17%.

The CMEA countries' share of Polish exports declined from 61% in 1973 to 56% in 1974 and that of imports from 51% to 43% for the same period. Poland's largest trading partner among CMEA countries was the U.S.S.R. which in 1974 received 51% of the value of all Polish exports to the CMEA countries and supplied 51% of the value of all Polish imports from CMEA countries. Second most important trading partner was East Germany with 16% of the value of Polish exports and 17% of the total Polish import value. Czechoslovakia followed in third place accounting for 13% of Polish import and export values, while Hungary, Romania, and Bulgaria accounted for the balance of the CMEA region trade.

West Germany was Poland's most important trading partner among market economy countries. In 1974 it accounted for 17% of the value of all Polish exports and supplied 24% of the value of all Polish imports from these countries. The next ranking trading partners among market economy countries was the United Kingdom, followed by the United States, Italy, and France.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Production of aluminum in Poland totaled 102,000 tons in 1974, and has maintained the same approximate level for several years. The lack of aluminum raw material reserves created a dependence on imports of bauxite and alumina. Alumina imports during 1974 totaled 263,000 tons, representing an increase of 20,000 tons, or 8.2% over the 1973 level. The situation will not improve until 1978, when the production of alumina, by the Grzymek process, is to begin at Nowing, near Kielce. The plant under construction there is to produce 103,000 tons of alumina per year.[6]

Primary reduction plants in the Skawina and Konin Basins are the principal aluminum production centers in Poland. Because of raw materials shortages, Poland signed a 10-year agreement with Yugoslavia for delivery of 1.2 million tons of alumina in the period from 1976 to 1985. Alumina is also imported from the United States, while bauxite is imported from Hungary and West Germany.

**Copper.**—Poland, a major world copper producer, fulfilled the 5-year plan for copper mining and refining in 4 years. The plan provided for 180,000 tons of electrolytic copper to be produced in 1975, but the actual output was 195,000 tons in 1974, a 25% increase over that of 1973. It is expected that in 1975 the copper plants will deliver 235,000 tons of electrolytic copper,[7] and by 1980 production is to reach 425,000 tons. Production of crude copper ores totaled 13.9 million tons in 1974, an increase of 1.3 million tons or 10.7% over that of 1973. It is anticipated that the output of crude copper ore in 1975 will reach 17 million tons, 2.5 times as much as in 1971.

In 1974 Poland exported 58,000 tons of copper, 8,540 tons more than in 1973, an increase of 17.3%. Exports of copper to CMEA countries declined in 1974, but deliveries to market economy countries increased. Imports of copper decreased from 23,700 tons in 1973 to 10,400 tons in 1974. Nearly 80% of these imports came from non-CMEA countries.

Over the past 15 years Poland invested approximately Zl 40 billion[8] in the development of the Lubin-Glogów copper basin, consisting of three mines (the Polkowice, Lubin, and Rudna) and two copper smelting-refining works (Legnica and Glogów). The Polkowice and Lubin mines have already attained full production capacity of 4.5 million tons of ore per year. The first stage of the third mine, Rudna, the biggest and most modern copper mine in the country, started operating in June 1974, with a planned capacity, when all stages are com-

[6] Kurier Polski (Polish Courier). Warsaw, Sept. 11, 1975, p. 2.
[7] Zycie Gospodarcze (Economic Life). Warsaw, Apr. 27, 1975, p. 5.
[8] Zolnierz Wolnosci (Soldier of Freedom). Warsaw, Nov. 6, 1975, p. 4.

pleted, of 7.5 million tons per year. It is expected that 50% of this will be achieved in 1975.

The two plants in operation, one at Legnica and the other at Glogów, were completely integrated from smelting to electrolytic refining. The Legnica plant, originally designed for 25,000 tons per year of production capacity, after modernization was producing 70,000 tons of electrolytic copper per year. In 1977 the Legnica plant will supply approximately 100,000 tons of electrolytic copper per year.

The Glogów I copper plant is being modernized to produce 160,000 tons per year. Two production sections already were in operation and design capacity is to be achieved during the second quarter of 1975. When construction of Glogów II is completed, it is estimated that its production will be 150,000 tons of copper per year. The Glogów II plant is to be put into operation by yearend 1976. The next planned project of this type is to be located at Orsk, near Lubin.

The largest deposits of copper in Poland were discovered in 1957, and as a result of this discovery Poland ranks eighth in the world in copper ore reserves.

**Iron and Steel.**—In 1974 Poland produced 14.6 million tons[9] of crude steel, which was equal to 2% of world steel output. Production of pig iron increased 53,000 tons over the 1973 level, crude steel increased 509,000 tons, rolled products 691,000 tons, and steel pipes 89,000 tons. The plan for the next 5-year period calls for the production of 22 million tons of crude steel in 1980.[10]

Poland's steel industry development plans are expected to reduce the need to import pig iron and steel products, although the industry is to remain heavily dependent on imported iron ore. Imports of pig iron, in 1974, reached 1.7 million tons, an increase of 202,000 tons over the 1973 level. Steel product imports are also significant imports, because the country, as yet, has been unable to produce the variety of rolled steel products required. Polish imports of rolled products increased in 1974 to 2.3 million tons, an increase of 500,000 tons (27%) over that of 1973. Some 1.32 million tons of rolled products were exported, an increase of 11.9% over that of 1973. Exports of steel pipe at 30,500 tons, decreased by 24.9% for the same period. This was due to the strong demand for steel pipe at home. In 1976 exports of steel products is to increase again when the first stage of the Katowice steel plant will be completed.

Polish reports do not assess the overall technical level of the nation's steel industry.[11] Although many plants and shops measure up to high modern standards of world technology, Poland still has many old-fashioned steel plants mindful of the 19th century, but these are being phased out as modernization and expansion activities continue in major iron and steel plants in the country.

One of the biggest metallurgical plants in Kracow, the Lenin Metallurgical Plant, which produced 6.30 million tons of steel in 1973, and 6.75 million tons in 1974, is now being expanded. A new sheet rolling mill for automobile bodies was started in 1972, and in 1974 additional rolling and sheet metal processing equipment imported from Japan and France was installed. Japanese and Polish computers and computer components were also installed for automatic control of the production process. The second stage of the plate rolling mill at the Beirut Steel Works, in Czestnochow, with a production capacity of over 700,000 tons per year of plate, mainly for the shipbuilding industry, was completed in 1974.

Construction of the new metallurgical plant at Katowice continued in 1974. Production at this plant was scheduled to begin in 1976, with an output of 4.5 million tons of steel and 3.9 million tons of semifinished metallurgical products.[12] The plant's oxygen converters, with a capacity of 350 tons of steel each, will be three times larger than the units now in operation at the Lenin steel works. The total cost of plant construction is estimated at Zl 34 billion; some 15 billion zlotys have already been invested, including Zl 4.2 billion invested in 1974.

The Polish steel industry is almost entirely dependent upon imported iron ore, of which 15.6 million tons was purchased in 1974. Imports of iron ore increased in 1974 by 1.9 million tons, or 13.9% in comparison with the 1973 level. The U.S.S.R. has for many years been the chief source of iron ore for Poland. Approximately 85%

[9] Concise Statistical Yearbook of Poland. Warsaw, 1975, p. 94.
[10] Zolnier Wolnosci (Soldier of Freedom). Warsaw, Nov. 25, 1975, p. 4.
[11] Zycie Gospodarcze (Economic Life). Warsaw, Mar. 3, 1974, pp. 1, 2.
[12] Trybuna Ludu. Warsaw, May 22, 1975, pp. 1, 4.

of the iron ore imported comes from the U.S.S.R. and about 15% from Sweden, Brazil, East Germany, and Czechoslovakia. Domestic production of iron ore has decreased from year to year. Output from 1970 to 1973 decreased by 44% and during 1974 by 9.7%. Therefore, imports of iron ore can be expected to increase considerably, particularly when the Katowice steelworks has been completed. Poland's principal iron ore deposits are located in the Swietokryzyskie Mountains, northeast of Krakow, but the deposits are of low grade and cannot supply more than a fraction of national requirements.

**Lead and Zinc.**—Poland produced 233,000 tons of refined zinc and 71,600 tons of refined lead in 1974. Production of zinc declined by about 1%, but lead production increased by 4.7% compared with 1973 levels.

Poland has long been one of the largest zinc-producing countries in the world. A zinc smelting plant was recently completed at Miasteczko Slaskie. Production of zinc is expected to increase to 237,000 tons in 1975 and to 260,000 tons by 1980. Production of lead is expected to be 74,000 tons in 1975 and 120,000 tons in 1980.

In 1974 Poland produced 4.15 million tons of crude lead-zinc ores (1.7% over that of 1973). Deposits of lead-zinc ore occur in several regions, but mine production is being developed in the Olkusz region, which has the largest reserves. During 1974 the new Pomorzany underground mine, near Olkusz, started production of lead-zinc ore. The mine, with a concentration plant, is part of the Boleslaw mining and metallurgical complex at Bulowina. In approximately 3 years, the mine is expected to produce 2.1 million tons of ore per year.[13]

Zinc is one of the traditional commodities exported by Poland. In 1974 exports of zinc and zinc-rolled products declined by 4.9% from 95,600 tons in 1973 to 90,900 tons in 1974. Imports of zinc concentrates decreased from 126,000 tons in 1973 to 95,200 tons in 1974. This may be attributed to the startup of the Pomorzany mine.

## NONMETALS

**Fertilizer Materials.**—In terms of nutrient content, Poland produced 1.46 million tons of nitrogen and 823,000 tons of phosphatic fertilizers in 1974. Production of nitrogen fertilizers increased 6.7% as compared with 1973, but phosphatic fertilizer production remained at approximately the same level as in 1973. Total output of nitrogen fertilizer in 1975 was planned to reach 1.9 million tons, and of phosphatic fertilizers, 1.0 million tons. The goals for 1980 are at 2.2 and 1.3 million tons, respectively.[14]

The amount of nitrogen fertilizer exported in 1974 in terms of nutrient content declined by 4.3% in comparison to 1973, to a level of 384,200 tons.[15] At present, Poland's exports of nitrogen fertilizers are heavily dependent on urea, the product being sold mainly to developing countries. Productive capacity for this compound has risen fast, and the new Police plant (for which major expansion plans have been announced) could soon become a major source of fertilizers in Polish foreign trade. In terms of nutrient content, the amount of phosphorites and apatites imported in 1974 increased 9.9% compared with the 1973 level.

There were five main fertilizer plants in operation in 1974: The Chorzów, Tornow, Kedzierzyn, Pulawy and Wloclawek works. Phosphate fertilizers were produced at: Wroclaw, Kraków, Szczecin, Ubocz, Bogus, Zowice, Tarnobrzey, and Gdansk.

In 1974 the 440,000-ton-per-year compound fertilizer plant at Police was completed. An ammonia plant, with a capacity of around 496,000-ton-per-year, and a 396,000-ton-per-year urea plant, are also planned for the site. The Kedzierzyn and Pulawy ammonia plants are also being considered for further expansion. Expansion is already underway at the Kedzierzyn plant, where the capacity was reported at 440,000 tons per year. Pulawy is Poland's largest ammonia-producing plant, with a capacity of 1 million tons per year.[16]

The use of mineral fertilizers per hectare of land in Poland has increased over the past few years. In 1974 consumption of fertilizer per hectare of area was reported as 173.6 kilograms compared with 157.6 kilograms in 1973.

**Sulfur.**—In 1974 Poland produced a total of 4.1 million tons of native sulfur, an increase of 540,000 tons, or 15% more than the 3.5 million tons produced during

[13] Zycie Gospodarcze (Economic Life). Warsaw, No. 50, Dec. 14, 1975, p. 7.
[14] Nitrogen. London, No. 96, July/August 1975, p. 10.
[15] Pages 1–16 of work cited in footnote 4.
[16] Nitrogen. London, No. 95, May/June 1975.

1973. It was anticipated that total capacity of sulfur production would increase to 4.6 million to 4.9 million tons in 1975, as a result of increased output at the Jeziorek and possibly also the Machow mines.[17] In 1975 Poland will be able to begin development of a new sulfur deposit in the eastern part of the Rzeszow region. It was anticipated that total productive capacity could increase to 6 million tons per year by 1976 or 1977.[18]

Polish sulfur is surface mined at the Piaseczno and Machow operations while the Frasch process is used at the Grzybow and Jeziorko mines. In 1974 85% of the sulfur used in Poland was for the production of sulfuric acid; 5.9% was used by the petroleum industry; 3.6% in production of fertilizers; 3%, in the paper industry; and 4%, in the rubber industry. Poland accounted for 3% of the world's production of sulfuric acid in 1974.

Poland is the world's second largest exporter of sulfur, after Canada. Exports of sulfur reached 3.02 million tons in 1974, an increase of 5.2% in terms of quantity and 54% in terms value compared with 1973.[19] Approximately 2 million tons of sulfur was exported to non-CMEA countries. Sulfur prices in non-CMEA countries increased by 80.7% in 1974. Polish sulfur was sold and shipped in four different forms: as mined, liquid, granulated, and ground. The chief buyers among market economy countries were Norway, Austria, Italy, Finland, the United Kingdom, and India. Exports of large amounts of liquid sulfur require renting of terminal facilities for handling at destination. Such facilities are now operating at Rumcon, United Kingdom, 30,000 tons capacity; at Rotterdam, the Netherlands, 20,000 tons capacity; and at Rouen, France, 20,000 tons capacity.

## MINERAL FUELS

For many years coal, including lignite, has been the major source of primary energy in Poland. Production of primary energy derived from fossil fuels, fuelwood, and hydroelectric generation increased from 180.1 million tons standard coal equivalent in 1973 to 185.1 million tons in 1974.

In 1974 the share of coal in total primary energy production increased to 93.9% from 93.7% in 1973. During the same period the share of petroleum increased from 0.3% to 0.4%, while that of natural gas declined from 4.5% to 4.1%. Total consumption of all types of primary energy increased from 162.8 million tons of standard fuel equivalent in 1973, to 163.1 in 1974. The primary energy balance for 1973 and 1974 is shown in table 4.

In 1974 Poland produced 91.6 billion kilowatt-hours of electricity, up from 84.3 billion kilowatt-hours in 1973, an increase of 8.7%.[20] The installed capacity of electric powerplants was 19,130 megawatts in 1974, up from 17,730 megawatts in 1973, or an increase of 7.9%.[21] During 1974 about 4.5 billion kilowatt-hours of electricity was ex-

**Table 4.—Poland: Total primary energy balance for 1973 and 1974**
(Million tons of standard equivalent) [1]

| | Total primary energy | Coal (lignite, anthracite, bituminous) and coke | Crude oil and petroleum products | Natural gas | Others (peat, wood, hydropower) |
|---|---|---|---|---|---|
| 1973 | | | | | |
| Production | 180.1 | 168.8 | 0.57 | 8.03 | 2.70 |
| Exports | 41.95 | 39.9 | 2.05 | -- | -- |
| Imports | 24.6 | 1.2 | 21.12 | 2.28 | -- |
| Apparent consumption | 162.8 | 130.1 | 19.64 | 10.31 | 2.70 |
| 1974 | | | | | |
| Production | 185.1 | 173.9 | .81 | 7.65 | 2.78 |
| Exports | 46.2 | 44.4 | 1.82 | -- | -- |
| Imports | 24.2 | 1.2 | 20.2 | 2.82 | -- |
| Apparent consumption | 163.1 | 130.7 | 19.19 | 10.47 | 2.78 |

[1] Conversion factors used are hard coal, 1.0; brown coal, 0.3; coke, 0.9; crude oil 1.54; natural gas, (1,000 cubic meters), 1.33; hydroelectric power (1,000 kilowatt-hours), 0.125.

[21] Work cited in footnote 9.

ported and 1.7 billion kilowatt-hours imported.[22]

Poland's electric powerstations were fueled mainly by coal in 1974: 70% of the electric power generated came from hard coal; 27% from brown coal; and about 3% was derived from oil-fueled and hydroelectric powerstations. In the future, the demand for electric power is expected to increase between 8% to 9% per year. Output of electric power may reach 97 billion kilowatt-hours in 1975, increasing to about 133 billion kilowatt-hours in 1980.[23]

In 1974 a total of 1,500 megawatts of new electric power units were commissioned; 6 units of 200 megawatts each (Rybnik, Patnow, Dolna Odra and Kozienice) and 2 units of 150 megawatts each (Sekoerk, Lodz).[24] The construction of the first nuclear powerplant is to begin in the late 1970's and the entire project is to be completed in 1987.[25]

**Coal.**—During 1974 Poland produced a total of 162 million tons of hard coal, an increase of 5.4 million tons, or 3.4% over that of 1973. Coal production in 1975 is expected to reach 171 million tons, increasing to 190 million to 195 million tons by 1980.

Poland is the second largest exporter of coal in the world. Total exports of hard coal increased from 35.9 million tons in 1973 to 40.1 million tons in 1974, an increase of 4.2 million or 11.7%. In 1974 Poland exported coal to 31 countries. The U.S.S.R. was the largest importer of hard coal from Poland, with a total of 9.5 million tons. All other CMEA countries accounted for 5.6 million tons. Non-CMEA countries imported 25 million tons of coal from Poland in 1974.

Poland is one of the largest producers of brown coal, which is used mainly by local elelctric powerstations. Brown coal (lignite) production increased from 39.2 million tons in 1973 to 39.8 million tons in 1974, an increase of 1.5%. The trend is expected to continue in the future. In 1974 about 5.2 million tons of brown coal was exported, 4% over that of 1973. The principal importers of brown coal were Bulgaria, Yugoslavia, India, East Germany, and Romania.

Production of coke reached 18.1 million tons in 1974, a 2.3% increase over that of 1973, and it was expected that in 1975 it will reach 18.4 million tons.[26] Coke exports during 1974 totaled 3.0 million tons, an increase of 220,000 tons, or 7.9% over the 1973 level. Coke is gradually becoming less important on Poland's export list. In 1974 East European countries received approximately 15% of the coke exported from Poland, while Western countries received about 75%.

Hard coal is located in three basins: the Upper Silesian, Lower Silesian, and Lublin. Lignite is in the central and western parts of the country. The Upper Silesian Basin produced about 97% of the total coal output in 1974. During the past 30 years, 41 coal mines have been expanded and modernized, and 14 new big mines have been developed for exploitation. Two more mines, Slask (west of Katowice) and Pniowek (south of Katowice in the Pszczyna District), were commissioned in December 1974. The Slask mine, initially producing 1,500 tons per day, is expected to reach an output of 7,000 tons per day in 1978. The Pniowek mine produced about 100,000 tons of coking coal in 1974. The final plans for the development of the Lublin and Belchatow Basins will be made in the near future.[27]

The Lublin coal basin covers the territory between the Bug and Wieprz Rivers (eastern part of the country near Lublin). It contains high-energy coal at a depth of 600 to 1,000 meters. It was estimated that the first load of coal from the first mine, near the Bogdanka Village, would be obtained in 1977. In 1990 the development of the first stage of the Lublin Basin is to be completed, with four mines producing approximately 25 million tons of hard coal per year.

The total reserves of hard coal in the three coal basins (Upper Silesia, Lower Silesia and Lublin) to a depth of 1,000 meters) totaled 100 billion tons. About 40.5 billion tons of total reserves are located in Lublin Voivodship.[28]

The Belchatow brown coal region is located in Central Poland; the Belchatow brown coal-energy complex will be the greatest project of the current 5-year plan, and it is to be commissioned in 1980. Bel-

[25] Page 37 of work cited in footnote 5.
[26] United Nations Economic and Social Council, New York, coal/WP. 1/R. 25/Add.2, Dec. 10. 1975.
[27] Zycie Gospodarcze (Economic Life). Warsaw, Mar. 16, 1975, p. 1.
[28] Page 2 of work cited in footnote 27.

chatow is to have an annual capacity of 40 million tons per year when it is fully developed and, together with Szczercow mines in the same region, the total output will approach 50 million tons.[29] Belchatow's brown coal reserves are said to total 1,250 million tons, and those of the Szczercow Field, an additional 870 million tons.

**Natural Gas.**—Extraction of gas in 1974 was 5.7 billion cubic meters, a decrease of 4.8% compared with that of 1973. Imports of natural gas from the U.S.S.R. totaled 2.1 billion cubic meters, a 24% increase compared with those in 1973. Most of the domestic natural gas consumed in Poland was extracted from the Lubaszow Field. When the Orenburg-Eastern Europe gas pipeline is completed and put into operation in 1978, Poland is to receive an additional 2.8 billion cubic meters per year from the U.S.S.R.[30] Construction of this pipeline is to start in 1975.[31]

**Petroleum.**—Production of crude oil in Poland is relatively insignificant. In 1974 the output amounted to 550,000 tons, an increase of 158,000 tons, or 40% over that of 1973. It is expected that the output of crude oil in 1975 will be approximately 700,000 tons. About 11 million tons of crude oil was imported (mainly from the U.S.S.R.) in 1974, a decrease of 4.5% compared with that of 1973. Some 146,000 tons of crude oil was imported from countries other than the U.S.S.R. (mainly from Iran). According to Polish sources, 13 million tons of crude oil will be imported in 1975.[32] In 1974 Poland exported 1.2 million tons of petroleum products and synthetic fuels, which is 11% less than that of the 1973 year. For the same period, imports of petroleum products (automotive fuel, lubricants) have declined from 3.08 million tons in 1973 to 3.02 million tons in 1974, as the Plock refinery was completed and came into production.

Poland has signed an agreement to participate in the construction of pipelines in Byelorussia of the U.S.S.R. This agreement provides for construction of an oil pipeline from Polotsk, in the U.S.S.R., to Poland, and it is expected that it will be completed by yearend 1976.[33] In payment for the construction of this pipeline, Poland will receive additional deliveries of approximately 1 million tons of crude oil yearly, for 20 years, beginning in 1977.

In 1974 the Plock refinery, together with several smaller plants, produced approximately 11.4 million tons of refined petroleum, which by world standards is not a large amount. The Plock refinery is to attain a capacity of 13 million tons of crude oil input in 1975.

In 1975 the first stage of construction of the Gdansk refinery is to be completed, and is expected to produce 3 million tons of petroleum products per year. Completion of the second stage of the plant is expected sometime in 1977; at the same time, construction of refineries in Poznan, Czechowice and Blachownia Slaske will also continue. The first section of the Blachownia refinery is expected to start operating in 1978, with an anticipated production of 3 million tons per year of petroleum products. The Czechowice refinery will concentrate on the production of fuel oils and lubricants, while the Blachownia refinery will gradually become transformed into a petrochemical complex. The Polish petroleum industry is generally concentrated in a narrow belt along the Carpathians.[34] Intensified exploration has resulted in the discovery of new crude oil fields in the Portynia region. In the Carpathians crude oil fields have been expanded in the regions of Weglowka and Osobnica, and some new fields have been discovered in the Carpathian Foreland around Bszezowki and Grobla, as well as in the lowlands of Poland, known as the Pomorsko and Maszewo regions.

# The Mineral Industry of Portugal

By Norman A. Matthews [1]

The Portuguese mineral and metal industries produced lower tonnages overall in 1974 compared with those of 1973, although the value was substantially greater because of higher prices. The total tonnage produced in 1974, of 20 mineral commodities for which data were available, quarterly was 1,299,390, compared with 1,368,150 in 1973; relative values were $34.0 million [2] in 1974, and $21.7 million in 1973. Political unrest during most of the year impeded reporting of new mineral resource developments and delayed statistical compilations.

Portugal functioned with interim governments during most of the year; policies were directed at nationalization of service industries and major segments of the manufacturing industry, land reform aimed at increased agricultural production, and redistribution of revenue from the productive capacity of the nation. Principles were elucidated and debated but implementation was not consummated to sustain an overall national effort to improve the standard of living and balance of payments. Tourism declined over 31%, and remittances by emigrant workers declined 50% when compared with that of 1973. At the same time, the imbalance between value of imports and exports increased to such a degree that foreign currency reserves declined 14% during 1974. Value of exports increased to $2.26 billion in 1974, representing a 28% increase compared with 1973, whereas value of imports increased to $4.46 billion, an increase of 41% compared with 1973.

During 1974, minimum wage legislation was instituted which provides substantial wage increases to 50% of the nation's workers. Parallel increase in salary wages plus the increased cost of imported food staples resulted in inflation of 25% to 30%. Unemployment increased from a negligible level early in the year to 4% in the last quarter as many emigrant workers returned because of recessions in the more northerly European countries. A further increase in unemployment was expected when Portuguese nationals returned from Mozambique and Angola and overseas Portuguese troops returned and were demobilized. Irrespective of these considerations, the Government's major problem involved increasing productivity in the country so that it can sustain internal growth and increase exports to pay for the high-technology items that Portugal must continue to import.

## PRODUCTION

Overall value of the principal mineral commodities produced increased 57% because of higher prices in 1974, compared with that of 1973; tonnage of the same commodities declined overall and production of some commodities, was not reported in 1974. Production of 230,210 tons of anthracite coal represented an increase of 4%, compared with that of 1973. Copper mine output of 1,949 tons of ore and concentrate remained similar to that produced in 1973, whereas the tonnage of tin concentrate (618 long tons) declined 7%. Production of tungsten concentrate, a significant item of Portugal's mineral export trade, included 2,393 tons of wolfra-

mite concentrate and 149 tons of scheelite concentrate, 2% lower than comparable combined 1973 figures. In contrast, the quantity of ferrotungsten produced increased modestly to 369 tons in 1974. Refined copper production increased to 2,519 tons in 1974, whereas secondary aluminum production declined to 1,557 tons.

Production of hematite ore increased substantially in 1974; production of manganiferous iron ore (42% iron and 7.4% manganese) was 24,450 tons, a decline of 46% from that of 1973. Steel production declined substantially irrespective of increased demand, apparently because of labor strife which reduced production to one-third of the normal monthly level from August through October. Production of iron ore sinter declined 22% to 243,285 tons, pig iron 27% to 252,000 tons, and steel ingots 9% to 376,000 tons, when compared with that of 1973. Production of wrought steel products totaled 424,444 tons, partly from imported slabs and other semifinished items, compared with 509,271 tons in 1973. Ferrous casting production totaled 80,482 tons in 1974, a modest increase over that produced in 1973.

At yearend, production of electrical energy was by hydroelectric plants (82%) and thermal plants (18%). Also, additional personnel were alloted to increase coal production, and production of hematite iron ore was resumed at a higher rate than had been achieved in recent years.

In the nonmetallic minerals area, production of most commodities in 1974 was at levels similar with those of 1973, as the following relative tonnages indicate (1973 figures in parentheses): washed clay 27,214 (22,698); raw clay 23,979 (21,856); rock salt 620,000 (605,000); cupriferous pyrites 510,571 (532,401); barite 1,489 (1,458); diatomite 1,933 (1,153); feldspar 29,900 (24,018); quartzite 181,000 (173,000); and talc 1,170 (1,110). Production of hydraulic cement in 1974, 3,295,000 tons, was approximately equal to the record quantity produced in 1973. Sand and gravel data production continued at high levels.

Production of fertilizer materials in 1974 totaled 1,075,000 tons, a 4% increase over production in 1973. Production of inorganic industrial chemicals declined overall in 1974, as exemplified by—sulfuric acid 340,111 tons (a decline of 5%), nitric acid 165,939 tons (a decline of 32%), and hydrochloric acid 36,075 tons (a decline of 9%). Production of other classes of materials, such as tile and brick for construction and resins for plastics manufacture, also declined in 1974, compared with production in 1973. Production of petroleum products in 1974 totaled 4,534,706 tons, a 14% increase over that produced in 1973, with the increase principally in gasoline and fuel oil fractions.

e Estimate. p Preliminary. r Revised.
1 Less than ½ unit.
2 Includes production from the Azores and Madiera Islands as follows in thousand tons: 1972: Azores—15; Madiera—30; 1973: Azores—20; Madiera—31; 1974: Azores—14; Madiera—31. The balance of output in each year was from continental Portugal.

## TRADE

The Portuguese trade deficit increased substantially in 1974, with the value of exports approximating $2.26 billion and the value of imports $4.46 billion. The deficit of $2.2 billion compares with $1.12 billion in 1973, and $950 million and $617 million in 1972 and 1971, respectively. The unsettled political climate adversely affected most business firms, large and small, so that the tonnage of exports declined in most categories, whereas import tonnages were equalled or increased when compared with those of 1973. The considerably higher prices paid for raw materials and high-technology material resulted in the marked increase in the foreign trade deficit. For example, the aggregate of 11 solid fuels, nonferrous metals, iron ore, and steel import commodities totaled 1,812,090 tons valued at $327 million in 1974, compared with 1,885,550 tons valued at $169 million in 1973. Steel, in ingot, slab, coils, and plate form, accounted for 74% of the 1974 import value of these commodities, followed by copper, phosphate rock, zinc, bituminous coal, and iron ore.

During 1974, trade patterns did not change significantly, but the relative value of mineral and metal exports declined when compared with that of textiles, clothing, and other manufactured apparatus and machines. Some of the largest categories of exports in 1973, the last year for which detailed values were available, included (1) textiles and clothing, $507 million; (2) processed food products and beverages, $258 million; (3) electrical components and machines, $191 million; (4) wood products, $169 million; (5) pearls, gems, and precious metals and products, $105 million; (6) chemical industry products, $95 million; and (7) paper and paper products, $93 million. Imports, by major classifications, in order of value included (1) electrical apparatus and machines, $552 million; (2) transportation equipment, $371 million; (3) textile materials and fabrics, $364 million; (4) base metals and products, $257 million, including $130 million of iron and steel products; (5) chemical industry products, $234 million, including $73 million in organic chemicals); (6) vegetable products, $233 million; and (7) mineral products, $204 million, including $182 million for coal, crude petroleum, and petroleum products.

Exports from Portugal went to (1) Europe, accounting for 66% of the total, of which the principal countries were the United Kingdom, West Germany, Sweden, France, and Italy; (2) the Overseas Provinces, 15%; and (3) the United States, 9.8%. Of the imports, European Countries dominated by West Germany, the United Kingdom, France, Spain, and Sweden, supplied 65%; the Overseas Provinces provided 10%; and the United States, 8.2%

Imports from the United States were valued at $240 million in 1973, whereas exports to the United States were valued at $173 million. Principal items imported from the United States included (1)

cereal grains, $74 million; (2) cotton and other fibers $38 million; (3) electrical apparatus and machines, $25 million; (4) aircraft and parts, $19 million; (5) soya bean products, $15 million; (6) iron and steel products, $9 million; and (7) raw cotton, $8 million. Principal exports to the United States were (1) clothing and accessories, $20 million; (2) electrical and electronic components, $19 million; (3) cork and cork products, $15 million; (4) tomato pastes, $12 million; and (5) prepared foods, $9 million.

2 Less than ½ unit.

## COMMODITY REVIEW

### METALS

Production of lead concentrates continued at about the reduced level of 1973. Zinc mine output resumed at the higher levels achieved in 1972. Otherwise, there was little change in the variety of minerals produced. In general, the unsettled political climate impeded production and halted announcements of new projects or developments at existing facilities.

*Iron and Steel.*—At yearend, continuously cast steel billets were produced for the first time in Portugal, at the rate of 22,000 tons per month. Output was presumably at the Siderúrgia Nacional plant at Seixal where Phase 1 of an expansion program was to be completed in 1974. The Government announced Phase 2 of the expansion program was to be completed in 1978 or 1979. Primary items are a new blast furnace of 1.5-million-tons-per-

year capacity, a basic oxygen furnace (BOF) plant of 1.6-million-tons-per-year capacity, and associated continuous-casting equipment. No details of progress on the Phase 1 program have been received, and the production potential of existing facilities was not realized in 1974, apparently because of labor strife that lasted several months. As a result, steel was imported at a much higher rate than previouly (803,000 tons in 1974 versus 573,000 tons in 1973) and was the dominant item in the value of mineral and metal imports. Mining of hematite ore (40% iron) was resumed at yearend at an annual rate of approximately 75,000 tons.

## NONMETALS

Production of most nonmetallic minerals continued at the same or lower rates in 1974, when compared with those of 1973. Production of quartzite showed a modest increase and cupriferous pyrite a modest decrease in 1974. As a part of the nationization program for major industry segments, the Government assumed a controlling interest in the fertilizer industry and effected a merger of Amoniaco Portugues, Sociedade Portuguesa de Petroquimica, and Nitratos de Portugal. Investments approximating $195 million were also announced to increase domestic fertilizer production by 1980, including a new fertilizer plant in the Sines industrial zone.

## MINERAL FUELS

Construction continued on the new oil refinery and port facilities at Sines which were expected to be in operation in 1976. Several associated petrochemical projects have been projected for operation in the first phase which is to be completed in 1977 or 1978. A 230,000-ton-per-year ethylene plant has been announced, with downstream facilities including a low-density polyethylene plant of 120,000-ton-per-year capacity, a polypropylene plant of 50,000-ton-per-year capacity, a high-density polyethylene plant of 30,000-ton-per-year capacity, a vinyl chloride monomer plant of 150,000-ton-per-year capacity, and a polyvinyl chloride plant of 55,000-ton-per-year capacity.

Although several exploratory oil wells were drilled offshore during the year, no reports of indications were made public.

To substantially increase anthracite coal production, additional coal miners were employed late in 1974.

# The Mineral Industry of Romania

By Joseph B. Huvos [1]

Romania's centrally planned economy was based on mutually coordinated production schedules and production targets were predetermined by the 1971–75 national plan for economic development. Romania's economic growth is closely linked to its mineral resources and while these mineral resources have little significance by world standards, they are quite important to the country's economy.

Compared with 1973, raw coal production increased by 2,543,000 tons, crude steel by 679,000 tons, mineral fertilizers (100% active substance) by 169,000 tons, and cement by 1,347,000 tons. Natural gas production increased by 877 million cubic meters, and electric power by 2.3 billion kilowatt-hours. There were also increases in the output of nonferrous metals, petroleum products, and petrochemicals.

Gains in mineral industry production were achieved mainly by massive construction of new plants and installation of new equipment, thereby accelerating industrialization but leaving less time for improving efficiency and quality. Often western technology and processes were used to achieve industrial goals.

There were about 52,700 persons employed in the coal industry, 32,500 in the petroleum industry, 71,100 in the ferrous mining industry, about 66,100 in the nonferrous mining and metallurgical industries, 11,100 in the nonmetallic minerals industry, and 32,400 persons in the electric power industry. Average monthly income in industry was about 1,660 lei,[2] an increase of 7.2% over that of 1973. To ease the shortage of labor, pensioners were encouraged to return to active employment.

Extensive prospecting and exploration for mineral resources continued. In 1974, Romania's industry invested 61.3 billion lei in new plants and equipment, an increase of 9.5% over that of 1973. Of this, 8.3 billion lei was for electric power and heating, 7.5 billion lei for the fuels industry, 6.2 billion lei for the iron and steel industry, and 9.7 billion lei for the chemical industry.

Major productive capacity went onstream at the Slatina aluminum reduction plant, the thermoelectric plants on the Somes and the Olt Rivers, the Galati Siderurgical Combine, the alloy plant at Tirgoviste, and the wire mill at Buzau.

Romania's supply-demand balance for the more important mineral products did not change much in 1974. The only exports of mineral products significant by world trade standards in 1973 were 6.5 million tons of petroleum products, 1.4 million tons of steel semimanufactures, 58,589 tons of nonferrous metals including aluminum, 291,965 tons of fertilizer materials, and 1.8 million tons of cement.

One of the more important government measures concerning the mineral industries was the reorganization of the Ministry of Mines, Petroleum and Geology. Decree No. 42/1974 of February 18, 1974, divided the Ministry in two general directorates (petroleum and gas, and geology), and eight specific directorates (planning, technical, organization, investments, international cooperation, finance, supply and marketing, and administration). Five regional centers were established (the Petrosani coal center, Baia Mare nonferrous mining and metallurgy center, Deva ore mining center, Medias natural gas center, and Bucharest salt and nonmetallic minerals center).

[1] Foreign mineral specialist, Division of Coal.

[2] Values have not been converted from Romanian currency units (lei) to U.S. dollars, because of the wide variation between the official exchange rate (lei 6=US$1.00); tourist rate (lei 18=US$1.00), and various other exchange rates used for individual transactions.

## PRODUCTION

Mineral production statistics were not reported for a number of commodities, and much of the data in the production table is estimated. New capacity was added in many branches of the Romanian mineral industry, which resulted in significantly increased production.

The Transylvanian part of the country, inside the semicircle of the Carpathian Mountains, produced almost all the natural gas, bituminous coal, nonferrous metals, and nonmetallic minerals. Almost all crude oil and lignite were produced in the plains outside of the Carpathian chain.

The most significant increases in production of mineral commodities were in the areas of aluminum, iron and steel, coal, fertilizer materials, and cement.

**Table 1.—Production of selected mineral commodities**
(Metric tons unless otherwise specified)

| Commodity [1] | 1972 | 1973 | 1974 [p] |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite, gross weight [e] | 305,000 | 345,000 | 345,000 |
| Alumina, gross weight [e] | 210,000 | 282,000 | 374,000 |
| Ingot (including alloys) | 121,533 | 141,241 | 187,000 |
| Bismuth, mine output, metal content [e] | 80 | 80 | 80 |
| Cadmium, smelter output [e] | 80 | 80 | 80 |
| Copper: [e] | | | |
| Mine output, metal content, recoverable | 35,000 | 42,000 | 50,000 |
| Smelter | 35,000 | 42,000 | 50,000 |
| Refined | 35,000 | 42,000 | 50,000 |
| Gold, mine output, metal content [e] troy ounces | 60,000 | 60,000 | 60,000 |
| Iron and steel: | | | |
| Iron ore thousand tons | 3,361 | 3,234 | 3,265 |
| Pig iron and blast furnace ferroalloys do | 4,890 | 5,713 | 6,081 |
| Crude steel do | 7,401 | 8,161 | 8,840 |

| Liquefied petroleum gas | do | 2,645 | 2,865 | 2,831 |
| Asphalt | do | 3,515 | 3,660 | 3,539 |
| Total | do | 115,633 | 125,489 | 128,355 |

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, antimony, asbestos, gypsum, mica, and natural gas liquids, as well as a variety of crude construction materials are produced, but output is unreported and available general information is inadequate to permit formulation of reliable estimates of output levels.
[2] Romanian sources do not indicate whether refinery fuels are reported as a part of the listed product yields or not. Moreover, additional minor products may be produced but are not listed in official sources.

## TRADE

In Romania's mineral economy, international trade ranks high among the industry's priorities. The volume of trade is outlined in the national 5-year plan, and the trade itself is conducted by national trading enterprises and directed by the Ministry of Foreign Trade, according to national goals and priorities. Romanian foreign trade is oriented towards the importation of foreign technology for speeding up industrialization and providing missing raw materials. Romania's exports consist mainly of petroleum products and other processed raw materials.

The value of total Romanian trade turnover (exports plus imports) expanded by 38.3% from 36.0 billion lei in 1973 to 49.8 billion lei in 1974. Romanian trade with developed market economy countries in 1974 amounted to 23.3 billion lei; trade with developed market economy countries totaled 5.8 billion lei.

The value of total commodity trade with various groups of countries in 1970–74 follows in billion lei:

| Groups of countries | 1971 | 1972 | 1973 | 1974 | Percent increase 1973–74 |
|---|---|---|---|---|---|
| COMECON (CMEA) countries [1] | 11.8 | 13.3 | 15.3 | 17.3 | 13.1 |
| Other centrally planned economy countries | 1.0 | 1.1 | 2.5 | 3.4 | 36.0 |
| Total centrally planned economy countries | 12.8 | 14.4 | 17.8 | 20.7 | 16.3 |
| Developed market economy countries | 8.3 | 10.0 | 14.1 | 23.3 | 65.2 |
| Developing market economy countries | 4.1 | 4.4 | 4.1 | 5.8 | 41.5 |
| Total market economy countries | 12.4 | 14.4 | 18.2 | 29.1 | 59.9 |
| Grand total Romanian trade value | 25.2 | 28.8 | 36.0 | 49.8 | 38.3 |

[1] COMECON (CMEA)—Council for Mutual Economic Assistance comprising the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

## COMMODITY REVIEW

### METALS

Development of ferrous and nonferrous industries reportedly reached the goals foreseen by the 1971–75 5-year plan; the biggest growth-rate was in the area of iron and steel, and the aluminum industry.

**Aluminum.**—Romania has one aluminum reduction plant, with a probable productive capacity as of January 1, 1975, of 200,000 tons of primary metal per year. In 1974, production of primary metal, including alloys, was 187,000 tons, a 32.4% increase over that of 1973. The increase in production was made possible by startup of a new potline at the Slatina aluminum reduction plant. The Slatina smelter had been under continuous expansion for the past 9 years. This continued the trend of rapid growth in Romanian aluminum industry during the current 1971–75 5-year plan period, at the end of which primary metal production is slated to reach 200,000 to 208,000 tons.

Bauxite for Romania's aluminum industry is provided partly by domestic mines located in the Oradea area near Dobresti, and partly by imports. In 1973, 385,000 tons of bauxite was imported, mainly from Greece, 241,300 tons and Yugoslavia, 135,000 tons. Alumina imports in 1973 totaled 112,100 tons, including 40,400 tons from France, 25,100 tons from Guinea, and 14,800 tons from the People's Republic of China.

In 1974, Romania's estimated bauxite production was 345,000 tons, unchanged from that of 1973. Domestic and imported bauxite is converted to alumina in two plants, one located near the Oradea bauxite mines, the other in the Danube Delta near Tulçea; each plant has a productive capacity of 250,000 tons of alumina per year.

In 1974, estimated alumina production was about 374,000 tons, an increase of 32.6% over that of 1973.

In 1974, Romania exported over 90,000 tons of aluminum. Much of Romanian alumina was sent to Japan and the People's Republic of China.

Romania has a well-developed aluminum metal and alloy processing industry located near the Slatina reduction plant. The primary metal is processed into bars, tubes, shapes, sheet, strip, foil, and cables.[3]

**Copper.**—In 1974, Romania's estimated copper production was 50,000 tons, an increase of 19% over that of 1973. Romania's most important copper mines are located at Baia Mare (Cavnic, Baia Sprie), Rosia Montana, Moldova Noua, Borsa, Balan, and Lesul Ursului.

In 1974, work continued on the development of existing copper mines. Production increased at the Lesul Ursului and Moldova Noua mines. These mines represent the trend towards the utilization of large quantities of low-grade ores such as the Moldova Noua banatites with 0.23% copper content and the Rosia Poienii deposits with 0.3% copper content.

**Iron Ore.**—Romanian iron ore industry operated five mines located at Hunedoara (Teliuc, Ghelar), Cluj (Capus, Lueta), and Resica (Ocna de Fier). Because of the limited size of Romanian iron ore reserves, iron ore production will remain stationary for the current 5-year period. In 1974, Romania's estimated production of iron ore was 3.3 million tons, an increase of 0.9% compared with that of 1973.

In 1974, Romania imported 10 million tons of iron ore. In 1973, most of the iron ore was imported from the Soviet Union (5.8 million tons), and about 2 million tons from India.

**Iron and Steel.**—In 1974, Romanian steel production increased by 679,000 tons to about 8.8 million tons (planned quota was 8.628 million tons); pig iron production increased by 368,000 tons to 6.1 million tons. Expansion of the iron and steel industry's productive capacity is one of the major goals of the current 1971–75 5-year plan, with steel production targeted to reach or exceed 10 million tons per year by 1975. While no major units were commissioned during 1974, work continued on expansion of the Galati and the Hunedoara Siderurgical Combines.

**Lead and Zinc.**—In 1974, Romania's smelter lead production was an estimated 39,000 tons, unchanged compared with that of 1973; smelter zinc production was 43,000 tons, an increase of 2.4% over that of 1973. Romania's lead and zinc concentrate came mainly from the Baia Mare mining complex, Balan, and other smaller complex sulfidic ore mines. Reduction from the sintered concentrates was mainly at the Copsa Mica Imperial Smelting Process lead-zinc blast furnace plant, reportedly having a capacity of 60,000 tons of zinc and 35,000 tons of lead per year.

## NONMETALS

**Barite.**—Barite was mined at Ortra, adjacent to the Lesul Ursului copper mines. In 1974, estimated barite production was 116,000 tons. The ore mined is prepared by grinding, flotation, calcining, and micronizing. There are plans to expand processing to include gravity separation.

**Cement.**—In 1974, Romania cement production was 11.2 million tons, an increase of 13.7% over that of 1973, but down 7.6% from the 12.05-million-ton target set for the year. The 1975 plant target was 13.6 million tons.

**Fertilizer Materials.**—Fertilizer production totaled 1.4 million tons active substance, an increase of 14% over that of 1973 but short of the downward revised plan target of 2 million tons. Of the total fertilizer production, nitrogen fertilizer constituted 70.8% and phosphorus fertilizer constituted 29.2%. The increase in production was obtained mainly from new capacities.

Romania was a significant exporter of fertilizer materials with 1,284,700 tons exported in 1974.

Romania continued to concentrate on increasing its fertilizer material plant capacity. At yearend 1974, Romania's ammonia capacity was 2.1 million tons (product), with a 1.3-million-ton capacity in the planning stage. Phosphoric acid capacity was an estimated 300,000 tons (phosphorus pentoxide), with a 110,000-ton capacity in the planning stage.[4]

The Craiova industrial center for chemical fertilizers will be expanded by a major fertilizer plant complex at Tecuci. According to plans the following individual units will be built: A 300,000-ton-per-year am-

[3] Pauncev, E. (Modern Technologies at the Slatina Aluminum Works.) Metallurgia (Bucharest), v. 25, No. 12, December 1974, transl. in JPRS No. 1269. Apr. 3, 1975. p. 26.

[4] Survey of World Ammonia and Phosphoric Acid Capacities. ECN (London), v. 26, No. 658, Oct. 18, 1974, p. 79.

monia plant, based on natural gas; a 430,000-ton-per-year urea plant; a 400,000-ton-per-year sulfuric acid plant; a 110,000-ton-per-year phosphoric acid plant (phosphorus pentoxide), using the hemihydrate process, and yielding 400,000 tons per year of gypsum, to be processed into 100,000 tons per year of wallboard; a 208,000-ton-per-year diammonium phosphate plant; a 3,000-ton-per-year ammonium fluoride plant; and a 1,500-normal-cubic meter-per-hour technical oxygen plant.

Four complex fertilizer plants are now under construction in Romania by Davy Powergas Inc. Each plant has a capacity of 891,000 tons per year of product. One is located at Tirgu Mures, and was scheduled for commissioning in June 1975; one is at Craiova and was scheduled for yearend 1975; one at Turnu Magurele was scheduled for spring 1976; and one at the Arad [5] plant was scheduled for summer 1976.[6] This represents a change in policy by the Ministry for Chemical Industry towards adopting the nitrophosphate process.

At Slobozia, where a 300,000-ton-per-year ammonia plant was built by the Coppée Rust Co., a 290,000-ton-per-year granulated urea plant went onstream in 1974. The plant uses the DSM process, and nitric acid and nitrates are also produced there.

Romania and Chile have entered in a joint venture to create a $100 million ammonia-urea complex and a $65 million phosphate fertilizer plant, to be located in Chile at Cabo Negro and at the Las Ventanas copper smelter and refinery, respectively.

*Phosphatic Fertilizers.*—Romania has no phosphatic raw materials of its own and has to import all of its requirements.

In 1974, Romania imported 561,300 tons of phosphatic raw materials, mainly apatite from the U.S.S.R., an increase of 9.9% over that of 1973. In 1974, the United States and Israel delivered phosphates to Romania in amounts of 28,000 and 78,000 tons, respectively. Phosphatic materials are used mostly in complex fertilizers with recent emphasis on nitrophosphates.

At the Valea Calugareasca fertilizer complex construction has started on a 20,000-ton-per-year sodium tripolyphosphate unit.

Geomin, the Romanian State mines planning company will assist Syria in the expansion of phosphate mining operations at Knefis, which was built originally with Romanian help.

*Potassic Fertilizers.*—Romania has no potash raw material sources and imports all of its potassic requirements. In 1974, Romania imported 64,700 tons of potassic materials, an increase of 8.2% over that of 1973. Suppliers of this material were the U.S.S.R. and East Germany. The bulk of Romania's potassic materials was used in the form of complex fertilizers.

*Nitrogenous Fertilizer Materials.*—In 1974 nitrogen production was 980,000 tons, an increase of 14.8% over that of 1973. The production target for 1975 was set at 1,547,500 tons.

**Salt.**—Romania's total salt reserves exceeded 20 billion tons, and mining was mainly at 10 locations during 1974. Production was an estimated 3,923,000 tons, an increase of 19.0% over that of 1973. Romania has a well-developed sodium industry, which produced in 1974 sodium products estimated to have exceeded 1 million tons, including calcined and caustic soda, chlorine, sodium sulfate, and others. Romania helped Egypt build a sodium product plant at El Mex, near Alexandria.[7] The plant went on-stream in 1974.

## MINERAL FUELS

In Romania, production of primary energy from fossil fuels and hydroelectric sources increased from 69.8 million tons of standard fuel equivalent in 1973 to an estimated 72.7 million tons in 1974. The output of crude oil increased from 14.3 million tons to 14.5 million tons, and that of natural gas from 29.2 to 30.1 billion cubic meters. The share of these two fuels in Romania's primary energy supply declined correspondingly from 76.0% to about 74.2% during the 1973-74 period. In 1974, Romania produced 29.2 million tons of run-of-mine coal and lignite (including 8.5 million tons of coking coal). The share of coal (lignite, bituminous, and anthracite) in the primary energy supply increased from 22.8% in 1973 to about 24.3% in 1974. While the trend is to keep up present levels of crude oil production, efforts were made to increase the production rate of natural gas and coal. Romania's production of hydroelectric power increased by 12.3%.

In 1974, Romania produced 49.1 billion kilowatt-hours of electricity, 2.3% more

[5] Scînteia (Bucharest). Mar. 14, 1975, p. 3.
[6] Nitrogen (London). No. 94, March–April 1975, p. 19.
[7] Lumea (Bucharest). No. 13, Mar. 27, 1975, p. 11.

than in 1973. Thermal powerplants generated 40.6 billion kilowatt-hours (82.7%) of the electricity and hydroelectric powerplants generated 8.5 billion kilowatt-hours (17.3%). Installed capacity of electric powerplants in the country at yearend totaled 10.6 million kilowatts. In 1974, Romanian industry consumed 58.3% of the electrical energy produced.

Power exports in 1974 amounted to 3.1 billion kilowatt-hours. Exports of petroleum products reached about 6.5 million tons, a 37.2% increase; and gas exports were 205 million cubic meters.

The primary energy balance of Romania for 1973 and 1974, is shown in table 4.

**Table 4.—Romania: Total primary energy balance for 1973 and 1974**
(Million tons of standard fuel equivalent)

| Year | Total primary energy | Coal, lignite, anthracite, bituminous, and coke | Crude oil and petroleum products | Natural and associated gas | Hydroelectric power |
|---|---|---|---|---|---|
| 1973: [1] | | | | | |
| Production | 69.8 | 13.0 | 19.1 | 36.8 | 0.9 |
| Imports | 10.6 | 3.7 | 6.5 | -- | .4 |
| Exports | 7.1 | -- | 6.4 | .3 | .4 |
| Apparent consumption | 73.3 | 16.7 | 19.2 | 36.5 | .9 |
| 1974: [2] | | | | | |
| Production | 72.7 | 14.3 | 19.4 | 37.9 | 1.1 |
| Imports | 11.9 | 3.7 | 7.8 | -- | .4 |
| Exports | 10.4 | -- | 9.7 | 3 | .4 |
| Apparent consumption | 74.2 | 18.0 | 17.5 | 37.6 | 1.1 |

[1] Production data for 1973 and 1974 taken from the Statistical Yearbook of the Socialist Republic of Romania (Bucharest), 1974 and 1975; trade data from Foreign Trade of the Socialist Republic of Romania (Bucharest) 1973.
[2] Production data reported in Scinteia (Bucharest) Mar. 11, 1975 and in other Romanian sources.

**Coal.**—Romania's rapid industrial expansion required further development of its coal industry. In 1974, Romania's three major and several smaller coalfields produced 29.2 million tons of run-of-mine coal including anthracite and bituminous coal (8.5 million tons), brown coal (683,000 tons), and lignite (20 million tons); this was not significant even by regional standards, but important for Romania's economy. About 68.5% of all coal was surface mined. Run-of-mine coal production fell short by 10.8% of the plan target for 1974, which was 32.5 million to 33.0 million tons.

Romania's bituminous coal was mined mainly (96%) in the Valea Jiului coal fields, with the rest coming from the smaller Anina coal fields. In all, 14 coal seams were mined; most workings were of the longwall type, and were at depths of up to 1,500 feet.

Romania's total lignite reserves are estimated at 3 billion tons.[8] This total includes 2 billion tons of minable reserves of which 1.24 billion tons are suitable for strip mining and are located south of the Carpathian chain between the Danube and the Oltet Rivers. The region includes the Rovinari, Motru, and Jilt Basins, where a total of 11 strip mines are operated.

**Natural Gas.**—Romania produced 1.1 trillion cubic feet of natural gas, a 2.9% increase over that of 1973. Of this quantity 208 billion cubic feet was associated gas. Romania produced also an estimated 17.1 billion cubic feet of manufactured gas, (coke oven and blast furnace gas), 11.9% less than that in 1973.

Romania's natural gas reserves are estimated at 280 billion cubic meters,[9] and are located in a large kidney-shaped area near the center of the Transylvanian Basin (Tirgu-Mures, Turda, Copsa, Mica, and Fagaras).

Romania will contribute convertible currency for buying equipment for the COMECON gas pipeline, to be built by 1978, and which will run from the Orenburg (U.S.S.R.) gasfields to the Western border of the Soviet Union.

Natural gas is the basis of a well-developed petrochemical industry in Romania. Exploration for hydrocarbons had a high priority with about 310 million lei earmarked for this purpose, an increase from 300 million lei in 1973. Exploratory drilling during 1974 was about 180,000 meters,

[8] Popa, A., and D. Fodor. Der Braunkohlentagebau in der Socialistischen Republik Rumänien (Brown Coal Mining in the S.R. Romania). Neue Bergbautechnik (Leipzig). V. 3, No. 10, October 1973.
[9] World Oil. V. 177, No. 3, Aug. 15, 1973, p. 118.

an increase of 10,000 meters over that of 1973. Twenty-two new natural gas structures were discovered compared with 16 new structures discovered in 1973.

In 1974, Romania had natural gas pipelines totaling 6,500 kilometers in length. Turbo compressor units with a total capacity of 36,000 horsepower were used to transport the gas. The pipelines interconnect all major industrial consumers with the gasfields. One pipeline connects the Romanian gasfields to Hungary and is used to export 200 million cubic meters of natural gas per year.

**Petroleum.**—In 1974, Romania produced 14.5 million tons of petroleum or about 0.6% of world output, an increase of 199,000 tons over that of 1973. Output exceeded slightly the plan target of 14.4 million tons for the year. The country continued to increase its imports of crude oil from the Middle East. Total imports of crude oil were 4.5 million tons in 1974, an increase from 4.1 million tons in 1973. Exports of petroleum products were 6.5 million tons. This helped to provide some convertible currency needed for importing industrial equipment from the West.

In 1974, three main oilfields were exploited; the Prahova Valley oilfield (Ploieste, Pitesti, Tirgoviste, and Telejean), that on the Moldavian slopes of the Carpathian mountains (Bacau), and the one in the West Carpathian region. There were about 7,000 oilwells and 250 drilling rigs in operation in 1974. In 1974, Romania was also an important exporter of petroleum drilling equipment with exports to 25 countries totaling 500 million lei, 13% of Romania's equipment exports.[10]

Exploraton efforts continued for new oilfields during 1974. Exploratory drilling was reportedly 840,000 meters, compared with 830,000 meters in 1973. The number of petroleum deposits discovered during the year was about 17, up from 14 in 1973. Funds allocated and spent for exploration were about 19 billion lei, unchanged from that in 1973. At present there are over 70 wells deeper than 4,000 meters, with the deepest well, Ghergheasa No. 922 at 6,204 meters in depth.[11]

The first offshore drilling platform to be used in the Black Sea was under construction by Romanian companies and it was slated to be completed before yearend 1975.

The Romanian petrochemical industry continued its vigorous expansion. A new 50,000-ton-per-year dimethyl-terepthalate plant was commissioned at the Brazi-Ploiesti petrochemical combine. Design was by Krupp Chemieanlagebau of West Germany using the Witten process developed by Dynamit Nobel AG.[12] Besides these, 21 other petrochemical plants were in various stages of construction.

**Other Fuels and Energy.**—Among Romania's less important sources for the energy economy in 1974 were hydroelectric power, nuclear energy, oilshale, and tar sands.

*Hydroelectric Power.*—In the overall energy economy, water power is of relatively small but increasing significance. Hydroelectric powerplants supplied 8.5 billion kilowatt-hours or 17.3% of all electric power generated in Romania in 1974, compared with 14.2% in 1973. At yearend 1974, total capacity of electric powerplants reached 10.6 million kilowatts, of which some 2.4 million kilowatts represented hydroelectric capacity. Installed capacity of hydroelectric powerstations was to increase by 250 megawatts in 1975. During the next 5-year plan of 1975–80, installed capacity is to increase by 30% to 39%.

*Nuclear Power.*—Agreement was signed in Moscow with the Soviet Union for construction of a 440-megawatt nuclear powerstation in Romania. Design will be a joint undertaking, while basic equipment will come from the Soviet Union. At present Romania has no atomic energy plant.[13]

*Oilshale.*—Construction started on an oilshale-fueled 990-megawatt powerplant at Oravita. Three 330-megawatt units are planned with an 8-kilometer-long conveyor belt to feed the plant oilshale.[14] A nearby open pit mine under development will supply more than 12 million tons of oilshale per year.

# The Mineral Industry of Sierra Leone

By Janice L. W. Jolly [1]

The Mineral industry of Sierra Leone continued to contribute around 69% to the total value of exports. Diamond was the nation's principal mineral export and formed greater than 80% of the total value of mineral exports. Significant quantities of iron ore and bauxite also were mined and exported in 1974. Sierra Leone ranks seventh in world production of diamond.[2] A reduction in diamond and iron output was forecast by the new 5-year plan [3] (1974-79), but was anticipated to be largely compensated by increased bauxite and rutile sales. The depressed state of the diamond industry had an adverse effect throughout 1974 on all sectors of trade within the country. Sierra Leone is a member of the International Bauxite Association (IBA) and was expected to join the Iron Ore Exporters Association in early 1975. Higher bauxite levies were set in 1974 by half the 10-nation IBA, including Sierra Leone.

A positive balance of payments was last achieved in 1972; in 1973–74 increased prices for imported oil and rice helped to produce trade deficits. In an effort to preserve foreign exchange, the Government introduced an exchange control order requiring residents of Sierra Leone to surrender all funds held abroad as specified in the order. Some foreign nationals employed in Sierra Leone were exempt.[4]

The Government mining policy was reaffirmed to be that of acquiring controlling interest in large mining enterprises with negotiations geared to individual circumstances. The strategy of mining sector development under the 5-year plan has three main objectives: (1) To progressively increase export earnings while reducing excessive dependency on diamond, (2) to establish mineral processing industries, and (3) to increase national participation in the mining sector. Even so, the new plan envisages an annual average growth rate of 6.2% (compared with the current 4.3%) and an aggregate investment during the period estimated at $735.1 million.[5]

About 45.6% of the capital for the 5-year plan will be derived from public sources and about 54.4% from private sources. Of the public investment, about 51.1% will be financed from domestic sources and 48.9% from foreign aid (official loans and grants). Both mining and agriculture will receive large allocations. Mining will receive $108.4 million, or 14.8% of the budget. The Government floated two new development stock issues totaling $5.9 million to finance development projects and help launch the new 5-year plan.

The plan envisages establishment of a sizable diamond cutting and polishing industry and of an alumina plant. Resumption of offshore exploration for petroleum will be encouraged. The capabilities of the Ministry of Mines for systematic surveying, prospecting, and evaluation of mineral resources will be increased by expansion of the Geological Survey. Much detailed geologic information is presently derived from prospecting and deposit evaluation done by mining companies. To safeguard the national interest, the legal staff of the Ministry of Mines was to be strengthened to ensure that all mineral resource information is made available to

[5] Where necessary values have been converted from Leones (Le) to U.S. dollars at the rate of Le1=US$1.18.

the Government. During the plan period, geological exploration will concentrate on the Kambui, Nimini, and Gori Hills schist belts of the Sula Mountains, where iron, copper, nickel, gold, molybdenum, lead, and zinc occurrences have been reported.

The Sierra Leone Geological Survey has proposed airborne geophysical exploration in the Sula Mountain area where a ground reconnaissance survey was recently done. A cassiterite occurrence in the Kalangbe area of Northern Province, and a small, irregular chromite deposit near Kenema in Southeastern Province were also being studied. A revival of gold mining was also being considered. Prospecting by Sierra Leoneans and small-scale mining will be encouraged through technical and financial assistance. A laboratory for testing mineral samples and a Planning and Economic Analysis Unit were also planned for the Department of Mines.

An allotment of $45.1 million under the 5-year plan was for hydroelectric expansion. The principal goal is a 46-megawatt hydroelectric plant to begin the Bumbuna hydroelectric project. The Bumbuna project was expected to be of importance to possible future growth of both the bauxite and iron industries. The first phase will become operational after 1978 with an estimated capital expenditure of about $37 million. Additional projects include a 3.5-megawatt hydroelectric plant near Dodo in the Kenema District, and a 10-megawatt generator and other inprovements in Freetown. These projects will bring the installed electrical capacity of the country to a total of 43.6 megawatts by 1977, not including the generating capacities of the mining companies.[6] Production, transport, and distribution of electricity was by the Sierra Leone Electricity Corporation (SLEC). Government control was permitted by the Electricity Corporation Act of May 3, 1974. Eighty percent of the electricity is consumed in Freetown. Execution of the Bumbuna hydroelectric project will be given to a separate semiautonomous authority with arrangements to coordinate activities with the SLEC and for takeover of the project by the SLEC after construction. The National Hydrological Decade Committee will be revitalized in the first year of the plan, prior to an Act of Parliament establishing a Natural Resources Agency to regulate and coordinate water resource utilization and to be responsible for designing hydroelectric facilities.

The Mano River Declaration signed on October 4, 1973, by Sierra Leone and Liberia related to economic union between the two countries. The first phase relating to goods of local origin is to be completed by the end of 1976. A draft treaty to create the Economic Community of West African States (ECOWAS) was scheduled for approval by delegates of 15 countries to a ministerial conference in early 1975. Ratification by seven States will bring ECOWAS into existence. Development aid was being given by the African Development Bank, the Federal Republic of Germany, the U.S. Government, the United Nations Development Program (UNDP), North Korea, Romania, and the People's Republic of China (PRC). Romania is providing Sierra Leone with agricultural machinery and fertilizers and a team of experts who will investigate mineral resources as part of an aid program. PRC assistance includes a geological exploration program and the hydroelectric scheme at Dodo.

## PRODUCTION AND TRADE

Mineral commodities produced by Sierra Leone in 1974 were valued at an estimated $103 million (not including petroleum refinery products), compared with an estimated $109.6 million in 1973. Mineral production figures are shown in table 1. A reduction in diamond output of 22% by 1979 was forecast by the 5-year plan [7] with export earnings stabilizing to around $74.1 million in 1978–79. Exports of iron ore were also projected to decrease by 20% over the plan period. By 1979, exports of bauxite, rutile, and ilmenite were expected to comprise 33.6% of the total value of mineral exports compared with 5.1% in the base 1973–74 year.

Diamond marketing conditions were abnormally strong in 1973, but the world diamond market took a downturn in early 1974 and at yearend trading conditions were still depressed. A lower unit price

[6] Page 49 of work cited in footnote 3.
[7] Work cited in footnote 3.

was earned in the first 10 months of 1974, when 844,398 carats valued at $37.7 million were exported, compared with 508,769 carats, valued at $32.9 million, for the same period in 1973.[8] Diamonds exported in 1974 were valued at approximately $87.4 million compared with an estimated $93.7 million for all of 1973. Most diamond exports went to the United Kingdom and Western Europe.

Next in importance were diamond exports to Asia, the Far East, and North America. Imports of most items were from the same places, but Asia formed a larger share of the market. Exports and imports are shown on tables 2 and 3, respectively.

Although the target for 1974 was 720,000 tons, and the same amount exported, bauxite production for the first 6 months of 1974 was down and was valued at $1,097,000, compared with $2,233,710 for the same period in 1973 and a total $4,109,940 for all of 1973.[9] A stepup in bauxite exports from the present 5.1% of the mineral export market to 12% of the total value of mineral exports was planned by 1979.

During the first 6 months of 1974, 9,793,446 imperial gallons of distillate fuel oil and 540,123 imperial gallons of jet fuel and kerosine were exported from the refinery at Freetown. Crude oil was supplied by Nigeria, the Netherlands-West Indies, Trinidad and Tobago, Kuwait, Italy, and the United Kingdom. The published capacity of the Freetown refinery is 10,000 barrels per day of crude oil.

| Total | do | 2,194 | 2,246 | 1,751 |

[p] Preliminary. [r] Revised.
[1] In addition to the commodities listed, a variety of crude construction materials (clays, sand, gravel, and stone) are produced, but quantities are not reported and available general information is inadequate for the formulation of reliable estimates of output levels. Also, a very limited production of gold may occur but again data are not available and no basis is available for reliably estimating this production. In addition, Sierra Leone annually refines 4,000 to 10,000 metric tons of salt from imported crude marine salt, but this is not included in the body of the table because it would represent a double counting of material credited to the country where the salt was originally collected.

## Table 2.—Sierra Leone: Exports and reexports of selected mineral commodities

## COMMODITY REVIEW

### METALS

**Bauxite.**—An alumina plant is planned for the Port Loko Area, scheduled for completion in 1981. The new 5-year plan allotted $47.2 million for the project. The total cost of the plant is estimated at $129.8 million pending completion of feasibility studies. A second mine with an annual output of 1.5 million tons was expected to become operational in the Port Loko Area by 1976–77. Total reserves of bauxite are estimated to exceed 30 million tons with 50% to 60% $Al_2O_3$. These are concentrated in the Mokanji Hills near Moyamba and have been mined since 1963 by the Sierra Leone Ore and Metal Company Ltd. (SIEROMOCO), a subsidiary of Suisse Aluminium Industries AG of Switzerland. Besides the reserves being mined at Mokanji and the earlier discovered deposit of the Gbonge Hills, those located in the Pujehun District comprise 2 million tons of 53% $Al_2O_3$ and 7% $SiO_2$. Aluminous laterite also occurs in the vicinity of Waia in Koinadugu District near Bumbuna, the site of planned hydroelectric expansion. This deposit contains 30% to 40% alumina and less than 7% silica. Other potential deposits are known in the Rokel River Group sediments and the ferruginous laterites north of Mabole and in Kukuna-Konta.[10]

**Gold.**—Seventeen chiefdoms have been declared gold-mining areas by the Ministry of Mines. One-year alluvial gold mining licenses were granted to nine Sierra Leoneans. Two U.S. citizens who had obtained gold buyer's and exporter's licenses were grubstaking these miners. An alluvial gold mining license can be granted only to a citizen resident in the declared area, or to a citizen approved by the Chiefdom Council of the declared Chiefdom. The Government charges a 9% royalty on gold exported from Sierra Leone. Only two rather small shipments were reported in 1974. Gold was discovered in 1926 and produced from 1930 until 1957 when the Alluvial Diamond Mining Scheme started and attention was diverted. Since then there has been little production. The two gold shipments in 1974, reportedly totaling 83 troy ounces, formed the first legitimate exports of gold since 1964.[11] The main producing areas were Dalakuru in the Northern Sula Mountains, the Matina-Yirisen Area and Makong in the schist belt, and Baomahun at the southern end of the Kangari Hill.

**Iron Ore.**—Average grade of concentrates from the Marampa Mine was 63.6% iron. The concentrator at the mine was modified in 1973, and a dam to store water was completed. A new tailing pumphouse was planned for 1974. The reserves were estimated at 67 million tons of 38% iron. The laterite red ore cap has been exhausted. The Tonkolili iron deposits have estimated reserves of 124 million tons of 55% to 56% iron. Other deposits are located at Bagla Hill in the Gola Forest Area of Southeastern Province where assays of the gneissose, magnetite-bearing ironstone with laterite capping indicate an average iron content of 40%. East of Kale Mabesi in the Pujehun District, ridges of a residual accumulation of magnetite blocks have been traced for 2½ and 4 miles. Nine million tons of residual material is estimated to a depth of 30 feet, and about 250,000 tons of primary ore per foot of depth is estimated below this.[12]

PRC geologists were reportedly examining iron deposits in the Tonkolili District, presently under concession to the British-owned Sierra Leone Development Co. (DELCO). The U.S. Bethlehem Steel Corp. continued investigation of the iron ore deposits at Bagla and was reportedly interested in a joint mining operation with DELCO.

**Titanium Minerals.**—The agreement reached in 1973 between two West German companies, Bayer Aktiengesellschaft and Preussag Aktiengesellschaft (Bayer-Preussag), and the Sierra Leone Government was ratified by Parliament in May 1974 and allowed for a 5-year special exclusive prospecting license in a 2,600-square-mile area of Southern Province. Bayer-Preussag has the right to obtain any amount of titanium minerals for the purpose of testing for commercial operation. The firm has been conducting surveys in Sierra Leone since October 1970 and will spend $590,000 over the next 5 years.[13]

[12] Page 13 of work cited in footnote 10.
[13] U.S. Embassy, Freeport, Sierra Leone. State Department Airgram A–43, May 16, 1974, 13 pp.

Rutile deposits have been located along the coast in Moyamba, Bonthe, and Pujehun Districts. A high proportion of the rutile is embedded in laterite, and extraction has proven to be costly. Rutile deposits in the Bonthe and Moyamba Districts have been estimated to contain about 11 million tons of 0.75% to 1.0% rutile.

During 1973, Bethlehem Steel Corp. replaced Armco Steel Corp. as the major shareholder in Sierra Rutile Ltd. (SRL). The Nord Resources Co. of the United States, holding 20% of SRL, is the managing company and is in charge of prospecting operations in a concession near Gbangbama. A pilot plant was constructed for designing a wet processing system. A large proportion of the deposit is under the water table, and experiments with pumping the water out were being made. At yearend, negotiations were in process between the Government and Bethlehem Steel. A 1977 production date was anticipated. The 5-year plan predicts the sales of rutile will account for 21% of all mineral exports by 1978–79. The last rutile production was in 1971.

Ilmenite and titaniferous magnetite deposits are also known in Sierra Leone.[14] Ilmenite occurs in the gabbro-norite complex of the peninsula, and as alluvial concentrations in beach sands between Tokeh and York and in the Whale River Estuary. Massive ilmenite and titaniferous magnetite deposits in the vicinity of Grafton and Hastings have also been examined by mining concerns. Ilmenite beach sands occur in the Lake Mabesi Area and at Shenge.

## NONMETALS

**Diamond.**—Early in 1974, the Government announced that five diamond firms of international standing would be licensed to purchase and export diamond in competition with the Diamond Corporation of West Africa Limited (DICORWAF), a part of the De Beers Central Selling Organization. Even so, DICORWAF appeared to be buying the same amount as before. The Government Diamond Office (G.D.O.) is managed by DICORWAF. Diamond production by the National Diamond Mining Company (Sierra Leone) Ltd. (DIMINCO) was depressed during 1974, reflecting the fact that reserves were being steadily depleted. DIMINCO was granted a prospecting license for a large area in Southern Province southwest of Bo. A comprehensive review of the history, geology, and geomorphology in the diamond mining fields of Sierra Leone was made by the Sierra Leone Geological Survey in 1968.[15]

## MINERAL FUELS

**Petroleum.**—All 1970 concessions granted to Occidental Petroleum Corp. and the Interocean-Union Carbide-Clinton International Group ended during 1973. When these firms relinquished their offshore licenses, the Damson Oil Corp.-Aracca Petroleum Co.-Plannet Oil Group remained the only concession holder in the country. There was no drilling or exploration activity reported.[16] The Damson Oil Corp. and Aracca Petroleum Co. were granted a joint concession in 1972 covering 1.28 million acres. Under a recently signed trade agreement with Romania, an oil exploration team was expected to begin an investigation of Sierra Leone's oil potential.

Plans were disclosed[17] for the purchase of a $354,000 liquid petroleum gas plant which will produce 1,500 tons of gas annually. During 1973, natural gas was imported from Liberia and France.

# The Mineral Industry of the Republic of South Africa

By James H. Jolly [1] and Charles W. Sweetwood [2]

The mineral industry of the Republic of South Africa achieved a record high in mineral output value in 1974. Sales of mineral commodities, including gold and diamond, totaled $5.8 billions,[3] 41% more than the record set in 1973. The main factors in setting the new high were soaring gold prices, increased demand for platinum by the automobile industry, and continued strong world demand for industrial minerals and metals.

The South African economy performed well in 1974, although economic growth slowed in the last quarter. The gross national product (GNP) was up 9%, and the gross domestic product (GDP) increased 7.2%. The metals and minerals industry contributed an estimated 17.4% to the GDP, which increased from $27.2 billion in 1973 to $32.9 billion in 1974. For the year, the value of imports outstripped exports, even including the vastly higher revenue from gold, and resulted in a current account deficit of $1.3 billion; however, this was counterbalanced to a large extent by a $1.1 billion inflow of capital. Gold and foreign exchange holdings declined slightly, and at yearend were valued at $1.7 billion.

The Government continued major programs to increase mineral exports and to attain greater self-sufficiency. Development of both the Sishen-Saldanha Bay and Richards Bay projects continued on schedule, and both harbors were expected to be ready for large-scale mineral exports in 1976. Construction of large new coal-fired powerplants, mainly in the Transvaal, continued; these plants were expected to provide the electrical power necessary for developing new mines and for increased domestic processing of minerals. In 1974, the mining industry and the iron, steel, and base metals industries were the largest customers of the Electricity Supply Commission (ESCOM), purchasing 32.2% and 30.7%, respectively, of all units sold. Late in the year the Government decided to go ahead with plans to construct a large-scale uranium enrichment plant using new technology. A $115 million pilot enrichment plant, completed in 1974, was evaluating the process. Although the energy crisis did not appreciably affect the South African economy in 1974, the Government announced plans to construct a second, much larger, oil-from-coal conversion plant to lessen the country's total dependence on imported oil. Programs to stockpile additional oil in old coal mines also continued.

The mining industry continued to experience significant increases in production costs due to general inflation and large wage increases. Wages paid to black workers, for example, increased to more than four times those paid prior to May 1973. Average underground wages for black workers in gold mines at yearend were $125 monthly plus free board and room. The average number of workers employed at all mines in the Republic of South Africa fell by 10,000 in 1974 to 666,693. Late in the year strikes and tribal violence at some mines disrupted production schedules and caused some workers to return

[1] Physical scientist, Division of Nonferrous Metals.
[2] Regional minerals officer, U.S. Consulate General, Johannesburg, Republic of South Africa.
[3] Where necessary, values have been converted from South African rand (R) to U.S. dollars at a rate of R1=US$1.471 (average of monthly averages as given in volumes 27 and 28 of International Financial Statistics.) The rate for 1973 was R1=US$1.445.

home after their contracts expired. Faced with rising labor costs and labor problems, the South African Chamber of Mines embarked on a $220 million research and development program to bring gold mining technology to a level comparable with that in other mining industries. Much of the effort of the program was aimed at improving productivity through mechanization.

In the metals sector, Palabora Mining Co. (PMC) announced a $100 million expansion program to increase copper production by 1977 despite a slowing of world demand for copper after midyear. Plans for a new electrolytic copper refinery near Cape Town, however, were deferred. Base metal exploration in northern Cape Province continued. Phelps Dodge Corp. was pilot-plant-testing bulk ore samples from its two large copper-lead-zinc-silver deposits near Aggeneys; however, a decision to bring the deposits into production was deferred until economic conditions improve. Gold production continued to decline, but output value increased dramatically, accounting for almost 67% of South Africa's mine production value in 1974. Development of several new gold mines was planned. Expansion in the iron and steel industry continued. In March, the Newcastle works of the South African Iron and Steel Industrial Corp. Ltd. (ISCOR) poured its first liquid steel. Plans to construct two major ferroalloy facilities in the Transvaal were announced. A new vanadium pentoxide producer came onstream in July. Zinc production doubled, and zinc refining capacity was to be increased by 50%.

In the nonmetals sector, production and value of diamond decreased as demand fell in the second half of the year following record sales in the first half. Fluorspar production declined slightly, but additional production capacity was planned. Production of phosphate ores increased fourfold in 1974, and more capacity was planned.

In the fuels sector, coal mining operations were expanding to meet increasing domestic and export requirements. Additional coal export contracts were signed, but exports would not begin until the completion of facilities at Richards Bay. The search for domestic petroleum continued both onshore and offshore with negative results. Gas shows in a well off the Orange River mouth, however, were encouraging, and more exploration activity in that area was planned in 1975.

## PRODUCTION

Total value of mineral production increased 38% (in terms of rands) over that of 1973. Value of production and/or sales, including uranium and platinum listed under ores and minerals in official statistics, was as follows:

| Commodity | Value (thousand dollars) | |
|---|---|---|
| | 1973 | 1974 |
| Gold | 2,585,524 | 3,853,745 |
| Silver | 10,594 | 12,073 |
| Diamond | 234,620 | 210,444 |
| Ores and minerals: | | |
| Local sales | [1]518,860 | 662,816 |
| Exports | 760,697 | 1,039,841 |
| Total | 4,110,295 | 5,778,919 |

[1] Data differ from that shown on table 5 because of difference in source.

In terms of quantity, production of most mineral commodities increased during the year, particularly chrome, iron and manganese ore, nickel, platinum-group elements, zinc and zirconium concentrates, Cape Blue crocidolite, coal, phosphate ores, vermiculite, clays, and stone. Significant decreases in output were registered by gold, silver, uranium, and anthophyllite. Gold (and byproduct uranium) continued to decline because lower grade ores were mined to take advantage of high gold prices.

1 Includes asbestos reported in source as anthophyllite, Cape Blue, and Transvaal Blue.
2 Local sales plus exports (actual production not reported).

## TRADE

In 1974, the Republic of South Africa's balance of payments position was aided significantly by export sales of mineral commodities, principally those of gold, diamond, platinum, and copper. Although the volume of mineral exports did not increase appreciably, the export value of most mineral products increased dramatically over that of 1973 because of high gold prices and substantial increases in the prices of most metals and minerals owing to strong world demand. Imports of metals and mineral products also increased significantly in 1974, primarily to satisfy the demands of the country's development programs. Imports of ores, concentrates, and metals increased 57% in volume and 123% in value over those of 1973. Oil imports continued to adversely affect the trade balance, spurring the search for domestic oil and promoting the construction of another oil-from-coal conversion plant.

Table 2.—Republic of South Africa: Mineral products trade
(Million dollars)

| Products | Exports | | Imports | |
|---|---|---|---|---|

## COMMODITY REVIEW

### METALS

**Aluminum.**—Alusaf (Pty.) Ltd., the country's only producer of primary aluminum metal, completed a $26 million expansion program in mid-1974 to increase aluminum output capacity 40% to 78,000 tons per year. The new capacity exceeds the country's requirements and plans called for the export of about 20,000 tons of aluminum in 1975. Production was a record 75,000 tons in 1974, 42% higher than in 1973. All of the smelter's alumina was imported, principally from the Gove, Australia, operation of Alusuisse (Swiss Aluminium Ltd.) which has a 22% interest in Alusaf.

**Antimony.**—The Republic's only antimony producer, Consolidated Murchison Ltd. (CM), operated near capacity in 1974. CM sold all of its concentrate production, 25,212 tons, as well as 426 tons from stocks. Although the costs of production increased 29%, the value of reported concentrate sales, 22,652 tons, increased 55% on 24% less volume than reported in 1973. CM continued development of the Alpha and Beta shafts to exploit deeper extensions of known ore bodies. The Athens shaft, which was designed to hoist 50,000 tons of antimony ore monthly, was scheduled for completion in the second quarter of 1975. Sinking of the Beta shaft was suspended at 357 meters but was to be continued in 1975 following completion of surface facilities. Efforts by the company to increase antimony ore reserves were disappointing in 1974. At current output levels, proved reserves, 5.7 million tons of ore averaging 3% antimony, were sufficient for 9 years of operation.

Antimony Products (Pty.) Ltd., a joint

venture of Chemtron Corp., CM, and Johannesburg Consolidated Investment Co., Ltd. (JCI), brought its $2.2 million crude antimony oxide plant near Gravelotte, Transvaal, onstream in April. The plant, which has an annual capacity of 3,600 tons of crude antimony oxide, was anticipated to consume approximately 25% of the antimony production of CM. Initially, Chemtron will purchase the facility's full output.[4]

**Chrome and Chromite.**—Production of chromite ore and concentrate was almost 1.9 million tons, a 14% increase over that of 1973. Local mining firms, anticipating strong demand in 1974, overproduced, and yearend stocks of exportable concentrate and ore exceeded 1 million tons. The domestic market was steady, but exports declined. Chromite exports were also hampered by internal rail tieups and port loading delays at Lourenço Marques, Mozambique.

The output of chrome sand increased dramatically to meet foundry demand, and both foreign and domestic sales were significantly higher than in 1973. The production of less-than-44% $Cr_2O_3$ chromite ore continued to increase relative to higher grade material, owing to increasing acceptance of lower grade charge chrome by the stainless steel industry.

**Copper.**—In 1974, mine copper production was a record 179,111 tons, making the Republic of South Africa the twelfth largest world producer. Although copper sales volume decreased slightly in 1974, the value, which was 30% higher than in 1973, was a record $328 million, owing mainly to high copper prices in the first half of the year. The copper industry was continuing expansion programs to increase mine production and smelter output, although construction of a new electrolytic copper refinery in Cape Province was deferred because of deteriorating world economic conditions in the latter half of 1974. In northern Cape Province, Phelps Dodge Corp. was developing a large new copper mine.

PMC, the country's largest copper producer, produced slightly less copper, 90,364 tons, than in 1973 because the head grade was lower. Smelter production, however, rose 3% owing to increased toll refining. Although the cost per ton of copper produced increased 32% in 1974, PMC continued to be one of the lowest cost producers of copper in the world. Production statistics for Palabora's copper operation were as follows:

| | | 1973 | 1974 |
|---|---|---|---|
| Ore treated | million metric tons | 19.2 | 19.2 |
| Grade of ore | percent Cu | .56 | .56 |
| Concentrate produced | thousand metric tons | 249.8 | 259.9 |
| Concentrate grade | percent Cu | 37.29 | 35.19 |
| Anode production: | | | |
| PMC material | metric tons | 93,637 | 90,364 |
| Other | do | 15,134 | 21,781 |
| Total | | 108,771 | 112,145 |
| Average cost per ton of copper produced | | $554 | $731 |

In September, PMC announced a $100 million expansion program to increase copper production to 125,000 tons per year by 1977. The expansion will also increase output of byproducts such as uranium, zirconium, and nickel sulfate. Plans called for enlarging the open pit beyond previously planned limits and expanding ore processing facilities. The open pit was to be deepened an additional 128 meters to an ultimate depth of 591 meters. Mining rates were to increase to 205,000 tons per day by late 1975 and to reach 300,000 tons by 1977. The supply of ore to the concentrator will be increased by 21,500 tons to 74,000 tons per day at a reduced cutoff grade of 0.2% copper and an overall average grade of 0.55% in the mill feed. Despite the higher mining rate, the life of the open pit operation was expected to continue to 1992, the same as projected before the expansion.

Prieska Copper Mines (Pty.) Ltd. (PCM) continued to expand operations and production in fiscal 1974. Startup problems, which hampered production in fiscal 1973, were largely overcome by

[4] Chemistry and Industry. South Africa Antimony Oxide Plant Goes On-Stream. No. 18, Sept. 21, 1974, p. 709.

mid-1974. For the fiscal year the ore milled reached 2 million tons, yielding 68,491 tons of copper concentrate and 67,993 tons of zinc concentrate. Pyrite and lead concentrates were also produced.

O'okiep Copper Co., Ltd., had higher sales and net income in 1974, despite sharp increases in costs for labor and supplies. Rapidly decreasing copper prices in the second half of the year, however, forced the company to cut its workforce by almost 20%. Development work at the Spektakel and Divide mines was suspended, and production from lower grade mines was curtailed. Drilling in existing mine areas added to ore reserves, especially at depth at the Carolusburg mine. Overall ore reserves at the company's mines at yearend were 29.1 million tons averaging 1.65% copper, compared with 26.9 million tons averaging 1.58% copper in 1973.

Production statistics for O'okiep, operator of 12 mines, 3 mills, and 1 smelter in northern Cape Province, were as follows:

| | | 1973 | 1974 |
|---|---|---|---|
| Ore milled | thousand metric tons | 2,991 | 2,912 |
| Grade of ore | percent Cu | 1.34 | 1.28 |
| Blister copper produced | metric tons | 34,292 | 32,477 |
| Blister copper sales | do | 34,473 | 33,384 |
| Sales value | million dollars | 57.9 | 67.4 |

Copper production at the Messina mine of Messina (Transvaal) Development Co., Ltd., for the year ending September 30, was 10,230 tons contained in concentrate. Although the concentrator throughput increased by 48,000 tons, 590 tons less copper was produced in 1973 because of a decrease in the grade of ore milled and lower mill recoveries. At the end of the fiscal year, proved ore reserves, at 5.2 million tons, were down about 200,000 tons with an unchanged grade of 1.45% copper.

Phelps Dodge Corp. carried out extensive pilot plant testing of bulk ore samples from its two large copper-lead-zinc-silver deposits near Aggeneys in northern Cape Province. The test results indicated that the ores presented no serious mill or concentration problems. The open pit ore reserves at the Broken Hill deposit were estimated at 79 million tons grading 0.38% copper, 4.28% lead, 2.32% zinc, and 1.7 ounces of silver per ton. The ore reserves at the other deposit, Black Mountain, were 78 million tons grading about 0.7% copper, 2.6% lead, 0.6% zinc, and 0.8 ounce of silver per ton. The ultimate extensions of the two deposits were not determined. Exploration and development were continuing; however, a decision to bring the deposits into production was deferred until economic conditions improve.

O'okiep and Tsumeb Corp., Ltd., of the Territory of South-West Africa began engineering work on a new electrolytic copper refinery planned for the Cape Town area; however, at midyear the project was postponed pending improvement in economic conditions. The proposed refinery, which has a planned capacity of 120,000 tons of cathode copper, will treat all of O'okiep and Tsumeb's blister copper production.

**Gold.**—The South African gold mining industry recorded record profits in 1974, although production continued to decline. Soaring gold prices, due mainly to instability of world currencies, rampant inflation, and speculative buying prior to legalization of gold ownership by U.S. citizens, resulted in a 46% increase in the value of gold produced. Revenue received amounted to $3,854 million in 1974, compared with $2,585 million in 1973.

Total South African production of gold was 24.4 million troy ounces, 3.1 million troy ounces less than that produced in 1973. Although the industry experienced shortages of labor, aggravated by the Malawian Government's decision to ban recruitment of mine labor and by tribal violence at a number of mines, the tonnage of ore milled was only marginally lower. The grade of ore, however, fell 11% to 0.32 troy ounce of gold per ton, owing principally to the mining of marginal-grade ore made economic by high gold prices. Higher gold prices also resulted in increased ore reserves, extended the lives of existing mines, and accelerated exploration and development of new gold deposits.

Working costs per ton of ore milled in-

creased 26% (in terms of rands) to $19.39 in 1974, because of substantial wage and salary increases and higher costs for stores and services. Despite the higher milling costs, the working profit per ton of ore milled increased $12.27 to $31.66. Producers received an average price of $158 per troy ounce of gold in 1974, 68% more than in 1973.

The South African Chamber of Mines announced a $220 million research and development program designed to hasten mechanization in gold mining. Principal motivation for this expanded effort was the increasing cost of labor and labor uncertainties. Major emphasis has been placed on the development of rock-cutting, reef-boring, and swing-hammer machines to reduce the number of workers, increase productivity, and improve safety by reducing the amount of explosives needed.[5]

e Estimate.

Source: Chamber of Mines of South Africa.

Three new major gold mines were under development. Unisel Gold Mines Ltd., a joint venture of Union Corp. Ltd. and Selection Trust Ltd., planned to begin production from its lease area just south of the President Brand mine in 1977. Cost of the project was estimated at $75 million. Unisel entered into an agreement under which St. Helena Gold Mines Ltd. will develop and operate the new mine. St. Helena planned to expand its mill to handle the Unisel ore.[6] In March, Anglo-American Corp. of South Africa, Ltd. (AAC) and Gold Fields of South Africa, Ltd. (GFSA) almost simultaneously announced plans to open adjacent mines, known as the Elandsrand and Deelkraal, respectively, southwest of the Western Deep Levels Ltd. mine in the Far West Rand area. Construction of surface facilities was underway by yearend at both properties. Shaft sinking was scheduled for 1975 with full-scale mining by 1980–81. Costs of the projects were estimated at $150 million each.

Loraine Gold Mines Ltd., a subsidiary of Anglo-Transvaal Consolidated Investment Co., Ltd. (Anglovaal), planned a $40 million expansion program. The program included doubling the milling rate to 200,000 tons per month by early 1979, constructing a new crushing plant, enlarging plant treatment facilities, and sinking a new shaft.

AAC planned to sink a new shaft at a cost of $120 million at the Free State Saaiplaas mine to exploit 28 million tons of marginal-grade ore. The shaft, which is designed to hoist 188,000 tons per month, was scheduled for commissioning in 1979 and was to be fully operational in 1981.

**Iron and Steel.**—Demand for steel was strong in 1974 and all categories of manufactured semifinished and finished iron and steel products registered gains. Steel production facilities were being expanded, and proposals to construct two new ferrochrome plants were made. Iron ore production increased, local sales were up, but exports declined.

ISCOR's Sishen-Saldanha Bay iron ore export project continued on schedule, but costs continued to rise. The first phase of the project, which included development of a new mine at Sishen, construction of an 860-kilometer electrified railroad, and building of port facilities to load 100,000-ton carriers at Saldanha Bay, was expected to be completed in 1976. A second, larger jetty to accommodate 260,000-ton vessels was to be added later. Iron ore exports were expected to begin in 1976, reaching 15 million tons in the early 1980's. As originally proposed, the Sishen-Saldanha

[6] South African Mining and Engineering Journal. Unisel—A Challenge to Mining Engineering. V. 87, No. 4096, September 1974, pp. 16–19.

railway line was to be used exclusively by ISCOR. However, late in the year, the Government agreed to allow private mining operations to use the railroad, which is to have a carrying capacity of 40 million to 50 million tons per year. The Government also approved, in principle, the development of the St. Croix offshore ore berth at Port Elizabeth to serve independent iron and manganese ore producers.[7]

*Iron Ore and Concentrate.*—Total iron ore production (hematite and magnetite) increased 5.4% to 11.6 million tons in 1974. Hematite production, almost 8.7 million tons, increased about 9%, whereas magnetite production, 2.9 million tons, decreased 3%. ISCOR was the principal producer of hematite, shipping 6.3 million tons of ore in 1974, up 0.3 million tons over that of 1973. The major portion of ISCOR's production, 5.8 million tons, was delivered to the company's three steelworks for processing; the rest was largely exported. ISCOR's production came from the Sishen (4.0 million tons) and Thabazimbi (2.3 million tons) mines. Iron ore production at the Sishen mine was scheduled to be gradually increased to 9.6 million tons by 1980 to meet the company's needs for raw materials. Consolidated African Mines Ltd. (CAM) and Associated Manganese Mines of South Africa Ltd. (AMM) were the other major hematite producers. The iron ore production of CAM was largely exported, whereas that of AMM (810,000 tons) was consumed internally in the production of ferroalloys.

Magnetite was produced by PCM and by Highveld Steel and Vanadium Corp. Ltd. (HSV) in 1974. PCM produced an estimated 2.2 million tons of concentrate in 1974, of which 773,198 tons was exported to Japan and about 700,000 tons was sold locally. PCM's magnetite exports declined about 6% in 1974, reportedly because of port problems at Lourenço Marques. HSV continued expansion of the Mopochs mine. The new primary crushing circuit was expected to be commissioned in 1975.

The outlook for iron ore exports from South Africa received a significant boost in 1974 with separate announcements by CAM and ISCOR relative to pending long-term contracts with Japanese buyers. In February, CAM signed a $147 million contract to supply 300,000 tons of manganiferous iron ore (34% Fe and 20% Mn) in 1977, 500,000 tons in 1978, 800,000 tons in 1979, and 1.0 million tons per year for 7 consecutive years beginning in 1980. Additionally, CAM reported that a second, larger contract for about 42 million tons was being negotiated but was contingent on the development of the St. Croix offshore ore loading terminal.

ISCOR moved ahead with its plans to export 7 million tons of iron ore per year to Japan via the newly developing Sishen-Saldanha Bay Project. In August, waste stripping operations began at ISCOR's new mine at Sishen, which is to provide the ore for the export scheme. Ore from the new mine, which is expected to begin production in 1975, was planned to be exported initially from St. Elizabeth until the railroad and port facilities are completed at Saldanha Bay in 1976.

*Iron and Steel Semimanufactures.*—Demand for steel continued strong in 1974, reflecting the massive requirements of South Africa's ambitious large-scale development projects. Despite increased local production of steel, many products were in short supply and imports rose significantly. Shortages in supply of most steel products, as well as the quantity of imports, were expected to gradually decrease as new production facilities in ongoing expansion projects come onstream.

ISCOR's long-term expansion, modernization, and diversification program at its three works is scheduled to be completed by 1984, at which time the company's total capacity should be 11.3 million tons per year of liquid steel. In 1984, the Vanderbijlpark. Newcastle, and Pretoria works were scheduled to have capacities of 5.5 million, 4.1 million, and 1.7 million tons, per year, respectively. Cost of the program, which began in July 1973, was estimated at $4.8 billion.

ISCOR's partially completed Newcastle works poured its first liquid steel in March and produced an estimated 340,000 tons of steel for the year. The first phase of construction at the Newcastle works, which cost about $1.1 billion, was expected to be completed in 1976. The yearly steel production was expected to reach 2.2 million tons at that time and 3 million tons in 1977–78.

[7] South African Shipping News and Fishing Industry Review. In Principle Green Light for St. Croix. V. 24, No. 10, October 1974, p. 17.

ISCOR and Vereinigte Österreichische Eisen and Stahlwerke A.G. (VÖEST) deferred a decision to go ahead with plans to build a steel mill at Saldanha Bay, mainly because of severe cost escalations. Negotiations were continuing and additional partners were being sought to participate in the project. As proposed, a 3-million-ton-per-year steel plant to produce blooms, billets, and slabs exclusively for the export market was to be constructed at Saldanha Bay at a cost estimated at $1 billion. Later, as markets increased, the capacity of the plant was to be raised to 12 million tons per year.

According to ISCOR's annual report for the year ending June 30, 1974, total production of ingot steel was 4,036,513 tons, slightly less than in 1973. Of this total, the Vanderbijlpark, Pretoria, and Newcastle works contributed 2,677,630, 1,351,925, and 6,958 tons, respectively. In addition, the latter works produced 20,189 tons of continuously cast blooms direct from molten steel.

HSV continued its $20 million expansion program to increase output of steel and slag vanadium by 25%. The project was expected to be completed by mid-1975 with the commissioning of the fourth continuous casting machine. In November, HSV announced a second expansion program to provide for the manufacture of flat products and increase steel output to 750,000 tons per year; this is about 320,000 tons more than in fiscal 1974. The program was scheduled to be completed by 1979 at a cost of $97 million and includes erection of a Tipping plate mill and installation of a continuous slab casting machine, a third shaking ladle replacement, a third basic oxygen furnace (BOF) steelmaking vessel, and a sixth submerged arc furnace.

*Ferroalloys.*—In 1974, two new ferrochrome plants, each capable of producing 120,000 tons were proposed. Tubatse Ferrochrome Ltd., a joint venture of General Mining and Finance Corp. Ltd. (51%) and Union Carbide Corp. (49%), planned to build a plant at Steelport in the eastern Transvaal, and nearby at Lydenburg, JCI and Showa Denko K.K. of Japan planned to build a similar-size facility. Both plants were expected to be completed in 1977 at a cost of about $37 million each. All production was destined for the export market.

**Manganese.**—Production of metallurgical and chemical manganese increased about 14%, reaching 4.7 million tons in 1974. Combined domestic and foreign sales, both of which increased in 1974, were valued at $115 million, 50% more than in 1973. Sales reportedly could have been higher, but shipments were affected by constraints on railway and loading facilities.

South African Manganese Ltd. continues as the principal producer of manganese ore, having a record output of about 2.7 million tons. AMM, the country's other major producer, shipped more than 1.9 million tons, about 19% more than in 1973.

Delta Manganese (Pty) Ltd., (DM), a joint venture of Delta Metal Co. Ltd. and Alcan Aluminium Ltd. (Alcan), completed construction of its new $21 million electrolytic manganese plant at Nelspruit in eastern Transvaal early in 1974 and immediately began an expansion program to increase the capacity of existing facilities from 14,500 tons to about 30,000 tons per year by the yearend 1975.

**Nickel.**—Nickel production, a byproduct of platinum mining, increased about 14% to 22,100 tons in 1974. The volume and value of local sales increased 31% and 38%, respectively, and exports jumped by 40% to 14,434 tons in volume and 62% ($50.7 million) in value over those of 1973.

**Platinum.**—The Republic of South Africa was the world's leading producer of platinum-group metals, accounting for nearly two-thirds of all platinum and one-fourth of the palladium mined. Although platinum-group metal production statistics are not reported, output was estimated at 2.8 million troy ounces, including 1.8 million troy ounces of platinum. Sales of platinum and palladium were firm for most of the year but weakened in the last quarter, owing mainly to declining sales of automobiles in the United States, Europe, and Japan.

Rustenburg Platinum Mines Ltd. (RPM) continued its expansion program to increase platinum output capacity by 0.5 million ounces to about 1.63 million ounces. Late in the year, the company decided to stretch out the program by 18 months, setting a new completion date near the end of 1977. RPM purchased Eland Platinum Mining Co. Ltd. for $23 million in July, thus acquiring leases that established its Amandelbult lease as a compact mining area with a strike length of 20 kilometers.

Impala Platinum Ltd. completed the major part of an expansion program in 1974,

At yearend, the mine and refinery capacity was 950,000 ounces per year of platinum-group metals.

Major extensions of the Wadeville platinum-group refinery, owned jointly by RPM and Johnson Matthey & Co., were completed in 1974. Production capacities at the enlarged facility, the largest of its kind, were estimated at more than 1.5 million ounces of platinum-group metals.[8]

Lonrho Ltd. formally opened its $3 million platinum refinery at Brakpan in July. The refinery, which is South Africa's third and most modern platinum refinery, will toll-refine precious metal concentrate produced in Norway from matte produced at Western Platinum Ltd.'s operation near Brits.[9]

**Tin.**—Production of tin concentrate for 1974 was 5,068 long tons, an increase of about 2% over that of 1973. Rooiberg Minerals Development Co. (RMD), the major producer, reported a production of 1,976 tons of tin-in-concentrate, or about 4,000 tons of tin concentrate, for the fiscal year ending June 30, 1974. Although the ore grade at both the "A" and the "C" mines was lower in 1974, tin output increased due to the treatment of greater tonnages of slime reclaimed from the dump and to improved efficiencies. Working cost, however, continued to rise, amounting to $11.25 per ton mined compared with $10.17 per ton in fiscal 1973.

RMD planned to develop a new mine at Vellefontein by mid-1977 at a cost of $1.8 million. Ore reserves were conservatively estimated at 600,000 tons grading 0.7% tin. Plans called for the sinking of an inclined shaft to exploit the ore body and for the processing of 5,000 tons of ore monthly at the "A" mine plant.[10]

Union Tin Mines Ltd. recorded increases in the tin output in both gravity and flotation concentrates. Tin production was 377 long tons in fiscal 1974 compared with 248 long tons in fiscal 1973. The increased production of tin concentrate was due to the opening of the western section of the mine and to a higher rate of reclamation from the old tailings dumps. Exploration efforts in 1974 near the mine failed to show any significant new tin mineralization.

**Titanium.**—Quebec Iron and Titanium Corp. Ltd., Union Corp., and the Government's Industrial Development Corp. planned to establish a mining operation to produce ilmenite, rutile, and zircon from coastal sands about 15 miles north of Richards Bay. Plans also included the building of a plant to smelt the ilmenite to make pig iron and Sorel slag. Production was expected in late 1977. Reserves were estimated at 41 million tons of ilmenite, 1.5 million tons of rutile, and 3.4 million tons of zircon.

S. A. Titan Products Ltd. of Umbagintwini, 10 miles south of Durban, the only local producer of titanium oxides, planned to spend $6 million over the next 4 years to expand its production capacity. The company produced about 24,000 tons of titanium oxides in 1974 using raw materials imported from Canada.

**Uranium.**—The production of uranium, a byproduct or coproduct at eight gold mines, declined again in 1974 despite a 14% increase in gold ore treated. The decreased output reflected the policy of mining lower grade ores because of higher gold prices. Uranium production was 3,074 tons, 20 tons less than in 1973. The uranium market was generally depressed in 1974, though prices and demand were improving at yearend. About midyear, sales of uranium were reportedly temporarily halted pending an expected increase in world prices. The South African Nuclear Fuels Corp. (NUFCOR), the state-owned company through which all the country's uranium is sold, also planned to hold its uranium stocks, estimated at 20,000 tons, until prices rose.[11] Mines not processing gold ores for uranium continued to stockpile high-grade uranium-bearing slimes. The uranium mill at AAC's President Brand mine continued on a care and maintenance basis. In December, West Rand Consolidated Mines, Ltd. ceased uranium production pending better market conditions.

Source: Chamber of Mines of South Africa. January-December 1974.

The enrichment pilot plant of the government-owned Uranium Enrichment Corp. of South Africa Ltd. (UEC) at Valindaba, near Pretoria, was nearing completion and was expected to be in operation in early 1975. UEC decided late in the year to proceed with construction of a large-scale commercial enrichment plant having a yearly capacity of 2.4 million separative work units (2,400 tons of enriched uranium.) [12]

In September, plans were announced for a two-unit nuclear reactor installation, each unit of about 1,000-megawatt capacity, at Koeberg near Cape Town. A nuclear program was proposed to preserve coal resources for the petrochemical industry and for coal gasification and liquefaction.

**Vanadium.**—The vanadium market remained firm throughout the year, paralleling the world steel industry which operated at capacity in 1974. The Republic of South Africa's production of vanadium, about 40% of the world's total output, was 8,152 tons, down slightly from 1973's record high. HSV, the country's only producer of vanadium slag, increased slag output to record levels in 1974. An $18 million program to increase iron and steel and vanadium slag production by 25% was completed in December. In November, an additional $97 million expansion program was authorized to increase iron and steel production. (See iron and steel section.) Included in the program was a third shaking ladle for the production of the vanadium slag that will result from the added iron and steel output.[13] A new magnetic separation plant was commissioned late in 1974 at the Mopochs mine, which supplies ore for the steelworks (slag) and for the Vantra division (vanadium pentoxide). The new facility increased the yield of usable vanadium-bearing magnetite ore from 65% to 85%. HSV's vanadiferrous magnetite ore reserves were estimated at 120 million tons averaging between 1% and 1.6% $V_2O_5$.

Transvaal Alloys Ltd., a joint venture of the Otavi Mining Co. Ltd. and Vereinigte Aluminium-Werke A.G. of West Germany, became South Africa's third producer of vanadium pentoxide in July.[14] The company's mine and plant are located at Wapadskloof, 65 miles northeast of Middleburg. The capacity of the plant was estimated at 1,500 tons per year of vanadium pentoxide, all for the export market.

**Zinc.**—South Africa's only zinc producer, PCM completed its second year of operation, attaining full production capacity of 220,000 tons of milled ore (about 8,000 tons of zinc concentrate) monthly at midyear. PCM's production of zinc concentrate for 1974 was 67,993 tons, compared with 34,031 tons in 1973. PCM's zinc sales for domestic consumption, 28,733 tons, were made to the Zinc Corp. of South Africa (ZINCOR), an electrolytic refining company. ZINCOR's production capacity, currently 50,000 tons per year, was to be increased to 75,000 tons by 1978 to process additional PCM concentrate.

Newmont Mining Corp. and O'okiep Copper Co. planned to conduct large-scale metallurgical test work on ore from their large zinc deposit near Gamsberg in northern Cape Province. Proven ore reserves were 93,500,000 tons of 7.5% zinc and 0.55% lead. Drilling in 1974 indicated a

much larger potential of somewhat lower grade ore.

**Zirconium.**—PCM modified and enlarged its baddeleyite ore upgrading plant, doubling the plant's rated capacity. Production for the year was 11,978 tons, compared with 4,956 tons in 1973. A large-scale pilot plant for the production of chemical-grade zirconium sulfate was commissioned in 1974. Customer acceptance of this new product reportedly was good.

## NONMETALS

**Asbestos.**—Although the production of asbestos minerals increased marginally in 1974, total sales reached $80 million, $12 million higher than those in 1973. Sales and production of individual mineral types varied significantly. Production of amosite, and anthophyllite decreased, whereas production of Cape Blue crocidolite and chrysotile increased. Transvaal Blue asbestos was not produced in 1974.

**Cement.**—Production and sales of cement increased 6.3% and 10%, respectively, in 1974 mainly because of continued high activity in the construction area. Profitability continued to be squeezed by rising costs, but a price increase granted in December offset rising production costs to some extent. Pretoria Portland Cement Co. Ltd. commissioned a new kiln at its Hercules factory and completed modernization of the 500,000-ton-per-year De Hoek plant of the company's subsidiary, Cape Portland Cement Co. Ltd. Anglo-Alpha Cement Ltd. planned to expand its Dudfield factory over the next few years, adding two additional kilns at a cost of $33 million.

Domestic and foreign sales of limestone increased by 6% to 14.9 million tons in 1974, compared with 14.1 million tons in 1973. Although local sales were higher in 1974, stocks of limestone were 5.2 million tons at yearend. Although lime output and demand decreased slightly in 1974, Union Lime Co. Ltd. was accelerating the construction program of the new lime plant at Ouplaas. The first kiln was expected to be commissioned by mid-1975 and the second by mid-1976. Cost of the program was estimated at $32 million.

**Diamond.**—Diamond sales by the Central Selling Organization (CSO) at $1.25 billion were $106 million, or 7.8%, lower in terms of rands than in 1973. Sales set a new record in the first half of 1974 but fell sharply in the latter half of the year because of marked deterioration in world economic conditions. The value of diamond stocks held by CSO increased $80 million to $397 million in 1974. South African diamond production was 7,510,074 carats, 55,300 carats less than in 1973. The value of sales was $210 million on sales of 7,071,434 carats, compared with a value of $235 million on sales of 7,277,866 carats in 1973. Diamond production by DeBeers Consolidated Mines Ltd. decreased slightly in 1974, mainly because operations at both the Finch and Koffiefontein mines were adversely affected by rain early in the year. Despite resumption of production at the Bultfontein mine, diamond output by the Kimberley Division decreased owing to the mining of lower ore grades at the DeBeers, Dutoitspan, and Wesselton mines. Production of the Namaqualand Division mines was 245,147 carats higher in 1974 due to higher output at Dreyers Pan.

**Fluorspar.**—Fluorspar production of all grades was 207,933 tons, 2,391 tons less than in 1973. Acid-grade fluorspar continued to be the principal product, accounting for 93% of the total production and 83% of local sales and exports.

Marico Fluorspar (Pty.) Ltd., a subsidiary of United States Steel Corp., continued development of its mine at Zeerust, Transvaal. Production was scheduled to begin late in 1975 with full-scale mine and beneficiation operations to start by early 1976. The plant was designed to produce 120,000 tons of acid-grade (97% $CaF_2$) and 50,000 tons of metallurgical-grade (92% $CaF_2$) concentrates per year.

Chemspar, Inc., a subsidiary of Phelps Dodge Corp., rehabilitated and brought into production in early 1974 the mine and mill purchased from Ottoshoop Holdings (Pty.) Ltd., in 1973 for $6 million. Output of acid-grade fluorspar was 12,000 tons in 1974; however, at yearend, the production rate was approaching the planned rate of 2,500 tons monthly.

Transvaal Consolidated Land and Exploration Co. Ltd. (TCL) was building a pilot plant near Zeerust to study the possibility of upgrading its large deposit of 15% $CaF_2$ ore. If the tests were favorable, TCL planned to start construction of a full-scale acid-grade plant.

**Phosphate.**—Production of phosphate ores increased almost fourfold, reaching 7.8 million tons in 1974. Domestic demand for phosphate rock for the manufacture of fertilizers and phosphoric acid continued to grow rapidly. Revenue from sales of phosphate increased from $21 million in 1973 to $25.4 million in 1974. Local sales increased by $3.4 million, whereas export sales rose from $56,000 in 1973 to more than $1 million in 1974.

The Phosphate Development Corp. Ltd. (FOSKOR) embarked on an expansion program costing $59 million to increase annual production of phosphate concentrate from 1 million tons to 2.8 million tons by 1977. The first phase of the program, involving the pumping of phosphate tailings from PMC's operation to the extended FOSKOR plant, was operating in 1974 and will increase concentrate production by 750,000 tons per year. Triomf Fertilizers (Pty.) Ltd. was erecting a plant at Richards Bay to manufacture phosphoric acid for export. The new plant was scheduled for commissioning in 1977. Fedmis (Pty.) Ltd. was also enlarging its Phalaborwa plant to increase output of phosphoric acid for export. Omnia Fertilizers (Pty.) Ltd. planned production of superphosphate for local markets in 1975 at its plant at Impala Platinum Ltd.

**Vermiculite.**—In 1974, PMC, the country's only vermiculite producer, produced a record 182,613 tons of vermiculite, 17% more than in 1973. Although the tonnage milled, 1,125,634 tons, was slightly less than in 1973, production increased because the company recovered substantial amounts of ore from the marginal ore stockpile.

## MINERAL FUELS

**Coal.**—Coal, which provides 75% of South Africa's total energy needs, assumed greater importance in 1974 as a low-cost energy source in lieu of oil. Increased emphasis was placed on the development of large-scale coal-fired powerplant projects, and the Government announced plans to build a second, much larger, oil-from-coal conversion plant. To meet both expected domestic and contracted export demand, the coal industry continued with mechanization and expansion programs, brought new mines into production, and planned new mining operations. Expansion of coal exports continued to be a controversial topic between producers and the Government. A new coal consumption and resource study, initiated by the Government late in 1974, was expected to form the basis for a revised coal export policy.

Coal production increased 7% to 66.1 million tons in 1974. Sales increased by 5% to 64.6 million tons, compared with 61.5 million tons in 1973. The increase was lower than expected and reflected the severe railcar shortage suffered by collieries throughout the year. About 97% of the coal sales were for domestic consumption. The apparent consumption of coal in South Africa by category was approximately as follows in 1974: Electricity (48%), commercial trade (25%), railways (11%), oil and gas-from-coal conversion (10%), and iron and steel (6%).

In December, the Government announced that a second oil-from-coal conversion plant, called SASOL II, was to be constructed by the South African Coal, Oil and Gas Corp. Ltd. (SASOL). The project, valued at $1.6 billion, was scheduled for completion in 1981. Plans called for a plant complex containing a coal gasification system, a liquefaction reactor system, chemical-petrochemical units, and support facilities. The proposed plant is planned to process 40,000 tons of coal per day into gasoline and diesel fuels, ethylene, ammonia, sulphur, and various coal-tar derivatives. A U.S. firm, Fluor Corp., will act as general contractor for the project.

Major efforts were underway to develop coalfields near developing and planned powerplant sites. AAC's Arnot underground mine and temporary open pit reached full production and in September produced a record output of 416,000 tons. On completion of the new dragline in 1975, the colliery was expected to have the capacity to supply 6 million tons of coal per year to the adjoining Arnot powerstation of ESCOM. AAC also brought its large Kriel colliery, Transvaal, into preliminary production late in 1974. This operation will supply coal to ESCOM's newly developing 3,000-megawatt Kriel powerstation beginning in 1975. When the powerstation is completed in 1980, 8.5 million tons per year of Kriel colliery coal will be consumed. New coal mines or extensions to existing mines were planned or under development to supply several other ESCOM coal-fired powerstations being constructed in the Transvaal.

Government approval was given to AAC's Coronation Collieries to export to Japan 850,000 tons of low-ash coal per year for a period of 5 years from the second half of 1976 and 500,000 tons yearly for a further 5-year period after that.[15] According to its annual report, AAC was successful in obtaining conditional approval from the Government for the export of 100 million tons of coal over a period of 20 years, which together with approvals to other companies could result in coal exports reaching 40 million tons per year by the mid-1980's.

**Petroleum.**—South Africa's hopes of finding oil were raised in February when natural gas was discovered by Chevron Oil Co. of South-West Africa about 180 kilometers off the Orange River mouth. Although the discovery was not thought to be economic, the gas shows were encouraging enough to justify further exploration in the area.[16] The Government planned to increase the budget of the Southern Oil Exploration Corp. (Pty.) Ltd. (SOEKOR) in 1975 from $11 million to about $30 million to expand oil exploration activities on both the land and the Continental Shelf. Plans called for offshore drilling by two rigs instead of one in 1975 and for the hiring of two additional rotary rigs to drill on land. SOEKOR also announced that extensive marine seismic surveys were to continue to 1976 to provide planning for drilling work after 1976.

# The Mineral Industry of the Territory of South-West Africa

By James H. Jolly [1]

The mineral industry of the Territory of South-West Africa continued to be a major factor in the country's economy, accounting for about 50% of the gross domestic product value. Although statistics are not available, the value of mineral production was estimated at about $500 million.[2] Most of the production value was attributed to the operations of Tsumeb Corp. Ltd. and Consolidated Diamond Mines of South-West Africa Ltd. (CDM).

Exploration and development work continued at a high rate; however, some programs were deferred or were undergoing reevaluation at yearend because of lower metal prices and deteriorating world economic conditions. Major exploration and development interest continued to center on copper and uranium. The Asis Ost copper mine was nearing the production stage at yearend and production at the Otjihose copper deposit, which has reserves of 16 million tons of 2% copper ore, was expected to begin in August 1975. Plans to develop a copper-zinc deposit near Okahandja were deferred by Falconbridge Nickel Mines Ltd. (FNM) due to the dramatic fall in copper prices during the second half of 1974. Other potential copper deposits in the Territory were being evaluated or were being considered for development.

Development of the world's largest uranium mine at Rössing continued on schedule. The operation, which will initially involve mining at a rate of 120,000 tons of ore and overburden daily, was expected to come onstream in 1976. The deposit was reported to have sufficient ore reserves to support mining operations for more than 25 years.

The search for exploitable oil and gas continued without success. Gas shows in an offshore well drilled 180 kilometers west of the Orange River mouth, however, raised government hopes of finding oil. No drilling was expected in 1975, but the Government planned a comprehensive drilling program to evaluate the country's offshore petroleum potential beginning in 1976.

## PRODUCTION AND TRADE

The South-West Africa Administration, Republic of South Africa, continued its policy of not disclosing mineral production statistics for the Territory. Most of the statistical data on production were derived from annual reports of companies operating in the country, mainly Tsumeb Corp., CDM, and the South-West Africa Co. Ltd. (SWACO). The Territory traditionally produces a large variety of minerals, particularly nonmetals, but output data are not available and these commodities are not listed in table 1.

The production of mineral commodities generally declined in the Territory in 1974. The mining of lower grade ores, mainly by Tsumeb, resulted in reduced

[1] Physical scientist, Division of Nonferrous Metals.

[2] Where necessary, values have been converted from South African Rand (R) to U.S. dollars at a rate of R1=US$1.471 (average of monthly averages as given in volumes 26 and 27 of International Financial Statistics). The rate in 1973 was R1=US$1.445.

mine production of lead, silver, and copper. The smelter output of each, however, continued to exceed mine production because of custom refining of imported concentrate. Increased open pit mining at the Rosh Pinah mine and the processing of higher grade ores at SWACO's Berg Aukas operation led to higher zinc production, despite declining zinc recovery by Tsumeb. Vanadium production also rose substantially because of the higher grade ores mined at Berg Aukas. The Territroy's tungsten output increased sevenfold owing to production from the reopened Krantzberg tungsten deposit near Omaruru. Diamond production decreased slightly but the value of production rose substantially.

**Table 1.—South-West Africa: Production of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity [1] | 1972 | 1973 | 1974 [p] |

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, South-West Africa, prior to 1967, produced bismuth concentrates, cesium ore, columbite-tantalite concentrates, gold, manganese ore, molybdenum concentrates, graphite, lime, mica, precious stones, kyanite, sillimanite, and a variety of crude construction materials (clays, stone, and gravel). No official statistics have been published since yearend 1966, and available information is inadequate to ascertain whether production has continued or not, and if so, at what levels.

[2] Data are compiled from operating company reports as follows: Tsumeb Corp. Ltd. (arsenic, mine and refined cadmium, mine and blister copper, mine and refined lead, mine and smelter silver, mine zinc, and pyrite concentrate); South-West Africa Co. Ltd. (mine lead, mine tin, mine tungsten, mine vanadium, and mine zinc); South African Iron and Steel Industrial Corp. Ltd. (ISCOR) for Imcor Zinc (Pty.) Ltd's Rosh Piah mine (mine lead and mine zinc), and for ISCOR's own Uis mine (mine tin); General Mining and Finance Corp. Ltd. for Klein Aub Koper Maatskappy Ltd.'s mine near Rehoboth (mine copper and mine silver); and Falconbridge Nickel Mines Ltd. for Oamites Mining Co. (Pty). Ltd., Oamites mine (mine copper). Data from Tsumeb Corp. Ltd and Falconbridge Nickel Mines Ltd. are for calendar years, data from other companies for fiscal years ending June 30 of the year stated.

[3] White arsenic equivalent of all arsenic products reported as being produced.

[4] Figure comprises reported production of Tsumeb Corp. Ltd. and Oamites Mining Co. (Pty.) Ltd. plus an estimate for Klein Aub Koper Maatskappy Ltd.

[5] Figure comprises reported production of Tsumeb Corp. Ltd. and South-West Africa Co. Ltd. plus an estimate for Rosh Pinah mine.

[6] Figure comprises reported production of Tsumeb Corp. Ltd. plus an estimate for Klein Aub Koper Maatskappy Ltd.

[7] Total figures reported by DeBeers Consolidated Mines Ltd. in company annual reports for calendar years; detail on gem and industrial diamonds are estimates, assuming output to be 95% gem quality.

[8] Data for 1972 are estimated, based on recorded imports by selected countries from the statistical territory of South Africa (Republic of South Africa, Territory of South-West Africa. Botswana, Lesotho, and Swaziland) minus known production from the Republic of South Africa. (There is no known production in Botswana, Lesotho, or Swaziland) Data for 1973 and 1974 areas reported in World Mining, June 25, 1975, p. 147.

## COMMODITY REVIEW

### METALS

Tsumeb Corp., operators of three major base metal mines, mined and milled copper, lead, and zinc ores and operated the Territory's only lead and copper smelters. Metal sales of $106.8 million, including $26.3 million from custom material, were 24% (in terms of rand) higher than those of 1973 and almost 96% higher than those of 1972. Concentrate output was lower owing to smaller ore production and generally lower ore grades. Tsumeb smelters produced 46,612 tons of blister copper and 64,342 tons of refined lead, compared with 36,049 tons of blister copper and 63,592 tons of lead in 1973. Both smelters consumed increasing amounts of custom concentrates. Although some of the custom material was domestically produced, most was imported from sources outside the Territory.

e Estimate. r Revised.
[1] The lower recovery of zinc (to zinc concentrates) was due mainly to the shutting down of the zinc circuit on days when zinc heads were too low for economical operation.
[2] Concentrates from Tsumeb Corp. Ltd.
[3] Production.

Exploration and development continued at the Tsumeb, Kombat, and Matchless mines, as well as the new Asis Ost mine. Positive ore reserves in the Tsumeb mine increased substantially in 1974 as additional reserves between the 36 and 38 levels were proven by diamond drilling. Exploration drilling on the 44 level continued but no significant mineralization was intersected. In 1974, 39% of production at the Tsumeb mine came from stopes and pillars above the 30 level, 54% from the 32 and 34 levels, and 7% from the 35 level. At Kombat a reappraisal reduced the total tonnage of ore reserves but improved the overall grade. Deep exploration drilling from the 8 level haulage continued with moderately encouraging results. Ore reserves at the Matchless mine increased but exploration drilling at adjacent prospects was disappointing. At Asis Ost, a joint venture of Tsumeb and SWACO, ore reserves remained unchanged, mine development continued, and 5,730 tons of development ore, produced in the latter half of 1974, was processed at the Kombat mill.

Tsumeb Corp. continued exploration

of numerous prospects in various parts of the Territory, both independently and jointly with SWACO. At Asis West, immediately west of the Kombat mining area, drilling intersected a potentially minable, mineralized zone. Additional exploration drilling in the prospect area was planned in 1975.

Table 3.—Ore reserves of Tsumeb Corp. Ltd.[1]

| | Quantity (metric tons) | Grade (percent) | | | |
|---|---|---|---|---|---|
| | | Copper | Lead | Zinc | Sulfur |

| Asis Ost | 288,000 | .70 | 1.80 | -- | -- |

[1] As of Dec. 31, 1974.

**Arsenic.**—The Tsumeb arsenic plant roasted 20,074 tons of reverberatory and converter baghouse dusts, dross skims, and storage material in 1974, producing 6,722 tons of arsenic trioxide material of various grades. About 7,370 tons of pyrite concentrate from the Matchless mine was used as roaster flux. Estimated arsenic production was 18% lower than the record output of 1973. Sales of arsenic trioxide material were 5,399 tons, slightly less than in 1973.

**Cadmium.**—Tsumeb Corp. processed 4,563 tons of sinter baghouse dust in 1974, producing 114 tons of refined cadmium, 10 tons more than in 1973.

**Copper.**—The Oamites Mining Co. (Pty.) Ltd., a joint venture of FNM and the International Development Corp. (IDC), a Republic of South Africa Government agency, produced about 9% less copper in 1974 than in 1973 despite milling 11% more ore. The ore grade declined significantly because much of the ore production came from peripheral areas of the ore body where the vein widths were less and ore dilution higher. The company was developing deeper mine levels to achieve grade improvement. Production statistics for the Oamites mine for 1973 and 1974 follow:

| | 1973 | 1974 |
|---|---|---|
| Ore milled ---------- tons -- | 556,000 | 617,000 |
| Mill head grade - percent Cu -- | 1.35 | 1.13 |
| Mill recovery ------ percent -- | 92.98 | 91.32 |
| Concentrates produced dry tons -- | r 20,000 | 19,000 |
| Recoverable copper --- tons -- | 6,997 | 6,356 |

r Revised.

Development of the Otjihase copper deposit by Johannesburg Consolidated Investment Co. Ltd. (JCI) and Minerts Development (Pty.) Ltd., continued on schedule despite low copper prices prevailing at yearend. JCI and Minerts were investing about $26 million to establish mine and mill facilities for a 100,000-ton-per-month operation. Production from the deposit, which has 16 million tons of ore averaging about 2% copper with some zinc and silver, was expected to begin in August 1975.

Noranda Mines Ltd. began exploratory drilling on Laurasia Resources Ltd.'s Longbeen copper prospect near Windhoek early in the year. Three mineralized zones, each 30 to 50 feet in width and up to 3,000 feet long with surface assays that vary from less than 1% to 4% copper, were to be explored.[3]

Falconbridge Explorations Ltd., a sub-

[3] Financial Times. Laurasia in S.W. Africa. No. 26,280, Feb. 5, 1974, p. 22.

sidiary of FNM, completed an exploration drilling program in 1974 at its copper-zinc sulfide deposit on the farm Elbe, near Okahandja. Estimated reserves were about 4 million tons grading 1.5% copper, with some zinc and silver values.[4] Plans to bring the property into production in about 2 years at a cost of $13 million were deferred at the end of the year because of the dramatic fall in copper prices and deteriorating worldwide economic conditions.

FNM also reported finding significant sulfide mineralization in the same area as Elbe, at its Swartmodder prospect. Drilling to evaluate the discovery was underway.

**Lead, Zinc, and Vanadium.**—Concentrate production at the Berg Aukas operation of SWACO increased almost 20% over that of fiscal 1973. Although the mill and treatment plant operated at last year's level, production of all four concentrates increased due mainly to the mining of higher grade vanadiferous-cavity-fill material from the 17 level and richer sulfide ore from normal mining operations. Production statistics for the Berg Aukas mine in fiscal 1974 follow:

| | Quantity (metric tons) | | Grade (percent) | | |
|---|---|---|---|---|---|
| | 1973 | 1974 | $V_2O_5$ | Lead | Zinc |
| Ore hoisted | 171,200 | 172,300 | 1.14 | 4.7 | 20.0 |
| Ore milled | 135,600 | 135,000 | 1.42 | 5.7 | 25.0 |
| Concentrates: | | | | | |
| Lead vanadates | 6,576 | 8,348 | 17.51 | 42.9 | 18.6 |
| Zinc sulfide | 6,988 | 11,436 | -- | 3.0 | 56.8 |
| Lead sulfide | 919 | 1,214 | -- | 55.4 | 19.9 |
| Zinc silicates | 27,930 | 29,710 | -- | 3.4 | 46.8 |

The company continued development of the ore bodies below the 14 level, mostly on the 17 level. The establishment of the 19 level was completed and the main mine workings were dewatered to this horizon. No. 2 shaft was deepened to a position about 30 meters above 23 level. The ore reserves at the end of fiscal 1974, as indicated by drilling, were as follows in thousand metric tons:

| Locality | | Grade (percent) | | |
|---|---|---|---|---|
| | | $V_2O_5$ | Pb | Zn |
| No. 1 shaft | 125 | 0.7 | 4 | 19 |
| No. 2 shaft | 1,395 | .4 | 5 | 16 |
| Possible No. 2 shaft | 310 | .5 | 3 | 20 |
| Total mine 1974 | 1,830 | .5 | 4 | 17 |
| Total fiscal 1973 | 1,800 | .5 | 5 | 17 |

The Rosh Pinah mine of Imcor Zinc (Pty.) Ltd., (Imcor) a subsidiary of South African Iron and Steel Industrial Corp. (ISCOR), produced 26,300 tons of zinc concentrate and 7,700 tons of lead concentrate, compared with 29,700 tons and 8,100 tons, respectively, in fiscal 1973. Production from its new open pit mine reached 100,000 tons of ore and waste early in 1974. Ore reserves in the underground mining area were expected to be depleted by September 1976 and Imcor planned to increase the open pit tonnage to 160,000 tons by August 1976. Improvement in the grade of ore mined to 10% combined metals (zinc, lead, copper, and silver) was expected in 1975.

**Silver.**—Domestic production of silver, a byproduct of copper and lead mining, declined slightly from that of 1973; however, total output increased due to increased custom smelting of imported concentrate. Tsumeb Corp. continued to be the largest silver producer in the Territory, recovering 1,325,407 ounces in company-produced concentrates. Virtually all silver produced in the country was processed by Tsumeb, which exported the silver in the form of blister copper and doré bullion for toll refining elsewhere. In 1974 sales of silver by Tsumeb were 2,215,911 ounces, valued at about $10.4 million.

**Tin-Tungsten.**—Nordex Joint Venture Ltd., owned by Nord Resources Corp. (40%) and Ebco Mining Co. (60%), was the only tungsten producer in the Territory in 1974. Nordex produced about 280 tons of 70% tungsten-trioxide concentrate at its Krantzberg tungsten deposit near Omaruru. A new ore zone was under development and was planned for mining in 1976. Ore reserves, grading 0.6% tungsten trioxide, were reportedly sufficient for a 7- to 10-year operation.

SWACO's Brandberg West tin-tungsten mine, which closed in 1973, remained on a care-and-maintenance basis. Exploratory drilling continued and a decision on whether to recommence waste stripping operations was expected early in 1975. The ore reserves of the mine were estimated at 6 million tons, grading 0.153% tin and 0.079% tungsten.

Tin was produced only at the Uis mine operated by ISCOR in 1974. Concentrate production was 1,220 long tons contain-

[4] Engineering and Mining Journal. V. 175, No. 6, June 1974, p. 240.

ing 769 long tons of tin, 120 tons more than that reported in fiscal 1973. All of the concentrate was shipped to ISCOR's Vanderbijlpark Steel Works in the Republic of South Africa for processing.

**Uranium.**—Rössing Uranium Ltd., a joint venture of Rio Tinto South Africa, Ltd., IDC, General Mining and Finance Corp., Total Compagnie Minière et Nucleaire, and Rio Algom Mines Ltd., continued development of its large, open pit uranium mine 48 kilometers east of Swakopmund. Development costs were put at $132 million, most of which, through 1974 were supplied by IDC. Production was scheduled to begin in 1976 at an initial rate of 60,000 tons of ore per day yielding about 15 million pounds of $U_3O_8$ per year, making the mine the world's largest producer of uranium. Facilities to operate at the planned production rate, 120,000 tons of ore per day, were expected to be completed by 1980. $U_3O_8$ reserves are estimated to exceed 100,000 tons ($10 per pound $U_3O_8$), sufficient for at least 25 years operation.[5]

## NONMETALS

**Diamond.**—Diamond production continued to be the largest contributor to the mining industry of the Territory. Production by CDM, producer of virtually all of the diamond recovered in the country, decreased almost 30,000 carats to 1.57 million carats in 1974 due mainly to a decline in diamond grade. The cost of mining and processing a ton of gravel rose 46% (in terms of rand) to $4.04 due to wage increases, higher costs for equipment and stores, and an 18% increase in the amount of overburden stripped.

Development of the Western Block continued. In the foreshore area, the use of a well point dewatering system for maintaining slope stability of the seawall enabled mining to be extended to a distance of 120 meters seaward of the high water mark. A bucketwheel excavator and conveyor bridge system was being installed in the Western Block where the stripping ratio is high. The system, which is scheduled to start operations in April 1975, was expected to reduce the cost of overburden removal 30% below that of other methods used to date.[6] The total area of overburden to be removed by the system is 10,533 million square meters, and an average of about 14 cubic meters of overburden will have to be removed to expose 1 square meter of diamondiferous material. A total of 147 million cubic meters are scheduled for stripping over a period of 12 years.

Two additional conglomerate treatment plants were under construction. The No. 2 plant was nearing completion and was to be commissioned early in 1975. Processing water for the No. 2 plant is obtained through a shaft and tunnel system that extends into the sea.[7] The system has a maximum throughput of 70 million liters of seawater per day. Construction of the No. 3 conglomerate plant, which is about 8 kilometers north of the No. 4 plant, started in September and commissioning was scheduled for 1976.

The new X-ray recovery facility at the No. 4 plant was onstream in September. This facility is designed to handle the entire production from the four conglomerate treatment plants.

In 1975 CDM planned an extensive program to prospect the Orange River at geologically favorable points for payable deposits of diamonds. The gravels will be treated in a 50-ton-per-hour plant.

## MINERAL FUELS

**Petroleum.**—The Territory's hopes for finding oil were raised in February when natural gas was discovered by Chevron Oil Co. of South-West Africa in block 12, in a well drilled by the Sedco 135 about 180 kilometers off the Orange River mouth. Although the discovery was not thought to be economic, the gas shows were encouraging enough to justify further exploration in the area.[8] No drilling activity was expected in 1975 because drill rigs were not available. Southern Oil Exploration Corp. (South-West Africa) (Pty.) Ltd. (SWAKOR), an agency of the South-West Africa Administration, however has contracted for additional offshore drilling in 1976.

Damson Oil Co. obtained a one-third interest in block 9, which adjoins block 12, from Aracca Petroleum Co. Other interest holders in the lease include Aminex, Ltd.; Asmera, Ltd.; and Canadian Southern Petroleum, Ltd., all of Canada.[9]

Getty Oil Co. and Phillips Petroleum Co. were dropping their 21,300-square-mile deepwater prospecting lease, blocks 15 and 16, in 1975 mainly due to high geological and technical costs associated with deepwater exploration. The Continental Overseas Oil Co. withdrew from the consortium in November.[10]

# The Mineral Industry of Spain

By Scott F. Sibley [1]

An 18% annual rate of inflation and relatively high oil prices combined to reduce the annual growth rate of Spain's gross national product (GNP) from 8% in 1973 to an estimated 5% (in real terms) in 1974. Although the economy in the first half of the year roughly paralleled that of the same period in 1973, Spain experienced a downward trend in many facets of the economy in the second half. Statistics for indicators such as employment, industrial production, and tourism compared unfavorably with second-half figures for 1973, reflecting the worldwide economic situation.

However, for the year, declines were shown only in industrial production (—0.7%) and new car registrations (—3.3%). The balance-of-trade deficit of $8.4 billion [2] was perhaps the most prominent sign of a worsening economic picture. Combined with declines in both tourism and remittances from emigrant workers, the balance of payments went from a surplus of $500 million in 1973 to a deficit of about $3.5 billion. Nevertheless, Spain's monetary reserve position remained strong throughout 1974.

Despite these problems, consumer demand was expected to remain strong in 1975. The Government authorized wage increases at least equal to the rise in the cost of living and, in some cases, up to 3% more. Salaries during 1974 reportedly averaged about 26% above those of 1973, but labor problems such as strikes (particularly in the northern industrial areas) were troublesome to the economy. Primary goals set for 1975 were reducing both the balance-of-payments deficit and inflation.

Mineral exploration was booming in several different areas of Spain. These regions included the Huelva massive sulfide province in the southwest, the Murcia and Reocin-Soria lead-zinc provinces in the southeast and north, and Galicia in the northwest, where disseminated tin, tungsten, copper, and lead-zinc deposits are found. Part of the reason for this increased activity was the $25 million Spanish Mineral Exploration Plan, which was in its second year. In addition, more than 10 international mining companies were actively searching for minerals during the year.

## PRODUCTION

Commodities showing significant production gains in 1974 compared with those of 1973 were blister copper (37%), iron ore and concentrate (17%), primary zinc metal (21%), acid-grade fluorspar (13%), bituminous coal (4.8%), and crude steel (4.2%).

Spain's steel industry continued its healthy growth in 1974, moving into 9th place among the 23 members of the International Iron and Steel Institute, compared with 13th place in 1972. Spanish steel manufacturers produced about 11.3 million tons of steel in 1974.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Data presented includes recorded production of salable acid-grade fluorspar from both fluorspar mines and lead-zinc-fluorspar mines plus an estimate for the production of salable acid-grade fluorspar obtained by beneficiating a portion of total reported salable metallurgical-grade fluorspar output. Total reported production of acid-grade fluorspar was as follows in metric tons: 1972—gross weight 253,870 (calcium fluoride content 246,716); 1973—gross weight 239,824 (calcium fluoride content 233,212); 1974—gross weight 256,537 (calcium fluoride content 248,400). Estimated production of acid-grade fluorspar from beneficiation of metallurgical-grade fluorspar was as follows in metric tons (with quantity of metallurgical-grade fluorspar reported as being processed in this manner given in parenthesis following estimated acid grade output): 1972—gross weight 58,815 (147,037), calcium fluoride content 57,345 (58,815); 1973—gross weight 45,293 (113,233), calcium fluoride content 44,161 (45,293); 1974 (all estimated)—gross weight 64,491 (161,228), calcium fluoride content 62,879 (64,491).

[2] Data presented are the difference resulting from the subtraction of that quantity of metallurgical-grade fluorspar reportedly consumed for the production of acid-grade fluorspar (see footnote 1) from the total reported metallurgical-grade fluorspar output, including that derived from lead-zinc-fluorspar.

## TRADE

Spain's balance-of-trade position deteriorated significantly in 1974 after recovering somewhat in 1973. The mineral trade deficit (excluding chemicals and mineral fuels) rose from $808.2 million in 1973 to $1,373.4 million 1974, a 70% increase. The total commodity trade deficit increased 86% over that of 1973. Values for mineral commodity trade for the last 3 years follow:

| | Value (million dollars) | |
|---|---|---|
| | Mineral commodity trade | Total commodity trade |
| Exports: | | |
| 1972 | 520 | 3,831 |
| 1973 | 774 | 5,257 |
| 1974 | 1,191 | 7,092 |
| Imports: | | |
| 1972 | 2,179 | 6,837 |
| 1973 | 2,555 | 9,752 |
| 1974 | 5,960 | 15,449 |

Source: Estadistica del Comercio Exterior de España (Madrid).

Exports of mineral commodities were valued at $1,191 million, an increase in value of 54% over that of 1973. Increased values of chemicals, tin, and various other mineral exports were greatly exceeded by increased values for imports of iron and steel, copper, and platinum-group metals. Mineral fuels, valued at $481 million, accounted for approximately 40% of Spain's total mineral exports in 1974. Among major mineral groupings, only iron and steel and mercury registered declines in exports.

The value of mineral commodities imported during 1974 increased 133% over that of 1973. The increases were especially large in iron and steel, assorted minerals, copper, aluminum, and platinum-group metals. However, the largest increase was in mineral fuels imports, which rose from $1,266 million in 1973 to $3,920 million in 1974, a 210% increase. Combined with iron and steel, the two accounted for 80% of the total value of mineral imports.

Mineral commodity trade in 1972 and 1973 is given in tables 2 and 3.

## Table 2.—Spain: Exports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite and concentrate | (1) | -- | |
| Oxide and hydroxide | 6 | 38 | United Kingdom 23; Portugal 14; Thailand 1. |

| Paving and flagstone | 20 | (1) | All to Andorra. |
| Other | 18,072 | 18,444 | Mainly to West Germany. |
| Dolomite | 22,649 | 36,870 | Mainly to United Kingdom. |
| Gravel and crushed rock | 16,300 | 53,234 | Andorra 33,359; Portugal 18,440; United Kingdom 630. |

See footnotes at end of table.

## Table 2.—Spain: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Stone, sand and gravel—Continued | | | |
| Quartz and quartzite | 89,784 | 115,198 | Mainly to Norway. |
| Sand, excluding metal bearing | 35,386 | 49,352 | Mainly to Andorra. |
| Sulfur: | | | |
| Elemental, all forms | 1,377 | 988 | France 480; Egypt 400; Morocco 108. |
| Sulfur dioxide | 3 | 10 | Mainly to Portugal. |
| Sulfuric acid | 9,486 | 3,439 | Morocco 1,800; France 1,634; Equatorial Guinea 3. |
| Talc, steatite, soapstone, pyrophyllite | 65 | 140 | Italy 100; France 20; Dominican Republic 11. |
| Other nonmetals, n.e.s.: | | | |
| Crude: | | | |
| Meerschaum, amber, jet | 38,161 | 47,413 | United Kingdom 16,410; France 12,451; West Germany 10,877. |
| Other | 121,597 | 152,739 | France 108,576; Belgium-Luxembourg 31,210; Japan 7,235. |
| Slag, dross, similar waste, not metal bearing | 62 | 3,994 | Portugal 2,400; France 1,594. |
| Oxides and hydroxides of magnesium, strontium, and barium | 249 | 502 | West Germany 300; United States 127; Republic of South Africa 75. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | 31,646 | 29,222 | France 21,805; Cuba 3,274; Algeria 1,143. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 957 | -- | |
| Carbon black and gas carbon | 7,741 | 6,062 | Portugal 3,034; Morocco 1,110; Italy 600. |
| Coal and briquets: | | | |
| Anthracite and bituminous coal | 42,113 | 7,630 | Mainly to Belgium-Luxembourg. |
| Briquets of anthracite and bituminous coal | 2 | -- | |
| Lignite and lignite briquets | 526 | 626 | All to Andorra. |
| Coke and semicoke | 6,569 | 2,195 | Mainly to Portugal. |
| Hydrogen, helium, rare gases | 4 | 6 | Do. |
| Peat, including peat briquets and litter | 200 | 350 | All to Portugal. |
| Petroleum: | | | |
| Crude and partly refined thousand 42-gallon barrels | (1) | 103 | All to Italy. |
| Refinery products: | | | |
| Gasoline, including natural do | 8,079 | 7,436 | Netherlands 2,410; United Kingdom 1,362; United States 1,177. |
| Kerosine and jet fuel do | r 1,477 | 407 | United States 120; Libya 71; United Kingdom 64. |
| Distillate fuel oil do | 15,068 | 17,259 | United States 3,809; West Germany 2,394; Bunkers 1,013. |
| Residual fuel oil do | 11,543 | 12,293 | United States 5,568; Bunkers 3,447; Italy 1,245. |
| Lubricants do | r 138 | 104 | Mainly to Italy. |
| Other: | | | |
| Liquefied petroleum gas do | r 534 | 237 | Mainly to France. |
| Mineral jelly and wax do | 14 | 7 | Mainly to United Kingdom. |
| Bitumen and other residues do | 230 | 427 | Algeria 201; Portugal 98; Zaire 47. |
| Bituminous mixtures, n.e.s. do | 149 | 127 | Equatorial Africa Customs Union 58; Nigeria 27; Zaire 20. |
| Pitch and pitch coke do | 29 | 42 | Mainly to France. |
| Unspecified do | 17 | 83 | Mainly to United Kingdom. |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | 17,973 | 15,991 | Mainly to Netherlands. |

r Revised.
1 Less than ½ unit.

## Table 3.—Spain: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 100,937 | 108,839 | Greece 49,009; Guyana 37,902; Surinam 11,238. |
| Oxide and hydroxide | 304,301 | 326,770 | France 139,747; Guinea 119,935; Jamaica 50,835. |
| Metal, including alloys: | | | |
| Scrap | 3,738 | 3,453 | Canada 1,161; Portugal 325; France 270. |
| Unwrought | 30,924 | 25,541 | United Kingdom 7,894; Norway 6,641; Netherlands 3,116. |
| Semimanufactures | 7,906 | 9,123 | Belgium-Luxembourg 2,076; West Germany 1,388; Sweden 1,049. |
| Antimony: | | | |
| Ore and concentrate | 550 | 306 | Mainly from Morocco. |
| Metal, including alloys, all forms | 296 | 367 | Belgium-Luxembourg 112; People's Republic of China 88; Czechoslovakia 84. |
| Arsenic: | | | |
| Natural sulfides | 500 | -- | |
| Trioxide, pentoxide, acids | 569 | 547 | Mainly from France. |
| Metal, including alloys, all forms | 12 | 16 | Mainly from Sweden. |
| Beryllium metal, including alloys, all forms kilograms | 11 | 5 | Mainly from United States. |
| Bismuth metal, including alloys, all forms | 93 | 103 | West Germany 51; United Kingdom 11; Mexico 10. |
| Cadmium metal, including alloys, all forms | 1 | 1 | Mainly from United Kingdom. |
| Chromium: | | | |
| Chromite | 54,837 | 89,690 | Republic of South Africa 33,364; Turkey 25,315; U.S.S.R. 13,601. |
| Oxide and hydroxide | 454 | 357 | Poland 138; Bulgaria 106; West Germany 67. |
| Metal, including alloys, all forms | 27 | 17 | Mainly from United Kingdom. |
| Cobalt oxide and hydroxide | 97 | 148 | Belgium-Luxembourg 62; Canada 53; France 30. |
| Copper: | | | |
| Ore and concentrate | 144,948 | 115,457 | Australia 40,994; Ireland 38,124; Mauritania 11,019. |
| Matte | 24,529 | 14,408 | Israel 7,170; Chile 5,246; United Kingdom 1,327. |
| Copper sulfate | r 619 | 908 | Bulgaria 589; Belgium-Luxembourg 114; Yugoslavia 100. |
| Metal, including alloys: | | | |
| Scrap | 16,763 | 18,419 | France 4,203; West Germany 2,901; United States 2,415. |
| Unwrought | 35,779 | 50,578 | Belgium-Luxembourg 9,997; Zambia 8,673; Chile 7,792. |
| Semimanufactures | 14,018 | 16,871 | United Kingdom 2,989; West Germany 2,674; Italy 2,331. |
| Gold: | | | |
| Ore and concentrate | 2 | -- | |
| Waste and sweepings kilograms | 500 | 509 | All to West Germany. |
| Metal, unworked or partly worked thousand troy ounces | 836 | 804 | United Kingdom 418; Switzerland 354; West Germany 29. |
| Iron and steel: | | | |
| Ore and concentrate, except roasted pyrite thousand tons | 4,147 | 5,116 | Brazil 1,209; Sweden 877; Mauritania 732. |
| Roasted pyrite | 341 | -- | |
| Metal: | | | |
| Scrap thousand tons | 1,825 | 2,012 | United States 898; United Kingdom 347; U.S.S.R. 186. |
| Pig iron, including cast iron do | 34 | 43 | Canada 21; Finland 10; West Germany 8. |
| Sponge iron, powder, shot do | 7 | 8 | Sweden 5; France 2; West Germany 1. |
| Ferroalloys do | 21 | 26 | France 5; West Germany 2; Finland 2. |
| Steel, primary forms do | 353 | 377 | Netherlands 215; United Kingdom 37; Japan 23. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, sections do | 139 | 173 | West Germany 37; France 21; Brazil 19. |

See footnotes at end of table.

## Table 3.—Spain: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Iron and steel—Continued | | | |
| Metal—Continued | | | |
| Semimanufactures—Continued | | | |
| Universals, plates, sheets _ thousand tons | 529 | 403 | West Germany 110; United Kingdom 86; France 67. |
| Hoop and strip _ do | 53 | 74 | France 26; West Germany 16; Czechoslovakia 8. |
| Rails and accessories do | 1 | 3 | France 1; United Kingdom 1; West Germany 1. |
| Wire do | 13 | 15 | West Germany 5; Belgium-Luxembourg 4; France 3. |
| Tubes, pipes, fittings do | 46 | 47 | West Germany 14; France 9; Italy 7. |
| Castings and forgings, rough | 695 | 1,178 | Italy 465; West Germany 262; France 207. |
| Lead: | | | |
| Ore and concentrate | 24,728 | 33,012 | Mainly from Morocco. |
| Oxides | 3 | 452 | Mainly from United Kingdom. |
| Metal, including alloys: | | | |
| Scrap | 127 | 984 | Mainly from United States. |
| Unwrought | 3,511 | 6,344 | West Germany 2,901; United Kingdom 2,097; East Germany 670. |
| Semimanufactures | 175 | 140 | West Germany 54; Belgium-Luxembourg 28; Denmark 20. |
| Magnesium metal, including alloys, all forms | 558 | 953 | United States 582; Norway 322; France 23. |
| Manganese: | | | |
| Ore and concentrate | 259,677 | 331,098 | Republic of South Africa 124,378; Ghana 58,830; Equatorial Africa Customs Union 52,386. |
| Oxides | 1,582 | 1,954 | Japan 1,089; Taiwan 300; People's Republic of China 250. |
| Metal | 456 | 694 | Japan 310; United States 212; France 145. |
| Mercury 76-pound flasks | 5 | 15 | Austria 9; West Germany 3; Mexico 1. |
| Molybdenum metal, including alloys, all forms | r 46 | 30 | United States 8; United Kingdom 8; Austria 5. |
| Nickel: | | | |
| Ore and concentrate | 101 | 10 | All from Belgium-Luxembourg. |
| Matte, speiss, similar materials | 312 | 468 | Finland 216; Canada 154; Republic of South Africa 40. |
| Metal, including alloys: | | | |
| Scrap | 167 | 116 | Mainly from France. |
| Unwrought | 3,789 | 4,853 | Cuba 1,334; Canada 1,299; United Kingdom 804. |
| Semimanufactures | r 1,812 | 2,037 | France 1,027; United Kingdom 277; West Germany 272. |
| Platinum-group metals and silver: | | | |
| Ore and concentrate | 89 | -- | |
| Waste and sweepings | 431 | 644 | Mainly from United States. |
| Metal, including alloys: | | | |
| Platinum group troy ounces | (1) | (1) | Mainly from Brazil. |
| Silver thousand troy ounces | r 8,906 | 11,413 | United States 3,002; Belgium-Luxembourg 1,190; United Kingdom 1,093. |
| Rare-earth metals: | | | |
| Oxides | 110 | 160 | France 95; United Kingdom 54; United States 6. |
| Metals, including alloys | 13 | 21 | France 13; Brazil 7. |
| Selenium, elemental | 11 | 20 | Japan 8; United States 4; Canada 4. |
| Silicon, elemental | 2,419 | 440 | Mainly from Yugoslavia. |
| Tellurium, elemental | 9 | 10 | United Kingdom 5; Peru 4; U.S.S.R. 1. |
| Tin: | | | |
| Ore and concentrate _ long tons | 5,009 | 5,266 | Zaire 2,840; Bolivia 537; Australia 419. |
| Oxides do | r 74 | 115 | United Kingdom 78; West Germany 34; Italy 1. |
| Metal, including alloys do | 120 | 122 | United Kingdom 71; West Germany 31; Belguim-Luxembourg 6. |
| Titanium: | | | |
| Ore and concentrate | 39,468 | 43,766 | Mainly from Norway. |
| Oxides | 7,841 | 7,205 | West Germany 2,321; France 1,745; Italy 1,370. |

See footnotes at end of table.

## Table 3.—Spain: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Tungsten: | | | |
| Ore and concentrate | 208 | 348 | Bolivia 197; Rwanda and Burundi 73; Burma 55. |
| Metal, including alloys, all forms | 20 | 22 | United Kingdom 6; Austria 5; West Germany 2. |
| Uranium and thorium: | | | |
| Ore and concentrate (uranium) kilograms | 56 | 434 | All from United States. |
| Oxides | 2 | 2 | Mainly from France and United Kingdom. |
| Metal, including alloys, all forms kilograms | 151 | 561 | Mainly from Italy. |
| Vanadium: | | | |
| Pentoxide do | 400 | 19 | United Kingdom 10; West Germany 9. |
| Metal, including alloys, all forms | -- | 10 | Mainly from United States. |
| Zinc: | | | |
| Ore and concentrate | 48,121 | 55,830 | Canada 24,452; Peru 13,249; Sweden 6,542. |
| Oxide and peroxide | 375 | 906 | West Germany 503; France 133; Netherlands 89. |
| Metal, including alloys, all forms | 3,959 | 3,560 | France 1,083; Republic of Korea 761; U.S.S.R. 756. |
| Zirconium metal, including alloys, all forms | 1 | 3 | Mainly from France. |
| Other: | | | |
| Ore and concentrate: | | | |
| Of molybdenum, tantalum, titanium, vanadium, zirconium | 5,491 | 15,987 | Mainly from Australia |
| Of base metals, n.e.s | 14,165 | 272 | Do. |
| Ash and residue containing nonferrous metals | 44,226 | 131,682 | Mainly from Peru. |
| Oxides, hydroxides, peroxides of metals | 1,364 | 1,518 | West Germany 389; France 336; Norway 211. |
| Metals, including alloys, all forms: | | | |
| Alkali and alkaline earth | r 491 | 72 | Mainly from West Germany. |
| Pyrophoric alloys | 10 | 10 | West Germany 4; France 1; United Kingdom 1. |
| Base metals, including alloys, all forms, n.e.s | 266 | 403 | Belgium-Luxembourg 115; United States 85; France 62. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Pumice, emery, natural corundum, etc | 2,512 | 809 | United States 273; Italy 194; France 161 |
| Dust and powder of precious and semiprecious stones (except diamond) value, thousands | $61 | $49 | United States $21; France $14; United Kingdom $10. |
| Grinding and polishing wheels and stones | 921 | 1,339 | West Germany 283; Italy 236; United Kingdom 228. |
| Asbestos | 82,608 | 109,045 | Republic of South Africa 50,697; Canada 44,759; Italy 6,665. |
| Barite and witherite | 1,111 | 1,012 | Mainly from France. |
| Boron materials: | | | |
| Crude natural borates | 32,524 | 58,139 | Mainly from United States. |
| Oxide and acid | 855 | 2,739 | Mainly from Turkey. |
| Bromine | (1) | 20 | Mainly from Israel. |
| Cement | 144,828 | 375,388 | United Kingdom 88,428; Romania 83,032; Lebanon 75,955. |
| Chalk | 7,476 | 6,907 | France 4,793; Belgium-Luxembourg 790; West Germany 785. |
| Clays and clay products, including all refractory brick: | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite | 36,007 | 36,227 | Italy 18,078; Morocco 11,398; United States 3,239. |
| Kaolin (china clay) | 92,468 | 106,690 | Mainly from United Kingdom. |
| Other | 51,183 | 57,160 | United Kingdom 29,694; France 12,057; United States 6,901. |
| Products: | | | |
| Refractory, including nonclay brick | 27,441 | 31,577 | West Germany 8,940; France 8,307; Austria 5,998. |

See footnotes at end of table.

## Table 3.—Spain: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Clays and clay products—Continued | | | |
| Products—Continued | | | |
| Nonrefractory | 16,040 | 32,433 | Italy 18,528; Portugal 5,473; West Germany 4,227. |
| Cryolite and chiolite | 1,250 | 1,520 | All from Denmark. |
| Diamond: | | | |
| Natural and synthetic: | | | |
| Gem, not set or strung value, thousands | r $7,979 | $6,203 | Mainly from Belgium-Luxembourg. |
| Industrial, including powder ---------- do | $1,479 | $5,454 | France $2,611; Belgium-Luxembourg $1,361; Republic of South Africa $598. |
| Total ---------- do | r $9,458 | $11,657 | |
| Manufactured, industrial -- do | $35 | $4 | Mainly from United Kingdom. |
| Diatomite and other infusorial earth | 2,562 | 3,017 | Uinted States 1,525; France 1,060; West Germany 312. |
| Feldspar, leucite, nepheline, nepheline syenite | 9,433 | 14,390 | France 8,476; Republic of South Africa 2,993; Norway 1,560. |
| Fertilizer materials: | | | |
| Crude: | | | |
| Nitrogenous | 49,414 | 40,617 | Mainly from Chile. |
| Phosphatic -- thousand tons | 1,999 | 1,941 | Mainly from Morocco. |
| Potassic | 5 | 1 | Mainly from France. |
| Manufactured: | | | |
| Nitrogenous | 235,607 | 230,903 | France 66,878; West Germany 50,142; Norway 49,141. |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Primary aluminum production in Spain totaled 188,795 tons in 1974. Between 1964 and 1974, primary aluminum production rose 280% as a result of large investments and research. Typical of the modernization and improvement that had been carried out was the plan by Empresa Nacional de Aluminio, S.A. (ENDASA), to install a computer control system for its smelting operations. ENDASA had contracted with Alcan Smelter Services and Alcan Aluminum, Ltd., of Canada, to carry out the installation. ENDASA also was to supply Echevarría Hermanos, S.A., of Vitoria with unwrought aluminum for 18,000 tons of electrical cable to be exported to Yugoslavia. The issuing of export licenses for unwrought aluminum previously had been temporarily suspended, in early 1971 and late 1973. The suspension was lifted each time.

In January 1974, Aluminio de Galicia, S.A. (ALUGASA), expanded its capacity by bringing 18 additional aluminum cells into operation at its La Coruña smelter. This raised total capacity to 70,000 tons per year. As of January, this expansion plus ALUGASA's Sabiñánigo facility, brought the company's total capacity up to 84,000 tons per year of primary aluminum.

The location for the Villagarcía de Arosa alumina-aluminum complex was uncertain at yearend. The project called for the production of 800,000 tons per year of alumina and 175,000 tons per year of aluminum in several stages. The project was originally planned for a location near Pontevedra on Spain's Atlantic coast, but strong opposition from groups fearing pollution damage to the coastal areas forced relocation of the site. The new site being considered was in Luago Province of Galicia. The delay and change of location would increase the total investment substantially from the original $443 million.

Instituto Nacional de Industria (INI), the Spanish state-holding company, held 5% of the capital of Cia. Exploradora de Bauxita (Trombetas). The latter planned to supply the alumina and aluminum complex at Villagarcía de Arosa with bauxite from the Trombetas River deposit in northern Brazil.

**Copper.**—Andaluza de Piritas, S.A., studied the feasibility of recovering about 52 million tons of pyrite from deposits that were evaluated over the previous 4 years at Aznalcóllar, Seville. To extract the mineral content, an open pit greater than 2 kilometers in diameter would be required to remove about 15 million tons of overburden. The project would be carried out in three phases. The first phase would yield 40,000 tons per day of pyrites, which would be processed by flotation. The output would represent about 50% of the copper and zinc concentrates and 30% of the lead currently produced in

Spain by this process. The second phase would encompass the extraction of the iron and sulfur contained in the pyrites after the flotation processing. This would require the construction of secondary chemical processing plants. The third phase involves the transformation of the copper, lead, and zinc concentrates into finished metals, which would require a large complex of facilities. Initial excavation, earth movement, and basic structures would require 3 years to complete and would employ about 1,500 workmen; the required labor force would decrease to about 500 for the actual mining and processing. The project was being planned in collaboration with the West German firm of Metalgesellschaft, A.G.

**Iron Ore.**—Several mining companies reported to the Ministries for Industry and Public Transport that the iron ore mining industry was beset by excessively high rail costs in 1974. In some cases, inland rail freight tariffs were as much as 60% of the cost of the ore, which made it difficult to compete with imported ores of higher iron content that are not subject to such high transport premiums.

Agrupacion Minera S.A. (AGRUMINSA), the mining subsidiary of Altos Hornos de Vizcaya, S.A. (AHV), conducted prospecting operations with the Instituto Geologico y Minero in the provinces of Vizcaya (the Abanto and Ciérvana regions), Guadalajara (El Pobe), and Granada (Marquesado). AGRUMINSA planned to expand sinter capacity with a new 2-million-ton-per-year plant to be built at Sestao. Carbonate iron ore from deposits in Gallarta and Bodovalle would be used.

A joint Spanish and Brazilian company was established in Brasilia, Brazil, to exploit iron ore and manufacture pellets for the Spanish iron and steel industry. The Brazilian firm Companhia Vale do Rio Doce (CVRD) was to have a 51% interest in this first joint iron ore agreement. A capacity of 3 million tons per year of ore was expected. INI committed itself to consuming a minimum of 1.8 million tons of this total. Spain also was to exploit iron ore deposits in Guinea. The project was to be called Mifergui-Nimba.

**Iron and Steel.**—The generally favorable situation of the steel industry in 1973 was tempered somewhat in 1974 by the rising cost of labor and raw materials, and the heavy dependence on imports of coking coal, iron ore, and scrap. Spanish demand for scrap greatly exceeded supply throughout 1974. About 1.3 million tons was needed to fulfill demand. However, expansions continued, and a new National Iron and Steel Plan was established for 1974 to 1982. It was predicted that Spain's steel consumption would be 11.4 million tons in 1974, and would gradually increase to 20 million tons in 1982. During the first 10 months of 1974, Spanish steel consumption was 9.5 million tons, a 5.5% increase over that of the same period of 1973. More than 80% of this amount was common steel; the remainder was specialty steels. By 1985, Spain planned to double its steel-producing capacity. A target of 12 million tons was set for 1975. The previous national program resulted in quadrupling production in 8 years.

The new program basically continued the one established in 1964 and permitted smaller, nonintegrated firms to work together to increase their production efficiency. Nonintegrated firms may also receive special benefits for volunteering to act in concert with the Government. One such expansion program, which included a specialty steel mill, was planned for the Reinosa works of Astilleros Españolas S.A., an INI subsidiary. In addition, projects were approved for Campo de Gibraltar and the industrial area of Galicia. For Galicia in particular, a nonintegrated, nonspecialty steel plant was planned. Direct reduction expansion was also high on the list of priorities and, rather than being concerned only with increasing domestic production, the new program was more internationally oriented.

Unión de Siderúrgicas Asturianas, S.A. (UNINSA), located at Gijón-Veriña, and Empresa Nacional Siderúrgica, S.A. (ENSIDESA), at Avilés, were to have merged by yearend. The two firms were expected to boost their combined steel output to 7 million tons by 1977. INI would hold about 90% control of the new company, which would adopt the name of ENSIDESA. After the merger, the company would employ 25,000 and would be the largest industrial concern in Spain by volume of sales. ENSIDESA was also considering expanding its Veriña plant at the beginning of 1974; plans included constructing two new blast furnaces,

a sinter plant, a steel shop, and extensions to existing coke-oven batteries.

AHV bought the Spanish reroller Laminaciones de Lesaca in early 1974. The purchase improved AHV's cold-rolling and galvanizing capability, and marketing channels were extended by Lesaca's distribution warehouses in 18 Spanish towns. Moreover, Lesaca's product range was considerable, and included small-diameter welded tubes, structural tubes, sections, cold-rolled sheet, and hot-rolled and galvanized sheet.

In other developments of AHV, the No. 2A blast furnace at the Sestao works was reconstructed and relit at the beginning of the year. Capacity was reported as 1.9 million tons per year of steel, 87% of which was produced by the basic oxygen process.

Work continued on the major project at Sagunto near Valencia during the year. The construction, performed by Altos Hornos de Mediterraneo (AHM), was not expected to be completed until 1980.

A direct-reduction plant was to be built on the Biscay coast by a consortium of Spanish companies. Construction was expected to take 2 years, and the plant was to consume natural gas. Banco de Credito Industrial would provide 40% of the necessary funds. Tecomet S.A. of Bilbao reportedly opened negotiations for the construction of direct-reduction installations for Siderúrgica de Gibraltar, S.A., and two other projects.

**Lead and Zinc.**—Asturiana de Zinc, S.A., planned to construct a sulfuric acid plant at San Juan de Nieva (Asturias). The West German firm Lurgi Chemie & Hüttentechnik Gmbh (Frankfurt) was commissioned to design and construct the facility, which was to use the Lurgi process. The new operation would assist in increasing zinc production of the company from 85,000 tons per year to between 110,000 and 120,000 tons per year by 1975.

In other developments, STA Minero Metalurgica Peñarroya España, S.A., of Madrid signed an agreement with the French firm Tecminement of Paris for a turnkey technical operation. The French company was to install a wet dechlorination apparatus at Peñarroya's lead and silver refinery furnaces at Cartagena. A group of Spanish companies planned to build a 35,000- to 40,000-ton-per-year lead smelter at Linares, Jaén. The unit would treat sulfide residues from the Huelva-Sevilla region, as well as local ores. The smelter would cost $8.7 million, and replace the 17,000-ton-per-year La Cruz smelter.

The planned mining operation for Aznalcóllar, Seville, described under the "Copper" section would also produce quantities of lead and zinc.

**Mercury.**—The Spanish Minister of Industry established a provisional reserve in favor of the state for all minerals within a 25-kilometer radius of the Almadén mine. This comprised parts of the provinces of Ciudad Real, Córdoba, and Badojoz, and was to avoid any interference with exploration of Minas de Almadén. The study of the treatment of tailings at the Almadén mine by Soviet technicians materialized into a $6.1 million contract with Machinoexport of the U.S.S.R. for extracting quicksilver from low-grade ore.

The first International Mercury Congress was held in Barcelona on May 6–13, and was attended by representatives from 27 nations. At the meeting, Antonio Berrera de Irimo, the Spanish Minister of Finance, suggested establishing a permanent organization to encourage cooperation between the mercury consuming and producing countries. He stated that prices must be stabilized for the good of producer and consumer, and that the beneficial uses of mercury must be stressed. Papers were presented at the meeting on history-economics, geology, extractive metallurgy, analysis, contamination, biological effects, and applications of mercury.

**Tin.**—Mettalurgia del Noroeste, S.A. (MENSA), contracted with the Bolivian Mining Corporation (COMIBOL) to buy 1,200 tons per year of high-grade tin concentrate as part of a Bolivian minerals marketing policy of promoting sales outside traditional markets. COMIBOL's yearly capacity was expected to increase to about 7,000 tons per year of tin by July. It was reported that private Bolivian concerns were also expected to sell large amounts of high-grade tin concentrate to Spain during the year and that MENSA was considering buying low-grade concentrates.

**Titanium and Tungsten.**—Spain was rejected as a location for a $TiO_2$ plant by E. I. du Pont de Nemours & Co. of the United States. The rejection was partly

the result of a proposal by Titanio, S.A., to build a 30,000-ton-per-year $TiO_2$ plant utilizing the sulfate route at Huelva on the south coast; Titanio planned to increase production to 100,000 tons per year by 1978. Pollution problems at other $TiO_2$ plants along the Mediterranean reportedly severely disrupted operations, a factor which undoubtedly contributed to du Pont's decision.

Spain reportedly consumed between 150 and 200 tons of tungsten in 1974. Ferroaleaciones Españolas, S.A., supplied nearly all of the material for a few imports.

## NONMETALS

**Chlorine.**—Energia e Industrias Aragonesas, S.A. (EIASA), concluded a contract with Oronzio de Nora-Impianti Elettrochimi S.A. of Italy. Under terms of the contract, the Italian firm would supply de Nora mercury cells to EIASA's Huelva plant, boosting its chlorine capacity by 110 tons per day. When fully operational in mid-1975, the new unit should increase Huelva's capacity to 230 tons per day of chlorine.

**Fertilizer Materials.**—*Phosphates.*—Capacity of the phosphate mine of Fosfatos de BuCraa, S.A., in the Spanish Sahara was reported as 3 million tons in 1974. This was to be increased to 6 million tons annually in 1975, with reserves estimated as 1,700 million tons of phosphate rock. Production for 1975 was projected at 4 million tons. About 50% of that amount was produced in 1974. For 1976, production was to be increased to 5 or 6 million tons. A decision on whether to expand to 10 million tons per year would be made at that time.

The $P_2O_5$ content of the ores at Bu Craa is between 30% and 40%, and thickness of the phosphate layer varies from 2.5 to 7 meters. Most of the 75% and 80% bone-phosphate-of-lime concentrate was shipped to Spain; the remainder went to Japan, the United States (28,000 metric tons), and Uruguay. Strip mining was used to remove the mineral, and a primary crushing plant was used to remove silex and limestone waste. Other facilities included a 100-kilometer conveyor to carry the ore to the coast, and a concentration plant and port facility. Most of the equipment was supplied by U.S. companies. No facilities existed in the Spanish Sahara for processing concentrated phosphate into fertilizers or phosphoric acid.

**Sand and Gravel.**—*Silica.*—The only silica exports went to the Pyrenean State of Andorra. Silica was imported by Spain in 1974 from Belgium, the Netherlands, France, and West Germany, but the total amount was relatively small.

Largest of the Spanish silica-sand producers was Arenas de Arija, S.A., which reportedly produced over 250,000 tons of silica sand from two operations in Burgos Province—at Arija and Cabanas de Vintus. Second in size was Industrias de Cuarzo, S.A., which extracted sand from operations at Ribadesella in Oviedo Province and Burgillo in Segovia Province. Nearly all of its approximately 200,000-ton-per-year output was consumed by its parent company. Sand was produced as a coproduct of kaolin mining by both Caolines del Norte, S.A., and Caosil, the third and fourth largest producers, respectively. Caolines del Norte, S.A., produced about 50,000 tons of silica sand from two operations, at Hontoria del Pinar (Burgos Province) and Soria (Soria Province). Caosil produced somewhat less from its operation at Villanvera de Algora (Guadalajara). One of the principal end products of sand is glass. The major manufacturer of glass in Spain was Cristaleria Española, which produced flat glass and other glass products at six main works in Spain.

## MINERAL FUELS

**Petroleum and Natural Gas.**— Spain relied on imports from Arab countries for over 75% of its requirements of crude oil during the year. Spanish officials held several meetings with Arab representatives regarding petroleum supply. In particular, negotiations took place with Saudi Arabia and Iraq. Spain agreed with Iraq to supply industrial and agricultural machinery, as well as to execute various industrial and agricultural projects, in exchange for the insured supply of 28 million tons of crude petroleum over a 5-year period. By this agreement, Iraq was to supply about 15% of the total of crude oil imports. Despite its close cooperation with the Arabian countries, Spain paid world market prices for its imported oil, which were reflected in high domestic prices for petroleum products. In March, the prices of a wide range of petroleum products increased substantially. Gasoline was raised 17.5% and diesel

fuel, depending on its end use, was raised as much as 242%. Fuel oil for heating rose 48%; for industrial use, the price increase was 94%. Compañiá Arrendataria del Monopolia Petróleos, S.A. (CAMPSA), was reportedly subsidized by the Spanish Government with $500 million in order to keep prices at these levels during 1975. Because of the price hikes, power rates were to be raised about 15% in April 1975. To deal with the energy situation, a series of measures from exploration to expansion of power facilities were to be implemented by the Spanish Government. Energy-saving measures were also taken, such as setting lower highway speed limits and adjusting clocks 1 hour ahead of solar time.

A draft law on hydrocarbons was also debated in the Spanish legislature. Included in the bill were new jurisdiction claims on the Continental Shelf and a depletion allowance for prospecting companies. Total investment of the Spanish oil industry to the beginning of the year was $2.5 billion, divided as follows: domestic exploration and production, 15%; foreign exploration and production, 15%; sea transport of crude oil, 21%; refining, 31%; and distribution, 28%.

Three Spanish oil companies merged into a single company, to be known as the Empresa Nacional de Petróleos (ENPETROL). These companies were Refinería de Petróleos de Escombreras, S.A. (REPESA); Empresa Nacional de Petróleos de Tarragona, S.A. (ENTASA); and Empresa Nacional "CALVO SOTELO" de Combustibles Liquidos y Lubricantes, S.A. (ENCASO). The new company's refining capacity for the national market will be 14 million tons for 1974, with a planned increase to 26 million tons in the following 5 years. ENPETROL was to assume responsibility for 24% of Spain's energy supplies in 1980.

Under Decree No. 2232, dated July 20, 1974, Spain issued a plan calling for an increase in petroleum refining capacity to 86 million tons per year by 1980, from the 1974 capacity of 50 million tons per year. About 73 million tons of the projected amount would be for domestic consumption, and the remainder would be for export. Eight of Spain's nine refineries were to be expanded, and one new refinery was to be constructed in central Spain. The expansion included REPESA's Cartagena refinery, the Algericas and Tenerife refineries of Compañia Española de Petróleos (CEPSA); and the Bilbao refinery of Refinería de Petróleos del Norte, S.A. (PETRONOR).

Although the offshore Amposta Field provided less than 5% of Spain's oil requirements, record production rates were reported during the year. Production could have gone higher, but was limited to about 1.5 million tons in order to make reserves last longer.

A new thermal electrical plant utilizing either fuel oil or natural gas was to be constructed in the town of Cubellas (Barcelona). Scheduled to enter service in 1977, the plant, which belonged to Térmicas del Besos, S.A., was to have a guaranteed power capacity of 520 megawatts and annual production of 2 billion kilowatt-hours. Térmicas del Besos, S.A., is an affiliate of Hidroeléctrica de Cataluña, S.A. (HECSA), and the INI company, Empresa Nacional Hidroeléctrica del Riborzana, S.A. (ENHER).

Because natural gas was considerably cheaper than crude oil, Spain hoped to obtain imports from Algeria by 1978. A state company, Empresa Nacional del Gas (ENAGAS), was formed to handle present and future supplies and distribution throughout Spain. Plans were made by the company to prospect for gas in Mediterranean littoral areas. About 4% of Spain's energy needs were supplied by natural gas during the year, mostly from Libya. ENAGAS, along with Gaz de France and Socíété Nationale pour la Recherche, la Production, le Transport, la Transformation, et la Commercialisation des Hydrocarbures (SONATRACH) of Algeria, also studied the possibility of constructing a pipeline between Spain and Algeria.

**Nuclear Energy and Uranium.**—Nuclear powerplant construction continued apace during the year. Four new power stations were under construction: Almaro in Cáceres Province (total capacity of 1,680 megawatts), Lemoniz in Vizcaya Province (production of 1,860 megawatts), and Cofrentes in Valencia Province (975-megawatt group capacity). Fourteen more units were in the planning stage. At year-end, about 3% of total energy output was nuclear. However, under the National Electricity Plan that figure is forecast to rise to 30% and 50%, respectively, for 1980 and 1985. The Spanish agency co-

ordinating the nuclear expansion program, Empresa Nacional del Uranio, S.A. (ENUSA), signed an agreement with Techsnabexport of the U.S.S.R. whereby the latter was to supply uranium-enriching services to Spain. Uranium was to be supplied by European countries (27.5%), the United States (37.9%), and the U.S.S.R. (17.3%). The remainder would be domestically supplied. ENUSA expected to import more than 80% of its fuel supplies through the next decade. In 1973, 67 tons of uranium-bearing yellow cake were imported and 119 tons ($U_3O_8$ content) were domestically produced.

# The Mineral Industry of Sweden

By Thomas S. Jones [1]

Aided by strong national economic conditions, Swedish production of both iron ore and steel continued to advance in 1974 to new record levels. Growth of future steelmaking capacity was given great impetus by parliamentary approval of the "Steelworks 80" project of the state-owned Norrbottens Järnverk AB (NJA). A 4-million-ton-per-year steel plant is to be built, a 60% increase over current Swedish capacity. Private concerns instituted a number of smaller steelmaking expansions. Among nonferrous metals, output of refined copper was about the same as in 1973 but mine production decreased 9%. For other nonferrous metals, chiefly aluminum, lead, zinc, silver, and tungsten, production and trade were either about the same as those of 1973 or generally declining. Among nonmetal mineral commodities, cement output further declined, as the housing industry still failed to show strength. Fertilizer production was up, and Luossavaara-Kiirunavaara AB (LKAB) made plans to convert apatite extracted from iron ore into ammonium phosphate. A large, newly found deposit of feldspar was being evaluated.

In mineral fuels, petroleum imports, which supplied upwards of 70% of Sweden's primary energy, were restrained and declined. Petroleum refinery capacity was to be raised shortly, to about 80% of the 1974 consumption level, by addition of the Scanraff unit. Other expansions of refinery capacity were underway or announced. Coal imports were substantially higher; coke needs can be expected to grow significantly within a few years because of NJA's "Steelworks 80" project. Power from nuclear energy was a matter of controversial attention, with Sweden appearing to move towards development of full fuel cycle capability.

Domestic demand drove the national economy upwards 3.7% to a real gross domestic product of over $38 (constant 1968 prices). The trade deficit for mineral commodities increased 230% to over $2 billion. This was nearly four times the trade deficit for all commodities, and largely resulted from much higher petroleum prices. Other commodities exhibiting significant price increases were iron ore, steel, and fertilizers. Indices of domestic producer prices for mineral commodities increased as follows:[2] Petroleum and coal products, 78%; chemicals and chemical products, 44%; iron and steel, 40%; unwrought nonferrous metals, 27%; ores, minerals, and manufactured products, 25%; and refined copper, 19%. The overall consumer price index increased 10%.

The Government exerted influence over all key metals and fuels, either through ownership, regulatory authority, or parliamentary action. Minerals companies were subject to 1974 government requirements that firms reserve 20% of net profits for financing improvements in working conditions and contribute 15% of net profits to a special investment fund for reducing energy consumption. As in other countries adjusting to a new economic atmosphere stemming from actions of the Organization of Petroleum Exporting Countries, Sweden began an official inquiry into medium- and long-term aspects of all minerals of economic importance to the country.

## PRODUCTION

Preliminary indices of production volume in the mineral industries in 1973 and 1974 were as follows:

Statistics on production of mineral commodities are detailed in table 1.

| Industry sector | (1968=100) | |
|---|---|---|
| | 1973 | 1974 |
| Iron ore mining | r 120 | 127 |
| All mining and quarrying | r 128 | 142 |
| Primary metals | r 126 | 132 |
| Nonmetallic mineral manufacturing | 107 | 101 |
| Petroleum refining | r 111 | 109 |
| All industry | 127 | 134 |

r Revised.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, cobalt, nickel (as nickel sulfate), and metallic titanium are also produced, but output is not reported and information is inadequate to make reliable estimates of output levels.
[2] Includes sponge iron as follows in thousand tons: 1972—178; 1973—190; 1974—197.

## TRADE [3]

Swedish exports of mineral commodities in 1974 [4] were valued at $2.44 billion,[5] 35% greater than in 1973. Principal export items continued to be iron and steel, iron ore, and nonferrous metals, which accounted for 54%, 18%, and 13%, respectively, of mineral export value. Imports of mineral commodities in 1974 had a value of $4.75 billion, 90% larger than in 1973. Major import items were petroleum and petroleum products, iron and steel, and nonferrous metals, which constituted 55%, 21%, and 11%, respectively, of mineral import value.

The approximate trade deficit for mineral commodities therefore grew in 1974 to $2.3 billion, a 230% increase over the deficit of 1973. In a strong trade year, values of both exports and imports increased for nearly all mineral commodities. However, growth in value, both on a percentage basis and in the total amount, was greatest for petroleum. Thus, large net imports of costlier petroleum mainly caused the increased deficit. For Sweden, the average value of petroleum imports increased 196%, while that for imports of petroleum products increased even more, by 238%.

Trade statistics for mineral commodities in 1972 and 1973 are shown in tables 2 and 3.

[3] Statistiska Centralbyrån (Stockholm). Utrikeshandel 1974. Månadsstatistik—December (SOS). 1975.
[4] Based on the following numerical divisions of the Standard International Trade Classification (SITC): 27, 28, 32, 33, 34, 51.3, 52, 56, 66.1, 66.2, 66.31, 66.7, 67, and 68.
[5] Conversions from Swedish kronor (SKr) to U.S. dollars were made at the following rates: For 1974, SKr 4.4394=U.S.$1.00; for 1973, SKr 4.3673=U.S. $1.00. Source: International Monetary Fund. International Financial Statistics, v. 8, No. 7, July 1975, p. 358.

2 Partial figure; excludes an unspecified quantity valued at $10,207,000.

## COMMODITY REVIEW

### METALS

**Aluminum.**— The sole producer of primary metal, Gränges Aluminium (division of Gränges AB), experienced a year of full production at both smelting and rolling facilities, although its press products operations dropped off in the latter half of the year. Production of primary aluminum at Sundsvall was 82,000 tons, nearly unchanged from 1973, while production of foundry alloys at Mansbo grew 8% to 13,000 tons, and shipments of semimanufactures from Finspång increased by 3% to 74,000 tons.

Imports of raw materials for aluminum manufacture included 188,000 tons of aluminum oxide and hydroxide, the same as in 1973, and 97,000 tons of bauxite. Bauxite imports were nearly double those in 1973, possibly in anticipation of expansion of the Sundsvall smelter. Annual capacity of this smelter is to be raised to 132,000 tons from the present 85,000 tons at an estimated cost of $75 million. Environmental effects of the proposed expansion have been under study by the Government, which has proposed as an alternative the construction

of a new smelting plant in northern Sweden. Completion of the expansion at whatever site chosen is not expected before 1977. Production capacity for building sheet at Finspång is also to be enlarged at a cost of about $15 million. Gränges Metallverken, another division of Gränges AB, has begun adapting techniques developed for automated zinc diecasting to aluminum diecasting.[6]

Exports of aluminum in 1974 decreased about 1% overall from the 1973 total, as exports of unwrought metal dropped nearly one-half to 12,000 tons, while exports of semimanufactures increased about one-fifth to 51,000 tons. The annual rate of increase in imports advanced slightly to 24%; 54,000 tons of unwrought metal and 50,000 tons of semimanufactures were imported. Consumption of primary aluminum was reported to have declined to 83,000 tons, a decrease of 17% from 1973.[7]

**Arsenic.**—Production of arsenic trioxide by Boliden AB decreased about 13% from the 1973 volume to 13,300 tons, partly because crude arsenic was of lower grade. The new metallic arsenic plant, with a production capacity of 1,500 tons per year, that was to have gone into operation in mid-1974, proved more difficult to start up than expected. Consequently, the timetable for increasing production of metal was not met. Early in the year Boliden was reportedly engaged in a marketing controversy over profitmaking by resellers of Boliden material.[8]

**Copper.**—Swedish mine production, measured as copper contained in concentrates, decreased 9% to 40,600 tons. However, production of total refined copper (primary plus secondary) at just under 60,000 tons advanced hardly at all.[9]

At Boliden, sales diminished by 6%, even though prices averaged 32% higher than in 1973. Copper content of mine output by Boliden decreased to 36,000 tons because of lower copper content in Aitik ore and production losses caused by the need for mill repairs at Aitik. Ore production at the Aitik mine climbed 3% to 6.1 million tons. Production of electrolytic copper increased by 400 tons to 59,000 tons of which 28,500 tons was produced from Boliden material. Blister copper, which in 1973 had amounted to 2,400 tons, was not produced.

Expansion of Boliden's Stekenjokk mine continued, as did installation of a plant for cleaning gases from copper roasting furnaces. Acquisition of additional open pit mining machinery and support facilities was authorized for the Aitik mine. On the condition that a satisfactory license could be obtained for continued operation of the Rönnskär smelter, new projects approved for the smelter included: A Kaldo plant for recovering residual copper from copper converter slag simultaneously with smelting of copper concentrates; a central plant for scrubbing process gases; and an additional sulfur dioxide plant. The Kaldo plant will increase smelting capacity to about 85,000 tons of copper per year and will considerably lower energy consumption for smelting. In March 1974, Boliden committed another $500,000 to the joint mine–concentrator copper-nickel project with Great Lakes Nickel Ltd. in Ontario. This latest commitment was mainly for surface and underground development work.

Deliveries of copper and alloy semimanufactures by the Gränges Metallverken division of Gränges AB were 118,000 tons, slightly more than in 1973. In 1974, new tube-producing facilities began operating at Granefors and Västerås, and Töcksfors Verkstads AB was acquired. Töcksfors Verkstads has wire and cable facilities at Töcksfors, Årjäng, and Koppom; investments are being made in production of underground and overhead cables at Töcksfors.

Trade in unwrought copper and alloys increased over 1973, by 8% to 20,500 tons for exports and by 12% to 70,400 tons for imports. Trade in semimanufactures was practically unchanged, exports decreased 1,000 tons to 53,000 tons and imports increased by the same amount to 27,000 tons. Consumption of refined copper in 1974 was down 8% to 104,500 tons.

**Ferroalloys.**—Production of ferroalloys containing chromium, silicon, manganese, and the refractory metals decreased 5% overall to 214,000 tons. The major change from the 1973 production pattern was a 70% increase in the production of high-carbon ferrochrome, to 62,000 tons. The increase in ferrochrome production con-

[6] Huskonen, W. D. Automatic Zinc Diecasting in Sweden. Foundry, v. 102, No. 2, February 1974, pp. 75–76.
[7] World Bureau of Metal Statistics (London). World Metal Statistics, v. 28, No. 8, August 1975, p. 10.
[8] Metal Bulletin. No. 5869. Feb. 14, 1974. p. 32.
[9] Statistiska Centralbyrån (Stockholm). Bergshantering 1974. 1975, pp. 89, 97.

trasted to declines in production of all other ferroalloys; ferromanganese was not produced at all in 1974. Sales of ferroalloys amounted to 85% of production at prices averaging 48% greater than in 1973. Volume of trade in ferroalloys continued at levels comparable to production volume. As many tons of ferroalloys were imported as produced. Volume of exports was two-fifths production volume, to give net imports of 129,000 tons, 60% the volume of production. Ferronickel and ferromanganese were major import items, accounting together for 86% of net ferroalloy imports.

The new "COBO" cold-bonding process is scheduled to be put into operation in 1975 at the Tröllhättan plant of AB Ferrolegeringar. In this application, silica dust that was formerly a waste product will be used as the binder. Cold-bonding is to be achieved by autoclaving at about 200° C in the presence of water, according to methods developed at the Royal Institute of Technology in Stockholm.[10]

**Iron Ore.**—Production and exports of iron ore again both advanced to record levels in 1974. Production increased 4% to 36.152 million tons, whereas exports grew only 0.6% to 33.105 million tons. Value of exports in 1974 was equivalent to about $429 million, 20% more in terms of dollars than in the previous year, and nearly 22% higher when expressed in Swedish kronor. Average unit value of iron ore exported in 1974 (SKr 56.8 per ton) similarly increased by 21% compared with 1973. The 1974 figures for price and value reflect price increases negotiated in late 1973 of about 25% for 1974 iron ore delivery contracts.

Production and shipments of iron ore by the principal producers in 1974 were as follows, in thousand tons:

| Company | Production | Shipments | | |
|---|---|---|---|---|
| | | Export | Domestic | Total |
| Luossavaara-Kiirunavaara AB (LKAB) | [1] 30,000 | 29,727 | 1,467 | 31,194 |
| Tuolluvaara Gruv AB (TGA) [2] | NA | NA | NA | 957 |
| Gränges AB | [3] 3,288 | [e] 1,664 | [e] 1,721 | 3,385 |
| Stora Kopparbergs Bergslags AB (SKB) [4] | 1,550 | NA | NA | 1,718 |

NA Not available. [e] Estimate.
[1] Including 7.7 million tons of pellets.
[2] Shipments for TGA as reported by LKAB.
[3] Including 1.2 million tons of pellets, of which 0.8 million were cold-bonded.
[4] Including contributions from AB Dannemora Gruvor.
Source: 1974 Annual Reports for LKAB, Gränges AB, and SKB, and data reported in Skillings' Mining Review, v. 64, 1974: No. 6, Feb. 8, p. 13 (LKAB); No. 8, Feb. 22, p. 4 (Gränges AB); No. 10, March 8, p. 12 (SKB).

Stocks of iron ore at Swedish mines at yearend 1974 totaled 4.6 million tons, down from the yearend stocks of 1973 which totaled 6.2 million tons. The drop in stocks of about 2 million tons for the second consecutive year came as shipments continued to exceed production. Production was hampered by several factors including labor troubles.

Exports of Swedish iron ore products in 1974 included 7.7 million tons of pellets, 8.2 million tons of unagglomerated ore fines and concentrate, and 17.3 million tons of lump ore. Exports of pellets by LKAB were about 1.6 million tons more than in 1973. Shipments by LKAB through the Norwegian port of Narvik totaled 22.1 million tons at an average cargo weight of 44,300 tons. Work was underway on a new 208-meter quay to expand shipping facilities at Narvik. This quay is to be completed in 1977 and will raise annual port capacity to 30 million tons from 23 million tons. The quay will accommodate ships of 150,000 tons and upwards, in comparison with present facilities for ships up to 100,000 tons. On the Baltic, LKAB shipments through Luleå amounted to 7.8 million tons in 1974 at an average cargo weight of 19,200 tons. Limited winter shipping was done using ships strengthened for ice and with the aid of ice breakers.

In December 1974, state-owned LKAB acquired both ferrous and nonferrous ore mining companies. All shares of Tuolluvaara Gruv AB (TGA) were acquired on December 2. TGA has been producing about 1 million tons per year from a mine

[10] Hassler, B., and P. G. Kihlstedt. Design Principles of the COBO Process as a Method of Agglomerating Mineral Concentrates. Paper in Swedish Mining Mission to USA, May 1975, 11 pp.

at Kiruna and operated at a loss in 1974. AB Statsgruvor, a state-owned company with which LKAB has had close ties for some years, was acquired at yearend 1974. Statsgruvor operated mines in central Sweden from which lead, zinc, tungsten, and copper concentrates are obtained. Iron ore prospecting activities by LKAB included completion of initial deep-level surveys towards the 1,000-meter level at Malmberget and evaluation of depostis at Norrbotten. Dolomite pellets were produced on a trial basis at the new pelletizing plant at Malmberget, and were given full-scale trials for blast furnace use in Poland and for direct reduction at Canadian and West German plants.

The change to mining by continuous block caving methods proceeded at the Grängesberg mine of Gränges.[11] This change, stemming from a 1971 decision to operate the mine with trackless equipment, is expected to be completed in late 1976, and will replace mining by block caving plus some sublevel caving. Gränges decided in 1974 to increase its investment in facilities for producing low-phosphorous concentrate at Grängesberg with new equipment to be installed by 1977.

Stora Kopparbergs acquired AB Dannemora Gruvor from Fagersta AB effective March 1974. Also adding to Stora Kopparberg's future prospects, was the delineation of an estimated 50 million tons of ore comprising mostly 40% iron at Vintjärn.

Swedish iron ore mining companies agreed to provide technical assistance and advice on several foreign deposits in Africa and the Middle East. LKAB was carrying out studies of ore in the Nimba region of Guinea and at Gara Djebilet in Algeria. Gränges was collaborating with the National Iranian Steel Industries Corp. on development of deposits at Gol-e-Gohar in southern Iran which, beginning in 1978, are expected to yield 5 million tons per year of ore with 60% iron.

**Iron and Steel.**—Production, trade, and consumption of iron and steel in 1974 showed moderate or strong advances in volume in all categories except exports. Compared with 1973, production was up 6%, exports were virtually unchanged, imports increased 8%, and steel consumption increased 8% to 4.63 million tons. The iron and steel industry operated overall at about 86% of capacity to produce just under 6 million tons of raw steel and 4.3 million tons of finished steel. These new alltime highs continued production trends of recent years.

The index of Swedish producer prices for iron, steel, and ferroalloys in 1974 averaged 40% higher than in 1973. For steel semimanufactures, the average value of Swedish exports in 1974 was equivalent to $634 per ton ($476 in 1973), while the average value of imports was equivalent to $355 per ton ($255 in 1973). Several producers reported higher profits than in 1973; however, state-owned Norrbottens Järnverk AB (NJA) again reported a loss, partly attributed to long-term delivery contracts at fixed prices proving too low. Investment in the iron and steel industry in 1974 was estimated at $208 million, only slightly above the 1973 figure of $200 million.

Annual production capacities for pig iron and raw steel in Sweden at yearend were about 4.0 million and 7.1 million tons, respectively.[12] Compared with 1973, this represented an increase of 7% for pig iron and 3% for raw steel. Completion of a blast furnace by Surahammars Bruks AB was largely responsible for growth in pig iron capacity. Production capacity for sponge iron increased in 1974 by nearly one-third to 257,000 tons per year, reversing the capacity drop in 1973. The increase resulted from putting into operation a 60,000-ton-per-year tunnel kiln by Höganäs AB. Auxiliary equipment for this 260-meter kiln is to be installed in 1975.

Distribution of steelmaking capacity by process was practically the same as in 1973, as follows: Oxygen, 41%; electric (mostly arc), 40%; and open-hearth, 19%. At 29%, the proportion of alloy and high-carbon steel in total steel production was also nearly unchanged.

The year 1974 promised to be a milestone for the Swedish steel industry. In May, parliamentary approval was given for NJA's "Steelworks 80" project, to build a new integrated iron and steelworks at the company's Luleå site in northern Sweden. When completed, at a cost now estimated in excess of $1 billion, the new plant would produce over 4 million tons of crude steel per year, a 60% increase over current Swedish capacity. Furthermore, the

[11] Mining Magazine. Grangesberg: Changeover to Continuous Block Caving. V. 132, No. 6, June 1975, pp. 418–431.

[12] Jarnverksföreningen (Stockholm). Svensk Jarnstatistik. No. 1, May 27, 1975, table 15.

project represents a break from traditional Swedish steelmaking philosophy. Using ore from nearby LKAB mines, mass production of ordinary commercial steels will be the goal rather than production of stainless and specialty steel as has been characteristic of the industry. The project has generated considerable controversy within Sweden. However, the argument advanced that trends in world markets favor such a plant gained support from interest shown by at least one Japanese steelmill in taking one-half million tons of crude steel per year for 5 years beginning in 1979. NJA planners visualize that 90% of the output of the plant will be exported, mostly to western Europe.

Basic, bottom-blown (OBM) converters were among steelmaking installations completed or started in Sweden in 1974. At the Domnarvet works of SKB, a 30-ton unit that made steel by the Swedish-developed Kaldo process was converted to an OBM unit as of August. OBM steelmaking at Domnarvet was preceded in February by startup of a 35-ton unit at Surahammars Bruks AB. The installation at Surahammars was initially planned as a conventional top-blown converter, but was changed to a greenfield OBM plant. Gränges announced plans to install a Linz-Donawitz (LD) converter at the Oxelösunds works of Gränges Steel. The unit, reported to be 180-ton, is scheduled to be in production by 1977 as part of a program to expand capacity for crude steel by 50%.

In stainless and alloy steelmaking, Gränges' Nyby Bruk AB began operating a 60-ton argon-oxygen-decarburization (AOD) unit in 1974, and Sandvik AB began installation of a similarly sized AOD unit reportedly to start production in 1975. Production by the Creusot-Loire-Uddeholm (CLU) process, a joint Swedish-French development, was pioneered by Uddeholms AB in a 70-ton converter beginning in late 1973. In the CLU process, the diluting gas during decarburization is steam rather than argon as used in the AOD process, leading to potential savings estimated at $10 to $20 per ton. Fagersta AB decided to increase ingot capacity for high-speed steel by putting into operation by 1977 a new plant with a 25-ton arc furnace. SKF planned to add a new twin-furnace steelmaking plant at Hofors. At Avesta Jernverks AB a cold strip mill is to be replaced in 1976 by a new mill capable of producing 40,000 tons per year of sheet and plate in widths up to 2 meters.

Production of crude forms of alloy and high-carbon steel in 1973 and 1974 is shown by the following tabulation in thousand tons.

| Type of steel | 1973 | 1974 |
|---|---|---|
| Stainless | 467 | 519 |
| Heat-treatable, case-hardening, and spring | 307 | 365 |
| High-carbon (unalloyed) | r 229 | 241 |
| Tool | 108 | 119 |
| High-speed | 29 | 34 |
| Free-machining | 13 | 13 |
| Other, including ball-bearing | 442 | 446 |
| Total | 1,595 | 1,737 |

r Revised.

Imports of steelmaking raw materials in 1974 included 209,000 tons of pig iron, 368,000 tons of iron and steel scrap, 270,000 tons of chromite, 37,800 tons of manganese ore, 8,500 tons of molybdenum concentrate, 13,800 tons of unwrought nickel, 711 tons of vanadium pentoxide and other compounds and 14,400 tons of fluorspar.

Consumption of selected raw materials in the manufacture of pig iron, sponge iron, ferroalloys, and raw steel in 1974 is shown in table 4.

Table 4.—Consumption of selected raw materials
(Thousand metric tons unless otherwise specified)

| Materials | Used in production of | | | |
|---|---|---|---|---|
| | Pig iron | Sponge iron [1] | Ferro-alloys | Raw steel |
| Metallic: | | | | |

[1] Including pulverized sponge iron.
[2] Less than ½ unit.
[3] Estimated (on basis of table 20 of source publication) to consist about 83% of iron ore and 17% of additives such as mill scale, furnace dust, lime, slag, etc.
[4] Including slaked lime but excluding lime used in production of iron ore sinter and pellets.

**Lead and Zinc.**—In practically all aspects of production, sales, trade, and consumption, 1974 was a year of downward trends. Consumption of refined lead was an exception, which showed a slight 1% advance to 34,000 tons, as reflected in nearly 10,000 tons of imported lead and lead alloys, a 63% increase over 1973. Mine production of lead, in terms of lead content, was 73,700 tons, a 32% drop from 1973, while production of refined lead fell 3% to 45,200 tons. Excess domestic production of lead concentrate continued to be exported for processing; ore exports fell 18% to 47,000 tons. Exports of lead and lead alloys, mostly in unworked condition, decreased 9% to 28,000 tons. Mine production of zinc, expressed as zinc content, declined 4% to 114,000 tons, none of which was smelted in Sweden. Ore exports of 207,000 tons were 8% less than in 1973. Imports of unwrought and wrought zinc and zinc alloys were 2% lower than in 1973, and amounted to 46,000 tons. Exports of corresponding zinc materials at 2,000 tons were down 40%. Slab zinc consumption decreased 8% to 40,000 tons.

Sweden's major producer, Boliden, experienced overall lower results for lead and zinc because sales, in terms of metal content, declined 13% from 1973 amounts for lead materials and 7% for zinc materials. Production of lead ore from the Laisvall

Mine was 1.2 million tons, the same as in 1973. Zinc, in zinc concentrates produced, amounetd to 74,900 tons, which was a 6% decrease from that of 1973 and was attributed to lower zinc content of ore. Production of zinc clinker decreased about 5% to 26,900 tons.

Construction continued at Boliden's Rönnskär works on a Kaldo plant for refining lead-bearing intermediate products from copper and lead production. A new oxygen plant being built was scheduled to begin operating in early 1975. Approval was given for renovations and installations at Laisvall which would increase production capacity by 200,000 tons to 1.4 million tons of ore per year, subject to receiving permission from environmental officials.

At yearend 1974, LKAB acquired all shares in AB Statsgruvor, a state-owned mining company, which has a lead-zinc mine at Stollberg in central Sweden with yearly capacity of 5,000 tons for lead concentrate and 6,000 tons for zinc concentrate.

**Silver.**—Mine production of silver in nonferrous ore declined 4% to 4.5 million troy ounces. Production of silver metal and alloys decreased nearly 5% to 6.0 million troy ounces, of which 4.9 million troy ounces were obtained from domestic ore while the remaining 1.1 million troy ounces were produced on a toll basis. Practically all of Sweden's production of silver was by Boliden, which experienced a 24% drop in sales volume of silver produced from its own material. Boliden announced in 1974 a decision to expand the silver mine at Hällefors. Imports of foreign ore to be used for extracting silver, platinum, and platinum metals dropped substantially in 1974, decreasing to 123 tons from 1,100 tons imported in 1973. For all forms of silver metal and alloys, Sweden's net imports increased 44% in 1974 to 117 tons.

**Tungsten.**—Sweden was a net importer of tungsten materials, producing only about one-fifth of its needs from domestic sources. A major use was for hard metals such as carbides, for which estimated tungsten demand in 1974 was 1,350 tons. An additional 400 tons was estimated to have been consumed in making ferrotungsten. Output of the only tungsten mine, at Yxsjöberg, was equivalent to 268 tons, metal content, down about one-fifth from that of 1973. Net imports of ore decreased 19% from 1973 levels, to 1,876 tons in 1974. In 1974, exports exceeded imports by 54 tons for all forms of tungsten, opposite to 1973 when imports of tungsten were 82 tons more than exports.

AB Statsgruvor, operator of the Yxsjöberg mine, was acquired by the state-owned mining company LKAB as of January 1, 1974. The Cemented Carbide Div. of Sandvik AB started a new line at its Coromant factory for producing tungstic oxide from wolframite and scrap-cemented carbide as a way of reducing dependence on scheelite, and increased furnace capacity for making tungstic oxide. At the beginning of the year Sandvik became a majority owner of the new company Seco Tools AB, which also manufactures and sells cemented carbides. Seco Tools was formerly a part of Fagersta AB, which then became a minority owner of the new company.

## NONMETALS [13]

**Cement and Other Construction Materials.**—Production in 1974 was 3.3 million tons, about 13% below the level of the last few years, during which there has been a general declining trend. Exports dropped substantially, by 41% from 1973 to 473,000 tons. Imports remained relatively small at 24,000 tons, 11% below that of 1973. Cementa AB, a division of the Euroc Group, continued as Sweden's sole cement producer.

Gypsum imports declined again, falling 9% to 428,000 tons. The Chemicals Div. of Boliden continued commercial trials on replacement of natural gypsum with by-product gypsum, and began making regular deliveries to the cement industry.

**Feldspar.**—Production came almost completely under State control at yearend 1974 when state-owned LKAB increased its holdings from 67% to 90% in AB Forshammars Bergverk, Sweden's only feldspar producer. In April, a private prospector discovered a large deposit of feldspar at Hällsjön in central Sweden. The deposit was close to the surface and promised to be the largest single deposit in the country. The claim, which contained material suitable for ceramic applications, was under investigation by Statsgruvor.

**Fertilizer Materials.**—Volume of crude

[13] For a review of this commodity area in Sweden see Industrial Minerals, No. 87, December 1974, pp. 7–35.

phosphate imports increased moderately by 11% to 696,000 tons in 1974. Substantial raw material price increases occurred, as value of imports more than tripled compared with 1973. Boliden reported that the price of phosphorous raw materials rose 400%, although the effect of this increase on the company was largely offset by increases in product prices also. Supra AB, a Boliden subsidiary which accounts for virtually all of Sweden's fertilizer production, increased its output by 5% to 1.3 million tons. Because of sharp rises in raw material costs, Supra increased fertilizer prices by 70%; in September prices were frozen by government action. Imports of potassium salts and manufactured fertilizers in 1974 declined less than 1% to 854,000 tons. Exports of phosphate fertilizer rebounded strongly, more than doubling to 173,000 tons.

Production of phosphoric acid by the Chemicals Div. of Boliden increased by 11% to 106,000 tons. Output of the company's new acid plant at Helsingborg increased significantly in spite of continuing operating problems. LKAB planned to make a $38 million installation at Vitåfors near Malmberget to convert apatite separated from iron ore to monoammonium phosphate. The operation would annually yield about 190,000 tons of phosphate from the processing of 250,000 tons of apatite. Apatite concentrate containing 17% phosphorous from the Gränges iron ore mine at Grängesberg is already in use for making fertilizer.

Project engineering continued at Supra on a multination plan for an ammonia plant in Scotland. Supra acquired 50% ownership of Reci Industri AB in Sweden. Reci collects waste oil from which Supra makes ammonia at Kvarntorp. Imports of nitrogenous fertilizers grew 7% to 545,000 tons.

**Fluorine.**—Production of acid and metallurgical-grade fluorspar dropped by nearly 12% in 1974 to 4,000 tons; fluorspar imports fell by about 9% to 14,400 tons. Consumption of selected fluorine materials in 1973, in the basic metal industries, was 11,000 tons of fluorspar and 2,200 tons of hydrofluoric acid, 10% and 20% increases respectively, over those of 1972.

**Sulfur.**—Boliden, which accounts for nearly 90% of Sweden's output, produced 826,000 tons of sulfuric acid in 1974, a negligible increase over 1973. Most of this acid, 663,000 tons, was produced at Helsingborg from pyrites, the balance of 163,000 tons being obtained from smelter gases at Rönnskär. Boliden also manufactured 55,000 tons of liquid sulfur dioxide, 24,500 tons of which came from the Helsingborg plant and 31,000 tons of which were from the Rönnskär smelter. For these materials, origins and amounts obtained were little different than in 1973.

Exports of sulfuric acid dropped precipitously to 73,000 tons, only about one-fourth that of a year earlier. Imports of sulfuric acid decreased 11% to 100,000 tons; however, imports of crude sulfur grew 29% to 130,000 tons.

## MINERAL FUELS

**Energy Balance.**—Hydropower was the only major energy source domestically available in quantity. Some expansion of hydropower is possible, subject however to legislative and environmental constraints. Energy from imported fossil fuels supplied the majority of Sweden's energy demand, as shown in table 5.[14]

[14] The Swedish Institute (Stockholm). Energy Supply in Sweden FS 37, June 1974, 4 pp.

Table 5.—Energy balance in Sweden, 1973

| Energy | Quantity ($10^9$ kilowatt hours) | Percent of grand total |
|---|---|---|
| SUPPLY | | |
| Indigenous energy: | | |
| Hydropower | 70 | 14 |
| Waste | 31 | 6 |
| Wood | 8 | 2 |
| Total | 109 | 22 |
| Imported primary energy: | | |
| Crude oil | 125 | 25 |
| Coal | 8 | 2 |
| Uranium | 7 | 1 |
| Total | 140 | 28 |
| Imported processed energy: | | |
| Electric power | 6 | 1 |
| Gasoline and kerosine | 41 | 8 |
| Fuel oil | 189 | 38 |
| Coke | 12 | 3 |
| Total | 248 | 50 |
| Grand total | 497 | 100 |
| CONSUMPTION | | |
| Utilized: | | |
| Industrial | 131 | 26 |
| Transportation | 13 | 3 |
| Domestic and commercial | 109 | 22 |
| Total | 253 | 51 |
| Exports | 34 | 7 |
| Losses (primary conversion, transmission, end consumption) | 210 | 42 |
| Grand total | 497 | 100 |

**Energy.**—*Electric.*—According to preliminary figures, production of electricity in 1974 totaled 75.13 billion kilowatt-hours, 4% less than in 1973. Of the total production, hydroelectric plants provided 76%, conventional thermoelectric plants 21%, and nuclear powerplants 3%, virtually the same distribution as in 1973. In 1974 SKB continued construction on a 28-megawatt hydroelectric powerstation at Kvarnsveden to be completed in 1975. Total generating capacity installed in Sweden at yearend was 23,842 megavolt amperes, of which 58% was hydroelectric, 37% conventional thermal and 5% nuclear.

Consumption of electricity in 1974 was distributed as follows: Mining, quarrying, and transportation, 51%; households and commerce, 35%; transmission losses 10%; land transport, 3%; and gas, steam, and water supply, 1%. Fuel consumption in generating electricity in 1974 [15] is shown in the following tabulation:

| Energy Source | Amount used, thousand tons oil equivalent |
|---|---|
| Fuel oils | 2,611 |
| Uranium dioxide | 536 |
| Coal | 39 |
| Blast furnace and coke oven gas | 34 |
| Lye | 26 |
| Trash | 22 |
| Wood waste | 20 |
| Gasoline, kerosine, and diesel oil | 3 |
| Total [1] | 3,292 |

[1] Data may not add to total shown because of independent rounding.

*Nuclear.*—Sweden's first nuclear power reactor at Agesta outside Stockholm was closed in July 1974 for economic reasons and not because of lagging interest in nuclear power. On the contrary, nuclear energy

[15] Statistiska Centralbyrån (Stockholm). Elstatistik för År 1974 (Electric Energy Statistics 1974). Statistiska Meddelanden. Nr. I 1975:29, June 9, 1975, p. 3.

research and development continued as a priority item of energy research. Developments in Sweden were even described as possibly leading to fashioning of a complete fuel cycle.[16]

Connection of the second nuclear power unit at Oskarshamn to the national network in October brought the total installed capacity of that station to 1,100 megawatts. Bringing into operation two nuclear units at Ringhals, one a boiling-water reactor by Asea-Atom and the other a pressurized-water reactor by Westinghouse, will raise the country's installed nuclear generating capacity to 2,260 megawatts. Construction underway on two nuclear units at Forsmark will add another 1,800 megawatts. Other units licensed will increase Sweden's nuclear generating capacity to about 5,500 megawatts by 1980. The rate of expansion beyond that depends on parliamentary action.

In February the Swedish Nuclear Fuel Supply Co. signed a uranium enrichment contract with the U.S.S.R.'s Teknabexport. The Soviet Union is to deliver 300 separative work unit (SWU) tons of enriched uranium in 1979 and 1980 from uranium ore to be provided by Sweden, and there is an option for further enrichment services to 1989. Since Sweden has its uranium supply secured until 1996 by agreement with the United States, Soviet enriched uranium constitutes a reserve. Sweden decided against participation in the French-initiated European consortium, which is to construct a gaseous diffusion uranium enrichment plant in France. In December, the Swedish Nuclear Power Inspectorate signed an agreement with the U.S. Nuclear Regulatory Commission for cooperation in regulation of safe operation of nuclear powerplants.

LKB undertook further studies with AB Atomenergi and the State Power Board on extraction of uranium at Ranstad. Production of 1,275 tons of uranium from 6 million tons of shale, beginning in 1980 at the earliest, was to be surveyed. The Atomic Energy Co. began planning a central plant at Studsvik for treatment and storage of low and moderately radioactive waste. The plant is to handle 900 tons of waste per year by burning it and baking the residue into asphalt or concrete blocks for storage in a special guarded building. With commencement of operations in 1976, the plant will be able to handle wastes from hospitals, universities, industry, and nuclear powerplants up to 1980.

**Coal and Coke.**—Imports of solid fuels in 1974 included 1.5 million tons of coal, 1.6 million tons of coke, and 13,000 tons of lignite. Coal, coke, and lignite were all imported in larger quantities than in 1973, the increases amounting to 48%, 7% and 30%, respectively. The decision to proceed with the "Steelworks 80" project of NJA is expected to raise coking coal requirements to 4 million tons per year. It is anticipated that the additional requirements will be met by imports from Poland, the Soviet Union, Australia, and the United States.

The pattern of consumption of purchased coal and coke by mining and primary metal industries in 1974 in tons, was as follows:

| | Coal | Coke |
|---|---|---|
| Iron ore mines | 73,643 | 88,742 |
| Iron and steel works | 224 | 1,694,303 |
| Ferroalloy works | 17,571 | 114,496 |
| Other iron-manufacturing | 16 | 3,354 |
| Nonferrous metal smelters | 61,113 | 2,232 |
| Lime manufacturing | 6,756 | 21,598 |
| Other mines, quarries, etc. | 80 | 6 |
| Total | 159,403 | 1,924,731 |

**Petroleum.**—Sweden, dependent on imported oil and petroleum products for 70% or more of its energy, experienced problems during the fuel crisis of 1973–74 similar to those of other developed nations. A few weeks of gasoline rationing in January 1974, ending with a dramatic increase in gasoline price to spur conservation, was ultimately followed by a marketing price war in the summer. Government actions to combat future crises included joining the International Energy Agency and imposing a surtax on gasoline and fuel oil for 3 years beginning July 1, 1974, to finance a 3-million-cubic-meter stockpile of crude oil.

The partly government-owned prospecting company, Oljeprospektering AB (OPAB), continued seeking oil on Gotland Island and in adjoining Baltic Sea waters, so far without notable success. The possibility of oil finds in the area apparently led to difficulty in setting Continental Shelf boundaries between Sweden and both the Soviet Union and Poland. Petroswede AB,

[16] The Financial Times. Sweden. Growing Opposition to Nuclear Expansion. No. 26,406, July 8, 1974, p. 19.

50% government-owned, made an agreement with Egyptian General Petroleum Corporation for joint exploration in Egypt's Natroun valley.[17]

Trade, refining, and consumption of oil and petroleum products all fell in 1974. Crude oil imports, falling since 1971, declined 5% to 10.05 million tons. For petroleum products, imports at 19.15 million tons were down 3% and exports decreased about 7% to 1.3 million tons. Refinery throughput of crude oil and feedstocks was 11.26 million tons, off 3%. Inland consumption of petroleum products was reported to have dropped 10% as follows, in thousand tons:

| Product | 1973 | 1974 |
|---|---|---|
| Gasoline | 3,163 | 2,912 |
| Kerosine | 138 | 88 |
| Gas/diesel oil | 9,487 | 7,872 |
| Residual fuel oil | 12,314 | 11,541 |
| Other | 1,875 | 1,848 |
| Total | 26,977 | 24,261 |

Source: Organization for Economic Cooperation and Development (Paris). Provisional Oil Statistics by Quarters, 4th Quarter 1974, 21 pp.

Government and industry both showed interest in expanding Sweden's refining capacity above the 20-million-ton-per-year capacity to be reached with completion of the Scanraff project. The Scanraff refinery at Lysekil on the west coast is a joint effort between Texaco Inc. and Oljekonsumenternas Förbund, a Swedish cooperative. This plant represents the largest single U.S. investment in Sweden. The first crude oil cargo was discharged in November 1974. The refinery was designed to process at least 8.3 million tons of crude oil annually, largely to be obtained from the Arabian American Oil Company (Aramco) in the Persian Gulf. The refinery is equipped to produce mainly fuel oils containing not more than 1% sulfur. Desulfurization will result in production of about 50,000 tons per year of byproduct sulfur expected to be consumed mostly within Sweden.

# The Mineral Industry of Taiwan

By K. P. Wang [1]

Taiwan's importation and processing activities in minerals and metals overshadow indigenous extraction. A comparison of output values show that the mineral processing sector outweighed the mining sector by 14 to 1 in 1974. The mineral processing sector accounted for 27% of the 1974 estimated gross national product (GNP) compared with 2% for the mining sector. Breakdown by value of output for specific mineral-related sectors, in million U.S. dollars,[2] is as follows:

| Sector | 1973 | 1974 |
|---|---|---|
| Overall mining | 118 | 288 |
| Coal | 48 | 129 |
| Metals | 18 | 29 |
| Oil and natural gas | 28 | 102 |
| Salt evaporation | 3 | 4 |
| Nonmetals and quarrying | 26 | 24 |
| Manufacturing of mineral and related products | 1,839 | 3,871 |
| Chemical products | 695 | 1,786 |
| Oil and coal products | 411 | 930 |
| Nonmetallic mineral products | 227 | 364 |
| Basic metals | 428 | 651 |
| Metal products | 78 | 140 |

Estimated GNP for 1974 was $14.1 billion at current prices and $8.7 billion at 1971 prices compared with $10.2 billion and $8.6 billion, respectively, for 1973. Industrial production was 30% of the net domestic product and agricultural production 13%. In absolute values, GNP growth was minimal and this was generally true of the mineral and related industries also. Like in many countries, the economic dislocation was great, with overall prices going up about 50% in a year while prices for oil and some other raw materials increased severalfold. Taiwan tried to control inflation, however, by permitting prices to initially rise to high levels and then pegging them at these levels indefinitely. This allowed enterprise to plan ahead while continuing to produce.

Taiwan's relatively meager mineral reserves have been recently reported as follows,[3] in thousands of tons: Coal, 226,000; marble, 300,000; dolomite, 120,000; glass sand, 82,000; asbestos, 80; gold ore, 7,500; copper ore, 16,000; talc, 2,500; pyrites, 1,900; magnetite, 200; manganese, 100; ilmenite, 45; zircon, 25; monazite, 90; and sulfur, 2,500. Natural gas reserves have been estimated at 32 million cubic meters (1.1 billion cubic feet), and proven petroleum reserves onshore, 3.5 million kiloliters (22 million barrels).

Taiwan's major governmental industrial projects were mainly under the Ministry of Economic Affairs (MEA) with some under provincial jurisdiction. There are a number of important government or quasi-government corporations, such as China Petroleum Corp. (CPC), Taiwan Aluminum Corp. (TALCO), China Iron and Steel Corp., Ltd. (China Steel), Taiwan Metal Mining Corp. (TMMC), Taiwan Fertilizer Co. (TFC), and Taiwan Ship-

[1] Supervisory physical scientist, Division of Nonmetallic Minerals.

[2] Where necessary, values have been converted from New Taiwan dollars (NT$) to U.S. dollars at the rate of NT$38=US$1.00.

[3] Far East Economist Review (Hong Kong). Aug. 1, 1975, pp. 34–35.

building Corp. The coal and cement industries have been essentially turned over to private enterprises. Within MEA, there is a Department of Mines, a small organization dealing with policy and administrative matters. The Department of Mines started to look into the matter of expanding the provincial Taiwan Geological Survey into a full-fledged modern Survey under the central government. The Mining Research Service Organization (MRSO) in Taipei and the Metal Industries Research Institute in Kaohsiung are now major components of the newly formed Institute of Industrial Technology aimed at providing technical support to Taiwan's mineral and related industries. MRSO does important work in resource evaluation, mining and beneficiation consultation, and energy investigations.

Despite the oil and economic crises and the nearly zero industrial economic growth in 1974, Taiwan was moving ahead with almost all of its 10 big industrial projects.[4] For fiscal 1975, the Government budgeted $1,255 million out of a total of $2,934 million for these projects. During the first half of 1974, 42 miles of the 235-mile North-South Freeway was completed. Three contracts totaling $167 million were signed in the spring of 1974 for electrification of the west coast mainline railroad from Keelung to Kaohsiung. Construction of the Suao-Hualien railroad through rugged mountains in the east was finally started on Christmas day 1973. Construction began on a new Taipei International Airport near Taoyuan in mid-1974, to be completed in three phases—1980, 1990, and 2000. In a project concerning powerplants, Taiwan will simultaneously work on nuclear, water, and thermal powerplants. Taiwan was moving ahead on developing the petrochemical industry, including building four naphtha crackers. China Steel was working towards implementation of the first phase of its Kaohsiung project calling for 1.5 million tons of crude steel by 1978. A new large shipyard for constructing 450,000-ton tankers ran into trouble, because of the large surplus of tanker capacity worldwide; this project no doubt will be modified. When the first phase of construction is completed in 1976, the new Taichung port is expected to accommodate 3 million tons of shipping per year. The Suao port, auxiliary for Keelung, will be expanded; work in 1974 consisted of dredging to deepen the Suao channel from 6 to 7.5 meters.

Taiwan's output of electric power was about 20.5 billion kilowatt-hours in 1974, 3.5% higher than that of 1973. The bulk of the power was produced by the Taiwan Power Co. (TPC). Taiwan Power's installed capacity was 4.1 million kilowatts in April 1974, and about 4.7 million kilowatts at yearend 1974. Projects underway would increase capacity further to about 6.5 million kilowatts by yearend 1976.

As of April 1974, Taiwan's 29 hydroelectric plants had a combined capacity of nearly 1.2 million kilowatts. A long-term project at Sun Moon Lake would add nearly 1.5 million kilowatts. By yearend, Tachia River in central Taiwan was expected to have the following capacity: The already installed 360,000-kilowatt Chingshan plant (Taiwan's largest); the 234,000-kilowatt Techi plant; the 180,000-kilowatt Kukuan plant; and the 79,000-kilowatt Tienlun plant. A 1.85-million-kilowatt thermal plant at Taling near Kaohsiung is to be completed in mid-1975. Construction of the first nuclear plant was well underway in northern Taiwan; startup of one unit of 636,000 kilowatts was expected by October 1976. All told, Taiwan hopes to have 7.8 million kilowatts (eight generators at three plants) of nuclear capacity by 1985. In view of the difficulties encountered by nuclear plants worldwide, however, plans could very well be delayed or modified.

Taiwan's industries consumed 13.75 billion kilowatt-hours of electricity in 1974, including 6.6 billion kilowatt-hours in the minerals and related fields. Estimated breakdown within the minerals and related industries was as follows, in million kilowatt-hours: Iron and steel, 1,387; basic industrial chemicals, 1,132; cement, 762; chemical fertilizers, 536; aluminum, 352; other chemical products, 1,645; mining and quarrying, 317; metal products, 325; and ceramics, 150.

## PRODUCTION

Coal output declined another 12%, whereas crude oil and natural gas gained 25% and 9%, respectively. Neither oil nor gas production was of consequence by

[4] China Publishing Co. Taiwan's Ten Big Projects. July 1974, pp. 1–24.

world standards, but the latter was important to the domestic economy. The real significance of oil was in the production and consumption of refinery products derived from imported crude, which far overshadowed domestic crude in overall oil supply. Overall production of petroleum products declined somewhat.

Steel ingot output increased by 12%. Aluminum production showed a drop of 11% because of electric power and high raw material cost difficulties, among other things. Mine copper output showed little change, but refined copper output increased 48% with the expansion of the refinery.

Overall output in chemical fertilizers showed a great change with rises in some items and declines in others. Salt production declined slightly, but a new plant was brought in. Increased domestic demand for cement absorbed the 4% growth in output. The marble industry was running into difficulties, because of the need to further modernize.

1 From Chinkuashih only.
2 Only reported volumetrically at 378,076 cubic meters.
3 Excludes sulfur produced by oil refineries.
4 Mainly processed into natural gas liquids.

## TRADE

Taiwan's trade continued at high levels, despite severe economic difficulties during 1974. Taiwan fared better than most of the other 20 major world trading nations. Two-way trade reached $12.61 billion up more than 50% from the previous year. Exports increased from $4.48 billion in 1973 to $5.64 billion in 1974 and imports increased from $3.79 billion to $6.97 billion. Measured in real terms (comparable 1973 prices), however, imports and exports both declined slightly. The largest import items were general machinery, petroleum products, electrical machinery, iron and steel products, transportation equipment, and chemicals and fertilizers. Industrial products represented 85% of all exports. Textiles with electrical machinery, wood products, general machinery, and metal products lead the way in that order. Japan and the United States remained the leading trading partners.

In 1974 mineral and metal products represented 3% to 4% of all exports and possibly 15% of all imports, reflecting Taiwan's reliance on imported raw materials and semimanufactures. During the year, mineral exports increased to possibly $250 million, mainly on account of increased exports of metal products. Mineral imports showed a twofold gain in value (about $1.81 billion in 1974), accountable mainly by higher prices, a one-third tonnage increase in iron and steel imports, and a more than doubling in the volume of petroleum imports. Table 2 shows the principal mineral categories traded during the last 3 years and table 3 indicates specifically the tonnage and value of major mineral products imported in 1974.

[5] Included in coal, all grades.

## COMMODITY REVIEW

### METALS

**Aluminum.**—The government-owned TALCO remained the sole producer of primary aluminum, with little prospect of other producers coming into being in the foreseeable future. Its chemical and reduction facilities at Kaohsiung, rated at 76,000 tons per year of alumina and 38,000 tons per year of aluminum, encountered numerous difficulties during 1974, including power shortages, a nearly doubling of costs and prices, and difficult economic conditions in general. These factors caused a decline in output, a reversal from profit to loss, price disadvantages when compared with imported aluminum, and a slowdown of an expansion program already underway. With the help of the French company Péchiney, the plan was to raise capacity to 140,000 tons of alumina and 70,000 tons of aluminum near the beginning of 1976.

In 1974, Taiwan produced 31,320 tons of primary aluminum ingot (down 3,791 tons from 1973), approximately 3,000 tons of secondary aluminum, 16,426 tons of aluminum sheets, 23,681 tons of aluminum products, and 1,944 tons of aluminum foil. All of the primary aluminum, the bulk of the sheets and plates, all of the foil, and a minor part of the products were produced by TALCO. To improve its financial position, TALCO was considering branching more into fabricated products. In 1974, two small private firms—China Wire & Cable Co. and Walsin Electric Wire & Cable Co.—produced the entire tonnage of secondary aluminum and the bulk of the extrusions, cables and wires, and castings.

Taiwan's 1974 aluminum consumption was estimated at about 60,000 tons, up possibly 20% over that of 1973. Output of products was close to 45,000 tons during the year, and imports during the first half of 1974 exceeded exports by about 9,000 tons. One reason for the high imports was that large tonnages of ingots were purchased, because foreign aluminum was considerably lower in price than Taiwan's quotation of about $0.56 per pound late in 1974. TALCO officials believe that aluminum consumption will continue to grow in areas like building and construction, transportation, electrical goods, containers and packaging, consumer durables, and machinery and equipment.

As usual, Taiwan imported all its bauxite requirements (the island consumed about 125,000 tons in 1974), mainly from two adjoining mines in Johore, Malaysia, and from Australia. The bauxite was converted to alumina, requiring about 16,000 to 18,000 tons of caustic soda. There was no serious effort to consider importing alumina in lieu of bauxite. Power shortages and high power costs have become critical factors in making plans, even though electricity consumption has been cut to about 16,000 kilowatt-hours per ton of aluminum.

**Copper.**—The government-owned TM-MC continued to control most of the copper business in Taiwan. The Chinkwashih mine near Keelung was clearly showing signs of age, with mine copper output declining to about the 2,000-ton per year level. More cement copper was produced, as a result of the introduction of a bacteria-leaching process. Chinkwashih's copper concentrate is only 15% to 20% copper and high in arsenic. Taiwan had trouble selling this to Japanese smelters, and started to refine the concentrate in a newly completed 10,000-ton smelter near the mine site. This smelter, built with some informal Japanese help, may eventually be expanded to 30,000 tons. Even in 1974, most copper raw materials (mainly concentrate and cement copper) came from abroad—mainly from the Philippines and Mexico. Chinkwashih's production of its own byproduct gold increased slightly, because of the rise in world gold prices. Additional gold was derived from imported copper materials. Taiwan's total output of refined copper reached 9,859 tons in 1974, 3,210 tons higher than in 1973.

Copper requirements in Taiwan have been increasing at about 15% yearly. In 1973, Taiwan imported more than 14,000 tons of refined copper and 10,000 tons of copper products. Most likely, imports of these two items were of the same magnitude in 1974; in addition, 6,000 to 8,000 tons of mine copper (copper-in concentrates and matte) were imported to feed the new smelter. Rolling and fabrication facilities are mainly in private hands; one important product is cable and wire which also happen to be significant in exports.

**Iron and Steel.**—Construction of China Steel's integrated steelworks at Kaohsiung

moved ahead towards scheduled completion by early 1978. The USS Engineers and Consultants Inc., a subsidiary of United States Steel Corp., provided technical services and supervision in construction and will eventually also give guidance in the operation of the steelworks during at least the initial stages. USS Engineers had taken over from Vöest Steel Corp. of Austria. By mid-1974, the cost of the project was estimated at $665 million, already more than double the original estimate. In view of continued spiraling costs, the project most likely will top $1 billion before it is completed. China Steel is a quasi-government corporation with 55% of the capital from private investors. A significant part of the funding will come from domestic and foreign loans. Capacity will be 1.5 million tons when production begins in 1978, which could be increased to 6 million tons subsequently. Initial facilities will include: Coke and sinter plants; blast furnace and basic oxygen steel production facilities; continuous casters for the production of billets and slabs; plate and rod and bar mills; plus processing, warehousing, and shipping facilities. The Retired Servicemen's Engineering Agency has been awarded a $4 million contract to build two wharves for the steelworks. By 1978, the steelworks is expected to produce 150,000 tons of pig iron, 245,000 tons of steel ingot, 400,000 tons of steel plate, 300,000 tons of steel wire, and 300,000 tons of steel rods. USS Engineers will be responsible for training both at the plant site and the United States. When the steelworks is in operation, almost all of the iron ore and most of the coking coal will be imported from Australia and elsewhere.

Although Taiwan has produced from 110,000 to 150,000 tons of pig iron annually in recent years, its output of steel products has been closer to 1.5 million tons. Iron ore consumption is relatively small, whereas domestic and imported industrial scrap and ship scrap are the principal iron raw materials. The island's ship scrapping industry is big by world standards. All types of old ships ("live" or "dead") are brought in for scrapping, with special materials, such as, engines, instruments, and equipment salvaged first before cutting up the ships. During 1972–74, an annual average of 1.2 million light displacement tons of imported ships (numbering more than 200) was scrapped and an annual average of possibly 700,000 tons of scrap was imported for consumption.

Local steel product output falls far short of demand, which explains why the decision has been made to build the new steelworks. Imports of iron and steel, including scrap, has risen from 1.50 million tons in 1972 to 1.95 million tons in 1973 (includes 716,000 tons of scrap) and 2.58 million tons in 1974. Because of greatly increased prices, value of steel imports increased from NT$6.9 million in 1972 to NT$11.3 billion in 1973 and NT$24.0 billion in 1974.

Taiwan Iron Manufacturing Corp. and Tang Eng Iron Works led the field of about 160 small steel mills which produce mainly rod and bar, structural sections, and tubes and pipes, in that order. With China Steel getting into the business, Tang Eng Iron Works is shifting into high-priced alloy steels with installation of two new 30-ton electric furnaces. Tang Eng is also looking into a "Midrex" 400,000-ton-per-year direct reduction plant, hoping to use local natural gas.

**Other Metals.**—In 1974, Taiwan produced about 22,900 troy ounces of gold and 32,800 troy ounces of silver. Gold output was slightly higher than the 1973 production, but silver output dropped to not much more than a third of the previous year's level. The Tai Yang Mining Co., with possibly 2 million tons of ore and 300,000 ounces of recoverable gold located at Juifang near Keelung, was about to resume mining under high-price conditions.

Taiwan does not produce any primary zinc, lead, tin, and nickel but consumes sizable tonnages. In 1974, 22,277 tons of unwrought zinc valued at NT$650 million were imported, including 11,313 tons from Argentina, 4,562 tons from Canada, and 2,453 tons from Japan. In addition, 1,446 tons of scrap zinc were also imported, mainly from the United States. Unwrought lead imports totaled 4,384 tons valued at NT$113 million, including 3,229 tons from Australia; scrap lead imports amounted to 3,350 tons valued at NT$25 million, including 1,983 tons from the United States. Tin imports totaled 706 tons (1,250 tons in 1973) valued at NT$173 million, including 583 tons from Malaysia. Nickel imports totaled 1,601 tons (1,748 tons in 1973) valued at NT$218 million, including 702 tons from Canada, 422 tons from

the United States, and 388 tons from Norway. During 1974, Taiwan produced 27,726 tons of galvanized sheet, 42,528 tons of galvanized wire, and 17,621 tons of tin plate.

## NONMETALS

**Cement.**—Taiwan cement output gained 4% over that of 1973 and established a record production of 6,171,366 tons in 1974. However, exports continued to decline from 1,081,000 tons in 1972 to 544,000 tons in 1973 and 346,000 tons in 1974. Hong Kong and Indonesia were the major destinations, with the South Vietnam market virtually eliminated. Prospects for long-term exports were not bright; however, domestic demand continued to rise. Taiwan's cement capacity was about 8 million tons in 1974 and was scheduled to be raised to 11 million tons after 1976. Taiwan has abundant limestone, but western reserves are being exhausted, and huge eastern reserves necessitate construction of new plants near these resources. Taiwan may need 130,000 tons of gypsum per year for cement manufacture, and peak production has been less than one-tenth of this; Mexico has been the leading gypsum supplier to the island.

Taiwan Cement Corp. (TCC), a former government firm turned private, remained by far the largest of the 12 cement companies on the island. Its yearend 1974 capacity of about 3 million tons was in the process of being expanded to 3.8 million tons by mid-1975. TCC has four plants—one each at Kaohsiung, Chutung, Suao, and Hualien. A 200,000-ton kiln at Suao was being replaced by a 500,000-ton unit and a 300,000-ton kiln at Kaohsiung was being replaced by an 800,000-ton unit. Most TCC kilns are of the suspension preheater type and consume coal. Affiliated companies produce cement products, and the Kaohsiung machinery plant makes the equipment needed by TCC. TCC had a good year in 1973, with sales of more than $68 million. Increased sales in 1974 only reflected higher prices. With the spiraling of energy costs, profit margins were drastically cut.

Asia Cement Corp., with a 1.7-million-ton plant at Tahu near Hsinchu, ranked next to TCC; the firm was scheduled to add an 800,000-ton facility by August 1975. During the year, the Chengtai Cement Co. was building a 1,000-ton-per-day four-stage suspension preheater kiln at the Panpingshan plant near Kaohsiung. Both the Chiahsin Cement Co. and the Universal Cement Co. started to build 500,000-ton kilns. A new company—Rebar Cement Co.—made plans to complete an 800,000-ton facility at Suao by 1976.

**Fertilizer Materials.**—The government-owned Taiwan Fertilizer Co. (TFC), the largest of Taiwan's three nitrogen producers, operated four ammonia fertilizer plants with a combined primary capacity of about 390,000 tons per year $NH_3$. TFC will spend $92.7 million to expand facilities.[5] A $73.5 million unit at Miaoli will turn out 186,000 tons per year of urea and 300,000 tons per year of liquid ammonia, with onstream target of July 1977; M. W. Kellogg Co. is the design engineer, and the Export-Import Bank and Chase Manhattan Bank have approved $28 million and $14 million loans, respectively, for the project. At Nankang, TFC will spend $4 million to convert a 54,000-ton-per-year ammonia plant to natural gas use by yearend 1975. Also, at Nankang, a $2 million, 200,000-ton-per-year mixed fertilizer plant is scheduled to be completed at yearend 1975. In the northern part of the country, at Hsinchu, a $13 million, 10,000-ton-per-year melamine plant is expected onstream in mid-1977. TFC already has a 100,000-ton-per-year mixed fertilizer plant at Kaohsiung and was considering building another 350,000 ton-per-year mixed fertilizer plant "in the center of the country" for completion by 1980. The Kaohsiung Ammonium Sulphate Corp. and CPC were the other firms engaged in nitrogen production. CPC has a joint-venture plan with Saudi Arabia to build a large ammonia-urea complex in connection with petrochemicals.

TPC has a phosphoric acid plant in Kaohsiung. However, the China Phosphates Industries Corp., a government enterprise, will be a new source for phosphates when its facility costing $44.5 million is completed in 1976. China Phosphate's goal is to produce 100 tons per day of phosphoric acid, 400 tons per day of sulfuric acid, 90 tons per day of calcium phosphate, 70 tons per day of sodium phosphate, and 400 tons per day of by-product gypsum. Local sulfur might be available from petroleum refineries, but phosphate rock must continue to be imported. During 1974 Taiwan imported 251,340 tons of phosphate rock (139,947

[5] Chemical Week (New York). V. 116, No. 16, Apr. 16, 1975, p. 21.

tons in 1973), mainly from the United States and Jordan.

In 1974 Taiwan produced 481,580 tons of ammonium sulfate (capacity 600,000 tons), 177,530 tons of urea (capacity 300,000 tons), 349,232 tons of anhydrous ammonium, 234,250 tons of calcium superphosphate (capacity 250,000 tons), and 189,764 tons of compound fertilizers (capacity 250,000 tons). The nitrogen comes from the air, but Taiwan virtually has no potash for making compound fertilizers. The Chinese are trying to use as much local natural gas and imported oil as possible to make nitrogenous fertilizers.

**Salt.**—Taiwan's salt output declined from 380,522 tons in 1973 to 362,809 tons in 1974. Consumption continued to increase, mainly in the soda-chlorine industry which produced 89,656 tons of caustic soda (86,583 tons in 1973), 196,426 tons of "liquid soda" (185,584 tons in 1973), and 59,712 tons of soda ash (53,979 tons in 1973). Salt imports reached an unprecedented 509,312 tons, including 455,555 tons from Australia. A $23 million, 100,000-ton-per-year ion-exchange membrane salt plant, furnished by the Japanese firms Marubeni Corporation and Asahi Chemical Industry Co., Ltd. aimed at relieving the salt shortage, was completed near yearend 1974 at Miaoli. The island's salt is all produced by Taiwan Salt Works, a government monopoly.

**Stone.**—*Marble.*—Taiwan's relatively new marble industry, located on the east coast near Hualien, is run mainly by the Retired Servicemen's Engineering Agency. Output reached a peak of 398,558 cubic meters in 1973 but declined to 378,076 cubic meters in 1974. Marble producers were asking for government assistance to modernize near yearend because existing quarrying machinery is outdated. Taiwan's marble reserves are extensive (possibly 300 million tons) and good in quality and variety. Future growth will be in structural marbles, but marble craft was the mainstay of the business in the early development stages. Exports have been increasingly important, mainly to Australia and the United States.

**Other Nonmetals.**—Taiwan's elemental sulfur production was reported at only 3,310 tons compared with 208,848 tons of imports in 1974 (121,917 tons in 1973). However, the quantity of sulfur or sulfuric acid recovered from oil refining is not known but is probably large. Pyrite production, mainly from the Chinkwashih copper mine, was just above 10,000 tons in 1974 or a third of the output in 1972. Talc output declined to 13,517 tons, or to just above half the 1973 level. Most of Taiwan's asbestos requirements are met by imports, primarily from the Republic of South Africa. More than 120,000 tons of dolomite was produced in 1974. Clays were both exported and imported. Taiwan relied totally on imports for mica, graphite, abrasives, and fluorspar. Taiwan Alkali Corp.'s (subsidiary of CPC) 30,000-ton-per-year titania plant was completed in July; it can meet domestic requirements and provide sizable tonnage for export. In 1973 Taiwan produced no titania and imported more than 8,000 tons.

## MINERAL FUELS

**Coal.**—Production continued to decline from 3.913 million tons in 1972 to 3.327 million tons in 1973 and 2.934 million tons in 1974 despite a 1.5-US cents-per-cubic-meter tax on natural gas to subsidize the coal industry. The decrease in 1974 was due in part to sluggish markets and imports of sizable quantities of coal in 1973 to guard against a possible fuel shortage. Meanwhile, coal consumers were converting to other fuels during the period before the oil crisis. Hopefully, coal production will be stabilized at 3 million to 3.5 million tons per year. Wholesale coal prices reached about $30 per ton at yearend 1974, which was low compared with some foreign coals. Basically, the coal industry in Taiwan continued to suffer from resource limitations. As stated, when the new steelworks comes into being, most of the coking coal needed will have to be imported.

**Petroleum.**—Output of indigenous crude oil increased nearly 25%, but this still represented less than 2% of all oil imports. During 1974, Taiwan imported 13.740 million tons of crude oil (to convert to barrels, multiply by roughly 7.3) and 1.981 million tons of refined oil products consisting predominantly of fuel oil (to convert to barrels, multiply by roughly 6.7). Crude oil imports in 1974 were valued at about NT$27.26 billion, and refined oil imports at NT$5.08 billion. In 1973, crude oil imports were only 5.447 million tons valued at NT$5.42 billion.

The severalfold increase in unit price is readily apparent. However, the jump in volume of imports does not mean that consumption rose very sharply but rather that abnormally small amounts were imported in 1973 because in 1972 there was a large imported surplus. Actual consumption in 1973–74 was probably closer to average imports for those 2 years. Taiwan's oil consumption has been rising at a rate of 10% to 15% per year. Most of the crude came from the Middle East, dominated by Saudi Arabia and Kuwait. Kuwait and secondarily Bahrain and Japan were the major suppliers of refined petroleum to Taiwan. The economic relationship with Saudi Arabia has been strengthened since the beginning of the oil crisis. A communique announced early in 1974 indicated that Taiwan and Saudi Arabia would consider joint ventures for building an oil refinery, methyl plant, and urea plant within Taiwan; and Taiwan would furnish technical aid in agriculture, fisheries, powerplant management, and rural electrification within Saudi Arabia.

Taiwan's economy is greatly affected by oil.[6] The island derives 75% of its energy from petroleum, and two of its most important industries—textiles and plastics—depend on it for most of the necessary raw materials. The small petrochemical industry is growing rapidly to supply the intermediates for making plastics and man-made fibers. The company with the primary responsibility of keeping Taiwan's lights burning, its transportation moving, and its factories working is the CPC, a state-owned integrated company that dominates Taiwan's oil and gas economy from the well and tanker to the gas pump. CPC already has six 100,000 deadweight-ton tankers, two buoys (a third buoy for handling 250,000-deadweight-ton tankers is under construction), and 2.5 million hectoliters of storage capacity. With the completion of a new 1 million-hectoliter tank farm, CPC will be able to maintain a 3-month oil reserve for the island.

CPC's total refining capacity, embodied mainly in the Kaohsiung refinery, was about 230,000 barrels per day at yearend 1974 (to convert barrels per day to metric tons per year, multiply by 50). To supply a major petrochemical complex in Kaohsiung, construction of another large refinery was being considered. The company supplies fuel oil to drive the generators of TPC and retails gasoline through a network of more than 250 filling stations plus facilities at airports and harbors.

To supply the petrochemical industry, CPC's first naphtha cracker, with an annual capacity of 54,000 tons of ethylene and 27,000 tons of propylene, has been in operation for 6 years. The second cracker, to be completed in the spring of 1975, will supply 230,000 tons of ethylene, 115,000 tons of propylene, and 35,000 tons of butadiene yearly. Preliminary work on a third and much larger cracker (920,000 tons of ethylene, etc.) has started, but a drop in demand for petrochemicals brought about by the current economic slump will probably cause a considerable delay in construction. Expansion in petrochemicals has made it necessary for CPC to increase its capitalization from $125 million to $210 million. The crackers will supply existing downstream petrochemical plants as well as various planned projects to be built around the crackers with domestic and foreign private capital. There will be at least 20 new downstream projects to produce intermediates like polypropylene (PP), vinyl chloride monomer (VCM), polyethylene (PE), ethylene glycol (EG), styrene, dimethyl terephthalate (DMT), synthetic butadiene rubber (SBR), and acrylonnitrile, etc.

Foreign oil may cost Taiwan nearly $1 billion annually in the near future. To keep expenditures down, Taiwan was shifting some purchases from international oil firms to direct deals with governments of producing nations. CPC was also trying to shift some purchases from the Middle East to places like Indonesia and Brunei. Taiwan was also searching for oil offshore. Little oil has been found onshore, but much natural gas has been found and output reached 1,587 million cubic meters in 1974. CPC plans to spend about $100 million in the next 4 years for exploration—more than half offshore and some in the Philippines and elsewhere.

Six American oil companies are involved in the search for oil offshore. Each has been granted a concession by CPC, which retains a seventh zone for itself. The total area involved is 240,000 square kilometers in the Taiwan Straits, East China Sea, and the Yellow Sea. In the

[6] Modern Asia (Hong Kong). Taiwan Copes With the Oil Crunch. V. 9, No. 2, March 1975, pp. 49–52.

southernmost zone the American Oil Co.–Continental Oil Co. (AMOCO-CONOCO) concession, gas was found at 13,000 feet from one well. CPC would have 25% interest in this and could acquire another 25%. However, it takes 4 or 5 wells to delineate the field and 10 to 20 wells to make the field pay. It costs about $5 million per well, so the future is still most uncertain. Besides, especially for the northern concessions, international jurisdictional problems compound the difficulties. AMOCO began to drill another well (the third, the first being dry) but other concessionaries were taking a wait-and-see attitude.

# The Mineral Industry of Thailand

By David G. Willard [1]

Thailand's mineral industry experienced a relatively prosperous year in 1974, as did the country's economy as a whole; but the future prospects for mineral investment were clouded by the political instability that has affected the business climate since the Kittikachorn Government was overthrown late in 1973. Although physical output of minerals showed mixed results compared with 1973 levels, sharply higher prices boosted the total value of production by 45%. Mineral trade likewise changed little in volume, but total values of mineral exports and imports were up 32% and 55%, respectively.

The most significant event in Thailand's mining industry was the cancellation of tin-mining concessions owned jointly by an American and a Netherlands firm. A large Thai zinc mine was activated with production of approximately 143,000 tons of ore valued at about $8 million during 1974, the first year of operation.

Economic growth slipped to a rate of 3.4% for the year (after adjustment for the effects of price changes) which is considerably below the 13.1% growth rate between 1972 and 1973. However, good agricultural production and a record balance of payments surplus estimated at $400 million [2] contributed to a fairly satisfactory overall financial picture. The rapid rise in prices proved to be a double edged influence, increasing the value of the country's exports of agricultural and mineral products but also raising the cost of its imports, particularly in the case of petroleum products. Other sources of income, chiefly oil concession payments and other transfers and net capital inflow, overcame the deficit on commodity trade. Economic prospects for 1975 are less encouraging. A likely decline in prices for Thailand's commodity exports, continued high petroleum costs, and some reduction in capital inflow and other monetary transfers (including the phasing out of U.S. military activity in the country), all point to a likely balance of payments deficit for 1975. Considering the country's adequate international reserves, however, these need not lead to a serious decline in economic growth.[3]

**Government Policies and Programs.**—Political instability remained the country's number one problem as a badly fragmented parliament provided very little guidance for the Ku rit Government which took office in the spring of 1975. Throughout 1974 the Thai caretaker administration of Prime Minister Sanya Dhammaskti was unable to give a clear indication of future government policy directions. A growing economic nationalism which contributed to the cancellation of tin mining concessions, partly owned by a U.S. company, added a further element of uncertainty.

The tin mining concessions of Thailand Exploration & Mining Co. (TEMCO), jointly owned by Union Carbide Corp. and Royal Dutch Petroleum (Shell) were cancelled by the administration of Prime Minister Seni Pramoj. No other foreign mining concessions were being threatened with revocation.

Controversy over the TEMCO concession stemmed from charges that it was illegally purchased in 1970 from a Thai company whose owners included members of the Thanon-Prapas military government, which was overthrown in 1973. Intense political pressures were mounted against

[1] Economist, Division of Nonmetallic Minerals.

[2] Where necessary, values have been converted from Thai baht (B) to U.S. dollars at the rate B20.375 = U.S.$1.00.

[3] U.S. Embassy, Bangkok, Thailand. State Department Airgram A–111, Apr. 11, 1975.

the concession by students, members of the press, and local government officials and were thought to have pushed the administration into its decision. The owners were considering legal action but were attempting first to arrive at a negotiated settlement. A State mining enterprise was formed to take over the mining operation, and the Government had not yet made any mention of compensation.[4]

The Thailand Smelting and Refining Co., another subsidiary of the same two owners, and operator of the country's lone tin smelter, had not yet been brought into the controversy; nor had a similar attack been mounted against other foreign mining concessions. However, the TEMCO case increased the uncertainty felt by many investors which had already developed during the preceding period of political instability.

Important mineral discoveries reported during the year included five more (for a total of seven) successful oil or gas wells in the Gulf of Thailand and onshore and offshore tin deposits in the Ranong, Phuket, and Yala areas. Possibly more important in the long run were exploration programs to delineate large deposits of potash located in northeast Thailand and extending into Laos, which could help to relieve the shortage of low-cost fertilizer that perenially plagues the country's farmers. However, development of this resource lies some years in the future even if it proves feasible.

A survey report by Underwood, McLellan and Associates, Ltd., to the Thai Government recommended additional public funding for mineral exploration in northern Thailand. The Canadian International Development Agency, sponsor of the study, said that investigations in that area should be expanded to include commodities other than tin and fluorite, the ones on which most previous interest had been focused. Other minerals mentioned as having possibilities for additional development included antimony, lead, manganese, phosphate, and potash.[5]

A $75 million loan for a hydroelectric powerplant was negotiated by the Government of Thailand with the World Bank in April 1974. The loan would pay for 41% of the estimated $181 million cost of the Ban Chao Nen project. Another $45 million was expected to be provided by Japan's Overseas Economic Cooperation Fund. The project, which will be owned by the Electricity Generating Authority of Thailand, includes the dam, a powerplant, and transmission lines serving several parts of the country.[6] Another potential future power development was the Ao Phai nuclear powerplant, a 650-megawatt unit proposed for Chon Buri Province. Initial service was expected to begin in 1981; however, the country's political and economic difficulties appeared to have caused a setback in the planned mid-1974 start of construction.[7]

## PRODUCTION

Production of Thailand's leading minerals showed a mixed record of increases and decreases in 1974. Fluorspar and cement production were both higher than in 1973, while lower output levels were recorded for tin and tungsten. A newly opened zinc mine moved that commodity into the ranks of the country's leading minerals.

Considerably higher prices accounted for most of an estimated 45% increase in the total value of crude mineral production. Estimated total value was $320 million in 1974 and $220 million in 1973. Major contributors to the gain were antimony, tin, tungsten, and zinc—in most cases entirely the result of higher prices—and smaller increments were provided by barite, cement, fluorspar, and feldspar.

Thailand's petroleum refineries produced 13% fewer barrels of refined products in 1974, and the drastic rise in crude oil costs reduced the total value of refinery output below that of the previous year.

## TRADE

The trade gap that has been a consistent problem of Thailand's economy grew much wider in 1974. Total exports fell short of total imports by 21%. The trade gap increased by 37% to about $200 million due mainly to growth in the total volume of trade. The largest gap continued to be in trade with Japan, the country's principal trading partner, in which imports exceeded exports by about 17%. However, the greatest widening of the gap occurred in trade with the United States. Exports to the United States rose approximately 22% but imports were up nearly 45%, and the difference between the two increased by 75%. The United States purchased 8% of Thailand's exports and was the supplier of 13% of its imports.[8]

Tin remained Thailand's chief source of mineral income, accounting for 7% of the total value of exports. Other principal mineral exports were precious stones, cement, tungsten, petroleum refinery products, and fluorite. All of these, except petroleum refinery products, showed increases in export value from 1973 to 1974.

[8] Country figures based on data for 10 months.

Crude petroleum imports led by a wide margin as the country's chief mineral import expenditure. In 1974 the cost was nearly triple that of 1973 and was the principal cause of the enlarged trade deficit. Other leading mineral imports, for which the country spent appreciably more in 1974, were iron and steel, refinery products, fertilizers and pesticides, and other base metals.[9]

## COMMODITY REVIEW

### METALS

**Iron and Steel.**—Production of iron ore in Thailand in 1974 remained at the 1973 level of 36,000 tons, an improvement over the recent low of 22,000 tons in 1970 but far below the peak years of the mid-1960's when production exceeded 700,000 tons. Imports of iron and steel scrap, pig iron, and semimanufactures continued to climb rapidly in 1973, reaching about 1,057,000 tons, an 18% increase over the 895,000 tons imported in 1972; about 184,000 tons, or 17% of the 1973 total, came from the United States. Preliminary figures for 1974 indicated a 12% decrease in imports to about 932,000 tons, and a continuation of the steeply rising price trend.

Production of pig iron, crude steel, and steel billets in the country increased 11% from 306,000 tons in 1973 to 338,000 tons in 1974. Since most steel production is consumed domestically, exports of steel products were relatively small.

A project to build an integrated steelworks in Thailand was postponed late in 1974, nominally on account of the current labor unrest. The Thai Government, four Japanese steel companies—Nippon Steel Corp., Nippon Kokan KK, Kawasaki Steel Corp., and Sumitomo Metal Industries, Ltd., and four Japanese trading companies—Mitsui & Co., Mitsubishi Corp., C. Itoh & Co., and Marubeni-Iida Co. Ltd.—had planned the complex which was to include a steel mill along with hot-rolled and cold-rolled sheet mills. Another likely reason for the postponement was a Japanese Government policy aimed at slowing down Japanese overseas investment. Without an export market the project would only have added to the local steel industry's excess capacity problem.[10]

The United States quota on scrap iron exports to Thailand was increased in the first quarter of 1974 to provide some relief to Thai producers who had been forced to reduce production because of a worldwide steel scrap shortage. However, escalating production costs, a work stoppage by construction contractors, and a restriction on exports of steel bars imposed by the Thai Ministry of Commerce caused a further production cutback. As a result, most of the additional quota was not utilized.[11]

**Lead.**—Lead ore production in 1974, at 3,600 tons, declined again following an unusually high output of 8,700 tons in 1973. Lead content of the ore averaged 43% both years.

**Tin.**—Tin remained Thailand's most valuable mineral product topping its nearest rival, cement, by a margin of almost 2 to 1 in value. Output of tin concentrate, assaying an average of 73.2%, declined slightly in 1974 to 27,332 long tons, down 3% from the 28,114 long tons produced in 1973. Tin metal production decreased 14% to 19,514 tons. Soaring tin prices increased the total value of tin concentrate to $156 million, 70% above the $92 million received for the commodity in 1973. Exports of tin metal were off 14% to 19,161 long tons in 1974 from 22,313 long tons in 1973, but exported tin values climbed approximately 50% above 1973 reaching $147 million. Sales of tin metal to the United States declined significantly for the second straight year to 5,239 long tons from 7,260 long tons in 1973, a drop of 28%, but higher prices caused the export value to rise to $38.3 million, 19% more than the $32.1 million sold to this country in 1973. Shipments of 30,361 long tons from the U.S. stockpile contributed to this decline and filled most of the gap between world production and demand and may have contributed to the eventual moderation of the price spiral.

A total of 669 mines operated in 1974, slightly more than in the previous year. Included were 24 dredges, 278 gravel pump mines, 12 hydraulic mines, 108 ground sluicing operations, 211 tin-tungsten mines, and 36 miscellaneous operations. Total employment averaged about 37,000, a bit less than the 38,000 employed in 1973 (a typographical error caused the figure 3,800 to be reported in the 1973 Minerals Yearbook).[12]

Production remained below average during the early part of 1974 due to a shortage of diesel oil stemming from the worldwide

petroleum crisis. Mining operations thereafter returned to a normal level until the onset of the TEMCO controversy in the fall, which brought operation of the company's large dredge at Phangnga to a stop pending its resolution.

World prices for tin metal peaked in mid-1974 and descended during the second half of the year but by yearend were still above their levels at the end of 1973. The price at New York, N.Y., rose to $4.63 per pound in June and finished the year at $3.52 per pound while the export price f.o.b., Bangkok, reached $4.02 per pound in May and then descended to $2.71 per pound in December.[13] The continued gap between world production and consumption of tin, the near depletion of the International Tin Council's buffer stock, the worldwide inflation and unstable currency exchange ratios, all of which added further fuel to the fires of speculation, were the principal reasons for the record-breaking price rise.

Discovery of a new alluvial tin deposit off the west coast of Thailand was announced by Leighton Mining N.L. The discovery was made in a 90,000-acre offshore concession area between Ranong and Phuket which Leighton is exploring in a joint venture with Boonsoong Tin Dredging Co. Preliminary estimates put the deposit at 40 million cubic yards grading 0.34 pound of cassiterite per yard. No decision on mining had been made pending completion of the exploration program.[14]

A favorable report also was made by Canadian-Siam Resources on drilling results from their lease in Yala Province. Assays from nine drill holes led to an estimate of 400,000 tons of recoverable tin ore.[15]

**Tungsten.**—Production of tungsten underwent another sharp drop in 1974, declining by 15% to 4,276 tons from 5,048 tons in 1973. Nonetheless, Thailand still produced about 6% of the world total. The average value per ton rose from $3.05 to $5.47 boosting the total value to $23.4 million from $15.4 million in 1973, a gain of 52%. All production is exported.

Tungsten mining continued to be carried out mainly by small operators. Despite the smaller output in 1974, both the number of mines and the number of employees were approximately double those of 1973. An average of 18 mines employing 1,300 miners were active in 1974 as compared with 9 mines and 654 employees in 1973. The strong uptrend in prices was undoubtedly a factor behind the increased mining activity.

A proposed increase in the disposal rate of tungsten in the U.S. stockpile from 6 million to 10 million pounds per year was cancelled partly because the higher rate might have a depressing effect on world prices.[16]

**Zinc.**—Output of zinc concentrate, assaying approximately 23%, reportedly reached about 143,000 tons in 1974, the first year of large-scale zinc production in Thailand. The ore, valued at approximately $8 million, was taken from the Mae Sot mine of Thai Zinc Ltd., a subsidiary of New Jersey Zinc Co. (NJZ). Nearly one-half of the concentrate was shipped directly from Thailand to an NJZ processing plant in Palmerton, Pa., for further beneficiation; the remainder was held in inventory as feed for a 60,000-ton-per-year electrolytic zinc refinery scheduled to be built in northern Thailand. Total reserves in the deposit were estimated at 3.5 million tons reportedly implying a life of 10 or 11 years.

**Other Minerals.**—Hibino Kinzoku Kogyo opened an antimony mine at Banpin in June 1974. Initial production was at the rate of 150 tons of contained antimony per month. Reserves were estimated to be 500,000 tons of antimony. The entire production of concentrates will be shipped to Hibino's plant in Japan.[17]

Copper deposits in Loei Province attracted the interest of mining firms during the year. A tender offer by the Thailand Department of Mineral Resources (DMR) drew requests for application forms from more than 30 companies. Examinations by geologists of the sites and of the cores from earlier exploratory drilling by DMR had stimulated the interest. The bids were under study by DMR.[18]

Output of manganese declined in 1974, with the downturn being distributed about evenly between metallurgical and battery grades. Continuing price increases, however, kept production well above the level that prevailed before 1973. No new mining or processing developments occurred during the year.

## NONMETALS

**Barite.**—The upsurge in oil-well drilling in Southeast Asia resulting from the petroleum shortage early in the year boosted the demand for barite for use as a component of drilling muds. Barite production responded with an 80% rise to 201,000 tons in 1974 from the 112,000 tons produced in 1973. Exports of barite decreased 20% in 1974 to 75,337 tons. The average export price in 1974 was $23 per ton, compared with the 1973 value of $25 per ton. Thailand contains many rich deposits of barite grading as high as 80% $BaSO_4$, but mining has remained largely in the hands of small producers whose output is marketed through agents in Bangkok. A few larger companies also mine barite, in some cases under a purchase contract with an individual foreign consumer.

**Cement.**—Cement output remained on a gradual uptrend in 1974, increasing by 6% to 3,958,000 tons as compared with 3,745,000 tons in 1973. Exports rose to 920,000 tons, 5% above the 1973 level of 878,000 tons, and the value of exports approximately doubled, rising to $32 million in 1974. Domestic demand increased slightly, but domestic prices continued to be restricted by the Thai Government. Increasing costs, particularly for fuel oil, therefore rendered domestic sales less attractive and induced further efforts by producers to develop export markets.[19]

Despite the continued problem of overcapacity relative to domestic requirements and the resulting dependence on increased exports, the cement industry continued to plan further expansions as reported in the 1973 Minerals Yearbook. Thai Sathapana Co. Ltd. planned a new 1,000-ton-per-day plant at Amphur Pak Tho in Ratchburi Province which was to begin production early in 1975. Jalaprathan Cement Co. Ltd. proposed to double the capacity of its plant at Cha-Am in Petchuri Province from 1,500 to 3,000 tons per day, and to raise the capacity of its Takhli, Nahhon Sawan plant 1,000 to 1,250 tons per day. Siam Cement Co. Ltd. planned to double the capacity of its plant at Kaeng Khor, Saraburi Province, from 750,000 to 1,550,000 tons per year by mid-1975.[20] Siam City Cement Co. Ltd. was preparing to boost its capacity at Kaeng Khoi from 2,000 to 5,000 tons per day. When completed the projects will add approximately 2.5 million tons per year to the present 4.3 million-ton-per-year capacity. A strong increase in export sales will be imperative if the new capacity is to be profitable.[21]

In a related development, Siam Iron and Steel Co. Ltd., announced plans to increase its capacity for producing prestressed concrete reinforcing wire at its Ta Luang plant to 20,000 tons per year in several steps by 1977.[22]

**Fertilizer Materials.**—Thailand's shortage of fertilizers, principally nitrogen and phosphate varieties, became more acute in the early part of 1974 as world supplies dwindled. Higher prices stemming from rising crude oil costs further aggravated the small farmers' plight. In order to relieve the situation, the Government cancelled regulations banning fertilizer imports.[23]

A long-range solution to the problem remained in the distant future, but the possibility improved with the discovery of large potash deposits in northeastern Thailand during the year. Deposits of carnalite in the vicinity of Udon Thani, averaging more than 100 feet in thickness, were revealed by a DMR drilling program during the year. Concurrently, a deposit of sylvite, a superior source of potash, was located across the border in Laos. If the Laos deposit proves feasible after exploration, it will probably be developed first; otherwise, the Thai deposits may become the prime fertilizer sources for Southeast Asia[24]

A granulation plant, which will grind and mix imported fertilizer raw materials, was under construction and was expected to go onstream early in 1975. The plant, owned by Thai Central Chemical Co., is located in Bangkok.[25]

[24] U.S. Embassy, Bangkok, Thailand. State Department Telegram 19096, January 1975.
[25] Page 174 of work cited in footnote 23.

**Fluorspar.**—During 1974 about 54,000 tons of acid-grade fluorspar (acid-spar) and 336,000 tons of metallurgical-grade fluorspar (met-spar) were produced in Thailand. This represents a 54% increase in acid-spar production and a 2% decrease in met-spar production compared with 1973. About 181,000 and 28,000 tons of met-spar and acid-spar, respectively, were exported to Japan. Approximately 67,000 tons of fluorspar was shipped to the U.S.S.R. The remainder was exported mainly to Far Eastern countries. Less than 1,000 tons of met-spar was used internally in the steel industry.

Thai Fluorite Processing Company Ltd.'s concentrating plant, which is located in Petchaburi Province and is jointly owned by Kaiser Cement Co. (60%) and Jalaprathan Cement Co. (40%) continued in full operation during the year. This is the only fluorspar froth flotation plant in Southeast Asia. During the year the company abandoned its mining operations and adopted the policy of supplying its plant with custom ore. All of the acid-spar they produced was sold to Ataka Trading Co. of Japan, and most of it was shipped to Japan.

Although Japan is trying to diversify its source of fluorspar, it still imports over 65% of domestic demand from Thailand. Universal Mining Co., which is controlled by Japanese interests, continued to operate its heavy-media separating plant in the Ban Hong District near Chiengmai, Lamphun Province.

About 155 fluorite deposits have been identified in Thailand. During 1974, an average of 76 deposits were worked and regularly employed about 6,600 people. During the last 4 months, employment dropped off until there were only about 5,000 people employed in mining at year-end.

The domestic price of met-spar averaged $38.35 per ton on the Bangkok market for the first 6 months, but increased to about $46 per ton by yearend. The export price f.o.b. port of Bangkok was usually $1 to $3 more per ton, and it also increased toward the end of the year when a fuel shortage developed. At the first of the year, acid-spar was quoted at $65 per ton, but by the end of the year the price was up about 15%, f.o.b. port of Bangkok. The rising value of fluorspar at the end of the year reflected increased costs of wages and fuel.

No further activity has been reported on the proposal by a Thai-Australian venture to build in the Cha-am area a $2 million flotation plant to produce 150,000 tons annually of chemical-grade fluorspar.

**Gypsum.**—Output of gypsum rose strongly in 1974, the second consecutive year of rapid growth. Production rose to 312,000 tons in 1974, an increase of 32% above that produced in 1973. Exports of approximately 132,000 tons represented a tripling of 1973 shipments of 42,000 tons.

**Other Nonmetals.**—Kaolin production trebled in 1974 reaching 61,000 tons compared with 19,000 tons in 1973. Output of feldspar recorded another strong increase of 55% to 6,998 tons. Production of silica sand rose by a more moderate 16%. On the negative side, quartz production was down 22% and output of talc group minerals dropped 81% from an abnormally high peak in 1973.

The planned salt mine of the Thai Asahi-Diamond Shamrock combine at Chaiyaphum in Nakhon Ratchasima Province expects to produce limestone and soda ash as byproducts.[26]

## MINERAL FUELS

**Coal.**—Lignite production increased to 485,000 tons in 1974, a gain of 34% over the 361,000 tons produced in 1973. The two major producing areas were at Mae Moh in Lamphun Province and in Krabi Province. Output was reported at four mines, and a total of approximately 700 miners were employed. The entire output was consumed domestically, mainly for power generation and fertilizer production, and none was exported. The country imports more than half of its coal requirements.

Plans have been announced for a second lignite-burning powerplant of 75 megawatts at Mae Moh, which is scheduled for completion in 1978.[27] The plant will be owned by the Electricity Generating Authority of Thailand (EGAT), and was estimated to cost $34.5 million.

**Petroleum.**—Petroleum was Thailand's chief mineral concern, as it was for virtu-

[26] Far Eastern Economic Review. Thailand: Potential for Potash. V. 88, No. 16, Apr. 18, 1975, p. 41.

[27] U.S. Embassy, Bangkok, Thailand. State Department Airgram A–109, Apr. 11, 1975.

ally the entire world in the early part of 1974. Despite the necessity for restricting consumption of oil products and establishing priorities for uses, the country came through the oil shortage period with relatively little damage. Places of entertainment, neon lighting, and night gasoline station service were limited or closed down. A list of 11 priority industries was established, and fuel was allocated according to consumers' historical record of purchases. Some shortages did occur, particularly those affecting internal transportation and export shipping of agricultural products. Also, a certain amount of hoarding and black market operations took place. Purchases totaling 125,000 tons of diesel oil were negotiated with the People's Republic of China in the early part of the year in order to alleviate critical requirements for diesel oil by Thailand's internal transportation system.[28]

Petroleum product prices were forced to rise substantially due to increased crude oil costs, but the Government maintained controls on product prices in order to reduce their impact on the country's already high inflation rate. As a result, many of the country's refineries complained of reduced profit margins.[29]

Greater success was achieved in petroleum exploration in the Gulf of Thailand than in previous years. By the end of 1974, a total of 20 offshore wells had been drilled, and 7 of these encountered oil or natural gas. The unusually high success ratio was tempered, however, by the failures of two subsequent wells which had been intended to delineate the field. Those failures raised the possibility that the offshore petroleum might be limited to scattered pockets and may not constitute a large reservoir. The drilling programs planned for 1975 should answer the question. Production from the successful wells is slated to begin in 1976.[30]

That same year will see the first wells drilled in a newly leased concession area of the Andaman Sea in water depths exceeding 200 meters (656 feet). Blocks W7, W8, and W9 were leased respectively to Oceanic Exploration Southeast Asia, Inc., jointly with Suwannamas Co., Ltd., a combine of Union Oil Co., Amoco Petroleum Co., British Petroleum Co., Hamilton Brothers Thailand SDAD, Ltd., Seamens Resources, Ltd., and Esso. To offset the higher cost of deep-water operations, the Government reduced the royalty rate for output from 12-½% to 8-½%.[31]

Investigation of a different source of oil took a further step forward with the announcement that the Government was setting up a pilot plant to refine oil shale at Li in Lamphun Province. The $25,000 plant may be expanded into a full-scale mining and refining venture if it proves successful.[32]

Construction of a proposed petrochemical complex at Sri Racha was postponed because of the petroleum shortage. The Thai Petrochemical Co., Ltd., complex, a joint venture of the Japanese Mitsui and Mitsubishi companies, Royal Dutch Shell, and Thai interests, was to include upstream facilities for producing ethylene and propylene from naphtha cracking, and downstream facilities for turning out a variety of chemical derivatives at a total estimated cost of $450 million. The Japanese partners stated their desire to postpone the project for 2 or 3 years citing reduced industrial demand in the wake of the oil shortage, difficulty in obtaining financing, and local conservationists opposition among other reasons. A more restrictive Japanese Government policy on overseas investment was considered a further possible factor.[33]

# The Mineral Industry of Tunisia

By Roland W. Merwin [1]

Tunisia's gross domestic product (GDP) was approximately $3,073 [2] million, an increase of 22% over the revised GDP of 1973. The mineral share of the GDP, exclusive of the manufacturing sectors of the mineral industry, increased 24% over that of 1973 and comprised about 7% of the 1974 total. Crude petroleum production accounted for approximately 68% of the mineral portion of the GDP. Not only was the mineral segment of the GDP moderately significant by world standards, it was particularly important to Tunisia as a source of foreign exchange.

Although the natural-gas, petroleum, and phosphate-rock sectors of the mineral industry are small by world standards, they were key elements in efforts by the Tunisian Government to industrialize the predominantly agricultural economy and were receiving priority consideration by Government planning organizations. Additionally, attention was being given to expanding the production of barite, cement, fluorspar, iron ore, lead, salt, and zinc. The Government of Tunisia was active in promoting foreign investment in the mineral industry, with emphasis on projects that would process raw materials in Tunisia for export.

The petroleum industry continued to be the most important sector of the mineral industry in terms of both present output and future prospects. A major offshore field in the Gulf of Qabis came into production in 1974 at the rate of 40,000 barrels per day, and a smaller onshore field near Sfax was being brought into production. Additionally, a promising new field was discovered offshore in the Gulf of Qabis. The petroleum industry was almost entirely controlled by French and Italian companies in which the Tunisian Government had participating interests. The Government-owned Establishment Tunisienne pour l'Activite Pétrolière (ETAP) was established to hold the Tunisian participation in all petroleum joint ventures. There were plans for ETAP to engage directly in exploration and operations.

The natural gas industry became increasingly important to the industrial development of the nation. With large proven reserves both onshore and offshore, Tunisia's energy needs, formerly supplied by petroleum, were being rapidly shifted to natural gas. Additionally, strong emphasis was placed on establishing petrochemical and fertilizer industries based on natural gas.

The phosphate industry continued to be the second-most-important segment of the mineral industry, and the Government of Tunisia continued to regard its revitalization as one of its most important objectives. The phosphate-rock mining industry is almost entirely owned and operated by the Government-controlled Compagnie des Phosphates et du Chemin de Fer de Gafsa (Sfax-Gafsa), which was engaged in expanding mining activities, modernizing mines and beneficiation-plant facilities, and improving shipping facilities.

One of the major problems facing the Tunisian phosphate-rock industry was marketing its relatively low-grade ores in competition with higher grade ores from other exporting countries. Therefore, top priority was placed on expanding the fertilizer-manufacturing industry to permit the export of a finished product. The major fertilizer manufacturer, the Government-controlled Industries Chimiques Maghrébines (ICM), doubled its phosphoric acid production capacity during 1974 and placed a second tankship in operation for transporting this product to European markets. Additionally,

[1] Supervisory physical scientist, Division of Nonmetallic Minerals.

[2] Where necessary, values have been converted from Tunisian dinars (TD) to U.S. dollars at the rate of TD1=US$2.30.

the Government announced plans to construct a new fertilizer-manufacturing complex that would produce both phosphoric acid and ammonia; these products would be used to produce ammonium phosphate fertilizers for export.

The nonferrous and nonmetallic mineral industries continued to receive increasing attention under the auspices of the Government-owned mining company Société Tunisienne d'Expansion Minière (SOTEMI). Emphasis was placed on increasing the production and exportation of lead, zinc, and fluorspar in processed forms.

## PRODUCTION AND TRADE

Among the principal mineral commodities produced in Tunisia, the outputs of iron ore, natural gas, petroleum, and phosphate rock increased in quantity over those of 1973, whereas the outputs of barite, cement, fluorspar, lead, salt, and zinc declined. Overall, there was a substantial increase in the value of mineral production in 1974 compared with that of 1973, principally because of the higher price for phosphate rock in world markets.

As in the past, Tunisia exported most of its mineral production, which continued to make a significant contribution to the export trade. In 1974, minerals and mineral-related products accounted for approximately 63% of the value of the nation's export trade.

The major portion of Tunisia's trade was with Europe, particularly the European Communities (EC), of which Tunisia was an associate member. The second-most-important trade partner was eastern Europe. Available data on mineral production and trade are given in tables 1 to 3.

**Table 1.—Tunisia: Production of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity [1] | 1972 | 1973 | 1974 [p] |
|---|---|---|---|
| **METALS** | | | |
| Iron and steel: | | | |
| Iron ore and concentrates, gross weight ___ thousand tons | 890 | 809 | 815 |
| Pig iron ___ do | 143 | 157 | [e] 118 |

## COMMODITY REVIEW

### METALS

**Iron and Steel.**—Iron ore production increased slightly above that of 1973. The Djebel Djerissa mine continued to be the major producer; the remaining portion of the output was obtained from the relatively small Tamirah mine. The state-owned El Fouladh iron and steel mill was expanding its steelmaking capacity in the expectation that increased local consumption of iron ore would compensate for a continuing decrease in exports of crude ore, which in past years have been mainly to Italy.[3]

[3] U.S. Embassy, Tunis, Tunisia. Industrial Outlook Report: Minerals, 1974. State Department Airgram A-68, June 13, 1975, 11 pp.

**Lead.**—Domestic mine production decreased substantially below that of 1973; all of the output was from the operations of SOTEMI. There were no plans for expansion of mining facilities. Lead concentrate was smelted by Peñarroya-Tunisie at its Mégrine smelter, where output of refined lead was slightly more than that of 1973. This smelter was heavily dependent upon imported lead concentrate from Algeria, Italy, and Morocco; Morocco was the major supplier. Essentially all of the refined lead was exported, with Italy being the major consumer. Morocco was reportedly planning to construct a major smelting complex that would utilize its total lead ore production. Unless new import sources of lead concentrate were developed, this would have an adverse effect on Tunisia's production of refined lead.[4]

**Zinc.**—Mine output of zinc concentrate was substantially lower than that of 1973. All of it was produced by SOTEMI from mines located in western Tunisia, near the Algerian border. The entire output was exported to European markets for refining into metallic zinc. It was anticipated that production would increase during the next few years when the Fradj Hassen mine is brought into production.[5]

**Other Metals.**—Mercury was produced at mining operations, and silver was produced as a byproduct of lead smelting. The outputs of both of these metals were substantially below those of 1973.

## NONMETALS

**Cement.**—Cement was produced at two plants—one in Tunis and one in Bizerte. Output was slightly less than that in 1973 and supplied only about one-half of Tunisia's domestic requirements. Because of projected increases in construction activities, plans were made to increase cement-production capacity as an alternative to continued heavy imports of this commodity. A contract was awarded for the construction of a cement plant at Qabis with a 700,000-ton-per-year capacity. This project was to be undertaken by the Tunisian Government, with possible financing from Arab oil-producing states. Agreement in principle was also reached with Algeria covering the construction of a cement plant at Talah near the Algerian border, to be operated jointly by both countries. This plant would have a capacity of 1 million tons per year. Additionally, an expansion of the present cement plant at Bizerte was under consideration.[6]

**Fertilizers.**—*Phosphates.*—Tunisia ranked fourth among nations of the world as a producer of phosphate rock and fifth as an exporter of this commodity (by quantity). Phosphate rock production in 1974 amounted to 3.82 million tons, 10% more than that of 1973 and 11% greater than the previous record output in 1968. In 1974, 62% of the production was exported directly in the form of crude and ground phosphate rock. The remaining 32% of the output was utilized by domestic fertilizer complexes for manufacturing phosphoric acid and triple superphosphates, also mainly for export.

The financial position of the phosphate-rock-mining industry improved dramatically during 1974 as a result of worldwide increases in phosphate rock prices. The Tunisian export price for phosphate rock increased from $13 per ton in early 1973 to $35 per ton during much of 1974, and finally to $56 per ton in January 1975.[7]

Approximately 92% of the phosphate rock production was derived from seven mines owned and operated by Sfax-Gafsa; operations centered in the Gafsa region of central Tunisia. The remainder of the output was obtained from a mine owned and operated by Société Tunisienne d'Exploitation Phosphatiere in west-central Tunisia near the Algerian border.

In the past, Tunisia found it difficult to market its low-grade ores from high-cost underground mines competitively with other countries that produced higher grade ores from lower cost open pit mines. However, Tunisia's competitive position was being improved by a number of programs designed to remedy this situation. These included increasing production at Tunisia's sole open pit mine, mechanizing underground mines, modernizing beneficiation facilities, and improving the railroad systems between the mines and ports.

In addition to local funding, which became available because of higher phosphate rock prices, Tunisia was receiving substantial international assistance for these projects. The World Bank provided a loan of $23 million to help finance a major expan-

[4] Pages 8–9 of work cited in footnote 3.
[5] Page 9 of work cited in footnote 3.
[6] Pages 9–10 of work cited in footnote 3.
[7] Page 6 of work cited in footnote 3.

sion program at the new Sehib mine. Romania provided financial assistance for the expansion of the M'Rata mine. The Kuwait development fund approved a loan of $6.9 million to help modernize existing mines and ore-treatment facilities. The People's Republic of China (PRC) approved in principal a loan for the purchase of 1,000 railroad cars.[8]

The Government of Tunisia continued its long-range program to expand the fertilizer-manufacturing industry. These programs were based on (1) the availability of low-cost (but low-grade) phosphate rock, which is normally difficult to market in international trade, and (2) the favorable trade agreement with the EC, which gives Tunisia an advantage in marketing the finished fertilizers in the European market. Additionally, exporting finished fertilizers instead of phosphate rock would obtain a better return of foreign exchange.

ICM, the major fertilizer manufacturer, brought a new phosphoric acid plant into production in October 1974, which increased its total phosphoric acid production capability to 250,000 tons per year $P_2O_5$ content.[9] Additionally, ICM improved its phosphoric acid export capability by placing a second phosphoric acid tanker in service in 1974. This vessel, the *Gafsa,* has a 10,500-ton capacity.[10]

The Government of Tunisia decided that, rather than further expand the ICM facilities, it would form a new company to construct and operate a fertilizer-manufacturing complex that would produce ammonium phosphate fertilizers for export. As planned, the new complex would have an annual production capacity of 250,000 tons of phosphoric acid and 365,000 tons of ammonia. Reportedly, the bulk of the financing for this large project will probably be obtained from either Kuwait or Abu Dhabi.[11]

**Fluorspar.**—SOTEMI produced chemical-grade fluorspar at mines in the Zaghwan region of central Tunisia. The output was substantially less than that of 1973. The lower output was accounted for by suspended beneficiation operations at the Hamam Jedidi mine and suspended operations at the Haman Zribi mine during a major modernization and expansion program. Construction of an aluminum fluoride plant at Qabis to utilize domestic fluorspar as a raw material was underway and scheduled for completion in 1976. Reynolds Aluminum Co., a U.S. firm, has a minority interest in this venture, which expected to improve Tunisia's export potential for fluorspar.[12]

**Other Nonmetals.**—Barite, construction clays, hydraulic lime, and marine salt were produced in 1974, but the output of each of these materials was lower than that of 1973. Most of the barite was ground in Tunisia and used for oil well drilling muds, whereas most of the salt was exported. Additionally, common clay and shales, sand and gravel, and stone were produced for local consumption as construction materials. The outputs were not reported.

## MINERAL FUELS

**Natural Gas.**—Marketed production of natural gas was 77% more than that of 1973. Most of the gas was produced in the El Borma Field in southern Tunisia and piplined to Qabis, where it was used for power generation and industrial purposes. Additional compressor stations were being installed to double the capacity of the pipeline.

As a result of a comprehensive study, the Tunisian Government announced that it had proven reserves of approximately 1.8 trillion cubic feet of gas in three offshore gasfields in the Gulf of Qabis. Studies were continuing regarding the economic feasibility of collecting this gas at the rate of about 125 billion cubic feet per year and bringing it onshore by pipeline for utilization by petrochemical and ammonia plants and other industries.[13]

In view of the large proven domestic reserves of natural gas, there was a lessening interest on the part of the Government of Tunisia in participating in the projected natural gas pipline from Algeria through Tunisia under the Mediterranean to Italy.

**Petroleum.**—Crude petroleum production increased 7% above that of 1973. The offshore Ashtart Field came into production in April 1974 and production increased rapidly to over 40,000 barrels per day. This new production more than offset a 30% drop in production at the onshore El Borma Field, which was due primarily to the inauguration of an ambitious program to drill

[13] Page 5 of work cited in footnote 3.

water-injection wells in order to maintain operating pressures in the field. Production from other small fields in Tunisia remained relatively steady. Plans were made to initiate production at the small, onshore Sidi Behara Field near Sfax.[14]

At yearend 1974, there were 21 outstanding exploration permits covering 187,000 square kilometers, compared with the same number of permits covering 195,000 square kilometers at yearend 1973. About one-half of the area covered was offshore.[15]

Although geological fieldwork and gravitometer and magnetometer surveys decreased in 1974 compared with those activities in 1973, land and marine seismic operations increased roughly 70%. Sixteen exploratory wells were drilled in 1974, 10 onshore and 6 offshore, compared with a total of 9 in 1973. The primary new discovery in 1974 was the very promising offshore Isis Field, approximately 120 miles due east of Sfax in the Gulf of Qabis. Ten development wells were drilled in 1974, including five at the offshore Ashtart Field. All 10 wells were producers.[16]

Several proposals were considered for expanding petroleum refining capacity in Tunisia. Under one plan, the Government decided that instead of entrusting construction of a projected 120,000-barrel-per-day refinery in Qabis to a foreign partner, it would undertake to build a 60,000-barrel-per-day refinery there, whose capacity could eventually be doubled. However, in view of the excess refinery capacity in the Mediterranean area, it was decided to suspend construction of the refinery at this time. It was considered possible that doubling the capacity of the existing 20,000-barrel-per-day refinery in Bizerte would best meet the immediate needs of the country.[17]

# The Mineral Industry of Turkey

By E. Shekarchi [1]

During 1974, the Turkish economy continued to show relatively good growth and expansion. Due to world inflation and the cost of raw materials, the mineral industries' contribution to the economy in 1974 was higher than in 1973. The highest gross national product (GNP), in the republic's history, $22.4 billion,[2] was reported for 1974, an increase of 6.6% over that of 1973. Per capita GNP increased 4% from $547 in 1973 to $569 in 1974. Although the number of Turkish workers abroad decreased to about 700,000, their contribution to Turkey's economy was a significant $1.4 billion, an increase of 19% when compared with 1973 returns.

The Turkish mineral industry under the third 5-year plan (1973-77) had a successful year in 1974. Development work advanced in the iron, copper, boron, and phosphate industries. Basic infrastructure projects such as electric power generation, port facilities, irrigation, and water supply were emphasized over industrial investments and capital goods. However, the main aim of the 5-year plan, the reform of the mining and petroleum administration, remained untouched during the year. In this 5-year plan, it was envisaged that a mining office was to be organized to carry out necessary long-term studies of mineral policies, examine international mineral markets, evaluate exploration license applications within 6 months, and prepare a report every 3 years indicating the reserves in areas with operation licenses. Furthermore, under public sector-exploration, activities were to be stepped up, and Etibank, and Türkiye Komur Isletmeleri (TKI) were to be given specified responsibilities.

Turkey's third 5-year plan projected a production of metallic minerals three times greater than the amount produced during the second 5-year plan—or a yearly growth rate of 27%. The yearly growth rate for nonmetallic minerals, excluding coal and petroleum, was projected at 16%. Mining investment including coal and petroleum was projected at $1.2 billion.

The Turkish Parliament ratified an agreement, between Turkey and Iraq, for construction of a crude oil pipeline from the Kirkuk oilfields in Iraq to Dörtyol on the Mediterranean coast of Turkey. In August 1974, Türkiye Petrolleri A.O. (TPAO) organized a subsidiary corporation, Borü Tesisleri A.S. (BOTAS), to assume responsibility for the Turkish portion of the pipeline. In November, BOTAS signed a contract, valued at $400 million, with the West German firm Mannesmann Rohrbau for supply of pipe, pipeline construction, pumping stations, and certain terminal facilities. The pipeline when completed was to transport 25 million tons of crude oil per year. Approximately 640 kilometers of pipeline is in Turkish territory and 341 kilometers in Iraq.

Devlet Su Isleri Genel Müdürlügü (DSI), (Ministry of Hydropower Dams Directorate) increased capacities at some projects, revised the treatment of the work package for tenders, and set more realistic completion dates in order to meet the interconnected power supply target for the country. In 1974, DSI had not begun any new hydroelectric projects; rather, its effort was directed toward the completion of ongoing projects with minimum delays. There were eight projects that DSI planned to initiate during 1975. Also, the agreement initiated in October 1973 with the U.S.S.R. for jointly shared construction

[1] Physical scientist, Division of Ferrous Metals.
[2] Where necessary, values have been converted from Turkish lira (LT) to U.S. dollars, at the rate of LT14=US$1.00.

costs of a dam on the Arpacay River was not finalized in 1974, though DSI intended to implement the agreement in the near future. The Arpacay hydroelectric project was to be completed within 4 years at a cost of $18 million. The Arpacay River forms part of the frontier between the U.S.S.R. and Turkey.

Preparatory work proceeded rapidly for construction of the Arslantas dam. The cost of the dam, about $200 million, was to be financed by $44 million from a World Bank loan, $30 million from International Development Association, and remainder from Turkish sources. The project was expected to be completed by 1981 and was to include a hydroelectric plant with a 138-megawatt generating capacity.

The Kaban hydroelectric powerplant at Elâzig began partial operation in September 1974. By yearend, four of its 150-megawatt units were to be installed. With the opening of the Seyitomer 300-megawatt lignite plant, Turkey's electric generating capacity increased by 25% during 1974.

The world petroleum crisis didn't significantly affect the Turkish supply since Turkey maintained good relations with the petroleum producing nations. However, the price increase, about 50%, was a tremendous drain on the Turkish budget. There were continuing differences between the Ministry for Energy and Natural Resources and two private companies, Mobil Oil Turk A.S. and British Petroleum Co., Ltd., with respect to prices for crude petroleum imports by these companies for their refineries in Turkey. By yearend, no mutually satisfactory answer was found.

A ground breaking ceremony was held in October for a new chemical fertilizer complex in Izmir. Production from the plant, reportedly 306,000 tons of fertilizer per year, would enable Turkey to save several million dollars in foreign exchange. Cost of the project was estimated at $35 million. The investment was shared by more than 3,500 shareholders including some 2,500 Turkish workers employed abroad.

During the past 2 years, the Turkish Government made few currency adjustments in response to international monetary fluctuations. In the latter part of 1974, however, the Government made more frequent adjustments in the exchange rate between the Turkish lira and other national currencies. The most significant of these changes was announced in November when the Turkish lira was, in effect, devalued with respect to most Western European currencies. The value of the Turkish lira was set approximately 8% lower with respect to the Deutsche mark and 9% lower with respect to the Swiss franc. Its parity with respect to the U.S. dollar was not changed significantly. The change in the rate with the Deutsche mark, in particular, was expected to encourage an increase in remittances by Turkish migrant workers.

## PRODUCTION AND TRADE

Table 1 gives the production of primary minerals and processed metal and nonmetals, while tables 2 and 3 cover details of foreign trade, including total tonnages by commodities and destinations.

Turkey had one of the highest inflation rates of the Organization for Economic Cooperation and Development (OECD) countries, about 30% in 1974. Budgetary deficits of $2 billion, military expenditures engendered by the Cyprus problem, and credit restrictions to curb inflation indirectly contributed to a scarcity of capital and affected industrial production. The contribution of the mineral industry to exports was similar to that of the previous year.

| Residual fuel oil | do | 31,236 | 37,759 | 36,537 |
| Lubricants | do | 338 | NA | 257 |
| Other: | | | | |
| Liquefied petroleum gas | do | 3,861 | 4,929 | 4,659 |
| Naphtha | do | 1,806 | 2,046 | 2,756 |
| Petroleum asphalt | do | 1,279 | 1,407 | 1,448 |
| Unspecified | do | 75 | 75 | 161 |
| Refinery fuel and losses | do | 3,959 | 3,483 | 1,896 |
| Total | do | 79,999 | 4 95,571 | 94,680 |

e Estimate. p Preliminary. r Revised. NA Not available.

1 Total content of material reported as run-of-mine lead ore and lead-zinc ore; excludes lead content of material reported as run-of-mine zinc ore.

2 Total content of material reported as run-of-mine zinc ore and lead-zinc ore; excludes zinc content of material reported as run-of-mine lead ore.

3 Does not include crushed limestone used in the manufacture of cement.

4 Total for listed figures only; does not include an estimate for lubricant production.

## Table 2.—Turkey: Exports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Ore and concentrate | 150,000 | 144,620 | All to U.S.S.R. |
| Metal: | | | |
| Scrap | 50 | 100 | Do. |
| Unwrought | -- | 43,973 | Mainly to U.S.S.R. |
| Semimanufactures | 543 | 4,870 | U.S.S.R. 2,901; West Germany 568; Lebanon 417. |
| Antimony ore and concentrate | 3,278 | 5,069 | West Germany 1,849; Yugoslavia 1,778; United States 1,291. |
| Arsenic, natural sulfides | 2 | 3 | All to France. |
| Copper including alloys: | | | |
| Ore and concentrate | 5,560 | -- | |
| Unwrought | -- | 2,602 | Greece 1,000; Yugoslavia 992; Spain 610. |
| Semimanufactures | r 176 | 9 | Greece 3; West Germany 3. |
| Chromium ore and concentrate | 342,257 | 404,910 | United States 95,482; West Germany 49,110; Sweden 41,886. |
| Iron and steel: | | | |
| Ore and concentrate, including roasted pyrite | -- | 5,372 | All to West Germany. |
| Metal: | | | |
| Ferroalloys | r 12,591 | 20,547 | U.S.S.R. 10,250; Belgium-Luxembourg 2,540; Netherlands 1,775. |
| Semimanufactures | r 11,464 | 27,257 | Syria 8,121; Lebanon 7,712; West Germany 5,554. |
| Lead ore and concentrate | 11,351 | 8,390 | United Kingdom 3,185; Bulgaria 1,250; France 1,130. |
| Manganese ore and concentrate | -- | 520 | Spain 500. |
| Mercury 76-pound flasks | 8,478 | 8,011 | Netherlands 3,270; United Kingdom 2,165; United States 1,201. |
| Zinc: | | | |
| Ore and concentrate | 16,691 | 26,010 | Italy 9,600; Bulgaria 6,560; Switzerland 4,000. |
| Oxide | 485 | -- | |
| Metal, semimanufactures | 509 | 559 | Switzerland 503; West Germany 56. |
| Other: | | | |
| Ore and concentrate | 5,151 | 8,970 | United States 5,100; U.S.S.R. 2,520; Italy 1,250. |
| Ash and residue containing nonferrous metals | 627 | 587 | All to Netherlands. |
| Metals including alloys, all forms | 117 | 169 | Netherlands 80; Jordan 40; United States 39. |

## Table 2.—Turkey: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS | | | |
| Abrasives, natural | 75,043 | 64,209 | Netherlands 56,888; United States 6,045. |
| Barite | 38,243 | 110,530 | West Germany 40,571; U.S.S.R. 29,273; United States 22,180. |
| Boron materials: | | | |
| Crude natural borates | 148,574 | 355,124 | Italy 74,515; France 57,401; Japan 37,220; Switzerland 34,600. |
| Oxide and acid | 8,760 | 14,376 | West Germany 5,998; Japan 1,800; Netherlands 1,340. |
| Cement thousand tons | 1,362 | 980 | Israel 369; Syria 198; Libya 138. |
| Chalk | 649 | 522 | United Kingdom 330; Iran 140; Greece 46. |
| Clays and clay products: | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite | 491 | 2,020 | Lebanon 1,150; Italy 820. |
| Fire clay | -- | 45 | All to Iraq. |
| Fuller's earth, chamotte | -- | 50 | All to Syria. |
| Kaolin | 7,774 | 5,927 | Lebanon 5,705. |
| Other | 233 | 17 | Iraq 15; West Germany 2. |
| Products: | | | |
| Refractory | 1,841 | 3,158 | Iraq 1,580; Iran 1,374. |
| Nonrefractory | 911 | 5,674 | Netherlands 1,554; West Germany 1,377; Israel 1,037. |
| Diatomite and other infusorial earth | -- | 2 | All to Italy. |
| Feldspar | 1 | -- | |
| Lime | -- | 4,568 | All to Libya. |
| Magnesite: | | | |
| Crude | 8,190 | 8,550 | Austria 6,250; Yugoslavia 1,781. |
| Calcined | 65,218 | 73,444 | Austria 56,750. |
| Mica | 1 | -- | |
| Pyrite (gross weight) | 36,265 | 6,160 | All to West Germany. |
| Salt | 4 | 28 | All to Cyprus. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked, calcareous | 3,102 | 3,834 | Italy 2,083; Lebanon 1,178. |
| Worked | 26 | 16 | Switzerland 5; Cyprus 4. |
| Dolomite | -- | 27 | Libya 20; Greece 6. |
| Gravel and crushed rock | 498 | 50 | All to Israel. |
| Quartz and quartzite | 1 | 16 | All to Sweden. |
| Sand, excluding metal bearing | 500 | 1,000 | All to Greece. |
| Sulfur, sulfuric acid | -- | 26,025 | All to Switzerland. |
| Talc | 9 | 66 | Libya 20; United Kingdom 20; Greece 19. |
| Other nonmetals, n.e.s.: | | | |
| Crude, meerschaum, amber, jet | 4,118 | 8 | West Germany 6. |
| Slag, dross and similar waste, not metal bearing | 395 | 166 | All to Spain. |
| Oxides and hydroxides of magnesium, strontium, and barium | -- | 50 | All to Pakistan. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | 705 | 1,529 | Israel 1,516. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt, natural | -- | 50 | All to Cyprus. |
| Coal, coke, briquets | -- | 600 | All to Iraq. |
| Hydrogen, helium, and rare gases | 5 | 11 | All to Israel. |
| Petroleum: | | | |
| Crude and partly refined thousand 42-gallon barrels | 166 | -- | |
| Refinery products: | | | |
| Gasoline do | 3,497 | 3,192 | United States 1,200; West Germany 1,078; Greece 379. |
| Kerosine and jet fuel do | r 848 | 736 | Netherlands 274; Greece 108; United States 95. |
| Distillate fuel oil do | 1,408 | 1,257 | United States 507; Netherlands 147; Italy 139. |
| Residual fuel oil do | 1,403 | 749 | Italy 293; West Germany 228; Greece 228. |
| Other: | | | |
| Liquefied petroleum gas do | 15 | -- | |
| Unspecified do | 163 | 840 | Italy 245; Netherlands 240; United States 129. |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | 17,560 | 11,357 | All to Italy. |

r Revised.

## Table 3.—Turkey: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Oxide and hydroxide | 927 | 1,892 | U.S.S.R. 1,628; West Germany 113. |
| Metal: | | | |
| Unwrought | 31,559 | 40,363 | Switzerland 15,850; Canada 11,490; West Germany 7,039. |
| Semimanufactures | 10,454 | 6,711 | Spain 2,661; West Germany 1,424; France 801. |
| Arsenic trioxide, pentoxide, acids | 119 | 57 | West Germany 27; United Kingdom 18; France 12. |
| Cadmium metal including alloys, all forms | 10 | 8 | Belgium-Luxembourg 3; West Germany 2; Netherlands 2. |
| Chromium oxide and hydroxide | 229 | 201 | Italy 132; West Germany 20. |
| Cobalt: | | | |
| Oxide and hydroxide | 15 | 16 | Mainly from Belgium-Luxembourg. |
| Metal including alloys, all forms | 3 | 1 | Mainly from United States. |
| Copper: | | | |
| Ore and concentrate | 21,340 | 17,858 | Mexico 9,467; Australia 8,391. |
| Matte | -- | 399 | All from United Kingdom. |

## COMMODITY REVIEW

### METALS

**Aluminum.**—The integrated aluminum plant at Seydisehir operated below capacity during the year owing, for the most part, to a power shortage. The shortage resulted when the power grid of the Kaban hydroelectric plant, from which the plant draws its power, was not completed as scheduled by yearend 1974. Total capacity of the Seydisehir complex when completed will be 200,000 tons of aluminum ingot, and 60,000 tons of aluminum billets, beams, plates, and foil. Feed for the complex in 1974 came from the bauxite mines of Murtas and Dogankuza.

Bauxite production was 664,909 tons, of which one-third was exported to the U.S.S.R. as concentrate and one-third was converted to alumina and then was exported to the U.S.S.R. for partial payment of the Seydisehir integrated plant. The U.S.S.R. provided $62 million for the financing of the plant in 1972. The remaining one-third of bauxite production was converted to alumina for domestic consumption.

**Chromite.**—The improved price structure of chromite on the international scene brought a significant improvement to the chromite industry of Turkey in 1974. Aside from 40,000 tons of chromite consumed in the Antalya ferrochrome plant, Turkey exported most of its production, mainly to Japan, Europe, and a limited amount to the United States.

Etibank's Antalya ferrochrome plant produced at full capacity, whereas the ferrochrome plant at Elâzig, financed by a Japanese credit, remained under construction. The Elâzig ferrochrome plant was scheduled to start production in 1977 with a 50,000-ton capacity. However, due to strong demand for ferrochromium, Etibank was giving serious consideration to expansion of the plant capacity before full production in 1977.

The production of chromite ore increased 21% in 1974 compared with 1973 output. Etibank, the largest producer in the country, provided 45% of the export tonnage. Most of the production was from Etibank's eastern mine. The Kafdagi mine and the concentrator of Etibank near Elâzig were scheduled to start production the latter part of 1975. Targeted production of this mine was given at 124,000 tons per year of 48% chrome ore.

**Copper.**—Production of blister copper in Turkey increased 20% in 1974, when compared with 1973 output. The sulfuric acid plant of Karadeniz Bakir Isletmeleri A.S. (KBI), because of malfunctioning electrostatic precipitators, was not in operation in 1973 and functioned only on a limited scale in 1974. According to reports of the Maden Tetkik ve Arama Enstitüsü (MTA), the Mineral Research and Exploration Institute of Turkey, although there were 600 known copper occurrences in Turkey, the country's total copper production came from only 10 operating mines. Etibank produced blister copper and copper pyrite, while KBI and the Black Sea Copper Co., owned 49% by Etibank and remainder by private Turkish banks, produced blister copper and sulfuric acid. KBI's major facilities, located mostly in the north and northeastern sections of Turkey, included the following: (1) The Çakmakkaya open pit mine with daily production of 6,000 tons; the Damar open pit mine, with daily production of 5,000 tons; and the Çakmakkaya concentrator, with a milling capacity of 9,000 tons per day. (2) The Çakmakkaya-Hopa filtering slurry pipeline consisting of two 62-kilometer pipelines, one for transporting copper concentrate and the other for pyrite concentrate; and filtering, drying, and shiploading facilities located at Hopa, a port on the Black Sea. (3) The Bakibaba-Kur underground mine with production capacity of 300 tons per day of high-grade copper ore and 300 tons per day of copper pyrite. (4) The Lahanos-Espiye underground mine and the Kizilkaya-Espiye open pit mine which were under active exploration during 1974. (5) The Samsun flash copper smelter, 16 kilometers inland from the port of Samsun which could produce yearly 41,000 tons of blister copper, and 365,000 tons of sulfuric acid, and includes a slag cleaning plant with 8,000-tons-per-day capacity. In addition, the smelter when in full operation was to yield 11,000 troy ounces of gold and 210,000 troy ounces of silver per year.

**Iron Ore.**—Iron ore production decreased 12% in 1974 compared with 1973 output. High-grade iron ore from Divrigi mine supplied both the Karabük and Eregli

steel plants. Tenders for the beneficiation plant proposed for low-grade Divrigi iron ore were issued during the year. The proposed plant was to beneficiate and pelletize the sulfureous magnetite ores of central-eastern Turkey for use in steel mills.

**Iron and Steel.**—Production of crude steel including cast and pig iron increased 29% in 1974 compared with 1973 figures. The increase was due to expansions at the Karabük steel mill as well as new units that became operational at the Eregli steel mill in 1974.

According to projections made by the Turkish Planning Organization (TPO), steel production in Turkey was expected to increase from 2.1 million tons in 1975 to 2.24 million tons in 1990. The increase was expected to result from completion of the Iskenderun integrated steelworks and two new steel mills to be built near Adapazari. The Iskenderun steel mill was expected to begin partial production by 1976. The Adapazari mill, under feasibility study, was expected to reach partial production by 1989. However, construction of the Iskenderun steel mill was delayed in 1974 pending discussion of the proposed increase in capacity from 1 million to 2 million tons and completion of a feasibility study of supplying coke for such an expansion.

International Finance Corp. (IFC) approved a $3.6 million loan and a $430,000 equity investment in Borusan Gemlik Boru Tessisleri, A.S., to help finance a 130,000-ton-per-year steel tube plant in northern Turkey. The entire cost of the plant, to produce ½- to 4-inch-diameter black and galvanized tubes, mostly for domestic consumption, was estimated at $10 million.

**Lead and Zinc.**—Cinko-Kursun Metal Sanayii A.S. of Turkey (CINKUR), owned 47% by Etibank and the remainder by private investors, continued its mining activities in the Zamanti Valley. Also, CINKUR's lead-zinc smelter in Kayseri was nearing completion in 1974. A feasibility study for this smelter project was started in late 1971 by Surveyer, Nemiger, and Chenevert, Inc. (SNC), and in 1972, a substantial loan for its construction was obtained from the Economic Development Corporation (EDC). The upper oxidized zone of the ore body contained zinc carbonate grading 10% to 50% zinc. The entire ore body, including lower grades, was estimated at 3.5 million tons. The lead-zinc smelter was to process 238,000 tons per year of mixed ore and was to produce 40,000 tons of zinc and zinc products, 125 tons of cadmium, and 6,000 tons of lead. All of the engineering, procurement, and construction management was under SNC's supervision, and Allis-Chalmers Co. of Canada and KHD Industrieanlagen A.G. of West Germany supplied the equipment for the smelter and mining. The full operation of mine and smelter was originally expected in early 1975. However, owing to financial problems, this date was postponed to 1976.

Production of lead and zinc in 1974 was 22% higher than that in 1973.

**Mercury.**—Etibank's exploration of its newly acquired concession of 1,000 hectares near Bolali, Usak Province, continued during 1974, but no new findings were reported. Production of mercury decreased 1% in 1974 compared with 1973 output. Though export values were higher during 1974 than those of 1973, the export volume decreased because of governmental restrictions and a decrease in mercury consumption.

**Tungsten.**—Etibank's mine development plan and construction of a concentrator at the Uludag tungsten deposit met difficulties in the latter part of 1974. A fire broke out in some of the developed tunnels of the mine and forced a delay of several weeks. Etibank had earmarked an investment of about $26 million for the entire project. The concentrator was designed to treat scheelite, the typical type of ore found in the Uludag deposit, at a rate of 560,000 tons per year, and to produce 3,000 tons of concentrate containing 65% $WO_3$. Because of the delays, Etibank rescheduled initial operation of concentrator for mid-1976 or 1977.

**Uranium.**—Management of Etibank announced establishment of a small pilot plant to process and enrich uranium ore in western Turkey, where known reserves of uranium ore were given at 4,000 tons. The information on the grade of the ore was not available.

## NONMETALS

**Barite.**—Barit Maden Turk A.S. (BMT) exported 65,000 tons of barite in 1974, 41.2% less than 1973 exports. The decrease was due to governmental decisions on exports rather than to declining produc-

tion at the mine. Most of 1974 barite exports were to oil-producing nations of the Middle East, and some was exported to Japan and the United States. Management of BMT announced in 1974 that a grinding plant was soon to be installed at the mine site. However, details of plant capacity and startup date were not available at yearend 1974.

**Boron.**—Turkey remained one of the world's leading boron producers in 1974. Etibank, the state-owned organization, held concession rights to about 12,000 square kilometers. The rights entitled Etibank to explore for and exploit not only borate minerals, but also copper, chromite, sulfur, and mercury.

Turkish boron deposits usually are associated with shales, marls, and occasionally bentonite, and as a minor mineralization in volcanic tuffs. Prior to the 1973 construction of Etibank's clay-washing plant in Kirka, most Turkish boron ore was upgraded by hand. By the end of 1974, the capacity of the clay washing plant reached 850,000 tons per year.

The amended "bill for mining reform," which proposed specific rules and regulations for future foreign investors in the borate industry, remained in parliamentary committee, and no action had been taken by yearend 1974. Under the proposed bill, a foreign company would not be allowed to obtain an exploration license but could participate with a Turkish license-holder. Also, Turkish authorities were to decide which boron deposits were to be exploited by the State organization and which deposits could be operated as a joint venture. Other major companies involved in borate production in 1974 were the Mortas-Bortas group, Rosih ve Ihsan A.S.; and Ali Sayacki.

**Celestite.**—BMT successfully produced and marketed celestite during 1974. Celestite deposits, located about 15 kilometers south of Sivas, were found to be of high strontium content. Samples of shipments dried at 100° C had the following analysis: Strontium sulfate 97.1%, barium sulfate 0.54%, calcium sulfate 1.21%, and other 1.15%. BMT exported 10,000 tons of ore to western and eastern European countries and Japan during 1974. The mine production capacity was given as 200 tons per day. Officials of BMT were optimistic about future production of celestite in Turkey because of the ore's high grade.

**Fertilizer.**—Although plant construction during the second 5-year plan did add some nitrogenous fertilizer capacity to that already in existance at Kütahya and Karabük, production by no means met demand in 1974. During the third 5-year plan (1973-77), fertilizer capacity was to be expanded. The fertilizer capacity for 1972 and the estimated fertilizer capacity for 1977 are as follows, in thousand tons per annum product:

| | 1972 | 1977 |
|---|---|---|
| Ammonium sulfate | 68 | 168 |
| Ammonium nitrate | 935.5 | 1,588.5 |
| Urea | -- | 274 |
| Single superphosphate | 422 | 522 |
| Triple superphosphate | 320 | 400 |
| Diammonium phosphate | 150 | 520 |

To implement the new capacity, planners had allocated an investment of about $500 million for new construction and expansion purposes.

Turkish imports of fertilizers during 1974 were over 50% less than the record levels of 1973. Decreased imports of fertilizer were reflected in consumption as 11% less nitrogen and 22% less phosphate were consumed in 1974 than were consumed in 1973. However, with economic recovery foreseen in 1975, fertilizer consumption was expected to recover, resulting in the demand for nitrogen products rising to 450,000 tons of nitrogen as compared with 380,000 tons in 1974 and 430,000 tons in 1973.

Producers of fertilizers in Turkey anticipated overcoming production problems in existing plants and with the expansion of facilities coming onstream in 1975 to eventually eliminate Turkish dependence on foreign fertilizer resources.

Etibank's phosphate mining remained on a limited scale while the company experimented to find the most economical and efficient beneficiation technique. Etibank officials reported reserves of 400 million tons of ore of mixed grade ranging from 30% $P_2O_5$ to 10% $P_2O_5$. Most of the phosphate deposits were located in the Mazidag area, in southeastern Turkey.

New discoveries of phosphate were reported in southeast Turkey at Bogazkerim near Kilis on the Syrian border in 1974. Reportedly, the deposits were large, and small-scale mining had begun during the year.

**Magnesite.**—Magnesite production in 1974 was 47.5% higher than the 1973 output. Most of the production was from the Eskisehir and Kütahya mines. The Tavsanli deposits were still under development in 1974. Construction of a dead-burned magnesite plant, belonging to Kütahya Manyesit Isletmeleri A.S. (KUMAS), continued in 1974. The plant was designed to produce 80,000 tons of refractory-grade MgO per year. The main producer of dead-burned magnesite was Magnesite Anonim Sirketi Magnent Ltd. Most of their production was exported to European countries and Japan.

**Perlite.**—Perlite production during the year decreased 10% compared with 1973 output. Perlite producers were looking for an effective international market in the future. According to the MTA's report, perlite deposits contained large reserves and were very accessible for shipping to overseas markets.

**Pyrite.**—Cupreous pyrite production was 75% higher than the 1973 output. The increase was attributed to intensive mining activities in copper mines along the Black Sea coast. Most of the cupreous pyrite was exported to West Germany in exchange for copper metal or other commodities needed in the Turkish economy.

## MINERAL FUELS

MTA's geophysical and geological mapping program started in 1963. Drilling yielded geothermal indications at four localities in Turkey. In 1965, Kizildere near Denizli was discovered, and in 1966, the United Nations drilled 15 holes ranging in depth from 400 to 800 meters. Hot water containing 10% to 15% steam was produced at the surface, and wellhead pressures ranged from 5 to 50 atmospheres. The maximum measured temperature of water produced at the wellhead was 200° C. Because of high contamination with calcium and boron elements, large-scale production and exploitation was delayed; more research and study was needed to overcome this handicap.

The next area of interest was in the vicinity of Afyon, where a well drilled by MTA to a depth of 200 meters encountered steam under high pressure and the well blew-out. MTA succeeded in terminating the blow-out by drilling a side-well and injecting cold water. The measured temperature of the aquifer was reported at 140° C.

The third geothermal area was at Seferihisar, south of Izmir on the Aegean Sea. Natural hot springs occur there, and the geological and geophysical surveys by MTA indicated favorable conditions. One shallow-temperature gradient well encountered steam at a depth of 60 meters. A 1,000-meter hole was scheduled to be drilled in the vicinity, but the time was not specified.

The fourth area surveyed by MTA was in the Kizilcahaman section. It is a broad basin extending 70 kilometers north and 40 kilometers northeast of Ankara, with numerous hot spring occurrences. A 2,000-meter well was started in 1973 with the expectation that sufficient hot acquifer would be encountered to permit utilization by the city of Ankara. Further details of the drilling program were not available at the end of 1974.

The major aim of MTA activities in all these areas was (1) To determine if natural hot water could be utilized economically to heat an entire city; (2) to expand the use of natural hot waters for heating cities such as Ankara, since Turkish lignite produces an excessive amount of pollution; (3) to utilize natural hot water in heating greenhouses to increase food supply; and (4) to develop electric power from geothermal energy. Although limited machinery and funds hindered MTA's program in 1974, it was planned to add a second drilling rig and to extend exploration activities to eastern Turkey.

After Norway, Turkey possessed the greatest hydroelectric potential in Europe in 1974, about 430,000 gigawatts. However, only 7% of this potential had been put to use by the end of the year. Average power consumption per inhabitant was reported to be 333 kilowatt-hours. Turkey brought into partial operation one of the country's largest hydroelectric projects, Kaban dam in 1974. The Kaban dam located on the upper course of the Euphrates River, lies about 600 air kilometers east of Ankara, in a location where the Anatolian plateau is at an altitude of 1,300 meters.

The Kaban installation was expected to influence Turkey's entire economic development since it was to provide a sizable quantity of energy for the industrial centers in northwestern Anatolia through

a 380-kilovolt line and for the consumer centers in eastern and southeastern Anatolia, which were to be serviced by by a 150-kilovolt line. The project supplied energy for the Seydisehir aluminum plant, Guleman ferrochrome plant, Divrigi iron and Maden copper mines.

**Coal.**—Plans for the Elbistan lignite project, including an opencast mine and a thermal powerplant, progressed in 1974. The powerplant was to be administered by Türkiye Elektrik Kurum Genel Müdürlügü (TEK) (Turkish Electric Power Directorate General) and the lignite mining operation and overall project administration responsibilites were to be by Türkiye Kömür Isletmeleri Kurum Genel Mudurlugu (TKI) (Turkish Coal Works Directorate General.) Cost of the entire project was estimated at $500 million. The Elbistan lignite deposit was estimated to contain approximately 3 billion tons of lignite with an overburden thickness ranging from 60 to 100 meters. The workable lignite seams reportedly averaged 40 meters, and the calorific value of the coal ranged from 800 to 1,600 kilocalories per kilogram, which was regarded as comparatively low. TKI planned to mine 20 million tons of lignite per year, of which 17.5 million tons were earmarked for power generation and 2.5 million tons were designated for domestic fuel requirements. The loans for the entire project were obtained from the World Bank, the European Investment Bank, France, West Germany, and Italy. Initial production of lignite was scheduled for 1978 to coincide with completion of the thermal plant. The plant was designed to have four 300-million-watt units with the following basic accessories: Boiler plant, turbogenerator sets, cooling systems, piping and condensation systems, instrumentation and control equipment, transformers, and a low-voltage system. In addition to these systems, other units such as coal handling and ash removal equipment, cranes and workshop facilities, water supply and auxiliary cooling units, and switchyard machinery were to be installed. The net capacity of the project was envisaged to be 1,048 megawatts, at a cost of $1 billion.

Bituminous coal production of Turkey, by both private and public sectors increased 8% in 1974 compared with 1973 output, while the lignite production in both sectors remained almost the same. Coke production increased 29% in 1974 while sales decreased 21% when compared with 1973 figures. Data on consumption were not available, but data on sales were published. Inasmuch as imports and exports were insignificant and changes in stocks were minimal, consumption was approximately equivalent to sales of unwashed coal and lignite to production of coke as shown below, in thousand tons:

| | Production [1] | | Sales [2] | |
|---|---|---|---|---|
| | 1973 | 1974 | 1973 | 1974 |
| Bituminous coal (ungraded): | | | | |
| Public sector | 7,841 | 8,506 | [3] 4,465 | [3] 4,704 |
| Private sector | 9 | 5 | 8 | 4 |
| Total | 7,850 | 8,511 | 4,473 | 4,708 |
| Lignite (ungraded): | | | | |
| Public sector | 7,537 | 7,666 | 4,806 | 5,382 |
| Private sector | 3,028 | 2,507 | 3,000 | 2,500 |
| Total | 10,565 | 10,273 | 7,806 | 7,882 |
| Coke [4] | 940 | 1,214 | 808 | 640 |

[1] Data do not agree with that shown on table 1 because of difference in source: Turkiye Komur Isletmeleri Kurmumu, 1974, p. 9.
[2] Sales figures were given in lieu of consumption.
[3] Washed product.
[4] Country's total production and sales, including public and private sector.

**Petroleum.**—*Exploration.*—In the face of the world oil crisis and rapidly rising oil prices, oil exploration requests were accelerated. It was decided by TPAO to increase the depth of producing oil wells from 4,500 meters to 6,000 meters. TPAO's activities were concentrated in the area of Tuz Lake, where exploratory wells 15 years old were proven negative; in the northern sector of Siirt Province; in the area of Murat River; and in the provinces of Adana, Aidyaman, and Erzurum. TPAO decided to drill 24 new wells in Turkish Trace where it recently had discovered a high-quality crude. TPAO's activity continued near Gaziantep, Nuraylin, and Cizre in southwestern Turkey.

Additional exploration licenses were obtained for offshore exploration in the Aegean and in the Mediterranean Seas. However, considerable tension was building up in both Greece and Turkey with respect to offshore drilling in the area, due to disputes over seabed boundary rights between the two nations. By yearend, no solution was found although both countries were working on the problem.

In 1974, Aladdin Middle East Ltd. discovered petroleum in Region V, a main oil producing area of Turkey. The find was a rather light oil with specific gravity of 22° API. By yearend, more geological and seismographic work was done, and more drilling on the concession was scheduled for 1975.

*Production.*—According to the Association of Turkish Petroleum Geologists, TPAO produced 20,000 of the 65,000 barrels of crude oil per day in Turkey. Other producers were Shell Company of Turkey Ltd. 39,000 barrels; Mobil Exploration Mediterranean Inc. 7,800 barrels; and the Ersan Petrol Sanayii A.S. 720 barrels per day. Salient production statistics on oilfields in Turkey are as follow:

| Name of field and discovery date | Number of wells | | | | | Production in barrels | | Gravity API |
|---|---|---|---|---|---|---|---|---|
| | Depth (feet) | Flowing | Pumping | Gas lift | Shut in | Daily average 1st 6 months of 1974 | Cumulative July 1, 1974 | |
| Ersan: Kahta, 1958 | 3,500 | -- | 5 | -- | 1 | 721 | 3,446,651 | 11.5 |
| Mobil: | | | | | | | | |
| Bulgurdag, 1960 | 6,500 | -- | 1 | -- | 2 | 102 | 2,203,000 | 39.0 |

# The Mineral Industry of the U.S.S.R.[1]

By V. V. Strishkov [2]

The U.S.S.R., with a centrally planned economy and low-wage labor, is the world's second largest producer of industrial products. It is the leading producer of petroleum, iron ore, manganese ore, chromium, potassium salts, phosphates, and cement. It holds second place in the production of steel, gold, natural gas, aluminum, fluorite, and platinum-group metals, and it is one of the leading producers of copper, nickel, lead, zinc, tungsten, molybdenum, mercury, and native sulfur.

Compared with 1973 figures, the following increases, in million tons, have been reported: Raw coal and lignite—16.9; oil (including condensate)—29.9; iron ore—8.8; pig iron—3.9; crude steel—4.7; finished rolled, ferrous metals—2.8; steel pipe—0.6; mineral fertilizers—1.9 (100% content); and cement—5.6. Electric power output increased 60 billion kilowatt hours. There were also increases in the output of nonferrous, rare, and precious metals, refined petroleum products, and nonmetallic minerals. In 1974 the annual plan for production of many mineral products was met, but rolled ferrous metals, steel pipe, aluminum, and nickel production failed to meet even the reduced growth rate set for 1974.

Despite impressive gains in mineral production, as reported in the Soviet press, there have been consistent reports of the failure of mineral commodities to reach planned goals and to supply industrial needs.

The Soviet ferrous and nonferrous industries employed over 3 million workers;[3] the ferrous industry alone accounted for about 2 million "production" workers and some 75,000 university graduate engineers and 125,000 graduate technicians. There were over 2 million employees in the coal industry, including 61,500 university graduate engineers and 141,000 technicians. The oil, gas, and petrochemical industries employed 2.6 million, including over 250,000 in the development of oilfields and gasfields.[4]

Equipment used in Soviet mineral industry is standard and of the type made earlier in Western Europe and in the United States. The manufacture of mining equipment has increased substantially, but the technical standards and the quality of the equipment have fallen short of planned goals. Equipment manufacturing plants have been criticized in the Soviet press [5] for the poor quality of their products. Some enterprises produce only products that are "profitable" for them and pay little attention to the needs of the State.[6] When considering the growth of Soviet mineral production, it must be remembered that mineral industry output has grown because the country has natural resources, manpower, and favorable geographical and climatic conditions.

Despite the expansion of the Soviet mineral industry, supply has not kept up with demand and there have been chronic mineral and fuel shortages, particularly in the European part of the U.S.S.R. The Soviet economy sustains immense losses each year as a result of insufficient output and underutilization of energy and metals.

[6] Pravda, Moscow. Dec. 28, 1973, p 1.

Over 5,000 deposits of various minerals were being exploited in 1974. Extensive prospecting and exploration for practically all commodities was carried out on a large scale. There were over 500,000 employees in the geological and prospecting organizations of the U.S.S.R. in 1974, including 63,000 graduate specialists with university education and over 53,000 graduate technicians. A total of over 3 billion rubles was allocated for geological exploration in 1974, 8% more than in 1973.[7] About 52% of all funds was for oil and gas exploration and 5% for exploration for coal deposits. Over 2,500 geological and geophysical teams are permanently employed in the prospecting and exploration of oilfields and gasfields, and about 2,200 exploratory wells are completed each year, using some 2,500 drilling rigs. Drilling footage on oil and gas increased from 9.1 million meters in 1963 to 13.6 million meters in 1973. In 1974, 14.5 million meters were planned.[8]

In many instances, the exploration program has not substantially improved the U.S.S.R.'s reserve position. This is particularly true of nonferrous metals, rare metals, and gold. There are shortages of bauxite, copper (Urals), nickel (Kola Peninsula), mercury (Ukraine), and lead (Central Asia).

The main purpose of recent Soviet mineral exploration has been to improve the distribution of the raw material reserves for the production of major metals, all fuels, and many nonmetallic minerals. However, during the past 10 years, no increment in tin reserves has been achieved even in the Soviet Far East. Poor results were also reported in the growth of reserves of bauxite, lead, zinc, mercury, tungsten, antimony, and nickel (Kola Peninsula).[9] Good results were obtained in increasing the quantity and quality (by 50%) of copper-nickel reserves in the Norilsk area, where 20 teams of geologists were employed in 1974.

More than 300 scientists and specialists were assigned to carry out fieldwork with the Far Eastern Institute of Geology in 1974. The main effort was concentrated in the Sikhote-Alin area for tin and polymetallic ores. Some 30 geological teams were assigned to Kamchatka, Sakhalin, Chukotca, the Kurills, and Khabarovsk Kray in a search for gold deposits. Geologists from the COMECON[10] countries were jointly prospecting for oil and gas in the Baltic Sea and in the Black Sea.

Despite the extensive, specially oriented geological prospecting conducted for many years, the production facilities at 34 enterprises of nonferrous industry, which were built recently, continued to experience ore shortages and losses due to miscalculations when estimating ore reserves.[11]

Capital investment in the Soviet economy amounted to 105.7 billion rubles in 1974, 7% over that of 1973. Production capacity either new, expanded, or renovated commissioned in the mineral industry during the year, in million tons, was as follows: Crude iron ore, 24.4; raw coal, 19.4; pig iron, 4.0; crude steel, 3.0; ferrous semimanufactures, 1.8; mineral fertilizers, 7.0 (Soviet standard); trunk crude and product lines, 6,200 kilometers; trunk gaslines, 8,400 kilometers; and powerplants, 10 million kilowatts. Construction plans which included projects for the above industries were not all met in 1974, and several important facilities due to startup in 1974 were not completed.

In 1974, 19.3% more capital investments were allocated for developing the refining and petrochemical industry compared with 1973 investments. Capital investment in the petroleum and gas industries increased 60% from 1965 to 1970 compared with the 1961–65 period, and 200% compared with the 1971–75 period.[12]

New enterprises that became operational in the iron and steel industry included facilities at the Mikhaylovskiy Novo-Krivorozhskiy, Ingyletskiy, and Lysakovskiy mining and processing combines, the No. 9 blast furnace at the Krivorozhsk works, the first stage of oxygen convertor shop No. 2 at the West Siberian works, blooming mill "1500" at the Nizhne-Tagilskiy complex, and rolling mill "950–900" at the Donetsk metallurgical works.

In nonferrous metallurgy new facilities

were put into operation at the Krasnoyarsk aluminum plant and at the Dzhezkazganskiy, Norilskiy, and "Sveronikel" complexes.

New facilities for ammonium production were started up at the Novomoskovskiy and Severodonetskiy chemical complexes, at the Voskresenskiy and Gomelskiy chemical works, and at the Kuybyshevskiy nitrogen plant.

In the coal industry, the three following facilities were reported to have come onstream in 1974: The Krasnoarmeyskaya Kremenchugskiy, Polotskiy, Novo-Ufim-Donets Basin and two beneficiation mills—Zapadno-Donbasskaya No. 1 in Dneprovskaya Oblast' and Krasnaya Zvezda in Donets Oblast'.

New capacities for primary and secondary refining of crude oil started up at the Novokuybyshevskiy, Angarskiy, and Omskiy complexes, and at the Kirishskiy, Kremenchugskiy, Polotskiy, Novo-Ufimskiy, and Groznenskiy imeni Sheripova refineries. The first stage of the Orenburgskiy gas plant and of the 2,500-kilometer Tyumen'sk Oblast'-Tsentr trunk gas pipeline were completed in 1974.

The U.S.S.R. continued to experience much difficulty in the construction of mineral industry projects. Efforts were dispersed over a large number of projects, with the work taking 1.5 to 3 times as long as specified by the U.S.S.R. State Construction Committee. The 10- to 15-year period required to develop a mine with a capacity of 1 million to 2 million tons per year contributed to disparities between capacities of mines, concentration mills, and metallurgical plants, as for example, at the Petrovskhya-Glubokaya coal mine in the Donets Basin. During the development period (under development since 1962) estimated cost has risen by more than 20 million rubles as a result of the many changes in design. In 1973 alone, Dongiproshasht (Donets Coal Mining Design Institute) replaced 174 drawings related to the Petrovskhya-Glubokaya mine and 176 drawings for the Oktyabskiy Rudnik mine.[13] The 3-year construction time for the Karaganda metallurgical plant was approved by the Ministry of Ferrous Metallurgy. Actually, the plant has been under construction for 8 years and has not been completed. The cost of installing equipment increased from 16 million to 48 million rubles and later to 72 million rubles.[14]. Also in the field of ferrous metallurgy the following scheduled facilities were not put into operation in 1974: A blast furnace at the Karaganda metallurgical plant, an oxygen converter shop at the Novolipetsk plant, rolling mills at the Cherepovets and Nizhne-Serginsk metallurgical plants, and about 80 other projects. Construction of the following petroleum refineries was not proceeding according to plan: Groznyy, Kremenchug, Kherson, Krasnovodsk, Fergana, Mazheykyay, Chardzhov, Achinsk and Pavlodar.[15]

Construction of the 3,200-kilometer Baykal Amur Railway began in 1974. The present Trans-Siberian Railway runs parallel and very close to the People's Republic of China (PRC) border. This new line, even at its nearest point, is separated from the border by several hundred kilometers of rugged terrain. Annual capital investment in construction of Baykal-Amur Railway is expected to rise from 57 million rubles in 1974 to 285 million rubles in 1975; the completion date is currently set for 1982. The new railway will assist the economic development of a territory of some 1 million square kilometers which is reportedly rich in minerals.

Additional production capacities, including new or expanded plants and renovation of existing facilities in million tons unless otherwise specified, are shown below.

| Commodity | Actual | | 1974 | |
|---|---|---|---|---|
| | 1972 | 1973 | Planned | Actual |
| Iron ore, crude | 28.5 | 39.0 | 36.7 | 24.4 |
| Coal and lignite, raw | 18.0 | 34.0 | 27.9 | 19.4 |
| Pig iron | -- | 3.7 | 5.8 | 4.0 |
| Steel, raw | 2.2 | -- | 7.0 | 3.0 |
| Finished ferrous rolled metal | 1.6 | 3.5 | 4.8 | 1.6 |
| Mineral fertilizers (Soviet standard) | 7.0 | 8.9 | 10.5 | 7.0 |
| Cement | 4.2 | 3.7 | 5.8 | 5.6 |
| Powerplant, million kilowatts | 1.5 | 11.0 | 11.3 | 10.0 |

Labor turnover remains a serious problem at many mines and plants. For example, in the three enterprises where surveys were conducted (the Turgay bauxite mining administration, the Irtyshskiy polymetallic complex, and the Zolotushinsk mining administration in Kazakhstan) labor turnover has reached 48.5%. During 1 year the worker turnover at the enterprises was almost one-half.[16] Soviet surveys showed that labor turnover has an adverse effect on the labor discipline among the workers. This is attributed mainly to the lag in housing construction and medical and consumer services, to low financial incentives, and to the heavy manual work involved.

Every year large-scale production facilities are put into operation in the mineral industry, while facilities for housing and consumer services are lagging. For example almost 14,000 workers at the Cherepovets metallurgical plant are waiting for housing.[17]

Soviet statistical agencies do not publish data on the actual earnings of mineral industry workers. The average monthly earnings of all Soviet workers and employees in 1974 was 140.7 rubles[18] compared with 134.9 rubles in 1973, an increase of 4.3%. According to the Economic Gazette,[19] the average earnings of white collar employees in the Soviet coal industry were 177 rubles per month in 1973. In 1974 the monthly minimum wage continued to rise and went from 60 to 70 rubles in the North and the Soviet Far East regions.[20]

When considering the actual market value of 1 ruble to be US$0.33 (on the Soviet black market the rate of $1.00 equals between 3 and 4 rubles), then the average real annual earnings of Soviet workers and employees, white collar workers in the coal industry, and minimum wage workers amount to $540, $708, and $280, respectively.

The U.S.S.R.'s reported mineral commodity consumption per capita approaches that of Western Europe, although there is still a significant difference in the standard of living. One reason for the apparent difference is that the Soviet growth is measured in terms of energy and minerals produced not in terms of energy and metals usefully consumed. In addition, fuel and mineral shortages often bring with them substandard commodities which are marketed as standard items.

Although simple comparisons of minerals data between the Soviet Union and those of Western countries are often made, most are invalid unless qualified in great detail. Thus, the relative size or the relative growth of the economy of the Soviet mineral industry can best be determined from a careful and exhaustive study of all pertinent Soviet publications. Soviet self-criticism, although sometimes reported in obscure fashion, shows an amazing and acute awareness of the problems of the Soviet industries.

Practically all mineral commodity exports increased in 1974, with fuel exports showing the fastest growth. Fuels, mineral raw materials, and metals play the largest role in Soviet exports, representing about 44% of total official exports during 1974. Oil, gas, and metal exports are expected to rise, despite increasing domestic demand and some production and transportation difficulties. The export of mineral commodities produces foreign exchange to help pay for imports, even though almost all mineral commodities exported could be easily consumed within the country.

**Government Policies and Programs.**—Soviet mineral policy continues to be based on the principle of maximum self-sufficiency at any price. Actual or estimated costs of production in the U.S.S.R. are not a prime factor in the selling price of a commodity on the domestic or international market. The Soviet system permits the establishment of selling prices at any level believed desirable to meet political and economic requirements. Therefore, many mineral ventures in the Soviet Union would be uneconomic by Western standards.

One of the most striking contrasts between Soviet and Western mineral economies is the clear direction given to the development of Soviet mineral policy. In

[16] Narodnoye khozyaystvo Kazakhstana (National Economy of Kazakhstan), Alma-Ata. No. 1, January 1974, pp. 67–71. Soviet yustitsiya (Soviet Justice), Moscow. No. 18, September 1974, pp. 18–20.

[17] Sovetskaya Rossiya (Soviet Russia), Moscow. Sept. 19, 1974, p. 2.

[18] Official exchange rate is 1 ruble=US$1.37 (Jan. 1, 1975). Approximate buying power of 1 ruble relative to prices in the United States for hard goods and food according to some estimates ranges from about 20 to 50 cents.

[19] Ekonomicheskaya gazeta (Economic Gazette), Moscow. February 1974.

[20] Pravda, Moscow. Jan. 25, 1975, p. 3.

most market-oriented economies, national mineral policy is largely an accommodation of often divergent and conflicting sectors in the economy. In contrast, the Soviet Union's 5-year plans and the year-to-year plans set, in unmistakable terms, a definite policy for all mineral commodities. In addition to expressing established national priorities within which each industry must operate while at the same time pursuing the goals set for it, the plan is also law and carries mandatory obligations. Mineral development, as the basis for industrial growth, holds a key place in Soviet economic policy. Substantial funds are spent on mineral exploration and development and the funds are distributed over a dozen specialized ministries.

Much attention is now being devoted to economic integration of the COMECON countries, which makes East Europe, Mongolia, and Cuba more dependent upon the Soviet mineral industry. Yugoslavia is not a member of COMECON, although an agreement formalized in 1964 laid the foundation for Yugoslav cooperation and participation within the group (it has observer status in half of the COMECON's 24 commissions). An agreement on cooperation between Yugoslavia and COMECON's International Investment Bank was signed on April 26, 1974. Yugoslavia is the first country which is not a COMECON member to sign a cooperation agreement with the Bank. The COMECON also cooperates with Finland under a 1973 agreement.

The Soviet Union and its COMECON partners have agreed on a plan for economic integration over the next 15 to 20 years, and the COMECON countries in East Europe are participating with their capital, machinery, and labor in the development of the Soviet minerals industry. Among the new forms of cooperation between COMECON countries are long-term and large-scale "joint" ventures in industrial construction, particularly in the development of Soviet natural resources. The East European countries are now engaged in the construction of the Staryy Oskol Steel complex, the Kiembay asbestos plant, the "Mir" electric system, the "Druzhba" oil pipeline, and many other Soviet projects. In the first half of 1974, the U.S.S.R. required these countries to make new contributions to the Orenburg gas project and to the construction of a 2,750-kilometer gas pipeline from Orenburg to the Soviet-Western border. The control of the COMECON countries is arranged by the Soviet Union through the International Bank for Economic Cooperation and the International Investment Bank.

In certain circumstances, the Soviet Union extends credits for the construction of certain industrial projects under "aid" for the industrialization of COMECON nations, where rich resources of ores and fuels exist. However, the production goes to the Soviet Union to offset credits and interest and to pay for the services, fuels, and metals that are imported from the U.S.S.R. In this way, the uranium resources of Czechoslovakia and Hungary, the bauxite of Hungary, the nickel of Cuba, the polymetallic ores and concentrates of Bulgaria, and the coal, copper, and zinc of Poland go directly to the Soviet Union.

Soviet law does not permit private ownership of the "means of production", but foreign investors are invited to develop deposits and to construct plants in the U.S.S.R. and repayment is promised in the form of production from these operations. Thus the Soviet Union was able to bring much needed investment and technology from Western countries by using joint venture arrangements.

In its economic relations with developed Western countries, the Soviet Union strives for all-round businesslike cooperation. Longterm agreements on developing economic, scientific, technical, and industrial cooperation with the United States, West Germany, France, Italy, the United Kingdom, and others were signed in 1974. These provide for cooperation in the construction of industrial complexes, expansion and modernization of existing industrial enterprises, and research planning. They also provide for the implementation of "joint" operations in such fields as computer technology, instrument building, chemical industries, ferrous and nonferrous metallurgy, the oil, coal, and mineral industries, and protection of the environment. The Soviet Union needs Western technology to solve many problems of the mineral industry.

The Soviet Union has large technical assistance and economic aid programs including over 300 projects in 64 foreign countries at a total cost of about 5 billion rubles. Soviet specialists provide technical

assistance for geological research, prospecting, and exploration in 30 developing countries.[21] This work is conducted through bilateral agreements and through appropriate agencies of the United Nations.

In many instances, developing countries pay for Soviet assistance with mineral commodities. The U.S.S.R. is now able to secure a substantial flow of mineral imports at low cost from friendly, developing countries, and there are indications that it intends to extend this pattern to gain exclusive access, for itself and other COMECON countries, to deposits of exceptional quality.

In September 1974 the Soviet Government, in accordance with the March 2, 1973 decree of the Council of Ministers and Central Committee of the CPSU on measures for further perfecting industrial management, approved management restructuring in the coal, oil, and gas industries.

The coal industry will be managed on both the two-link (National Ministry and Producing Association) and the three-link system (National Ministry, Ukranian Ministry, and Producing Association). The gas industry will also have a two- and three-link system, depending on the specific character of gas development in individual regions of the country: The U.S.S.R. Ministry of Gas Industry-Production Association/Enterprise; and the U.S.S.R. Ministry of Gas Industry-All Union Industrial Association-Production Association/Enterprise. The oil industry will operate exclusively on the two-link system: U.S.S.R. Ministry of Oil Industry-Production Association/Enterprise.

Coal, gas, and oil industries will have 47, 32, and 22 production associations, respectively, to be achieved through combining 1,600 coal, 200 gas, and 300 oil independent enterprises and organizations.

As envisaged in the 1973 decree, formation of industrial and production associations will be accompanied by elimination of the main production administrations (glavki) of central coal, gas, and oil in Moscow. Target dates for final changes in these ministries to the new management system are 1974 (gas industry), 1975 (oil industry), and 1976 (coal industry). The new system of management will result in annual savings to the Government of 120 million to 130 million rubles in the coal industry, 100 million to 110 million rubles in the gas industry, and 27 million rubles in the oil industry.[22] Numbers of white collar workers in management of three industries were also significantly reduced.

In 1974, the draft of the general scheme for management of ferrous metallurgy was being worked out jointly with the Gosplan (State Planning Committee of the U.S.S.R.) and the Ministry of Finance, after which it would be submitted to the U.S.S.R. Council of Ministers.

The State plan for 1975 was approved by the CPSU Central Committee and ratified by the Supreme Soviet on December 20, 1974. Soviet planners reduced the 1975 target provided for in the original 5-year plan and stressed heavy industry production for the year. The plan calls for an overall increase in industrial output of 6.7% including a 7% increase in heavy industry output and a 6% increase in consumer goods output. Capital investments in 1975 will total 113 billion rubles, or a 7.3% increase over those of 1974. Major investment areas in 1975 will be the fuel-energy sector, ferrous and nonferrous metallurgy, the chemical industry, and the machine construction industry.

Special attention in the 1975 plan is focused on the fuel and power sectors. The production of electric power is to increase by 60 billion to 1,035 billion kilowatt-hours. Because of the constant fuel crisis and to improve the fuel-energy balance in the European part of the U.S.S.R., impetus will be given in 1975 to rapid expansion of nuclear powerplants. Crude oil extraction (including condensate) is planned at 489.4 million tons, 30 million tons over that of 1974; natural gas output is to amount to 285 billion cubic meters, an increase of more than 24 billion cubic meters over that of 1974. The main sources to increase petroleum and gas production in 1975 are the fields of Western Siberia, Kazakhstan, Central Asia, the Komi A.S.S.R., the Udmurt A.S.S.R., and Permskaya, and Orenburgskaya Oblasts.

Raw coal and lignite output is to total 700 million tons. The coal and lignite production target for 1975 will be above the original 5-year plan, which highlights the importance attached to coal and lignite as substitutes for oil and gas. It is planned to invest 2.5 billion rubles in development of the coal and lignite industry in 1975; the main annual increase in

[21] Sotsialisticheskaya industriya (Socialist Industry), Moscow. Sept. 14, 1974, p. 4.
[22] Sotsialisticheskaya industriya (Socialist Industry), Moscow. Sept. 6, 1974, p. 1.

production of hard coal is to be in the Donets Basin (5.5 million tons) and in the Kuznetsk Basin in Siberia (4.3 million tons).

Crude steel output is to be increased 6 million to 142 million tons. Compared with 1974 production, finished ferrous rolled metal is to be increased by about 5% and steel pipes by 6.2%. The rolled steel industry faces problems of both quantitative as well as qualitative production. Capital investment in ferrous metallurgy is to be increased by more than 19% over that of 1974.

The 1975 nonferrous metallurgy plan calls for increased production of aluminum, copper, nickel, and other metals. Objectives are being specified to develop the ore base for the nonferrous sector and particularly for the lead, zinc, and copper industries. The 1975 plan envisages production of 90 million tons (Soviet standard) of mineral fertilizers, an increase of 10.3 million tons, and the production of 122 million tons of cement, an increase of 7.0 million tons. The power potential of the U.S.S.R. is to be increased by 13 million kilowatts in 1975.

A 28-million-ton increase in crude iron ore capacity is to be obtained by the construction of new facilities at the Lebedinskiy, Novokrivorozhskiy, Kachkanarskiy, and Dneprovskiy iron ore mining and concentrating complexes. New facilities for finished ferrous rolled metal are to be put into operation at the West Siberian, Cherepovetz, and Orsk-Khalilovo metallurgical plants. The plan also calls for construction of 10,000 kilometers of main oil and gas pipelines.

Soviet industrial production, in million tons unless otherwise specified, is shown in the following tabulation:

| Commodity | 1974 | | 1975 | |
|---|---|---|---|---|
| | Planned | Actual | Originally planned | Newly planned |
| Iron ore (usable) | 221.0 | 225.0 | 254.0 | 235.5 |
| Pig iron | 99.5 | 99.0 | 105–110 | 104.8 |
| Steel, raw | 135.9 | 136.2 | 142–150 | 142.0 |
| Finished ferrous rolled metal | 95.2 | 95.9 | 101–105 | 99.5 |
| Steel pipes | 15.1 | 15.0 | e 18.0 | 15.9 |
| Cement | 114.0 | 115.0 | 122–127 | 122.0 |
| Mineral fertilizers (Soviet standard) | 80.2 | 80.3 | 90.0 | 90.0 |
| Coal, raw (bituminous, anthracite, lignite) | 679.1 | 678.6 | 685–695 | 700.0 |
| Natural gas billion cubic meters | 256.8 | 261.0 | 300–320 | 285.0 |
| Petroleum, crude including condensate | 458.9 | 459.0 | 480–500 | 489.4 |
| Power, electric billion kilowatt-hours | 975.0 | 975.0 | 1030–1070 | 1,035.0 |

e Estimate.

The 1975 plan, and all preceding plans, call for complete utilization of capacities, primarily in the field of fuel extraction, ferrous and nonferrous metallurgy, and the chemical industry. Efficiency of the utilization of working capital is also to be improved. The Soviets plan to save around 1.5 million tons of rolled ferrous metals in machine-building and metal processing, more than 11 billion kilowatt-hours of electric power, and about 12 million tons of standard fuel equivalent and other material resources. In 1975 average monthly earnings of Soviet workers are planned to be over 144 rubles, or 2.7% over those of 1974. Increases of minimum wages for industrial workers to 70 rubles per month will continue in 1975.

The 10th 5-year plan (1976-80) envisages large projects in a number of sectors including fuel-energy, agriculture, and railways and several major industrial projects in cooperation with other COMECON nations.

Policy in the fuel sector will be characterised by structural changes that will enhance the coal industry as compared with the oil and natural gas industries which resulted from a new technology that promised to produce gaseous and liquid fuels from coal. Experimental work is to be greatly expanded in order to create a new branch of the fuel industry. At the same time, both the oil and gas industries will be developed further. Geological exploration will be concentrated on the growth in recoverable reserves in the European part of the U.S.S.R. and efforts will be made to increase recovery of oil and gas.

Declining reserves of raw materials and fuels in the European part of the U.S.S.R. have forced Soviet planners to give increased attention to reserves located in the north and east of the country. Exploiting these reserves will be difficult because of extreme climatic conditions and will also necessitate large capital investment in railroads and pipelines for long-distance transportation.

Efficient use of capital investment and improved labor productivity both have high priorities under the 10th 5-year plan. The plan also calls for changes in economic indicators. There will be three new sections: (1) Environmental protection and improved utilization of natural resources; (2) economic cooperation between the U.S.S.R. and the Socialist countries and the development of economic integration (formerly this was in the foreign trade section); and (3) improving economic management. In the new plan more emphasis will be paid to indicators which characterise scientific-technical progress. Beginning in 1976, planning and accounting of industrial commodity output and other value indicators will be calculated using prices and rates of January 1, 1975, instead of those of July 1, 1967.[23]

## PRODUCTION

A Soviet decree dated April 28, 1956, classifies as State secrets all data on production capacity and production plans of nonferrous, precious, and rare metals enterprises as well as data on the fulfillment of these plans.

Although the U.S.S.R. does not publish official statistics on many mineral commodities, information on most basic materials is available. Together with published information on industrial development, this information provides the basis for estimating output of other commodities. Many of the figures in the production table are interpretative extrapolations from Soviet published material and represent at best an order of magnitude.

Production of nonferrous metals using oxygen, natural gas and electrothermic processes increased in 1974. At the Balkhash complex in Kazakhstan, for example, about 20% of all copper concentrate was smelted directly in the converters, bypassing the reverberatory smelting stage. The Almalyk complex in Uzbekistan is using an oxygen-flash smelting process. More than 70% of the nonferrous enterprises were using natural gas in 1974. The natural gas consumption of the nonferrous industry reached 5 billion cubic meters in 1974.

Recovery of metals in concentrate increased during 1966–70 as follows: Copper, 2.5%; zinc, 3.2%; nickel, 7.2%; tungsten, 2.5%; and molybedenum, 4.6%. In metallurgical conversion the extraction of nickel increased 2.7%; zinc, 1.9%; cobalt, 1.3%; and copper, 0.5%. During the current 5-year plan there has been a further increase in extraction from ores and concentrates, but the planned extraction targets for many nonferrous metals were not achieved and continued to be much below the Western level.

In the course of mining and processing at the Bashkirian copper-sulfur complex, the Uchaly mining and concentration combine, and the Buribayevskiy ore administration in Bashkir A.S.S.R. significant quantities of zinc, sulfur, and precious metals were lost. Similarly, the third section of the Uchaly' concentrator was recently put into operation with imperfections and zinc concentrate was not recovered for some time. Planned quotas for extracting copper and zinc were also not met at the Sibay, Tekeliyskaya, Berezovskaya, Leninogorskaya, Belousovskaya, and other concentrators, resulting in losses of nonferrous and rare metals.[24]

There are also important slag losses. In June 1974 there were more than 280 million tons of slag containing about 8 million tons of metal in dumps at 17 large metallurgical plants alone. Although 2.5 million tons of metal was recovered from slag in 1965, this has declined to 1.3 million tons in 1973 despite increasing slag quantities. Technically the extraction of metal from slag is extremely poor at metallurgical plants, and magnetic separation is only done at certain enterprises.[25]

In 1974, a number of mines and plants were commissioned despite numerous imperfections and inadequate equipment.

Many projects have operated over a long period with lower capacities than originally planned. Only 75% of new projects manage to reach rated capacity because of poor design quality and defects in equipment. By January 1, 1974, planned capacity had not been reached at many blast furnaces, open-hearth shops, and rolling mills.[26] In the coal industry 190 mines did not reach their planned capacity in 1974.[27]

In many sectors of the Soviet economy more electric power, fuels, and metals are consumed per unit of product than is required with modern technology. In many Soviet industrial enterprises an enormous quantity of secondary power, fuels, and metals are insufficiently utilized.

Because of a shortage of some needed equipment, there was a rapid increase in stocks at many establishments. Stocks at Soviet industrial enterprises increased 990 million rubles during 9 months of 1973, which included 138 million rubles of foreign equipment. At the same time many other projects could not be completed because of a shortage of equipment.[28]

Ferrous metal production in the U.S.S.R. is increasing from year to year and rolled steel output reached 109 million tons in 1974. Nevertheless, the economy continued to experience shortages of ferrous metals. The June 1974 decree of the Central Committee of the CPSU pointed out that the Ministry of Ferrous Metallurgy U.S.S.R. was not taking the necessary steps to improve quality and broaden the variety of rolled products, pipe, and other metal products. Production fell considerably short of goals for rolled products made of low-alloy steels, for example, principally because of the lack of thermal facilities in metallurgical plants.[29] A study of Soviet publications showed that only about 45% of the total crude steel production is effectively used in the Soviet economy, and more than one-half is remelted or lost as a result of inefficient production and consumption of metal.

The quality of raw materials at some blast furnaces has deteriorated and the productivity of furnaces has sharply declined, while at other locations breakdowns have become more frequent and idle time for equipment has risen.[30]

The total cost of production installations and equipment in the coal industry increased from 7,154.4 million rubles in 1960 to 12,714.4 million rubles in 1972, or 80%, but production of coal and lignite increased only 23% during the same period. The efficiency of capital investment in the coal industry decreased 28% during the 1960–72 period.[31]

Over 90% of 1974 mineral production was shipped by rail. The average transportation distances follow: Coal and lignite, 687 kilometers; coke, 792 kilometers; crude oil and petroleum products, 1,252 kilometers; iron and manganese ores, 731 kilometers; and ores for the nonferrous industry, 931 kilometers.

While the U.S.S.R. does not publish statistical data of injuries in the mineral industry, available Soviet information reveals that there were many fatal injuries in the mineral industry. In 1974, fatal injuries occurred at 485 Soviet coal mines,[32] and there were serious problems in the coal industry. There was a high rate of fatal injuries in many mines which resulted from mine management neglect, inadequate safety conditions, and violations of safety regulations and labor laws in order to increase production. Fatal injuries in the nonferrous industry of Kazakhstan did not decrease.[33] The accumulation of dust at work sites in the underground coal and metal mines of the Soviet Union is high and often exceeds the sanitary standard.[34]

The administration of Soviet mines and plants, with the approval of the trade organization, has often used overtime work to fulfill the planned production quotas, has sometimes required workers to work two or three shifts in succession, and has required underground miners to work an

8-hour shift instead of a 6-hour shift, in violation of labor law.[35]

The general level of technology in the Soviet mineral industry has lagged consistently behind that of the more advanced Western countries. The rule is that new technology is introduced and proved first in the Western country and then after a time it is made available to the U.S.S.R. Transfer of Western technology to the Soviet Union continued to be the most important factor in Soviet mineral industry development. A low degree of mechanization is characteristic in such areas as mine development, roof support, and hauling of coal and ores. The labor intensive functions of mining and metallurgy occupy large numbers of workers who could be replaced by machinery. For example, in coal mining, manual labor is used almost exclusively in longwall work (49,000), for roof support in development workings (24,000), for loading of coal and rock in development workings (20,000), and for maintenance of workings (76,000 workers).[36] Many operations in loading and maintenance shops of nonferrous enterprises were performed manually, with the result that hundreds of million rubles were lost.[37]

The Soviets are increasingly conscious of the age and obsolescence of their machine tools and of much of their mining and metallurgical machines and equipment. Soviet industries continue to turn out obsolete models because the emphasis is on production and no time adjustments are made for retooling. The Soviets prefer not to use new and untried equipment with its inherent risk of failure and are inclined to use old and established equipment.

Soviet reports have documented obsolete equipment in 43 blast furnaces, 80 open-hearth furnaces, 97 rolling mills, about half of the power units, and a large percentage of the metal products equipment. Ten-year-old units are being used to smelt 31% of the pig iron, 29% of the open-hearth steel, and 31% of the finished rolled metal.[38] Out of 200 coking batteries in the U.S.S.R., more than half have been operating for more than 20 years, some of them for 40 years. Many became obsolete or were worn out long ago.[39]

The use of obsolete drills and the inferior quality of drilling bits and steel in underground metal mining required a large number of manual workers.[40] The petroleum and gas industries also had special problems. The drilling of exploration and developmental wells in these industries failed to meet planned targets.[41]

Automation of Soviet rolling mills lags behind that of the Western countries both in availability of the facilities and the systems necessary for automation of rolling equipment.[42]

Soviet investigations show that coal production equipment is utilized at an average rate of 40% to 45% while the plan calls for 65%. This means that between 55% and 60% of the machinery and equipment is idle. As a result the coal industry is losing more than 180 million rubles per year. The situation is made worse by the fact that generally coal enterprises are not responsible for the low level of equipment utilization, and they are not much interested in improving the situation.[43].

Half of the quotas set for longwall machinery have not been fulfilled. As a result, almost one-quarter of the Ukranian coal mines failed to meet their planned targets for the first half of 1974,[44] and some 70% of the coal at the steeply inclined coal seams in the Donets Basin is mined by means of obsolete pneumatic pick.[45]

During the last 3 years, labor productivity at the Chukotka gold and tin mines declined 1.8% and production cost of the metals increased significantly. Excavators, bulldozers, drilling machines, trucks, and other machines, which were made for the use in the central regions of the European part of the U.S.S.R., were idle for a long time under Arctic conditions.[46]

In the cement industry, for each rotary furnace, there are an average of 50 short

| As reported, gravimetric units [2] | 400,440 | 429,037 | 458,948 |
| Converted, volumetric units thousand 42-gallon barrels | 2,943,234 | 3,094,350 | 3,373,650 |
| Refinery products [10] thousand tons | 292,000 | 316,000 | 326,000 |

[p] Preliminary. [r] Revised. NA Not available.
[1] Estimate except where otherwise noted.
[2] Reported in Soviet sources.
[3] Source: Unless otherwise specified, United Nations Annual Bulletin of Steel Statistics for Europe, 1974, v. 2, New York, 1975, p. 23.
[4] Estimated from reported total given subsequently in table on the basis of the reported distribution of the equivalent total in 1971 and 1973.
[5] Estimated on the basis of 6 months data published in: United Nations Quarterly Bulletin of Steel Statistics for Europe 1973, v. 24, No. 4, New York, 1974, p. 20.
[6] Items reported under this heading are produced from semimanufactures listed above and possibly also from similar imported semimanufactures. Therefore these data are not additive to total semimanufactures listed.
[7] Partial figure, representing only that vanadium in exported slags; does not include vanadium produced for domestic consumption in any form or for export in any form except slag.
[8] Run-of-mine coal; the average ash content of coal shipped from mines was over 20%, and the average calorific value was a little more than 5,000 kilocalories per kilogram in 1973.
[9] Source: United Nations: Annual Bulletin of Coal Statistics for Europe, 1974, v. 9, New York, 1975, pp. 31, 57.
[10] Not distributed by type, and therefore not suitable for conversion to volumetric units.

## TRADE

Soviet foreign trade is a State monopoly, run by more than 60 commodity-oriented trading organizations under the supervision of the Ministry of Foreign Trade. Political objectives exert a strong, and often determining, influence on foreign trade. The Soviet Union trades with 112 countries, and in 89 cases the trade is based on interstate agreements. Soviet foreign trade continued to be oriented toward the importation of needed machinery and equipment, including complete industrial plants. Exports of minerals produce foreign exchange to help pay for imports, even though most minerals exported could be consumed within the country.

Soviet foreign trade turnover (exports plus imports) in 1974 reached 39.6 billion rubles, an increase of 8.3 billion rubles or 26.2%, primarily as a consequence of inflated prices. Major price increases for basic Soviet exports to Western developed countries, in percent, were as follows: Crude oil, 20; petroleum products, 67; natural gas, 39; chrome ore, 70; copper, 46; aluminum, 24; ferrous metals, 12; and mineral fertilizers, 38. Foreign trade turnover in 1975 is to be increased by 13% over that of 1974.

Exports increased 4.9 billion rubles to 20.8 billion rubles while imports increased 3.3 million rubles to 18.8 million rubles.

Soviet trade turnover by country group, in billion rubles, was as follows:

| | 1973 | 1974 | 1974 (percent of 1973) |
|---|---|---|---|
| Countries with centrally planned economies | 18.3 | 21.4 | 116.7 |
| Of these COMECON countries | 16.9 | 19.3 | 114.4 |
| Western developed countries | 8.3 | 12.4 | 148.7 |
| Developing countries | 4.7 | 5.8 | 123.5 |
| Total | 31.3 | 39.6 | 126.2 |

The volume of total official trade with leading Western, developed countries, in million rubles, follows:

| | 1972 | 1973 | 1974 |
|---|---|---|---|
| Germany, West | 827 | 1,210 | 2,209 |
| Japan | 816 | 994 | 1,683 |
| Finland | 602 | 777 | 1,540 |
| Italy | 468 | 614 | 1,137 |
| France | 544 | 722 | 941 |
| United Kingdom | 558 | 715 | 890 |
| United States | 538 | 1,161 | 742 |
| Netherlands | 222 | 356 | 571 |

Soviet figures for foreign trade in 1974 provide abundant evidence of the declining importance of the centrally planned economy countries in the Soviet Union's external trade. Whereas trade with the centrally planned economy countries in 1971 represented 65.4% of the total, it was only 58.5% in 1973 and 54% in 1974. Trade with COMECON countries declined from 59.6% of the total in 1972 to 54% in 1973 and to about 50% in 1974.

Soviet official trade turnover with COMECON countries, in million rubles, was as follows:

| Country | 1972 | 1973 | 1974 |
|---|---|---|---|
| Germany, East | 3,705 | 3,965 | 4,315 |
| Poland | 2,803 | 3,000 | 3,584 |
| Czechoslovakia | 2,626 | 2,760 | 3,029 |
| Bulgaria | 2,345 | 2,555 | 2,904 |
| Hungary | 1,882 | 2,064 | 2,282 |
| Romania | 1,053 | 1,130 | 1,191 |
| Cuba | 822 | 1,110 | 1,642 |
| Mongolia | 287 | 338 | 404 |

Official trade with Yugoslavia increased from 569 million rubles in 1972 to 671 million rubles in 1973 and to 1,240 million rubles in 1974. Trade with North Vietnam was 236 million rubles (compared with 180 million in 1973), with North Korea 343 million rubles, and with the PRC 214 million rubles (up from 201 million in 1973).

The Soviet Union has signed agreements with more than 70 developing countries. The official trade turnover with leading nations in 1973 and 1974, in million rubles, follows:

| Country | 1973 | 1974 |
|---|---|---|
| Egypt | 541 | 728 |
| India | 589 | 615 |
| Iran | 275 | 496 |
| Iraq | 332 | 453 |
| Brazil | 126 | 202 |
| Syria | 119 | 172 |
| Algeria | 117 | 172 |
| Argentina | 77 | 137 |
| Nigeria | 40 | 92 |

r Revised. NA Not available.

[1] Data possibly incomplete; total not reported. Totals given represent sum of quantities under individual countries.

[2] Details on destination of crude oil and the various refinery products are not reported individually. Total exports of these commodities are reported on a tonnage basis by destination, but are not convertible to a barrel basis owing to the varying specific gravity of the different commodities that constitute the total. Therefore, country detail given under the heading "Principal destinations" is based on the percentage of the total accounted for by major recipients.

## Table 3.—U.S.S.R.: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |

[1] Data possibly incomplete; total not reported. Totals given represent sum of quantities reported under individual countries.
[2] Details on origins of various refinery products are not reported individually. Total imports of these commodities are reported on a tonnage basis by source, but are not converted to a barrel basis owing to the varying specific gravity of the different commodities that constitute the total; therefore, country detail given under the heading "Principal sources" is based on the percentage of the total accounted for by major exporters.

Fuels, minerals, and metals continued to account for a large part of Soviet exports, comprising about 44% of the total official exports in 1974.

Soviet exports of selected mineral commodities by group of countries are presented in table 4.

## Table 4.—U.S.S.R.: Exports of selected mineral commodities by country group

(Thousand metric tons)

| Year and commodity | COMECON countries | Other centrally planned economy countries | Total centrally planned economy countries | Developed market economy countries | Developing market economy countries | Total market economy countries | Total exports |
|---|---|---|---|---|---|---|---|
| 1973: | | | | | | | |
| Coal | 14,300 | 1,400 | 15,700 | 8,300 | 500 | 8,800 | 24,500 |
| Crude oil and products | 63,100 | 4,700 | 67,800 | 47,500 | 3,000 | 50,500 | 118,300 |
| Iron ore | 36,400 | 100 | 36,500 | 4,900 | -- | 4,900 | 41,400 |
| Manganese ore | 1,099 | 40 | 1,139 | 159 | -- | 159 | 1,298 |
| Chromium ore | 266 | 36 | 302 | 949 | -- | 949 | 1,251 |

Source: Vneshnyaya torgovlya (Foreign Trade), Moscow. No. 6, June 1975, pp. 51–55.

Exports of crude oil and petroleum products declined from 118 million tons in 1973 to 116 million tons in 1974 and comprised 70% crude oil and 30% refined products. Soviet oil exports to centrally planned economy countries increased from 68 million tons in 1973 to 72 million tons in 1974. Exports of crude oil and products to market economy countries decreased from 50 million to 45.5 million tons. Exports of natural gas increased from 6.8 billion cubic meters in 1973 to 14 billion cubic meters in 1974, and those of coal and anthracite increased from 24.5 million to 26.2 million tons. Electric power exports increased from 9.9 billion to 10.9 billion kilowatt-hours for the same period.

Exports of copper increased in 1974 to 248,000 from 237,700 tons in 1973, and aluminum exports increased to 528,700 from 518,300 tons. Exports of lead decreased from 97,000 to 95,500 tons in 1974, while pig iron exports decreased from 5.2 million to 4.9 million tons.

Since 1970, petroleum exports to Western countries have hardly varied (44 million to 47 million tons per year), but shipments to centrally planned economy countries have been increasing consistently. Sales to Western countries are unlikely to change significantly over the next 5 years.

The Soviet Union intends to increase its deliveries of natural gas to West European countries. A second pipeline is to be constructed along the route of the present international gasline, together with four new compressors and five distribution sections. It is expected that the annual capacity of the line will reach 28 billion cubic meters by 1978. This will also permit increased gas deliveries to Czechoslovakia and the beginning of deliveries to Yugoslavia.

Most of the U.S.S.R.'s 1974 export trade in minerals was with Europe and Japan. Since 1972, West Germany has ranked first in Soviet trade with developed Western countries. Trade between Finland and the U.S.S.R. amounted to over 1.5 billion rubles in 1974 and is to be increased by 10% in 1975.

Although Soviet-French trade has grown an average of more than 20% each year over the past 3 years, it accounted for only 2.4% of Soviet foreign trade in 1974—much less than that with West Germany or Finland. The U.S.S.R. is increasing its exports of petroleum to France from about 1 million tons in 1974 to over 1.6 million tons in 1975. U.S.S.R.-United States trade exceeded $1 billion in 1974. Reportedly, the Bank of America has offered to form a banking syndicate to lend the Soviet Union up to $500 million to finance imports from the United States. The Export-Import Bank's loans to the U.S.S.R. were recently limited to $300 million. In 1974 exports from the United States to the Soviet Union totaled approximately $700 million.

Soviet-Belgian trade increased 100% in the past 3 years reaching a level of over 500 million Belgian francs. This is about half as much as Soviet-French trade. In the past 5 years the United Kingdom has fallen to sixth place in trade with the U.S.S.R., behind West Germany, Japan, Finland, Italy and France. However according to preliminary figures trade with the United Kingdom increased by almost 25% in 1974 and is nearing an annual figure of 900 million rubles. Soviet-Canadian trade has doubled in the past 5 years.

Among the developing countries, Egypt, India, Iran, Iraq, Brazil, Syria, and Algeria were the most important trading partners in 1974. In the trade with developing countries, the Soviet Union gives preference to State-owned economic agencies. In some developing countries, Soviet-aided enterprises are the cornerstone of industrial growth and repayment is often made in minerals.

The Soviet Union provides nearly 100% of the COMECON countries' imports of crude oil, natural gas, pig iron, and electric power, 66% of their petroleum products, rolled ferrous metals, and phosphorus fertilizers, 60% of coal and manganese ore, and up to 90% of iron ore. Exports of Soviet petroleum to COMECON members will rise from 138 million tons during the 1966–70 period to some 243 million tons between 1971 and 1975; similarly natural gas exports will rise from 8 billion cubic meters to about 30 billion cubic meters. In 1974, Soviet-Yugoslavian trade reached a value of $1.4 billion. It is anticipated that trade turnover in 1975 may exceed $2 billion. The U.S.S.R. will supply Yugoslavia with petroleum, coal, metals, and other raw materials. Yugoslavia will provide bauxite, nonferrous metals, and other goods. Soviet trade with Cuba rose from 160 million

rubles in 1960 to 1,642 million rubles in 1974. Soviet exports to Cuba include ferrous and nonferrous metals, petroleum (over 7.6 million tons in 1974), anthracite, coke, sulfur, mineral fertilizers, etc. In addition to other goods, Cuba delivers nickel concentrates to the Soviet Union.

While most of the Soviet mineral trade has hitherto been with the other centrally planned economy countries, the U.S.S.R. is now aiming at increased exports to Western countries and especially to the United States.

Mineral commodity imports in 1974 included ferrous and nonferrous semimanufactures, steel pipes, bauxite and alumina, tin, tungsten concentrate, talc, mica, and natural gas. There was a considerable increase in the import of machinery and plants, which mainly came from Western countries.

Trade tables are derived from the official statistics of the Ministry of Foreign Trade for 1971, 1972, and 1973. Official detailed figures for 1974 are not available but much the same general pattern can be expected.

## COMMODITY REVIEW

### METALS

The Ministry of Nonferrous Metallurgy is principally geared to the production of the major metals, and as a result, many byproduct commodities are lost. For example, at the Mednagorsk copper and sulfur complex in the Urals almost all metallurgical slag is dumped; more than 20 million tons have accumulated. Again the Balkhash complex in Kazakhstan recovered only 12% to 13% of the rhenium from the raw material and 36% of lead in dust. Because of poor technology to utilize reverberatory gases, 5.6% of the rhenium, 15.3% of the lead, and 55% of the sulfur is lost.[48]

Beneficiation and metallurgical facilities continued to experience poor metal recoveries; for example, there were 60% losses of metals in concentration and metallurgical processes of copper pyrite ores and concentrates in the nonferrous industry of Bashkir A.S.S.R.[49] During mining, concentration, and metallurgical processing, the Bashkirian nonferrous enterprises lose much zinc, sulfur, and precious metals.[50]

Ore production at many mines remained below planned quotas. Shortcomings in both the ore delineation and the development of many existing mines led to reduced efficiency. Nonfulfillment of shaft sinking and deepening programs and underground development is a continuing problem. Development of the Tishinskiy and Karagalinskiy complexes in Kazakhstan, the Almalyk complex in Uzbekistan, and others has been very slow.[51] Poor maintenance resulted in major breakdowns at the Dzhezkazgan copper complex, the Achinisk alumina plant, and the "Elektrotsink" zinc plant. The Alaverdy complex in Armenia had a high breakdown record.[52]

Output of many refined metal products depends on cooperation between mining, concentration, and metallurgical enterprises which are located at a considerable distance from each other.[53]

The copper and nickel enterprises did not fulfill their 1974 quotas. The plan for placing new facilities in operation was also underfulfilled. Metallurgical plants frequently suffered from shortages in raw materials because of the lag in placing in operation facilities for mining and processing ores.[54]

**Aluminum.**—The Soviet Union is the world's second largest producer of aluminum with probable capacity in January 1975 of 1.8 million tons. Exact production figures are not available, but 1974 estimated production was about 1.56 million tons (including 130,000 tons of secondary), a 5% increase over 1973 output. Production fell short of the 8.2% planned increase, there were shortfalls at the Bratsk aluminum plant, and output did not start at the Regar plant in Tadzhikistan. Under the present 5-year plan, 1975 output is scheduled to be 1.5 to 1.6 times the 1970 level. It is planned to complete construction of the Bratsk and Krasnoyarsk aluminum plants, to put into oper-

ation the first stage of the Regar plant in Tadzhikistan, and to enlarge facilities at the other aluminum plants during the 1971–75 period. Capital investment for aluminum in the 1971–75 period comprises about one-third of the total in the nonferrous sector. It is planned to import large quantities of bauxite and alumina due to shortages of high-quality bauxite in the U.S.S.R. Soviet output of aluminum may reach 1.65 million tons by 1975 and 2.2 million tons by 1980. Exports increased from 368,900 tons in 1970 to 518,300 tons in 1973 and 528,700 tons in 1974. Planned exports are an estimated 500,000 tons in 1975 and about 800,000 tons in 1980.

Construction continued at the Bratsk, Krasnoyarsk, Irkutsk, and Regar primary aluminum plants. With the commissioning of one potline at the Krasnoyarsk plant in May, almost 50% of the total capacity was completed. Another potline at the same plant was put into operation in December 1974. The new potline at Bratsk, which was due for operation in 1974, was not completed.[55] Construction of the first potline at the Regar plant has been under way for 5 years and was due for completion in 1974, but was not commissioned. As a result a considerable part of the Nurekskoy GES (hydroelectric powerstation) is underemployed.[56] New production facilities for secondary aluminum were put into operation at the Mtsensk, Sukhoy Log, and Khabarovsk plants for secondary nonferrous metals and also at the Kuybyshev Lenin ironworks and steelworks.

Pechiney Ugine Kuhlmann has concluded an agreement with the Soviet Union for the construction of 1-million-ton-per-year alumina plant at Nikolayev on the Black Sea and a 500,000 ton-per-year aluminum primary reduction plant in Siberia. Part of the estimated $1.2 billion cost will be repaid by product shipments to France. Large bauxite mines are under development with Soviet aid in Hungary, Yugoslavia, and Guinea and construction of the Nikolayev alumina plant began in December 1974 to treat imported bauxite.

The shortage of bauxite reserves is limiting the development of the aluminum industry.[57] Development of technology for producing alumina from the Kiya-Shaltyrsk (Belogorsk) nepheline open pit on the border of Krasnoyarsk Kray and Kemerovo Oblast has been given priority. Both the Achinsk alumina-from-nepheline plant in West Siberia and the Kirovabad alumina-from-alunite plant in Azerbaydzhan performed poorly in 1974. Inadequate maintenance at Achinsk caused major breakdowns during the year.[58]

The northern Urals continued to be the main bauxite- and alumina-producing region in 1974; between 1971 and 1973 production from this area increased 25.6%. New facilities for production of 40,000 tons of alumina per year were put into operation at the Ural plant in December.[59] It is planned to increase bauxite production in the northern Urals by 37.6% during 1971–75.[60]

The second largest bauxite and alumina-producing area was Kazakhstan, where the Pavlodar alumina plant No. 1 was among the nation's largest. Plant No. 2 was under construction. Development of the Ayat-2 bauxite mine in Kazakhstan continued in 1974 as a fourth supplier for the Pavlodar plant. Production of bauxite in Kazakhstan is to be doubled by a new open pit to be developed at the Krasnontyabriskiy deposit in Kustanay Oblast'.

After removal of 3 million cubic meters of overburden, the Severoonezhskiy open pit in Arkhangel'skaya Oblast' first produced bauxite in July 1974. A shipment was made for industrial testing to study beneficiation and the production of alumina.[61]

Development of the first stage of the Deak bauxite mine, Veszprem County in Hungary, with an annual capacity of 300,000 tons, was completed in June. The second stage is scheduled for 1976, and part of the output will be shipped to the U.S.S.R. Under the Hungarian plan, 21 billion to 22 billion forints will be spent in Hungary to develop the alumina industry during 1970–85. The program is linked to a Soviet-Hungarian agreement, whereby Hungary delivers alumina to the U.S.S.R.; the agreement includes the construction of a large alumina plant in Hungary.

[61] Rabochaya gazeta (Workers Gazette), Kiev. July 10, 1974, p. 1.

The apatite complex at Kola Peninsula produced about 1.5 million tons of nepheline concentrate in 1974. This was less than one-third of capacity, but the Pikalevo alumina and Volkhov aluminum plants are not able to use the increased quantities of the nepheline product.[62]

The 1974 plan called for bauxite exploration in the Urals, in the region of the Kursk Magnetic Anomaly, Tinanskiy Mountains, Kazakhstan, and Siberia. Reportedly, bauxite deposits were discovered in the Srednetimanskiy mountain ridge, Komi A.S.S.R.

**Antimony.**—The Kadamzhay combine in the Kirgiz S.S.R. remained the principal antimony center, where integrated facilities produced most of country's refined products. Development continued on a new underground level at the mine, and ore extraction is to be doubled in the future. Construction of the second stage of the Aznob mining and concentrating combine (Dzhidzhikrutskiy complex) in Tadzhikistan continued in 1974; on completion it is to be the main Soviet producer of antimony and mercury. An antimony ore deposit associated with gold was under development at Sarylakh in Yakut A.S.S.R., near the Polar circle.

**Beryllium.**—The Soviet Union continued to be one of the world's largest producers and consumers of beryl, beryllium alloys, and metal. There are numerous deposits mainly in Kazakhstan, Kola Peninsula, Transbaykal, Urals, Soviet Far East, and Western Ukraine. Production is being expanded, and the probable level was 1,500 tons of beryl (10% to 12% BeO) in 1974.

**Bismuth.**—In 1974, bismuth was recovered as byproduct of lead smelting in Kazakhstan and other regions of the U.S.S.R., from dust and crude lead at the Balkhashskiy and Mednogorskiy copper complexes, and from tungsten and molybdenum ores. Recovery of metal in concentrate was less than 50% of metal contained in ores. An experimental section for commercial production of metallic bismuth was put into operation at the Far Eastern mining and metallurgical complex in July 1974.

**Cadmium.**—Cadmium is recovered at various Soviet lead and zinc smelters. The region of Kazakhstan recently became an important producer of cadmium. It is planned to obtain large quantity of cadmium from lead slag. Average total cadmium recovery was about 60%.

**Chromium.**—The U.S.S.R. continued to be the world's leading producer and exporter of chromite. About two-thirds of the production was exported, and over 80% of this was destined for Western countries. Approximately one-third was consumed in the U.S.S.R. as follows: Metal production, 45%; refractories, 32%; and chemicals and other products, 23%. Estimated data on production, exports, and consumption of chromite in 1968–69 and 1970–80 are summarized, in thousand tons, in the following tabulation:

| | 1968 | 1969 | 1970 | 1974 | 1975 | 1980 |
|---|---|---|---|---|---|---|
| Production (30% to 56%) $Cr_2O_3$ | 1,270 | 1,700 | 1,750 | 1,950 | 2,000 | 2,250 |
| Exports (48% to 56%) $Cr_2O_3$ | [1]748 | [1]1,144 | [1]1,200 | [1]1,100 | 1,150 | 1,250 |
| Consumption and stocks (30% to 56%) $Cr_2O_3$ | 522 | 556 | 550 | 850 | 850 | 1,000 |

[1] Reported in Soviet sources.

About 94% of total Soviet chromite reserves are situated in Kazakhstan with the balance in the Ural Mountains. The Donskoye operation at Khrom-Tau in Aktyubinsk Oblast', Western Kazakhstan, which produces over 90% of the Soviet output, is the only supplier of high-quality ore in the U.S.S.R. Deposits of chromium ores in the Urals which have a low chromium oxide content (20% to 40%) as well as a low $Cr_2O_3$:FeO ratio are mostly used in the chemical and refractory industries.

The chemical composition of chromium ore at Donskoye, in percent was as follows:

[62] Pages 1–2 of work cited in footnote 19.

| Open pit | $Cr_2O_3$ | FeO | $SiO_2$ | MgO | $Al_2O_3$ | CaO |
|---|---|---|---|---|---|---|

Source: Stal' (Steel), Moscow. No. 10, October 1974, p. 911.

The grade of most ores is adequate for direct shipping after handpicking. There were two crushing and grinding mills in operation at Khrom-Tau in 1974, which classified ore into the following three sizes: 300 to 100 millimeters; 100 to 10 millimeters; and 10 to 0 millimeters. The first chromite concentrator, with an annual capacity of 1 million tons (300,000 tons of concentrate), was under construction at Donskoye, and the first section went into operation in 1974. The new mill will process lower grade ores that have previously been stockpiled. The Southern open pit, the largest at Donskoye with an annual planned capacity of 400,000 tons of crude ore, began production in 1974. Development of the first underground mine, the 40 Let Kazakhskoy S.S.R.—Molodezhnoye, with an annual capacity of 2 million tons of crude ore, continued at Donskoye and is scheduled for completion in 1980.

During 1976–80, the Soviets plan to bring onstream new ferrochromium production facilities. They are planning to reach an agreement with United States companies on the construction of ferroalloy plants with repayment in production. The Soviets are also negotiating similar projects with several West European and Japanese companies.

Reportedly Soviet chrome ore was selling for $70 to $80 per ton f.o.b. loading point for the 48% $Cr_2O_3$ ore with a 4:1 iron ratio. The price of Soviet chrome ore may double depending on embargo on Rhodesian chrome.

**Cobalt.**—Gross cobalt reserves are estimated at about 100,000 tons of metal content, chiefly in nickel-cobalt ores and in cobalt ores of the Khovu-Aksinsk deposit in Tuva Autonomous Republic. Production continues to be concentrated at the Norilsk (West Siberia), Nikel (Kola Peninsula), and Yuzhuralnikel' (Urals) complexes, at the Ufaley and Rezhsk nickel plants in the Urals, and also at some copper plants. Recovery of cobalt remained low, especially from the copper pyrite ore of Bashkiria.[63] During the 1965–70 period, the extraction of cobalt from ores and concentrate increased 1.3%. The current 5-year plan (1971–75) calls for additional increases in cobalt recovery. Some improvements were achieved in the metallurgy of cobalt at the Yuzhuralnikel' complex in Orsk.

**Copper.**—Production of blister copper in 1974 is estimated at 900,000 tons, including 160,000 tons of secondary copper. The increase is due mainly to enlarged facilities at the Dzhezkazgan complex in Kazakhstan and the Norilsk complex in West Siberia. A large converter at the Norilsk complex, which will increase output by about 20%, was commissioned in April. The ore is supplied from the new Oktyabr'skiy mine. Under the 1971–75 5-year plan, output in 1975 is scheduled to be 35% to 40% over the 1970 level. The plan provides for a 30% increase in copper production in Armenia and a 70% increase in Kazakhstan. Output of blister may reach 950,000 tons by 1975, rising to 1.2 million tons by 1980. Exports increased from 123,000 tons in 1970 to 248,000 tons in 1974. Estimated exports in 1975 are 210,000 tons, rising to about 400,000 tons in 1980.

There was an increase in smelting using oxygen-enriched air blasting in 1974. At the Balkhash complex in Kazakhstan, about 20% of the copper concentrate was smelted directly in converters.

The present level of automation in the copper industry lags much behind the level that has been achieved at Soviet enterprises in other industries.[64] Because of poor maintenance, there were major breakdowns at the Alaverdy plant in Armenia.[65]

Kazakhstan continued to be the main center of copper production, and the Balkhash complex there is the largest producer in the country. The 1971–75 5-year plan calls for a 70% increase in refined copper production in Kazakhastan. In open pit mining, which represented about

[63] Izvestiya, Moscow. Feb. 19, 1974, p. 3.
[64] Pages 81–84 of work cited in footnote 33.
[65] Work cited in footnote 51.

60% of total output in 1974, some 40-ton trucks were introduced. Development of Sayak-2 open pit at the Balkhash complex was not completed in 1974 and was rescheduled for 1975. Development of Sayak-3 open pit began in 1974. Development of underground copper mines at the Dzhezkazgan and Irtysk complexes in Kazakhstan is proceeding slowly.[66]

The first stage of Section 10 of the Dzhezkazgan concentrator was commissioned in March. As a result of the sharp fluctuations in the character of the ore delivered, the content of copper and lead in concentrates decreased during 1974.[67]

The Urals was the second largest copper-producing region. Copper is mined at both open pit mines (Uchalinskiy, Mezhozerskiy, Sibayskiy, and Gayskiy) and underground mines (Degtyarskiy, Karabashskiy, Gayskiy, Imeni III International, and Levikhinskiy). The open pit share has increased from 39.3% in 1958 to 67% in 1973. This is attributed to the development of the Gayskiy, Uchalinskiy, and Ob'edinennyy open pits of the Uchalinskiy complex and the decline of the old Degtyarskiy, Krasnoural'skiy, and Karabashskiy underground mines. This trend is expected to continue although there is a shortage of copper reserves in the Urals.[68]

Construction of the first stage of the Madnueli copper complex in Georgia was not completed in 1974, although concentrate production was planned for January 1975. This is now rescheduled for later in 1975. The second stage is to be completed in 1976. It is planned to develop copper deposits at Udokan in Siberia and Boshchekul'skoye in Kazakhstan in 1976–90.

Flash-smelting plants for copper and nickel from Outukumpu Oy, Finland, are to be delivered to the Norilsk complex in 1976–77. The annual capacity of the smelters will be 550,000 tons of nickel concentrate (100,000 tons of nickel) and 650,000 tons of copper concentrate (200,000 tons of copper). The Soviet Union is to aid India in developing the Mananjkhand copper project in Madhya Pradesh. The first stage of the project, with a yearly capacity of 10,000 tons of copper from 1 million tons of ore, is to be completed in 7 years. The total project envisages 2 million to 3 million tons of ore per year to produce about 25,000 tons of copper.

Soviet experts are assisting in the design and construction of the Erdent copper-molybdenum complex in Mongolia. Ore from the first stage is programed for 1978. Power is to be supplied from the Gusinoozersk thermal powerplant in the U.S.S.R.

**Gold.**—Gold output in 1974 was estimated at 7.3 billion troy ounces. Over two-thirds came from the Soviet Far East and East Siberia (mainly from placers at Kolyma, Aldan, Dzhugdzhur, Indigarka, Yana, and Chukotka); most of the balance came from gold and polymetallic ores in the Urals, Kazakhstan, Armenia, Uzbekistan, and West Siberia. Prompted by higher international prices, the Soviet Union plans to increase production and is importing large-scale equipment from West Europe and the United States. Gold production is estimated at 7.5 billion troy ounces in 1975 and 8.6 billion troy ounces in 1980.

There are no accurate figures, but according to some estimates, Soviet gold exports to the Western World totaled 6.4 billion troy ounces in 1972 and 9.0 billion troy ounces in 1973, the highest since 1965. Exports in 1974 were much below the 1972–73 levels and will probably be similarly low in 1975. Reportedly, the Soviet Bank for foreign trade has concluded an agreement with the Continental Gold Corp. for direct sales to the United States.

Although Soviet sources report reserves sufficient for 16 to 17 years at the present rate of production, extensive prospecting continues. In several main gold-producing regions, plants are being shifted to more distant localities. Several big mines are suffering from lack of reserves, and new mines have been opened in the northeastern parts of Soviet Far East and the Yakut A.S.S.R. In view of the importance of gold in the Soviet economy, an intensive search is in progress. The first Soviet symposium on the mineralogy and geochemistry of gold was held in Vladivostok in September 1974.

Magadan Oblast' continued to be the main center of gold production, but 16 enterprises failed to meet their production quota and 19 did not fulfill their productivity plans in 1974. The Severovostok-

[66] Work cited in footnote 51.
[67] Pages 81–84 of work cited in footnote 33.
[68] Voprosy ekonomiki (Problems of Economics). Moscow, No. 1, January 1974, p. 34.

zoloto (North-Eastern Gold Mining) association had 18 dredges in operation in 1974.

Capital investment in this association totaled 112.5 million rubles in 1974. The 1974 target for construction of new facilities was met, but the building of facilities at the Karamken complex, Dukat mine, and Zapadnopolyanskiy complex did not progress fast enough. The plan for gold extraction of the Severovostokzoloto association in 1975 has been increased, compared with that of 1974, and it will be necessary to increase the volume of stripping 25% to 27% and that of sand washing 15% to 18%.

In Yakut A.S.S.R., the second largest gold-producing region, the Aldanzoloto complex fulfilled its 1974 gold production plan ahead of time. The mines of the Indigirzoloto complex were supplied with new imported trucks, an imported 15-cubic meter scraper and nine Soviet washing installations in 1974.

An old placer mine at Kirovskiy in Amur Oblast', originally opened in 1911, is being renovated; installation of a 250-liter dredge is to begin in 1975. A new dredge at the Aprelskiy section of the Dambuki placer mine in Amur Oblast' began production in June. Installation of a new 250-liter dredge began at the Dzheltulak deposit of the Soloveysk placer mine in this oblast' in July. A second hydraulic installation was commissioned at the Polina Osipenko mine in Khabarovsk Kray in 1974, and a new ore processing section was commissioned at the Taseyevo gold plant of the Baleyzoloto complex in Chita Oblast' in 1974.

The Isakovsk placer mine in the Urals, developed over 150 years ago, fulfilled the 1974 production plan in October; dredge No. 33 has already met the 1975 target. There were four dredges in operation at the Yuzhno-Zaozerskiy mine in the Urals in 1974. The construction of the Zod concentrator is to be completed in 1975.

**Iron Ore.**—The iron and steel industry in the U.S.S.R. operated 71 underground mines and 63 open pits with a total capacity of about 250 million tons of usable ore in 1974. Over 80% of ore production was from open pits nearly half of which came from seven pits, each producing over 10 million tons per year.

Production of usable ore was 225 million tons (425.2 million tons of crude ore), an increase of 9 million tons over that of 1973. Production of usable ore is scheduled to reach 235.5 million tons (original plan was 254 million tons) in 1975. It is estimated that production of usable iron ore will reach 235 million tons in 1975 and 275 million tons in 1980. Exports of iron ore increased from 38.4 million tons in 1972 to 41.4 million in 1973 and 43.3 million tons in 1974. The principal increase was in exports to COMECON countries, which equaled about 90% of the total exports.

There were 91 iron ore concentrating mills, of which 29 had sintering and 4 had pelletizing facilities in operation in 1974.

Iron ore production in the U.S.S.R. is shown in the following tabulation:

| | 1970 | 1974 |
|---|---|---|
| Output (million tons): | | |
| Crude ore | 354.1 | 425.2 |
| Usable ore | 194.7 | 224.8 |
| Concentrates | 120.4 | 143.2 |
| Direct-shipping ore | 74.3 | 81.1 |
| Iron content (percent): | | |
| Crude ore | 32.9 | 32.35 |
| Usable ore | 58.8 | 59.34 |

Source: Gornyy zhurnal (Mining Journal), Moscow. No. 1, January 1975, pp. 3–4.

Direct shipping ore averaged 54% to 55% iron in 1974, and that of ore concentrate averaged 64.3% iron. Agglomerate output reached 148.7 million tons in 1974, and pellets, 23.4 million tons.

In spite of being a large exporter of iron ore, the U.S.S.R. has continuous problems supplying its own plants, both quantitatively and qualitatively.

Agreements on the development of iron ore extraction and ferro-alloy manufacture in the U.S.S.R. and on long-term deliveries of these products to COMECON nations were signed in 1974. Under these agreements, from 1975 to 1978 the COMECON countries will supply the U.S.S.R. with machinery, equipment, and materials necessary for increasing Soviet

iron ore extraction, concentration of ores, and ferro-alloy manufacture. The Soviet Union will increase its supply to COMECON nations of iron ore concentrates and ferroalloys.

At yearend 1971, gross ore resources in the U.S.S.R. totaled 111,000 million tons, averaging 34.8% iron. These were distributed as follows: The Ukraine (31%); European Center (24.4%); Urals (15.7%); Kazakhstan (15.0%); Siberia (7.4%); Northwest (3.0%); Soviet Far East (2.5%); and others (1%).

Gross measured, indicated, and inferred resources of iron ore in place (Soviet categories A+B+C1) totaled 60,200 million tons and averaged 38% Fe; speculative reserves in place (category C2) totaled 50,800 million tons and averaged over 30% Fe. There is a shortage of high-grade iron ore reserves in the U.S.S.R.[69]

Some of the resources contain objectionably high percentages of zinc and arsenic. Large capital investments and research are needed to bring these resources into efficient production.

Soviet iron ore mining is less efficient than equivalent operations in the West. Soviet technical lag in iron ore mining resulted from relative lack of technical knowledge and technically inferior equipment. Despite considerable mechanization, productivity of Soviet miners is much below that of miners in the West. Ore beneficiation in the Soviet iron ore industry is carried out by less advanced methods. Agglomeration techniques are copies of old-fashioned Western sintering, and modern pelletization has still a very limited application.

The Ukraine produced about 56% of Soviet iron ore, and the Krovoy Rog Basin in the Ukraine produced about 90% of that republic's total 1974 output. The Urals was the second largest producer, followed by Kazakhstan, Siberia, the Kursk region, and the Kola Peninsula.

The iron ore for the Kuznetsk complex in Siberia was shipped from six mines. The seventh mine, the Irbinskoye mine, was under development in 1974.

The construction of the Kostomuksha iron ore complex in Soviet Karelia by Finnish companies began in 1973. According to a basic agreement signed in March 1974, three West German companies (Friedr. Krupp GmbH, the Korf Steel group, and Salzgitter A.G.) are to construct an electrometallurgical complex in Staryy Oskol, Belgorod Oblast'. The project will be carried out in two stages; the cost of the first stage is Deutsch mark (DM) DM2,500 million, about US$980 million in 1974. At the same time, the U.S.S.R. is assisting in the construction of iron and steel plants in Poland, Yugoslavia, Egypt, Indian, Pakistan, and other developing countries.

Intensive iron ore exploration covering many Soviet regions was undertaken in 1974.

**Iron and Steel.**—The U.S.S.R. iron and steel industry holds first place in the world in total quantity of iron ore mined, coke, refractories, ferroalloys, and steel pipe produced and second place (after the United States) in steel output. However, under modern conditions not only the quantity of metal produced but also the quality of metals produced is of decisive significance. An increase in the assortment and shape of metal products is also important. If the assortment of rolled steel products proves to be inadequate, then a considerable part of the steel will be inefficiently utilized. Growth in metal demand and constant metal shortages have led the Soviet ferrous metallurgy for a long time in a quantitative direction. Improvement in the shape and dimensions of metal sections is the best source of saving metal.

In the Soviet steel industry productivity calculations are based on tonnage. The plan for production of metal is annually increased by a definite number of tons, regardless of the assortment and length of the sections. Tonnage is also used in evaluating the work of rolling shops and workers.

Each year the plan for rolled steel is overfulfilled, and at the same time millions of tons of rolled products are not supplied on the orders. It must be assumed that the management of Soviet enterprises is not concerned with the needs of the Soviet customers. A great proportion of the rolled products consists of sizes and shapes that are not in large demand. Such a system prevents conservation of metal and makes for wastefulness in metal consumption. Thus shortage of many steel products in the U.S.S.R. is creating a big problem in the Soviet economy.[70]

The poor quality of Soviet iron and

[69] Razvedka i okhrana nedr (Exploration and Conservation of Natural Resources), Moscow. No. 3, March 1972, p. 1.

[70] Rabochaya gazeta (Workers' Gazette), Kiev. Dec. 22, 1971, p. 3.

steel products, of course, significantly, affects other branches of industry, particularly machine construction. The branches of industry dependent upon iron and steel are constantly complaining; their work is dependent on the quality and quantity of the metal they receive, and they are dissatisfied not merely with the lapse in production because of the shortage of metal, but with the fact that the material they do receive does not come up to customer specifications.

The quality of Soviet steel compared with Western or Japanese steel is not quite as high. The majority of plants were built in the 1930's and originally were the typical United States design of that period.

In 1974, estimated production of crude steel at major metallurgical works, in million tons, was as follows:

| | |
|---|---|
| Magnitogorsk complex | 15.0 |
| Krovoy Rog plant | 11.0 |
| Zhadanov Il'rich plant | 7.5 |
| Nizhniy Tagil complex | 6.5 |
| Cherepovets plant | 6.5 |
| Chelyabinsk plant | 6.3 |
| Kuznetsk complex | 5.0 |
| Zaporozhstal' plant | 5.0 |
| Karaganda complex | 5.0 |
| West Siberian plant | 4.5 |
| Other plants (66 plants) | 63.9 |
| Total | 136.2 |

Soviet metallurgical plants have a large proportion of auxiliary workers in production shops. Some spare parts and components for metallurgical equipment are produced in primitive workshops with obsolete equipment. As a result, there are many more repair workers than workers in operation which comprise blast furnaces, steel smelters, and rolling mills.

The ferrous industry failed to meet planned production costs mainly because of overly large consumption of raw materials, supplies, energy, and a large labor force. These excessive consumption uses stemmed from high losses due to defective production.

Production facilities of the industry are technically backward and equipment is obsolete and of low efficiency. Iron ore, pig iron, and steel are obtained as a result of a big outlay of labor and capital, and mechanization of production processes could be greatly improved.

Published Soviet data established that millions of tons of iron and steel were not reaching end users in the form of new products. The June 1974 decree of the Central Committee of the CPSU pointed out that Ministry of Ferrous Metallurgy was not taking the necessary steps to improve quality and broaden the assortment of rolled products, pipe and other metal products, the industry was not complying with the assigned tasks of turning out such items as thin sheets, curved shapes, graded cold-rolled steel, and low-alloy and heat-hardened steel. Production fell considerably short of plan goals for rolled products made of low-alloy steels, for example, principally because of the lack of thermal facilities in metallurgical plants.[71]

Since it generally takes a larger labor-intensive force to produce economical shapes of metal, Soviet enterprises run by a system of planning and economic incentives are more interested in manufacturing the less economic types of steel products.[72]

For about 15 years a system has been under development for planning and accounting for production of rolled goods in adjusted tons (taking labor-intensity into account). Ten years ago it was discussed at a special all-union conference and was approved. But its final revision and introduction into production have been dragged out up to now.

One of the basic shortcomings in the work of many Soviet metallurgical plants is disproportionate development of the individual phases of metallurgical processing, which in turn has tended to increase even further the discrepancy between the primary and final phases of facilities of steel mills.

About 90% of the total tonnage of iron and steel industry products in the U.S.S.R. in 1974 was shipped by rail. The average distance of railroad deliveries of iron and steel commodities in 1974, in kilometers, was as follows:

| | |
|---|---|
| Coke | 874 |
| Iron ore | 702 |
| Ferrous Metals | 1,393 |

Source: Zheleznodorozhnny transport (Railroad Transport), Moscow. No. 3, March 1975, p. 6.

*Capital Investment and Construction.*— The iron and steel industry is one of the

[71] Material'no-tekhnicheskoye snabzheniye (Material-Technical Supply), Moscow. No. 3, March 1974, p. 48. Pravda, Moscow, June 21, 1974. Economicheskaya gazeta (Economic Gazette), Moscow. No. 4, January 1975, p. 2.

[72] Pravda, Moscow. June 21, 1974, p. 1.

most active capital investment areas of the Soviet economy. Over 25 years (1951–75) about 45,000 million rubles have been invested for the development of the Soviet ferrous industry; this represents 3.3% of total investments in the national economy and 8.2% of investments in industry. The active capital in the iron and steel industry as of January 1, 1973, constituted 9.8% of the active capital of the country.

The plan for capital investment in 1975 for the iron and steel industry is set at 4,040 million rubles. Capital investment in the construction of new facilities and enlargement and renovation of existing ones are to be 3,600 million rubles or 11.8% over that of 1974.[73]

In the Soviet iron and steel industry production of metals is increasing at a slower rate than the growth of capital investment, about 3% per year. Incomplete utilization of existing capacities, prolongation of construction projects, and unsatisfactory work of many units and plants are the principal reasons. Unsatisfactory introduction of planned capacities of new units also has pronounced negative effects on the level of returned capital. New units are slow in attaining capacities mainly because actual conditions of their operation do not correspond with their designed and planned utilization.

Many mines and plants have been put into operation despite numerous imperfections and inadequate equipment and have operated over a long period of time with lower capacities than originally planned. Every fourth, new installation does not manage to reach rated capacity because of the low quality of design and equipment defects. For example, the 350 to 500 rolling mill at the Zlatoust metallurgical plant in the Urals was put onstream September 30, 1973. But 6 months later, it reached only 25% of its capacity.[74] By January 1, 1974, planned capacity had not been reached at many blast furnaces, open-hearth shops, and rolling mills.[75]

Because of the shortage of some needed equipment, there has been a rapid increase in stocks at many iron and steel enterprises. Many other iron ore works and metallurgical plants cannot be completed because of a shortage of equipment.[76]

*Pig Iron.*—In 1974, 36 enterprises operating 140 blast furnaces produced 99.9 million tons of pig iron, an increase of 3.9 million tons over the 1973 level. Average blast-furnace capacity is reported at over 1,180 cubic meters. About half of all blast furnaces used oxygen for enrichment; some 85% of the pig iron is being produced by partial use of natural gas and oxygen at 107 blast furnaces. The Cherepovets metallurgical plant, which produced 5 million tons of pig iron and about 6.5 million tons of raw steel, employed 34,000 men and women in 1974.[77] Estimated Soviet output for pig iron for 1975 and 1980 is 105 million and 125 million tons, respectively.

The quality of raw materials at some blast furnaces has deteriorated and the productivity of the furnaces has sharply declined, while at other furnaces breakdowns have become more frequent and the idle time of the equipment has risen.[78]

*Crude Steel.*—Seventy-six metallurgical works produced 136 million tons of raw steel in 1974, 4.7 million tons more than in 1973. It is planned to produce 142 million tons in 1975. Estimated levels for 1975 and 1980 are 142 million and 165 million tons, respectively. Distribution of production by processes, in percent, follows:

| Process | 1960 | 1965 | 1967 | 1968 | 1969 | 1970 | 1971 | 1972 | 1973 |
|---|---|---|---|---|---|---|---|---|---|
| Oxygen converter | 3.8 | 5.0 | 10.2 | 11.8 | 13.7 | 15.3 | 17.1 | 18.0 | 18.3 |
| Electric steel | 8.9 | 4.9 | 4.6 | 4.6 | 9.0 | 10.7 | 11.5 | 12.3 | 13.1 |
| Open hearth | 84.4 | 88.0 | 83.4 | 81.9 | 75.9 | 72.6 | 70.3 | 68.7 | 67.7 |
| Bessemer | 2.9 | 2.1 | 1.8 | 1.7 | 1.4 | 1.4 | 1.1 | 1.0 | 0.9 |

Although several large open-hearth furnaces (600- to 900-ton capacity) were in operation, the average capacity of all (about 400) Soviet furnaces was approximately 245 tons. In 1975, over 80% of the open-hearth steel was produced with the use of oxygen. Almost one-half of Ukrainian open-hearth furnaces employing the latest equipment did not reach rated capacity.

[73] Koks i Khimiya (Coke and Chemistry), Moscow. No. 2, February 1975, pp. 1–4.
[74] Pravda, Moscow, Oct. 19, 1974, p. 2.
[75] Work cited in footnote 26.
[76] Work cited in footnote 28.
[77] Ekonomicheskaya gazeta (Economic Gazette), Moscow. No. 37, September 1974, p. 2.
[78] Sotsialisticheskaya industriya (Socialist Industry), Moscow. Aug. 24, 1974, p. 1.

At yearend 1974, there were 34 operating oxygen converters, of which 27 had capacities of 100 tons or more. The Soviets have been proceeding slowly on the installation of Linz Donawitz (LD) oxygen converters, although several 300-ton units are in operation. Soviet oxygen furnaces are smaller and less advanced than those in the West, and continuous-casting technology is likewise more advanced in the West.

*Rolled Products.*—Soviet rolled ferrous output in 1974 totaled 109 million tons, of which 94.3 million tons was finished products, a 3% increase over that of 1973. Despite increases in total output, production of many structural shapes remained inadequate. Output of rolled products is measured in tons. Therefore, metallurgical plants prefer to produce heavy types of products and are reluctant to manufacture thin sheet and light sections. Estimated level for 1975 and 1980 are 99.5 million and 115 million tons, respectively.

The general designs of the Soviet rolling mills are similar to United States mills installed 20 to 30 years ago, and many are substantial duplicates. The Soviet rolling and finishing industry is inferior not only in quality of products and plant layout and equipment but also in labor productivity. Of the total rolled steel produced, some 30% came from about 25 rolling mills installed in the 19th century. Automation of Soviet rolling mills lags behind that of the Western countries both in availability of facilities and of systems necessary for automation of rolling equipment.[79]

*Steel Pipe.*—In terms of tonnage the Soviet Union was the largest world producer of steel pipe, with a total of 15 million tons in 1974, a 4% increase over 1973 production. Fabrication, however, is inadequate for internal demand, and more than 10% of requirements have to be imported from West Europe and Japan. About 60% of the total Czechoslovakian pipe production goes to the U.S.S.R. Quality of pipe is poor and does not correspond to state standards. According to Soviet sources, use of incorrect types and sizes of pipe in the gas and petroleum industries resulted in the use of 16% more metal than was necessary. The low quality of pipe which was produced without coating reduced their service life approximately three times. The petroleum industry is compelled to create shops for pipe coating.[80] It is estimated that production of steel pipe may reach 15.7 million tons in 1975 and 19 million tons in 1980.

*Scrap.*—Over 70 million tons of steel and pig iron scrap was remelted in 1974. Approximately 50% of the scrap came from metallurgical works, 22% came from metal fabrication plants, and the remainder was old scrap, mainly unused machines and spare parts. Metallurgical enterprises received mainly light unprocessed scrap which caused difficulties in steel smelting shops. The share of scrap in charge of Martin furnaces was about 45% and that of electric furnaces was some 96%. Soviet ferrous scrap plays an important part in the international scrap trade and for many years the U.S.S.R. exported scrap in quantities to Italy, Japan, Finland, and Sweden.

*Ferroalloys.*—Part of the Soviet effort to improve quality of steel is devoted to ferroalloy plants. The first stage of a plant for producing ferromanganese was commissioned at the Nikopol' ferroalloy plant in Dnepropetrovsk Oblast' (Ukraine) in 1969. There are 12 electric furnaces in this plant. The Zestafani ferroalloys plant in Georgia is also a leading plant for the production of ferromanganese. The Yermak ferroalloys plant in Kazakhstan is a main producer of ferrosilicon. The U.S.S.R. is also an important producer of ferrochromium and ferrovanadium. Large quantities of ferroalloys are produced for export.

*Ferrous Metal Consumption.*—The basic demand for ferrous metals in the Soviet economy came from four sectors: Machine-building and metalworking, construction, railroad transportation, and oil and gas industries. Consumption of ferrous metals by sector in 1974, in percent, was as follows:

| | |
|---|---|
| Machine-building and metalworking industries | 50.3 |
| Other sectors of industry | 10.7 |
| Construction | 32.5 |
| Railway transport | 3.3 |
| Agriculture | .7 |
| Other branches of economy | 2.5 |
| Total | 100.0 |

[79] Work cited in footnote 42.
[80] Izvestiya, Moscow. Aug. 1, 1967, p. 3.

Because of the unbalanced production of some types of rolled products and steel pipes, customers involuntarily adjusted their requirements, by accepting products that were "given" rather than those that were needed.

*Ferrous Metal Trade.*—Iron ore, pig iron, ferroalloys, rolled ferrous products and steel pipe represented about 9% of total official exports in 1974; the share of rolled ferrous products and steel pipe in Soviet official imports was about 8%.

Exports of iron ore increased from 41.1 million tons in 1973 to 43.3 million tons in 1974. Shipments of pig iron decreased from 5.3 million tons in 1973 to 4.9 million tons in 1974, and those of rolled ferrous metal from 6.5 million in 1973 to 6.4 million tons in 1974. But imports of rolled ferrous products and steel pipes increased from 5.2 million tons in 1973 to 7 million tons in 1974.

The Soviet Union provides nearly 100% of the COMECON countries imports of pig iron and rolled ferrous metals and up to 90% of their iron ore.

The total ferrous commodity trade with various groups of countries in 1974, in thousand tons, was as follows:

| Commodity | COMECON countries | Other centrally planned economy countries | Total centrally planned economy countries | Developed market economy countries | Developing market economy countries | Total market economy countries | Total exports |
|---|---|---|---|---|---|---|---|
| Iron ore | 37,400 | 200 | 37,600 | 5,700 | -- | 5,700 | 43,300 |
| Pig iron | 4,526 | 30 | 4,556 | 235 | 119 | 354 | 4,910 |
| Rolled steel | 5,492 | 433 | 5,925 | 67 | 445 | 512 | 6,437 |
| Steel pipe | 259 | 14 | 273 | 28 | 21 | 49 | 322 |

The rolled ferrous products industry does not meet the demand of all sectors of the Soviet economy, and some 10% (in addition to over 10% of steel pipe demand) has to be imported.

*Technology.*—The general level of iron and steel technology in the U.S.S.R. has lagged behind that of the more advanced Western countries. A low degree of mechanization in the U.S.S.R. is characteristic in many processes. Labor-intensive functions of mining and metallurgy occupy large numbers of workers who could be replaced by machinery. A study by G. B. Holland entitled Ferrous Metallurgy Today and Tomorrow described the actual technological level of the Soviet iron and steel industry and waste of metal in the Soviet economy.[81]

According to Holland, the ferrous industry employs 1.75 million workers, including 1.3 million "production" workers and 130,000 graduate engineers and technicians. Every year about 100 million rubles are allocated to scientific research. Eighteen-thousand five-hundred scientists and engineers are employed in research organizations, of which 9,000 are scientists.

The main trend of technological progress in ferrous metallurgy has been to increase the unit capacity of metallurgical units and to increase quantity with little attention to quality. As a result of Soviet technological lag in certain important aspects of steel smelting, much of the ingot is not meeting the high Western standard of product quality. Poor quality steels used in machine construction resulted in the short service life of machinery and equipment and loss of large capital investments.

In the Soviet Union smelting of pig iron exceeds the production of finished rolled products by 5.5% to 6.5%, while in Western countries the production of finished rolled products exceeds the smelting of pig iron by 8% to 10%. In 1973, the output of sheet metal comprised 38.49% (33.6 million tons) of the total Soviet production as compared with 68% in the United States and 62% in Japan. The difference is even greater in the production of cold-rolled sheet to total sheet. Specific consumption of rolled sheet metal compared with graded metal ranges from 20% to 25% less. Moreover, producing cold-rolled sheet and stock with various types of hardening and protective coating makes the metal not only thinner but also tougher. But the volume of coated rolled metal products in the U.S.S.R. is completely inadequate (in 1970 just a little more than 1 million tons); for this reason the average weight of 1 square meter is twice as great as in the United States, and consequently twice as much

[81] Work cited in footnote 38.

metal is consumed in the manufacture of metal products.

The number of shapes and shape dimensions of graded rolled metal is increasing too slowly. For example, in 1970 the quantity of shapes produced was four times smaller than in the United States and the production of curved sections made from sheet metal was 10 times smaller. These facts are directly confirmed by the following quantities of shavings produced in metal working and machine-building: In the United States, 2.9 million tons per year, and in the U.S.S.R. 7 million tons per year.

The ratio between the production of graded and sheet rolled metal, the inadequate assortment of rolled metal, and the slow rise in the quality of the steel have all led to a situation in which Soviet equipment is between 25% and 45% heavier than the equipment of other countries. Thus, the oxygen converter in the Zhadanavo plant weighs 626 tons, while the oxygen converter manufactured in Austria weighs 426 tons. The 1200 Soviet rolling mill weighs 2,200 tons, whereas in the United Kingdom such a mill weighs between 800 and 1,000 tons; a pipe welding mill in the Soviet Union weighs 2,750 tons, whereas one in West Germany weighs 1,000 tons; a continuous miner in the Soviet Union has a weight per ton of coal mined that is 2.5 to 3 times greater than that in the United States. Because of the low volume of production of alloy and low-alloy steel, average toughness of this steel is 25% to 30% lower than world standards; this accounts for the slow rate of improvement in the durability and longevity of Soviet equipment.[82]

Improving the quality of steel and rolled metal by known methods can reduce consumption of metal per unit of finished products and in finishing operations involved in trimming, and reduce the increase in quantity of poorer quality metal used. But the existing system of prices does not stimulate ferrous metallurgy to produce high-quality products.[83]

The shortage of high quality rolled metal and graded products also have adverse effect on the indicators of capital investment and output capital ratio. A 1.5 to 3-fold excess in the weight of metallurgical equipment compared with world standards makes for excessively heavy structures as well as unwieldy and voluminous designs, which take up much space. This results in a 1.5 to 2-fold lengthening of construction time compared with approved rates and a rise in uncompleted construction projects, which increased from 84% in 1965 to 103% in 1970.[84]

The very system of planning the volume of salable products and profits earned from the level achieved, encourages production of rolled stock which in turn gives rise to increased metal-consumption in manufactured products. Users of the metal are not always interested in reducing the weight of manufactured metal items, because this reduces gross production and lowers economic indicators.[85]

In 1970, facilities for producing rolled stock within the Ministry of Ferrous Metallurgy amounted to 81 million tons, against steel production amounting to 115 million tons. With a planned coefficient of steel consumption per ton of rolled stock equal to 1.3, these facilities are hardly sufficient to roll the steel that was smelted. The situation is almost unchanged as 1975 approaches. The inadequacy of facilities for steel smelting and rolling production is one of the basic causes of the restricted production of graded products, and it hinders the rapid introduction of technological innovations and new processes, especially in the renovating of existing enterprises.[86]

The replacement of obsolete equipment in ferrous metallurgy is proceeding slowly. Through industry as a whole, the level of replacement of old equipment is twice as high as in ferrous metallurgy. The steel industry uses a large quantity of obsolete equipment: 43 blast furnaces, 80 open-hearth furnaces, 97 rolling mills, about one-half of the power units, and a large percent of the metal products equipment. Units aged up to 10 years are being used to smelt 31% of the pig iron, 29% of the open hearth steel, and 31% of the finished rolled metal.[87] Out of 200 coking batteries in the U.S.S.R., more than half have been operating for more than 20 years; some for 40 years; many became obsolete or physically worn out long ago.

Technological processes such as the pro-

[82] Work cited in footnote 38.

[84] Work cited in footnote 38.
[85] Work cited in footnote 38.
[86] Work cited in footnote 38.
[87] Work cited in footnote 38.

duction of oxygen converter steel, continuous casting, and measures to improve the quality of the steel and rolled metal require a smaller capital investment to increase production and make it possible to work out new production lines, which further serve to reduce the capital-output ratio. For example, the specific capital expenditures of converter steel production are 28% to 30% lower than those of open-hearth production. In 1960, the production of oxygen converter steel in the Sovet Union, the United States, and Japan was approximately the same, constituting 2.5 million tons, 3.1 million tons, and 2.6 million tons, respectively. From 1960 through 1970, production increased to 58.6 million tons in the United States, 74.0 million tons in Japan, and 15.3 million tons in the Soviet Union. Although scientific technological developments and production volumes were at the same level, the development of converter production was held back in the Soviet Union because preference was given to the familiar open-hearth method. While open-hearth steel smelting increased by 1.5 times in the U.S.S.R., in the United States it decreased by 0.5 times and in Japan 4.5 times.

Continuous steel-casting units boost the output of usable metal by 8% to 17%. Compared with the usual system, they require 8% to 10% less specific capital investment, or 25% to 35% less with the development of radial and curvilinear continous-steel-casting units. The increased volume of continuous casting in the U.S.S.R. is slow—from 1.1 million tons in 1960 to 5.9 million tons in 1972.

Capital investment in finishing operations (heat-hardening, trimming, coating of rolled stock, and improving quality) are smaller than capital investment in new facilities for the production of run-of-mill rolled stock, with a simultaneous savings in the metal consumed for the finished manufactured products. Thus, according to estimates by the Scientific-Research Institute of Economics of Gosplan U.S.S.R. (State Planning Committee of the U.S.S.R.), if metal consumers replace hot-rolled stock in the amount of 35 million tons by higher quality rolled stock and further purified metal items, it would be possible to save 5.6 million tons of rolled stock and reduce capital investment in the Soviet economy by 500 million rubles.[88]

*Efficiency.*—The Soviet steel industry acts like one big company and could be called the world's largest steel-producing organization under a single management. Under the Soviet system, management can dispose of products, and act without regard for consumers needs. With State control and low labor costs the U.S.S.R. is in a position to maximize the use of its domestic resources even at the cost of submarginal production.

Expansion of the Soviet iron and steel industry continues to be achieved mainly through increased labor and capital rather than advanced technology. It is estimated that 2 to 3 times more investment and labor in real terms are required in the U.S.S.R. than in the principal countries of the West to achieve a given increase in metal output. Because of shortages of metals, efforts are directed chiefly toward fulfilling quantitative goals and less attention is paid to quality. The productivity of labor and equipment is below planned levels, and practically all sectors of the iron and steel industry maintained larger production personnel than called for by plan targets. At the root of these problems is apparently technological backwardness in mining, beneficiation and metallurgical processing, and inefficient production and consumption of metals; the Soviet economic system does not generate innovation.

The assortment of rolled stock in the U.S.S.R. is several times smaller than in the developed Western countries. Many analogous shapes in the U.S.S.R. per unit of length for the same area of service weigh more than the foreign ones. Thus, the thickness of tinplate in the U.S.S.R. is approximately double. The quality of Soviet metal products is lower than those of the Western countries. The U.S.S.R. produces significantly less thin-sheet, cold-rolled steel and plate with platings. It does little to use the strengthening heat-treating of metal. Obviously, with such an assortment and such quality of metal products in the U.S.S.R., the U.S.S.R. can manufacture 1.5 to 2 times less machinery, instruments, and consumer goods from ton of metal than the major Western nations.

Approximately one-half of the finished steel produced (including bars, plates, structural shapes, rails, wire, and coated and uncoated sheet steel) reportedly does

[88] Work cited in footnote 38.

not properly meet consumer specifications. Such a situation in the Soviet steel production is caused by the existing system of planning and accounting for output in physical tonnage and also by bonuses for workers for fulfilling the plan in tons.

Careless storage and utilization of metal have been revealed at many Soviet enterprises. Rolled metal products are stored poorly, sheet metal is stocked outdoors, and cut pieces of sheet metal are mixed with other materials. Some of these products have been stored without use for 5 years.[89]

Despite the expansion of iron and steel production in the U.S.S.R. in recent years, the supply of metal has not kept pace with demand. The Soviet Union is consuming much less steel per capita than West Europe at the present time, because growth is measured in tons of metal produced not in tons of metal usefully consumed. Thus, the large gap in the average ferrous metal consumption is expected to be maintained in the future.

The Soviet economy sustains immense losses each year as a result of inefficient output and consumption of ferrous metals. In many sectors of the economy, more ferrous metals are consumed per unit of production than is required with modern technology. The relative growth of the Soviet iron and steel economy, therefore, can best be determined only from a careful and exhaustive study of the pertinent official Soviet publications.

Although the avoidable losses of ferrous metals are not known completely, nor have they been adequately quantified, they have been widely reported in the Soviet press. According to Soviet sources, estimates of avoidable raw steel losses due to inefficient production and consumption of finished limited rolled ferrous metals in the Soviet economy in 1974 were placed, in million tons, as follows:

| | |
|---|---|
| Production of 94.2 million tons of finished rolled products from 136 (minus 0.5% for castings) million tons of crude steel | 8.0 |
| Over one-half of rolled steel produced in the U.S.S.R. is used in machine construction and metal workings plants, almost one-fourth of it is lost in shavings | 10.7 |
| Heavy weight of machinery and equipment (average 35%) | 20.0 |
| Heavy weight of rolled products in construction and other uses | 13.4 |
| Low quality of machinery and equipment shortened the lifetime on the average by 50% | 5.7 |
| Low quality of machinery and equipment requires additional spare parts and repair | 2.9 |
| Unused machines and spare parts remelted as old scrap (10% of the total scrap) | 10.0 |
| Careless storage and utilization of rolled metal (4% of total scrap) | 4.0 |
| Total losses of raw steel | 74.7 |

A careful and exhaustive study of the Soviet publications shows that only about 45% of the total crude steel production is efficiently used in the Soviet economy and 55% is remelted or lost as a result of low technology of the iron and steel industry and inefficient production and consumption of metal.

Soviet iron and steel statistics are presented in table 5.

[89] Agitator (Propagandist), Moscow. No. 2, 1975, pp. 15–16.

Table 5.—U.S.S.R.: Soviet salient iron and steel statistics
(Million metric tons)

| Item | Actual | | | Estimated | |
|---|---|---|---|---|---|
| | 1960 | 1965 | 1970 | 1975 | 1980 |

[1] Insignificant.
[2] Estimated net consumption according to Western standards.

**Lead and Zinc.**—The Soviet lead and zinc industry is probably the second largest in the world. Estimated output of primary metal in 1974 was 475,000 tons of lead and 680,000 tons of zinc. Ore reserves were estimated in 1974 at 16 million tons of contained lead and 20 million tons contained zinc; over two-thirds are located in Kazakhstan chiefly in the Altay region and in the district of Kara-Tau. There are also large reserves of zinc in the Urals. Estimated production of primary metals in 1975 is placed at 480,000 tons of lead and 690,000 tons of zinc; estimated levels for 1980 are 530,000 and 740,000 tons, respectively. Exports of lead decreased from 97,000 tons in 1973 to 95,000 tons in 1974. Neither lead nor zinc output quotas were reached in 1974 nor in previous years, owing to ore shortages, slow construction of new facilities, and low metal recoveries.[90]

Kazakhstan continued to be the leading lead and zinc producer, and output is to be increased 27.2% and 15.7%, respectively, during 1971–75. Extensive renovation of the Ust'-Kamenogorskiy lead and zinc complex is planned over the next 15 years. Completion of No. 12 blast furnace at the Chimkent lead plant in Kazakhstan was rescheduled for 1975.[91]

Output of zinc at the Almalyk plant increased 6% in 1974 over that of 1973, but the plant continued to experience raw material shortages.[92]

The Ust'-Kamenogorskiy and Leninogorskiy complexes and Chimkent lead plant in Kazakhstan, and some other lead and zinc plants experienced raw material shortages in 1974. The "Elektrotsink" zinc plant in North Caucasus received only 20% to 23% of local raw material from the Sadonskiy complex, the remainder was shipped from other regions over a long distance with 8 times higher transportation costs.[93] Due to the violation of preventive maintenance a breakdown situation was created at the "Elektrotsink" plant in 1974.[94]

Development of the Nikolayevskiy lead, zinc, silver, and bismuth deposit at the Eastern complex in Dal'nogorsk, Primorskiy Kray, continued in 1974. Construction of the Gorevskiy lead and zinc com-

[94] Work cited in footnote 51.

plex at the lower reaches of the Angara River in Krasnoyarsk Kray began in 1974. The first samples of the ore were sent to Kemerovo and Kazakhstan for a recovery process to be developed.

**Magnesium.**—Five magnesium plants with an estimated combined yearly capacity of 67,000 tons produced an estimated 60,000 tons, over 5% more than in 1973. Exports of metal increased from 14,800 tons in 1971 to 27,900 tons in 1974.

**Manganese.**—The Soviet manganese industry is the largest in the world with marketable ore output at 8.3 million tons, or 1% over that of 1973. Three-quarters of the total came from the Nikopol' Basin in the Ukraine, and the rest from the Criatura Basin in Georgia. Some 300,000 tons of crude ore were produced in the Urals. Exports of manganese ore increased from 1.3 million tons in 1973 to 1.5 million tons in 1974.

Facilities with an annual output of 250,000 tons of crude ore were commissioned at the Chiatura Basin in 1974, while completion of the first stage of a concentrator at Darkveti in this basin was rescheduled for 1975. A manganese complex with an annual capacity of 1 million tons of crude ore is under construction at the Nikopol' Basin. Hitherto, basically soft oxide ore was mined by underground methods in the Nikopol' Basin but the expansion necessitates the mining of rather hard carbonite ores; the known carbonite reserves are about half of the total.

**Mercury.**—Mercury output was estimated at 54,000 flasks (76 pounds) and the U.S.S.R. was apparently self-sufficient in 1974. Exports of mercury to Western countries are expected to start in 1975–76. The Khadarkan complex in Kirgizia continues to be the largest mercury operation. Production at the Nikitovskiy complex in the Ukraine, the second major producer, has risen steeply, but the shortage of proved reserves limits its expansion.[95] The Teming-Khainskoye mercury enterprise in Tuva, A.S.S.R., increased its production in 1974.

Construction continued on the Dzidzikrutskiy (Aznob) Mercury-antimony complex in Tadzhik S.S.R., and was scheduled for completion in 1975. Construction of a new mercury complex at Zapadnaya Polyana, 130 kilometers from Pevek in Chukotka began in 1974. Small cinnabar deposits have been found in the Transcarpathian Oblast', Ukraine.

**Molybdenum.**—The metal content of molybdenum concentrates was estimated at 8,800 tons, about 4% above that of 1973. About 50% came from copper-molybdenum ores in Armenia, Kazakhstan, Sorskoye, and other deposits in Siberia; over 30% was molybdenite ores mines in Uzbekistan and in Siberia; the remainder came from tungsten-molybdenum ores of Tyrny-Auz (Kabardin A.S.S.R. in North Caucases) and Dzhida (Buryat A.S.S.R.). Soviet reserves of molybdenum in ore may approach 200,000 tons.

Armenia is the major producer of concentrates, which are shipped out of the republic for further processing. The Kadzharan copper molybdenum complex in Armenia supplied about 25% of Soviet molybdenum in 1974. Output of molybdenum concentrates in 1975 at this complex is to be increased by 20% above the 1970 level. Production of molybdenum concentrate was increased at the Balkhash complex in Kazakhstan and at the Almalyk complex in Uzbekistan. The Tyrny-Auz complex, one of the largest Soviet molybdenum operations, which is also being expanded, had one underground mine, two open pits (one under development), and a concentrator in operation in 1974. Renovation of the 25-year-old Sorskiy molybdenum complex in Khakas Autonomus Oblast' was in progress in 1974. Reportedly, a deposit of molybdenum ore was discovered near the Sayan Mountains in Krasnoyarskiy Kray in 1974.

**Nickel.**—The U.S.S.R. retained its position as the world's second largest producer of nickel, with an estimated 145,000 tons of smelter products, 7.4% more than in 1973. The 1974 plan called for a 13.7% expansion, but because of low recoveries and slow development of richer deposits at Norilsk the planned quota was not met. Sulfide ores are mined at Norilsk in West Siberia and in the Pechenga-Monchegorsk area in the Kola Peninsula. Oxide ores are produced in the Aktynbinsk area of the Southern Urals, the Ufaley area of the central Urals and the Ukraine. The centers of production in order of importance continue to be Norilsk, Urals, and the Kola Peninsula. Of the seven smelters in operation, Norilsk is the most important; Ufaley, Rezh, and Khalilovo smelters in the Urals are a close second. The Mon-

[95] Work cited in footnote 68.

chegorsk and Pechenga smelters are third, and the Pobuzhsk ferronickel plant in the Ukraine is fourth. Production is estimated at a probable 155,000 tons in 1975 and 200,000 tons in 1980. In the future the Soviet Union will be an important nickel exporter, based on both Soviet and Cuban concentrates.

The Norilsk complex in West Siberia is producing copper, nickel, cobalt, platinum-group metals, selenium, and other rare metals, and recent expansion has been rapid. In 1973 the production of nickel increased 31% over that of 1972, and during 1974 Norilsk had to expand nickel output 87.7% over that of 1970. In 1973, the leading Talnakh's "Mayak" mine achieved its planned capacity, and the fourth stage of the larger "Komsomol'skiy" mine was commissioned. In 1974, new facilities were put onstream at the "Komsomol'skiy" mine and development was nearing completion on the Oktyabr'skiy mine.

The first stage of the Oktyabr'skiy mine at Norilsk was completed in August and the second stage in December 1974. The mine operates a depth of about 1,000 meters, and full planned capacity is to be reached in four stages by 1980. The Oktyabr'skiy mine is the largest underground mine in the Soviet nonferrous industry. The Mayak, Komsomol'skiy, Oktyabr'skiy, and other (old) enterprises at Norilsk were in operation in 1974. The Taymyr mine (1,000 to 1,500 meters deep), the fourth underground mine at the Talnakh and Oktyabr'skiy deposits, was under development in 1974.

Recovery of nickel in concentrate increased by 7.2% in 1966–70. During the 1971–74 period a further increase in nickel recovery from ores was achieved. Nevertheless, losses continued to be high. For example, losses during recovery of nickel from 1.5% nickel content ore at the Rezhsk nickel plant were up to 20% in 1974.[96]

Because of preventive maintenance repair violations at the Pobuzhsk ferronickel plant, which was put into operation in 1973, there were major breakdowns.[97] Reportedly, a deposit of copper-nickel ore was discovered near Zapolarnyy in Murmansk Oblast' in 1974. Twenty teams of geologists were engaged in searching for copper-nickel ore at Norilsk region in 1974.[98]

The U.S.S.R. is financing a $600 million expansion of Cuban nickel production, with output of 90,000 tons per year, scheduled for 1985. The Gipronickel Institute in Leningrad is designing a new plant to be built in Oriente Province to recover nickel and cobalt. A short-term program is underway to increase the capacity of the 36,000-ton-per-year Punta Gorda nickel complex with the assistance of Soviet and Czech engineers.

The Soviet Union has been negotiating an agreement with Finnish, West German, and Japanese companies to supply equipment for a nickel smelting plant, which is to be built in the Kola Peninsula region. The raw material for this plant will partially be shipped from Norilsk.

**Platinum.**—The Soviet Union remains the largest producer and exporter of platinum–group metals, supplying 20% to 25% of international exports of platinum and more than 50% of world consumption of palladium and rhodium. Reserves are adequate to maintain current production for many years, with increased exports. The U.S.S.R. is steadily expanding its output of platinum–group metals; the estimated output was 2.5 million ounces in 1974. Production of platinum and platinum–group metals may reach 2.65 million ounces by 1975 and 3.2 million ounces by 1980.

Production of platinum and platinum–group metals came principally from the Norilsk complex in West Siberia, the Severonikel and Pechenganikel complexes on the Kola Peninsula, and several placer deposits in the Urals. Virtually all platinum–group metals were produced as byproducts, with about 75% coming from Norilsk. The high priority given to the Norilsk development suggests that the Soviets are determined to proceed with increased production of platinum and platinum–group metals despite high costs imposed by the harsh northern climate. Expansion is expected to accelerate in a few years, with completion of the Oktyabr'skiy mine at this complex. This mine has been under development since 1969. The Oktyabr'skiy mine is the third mine to be put into operation at the Norilsk complex since the discovery of new and rich deposits; the development program began in 1961.

**Silver.**—Output of silver was estimated

[96] Pravda, Moscow. February 26, 1974, p. 2.
[97] Work cited in footnote 51.
[98] Sotsialisticheskaya industriya (Socialist Industry), Moscow. May 21, 1974, p. 2.

at 42 million troy ounces, 2.4% above that of 1973. Almost all silver is produced as a byproduct from nonferrous operations, with production mainly centered in the Soviet Far East, East Siberia, the Urals, Kazakhstan, and Armenia. During the year 14 gold treatment plants extracted silver, and the Norilsk complex in West Siberia and some of the Kola copper-nickel enterprises also produced silver. The Zarafshan gold plant in Uzbenistan began production of silver in 1974.

**Tin.**—Although the Soviet tin production policy is based on self-sufficiency at any price, output continues to be inadequate and about 15% of requirements had to be imported in 1974. Tin production in 1974 was estimated at 29,500 long tons, 1.7% over that of 1973. The Soviet Far East, Yakutia, and Transbaykal were the main tin producers. In 1974, over 25% of total output was from placers, and the Soviet northeast placers accounted for 75% of production.

The Dal'olovo (Far East Tin) concern in Primorskiy Kray was closed in 1974, and all its operations were transferred to the Khrustal'nyy complex in the same Kray. As a result, the Khrustal'nyy mine operated the Khrustalnoye, Silinskoye, Verkhneye, and Levitskoye deposits in 1974. The Arsen'evskaya mine of the Khrustal'nyy complex is under development and scheduled for completion in 1975. Development of the Pridorozhnyy mine, operated by the Solnechnyy complex in Khabarovsk Kray, was completed in 1974. This is the second mine (the other is Molodezhnyy) at this complex. The Solnechnyy and Pereval'skiy mines at the Khrustal'nyy complex were under development in 1974.

Production at the new Muza section of the Omsukchan mining and concentrating complex in Magadan Oblast' began in 1974. The Badzhal deposit was discovered in the Amgun River Basin through which the Baykal-Amur railway is to be built.

Three known refineries were operating in the U.S.S.R. in 1974: The Novosibirsk, Ryazan', and Podol'sk (near Moscow). The Nonsibirsk central smelter, the largest in the country, was short of 2.6 million rubles of working capital in 1974.

**Titanium.**—Development of the titanium industry continues with an estimated production of 28,000 tons of titanium metal, the U.S.S.R. was the world's second largest producer in 1974. Large amounts of titanium sponge are now sold to the West. During 1971–75, a 40% expansion is expected and exports will increase significantly. The industry continued to be based mainly on Ukranian and Siberian ilmenite and rutile. Reports indicated that a titaniferrous slag containing 83% titanium dioxide is being produced at the Zaporozhye plant.

Renovation of the Irshanskiy mining and concentration complex in Zhitomirskaya Oblast' was completed during 1971–74, and the complex met the 1974 quota ahead of schedule. Output of zircon, rutile, and ilmenite concentrates from Samotkanskoye placer increased in 1974. The Ust'-Kamenogorsk titanium and magnesium complex almost attained the production level planned for 1975.

**Tungsten.**—Estimated production of 7,000 tons of tungsten in concentrate was insufficient for growing domestic needs, and about 33% of requirements had to be imported. The industry continues to be centered mainly in the North Caucasus, Transbaykal, the Soviet Far East, Central Asia, and Kazakhstan.

Development of the second open pit at the Tyrny-Auz tungsten-molybdenum complex in North Caucasus continued in 1974. Exploration of a new tungsten deposit in Buryat A.S.S.R., which will increase production at the Dzhida tungsten-molybdenum complex, continued in 1974.

**Vanadium.**—The Soviet Union, with large vanadium resources, is becoming an important producer and exporter. The principal sources in 1974 continued to be vanadium-rich slag, a coproduct with iron from the titaniferrous magnetites of the Kachkanar open pits in the Urals and the iron ore of Lisakovskiy deposit in Kazakhstan. However, the metallurgical problems of vanadium recovery have not yet been satisfactorily resolved. The Nizhniy Tagil metallurgical complex is the only modern enterprise in the U.S.S.R. that produces raw material and its alloys. A new plant for ferrovanadium production from Urals magnetite ores continued to be under construction at the Serov steel plant. The third section of the first stage of the Lisakovskiy complex was completed in 1974.

**Minor Metals.**—The Soviet Union possesses commercial deposits of all those rare metals that have assumed importance in

modern rocketry, aircraft, and nuclear energy. The main deposits are in Kazakhstan, Kola Peninsula, Armenia, Urals, Ukraine, Norilsk, Transbaynal, and Soviet Far East. Experimental extraction of gallium from wastes at the Pavlodar alumina plant began in 1974. Production of indium, selenium, thallium, and tellurium as a byproduct of copper and zinc operations at the Bashkirian nonferrous industry began in February 1974, and commercial production of indium at the Almalyx complex in Uzbekistan began in May 1974. Production of scandium, as byproduct of the Ust'-Kemanorgorsk titanium and magnesium complex in Kazakhstan, began in May 1974. Output of silicon in the Ukraine attained the production level of 1975.

## NONMETALS

The Soviet Union produced a wide variety of nonmetallic minerals. However, the resource position varies from a adequacy for many nonmetallic minerals to apparent shortages of others such as barite, fluorspar, mica and talc.

**Asbestos.**—In 1974, the U.S.S.R. produced an estimated 1.36 million tons of six grades of asbestos, 80,000 tons more than in 1973, and was second only to Canada. Canadian equipment is being used in large-scale expansion of the industry. Exports increased from 385,300 tons in 1970 to 448,900 tons in 1973 and to 528,000 tons in 1974. Despite export expansion in recent years, with about half going to Western market, the domestic asbestos deficit was 200,000 tons in 1971 and is expected to be about 100,000 tons in 1975.[99]

The 1971–75 5-year plan foresees a rise in production of 563,000 tons by increasing output at Dzhetygara from 259,000 tons in 1970 to 360,000 tons in 1975, by expansion of the plant No. 6 in the Urals from 320,000 to 550,000 tons, and by increasing output at other facilities in the Urals and at the Tuvaasbest combine. Estimated output for 1975 and 1980 is 1.45 million tons and 1.7 million tons, respectively.

Development is centered in the Urals, Kazakhstan, and Tuva A.S.S.R. Output of chrysotile asbestos at the Ural-asbest combine was estimated at 930,000 tons; in Kazakhstan, the Dzhetygara No. 1 mill produced 340,000 tons and the No. 2 mill, 60,000 tons. The first section of the Dzhetygara No. 2 mill, with a 100,000-ton annual capacity was completed in February 1974, and the second stage with the same capacity was commissioned in December 1974.

In 1974 the Tuvasbest combine at Ak-Dovurak in Tuva A.S.S.R. produced an estimated 35,000 tons of the highest quality and the greatest fiber length of any known Soviet asbestos reserves. For some time anthophyllite and other nonchrysotile varities of asbestos have been mined at a small Sysersk deposit in the Urals and at the Bugetyysk deposit in the Mugadzhary Hills, Kazakhstan.

Development of the Kiembay deposit in Orenberg Oblast' (Southern Urals), which started in 1968, continued in 1974. Under an agreement signed in June 1973, seven COMECON members are to assist in completion of this project. The design capacity of the complex is 500,000 tons per year of grades III to VI from 24 million tons of ore with an average grade of 4.4%. The complex is to be built in two equal stages. Reserves at the Kiembay deposit are estimated at 20 million tons. The open pit will be 2.2 kilometers long, 1.8 kilometers wide, and 150 meters deep. The first stage is to be completed in 1979 and its output will be shared among the COMECON members in proportion to their contribution to the construction. The design of the Molodezhnyy asbestos mining and concentrating complex in Buryat A.S.S.R. was completed in 1974.

**Barite.**—Barite is mined by both open pit and underground methods, and at some operations crude output is concentrated by flotation. About two-thirds of the country's barite consumption in 1974 was produced domestically; the balance is being filled by imports of high-grade barite mainly from North Korea, Bulgaria, Yugoslavia, and Romania. The main center of production continued to be Georgia, which produced over two-thirds of the total output in 1974. Some deposits have been developed in Kazakhstan, West Siberia, the Urals, Azerbaydzhan, and Armenia. The increase in output in 1974 was attributed largely to the increasing byproduct output at the Achisay polymetallic complex in Kazakhstan. Construction of a 45,000-ton-per-year complex at Khaishi in Svanetia,

[99] Narodnoye khozyaystvo Kazakhstana (National Economy of Kazakhstan), Alma-Ata. No. 12, December 1971, p. 89.

Georgia, and development of the Zharemsk underground mine and open pit in Kazakhstan continued in 1974.

**Cement.**—Approximately 110 plants produced 115.1 million tons of cement, or 4.5% more than in 1973. Plans called for the construction of 5.8 million tons of new capacity in 1974, but 5.6 million tons of the total was completed. The planned construction costs of a cement plant with a yearly capacity of 0.6 million tons was over 20 million rubles. As a result of poor-quality cement and inefficient transportation and use of cement, 21% to 22% of the total production was wasted in 1974.[1] Losses of cement in the producing plants totaled 5% to 6% of gross output; in loading, unloading, and transporting, 10%; and in utilization by concrete and mixing plants, 6%. With a total cement production of 115 million tons in 1974, these losses would mean an effective reduction in available supply of 25 million tons.

Plans call for production of 122 million tons of cement and for construction of 4.3 million tons of new capacity in 1975.

**Diamond.**—The U.S.S.R. continued to make rapid progress in expanding its diamond industry, which is centered in Yakutia where about 20 deposits have been discovered. Production in this region started at a small plant in 1957. In January 1974, the industry consisted of the large Mirnyy open pit with five concentrators, the Aykhal open pit and concentrator, the Udachnaya placer mine and concentrator (near the Arctic Circle), and the Irelyakh placer mine with two dredges. Small quantities of gem and industrial stones were produced from the Vishera River region placers in Perm'Oblast', western Urals. In 1974, output was estimated at 7.6 million carats of industrial quality and some 1.9 million carats of gem quality. The diamond industry remains a major foreign exchange earner with receipts of some 300 million rubles in 1974.

Gem stones are cut with the assistance of Belgian specialists at Leningrad, Sverdlovsk, and Smolensk. The U.S.S.R. has arranged to market its diamond output in Antwerp through a newly formed Soviet-Belgian company in which Almazyuvelirexport has the controlling interest.

**Fertilizer Materials.**—Production totaled 19.3 million tons in nutrient content, or 80.3 million tons in bulk fertilizer content,[2] an increase of 11% over that of 1973. Nitrogen fertilizers constituted around 41%; potassium fertilizers, 34%; phosphate fertilizers, 18%; and phosphatic flour, 7%. The Soviet mineral fertilizers industry met production goals for 1974. This increase was obtained mainly through the commissioning of new capacities. In 1974, capacity at plants was expanded by 7 million tons of fertilizers (Soviet standard) per year, including facilities at the Novomoskovskiy, Severodonetskiy (the third Kellog-designed, 1,500-ton-per-day ammonia plant), and Voskresenskiy chemical complexes as well as at the Gomel'skiy and Kuybyshevskiy chemical plants. The planned quota for construction of new facilities was met by 68% in 1974.

There was an increase in exports of potassium salts and phosphorus and nitrogen fertilizers. Despite substantial production and large exports, fertilizers did not meet domestic demand. A high percentage of superphosphate and potassium fertilizers was not granulated and great difficulties were experienced in commissioning some new projects and attaining planned capacity of facilities.[3]

Over 97% of the fertilizers were shipped by railroad, mostly in bulk, causing loading losses, moisture penetration, and difficulties in loading and unloading. Unloading took place at almost 7,000 railroad stations with the use of manual labor. As a result, about 10 million tons (15% of the total shipped) of fertilizers was lost in 1974.[4]

An agreement between the Soviet Union and certain COMECON countries has been signed for the construction of the Kingisepp mineral fertilizer plant in Leningrad Oblast'. The East European countries will supply the equipment for this plant in exchange for Soviet deliveries of ammonium phosphate over a period of 10 years, beginning in 1976.

The U.S.S.R. is cooperating with France, the United States, West Germany, and other Western countries in the pro-

[1] Material'no-tekhnicheskoye snabzheniye (Material-Technical Supply), Moscow. No. 6, 1973, pp. 3–8.
Shakhtnoye stroitel'stvo (Shaft Construction), Moscow. No. 9, 1973, pp. 5–6.

[2] The average content (nitrogen, phosphorus, and potash) is expressed in Soviet standard units. Nitrogen is expressed as ammonium sulfate, 20.5% N, phosphate is expressed as 18.6% $P_2O_5$, potash is expressed as 41.6% $K_2O$, and ground rock phosphate (phosphatic flour) is expressed as 19% $P_2O_5$.

[3] Ekonomicheskaya gazeta (Economic Gazette). Moscow. No. 9, February 1975, p. 2.

[4] Material'no-tekhnicheskoye snabzheniye (Material-Technical Supply), Moscow. No. 8, August 1974, pp. 8–12.

duction of chemical products. The construction of an ammonia complex with an annual capacity of 1.8 million tons began in 1974 near Kuybeshev. Chemical Construction Co. of the United States will supply engineering and equipment for four 1,360-ton-per-day ammonia plants to be operating by the end of 1978 under a $200 million contract with the U.S.S.R. Natural gas from the nearby Orenburg Field will serve feedstock. A 1,500-ton-per-day urea plant will be constructed in the U.S.S.R. by the Italian company Montedison. French Creusot-Lori Enterprises will construct a 1.8 million-ton-per-year ammonia plant at Gorolvka in the Donets Basin, Ukraine, and at Kemerovo in West Siberia. Each complex comprises a two-line plant, each line with a capacity of 1,360 tons per day. Toyo Engineering Co. Ltd. and Mitsui Group have exported 12 ammonia plants and 1 urea plant to the Soviet Union and have received inquiries for 8 more large ammonia plants. At the same time, the Soviet Union will aid Morocco's phosphate industry under a long-term technical cooperation agreement signed in March 1974.

The growth of the Soviet mineral fertilizer industry is on the priorities list of Soviet planners. The 1975 plan envisages output of 90 million tons in bulk (22.2 million tons of nutrients), with 72 million tons being supplied to agriculture, and a 13.7 million-tons-per-year construction of new mineral fertilizer facilities. Estimated production for 1975 and 1980 is 90 million tons (Soviet standard) and 125 million tons, respectively.

*Nitrogen.*—Nitrogen production was expanded from 35.3 million tons (20.5% N) in 1973 to 38.3 million tons in 1974, 3.0 million tons more than 1973 production. The bulk of the production was in the form of ammonium sulfate and ammonium nitrate fertilizers, although production of urea and liquid fertilizers has increased. Estimated levels of nitrogen production for 1975 and 1980 are 42 million tons (20.5% N) and 56 million tons, respectively.

*Phosphate.*—Increased output of phosphate fertilizers in 1974 was attained largely through the commissioning of new capacity rather than through greater use of available facilities. Single superphosphate continued to be basic type of material produced.

The Soviet Union possesses two of the world's greatest reserves of phosphate rock, the apatite-nepheline ores in the Kola Peninsula and phosphorites in the Karatau area in southern Kazakhstan. The apatite concentrate with 39.4% $P_2O_5$ provided about 75% of all raw materials for the production of phosphate fertilizers; the balance was produced from Karatau phosphorites. Deposits of phosphorites also occur in Upper Kama, the Moscow District, Kingisepp in Leningradskaya Oblast', Bryansk, and some other regions, but the $P_2O_5$ content is rather low. Generally they produce phosphorite flour with about 19% $P_2O_5$.

Minable reserves of phosphate were estimated in 1974 at about 2,700 million tons of phosphate rock (overall average grade 13.8% $P_2O_5$), including some 250 million tons of proved reserves and 2,917 million tons of apatite (average grade about 18% $P_2O_5$), including around 500 million tons of proved reserves.

Estimated output of phosphate rock was 57.6 million tons in 1974, including 35.6 million tons of apatite (17.7% $P_2O_5$) and 22 million tons of sedimentaries (13% $P_2O_5$). The main centers of phosphate rock production continued to be the "Apatit" complex on the Kola Peninsula, and phosphorite deposits at Karatau in Kazakhstan, Kingisepp in Leningrad Oblast', Egor-evsk and Lopatino (Voskresensk complex) in Moscow Oblast', Upper Kama in the Urals, and Kolpino in Bryansk Oblast'.

The Khibiny apatite-nepheline deposit is the largest single phosphate source. Mined ore, averaging 17% to 18% $P_2O_5$ was concentrated up to 39.4% $P_2O_5$ with 92% recovery. The apatite complex produced 15.3 million tons of concentrate (35.6 million tons of ore) in 1974 from three underground mines and one open pit and two concentrators. The complex employed over 16,000 workers in 1974. New facilities with a yearly capacity of 1.7 million tons of apatite ore were commissioned at the Tsentral'nyy open pit in 1974. Production of apatite ore began at the mall Saamsk open pit in November.

Construction of the experimental mill at the Zabaykal'skiy complex in Buryat A.S.S.R. started in 1974. Between 1976 and 1980 this will begin experimental production of an apatite concentrate from the Oshurkovo deposit where reserves are large, but have only a 4% $P_2O_5$ content. In the future, the commercial Zabaykal'-

skiy apatite complex, with an annual capacity of 1.3 million to 1.5 million tons of concentrate is to be built. At the Kovdor iron ore and concentrating complex on the Kola Peninsula an apatite concentrate plant with a first stage capacity of 880,000 tons was commissioned in December 1974.

The 40 commercial deposits in the Karatau area of Kazakhstan contain 1,700 million tons of phosphorite. Less than half of the reserves of the basin can be extracted by open pit methods. Seven open pits at the Akcay and Dzhanytas deposits and the Molodezhnyy underground mine at the Chulaktan deposit have a total capacity of around 7.5 million tons and were operating in 1974. About 70% of total production in Karatau came from the Dzhanytas deposit. The ore, containing up to 26% $P_2O_5$, was upgraded to 28.5% $P_2O_5$ but recovery is low. Because of equipment shortages, Dzhanytas open pits produced 7 million tons of ore below the planned capacity in 1974.[5]

The Voskresensk complex in Moscow Oblast' produced over 2 million tons of phosphate flour in 1974. The first stage for the production of monoammonium phosphate at the Kingisepp phosphorite complex in Leningradskaya Oblast' was commissioned in 1974. The second stage was under construction and is scheduled for completion in 1975.

Reserves of apatite ore at the Beloziminsk deposit in Irkutusk Oblast' in categories $C_1$, plus $C_2$ (possible reserves) with 6.4% to 11.7% $P_2O_5$ content were approved by the GKZ. (State Commission for Reserves) in 1974. Reportedly, the Siliktarskiy apatite deposit was discovered in southern Yakutia in 1974.

*Potassium.*—The Soviet Union is one of the world's leading countries in potassium ore reserves, fertilizer output, and exports of potash salts. Gross potash reserves are reported at 22,900 million tons of 16% to 40% $K_2O$ content (3,800 million tons of $K_2O$). About two-thirds of the reserves are located at the Upper Kama Basin in the north Urals. Estimated 1974 potash output was 15 million tons (41.6% $K_2O$) over 3% higher than in 1973. The four major producers are Solikamsk and Berezniki on the western side of the Urals, Soligorsk in Belorussia and Stebnikov, and Kalush in West Ukraine. Eight combines were in operation in 1974.

Under the 1971–75 5-year plan, potash output is to increase from 9.8 million tons (41.6% $K_2O$) in 1970 to 19.8 million tons in 1975. The Uralkaliy (Ural potash) concern is to increase production of potash salts from 3.8 million to 10.8 million tons; the Belaruskaliy concern is to increase production of potassium chloride from 4.8 million to 8 million tons per year, and the Kalush chemical-metallurgical complex is to increase the output of fertilizers from 382,000 tons in 1970 to 500,000 tons (41.6% $K_2O$) in 1975. Estimated levels of potash output for 1975 and 1980 are 17 million tons (41.6% $K_2O$) and 23 million tons, respectively.

In 1974, the Belaruskaliy concern produced an estimated 7.6 million tons (41.6% $K_2O$) from about 28.7 million tons of ore with a recovery of 80%. Construction of the Soligorsk No. 4 potassium complex in Belorussia began in 1974. The second stage of the Berezhiki No. 3 potassium complex in the Urals, with an annual capacity of 1.8 million tons, was completed in December. The total yearly capacity of the Berezniki No. 3 complex is 3.6 million tons (41.6% $K_2O$). The Berezniki No. 4 potassium complex and the new facilities at the Solikamsk mining operations in the Urals were under construction in 1974.

A 5-year cooperative agreement between the U.S.S.R. and East Germany on the development of automated process control for potash mines and plants was signed in November 1974. Reportedly, several deposits of potassium have been discovered in the southeast of Turkmenia.

**Fluorspar.**—Fluorspar output remained below domestic requirements despite efforts to achieve self-sufficiency. Imports of fluorspar from Mongolia, PRC, Thailand, and Japan increased from 144,700 tons in 1970 to 487,400 tons in 1974. Estimated levels of fluorspar output for 1975 and 1980 are 475,000 tons and 540,000 tons, respectively.

Fluorspar is mined in Maritime Kray (Voznesensk deposit), Chita Oblast' (Kalanguyev, Abagaytuysk, Solnechnyy, and Usulinsk deposits), Buryat A.S.S.R., Central Asia, and other regions. The first section of a new facility at the Yaroslavskiy complex in the Maritime Kray

[5] Narodnoye khozyaystvo Kazakhstana (National Economy of Kazakhstan), Alma-Ata. No. 9, September 1974, pp. 31–33.

was commissioned in 1974 at a cost of 1.2 million rubles. At the concentrator three mills were installed, flotation machines were replaced, and other extensive renovation was carried out. The new unit is to process 345,000 tons of ore per year.

**Mica.**—The domestic supply of mica was augmented by large imports, despite the increasing use of substitutes. Strategic-grade mica continued to be imported from India to meet special industrial demands. Imports of mica increased from 160 tons in 1968 to 725 tons in 1974. Estimated output of mica totaled 41,000 tons in 1974.

Irkutsk Oblast' continued to be the main supplier of muskovite. Nine mines were in operation in 1974. Mica is also mined at the Aldanslyuda (Aldan mica) combine in Yakutia and at the Karelslyuda (Karelia mica) and Kovdorsly (Kovdor mica) combines in the Karelo-Murmansk region.

**Salt.**—The Soviet Union is one of the world's leading countries for salt reserves, production, and exports. Production in 1974 was estimated at 12.5 million tons. Output of salt may reach 13 million tons by 1975, expecting to rise to 16 million tons in 1980. Exports increased from 279,700 tons in 1973 to 346,300 tons in 1974. Salt development is concentrated in the Donets Basin, the Urals, East Siberia, Armenia, West Ukraine, and other areas. The Donets Basin continued to account for over 40% of total output in 1974. The increase in production came mainly from the Iletsk mine in Orenburg Oblast' and the Avansk mine in Armenia.

The Nizhniy Baskunchak salt complex, with an annual capacity of 700,000 to 900,000 tons, was under construction in 1974. The construction of the Verkhnekamsk salt complex in Permskaya Oblast' and renovation of the Iletsk mine continued in 1974. The Avansk mine and a new mine with an annual capacity of 60,000 tons are under development and scheduled for completion in 1975. Construction of the Mosyr salt complex in Belorussia, based on rock salt deposits which lie at depths of up to 700 meters began in 1974. The planned capacity of the complex is 360,000 tons per year. It is planned to develop the Berezniki and Solikamsk potassium complexes in the Urals during the 1976–80 period. The U.S.S.R. has awarded a contract to Tecnimont for the engineering of the 270,000-ton-per-year Sterlitamak salt plant in Bashkiria. The plant will be based on Montedison technology and is due to startup in 1976.

**Sulfur.**—The U.S.S.R. has large reserves of sulfur, but grades are low and costs high. Estimated production of contained sulfur totaled 8 million tons, of which 3.6 million tons was recovered from pyrite, 2.4 million tons from native sulfur, and 2 million tons from other elemental sulfur. Estimated levels of total sulfur output for 1975 and 1980 are 8.4 million and 10 million tons, respectively. The principal producers of native sulfur continue to be Rozdol (West Ukraine) and Gaurdak in Central Asia, which together produced the bulk of the country's requirements. Exports of sulfur decreased from 440,300 tons in 1973 to 439,600 tons in 1974. Imports increased from 468,300 tons in 1973 to 471,800 tons in 1974.

The Northern open pit of the Gaurdak complex in Turkmenia produced 1.5 million tons of ore in 1974. This new open pit, with a yearly capacity of 600,000 tons of ore, was under development in 1974. The Yavorovskiy mine in L'von Oblast' produced 150,000 tons of sulfur from 23 wells, using the Frasch process. The first stage of this mine, with a yearly capacity of 300,000 tons, is scheduled for completion in 1975. The second stage, with the same capacity, will also be constructed in 1975.

**Talc.**—The U.S.S.R. produced an estimated 410,000 tons of talc in 1974, 2.5% more than that of 1973. In 1974, only the Onot deposit in Irkutsk Oblast', with a yearly capacity of 45,000 tons of talc, produced high-grade material. Despite large reserves and the development of new mines and beneficiation facilities, imports of talc increased from 44,900 tons in 1973 to 72,700 tons in 1974. Estimated levels of talc output for 1975 and 1980 are 420,000 and 500,000 tons, respectively.

The Miass and Shabrovsk deposits in the Urals and the Kirgiteysk deposit in Krasnoyarskiy Kray were the major Soviet producers of low-quality talc in 1974. Some talc ore was mined from the Southern Osetinsk and other small deposits. The raw material at the Onotsk deposit is shipped for processing to the Miass talc mill in the Urals. The Alguyskoye talc deposit has been explored and it is planned to develop this deposit in the future.

## MINERAL FUELS

Production of primary energy derived from fossil fuels, fuelwood, and hydroelectric and nuclear generation increased from 1,437 million tons in standard fuel equivalent in 1973 to an estimated 1,527 million tons in 1974. The share of petroleum and natural gas in the total Soviet primary energy production increased from 62.3% in 1973 to 63.8% in 1974, while that of coal (anthracite, bituminous, and lignite) declined from 32.6% to 31.4%, respectively. The output of primary energy (from all sources) in the U.S.S.R. in 1975 is placed at 1,625 million tons of standard fuel. By 1980, Soviet primary energy production (from all sources) is to rise to 2,000 million tons. Soviet energy production will get high investment priority during the 1976–80 plan period.

Total consumption of all types of primary energy in the Soviet Union increased from 1,276 million tons of standard fuel equivalent in 1973 to an estimated 1,346 million tons in 1974. The share of petroleum and natural gas in total Soviet primary energy consumption increased from 59.1% in 1973 to an estimated 60.2% in 1974, while that of coal declined from 35.3% to 34.3%, respectively. Total consumption of all types of primary energy in the U.S.S.R. is to be equivalent to 1,420 million tons of standard fuel in 1975 and to over 1,700 million tons in 1980.

In 1974, the U.S.S.R. produced 459 million tons of crude oil and gas condensate, 684 million tons of run-of-mine coal and lignite (including 175 million tons of raw coking coal), and 261 billion cubic meters of natural gas. Increases of 7% for oil and gas condensate, 10% for gas, and 3% for coal were recorded over 1973 production.

Despite expansion of Soviet primary energy production and exports during recent years, the fuel and energy supply in the U.S.S.R. has not kept up with demands of the Soviet economy, which has experienced chronic energy shortages, particularly in the European part of the U.S.S.R. The Soviet economy sustains immense losses each year as a result of inefficient output and underutilization of energy.

The Soviet Union's reported energy consumption per capita approaches that of Western Europe, although there is still a significant difference in the standard of living. One reason for the apparent difference is that the Soviet growth is measured in terms of energy "produced," not in terms of energy usefully consumed. In addition, fuel shortages often bring with them the production of substandard fuels, which are often marketed as standard quality fuels.

The primary energy balance of the U.S.S.R. for 1973 and 1974 is shown in table 6.

**Table 6.—U.S.S.R.: Total primary energy balance for 1973 and 1974**
(Million tons of standard fuel equivalent)

| Year | Total primary energy | Coal (lignite anthracite, bituminous) and coke) | Crude oil and petroleum products | Natural and associated gas | Peat | Oil shale | Fuelwood | Hydropower | Nuclear power |
|---|---|---|---|---|---|---|---|---|---|
| 1973: [1] | | | | | | | | | |
| Production | 1,436.6 | 468.4 | 613.5 | 282.4 | 20.2 | 10.6 | 25.1 | 15.0 | 1.4 |
| Imports | 44.0 | 9.3 | 21.0 | 13.7 | -- | -- | -- | -- | -- |
| Exports | 204.2 | 25.8 | 169.0 | 8.2 | -- | -- | -- | 1.2 | -- |
| Apparent consumption | 1,276.4 | 451.9 | 465.5 | 287.9 | 20.2 | 10.6 | 25.1 | 13.8 | 1.4 |
| 1974: [2] | | | | | | | | | |
| Production | 1,526.6 | 480.0 | 657.0 | 314.0 | 20.2 | 10.9 | 25.1 | 17.5 | 1.9 |
| Imports | 31.0 | 9.0 | 7.7 | 14.3 | -- | -- | -- | -- | -- |
| Exports | 211.7 | 27.6 | 166.0 | 16.8 | -- | -- | -- | 1.3 | -- |
| Apparent consumption | 1,345.9 | 461.4 | 498.7 | 311.5 | 20.2 | 10.9 | 25.1 | 16.2 | 1.9 |

**Coal.**—In 1974, the U.S.S.R. produced 684 million tons of run-of-mine bituminous coal, anthracite, and lignite, the equivalent of an estimated 392 million tons of clean coal according to Western practice and experience, placing it second among world coal producers. This was 17 million tons of raw coal (or 2.4%) more than was produced in 1973. The Soviet coal industry employed about 1.2 million "production" (a Soviet term used for statistics) workers, some 0.6 million "nonproduction" workers, 64,000 university graduate engineers (of whom 87 were doctors of sciences and 1,317 were candidates of sciences), and 148,000 graduate technicians. On the average, there were 60 specialists (mainly mining engineers and geologists) with a university degree, and over 150 graduate technicians for each mine. The coal industry had 36 research and design establishments with a total staff of over 41,000 persons. The coal industry employed 770,000 women, including 109,000 at the underground mines and 10,000 at the open pits.[6]

Gross production at the Soviet Union's 10 major and numerous minor coalfields amounted to an estimated 448 million tons of bituminous coal, 76 million tons of anthracite, and 160 million tons of brown coal and lignite. About 30% (202 million tons) of the total output was surface mined. Of the total output, coking coal accounted for an estimated 175 million tons, or 1.2% more than in 1973.

The 1974 production came from about 800 underground mines with an average yearly capacity of 585,000 tons and 69 open pits with an average yearly output of 2.9 million tons of run-of-mine coal and lignite. Many mines did not meet their established production quotas and did not attain planned capacities in 1974.

In 1975, production of raw coal and lignite is to reach 700 million tons. The 1975 plan envisages a total investment of 2.5 billion rubles in the development of Soviet coal industry. Facilities for the mining of 30 million tons of raw coal and lignite per year and for the processing of 12.6 million tons of run-of-mine coal per year are to be put into operation.

The expansion of the coal industry had been achieved through increased labor and capital rather than advancing technology and by mining a proportionately large share of lower quality coals and lignites. It is estimated that in real terms 2 to 3 times more investment and labor are required to achieve a given increase in coal output in the U.S.S.R. than in other principal coal-producing countries in the West. Because of persistent coal supply deficits, the achievement of quantitative goals is stressed in published literature. Qualitative goals have been postponed so that a large part of coal output does not meet established Soviet standards of quality. The productivity of labor and equipment is below planned levels, and practically all sectors of the coal industry maintain a greater number of production personnel than called for by planned targets.[7]

The consumption of coal remains centered in the European part of the

[6] Sovetskiy shakhter (Soviet Miner), Moscow. No. 3, March 1975, p. 1.

[7] Pravda, Moscow. Jan. 26, 1974, pp. 1–3. Planovoye khozyaystvo (Planned Economy), Moscow. No. 11, November 1973, pp. 16–23.

U.S.S.R., and the bulk of the coal mined in the Eastern regions is shipped great distances to consumers in the established European industrial centers. The singularly and traditionally important position of the Donets Basin derives from its geographical location and high-grade coal. Much of the Soviet industrial expansion could have been fueled by a large output of coal in the Donets Basin, but because of low labor productivity and a shortage of labor, the Donets Basin could not supply all of the economy.

This chronic shortfall in Donets Basin coal output was the main reason for the development of coal regions in the East; it was not simply a logical movement to develop new coal regions in the East as is sometimes claimed.

During 1969–72 there was a transition from a five- and four-echelon system of management to a four- and three-echelon system. As a result, 90 trusts and 2 concerns were abolished. The number of underground coal mines of the Ministry of the Coal Industry has been reduced from 966 in 1967 to about 800 in 1973, and these were organized into 580 mine administrative units. Nevertheless, 45 small mines, with a yearly capacity of up to 100,000 tons of raw coal each, were in operation in 1974.

There are three levels of management in the coal industry of the U.S.S.R. (the National Ministry, the Concern, and the Mine) and four levels in the Ukrainian S.S.R. (the National Ministry, the Ukrainian Ministry, the Concern, and the Mine). The long-term plan envisages a transition to a two-level system of management (the National Ministry and the Coal Producing Unit) or three-level system (the National Ministry, Ukrainian Ministry, and Coal Producing Unit). Each coal producing unit will include from 13 to 56 subordinate production units (mines, pits, beneficiation plants, and transport and repair organizations). A two-level management system will operate for 26 coal-producing units, 1 oil shale-producing unit, and the Hydraulic Coal Mining Scientific Production Association and there will be a three-level management system for 16 coal-producing units and 2 coal beneficiation units located in the Ukraine.

The average working thickness of the coal seams, according to 1974 data, was 1.32 meters. The maximum depth of underground coal production reached 1,150 meters in 1974, while the average depth was about 370 meters.

The relative share of coal production coming from gently dipping seams was about 70%; that of inclined seams, 14%; and that from steep seams, 16%. The hand-loading of coal at gently inclined seams was over 20% in 1974.

Distribution of coal production by mining methods, in percent, follows:

| | |
|---|---|
| Longwall | 85 |
| Slicing | 8 |
| Shield | 3.2 |
| Room and pillar | 1.7 |
| Others | 2.1 |

In 1974, the average longwall length was 132 meters, and the average rate of advance was 39.4 meters per month. The average capacity of each underground mining section (longwall) was 440 tons of raw coal per day (four 6-hour shifts) in 1974.

Raw coal production by principal basin in 1974, in million tons, follows:

| | |
|---|---|
| Donets | 219.5 |
| Kuznetsk | 128.3 |
| Karaganda | 45.2 |
| Moscow | 35.0 |
| Pechora | 23.3 |
| Others | 232.7 |
| Total | 684.0 |

The Donets, Kuznetsk, Karaganda, and Pechora coal basins together produced 80% of the total coal output in terms of calorific value and about 97% of the coking coal in the Soviet Union. Some salient characteristics of the coal and other data of these basins are given in table 7.

## Table 7.—U.S.S.R.: Major coal basins

| Basin | Type of coal mined | Number of workable seams | Seam thickness (meters) | | | Depth of mining (meters) | | | Remarks |
|---|---|---|---|---|---|---|---|---|---|
| | | | Minimum | Maximum | Average | Minimum | Maximum | Average | |
| Donets | Bituminous and anthracite. | 40 | 0.5 | 1.6 | 0.95 | 100 | 1,150 | 470 | It has large reserves represented mainly by thin seams. Two-thirds of the reserves are high-grade coals of which one-half are coking coals. More than 70% of the coal production comes from flat seams (0–25 degrees pitch). |
| Kuznetsk | Bituminous and lignite. | 68 | .8 | 20.0 | 2.23 | 50 | 400 | 250 | Over 90% of coal is produced from seams over 1.2 meters thick and nearly 22% from seams over 6.5 meters thick. Coking coal comprises over 20% of the reserves. Recently an extensive use of opencast mining has taken place in the basin. |
| Karaganda | Bituminous | 45 | .7 | 7.5 | 1.79 | 100 | 400 | 330 | About 97% of the coal seams are flat. More than 50% of the reserves are coking coals. |
| Pechora | do | 39 | .5 | 4.5 | 1.90 | 150 | 500 | 430 | The basin has large reserves of coking coals. Over 65% of coal is produced from flat seams. |
| Moscow | Lignite | 2 | .9 | 3.5 | 2.27 | 50 | 100 | 61 | Brown coal has an ash content of about 45%. The coal seams are flat. The main consumers of the coal produced in this basin are power-plant and domestic heating of the central regions of the U.S.S.R. |

According to plan, production of raw coal and lignite will increase to 700 million tons in 1975 and 800 million to 810 million tons in 1980. As earlier scheduled quantitative goals were not met, the original yearly targets for 1959–71 were revised and the surface mining of low-quality lignite was increased. Reports of persistent and chronic labor shortages and low-labor productivity indicate that production of high-quality coal (mainly by underground mining) may fall slightly short of planned targets, while the output of lower rank coals and lignites may be increased substantially in the future. Estimated levels of all coal production for 1975 and 1980, therefore, may be 700 million tons of raw coal (400 million tons of clean coal) and 805 million tons of run-of-mine coal (460 million tons of clean coal), respectively. Soviet long-range forecasting places the demand for raw coal and lignite in the year 2000 at around 1 billion tons, even though oil, natural gas, and nuclear power are developed to a maximum. Coal, therefore, will remain the principal source of energy for industrial use.

Over the next 10 years, priority has been given to coal development in the Asian part of the country (chiefly in the Kuznetsk Basin), where planned gross production is to reach 228 million tons in 1975 and 300 million tons in 1980.

The Kansk-Achinsk Basin and the Itat deposit in Siberia and the Ekibastuz and Maykuben deposits in Kazakhstan are the sites of the largest develoment of surface mining of low-quality coals and lignite. In the European part of the U.S.S.R., most of the new coal production is to come from the Donets coal basin. But because of the anticipated shortage of fuel, plans are to develop by 1980 seven new mines, with a total capacity of 14 million tons of raw lignite in the Moscow Basin. These mines will supply thermal electric powerplants located in the central areas of the European part of the U.S.S.R. The output of coal for coking is to be increased substantially in the Donets, Kuznetsk, and Karaganda Basins.

Because of location of deposits and mining methods, the production cost of coal varies widely in the U.S.S.R. Available cost data on Soviet coal output indicate that production costs of coal in the Asian part of the U.S.S.R. is 20% to 30% less than those in the European regions of the country.

The planned goals for coal and lignite production, actual output, and the author's estimates for 1960, 1965, 1970, 1975, and 1980 are shown in figure 1.

*Coal Reserves.*—Published estimates of Soviet coal resources must be interpreted in terms of our own standards for measuring coal reserves to arrive at some meaningful understanding of the data. According to the Soviet classification, the reserves of coal are divided into two parts: *Balansovye* (identified, economically minable reserves in place) and *Zabalansovye* (identified, submarginal but minable reserves in place). Each part is subdivided into four categories: "A", "B", "$C_1$", and "$C_2$". Reserves in category A are reserves that are prospected in detail and measured (comparable with U.S. measured reserves in place). Category B includes reserves which are also measured as in A except that detailed quantitative and qualitative data are not accurate enough for inclusion in category A. Category B may be equated with indicated reserves in place in customary U.S. usage. Category $C_1$ might be equated with U.S. inferred reserves in place which are determined by geophysical research and by sundry scientific investigation and observation of natural outcroppings. Soviet category $C_2$ might be equated with the undiscovered, hypothetical (in known districts), and speculative (in undiscovered districts) reserves in place in the usual U.S. terminology.

The official hypothetical and speculative coal resources of the U.S.S.R. are large, but they are no more than geologic prognoses that have yet to be confirmed and explored. According to the estimates made in 1968, Soviet official geological reserves of coal and lignite account for 6,800 billion tons, or about 55% of world coal reserves. Of these, 4,050 billion tons are reserves of hard coal and 2,750 billion tons are reserves of brown coal and lignite. But official Soviet economically minable reserves (the so-called balansovye) of coal and lignite in place in the A, B, $C_1$, and $C_2$ categories are only 523.7 billion tons (including 334.1 billion tons of hard coal and 189.6 billion tons of brown coal and

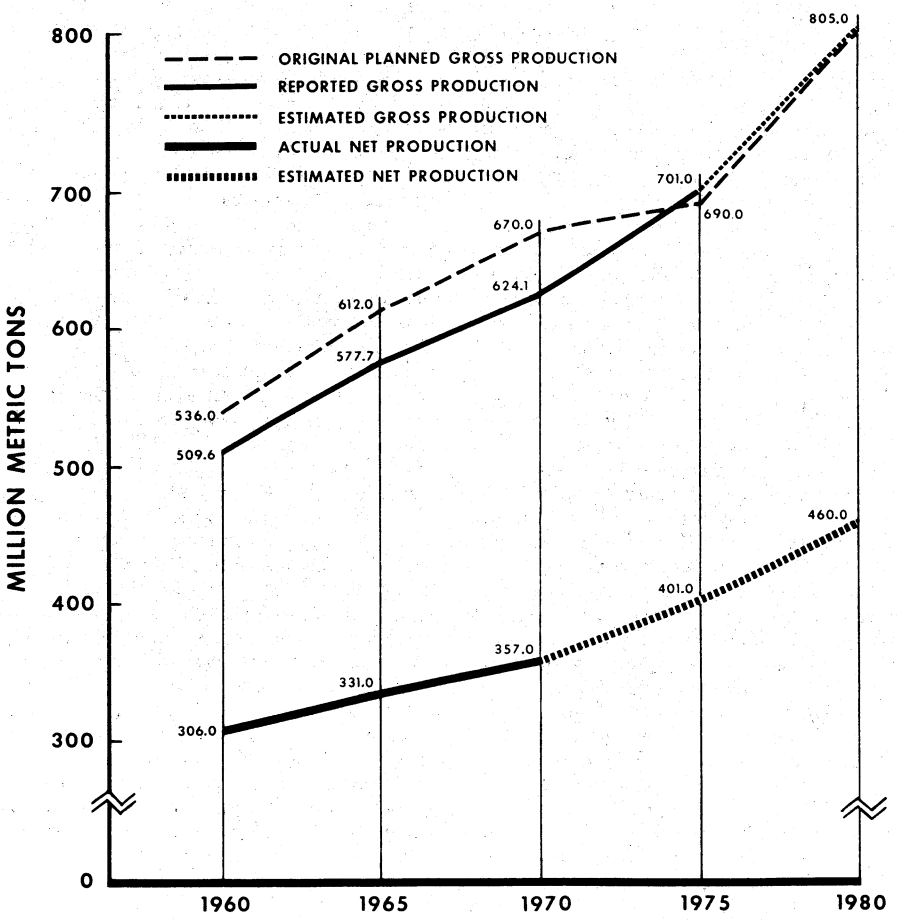

**Figure 1.—Soviet coal production, actual and estimated, 1960–80.**

lignite), or only about 8% of total geological resources.[8]

Economic minable coal and lignite reserves, by basin and category, are shown in table 8.

**Table 8.—U.S.S.R.: Soviet economic minable reserves (balansovye) of coal and lignite, by basin and category, on Jan. 1, 1968**
(Billion metric tons)

| Regions, coal basins, and deposits | Categories | | Total |
|---|---|---|---|
| | A+B+C1 | C2 | |
| Donets Basin | 40.5 | 16.8 | 57.3 |

Source: Kratkiy spravochnik gornogo inzhenera (Short Reference Book of the Mining Engineer). Moscow, 1971, p. 8.

The composition of the U.S.S.R. coals according to rank is as follows: Anthracite, semianthracite, and lean coals, 10.2%; coking coal, 21%; gas coal, 20.3%; long-flame coal, 10.9%, subbituminous coal, 1.4%, and brown coal and lignite, 36.2%. Thus, over half of the minable reserves consist of anthracite and bituminous coals. The chief coking coal reserves occur in the Donets, Kuznetsk, Karaganda, Pechora, Kizel, Tkvarcheli, and Tkvibuli basins.

Coal and lignite reserves, by rank and by major basin, are presented in table 9, and by area and category, in table 10.

*Mine Planning and Construction.*—Soviet literature contains many reports on construction problems in the coal industry, citing shortage of equipment, materials, and labor as well as lack of work organization as causes. Construction of new projects is still slow, expensive, and frequently below Western established professional standards. Traditionally, Soviet efforts in the construction of coal enterprises have been dispersed over a large number of projects, and the period of construction has been long compared with equivalent construction Western countries. An example of the lag in development schedules, in months, may be seen from the figures[9] shown in the following tabulation:

| Project | Planned time | Actual time |
|---|---|---|
| The Anzher coal mine, Kuznetsk Basin | 52 | 248 |
| The 21-bis coal mine, Donets Basin | 74 | 174 |

Development of the Raspadskaye underground coal mine in the Kuznetsk Basin, with an annual capacity of 2 million tons of raw coal, began in 1960, and during the subsequent 13-year period only half of the planned installations have been completed. Two thousand workers were employed at this project in 1972.[10]

The delay in completion of projects has sometimes resulted in disparities between the capacity of the mine, the preparation plant, and consumer plant. The practice of resorting to expedients in order to meet operating schedules of mines and beneficiation plants has resulted in subsequent inefficiencies.[11] Planned labor productivity lags far behind design indicators, and delays are necessary to achieve planned capacity. Mine renovation schedules are also delayed. It was reported in 1973 that 217 old, underground coal mines (28% of the total in operation), producing 103 million tons of raw coal per year, have not been modernized for 20 years.[12] Certain Republics and organizations, trying to attract large development appropriations in their area, may exaggerate the value of local coal deposits. According to Soviet reports, many projects have to be dropped after expensive reinvestigation. Thus, vast sums of money are often spent in developing uneconomic mines.

Each year the capital investment plan (in rubles) is almost fulfilled, but the plan for the completion and formal transfer of new capacities for operation is not fulfilled; in several projects of the coal industry, a shortfall of 40% or even more has been reported. Project completion delays resulted in large overexpenditures. Losses are incurred not only because of construction delays, but also because of long lead times to develop production at new mines which have been put into operation. Several years usually pass before the volume of output reaches the planned level. If one adds to this the period required for planning and construction, then the total time for a given enterprise to come into full production comes to 10 to 12 or

[9] Veprosy ekonomiki (Problems of Economics), Moscow. No. 8, August 1973, p. 37.
[10] Sovetskiy shakhter (Soviet Miner), Moscow. No. 3, March 1973, p. 21.
[11] Veprosy ekonomiki (Problems of Economics), Moscow. No. 8, August 1973, p. 34.
[12] Ugol' (Coal), Moscow. No. 8, August 1973, pp. 70–74.

even more years. During these years, machinery becomes obsolete and the return of capital invested is much smaller than expected.

The goals of the 7-year plan (1959–65) and of the 5-year plan (1966–70) for the development of coal mines and the construction of coal preparation plants as they were originally published were not fulfilled. Only 40% of the target of the coal preparation plant construction of the 7-year plan (1959–65) was met.[13]

During the 5-year plan (1966–70) capacities for the mining of 92.4 million tons of raw coal per year and for the preparation of 42.9 million tons per year were put into operation. Capital investment on development of production capacity for the 1960–70 period was about 8 billion rubles.[14] The 1971–75 plan foresees commissioning of coal mines and open pits with a total yearly capacity of 140 million tons of run-of-mine coal and capacities for preparation of 55.5 million tons per year. Capital investment in the Soviet coal industry for the 1971–75 period has been set at a level of over 10 billion rubles. During the 1966–72 period, development of new deep and surface mine capacity fell short of the goal by over 43 million tons of raw coal.

The yearly capacity of coal and lignite mines and open pits was increased by 19.4 million tons (raw coal) in 1974, or by 72% of planned target. The more important enterprises put into operation included the first stage of the Krasnoarmeyskaya-Kapital'naya underground mine in the Donets Basin. The goal of the 1974 plan in coal preparation plant construction was fulfilled by 64%.

*Geographical Distribution.*—The systematic increase in the demand for coal (mainly in the European part of the U.S.S.R.) and the technical difficulties accompanying the development of the Donets Basin were reflected in the radical alteration of geographic distribution of the coal industry in the U.S.S.R. after World War II. New local bases for the production of low-calorie coal were created and played a prominent role in the fuel balance of the U.S.S.R. The geographical distribution of the coal industry was greatly altered during the past two decades. Coal production shifted eastwards. Between 1950 and 1974, the transportation of coal from Siberia and Kazakhstan to the Center and Volga regions of the European part of the U.S.S.R. increased 14 times and reached 36 million tons per year.

With an output and delivery to consumers of 684 million tons of run-of-mine coal in 1974, railroads transported over 600 million tons of coal and coke over an average distance of over 700 kilometers. Coal and coke accounted for more than 20% of all railroad freight carried in 1974.

The increased importance of the Asian regions of the country in the production of coal, while the main consumption remains in the European part of the U.S.S.R., will inevitably be accompanied by increased interregional traffic of coal and will require additional capital investment to expand the capacity of the railroads and to increase the rolling stock. This also calls for intensive expansion work on the part of the railroads to meet the anticipated workload. Consumers who receive the coal which has been shipped over long distances are not in a position to benefit from the economic advantages of using cheaper (in Btu value) coal from the Donets Basin.

*Surface Coal Mining.*—The growth in production of coal by surface mining has a high priority in the Soviet Union. Almost one-third of the coal and lignite output is to come from open pit mines by the end of the 1971–75 5-year plan. The increase is to be achieved mainly as a result of the development of coal deposits of Siberia and Kazakhstan.

Stripping operations in the Soviet Union are based on the use of 15- and 25-cubic-meter walking draglines, 4- to 8-cubic-meter shovels, and dumpers of 27- and 40-ton capacity. The largest walking dragline is presently being installed at the Nazarov surface coal mine. The first Soviet 65-ton truck, built in Byelorussia, was being tested at a surface coal mine in Eastern Siberia in 1973 and 1974.

At present, surface coal mining is practiced in 12 regions of the U.S.S.R. Total Soviet coal and lignite output is scheduled to increase 71 million tons during 1971–75. One-third of this increase is to come from the Ekibastuz Basin in northeast Kazakhstan, which is to have an annual production of 56 million tons by 1975.

[13] Ugol' (Coal), Moscow. No. 1, 1967, pp. 6–7.
[14] Ekonomicheskaya gazeta (Economic Gazette), Moscow. No. 26, June 1971, p. 4.

The Ekibastuz Basin contains 7.4 billion tons of coal in an area of 160 square kilometers. The deposits lie at shallow depths where the total thickness of three seams fluctuates from 120 to 192 meters; the workable thickness of these seams is 86 to 143 meters. The ash content of the coal in seams fluctuates between 25% and 52%, and that of coal shipped to consumers averages 40% to 45%. Some 40 million tons of raw coal was produced at this basin in 1974. The Central, South, and four sections of the Bogatyr' open pits were in operation. The fifth section of the Bogatyr' open pit was commissioned in February 1974. The annual capacity of all five sections of the Bogatyr' open pit is now about 25 million tons of raw coal. About 100 excavators of various types are used in overburden removal and mining. Five of them have a capacity of 1,000 tons per hour, and two of them, 3,000 tons per hour. Four "1,000" and one "3,000" bucket-wheel excavators operate in the Bogatyr' open pit. All seven bucket-wheel excavators were manufactured in East Germany.

Seventeen thermal powerplants in Kazakhstan, the Urals, and Siberia, with a total capacity of over 8 million kilowatts, operate on Ekibastuz coal. It is planned to build four additional thermal powerplants in this area with a total capacity of 16 million kilowatts to serve the European part of the U.S.S.R.

*Hydraulic Mining.*—In 1974, hydraulic mining yielded some 11 million tons of raw coal, which came from nine hydraulic underground coal mines and five hydraulic sections of conventional underground coal mines. In Soviet practice, hydraulic coal mining involves primarily hydraulic transport from the production face to the mine surface. Actual cutting of coal is done by a combination of conventional and hydraulic methods. Labor productivity is 50% below that planned, costs proved to be double, and operational losses of coal (up to 46%) are 2.3 times the design levels. Consumption of electric power at hydraulic mines in the Kuznetsk coal basin is over 50 kilowatt-hours per ton of coal, and consumption of water is 7.7 to 27 cubic meters per ton. The Ministry of Coal Industry decided several years ago to postpone new hydraulic mine development until some of the technical problems were overcome.

*Underground Gasification.*—The first large-scale experiments in underground coal gasification were undertaken in the U.S.S.R. during the 1930's. Since 1946, experimentation and development have been greatly intensified and by 1960 the process of underground gasification of coal was apparently on the threshhold of commercial use. Some of the most critical problems of commercial utilization of gas from underground coal gasification have not as yet been solved. Among them, the two most important are (1) to obtain a continuous and controlled gasification process and (2) to produce gas at competitive cost levels. Yearly underground coal gas production targets for 1960–73 were abandoned because they proved to be unrealistic.

The level of Soviet gas production from underground coal gasification for selected years, in million cubic meters, follows:

| | |
|---|---|
| 1940 | 167 |
| 1950 | 226 |
| 1960 | 1,448 |
| 1965 | 1,175 |
| 1969 | 1,138 |
| 1970 | 1,053 |
| 1974 [e] | 1,500 |

[e] Estimate.

*Mining Machinery and Technology.*—The technology of the Soviet coal industry is generally below the level of West European coal-producing countries in (1) the application of narrow-web coal face cutting; (2) mechanized loading; (3) mechanized roof support work; and (4) mechanized tunneling. A prop-free-face system and coal planners in Soviet longwall coal mining came into use some 12 years after their introduction in the coal mines of the United Kingdom and West Germany.

In April 1973, the Central Committee of the Communist Party adopted a resolution on technical reequipment of the coal industry. The resolution notes that many labor-intensive production processes in mines are not mechanized and that a large number of production faces are equipped with obsolete machinery and mechanisms.

In coal mine development, tunneling machines are used in only 25% of drifting operations. At large coal-producing concerns such as Kizelugol' (Urals), Rosto-

vugol' (Donets Basin), and Gruzugol' (Georgian S.S.R.), no drifting is done by tunneling machines.[15]

In many faces equipped with wide-web continuous miners and cutters, large amounts of coal were being extracted by blasting. The productivity of narrow-web continuous miners was two to three times below established norms. A low-degree of machine utilization in coal mining stems from defective construction, lack of sufficient repair shops and spare parts, poor work organization, and poor training of operators. As a rule, mining machines are operated 22 to 24 hours per day, and expensive equipment is worked until it breaks down. Under such conditions it is difficult to organize timely, proper preventive maintenance for equipment.[16] On the average, continuous miners remain idle 65% to 70% of the worktime.[17]

There were no high-efficiency continuous miners for hard coal, while the utilization of cutter-loaders on steep seams did not increase labor productivity significantly. Therefore, coal-cutting equipment for the mining of steeply dipping seams has been purchased from France and is being assembled at the mines of the Prokopyevskugol' Administration in the Kuznetsk Basin.

The production of mining equipment, especially for mechanizing auxiliary processes, proceeds slowly, according to Soviet press reports, and spare parts output for mining machinery is inadequate. The available machinery did not supplant manual labor at coal mines. The work performed manually with machines comprises 60% at longwalls, 57% in development, and 100% in repair of workings.[18] Manual labor is used almost exclusively in longwall roof support (79,000 workers), loading of coal in longwalls (49,000), roof support in development workings (24,000), loading of coal and rock in development workings (20,000), and repair of workings (76,000 workers).[19]

It was reported that Soviet expenditures for pit props are enormous. The delivery of pit props, which are not to specification, is common and requires additional mine labor to correct deficiencies. At present, 40 to 45 cubic meters of prop timber (compared with 34.9 cubic meters before the Revolution of 1917) are used per 1,000 tons of coal output. In addition, losses of metallic supports are in excess of the established norms. The installation of roof bolting has not yet been fully mechanized.

The number of the main mining machines and mechanisms at U.S.S.R. coal mines in 1973 is given in the following tabulation:

| | |
|---|---|
| Cutter-loaders | 3,937 |
| Cutters | 305 |
| Tunneling machines | 1,191 |
| Loading machines | 4,487 |
| Chain conveyors | 34,708 |
| Belt conveyors | 12,708 |
| Trolley mine locomotives | 13,554 |
| Excavators | 1,363 |
| Air picks | Large |
| Air hammers | Large |
| Air drills | Large |
| Electric drills | Large |

*Labor Productivity.*—

> The subject of statistics is considered as a party, class and social science . . . U.S.S.R. statistics, based on the doctrines of the classic of Marxism-Leninism, gives a correct and exact account of all the sides of the process of expanded social reproduction.[20]

This quotation is illustrative of an admitted bias in statistical reporting. Perhaps nowhere is this bias more evident than in the coal industry's reporting of productivity.

The low productivity of miners in the first 5-year plan (1928–32) forced Soviet planners to introduce a new system of calculation of labor productivity on the basis of the "production" worker category, rather than to include all mine workers, which had been the practice. The new method of calculation gave a "cosmetic" improvement to official indicators of labor

productivity and to the earnings of workers in the coal industry during the first 5-year plan and has been maintained ever since.

The change in calculating indicators of labor productivity had the effect of raising the reported average earnings of the workers because of the preponderance of higher paid underground miners in the select group of production workers. The change in productivity calculations also obscured the results of productivity trends during 1924–28, a short period of market economy and relative industrial autonomy in the Soviet Union. Furthermore, the 5-year plan data on productivity could not validly be compared with data for any other period.

One might also note that statistics of accidents and fatalities in all branches of the Soviet economy, including the coal industry, are not published although available data indicate that there are many fatalities.

The only official employment and labor productivity data released in the U.S.S.R. refer to "production" workers ("Rabochiye po dobyche"). Unlike the customary practice in West European countries and the United States, and also unlike the method used in the United Nations Committee for Coal, many categories of personnel (including more than 60,000 workers employed at the coal preparation plants) are not included in the "production worker" group.

In 1974, the official average monthly (25.4 shifts) productivity of Soviet coal miners was 73.1 tons (54.3 tons per month in underground mines and 391.2 tons per month in surface mines). But these data relate only to "production" workers. Official data on the number of "production" workers used in labor productivity calculations, include only about two-thirds (from 57% to 70% depending on coal basins) of all workers normally counted in computing labor productivity by the method used in the United Nations Committee for Coal. Further, productivity statistics on the Soviet coal industry are reported for gross production, whereas it is customary elsewhere to measure output and productivity in terms of marketable coal.

If the above indexes are taken as reasonably accurate, actual labor productivity in Soviet coal mines is about one-third of that reported, according to Western terms of reference. The actual productivity is about one-third of that of the coal miners of Great Britain and West Germany and nearly one-twelfth of that of the miners in the United States.

Since most Soviet coal comes from underground mines and the Donets Basin is by far the most important center of underground mining, the history of progress of labor productivity at this basin may be indicative of the industry as a whole.

In 1913, the average monthly productivity of the worker of the Donets Basin was 13 tons, while the per shift productivity of commodity coal was 0.61 ton.[21]

In 1974, average monthly official productivity of the "production" workers in the Donets Basin was 43.9 tons[22] of run-of-mine coal, or 25.1 tons of clean marketable coal. Actually, the productivity of a Donbass miner in 1974 amounted to only 0.95 ton of commodity coal per shift, that is, it increased only by 0.34 ton in 56 years, despite the immense technical progress that had taken place elsewhere in the world during this period.

Because of low productivity, the Soviet Union was not able to supply fuel requirements for the economy from the Donets Basin, which contains immense reserves of high-quality coal.

This difficulty to supply fuel was the main reason for the geographic transfer of a large part of the Soviet coal industry to the Asian part of the U.S.S.R. and for shipping coal by rail from Kuznetsk and Karaganda to supply the industrial regions of the Volga, the Center and, in part the Urals. Colossal losses are sustained annually because of superfluous shipping expenses which exceed many times any savings achieved by extracting coal by surface mining in Siberia and Kazakhstan. Soviet planners are compelled, therefore, to increase the economically unprofitable production of brown coal and lignite on a massive scale and to lower systematically the quality of the coal produced.

*Labor and Salary.*—The piece-rate principle, previously denounced as a capitalist exploitation of workers, has become a principal feature of the coal mining industry of the U.S.S.R. A basic feature of Soviet

[21] Bratchenko, B. F. Perspktivy razvitiya ugol'noy promyshlennosti S.S.S.R. (The Prospects of the Development of the Coal Industry of the U.S.S.R.) Moscow. 1960, pp. 337–338.

[22] Ugol' (Coal), Moscow. No. 4, April 1975, p. 71.

labor legislation is that workers are obliged to achieve a specific minimum output within a specified period of time. This minimum is the work norm and is established for virtually every phase of employment.

While the trade unions in Western countries are principally wage-bargaining organizations, their Soviet counterparts have other functions and objectives. With no wage bargaining, the Soviet trade union functions mainly to increase labor productivity.

The number of legally prescribed working hours per week is 41 hours on the surface and 36 hours underground. There are 4 shifts per day (6 hours each shift) in underground coal mining and 3 shifts per day (7 hours each shift) on the surface. There are 330 working days per year.

Because of low growth rates in coal production, the mines are assigned additional tasks each year, and this led to Sunday and holiday operations.[23]

*Coal Preparation.*—Preparation of coal for the market does not play a great role in the industry and is normally restricted to coking coals and coal for export. The shortage of coal beneficiation facilities forced Soviet planners to place greater emphasis on improvements in quantity as an expedient. Multistage manual preparation underground at longwall operations and belt picking conveyers was in wide use. Only 40% of the goal of the 1959–65 7-year plan in coal preparation plant construction was fulfilled. The target of the 1966–70 5-year plan in coal preparation plant construction was also not met. Current plans are to commission 15 new preparation plants with a total annual capacity of 55.5 million tons of raw coal during 1971–75. Contrary to the rising world trend, the preparation of coal in the Soviet Union has declined in recent years.

Practically all Soviet coal requires beneficiation, but of the 684 million tons produced in 1974 preparation plants run by the Ministry of Coal Industry processed only 264.6 million tons to produce 150.4 million tons of clean coal.[24] This gives a recovery factor of 0.57, a value which may be used to calculate equivalent clean-coal tonnage. About one-fourth of all the coal beneficiated is treated on delivery to plants associated with the coking industry of the Ministry of Ferrous Metallurgy. According to Soviet sources, 61.4% of coal beneficiated was washed, 16.8% was treated by heavy media, 13% was prepared by pneumatic methods, 8.6% was treated by flotation, and 0.2% was cleaned by other methods.

Unsuitable underground mining machinery and the shortage of beneficiation facilities led to the deterioration of the main components of fuel quality, ash content, and size. Very few machines yield large lumps, and their technical quality is low.[25] The large proportion of fines in coals shipped to Soviet preparation plants (50% to 70%, compared with 30% to 40% delivered to the plants of West European countries), greatly complicates the comparatively low level technology of coal preparation, raises costs, and lowers the productivity of labor and plants.

According to Soviet sources, many new preparation plants were put into operation in spite of numerous imperfections and insufficient equipment. Labor productivity and the utilization of capacity were below planned levels, and a large number of workers were occupied in repair and auxiliary operations. Practically all coal preparation plants maintained greater numbers of production personnel than called for by plan targets. Fifty-three plants of the Ministry of the Coal Industry were put into operation after 1960; they employed 7,400 workers above the number envisaged in the plan. There were over 60,000 workers in the Soviet coal preparation industry in 1974.[26]

All 143 coal preparation plants of the Ministry of Coal Industry, on the average, are idle about 30% of working time. Many plants are not fulfilling the plans on coal processing, labor productivity, and other planned indexes. The delivery of a large amount of coal with deviations from the standards is indicative that the mines and preparation plants give little attention to the quality of coal shipped.[27] For example, with a higher percentage of ash than is indicated in the documents given by the suppliers, 384,000 tons of coal in 1972 and about 250,000 tons in 1973 were sent back to producers and dumped into the waste piles at the mine.

[23] Pravda, Moscow. Aug. 25, 1973, p. 3.
[24] Ugol' (Coal), Moscow. No. 4, April 1975, p. 70.
[25] Pravda, Moscow. Oct. 24, 1973, p. 3.
[26] Koks i khimiya (Coke and Chemistry), Moscow. No. 11, November 1972, pp. 4–6.
[27] Ugol', Moscow. No. 8, 1973, pp. 70–74.

During 1928–74, the official quality of marketable coal declined 41% from the average 6,940 kilocalories per kilogram in 1928 to about 4,900 kilocalories per kilogram in 1974. The officially reported ash content of coals shipped from the mines has increased from 19.4% in 1965 to 20.1% in 1974 and some lower grade lignites used in home heating and power generation have been reported to contain as much as 45% ash. In wintertime, preparation plants sometimes dispatch wet coal, which freezes in transit into a solid mass, and thus becomes impossible to unload.[28]

*Losses of Coal.*—Because Soviet coal preparation facilities are inadequate, losses in the fuel efficiency of the overall economy are staggering. Among the most prominent negative effects of inadequate coal preparation and classification are (1) inefficient combustion because of the refuse contained in the coal; (2) high rail transportation costs increased by moving the inert wastes in coal; (3) additional supply burdens caused by the displacement of specific coals to accommodate transportation problems; and (4) aggravated existing shortages leading to still further economic dislocations of resorting to more costly expedients, crosshauls of coals, and inadequate use and underuse of rail equipment.

The results of these negative factors are not known completely, because they have not been adequately quantified or reported widely in the Soviet press. Estimates of coal losses due to the use of unprepared coals at electric powerplants in 1974 were placed at about 25 million tons in terms of raw coal. Rail transportation of untreated coal (average haul in 1974 over 700 kilometers) resulted in the loss of 33 million tons of raw coal or about 5% of the total output. To avoid delays in extracting and dispatching coal, mines are forced to accept damaged railway cars and repair them under primitive conditions. A daily load equal to 55,000 cars would result in an expenditure of "tens of millions of rubles."[29] Annual losses in rail transportation were reported at about 10 million tons of coal and additional expenditures for cleaning up coal spills from the railroads, at 50 million rubles.[30]

These losses add to existing shortages and intensify the drive to stimulate production which leads to a vicious circle of still greater emphasis on expedient quantity, frequently at the expense of quality.

The Soviet coal consumer cannot always get the kinds of coal best suited to his needs. The many obstacles hindering production and delivery of the more desirable coals also decrease effectiveness of the available coals. This low utilization factor is the principal reason for the lack of insight into the real problems of Soviet coal. Many statements, comparisons, and evaluations published in the West are concerned with only a superficial reporting of Soviet statistical data.

It is estimated that the Soviet economy suffers about a 35% loss because of inefficiency in production, transportation, and use of unprepared coal.

*Consumption.*—The consumption of coal remains centered in the European part of the U.S.S.R., and the bulk of the coal mined in the Asian part of the country is shipped to meet consumer requirements in established European industrial centers. More than one-third of all coal and lignite mined in the U.S.S.R. goes into electricity generation and one-quarter is coked. Coal and lignite are also used as household fuels in cities and towns. The consumption of coal in preference to oil, wherever possible, is encouraged as a means of increasing the availability of oil for export.

The most promising markets where coal consumption is expected to expand are electric powerplants, metallurgy, and retail deliveries. By 1980, coal consumption by electric powerplants is expected to increase to about twice the 1970 level. The share of coal in electric power generation is expected to fall from 49% in 1970 to about 45% in 1980.

*Exports.*—The Soviet Union became a net exporter of coal and coke in 1956 and has gradually strengthened its position since that time. Coal exports increased from 5.7 million tons in 1956 to 26.2 million tons in 1974, while exports of coke increased from about 2 million to 4.6 million tons during the same period.

Over one-third of the coal exported and about 1 million tons of coke were shipped to market economy countries in 1974. Among the major market economy markets for Soviet coal, Japan ranks first, followed by Italy, France, and Austria. Coals ex-

[28] Pravda, Moscow. Jan. 28, 1974, p. 1.
[29] Pravda, Moscow. Jan. 13, 1974, p. 3.
[30] Pravda, Moscow. Nov. 27, 1973, p. 3.

ported to the West are high-quality coking coals and anthracite mainly from the Donets and Kuznetsk Basins.

One very important aspect of Soviet coal for export is the cost-price relationship. The actual cost of production may not always figure in the selling price of coal in the West. The high national priority placed on exports, which must meet high international competitive price and quality standards, makes Soviet coal exports successful only at supported prices in Western terms of reference.

The relative share of coal and coke in the official aggregate exports increased from 3.2% in 1970 to 3.6% in 1974. The Soviet policy of increasing exports of high-quality coal and coke to market economy countries is expected to continue in the future, although these exports are not likely to grow significantly. As in the past, the market for coal and coke from the U.S.S.R. will be limited to established coal-deficit markets in Europe (Eastern and Western countries) and Japan.

An agreement on Japanese assistance in the development of the Neryungra coalfield in the southern region of Yauktia was signed on April 30, 1974. Under the agreement, Japan is to provide the Soviets with $450 million worth of coal mining and railway equipment between 1975 and 1981. Exports of coal from this field to Japan will begin in 1983 at the level of 3.2 million tons per year, increasing to 5.5 million tons in 1985 and are expected to increase through 1998. The Soviet Union will export an additional million tons of Kuznetsk coal to Japan each year during 1979–98 and is building a large coal transhipping complex at Wrangel port, about 100 kilometers from Vladivostok in the Soviet Far East. Construction of this deepwater port has been designed with the aid of Japanese engineers.

According to signed trade agreements, during 1966–70 the U.S.S.R. was to deliver the following quantities of coal, in million tons, to the following countries:

| | |
|---|---|
| East Germany | 31.5 |
| Czechoslovakia | 19.0 |
| Yugoslavia | 5.0 |
| Hungary | 4.6 |

The steady flow in Soviet exports of coal and coke to centrally planned economy countries is planned to grow from an estimated 20.3 million tons in 1974 to 21 million tons in 1975 and to 24 million tons in 1980. East Germany and Bulgaria are the major importers of Soviet coal and coke in the CMEA group of countries.

Soviet exports of coal and coke by country of destination in 1973 and 1974 are presented in tables 11 and 12.

**Table 11.—U.S.S.R.: Exports of coal by country of destination in 1973 and 1974**
(Thousand metric tons)

Source: Vneshnyaya torgovlya S.S.S.R. za 1974 god (Foreign Trade of the U.S.S.R. for 1974), Moscow. 1975, p. 72.

*Imports.*—Imports of coal and coke increased from 7 million tons in 1956 to 10.4 million tons in 1974. Poland is the only exporter of coal and coke to the U.S.S.R. Some of the reported imports of Polish coal and coke may not be shipped to the U.S.S.R. but be just credited to Soviet accounts for shipment to East Germany and other countries. In 1975, some 10 million tons of coal and about 1 million tons of coke are expected to be imported by the U.S.S.R. In 1980, some 12 million tons of coal and about 1 million tons of coke are likely to be imported by the Soviets from Poland.

Soviet coal and coke statistics are presented in table 13.

[1] Run-of-mine coal as reported in Soviet sources.
[2] Clean coal, estimated in accordance with Western practice and experience.
[3] None from market economy countries.

Source: Production data for 1960, 1965, and 1970 taken from the National Economy of the U.S.S.R., Moscow, 1960, 1965, and 1970; trade data from Foreign Trade of the U.S.S.R., Moscow, 1960, 1965, 1970, and 1974.

*Health and Safety.*—While the U.S.S.R. does not publish statistical data on injuries in the coal industry, available Soviet information reveals that there are many fatal injuries. In 1970, fatal injuries occurred at 45% of the Soviet coal mines.[31] There were at least three coal (methane) ex-

[31] Bezopasnost' truda v promyshlennosti (Labor Safety in Industry), Moscow. No. 3, March 1971, p. 4.

plosions in 1966; four in 1967; five in 1968; and four explosions in 1969.[32]

For many years a large share of the accidents (35% to 40%) occurred at production and developmental faces as a result of roof falls. The second largest group (17% to 25%) occurred during underground haulage. The third group (7% to 10%) consisted of accidents caused by machines and electricity. Finally, accidents which occurred in blasting or in handling explosives form the fourth group.

Accidents caused by roof falls at production and developmental faces are the result of inadequate support, caused mainly by shortages of props.[33] The neglect of proper roof control in mining steep coal seams of large- and medium-sized thicknesses at mines in the Prokopyevsk Region of the Kuznetsk Basin resulted in an increase in the number of fatal accidents caused by workers falling into the discharge openings where the shield system of mining was followed.[34]

The accumulation of dust in underground coal mines of the Soviet Union is high and often exceeds the safety and health standards.[35]

The administration of coal mines, with the approval of the trade union, has often used overtime to fulfill planned quotas of coal production, has sometimes required miners to work two to three shifts in succession, and has even required underground miners to work an 8-hour instead of a 6-hour shift in violation of the labor law.[36]

**Natural Gas.**—The country produced 261 billion cubic meters of usable gas, about 11% more than in 1973, but below the original 1974 plan target of 280 billion cubic meters. Of this quantity, about 99% consisted of natural gas and oil-associated gases and over 1% was gas from gasification of coal and oil shale. In 1974, gas accounted for 20.6% of the U.S.S.R. primary energy production. About 68% of the total was produced in the European part of the U.S.S.R., including over one-fifth in the Ukraine. There were about 4,500 producing wells in 1974, but 15% to 20% of them were idle.

The Ministry of Construction of the Enterprises of the Oil and Gas Industry did not fulfill plans for development of oilfields and gasfields and construction of gas pipelines and compressor stations.[37] Targets were not met by more than one-quarter of the drilling crews. Losses of time in drilling as a result of idleness and accidents amounted to 20% and in the Turkmenia and Orenburg associations, they were running above 30%.[38]

According to the 1975 plan, extraction of natural gas was expected to reach 285 billion cubic meters. The plan calls for the laying of 6,000 kilometers of trunk gas pipeline, completion of 50 new compressor stations, and start of work on the second stage of the 15-billion-cubic-meter Orenburg gas complex for processing high-sulfur natural gas; it is planned to increase extraction of sulfur at this complex from 270,000 tons in 1974 to 451,000 tons in 1975. The 1975 plan envisages 2.9 billion rubles of total investments in the development of the Soviet gas industry, or 16% more than in 1974.

The 1975 planned targets in the main gas-producing regions, in billion cubic meters, are given in the following tabulation:

| | |
|---|---|
| Ukraine (natural gas) | 57.5 |
| Turkmenia | 47.5 |
| Uzbekistan | 36.2 |
| Tyumen' | 34.5 |
| Orenburg | 17.4 |
| Komi A.S.S.R. | 17.2 |
| Stavropol' | 10.5 |
| Ukraine (associated gas) | 9.7 |
| Kaspian (offshore associated gas) | 7.9 |
| Kuban' | 5.5 |
| Mangyshlak (associated gas) | 4.5 |
| Tatar A.S.S.R. (associated gas) | 4.4 |
| Others | 32.2 |
| Total | 285.0 |

*Exploration and Reserves.*—In 1974, there were over 650 gas, gas condensate, and gasfields and oilfields in the U.S.S.R. At yearend 1974, according to Soviet estimates, natural gas reserves in categories $A+B+C_1$ (measured, indicated, and inferred reserves in place) reached 20 trillion cubic meters. About 80% of the gross re-

[32] Bezopasnost' truda v promyshlennosti (Labor Safety in Industry), Moscow. No. 3, March 1971, p. 11.

[35] Sovetskiy shakhter (Soviet Miner), Moscow. No. 7, July 1973, p. 7.
[36] Literaturnaya gazeta (Literary Gazette), Moscow. July 25, 1973, p. 1.
[37] Stroitel'stvo truboprovodov (Pipeline Construction). No. 1, January 1975, p. 2.
[38] Ekonomicheskaya gazeta (Economic Gazette), Moscow. No. 17, April 1975, p. 2.

serves of gas in the Soviet Union are found in Western Siberia and Central Asia. Some 13.4 trillion cubic meters of gross gas reserves, or 67% of the total gross reserves, are in 17 fields. The major gross gas reserves, 12.6 trillion cubic meters, are in Siberia, including 11.8 trillion cubic meters in Tyumen' Oblast'; the European part of the Soviet Union contains about 3.7 trillion cubic meters; and Central Asia contains about 3.7 trillion cubic meters of gas. There are eight gas and gas-condensate fields with total gross reserves of 200 billion cubic meters.

Development of the gas industry in the near future will continue to be based on gas reserves contained in the largest and large-sized fields. However, in the European part of the U.S.S.R. the smaller fields are being used in addition to major ones.

In addition to the Shebelinskoye, Gazli, Achakskoye, and North Stavropol'skoye fields that are now being exploited, there are 36 other large gas and gas-condensate fields; of these only the Vuktyl, Medvezh'ye, Naip, and Western Krestischenskoye Fields are being exploited on an experimental-commercial basis. The largest fields of Tyumen' Oblast' are Urengoyskoye Yamburgskoye, and Arkticheskoye.

In Central Asia, the Shaltyk Field has been prepared for exploitation, its gross gas reserves exceed 1 trillion cubic meters. Gas production at this field in the near future should be raised to 32 billion cubic meters per year. In 1975, the Naip Field will be put into operation on an experimental commercial basis. This field has gross gas reserves of about 200 billion cubic meters.

In the European part of the Soviet Union, west of the Urals, the large Orenburg and Vuktyl Fields have been discovered and opened up in recent years. Gas reserves in the Orenburg Fields (categories $A+B+C_1$) are estimated at 1.66 trillion cubic meters. Gross gas reserves of the Vuktyl Field (same categories) amount to 364.2 billion cubic meters. In the eastern part of the Ukraine, near Shebelinka Field, the Western Krestishchenskoye (gross reserves 180 billion cubic meters), Yefremorskoye (60 billion cubic meters), the Melikhovskoye, and other fields have been developed.

A base for gas production has been set up in the mouth of the Yenisey River. Exploitation has begun on the Messoyakhskoye Field; in addition, discoveries have been made of the Soleninskoye, Pelyatkinskoye, Kazantsevskoye, Ozernoye, and Sazunskoye Fields.

More than 80% of gross gas reserves that have been discovered are at depths extending to 3,000 meters.

*Gasfields.*—The 1974 planned extraction of gas by major areas, in billion cubic meters, was as follows:

| | |
|---|---|
| Ukraine | 57.5 |
| Turkmenistan | 37.2 |
| Uzbekistan | 36.0 |
| Tyumen' Oblast' | 23.0 |
| Komi A.S.S.R. | 16.3 |
| Orenburg | 12.6 |

The Ukraine continued to occupy first place in the production of gas. Thirty-four gasfields were in operation, including Shebelinka and Efremovka. The Shebelinka gasfield contains about 0.5 billion cubic meters of gas and has 571 wells. Turkmenia was the second largest gas-producing region. Six gasfields were being exploited in this republic in 1974. The first stage (32 wells) of the Shatlyn gas condensate-field in Turkmen S.S.R. was commissioned in June, and development of the second stage began in July.

Uzbekistan with an output of 36 billion cubic meters was the third largest gas-producing region. The establishment and development of the gas industry in Uzbek S.S.R. are connected with the exploitation of the Gazli Field. The extraction of natural gas in Tyumen Oblast', where more than 70% of the country's gross reserves are located, is planned at 34.5 billion cubic meters, or 11.5 billion cubic meters over that of 1974. The first gas-producing well was put into service in the Urengoy area in December. The plan for development of this field calls for drilling 70 wells in the southern part of the field and for annual production of 30 billion cubic meters of gas.

*Transportation.*—The total length of trunk gas pipelines increased from 83,500 kilometers in 1973 to 98,600 kilometers at yearend 1974. About 5,100 kilometers of transmission gas pipelines were built. Completion of 6,000 kilometers of gas trunk pipelines is planned for 1975. Completed was the 2,500-kilometer Tyumen' Oblast'-Center line, a number of new sectors of the Central Asia-Center, and other gas-lines.

*Gas Processing.*—The utilization of associated gas continued to be low, especially in West Siberia, Mangyshlak Peninsula, and Turkmen S.S.R., because construction of gas refinery plants, compressor stations, and main gaslines to transport the gas has been slow. The 1971–75 5-year plan called for commissioning of facilities to refine 12 billion cubic meters of associated gas per year; however, facilities for refining only 3.2 billion cubic meters were commissioned during the 1971–74 period.

The capacity of gas-processing plants increased from 6.6 billion cubic meters per year in 1966 to over 14 million cubic meters in 1975. There were 17 associated gas-processing plants in operation. With the assistance of French firms, the first stage of the Orenburg gas-processing plant, with an annual capacity of 15 billion cubic meters, was put into service in July. One-hundred and fifty developmental wells were drilled, and three installations for gas refining, with an annual capacity of 5 billion cubic meters each, and other facilities were built. Seven hundred million rubles has been invested since the start of construction. For the first time in the U.S.S.R., the Orenburg gas refinery began the production of sulfur. The second stage of this plant was under construction in 1974.

The following associated gas-processing plants were under construction in 1974: Nizhnevartovsk No. 1 and No. 2, Yuzhno-Balyk, and Pravdinsk in Tyumen' Oblast'; Kazakhskiy No. 1 and No. 2 in Mangyshlak Oblast'; Groznyy No. 2 in North Caucasus; Belorusskiy in Gomel' Oblast'; Gnedintsevskiy in the Ukraine; and Permskiy No. 2 in the city of Perm'.

*Underground Gas Storage.*—On January 1, 1975, the total volume of 20 underground storage facilities was about 20 billion cubic meters, 10 billion cubic meters of which were under exploitation. The Potoratskoye underground gas storage facility near Tashkent was filled in November. About 1 billion cubic meters of gas was pumped into it from the Bukhara-Tashkent—Alma-Ata pipeline for use during winter. Development of underground storage facilities lagged behind goals foreseen in the 1971–75 5-year plan.

*Consumption.*—More than 50% of the natural gas extracted was utilized for industrial purposes, 26% was used for power generation, and 12% was consumed by households.

Natural gas became of considerable significance in metallurgy, machine-building, metal working, and construction materials industry. The share of gas in the total fuel consumption, in percent, was as follows: Pig iron production, 12; nonferrous metallurgy, 14; rolled steel, 40; machine-building and metal working, 5.6; and cement industry, 61. The share of gas in the fuel balance of powerplants reached 22% in 1974, a 7.2 billion-cubic-meter increase feedstock in the production of synthetic products and nitrogen fertilizers.

*Trade.*—Exports of natural gas from the Ukraine totaled 14 billion cubic meters in 1974, a 7.2 billion-cubic-meter increase compared with those in 1973. Soviet imports of natural gas from Iran and Afghanistan increased from 11.4 billion cubic meters in 1973 to 11.9 billion cubic meters in 1974. For the first time the U.S.S.R. became a net gas exporter.

The first West European country to import Soviet natural gas was Austria. It receives gas under a 23-year agreement signed in 1968. Under an agreement signed November 29, 1974, deliveries of Soviet gas to Austria will be increased from 1.5 to 2 billion cubic meters per year for 1978–2000. The Soviet Union has two agreements (1970 and 1972) with West Germany's Rhurgas for delivery over 20 years of about 120 billion cubic meters of gas. West Germany began to receive gas through the transit pipeline in 1973. Under contract No. 3, signed on October 29, 1974, the Soviet Union will supply West Germany with 60 billion cubic meters of natural gas. Under the barter deal West Germany will supply in 1975–76 another 1 million tons of large-diameter steel pipe to the U.S.S.R. in return for an increased supply of natural gas. Deliveries of gas under the new contract will start on January 1, 1978, at a minimum 2.5 billion cubic meters per year. Like the present deliveries, the additional supplies will be routed through Czechoslovakia. From 1980 at least 10 billion cubic meters will be supplied annually. Total deliveries from 1973 to yearend 2000 will amount to over 200 billion cubic meters.

In 1974, Italy joined the group of West European importers of Soviet natural gas. The Soviet-Italian gas pipeline was completed in April and Soviet gas reached Italy on May 1, 1974. The line was built on the basis of an agreement signed in December 1969. The capacity of the pipe-

line is to reach 13 billion cubic meters by 1975. In 1974, Italy received 790 million cubic meters of gas. Over the 1975–76 period the volume of deliveries to Italy will grow and will reach 6 billion cubic meters per year. From 1977, 6 billion cubic meters of Soviet gas will be sent annually to Italy under a 20-year agreement.

Deliveries of Soviet gas to Finland under the 20-year agreement started in 1974. During the first year of supplies, 443 million cubic meters were exported, and this will subsequently be raised to 1.4 billion cubic meters per year.

The Soviet Union is continuing its negotiations with Gaz de France for the delivery of natural gas to France through the international pipeline over 20 years (starting in 1976) of 2.5 billion cubic meters per year.

The Soviet Union intends to further increase its deliveries of natural gas to West European countries. For this purpose a second pipeline will be constructed along the existing right-of-way of the present international gasline and four new compressors and five distribution sections will be built. It is expected that the yearly throughput capacity of the pipeline will reach 28 billion cubic meters by 1978. This will also permit increased deliveries of gas to Czechoslovakia and the beginning of supply of gas to Yugoslavia.

Discussion on exploration and shipment of Yakutsk natural gas to Japan and the United States continued in 1974. An agreement of cooperation in geological prospecting in the Yakut gasfield was signed on November 22, 1974. Reportedly, a new Soviet-Swedish economic agreement was to be signed in 1975. The U.S.S.R. had agreed to supply yearly 1 billion cubic meters of natural gas to Sweden until the year 2000, but Sweden has declined the Soviet offer of natural gas.

According to an agreement, Bulgaria, Hungary, East Germany, Poland, and Czechoslovakia will build the Orenburg-Eastern Europe gas pipeline. The 1,420-millimeter-diameter pipeline will be 2,750 kilometers long. Its route has been divided into five sections: Urals, Volgograd, Kharkov, Cherkasky, and Ivano-Frankovsk. Work on each section will be carried out by one of the COMECON countries. The first section, from Orenburg to Aleksandrov Gay (Urals), 550 kilometers, is to be laid by Poland. The maximum number of Polish workers to be employed on the project at any time will be 7,000. The second section, the Volgograd, from Aleksandrov Gay to Sokhranovka (560 kilometers) across the Volgograd and Rostov area, will be built by 6,000 Czechoslovakian workers. The Khar'kov section (595 kilometers) will cross the territory of Rostov, Voroshilovgrad, Khar'kov and Poltava Oblast's and will be built by some 4,000 Hungarian workers. The fourth (Cherkassy) section (550 kilometers), to be built by East Germany, begins south of Kiev and runs in an east-west direction as far as Vinnitsa on the river Bug. The last section (Ivan-Frankovsk) across the Carpathians will be built by Bulgaria.

The U.S.S.R. will make geological surveys of route lines and will also provide all technical documentation, technical training of personnel, and housing for East European workers. Construction of this trunk pipeline will start in 1975. The whole pipeline should be in service by the third quarter of 1978 and by 1980 it will be supplying the U.S.S.R. and East European countries with 15.5 billion cubic meters of gas per year. The Soviet Union will repay five COMECON nations through deliveries of natural gas over 12 years. Romania will provide hard currency for purchase of equipment and other materials in the West.

An agreement on long-term exports of Soviet natural gas to Yugoslavia was signed at the end of 1974. The delivery of gas via Hungary should begin in 1976.

Exports of natural gas increased in 1974 compared with those in 1973 and were as follows, in billion cubic meters:

| Country | 1973 | 1974 |
|---|---|---|
| Czechoslovakia | 2.4 | 3.2 |
| Poland | 1.7 | 2.1 |
| West Germany | .4 | 2.1 |
| Austria | 1.6 | 2.1 |
| Italy | -- | .8 |
| Finland | -- | .4 |
| Bulgaria | -- | .3 |
| Unknown | .7 | 3.0 |
| Total | 6.8 | 14.0 |

**Petroleum.**—In 1974, the Soviet Union produced 459 million tons of crude oil and gas condensate, a 7% increase that put the U.S.S.R. first in production for the first time. Soviet crude and petroleum product exports declined slightly, from 118.3 million tons in 1973 to 116.2 million

tons in 1974. Imports of crude oil and products dropped sharply from 14.7 million tons to 5.4 million tons for the same period. The U.S.S.R. was again a large exporter of crude oil and products with 27.5% of the total production. The share of petroleum in the U.S.S.R.'s total fuel production (30.5% in 1960, 35.8% in 1965, and 41.1% in 1970) is increasing steadily and reached an estimated 44% in 1974.

In 1974, over 500 (including 36 large) oil and gas condensate fields were in operation, with a total of over 61,000 wells. Increased production came mainly from West Siberia, where 16 oilfields were producing in 1974. West Siberia now has 98 oilfields, the largest of which is Samotlor. Production in this region began in 1965 and reached 89 million tons in 1973 and 116 million tons in 1974. The goals for 1975 are set at 146.5 million tons and in 1980 the output is to reach 230 to 260 million tons.

Late in 1974, the U.S.S.R. increased the price of petroleum sold to other centrally planned economy countries by about 2.4 times.

Soviet petroleum production is increasing regularly by some 7% per year and will reach 490 million tons by 1975 and some 640 million tons by 1980. The greatest increment in petroleum production is foreseen in Western Siberia, Mangyshlak Peninsula in Kazakhstan, Komi A.S.S.R., and Udmurt A.S.S.R. Twelve out of 26 petroleum regions are to increase production. However, 14 regions will reduce production. The greatest drop in production will occur in North Caucasus, Ukraine, Kuybyshev Oblast', and the Lower Volga region.

It is planned to drill more than 8.5 million meters of wells, to put 4,300 new developmental oil wells into operation, and to lay 2,700 kilometers of oil pipeline in 1975. Capital investment is to rise during 1975 to 9% over that of 1974, reaching 2.7 billion rubles; the volume of construction-installation work should reach 1.7 billion rubles, an increase of 17%. Facilities with the following capacities are to be commissioned among others during the 1975 year: Crude oil collection, 87.2 million tons; crude oil preparation, 69 million tons; and petroleum pipelines, 2,750 kilometers.

Reportedly, the Soviet Oil Industry Minister has proposed to American companies technical cooperation in the field of exploration and oil extraction using new methods and techniques. He also stressed that oil companies from any country could take part and the U.S.S.R. is ready to pay for this sort of cooperation.

*Exploration and Reserves.*—A total of over 3 billion rubles was allocated for geological exploration in 1974, 8% more than 1973. About 52% of all funds was for oil and gas exploration. Over 2,500 geological and geophysical teams are permanently employed in the prospecting and exploration of oilfields and gasfields. Drilling footage for oil and gas increased from 13.6 million meters in 1973 to about 14.5 meters in 1974. About 42% of the total wells were exploratory. In 1974, a total of over 4,400 oil-producing wells were completed. The prospecting for oilfields and gasfields was strengthened in the Komi A.S.S.R., Orenburskaya and Permskaya Oblasts, the Volga region, the Ukraine, Belorussia, the Caspian Offshore Shelf, and the petroleum and gas regions of the North Caspian region. About 40% of oil industry investment was spent on drilling.

Depletion of shallow oilfields and gasfields is pressing the Soviet drilling industry to upgrade its drilling technology to the level attained in the West. As result of this, the U.S.S.R. has been purchasing technology and equipment from the United States, Western Europe, Canada, and Japan. In 1974, there were some serious shortcomings in the performance of drilling operations and a large number of wells in potential regions were never drilled to the projected depths.[39]

*Oilfields and Crude Oil Production.*—In 1974, oil was produced in a number of separated regions, of which the Volga-Urals area was most important. West Siberia was the second largest producer followed by the North Caucasus, Kazakhstan, Turkmenistan, Azerbaydzhan, Ukraine, and Belorussia.

Tyumen Oblast', where 14 oilfields were in operation, replaced Tatar A.S.S.R. as the Soviet Union's leading crude producer in 1974. The Samotlor oilfield in this Oblast, the largest oilfield in the U.S.S.R., accounted for 50% of the oil extracted in

[39] Neftyanik (Oil Man), Moscow. No. 10, October 1974, pp. 1–3.
Neftyanoye khozyaystvo (Oil Economy), Moscow. No. 4, April 1974, pp. 62–66.

West Siberia. Plans call for an extraction rate of 100 million tons per year at this oilfield by 1977. About 1,000 developmental wells were put into operation in West Siberia, where 50,000 people were employed in 1974. Development of the Ust'-Balyk oilfield was continuing.

Production of crude oil in West Siberia in 1971–75, in million tons, was as follows:

| | | |
|---|---|---|
| 1971 | 44.8 | |
| 1972 | 62.7 | |
| 1973 | 87.7 | |
| 1974 | 116.4 | |
| 1975 | 146.1 | (planned) |

The Tatar A.S.S.R., which for the first time produced 103.5 million tons of crude oil in 1974, became the second largest crude producer. The oil of this region is the cheapest in the Soviet Union. The Romashkino oilfield is the largest in Tatar A.S.S.R. Growth in petroleum production in Tatar A.S.S.R., in million tons, was as follows:

| | |
|---|---|
| 1960 | 46.3 |
| 1965 | 79.7 |
| 1970 | 101.9 |
| 1974 | 103.5 |

The Bashkir A.S.S.R. contributed 40 million tons of crude in 1974; some 690 developmental wells were put into operation. The Udmurt A.S.S.R. had the second (after West Siberia) fastest growth rate for crude production in the U.S.S.R. For the first time, Perm Oblast' extracted 20 million tons of crude in 1974.

The output of crude in Kazakhatan increases from year to year. The largest reserves are on the Mangyshlak Peninsula. Up to 1975, nine oilfields, of which five were already supplying crude oil, were surveyed. The largest oilfield is Uzen', which produced some 13 million tons of the republic's total which was over 20 million tons. More than 200 new developmental wells were put into production in Kazakhstan in 1974.

About 170 developmental wells in Belorussia produced 7.8 million tons of crude in 1974. For several years oil production on Sakhalin Island was held at about 2.4 million tons per year.

Chechon-Ingush A.S.S.R., Kazash S.S.R., Ukrainian S.S.R., and several other regions did not meet crude oil production quotas during 1971–74.

Shifts in Soviet actual and planned production of crude oil are shown in table 14.

**Table 14.—U.S.S.R.: Production of crude oil by region in selected years from 1940 through 1975**
(In percent)

| Region | Actual | | | | Planned | |
|---|---|---|---|---|---|---|
| | 1940 | 1950 | 1960 | 1965 | 1970 | 1975 |

Source: Ekonomika neftyanoy promyshlennosti (Economics of Oil Industry), Moscow. No. 8, August 1973, p. 7.

*Offshore Production.*—Several offshore fields have been developed in the Caspian Sea off Azerbaydzhan. The "Neftyanye Kamni" (Oil Stones) Field is 20 to 25 kilometers from the coast and the largest in Azerbaydzhan. From steel trestles, which cover a distance of more than 200 kilometers, more than 1,000 wells have been drilled. These wells produced one-third of the total crude production in Azerbaydzhan in 1974. Drilling platforms were installed at water depths of 10 to 25 meters, and construction of platforms for wells at depths of 25 to 30 meters continued in the northeast region of Neftyanye Kamni. In 1974, about two-thirds of the crude oil (11.5 million tons) and three-fourths of the natural gas (8 billion cubic meters) produced in Azerbaydzhan came from offshore fields.

Offshore oil was also produced from several wells in Turkmenistan, where several oilfields have been found offshore recently. Development of Zhdanov and Lam Fields in this republic continued in 1974. Reportedly, a promisory offshore oilfield has been discovered in the western part of the Azov Sea. The first offshore oilfield in the Baltic Sea was discovered after 2 years of prospecting in Kurskiy Bay. Drilling of exploratory wells continued in the Black Sea. A small steel platform designed in Baku is to be set up in the Sea of Okhotsk near Okha to search for offshore oil. The platform will be assembled at the shore and towed out to its site, in a 15 meter-deep part of the sea. According to Soviet sources, offshore oilfields are situated not only in the Caspian Sea but also in the Black, Azov, Baltic, and Okhotsk Seas and in the Arctic Ocean.

During 1971–75, almost 780,000 meters are to be drilled offshore in Azerbaydzhan. The depths of wells are constantly increasing and by the end of the ninth 5-year plan depths should exceed 5,000 meters. According to Soviet calculations, 60% to 65% of the predicted reserves of oil and gas in Azerbaydzhan are offshore.

In 1967, the floating platform "Apsheron" began drilling the first deep, 1,800-meter well near the Savenko bank. Water depths in this region of the Caspian Sea reach 13 to 14 meters. In 1968, a floating rig, the Khazar, built in the Netherlands to Soviet specifications, was put into drilling operation in the Caspian Sea where the water depth is not more than 60 meters. The equipment was built for drilling to a depth of 6,000 to 7,000 meters. The floating drilling platform, the Azerbaydzhan, completed in December 1971, can drill wells to a depth of 3,000 meters in water of up to 20 meters deep. A new floating drilling rig, Kaspiy, designed in Baku (probably a copy of the Khazar rig) and built at the Krasnye Barrikady shipyard in Astrakhan became operational in the Caspian Sea in October 1974. It is capable of drilling a 6,000-meter well where the depth of the sea is 60 meters. The Kaspiy is the first of a series of 10 such rigs, which will be constructed in the future. Construction of the second unit to operate in the Black Sea was started in 1974. Negotiations on joint exploration of offshore oilfields adjacent to the Sakhalin Island, between the U.S.S.R. and United States and Japanese firms continued in 1974.

*Refining and Petroleum Product Supply.*—The 1971–75 5-year plan envisages an increase in product output in 1975 by 1.4 times as compared with 1970. However, the planned 1971–74 goal was not met. Information pertinent to refining and utilization of petroleum products is secret and material on the subject is not easily accessible. However, a great deal of indirect information is available. Soviet crude oil is treated both at field plants and at refineries. However, the problem of preparing crude for refining has not been solved. The crude obtained at field dewatering installations contains up to 1.5% water (average 0.76%) and up to 5,000 milligrams of chloride salts per liter (average 739 milligrams) while the norms permit only 0.2% water and 40 milligrams of salt per liter.[40] As a result, according to Soviet sources, refinery consumption and losses amount to 13.4%.[41] The total loss incurred by refining insufficiently desalinated crude oil is more than 200 million rubles per year.[42] Losses in storage and transportation of crude oil to refineries are estimated at 1.6%. While the Soviets do not report output figures for petroleum products, good estimates can be derived, however, by applying to reported crude pe-

[40] Khimiya i tekhnologiya topliv i masel (Chemistry and Technology of Fuels and Lubricants), Moscow. No. 8, August 1972, pp. 1–5, and No. 1, January 1975, pp. 1–6.
[41] Promyshlennaya energetika (Industrial Power Engineering), Moscow. No. 2, February 1968, p. 3.
[42] Sotsialisticheskaya industriya (Socialist Industry), Moscow. June 3, 1970, p. 1.

troleum input a factor of 85%. Thus, Soviet output of refined products from crude oil (including condensate) in 1974 has been estimated at 326 million tons. Approximately 80 refineries were in operation, with a total estimated capacity as of January 1, 1975, of 362 million tons. Based upon production and trade figures, Soviet consumption of refined products in 1974 has been estimated at 290 million tons. The utilization of petroleum in the Soviet chemical industry reached not more than 3% of the total crude production, and the utilization of natural gas reached less than 7%.

Since the beginning of the present 5-year period, the average capacity of the Soviet Union's oil refineries has increased 24%.[43] The renovation and enlargement of existing refineries, in addition to the construction of new ones, forms the basis of Soviet petroleum technological policy. Obsolete installations of low productivity are being replaced by "combined blocks," mainly from Western countries, that merge several processes and are able to refine 6 million to 8 million tons of crude per year. Litwin S.A., French subsidiary of Amtel, Inc., will build a petrochemical complex at Shevchenko in Kazakhstan. The project, which will be built in 4–5 years will have an installed value of $220 million. The complex will consist of five plants. UOP has signed a contract with the Soviet Licensintorg for the design and supply of equipment for three oil processing units for refineries in the U.S.S.R. In 1974, new capacities for primary processing of oil and catalytic reforming were put into operation at Novokuyubyshev, Angarsk, and Omsk complexes and at Kirishi, Kremenchung, Polotsk, Novo-Ufimsk, and Groznyy imeni Sheripova refineries.

*Transportation.*—About one-half of the total tonnage of crude oil and refinery products moved in the U.S.S.R. in 1974 was shipped by rail. The total length of crude oil and petroleum product trunk pipelines, as of January 1, 1974, totaled over 47,000 kilometers, and the average distance of pipeline deliveries in 1973 was about 900 kilometers. Only about 70% of total pipeline capacity was utilized. The network of crude oil and petroleum product lines increased an estimated 5,300 kilometers in 1974. The recent growth in estimated total length of crude oil and petroleum product trunk pipelines is shown, in thousand kilometers, in the following tabulation:

| Year | Crude pipelines | Product pipelines | Total |
|---|---|---|---|
| 1970 | 31.6 | 5.8 | 37.4 |
| 1971 | 34.5 | 6.5 | 41.0 |
| 1972 | 35.4 | 7.5 | 42.9 |
| 1973 | 39.2 | 8.0 | 47.2 |
| 1974 | 44.2 | 8.3 | 52.5 |
| 1975 (plan) | 46.9 | 8.5 | 55.4 |

Among the most important pipelines constructed in 1974 were the 1,490-kilometer, 820-millimeter Kuybyshev-Tikhoretsk-Novorossiysk crude pipeline; the 1,135-kilometer, Ukhta-Yaroslavl crude pipeline; and the 232-kilometer Khashuri-Batumi product pipeline. Construction of the 2,250-kilometer, 1,220-millimeter Samotlor-Kuybyshev crude pipeline started in 1974.

The largest Soviet crude pipeline is the "Druzhba" with a total two-line length of 9,310 kilometers, of which 6,950 kilometers are located in Soviet territory. This pipeline delivers crude from Tataria, Kuybyshev, and West Siberia to Czechoslovakia, Poland, Hungary, and East Germany. During recent years a number of crude trunk lines have been built including the 1,920-kilometer Samotlor-Almetyevsk and the 800-kilometer Alexandrovskoye-Anzhero-Sudzhensk.

The first large Soviet-built tanker, the 182,000-ton *Krym,* successfully completed trial runs in the Black Sea in 1974. This tanker is 2.5 times larger than the *Sofiya* type of tankers.

*Trade.*—Soviet exports of crude oil and petroleum products totaled 116.2 million tons in 1974, a 1.8% decrease compared with those in 1973, comprising 80.6 million tons (68%) of crude oil and 35.6 million tons (32%) of oil products. Over 61% of total exports of crude oil and petroleum products (71.7 million tons) were shipped to centrally planned economy countries. The balance (44.5 million tons) went to market economy countries. The U.S.S.R. exported more than one-fourth of its production in 1974. In 1974, as payment for various supplies, the U.S.S.R. received 4.4 million tons of crude oil (including 3.9 million tons from Iraq and 0.2 million tons from Egypt) and 1 million tons of petroleum products, mainly from Romania.

[43] Pravda, Moscow. July 23, 1974.

Soviet exports of crude and petroleum products by country of designation in 1974, in thousand tons, are as follows:

| | |
|---|---|
| Czechoslovakia | 14,836 |
| East Germany | 14,424 |
| Poland | 11,855 |
| Bulgaria | 10,855 |
| Finland | 9,173 |
| Cuba | 7,643 |
| Italy | 6,788 |
| Hungary | 6,729 |
| West Germany | 6,340 |
| Yugoslavia | 3,790 |
| Sweden | 3,027 |
| Netherlands | 2,975 |
| Belgium | 1,752 |
| France | 1,360 |
| Spain | 1,351 |
| Japan | 1,241 |
| Greece | 1,032 |
| India | 1,009 |

| Somalia | 113 |
| Cyprus | 106 |
| Others | 2,614 |
| Total | 116,200 |

Source: Vneshnyaya torgovlya S.S.S.R. za 1974 god (Foreign Trade of the U.S.S.R. for 1974). Moscow, 1975, 314 pp.

Crude oil and product exports from the U.S.S.R. to COMECON countries will continue to grow. According to an agreement, signed December 23, 1974, supplies of petroleum from the Soviet Union to Czechoslovakia are to increase by 8.4% in 1975 to 15.5 million tons of crude and more than 0.36 million tons of products. Under a contract, signed December 6, 1974, Poland is to build a 450-kilometer oil pipeline linking Belorussia with Estonia. It will be paid for in additional deliveries of crude oil to Poland. The Soviet Union will continue to meet most of Hungary's oil requirements and in 1980 it will also deliver substantial quantities of electric power and natural gas. Reportedly, on the average the COMECON nations will be receiving 5% more crude oil from the U.S.S.R. during 1975 at unchanged prices. The price of Soviet crude to Hungary was 15.89 rubles per ton.

According to an agreement signed in February 1974 between Yugoslavia, Hungary, and Czechoslovakia, construction of the Adria crude pipeline began at yearend 1974. It is planned that crude oil, delivered from the Middle East and North Africa to the port of Rijeka, Yugoslavia, will flow to Yugoslavia, Hungary, and Czechoslovakia by 1977. Soviet petroleum statistics are presented in table 15.

**Other Fuels and Energy.**—Among the Soviet sources of fuels and energy of lesser significance in the energy economy in 1974 are hydroelectric power, nuclear energy, oil shale, peat, and fuelwood.

**Table 15.—U.S.S.R.: Salient petroleum statistics**
(Million metric tons)

e Estimate.
[1] Production data 1960, 1965, and 1970 taken from the National Economy of the U.S.S.R., Moscow, 1960, 1965, and 1970; trade data from Foreign Trade of the U.S.S.R., Moscow, 1960, 1965, 1970, and 1974.

*Hydroelectric Power.*—Electric power stations generated 975 billion kilowatt hours, a 6% increase over that of 1973. At yearend 1974, the total capacity of all Soviet powerplants reached 205.1 million kilowatts compared with 196.1 million kilowatts in 1973. Production of all electric power is planned to rise to 1,035 billion kilowatt-hours in 1975, 30 billion less compared with the original plan of 1,065 kilowatt-hours. There are plans to commission 12.9 million kilowatts of new electric-power generating facilities in 1975, including 7.7 million thermal, 1.4 million nuclear, and 3.8 million kilowatts hydroelectric capacity. Exports of electric power rose from 9.9 billion kilowatt-hours in 1973 to 10.9 billion kilowatt-hours in 1974, including about 9.3 billion kilowatt-hours to centrally planned economy countries and over 1.5 billion kilowatt-hours to Finland and Norway. Hungary remained the principal importer of Soviet power followed by Bulgaria, Czechoslovakia, and Poland.

Electric power generation and the capacity of Soviet electric powerplants, by type, in 1974 are shown in the following tabulation:

| Type | Capacity | | Production | |
|---|---|---|---|---|
| | Million kilowatts | Percent | Billion kilowatt-hours | Percent |
| Thermal electric | 164.6 | 80.2 | 827.0 | 84.9 |
| Nuclear | 3.7 | 1.8 | 18.0 | 1.8 |
| Hydroelectric | 36.8 | 18.0 | 130.0 | 13.3 |
| Total | 205.1 | 100.0 | 975.0 | 100.0 |

Source: Elektricheskiye stantsii (Electric Powerplants), Moscow. No. 1, January 1975, p. 3.

About 85% of all Soviet electric energy is generated at thermal powerstations fueled mainly by coal as is indicated, in percent, in the following tabulation:

| Source of fuel | 1970 | 1975 |
|---|---|---|
| Coal | 48.6 | 45.0 |
| Mazut | 23.0 | 25.6 |
| Natural gas | 23.1 | 23.4 |
| Peat, oil shale, and other | 5.3 | 6.0 |
| Total | 100.0 | 100.0 |

Source: Elektrichesniye stantsii (Electric Powerplants), Moscow. No. 1, January 1975, p. 3.

The leading role of coal in power generation is expected to continue for a long time, and the share of coal as fuel for power generation is expected to increase. Up to 75% of the solid fuel burned at the U.S.S.R.'s thermal electric powerplants has a combustion heat of 1,500 to 5,500 kilocalories per kilogram. Soviet energy production will get high investment priority during the next 5-year plan period (1976–80).

About one-half of the total capacity of hydroelectric powerstations of the U.S.S.R. is concentrated at plants with a capacity of over 1 million kilowatts. The largest operating station is the Krasnoyarsk hydraulic powerplant with a capacity of 6 million kilowatts. In 1974, 19 hydro-units were put in operation at the Ust'-Ilimskaya, Chirkeyskaya, Dneprovskaya No. 2, Rizhskaya, Kanevskaya, and Toktogul'skaya hydraulic powerplants with a total installed capacity of 1.9 million kilowatts.

Planned consumption of power, by major branches of the Soviet economy, in 1975 is shown in the following tabulation:

| Consumer | Billion kilowatt-hours | Percent of total |
|---|---|---|
| Industry | 582.0 | 56.2 |
| Construction | 20.0 | 1.9 |
| Transport | 74.4 | 7.2 |
| Agriculture and rural population | 72.5 | 7.0 |
| Domestic (urban) | 123.5 | 11.9 |
| Powerplants and losses | 151.6 | 14.7 |
| Exports | 11.0 | 1.1 |
| Total | 1,035.0 | 100.0 |

Source: Elektricheskiye stantsii (Electric Powerplants), Moscow. No. 1, January 1975, p. 3.

In the beginning of the 1960's a voltage of 660 volts was inserted in the GOST (State Standards) and found to be applicable in the mines and pits of chemical mining enterprises. But because of shortage of electric equipment adaptable to 660 volts instead of 380 only a portion of the coal mines and several potassium mining operations are using 660 volts.[44]

*Nuclear Power.*—The Soviet Union operated seven atomic powerplants with a total capacity of 2,602 megawatts, or 1.8% of the capacity of all electric powerplants in the country on January 1, 1974 (Novo-Voronezh, four reactors, total capacity 1,445 megawatts; Beloyarsk, two reactors, 300 megawatts; Melekess, one reactor, 50 megawatts; Obninsk, one reactor, 5 megawatts; Kola Peninsula, one reactor, 440 megawatts; Shevchenko, one reactor, 350 megawatts; and Bilibino, one reactor, 12 megawatts). In 1974, the following nuclear powerplants were put into operation: The first stage (one reactor) at Leningrad, with a capacity of 1,000 megawatts commissioned in January and the second stage (one reactor) of the Kola Peninsula with a capacity of 440 megawatts, completed December 31. Therefore, the total installed capacity of all eight Soviet nuclear powerplants was 4,042 megawatts or about 2% of the capacity of all electric powerplants in the U.S.S.R. on January 1, 1975.

In 1974, Soviet nuclear powerplants generated 18,000 million kilowatt-hours (54% more than in 1973), or 1.8% of all power supplied in 1974. It is planned to generate 25,000 million kilowatt-hours in 1975. Several nuclear powerplants were under construction in 1974, of which two were scheduled for completion in 1975.

Estimated levels of Soviet atomic generating capacity for 1975 and 1980 are 5,000 and 17,500 megawatts, respectively. The U.S.S.R. will probably increase the production of nuclear power from 18 billion kilowatt-hours in 1974 to 20 billion in 1975 and 65 billion kilowatt-hours in 1980. Nuclear power output is to represent about 4.7% of national electric power production and about 0.5% of total Soviet primary energy output by 1980.

The U.S.S.R. provides technical assistance in the construction of atomic powerplants in COMECON countries. A nuclear powerplant with a capacity of 70 megawatts was put into operation at Rheinsberg, East Germany, in May 1966. Reportedly, a nuclear powerplant near Greifswald on the Baltic coast was put into operation in December 1973, and the second stage of this plant was completed in December 1974.

In December 1972, the first Czechoslovakian nuclear powerplant, with a capacity of 140 megawatts, was put into operation at Yaslovske Bohunice in Western Slovakia. The second stage of this plant was under construction in 1974. The technical project on the second nuclear powerplant in Czechoslovakia, with a capacity of 440 megawatts, was completed by Soviet engineers in 1974.. The first stage (440 megawatts) of the Kozloduy nuclear powerplant in Bulgaria was completed in December 1974. Construction of similar nuclear powerplants, with a capacity of 440 megawatts each, began in Hungary (Paks nuclear powerplant) and in Romania in 1974 and were scheduled for completion by 1985. Yugoslavia's first nuclear powerplant, the Krsk plant with a capacity of 600 megawatts, was under construction in 1974 and scheduled for completion by 1985.

The first nuclear powerplant in Poland, with a capacity of 440 megawatts, is to be built on lake Zarnowieckie, Gdansk Province, during the 1990's. Cuba's first atomic powerstation is to be built in Las Villas Province with Soviet assistance.

Finland ordered two nuclear powerplants from Sweden and two from the Soviet Union. Two more plants may be ordered from the U.S.S.R. at a later date. Both of the Swedish-supplied powerplants will use uranium fuel bought from Canada and enriched by the Soviet Union. According to a long-term agreement, Spain will import an estimated $400 million worth of Soviet uranium concentrate to fuel nuclear powerplants in Spain. Reportedly, Rheinish Westfälisches Elektrizitaetswerk AG (RWE) has a contract with the Soviet Union, worth DM1,000 million (about US$392 million in 1974) and valid until 1990, that will ensure a sufficient supply of uranimum for the nuclear powerplants. The contract for the enrichment of uranium for Austria's second nuclear power project for a 12-year period was signed by the U.S.S.R. on May 23. This nuclear powerplant is scheduled to operate in 1980 or 1981.

[44] Sotsialisticheskaya industriya (Socialist Industry), Moscow. Sept. 14, 1974, p. 2.

*Oil Shale.*—Minable oil shale reserves, confined to deposits in Estonia, Leningrad Oblast', and the Volga region, amounted to over 5 billion tons of standard fuel equivalent (16.7 billion tons). The largest oil shale reserves are in Estonia. The production of oil shale increased from 31.1 million in 1973 to an estimated 33 million tons in 1974. Output of oil shale may possibly reach 34 million tons in 1975 and 38 million tons in 1980. Over two-thirds of the extracted shale in the U.S.S.R. is burned at the Pribaltiyskay and Estonskay thermal electric powerplants. The remainder is processed into furnace oil, gasoline, fuel gas, phenols, and aromatic hydrocarbons. Oil shale is also used in commercial everyday needs. The world's biggest powerplant in Tallin fueled by oil shale has reached a capacity of 1,600,000 kilowatts.

The main center of production as in prior years, was the Estonian S.S.R. where output totaled over 27 million tons in 1974 and is expected to be 28 million tons in 1975. There were eight underground mines and four open pits in Estonia in operation in 1974. The No. 3 mine at Kiisa in this republic was put into operation in 1974. Initial output of the mine will be 1.5 million tons a year; full capacity of 5 million tons is to be reached in 1977.

*Peat.*—The Soviet Union produced an estimated 191.6 million tons of peat in 1974. Of this quantity, 60 million tons consisted of fuel peat and 131.6 million tons of agricultural peat. This last figure includes peat from collective farms, which may be used for local fuel. The Russian Soviet Federated Socialist Republic (R.S.F.S.R.) occupied first place in the production of peat in the U.S.S.R. and produced some 57% of the total. Belorussian S.S.R., with an output of about 22% of the total, was the second largest peat producing region.

Soviet gross reserves of peat were estimated at 163.2 billion tons in 1973. However, about 11% of today's minable reserves are located in the Central European part of the U.S.S.R., Belorussia, the Baltic States, and the Ukraine regions, which all together produced over 80% of the national output in 1974.

Reserves and production of peat, by Soviet Union Republic, in 1973 were as follows:

| Republic | Reserves | | Production | |
|---|---|---|---|---|
| | Billion metric tons | Percent of total | Million metric tons | Percent of total |
| R.S.F.S.R | 151.1 | 92.6 | 110.8 | 57.8 |
| Including regions: | | | | |
| North-West | 20.0 | 12.2 | 19.1 | 10.0 |
| Center | 5.2 | 3.2 | 44.8 | 23.4 |
| Volgo-Vyatka | 2.0 | 1.2 | 20.6 | 10.7 |
| Volga | .3 | .2 | 10.1 | 5.3 |
| Urals | 9.4 | 5.8 | 9.7 | 5.1 |
| West Siberia | 103.8 | 63.6 | 3.6 | 1.9 |
| Soviet Far East | 5.4 | 3.3 | 2.0 | 1.0 |

There were 79 electric powerplants with a total capacity of 3,740 megawatts, fueled by peat, in operation in the U.S.S.R. in 1974. Fuel peat is also used in domestic heating.

# The Mineral Industry of the United Kingdom

By Horace T. Reno [1]

The United Kingdom began 1974 with industrial plants operating at less than half of normal. Coal miners were refusing to work overtime, and it was apparent that a coal strike was pending. Most industries were operating on a 3-day week to conserve energy. Demand for consumer goods was strong. Nevertheless, the miners struck on February 10, effectively shutting down the entire coal mining industry. By the time the strike was settled by raising miners' wages on March 8, consumer demand had begun to slack off. The price of coal had to be raised to take care of the wage raise. Consequently, in the last half of the year the United Kingdom was in a definite recession, running well in advance of recessions in other member countries of the European Communities (EC).

Throughout the year the United Kingdom was completely dependent on imported oil. The high cost of both oil and coal resulted in increased costs for all goods produced in the country. Wholesale prices rose 25%, retail prices rose 19%, and wages rose 28%. There was a deficit of £5,190 [2] million in the United Kingdom trade balance, £3,491 million of which was the direct result of high oil prices. Imports of steel and automobiles were up sharply from 1973 levels, while domestic production of steel and automobiles was 16% and 12% less, respectively, than the quantities produced in 1973. Inflation practically overwhelmed the United Kingdom economy. The Stage Three Wage-Price Program included special provisions which allowed increases in wages. It is significant that the threshold to trigger these increases was reached 11 times during the year.

A new government department was formed on January 8 to take over full responsibility for energy matters. It was assigned responsibility for coal, electricity, gas, oil, and nuclear power, responsibilities previously held by the Department of Trade and Industry.

[1] Physical scientist, Division of Ferrous Metals.

[2] The value of the United Kingdom pound (UK£) in relation to the U.S. dollar varied erratically in 1974. At yearend, however, the exchange rate was UK£=US$2.35.

## PRODUCTION

Production indexes for the mining and quarrying and the manufacturing branches of the mineral industry were as follows (1970=100):

| | 1973 [r] | 1974 |
|---|---|---|
| Mining and quarrying | [r] 93.6 | 83.8 |
| Manufacturing: | | |
| Ferrous metals | [r] 97.3 | 87.8 |
| Nonferrous metals | [r] 106.1 | 103.2 |
| Brick, pottery, glass, etc | [r] 126.2 | 107.1 |
| Chemicals | [r] 121.6 | 127.6 |
| Coal and petroleum products | 110.0 | 106.1 |
| All industry | [r] 109.9 | 106.4 |

e Estimate. p Preliminary. r Revised. NA Not available.
[1] Includes antimony content of antimonial lead and antimony compounds.
[2] Includes wheels, centers, tires, and axles, and semimanufactures for sale.
[3] Lead refined from imported bullion.
[4] Lead refined from scrap materials and domestic ores.
[5] Year ending May 31 of that stated.
[6] Excludes plaster.
[7] Consists of bricks, retorts, molds, and other refractory products made from clays, silica, siliceous material, magnesite, alumina and chrome materials.
[8] Gas made at gasworks plus purchased coke oven and refinery gas.

## TRADE

Trade in mineral commodities in 1974 accounted for approximately 23% of the value of all exports and 16% of the value of all imports by the United Kingdom, almost exactly the reverse of the ratios between the value of mineral commodities and the total value of exports and imports in 1973.

Approximate values of major mineral commodities traded in 1974 follow:

| Commodity | Value (million dollars) | |
|---|---|---|
| | Exports | Imports |
| Petroleum, crude | 66 | 8,566 |
| Diamond, gem and industrial | 1,949 | 1,780 |
| Iron and steel | 364 | [1] 756 |
| Copper | 420 | 950 |
| Refined gold bullion | 3,327 | 980 |
| Petroleum products | 1,527 | 1,566 |
| Silver and platinum-group metals [1] | 602 | 561 |
| Aluminum | 172 | [1] 392 |
| Nickel | 210 | [1] 224 |
| Lead and zinc | 114 | [1] 403 |
| Tin | 88 | [1] 134 |

[1] Including ores and concentrates.

| Alkali, alkaline earth, and rare-earth metals | 305 | 341 | NA. |
| Pyrophoric alloys | 53 | 102 | NA. |
| Base metals including alloys, all forms, n.e.s | r 1,260 | 2,390 | NA. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Pumice, emery, natural corundum, etc | 7,786 | 4,705 | United States 284. |
| Dust and powder of precious and semiprecious stones value, thousands | r $6,164 | $7,197 | France $1,373; Japan $1,206; United States $983. |
| Grinding and polishing wheels and stones | 6,369 | 7,883 | Sweden 937; Finland 503; Poland 395. |
| Asbestos, crude and waste | 3,710 | 2,826 | France 581; West Germany 507; Italy 385. |
| Barite and witherite | 1,488 | 2,135 | NA. |
| Boric oxide and acid | 143 | 173 | NA. |
| Cement thousand tons | 793 | 1,506 | United States 1,123; Canary Islands 115; Ivory Coast 85. |
| Chalk | 32,917 | 45,137 | NA. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s. thousand tons | 2,509 | 2,848 | West Germany 468; Italy 452; France 317. |

See footnotes at end of table.

## Table 2.—United Kingdom: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Clays and clay products (including all refractory brick)—Continued | | | |
| Products: | | | |
| Refractory (including nonclay bricks) ____ thousand tons __ | 249 | 347 | Belgium-Luxembourg 63; West Germany 54; Sweden 32. |
| Nonrefractory _____ do ____ | 84 | 91 | United States 20; Canada 16; Australia 8. |
| Cryolite and chiolite _____ | 12 | 23 | NA. |
| Diamond, all grades _ value, millions __ | r $1,141 | $1,949 | Switzerland $557; Belgium-Luxembourg $538; United States $376. |
| Diatomite and other infusorial earth __ | 3,676 | 3,080 | NA. |
| Feldspar and fluorspar _____ | 70,883 | 88,655 | Canada 30,319; Norway 16,141; Netherlands 10,635. |
| Fertilizer materials: | | | |
| Crude: | | | |
| Nitrogenous _____ | __ | 37 | NA. |
| Phosphatic _____ | 103 | 2,599 | NA. |
| Potassic _____ | 139 | 90 | NA. |
| Other _____ | 234 | 762 | NA. |
| Manufactured: | | | |
| Nitrogenous value, thousands __ | r $5,977 | $7,720 | Ireland $2,813; India $1,758; West Germany $459. |
| Phosphatic _____ | 57,290 | 75,879 | Ireland 22,605. |
| Potassic _____ | 2,822 | 1,832 | NA. |
| Other, including mixed _____ | 105,176 | 266,421 | Ireland 131,130; West Germany 36,164. |
| Graphite, natural _____ | 1,909 | 1,815 | NA. |
| Gypsum and plasters _____ | 11,137 | 14,712 | NA. |
| Lime _____ | 42,216 | 38,368 | Nigeria 9,303. |
| Magnesite _____ | 3,261 | 2,027 | NA. |
| Mica: | | | |
| Crude, including splittings and waste _____ | 12,337 | 5,559 | NA. |
| Worked, including agglomerated splittings _____ | 154 | 274 | West Germany 70; Belgium-Luxembourg 30. |
| Pigments, mineral: | | | |
| Natural, crude _____ | 1,651 | 2,668 | NA. |
| Iron oxides, processed _____ | 9,000 | 7,172 | NA. |
| Precious and semiprecious stones, except diamond: | | | |
| Natural _____ value, thousands __ | r $21,015 | $43,806 | Switzerland $13,816; France $5,088; Hong Kong $3,872. |
| Manufactured _____ do ____ | r $150 | $243 | NA. |
| Salt _____ thousand tons __ | 421 | 479 | Sweden 162; Nigeria 115; Ireland 44. |
| Sodium and potassium compounds, n.e.s.: | | | |
| Caustic soda _____ | 176,591 | 276,446 | Australia 126,795; New Zealand 19,591; Canada 18,416. |
| Caustic potash, sodic and potassic peroxides _____ | 814 | 876 | NA. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked _____ | 10,489 | 12,502 | West Germany 6,089. |
| Worked _____ | 4,074 | 5,381 | France 2,112; Denmark 733. |
| Dolomite, chiefly refractory grade _ | 24,750 | 21,192 | Chile 14,973. |
| Gravel and crushed rock thousand tons __ | 3,863 | 4,132 | France 1,910; Netherlands 1,122; West Germany 498. |
| Limestone (except dimension) ____ | 41,739 | 53,220 | NA. |
| Quartz and quartzite _____ | 259 | 228 | NA. |
| Sand, excluding metal bearing ____ | 56,772 | 74,969 | Ireland 28,770. |
| Strontium minerals, celestite [1] _____ | 4,300 | 3,000 | NA. |
| Sulfur: | | | |
| Elemental: | | | |
| Other than colloidal _____ | 2,073 | 1,830 | NA. |
| Colloidal _____ | 142 | 597 | NA. |
| Sulfur dioxide _____ value __ | r $17,513 | $34,331 | NA. |
| Sulfuric acid _____ | 19,069 | 68,294 | Ireland 35,337; Spain 7,388. |
| Talc, steatite, soapstone, and pyrophyllite _____ | 1,729 | 2,044 | NA. |
| Other nonmetals, n.e.s.: | | | |
| Crude _____ | 472,672 | 517,817 | Norway 209,634; Belgium-Luxembourg 115,338; West Germany 95,943. |

See footnotes at end of table.

## Table 2.—United Kingdom: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Other nonmetals n.e.s.—Continued | | | |
| Slag, dross and similar waste, not metal bearing: | | | |
| From iron and steel manufacture | 127,782 | 135,879 | West Germany 130,830. |
| Slag and ash, n.e.s | 1,573 | 1,771 | NA. |
| Oxides and hydroxides of magnesium, strontium and barium | 15,893 | 40,596 | United States 7,199; France 4,878; West Germany 3,817. |
| Halogens, other than chlorine | 1,529 | 1,843 | NA. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | 102,573 | 75,077 | Ireland 10,328. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 3,665 | 8,420 | Ireland 3,243; Denmark 1,650. |
| Carbon black | 43,197 | 48,415 | Ireland 6,445; France 5,171; West Germany 4,011. |
| Coal and briquets: | | | |
| Anthracite and bituminous coal thousand tons | 1,749 | 2,693 | West Germany 1,607; France 507; Belgium-Luxembourg 145. |
| Briquets of anthracite and bituminous coal do | 124 | 176 | Norway 170. |
| Lignite and lignite briquets | 390 | 202 | NA. |
| Coke and semicoke thousand tons | 382 | 586 | Norway 214; Sweden 211. |
| Gas, manufactured | 16 | -- | |
| Hydrogen and rare gases | 963 | 1,292 | NA. |
| Peat, including peat briquets and litter | 500 | 1,083 | NA. |
| Petroleum: | | | |
| Crude and partly refined: | | | |
| Crude thousand 42-gallon barrels | 21,398 | 20,510 | Ireland 7,612; West Germany 2,638; Belgium-Luxembourg 2,456. |
| Partly refined do | 2,784 | 581 | Netherlands 329; West Germany 150; Ireland 59. |
| Refinery products: | | | |
| Gasoline (including natural) do | 17,670 | 19,591 | Sweden 5,184; Ireland 4,625; Denmark 3,178. |
| Kerosine and jet fuel do | 9,231 | 7,317 | Norway 2,298; Ireland 1,865; Sweden 1,080. |
| Distillate fuel oil do | 45,183 | 47,327 | Sweden 17,406; Denmark 10,822; Norway 4,342. |
| Residual fuel oil do | 37,024 | 37,291 | Denmark 12,059; Ireland 9,261; Sweden 6,122. |
| Lubricants do | 5,209 | 5,656 | Belgium-Luxembourg 511; Sweden 424; Denmark 364. |
| Other: | | | |
| Liquefied petroleum gas do | 1,569 | 2,163 | Ireland 694; Portugal 388; United States 358. |
| Mineral jelly and wax do | 36 | 110 | Netherlands 22; West Germany 19; Ireland 12. |
| Nonlubricating oils, n.e.s do | 345 | 4,250 | Netherlands 3,189; Republic of South Africa 56. |
| Bitumen and other residues, and bituminous mixtures, n.e.s do | 731 | 457 | Ireland 204. |
| Pitch, pitch coke, and petroleum coke do | 1,280 | 1,110 | Norway 430; Italy 147; Canada 107. |
| Total do | 118,278 | 125,272 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals value, thousands | r $7,445 | $9,895 | Netherlands $1,341; West Germany $814; United States $706. |

## Table 3.—United Kingdom: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite and concentrate thousand tons | 319 | 299 | Ghana 225; Greece 48. |
| Oxide and hydroxide do | 315 | 546 | Jamaica 339. |
| Metal including alloys: | | | |
| Scrap do | 14 | 21 | NA. |
| Unwrought do | 267 | 287 | Norway 136; Canada 63; Ghana 21. |
| Semimanufacturers do | 86 | 94 | United States 20; Norway 16; Belgium-Luxembourg 11. |
| Arsenic trioxide, pentoxide and acids [1] | 2,800 | 6,300 | NA. |
| Beryllium metal including alloys, all forms | 6 | 13 | United States 12. |
| Bismuth metal including alloys, all forms [1] | 531 | 550 | NA. |
| Cadmium metal including alloys, all forms [1] | 1,377 | 1,338 | NA. |
| Chromium: | | | |
| Chromite thousand tons | 77 | 199 | Republic of South Africa 103; Philippines 88. |
| Oxide and hydroxide value, thousands | r $803 | $709 | NA. |
| Cobalt: | | | |
| Oxide and hydroxide | 732 | 808 | Mainly from Canada. |
| Metal including alloys, all forms [1] | 1,300 | 1,900 | NA. |
| Columbium and tantalum, tantalum metal including alloys, all forms | 27 | 67 | United States 29. |
| Copper: | | | |
| Ore and concentrate | 57 | 204 | NA. |
| Matte | 300 | 15 | All from United States. |
| Metal including alloys: | | | |
| Scrap | 17,716 | 23,712 | United States 8,369; Ireland 3,007; Netherlands 1,799. |
| Unwrought | 448,752 | 466,591 | Zambia 122,755; Chile 87,811; Canada 87,099. |
| Semimanufactures | 24,093 | 40,284 | Canada 8,177; West Germany 5,319; Finland 4,334. |
| Gold, unworked or partly unworked: | | | |
| Bullion: | | | |
| Refined thousand troy ounces | 19,073 | 21,610 | NA. |
| Unrefined do | 392 | 371 | NA. |
| Other do | 70 | 114 | NA. |
| Iron and steel: | | | |
| Ore and concentrate, except roasted pyrite thousand tons | 17,351 | 22,918 | Canada 5,476; Sweden 4,671; Brazil 2,437. |
| Roasted pyrite do | 361 | 237 | Sweden 180; Greece 26. |
| Metal: | | | |
| Scrap do | 40 | 222 | United States 139; Netherlands 13. |
| Pig iron, including cast iron, sponge, powder and shot do | 199 | 148 | Norway 56; Finland 28; U.S.S.R. 19. |
| Ferroalloys: | | | |
| Ferromanganese do | 92 | 79 | Norway 45; Republic of South Africa 21. |
| Other do | 218 | 244 | NA. |
| Steel, primary forms do | 482 | 263 | Netherlands 39; U.S.S.R. 23; Japan 21. |
| Semimanufacturers: | | | |
| Bars, rods, angles, shapes, sections: | | | |
| Wire rods do | 96 | 103 | Sweden 25; West Germany 16; Netherlands 12. |
| Other bars and rods do | 531 | 501 | Netherlands 85; Sweden 77; West Germany 63. |
| Angles, shapes, sections do | 142 | 132 | Belgium-Luxembourg 39; Republic of South Africa 31; Sweden 9. |
| Universals, plates, and sheets: | | | |
| Heavy and medium plates and sheets, uncoated do | 315 | 381 | West Germany 93; Sweden 57; Poland 40. |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Lynemouth aluminum smelter, the last of the three new smelters constructed since 1969, reached full-capacity production of 120,000 tons per year in the third quarter of 1974. Production at the Invergordon and Anglesey smelters, however, was restricted by power shortages and labor problems; they produced at 80% and 75% of capacity, respectively. Domestic primary aluminum production was an estimated 293,000 tons, an increase of 16% over the quantity produced in 1973. Apparent aluminum consumption of 464,000 tons was about 5% less than the quantity consumed in 1973. Imports of bauxite in 1974 totaled 324,000 tons, valued at £3,140,000. Ghana supplied 223,000 tons valued at £1,695,000, 69% of the total quantity but only 54% of the total value. Imports of aluminum and its alloys, wrought and unwrought, totaled 281,000 tons, 27% less than the quantity imported in 1973.[3]

Although there was a decrease in total apparent consumption of aluminum in 1974, all the major markets except transportation and hollowware used more aluminum in 1974 than in 1973.

The British price for aluminum ingot was still among the lowest in European countries. The United Kingdom Government approved increases in the Alcan Aluminum Co. Ltd. list price for 99.5% primary ingot to £316.5 per ton in March, and £361.5 per ton in August. British Aluminum Co. Ltd. and several semifabricators also received permission to increase ingot prices.

**Iron and Steel.**—The British iron and steel industry began the year with a production cutback owing to a shortage of coal and transportation problems caused by unsettled labor conditions at the coal mines and on the railroads. Most of the industry-wide labor-related problems were solved by the first of April, but wildcat walkouts at steel plants continued to plague the industry. The situation became so bad that British Steel Corp. (BSC) closed its Llawern plant until the unions there agreed to abandon wildcat walkouts.

The country imported 40% more steel in 1974 than in 1973, and exported 23% less. The domestic steel industry produced 22.4 million tons of steel, 16% less than the 26.6 million tons produced in 1973. The total apparent supply of 28.62 million tons after adjustment for producers' stock changes was 7% less than the apparent supply in 1973.

The steel industry consumed 44% less domestically produced iron ore in 1974 than it had consumed in 1973, but consumption of imported ore was only 5% less than in 1973. The trend of declining unit coke consumption was reversed as the industry consumed 606 kilograms of coke per ton of iron in 1974, compared with only 577 kilograms per ton in 1973. There was a severe shortage of iron and steel scrap. The average price more than doubled during the year. Labor productivity, measured by steel output per man-year, was down 11% from the high level achieved in 1973. According to Department of Trade and Industry indices, the average prices of steel and coal, compared with prices in 1973, were up 39% and 37%, respectively.

There was a severe shortage of most forms of steel throughout the year. The Government tightened export controls, and BSC passed up higher prices for steel in foreign markets in favor of home deliveries. Compared with steel shipments in 1973, there were notable differences in shipments of ingots, billets and slabs, heavy plates, hot-rolled strip, tinplate, and all sizes of tubes and pipes. Among finished steel deliveries to home markets, deliveries of iron and steel for repair and maintenance of industrial plant steelworks, to motor vehicle manufacturers, and for construction were substantially below deliveries in 1973. However, deliveries to iron and steel plants for further manufacture, and deliveries to the transportation and communication industries were noticeably higher.

BSC's expansion program was essentially on schedule, but the corporation agreed with the Government to cut back the cost £84 million from the first planned expenditure of £3,000 million. BSC's steel output in 1974 was 19% less than in 1973, but the corporation reported profitable operation for the 2d year in a row. Work was started

[3] Department of Trade and Industry (London). Overseas Trade Statistics of the United Kingdom. December 1974.

on a new iron ore terminal at Hunterston-on-the-Clyde to accommodate ore carriers of up to 250,000 tons. Its operation is vital to the steel plant at Ravenscraig. A £15 million electric arc furnace was being constructed under the expansion program at the Clydesdale works to increase the corporation's share of business related to the oil and gas developments in the North Sea. BSC continued its program of closing uneconomic steelworks and phasing out the high-cost open-hearth furnaces; however, it met opposition from the Government and from steelworkers' unions in closing the steel plants, so its retrenchment program fell somewhat behind schedule.

The use of electricity in the iron and steel industry increased almost 40%, compared with the quantity used in 1973; but the quantity of coal, coke and coke breeze, liquid fuel, and gas consumed per ton of crude steel produced was little changed from the pattern of usage in 1973.

*Iron Ore.*—Phasing out of the domestic iron ore industry was accelerated during the year. Mines produced about half as much ore in 1974 as they did in 1973, and domestic ores provided only 18% of the iron ore consumed. Iron ore imports in 1974 totaled 19,675,000 tons, valued at £166,641,000. Canada was the principal supplier with 22%, followed by Sweden 20%, Brazil 16%, Venezuela 9%, and Mauritania 8%.

*Iron and Steel Scrap.*—Iron and steel scrap was in short supply throughout the year, and the Government restricted exports accordingly. Iron and steel scrap imports totaled 139,548 tons, valued at £12,523,000 in 1974. The United States supplied 89% of this total, and the Netherlands 3%. All other countries together supplied the remaining 8% in small amounts. Scrap exports totaled 312,036 tons, valued at £12,020,000. Eighty-five percent of the iron and steel scrap exports went to EC countries.

**Lead and Zinc.**—Domestic mine production of lead in 1974, as in 1973, was not significant. Refined lead production from primary and secondary materials totaled 277,000 tons, 4% more than in 1973. Lead consumption of 247,000 tons was 12% less than in 1973. Imports of lead ore and concentrate totaled 55,000 tons, 40% more than in 1973. Peru supplied 14,000 tons of the total, EC countries supplied 7,000 tons, and other countries the remaining 41,000 tons. Slab zinc production of 84,351 tons was slightly more than in 1973. Zinc consumption was estimated at 12% less than the 305,000 tons consumed in 1973. Zinc imports for consumption totaled 206,000 tons, 46% more than in 1973. Australia was the principal supplier, followed by Peru and the EC countries. The Irish Republic supplied 22,000 tons of the total.

**Tin.**—The tin mines of Cornwall were affected by restricted working time and power shortages in the first part of the year. They produced 2,534 long tons of tin in 1974, 32% less than in 1973. Smelter production, at 15,136 long tons, was 24% less than in 1973. Consumption of refined tin produced from primary and secondary materials was estimated at 16,700 long tons, 9% less than in 1973. The average price for tin was £3,499.82 per ton.

Cornwall Tin & Mining Corp. decided to bring the Mt. Wellington mine into production at 600 long tons of ore per day for an annual output of 1,500 long tons of metal. The Mt. Wellington mine is in South Cornwall, the other side of the Carnon valley from the Wheal Jane mine.

The United Kingdom imported 39,752 long tons of tin ore and concentrate in 1974, with Bolivia and other South American countries the principal suppliers.

## NONMETALS

**Barite.**—The need for drilling mud for petroleum exploration in the North Sea continued to stimulate interest in barite in the United Kingdom. The Highlands Islands and Development Board released a report on barite deposits in the Scottish highlands and islands.[4] The ports of Aberdeen and Dundee have become supply centers for vessels that serve the specialized needs of the oil rigs drilling in ocean depths of 500 feet and more. Fully integrated supply bases by means of which a vessel can dock and be simultaneously loaded with drilling mud, cement, pipe, water, and fuel were completed at Aberdeen.[5]

**Fluorspar.**—The fluorspar reserves of the United Kingdom have been estimated at

[4] Industrial Minerals. No. 82, July 1974, p. 36.
[5] Port of Houston Magazine. V. 18, No. 9, September 1974, pp. 9–12.

25 million tons averaging 40% $CaF_2$ in all categories, but only about 5 million tons of this quantity can be regarded as proved. Additional potential fluorspar resources have been reported in the Derbyshire area in central England, and further potential in the Durham, Northumberland, and Cumbria areas of northern England.

**Potash.**—Limited commercial production of potash occurred at the Cleveland potash mine at Boulby near Staithes in North Yorkshire. Mining was restricted to a single shaft operation.[6] The production program was delayed when fluid pressures in excess of 1,300 pounds per square inch gage were found in the brine-bearing Bunter Sandstone strata between 2,000 and 3,000 feet. The second shaft has been completed and was being fitted with hoisting equipment for service in 1975. Over 400 men were employed at the property, and it is expected that 600 will be employed when the mine reaches full production. This operation is particularly significant to the United Kingdom economy because despite increases in operating costs since the project was planned, potash mining is expected to make a substantial contribution to the balance of payments.

**Sand and Gravel.**—Increased installation and upkeep costs of new plants due to stricter environmental control regulations in the sand and gravel industry apparently is one of the major reasons that operations tend to favor larger companies. Britain's largest producer of sand and gravel aggregates installed radar on the tugs used to push sand- and gravel-laden barges from the mining area to the processing plant. The radar enables the tugs to avoid islands left in the pit as part of a company reclamation policy.[7]

A single-screw sand and gravel 4,425-ton suction dredge, designed to pump 2,200 tons of material per hour at depths of 23 meters, was delivered to British Dredging Ltd. The dredge can operate at depths up to 45 meters. Dredged material is processed and stored on the vessel. On each voyage the dredge can produce 3,556 tons of drained sand and gravel.[8]

## MINERAL FUELS

**Coal.**—The coal industry began the year with miners refusing to work overtime. The mines were completely shut down by a strike on February 10 which continued to March 8. Limited mine production for more than 6 months depleted coal stocks at electrical generating plants and steel mills. Imported coal partially solved the problem, but the spot prices for imported coal brought the cost up to where coal was not a satisfactory alternative to fuel oil. Moreover, French and Polish coal miners supported their British counterparts, and workers at United Kingdom seaports refused to unload Polish coal from ships docked when the strike started.

In its hearings to settle the strike, the Pay Board apparently discovered that miners' pay, instead of being above average for manual workers in manufacturing, was actually 8% below the average. The Coal Board supported miners' claims for more money and argued that a major shift in the relative position of miners' pay was essential to attract workers to the coal mines. These points were recognized in the settlement, which increased miners' wages an average of 23½% on basic earnings, and within this increase the differential between coal face and other underground workers' wages was increased. A production bonus based on total national output was agreed to by the Coal Board and the miners' union.

Basic earnings, shown in pounds per week, before and after the strike settlement follow:

| | Before settlement | After settlement |
|---|---|---|
| Minimum surface | £36–40 | £41 |
| Minimum underground | 40–40 | 47 |
| Coal face | 49–40 | 61 |

Settlement of the strike apparently alleviated many of the labor problems in the coal mines. The industry produced 125 million tons of coal in the 1974–75 period, compared with 107 million tons in the 1973–74 period. Output of 42 hundredweight per man-shift at the beginning of the year was increased rapidly after the strike, exceeding 47 hundredweight, and for the year as a whole it averaged 45 hundredweight. At pits working at the end of

[6] European Chemical News Large Plants Supplement. V. 26, No. 658, Oct. 18, 1974, pp. 46–48.
[7] Ironman, R. European Editor, International Report. Rock Products, v. 77, No. 11, November 1974, p. 28.
[8] Cement, Lime and Gravel. New Dredging Vessel Launched. V. 49, No. 2, February 1974, p. 42.

March 1975, the number of coal faces increased from 711 to 749 and daily output per face was increased from 556 tons to a record 659 tons per face. Better working conditions in the mines were reflected in the ability of the industry to recruit labor. More than 30,000 men and boys were recruited and the number of mine workers increased by more than 6,000 to almost 200,049, the first increase since 1947. The industry engaged in a major training program for new employees.

A large part of the competitive advantage that coal has had over oil was eroded. Nevertheless, the Energy Board emphasized the use of coal over oil for both the short and the medium term, and the Government decided to invest £600 million in the coal industry over the next decade in addition to that provided in the Coal Industry Act of 1973.

The Government looked to the coal industry as a potentially self-supporting segment of the country's nationalized industrial complex. It was apparent that the industry was establishing a better financial foundation: Ten collieries were closed, and the industry had a profit of £33.8 million in 1974, compared with the 1973 loss of £112.3 million.

Supplying the United Kingdom with coal cost £41.3 million in foreign exchange payments. Imports totaled 3.5 million tons valued at £62.1 million, offset by exports of only 1.9 million tons valued at £20.8 million. Comparable figures in 1973 were imports of 1.7 million tons valued at £21.3 billion, and exports of 2.7 million tons valued at £13.5 million.

The safety record of the coal industry was better in 1974 than in past years because the number of fatalities fell to 56, the lowest on record, and an improvement of 17% compared with the 1973 rate per 100,000 man-shifts. However, the number of reportable serious injury accidents was 576 in 1974, compared with only 461 in 1973.

The National Coal Board agreed with the European Coal and Steel Community (ECSC) that they support research out of the ECSC 1973 and 1974 budget. An international energy agency, established by 16 major industrial nations as a result of the oil crisis, nominated the United Kingdom to lead coal research and development. Investigation of fluidized bed combustion to burn coal smokelessly and efficiently was the principal research during the year.

**Petroleum.**—The Government became increasingly concerned with North Sea oil resources, anticipating that the oil revenues would solve all of Great Britain's monetary and foreign exchange problems. There was increasing pressure within the Government that existing license terms for North Sea oil should be renegotiated to assure that the Government obtain its just share of revenues. Most discussions stopped short of complete nationalization of the industry; nevertheless, that possibility was ever present.

Realities overtook the optimistic forecasts of the past. No North Sea oil from United Kingdom waters was delivered onshore in 1974. Development and significant monetary return from North Sea oil was set back a year or more by labor disputes among the companies supplying North Sea equipment and rapidly rising costs stemming from inflation.

The trade deficit caused by the cost of imported crude oil continued to mount. In 1974 the United Kingdom imported 111.8 million tons of crude and partly refined oil valued at £3,852 million. Exports of petroleum crude and partly refined were valued at only £32 million, leaving a net trade deficit of £3,820 million. Imports of crude petroleum totaled 109,350,993 tons (28.5 billion gallons). Saudi Arabia supplied 32% of the total, Kuwait 15%, Iran 13%, Libya 8%, Nigeria 7%, EC countries 5%, and Venezuela and Iraq 3% each. Other countries supplied the remaining 14%.

Texas North Sea U.K. Co., a wholly-owned subsidiary of Texaco Inc., reported a significant discovery of oil in United Kingdom waters about 116 miles northeast of Aberdeen, Scotland. The discovery well is about 8 miles southwest of the Piper field.[9]

[9] Wall Street Journal. Texaco Unit in U.K. Hits North Sea Oil; Getty Reports Find. V. 184, No. 127, Dec. 30, 1974, p. 12.

# The Mineral Industry of Venezuela

By Ronald F. Balazik [1]

Several events made 1974 one of the most significant periods in the history of Venezuela's mineral industry. Total value of mineral industry output rose to a record high of $10.6 billion [2] during the year; the country's iron ore industry, which accounted for about 3% of total mineral output value, was nationalized at yearend; and the Government made preparations for the impending nationalization of the petroleum industry. This industry accounts for over 96% of total mineral output value, almost 25% of Venezuela's gross domestic product, about 85% of Government ordinary revenues, and nearly 95% of export receipts.

In 1974, Venezuela retained fifth place among the world's crude oil producing nations after the U.S.S.R., the United States, Saudi Arabia, and Iran. In addition, Venezuela remained the world's third leading petroleum exporting country following Saudi Arabia and Iran.

Also during 1974, Venezuela and Mexico ratified agreements implementing technical cooperation in the steel, petroleum, and petrochemical industries. Similar scientific and technical cooperative programs also were discussed during the year with representatives of Algeria, France, Iran, Surinam, and Yugoslavia. In addition, talks were held with Brazil, Ecuador, and Peru to establish a Latin American organization to promote better prices for raw materials, including minerals.

The Ministry of Mines and Hydrocarbons instituted a survey program to determine resources in the Perijá Range, State of Zulia. Prior to the survey, exploration in the 12,000-square-kilometer region was primarily a search for petroleum. However, the present program, expected to require several years for completion, will focus on the discovery of new metal resources.

In 1974, the Government began to implement the Venezuelan Investment Fund, a multimillion-dollar financial assistance program based on oil revenues and designed to assist economic development in Latin America. Specifically, the fund was used to provide price supports for raw materials, subsidize petroleum imports of some Central American countries, and finance projects to develop natural resources. The fund will be used to aid Venezuelan projects as well as those of other Latin American countries.

Venezuela's participation in the Andean Pact (a common market agreement with Bolivia, Chile, Colombia, Ecuador, and Peru) became effective on January 1, 1974. Several provisions of the pact have significant implications for Venezuela's mineral industry. For example, import and export taxes on products such as mineral fertilizers and petrochemicals can be adjusted under tariff regulations of the pact.

The United Nations Third Conference on Law of the Sea convened in Caracas during 1974. Approximately 5,000 officials from 151 of the world's 153 nations attended the conference to formulate a new system of international law governing the utilization of natural resources in marine areas. The delegates discussed nearly 100 issues, including offshore exploration and seabed mining. The conference served to identify and define specific areas of disagreement for arbitration at another meeting to be held in Vienna during 1975.

At yearend 1974, the Ministry of

[1] Physical scientist, Division of Petroleum and Natural Gas.

[2] Where necessary, values have been converted from bolivars (Bs) to U.S. dollars at the ratio of Bs4.40=US$1.00.

Mines and Hydrocarbons was preparing a report concerning mechanisms for promoting the nonmetallic minerals industry of Venezuela. The report also focused on factors that have retarded development of the industry. When completed, the report will be used to devise Government policy for the mining of nonmetallic minerals.

In 1974, Dr. Valentín Hernández became the new Minister of Mines and Hydrocarbons replacing Dr. Hugo Pérez La Salvia.

## PRODUCTION

The performance of Venezuela's mineral industry in 1974 was dominated by the production of petroleum and iron ore. The output of crude and refined petroleum declined significantly while iron ore production reached a record high. Other sectors of the country's mineral industry registered mixed performance during the year.

Table 1.—Venezuela: Production of mineral commodities
(Metric tons unless otherwise specified)

| Commodity [1] | | 1972 | 1973 | 1974 [p] |
|---|---|---|---|---|
| **METALS** | | | | |
| Aluminum, unalloyed ingot | | [r] 23,000 | 25,100 | 46,000 |
| Gold, mine output, metal content | troy ounces | 20,355 | 19,020 | 16,966 |
| Iron and steel: | | | | |
| Iron ore and concentrate | thousand tons | 18,499 | 23,110 | 26,424 |
| Metal: | | | | |
| Pig iron | do | 537 | 546 | 545 |
| Crude steel | do | 1,127 | 1,063 | 1,054 |
| Semimanufactures | do | -- | -- | 37 |
| **NONMETALS** | | | | |
| Cement, hydraulic | do | 2,982 | 3,413 | 3,494 |
| Diamond: | | | | |
| Gem | carats | 139,600 | 232,900 | 279,500 |
| Industrial | do | 316,700 | 545,300 | 969,500 |
| Total | do | 456,300 | 778,200 | 1,249,000 |
| Fertilizer materials: | | | | |
| Crude, phosphate rock, marketable | | [r] 44,000 | 95,393 | 121,467 |
| Manufactured, nitrogenous, gross weight | | 218,189 | 233,865 | [e] 250,000 |
| Gypsum | | [e] 100,000 | [r e] 150,000 | 164,500 |
| Salt, all types | | [r e] 220,000 | [r e] 220,000 | 223,173 |
| **MINERAL FUELS AND RELATED MATERIALS** | | | | |
| Carbon black | | 7,500 | 8,000 | 18,000 |
| Coal bituminous | | [r] 40,359 | 49,696 | 57,086 |
| Gas, natural: | | | | |
| Gross production | million cubic feet | [r] 1,625,173 | 1,745,702 | 1,639,511 |
| Marketable production | do | [r] 387,718 | 459,936 | 475,969 |
| Natural gas liquids: | | | | |
| Condensate | thousand 42-gallon barrels | 1,435 | 1,174 | 1,250 |
| Natural gasoline | do | 7,244 | 7,952 | 7,825 |
| Liquefied petroleum gas | do | 20,819 | 23,382 | 21,521 |
| Total | do | 29,498 | 32,508 | 30,596 |
| Petroleum: | | | | |
| Crude | do | 1,178,489 | 1,228,596 | 1,086,333 |
| Refinery products: [2] | | | | |
| Aviation gasoline | do | 194 | 213 | 288 |
| Motor gasoline | do | 30,635 | 32,030 | 36,258 |
| Naphtha | do | 35,747 | 37,125 | 33,694 |
| Jet fuel | do | 13,820 | 16,400 | 12,521 |
| Kerosine | do | 4,163 | 5,632 | 3,583 |
| Distillate fuel oil | do | 54,156 | 58,308 | 48,300 |
| Residual fuel oil | do | 248,244 | 304,229 | 280,494 |
| Lubricants | do | 3,641 | 4,308 | 6,684 |
| Other: | | | | |
| Liquefied petroleum gas | do | 3,772 | 3,563 | 3,091 |
| Asphalt and bitumen | do | 7,587 | 5,258 | 3,800 |
| Refinery gas [3] | do | 7,556 | 7,166 | 5,504 |
| Unspecified | do | 3,148 | 2,610 | 2,322 |
| Total | do | 412,663 | 476,842 | 436,539 |

[e] Estimate. [p] Preliminary. [r] Revised.
[1] In addition to the commodities listed, lime, sand, gravel, clays, and stone are produced, but information is inadequate to make reliable estimates of output levels.
[2] Includes refinery fuels.
[3] Liquid equivalent.

## TRADE

Exports of mineral commodities continued to dominate Venezuela's overall foreign trade. The United States was the principal destination of direct petroleum shipments, followed by the Netherlands Antilles. However, almost all of the petroleum shipments to the latter country consisted of crude and unfinished oils destined for processing at two large refineries owned by the parent companies of Creole Petroleum Corp. and Shell Quimica de Venezuela, Venezuela's first- and second-ranking crude oil producers. These refineries export their output and are, in a sense, an integral part of Venezuela's petroleum industry.

Exports of Venezuelan petroleum from Venezuela and the Netherlands Antilles by principal areas of destination during 1972-74 follow:

| Destination | Exports (thousand 42-gallon barrels) | | |
|---|---|---|---|
| | 1972 | 1973 | 1974 |
| Western Hemisphere: | | | |
| Canada | 152,124 | 136,915 | 105,580 |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Three major aluminum development projects were underway in Venezuela during 1974, but two were combined by yearend. All of the projects were part of a national effort to increase aluminum production nearly ten-fold, to about 470,000 tons per year, by 1981.

The largest aluminum project envisions a 280,000- to 350,000-ton-per-year smelter near Puerto Ordaz in the Guayana District of northeastern Venezuela. This project merges two previously separate Venezuelan-Japanese construction schemes for aluminum smelters in the district. Project operations will be implemented by a joint company, Industria Venezolana de Aluminio (New Venalum). The company consists of Corporación Venezolana de Guayana (CVG), an entity with 80% government ownership; Showa Denko K.K., 7%; Kobe Steel, Ltd., 4%; Mitsubishi Heavy Industries Ltd., 4%; Sumitomo Chemical Co., Ltd., 4%; and Marubeni Corporation, 1%. The proposed smelter, estimated to cost over $300 million, is expected on-stream by 1977 with an initial capacity of 70,000 tons per year. The plant reportedly will include aluminum-casting and hot-rolling facilities. Reynolds Metals Co. is providing technical assistance for construction, which reportedly was underway by yearend. Part of the alumina feed for the smelter will be provided by the Aluminum Co. of America (Alcoa) from its Surinam sources. However, the Government also hopes to find and utilize domestic bauxite supplies. Power for the smelter will come from the Government hydroelectric project on the Caroní River northeast of El Manteco.

At yearend, the Ministry of Mines and Hydrocarbons was planning to initiate a program to study the possibility of aluminum production in Bolivar State. The study will concern various nonconventional extraction methods, as well as the Bayer and Pedersen processes.

**Copper, Lead, and Zinc.**—During 1974, the government-owned Corporación de los Andes, two Japanese companies (Dowa Mining Co., Ltd., and Nissho-Iwai Co., Ltd.), and private Venezuelan interest together planned to develop copper-lead-zinc deposits near Bailadores in Mérida State. The deposits reportedly contain up to 2.5 million tons of ore grading 1.5% copper, 7% lead, and 26% zinc. The public and private firms own 70% of the project while the Japanese companies own 15% each. If the conclusions of a 1974 feasibility study are favorable, the Government will consider the construction of a 33,000-ton-per-year zinc smelter. Production is expected to commence in 1975 and reach an annual rate of 20,000 tons by 1978 with later expansion to 35,000 tons.

**Gold.**—During 1974, Nord Canamerex Partnership, an affiliate of Nord Resources Corp. (a U.S. firm), reportedly had nearly completed a combination gravity-flotation mill at its Nueva Corazon de Jesus property in the El Dorado District. The com-

pany had expected the mill to begin processing 75 tons of ore per day by yearend. Construction of the mill followed exploration that revealed a gold-bearing quartz vein over 30 meters deep, about 250 meters in strike length, and approximately 1 meter in average width. Assays vary from a trace to 8.4 ounces of gold per ton, and average about 1.5 ounces per ton. Additional exploration is planned for the 5-square-kilometer property and surrounding concessions.

Also during the year, the Ministry of Mines and Hydrocarbons Technology Mining Research Laboratory carried out a study regarding the recovery of other valuable metals from gold tailings at the El Peru gold mines in Venezuelan Guayana. The Ministry estimates that there are approximately 3 million tons of tailings in the treatment plant dumps with tenors ranging from 0.1% to 0.4% wolfram oxide. Preliminary testing indicated tenors ranging from 1 to 4 grains per ton, with a possible recovery of 80%.

**Iron and Steel.**—Iron ore output increased by 14% to a record high of over 26 million tons in 1974. Crude steel output rose to slightly more than 1 million tons during the year.

Almost all of Venezuela's iron ore output was accounted for by the Orinoco Mining Co. (a subsidiary of the United States Steel Corp.) which produced 84%, and Iron Mines Co. of Venezuela (a subsidiary of Bethlehem Steel Corp.) which produced 15%. The remaining output was produced at the San Isidro deposits near Ciudad Piar. Nearly all of the output was exported, primarily to the United States, which received 63% of the total. Domestic consumption was by Siderúrgica del Orinoco S.A. (SIDOR), a subsidiary of CVG that obtains the bulk of its iron ore supply from the San Isidro deposits.

The Orinoco Mining Co. and Iron Mines Co. of Venezuela were nationalized at yearend. The Government reportedly paid a total of $100 million compensation to the parent companies. Payments are to be made quarterly in Government bonds over a 10-year period at 7% annual interest. Bethlehem Steel Corp. and United States Steel Corp. personnel will remain in Venezuela to provide management and technical assistance during a transition period of at least 1 year's duration.

A series of work stoppages occured at the Orinoco Mining Co. and Iron Mines Co. of Venezuela during October and November 1974. Strike action reportedly was taken by workers to support wage claims and insure that their retirement rights would be retained following nationalization of the industry. The workers returned to the mines after government assurances that employee rights were explicity guaranteed under the impending nationalization.

During the year, the Government proceeded with its $2.6 billion plan to expand steel industry capacity from an existing 1.3 million tons per year to a projected 5.0 million tons per year by 1978. Supplemental expansion to 10 million tons per year is expected by 1980, followed by an additional 5-million-ton-capacity increase by 1985. The expansion program, which emphasizes utilization of electric furnaces and direct reduction smelting processes, is under the auspices of the state-controlled CVG in association with foreign and domestic private capital. The expansion plan envisions greater domestic resource development and is designed to diversify Venezuela's exports and reduce its heavy dependence on petroleum. The first stage of the plan involves expansion of existing facilities, mainly those of SIDOR.

A three-stage investment program planned by the privately owned Siderúrgica Venezolana, S.A. (SIVENSA) will involve erection of an electric steelmaking plant, installation of a continuous casting system for billet production, and a construction of a 720,000-ton-per-year pelletizing plant, and a direct reduction plant. Completion of these facilities will result in a total production of 475,000 tons of steel and 225,000 tons of billets.

**Nickel.**—Development activity at the Loma de Heiro ferronickel deposit was limited. The ore body located in the States of Araqua and Miranda was estimated at 55 million tons of 1.65% contained nickel ore. It was estimated that an investment of $90 million would be required to process 10,000 tons of nickel per year.

**Silicon.**—Nobel-Bozel (France), CVG, and private Venezuelan interests formed a joint-venture group to construct a ferrosilicon plant in Mantanzas at a cost of about $22 million to produce 55,000 tons by 1977. Nobel-Bozel will own 50% of the plant, and CVG and private investors will divide the remaining shares.

**Titanium.**—In early 1974, the Ministry of Mines and Hydrocarbons completed geophysical surveys of titanium-bearing areas in the State of Yaracuy. Following the surveys, which were part of a program begun in 1972, the Ministry began exploration drilling to establish reserve estimates. Based on these estimates, the Ministry will proceed with studies to determine the commercial feasibility of mining the titanium ore.

## NONMETALS

**Cement.**—During 1974, C.A. Venezolana de Cementos, the country's largest cement producer, completed its 1,800,000-ton-per-year, computer-operated cement plant in Anzoategui State at a cost of $41 million. The company also planned to enlarge the output of its Barquisimeto plant and expected to construct a plant in Maracaibo and another in Pertigalete with annual capacities of 750,000 tons and 2 million tons, respectively.

**Feldspar.**—During 1974, the Ministry of Mines and Hydrocarbons undertook studies for creating incentives to increase domestic feldspar production. The efforts to increase production are part of a program designed to stimulate economic development as well as supply more domestic raw materials for Venezuelan industry.

**Fertilizer Materials.**—Despite delays arising from shortages of materials and trained manpower, Venezuela's mineral fertilizer industry made several gains during 1974. The industry is being expanded under a government program designed to make the country self-sufficient in, and an exporter of fertilizer products.

The second ammonia plant and the second urea plant at the El Tablazo petrochemical complex in Zulia State began production in 1974. These plants complete a $200 million petrochemical fertilizer project of two ammonia plants and two urea plants designed to produce a total of 594,000 tons of ammonia and 792,000 tons of urea yearly. The plants are operated by Venezolano del Nitrogeno C.A. (NITROVEN), a joint-venture firm owned 90% by the Governmental Instituto Venezolano de Petroquimica (I.V.P.) and 10% by Petroquimica del Atlantico of Colombia. All production is scheduled for foreign markets. Contracts for shipments reportedly have been concluded with the United States, Brazil, Mexico, and the People's Republic of China.

Planning for an additional ammonia production facility at El Tablazo also was underway during 1974. The plant will have a capacity of 600,000 tons per year, all for export, and was scheduled for completion in late 1975. Plant operations are to be conducted by Marammonia C.A., a joint-venture company composed of I.V.P. (51%) and Grupo Internacional Transammonia de USA (49%).

Also in 1974, the Government negotiated several joint-venture fertilizer production schemes with foreign investors. Occidental Petroleum Corp., (a U.S. company) and I.V.P. discussed the formation of a company to produce ammonia and urea. In addition, Snam Auxini Projectos (Spain) was awarded a contract to install a rock phosphate processing plant at Morón in Carabobo State.

**Talc.**—During 1974, the Ministry of Mines carried out an evaluation of talc deposits in southern Yaracuy State. The deposits constitute one of the major talc and soapstone deposits in northern Venezuela. Results of the Government evaluation were very promising in regard to commercial possibilities for the deposits.

## MINERAL FUELS

**Coal.**—During 1974, Corporación Desarrollo de la Region Zuliana (CORPOZULIA), a governmental agency, was engaged in a $1 million feasibility study of the Guasare coal deposits in the State of Zulia. The Government envisions production of 6 to 10 million tons of coal yearly from the Guasare deposits, which are estimated to contain about 800 million tons of reserves. CORPOZULIA officials indicate that the Guasare coal could fulfill the requirements of Venezuela's steel industry indefinitely. The Government announced during 1974 that neither Guasare coal nor the Naricual coal deposits in Anzoátegui State would be developed with private capital.

Also in 1974, the Government established a National Coal Commission subordinate to the Ministry of Mines and Hydrocarbons. The Commission is to control, coordinate, and formulate requirements for development of the coal mining industry.

**Petroleum and Natural Gas.**—Crude oil production decreased to an average of

2,976,255 barrels per day during 1974 in response to market factors and Government efforts to conserve the country's remaining petroleum resources. This output represented a 12% annual decrease and was the lowest production level in 12 years. Medium crudes (22.1° to 30° API), light crudes (over 30° API), and heavy crudes (under 22.1° API, accounted for 38%, 33%, and 29% of total output, respectively.

**Table 4.—Venezuela: Salient statistics of the petroleum and natural gas industry**

p Preliminary. r Revised.
[1] Includes refined or partly refined products blended with crude oil.
[2] Includes refinery fuel.

Source: Ministerio de Minas e Hidrocarburos. Memoria y Cuenta, Año 1972, 1973, 1974. Caracas, Venezuela, March 1973, March 1974 and March 1975.

Natural gas production, nearly all from oilfields, accompanied the decline in oil output by decreasing 6% during 1974. However, the ratio of gas to oil output increased to 1,509 cubic feet of gas for each barrel of oil produced.

The capacity of natural gas injection facilities increased 146 million cubic feet daily to a total of 4,079 million cubic feet per day in 1974. Gas injection during the year was at a daily rate of 2,233 million cubic feet. Water injection capacity rose 160,444 barrels per day to a total of 3,154,009 barrels daily by yearend 1974, and the average injection rate during the year was 2,037,807 barrels per day.

The total length of crude oil and natural gas pipelines in service increased 23 and 79 kilometers, respectively, during 1974, but refined product lines remained the same. Data on the length of pipelines in operation at yearend were as follows:

| Type of line | Total length (kilometers) |
|---|---|
| Crude oil: | |
| Trunk | 3,359 |
| Secondary | 2,869 |
| Total crude oil | 6,228 |
| Refined products | 512 |
| Natural gas | 3,058 |
| Grand total | 9,798 |

Source: Ministerio de Minas e Hidrocarburos. Memoria y Cuenta, Año 1974. Caracas, Venezuela, March 1975.

Proved reserves of crude oil increased by about 4,621 million barrels to a reported total of 18,568 million barrels at yearend 1974. As of the same date, natural gas reserves totaled 38,308 billion cubic feet, approximately 430 million cubic feet more than the revised 1973 yearend figure of 38,308.4 billion cubic feet. The increase in both oil and gas reserves resulted primarily from the upward revision of the

quantities recoverable from producing fields. Approximately 97% of total proved gas reserves at the end of 1974 was accounted for by dissolved and associated gas.

Geophysical exploration, exploration development, and injection drilling activities during 1974 were as follows:

| | | 1972 | 1973 | 1974 |
|---|---|---|---|---|
| Geophysical exploration: | | | | |
| Gravimetric and magnetic surveying | party months | 3.0 | -- | .9 |

[1] May include wells in which both crude oil and nonassociated natural gas were discovered in separate zones.

Source: Ministerio de Minas e Hidrocarburos. Memoria y Cuenta, Año 1972, 1973, 1974. Caracas, Venezuela, March 1973, March 1974 and March 1975.

During 1974, the Ministry of Mines and Hydrocarbons completed 32 stratigraphic wells in the Orinoco Oil Belt and announced that it had completed most of its seismographic studies in the area. The studies indicated thicker-than-anticipated, oil-bearing formations and the extension of the belt farther south, toward the Orinoco River. Moreover, new data released by the Ministry during 1974 indicated that the belt contains some light oil as well as the known deposits of very heavy crude. The Government also held discussions with several foreign interests during the year concerning mutual development of the belt, including the construction of a special refinery to process heavy crude oil.

In November 1974, the National Petroleum Reversion Commission appointed by President Pérez completed its 6-month deliberations on the nationalization of the petroleum industry. On December 23, the Commission presented the President with a draft nationalization bill for the Venezuelan Congress and a series of reports on the technical, administrative, and legal aspects of nationalization. At yearend, the President and his administration were studying the bill in preparation for its submission to Congress for enactment in 1975.

The nationalization bill establishes a timetable of 120 days for termination of all private oil concessions after it becomes law. However, indemnification will be paid to the oil companies based on the Government's net book valuation of nationalized assets. Moreover, the bill reportedly will permit Government and private industry partnerships in oil industry operations.

During 1974, the Ministry of Mines and Hydrocarbons planned a major investment program totaling $920 million to upgrade the existing 1.6 million-barrel-per-day refining capacity in the country. The program was scheduled to begin in 1975 and continue through 1980. The objective of the program is the installation of new processes that will maximize yields of higher profit products.

In October 1974, the Government announced its intention to acquire 23 oil tankers within the next decade for the

formulation of a national petroleum fleet. Seven of the tankers, each with a displacement of 60,000 deadweight tons, were to be acquired by mid-1975 at a cost of nearly $200 million. The fleet is scheduled to transport 50% of Venezuela's crude oil exports by 1985.

A total of 18 petroleum tanker terminals were active in the exportation of crude oil and refinery products during 1974. Of these, the three terminals operated by Creole Petroleum Corp. accounted for 41% of all shipments and the five operated by Cia. Shell de Venezuela, Ltd., loaded 30%.

During 1974, the Government postponed indefinitely a $300 million construction project for facilities near Maracaibo to produce and export liquefied natural gas (LNG) to the United States. Two other projects directly concerning the United States were under consideraion late in the year: (1) Construction of a refinery in the State of Mississippi to process Venezuelan crude, and (2) construction of a 2,800-mile natural gas pipeline from Maracaibo to Texas.

On February 7, 1974, a power failure closed a Shell Oil Co. refinery at Punta Cardón, and a fire interrupted operations of a Gulf Oil Co.-Texaco Inc. refinery at Puerto La Cruz. The two incidents were unrelated as well as accidental, and both refineries were operating at full capacity by March.

In 1974, the Government announced that it was planning to take part of its petroleum royalty payments in oil, rather than cash. The payments in kind, amounting to approximately 100,000 barrels per day, are intended for three purposes: (1) to supply Latin American countries that have petroleum shortages, (2) to sell in wider world markets, and (3) to exchange for critically needed raw materials.

At yearend 1974, the Government reportedly was considering the purchase of at least part ownership of both the Shell Oil Co. refinery and the Exxon Corp. refinery in the Netherlands Antilles. Government officials did not confirm the report, however.

A computerized data bank for oil and natural gas wells began operating in 1974 under the aegis of the Ministry of Mines and Hydrocarbons. Selected digitized profiles of all wells drilled in the country will be entered in the computer storage system by 1977.

In addition to the projects noted under "Fertilizer Materials," 17 additional production facilities were contemplated or under construction during 1974 at the El Tablazo and Morón petrochemical complexes. These facilities will manufacture an array of products including low- and high-density polyethylene, vinyl acetate, isopropanol, acrilonitrile, polypropylene, sodium tripolyphosphate, and polyvinyl chloride. Although several foreign companies have made investments, the majority of these enterprises will be owned by IVP or private Venezuelan companies.

The basic infrastructure of the El Tablazo complex was nearly complete by yearend 1974. Infrastructure elements included docking facilities, a thermoelectric plant with a substation, electric distribution lines, liquids and gas handling facilties, effluent treatment installations, and an olefin and liquefied gas plant. Most derivative or satellite plants and downstream production facilities are in the planning stage only.

In addition to El Tablazo and Morón, other parts of the country were scheduled for petrochemical projects during 1974. Venezuelan and Romanian representatives together prepared plans for the installation of a $20 million soda ash plant at Cumaná in Sucre State. In addition, Química Venoco, a Venezuelan concern, planned to invest about $4 million to expand lubricating oil and grease production at Guacara in Carabobo State.

Special emphasis was placed on projects concerning the synthesis of food products from hydrocarbons. IVP (50% ownership), British Petroleum Co., Ltd. (20%), and two consumer cooperatives (15% each) agreed to construct a $100 million plant at Puerto La Cruz in Anzoátegui State to convert paraffin waxes into animal feed at a rate of 100,000 tons per year beginning in 1978. Italian investors reportedly submitted plans to the Government for a similar plant on the Península de Paraguaná. In addition, the Ministry of Mines and Hydrocarbons contracted with Batelle Memorial Institute, C.A., to prepare a feasibility study for the manufacture of high-protein food from petroleum.

Early in 1974, Pérez administration representatives met with officials from Cuba to discuss resumption of petroleum, natural gas, or petrochemical sales to the island. By yearend, however, no trade policy change toward Cuba had been promulgated by the Government.

## Table 5.—Venezuela: Distribution of landholdings, crude oil production, and refining capacity, by company, 1974

# The Mineral Industry of Yugoslavia

By Roman V. Sondermayer [1]

Nonferrous ores and metals remained the most significant mineral products of Yugoslavia during 1974. Bauxite, copper, byproduct gold, selenium, germanium, lead, zinc, bismuth, cadmium, silver, mercury, barite, feldspar, cement, coal, petroleum, and pyrite were among the more important minerals produced in the country. However, only bauxite, copper, lead, zinc, and mercury were of world significance. Iron and steel output continued below demand. Consequently, imports of large quantities of iron and steel semimanufactures were required.

Increasing crude oil prices made the use of domestic coal more attractive, and plans for expansion of production were announced. However, most of the domestic coals were brown and lignite, and imports of high-rank coals and coke were necessary. Although crude oil output reached 3.5 million tons, an alltime high, imports were necessary to meet two-thirds of demand.

There were a number of significant developments during 1974. Construction continued on alumina plants in Vlasenica, Bosnia, and alumina and aluminum plants near Mostar, Hercegovina. Production started on a 35,000-ton-per-year plant for production of aluminum rolled products in Sevojno, Serbia. Development continued on the Bučim copper deposit and on the nickel deposit near Rzanovo, both in Macedonia. Westinghouse Electric Corp. started construction on Yugoslavia's first nuclear powerplant located in Krško. Preliminary administrative work was concluded on construction of a crude oil pipeline from the Adriatic to inland refineries in Yugoslavia, Hungary, and Czechoslovakia.

## PRODUCTION

Mineral producers directed their efforts toward modernization of existing facilities and construction of new installations. The aim was to transform the mineral industry from a producer and exporter of ores and concentrates to a producer and exporter of primary metals and semimanufactured products. In addition, efforts were made to reduce the country's dependence on imported energy. Although investments in building new facilities and expanding and renovating existing processing facilities were predominant, a shift continued in channeling available capital toward mine expansion. Shortages of ores and concentrates forced this trend. Mechanization and automation in both mining and processing continued during 1974.

Modern and efficient methods prevailed in petroleum exploration, production, and refining. All three primary methods of oil production—flowing, pumping, and gas lift—were used; dual completion was used at some wells, and secondary recovery at some older fields. Chemical and hydraulic methods for stimulating gas and oil production were everyday practices.

## Table 1.—Yugoslavia: Production of mineral commodities

(Metric tons unless otherwise specified)

| Commodity [1] | 1972 | 1973 | 1974 [p] |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite, gross weight ---- thousand tons | 2,197 | 2,167 | 2,370 |
| Alumina, gross weight | 126,027 | 274,721 | [e] 300,000 |
| Ingot, including secondary | 72,716 | 90,845 | 147,089 |
| Antimony: | | | |
| Mine output, metal content | 1,975 | 2,055 | [e] 2,034 |
| Metal (regulus) | 1,744 | 1,999 | 2,349 |
| Bismuth, smelter output | 89 | 55 | 100 |
| Cadmium, smelter output [e] | 140 | 140 | -- |
| Chromium, chromite, gross weight | 28,137 | 9,594 | 24,229 |
| Copper: | | | |
| Mine output, metal content | 103,133 | 111,793 | [e] 123,000 |
| Blister: | | | |
| Primary | 149,047 | | [e] 163,200 |
| Secondary | 1,464 | {160,025} | [e] 1,800 |
| Refined (electrolytic): | | | |
| Primary | 128,611 | 133,639 | 139,741 |
| Secondary | 1,363 | 3,841 | 10,265 |
| Gold ---- troy ounces | 136,898 | 176,347 | [e] 177,000 |
| Iron and steel: | | | |
| Iron ore, gross weight ---- thousand tons | 3,960 | 4,671 | 5,034 |
| Pig iron ---- do | 1,819 | 1,955 | 2,126 |
| Ferroalloys ---- do | 131 | 155 | 190 |
| Crude steel ---- do | 2,588 | 2,676 | 2,832 |
| Semimanufactures ---- do | 1,920 | 1,961 | 2,235 |
| Lead: | | | |
| Mine output, metal content | 120,173 | 119,312 | [e] 135,000 |
| Metal: | | | |
| Smelter, crude, including secondary | 102,164 | 112,632 | [e] 125,000 |
| Refined, including secondary | 87,496 | 98,033 | 113,876 |
| Manganese ore and concentrate, gross weight | 15,340 | 9,718 | 13,282 |
| Mercury ---- 76-pound flasks | 16,419 | 15,606 | 15,838 |
| Selenium, elemental ---- kilograms | 40,880 | 42,880 | 45,000 |
| Silver, refined including secondary -- thousand troy ounces | 3,582 | 4,302 | 4,702 |
| Zinc: | | | |
| Mine output, metal content | 96,731 | 97,428 | [e] 169,000 |
| Smelter, including secondary | 48,641 | 63,121 | 86,380 |
| **NONMETALS** | | | |
| Asbestos | 11,040 | 9,391 | 12,247 |
| Barite | 70,528 | 62,053 | 65,000 |
| Cement, hydraulic ---- thousand tons | 5,751 | 6,376 | 6,647 |
| Clays: | | | |
| Crude fire clay | 335,604 | 300,236 | [e] 300,000 |
| Calcined fire clay | 95,750 | 86,247 | [e] 90,000 |

| Natural, gross production ---- do | 43,861 | 46,933 | 51,100 |
| Natural gas liquids and liquefied petroleum gas: [4] | | | |
| Propane and butane ---- thousand 42-gallon barrels | 2,278 | 524 | NA |
| Natural gasoline and pentane ---- do | [r] 265 | 228 | NA |
| Petroleum: | | | |
| Crude oil: | | | |
| As reported ---- thousand tons | 3,200 | 3,332 | 3,458 |
| Converted ---- thousand 42-gallon barrels | 23,702 | 24,680 | 25,610 |
| Refinery products: [5] | | | |
| Gasoline ---- do | 11,849 | 12,988 | 13,830 |
| Jet fuel ---- do | 1,617 | 1,913 | 2,520 |
| Kerosine ---- do | 73 | 93 | |
| Distillate fuel oil ---- do | 18,613 | 19,083 | 20,328 |
| Residual fuel oil ---- do | 19,907 | 23,177 | 28,751 |
| Lubricants ---- do | 856 | 865 | 1,061 |
| Asphalt and bitumen ---- do | [r] 2,230 | 1,976 | 2,113 |
| Other ---- do | [r] 495 | 1,144 | NA |
| Refinery fuel and losses ---- do | [r] 2,220 | 2,443 | [e] 2,737 |
| Total ---- do | [r] 57,860 | 63,682 | 71,340 |

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, germanium, bentonite, kaolin, common clay, and diatomite are also produced but available information is inadequate to make reliable estimates of production levels.

[2] Figure reported as gross weight is apparently derived from converting various grades of fertilizer with different $P_2O_5$ or N contents to a standard equivalent figure. Nitrogen fertilizers were converted to a gross weight figure containing 20% nitrogen and phosphate fertilizers to a gross weight figure containing 16.5% $P_2O_5$.

[3] Includes vacuum salt.

[4] Includes natural gas liquids derived from gasfields, oilfields, and liquefied petroleum gas from refineries.

[5] Liquefied petroleum gas produced from refineries is included in both natural gas liquids and refinery fuels and losses. The manner in which data is presented in available sources makes this double counting unavoidable.

## TRADE

During 1973, the latest year for which data are available, Yugoslavia's mineral trade was diversified, and many commodities were exported to and imported from a large number of countries. Exports consisted mostly of nonferrous metals and products, and European countries were again the principal purchasers. Principal import items were bituminous coal, crude oil, and iron and steel semimanufactured products. The largest sources of mineral imports remained the U.S.S.R. and other COMECON [2] countries.

[2] COMECON (CMEA—Council for Mutual Economic Assistance) comprising the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

## Table 2.—Yugoslavia: Exports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate thousand tons | 1,813 | 1,707 | U.S.S.R. 705; West Germany 413; Italy 234. |
| Alumina | 23,328 | 86,622 | Poland 36,201; Italy 22,571; Romania 10,721. |
| Metal, including alloys: | | | |
| Scrap | 6,534 | 5,559 | Italy 3,939; West Germany 1,528; France 92. |
| Unwrought | 30,759 | 42,216 | Japan 11,417; Poland 5,988; People's Republic of China 4,000. |
| Semimanufactures | r 36,393 | 40,953 | Czechoslovakia 9,914; Bulgaria 4,858; United States 4,801. |
| Antimony regulus | 1,315 | 1,114 | Mainly to U.S.S.R. |
| Bismuth, including alloys, all forms | 79 | 5 | All to United Kingdom. |
| Cadmium, including alloys, all forms | 171 | 78 | United Kingdom 36; Netherlands 33; Italy 5. |
| Chromium: | | | |
| Chromite | 7,583 | 3,060 | All to Czechoslovakia. |
| Oxide and hydroxide | 120 | 183 | West Germany 130; Switzerland 50; United States 3. |
| Cobalt, including metal, all forms | 6 | -- | |
| Copper: | | | |
| Matte | -- | 7 | All to Lebanon. |
| Copper sulfate | 4,609 | 6,038 | Italy 3,164; Romania 866; Greece 750. |
| Metal, including alloys: | | | |
| Scrap | 645 | 471 | All to Italy. |
| Unwrought | r 90,339 | 78,101 | United States 41,541; United Kingdom 13,169; France 9,450. |
| Semimanufactures | r 45,246 | 38,732 | Italy 5,340; United States 4,974; Czechoslovakia 4,654. |
| Iron and steel: | | | |
| Ore and concentrate | -- | 150 | All to Italy. |
| Roasted pyrite | 1,783 | 1,846 | All to Austria. |
| Metal: | | | |
| Scrap | 17,699 | 21,624 | Italy 16,768; West Germany 4,223; Austria 389. |
| Pig iron, ferroalloys, and similar materials | r 176,553 | 404,698 | People's Republic of China 159,409; Italy 85,425; Austria 52,397. |
| Steel, primary forms | r 4,503 | 48,189 | Switzerland 30,036; Hungary 9,637; France 4,990. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, sections | r 116,763 | 260,481 | Turkey 56,305; U.S.S.R. 41,382; West Germany 24,814. |
| Universals, plates, and sheets | r 65,385 | 135,762 | U.S.S.R. 53,792; Italy 34,058; West Germany 17,093. |
| Hoop and strip | r 9,098 | 21,050 | Italy 18,587; Switzerland 1,291; Romania 1,151. |
| Rails and accessories | 46,684 | 60,988 | Romania 38,354; Poland 14,266; Bulgaria 6,641. |
| Wire | 387 | 6,814 | Italy 3,457; Israel 1,312; U.S.S.R. 731. |
| Tubes, pipes, and fittings | 87,113 | 127,458 | East Germany 77,299; Italy 32,948; West Germany 12,066. |
| Castings and forgings | 12,934 | 17,836 | Poland 6,383; Czechoslovakia 3,975; East Germany 2,091. |
| Lead: | | | |
| Ore and concentrate | 21,890 | 18,220 | West Germany 7,480; U.S.S.R. 6,236; Italy 4,504. |
| Oxides | 574 | 685 | Mainly to Italy. |
| Metal, including alloys: | | | |
| Unwrought | r 39,803 | 40,481 | U.S.S.R. 21,380; Austria 6,154; Czechoslovakia 6,116. |
| Semimanufactures | r 1,155 | 1,265 | France 539; Italy 515; Libya 65. |
| Magnesium metal, including alloys, all forms | 9 | -- | |
| Manganese: | | | |
| Ore and concentrate | -- | 380 | All to Italy. |
| Oxides | -- | 50 | All to Hungary. |
| Mercury 76-pound flasks | 13,678 | 13,551 | United States 9,917; Bulgaria 600; Hungary 600. |
| Nickel, including alloys, all forms | r 143 | 338 | West Germany 203; Italy 73; Switzerland 27. |

See footnote at end of table.

## Table 2.—Yugoslavia: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Platinum-group metals, including alloys, all forms, palladium -- troy ounces -- | r 1,222 | -- | |
| Selenium, elemental ------ kilograms -- | 40,890 | 40,784 | Mainly to United Kingdom. |
| Silicon ---------- | 13,892 | 18,005 | West Germany 4,748; Japan 4,488; United States 3,279. |
| Silver: | | | |
| Waste and sweepings troy ounces -- | 32,569 | -- | |
| Metal, including alloys, all forms thousand troy ounces -- | r 2,737 | 2,962 | West Germany 1,467; United Kingdom 1,070; Czechoslovakia 412. |
| Tin, including alloys, all forms long tons -- | r 125 | 124 | France 78; Austria 22; Italy 15. |
| Titanium: | | | |
| Oxides ---------- | -- | 1,674 | Mainly to East Germany. |

| Uranium ore and concentrate ---------- | 791 | -- | |
| Zinc: | | | |
| Ore and concentrate ---------- | 49,735 | 50,852 | Mainly to Bulgaria. |
| Oxide ---------- | 1,516 | 1,190 | Italy 340; East Germany 300; Hungary 250. |
| Metal, including alloys: | | | |
| Blue powder ---------- | 1,873 | 2,141 | Mainly to Czechoslovakia. |
| Unwrought ---------- | 22,288 | 34,559 | Czechoslovakia 11,552; United States 10,135; Italy 4,874. |
| Semimanufactures ---------- | 10,182 | 9,736 | West Germany 3,956; Czechoslovakia 2,966; France 620. |
| Other: | | | |
| Ash and residue containing nonferrous metals ---------- | 8,411 | 6,414 | Mainly to Italy. |
| Oxides, hydroxides, and peroxides of metals, n.e.s ---------- | 66 | 54 | Mainly to West Germany. |
| Metals, including alloys, all forms, metalloids ---------- | 85 | -- | |
| NONMETALS | | | |
| Abrasives, natural, n.e.s., grinding and polishing wheels and stones ---------- | r 1,379 | 2,528 | Poland 1,178; Romania 644; U.S.S.R. 198. |
| Asbestos ---------- | 974 | 747 | Albania 543; West Germany 142; Czechoslovakia 62. |
| Barite and witherite ---------- | 51,816 | 38,368 | U.S.S.R. 28,130; Hungary 9,618; Albania 600. |
| Cement ---------- | 20,886 | 88,703 | Libya 68,756; Italy 6,875; Israel 4,600. |
| Chalk ---------- | 23 | 51 | Mainly to Lebanon. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite ---------- | 18,056 | 15,881 | Poland 10,619; East Germany 3,886; Hungary 797. |
| Fire clay ---------- | r 26,605 | 14,129 | Italy 7,409; Hungary 6,386; Greece 300. |
| Kaolin ---------- | r 354 | 73 | Mainly to Italy. |
| Other ---------- | r 7,024 | 11,801 | Do. |
| Products: | | | |
| Refractory (including nonclay bricks) ---------- | r 74,932 | 77,696 | Poland 24,322; West Germany 17,759; Romania 16,608. |
| Nonrefractory ---------- | r 305 | 4,106 | Poland 2,271; Hungary 1,455; Italy 75. |
| Diatomite and other infusorial earth --- | -- | 41 | Mainly to Greece. |
| Feldspar ---------- | 13,166 | 18,223 | Hungary 6,614; Czechoslovakia 5,394; East Germany 3,301. |
| Fertilizer materials, manufactured: | | | |
| Nitrogenous ---------- | r 48,591 | 42,857 | All to West Germany. |
| Phosphatic ---------- | r 177,490 | 286,107 | Hungary 126,098; Bulgaria 80,481; U.S.S.R. 78,879. |
| Other, including mixed ---------- | 241,027 | 254,396 | Hungary 118,449; Italy 39,266; West Germany 34,634. |
| Gypsum and plasters ---------- | 180 | 61 | Mainly to Hungary. |
| Lime ---------- | -- | 13,934 | Do. |
| Magnesite ---------- | 19,956 | 37,147 | Poland 18,186; United States 7,260; Italy 7,226. |
| Pyrite (gross weight) ---------- | 22,534 | 22,391 | Czechoslovakia 10,998; West Germany 5,999; Italy 5,394. |
| Salt and brine ---------- | 610 | 51 | Mainly to Hungary. |

See footnote at end of table.

## Table 2.—Yugoslavia: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Sodium and potassium compounds, n.e.s | r 5,884 | 15,434 | Italy 8,859; Brazil 5,100; Albania 1,000. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked | r 77,991 | 54,364 | Italy 37,239; West Germany 5,594; Czechoslovakia 3,453. |
| Worked | 6,464 | 6,809 | Austria 4,834; West Germany 1,668; Czechoslovakia 130. |
| Dolomite, chiefly refractory grade | 393 | -- | |
| Gravel and crushed rock | r 3,240 | 4,344 | Italy 1,579; West Germany 686; Greece 509. |
| Limestone (except dimension) | 274 | 348 | Mainly to Hungary. |
| Quartz and quartzite | r 18,914 | 15,582 | Mainly to West Germany. |
| Sand, excluding metal bearing | r 649 | 238 | All to Libya. |
| Sulfur: | | | |
| Elemental: | | | |
| Other than colloidal | 1,391 | 4,745 | Mainly to Romania. |
| Colloidal | 20 | -- | |
| Sulfur dioxide | -- | 63 | Mainly to Hungary. |
| Sulfuric acid | r 18,837 | 1,517 | Romania 802; Austria 715. |
| Talc, steatite, soapstone, and pyrophyllite | -- | 617 | Mainly to Poland. |
| Other: | | | |
| Crude: | | | |
| Calcite | 133 | 60 | Mainly to Libya. |
| Unspecified | -- | 10 | All to Italy. |
| Slag, dross and similar waste, not metal bearing | 4,419 | 2,807 | Italy 1,917; Austria 889. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Carbon black | 175 | 181 | Mainly to Poland. |
| Coal and briquets: | | | |
| Anthracite and bituminous coal | 903 | 1,156 | All to Austria. |
| Lignite and lignite briquets | 589,863 | 517,914 | Mainly to Austria. |
| Hydrogen, helium, and rare gases kilograms | -- | 452 | All to Pakistan. |
| Peat, including peat briquets and litter | r 31 | -- | |
| Petroleum: | | | |
| Crude and partly refined: | | | |
| Crude thousand 42-gallon barrels | 559 | 528 | Mainly to Austria. |
| Partly refined do | 218 | 144 | All to Austria. |
| Refinery products: | | | |
| Gasoline do | 132 | 265 | Mainly to Czechoslovakia. |
| Kerosine and jet fuel do | 108 | 142 | United Kingdom 75; France 10; Netherlands 9. |
| Distillate fuel oil do | r 207 | 204 | Austria 25; Greece 23; Panama 20. |
| Residual fuel oil do | 387 | 406 | Greece 103; Israel 100; Liberia 41. |
| Lubricants do | r 48 | 7 | Austria 3; Czechoslovakia 2; Bulgaria 1. |
| Other: | | | |
| Liquefied petroleum gas do | 261 | 178 | Mainly to Italy. |
| White spirit do | 8 | 14 | All to Austria. |
| Mineral jelly and wax do | 23 | 41 | Italy 24; West Germany 16. |
| Petroleum coke do | 55 | 43 | Mainly to West Germany. |
| Unspecified do | 461 | 403 | Austria 180; United Kingdom 51; Romania 45. |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | r 2,361 | 3,776 | Mainly to Italy. |

r Revised.

## Table 3.—Yugoslavia: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite and concentrate thousand tons | 166 | 170 | Mainly from Australia. |
| Oxide and hydroxide | r 46,810 | 46,220 | Mainly from Guinea. |
| Metal, including alloys: | | | |
| Unwrought | 45,872 | 56,664 | U.S.S.R. 35,046; Bulgaria 3,981; Austria 3,767. |
| Semimanufactures | r 13,228 | 20,036 | U.S.S.R. 5,632; West Germany 5,268; Italy 2,533. |
| Antimony: | | | |
| Ore and concentrate | 1,383 | 1,677 | All from Turkey. |
| Metal, including alloys, all forms | 191 | 71 | Austria 25; Italy 20; United Kingdom 15. |
| Arsenic: | | | |
| Trioxide, pentoxide and acids | r 18 | 68 | Mainly from West Germany. |
| Metal, including alloys, all forms | 15 | 4 | All from West Germany. |
| Beryllium, including alloys, all forms kilograms | 38 | 75 | Mainly from West Germany. |
| Bismuth, including alloys, all forms | 22 | 8 | Netherlands 3; Switzerland 2; Japan 2. |
| Cadmium, including alloys, all forms | (1) | 21 | U.S.S.R. 10; Netherlands 6; United Kingdom 4. |
| Chromium: | | | |
| Chromite | 58,660 | 161,399 | Albania 114,911; U.S.S.R. 34,986; Turkey 9,551. |
| Oxide and hydroxide | 772 | 417 | Mainly from U.S.S.R. |
| Metal, including alloys, all forms | 1 | 35 | United Kingdom 14; Albania 14; Switzerland 5. |
| Cobalt: | | | |
| Oxide and hydroxide | 102 | 19 | Mainly from Belgium-Luxembourg and West Germany. |
| Metal, including alloys, all forms | 37 | 46 | Belgium-Luxembourg 31; Switzerland 6; United Kingdom 5. |
| Columbium and tantalum, tantalum, including alloys, all forms kilograms | 124 | 215 | United States 110; Austria 60; Hungary 30. |
| Copper: | | | |
| Ore and concentrate | 61,911 | 34,957 | Mainly from Chile. |
| Copper sulfate | 296 | 20 | All from Bulgaria. |
| Metal, including alloys: | | | |
| Scrap | 2 | (1) | All from Austria. |
| Unwrought | 34,117 | 59,357 | United Kingdom 22,322; Chile 20,144; Zambia 12,679. |
| Semimanufactures | 17,595 | 13,328 | Chile 3,754; U.S.S.R. 3,037; West Germany 2,128. |
| Germanium, including alloys, all forms kilograms | 1 | 52 | Mainly from Poland. |
| Iron and steel: | | | |
| Ore and concentrate | 282,709 | 389,870 | Brazil 248,647; U.S.S.R. 75,319; Mauritania 36,267. |
| Metal: | | | |
| Scrap | r 261,708 | 298,636 | U.S.S.R. 145,302; Poland 81,375; West Germany 28,122. |
| Pig iron, including cast iron | r 95,986 | 34,507 | U.S.S.R. 17,940; Canada 6,977; Czechoslovakia 6,730. |
| Sponge iron, powder and shot | 1,826 | 2,094 | Sweden 1,496; France 339; Italy 187. |
| Ferroalloys: | | | |
| Ferromanganese | r 1,541 | 3,619 | Italy 1,686; United Kingdom 768; West Germany 585. |
| Other | r 3,522 | 3,674 | West Germany 1,865; France 660; Austria 436. |
| Steel, primary forms: | | | |
| Blooms, billets, slabs, sheet bars | r 165,115 | 168,810 | U.S.S.R. 98,494; Czechoslovakia 39,610; East Germany 17,679. |
| Coils for recoiling | 158,376 | 208,579 | U.S.S.R. 122,810; Czechoslovakia 52,163; Bulgaria 12,054. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, sections | r 366,176 | 239,889 | Romania 66,177; U.S.S.R. 34,840; Bulgaria 22,894. |
| Universals, plates, and sheets | r 462,729 | 594,135 | Japan 150,167; Czechoslovakia 81,006; West Germany 73,103. |
| Hoop and strip | 79,596 | 106,918 | West Germany 23,041; U.S.S.R. 21,759; Czechoslovakia 11,300. |
| Rails and accessories | 1,993 | 3,374 | West Germany 1,769; Austria 958; U.S.S.R. 358. |

See footnotes at end of table.

## Table 3.—Yugoslavia: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Iron and steel—Continued | | | |
| Metal—Continued | | | |
| Semimanufactures—Continued | | | |
| Wire | r 24,547 | 39,761 | West Germany 15,066; Romania 12,270; Italy 4,445. |
| Tubes, pipes and fittings | r 82,395 | 65,971 | East Germany 17,725; Bulgaria 12,263; West Germany 11,961. |
| Castings and forgings, rough | 1,297 | 678 | West Germany 361; Austria 124; Italy 112. |
| Lead: | | | |
| Ore and concentrate | 3,048 | 3,768 | Mainly from Morocco. |
| Oxides | r 623 | 198 | West Germany 106; Austria 80; U.S.S.R. 11. |
| Metal, including alloys: | | | |
| Scrap | -- | 1,173 | Austria 709; Switzerland 317; United Kingdom 122. |
| Unwrought | r 5,806 | 13,736 | Bulgaria 6,792; Zambia 2,152; Italy 1,524. |
| Semimanufactures | 36 | 11 | All from West Germany. |
| Magnesium metal, including alloys, all forms | 581 | 1,275 | United States 420; West Germany 268; U.S.S.R. 175. |
| Manganese: | | | |
| Ore and concentrate | 58,699 | 56,688 | Gabon 19,092; Brazil 16,383; U.S.S.R. 14,345. |
| Oxides | 2,538 | 1,817 | Gabon 938; Belgium-Luxembourg 355; Japan 345. |
| Metal | 103 | 157 | United States 59; Netherlands 41; Switzerland 25. |
| Mercury ---- 76-pound flasks | 701 | 20 | All from United Kingdom. |
| Molybdenum: | | | |
| Ore and concentrate - kilograms | 40 | -- | |
| Metal, including alloys, all forms | 130 | 16 | Mainly from Austria. |
| Nickel metal, including alloys, all forms: | | | |
| Scrap | -- | 11 | All from Netherlands. |
| Matte, speiss, and similar materials | -- | 20 | Mainly from Austria. |
| Unwrought | 507 | 1,366 | France 294; Netherlands 263; Austria 255. |
| Semimanufactures | r 611 | 1,428 | West Germany 649; Austria 538; Italy 91. |
| Platinum-group metals, including alloys, all forms: | | | |
| Platinum ---- troy ounces | r 2,596 | 1,304 | U.S.S.R. 804; Italy 217; West Germany 209. |
| Palladium ---- do | r 46,422 | 26,007 | Mainly from U.S.S.R. |
| Rhodium ---- do | r 354 | -- | |
| Other ---- do | 418 | 841 | Sweden 518; United Kingdom 321; West Germany 2. |
| Selenium, elemental ---- kilograms | 450 | -- | |
| Silver metal, including alloys thousand troy ounces | r 1,138 | 1,890 | Switzerland 718; West Germany 539; United Kingdom 259. |
| Tellurium, elemental ---- kilograms | 495 | -- | |
| Tin: | | | |
| Oxides ---- long tons | r 24 | 15 | Mainly from West Germany. |
| Metal, including alloys: | | | |
| Unwrought ---- do | r 716 | 1,335 | Mainly from Malaysia. |
| Semimanufactures ---- do | r 112 | 62 | Mainly from West Germany. |
| Titanium: | | | |
| Ore and concentrate | 2,637 | 24,031 | Mainly from Australia. |
| Oxides | 5,308 | 5,515 | West Germany 2,325; France 1,547; Czechoslovakia 475. |
| Metal, including alloys, all forms | 2 | 4 | Mainly from United Kingdom. |
| Tungsten metal, including alloys, all forms | 59 | 56 | Netherlands 25; United Kingdom 19; France 5. |
| Zinc: | | | |
| Ore and concentrate | 6,250 | 44,702 | Canada 28,371; Mexico 6,380; West Germany 5,006. |
| Oxide | r 176 | 138 | Mainly from West Germany. |
| Metal, including alloys: | | | |
| Blue powder | 2 | -- | |
| Unwrought | r 23,845 | 27,995 | Zambia 19,598; Bulgaria 4,843; West Germany 2,326. |
| Semimanufactures | r 688 | 1,189 | West Germany 947; Italy 101; Japan 84. |

See footnotes at end of table.

## Table 3.—Yugoslavia: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Zirconium including alloys, all forms | 6 | 20 | Switzerland 10; Italy 9; West Germany 1. |
| Other: | | | |
| Ore and concentrate: | | | |
| Of vanadium, tantalum and zirconium | 887 | 1,497 | Mainly from Australia. |
| Of base metals, n.e.s | -- | 50 | All from Turkey. |
| Ash and residue containing nonferrous metals | 309 | 446 | Mainly from Austria. |
| Oxides, hydroxides, and peroxides of metals, n.e.s | r 661 | 641 | West Germany 459; Norway 59; Netherlands 48. |
| Metals, including alloys, all forms: | | | |
| Metalloids | 2 | 26 | East Germany 15; West Germany 10. |
| Akali, alkaline earth, and rare-earth metals | 193 | 173 | France 89; West Germany 60; Italy 20. |
| Pyrophoric alloys | 8 | 8 | Mainly from People's Republic of China. |
| Base metals, including alloys, all forms, n.e.s | 39 | 25 | Mainly from United Kingdom. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Pumice, emery, natural corundum, etc | 1,061 | 1,011 | Italy 401; Greece 238; Denmark 228. |
| Grinding and polishing wheels and stones | r 1,236 | 1,371 | Austria 910; Italy 183; West Germany 168. |
| Asbestos | 43,282 | 39,038 | U.S.S.R. 25,073; Botswana 7,707; Canada 5,947. |
| Barite and witherite | r 617 | 1,362 | Greece 500; West Germany 317; Italy 224. |
| Boron materials: | | | |
| Crude natural borates | 11,832 | 14,639 | Mainly from United States. |
| Oxide and acid | r 372 | 1,252 | U.S.S.R. 475; France 250; Czechoslovakia 200. |
| Bromine | 3 | 9 | Mainly from Austria and United Kingdom. |
| Cement: | | | |
| Portland thousand tons | 590 | 605 | U.S.S.R. 280; Romania 161; Italy 64. |
| Other do | 302 | 264 | Mainly from Italy. |
| Chalk | 1,083 | 966 | Mainly from France. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite | 33 | 334 | Mainly from Greece. |
| Fire clay | r 10,650 | 15,017 | Mainly from Czechoslovakia. |
| Fuller's earth, dinas, chamotte | r 3,429 | 2,746 | West Germany 1,513; Austria 697; Czechoslovakia 363. |
| Kaolin | 38,330 | 48,768 | Czechoslovakia 21,438; East Germany 11,717; Greece 9,734. |
| Other | r 3,402 | 5,557 | Bulgaria 3,066; Czechoslovakia 1,469; West Germany 562. |
| Products: | | | |
| Refractory (including nonclay bricks) | r 17,974 | 24,213 | West Germany 8,632; Austria 5,060; Italy 3,357. |
| Nonrefractory | r 237,587 | 223,234 | Romania 88,151; Bulgaria 43,187; Italy 36,061. |
| Cryolite and chiolite | (1) | 750 | All from West Germany. |
| Diamond: | | | |
| Gem, not set or strung carats | 5,370 | 9,150 | Belgium-Luxembourg 6,350; Switzerland 1,000; People's Republic of China 900. |
| Industrial do | 101,150 | 225,585 | Switzerland 119,600; United Kingdom 52,220; Austria 37,300. |
| Powder do | 121,285 | 125,850 | U.S.S.R. 71,975; Netherlands 27,400; United Kingdom 13,750. |
| Diatomite and other infusorial earth | r 2,586 | 691 | Czechoslovakia 266; Austria 168; East Germany 90. |
| Feldspar | 51 | 20 | All from West Germany. |
| Fertilizer materials: | | | |
| Crude, phosphatic thousand tons | 1,062 | 1,025 | Mainly from Morocco. |
| Manufactured: | | | |
| Nitrogenous | 151,121 | 190,871 | U.S.S.R. 151,859; Poland 17,130; Bulgaria 16,191. |
| Phosphatic | 38,989 | 25,504 | All from Morocco. |
| Potassic | 375,270 | 331,222 | U.S.S.R. 168,080; East Germany 154,013; West Germany 9,000. |

See footnotes at end of table.

## Table 3.—Yugoslavia: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Fertilizer materials—Continued | | | |
| Manufactured—Continued | | | |
| Other, including mixed | 10 | 26,093 | Poland 16,584; Spain 5,000; Mexico 4,500. |
| Ammonia | r 28,375 | 40,166 | Hungary 23,238; Austria 7,221; Czechoslovakia 4,564. |
| Fluorspar | 4,948 | 4,449 | East Germany 3,110; Austria 897; West Germany 262. |
| Graphite, natural | 2,045 | 1,934 | Austria 1,345; U.S.S.R. 301; West Germany 115. |
| Gypsum and plasters | r 559 | 108 | Mainly from Italy. |
| Iodine | 8 | 22 | West Germany 10; Austria 5; United Kingdom 4. |
| Lime | r 13,237 | 8,251 | Bulgaria 4,568; Austria 2,625; Italy 1,058. |
| Magnesite | 585 | 6,116 | Italy 3,083; Turkey 2,366; West Germany 344. |
| Mica: | | | |
| Crude, including splittings and waste | r 191 | 187 | Norway 102; West Germany 63; Austria 16. |
| Worked, including agglomerated splittings | r 78 | 109 | Switzerland 29; France 23; Czechoslovakia 19. |
| Pigments, mineral: | | | |
| Natural, crude | 6 | 86 | West Germany 33; Netherlands 28; Hungary 25. |
| Iron oxides, processed | 1,844 | 2,165 | West Germany 1,425; Czechoslovakia 250; France 151. |
| Precious and semiprecious stone, except diamond: | | | |
| Natural ---- kilograms | r 102 | 82 | Switzerland 18; West Germany 17; Austria 15. |
| Manufactured ---- do | 227 | 207 | Switzerland 108; Czechoslovakia 38; Austria 25. |
| Pyrite (gross weight) | r 108,564 | 210,942 | Mainly from U.S.S.R. |
| Quartz, piezoelectric ---- kilograms | 1,062 | 1,741 | United States 925; United Kingdom 808; Japan 7. |
| Salt and brine | 71,610 | 114,279 | Romania 73,266; Tunisia 40,410; West Germany 358. |
| Sodium and potassium compounds, n.e.s.: | | | |
| Caustic soda | r 70,774 | 87,373 | Italy 44,131; West Germany 27,749; France 15,299. |
| Caustic potash, sodic and potassic peroxides | r 2,488 | 1,189 | East Germany 652; Czechoslovakia 316; Italy 146. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked: | | | |
| Calcareous | 623 | 3,896 | Mainly from Italy. |
| Slate | 393 | 520 | Mainly from West Germany. |
| Other | 683 | 2,679 | Mainly from Italy. |
| Worked: | | | |
| Slate | 61 | 191 | Do. |
| Other | 1,877 | 178 | Do. |
| Dolomite, chiefly refractory grade | r 5,998 | 5,723 | Do. |
| Gravel and crushed rock | r 99,742 | 72,630 | Hungary 54,693; Austria 17,337; West Germany 293. |
| Limestone (except dimension) | 11,513 | 16,680 | All from Hungary. |
| Quartz and quartzite | 11,158 | 7,031 | West Germany 4,305; Greece 2,500; Switzerland 126. |
| Sand, excluding metal bearing | 69,571 | 81,501 | Italy 41,948; Hungary 23,803; West Germany 8,712. |
| Sulfur: | | | |
| Elemental, all forms | r 33,187 | 42,420 | Poland 36,166; West Germany 4,209; Italy 2,004. |
| Sulfur dioxide | -- | 63 | All from Hungary. |
| Sulfuric acid | 9,649 | 61,125 | Hungary 44,490; Bulgaria 15,625; West Germany 1,008. |
| Talc, steatite, soapstone, and pyrophyllite | 1,610 | 2,040 | Italy 976; Austria 199; West Germany 112. |
| Other nonmetals, n.e.s.: | | | |
| Crude | 4,885 | 23,451 | Greece 15,500; Hungary 6,624; Austria 1,277. |
| Slag, dross, and similar waste, not metal bearing | r 173,339 | 172,132 | Mainly from Italy. |
| Oxides and hydroxides of magnesium, strontium, and barium | 310 | 325 | West Germany 170; United States 83; France 31. |

See footnotes at end of table.

Table 3.—Yugoslavia: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | r 6,680 | 1,453 | Mainly from Albania. |
| Carbon black and gas carbon | 4,531 | 9,609 | Italy 6,662; West Germany 2,476; East Germany 155. |
| Coal and briquets: | | | |
| Anthracite and bituminous coal thousand tons | r 1,885 | 1,964 | U.S.S.R. 1,162; Czechoslovakia 625; United States 141. |
| Briquets of anthracite and bituminous coal | -- | 200 | All from Netherlands. |
| Lignite and lignite briquets | r 277 | 17,869 | All from Hungary. |
| Coke and semicoke -- thousand tons | 302 | 482 | Poland 216; U.S.S.R. 108; Czechoslovakia 61. |
| Hydrogen, helium, and rare gases kilograms | r 6,495 | 2,355 | Italy 1,064; West Germany 554; Austria 300. |
| Peat, including peat briquets and litter | 3,879 | 4,636 | Poland 2,832; Hungary 1,286; Austria 400. |
| Petroleum: | | | |
| Crude thousand 42-gallon barrels | 31,034 | 61,206 | Iran 34,542; U.S.S.R. 16,902; Iraq 7,375. |
| Partly refined do | 192 | 127 | Italy 50; Czechoslovakia 27; West Germany 23. |
| Refinery products: | | | |
| Gasoline do | 146 | 285 | Algeria 102; U.S.S.R. 96; Netherlands 29. |
| Kerosine and jet fuel do | 57 | 45 | U.S.S.R. 30; Switzerland 13; Italy 1. |
| Distillate fuel oil do | r 3,121 | 2,751 | U.S.S.R. 1,943; Romania 727; Algeria 76. |
| Residual fuel oil do | 3,195 | 4,332 | Mainly from U.S.S.R. |
| Lubricants do | r 344 | 285 | Hungary 40; United Kingdom 39; Netherlands 32. |
| Other: | | | |
| Liquefied petroleum gas do | (1) | 131 | Bulgaria 78; Italy 18; Hungary 16. |
| Mineral jelly and wax do | r 37 | 35 | East Germany 10; Romania 8; Hungary 7. |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Programs continued on converting the country's aluminum industry from a producer and exporter of bauxite to a processor of bauxite and exporter of aluminum metal. New aluminum-producing facilities were under construction or completed. To meet increased bauxite demand, new bauxite mines were prepared and old ones expanded. Although output of bauxite, alumina, and aluminum increased, demand for aluminum exceeded the available supply, and imports were necessary.

In anticipation of increased future domestic demand, expansion of bauxite-producing facilities was underway at yearend. Plans to increase annual bauxite production from 320,000 to 500,000 tons were made public at the Mostar bauxite mine. At the Nikšić bauxite mine, expansion continued, and output of 450,000 tons, achieved in 1974, was scheduled to reach

750,000 tons in 1976. The management of the Nikšić mine was also examining the possibility of increasing bauxite output to 1.5 million tons per year by 1980 or later. Output in the Sumarica open cast mine at the Vlasenica bauxite-producing area increased to 300,000 tons. Bačun, the new mining area, was ready for initial production of 300,000 tons of bauxite per year. This output will be increased to 600,000 tons. Development of the Podbracan underground mine should lead to production of 400,000 tons of bauxite per year. Most of the bauxite produced in the area will be used at the Vlasenica alumina plant, which was under construction during 1974.

Development continued at the Vlasenica project, a 600,000-ton-per-year alumina plant, near Zvornik, partly financed with a $130 million[3] loan from the U.S.S.R. Technicians from the U.S.S.R. designed the plant and Soviet factories started deliveries of equipment. Completion of the project was planned for 1976. For a 10-year period after completion, most of the alumina from the plant will be shipped to the U.S.S.R. for repayment of the loan. The alumina plant is located at Karakaj, a locality near Zvornik in Bosnia.[4]

Although construction of the Sibenik aluminum plant was completed and production started in 1973, the plant was operating much below its 75,000-ton-per-year capacity during 1974. Shortages of electric power prevented operation at full capacity. At yearend, the situation had improved and of a total of 208 electrolytic cells only 32 cells were out of production.

Construction of the 280,000-ton-per-year alumina plant at Mostar also continued. Production was planned for 1975. Total cost for the plant amounted to the equivalent of $30 million and was partly financed by loans from France. Construction of an 85,000-ton-per-year aluminum plant, also at Mostar, was underway at yearend. When completed in 1976 or early in 1977, Mostar will have an integrated installation from bauxite to aluminum metal. The state-owned firm Energoinvest from Sarajevo is the investor for the project and will manage both plants.

At the Titograd alumina and aluminum plant, construction started on a new aluminum rolling mill with an annual capacity of 15,000 tons of semimanufactured products. The Italian company, Temko, will provide the "know-how." The new plant will employ 450 workers. Production was scheduled for late in 1975 or early in 1976.

In Sevojno, Serbia, a 35,000-ton-per-year plant for production of aluminum-rolled semimanufactures went onstream in the spring of 1974. The new facility is part of an existing copper-rolling mill and will employ an additional 800 workers. Most of the production, about 80%, has been contracted for export. Aluminum from the Titograd aluminum plant and imported metal will be used in the new facility.

**Antimony.**—The inactive Lojane mine near Kumanovo, in Serbia, will be reopened. Rudarsko Topionički Bazen Zajača, the country's only mine and smelter producer of antimony, Jugometal of Belgrade, and Opalska Breča of Kumanovo, concluded an agreement to finance reopening of the Lojane mine at a cost equivalent to $690,000. Production will start early in 1975 with an annual output of 45,000 tons of ore and 2,300 tons of antimony concentrate. Concentrate will be processed at the Zajača smelter.

At Mramor, on Kapaonik Mountain, near Brus, Serbia, a new antimony mine will be opened. Capacity of the mine and flotation plant were not made public.

**Copper.**—Rudarsko Topioničarski Bazen, Bor (RTB), Serbia, with its mine, flotation plant, and smelter at Bor; mine and flotation plant at Majdanpek; and new mine under development at Krivelj, remained the principal activity related to copper. However, development continued at the Bučim copper deposit, near Radovište, in Macedonia. Bučim was expected to become the second copper-producing facility in Yugoslavia.

At RTB, plans were announced to increase annual copper production to 200,000 tons and subsequently to 240,000 tons.[5] The key to this development will be the opening of a large deposit of low-grade ore at Krivelj. The management of RTB expects Krivelj to reach its planned annual

[3] Where necessary values have been converted from Yugoslav dinars (din) to U.S. dollars at a rate of din17=US$1.00.

[4] During 1974, this plant was mentioned in different publications as Vlasenica, Zvornik, or Birac plant.

[5] U.S. Embassy, Belgrade, Yugoslavia. State Department Airgram A-250, May 15, 1975, 2 pp. and 3 attachments.

capacity of 60,000 tons of copper in 1981. Kaiser Engineering Co. has prepared basic studies on the equipment for mining and beneficiating Krivelj ore. In September, the directors of the Export-Import Bank authorized a $2,820,000 loan to RTB to finance approximately 30% of the cost of equipment for its copper mining operation. Repayments are to be made semiannually over a period of 7 years at an interest rate of 8% and a guarantee fee of 1%.

The old Bor beneficiation plant was modernized without interrupting production. Copper recovery improved 9% compared with the previous year and reached 82% to 85% of capacity.

A break in a dam on a water-storage lake stopped production at the Majdanpek flotation plant during January. The damage was repaired, and the plant was again in operation in February.

Exploration and preliminary work continued for development of the Bučim copper deposit. A mine and beneficiation plant were planned, and preliminary work had started at the deposit. When the first phase of development is completed in 1977, capacity will reach 21,000 tons of copper per year. This capacity will be expanded later to 60,000 tons of copper. At yearend financing had been arranged. The U.S. Export-Import Bank approved a direct $10 million credit to purchase U.S. technology and equipment for development. This credit will provide 45% of the total $22.5 million required for all equipment and services. The remaining financing will be covered by U.S. companies (45%) and by financial institutions of Macedonia (10%).

**Iron and Steel.**—Renovation and expansion continued in the iron and steel industry. Domestic output of iron and steel products was inadequate to meet demand, and imports of iron and steel semimanufactures were by value one of the largest import items. Shortages of electric power slowed production at ferroalloy and steel plants during the last part of the year.

In Zenica, Bosnia, the largest iron and steel plant in the country, the second phase of a renovation and expansion program was in progress. When completed in 1975, annual production of steel should reach 2.5 million tons. The tabulation below shows tentative annual output capacities for steel plants in 1985:

| | *Million tons* |
|---|---|
| Existing plants: | |
| Slovenia | 1.10 |
| Zenica | 2.65 |
| Skopje | 2.06 |
| Smederevo | 2.79 |
| Sisak | 1.60 |
| Nikšić | .40 |
| New plants: | |
| Prijedor | 3.00 |
| Jadranska Zelezara | 2.20 |
| Total | 15.80 |

**Lead and Zinc.**—Renovation of the Stari Trg and the Kopaonik mines, and development of mines at Zute Prline. Kopaonik, and Crnac, all in Serbia, and at Mojkovac-Brskovo in Montenegro continued during 1974. These activities were part of the Trepča Enterprise efforts to increase lead and zinc mine capacity in the country.

In the vicinity of the new Blagodat mine near Kriva Feja, Serbia, on Besna Kobila Mountain, discovery of a new lead and zinc deposit was announced.

In Macedonia, two new lead and zinc mines were planned in 1974. These mines, located in Makedonska Kamenica and Kriva Palanka, will have an aggregate annual capacity of 1.5 million tons of ore. The smelter at Titov Veles will process concentrates from these two mines.

In Bosnia, east of Ljubovia, a deposit containing about 2 million tons of polymetallic ore was discovered. However, the location of the deposit, which would require building a road in difficult terrain, makes development in the near future questionable.

**Nickel.**—At Rzanovo, near Kavadarci, preliminary work continued on a nickel project, managed by Feni. The U.S. Export-Import Bank extended a $38.7 million credit to support an $86 million sale of U.S. goods and services. Arthur G. McKee Co., of Cleveland, Ohio, will furnish technical assistance for the project. Plans call for mine development, a 64,000-ton-per-year ferronickel plant, and auxiliary installations. Initial production was scheduled for 1979. According to reports, about 24 million tons of nickel-bearing ore, with an average nickel content of 0.9%, was discovered and confirmed in the area.

Based on two nickel deposits, Goleš and Cikatovo, in Kosovo, Serbia, plans were made for development of mines and a smelter in the area. Approximately 1.2

million tons of ore will be produced yearly. The new smelter was planned for an annual production of 10,500 tons of ferronickel. Preliminary figures set ore reserves in the area at 25 million tons. Specialists from the U.S.S.R. were working on the project, and Soviet equipment will be purchased for the mine, beneficiation plant, and smelter. At yearend financing was not assured.

**Uranium.**—The cornerstone was laid and construction started on Yugoslavia's first nuclear power station near Krško. The 615-megawatt nuclear powerplant (pressurized water reactor) will be built by Westinghouse Electric Corp. To fuel the reactor, domestic uranium concentrate (yellowcake—$U_3O_8$) will be enriched in the United States. To provide necessary ore and concentrate, development of domestic uranium deposits continued. The focal point remained the uranium deposit at Zirovski Vrh in Slovenia. In addition to several hundred drill holes that covered an area of 120 square kilometers, approximately 5 kilometers of drift were driven through the deposit. According to plans, the mine will supply ore for a 300-ton-per-year capacity concentrator to be built at the minesite. Reserves at Zirovski Vrh were considered adequate to support production at this rate for a period of 15 years.

**Other Metals.**—Yugoslavia also produced bismuth, cadmium, chromite, germanium, gold, manganese, mercury, selenium, and silver in 1974. Except for mercury, produced at Idria, Slovenia, output of the other metals was modest. Bismuth was a byproduct of the lead and zinc operation at Trepča, Serbia; and cadmium was a byproduct at Trepča and at the Zorka plant at Sabac, Serbia. The Bor complex in Serbia yielded gold, germanium, and selenium as byproducts of copper. Manganese was produced in Bosnia. Trepča was the main source of silver, a byproduct of lead and zinc processing.

## NONMETALS

**Asbestos.**—Renovation continued at the asbestos mine near Stragari, Serbia, operated by Stragari-Azbest. New "know-how" was purchased in Japan. When the renovation is completed in 1975, production should double and reach an estimated output of 5,000 tons per year of asbestos. Reserves totaled about 12 million tons of ore with an average asbestos content of 12%. Another 10 million tons of probable ore reserves were reported in the vicinity of the Stragari mine. Most of the production will be exported in the form of fiber, fines, and tiles.

**Cement.**—Cement remained the most significant nonmetal produced in the country. Croatia and Serbia were the principal cement-producing states, providing 39% and 27%, respectively of the country's total output. Expansion of existing cement plants and the planning and construction of new facilities were aimed at ending shortages of cement. However, when all planned facilities are completed in 1985, Yugoslavia would have an annual cement capacity of 17 million tons. Domestic demand for 1985 was planned at 14 million tons. Consequently, 3 million tons of plant capacity will be available for production of cement for export. Controversy existed regarding wisdom of such an extensive expansion of the cement industry.

Production started at the 340,000-ton-per-year cement plant at Lukavac, in Bosnia. A 550,000-ton-per-year plant at Kosjerić, in Serbia, and a 330,000-ton-per-year plant at Plevlja, Montenegro, were near completion at yearend. In addition, expansion and renovation of the Koromačno cement plant near Labin, Croatia, was completed during the year. Annual capacity was increased from 70,000 tons to 400,000 tons.

Expansion continued at the Beočin and Popovac cement plants, in Serbia, and the Dalmacija and Podsused plants, in Croatia. The Beočin plant will have an annual capacity of 2 million tons, Podsused about 550,000 tons, and the Dalmacija and Popovac plants will add capacity of 600,000 tons each per year, when expansions are completed.

Construction started on the Anhovo cement plant at Anhovo, Slovenia. Annual capacity of the plant was planned at 1 million tons with a completion date in 1976. The International Finance Corp., an arm of the World Bank, has granted a $10 million loan. The remaining funds will be provided by a domestic bank (Ljubljanska Banka). The Anhovo cement products factory will use most of the cement produced at Anhovo. The Ostruznica, Našice, and Bela Palanka plants were in different stages of planning.

**Lime.**—Construction started on a 10,000-ton-per-year hydrated lime plant located in Lički Lešće, Croatia. This new plant will be part of the existing lime facility operated by a local enterprise.

**Marble.**—Approximately 100,000 cubic meters of marble were discovered near Mrzen, a small locality in the general area of Kavadar. At yearend, local authorities were trying to arrange financing for a quarry with an annual production capacity of 5,000 cubic meters of marble.

## MINERAL FUELS

Yugoslavia remained dependent on imports of high-rank coals, coke, and crude oil. Coal was the principal source of energy in Yugoslavia during 1974. As a source of energy, the significance of domestic coal increased because of higher prices for imported crude oil. Development of new coal mines, modernization of existing mines, and construction of new coke plants, petroleum refineries, gas and oil pipelines, and electric powerplants, including one nuclear, were the principal events in the energy industry of the country.

**Coal.**—Most of Yugoslavia's coal production consisted of low-rank coals. Brown coal and lignite comprised the bulk (98.2%) of the coal output. Approximately 2.5 million tons of bituminous coal, coke, and related products were imported. The coal industry had a stable and growing demand throughout the year, due principally to high prices for imported crude oil. These high oil prices made Yugoslav authorities continue the trend, started last year, to revert to coal, the most abundant energy source in the country. Coal-related projects, delayed in the past, have been given greater attention, and financing for most of them was secured. New mines were opened, and plans were drafted for increased coal production in all parts of the country. For the first time in its history, Macedonia was included in plans for future coal production.

In Bosnia and Herzegovina (Bosna i Hercegovina), the State with the largest production of coal, a new mine was developed, new coal deposits were discovered, and plans were made public to increase output threefold by 1985.

The new opencast mine, Gracanica, with an annual capacity of 500,000 tons of brown coal, produced almost at capacity at yearend. Most of the overburden had been removed, and the principal conveyor belts had been assembled.

In central Bosnia, near Zenica and Kakanj, new deposits of brown coal were discovered. Proven reserves of 250 million tons and possible reserves of 520 million tons were reported.[6]

According to a recently published plan, the coal mines of Bosnia and Herzegovina should increase annual output from 12 million tons in 1974 to 36 million tons in 1985. About 72.4% of this coal will be delivered to utilities, industry will receive about 19%, and households and others will receive the rest. To reach the planned targets, productivity in underground coal mines must increase from 2.5 tons per man-shift to 4 to 6 tons per man-shift. Investments in new equipment and in mine reconstruction were also part of the plan. Financing for the new development was not secured at yearend.

Macedonia was planning to join the coal-producing States of Yugoslavia. About 200 million tons of lignite were discovered near the village of Suvodol, Pelagonia, Macedonia. Total reserves in the area were estimated at 1,300 million tons of lignite. Based on Pelagonia's coal reserves, plans for construction of two thermal powerplants of 210 megawatts electrical each were discussed by planning authorities in Macedonia.

In Crna Gora financing was secured for development of a new mine, Petnjak. The Petnjak brown coal deposit is located near Ivangrad, where reserves in the existing mine, Budimlje, were near depletion. The Petnjak mine was scheduled to start production late in 1976 with an initial annual output of 200,000 tons. In the second phase of construction, annual mine capacity should increase to 300,000 tons. Reserves are expected to last over 50 years at that rate of production. About 700 workers will be employed when the mine is in full operation. Engineering for the new mine will be provided by domestic enterprises, and Kopex, from Poland, will supply the equipment.

The Plevlja mine, in Crna Gora, was scheduled for expansion from a present annual output of about 400,000 to 3.5 million tons in 1982. When completed, two powerplants, with a capacity of 210 megawatts electrical each, and the cement plant

[6] Privredni Pregled (Belgrade, Yugoslavia). May 7, 1974, p. 3.

at Plevlje will be the principal consumers of the additional coal.

In Serbia, coal-related activities were concentrated in the large lignite basins at Kolubara and Kosovo. The management of the Kolubara Basin adopted a $176 million investment plan for a new opencast mine, Tamnava. The mine was expected to be completed between 1978 and 1980. Reports indicated an annual mine capacity of 18 to 20 million tons. The Obrenovac thermal electric plant will use most of the lignite produced at Tamnava. An association of utility companies from Croatia will finance part of the mine development in exchange for an assured supply of coal to generate about 1,400 to 1,960 gigawatt-hours per year of electricity.

In the Kosovo coal basin, plans were made to increase annual lignite output at the Kosovo combine from 6.5 million to 27 million tons in 1982. This output could be increased to 53 million tons of coal by 1990. In the western part of the basin, coal reserves could sustain an annual production of 13 million tons for 64 years.

Coke demand remained higher than domestic production, and imports were essential to assure continuous operation of the iron and steel industry. As in the past, imported coking coal comprised the bulk of the coal processed in coking plants during 1974. To reduce dependence on imported coke, construction continued on a fourth coke battery (700,000 tons of coke per year) at the Lukavac coke plant.

The management of the Sisak (Zeljezara Sisak) iron and steel works at Sisak, Croatia, awarded a contract for design and construction of a 850,000-ton-per-year coke plant to Dr. C. Otto & Comp. GmbH of the Federal Republic of Germany. The new coke plant will be located in Bakar, near Rijeka on the Adriatic Sea, and will consist of 65 double-flue, slot-type coke ovens with a daily coking coal throughput of 3,300 tons. Plant completion was planned for 1977 or early in 1978. Two-thirds of total cost of $50.5 million will be financed by the West German firm; Yugoslavia's banks will provide the balance. Design for the plant provided for future expansion of annual production to 1.7 million tons of coke. The steel plant at Sisak and steel plants in Slovenia will be the principal users of the coke from Bakar.

**Petroleum.**—Production of crude oil reached an alltime high of 3.5 million tons (about 70,000 barrels per day) in 1974. This increased output resulted from higher production at the Beničanci Field in Croatia and the Kikinda and Velebit Fields in Serbia. Industrija Nafte (INA), headquartered in Zagreb, Croatia, and Naftagas in Novi Sad (Vojvodina), Serbia, remained the only producers of, and the most important refiners of, crude oil in the country. INA was by far the largest, accounting for about 70% of the total output. Naftagas produced the rest.

Six refineries, three operated by INA, two by Naftagas, and one by Energoinvest, had an installed annual capacity of 13.2 million tons.

INA-Naftaplin ordered an offshore drilling rig (jack-up type) in the Netherlands. High prices for offshore drilling contracts, lack of readily available contractors, prospects for drilling about 50 offshore wells in the Adriatic Sea, and possibilities for offshore drilling in India and Bangladesh prompted INA to purchase one offshore drilling rig.

*Exploration, Development, and Production.*—INA, in Croatia, and Naftagas, in Serbia, carried out exploration and development drilling for crude oil and natural gas. Both enterprises drilled approximately 254,254 meters (about 814,000 feet) with 19 drilling rigs. A total of 172 wells was drilled; 47 were exploratory and 125 were producing wells.[7] Major exploration drilling was conducted by INA in Medjumurje, Slavonija, and Baranja, and by Naftagas in Banat and Bačka.

In Medjumurje, crude oil was discovered at Mihovljan, near Cakovec, at a depth of 1,800 meters. In Slavonija, discovery of a new gasfield at Bokšić Lug, near Našice, with reserves of 11 billion cubic meters, was confirmed with additional drilling. Drilling was underway at Cadjavicki Lug, near Podravska Slatina, Kućanci, Vladislavci, and Ogod, but results had not been reported at yearend. In all drilling in Slavonija the target depth was over 3,000 meters. In Banat, near the existing Kikinda Fields, a new oilfield and gasfield, Mokrin Zapad, was discovered. In Majdan-Arandjelovo, tests of a new discovery well were underway at yearend. In Banat, depths of exploratory drilling were also more than 3,000 meters, indi-

[7] Number of producing wells include extension wells.

cating a transition of exploratory drilling from shallow to deep wells.

Offshore exploration was carried on by INA in the northern part of the Adriatic Sea and by Jugopetrol-Adria-Kotor, an enterprise jointly owned by Jugopetrol-Kotor of Yugoslavia and Buttes Gas & Oil Co. and Challenger Oil and Gas Co., a wholly owned subsidiary of Global Marine Inc., both of the United States. Results for offshore activities were not made public at yearend. The offshore drilling rig ordered in the Netherlands by INA will be capable of drilling in waters 90 meters deep and to a depth of 6,000 meters.

INA made an effort to participate in exploration in Syria and Bangladesh. INA-Naftaplin concluded a $10 million contract with the Syrian state-owned General Petroleum Co. to drill three wells up to 15,000 feet deep in Syria. A U.S.-made drilling rig, Emsco-Continental 1500, was shipped from Yugoslavia to Syria for the project. About 36 drillers and supervisory personnel from Yugoslavia will operate the rig. Reports indicated that 3 years will be needed to complete the contract. In Bangladesh, offshore geophysics was the principal activity during 1974.

The largest part of Yugoslavia's crude oil and natural gas production came from various oilfields in Croatia. Beničanci, Zutica, and Struzec were the principal ones. In Serbia, the Velebit and Kikinda Fields produced most of the crude oil in that State. Secondary recovery (water flooding) was carried out at the Ivanić oilfield, in Croatia. Facilities for another water flooding project were under construction at the Zutica oilfield.

During November, a tentative plan was made public for future development of INA-Naftaplin. The growth rate for crude oil production was planned at 5.3% per year and that of natural gas at 22.2% per year. Accordingly, crude oil and natural gas output would be 3.4 million tons and 2 billion cubic meters, respectively, by 1980. To reach these production targets, 50 promising areas in the Sava, Drava, and Mura sedimentary basins would be drilled with 190 "wildcat" wells, totaling 500,000 meters of exploratory drilling. Furthermore, exploration in the Dinaric Alps, near the shoreline and inland, Istria, and Ravni Kotari, called for drilling 5 to 6 exploratory wells 3,500 to 5,500 meters deep.

*Refineries.*—Six state-owned refineries processed a total of 10.4 million tons of crude oil during 1974 and operated at 83.4% of installed capacity. Imported crude petroleum accounted for 67.5% of the total throughput.

The following tabulation shows capacities of operating refineries during 1974:

| Location of refinery | Location of operating enterprise | (million metric tons per year) Capacity |
|---|---|---|
| Bosanski Brod | Energoinvest-Sarajevo | 2.5 |
| Lendava | INA-Zagreb | .6 |
| Rijeka | ---- do | 4.5 |
| Sisak | ---- do | 3.6 |
| Novi Sad | Naftagas-Novi Sad | .6 |
| Pancevo | ---- do | 1.4 |
| Total | | 13.2 |

Preliminary plans called for expanding present refinery capacity to 27 million tons per year by 1980. In addition, two refineries, one in Koper, Slovenia, and another in Skopje, Macedonia, were planned for completion early in 1980.

Expansion continued at Naftagas-operated refinery near Novi Sad. When the refinery is completed late in 1975 or early in 1976, it will have a capacity of 1.3 million tons per year. In addition, possibilities were explored to expand the Novi Sad refinery annual throughput capacity to 3 million tons.

Management of the Sisak refinery announced plans for increasing present annual capacity of 3.6 million to 7.5 million tons by 1982.

The planning board of the Rijeka refinery announced targets for future expansion of the refinery's capacity to 8 million tons per year.

The organization Sernim continued preliminary work for construction of its first petroleum refinery, at Koper, Slovenia, on the Adriatic coast. Reports indicated annual capacity ranging from 3 million to 8 million tons. Financing reportedly was

arranged with participation of Kuwait, Libya, and Syria. Products were planned for marketing in central Europe. INA, with its large refinery in nearby Rijeka, has expressed opposition to the project.

Construction of the first petroleum refinery in Macedonia was announced in mid-1974. The 2-million-ton-per-year refinery will be located near Skopje. Equipment for the refinery will be purchased in the U.S.S.R. Imported crude oil will be brought by rail from the port of Thessaloniki, Greece. Financing, except for a lesser part, was assured at yearend.

*Transportation.*—Rail, trucks, river barges, and tankers moved most of the crude oil and products. Only a small part was moved by pipelines. However, steps were taken to make pipelines the principal means for moving crude oil. Preliminary work continued on the first crude oil trunk pipeline. An agreement was signed between INA, Energoinvest, and Naftagas for Yugoslavia, Mineralimpex from Hungary, and Czempol from Czechoslovakia on financing construction and use of the 700-kilometer pipeline. Representatives of these governments signed an agreement guaranteeing construction of the pipeline.

The pipeline will start at Omišalj, on the island of Krk in the north Adriatic, where a new port will be built and will lead to refineries at Rijeka, Sisak, Bosanki Brod, Novi Sad, and Pančevo, with a branch to the Hungarian border and to Lendava. The pipeline will have an annual capacity of 34 million tons, of which 10 million tons are reserved for INA refineries; 5 million tons for the Energoinvest refinery; 9 million tons for Naftagas refineries; and 10 million tons for refineries in Hungary and Czechoslovakia.

INA, Energoinvest, and Naftagas organized an enterprise that will construct the pipeline in two phases. In the initial phase, the pipeline with pumping stations, a port in Omišalj, and storage tanks will be completed in 1976. In the second phase, which will last another 2 years, more storage tanks will be built at Omišalj, and remaining installations will be completed. At yearend, financing of $450 million to $500 million, a sharp increase from the $220 million in preliminary plans, appeared assured, except for $150 million. Yugoslavia will provide $130 million while Hungary and Czechoslovakia will invest $25 million each. The rest will be obtained from Kuwait, an international bank consortium, and the International Bank for Reconstruction and Development.

Preparations for construction of main gaslines were underway in Serbia and Croatia. In Serbia, financial arrangements between domestic banks were concluded for the domestic share of total costs for the 1,268-kilometer trunkline between Senja and Nis. Initial capacity of the pipeline was planned at 2.7 billion cubic meters yearly. In Croatia, a 50-kilometer segment, from Miholjac to Osijek, of the Budrovac-Osijek main gasline was under construction. The gasline will bring natural gas from Bokšić Lug gasfield to Osijek.

Yugoslavia's rail system owned about 3,800 railway tank cars with a total carrying capacity of 127,534 tons. During 1974, approximately 4.5 million tons of crude oil and products were moved by rail.

Road transportation, principally of refinery products, was carried out by 1,680 tank trucks with an aggregate capacity of 47,096 cubic meters.

Transport of crude oil and products on inland waterways was by a total of 168 vessels with total capacity of 172,394 deadweight tons.

Yugoslavia's maritime enterprises owned 34 tankers with 243,266 deadweight tons, but only 7 tankers were over 10,000 deadweight tons. About 15 small seagoing tankers with a capacity of 8,000 deadweight tons were used for transportation of petroleum products along the Adriatic coast.

# The Mineral Industry of Zaire

By George J. Coakley [1]

Zaire continued to be the largest producer of cobalt and industrial diamond in the world and was ranked sixth in mine production of copper. Most of Zaire's exports by value and over half of governmental revenues were derived from production of mineral commodities. Shaba Province in southeastern Zaire was the leading mineral-producing region and accounted for all of the copper, zinc, manganese, coal, byproduct cobalt, cadmium, and germanium output. Kivu Province was the center of columbium-tantalum, gold, tin, and tungsten mining, and Kasai Province was the location of diamond mining.

Announced expansion plans would increase copper and associated cobalt production about 60% by 1980. However, until expected completion in 1977 of a high-voltage, direct-current transmission line from new generating capacity at Inga on the lower Zaire River to Shaba Province, there may be a critical energy shortage that could curtail output. Development of two offshore oilfields discovered between 1970 and 1973 continued during the year with production scheduled to commence in late 1975 at the rate of 25,000 barrels per day.

During 1974 a new government agency was set up to market Zaire's copper output, and the Government stated its intention to refine all domestic copper internally.

In actions attempting to bolster the depressed world copper market, Zaire as a member of the Conseil Intergouvernemental des Pays Exportateurs de Cuivre (CIPEC) agreed to cut all copper exports by 10% effective December 1, 1974.

**Government Policies and Programs.**—Two major political-economic programs were implemented or announced during the year by President Mobutu Sese Seko, which will have long-range impact on the mineral industry of Zaire. The Zairianization measures announced on November 30, 1973, called for the return of ownership of all former colonial properties and enterprises to Zairians. Property developed by noncolonial foreign interests would be taken over and compensated for within 10 years. All new mining concessions must include 50% Zairian participation. All subsidiaries of the Belgian firm Union Minière du Haut Katanga are to become 100% Zairian, starting with the appointment of a Zairian director-general for La Générale des Carrières et des Mines du Zaire (Gécamines) in 1974. It is planned that the percentage of Zairians holding key technical and administrative positions in Gécamines will increase from 36% to 60% by 1980. Two other important decisions for the copper industry implemented under these measures are the creation of a national copper marketing corporation to take over functions previously handled by the Belgian firm Société Générale des Minerais (SGM) and the Government's expressed determination to have the country's entire copper production refined domestically by 1980.

In addition to its mining activities in Shaba Province, Gécamines has been given the additional ownership and administrative responsibility for the provincial hospital, agricultural installations, and flour mill, and in general to provide needed social services to Shaba. Like Gécamines, several new authorities were set up to consolidate and administer activities in tin mining, electrical power, and petroleum distribution. Exempted from these actions were foreign companies such as Société de Dévelopment Industriel et

[1] Physical scientist, Division of Nonferrous Metals.

Minière du Zaire (Sodimiza), Société Minière de Tenke-Fungurume (SMTF), (a consortium of United States, British, French, and Japanese companies and the Government of Zaire) and Zaire Gulf Oil Co. which invested in Zaire and operated under the conditions of the Code of Investment of June 29, 1969.

In addition to the Zairianization measures described above, new "radicalization" measures announced in December 1974 called for the imposition of state control over more than 100 firms of both foreign and Zairian ownership.

Zaire was looking forward to the completion of the Inga hydroelectric project to spur new industrial growth in the country. The new facility will increase the supply of electricity from 2.5 billion kilowatt-hours in 1974 to 105 billion kilowatt-hours in 1978. A key part of the project, the construction of a 1,800 kilometer-long high-voltage transmission line from the Inga Dam near the mouth of the Zaire River to the heart of the copper mining district near Kolwezi, Shaba, met with some delays with completion now expected in 1977 or 1978.

In November the CIPEC ministers met in Paris and agreed to cut back all copper exports effective December 1, 1974, by 10% in comparison with the levels achieved during the previous 6 months. This quota represented a total reduction in the CIPEC countries' shipments of 17,500 tons of copper per month, of which Zaire's share would be 4,000 tons per month.[2]

## PRODUCTION AND TRADE

Mine production of copper continued an upward trend, increasing 2% to a record 499,000 tons in 1974. Other important mineral commodities with mine production increases were cobalt 17%, zinc 1%, and diamond 5%. Production decreases were recorded for coal 10%, silver 15%, gold 5%, manganese 8%, and tin 13%. Details of mineral production are shown in table 1. Export data are shown in table 2. The import data that appeared in the Zaire chapter of the 1972 Minerals Yearbook are the most recent official information available.

[1] Data for totals reported are official statistics of Zaire as reported in Industrie Minière de La Republique du Zaire, Annual Report, 1973.

[2] Value only reported at US$32,006,000.

[3] Value only reported at US$372,000.

Gécamines copper export revenues were $836 million for 1974, compared with $748 million in 1973.[3] This mineral commodity continued to contribute approximately two-thirds of Zaire's foreign exchange earnings. While the average price received for Zairian export copper in 1974 was about 82 cents per pound, the sharp drop in London Metal Exchange copper quotations from a high of $1.52 in April to $0.53 at yearend represented a significant loss of potential revenue to the economy of Zaire. CIPEC estimated the loss in export revenue to Zaire at $11 million annually for each 1-cent reduction in price, for a total loss of over $600 million in 1974.[4]

## COMMODITY REVIEW

### METALS

**Cobalt, Copper, Zinc, and Associated Metals.**—The Government of Zaire announced its intention to have the country's entire copper production refined domestically by 1980. By that year expansions announced under the second 5-year plan, combined with the two private-government joint venture developments underway in 1974, are scheduled to increase Zaire's annual copper production to 800,000 tons. Zaire produced just under 500,000 tons of copper in 1974. The Government also reached an agreement in principle to compensate Union Minière with a sum of $100 million for the 1967 expropriation of its mines, which are now run by the state agency Gécamines. It was also agreed that a Zairian marketing company formed in July 1974 would take over the copper marketing operations of SGM effective January 1975. SGM, a subsidiary of Union Minière, will train Zairian personnel and will continue to market Gécamines copper until the national company becomes fully operational.

Gécamines operated 3 underground and 6 open pit mines, 5 mills, 1 copper smelter at Lubumbashi, and 2 electrowinning refineries at Luilu and Shituru, all in Shaba Province. The company provided approximately two-thirds of foreign exchange receipts and one-half of government revenues for Zaire during 1974. Gécamines produced all of Zaire's cobalt and zinc and approximately 95% of its copper, representing total sales revenue of over $1 billion. From this amount $452 million was paid to the Government in duties and taxes.

Copper output of Gécamines advanced 2% to 471,100 tons including 324,000 tons of copper in refined shapes. Byproduct gold (4,662 troy ounces) and silver (1.65 million troy ounces) were recovered during metallurgical processing of copper concentrate. The company also produced 17,500 tons of cobalt as a coproduct, principally from its western group of mines, and 68,700 tons of zinc along with 272 tons of cadmium and 61,700 kilograms of germanium from the Kipushi mine and Kolwezi electrolytic zinc plant. During 1974 Gécamines absorbed by government order the assets, rights, liabilities and activities of Société Métallurgique de Kolwezi (SMK), operator of the electrolytic zinc plant, and of another affiliate, Société Generale Industrielle et Chimique de Likasi (SOGECHIM), which produced sulfuric acid from zinc roaster gases for use in the copper industry. Roasted and unroasted zinc concentrates that were in excess of the needs of the Kolwezi zinc plant were available for export.

Gécamines embarked upon a $250 million expansion plan to increase production to 570,000 tons of copper and 18,500 tons of cobalt by 1978. An additional expansion to 600,000 tons of copper by 1980 was contemplated. This plan included construction of two new open pit mines, Dikuluwe and Mashamba, a new concentrator with an annual capacity of 4 million tons of ore, a flash smelting plant with an annual capacity of 125,000 tons of blister copper and 6,000 tons of 55% white alloy cobalt, and a 100,000-ton-capacity electrolytic refinery all located near Kolwezi. A new acid plant will produce 100,000 tons of sulfuric acid yearly. The two new mines, with combined reserves estimated at 171 million tons of 4.1% copper and 0.3% cobalt, are due to open in late 1975. The timing and success of the entire project are heavily dependent on the completion of the transmission line from Inga Dam to Shaba.

[3] Where necessary, values have been converted from the Zairian currency Zaire to U.S. dollars at the rate of Z1.00=US$2.00.

[4] Work cited in footnote 2.

Sodimiza was controlled 20% by the Zaire Government and 80% by a consortium of the eight major Japanese mining companies. During 1974 the original six-member Japanese consortium was joined by Mitsubishi Metal Corp. and The Dowa Mining Co. Ltd. In its second full year of operating the Mushoshi mine and mill in Shaba Province, Sodimiza increased mine production 10% to 1.5 million tons of ore. Production of 77,000 tons of concentrate with an average copper content of 36% yielded 27,700 tons of contained copper. Most of the concentrate was exported via Lobito, Angola, for smelting and refining in Japan. Sodimiza continued development of the Kinsenda mine during the year, seeking the most suitable mine design to exploit an irregular-shaped ore body and to control serious ground water problems. Production was not expected to begin before 1977 or 1978. Previous estimates placed ore reserves at 100 million tons of 3.5% copper at Mushoshi with 35 million tons of 5.5% copper at Kinsenda.

Sodimiza conducted exploration at two other sites, Mokambo and Kilela-Balanda, where copper deposits have been discovered. All of the mining and exploration activities are contained in a 36,000-square-kilometer concession in southeastern Shaba near the Zambian border. Under the terms of the agreement this concession was reduced by 50% during 1974 to be followed by a 50% reduction of the remainder in 1975.

SMTF continued construction and development of the Tenke-Fungurume project during the year. The scheduled startup date for the planned 150,000-ton-capacity refinery may be delayed past 1977 pending completion of the new Inga transmission lines. Inflation raised the cost of the SMTF project to over $700 million. Reserves of mixed oxide and sulfide ore were estimated at 48 million tons of 5.4% copper and 0.42% cobalt. SMTF plans to use a process involving the conversion of sulfides to oxides prior to recovery of copper by leaching, solvent extraction, and electrowinning.

**Columbium-Tantalum, Gold, Tin, and Tungsten.**—Production of tin contained in cassiterite concentrate in Zaire decreased 13% to 4,675 long tons. Zairetain, 50% owned by the Zairian Government and 50% by Compagnie Géologique et Minière des Ingénieurs et Industriels Belges (GEOMINES), expanded capacity at its Manono mine located in north-central Shaba Province to 100 long tons of concentrate per month in mid-1974. Expansion to 150 long tons per month will be completed in 1975 by recommissioning a washing plant. The mine had reserves for 3 to 4 years of operation at the higher rate. During 1974 the company's four open pit mines produced 1,045 long tons of cassiterite and 30 tons of tantalite. From the former it produced 685 long tons of refined tin ingot for export through the Angolan port of Lobito.

Syndicat Minière de l'Etain (SYMETAIN) is Zaire's largest producer of tin and a major producer of tungsten. Its main production areas are at Kalima and Punia in the Maniema District of Kivu Province. In 1974 SYMETAIN produced 2,484 long tons of tin concentrate and 5 tons of tungsten concentrate.

Cobelmin-Zaire (Cobelmin), a subsidiary of Compagnie Belge d'Enterprises Minières, operated concessions in Kivu Province owned by five smaller mining companies. These companies were Compagnie Minière des Grand Lacs (MGL), Kinoretain, Kindamines, Minerga, and Miluba. Cobelmin's production in 1974 included 18,734 troy ounces of gold, 2,788 long tons of tin concentrate, 28 tons of columbium-tantalum, 290 tons of tungsten concentrate, and 106 tons of thorium concentrate.

A plan was agreed upon to consolidate the major mining companies in Kivu Province into one operating company, with Cobelmin to assume administration of Kivumines, Phibraki, and Somikubi during 1974. It was expected that SYMETAIN will be merged into the group during 1975. A significant participation by the Zairian Government was also expected. The name proposed for the merged firms was Société Minière et Industrielle du Kivu (Sominki).

**Manganese.**—Société Minière de Kisenge operated three open pit manganese mines at Kisenge near the Angolan border. Most of the output was a manganese oxide product containing 48% to 55% manganese; 309,000 tons was produced in 1974, a decrease of 8% from 1973.

## NONMETALS

**Cement.**—Cimenteries du Shaba (Cimshaba), Société des Ciments du Congo (CICO), Ciments Metallurgiques de Likasi

(CML), and Ciments-Lacs operated cement plants and produced a total of 380,000 tons of cement, compared with 537,000 tons in 1973. Cimshaba, one of the major cement companies, produced 91,650 tons of cement, up 16% over 1973; 12,000 tons of lime, up 50%; and 10,200 tons of ballast. These materials were consumed domestically, with Gécamines being a principal user. A shortage of railroad cars and cement bags created severe distribution problems during the year.

**Diamond.**—Production of diamond was 13.6 million carats compared with 12.9 million carats in 1973. Société Minière de Bakwanga (MIBA), located at Mbuji Mayi, East Kasai region, was the principal producer of diamond, mostly of industrial quality. The 1974 production increase of nearly 1 million carats is attributed to improved output from MIBA's crushing bort operation at Lubilash. In November 1973 the Government announced its intention to take over operation of the MIBA diamond mines.

## MINERAL FUELS

**Coal.**—La Société des Charbonnages de la Luena operated a coal mine about 45 miles northwest of Lubudi in southwest Shaba. Production was 103,000 tons, a 10% decline from that of 1973. Peak production was 429,000 tons in 1955; output since then has declined, largely owing to development of hydroelectric power in the region and electrification of the railroads. Also Luena coal is not suitable for coking, and coal for that purpose was imported. Principal consumers of Luena coal were Gécamines and Cimenteries de Lubudi. In connection with Gécamines' expansion plans, a new Lurgi coal gasification plant was expected to increase demand for Luena coal.

**Petroleum.**—Two offshore oilfields were scheduled to be brought into production in 1975 by a consortium of United States, Belgian, and Japanese companies in which Gulf Oil Zaire holds a 50% equity. Initial production of 25,000 barrels per day of high-quality, low-sulfur oil was to begin in late 1975. Discovery wells were drilled in one structure in 1970 and in another structure in 1973. About $25 million was expended in exploration and appraisal of the offshore area through 1973. An estimated $30 million to $35 million was planned to be invested in 1974 and 1975 before the start of production.

Texaco Inc., Royal Dutch/Shell Group (Shell), Mobil Oil Corp., Petrofina, S.A. and Global Energy had licenses to explore for oil in Zaire, chiefly onshore in the central Zaire River Basin and in Bas Zaire. The Government of Zaire reserved the right to participate in the projects at a later date.

The Government, in equal partnership with Italy's Ente Nazionale Idrocarburi (ENI), operates the Sozir petroleum refinery at Moanda, which supplies about 50% of the country's refined petroleum needs. According to plans, annual production at the Sozir refinery was to be increased to 25,000 barrels per day during 1973–74 from the 1972–73 output of 15,000 barrels per day of refined petroleum products. In December 1973 the Government nationalized the marketing facilities of Mobil Oil Co., Texaco Inc., Petrofina, S.A., and Shell, placing marketing operations under control of the Ministry of Energy and a new government agency Petrozaire. This action did not affect investments made by the foreign oil companies in the areas of new exploration and production.

# The Mineral Industry of Zambia

By Gertrude N. Greenspoon [1]

Although efforts to lessen Zambia's dependence on copper as the main source of national income continued in 1974, copper mining contributed over 40% to the value of the gross domestic product (GDP) and accounted for 94% of total export value. Copper is expected to continue as the principal national income earner. Progress continued in developing small mines as expansion plans were made for the Lochinvar gypsum mine and a new mine for the production of feldspar and fluorspar opened in 1973 near Kariba.

Transport problems resulting from the border closure with Southern Rhodesia in 1973 continued. Congestion occurred at the ports of Dar es Salaam, Tanzania; Mombasa, Kenya; and Lobito, Angola. The completion of the Tanzania-Zambia Railway (Tazara), expected by mid-1975, will increase Zambia's trade capacity. The railway crossed into Zambia in August 1973 and on completion will join Zambia's existing railway at Kapiri Mposhi. Most of Zambia's exports and imports will be routed over Tazara to the Tanzanian port of Dar es Salaam.

On March 1, a retirement benefit plan was incorporated in the labor agreement reached with the Mineworkers' Union of Zambia in November 1973. The contract is for 3 years.

## PRODUCTION

The value of mineral production totaled $1,456 million,[2] a 19% increase over that of 1973. Mine production of copper fell 1% but smelter and refinery outputs rose 3% and 6%, respectively. Mine production of lead was unchanged from 1973 but zinc output rose 10% over that of 1973. Production of cobalt metal fell from 2,664 tons to 2,374 tons. Coal production was 14% less than that in 1973.

## TRADE

Continued improvement was recorded in Zambia's trade surplus in 1973. Copper prices continued the strong upward trend that began in the last quarter of 1973 and reached a record $3,366 per ton on April 1, 1974. This together with reduced imports, because of transport problems, resulted in a $616.3 million surplus, nearly triple that in 1972 and the largest since 1969.

The value of total trade and mineral trade, in million dollars, follows:

| | Mineral commodity trade | Total commodity trade |
|---|---|---|
| Exports: | | |
| 1971 | 658.6 | 679.2 |
| 1972 | 813.5 | r 844.8 |
| 1973 | 1,131.4 | 1,157.4 |
| Imports: | | |
| 1971 | 55.8 | 559.0 |
| 1972 r | 53.8 | 627.8 |
| 1973 | 60.4 | 541.1 |

r Revised.

Mineral exports from Zambia in 1973 were valued at $1,131 million, 39% more than those in 1972. Copper exports valued at $1,089 million, 94% of total exports, continued as the leading exchange earner, followed by zinc, lead, and cobalt. These four commodities accounted for 98% of the total exports in 1973. For the fourth consecutive year, Japan was Zambia's major market.

The value of imports in 1973 was $541.1 million, 14% less than that in 1972. Mineral commodities accounted for $60 million, of which $52 million was for mineral fuels.

[1] Mineral specialist, Division of Nonferrous Metals.

[2] Where necessary, values have been converted from the Zambian currency kwacha (K) to U.S. dollars at the rate of K1.00=US$1.56.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, manganese ore was known to have been mined in 1973, and may have been mined in 1971 and 1972 as well, but output was not quantitatively reported and no basis for estimation exists. In 1970, the last year for which manganese ore production was reported, 6,081 tons were produced.

[2] Chiefly contained in blister copper, refinery muds, and electrolytic copper.

[3] Refined silver and silver contained in blister copper, refinery muds, and electrolytic copper.

## Table 2.—Zambia: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum, including alloys, all forms | 729 | 763 | Republic of South Africa 620; Zaire 142. |
| Cadmium metal, unwrought | 15 | 6 | All to Republic of South Africa. |
| Cobalt metal, unwrought | 2,329 | 1,145 | United Kingdom 748; People's Republic of China 200; Poland 60. |
| Copper: | | | |
| Ore and concentrate | 18,116 | -- | |
| Copper bearing residues | 2,005 | 1,449 | Belgium-Luxembourg 1,001; Japan 448. |
| Metal: | | | |
| Scrap | 447 | -- | |
| Unwrought: | | | |
| Unrefined blister | 87,741 | 43,071 | Japan 18,449; United Kingdom 10,924; Yugoslavia 6,030. |
| Refined: | | | |
| Wire bar | 548,448 | 521,259 | United Kingdom 115,550; Japan 114,905; Italy 73,772; West Germany 47,229. |
| Cathode | 72,635 | 104,206 | Japan 40,735; West Germany 23,009; France 21,814; United Kingdom 8,673. |
| Total | 621,083 | 625,465 | |
| Semimanufactures | 389 | 66 | Kenya 54; Pakistan 12. |

## COMMODITY REVIEW

### METALS

**Copper.**—Smelter production of copper rose 3% over that in 1973 and was slightly in excess of the record output in 1969. Mine production dropped for the second successive year and was 1% below that in 1973. Refinery output increased 6% continuing the upward trend begun in 1972.

Mine production of copper by Roan Consolidated Mines Ltd. (RCM) for the year ended June 30, 1974, was 5% higher than that in the same period of 1973. Output by mine, in tons, was as follows:

| Mine | 1973 | 1974 |
|---|---|---|
| Mufulira | 120,700 | 128,500 |
| Luanshya (includes Baluba) | 84,700 | 89,300 |
| Chambishi | 36,200 | 43,700 |
| Chibuluma | 22,600 | 17,900 |
| Kalengwa | 12,200 | 11,700 |
| Total | 276,400 | 291,100 |

Increased output at Mufulira reflected continued recovery efforts from the 1970 accident. At Luanshya higher output from the Baluba section and more ore mined and treated at Chambishi together with increased copper content of the ore resulted in increased outputs. Production from Chibuluma was adversely affected by a decline in grade of ore mined. Refined copper production totaled 281,000 tons, of which 245,100 tons was wirebars, 28,500 tons cathodes, and 7,500 tons was leach cathodes.

Ore production at Mufulira totaled 6.94 million tons averaging 2.16% copper (6.37 million tons and 2.18% in 1973). Smelter production, including concentrates and materials from other mines, was 156,300 tons of anodes. Production of wirebars totaled 110,800 tons. In the smelter, the reverberatory furnaces were converted from coal to heavy fuel oil, and both wirebar furnaces in the refinery were also using heavy fuel oil.

At Luanshya, 7.26 million tons (6.49 million tons in 1973) was mined, including 1.11 million tons from Baluba. Smelter production was 124,800 tons. A total of 1.80 million tons of ore, including 1.57 million tons of sulfide ore was produced from the Chambishi open pit mine. In addition, 145,000 tons was produced from underground operations. The vat leach plant and the Chambishi and Mufulira concentrators treated 2.04 million tons of ore. Treatment of ore at Mufulira ceased in November 1973 when expansions to the Chambishi concentrator were completed.

The Chibuluma operations produced and treated 648,000 tons of ore averaging 2.74% copper and 0.12% cobalt; and 72,000 tons of 2.84% copper ore was

sent to RCM smelters as converter flux. The Kalengwa mine produced 190,000 tons of ore; 108,000 tons was treated, and ore and concentrate produced contained 11,700 tons of copper.

Output at the Ndola Copper Refinery rose for the second successive year. Cathodes produced totaled 137,300 tons (133,200 tons in 1973), and the casting plant produced 169,700 tons of wirebars (156,600 tons in 1973).

Ore reserve data for the RCM group at the end of June 1974 follows:

| Mine | Ore (thousand metric tons) | Copper (%) |
|---|---|---|
| Luanshya | 141,797 | 2.58 |
| Mufulira | 140,697 | 3.22 |
| Chambishi | 43,177 | 2.93 |
| Chibuluma | 8,173 | 4.74 |
| Kalengwa | 1,231 | 6.67 |

Development of Kalulushi East, south of Chibuluma, continued. Ore reserves were estimated at 3.8 million tons averaging 4.15% copper. Application for a mining license has been made, and it is estimated that about $25 million will be needed to bring the mine into production. Production is scheduled for 1979 when the ore supply from the two shafts at Chibuluma will begin to decline. Ore production at the two shafts will cease in 1981 at which time the Kalulushi East will be in full production.

RCM was preparing to construct a plant to recover precious metals from the electrolytic refinery slimes produced at its refinery and at Nchanga Consolidated Copper Mines, Ltd. (NCCM). This material is now shipped abroad for treatment.

NCCM produced 408,800 tons of copper in the year ended March 31, 1974, compared with 440,000 tons in the same period of 1973. Smelter and leaching plant output totaled 403,900 tons. In addition, 9,100 tons was produced at RCM plants and total output was 413,000 tons.

A total of 5.9 million tons of ore was produced by the Rokana division, of which 57% was from the Mindola ore body. The concentrator treated 5.7 million tons of underground ore and produced 285,400 tons of copper concentrate averaging 30.63% copper and 0.67% cobalt and 53,600 tons of cobalt concentrate containing 6.69% copper and 4.51% cobalt. In addition, the concentrator treated 47,000 tons of ore from open pit operations, and the Torco plant treated 163,200 tons of ore. Output of anode and blister copper was 286,700 tons, and refinery production totaled 324,000 tons. Heavy fuel oil burning facilities were installed on the reverberatory furnaces during the year, and two units in the refinery tankhouse were converted to periodic current reversal operations.

At the Bwana Mkubwa open pit mine, 854,000 tons of ore averaging 3.27% copper was mined. The concentrator treated 677,400 tons of ore and produced 97,200 tons of concentrate containing 16.47% copper. Copper contained in concentrate was 16,000 tons.

The Chingola division produced 9.8 million tons of 3.54% copper ore of which 6.7 million tons came from the Nchanga, Chingola, Mimbula, and Fitula open pit operations. The remainder was from the Lower and Upper underground mines. The Konkola concentrator treated 1.5 million tons of Chingola ore and produced 25,200 tons of 50.79% copper sulfide concentrate and 113,200 tons of 18.22% copper oxide concentrate. The high-grade leach plant produced a record 111,400 tons of copper, but delays due to shortage of construction materials affected production at the low-grade leach plant. Stage I, the cementation plant, operated until November 1973, and in December the first phase of Stage II, the solvent extraction plant, was brought into production. The entire Stage II of the plant was expected to be operational in September 1974, with the complete plant in operation in October.

Ore mined and milled at the Konkola division totaled 1.7 million tons of ore and yielded 47,100 tons of copper in concentrate.

The decision was made to proceed with reopening of the Kansanshi mine. The mine is located near Solwezi in Northwestern Province and was closed after flooding in 1957. Operations will consist of an open pit mine and a leach, solvent extraction, and electrowinning plant. About

26,000 tons of copper will be produced annually. Operations were expected to begin in late 1977 and the project will cost about $70 million.

Ore reserve data for the NCCM group at yearend 1973 follows:

| Mine | Ore (thousand metric tons) | Copper (%) |
|---|---|---|
| Chingola | 254,130 | 3.45 |
| Bancroft (Konkola) | 126,048 | 3.56 |
| Nkana (Rokana) | 122,006 | 2.51 |
| Bwana Mkubwa (Rokana) | 3,887 | 3.62 |

In addition to the expansion plans of the two copper mining groups, Geomin, a Romanian-based mineral development company, in a joint venture with Mindeco, Ltd., formed a new company, Mikambo Development Co., Ltd., to investigate the feasibility of beginning operations at Mokambo near the Zairian border. The mine is believed to contain sufficient ore to provide 15,000 tons of copper in concentrate annually for about 12 years.

**Lead and Zinc.**—The Broken Hill division of NCCM produced 444,900 tons of lead-zinc ore, 25% more than that in 1973. The increase resulted from greater tonnage of ore mined to compensate for the declining ore grade in the deeper levels of the mine. The concentrator treated 422,200 tons of ore containing 8.5% lead and 19.2% zinc, and produced 24,000 tons of lead concentrate averaging 44.8% lead and 35,800 tons of zinc concentrate averaging 58.7% zinc. Production of lead and zinc totaled 25,000 tons and 56,300 tons, respectively, in the year ended March 31, 1974. Reserves at Broken Hill at the end of 1973 totaled 3.3 million tons averaging 23.8% zinc and 10.7% lead.

Difficulty in obtaining steel supplies will delay completion of the Waelz kiln project by nearly 3 months. The new plant was originally scheduled for operation in early 1975.

**Other Metals.**—Cobalt production at the Rokana plant totaled 1,870 tons in the year ended March 31, 1974. The decreased output was due to reduced receipts of cobalt hydroxide from Chambishi division (RCM). The Rokana smelter produced 117,700 tons of byproduct sulfuric acid (100% equivalent) and the Luanshya smelter produced 38,700 tons. Treatment of stockpiled crude silver materials twice during the year at the Broken Hill division yielded 176,118 ounces of silver.

## NONMETALS

The Rokana division cobalt plant produced 13,800 tons of gypsum. Proven and indicated reserves at the Nampundwe sulfur mine totaled 10.9 million tons averaging 16.6% sulfur and 0.63% copper at yearend 1973. The concentrator milled 192,800 tons of ore and produced 81,200 tons of concentrate containing 40.6% sulfur and 2.61% copper.

The Lochinvar gypsum mine in the Kafue Plain will increase output from 500 to 2,000 tons per month when electric power becomes available from the Zambia Electricity Supply Corp. The feldspar-fluorspar operation near Kariba which began production at yearend 1973 has an estimated life of 10 to 15 years and will supply the requirements for the Kapiri Mposhi glass factory which became operational at the end of 1973.

## MINERAL FUELS

The Indeni Petroleum Refining Co., Ltd. oil refinery which became operational in mid-1973 was expected to reach design capacity of 1.1 million tons annually by about 1982–83. Industrial growth in Zambia and the general development in recent years were greater than anticipated and this capacity will now be attained in 1977–78. The Tazama pipeline capacity was increased to 1.1 million tons in line with the refinery. Both projects are under consideration for expansion to about 1.5 million tons annually, and it is estimated that this will satisfy Zambia's requirements to about 1983.

## CONTENTS

## BAHAMAS [1]

Development of the Bahamas as a port, transshipment terminal, and refining center was significantly more important during 1974. The largest single industrial enterprise on the island is the Bahamas Oil Refining Co. (BORCO) refinery in Freeport, which processes 500,000 barrels per day of oil, and has storage facilities for over 18 million barrels of crude oil and petroleum products. Imported crude was valued at approximately $1.5 billion; the main suppliers were Iran, Saudi Arabia, Nigeria, and Gabon. Trinidad was the leading supplier of refined products. According to Ocean Industries, Inc., aragonite production was valued at $1.8 million. Cement production was reported at 794,000 tons; its principal market is in the southeastern United States.

Burmah Oil Bahamas Ltd. expects its transshipment terminal at South Riding Point on Grand Bahama Island to be fully operational in 1975. The terminal is capable of handling 100 million barrels per year of oil, which will gradually increase to a capacity of 200 million barrels over a 2-year period. Supertankers of up to 440,000 deadweight tons are able to berth at this facility and discharge their cargo directly into smaller tankers of up to 80,000 deadweight tons. When smaller tankers are not available, the oil can be pumped through two 36-inch-diameter submarine pipelines connecting the terminal to the onshore storage facilities. The inner harbor is the second major part of the onshore facilities; with a depth of 42 feet, it will accommodate small tankers.

[1] Prepared by Fay D. Dillard, mineral specialist, Division of Petroleum and Natural Gas.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the countries listed individually in this table, Bermuda, Grenada, and St. Lucia presumably produced crude construction materials (clays, sand, gravel, and stone) but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2] In addition to the commodities listed, mineral commodity output may also include crude construction materials (clays, sand, gravel and lime) other than those listed, but data on such production are not collected and available information is inadequate to make reliable estimates of output levels.

[3] In addition, gypsum, iron ore, manganese ore, pyrite and salt, all produced in significant quantities prior to the termination of publication of official statistics, presumably were produced during the period covered by the table, but information is inadequate to formulate reliable estimates of output.

[4] Includes nickel content of nickel oxide and nickel fonte in addition to metallic nickel and ferronickel.

[5] Export figure, all production presumed to be exported.

[6] Erroneously reported as 42-gallon barrels in the previous edition.

[7] Presumably, salt is also produced, but output is not reported and information is inadequate to make reliable estimates of output levels.

[8] Data reported in cubic meters.

[9] Data reported in metric tons.

## BARBADOS [2]

The concession agreement between the Barbados Government and the U.S. firm, General Crude Oil Co. of Houston, Tex., has been renewed until July 1976. During 1974, six operating wells produced about 400 barrels per day of high-quality, almost sulfurless crude oil; the oil was sold to the island's only refinery, owned by Mobil Oil Barbados, Ltd. General Crude estimates it will be producing 1,000 barrels per day by mid-1975. The one producing natural gas well is capable of supplying 200,000 cubic feet per day, or about 57% of local requirements, and prospects for other wells are excellent. General Crude plans to conduct an active exploration program.

The Mobil Oil refinery processed approximately 3,000 barrels per day of petroleum, which was supplied by Venezuela, along with the small amount produced locally. The production of mineral commodities in Barbados is shown in table 1.

[2] Prepared by Fay B. Dillard.

## BERMUDA [3]

A decline in the construction industry in 1974 led to decreased output of construction aggregates, the principal products of the small mining industry in Bermuda. As in past years, mineral production in Bermuda in 1974 consisted of small quantities of sand, dimension limestone, and crushed limestone. Production of crushed limestone totaled about 50,000 tons in 1974. The great bulk of the output was used as aggregate in asphalt mixes; the remainder was used in paving and concrete construction units such as blocks and curbing. Imports consisted principally of petroleum refinery products, precious metals, and construction aggregates.

## CUBA [4]

Estimates of Cuban mineral production are shown in table 1. Detailed information on the Cuban mineral industry is not available, and the following items are from the few published accounts.

An economic pact with the U.S.S.R., signed at yearend 1972, provided for tripling Cuban nickel capacity by the mid-1980's. Cuba also had trade agreements with other centrally planned economy countries that call for increased imports of Cuban nickel, copper, and chrome ores.

### COMMODITY REVIEW

**Metals.**—*Chromite.*—Output in 1974 was estimated at about 20,000 tons. The mines are located in the Moa-Baracoa area in Oriente Province.

*Cobalt.*—Production in 1974 stayed at about the 1973 level of 1,600 tons. The cobalt was produced in sulfide form as a byproduct of nickel production.

[3] Prepared by Harold J. Drake, physical scientist, Division of Nonferrous Metals.
[4] Prepared by William C. Butterman, physical scientist, Division of Nonferrous Metals.

*Copper.*—Production in 1974, estimated at 6,000 tons, came from the Capitan Alberto Fernandez mine (formerly the Matahambre mine) in Pinar del Rio Province.

*Nickel.*—Production in 1974 is believed to have been at about the 1973 level of 32,000 tons. Cuba remained the world's fourth-largest source of nickel. The economic agreements signed with the U.S.S.R. in 1972 called for Cuban nickel output to roughly triple. A new 30,000-ton-per-year plant at Punta Gorda in Oriente Province was to be operational in late 1973, the plants at Moa Bay and Nicaro were to be modernized, and Nicaro's capacity was to be expanded. Expansion of the nickel industry will be furthered by a Soviet agreement to purchase Cuban output through 1980 at a fixed price of $2.27 per pound, and by a trade agreement with Spain that calls for increased imports of Cuban nickel.

**Nonmetals.**—*Cement.*—Production in 1974 was estimated at 1.5 million tons. Cuban cement capacity was estimated at 2.4 million tons in 1972, after completion of two new plants with a combined capacity of nearly 1.1 million tons per year.

## DOMINICAN REPUBLIC [5]

Production of bauxite by the Aluminum Company of America (Alcoa) in Barahona Province was 1,210,000 tons in 1974. Bauxite shipments to the United States totaled 1,303,588 tons. The Government of the Dominican Republic and Alcoa reached an accord at yearend that reportedly would more than double the revenues paid to the Government on bauxite production. Retroactive to April 1, 1974, Alcoa would pay a royalty on bauxite production based on a rate of 5.5% of the average price obtained by Alcoa on sales of primary aluminum metal. The agreement also in-

[5] Prepared by E. Chin, physical scientist, Division of Nonferrous Metals.

cluded revisions in the method of calculating earnings on taxable income. Under the terms of the agreement, the royalties paid on bauxite production would be provisional until Alcoa's dispute on the terms of bauxite production taxation in Jamaica have been settled.

The ferronickel operation of Falconbridge Dominicana C. por A. (Falcondo) operated at or near its design capacity of 63 million pounds per year of nickel in ferronickel. Higher production costs from increased oil prices were partially offset by operational economies and plant modifications. Shipments of ferronickel by Falcondo were expected to contribute more than $60 million per year to the gross foreign exchange revenue of the Republic.

Construction and equipment installation for the Pueblo Viejo gold and silver mining complex of Rosario Dominicana S.A. (Rosario) was essentially completed by yearend. Initial shipments of gold and silver were expected in early 1975. In June 1974, the parent companies, Rosario Resources Corp. and Simplot Industries, Inc., entered into an agreement with the Central Bank of the Dominican Republic whereby the state acquired 20% participation in Rosario. Total investment in the complex was estimated to be in excess of $30 million, the loan portion of which is a combination of finance from Dominican Republic and U.S. banks.

Reserves of oxide ore were estimated at 30 million tons containing 0.128 troy ounce of gold and 0.82 troy ounce of silver per ton. A sulfide deposit underlying the oxide ore has been identified; drilling has proved 17.7 million tons of ore grading 2.19% zinc, 0.252% copper, and 0.131 troy ounce of gold and 1.12 troy ounce of silver per ton. The cyanidation plant, which has a capacity of 8,000 tons per day of ore, will process only the oxide ore in the initial stage of development. When the mine is in full production, which was expected in late 1975, it is scheduled to produce 350,000 troy ounces of gold and 1.5 million troy ounces of silver per year. At this capacity, the Pueblo Viejo mine will be the largest open pit gold producer in the Western Hemisphere.

Cementos Nacionales, S.A., will build a cement plant near the port of San Pedro de Macoris, about 43 miles east of Santa Domingo. The dry process plant, which will have a production capacity of 510,000 tons per year, was scheduled for completion by September 1975. Loan capital from the Export-Import Bank, the Chemical Bank, and the Chase Manhattan Bank will total $20.2 million. In addition, the International Finance Corp. will loan $7.38 million, and an additional $14 million will be financed by Dominican sources.

## HAITI [6]

The bauxite mining operation of Reynolds Haitian Mines S.A. was the only important mineral activity in Haiti. In 1974, production of bauxite by Reynolds was estimated to be 649,000 tons. Bauxite shipments to the U.S. were 598,452 tons. In early December, the Government of Haiti, and Reynolds reached an agreement on a basis for computing a severance tax on bauxite shipments for 1974. The rate per long dry ton of bauxite was slightly less than 0.0146% of the average realized price per short ton of primary aluminum ingot. According to reports, a royalty of 50 cents per ton of bauxite was also applicable. Payment of the severance tax and the royalty for bauxite shipments during the first three quarters of the year were due on December 22 to the Administration Generale des Contribution. The payment for fourth-quarter shipments was due on January 15, 1975. Further negotiations were expected in 1975 to establish final agreement on bauxite tax rates.

The Government of Haiti has proposed the establishment of an independent agency to coordinate mineral activities. The new agency will be charged with formulating a national policy for the improvement and utilization of the country's mineral and energy resources.

## JAMAICA [7]

In 1974, Jamaica was the second-largest bauxite-producing country in the world and the third-largest producer of alumina, the intermediate product in the production of aluminum from bauxite. Alumina and bauxite together accounted for 72% of the total value of all Jamaican exports.

Bauxite and alumina were produced by subsidiaries of six aluminum companies based in the U.S. and Canada. During 1974, bauxite exports increased 8% and alumina exports increased 19%. Bauxite was exported by Kaiser Bauxite Co., Reynolds Jamaica Mines, Ltd., and Alcoa Minerals of Jamaica, Inc. The producers of alumina in Jamaica were as follows:

| Company and plant location | Yearend capacity (thousand metric tons) | Ownership |
|---|---|---|
| Alcan Jamaica, Ltd.: | | Alcan Aluminium Ltd. 100%. |
| Ewarton, St. Catherine | 566 | |
| Kirkvine, Manchester | 558 | |
| Alcoa Minerals of Jamaica, Inc.: | | Aluminum Co. of America 100%. |
| Woodside, Clarendon | 500 | |
| Alumina Partners of Jamaica, Ltd.: | | Reynolds Metals Co. 36.8%, Anaconda Aluminum Co. 36.8%, and Kaiser Aluminum & Chemical Corp. 26.4%. |
| Nain, St. Elizabeth | 1,179 | |
| Revere Jamaica Alumina, Ltd.: | | Revere Copper & Brass, Inc. 100%. |
| Maggotty, St. Elizabeth | 200 | |
| Total | 3,003 | |

The Government of Jamaica was one of seven governments that participated in the organization of the International Bauxite Association (IBA) in 1974. The announced objectives of the member countries of IBA included securing equitable returns from the exploitation of their bauxite resources and effective national control over their bauxite industries. Headquarters for the new organization was established in Kingston, Jamaica.

Early in 1974, the Government of Jamaica requested discussions with the bauxite producers on increasing its revenues from bauxite production and its control and participation in the development of Jamaican bauxite resources. Representatives of the Government and the producers held a series of meetings but were unsuccessful in renegotiating existing bauxite tax agreements.

In June, the Jamaican Government en-

[7] Prepared by Horace F. Kurtz, industry economist, Division of Nonferrous Metals.

acted legislation imposing a new bauxite-production levy, retroactive to January 1, 1974. The new levy was based on a percentage of the realized price on primary aluminum. The applicable rate was set initally at 7.5% and was scheduled to increase to 8.0% on April 1, 1975, and 8.5% on April 1, 1976. Estimates of the levy to be applied in 1974 ranged from $11 to $14 per ton, depending on the assumed price of aluminum. In addition to the levy, the royalty on bauxite production was increased to $0.55 per ton. Jamaican taxes and royalties in 1973 reportedly averaged about $2 per ton. The new bauxite legislation also specified minimum production levels for each producer.

The producers made quarterly payments on the required new levies under protest, claiming violation of previous agreements on taxation. Three of the companies filed requests for arbitration with the World Bank's International Center for Settlement of Investment Disputes (ICSID). The Jamaican Government asserted that ICSID had no jurisdiction in these disputes.

In the last quarter of 1974, the Government began company-by-company negotiations to acquire equity participation in bauxite mining, ownership of bauxite lands, and control of mining rights. An agreement was reached with Kaiser whereby Kaiser would sell the Government its bauxite lands (40,000 acres) and a 51% interest in its mining assets at book value. The Government agreed to provide a 40-year reserve of bauxite at the current rate of extraction under a land-leasing arrangement and to adjust the bauxite levy by keeping it at 7.5% for 3 years and at 1% less than the national levy for two additional years.

By yearend, a preliminary agreement had also been reached with Revere Jamaica Alumina, Ltd., that provided for the purchase of Revere's bauxite lands by Jamaica, a lease back of reserves, and a government and Revere mining partnership. The Government may also participate with six Japanese companies in a proposed expansion of Revere's Maggotty alumina plant. Feasibility studies were in progress.

The Governments of Jamaica and Mexico agreed to establish an integrated bauxite, alumina, and aluminum complex as a joint venture. Announced plans include a bauxite mine to produce at least 1.3 million tons per year, a caustic soda plant, and an alumina plant of 600,000 tons to 800,000 tons per year capacity, all of which will be located in Jamaica. In addition, an aluminum smelter of 120,000 tons per year capacity is to be built in Mexico.

Another bauxite-to-aluminum joint venture being studied involved Jamaica, Guyana, and Trinidad and Tobago. Bauxite and alumina would be supplied by Jamaica and Guyana and a smelter, which would use natural gas from Trinidad for power would be constructed at Point Lisas, Trinidad.

Construction of a plant to produce 18,000 tons per year of galvanized steel sheet was completed during 1974. The plant is a joint venture of Industrial Commercial Development Ltd. of Jamaica (65%) and three Japanese firms (35%), which have formed G.I. Industries Ltd. to operate the plant.

Limestone, Jamaica's most abundant mineral raw material, was quarried throughout the island for use as an aggregate in construction and was used in making cement and lime. Cement production declined slightly during the year to 399,000 tons. Lime production, mainly for use in making alumina, increased sharply to about 305,000 tons. Gypsum production, most of which was exported, declined to 269,000.

Esso West Indies, Ltd., operated the only petroleum refinery in Jamaica. The plant, located at Kingston, used imported crude oil.

## Table 11.—Jamaica: Exports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |

[1] Less than ½ unit.
[2] Value of silver metal imported in 1972 was $371,000.
[3] Value of other ore and concentrate of metals in 1973 was insignificant.
[4] Excludes products not reported in quantitatively but valued at $777,552 in 1972 and $27,668 in 1973.
[5] Value of precious and semiprecious stones in 1972 was $63,000.
[6] Fuel briquets (coal, lignite, coke and/or peat) were 447 metric tons in 1972.

## MARTINIQUE [8]

Mineral production in Martinique in 1974 consisted of construction aggregates, clays, marine salt, fertilizers, cement, and petroleum refinery products. Production of crushed stone in 1974 totaled 292,000 tons; salt, 300,000 tons; and pumice, 110,000 tons. No official statistics were reported on the output of fertilizer and cement. Output from the oil refinery on Martinique consisted principally of 1.2 million barrels of residual fuel oil, 1.7 million barrels of gasoline, and 711,000 barrels of distillate fuel oil.

Mineral production on Guadeloupe consisted principally of construction aggregates and cement. Production of crushed stone totaled 385,000 tons; sand, about 255,000 tons; and pozzalon, 175,000 tons. Output from cement operations was not reported in official statistics.

## NETHERLANDS ANTILLES [9]

In a joint venture involving Bonaire Petroleum Corp. N.V. and Northville Industries Corp. (U.S.), construction began in 1974 on a new transshipment terminal at Bonaire. This site is a natural deep-water harbor and is within easy reach of major crude oil shipping routes connecting the Middle East with the Caribbean and the U.S. east coast. The terminal is being constructed on the sheltered northwest coast of the island and is expected to become operational by July 1975. The dock facilities will be capable of handling supertankers up to 500,000 deadweight tons, and will have an initial storage capacity of 5 million barrels of crude oil and petroleum products. The terminal capacity will be expanded later to 15 million barrels on the present 500-acre site. Freight costs are expected to decline when Middle East oil is transported by supertankers to Bonaire, and then transshipped by smaller coastal tankers to the east coast of the U.S. and Canada.

Curaçao's new transshipment center at Bullen Bay opened officially in June 1974. Plans for expansion from 200,000 barrels per day to 825,000 barrels per day is expected by yearend 1975. There will be six jetties capable of handling tankers with capacities from 20,000 deadweight tons to 530,000 deadweight tons.

The Shell Curaçao N.V. refinery at Emmastad, with a capacity of 460,000 barrels per day, and the Lago Oil and Transport Co. on Aruba, with 440,000 barrels per day, may be augmented by another $25 million refinery at Bonaire if the plans of Northville Industries are successful. The production of mineral commodities in the Netherlands Antilles is shown in table 1.

## TRINIDAD AND TOBAGO [10]

The Government of Trinidad and Tobago became the largest government refiner in the Caribbean in 1974 with the purchase of Shell Trinidad Ltd.'s refinery at a cost of about $46.8 million. Total crude production averaged 186,670 barrels per day during 1974 and proved reserves amounted to 2.5 billion barrels. The petroleum industry continued to account for most of the country's export receipts.

### COMMODITY REVIEW

**Metals.**—*Aluminum.*—An agreement was signed in June 1974 by the Governments of Trinidad and Tobago, Guyana, and Jamaica for the construction of a new aluminum smelter in southern Trinidad. Guyana and Jamaica will supply the alumina and Trinidad and Tobago will supply natural gas as the power source for the operations. Construction is planned to begin in January 1976. The smelter will be the first to be owned by the Caribbean nations themselves. Yugoslavia has offered to help finance this venture and several companies, including Kaiser Aluminum & Chemical Corp. and Alumínio Argentino S.A. (Aluar), have shown an interest in providing the technology.

**Mineral Fuels.**—*Petroleum and Natural Gas.*—An exploration and production license was granted in 1974 to a consortium including Texaco Trinidad Ltd. and Trinidad-Tesoro Petroleum Co. Ltd. for an area off the southeast coast. Production-sharing contracts were awarded to Texaco Trinidad, Mobil Oil Corp., Deminex, and Tenneco, Inc., for four offshore tracts. One of the tracts is in the Gulf of Paria off the west coast and three were off the east coast, comprising approximately 1.2 million acres.

Amoco Trinidad Oil Co., Ltd., began development in 1974 of its new Poui Field off the east coast of Trinidad. In early October, the Poui A–1 well tested approximately 4,000 barrels per day of low-sulfur oil. A production platform is being completed adjacent to the drilling platform; however, until it is available, Poui A pro-

[10] Prepared by Fay B. Dillard.

duction will be fed into an 18-inch underwater line connected with other Amoco Trinidad offshore platforms to onshore storage facilities at Galeota Point. At yearend, 52 wells were producing from the seven operational platforms, including the Poui platform, that have been installed by Amoco Trinidad off the east coast of the island. Within the next year, two additional drilling platforms are expected to be completed. Drilling continued in the Samaan and Teak Fields. Amoco Trinidad drilled 18 development wells in 1974, and 29 wells are scheduled for 1975. Crude oil output was approximately 100,000 barrels per day by yearend.

The Government of Trinidad and Tobago purchased the oil properties of Shell Trinidad in August 1974. They include a 100,000-barrel-per-day refinery at Point Fortin in southwestern Trinidad, a chain of service stations, and about 24,000 barrels per day of onshore and offshore crude oil production. The government-owned company was renamed the Trinidad and Tobago Oil Co., Ltd. Trinidad-Tesoro Petroleum Co., Ltd., an affiliate of Tesoro Petroleum Corp. of San Antonio, Tex., has been named to manage the former Shell properties; the operations will be carried out on a fee basis. The Government is a 50.1% partner in Trinidad-Tesoro, which has a production of about 40,000 barrels per day of crude oil and 32 million cubic feet per day of natural gas.

The Government has authorized Shell International to form a new company in Trinidad, to be known as Shell Chemicals and Services—East Caribbean Ltd., to continue the activities of Shell Trinidad that the Government did not acquire. These activities will include providing chemical and aviation services, supplying base oils and additives, and providing the technical services required.

Gross natural gas production increased substantially in 1974 and large reserves have been established. Amoco Trinidad's discovery of proven and potential natural gas reserves off the southeast coast of Trinidad are estimated at 11.2 trillion cubic feet. A new pipeline is to be constructed across Trinidad to take newly discovered gas from the west coast to Point Lisas, where major industrial development is to take place. Plans call for the construction of two 1,200-ton-per-day ammonia plants. Feasibility studies were undertaken on several petroleum-based industrial enterprises. Another industrial project in the planning stage is an iron- and steelworks to make sponge iron, either for use within the Caribbean or for export. The Government expects to hold majority control in these new ventures. During 1974, plans were terminated for the liquefaction of natural gas and its transport to the Texas gulf coast by ocean tankers. Although this was a severe setback to the Government's hopes of developing this new industry, discussions were expected to begin immediately on a new contract for the liquefied natural gas (LNG) plant.

Production of mineral commodities in Trinidad and Tobago is shown in table 1.

The exports and reexports of mineral commodities are reported in table 14. The imports in mineral commodities are reported in table 15.

# The Mineral Industry of Central American Countries

By Ronald J. DeFilippo [1]

## CONTENTS

## BELIZE

Belize imported over 80% of its mineral requirements including all of its petroleum supplies in 1974. Mineral production was confined to limestone, sand, gravel, and marl, all for internal use. The total value of all mineral production was about $2.6 million [2] compared with $3.4 million in 1973.

The Caribbean Development Bank approved loans to Belize totaling almost $16 million for a deepwater port, roads, electric power, an industrial center, and other projects.

[1] Physical scientist, Division of Nonferrous Metals.
[2] Where necessary, values have been converted from Belize dollars (BZ) to U.S. dollars at the rate of BZ$1.60=US$1.00.

## COSTA RICA

Of the commodities showing the largest increases in production in 1974 over that of 1973 are silver, 934%; marble, 437%; gold, 131%; lime, 69%; and cement, 10%.

President Quiros outlined the Government's economic policy for the next 4 years at his inauguration in May. Included were plans for more active development of the country's reserves of bauxite, sulfur, copper, iron and gold, and development of basic industries, notably hydroelectricity, petrochemicals, and cement. Some of the problems which have hindered development in the past were an inadequate transportation system, incomplete geological information, the small size of most ore bodies, and the low grades of most mineral occurrences.

**Table 2.—Costa Rica: Exports of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |

r Revised.

1 Metal oxides and hydroxides excluded as they were reported inseparably from metal salts and other compounds.

2 Less than ½ unit.

### COMMODITY REVIEW

**Metals.**—*Aluminum, Copper, Lead, and Zinc.*—Exploration for bauxite continued on the Santa Flera peninsula at Cordillera de Talamanca. Construction of a smelter scheduled to begin in 1974 was delayed.

Swiss Aluminium Mining of Costa Rica, S.A. (SAMCOSA), was developing its Cerro Boruca mine near San Isidro del General and was also exploring a copper-molybdenum prospect. SAMCOSA was also developing its Bajo de Limon lead-zinc mine near Turrucares by incline and adit.

*Gold.*—Bulora Corp. Ltd., through its subsidiary Esperanza Mines Corp., completed underground development and surface facilities at the reopened El Libano mine located near Tilaran. The modern cyanide process plant has a capacity of 100 tons per day which could be increased later to 200 tons per day. A 15-degree decline was being driven with sufficient size to permit trackless mining. The company's property around the mine encompassed 35 square kilometers and was reported to have many gold showings. The company was looking at other old gold properties in Costa Rica and negotiations were underway regarding three of them.

**Mineral Fuels.**—*Petroleum.*—Costa Rica imported all its petroleum requirements from Venezuela. Late in the year the Government offered offshore gas and oil exploration concessions in an attempt to develop domestic reserves.

Planning was still underway for four new 200,000-barrel-per-day oil refineries to supplement the Government's small facility at Puerto Limon.

## EL SALVADOR

Gold and silver production were up 15% and 37%, respectively, over that of 1973. Production of extruded aluminum increased by 22%.

The Comisión Ejecutiva Hidroelectrica del Rio Lempe (CEL) was nearing completion of a 30-megawatt geothermal plant. Two similar plants were planned in the same area by 1977 and 1979. CEL was also making studies on a new hydroelectric plant at San Lorenzo. The construction of hydroelectric and geothermal powerplants was intended to end El Salvador's dependence on petroleum for electrical power generation.

## COMMODITY REVIEW

**Metals.**—*Gold.*—San Sebastian Mines, Inc., increased production to 1,200 troy ounces of gold per month. The property was being exploited under lease by San Sebastian Gold Mines, Inc., of Nevada. Still in the planning stage was a $1 million program to improve efficiency by reducing mining and processing costs from $65 to $45 per ounce. The deposits are located in the eastern part of El Salvador.

Minas San Cristobal, S.A., owned by Canadian Javelin, Ltd., was completing development of its Encuentos gold and silver mine. The San Cristobal mine produced throughout the year; the ore assayed 5 troy ounces of silver and 0.087 troy ounces of gold per ton. Both mines will send ore to the Minas San Cristobal mill where plans were underway to increase capacity from 32,000 tons to 75,000 tons of ore per year. Drilling programs were in progress, and if sufficient ore reserves are discovered, the capacity of the plant may be increased to as much as 150,000 tons per year by 1977.

**Mineral Fuels.**—Late in the year, the Government opened a major offshore tract to oil exploration. Approximately 19,000 square kilometers were being offered in 33 exploratory zones including one area of potential contention with Honduras located opposite the mouth of the Gulf of Fonesca. The Comisión Nacional del Petroleo received numerous inquiries from United States and other foreign firms interested in bidding for these concessions. The oil exploration program was being handled under the legal aegis of Decree 86 (September 13, 1974), an executive order amplifying the existing Mining Code and Complementary Law on Mining.

The Ministry of Economy requested an additional $70,000 [3] to initiate oil exploration and development surveys by the Comisión Nacional del Petroleo.

# GUATEMALA

On June 12 the Guatemalan Congress passed a decree amending the 1955 petroleum code. Under the decree, petroleum operations contracts rather than government-granted concessions would be awarded as a basis for exploration or exploitation. The taxation system was also altered so that petroleum companies would pay an in-kind tax equivalent to 40% of total petroleum production. There was no required percentage of Guatemalan equity participation, but no operations would be

[3] Where necessary, values have been converted from El Salvador colon(ES¢) to U.S. dollars at the rate of ES¢1.00=US$0.40.

allowed to exceed a 30-year duration. There would be no import duties on petroleum equipment or raw materials unless available in Guatemala. Exports of petroleum would be exempt from duties. The petroleum code was not to be retroactive.

### COMMODITY REVIEW

**Metals.**—*Copper.*—The Oxec copper mine in Santa María Cahabon was the newest and most important metal producer in 1974. The concession for the mine was held by Transmetales Limitada, a division of Recursos del Norte Limitada, which in turn is a subsidiary of Basic Resources International, a Luxembourg firm. Production from the mine, with a capacity of 25,000 tons per year, will be sold to the Spanish smelting firm Rio Tinto Patino, S.A., an affiliate of Rio Tinto-Zinc Corp., Ltd., a United Kingdom company. The first shipment of copper concentrate left Puerto Barricos at the end of March. Reserves at the mine were equivalent to about 5 years of production.

*Nickel.*—The most important mineral development for Guatemala was the anticipated mining and refining of nickel near El Estor by Exploraciones y Explotociones Mineras Izabel, S.A. (Exmibal), a joint venture between International Nickel Co. Inc. and The Hanna Mining Co. When the plant is completed in 1976, it will produce 12,700 tons of nickel per year in the form of a sulfide matte containing 75% nickel. Exmibal was also exploring for petroleum to provide an adequate supply of fuel at reasonable cost for the plant. The plant would require 21 kilograms of petroleum per kilogram of nickel produced.

*Silver.*—Plata Ltd., a firm owned by two resident Americans, was exploring for silver near San Pedro Sacatepequez. If enough reserves can be proven, the company may begin production in 2 years. Tormex was exploring for silver in the Department of Chiquimila. Diamond drilling gave encouraging results but production was not expected to begin until yearend 1975

*Zinc.*—Tormex Mining Developers, Ltd., was involved in a program of diamond drilling and drifting at its Minas de Oriente zinc-lead-silver concession 70 miles east of Guatemala City. A small portion of the 40-square-kilometer concession was explored. Reserves of 1.6 million tons of ore grading 6% zinc were outlined and determined to be suitable for open pit mining.

**Nonmetals.**—*Feldspar and Silica.*—Industria Centroamericana de Vidrio, S.A. (Cavisa), the local glass manufacturing plant, began to supply some of its own feldspar and silica sand. Feldspar reserves were considered sufficient for 60 years at a production rate of 50,000 tons per year. About two-thirds of the feldspar production was planned for export. The doubling of the price of silica sand on the international market encouraged Cavisa to begin exploiting domestic deposits, but none of the sand was to be exported.

**Mineral Fuels.**—*Petroleum.*—Shenandoah Oil Corp. in a joint venture with three other companies reported encouraging results from the Rubelsanto No. 1 well in northeast Guatemala, about 10 miles from the Gulf coast. In the best test the well flowed at a rate of 2,250 barrels per day of 30-degree gravity oil from intervals at depths of 1,578 and 1,601 meters. The total depth of the well was 1,624 meters. Late in the year, two more wildcats were being drilled in the same Rubelsanto structure where the Shenandoah group has exploration rights on 900,000 acres. This discovery was the first successful petroleum venture in the country and drilling was initiated as a result of finds in the neighboring Chiapas-Tabasco Field of Mexico and sulfur exploration drill holes. The Cretaceous oil-producing formation may extend from Mexico through to Belize. By yearend the Government had 35 applications from interested oil companies for exploration permits.

## HONDURAS

Mine production of antimony and gold more than doubled over that of 1973 while cadmium production increased 53%; lead, 1%; silver, 16%; and zinc, 22%. The mining industry of Honduras contributed about 2% to the gross national product.

The Government publicly recognized the need for foreign investment to supplement Honduran capital in the development process. Public sentiment is that foreign investors should participate on a minority basis wherever possible. The labor law requires at least 90% Honduran employment at most enterprises.

## Table 6.—Honduras: Exports of mineral commodities

(Metric tons unless otherwise specified)

## COMMODITY REVIEW

**Metals.**—*Silver, Gold, Lead, and Zinc.*—Rosario Resources Corp. (Rosario) owned the El Mochito mine in the Department of Santa Barbera, the largest mining operation in Honduras. Higher metal prices and 95% increase in mine production in 1974 gave El Mochito the most profitable year in its 26-year history.

Production at El Mochito in 1974 is shown in the following tabulation:[1]

| | Silver (troy ounces) | Gold (troy ounces) | Lead (metric tons) | Zinc (metric tons) |
|---|---|---|---|---|
| Lead concentrates | 2,527,264 | 1,319 | 19,096 | 2,935 |
| Zinc concentrates | 682,878 | 566 | 1,500 | 20,311 |
| Doré bullion | 220,373 | 252 | -- | -- |
| Total | 3,430,515 | 2,137 | 20,596 | 23,246 |

1 Data differs from that shown on table 1 because of difference in source.

Cadmium contained-in-concentrates amounted to 247 and 217 tons in 1973 and 1974, respectively.

El Mochito produced 297,511 tons of ore grading 7.83% lead, 8.61% zinc, 11.19 troy ounces of silver and 0.007 troy ounce of gold per ton. Development activities were concentrated on the delineation of the Yojoa and Main ore bodies on the 1850 level. Exploration, delineation, and development of the San Juan ore body continued; the first shrinkage stope on the 1350 level was placed in operation late in 1974 and a second stope was started.

Ore reserves in the Main and Yojoa ore bodies were given as 1.6 million tons grading 10.32% lead, 10.62% zinc, and 12.3 troy ounces of silver and 0.007 troy ounce of gold per ton. San Juan ore body reserves were increased to 3.7 million tons grading 2.88% lead, 7.74% zinc, 0.38% copper, and 2.93 troy ounces of silver, and 0.002 troy ounce of gold per ton. Total reserves of both ore bodies were thus increased by 873,690 tons to 5,258,221 tons with an average grade of 5.73 ounces of silver and 0.003 troy ounce of gold per ton; 5.10% lead; 8.60% zinc, and 0.26% copper.

An exploration program was initiated using geophysical and geochemical methods to trace the Porvenir fault zone from the San Juan ore body to the southwest. Rosario's exploration teams cut 46 miles of exploration lines for this project. Overall exploration of the Mochito Basin suggested a number of new target areas related to geological structure extrapolated from the El Mochito mine.

The American Smelting and Refining Company/Rosario joint venture began a deep exploration program utilizing the old Rosario mine in which almost 5,000 meters of adit and drilling work was conducted. Rosario was investigating the possibility of another joint venture with Imperial Smelting Ltd. and Brownsville Refining Co. to establish a smelter to process zinc, lead, and copper. Rosario planned to use the

sulfuric acid from the smelter to produce fertilizer from Rosario's phosphate deposits in Florida.

Allizanza Industrial, S.A., a subsidiary of NRD Mining Ltd. of Canada, started a program to determine the potential of the Tatumbula gold prospect near Tegucigalpa. The prospect was explored in 1950 and at that time 225,000 tons of ore grading 0.2 troy ounce of gold per ton and 0.5 troy ounce of silver per ton was indicated.

**Nonmetals.**—*Cement.*—Bell Western Corp. planned to spend $50 million, to build a 600,000-ton-per-year cement plant, located between Omoa and Cuyamel on the north coast. Ancillary developments at the site would include a bulkloading port facility and a limestone mine, and the first development of domestic coal deposits for use in fueling the cement kilns.

**Mineral Fuels.**—*Coal.*—For fueling its cement plant kilns, Bell Western applied to the Government for rights to exploit a coal deposit in the Province of Yoro some 30 kilometers from the town of Victoria. The coal would be transported by pipeline as a slurry to Santa Rita and then by rail to the plants at Puerto Cortes.

*Petroleum.*—Exploration activity increased on concessions held by 12 companies, and additional concessions were requested by two companies. The companies active in exploration were Mobil Oil Co. Ltd., Signal Oil Co., Union Oil Co., Standard Oil of California, Petroleos Hondorenos, S.A., Shell Oil Co., Louisiana Land Exploration, and Petroleos de Atlantido, S.A. Mobil held concessions under three different names: Mobil Company of Honduras, Mobil Petroleum Honduras, and Mobil Exploration Honduras. Petroleos Weeks de Honduras and Empresa Centro Americano de Inversiones, S.A., were also seeking exploration areas.

## NICARAGUA

Significant increases in production over those of 1973 were registered in copper, silver, lead, zinc, and cement. Gold production decreased slightly.

Representatives of Nicaragua and Honduras negotiated the extension of their bilateral trade treaty which will maintain significant trade in mineral products between the countries.

## COMMODITY REVIEW

**Metals.**—*Copper.*—Rosario Mining of Nicaragua, Inc., a wholly-owned subsidiary of Rosario Resources, Inc., acquired a permit to mine about 1.2 million tons of copper ore grading 0.36% copper from below the bottom of the main Rosita pit. A total of about 610,000 tons of ore was milled from the main pit and from a small auxiliary pit known as the R–13. By yearend Rosario was converting the copper mill at Rosita to a gold mill.

*Gold.*—Rosario Resources spent most of the year rehabilitating the shaft and dewatering the Siuna mine. At yearend, proven reserves at Siuna were 2.6 million tons grading 0.097 troy ounce of gold per ton; probable reserves were 6.7 million tons grading 0.074 troy ounce of gold per ton. Late in the year, Rosario resumed ore deliveries from the Riscos de Oro mine, an open pit gold mine about 15 miles from the Rosita mine. Total deliveries were 13,400 tons of gold-silver ore grading 0.055 troy ounce of gold and 3.76 troy ounces of silver per ton. The Rosita copper mill was being converted to a 500-ton-per-day gold mill with a cyanide section. The discovery of considerable gold reserves including those at closed gold-silver mines was the main factor in converting the Rosita mill to a silver-gold operation. Rosario was conducting intensified surface exploration and drilling on the 4,424-square-kilometer plot surrounding the Siuna, Rosita, and Riscos de Oro mines. Exploration also was conducted on a 495-square-kilometer section of the Riscos property.

**Nonmetals.**—*Cement.*—Production of portland cement increased for the second consecutive year from 192,195 tons in 1973 to 235,732 tons in 1974, reflecting a continued demand for construction materials in Managua, damaged in the 1972 earthquake. Once Managua is rebuilt, cement manufacturers believe that cement will be exported to other Central American countries. The capacity of Nicaragua's only cement manufacturing plant was increased from 193,000 to 270,000 tons.

**Mineral Fuels.**—*Petroleum.*—Nicaragua imported all its crude and refined petroleum from Venezuela. Crude oil imports increased by 8% over those of 1973. There was one petroleum refinery in Nicaragua which was operated by Esso Standard Oil, S.A., with an installed refining capacity of 21,000 barrels per day. Texaco Inc. and Gulf Oil Corp. began oil exploration on the Pacific Continental Shelf. Texasgulf had a 3-million-acre oil and gas concession off the Pacific coast. Partners in the venture were Royal Dutch Shell, El Paso Natural Gas Co., and Oceanic Exploration Co. A test well was drilled by El Paso on an adjacent concession and several large structures were mapped. An exploration well was planned for 1975.

# PANAMA

The major mineral industry of the country was mining of construction materials but there was very active exploration for copper materials and petroleum refining. Panama imported all its crude oil from Ecuador, Venezuela, and Saudi Arabia for its single refinery. Panama's major mineral export commodity were refiinery products which were shipped to the United States.

## COMMODITY REVIEW

**Metals.**—*Copper.*—From 1965 to 1974 about one-half of Panama was explored for copper mineralization. By yearend 1974 four major copper deposits were being investigated: Cerro Charca by Asarco Exploration Co. (subsidiary of American Smelting and Refining Company); Cerro Colorado by Pavonia Exploration, S.A. (owned by Canadian Javelin, Ltd. (CJL)); Cerro Petaquilla by Cobre Panamá, S.A. (Cobre); and Rio Pito, which is to be further explored by Noranda Exploration, a subsidiary of Noranda Mines, Ltd.

In evaluating the impact of the exploitation of copper resources, the Panamanian Director for Mineral Resources recommended that the net profit of private industry should be at least 15%, while Government participation in gross earnings should be at least 60%. He estimated that over the 4- to 5-year period necessary to recoup the original investment, an annual average of $81 million would be earned by the Government and $54 million by industry. These figures were based on a production average of 100,000 tons per day of 0.6% copper ore for the entire copper industry.

Of the four major copper projects in Panama, the Cerro Colorado deposit located in Chiriqui Province has drawn the most attention. By yearend CJL, through its subsidiary, Pavonia Exploration, was organizing a Canadian-British-Japanese consortium to explore the deposit. The Government was still considering the proposed contract at yearend.

Diamond drilling of the Cerro Colorado deposit by Pavonia showed 2 billion tons of proven copper ore reserves and an additional 2 billion tons combined probable and possible reserves all grading about 0.61% copper. The government-owned Banco Nacional S.A. estimated that the Cerro Colorado deposit could employ 3,000 to 4,000 workers. Plans called for daily production and processing of 80,000 tons of ore which would give the mine an operating life of 50 years. Development of the mine and related plant facilities would require 5 years and would cost an estimated $500 to $800 million.

Meanwhile, Cobre reported a potential of 300 million tons of ore from which yearly production would be about 30,000 tons of copper. Intensive exploration was planned to start in May 1975 and to continue through September 1977. Cobre was formed by Japanese interests headed by Mitsui Mining & Smelting Co., Ltd., and the deposits are located in the petaquilla area of Colón Province.

*Gold.*—In addition to its Cerro Colorado holdings, Pavonia obtained a 68,131-hectare exploration concession in Veraguas Province to outline and extend gold reserves. When Pavonia gained the concession, it announced that it would seek to transfer it to Ottenia, S.A., which is to two-thirds owned by Bison Petroleum and Minerals Ltd. and one-third owned by CJL.

**Mineral Fuels.**—*Petroleum.*—By yearend Panama had no petroleum production and although limited exploration continued as part of a general study on the utilization of the Isthmus as a transportation corridor, a pipeline route was proposed which would extend from Palo Grande (Tocumen) to Bahia Las Minas. The project would also include a pipeline and refinery. The Government would need an estimated $3.5 million for recommended plan studies and land acquisition. Panama would also need to secure crude oil supply commitments from Ecuador, Peru, and possibly from private oil companies to make the trans-Isthmus venture viable. If Panama should become a major petroleum producer, the pipeline and port facilities would be an asset for any potential export trade.

## CONTENTS

## ECUADOR [1]

In 1974, the Ecuadorean economy showed a 45% increase in its current gross domestic product (GDP) compared with that of 1973. Rising petroleum investment, production, and revenues accounted for a substantial portion of an average yearly GDP growth rate of over 8% since 1970. Higher prices for crude petroleum, other mineral commodities, and tropical products contributed to rising export values, totaling about $1.2 billion during the year.

In February, the U.S. Export-Import Bank authorized a direct loan of $2.66 million to Empresa Electrica del Ecuador (EMELEC) and a financial guarantee for an additional $2.66 million loan by Chase Manhattan Bank, New York. The $5.3 million financing was for U.S. equipment and services in expansion of the Estero Salado Thermal Power Station in Guayaquil.

The Government was negotiating new contracts with petroleum companies at yearend. The contracts were expected to grant Corporación Estatal Petrólera Ecuatoriana (CEPE), the state-owned petroleum corporation, the option to acquire an initial 25% equity participation in each company venture, to be increased to 51% under specified conditions.

Among the country's mineral products, petroleum showed the largest increase in value, owing mainly to world price increases in 1974. Petroleum was the principal export totaling, in value, about $613 million compared with $600 million in 1973. The Texaco-Gulf consortium was the only significant producer of crude oil. Its concessions in Oriente Province (upper Amazon River Basin) produced about 240,000 barrels per day until April, when the Government established a production limit of 210,000 barrels per day. This was 16% below the capacity of the connecting pipeline, which terminates on the Pacific Coast at Esmeraldas. Along the geological trend with Texas-Gulf's holdings in Oriente Province, Cayman del Ecuador, the operator for an American consortium, reportedly was ready to enter production at 10,000 barrels per day from its 827,000-acre concession, pending final agreement of terms governing operations.

Work continued at yearend on the construction of a $92 million, 55,600 barrel-per-day refinery at Esmeraldas. A Japanese contracting firm planned to have the facility on-stream in the latter part of 1976. Existing refinery capacity was reportedly about 35,000 barrels per day; 13.1 million barrels of petroleum was processed into refined products during the year. Refinery

[1] Prepared by Thomas G. Clarke, physical scientist, Division of Nonferrous Metals.

output was up about 11% over that in 1973.

In June, CEPE declared it was increasing its equity participation in the Texaco-Gulf consortium to 25% from a former 16% share. Taxes were also increased. A pipeline break, caused by surface flooding, occurred near yearend, reducing production to 70,000 barrels per day in November. Crude production for the year was 16% less than in 1973. Another pipeline break, near Esmeraldas, interrupted production in February 1975.

Proven reserves of petroleum in the Texaco-Gulf concession amounted to 1.8 billion barrels of oil, equivalent to about 20 years of production at established rates. The trans-Andean pipeline used by Texaco-Gulf was estimated to be expandable to 400,000 barrels per day with the addition of several pumping stations. Proven petroleum reserves for the country totaled 5.3 billion barrels, with total resources in all areas estimated at 115 billion barrels.

Outputs of copper and byproduct gold and silver were lower, but zinc production increased over that of 1973. The production of lead concentrate was 143 tons. A total of 32,667 tons of rolled iron and steel products was produced by one firm in Guayaquil during the year. A production increase was recorded in cement.

During the year, the Government determined that five nondomestic companies were qualified to bid on mining concessions in Azuay Province. The two prospective areas for the bidding are in the Chaucha area—a $50 million project expected to result in the processing of 7,000 tons per day of copper-molybdenum ore and the La Plata deposit expected to yield 150 tons per day of copper-lead-zinc-silver concentrates.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] In addition to the commodities listed a variety of crude construction materials (common clays, sand, gravel, and stone) undoubtedly is also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2] Less than ½ unit.

[3] Gem and industrial diamond production are estimated based upon a reported total production.

[4] In addition to this total, the Central Bank of Uruguay reported 63,161 cubic meters of granite as exports.

[5] Recovered from refinery gases.

## FRENCH GUIANA [2]

Only minimal quantities of minerals such as clay, gold, sand and gravel, and crushed stone were believed to have been produced in Guiana during 1974.

Kaw, Observatoire, and Isle de Cayenne are Guiana's bauxite concessions. Thus far, only Kaw has been thoroughly examined. Some development work has been done. Reserves are reportedly 42 million tons containing 47% alumina and 2% silica. Any bauxite production would probably be sent to Surinam for refining to alumina.

## GUYANA [3]

As in previous years bauxite was the major product of the nation's mineral industry. Some of this output was converted to alumina and calcined bauxite. The government-owned Guyana Bauxite Co., Ltd. provided about 80% of the nation's production of bauxite. Bauxite and alumina produced in Guyana was exported for the manufacture of refractories and for processing into aluminum metal. Guyana accounted for almost 4% of world bauxite production and 1% of world alumina production.

The remainder of the country's mineral production consisted of small quantities of gem and industrial diamond and gold.

The Government of Guyana enacted legislation on September 25, 1974, which increased the tax levy on bauxite production from $0.68 to $11.16 per ton. Subsequent negotiations by the Government of Guyana, Reynolds Metals Co. and the Overseas Private Investment Corp. (a U.S. Government agency) allowed an agreement to be prepared for the nationalization of

[2] Prepared by Benjamin Petkof, physical scientist Division of Nonferrous Metals.

[3] Prepared by Benjamin Petkof.

Reynolds properties in Guyana. The Guyana Government agreed to the payment of the approximate book value of the company or $14.5 million for its nationalized assets. Net compensation was reduced to $10 million because of settlement of claims between the Government of Guyana and Reynolds relating to income tax and bauxite production levies.

Complete nationalization occurred on January 1, 1975. With this action all bauxite activities within the country came under direct government control.

**Table 2.—Guyana: Exports and reexports of mineral commodities**

## PARAGUAY [4]

Paraguay is a landlocked country of 157,000 square miles, bordered by Argentina, Bolivia, and Brazil. The economy is mainly pastoral. There are few developed mineral resources.

Mineral production was at record levels in 1974. The volume of production of nonmetals expanded 11% to 3.2 million tons. The value of nonmetals increased 49% to $14.5 million and the value of petroleum refinery products more than doubled to $54.2 million. New annual records were established for each nonmetallic mineral.

There were few mineral exports. Leading mineral imports were crude oil, iron and steel, salt, and asphalt.

Paraguay continued to develop the hydroelectric potential of the Parana and Paraguay Rivers. The $4 billion Itaipu project with Brazil will generate 12,600 megawatts, the world's largest. The Yacyreta-Apipe project with Argentina will generate 3,300 megawatts. Paraguay has reserved the right to sell or use its half of the power output. Plans were developed for construction of a diversion canal to handle the river during the construction of the Itaipu dam. The canal will cost more than $100 million. The completion of these hydroelectric projects in the mid-1980's could drastically transform the Paraguayan economy from an energy-short to an energy-exporting country.

### COMMODITY REVIEW

**Nonmetals.**—*Cement.*—Shipments of cement increased 39% to 103,000 tons and were 26% above the 1971 record. The new hydroelectric dams under construction will require large quantities of cement. Paraguay's share of the cement for the Itaipu dam will be 2 million tons. A new cement plant will be built in Paraguay by Argentina, Brazil, and Paraguay to supply cement for the Itaipu dam. The plant will cost $45 million and have a capacity of 250,000 tons per year. Each country will pay one-third of the total cost of the plant.

*Clays.*—Output of common clay for cement and heavy clay products increased 8% to a record 650,000 tons. Production of kaolin was a record 12,000 tons.

*Gypsum.*—Production of crude gypsum for cement expanded 39% and was 22% above the 1971 record.

*Lime.*—Output of lime increased 5% to a record 26,700 tons.

*Sand.*—Production of common sand was a record 600,000 tons, an increase of 11%. The Itaipu dam will require 5 million tons of sand from Paraguay.

*Stone.*—Output of crushed stone increased 10% to 1.7 million tons, 1% above the 1971 record. Most of the stone was used in cement. The new dams will require large quantities of stone.

**Mineral Fuels.**—*Petroleum.*—Paraguay has produced no crude petroleum and is completely dependent on imports. Crude oil was imported downriver from Bolivia and upriver from Argentina. Imports in 1974 were 230,000 tons, of which one-half came from Bolivia. A 10,000-barrel-per-day refinery at Asuncion is operated by Refineria Paraguaya S.A., which holds a refining monopoly.

An agreement was signed which grants to Exxon the right to explore an area of 3 million hectares along the border with Argentina.

*Refinery Products.*—Output of refinery products decreased 13% below the 1973 record to 1,791,000 barrels. Output of jet fuel was a record 65,000 barrels, but production of distillate fuel oil decreased 14%, kerosine 7%, liquefied petroleum gas (LPG) 16%, and motor gasoline 24%.

[4] Prepared by Avery H. Reed, supervisory physical scientist, Division of Nonmetallic Minerals.

## SURINAM [5]

Bauxite and products made from bauxite continued to be the principal export of Surinam and a major source of its foreign exchange. Surinam was the third largest bauxite-producing country in the world. An alumina plant located at Paranam was believed to be the second largest in the world.

Bauxite was mined by Surinam Aluminum Co. (Suralco), an Aluminum Co. of America (Alcoa) subsidiary, and Billiton Maatschappij Suriname, N.V. Suralco also produced alumina and aluminum and converted bauxite to alumina for Billiton. Exports of bauxite, most of which was shipped to the United States, increased 3% in 1974. Alumina exports declined 11% and went largely to Europe and the United States. Aluminum exports were virtually unchanged.

In March the Government of Surinam was represented at the organizational meeting of the International Bauxite Association (IBA). The announced objectives of IBA included the securing of fair and equitable returns from the exploitation of bauxite resources in member countries and the securing of effective national control over their bauxite industries. The Government officially ratified the statutes of IBA in October.

In December, Suralco and the Government of Surinam signed an interim agreement which would increase bauxite revenues paid to the Government to about $10 per ton retroactive to January 1, 1974. Previous revenues from bauxite have been estimated at $2.50 per ton. Under the agreement, which was effective through 1975, the new bauxite levy will be calculated on the basis of 6% of the average yearly price realized by Alcoa on unalloyed aluminum ingot.

Alcan Aluminum Ltd. and Billiton signed a joint venture agreement in July to establish a new company, Alcan Billiton Suriname N.V. (ABS), which will construct and operate a bauxite calcining plant at Smalkalden. The agreement gave the Surinam Government an option on one-third of the equity in the venture. Plant capacity was expected to be 150,000 tons per year of calcinated bauxite, and production was scheduled to begin in 1976.

[5] Prepared by Horace F. Kurtz, industry economist, Division of Nonferrous Metals.

Reynolds Metals Co., which had been exploring for bauxite in western Surinam under a joint venture with the Government, relinquished its concession and export rights. In acquiring full ownership of the venture, the Government agreed to compensate Reynolds $3.5 million.

Representatives of the Government and Placer Development Ltd. of Canada signed a joint-venture agreement for gold exploration and mining on a concession near the town of Brokopondo. The two parties will share equally in the venture to be known as Surplacer N.V.

An offshore oil exploration program to begin in 1975 was announced by the N.V. Elf Petroleum Suriname—Royal Dutch/Shell consortium which holds an offshore concession. Initial drilling will occur north of Coronie in 125 meters of water.

## URUGUAY [6]

Uruguay is a small country on the east coast of South America, between Argentina and Brazil. It has 72,000 square miles and 3 million people. It is mainly agricultural, with an economy based on wool and meat. There are few known mineral resources. There is little foreign trade in minerals.

Mineral output in 1974 increased 11% to 5.6 million tons of nonmetallic minerals. This was a new yearly record, 5% above the 1972 record. Total value of production increased 35% to $34.6 million but was 12% below the 1972 record. Output of petroleum refinery products increased 1% to 12.2 million barrels, a new record.

Lack of coal and oil resources makes it important to develop the hydroelectric potential. Planning continued on two large projects, the Salto Grande dam on the Uruguay River, a joint $500 million project with Argentina; and the El Palmar dam on the Negro River.

### COMMODITY REVIEW

Cement shipments increased 6% above the 1973 record to 547,000 tons. Clay output increased 14% to 325,500 tons per year, a new record. Output of sand increased 19% to 1.6 million tons. Production of crushed stone increased 7% to 4.6 million tons, a new record.

Refinery output of residual fuel oil increased 4% to 5.3 million barrels. Production of distillate fuel oil decreased 12% to 2.5 million barrels. Sales of gasoline increased 15% to 2.2 million barrels. Use of kerosine decreased 5% to 1.4 million barrels.

A state refining monopoly, Administración Nacional de Combustibles, Alcohol y Portland (ANCAP), has operated a refinery at La Teja, outside Montevideo, since 1937. Current capacity is 49,000 barrels per day. Uruguay is entirely dependent on imports for its oil. In 1974, imports of crude oil were from Kuwait (46%), Nigeria (28%), Iran (20%), and Iraq (6%).

Interest in oil exploration continued. Chevron was awarded a contract to explore offshore, near Punta del Este.

By Staff, Bureau of Mines

## CONTENTS

## ALBANIA [1]

Albania's centrally planned agricultural economy continued its shift towards industrial expansion. As in other East European countries, Albania's production schedules were centrally coordinated and production targets were predetermined in principle by the 1971–75 national plan for economic development.

Economic growth of Albania is closely linked with the development of its significant mineral resources. Albania, in 1974, was the world's third largest producer of chromium ore. Production of other commodities which ranked lower in importance by world standards, but were nevertheless important to the country's economy, were nickeliferous iron ore, copper ore, blister copper, copper wire, crude oil, petroleum products, lignite, natural gas, natural asphalt, and cement.

Compared with 1973 figures, crude oil production, in thousand tons,[2] increased by 55; gasoline by 7; distillate fuel oil by 161; chromium ore by 104; blister copper by 0.42; nickeliferous iron ore by 19; and cement by 37. Natural gas production increased by 23 million cubic meters,[3] and electric power by 96 million kilowatt-hours. There were also increases in the output of coal and steel semimanufactures.

Despite impressive gains in mineral production as reported in the Albanian press, there have also been reports of failures to reach planned goals to supply industry's needs.

Expansion of the mineral industry was achieved through a combination of increased labor, capital, and productivity. There were about 70,000 persons employed in Albania's minerals or minerals-related industries. To ease the shortage of labor in industry, Albanian administrative workers and members of the armed forces had to contribute physical labor to the country's economy. Each year men and unmarried women had to contribute 30 days and married women and members of the police force, 15 days.[4]

As in other East European countries, Albanian trade unions are not wage-bargaining organizations, but function mainly as an avenue for increasing labor productivity and the fulfillment of planned work quotas.

In 1974, the People's Republic of China (PRC) continued to assist in the construction of several industrial projects. These were (1) the Elbasan Metallurgical Combine; (2) the Fierzë 500-megawatt hydroelectric powerplant; (3) the 1-million-ton-per-year Ballësh petroleum refinery; (4) the Burrel chromite concentrator and ferrochrome plant; (5) the Laç copper ore concentration plant; (6) the Fier urea plant; and (7) the Vlora polyvinylchloride plant.

[1] Prepared by Joseph B. Huvos, foreign mineral specialist, Division of Coal.
[2] One metric ton of Albanian crude oil = 6.672 U.S. barrels of 42 gallons.
[3] 1 cubic meter = 35.3145 cubic feet.
[4] Probleme Ekonomike (Tirana). No. 2, April–June 1975, p. 71.

Industrial projects commissioned during 1974 included the 250-megawatt Mao Tse Tung hydroelectric powerplant; the Elbasan-Prrenjas railroad; and the 220-kilovolt Elbasan-Fier; and Bistrice-Konispol electric power transmission lines.

Geological exploration and prospecting increased in 1974. The Gur i Kuq nickeliferous iron ore mine and the Valias coal mine were expanded.

Albania's Council of Ministers, by its decision No. 204 of October 23, 1973, ordered the establishment of quality control organizations during 1974–75.[5]

## PRODUCTION

Mineral production statistics were not officially reported for a number of commodities. Therefore, many of the data were estimated and represent at best an order of magnitude. Production capacity for almost all mineral commodities increased during the year.

Reportedly some 35 minerals were produced in the country in 1974. While output of most mineral industry commodities increased steadily, production goals were not reached in metals, nitrogenous fertilizers, cement, and oil drilling; in some instances there was no demand for the goods produced. The transportation industry failed to reach some targets in 1974.[6]

Construction of roads and railroads continued during 1974 and plans are to expand the domestic railroad network by 43% during the 1976–80 plan period. Of a total of 40.1 million tons of merchandise shipped in 1974 in Albania, 76.1% were transported by road; 21.6% by rail; and 2.3% by sea. About 5.7% of all investment funds in 1973 were spent in the country's transportation and communications industries.

e Estimate. p Preliminary. r Revised. NA Not available.

[1] In addition to the commodities listed, a variety of crude construction materials (common clay, sand, gravel, and stone) is undoubtedly produced, but output is unreported and available general information is inadequate to make reliable estimates of output levels.

[2] Smelter output used as an estimate of mine output inasmuch as there is no evidence of ore and/or concentrate exports.

[3] Petroleum data converted to barrels from metric tons using the following factors: Crude petroleum—6.672; gasoline—8.50; kerosine and jet fuel—7.75; distillate fuel oil—7.46; residual fuel oil—6.66; lubricants—7.00; petroleum wax and jelly—7.87; asphalt and bitumen—6.06; petroleum coke—5.50; unspecified—7.00. The tonnage figures for "unspecified" were derived by subtracting the tonnages for individual products reported from a reported total refinery product figure, which may have excluded refinery fuel.

[4] Sales.

[5] Excludes shipyards production of crude castings.

[6] May include small amounts of other fertilizers.

[7] Calculated on the basis of 11.7% contained nitrogen in total quantity fertilizer reported on preceding line.

[8] Exports.

## TRADE

In Albania's mineral economy, international trade ranks high among industry's priorities. Since the volume of trade is outlined in the national 5-year plan and is conducted by the Ministry of Foreign Trade, planned exports and imports reflect national goals and priorities. There is also an implied commitment to export to achieve the desired trade balance.

Albania's foreign trade continued to be oriented towards the importation of capital goods to increase Albania's self-sufficiency. Exports of minerals and semiproducts helped to pay for these imports. The sale of minerals and their products was carried out largely under bilateral trade agreements negotiated on a State-to-State basis.

In 1973, Albania reported exports of crude oil, bituminous flux, nickeliferous iron ore, chromium ore, blister copper, electrolytic copper, copper wire, and six products of the light or food industries. Other exports not reported included chromium concentrate; rolled steel; electric wire and cables; sulfuric acid and pyrite; soda ash; sodium hyposulphite; selenium; cement; silica brick; marble; and electric power.

Data in the trade tables were compiled from trade returns of trading partner countries, as reported in the World Trade Annual of the United Nations.

It was reported that the Nation's trade volume (exports and imports) reached the 1971–75 plan target 2 years ahead of schedule. The increase in the 1974 trade volume was 11.7% compared with 1973 and 86% compared with 1970. Reportedly, in 1974, Albania exported 350 commodities which included 62% processed goods and mineral products.

Among Albania's trading partners the PRC ranked first with an estimated $245 million, or 70% of all trade (exports and imports) in 1974, and there was a large surplus in favor of the PRC resulting from deliveries under aid credits. Albania had bilateral trade agreements with Yugoslavia, Italy, Austria, Malta, the Sudan, the United States, and the East European countries.

In 1974, U.S. imports from Albania were valued at $483,900 and included $218,144 worth of chromium ore. U.S. exports to Albania were valued at $485,000.

## COMMODITY REVIEW

**Metals.**—Output of metals lagged behind goals as foreseen by the 5-year plan of 1971–75. The production of ores and metals, however, continued to grow and reportedly reached or exceeded the revised plan targets for 1974.

The production of bauxite, manganese ore, lead, zinc, and pyrite concentrate was not reported and available data were not adequate to make reliable estimates of output levels.

*Chromium Ore.*—Albania was the world's third largest producer of chromium ore in 1974 with 9.8% of the world's total production following the U.S.S.R. and the Republic of South Africa. Output from Albania's seven chromium mines reached an estimated 715,000 tons, 104,000 tons more than in 1973. The original 5-year plan called for the production of 900,000 tons of ore in 1975, but the revised plan target for 1974 was 837,000 tons.[7] Chromium ore was Albania's leading export product. In 1973, the country exported 466,000 tons of ore 18,000 tons less than in 1971; exports included 36,254 tons to Poland and 30,000 tons to Romania. The 1974 exports of chromium ore included 104,300 tons to Yugoslavia, 40,945 tons to Italy; 10,035 tons to Hungary; and about 3,000 tons to the United States. The average grade of the chromium ore exported increased from 22.8% $Cr_2O_3$ content in 1960 to 36.5% in 1973. Albania's main chromium mining area is near Batër-Martanesh located 40 kilometers northeast of Tirana in the Mat Valley. The Todo Manco mine in this area was the country's largest,[8] and was equipped with a 200,000-ton-per-year ore beneficiation plant. A smaller mine was located at Zerqan.

Albania's second chrome mining center is in the north near Kam and Kalimash, where a beneficiation plant is to be built during 1976–80. About 25% of the country's chromium ore was processed in 1974. In 1973 the mined ores had an average content of 37.5% $Cr_2O_3$, 13% FeO, and 22% $Al_2O_3$. Concentrates exported in 1974 had a $Cr_2O_3$ content of 41% to 46%. In 1974, with the assistance of the PRC, construction started on the Burrel, Mat District ferrochromium plant which is to supply the Elbasan Metallurgical Combine.

*Copper.*—Albania's blister copper production reached an estimated 7,420 tons in 1974, an increase of 6% over that of 1973. Exports included 2,016 tons of blister and 2,481 tons of copper wire in 1973. While all copper produced in 1965 was exported as blister, about 60% of the copper production in 1975 is to be converted into wire and the remainder into various products such as refined metal, bronze, and brass.[9] Albania's copper mines are in the north. The largest mine is at Gjegjan near the Yugoslav border. The copper concentrates were processed at the Kukës smelter. Another smelter with an electroyltical refinery is located at Rubik. Construction of a large smelter and electrolytical refinery continued at Laç during 1974. When the plant is completed, it will process copper concentrates from the Rubik mine.

The average recoverable copper content of Albanian ores was 1.9% in 1970.

[7] Pages 1–5 of work cited in footnote 6.
[8] Probleme Ekonomike (Tirana), Nos. 5–6, May–June 1974, pp. 3–22.
[9] Work cited in footnote 8.

Copper wire is produced at Shkodër at a plant built with the assistance of the PRC. It was reported that the excess capacity of the mill is to be used for processing imported aluminum ingots.

*Iron Ore, Nickeliferous.*—Production was about 403,000 tons in 1974, an increase of 5% compared with that of 1973. The production target for 1975 was set at 650,000 tons. Exports totaled 318,000 tons in 1973, 72,000 tons less than in 1970. The most important nickeliferous iron ore mines are near Lake Ohrid at Pishkash and Prenjas, Poradec County. The ore is mined in open pits and averaged about 1% nickel. It also contained some cobalt. In 1974, the ore was exported, but in 1975 it is to be used domestically at the Elbasan Metallurgical Combine.

The Elbasan Metallurgical Combine is one of Albania's largest investment projects. The PRC assisted in the plant construction which started in 1971. Pig iron production is to start in 1975. According to plans, the output of all products is to total 800,000 tons per year in 1980 and will include wire, sheets, profiles, bars, and ingots.[10] The plant facilities are to include kiln prereduction of ores followed by smelting in electric arc furnaces. There are also plans to recover the nickel and cobalt from the ores separately at some later date. The rolling and fabricating plants of the combine had been completed in 1970 and are used to process steel into various rolled products. The total output of rolled metal at this plant was about 38,000 tons in 1974, an increase of 5.6% over that of 1973. A railroad for transporting iron ore from the mines in Prenjas to the Elbasan Metallurgical Combine was completed in 1974 and there are plans to extend the railroad to Struga, Yugoslavia.

**Nonmetals.**—In 1974, Albania reported production of cement, nitrogenous and phosphatic fertilizer, soda ash, caustic soda, and unspecified quantities of asbestos, kaolin, dolomite, gypsum, lime, limestone, marble, olivine, quartzite, selenium, silica, sulfur, sulfuric acid, and volcanic glass. Albania did not release data on imports of nonmetals, but Yugoslavia reported exports of 100 tons of talc, 380 tons of sulfur, 600 tons of barite, and 41 tons of bentonite to Albania in 1973.

*Cement.*—The output of cement reached an estimated 555,000 tons in 1974, an increase of 7.1% over that of 1973. Cement production is to reach 1 million tons in 1975. Reportedly some cement was exported in 1974, but no precise data were available. Albania's cement plants are at Elbasan and Fusë – Krujë.

*Fertilizer Materials.*—The output of nitrogen fertilizer was about 110,250 tons, an increase of 4% over that of 1973. A revised production target for nitrogen fertilizer in 1975 was an estimated 200,000 tons. The published production target for nitrogen and phosphatic fertilizer for 1975 was 330,000 tons. Albania's only nitrogenous fertilizer plant was built at Fier with the assistance of the PRC. Output in 1974 included about 50,000 tons of ammonia and unspecified amounts of ammonium nitrate. Construction continued on a urea plant also at Fier, which is to double Albania's nitrogen fertilizer production. The total output of phosphatic fertilizer, including granulated and powdered superphosphate, was 110,000 tons, unchanged as compared with that of 1973. Phosphate rock was supplied by Morocco in 1974.

Construction of the PRC assisted Laç fertilizer plant, the only one in Albania, was completed in 1967. The plant included facilities for production of sulfuric acid; sodium silico-fluoride; sulfates of aluminum, ammonium, chromium, copper, magnesium, and sodium. Raw materials used were imported native sulfur and some domestic pyrite concentrate.

*Sodium Compounds.*—The production of sodium carbonate at the Vlorë caustic soda plant was about 22,000 tons, a 4.8% increase over that of 1973. Construction continued on a second sodium carbonate plant at Vlorë, which would double present production. Caustic soda output in 1973 was 18,000 tons. Marine salt used as a raw material in the plant was replaced in 1974 by rock salt from Delvinë, Sarandë County.[11] Estimated production of rock salt was 50,000 tons in 1974, unchanged as compared with that of 1973.

**Mineral Fuels.**—Albania's estimated production of primary energy from fossil fuels and hydroelectric sources increased from 3.56 million tons of standard fuel equivalent in 1973 to 3.81 million tons in 1974. Estimated output of crude oil increased from 2.2 million to 2.3 million tons and that of natural gas from 190 million to 203 million cubic meters. The share of these

[10] Work cited in footnote 8.
[11] Zeri i Popullit (Tirana), July 14, 1974, p. 3.

fuels in Albania's primary energy supply increased correspondingly from 73.8% in 1973 to 74.8% in 1974. In 1974 Albania produced an estimated 851,000 tons of lignite coal. The share of lignite in the primary energy supply decreased from 21.3% in 1973 to 21.0% in 1974. The share of hydroelectric power decreased from 4.9% to 4.2% during the same period. The trend in Albania's energy was towards an increase in the output of all energy carriers, the elimination of imports of high rank coal and of petroleum products, and the export of surplus fuels and energy.

In 1974 Albania produced an estimated 1,699 million kilowatt-hours of electricity, 6.0% more than in 1973. Thermal powerplants generated 485 million kilowatt-hours of electricity (28.6%) and hydroelectric powerplants 1,213 million kilowatt-hours (71.4%). Installed capacity of electric powerplants at yearend totaled 467,000 kilowatts.

Albanian industry consumed about 72% of the fossil fuels and 9% of the electric energy produced.

Total energy balances of Albania for 1973 and 1974 are shown in table 4.

**Table 4.—Albania: Primary energy balance for 1973 and 1974**
(Million tons of standard fuel equivalent)

| Year | Total primary energy | Coal (lignite) | Crude oil and petroleum products | Natural and associated gas | Hydroelectric power |
|---|---|---|---|---|---|
| 1973: [1] | | | | | |
| Production | 3.56 | 0.46 | 2.73 | 0.23 | 0.14 |
| Imports | 0.02 | .02 | -- | -- | -- |
| Exports | 1.33 | -- | 1.30 | -- | .03 |
| Apparent consumption | 2.25 | .48 | 1.43 | .23 | .11 |
| 1974: [2] | | | | | |
| Production | 3.81 | .48 | 2.93 | .25 | .15 |
| Imports | .02 | .02 | -- | -- | -- |
| Exports | 1.45 | -- | 1.40 | -- | .05 |
| Apparent consumption | 2.38 | .50 | 1.53 | .25 | .10 |

[1] Production and trade data for 1973 taken from Thirty Years of Socialist Albania (Tirana) 1974.
[2] Production and trade data for 1974 reported in Zeri i Popullit (Tirana), Jan. 28, 1975, pp. 1–3, and in other Albanian sources; export trade was taken from trade returns of Albania's trading partner countries.

*Coal (Lignite).*—Lignite production was estimated at 851,000 tons, an increase of 40,000 tons over that of 1973. According to the 5-year plan of 1971–75, the coal production target for 1975 was 1.25 million tons, but the revised plan calls only for 0.894 million tons, or 5% over that of 1974. Albania also imported an estimated 20,000 tons of bituminous coal and coke in 1974 and exported unspecified quantities of lignite during the same year. The calorific value of the lignite mined in Albania was about 4,900 kilocalories per kilogram (8,800 Btu per pound). Albania's largest lignite deposits are near Korcë; the mines are at Mborjë, Drenovë, and Memaliaj in Tepelenë County. Reportedly there was also a coal preparation plant near these mines. In the Tirana area the mines are at Krrabë and Manezë.

*Natural Gas.*—In 1974 Albania produced an estimated 203 million cubic meters of natural gas, 6.8% over 1973 production. According to the original 5-year plan of 1971–75, the 1975 natural gas production target was 255 million cubic meters, but the revised plan for 1975 envisages a target of about 300 million cubic meters.

Albania's gasfields are located in the same area as its oilfields. Reportedly, estimated gas resources were 227 billion cubic meters in 1974.[12] Natural gas was used in the petrochemical industry, thermal power generation and the domestic sector. There are plans to extend Albania's gas pipelines to all major cities by 1980.

*Petroleum.*—Crude oil output in 1974 was 2.255 million tons, 3% more than that of 1973; the production target for 1975 is 2.7 million tons. Exports of crude oil in 1974 amounted to about 441,000 tons and those of bituminous flux about 1,035,000 tons. Several petroleum products which are not produced in the country were im-

[12] Petroleum Publishing Co. International Petroleum Encyclopedia. Tulsa, Okla., 1975.

ported from Italy, Yugoslavia, and Hungary.

Albania's oilfields are at Patos, Marinezë, and Stalin. The crude oil produced had an average specific gravity of 0.8, yielded about 13% gasoline and 40% asphalt, and contained 3% sulfur. Estimated refining capacity in 1974 was 2 million tons, of which 1 million tons was located at Fier and 500,000 tons each at the Stalin and Cerrik installations. Construction continued at the Ballësh 1-million-ton-per-year refinery in 1974. The refinery, built with PRC assistance, is to be equipped with catalytic processing units making Albania independent of imports of petroleum products and is to provide petrochemical feedstock to the country's petrochemical industry such as the polyvinylchloride plant under construction in Vlorë. Albania's oil pipeline system connects the seaport of Vlorë to the country's oilfields and refineries. Construction of a railroad connecting Fier to the Ballësh refinery continued in 1974.

*Electric Energy.*—In the overall energy economy of Albania, hydroelectric power was of major importance. In 1974, hydroelectric powerplants supplied 1,213 million kilowatt-hours, or 71.4% of all electric power generated. At yearend 1974, total capacity of all electric powerplants reached 467,000 kilowatts, of which the capacity of hydroelectric powerplants totaled 325,000 kilowatts.[13] Exports of hydroelectric energy included 364 million kilowatt-hours to Yugoslavia[14] and unspecified amounts to Greece.

In 1974, the following hydroelectric powerplants were in operation: the 5,000-kilowatt "Lenin" and the 20,000-kilowatt "Stalin" powerplants, both on the Bistricë River; the 25,000-kilowatt "Engels"; an unnamed 25,000-kilowatt plant on the Matë River; and the 250,000-kilowatt Mao Tse Tung powerplant, commissioned in 1974, on the Drini River. Construction of the 500,000-kilowatt Fierzë powerplant, also on the Drini River, was continued in 1974. The 200,000-volt Fier-Elbasan and the Bistricë – Konispol powerline was completed in 1974.[15]

## DENMARK (INCLUDING GREENLAND)[16]

A 20% increase in production by the scrap-based iron and steel industry was one of the most favorable developments in the Danish minerals industry in 1974. The increase in steel output was almost solely attributable to Det Danske Staalvalsevaerk A/S (DDS), which continued a program of plant expansion. Also encouraging was the first full year of operations at the Black Angel mine for lead and zinc in Greenland, where exploration for additional mineralization progressed. Construction-oriented nonmetallic minerals did not fare well, as evidenced by declines in sales of cement and in exports of stone, sand, and gravel. No significant production of crude oil was yet achieved. However, exploration and development activity went forward at the Dan Field in the North Sea, and bids were received for oil drilling off western Greenland.

The national economy entered an uncertain period.[17] Domestic demand began falling in 1974, and thus exports became the strongest demand factor. Construction activity declined severely; unemployment rose and was approaching 5% at yearend. Prices increased substantially. Raw materials prices increased 132% for all fuels; 108% for fuel oils; 34% for iron and steel; 30% for other industries; and 61% overall. The consumer price index was 15% higher. Rate of growth of domestic product decreased to about 2% as compared with 4% in 1973. The deficit in the balance of payments about doubled, and the trade deficit for mineral commodities increased markedly as anticipated in view of petroleum price increases.

### PRODUCTION

There continued to be no primary, only secondary production of metals in Denmark. The only metallic ore mining was for lead-zinc ore in Greenland, and this ore was shipped mainly to other European countries for smelting. The main nonmetallic materials mined were chiefly for construction and agricultural purposes: Sand and gravel, stone, chalk (mostly for cement manufacture), and limestone. Detailed mineral production data are not

[13] Bashkimi (Tirana), Nov. 22, 1974, p. 2.
[14] Foreign Trade of Yugoslavia (Belgrade), 1975.
[15] Ylli (Tirana), June 1975, p. 30.
[16] Prepared by Thomas S. Jones, physical scientist, Division of Ferrous Metals.
[17] Danmarks Statistik (Copenhagen). Statistiske Efterretninger, Konjunkturoversigt, December 1974, pp. 51–53; April 1975, 119 pp.

available, but physical output may be inferred roughly from sales data. Sales data, with distortions for inflated petroleum prices, generally paralleled the employment pattern (index of man-hours worked, wage earners only), which in 1974 showed the following changes relative to 1973: Basic metal industries, +14%; fabricated metal products, +3%; chemicals and chemical products, −3%; nonmetal mineral products, −7%; mining and quarrying, −15%; and all industries, −3%.

Thus 1974 was a year in which steel production was strong, about 20% greater than in 1973, and the nonferrous metal industries did about as well as in the year previous, with production of refined pig lead up 11%. Crude oil output from the North Sea was still negligible in relation to domestic demand; refinery throughput, restrained both by price rises and conservation efforts and with no expansion, was down 5%. Developments in the construction industries were definitely negative, cement sales declining 14%.

On the basis of sales, available data on production of mineral commodities are given in table 1.

## TRADE [18]

Denmark's 1974 trade in mineral commodities resulted in another deficit, amounting to about $2.5 billion (DKr 15 billion),[19] an 80% increase compared with 1973 figures.[20] By value, Denmark was a net importer for all mineral commodity groups but metal scrap. The 1974 trade surplus in scrap was due mainly to exports of copper and iron, about equal in value. Value of net scrap exports increased 71%. Value of net imports of mineral commodities increased for all groups except for nonmetallic mineral manufactures, which declined 68%. Largest per year increases in value of net imports were for coal and coke (185%), petroleum and petroleum products (127%), and crude fertilizers and minerals (127%).

Petroleum and petroleum products constituted an increasing portion of net import value, rising to 59% of the total for 1974 from 47% of the total for 1973. Price increases were responsible, as volume of petroleum imports declined while unit value of net imports increased by about 180% for crude oil and 110% for petroleum products. Iron and steel was the only other commodity group which accounted for over 10% of net import value and amounted to 20% of the 1974 total, down from 28% in 1973. In terms of value, distribution of principal imports between commodity groups was about the same both for imports and exports. Petroleum and petroleum products amounted to approximately half or more of each total, while iron and steel comprised about one-fifth and nonferrous metals about one-tenth.

A great majority of Denmark's trade in mineral commodities was with Western Europe, except for petroleum and petroleum products. Even in petroleum, Western European sources accounted for the largest share (47%) of import value; Middle Eastern countries accounted for 36%. Denmark's largest payments for petroleum imports went to Iran (19%), the United Kingdom (17%), the Netherlands (14%), and Saudi Arabia (5%). Sweden was the main buyer of petroleum exports, taking 73% by value; almost all the rest went to other countries in Western Europe. For other minerals and metals, the chief Western European trading partners, roughly in order of importance on a value basis, were West Germany, Sweden, Norway, and the United Kingdom. West Germany dominated as a source of iron and steel and as a buyer of scrap metals. Norwegian products accounted for two-thirds of the cost of imported manufactured fertilizers. The largest share of trade in nonferrous metals was with Sweden.

Details of Danish trade statistics for 1972 and 1973 are given in tables 5 and 6.

[18] Sources of trade data for 1973, Danmarks Statistik (Copenhagen). Statistisk Tabelvaerk 1975—VI (External Trade of Denmark) 1973, v. 2; for 1974, Handels-statistiske Meddelelser (Monthly Bull. of Foreign Trade), v. 65, No. 12, December 1974.

[19] Conversions from Danish kroner (DKr) to U.S. dollars were made at the following rates for 1973, DKr 6.0495=US$1.00; for 1974, DKr 6.0949=US $1.00, a change of only 1%. Source: International Monetary Fund. International Financial Statistics. V. 28, No. 9, September 1975, p. 118.

[20] Based on the following numerical divisions of the Standard International Trade Classification (S.I.T.C.): 27, 28, 32, 33, 34, 51.3, 52, 56, 66.1, 66.2, 66.31–66.34, 66.7, 67, and 68.

## Table 5.—Denmark: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Zinc: | | | |
| Oxide | 51 | 88 | West Germany 55; Kuwait 15; Norway 10. |
| Metal including alloys: | | | |
| Scrap including blue powder (dust) | 2,371 | 2,645 | West Germany 1,504; Italy 304. |
| Unwrought and semi-manufactures | 309 | 168 | Greenland 36; Norway 27; United States 21. |
| Other: | | | |
| Ash and residue containing nonferrous metals | 6,222 | 3,731 | West Germany 1,371; Netherlands 1,244; United Kingdom 605. |
| Oxides, hydroxides, and peroxides of metals, n.e.s. | 11 | 9 | Finland 4; Sweden 2; Kenya 2. |
| Base metals including alloys, all forms, n.e.s | 5 | 3 | Austria 2; Sweden 1. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Pumice, emery, natural corundum, etc | 10 | 8 | West Germany 4; Norway 3. |
| Grinding and polishing wheels and stones | 1,049 | 1,191 | Ethiopia 315; Iran 251; Bangladesh 200. |
| Asbestos | 109 | 111 | Yugoslavia 39; Sweden 20; Norway 20. |
| Barite and witherite | r 11 | 37 | Iceland 27. |
| Boron materials: | | | |
| Crude natural borates | -- | 3 | Iraq 2. |
| Oxides and acid | 2 | 8 | NA. |
| Cement | 256,417 | 141,463 | Iceland 30,349; West Germany 24,332; Israel 21,018. |
| Chalk | 16,510 | 16,933 | Sweden 10,315; Norway 3,673; Finland 2,284. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s | 3,753 | 4,825 | Sweden 1,298; Finland 1,084; West Germany 528. |
| Products: | | | |
| Refractory [3] | 46,064 | 42,615 | United Kingdom 11,750; West Germany 6,214. |
| Nonrefractory | 93,869 | 72,442 | West Germany 51,756; Norway 9,541. |
| Cryolite and chiolite | 17,870 | 31,070 | NA. |
| Diamond: | | | |
| Gem, not set or strung value, thousands | $26 | $23 | Belgium-Luxembourg $11. |
| Industrial do | r $1 | -- | |
| Diatomite and other infusorial earth | 56,420 | 62,916 | West Germany 42,760; United Kingdom 8,315. |
| Feldspar and fluorspar | 520 | 20 | Mainly to Australia. |
| Fertilizer materials: | | | |
| Crude: | | | |
| Phosphatic | -- | 1 | All to Iceland. |
| Other | r 251 | 281 | Sweden 254; United States 26. |
| Manufactured: | | | |
| Nitrogenous | 49 | 88 | Iceland 39; West Germany 27; Japan 14. |
| Phosphatic | 49,570 | 3,742 | Mainly to East Germany. |
| Potassic | 22 | 14 | All to Sweden. |
| Other including mixed | 449 | 257 | Netherlands 122; Sweden 74; Japan 27. |
| Ammonia | r 15,959 | 5,133 | West Germany 3,084; Sweden 2,037. |
| Graphite, natural | 4 | (2) | NA. |
| Gypsum and plasters | 38 | 1,232 | Mainly to Sweden. |
| Lime | 15,591 | 27,666 | Norway 15,267; Sweden 9,124. |
| Magnesite | 2 | 32 | Mainly to Brazil. |
| Mica, all forms | 46 | 41 | Brazil 15; Switzerland 10; Portugal 5. |
| Pigments, mineral including processed iron oxide | r 287 | 399 | Finland 186; West Germany 108. |
| Precious and semiprecious stones, except diamond kilograms | 211 | 169 | Sweden 97; Norway 42. |
| Salt | 123,742 | 167,035 | Sweden 116,531; Norway 39,962. |
| Sodium and potassium compounds, n.e.s | 959 | 50 | Iceland 35; Sweden 11. |

See footnotes at end of table.

## Table 5.—Denmark: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked | 72,147 | 40,825 | Mainly to West Germany. |
| Worked | 1,470 | 1,424 | West Germany 1,083; Netherlands 151. |
| Dolomite, chiefly refractory grade | 46 | 205 | Finland 151; Sweden 53. |
| Gravel and crushed rock thousand tons | 3,524 | 2,625 | Mainly to West Germany. |
| Limestone (except dimension) | 103,547 | 84,567 | Sweden 48,995; West Germany 24,321; Norway 11,160. |
| Quartz and quartzite | 35 | 148 | Sweden 84. |
| Sand excluding metal bearing | 140,570 | 175,055 | Sweden 114,699; West Germany 29,869; Norway 18,137. |
| Sulfuric acid | 45 | 22 | Iceland 13. |
| Talc, steatite, soapstone, pyrophyllite | 66 | 74 | Yugoslavia 24; Nigeria 16; Iceland 16. |
| Other nonmetals, n.e.s | | | |
| Crude | 1,218 | 1,856 | West Germany 720. |
| Slag, dross, and similar waste not metal bearing | 30,556 | 49,584 | West Germany 39,542; Norway 9,910. |
| Oxides and hydroxides of magnesium, strontium, barium | 1 | 11 | Mainly from Sweden. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 48 | 181 | Norway 86; Sweden 61; United Kingdom 20. |
| Carbon black and gas carbon | 253 | 158 | Sweden 102; Norway 25. |
| Coal and coke including briquets | 62,009 | 62,914 | Sweden 34,448; Norway 19,236; West Germany 5,208. |
| Gas hydrocarbon, liquefied | 4,527 | 10,178 | United Kingdom 4,417; Sweden 2,450; Norway 1,595. |
| Peat including peat briquets and litter | 1,912 | 1,878 | West Germany 1,166; Japan 423. |
| Petroleum refinery products: | | | |
| Gasoline thousand 42-gallon barrels | 5,096 | 6,107 | Sweden 4,902. |
| Kerosine and jet fuel do | 378 | 359 | Sweden 277; Norway 82. |
| Distillate fuel oil do | 4,896 | 6,357 | Sweden 5,401; Norway 663. |
| Residual fuel oil do | 6,284 | 7,245 | Sweden 4,649; United Kingdom 390; Norway 839. |
| Lubricants do | r 146 | 137 | Norway 97; Sweden 14. |
| Mineral jelly and wax do | 5 | 5 | Sweden 1; Norway 1; Finland 1. |
| Other do | 637 | 891 | Norway 337; Sweden 265; Finland 121. |
| Total do | r 17,442 | 21,101 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | 7,827 | 10,646 | Sweden 7,765; Norway 1,505. |

r Revised. NA Not available.
[1] Not including synthetic corundum.
[2] Less than ½ unit.
[3] Including those of magnesite, diatomite, and other refractory materials.

## Table 6.—Denmark: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 35,708 | 1,777 | Mainly from Guyana. |
| Oxide and hydroxide [1] | 456 | 769 | West Germany 370; United States 18; United Kingdom 114. |
| Metal including alloys: | | | |
| Scrap | 904 | 1,014 | East Germany 505; Norway 244; Sweden 184. |
| Unwrought | 3,594 | 6,038 | Norway 3,210; United Kingdom 1,547; Sweden 698. |
| Semimanufactures | 42,728 | 51,896 | Sweden 10,091; Norway 8,565; West Germany 6,952. |

See footnotes at end of table.

[2] Including spiegeleisen, grit, sponge, powder and shot of iron and steel.
[3] Including wire rod.

## COMMODITY REVIEW

**Metals.**—*Iron and Steel.*—Crude steel production continued to be based on scrap melting, with no smelting of the negligible amount of domestic iron ore mined. Denmark imported much more iron and steel than was produced domestically, thus having a surplus of scrap available for export. Production and presumably also consumption rebounded in 1974 to new record levels. Crude steel production was estimated to increase 19% to 535,000 tons, which would put apparent crude steel consumption in excess of the 2.35 million tons reported for 1973. DDS, the main producer, reported 490,000 tons of raw steel manufactures for 1974,[21] an 18% increase. DDS production of finished steel also increased 18% to 456,000 tons, comprising 217,000 tons of plates and 239,000 tons of sections plus some wire rod.

[21] Arsberetning (Annual Report). 1974.

Scrap consumption in 1974 also appeared to be heading upwards towards 1972 levels. For the first half of 1974, total scrap consumption, of which about 96% was accounted for by melt shops, was 26% ahead of the same period in 1973, when 420,000 tons were used. Open hearths (six furnaces) were used for 96% of steel production with one electric arc furnace accounting for the remainder.[22] Both output and dominant furnace type will change as DDS continues with its expansion into an all-electric steelmaking operation. By 1976, capacity is to be raised to 500,000 tons per year both for raw steel and for plate production.

Exports of iron and steel in 1974 increased 20% to 471,000 tons, including 130,000 tons of scrap (scrap export increase of 16%). Imports, however, declined 1% to 1,760,000 tons, a total which contained only 4,300 tons of scrap. Scrap prices, which had more than doubled in 1973, continued to rise during the first half of the year. Product prices likewise increased, as the year-average wholesale price index for iron and steel articles was 27% higher in 1974 than in 1973. Iron and steel stocks in Denmark at yearend included 36,000 tons of pig iron and ferroalloys, 402,000 tons of scrap, and 520,000 tons of semimanufactures.[23]

*Nonferrous Metals.*—The only production of nonferrous metal ore was from a lead-zinc mine in Greenland which began operating late in 1973. There was no primary, only secondary smelting of principal nonferrous metals carried out in Denmark. The industry was reported as consisting of two plants producing a variety of forms of a number of nonferrous metals, two plants specializing in aluminum products, one plant specializing in lead-tin solder, and one plant specializing in producing scrap iron and tin from tinplate scrap.[24] Nonferrous metals consumed in large quantities were lead and zinc, with the consumption pattern reported as follows[25] in thousand tons:

| | 1973 | 1974 |
|---|---|---|
| Aluminum, primary | 2.2 | 1.9 |
| Copper, refined | 5.5 | 5.3 |
| Lead, refined | 18.9 | 22.9 |
| Zinc metal | 12.8 | 13.0 |
| Tin, refined | .6 | .6 |
| Nickel, primary | .1 | .1 |

The most notable change in 1974 was a 21% increase in lead consumption. Production of refined pig lead was reported to have grown 11% to 14,900 tons. Production of aluminum and aluminum alloy semimanufactures and castings was stated to have shown a slight drop to 3,600 tons.

In 1974 production from the first full year of operations at the Black Angel mine in western Greenland amounted to 634,000 tons of ore having a grade of 23.4%, zinc plus lead.[26] Processing was carried out on 575,000 tons to yield concentrates containing 88,500 tons of zinc and 24,100 tons of lead. Shipments were made from Greenland between July and November, mostly to various European smelters, including plants in Belgium and West Germany.[27] Measured and indicated zinc-lead ore reserves declined 19% to 790,000 tons. Surface exploration in the Cover zone of the mine was completed, which indicated presence of ore between this zone and the Angel zone. Detailing of mineralization was started with digging of a 6,000-foot drift from the Angel zone eastwards towards the Cover ore zone. The Black Angel mine was operated by Greenex A/S, 62% owned by Vestgron Mines Limited, itself 62% owned by Cominco Ltd.

Average yearly wholesale price indices for nonferrous metals and articles all increased from 1973 to 1974 as follows: Aluminum, 26%; copper, 24%; lead, 34%; tin, 66%; and zinc, 51%.[28] Net imports of refined copper, brass, bronze, and copper and copper alloy semimanufactures were reported to have declined 16% in 1974 to 29,000 tons. Stocks of unwrought metal, semimanufactures, and scrap in Denmark at yearend included 11,800 tons of aluminum, 17,600 tons of copper, 5,200 tons of lead, and 3,900 tons of zinc.

**Nonmetals.**[29]—*Cement and Other Construction Materials.*—Near-crisis conditions developed in the building industry, as both residential and public construction declined. This was a reaction to the high levels of activity in 1973, which caused limitations to be imposed, which have now been removed. Measures have been taken to stabilize house construction at about 40,000 units per year, 80% of the 1973 rate. During the decline, the number of dwellings under construction fell 30%, new starts were down 49%, and total building area was 32% less than in 1973.

Cement sales in 1974 were down 14% to 2,492,000 tons.[30] While exports recovered to 179,000 tons, a 27% increase, imports almost ceased, dropping to only 4,000 tons. National production capacity in 1974 was estimated as 3.4 million tons per year, with no change in capacity projected for 1975.[31] As of the beginning of 1975, all of Denmark's production of cement was by a single company, A/S Aalborg Portland-Cement-Fabrik (APCF). Denmark's world-scale role in cement technology was evidenced during 1974 by Iraq's order to F. L. Smidth for a 2-million-ton-per-year turnkey cement plant. Chalk production, mainly for cement manufacture, was estimated to exceed 5 million tons.

Stone, sand, and gravel exports were 13% less than in 1973 at about 2.5 million tons. Production of industrial sand was mainly from Bornholm Island off the southern coast of Sweden, where the Swedish firm Ahlsell & Ågren has a plant with a capacity of 250,000 tons per year. Limestone production was estimated as about 3 million tons. Principal producers were A/S Faxe Kalkbrud for industrial limestone and lime and Dansk Landbrugs Grovvareselskab a.m.b.a. (DLG) for agricultural limestone. DLG's largest plant at Aggersund quarried 600,000 tons in 1974, with 1975 production expected to rise to 1 million tons. Gypsum imports increased by 35% for the second straight year, to 409,000 tons. Denmark, the world's only source of a type of diatomaceous earth known as moler, exported a net of 61,000 tons of crude moler and other diatomaceous materials, a 4% increase. Production of moler from the islands of Fuur and Mors was estimated at about 220,000 tons. Sales of refractory and insulating products made from moler and infusorial earth dropped by more than 50%, although exports appeared to climb by about 17%.

*Cryolite and Salt.*—Exports of cryolite increased 12% to 35,000 tons. This material originated from stockpiles in Greenland, having been shipped to Copenhagen for beneficiation by the partly state-owned company, Kryolitselskabet Øresund A/S, the only company in the world which concentrated natural cryolite. Dansk Salt I/S, with a reported production capacity of 350,000 tons per year, was Denmark's only salt producer and was owned equally by Danish and the Netherlands interests. Net imports of salt grew substantially in 1974 to 141,000 tons as compared with only 8,000 tons in 1973.

*Fertilizer Materials.*—Imports, a strong factor in Denmark's agricultural industry, were overall virtually unchanged from 1973. Crude imports were up 3% to 362,000 tons, but imports of manufactured materials were down 3% to 1.07 million tons. The most significant changes in the import pattern were in manufactured materials, of which nitrogenous fertilizers declined 47% to 128,000 tons while compound nitrogenous fertilizers increased 15% to 698,000 tons.

Denmark's largest fertilizer maker, Superfos A/S, increased output by 5% to 880,000 tons in 1974. Of this total, phosphorus (P) and phosphorus-potassium (PK) fertilizers accounted for 72%, and the balance was compound nitrogenous (NPK) fertilizers. The company was somewhat sheltered from large raw materials price increases during the year because long-term contracts for delivery of liquid ammonia and sulfur had already been made before the oil crisis. Pressure from raw materials prices, however, resulted in significant price increases for finished products. A new plant being built for producing ammonium nitrate solution and doubling of granulation capacity by mid-1976 will more than double Superfos capacity for NPK production to 600,000 tons per year. An additional plant is also to be built to increase nitric acid production. At yearend 1974, operations were consolidated at two plants in Jutland as production at the Kalundborg factory was terminated. Late in the year, Superfos and DLG withdrew from a British-Scandinavian project to produce ammonia from gas from Norway's

Frigg Field at a plant at Peterhead, Scotland; the project will continue.

Consumption of plant nutrients in Danish agriculture increased further during the 1973–74 fertilizer year. In terms of nutrients, consumption amounted to 365,000 tons of nitrogen, 70,000 tons of phosphorus, and 180,000 tons of potassium. Total consumption of the main types of fertilizers was about 1.96 million tons, approximately two-thirds of which was supplied by Superfos.[32]

**Mineral Fuels.**—*Energy Balance and Electric Power.*—Denmark was almost completely dependent on foreign sources of primary energy, having no domestic production of either coal or natural gas and only negligible production of oil and hydropower. In 1973, foreign primary energy supplied 99.6% of Denmark's net consumption of 25.4 million tons of coal equivalent, of which 89% came from oil and 11% from coal.[33] Space heating accounted for 60% of final inland energy consumption. Gross inland consumption dropped 9% in 1974 to 25.4 million tons of coal equivalent as compared with 28 million tons in 1973. Total energy imports declined 4%; petroleum and petroleum products accounted for 88% of energy imports, with 11% coming from coal and coke. The national total energy balance is given in thousand tons coal equivalent in the following tabulation:

| Total energy | 1973 | | | 1974 | | |
|---|---|---|---|---|---|---|
| | Distribution | | | Distribution | | |
| | Percent | Quantity | Total | Percent | Quantity | Total |

• Estimated. NA Not available.

Practically all Denmark's generation of electricity was by conventional thermal powerplant; 0.1% was hydroelectric. As shown in the following tabulation, household usage, at 72% of the total, was dominant in the electrical energy consumption pattern, as it was for total energy consumption. Final electrical energy consumption in 1974 was 15.5 billion kilowatt-hours, 1% less than in 1973. Net production of electricity declined 2% in 1974 to 17.6 billion kilowatt-hours.

Denmark joined the International Energy Agency of the Organization for Economic Cooperation and Development (OECD) in November 1974.

Electrical energy data are given in millions of kilowatt hours in the following tabulation:

[32] Superfos A/S (Vedbaek). Annual Report and Accounts, 1974, graph p. 6.

[33] Eurostat (Luxembourg). Energy Statistics. 1975, No. 2, pp. 3, 7, 16, 17, 55, 79, 94–95.

*Coal and Coke.*—Imports of coal and coke both grew by about one-fifth in 1974. Coal imports were up 20% to 3.63 million tons. Coke imports increased 19% to 160,000 tons, corresponding to about 5% of the coal volume. Poland was by far the largest supplier of coal, with 85% of the total, while the Soviet Union (9%) and Canada (4%) furnished most of the balance. The majority of coke imports was about equally distributed between France, West Germany, and the Soviet Union. Primary usage for coal was in thermal powerplants, minor amounts being used industrially and for gas production. Increases in annualized raw material price indices for coal and coke accelerated to 42% and 29%, respectively. Domestic coal stocks at yearend were 2.1 million tons, about 30% greater than in 1973.

*Petroleum.—Consumption and Refining.*—Consumption in 1974, estimated at 325,000 barrels per day (16 million tons per year), was down 10% from 360,000 barrels per day (17.8 million tons per year) in 1973.[34] Production of 86,000 tons from the Danish North Sea territory amounted to only 0.5% of consumption. Therefore, crude oil needs were met almost entirely by imports. Crude imports in 1974 totaled 9.28 million tons, 5% less than in 1973, but at a value of DKr4.5 billion, 167% greater. Principal supplying countries were Iran (47%); Saudi Arabia (12%); Kuwait (8%); Nigeria (7%); Oman (5%); and Qatar (4%). There were no exports of crude oil.

Imports of petroleum products were about four times as great as exports in both quantity and value. Imports were 7% less than in 1973 at 10.7 million tons, but at a value of DKr6.16 billion, 105% greater. Principal import sources, each for about one-fourth of the total, were the United Kingdom and the Netherlands. Heavy fuel oils comprised 43% of imports and heating oil 32%. Petroleum products exported came to 2.63 million tons, an 8% decrease; exports consisted of about 43% middle distillates, 27% gasolines, and 22% residual oils. Value of overall net imports of crude oil and petroleum products increased 125% to $1.48 billion.

Refinery throughput dropped 5% to 9.2 million tons in 1974. Combined capacity of the three refineries, 220,000 barrels per day (10.9 million tons per year), amounted to about 60% of requirements. A 200,000-barrel-per-day refinery proposed at Kalundborg by JOC Oil Co., Ltd. of the Netherlands would almost double Danish refinery capacity.[35]

The yearly average raw material price index for crude oil increased by 177% from 1973 to 1974. The peak price was reached in February 1974, after which the index dropped and held steady at a value about 4% less. Increases in indices for major petroleum products in the corresponding period amounted to 110% for gasoline, 88% for heating oil, and 141% for fuel oil. Domestic stocks at yearend included 4.35 million tons of petroleum products and 623,000 tons of crude oil.

*Exploration and Development.*—Dansk Undergrunds Consortium (DUC) announced plans to expand production from the Dan Field in the North Sea from current levels in the vicinity of 100,000 tons per year towards the original 1976 target of 1.25 million tons per year. Three wellhead platforms, each with six wells, are to

[34] Petroleum Publishing Co. International Petroleum Encyclopedia. Tulsa, Okla., 1975, pp. 18, 311, 315, 330, 336, 337, 397, 398.
[35] World Petroleum Report. V. 21, 1975, p. 68.

be installed. In December, Gulf Oil Corp. withdrew from DUC, leaving a four-party group consisting of Royal Dutch/Shell (40%), A. P. Moeller (30%), Standard Oil Co. of California (Chevron, 15%), and Texaco, Inc. (15%). The Danish firm A. P. Moeller remained as operator. Exploration efforts of DUC met with mixed success. Oil was reported at the discovery well M–8 a mile northwest of Dan at a depth of 11,483 feet, about 4,900 feet deeper than at Dan. A third well on the E structure, however, was found not to have reservoir conditions suitable for production. On land in northern Jutland, DUC gave up on an 8,563-foot wildcat. In the Baltic, A. P. Moeller, acting for DUC, contracted for a Norwegian seismic vessel to follow up promising aeromagnetic surveys near Bornholm Island.[36]

Initial steps were taken towards beginning oil exploration around Greenland. Bids were called for on 25,000 square miles off western Greenland between the 60th and 72d parallels. The Danish Ministry for Greenland received bids from 23 companies from 9 nations. Drilling is not expected to commence before 1976. Leasing terms may result in government revenues amounting to 80% of net profits.[37] Production costs are expected to be about $9,000 per daily barrel of production, higher even than for North Sea oil.[38] Other areas of eastern and northern Greenland have more geological promise, but entail even greater costs. Applications were also reported for concessions to do preliminary work off the Faeroe Islands.

## ICELAND [39]

In common with other nations attempting to diversify and expand their economies, Iceland took a battering from increased petroleum prices and a continued domestic inflation rate of 30%. The resultant political crisis brought about the formation of a new government. The present government is more favorably disposed to foreign investment, as indicated by the establishment of the Icelandic Alloys Ltd., a joint venture between the Government of Iceland and Union Carbide Corp., New York, for the production of ferrosilicon. Lacking an established body of laws or regulations concerning foreign investment, the Government is taking a cautious approach. As a result, foreign investment and proposals are considered on a case-by-case basis. Government participation would most likely be required in a major foreign investment because of the small size of the Icelandic economy. Foreign investment would probably be restricted to energy intensive industries since cheap hydroelectric power is available. Another possibility is the production of chemicals from geothermally heated seawater. The combination of limited manpower, heavy national debt, and high inflation, with little prospect of improvement before 1976, makes any new mineral developments unlikely in the near future.

### PRODUCTION

Decreases in output of aluminum and cement reflected the general decline in mineral production in 1974. Icelandic Aluminum Co.'s (ISAL) smelter production dropped 12% to 69,600 tons from 72,000 tons in 1973. A slackening of the construction boom caused cement production to drop 25% to 101,000 tons from 133,900 tons in 1973. Output of sand and gravel showed a significant decrease with the output of stone, up sharply from 168,000 tons to 270,000 in 1974. Output of fertilizer increased from 30,000 tons to 35,270 tons in 1974. Pumice dropped from 19,000 tons in 1973 to 6,930 tons in 1974.

Mineral production value increased an estimated 19% above the 1973 level, from $58.5 million to $69.6 million in 1974. Both figures exclude production of clay products, for which value data are not available. The increase in value can be credited almost entirely to inflation.

### TRADE

Aluminum exports declined 12.5% in 1974 as a result of the general malaise in world markets. A corresponding reduction occurred in the country's total mineral commodity exports, the greatest part of which consists of aluminum shipments.

[36] World Oil. V. 181, No. 3, Aug. 15, 1975, p. 111.
[37] Page 72 of work cited in footnote 35.
[38] Dullforce, W. The Financial Times, No. 26775, Sept. 22, 1975. p. 16.
[39] Prepared by W. Timothy Adams, physical scientist, Division of Nonmetallic Minerals.

Exports of diatomite were up in value but added only $3.3 million to the country's trade balance. The only other mineral-related products exported were scrap metals.

An attempt to maintain full employment and an expanding economy kept mineral imports in 1974 at a high level. Refined petroleum products constituted the largest category of imported minerals in value followed by alumina, manufactured fertilizers, and crude metal shapes.

Reduced aluminum exports and increased mineral imports resulted in Iceland's balance of trade reaching the critical stage. The country's need to import practically all mineral commodities consumed results in a normally deficit trade balance. Although increased aluminum exports produced a slight mineral trade surplus in 1973, increased petroleum product prices and Iceland's rampant inflation resulted in 1974 in the largest trade deficit recorded. Recovery of world aluminum markets and politically unpopular import controls offer the only hope of restoring the mineral trade deficit to near normal proportions. Balances of total commodity trade and mineral trade in 1972 through 1974 were as follows, in million dollars:

| | 1972 | 1973 | 1974 |
|---|---|---|---|
| Total commodity trade: | | | |
| Exports | 191.4 | 278.1 | 328.0 |
| Imports | 233.4 | 340.4 | 524.4 |
| Balance | −42.0 | −62.3 | −196.4 |
| Mineral commodity trade: | | | |
| Exports | 33.6 | 50.5 | 51.8 |
| Imports | 39.8 | 39.6 | 90.9 |
| Balance | −6.2 | 10.9 | −39.1 |

2 Mainly sulfuric acid.

## COMMODITY REVIEW

**Ferrosilicon.**—Agreement was reached between Union Carbide and Iceland regarding the building of a ferrosilicon plant at Grundartangi on the north shore of Hualfjordur. Iceland is to own 55% and Union Carbide 45% of the enterprise. Two furnaces will have an initial capacity of 47,000 tons per year of 75% ferrosilicon. Electric power for the plant will come from Sigalda, a hydroelectric plant presently under construction. The ferrosilicon plant will consume 60 megawatts of the 150-megawatt generating capacity.[40]

**Other Minerals.**—Discussions were held during the year between the Iceland Government and several companies concerning the establishment of mineral processing industries that would take advantage of the island's inexpensive hydroelectric power. Iceland's greatest natural resource asset is its great and largely unexploited supply of hydroelectric power. This asset offers the opportunity to diversify the economy away from the fishing industry. However, the effort to expand the electrical power supply in the Eastffords area has suffered a blow. Failure by the contractor to deliver technical equipment for the Lagarfoss powerplant high-tension power grid will result in the rationing of electricity and a cutback of 20% in consumption over the winter. Delivery is not now expected until next spring.[41]

# SWITZERLAND [42]

As a result of its land-locked location and its lack of substantial mineral resources, the major mineral industry of Switzerland in 1974 continued to be its mineral processing operations which refined imported raw materials and exported finished products.

The domestic production of nonmetallic mineral commodities from indigenous natural resources continued during the year. Salt production increased 4% while production of cement and lime decreased 9%, and 18% respectively. Estimated gypsum production remained unchanged. Smelter production of preliminary aluminum, all from imported raw materials, increased 2% during 1974. Production of steel ingots and rolled sheet steel each increased by 2% during 1974. Swiss pig iron production and crude steel castings increased 35%, and 82% respectively, during the year. Imports of crude oil used as petroleum refinery feed stock decreased by 2% as the two major products of Swiss petroleum refineries, distillate fuel oil (gas, oil and diesel fuel) and residual fuel oil, increased 3% and declined 19%, respectively. Imported natural gas more than doubled during the year and totaled 33,224 million cubic feet while production of manufactured gas decreased 31% and totaled 10,282 million cubic feet.

Swiss production of gashouse coke decreased 70% during the year and totaled 30,000 tons.

[40] U.S. Embassy, Reykjavik, Iceland. State Department, Airgram A–32, May 5, 1975.
[41] U.S. Embassy, Reykjavik, Iceland. State Department. Airgram A–76, Oct. 9, 1974.
[42] Prepared by Richard F. Stevens, Jr., physical scientist, Division of Ferrous Metals.

The estimated Swiss gross national product (GNP) continued to increase to a new record high of almost 139.5 billion Swiss francs (SwF), about $46.8 billion, representing an apparent increase of 7.8% over that of 1973.[43] The worldwide economic slump did not reach Switzerland until the latter part of 1974. While the Swiss Government's antiinflation program had begun to reduce domestic demand by mid-1973, a large backlog of orders and continued high foreign demand for Swiss exports kept industry operating at peak capacity and full employment throughout most of 1974. By yearend, foreign demand had eased and the Government's restrictive policies began to slow the pace of economic activity. Real GNP expanded by only 0.2% in 1974.

Faced with weakening domestic and foreign demand, a number of Swiss firms found it necessary to lay off some workers for the first time in many years. However, the number of persons looking for work was less than 0.1% of the total labor force. For long-standing political and sociological reasons, which were amplified by growing public concern over unemployment, the Government continued its attempts to reduce the number of foreign workers in Switzerland which now comprise about 30% of the labor force.

Inflation remained Switzerland's primary economic concern. With rising wages and import costs providing the main impetus, most Swiss economists predicted that consumer prices will increase by about 6% to 8% during 1975.

Helped by a decline in the domestic consumption of petroleum products and increased earnings on capital investments abroad, Switzerland was one of the few nonoil producing countries to have a balance of payments surplus on current account in 1974.

Petroleum, the country's main source of energy, provided over 77% of the total energy consumed in Switzerland during 1974.[44] Hydroelectric and nuclear power accounted for over 17% of the total 1974 Swiss energy consumption, coal provided about 2%, and imported natural gas provided most of the remainder.

Consumption of petroleum products decreased 9% and totaled 100 million barrels during the year. Preliminary data indicated that imports of crude oil decreased almost 2% to 45.0 million barrels in 1974.[45] The United Arab Emirates was the major source of imported crude oil and supplied 35% of the total. Other significant sources of crude oil imports during the year were Libya (16%), Nigeria (14%), Kuwait (12%), Saudi Arabia (9%), Algeria (7%), and Tunisia (5%).

Swiss imports of petroleum refinery products declined in 1974 at an average yearly rate of 11.3%. It was the first time since World War II that oil imports into Switzerland did not expand but drastically dropped. The sharpest decline, 14%, was registered for imports of heating oil as a result of the mildest winter on record and of the high cost of heating oil. The reluctance of motorists to pay the heavy supertax imposed by the Swiss Government on gasoline was evidenced by the 3.9% reduction in gasoline consumption.

Preliminary foreign trade data indicated that 52.6 million barrels of refinery products were imported in 1974, most of which were obtained from sources in the European Communities (EC), mainly from France, West Germany, Italy, and the Netherlands. In addition, some gasoline and distillate fuel oil was imported from the U.S.S.R. The major exports of refined petroleum products were reported to be 1.1 million barrels of residual fuel oil which were shipped primarily to Austria (72%) and West Germany (22%).

The relationship between Swiss mineral commodity trade and total commodity trade is indicated in the following tabulation which also shows the disparity in the balance of trade:

| Trade balance: | | | |
| 1971 | −993 | −1,386 | XX |
| 1972 | −1,035 | −1,594 | XX |
| 1973 | −1,566 | −2,143 | XX |

XX Not applicable.

During 1973, nonferrous metal exports (excluding ores, concentrate, and scrap), primarily wrought aluminum products, represented about 44% of total Swiss mineral exports by value or over $259 million. Precious and semiprecious stones, including industrial diamond, accounted for 24% or $139 million, and iron and steel valued at $67 million accounted for 12% of Swiss mineral exports in 1973. The Western European countries of the EC and of the European Free Trade Association (EFTA) continued to be the major recipients of Swiss mineral exports.

Mineral fuels, the largest major group of mineral commodity imports in 1973, primarily crude petroleum, contributed $836 million or 39% to the total value of Swiss mineral imports. Imports of iron and steel, valued at $623 million contributed 29%, and nonferrous imports valued at $296 million represented 14% of the total. Imports of gems and semiprecious stones were valued at $172 million in 1973, or 8% of the total reported mineral imports. EC countries continued to be the major source of most of the 1973 Swiss mineral imports (excluding mineral fuels).

Data on Swiss petroleum and petroleum products were converted from metric tons to U.S. barrels of 42 gallons by using the conversion factors given in the 1973 International Petroleum Annual.[45] The 1974 apparent consumption of refined petroleum products in Switzerland, approximately 44% of which was domestically refined from imported crude oil and the remainder of which was imported as refined products, is indicated in the following tabulation, in millions of U.S. barrels:

[46] U.S. Bureau of Mines. International Petroleum Annual, 1973. March 1975, 31 pp.

| Products | 1973 | 1974 | Percent change |
|---|---|---|---|
| Distillate fuel oil | 58.2 | 29.1 | −50.0 |
| Motor and aviation gasoline | 23.1 | 21.2 | −8.2 |
| Residual fuel oil | 17.1 | 33.1 | +93.6 |
| Kerosine and jet fuel | 5.4 | 4.9 | −9.3 |
| Lubricants (including greases) | .7 | .7 | -- |
| Other refined products | 4.5 | 9.0 | +100.0 |
| Refinery fuel and loss | 1.6 | 2.4 | +50.0 |
| Total [1] | 110.5 | 100.5 | −9.0 |

[1] Data may not add to totals shown because of independent rounding.

| Crude clays, n.e.s | 9,488 | 16,272 | West Germany 13,589; Austria 2,565. |
| Products: | | | |
| Refractory (including nonclay brick) | 1,541 | 1,143 | Austria 494; Italy 231; West Germany 147. |
| Nonrefractory | 47,401 | 40,312 | West Germany 16,441; France 10,265; Austria 10,169. |
| Cryolite and chiolite ----- kilograms -- | 10,800 | 12,221 | Italy 10,000. |
| Diamond: | | | |
| Gem not set or strung, value, thousands -- | $35,163 | $51,708 | France $12,003; West Germany $9,717; Netherlands $5,181. |
| Industrial ---------- do ---- | r $1,472 | $2,424 | West Germany $932; United Kingdom $748; France $196. |
| Diatomite and other infusorial earth --- | 92 | 44 | Austria 40; Italy 5. |
| Feldspar and fluorspar | 275 | 227 | West Germany 96; Peru 75; Sweden 35. |
| Fertilizer materials: | | | |
| Manufactured: | | | |
| Nitrogenous | 90 | 486 | NA. |
| Phosphatic | 10 | 17 | All to West Germany. |

See footnotes at end of table.

## Table 8.—Switzerland: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Fertilizer materials—Continued | | | |
| Manufactured—Continued | | | |
| Potassic | 1 | (1) | Mainly to West Germany. |
| Other including mixed | r 580 | 1,168 | Italy 744; France 133. |
| Ammonia | 54 | 73 | Austria 63; France 8. |
| Graphite, natural | 37 | 7 | West Germany.[1] |
| Gypsum and plasters | 5,594 | 6,538 | Mainly to Austria. |
| Lime | 4,697 | 5,262 | West Germany 3,552; France 1,693. |
| Magnesite | 32 | 72 | France 40; West Germany 17. |
| Mica: | | | |
| Crude including splittings and waste | 63 | 90 | Ireland 26; Peru 26; Sweden 12. |
| Worked | 327 | 378 | Sweden 63; Austria 40; United Kingdom 40. |
| Pigments, mineral: | | | |
| Natural, crude | 32 | 49 | Mainly to Peru. |
| Iron oxides, processed | 59 | 62 | France 20; Italy 11; Austria 10. |
| Precious and semiprecious stones, except diamond: | | | |
| Natural, crude -- thousand carats | r 22,325 | 37,975 | India 9,410; Italy 3,795. |
| Manufactured ---------- do | 330,070 | 332,210 | West Germany 62,750; Italy 59,825; Austria 53,800. |
| Pyrite (gross weight) ---- kilograms | 490 | 100 | NA. |
| Salt and brine | 55 | 37 | France 3. |
| Sodium and potassium compounds, n.e.s | 20,714 | 35,245 | Austria 13,463; France 10,041; West Germany 6,452. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked | 43,303 | 36,967 | West Germany 26,561; Italy 5,116. |
| Worked | 11,156 | 12,997 | Mainly to West Germany. |
| Dolomite, chiefly refractory grade | 57 | 46 | West Germany 4. |
| Gravel and crushed rock | 34,973 | 23,464 | West Germany 17,079; France 2,866. |
| Limestone (except dimension) | 10 | 51 | West Germany 16; Italy 5. |
| Quartz and quartzite | 35,458 | 32,422 | Italy 25,741; West Germany 5,265. |
| Sand excluding metal bearing | 10,201 | 12,693 | West Germany 5,632; France 2,755; Austria 2,174. |
| Sulfur: | | | |
| Elemental, all forms | 153 | 158 | West Germany 133. |
| Sulfur dioxide | 73 | 148 | West Germany 92; Austria 56. |
| Sulfuric acid; oleum | 47,621 | 32,162 | France 18,234; West Germany 12,872. |
| Talc, steatite, soapstone, pyrophyllite | 1,266 | 1,256 | Mainly to Italy. |
| Other nonmetals, n.e.s.: | | | |
| Crude | 297 | 541 | Italy 284; France 174; West Germany 54. |
| Slag dross and similar waste, not metal bearing: | | | |
| From iron and steel manufacture | 4,499 | 2,726 | West Germany 2,305; France 370. |
| Slag and ash, n.e.s | 122 | (1) | West Germany.[1] |
| Oxides and hydroxides of magnesium, strontium, barium | 11 | 12 | West Germany 2. |
| Bromine, iodine, fluorine | 4 | 23 | Ireland 13; France 8. |
| Building materials of asphalt, asbestos, fiber cement, unfired nonmetals, n.e.s | 471 | 768 | France 572; West Germany 84. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 1,007 | 7 | France 2; West Germany 2. |
| Carbon black and gas carbon: | | | |
| Carbon black | 79 | 122 | U.S.S.R. 38; France 37; West Germany 17. |
| Gas carbon ---------- kilograms | 9 | 1 | NA. |
| Coal, all grades, including briquets | 1,921 | 2,599 | Mainly to West Germany. |
| Coke and semicoke | 228,057 | 28,718 | Austria 20,725; Italy 7,993. |
| Gas, hydrocarbon, manufactured | 102 | 91 | Mainly to France. |
| Hydrogen, helium, rare gases | 67 | 110 | Austria 86; West Germany 11. |
| Peat including peat briquets and litter | 501 | 1,523 | Austria 840; France 683. |
| Petroleum refinery products: | | | |
| Gasoline thousand 42-gallon barrels | 2 | 18 | Mainly to Austria. |
| Kerosine and white spirit -- do | (1) | (1) | Do. |
| Distillate fuel oil ---------- do | 22 | 59 | Do. |
| Residual fuel oil ---------- do | 751 | 1,463 | Do. |
| Lubricants ---------- do | r 94 | 55 | France 27; Austria 14. |
| Other: | | | |
| Liquefied petroleum gas ---------- do | 58 | 25 | Mainly to Austria. |
| Unspecified ---------- do | r 4 | 6 | West Germany 2; Austria 2. |
| Total ---------- do | 931 | 1,626 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | r 1,162 | 5,659 | Mainly to West Germany. |

r Revised. NA Not available.
[1] Less than ½ unit.

## Table 9.—Switzerland: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 11,046 | 9,924 | France 6,044; Italy 3,632. |
| Oxide and hydroxide | 162,347 | 146,355 | Guinea 36,816; France 7,686; Surinam 4,114. |
| Metal including alloys: | | | |
| Unwrought | 24,891 | 29,371 | Iceland 16,251; Norway 5,882. |
| Semimanufactures | 12,942 | 21,649 | West Germany 5,650; Norway 3,449; United Kingdom 2,959. |
| Antimony metal including alloys, unwrought | 212 | 95 | People's Republic of China 89. |
| Arsenic trioxide, pentoxide, acids | 24 | 48 | Mainly from France. |
| Beryllium metal including alloys, all forms kilograms | | | |
| Chromium: | | | |
| Chromite | 3,867 | 3,437 | Mainly from Republic of South Africa. |
| Oxide and hydroxide | 544 | 522 | West Germany 275; Italy 110; France 95. |
| Cobalt oxide and hydroxide | 5 | 6 | Belgium-Luxembourg 4; Canada 1; West Germany 1. |
| Columbium and tantalum metal including alloys all forms, tantalum | 2 | 3 | Mainly from United States. |
| Copper: | | | |
| Matte | 30,289 | 27,086 | Belgium-Luxembourg 8,797; West Germany 6,607; Zambia 3,901. |
| Copper sulfate | 609 | 1,091 | U.S.S.R. 630; Bulgaria 208; France 159. |
| Metal including alloys: | | | |
| Scrap | 397 | 505 | Israel 355; France 67; United Kingdom 39. |
| Unwrought | 3,366 | 1,233 | Belgium-Luxembourg 467; West Germany 346; United Kingdom 280. |
| Semimanufactures | 40,807 | 42,353 | United Kingdom 18,801; West Germany 9,744. |
| Gold metal, unworked or partly worked thousand troy ounces | 88 | 137 | West Germany 74; France 17. |
| Iron and steel: | | | |
| Ore and concentrate including roasted pyrite | 28,729 | 28,466 | Mauritania 20,961; Italy 6,781. |
| Metal: | | | |
| Scrap | 78,458 | 63,396 | West Germany 52,680; Netherlands 6,381. |
| Pig iron and similar materials | 56,287 | 83,193 | West Germany 51,329; France 12,279. |
| Ferroalloys | 22,793 | 20,499 | France 5,361; West Germany 3,267. |
| Steel, primary forms | 275,109 | 170,070 | France 57,974; Belgium-Luxembourg 42,230; West Germany 30,113. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, sections: | | | |
| Wire rod thousand tons | 152 | 141 | West Germany 63; France 53. |
| Other bars and rod do | 233 | 220 | West Germany 81; Italy 54; France 38. |
| Angles, shapes, sections do | 287 | 258 | Belgium-Luxembourg 80; France 80; West Germany 79. |
| Universals, plates sheets do | 674 | 679 | West Germany 227; France 180; Belgium-Luxembourg 67. |
| Hoop and strip do | 214 | 223 | Belgium-Luxembourg 65; West Germany 58; France 30. |
| Rails and accessories do | 64 | 49 | Austria 30; West Germany 8; Italy 5. |
| Wire do | 37 | 43 | Austria 20; West Germany 12. |
| Tubes, pipes, fittings do | 176 | 271 | West Germany 100; France 63; Austria 36. |
| Castings and forgings, rough do | 3 | 4 | West Germany 1; Belgium-Luxembourg 1; France 1. |
| Total do | 1,840 | 1,888 | |

See footnotes at end of table.

## Table 9.—Switzerland: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Lead: | | | |
| Ore and concentrate | 1 | (1) | NA. |
| Oxides | 218 | 197 | Mexico 90; Austria 40; West Germany 22. |
| Metal including alloys: | | | |
| Scrap | 10 | 8 | West Germany 5; Yugoslavia 1. |
| Unwrought | 21,830 | 17,034 | United Kingdom 5,171; France 3,025; West Germany 2,921. |
| Semimanufactures | 1,285 | 1,295 | Mainly from West Germany. |
| Magnesium metal including alloys, all forms | 1,053 | 2,059 | Norway 1,363; United States 300; Canada 234. |
| Manganese oxides | 886 | 663 | Japan 403; Belgium-Luxembourg 131; West Germany 70. |
| Mercury 76-pound flasks | 1,567 | 324 | West Germany 201; U.S.S.R. 35. |
| Molybdenum metal including alloys, all forms | 11 | 76 | Mainly from Austria. |
| Nickel: | | | |
| Matte, speiss, similar materials | r 1,497 | 1,077 | Canada 337; Norway 291; United Kingdom 146. |
| Metal including alloys: | | | |
| Scrap | 34 | 27 | United Kingdom 19; France 5. |
| Unwrought | 1,474 | 1,059 | Canada 334; Norway 291; United Kingdom 143. |
| Semimanufactures | 1,228 | 1,667 | West Germany 687; United Kingdom 427; France 186. |
| Platinum-group metals and silver including alloys: | | | |
| Platinum group thousand troy ounces | 208 | 354 | U.S.S.R. 115; West Germany 74; United Kingdom 58. |
| Silver do | 38,377 | 8,735 | West Germany 2,605; United Arab Emirates 1,431; United Kingdom 1,154. |
| Tantalum metal including alloys, all forms | 2 | 3 | Mainly from United States. |
| Tin: | | | |
| Oxides long tons | 32 | 28 | United Kingdom 15; Japan 7; West Germany 3. |
| Metal including alloys: | | | |
| Scrap do | 12 | 14 | West Germany 7; Sweden 6. |
| Unwrought do | 880 | 893 | Malaysia 289; United Kingdom 195; Thailand 175. |
| Semimanufactures do | 217 | 283 | West Germany 116; Netherlands 64; France 40. |
| Titanium oxides | 10,991 | 11,892 | West Germany 3,425; France 2,573; United Kingdom 2,414. |
| Tungsten: | | | |
| Ore and concentrate | -- | 40 | NA. |
| Metal including alloys, all forms | 85 | 99 | Mainly from West Germany. |
| Uranium and thorium oxides, including rare-earth oxides | 11 | 11 | France 3; West Germany 3; United States 2. |
| Zinc: | | | |
| Ore and concentrate | -- | 128 | NA. |
| Oxide | 2,331 | 2,461 | West Germany 1,004; France 743. |
| Metal including alloys: | | | |
| Scrap | 188 | 107 | Mainly from France. |
| Blue powder | 2,321 | 3,037 | Belgium-Luxembourg 1,170; West Germany 854; Netherlands 321. |
| Unwrought | 32,788 | 28,436 | West Germany 6,898; Belgium-Luxembourg 6,083; France 4,475. |
| Semimanufactures | r 4,090 | 5,419 | West Germany 2,000; Belgium-Luxembourg 1,846; United Kingdom 589. |
| Other: | | | |
| Ore and concentrate | r 1,845 | 2,440 | NA. |
| Ash and residue containing nonferrous metals | 759 | 466 | West Germany 229; France 149; Austria 54. |
| Waste and sweepings of precious metals | 24 | 9 | Denmark 3; Sweden 2; West Germany 2. |
| Oxides, hydroxides, peroxides of metals, n.e.s | 1,097 | 2,587 | Mainly from West Germany. |

See footnotes at end of table.

## Table 9.—Switzerland: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Other—Continued | | | |
| Metals including alloys, all forms: | | | |
| Metalloids | 1,983 | 2,456 | Netherlands 1,052; West Germany 542; France 528. |
| Alkali, alkaline earth and rare earth-metals | 525 | 428 | Mainly from West Germany. |
| Pyrophoric alloys | 17 | 8 | West Germany 5; Austria 2; United Kingdom 1. |
| Base metals including alloys, all forms, n.e.s | 386 | 666 | Japan 150; Republic of South Africa 139; United States 139. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Pumice, emery, natural corundum, etc | 1,260 | 2,013 | Italy 868; West Germany 714; Turkey 200. |
| Dust and powder of precious and semiprecious stones kilograms | 866 | 1,272 | Ireland 558; United Kingdom 357; United States 204. |
| Grinding and polishing wheels and stones | 1,576 | 1,623 | West Germany 692; Austria 214; Italy 180. |

## COMMODITY REVIEW

**Metals.**—*Aluminum.*—Swiss consumption of unwrought aluminum used to manufacture aluminum products decreased approximately 6% in 1974,[47] and was as follows in tons:

| | 1970 | 1971 | 1972 | 1973 | 1974 |
|---|---|---|---|---|---|
| Consumption, unwrought aluminum | 99,700 | 85,200 | 99,124 | 111,500 | • 105,000 |
| Production of aluminum manufactures: | | | | | |
| Wire | 1,638 | 1,769 | 2,495 | 1,461 | NA |
| Rods, bars, sections | 28,010 | 27,016 | 30,484 | 35,440 | NA |
| Plate, sheet, strip | 54,720 | 58,100 | 62,541 | 65,421 | NA |
| Tubes | 2,921 | 3,500 | 2,732 | 2,866 | NA |
| Forgings | 1,047 | 984 | 872 | 782 | NA |
| Total | 88,336 | 91,369 | 99,124 | 105,970 | • 112,200 |

• Estimated on basis of 9-month data. NA Not available.

*Copper.*—Swiss consumption of refined copper increased 18% in 1974, Swiss production of copper semimanufactures increased 9%, and production of copper alloy semimanufactures increased 4%,[48] and was as follows in tons:

| | 1970 | 1971 | 1972 | 1973 | 1974 |
|---|---|---|---|---|---|
| Consumption, refined copper | 48,100 | 40,500 | 30,100 | 25,500 | 30,200 |
| Production: | | | | | |
| Copper semimanufactures: | | | | | |
| Wire | 40,712 | 39,111 | 39,942 | 37,341 | 41,296 |
| Rods, bars, sections | 2,288 | 2,148 | 1,768 | 1,693 | 1,927 |
| Plates, sheets, strip | 2,035 | 2,060 | 2,421 | 2,169 | 2,564 |
| Tubes | 2,191 | 1,598 | 1,772 | 2,563 | 1,986 |
| Total (copper) | 47,226 | 44,917 | 45,903 | 43,766 | 47,773 |
| Copper alloy semimanufactures: | | | | | |
| Wire | 4,804 | 4,460 | 4,590 | 5,040 | 5,545 |
| Rods, bars, sections | 24,266 | 22,280 | 21,020 | 24,031 | 23,633 |
| Plates, sheets, strips | 15,248 | 13,111 | 12,323 | 14,588 | 16,054 |
| Tubes | 1,971 | 1,711 | 1,578 | 1,606 | 1,807 |
| Total (copper alloy) | 46,289 | 41,562 | 39,511 | 45,265 | 47,039 |

*Silicon.*—During 1974, two Swiss silicon-ferrosilicon producers were located at Bodio in southeastern Switzerland about 55 miles north of the Italian border.[49] Monteforno Acciaierie E. Laminatoi, the major producer had a reported capacity of 8,000 tons per year while Gotthardwerke für Electrochemische Industrie, a subsidiary of Lonza AG, had a rated capacity of 800 tons per year.

*Steel.*—Almost all of the 605,000 tons per year of steel produced by Switzerland's four steel works and about 80% of the 2 million tons per year of imported steel reaches Swiss consumers through metal dealers.[50] Steel trade in Switzerland is conducted through metal traders which act as intermediaries between mill and consumer. The size and scope of Swiss steel traders activities vary considerably. The amount of processing carried out by steel traders is increasing and includes decoiling, slitting, guillotining, flame cutting, and other methods of preparing steel to the customer's desired specifications.

There are currently about 150 steel stockholding firms (dealers) in Switzerland employing about 10,000 people which have a yearly turnover of about $500 million. Nearly all of these firms are members of eight regional trade groups under a central

body, Schqeizerische Stahlandelszentrale (SSZ), based in Basel.

**Nonmetals.**—*Cement and Other Construction Materials.*—During 1974, 15 Swiss cementworks located in 11 Cantons (Aargäu, Bern, Graubünden, Neuchâtel, St. Gallen, Schwyz, Schaffhausen, Solothurn, Tessin, Valais, and Vaud) produced almost 5.3 million tons of cement, a decrease of 9% compared with 1973 production.[51] Less than 1% of this material was exported. In addition, three clinker grinding plants were operated in the Cantons of Basel-Land, Geneva, and Tessin.

Consumption of cement in Switzerland during 1974, including imports of 58,219 tons, totaled 5.3 million tons and was used primarily for roads (40.1%), in building construction, excluding dams (28.6%), in cement shaped products (11.2%), and in power industry construction, including hydroelectric dams (1.5%).

*Lime.*—Production of hydraulic lime in Switzerland decreased 18.2% to 112,574 tons in 1974; domestic consumption fell 17.2% and totaled 115,753 tons during the year.[52]

# The Mineral Industry of Other Areas of Africa

By Staff, Bureau of Mines

## CONTENTS

## BOTSWANA [1]

The mineral industry of Botswana has been a major factor in the transformation of the country's economy. The gross domestic product (GDP) was an estimated $194 million [2] in 1974, and a growth rate of 14% was projected to continue through 1978. Rapid expansion in recent years has been possible through major developments in the mining and livestock sectors, which promise to provide a base for future industrialization. Even so, a series of circumstances in 1974 dampened expansion plans. During the year, a fourfold increase in the price of imported oil played havoc with the economy, as did the effects of world inflation, which necessitated a substantial mid-1974 increase in wages and salaries. A drop in copper prices, severe technical problems at Selebi-Pikwe copper-nickel complex, and a lower-than-expected volume of diamond sales all resulted in lower-than-expected mineral revenues. Except for diamond, mineral production was far below expected levels.

Estimated government revenue expected for 1975–76 was $108.9 million, an increase of 26% over that of 1974, but down from the 1974 increase over that of 1973 of 56%. Recurrent government expenditures for 1975 were projected at 48% above those of 1974, reflecting the inflationary circumstances previously outlined. Total value for development projects in the current 5-year plan ending 1978–79

[1] Prepared by Janice L. W. Jolly, physical scientist, Division of Ferrous Metals.

[2] Where necessary, values have been converted from South African Rand (R) to U.S. dollars at the rate of R1=US$1.48.

was estimated to be $405.7 million. However, only $297.2 million was expected to be implemented during the plan period; $173.8 million was expected from external sources, leaving $123.4 million to be contributed from domestic sources.

Botswana sees foreign investment as a key factor in its development and actively seeks private capital for development of minerals, manufacturing industries, and agriculture. The income tax law of 1973 provides relief on capital expenditures. The constitution prohibits nationalization unless approved by the National Assembly, and guarantees prompt payment of adequate compensation. All investment proposals must be approved by the Government, but there are no other restrictions on private foreign investment and no limitation on repatriation of profits. Botswana is a member of the Southern African Customs Union with the Republic of South Africa, Swaziland, and Lesotho. When the road link with Zambia is completed in mid-1976, Botswana will have access to African countries north of the Zambezi. It was announced during 1974 that the Government would exercise its rights under a 1969 agreement with the De Beers organization to renegotiate certain aspects of the agreement, since the Orapa operations have proved much more profitable than originally envisaged. Negotiations have been going on since 1973. The Government would increase its shareholding in Orapa Mining Co. from 15% to 50% and replace the existing profits tax and 5% sales royalty with a single sales royalty, subject to future amendment. These new arrangements are likely to increase the Government's share to 75%.

In September 1974, it was announced that Botswana would have its own currency within 2 years and will phase out the Rand. The Government was also to establish a central bank to be responsible for foreign exchange control and to set the exchange rate for the new currency.

Under the current 5-year development plan, the road network has been a major focus of attention. The construction of all-weather roads has been aided by loans from the International Development Association (IDA), the United Kingdom, the Swedish International Development Authority (SIDA), and the U.S. Agency for International Development (AID). Canada loaned over $5 million for a road link with Zambia, which is to extend 530 kilometers from Francistown to Kazungula and is expected to be completed by mid-1977. The total cost was expected to be $50 million. The Government decided that the Rhodesian railway system in Botswana was to be taken over, and will eventually be owned and operated by Botswana.[3] The Federal Republic of Germany was added to the list of countries assisting Botswana in developing a modern transportation system. The Federal Republic of Germany was to lend about $5 million for the development of the Francistown-Serule Road, and give about $346,280 for design of the road.

Installed electrical capacity in 1973 included 12 megawatts at Gaborone, 15 megawatts at Selebi-Pikwe, 0.8 megawatts at Francistown, and 1.9 megawatts from the facilities controlled by the national company Botswana Power Corp. (BPC). The BPC capacity will be increased to 65 megawatts by 1978, when the power facilities at Selebi-Pikwe will add 45 megawatts. In addition, private industries have installed power capacities of about 39 megawatts. Most power is thermally produced. Total output of coal from the mine near Palapye was being used for the thermal powerplant at Selebi-Pikwe.

The Selebi-Pikwe copper-nickel complex started production in February 1974, on schedule 33 months after initiation of construction. Bamangwato Concessions Limited (BCL), the company that operates the concession, is owned 15% by the Government and 85% by Botswana Roan Selection Trust Ltd. (BRST). The public holds a 40% equity in BRST with the remaining 60% owned one-half by American Metal Climax, Inc. (Amax) and one-half by Anglo-American Corp. and Charter Consolidated Group. Delays and technical problems in 1974 brought the total financing for the project to over $286 million. The higher capital requirements were partially offset by higher prices for base metals in 1974, but lower-than-expected production and prices were encountered in 1975. The additional finance required was put up by the shareholders. The technical problems encountered were largely associated with the high proportion of fines in

[3] Standard Bank Review (London). Botswana. October 1974, p. 19.

the ore delivered to the mill. The record rainy season raised the moisture content of the ore, hampering the movement of ore through the mill's crushing section. Work stoppages also occurred owing to explosions during concentrate drying, which were caused by the pyrophoric nature of the concentrates. Production reached 6,262 tons of copper-nickel matte in 1974 and was averaging about 1,000 tons per month, well below the planned 3,500 tons per month. The matte was to be delivered to Amax's Port Nickel plant in Louisiana, where it would be refined. A team of engineers was moved to Pikwe to remain on-site until normal operations could be achieved. The underground mine at Selebi was not expected to enter production until 1979. An Outokumpu Oy flash smelter and a sulfur-reduction plant were teamed to produce and capture the highest attainable amount of sulfur from the ore. The 127,000 tons of byproduct sulfur expected to be produced yearly will be sold in southern Africa.

Prospecting continued at the Matsitama copper deposits. Reserves were estimated to be about 10 million tons with 2.5% copper. Promising copper deposits were also reported south of Lake Ngami with a possible production twice that of Selebi-Pikwe.

There was increasing acivity in the search for coal. A team from Powell Duffryn Technical Services Ltd. of the United Kingdom completed a preliminary survey in conjunction with the Botswana Geological Survey. It was understood that the team would make a complete survey of coal deposits throughout Botswana. Following the energy crisis, Botswana's substantial coal reserves have become a valuable asset. Shell Coal Botswana, a wholly-owned subsidiary of the Royal Dutch/Shell group, was awarded a special prospecting license in March 1974 to seek coal, oil shales, and radioactive minerals over an extensive area in eastern and southern Botswana. Shell's prospecting license covers three areas covering about 15,000 square kilometers total. The concession is for 3 years with extensions. The present production of about 200,000 tons per year from the Morupule coal mine was forecast to increase to 1 million tons per year after 1977.

Investment areas discussed during 1974 with various American firms included the possibility of a cement factory. The Foley gypsum deposits were expected to have a production of 50,000 tons per year, starting in 1976. Of this, about 2,000 tons were planned for use at a cement factory to be located near Selebi-Pikwe at Mandinare, and the rest were to be exported.

In 1974, the Orapa mine raised its diamond production from the 1973 level of 2,416,000 carats to 2,718,000 carats valued at $44.8 million. Approximately 85% was industrial. In 1973, Botswana's output contributed approximately 5% of the world production of diamonds. The Orapa mine was expected to be the largest in terms of quantity (carats) in the De Beers group, though the quality and therefore value per carat is relatively low. Intensive testing of the DK–1 pipe located 40 kilometers southeast of the Orapa deposit established that it was economic. The area is smaller than Orapa, but the diamonds are of higher quality. The DK–2 is a small satellite pipe similar to DK–1. DK–1 and 2 were to be called the Letlhekine mine. Terms for mining these new deposits were under negotiation.

A salt and soda-ash refinery and town were being planned at Sua Pan within the next 5 years. The project was to be a joint effort between the Government and possibly Makgadikgadi Soda Limited, a subsidiary of BCL. In early 1975, however, BCL suspended its program of developing the salt project and let its prospecting license lapse, allowing the Government to pursue other promising avenues. The Government was to be responsible for the infrastructure, and the mining company for the refinery and other plant requirements.

Botswana imports all of its petroleum needs from the Republic of South Africa and some distillate fuel oil from Nigeria. Botswana's oil imports were valued at $3.4 million in 1974. During the fuel crisis early in 1974, the country suffered a shortage after the decision by the Republic of South Africa to reduce deliveries to Botswana at the same time as Lesotho and Swaziland. It was decided to raise oil storage capacity in Botswana, giving it additional reserve for future emergencies. Approximately $74,000 was to be borrowed for construction of new oil storage depots at six centers throughout the country, increasing reserve capacity to a 2-month supply. The loan was expected to come from a special fund set up by oil-exporting members of the Arab league for the member states of the Organization of African Unity (OAU).

## Table 1.—Other Areas of Africa: Production of mineral commodities

[e] Estimated. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the countries listed individually in this table, Equatorial Guinea, the French Territory of the Afars and Issas, the Gambia and Upper Volta, all covered textually in this chapter, presumably produce modest quantities of crude construction materials such as clays, stone, sand, gravel, and may produce minor amounts of other mineral commodities (most notably gypsum, lime, and salt), but output is not reported quantitatively and available information is inadequate to permit formulation of reliable estimates of output levels.

[2] In addition to the commodities listed, modest quantities of unlisted varieties of crude construction materials, (including clays, stone, sand, and gravel) presumably were produced, but output is not reported quantitatively, and available information is inadequate to permit formulation of reliable estimates of output levels.

[3] Limited quantities of tungsten minerals, columbite-tantalite and other pegmatite minerals may also be produced, but output is not recorded.

[4] Includes production of the Province of Eritrea.

[5] In addition, Ethiopia excluding Eritrea produces clay for the manufacture of bricks. Clay output for this purpose is unreported, but brick production was as follows (number of bricks): 1972—not available; 1973—1,846,652; 1974—575,326.

[6] Production of the Province of Eritrea only; additional quantities may be produced in other areas of Ethiopia.

[7] Reported as marble, without the modifying term cipoline.

[8] Less than ½ unit.

[9] In addition to the commodities listed, corundum and kyanite may also be produced, but output is not recorded.

[10] Not reported in gravimetric units; output totaled 3,727 cubic meters in 1973 and 4,810 cubic meters in 1974.

[11] Products marketed under the trade names of "baylifos" and "phosphal."

[12] In addition to the commodities listed, corundum (natural), graphite and mica have been produced in the past and output presumably has continued, but no basis for estimation of output levels is available. Through 1965, natural corundum output was at a level of several thousand tons, ranking Southern Rhodesia second only to the U.S.S.R.

[13] Data are sales for years ended August 31 of that stated.

[14] Data are for years ended September 30 of that stated.

[15] Data presented are 1964 total recorded production, rounded; eucryptite, lepidolite, petalite and spodumene were all produced in 1964. No reliable basis exists for estimating either individual output levels for these minerals or total output on a year-to-year basis.

[16] Includes nickel content of nickel oxide and nickel fonte.

[17] Output of Inyati mine only for years ended September 30 of that stated.

[18] Output of Beardmore mine only for years ended September 30 of that stated.

[19] Erroneously reported in previous edition; data presented therein were in thousand 42-gallon barrels, not metric tons as indicated.

[20] All figures reported are sales; actual production not reported.

## BURUNDI [4]

The mineral industry of Burundi was of minor importance to the national economy. Activity was highlighted in 1974 by the confirmation by a United Nations Development Program (UNDP) mineral survey team, that extensive commercially exploitable nickel deposits occur in the eastern and southern part of the country. The deposits, reportedly the largest in Africa, are garnierite-type lateritic cappings on ultrabasic rocks. Significant copper, cobalt, and platinum mineralization was also found in the rocks below the nickel laterites. Drilling delineated large tonnages of 2% nickel ores at Musongati and Nyabikere. UNDP exploration continued on these and other nickel deposits along a 30-kilometer zone of basic and ultrabasic rocks between the towns of Rutana and Mabanda, and was expected to be completed in 1975.

The UNDP planned to conduct a $2 million economic study beginning in 1975 on the feasibility of developing the deposits. The cost of exploiting the nickel deposits, including extensive hydroelectric and processing facilities and a complete transportation infrastructure, was roughly estimated at $500 million.[5] International mining companies have expressed interest in these deposits, but at yearend 1974, no mining concessions had been granted by the Government.

Inflation, transportation problems, and high petroleum prices adversely affected Burundi's economy in 1974. Both the balance of payments and the balance of trade registered deficits, and owing to low coffee prices, export earnings declined 11.5% to $27.8 million. Agricultural products accounted for virtually all of the export earnings; mineral products, largely tin and rare-earth concentrates, comprised about 2.5% of the total export value, or about $695,000, in 1974. Imports of mineral commodities were primarily iron and steel semimanufactures, refined petroleum products, cement, and salt.

Mineral production in 1974 was limited to small tonnages of bastnäsite (a rare-earth mineral) and cassiterite (tin) concentrates, lime, small quantities of placer gold, and unmeasured amounts of peat and common construction materials such as stone, sand, gravel, and clay. Bastnäsite was produced at a small underground mine near Karonge by Société Minerale de Karonge (SOMIKA). Statistical data on mineral production are not available, but bastnäsite output was probably less than 300 tons. Cassiterite was produced by SOMIKA at a mine in Muyinga Province near the Rwanda border. Tin production in 1974 was estimated at about 140 tons. In September, the two mining companies, Minetain Burundi and SOMIKA, merged into an enterprise, Sobumines, in which the Government owns 49%.

Interest in exploring for oil and gas in the Ruzizi River plain and Lake Tanganyika continued. Preliminary studies and possible drilling by the U.S. company, International Subsea Development Corp., were expected to begin in 1975.[6]

## CAMEROON [7]

The minerals industry of the Federal Republic of Cameroon followed the pattern of previous years, with only limited production of gold, limestone, marble, and cassiterite reported. Primary aluminum metal was produced from alumina imported from Guinea. Hydraulic cement also was produced. The trade pattern was similar to that of 1973. Only small quantities of metallic and nonmetallic minerals were exported although significant quantities of aluminum metal, cement, and scrap metal were exported.

Imports included aluminum oxide, iron and steel semimanufactures, cement, fertilizer materials, mineral fuels, and other metallic and nonmetallic mineral commodities.

Although current mineral production in Cameroon is small, there are known deposits of bauxite, kyanite, iron ore, and

[5] Where necessary, values have been converted from Burundi francs (FBu) to U.S. dollars at a rate of FBu78.35 = US$1.00.

U.S. Embassy, Bujumbura, Burundi. Economic Trends Report. State Department Airgram A–24, Apr. 4, 1975, p. 6.

[6] Quarterly Economic Review. Zaire, Rwanda, Burundi. No. 4, 1974, p. 15.

[7] Prepared by Benjamin Petkof, physical scientist, Division of Nonferrous Metals.

sand that may be developed in future years. Bauxite deposits are known at Minim and Martap, and additional deposits are at Dschang and Fongo Tongo. Kyanite deposits are known to occur at Otele, Nanga Eboko, and Edea. Low-grade hematite has been found at Kribi.

There has been limited prospecting for oil in Cameroon, with the following companies holding operating permits: Société Elf de Recherches et d'Exploitation des Petróles du Cameroun (Elf-Serepca), Cameroonian Shell Prospecting and Exploiting Co. (Shell Camrex), Gulf Oil Company of Cameroon, Mobil Oil, Niegria Inc., and Oceanic Exploitation Co. These companies hold 12 concessions in the Cameroonian coastal basin.

Efforts are being made to develop known natural gas reserves at Logbaba.

## CENTRAL AFRICAN REPUBLIC [8]

The mineral resources of the Central African Republic remained largely underdeveloped because of lack of investment capital and inadequate means of transport. Diamond continued as the major mineral product during 1974 with a total value of $10 to $15 million. Total trade was estimated at not more than $100 million. The balance of payments for 1974 was estimated at a $15 million deficit, owing partly to the high cost of imported petroleum products. A number of foreign-owned businesses were nationalized in 1974, including five petroleum-product-distribution firms. Prospects increased for construction of a 700-ton-per-year uranium concentrator, which could begin as early as 1976.

**Government Policies and Programs.**—The Central African Republic nationalized a number of foreign-controlled businesses including some French cotton and forest-product interests as well as five petroleum-product-distribution companies, two of which (Mobil and Texaco, Inc.) were U.S. firms. No compensation had been made by yearend for these acquisitions. Nevertheless, foreign investment in mineral ventures was actively sought by the Government. Total U.S. investment, primarily in diamond mining and cutting, was $7.5 million. France continued as the heaviest foreign investor in the country. Foreign aid was received from the U.S.S.R., Romania, and the European Development Fund.

### PRODUCTION AND TRADE

Diamond production continued as the major minerals industry in the Central African Republic, accounting for over 95% of mineral export value and approximately one-third of total export value. Estimated diamond production, shown in table 1, declined 8% in 1974 to 350,000 carats. No reliable figures were available on the value of 1974 mineral production. Total value of diamond production in 1973 was $10.9 million. World prices of gem-quality diamond increased significantly during 1974. No change was indicated in the previously reported production ratio of two parts gem diamond to one part industrial diamond. A small quantity of gold, less than 100 troy ounces, was produced as a byproduct of diamond mining.

Building-material output included crushed stone, sand and gravel, and brick and ceramic tile. Production figures were not available.

Diamond export data were not available; the Government considered all export data as strategic information not to be released.

Financial problems in the Central African Republic continued to increase, and the projected (November) balance of payments for 1974 was minus $15 million. Sharp increases in the price of petroleum imports affected the balance of trade adversely, and it was estimated that they would cost the country an extra $7.6 million in 1974.

### COMMODITY REVIEW

**Diamond.**—No expansion of diamond-mining capacity was reported in 1974, and production decreased 8% to 350,000 carats. Total employment was approximately 50,000. Resource exploration and foreign investment were encouraged.

[8] Prepared by Richard H. Singleton, physical scientist, Division of Nonmetallic Minerals.

Diamond mining continued as the major investment by the United States in the Central African Republic.

**Petroleum.**—Demand for petroleum products was estimated to be 84,000 cubic meters per year. This had been imported from Gabon prior to 1974, and about 15,000 cubic meters had been reexported to Chad. Most of the 1974 supply was purchased on credit from Algeria. Difficulties with transportation and payment threatened the oil supply during the year. The Algerian trade pact became mutually unacceptable by yearend, and the Central African Republic planned to turn again to Gabon's refinery at Sogara for its supply of petroleum products.

All five petroleum-product-distribution companies were nationalized in May 1974 and their functions taken over by the Central African Society of Hydrocarbons, a state-owned controlling body. Petroleum exploration was begun in the northern part of the country, but no drilling was undertaken in 1974.

**Uranium.**—Prospects increased for commercial development of high-phosphate uranium ore at Bakouma, 500 kilometers east of the capital, under an exclusive contract with Swiss Aluminium, Ltd. (Alusuisse). Estimated reserves were 15,000 tons of uranium. Planned investment was reportedly $8 million to build a plant with a capacity of 700 tons per year of concentrate, by 1976 at the earliest.

**Other Minerals.**—No further reports were available on building the cement and fertilizer plants, or on developing the iron ore deposits as reportedly planned in 1972 and 1973.

The UNDP proposed another mineral survey of the country. Preliminary satellite exploration indicated large deposits of heavy metals.

## CHAD [9]

The mining industry of Chad is quite small, with sun-dried natron (actually trona or hydrous sodium carbonate) the main mineral commodity produced. It is generally obtained as slabs weighing about 35 kilograms from about 20 saliferous basins northwest of Bol, near Lake Chad. Natron has a variety of uses, including human and animal consumption, preservation of meat and hides, and the manufacture of soap. Production data are shown in table 1.

The Continental Oil Company of Chad (CONOCO-Tchad), in which Shell Oil Co. has a 50% interest, has been searching for oil in Chad since 1969. Some evidence of oil was found at a well north of Lake Chad in Kanem prefecture in August to September 1974, but further tests and exploration were said to be necessary before the economic feasibility of the discovery could be determined. Two earlier wells were drilled in southern Chad, in Logone Oriental and Chari-Baguirmi prefectures. After drilling a fourth well in Kanem prefecture, plans were to transfer the rig south again for two additional wells.[10]

A mineral exploration project was begun in November 1973 with the assistance of 3-year UNDP financing. Exploration is to be concentrated in a 10,000-square-kilometer area of Mayo Kebi in southwestern Chad. Work was begun on setting up basic laboratory testing facilities along with the continuing preliminary exploration.[11]

## CONGO [12]

Petroleum was the major mineral product of the Congo. Potash continued to be the major nonfuel mineral commodity, followed by lead-zinc and copper ores.

Potash, mostly for export, was mined from a high-grade sylvanite deposit (60% $K_2O$) by Compagnie des Potasses du Congo (CPC). The revised sylvanite reserves of 1.5 million tons located in Hollé were expected to be depleted by 1976. Studies were being conducted on the feasibility of mining large deposits of carnallite when the Hollé sylvanite reserves are exhausted. At Pointe Noire, CPC planned to dredge the

harbor, construct a wharf to accommodate larger ships, and build new railroad transfer facilities.

The U.S.S.R. assisted in the exploration and development of deposits of lead-zinc-copper ore in the Mfouati region. Two basic areas of mineralization occur—one in the Yanga-Koubenza area, and the other in the Djenguile area. National Mines Company of Mfouati, established in 1974 as a government-owned minerals exploitation organization, planned to mine the Djenguile deposit where reserves were estimated at 350,000 to 400,000 tons of ore. Later it will mine the Yanga-Koubenza deposit where reserves were estimated at 4.1 million tons. It was estimated that production of a low-grade lead-zinc concentrate would average about 30,000 tons per year during 1975–78 and 20,000 tons per year thereafter. Production of a copper concentrate was estimated to be about 4,000 tons per year. A mill and flotation plant were being built with a capacity of 65,000 tons per year. The cost for bringing the Djenguile mine and mill onstream was estimated at about $4.1 million,[13] about one-half contributed by the Government and one-half by a material credit from the U.S.S.R.

Construction began on facilities to mine the gold deposits of the Sounda-Kakamoeka sectors (Kouilou region) as part of the U.S.S.R.-Congolese agreement of November 1972. Production of 24,000 troy ounces per year of gold was expected from the 5-ton-per-day mill. Reserves were estimated at 145,000 troy ounces of gold. National Mines Co. of Sounda was established to operate the mine. Total investment to equip the mine was estimated at $1.1 million to which was added $60,000 as technical assistance. Financing was insured by a credit from the U.S.S.R.

The Congolese Government gave first priority in its 1974–78 budget to improving transportation facilities. Line improvements and equipment purchases were needed to increase the capacity of the Congo Ocean Railroad from 3.8 million tons in 1973 to 5 million tons by yearend 1974. Increased capacity was needed by the railroad to transport a minimum of 2 million tons per year of manganese ore from southern Gabon to Pointe Noire.

In 1974, 22.4 million barrels of crude oil[14] was produced exclusively from the Emeraude Field, where 28 platforms were put into service by drilling 20 additional wells. Elf-CONGO and Azienda Generale Italiani Petroli S.p.A. (AGIP) of Italy operated the field. The Government projected that crude oil production from the Emeraude Field would decline at an average annual rate of 23% from 1974 to 1978, at which time production was estimated to be 7.9 million barrels. Crude oil production schedules called for decreased production in 1975; however, the schedules also indicated an increase to almost 50 million barrels by 1978 from all fields.

The Italian exploration team, AGIP-Recherches Congo, spent more than $22 million for exploration during 1969–74. AGIP's main discovery was the Loango-Marine Field where one production, three drilling, and one flare platform were to be completed by mid-1975. Approximately 34 production wells and 8 water-injection wells were planned for the field. AGIP also had a permit for offshore prospecting in the Maritime Madingo Field, an area of 3,415 square kilometers. The total investment for exploration and development was estimated at about $150 million. A 60-mile pipeline was being laid from the platforms to Djeno where storage tanks and port facilities were under construction. Gas reserves were estimated at 400 million cubic meters. All gas production was used to supply the Hollé steam-generating station.

Construction was scheduled to begin in 1975 for a 21,500-barrel-per-day refinery at Brazzaville.

## DAHOMEY[15]

The mineral production of Dahomey consisted of small amounts of salt, gravel, and cement for local consumption in 1974. Plans were being implemented for a ceramics plant in Cotonou, a cement works at Onigbolo, a marble works at Dadjo, and an oil refinery at Porto Novo. New interest was being shown in the Union Oil

[13] Where necessary, values have been converted from Communauté Financière Africaine Francs (CFAF) to U.S. dollars at the rate of CFAFI=US$0.0041.

[14] Converted at 7.206 barrels per ton of crude oil.

[15] Prepared by Janice L. W. Jolly.

Co.'s concession after their contract was revoked in early 1974. Agriculture remained the cornerstone of development, and the industrial sector remained relatively undeveloped. Large enterprises, both private and public, were financed mainly by foreign capital. France provided an estimated 40% of all bilateral and multilateral aid given to Dahomey. Much of the economy remained open to private capital, but private investment remained scarce, and the State was trying to establish public and semipublic companies. Nationalization of several companies occurred with announcement of a new change in government policy at the end of 1974. Along with higher prices for petroleum products, Dahomey also experienced higher prices for its imported food and manufactured products during 1974, causing the Government to take several steps to combat inflation by instituting price subsidies and increasing wages. The 1974 Government budget of $56.5 million[16] had an estimated deficit of $4.5 million. Civil service costs absorb about 66% of the Government budget expenditure.

Early in 1974, a hydrocarbon-supply commission was established to study the problems relating to the supply of liquid and gaseous hydrocarbons, including a regular inspection of reserves. On December 4, the petroleum distribution companies were nationalized, with certain banking, insurance, transportation, industrial development, and communications companies soon to follow. A new state society was created, Société Nationale de Commercialization des Produits Petróleirs (SONACOP), to commercialize and industrialize petroleum and its derivatives.[17] The stated governmental policy of giving Dahomeans the transport monopoly was implemented by the formation of the national transport and consignment company SONTRAC in early January 1975; 49% of the capital was held by the state, and 51% was divided between Dahomean shippers. A new profits tax was passed in July 1974 with a generally favorable reaction from local businesses. Those businesses subject to special indirect taxes such as distributors of cement and petroleum products were now able to deduct profit taxes from other tax obligations. The contribution to the National Development Fund, established in 1973 for reinvestment of profits, became obligatory after January 1, 1974, in the form of "investment certificates" subscribed to by taxpayers.

In 1974, Dahomey imported refined petroleum products from Algeria (145,254 tons). and Niger (66,678 tons). The Société Nationale de Raffinage (SONARAF) was created in July 1973 between the Dahomean State and British companies, Litwin Ltd. and Inha International Ltd. to build and develop a petroleum refinery in Dahomey. Funds to proceed with the project were being sought from the Ex-Im Bank and Nigeria. With cancellation of the Union Oil contract in early 1974, several other concerns, including a Romanian delegation, were showing interest in further exploration and possible exploitation. A new exploration agreement was signed in early 1975 with Shell Oil Co. of Dahomey (Dahorex). Under the new mining and petroleum code of 1973, a prospecting company has no guarantee of an exploitation license and can only make application for an exploration permit after it has discovered a commercially exploitable field.

The Société Nationale de Ceramique (SONAC) ceramics plant, located at Contonou, was expected to start in early 1975, and was a joint effort between the Dahomean State (80%) and a West German company (20%). The project necessitated an investment of about $2.1 million. A cement works was planned for Onigbolo with aid from the Nigerian Government. A loan of about $8.3 million was to be advanced by Nigeria in 1975 with a view to developing a number of projects of common interest, including the cement factory.[18] A joint development project was discussed between Niger and Dahomey at yearend 1974. Projects considered were extending the railway from Parakou to Dosso and Niamey, constructing a dam across the Mekrou River, and constructing the Gay-Malanville bridge.

The UNDP continued its program of helping the Government to strengthen the Geological Survey by establishing a geochemical laboratory and initiating a reconnaissance geological survey of the country with a contribution of $550,000.

[17] Industries et Travaux D'Outremer (Paris). Dahomey. V. 23, No. 254, January 1975, p. 71.

[18] Industries et Travaux D'Outremer (Paris). Dahomey. V. 23, No. 259, June 1975, p. 521.

UNDP was also to provide $234,000 to the international agency, Council of the Communaté Electrique du Benin (CEB), in order to further develop electrical energy resources. CEB was created by Dahomey and Togo in 1968 to buy and transport electricity from Ghana for both nations. Ghana has agreed to make available 50 megawatts of electricity for a continuous period of 115 years from the Akosombo power station.[19]

In January 1973, the Dahomean electrical company was nationalized and the government-owned Société Nationale d'Electricite et d'Eau (SDEE) was organized in its place. The total installed electrical capacity of four thermal power stations at Cotonou, Porto-Novo, Bohicon, and Parakou was about 10.6 megawatts in 1974.[20] In 1973, the total electrical energy consumed was 41.6 million kilowatt-hours, which was about 84% of that available.

There was a shortfall in the production of salt in 1974 because SODASEL, the only company recovering salt from seawater, had difficulty in getting production underway. It attained only about one-half of its production goal with about 2,500 tons of salt. Recent field research has confirmed earlier evidence of small, apparently noncommercial phosphate deposits in southern and central Dahomey. There are no concrete plans at present to exploit these deposits.[21] About 15,000 tons of gravel was also produced.

## EQUATORIAL GUINEA [22]

The mineral industry of Equatorial Guinea, including its two provinces, Rio Muni and Fernando Po, consisted primarily of petroleum prospecting and various mineral imports for 1974. Merchants Petroleum of Los Angeles, Calif., acquired a 5% interest in Aracca Petroleum's exploration rights in Rio Muni Province. Drilling plans were not disclosed. A nation of an estimated 350,000 people, the gross national product (GNP) has reportedly grown at a rate of 8% and reached $240 per capita, one of the highest in western Africa.[23] Equatorial Guinea had 360 kilometers of highway put in by the Spanish before their departure. The country produced 23 million kilowatt-hours of electricity in 1973. A World Bank loan of $2 million was made in 1973 to be devoted to the development of a highway maintenance program.

## ETHIOPIA [24]

Ethiopia's mineral industry continued to make a minor contribution to the general economy in 1974. Mineral production, not including refined oil products, was valued at approximately $12.8 million[25] in 1974, forming less than 1% of the estimated GDP of $2.4 billion. In January, the first copper was shipped to Japan from the Nippon Mining Co., Ltd. concession in Eritrea, but this activity was suspended by March, because of continuing civil disturbances. Tenneco Ethiopia, Inc. and the Polar Bear/Voyager Group also halted their exploration activities, while the Whitestone Group and Royal Dutch/Shell Group continued. In light of Eritrean objection to mineral exploitation licensed by the Ethiopian Government, little activity was expected in Eritrea in the near future.

Of major significance was the announcement by the Ethiopian Government on December 20, 1974, of the intent to pursue a socialist economic policy. This intent was better defined in a series of declarations in early 1975. Mineral activities exclusively reserved for the State were listed as large-scale salt mining, petroleum refining and natural gas, exploitation of precious metal and radioactive minerals, and certain basic industries such as ce-

ment. Areas where Ethiopian State and foreign capital could jointly operate included exploration and exploitation of petroleum and coal, and mining of ferrous and nonferrous minerals and chemical and fertilizer materials. The State would assume 51% of any such venture. Quarrying stone and related materials was left to the private sector, subject to regulation.[26]

Minerals produced in 1974 included marine salt ($4.5 million), cement ($5.3 million), gold ($2.3 million), copper ore ($473,170), platinum ($41,935), marble ($47,741), china clay, gypsum, sand and silica sand, stone, granite, talc, and lignite. Minerals produced in Eritrea included 90,000 tons of cement, 130 tons of china clay, 6,450 tons of lime, and 8,327 tons of limestone for 1974.[27]

The total value for exports in 1974 was estimated to be $319.2 million. Mineral exports including marine salt ($290,243) and refined petroleum products ($8.5 million) formed about 3% of the total value for items exported. Generally the export earnings were reduced by about 8%[28] from those in 1973, compared with a 44% increase in 1973 over that of 1972. The most striking cost increase in imports for 1974 was that of crude and refined petroleum products. Total imports were valued at an estimated $280.8 million. Ethiopia's oil import bill was estimated at $47.9 million in 1974, up from the $16.9 million required in 1973.

The Ethiopian Petroleum Co.'s refinery at Assab processed about 581,402 tons of crude oil in 1974, but has been reportedly operating at a loss which has made it necessary to consider subsidizing its operations. Besides the refinery production, Ethiopia also imports refined petroleum products as well as crude oil. A total of 110,112 tons of refined petroleum products was imported in 1974. Most petroleum was imported from Saudi Arabia and Iran. Higher refinery costs (about $200,000 per year) also contributed to higher prices for petroleum products during 1974.

In December 1974, Tenneco Ethiopia, Inc. and the Polar Bear/Voyager Group (composed of Voyager Petroleum Ltd., 25%; Polar Bear International Ltd., 25%; Cardinal Petroleum Ltd., 25%; and Houston Oils Ltd. of Canada, 25% announced their withdrawal from Ethiopian oil exploration, principally because of a lack of substantial discoveries. Tenneco had continued to operate three seismic crews throughout 1974. The Voyager Petroleum Group relinquished its Ogaden Basin permit after completion of a gravity survey. Whitestone Ethiopia (Whitestone International and Louisiana Land and Exploration Co.) was completing its first stage of geological and geophysical activities that began in 1973. The second stage of exploration was expected to begin in 1975 with drilling possible sometime in 1976. Royal Dutch/Shell was prospecting along the Eritrean coast, southeast of Massawa. Shell acquired the offshore concession in July. Shell's oil prospecting permit was for 12 years, requiring an investment of about $10 million. General American Oil Company of Ethiopia Inc. (GAO) acquired a 31% interest in Red Sea acreage that will eventually be reduced to 617,000 acres. Thus far, GAO has drilled two dry holes.

An increased number of prospecting permits and exploration licenses were reportedly granted during the year.[29] Strengthened by a UNDP-financed project, the Geological Survey also saw an increase in activities during 1974. Canadian, Japanese, and Chinese-aided geological and mineral surveys were also active. Artena Corp. continued studying the lateritic nickel deposits in Sidamo Province. Gold continued to be produced from the Government gold mine in Sidamo Province, and exploration for placer gold in western Wollega continued with encouraging results. A preliminary assessment of these deposits should be complete during 1975. Copper exploration continued at Tigre and a number of mineralized zones have been located. Test drilling was to begin on disseminated copper in metavolcanics. Large deposits of diatomite are also under study, as are industrial minerals for local glass and cement companies. Exploration was also active for other industrial minerals such as soda ash, fluorite, borates, and phosphates, as well as for base metals. Some beryl and wolframite occurrences have been staked by prospectors in northern Harrar Province.

In March 1974, work was stopped at the Ethio-Nippon Debarwa copper mining site in Eritrea. In January, 1,900 tons of copper had been exported to Japan. Other copper deposits of equally high quality are also reported in this mineral concession. The Ethiopia Railroad in northern Eritrea continued to show declines in both freight and revenue during 1974. In early 1974, the railroad was affected by a coal shortage as a result of Australian coal strikes as well as by antiquated equipment.

## THE FRENCH TERRITORY OF THE AFARS AND ISSAS [30]

Mineral industry activity in the French Territory of the Afars and Issas contributed very little to the economy of the nation in 1974. Mineral trade consisted primarily of imports and reexports. Petroleum products, cement, metals, and semimanufactured metal products head the import list. The principal mineral activity in 1974 consisted of exploratory work for a geothermal source of energy. Recent high petroleum prices have made this source of energy seem more economically attractive. It was estimated that each borehole drilled in the otherwise barren basalt fields could furnish 10 megawatts, or reportedly one-third of the electricity consumed in Djibouti. The reopening of the Suez Canal and events in Ethiopia have resulted in a rise in importance of the strategically located port Djibouti. A salt works was also being planned for Djibouti.[31]

## THE GAMBIA [32]

Gambia, a country with 494,279 people and a GDP of approximately $63 million, had negligible mineral production in 1974. Mineral activity has been reported, however, in exploration for deposits of kaolin, ilmenite, and oil. Small amounts of unrecorded sand and gravel were produced for local consumption. Gambia and Iceland signed a letter of intent for a joint venture in construction of an ilmenite-processing plant in Gambia and a smelting plant in Iceland, contingent upon success of feasibility studies being carried out by the UNDP. The deposits were estimated to contain about 5 million tons of black sands. The Shell Oil (50%) and Pecten Gambia (50%) group was granted offshore (492 square miles) and onshore (554 square miles) oil exploration licenses. The Aracca Petroleum Company of New York had its exploration license renewed. Both companies have done seismic work. Shell began clearing for onshore seismic work in 1974, starting near the southern Senegal border and working north towards Banjul (formerly Bathurst). Merchants Petroleum Co. of Los Angeles acquired a 5% interest in Aracca's exploration rights in Gambia. No drilling plans were disclosed. Terra Resources of Tulsa, Okla., and five other oil companies had an option on 6,480 square kilometers offshore. Seismic data were being evaluated.

At yearend 1973, an Austrian firm, VÖEST-Alpine, Montan AG submitted a feasibility study for an oil refinery. The conclusions reached were favorable. In April 1974, the United Nations undertook a separate study of the project and indicated that it should probably be a joint venture with an oil-producing country. The refinery would probably have a yearly productive capacity of 1 million tons, and a capital investment of $73 million [33] was visualized.

Work on the Banjul port development was expected to be complete at the end of 1974, adding a deepwater port 9 meters deep and 122 meters long, and new transit sheds. The first phase of the UNDP hydrological and topographic study of the Gambia River was nearing completion in 1974. A total of 289 kilometers of asphalt-

surfaced roads and 523 kilometers of all-weather gravel roads existed in Gambia in 1974.

Foreign trade in mineral commodities consisted principally of imports of cement, iron and steel items, refined petroleum products, and fertilizers. A trade agreement was signed between Gambia and Liberia in which Gambia would import timber, cement, petroleum products, and beverages while exporting cattle and peanut oil to Liberia. Petroleum products represent between 3.5% and 4.5% of the total import values.

## GUINEA [34]

Bauxite and alumina were the principal mineral products of Guinea, and exports of these commodities continued to be the country's major source of foreign exchange.

Estimated bauxite production in Guinea more than doubled in 1974. It was the first full year of production at the Boké project operated by Guinea Bauxite Co. (CBG), and output by this venture alone exceeded 4 million tons. CBG was owned by the Government of Guinea (49%) and Halco (51%), a consortium of aluminum producers consisting of Aluminum Co. of America, 27%; Alcan Aluminium Ltd., 27%; Martin Marietta Aluminum, Inc., 20%; Péchiney Ugine Kuhlmann (PUK), 10%; Vereinigte Aluminium-Werke A.G. (VAW), 10%; and Montecatini-Edison S.p.A., 6%.

Bauxite was also mined by Friguia, which continued to operate the only alumina plant in Africa. Friguia was owned by the Government (49%) and Frialco Co. (51%), another international consortium. Frialco was owned by Olin Corp. (38.5%), PUK (36.5%), British Aluminium Co., Ltd. (10%), Alusuisse (10%), and VAW (5%). Late in the year, Olin sold its equity in Frialco to Noranda Mines, Ltd., which has a primary aluminum plant in the United States.

A third bauxite producer, the Government's Kindia Bauxite Office (OBK), began mining the deposits at Debele in the Kindia region in 1974. This project was initiated with the technical assistance and financing of the U.S.S.R. All of the production, which was expected to reach 2.5 million tons per year, was to be exported to the U.S.S.R.

The Government and Alusuisse joint venture, Société Minière et de Participations Guinée-Alusuisse (SOMIGA), was reportedly developing bauxite deposits in the Tougué region. Alusuisse reported that prospecting revealed over 2 billion tons of commercial-grade bauxite in this area. Another potential producer, Dabola Bauxite Co. (SBD), expected to complete feasibility studies in 1975 on its project near Dabola. SBD was a joint venture of the Governments of Guinea and Yugoslavia.

Extensive iron ore deposits occur at Mount Simandou in southeastern Guinea and in the Nimba Mountains adjacent to the Liberian deposits mined by Liberian-American-Swedish Mining Co. (LAMCO). A multinational company, Miferugui-Nimba, was formed to develop the Nimba deposits. The Government of Guinea, three other African countries, and a group of European and Japanese companies have reportedly underwritten all of the shares of Mifergui-Nimba. A similar company was expected to be formed to develop the Simandou deposits. Initially, ore from the Nimba project is to be shipped over the rail system used by LAMCO and exported from Buchanan, Liberia. Further plans include extension of the Conakry-Kankan railroad so that ore can be shipped from Nimba and Simbandou through Guinea to Conakry.

## IVORY COAST [35]

The mineral industry of the Ivory Coast remained of minor importance to the country's economy. Diamond production, the only significant mining activity, decreased 7% in volume owing to the closing of an obsolete plant. It was evident that diamond production, valued at about $7 million,[36] would remain the major mining activity throughout the seventies. Petroleum refin-

[34] Prepared by Horace F. Kurtz, industry economist, Division of Nonferrous Metals.

[36] Where necessary values have been converted from Communauté Financière Africaine Francs (CFAF) to U.S. dollars at the rate of CFAF236=US$1.

ing and cement production continued using imported raw materials. Expansions in capacity were underway in both of these industries. The petroleum refining and distribution industries were partially nationalized with formation of government-industry jointly owned companies. Drilling for offshore oil continued with reasonable optimism.

The Ivorian economy performed surprisingly well in 1974 in spite of the oil crisis and worldwide inflation and recession. The GDP, at $3.73 billion, showed a real growth of 13% compared with an average of 7% for the previous 4 years. Actual GDP increased 55%. High prices prevailed throughout the year for cocoa and coffee, the two major commodities. Real industrial production increased 9%. Total export value increased 58% to $1.24 billion, 71% of which was cocoa, coffee, and timber. The balance of trade showed a $0.25 billion surplus, nearly double that of 1973. France was the main trading partner. About 7% of Ivorian trade was with the United States. External indebtedness increased 57% to $1.12 billion. Wholesale prices increased 19%.

Efforts to moderate inflation and further increase production were hindered by price increases for imports and the depressed economic status of developed countries. In an attempt to broaden the mineral industry, free enterprise and foreign investment in natural resource ventures was encouraged. In May 1974, total foreign investment was $442 million. The U.S. investment was $39 million, two-thirds of which was in petroleum, but which also included a diamond mine and a battery factory. After a modest depression, the Government was prudently expectant of an upturn at year-end.

A second major hydroelectric project with a capacity of 210 megawatts was scheduled for completion in 1979. The Government strived to lessen dependency on imported oil by developing water power.

Construction of a large pellet-producing, iron ore mine-concentrator complex was scheduled to begin in 1976. The project, planned to include a railroad and port, was to be the largest venture ever undertaken in the Ivory Coast.

Plans were made to exploit a gold deposit. Exploration was conducted for other metals and extensive nickel deposits were discovered.

**Government Policies and Programs.**—The Government continued to encourage free enterprise and foreign investment, which had been responsible for the country's economic success. Partial domestic ownership of foreign companies was encouraged, however, and by yearend the State owned 30% of the oil refinery and 50% of one of the petroleum-product-distribution companies. Training and promoting Ivorian citizens in industry was encouraged. The Government strived for independence from foreign-oil importation by development of state-owned hydroelectric power dams. Phasing out thermal-electric power units and commissioning the 180-megawatt Kossou-dam unit on the Bandama River in 1973 boosted the hydroelectric capacity to 69% of the country's total 325-megawatt capacity. A second major dam on the Bandama River, the Taabo project with a capacity of 210 megawatts, was scheduled for completion in 1979. Construction was scheduled to begin in 1975.

Mineral exploration continued in the northern and western portions of the country, including a second series of aerial explorations by Kenting Earth Sciences Ltd. under a Canadian loan. Searches for nickel in the Biankouma and the Syola regions and for placer gold in the Loho Basin were emphasized. Deposits of nickel, gold, molybdenum, and zinc were discovered. Promising deposits containing 1.5% to 1.8% nickel were found in the Biankouma area. The Sipouli nickel deposit was estimated to cover at least a 20-square-kilometer area. No exploitation plans were reported in 1974 for these deposits. Foreign investment in jointly owned mineral facilities was encouraged although all minerals were state-owned. Buildings of railroads and ports in cooperation with industry was encouraged. Drilling for offshore oil continued in 1974 without success.

## PRODUCTION

Diamond production continued as the only significant mining activity in the Ivory Coast. Production decreased 7% from 1973 to 278,500 carats because an obsolete factory was closed in 1974. No further production decrease was anticipated for 1975. Total value of 1974 diamond production was estimated to be about $7 million.

Production of cement, using imported clinker, decreased 5% to 630,000 tons. Its

estimated value was on the order of $25 million. Nearly all of it was used domestically. Expansion of production facilities was begun in view of anticipated increased demand caused by new construction programs.

Petroleum refinery output increased 18% to 1,340,000 tons, using crude oil imported from the Middle East and Nigeria. Total value of the refined product was estimated to be approximately $150 million. Refinery capacity was 1.5 million tons and was being raised to 2.0 million tons.

Data on production of stone and sand and gravel were not available.

## TRADE

Total export value increased 58% to $1.24 billion, mainly because of higher prices for coffee and cocoa. The three major exported commodities—cocoa, coffee, and timber, in order of value—constituted 71% of total export value. Cocoa became the leading commodity, primarily at the expense of timber. France continued as the major customer, with 26% of total export value, followed by the Netherlands, with 16%, double that of 1973. The United States received 7.1% of Ivorian exports compared with 5.6% in 1973. Diamond exports increased 1% to 291,291 carats valued at approximately $7 million. Approximately 275,000 tons of refined petroleum products, primarily motor gasoline and diesel fuel, valued at approximately $30 million was exported to nearby African countries, mainly Mali and Upper Volta, more than tripling the 1973 export volume.

Total import value increased 53% to $984 million despite a decrease in volume. Major imports were equipment, finished and semifinished goods, and crude petroleum. France remained the major exporter to the Ivory Coast, accounting for 39% of Ivorian imports compared with 44% in 1973. The United States supplied 6.9% of Ivorian imports compared with 9.0% in 1973. Crude petroleum imports, from the Middle East and Nigeria, increased 18% in volume to 1,377,000 tons, and more than quadrupled in value to approximately $140 million. A small quantity of this crude petroleum, approximately 21,000 tons, was reexported to neighboring countries. A small quantity of refined petroleum products, approximately 37,000 tons, was imported. Approximately 521,000 tons of clinker, with an estimated value of $2 million to $3 million, was imported from France, Spain, and the United Kingdom (in order of volume) for domestic cement manufacture. In addition, 130,000 tons of portland cement was imported, mainly from France. A small amount of cement, 18,000 tons, was exported. Various chemical fertilizers, totaling 101,000 tons and with an estimated value of about $4 million, was imported. Approximately 10% of this chemical fertilizer was reexported.

The balance of trade surplus, $252 million, was nearly double that of 1973.

## COMMODITY REVIEW

**Metals.**—*Gold.*—Bureau de Recherches Géologiques et Minieres, (BRGM), a consortium led by the French, signed an agreement with the Government to jointly exploit the Ity deposit west of Man. A total of 66 tons of ore had been collected by August. Assays ran up to 0.006% gold. Beneficiation studies were in progress. Planned plant capacity was 40,000 to 50,000 ounces of gold per year.

*Iron Ore.*—An agreement between the Government and the Man Iron Ore Consortium, leading to exploitation of the Mt. Klahoyo iron ore deposits near Man, was signed in November. Pickands Mather and Co., the project management member of the international consortium, contracted Kaiser Industries Corp. to undertake the engineering study, scheduled for completion in March 1976. The complex was to include a mine and concentrator, with an annual output of 12 million tons of pellets. Construction was scheduled to begin late in 1976, and production was to begin in 1980. The Government chose an electric railroad instead of the consortium-proposed slurry pipeline as the means of transport from Man to the port of Pedro, a distance of 300 kilometers. Costs of constructing the railroad and port was to be shared by government and industry. This was the largest project ever undertaken in the Ivory Coast and reportedly was to cost approximately $1 billion. It was estimated that the deposit contains an equivalent of 350 million tons of iron ore pellets.

The Government announced plans for building a 100,000-ton-per-year iron-smelting complex at San Pedro by 1980. The plan included direct reduction facilities using natural gas and a rolling mill.

**Nonmetals.**—*Cement.*—Two companies, Société Ivorienne des Ciments et Matériaux and Société des Ciments d'Abidjan, have been manufacturing cement in Abidjan since the mid-sixties. Their combined clinker-crushing capacity was reported to be 900,000 tons. Because of projected increases in construction activity, the former company announced plans to begin building a 180,000-ton-per-year cement plant in 1975 at San Pedro at a cost of $3 million.

*Diamond.*—The major diamond producer, Société Anonyme de Recherches et d'Exploitation Minières en Côte d'Ivoire (SAREMCI) had closed one of its three plants late in 1973 because of age and outdated equipment. Equipment modification of its plants allowed SAREMCI to produce 205,642 carats in 1974 or 74% of total domestic production. However, SAREMCI's production decreased 16% below that of 1973. The other 26% of domestic production came from Société West African Selection Trust and Harry Winston, Inc. (WATSON) whose output increased 30% over that of 1973. Both diamond companies explored for new deposits during 1974. Total inventory for both companies was 26,266 carats at yearend.

**Mineral Fuels.**—*Petroleum.*—Fifty percent of Shell-British Petroleum's Ivorian oil-distribution system was nationalized late in 1974. A permit was awarded in January 1975 to a multinational consortium operated by Phillips Petroleum Co. for offshore exploration of a 19,000-square-kilometer area. Estimated cost of this exploration was $45 million over 10 years. Offshore drilling continued through 1974 with some encouraging signs, but no positive discovery of exploitable deposits.

## LESOTHO [37]

The mineral industry in Lesotho received some good news in 1974 when a plan to develop a diamond mining operation at Letseng-la-Terai was announced. De Beers Consolidated Mines and the Government of Lesotho reached an agreement in early 1975 whereby De Beers would develop and open a mine in approximately 2 years. The decision terminated 2 years of negotiations, which had been preceded by several years of unsuccessful exploration.

No other mining developments occurred, but exploration continued for additional mineral resources. The first oil well was drilled in a series of wildcats planned by Westrans Petroleum, Inc., in a large area of southern and western Lesotho. The Canadian Government committed $972,000 in aid during 1975 for use in an aeromagnetic survey and other programs.[38]

---

[37] Prepared by David G. Willard, economist, Division of Nonmetallic Minerals.

[38] Engineering and Mining Journal. Exploration Round-up. V. 176, No. 9, September 1975, p. 237.

It was evident that mineral developments would be desirable to offset other factors affecting the economy. Rising import costs, particularly for fuel, worsened the country's already negative balance of trade. Disturbances in the South African mines, where many of Lesotho's men were employed, forced the Government to consider taking over the recruitment of workers in order to better insure their safety and suitable working conditions.[39]

### PRODUCTION AND TRADE

Diamond remained Lesotho's only recorded mineral product in 1974. Production was estimated to have increased 32% to 11,307 carats in 1974 from 8,587 carats in 1973. (Only export figures were available, but all of Lesotho's production was exported). Diamond output remained at only about 60% of that in the peak 1966–70 period because the two largest diamond pipes, Letseng-la-Terai and Kao, remained closed to native diamond diggers in order that the Government might promote their development by mining companies. The proportion of production stone quality increased from 13% in 1973 to 16% in 1974. This, plus a sharp increase in gem-diamond prices, caused the value of diamond production in 1974 to soar 175% to $1.1 million from $400,00 in 1973.

Small quantities of other gem stones and construction materials were also produced, but no production statistics were available.

Aside from diamond, no figures on mineral trade were available for Lesotho for 1973 or 1974. Exports of mineral-related products other than diamond were believed to be minor. Rising costs for petroleum products probably offset the increase in diamond export values, leaving Lesotho with a negative balance in mineral trade.

### COMMODITY REVIEW

**Diamond.**—After several years of unsuccessful exploration and negotiations, a contract was signed that should result in commercial diamond production at Letseng-la-Terai, Lesotho's richest diamond pipe. De Beers Lesotho Mining Co., Ltd., a subsidiary of De Beers Consolidated Mines of South Africa that was formed to develop and operate the mine, was owned 75% by De Beers and 25% by the Government of Lesotho. A second company was being formed in Lesotho to market the product, although international distribution was to be handled by De Beers' central selling organization. A surface mine with a capacity of 4,000 tons per day of ore, a recovery plant, and a new road into the previously isolated mountain were scheduled for development, at a total cost of approximately $35 million. About 500 workers were to be employed. Preliminary construction was underway, and mine startup was targeted for early 1977. Between 62.5% and 72% of the revenue (depending on profitability) would accrue to the Lesotho Government through taxes and profit shares.[40]

No activity or negotiations were reported by the Kao diamond pipe, which had been inactive since exploration by Newmont Mining Corp. and United States Steel Corp. terminated in 1973.

The year's only production was by native diggers at the Liqhobong and Limpane pipes.

**Petroleum.**—Drilling of the first in a series of exploratory oil wells was begun by Westrans Petroleum, Inc. The company held exploration rights covering a large portion of southern and western Lesotho and had agreed to drill nine wells during 1974–82.[41]

## MALAGASY REPUBLIC[42]

The economy of the Malagasy Republic is basically agricultural, with 40% of the country's 7.5 million people engaged in subsistence agriculture. A small industrial sector dominated by petroleum refining, food processing, cotton textile, and cement provides only a limited market for indigenous minerals. Therefore, mineral industry activity is generally limited to commodities with export markets. Mineral industry activity was increasing, but accounted for only approximately 5% of total 1974 exports. Marketing Malagasian products continued to be difficult because of geographical location and logistical difficulties. The

[39] Mining Journal. Lesotho Labour Recruitment. V. 282, No. 7730, Mar. 15, 1974, p. 198.
[40] U.S. Embassy, Maseru, Lesotho. State Department Airgram A–18, April 4, 1975, pp. 1–2. Mining Journal. De Beers Plans Diamond Mine. V. 282, No. 7729, Mar. 8, 1974, p. 171.
[41] Oil and Gas Journal. Westrans Drilling First Lesotho Test. V. 72, No. 35, Sept. 2, 1974, p. 19.
[42] Prepared by W. Timothy Adams, Physical scientist, Division of Nonmetallic Minerals.

economic situation remained relatively stagnant because of uncertainty over the extent of Government intervention in the economic sector.

Increased prices for graphite and chromite in 1974 will probably be offset by decreased shipments. Although local demand for refined petroleum products can be met by the refinery at Tamatave, increased costs of crude petroleum will greatly increase the overall trade deficit. A technical and economic evaluation of the Manantenia bauxite deposits was completed, but development of this resource is unlikely at this time. Evaluation of iron, lateritic nickel, and ilmenite and zircon sands continued. Oil prospecting continued both onshore and offshore in 1974, with only minor shows of oil or gas. Increasing costs of the supporting infrastructure decreased the possibility of developing coal deposits in the south.

The Canadian Government has agreed to undertake a feasibility study for the Rogez Hydroelectric Project on the Vohitra River. The Canadian Government is expected to loan $10 million, the Japanese Government $20 million, and the World Bank $40 million of the estimated $70 million cost of the project. Power generated by the project could be used to process chromite to ferrochrome and exploit the Ambatovy nickel deposits.

**Government Policies and Programs.**—Since 1972, the Government has pursued a policy of rapidly enlarging its control over and direct participation in the economy. A number of sectors, including mining and energy, are now reserved exclusively for the State, or for State-dominated enterprises. The new Military Directory, which came to power in February 1975, has not yet defined its economic policy in detail, but has declared "it is prepared to collaborate with businessmen who respect its objectives." Since mid-1974, there were no major new initiatives toward further State participation in the economy, but the Government has moved to further initiatives taken earlier, and to improve the performance of new State enterprises.

New private investment in Malagasy has been very limited owing in large part to uncertainty concerning the extent of the State's eventual participation in the economy. Also, incentives in the Investment Code promulgated in 1973 have been inadequate to attract much interest.[43]

The National Military Office for Strategic Industries was established January 1, 1975. The mission of the new office is supervision of all exploration or exploitation of mineral resources of military or strategic character, particularly uranium and radioactive minerals, petroleum, and bituminous materials.[44]

The Malagasy Republic agreed to adopt statutes establishing the East African Mineral Resources Development Center at Dodoma, Tanzania. The center will advise participating governments about mineral developments, carry out feasibility studies, run training courses, provide laboratory services, undertake field work in mineral developments, and collect and publish information and data.[45]

The Malagasy Republic Government has on several occasions declared its willingness to welcome foreign investment. In most sectors of the economy, there are no set programs for attracting foreign investment and each case is considered individually. In the mineral sector, the Government has declared a policy of requiring majority State ownership in all new ventures. Firms examining investment possibilities in the mineral sector should be prepared to work in close collaboration with the Government, with the latter having a controlling interest in any new venture.[46]

## PRODUCTION

During 1974, mineral production was maintained substantially at 1973 levels. The performance of the mineral industry reflected continued marketing difficulties, uncertainty over the Government's economic policies, and the general decline of the world economy. Chromite, graphite, and mica continued to be the primary minerals produced.

Value of mineral production increased about 175% to an estimated $57.4 million in 1974 from $20.9 million (revised) in 1973. Petroleum refinery production value accounted for most of the increase, as the price of crude petroleum input increased

[44] U.S. Embassy, Tananarive, Malagasy Republic. State Department Airgram A-001, Jan. 9, 1975, pp. 1–2.
[45] U.S. Embassy, Addis Ababa, Ethiopia. State Department Airgram A-94, May 28, 1975, p. 1.
[46] U.S. Embassy, Tananarive, Malagasy Republic. State Department Airgram A-049, May 30, 1975, p. 1.

from approximately $2.80 per barrel in 1973 to approximately $11.50 per barrel in 1974. Crude petroleum processed was approximately 5 million barrels in 1974.

Chromite production declined slightly to 156,000 tons. Cement production declined approximately 12% to 61,000 tons. Mica declined about 4% to about 857 tons. Graphite production increased 24% to about 17,000 tons, with the value increasing about 19%. In general, production of abrasives, feldspar, gem, semiprecious, and ornamental stones remained approximately the same. Statistics are unavailable on the production of building material for domestic consumption (stone, sand, and gravel).

## TRADE

Mineral exports in 1973 increased slightly over those of 1972. The value of mineral commodity exports paralleled worldwide price increases. Shipments of chromite concentrate were 97,952 tons valued at $2.4 million, down from 117,900 tons and $3.4 million in 1972. Exports of graphite decreased 4% in quantity and increased 2% in value; mica increased 57% in quantity and 40% in value; and gem, semiprecious, and ornamental stones increased 23% in value.

Crude petroleum imports in 1974 increased only 1% to 4.912 million barrels, but 12% in value to $13,813 million. Value of the total commodity trade and mineral commodity trade 1971–73 was as follows, in million dollars:

| | 1971 | 1972 | 1973 |
|---|---|---|---|
| Total commodity trade: | | | |
| Exports | 147.0 | 167.0 | 186.0 |
| Imports | 214.0 | 207.0 | 188.0 |
| Balance | −67.0 | −40.0 | −2.0 |
| Mineral commodity trade: | | | |
| Exports | 12.0 | 14.8 | 17.4 |
| Imports | 30.4 | 32.9 | 34.0 |
| Balance | −18.4 | −18.1 | −16.6 |

Source: Statistiques Du Commerce Exterieur De Madagascar. V. 2, issues for 1971, 1972. V. 1, 1973.

Tight governmental controls over imports reduced the mineral commodity trade deficit to less than expected and almost equalized the total commodity trade balance. The balance of mineral trade in 1974 was expected to decline.

Although prices of chromite, graphite, and mica were expected to increase, quantities exported were expected to decrease. The decline in demand for these minerals, coupled with the rise in crude petroleum prices, was expected to increase the trade deficit. Uncertainty over the extension of government's role in proposed policies and programs increased reluctance to invest in new mineral ventures. Marketing and transportation difficulties also were a contributing factor. Increased petroleum refinery capacity was capable of meeting local demands. A decrease in imports of refined petroleum products in conjunction with continued strict import controls was expected to minimize the mineral commodity trade deficit.

Detailed statistics on the mineral commodity trade are given in tables 5 and 6.

## COMMODITY REVIEW

**Metals.**—*Bauxite.*—The 165-million-ton Manantenia bauxite deposit continued to be the object of negotiations between the Malagasy Government and outside parties. Compagnie de Produits Chimiques et Péchiney continued its search for associates to aid in development of the project. A loan agreement was signed with Japan to construct a hydroelectric complex on the Namorona River to supply power to aluminum smelters.

*Chromite.*—Madagascar Chrome Resources Development Co., a new joint venture, began exploration for chrome. The new company is a partnership between seven Japanese ferroalloy producers and C. Itoh & Co., Ltd. (Japan), BRGM, and Compagnie Financiese Eurafricaine, a subsidiary of Anglo American Corp. of South Africa.[47] Approximately 360 outcrops have been located, the biggest running for 200 meters on strike with a vein width of 10 meters. A geological survey and diamond-drilling program is expected to take several years to complete. The survey will be centered on an 8,000-square-kilometer area in the Andilamena-Tsaratanana Districts. First shipments of chromite to Japan are expected in 1979.[48]

*Iron.*—Deposits discovered at Ambatovy, Bekiskopa, Fastentsara, and Ambohipaky were being evaluated.

*Nickel.*—Exploration and evaluation activities reported in the 1973 Minerals Yearbook continued. The deposit would be exploited with power from the proposed Rogez hydroelectric project.

**Nonmetals.**—*Cement.*—The Amoania cement plant was reportedly operating at full capacity. The construction of a second plant to satisfy local needs was under consideration. This plant will probably be located near Tananarive in the plateau region where most of the cement is used.

*Graphite.*—Demand for quality flake graphite continued to be considerably more than production. Exports continued to be limited primarily by internal transportation difficulties and the producers' reluctance to make necessary investments for improvement of facilities. Production in 1974 was 17,280 tons.

*Mica.*—Production decreased slightly to 857 tons in 1974. Mica production continues erratic because of strong competition from synthetic products.

**Mineral Fuels.**—*Coal.*—Utah Development Co. applied for a coal prospecting permit in the Tulear region, southern Malagasy. However, it is believed that little activity will result because of the investment necessary to develop the infrastructure required to develop the coal deposits.

*Petroleum.*—An oil exploration program continued in all the sedimentary basins of the island and the surrounding Continental Shelf. The presence of oil and gas in varying quantities has been indicated in several areas. Evaluation of these shows is continuing; however, no exploitable reserves of petroleum have yet been found.[49] The petroleum refinery at Tamatave continued to operate at close to its installed capacity of 31,500 barrels per day.

**Other Minerals.**—The entire east coast of the Malagasy Republic is covered by exploration permits for ilmenite and zircon sand. Montedison continued its study of commercially exploitable beach sand deposits in the Tamatave region. Evaluation of the beach sand deposits (ilmenite, monazite, and zircon) of the extreme southeast coastal region continued. BRGM and United States Steel Corp. are interested in developing these deposits.[50]

# MALAWI[51]

The mineral industry of Malawi was of minor significance to the nation's economy in 1974. Mineral production consisted primarily of cement, dolomite, agate, and small amounts of sand, and gravel for local use. Mineral exploration continued at a fairly high level, and much interest was being shown in Malawi's coal and carbonatites. Malawi recorded its third year of surplus in 1974 in its recurrent budget, and foreign exchange reserves climbed 25% to $83.2 million.[52] While an inflation rate

of nearly 18% allowed real GDP to increase by only 5% in 1974 compared with 8.5% in 1973, the 1974 GDP at current prices was estimated to be $641.6 million, up 24.7% from 1973.

The 1974–75 budget was presented on March 15, 1974, with development estimates providing for a total expenditure of $59.6 million. Over $16.8 million was allocated to roads and railways, and a similar amount to agriculture and natural resources. Development will continue to be financed largely from external loans and grants, but using local resources of over $10.8 million was also planned. Canada provided Malawi with $22.4 million to expand and improve the railway system, including a new line from Salima to Lilongwe. Railway construction started and was scheduled for completion by 1978. IDA granted a loan of $10 million for improvement of the Lilongwe-Kasungu road. AID made a $11.4 million loan for the construction of the Lilongwe-Mchinji-Zambian border road. This road will facilitate movement of traffic between Zambia and Malawi, which by 1975 would become very important in transportation of copper as other Zambian export routes became closed. There was a total of 10,730 kilometers of road in 1974 with approximately 2,045 kilometers paved or graveled.

About 5% of the development budget for 1974 was to be spent on electric power development. Phase 1 of the Tedzani Falls hydroelectric project on the Shire River became operational in mid-1973, and contracts for phase 2 were let in May 1974. Power production by the Electric Supply Commission increased 12%. A study was being made for a second stage for the Nkula Falls hydroelectric facility. The installed hydroelectric capacity was 64 megawatts in 1974, supplemented by a thermal capacity of 24 megawatts, for a total of 88 megawatts.

Development work on the new capital city forged ahead. Most government ministries, as well as some foreign missions, have now moved to the new capital. The final move is scheduled for 1976–77, but Lilongwe officially assumed the title of capital city on January 1, 1975.

Malawi's economy was described as a partnership between private and public sectors. Malawi continued to attract substantial foreign aid and investment and was encouraging further diversification of its industrial base. Establishment of foreign-owned industry in Malawi is particularly encouraged where Malawi parastatal participation is considered. Taxes on companies are essentially the same whether controlled by foreign or local interests. The basic corporate income tax rate is 40% of net profit, with an additional 5% on profits for companies not incorporated in Malawi or companies repatriating profits to countries with no corporate taxes. All Overseas Private Investment Corporation (OPIC) programs are potentially operative in Malawi. Export restrictions exist only as license requirements in areas of agricultural, cement, base-metal, petroleum, and gem stone products.

Exports were valued at an estimated $121.8 million in 1974, up 27% over those of 1973. Exports went mostly to the United Kingdom, Rhodesia, Zambia, the United States, the Republic of South Africa, the Netherlands, and Ireland. Exports to the European Economic Community (EEC) accounted for 56% in 1974, and Africa and North America accounted for 23% and 9%, respectively. Although reexports in 1974 were 16% higher than in 1973, petroleum products shipped from the Salima storage depot to Zambia were down 48%, reflecting changes in distribution patterns introduced in late 1973.

Imports were valued at an estimated $185.4 million in 1974, up approximately 34.7% from those of 1973, and came mostly from the United Kingdom, the Republic of South Africa, Rhodesia, Japan, Zambia, West Germany, and the United States. Fertilizer prices more than doubled, as did petroleum prices. In the first 6 months of 1974, 517,473 barrels of refined petroleum products were imported, mainly from Iran, the Republic of South Africa, and Mozambique. The value for oil imports increased from an estimated $17 million in 1973 to about $29 million in 1974. About 15% of Malawi's import value was estimated to be refined oil products.

Preliminary studies were underway for the establishment of a fertilizer granulating plant to be supplied from phosphate deposits located near Tundulu. Mineral exploration continued during 1974 with several mining companies holding exclusive licenses for certain areas. UNDP and the Malawi Geological Survey were also active. With the prospect of a growing coal market, there was a renewed interest in

the coal deposits located at Chiromo in the south and the Nkana coalfield in the Karonga District of northern Malawi. The Geological Survey conducted a brief reconnaissance of these deposits. The Nkana Field, an extension of a larger coalfield in Tanzania, has inferred reserves of about 12.7 million tons within 500 feet of the surface. Exploration around the carbonatites continued. Lonrho (Malawi) Ltd. was looking into commercial viability of the Kangakhunde Hill monazite-strontiante deposit. About 1,000 tons of ore was mined for pilot plant tests. Reynolds International was interested in fluorite-bearing carbonatites located in the southeast. International Nickel S.A. (Pty) and Eland Exploration (Pty) were also prospecting in southern and central Malawi. Pitting and sampling for assessment of the Chimwadzulu sapphire-ruby occurrence was done by Hermes Mining Ltd. The UNDP airborne geophysical survey in 1971 was being followed up by ground investigations by UNDP personnel and the Geological Survey. Four areas were included: Karonga and Rumphi in the north, Dzalanyama in the central region, and Nsanje in the south. Thorium and possible uranium mineralization was indicated by radiometric anomalies along several zones in the Karonga area.

The Portland Cement Co. (Malawi) Ltd. mined 123,418 tons of limestone in 1974 at its Changalume operation west of Zomba. About 81,073 tons of cement were produced along with about 91 tons of dolomite. About 21.8 tons of red and gray agates were also produced from the Chikwawa District. Unknown quantities of rock and gravel for road building were also quarried.

Persons employed in the mining and construction field in 1974 were listed as 23,733, up 8.4% from 1973.[53] Higher rates of pay for migrant workers, including mine workers in the Republic of South Africa, offset the effects of repatriation following suspension of mine worker recruitment early in 1974. This followed an airline crash on April 4, 1974, which resulted in the death of 17 Malawian mine workers returning from the Republic of South Africa. At one time in 1974, the number of mine workers at work in the gold mines was up to 130,000. By 1975, there were fewer than 12,000.

## MALI [54]

The mineral industry of Mali represented a very small sector of the Nation's economy in 1974. Mineral production consisted primarily of cement, marble, gold, and salt. Mineral exploitation of other commodities remained in the research stage. Salt production, estimated at approximately 3,000 tons per year, is done by traditional methods, with no central authority for monitoring overall production. Cement production reportedly increased 16% during 1974 to 48,500 tons.[55] An estimated 30 troy ounces of gold was produced.

Mali's economy has been plagued by a number of serious problems in recent years, stemming principally from the drought that has gripped this part of Africa for 7 years. The drought ended in 1974, but this was accompanied by catastrophic flooding in parts of Mali during August and September 1974. Even so, with return to more normal weather conditions, agriculture, which contributed over 43% to the 1974 GDP of approximately $430 million,[56] was expected to regain some strength.

Heavy reliance on imports has contributed to a weakening of the Malian financial position. Increased prices during 1974 for oil and other imported items resulted in a negative trade difference of approximately $66.2 million between the value for imports ($102.4 million) and exports ($36.2 million). On the positive side, Mali's industrial sector has been steadily expanding, and mineral prospecting has revealed promising ore deposits. A number of development projects for Mali's natural resources were being planned or were underway.

Mali commenced the new 5-year Development Plan for 1974–78. A total of $823 million was to be spent over the planned period. About 78%, or $642 million, was to be derived from foreign aid. The amount allotted to mine development was $27.9 million, which was to include the following: (1) Bauxite deposits, estimated at 800 million tons of 40% to 45% $Al_2O_3$ and less than 4% $SiO_2$; (2) iron, estimated at 1 billion tons of 56% to 65% Fe; (3) manganese, estimated at 3.5 million tons of 43% to 46% Mn; (4) lithium, estimated at 300,000 tons of 6% to 7% lithium oxide; (5) phosphate, estimated at 20 million tons of 28% to 30% $P_2O_5$; and (6) limestone. Objects of prospecting would be deposits of kaolin, salt, copper, lead and zinc, uranium, gold, diamond, and oil. An expansion of the cement factory at Diamou and exploitation of the gold deposit at Kalana were planned as cooperative efforts with the U.S.S.R. A Japanese survey team indicated uranium reserves of about 91,000 tons of uranium oxide in the Adrar des Iforas area near the Algerian border. The Japanese Power Reactor and Nuclear Fuel Development Corp. was to continue prospecting for uranium in 1975.

Texaco and Exxon had a joint effort (50% each) in petroleum exploration. The permit, acquired by Texaco in 1970, covered 99,200 square miles in the Toudeni Basin. Extensive seismic operations were scheduled. In addition, Murphy Eastern Oil (the United Kingdom), Comoro Exploration Ltd., Sunningdale Oil Ltd .(Canada) and Sun-Global also conducted seismic surveys for petroleum in Mali. Energy Petroleum Co. of Delaware was exploring for oil in the Azaouak Valley near Nigeria in southeastern Mali.

Foreign aid for development projects during 1974 were multinational. In September 1974, French aid of $4 million was given for various public works, agriculture, and administration projects. The Aid and Cooperation Fund (FAC) agreed to grant $2.1 million for the Kayes road program (438 kilometers of road). In addition, financing was also given earlier in July 1974 by FAC for final studies on the Selinque dam. The Federal Republic of Germany also loaned $15.2 million to begin an oil refinery with an estimated capacity of 30,000 tons at Kita, construction of a highway between Tienfala and Koulikoro, and two other development projects. The People's Republic of China (PRC) was expected to aid with the Manatali Dam.[57] Mali was among 24 states that in August 1974 set up the Islamic Development Bank with an initial capital of $900 million. The purpose of the bank was to help the economic and social de-

velopment of Islamic countries and communities.

In a meeting in May 1974, a master plan for the Senegal River Development Organization (OMVS) was adopted by the three participating countries (Mali, Senegal, and Mauritania) that would serve as a working document for foreign sources of financing. Ownership of the projects was agreed to belong to the three nations as well as financial guarantee and debt, and the principle of equal rights with case-by-case examination would be applied to water usage. The Manantali Dam, built on Malian territory, will thus belong to the OMVS nations. The development of the river basin includes both agriculture and mining. Investments totaling $3.3 billion to be spent over 40 years were visualized. They include establishment of electric power at Manantali and a mineral (bauxite and iron) transport plan from Mali and Senegal. In the first 7 years, the Manantali Dam ($110.8 million) the Delta Dam ($21.7 million), and the port development at Saint Louis ($27 million) the Kayes port, and ports of call along the length of the river would be completed. Two other dams (Gouina and Felou) will be completed by 1990. Development of the mining sector is linked to electrical power production. OMVS experts expect a production of 600,000 tons of alumina and 5 million tons of iron ore per year from deposits located southeast of Manantali. Actual mining depends upon completion of the necessary infrastructure.

Studies for the Selinque dam are being done under multinational cooperation between France, Italy, FRG, European Development Fund (FED), and UNDP. These studies have already cost $1.1 million, and France granted a new subsidy of about $234,500 in 1974. The dam, located 30 kilometers southeast of Bamako on the Sankarani River, will supply a four-turbine hydroelectric powerplant with an installed capacity of 44.8 megawatts. Financing to build the dam was expected from FRG, Saudi Arabia, France, Canada, Italy, FED, and the African Development Bank (ADB). Construction work on the dam was expected to begin during the last quarter of 1976.

Electricity was provided by the Société Energie du Mali (EDM), which is owned 55% by the State and 45% by private and public French interests. Electricity was produced by two hydroelectric centers and 10 diesel generators with a total installed capacity of 33,783 kilowatt-hours. Manantali will have a 150-megawatt capacity. Total electrical production in 1973 was 60.9 million kilowatt-hours, an increase of 16% over that of 1972.

Petroleum imports during the first half of 1975 were from Senegal and Ivory Coast. Refined products totaled 438,000 barrels during this period compared with 548,143 barrels during the second half of 1974.

## MAURITANIA [58]

The mineral industry of the Islami Republic of Mauritania increased its contribution to the country's economy to about 45% of the GDP in 1974. Value of mineral output was estimated at $173 million [59] compared with $121.4 million in 1973. Copper production decreased 6%, but iron increased 11% and gypsum increased over 500% from the 1973 production figures. Small amounts of byproduct gold and salt were also produced. The iron mines were nationalized on November 28, 1974, and the copper mines were being considered for nationalization in early 1975. The Government was moving ahead with studies aimed at construction of a copper smelter at Nouakchott, a steel mill at Nouadhibou, and the million-ton petroleum refinery at Nouadhibou, Mauritania's iron ore port. Inflation was a problem through much of 1974, aggravated by the rise in oil prices and other import costs. To ease the burden of higher prices, the Government subsidized staple foods and transportation costs. Such subsidies cost the Government an estimated $7.2 million in 1974. More than one-half of Mauritania's yearly fuel consumption has consisted of gas and oil. Mauritania has few automobiles and little need for heating oil, but its huge iron-mining complex is run almost entirely on petroleum products. A total of 159,251 tons of petroleum products was used in 1974, down 2% from the 1973 total. All electrical equipment utilizes diesel turbines.

Mauritania is a member of the West African Economic Community (CEAO), which is a regional economic cooperation organization composed of the Ivory Coast, Upper Volta, Mali, Niger, and Senegal. It was instituted in 1959 and revised in 1966. Mauritania also joined the Arab Center for Industrial Development, which is an organ of the Arab league, in 1973. The center was created in 1969 to coordinate the efforts of Arab countries in various industrial fields. Mauritania was expected to join the Association of Iron Ore Exporting Countries in 1975. A general agreement between Bulgaria and Mauritania was signed June 29, 1974, for cooperation in mining and geology, agriculture, and commerce. Bulgaria agreed to send several teams of specialists to Mauritania to explore these areas of cooperation. Romania was also expected to cooperate on mineral activity. Credits for highway and port improvement in 1974 totaled $11 million from the Canadian Fund for International Development Agency (CIDA), the Kuwait Fund for Arab Economic Development, and the World Bank.

Exploration efforts for various minerals were continued by the UNDP, the Société National Industrielle et Minière (SNIM), BRGM and several private consortiums. The Kuwait Fund agreed to finance a study to synthesize past geological reports and to develop a minerals master plan for Mauritania. This study was to begin in 1975 and may be done by a United States firm. UNDP exploration found signs of manganese on the eastern part of the Requeibat Ridge.

BRGM continued its studies at Diaguili where substantial new copper deposits (with gold) have reportedly been found near Selibaby on the Senegal-Mali frontier. A geological study [60] was also published on the central part of the Mauritanides belt, providing some description of the copper concentrations of the area. A permit for copper prospecting was accorded to SNIM in the Akjoujt region. The Société Minière de Mauritanie (SOMIMA) has been plagued with concentration-process problems since production started in 1971. Losses were estimated at about $35 million and were absorbed by the parent Charter Consolidated Company. During 1974, copper ore production reached 32,900 tons of concentrates, containing 20,079 tons of metal. These are oxide ores with 2.5% to 2.9% copper and 3 grams per ton of gold. With proven deposits of copper oxides expected to be exhausted by 1978, SOMIMA was considering exploitation of the copper sulfides with reserves estimated at 35.9 million tons of 1.28% copper and 0.8 gram per ton of gold.[61] No final decision on the copper sulfide project was expected until early 1975. The Société Nationale Industrielle and Kuwaiti interests formed a joint company to build a 30,000-ton-per-year copper smelter.

The study of low-grade magnetite deposits east of Zouerate entered its final phase. Tests on the iron ore continued overseas and at the pilot plant at Zouerate. SNIM was granted permission to begin iron ore exploration in the Akjoujt region. The three iron mine areas (Tazadit, Rouessa, and F'Derick) produced 11.7 million tons of 63% iron ore in 1974. Iron ore exports went mainly to the United Kingdom, France, Japan, Belgium, Italy, and West Germany, with smaller shipments to Spain, Algeria, the Netherlands, United States, Yugoslavia, and Switzerland. Iron exports, valued at $130.3 million in 1974, accounted for about 70% of Mauritania's foreign exchange earnings and over 40% of the Government's revenues.

At current production rates, Mauritania's high-grade iron ore was expected to last only about another 10 years. The iron mining corporation, Société Anonyme des Mines de Fer de Mauritanie (MIFERMA) had been experimenting with a new dry concentration process for concentrating the 2 billion tons of low-grade ore (28% to 35%) interspersed with the currently exploited higher grade deposits. The pilot plant began operating in 1974. It was estimated that about $300 million would be needed for the large-scale, low-grade-ore exploitation. Before nationalization in 1974, the capital of MIFERMA was reportedly held by Mauritania (5%), BRGM (24%), Usinor and Denain Nordest Longwy (13%), other French industrial and banking groups (18%), Finsider of Italy (18%), August Thyssen Hütte AG (5%), and the U.S. firm International Minerals and Chemical Corp. (3%). The World Bank and the Caisse Centrale de Cooperation Economique (CCE) also held interests in the company. The new mining corporation will be run by SNIM. A joint venture was organized to prospect for iron ore in Sfariat-Zerrmar area by MIFERMA, SOMIMA, Basic Resources Inc., and some Dutch interests.

The gypsum quarry operated by SNIM began operations in October 1973. The quarry is located 65 kilometers north of Nouakchott at the N'Drahamcha sabkha. Production reached 8,312 tons in 1974 compared with 1,955 tons in 1973. Gypsum was being exported to Senegal and the West African Cement Co. plant in Rufisque.

A consortium of companies, including SNIM, BRGM, the Société Senegalaise des Phosphates des Thies, and the Romanian company, GEOMINES, began exploration for phosphate in the Aleg-Kaedi-Boghe region. An agricultural fertilizer plant was reportedly planned.

The Compagnie Française de Petroles (CFP) continued its exploration of Dorsale Regueibat and Tasiast for uranium. The company was given authority to widen its area of exploration and also add the following partners: In permit No. 22, PUK (20%), Commissariat à l'Énergie Atomique (10%), and TOTAL, Compagnie Minière et Nucleaire (70%); and in permit No. 26, Tokyo Uranium Development Co., Ltd. (20%), Compagnie Péchiney U.K. (20%), TOTAL (50%), and CFP (10%). Tokyo Uranium Development Co. is composed of Marubeni Corporation (57.5%), Nippon Mining Co., Ltd. (30%), Fiji Bank, and Industrial Bank of Japan (each 5%), and Yasuda Fire & Marine Insurance Co., Ltd (2.5%). Prospecting will begin in the Ghallaman area in northern Mauritania. The concession covers 165,000 square kilometers. The yearly investment is expected to be $500,000. The companies are required by contract to put up 20% of the funds required, enabling them to receive the same percentage of uranium ore. An aerial exploration program was completed in 1974.

In 1974, electricity was controlled by the Société Maurtanienne d'eau et d'Electricite (MAURELEC) which was owned 78.2% by the State and by the French CCE. Complete nationalization of the company was expected in 1975. In 1973, a total of 70 million kilowatt-hours of electricity was produced. New projects were expected to increase production as follows: At Nouakchott for 1974–75, a total of 27,000 kilowatts resulting from aid by the People's Republic of China; at Nouadhibou, 24,000 kilowatts by 1976; at Kaedi, 1,000 kilowatts; at Rosso, 600 kilowatts in 1974; and at Atar, 400 kilowatts in 1974. By 1976, the total installed power was expected to be 59.8 megawatts.[62]

Three test holes for petroleum were drilled in 1974. The first hole was by Texaco and Exxon in the Taoudenit Basin, 160 kilometers northeast of Tichit. Texaco ceded 50% of its petroleum rights to

[62] Industries et Travaux D'Outremer (Paris). Maritanie. V. 22, No. 253, December 1974, p. 1096.

Exxon in April 1974. It hit traces of gas. The second well was also located in the Taoudenit Basin some 400 kilometers northeast of Tichet and was sunk by AGIP Exploration and Exploitation (Mauritania) and the Japanese company World Energy Development Co. AGIP ceded 25% of its petroleum rights to World Energy in January 1974. World Energy Development is an affiliate of C. Itoh & Co. The agreement required approval of all three governments involved in the prospecting area. Shell Mauritania Co. hit gas at 3,500 meters in a well located 80 kilometers northwest of Nouakchott, offshore in about 600 meters of water. Amoco and Planet Oil and Mineral Corp. of Texas were prospecting off Cape Timeris. A refinery at Nouadhibou was to be financed by Austria (50%), the Netherlands (25%), and East Germany (25%). Crude oil for the refinery will be obtained from Algeria.

## MAURITIUS [63]

Mineral activity in Mauritius consisted of marine salt and lime production in 1974 and a continuation of oil exploration in offshore areas. Mineral production contributed 0.1% to the estimated GDP of $468 million for 1974.[64] Approximately 5,000 tons of salt valued at $248,344 and 4,000 tons of lime valued at $223,538 were produced in 1974, representing nearly a 30% decrease in both quantity and value from the 1972 and 1973 production. Although the value of mineral production was down, the 1974 GDP for the nation of about 881,000 people saw a 71% increase at current prices over the 1973 GDP. This was mainly the result of the increase in sugar production and prices, and inflation, which was 29.1% in 1974 compared with 13.5% in 1973 and 5.4% in 1972. The value of exports ($296 million) exceeded the import value ($291 million) for a trade surplus in 1974, even though imports increased 92% in value over those in 1973. Included in imported goods were refined petroleum products from Iran and South Yemen. A total of 1.3 million barrels, comprised of motor gasoline (12.3%), jet fuel and kerosine (20.5%), distillate fuel oil (39.7%), and residual fuel oil (27.5%), was imported in 1974.

Prospecting for oil continued on the Texaco concession in the area of St. Brandon in the Cargados Carajos Shoals, 418 kilometers north of Mauritius. In early 1974, the Texaco project entered its second phase as it began geophysical probes with the ship *Western Endeavour* and was preparing to start the first test drillings. A drillship was to arrive in early 1975 to begin drilling. There were reports of oil and gas being found [65] as well as the discovery of large deposits of manganese nodules in the sea floor south of the Nazereth banks.[66] A team of Indian Government geologists were reportedly to begin studying other offshore oil prospects in 1975 as part of a technical assistance agreement. India was already assisting with a cement plant designed for internal needs. The People's Republic of China was assisting in building a new international airport to replace Plaisance airport, already saturated with heavy traffic.

## NIGER [67]

The mineral industry of Niger continued to play an increasingly important part in the national economy in 1974 because the principal economic activity, agriculture (peanuts, grains, and cattle), continued to suffer from the effects of drought. The mineral industry was the main employer of industrial labor, and minerals, largely uranium, were the most valuable export commodity. A change in government in April did not appreciably affect ongoing exploration, and the search for exploitable uranium and petroleum deposits accelerated in 1974. New uranium-exploration companies were formed, and the first drilling for petroleum began.

The Government created a new agency, the Bureau de Recherche et Exploitation Minière (BUREMI), to administer the country's mining research and development. BUREMI will have jurisdiction over all geological research and mining activities, including the granting of exploration permits, equity participation in mining ventures, marketing of mineral products, and the training of local technical cadres.

The value of mineral production, for which complete data are not available, increased in 1974 owing to higher world prices for tin and uranium. Uranium output, valued at an estimated $28.1 million,[68] accounted for most of Niger's mineral production value in 1974. Other mineral commodities produced were cement, tin concentrate, gypsum, limestone, salt, minor quantities of gold, and various amounts of crude construction materials, such as stone, sand and gravel, and clay. The only mineral exports were uranium and tin concentrate and probably small amounts of cement and salt. Exports of uranium oxide ($U_3O_8$), all to France, accounted for the bulk of total export sales.

[68] Where necessary, values have been converted from Communauté Financière Africaine Francs (CFAF) to U.S. dollars at a rate of CFAF202=US$1.00.

Principal mineral imports were iron and steel semimanufactures and refined petroleum products.

Société des Mines de l'Air (SOMAIR), a consortium composed of the Government of Niger, the French Commissariat à l'Énergie Atomique (CEA), Compagnie Française des Minerais d'Uranium, Péchiney-Mokta Mining Co. (France), Urangesellschaft AG (West Germany), and Agip Nucleare S.p.A. (Italy), was the sole producer of uranium in 1974. Production of $U_3O_8$ in concentrate at SOMAIR's Arlit uranium mine in northwest Niger, increased from 1,118 tons in 1973 to 1,318 tons in 1974. A second processing line at the SOMAIR plant was put into operation in December, but the new line was not expected to operate at full capacity during 1975. In 1976, production of uranium was scheduled to be between 1,500 and 2,000 tons, part of which was expected to be recovered from the leaching of dump materials.

Japan's Overseas Uranium Resources Development Co., joined with the CEA and the Government of Niger in Compagnie Minière d'Akouta (COMINAK) to exploit the uranium resources in the Akouta area southwest of Arlit. The mining venture, which will cost about $70 million, was expected to begin production in 1979 at a yearly rate of 2,000 tons $U_3O_8$.[69] Uranium reserves in the Akouta deposit were estimated at 30,000 tons $U_3O_8$. Japan planned to purchase about 40% of the uranium after enrichment in Europe.

The Government planned to develop a coal deposit, discovered near Agadez in 1964, to fuel a thermal power station for electricity at the Akouta uranium mining operation. Agadez coal reserves were estimated at about 4.5 million tons. The proposed power station was to be of sufficient size to eventually supply electrical power also to SOMAIR's Arlit mining operation.

Two uranium exploration ventures became active in 1974. In April, CONOCO, CEA, and the Government began a 3-year, $7 million exploration program on a CEA concession near Imouranen, 50 kilometers south of Arlit. As an equal partner, the Government was to have the right to market its share of the uranium produced.[70]

Société des Mines du Djado (SMD), a consortium composed of CEA, the Government, and Urangesellschaft AG of West Germany, began exploration for uranium in the Djado region of northern Niger. In August, Japan's Power Reactor and Nuclear Fuel Development Corp. took a 25% interest in SMD. The first phase of the venture, an exploration program covering 40,000 square miles was expected to cost about $13.3 million.

Société Minière du Niger produced 120 tons of tin concentrate, containing about 78 tons of tin at the Taroudji and El Meki mines in the southern Air Mountains. In 1974, all of the tin concentrate, valued at about $625,000, was exported to Nigeria for processing.

A small goal production resulted from panning of alluvial deposits in the Sirba River region. Niger's one cement plan, at Malbaza, operated at about 50% of capacity during 1974, producing about 20,500 tons of cement, which was 38% less than in 1973. Traditional production of salt by solar evaporation was sufficient for domestic needs.

Exploration drilling for petroleum began late in the year at two sites in northeastern Niger. Texaco Niger, Inc., and Exxon began drilling near Fauchi in the Agaden concession in November. Another drilling operation was started in December by Texaco, Exxon, and Global Energy Co. (a subsidiary of Rosario Resources Corp.) in the Sequidine concession area, which lies north of Abaden concession. Scheduled drilling depths were 3,000 meters at Fauchi and 2,500 meters at Sequidine.

Drilling was expected in three additional areas in 1975. CONOCO, which holds a concession in eastern Niger with Shell, planned to bring in a drilling rig from Chad to drill a well 40 kilometers northwest of N'Guigmi in the Lake Chad region in 1975. Niger Sun Oil Co. was expected to start drilling north of Quallam, in southwestern Niger early in 1975. Global was considering drilling in its Dosso concession north of Niamey. Aeromagnetic and geophysical exploration programs were continuing in most concession areas.

[70] U.S. Embassy, Niamey, Niger. State Department Telegram 995, Apr. 9, 1974, 1 p.

## RWANDA [71]

The mining industry, Rwanda's consistent second source of export earnings, accounted for 17% of the total exports in 1974 compared with 22% in 1973. Cassiterite, the principal mineral produced and exported, furnished 12% of the total value of exports, a 4% decrease from that in 1973.

In discussions held with Swiss delegations, a new agreement was reached whereby Swiss experts will concentrate in mineral research in Rwanda. The previous agreement expired on February 4.

An aerial photography minerals prospecting project under the auspices of the United Nations was also inaugurated. It was hoped that it would be possible to locate geological structures containing exploitable mineral deposits.

## SENEGAL [72]

The only significant mineral currently being exploited in the Republic of Senegal is phosphate rock. Minor quantities of cement, salt, attapulgite (fuller's earth), and building stone were produced. The Government decided during 1974 that it would increase its ownership in the country's two phosphate-producing companies to 50%, effective January 1, 1975. Further, the Senegalese Government negotiated with the partners in the companies to accept a fixed lump-sum payment that would be created by the increase in the international price of phosphate rock. The distribution of the ownership of the companies has not been published; however, ownership is presumed to remain proportional to prior shares.

Compagnie Sénégalaise des Phosphates de Taiba ownership was 27.28% by BRGM, 23.87% by International Minerals and Chemical Corp. (IMC), 14.3% by Compagnie Financière pour l'Outer-Mer (Cofimer) of France, 10.41% by Cie. Central de Co-operation Economique (CCCE), 2.48% by Comiphos, 5.21% by Rhône-Progil, 3.76% by Auxom, 0.46% by OPFIA, and 3.05% by the Senegalese Government.[73]

The unusually high-grade calcium phosphate concentrate from Taiba commanded a market price of $76 per ton effective July 1, 1974. The plant and mine are located near Tivaouiane, 70 miles east of Dakar. Bucket-wheel excavators remove an average 25 meters of sandy overburden assisted by draglines. Draglines (18-cubic-yard capacity) are used to mine the 7-meter-thick matrix seam and load out into 100-ton trucks for transport to a grizzly screen and scrubbing station to remove coarse rubble. The slurry from this station is pumped to the washing and flotation plant. Taiba produced 1,472,000 tons of marketable phosphate rock in 1974, which is projected to increase to 1.6 million and 1.7 million tons in 1975 and 1976, respectively. Although the remaining reserve at the Taiba mine is limited to 25 million tons, the Tobene deposits adjacent to the Taiba mine are believed to have reserves ranging from 50 million to 100 million tons. Production from Tobene may start in 1978. Taiba ore assays 29% $P_2O_5$ in place and is concentrated to 37.3% $P_2O_5$. Overall weight recovery is 40%. Sales volume in 1974 totaled 1,574,000 tons. The principal markets were France, the Netherlands, the United Kingdom, and Greece.

The Société Sénégalaise des Phosphate de Thiès was owned wholly by the French firm Péchiney Saint-Gobain. The company operates an aluminum phosphate mine at Pallo, about 6 kilometers from Lam–Lam, where the plant is located. The Senegalese Government acquired a 50% interest in this company and also received a special contribution from the firm to permit the Government to share in the excess profits developed from the higher prices in effect in 1974. In addition to the aluminum phosphate mined at Pallo, a deposit of calcium phosphate at Lam-Lam, similar to the ore at Taiba, was mined in 1974. This deposit was mined in 1942 but mining was discontinued because of high costs. At the Pallo mine, the overburden ranges from zero to 5 meters and the thickness of the matrix ranges from 1 to 8 meters. The average ore assay in the ground is 28.5% $P_2O_5$. After the fines are screened out of the ore at Lam–Lam, the $P_2O_5$ content is 29.5%, and after calcining, 34%. The

[73] Industrial Minerals. No. 82, July 1974, pp. 35–36.

most recent estimate of reserves remaining at Pallo is 50 million tons.

Because the Pallo ore varies in thickness, drill holes for core samples are set on 25-meter centers. After the overburden is dozed to the side, the matrix is drilled, blasted, loaded into trucks, hauled to a crushing and transfer station, and trucked to Lam-Lam. The ore is screened at Lam-Lam to produce natural aluminum phosphate rock. Some of this material is calcined in a rotary kiln to solubilize the $P_2O_5$ content, and sold as clinker or Phospal and Polyfos. A small quantity of calcium phosphate was mined at Lam-Lam. The overburden is about 21 meters thick and the matrix averages 5 meters thick. The ore assays 28% to 30% $P_2O_5$ in place and can be screened to produce a 34% $P_2O_5$ product. Reserves are on the order of 800,000 tons. Production is not expected to exceed 100,000 tons per year and will not continue unless the international market price of phosphate rock remains at 1974 levels. The production of aluminum phosphate rock and special products is shown in the following tabulation:

| | 1973 | 1974 | Percent change |
|---|---|---|---|
| Natural aluminum phosphate rock | 218,895 | 405,862 | +85 |
| Special products: | | | |
| Clinker phosphates | 63,816 | 96,798 | +52 |
| Phospal and Polyfos | 5,407 | 4,615 | −15 |
| Baylifos | 78 | -- | -- |
| Crushed aluminum phosphate | 543 | 1,606 | +196 |
| Phosphate rock (calcium phosphate) | -- | 9,594 | -- |

The total production of phosphate rock in Senegal in 1974 was 1,472,000 tons from Taiba and 405,862 tons from Thies, or 1,878,000 tons. The calcium phosphate production from the Lam-Lam calcium phosphate mine, 9,594 tons, was probably included in the total production from the Société Sénégalaise des Phosphate de Thiès.

Cement production from the three-kiln plant at Rufisque, owned and operated by Société Ouest Africaine des Ciments (SOCOCIM), totaled 332,000 tons in 1974, a small increase over the 295,834 tons produced in 1973. Most of the 1974 production was used in Senegal, and 92,217 tons was exported to neighboring countries.

Salt production from the Sine-Saloum Saltflats was 150,000 tons, of which 105,817 tons was exported.

The Société Prochimat produced 4,810 cubic meters of attapulgite and exported 4,970 cubic meters.

A new refinery and petrochemical plant is planned for Cayar, about 60 kilometers north of Dakar, that will be able to accommodate supertankers after construction of a wharf.[74] The joint Sénégalese-Iranian project with participation from Gabon will have a capacity of 6 million tons per year of crude, one-half of which will be for bunkering, and the other one-half will be distilled products for export to the United States. This will be completed by 1978 and include a 250,000-ton-per-year sulfuric acid plant and an 80,000-ton-per-year phosphoric acid plant. The second stage of development, due onstream in 1980, will include a 100,000-ton-per-year ethylene unit, a 40,000-ton-per-year sodium unit, a 35,000-ton-per-year chlorine unit, a 90,000-ton-per-year ammonia plant, and a 50,000-ton-per-year polyvinyl chloride plant.

In the third stage, due to come onstream in 1983, the complex would receive a 420,000-ton-per-year fertilizer unit and a 45,000-ton-per-year detergent plant.

## SOMALIA [75]

The mineral industry of the Somali Democratic Republic contributed very little to the economy of the nation in 1974. Mineral production was largely confined to marine salt, meerschaum, sandstone block or local building, and reportedly, tin and a small amount of piezo-electric quartz.

The 1974–78 5-year plan was implemented, laying foundations for a long-range industrial policy. An estimated $631 million [76] was allotted for the plan period. A total of $421 million was to be derived from foreign loans and grants. Industrial development was to be allotted $95 million; mines, about $7 million; and the development of electricity and other sources of energy, about $2.2 million. During the 1971–73 development plan, $108.6 million was spent. Hard hit by drought for the past several years, much of Somalia's financial resources has been channeled into relief, delaying some development projects.

The trade deficit continued in 1974 at a much higher rate than in 1973. In the first quarter of 1974, exports were valued at $28.6 million compared with imports valued at $61.6 million for the same period. Early in 1974, a shortage of foreign exchange, brought about mainly by increased prices for petroleum and other imports, had forced the Government to limit imports to only essential commodities. More radical measures were adopted by mid-1974, including suspension of some import items.

During 1974, approximately 120,000 tons of petroleum products were imported, valued at $14.7 million. This compares with an estimated $3.2 million spent in 1973. Petroleum consumption was expected to substantially increase in view of planned heavy industrialization, mechanization of agriculture, and expanded general services. Consequently, the feasibility of establishing a 1-million-ton-per-year crude capacity petroleum refinery at Mogadiscio, costing about $8.6 million, has been studied. In an accord signed April 20, 1974, the refinery will be a joint Iraq-Somali project on a 50%-each basis. Iraq will furnish the currency, including Somalia's share. Somalia's loan will extend over 3 years, to be paid beginning on the date of operation. Iraq will also provide crude oil, training, management, and marketing for any exportable surplus. A major investment was also earmarked for establishing adequate oil storage facilities at strategic localities to insure reliability and continuity of oil supply. The scheme was expected to extend through the 1974–78 program period for completion.

A cement plant with a 100,000-ton capacity was planned for Berbera. An estimated $10.9 million investment was etimated for the auxiliary facilities, geological exploration, and mine development. All raw material required is located in the Berbera (Bihindule) District. The work plan for construction was to be finalized during the first half of 1974. A large gypsum deposit, consisting of 7 million tons of gypsum and anyhydrite is located near Berbera at Suria Malableh. A pilot plant utilizing this material was to have a capacity of 265 tons of calcined gypsum, 20 tons of medical plaster, and 13,000 boxes of school chalk per year.

New salt works and modernization of old salt works was also planned. Salt production is carried out along coastal areas and inland under primitive methods. The rate of production per basin varies. In the Red Sea area during the dry season, production is 60,000 quintals of salt every 10 days, but only 20,000 quintals in the wet season. In the Indian Ocean, the comparable amounts are 20,000 quintals and 12,000 quintals during the two seasons. Salt development will be confined to Merca, Chismayu, Zeila, and Berbera, with a total investment of about $900,000.

The Bulgarian and Somalian Governments were also planning a factory for treating tin. A project to set up a castings foundry and mechanical workshop was also to be realized. The Organization of United Nations for Industrial Development (ONUDI) let a contract for $10,500 to the Yugoslavic enterprise Ingra to creating a prototype foundry.[77] Construction work was to be completed in 1975. The second phase, increasing castings production to 1,500 tons per year, was proposed for the latter part of the 1974–78 program.

An investment of approximately $13 million was to be spent to increase the total

[75] Prepared by Janice L. W. Jolly.
[76] Where necessary, values have been converted from Somalian shillings (Ss) to U.S. dollars at the rate of Ss6.295 = US$1.00.
[77] Industries et Travaux D'Outremer (Paris). Somalia. V. 23, No. 256, March 1975, p. 234.

installed electrical capacity from its present level of 19,800 kilowatts to 50,300 kilowatts in 1978. A self-supporting public electric authority was to be set up to organize the supply of electricity. Most electricity is produced by thermal units, but the Fanole project will harness hydroelectric potential (5 megawatts) for the Lower Juba region. Intensive exploration for gas, oil, and other sources of energy was also planned. A survey conducted in 1972 indicated geothermal resources in a number of areas.

The UNDP continued phase 3 of its exploration efforts. Small, relatively low-grade iron ore deposits were described at Bur Gulan where 130 million tons exist, and at Dinsor in Upper Juba where about 50 million tons are reported. A Somali geophysical team was investigating the sepiolite and bentonite deposits near El Bur in the central part of the country. There was some small-scale mining of sepiolite (meerschaum). Exports of meerschaum were believed to approximate $20,000 in 1974. The Quaternary ilmenite sand deposits in the Chismaio area were estimated at more than 10 kilograms of ilmenite per ton. The reserves were estimated to be at least 180,000 tons.[78] Piezoelectric and optical quartz in commercial quantities was also found by UNDP in a belt of Precambrian rocks extending from the Ethiopian border to Burao. There are apparently three main types: Pegmatites (Wai-Wai type), quartz-feldspar veins (Mandera type), and quartz-calcite veins (Abdul Qadr type). Some mineral exploration activity is reportedly underway by COMECON (CMEA—Council for Mutual Economic Assistance) countries. Sulfur deposits were also reported at Berbera,[79] where there was less than 1,000 tons of sulfur scattered over nine sites. Geological conditions similar to those at Berbera prevail over a long stretch of the Gulf of Aden coast, and other sulfur deposits may be found there.

During 1973, a special license was granted to a Bulgarian group to investigate and reactivate the Majayahn cassiterite mines. About 100 tons of tin ore has reportedly been extracted from sites near Bosasso and Los Qoray and shipped to Bulgaria for testing and processing. The operation is the result of a $1.5 million loan extended by Bulgaria in 1972.

During 1974, UNDP completed investigation of the uranium-bearing ores in southern Somalia. The Wabo carnotite deposits in the Mudugh area were estimated to contain at least 5,000 tons of $U_3O_8$ equivalent in ores with an average grade of 0.07%. Ente Nazionale Idrocarburi (ENI), the Italian firm, holds the only publicly announced uranium concession. This concession predates the 1969 revolution. In 1973, ENI resumed its search for uranium after several years of suspended operations. The concession, located in the Mudugh region, is not yet producing commercially significant quantities of uranium. If exploitable deposits are found, ENI will negotiate terms for extraction and marketing since the present agreement only covers exploration. Another uranium deposit, discovered during the UNDP-financed mineral survey, is reportedly being tested by the U.S.S.R. There are other promising uranium zones including Mirrig, Bulale, and Hamur. Two others, Dusa Mareb and Wamole, are structurally related and, while they have been prospected less, they contain ore-grade material. Additional exploration reportedly could increase reserves twofold. All of these are sedimentary epigenetic carnotite deposits limited to Miocene lagoonal beds.

The Hammar Petroleum Company concession expired, and most of it was granted to Burmah Oil Somalia Ltd., operator for a group of investors including Adobe Africa Inc.; Petrolia International Trading and Shipping Corp. of Panama, R. P.; Home Oil Co., Ltd.; Tricentrol Ltd.; and Maersk Olieudvinding A/S. Burmah acquired 19,943 square kilometers, in which geological and geophysical work was planned for the first 2 years. CONOCO of the United States was carrying out seismic, gravity, and other field geologic surveys, employing nearly 300 people [80] in its central Somalia concession. Elf-SOMALIA spudded an offshore wildcat well near Hafun in April 1974. The well was abandoned for technical reasons on May 17 in the Cenomanian at 1,394 meters. Drilling was to resume on the location in 1975. Elf-SOMALIA and the CFP and TOTAL

group obtained offshore oil exploration permits near the Kenya border. Both ELF concessions (including the Hafun permit) total over 15,540 square kilometers. Deutsche Texaco AG was conducting seismic gravity and field geology studies. ENI/AGIP holds both onshore and offshore concessions.

## SOUTHERN RHODESIA [81]

Southern Rhodesia continued to be an important mineral-producing country despite the economic sanctions levied against it by the United Nations. The value of mineral output increased 22% over that of 1973, totaling R$165.2 million.[82] The volume of mineral production decreased 4.3% in 1974, the first decrease since before the Unilateral Declaration of Independence (UDI) in 1965. The slowing world economy and increasingly adverse exchange rates helped create the situation.

Exports continued despite the sanctions, though usually at less than world prices. The 1972 U.S. exception of chromite, nickel, and other strategic minerals from economic sanctions via the Byrd Amendment to the Military Procurement Act was still a matter of controversy during the year, but no action to repeal it had been effected by yearend. A vote on the issue by the U.S. House of Representatives was expected in mid-1975.

Registration of new mining and quarrying companies in 1974, with nominal capital of $3,204,250, totaled an alltime high of 56. Two mining companies increased their registered capital by $17,661,000 in 1974, the largest monetary increase since 1968. The contribution of the mining and quarrying industries represented nearly 7.2% of the GDP of $2,941.4 million in 1974.

Over 61,600 persons were employed in the mining and quarrying industries in 1974, a 6% increase over that of 1973.

Interest in minerals exploration continued high during the year, especially for gold, as new exclusive prospecting orders and extensions exceeded revocations, withdrawals, and forfeitures. At yearend, 64 exclusive prospecting orders were in effect, up over 40% from that of 1973. Most of these were for copper and gold, but also included most of the minerals mined in Rhodesia. Many small gold mines came into production in 1974 (61 from January 1 to July 1, 1974) because of the dramatic increase in the price of gold worldwide. A total of 43 exclusive prospecting orders were granted in 1974, and 26 of those were primarily for gold.

Rhodesia supplied 5,689 million kilowatt-hours of electrical energy to the Central African Power Corp. (CAPCO) grid and withdrew 5,310 million kilowatt-hours. Energy from CAPCO plus 310 million kilowatt-hours from public and private noninterconnected stations brought total electrical energy consumed in Rhodesia to 5,620 million kilowatt-hours, an increase of 7% over that of 1973. The mining and quarrying industries consumed 19% of the total in 1974, the same as in 1973.

### COMMODITY REVIEW

**Metals.**—*Chromium.*—Exports of chromite and ferrochromium to the United States in 1974 were as follows:

| | Gross weight (tons) | Value |
|---|---|---|
| Chromite, not more than 40% chromic oxide | 4,702 | $105,792 |
| Chromite, 46% or more chromic oxide | 60,234 | 2,445,348 |
| High-carbon ferrochromium | 26,494 | 6,519,610 |
| Low-carbon ferrochromium | 4,499 | 2,258,135 |
| Ferrochromium-silicon | 2,983 | 1,053,192 |

Latest reports indicate that the large-scale ferrochromium smelter being built by Rio Tinto (Rhodesia) at its technical headquarters in Effel Flats should be completed by 1975. A permanent plant was scheduled to be erected at a later date. Rail facilities and electricity are available, and water will be supplied from the new Claw Dam.

The world's second-largest reserve of chromite is in Rhodesia, totaling about 560,000,000 tons or about one-third of the total world reserves. Rhodesia has the world's largest reserves of high-quality chromite.

*Copper.*—Total metal content recovered

[81] Prepared by Larry J. Alverson, Industry economist, Division of Ferrous Metals.

[82] Where applicable, values have been converted from Southern Rhodesian dollars (R$) to U.S. dollars at a rate of R$1 = US$1.75.

from ores produced by subsidiaries of Rhodesia's largest copper producer, Messina (Transvaal) Development Company Limited, was approximately 33,000 tons, a slight decline from the 1973 total. Ore production at the Mangula mine of M.T.D. Mangula Ltd. declined 3% to 1,299,000 tons and, although the total minable reserves remained unchanged at 15 million tons, dilution of the ore in the upper section of the mine caused the grade of the extracted ore to drop to 1.1% copper. Concentrate produced contained 13,284 tons of copper, a decrease of 8% from that of 1973. A shortage of sulfuric acid resulted in a shutdown of the mine's leach plant for 6 months of the year; however, 1,057 tons of metal in copper cement was recovered. When the supply of the acid was restored in July, the plant was reopened and a total of 240,000 tons of ore assaying 0.77% copper was stacked for leaching. Production during the third year of operation at Mangula's Silverside mine declined 5% to 193,000 tons of ore averaging 1.22% copper. Concentrate produced contained 1,598 tons of copper, a decrease of 21% from that of 1973, due to delays in commissioning the winding equipment at the concentrator. Mining further depleted oxide ore reserves to 190,000 tons. Sulfide ore reserves were reassessed at 390,000 tons averaging 1.67% copper. In contrast to Silverside's declining performance, the company's Norah mine improved both its production and reserve position during the year. Ore production climbed 9% to 257,000 tons averaging 1.2% copper. Concentrate produced contained 2,918 tons of copper, an increase of 22% over that of 1973. Development drilling increased proven sulfide ore reserves 9% to 1,890,000 tons grading 1.36% copper. Lomagundi Smelting and Mining (Pvt.) Ltd., another subsidiary of Messina, operated three copper mines in Rhodesia during the year. The company's Gwai River mine increased ore production 4% to 176,000 tons with an average copper content of 0.79%. However, copper contained-in-concentrate produced at the mill declined 18% to 1,289 tons. Considerable development work at the mine failed to increase proven reserves; they declined 8% to 216,000 tons averaging 1% copper. The company's Shackleton mine produced a record high of 619,000 tons averaging 1.83% copper, an increase of 14% from that of 1973. Copper contained-in-concentrate produced in the mill was 10,548 tons, an increase of 1,779 tons, or 20%, over that of 1973. Proven ore reserves were 1,503,000 tons averaging 2.14% copper.

The Alaska mine increased its copper ore production by 34,000 tons to 305,000 tons at an average grade of 0.95% copper. The copper content of concentrate produced at the mill declined 16% to 2,091 tons, however. Proven reserves at the mine markedly increased to 938,000 tons assaying 1.19% copper through the inclusion of large low-grade ore bodies.

Metal content of ore produced at the Inyati and Muriel copper mines of the Coronation Syndicate Ltd. totaled 6,695 tons, a 9% decline from that of 1973. The Inyati mine continued to account for most of the production.

*Gold.*—The four mines of the Coronation Syndicate Ltd. (Arcturus, Inyati, Mazoe, and Muriel) produced 63,784 troy ounces of gold during the year, a decrease of 29% from that of 1973. However, profit before taxes for the group (including copper operations) increased to R$9,900,000 from R$6,020,000 in 1973, an increase of over 64%, because of a worldwide increase in the price of gold.

The continued rising price of gold spurred further interest in reopening old gold mines and prospecting for new ores. A total of 61 new gold mines came into production in the first 6 months of 1974.

Falcon Mines Ltd., which includes the Dalny, Arlandzer, Delcia, Beehive, Turkois, and Venice gold mines, produced a total of 230,720 troy ounces for the year ending September 30, 1974, compared with 212,900 troy ounces in 1973. Development advanced 6,470 meters during the year for all the mines combined. Development westward in the Dalny, the most lucrative mine of the group, continued throughout the year on levels 19 to 29. Sampling results were generally satisfactory, and the high-percentage payability of the ore body was a feature of the year's work. Profit for the group was nearly $4.3 million.

The roasting plant at Que Que, which has been on a maintenance basis since 1970, was recommissioned in May 1974. With the increase in the free-market price of gold, operations have resumed at numerous gold mines. This made available a considerable amount of refractory con-

centrates, which led to the decision to recommission the plant. A scheme was developed whereby all suppliers of concentrate share in the actual proceeds from the gold recovered in proportion to the gold contained in their concentrates. Attention was also being given to the possibility of re-treating existing dumps at the plant, since this has been indicated as potentially profitable. The value of recovered gold was expected to be in the vicinity of $1,750,000 per year.

*Nickel.*—Work advanced on diamond drilling and prestripping ore bodies at the nickel mine of Shangani Mining Corp. which is 55.2% owned by Johannesburg Consolidated Investment Company Ltd. (JCI) with Rhodesian Nickel Corp. having a 36.8% interest. Excavation of the river-diversion canal was nearly completed, and building of the African township was started. Work on the European township and main water-supply line from the Tiyabenzi Dam was scheduled for 1975. The open pit will eventually be 650 meters long by 350 meters wide and 120 meters deep. The deposit contains east and west ore bodies, with the east ore body containing about 15 million tons of ore. After allowing for dilution, it was estimated that the mine will yield more than 19 million tons of ore with an average mill grade of 0.78% nickel. Production is planned to be between 5,000 and 6,000 tons per year of nickel with a milling rate of 75,000 tons per month of ore.

JCI was experiencing serious underground water difficulties with the exploratory shaft at its vast nickel depoits near Damba. Reportedly, if the deposits are as large as expected, the project could become larger than the over $20 million Shangani complex.

Work on the Epoch nickel mine of Trojan Nickel Ltd. continued in 1974. Installation of water and electricity was completed, and temporary sinking hoists and a headframe were erected. Two 3-meter circular shafts were being drilled to a final depth of 312 meters, at which time permanent hoists and a headframe will be installed, and development will begin. Reserves of 2.5 million tons of ore grading 0.75% nickel have been indicated by drilling samples. Other zones indicated further tonnage of high-quality ore.

Exports of nickel to the United States in 1974 totaled 1,726 tons valued at $5,629,058.

*Tungsten.*—The Beardmore Mine of Messina ceased mining operations in April 1974 when ore reserves were depleted. The plant was changed to retreat slimes and sands. Of the underground production of 16,400 tons of ore at 0.67% tungsten trioxide ($WO_3$), 1,000 tons of waste was sorted and 15,400 tons assaying 0.71% was milled. In addition, 13,000 tons of slimes and 16,000 tons of sands with a $WO_3$ content of 0.54% and 0.21%, respectively, were treated. Recoveries were 32.3% for the slimes plant and 42.2% for the sand plant. Production totaled 203 tons of scheelite concentrate containing 115 tons of $WO_3$. It was expected that the stockpile of sands and slimes, which can be economically re-treated, will be depleted by December 1974.

**Nonmetals.**—*Asbestos.*—Exports of crude asbestos (chrysotile) to the United States totaled 1,558 tons valued at $1,009,484 compared with 767 tons valued at $423,478 in 1973. Most of the production came from four mines of the Rhodesian and General Asbestos Corp. (Pvt.) Ltd. and Pangani Asbestos Mines (Pvt.) Ltd. Production in 1974 totaled an estimated 100,000 tons. According to a United Nations Security Council report, estimated 1973 production totaled 165,000 tons.

Block caving is the most favored method of mining asbestos in Rhodesia, with the main alternative being sublevel caving. Most mines begin as surface quarries and are eventually converted to underground operations as the overburden-to-ore ratio increases beyond economic limits.

*Phosphate.*—A $5,250,000 extension to the Dorowa phosphate mining complex of A.E. & C.I. Rhodesia Ltd. was inaugurated on July 1974. The phosphate-bearing mineral at Dorowa is apatite, which is mined in a large open pit about 40 miles south of Inyazura. Construction of the Dorowa plant began in 1964 and the phosphate concentrator opened the next year. New extensions to the plant increased capacity over 50%. The new plant incorporates the latest in milling and flotation equipment; one feature is a wet autogenous mill, which is the largest in Rhodesia and can process 185 tons per hour of ore. The design capacity of the concentrator is 180,000 tons per year of concentrate, while the plant treats nearly 1,700,000 tons per year of

ore. It uses 5,000 cubic meters of water per day, with about 10 tons of ore required to produce 1 ton of concentrate.

**Mineral Fuels.**—*Coal.*—A report published in Rhodesia indicated a total probable reserve of 2.5 billion tons of coal, of which about 755 million is considered extractable from both open pit and underground operations. Of the extractable coal, 59% is low in ash, suitable for making coke. Of the open pit reserves, 81%, or 220 million tons, is high-ash coal suitable for steam raising. In addition, there is a possible resource of about 5 billion tons of coal and possible large resources of carbonaceous shale with up to 60% ash. Low-ash coal, suitable for the production of coke, is not likely to be found outside the Wankie District and the coalfields of the Limpopo and Sabi Valleys.[83]

Coal sales of Wankie Colliery Corp. Ltd., Rhodesia's only coal producer, were 2,794,000 tons, nearly the same as in 1973. Coke sales totaled 267,000 tons, an increase of 13% from that of 1973.

Wankie hoped to commission the second stake of the coke ovens at its No. 2 colliery by yearend 1974. It provides for the coal to be heated prior to being fed into the ovens and should lead to a marked increase in output.

*Gas.*—Rhodesia's first coke gas-producing plant was brought into full commercial operation in August 1974. This development was expected to play a significant role in the country's economy by reducing oil imports, providing a new industry and employment, and increasing the sale of Wankie coke by as much as 50,000 tons per year. The plant is capable of producing 5,000,000 Btu per hour. It is anticipated that more than 100 major mining and industrial complexes presently using oil will draw their energy sources from coke-produced gas.

*Petroleum.*—Rhodesia was planning an exploratory drilling program for oil in the Matabeleland Province for late in the year. Goldfields Prospecting Company (Pty.) Ltd. will conduct the search, which will cover more than 48,000 hectares in the Bulawayo and Victoria mining districts. Rhodesia currently imports all of its oil needs since there is no domestic production.

## SPANISH SAHARA[84]

The phosphate deposits of Bu-Craa are located in the northern area of the Spanish Sahara, about 197 kilometers southeast of El Aaiun, the capital of the province, and 100 kilometers from the Atlantic coast. The principal mineral produced in the Spanish Sahara is phosphate rock from the Bu-Craa mine. Production in 1974 was 2,300,000 tons, of which 2,179,200 tons was exported. This was an increase of 230.3% over the level of production of 696,400 tons in 1973 and a major improvement over the 150,000 tons produced in 1972 when mining started.

The company was renamed in 1969 from Empresa Nacional Minera del Sahara, S.A., to Fosfatos de Bu-Craa, S.A. (Fosbucraa), after the phosphate deposit was confirmed. Fosbucraa is a wholly-owned subsidiary of the Spanish Government's Instituto Nacional de Industria.

A drilling and sampling program has confirmed 1.7 billion tons of reserves under an area of 231 square kilometers. The thickness of the mineral deposit ranges from 2.5 to 7 meters. Reserves were determined on the basis of concentrates ranging from 31% to over 36% $P_2O_5$. The average $P_2O_5$ of the phosphate rock produced in 1974 was 36.04%.

A majority of the phosphate rock produced in the Spanish Sahara is exported to Spain. When Moroccan phosphate rock shipments to Spain were reduced in 1974 to 25% of those shipped in 1973, shipments of Saharan phosphate rock to Spain were increased. By government regulation, Spanish Sahara rock shipments to Spain can only be carried in Spanish flagships and inadequate domestic shipping capacity caused some backup at the port of El Aaiun. The rivalry for control of the phosphate deposits in the Spanish Sahara was emphasized by claims of both Morocco and Mauritania of sovereignty over Spanish Sahara. Under a 1966 agreement with the United Nations, Spain plans to relinquish control and assist the inhabitants to

[83] Hodgson, W. A. Coal Resources of Rhodesia. Sixth Annual Report. Institute of Mining Research, University of Rhodesia, Salisbury, Rhodesia, January 1975, pp. 30–32.

[84] Prepared by William F. Stowasser.

determine their own future. These problems have not been resolved and it is probable that the reported [85] sabotage of the conveyor belt that carries phosphate rock from the mine at Bu-Craa to the port of El Aaiun, interrupting operations during the month of November, was caused by a guerilla faction.

At the Bu-Craa mine, a "walking" dragline with a 60-cubic-yard-capacity bucket strips the overburden from the mineral deposit. Either a bucketwheel excavator or electric shovel is used to excavate the ore and load 100-ton-bottom-dump trucks used to carry the ore to the primary crushing plant at the mine. The coarse fraction, plus 10 millimeters, is screened out and wasted. The undersize is conveyed a distance of 100 kilometers to the beneficiation plant at El Aaiun. The phosphate ore is subjected to secondary crushing followed by washing in trommels with seawater. The ore is classified on screens and in cyclones to separate sands and slimes from phosphate-bearing nodules. The concentrates are centrifuged with fresh water and dried in fluid-bed kilns. The product is dry-screened to obtain a final classification.

The plant is being expanded. Production projections are 4 million tons for 1975 and between 5 million and 6 million tons in 1976. In 1975, the company will decide on an additional expansion program to increase the capacity of the mine and beneficiation plant to 10 million tons per year.

## SUDAN [86]

The mineral industry of Sudan continued to be a minor part of the nation's largely agricultural economy. Over 85% of the population is engaged in agriculture (mainly subsistence) and livestock raising. Cotton was the most important cash crop, accounting for about 40% of the total export value. GDP was estimated at $1,746 million [87] for 1974, representing a 5% improvement over that of 1973. The contribution of mining to the GDP was very small. Mining was mainly confined to small-scale gold operations, a salt industry based on solar evaporation of Red Sea water, and building stone, gypsum, mica, talc, and chromite mining. Oil was discovered in central Sudan and off the Red Sea coast, new cement plants and a new refinery were being planned, and there was renewed interest in gold mining.

During 1974, inflation of over 20% was reported to have affected fuel and consumer goods prices. The trade deficit continued with imports of food being the chief cause. Imports were 62% higher in 1974 than in 1973, and were expected to grow an average of 25% per year over the next 5 years, reaching $1.2 billion by 1980.[88] A fall in export commodity demand markedly reduced Sudan's export receipts for 1974. Total exports for 1974 were valued at $438.5 million, and imports were valued at $655.5 million. Mineral exports, excluding petroleum refinery products, were valued at $1.8 million. Chrome ores, valued at an estimated $831,671, were exported to Switzerland, the People's Republic of China, and Japan. Building stone valued at an estimated $207,931 was shipped to the Federal Republic of Germany. India was Sudan's fifth-largest goods supplier during the first half of 1974, but an announcement to halt the trade agreement with India was made in July. A trade agreement between Czechoslovakia and Sudan was signed in December 1974.

Exports of refinery products were valued at $17.1 million, including reexports. Imports of petroleum products were valued at an estimated $85.5 million in 1974, compared with $23.9 million in 1973 for a similar amount imported. Crude oil imports amounted to 1,160,941 tons in 1974. Sudan signed an agreement with the Iranian Government in May 1974 for furnishing crude petroleum. Under this agreement, Sudan will import 1.2 million tons of crude oil valued at $100 million. Sudan was to pay $35 million in cash, and the remaining $65 million was to be in the form of a 5% interest loan. The first installment was to be due on April 1, 1978.[89]

Investment incentives were further lib-

eralized in 1974, and in early 1975 foreign banks for the first time since 1972 were encouraged to return to the Sudan for all but local commercial banking. Foreign banks were to operate in foreign trade facilities or in financing development projects, and in long-term and medium-term financing. The demands of inflation, development, and consumption were causing a strain on Sudan's money reserves. The country's international liquidity continued to drop by a reported 9% [90] during 1974. Even so, plans and loans were being made for badly needed development projects. The Government allocated approximately $290 million for development projects in 1973–74, and $603 million in 1974–75. The Railway Authority development budget for 1974–76 was planned at about $157.8 million.[91] The main link between the most productive areas of Sudan and the Red Sea is the narrow-gauge Sudan Railway system, already much overextended in use. A $24 million IDA loan was aimed at modernizing the railroad with a large number of U.S. made diesel locomotives and other equipment due for delivery in 1975.

There were only about 300 kilometers of asphalted roads in the country. There was great congestion at Port Sudan (the only port), which was expected to increase as the Suez Canal opened. With aid from the United Kingdom of $24 million, a 996-kilometer highway was being constructed between Wad Medani to Port Sudan via Gedaref, Kassala, and Haiya, and was expected to be finished by 1978. The road along the coast between Port Sudan and Suakin would be inaugurated by March 1976. The Kosti bridge was expected to be completed by 1978, and the Kosti-El Obeid road, 217 kilometers long, was to be repaved. Relief would also soon be afforded by the new oil products pipeline being built with Kuwaiti aid from Port Sudan to Khartoum, which was expected to be finished by June 1976. A new port south of Port Sudan and improvement of river services were also planned. A study by the Kuwait Fund suggested $2.9 billion in transport expenditures was needed over a 12-year period.

The World Bank agreed to lend $23 million through the IDA to finance electric power expansion. This was a contribution towards a $40-million project to provide additional electrical facilities for industrial and agricultural development over the next 5 years. Federal Republic of Germany was also to loan $48 million for various projects including a hydroelectric complex at Juba, and roads between Wau, Tonj, Rumbek, and Juba, and between Wau, Tambura, and Yambio. Great Britain granted a loan of $7.2 million to build a cement factory at Kappeta and an electric power station at Malakal, and to use in several agricultural projects. Egypt and Sudan reached agreements for the formation of joint companies for exploiting mineral resources in both countries, and for appropriating $1.4 million toward road and rail projects linking Egypt and Sudan. Sudan was also among 24 states that, in August 1974, set up the Islamic Development Bank with an initial capital of about $900 million to help the economic and social development of Islamic countries and communities. The Arab Investment Company, established in June 1974 with capital of $200 million, has also been giving help to Sudan for a number of projects.[92]

Electrical power, mostly from hydroelectric generators, was expected to attain 253 megawatts in 1974–75. New electric generators were to be constructed at Bari, Kilometer 10, Madani, Atbarah, and Port Sudan. A thermal unit, financed by the African Development Bank (BAD) was to be constructed at Juba.

A general shortage of cement occurred in Sudan in 1974, curtailing construction and tripling the price of cement. Kordofan Province alone needs 150,000 tons of cement per year from the present facility at Raik. Because of transportation difficulties, however, no more than 20,000 tons were shipped. In 1974, 300,000 tons of cement were produced valued at an estimated $9 million. It was announced that Cement Production (Sudan), a Sudanese company with part United States and Saudi Arabian ownership, was to build a plant costing $40 million to produce approximately 400,000 tons per year at Msersa Arakiyia on the Red Sea, 32 kilometers north of Port Sudan. Two U.S. firms, Buttes Gas and Oil and KH International, and the Saudi conglomerate, Triad, will provide $10 million. The rest was to be supplied

by a United States-British banking consortium. The plant will take 15 months to build and will utilize local deposits of gypsum and calcium obtained from Red Sea coral. It was estimated that available raw materials could supply 1 million tons per year for 1,000 years. Part of the plant's output was planned for export. The gypsum deposits along the coast of the Red Sea north of Port Sudan were described in a recent report.[93] Deposits of Miocene age occur in three districts containing approximately 92 million tons. A team of West German experts from the Gluckner Co. also arrived in January 1974 to study the technical and economic feasibility of the southern region cement project to be carried out in Equatoria Province. The preliminary studies will last about 4½ months. The new plant will provide cement needs for the southern region.

Transportation has been the major constraint in the exploitation of known mineral resources. UNDP has been providing assistance to the Government in mineral exploration since 1967, originally covering three areas involving a number of minerals; activities were then limited to copper exploration in Hofrat en Nahas and to asbestos exploration in the Ingessana Hills. More recent efforts have been concentrated on ground water exploration. A budget of $5.7 million was allocated for geological studies and mineral exploration to cover 150,000 square kilometers[94] along the Red Sea. Investigations were to include iron, gold, and gypsum deposits known to occur in the area. Many gold veins occur in the Jubayt al-Ma'adin area over 7 square kilometers. Zinc mineralization estimated at 222 million tons was reported in the Ayit area, north of Port Sudan. The Gebeit gold mine, located in north Red Sea Hills, probably was worked as long ago as 3,500 years.[95] At least several hundred thousand ounces have been produced from the mine. In recent times, it has been the biggest and most efficiently worked of the Sudan gold mines.

Chevron, a Standard Oil Co. of California subsidiary, reportedly secured 39 concessions for oil prospecting in the southern Red Sea region and, on November 23, 1974, secured an additional 645 licenses covering 516,000 square kilometers in the southern interior. All of these awards were under the Petroleum Resources Act of 1972, which provides for 6 years of exploration and a government option of 50% in case of discovery. Chevron was also to share in exploration of three areas awarded to American Pacific International in 1974, as well as obtaining a 37.5% share (along with Texaco, which also acquired a 37.5% share) in the Red Sea concession held by Ball and Collins of the United Kingdom. Chevron was the operator of this concession. Ball and Collins was awarded 17 licenses covering 13,600 square kilometers on January 30. In early 1975, oil was discovered in central Sudan and off the Red Sea coast. Chevron Overseas Petroleum, which was operating in the area, indicated oil occurred in commercial quantities around the Suakin archipelago and that offshore drilling would begin in 1976. Gas had also been discovered in the Red Sea, and test drilling was expected to begin at yearend 1975. Hunting Geology and Geophysics of the United Kingdom was to do a program of areomagnetics, photography, and satellite mapping for Chevron, covering an area of 321,000 square kilometers in southern Sudan. Sudanese Resources Development Corp. (a subsidiary of Oceanic Exploration Co.) was awarded 18 licenses.

A refinery with a capacity of 200,000 barrels per day of crude oil, representing an investment of nearly $300 million, was to be established at Port Sudan. The refinery will be an enterprise shared by the Sudanese state and Triad Naft of Saudi Arabia.

## SWAZILAND[96]

The mineral industry of Swaziland made a significant contribution to the national economy in 1974, providing about 11% of the estimated GDP of $184 million.[97] Minerals produced were iron ore ($11.1 million), asbestos ($8.3 million), coal ($718,269), kaolin ($35,319), barite ($20,975), pyrophyllite ($322), and tin ($2,757). Iron ore production exceeded that of 1973, even though transportation problems caused by port congestion and delays in railroad shipments in Mozambique severely curtailed movement of iron ore during the latter part of 1974. Other problems for the mineral industry were caused by inflation, a result of the rise in prices for imported petroleum. In terms of value, 1974 imports ($115 million) were $16.8% above the 1973 level. Petroleum products valued at $12.4 million were imported in 1974 and formed approximately 11% of the total import value. Even so, Swaziland recorded a favorable balance of payments for 1974. Items for export were valued at an estimated $173 million; iron ore and asbestos formed approximately 11% of the total estimated value.

On September 6, Swaziland instituted its own currency, the Emalangeni, although it will remain a member of the South African Customs and Currency Union, which includes Botswana, Lesotho, and the Republic of South Africa. An agreement was signed on December 5 with the Governments of Lesotho and the Republic of South Africa that reinforced valuable past financial relationships, but established each country as sole authority responsible for its own exchange transactions within context of a mutually determined policy. In addition, Swaziland was a signatory to the Lome Convention February 18 in Togo, opening up the European market to its products.

The Small Enterprises Development Corporation (Sedco) was to establish a small foundry at Manizini Estate. It would be the first foundry in Swaziland and would be utilized for both ferrous and nonferrous castings. Local sand will be used in making molds. The first prototype was planned for completion in 1975. An investment of $74,500 was visualized. Production at the newly established Swaziland Chemical Industries (Pty.) Ltd. fertilizer plant at Matsapa was expected to start at the end of 1974. It will produce up to 4,000 tons per month. Koer Industries Limited of Israel was to open a ceramics factory utilizing local kaolin from Sicunsa. Employment for over 200 people was visualized. Various studies concerning the proposed thermal power station continued. The Swaziland Collieries concession at Mpaka was being drilled to establish quality and quantity of coal required.

The publication of the Mineral Rights Taxation Order in 1973 resulted in the relinquishing of undeveloped mineral rights covering approximately 1,230 square kilometers, which became available to new applicants. Early in 1974, exclusive prospecting licenses were granted to Shell Coal (Swaziland) Ltd. and Sir Alfred McAlpine and Sons Ltd. for exploration over large parts of the coalfields. Shell agreed to spend $447,000 and begin prospecting within 3 months. The geochemical reconnaissance sampling was continued by the Geological Survey and Mines Department. Results from an area in central Swaziland covering 2,600 square kilometers were reported.[98] Cominco and De Beers both continued prospecting in their respective areas, granted in 1973. Investigations of talc, calcite, and clay deposits were made during 1974 and small-scale production was hoped for in the near future. By yearend 1974, a start had been made on opening up and sampling the dormant Piggs Peak gold mine where the lower three levels have been flooded. The pyrophyllite mine near Sicunusa was closed during 1974 because of the poor quality of the product.

The Swaziland Geological Survey and Mines Department was continuing to review the overall iron ore situation and had recently summarized much of the previous work.[99] The following resource data were indicated for Swaziland's low-grade iron deposits: Swaziland Iron Ore Development Company (SIODC) lease

[96] Prepared by Janice L. W. Jolly.

[97] Where necessary, values have been converted from Swaziland Emalangeni (E) to U.S. dollars at the rate of E1=US$1.49.

[98] Swaziland Ministry of Industry, Mines, and Tourism. Annual Report of the Geological Survey and Mines Department For The Year Ended Dec. 31, 1973, p. 33.

[99] Swaziland Ministry of Industry, Mines, and Tourism, Quart. Bull., v. 2, April 1975, pp. 9–12.

area, 58.5 million tons at 43.2% Fe; north of SIODC lease area, 67.9 million tons at 31.7% Fe; Piggs Peak and Havelock area, 300 million tons at 35% Fe; and southern Swaziland (Maloma and Gege), 150 million tons at 30% Fe. This represents a total of 576.4 million tons with an average 34.2% Fe. The results of Anglo American's investigation into the feasibility of mining the low-grade, banded iron formation of the northwest highlands were received by the Geological Survey and were reportedly as discouraging as those received following the UNDP study in 1971.[1] There were two main adverse factors—difficult beneficiation caused by the frequent occurrence of magnetite and hematite as intimate irregular intergrowths, and the high cost of transportation. Investigations were planned for other iron deposits at Maloma, Gege, and in the valley of the Mkhondo River north of Hlatikulu. The feasibility of producing sponge iron or steel within Swaziland was also to be considered.

At SIODC's Ngwenya mine, an average of 521 people were employed with earnings totaling $1.5 million for 1973. The high-grade ore mined at Ngwenya contains between 62% and 65% iron with small amounts of silica, alumina, arsenic, phosphate, and titanium. Medium-grade ore, which is to be exported to Japan between 1975 and 1978 will contain a minimum of 59% iron and 1% manganese. The initial contract with Nippon Steel Corporation of Japan to supply 15 million tons of high-grade iron ore over a 10-year period expires March 1975. In 1970, a second major contract was signed to provide the same Japanese firm with 6 million tons of medium-grade iron ore over a 3-year period beginning in 1975. Owing to recent inflationary pressures, a revision in price was deemed necessary, was negotiated, and a contract was signed late in 1974. One problem for SIODC was that the price agreed upon in 1974 was close to the break-even point, making it critical that the mine move 6,000 tons of ore daily to Lourenço Marques for export.[2] Transportation costs were high in 1974, caused in part by disturbances and irregularity in shipments through Mozambique. The South African railways was studying the possibility of a route between Swaziland and the new minerals port at Richards Bay.

Geochemical reconnaissance for tin continued and detailed auguring and pitting indicated 75 tons of cassiterite and an equal inferred amount in a recently discovered residual deposit from a stockwork of pegmatites north of Kubta. Approximately one-half ton of tin was mined in 1974 and sent to the Republic of South Africa for processing. There was also some small-scale eluvial tin mining. Stripping operations began at the Pentoyz Mine of the R. D. and B. Tin Mine Ltd. at the end of 1973, where approximately 20 men were employed.

The Havelock Mine of Havelock Asbestos Mines (Swaziland) Ltd. were still encountering the old difficulties of dilution and ground movement, but these were reportedly being controlled. An average of 1,832 laborers were employed in the asbestos mine, earning a total of $3.1 million during 1973. About 72,000 tons of ore is mined each month, from which about 3,000 tons of asbestos fiber is recovered. The chrysotile bodies occur in the center of partly sheared serpentine. The underground extraction is done by both sublevel shrinkage down to the 345 level, and by sublevel caving between the 245 and 315 levels. Four grades of long and medium-length fibers are produced (HVL 3, HVL 4, HVL 5, and 1877) as well as special blends. Besides Swaziland, the only other commercial producers of long-fiber chrysotile (equivalent to Quebec Asbestos Mining Association QAMA Groups 1–3) are the United States (Arizona), Canada, Rhodesia, People's Republic of China and the U.S.S.R. The slight decline in asbestos exports for 1974 was largely due to shipping difficulties at Lourenço Marques. No progress was reported on exploration in the adjacent Lonrho concessions.

The Swaziland Barytes Ltd. mine at Londosi started production in 1974. An average of 55 men were employed at the mine in 1973, earning $38,960 for the year. About 296 tons of barite were exported to the Republic of South Africa in 1974. New markets for drilling muds were being examined and rail freight to Lourenço Marques or to Richards Bay looked favorable.

[2] U.S. Embassy, Mbabane, Swaziland. State Department Airgram A-9, Jan. 17, 1975, p. 1.

The evaluation of the coal reserves of the Lowveld continued. In 1974, the world energy crisis added impetus to coal exploration, and several applications were processed for prospecting rights over unallocated areas. Swaziland's coalfields occur on the eastern side of the country. Coal seams of varying thickness and quality have been discovered over most of the Lowveld. Minable reserves in excess of 200 million are indicated; resources are estimated in excess of 400 million tons. Most of the coal is low-volatile bituminous, with a smaller quantity of semianthracite or anthracite coal. Considerable potential exists for exports of specially prepared and selected coals from the Lower Coal Seam (Main Seam). Coals from the Upper Seam are poorer in quality and interbedded with shale. The export of large tonnages of such coals is one of the targets of present exploration activities and it was hoped that markets would be found for the export of several million tons per year. The Government reportedly [3] hoped to open three new coal mines by 1980. Swaziland Collieries (a subsidiary of Anglo American Corp.), which operates the Mpaka coal mine, and JCI were reportedly reviewing the possibility of reopening the anthracite prospect at Maloma. Plans were indicated for two high-grade anthracite mines. Combined capacity for both export and use in power generation was estimated at 5 million tons per year with around 2,000 people employed.[4]

One of the results obtained from coal exploration by the Geological Survey in the Lower Coal Member of the Middle Ecca Formation in the Ngomane area has been the good correlation of coal seams over large areas. The main seam of the lower coal member can be correlated over 100 kilometers and can be shown to maintain a constant minable thickness over most of that distance. Where variations in thickness occur, and where the main seam is thick, the associated seams are also thick. This suggested that another thick coal sequence may be developed in the Ngomane area, as indicated by the thickness of individual minor seams. At yearend 1973, three boreholes had been completed in the Ngomane area and two were in progress by early 1974. In October 1974, a mission headed by the Japanese Minister for Industry, Mines, and Tourism visited Swaziland and was expected to conduct a survey into the possibilities of coal mining in the kingdom.[5]

During 1973, known fluorite occurrences of southern Swaziland, south of Mhlosheni and Hluti were restudied. This was followed by a search that indicated more widespread fluorite occurrences than previously known. None of the prospects have proved economic so far.

On April 15, 1974, the Swazi nation through the Tibiyo Taka Ngwane Fund was awarded the mining lease for the kaolin deposits near Sicunusa. All the mining equipment owned by Kaolin (Pty.) Ltd. has been purchased by the Tibiyo Fund. Kaolin production increased and no production problems were experienced following this transference of mine ownership to the Swazi nation. New markets were appearing for crude clay, produced in three grades (white, cream, and pink) for South African industries. The deposits are estimated to be in excess of 300,000 tons, but not all is salable. Up to 300 tons of clay each month was expected to be excavated.

## TOGO [6]

"If 1975 has been declared 'Year of the Farmer' in Togo, certainly 1974 should have been declared 'Year of Phosphate.' " [7] That quotation sums up the situation in Togo's mining industry and economy in 1974. The phosphate industry became the center of action, partly as a result of a fivefold increase in phosphate prices and partly because of its nationalization early in the year.

The price rise boosted Togo's income from phosphate mining by 450% and gave the country its first positive balance of trade. Owing to the nationalization, all of the income was retained, and government revenues rose by a much larger factor. Production of most other mineral commodities also increased, but their effect on the total economic picture was minimal.

[6] Prepared by David G. Willard.
[7] U.S. Embassy, Lome, Togo. State Department Airgram A-38, June 24, 1975, p. 3.

Generally poor results elsewhere in the economy magnified the importance of the gain in mining. Although Togo escaped the worst of the Sahel drought, agricultural production declined, causing a drop in cash crop income and a rise in food imports. World inflation, particularly in fuel costs, meanwhile sharply boosted the bill for imported goods.

Developments in mining moved relatively slowly during the year because investors were cautious in the wake of the phosphate nationalization and generally uncertain business conditions. Construction of the oil refinery at Lome finally began more than 1 year behind schedule, but work had not yet started on either of the other two major mineral-processing projects, the cement and fertilizer plants. However, the Government's profits from phosphate should enable starts to be made on both in 1975. Prospects for offshore petroleum production diminished with the withdrawal of the only two remaining concessionaires.

The outlook for mining in 1975 remained generally favorable, although phosphate earnings had begun to dip as the result of a growing world oversupply. Somewhat lower export revenues and a continuing increase in most import costs are expected to reduce both the trade balance and the Government's budget surplus. The phosphate industry will continue to underpin the economy, however, and will probably provide sufficient profits to support further progress on currently planned investments.

**Government Policies and Programs.**—Nationalization of Compagnie Togolaise des Mines du Benin (CTMB) does not appear to have signaled increasing governmental control of the economy. Policy differences between the company and the Government, along with the phosphate industry's prime importance to the economy, probably made CTMB's situation unique and brought on the governmental action. The successful conclusion of a compensation agreement and the absence of further nationalizations or changes in laws pertaining to business have helped to restore investor confidence in the Government and its policy.[8]

Goals for Togo's third 5-year development plan, covering 1975–80, were announced on the heels of an analysis showing that the second 5-year plan (1970–75) was falling short of its objectives. Below-average agricultural growth (partly caused by drought) and unstable world market and financial conditions were found primarily to blame for the shortfall; accordingly, the new plan placed heavy emphasis on agricultural development and economic independence. Of particular concern to investors were policy declarations calling for reduced dependence on outside financing, reduction of the scale of industrial projects, the substitution of labor for capital, and a priority status for agricultural development.[9]

Slow improvements continued to be made in the country's physical facilities. With help from the West German-European Development Fund, the port of Lome was being expanded to allow off-loading of petroleum products and other cargo. The $22 million project was scheduled for completion in 1977. Improvements in the road and rail systems were in the planning stage.[10] Also in the planning stage were additions to the country's electric power capacity with the help of a $234,000 United Nation's grant to the Communauté Electrique du Benin (CEB) for studies of anticipated power requirements in Togo and Dahomey and the updating of a feasibility plan for the Mono River hydroelectric project. Plans already prepared called for a special power distribution system to serve the proposed cement plant of Ciments de l'Afrique de l'Ouest (CIMAO).[11]

## PRODUCTION AND TRADE

A relatively small increase in physical output accompanied by drastic increases in prices resulted in a massive growth in the value of Togo's mineral production in 1974. On the basis of incomplete figures, it can be estimated that the total value increased more than 300%, from about $30 million in 1973 to over $130 million in 1974. These figures exclude all output of building materials, the values of which are not reported.

Phosphate production reached its capacity level of 2.5 million tons in 1974, as

[8] U.S. Embassy, Lome, Togo. State Department Telegram 1764, August 1975, p. 1.
[9] U.S. Embassy, Lome, Togo. State Department Airgram A–34, June 11, 1974. Joint Publications Research Service. Translations on Africa No. 415, JPRS L/4989, Aug. 1, 1974, p. 29.
[10] U.S. Embassy, Lome, Togo. State Department Airgram, A–38, June 24, 1975, p. 7.
[11] U.S. Embassy. Lome, Togo. State Department Airgrams A–66, Dec. 10, 1974, and A–43, July 5, 1974, p. 5.

the adjustment accompanying nationalization was made without serious disruption. A 13% increase in output coupled with a fourfold increase in the average unit value skyrocketed the total value received from phosphate by over 350%, from $28 million in 1973 to $130 million in 1974. That gain plus the assumption of complete ownership boosted government revenue from phosphate by an even larger factor and brought the industry to its present dominant position in the economy.

Higher output levels were recorded for most other mineral products, but their contributions to the country's income were minor in comparison with that of the phosphate industry. Government investments in highways and industrial and tourist facilities increased the demand for construction materials despite a downturn in private construction activity. Output of the cement clinker crushing plant increased 12% to its capacity of nearly 128,000 tons, and production levels of brick and ceramic tile remained high. The only recorded mineral industry to experience a poor year was the marble industry, output of which declined 29% from the previous year's level.

Statistics on Togo's mineral production in 1973 and 1974 are included in table 1.

Detailed trade data for Togo were not available at the time this chapter was written. The latest trade statistics available are those for 1972, and are contained in the 1973 Minerals Yearbook chapter.

## COMMODITY REVIEW

**Cement.**—The CIMAO consortium gained an additional partner in 1974, the Government of Ghana, which became the third west African member along with the Governments of Togo and the Ivory Coast. A need for additional sources of financing had delayed the start of construction on the cement plant, but tenders for some of the equipment were expected to be issued within the next year. The plant is designed for an initial capacity of 1.2 million tons per year, increasing to an ultimate capacity of 1.8 million tons per year, and will require a regional market. Its raw material source is the extensive limestone deposit recently discovered at Sikakondji.[12]

Slackening regional demand for the output of Togo's clinker-crushing plant during the fall allowed the Government to cancel a ban on exports of cement that had been imposed in September 1973. Reduced construction activity resulting from the oil shortage's impact on business was responsible for the drop in cement demand. However, an upsurge in construction caused the ban to be reimposed during the following summer.[13]

**Phosphate.**—A tense political situation was resolved by the complete nationalization of CTMB on February 4, 1974. CTMB owned the phosphate mine that has become Togo's most important industry. Arrangements for the takeover and negotiations for compensation of the previous owners proceeded reasonably smoothly and rapidly. A technical agreement had previously been signed with a Parisian company of phosphate specialists for the provision of technical, maintenance, purchasing, and marketing assistance. Production rose to capacity, and a compensation agreement that reportedly satisfied all parties was reached by midsummer. Shipments to customers, including those who were former owners, were not interrupted.[14]

Reasons for the takeover apparently centered on the marketing policies of the former owners of CTMB who, since they included several major phosphate consumers, had been unwilling to raise their prices in line with the phosphate market's trend.[15] The company's name, Compagnie Togolaise des Mines du Benin, remained unchanged, but its suffix became "Société Nationale" instead of "Société Anonyme Mixte" and the contraction was altered to COTOMIB. A new board of directors consisting entirely of government agency heads was appointed by the President.[16]

Construction work was completed on the new mine at Kpogame, which started producing in September 1973. However, construction of the Société Togolaise des Engrais (STEN) fertilizer plant was de-

[16] U.S. Embassy, Lome, Togo. State Department Telegram 1407, July 1974, 2 pp.

layed owing to deteriorating market conditions. Although the phosphate selling price was maintained at $75 per ton, export sales volume fell below the expected level and stockpiles increased. Production cutbacks were likely if the market failed to improve.[17]

**Petroleum.**—Construction work on Togo's first oil refinery began during the summer of 1974, more than 1 year after the foundation stone was laid in April 1973. Preparatory work comprising a construction camp, internal roads, and storage-tank foundations occupied the remainder of the year. Laying pipelines from the new pier in Lome's port was slated for early 1975, and some of the major plant equipment was beginning to arrive. Owing to the delay, startup of the refinery is not now expected until the fall of 1976.[18] Crude oil will be supplied from both Nigeria and Gabon, in each case as part of a barter agreement for Togolese phosphate.[19] Togo currently depends entirely on imports for its petroleum supply, the cost of which rose from $3.7 million to $10.5 million between 1973 and 1974. The refinery could provide a considerable savings in foreign exchange as long as there continues to be a sufficient export outlet for its surplus.[20]

Prospects of finding crude petroleum off Togo's coast grew dimmer as the only two concessionaires ceased all activity and relinquished their exploration rights. Ashland Oil Co., operator for Frontier Petroleum Corp. and Amerada Oil Co., had previously drilled two unsuccessful wells, the last in 1971. After analyzing the results, the combine announced its withdrawal in late 1973. Shell Togorex had received a concession in January 1972 that consisted of an area previously relinquished by Frontier and a new deepwater area. The company undertook no drilling and announced its intention to withdraw in early 1974. Possible interest in a concession was shown by CONOCO.[21]

**Other Minerals.**—Exploration for other mineral resources continued through the aid of various public agencies, but no new discoveries were announced. The French BRGM, in conjunction with the Fonds d'Aide et de Cooperation (FAC) investigated copper and chromite deposits in the Lama Kara region. The UNDP assisted the Service des Mines et de la Geologie Togolaise in the establishment of a geochemical laboratory and the organization of a reconnaissance geochemical survey.[22]

## UPPER VOLTA[23]

The mineral industry of Upper Volta contributed very little to the estimated GDP of $313.2 million[24] for 1974. Most activity was in the form of agreements signed, development plans, and foreign aid. Inflation of 20% to 30% was a problem, and the value of petroleum imports saw an increase of 40%. The energy crisis brought about an additional $2 million for higher priced petroleum imports in 1974. The chronic trade deficit persisted. Even so, the outlook was optimistic toward the end of the year as the development agreement for the Tambao manganese project was signed and financing for the necessary infrastructure was being realized.

The second 5-year plan (1972–76) relied on foreign aid for about 80% of total project financing. Total investment during this period was set at approximately $270 million. Some of the plan's objectives have been revised as a result of the drought. New project focus is on the processing of primary products. Government receipts, accounts, and expenditures for 1974 were set at $56 million, up 15% from those of 1973. France accorded a grant of $3.26 million as substitute for taxes lost because of drought. Despite the sizable current account deficit, the country had a slight balance of payments surplus. This is due mainly to the inflow of for-

eign aid ($70 million in 1974) and remittances from Upper Voltans working in neighboring countries (about $30 million per year.)[25] The national debt represents 7.5% of the budget.

More than 40% of foreign aid has come from France and 30% from the EEC. Federal Republic of Germany, People's Republic of China, Canada, Netherlands, Switzerland, Zaire, Libya, and the United States have all contributed to the subsidies and loans. Contributions on the part of international organizations such as the International Bank for Reconstruction and Development (IBRD), the African Development Bank (ADB), UNDP, the European Development Fund (EDF), and the Aid and Cooperation Fund (FAC) have also been made. Part of the aid granted was for the struggle against drought. Economic development efforts have been hampered by the country's landlocked position, the drought, and increased prices for oil and manufactured goods.

In November 1974, the Banque Internationale des Voltas (BIV) replaced the Banque International d'Afrique Occidentale. The Government holds 51% of the BIV and the First National Bank of New York holds 24%. Upper Volta is an active member of several African organizations for economic coordination, trade, and development, including the West African Economic Community (CEAO) based in Upper Volta, and the Organization Commune Africaine Malgache et Mauricienne (OCAM). The Liptako-Gourma agreement includes Upper Volta, Mali, and Niger.

The Liptako-Gourma development program financing began in 1974. Economic development for the region covers four areas: Highway and rail infrastructure, mineral prospecting, agriculture, and geophysical research. Photographs taken during the mission of the U.S. Skylab 3 were to be used for detecting resources of the Liptako-Gourma area.[26] In 1974, work will begin on enlarging and asphalting 815 kilometers of roads. Another keystone to opening up the region is the construction of the Ansongo (Mali)-Ouagadougou extension of the Abidjan-Niger railway line. The railroad, 705 kilometers long, and costing about $90 million, will cross the mining region of Tambao, and will have a line going to Niamey (Niger) from Dori. The cost of the railroad from Tambao to Ouagadougou was now estimated to be about $81 million, including equipment. A conference for the coordination of financing the Tambao projects was held in December between the Government and representatives of Canada, France, Japan, West Germany, ADB, World Bank, EDF, Caisse Centrale de Cooperation Economique (CCE) and the Banque Europeene d' Investissements (BEI). The PRC also reportedly made a $25 million credit offer for construction of the railroad.[27] Upper Volta requested a loan of $450,000 from the World Bank for financing the study for the route extending from Dori to Djibo.

Electrical power is also a prime development target. A diesel power station, composed of two units generating 1,500 kilowatts each, was scheduled to be put into service in May 1975 at Ouagodougou. Four other projects were under discussion for Bobo-Dioulasso (1,500 kilowatts scheduled for May 1976), and for Kou River, Gaoua, Kaya, Tenkodogo, and FadaN'Gourma (scheduled for completion before 1976). Construction of a dam with a 60,000-kilowatt-hour generating capacity on the Black Volta at Noumbiel is planned for the Gaoua area.[28] Total installed electrical capacity at the end of 1973 was 16.7 megawatts. The principal operator of electric energy was the State Société Voltaique d' electricite (VOLTELEC).[29]

Total foreign investment at the end of 1973 was estimated at $13 million to $17 million, of which about 60% was French and/or European. The Voltans have a liberal investment code, which grants tax and customs exemptions, tariff protection, eased foreign currency restrictions, and guaranteed arbitration.

The General Office for the Tambao Projects was set up in March 1974, to coordinate various studies and projects. Its purpose was to promote all operations and carry out the construction of the Ouagadougou-Tambao railroad, the acquisition of rolling stock, the working of

the Tambao mine and related projects, the managing of the Tin Hrassau cement works located near Tambao, the installation of equipment for supplying water and energy to the Tambao complex and Tin Hrassau, and finally, the necessary improvements to the port where the mineral will be exported. In addition to the General Office, the Direction des Mines et de Geologie continues to be involved in prospecting for diamonds and kaolin. The UNDP, BRGM and the Société Generale d' Exploitation et de recherche Minière (SOGEREM) were also undertaking mineral studies. Federal Republic of Germany had donated geophysical equipment to the Direction des Mines et de Geologie in June 1974.

SOGEREM, a subsidiary of PUK, was evaluating the white bauxite deposits of the Kaya-Kongoussi area. A previous study by BRGM indicated 3 million to 5 million tons. In another region, extending from Dano to Tougan, the existence of bauxite has also been confirmed, but further studies were needed in both areas. A French loan was to be used for the reconnaissance studies.

BRGM was studying copper, antimony, and phosphate deposits. The lead occurrence at Gan, 30 kilometers northeast of Tougan, and the antimony at Mafoulou, 20 kilometers southeast of Kongoussi, were being studied to determine their extent and the economic feasibility of mining them. The phosphates at Anly contain between 2.7 million and 4 million tons of 27% to 31% $P_2O_5$, as determined in 1973. Other large phosphate strata were also noted in the Kodjari-Tansanga District. Followup studies were being inaugurated. Copper-gold reserves at the Dienemera deposit were estimated at 40 million tons of ore containing 0.8% copper and 2 grams gold per ton and, reportedly, an additional 3.5 million tons of 2% copper.

Systematic prospecting for diamonds was initiated by the Direction des Mines et de Geologie based on the original discovery of 19 small diamonds in the Comoe Basin in an attempt to pinpoint the origin. UNDP was assisting the exploration of 70,000 square kilometers north of Ouagadougou. New possibilities were being speculated for the vanadium-bearing iron ores of the Tin Edia deposit near Oursi, where reserves were estimated at 50 million tons of 40% to 45% Fe, 9% to 14% Ti, 2.2% $SiO_2$, and 1% $V_2O_5$.

The concession for exploiting the Tiara marble deposits, located 32 kilometers from Bobo-Dioulasso, was given to Compagnie Voltaique d'Exploitation Minière (COVEMI). Other marble deposits are known at Kiounkogo (1,350,000 cubic meters), Kioukar-Tingo (9 million cubic meters) and Samandeni (6 million cubic meters). The Tin Hrassan limestone deposit on which the cement project is to be based contains 56 million tons of rock with 46% CaO and 3% MgO. A cement factory to produce 70,000 to 133,000 tons per year was planned.

An agreement was signed in early 1975 for mining the Tambao manganese deposit, creating a new company called the "New Society," in which Upper Volta will have 51% and an association of international interests will have 49%. This is distributed as follows: The Ferric Alloys Corporation of Japan, 30%; Exploration and Bergbau Co. of West Germany, 9%; Union Carbide Co. of the United States, 7%; and Société Minière Manganese of France, 3%. The agreement provides for a buy-back arrangement of the production in proportion to the shares each company owns in the mining venture. The ore would thus be sold to Japan (383,000 tons), West Germany (115,000 tons), the United States (89,000 tons), and France (38,000 tons). The new development company was to be capitalized at $8 to $10 million, indicating development costs of about $30 million. Production was anticipated by 1980. The mine was expected to have a life of at least 25 years.

# The Mineral Industry of Other Countries of the Near East

By Daniel C. Adkins,[1] and Fay B. Dillard,[2] and Bernadette Michalski [2]

## CONTENTS

## BAHRAIN [3]

During 1974, the Bahrain Government reported revenue receipts approaching $133 million. Of this total, $85 million was realized from the petroleum industry. More than a third of total petroleum revenues or $31 million was derived from the Bahrain Government's 50% interest in the Saudi Arabian Abu Safah Field. Domestic production is limited to the Awali Field, which averaged a little more than 67,000 barrels per day. Bahrain Petroleum Co., Ltd. (Bapco) operated the Awali Field and the 250,000-barrel-per-day refinery at Awali. Refinery daily throughput in 1974 averaged 245,000 barrels of crude and 5,400 barrels of blend stocks. More than 70% of the refinery throughput was Saudi Arabian crude delivered via the Dharan pipeline. The fee levied on Saudi Arabian crude processed at the Awali refinery and the tax and royalty payments on domestic production accounted for most of the remaining petroleum-derived revenues.

Bapco produced nonassociated gas from the Khuff Zone and from the Arab Zone. Total natural gas production averaged 274 million cubic feet per day, compared with 227 million in 1973. Higher gas production resulted from field facility modification and installation of new units. The largest single consumer of natural gas was Aluminium Bahrain, Ltd. (Alba), which utilized 112 million cubic feet per day to power its aluminum smelter.

Seventy-seven million cubic feet of natural gas was injected daily into the oil reservoir for pressure maintenance, 57 million cubic feet was consumed daily at the Bapco refinery, and 24 million cubic feet was delivered daily to the Government power station.

In late 1974, the Bahrain Government acquired a 60% participation in Bapco, formerly a joint venture of Texaco, Inc. and Standard Oil Co. of California. The 60% participation was retroactive to January 1974. The Bahrain Government also acquired a 25% participation retroactively effective for the 1973 calendar year. The participation agreement includes the Government's offer to permit the company to buy back the equity crude at a rate be-

[3] Prepared by Bernadette Michalski.

tween 93% and 95% of the posted price. The participation agreement includes Bapco's oil and gas production operations but excludes refinery operations.

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, crude construction materials such as common clays, stone, and sand and gravel presumably are produced, but output is not recorded quantitatively and general information is inadequate as a basis for formulation of estimates of output levels.

[2] Excluding gas used for gas lift.

[3] In addition to the emirates listed (Abu Dhabi, Ajman, Dubai, and Sharjah), there are three others: Fujairah, Ras al-Khaimah, and Umm al-Qaiwain; these record no mineral production but presumably produce small quantities of crude construction materials.

[4] Revised to none.

Muharraq Island, Bahrain, has been selected as the site for the Organization of Arab Petroleum Exporting Countries (OAPEC) shipbuilding and repair yard. The cost of the project, financed by Bahrain, Libya, Saudi Arabia, Kuwait, Iraq, Qatar, and the United Arab Emirates, has been revised upward to $186 million. Initial plans included facilities for repair of 500,000 deadweight ton and 1-million deadweight ton tankers; however, these plans may be revised in view of the changing trend in shipping patterns. The contract for dredging operations was awarded to Falcon Dredging Co., a joint venture of Costain Civil Engineering Ltd. (United Kingdom) and Blankevoort (Netherlands). Dredging activity involves clearing 450,000 square meters to a water depth of 12 meters. The contract for the design and civil engineering was awarded to Sir Alexander Gibb and Partners (United Kingdom) and Profabril, a subsidiary of Companhia Union Fabril (Portugal). The management contract was awarded to Lisnave (Portugal). Drydock services should be available by mid-1977.

Primary aluminum was produced at the Alba smelter near Askar. The smelter operated at capacity, producing 118,000 tons of aluminum ingot in 1974. Imported alumina from Aluminum Co. of America (Alcoa) operations at Kwinana, Australia, was the source of raw material. Power was supplied by the 300-megawatt-capacity Alba powerstation, which is fueled by natural gas from the Khuff formation. Aluminium Bahrain, Ltd. sells its production to six shareholders in quantities proportionate to their equity in the company. Almost all production is exported in ingot form. Plans for an aluminum extrusion plant to service local needs are under consideration. Bahrain's production of mineral commodities is reported in table 1, while trade in crude petroleum and petroleum products is reported in table 2.

**Table 2.—Bahrain: Foreign trade of crude petroleum and petroleum refinery products**

## JORDAN [4]

The economy continued to expand during 1974 with the gross national product (GNP) at about $1 billion [5] in current dollars, a real increase of 7% over that of 1973. The mineral industry contributed about 15% of this total. The principal mineral industries are phosphate rock mining and beneficiating, cement manufacturing, refining imported crude petroleum, and metal manufacturing from crude imported forms. Feasibility studies are planned on extracting potash from the Dead Sea. Production of Jordanian mineral commodities is reported in table 1.

Total exports were valued at $126 million, almost three times the 1973 level, with nearly half of this total accounted for by raw phosphates, Jordan's chief export. During 1974, cement exports rose substantially.

Imports in 1974 were valued at $498 million. Although the trade deficit totaled $372 million, foreign exchange reserves increased by 10% to $377 million, making Jordan's balance of payments favorable by $43 million in 1974.

Phosphate production reached approximately 1.6 million tons in 1974, a 44% increase over the 1973 figure. Confirmed phosphate rock reserves reached approximately 300 million tons, while potential reserves were estimated at 1,000 million tons. With the planned completion in 1975 of a railway extension from the El Hasa mines to Aquaba, along with a third phosphate loading berth, and the reopening of the Suez Canal in 1975, Jordan will have the means to supply new potential markets. The Jordan Phosphate Mines Co. hoped to triple its output of phosphate rock by 1976; most of the expansion was scheduled to come from the high-grade phosphate mined at El Hasa in Southern Jordan. Also plans were being made for the addition of two mill sites either at the existing mines at El Hasā, or at a new site further south.

Plans were nearing completion at year-end 1974 for the construction of a chemical fertilizer manufacturing complex, the Jordan Fertilizer Industry Co. The Agrico Chemical Co., a subsidiary of the Tulsa, Okla.-based Williams Companies, will have 25% of this joint venture. Construction by Agrico on this project was scheduled to begin during mid-1975, to be completed in 1978 at an estimated cost of $180 million. Agrico will operate the plant for 3 years, after which all the plant's personnel will be Jordanian nationals. The plant will produce phosphoric acid (1,000 tons per day), triple superphosphate, monobasic ammonium phosphate, and dibasic ammonium phosphate. Capacity is expected to be 600,000 tons per year. This new export venture reportedly will be the largest single private investment by a U.S. firm in Jordan.

The proved manganese reserves in southern Jordan have been reported at 1.5 million tons, with 38% manganese content. The Nation's total reserves are estimated at 5 million tons. In addition to manganese mining, Jordan is also considering copper mining. Proved copper ore reserves amount to 60 million tons, and the total probable reserves are about 150 million tons.

Exploration activities by Desco Investments, Ltd. (Canada) for petroleum did not result in any commercial discoveries. However, Jordan invited other firms to enter exploration activities. No petroleum is produced in Jordan, and most domestic requirements are satisfied by the Zerqa' refinery processing of Saudi Arabian crude delivered via the Trans-Arabian Pipeline (TAPline). During 1974 a price dispute between TAPline and Jordan was not resolved. In spite of the unsettled price, an average of 16,000 barrels per day was refined at Zerqa'. The state-owned Jordan Petroleum Refinery Co. invited bids in mid-1974 to expand its refinery installations at Zerqa' to increase capacity to 2.9 million tons per year and to add hydrotreating and aromatics extraction units. The project includes construction of a new bulk storage station in Amman and new storage tanks and ancillary facilities at Zerqa'. Two product pipelines will link the refinery to the products terminal in Amman.

## LEBANON [6]

The indigenous mineral industry is limited to several nonmetal mining and processing operations, the most significant of which are the limestone and gypsum quarries, which support a cement industry large enough to both satisfy domestic requirements and provide about one-half million tons of cement per year for export. Because Lebanon does not produce petroleum or primary metals, these commodities are imported. Using this imported feedstock, the Nation's refineries and mills supply more than half of Lebanon's petroleum product requirements and a significant portion of requirements for metal semimanufactures. Mineral commodity production in Lebanon is shown in table 1.

The overland pipelines that deliver crude petroleum from Saudi Arabia and Iraq to Lebanon's two refineries also deliver crude oil to Mediterranean export terminals, and the Lebanese Government has realized a substantial income from transit fee payments estimated at well over $25 million per year in recent years. However, transit fee revenues were drastically reduced in 1974 as a result of economic factors that decreased the desirability of offtaking crude from Mediterranean ports and the Government's sequestering policy.

The Iraq National Oil Co. (INOC) pipeline, which connects the Northern Iraq petroleum fields with the Mediterranean export terminal at Tripoli, Lebanon, transported nearly 123 million barrels of crude oil in 1974. Exports of crude from the Tripoli terminal exceeded 111 million barrels, and deliveries to the Tripoli refinery and storage facilities absorbed the remaining 12 million barrels. Crude delivered to the 36,000-barrel-per-day capacity Tripoli refinery was priced at $2.65 per barrel in 1974 and at $2.75 per barrel in 1975, as a result of an Iraqi-Lebanese contract negotiated just before the 1973 price increases.

The petroleum price increases of 1973–74 reduced world demand and dropped world tanker rates from worldscale 400 to below worldscale 100. This created a price advantage for Persian Gulf crudes shipped around the Cape of Good Hope compared with the cost of Middle East crudes transported by overland pipeline to Mediterranean ports. Iraq adjusted its crude price downward from $13.00 per barrel in early 1974 to $11.50 per barrel in the third and fourth quarters of the year. In spite of the price adjustment, exports from the Tripoli terminal were reduced 28% from 1973 levels, proportionately reducing Lebanon's transit fee revenues.

TAPline, a subsidiary of Arabian-American Oil Co. (Aramco), transported 81 million barrels of crude oil from the Persian Gulf to the port of Sidon, Lebanon in 1974. Exports totaled 76 million barrels, and the remainder was delivered to Mediterranean Refining Co. (Medreco). In 1973 TAPline throughput to Sidon was 151 million barrels, of which 143 million barrels was exported. The price advantage for Persian Gulf crudes contributed to the reduced offtake at the TAPline Mediterranean terminal at Sidon. During the first 9 months of 1974, offtake averaged 250,000 barrels per day. By yearend offtake averaged 40,000 barrels per day, far below the 1973 average of nearly 400,000 barrels per day.

The exrefinery price dispute between the Lebanese Government and Medreco, owned by Mobil Oil Co. and Caltex Petroleum Co., remained unsettled at yearend. Under a series of temporary agreements, Medreco under fee refined crude supplied by the Lebanese Government, which in turn sequestered crude from TAPline to provide feedstock to the 17,500-barrel-per-day Medreco refinery. Negotiations continued between TAPline and the Lebanese Government on the price of crude refined at Medreco, but no settlement was reached by yearend. Until agreement is reached, TAPline has withheld payment of transit fees.

Plans for construction of a refinery backed by Saudi Arabian financing gathered momentum with the Lebanese review of a feasibility study prepared by Universal Oil Products Co. (United States). The 125,000-barrel-per-day-capacity refinery is to be near Sidon and should require 4 years to complete construction once the contract is awarded.

During 1974 the Lebanese Government granted offshore exploration concessions to Compagnie Française des Pétroles (France) and to AGIP S.p.A., a subsidiary of Ente Nazionale Idrocarburi (ENI) (Italy). No exploration activity was yet reported in 1974.

Much of Lebanon's requirements for rolled steel products and small-diameter

[6] Prepared by Bernadette Michalski.

pipe were supplied by the Byblos-Amdich rolling mill of Consolidated Steel Lebanon, S.A.L., the Tripoli rolling mill of the Lebanon Steel Co., S.A.L, and the pipe mills of Société Nationale des Tubes S.A.L. and Tubes du Levant S.A.L. A significant portion of domestic requirements for rolled and extruded nonferrous metal products were manufactured by Société pour le Commerce l'Industrie d'Aluminum et les Entreprises and by Société pour l'Industrie des Métaux. Imported scrap and primary metal forms serve as raw material for the Lebanese mills.

2 Less than ½ unit.
3 May include some manufactured materials, reported inseparably from unwrought and semimanufactured forms.

## OMAN [7]

Exploration results have indicated that Oman has a potential for a diversified mineral economy, and investment capital is being sought to develop deposits of copper, chrome, and manganese. For the present, however, the petroleum industry continues to sustain the Oman Government, supplying about 95% of government revenues. These revenues are largely invested in infrastructure development.

Crude petroleum production averaged more than 290,500 barrels per day from four fields operated by Petroleum Development Oman, Ltd. (PDO). Production by field was as follows, in thousand barrels per day:

| Field | 1973 | 1974 |
|---|---|---|
| Fahud | 115.3 | 107.7 |
| Yibal | 87.2 | 93.2 |
| Natih | 51.1 | 49.9 |
| Al Huwaisah | 39.3 | 39.7 |

Production continued to decline as a result of pressure loss; however, secondary recovery waterflood operations have been undertaken in the Yibal, Fahud, and Natih Fields. Three new fields are under development in central Oman; when brought into production in 1975 they should augment Oman's petroleum production by 50,000 to 90,000 barrels per day. Future production, like current production, will be transported by pipeline to the export terminal Mina al Fahal.

During 1974 over 1 billion cubic feet of associated gas was produced. Most of this production was flared because gas reserves are too limited to warrant the high cost of constructing liquefied natural gas (LNG) production and export facilities. Feasibility studies are, however, under consideration for utilizing associated gas in power generation and fertilizer production.

The Government of Oman, having acquired 25% interest in PDO during 1973, increased its participation to 60% in 1974. This action readjusted equity holdings, with Royal Dutch/Shell holding 34%, CFP holding 4%, and Portuguese Participation and Exploration Corp. (Partex) holding the remaining 2%.

## PEOPLE'S DEMOCRATIC REPUBLIC OF YEMEN [8]

Commercial production of mineral commodities is limited to salt and to petroleum products which are refined from imported crude oil. While copper deposits containing gold and silver are reported in the Maahir-Ghabor area, further exploration is required to determine if these deposits are commercially exploitable. Financial assistance is anticipated from the United Arab Emirates to support a broad exploration program. Final agreements on exploration financing should be reached in 1975. Petroleum exploration was initiated in 1971 in the Hadhramaut area by the South Yemeni Algerian Petroleum Co. (SYAPCO), in which the State petroleum agency holds 51% equity and Société Nationale pour la Récherche, la Production, le Transport, la Transformation, et al Commercialisation des Hydrocarbures (SONATRACH) holds 49% equity. No discoveries were reported by SYAPCO. The People's Democratic Republic of Yemen is considering opening additional territories for hydrocarbon exploration by 1975.

The Aden refinery processed an estimated 68,000 barrels per day of crude oil in 1974. Most of the crude oil imports came from Iran, Kuwait, and Egypt. The bulk of Aden refinery products are exported. To permit easier tanker access to crude unloading and products loading facilities, the petroleum harbor at Aden was being dredged in 1974, to increase the depth from 40 to 41 feet.

Commercial salt production is conducted at the Khawr Maksar evaporating ponds under the direction of the state-owned General Salt Organization. Enough evaporated salt is produced to supply domestic consumption requirements and to permit limited quantities for export.

Refer to table 7 for exports and reexports of mineral commodities.

## QATAR [9]

Government income realized from the petroleum industry in the form of royalties, taxes, and the sale of participation crude was estimated at $1.8 billion in 1974, or about 95% of total government revenues.

During 1974 a government decree established the Qatar General Petroleum Organization (QGPO), a government-owned agency with a mandate to engage in all phases of the oil industry. The QGPO represents the Government's equity in the Qatar Petroleum Co., Ltd. (QPC). This equity was increased from 25% to 60% in 1974, adjusting equity holdings as follows: QCPO 60%, British Petroleum Co., Ltd. 9.5%, Royal Dutch/Shell 9.5%, Compagnie Française des Pétroles 9.5%, Near East Development, 9.5%, and Partex 2.0%.

Government equity in the Shell Oil Co. of Qatar (SOCQ) was also increased from 25% to 60% in 1974, lowering Royal Dutch/Shell equity from 75% to 40%. The QGPO also represents Government equity in the Arab Maritime Petroleum Transportation Co., the Arab Petroleum Pipelines Co., the National Oil Distribution Co., and the Arab Company for Shipbuilding and Repair.

More than half of Qatar's crude oil production was produced by SOCQ which averaged more than 295,000 barrels per day of 36° API crude from three offshore fields. These fields are linked by subsea pipelines to the export terminal at Halul Island. Production by field was as follows, in thousands of barrels per day:

| Field | 1973 | 1974 |
|---|---|---|
| Bul Hanine | 143.9 | 142.0 |
| Maydan-Mahzan | 137.4 | 129.8 |
| Idd El Shargi | 38.0 | 23.2 |

The remainder of Qatar's crude production was obtained from 57 wells in the onshore Dukhan Field operated by QPC. Daily production averaged over 223,000 barrels of 40° API gravity crude. About 221,500 barrels per day was exported from

[9] Prepared by Bernadette Michalski.

the Umm Said terminal. Of the remainder, about 525 barrels per day was utilized in the powerplant and desalination plant. About 265 barrels per day was delivered to the state-owned topping plant at Umm Said, which operated through October 1974, and by yearend a total of 250,000 barrels of Dukhan Field crude had been delivered to the National Oil Distribution Co. 6,800-barrel-per-day-capacity refinery, which was commissioned in mid-September. At yearend the QPC natural gas liquid plant was commissioned. Supplied with Dukhan Field associated gas, the plant will eventually produce 800,000 tons of natural gas liquids per year. The bulk of the plant output will be exported to Japan.

Although the petroleum industry continued to dominate Qatar's mineral economy, the Government of Qatar has entered into a series of agreements launching the nation's first iron and steel works. Qatar Steel Co. Ltd. with 70% equity held by the Government of Qatar, 20% equity held by Kobe Steel, Ltd. of Japan, and 10% equity held by Tokyo Boeki Ltd. also of Japan, will build a 400,000-ton-per-year capacity iron and steel plant at Umm Said. Plant construction was to begin in 1975 with completion scheduled for 1977. About 75,000 tons of plant products will be absorbed by the domestic market, with the remaining production destined for the export market. Kobe Steel will be responsible for plant management, and Tokyo Boeki will handle marketing abroad. The plant will employ the Midrex (United States) direct reduction process for sponge iron production. The total cost of the project is estimated at $200 million.

Qatar National Cement Co. operates Qatar's sole cement manufacturing facility. The Umm Bab plant capacity was expanded to 220,000 tons per year in 1974. Plant products include portland cement for building construction and sulfated cement for marine foundations.

## SYRIAN ARAB REPUBLIC [10]

Indigenous mineral resources of commercial value include petroleum and natural gas, phosphate rock, gypsum, and rock salt. Table 1 lists production of mineral commodities. The petroleum industry contributes substantially to the Syrian economy, both directly through production and processing and indirectly through fees paid for Iraqi and Saudi Arabian oil transiting Syria via pipelines linking producing fields with Mediterranean shipping terminals. The Ministry for Petroleum and Mineral Resources allotted 95% of its $240 million budget for 1974 for development and expansion of all phases of the domestic petroleum industry. Exploration activity was accelerated by the opening of nearly 18,000 square kilometers for exploration and development under service contract arrangements. Crude petroleum production from the Karachok, Rumailan, and Sawaidiyah Fields in northeastern Syria increased from 105,000 barrels per day in 1973 to 124,000 barrels per day in 1974. Projections for 1975 were placed at 175,000 barrels per day. The bulk of Syria's output, or nearly 118,000 barrels per day was exported, earning $434 million in foreign exchange in 1974. The remaining production was blended with lighter Kirkuk crude imported from Iraq and refined at the Homs refinery where throughput averaged 35,000 barrels per day in 1974. A contract was awarded to Romania's Industrial Export Organization for the construction of a 120,000-barrel-per-day capacity refinery at Banias. The refinery is scheduled to be completed in 1977 at a cost of $297 million. Feedstock for the Banias refinery will be 36° API gravity Iraqi crude, and 25° API gravity Syrian crude at a 4:1 ratio.

Syrian revenues obtained from transit fees levied on petroleum produced in Iraq and Saudi Arabia and carried via pipeline across Syria were reported as $164.3 million in 1974. The bulk of transit fee payments were obtained from Iraq whose shipments via the INOC pipeline to Tripoli and Banias averaged nearly 840,000 barrels per day crossing about 450 kilometers of Syrian territory. Shipment of Saudi Arabian crude via TAPline, which crosses nearly 200 kilometers of Syrian territory on its journey to the export terminal at Sidon, averaged nearly 223,000 barrels per day in 1974.

While petroleum production, processing, and transportation dominate the Syrian mineral industry, investments in phosphate rock production and in cement and fertilizer manufacturing are showing promising returns. The development of phosphate rock deposits at Khunaifis and al Sharqiyah A and B should bring annual production to 1.35 million tons by 1975. Expansion of existing cement plants and construction of new facilities should bring cement production to 6 million tons per year by 1980. Fertilizer production at Homs was expanded from 300 tons per day to 700 tons per day in 1974, with expansion to 1,000 tons per day planned by 1978.

## UNITED ARAB EMIRATES [11]

The United Arab Emirates, formed in 1971, is a federation of seven independent sheikdoms. Included in the federation are Abu Dhabi, Ajman, Dubai, Fujairah, Ras al-Khaimah, Sharjah, and Umm al-Qaiwain.

The Presidency and Vice-Presidency of the federation are held respectively by the rulers of Abu Dhabi and Dubai, the major oil producing emirates.

Table 1 gives mineral production statistics on the United Arab Emirates.

**Nonmetallic Minerals.**—*Cement.*—The Abu Dhabi Government has allocated $10 million and started construction of a 200,000-ton-per-year cement plant.

A preliminary agreement for construction of the Dubai national cement plant was signed by the Dubai Government and Costain Civil Engineering. The $45 million [12] plant will have a capacity of 500,000 tons per year, which will make it the largest in the Persian Gulf and provide Dubai with another export commodity.

In Ras al-Khaimah the Union Cement

[10] Prepared by Bernadette Michalski.

[12] Where necessary, values have been converted from United Arab Emirates dirhams to U.S. dollars at the rate of UAED3.95 = US$1.00.

Co. neared completion of its 250,000-ton-per-year-capacity cement plant at Khor Kuwait. The plant is being built by Mothercat Ltd. (United Kingdom-Lebanon) at a cost of $14 million.

**Mineral Fuels.**—*Natural Gas.*—Abu Dhabi's Government moved to utilize its onshore natural gas reserves by awarding Suedrohrbau GmbH & Co. K.G. (West Germany) a contract to build a 24- and 18-inch natural gas pipeline from the Habskan production area to the city of Abu Dhabi. The 152-kilometer pipeline was scheduled for operation in early 1976 and should supply fuel for a gas turbine electric power project and other needs.

During 1974 Abu Dhabi Gas Liquefaction Co., Ltd. (ADGLC) continued construction of its Das Island natural gas liquefaction plant and expanded the design to include production of 220,000 tons per year of light distillate and 230,000 tons per year of sulfur. Air Products & Chemicals Inc. (United States) is to design the 2.2-million-ton-per-year liquefaction process and provide the needed heat exchangers. British Ropeway Engineering Co. was awarded a contract for sulfur reclaiming, storage, and loading facilities. The main contractors are the Bechtel Corp. (United States) for engineering and Chiyoda Chemical Engineering and Construction Co. (Japan) for construction. When the plant is completed in 1976, associated gas from Abu Dhabi Marine Areas, Ltd. (ADMA) offshore operations will be used to produce 3 million tons per year of liquefied gas for the Tokyo Electric Power Co. of Japan. In late 1974, the Abu Dhabi National Oil Co. (ADNOC) increased its participation to 51%. (See table 10 for 1974 participation figures.)

The Government of Dubai and Sunningdale Oils Ltd. of Canada signed a letter of intent for a 15-year joint venture to gather and market Dubai's associated gas, which is currently being flared. Sunningdale will conduct feasibility and design studies for a proposed plant to recover 700,000 tons per year of natural gas liquids from the associated gas.

[1] ADGLC is to utilize the associated gas from ADMA's concession.
[2] Sunningdale Oils Ltd. is to utilize the associated gas from DPC's concession, but is planning to use only the natural gas liquids at this time.

*Petroleum Exploration.*—The Abu Dhabi Petroleum Co., Ltd. (ADPC) drilled three exploratory wells (table 11) along the coast without finding oil in commercial quantities. Abu Dhabi Phillips Petroleum Co. (Phillips) drilled five exploratory wells, of which one was a potential producer. The Middle East Oil Co., Ltd., a Japanese consortium led by Mitsubishi Oil Co., Ltd. relinquished its onshore concession after spending $25 million drilling 15 unsuccessful exploratory wells. All petroleum companies with concessions offshore Abu Dhabi engaged in seismic surveying except Abu Dhabi Marine Areas Ltd. (ADMA). Three offshore concessionaires drilled a total of five exploratory wells, but Sunningdale Oils Ltd. and Abu Al Bu Koosh Oil Co., Ltd., operated by Compagnie Française des Pétroles (CFP) drilled none.

Texas Pacific Dubai Inc., a subsidiary of Distillers Corp.-Seagrams, Ltd. (Canada), acquired a concession offshore Dubai in September 1974. The agreement called for a $10 million signature bonus and geophysical exploration within the year. There was no exploratory drilling during 1974, although Dubai Petroleum Co. (DPC) operated by Continental Oil Co. (Conoco), ran a crew-month of seismic work (table 11).

Source: American Association of Petroleum Geologists.

Ajman and Umm al-Qaiwain have adjacent offshore areas that are leased to United Refining Co. and claimed by Occidental Petroleum Corp., both of the United States. United Refining Co. completed a seismic survey offshore both emirates. There was no drilling activity in either emirate.

In Fujairah the Reserve Oil and Gas Co. (United States) signed an offshore concession agreement for 2,850 square kilometers and completed seismic and gravity surveys. The company is to drill at least three wells within 4 years.

In early 1974 Sharjah signed an onshore concession agreement with Crystal Oil Co. (United States) which later extended participation to Norsk Hydro A.S. (Norway)

and Sogedip (France). A seismic survey was underway by yearend.

Reserve Oil and Gas Co. signed an offshore concession agreement with Sharjah which obliged the company to drill within 2 years. Reserve Oil and Gas Co. completed a seismic and gravity survey in its interlinked Sharjah and Fujairah concessions during 1974.

Crescent Petroleum Co., with Buttes Oil and Gas Co. (United States) as operator, drilled and abandoned an exploratory well and completed a seismic survey during 1974.

In Ras al-Khaimah, Norsk Hydro A.S. bought the onshore concession that Peninsula Petroleum Co. (United States) had obtained in June 1973. The company was to undertake a seismic survey in late 1974 or early 1975. Offshore Ras al-Khaimah, Vitol Exploration B.V. (Netherlands) sold half interest in its concession to Weeks Natural Resources Ltd. (United Kingdom) and engaged in seismic work. There was no drilling activity.

**Table 12.—Summary of drilling in United Arab Emirates, 1974**

e Estimate. NA Not available.
[1] All dump flood wells.
[2] Including 25 water supply wells and 27 water injection wells.
[3] One well abandoned for mechanical reasons.
[4] All water injection wells.
[5] Including 11 water injection wells.

*Petroleum-Development and Production.*—ADPC had five drilling rigs engaged in field development and secondary recovery. The rigs drilled 475,000 feet including 7 development wells, 27 water injection wells, 25 water supply wells, and 4 service wells (table 12). Many of the wells helped complete the power water injection system in the Bab oilfield, which was pumping 260,000 barrels per day of water by yearend 1974. The injection projects for the Asab and Bu Hasa Fields are to be completed during 1975. The Asab oilfield was brought into production during December 1973 and maintained an average monthly production of 360,000 barrels per day during 1974 (table 13). The Bu Hasa and Bab Fields averaged 468,000 and 91,000 barrels per day, respectively.

The Abu Al Bu Koosh Oil Co. started oil production in July 1974, and with the addition of four more development wells, reached a rate of 56,000 barrels per day in December 1974. The Abu Al Bu Koosh oilfield is an extension of Iran's offshore Sasson oilfield.

ADMA started work on a $750 million waterflood secondary recovery project which would increase production from 462,000 barrels per day in late 1974 to 880,000 barrels per day in late 1975, and to as much as 1.2 million barrels per day by 1980. This would involve the injection of 1 million and eventually 2.5 million barrels per day of processed seawater. ADMA estimates about 10% of the total oil in place has been recovered, and the waterflood should allow an ultimate recovery of 30% to 35% of the original oil in place. Drilling by 6 jack-up rigs included 10 wells in the Umm Shaif Field and 11 wells in the Zakum Field. Nine of the 21 wells were dump flood wells which will later be turned into power-injection wells. The El Bunduq Field was also being readied for production and connected to processing and terminal facilities on Das Island.

Abu Dhabi Oil Co., Ltd. (ADOC) has spent $130 million on developing the offshore Mubarraz Field.

In Dubai the Dubai Petroleum Corp. (DPC) continued development of the Fateh and Southwest Fateh Fields with a $200 million program of development drilling and secondary recovery designed to raise production to 400,000 barrels per day during 1975. Over $85 million was spent on the Fateh Field waterflood project finished during 1974, and another $25 million was spent on a gas-lift project nearing completion in the southwest Fateh.

Most Crescent Petroleum Co.'s drilling was for development (7 wells) and water injection (11 wells) in the Mubarek oilfield, which started production in July after the expenditure of $60 million. This field is 14.5 kilometers southeast of Abu Musa Island in 63 meters of water. The pay zones are in the Middle Cretaceous Mishriff and Upper Cretaceous Ilam zones at a depth of 3,800 to 3,960 meters. Significant quantities of associated gas are also present.

Currently oil produced in the Mubarek Field is pumped into a 640,000-barrel storage vessel *Baraka I* and offloaded into the tankers of Ashland Oil Inc., Skelly Oil Co., Kerr-McGee Corp. and Cities Service Co. The maximum production capacity is limited to 100,000 barrels per day by the storage and support complex. Sharjah has made arrangements with Iran and Umm al-Qaiwain concerning conflicting border claims. Iran and Sharjah will share oil royalties equally.

*Petroleum Refining.*—In Abu Dhabi construction of a 15,000-barrel-per-day refinery started in early 1974. ADPC expects to complete this refinery at Umm

al-Nar Island during 1975. Crude petroleum will be separated into light and heavy fractions at Habskan, and the light oil will then be piped to Umm al-Nar Island by a new 122-kilometer 8-inch pipeline. The Kellogg Co. (United States) received a $35 million contract for refinery design and construction, while the Pan-Arabian Co. is charged with laying the 3,000 tons of pipe. The refinery will supply gasoline and liquefied petroleum gas for local consumption.

In Dubai construction of a 200,000-barrel-per-day export refinery was under consideration, but no contracts were awarded by yearend.

*Petroleum Trade.*—Mineral trade consisted primarily of crude oil exports, and imports of refined petroleum products and construction materials. Abu Dhabi earned $3.5 billion from oil exports, while Dubai and Sharjah together earned nearly $700 million from oil exports. Five countries received 80% of petroleum exports from the United Arab Emirates. They were Japan (33.0%), France (21.1%), the United Kingdom (9.4%), the United States (8.5%), and West Germany (8.0%). During 1974 the Emirates imported 450,353 tons of processed petroleum products from Iran (58%), Kuwait (24%), and other Persian Gulf countries. The imported products were motor gasoline (1,196,000 barrels), distillate fuel oil (1,031,000 barrels), jet fuel and kerosine (804,000 barrels), and residual fuel oil (462,000 barrels).

A further expansion of Port Rashid is planned costing around $150 million. The project involves constructing over 5 kilometers of breakwaters which will enclose 3.9 square kilometers. The harbor will be dredged to a minimum depth of 11.5 meters, providing almost a square kilometer of new land and 22 new cargo berths. Sir William Halcrow and Partners, Ltd. (United Kingdom), the consulting engineers, will invite contract proposals. This port expansion is in addition to the Dubai Drydock Co.'s project for two 500,000 deadweight ton and one 1,000,000-deadweight-ton capacity drydocks.

Sharjah signed a contract with three civil engineering firms—Archirodon S.A. (Greece), Hochtief A.G. (West Germany), and Six Construct (Belgium)—for construction of a deepwater harbor in the existing Sharjah Creek. Sir William Halcrow and Partners, Ltd. are to be the consulting engineers for the project, which is expected to cost $48 million and eventually to provide six deepwater berths. Over 4 kilometers of breakwaters and sea wall will be built in addition to substantial dredging within the harbor and its approaches. Financing will be provided by Citicorp International Bank Ltd. (United Kingdom), European Arab Bank (Belgium), Chartered Bank (United Kingdom), and Sharjah.

## YEMEN ARAB REPUBLIC [13]

The mineral industry of the Yemen Arab Republic is based on the extraction and processing of several nonmetallic minerals and the manufacture of cement. Most of the nonmetallic minerals, including building stone, limestone, and gypsum, are mined for local consumption; however, rock salt has been mined at Salif in com-

[13] Prepared by Bernadette Michalski.

mercial quantities for export. Exports approached 74,000 tons in fiscal year (FY) 1972; dipped to 800 tons in FY 1973 and were discontinued in FY 1974, while expansion activities in the Salif Harbor area prevented normal shipping operations. Harbor expansion was planned and implemented by Canadian firms with financing available from the Kuwait Fund for Arab Economic Development. New facilities at Salif include a 250-meter concrete pier which can accommodate vessels up to 50,000 deadweight tons, and a conveyor system capable of loading 1,000 tons of salt hourly. The new port facilities will be available in late 1975, and rock salt exports will resume as markets are established. Salt reserves at Salif have been estimated at 25 million tons, affording the Yemen Arab Republic an excellent opportunity to improve its balance of payments position.

Cement production was inaugurated in the Yemen Arab Republic with commissioning of the Bajil cement plant in 1972. By September 1974 plans were discussed to expand plant capacity from 50,000 tons per year to 100,000 tons per year. The construction of a second cement plant was to be financed by Libya; plant capacity would be 1.5 million tons per year. By yearend no fixed contracts were announced for either project.

Three offshore exploration and development concessions were awarded in 1974. Royal Dutch/Shell conducted seismic surveys in its 10,000-square-kilometer concession in the Red Sea off the Yemen Arab Republic, and just south of the Shell concession seismic surveys were conducted by Santa Fe Minerals, Inc., a subsidiary of Santa Fe International Corp. (United States) and Toyo Menkakaisha Ltd. (Japan). The Santa Fe group announced that exploratory drilling in their concession area was expected in the spring of 1975. At yearend the Libyan National Oil Co. entered a concession agreement covering the southern portion of the Yemeni Continental Shelf.

Domestic petroleum product requirements are met entirely through imports. The procurement and distribution of all petroleum products is under the auspices of the Yemen National Petroleum Co. (YNPC). Product imports are obtained from the Aden refinery in the People's Democratic Republic of Yemen, for lubricants which are obtained from Kenya. Imports are estimated as follows, in thousand barrels:

| Product | 1973 | 1974 |
|---|---|---|
| Motor and aviation gasoline | 410 | 544 |
| Kerosine | 284 | 342 |
| Jet fuel | 31 | 44 |
| Diesel oil | 623 | 783 |
| Fuel oil | 146 | 403 |

Petroleum products are delivered by coastal tankers to the port of Hodeida where limited port facilities can accommodate only vessels of 4,000 deadweight tons or less. In mid-1974 expansion activities at Hodeida were underway; however, the developing port of Salif may eventually be the chief petroleum product import center. Expansion and construction of petroleum product storage facilities at Salif, Hodeida, Sana, and Mocha were also underway in 1974, raising storage capacity from its present level of 125,000 barrels to an eventual level of 600,000 barrels.

# The Mineral Industry of Other Areas of the Far East and South Asia

By Staff, Bureau of Mines

## CONTENTS

## AFGHANISTAN [1]

In 1974 Afghanistan reported increases in production of hydraulic cement, coal, natural gas, and salt. Production of barite and talc was reported for the first time. Table 1 summarizes the production totals for each commodity. Natural gas was the primary mineral commodity extracted in Afghanistan in 1974. Exports of natural gas, primarily to the U.S.S.R., reached 2.8 billion cubic meters worth about $20 million. The Department of Petroleum Exploration announced plans to exploit about 30 billion cubic meters of sour gas from the Jerqodaq Fields. The new facilities are to include the construction of a 2-billion-cubic-meter storage facility, drilling of 44 wells to depths of 2,200 meters each, pipelines, and a refinery. Construction is expected to be completed in 1976. The project is financed partly by the U.S.S.R.

Natural gas from Khowaja Gogirdak Fields was used for production of power and fertilizer. More than 18,600 tons of urea fertilizer was produced at the Mazari Sharif chemical fertilizer factory in 1974. The capacity of this plant was reported to be 105,000 tons.

Barite mines increased production in the Farinjal area of Ghorband and in the Sanlon area of Herat. The barite in the Herat region contains about 85% barium sulfate. The Farinjal deposits are estimated to contain 52,000 tons and the Herat reserves are said to total more than 1.4 million tons. The Farinjal barite is used primarily in the northern regions of Afghanistan in oil and gas exploration well drilling. The Herat barite is being used in the paint industry because of its higher barium sulfate content. In September, an agreement was signed with the U.S.S.R. for the export of 10,000 tons of unprocessed barite.

Talc production targets were set at 20,000 tons per year from deposits in Shinwar and Nangarhar. Reserves of talc in these two mines are estimated to be 170,000 tons. Other mineral commodities showing promise are gold, copper, and fluorite Copper reserves near Ainak are estimated to total 1 million tons with a copper content of 1% to 2%. Fluorite reserves in Bakhoot Orizgone are 1 million tons including 300,000 tons of pure fluorite.

[1] Prepared by Stanley K. Haines, physical scientist, Division of Nonmetallic Minerals.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the countries listed individually in this table, Nepal, covered textually in this chapter, presumably produces a variety of crude construction materials such as clays, stone, sand, gravel, and may produce cement, but production statistics are not available, and general information is inadequate to make reliable estimates of output levels.

[2] In addition to the commodities listed, a variety of crude construction materials such as clays, stone, sand, and gravel presumably were produced, but production statistics are not available and general information is inadequate to make reliable estimates of output levels.

[3] Data for years beginning March 21 of that stated.

[4] For the year ended June 30 of that stated.

[5] Gross production not reported. Marketed output is reported in lieu of gross production estimate because the quantity flared, vented, and/or reinjected is believed to be small.

[6] Source for 1972 and 1973 data: Statistical Office of the United Nations, World Energy Supplies 1970–73, Series J, No. 18. Previous editions of this publication showed output of gasoline and distillate fuel oil, but these listings have been discontinued and figures for kerosine and residual fuel oil that previously were shown as reported figures have been labeled as estimates.

[7] For cement production only.

[8] Exports.

[9] In addition to the commodities listed, chromite, iron ore, and lead-zinc ores were mined in the past and the country produced pig iron, crude steel, and smelter zinc from its industrial facilities, but the status of these industries under prevailing conditions is not sufficiently clear to permit preparation of reliable estimates of output. Similarly, no data on crude construction materials is available and no reliable basis for estimation is available.

[10] From official import statistics of the U.S.S.R.

[11] The South Vietnam Directorate of Natural Resources estimates a kaolin production level of 420,000 cubic meters annually for the years 1972–73, but the figure is inordinately high for true marketable china clay grade kaolin. No such estimate was made for 1974.

[12] Additional varieties of stone presumably are produced, but production statistics are not available, and general information is inadequate to make reliable estimates of output levels.

## Table 2.—Afghanistan: Imports of petroleum refinery products

(Thousand 42-gallon barrels)

| Commodity | 1971 | 1972 [e 1] | 1973 [e] |
|---|---|---|---|
| Gasoline, all grades | [2] 969 | [r] 1,020 | 1,100 |

## BANGLADESH [2]

The mineral industries in Bangladesh had a mixed year in 1974. Production of crude steel, mild steel products, hydraulic cement, and limestone increased over 1973 levels. Kaolin (china clay), natural gas, and salt production decreased. Table 1 summarizes the statistical data for mineral production in Bangladesh.

The gasfields at Rashipar, Kalas Tila, Titas, Bakhrabad, Habiganj, Haripur, and Chhatak were estimated to contain 8.29 trillion cubic feet of reserves with total resources of 20 trillion cubic feet. Hydrocarbon content of the gas was said to be over 95% regardless of producing field, allowing the gas to be used as either fuel or feedstock. The low sulfur content makes the gas well suited for home heating purposes. As a feedstock the gas was used to produce fertilizers and petrochemicals. Current consumption of gas was estimated to be 60 million cubic feet per day. Of this total an estimated 35 million cubic feet was processed into fertilizer, 20 million cubic feet for power, and 5 million cubic feet for industrial, commercial, and domestic uses.

Offshore areas of Bangladesh were considered to contain considerable quantities of oil. In October 1974 Bangladesh signed contracts with six foreign oil companies for the exploration for oil of 30,000 square miles in the Bay of Bengal. The companies were Atlantic Richfield Co., Ashland Oil Inc., Union Oil Co. of California, Canadian Superior Oil Ltd., Ina Naftaplin (Yugoslavia), and the Japan Petroleum Development Corporation. The Soviet Union was exploring for oil and gas in a number of onshore locations.

Bangladesh's coal requirements were estimated at 2 million tons per year with India providing the bulk of imports. India was to supply 660,000 tons of noncoking coal to Bangladesh by March 1974.

## BRUNEI [3]

A mineral economy based on petroleum and natural gas proved highly beneficial to Brunei in 1974 as rising prices raised the country's earnings to a level nearly triple that of 1973. Even a slight decline in petroleum output failed to slow the upsurge of oil revenues, and the rising receipts accruing from liquefied natural gas (LNG) sales further swelled the flow of income. In fact, the sudden influx of wealth left the country in somewhat of a quandry as to its disposition in a world of rapid inflation and fluctuating currencies.[4]

Attempts to diversify the economy, which obtains over 90% of its income from oil and gas production, were spelled out in the National Development Plan covering the period 1975–79. Goals of the plan include diversification of agriculture, development of infrastructure, and encouragement of foreign investment in agriculture, mining, and manufacturing, partly in order to make more skilled jobs available. In line with these goals, a Japanese consortium announced plans to build a large pulp and paper plant, and investors from other countries were showing interest in proposals to develop fertilizer, glass, ceramic, and petrochemical industries.[5] Efforts to achieve a wider distribution of the country's wealth among its population were being made.[6]

Development activity in connection with the country's present mineral industries during the year was limited to expansion of offshore petroleum production facilities and completion of the final liquefaction train for the LNG plant. No new petroleum or natural gasfields were discovered, and plans for a new oil refinery did not proceed beyond the discussion stage.

### PRODUCTION AND TRADE

Petroleum and natural gas continued to be Brunei's only mineral products in 1974, but they were sufficient to provide the country with a very sizable increase in

revenue. The total value of Brunei's 1974 mineral production was $886 million, almost three times the 1973 value of $321 million.

Output of crude petroleum declined by 11% in 1974 to 70,338,000 barrels from 78,673,000 barrels in 1973. A well blowout and reduced demand were responsible for the decrease.[7] However, the extreme rise in crude oil prices during the year pushed the value of petroleum up by 166%, from $308 million in 1973 to $819 million in 1974. Gross natural gas production increased strongly to 244 billion cubic feet in 1974 from 220 billion cubic feet in 1973. Marketed natural gas production was up 4% from the 1973 level, but exceeded the 1972 level by 1,105%. Marketed production represented 73% of gross production in 1974 as compared with 9% in 1972. The change reflected the market outlet provided by the LNG plant, for most of the gas, which is produced in association with petroleum, previously could not be utilized. A sharp rise in gas prices, added to the increase in marketed production, boosted the value of natural gas output to $32 million in 1974.

Output levels of both natural gas liquids and petroleum refinery products were also higher than that of 1973, and their values reflected the price increases of the parent materials.

Petroleum and natural gas continued to dominate Brunei's trade picture, accounting for 96% of the total value of exports. The country's export earnings in 1974 were almost three times greater than the 1973 earnings. Sales of LNG amounted to 10% of export earnings in 1974, the first year in which the new industry made a significant contribution to the country's economy. The increase in oil and gas prices assured that Brunei's balance of trade would swing into the favorable side, as export earnings were more than six times greater than expenditures on imports.[8]

Detailed trade data for 1973 and 1974 were not available at the time that this chapter was written. The latest trade statistics available are those for 1971 and 1972, and are contained in the 1973 Minerals Yearbook chapter.

### COMMODITY REVIEW

**Natural gas.**—The fifth and final liquefaction train was installed in the LNG plant during 1974. The entire plant was operating but was not scheduled to reach full capacity until 1976. A fourth tanker was commissioned in 1974, and three more were on order to complete the fleet of seven specialized carriers which will transport the LNG to Japan. No further expansion plans were announced, although the addition of more capacity may be a possibility in the future.[9]

**Petroleum.**—Production is scheduled to be expanded at Shell Oil Co.'s offshore Southwest Ampa Field in 1975 with the addition of two new platforms housing nine 30,000-barrel-per-day production units. Onshore storage is to be doubled to 3 million barrels by the construction of three 470,000-barrel tanks, scheduled to be completed in early 1975.[10]

No new oil or gasfields were discovered in 1974, and there was a slackening in exploration activity. Shell, the only producer, limited its drilling activity to development wells. Two consortiums—one consisting of Sun Oil Co., Clark Oil Co., and Superior Oil Co. and the other including Ashland Oil, Woods Petroleum Corp., and Pennzoil International—have been conducting exploration programs both offshore and onshore but so far without success.

Plans for a new oil refinery at Lumut remained in the discussion state, and no start was made on construction.

## HONG KONG [11]

Hong Kong lives by trade, and its economy was therefore highly vulnerable to adverse economic currents which swept the world in 1974. Declining orders from its industrialized customers and inflated costs for its raw materials, fuels, and consumption imports tested the ability of the local business community to adapt to and survive in an unfavorable environment. Some enterprises failed the test, but the colony's economy as a whole emerged intact and in a relatively good position to take advantage of any improved opportunities that 1975 might bring.

[7] Hong Kong and Shanghai Banking Corp. The Chairman's International Survey for the Year 1974. Far Eastern Economic Review, v. 88, No. 18, May 2, 1975, p. 47.

[9] Work cited in footnote 7.
[10] Petroleum Economist. News in Brief. V. 41, No. 5, May 1974, p. 195.
[11] Prepared by David G. Willard.

A decline in the volume of exports and a slight widening of the unfavorable balance of trade were the principal causes of Hong Kong's economic distress. Behind the drop in exports lay economic recessions in industrialized nations, triggered by the previous yearend's petroleum shortage and high oil prices. The same cause held the number of tourists visiting Hong Kong to the 1973 level, in contrast to a 17% average per year growth rate in the previous decade. Prices for most primary products increased in excess of those for manufactured goods, causing the unfavorable shift in the trade balance. The outcome for Hong Kong was zero growth in the gross domestic product (GDP), an increase in unemployment and underemployment, a deficit government budget, and declining construction activity.

In Hong Kong's basically free enterprise economic environment, a large share of the impact fell upon labor with the result that pressure for wage increases was sharply reduced from that in previous years. That factor and the success of entrepreneurs in lowering other costs brought a drop in the rate of inflation later in the year, leaving Hong Kong in a good competitive position to take advantage of any recovery in world markets in 1975.[12]

The small mining industry was unaffected as a whole by the economic slump, but its sectors fared variously. Production of iron ore and feldspar were both up while kaolin and quartz output fell. Cement production increased, mostly as the result of projects began the year before.

The metals processing industry also experienced the general economic slump. A net decline of 31 brought the number of companies in the industry down to 211 in 1974 from 242 in 1973. Employment fell by 5% to an average of 2,892 from 3,058 the year before. The situation would have been worse had not higher costs of imported products allowed the local industry to capture a greater share of the Hong Kong market.[13]

Fortunately for Hong Kong, the governmental machinery setup to deal with the petroleum crisis went largely unused. Controls on the distribution of oil were never put into effect, and the only restriction that occurred was a curfew on advertising lights. Chief among the factors bringing about this outcome was the willingness of the People's Republic of China to provide petroleum, for which the Hong Kong Government set aside land for construction of storage facilities. Other factors included government measures to discourage private car use (more for reasons of congestion than fuel conservation), a cutback in electric power reserves and publicity efforts. The historic trends of increasing petroleum imports and conversion from coal to oil continued, although at reduced rates.[14]

Budget deficits forced the Government to delay portions of its public works programs during the year, but below average rainfall gave further impetus to the three major water supply projects. Since Hong Kong has no rivers of consequence, all water supplies must currently be obtained from stored runoff until the desalination project is completed. All civil engineering work was completed in connection with raising the dams on Plover Cove reservoir, and construction continued on appurtenant facilities. The dry summer enabled good progress to be made on construction of dams for the High Island complex. Delays in the manufacture in Japan of equipment for the Castle Peak desalting plant, caused by the fuel crisis, forced a rescheduling of completion dates for that project.[15] Looking further into the future, the Government completed feasibility studies for a second desalter, and the possibility of a nuclear powerplant was under discussion.[16]

The Government, in its effort to reduce projected budget deficits, proposed a tax revision package as part of its 1975–76 budget. Included were a 1-year increase in the company profits tax from 15% to 16.5%, a dividend-withholding tax (to take effect in the 1976–77 fiscal year), and higher property tax rates.[17] Another legislative proposal was a labor relations bill containing a provision which allows the Governor to halt a strike by declaring a cooling-off period.[18]

Trade negotiations with the United States and the European Economic Community (EEC) failed to provide any hope

for immediate improvement in Hong Kong's market situation. The U.S. Government excluded Hong Kong from its list of developing countries to be granted concessions on exports to the United States under the generalized system of preferences which is to come into effect late in 1975. Hong Kong remained off the list due to its industrial capability, but many of its competitors were included on the list.[19] The EEC offered only minor adjustments in its generalized system of preferences (in which Hong Kong is included) because of the currently depressed economic condition of many EEC members.[20]

## PRODUCTON AND TRADE

Mineral production trends in Hong Kong were mixed in 1975, and the net outcome was not greatly changed from that in 1974. Prices of Hong Kong's commodities increased only slightly in contrast to the inflationary price rises of many world minerals. Mining remained a minor contributor to Hong Kong's GDP.

Output of iron ore was up during the year, and feldspar production also increased. Lower output levels were recorded for both kaolin and quartz. Production of cement continued on an uptrend despite a reduction in Hong Kong's overall level of construction activity. Total value of Hong Kong's mineral output, excluding cement, remained at $1.3 million in 1974, unchanged from 1973 output.

Hong Kong's trade mirrored the colony's economic fluctuations during 1974. Exports and imports both rose sharply in value but declined in volume. Exports gained 18% in value to $4.5 billion but fell off 7% in volume, while import value, at $6.8 billion, was up 18%, but import volume declined 4%. Reexports fared worse than domestic exports, growing only 9% in value to $1.4 billion, far below the 57% increase in 1973, causing many to be concerned about the future of Hong Kong's entrepôt trade. The colony's terms of trade worsened slightly as export coverage of imports fell to 88% from 90% in 1973, but the trend appeared to be improving by yearend 1974.

Mineral trade exerted a negative influence on Hong Kong's economy during the year, since a major part of the rise in imports was caused by higher petroleum prices. Increases also occurred in the costs of other mineral imports but were of less overall importance. Earnings from mineral exports are too small to have a significant effect on the economy.[21]

Hong Kong's mineral trade in 1972 and 1973 is given in tables 3 and 4.

### COMMODITY REVIEW

**Metals.**—*Iron Ore.*—The Ma On Shan mine increased its production of iron ore by 6% to 159,737 tons in 1974 from 150,713 tons in 1973, despite a continued recession in the iron and steel industry of Japan which consumes most of the mine's output.

**Nonmetals.**—*Stone, Sand, and Gravel.*—The rate of private and public construction in Hong Kong, despite a partial downturn in 1974, has begun to outstrip local supplies of mineral construction materials. Quarries in Hong Kong have been expanded, and it has been necessary to import supplies from nearby Macao. Three large granite quarries, operated by Hong Kong companies, have recently been opened on Macao to meet the requirements in Hong Kong.[22]

**Mineral Fuels.**—*Petroleum.*—Two competing proposals to build a large oil refinery in Hong Kong (from Shell Oil Co. and the combine of the Textile Alliance/TOA Oil Co., Ltd., the latter proposal including a petrochemical plant) remained under consideration by the Government during the year, but no decisions were announced. The oil shortage and subsequent recession undoubtedly were responsible for delaying these projects.[23]

## KHMER REPUBLIC [24]

Mineral production in the Khmer Republic in 1974 was probably confined to cement, gem stones, gold, phosphate rock, salt, silica sand, and simple nonmetal construction materials, although no data were officially reported.

Possible exploitable mineral occurrences of copper, iron ore, lead and zinc, manganese, and molybdenum are known; however, no attempt has been made to delineate their commercial importance, owing to the uncertain economic and political conditions that have existed in the country for the past several years.

In order to restore balance to the economy, the country's Minister of Finance, Plan, and Economy announced on September 15, 1974, a program of economic measures designed to rectify certain current severe price distortions. Three of the measures would affect mineral-related commodities and were as follows: (1) The raising of prices on petroleum refinery products to bring about reduced consumption of high dollar cost gasoline, kerosine, gas oil, diesel oil, and fuel oil; (2) the continued prohibition on the export of brass; and (3) the decontrol of the sale and transport of gold and articles made of gold throughout the country.

A new powerplant went onstream in July 1974 to relieve the electricity shortage in the capital city of Phnom Penh. The Pet Lauk Sangh powerplant, with a generating capacity of 8,400 kilowatts, will supplement the Chak Angre powerplant capacity of 10,500 kilowatts.

The oil refinery at Kompong Som has been inoperative since mid-1971, and remained so in 1974. Imports of petroleum refinery products (distillate and residual fuel oil, gasoline, jet fuel and kerosine) from Singapore and Thailand for the first half of 1974 were approximately 1.2 million barrels.

Plans were made in 1974 by the Khmer Republic to install a second offshore oil drilling rig, but further developments were not known at yearend.

## LAOS [25]

In April 1974, a Provisional Government of National Union (PGNU or RGL) was formed in Laos to solidify the country and hopefully bring about peaceful reconstruction and development measures to stabilize the country's war-torn economy. However, for both domestic and external economic reasons, efforts of the new coalition government to stabilize the economy during the year were not very successful. The budget deficit rose 42% and consumer prices advanced 47% during the year. In addition, the world economic situation in 1974 further aggravated the economic problems of

[25] Prepared by Arthur C. Meisinger.

the country, as did the decline in foreign exchange availabilities. Despite all this, some progress was made in developing the country's small mineral resource base. Mineral production was reported for tin (the major mineral commodity), rock salt, and coal in 1974; investigations of possibly exploitable resources of potash and iron ore were initiated with foreign assistance; and gold reexports increased substantially for the second straight year.

## COMMODITY REVIEW

**Metals.**—Gold reexports from Saigon and Bangkok through Vientiane to Europe continued to respond sharply to higher price levels and profit margins. The quantity exchanged in 1974 was 1,144,810 troy ounces compared with 648,595 troy ounces in 1973.

Investigations of two iron ore deposits in Xieng Khowang Province continued with Japanese assistance in 1974.

The mining of tin from the Phon Tou and Nong Sun mines continued in 1974. Tin metal content of the ore produced was 585 tons compared with 550 long tons in 1973.

Resumption of tin mining in the Boneng District was reported, but no details were available at yearend. Also reported during the year was an interest shown by Mitsubishi Mining & Smelting Co., Ltd., Japan, in setting up a tin smelter in Laos.

**Nonmetals.**—Salt produced from brine operations near Vientiane in 1974 was reported to be 1,000 tons more than the 8,600 tons produced in 1973.

The Laotian Government initiated a drilling program to prospect for potash deposits. The project will consist of drilling five holes over a 10,000-square-kilometer (3,860 square mile) area, north-northeast of Vientiane. Intensive prospecting for potash will also be conducted across the border in Thailand.

**Mineral Fuels.**—Mining of coal was initiated by the State Express Company of Laos (Chinese-owned) from deposits north of Vientiane, near the town of Vang Vieng. The deposits were located by the Laotian Government in 1964. Reported production in 1974 was 800 tons.[26]

| Bitumen and bituminous mixtures, n.e.s., do | 3 | 3 | United States 2; Thailand 1. |
| Unspecified, do | (1) | (1) | Mainly from Singapore. |
| Total, do | 1,293 | 1,359 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | 228 | 10 | United Kingdom 8; Thailand 2. |

[1] Less than ½ unit.

## MONGOLIA [27]

Mongolia reportedly continued to achieve progress in 1974 toward modernizing various sectors of its mining industry. Under the country's fifth 5-year plan, (1971–75) for development of the national economy, particular emphasis in 1974 was placed on increased output of ores (30%), building construction materials (10%), and electrical energy (50%). Currently, enterprises which have been built or reconstructed with Soviet aid turn out 35% of Mongolia's gross industrial output, 90% of the electrical energy, and 85% of the coal. More than 30% of Soviet economic aid received by the country during 1971–75 has been used in developing industry,

[27] Prepared by Arthur C. Meisinger.

particularly in modernizing and expanding mining enterprises.

Exploration for mineral deposits was stepped up during the year and as a result new areas of copper, tungsten, and molybdenum mineralization were discovered in the country. One of the more significant discoveries was a reportedly large deposit of phosphorite in the Hobsogol Lake Basin, northern Mongolia. According to preliminary assessments, the deposit is second in size only to the Soviet Union's Karatau phosphorite deposit.

No official Mongolian trade data are available. However, because at least 85% of the country's total trade is with the U.S.S.R., officially recorded Soviet trade statistics are believed to be highly indicative of Mongolian mineral commodity trade. Mineral commodities imported by Mongolia from the U.S.S.R. in 1974 included coal and coke, crude petroleum and petroleum products, iron and steel products, ferrous and nonferrous metals, and refractory materials. Mongolian mineral commodity exports to the U.S.S.R. included a small quantity (53 tons) of tungsten concentrates and raw material not specified, ferrous metal scrap, cement, and a significant tonnage of metallurgical grade fluorspar.

Mineral commodities produced by Mongolia in 1974 (table 1) included coal, construction materials, cement, fluorspar, tungsten, salt, and crude petroleum and petroleum refinery products.

Coal output, which accounts for about 60% of Mongolia's annual mineral production by value, continued to show improvement in 1974. During the first 4 years of the current 5-year plan (1971–75), coal output has reportedly been increased by 1.2 times, and overall production capacity of the 14 operating coal mines in 1974 was reported to be 2.42 million tons. About three-fourths of the coal mined annually is by open pit methods. Productive capacity of the Sharyn Gol surface mine was increased in 1974 from 1.4 million to 2.1 million tons, and plans to further increase coal output to 2.5 million tons in 1975 were initiated during the year.

Imported crude oil from the U.S.S.R. in 1974 continued to supply Mongolia's small refinery at Dzuun Bayan. Total imports of crude oil and petroleum products from the U.S.S.R. increased from 323,000 tons in 1973 to 347,000 tons in 1974.

In February 1973, the Governments of Mongolia and the U.S.S.R. agreed to a joint development of the large copper-molybdenum deposit discovered in 1972 in the Erdenet Mountain area of Mongolia. Development plans were continued in 1974 to include construction in 1975 of a smelter-concentrator complex and the beginning of mine development by 1976.

With the help of Soviet aid, the Berhin fluorite mine was expanded in order to double production capacity. Estimated production of fluorspar in 1974 was 240,000 tons, the same as in 1973. All of the fluorspar produced by Mongolia is shipped to the U.S.S.R., and the quantity exported in 1974 was approximately 249,000 tons compared with 239,000 tons in 1973.

## NEPAL [28]

The contribution of the mineral industries to the Nepal gross national product (GNP) was small. Government expenditures for industry and mining were estimated to have been $8.3 million in 1974.

United Nations Development Program (UNDP) technical experts arrived in Nepal to begin a $1.7 million exploration project. The Government of Nepal is contributing $800,000 of the overall cost. The project was planned to run 3 years and be staffed mainly by Nepalese technicians.

Nepal's first cement plant, scheduled to begin operation in 1974, has experienced more delay and was now expected to commence production early in 1975. The Nepal Bureau of Mines began preparation of a report on the feasibility of a second cement plant to be located in Bhainse-Hetauda which is to have a 200,000-ton per year capacity. In 1974, Nepal's requirements for cement were estimated to be 200,000 tons per year. Imports from the People's Republic of China, India, and the Republic of Korea were expected to make up the bulk of the requirements. Many construction projects in 1973–74 were delayed due to shortages of imported cement.

Limestone deposits of about 5 million tons were discovered at Bhainse-Hetauda. The Nepal Bureau of Mines expected to find additional deposits near Okhare.

[28] Prepared by Stanley K. Haines.

A two-phased feasibility study of a small-scale iron and steel plant with an estimated capacity of 50,000 to 80,000 tons per year was begun. The first phase was expected to be completed early in 1975. The capacity estimates were based on the following iron ore deposits: 10 million tons at Phulchoki and Katmandu; 8 milllion tons at Those in the Janakpur zone; 1 million tons at Labdi in the Gandaki zone; and about 1 million tons at Jirbang in the Narayani zone.

## SINGAPORE [29]

Singapore achieved a 25.1% rate of economic growth, with the GNP in 1974 reaching an estimated $5.273 billion[30] (or S$12.66 billion) in current prices. Even discounting inflation of 22%, the increase of GNP in constant dollars was 6.8% over that of 1973 as compared with 11% a year earlier. These achievements were made despite worldwide unstable monetary conditions, commodity shortages, and the oil crisis. Personal savings increased $227 million, elevating gross national savings to $1,275 million at yearend 1974. New local and foreign investments were still substantial, with manufacturing, including oil and related ventures, and shipping and services leading the way. Generally, the Singapore Government welcomes foreign investment and provides fiscal incentives and active assistance to industries of particular interest. Investment commitments in manufacturing, however, fell by 13% in 1974 to $345 million. Construction was up 36% to $400 million, or about a 16% real gain over that of 1973. Inflationary pressures eased early in 1975.

Manufacturing which encompasses mineral-related fields like petroleum refining, metal fabrication, cement, and chemicals gained ground as the leading components of the GNP. Manufacturing output, measured in terms of value added, increased to $1,267 million as compared with $957 million in 1973; there was a real gain of 2.2% despite the world recession, and this was important in sustaining high-level employment. Approximately 20% of the value added in manufacturing in 1974 was attributed to petroleum refining and nearly half of the manufactured products were exported. Most manufacturing industries were in a depressed condition, including the electronics, textiles, garments, food, leather, paper, and wood products industries.

However, the oil refining, oil rig construction, and industries related to ships were doing well to account for the overall gain. The shipbuilding and repair industry increased its turnover by 40% to $290 million, remembering that Singapore is the world's fourth largest port. Many shipyards had orders on hand for several years. Singapore supports the oil exploration activities of all of Southeast Asia, and its expanding oil rig construction industry became the third largest in the world.

Petroleum activities occupied a special role in the economy. Singapore continued to supply large quantities of fuel oil for bunkering international ships and considerable jet fuel for servicing airplanes. Overall oil imports were approximately 27 million tons valued at about S$4.90 billion ($2.04 billion) during 1974, including 23 million tons (or about 168 million barrels) of crude oil valued at S$3.93 billion ($1.63 billion). Crude oil imports in 1974 were about the same as in 1973 in tonnage, but the value increased more than 2.5 times. Only a small part of the imported petroleum was consumed internally. Five refineries were in existence, and four of these recently underwent expansion. Singapore's daily oil refining capacity was brought up to more than 1 million barrels at yearend 1974. The United States is the largest foreign investor in Singapore, and half of U.S. investments of possibly $650 million was in petroleum refining and another 15% in other areas of the oil enterprise. Singapore was very important as a support base for oil exploration and production in nearby countries, particularly Indonesia.

During the oil crisis and its aftermath, Singapore was very concerned about the economic well-being of various industrialized countries, particularly Japan and the United States because difficult times in these countries could sharply reduce their new investments in the small republic. Industries dependent upon export sales were adversely affected whereas industries supplying domestic markets fared well. Since

[29] Prepared by K. P. Wang, supervisory physical scientist, Division of Nonmetallic Minerals.

[30] Where necessary, 1974 values have been converted from Singapore dollars (S$) to U.S. dollars at the rate of S$2.46=US$1.00. In 1973, the average exchange rate was about S$2.49=US$1.00.

Singapore has a large oil refining capacity, it does not fear inadequate liquid fuel supplies for the local economy. Nevertheless, the Government, through raising oil and products taxes and urging voluntary restraint, brought down fuel consumption by 10% to 15% during 1974. Bunkering demands were generally met. Inflation was nearly brought under control around year-end 1974. While not being able to compensate for the much higher fuel rates, expanding oil exploration activities in Southeast Asia benefited Singapore greatly.

Alongside the progress in industry, trade, and tourism, Singapore also made headway towards becoming a major international financial center through development of its Asian dollar market, gold market, and secondary money market. Plans were underway to create a gold exchange, involving both spot and future contracts based upon certificates of gold deposits issued by authorized banks, on similar lines as the Winnepeg exchange.

## PRODUCTION

Singapore's output of refined petroleum products was of some importance by world standards, with residual fuel oil leading the way, followed by distillate fuel oil, gasoline, jet fuel, and kerosine, in that order. Crude oil processed in 1974 was approximately 170 million barrels, slightly higher than in 1973. In addition, significant quantities of semiprocessed oil were also refined. Ingot steel production surpassed 200,000 tons by a sizable margin. Construction continued at high levels, and this held up cement output at more than 1 million tons for the 4th year in a row. Cement imports reached approximately 1.2 million tons in 1974, with Japan and the Republic of Korea as the leading suppliers, followed by the Philippines and Thailand. Singapore produced 1.8 million cubic meters of granite in 1974. The country's mineral production statistics are shown in table 1.

## TRADE

Singapore's total foreign trade increased to $14.40 billion in 1974, as compared with $8.60 billion in 1973 when the U.S. dollar was worth slightly more. Exports (f.o.b.) increased 58.9% to $5.90 billion and imports (c.i.f.) increased 63.1% to $8.50 billion. The trade deficit was more than offset by income from services such as tourism, banking, insurance, shipping, and capital inflow from abroad. In fact, a net balance-of-payments surplus of $295 million was registered in 1974. The above figures do not include trade with Indonesia. Generally, trade with developing countries in Asia was more promising than trade with industrialized countries, because of basic activities related to building up infrastructure and new industries. Although much of the increases in both imports and exports can be attributed to much increased petroleum prices and worldwide inflation, Singapore's actual volume of cargo handled declined by only 1.5%, attaining 60.4 million freight tons. Entrepôt trade continued to represent the lifeblood of Singapore's economy.

During 1974, Singapore imported nearly 200 million barrels of oil. Approximately 84% of the imports was high-sulfur crude oil, mainly from Kuwait, Saudi Arabia, and Iran; about 13% was fuel oil; and the remainder was various other refined petroleum products. In 1973, total oil imports exceeded 220 million barrels; yet the value added up to less than one-third of the 1974 oil import value. Thus, Singapore suffered the fate of steep rises in oil prices. After Singapore refines the crude, most of the locally produced refined products plus the imported refined products are then exported or sold for bunkering. In recent years, Singapore's petroleum exports corresponded to about 75% to 80% of the petroleum imports in value. The importance of this small country as a petroleum distribution center is self-evident.

Singapore's imports of iron and steel products were worth S$556 million ($223 million) in 1973 and S$1,235 million ($515 million) in 1974. During 1974, steel exports were equivalent to about 20% of the steel imports in value and 28% in tonnage. Singapore's cement clinker imports were valued at S$80 million in 1974 and S$42 million in 1973. Imports of copper and aluminum products were somewhat lower in value than cement.

## Table 7.—Singapore: Exports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 400 | 320 | All to Malaysia. |

| Slag, dross and similar waste, not metal bearing | 11 | 20 | Malaysia 12. |
| Oxides and hydroxides of magnesium, strontium, barium | 2 | 1 | All to Malaysia. |
| Bromine, iodine, fluorine value | r $6,700 | $33,882 | South Vietnam $25,685. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | 10,221 | 8,965 | Malaysia 7,119. |
| **MINERAL FUELS AND RELATED MATERIALS** | | | |
| Asphalt and bitumen, natural | 32 | 1 | All Malaysia. |
| Carbon black | 1,087 | 1,849 | Malaysia 1,147; Taiwan 680. |
| Coal, all grades, including briquets | 342 | 284 | Burma 127. |
| Coke | 1,486 | 2,270 | Malaysia 2,254. |

See footnotes at end of table.

## Table 7.—Singapore: Exports of mineral commodities—Continued
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS—Continued | | | |
| Hydrogen, helium and rare gases value | r $1,544 | $671,051 | Malaysia $460,663; Brunei $88,506. |
| Petroleum: | | | |
| Crude and partly refined 42-gallon barrels | 465,155 | 129,276 | All to Japan. |
| Refinery products: [3] | | | |
| Gasoline: | | | |
| Aviation thousand 42-gallon barrels | 2,650 | 1,946 | South Vietnam 1,446. |
| Motor do | 15,454 | 17,959 | Japan 9,083; Republic of Vietnam 3,919. |
| Kerosine and jet fuel do | 26,790 | 24,065 | United States 5,665; Japan 3,703; Hong Kong 3,438. |
| Distillate fuel oil do | 22,026 | 23,945 | South Vietnam 6,772; Hong Kong 3,914; Thailand 3,059. |
| Residual fuel oil do | 48,574 | 46,993 | Japan 17,198; Hong Kong 12,147; Australia 8,152. |
| Lubricants do | 928 | 1,542 | Mainly to Malaysia. |
| Mineral jelly and wax do | 190 | 397 | Thailand 42; Taiwan 41; Philippines 40. |
| Other: | | | |
| Nonlubricating oils, n.e.s. do | r 19 | 44 | Mainly to Malaysia. |
| Pitch and petroleum coke do | 3 | 4 | Malaysia 3; Burma 1. |
| Bitumen and bituminous mixtures, n.e.s do | 1,076 | 1,283 | Australia 422; South Vietnam 252; Bangladesh 250. |
| Other do | 4,378 | 5,052 | Thailand 3,340; Hong Kong 771. |
| Total do | r 122,088 | 123,230 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons | [4] 255 | 730 | Japan 196; United States 179; Malaysia 121. |

r Revised.
[1] Excluded from this total are hand polishing stones valued at $73,313 for 1972.
[2] Excluded from this total are bricks of baked clay valued at $22,684 for 1972.
[3] In addition to the products listed, liquefied petroleum gas valued at $12,672,425 in 1972 was reported.
[4] Excluded from this total are benzol and creosote oil.

## Table 8.—Singapore: Imports of mineral commodities
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 1,153 | 301 | People's Republic of China 300. |
| Oxide and hydroxide | 7,451 | 9,755 | Japan 5,853; People's Republic of China 3,300. |
| Metal including alloys, all forms | 10,901 | 14,635 | Japan 3,558; United States 2,209. |
| Chromium oxide and hydroxide | 49 | 78 | West Germany 38; United Kingdom 14. |
| Cobalt oxide and hydroxide | (1) | (1) | Mainly from France and Monaco. |
| Copper: | | | |
| Ore and concentrate | 255 | -- | |
| Metal including alloys, all forms | r 7,448 | 8,749 | Australia 3,330; Japan 2,956; United States 829. |
| Gold bullion troy ounces | 26,638 | -- | |
| Iron and steel: | | | |
| Ore and concentrate | 2,952 | 50,517 | Brazil 40,640; Australia 9,685. |
| Metal: | | | |
| Scrap | 106,354 | 61,591 | Australia 39,030; United States 15,282. |
| Pig iron including cast iron | 32,470 | 31,713 | India 18,159; People's Republic of China 5,724. |
| Sponge iron, powder and shot | 252 | 186 | Japan 92; United Kingdom 29; India 25. |
| Ferroalloys: | | | |
| Ferromanganese | 1,070 | 2,900 | Japan 1,603; India 1,110. |
| Other | 453 | 3,090 | Japan 2,709. |
| Steel, primary forms | 17,390 | 39,931 | Japan 18,671; North Korea 9,690. |

See footnotes at end of table.

Table 8.—Singapore: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS—Continued | | | |
| Total ----- thousand 42-gallon barrels -- | r 50,200 | 48,728 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals ----- | r 5329 | 449 | Malaysia 416; Thailand 14. |

r Revised.
[1] Less than ½ unit.
[2] Excluded from this total are hand polished stone valued at $122,728 for 1972.
[3] Excluded from this total are bricks of baked clay valued at $858,105 and imported in 1972 from West Malaysia.
[4] In addition to the products listed, liquefied petroleum gas valued at $40,967 in 1972 was imported.
[5] Creosote oil is excluded from this total.

## COMMODITY REVIEW

**Metals.**—*Iron and Steel.*—Singapore's steel imports were 1,429,000 tons in 1974, valued at about $515 million. This meant a 37% gain in tonnage and 131% gain in value. Steel ingot (derived from scrap) and reinforcing bar production both established records in 1974, and output of rolled semimanufactures may have topped 350,000 tons. Exports were nominal, as usual. Japan has been by far the leading supplier of steel products to Singapore, furnishing 603,000 tons in 1972, 774,000 tons in 1973, and 1,043,000 tons in 1974. About two-thirds of the steel imports from Japan consisted of shapes, plates, pipes, and tubing.

Singapore has only two steel producers of any consequence. The National Iron & Steel Mills, Ltd. (NISM), with a plant at Jurong has electric furnaces, merchant bar mills, and a wire rod mill which turn out more than 200,000 tons of steel products annually. The second and lesser producer is the Malaysia Iron & Steel Mills, Ltd. NISM and the Japanese trading firm Mitsui & Co., Ltd. are in a joint venture called the Eastern Wire Manufacturing Co.

Various ideas for building large steel plants in Singapore or nearby have been aired in recent years. Mitsui & Co. believed a steel plant producing up to 500,000 tons of plates may be economically viable and organized a Japanese steelmakers mission to visit Singapore to study the possibilities. Meanwhile, the Singapore Economic Development Board was urging a much larger integrated plant. Prime Minister Lee suggested that a multinational joint-venture, integrated steel plant might be built in Indonesia. Although Singapore's requirements are rapidly expanding, nothing specific on steel-plant construction developed in 1974, probably because of the worldwide economic difficulties.

**Nonmetals.**—*Cement.*—Singapore's three cement plants were operating at nearly full capacity in 1974. All are really grinding operations, relying totally on imports of clinker. In 1974, Singapore's imports of such clinker was 1,041,352 tons and in 1973, 1,020,721 tons. During 1972–74, the Asia Cement (Malaysia), Ltd., plant at Jurong produced about 42% of Singapore's total cement; the Singapore Cement Manufacturing Co., Ltd., plant, 32%; and the Pan Malaysia Cement Works Ltd. plant at Jurong 26%. Singapore also imported finished cement, about 145,000 tons in 1974 and 160,000 tons in 1973. Singapore's cement consumption can be estimated on the basis of these figures. Output of finished cement was 1,028,000 tons in 1973, not too different from that in 1974. Value added on Singapore's cement output was S$26.3 million in 1974 and S$22.7 million in 1973, which constitutes no real gain.

**Mineral Fuels.**—*Petroleum.*—Singapore's program to sharply expand oil refining capacity reached a pause stage at yearend 1974 after attaining the daily level of just over a million barrels throughput. Further expansion based upon exports became uncertain because of the dislocations brought about by the cessation of the Vietnam war, vastly increased oil prices, Japan's idle capacity created by prolonged recession and hence reluctance to import large quantities of refined oil from Singapore, and competition from other areas in Asia where refineries can be built. It became evident that little additional U.S. investment in Singapore's refineries would be forthcoming for the immediate years ahead even though there may be justification to build low-sulfur (i.e. to process Indonesian crude) or "sweet" oil refineries in Singa-

pore's bunkering and entrepôt trade clearly should continue to grow and local industrial demand for petroleum should also increase.

Singapore not only has the world's third largest refinery complex but is also significant in many other aspects of the oil business. Shipping is so heavy that the Singapore Parliament deliberated on a Civil Liability (Oil Pollution) Act. A floating oil storage terminal was completed around the beginning of 1974 for a consortium of five U.S. oil firms. Gardner-Denver Co. of Dallas recently convened a conference at the U.S. Trade Center in Singapore to promote the sale of oil exploration and drilling equipment. Singapore has become an oil logistics center in the Pacific, and various kinds of seafaring oil exploration and development barges and equipment are built, assembled, and serviced here.[31] Many international oil companies working in Southeast Asia have established headquarters in the small country.

Shell Eastern Petroleum Ltd., expanded its refinery on Pulau Bukum to 530,000 barrels per day near yearend 1974, making this operation the second largest refinery in the world. The Government of Singapore was still seriously considering construction of a large joint-venture petrochemical complex on Pulau Ayer Merbau off Jurong which might utilize naphtha from the Shell refinery. A 50–50 partnership with Sumitomo Chemical Co., Ltd. was thought to be firm until the Japanese company requested deferral of startup date from 1979 to 1985 on grounds of overcapacity in the Japanese home market. The latest word was that the Singapore Government was putting out feelers, to invite an Arab investment of 25% while asking for a $270 million Japanese loan.

Two wholly U.S.-owned refineries, Esso Singapore Pte. Ltd. and Mobil Oil Singapore Pte. Ltd. completed expansion programs during the year. Esso's refinery on Pulau Ayer is rated at 231,000 barrels per day and Mobil's refinery in the Jurong Industrial Estate at 175,000 barrels per day. Within the confines of Singapore Petroleum Co. Pte. Ltd.'s 65,000-barrel-per-day refinery on Pulau Merlimau (near Esso's refinery) Singapore Petroleum, in a joint venture with the Far East Oxygen (Singapore) Pte. Ltd., completed a 30-ton-per-day carbon dioxide plant (expandable to 200 tons). The fifth refinery is small and land space limitations prevent it from being expanded.

## SRI LANKA [32]

Mineral production in Sri Lanka showed mixed results for various commodities. Gem stone production decreased 13% in value from $15.8 million in 1973 to $13.8 million in 1974. Production decreases were also reported for ilmenite, mica, massive quartz, common salt, and zircon. Commodities showing increases in production were hydraulic cement, feldspar, graphite, limestone, and rutile.

The beneficial effect of the amnesty period for any illegal earnings from gem stones and the exemption from certain taxes for sales to overseas buyers and tourists continued. A side effect was a "gem rush" to open new mines and take advantage of the situation. The State Gem Corporation retail outlets do not monopolize the gem trade but acted overall to increase the quality of the offerings. Instruction and training in modern techniques to produce precision cut gem stones was begun. The primary gem stones mined are sapphires, rubies, aquamarine, and topaz.

Graphite production increased 52% from 1973 to 9,447 tons in 1974. U.S. imports of Sri Lankan graphite were 2,328 tons, down 10% from 2,578 tons in 1973. In 1974 the United States lost to Japan its traditional position as Sri Lanka's best customer for graphite.[33]

Preliminary arrangements were completed to start work on another new mine at Ragedra in the Dodangaslanda District. A pilot plant was established in collaboration with the Ceylon Institute of Scientific and Industrial Research to beneficiate lower grades of graphite. Work was well underway on a flotation plant for the upgrading of graphite. Investigations also continued to set up a plant for the manufacture of semicolloidal graphite in collaboration with the Ceylon Petroleum

[31] Far Eastern Economic Review (Hong Kong). Oil Logistics—Other Countries' Woes Are Singapore's Gain. Aug. 15, 1975, pp. 15–18.

[33] U.S. Embassy, Colombo, Sri Lanka. State Department Airgram A-43, Feb. 28, 1975.

Corporation and the Joseph Dixon Crucible Corporation. Primary markets would be in India and southeast Asia.[34]

The setting up of the State Graphite Corporation in 1972 has revitalized this industry.

The Sri Lanka Geological Survey Department completed a reserve estimate of the black sand body at Pulmoddai on the northeast coast. Exposed at near low tide is a high-grade deposit of 3.3 million tons of heavy mineral sand, 4½ miles long, 300 feet wide and 8 feet deep. Ilmenite accounts for 70% to 75% of this quantity; rutile for 10% to 12%; zircon 8% to 10%; and monazite for 0.4%. The ilmenite is under long-term contract to Japanese interests. Most of the 3,003 tons of rutile exported went to Europe. Technical difficulties at the China Bay plant were limiting the rutile and zircon output. Ilmenite production decreased from 90,551 tons in 1973 to 78,556 tons in 1974.[35]

The Sri Lanka Mineral Sands Corporation announced an expansion at the separation plant from 83,000 to 140,000 tons per year. Completion is scheduled for 1980.

The Sri Lanka Geological Department announced in 1974 the discovery of an estimated 25 million tons of recoverable phosphate rock near Eppawala in the North Central province. Production was reported to have started with an estimated 49,210 tons produced in 1974. The building of a phosphate fertilizer plant would relieve a major strain on the Sri Lanka trade balance.[36]

Sri Lanka's iron ore deposits are of two types—surface lateritic ore and banded ironstone. The lateritic deposits are located in the southwestern sector of the island and are estimated to contain 2 million to 3 million tons of easily accessible ore. Banded ironstone deposits are estimated at 5 million to 6 million tons.[37]

The petroleum industry was dependent on imports for all crude oil. Refinery input in 1974 was reported at 1,523,874 tons. Legislation was introduced in the Sri Lanka National Assembly to open doors to foreign investment. This legislation would permit foreign investment and participation in oil and gas exploration and development and expansion of the country's refining and petrochemicals industries.[38]

Ceylon Petroleum Corp. announced the expansion of its refinery at Sapugaskana to 55,300 barrels per day total capacity. The Government approved the construction of a new 100,000-barrel-per-day refinery at Trincomalee on the northeast coast.[39]

A urea fertilizer plant, using naphtha from the petroleum refinery at Sapugaskana, has been approved. The $110 million project has Kuwait and Iranian financing as well as commitments from the Asian Development Bank, West Germany, and India.[40]

McCallum Breweries (Ceylon) Ltd. has government approval to build a sodium silicate plant using local high-grade silica sand. No other details are available at this time.

## NORTH VIETNAM [41]

Economic and industrial rehabilitation continued to show progress in North Vietnam during 1974. Most of the infrastructural facilities damaged by bombing in 1972 and 1973 were reported to have started operating normally. Reliance on imports as well as foreign aid, continued to be a major item in 1974. The main economic targets for the country in 1974 were a 42% increase in industrial production and a 21% increase in the GNP compared with 1965 (prewar record year), industrial production and GNP.

Although data on total output of the country's mineral industry have not been reported in recent years, coal, iron ore, phosphate rock, zinc, tin, salt, cement, and a variety of nonmetallic construction materials were produced in 1974, according to various sources.

### COMMODITY REVIEW

**Metals.**—The Thai Nguyen Iron and Steel Works, North Vietnam's major steel plant, was reported to be fully operational. Construction of a steel rolling mill at Gia Sang was near completion with East German aid, and a steel laminating plant was reported to be about 65% constructed in Bac Thai Province.

The country's small zinc refinery at Quang Yen reportedly resumed operations

[41] Prepared by Arthur C. Meisinger.

on ore supplied by the Cho Dien mine in 1974. Tin was also produced during the year from the Cao Bang mine near the Chinese border.

Exports of large quantities of American scrap metal, mostly copper, to Hong Kong were reported in 1974. The ordinance scrap, collected from South Vietnam battle areas now under control of the North Vietnamese, was shipped from the Port of Dong Ha.

**Nonmetals.**—Work was completed on rehabilitation of 14 small cement plants located throughout the country. Expected production was 100,000 tons of cement in 1974 compared with only 23,000 tons reported for the 14 plants in 1973. Plans were made to construct seven additional plants during the year.

The quantity of cement produced from the country's largest cement plant at Haiphong was reportedly 320,000 tons in 1974.

Construction was started on the Dong Vinh cement plant in Thanh Hoa Province. Planned capacity of the plant was reported to be 10,000 tons per year.

An industrial complex, near Diem Son, for the production of construction materials was under study in 1974. The complex will reportedly include a cement plant capable of producing 1.2 million tons of cement per year.

A plant producing reinforced concrete was constructed during the year with Cuban aid. Planned output of the plant was reported to be 3,200 cubic meters of reinforced concrete slabs.

Phosphate fertilizer production was estimated to be 1.2 million tons in 1974.

New modern equipment installed in the Lam Thao superphosphate plant reportedly increased sulfuric acid production capacity by 17% in 1974. Also reported during the year was the installation of three carbonic gas furnaces and two ammonia compressors in the Ha Bac phosphate fertilizer plant, north of Hanoi.

Salt production for the first 9 months of 1974 was reported to have exceeded the 1973 output by 60,000 tons.

**Mineral Fuels.**—The country's vital coal industry was nearly back to normal. The planned norms for coal production and exports in 1974 were exceeded by 10% and 25%, respectively. Estimated output of anthracite was nearly 4.0 million tons in 1974, of which 664,410 tons was exported to Japan compared with 184,757 tons in 1973.

## SOUTH VIETNAM [42]

South Vietnam's general economy and industrial base continued to be hampered by inflation in 1974. In the last half of the year, reduced consumer demand, high costs, and continued military activity took heavy tolls on the country's industry and new investment projects. Private construction activity was at a low level throughout the year. Government projects continued but usually after being scaled down or refunded to reflect increased material costs.

The emphasis in development plans during the year was shifted further to agriculture and supporting industries. Industry in general was depressed both by lack of demand and shortage of foreign exchange for imported supplies. As an example, the Bien Hoa scrap-based steel mill could not operate at full capacity to produce round bars in 1974 because of the shortage of scrap metal. Also, higher prices for oil in 1974 sharply reduced the country's consumption of petroleum products imported to help meet domestic requirements.

Production of nonmetallic minerals in South Vietnam in 1974 included cement, various types of stone, sand and gravel (including silica sand), kaolin and other clays, lime, and gypsum. Most of the requirements for fertilizers, iron and steel products, nonferrous metals, and petroleum products continued to be imported.

### COMMODITY REVIEW

**Nonmetals.**—*Cement.*—The Ha Tien Cement Company operations were curtailed in 1974, because of adverse military interruption of supply lines to the plant facilities and shell damage to fuel tanks. The plant had to be closed down at yearend. Production of cement, therefore, was 294,000 tons compared with 265,000 tons in 1973.

*Clays—Kaolin.*—Despite numerous interruptions, kaolin was mined in Tuyen Duc Province. Production at the mine was estimated to be 265 cubic meters in 1974, all for use in the country's small porcelain

[42] Prepared by Arthur C. Meisinger.

industry. Increased kaolin production is planned for 1975 when the Vinh Tuong pottery plant is to resume operations.

*Lime and Limestone.*—Small-scale lime manufacturing continued to increase during 1974 to make up for the decrease in fertilizer imports. Sea shells were also being exploited for their lime content to supplement local fertilizer shortages in the country.

The Cam Ranh Bay area of South Vietnam is reported to have deposits of high-grade limestone estimated to contain 6 million tons. A decree establishing the Cam Ranh Bay area as an industrial zone was announced by the Prime Minister on May 21, 1974. If industrial development of the area is possible in the near future, the limestone deposits would become important in reducing the country's dependence on foreign supplies of cement.

*Salt.*—The quantity of salt produced for local consumption in 1974 was an estimated 200,000 tons, about the same as that of 1973. Construction of the Hon Khoi Salt Co.'s new purification plant was completed in October 1974. Also during the year, members of the Hon Khoi Salt Cooperative reportedly mined 17,000 tons of salt, and plans were made to double the output in 1975.

*Silica Sand.*—The KATECO Sand Company reportedly exported approximately 12,500 tons of silica sand, valued at $105,500 in 1974. Demand for the high-quality sand used in the manufacture of optical glass has been declining, according to company officials. The company reportedly does not plan to develop or expand their operations and may discontinue mining because of increasing operational costs and decreasing demand for the sand.

**Mineral Fuels.**—*Petroleum.*—South Vietnam continued to rely on imports of petroleum refinery products to meet consumption requirements in 1974. Imports, primarily from Singapore, consisted of gasoline, kerosine, jet fuel, and distillate and residual fuel oils.

In June 1974, a decree was issued by the Government that established the Petroleum and Minerals Agency (PMA) as an autonomous unit in the Ministry of Trade and Industry. The country's current National Petroleum Board (NPB) reportedly will be placed under the Directorate of Petroleum.

In the second rounding of bidding for offshore oil concessions in the South China Sea, the Government of South Vietnam granted 9 exploration rights to 11 oil companies for a total of $30 million in 1974.

Results of offshore drilling tests in August by Pecten-Vietnam, a wholly-owned subsidiary of Shell Oil Co., Inc., in partnership with Vietnam-Cities Services, Inc., confirmed a discovery of oil and natural gas. A second wildcat well drilled by the company in October also encountered oil and natural gas located in the South China Sea, approximately 344 kilometers south of Vung Tan, South Vietnam.

# The Mineral Industry of Other South Pacific Islands

By Staff, Bureau of Mines

## CONTENTS

## BRITISH SOLOMON ISLANDS [1]

Mineral activity in 1974 in the British Solomon Islands Protectorate (BSIP), if any, went unreported in available journals. Gold production (mostly from Guadalcanal) must be assumed in the light of the world gold market. Production reported for the 5 years 1969–73 follows, in troy ounces:

| Year | Quantity |
|---|---|
| 1969 | 413 |
| 1970 | 291 |
| 1971 | 444 |
| 1972 | 200 |
| 1973 | 963 |

There was no further word about the potential start of bauxite production.

[1] Prepared by Robert A. Clifton, physical scientist, Division of Nonmetallic Minerals.

[1] This area undoubtedly produces crude construction materials (common clays, sand, gravel, and/or stone) in addition to the listed commodities, but output is unrecorded and information is inadequate to make reliable estimates of output levels.

[2] Nickel-cobalt content of metallurgical plant products, plus estimated recoverable nickel-cobalt in exported ores.

## CHRISTMAS ISLAND [2]

Christmas Island has an area of about 55 square miles and is located in the Indian Ocean approximately 230 miles south of Java. As in past years, phosphate rock and dust was the only mineral commodity produced during 1974.

The base rock of the island is volcanic and is overlaid by corral limestone in the form of irregular pinnacles. The phosphate exists in three beds on top of the limestone, with each bed averaging 20 feet in depth. The richest A-grade bed lies immediately above the coral limestone; the lean C-grade bed, which is more like a phosphate-rich subsoil, lies on the surface; and the intermediate B-grade bed lies between the A and C beds. A calcination process has been used since 1967 to improve the low-grade C material.[3]

Exports of phosphate rock increased 21% in 1974.[4] A 25% increase in mining capacity is expected in 1975-76.[5]

## FIJI ISLANDS [6]

The value of minerals produced in Fiji increased 52% in 1974 to $9.8 million.[7] Gold was the most important mineral product, accounting for $6.8 million, or 69%, of the total mineral output value. River sand and gravel accounted for $1.7 million, and quarried stone, for another $0.7 million. All other minerals accounted for $0.6 million.

Gold production decreased 14% in 1974, but the revenues from gold increased 39%. Production was from the mine of the Emperor Gold Mining Co. Ltd., which also yielded 27,000 ounces of byproduct silver and a few thousand pounds of byproduct tellurium. The output of sand and gravel doubled in 1974, but production of quarried stone fell 12%. Production of cement decreased 7%, and production of coral sand for cement manufacture increased 17%.

A consortium headed by Amax Inc. and Anglo American Corp. of South Africa Ltd., announced the discovery of a potentially large copper deposit at Namosi, about 20 miles from Suva.[8] The consortium signed an agreement with the Government of Fiji, and planned a 3-year exploration program. Plans to drill the first exploratory oil well in Fiji were also reported. The Southern Pacific Petroleum Co. announced that it would drill the well in its concession north of the island of Vitu Levu in 1975. Altogether, about 20 companies were engaged in mineral and petroleum exploration in Fiji.

## NAURU AND OCEAN ISLAND [9]

The Republic of Nauru is a small island with an area of 8.5 square miles; Ocean Island is even smaller than Nauru. These two islands are located near the Equator, about 1,700 miles northeast of Australia and about 160 miles from each other. Phosphate rock is the only mineral produced on both islands, and the entire output is exported.

Exports of phosphate rock from Nauru decreased about 2% in 1974. On Ocean Island, phosphate exports were down 26% compared with those of 1974.[10]

India signed a long-term agreement with the Nauru Phosphate Corp. (NPC). A shipment of 50,000 tons of rock was to be made in 1974–75, followed by larger shipments during the next 2 years. The quantities involved are less than 5% of Nauru's total capacity, but, heretofore,

[9] Prepared by Michael J. Potter.
[10] Work cited in footnote 4.

Australia, Japan, and New Zealand had been the only other markets supplied by NPC.[11]

Nauru rock is high grade, averaging 83% phosphate. By comparison, Tunisian rock is 74% phosphate and Jordanian material is 73%. Rock grading 95% is to become available in 1975, when a calcination plant goes into operation.[12]

The British Phosphate Commission, which mines phosphate on Ocean Island, decided not to expand production by 100,000 tons per year following representations from the islanders. It is estimated that deposits will be worked out by 1980 at the present rate of mining.[13]

## NEW CALEDONIA [14]

The French island territory of New Caledonia was the second-largest producer of nickel in the market-economy countries in 1974. The principal producer of nickel on the island was Société le Nickel S.A. (SLN). Plans were announced in March 1974 to reorganize SLN into a holding company under the name "I-Metal." The quantity of nickel ore mined in 1974 totaled 7 million tons, exceeding that mined in 1973 by nearly 20%. Production of ferronickel increased 36% in 1974 compared with that of 1973, while matte production decreased 12%. Exports of nickel ore to Japan increased 19% in 1974 compared with those of 1973. The ore grade remained unchanged from 1973 at 2.46% nickel plus cobalt. At yearend, nickel producers on the island were still awaiting a decision by the French Government regarding changes in the tax laws.

### PRODUCTION

Nickel ore production increased in 1974 to 7,015,000 tons compared with 5,858,000 tons in 1973. SLN remained the principal ore producer and the only producer of refined nickel on the island. Its refinery at Doniambo produced 67,370 tons of nickel in 1974 (18,837 tons in matte and 48,533 tons in ferronickel), compared with 57,235 tons of nickel in 1973 (21,476 tons in matte and 35,759 tons in ferronickel).

A small quantity of chromium ore (3,566 tons) was mined and exported to Japan in October 1974 by the Société de la Tiebaghi. The ore contained 50% $Cr_2O_3$ and averaged 3.4% moisture. Jade was produced in limited quantities during the year.

## TRADE

Mineral exports, composed principally of nickel ore, ferronickel, and nickel-cobalt matte, were valued at about $259 million in 1974, compared with $186 million in 1973. Exports of nickel ore, mainly to Japan, increased from 2,802,919 tons in 1973 to 3,347,153 tons in 1974. The average nickel content of the exported ore remained unchanged from that of 1973 at 2.46% nickel plus cobalt.

Exports of ferronickel and matte during 1974 totaled 67,196 tons of nickel content —47,123 tons in ferronickel and 20,073 tons in matte. Most of the exported ferronickel (64%) and matte (44%) went to France. Of the remaining ferronickel, the United States received 28%; Japan, 7%; and Australia, the remainder. Of the remaining matte, the United States received 26%, Japan, 17%; Canada, 8%; and Finland, 5%.

## COMMODITY REVIEW

**Metals.**—*Chromite.*—Société de la Tiebaghi mined 3,566 tons of chromite ore and exported it to Japan in October 1974. The ore contained 50% $Cr_2O_3$ and 3.4% moisture.

*Nickel.*—Production of nickel ore in New Caledonia in 1974 was 20% greater than in 1973. Nickel smelter production increased nearly 18% in 1974 over that of 1973. Ferronickel production increased 36% and matte production decreased 12% compared with that of 1973. Exports of nickel ore to Japan in 1974 increased 19% compared with exports in 1973. Next to France, the United States was the leading recipient of ferronickel and matte, followed by (in decreasing order) Japan, Canada, Finland, and Australia.

SLN, the largest nickel producer on New Caledonia, concluded several major deals that should affect nickel production on the island for many years to come. Early in 1974, SLN sought and obtained an agreement from Kaiser Aluminum & Chemical Corp. of the U.S. to purchase Kaiser's 50% interest in the New Caledonian Nickel Co., thus giving SLN full ownership. According to company officials, the settlement would permit SLN to reinforce its position in the world nickel market, while Kaiser Aluminum could concentrate its effort on activities other than nickel.

A second major event occurred in March 1974 when the management of SLN announced an agreement in principal with Société Nationale des Petroles d'Aquitaine (SNPA) to form a joint firm to handle SLN's mining and industrial assets in New Caledonia and France. Under the proposed plan, SLN would be reorganized into a holding company under the name "I-Metal." Stockholders also approved the creation of a special nickel subsidiary, Société Métallurgique le Nickel. SNPA's agreement to take a 50% share in I-Metal's newly created subsidiary would depend on the Government's forthcoming tax proposal for New Caledonian nickel processors. Reportedly, SNPA made the first installment of 100 million francs to Société Métallurgique le Nickel. According to SNPA officials, the decision to join I-Metal would not involve any change in the company's previous decision to join Freeport Corp. in developing the Goro deposit on New Caledonia.

The third major event that occurred during 1974 was the acquisition of approximately 10% of the common stock of SLN by Amax Inc. The stock acquisition made Amax the second-largest shareholder after the approximately 26% held by the Rothchild Group. According to a company official, Amax planned to purchase material from SLN for feed to its newly renovated refinery at Port Nickel, La.

Compagnie Française d'Entreprises Minières Métallurgiques et d'Invistessements (COFREMMI), a wholly-owned subsidiary of Patino N.V., obtained a go-ahead from the French Government to establish a nickel mining and metallurgical project in northern New Caledonia. COFREMMI was to develop ore deposits in the Tiebaghi and Poum areas of New Caledonia. In the Tiebaghi deposits, proven reserves were 13 million tons of ore containing 3% nickel plus cobalt in garnierite, and 17 million tons of 1% nickel plus cobalt in laterite. Proven reserves at Poum were 35 million tons of 3.2% nickel plus cobalt in garnierite, and 41 million tons of 1.34% nickel plus cobalt in laterite. Company plans called for mining the garnierite first.

Société Métallurgique de Nickel Patino Péchiney Grânges (SOMMONI), a wholly-owned subsidiary of COFREMMI, was to build a ferronickel plant and produce 40 million pounds per year of nickel in ferronickel (35% nickel content). The output may be increased to 80 million pounds per year at a later date. Work on the plant site began in December 1973 and was to be intensified to achieve production by the middle of 1976. Société Française d'Electrometallurgie (SOFREM), a subsidiary of Péchiney Ugine Kuhlmann, was to provide technical assistance during the first 15 years of operation. SOFREM had developed and patented an electric furnace process for treating New Caledonian ores and had completed a 12-month pilot plant test. The company was to conduct an additional 6 months of trials with a 5-megawatt semicommercial plant. The semicommercial plant was to be used by SOFREM for training personnel who ultimately would operate the smelter in New Caledonia.

At yearend, the French Government still had not made a decision regarding

changes in New Caledonia's tax structure. Nevertheless, a decision regarding New Caledonian taxes was expected early in 1975.

## NEW HEBRIDES [15]

During 1974, the New Hebrides reported no activities in the mineral industry. The Forari mine on Efate (Vate) Island is assumed to have remained active and producing. In previous years, the manganese was exported as a 42% concentrate. Production and export data for the period 1964–73 are as follows, in tons of contained manganese:

| Year | Production | Exports |
|---|---|---|
| 1964 | 23,454 | 25,607 |
| 1965 | 26,229 | 31,629 |
| 1966 | 29,553 | 25,236 |
| 1967 | 27,658 | 27,948 |
| 1968 | 21,306 | 17,432 |
| 1969 | -- | -- |
| 1970 | 5,948 | 11,057 |
| 1971 | 5,811 | 5,776 |
| 1972 | 10,942 | 14,548 |
| 1973 | 12,674 | NA |

NA Not available.

## PAPUA NEW GUINEA [16]

Papua New Guinea is now self-governed, and the Papua New Guinea House of Assembly in Port Moresby set September 16, 1974, as the date for the country's full independence. A new currency, the Kina, will be introduced on April 19, 1975; its value will initially equal the currently circulated Australian dollar.

The only significant mine operation in Papua New Guinea in 1974 was the massive copper mine at Panguna on Bougainville Island. The mine, operated by Bougainville Copper Pty. Ltd. (BCP), contributed about 99.5% of the total mine output from Papua New Guinea. Of the country's $440 million export earnings in 1974, BCP accounted for $292 million. The BCP managing company is 80% owned by Bougainville Mining Ltd., with 20% held in trust by the Administration of Papua New Guinea. Bougainville Mining, in turn, is owned two thirds by Conzinc Riotinto of Australia Ltd. (CRA) and one third by New Broken Hill Consolidated Ltd.

The original contract between BCP and the Government of Papua New Guinea was renegotiated during the year. The new agreement left the equity unchanged, but provided greater tax revenue for Papua New Guinea. BCP will forfeit its tax privileges and pay a 70% excess profits tax that will start at $87.2 million after payment of standard company rate of 33-⅓%. The $87.2 million figure will guarantee the company a return of 15% on capital investment. The figure may be adjusted in the future to account for new capital investment and abnormal inflation. The agreement also revoked accelerated depreciation provisions that allowed the company to exclude 20% of its income from tax calculations. In addition, the company will be required to pay import duties, and contribute 50 cents per ton of copper produced to an environmental rehabilitation fund. The new agreement is expected to gross about $500 million over the next 10 years.

Negotiation continued between the Papua New Guinea Government and Kennecott Pacific Pty. Ltd. on the OK Tedi copper project in northwestern Papua New Guinea. At yearend, negotiations were in a critical stage, with major differences centering on taxation and arbitration. Production of minerals on the small islands of New Britain, New Ireland, Manus, Misima, and other smaller islands remained insignificant.

### PRODUCTION

The mineral production for Papua New Guinea during the last 3 years is shown in table 1.

The total value of mineral output showed an increase from the previous year. Pro-

[15] Prepared by Robert A. Clifton.
[16] Prepared by Charlie Wyche, physical scientist, Division of Nonferrous Metals.

duction of both gold and silver in 1974 was down sharply from the 1973 production. The main factor in the value increase from $275 million[17] in 1973 to $293 million in 1974 was the large rise in world metal prices. The prices that particularly affected Papua New Guinea were copper, gold, and silver.

## COMMODITY REVIEW

**Metals.**—*Copper.*—The total copper output in Papua New Guinea was produced by BCP at the Panguna mine. In 1974, a total of 30.1 million tons of ore was milled, producing 182,868 tons of copper contained in concentrates. The mine and concentrator operated satisfactorily all year. Adding a ninth ball mill and improving the crushing and grinding circuits offset the effects on production of mechanical problems. Recovery and concentrate grade improved despite a slight decline in mill-head grade.

All buyers under company sales agreements received deliveries at or above the contracted level during the first half of 1974. In the second half of the year, demand for copper declined rapidly, giving rise to surpluses of available metal. There was a particularly heavy concentration of stocks in Japan. As a result, Japanese buyers received a reduction in deliveries of concentrate from Bougainville. Sales revenue totaled $280 million in 1974 from sales of concentrates containing 192,000 tons of copper, 680,800 troy ounces of gold, and 1.5 million troy ounces of silver. In addition to long-term contracts with Japanese, West German, and Spanish firms, the People's Republic of China planned to buy 5,000 tons of copper concentrate.

The Panguna mineralization is a high-sulfur porphyry copper deposit situated in the Kawerong Valley in south-central Bougainville. Chalcopyrite is the dominant primary copper mineral, accompanied in places by bornite and a little molybdenite and silver. Gold content varies with copper, and pyrite is widely distributed. Chalcopyrite occurs principally in the Panguna Andesite, in and about the leucocratic quartz diorite, and in the biotite diorite. Oxidized and secondary zones occur at the Panguna deposit. The oxidized zone ranges from zero to 260 feet thick, and averages about 100 feet. The base of the zone may be defined mineralogically by the upper limit of chalcocite, chalcopyrite, or bornite, and the lower limit by malachite, cuprite, and limonite. An evaluation program, completed after drilling more than 200 holes in 1974 for a total of 240,000 feet, indicated reserves at approximately 870 million tons averaging 0.47% copper and 0.02 troy ounce of gold per ton.

Negotiations between Kennecott Copper Corp. and the Government of Papua New Guinea concerning development of the OK Tedi deposit continued during the year. This deposit, with proven reserves of 151 million tons assaying about 0.75% copper and 0.17 troy ounce of gold per ton is near the headwaters of the Fly River. An open pit mine to produce 30,000 tons per day of ore has been proposed. At this mining and milling rate, about 95,000 tons of copper in concentrate and 240,000 troy ounces of gold would be produced annually during the early years of operation. Kennecott submitted a detailed set of conditions to the Papua New Guinea Government under which it is prepared to develop the deposits. The firm proposed that the Government advance $70 million of the estimated $395 million cost. Japan is the anticipated market for the concentrate.

Kennecott farmed out up to 61% of its interest in another copper prospect at Yandera on the northern flank of the central Bismark Ranges, 30 miles northwest of Goroka. The Yandera interest was farmed out to Triako Mines N.L; which will share it on an equal basis with Buka Minerals N.L. Triako will manage the joint project. The 61% will be gained by spending $5 million, with the agreement covering exploration and development of about 600 square miles.

Mount Isa Mines Ltd. entered into a similar agreement with a consortium of Japanese companies comprising Sumitomo Metal Mining Co., Ltd., The Dowa Mining Co., Ltd., Sumitomo Shoji Kaisha, Ltd., and Marubeni Corporation, to farm out its Frieda River prospect in Papua New Guinea. The agreement is subject

[17] Where necessary, values have been converted from Australian dollars ($A) to U.S. dollars at the rate of $A1=US$1.43.

to approval by the Papua New Guinea Government, the Japanese Government, and other authorities. Under the agreement, Japan will spend $5 million on exploration and other work over a 5-year period to earn a 40% interest. Although further geological work is necessary, present indications are that the prospect, in the Sepik area, contains about 366 million tons of ore of an average grade of 0.45% copper.

The Australian Government pledged support of a feasibility study that could lead to establishment of a large primary aluminum smelter on the Purari River in Papua New Guinea. The Papua New Guinea-Australia-Japan study involved a series of dams on the Purari for hydroelectric power, an industrial complex that would include an aluminum smelter, and ferroalloy and caustic soda facilities. The smelter would be a 600,000-ton-per-year unit. The feed material would be supplied from Western Australia, where the Japanese are involved in bauxite-alumina projects.

**Mineral Fuels.**—*Petroleum.*—A consortium led by Phillips Australian Oil Company started drilling for oil 64 miles out from Kerema in the Gulf of Papua. Drilling will be to a depth of 17,000 feet. Australian Petroleum Co. Pty. Ltd., a subsidiary of Oil Search Ltd. of Sydney, continued to conduct exploration work in the Gulf of Papua. Shell Development (Australia) Pty. Ltd. and Australian Gulf Oil Co. were making plans to continue an exploration program in the offshore Bougainville area after evaluating data obtained earlier.
