BUREAU OF MINES

**UNITED STATES DEPARTMENT OF THE INTERIOR**

**BUREAU OF MINES**

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

# Foreword

The Federal Government, through the medium of the Minerals Yearbook or its predecessor volumes, has for 92 years reported annually on mineral industry activities. This edition of the Minerals Yearbook presents the record on worldwide mineral industry performance during 1974. In addition to statistics, the volumes provide background information to help in interpreting the year's developments. The content of the individual volumes is as follows:

Volume I, Metals, Minerals, and Fuels, contains chapters on virtually all metallic, nonmetallic, and mineral fuel commodities important to the domestic economy. In addition, it includes a general review chapter on the mineral industries, a statistical summary, and a chapter on mining and quarrying trends.

Volume II, Area Reports: Domestic, contains chapters on the mineral industry of each of the 50 States, the U.S. island possessions in the Pacific Ocean and the Caribbean Sea, the Commonwealth of Puerto Rico, and the Canal Zone. This volume also has a statistical summary, identical to that in Volume I.

Volume III, Area Reports: International, contains the latest available mineral data on more than 130 foreign countries and discusses the importance of minerals to the economies of these nations. A separate chapter reviews minerals in general and their relationships to the world economy.

The Bureau of Mines continually strives to improve the value of the Yearbook for its users. Therefore, the constructive comments and suggestions of readers will be welcomed.

***Director.***

# Acknowledgments

The Bureau of Mines, in preparing this volume, utilized extensively statistical and other basic data on mineral production, consumption, and trade provided by various foreign government mineral and statistical agencies through a variety of official publications. The cooperation and assistance of these agencies is gratefully acknowledged. Statistical and informational material was also obtained from airgrams of the U.S. Department of State, from United Nations publications, and from the domestic and foreign technical and trade press. Of particular help in preparing this volume were the routine and special reports submitted by the minerals, petroleum, economic, and commercial officers and other members of the Department of State. Their contributions are sincerely appreciated.

The chapters of this volume were prepared by the staff of the Assistant Director—International Data and Analysis of the Associate Directorate—Minerals and Materials Supply/Demand Analysis. The "Minerals in the World Economy" chapter and the production and trade tables of the country chapters were prepared in the Geographic Statistics Group of the Office of Technical Data Services. Final correlation and checking of this volume were performed by the Minerals Yearbook staff of the Office of Technical Data Services.

The regimes of some countries reviewed in this volume are not recognized by the U.S. Government. The information contained herein is technical and statistical in nature and is not construed as conflicting with or being contradictory of U.S. policies toward these countries.

ALBERT E. SCHRECK, *Editor-in-Chief.*

# Minerals in the World Economy

By Charles L. Kimbell [1] and George A. Morgan [2]

The world's mineral industry in 1974 again registered gains in almost all measurable aspects of its activities, showing a rather surprising recovery from the energy crisis of late 1973 and early 1974. By yearend, however, there were definite indications, at least among developed market economy nations, of economic problems, some relating to high fuel costs, and of industrial slowdowns in industries that consume mineral industry products, and these difficulties did not provide a very bright outlook for industrywide growth as 1975 began. A somewhat brighter outlook was indicated for the developing market economy nations as a group, but not for all members of the group individually, as market prices for their raw materials (most notably crude oil) advanced considerably. Obviously those developing market economy countries with substantial production facilities for minerals—particularly fuel minerals—registered substantial economic benefits in terms of earnings per unit of mineral commodity sold, but reductions in volume of output occurred in some places, thus partly negating gains made on the basis of unit price increases. However, developing market economy nations with limited exploitable mineral resources suffered from higher prices for fuels and other imported mineral products as well as from lower levels of activity in other sectors of their economy that in turn were partly related to the higher prevailing fuel costs. These costs, coupled with higher prices for other commodities manufactured using the more expensive energy products, combined to make the goals of a higher quality of living less attainable in the nonenergy-rich developing countries, while the energy-rich developing nations benefitted considerably.

The centrally planned economy nations of Eastern Europe and Asia were generally less affected by the energy crisis and its related problems than were the market economy countries, but there were some effects upon interbloc trade patterns. Here, unlike in the market economy nations, there was no evidence of a mineral industrial activity downturn at yearend.

The United Nations index of overall world industrial production for 1974 was 4.1% higher than that for 1973, reflecting both increases in output and inflationary price trends. The following tabulation compares, on a percentage change basis, the differences in United Nations production indexes for various sectors of the mineral industry between 1972 and 1973 and between 1973 and 1974:

[1] Supervisory physical scientist, Office of Technical Data Services.
[2] Physical scientist, Office of Technical Data Services.

| Industry sector | Percentage change in United Nations world industrial production indexes | |
|---|---|---|
| | 1972–73 | 1973–74 |
| Extractive industries: | | |
| Metals | +5.9 | +1.9 |
| Coal | −1.0 | -- |
| Crude petroleum and natural gas | +8.0 | +5.0 |
| Total extractive | +6.5 | +3.5 |
| Processing industries: | | |
| Base metals | +11.2 | +2.5 |
| Nonmetallic mineral products | +8.8 | +2.4 |
| Chemicals, petroleum, coal products | +11.2 | +3.9 |
| Overall industrial production | +8.9 | +4.1 |

Receipt of additional and revised data by the United Nations on worldwide production activities in 1972 and 1973 (subsequent to the publication of the 1973 edition of this chapter) led to a downward revision in the overall industrial production index growth rate from the 9.6% increase reported in that chapter to the 8.9% increase reported in this edition. In contrast, however, the growth rate for five of the minerals-related sectors was higher in the revised data than in the original.

For all of the mineral producing and mineral processing sectors of the overall world industrial complex listed in the foregoing tabulation, 1974 was a year of reduced growth rate levels from those set in 1973 except for coal mining, where a zero growth level was recorded for 1974 in contrast to the 1% decline registered for 1973. It seems noteworthy that in 1974 only the crude petroleum and natural gas extraction sector among the listed mineral-related industrial sectors registered a growth rate exceeding the overall industrial production index, in contrast to the experience of 1973, when base metals processing and chemicals, petroleum and coal processing, as well as crude petroleum and natural gas extraction registered a greater increase than overall industrial production.

Available partial and preliminary data on world trade suggest that the total value of major mineral commodity trade (SITC–R Divisions 27, 28, 32, 33, 34, 67, and 68) in 1974 was of the order of $160,000 million, up by 5% or more from the recorded level of $152,061 million for 1973. This modest growth, far lower than the 43% increase registered between 1972 and 1973, reflects the modest increases in prices in 1974 (compared with the sharp increase in 1973), as well as a marked slowdown in growth, if not a small decline in the overall volume of materials being moved. Considering crude oil, the largest single mineral commodity moved in terms of volume, world exports totaled 11,478 million barrels in 1974, about 0.8% below the 1973 level of 11,563 million barrels.

World mineral consumption in 1974 was generally at modestly higher levels than in 1973, but this was by no means universal for mineral commodities. Preliminary figures suggest that worldwide energy consumption advanced by only 0.8% over the 1973 level reaching 7,971 million metric tons of standard coal equivalent (7,909 million tons in 1973). This may be contrasted with a 5.8% growth rate between 1972 and 1973. It seems most significant to note that the growth rate differed considerably between market economy countries and centrally planned economy countries, with the former as a group registering a decline of about 0.9%, while the latter registered a 4.8% increase. In the case of the iron and steel industry, world consumption of both iron ore and scrap reached new highs, increasing by 2.8% and 2.2%, respectively, in 1974, both rates of increase below those set between 1972 and 1973 (10.9% and 7.1%, respectively). Among major nonferrous metals, only aluminum registered a gain in quantity from the viewpoint of consumption between 1973 and 1974 (up 2.6%); in contrast copper, lead, zinc, and tin showed declines ranging from 3.7% to 6.3%. This decline in use led to output cutbacks late in 1974 and foretold of reduced output levels in 1975 to avoid development of substantial stocks.

Considering prices of mineral materials, the higher prices for fuels, particularly oil, was undoubtedly the most significant from the viewpoint of impact on the economy, and this fuel cost increase was a major factor in increases in prices of most major nonfuel mineral commodities in 1974.

Wars and civil disorders had a much more modest effect on mineral production in 1974 than in 1973. The virtual end of U.S. involvement in Vietnam reduced requirements for mineral commodity supplies in that area. In Chile, the copper industry recovered from the slump related to the change of government in September 1973. Efforts continued to clear the Suez Canal of the debris of the Yom Kippur war and the reopening of this important transportation route was expected in 1975.

## PRODUCTION

The estimated value of world crude mineral production in 1974 was $198,300 million in terms of constant 1973 dollars, an amount of $6,700 million or 3.5% higher than the 1973 level. The indicated growth between 1973 and 1974 was much less than the 6.6% increase indicated for 1972 to 1973. The following tabulation

gives approximate data on value of world crude mineral production for selected years in the time period 1950–74, both as reported in a recognized international mining magazine for a selected group of commodities and as extrapolated to cover all crude mineral commodities by the U.S. Bureau of Mines:

| Year | Thousand million constant 1973 dollars | |
|---|---|---|
| | Value of 53 [1] major crude mineral commodities [2] | Value of all crude mineral commodities [3] |
| 1950 | 46.2 | 52.6 |
| 1953 | 60.3 | 69.3 |
| 1958 | 77.4 | 93.0 |
| 1963 | 85.6 | 104.9 |
| 1968 | 99.2 | 120.2 |
| 1972 | 149.4 | 179.8 |
| 1973 | 159.2 | 191.6 |
| 1974 | 164.8 | 198.3 |

[1] The list of commodities included appears in table 5 of this chapter; one commodity covered for 1950–68 (beryl) is excluded from the 1972–74 figures, but the overall impact of this omission is regarded as insignificant.

[2] Data for all years except 1972 and 1974 are as reported in Annales des Mines, December 1975, p. 13; data for 1972 and 1974 are extrapolated from the 1973 Annales des Mines figure on the basis of the United Nations index of extractive industry production in United Nations Monthly Bulletin of Statistics, August 1975, p. xii.

[3] Data extrapolated from those values given for 53 commodities to compensate for commodities not included in the source of that data. For details on the basis for extrapolation, see relevant text in this chapter under "Value of World Mineral Production."

It should immediately be stressed that the figures in the foregoing tabulation differ appreciably from those appearing in previous editions of this chapter, in part because the values in previous editions are in terms of 1968 constant dollars, while the values herein are in terms of 1973 constant dollars. Moreover, it should be noted that the figures for 1974 differ significantly from a preliminary estimate made by the source publication for 1974. The reasons for these differences are discussed in more detail under "Value of World Mineral Production" subsequently in this chapter.

These figures, unfortunately, tend to belittle the role of the mineral industry in the world's economy, consisting as they do of only the crude mineral value. If the value added through processing—smelting of metals, refining of oil, and manufacture of materials such as cement—were included, a 1974 figure of the order of $430,000 million could be regarded as a conservative estimate of the value of the output of the world's mines, smelters, and refineries. Moreover, it should be considered that these crude and processed mineral commodities constitute an overwhelmingly dominant part of the material base for all manufacturing endeavors, as well as a significant requirement for the agricultural industries, the latter in that they include the major fertilizer materials.

## PRODUCTION INDEX PATTERNS

The United Nations indexes for mineral industry production of the world (excluding the centrally planned economy nations of Asia) are given in table 1, together with index numbers for major sectors of the industry and for overall industrial production; all figures being provided for both the world aggregate and for individual major geographic and economic areas.

The index for output of the extractive industry as a whole again increased in 1974, exceeding the 1973 level by 3.5%; however, this increase was much smaller than the 6.5% growth recorded between 1972 and 1973. Moreover, when this growth is considered in the light of increased constant dollar values for many commodities, it is evident that gains in quantity of material produced were minimal.

Considering individual sectors of the extractive industry, the crude petroleum and natural gas index showed the most substantial gain, between 1973 and 1974, a 5% increase compared with an 8% increase between 1972 and 1973. The metal mining index rose by 1.9% between 1973 and 1974, compared with a 5.9% increase between 1972 and 1973, and the index for coal remained unchanged between 1973 and 1974, having shown a 1% decline between 1972 and 1973.

Reviewing the minerals processing sectors for which index numbers are available, the world's base metals processing sector registered only a 2.5% gain between 1973 and 1974 compared with an 11.2% growth between 1972 and 1973. Similarly the world's nonmetallic mineral products sector index advanced only 2.4% between 1973 and 1974 (8.8% between 1972 and 1973), and the world's chemicals, petroleum products, and coal products sector index increased only 3.9% between 1973 and 1974 (11.2% between 1972 and 1974). Perhaps even more noteworthy was the fact that all three of these sectors as well as two of the three listed sectors of the extractive industry (coal being the lone exception) showed declines after mid-year 1974.

Considering the differences between geographic areas in most general terms, the centrally planned economy nations showed greater advances between 1973 and 1974 than did the market economy countries, but within the broad group of market economy countries, some areas matched or exceeded the increases registered by the centrally planned economy countries.

## QUANTITATIVE COMMODITY OUTPUT

Total world output of 71 mineral commodities for the years 1972–74 is given in table 2. Regional distribution of output of these same commodities is given on a percentage basis in table 3. In addition to these same commodities is given on a per- the end of this chapter includes world output of selected major commodities by principal producing countries for 1972–74.

**Nonfuel Mineral Commodities.**—Of the 39 metallic mineral commodities listed in table 2, 24 registered production increases in 1974 relative to their 1973 performance, while 14 showed declines and one was not comparable owing to the exclusion of the output of the United States in the 1974 total but not in the 1973 total.

Among the 23 industrial nonmetallic mineral commodities for which production data are given in table 2, 20 recorded higher output levels in 1974 than in 1973, with only 3 showing declines.

Tables 33 to 48 inclusive in the statistical summary section of this chapter give output levels of selected major nonfuel mineral commodities (metals and nonmetals) by major producers for 1972–74.

**Mineral Fuel Commodities.**—In 1974, world production of energy from all sources reached a level of 8,641 million tons of standard coal equivalent (SCE) compared with 8,538 million tons SCE in 1973 and 8,037 million tons SCE in 1972 (both figures revised from those reported in previous editions of this chapter). The 1974 figure was a new high for total world energy production, and the growth was a general one, shared by each of the major primary commercial energy sources,[3] although the growth rate was not uniform for each of the energy sources. The percentage distribution of each major energy source for the years 1972–74 inclusive is given in the following tabulation:

| Energy source | Share of total energy production (percent) [1] | | |
|---|---|---|---|
| | 1972 | 1973 | 1974 |
| Coal (including lignite) | 30.4 | 29.1 | 29.1 |
| Petroleum | 48.0 | 49.5 | 49.1 |
| Natural gas | 19.4 | 19.2 | 19.4 |
| Hydro, geothermal, nuclear electricity | 2.2 | 2.2 | 2.4 |
| Total | 100.0 | 100.0 | 100.0 |

[1] Based on data in United Nations, World Energy Supplies, 1950–74. Statistical Papers, Ser. J, No. 19, New York, 1976, p. 10.

For the first time since 1958, petroleum registered a decline in its share of total energy supply in 1974, while coal (all types) remained virtually even with its 1973 share, with natural gas and primary electric power registering increases in their share of the total.

Output data by major producing countries for coal, natural gas, and crude petroleum for the 3-year period 1972–74

[3] Petroleum, coal (anthracite, bituminous, and lignite), natural gas, and hydroelectric and nuclear electric power; data do not include figures for fuelwood, charcoal, bagasse, animal dung, rice husks, peat, and other minor fuels, although such materials are used as commercial fuels in some nations and in a few countries are the source of a significant part of total energy produced.

are given in tables 49, 50, and 51, respectively.

## VALUE OF WORLD MINERAL PRODUCTION

The comprehensive study on value of world mineral production that has been prepared for over two decades for the French language monthly mineral industry publication, *Annales des Mines* was extended for another 5-year increment in the December 1975 issue of that publication. The series now provides nearly uniform data for the years 1950, 1953, 1958, 1963, 1968, and 1973. The study fixes the constant 1973 dollar value of total world production of a selected list of crude mineral commodities [4] at $159,201.4 million for 1973, compared with a 1973 constant dollar value of $99,230.4 million for 1968. This 60% increase in value between 1968 and 1973 is equivalent to an average annual increase of 9.9%, which the source publication attributes to a 5.6% annual average increase in quantity and a 4.1% annual average increase in the inflation-corrected price index for crude minerals. The figures in the French source have been roughly extrapolated by the U.S. Bureau of Mines to cover the full range of crude mineral commodities covered in the Minerals Yearbook, on the basis of the share of total U.S. crude mineral output value accounted for by those selected commodities covered by the French source. Basic data for this extrapolation are as follows:

| Year | Million current U.S. dollars | | Percentage of total accounted for by selected commodities |
|---|---|---|---|
| | Value of total U.S. crude mineral output | Value of U.S. output of selected minerals covered in Annales des Mines [1] | |
| 1950 | 11,855 | 10,405 | 87.8 |
| 1953 | 14,382 | 12,511 | 87.0 |
| 1958 | 16,526 | 13,754 | 83.2 |
| 1963 | 19,620 | 16,002 | 81.6 |
| 1968 | 24,974 | 20,591 | 82.5 |
| 1973 | 36,788 | 30,579 | 83.1 |

[1] Values as reported by U.S. Bureau of Mines, not as reported in *Annales des Mines*. Corresponding values as reported in *Annales des Mines* in million dollars were: 1950—$10,406; 1953—$12,435; 1958—$12,440; 1963—$15,742; 1968—$20,232; and 1973—$29,876.

The published figures for value of world production appearing in *Annales des Mines* for the selected group of commodities were increased on the basis of the percentages in the right hand column of the foregoing tabulation because comprehensive international data are not available on production of many of the commodities not covered in the French source, either on the basis of tonnage or value. The extrapolation has been done on the basis of the U.S. experience in order to provide at least a rough approximation of the value of total world crude mineral output, even though it is recognized that, in all likelihood, the ratio between (1) the value of commodities included in the French study and (2) the value of commodities excluded from that study is not at all consistent from country to country around the world. The results of this extrapolation appear in the first tabulation under the heading "production" in a preceding part of this chapter. That tabulation also includes an extrapolation of the *Annales des Mines* 1973 figure to 1974, based on the United Nations index of world extractive industry production, and an interpolation of a figure for 1972 based on the same index. It should be noted that the extrapolation for 1974 differs widely from an estimate of 1974 world crude mineral production value provided in the *Annales des Mines* article.

This French publication gives the estimated value of output of selected crude minerals in 1974 at $315,000 million to $320,000 million, nearly a doubling in the value calculated for 1973, with only 1% of the increase as a result of an increase in quantity, the rest being attributed to a virtual 100% increase in the constant dollar-based crude mineral price index. This does not adequately take into account inflation. Considering data for the United States alone, the current dollar value of

[4] For commodities included, see table 5 of this chapter.

total crude mineral output advanced nearly 50% from $36,788 million in 1973 to $55,172 million in 1974, but application of a deflator factor to the 1974 value to express it in terms of 1973 constant dollars gives a figure of $35,989 million, about 2.2% below the 1973 level. Considering the lower activity level of industry in many developed industrialized nations in 1974, the extrapolation on the basis of the United Nations index appears more representative of actual events than does the *Annales des Mines* estimate.

## GEOGRAPHIC DISTRIBUTION OF WORLD MINERAL OUTPUT VALUE

Available information is inadequate to extrapolate to 1974 the value of crude mineral commodity production on a country by country basis from the 1973 data published in *Annales des Mines,* but it seems in order to present that 1973 data as a reasonably reliable picture of the roles played by various nations in the worldwide mineral extraction picture. In 1973, the United States continued to rank first among the countries, accounting for 18.77% of the total value of output of the commodities selected for inclusion in the *Annales des Mines* study. The United States was followed very closely by the U.S.S.R., with 17.64% of the 1973 total, as shown in table 4. The relative ranking of these nations has not changed since the study was started in 1950, but the share of the total accounted for by each country has varied sharply, with the United States registering a continual decline from nearly 40% of the total in 1950, while the U.S.S.R. showed a gain from slightly better than 11.4% of the total in 1950 to over 18.1% in 1968, with a decline of 17.6% in 1973.

Saudi Arabia ranked third in 1973, with about 5.7% of the total (including that nation's share of output from the Kuwait-Saudi Arabia Partitioned Zone), this advance from eighth rank in 1968 was almost wholly due to the country's role as an oil producer.

The People's Republic of China, ranked fourth in both 1968 and 1973, showed a modest increase in its share of the total, while Iran, ranked fifth in 1973, more than doubled its output value between 1968 and 1973, and in doing so advanced from 11th rank in 1968. Canada, which ranked third in 1968; Venezuela, which ranked fifth in 1968; West Germany, which ranked sixth in 1968; and Libya, which ranked ninth in 1968, occupied, respectively, sixth, seventh, eighth, and ninth places in 1973, followed by the Republic of South Africa, which ranked 10th in both years. Among the top 10 producing nations in 1968, only the United Kingdom fell from that group, dropping from seventh rank in 1968 to 13th rank in 1973. Space does not permit further or more detailed review of individual countries and their shifts in shares from 1968 to 1973, but it appears significant to point out that the share of the total accounted for by the top 10 nations in each of the years has declined. In 1950, the first 10 ranked nations accounted for 77.65% of the total, compared with 70.32% in 1968 and 67.5% in 1973, reflecting chiefly the relatively higher growth rates of developing nations as sources of world mineral supplies. Among developed market economy nations, only Australia (on the basis chiefly of its gains in bauxite, iron ore, and copper) and the Netherlands (almost solely on the development of the Groningen gasfield) showed substantial increases in rank or share of total, while a number of developing market economy nations advanced appreciably, among the more noticeable being Nigeria, Indonesia, and Abu Dhabi (of the United Arab Emirates).

## COMMODITY DISTRIBUTION OF WORLD MINERAL OUTPUT VALUE

As in the case of a geographic distribution of the *Annales des Mines* data on value of crude mineral output, the inadequacy of data precludes extrapolating from 1973 to 1974 any distribution by commodity. Table 5 of this chapter, however, furnishes the 1973 figures for each of the commodities covered in the French study. The most salient points to note include the continued rise in the relative importance of petroleum which ranked first among all commodities in terms of value, from 33.8% of the total in 1950 to 40.0% in 1968 and to 47.5% in 1973. Also noteworthy is the decline in the role of second-ranked bituminous and anthracite coal from 37.8% in 1950 to 21.0% in 1968 and to 18.2% in 1973, this latter decline despite an increase in each year in terms of constant dollar value. Following the pattern of petroleum between 1968 and 1973, natural gas, ranked third among all com-

modities in both these years, accounted for an increased share of the total in 1973, with a figure of 7%. Another significant point was the change in the percentage share credited to all fuel-related materials (petroleum, anthracite coal, bituminous coal, lignite coal, natural gas, and natural gas liquids), which as a group accounted for 76.5% of the total in 1950, declined to 72.9% in 1968, and then increased to a new high of 77.0% in 1973.

Among the nonfuel minerals, copper ranked first in terms of crude output value in 1973 as in 1968, and the commodity was ranked fourth among all listed commodities in both those years, but it accounted for only 6.31% of the value of the listed commodities in 1973. Iron ranked second among the nonfuel minerals and fifth among all listed commodities in both 1968 and 1973, accounting for only 4.43% of the total value in 1973. Other metals, specifically gold, zinc, nickel, and lead, occupied sixth, ninth, tenth, and eleventh places, respectively, among the total list of commodities in 1973, with lignite coal and natural gas liquids (ranked seventh and eighth, respectively) completing the list of the top 11 commodities. The highest ranked industrial nonmetal was salt, in 12th place in 1973, followed directly by potash and diamond, but none of the commodities ranking below 8th individually accounted for 1% of the total of the listed commodities. The first eight commodities in 1973—five fuels and three metals—accounted for 89.98% of the total value of the 51 commodities listed in that year.

Percentage shares of total listed values accounted for by major commodity groups are shown in the following tabulation (uranium counted among fuels):

| Commodity group | Percent of value of all listed commodities | | |
|---|---|---|---|
| | 1950 | 1968 | 1973 |
| Mineral fuels | 76.5 | 72.9 | 77.0 |
| Metals | 19.2 | 21.0 | 18.7 |
| Industrial nonmetallics | 4.3 | 6.1 | 4.3 |

In considering the foregoing tabulation, however, it should be borne in mind that the list of commodities represented is incomplete, excluding a number of major nonmetallics, most prominent of which are stone and sand and gravel and, if data for these materials were available, the industrial nonmetals would account for a considerably larger part of the total.

## TRADE

### GENERAL TRENDS

Data on a worldwide basis concerning the aggregate value of world mineral trade is not yet available for 1974. If the results of previous years are any indication of what can be expected, however, it may be assumed that an increase of from 10% to 20% was not unreasonable. But when one examines the results for 1973, the most recent year for which such data are available, one finds that the estimated value of all mineral commodities traded was $152,061 million, a startling increase of 42.8% from the previous year's 16.3% increase. Such unparalleled change was the result of the world energy situation brought on in part by restricted fuel supplies and higher prices—a situation whose ripple effect spilled over into other commodities and continued into 1974 as indicated by the pricing situations mentioned elsewhere in this chapter. In terms of actual dollar value, the total represents an increase of $45,607 million from the previous year and accounts for 26.6% of the value of all commodities traded compared with 25.6% in 1972. A comparison of 5-year data (1969–73) of the estimated value of world trade is shown in the following tabulation:

| Year | Estimated value of all mineral commodities traded [1] (million dollars) | Increase relative to previous year (percent) | Mineral commodities' share of all commodities traded (percent) |
|---|---|---|---|
| 1969 | 71,166 | 12.3 | 26.2 |
| 1970 | 83,497 | 17.3 | 26.8 |
| 1971 | 91,571 | 9.7 | 26.2 |
| 1972 | 106,454 | 16.3 | 25.6 |
| 1973 | 152,061 | 42.8 | 26.6 |

[1] Value estimated from data on mineral commodities appearing in table 6 to which have been added a factor for all mineral commodities not included in that table. The factor added is based on comparison of complete mineral trade value returns for selected countries with data given for these same countries in the source for table 6, which includes only the selected mineral commodity groups specified in the footnotes to that table. This comparison indicates that the recorded mineral commodities listed in table 6 represent about 81.5% of total mineral commodity trade.

The value of exports from developing market economy countries increased in both absolute terms and in terms of percent of the world total. Trade from developed market economy countries also increased but accounted for a reduced share of the total. The export value of major mineral commodity groups was up dramatically, and while the percentage distribution of the various groups to the total remained relatively unchanged, the growth rates for each were much greater than that recorded for any previous year.

## COMMODITY GROUP TRADE PATTERNS

The pattern in the value of world export trade in five major mineral commodity groups for the years 1969–73, in comparison with the value of all commodities traded, is listed in table 6. This table is then further analyzed in terms of the distribution of total value of export trade in major mineral commodity groups by each group (table 7) and by the percent growth in the value of each group over the same 5-year period (table 8). Consistent with its historical record was the performance of the mineral fuels group, the world export value of which increased to $63,100 million, or 50.9% of the value of all mineral commodities traded. Although this differs only slightly from its revised percentage share in 1972, in terms of growth of value it represents a jump of 43.2% from 1972. Iron and steel had the second highest value of any mineral commodity traded at 23% of the total, well below half of the value listed for mineral fuels, but with a 42% increase over the previous year. This also represents the third consecutive year of decline of iron and steel's percentage of the total. The world export value of nonferrous metals gained a slightly larger percentage of the total, as did all ores, concentrates, and scrap. For both commodity groups the increases reverse a decline which began in 1970. The percentage growth in the value of nonferrous metals was 44.8% in 1973 over that of 1972, but up almost 63% from its low in 1971. The value of ores, concentrates, and scrap, which also experienced a low for the 5-year period in 1971, rebounded 57.6% from that year and 45.2% from 1972. The 1973 value of $11,220 million represents the highest percentage increase of any of the five groups listed. Crude nonmetals accounted for the lowest export value of the major mineral commodity groups; they also experienced the lowest growth rate at 30.4%. The combined value of all metals traded was up 43.4%, while major mineral commodity groups as a whole were up 42.8% over 1972. Comparison with the growth in value of all commodity groups traded at 37.9% indicates that major mineral commodity groups again took the lead which they had attained in 1970. It may be assumed, however, that this reversal will only be a temporary one as the increase in export value of major mineral commodities is passed along to other industries.

## REGIONAL TRADE PATTERNS

An overall picture of the value of world trade in major mineral commodity groups (metal ores, concentrates and scrap, iron and steel, nonferrous metals, nonmetallics, and mineral fuels) is available for 1973. The compilation listed in table 9 gives

value of both imports and exports of the aggregate of major mineral commodity groups for selected areas and countries, as well as trade in all commodities for these same regions. The percent share of total trade by these commodity groups for the regions listed is also given. Table 10 further defines the column titled major mineral commodity groups by listing trade in each group separately in terms of exports from and exports to the regions listed. Finally, table 11, the last of the series, records the direction which the aggregate value of trade in major mineral commodities took in terms of either area of the world, country trade group, or country.

The pattern of world trade in major mineral commodity groups by developed and developing market economy countries and centrally planned economies in terms of aggregate value and percent of the total is given in the following tabulation:

| Destination [1] | Source of exports [1] | | | | |
|---|---|---|---|---|---|
| | Market economy countries | | Centrally planned economies | Undistributed [2] | Total |
| | Developed | Developing | | | |
| Value (million dollars): | | | | | |
| To market economy countries: | | | | | |
| Developed | 46,140 | 43,030 | 5,140 | —100 | 94,210 |
| Developing | 7,765 | 8,830 | 784 | —4 | 17,375 |
| To centrally planned economy countries | 3,561 | 864 | 6,335 | —5 | 10,755 |
| Undistributed [2] | 1,004 | 536 | 41 | 9 | 1,590 |
| Total | 58,470 | 53,260 | 12,300 | —100 | 123,930 |
| Share of world total in percent: | | | | | |
| To market economy countries: | | | | | |
| Developed | 37.2 | 34.7 | 4.1 | ([3]) | 76.0 |
| Developing | 6.3 | 7.1 | .6 | ([3]) | 14.0 |
| To centrally planned economy countries | 2.9 | .7 | 5.1 | ([3]) | 8.7 |
| Undistributed [2] | .8 | .5 | ([3]) | ([3]) | 1.3 |
| Total | 47.2 | 43.0 | 9.8 | ([3]) | 100.0 |

[1] Sources and destinations grouped according to United Nations practice; developed market economy countries are Austria, Belgium, Canada, Denmark, Finland, West Germany, Greece, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, the Republic of South Africa, Spain, Sweden, Switzerland, Turkey, the United Kingdom, the United States, and Yugoslavia; centrally planned economy countries are Albania, Bulgaria, People's Republic of China, Czechoslovakia, East Germany, Hungary, North Korea, Mongolia, Poland, Romania, the U.S.S.R., and North Vietnam; developing market economy countries include all countries not specifically listed previously in this footnote.

[2] Figures represent difference between reported totals and reported detail. Explanations for negative quantities are not provided in source publication.

[3] Insignificant.

As regards actual dollar value, every area listed in the tabulation posted an increase in 1973 over the previous year's level. Developing market economy countries showed a 58.1% increase in the value of their exports to developed market economies, increasing their share of the total to 34.7%, up from 32.6% in 1972. The value of trade among developing market economy countries themselves was up 53.2%, but this amounted to only 7.1% of total world trade in these commodities. The value of trade among developed nations was up 40.1%, but their share of the world total declined several percentage points from 39.5% in 1972 to 37.2% in 1973. Significantly, developed nations also raised the level of trade with developing market economy countries, increasing in value by 58.8% and accounting for 6.3% of the world total. The value of trade from centrally planned economy countries to developed market economies reached $5,140 million, up 64.7%, but still less than 5% of the total. Overall, the value of exports from developed market economy countries continued to make up the largest portion of the world total at 47.2%, but their share declined with respect to developing nations and centrally planned economy countries which accounted for 43% and 9.8%, respectively. Developed market economy countries again raised the percentage of total imports from the world at 76%, up from 75.9% in 1972, thus appearing to sustain the trend of higher consumption levels for those nations. A significant change in the implied consump-

tion pattern was the percent change in receipts by centrally planned economies from the world, which jumped from 9.4% to 14% in 1973, placing them on parity with receipts from developing market economy countries that were also at 14%.

The percentage of value of world trade in all commodities, which was accounted for by major mineral commodities again showed considerable variation for the countries and regions listed in table 9 for 1973. As in the past, the Near East with its petroleum supplies recorded the largest portion, with 85.7% of the value of exports from that region being made up of mineral commodities, unchanged from the previous year. For Other Africa, 58.3% of the value of all exports from that region were mineral commodities, up slightly from 1972. The proportion of trade both into and out of the European Economic Community (EEC), the European Free Trade Association (EFTA), and the centrally planned economy countries of Europe that was mineral commodity changed only slightly compared with that of 1972, but in the case of Other Europe, 17% of the value of that region's exports were in major mineral commodities, up from 11.8% the previous year. The United States and the Republic of South Africa again had the lowest percentage of the total value of exports as mineral commodities, 7.8% and 7.9%, respectively. Although the United States percentage is down from the past year, the value of major mineral commodity groups as a whole increased 41.2%, but this increase, despite its magnitude, was overshadowed by the much larger value of all commodities exported with a 43.4% increase. It must be taken into account that the data presented for the Republic of South Africa exclude values for gold, diamonds, and metals; if these values were added they would considerably change the percentage of mineral commodity exports. Major mineral commodities share of all commodities exported to the regions shown was up for all areas except EFTA, the Near East, and areas listed as not reported. Japan continued in its position as the nation with the largest percentage of total imports listed as mineral commodities at 38.2%, up slightly from 1972. The major mineral commodities share of all commodities exported to the United States amounted to 25.5%, compared with 21.4% the previous year. A similar pattern was experienced by centrally planned economy countries, with 25.4% of the value of exports to those nations listed as mineral oriented. The share of the value of all commodities exported to the Republic of South Africa accounted for by mineral commodities increased to 13.3%, with a twofold increase in the actual value of those commodities.

Each of the individual major mineral commodity groups listed in table 10 showed an increase in the value of exports compared with 1972 values. The largest percentage increase was in mineral fuels, which was up 53.1%, followed by nonferrous metals, up 46.7%, and metal ores, concentrates, and scrap, up 46.2%. Countries and regions which are major fuel exporters generally had the largest increases in value, as in the case of Latin America which went from $4,650 million in 1972 to $7,980 million in 1973, a 72% increase. The value of exports to major industrialized countries or regions of mineral fuels jumped drastically from the previous year. In the case of the United States, the value of mineral fuel imports was up $5,290 million, or 98.5% over that of 1972. The total value of fuel imports for market economy Europe was up 42.1%, but most of this was due to the increase in the EEC where a value increase of 78.5% occurred. The value of mineral fuels to Japan, a net importer of energy, was up 75.3%, while iron and steel exports from that same country were up 47.1%.

Table 11, which lists sources and destinations of the aggregate of major mineral commodities in terms of major world areas and countries, gives an indication of the relative export-import position for those same areas. Thus, comparison of total exports credited to each country or region (vertical grand total column) with total receipts (horizontal grand total line) will indicate the status of the region as either a net importer or net exporter of major mineral commodities. An obvious example of a net exporter is the Near East, where the total value of mineral exports from that region amounted to $23,150 million, compared with imports from the world of $2,267 million. In contrast, the United States with total mineral imports valued at $17,820 million vastly exceeded its export receipts of $5,500 million. Centrally planned economy countries of Europe are net exporters, with the value of mineral commodities exported at $11,780 million in contrast with $9,325 million imported.

## CONSUMPTION

### NONFUEL MINERAL COMMODITIES

Data on consumption of many mineral commodities is lacking for 1974, but based upon what is available, it is reasonable to assume that consumption of many nonfuel mineral commodities again increased, albeit slightly. In particular, the large volume—nonfuel mineral commodities such as iron ore, iron and steel scrap, and fertilizers—showed increases over 1973 levels, but these increases were considerably smaller than in previous years. In the case of iron ore, consumption of 23 major world producers of pig iron, excluding the People's Republic of China (PRC), as given in table 12, increased to 717.7 million tons, or 3% over that of 1973. The portion of this total that was consumed directly in steelmaking was estimated at about 6 million tons. Of the remaining iron ore consumed, about 46% was treated in agglomerating plants prior to being fed to blast furnaces, and an estimated 53% was fed to blast furnaces and other facilities for production of pig iron and other products with or without agglomeration. Individual country consumption levels were up only slightly for some countries. In the United States iron ore consumption was up only 1%, while in Japan it was up 2%, compared with a 22% or 21.7-million-ton increase between 1972 and 1973. The EEC as a whole fared better with iron ore consumption up 6.8%, led mainly by France up 9.5% at 50.8 million tons and Italy up 62.6% at 18.7 million tons. West German consumption was up 4.7 million tons but the United Kingdom, the third largest consumer in the EEC, dropped 22.1% or 6.3 million tons in 1974. The EFTA also registered a decline of 23.8%, but centrally planned economy countries of Europe, which were less affected by the world recession, increased total iron consumption by 4.6% or 9.8 million tons. Most of this increase was in the U.S.S.R., where an additional 6.2 million tons was used in 1974 compared with 1973 consumption.

As in the case of iron ore, consumption of iron and steel scrap increased only modestly, up 2.2% at 306.2 million tons. Table 13 lists consumption of iron and steel scrap by 24 selected countries subdivided into major economic groups for the period 1972–74. As in the past, the United States was the leading consumer of scrap at 95.7 million tons, up 2% over 1973 consumption and 27.8% above total EEC consumption. Japan, previously the second largest consumer of iron and steel scrap, fell to third place behind the U.S.S.R. Japanese consumption fell 4.9% to 46.2 million tons, compared with an increase of 1.3% for the U.S.S.R. at 46.9 million tons. Centrally planned economy countries of Europe as a group increased iron and steel scrap consumption by 3.4% to 68.4 million tons. Notable was the use of recyclable material in the Czechoslovakian steel industry, where consumption increased 23.7% to 6.9 million tons. Consumption by the EEC was up 6.1%, with a considerable portion of the increase due the United Kingdom. That country's use of iron and steel scrap increased 17.1% or 2.5 million tons.

Table 14 lists the estimated world consumption of five major nonferrous metals. Unlike the previous year's performance of these commodities when consumption increased for each metal, there was only an increase for aluminum in 1974. Aluminum consumption was up 2.6% or 340,000 tons, a relatively modest increase compared with the 10.6% increase in 1973 over that of 1972. Copper consumption, heavily tied to the construction industry, decreased 6.3% or 546,000 tons. Lead and zinc consumption declined 3.7% and 5.5%, respectively, in 1974. In the case of the latter, the percentage decline represented a drop of 309,000 tons. Tin, the smallest volume metal consumed, declined 5.7% or 12,000 long tons.

Information concerning the consumption level of many nonmetallic mineral commodities is lacking, but considering the restrictions on fuel supplies and the near tripling of prices for crude oil which had the effect of driving up prices on most mineral commodities, available data indicate that demand slackened considerably and thus drastically reduced consumption. Just as the forces and interactions which make up the economic systems of various countries are diverse in both nature and scope, so are the supply-demand cycles which affect an individual mineral commodity's position. Despite the increased recovery of byproduct sulfur in response to industry fulfillment of pollution emis-

sion level requirements, world consumption of that commodity increased again by 4.2% or 1.3 million tons in 1974. Continued increase in the need for sulfur is attributable to the increase in consumption of fertilizers for the agricultural sector and the consistent demand for sulfuric acid. World consumption of nitrogen fertilizer for the 1973–74 fertilizer year (July 1, 1973 to June 30, 1974) was reported at 38.5 million tons, a 6.7% increase from the previous year. Consumption of phosphate fertilizers ($P_2O_5$ content) increased from 24.2 million tons to 25.7 million tons, a 6.2% increase. Potash consumption in terms of $K_2O$ equivalent for the 1973–74 fertilizer year was 20.9 million tons, a 10.6% increase over the previous year's total.[5]

## MINERAL FUEL COMMODITIES

Table 15 gives world consumption of energy by energy source in terms of standard coal equivalent (SCE) for 1974. Analysis of the change in the actual quantity of energy consumed is available for the period prior to and during the world energy crisis. World consumption of coal, oil, natural gas, and primary electric power (that power produced by means other than the burning of the aforementioned fossil fuels), amounted to 7,971 million metric tons SCE. This represents an increase of only 0.8% from the 7,909 million tons SCE consumed in 1973, when total energy consumption rose 5.8%. In past years the growth rate in per capita consumption lagged behind that for the aggregate of energy consumed, suggesting that world population was increasing at a faster rate than the rate at which additional energy was being produced. But in 1974 per capita energy consumption actually showed a decline, adding credence to the theory that the balance between the two sides is precarious at best and that the total amount of energy available, which is translatable in terms of standard of living, is a critical factor. The percentage share of the total made up by liquid fuels decreased to 44.8% from 45.5% in 1973, a significant decline as that energy source represents the largest portion of the total.

The share of solid fuels continues to increase slightly, up to 31.8% from 31.7% the previous year. The portion accounted for by natural and imported gas also increased slightly, while primary energy made up 2.6% of the total.

The ranking of the various energy sources by rate of growth varied considerably from that of 1973. Liquid fuels declined 1% compared with a 7.8% increase between 1972 and 1973. Natural gas consumption at 20.9% of total energy consumed had a growth rate of 2.8% in 1974 compared with 4.4% in 1973. The growth rate of solid fuels again increased as the availability of liquid fuels declined in 1974, increasing 1.1% in comparison with 4% in 1973.

In addition to breaking down consumption of energy by source, table 15 also gives consumption by continental division for the 6-year period 1969–74. Market economy countries accounted for 69.6% of total world energy consumption at 5,547 million tons SCE. Comparison of the percent distribution by energy source of total energy consumed by market economy countries and centrally planned economy countries continues to reveal marked variation. In the case of market economies, 52.3% of total energy consumption was liquid fuels as opposed to 27.4% for centrally planned economies. Coal continues to be the traditional source of energy for the latter economies, having surpassed the rest of the world in consumption of that fuel in 1971.

The growth rate of solid fuels was approximately 1% for centrally planned economy nations in 1974, while that for market economy nations was unchanged, compared with a 1973 increase of 5.1%. In addition, solid fuels account for 54% of total consumption by centrally planned economies compared with 22% for market economies. Western Europe, in particular, decreased consumption of the solid fuel sector by 4.3% but continued to expand utilization of North Sea resources as natural gas consumption was up 14.8%. Regionally, areas with historically low consumption levels generally have had the highest growth rates of the aggregate of energy consumption. However, in 1974 developing countries suffered severely as they were least prepared to finance the higher costs of increased energy imports. The Far East and Oceania had increases

[5] British Sulphur Corp. Ltd. Statistical Supplement No. 12. November–December 1975, London, 1975.

of only 0.3% and 1.1%, respectively. Only in the Near East, which is a net exporter of liquid fuels, was the growth rate in energy consumption on par with previous years at 8.2%.

World per capita energy consumption decreased by 1%, but on a regional basis this percentage varied considerably. North America with a per capita consumption of 11,321 kilograms, far exceeded consumption by the centrally planned economies of Europe, the next highest ranking area, at 5,139 kilograms. Despite such a position for North America, however, preliminary data indicated that per capita consumption declined for the first time, down 3.1%. Centrally planned economy countries of Europe remained relatively unaffected by the energy crisis, increasing 3.1%; Western Europe, a region of high energy input, experienced a decrease in per capita consumption of 2.1%.

## INVESTMENT

General information regarding worldwide investment in the mineral industry indicated renewed expansion in 1974, particularly as regards petroleum. Although investment data is not available for each commodity for 1974, revised figures available for the petroleum and iron and steel industries, as well as detailed worldwide investment by the United States, indicate a decline in 1973 followed by expansion of investment in 1974. As in the past, comprehensive mineral industry investment data by the centrally planned economy countries is not published, but individual announcements by the U.S.S.R., PRC and various East European countries continue to reveal major expansion plans for plant, refinery, or pipeline development, as well as trade or cooperative agreements. Taken as whole these developments support the general trend of continued expansion or upgrading of mineral industry related facilities in those countries.

Investment expenditures made in the steel industry for 1972 and 1973 for various countries and regions is given in table 16. The data listed indicate that total value of investment declined approximately 2% from the revised 1972 figure of $7,908 million to $7,762 million in 1973. Investment in the nations of the EEC fell 5.2% as the recession which had earlier gripped Japan caught up with Europe. The EFTA expanded investment by $32 million, a relatively insignificant amount in comparison with the EEC. The United States, contrary to an investment decline in most leading industrialized countries and after suffering a 5-year investment decline of its own, increased investment in the steel industry by $432 million. Included in this figure, however, are large expenditures for nonproductive facilities such as pollution monitoring and control devices and equipment. Investment expenditures for the steel industry in Japan declined for the third year as that country began to show major readjustments in its productivity rates for steel and nonferrous metals. The 1973 investment of $2,071 million represents a decline of $325 million from 1972. Australia, with a relatively modest investment of $216 million in 1972, reduced that level in 1973 by $85 million to $131 million.

Market economy country investments in terms of capital expenditures and exploration expenses for petroleum, by geographic area, are given in table 17. Equivalent data is given by industry sector and type of expense in table 18. The total investment in 1974 for capital expenditures and exploration expenses for petroleum amounted to a record of $45,885 million or $14,190 million more than in 1973, and over 73% more than 1972 expenditures. The distribution of these expenditures in market economy countries for 1973 and 1974 is given in the following tabulation by area in percent of the total:

| Area | Percent of total | |
|---|---|---|
| | 1973 | 1974 |
| United States | r 36.2 | 38.7 |
| Other Western Hemisphere | 11.3 | 11.6 |
| Western Europe | 15.8 | 15.5 |
| Africa | 3.5 | 3.0 |
| Near East | 4.5 | 4.0 |
| Far East | 8.3 | 8.2 |
| Unspecified | r 20.4 | 19.0 |
| Total | 100.0 | 100.0 |

r Revised.

The United States, with the largest percentage of the total, increased its share in 1974, rising to 38.7%. Other Western Hemisphere countries also increased their share slightly from 11.3% to 11.6%, while all other regions listed declined in their percentage of the total. Such data is well in line with developments in 1972 and 1973, which saw nationalization or expropriation of oilfields and refineries, as well as generally unstable conditions for either exploration or development work in many countries, and the concomitant return to the United States of much investment capital. Further analysis of table 17 shows that in terms of actual dollar value every area listed experienced an increase in capital expenditures of between 24% and 56%. Much of the increase simply represents higher costs for facilities of comparable size and complexity undertaken in previous years. Capital expenditures in the United States, increased by nearly $6 billion in 1974, compared with $1.6 billion between 1972 and 1973, while exploration expenses were up 32.9%, exceeding $1 billion for the first time. Capital expenditures for other Western Hemisphere nations increased 49.6%, with exploration expenses up 47.3%. Western Europe and the Far East had increases in capital expenditures of 43.4% and 46.3%, respectively. The Near East, with its large petroleum reserves, increased capital expenditures 27.3%. Capital expenditures for tanker construction continued strong, though at a slower pace than in 1973. Competition for petroleum supplies drove up tanker rates and added pressure to new tanker construction despite signs of saturation of the Very Large Combination Carrier (VLCC) market based on contracts for new tankers under construction or on order. Expenditures in that area were up 34.9%, or $2,250 million.

Capital expenditures in the petroleum industry by industry sector for market economy countries is given in table 18. Expenditures for production of crude oil and natural gas, by far the largest portion of total petroleum industry capital expenditures, nearly doubled from 1972 to $18,765 million in 1974, and increased 51.1% from 1973. Expenditures for marine facilities, which include investment in tanker construction, amounted to $8,900 million, or 19.4% of total expenditures, an increase of 35.9% from 1973. Excluding expenditures in the marketing sector, which declined for the third consecutive year, the investment level increased for every other sector. Pipeline investment doubled from that of 1973, at $2,460 million in 1974, after having remained relatively stable for several years. The amount expended in exploration also was up by 28.5% at $2,185 million. Though accounting for the smallest percentage of the total at $770 million, investment in natural gas plants was up 51%, reflecting development of North Sea gasfields and oilfields, as well as the increase in demand for the utilization of natural gas.

United States direct foreign investment in mineral industries in terms of value, earnings, and income for the 4-year period 1971–74, with detailed country breakdown for the latest 2 years, is given in table 19. Preliminary 1974 data indicate only a slight increase in value of the U.S. investment in foreign mining, smelting, and refining. The value of investment in that sector increased 1.4% overall, with most of the increase again coming from Canadian investment which was up $127 million. Total U.S. investment in mining was below 1973 levels in Latin America and Europe but increased $34 million in other countries of Africa. As regards the Far East and Pacific, the value of investment in Australia increased by $116 million, and in nations included with "Other" also was up for the year. Overall earnings for that sector were up 28.7%, while income improved 28%. United States foreign investment in the petroleum industry fared somewhat better, increasing by 10.8% to $30,248 million. Where data was available for 1973 and 1974, figures indicate general increases for most countries. Investment in Japan and Peru was up 57.6% and 60.4%, respectively. Value of investment in Denmark and Ireland was raised by $152 million, while in the United Kingdom it was up $458 million. The amount allocated for foreign shipping persisted in an upward trend, increasing by $668 million in 1974, but investments in the Near East fell off 24.4%. Preliminary data also report substantial change in the earnings and income from petroleum, up 221% and 275%, respectively, compared with increases of 12.4% and 11.6%, respectively, in 1972.

## TRANSPORTATION

### MARINE TRANSPORT

The large tonnages of mineral commodities which move in international trade are transported primarily by ocean-going vessels of three distinct classes: Tankers, bulk carriers, and freighters. The U.S. Maritime Commission classification of these vessels is given in table 20, listing number of vessels, gross tonnage, and deadweight tonnage for each class for the 5-year period 1970–74. The three prime classes of carriers listed recorded increases in each category but the group under "Other", which includes combination passenger-cargo and combination passenger-refrigerated cargo declined in 1974 in each category. The tables given in this section consider total vessels afloat without regard to end use. Therefore one must consider that vessels in each of the classes are not involved wholly or even partly in the transport of mineral commodities. Tankers generally move crude oil, gas, or refinery products but may also move molten sulfur. Bulk carriers also move substantial quantities of agricultural products in addition to fertilizers and crude minerals while freighters transport metal products as well as some ores and concentrates.

A general idea of the extent of world movement by these vessels can be obtained by viewing tables 21, 22, and 23, which give shipment of tanker and dry cargo by loadings and unloadings over a 5-year period.

Table 21, which lists the total for each category, indicates that tanker cargo loadings were down less than 1.6%, reflecting the reduction in such traffic due to the oil embargo and subsequent doubling and tripling in price of many grades of crude. Dry cargo loadings were up 3.1% but this is considerably below the 15.4% of the previous year, again reflecting the increase in the cost of transportation.

The regional pattern of tanker and dry cargo movement by loadings and unloadings for 1974 reflects the general downturn in various economies during the year, particularly for technologically intensive countries with heavy fuel requirements. Of the three major regions listed, only for the centrally planned economies was there an increase in loadings of tanker cargo, while developing market economies recorded the only increase in unloadings. Loadings of tanker cargo in the United States were reduced to zero, while unloadings declined for the first time since this series of data began. Western Europe, with tanker unloadings of over three times that for the United States, declined 3.2% in 1974. The Near East, the leading supplier of tanker cargo on a regional basis, increased loadings by only 6 million tons compared with 146 million in 1973, while in the Western Hemisphere Venezuela reduced loadings by 8.2%. As in the United States, Japanese unloadings of tanker cargo fell by 6.5% or 18 million tons after years of continually expanding economic growth.

Loadings and unloadings of dry cargo increased in 1974 for every major region listed in table 23 except for centrally planned economies which declined in unloadings by 6.6%. Loadings in market economy countries slowed considerably, with actual declines in Canada and the United States. Loadings in Western Europe were up 5.6% while Australia and New Zealand continued to expand also at 4.7% in 1974. Among developing market economies the area listed as other Latin America had an increase in loadings of 10.9% or 14 million tons, while countries of the Far East reduced loadings by 12 million tons. Developed market economies also experienced substantial reductions in the level of unloadings for that region, up 63 million tons or 5.9% compared with 121 million tons in 1973. Developing market economy countries as a whole increased unloadings by 8.8%, with Other Latin America up nearly 30% at 49 million tons and the Far East up 3% at 104 million tons. After 3 consecutive years of increase, unloadings of dry cargo by the U.S.S.R. were cut in half in 1974 to 12 million tons, thus accounting for the decline in that category by centrally planned economies.

As mentioned previously, not all of the vessels comprising the world's merchant fleet move only mineral commodities, but while data are not available on the percentage of world commodity movement which is mineral commodity in nature, it is possible to obtain a reasonable indication of such by analysis of traffic transiting the Panama Canal.

In 1974 57.6% by weight of all material

passing through the Panama Canal was mineral commodity, compared with 55.6% in 1973. As the capacity limitations of the lock system restrict the size and weight of vessels passing through the canal, it is reasonable to assume that the percentage of total world commodity movement which is minerals related is even larger due to the number and size of tankers and bulk carriers moving petroleum and refinery products that cannot enter the canal.

At yearend 1974 the world merchant fleet[6] totaled 22,449 vessels, with a gross tonnage of 306,366,000 tons and a deadweight tonnage of 503,348,000 tons. These figures represent increases of 3.9%, 11.1%, and 12.8%, respectively, over 1973. The rate of growth continued to vary for the various vessel classes; in terms of number of vessels bulk carriers had the highest percentage increase followed by tankers, while tankers led in percentage growth of both gross tonnage and deadweight tonnage. Freighters remained the largest individual class of vessel despite having the lowest growth rate, comprising 11,449 vessels or 51% of the total, down slightly from 51.7% the previous year. Despite the relatively low growth rates for number and weight of vessels, freighters also showed much improvement in both areas compared with 1973 figures.

**Bulk Carriers.**—In 1974 the world bulk carrier fleet increased by 275 vessels or 7.2%, compared with 261 vessels in 1973. Significantly, the rate of growth of bulk carrier size in both gross tonnage and deadweight tonnage fell behind that for tankers, dropping to 10.3% and 10.4%, respectively, in 1974, compared with growth rates of 15.2% and 16.3%, respectively, for bulk carriers in 1973. Average gross tonnage of individual vessels increased to 20,200 tons, compared with 19,647 tons the previous year, while in terms of deadweight tons the average size moved up to 34,176 tons from 33,195 tons. There has been a marked decline in the number of combined carriers on order after nearly 10 years of rapid growth in response to advantages gained from the relatively newly adopted concept of combined operations. Presumably demand for such vessels has declined as these needs were met, and requests for carriers up to 150,000 deadweight tons are in response to new specific requirements, as in the case of reopening of the Suez Canal.

The following table lists the total number of bulk carriers in service under the major flags of registry ranked in order of aggregate deadweight tonnage for 1974:

| Country | Number of vessels | Deadweight tonnage (thousand tons) |
|---|---|---|
| Liberia | 841 | 32,642 |
| Japan | 542 | 21,196 |
| Norway | 320 | 15,983 |
| United Kingdom | 332 | 13,729 |
| Greece | 479 | 13,133 |
| Italy | 147 | 5,886 |
| Sweden | 90 | 4,839 |
| West Germany | 77 | 3,876 |
| Panama | 183 | 3,621 |
| India | 66 | 2,667 |
| France | 59 | 2,285 |
| Spain | 56 | 1,722 |
| Poland | 71 | 1,479 |
| U.S.S.R. | 150 | 1,421 |
| Singapore | 37 | 1,413 |
| Brazil | 33 | 1,047 |
| Other | 592 | 12,328 |
| Total | 4,075 | 139,267 |

**Freighters.**—Freighters make up the most numerous class of oceangoing vessels, primarily moving smelter and mill products, as well as other processed materials. In 1974 the number of freighters increased 2.5% to 11,449 vessels. Gross tonnage increased 3.1% to 68,855,000 tons, while deadweight tonnage was up 3.3% to 93,476,000 tons. Freighters again declined in percentage of aggregate gross

[6] Oceangoing steamships and motorships of 1,000 gross tons and over.

tonnage, falling to 22.5% from 24.2% the previous year, while in terms of percent of deadweight tonnage the decline was from 20.3% to 18.6%. The reduction in the proportion of the total of these two categories is primarily due to the extensive replacement of available tonnage by tankers and bulk carriers. However, the average vessel size increased slightly from 5,979 gross tons and 8,103 deadweight tons in 1973 to 6,014 gross tons and 8,165 deadweight tons in 1974.

The following tabulation, which lists the principal nations of registry of freighters in order of their share in aggregate deadweight tonnage for 1974, indicates that the U.S.S.R. has moved into first place ahead of Greece in the overall ranking:

| Country | Number of vessels | Deadweight tonnage (thousand tons) |
|---|---|---|
| U.S.S.R | 1,413 | 8,825 |
| Greece | 909 | 8,761 |
| Japan | 951 | 7,783 |
| United States | 589 | 7,261 |
| United Kingdom | 650 | 6,140 |
| Panama | 870 | 5,764 |
| Liberia | 506 | 5,224 |
| West Germany | 460 | 3,839 |
| Cyprus | 465 | 3,246 |
| Norway | 313 | 2,643 |
| Netherlands | 283 | 2,354 |
| China, People's Republic of | 234 | 2,087 |
| Other | 3,856 | 29,549 |
| Total | 11,449 | 93,476 |

**Tankers.**—The number of tankers added to the world merchant fleet in 1974 increased by 6.4% or 308 vessels. In terms of gross tonnage and deadweight tonnage the additions amounted to increases of 17.2% and 18.6%, respectively, and continue to support the trend of increased productivity or carrying capacity. The average size of tankers continued to increase as many of the newer vessels were in the supertanker class, with gross tonnage averaging 28,002 tons and deadweight tonnage 51,053 tons. Comparison with the average size of tankers in 1966 indicates that the deadweight tonnage has nearly doubled, while gross weight of an individual tanker is up 71.3%. The distribution of world oil tanker tonnage by size group for 1974 is given in table 24 and includes a comparison with tanker distribution in 1966. Deadweight tonnage in service at yearend 1974 was 255.8 million tons, 16.3% greater than the previous year. However, for the first time, the share of tankers in the total world order book did not increase significantly, and actual tonnage of new vessel construction in progress or on order at yearend 1974 was 164.4 million deadweight tons, down 16.8% from a record high the previous year. Vessels in the 205,000 to 285,000-deadweight-ton class accounted for the largest percentage of tanker tonnage afloat at 41.2% and for 57.9% of new vessel construction in progress or on order. Assuming all vessels currently in progress or on order are completed, and discounting any losses from existing operational tonnage, the total world tanker fleet will amount to 420.2 million deadweight tons. Information from other sources indicates that the rapid increase of orders for tankers of 400,000 deadweight tons and above has finally subsided, but those few orders which did materialize showed a preference for vessels over 500,000 tons. However, regarding overall tanker construction, world shipyards have been booked since 1969, and the high volume of vessels currently on order indicates that deliveries will remain at a high level until 1976. Port limitations at many developed countries, particularly the United States with a maximum allowable vessel size of 80,000 tons, will provide impetus to continued reliance upon smaller size tankers for transfer of crude and refined products, the latter having had an increase in growth of trade as more producing countries startup or expand their

refining capacity. Specifically, there is renewed interest in construction of tankers under 150,000 deadweight tons, partly because the age of approximately 32% of tankers below that weight class is 15 years or older and because of the expected reopening of the Suez Canal in 1975. Completion of construction of many tankers in recent years, particularly very large carriers, has already resulted in replacement of a large percentage of the fleet. The following tabulation gives the percentage of total tonnage in terms of the year of completion of vessels classified as tankers in 1973 and 1974:

| Year of completion | Percent of total tonnage | |
|---|---|---|
| | 1973 | 1974 |
| Up to yearend 1945 | 2.1 | 1.5 |
| 1946–50 | .9 | .6 |
| 1951–55 | 5.5 | 4.1 |
| 1956–60 | 13.4 | 11.2 |
| 1961–65 | 15.9 | 13.5 |
| 1966–70 | 30.5 | 25.7 |
| 1971–74 | 31.7 | 43.4 |

Source: British Petroleum Co. Ltd. BP Statistical Review of the World Oil Industry, 1973 and 1974. Bayard Press, London, 1973, 1974, p. 14.

The number of tankers with flags of open registry countries continued to expand in 1974. A breakdown of the world tanker fleet at yearend 1974 in terms of flag of registry ranked, in order of national aggregate deadweight tonnage, is shown in the following tabulation:

| Country | Number of vessels | Deadweight tonnage (thousand tons) |
|---|---|---|
| Liberia | 945 | 73,819 |
| United Kingdom | 467 | 31,494 |
| Japan | 520 | 30,707 |
| Norway | 337 | 24,472 |
| Greece | 334 | 14,287 |
| France | 149 | 11,947 |
| United States | 278 | 9,298 |
| Panama | 222 | 8,828 |
| Italy | 229 | 7,012 |
| Germany, West | 84 | 5,568 |
| U.S.S.R | 455 | 5,534 |
| Sweden | 74 | 4,935 |
| Denmark | 60 | 4,580 |
| Spain | 108 | 4,332 |
| Other | 859 | 24,627 |
| Total | 5,121 | 261,440 |

## OCEAN FREIGHT RATES

Indexes of ocean freight rates in terms of trip and time charter for selected countries by cargo type and vessel size are given in table 27. Considerably more detail is now available regarding tanker and dry cargo freight rates by vessel size. No single trend could be determined for the direction of freight rate movement for all the countries listed, but in general rates for western market economy countries declined for tankers, while dry cargo rates increased. Trip charter rates for West German tankers fell 35.3% in 1974, following a nearly threefold increase between 1972 and 1973. Time charter rates for that country for dry cargo shipments climbed 19.8%, but on a quarterly basis they showed a decline throughout the year. Norwegian dry cargo freight rates for trip charter and time charter increased 34.8% and 89%, espectively, over 1973. Rates for the larger vessel sizes decreased for tanker and dry cargo in both Norway and the United Kingdom as high crude oil prices and spreading recession dampened demand, leaving only the smaller carriers in competitive position. The effect of the oil embargo and consequent glut of avail-

able tonnage on centrally planned economy countries was nearly nonexistent, at least as far as freight rates were concerned. Rates were up for the three classes of vessels listed for the past four consecutive years.

## PANAMA AND SUEZ CANALS

In 1974 the number of transits and total cargo moved through the Panama Canal increased by 1.2% and 17.2%, respectively, compared with 1973 figures. Total cargo moved set a new record at 151,927,000 tons as the canal witnessed another year of increase in the average size of ships transiting that waterway, particularly as influenced by the oil embargo and grain shipments to the U.S.S.R. and the PRC. The total number of transits continued to lag behind the levels set at the height of the Vietnam War, but the oil embargo initiated by several major oil producing nations resulted in increased demand and rerouting of crude oil and refinery products through the Panama Canal. The percentage of total cargo moved, which consisted of mineral commodities, increased to 57.6% or 87,500,000 tons, compared with 55.5% or 71,821,000 tons in 1973. Thus an additional 15,679,000 tons or 21.8% was listed as mineral commodity moving through the canal. Mineral commodity movement in comparison with other Panama Canal activity is summarized in the following tabulation:

| | Fiscal years | | |
|---|---|---|---|
| | 1972 | 1973 | 1974 |
| Number of transits: | | | |
| Commercial ocean traffic | 13,766 | 13,841 | 14,033 |
| Other traffic | 1,432 | 1,268 | 1,236 |
| Total | 15,198 | 15,109 | 15,269 |
| Cargo moved (thousand metric tons): | | | |
| Commercial ocean traffic: | | | |
| Mineral commodities | 63,099 | 71,821 | 87,500 |
| Other commodities | 47,999 | 56,087 | 62,626 |
| Subtotal | 111,098 | 127,908 | 150,126 |
| Other traffic, all commodities | 1,873 | 1,481 | 1,801 |
| Total | 112,971 | 129,389 | 151,927 |

Table 25 gives commercial ocean traffic through the Panama Canal in terms of number of transits and total cargo moved by class of vessel for 1973 and 1974. Dry bulk carriers continued to be the primary mover, accounting for nearly half of the total tonnage traversing the Canal and up 23.8% over the 1973 total moved by such vessels. General cargo ships had the highest number of transits, despite the 18.8% drop from the previous year's high, while no combination carriers transited the Canal in 1974. The tonnage moved by tankers was up 38%, with a 30% increase in the number of transits, most of which was from Atlantic to Pacific.

Analysis of mineral commodity movement through the Canal over a 3-year period by commodity and direction of movement is given in table 26. Of the total tonnage of mineral commodities moved, 63.6% by weight was Pacific bound. Several substantial changes occurred in the movement of mineral commodities of historically large volume, particularly fuels. Total transit of crude petroleum was up 45.3% or 5,336,000 tons more than in 1973, while the tonnage of refined products moved was up 33% to 15,362,000 tons.

Coal and coke shipments, largely from the East and Gulf Coast United States, amounted to 18,526,000 tons, up 33.6% over that of 1973. Unlike the previous year when approximately 2.4 million tons bypassed the Canal via the Cape of Good Hope shipping route, an estimated 1.8 million tons bypassed in 1974. The reduction may reflect, in part, the increased cost of operation of vessels on the longer route, particularly during the energy crisis, which drove up the cost of fuel. Pacific-bound shipments of phosphatic fertilizer were up by 623,000 tons as demand for that commodity grew. In general shipments of most major crude ores and

concentrates increased, except in the case of bauxite and alumina, which declined by 427,000 tons. Total movement of copper ores and concentrates was up by 102,000 tons, while the tonnage of zinc ore and concentrate increased to 988,000 tons, up 25.9% from 1973. Iron ore shipments through the Canal increased significantly in both Pacific and Atlantic bound directions, with total tonnage up 629,000 tons or 26.8%.

Prospects appear bright for the reopening of the Suez Canal, possibly by March of 1975. Prior to its closure in 1967 as a result of Arab-Israeli conflict, the canal was a vital trade route, particularly as regard European seaborne imports, one-third of which passed through the Canal. Suez Canal traffic at that time accounted for nearly 14% of total seaborne trade, and its closure, coupled with continued hostility in that region, added extreme impetus to selection of alternative routes or transport methods. The result was a massive expansion in the shipbuilding industry which led to the virtual replacement of a large percentage of the merchant fleet and the creation of a supertanker class of carrier. Expansion plans continued unabated until October 1973, when the oil embargo occurred. Simultaneously plans were being laid to reopen the Suez Canal. Initial clearing operations involved removal of mines, explosives, and abandoned or sunken vessels. Dredging was underway which will allow for the accommodation of tankers of 70,000 deadweight tons laden and 110,000 deadweight tons in ballast. Further widening is expected, and projected transit of both dry and tanker cargo tonnage in 1975 is 120 million tons. In relation to existing trade routes, reopening of the Canal will reduce the length of three principal oil transport routes by 30% to 55%.

## PIPELINES

In 1974 pipeline construction continued to show strong gains, particularly in centrally planned economies. Financing was a major problem in planned pipeline construction and in at least one case shortages of pipe figured significantly in project delays. Although comprehensive summaries of pipeline systems are not available, the following section highlights some of the projects planned or underway in 1974.

In Europe activity remained centered around North Sea developments. Construction continued on the crude line from Ekofisk to Teesside in the United Kingdom while deliveries of natural gas through the Ekofisk to Emden, West Germany, line remained scheduled for late 1975. In the U.S.S.R. plans for 1974 called for the laying of a total of 5,600 miles of oil and gas trunk lines. In addition to the 48-inch, 1,400-mile line from Samotlor to Kuibyshev, a 1,200-mile crude oil line from Subkhankulovo to Novorossisk on the Black Sea was planned. Expansion will be made toward central European U.S.S.R. with gaslines from Komi and Tyumen. However, one major modification in pipeline construction plans was termination of the proposed 2,500-mile crude oil line from Tyumen in West Siberia to Nakhodka on the Pacific. Instead of such a route, crude oil would be piped from Alexandrovskoye in the Tyumen area to a storage area in Central Siberia. From there it would be loaded to a railway, which presumably is already under construction. Thus priority is being given to construction of a second trans-Siberian railroad. Agreement in principal has also been made with COMECON countries for the laying of a 1,900-mile line from the Orenburg gasfield to eastern Europe. In Hungary work began on a 130-mile, 25-inch stretch of the Andria pipeline, which is to supply crude landed at the Bay of Pijeka to refineries in Yugoslavia, Hungary, and Czechoslovakia.

In the Near East the Turkish Petroleum Corp. has asked for postponement of negotiations with Iraq regarding construction of the 620-mile crude oil pipeline from Kirkuk to a terminal in southeast Turkey. The line was expected to supply 25 million tons of Iraq crude per year.

Delays of a legal nature continued to curtail work on the Alaska pipeline, despite the overcoming of numerous technical problems. In anticipation of its eventual startup and completion, however, Costa Rica reportedly has awarded a contract for a 180-mile pipeline from the Pacific Coast to the Atlantic port of Limon to carry Alaska crude to the east coast of the United States. Capacity of the line is to be 1.6 million barrels per day and the project is expected to take 5 years to complete. Preliminary information indicates that Panama may make a similar offering.

Argentina was the primary area of pipeline activity in South America in 1974. In April a 110-mile natural gas line between Mar del Plato and Tandil went into operation with an initial capacity of 2.5 million cubic feet per day, while a 140-mile line from the Monteogudo gasfields to Sucre came onstream with a design capacity of 17.2 million cubic feet per day. A major contract was awarded to a consortium of three United States companies for a 400-mile stretch of trans-Andean pipeline broadly parallel to the Marañon River from San José de Saramuro to the Porculla Pass. The remaining 112-mile link will be laid by an Italian-Argentine company, with completion expected in July 1976. In Peru the 550-mile trans-Andean pipeline from the Corrientes Fields to Bayovar was delayed because of pipe shortages. The completion date for the 36-inch crude line has now been put ahead to January 1977. The line is to have an initial capacity of 200,000 barrels per day, and may be increased to 320,000 barrels per day, but financing continues to be a major problem. Government policy makers in Bolivia are again negotiating for the export of gas to Brazil via a 1,900-mile line from Santa Cruz to São Paulo. Capacity of the line is to be 240 million cubic feet per day.

## PRICES

The price increases which so markedly characterized the major mineral commodity price movements in 1973 were overshadowed by a pricing situation in 1974 which outstripped all previous levels and even the most generous of expectations in the light of continued restricted fuel supplies. Even the relatively quiescent price of lead moved considerably higher in response to related mineral commodity price movement. Despite the paucity of detailed average world price data for steel and other large-volume mineral commodities such as crude oil and refinery products, prices again increased based on general industry information from both suppliers and consumers.

As regards pricing situations for specific mineral commodities, tables 28, 29, and 30 give average annual prices for the 3-year period 1972–74 for several major nonferrous metals on three world markets—the United States, the United Kingdom, and Canada. Also included are average monthly prices for 1974 for these same commodities. The date listed in the tables indicate that, without exception, average annual prices for each of the commodities in each country increased in 1974 with respect to 1973. It should be noted that in Canada aluminum producers continued to cease quoting a published price for that commodity, a practice begun in 1972. Three consecutive years of decline of aluminum prices in the United States was reversed in 1974 when the average annual price increased 36.5% over that of 1973. Prices had fallen 5.3% the previous year but then jumped 16% to 29.0 cents per pound at the beginning of 1974. By mid-1974 the price was at 33.5 cents per pound and continued its upward climb, reaching a high of 39.0 cents per pound at the end of the third quarter which persisted through the remainder of the year. A nearly analogous price movement situation held true for the United Kingdom. After a decline of 3 years, the average annual price of aluminum climbed, with several minor monthly reverses, throughout the year, finishing up 31.8% at 34.690 cents per pound. The pattern of monthly copper price movement was relatively the same for each of the three markets, but the percent change varied considerably. At the start of the year all three markets had price increases of 14% to 17%, with the level in the United Kingdom continuing a strong increase until May when prices began at first a precipitous, then a gradual decline to the end of the year, ending up 15.2% higher than in 1973. A peak price of 137.565 cents per pound was reached in April, 70.2% above the previous year's annual average. In Canada copper prices climbed for the first 6 months, then began a gradual but steady decline through the rest of the year, ending up 24.9% over that of 1973. Copper prices in the United States were up 30.2% over the previous year, but monthly prices were erratic in the first quarter. In January 1974 prices were up 15.7% from the previous year's average, but then declined to 67.950 cents per pound for the next 3 months. In May prices jumped again and continued to a yearly high in July and August. However, in September United

States copper prices began a decline which continued through the last quarter, but the loss was insufficient to wipe out the gains made in the earlier part of the year. Lead prices in the United States and Canada were up 38.4% and 28.0%, respectively, in 1974. United States lead prices increased for the first 6 months, then remained at 24.50 cents per pound for the remainder of the year. Canadian lead prices rose consistently to a high of 21.50 cents per pound in May and remained at this level. Lead prices in the United Kingdom were more erratic, increasing during the first quarter, then declining for four successive months with a mild rebound in August, then falling again for 3 months but ending the year up in December. Despite such mild declines, the magnitude of the increases was predominant, boosting the annual average 38.3% for the year. Zinc prices for all three countries were up considerably, with average annual price increases of 74.0% for the United States, 46.1% for the United Kingdom, and 45.9% for Canada. United States prices were up for every month except May and November, while United Kingdom prices increased until June when a decline occurred, which brought the average monthly price of zinc down to nearly half the level posted in January. Canadian prices were either up or stable for each month, with December prices up 19.4% over the January level. Tin prices continued to stage major increases, climbing 75.5% in the United States in 1974 compared with 28.7% in 1973. United Kingdom prices were up 70.3%, despite three consecutive months of decline in the third quarter. Silver prices, which had increased approximately 51% in 1973 for both the United States and the United Kingdom, again jumped dramatically. United States silver prices closed the year up 84.4%, while United Kingdom prices were up 85%. No yearly average was reported for Canadian silver prices in 1973, but by yearend 1974, prices were up 19.7% from the beginning of the year.

The mineral commodity export price indexes given in table 31 list export price indexes for metal ores and fuels, as well as an index for all crude minerals combined. The price index for exported crude minerals jumped 296 index points (1963= 100) or 164% in 1974 over that of 1973. Increases were recorded for each consecutive quarter, with the fourth quarter index at 486. Even more spectacular was the export price index for fuels, which was up 194%, or 365 index points over the 1973 level. The price index for fuels also increased each consecutive quarter, ending the year at an all-time high of 565. Metal ores, which were up 20.2% in 1973, climbed another 34.2% in the commodity price boom which highlighted 1974. The metal ores export price index reached a high of 231 in the second quarter of 1974, but then tapered off to 207 at yearend.

The United Nations analysis of export price indexes given in table 32 breaks down price indexes for developed and developing areas in terms of total minerals and nonferrous base metals. The annual average export price index for total minerals for developing areas increased from 178 in 1973 to 536 in 1974, a record 201%. The export price index for nonferrous base metals for that same area also increased at 26.6%, but this was considerably below the 56.5% registered in 1973. It can be seen that the index dropped drastically from 407 in the second quarter to 233 by yearend. Developed areas registered a 26.1% increase in the nonferrous base metals index, with the high for the year occurring in the second quarter, while the index for total minerals was up 69.1%. Unlike the price indexes for the developing areas, which attained their greatest momentum in the first half of the year, the index for total minerals for developed areas shows a longer lead time for prices to reach their maximum, which took place in the final quarter.

## STATISTICAL SUMMARY OF WORLD PRODUCTION AND TRADE OF MAJOR COMMODITIES

The final 31 tables in this chapter (tables 33 to 63) extend the statistical series that was started in the 1963 edition of the International Area Reports volume of the Minerals Yearbook and that was subsequently updated in the 1965 and 1967–73 editions. They are primarily a supplement to other statistical data within this chapter but also serve as a summary of international production and trade data for

major commodities covered in greater detail on a commodity basis in Volume I of the 1974 Minerals Yearbook and on a country basis in the balance of Volume III.

The data presented here on production (tables 33 to 51) in most instances correspond to the commodity world production tables appearing in Volume I of 1974 Minerals Yearbook, and as such may not correspond exactly with figures presented in the individual country chapters of Volume III. Such differences are usually the result of the receipt of revised data for inclusion in one chapter subsequent to the completion of the other chapter. In most cases, the individual country chapters were prepared later, and therefore should be regarded as more reliable.

The data on world trade in major commodities presented in this chapter (tables 52 to 63) may not correspond exactly to those presented elsewhere in Volume III of the Minerals Yearbook because these summary tables are compiled at least in part from sources other than those used in the individual country chapters in order to obtain data on a consistent basis. The differences, however, are regarded as unimportant from the viewpoint of indicating the general pattern of trade in these commodities. It should be noted that table 58, covering manganese trade is a new addition to this chapter.

**Table 1.—United Nations indexes of world [1] mineral industry production**

| Nitrogen fertilizers, contained nitrogen [7] ---- do | r 35,028 | 37,923 | 40,852 |
| Phosphate rock ---- do | r 90,031 | 98,781 | 110,381 |
| Potash (marketable), $K_2O$ equivalent ---- | r 20,012 | 22,042 | 23,668 |
| Pumice [3] ---- do | r 15,601 | 14,874 | 13,083 |
| Salt ---- do | r 146,413 | 151,193 | 157,266 |
| Strontium minerals [3] ---- metric tons | r 100,154 | 93,261 | 97,804 |
| Sulfur, elemental: [8] | | | |
| Frasch and from ores ---- thousand metric tons | 14,125 | 16,128 | 18,059 |
| Content of pyrite [9] ---- do | 10,721 | 10,641 | 10,676 |
| Byproduct ---- do | 20,520 | 22,276 | 22,825 |
| Total ---- do | 45,366 | 49,045 | 51,560 |
| Talc, soapstone, pyrophyllite ---- do | r 4,830 | r 5,269 | 5,464 |
| Vermiculite [3] ---- do | 465 | 498 | 503 |

See footnotes at end of table.

## Table 2.—World production [1] of major mineral commodities—Continued

| Commodity | | 1972 | 1973 | 1974 [p] |
|---|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS | | | | |
| Coal: [10] | | | | |
| Anthracite | million metric tons | 175 | 176 | 187 |
| Bituminous | do | [r] 2,049 | 2,094 | 2,110 |
| Lignite | do | [r] 793 | 819 | 833 |
| Total | do | [r] 3,017 | 3,089 | 3,130 |
| Coke: | | | | |
| Metallurgical | thousand metric tons | [r] 340,525 | 368,547 | 370,804 |
| Other types | do | [r] 18,172 | 17,627 | 17,590 |
| Fuel briquets | do | 94,713 | 86,761 | 90,266 |
| Gas, natural, marketed | billion cubic feet | [r] 43,425 | 46,139 | 47,130 |
| Peat | thousand metric tons | [r] 200,618 | 199,737 | 199,893 |
| Petroleum, crude | million barrels | [r] 18,601 | 20,368 | 20,516 |

[p] Preliminary. [r] Revised.

[1] Incorporates numerous revisions from world production tables and country production table appearing in Volumes I and III, respectively, of the Minerals Yearbook as well as in the corresponding table in previous editions of this chapter.

[2] U.S. production withheld to avoid disclosing individual company confidential data.

[3] Excludes production from centrally planned economy countries: Albania, Bulgaria, the People's Republic of China, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, North Korea, North Vietnam, Poland, Romania, the U.S.S.R. and Yugoslavia, except in the case of vanadium which includes a figure for the U.S.S.R. alone.

[4] Data presented for pig iron includes relatively small quantities of ferroalloys (not duplicating quantities reported under ferroalloys) produced in a few countries that do not report ferroalloys production separately from pig iron production.

[5] Excludes portion produced in the United States which in previous years accounted for approximately 50% of the total.

[6] Excludes production from countries listed in footnote 3 except for Yugoslavia.

[7] Years ending June 30 of that stated.

[8] Series revised from that published in previous editions to include additional forms of sulfur not previously reported, including most prominently, sulfur content of pyrite. Other forms of sulfur incorporated include sulfur recovered directly as acid from metallurgy and sulfur content of gypsum used for production of sulfur and/or sulfur compounds.

[9] Pyrite heretofore has been reported separately, and on a gross weight basis rather than in terms of sulfur content. Gross weight figures corresponding to the sulfur content figures entered here were as follows, in thousand metric tons: 1972—[r] 22,856; 1973—22,914; 1974—23,640.

[10] Production of coal by some countries is not reported divided into the three categories listed; such output has been distributed to the three listed grades according to best available information from supplementary sources relating to the quality of such coals.

## Table 3.—Approximate percentage distribution of world mineral commodity production by major areas in 1974 [1]

| Commodity | Western Hemisphere | | | Eastern Hemisphere | | | | | | | World | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | Europe | | | Near East and Asia | | | | | |
| | North and Central America [2] | South America | Total | Market economy [3] | Centrally planned economy [4] | Africa | Market economy [5] | Centrally planned economy [6] | Oceania | Total | Market economy | Centrally planned economy |
| **METALS** | | | | | | | | | | | | |
| **Aluminum:** | | | | | | | | | | | | |
| Bauxite | 24.7 | 13.9 | 38.6 | 10.5 | 9.8 | 9.7 | 5.0 | 0.8 | 25.6 | 61.4 | 89.4 | 10.6 |
| Alumina | 38.0 | 6.9 | 44.9 | 14.5 | 12.5 | 2.3 | 7.8 | 1.0 | 17.0 | 55.1 | 86.5 | 13.5 |
| Aluminum ingot | 41.8 | 1.6 | 43.4 | 25.0 | 14.8 | 2.1 | 11.1 | 1.1 | 2.5 | 56.6 | 84.1 | 15.9 |
| Antimony, mine output | 7.6 | 19.9 | 27.5 | 5.9 | 11.3 | 25.1 | 11.4 | 16.7 | 2.1 | 72.5 | 72.0 | 28.0 |

| MINERAL FUELS AND RELATED MATERIALS | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Coal: | | | | | | | | | | | | |
| Anthracite and bituminous | 24.5 | .4 | 24.9 | 10.7 | 31.3 | 2.9 | 5.7 | 21.6 | 2.9 | 75.1 | 47.1 | 52.9 |
| Lignite | 2.1 | -- | 2.1 | 21.9 | 71.2 | -- | 1.1 | .3 | 3.4 | 97.9 | 28.5 | 71.5 |
| Coke: | | | | | | | | | | | | |
| Metallurgical | 17.1 | .9 | 18.0 | 24.4 | 31.4 | 1.2 | 15.4 | 8.2 | 1.4 | 82.0 | 60.4 | 39.6 |
| Other types | -- | .3 | .3 | 10.6 | 41.7 | .8 | 46.4 | -- | .2 | 99.7 | 58.3 | 41.7 |
| Fuel briquets | -- | -- | -- | 15.3 | 69.5 | .7 | 13.3 | -- | 1.3 | 100.0 | 30.5 | 69.5 |
| Gas, natural, marketed | 53.5 | 2.1 | 55.6 | 12.4 | 23.2 | 1.2 | 4.6 | 2.6 | .4 | 44.4 | 74.2 | 25.8 |
| Peat | .5 | -- | .5 | 3.6 | 95.9 | -- | -- | -- | -- | 99.5 | 4.1 | 95.9 |
| Petroleum, crude | 20.0 | 7.2 | 27.2 | .6 | 17.1 | 9.8 | 42.3 | 2.3 | .7 | 72.8 | 80.6 | 19.4 |

NA No percentage calculated because production data are not available and no basis is available for formulation of reliable estimate of output level.

[1] Percentages in this table have been calculated from commodity tables prepared for Volume I of the 1974 Minerals Yearbook, and as such may differ slightly from percentages that might be prepared using data from the country chapters in Volume III of the 1974 Minerals Yearbook.

[2] Includes Caribbean Islands.

[3] Austria, Belgium, Denmark, Finland, France, West Germany, Greece, Greenland, Iceland, Ireland, Italy, Luxembourg, Malta, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, United Kingdom and Yugoslavia.

[4] Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

[5] Afghanistan, Bahrain, Bangladesh, Brunei, Burma, Cyprus, Hong Kong, India, Indonesia, Iran, Iraq, Israel, Japan, Jordan, Khmer, Republic of Korea (South Korea), Kuwait, Laos, Lebanon, Malaysia, Oman, Pakistan, Philippines, Qatar, Saudi Arabia, Singapore, Sri Lanka, Syria, Taiwan, Thailand, Turkey, United Arab Emirates, South Vietnam, Yemen Republic, and People's Republic of Yemen.

[6] People's Republic of China, North Korea, Mongolia, and North Vietnam.

[7] Percentages calculated from a total with no figure included for the United States because U.S. data are withheld to avoid disclosing individual company confidential information.

[8] Percentages calculated from a total including no estimates for production by any centrally planned economy countries.

[9] Percentages calculated from a total including no estimates for production by centrally planned economy countries of Asia.

[10] Production negligible (less than 0.05% of total world output).

## Table 4.—Geographic distribution of world crude mineral production value by country

| Country | Value of production [1] (million 1973 U.S. dollars) | | | Country's share of total [2] (percent) | | | Country's rank among world producers [3] | | |

[1] Values are as reported in source except that the value assigned therein for Puerto Rico has been added to that for the United States, and the value assigned therein for the Kuwait-Saudi Arabia Partitioned Zone has been equally divided between Kuwait and Saudi Arabia.

[2] Percentages are as reported in source except for inclusion of Puerto Rico with the United States and division of the Kuwait-Saudi Arabia Partitioned Zone's share between Kuwait and Saudi Arabia. Some percentages differ slightly from percentages calculated from corresponding value data in this table due to rounding of value data.

[3] Rankings are as reported in source except that the Kuwait-Saudi Arabia Partitioned Zone, ranked in the source as 36th in 1973 and 1968 (no production in 1950), has been omitted and all lower ranked countries have been advanced by one number. (Puerto Rico ranked below 40th, and as such did not influence rankings listed separately.)

[4] Includes Puerto Rico.

[5] Includes allowance for Kuwait-Saudi Arabia Partitioned Zone.

[6] Values and percentages derived by difference between sum of figures for individually listed countries above and listed totals; for this reason percentages given may not be calculable from listed values.

## Table 6.—Value of world export trade in major mineral commodity groups [1]

(Million U.S. dollars)

| Commodity group [1] | 1969 [r] | 1970 [r] | 1971 [r] | 1972 [r] | 1973 |
|---|---|---|---|---|---|
| Metals: | | | | | |
| All ores, concentrates, scrap | 6,360 | 8,110 | 7,120 | 7,730 | 11,220 |
| Iron and steel | 13,710 | 17,070 | 17,760 | 20,080 | 28,510 |
| Nonferrous metals | 11,180 | 12,200 | 10,410 | 11,700 | 16,940 |
| Subtotal | 31,250 | 37,380 | 35,290 | 39,510 | 56,670 |
| Nonmetals (crude only) | 2,270 | 2,380 | 2,820 | 3,190 | 4,160 |
| Mineral fuels | 24,480 | 28,290 | 36,520 | 44,060 | 63,100 |
| Total | 58,000 | 68,050 | 74,630 | 86,760 | 123,930 |
| All commodities | 271,910 | 311,990 | 348,980 | 415,330 | 572,650 |

[r] Revised.

[1] Data presented are for selected major commodity groups of the Standard International Trade Classification—Revised (SITC—R), and as such exclude some mineral commodities classified in that data array together with other (nonmineral) commodities. SITC—R categories included are as follows: Ores, concentrates, and scrap—SITC Division 28; iron and steel—SITC Division 67; nonferrous metals—SITC Division 68; nonmetals (crude only)—SITC Division 27; mineral fuels—SITC Division 3. Major items not included are the metals, metalloids, and metal oxides of SITC Group 513; mineral tar and crude chemicals from coal, petroleum, and natural gas of SITC Division 52; manufactured fertilizers of SITC Division 56; and nonmetallic mineral manufactures of SITC Groups 661, 662, 663, and 667.

## Table 7.—Distribution of total value of export trade in major mineral commodity groups by group [1]

(Percent)

| Commodity group [1] | 1969 | 1970 | 1971 | 1972 | 1973 |
|---|---|---|---|---|---|
| Metals: | | | | | |
| All ores, concentrates, scrap | 11.0 | 11.9 | 9.5 | 8.9 | 9.0 |
| Iron and steel | 23.6 | 25.1 | 23.8 | 23.1 | 23.0 |
| Nonferrous metals | 19.3 | 17.9 | 14.0 | 13.5 | 13.7 |
| Total | 53.9 | 54.9 | 47.3 | 45.5 | 45.7 |
| Nonmetals (crude only) | 3.9 | 3.5 | 3.8 | 3.7 | 3.4 |
| Minerals fuels | 42.2 | 41.6 | 48.9 | 50.8 | 50.9 |
| Grand total | 100.0 | 100.0 | 100.0 | 100.0 | 100.0 |

[1] For detailed definition of groups, see footnote 1, table 6.

## Table 8.—Growth of value of export trade in major mineral commodity groups, by group [1]

(Percent increase over previous year)

| Commodity group [1] | 1969 | 1970 | 1971 | 1972 | 1973 |
|---|---|---|---|---|---|
| Metals: | | | | | |
| All ores, concentrates, scrap | 13.8 | 27.5 | −12.2 | 8.6 | 45.2 |
| Iron and steel | 20.1 | 24.5 | 4.0 | 13.1 | 42.0 |
| Nonferrous metals | 18.4 | 9.1 | −14.7 | 12.4 | 44.8 |
| All metals | 18.2 | 19.6 | −5.6 | 12.0 | 43.4 |
| Nonmetals (crude only) | 4.6 | 4.9 | 18.5 | 13.1 | 30.4 |
| Mineral fuels | 6.3 | 15.6 | 29.1 | 20.7 | 43.2 |
| All major mineral commodity groups | 12.3 | 17.3 | 9.7 | 16.3 | 42.8 |
| All commodity groups | 14.1 | 14.7 | 11.9 | 19.0 | 37.9 |

[1] For detailed definition of groups, see footnote 1, table 6.

## Table 9.—Significance of trade in major mineral commodity groups [1] to total trade of various world areas in 1973

| Area and country [2] | Value, million U.S. dollars | | | | Major mineral share of total commodities (percent) | |
|---|---|---|---|---|---|---|
| | Major mineral commodity groups | | All commodities | | | |

[1] For detailed definition of groups, see footnote 1, table 6.

[2] Regional groupings generally conform to United Nations practice; modifications and special aspects of classification scheme are as follows: (1) Latin America includes Mexico, Central America, and South America, but excludes Caribbean Islands; (2) EEC consists of Belgium, Denmark, France, West Germany, Ireland, Italy, Luxembourg, the Netherlands, and the United Kingdom; (3) EFTA consists of Austria, Finland, Iceland, Norway, Portugal, Sweden and Switzerland; (4) Other market economy Europe consists of Greece and Spain as well as Yugoslavia (a centrally planned economy country); (5) centrally planned Europe includes Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.; (6) Other Africa corresponds to the United Nations category "Developing Africa"; (7) Near East corresponds to the United Nations category "Developing Asia, Middle East"; (8) Other market economy South Asia and Far East refers to the United Nations category "Developing Asia, Other"; (9) centrally planned Far East and South Asia consists of the People's Republic of China, North Korea, Mongolia, and North Vietnam; (10) the category "Not reported" is derived by subtracting all listed figures from reported totals, and includes the Caribbean and Pacific Islands.

[3] Partial figure; value of crude nonmetals excluded but presumably included under "Not reported."

[4] Percentage based on partial figure; see footnote to entry in "Exports from" value column.

[5] Partial figure; includes value of mineral fuels and crude nonmetals only; totals for other commodity groups presumably included under "Not reported."

[6] Partial figure; value of iron and steel excluded, but presumably included under "Not reported."

[7] Partial figure; includes value of mineral fuels only; totals for other commodity groups presumably included under "Not reported."

[8] Partial figure; value of metal ores, concentrates, and scrap as well as crude nonmetals excluded but presumably included under "Not reported."

NA Not available. XX Not applicable.

[1] For detailed listing of commodities included, see footnote 1, table 6. It should be noted that certain commodities excluded for specific areas as indicated by footnotes are presumably included in grand totals.

[2] For detailed definitions of areas listed see footnote 2, table 9.

[3] Not reported in source. Data represents the difference between reported total detail. In selected cases the reported detail exceeds the reported total.

[4] Excludes crude nonmetals.

[5] Includes crude nonmetals and mineral fuels only.

[6] Excludes iron and steel.

[7] Includes mineral fuels only.

[8] Excludes crude nonmetals and metal ores and scrap.

[9] Summation of detail exceeds reported total by 5 million. Reason for discrepancy is unknown.

[10] As reported in source. Detail may not add to listed total.

[11] Summation of detail exceeds reported total by 80 million. Reason for discrepancy is unknown.

[12] Summation of detail exceeds reported total by 36 million. Reason for discrepancy is unknown.

[13] Summation of detail exceeds reported total by 54 million. Reason for discrepancy is unknown.

[1] Yearly data based on a total of three categories: Iron ore for steelworks, for agglomerates, and iron ore and concentrate for blast furnaces. An estimated figure is based on a partial total of these three categories or is an apparent consumption computed by adding production and imports and then deducting exports.

[2] Includes sinter produced at mines.

[3] Includes calcined ores.

[4] Includes 422,000 metric tons of contained metal for steelworks in 1972, 211,000 metric tons in 1973, and 208,000 metric tons in 1974.

Source: United Nations Economic Commission for Europe, Annual Bulletin of Steel Statistics for Europe, 1974. V. II, New York, 1975, and official production and trade statistics for selected countries.

## Table 14.—Estimated world [1] consumption of major nonferrous metals

| Commodity | | 1972 r | 1973 r | 1974 p |
|---|---|---|---|---|
| Aluminum [2] | thousand metric tons | 12,036 | 13,308 | 13,648 |
| Copper [3] | do | 7,956 | 8,676 | 8,130 |
| Lead [4] | do | 3,962 | 4,214 | 4,058 |
| Zinc [5] | do | 5,199 | 5,650 | 5,341 |
| Tin [6] | thousand long tons | 188 | 209 | 197 |

p Preliminary. r Revised.

[1] In general, figures are totals for major consuming countries only; sum of consumption by excluding minor consumers may be significant; data included for centrally planned economy countries (except Yugoslavia) are listed as conjectural in source.

[2] Apparently includes secondary metal.

[3] Primary and secondary refined metal.

[4] Chiefly primary, but including some secondary.

[5] Primary and secondary slab.

[6] Primary only as reported by the International Tin Council. Centrally planned economy countries (except Yugoslavia) are excluded; consumption of primary and secondary tin by these countries is estimated at about 60,000 long tons annually.

| 1973 | 2,503 | 3,598 | 1,623 | 186 | 7,909 | 2,080 |
| 1974 | 2,531 | 3,567 | 1,668 | 205 | 7,971 | 2,059 |

[1] In most cases data are aggregates of country figures representing apparent inland consumption—the arithmetic result of adding production and imports and subtracting from this sum the total of exports, bunker loadings, and additions to stocks (where the latter are known). All totals in this table are reported in source and may not represent the sum of listed parts due to rounding and/or omission from detail of minor quantities not listed separately. A large number of entries in this table have been revised from those appearing in previous editions of this chapter due to revisions published in new edition of source; such revisions have not been identified by footnotes.

[2] Areas listed are those appearing in source and have not been conformed in scope to standard terms used elsewhere in the Minerals Yearbook.

[3] Includes Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

[4] Includes People's Republic of China, North Vietnam, Mongolia, and North Korea.

[1] Maritime Administration classification. Tankers include whaling tankers. Vessels shown here as "Other" include combination passenger and cargo, combination passenger and refrigerated cargo, and refrigerated freighters. Contribution of these vessels to mineral commodity trade is regarded as unimportant. Data are as of December 31 of year indicated.

## Table 21.—World shipping (tanker and dry cargo) loadings and unloadings
(Million metric tons)

## Table 24.—Distribution of world oil tanker tonnage, by size group [1]

| Size group (deadweight tons) | 1966 | | 1974 | | | |
|---|---|---|---|---|---|---|
| | | | In service | | New building in progress or on order at yearend | |
| | Million deadweight tons | Percent of total | Million deadweight tons | Percent of total | Million deadweight ton [2] | Percent of total |
| Under 25,000 [1] | 30.0 | 30.2 | 21.9 | 8.6 | 1.1 | .7 |
| 25,000–45,000 | 25.3 | 25.5 | 30.5 | 11.9 | 7.1 | 4.3 |
| 45,000–65,000 | 21.2 | 21.3 | 22.6 | 8.9 | 1.8 | 1.1 |
| 65,000–125,000 | 21.8 | 21.9 | 46.4 | 18.1 | 17.6 | 10.7 |
| 125,000–205,000 | 1.1 | 1.1 | 18.0 | 7.0 | 21.4 | 13.0 |
| 205,000–285,000 | -- | -- | 105.5 | 41.2 | 57.9 | 35.2 |
| 285,000 and over | -- | -- | 10.9 | 4.3 | 57.5 | 35.0 |
| Total | 99.4 | 100.0 | [3]255.8 | 100.0 | 164.4 | 100.0 |

[1] Includes vessels 2,000 deadweight tons and over for 1966 and 10,000 deadweight tons and over for 1974.
[2] Excludes 7.3 million deadweight tons combined carriers.
[3] Data differ slightly from total given in table 20 because of difference in source.

[e] Estimate. NA Not available. XX Not applicable.

[1] Data presented are compiled from import statistics of countries listed as recipient countries unless otherwise specified and, as such, are incomplete, but are believed to account for the overwhelming share of total world movement of bauxite and alumina.

[2] Unless otherwise specified, figures are those reported in latest country chapter of Volume III, Minerals Yearbook. Data on bauxite production are on dry equivalent basis for a number of countries, and as such may be reported on a different basis from bauxite exports, which almost universally are on a gross weight basis and which are obtained from the Statistical Office of the United Nations and other sources. Data on alumina production are generally for output prior to calcination, while data on alumina exports, also from the Statistical Office of the United Nations and official country source data, include aluminum hydroxide and thus may not be exactly comparable.

[3] Countries selected are most of the world's significant aluminum producers that depend upon imports of bauxite and/or alumina for a significant share of their raw material requirements, plus a few minor countries for which data were readily available. Data are from the Statistical Office of the United Nations except for the U.S.S.R. and Canadian figures, which are from official Soviet and Canadian sources.

[4] Includes U.S. Virgin Islands.

[5] Less than ½ unit.

[6] Data for fiscal year ending September 1973.

[7] Data represent export figures of source country.

[8] World Mining, June 25, 1975.

[9] Figure represents difference between reported detail and reported total.

## Table 53.—Major trade in iron ores, concentrates, and agglomerates (excluding roasted pyrite) [1] in 1973

[1] Disparities between recorded total exports of source countries and totals of recorded imports of recipient countries from each listed source country are generally due to (1) time lag between shipment and receipt and (2) the fact that the latter totals are incomplete, representing only the imports of the nations listed in the column heads and in footnotes 11, 12 and 13.

[2] Unless otherwise specified, data are compiled from official import statistics of listed recipient countries.

[3] Unless otherwise specified, data are from official export statistics of listed source countries.

[4] Official import statistics for Czechoslovakia, Poland, Romania, and the United Kingdom do not fully distribute total imports by country of origin, and therefore do not clearly indicate whether these nations received shipments from any of the source countries where this footnote has been entered.

[5] Official mineral statistics publication of source country rather than official trade returns.
[6] Less than 500 metric tons.
[7] World Mining, June 25, 1975, p. 138.
[8] Figures adjusted from those reported in official import statistics of Belgium-Luxembourg, France, West Germany, and the Netherlands to compensate for ores originating in Sweden and recorded as a part of the exports of that country in official Swedish export statistics, but shipped through Narvik, Norway, and as a result credited in recipient country's import statistics as originating in Norway.
[9] Official Norwegian export statistics (an equal amount has been subtracted from the total tonnage for which no origin was reported).
[10] Summation of (1) recorded exports of the following countries, with export quantity following country name, in thousand metric tons: Austria—1; Belgium-Luxembourg—77; Bolivia—2; Denmark—6; West Germany—6; Hong Kong—159; Iran—1; Republic of Korea (South Korea)—261; Morocco—490; Netherlands—540; New Zealand—1,959; Poland—2; Tunisia—424; and Switzerland—4; together with (2) apparent exports (as measured by imports of trading partner countries) with apparent export quantity following country name, in thousand metric tons, and trading partner countries listed in parentheses: Czechoslovakia—42 (Austrian imports only); Indonesia—280 (Japanese imports only); North Korea—423 (Japanese imports only); Panama—73 (Mexican imports only). In addition to the foregoing list of countries, Italy, Japan, Portugal, the United Kingdom, and Yugoslavia recorded iron ore exports, but each of these nations individually exported less than 500 tons apiece.
[11] Includes the following countries with recorded total imports of each following the country name, in thousand metric tons: Austria—1,970; Bulgaria—1,602 (based on export data of the U.S.S.R. only); Denmark—2; Finland—947; East Germany—2,902 (based on export data of Sweden—170 and the U.S.S.R.—2,732); Greece—854; Norway—44; Portugal—492; Spain—5,116; Sweden—less than one-half unit; Switzerland—28; and Yugoslavia—390.
[12] Includes the following countries with recorded total imports of each following the country name, in thousand metric tons: Australia—15; Republic of Korea (South Korea)—467; Malaysia—14; Singapore—50.
[13] Includes the following countries with recorded total imports of each following the country name, in thousand metric tons: Argentina—1,235; Brazil—less than one-half unit; Mexico—75; Venezuela—less than one-half unit.
[14] Includes the following reported source countries with total quantity credited to each following the country name in thousand metric tons: Argentina—31; Belgium-Luxembourg—47; Bolivia—21; Czechoslovakia—42; Denmark 8; Gabon—24; West Germany—132; Greece—37; Hong Kong—149; Indonesia—280; Iran—6; Italy—64; Japan—137; North Korea—423; South Korea—280; Libya—369; Malta—32; Morocco—377; Mozambique—281; Netherlands—122; New Zealand—2,029; Panama—73; Portugal—113; Tunisia—359; Yugoslavia—3.

XX Not applicable.

[1] Unless otherwise specified, data are complied from export statistics for countries listed as source countries in stub of table.

[2] Detail may not add to listed total due to rounding.

[3] Less than ½ unit.

[4] World Bureau of Metal Statistics, World Metal Statistics, v. 29, No. 3, 1976.

[5] Includes 32,300 tons to Argentina.

[6] Includes 31,300 tons to Hungary and 17,000 tons to Romania.

[7] Includes 29,000 tons to India.

[8] Includes the following countries (total exports in thousand tons in parentheses following names): Australia (NA); Austria (10); Denmark (2); Finland (24); France (16); Italy (8); Japan (30); Netherlands (13); New Zealand (1); Norway (34); Spain (19); Switzerland (6); Yugoslavia (78).

NA Not available. XX Not applicable.

[1] Because some countries do not report destination for a portion of exports (see unallocated column), figures given for distribution of those countries' exports by continental area are not exactly correct. However, such unallocated quantities are sizable only in the case of some of the centrally planned economy countries and the Republic of South Africa.

[2] All Western Hemisphere areas except the United States and Canada.

[3] Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R.

[4] Excludes wheels, tires, and axles.

[5] Excludes exports to East Germany.

[6] Excludes exports to Belgium-Luxembourg, which were approximately 600,000 tons.

[7] Partial figure; derived from import data of partner countries. Source: Statistical Office of the United Nations. 1973 World Trade Annual. V. III, Walker and Co., New York, 1974, 475 pp.

[8] The distribution is composed of partial figures derived from import data of major trading partners utilizing the source in footnote 9. The total is taken from United Nations, 1973 Annual Bulletin of Steel Statistics for Europe, v. I, New York, 1974, p. 42.

[9] The distribution is official Romanian trade statistics and does not include ingots. The total includes ingots and is taken from the source in footnote 10.

[10] Year ended June 30, 1973.

[11] Bahrain, Cypress, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Muscat and Oman, Qatar, Saudi Arabia, People's Democratic Republic of Yemen, Syria, United Arab Emirates, Turkey, and Yemen Arab Republic.

[12] Consists of the People's Republic of China, North Korea, North Vietnam; Mongolia is included under other market economy South Asia and Far East, owing to its inseparability from this group in source.

NA Not available.

[1] Compiled from official import statistics of the listed destination countries except where otherwise indicated.

[2] Includes the following countries except as indicated by footnote 13 (with total quantities credited to each in parentheses, following the country name, in metric tons): Argentina (2), Austria (20), Belgium-Luxembourg (38,709), Bolivia (479), Canada (556), France (32,373), West Germany (7,724), Greece (9,104), Hungary (14,052), Indonesia (7,339), Iran (9,552), Ireland (1,484), Italy (50), Japan (1,808), Mozambique (438), Netherlands (24,598), New Hebrides (33,605), Philippines (1,939), Portugal (6,278), Romania (21,956), Singapore (1,952), Sweden (214), Thailand (14,182), Turkey (473), Uganda (1,654), United Kingdom (1,462), United States (54,304). These figures represent reported origins of shipments received rather than reported exports of the listed countries, and the list includes a number of countries which do not produce manganese ore. Receipts from these countries presumably are either transshipments through the listed country or re-exports.

[3] Includes materials reported as originating in Congo (Brazzaville), but believed to have originated in Gabon, as follows, in metric tons: Belgium-Luxembourg—25,219; West Germany—69,659; Japan 2,892; Netherlands—2,002; Norway—42,133; and United Kingdom—42,488.

[4] Data compiled from export statistics of source countries.

[5] Data from export statistics of Sweden.

[6] Import statistics of the Netherlands include a substantial quantity of material originating from unreported origins; the bulk of this material is believed to have originated in Brazil and Morocco, on the basis of export statistics of those nations.

[7] Spanish import statistics officially report this as originating in the "Equatorial Customs Union;" it is believed that Gabon is the origin.

[8] Includes the following countries reporting imports (with total imports in parentheses, following the country name, in metric tons): Australia (4,870), Austria (742), Denmark (3,384), Finland (44), Greece (2,394), Hong Kong (662), Malaysia (West only) (834), Mexico (8,350), Morocco (28), Philippines (2,433), Portugal (123), and Thailand (334); as well as recorded exports of source countries to other destinations (with recorded exports of all listed source countries to these destinations in parentheses, following the destination country name, in metric tons): Bangladesh (25), Chile (47), Colombia (2,526), Egypt (479), Indonesia (1,900), Iran (360), Kenya (200), Sri Lanka (458), and Venezuela (686).

[9] Based on export statistics of Mexico; includes Colombia (2,526) and Venezuela (686).

[10] Sum of figures listed for individual destinations, including those items covered by footnote 4.

[11] Actual recorded exports of listed source countries from official trade returns unless otherwise specified.

[12] Exports reported in source other than official trade returns.

[13] Includes the following countries (quantities in parentheses, following country name, in metric tons): Belgium-Luxembourg (2,846), France (9,923), West Germany (4,023), Greece (8,363), Italy (30), Japan (1,812), Netherlands (38,290), Portugal (3,386), Singapore (2,320), Sweden (341), Thailand (17,240), United Kingdom (3,520), and United States (52,115).

## Table 59.—Major world trade in zinc ores and concentrates [1]

| Centrally planned Asia | .21 | .18 | 1.42 | 1.44 | NA | NA |
| Centrally planned Europe | 37.12 | 38.22 | 6.00 | 5.99 | NA | NA |
| Total [3] | 380.30 | 399.18 | 351.43 | 366.74 | 153.90 | 164.73 |

NA Not available.
[1] Figures given are for fuel commodities only, excluding lubricants and other refinery products not normally used as energy sources. Apparent discrepancies between export, import, and bunker totals evidently result from quantities of material en route at yearend, from incomplete data, and from differing practices from country to country in the method of reporting bunkering materials.
[2] Continental areas are the same as those used in table 61 except that Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, and the U.S.S.R. are reported under the group term "Centrally planned Europe," while the People's Republic of China, North Korea, Mongolia, and North Vietnam are reported under the group term "Centrally planned Asia."
[3] Reported totals; may differ from sum of detail due to rounding.

# The Mineral Industry of Algeria

By John L. Albright [1]

Exploration, production, processing, and marketing of numerous minerals in Algeria, the second-largest country in Africa, were carried out by the state-owned Société Nationale de Recherches et d'Exploitations Minières (SONAREM). Natural gas and petroleum developments were dominated by the state-owned Société Nationale pour la Recherche, la Production, le Transport, la Transformation, et la Commercialisation des Hydrocarbures (SONATRACH). Plans were developed during the year for the construction of several cement plants, petroleum refining and storage installations, and natural gas processing and transportation facilities.

Algeria issued a contract to a Japanese firm to construct a 120,000-ton-per-year ethylene plant at Skikda, scheduled for completion during 1976. An agreement was signed by the Algerian Government and a French firm for the construction of a plant at Annaba that would process 40,000 tons of phosphate annually to produce sodium tripolyphosphate, mainly for export. Société Nationale de Sidérurgie began production at its new sulfuric acid plant at Ghazaouet, which is rated at 270 tons per day. The facility processed sulfur-dioxide-containing gases from a zinc-concentrate roaster plant.[2] Algeria signed an agreement with two Brazilian companies to create a joint construction corporation to expand the Algerian railroad system. The capacities of several railroad lines are to be increased, classification yards enlarged, and a new line approximately 425 kilometers long is to connect Ghardaia (south of Algiers) with Hassi Messaoud and Touggourt. Government revenues from the petroleum industry, including the state-owned sector, totaled approximately $900 million in 1973 and were budgeted at approximately $2 billion in 1974.[3] These revenues were expected to increase nearly 76% to $3.5 billion in 1975.

The Government embarked on its second 4-year economic plan, covering 1974 to 1977, which stressed industrial expansion. According to the plan, industrial investments will total $12 billion in 1974–77, but will not include exported-oriented projects such as enlargements to natural gas liquefaction plants, pipelines, port facilities, and tankers. Expansions of the cement, petroleum-refining, and steel industries were included in the plan. Société Nationale Algérienne de l'Electricité et du Gaz (SONELGAZ) developed plans to enlarge the electric-power-generating capability of the country to meet the demands of several new industrial complexes in eastern Algeria. New natural-gas-fueled units with a total generating capacity of 130 megawatts were added to the Annaba powerplant, raising its generating potential to 182 megawatts. In 1974, the company was installing a 125-megawatt plant at Skikda, and it finalized plans for a 135-megawatt powerplant to be built at Hassi Messaoud. In June 1974, the World Bank approved loans to Algeria totaling $157.5 million for development projects. A loan of $49 million will be used to rehabilitate the railway system, a $70 million loan will help finance the construction of liquefied natural gas (LNG) export facilities at the port of Bettioua, and a $38.5 million loan will be used to enlarge SONELGAZ's electric power system.[4]

## PRODUCTION

Small amounts of numerous minerals were produced in 1974, but activity in the Algerian mineral industry was dominated by the natural gas and petroleum sectors. Crude oil production in 1974 totaled 368.1 million barrels, averaging about 1 million barrels per day; this represented a decline of 32.4 million barrels, or 8.1%, from that of 1973. Production of marketable natural gas reached 211 billion cubic feet in 1974, an increase of 43.7 billion cubic feet, or 26%, over that of 1973.

[e] Estimate. [p] Preliminary. NA Not available.

[1] In addition to the commodities listed, secondary aluminum, secondary lead, and copper may be produced in small quantities and additional crude construction materials (crude clays and stone) presumably are produced for local consumption, but output is unreported and available information is inadequate to make reliable estimates of output levels.

[2] Partial figure production by firms employing 20 or more persons only. Total output is believed to be much higher, perhaps to the order of 175,000 tons annually.

[3] Partial figure, production by firms employing 20 or more persons only. No basis available for estimating total output.

[4] Source indicates unit of measure to be square meters, but this appears to be incorrect.

## TRADE

Shipments of crude oil dropped 6.4% from 344.8 million barrels in 1973 to 322.6 million barrels in 1974. SONATRACH continued as the leading oil exporter in the country, with 73% of the shipments; Compagnie Française des Pétroles (Algérie) (CFP), Essence et Lubrifiant de France-Enterprise de Recherches et d'Activités Pétrolières (Elf-ERAP), and Getty Petroleum Co. were the other petroleum exporters. West Germany continued to be SONATRACH's best customer, purchasing 65.5 million barrels of oil, or 27% of the 235 million barrels of oil exported by the company. Crude oil shipments to the United States were SONATRACH's second largest at 62.6 million barrels, an increase of nearly 53% from those of 1973. More than one-half of the crude oil exported by the firm went to European refiners, and most of the remainder went to the United States and North Africa.

Shipments of LNG to France were interrupted early in 1974 by equipment failures at SONATRACH's Skikda plant. SONAREM continued as an important world exporter of mercury, and it supplied about 20% of the U.S. mercury imports.

r Revised.
1 May include some manufactures not normally listed among mineral commodities.
2 Less than ½ unit.

## COMMODITY REVIEW

### METALS

**Iron Ore.**—The Government revealed plans to exploit the Gara Djebilet iron ore deposits in southwest Algeria and construct a 1,100-kilometer railroad from that area to the Mediterranean coast. Ore production at Gara Djebilet may reach 10 to 12 million tons per year in the near future.[5]

**Lead and Zinc.**—The electrolytic zinc plant near Ghazaouet, under construction since 1970, was readied for service during the fourth quarter of 1974. The annual production rate of 40,000 tons of zinc is expected to double after planned expansions. El Abed zinc ore will be processed at the Ghazaouet plant, and approximately 80% of the zinc will be exported.

**Uranium.**—SONAREM negotiated an agreement with Uranerzbergbau GmbH of West Germany for assistance in the mining and marketing of uranium. Details of the agreement were not publicized.

### NONMETALS

**Cement.**—Negotiations were carried out and contracts signed with foreign engineering firms for the construction of three cement plants along the northern coast. Each of the new plants will have an annual production capacity of 1 million tons. A West German company will build one of the plants at 'Aïn el Kebira (near Sétif), a Japanese firm will construct a similar plant at El Asnam (near Algiers), and an unidentified foreign firm will build the third plant at Zahana (near Oran). Construc-

[5] Mining Journal. Iron Ore Railway for Algeria. V. 283, No. 7268, Dec. 6, 1974, pp. 491–492.

tion of the 1-million-ton-per-year plant at Meftah, near Algiers, continued and was scheduled for completion in 1975.

**Fertilizer Materials.**—SONATRACH developed plans to build an ammonium nitrate and nitric acid production complex at Annaba to be rated at 100 tons per day of ammonium nitrate and 800 tons per day of nitric acid. Completion was scheduled for yearend 1976.[6]

## MINERAL FUELS

**Natural Gas.**—In 1974, the total natural gas reserves in Algeria were estimated at 250 trillion cubic feet, which included nearly 99 trillion cubic feet of proved reserves, 130 trillion cubic feet of probable reserves, and 21 trillion cubic feet of possible reserves. Additional processing and transportation facilities were planned, but the industry encountered intermittent operating problems with its gas-processing equipment. Equipment failures plagued SONATRACH's LNG plant at Skikda during the first half of 1974; shipments of LNG to France, the major customer of the plant, were reduced until production was restored in June. Gas shipments to the United States were also curtailed, and a planned increase in exports to the United States, scheduled to begin at the end of 1974, was delayed until the second half of 1975.[7] Cie. Nationale Algérienne de Navigation ordered five LNG tankers, each with a capacity of 125,000 cubic meters (4.4 million cubic feet), at a total value of about $500 million from French shipyards. Construction of the vessels was scheduled for completion in 1978.

Construction was completed at a second natural gas reinjection plant at Hassi Messauod, which included two high-pressure centrifugal compressors driven by gas turbines. SONATRACH issued a contract valued at $56 million to an Italian firm for the installation of three additional gas reinjection plants at Hassi Messaoud.

SONATRACH signed an $850 million contract with an international consortium for the construction of a huge plant for LNG and natural gas liquids at Bettioua, several kilometers east of Arzew. The consortium included Chemical Construction Corp. (United States), Creusot Loire Entreprises (France), Mannesmann-Export Aktienge-Sellschaft (West Germany), Sybetra (Belgium), Traction et Electricité (Belgium), and Vöest-Alpine (Austria). Each year, the plant will liquefy 547 billion cubic feet of natural gas for export and produce 450,000 tons of butane and 480,000 tons of propane. The LNG will be exported from the new port of Bettioua to France and Italy. Overall cost of the project will be approximately $2.3 billion, including the plant, port facilities, and twin, large-diameter natural gas pipelines from the Hassi R'Mel gasfield in the Sahara Desert to the coastal processing complex.[8]

A consortium of 14 Japanese companies proposed the construction of a methanol plant in Algeria rated at 20,000 to 30,000 tons daily. The output would be shipped to Japan for use as industrial fuel.

During the year, SONATRACH negotiated an agreement with Empresa Nacional del Gas of Spain and Gaz de France, establishing a joint company, Société d'Etudes pour le Gazoduc de la Mediterranée-Ouest, to plan a 1,300-kilometer natural gas trunkline from the Hassi R'Mel field through the Straits of Gibraltar to southern Spain. Algeria also signed an agreement with the Spanish gas company for the annual delivery of 159 billion cubic feet of LNG to Spain for 20 years.[9] Spain began taking delivery of Algerian LNG in February 1974 under the terms of a 15-year contract signed in 1972 between Gas Natural, S.A. and SONATRACH. In June, SONATRACH signed contracts with Ruhrgas A.G. and Salzgitter Ferngas GmbH of West Germany for the sale of nearly 212 billion cubic feet of LNG annually over 20 years beginning in 1979.

SAIPEM, a subsidiary of the Italian firm, Ente Nazionale Idrocarburi, and SONATRACH established a company called Société Algérienne de Construction Industriel et Pétrolière (ALCIP) to build natural gas and petroleum facilities in Algeria. ALCIP will be owned 51% by SONATRACH and 49% by SAIPEM; its first project will be a 507-kilometer, 102-centimeter-diameter gasline from Hassi R'Mel to Arzew.

[8] Petroleum Economist. $850 Million LNG Plant. V. 41, No. 10, October 1974, p. 379.

[9] European Chemical News. New Algeria-France-Spain Gas Company. V. 25, No. 628, Mar. 22, 1974, p. 11.

SONATRACH awarded a contract to a Canadian firm for engineering the 595-kilometer Algerian section of the proposed 2,655-kilometer gas pipeline from Hassi R'Mel to La Spezia, Italy. The Algerian section will run north-eastward to the Tunisian border from the Hassi R'Mel gasfield. The Algerian firm also issued a contract to a British firm for the construction of compressor stations for the 40-inch-diameter Hassi R'Mel to Skikda gasline. The new stations will boost the capacity of the pipline from 324 billion to 448 billion cubic feet per year.

**Petroleum.**—In 1974, SONATRACH negotiated joint 51%–49% oil exploration agreements with several large foreign companies providing for the Algerians to hold the controlling shares. Amoco International Oil Co. and SONATRACH signed a joint-venture agreement for the exploration of 17,000 square kilometers in the Sahara Desert. Amoco will spend $33.5 million over a 2-year period exploring near Hassi Messaoud and Illizi.[10]

Brazil's Petrobrás Internacional S.A. (Braspetro) signed a joint exploration arrangement with SONATRACH, involving an investment of about $39 million on a 17,500-square-kilometer tract near Biskra.

Three West German companies, Union Rheinische Braukohlen Kraftstoff A.G., Veba-Chemie A.G., and Wintershall A.G., formed a consortium and signed an oil exploration and supply agreement with SONATRACH. Deutsche Erdölversorgungsgellschaft mbH (Deminex) will explore in the 19,700-square-kilometer concession for the consortium. If oil is found, the West German firms will be entitled to 49% of the production for 12 years. Early in 1974, Algeria signed oil exploration agreements with three French companies. SONATRACH settled the financial arrangement with Elf-ERAP for the 1971 Algerian nationalization of the company's operations and reached an agreement with the French group on a prospecting partnership covering 8,500 square kilometers of territory.[11] Elf-ERAP will spend $31 million exploring for oil near El Oued-Biskra and Gassi El Agreb according to the terms of the agreement. A similar 51%–49% oil exploration agreement covering 8,440 square kilometers was signed with the Société Nationale des Pétroles d'Aquitaine of France, and SONATRACH signed a 51%–49% agreement with CFP. CFP will invest $15 million exploring some 10,000 square kilometers onshore and about $3.5 million exploring offshore areas. During the year, the French firm began drilling about 11 kilometers offshore, near Algiers.

Hispanica de Petroleos, S.A. (Hispanoil), of Spain reported an oil discovery on its Kef el Argoub permit in southern Algeria, where it is committed to spend $33.5 million on exploration over a 4-year period.[12] The discovery well flowed 1,100 barrels per day of 43.4° API crude oil with a low sulfur content. Hispanoil also found oil at El Meharis, where its well flowed 44° API oil at 2,200 barrels per day.

During 1974, 123 wells were drilled (16 dry, 9 natural gas, 46 oil, and 52 service) for a total of 237,500 meters, a decrease of 13,860 meters from that of 1973. Only three discovery wells were reported, two by Hispanoil and one by CFP.[13] The French discovery was in the Illizi Basin, but other details were not released.

The posted price of SONATRACH's crude oil was set at $16.216 per barrel, effective January 1, 1974. This was more than four times higher than the January 1, 1973, price of $3.953 per barrel, and 75% higher than the fourth quarter 1973 posted price of $9.25 per barrel. The selling price per barrel was set at $14 in January 1974 (compared with $3.00 in January 1973), fell to $13 in July, and was further reduced to $12.30 for the fourth quarter of 1974.

The Italian firm Snam Progetti S.p.A. signed a $300 million contract with SONATRACH for the construction of a 300,000-barrel-per-day petroleum refinery at Skikda. The Italian company will also construct a storage depot for refined products at El Khroub about 20 kilometers south of Constantine, to be linked to the refinery by two pipelines. Snam Progetti S.p.A. previously designed the 86-centimeter crude oil pipeline from the Haoud El Hamra oilfield to Skikda.

# The Mineral Industry of Angola, Mozambique, and Guinea Bissau

By Janice L. W. Jolly [1]

## ANGOLA

The mineral industry of Angola made a significant contribution to the economy in 1974. Both production and revenues earned from the mineral industry in 1974 increased markedly over those of 1973. Exports (including all products) were valued at $652 million [2] in the first half of 1974, compared with $298 million for exports in the same 1973 period, while imports for the first half of 1974 were valued at $307 million and for the comparable 1973 period at $222 million. The increase in export value in 1974 over 1973 was mostly due to petroleum, but significant increases also occurred in iron ore and diamonds. Following the events of April 25, 1974, in Portugal, however, and the announcement of expected independence for Angola, productivity in general showed a decrease of about 30%. Some activities, such as civil construction reportedly [3] showed a reduction in excess of 50%. By yearend 1974, several factors pointed to marked recession: the abnormal situation in the ports, the swift rise of inflation, and near paralysis of investments in productive activities. Industrial enterprises had seen their labor forces reduced to less than a third and others idled their machines. The Credit and Securities Inspection of Angola published notices in October and November 1974 temporarily suspending money transfers, with only a few exceptions being made.

The fourth development plan period (1974–79) started in 1974 with a budget of $165.2 million, which represented 17.8% of the total State budget. In 1975 over $231.3 million was expected to be spent on the development plan, representing 20% of the total budget for the year of $1,073.8 million. For the first time, ordinary receipts (notably petroleum) were expected to defray the greater part of these expenditures. A 12.5% royalty was collected on petroleum production, and the tax on profits of petroleum producers was 50%. These were expected to be raised in 1975 to 16.67% (royalties) and 60% (profit tax). In 1974, 72.4% of all financing came from loans and 27.6% from Angola's own funds. The 1975 program provides that Angola's funds will cover 63.3% of all expenditures, with the rest from loans. Increased attention was to be paid to infrastructure construction, such as roads, maritime shipping, and aviation. In addition the plan also called for investments in manufacturing (import substitution), mining, and metallurgy.

Carbonatites were the subject of a recent [4] report by the Angolan Department of Geology and Mines. Carbonatites in the Chivira-Bonga, Monte Verde, Coola, Bailundo, Longonjo, Virulundo, Chitado, Capula, Cuacra, Chinga, Catanda, Capunda, Morro Vermelho and Lupongola areas were described. The possibility of using these as sources of raw materials for rare earths, uranium, cement, soda, potash, ceramic,

and ornamentation industries was visualized. Two publications listing work done by the Geologic Division between 1960 and 1973 were also recently issued [5] and complement the bibliography published in 1970.

General Mining and Finance Corp. Ltd. announced cessation of all prospecting operations in Angola at the end of 1974. General Mining had been exploring around Nova Lisboa where it had found deposits of lead and zinc.

In the 10 years between 1963 and 1973, total production of electric energy increased from 221 to 984 million kilowatt hours, at an average yearly rate of 16.1%. Angola consumed 860 million kilowatt hours in 1974. In 1973 production came from 1,472 thermal and 70 hydroelectric generating plants. Hydroelectric generating stations in Angola were expected to have a total capacity of 343 megawatts in 1974. Two more generators were under construction; one at the Quiminha dam on the Bengo (25 megawatts) and the other at the Chigala dam (5 megawatts) built for Companhia de Diamantes de Angola (DIAMANG). In Moçâmedes two diesel units of 5.5 megawatts each were finished in 1974. The extension of the Malembo plant, functioning with natural gas, was to be finished in the third month of 1975.[6] A hydroelectric powerstation was also being built as part of the Cunene River Scheme. In 1974 a contract was signed by Hydrodine, the electrical and mechanical contracting subsidiary of the South African Murray and Stewart Co. A contract was signed with Voëst Alpine A/G for the installation of generators (3,100 megawatts each). Water turbines and generators for the station are being built on the Cunene River on the northern border of the Territory of South-West Africa, adjoining Angola. Hydrodine, based in the Territory of South-West Africa, expected to start work in mid-1975. The electrical and mechanical side of the contract was reported as worth more than $14.7 million.

## PRODUCTION AND TRADE

The total value of mineral production (excluding refinery production) was $821.2 million in 1974, compared with the estimated $402.7 million for 1973. Crude oil was the principal mineral exported in 1974, followed by iron ore and diamonds. After raising the price of crude oil, Angola exported a record total for an estimated value of $675 million, compared with an estimated $235 million [7] for 1973. Including the Cabinda oil fields, which produce 99.2% of Angola's oil, Angola recorded an average daily production of approximately 169,000 barrels per day in 1974.

The extraction and processing industries generally registered output increases accompanied by price rises in the first half of 1974. However, there were some exceptions. For instance, granite production dropped from 4,245 cubic meters produced in the first 6 months of 1973 to 3,193 cubic meters in the equivalent 1974 period, and kaolin dropped from 245 tons in the first 6 months of 1973 to 117 tons in the same 1974 period. No manganese or copper was registered in the first half of 1974. Manganese production has not been reported since October 1973, and is presumed to have ceased. Production of iron ore went up from 2.3 million tons worth $24.2 million in the first 6 months of 1973 to 2.9 million tons worth $26.2 million for the same period in 1974, and diamonds were up from 930,972 carats worth $37 million in the first 6 months of 1973 to 948,639 carats worth $41.2 million in the same period of 1974. Total diamond output for 1974 was 1.93 million carats, 8% less than 1973. Half again this amount of diamond output was also probably sold illegally. Reasonable increases also occurred in marine salt, asphaltic rock, and chalk.[8]

In 1974 a dramatic doubling of exports from Angola to the U.S. occurred, notably owing to increased crude petroleum shipments. Cabinda supplied about 2.25% of the total U.S. oil imports. Imports into Angola from the U.S. also increased by about 76% to $50.3 million through October. Canada, Japan, and West Germany also imported oil from Angola and, along with the United States and Portugal, accounted for all but 1% of Gulf Oil Corp.'s shipments of Cabinda crude. Portugal's con-

sumption of Angola's oil dropped during 1974 and shipments to Japan were concentrated into the last 3 months of the year.

Trade expansion occurred during the greater part of 1974 despite political uncertainties, strikes, declines in productivity, and departing numbers of workers and entrepreneurs. Even so, by the end of the year, these factors all served to reduce the amount of merchandise handled by the ports of Lobito and Luanda. It was estimated that port calls by navigation companies were reduced by about 30% relative to 1973. Freight rates were also raised 30% on September 9, 1974, reflecting difficulties encountered. Petroleum remained the only export mineral commodity that was unaffected by the deteriorating port conditions. A force majeure was declared by Angola National Steelworks at yearend when it canceled steel scrap purchases because its steel market had declined, tighter import license restrictions had been imposed, and it was having difficulties with its work force.

Detailed trade data for 1973 and 1974 were not available at the time that this chapter was written. The latest trade statistics available are those for 1972, and are contained in the 1973 Minerals Yearbook chapter.

**Table 1.—Angola: Production of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity [1] | 1972 | 1973 | 1974 [p] |
|---|---|---|---|
| METALS | | | |
| Beryllium, beryl, gross weight | 175 | 115 | e 100 |
| Gold, mine output, metal content: | | | |
| Placer ---- troy ounces | 39 | NA | NA |
| Vein ---- do | 1,665 | NA | NA |
| Total ---- do | 1,704 | e 2,000 | e 2,000 |
| Iron ore and concentrate, gross weight ---- thousand tons | 4,831 | 6,052 | e 5,170 |
| Manganese ore and concentrate, gross weight | 37,700 | 4,682 | -- |
| NONMETALS | | | |
| Cement, hydraulic ---- thousand tons | 624 | 768 | 812 |
| Clays, kaolin | 854 | 667 | e 550 |
| Diamond: | | | |
| Gem ---- thousand carats | 1,616 | 1,594 | e 1,448 |
| Industrial ---- do | 539 | 531 | e 482 |

| Total ---- do | 3,563 | 5,338 | 5,414 |

e Estimate. p Preliminary. NA Not available.
[1] In addition to the commodities listed, a variety of crude construction materials such as clays, sand, gravel, and broken stone presumably is produced for local consumption, but information is inadequate to make reliable estimates of output levels.

## COMMODITY REVIEW

**Metals.**—*Copper.*—The Tetelo copper deposits near Uíge in the north of Angola reportedly started production in 1973 with 20,000 tons of concentrates.[9] The mine was managed by Sociedade de Investigacoes Mineiras (SIMEIRA). The copper deposits of the English mine near Benguela were expected to be exploited near yearend 1975. Deposits located to the east of Novo Redondo in the proximity of Binga cataract (Cachoeiras Region) were also reportedly[10] attracting attention of such companies as DIAMANG, Companhia Mineira do Lobito, S.A.R.L. (CML), the U.S. Bethlehem Steel Corp. and Anglo American Corp. of South Africa, Ltd. Observations on the copper occurrences in the Chachoeiras Region of the Cuanza Basin were made in a recent report[11] by the French Bureau de Récherches Géologique et Minère (BRGM). The mineral concentrations were distributed in lagoonal-deltaic sediments at the edge of the continent, consisting of conglomerates, sandstones, and siltstones. Remobilization occurred with tectonic movement after consolidation. They are associated with carbonate cement as well as well-formed detrital elements. The stratiform mineralization at Binga was estimated at 100,000 tons of copper metal at a grade varying between 1% and 6% copper.

Exploitation of several copper deposits in the Huíla and Cuanza Sud Districts was also authorized by the Angolan Government during 1974. One deposit is reportedly located near the Impulo administrative post in Quilengues District, two others are located in the Huíla District near Sa Da Bandeira, and a fourth is located in Munenga in the Libolo sector of the Cuanza Sud District. The exploitation of the first three deposits was reportedly granted to one company. Chromalloy American Corp., in association with Johannesburg Consolidated Investment Co. (JCI) applied to the Government for approval of a copper exploration program 160.9 kilometers east of its gold mining operations on the Canjangue and Cuengue deposits located south of Nova Lisboa.

*Gold.*—In May 1974 Chromalloy American informed its shareholders that the company would begin operations at its gold mine pilot plant utilizing ores from the Canjangue and Cuengue deposits. Enough ore has been established to keep the pilot plant operational for a 2-year period. Ores assay from 1.5 ounces per ton to 28 ounces per ton gold. Initial production, after delays in equipment deliveries, got underway at yearend 1974. The mine was reportedly producing $60,000 to $75,000 in gold in December with $125,000 to $150,000 expected each month between January and March 1975 and at the $300,000 level by April 1975. Expenses were reportedly running at about $80,000 per month. Chromalloy expected to operate the pilot plant for at least 1 year. CML, which has been prospecting for gold at Cassinga-M'Popo, was reportedly making a joint venture agreement with an undisclosed mining group for exploitation of the M'Popo gold deposits.

*Iron Ore.*—By yearend 1974, Companhia do Manganés de Angola (CMA), operator of the Cassala Mines, had decided to postpone the Cassala-Quitungo iron ore mining and pelletizing project indefinitely because of rising costs.[12] An American consulting firm was to be assigned the advance project for installation of the first phase of the pelletizing unit.

CML completed the feasibility and engineering studies for a 3-milion-ton-per-year pellet plant and associated facilities. Actual construction was to start during 1974. At yearend 1974, CML had contracted with Arthur G. McKee and Co. to conduct a pre-design and feasibility study to evaluate the technical and economic possibilities of low-grade iron ore development at its Cassinga mine. The study was expected to include a drilling program to determine whether a long-term operation can be supported, and a testing program to establish the best method to upgrade the ore. If it proves feasible, McKee will also develop plans for auxiliary installations, including townsite, powerplant, and other onsite facilities. The Cassinga mine was estimated as having proven reserves of

100 million tons with 62% to 64% Fe and 2,000 million tons with 40% to 50% Fe.

**Nonmetals.**—*Alabaster.*—Two deposits of alabaster were discovered in Angola in the area of Benguela near Dombe Grande. Total reserves were on the order of 3,750,000 cubic meters. The price in Europe[13] of a cubic meter of alabaster was reported to be a minimum of $654.50 in 1974.

*Cement.*—Because Luanda and Lobito ports were operating irregularly, a shortage of cement occurred in late 1974, affecting the civil construction sector and the entire southern part of the country. Labor troubles caused a slowdown at Luanda's cement factory. This plant had been shipping about 1,000 tons of cement per day to other African countries. A new cement factory, requiring an investment of $155 million,[14] was authorized during the first quarter of 1974 for Moçâmedes with a capacity of 240,000 tons per year of cement.

*Diamond.*—World demand for diamond began to slip in early 1974 from the record 1973 levels. Almost all of Angola's diamond output comes from DIAMANG operations centered on alluvial deposits. In past years there has been a tendency for caratage to fall, mostly due to declines in the overall grade of diamondiferous gravels treated. Treatment plants were modernized and more mechanized equipment were used to improve recovery. DIAMANG's associated company, Consorcio Mineiro de Diamantes S.A.R.L., in which De Beers Consolidated Mines, Ltd. has a 45% stake, continued to explore vigorously, especially in the Cuango River Basin. DIAMANG held producing areas covering some 80,450 square kilometers in the Cuango and Cassai river basins. Angola's diamond reserves were estimated[15] to be 20 million to 100 million carats, of which 15 million to 25 million carats are of gem quality. World reserves were estimated at 1,000 million to 1,205 million carats.

*Feldspar, Quartz and Mica.*—The Provincial Office of Geology and Mines Service of Angola announced discovery of five feldspar and quartz deposits in a routine inspection of the Caxito region. In addition, a mica and quartz deposit was discovered in the same region at Miaila. A new deposit of "clive" quartz in a column 20 meters high was described[16] at Cassongue, situated about 40 kilometers northwest from the village of Jamba.

*Phosphate.*—Substantial phosphate deposits are known in Cabinda. The Companhia dos Fosfatos de Angola (COFAN) has been assessing their viability for some time. In 1974 the company sought a year's extension to its rights over the deposits to allow time to reassess feasibility. Phosphate deposits are also found in the Zaire District. These were being considered for working by the State-owned Diversification and Development Fund.

**Mineral Fuels.**—*Petroleum.*—During 1974 Texaco Petroleum of Angola, in its capacity as operator for the PETRANGOL-ANGOL-Texaco Association, announced the discovery of petroleum in Santo Antonio do Zaire, although sufficient quantities had not been proved for commercial production. Prospecting along the Angolan coast were Cabinda Gulf Oil Co., Argo Petroleum Portuguesa, Pesquisa e Exploracao de Petroleos, Esso Angola Ltd., and a group for Amerada Hess Corp. of Angola. Companhia de Petroleos de Angola (PETRANGOL) and the Sociedade Portuguesa de Exploracao de Petroleos, S.A.R.L. (ANGOL) in liaison with Occidental Petroleum Corporation of Portugal, Amoco Cuanza Petroleum Co., and Iberian Petroleum, were prospecting on the continental platform in the Cuanza Basin.

Portuguese Decree-Law 89/74 published March 6, 1974, in Diario do Governo contains the text of two new petroleum exploration and production contracts. One was granted to Esso, covering a deep water area of 20,000 square kilometers in the Santo António do Zaire-Ambrizete Zone. The second was awarded to Sun Oil-Amerada Hess-Cities Service International group, covering a belt of 10,000 square kilometers on land and sea less than 600 meters deep stretching from Novo Redondo to Benguela. Four years were initially allowed for exclusive rights to prospect and develop and 30 years for production. Oil may be diverted by the Government in case of war or grave emergency.

Portugal has the preferential right to ac-

[13] Industries et Travaux d'Outre-Mer. Matériaux de construction (Contruction Materials). V. 23, No. 256, March 1975, p. 226.

[14] Banco De Angola (Luanda). Boletim Trimestral, No. 65, January–March 1974, p. 25 (in Portuguese).

[15] Industries et Travaux d'Outre-Mer. Le Marche Mondial du Diamant (The World Market of Diamonds). V. 23, No. 254, January 1975, pp. 49–50.

[16] Machairas G. Un Nouveau Gisement de Quartz Clive à Cassongue (A New Deposit of Clive Quartz in Cassongue) (Angola). Bull. Soc. Fr. Mineral. Cristallogr. V. 96, No. 6, 1973, pp. 395–397 (in French).

quire 37.5% of the petroleum produced, plus an additional 12.5% of petroleum production as a tax in kind, giving together a preferential right equaling 50% of the production. The new contracts called for a 20% shareholder status for the Province of Angola. Portuguese have a major say in board member selection. Concessionaires are required to give first preference to Portuguese materials, contractors, and consultants.[17] Exxon paid a signature premium of $1.6 million while the Sun Oil group was reported to have paid a signature premium of $800,000. A Portuguese chartered company will be formed for development, of which Angola will acquire 20% of the stock. A premium is also due to Portugal on production of over 100,000 barrels per day and a pledge was made to reinvest some of the proceeds in Angola.[18]

In early 1974 PETRANGOL and ANGOL were authorized to draw up a contract with Occidental, Amoco Cuanza, and Iberian Petroleum to permit more intensive prospecting on the Continental Shelf of the Cuanza Basin. The contract provisions may be revised on demand of the State. In exports they will be exempt from customs duties and taxes with exception of 1% ad valorem statistical tax, the stamp tax, wharfage, and other payments due for services rendered that are not of a fiscal nature. The State has a right to buy a maximum of 37.5% of the total quantities of substances extracted and put on sale. Occidental, Standard Oil Co. (Indiana), and Continental Oil Co. were also reported as sharing exploration with PETRANGOL and ANGOL. Under the terms the U.S. firms together will hold 50% interest in an exploration venture covering about 7,200 square kilometers.

A group consisting of Tesoro Petroleum Corporation, San Antonio, Texas, General Exploration L.A. of California, and Geotherme S.A.R.L. of Paris expressed interest in exploration in various parts of Angola in early 1974. Application was made for the required license to prospect. Ansa Petroleum Co.[19] holds 25% of the PETRANGOL concession area south of Luanda. The South African companies, General Mining, and their associate, Federale Mynbou and Sentrust, holds 34% of Ansa; Anglo American and De Beers hold 24%, Sanlam 21%, and the rest of Ansa is distributed among Rand Mines, Ltd., Unicorp, and JCI.

Installation of a new pipeline at Cabinda caused a temporary decrease in oil production in June 1974. Petroleum exports for the first 6 months of 1974 (25.1 million barrels) from Cabinda showed a 6.5% decrease from the 1973 figures for the same period. However, the new pipeline was operating later in the year and contributed to the overall increased production for 1974 from Cabinda. A new probe "Bob Bushman" belonging to Field Viking Drilling Co. was delivered to Cabinda to be used for offshore prospecting.

Crude oil reserves were estimated at yearend 1973[20] as 1.31 billion barrels (up 6.2% from 1972). Natural gas was estimated at 41 billion cubic meters of gas (up 3.4% from 1972).

An application was made in February 1974 for construction of a 5-million-ton refinery in the Moçâmedes area by Angola Energy Ltd., a firm with headquarters in London. Refinery input will be local crude oil.[21] American capital of about $100 million will be used. The Luanda refinery was in the process of extension as authorized in December 1973. At the same meeting, the Portuguese Council authorized the installation of a refinery of solid bituminous products at Ambriz. Riverwood Corporation of the United States received the permit and was given leases to 9,000 acres of asphalt deposits located along the Lifune River on the coast, north of Luanda. Riverwood expected to put the first plant into operation by 1977.

## MOZAMBIQUE

The mineral industry in 1974 contributed significantly to the Mozambique economy, but production was down as much as 50% in some mineral commodities. A shortage of foreign exchange in mid-1974 (from June 30 to July 10) brought about a temporary closing of the petroleum refinery and an import suspension except for certain limited categories. The balance of

[21] O Comercio (Luanda). Huge Investments in Oil Refineries Planned. Sept. 14, 1974, pp. 1, 8. (in Portuguese).

payments deficit for 1974 was expected to be around $80 million [22] and Mozambique's external debt to surpass $650 million. The 1974 deficit reflected higher world prices for imported items such as petroleum and wheat. Mozambique had no foreign reserves and suffered an internal liquidity crisis during 1974, with some firms facing bankruptcy. A 40% increase in customs clearance fees early in 1974 was prompted by the Government's need for additional revenue to meet mounting public expenditures. It was estimated that $21 million would be collected from this source in 1974. Even though petroleum products were exempt, retail prices of gasoline and diesel oil were increased by over 50% (compared with January 1973, the increase amounted to over 200%).

The 1974 government budget was increased to $597 million, up 18.7% from the preliminary estimates. Forty million dollars was allotted to transportation improvements and $20.2 million to regional development. Banking and insurance organizations were required to finance 82.4% of the 1974 development plan. Nearly 15% was provided by the Portuguese Central Government budget. The preliminary 1975 budget was balanced at $513.9 million, but later increased with an additional $9 million by the Transitional Government.

A Transitional Government was set up on September 20, 1974, to provide a smooth transition to independence, expected on June 25, 1975. During 1974, however, Mozambique was plagued by problems and crises that made havoc of the country's economy. Three of Mozambique's major rivers, the Búzi, Pùgoè, and Zambezi, flooded in February, leaving thousands homeless and disrupting vital transportation routes between Beira and Quelimane. Despite the flood, work on the Cabora Bassa Dam was not impeded. Following the change in Portuguese Government on April 25, 1974, civil unrest and disturbances in Mozambique caused an exodus of technicians and skilled workers. Most of the civil construction, e.g., the road that links Beira with the north, was paralyzed. Dock strikes for higher pay in June, August, and September, caused further congestion and contributed to an inflation reaching an annual rate of 30%. Civil disturbances were most extreme during the week of September 7–12, and again in October, bringing traffic in the major ports to a standstill and severely limiting income from transit operations and tourism. Port and railroad activity and the tourist industry all suffered greatly during 1974.

The Mozambique economy leans heavily on its neighbors for economic stability. The Ports and Railways Administration provided over 45% of all foreign exchange earnings in 1974 through activity at the ports of Beira and Lourenço Marques which also serve Rhodesia, the Republic of South Africa, Zambia, Malawi, and Swaziland. Approximately 80% of Rhodesian import-export traffic passes through Mozambican ports. The tourist industry was an important industry in 1973, providing about $23.9 million to the economy. Approximatey 100,000 Mozambique workers were also employed in South African mines, providing 15% of the Mozambique budget paid in gold.

Major transportation improvements were announced for the fourth development plan launched in April 1974. An extension to the Gorjão wharf in Lourenço Marques would be finished at the end of 1975 at a cost of $24 million. Twenty-two diesel locomotives (purchased from the United States in 1974) and eight shunting engines were to replace steam locomotives in anticipation of growing traffic from neighboring countries. The Mozambique Government announced its intention to start a new $90 million offshore bulk loading terminal south of Lourenço Marques, scheduling completion for 1976. Known as Ponta Dobela, it will be used to load iron ore, coal, and other dry bulk materials. It will also allow liquid cargoes to be loaded or unloaded. The dry bulk storage capacity will be 1.2 million tons, and the liquid storage capacity was planned to be 800,000 tons. It was also expected to handle crude oil, pumping it to an inland tank farm.

The question of the distribution of profits from the hydroelectric complex of Cabora Bassa was yet to be solved. The principal beneficiary could be either the Portuguese or the Mozambique Governments.[23] Cabora Bassa began filling with water on December 5, 1974, and electrical production was scheduled to begin in early 1975. It was expected to have a total installed electrical capacity of 3.6 million megawatts at two generating centers with approximately 1,400 kilometers of energy trans-

[22] Where necessary, values have been converted from Mozambique escudo (M. Esc) to U.S. dollars at the rate of M. Esc = US$0.03984.

[23] Marchés Tropicaux et Méditerranéens (Paris). Problem of Dam Profits Remains. Dec. 6, 1974, p. 3346 (in French).

porting lines. The Republic of South Africa was expected to acquire 680 megawatts in 1975, increasing to 1,070 megawatts by 1977 and finally to 1,470 megawatts at yearend 1979. A program to improve the electrical network of Lourenço Marques was also announced in 1974 costing about $7.9 million between 1974 and 1980.

The Gabinete do Plano do Zambeze (GPZ) was organizing and collaborating on a number of projects for the extractive and transformative metal industries of the Tete District. They were collaborating on an electrometallurgical project based on exploitation of the titaniferous magnetite deposits of Tete; on exploitation and exploration of fluorite in the Chioco-Changara and Geramo (Canxixe) areas; on studies for establishing industries consuming electricity; on detailed geologic studies of various mineral areas, especially those along the Karoo-crystalline rock contact; on a study of coal deposits; and executing geochemical prospecting along the Nhaluiro (Chemba) River. The execution of these programs was being done with the collaboration of the Direcção de Servicos de Geologia e Minas, Inspecão Geral de Minas; Instituto Nacional de Investigaçõa Industrial; Laboratório de Fisica e Engenharia Nuclear de Moçâmbique; Serviço de Fomento Mineiro; and the University of Lourenço Marques.

A French scientific memoir was recently published[24] describing the mineralogy and geochemistry of the pegmatites in Mozambique. A long list of important minerals are produced from these rocks, including gem stones, columbite-tantalite, and radioactive minerals.

CML (associated with American Steel Company) held a mineral exploration concession for minerals except hydrocarbons and diamonds, as did Companhia Moçâmbicana de Minas S.A.R.L. (COMOCMIN), a subsidiary of JCL and Anglo American Corp.

## PRODUCTION AND TRADE

Mineral production fell in 1974, by amounts up to 50% in some commodities as compared with 1973. Bauxite, bentonite, cement, granite and quarry stone, lime, montmorillonite, and sea salt showed decreases in production, whereas coal, some gem stones, tantalite, and copper concentrates showed modest increases. An estimated 3.9 million barrels of petroleum products were produced in 1974 compared with 6.0 million barrels in 1973. Refinery production was estimated to be half its capacity by yearend 1974 due to the exodus of technicians and reduced crude oil imports.[25] Imports of petroleum products in January to July 1974 showed a 63% overall decline over the comparable 1973 period. U.S. companies reportedy purchased about 70% of Mozambique's 1974 output of tantalite, which was estimated to be 33 tons in the first 10 months of 1974, as compared with 27 tons in the same 1973 period.

The flow of goods had practically stopped during the political crisis early in 1974, but had improved by November, and the Provisional Government was making efforts to bring it back to normal. Traffic in the six major ports of Lourenço Marques, Beira, Quelimane, Nacala, Porto Amélia, and Mocímboa da Praia was down in 1974, compared with 1973. There was also reportedly a 50% decrease in ore carried by the railroad between South Africa and Lourenço Marques during 1974. The possibility of increasing the number of ore cars that operate on the Ressano Garcia line was being studied.

Kenya was reportedly investigating the possibility of making maritime shipments of goods to Nacala or Beira and then using Mozambique railroads for its exports to Zambia.

[1] Partial figure, but believed to represent by far the largest part of the total.

## COMMODITY REVIEW

**Metals.**—*Bauxite.*—The Alumen mine near Manica has produced 5,000 tons to 7,000 tons per year from ore that contains 62.3% $Al_2O_3$, 3% $SiO_2$, and 2.2% $Fe_2O_3$. Reserves of the deposit at Milange near Manica in Vila Pery District were reported to be an estimated 60 million tons of 43.73% $Al_2O_3$.[26] Other deposits are known to occur in the Zambézia District as alteration products of rocks in the alkaline province of Chirua.

*Copper.*—Copper ore was produced at the Edmundian mine in Manica, which reportedly was valued at $987,733 in 1973.[27] After suspension of mining in 1968, the Edmundian was reactivated in 1970, producing 22% copper concentrates from min-

[27] Industriade Moçâmbique (Lourenço Marques). A Actividade Mineira em Moçâmbique (Mining Activity in Mozambique). V. 7, No. 11, November 1974, p. 380.

eralized greenstone ore containing 2.7% copper.

*Gold.*—The Braganca, Monaque, and Chua gold mines in the Manica District near the Rhodesian frontier were reported[28] as being reopened. The Monarch, and possibly Guy Fawkes, Dot's Luck, and Boa Esperanca mines, as well as gold-bearing terrains in other parts of the country, were also being considered for reworking.

*Iron.*—There are numerous occurrences of iron minerals in Mozambique, according to the Mozambique Geological Services,[29] which together constitute a total estimated resource of about 272 million tons, of which about 49 million can be classified as reserves. These generally can be classed into three types: (1) magmatic injection deposits, (2) pyrometasomatic deposits, and (3) sedimentary deposits. In the first category are the titaniferous magnetite deposits of Massamba, Inhantipissa, Chizita, Machédua, Caldas Xavier and Doa (Pangula Mountain) that occur in the Precambrian gabbro anorthosite complex of the Tete District. The Mozambique Geological Services calculated the "certain" reserves of the Massamba deposit to be 4.5 million tons, the Machédua to be 1 million tons, Caldas Xavier to be 2 million tons, and the Inhantipissa to be 3 million tons. Another 50 million was possible in Tenze Mountain. The Doa deposit was estimated to be 18 million tons. The chemical composition of the ore reportedly varies little from deposit to deposit, and generally contains 47% Fe, 13% $TiO_2$, 5% $SiO_2$, and 0.20% $V_2O_5$.

In the pyrometasomatic category is a series of deposits occurring in Precambrian limestones near Fíngoè including the Muândi, Luzina, Meungoè, and Tumba deposits. The most important of these is Muândi and was reported to have reserves of 6.8 million tons. One to 2 million tons were estimated for Tumba, 2 million for Muengoè, and less than 1 million at Luzina. The ore generally contains 65% Fe, 1% $SiO_2$, and 0.10% to 0.20% $TiO_2$.

Sedimentary-type deposits include the banded ironstones of the Macequeca formation in the Vila Pery District and the itabirites of the Tete, Zambezia, and Moçâmbique Districts. The Honde deposits, located along the bank of the Honde River, are composed of a number of itabirite outcrops of the Manica System and were estimated to contain resources of 100 million tons of 38% Fe, which could be upgraded to 40% by grinding and magnetic separation. The most important deposits, under examination by the Hondeminas Co.,-Sociedade Mineira, S.A.R.L., were the Mabota, Machacauira, Chito Sul, and Nhandiro. The Mavita and Tsetsera deposits occur in metasediments of the Manica System. The Mavita deposit was estimated to contain reserves of 15 million tons with an average 30% Fe. This could be upgraded to about 58% Fe by grinding and magnetic separation. Other deposits include the Chaca deposit, estimated to have more than 6 million tons (possibly 60 million tons as initially attributed) and the Nhancungue, Ruo, Miravone, and Iapala deposits with characteristics similar to the Chaca deposit but more limited and less regular in occurrence.

In March 1974, Companhia de Moçâmbique (Siderurgia de Moçâmbique) announced plans to build steel mills at Tete and Beira. In the first stage, entering into production by 1977, a furnace at Tete would use local iron ore to make pig iron, which would be shipped to a steel mill at Beira. The initial capacity of the pig iron plant will be 25,000 tons per year, eventually raised to 100,000 tons per year. An authorization was also given at the beginning of 1974 for construction of a foundry at Nampula.

*Nickel.*—The possibility of nickel deposits in the ultrabasic rocks of the Tete, Moçâmbique, and Vila Pery (Manica) Districts was indicated by geochemical anomalies. The Atchize area is characterized by serpentines and gabbros with disseminated pyrrhotite.[30] Garnierite was also observed.

*Titanium Minerals.*—Coastal dunes containing 5% to 15% heavy mineral layers of ilmenite (78%), zircon (13%), monazite (5%), and rutile (2%), occur between Majanja da Costa and Moma.[31] Rutile seems to be the highest in the Raraga region. At Mobase reserves of these minerals were estimated to be about 18 million tons, corresponding to about 2 million tons of concentrate ore. At Nabúri-Moma, there was estimated 6 million tons of dune material containing mineral concentrates.

[28] Industries et Travaux d'Outre-Mer (Paris). Afrique Australe. V. 23, No. 256, March 1975, p. 271 (in French).

[29] Direccao Dos Servicos De Geologia e Minas (Lourenço Marques). Carta de Jazigos e Ocorrencias Minerais (Map of Deposits and Mineral Occurrences). Imprensa Nacional de Moçambique, 1974, scale 1:3,000,000, explanation, 60 pp.

[30] Work cited in footnote 29.

[31] Work cited in footnote 29.

Destruction of these dunes by the sea has also resulted in extremely rich concentrations of heavy minerals along the coast under water, principally in the region of Pebane, where the amount of heavy mineral layers reaches 70% to 80%. Large deposits of titanium minerals and zircon, estimated at 30 million tons ilmenite, 2 million tons rutile, and 3 million tons zircon, were discovered along the coast of Mozambique by the West German Preussage A.G. exploration group during 1974. The deposits were discovered at a depth of 30 meters.

*Uranium.*—The Companhia do Urânio de Moçâmbique indicated the existence of 26 uranium deposits at Moatize in the Tete District.

**Nonmetals.**—*Cement.*—CM was licensed in May 1974 to increase cement production at its Salazar plant in the Lourenço Marques District.[32] In early 1974 a contract was signed between CM and the Banco de Fomento Nacional for the financing of a fourth line of cement manufacture at its Matola plant. The investment necessary for this operation totaled $15.9 million. The extension was reported as starting in late 1974, allowing an additional production of 2,500 tons per day of cement. When coal operations were temporarily suspended during 1974, officials of the cement works near Beira, whose operations depend on coal supplies from Moatize, expected to import coal from the Republic of South Africa.

*Clays.*—Extension and modernization of equipment was planned for the ceramic factory at Lourenço Marques. Kaolin from the Tete deposits was to be substituted for imported kaolin.

*Diamond.*—Companhia de Diamantes de Moçâmbique, S.A.R.L. (a subsidiary of De Beers Associated with Anglo American Corp.) was exploring for diamond in Tete province near the Malawi border. Diamonds were reportedly found, and mining was planned for 1975. The original concession terminated on September 20, 1974.

*Fluorite.*—Bethlehem Steel temporarily halted large-scale exploration activity for fluorite in April 1974 because of the uncertain political situation. About 600,000 tons of fluorite (65% average grade fluorite) were reported in Djanguire, Tete. Sixty million tons of lower grade ore (16% to 26% fluorite) was also reported in other deposits of the Tete, Vila Pery, and Beira areas.

*Gems and Semiprecious Stones.*—Deposits of semiprecious stones exist principally in Zambezia, Niassa, and Moçâmbique Districts. The most important occurrences include those of tourmaline in the Alto Ligohna and Nacala areas, beryl crystals (aquamarine and emerald) from Zambezia, and garnets from the Nova Freixo area, Niassa District. Deposits also occur in the Tete, Vila Pery, Lourenço Marques, Inhambane, and Beira Districts. In the pegmatite areas, along with beryl and tourmaline also occurs amazonite, citron and rose quartz, topaz, morganite, and very rare kunsite and hiddenite crystals.[33]

**Mineral Fuels.**—*Coal.*—Three basins contain coal in quantity: The Moatize-Minjova, Sanangoé-Mefideze, and Chicoa-Mecúcoè. The Moatize-Minjova Basin was the only producing area and was being developed and explored by the Companhia Carbonífera de Moçâmbique S.A.R.L. (CCM) and the Companhia Carbonífera de Moatize, owned 41% by Dias da Cunha, 49% by South African Iron and Steel Industrial Co., Ltd. (ISCOR), and 10% by the State of Mozambique. Reserves were estimated at approximately 400 million tons, 40% of which was reportedly noncoking coal. The Government had hoped that production would be modestly increased in 1974. Plans included: Export of 1 million tons of raw coal per year to ISCOR and 400,000 tons per year of beneficiated coal to Japan, eventually increasing to 4 million tons; to supply 70,000 to 130,000 tons per year of raw coal for the planned aluminum industry; 100,000 to 150,000 tons per year of coking coal for the metallurgical industry of Tete; increasing to 400,000 tons per year including railway and cement factory needs. A total of 5.8 million tons per year was planned to be exported. The firm was studying both underground or open pit alternatives for expansion. However, operations were suspended in early 1974; once after guerrilla action on the Tete-Moatize railroad, and again because of drainage problems. A few European export contracts were lost, and local companies were forced to import coal for their operations. The action also affected approximately 1,300 coal miners.

Coal deposits in the Sanagoé-Mefídeze Basin are similar to those at Moatize-Minjova. A great part of this concession, located south of Songa, Tete District, is held by COMOCMIN, a company affiliated with the South African firm JCI. A number of other companies were report-

[32] Industriade Moçâmbique (Lourenço Marques). Movement of Industrial Licenses in Mozambique. V. 7, No. 6, June 1974, p. 230.
[33] Work cited in footnote 29.

edly interested in the 150-kilometer-long tract of land between Chicoa and Mecúcoè along the Zambezi River and above the Cabora Bassa Dam. Coal mined in this area could be transported via river on the upper Zambezi. Barge transportation of coal was under study by a firm under contract to the Zambezi Plan Bureau. The study was also to consider the economic feasibility of building a port at the mouth of the Zambezi River and a railroad spur from Tete to the river.[34] Other coal deposits[35] occur near the Gama River, south of Espungabera near the Rhodesian border; in the north near the Lugenda, Luchímua, and Lângua Rivers; and north of Maniamba on the Lunho River.

*Petroleum and Natural Gas.*—According to a 1974 report[36] by the Mozambique Services of Geology and Mines, gas reserves totaling 121 billion cubic meters were reported in the three fields discovered by Mozambique Gulf Oil. Gas reserves analyzed as 95.5% methane occur in the Pande Field (estimated at $114 \times 10^9$ cubic meters), Temane Field (estimated at $3 \times 10^9$ cubic meters), and Búzi Field (estimated at $4 \times 10^9$ cubic meters). An important petrochemical complex utilizing the Pande gas to make ammonia and synthetic fertilizer was envisaged by the Government.

Oil exploration, suspended earlier in 1974, was expected to resume in December at the mouth of the Zambezi River. Hunt International Petroleum Company was expected to explore the Beira area and near the mouth of the Zambezi River in 1975, spending approximately $2.4 million. Hunt relinquished another 25% of its original 20,720-square-kilometer concession, thus retaining approximately 10,360 square kilometers for the next 2 years. Texaco had requested permits for two areas, from Rovumo to Lúrio (in 1969) and the offshore region from Ponta do Oura to Inhambane (in 1974). The Texaco area near the Tanzania border was approved early in 1974, but the southern area near Inhambane was still pending. The changing political situation in Mozambique had caused withdrawal of some interests during 1974 and encouraged others. Kilroy Petroleum Co. Ltd. and Imperial Oil Ltd. of the United States, and the South African company Southern Oil Exploration Corp. (Pty) Ltd. (SOEKOR), reportedly withdrew requests for petroleum permits. The U.S. company Anshutz Overseas Corp. requested a concession extending from Beira to just north of Quelimane and was also reportedly interested in the Pande gasfield. World Mineral Limited, registered in Liberia and a subsidiary of an American company (Eastern Petroleum), requested a petroleum exploration concession in the Chibuto area near Lourenço Marques. Carlsberg Petroleum of California was also showing interest in Mozambique petroleum exploration.

The Sociedade Nacional de Refinação de Pétroleos, S.A.R.L. (SONAREP) refinery located at Lourenço Marques suspended operations in June and early July 1974 because of a lack of foreign exchange credits to pay crude oil suppliers.[37] The prospects of exporting petroleum products to other African countries such as Zambia, Tanzania, and Madagascar were being examined along with plans for refinery expansion. Swaziland was reportedly the only African country importing products from the SONAREP refinery in 1974.

## GUINEA BISSAU (FORMERLY PORTUGUESE GUINEA)

Portugal granted independence to Portuguese Guinea on September 10, 1974, under an agreement signed on August 26 in Algiers. The ruling party had previously renamed the new nation Guinea Bissau. Guinea Bissau has no important mineral production and depends upon peanuts and rice for exports and exchange earnings. The nation of approximately 800,000 inhabitants consumes an estimated 70% of its agricultural production. Oil prospecting has been carried out, and resources of phosphate, gold, zircon, iron, and bauxite have been reported. Esso Exploration Guinea Inc. and Western Geophysical had been prospecting for oil offshore Guinea Bissau. Electricity is produced exclusively by thermal generators, and in 1973 the total installed electrical capacity for the country was 10,742 kilowatts.[38]

## OTHER PORTUGUESE POSSESSIONS

Cape Verde Islands was scheduled to achieve independence from Portugal in 1975 according to an agreement made in December 1974. A transitional government was setup in the interim. The islands have been hit hard by a drought lasting 7 years. As a result little food production or other industry exists for the population of more than 270,000, who are dependent upon imports. Unexploited mineral deposits such as phosphates, strontium, and gypsum have been reported. Carbonatites containing barium and strontium were reported [39] as representing the only known occurrence of such rocks in an oceanic environment. Oil prospecting has been carried out by Hidrocarbonetos de São Tome e Principe, a subsidiary of Ball and Collins (Oil and Gas) Ltd. of London and Texas Pacific Oil Co. Inc. of Portugal in offshore areas. Naveril Enterprises requested a permit in 1974 from the Cape Verde Government to enlarge a 6-million-ton petroleum and byproducts refinery to be setup on São Vincente Island so that fertilizers, insecticides and other products may also be produced. An investment of $86,580 [40] was visualized The same firm was also studying the possibility of desalinized water and electricity production for the island.

São Tome et Principe Islands were also to achieve independence from Portugal in 1975. The island nation has a population of approximately 70,000 and no important mineral production, although oil prospecting by the British group of Ball and Collins has been done. No field exploration was carried out in 1973 by this company, which was the only concessionaire.

# The Mineral Industry of Argentina

By John L. Albright [1]

Argentina maintained its position as one of South America's most industrialized nations, and its mineral industry was one of the most active on the continent. South America's leading diatomite, feldspar, gypsum, mica, peat, and pumice producers operated in the country; and Argentina was the continent's second largest producer of cement, crude oil, fluorspar, iron and steel, lead, and natural gas. Its production of crude oil was larger than the combined output of Brazil, Chile, and Colombia.

The country became more dependent on foreign sources of petroleum in 1974 as domestic production of crude oil fell, and imports of petroleum increased. Crude oil production had peaked in 1972, when the Argentine output totaled 159 million barrels. The domestic coal, iron, and steel industries were being developed during 1974, and mining industry officials were evaluating plans to develop iron ore deposits in Misiones Province and initiated a series of studies concerning the development of alunite, barite, and fluorspar deposits in Chubut Province in southern Argentina.[2]

Several petrochemical plants were being constructed, and expansions were made to petroleum refining and transportation facilities. Plans were developed to build an additional refinery, a lubricating oil plant, and a fertilizer plant. In an effort to broaden its energy base and make necessary supplies of electricity available to the industrial and mining sectors of the economy, the Government studied plans to install new nuclear and hydroelectric generating plants. Hydroelectric powerplants were under construction during the year on Río Futaleufú and Río Uruguay. Construction of one nuclear powerplant was completed, work began on another, and the country's first aluminum plant was commissioned during the year. Negotiations were carried out with foreign economic and trade groups to develop Argentine mining, manufacturing, petroleum, and petrochemical industries.

During the first quarter of 1974, the Government implemented the Mining Promotion Law of November 1973 by publication of Decree No. 443/74. According to the decree, Certificates for Mining Promotion would be issued by the Government to mining companies for approved projects to promote mining investments. The decree also prohibited the export of certain unrefined, semiprocessed, or mineral concentrates.

## PRODUCTION

Argentina was South America's second largest producer of petroleum and natural gas in 1974. Crude oil production totaled 151 million barrels, a decrease of less than 2% from the 1973 output. Yacimientos Petrolíferos Fiscales (YPF), the Government oil entity, accounted for 72% of the output, and nearly all of the remainder came from areas operated by private companies under service contracts with YPF. Amoco Argentina Oil Co., Argentina Cities Service Co., and YPF were the largest producers; eight other oil companies were engaged in producing crude oil in the country. More than one-half of the domestic output

[1] Mineral specialist, Division of Petroleum and Natural Gas.

[2] Mining Annual Review 1975. Argentina. Mining Journal (London), June 1975, p. 343.

came from wells in Chubut, Mendoza, and Santa Cruz Provinces, and important quantities of crude oil were produced in the Provinces of Jujuy, LaPampa, Neuguén, Río Negro, Salta, and in the territory of Tierra del Fuego.

The gross production of natural gas totaled 332.9 billion cubic feet, an increase of 18 billion cubic feet or 5.7% above natural gas production during 1973. Nearly 80% of the gas production was by YPF, and YPF contractors accounted for the remaining output, less 0.7% of the total which was produced by several private companies.

Cement, coal, pig iron and steel all recorded important increases in production during the year.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, cadium, lime, perlite, and urea are also produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates as output levels.

[2] Revised to none.

[3] Hot rolled semimanufactures only; excludes (1) castings and (2) cold rolled semimanufactures produced from imported hot rolled semimanufactures.

[4] Excludes white cement.

[5] Partial figure, excludes other unspecified nitrogenous fertilizers.

[6] Partial figure, rafaelite only, excludes pyrobitumen.

## TRADE

The Government continued its program of import controls over numerous commodities that it established in 1972, and exercised controls over the exportation of a wide range of raw and semiprocessed materials and numerous finished products containing aluminum, copper, and tin. An export ban was enforced on numerous commodities including iron and steel scrap, unworked stainless steel plates, lead and zinc ore, and sulfur. Exports of most iron and steel products were subjected to prior approval by the State organization Fabricaciones Militares (FM).

Imports of crude oil in 1974 were valued at $342.8 million,[3] more than double the $115.1 million value placed on the oil imports in 1973. About one-half of the crude oil imported in 1974 came from Libya (more than three-fourths of the oil supplies came from North Africa and the Middle East), and Argentina negotiated the purchase of 38 million barrels of Libyan crude oil to be delivered in 1975. Bolivia and Saudi Arabia had been Argentina's principal suppliers of crude oil in 1973.

Argentina and Bolivia signed an extensive economic agreement in 1974 that included provisions for future sales of Bolivian iron and steel products and natural gas to Argentina; developing telecommunication and transportation links between the two countries; and stimulating the exploration, exploitation, and trade of hydrocarbons. The two countries also agreed to study the development of hydroelectric generating plants and the feasibility of establishing a joint-venture nitrogenous fertilizer plant. They further agreed to stimulate trade with one another and to examine the reduction or removal of trade barriers.

Argentina and Brazil negotiated an agreement whereby they will establish a joint company to exploit and market iron ore from Brazil's Corumba deposit near the Argentine border. Argentina may purchase large quantities of Brazilian iron ore and manganese over the next 50 years, under the terms of the agreement.

Economic agreements signed by Argentina and Romania provided for cooperation in developing chemical, metallurgical, mining, petrochemical, petroleum, and steel industries. According to the agreements the two countries will attempt to expand the exchange of technology and develop joint production and marketing ventures. Romania reportedly extended $100 million to Argentina for the purchase of Romanian capital goods and equipment, which may be repaid with Argentine industrial products.

[3] Where necessary, values have been converted from Argentine pesos (M$N) to U.S. dollars at the normal financial rate of M$N9.98=US$1.00.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Aluminios Argentinos, S.A. (ALUAR), began operating the country's first aluminum smelter at Puerto Madryn, near Buenos Aires, at the initial rate of 36,000 tons per year. ALUAR planned to double the rate of production during 1975, and in 1976, the plant is expected to reach its full design capacity of 140,000 tons per year. Production was based on imported alumina.

**Copper.**—Compañía Minera Aguilar, S.A. (CMA), began work on a pilot plant at the Pachón copper deposits in San Juan Province and constructed a road from the site to La Junta, approximately 220 kilometers distant. The company plans to begin commercial output at Pachón in 1980. In addition to further exploration activities in San Juan Province, CMA carried out exploration in Mendoza and Neuguén Provinces where large deposits of copper, molybdenum, and other minerals are believed to exist.

**Iron and Steel.**—Steps were taken in 1974 to improve the availability of iron ore supplies and to expand Argentina's iron and steel production facilities. Production of crude steel increased 9% from 2.2 million tons in 1973 to 2.4 million tons in 1974, and pig iron output increased by 33% to 1.1 million tons during 1974. The domestic industry planned to raise crude steel output to 6 million tons per year by 1977 and to 10 million tons per year by 1980. Negotiations were carried out with Bolivia and Brazil for future supplies of iron ore, and mining equipment was obtained from Sweden to be used in a new mine at Sierra Grande, in southern Argentina. Production at Sierra Grande is expected to average 3.5 million tons of iron ore per year.[4]

New furnaces were installed at Acindar, Santa Rosa, and Zapla; and a continuous casting plant was built at Acindar. Aceros Bragado, S.A., acquired a steel sheet rolling mill, and Dálmine Siderca S.A.I.C. reportedly obtained a direct reduction plant and a seamless steel tube mill. Expansions were planned at several other mills. FM requested international bids for the construction of a steel mill in Argentina rated at 2.5 million to 3 million tons per year, to begin production by yearend 1978. The State will be the main stockholder in the planned steel mill.[5]

**Uranium.**—Prospecting for uranium reportedly resulted in a discovery of unknown size in the northwest part of the country. Comisión Nacional de Energía Atomica (CNEA) announced plans to develop the deposit at Sierra Pintado in Mendoza Province.

During the year, construction activities were completed at one nuclear powerplant and started at another. The 319-megawatt Atucha nuclear plant, South America's first, began supplying Argentina with electricity. The plant is located on the Río Paraná about 100 kilometers northwest of Buenos Aires. A site at Embalse, near Córdoba, was chosen for the country's second nuclear powerplant, and CNEA commenced the construction of a 600-megawatt plant there in 1974. During the year, CNEA reviewed plans for a third nuclear powerplant, which will probably be built near Atucha and have a capacity identical to the Embalse plant.

**Other Metals.**—The State mining company Yacimientos Mineros de Aguas de Dionisio (YMAD) prepared plans to begin producing 25,000 tons per year of manganese concentrates along with 600 kilograms of gold and 2,500 kilograms of silver from the Farallon Negro deposits in Catamarca Province in 1975. YMAD's proven reserves at the deposit will last 12 years at anticipated production rates. The company was conducting exploratory activities at Alto de la Blend and Bajo de la Alumbrera.

A plant may be built in San Luis Province to process low-grade tungsten ore. The local government solicited bids for the construction of the plant near La Toma, about 650 kilometers west of Buenos Aires. CMA produced 49,835 tons of lead concentrate, 1.9 million troy ounces of silver, and 86,800 tons of zinc concentrate in 1974.

### NONMETALS

**Cement.**—Near yearend, the new 400,000-ton-per-year-capacity cement plant in Buenos Aires Province began operations, increasing Argentina's installed produc-

[4] Mining Journal. Crushers for Argentina. V. 282, No. 7729, Mar. 8, 1974, p. 178.
[5] Mining Journal. Argentine Steelworks Tenders. V. 283, No. 7256, Sept. 13, 1974, p. 222.

tion capacity by 4.9% to nearly 8.6 million tons per year. More than three-fourths of the industry's capacity was located in the Provinces of Buenos Aires and Córdoba. Argentina's portland cement plants operated at 63% of their capacity in 1974, producing 5.4 million tons of cement. In addition, more than 42,200 tons of white cement was produced during the year. The industry employed more than 8,000 workers.

Major cement consuming areas were the capital city and the Provinces of Buenos Aires, Córdoba, Mendoza, and Santa Fe. Nearly all domestic shipments of cement were handled by highway and railroad vehicles, and less than 1% of the consignments was transported by waterway.[6]

**Clays.**—*Alunite.*—Two deposits of alunite have been discovered in Chubut Province. One of the discoveries was made near Camarones, and the other deposit was discovered at Alto Río Senguerr. Estimates of reserves have not been made.[7]

**Fertilizer Materials.**—An agreement was signed during 1974 by Argentina and Bolivia that called for feasibility studies concerning the construction of a nitrogenous fertilizer plant that would supply both countries. The negotiators envisaged a binational plant to be built near the Argentine-Bolivian border, producing about 1,000 tons per day of ammonia and a similar volume of urea.

## MINERAL FUELS

**Coal and Coke.**—Production of washed coal by Yacimientos Carboníferos Fiscales (YCF) totaled 625,647 tons in 1974, an increase of 38% above that of 1973. The washed coal output was 53% of YCF's gross mine output. During the year, railroads transported 523,625 tons of coal from the Río Turbio mines in southwestern Argentina to the port of Río Gallegos where 437,462 tons were shipped by water to consumers in Buenos Aires and San Nicolás. Argentina imported 906,088 tons of bituminous and 1,000 tons of anthracite coal in 1974; the coal imports were valued at $55.2 million. During the year, 3,147 tons of coke was imported from Belgium.[8] Poland signed an agreement whereby they would assist YCF in developing the Río Turbio mines and in exploring in other areas.

**Petroleum and Natural Gas.**—YPF and other oil companies continued to develop Argentina's petroleum and natural gas industries. Yearend reserves of crude oil were estimated at 2.3 billion barrels, down 154 million barrels from that of yearend 1973; reserves of natural gas were estimated at 7.1 trillion cubic feet, up 1.1 trillion cubic feet from that of 1973. Nearly all exploration operations were conducted by YPF crews or by private companies under contract to the Government oil company. An average of 7 geologic, 1 gravity, and 22 seismic groups were active during the year. Marine surveys were carried out offshore Río Colorado, the Río Salado Basin, and Tierro del Fuego. YPF submitted the most favorable bid to Ecuador for the right to explore an area of 2,000 square kilometers in that country.

In Argentina, 606 oil wells totaling 1.3 million meters were drilled in 1974; the number of wells drilled exceeded the previous year by only 9 wells.[9] YPF's offshore drilling program was delayed when a jack-up rig sank while in tow to Argentina from the United States. Another rig was under construction in a French shipyard and was scheduled for delivery in 1976.[10] YPF made three oil discoveries in Mendoza Province near the Chilean border; each flowed more than 500 barrels of oil per day, and the productive depths reportedly ranged from 1,414 to 3,146 meters.

During 1974 the Government took over the marketing of all petroleum and petroleum products in the country. Six private retailing companies, including subsidiaries of Cities Service Co. and Exxon Corp., were affected. The Government action did not affect refinery operations by foreign companies.

Argentina's petroleum refinery throughput capacity totaled 720,718 barrels per day in 1974, the third largest in South America, behind that of only Venezuela

and Brazil. YPF's plants accounted for approximately 66% of the total capacity, and the company's 289,000-barrel-per-day refinery at La Plata near Buenos Aires was the largest in the country.[11] Approximately 88% of the oil processed at Argentina's refineries was from domestic sources. Refinery operations averaged 465,300 barrels of oil per day in 1974, down 6,000 barrels per day from that of 1973. Argentina's refineries could not satisfy the country's demand for petroleum products, and significant quantities of fuel oil, gas oil, gasoline, liquefied petroleum gas (LPG), and lubricants were imported. In 1974 YPF revealed its plans for the construction of a $300 million, 150,000-barrel-per-day refinery on the coast near Bahía Blanca. The new plant is to be completed by yearend 1978. YPF also developed plans for a 200,000-ton-per-year lubricating oil plant for the Punta Alta area, located about 24 kilometers south of Bahía Blanca.

Sales of petroleum products decreased approximately 4% during 1974, with gains in sales of gas oil, kerosine, LPG, and lubricants. Sales of aviation gasoline and diesel oil recorded the largest declines, 26% and 20%, respectively.

YPF and the provincial government of Chubut agreed to carry out a feasibility study for a refinery and petrochemical plant to be supplied by the San Jorge oilfields. Petrochemical plants were being built during the year at two sites in Argentina. An ethane cracking plant was under construction at the Petroquimica Bahía Blanca (PBB) plant site in Bahía Blanca. The plant was scheduled to begin producing ethylene and propylene in 1975. Petroquimica General Mosconi (PGM) readied its aromatics plant for production in La Plata. Output from the PGM plant will include benzene, cyclohexane, toluene, xylene, and higher aromatics.[12]

YPF constructed a large-diameter, crude oil pipeline from the Puerto Rosales marine petroleum terminal to the La Plata petroleum refinery, a distance of about 650 kilometers. This 81-centimeter trunkline, the country's largest, has a throughput capacity of 240,000 barrels per day that can be expanded to 500,000 barrels per day.[13]

Sales of natural gas by Gas del Estado, the state-owned gas company, totaled 256 billion cubic feet in 1974, an increase of 18 billion cubic feet or 7.5% from that of 1973.

# The Mineral Industry of Australia

By Charlie Wyche [1]

A contrast of both favorable and unfavorable events characterized Australia's mining industry in 1974. The rapid increase in metal prices during most of the year more than offset the decline in the final quarter. The price drop at yearend was also partly compensated for by devaluation of the Australian dollar. The overall price rise brought increased production and revenue to operating mines. According to early estimates, the $2.90 billion [2] value of mine and quarry production, together with value added by local smelting and processing, credited the mineral industry with products valued at $4.1 billion. This figure represented 5.3% of the $78 billion (adjusted gross national product (GNP). Since 1969 value of mineral output in constant dollars has almost doubled. The advance was achieved despite a decline in exploration, increased inflation, environmental difficulties, and serious shortages of workmen, equipment, and supplies.

Australia ranks among the world's five major producers of bauxite, iron, tin, silver, lead, zinc, and manganese and has 24% of the world's uranium reserves. It is the world's 10th largest producer of black coal, and its brown coal resources in Victoria are probably the world's largest. With the development of phosphate deposits in the Mount Isa Area of Queensland, Australia will rank among the three largest world producers of this mineral. Of the mineral commodities produced in Australia during 1974, iron ore, bauxite, alumina, copper, and coal showed significant increases. These commodities accounted for over 70% of the total value of the Nation's mineral production in 1973, the most recent year for which complete value data are available. The 10 leading mineral commodities or categories, in order of value, in million dollars, were as follows: Coal, 488.1; iron ore 427.5; crude petroleum, 380.2; copper, 267.9; construction materials, 196.6; lead in ore and concentrate, 110.9; zinc in ore and concentrate, 97.1; mineral sands (including rutile, zircon, and ilmenite), 63.0; gem stones 47.3; and tin-in-concentrate, 43.4.

Although all six States and the Northern Territory contributed to the mineral output, Western Australia with its large iron ore, nickel, and gold industries furnished 24.5% of the total value of Australia's mineral production. The iron ore production value increased from $583 million to $654 million, a rise of 12%.

Queensland's aluminum raw materials, base metals, and coal resources ranked that State in second place with 23.7%, and New South Wales with its large base metals and coal production was a close third, accounting for 20.5% of the total value. Victoria, with substantial production of brown coal, was fourth with 17.5%. Tasmania, South Australia, and the Northern Territory with a wide variety of minerals such as copper, tin, zinc, and bauxite contributed the remainder.

Aided by a continuation of good economic conditions in world markets which developed late in 1973, exports of primary mineral products (excluding gold) increased by 9% to a record $2.2 billion in 1974. The value of gold shipments was excluded in accordance with international standards, whereby shipments of refined gold and bullion are not classified as merchandise trade. The increase was attributed to higher prices and increased shipments of iron ore and pellets, nickel, alumina, and black coal, which accounted for more than 65% of total mineral ex-

[1] Physical scientist, Division of Nonferrous Metals.
[2] Unless otherwise indicated, values have been converted from Australian dollars ($A) to U.S. dollars at the rate of $A1 = US$1.27.

ports. Exports of iron ore from Western Australia increased in quantity from 64 million tons in 1973 to 75 million tons in 1974; the value of shipments increased from $524 million to $588 million. Production of nickel in concentrates increased in value by 25%, from $103 million to $129 million. Higher export values were also reported for refined copper, tin, manganese ore, and crude oil.

Although Australia exported minerals and metals to more than one hundred countries in 1974, Japan, the United Kingdom, United States, and countries of the European Economic Community (EEC) accounted for 90% of total mineral exports. Japan alone received more than 85% of the total iron ore and black coal production. Australia continued to import substantial quantities of phosphate rock, sulfur, asbestos, and industrial diamond. Although the population and economy were expanding, the value of mineral imports increased nominally over the $250 million in 1973.

Exploration expenditures for petroleum increased from $136 million in 1973 to about $146 million in 1974. Private industry spent about $90 million on exploration for minerals other than petroleum, compared with $85 million in 1973.

## PRODUCTION

Australia's mineral production in 1974 included 51 basic commodities, 24 of which were metallic, 23 nonmetallic and construction materials, and 4 fuel minerals. Despite labor and environmental problems, production gains were recorded in more than half of the commodities, and the total value of minerals produced was 20% greater than that in 1973. Major commodities that showed decreases were lead, gold, silver, tin, and zinc.

e Estimate. p Preliminary. r Revised. NA Not available.
[1] Exports (production not officially reported).
[2] Data are for year ended November 30 of that stated.
[3] Data are for year ended November 30 of that stated for plants owned by The Broken Hill Pty. Co. Ltd.
[4] Figures represent estimated refinery recovery from nickel concentrates exported to Japan from Kambalda.
[5] Partial figure; output by Peko-Wallsend Ltd. only.
[6] Data are for year ended June 30 of that stated.
[7] Excludes production from Victoria, for which data are not available.
[8] Excludes production from Northern Territory, Australian Capital Territory, and Queensland.
[9] Excludes production from Western Australia.
[10] Sulfur content of materials obtained as a byproduct of nonferrous metallurgical operations and oil refining.

## TRADE

The trade data in tables 2 and 3, provided by the Commonwealth Bureau of Census and Statistics, cover the official July 1 to June 30 yearly reporting period; therefore, the data are not comparable with calendar year data presented elsewhere in this review.

## Table 2.—Australia: Exports and reexports of mineral commodities [1]

(Metric tons unless otherwise specified)

| Commodity | 1971–72 | 1972–73 | Principal destinations, 1972–73 |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite, gross weight [2] thousand tons | 5,563 | 6,701 | Japan 3,457; West Germany 1,613; Italy 454. |
| Alumina, gross weight ____ do ____ | 2,460 | 2,592 | NA. |
| Metal: | | | |
| Scrap | 2,823 | 1,640 | Japan 1,503; Thailand 57; Taiwan 37. |
| Unwrought | 96,239 | 81,462 | NA. |
| Semimanufactures | 5,048 | 5,007 | Indonesia 1,399; New Zealand 1,113; Hong Kong 544. |
| Beryllium ore and concentrate, gross weight | 54 | 168 | United States 142; Japan 26. |
| Cadmium metal, refined, unwrought and semimanufactures | 658 | 594 | United States 197; Netherlands 186; United Kingdom 101. |
| Chromium: | | | |
| Chromite ore and concentrate, gross weight | 11 | -- | |
| Chromium oxides and hydroxides | 212 | 11 | New Zealand 10. |
| Columbium and tantalum, columbite-tantalite concentrate, gross weight ____ | 170 | 290 | United States 140; Netherlands 98; Japan 20. |
| Copper: | | | |
| Ore and concentrate, gross weight | 141,396 | 164,254 | Japan 159,775; Belgium-Luxembourg 2,858; West Germany 834. |
| Matte | 3,791 | 7,012 | All to Belgium-Luxembourg. |
| Metal including alloys: | | | |
| Copper-lead dross and speiss ____ | 1,287 | 2,817 | All to United States. |
| Copper slags and residues ____ | 132 | 18 | Mainly to United States. |
| Scrap including alloys scrap ___ | r 583 | 733 | Japan 616; United Kingdom 67; Taiwan 50. |
| Unwrought: | | | |
| Blister and cement | 5,869 | 7,797 | Japan 7,728; United Kingdom 69. |
| Other, unalloyed | 56,517 | 49,967 | United Kingdom 23,395; West Germany 13,798; France 7,268. |
| Alloyed | 17 | 64 | Japan 28; Malaysia 12; New Zealand 11. |
| Semimanufactures: | | | |
| Unalloyed | 15,307 | 7,827 | New Zealand 1,827; United Kingdom 1,295; Singapore 1,215. |
| Alloyed | 3,294 | 4,611 | Hong Kong 2,385; New Zealand 846; Singapore 491. |
| Gold: | | | |
| Ore and concentrate, metal content [3] troy ounces | r 213,352 | 61,987 | NA. |
| Metal: | | | |
| Mint bullion ____ do ____ | 108,865 | 293,207 | United Kingdom 267,601; Hong Kong 25,590. |
| Refined and unrefined bullion do ____ | 9,883 | 35,287 | Japan 34,051; New Zealand 722; United Kingdom 514. |
| Iron and steel: | | | |
| Ore and concentrate thousand tons | 50,239 | 66,294 | Japan 56,416; Italy 1,812; West Germany 1,731. |
| Metal: | | | |
| Scrap ____ do ____ | 553 | 543 | NA. |
| Pig iron and equivalent materials ____ do ____ | 528 | 687 | People's Republic of China 289; Japan 194; Italy 156. |
| Ferroalloys | 222 | 184 | New Zealand 157; Malaysia 23. |
| Steel ingots and other primary forms ____ thousand tons | 298 | 757 | West Germany 256; Republic of Korea 122; Philippines 121. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, sections ____ do ____ | 153 | 155 | New Zealand 50; Singapore 22; Indonesia 12. |
| Universals, plates, sheets do ____ | 271 | 351 | United States 62; New Zealand 57; United Kingdom 33. |
| Hoop and strip ____ do ____ | 6 | 10 | New Zealand 8. |
| Rails and accessories do ____ | 23 | 25 | People's Republic of China 11; New Zealand 9; Thailand 4. |
| Wire ____ do ____ | 21 | 22 | New Zealand 9; Indonesia 3; United States 2. |
| Tubes, pipes, fittings do ____ | 54 | 82 | NA. |
| Castings and forgings, rough do ____ | 2 | 2 | United States 1. |
| Total ____ do ____ | r 530 | 647 | |

| Sand, gravel, limestone flux, and other calcareous stone ---------- | 218,812 | 387,987 | Japan 336,106; United States 44,221. |
| Sulfur, sulfuric acid ---------- | 136 | 10,830 | Japan 10,675. |
| Talc, steatite, soapstone, pyrophyllite -- | 30,648 | 31,402 | Japan 18,182; Netherlands 11,017; New Zealand 2,079. |
| Other nonmetals, n.e.s.: | | | |
| Crude: | | | |
| Quartz, mica, feldspar, fluorspar, cryolite, chiolite ---------- | 1,446 | 2,140 | United States 1,106; Japan 562; New Zealand 430. |
| Refractory materials, except clay and magnesite ---------- | 99 | 151 | Papua New Guinea 31; Timor 19; Philippines 19. |
| Other ------ value, thousands -- | $114 | $431 | Japan $196; New Zealand $80; West Germany $50. |
| Oxides and hydroxides of magnesium, strontium, barium ---------- | 5 | 373 | New Zealand 321; Philippines 50. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s ---------- value, thousands -- | $2,901 | $2,667 | Canada $1,042; Papua New Guinea $993; Singapore $130. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Carbon black ---------- | 16,194 | 21,694 | New Zealand 6,658; Indonesia 5,276; Malaysia 3,323. |
| Coal, bituminous, lignite and peat (including briquets): | | | |
| Bituminous coal and briquets thousand tons -- | 21,909 | 25,800 | Japan 23,095. |
| Lignite, peat and briquets thereof do ---- | 11 | 6 | All to Japan. |
| Coke and semicoke ---------- do ---- | 73 | 204 | New Caledonia 81; Netherlands 47; Venezuela 27. |
| Petroleum: | | | |
| Crude and partly refined thousand 42-gallon barrels -- | 6,859 | 2,077 | Japan 1,410; New Zealand 323; United Kingdom 312. |
| Refinery products: | | | |
| Gasoline ---------- do ---- | 1,550 | 1,428 | New Zealand 893; Singapore 295; Fiji 155. |
| Jet fuel ---------- do ---- | 2,558 | 1,422 | New Zealand 547; Fiji 512; United States 273. |

See footnotes at end of table.

## Table 2.—Australia: Exports and reexports of mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1971–72 | 1972–73 | Principal destinations, 1972–73 |
|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS—Continued | | | |
| Petroleum—Continued | | | |
| Refinery products—Continued | | | |
| Kerosine | | | |
| thousand 42-gallon barrels | 235 | 246 | New Zealand 194; Fiji 33; Gilbert and Ellice Islands 11. |
| Distillate fuel oil ------ do | 3,421 | 2,436 | New Zealand 721; United Kingdom 323; Singapore 321. |
| Residual fuel oil ------ do | 1,384 | 3,408 | Japan 3,022. |
| Lubricants ------ do | 1,044 | 847 | New Zealand 344; Malaysia 138; Republic of South Africa 123. |
| Other ------ do | r 321 | 270 | New Zealand 106; Bahrain 53; Singapore 26. |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | | | |
| value, thousands | $76 | $1,028 | New Zealand $764; Japan $88; Malaysia $88. |

r Revised. NA Not available.

[1] Data given are for years beginning July 1; unless otherwise specified.

[2] Data given are for years beginning January 1; in the case of bauxite, figures are receipts by trading partner countries.

[3] Data from "Australian Mineral Industry. Quarterly Review—Quarterly Statistics," Bureau of Mineral Resources, Geology, and Geophysics. V. 27, No. 3, March 1975, and for years beginning March 1 of that stated.

[4] In addition to the forms of nickel listed, Australia also exported nickel ores and concentrates, but neither quantity nor value is published in a form that is separable from other commodities.

Source: Unless otherwise specified: Overseas Trade Bulletin No. 69, 1971–72, and No. 70, 1972–73, Commonwealth Bureau of Census and Statistics, Canberra, Australia, 1972 and 1974.

## Table 3.—Australia: Imports of mineral commodities [1]

(Metric tons unless otherwise specified)

| Commodity | 1971–72 | 1972–73 | Principal sources, 1972–73 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Oxide and hydroxide | 19,237 | 3,847 | Japan 820; West Germany 670; Netherlands 664. |
| Metal including alloys: | | | |
| Scrap | 701 | 997 | New Zealand 949. |
| Unwrought | 633 | 712 | United Kingdom 438; Canada 215. |
| Semimanufactures | 3,093 | 3,523 | United States 1,461; United Kingdom 1,079. |
| Antimony metal, all forms | 72 | 80 | Mainly from People's Republic of China. |
| Arsenic trioxide, pentoxide and acids | 1,116 | 1,130 | United Kingdom 380; People's Republic of China 230; Territory of South-West Africa 195. |
| Beryllium metal including alloys, all forms ------ value | $2,382 | $2,550 | United States $1,275. |
| Bismuth metal including alloys, all forms | 13 | 11 | United Kingdom 9; Japan 2. |
| Cadmium metal including alloys, all forms | 70 | 15 | North Korea 5; Yugoslavia 5; Japan 5. |
| Chromium: | | | |
| Chromite | 6,508 | 586 | All from Republic of South Africa. |
| Oxide, hydroxide and trioxide | 319 | 589 | United States 191; West Germany 177; U.S.S.R. 174. |
| Metal including alloys, all forms | 71 | 24 | France 18; Japan 3; United Kingdom 2. |
| Cobalt: | | | |
| Oxide and hydroxide | 18 | 8 | United Kingdom 5; Belgium-Luxembourg 2. |
| Metal including alloys, all forms | 68 | 128 | Zambia 73; Belgium-Luxembourg 16. |
| Copper: | | | |
| Ore and concentrate | 5 | 1 | Mainly from Fiji. |
| Copper sulfate | 2,355 | 2,593 | New Zealand 2,166. |
| Metal including alloys: | | | |
| Scrap: | | | |
| Unalloyed | r 682 | 1,434 | New Zealand 1,050; Papua New Guinea 166. |
| Alloyed | 2,057 | 1,592 | New Zealand 974; Papua New Guinea 302; Solomon Islands 175. |
| Unwrought | 81 | 630 | Israel 506; United Kingdom 78. |
| Semimanufactures | r 4,164 | 4,488 | United Kingdom 2,624; West Germany 564; Japan 538. |

See footnotes at end of table.

## Table 3.—Australia: Imports of mineral commodities[1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1971–72 | 1972–73 | Principal sources, 1972–73 |
|---|---|---|---|
| METALS—Continued | | | |
| Gold: | | | |
| Ore and concentrate, gross weight | 18 | 12 | All from Fiji. |
| Crude bullion, gold content troy ounces | 58,403 | 99,709 | Fiji 77,982; Papua New Guinea 21,459. |
| Refined bullion do | 53,845 | 5,130 | Japan 4,910. |
| Iron and steel: | | | |
| Ore and concentrate, including roasted pyrite | 5,984 | 24,988 | Canada 16,531; Philippines 8,383. |
| Metal: | | | |
| Scrap | 190 | 141 | New Zealand 66; Solomon Islands 66. |
| Sponge iron, powder and shot | 6,749 | 6,108 | Sweden 2,538; Japan 1,601. |
| Spiegeleisen | 18 | 29 | All from West Germany. |
| Ferroalloys: | | | |
| Powder: | | | |
| Ferromanganese | 1,404 | 552 | Japan 286; Republic of South Africa 121; France 102. |
| Other | 189 | 179 | Japan 106; France 30; United Kingdom 28. |
| Shot: | | | |
| Ferrochromium | 4,991 | 7,645 | Republic of South Africa 5,456; Japan 1,634. |
| Ferromanganese | 9,370 | 5,817 | Republic of South Africa 5,519. |
| Ferromolybdenum | 148 | 243 | United Kingdom 104; United States 55; Chile 38. |
| Ferrosilicon | 9,771 | 9,202 | Republic of South Africa 5,345; Norway 1,915; Japan 1,163. |
| Ferronickel | 1,029 | 1,337 | All from New Caledonia. |
| Other | r 2,631 | 2,976 | United Kingdom 1,732; Republic of South Africa 675. |
| Steel, primary forms | r 70,478 | 60,255 | Japan 48,791; United Kingdom 10,190. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, sections | 69,513 | 34,426 | Japan 17,700; United Kingdom 6,223. |
| Universals, plates, sheets | 308,275 | 221,104 | Japan 202,754. |
| Hoop and strip | 29,030 | 31,695 | Japan 25,280. |
| Rails and accessories | 28,688 | 322 | United States 169; Japan 81. |
| Wire | 9,198 | 10,541 | Japan 6,815; United Kingdom 1,380. |
| Tubes, pipes, fittings | 98,497 | 140,815 | Japan 109,035. |
| Castings and forgings, rough value, thousands | $177 | $200 | United Kingdom $136; United States $46. |
| Lead: | | | |
| Oxides | 31 | 26 | United Kingdom 12; Republic of South Africa 10. |
| Metal including alloys: | | | |
| Scrap | 465 | 412 | New Zealand 151; Papua New Guinea 146; Solomon Islands 103. |
| Unwrought and semimanufactures | 42 | 44 | United Kingdom 19; Canada 9; United States 5. |
| Magnesium metal including alloys, all forms | 1,505 | 1,498 | Norway 649; United States 395; U.S.S.R. 358. |
| Manganese: | | | |
| Ore and concentrate: | | | |
| Battery grade | 1,636 | 1,524 | All from Ghana. |
| Metallurgical grade | 3,228 | 3,346 | People's Republic of China 3,290. |
| Oxides | 969 | 1,130 | Japan 690; United States 281. |
| Metal including alloys, all forms | 717 | 721 | Japan 555; Republic of South Africa 106. |
| Mercury 76-pound flasks | 1,243 | 1,596 | Spain 435; Philippines 275; U.S.S.R. 252. |
| Molybdenum: | | | |
| Ore and concentrate | 224 | 359 | Canada 165; Chile 107; United States 66. |
| Metal including alloys, all forms: | | | |
| Wire | 9 | 6 | United States 5. |
| Other value, thousands | $188 | $82 | United Kingdom $37; United States $33. |
| Nickel: | | | |
| Ore and concentrate | 5 | -- | |
| Matte, speiss, and similar materials | 623 | 929 | Canada 928. |
| Metal including alloys: | | | |
| Scrap | 5 | 28 | All from New Zealand. |
| Unwrought | 1,348 | 1,020 | Canada 1,020. |
| Semimanufactures | 628 | 658 | United Kingdom 494. |

See footnotes at end of table.

Table 3.—Australia: Imports of mineral commodities[1]—Continued
(Metric tons unless otherwise specified)

| Commodity | 1971–72 | 1972–73 | Principal sources, 1972–73 |
|---|---|---|---|
| METALS—Continued | | | |
| Platinum-group metals and silver: | | | |
| Ore and concentrate | 65 | 21 | New Zealand 11; Fiji 10. |
| Waste and sweepings value, thousands | $69 | $230 | New Zealand $228. |
| Metals including alloys: | | | |
| Platinum group - troy ounces | 382,133 | 180,762 | Japan 96,116; United States 60,549. |
| Silver containing 75% or more silver, silver content - do | 39,148 | 77,033 | United States 37,917; Fiji 16,705; New Zealand 10,138. |
| Silicon metal | 1,950 | 2,366 | Sweden 1,012; Canada 669; France 418. |
| Tin: | | | |
| Oxides long tons | 6 | 42 | United Kingdom 37. |
| Metal including alloys: | | | |
| Scrap do | 2 | -- | |
| Unwrought do | 94 | 64 | Malaysia 63. |
| Semimanufactures do | 2,394 | 38 | Republic of South Africa 23; United Kingdom 8. |
| Tungsten: | | | |
| Ore and concentrate | -- | 1 | All from United Kingdom. |
| Metal including alloys, all forms | 13 | 11 | United States 4; United Kingdom 4; West Germany 2. |
| Zinc: | | | |
| Ore and concentrate | -- | 18 | All from Canada. |
| Oxides | 1,267 | 771 | United States 353; Canada 282. |
| Metal including alloys, all forms | r 213 | 102 | New Zealand 48; United Kingdom 38. |
| Other: | | | |
| Ore and concentrate: | | | |
| Of niobium, tantalum, titanium, vanadium, and zirconium | 1 | 1 | Mainly from United Kingdom. |
| Of base metals, n.e.s | 11,616 | 2,448 | Japan 1,100; United States 1,036. |
| Ash and residue containing nonferrous metals | 614 | 5,645 | Chile 5,000. |
| Oxides, hydroxides and peroxides of metals, n.e.s | 699 | 895 | United Kingdom 339; Norway 180; Japan 148. |
| Metals including alloys, all forms: | | | |
| Metalloids | 1,238 | 3,224 | United States 1,541; Canada 990; U.S.S.R. 619. |
| Alkali, alkaline earth and rare-earth metals | 39 | 101 | United Kingdom 50; United States 42. |
| Base metals including alloys, all forms, n.e.s | 80 | 122 | United States 68; Japan 27. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Pumice, emery, natural corundum, etc | 1,188 | 1,308 | United States 735; New Zealand 236; United Kingdom 149. |
| Grinding and polishing wheels and stones | 817 | 979 | West Germany 218; Japan 183; United Kingdom 162. |
| Asbestos: | | | |
| Chrysotile | r 41,365 | 50,014 | Canada 49,881. |
| Amosite | r 10,988 | 7,587 | Mainly from Republic of South Africa. |
| Other | r 9,312 | 3,773 | Canada 3,626. |
| Barite and witherite, natural and ground | 1,660 | 1,209 | People's Republic of China 625; Indonesia 340. |
| Boron materials: | | | |
| Crude natural borates | 1,989 | 1,301 | United States 1,289. |
| Oxide and acid | 3,543 | 3,330 | United States 2,883; People's Republic of China 400. |
| Cement, hydraulic | r e 9,353 | e 8,240 | United Kingdom 4,287; Spain 1,354; West Germany 1,289. |
| Chalk | 7,785 | 8,782 | United Kingdom 4,466; France 4,312. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite | 65,524 | 63,139 | United States 58,893; |
| Fire clay and ball clay | 10,948 | 9,968 | United States 9,247. |
| Andalusite, mullite, chamotte, and dinas earths | 8,484 | 8,464 | Republic of South Africa 8,390. |
| Kyanite and sillimanite | 3,418 | 490 | United States 379; India 50. |
| White clays | 27,649 | 37,535 | United Kingdom 28,129; United States 9,367. |
| Other | 9,621 | 17,936 | United States 17,669. |

See footnotes at end of table.

## Table 3.—Australia: Imports of mineral commodities[1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1971–72 | 1972–73 | Principal sources, 1972–73 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Clays and clay products (including all refractory brick)—Continued | | | |
| Products: | | | |
| Refractory (including nonclay bricks) | [3]37,382 | [3]21,689 | United States 7,341; Japan 5,728; United Kingdom 5,627. |
| Nonrefractory | | | |
| value, thousands | $11,403 | $19,105 | Japan $13,769. |
| Cryolite and chiolite | 244 | 216 | Mainly from Denmark. |
| Diamond: | | | |
| Gem, not set or strung—carats | 44,016 | 59,416 | Belgium-Luxembourg 22,401; Israel 17,090; India 8,743. |
| Industrial, including dust—do | 567,075 | 807,960 | Republic of South Africa 292,199; United States 136,553; Ireland 105,607. |
| Diatomite and other infusorial earth | 7,651 | 8,641 | United States 7,346. |
| Feldspar, leucite, nepheline | 9,149 | 11,148 | Norway 5,899; Canada 2,922; Republic of South Africa 1,446. |
| Fertilizer materials: | | | |
| Crude: | | | |
| Nitrogenous | 3,159 | 3,572 | Mainly from Chile. |
| Phosphatic—thousand tons | 1,654 | 2,282 | Nauru 1,228; Christmas Islands 684; Gilbert and Ellice Islands 331. |
| Manufactured: | | | |
| Nitrogenous | 5,766 | 13,260 | France 7,319; Japan 2,135; West Germany 1,874. |
| Phosphatic | 2,433 | 2,044 | All from Japan. |
| Potassic | 146,804 | 165,412 | United States 89,058; Canada 73,097. |
| Other, including mixed | r 15,381 | 6,271 | West Germany 5,301. |
| Ammonia—value | $3,573 | $2,550 | Japan $1,275. |
| Fluorspar | 27,212 | 15,716 | Thailand 8,862; Republic of South Africa 3,216; United Kingdom 2,968. |
| Graphite, natural | 1,160 | 1,253 | South Korea 505; People's Republic of China 344; Sri Lanka 284. |
| Gypsum and plasters | 957 | 855 | United Kingdom 448; United States 292; West Germany 108. |
| Iodine | 35 | 48 | Japan 47. |
| Lime | $14,292 | $16,575 | United Kingdom $7,650. |
| Magnesite, crude, calcined and fused | 223 | 2,174 | Japan 2,000. |
| Mica: | | | |
| Crude, including splittings and waste | 880 | 1,080 | India 456; Republic of South Africa 316; People's Republic of China 150. |
| Worked, including agglomerated splittings—value | $120,291 | $187,425 | United States $65,025; West Germany $40,800; United Kingdom $30,600. |
| Pigments, mineral: | | | |
| Natural, crude | 895 | 1,033 | Austria 454; United Kingdom 318. |
| Iron oxides, processed | 8,035 | 9,182 | West Germany 6,800; Spain 1,266. |
| Precious and semiprecious stones, except diamond: | | | |
| Natural—value, thousands | $2,388 | $4,395 | Australia (reimported) $1,329; Thailand $933. |
| Manufactured—do | $403 | $541 | Switzerland $158; Austria $105; West Germany $94. |
| Pyrite (gross weight) | -- | 13 | All from Turkey. |
| Salt | r 42,629 | 13,545 | United Kingdom 13,309. |
| Sodium and potassium compounds, n.e.s.: | | | |
| Caustic soda—value, thousands | $13,663 | $16,530 | NA. |
| Caustic potash, sodic and potassic peroxides | 1,853 | 1,939 | Japan 774; East Germany 454; West Germany 283. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked: | | | |
| Calcareous | r 7,367 | 4,414 | Italy 4,296. |
| Slate | 198 | 309 | Italy 100; Republic of South Africa 93; Japan 59. |
| Other | r 1,468 | 1,898 | Republic of South Africa 963; Finland 56; Sweden 218. |
| Worked—value, thousands | $507 | $636 | Italy $391. |
| Dolomite | 778 | 755 | West Germany 537; United States 139. |
| Gravel and crushed rock | r 625 | 601 | Belgium-Luxembourg 306; France 166; United States 75. |
| Limestone (except dimension) | r 739,175 | 981,365 | All from Japan. |
| Quartz and quartzite | 1,000 | 696 | Sweden 333; West Germany 259. |
| Sand, excluding metal bearing | 1,537 | 827 | United States 295; New Zealand 192; Sweden 150. |

See footnotes at end of table.

## Table 3.—Australia: Imports of mineral commodities[1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1971–72 | 1972–73 | Principal sources, 1972–73 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Sulfur: | | | |
| Elemental: | | | |
| Other than colloidal | 276,744 | 498,275 | Canada 396,492; United States 78,018. |
| Colloidal | 65 | 76 | United States 30; Netherlands 20; France 12. |
| Sulfur dioxide | 428 | 432 | Netherlands 209; Japan 190. |
| Sulfuric acid, oleum | 7 | 169 | U.S.S.R. 163. |
| Talc, steatite, soapstone, pyrophyllite | 671 | 1,373 | United States 794; People's Republic of China 250; India 182. |
| Vermiculite | 4,482 | 4,266 | Republic of South Africa 3,183; People's Republic of China 1,021. |
| Other nonmetals, n.e.s.: | | | |
| Crude | 5,386 | 1,311 | United Kingdom 319; New Zealand 230; Republic of South Africa 195. |
| Slag, dross and similar waste, not metal bearing: | | | |
| From iron and steel manufacture | 89 | 237 | United Kingdom 224. |
| Slag and ash, n.e.s | 37 | 11 | New Zealand 7; United Kingdom 2. |
| Oxides and hydroxides: | | | |
| Magnesium | 13,424 | 16,114 | Japan 15,534. |
| Strontium and barium | 6,934 | 9,020 | Japan 8,846. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s. | | | |
| value, thousands | $252 | $281 | Japan $107; United Kingdom $101. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 906 | 1,033 | United States 554; Trinidad and Tobago 452. |
| Carbon black | 3,139 | 2,265 | United States 1,378; United Kingdom 626. |
| Coal, all types, including briquets | 14,977 | 10,101 | Republic of South Africa 8,719; United States 1,236. |
| Coke and semicoke | 987 | 874 | United States 788. |
| Peat | 41,997 | 5,361 | West Germany 4,883. |
| Petroleum: | | | |
| Crude and partly refined thousand 42-gallon barrels | r 68,937 | 59,108 | Kuwait 16,727; Iraq 11,753; Saudi Arabia 10,904. |
| Refinery products: | | | |
| Gasoline do | 2,746 | 4,439 | Iran 1,824; Bahrain 924; Singapore 864. |

# COMMODITY REVIEW

## METALS

**Aluminum.**—Australia's rich bauxite deposits made a substantial contribution to the world aluminum industry in 1974. The domestic industry as a whole performed well during the year and new records were achieved in most sectors. Production of alumina was 4.9 million tons, 22% higher than that in 1973. The record production resulted mainly from expanded output at Gladstone, in Queensland, and at Gove, in the Northern Territory. Output from the refineries at Kwinana and Pinjarra in Western Australia also continued at a high level throughout 1974 chiefly because of increased production at Pinjarra, following expansion of plant facilities in mid-1973. Bauxite production in 1974 was nearly 20.1 million tons, 14% more than the record established in 1973. The total output of 9.3 million tons produced at Weipa, Queensland, was 13% above the 1973 level. This increase at Weipa was attributed to the completion in 1973 of a major expansion program to bring mining, beneficiation, and shipping facilities to a capacity of 10.5 million tons of bauxite per year. Primary aluminum production was 6% greater than that in 1973 but was less than the 1971 record output. A return to full production capacity of 223,000 tons per year was restrained in 1974 by industrial disputes at smelters, and by strikes that affected electric power supplies.

Comalco Industries Pty. Ltd., Australia's largest bauxite and alumina producer, increased output in 1974. This firm, operating at Weipa in Queensland, is owned 45% by the Kaiser Aluminum and Chemical Corp., 45% by Conzinc Riotinto of Australia, Ltd. (CRA), and 10% by the Australian public. The company produced a record of 9.3 million tons of bauxite in 1974, but some 5% less than had been planned. The lower shipments were due to strikes and overtime bans at Weipa and delays in coastal and overseas shipping. Of the total shipped, 4.0 million tons (43%) went to Gladstone for processing into alumina, 1.6 million tons (17%) was exported to Japan, and 3.7 million tons (40%) went to Europe and other areas, including 1.2 million tons to the alumina plant of Euralumina S.p.A. in Sardinia, Italy. Sales of bauxite to customers outside the company amounted to 8.5 million tons, compared with 8.2 million tons in 1973. Sales of calcined bauxite to manufacturers of abrasives continued at a high level. The second calcining kiln was brought into production in 1974 and operated satisfactorily.

Comalco's share of primary aluminum from the Bell Bay, Tasmania, and the Bluff, New Zealand, smelters amounted to 140,980 tons, an increase of 2% over production in 1973. Sales in both Australia and New Zealand were greater than those in 1973 but dropped below estimates in the final months of the year.

A proposal for the establishment of a large alumina plant in the South West Pacific region was further developed during 1974. Comalco and a number of prospective overseas participants expressed the intention to join in the establishment of such a plant. If the plan proceeds, the plant will be supplied with bauxite from Weipa.

Bauxite was produced at Jarradale and Del Park in Western Australia. These two bauxite operations in the Darling Ranges, near Perth, were operated by Alcoa of Australia Ltd. The Jarradale and the Del Park operations produced 6.0 million tons and 2.0 million tons of bauxite, respectively, in 1974. Output from Jarradale was shipped to the Kwinana refinery, and from Del Park to the Pinjarra refinery. Total bauxite reserves are about 500 million tons.

Bauxite was also produced at a major deposit located at Gove, in the Northern Territory. Gove Alumina Ltd. conducted the mining and refining operations and produced 1.5 million tons of bauxite in 1974. The alumina plant has a capacity of 1 million tons per year.

**Copper.**—The sharp rise in the price of copper during 1974 stimulated mine production and led to increased interest in copper deposits. The record 1974 production of copper in ore and concentrate was 16% more than that of 1973. Similarly, output of primary refined copper increased 12% compared with that of 1973. The gain in copper mine output was due largely to the increased ore tonnage treated by Mount Isa Mines Ltd., which accounted for about 60% of the total Australian copper production. Substantial increases in output were also recorded at the newly commissioned smelter at Tennant Creek.

Output of the principal copper produc-

ers in recent years is summarized in table 4.

In the year ending June 30, 1974, Mount Isa treated 5.3 million tons of copper ore yielding 152,500 tons of copper, an increase of 29% above the corresponding period in 1973. The near-capacity production was attained despite a cutback during the first quarter, because of a 5-week closure of the flood-damaged Mount Isa-to-Townsville railroad, which halted movement of supplies and concentrates. For a month ore production was cut by half and then gradually increased as the supply situation returned to normal. Major underground maintenance workshops were completed on several levels. Underground exploratory drilling at the Mount Isa mine continued, and copper reserves were estimated at 141 million tons.

Table 4.—Australia: Major copper industry facilities

| Facility | Production (metric tons of copper) [1] | | |
|---|---|---|---|
| | 1972 [r] | 1973 | 1974 |
| Mine: | | | |
| Mount Isa Mines Ltd | 120,208 | 118,110 | 152,510 |
| Mount Morgan Ltd | 14,240 | 8,488 | 9,587 |
| Cobar Mines Pty. Ltd | 10,203 | 8,255 | 8,720 |
| Mount Lyell Mining & Railway Co. Ltd | 26,078 | 22,532 | 23,331 |
| Electrolytic Zinc Co. of Australasia, Ltd | 2,824 | 1,262 | 1,845 |
| Tennant Creek Field | 6,710 | 8,092 | 14,773 |
| Smelters: | | | |
| Mount Isa Mines Ltd | 149,230 | 118,227 | 130,805 |
| Mount Morgan Ltd | 8,184 | 8,140 | 9,100 |
| Electrolytic Refining & Smelting Co. of Australia Pty. Ltd.[3] | 12,430 | 8,980 | 10,212 |
| Refineries: | | | |
| Mount Isa Mines Ltd | 118,228 | 118,227 | 130,805 |
| Electrolytic Refining & Smelting Co. of Australia Pty. Ltd.[2] | 27,523 | 24,240 | 28,340 |

[r] Revised.
[1] Metal content of ore for mines; primary blister copper for smelters; and primary electrolytic for refineries.
[2] Treats concentrates from Cobar Mines Pty. Ltd.

Mount Lyell Mining & Railway Co. Ltd. at Queenstown, Tasmania, produced 23,331 tons of copper in concentrate from 2.3 million tons of ore grading 1.2% copper. Total ore production from surface and underground mining operations was 112,370 tons greater than in the previous year with the proportion recovered from underground amounting to 78% of the total. The transition to full underground mining operations during the year progressed smoothly at the Prince Lyell section, which is the major underground ore body, accounting for 46% of total production. Exploration drilling continued within Queenstown mining leases throughout the year with the completion of 56 holes, totaling 25,600 feet. The drilling was largely directed towards extending and consolidating information in known ore bodies, particularly in the Prince Lyell, Cape Horn, Crown Three, and Royal Tharsis ore bodies. Reserves in all ore zones were estimated at 30 million tons of proven ore grading 1.48% copper and 10.6 million tons of probable ore grading 1.40% copper.

Cobar Mines Pty. Ltd., fully owned by BH South Ltd., treated 500,000 tons of crude ore, producing 8,720 tons of copper in 1974. The company continued development of the massive sedimentary copper and copper-zinc deposits in central New South Wales. The mineralization occurs in lenses up to 3,300 feet wide in seven main ore bodies over a 10-miles strike length. Two main shafts were deepened to 3,300 feet in 1974, and the mill capacity was expanded to 940,000 tons of ore per year. The CSA mine, currently in production north of Cobar, has estimated reserves of over 16.3 million tons grading 1.9% copper.

Kanmantoo Mines Ltd., in Kanmantoo, South Australia, also held by BH South, completed its second full year of production. Production for the year ended June 30, 1974, continued at comparable levels to 1973 when 954,000 tons of sulfide ore and 7,200 tons of oxide ore were mined at an average grade of 0.96% copper. Drilling in 1974 disclosed ore bodies of similar grade and type as the opencut, which will be mined by underground methods when the opencut ore is mined out about 1982.

Construction of a plant to treat stockpiled oxide ores was expected to be completed by March 1975. Treatment of the stockpiled oxide ore, now in excess of 560,000 tons, will require approximately 3 years.

Peko-Wallsend Ltd. operated a copper-gold mine at Mount Morgan, Queensland, and the Tennant Creek copper-gold-bismuth mines in the Northern Territory. At the Tennant Creek operations, the Warrego concentrator, rated at a capacity in excess of 770,000 tons of ore per year, treated 740,000 tons of ore during 1974. Ore reserves at the five Tennant Creek mines were over 8 million tons averaging 3% copper. During the year ended July 9, 1974, Mount Morgan Ltd. produced 9,600 tons of contained copper in 1.4 million tons of ore treated. Remaining reserves were estimated at slightly less than 4 million tons grading 0.75% copper. The new smelter at Tennant Creek also came into full operation during the year. A pilot plant based on a process patented jointly by the University of Queensland and Mt. Morgan Ltd. for the economic recovery of high-purity copper from a leach liquid was successfully operated at the Mount Morgan mine. The material treated was flue dust from the old smelting operations plus a test sample of Tennant Creek flue dust. The process leaves a bismuth-copper residue in a form acceptable for direct recovery of bismuth and copper.

**Gold.**—Despite sharp price increases from $97.81 per troy ounce in 1973 to $159.71 per troy ounce in 1974, Australia's gold production in 1974 declined for the second successive year. In Western Australia, production dropped 24% to 230,600 troy ounces. For the first time in many years, production in Western Australia was less than one-half of the national total. The lower grade ore mined by the Kalgoorlie companies, which was only one-half as rich in gold as it was in 1972–73, undoubtedly contributed to the decline. However, the shortage of suitable labor was the prime reason for the low output from existing mines. In spite of the active recruiting campaign and high unemployment rate in Australia during 1974, the large increase in new mines made it difficult to maintain a constant workforce. In Queensland and Tasmania production increased slightly.

Victoria and Western Australia were the only States in which gold was obtained from mines worked specifically as gold mines. In all other States production was from mines in which gold was either a by-product or a coproduct The main source of gold in Queensland was the Mount Morgan copper-gold ore body. The Golden Plateau N.L. mine at Cracow was the only other important producer in the State. In New South Wales virtually all gold production was from silver-lead and zinc concentrates.

In addition to increased interest in low-grade gold deposits, high ore prices stimulated interest in tailings dumps. In Western Australia, Australian Consolidated Minerals N.L. located tailings dumps estimated to contain approximately 145,000 tons with a grade of 0.73 troy ounces of gold per ton. The company also reported further tonnages of a similar grade at other locations. Lennard Oil N.L. staked 11 million tons of tailings at Canbelego, New South Wales, and at Lancefield, Western Australia. A treatment plant was set up at Canbelego to treat 100 tons per day. This site contains about 1.1 million tons of materials suitable for processing.

A gold prospect 250 miles from Port Hedland, Western Australia, was studied by Newmont Pty. Ltd. with plans to develop it at a cost of up to $30 million. Newmont is a subsidiary of Newmont Mining Corp. of the United States. The deposit, suitable for opencut mining, was estimated to contain about 3.8 million tons of ore averaging 0.28 troy ounce of gold per ton. Central Norseman Gold Corp. N.L. operated a gold mine at Norseman, 116 miles south of Kalgoorlie. In 1974, 130,000 tons of ore was treated to produce 30,948 troy ounces of gold and 22,948 troy ounces of silver. At Noble's Nob, Australian Development Ltd. operated an opencut gold mine near Tennant Creek, Northern Territory. Treatment in 1974 of 110,310 tons yielded 29,129 troy ounces of gold.

The principal gold producers and output during 1974 were as follow:

| Company | Gold produced (troy ounces) |
|---|---|
| Central Norseman Gold Corp. N.L | 30,948 |
| Golden Plateau N.L | 17,240 |
| Kalgoorlie-Lake View Pty. Ltd | 162,050 |
| Hill 50 Gold Mine N.L | 8,363 |
| North Kalgurli (1912), Ltd | 2,315 |
| Peko-Wallsend Ltd | 207,652 |

**Iron and Steel.**—The upward trend in Australia's iron and steel industry was slowed in 1974. Production increases

ranged from 1% for steel to 14% for iron ore, but pig iron output was down 5%. Domestic iron ore output increased mainly in the Pilbara region of Western Australia, where 90% of the total output was produced in 1974. During the early part of the year another firm began significant production of iron ore and iron ore pellets from a limonite deposit located at Robe River and Deepdale, in the Pilbara region. The higher production rate in 1974 reflected the substantial rise in prices for Japanese long-term contracts. The drop in pig iron production was caused by decreased output at Newcastle and Whyalla, where cutbacks implemented in late 1973 remained in effect during 1974. At Port Kembla, steel production was adversely affected by industrial disputes and by shortages of both labor and coal. Industrial disputes reduced coal stocks to less than half the normal quantity, and by midspring steelmaking activities had been curtailed substantially.

Japan imported 71 million tons of iron ore and iron pellets from Australia in 1974 and accounted for about 80% of total iron materials exported. Exports of iron ore and iron pellets to destinations other than Japan increased 2.4% to 8.4 million tons from 8.2 million tons in 1974. The increase in exports was due mainly to a buildup in shipments from the new pellet plant at Cape Lambert, which was commissioned in 1973. The iron content of the ore and pellets averaged 63.8% in 1973 compared with 64.0% in 1974.

Several new iron ore mines at Shay Gap, Sunrise Hill, and Paraburdoo in the Pilbara area began commercial production because of strong demand for ore in 1974. Commissioning of additional production capacity at Mount Whaleback and Paraburdoo should ensure substantial growth in domestic output. Small quantities of iron oxide were also produced for use in cement, gas purification, and coal washing.

The principal iron ore producers and quantities shipped in 1974 were as follow in thousand tons:

| Company | Quantity |
|---|---|
| Goldsworthy Mining Ltd., Western Australia (lump) | 7,925 |
| Hamersley Iron Pty. Ltd., Western Australia (lump, pellets) | 34,258 |
| Western Mining Corp. Ltd., (WMC), Western Australia (lump) | 582 |
| The Broken Hill Pty. Co. Ltd., (BHP), Western Australia (lump) | 2,546 |
| The Broken Hill Pty. Co. Ltd., (BHP), South Australia (lump, pellets) | 8,242 |
| Savage River Mines, Tasmania (pellets) | 2,200 |
| Frances Creek Iron Mining Corp. Ltd. Northern Territory (lump) | 494 |
| Mount Newman Iron Ore Co., Western Australia (lump) | 28,956 |

Production at Mount Tom Price and Paraburdoo mines operated by Hamersley Iron Pty. Ltd. and Kaiser Steel Corp. totaled 34.3 million tons of high-grade lump ore. The Mount Tom Price mine produced 12.7 million tons of high-grade lump ore, 6.5 million tons of high-grade fines, and 516,000 tons of low-grade fines. Total material shipments from the mine was 37.1 million tons. A major program of modification and upgrading of the Tom Price plant was carried out in 1974 and will be continued in 1975. Output at Paraburdoo mine was 7.8 million tons of high-grade lump ore, 6.4 million tons of high-grade fines, and 307,000 tons of low-grade fines. Total ore shipments were 32.8 million tons. Intensive exploration activity within the western sector of the Pilbara continued throughout 1974. Iron ore reserves at Mount Tom Price exceed 500 million tons averaging 64% iron, and an additional 150 million tons of material averages 58% iron. At Paraburdoo there were 16 ore bodies in an area extending for 15 miles.

The Broken Hill Pty. Co. Ltd. (BHP) and its wholly owned subsidiaries continued to dominate the production of iron and steel in Australia. Total iron ore production by BHP, including the company's 30% share at Mt. Newman, was 19.9 million tons, a little higher than the 19.1 million tons produced in 1973. This figure would have been higher except for periods of industrial unrest which slowed all iron ore production in the Pilbara area. Koolyanobbing production increased slightly to 2.6 million tons, but was below target because of severe rail restrictions imposed by the Western Australia Government Railways following a series of derailments on the line to Kwinana. Reduced domestic demand for Yampi and Whyalla ores caused production at those centers to drop below the 1973 total. Whyalla pellet production increased 18% to 1.9 million tons. The BHP consolidated annual reports for the years ended May 31, 1973, and May 31, 1974, summarize output of various products as follow in thousand tons:

| Commodity | Quantity | |
|---|---|---|
| | 1973 | 1974 |
| Pig iron | 7,117 | 7,551 |
| Steel ingots and billets | 7,233 | 7,705 |
| Blooms and slabs | 6,167 | 6,434 |
| Sheets, bars, billets, etc | 3,099 | 3,123 |
| Plate and strip | 2,458 | 2,751 |
| Merchant | 1,551 | 1,730 |
| Rod | 545 | 578 |
| Narrow cold-rolled strip | 111 | 96 |
| Tinplate | 243 | 243 |

Although production was higher in 1974, several major problems held increases for both iron and steel below expectations. These problems included a series of strikes at the beginning of the year over steelworkers' bonus payments and were compounded by power restrictions caused by industrial disputes in New South Wales.

Operations at Newcastle and Port Kembla were also seriously affected by a strike of metal trade employees. Further reductions in iron and steel output resulted from a shortage of coal. Coal stocks at the steelworks were depleted to the extent that operations had to be severely curtailed during the last two months of the year.

Work to expand the Newcastle plant to a steel capacity of 2.7 million tons per year proceeded on schedule. The expansion included installing the No. 2 bloom and continuous billet mill, uprating the No. 2 merchant mill and expanding the direct metal foundry. At Port Kembla, work on a secondary ore crushing plant, blending facilities, and a third sinter machine continued. The argon-oxygen decarburization plant to improve stainless steel manufacture was completed and preliminary work begun on the installation of continuous slab casting and vacuum degassing facilities. A walking-beam bloom furnace was nearing completion at Whyalla, and work was proceeding on additional oxygen capacity to allow increased oxygen injection into the blast furnace.

Mount Newman Iron Ore Co. produced 28.9 million tons of iron ore in 1974, compared with 26 million tons in 1973. The massive program to increase the capacity at Mount Newman from 30.5 million to 35.6 million tons per year continued, and further expansion was approved. Mining, loading, and transport equipment will be increased at a cost of $85 million to raise production to 40.6 million tons per year by 1976. Shipments during the year totaled 33 million tons.

**Lead and Zinc.**—Australia's lead and zinc industry faced difficult marketing conditions in 1974, and performance in some sectors fell below 1973 levels. A marked downturn in world demand for lead became evident early in 1974 as most world economies were subjected to the full impact of sharply rising oil prices. Reduced demand was accompanied by a decline in the average monthly spot price for lead on the London Metal Exchange, where the price fell in April. Demand for zinc showed signs of easing in mid-1974 after reaching a peak price of $0.96 per pound in May. However, the full effects of any easing in demand were offset to some extent by a need of both producers and consumers to rebuild stocks to acceptable levels. World producers' stocks had fallen to a 9-year low in December 1973.

Mine production of lead fell 7% to 377,300 tons mainly because of lower output by Broken Hill mines which normally accounted for about 62% of total Australian production. Zinc Corp. Ltd. and New Broken Hill Consolidated Ltd. (NBHC), operated by Australian Mining and Smelting Co. Ltd., reported a substantial drop in mine production in the first half of 1974. Lower output resulted mainly from a cave-in at the NBHC mine in 1973, difficulties with some mechanical equipment, and minor industrial problems. Output was also adversely affected by continued delays experienced in commencing new stopes in areas of the NBHC mine adjacent to the caving.

Lead bullion output decreased marginally to 147,200 tons in 1974. Higher output by Mount Isa Mines Ltd., failed to offset decreased production by Sulphide Corp. Pty. Ltd. at Cockle Creek, where the production decline resulted from a furnace maintenance shutdown, industrial problems, and disruption of coke suppliers. Refined lead production increased to 192,800 tons, about 1% over that in 1973.

Total domestic zinc mine production decreased 5% to 453,500 tons in 1974. Although the Zinc Corp. Ltd. and Electrolytic Zinc Co. of Australasia (EZ) recorded gains compared with 1973 output. A number of important developments affecting the Australian zinc industry were reported in 1974. In February Triako Mines N.L. announced that agreement had been reached with BHP concerning its participation in the exploration and development activities being conducted by Triako and its affiliated company, Buka Minerals N.L. Under the arrangement BHP's wholly-owned subsidiary, Dampier Mining Co. Ltd., obtained the right to acquire a majority interest in both Triako and Buka.

The directors of Broken Hill South Ltd. (BH), CRA, and Broken Hill Associated Smelters Pty. Ltd. (BHAS) announced in March that an agreement had been reached to sell BH South's 20% shareholding in BHAS to Australian Mining and Smelting Ltd. for $17.5 million. Since BH South is no longer engaged in lead mining at Broken Hill, the proposed change will more closely reflect the present supply of lead concentrates to BHAS, Australia's sole primary lead refinery. Also in March, EZ announced that mining had commenced at Beltana, South Australia, to meet an export contract for a trial shipment of willemite. Operation on a modest scale is scheduled for a number of years. Reserves at Beltana were estimated at 1 million tons assaying 34.5% zinc and 2.8% lead and 237,000 tons assaying 14.8% zinc and 10.6% lead.

Total ore treated at Mount Isa in 1974 amounted to a record 7.45 million tons, yielding 124,000 tons of lead, 103,000 tons of zinc, and 8.9 million ounces of silver. These production gains over 1973 reflect increased capacity following completion of an expansion program in 1973. Nevertheless, production was restricted early in 1974 due to closure in January of the flood-damaged Mount Isa-to-Townsville railway. Coal could not be sent to Mount Isa, and production was cut by half and then gradually increased as the supply situation returned to normal. Silver-lead-zinc ore reserves decreased by approximately the quantity of ore mined for the year. Ore reserves were estimated at 56 million tons in 1973. The Hilton mine, located about 13 miles from Mount Isa, has ore reserves estimated at 36 million tons. This silver-lead-zinc deposit was developed by Mount Isa Mines Ltd. Two shafts have been sunk, and the company reported that further development work was underway. The mine was expected to become operational in 1980.

EZ operated three mines and a central concentrating plant at Rosebery on the west coast of Tasmania. The Rosebery mine was responsible for more than 90% of the total ore produced in this district. The remainder was supplied by the small Farrell and Hercules mines located near the Rosebery mine. Production at the three mines in 1974 increased 5% to 526,200 tons of ore, yielding 127,000 tons of zinc concentrate and containing 67,000 tons of zinc. Industrial disputes and other problems at concentrate supply sources affected supplies of zinc concentrate to the Risdon smelter and resulted in a reduction in slab zinc production. The situation was partially alleviated late in the year by importing 22,000 tons of zinc concentrate from Canada and increased shipments from the Broken Hill mines. The total production of slab zinc, however, declined to 181,300 tons, 6% below the 1973 level. Construction of the world's largest fluid-bed roaster for zinc concentrate continued throughout the year. The commissioning of the new plant was expected early in 1975.

Australian Mining and Smelting Co. Ltd. operated The Zinc Corp. Ltd. and NBHC mines at Broken Hill. Ore treated in 1974 by The Zinc Corp. was 760,000 tons assaying 10.8% lead, 2.7 troy ounces of silver per ton of ore, and 10.1% zinc. At the NBHC mine, ore treated came to 880,000 tons at grades of 8.7% lead, 2.2 troy ounces of silver and 13.8% zinc. Ore reserves in 1974 were estimated at 6.1 million tons at the Zinc Corp. and 6.5 million tons at NBHC. North Broken Hill Ltd. also operated a mine at Broken Hill, New South Wales. This mine treated 455,296 tons of ore, producing 58,400 tons of lead 314,000 ounces of silver and 46,900 tons of zinc valued at $31.9 million. Ore reserves at June 30, 1974, were 4.6 million tons. Mine output by leading producers for 1972–74 were as follow, in tons:

| Mine | 1972 | | 1973 | | 1974 | |
|---|---|---|---|---|---|---|
| | Lead | Zinc | Lead | Zinc | Lead | Zinc |
| North Broken Hill Ltd | 58,584 | 46,648 | 63,364 | 46,313 | 58,383 | 46,922 |
| The Zinc Corp. Ltd | 86,039 | 78,832 | 82,860 | 60,900 | 74,850 | 62,800 |
| New Broken Hill Consolidated Ltd | 85,010 | 142,101 | 82,140 | 138,100 | 71,150 | 114,200 |
| Mount Isa Mines Ltd | 112,510 | 102,313 | 112,510 | 102,754 | 124,381 | 103,051 |
| Electrolytic Zinc Co. of Australasia Ltd. (Read-Rosebery) | 19,879 | 66,559 | 26,290 | 75,894 | 26,311 | 76,777 |

**Manganese.**—Production of manganese ore decreased marginally in 1974 to 1,521,989 tons. Increased output at the enlarged facilities of Groote Eylandt Mining Co. Pty. Ltd., a subsidiary of BHP, in the Northern Territory did not offset decreased production in Western Australia. Groote Eylandt operated the major open pit manganese mine on an island in the Gulf of Carpentaria. New production facilities included a concentrator, mining equipment, ore handling equipment, and a stockpiling area. Stockpiling facilities were increased fivefold to a 200,000-ton capacity, which included an elevating stacker and bucket-wheel system. Three 90-ton-capacity road trains were introduced to haul ore 10 miles from the concentrator plant to the ship-loading and stockpile areas. Groote Eylandt production totaled a new high of 1.4 million tons, 1.2 million tons for export and 188,612 tons for domestic consumption, in 1974. Previously, most of the ore from this 100-million-ton deposit was shipped to the BHP ferroalloy plant at Bell Bay in Tasmania.

Manganese ore produced in Western Australia totaled 95,000 tons in 1974. A ferruginous manganese deposit in northwest Western Australia with 20 million tons of proven reserves, worked by Longreach Manganese Pty. Ltd., produced about 38,000 tons of ore. Longreach made an agreement with Goldsworthy Mining Ltd. to use its rail and port installations. The Woodie Woodie ore deposit, worked by Bell Bros. Pty. Ltd., produced 56,000 tons of ore and sold 57,000 tons to Japanese consumers. Additionally, 4,741 tons of manganese dioxide was recovered as a sludge in the electrolysis of zinc sulfate at the Risdon plant of EZ. This material was used in fertilizers and chemical processes.

**Nickel.**—World nickel consumption continued to increase at a rapid rate, and during most of 1974 demand exceeded supply. To meet this demand, nickel producers around the world continued to build new facilities and to expand existing facilities. In Australia, production of nickel in concentrates during 1974 was 43,155 tons, 6% above the 1973 level. Several nickel producers arranged sales contracts, and domestic nickel production was expected to expand substantially in the immediate future.

Western Mining Corp. Ltd. (WMC), Australia's principal nickel producer, increased sales by 17% compared with 1974, and nickel production was up 14%. WMC delineated additional nickel deposits in the Kambalda area and began developing new ore shoots. Poseidon Ltd. announced that production would commence from its properties near Rockhamton, Queensland, and BHP planned production by 1977 from its Wingellino mine in Western Australia. The Selection Trust Group announced further increases in ore reserves at the Agnew deposit, also located in Western Australia. The partnership of Poseidon Ltd. and Union Hannah-Homestake was dissolved, and Poseidon began developing leases at Mount Windarra and South Windarra in partnership with WMC.

Substantial progress was made in consolidating and expanding WMC nickel operations in 1974. The company's nickel capacity of about 38,000 tons per year was the fourth largest in the western world in 1974. Nickel recovered in concentrates by WMC from the Kambalda ore increased 14% to 35,490 tons during the year. The Lunnon-Hunt, Durkin, and Otter-Juan mines were the main sources of production. Output from the Fisher mine increased, and production commenced from the Ken and Gellatly shoots. Purchase of ore from the Nepean mine, Great Boulder Mines Ltd., and North Kalgurli Mines Ltd. by WMC resulted in an additional 2,270 tons of nickel. Agreement was reached with Selcast Exploration Ltd. to purchase ore and concentrates produced from its Spargoville Area 3 mine. Deliveries were due to commence early in 1975.

Additional equipment, including an oxygen plant, was installed at the Kalgoorlie nickel smelter in preparation for increasing capacity to approximately 40 tons of nick-

el-in-matte per year. This equipment was tested and proved satisfactory. Work also began on expanding the Kwinana refinery to a capacity of 30,000 tons of nickel per year.

Exploration at Kambalda and in the Paris-St. Ives areas proved additional ore. Two new ore shoots were defined on the eastern flank of the Kambalda Dome. The search for nickel deposits outside the Kambalda-St. Ives regions continued with effort concentrated in the Kalgoorlie District.

The Western Australian Government signed an agreement under which a major nickel mining and treatment operation may be established near Agnew, 350 miles northeast of Perth. The deposit is one of the world's largest undeveloped nickel ore bodies with an estimated 40 million tons of ore averaging more than 2% proven nickel. Plans included development of an opencut mine and construction of a concentrator and a flash smelter. Construction was expected to begin late in 1975 with completion targeted for 1978. The ultimate cost of the project was estimated at $350 million. Initial production was expected to be 25,000 tons of nickel-in-matte which would need further refining. The matte will be shipped by truck and rail to the port of Esperance on the Australian Bright. The operation will be a joint venture of Western Selcast Pty. Ltd. (a subsidiary of the Selection Trust Group) and Mount Isa Mines.

Late in 1974, work on Australia's first laterite nickel mining project was completed. This project, located 140 miles inland from Townsville, Queensland, is owned by Freeport Minerals Co., Australia Co. N.L., and Metals Exploration N.L. All sections of the project were put into operation, and both nickel oxide and nickel-cobalt sulfide production commenced. Throughput was being progressively increased and design capacity was scheduled to be achieved by the third quarter of 1975. Ore reserves were estimated at 44 million tons containing 1.57% nickel and 0.12% cobalt. Sales contracts were signed covering about 95% of the mine output.

Both the Nepean and the Mount Keith mines in Western Australia are also jointly owned by Metals Exploration and Freeport Minerals. Nepean produced 72,000 tons of ore, containing 2,500 tons of nickel in 1974. Drilling of five test sites at Mount Keith increased indicated reserves in excess of 300 million tons at a grade of 0.6% nickel. Further exploratory drilling will be conducted in sites in the Albion Downs Basin. The mine is located north of Kalgoorlie, in Western Australia.

**Silver.**—Virtually all of Australia's silver was a coproduct of lead, zinc, and copper. There were no significant mining operations in Australia based primarily on silver. In 1974, domestic silver production decreased about 3.6% as a result of lower output by The Zinc Corp. Ltd. mine and the NBHC mine located at Broken Hill. The marginal increase in silver output by Mount Isa mines, Australia's largest silver producer, failed to offset the decline at Broken Hill. Queensland produced 53%, New South Wales 34%, and Tasmania 12% of all silver mined in Australia during 1974; Northern Territory and Western Australia supplied the remaining 1%. About 75% of the silver production was obtained from lead-silver bullion from smelting lead concentrates. Copper and zinc concentrates generated 14% and 9% of the silver output, respectively, and other concentrates (primarily gold bullion) provided about 1% of the silver. Principal producers of silver and their output during 1973 and 1974 were as follow in thousand troy ounces:

| Company | Quantity | |
|---|---|---|
| | 1973 | 1974 |
| North Broken Hill Ltd | 3,106 | 3,140 |
| The Zinc Corp. Ltd | 2,305 | 1,936 |
| New Broken Hill Consolidated Ltd. | 1,805 | 1,424 |
| Mount Isa Mines Ltd | 8,768 | 8,896 |
| Electrolytic Zinc Co. of Australasia Ltd | 3,081 | 2,571 |

Total production of refined silver (including silver of secondary origin) increased slightly in 1974. Mint production was down sharply because supplies of silver coinage withdrawn from circulation decreased. About 40% of the 1974 mine production was recovered as primary silver, nearly 45% was contained in lead bullion exported for refining overseas, and the remainder was contained in exported lead, copper, zinc, and copper-gold concentrates, and blister copper. BHAS produced 5.4 million troy ounces of refined silver as a byproduct of lead smelting and refining operations in 1974 and accounted for 80% of the total Australian production. Electrolytic Refining & Smelting Co. of Australia Pty. Ltd. recovered most of the remainder from Mount Lyell and Cobar copper concentrates. Silver was also re-

fined at the Perth Mint, by Matthey Garrett Pty. Ltd. in Sydney, and by Englehard Industries Pty. Ltd. in Melbourne. These operations were based mainly on scrap and bullion.

**Tin.**—Despite the lifting of export controls by the International Tin Council (ITC), production of tin in Australia decline 1% to 9,990 long tons, from 10,105 long tons in 1973. The drop in production occurred during the first 8 months, as output at most mines increased in the last quarter. Domestic consumption increased 9% over last year. The rise reflected the increased demand for tinplate and for tin to be used in float glass applications.

Renison Ltd., Australia's largest tin producer, began operations at its new heavy-media separation plant in late 1974, with an increase in mill throughput from 450,000 to 700,000 long tons per year. Production of tin-in-concentrate improved marginally to about 5,200 long tons. Recovery of tin metal from concentrates was 69.2%. Proved and probable ore reserves at its Tasmania mine were 9.3 million long tons at 1.36% tin. Renison and Consolidated Gold Fields Australia Ltd. continued exploration at Tasmania's Mount Lindsay tin prospect.

Aberfoyle Tin Co. N.L., a company controlled by Cominco Ltd., operated mines at Storeys Creek and Rossarden, near Aberfoyle, Tasmania. In the 48 working weeks of 1974, 42,137 long tons of ore was milled. Indicated ore reserves were 322,000 long tons.

Ardlethan Tin N.L. and Cleveland Tin N.L. both part of the Aberfoyle Group, operated throughout 1974. At Ardlethan, 449,500 long tons of ore was treated. Ore reserves were estimated at 2.5 million long tons with an estimated grade of 0.62%. Cleveland Tin treated some 314,210 long tons of ore in 1974. Ore reserves were estimated at 2.2 million long tons with a grade of 0.82% tin and 0.34% copper.

A tin-tantalite dredging plant was operated in an area about 160 miles south of Perth by Greenbushes Tin N.L. In 1974, 1,394 cubic yards of material was treated. The company negotiated an agreement with Vultan Minerals Ltd. for the purchase of its leases at Greenbushes.

Principal producers of tin concentrate and quantities of contained tin produced in 1973 and 1974 were as follow in long tons:

| Company | 1973 | 1974 |
|---|---|---|
| Aberfoyle Tin Co. N.L | 336 | 420 |
| Ardlethan Tin N.L | 1,520 | 1,495 |
| Cleveland Tin N.L | 1,385 | 1,470 |
| Gibsonvale Alluvials N.L | 415 | 440 |
| Greenbushes Tin N.L | 508 | 695 |
| J.A. Johnson & Sons Pty. Ltd | 65 | 115 |
| Loloma Ltd | 103 | 111 |
| Pilbara Tin Pty. Ltd | 310 | 215 |
| Ravenshoe Tin Dredging Ltd | 445 | 490 |
| Renison Ltd | 4,220 | 3,889 |
| Tableland Tin Dredging N.L | 420 | 418 |

**Titanium Concentrates.**—In 1974, Australia produced slightly over 1 million tons of titanium concentrates, increasing its lead as the world's largest producer.

Producers of rutile on Australia's East Coast in 1974 were Associated Minerals Consolidated Ltd.; Minsales (a subsidiary of Union Corp. Ltd. of South Africa), whose operating subsidiaries were Cudgen R.Z., and Consolidated Rutile Ltd.; Rutile and Zircon Mines (Newcastle) Ltd.; Mineral Deposits Ltd. and Queensland Titanium Mines Pty. Ltd. (both subsidiaries of NL Industries Inc.); and Dillingham Mining Co. In 1974, this group of companies also produced 35,000 tons of ilmenite.

In the Bunbury areas of Western Australia, the largest producer of ilmenite was Western Titanium Ltd., a subsidiary of Consolidated Gold Fields. Other producers were Western Mineral Sands, Pty. Ltd., Cable Sands Pty. Ltd., and Westralian Sands Ltd. In the Geraldton area, companies included Allied Eneabba Pty. Ltd., Jennings Mining Ltd., and Western Mining Corp., which took over the holdings of a number of corporate entities including West Coast Rutile Ltd., Black Sands Ltd., Kamilaroi Mines Ltd., and Mining Corp. of Australia Pty. Ltd. The mines in Western Australia, in addition to ilmenite, produced 3,750 tons of rutile in 1974.

On Fraser Island in Queensland, site preparation began early in 1974 for a sand operation jointly owned by Dillingham Mining Co., and Murphyores Holdings, Ltd. The deposit contains 2% heavy sands, and is expected to produce 65,000 tons of rutile and zircon, in about equal quantities, plus a small ilmenite byproduct. A wet mill will be built on the island, from which rough concentrates will be barged to a dry mill to be built at Maryborough. Environmental restoration will be conducted on a continuous basis. An initial investment of about $6 million was expected, with the operation to come on line

in mid-1975. Sand reserves were estimated to be sufficient to support 15 years of production.

Associated Minerals Consolidated Ltd. was reportedly investigating processes for producing synthetic rutile from its growing stockpiles of otherwise unusable ilmenite.

In Western Australia, Allied Eneabba Pty. Ltd., encouraged by the results of 7 months of pilot plant operation, began building its full-scale plant to produce 50,000 tons of rutile, 200,000 tons of ilmenite, and more than 100,000 tons of zircon per year, together with smaller quantities of other minerals. Rough concentrates will be moved to Geraldton for finishing. The plant was expected to cost $15 million and will be in production by July 1975. The ilmenite will be exported to pigment plants of E.I. du Pont de Nemours & Co., Inc., in the United States; other products will be sold on the open market.

In the same area, the Jennings Mining made its initial shipment of ilmenite from Geraldton to Japan. When in full production, output was expected to reach 240,000 tons per year of heavy minerals.

Late in 1974, WMC exercised its option to buy the entire issued capital stock of Black Sands Ltd., a company holding several mineral sands deposits including one at Jurien Bay. Black Sands was formerly owned two-thirds by Kamilaroi Mines, Ltd., and one-third by Mining Corp. of Australia. The price of the purchase was reportedly $11.5 million. Heavy mineral reserves were about 3.5 million tons. WMC plans to sell rutile and zircon, but to stockpile 200,000 tons of ilmenite per year, probably with the intention of using it subsequently as a raw material for making synthetic rutile. WMC had no immediate plans for the Black Sands Ltd. deposit at Cooljarloo.

Laporte Industries (Holdings) Ltd. began a series of additions to its sulfate-process pigment plant at Bunbury to add 50% to plant capacity by early 1976. Additional ilmenite supplies will be obtained from Western Titanium N.L., which reportedly was considering the large-scale operation of a heretofore unworked deposit in addition to the present activity at Capel.

Westralian Sands Ltd., jointly with Lennard Oil N.L., outlined a 2-million-ton body of sand near Gingin and was planning commercial production.

## NONMETALS

**Phosphate Rock.**—The final decision to commence full-scale development of the Duchess deposit was made by BH South in 1974. Queensland Phosphate Pty. Ltd., a subsidiary of BH South, will operate the mines. Production was scheduled for early 1975. Production will come from the Duchess deposits, which are located about 70 miles southeast of Mount Isa. Reserves at the large Duchess deposit and the smaller Ardmore deposit were estimated at 1.4 billion tons of phosphate rock grading 17.5% $P_2O_5$, and within the two deposits there are 40 million tons of 31% rock. Initial production was expected to be 200 tons per day, but yearly output of 3 million tons was planned by 1977.

BH South reported that substantial progress was made at the mine site. Removal of overburden was near completion. The crushing and screening plant was commissioned, and the access road to Duchess was completed. The rail link to the plant site was due for completion late in 1974, and the necessary support facilities at the mine were ahead of schedule.

Estimated capital expenditures to bring the property to a production rate of 1 million tons per year was put at $59 million. Some $33 million of this sum will be used for rail extension and and rolling stock. Financing was being provided by a consortium of Australian banks.

Imports of phosphate rock totaled 4 million tons, most of which came from Nauru and other Pacific islands, Christmas Island in the Indian Ocean, and, to a lesser extent, from Africa and the United States.

**Salt.**—Australia's production and exports of salt increased about 18% and 6%, respectively, in 1974. All domestic salt was produced by solar evaporation of seawater or natural brines associated with inland lakes. Although domestic demand continued to increase, exports to Japan were the principal outlet. New markets in Asia were developed, but several large Western Australia companies signed medium and long-term contracts with Japanese consumers.

The total 1974 production of Shark Bay Salt Co. was committed to Japan under sales contracts negotiated by Mitsui & Co. Ltd., which took a 49% equity in the project. The participation of Mitsui enabled the construction of a causeway to the

ship-loading point on Topper Island, allowing easier transport to the stockpile. The salt was originally transported to the stockpile by a slurry pipe line, but significant losses led to abandonment of this procedure. The bulk of Texada Mines Pty. Ltd. common salt production continued to be exported to Japan. Texada Mines' first shipment was made in 1967, and by yearend 1974 the company had exported more than 6 million tons of salt from its port complex at Cape Cuvier, Western Australia. Texada Mines is a wholly owned subsidiary of Southern Cross Mines Ltd. of Palo Alto, Calif. It is the largest producer of evaporates in the world and the second largest producer of solar evaporated salt.

South Australia ranked second after Western Australia in salt production. The main producers were Imperial Chemical Industries of Australia and New Zealand Ltd. (ICIANZ), followed by The Broken Hill Pty. Co. Ltd. at Whyalla. Both are seawater-solar evaporation pan operations. Together, they contributed 69% of the State's total production of 640,000 tons in 1974. Other principal salt-producing centers were Stenhouse Bay, Lake Fowler, and Lake MacDonnell.

Salt production in Queensland was down slightly from the 116,000-ton output in 1973. The two production companies are Central Queensland Salt Industries Ltd. and ICIANZ, both at Bajool. In Victoria, Cheetham Salt Ltd. was the main producer with operations based on seawater-solar evaporation pans near Melbourne. Salt is also harvested in smaller quantities from inland saline lakes in both the northwest and western parts of the State.

After a complete revision of harvesting procedures, Lefroy Salt Pty. Ltd. operated at normal capacity and began shipping to Japan. The new procedure necessitated the erection of a washing plant to improve the quality of salt to meet the requirements of the Japanese market.

**Sulfur.**—Imports of elemental sulfur decreased from 420,000 tons in 1973 to below 400,000 tons in 1974. Most of the imported sulfur and virtually all of the sulfur recovered from domestic pyrite and metallic sulfide ores was used in manufacturing sulfuric acid. Reflecting increased requirements by the manufacturers of superphosphate fertilizers, production of sulfuric acid was slightly above the 1973 level. During 1974, three companies produced a combined total of 224,251 tons of pyrite concentrates from base metal operations. These companies were Mount Lyell and Electrolytic Zinc, both in Tasmania, and Mount Morgan, Ltd., in Queensland. Lead and zinc concentrates were the basis of sulfuric acid produced at the smelters at Risdon, Tasmania, and Cockle Creek, New South Wales. In addition, alkylation sludges and hydrogen sulfide from some oil refineries and spent oxide from gas works provided a source of sulfide for acid production.

Sulfuric acid production increased 9% from 2.4 million tons in 1973 to 2.6 million tons in 1974. Of the total production in 1974, around 70% was made from elemental sulfur, 10% from pyrites, 19% from lead and zinc concentrates, and the remaining 1% from other materials. Consumption of sulfuric acid in 1974 was 2.4 million tons, of which 81% was used in the manufacture of superphospate, 2% for ammonium sulfate, and 17% for mining and metallurgical uses.

## MINERAL FUELS

**Coal.**—*Black.*—During 1974, the upward trend in Australia's coal industry was maintained. Moderate increases were recorded for both bituminous coal and lignite, although production during early 1974 was adversely affected by industrial disputes, floods, and wet-weather conditions. Increasing quantities of coal were produced in the Bowen basin area of central Queensland, Australia's major coal basin. The huge basin has known reserves of 13.3 billion tons of steam and coking coal. The coal occurs in seams that are from 2 feet to more than 160 feet thick.

Domestic black coal production increased to 70.4 million tons, 4% higher than that in 1973. Production in New South Wales and Queensland accounted for 95% of the total supply. Output in New South Wales increased 821,000 tons to 38.7 million tons. The major increases were those recorded from opencut mines of the northern district, particularly those supplying the Liddell powerstation, as well as from underground mines of the south coast in the southern district. Production in Queensland increased 1.3 million tons to 28.5 million tons in 1974, as existing operations in the Bowen basin expanded and new mines were developed. The major part

of the increase resulted from opencut operations at Goonyella and Peak Downs.

Exports to Japan and Europe increased in 1974. Japan, Queensland's largest customer, imported 13.1 million tons (up 5%), followed by Italy, 1 million tons (up 56%), and the Netherlands, 561,000 tons (up 20%).

France almost doubled its imports of Queensland coal with a purchase of 232,000 tons, mainly from the Peak Downs mine, 120 miles west of Mackay. This mine increased production 87% in 1974 to 4.4 million tons. Peak Downs is owned by Central Queensland Coal Associates (CQCA), a joint venture between Utah Development Company (85%) and Japanese-owned Mitsubishi Development Company (15%). CQCA expects to duplicate its coal export facilities at the port of Hay Point, south of Mackay, to supply a total capacity of 20 million tons of coal per year from Peak Downs and nearby Goonyella. Both mines are opencut and produce medium-volatile hard-coking coal. Development of the two mines, with township, port, railway, and ancillary services, cost $162 million.

Several other mines (Blackwater, Moura-Kianga, and Blair Athol) of similar size to Peak-Downs-Goonyella also operated in the Bowen basin during 1974. The Blackwater mine was operated by Utah Development Company. This field is 134 miles west of Rockhampton. The opencut mine produced medium-volatile, bituminous coking coal. Measured and indicated reserves were 1.4 billion tons of coking coal and 1 billion tons of noncoking coal. The mine exported 3.6 million tons to Japan.

Moura-Kianga mine, an opencut underground mine 87 miles southwest of Gladstone, was operated by Theiss Peabody Mitsui Coal Pty. Ltd., a consortium owned 22% by Theiss Holdings Ltd, 58% by American-based Peabody Coal Co., and 20% by Japan's Mitsui & Co. Present contracts will supply 4 million tons of hard-coking coal each year to Japanese steel mills.

Blair Athol mine, operated by Blair Athol Coal Pty. Ltd., produced 1.5 million tons of steam coal for local markets. Plans were underway to expand mine production to 6 million tons per year.

The proportion of coal mined by opencut methods in Queensland was around 87% in 1974, as output from Peak Downs increased and the Saraji mine commenced production during the year. In New South Wales, the quantity of coal recovered by underground methods decreased from 90% in 1973 to around 80% in 1974. In South Australia all coal was mined by opencut; in Tasmania by underground; and in Western Australia both methods were used (opencut output comprised about 65% of the total).

The number of miners in the coal industry as of yearend 1974 was 19,171, compared with 13,750 in 1973. Of these, 13,714 were in New South Wales and 4,531 in Queensland. South Australia, Western Australia, and Tasmania together employed less than a thousand miners. Coal output per shift in Australia was among the highest in the world. Production per man-shift worked underground came to 9.25 tons in 1974. In opencut mining the figure was 27.18 tons.

Australia's reserves of black and brown coal are such that at current or increased production rates reserves could last for hundreds of years. Known recoverable reserves of black coal are estimated to be more than 50 billion tons. There are also very large reserves at greater depths and some of these should be ultimately economic to recover. The Joint Board reported that New South Wales reserves of black coal totaled 26 million tons. The Queensland Coal Board reported that its measured and indicated reserves came to 13 billion tons. The Joint Coal Board reported output in leading producing States as follows:

**Table 5.—Production of black coal**
(Thousand metric tons)

| State | 1972 r | 1973 r | 1974 |
|---|---|---|---|
| Queensland | 23,489 | 27,189 | 28,501 |
| New South Wales | 39,176 | 37,882 | 38,703 |
| Tasmania | 132 | 115 | 128 |
| South Australia | 1,602 | 1,510 | 1,671 |
| Western Australia | 1,168 | 1,171 | 1,446 |
| Total | 65,517 | 67,867 | 70,449 |

r Revised.

Domestic consumption of black coal in recent years were as follow in thousand tons:

| | 1971 | 1972 | 1973 |
|---|---|---|---|
| Iron and steel | 7,653 | 8,948 | 9,754 |
| Electricity | 13,874 | 14,607 | 14,875 |
| Railways | 76 | 33 | 42 |
| Town gas | 249 | 131 | 164 |
| Cement | 793 | 899 | 876 |
| Metallurgical coke | 440 | 473 | 542 |
| Other (including bunkers) | 2,404 | 2,303 | 2,482 |
| Total | 25,489 | 27,394 | 28,785 |

*Brown.—(Lignite).*—Production of brown coal increased by 10% over that of 1973 to 27.2 million tons. Victoria was the only State in Australia in which brown coal was produced. Substantial deposits exist in South Australia, but these were regarded as subeconomic under current conditions. The major deposits in Victoria were in the Latrobe Valley, 60 miles southeast of Melbourne, where operations of the State Electricity Commission at Yallourn and Morwell were responsible for more than 90% of the total State production. Smaller quantities were produced from privately owned mines at Bacchus Marsch and Anglesea.

The State Electricity Commission of Victoria produced 26.1 millions tons of raw brown coal in 1974 compared with 23.4 million tons in 1973. Of the 1974 total, 11.2 million tons was obtained from the Yallourn opencut, 280,000 from the Yallourn North extension opencut, and 14.6 million tons from the Morwell opencut.

Alcoa of Australia Pty. Ltd. operated an opencut mine at Anglesea, 40 miles southwest of Melbourne, to provide fuel for its powerstation. Most of the electricity required by the Point Henry aluminum smelter was supplied from this powerstation. At Bacchus Marsch, brown coal was produced by Maddingley Brown Coal Co.

Because brown coal deteriorates rapidly and cannot be economically transported, virtually the entire mine production was consumed locally. The use pattern in recent years has approximated 80% in generation of electric power, 15% in manufacture of briquets, and 5% as an industrial fuel.

**Petroleum and Natural Gas.**—The upward trend of the past decade in the Australian petroleum industry was reversed in 1974, natural gas production, however, continued to increase. The 141-million-barrel petroleum output in 1974 was slightly lower than the 142 million barrels produced in 1973. The decrease resulted mainly from a drop in production at both the Barrow Island Moonie Fields, as production from the Gippsland Basin Fields increased sharply. Australia produced approximately 70% of its domestic crude oil requirements, from which about 90% of the Nation's supply of gasoline, diesel distillate, aviation turbine kerosine, and heating oil was produced. Usage of natural gas (including field and plant usage) during 1974 totaled 155,486 million cubic feet, a 7% increase over that of 1973.

In 1974, BHP and Esso Exploration & Production Australia Inc. produced 131,373,000 barrels of crude oil from the Gippsland Basin Field, equivalent to about 60% of Australia's consumption. Because of industrial disputes in the refining and shipping industries, production was about 7.5 million barrels less than expected. BHP-Esso also produced 1,104,000 tons of liquefied petroleum gas during the year, and natural gas deliveries totaled 15,670,000 cubic feet. Ethane production was 50,300 tons.

Installation of a booster pump station on the Halibut platform and a solution gas compressor on the Kingfish B platform have raised production capacity of the Halibut-Kingfish crude oil system to about 385,000 barrels per day. With the addition of Barracouta crude oil, and gasfield condensate, a peak per day production capacity of about 395,000 barrels can be attained. As a result of continuing seismic work, the recoverable reserves of the Halibut Field were 640 million barrels.

The Barrow Island Field in Western Australia was Australia's second largest oil-producing area. The number of wells producing crude oil at yearend 1974 was 321. The production rate averaged approximately 38,000 barrels per day. The 1974 oil output per day in the other producing States were as follow: Queensland 85 barrels and Victoria 2,700 barrels.

Despite a slight decline in production in 1974, total consumption of petroleum products increased 9% over that of 1973 to the highest level since 1969. The increase was attributed to the large rises in consumption of industrial diesel fuel, aviation turbine fuel, heating oil, lighting kerosine, and lubricants. Gasoline was the largest single item of petroleum products consumed in Australia; sales during the year were 77 million barrels, of 8.4% over the 1973 total.

Australia's 12 refineries produced 207 million barrels of marketable products in 1974, an increase of nearly 1% above the 1973 levels. Foreign trade in these items included exports totaling 26 million barrels, more than twice that for 1973. The largest volume increase was in exports of automotive gasoline, which almost doubled the 1973 quantity. Decreases were recorded only for power kerosine, fuel oil, and lubricants. Japan remained Australia's main

export market for petroleum products, due largely to its imports of liquefied petroleum gas. New Zealand was the other market. Imports increased by 10.3% in 1974 over those of 1973. Persian Gulf countries (mainly Kuwait and Saudi Arabia) continued to be the major source of imports of crude oil and other refinery feedstock, contributing 98% of the 1974 total.

Exploration in 1974 was conducted in all States and the Northern Territory. These activities culminated in new discoveries near the Marlin Field, Victoria (gas and oil); at the Alton Field, Queensland (gas); near Kalumburu Mission, Western Australia (oil); at Bonaparte Gulf Basin, Western Australia (gas); and at Barrow Island, Western Australia (gas). Total footage drilled for petroleum exploration in 1974 was 591,000 feet, approximately 3% above the 1973 figure. Areas of principal drilling activity were Western Australia—197,700 feet; Queensland—140,900 feet; and Victoria—76,100 feet. About 60% of the footage drilled was offshore, mainly because of the extensive drilling operations in the Northwest Shelf area in Western Australia. Private companies, the Bureau of Mineral Resources, and State geological agencies participated in these programs. Expenditure on petroleum exploration and development in 1974 totaled $14.6 million.

Australian proved and probable reserves of crude oil at yearend 1974 were 3.8 billion barrels. Natural gas reserves were 27 trillion cubic feet.

# The Mineral Industry of Austria

By Grace N. Broderick [1]

The Austrian economy in 1974 continued its strong performance with its gross national product (GNP) showing an increase of about 5% over that of 1973. As in previous years, the mineral industry represented only a small part of the GNP. Aluminum, antimony, copper, lead and zinc, iron and steel, cement, clays, graphite, magnesite, crude oil, and natural gas remained the principal mineral commodities produced in the country.

[1] Physical scientist, Division of Ferrous Metals.

r Revised. NA Not available.
1 Includes spiegeleisen, shot, powder, and sponge.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Production of primary aluminum in 1974 was 91,554 tons, an increase of about 3% over the 89,131 tons produced in 1973. The country's primary aluminum smelter capacity remained the same (92,000 tons) as in 1973.

Production of aluminum semiproducts in Austria rose to about 103,000 tons. This increase was obtained by the startup of the new cold-rolling mill of Vereinigte Metallwerke Ranshofen-Berndorf AG (VMRB). Planned expansions in the extrusions sector were deferred in view of the unfavorable situation in the building industries.

**Copper.**—During 1974 Austria remained a modest producer of copper ore, concentrate, and electrolytic copper. Output of copper (metal content of ore) was 2,687 tons compared with 2,742 tons in 1973.

**Iron and Steel.**—Iron ore output of 4,245,400 tons was slightly higher (+0.8%) than the previous record high of 4,210,500 tons set in 1973. Imports of iron ore in 1974 were about the same magnitude as the domestic output. Pig iron production increased from 3,005,689 tons in 1973 to 3,443,114 tons in 1974. Crude steel production rose from 4,238,085 to 4,698,519 tons.

VÖEST-Alpine AG, of Linz, completed its 1970–74 investment program, which included as major projects the opening of a third Linz-Donawitz (LD) steel mill raising the crude steel output of the company by 1.1 million to 3.3 million tons and a modern ore-dressing plant. Other developments were a new thermal unit, a second cold-rolling mill, and improvements in the field of environmental protection. Further expansion of metallurgical plants and finishing departments has been planned for the years 1975 through 1978.

**Lead and Zinc.**—Extraction of lead and zinc in 1974 was somewhat lower than in 1973, with production in terms of the lead

content of ore decreasing from 6,139 to 5,785 tons, and production of metal content of zinc ore decreasing from 22,151 to 20,977 tons.

**Tungsten.**—Production of tungsten will be resumed in Austria when a new tungsten mining operation and integrated tungsten plant are completed. The newly founded Wolfram Ges. mbH, in which interests are held by Austria's VÖEST-Alpine AG, the West German firm Deutsche Metallgesellschaft AG, and the U.S. company Teledyne, Inc., has its headquarters at Pölfing-Bergla, Styria. The open pit mine, which will produce relatively low-grade ore containing about 0.7% tungsten trioxide, is at Mittersill. Ore will be shipped to Bergla for refining. A former coal mining site is to be rehabilitated for the new tungsten refinery. Annual capacity will be equal to 15% to 20% of estimated European demand. About 75% of the annual output will be exported.

**Other Metals.**—Other metals produced in Austria in 1974 were antimony, cadmium, and germanium.

## NONMETALS

**Cement.**—Austria in 1974 produced 6,425,000 tons of cement compared with 6,260,000 tons in 1973 and the previous record high of 6,345,000 tons set in 1972.

Perlmooser Zementwerke AG reported on results of the company's operating experience with a rotary cooler and a grate cooler. At the Rodaun plant a rotary cooler (4.40 meters in diameter, 46 meters in length) was selected for its operational reliability, wear, and reduction of pollution. The thermal efficiency in performance tests attained a value of 69.4% at a 2,029-ton-per day kiln output and a 781-kilocalorie heat consumption per kilogram of clinker (natural gas firing); the specific power consumption of the cooler was 3.49 kilowatt-hours per ton of clinker. The final temperature of the clinker was 160°C on average, in conjunction with up to 50 gallons of water sprayed per kilogram of clinker.

With regard to modifications to increase the output of a preheater kiln, the cooling capacity at the Mannersdorf plant was successfully stepped up from 1,650 to 2,100 tons per day by the use of a grate cooler for aftercooling. The measurements performed, which showed that about 70.7% of the clinker heat entering the grate cooler was dissipated by the cooling air and by radiation, confirm the cooling effect achieved. The specific power consumption of the cooler is about 1.14 kilowatt-hours per ton of clinker. The clinker exit temperature was lowered from 238° to 76° C. The specific consumption of cooling air to achieve this was 1.69 Normal cubic meters per kilogram of clinker.[2]

**Clays.**—Austria produced 387,758 tons of illite, 312,425 tons of crude kaolin, and 155,248 tons of other clays (including clay sand) in 1974. Illite production was up about 19% from the previous year's 327,168 tons, and kaolin production increased nearly 4% over the 300,742 tons produced in 1973.

**Graphite.**—Crude graphite production in 1974 was 29,550 tons, an increase of nearly 72% over the 17,211 tons produced in 1973.

**Gypsum and Anhydrite.**—Austria produced 803,742 tons of crude gypsum and anhydrite in 1974, a decrease of about 8% from the 871,001 tons produced in 1973.

**Magnesite.**—Output of crude magnesite increased from the 1,418,628 tons produced in 1973 to 1,449,125 tons in 1974; production of sintered or dead-burned magnesite increased from 485,214 tons to 547,193 tons; caustic-calcined magnesite declined from 179,508 to 157,112 tons.

**Other Nonmetals.**—In 1974 Austria also produced a variety of other nonmetals including barite, diatomite, lime, quartz and quartzite, quartz sand, salt, sand and gravel, stone, sulfur, talc, and pumice (trass).

## MINERAL FUELS

Austria continued to be a modest producer of low-rank coals, crude oil, and natural gas. Domestic supplies were not adequate to meet the country's requirements and imports were necessary to satisfy the demand for energy.

Total electric power generation in 1974, according to preliminary figures published by the Federal Grid Authority, was 33,874 million kilowatt-hours. Of this total, water power accounted for 22,646 million kilowatt-hours, while thermal plants generated 11,228 million kilowatt-hours. Water supply during the year was favorable. Imports of power were reduced to 3,169 million kilowatt-hours, while exports increased to 6,126

[2] Rock Products. V. 77, No. 12, December 1974, p. 32.

million kilowatt hours. The total amount available for domestic supply, including transmission losses, the requirements of the Ranshofen aluminum works, and pumped storage, was 30,917 million kilowatt-hours; consumption, including transmission losses but excluding the Ranshofen aluminum works requirements, and pumped storage, was 28,754 million kilowatt-hours.

**Coal.**—Austria's coal production, which since 1968 has been confined to brown (subbituminous) coal, totaled 3,629,284 tons, a slight decrease from the 3,634,008 tons produced in 1973.

To meet its coal and coke requirements, Austria continued to rely on imports. Total consumption of solid fuels increased during 1974 with decreased consumption registered only by the transportation industry and households.

**Petroleum and Natural Gas.**—Crude oil production in Austria in 1974 was 2,238,144 tons, a decrease of 13% from that of the preceding year. Production of natural gas fell from 2,270 million cubic meters in 1973 to 2,207 million cubic meters in 1974, a decrease of 3%.

Domestic consumption of petroleum and petroleum products fell from 11,325,548 tons in 1973 to 10,171,827 tons in 1974, a decrease of 10.2%. Major consumption declines were reported for lubricants (down 30.6%), kerosine (down 28.9%), white spirit and special gasoline (down 18.7%), and residual fuels (down 13%). The chief reason for the decline in consumption was higher prices for all petroleum products. Other factors were the relatively mild winters of 1973–74 and 1974–75, as well as a number of Government measures aimed at conservation of energy. These measures included a regulation under which motorists were required not to drive on 1 day per week for a 5-week period early in 1974. Speed limits were introduced on public roads which remained in effect (130 kilometers on superhighways, 100 kilometers on other roads).[3]

A study undertaken jointly by Austromineral company and Österreichische Mineralölverwaltung AG (ÖMV–AG), both of Vienna, indicated that the volume of all petroleum deposits so far explored in Austria has been estimated at 285 million to 300 million tons, 35% of which could be extracted by current methods. Explored deposits of natural gas totaled some 75,000 million cubic meters, of which approximately 60% could be extracted. Strata at an unexplored depth between 6,000 and 10,000 meters were believed to hold another 115 million to 135 million tons of petroleum and 142,000 million to 165,000 million cubic meters of natural gas. Production costs, as far as these reserves were concerned, would be of the order of British and Norwegian North Sea operations.[4]

A new agreement with the Soviet Union on the annual delivery to Austria of 500 million cubic meters of natural gas from 1978 to 2000 was signed. This would increase the volume of Austrian imports of natural gas from 1.5 billion to 2.0 billion cubic meters per year. The agreement gives Austria an option for another 500 million cubic meters per year. VÖEST-Alpine in 1975 will start delivering to the Soviet Union a total of 200,000 tons of pipeline pipe.[5]

The Transaustria gas pipeline (TAG), which crosses Austria from the Czechoslovak to the Italian border, was completed on schedule after a construction period of about 30 months. On May 1, 1974, Soviet natural gas was pumped through the pipeline to Italy; official opening ceremonies were held on May 20. In addition to supplying Soviet gas to Italy and Austria, the pipeline will eventually supply gas to France through a connection at Gemona in northern Italy with the Monfalcone-Karlsruhe (MOKA) pipeline planned to extend from Monfalcone, Italy, through western Austria to Karlsruhe, West Germany.

# The Mineral Industry of Belgium and Luxembourg

By Norman A. Matthews [1]

The overall performance of the Belgian economy surpassed the average for the European Communities (EC) during the year but was beset by a high inflation rate (15%) and increasing unemployment, problems common to most of the developed countries of the Western World. The industrial production index increased 6.2% in 1974, compared with a 6.0% increase in 1973. Reflecting inflated prices of domestic production and exports, the gross national product (GNP) at $53.1 billion [2] was 18.3% above that of 1973. In real terms the GNP increase was 4.5%. The high level of industrial production was stimulated by business investment and domestic and export demand, with housing construction the weakest segment in the economy.

The economic outlook deteriorated substantially in September and prompted the new government, elected in May, to institute additional measures to slow inflation and, at the same time, to arrest the increase in unemployment. These measures were not successful however, since export demand promptly declined and necessitated curtailment in production of major export items such as steel, nonferrous metals, petroleum products, and most petrochemicals.

Unemployment reached 3.8% in June and 5.9% at yearend, the highest figures in recent years. The overall inflation rate of 15% was influenced substantially by wage increases of 20%, wholesale price increases of 11%, and retail price increases of 15%, compared with those of 1973. The balance of trade showed a modest deficit during the year. The substantial increases in export and import values were a reflection of higher prices. Imports from the United States increased 78% in value, reflecting higher prices for agricultural and mineral commodities and high-technology goods.

The overall extractive mineral production index declined in 1974, reflecting principally the downward trend in coal production; crushed stone and marble production also declined, whereas industrial sand production increased. Nevertheless, Belgium and Luxembourg continued to increase the volume of imported raw materials converted to high-value semifinished products such as steel, nonferrous metals, and petrochemicals. Record volumes were achieved in all these and their derivative industries such as metal fabrication and plastic products, which constitute an increasing share of the industrial economy and value of exports.

## BELGIUM

### PRODUCTION

Overall the industrial production index in 1974 exceeded that of 1973 by 6.2% with most of the excess occurring in the first 6 to 9 months of the year. For example, raw steel production during the first 6 months was at the annual rate of 17.3 million tons, or 11.7% higher than the annual rate in 1973, whereas production for 1974 as a whole was 16.2 million tons, exceeding the 1973 total by only 4.6%. Export demand weakened in September and some mills reduced output immediately; curtailment of shipments by 10% to 20% during the last quarter mostly affected those plants highly dependent on export markets.

[1] Physical scientist, Division of Ferrous Metals.
[2] Where necessary, values have been converted from Belgian francs (BF) to U.S. dollars at the rate of BF 38.96=U.S.$1.00, the approximate floating average during the year.

Similar softening of nonferrous metal markets developed generally in September and October in Europe, and the major Belgian producers announced curtailment of zinc and copper production in December. Nevertheless, record shipments were achieved in most mineral and metal commodities during the year. Exceptions involved coal production where the planned closing of some mines continued. A policy decision was made during 1974 to review the investment costs needed to increase production in the more efficient mines. Similarly, through substantial conservation efforts, the demand for crude petroleum was reduced. Imposition of price controls on domestic oil products further reduced refinery throughput of crude oil in March and April. Relative production in 1974 and 1973 of some of the most important commodities was as follows, with 1973 figures in parentheses and the percentage increase (+) or decrease (−) shown: Coal, 8,111,000 tons (8,842,000), −8%; marble quarried, 3,000 cubic meters (3,431), −12%; sand production, 17,560,000 tons (15,876,000), +10%; crude petroleum processed, 30,213,000 tons (37,005,000), −19%; gasoline production, 4,040,000 tons (4,767,000), −15%; production of nitrogen for fertilizers 420,000 tons (361,000), +16%; coke production, 8,052,000 tons (7,801,000), +3.0%; cement production, 7,435,000 tons (7,041,000), +6.0%; wrought steel products, 12,253,000 tons (11,448,000), +7.0%; nonferrous metals (copper, zinc, and lead) production, 811,000 tons (783,143) +3%; and aluminum wrought products, 263,000 tons (267,430), −2%.

Productivity increased substantially, as production increases were achieved with little increase in personnel and a corresponding reduction in the average hours worked.

A rapidly growing area of industrial activity involved the provision of heavy steel components for oil and gas development and production in the North Sea. An increasing number of Belgian firms were engaged as subcontractors in the provision of steel subassemblies, electrical machinery, work boats, steam generators, and other subassemblies or machinery. To a large extent these increasing outlets for steel offset the decline in exports of steel for automobile and commercial building construction during 1974.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed individually, Belgium produces a number of other metals for which only aggregate output figures are available. These aggregates are listed under other nonferrous metals.

[2] Known to include gold and silver and may include platinum-group metals.

[3] Derived by subtracting aluminum data from a reported total for unspecified base metals.

[4] Includes the following petroleum refinery products: Liquefied petroleum gas—4,231; asphalt—5,520; pitch—2,946; white spirit—1,821; unspecified—12,133.

## TRADE

Belgium and Luxembourg trade and economic statistics are consolidated and reported as statistics for the Belgium-Luxembourg Economic Union (BLEU). The record GNP in 1974, representing an 18.3% increase compared with that of 1973, was sustained by a modest increase in import and export volumes but at greatly inflated prices. As a result, imports and exports increased 25% and 35% respectively in value, and a modest deficit in trade value developed and was attributable to a large extent to the much higher prices for crude petroleum, animal feed grains, and fertilizer raw materials.

Western Europe, principally the countries of the enlarged EC, accounted for approximately 74% of the exports and 69% of the imports. West Germany, France, and the Netherlands continued as the principal trading partners, accounting for over 60% of the foreign trade. The substantial surplus in trade values with the European nations was more than offset by the deficits associated with crude petroleum imports at the high prices prevailing in 1974. Exports to and imports from the United States increased in value 22% and 78%, respectively, with the great increase in import value associated with the much higher prices of feed grains, phosphate rock, coal, and other raw materials. Economic stagnation among the major trading partners led to stringent economic measures being applied by the Government late in the year to dampen domestic demand, particularly for imported goods, and to reduce inflation. Similar actions by the principal trading countries began late in the year when inventories of steel and nonferrous metals climbed to such an extent that production curtailment was necessary.

Table 2.—Belgium-Luxembourg: Exports of mineral commodities
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |

| Scrap | 1,708 | 1,970 | West Germany 860; United Kingdom 568; Canada 219. |
| Unwrought | 165 | 213 | West Germany 70; United Kingdom 60; Netherlands 32. |
| Semimanufactures | 927 | 764 | NA. |

See footnotes at end of table.

## Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Platinum-group metals including alloys, all forms -- thousand troy ounces -- | 67 | 76 | West Germany 50; France 13; Netherlands 4. |
| Selenium, elemental ----- kilograms -- | 66,700 | 49,100 | Netherlands 24,800; West Germany 11,200; France 7,000. |
| Silver metal including alloys thousand troy ounces -- | r 166,010 | 22,560 | West Germany 7,525; United Kingdom 4,817; France 4,030. |
| Tin: | | | |
| Ore and concentrates -- long tons -- | 846 | 221 | Mainly to Spain. |
| Oxides ---------- do ---- | 247 | 136 | France 98; West Germany 26; Netherlands 6. |
| Metal, including alloys: | | | |
| Scrap ---------- do ---- | 88 | 136 | Mainly to Netherlands. |
| Unwrought ---------- do ---- | r 2,074 | 1,910 | Turkey 462; West Germany 441; France 389. |
| Semimanufactures ---- do ---- | 91 | 371 | West Germany 149; Arab Republic of Yemen 10; People's Democratic of Yemen 10. |
| Titanium: | | | |
| Ore and concentrate ---------- | 648 | 82 | NA. |
| Oxides ---------- | 26,670 | 28,942 | West Germany 9,549; France 5,433; United States 1,573. |
| Metal including alloys, all forms -- | 35 | 17 | NA. |
| Tungsten: | | | |
| Ore and concentrate ---------- | 163 | 88 | United Kingdom 47; United States 26; Republic of South Africa 15. |
| Metal including alloys, all forms -- | 19 | 59 | Netherlands 27; France 4. |
| Uranium and thorium ore and concentrate ---------- | 30 | 1 339 | Mainly to France 4. |
| Vanadium oxides -------- kilograms -- | 1,700 | 13,200 | NA. |
| Zinc: | | | |
| Ore and concentrate ---------- | 57,704 | 50,579 | West Germany 24,917; France 15,130; Norway 4,034. |
| Oxides ---------- | -- | 7,201 | Netherlands 2,218; United States 1,569; West Germany 730. |
| Ash and residue containing zinc ---- | 24,969 | 52,932 | Netherlands 39,760; West Germany 6,369; France 3,444. |
| Metal including alloys: | | | |
| Scrap ---------- | 7,350 | 9,045 | Mainly to France. |
| Blue powder (dust) ---------- | 28,025 | 28,420 | West Germany 11,092; France 4,464; Netherlands 2,062. |
| Unwrought ---------- | 192,679 | 221,678 | West Germany 73,406; United States 35,823; France 31,119. |
| Semimanufactures ---------- | 8,951 | 8,703 | West Germany 3,154; Netherlands 2,572; France 472. |
| Other: | | | |
| Ore and concentrate: | | | |
| Of columbium, tantalum, vanadium, zirconium -------- | 15 | 132 | Italy 50; United States 25; West Germany 24. |
| Of precious metals ---------- | 10 | -- | |
| Of base metals, n.e.s ---------- | 122 | 73 | West Germany 6. |
| Ash and residue containing nonferrous metals, n.e.s -------- | 36,012 | 29,396 | West Germany 4,615; United Kingdom 1,204; France 386. |
| Waste and sweepings of precious metals ----- value, thousands -- | r $1,270 | $1,406 | West Germany $893; United Kingdom $340; France $171. |
| Oxides, hydroxides, peroxides of metals, n.e.s ---------- | r 4,704 | 5,636 | West Germany 2,187; Netherlands 763; France 669. |
| Metals including alloys, all forms: | | | |
| Metalloids: | | | |
| Tellurium and arsenic ---- | 15 | 30 | West Germany 10; Japan 5; Netherlands 5. |
| Other ---------- | 229 | 142 | France 10. |
| Alkali, alkaline earth, rare-earth metals ---------- | 394 | 69 | NA. |
| Pyrophoric alloys kilograms -- | 500 | 100 | NA. |
| Base metals including alloys, all forms, n.e.s ---------- | 11,126 | 17,261 | Austria 90; France 1; United Kingdom 1. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Pumice, emery, natural corundum, etc ---------- | 4,237 | 2,952 | NA. |

See footnotes at end of table.

## Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Abrasives, natural, n.e.s.—Continued | | | |
| Dust and powder of precious and semiprecious stones, natural and manufactured ____ kilograms | 394 | 710 | United Kingdom 133; Israel 129; United States 105. |
| Grinding and polishing wheels and stones | 2,450 | 2,781 | France 1,333; West Germany 464; United Kingdom 287. |
| Asbestos | 778 | 433 | France 222; Netherlands 40. |
| Barite and witherite | 61 | 6,887 | Mainly to Netherlands. |
| Boron materials: | | | |
| Crude natural borates | 4,023 | 4,097 | Netherlands 1,958; France 1,506; West Germany 443. |
| Oxide and acid | 31 | 1,305 | West Germany 643; Italy 457. |
| Bromine ____ kilograms | -- | 300 | NA. |
| Cement ____ thousand tons | 1,586 | 1,652 | Netherlands 1,154; Nigeria 57; Saudi Arabia 48. |
| Chalk | 98,662 | 82,353 | Netherlands 44,682; France 11,689; West Germany 5,254. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite | 10 | 97 | NA. |
| Kaolin | 10,981 | 15,175 | Netherlands 10,125; France 3,419; United Kingdom 220. |
| Other | 8,150 | 6,456 | Netherlands 3,263; France 1,380; Italy 325. |
| Products: | | | |
| Refractory (including nonclay brick) | 100,443 | 102,130 | France 61,978; Italy 9,475; West Germany 6,519. |
| Nonrefractory value, thousands | $16,459 | $22,087 | Netherlands $8,054; West Germany $5,169; France $5,166. |
| Cryolite and chiolite | 1,179 | 1,140 | NA. |
| Diamond: | | | |
| Gem: | | | |
| Unworked -- thousand carats | 6,151 | 5,733 | India 2,064; Israel 1,325; United Kingdom 1,312. |
| Worked ____ do | 2,389 | 2,503 | United States 942; West Germany 275; Hong Kong 228. |
| Industrial: | | | |
| Unworked ____ do | 7,289 | 8,865 | United States 2,453; United Kingdom 1,794; Ireland 1,170. |
| Worked ____ do | 15 | 90 | Mainly to United Kingdom. |
| Diatomite and other infusorial earth | 673 | 900 | France 535; West Germany 152; Netherlands 132. |
| Feldspar, leucite, nepheline, nepheline syenite | 639 | 6,849 | Mainly to Netherlands. |
| Fertilizer materials: | | | |
| Crude: | | | |
| Nitrogenous | 363 | 957 | France 594; West Germany 347. |
| Phosphatic | 45,421 | 34,114 | West Germany 9,775; United Kingdom 7,347; Netherlands 5,506. |
| Potassic, $K_2O$ content | 61 | 126 | NA. |
| Manufactured: | | | |
| Nitrogenous, $N_2$ content ___ thousand tons | 296 | 369 | France 121; West Germany 62; Egypt 27. |
| Phosphatic, $P_2O_5$ content do | 347 | 335 | France 134; West Germany 98; Netherlands 27. |
| Potassic, $K_2O$ content - do | 198 | 253 | Norway 46; France 45; Netherlands 30. |
| Other, including mixed do | 1,216 | 1,385 | France 939; United Kingdom 49; Turkey 42. |
| Ammonia ____ do | 170 | 170 | Mainly to France. |
| Fluorspar | 531 | 557 | NA. |
| Graphite, natural | 130 | 148 | NA. |
| Gypsum and plasters | 11,483 | 31,635 | West Germany 20,606; Netherlands 9,600; France 568. |
| Lime ____ thousand tons | 687 | 729 | Mainly to Netherlands. |
| Magnesite | 1,178 | 1,669 | West Germany 212; Canada 14. |
| Mica: | | | |
| Crude, including splittings and waste | 87 | 132 | NA. |
| Worked, including agglomerated splittings | 787 | 1,170 | United States 297; United Kingdom 231; West Germany 163. |

See footnotes at end of table.

## Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Pigments, mineral, including processed iron oxides | r 1,960 | 4,165 | France 2,228; Italy 1,236; West Germany 80. |
| Precious and semiprecious stones: | | | |
| Natural (except diamond): | | | |
| Unworked ------ kilograms | 11,019 | 11,308 | United States 4,524; Switzerland 3,384; Netherlands 1,037. |
| Worked: | | | |
| Gem ---------- do | 133 | 186 | Netherlands 94; United Kingdom 22; France 5. |
| Industrial -------- do | 34 | 10 | NA. |
| Manufactured [2] ---------- do | 22 | 169 | France 103; United States 21; United Kingdom 7. |
| Pyrite (gross weight) | 5,233 | 1,235 | NA. |
| Salt and brine | 30,565 | 150,199 | France 98,113; West Germany 42,315. |
| Sodium and potassium compounds thousand tons | 16,418 | 415 | Netherlands 118; West Germany 57; France 53. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked: | | | |
| Calcareous ------- do | 909 | 1,028 | Mainly to Netherlands. |
| Slate ---------- do | 3 | 3 | Do. |
| Other ---------- do | r 49 | 64 | Do. |
| Worked: | | | |
| Slate ---------- do | 1 | 1 | Mainly to West Germany and Netherlands. |
| Paving and flagstone do | 3 | 8 | Mainly to Netherlands. |
| Other ---------- do | 10 | 12 | West Germany 4; Netherlands 2; France 2. |
| Dolomite, chiefly refractory grade ---------- do | r 1,315 | 1,545 | West Germany 668; Netherlands 645; France 103. |
| Gravel and crushed rock -- do | 7,732 | 8,598 | France 3,965; Netherlands 3,248; West Germany 246. |
| Limestone (except dimension) do | 541 | 532 | Netherlands 343; France 186. |
| Quartz and quartzite ----- do | 7 | 10 | Mainly to West Germany. |
| Sand, excluding metal bearing do | 2,826 | 3,229 | France 895; Italy 494; Netherlands 468. |
| Sulfur: | | | |
| Elemental, all forms | 8,991 | 21,391 | France 7,198; West Germany 4,932; Netherlands 3,569. |
| Sulfur dioxide | 237 | 46 | NA. |
| Sulfuric acid | 191,469 | 201,190 | France 127,854; West Germany 40,892; Netherlands 7,145. |
| Talc, steatite, soapstone, pyrophyllite | 14,445 | 17,538 | West Germany 4,134; Sweden 2,934; United Kingdom 2,524. |
| Other nonmetals, n.e.s.: | | | |
| Crude: | | | |
| Meerschaum, amber, jet ------ | 1,665 | 598 | West Germany 330; Switzerland 15. |
| Lithium minerals | 5,288 | 7,992 | Mainly to Netherlands. |
| Vermiculite, perlite, chlorite -- | 132 | 139 | NA. |
| Other ------- thousand tons | 1,513 | 1,521 | Mainly to Netherlands. |
| Slag, dross, and similar waste, not metal bearing ------ do | 3,232 | 2,903 | France 1,119; Netherlands 1,088; West Germany 673. |
| Oxides and hydroxides of magnesium strontium, barium ------ | 1,253 | 744 | NA. |
| Halogens | 13 | 20 | Greece 5; Israel 5; Italy 4. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 4,646 | 19,339 | Mainly to Netherlands. |
| Carbon black and gas carbon: | | | |
| Carbon black | 17,979 | 22,828 | Mainly to West Germany. |
| Gas carbon | 1,123 | 58 | NA. |
| Coal and briquets: | | | |
| Anthracite and bituminous coal thousand tons | 661 | 591 | West Germany 340; France 214; Netherlands 13. |
| Briquets of anthracite and bituminous coal -------- do | 90 | 55 | France 32; West Germany 13. |
| Lignite and lignite briquets ------ | 50 | 36 | NA. |
| Coke and semicoke -- thousand tons | r 422 | 456 | France 149; West Germany 130; Sweden 57. |
| Gas, natural -----million cubic feet | 60 | 4 | NA. |

See footnotes at end of table.

## Table 2.—Belgium-Luxembourg: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIAL—Continued | | | |
| Hydrogen, argon, other rare gases | 6,943 | 13,799 | France 5,778; Netherlands 2,000; West Germany 1,996. |
| Peat, including peat briquets and litter | 1,278 | 902 | Brazil 80. |
| Petroleum: | | | |
| Crude and partly refined thousand 42-gallon barrels | 113 | 2,216 | Mainly to West Germany. |
| Refinery products: | | | |
| Gasoline do | r 23,831 | 27,254 | United Kingdom 7,557; Netherlands 6,535; West Germany 4,870. |
| Kerosine do | r 5,574 | 4,783 | United Kingdom 1,899; Norway 585; West Germany 566. |
| Distillate fuel oil do | r 26,336 | 30,581 | West Germany 8,014; Sweden 6,538; United Kingdom 6,384. |
| Residual fuel oil do | r 37,016 | 39,966 | Sweden 8,654; United Kingdom 4,946; West Germany 4,878. |
| Lubricants do | r 2,169 | 2,281 | Netherlands 716; West Germany 215; Switzerland 152. |
| Other: | | | |
| Liquefied petroleum gas do | 1,871 | 1,550 | United Kingdom 222; France 207; Portugal 184. |
| White spirits do | 1,174 | 945 | West Germany 426; Netherlands 182; Sweden 108. |
| Mineral jelly and wax do | 10 | 14 | Spain 3; France 2; Netherlands 1. |
| Nonlubricating oils, n.e.s do | 46 | 25 | Saudi Arabia 7; Lebanon 6; West Germany 2. |
| Bitumen and other residues do | 2,916 | 3,261 | Netherlands 1,095; United Kingdom 837; West Germany 716. |
| Bituminous mixtures, n.e.s do | 60 | 68 | Netherlands 46; France 9; West Germany 3. |
| Pitch, pitch coke, petroleum coke do | 171 | 192 | France 135; Norway 32; Netherlands 23. |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons | r 171 | 224 | West Germany 78; Netherlands 53; France 30. |

r Revised. NA Not available.
[1] Figure does not contain thorium in 1973.
[2] May include diamond.

## Table 3.—Belgium-Luxembourg: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 17,019 | 14,961 | Guyana 8,215; West Germany 2,835; Netherlands 1,492. |
| Oxide and hydroxide | 14,487 | 16,256 | West Germany 13,981; France 993. |
| Ash and residue containing aluminum | 1,520 | 3,090 | United Kingdom 1,479; West Germany 761; France 302. |
| Metal including alloys: | | | |
| Scrap | 12,997 | 18,810 | Netherlands 10,011; France 4,026; Hungary 687. |
| Unwrought | 209,232 | 234,740 | Netherlands 77,273; Norway 44,307; France 32,313. |
| Semimanufactures | 48,076 | 60,939 | West Germany 24,402; Netherlands 17,893; France 10,066. |
| Antimony: | | | |
| Ore and concentrate | 8,459 | 12,024 | Bolivia 5,001; Canada 2,155; Morocco 1,259. |
| Metal including alloys, all forms | 50 | 352 | People's Republic of China 229; West Germany 100. |
| Arsenic: | | | |
| Natural sulfides | -- | 24 | NA. |
| Trioxide, pentoxide, acids | 316 | 252 | NA. |
| Beryllium metal including alloys, all forms kilograms | 2,100 | 800 | NA. |

See footnotes at end of table.

## Table 3.—Belgium-Luxembourg: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Bismuth metal including alloys, all forms | 382 | 485 | Mainly from Bolivia. |
| Cadmium metal including alloys, all forms | 1,070 | 1,259 | West Germany 364; Japan 320; U.S.S.R. 295. |
| Chromium: | | | |
| Chromite | 3,032 | 3,170 | Philippines 993; Netherlands 820; Mozambique 534. |
| Oxide and hydroxide | r 550 | 778 | West Germany 547; France 156. |
| Metal including alloys, all forms | 78 | 118 | West Germany 62; France 27; United Kingdom 20. |
| Cobalt oxides and hydroxides kilograms | 12,800 | 10,500 | Mainly from France. |
| Copper: | | | |
| Ore and concentrate | 25,447 | 30,990 | Canada 7,222; Morocco 6,007; Australia 5,876. |
| Matte | 197,329 | 223,682 | Zaire 137,152; Republic of South Africa 47,165. |
| Copper sulfate | 716 | 783 | France 505; U.S.S.R. 191. |
| Ash and residue containing copper | 12,075 | 28,224 | France 13,089; United States 8,569; Spain 2,439. |
| Metal including alloys: | | | |
| Unwrought | r 253,355 | 308,865 | Zaire 143,483; West Germany 31,614; France 24,971. |
| Semimanufactures | 17,632 | 22,913 | West Germany 11,610; France 4,611; Netherlands 3,534. |
| Germanium metal including alloys, all forms | 6 | 16 | Netherlands 11; Italy 4; Hungary 1. |
| Gold: | | | |
| Waste and sweepings value thousands | $479 | $1,207 | Mainly from the United States. |
| Metal, unworked and partly worked thousand troy ounces | r 789 | 956 | Switzerland 508; West Germany 153; United Kingdom 50. |
| Iron and steel: | | | |
| Ore and concentrate, except roasted pyrite thousand tons | 28,078 | 32,417 | France 14,215; Sweden 8,689; Norway 1,124. |
| Roasted pyrite do | 135 | 568 | France 430; West Germany 125. |
| Metal: | | | |
| Scrap do | r 827 | 698 | France 307; Netherlands 117; West Germany 113. |
| Pig iron, including cast iron do | 159 | 234 | West Germany 106; France 73; East Germany 31. |
| Sponge iron, powder, shot do | 5 | 7 | France 2; West Germany 2; Sweden 1. |
| Spiegeleisen do | 1 | (1) | Mainly from West Germany. |
| Ferroalloys do | 164 | 202 | France 73; Norway 39; West Germany 28. |
| Steel, primary forms do | 1,057 | 1,225 | Netherlands 422; West Germany 208; France 203. |
| Semimanufactures: | | | |
| Bars, rods, angles shapes, sections do | 586 | 764 | France 299; West Germany 178; Netherlands 90. |
| Universals, plates, sheets do | 596 | 669 | West Germany 154; Netherlands 124; France 112. |
| Hoop and strip do | 89 | 127 | France 80; West Germany 22; Netherlands 13. |
| Rails and accessories do | 8 | 7 | France 2; Netherlands 1; West Germany 1. |
| Wire do | 29 | 45 | West Germany 22; France 16; Netherlands 4. |
| Tubes, pipes, fittings do | 190 | 166 | West Germany 59; Netherlands 51; France 40. |
| Castings and forgings, rough do | 12 | 15 | France 4; West Germany 4; Netherlands 3. |
| Lead: | | | |
| Ore and concentrate | 113,813 | 105,161 | Ireland 30,035; Peru 15,849; Morocco 13,412. |
| Ash and residue containing lead | 40,935 | 57,478 | United States 18,097; France 13,403; United Kingdom 5,318. |
| Oxides | 1,325 | 3,752 | West Germany 2,441; France 554; Netherlands 418. |
| Metal including alloys: | | | |
| Scrap | 12,093 | 12,445 | West Germany 4,935; Netherlands 4,923. |
| Unwrought | 17,497 | 13,614 | France 4,237; Netherlands 2,931; West Germany 2,200. |

See footnotes at end of table.

1 Less than ½ unit.

2 Crude and manufactured potassic fertilizers not reported separately and total of these commodities not reported in terms of gross weight, but rather in terms of $K_2O$ equivalent. Total for 1972 was 535,521 tons $K_2O$ equivalent; total for 1973 606,016 tons $K_2O$ equivalent. Principal sources in 1973 were West Germany, 270,585; France, 136,748; U.S.S.R., 104,737.

## COMMODITY REVIEW

**Metals.**—*Nonferrous.*—Although no new nonferrous metals production facilities were announced during the year, full-capacity production at the new Métallurgie Hoboken-Overpelt S.A./N.V. electrolytic zinc refinery at Overpelt was achieved at midyear, leading to a total nonferrous metal production of approximately 811,000 tons, a 3% increase over the volume in 1973. Demand slackened in the last months of the year, particularly in copper and zinc, so that overall copper production was 404,000 tons, 4% more than 1973 tonnage. Zinc production, at 293,567 tons, represented a 3% increase over the tonnage in 1973.

Production of nonferrous wrought products was at the record level of 571,000 tons, representing a 6% increase over the tonnage produced in 1973 involving principally increases in tonnage of copper and zinc products. Production of precious metals (silver, gold, and the platinum metals) increased 40% over the 1973 level and was the second highest on record.

**Iron and Steel.**—The Belgium steel industry produced a record 16.2 million tons of raw steel in 1974, representing a 4.6% increase over 1973 output. Shipments did not keep pace because slackening export demand developed late in the year and some restocking of inventories occurred. Pig iron and coke production also set new records. Several modernization and expansion programs were underway. S.A. Cockerill-Ougrée-Providence et Espérance-Longdoz (Cockerill) initiated construction of a 2.5-million-ton-per-year Dwight-Lloyd sintering facility at the Liège location to improve burden characteristics and blast furnace productivity. Initial operation was expected in late 1975. S.A. Forges de Thy-Marcinelle et Monceau at its Marcinelle Division started a three-component major project involving (1) the installation of three 150-ton basic oxygen furnaces to replace basic Bessemer furnaces, (2) a six-strand continuous-casting machine for 4⅝ inch-square billets, and (3) provision of top pressure on the largest blast furnace to increase the production rate of pig iron. Total cost was estimated at $84 million with completion in 1976.

S.A. Usine Gustave Boël at La Louvière began construction of a cold reduction mill to convert 300,000 tons per year of hot-rolled coils into cold-rolled sheets and began installation of a continuous-slab-casting machine with a capacity of 500,000 tons per year and slab size to 10 inch thickness and 67 inch width. Cost of the projects was estimated at $45 million with completion late in 1975. Société Mètallurgique Hainaut-Sambre S.A. at Couillet initiated installation of a two-strand slab-casting machine which will increase capacity by 600,000 tons per year to 3 million tons per year and reduce the costs of conversion from molten steel to flat rolled products. Costs were projected at $68 million with completion in 1976.

Société Carlam, a joint venture of Société Mètallurgique Hainaut-Sambre, S.A. and the S.A. des Forges de Chatillon-Commentry-Biache of France, announced that a continuous 80 inch sheet mill was to be constructed at Charleroi. With a capacity of 1 million tons per year, the facility will enable the two parent companies to convert slab products that are now custom rolled by other steel companies. Cost was projected at $105 million with completion in mid-1976.

The Cockerill shipbuilding subsidiary at Hoboken authorized construction of a dry dock to accommodate ships to 300,000 tons. The facility is to be completed by 1976 at a cost of $38 million.

**Nonmetals.**—The nonmetallic minerals industry production index increased to 107.4 overall in 1974 compared with 102.6 in 1973 but declined to levels below corresponding months of 1973 late in the year. Limestone production decreased modestly compared with that of 1973. Sand production for all uses increased 14% compared with that of 1973, whereas dredged gravel production declined. The quantity of marble quarried declined about 10%, whereas the quantity of blue stone (granite) quarried increased slightly compared with that of 1973. Cement production reached a record 7,435,000 tons as new kilns contributed to capacity. Ordinary brick production declined modestly, as did slate for roofing and other products associated principally with housing construction.

The inorganic segment of the chemical industry operated at higher productive levels through October but then fell below the corresponding levels of 1973 during

the last 2 months as export demand declined suddenly. Production of nitric acid increased 5% over that of the record year 1973; sulfuric acid production approximately equaled the volume produced in 1973. Production of fertilizer intermediates and products continued at higher levels in 1974 as new facilities operated at full capacity; production of nitrogen for fertilizers, ammonium sulfate, superphosphate, and processed high-phosphorus Thomas slags increased substantially so that total volume of fertilizer materials approximated 2,598,000 tons, an increase of 6% over the corresponding tonnage in 1973.

**Mineral Fuels.**—Domestic coal production at 8,111,000 tons in 1974 represented an 8% decline compared with that of 1973 as the less efficient coal mines continued to close on a planned long-term schedule. However, productivity per manhour increased substantially during the year. The advent of high fuel oil prices has led to reconsideration of coal policies and a study to determine if the investment required would be justified for an increased level of coal production approximating 10 million tons per year. Coal imports were at the record level of 10,792,000 tons and were required to support increased needs for metallurgical coke production and to provide a higher percentage of fuel requirements for electrical energy production. Imports were principally from West Germany, Poland, and the United States.

The volume of crude petroleum processed during 1974 declined to 30,213,000 tons from 37,005,000 tons in 1973 as conservation measures were applied and price controls on domestic petroleum products reduced refinery throughput substantially in March and April. Gasoline and residual fuel oil production declined 18% from that of 1973, and the fuel oil conserved was replaced by an equivalent increase in coal consumption in the generation of electricity. Total electrical energy generated was 37,731 gigawatt hours, a 5.4% increase compared with that of 1973, whereas the increase from 1972 to 1973 was 9.4%. Fuels for electrical energy generation involved coal (18%), petroleum products (48%), natural gas (25%), and manufactured gas (9%). The percentage of energy generated from petroleum products declined 5% compared with that of 1973, and coal consumption increased an equivalent amount.

The first nuclear powerstation in Belgium (a pressurized water reactor of 393 megawatts) came on line in 1974; the second of the dual units at Doel will become operational at the end of 1975. A larger 870-megawatt unit at Tihange was scheduled to go into operation also in 1975. The overall plan for the period 1976–83 is to produce 25% of baseline electrical energy requirements from nuclear steam generators in 1980 and 50% in 1983.

The petrochemical industry continued its rapid growth as shown by the relative tonnage of primary materials consumed in the production plastics. The estimated figure of 407,000 tons for 1974 represents a 7% increase over the 380,000 tons consumed in 1973.

Total value of petroleum, petrochemical, and inorganic chemical projects planned in Belgium increased in 1974 compared with that of 1973. The number of projects has also increased to 91 valued at $1,500 million versus 68 in 1973 valued at $1,180 million. However, the value of projects actually contracted or under construction declined. The largest single project is the catalytic cracker and downstream facilities of Chevron Oil Belgium at Feluy. The Antwerp and Hainaut areas account for most of the facility expansions in value and number of projects.

## LUXEMBOURG

The steel industry, which dominates the industrial economy of Luxembourg, operated at record levels in 1974; total raw steel production of 6.45 million tons represented a 8.8% increase over the total for 1973. Over 90% was exported, and although export demand declined substantially late in the year, production continued at a high level to replenish depleted inventories of semifinished products. Pig iron production was also at a record level of 5.5 million tons, representing a 7.5% increase over the 1973 tonnage. Iron ore production in South Luxembourg totaled 2.7 million tons (a decline from the 3.8 million tons in 1973)

with the balance imported by Aciériés Réunies de Burback-Eich-Dudelange S.A. (ARBED) from captive mines in France, and from Sweden and Brazil.

ARBED announced two capital projects during the year, both of which will increase steelmaking capacity. Completion is scheduled for 1976. The single basic oxygen vessel at Esch-Schifflange will be replaced by an interchangeable device permitting alternate use of two vessels in one position, thereby increasing capacity from 420,000 to 700,000 tons per year. Cost was estimated at $9.5 million. The second project, at the Esch-Belval plant, involves replacing the original two basic oxygen vessels by larger, 150-ton units, thereby increasing plant capacity by 250,000 tons per year. The cost of the project, including improved heat recovery units in the hoods of the oxygen furnaces, was estimated at $14 million. A new 5-year plan for further expansion and modernization is under consideration by ARBED for 1976–80 but details have not been announced.

In 1973 about 75% of the steel tonnage was exported to countries of the EC with West Germany receiving 25%, Belgium 15%, France 15%, and the Netherlands 7% of the product.

[1] In addition to the commodities listed, Luxembourg also produces refractory clays and manufactured phosphatic fertilizers other than Thomas slag, but data are not published and information is inadequate to make reliable estimates of output levels.

# The Mineral Industry of Bolivia

By V. Anthony Cammarota, Jr.[1]

The mineral industry provided 53%, and petroleum and natural gas provided 37% of the total value of Bolivia's exports. High metal prices during most of 1974 enabled Bolivia to reach an f.o.b. value of $266 million[2] for its mineral exports. Corporación Minera de Bolivia (COMIBOL), after taxes and other allowances, made a profit of $5.2 million, compared with $9.3 million in 1973. Costs of labor, materials, and equipment, increased significantly. The private mining sector was similarly affected, especially in the matter of high mineral export taxes.

The Bolivian mining industry employed about 45,000 permanent workers and about 10,000 seasonal workers. COMIBOL was the largest employer with 24,000 workers, followed by the Medium Miners Association with 7,000, and the Small Miners Association and cooperative organizations with 14,000. COMIBOL derives its mineral output from its own mines, from leases of small mining properties, from purchases from cooperatives and small private owners, and from the volatilization of low-grade tin concentrate.

The Medium Miners Association increased from 23 companies in 1973 to 28 companies in 1974. While these companies produce 10 commodities, the only significant increase in production in 1974 was a 36% increase in zinc production. The Medium Miners cited heavy export taxes and the special tax on mineral exports to prevent windfall profits as the reasons for lower production. Increases in mining, transportation, and smelting costs contributed to cutbacks in development. A Medium Miners company is one that has paid-in capital of at least $100,000, and produces a minimum of 5.5 tons of fine tin in concentrate, or 20 tons of antimony or zinc, or 15 tons of copper or lead.

The Small Miners Association, which is obliged by law to sell its mineral production to Banco Minero de Bolivia (BAMIN), increased production by 103% over that of 1973. About 2,000 producers sell to BAMIN. These miners also experienced higher costs during the year, and would be more adversely affected because BAMIN deducts from its purchase price the higher smelting and transportation costs for the lower grade material from the Small Miners. In addition, there were about 120 unclassified mines which must sell their production to BAMIN unless authorized to sell directly to foreign buyers.

The Comisión Boliviana de Energía Nuclear (COBOEN) and the Ministry of Mines signed a contract with the Italian firm AGIP, S.p.A., to explore for uranium in Corocoro, Lípez, Tarija, and San José of Chiquitos.

Servicio Geológico de Bolivia (GEOBOL), the agency that gathers data from the Earth Resources Technical Satellite, mapped favorable mineral exploration areas in Bolivia. A U.S. Geological Survey mission was contracted to advise GEOBOL on its program.

A list of the more important Supreme Decrees (S.D.) passed in 1974 affecting the mining and smelting industries follows:

S.D. 11571, July 2, 1974: Created the Institute of Geologic, Mining, and Metallurgical Investigations (GEOMIN) as a state entity by combining GEOBOL, the Instituto de Investigaciones Minero-Metalúrgicas (IIMM), and the Departmento de Materias Primas, Comisión Boliviana de Energía Nuclear (COBOEN). GEOMIN will act as advisor and give technical

[1] Physical scientist, Division of Nonferrous Metals.

[2] Where necessary, values have been converted from peso Boliviana ($b) to U.S. dollars at the official exchange rate of 20$b = US$1.00.

assistance to the mining industry.

S.D. 11641, July 11, 1974: Authorized COMIBOL to sign a contract with the U.S.S.R. for the construction of a tin volatilization plant in Oruro.

S.D. 12087, December 27, 1974: Authorized Empresa Nacional de Fundiciones (ENAF), the national smelting company, to ask for bids from foreign countries to design a zinc refinery including a sulfuric acid recovery plant.

## PRODUCTION

Of the 12 metals mined in Bolivia in 1974, arsenic, bismuth, gold, and tungsten showed increases. Mine output of tin was down 2%. Of the nonmetals, production of crude gypsum increased 132%, but elemental sulfur production fell 26%. Gross natural gas production fell 5% because of a pipeline disruption, while crude oil production fell 4% because of a lack of export markets at a price acceptable to the Government, and technical and equipment supply problems in the oilfields.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, salt and a variety of construction materials such as clays, stone, sand, and gravel are produced, but information is inadequate to permit formulation of reliable estimates of output levels.

[2] Unless otherwise specified, data shown represent the sum of production by COMIBOL and exports by medium and small mines.

[3] Total national exports.

[4] Contained in zinc concentrates produced by COMIBOL.

[5] Includes COMIBOL output, and sales by placer mines. (Medium and small mines cannot legally export gold.)

[6] Total national exports excluding approximately 50,000 metric tons (gross weight) containing about 32,000 metric tons of iron that was exported from the Mutún deposit during 1972 and 1973.

[7] Sum of COMIBOL production; COMIBOL purchases from lessees in COMIBOL-owned mines and from other producers; sales of medium and small mines to ENAF and exports of medium and small mines.

[8] Sales by cement plants.

[9] Less than ½ unit.

## TRADE

Preliminary figures indicated an export value of $266 million f.o.b. for minerals, and $188 million for petroleum and natural gas in 1974. This represents an increase of $112 million from 1973 figures for minerals and $121 million for petroleum and natural gas. High metal and petroleum prices were responsible for the gain.

In 1974, the private mining sector exported minerals valued c.i.f. at approximately $190 million, up $79 million from the $111 million in 1973. COMIBOL's exports amounted to $196 million, up $82 million from the $114 million in 1973.

The value of all exported mineral commodities except manganese increased in 1974, although the amounts of zinc, antimony, copper, tungsten, lead, manganese, sulfur, and calcite declined. In addition, arsenic, barite, and marble were exported in 1974. Tin accounted for 60% of the total mineral export value in 1974, compared with 58% in 1973. The tin portion of the total export market decreased to 31% from 39% in 1973.

The relation of mineral trade to total trade for 1972–74 were as follows in million dollars:

| | Mineral commodity trade | Total commodity trade |
|---|---|---|
| Exports (f.o.b.): | | |
| 1972 | 146 | e 203 |
| 1973 | 154 | 268 |
| 1974 p | 266 | 504 |
| Imports (f.o.b.): | | |
| 1972 | NA | r 193 |
| 1973 | NA | 246 |
| 1974 | NA | e 349 |

e Estimate. p Preliminary. r Revised.

## COMMODITY REVIEW

### METALS

**Gold.**—South American Placers Inc. (SAPI) reverted 10,000 hectares of alluvial gold concessions back to the State. They had been held since 1956 along the Coroico, Challana, Tipuani, Mapiri, and Consata Rivers. SAPI estimated that within 3 years it will have dredged its remaining concessions. The Ministry of Mines planned to establish a national gold policy for exploration and development of gold resources.

**Tin.**—Of the 29,032 long tons of tin-in-concentrate produced in 1974, COMIBOL contributed 19,726 long tons, the Medium Miners 6,439 long tons, and the Small Miners 2,867 long tons. COMIBOL's mines accounted for 78% of its total production, leased mines for 14%, purchases for 7%, and volatilization for 1%.

COMIBOL estimated its cost to produce and market tin at $2.85 per pound, up from $2.13 in 1973. Mining and depreciation costs were $1.51, export taxes were 55 cents, a net earnings tax was 21 cents, and handling, transportation, insurance, and smelting was 58 cents.

COMIBOL's output of about 4 million tons of ore, including purchased ore, assaying about 0.6% tin, was treated in concentration plants for an overall tin recovery of 56% contained in a concentrate of 43% tin.

COMIBOL estimated its measured, indicated, and inferred underground reserves of tin as 17.8 million tons assaying 0.95% tin. In addition, another 155 million tons of alluvial and dump material grading 0.21% tin exist on the surface, but the cost of processing these materials is uneconomical. An important project finished by COMIBOL for developing more tin reserves was the 7,000-foot crosscut at the Caracoles mine. The cut reportedly intersected 16 tin veins which average about 3 feet in width and contain 1% to 3% tin.

The expansion of the Vinto smelter operated by ENAF was scheduled to be completed by late 1975. The second phase, raising capacity to 19,700 long tons, was to be finished in 1977. In addition, ENAF was planning a smelter for low-grade tin ore in Vinto, so that by 1979 ENAF would have a smelting capacity of 30,000 tons, approximately all of Bolivia's current tin output.

**Tungsten.**—ENAF selected Shattuck Chemical Co. of the United States to study the feasibility of constructing a plant to convert tungsten concentrates to tungsten powder, tungsten carbide, and ammonium paratungstate. The plant, to be built in Viacha adjacent to the ferroalloy plant being built by SKODAEXPORT, would be owned by ENAF and International Mining Co. of Bolivia.

**Zinc.**—Of the total zinc mine production of 48,221 tons, COMIBOL supplied 32,590 tons, the Medium Miners 14,829 tons, and the Small Miners 802 tons. COMIBOL's production fell 20% from that of 1973, whereas the Medium Miners' production increased 36%.

The Dowa Mining Co. Ltd., of Japan pledged to loan $3.5 million to New Jersey Zinc Co. for the development of the Huari Huari mine north of Potosí. Dowa plans to purchase 55,000 tons of zinc concentrate per year for the next 10 years from the new flotation mill to be built at the mine.

### NONMETALS

**Sulfur.**—Sulfur production fell 26% from that of 1973. Most of the output was

exported to Chile. Inferred sulfur reserves were estimated at 70 million tons assaying 55% sulfur. The deposits occur along most of the Bolivian-Chilean border and are volcanic in origin.

## MINERAL FUELS

**Petroleum and Natural Gas.**—In 1974, the Bolivian petroleum industry continued to benefit significantly from the world's energy crisis. Yacimientos Petrolíferos Fiscales Bolivianos (YPFB) exported 10.8 million barrels of petroleum valued at $164.0 million in 1974, compared with 11.8 million barrels valued at $48 million in 1973. In addition, YPFB exported 54,593 million cubic feet of natural gas valued at $29.2 million, compared with 55,450 million cubic feet valued at $18.1 million in 1973. Almost all the gas went to Argentina. Production of both petroleum and natural gas was slightly lower in 1974 because Bolivia held out for higher petroleum prices late in the year and because a bridge collapsed at the Río Grande Field, disrupting production for 18 days. The price of natural gas to Argentina was renegotiated late in 1974 from $0.35 per thousand cubic feet to $0.65 per thousand cubic feet, retroactive to September 1, 1974.

Domestic petroleum consumption increased 7.2% over that of 1973, to 5,533,309 barrels. The largest increase was noted for liquefied petroleum gas (LPG), so much so that YPFB was forced to buy LPG from Chile toward yearend. High truck transportation costs forced YPFB to plan a gas pipeline distribution system because of increasing demand in La Paz, Santa Cruz, Oruro, and Cochabamba.

**Table 4.—Bolivia: Crude petroleum production by YPFB, by field**
(Thousand 42-gallon barrels)

| Field | 1973 | 1974 p |
|---|---|---|
| Rio Grande | 4,856 | 4,562 |
| Monteagudo | 3,465 | 2,978 |

**Table 5.—Bolivia: Consumption [1] of petroleum refinery products**
(Thousand 42-gallon barrels)

| Products | 1973 | 1974 |
|---|---|---|
| Jet fuel | 146 | 204 |
| Gasoline, aviation | 106 | 129 |
| Gasoline, motor | 1,983 | 2,085 |
| Kerosine | 958 | 1,015 |
| Diesel oil | 818 | 930 |
| Fuel oil | 749 | 889 |
| Lubricants | 62 | 65 |
| Liquefied petroleum gas | 163 | 258 |

[1] Figures refer to actual civilian and military consumption through sales to consumers, and including YPFB consumption.

The attractive investment climate in Bolivia led to increased private capital expenditures in petroleum exploration. By yearend 1974, YPFB had signed 14 operations contracts with foreign oil companies, both singly and in groups. Texaco Inc., Superior Oil Co., Tesoro Petroleum Corp., and Zapata Corp. joined the U.S. companies that had signed in 1973. In addition, French, Spanish, and Canadian companies signed contracts. Exploration investments in Bolivia from those contracts are expected to reach $60 million within the next 3 years.

Recoverable petroleum reserves were estimated at 160 million barrels. Measured, indicated, and inferred reserves of natural gas were estimated by YPFB to be 5 trillion cubic feet. A new natural gasfield was discovered by the Palacios No. 2 well in 1974.

YPFB paid Gulf Oil Co. $11,412,860, leaving $60,016,680 outstanding on its debt to Gulf for nationalization of Gulf's property in 1969. With the increase in gas and petroleum prices it is possible for YPFB to pay off the debt within 6 years.

YPFB's drilling operations declined from 110,845 feet drilled in 1973 to 78,375 feet drilled in 1974. Eight development wells were completed, including two wells drilled in the Caranda Field to put out a fire. Seven exploratory wells were completed including Palacios No. 2, which found gas horizons north-northwest of the city of Santa Cruz.

# The Mineral Industry of Brazil

By F. W. Wessel [1]

While mineral production in 1974 accounted for 2% of Brazil's gross national product and 11% of its export value, domestic demand continued to exceed production for many commodities.

Preliminary figures show that Brazil's mineral exports totaled $902 million [2] in 1974, major items of which were iron ore ($571 million), petroleum products ($110 million), manganese ore ($50 million), and ferroalloys ($49 million). However, mineral imports for the year reached $5.6 billion, of which 92% was accounted for by crude oil, steel, copper, and fertilizer materials.

A matter of major concern to Brazil was a reduction in its mineral imports. The Companhia Vale do Rio Doce (CVRD), established in 1947 as a government-operated organization for mining and marketing iron ore, had its authority and scope broadened to include many other commodities, and to include prospecting, shipping, and operating iron ore pelletizing plants. Capitalization of CVRD was increased to $447 million at midyear. To permit further development of the petrochemical industry, particularly with respect to nitrogenous fertilizers, the capitalization of the Government petrochemical corporation Petrobrás Química S.A. (PETROQUISA) was doubled, standing at $171 million at yearend.

Brazil was making a serious effort to improve transportation, port facilities, and the availability of power. Improvement of railroads serving the port cities of Paranaguá, Rio Grande, Santos, and Vitória, and planning and construction of new rail lines to Tubarão and Itaqui, were underway at yearend. Plans for a new iron ore terminal on Sepetiba Bay and for port facilities at Aratu were approaching finality.

Eletrobras, the Government power monopoly, claimed an estimated 17,400 megawatts of installed power by yearend, 13,900 megawatts being hydroelectric and the remainder thermal.

At midyear it was officially announced that preliminary plans for two hydroelectric plants on the Tocantins River had been approved by the President. The power will be needed to produce aluminum from the Trombetas bauxite deposit. A total capacity of 4,000 megawatts is expected to be available by 1981. The power sites designated were at São Félix and Tucuruí.

Final agreement between Brazil and Paraguay on development of power at Itaipu (Sete Quedas) on the Paraná River was reached early in the year. First production of 700 megawatts is scheduled for 1982, and completion of the project is scheduled for 1988. Construction of the first 625-megawatt nuclear unit at Angra dos Reis continued. Construction of a new unit of 1,200 megawatts at the site, to be completed in 1981, was announced in June. In addition, the Brazilian nuclear program includes eight reactors, at various locations, for a total capacity of 11,000 megawatts by 1990, and a parallel effort to achieve self-sufficiency in enrichment capability. Eletrobras does not intend to build more oil-burning thermal powerplants.

Decree 74,557, signed by the President on September 12, reformulated the Interministerial Commission for Resources of the Sea. The Commission as now constituted will be a policymaking and managerial tool.

---

[1] Physical scientist, Division of Nonferrous Metals.

[2] Because of fluctuating exchange rates, meaningful conversion to U.S. dollars is impractical. At yearend, however, the exchange rate was New cruzeiros (NCr$) 7.435=US$1.00.

Voicing Brazilian position regarding formation of an iron ore producers' cartel, CVRD opposed Brazilian participation as not being in the nation's long-term interest, and raised doubts as to the effectiveness of such a cartel. CVRD preferred a policy of integration and cooperation between producers and consumers.

Final agreement with Bolivia concerning the development of Mutún iron ore, sale of natural gas to Brazil, and associated projects was signed on May 22. Feasibility studies of various phases began before year-end.

## PRODUCTION

Production of the three commodities of major domestic importance increased within the 0 to 10% range in 1974: Crude petroleum, 4.2%; steel ingot, 5.0%; and primary aluminum, 1.9%. Production of iron ore and bauxite increased 29.0% and 9.5%, respectively, but manganese ore output declined 16.6%. Mine production of copper increased 17.2%, zinc, 6.4%, and tin, 1.9%, but lead production was 3.2% less than in 1973. Base metal smelter production of lead, tin, and zinc increased 8.6%, 9.4%, and 37.1%, respectively, but copper smelter production was off 16.7%. Gold production was 9.8% higher, but silver output declined 23.2%. Pig iron production was up 5.7%, and ferroalloy production gained 23.8%. Mine production of nickel and of pyrochlore, however, declined 36.7% and 8.0%, respectively.

Nonmetallic minerals showed more general increases. Gains of 11.4% for cement, 13.6% for gypsum, 57.0% for magnesite, and 36.0% for asbestos were posted. Phosphate rock production declined 14.1% in $P_2O_5$ content. Shipments of quartz crystal were 75% greater, and sulfur production more than doubled its 1973 figure.

Coal production showed little change, but 27.7% more natural gas was marketed, and carbon black production increased 35.4%.

**Table 1.—Brazil: Production of mineral commodities [1]**
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 [p] |
|---|---|---|---|
| **METALS** | | | |

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, molybdenite, bismuth, and a variety of crude construction materials (sand, gravel, and additional unlisted varieties of stone) are also produced, but output is not reported and available information is inadequate to make reliable estimates of output levels.
[2] Concentrate.
[3] Partially estimated on placer gold.
[4] Includes baddeleyite-caldesite.
[5] By far the larger part of Brazil's diamond production is not reported statistically; hence, the estimates tabulated are based only on very general marked information.
[6] Partial figure.
[7] Reported U.S. imports from Brazil.
[8] Exports.
[9] This material apparently includes crude quartz used to produce quartz crystal (listed separately in this table) as well as additional unreported quantities in common quartz.
[10] Produced from a portion of the crude quartzite listed above; quantity of crude quartzite processed was not available in 1972; and 876,674 tons in 1973 (1974 not available).

## TRADE

In terms of value, exports from Brazil in 1973 were 17.9% to the United States, 10.0% to the Netherlands, and 9.0% to West Germany. Brazil's exports of iron ore, $363 million in 1973, increased 57% to $571 million in 1974. Brazilian imports originated in the United States (28.3%), West Germany (13.0%), and Japan (8.6%).

Data for mineral commodity imports in 1973 and 1974 follow:

| | Value (million dollars) | | Percent increase | |
|---|---|---|---|---|
| | 1973 | 1974 | Value | Quantity |
| Mineral fuels | 769 | 2,895 | 276 | 2 |
| Iron and steel | 493 | 1,535 | 211 | 133 |
| Fertilizers | 139 | 403 | 190 | 28 |
| Copper | 164 | 329 | 101 | 43 |
| Aluminum | 51 | 132 | 159 | 77 |
| Zinc | 41 | 76 | 85 | −18 |

Notable increases in exports from 1972 to 1973 included steel ingot, 139%; pig iron, 67%; iron ore, 47%; silver, 91%; pyrochlore, 32.0%; barite, 117%; and magnesite, 46%. Decreases included chromite, 6%; manganese ore, 33%; tungsten ore and concentrate, 22%; and industrial diamond, 36%.

Increased imports for the same period included steel ingot, 21%; aluminum, 12%; copper, 11%; lead 168%; zinc, 43%; chromite, 144%; ilmenite, 81%; cassiterite, 5%; asbestos, 11%; bentonite, 63%; industrial diamond, 28%; crude nitrogenous fertilizer, 16%; crude phosphatic fertilizer, 9%; manufactured potassic fertilizer, 15%; sodium compounds, 31%; sulfur, 22%; sulfuric acid, 952%; and crude petroleum, 39.5%. Decreases were few. Cement imports were 3.5% less, manufactured nitrogenous and phosphatic fertilizers declined 28% and 25%, respectively, and imports of coke were off 34.5%.

In September, Brazil and Canada concluded a trade agreement providing for shipment of Brazilian iron ore to Canada and Canadian coal to Brazil, using the same ships as carriers.

| Oxides, hydroxides, and peroxides of metals, n.e.s | 43 | 50 | United States 20; Argentina 10; Mexico 9. |
| Metals including alloys, all forms: | | | |
| Pyrophoric alloys kilograms | 142 | -- | |
| Waste and sweepings of precious metals do | -- | 17,250 | All to West Germany. |
| NONMETALS | | | |
| Abrasives, natural, n.e.s.: | | | |
| Emery | 8 | 4 | Mainly to Argentina. |
| Grinding and polishing wheels and stones | 167 | 203 | Colombia 55; Chile 35; Japan 29. |
| Asbestos | 200 | 102 | France 100; Japan 2. |
| Barite and witherite | 21,916 | 47,659 | Venezuela 25,818; Trinidad and Tobago 21,841. |
| Boron materials, oxide and acid | -- | 1 | All to Colombia. |
| Cement | 1,374 | 114,438 | Nigeria 86,200; Guyana 16,237; Senegal 10,000. |

See footnotes at end of table.

## Table 2.—Brazil: Exports and reexports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s.: | | | |
| Bentonite | 20 | 2 | All to Chile. |
| Kaolin | 2,511 | 2,878 | Uruguay 1,477; Argentina 800; Italy 501. |
| Other | 18 | 33 | Paraguay 32; Netherlands 1. |
| Products: | | | |
| Refractory (including nonclay bricks) | r 4,741 | 4,217 | Argentina 2,885; Poland 515; Uruguay 403. |
| Nonrefractory | r 4,778 | 9,310 | Paraguay 4,823; United States 1,008; Trinidad and Tobago 625. |
| Diamond: | | | |
| Gem, not set or strung carats | 20,440 | 11,070 | Netherlands 8,640; Spain 1,560; United States 870. |
| Industrial do | 24,790 | 15,945 | Netherlands 9,005; United States 2,745; Belgium-Luxembourg 1,470. |
| Diatomite and other infusorial earths kilograms | -- | 125 | All to Paraguay. |
| Fertilizer materials: | | | |
| Crude, phosphatic | (2) | -- | |
| Manufactured: | | | |
| Nitrogenous | 80 | 301 | Bolivia 281; Paraguay 20. |
| Phosphatic | 30 | 8,641 | Uruguay 8,301; Paraguay 310; Argentina 30. |
| Potassic | 300 | 240 | Paraguay 233; Bolivia 7. |
| Other, including mixed | 7,840 | 9,522 | Uruguay 6,837; Paraguay 1,762; Bolivia 826. |
| Ammonia | 2 | 2 | All to Paraguay. |
| Fluorspar | 26,835 | 24,936 | U.S.S.R. 11,000; United States 10,646; Australia 2,100. |
| Graphite, natural | -- | 10 | All to Argentina. |
| Lime | 28 | 20 | Bolivia 13; Paraguay 7. |
| Magnesite | r 38,285 | 55,910 | Poland 10,000; Argentina 7,780; Chile 6,300. |
| Mica: | | | |
| Crude, including splittings and waste | 2,578 | 1,738 | United States 854; Norway 500; Japan 254. |
| Worked, including agglomerated splittings | 3 | 1 | Mainly to United States. |
| Pigments, mineral, iron oxides, processed | 3 | 1 | All to Bolivia. |
| Precious and semiprecious stones, except diamond, crude and worked: | | | |
| Agate kilograms | r 1,031,654 | 1,314,530 | Japan 521,422; United States 429,950; West Germany 214,051. |
| Amethyst do | r 242,968 | 314,731 | Japan 104,324; West Germany 50,989; United States 48,856. |
| Aquamarine do | 10,828 | 3,864 | Japan 2,090; West Germany 972; United States 686. |
| Cat's eye do | r 30 | 1 | All to Hong Kong. |
| Citrine do | 30,148 | 45,351 | Japan 27,203; West Germany 7,834; Italy 5,470. |
| Emerald do | 7,398 | 11,665 | Switzerland 4,221; India 4,056; United Kingdom 1,272. |
| Garnet do | 1,069 | 7,339 | Japan 6,179; France 515; United States 515. |
| Opal do | r 476 | 701 | United States 245; Hong Kong 181; Japan 123. |
| Sapphire do | r 1 | (2) | Mainly to United States and Italy. |
| Topaz do | r 7,586 | 2,204 | West Germany 634; Japan 418; United States 312. |
| Tourmaline do | 6,888 | 3,670 | United States 1,404; Japan 813; West Germany 673. |
| Turquoise do | r 3 | -- | |
| Other do | r 445,776 | 377,801 | Japan 123,433; United States 65,648; West Germany 58,019. |
| Quartz crystal: | | | |
| Electronic and optical grade | 80 | 39 | Japan 31; United States 4; France 2. |
| Other | 3,179 | 4,329 | West Germany 1,554; Japan 694; France 642. |
| Salt | 1,406 | 26 | Paraguay 24. |

See footnotes at end of table.

## Table 2.—Brazil: Exports and reexports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Sodium and potassium compounds, n.e.s | (2) | 3,311 | All to Argentina. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked | r 11,378 | 17,324 | Italy 8,398; Japan 6,083; United States 983. |
| Worked | 1,925 | 3,325 | Japan 2,233; United States 568; Mexico 284. |
| Dolomite, chiefly refractory grade | 858 | 1,258 | Argentina 905; Colombia 350. |
| Quartz and quartzite | 146 | 201 | Belgium-Luxembourg 147; Netherlands 40; West Germany 10. |
| Sand, excluding metal bearing | 98 | 10 | Mainly to West Germany. |
| Sulfur: | | | |
| Sulfur dioxide ____ kilograms | -- | 68 | All to Ecuador. |
| Sulfuric acid, oleum | 30 | (2) | All to Paraguay. |
| Talc, steatite, soapstone, pyrophyllite | 101 | 428 | Colombia 260; United States 128. |
| Vermiculite | 332 | 30 | All to Spain. |
| Other nonmetals, n.e.s.: | | | |
| Crude | (2) | 1 | All to Paraguay. |
| Slag, dross, and similar waste, not metal bearing: | | | |
| From iron and steel manufacture | 10 | 90 | All to Argentina. |
| Slag and ash, n.e.s | 25 | -- | |
| Oxide and hydroxide of barium | -- | 32 | All to United States. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | 11 | 1 | All to Bolivia. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | (2) | 2 | Do. |
| Carbon black | r 367 | 202 | Uruguay 198; Chile 4. |
| Coke and semicoke of coal, lignite, or peat | r 8 | 18,352 | Netherlands 18,347; Bolivia 5. |
| Hydrogen and rare gases kilograms | -- | 477 | Argentina 440; United States 37. |
| Petroleum: | | | |
| Crude and partly refined thousand 42-gallon barrels | r 7,676 | 14,851 | Italy 7,491; Bahamas 3,433; Netherlands Antilles 2,076. |
| Refinery products: | | | |
| Gasoline: | | | |
| Aviation ____ do | 22 | 57 | Uruguay 35; Peru 18. |
| Motor ____ do | 101 | 95 | All to Peru. |
| Jet fuel ____ do | 43 | 75 | Peru 67; Paraguay 8. |
| Kerosine ____ do | 346 | 625 | Trinidad and Tobago 421; Uruguay 119; United States 73. |
| Distillate fuel oil ____ do | 7,320 | 12,230 | United States 6,162; Argentina 3,378; Netherlands 914. |
| Residual fuel oil ____ do | 995 | 105 | All to Argentina. |
| Lubricants (including grease) ____ do | -- | (2) | Mainly to Peru. |
| Other: | | | |
| Liquefied petroleum gas ____ do | 151 | 239 | Uruguay 101; Surinam 55; Mexico 42. |
| Naphtha ____ do | 71 | -- | |
| Mineral jelly and wax ____ do | 6 | 38 | Peru 13; United States 12; Republic of South Africa 4. |
| Pitch ____ do | 31 | 49 | All to Uruguay. |
| Not specified ____ do | 1 | (2) | Mainly to Bolivia. |
| Total ____ do | 9,087 | 13,513 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | r 788 | 40 | All to Argentina. |

r Revised.
1 Includes alumina gel.
2 Less than ½ unit.

## Table 3.—Brazil: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite and concentrate | 4,040 | 8,292 | Guyana 4,694; United States 3,588. |
| Oxide (alumina) and hydroxide | 1,705 | 1,708 | West Germany 1,143; United States 545. |
| Metal including alloys: | | | |
| Scrap | 781 | 4,987 | United States 4,035; Canada 883; Puerto Rico 35. |
| Unwrought | 44,378 | 49,839 | Canada 11,810; Norway 11,689; France 9,748. |
| Semimanufactures | r 7,793 | 12,778 | United States 6,479; France 2,241; Argentina 693. |
| Antimony: | | | |
| Ore and concentrate | 600 | 452 | Peru 175; Thailand 100; Bolivia 85. |
| Metal including alloys, all forms | 136 | 128 | Netherlands 58; United States 37; Belgium-Luxembourg 21. |
| Arsenic: | | | |
| Trioxide, pentoxide, and acids | r 732 | 723 | France 384; West Germany 188; Netherlands 85. |
| Metal including alloys, all forms | 26 | 31 | Netherlands 16; Sweden 11. |
| Beryllium metal including alloys, all forms kilograms | 104 | 51 | Italy 50; Japan 1. |
| Bismuth metal including alloys, all forms | 21 | 20 | Mexico 17. |
| Cadmium metal including alloys, all forms | 101 | 102 | Mexico 68; Peru 11; West Germany 8. |
| Chromium: | | | |
| Chromite | 4,737 | 11,554 | Philippines 9,572; Republic of South Africa 1,711; United States 221. |
| Oxide and hydroxide | 264 | 282 | West Germany 151; U.S.S.R. 89; Poland 25. |
| Metal including alloys, all forms | 16 | 29 | Japan 21; United Kingdom 6. |
| Cobalt: | | | |
| Oxide and hydroxide | 82 | 92 | Belgium-Luxembourg 69; Canada 10; United States 10. |
| Metal including alloys, all forms | 144 | 217 | Belgium-Luxembourg 178; United States 32. |
| Columbium and tantalum, tantalum metal including alloys, all forms kilograms | 28 | 61 | United States 41; Belgium-Luxembourg 16. |
| Copper: | | | |
| Copper sulfate | 3,680 | 3,751 | Peru 1,512; United Kingdom 646; Mexico 585. |
| Metal including alloys: | | | |
| Scrap | 24 | 997 | United States 768; Canada 112; Belgium-Luxembourg 82. |
| Unwrought | r 84,940 | 94,517 | Zambia 32,485; United States 20,042; Chile 10,876. |
| Semimanufactures | r 1,243 | 1,492 | United States 603; West Germany 464; United Kingdom 117. |
| Gold metal, unworked or partly worked troy ounces | 374,909 | 107,641 | United Kingdom 40,574; United States 40,060; Canada 16,558. |
| Iron and steel: | | | |
| Ore and concentrate | 4 | 305 | West Germany 250; Netherlands 50; United States 5. |
| Metal: | | | |
| Scrap | 31,873 | 21,763 | Mainly from United States. |
| Sponge iron, powder and shot | r 4,838 | 6,481 | United States 4,100; Japan 1,279; West Germany 975. |
| Ferroalloys | r 9,219 | 6,766 | Republic of South Africa 4,475; France 987; United States 869. |
| Steel, primary forms | 345,201 | 418,700 | Spain 165,370; United States 96,920; Japan 65,189. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes sections | 95,673 | 183,390 | Argentina 67,162; United States 35,351; Japan 29,329. |
| Universals, plates, sheets thousand tons | 411 | 1,004 | Japan 349; United States 245; West Germany 142. |
| Hoop and strip | 22,147 | 31,800 | West Germany 14,174; Japan 8,685; United States 2,705. |
| Rails and accessories | 84,325 | 78,005 | United States 42,170; West Germany 22,790; Japan 9,412. |

See footnotes at end of table.

## Table 3.—Brazil: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Iron and steel—Continued | | | |
| Metal—Continued | | | |
| Semimanufactures—Continued | | | |
| Wire | 21,008 | 23,623 | Argentina 13,314; West Germany 2,678; Japan 2,505. |
| Tubes, pipes, fittings | 44,185 | 49,301 | United States 14,860; Sweden 6,633; West Germany 4,975. |
| Castings and forgings, rough | 1,770 | 792 | United Kingdom 237; Belgium-Luxembourg 207; Italy 155. |
| Ingots, high-carbon and alloy steel | 10 | 48 | United States 22; United Kingdom 20. |
| Lead: | | | |
| Oxides | 541 | 1,651 | Mexico 1,441; West Germany 123; United States 43. |
| Metal including alloys, all forms | r 8,471 | 22,726 | United States 12,255; Mexico 8,508; Peru 907. |
| Magnesium metal including alloys, all forms | r 7,571 | 9,552 | United States 4,270; Norway 4,055. |
| Manganese: | | | |
| Ore and concentrate | 4,437 | 9,289 | Gabon 8,668; Belgium-Luxembourg 512; United States 80. |
| Oxides | 832 | 1,165 | Japan 934; United States 223. |
| Metal | 448 | 245 | Japan 201; United States 14. |
| Mercury 76-pound flasks | r 3,334 | 3,741 | Mexico 3,515; Peru 200. |
| Molybdenum: | | | |
| Ore and concentrate | 461 | 1,069 | United States 656; Canada 293; Spain 120. |
| Metal including alloys, all forms | 16 | 22 | United States 9; Netherlands 6; West Germany 2. |
| Nickel: | | | |
| Matte, speiss, and similar materials | (1) | (1) | All from West Germany. |
| Metal including alloys: | | | |
| Scrap | 8 | -- | |
| Unwrought | r 1,935 | 1,642 | United States 949; Netherlands 234; West Germany 122. |
| Semimanufactures | r 632 | 863 | France 268; United States 259; West Germany 77. |
| Platinum-group metals including alloys, all forms: | | | |
| Platinum troy ounces | 3,215 | 8,198 | United States 5,851; West Germany 997; France 611. |
| Other, including alloys thousand troy ounces | 1,989 | 52 | United States 39; West Germany 9; Netherlands 2. |
| Rare-earth metals kilograms | 2,754 | 4,614 | Mainly from United States. |
| Selenium, elemental | 12 | 20 | Peru 8; Canada 7; United States 3. |
| Silicon metal | r 2,382 | 2,231 | Norway 1,735; France 386; Italy 63. |
| Silver metal including alloys thousand troy ounces | 2,704 | 3,964 | West Germany 1,617; United States 1,020; Peru 488. |
| Sodium metal | 14 | 13 | Mainly from West Germany. |
| Tellurium, elemental | 344 | 630 | Canada 600. |
| Tin: | | | |
| Ore and concentrate long tons | r 3,022 | 3,163 | Bolivia 1,418; Singapore 1,158; Peru 205. |
| Oxides do | r 106 | 92 | United Kingdom 47; West Germany 43. |
| Metal including alloys, all forms do | r 14 | 11 | United States 9. |
| Titanium: | | | |
| Ore and concentrate: | | | |
| Ilmenite | 20,829 | 37,765 | All from Australia. |
| Rutile | 2,654 | 2,310 | Australia 1,678; Netherlands 408; Austria 169. |
| Oxides | r 3,051 | 2,173 | West Germany 679; France 480; Belgium-Luxembourg 127. |
| Metal including alloys, all forms | r 56 | 31 | United States 24; West Germany 2. |
| Tungsten metal including alloys, all forms | 15 | 25 | United States 12; Netherlands 4; West Germany 3. |
| Uranium and thorium: | | | |
| Oxides including rare-earth oxides | 55 | 94 | United States 60; Portugal 24; France 2. |
| Metals including alloys, all forms kilograms | 1 | (1) | All from United States. |

See footnotes at end of table.

## Table 3.—Brazil: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Vanadium: | | | |
| Oxides | 128 | 281 | Republic of South Africa 181; France 73; West Germany 19. |

r Revised.

1 Less than ½ unit.

2 Partial figure; quantity reported valued at $420,609 in 1972 and $651,654 in 1973. Total imports include unspecified quantities valued at $52,020 in 1972 and $5,362 in 1973.

3 Partial figure; quantity reported valued at $321,720 in 1972 and $507,763 in 1973. Total imports include unspecified quantities valued at $46,823 in 1972 and $52,483 in 1973.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Early in 1974 a $50 million program was announced for the purpose of increasing the capacity of the refinery and smelter of Companhia Mineira de Alumínio (ALCOMINAS) at Poços de Caldas, Minas Gerais. The company, jointly owned by Aluminum Co. of America, M. A. Hanna Mining Co., and Brazilian interests, will enlarge its facilities to produce 140,000 tons of alumina and 64,000 tons of metal annually.

Companhia Brasileira de Alumínio (CBA) also won state financing to expand production at its plant near São Paulo. The 75% expansion will increase company production to 406,000 tons of bauxite, 156,500 tons of alumina, and 70,000 tons of aluminum annually by 1976.

Plans for the exploitation of the Oriximina bauxite deposit in the Trombetas area were being developed by Mineração Rio do Norte S.A., a company organized by CVRD, Alcan Aluminium Ltd., and eight other companies. A mine, an alumina plant, a smelter, and a hydroelectric power installation were to be included. Completion was anticipated by 1980, at which time the annual production levels were expected to be 5.2 million tons of bauxite, 2 million tons of alumina, and 700,000 tons of primary metal.

Late in 1974, a separate company, Alumínio do Brasil S.A. (ALBRAS), was organized to plan and build the smelter and powerplant. The smelter, of 640,000 tons capacity, was to be built at Vila do Conde, near Belém. The powerplant, which will provide 3 million kilowatts, was to be built at Tucuruí on the Tocantins River; the smelter will require 1.2 million kilowatts at full capacity.

Kaiser Aluminum & Chemical Corporation sold its Brazilian subsidiary, Kaiser Alumínio do Brasil, jointly to Mitsui Mining & Smelting Co. and Surukawa Electric Co.

Alcan Alumínio do Brasil S.A. began building a second cold-rolling unit for aluminum sheet at its fabricating plant at Utinga, Bahia. When the new unit is in production, about mid-1976, it will double the plant's production of sheet, now 25,000 tons per year.

**Columbium.**—Brasimet Comercio e Industria, S.A., a subsidiary of South American Consolidated Enterprises of the Hochschild group, began development of the Catalão pyrochlore deposit, including construction of a 1,000-ton-per-day mill.

Companhia Brasileira de Metalurgia e Mineração announced plans to expand its production of pyrochlore concentrate from 21,500 tons per year to 30,000. The new capacity will come onstream at the end of 1976.

**Copper.**—Caraíba Metais S.A., invited the cooperation of Corporacíon del Cobre (CODELCO) of Chile in a joint venture to develop and operate the Caraíba deposit in Bahia.

Companhia Pesquisas de Recursos Minerais (CPRM), a government corporation, announced plans to leach copper ore in Rio Grande do Sul.

**Iron Ore.**—Final figures showed a 29% increase in production over that of 1973. Total shipments recorded reached 70.3 million tons, but this figure does not include production for Companhia Siderúrgica Nacional (CSN) at the Casa da Pedra and other mines. Exports were estimated at 57.4 million tons, a 32% increase.

CVRD continued to construct increased production capacity of various types. Open pit mine production was being expanded, with consequent addition of crushing, grinding, sizing, and magnetic concentration units. The 525-mile narrow-gage railroad from Itabira to Tubarão was being double-tracked; eventual capacity of 100 million tons per year is planned. Trains consisted of 160 cars of 72-ton capacity, but longer trains will be moved in the future. At Tubarão, facilities for car dumping, sizing, stockpiling, and ship loading were being added.

CVRD drew ore from three mines during the year: Caue, Conceicão, and Picarrão. Reserves at Caue were estimated at 450 million tons of 67% iron and an additional 650 million tons of 50% iron. Reserves at Conceicão were 600 million tons of high-grade ore and 800 million tons of milling-grade ore.

Amazonia Mineração S.A. (AMZA), owned 51% by CVRD and 49% by United States Steel Corp., continued development and equipping of the iron deposit of the Serra dos Carajás, in Pará, 250 miles southwest of Belém. A 600-mile railroad from

the mine to Ponta de Madeira, Maranhão, will be built to bring the ores to tidewater. First production is expected in 1978, and a maximum annual output of 50 million tons is expected by 1983.

CVRD and Companhia Aços Especiais Itabira (ACESITA) have formed a new company, Cia. Itavale, to mine iron ore from the Itabira area at Periquito, Onça, and Esmeril. Feasibility studies were underway. A production scale of 20 million to 25 million tons annually is planned.

Minerações Brasileiras Reunidas S.A. (MBR), owned 51% by Empreendimentos Brasileiros de Mineração, S.A., and 49% by St. John d'El Rey Mining Co. Ltd., a subsidiary of the M.A. Hanna Mining Co., shipped an estimated 8 million tons of ore from the Aguas Claras mine to its loading facilities at Sepetiba Bay. From this port most of the ore was shipped to Japan.

CSN, Brazil's government-owned steel producer, has contracted with Kaiser Engineers for the expansion of its Casa da Pedra iron mine, near Belo Horizonte, to 7 million tons annually. Completion is scheduled for mid-1976.

**Iron and Steel.**—Brazilian production of pig iron, steel ingot, and rolled steel products continued to increase during the year, by 5.7%, 5.0%, and 1.5%, respectively. A 10% increase had been programed; the shortfall was due to shortages of coking coal, most of which must be imported. The rate of delivery of coal by U.S. exporters in fulfillment of contracts was about 45% at yearend. Ingot production declined 11% at both CSN and Usinas Siderúrgicas de Minas Gerais, S.A. (USIMINAS), while production by Companhia Siderúrgica Paulista (COSIPA) was 23% greater than in 1973. Output of flat-rolled products, principally from these three mills, declined 7.3%, while output of nonflat shapes, mostly by the private sector, gained 9.7%.

Demand for steel in Brazil rose abruptly to a reported 12.2 million tons, thus increasing imports of steel from 2.6 million tons in 1973 to 4.7 million tons in 1974.

Siderúrgica Brasileira, S.A. (SIDERBRAS), the Government corporation which has the controlling share in CSN, COSIPA, and USIMINAS, at yearend was preparing to enter into capital participation in the private sector on a minority basis. SIDERBRAS was also authorized to negotiate for foreign coal supplies for Brazil's steel mills.

Kawasaki Steel Corporation and four other Japanese companies acquired a 99% interest in Minas do Serra Geral, S.A., which owns mines at Capanema, Minas Gerais. Studies were begun on the feasibility of annual production of 6 million tons beginning in 1977. The ore is intended for domestic consumption.

An estimated reserve of 400 million tons of high-grade ore was indicated at a deposit near the Xingu River in Pará, north of the Carajás area. The Antunes group was seeking a concession to develop the ore.

CVRD contracted to build a pelletizing plant of 4 million tons annual capacity in Brazil, at a cost of $120 million, $84 million of which is to be from an Egyptian source. The contract also provides for CVRD, along with Japanese and West German interests, to invest $4 million in a 1.6 million-ton-per-year direct-reduction iron plant near Alexandria, Egypt. The Egyptian General Organization for Industry will receive 3.6 million tons of pellets for use as feed to the sponge iron plant.

A newly formed company, Cia. Nippo-Brasileira de Peletização, owned 51% by CVRD and 49% by Nippon Steel Corporation and five other Japanese companies, will build two pellet plants, of 3 million tons total annual capacity, at Tubarão; the product is intended for export to Japan. MBR also was reportedly considering pellet plant construction, in this case near its loading docks at Sepetiba Bay.

Conselho Consultivo da Indústria Nacional de Siderúgica (CONSIDER), was constituted supervisor of a type of enterprise of recent appearance in Brazil—corporations with an international equity mix strongly oriented toward export trade. CONSIDER's authority to approve government financial assistance to steel projects remained unchanged. Expansion projects approved during the year included—

1. Increase in ingot capacity at CSN, COSIPA, and USIMINAS to 4.6 million, 3.5 million, and 3.5 million tons per year, respectively.

2. Expansion of capacity at ACESITA to an annual production of 614,000 tons of special steels.

3. Increases of various types of capacity at Cia. Ferro e Aço de Vitória, Companhia Siderúrgica Mannesmann, and Siderúrgica Fi-El Korff S.A.

4. Construction of a new 3-million-ton-per-year steel works on tidewater at Tubarão, Espírito Santo.

The Tubarão plant will be the first new Brazilian steel mill; the plant will have annual capacity of 3 million ingot tons by 1977, and it may expand to twice that figure by 1980. SIDERBRAS will provide 51% of the capital, while Kawasaki Steel and Finsider International, S.A., will share the remainder equally. The first stage of construction will include a blast furnace, two basic oxygen furnaces, and a slab mill.

In planning for a steel complex to be built at Itaqui, Maranhão, the present partners, SIDERBRAS and Nippon Steel, were seeking additional foreign participants and a reliable supply of coking coal. The Itaqui plant will depend on iron ore from Carajás; some degree of coordination is implicit.

The International Finance Corp. announced a loan of $60 million and a $4.5 million equity subscription to Companhia Siderúrgica da Guanabara (COSIGUA), to enable that company to increase its production, mainly of reinforcing bars and wire rod, to 480,000 tons by 1976. COSIGUA is scrap based, but the loan will be used in part to build a direct-reduction facility to reduce the company's dependence on increasingly scarce and expensive scrap.

The Export-Import Bank and the First National City Bank of New York have each authorized a loan of $1.06 million to ACESITA to finance purchase of a Sendzimir cold-rolling mill.

Late in 1974, the direct-reduction plant of Usina Siderúrgica da Bahia (USIBA) was inaugurated. USIBA and Aços Finos de Piratini, also a direct-reduction facility, produced 143,000 tons of sponge iron in 1974 and are expected to make 350,000 tons in 1975.

In March the Brazilian Government requested an increase in scrap export allocations from the United States.

The Association of Brazilian Ferroalloy Producers described the supply situation as "near self-sufficiency" and considered exports possible in the near future. Seventeen companies operating 40 furnaces reported a total annual capacity of 243,000 tons. Industry leaders are ALBRAS and Eletrosiderúrgica Brasileira, S.A., each accounting for 18% of the total capacity. Demand for 1974 was estimated at 182,500 tons.

**Nickel.**—For several years Baminco Mineração e Siderúrgia S.A., a company controlled by Metallgesellschaft AG and Exploration und Bergbau, GmbH, has conducted geological and metallurgical investigations into the lateritic nickel deposits at Barro Alto, Goiás. In 1974, International Nickel Co. of Canada Ltd. (INCO) entered into a participatory agreement with Baminco. The feasibility studies will be continued and expanded; a bulk sample will be shipped to INCO's pilot plant at Port Colborne, Ontario.

**Tin.**—Mineração Brumadinho Ltda., reported that mining began in January at the São Lourenço mine, which produced 50 tons of cassiterite monthly for the rest of the year. Production from the Alto Candeias property was expected early in 1975, as was the startup of the Cachoerinha mine. The Oriente Novo mine produced 1,500 tons of concentrate during the year.

Exploration has revealed large tin reserves in central Goiás. Production at the Serra Branco mine in Goiás was interrupted by heavy rains and flooding.

**Titanium.**—A large body of ilmenite was discovered near Aripuanã, in northwestern Mato Grosso. While the ore appears to be of good grade, lack of transportation makes early exploitation doubtful.

CVRD reported that feasibility studies and further geological investigations into the Tapira anatase deposit were proceeding. If warranted by the results of the studies, a pilot plant will be installed.

**Uranium.**—The Comissão Nacional de Energia Nuclear (CNEN) reported on Brazil's uranium reserves. The Poços de Caldas area, Minas Gerais, contains 3,940 tons of measured and 5,100 tons of probable uranium oxide ($U_3O_8$). The Figueira deposits in Paraná have 2,000 tons of $U_3O_8$ in ore of a 0.15% grade, and 4,000 tons more in ore of 0.04% grade. In addition, lower grade resources associated with carbonatites at Araxá, Minas Gerais, and the phosphate rock at Olinda, Pernambuco, contain 170,000 tons of the oxide.

## NONMETALS

**Cement.**—Production in 1974 was 11.4% greater than in 1973, exceeding the planned goals. Nevertheless, demand was significantly greater than production. Officials responsible for highway construction and other civil works reported acute local

shortages. One large producer shut down to correct unexpected technical difficulties.

Companhia de Cimento Portland Alvorada obtained a government loan to expand production at its Cimento Paraíso works, Rio de Janeiro.

**Fertilizer Materials.**—Demand for fertilizers in Brazil, which has been escalating sharply in recent years, was slightly less than 2 million tons in 1973. About 71% of the 1973 demand was met with imports. A world shortage and consequent high prices in 1974 caused an increased drain on Brazil's foreign exchange. In November public and private agencies announced planned expenditures of $1.35 billion over a 5-year period to make Brazil self-sufficient in all three fertilizer materials.

Nitrogenous fertilizers began to be produced in Brazil in 1970. Three plants produced 350 to 400 tons of these materials per day during 1974. Two of the plants, at Cubatão, São Paulo, and Camacari, Bahia, were subsidiaries of Petróleo Brasileiro S.A. (PETROBRAS). The third producer, with a plant at Cubatão, was Ultra Fertil, S.A., a subsidiary of Phillips Petroleum Corp. until midyear, when Phillips sold its 79% share to PETROQUISA.

In November the Government announced plans to invest substantially in construction of a plant to make ammonia and urea in Sérgipe, where natural gas production was not being fully used. The plant, jointly funded by PETROQUISA and Mitsui & Co., Ltd., will duplicate facilities now operating at Camaçari, Bahia, where 200 tons of ammonia and 250 tons of urea are made each day. Feedstock will come from the adjacent Mataripe oil refinery. The joint venture, Amonio Fosfatos de Nordeste, S.A., will produce and market ammonium phosphate fertilizers.

Phosphate rock was mined at Olinda, Pernambuco, until 1968 when transportation costs became excessive. Brazil's phosphate in 1974 came from an apatite deposit at Jacupiranga, São Paulo, and was mined by Serrana de Mineração S.A. Araxá S.A. Fertilizantes and Agrofertil S.A. Ind. e Com. de Fertilizantes were formed recently to produce phosphates at Araxá, Minas Gerais, and Maceío, Alagoas, but production is still a year or two in the future. Nearing production is the phosphoric acid plant of Companhia Riograndense de Adubos; construction began in 1973 in the State of Rio Grande do Sul. Beker Industries, Inc., announced its intention to build a fertilizer plant and a phosphoric acid plant in Brazil, using raw materials from the United States; the plants were to be onstream by 1977. The Monsanto Co. expected to have a similar installation in operation at São Jose dos Campos, São Paulo, early in 1976; source of the raw material was not specified.

In November, Comminerium Mineração S.A., and PETROBRAS, through its subsidiary PETROQUISA, became equal and sole stockholders in Kalium Mineração, S.A., a company which was awarded the contract to develop the potassium salt deposit at Carmópolis, Sergipe. The salt beds, discovered in 1965 in the course of drilling an oil well, were extensive, but presented the problem of mining the salt without adversely affecting production of oil and gas from adjacent areas.

A joint company was formed by representatives of Brazil, Iran, and Senegal to develop phosphate deposits in Senegal. Production is scheduled for late 1976; the product will be exported to Brazil at the rate of 2 million tons per year.

**Fluorine.**—Companhia Nitro Quimíca Brasileira placed contracts for construction of facilities to produce 8,500 tons of hydrofluoric acid, 6,000 tons of aluminum fluoride, and 6,000 tons of cryolite annually. The complex, at São Miguel, São Paulo, was to be completed by the end of 1975.

**Quartz.**—On August 29, a communication from Carteira de Comercio Exterior do Banco do Brasil (CACEX) temporarily prohibited the export of quartz, effective September 15. The order included both quartz crystal and lasca. The step was apparently taken because of irregularities in exporting procedures, and the National Council of Foreign Trade was studying the situation. Trade was resumed on September 26, but CACEX imposed the regulation that lasca in pieces of 200 grams or less may not be exported at less than $3.50 per pound, regardless of grade, and limited exports to 600 tons for the last quarter of 1974.

Both points upset the market; the floor price was much greater than the previous U.S. price of lasca, which averaged 20 to 30 cents per pound, and the export quota at 200 tons per month was less than former imports by the U.S. alone—263 tons per

month in 1972. CACEX also established floor prices for quartz crystal, although no quota was set. These actions were officially explained on the basis of Brazil's wish to foster domestic processing of quartz, both natural and fused. In further support of this intention on October 11 the Bank of Brazil began collecting a 10% ad valorem export tax on lasca; the proceeds were earmarked for a fund for industrial and technological development of quartz.

In November CACEX published a tabulation showing minimum export price levels for the three piezoelectric grades of lasca, by weight of fragment. Minimum price levels for export of jewelry grade were set at $7 to $20 per kilogram, depending on weight.

A company, Xtal, Ltda., was formed to process quartz for electronic use. Joint venture funding was being sought outside Brazil.

During 1975, exports of lasca were to be limited to 3,500 tons at floor prices of $1.60, $3.50, and $6 per kilogram, respectively, for the three grades.

**Sodium and Sodium Compounds.**—Carbocloro S.A. Industrias Quimícas, a subsidiary of Diamond Shamrock Co., was again the largest producer in Brazil; annual output since 1971 has been about 110,000 tons of caustic soda and 96,000 tons of chlorine. Early in the year The Dow Chemical Co. announced plans, approved by the Brazilian Government, to build a 150,000-ton-per-year chlor-alkali complex at Aratu, on the Bahia coast. The Ministry of Industry and Commerce authorized private companies to import soda ash, a right previously assigned solely to Companhia Nacional de Alcalis (CNA). CNA announced an expansion of its plant at Cabo Frio, Rio de Janeiro, and a new soda ash plant will be built at Macau, Rio Grande do Norte.

**Stone.**—CSN contracted with Kaiser Engineers for development of the Arcos limestone deposit in Minas Gerais. The mine is to produce 2.6 million tons annually, to be used in CSN's iron and steel plants at Volta Redonda, beginning in mid-1975.

## MINERAL FUELS

**Carbon Black.**—About midyear Phillips Petroleum sold its major Brazilian interests, but retained a 50% holding in Cia. de Carbonos Coloidais. This company's plant produced over 40,000 tons 1974, and was expanding its facilities to make 75,000 tons by 1976.

Financing has been obtained for the formation of Capuava Carbonos Industrias, Ltda., a joint venture of União de Industrias Petroquímicas S.A., and Cabot Corp. The new company will build an $11 million carbon black facility at Capuava.

**Coal.**—Discussion between the Brazilian and Colombian Governments, begun in 1973, continued in 1974. The tentative agreement provides for formation of a joint company to develop Colombian coal resources, export of the coal to Brazil, and export of Brazilian steel to Colombia in payment for the coal.

In March, heavy rains and flooding caused 9 of the 11 coal mines in Santa Catarina to suspend production.

Brazilian steelmakers became increasingly concerned during the year at the declining rate of delivery of U.S. coking coal to Brazil. A 30% shortfall by mid-August, in addition to reduced shipments of domestic coal because of floods, reduced steel companies'' inventories to a precariously low level. Later figures covering the period January to November showed 1,799,500 tons contracted, 798,360 tons received, and 45% delivery, for CSN, USIMINAS, and COSIPA; contracts and receipts by smaller steel companies may alter these totals.

The U.S. coal companies declared force majeure on the basis of labor troubles and material shortages. Higher priced spot sales increased during the year, but most were attributed to entry of small and marginal mines into the market. Worldwide demand for coal, and pricing thereof, increased as a result of the Arab oil embargo. No solution to the problem had been advanced by by yearend.

**Natural Gas.**—Despite some local Bolivian opposition, the agreement between Bolivia and Brazil for the export of Bolivian natural gas to Brazil was concluded in May. The agreement provided that (1) Bolivia will sell a minimum of 240 million cubic feet of gas to Brazil, (2) Brazil will provide financial and technical help to set up a steel plant at Puerto Suarez, a 1,000-ton-per-day nitrogenous fertilizer plant, and a 1,000-ton-per-day cement plant, and (3)

Brazil will buy 105,000 tons of sponge iron and 100,000 tons of bar and rod annually from the steel plant beginning in 1978. Brazil will double this rate of purchase in 1981, will buy 100,000 to 200,000 tons of urea per year, and will buy up to half the production of the cement plant.

Natural gas production, at 1.5 billion cubic meters, was 26% greater than in 1973. Reserves were estimated at 26.261 billion cubic meters as of December 31, an increase of 1.5% during the year.

**Petroleum.**—Production of crude petroleum was 4.2% greater than in 1973. Of the daily average production of 177,500 barrels, 9.5% originated in offshore wells. Bahia contributed 72% of total production, and Sergipe another 15%. Imports of petroleum and petroleum products cost Brazil $3.4 billion during the year, offset by only $0.3 billion in exports. Apparent consumption was 8% greater than in 1973, reaching 827,000 barrels per day. Reserves were estimated at 779 million barrels at yearend.

Exploration data for 1974 are summarized as follows:

| | Land | Offshore | Total |
|---|---|---|---|
| Drill rigs | 22 | 17 | 39 |
| Drill-months | 212.8 | 160.2 | 373.0 |
| Holes drilled | 132 | 52 | 184 |
| Length of holes drilled thousand meters | 197 | 168 | 365 |

New fields discovered in 1973 were Robalo and Camorim, off the shore of Sergipe, and Ubarana, off the shore of Rio Grande do Norte. A second hole drilled in 1974 in the Robalo Field penetrated two petroleum and four natural gas horizons, all between 2,100 and 2,300 meters. In 1974, discoveries were made at the Mero Field, off the coast of Alagoas; at the mouth of the Vasa-Barris River in Sergipe; and in the Garoupa and Pargo Fields off the coast of Rio de Janeiro. The Mero well is expected to produce 12,000 barrels of petroleum and 400,000 cubic meters of natural gas daily when it comes into production in 1976.

During the year, seismographic, aeromagnetic, and in some cases photogeologic surveys were conducted in Acre, central Amazonas, Rio Grande do Norte, Sergipe, Alagoas, southern Bahia, Espírito Santo, Paraná, and the Reconcavo Basin, and along the entire Continental Shelf.

Refinery throughput came to 785,800 barrels per day, 8% more than in 1973. The Paulínia plant completed its new distillation unit of 125,800 barrels per day capacity, which was in production during the last quarter. The Mataripe plant increased its production capacity for asphalt, and continued work toward expanding its production of lubricating oils. Construction of the two new refineries, Araúcaria (125,800 barrels per day) and São José de Campos (188,700 barrels per day), continued throughout the year. PETROBRAS announced plans to build a large marine oil terminal at Ilha Grande, Rio de Janeiro.

PETROBRAS and the U.S.S.R. signed a contract for 3.7 million barrels to be supplied to Brazil during the last 5 months of 1974. The oil will be carried in PETROBRAS tankers.

Brazil signed a 30-year contract with Libya for oil exploration over a 20,000-square-kilometer area south of Tripoli. Brazil expects to spend $35 million during the first 5 years.

The prototype plant continued its 3-year (1973–75) program to determine the economics of oil production from schists by the PETROSIX process. The plant, at Irati, Paraná, was producing 1,000 barrels daily at a cost of $6 to $7 per barrel. Commercial production is expected by 1979. Crude oil reserves in the Irati schist were estimated at 800 billion barrels. Geologic mapping of the Irati formation and reconnaissance of schists and shales in the northern and northwestern States continued.

# The Mineral Industry of Bulgaria

By Nikita Wells [1]

Performance of the Bulgarian economy, in the fourth year of its sixth 5-year plan (1971–75) was varied, and unlike previous years, the rates of growth in major economic sectors slowed. According to Bulgarian sources, industrial production and national income increased 8.5% and 7.5%, respectively, well below the initially planned figures of 11% and 10%. Capital investments dropped from 4.3 billion leva [2] in 1973 to 3.9 billion leva in 1974, much below the 1974 planned figure of 4.5 billion leva. Instead of the planned 34%, only 27.5% of the 3.9 billion leva went toward reconstruction and modernization.

Labor productivity for industry was reported to have increased 6% in 1974, accounting for almost three-fourths of the 8.5% increase in industrial production. The greatest achievements were reported in the chemical industry which registered an increase of 14.5%, and in the machine-building and metal processing industry which increased by 13.6%. The corresponding planned targets, however, were 27% and 21%, respectively.

Production of electric energy increased 3.9%, the increase being somewhat disappointing considering the effort applied to expansion of power production capacities. The production of the mineral fuels (coal, crude oil, and natural gas) fell considerably below the 1973 levels. Output of crude steel, iron ore, and pig iron fell slightly below that of 1973. The production of construction materials increased by 9%.

Bulgaria's chief industrial problems were labor shortages and low labor productivity, obsolete plants and equipment, unused production capacity, uneconomic transportation, and poor management. The mining industry in Bulgaria in general is characterized by low-grade ores and lower rank lignitic coals.

On the positive side, however, 1974 marked several cornerstones in Bulgarian economic development. In July, Bulgaria's first nuclear powerplant at Kozloduy began operation. In the same month construction of the Bulgarian section of the natural gas pipeline from the U.S.S.R. was completed and the first Soviet natural gas deliveries began. In June, a Bulgarian-Soviet Union agreement was signed denoting Bulgaria's participation in the construction of the Orenburg gas pipeline for which Bulgaria will receive yearly deliveries of natural gas. A new cold-rolling mill came into operation at the Kremikovtsi metallurgical complex during 1974. An agreement was also signed with the Soviet Union for Bulgarian participation in the construction of one of the largest steel mills in the U.S.S.R.

In the nonmetallic industry, the compound fertilizer complex at Devnya began operating during 1974 and thus increased the production of phosphatic fertilizers markedly. An agreement was also signed during the year with the U.S.S.R. for Bulgaria's participation in the construction of a phosphatic fertilizer plant in the U.S.S.R.

Bulgaria will continue its policy of integration with the U.S.S.R. and the other COMECON [3] countries which have claimed

---

[2] Because of fluctuating exchange rates, a meaningful conversion to U.S. currency is impractical. Therefore, expenditures are reported in leva and are not converted. Exchange rate June 1975: 1 leva = US$1.03 = 0.71 rubles (U.S.S.R.).

[3] COMECON (CMEA) Council of Mutual Economic Assistance comprising the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

70% of Bulgaria's foreign trade in 1974. Trade with the West will probably increase as Bulgaria looks for new equipment and assistance not available within the COMECON community.

## PRODUCTION

The iron and steel industry continued to experience serious problems in 1974 as evidenced by decreases of 2.6% in crude steel production, 3.2% in iron ore, and 5.1% in pig iron from that of 1973. No major developments were reported in the nonferrous metal sector. Copper mine output increased 7.5% and lead production increased by 4.8% over that of 1973.

In the nonmetallic industry the only sizable increase in production during 1974 appeared in phosphatic fertilizers (39% over that of 1973). This was due to the start of operations of the compound fertilizer complex at Devnya. Small increases were also seen in the production of asbestos, cement, kaolin, lime, and nitrogen fertilizers.

Production of mineral fuels showed disappointing results and continued a downward trend. For 1974, as compared with 1973, the production of coal decreased by 9%, crude oil by 24%, and natural gas by 19%.

Output of electricity in 1974 reached 22.8 billion kilowatt-hours, a 3.9% increase over that of 1973. This increase is relatively small since Bulgaria has been trying to expand its electric power production capacities and probably will not be able to meet the target of 30 billion kilowatt-hours by yearend 1975.[4]

| Total | do | 58,664 | 66,601 | 70,506 |

[e] Estimate. [p] Preliminary. [r] Revised.
[1] In addition to the commodities listed, bismuth, chromite, gold, silver, barite, fluorspar, magnesite, palladium, platinum, tellurium and uranium are also produced, but information is inadequate to make reliable estimates of output levels.

## TRADE

The value of Bulgaria's foreign trade turnover for 1974 was 7,917 million leva, showing a 24% improvement over 1973. Exports were reported to reach 3,721 million leva and imports 4,196 million leva. Trade with centrally planned economy countries amounted to 72.9% of total trade while trade with developed countries was 17.4% and with developing countries 9.7%.[5]

The volume of trade between Bulgaria and the U.S.S.R. in 1974 exceeded 3,948 million leva, showing a 10% increase over that of 3,948 million leva, showing a 10% increase over that of 1973 and accounting for approximately 50% of Bulgaria's foreign trade. In 1974, Bulgaria remained U.S.S.R.'s fourth most important trading partner.

In 1974, Bulgaria imported 6,205,000 tons of anthracite and bituminous coal of which 2,044,000 tons of anthracite and 3,741,000 tons of bituminous coal came from the U.S.S.R. Imported coke was 357,000 tons (294,000 tons from the U.S.S.R.) Almost all of the crude oil imported came from the U.S.S.R. and totaled 10,855,000 tons. The newly finished gas pipeline from the U.S.S.R. provided 307 million cubic meters of natural gas. Imports of iron ore totaled 2,396,000 tons (1,962,000 tons from the U.S.S.R.) and pig iron imports were 340,000 tons (318,000 tons from the U.S.S.R.). In addition, 34,300 tons ($P_2O_5$ content) of phosphatic fertilizers and 44,000 tons ($K_2O$ content) of potassium fertilizers were imported. Electric energy was imported from the Soviet Union and amounted to 3,645 million kilowatt-hours. Imports of nonferrous metals from the U.S.S.R. included 22,639 tons of aluminum and 16,243 tons of other nonspecified rolled nonferrous metals.

Bulgaria's exports of minerals and fuels in 1974 were very minimal and, in fact, showed a decrease from that of 1973 in most commodities except nitrogen fertilizers (69,200 tons, nitrogen content) and cement (143,000 tons). Other exports were 31,400 tons of sulfuric acid, 72,400 tons of bituminous coal, 5,800 tons of manganese ore, 290 tons of lead, and 4.1 million kilowatt-hours of electric energy.

Agreements have been signed between Bulgaria and the U.S.S.R. on cooperation in production of equipment for nuclear powerstations and in machine-building. Bulgaria is to supply machinery and equip-

[5] Statisticheskiy Yezhegodnik stran-chlenov Soveta Ekonomicheskoy Vzaimopomoshchi, 1975 (Statistical Yearbook of the COMECON countries, 1975). Moscow, 1975, p. 325.

ment worth 120 million leva for production plants in the U.S.S.R. and is to undertake certain kinds of construction on metallurgical projects.[6] In exchange, Bulgaria is to receive 1.12 million tons of iron ore concentrate and 9,000 tons of ferroalloys annually during the 1979–90 period.[7]

## Table 3.—Bulgaria: Imports of selected mineral commodities [1]—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Manganese: | | | |
| Ore and concentrate thousand tons | 103 | 108 | All from U.S.S.R. |
| Oxide | 220 | 120 | All from Japan. |
| Mercury 76-pound flasks | -- | 609 | All from Yugoslavia. |
| Nickel including alloys, all forms | 249 | 359 | West Germany 256; United Kingdom 103. |
| Platinum-group metals value, thousands | r $124 | $270 | All from Switzerland. |
| Tin: | | | |
| Oxides long tons | 23 | 16 | All from West Germany. |
| Metal including alloys, all forms do | 382 | 477 | All from United Kingdom. |
| Titanium oxides | 1,280 | 1,366 | Italy 1,221; West Germany 145. |
| Tungsten: | | | |
| Ore and concentrate | 20 | NA | |
| Metal | -- | 6 | All from United Kingdom. |
| Zinc ore and concentrate | 42,356 | 45,624 | All from Yugoslavia. |
| Other metal including alloys: | | | |
| Metalloids | r 1,086 | 531 | Do. |
| Scrap | 139 | NA | |
| Unwrought and semimanufactures | r 2,750 | 3,224 | All from U.S.S.R. |
| NONMETALS | | | |
| Abrasives: | | | |
| Dust of semiprecious stones value, thousands | $110 | $138 | All from Belgium-Luxembourg. |
| Grinding and polishing wheels and stones | 111 | 200 | Austria 81; United Kingdom 55; Italy 29. |
| Asbestos | 19,700 | 30,592 | All from U.S.S.R. |
| Cement [2] thousand tons | 166 | 143 | U.S.S.R. 139. |
| Clays and clay products: | | | |
| Crude | 729 | 1,325 | All from United Kingdom. |
| Products, refractory and nonrefractory | 26,849 | 43,826 | U.S.S.R. 36,384; Italy 4,195; Yugoslavia 3,247 |
| Diamond, industrial value, thousands | $175 | $301 | All from Belgium-Luxembourg. |
| Feldspar and fluorspar | r 468 | 632 | All from West Germany. |
| Fertilizer materials: [4] | | | |
| Crude: | | | |
| Phosphatic (apatite concentrates) | r 395,600 | 428,900 | All from U.S.S.R. |
| Potassic (salts) | 130,900 | 75,800 | Do. |
| Manufactured: | | | |
| Phosphatic | r 226,061 | 344,789 | U.S.S.R. 182,100; Yugoslavia 80,481; Spain 71,208. |
| Mixed | 9,304 | 18,319 | All from Yugoslavia. |
| Pigments, mineral, iron oxide | 319 | NA | |
| Salt thousand tons | 124 | 164 | All from Romania. |
| Sodium and potassium compounds: | | | |
| Caustic soda | 374 | 560 | All from Italy. |
| Caustic potash | 165 | NA | |
| Sodium sulfate | 10,693 | 18,266 | All from East Germany. |
| Sulfur | 6,029 | 7,649 | U.S.S.R. 6,618; Greece 992. |
| Other: | | | |
| Crude nonmetals | 396 | 177 | NA. |
| Oxides and hydroxides of barium, strontium, and magnesium | 132 | 91 | All from France. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Carbon black [2] | 14,780 | 16,964 | U.S.S.R. 15,336. |
| Coal, all grades thousand tons | 5,699 | 5,762 | U.S.S.R. 5,699. |
| Coke [2] do | 395 | 375 | U.S.S.R. 299; Czechoslovakia 41; Poland 35. |
| Petroleum: | | | |
| Crude [2] thousand 42-gallon barrels | 60,755 | 70,836 | U.S.S.R. 55,221. |
| Refinery products: | | | |
| Gasoline do | 12 | 9 | All from Romania. |
| Kerosine do | 5 | NA | |
| Distillate fuel oil do | r 494 | 225 | Romania 207; Greece 18. |
| Residual fuel oil do | r 666 | 981 | Romania 834; Greece 147. |

[1] Compiled from official import statistics of Bulgaria and from export data of selected trading partner countries.
[2] Data from official Bulgarian import statistics.
[3] Because of the incomplete nature of official Bulgarian import statistics for steel, such data have been taken from the United Nations, New York, World Trade in Steel, 1974.
[4] Official Bulgarian import statistics report 1,058,000 tons of all types of fertilizer imported in 1972, considerably in excess of the totals for the commodities listed, which were derived from trading partner export statistics. Among the source countries listed in official import statistics but not covered by trading partner export data was Tunisia, which supplied 118,000 tons in 1972, all of which was presumably phosphate rock. No equivalent data are available for 1973.

## COMMODITY REVIEW

### METALS

**Aluminum.**—An aluminum processing plant located near Shumen City is presently under construction and is planned to go into operation by 1977. It is to produce 48,000 tons of rolled products per year. Bulgaria imported 22,639 tons of aluminum from the U.S.S.R. in 1974.

**Copper.**—Copper mine output (metal content) for 1974 was 51,600 tons, showing an increase of 7.5% over that of 1973. The estimated production of blister, including secondary, was 55,000 tons and that of refined electrolytic copper was 48,000 tons, including secondary.

Approximately 80% of Bulgaria's copper ore is surface mined with the Medet open pit alone accounting for 75% of the total copper ore production. It had reached its capacity of 8 million tons per year of ore in 1972 and has since maintained this production level. The ores at Medet average 0.36% copper and 0.008% molybdenum. The Chelopech mine (near Sofia) is Bulgaria's largest underground copper mine and started operation in 1971 with 100,000 tons of ore per year, containing 0.5% to 1.5% copper. In 1975, this mine was to reach an ore production of 500,000 tons per year.

**Iron and Steel.**—In 1974, Bulgaria produced 2,188,000 tons of crude steel (2.6% lower than in 1973), 1,528,000 tons of pig iron, including blast furnace ferroalloys (5.1% lower than in 1973), and 2,685,000 tons of iron ore and concentrate (3.2% lower than in 1973). Bulgaria imported 2.4 million tons of iron ore (2.0 million tons from the U.S.S.R.) and 340,000 tons of pig iron (318,000 tons from the U.S.S.R.).

The Nation's two steel plants, both located near Sofia, were under expansion in order to meet the planned production of 3 million tons of crude steel by yearend 1975. The Kremikovtsi metallurgical complex, the larger of the two, reported considerable delays in production due to breakdowns in machinery, poor maintenance and repair, and insufficient skilled labor.[8] In addition, one of the largest furnaces at this plant was being reconstructed during 1974. The new 1,200-millimeter, 5-unit, cold-rolling mill, supplied by France, was put into operation at Kremikovtsi during 1974 and will be producing sheet steel as well as tin, zinc, and plastic-coated sheets.

An agreement was signed in 1974 by the COMECON countries for their participation in the construction of one of the largest steel mills in the U.S.S.R. In return for participation in the construction, Bulgaria will receive iron ore concentrates from the U.S.S.R.[9]

**Lead and Zinc.**—Lead smelter production (including secondary) for 1974 was estimated at 112,000 tons while that of zinc was estimated at 80,000 tons. No major changes or new developments were reported in the Bulgarian lead-zinc industry. Bulgaria exported 1,547 tons of lead to the

[8] Trud (Labor), Sofia, Oct. 2, 1975, pp. 1–2.
[9] Rabotnichesko Delo (Labor Review), Sofia, May 18, 1975, p. 4.

U.S.S.R. in 1973 and only 290 tons in 1974.[10]

All the Bulgarian lead-zinc ore is mined by underground methods and in 1974 mining was conducted at depths of 350 to 400 meters. The Gorubso Enterprise produced about 70% of the nation's lead and zinc in 1974.

**Uranium.**—Bulgaria has substantial uranium deposits which appear to have been well explored. The largest concentration of uranium occurs just north of Bukhovo in the Sofia Basin. Here the ore has been reported to contain as much as 2% of $U_3O_8$. The second deposit is found at Strelcha, 7 miles east of Panagiurishte. Other deposits are located in the Rhodope Mountains south of Asenovgrad where a large mine is located between Madan and Zlatograd.

Estimated reserves of uranium metal in Bulgaria are approximately 15,000 tons (17,689 tons of $U_3O_8$ and the estimated production capability is 100 tons per year of $U_3O_8$.[11] It is assumed that all of the uranium mined in Bulgaria in 1974 was exported to the U.S.S.R. Current data on Bulgaria's uranium reserves and mining is nonexistent due to the element of high secrecy imposed upon the uranium industries of the centrally planned economy countries.

## NONMETALS

**Asbestos.**—In order to satisfy its asbestos requirements, Bulgaria agreed to participate in the development of a complex for producing asbestos at the Kiembaev deposit in the Urals, U.S.S.R. In return, Bulgaria is to start receiving 40,000 tons of asbestos per year beginning in 1982.[12]

**Cement.**—Cement production for 1974 was 4.3 million tons, showing only a 2.8% increase over that of 1973. Bulgaria exported a total of 143,000 tons of cement and, in return, imported a total of 163,000 tons of which 137,000 tons came from the U.S.S.R.

Bulgaria is expanding and modernizing its six major cement plants in order to reach the planned 6-million-ton-per-year production capacity by yearend 1975. At that time, the Reka Devnya cement plant was to reach a 2-million-ton-per-year capacity, while the Zlatna Panega plant at Lukovit was to produce 1.6 million tons per year.

**Fertilizer Materials.**—Production of nitrogen fertilizers in 1974 was 525,000 tons (N content), an increase of only 1% over that of 1973. Phosphatic fertilizer production reached 188,000 tons ($P_2O_5$ content), showing a marked improvement of 39% over that of 1973. Bulgaria is self-sufficient in nitrogen fertilizers and exported 69,200 tons (N content) in 1974. The 1974 imports of phosphatic and potassium fertilizers were 34,300 tons ($P_2O_5$ content) and 44,000 tons ($K_2O$ content), respectively.

Bulgaria is expanding chemical complexes in order to increase mineral fertilizer production and thus to become self-sufficient by yearend 1980. During 1974, the compound fertilizer and soda ash complex at Devnya, near Varna, was brought into operation. The complex is composed of a 200,000-ton-per-year ammonia plant, a compound fertilizer unit (160,000 tons per year of $P_2O_5$); and a triple superphosphate plant (150,000 tons per year of $P_2O_5$). This complex was one of the major projects which Bulgaria has built in cooperation with the other COMECON countries. The greater part of the support came from the U.S.S.R., while Hungary helped with capital investment. An urea plant, with capacity of 450,000 tons per year, is planned for future construction at this complex.

A new compound fertilizer plant at Povelianovo is expected to start production in 1975 with a capacity of 914,000 tons per year. At the same site, a new ammonia plant is under construction and is to have a capacity of 190,000 tons per year of ammonia and a 276,000 tons per year of ammonium sulfate.[13]

An agreement between Bulgaria and the U.S.S.R. was signed in 1974 under which Bulgaria is to participate in the construction of the Kingisepp phosphate fertilizer plant in the U.S.S.R. As payment for such participation, Bulgaria is to receive 50,000 tons of fertilizers per year for a period of 10 years, beginning in 1976.

**Sulfur.**—In 1974, the production of elemental sulfur was 185,000 tons, an increase of 3% over that of 1973. Imports of 7,991 tons came from the Soviet Union in 1974. Bulgaria produced an estimated 150,000 tons of pyrite, with a total sulfur content of 63,000 tons.

[12] Work cited in footnote 9.

[13] Nitrogen, No. 99, January–February 1976.

Sulfuric acid production in 1974 reached 761,000 tons, an increase of 35% over that of 1973.[14] The bulk of this increase came from the 600,000-ton-per-year acid plant at the new Povelianovo fertilizer complex.[15] Plans were drawn up during 1974 for a new sulfuric acid section at the chemical complex in Dimitrovgrad.

## MINERAL FUELS

Bulgaria's total primary energy consumption for 1974 reached an estimated 36.0 million tons of standard fuel equivalent, showing an increase of 3.4% over that of 1973. Coal provided 51.2% of the total primary energy while oil represented 45.0%, natural gas 1.6%, hydroelectric power 0.8%, nuclear power 0.3%, and imported electric power 1.1%. Total primary energy balances of Bulgaria for 1973 and 1974 are shown in table 4.

[1] Conversion factors used are hard coal, 1.0; lignite and brown coal, 0.5; crude oil, 1.47; natural gas, 1.33 (per 1,000 cubic meters); hydroelectric and nuclear power 0.125 (per 1,000 kilowatt-hours), from World Energy Supplies, Statistical Papers, ser. J. No, 18, United Nations, New York, 1975.
[2] Bulletin of Electric Energy Statistics for Europe, v. 20, No. 2, United Nations, New York, 1975, p. 7.
[3] Production, see table 1.
Source: Data for 1973 from Statisticheski Godishnik na Narodna Republika B'lgariya 1974 (Statistical Yearbook of the People's Republic of Bulgaria 1974), Sofia, 1974.
Data for 1974 from Statisticheskiy Yezhegodnik stran-chlenov Soveta Ekonomicheskoy Vzaimopomoshchi (Statistical Yearbook of the COMECON countries), Moscow, 1975.

In order to meet its fuel requirements, Bulgaria had to import 64% of its total primary energy. In 1974, 10.9 million tons of crude oil and 6.2 million tons of anthracite and bituminous coal were imported, representing 44.4% and 17.2% of the total primary energy consumption, respectively. In addition, about 307 million cubic meters of natural gas were received through the newly finished gas pipeline from the Soviet Union, representing 1.1% of the primary energy consumption.

In 1974, a total of 22.8 billion kilowatt-hours of electric energy was produced by Bulgarian electric powerstations, showing a 3.9% increase over that of 1973. Of this energy, 19.8 billion kilowatt-hours was produced by thermal powerplants, 2.1 billion by hydroelectric plants, and 0.9 billion by the newly operational nuclear powerplant. Bulgaria had to import an additional 3.6 billion kilowatt-hours from the U.S.S.R. to meet its electric energy demand. Bulgaria's first nuclear powerplant was put into operation during 1974. A total of 928 million kilowatt-hours was produced during the year. By 1980, when the plant is to reach full capacity, it is to generate over 20% of Bulgaria's electric power needs.

**Coal.**—Production of coal in 1974 was 24.3 million tons, a decrease of 9.3% compared with that of 1973. Practically all of the coal is lower rank lignite and brown coal (24 million tons) and only 300,000 tons is either anthracite or bituminous.

In 1974, Bulgaria imported a total of 6.2 million tons of bituminous coal and anthracite of which 5.8 million tons came from the U.S.S.R.

Bulgaria's lignite production comes mainly from the Maritsa East Basin where the lignite is surface-mined. Reserves there are estimated at 3 billion tons of lignite, ranging in caloric value from 1,200 kilocalories per kilogram to 1,600 kilocalories per kilogram (average being 1,300 kilocalories per kilogram). Planned production goals at this basin were set at approximately 17 million tons in 1975. This will allow the production of 1.4 million tons of briquets and about 6 billion kilowatt-hours of electric energy which comprises about 23% of the total electric energy of the country.[16]

Bulgaria plans to produce a total of 31 million tons of coal in 1975. This goal was reported somewhat hard to achieve due to setbacks in the coal mining industry such as equipment breakdowns, problems in transportation, shortage of personnel, and poor equipment maintenance.[17]

With respect to the higher quality coals, especially brown coal, reserves are continuously decreasing in many of the existing mines. At the G. Dimitrov, Marbass, Chukurovo, and Black Sea mines the reserves are almost depleted. Bulgaria hopes to maintain brown coal output by the development of new mines in existing regions, especially in Bobov-Dol where a large share of brown coal is allocated to the new 630-megawatt thermoelectric powerstation which was under construction in 1974.[18]

**Natural Gas.**—Extraction of usable Bulgarian gas in 1974 was 6,360 million cubic feet (180 million cubic meters), a decrease of 19% from 1973. The North Bulgarian region was being investigated for gas resources and about 53 billion cubic feet (1.5 billion cubic meters) per year was planned to be extracted by the year 1990.[19]

The Bulgarian section of the natural gas pipeline, extending from the Soviet Union, was completed in July and started pumping gas shortly thereafter. According to the Soviet-Bulgarian agreement, Bulgaria is to receive 3 billion cubic meters of natural gas every year, starting with 1975. In 1974, 1 billion cubic meters were planned to be delivered but only 306,920,000 cubic meters were received.[20] The main delay was in the completion of the pipeline in Bulgarian territory, particularly distribution lines to various industrial complexes.[21] The chemical complex at Vratsa was the first to receive gas. The Devnya industrial complex near Varna also received gas during 1974. The main extension of the pipeline to Sofia, where the Kremikovtsi metallurgical complex is to be its most important consumer, was not yet finished and was to receive gas only in 1975.[22]

An agreement was signed in June, between the U.S.S.R. and the other COMECON countries for participation in the con-

[22] Rabotnichesko Delo (Labor Review), July 9, 1974.

struction of a large-diameter pipeline which is to deliver natural gas from the Orenburg gas condensate deposit, located in the southern Urals, to the western borders of the U.S.S.R. Bulgaria's reimbursement for the participation in the pipeline construction is to be 2.8 billion cubic meters of gas per year.[23]

**Petroleum.**—Crude oil output in 1974 was 144,000 tons, a decrease of 24% compared with that of 1973, continuing the declining trend of the past 5 years. This decrease in production was due mainly to lower output at the Pleven oilfields. The original expectations of the Dolni Dabnik Field, which was the richest oil find so far, was discouraging and reserves were found to be smaller than expected. Since domestic production is only approximately 1% of the country's total consumption, Bulgaria is almost totally dependent upon oil imports, largely from the Soviet Union. Soviet crude oil deliveries of 10,885,000 tons in 1974 were more than twice the volume delivered in 1970.[24] Small quantities of crude was also imported from Iran, Iraq, Libya, and Egypt.

Plans have been completed and construction started on the expansion and modernization of the Burgas and Pleven oil refining and petrochemical centers. The Soviet assisted construction of a new oil refining installation at Burgas was under way. The annual crude capacity at Burgas, where the Soviet crude oil is processed, amounted to 13.5 million tons in 1974.

The 1-million-ton-per-year capacity refinery at Pleven has been expanded and a new 6-million-ton-per-year refinery was under construction. The Pleven plant processed crude oil obtained from the Dolni Dabnik fields or delivered from the Soviet Union and Arab countries.

Under a new agreement with the U.S.S.R., Bulgaria is planning to build several petrochemical plants between the years 1976 and 1980.

Bulgaria, with the help of the Soviet Union, was considering offshore exploration in the Black Sea and was planning joint projects with other countries. Interest in such projects was shown by companies in the United States, the United Kingdom, and Japan.

Due to the shortage of crude oil, Bulgaria is taking a hard look at its oil shale resources and, in 1974, established a ministry specifically to look into the exploration, extraction, and utilization of oil shale. Several large oil shale deposits have been discovered and the total resources are now estimated at approximately 4 billion tons. These deposits were found in the Burkovo-Nikolaevo, Stara Zagora, Sliven, Pernîk, and the Khaskovo Districts.

**Nuclear Energy.**—The first reactor of Bulgaria's first nuclear powerplant, located near Kozloduy on the Danube, started up in July and was officially commissioned in September 1974 when the plant produced 98 million kilowatt-hours. A total of 928 million kilowatt-hours was produced in 1974. The second reactor is to go into operation by yearend 1975.[25] The nuclear powerplant was built in close collaboration with the Soviet Union, according to an agreement signed in July 1966. It is of a standard design, which is now used by all the COMECON countries, employing two of the Voronezh type VVER–440 light-water reactors, each having a capacity of 440 megawatts thus providing a total capacity of 880 megawatts. The Soviet Union provided the design, most of the equipment, and supervised the construction which began in October 1969.

The construction of the second section of the Kozloduy powerplant was in progress where the third and fourth reactors are planned to start operation in 1978 and 1979. This section is almost an exact duplicate of the first section, having also two 440-megawatt reactors thus providing an additional 880 megawatts of capacity. Therefore, by 1980, when both sections of this powerplant are in full operation, Bulgaria will have 1,760 megawatts of nuclear power which is to provide more than 11 billion kilowatt-hours per year or over 20% of the Nation's total electric power.[26]

# The Mineral Industry of Burma

By Timothy Adams [1]

Burma's mineral industry again stagnated, mainly because of the lack of modern equipment and insurgent activity. Exports of base metals and ores were approximately the same as in 1973. Burma will continue to export as much of its mineral output as possible to earn foreign exchange. With technical and financial assistance from U.S. and other bilateral sources, Burma moved to renovate existing mines and explore for new mineral resources.

An important agreement was signed with the Federal Republic of Germany to modernize the Bawdwin-lead-zinc mines. Capital allocations for the project were $11 million for open pit improvements, $19 million for the flotation mill, and $4 million for support facilities which include a 5,000-kilowatt hydroelectric plant. However, a West German mining technician was kidnapped near the Bawdwin mine in March. As a result, the Ministry of Mines recalled all foreign mineral experts under its jurisdiction to Rangoon and foreign assistance for Burma's mineral industry came to a virtual standstill.

The granting of concessions for offshore oil exploration to foreign oil companies marked a major change in mineral policy. Based on Indonesian experience, 13 of 25 offshore blocks were opened for development and were subjected to intensive seismic exploration and drilling activities. Also indicative of change was the completed survey of the Myanma copper deposits by a Japanese team. The Government of Burma was reported as seriously considering proposals from private foreign firms to develop the project. This marked a significant departure from previous policy regarding private foreign investment in the Burma mineral industry. This change may open other opportunities, albeit slowly, in this field in the future.

## PRODUCTION

Value of mineral production in Burma increased approximately 12% in 1974, the only sector of the Burmese economy to surpass targeted growth rates. Production of major minerals, including coal but excluding pertoleum, increased a marginal 5%. Considering the low level to which mineral production declined in 1973, the small increase in 1974 was insignificant. However, it did represent a temporary reversal of the declining trend in Burma's total mineral production. Generally, production of industrial minerals in 1974 remained close to past levels with yearly fluctuations in output caused largely by demand patterns of Government-operated industries.[2]

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, Burma also produces pottery clay, common sand, gravel, other varieties of crude construction stone, and other varieties of gem stones, but available information is inadequate to make reliable estimates of output levels.

[2] Includes fire clay powder.

## TRADE

Burma's overall foreign trade decreased from about $240 million in 1972–73 to an estimated $215 million in 1973–74. Although production increased in 1974, export volume of base minerals and ores declined about 16% from 1973 figures. silver exports at $0.6 million.

In 1972–73, base metal exports were estimated at $6.6 million and silver exports at $1.2 million. In 1973–74, base metal exports were estimated at $4.2 million and silver exports at $0.6 million.

Burma's imports of mineral and related products dropped somewhat from the estimated $21.4 million in 1972–73. The largest item has been base metals and manufactures. Coal and coke imports continued high.

Mineral industry reports were not obtainable from the Government on a timely basis. Hence, much of the information was estimated from available statistics published by the Central Statistical Organization, Rangoon, and other sources such as Mining Annual Review.

The latest specific commodity data on mineral exports and imports are shown in tabels 2 and 3 for the years 1971–72.

## COMMODITY REVIEW

### METALS

**Copper.**—Myanma Mineral Development Corp. (MDC) reported 26 million tons of copper ore at Sabetaung and 55 million tons at Kyesintaung. Diamond drilling continued in both areas to determine the extent of the porphyry copper mineralization.[3] The exploration program was con-

[3] World Mining. V. 27, No. 12, November 1974, p. 82.

ducted by Japanese personnel of the Metallic Minerals Exploration Agency of Japan. A pilot plant with a capacity of 30,000 tons per year of ore is to be constructed as a preliminary to joint Japanese-Burman development of the property. A feasibility study was begun for a refinery with a capacity of 20,000 tons per year of electrolytic copper by 1978.[4]

**Iron and Steel.**—The small Ywama steel plant, which has an electric furnace and rolling mills, remained the country's only steel producer. The plant, rated at 40,000 tons, continued to operate at approximately 50% capacity. Funds for construction of planned additional facilities continued to be unavailable.

**Lead, Zinc, Silver and Nickel.**—The government-owned Bawdwin enterprise in Northern Shan, operated by Bawdwin Mines Corp. (BMC), continued to be Burma's sole significant producer of nonferrous metals. The zinc concentrate produced was sold as such, mostly to Japan, whereas lead and other materials were sent to Namtu for smelting before marketing abroad.

The average grade of ore at Bawdwin apparently continued to decline. Output of ore from the mine increased, and a slight increase in the quantity of lead was reported. The old Namtu smelter with surplus capacity produced 9,300 tons of lead, 301,000 troy ounces of silver, and 3,001 tons of zinc concentrate.[5] A garnierite deposit was discovered in Chin State by the Directorate of Geological Survey and Exploration. Potential ore reserves were estimated at approximately 110 million tons at 1% nickel.[6]

**Tin and Tungsten.**—MDC continued to control most of the country's tin and tungsten mines. Concentrates were produced separately or in mixed form, and the combined annual output of the two related minerals was less than the average 2,200 tons of concentrates reported during the past 5 years. Although statistics were conflicting, Burma produced, in terms of metal content, approximately 400 to 760 long tons of tin and 300 to 500 tons of tungsten yearly. Most production came from the Tavoy and Mergui Districts in the Tenasserim district near the Thai border. The Mawski tin-tungsten mine probably accounted for about half of the total production. A contract was let to determine the feasibility of placer mining approximately 10,000 tons of tin-tungsten ore in the Heinze River Basin.[7] Third-stage rehabilitation of the Mawchi tin-tungsten mine continued. Output of tin-tungsten at Mawchi was planned to reach 1,800 tons per year metal content.[8]

## NONMETALS

**Cement.**—Three cement plants operated at Thayetmyo. Although all three produced at about 1,000 tons per day since the beginnning of 1974, Burma continued to experience cement shortages in many areas. The kilns presently use furnace oil as fuel, but a large natural gas deposit was found on the east side of the Irrawaddy River, about 22 miles south of Thayetmyo. The Government plans to pipe the gas to Thayetmyo but must first find the financing and equipment to build the pipeline.[9] Production for 1974 was 172,000 tons. Despite the openings of two new contract mills, lack of fuel held down production in 1974. Domestic supply lagged far behind demand.

Burma plans to establish a cement mill with 240,000 tons annual capacity at Kyoukse, about 20 miles south of Mandalay, with completion scheduled for 1978. If all planned expansions are completed, capacity will reach 860,000 tons per year and will provide Burma with a regular exportable surplus. Limestone will be supplied from a 450-million-ton deposit at Kyoukse, and gypsum will be brought by rail form Hsipow. The Tagundaing hydroelectric plant will supply power for the mill.[10]

**Fertilizer Materials.**—Burma had two urea plants located near the Chauk oilfields in central Burma which utilize the local natural gas deposits. Total output of urea in 1974 was 112,000 tons, or about 85% of capacity. Power constraints hindered greater output, but a new gas turbine generator should alleviate this problem. About 20,000 tons was exported in 1974 to take advantage of favorable prices.[11]

**Gem Stones.**—Uncut Burmese jade con-

[4] Metals Sourcebook. V. 11, No. 19, Oct. 14, 1974, p. 2.

[10] Work cited in footnote 2.
[11] U.S. Embassy, Rangoon, Burma. State Department Telegram Rangoon 01325, May 17, 1974.

tinued to be of importance in world jewelry circles. Many mines are in insurgent territory near the border and much jade produced was presumably smuggled out of the country. Burma also produced ruby, sapphire, spinel, other precious stones, and cultured pearls.

Total sales at the Tenth Gem Emporium, held in February 1974, were valued at $4.4 million. Pearl sales accounted for $1.0 million, jade for $3.2 million, and gems for $0.2 million. The Geological Survey and Exploration Corp. announced the discovery in north Burma of a new jade vein extending from Hukaway Valley to Putao and beyond. The deposits were described as being of high quality.[12]

**Salt.**—Burma produced about 125,000 tons of salt in 1974. The decreased production reflected the slowing of the modernization program begun in 1971. Production in excess of domestic requirements was exported, mostly to Singapore.

**Stone**—*Marble.*—Construction of a marble slab factory on the Mogok-Madaya highway at a cost of $0.5 million neared completion. The Taunggok marble mountain is expected to yield 30 million tons, and another mountain between the Salween and Kun Chaung Rivers is expected to yield another 30 million tons. Tenders to purchase marble have been received from several countries. Japan took 50,000 cubic meters in 1973–74.[13]

## MINERAL FUELS

**Coal.**—The Kalewa coalfield in the northwest, sole producer in Burma, produced 16,811 tons in 1974, up from 14,450 tons in 1973. Burma's imports of coal were 126,755 tons in 1973.

**Petroleum.**—The decision to invite foreign participation in offshore oil exploration, on a profit-sharing basis, attracted widespread attention in the petroleum industry. Contracts were signed for offshore petroleum exploration in 13 of 25 blocks, with 4 private companies or consortia—1. Martaban Cities Service Inc., Robina Oil Co., Inc. of Singapore, Sun Oil Co.; 2. Arakan Oil Development Co., Japan Petroleum Development Corp., Kyodo Corp.; 3. Cie. Française des Pétroles, AGIP S.p.A., Leminex Corp.; 4. Esso Exploration & Production (Burma) Inc. By yearend 1974, the four groups established skeleton staffs in Rangoon and subcontracted for additional surveys.[14] Seven wells were drilled by June, and five seismic vessels were surveying offshore areas on a large scale. Onshore oil exploration was dominated by the Myanma Oil Co. (MOC), which began a drilling program involving 4 to 6 wells. MOC also sent out seismic and field geology teams to survey the central and south Irrawaddy Basin. The Burmese Government showed interest in developing the infrastructure for prolonged petroleum exploration by setting up a modern supply base in Rangoon. Bids were also solicited for the construction of special rigs for MOC's onshore operations. West Germany was approached for technical and financial assistance to construct a 500-mile pipeline to connect the oilfields with Rangoon.[15] Production of crude oil from Burma's onshore fields remained at about the same level as in 1973, 7.6 million barrels were reported, with half attributed to the Mann field. In July a potentially significant oil strike was announced at Letpando. The Government announced that the new field insured Burma's self-sufficiency in oil by 1976. Natural gas production decreased slightly.

Ouptut of refined products was essentially the same as in 1973. No progress was reported on the longstanding plans to expand the capacity of the refinery at Syriam.

Preliminary estimates for 1974 indicated Burma's imports of petroleum products increased in volume by over 100% when compared with 1973. Much of the increase was due to imports of crude petroleum which had been sharply reduced in 1973. However, imports of refined products continued at approximately 200,000 tons in an effort to alleviate local shortages.[16]

# The Mineral Industry of Canada

By John A. Rathjen [1] and John M. Hague [2]

The total output of the Canadian mineral industry during 1974, including metallics, nonmetallics, structural materials, and mineral fuels established a new record of $11.7 billion [3] compared with $8.5 billion in 1973. This was an increase of 38% and marked the 16th consecutive annual increase in Canadian mineral production. The annual growth rate over the past 20 years has been about 9.8% with mineral fuels leading the other minerals in terms of value.

The value of production in the mineral fuels sector increased 60% to $5.22 billion in 1974 compared with $3.26 billion in 1973. Metal mine output reached a value of $4.89 billion in 1974, up from $3.88 billion a year ago, an increase of 26%. In nonmetals, production value was $895 million, an increase of 44% above the 1973 total of $620 million. The total value of structural materials rose to about $716 million in 1974 as compared with $679 million in 1973, an increase of about 5%. In terms of percentage of the total value the categories were as follows: Mineral fuels, 44.6%; metallics, 41.7%; nonmetallics, 7.6%; and structural materials, 6.1%.

The Canadian mineral industry provided 8.1% of the total gross national product (GNP), which was $142.6 billion in 1974. During this period the per capita value of mineral production went up to $522, an increase of $140 over 1973 and an alltime high.

The Canadian index of real domestic product (RDP) measures the volume of the country's gross output of goods and services in "constant dollars." It differs from the GNP in that it is a measure of production rather than income of Canadians. The RDP (1961=100) index figure for 1974 was 207.0, down slightly from 1973 when the published index was 210.5. The nominal decline was attributed to slowdowns in mining and a cutback in production of petroleum and natural gas during the second half of the year.

Investment trends in durable physical assets during 1974, including mineral industry capital and repair expenditures, increased in all categories over those of 1973. Investment in nonmetal mines was $377 million during 1974, 39.6% higher than in 1973. Petroleum and natural gas investments were up 28.7% to $1.4 billion, and metal mines increased 2.9% to $928 million. Higher investment was also apparent in the field of mineral-based manufactures. During 1974 the petroleum and coal based manufacturing industries spent a combined total of $585 million on new product lines. This represented an increase of 49.3% over 1973 expenditures. Primary metal manufacturing was up 29.4% to $1,056 million. The nonmetallic manufacturing area committed $313 million, an increase of 7.3%.

During 1974 Canada produced 62 individual mineral commodities, of which 10 accounted for 82.5% of the total value. The leading commodities, in percent of total value and with value expressed in millions were as follows: Petroleum, 30.8% ($3,616.9); copper, 12.1% ($1,412.1); nickel, 8.4% ($981.4); zinc, 7.7% ($900.0); iron ore, 6.2% ($724.4); natural gas, 5.9% ($692.7); natural gas by-products, 5.4% ($634.6); asbestos, 2.7% ($313.5); cement, 2.1% (246.9); and lead, 1.2% ($140.3). Although Canada does

[2] Mining engineer, Division of Nonferrous Metals.

[3] Because of fluctuating exchange rates, a meaningful conversion to U.S. currency is impractical. At yearend 1974, however, the exchange rate was Can$0.9912=US$1.00, which was used in this chapter.

not mine bauxite, it is an important producer of primary aluminum metal from imported ore and alumina. In 1974 the value of Canadian aluminum production was estimated to be above $755 million.

Canadian exports from the minerals sector during 1974 including both crude and fabricated products reached $10.9 billion, an increase of 51.7% over those of 1973. The contribution from metals and minerals represented approximately 34.6% of the total Canadian export trade in 1974. All of the commodities registered gains in value although several reductions in quantity were recorded. These gains were attributed primarily to the strong demand and high level of world prices, although trade was somewhat hampered by government restrictions pertaining to petroleum and natural gas as well as production and transportation problems in mining. Of the mineral industry total, fossil fuels and their products were the leaders, with a total shipping value of $4.9 billion amounting to 45% of the gross value. This was more than double the 1973 value of $2.3 billion. Exports of metal, ores, concentrates, and scrap rose to $2.4 billion, an increase of $400 million or 17% above those of 1973. Nonmetallic minerals increased to $510 million in 1974 from $411 million the previous year, a rise of 24%. Nonferrous metal exports, increased during the year rising from $1.6 billion in 1973 to $2.0 billion in 1974, an increase of 25%. Export of iron and steel alloys rose 56% to $746 million. Exports of nonmetallic minerals and base metal products cumulatively totaled $394 million.

Increases in value of mineral production during 1974 were recorded by all provinces and territories with the exception of Prince Edward Island which experienced a small decline. Four provinces contributed 78.9% of the total value; Alberta was the leader followed by Ontario, British Columbia, and Quebec. Alberta generated its revenue primarily from production of crude oil, natural gas and byproducts, and coal. The revenue from fuels, $4.3 billion, was about 96% of the provincial mineral value of $4.5 billion. Of the total value of $2.4 billion from Ontario, 83% or $2.1 billion, was derived from the metallic sector. Of the Canadian total mineral production value of $11.7 billion in 1974, the percentile standing of the 10 Provinces and 2 Territories was as follows: Alberta, 38.0%; Ontario, 20.8%; British Columbia, 10.2%; Quebec, 9.9%; Saskatchewan, 7.1%; Newfoundland, 3.9%; Manitoba, 3.8%; the Northwest Territories, 2.0%; New Brunswick, 1.8%; the Yukon, 1.6%; Nova Scotia and Prince Edward Island, less than 1% each.

Exploration and development continued at a slow pace pending resolution of Federal and Provincial legislation affecting the mining industry. Exploration activity, as indicated by diamond drill footage, was curtailed in 6 of 10 Provinces and in both Territories. Total exploratory drilling dropped from 4,568,000 feet in 1973 to 4,408,000 feet in 1974. The general downturn of the economy in Canada and the rest of the world, along with continuing inflation, had a dampening effect on mineral and metal industry growth. Furthermore, as a result of worldwide concern about consumption and available resources of energy-generating minerals, much activity and effort was directed toward solving these problems. Gulf Minerals Canada Ltd. continued construction and preparatory stripping operations for uranium at Rabbit Lake, Saskatchewan. Construction of a 2,000-ton-per-day mill was near completion at yearend and mining was scheduled to begin early in 1975. Agnew Lake Mines Ltd. at Agnew Lake, Ontario, announced plans outlining a pilot plant for in situ leaching of broken ore in stopes. Overall industry plans indicate that production expansion will provide for increases from 9.4 million pounds of $U_3O_8$ in 1974 to approximately 24 million pounds by 1980.

Exploration and development activity in the petroleum, natural gas, and local industries also continued through 1974. Oil and gas operations in the Arctic Islands, the MacKenzie Delta, and offshore on the Labrador Shelf added to and expanded reserves of these commodities to a point where feasibility studies concerned with methods of transportation and processing were being expedited. In the metals field a new company, Nanisivik Mines Ltd., was established to complete development and commence mining at a discovery by Texasgulf Inc. on the nothern end of Baffin Island in the Northwest Territories. Cominco Ltd. continued work on two other base metal properties in the Northwest Territories. Bathurst Norsemines

Ltd. and the Polaris mine in the high Arctic both added to known reserves as the result of continued diamond drilling. Capital investment in other metals and minerals was directed primarily to modernization and modification of existing plants.

## PRODUCTION

Canada's mineral production was reported from 10 Provinces, the Yukon, and the Northwest Territories. The value distribution and principal minerals of each are reviewed briefly in order of descending value.

Alberta maintained its leading position as a producer of minerals contributing $4.5 billion to the economy, mostly from crude petroleum and natural gas with a lesser contribution from coal and structural materials. The value of Alberta's production increased 60% over its value in 1973 due to increased prices for oil.

Ontario, by contrast, was the major producer of metals with a total mineral production of $2.4 billion. Of this $2.1 billion was from metals, mostly nickel, copper, and zinc; $62 million from nonmetals; $8 million from fuels; and $288 million from structural materials.

British Columbia, with substantial copper production despite a declining number of mines, retained third place with a total mineral production value of $1.2 billion, of which $514 million came from copper and $90 million came from combined lead and zinc production.

Quebec produced a broad range of metals and nonmetals with a total value of $1.16 billion. Copper was valued at $248 million, asbestos $244 million, iron ore $163 million, zinc $97 million, with gold, cement, stone and titanium accounting for other substantial values.

Saskatchewan reported a 62% increase in value of mineral production from that of 1973 for a total of $834 million. Much of the increase was due to the increased price of crude oil in spite of declining production. Values were crude petroleum, $448 million; potash, $306 million; with copper, zinc, coal, natural gas, and sodium sulfate accounting for most of the balance.

Newfoundland including Labrador, produced minerals valued at $458 million with iron ore accounting for $376 million, zinc $15 million, copper $13 million, and asbestos $18 million.

Manitoba's mineral production provided a gross value of $448 million, 6% greater than that of 1973. A decline of 14% in nickel production was offset by increased zinc production. Major metal values were nickel, $215 million; copper, $83 million; and zinc, $61 million. Crude oil production in Manitoba was valued at $27 million.

The Northwest Territories mineral output increased by 38% to $230 million. Zinc, lead, gold, and silver were the major contributors, valued at $138 million, $38 million, $28 million and $20 million, respectively. All four metals showed increases in volume as well as value. Petroleum and natural gas, although having great potential in the Territories, was valued at only $5 million.

New Brunswick announced that 1974 production reached a new high value, $221 million compared with $164 million in 1973. Metals dominated the list for a total of $188 million; $123 million in zinc, $21 million in lead, $20 million in silver and $18 million in copper with an additional $6 million from antimony, bismuth, cadmium and gold. Brunswick Mining & Smelting Corp. Ltd. and Heath Steele Mines Ltd. were the major producers.

Yukon Territory continued to be a major source of metals, producing $69 million in zinc, $44 million in lead, $29 million in silver, $18 million in copper, and $4 million in gold values. Asbestos production was valued at $22 million and the total 1974 production for the Territory was $187 million compared with $152 million in 1973.

Nova Scotia's mineral output valuation increased in 1974 to $82 million from $62 million in 1973. Most of the production was from nonmetallic minerals, coal and structural materials, although exploration for metals was proceeding with encouraging results.

Prince Edward Island produced structural materials valued at $1.6 million with no metal, nonmetal, or fuel production.

## Table 1.—Canada: Production of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 p |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Alumina, gross weight ---- thousand tons -- | 1,149 | 1,134 | e 1,200 |

e Estimate. r Revised. p Preliminary. NA Not available.

[1] Antimony content of antimonial lead alloys, flue dust and dore slag.

[2] Refined metal and bullion plus recoverable bismuth content of concentrates exported.

[3] Refined metal from domestic ores plus cadmium content of some exported ores and concentrates.

[4] Actual output not reported; figure represents cobalt content of all products including cobalt in nickel sinter shipped to the United Kingdom by International Nickel Co., for further processing and cobalt in nickel-copper matte shipped to Norway by Falconbridge.

[5] Total cobalt content of all products produced less the amount of cobalt metal reported as produced in Norway. Thus, this figure includes cobalt content of cobalt oxide produced in Canada for sale as such as well as cobalt metal and/or chemicals.

[6] Includes shipments of ingots from primary plants for rolling elsewhere.

[7] Refined nickel plus nickel content of oxide produced plus recoverable nickel in matte exported.

[8] Refinery output from all sources, including imports and secondary sources.

[9] Recoverable content of blister copper treated at domestic refineries, plus refined metal from domestic primary material.

[10] Cement shipped and/or used by producers.

[11] Includes value of bentonite and products from common clay, stoneware clay, fire clay and other types of clay.

[12] Crushed, building, ornamental, paving and other similar uses.

## TRADE

Data prepared by the External Trade Division, Statistics Canada, indicated that Canada's export and import commerce established record values of $32.4 billion and $31.9 billion, respectively, in 1974 corresponding to increases of 26% and 35% over the previous year. Despite a decline in the physical volume of exports (7%) and a moderate increase in imports (3.5%), prevailing high prices in the world market were strong enough to establish new peak revenues.

Exports from the minerals sector, including metals, nonmetals, fossil fuels, and fabricated materials totaled $10.9 billion, approximately 34% of all Canadian exports. When compared with 1973 exports this represents a rise of $3.5 billion or an increase of 47%. All major categories in the minerals field recorded increases in export value during 1974. The United States continued to be Canada's largest customer in terms of total exports totaling $21.5 billion. It was followed by Japan, $2.2 billion; the European Economic Community (EEC) countries, $2.0 billion; and the United Kingdom, $1.1 billion. Latin America also increased purchases from Canada during 1974 with Brazil, Venezuela, and Mexico accounting for over $738 million.

During 1974, imports also increased in value to about $6.6 million in the minerals area. In terms of dollars the increase amounted to $3.2 billion, some 92% above the 1973 total. All of the mineral categories registered strong gains with petroleum and natural gas accounting for $2.6 billion. Iron and steel alloys also increased 93% over 1973 to $1.3 billion. Principal countries supplying Canadian imports in declining order of value were the United States, $21.3 billion; EEC and Commonwealth countries, $3.7 billion; Japan, $1.4 billion; and Venezuela, $1.3 billion.

**Table 2.—Canada: Exports of mineral commodities**

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|

| Scrap: | | | |
| Unalloyed | 19,030 | 24,938 | United States 10,222; Belgium-Luxembourg 2,509; West Germany 2,461. |
| Copper alloys | 16,297 | 24,618 | United States 11,130; West Germany 3,901; Japan 2,770. |
| Unwrought, unalloyed | 293,421 | 287,468 | United States 114,728; United Kingdom 92,101; West Germany 27,032. |

See footnotes at end of table.

## Table 2.—Canada: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Copper—Continued | | | |
| Metal—Continued | | | |
| Semimanufactures: [1] | | | |
| Unalloyed | 38,553 | 49,044 | United States 22,330; United Kingdom 7,168; Lebanon 2,225. |
| Copper alloys | r 16,368 | 16,505 | United States 13,995; Japan 900; United Kingdom 366. |
| Iron and steel: | | | |
| Iron ore thousand tons | 29,275 | 37,668 | United States 21,651; United Kingdom 4,880; Japan 3,680. |
| Pig iron and related materials do | 651 | 618 | United States 369; Netherlands 130; Italy 50. |
| Ferroalloys: | | | |
| Ferromanganese | 2,067 | 3,024 | United States 2,882. |
| Ferrosilicon | 44,292 | 45,211 | United States 20,881; United Kingdom 18,423. |
| Other | 2,630 | 5,698 | United States 1,688; United Kingdom 1,487. |
| Steel ingots and other primary forms | 117,481 | 123,804 | United States 53,566; Iran 49,486. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, and sections | 343,533 | 309,607 | United States 224,231; United Kingdom 13,752; France 12,625. |
| Universals, plates, sheets and strip | 751,661 | 673,006 | United States 445,582; United Kingdom 31,420; Italy 30,629. |
| Rails and accessories | 73,112 | 124,225 | United States 52,872; Mexico 36,136; People's Republic of China 12,979. |
| Wire | 35,744 | 54,473 | United States 53,206; New Zealand 470; Pakistan 140. |
| Tubes, pipes, and fittings | 124,051 | 196,427 | United States 183,806; Barbados 2,210; Nigeria 1,510. |
| Castings and forgings, rough | 130,180 | 216,183 | United States 213,564; United Kingdom 789; Mexico 778. |
| Lead: | | | |
| Ore and concentrate, metal content | 162,001 | 193,412 | Japan 123,045; West Germany 22,251; United States 20,936. |
| Metal: | | | |
| Scrap, including alloy scrap | 11,165 | 21,713 | Netherlands 12,506; Republic of Korea 3,055; France 1,775. |
| Unwrought, unalloyed | 127,769 | 113,562 | United Kingdom 49,540; United States 47,988; India 4,582. |
| Semimanufactures [1] | 6,210 | 9,067 | United States 8,702; United Kingdom 146. |
| Magnesium metal | 2,606 | 2,961 | United Kingdom 863; People's Republic of China 768; United States 487. |
| Mercury [2] 76-pound flasks | 18,803 | 17,440 | All to United States. |
| Molybdenum ore and concentrate, Mo content [3] | 14,211 | 11,164 | Belgium-Luxembourg 4,056; Japan 3,256; West Germany 530. |
| Nickel: | | | |
| Ore, matte and speiss, Ni content | 100,998 | 91,068 | Norway 41,728; United Kingdom 34,060; Japan 15,073. |
| Oxide, Ni content | 33,236 | 59,710 | United States 36,664; Belgium-Luxembourg 7,109; United Kingdom 4,545. |
| Metal: | | | |
| Scrap | 1,934 | 2,187 | United States 1,475; Italy 284; Republic of Korea 201. |
| Unwrought | 109,678 | 125,161 | United States 74,929; People's Republic of China 22,543; United Kingdom 14,273. |
| Semimanufactures [1] | 4,143 | 6,619 | United States 3,801; United Kingdom 1,571; Italy 324. |
| Platinum-group metals: | | | |
| Concentrates, residues and matte, metal content troy ounces | 556,279 | 447,138 | United Kingdom 432,312; Norway 14,623. |
| Metal: | | | |
| Scrap do | 39,033 | 31,646 | United States 26,130; United Kingdom 5,516. |
| Other do | r 19,536 | 13,459 | United States 8,668; United Kingdom 4,667. |

## Table 2.—Canada: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Selenium metals and salts, Se content kilograms | 228,978 | 373,352 | United States 227,612; United Kingdom 96,887. |
| Silver: | | | |
| Ore and concentrate, Ag content thousand troy ounces | 22,199 | 26,009 | United States 13,397; Japan 6,112; West Germany 3,299. |
| Metal, refined do | 19,825 | 22,905 | United States 20,976; Belgium-Luxembourg 1,534; Trinidad and Tobago 207. |
| Tin ore and concentrate, Sn content[3] long tons | 140 | 313 | United States 167; United Kingdom 100; Mexico 45. |
| Titanium: | | | |
| Ilmenite and ilmenite sand[2 4] | r 191,754 | 200,252 | All to United States. |
| Titanium slag 70% $TiO_2$[2] | 153,611 | 91,015 | Do. |
| Uranium and thorium concentrates value, thousands | r $39,855 | $64,150 | United States $46,794; United Kingdom $17,356. |
| Zinc: | | | |
| Ore and concentrate, Zn content | 695,087 | 838,660 | Belgium-Luxembourg 267,271; Japan 192,299; United States 122,588. |
| Metal: | | | |
| Scrap, dross, ashes, and blue powder | 8,975 | 12,150 | United States 6,054; Belgium-Luxembourg 1,863; Netherlands 1,462. |
| Unwrought | 370,412 | 420,681 | United States 316,123; United Kingdom 62,961; Brazil 5,149. |
| Semimanufactures[1] | 6,601 | 4,712 | United States 3,697; United Kingdom 373; Japan 250. |
| Other, n.e.s.: | | | |
| Ore and concentrate, gross weight | 341,967 | 718,460 | Netherlands 260,973; United States 187,033; United Kingdom 154,373. |
| Ash and residue containing nonferrous metals | 1,160 | 5,053 | United States 4,679; United Kingdom 160; Japan 67. |
| Oxides, hydroxides and peroxides of metals | 68,761 | 82,859 | United States 75,658; United Kingdom 1,511; Venezuela 1,479. |
| Metals: | | | |
| Base metals, including alloys, all forms | 707 | 863 | United States 664; United Kingdom 73; Australia 30. |
| Precious metals[5] troy ounces | 43 | 22,405 | United Kingdom 17,750; United States 3,194; Italy 1,197. |
| NONMETALS | | | |
| Abrasives: | | | |
| Natural | 78 | 30 | United States 24; Chile 6. |
| Fused alumina, crude and grains | 160,001 | 171,322 | United States 155,236; United Kingdom 16,086. |
| Silicon carbide, crude and grains | r 94,699 | 92,983 | Mainly to United States. |
| Grinding and polishing wheels and stones value, thousands | $504 | $1,168 | United States $699; Australia $152. |
| Asbestos: | | | |
| Crude | 50 | 32 | United States 11; Japan 9; Italy 5. |
| Milled fiber, all grades thousand tons | 1,450 | 1,683 | United States 700; Japan 144; West Germany 129. |
| Barite, crude | 18,314 | 45,370 | All to United States. |
| Cement, portland thousand tons | 1,138 | 1,279 | Mainly to United States. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, including refractory clay do | 887 | 1,060 | Do. |
| Products: | | | |
| Refractory (including nonclay bricks) value, thousands | $8,770 | $12,585 | United States $8,225. |
| Nonrefractory do | $2,038 | $2,344 | United States $2,295. |
| Diamond: | | | |
| Gem, not set or strung carats | 188 | -- | |
| Industrial dust and powder do | 763 | -- | |

See footnotes at end of table.

## Table 2.—Canada: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Fertilizer materials: | | | |
| Nitrogenous ____ thousand tons __ | 835 | 772 | United States 766. |
| Potassic _____ do ____ | 5,750 | 7,129 | United States 5,218; Japan 602; Belgium-Luxembourg 354. |
| Mixed _____ do ____ | 846 | 764 | United States 596; Lebanon 72. |
| Ammonia _____ do ____ | 78 | 64 | Mainly to United States. |
| Gypsum, crude _____ do ____ | 5,410 | 5,754 | United States 5,678; Bahamas 76. |
| Lime _____ | 268,650 | 338,454 | United States 337,587; Greenland 620. |
| Nepheline syenite _____ | 397,714 | 406,835 | United States 396,837; United Kingdom 2,749; Australia 2,264. |
| Pigments, mineral, including processed iron oxides _____ | 12,193 | 16,653 | United States 15,267; Poland 325; Italy 322. |
| Precious and semiprecious stones, except diamond __ value, thousands __ | $224 | $348 | United States $124; Hong Kong $70 Japan $39. |
| Salt and brine _____ do ____ | r $5,032 | $6,051 | United States $5,948; United Kingdom $61. |
| Sand and gravel ____ thousand tons __ | 632 | 799 | Mainly to United States. |
| Sodium sulfate _____ | 118,988 | 143,037 | United States 140,029; Philippines 2,496. |
| Stone: | | | |
| Limestone, crude, crushed and refuse _____ thousand tons __ | 1,552 | 1,534 | Mainly to United States. |
| Quartzite _____ do ____ | 125 | 103 | Do. |
| Rough building and crude, n.e.s do ____ | 626 | 362 | Do. |
| Sulfur: | | | |
| Crude and refined _____ do ____ | 2,584 | 3,492 | United States 953; Australia 487; People's Republic of China 277. |
| Sulfuric acid and oleum __ do ____ | 95 | 123 | Mainly to United States. |
| Talc, steatite, soapstone, and pyrophyllite [2] _____ | r 6,054 | 7,641 | All to United States. |
| Other nonmetals, crude, n.e.s. value, thousands __ | $38,168 | $48,001 | United States $14,970; West Germany $9,231; France $4,428. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Coal, bituminous ____ thousand tons __ | 7,723 | 10,908 | Japan 10,625; United States 167; Chile 104. |
| Coke from coal _____ | 238,478 | 367,916 | United States 275,334; West Germany 49,940; Romania 25,222. |
| Fuel briquets, coal and coke _____ | 37,377 | 25,060 | All to United States. |
| Natural gas ____ million cubic feet __ | 1,007,054 | 1,030,913 | Do. |
| Petroleum: | | | |
| Crude thousand 42-gallon barrels __ | 341,253 | 420,060 | Do. |
| Refinery products: | | | |
| Gasoline _____ do ____ | 487 | 4,663 | United States 4,449; Mexico 201. |
| Distillate fuel oil ____ do ____ | 4,232 | 5,108 | United States 4,412; St. Pierre-Miquelon 476; Netherlands 135. |
| Residual fuel oil _____ do ____ | 32,178 | 36,262 | United States 35,844; Sweden 250; United Kingdom 150. |
| Lubricants _____ do ____ | 11 | 18 | United States 9; St. Pierre-Miquelon 4. |
| Other: | | | |
| Liquefied petroleum gas do ____ | 31,323 | 36,229 | United States 33,033; Japan 3,194. |
| Asphalt _____ do ____ | 424 | 514 | United States 507; United Kingdom 5. |
| Petroleum coke and pitch coke _____ do ____ | 5 | 11 | All to United States. |
| Total _____ do ____ | 68,660 | 82,805 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals _____ | r 4,242 | 3,036 | United States 2,834; Puerto Rico 182. |

r Revised.

[1] May include relatively minor quantities of certain shapes not normally included among semimanufactures.

[2] Partial figures, data given are U.S. imports for consumption only.

[3] Includes some scrap.

[4] Largely, if not all, used in the production of heavy aggregate.

[5] Excludes scrap and sweepings valued in thousands at $3,826 in 1972 and $7,308 in 1973.

## Table 3.—Canada: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| **METALS** | | | |
| Aluminum: | | | |
| Bauxite ——— thousand tons | 2,623 | 2,638 | Guyana 1,415; Surinam 422; Sierra Leone 357. |
| Alumina ——— do | 673 | 853 | Australia 334; United States 284; Jamaica 215. |
| Metal including alloys: | | | |
| Scrap | 7,420 | 10,286 | United States 10,263. |
| Unwrought | 34,746 | 44,938 | United States 33,165; United Kingdom 8,807. |
| Semimanufactures (including cable) | 93,084 | 107,150 | United States 100,389; United Kingdom 2,111; Belgium-Luxembourg 1,823. |
| Antimony oxides | 467 | 675 | United Kingdom 509; United States 143. |
| Chromium: | | | |
| Ore and concentrate, Cr content | 22,433 | 25,036 | Philippines 10,685; United States 8,597; Cyprus 3,412. |
| Oxide and hydroxide | 1,065 | 1,468 | France 577; United States 564. |
| Copper: | | | |
| Ore and concentrate (including scrap), Cu content | 19,632 | 52,833 | United States 23,830; Chile 16,517; Peru 6,610. |
| Copper sulfate | 1,572 | 1,298 | Belgium-Luxembourg 724; United States 317. |
| Metal: | | | |
| Unalloyed: | | | |
| Unwrought | 16,185 | 17,179 | United States 14,626; Netherlands 1,605; Chile 462. |
| Semimanufactures | r 5,199 | 7,502 | United States 5,852; Chile 740; Japan 487. |
| Alloys, unwrought and semimanufactures (including cable) [1] | r 17,763 | 17,618 | United States 12,692; United Kingdom 1,716; Netherlands 1,298. |
| Iron and steel: | | | |
| Iron ore ——— thousand tons | 1,753 | 2,689 | United States 2,172; Brazil 484. |
| Scrap ——— do | 1,111 | 914 | Mainly from United States. |
| Pig iron and related materials | 7,381 | 6,764 | Do. |
| Ferroalloys: | | | |
| Ferrochrome | 13,793 | 34,727 | Republic of South Africa 22,808; United States 6,719. |
| Ferromanganese (includes spiegeleisen) | 17,141 | 24,050 | United States 11,004; France 5,092; Norway 4,601. |
| Silicomanganese (includes silicospiegeleisen) | 15,093 | 9,752 | United States 6,609; Norway 1,100; Republic of South Africa 1,041. |
| Ferrosilicon | 8,676 | 12,920 | Yugoslavia 5,420; United States 4,133; Norway 2,284. |
| Ferrotungsten | 115 | 78 | Mainly from United Kingdom. |
| Ferrovanadium | 105 | 152 | All from United States. |
| Other | 12,558 | 29,868 | Greece 16,491; Republic of South Africa 4,078; United States 4,028. |
| Steel, primary forms | 243,294 | 86,408 | United States 75,582; France 6,092. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, and sections: | | | |
| Wire rod | 219,122 | 211,261 | Czechoslovakia 59,385; Japan 57,632; France 41,214. |
| Other bars and rod [1] | 212,732 | 237,475 | United States 162,924; Japan 20,424; United Kingdom 13,931. |
| Angles, shapes, and sections | 292,964 | 388,752 | United States 178,893; United Kingdom 67,235; Belgium-Luxembourg 50,909. |
| Universals, plates, sheets, and strip | 977,812 | 875,507 | United States 375,243; Japan 297,864; West Germany 108,505. |
| Rails and accessories | 9,290 | 15,457 | United States 14,033; United Kingdom 654. |
| Wire | 59,360 | 68,265 | United Kingdom 22,443; United States 12,357; Japan 11,652. |
| Tubes, pipes, and fittings | 233,637 | 245,741 | Japan 106,871; United States 105,611; United Kingdom 11,821. |
| Castings and forgings | r 188,176 | 138,556 | United States 127,195; United Kingdom 7,731; Spain 842. |

## Table 3.—Canada: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Clays and clay products (including all refractory brick)—Continued | | | |
| Crude clays, n.e.s—Continued | | | |
| Fire clay | 44,769 | 31,868 | All from United States. |
| Fuller's earth | 6,372 | 12,310 | Do. |
| Kaolin (china clay) | 210,500 | 185,455 | United States 149,291; United Kingdom 36,164. |
| Other (including refractory clay) | 75,885 | 93,584 | United States 93,476; United Kingdom 104. |
| Products: | | | |
| Refractory (including nonclay bricks) - value, thousands | $28,028 | $35,149, | United States $31,584; United Kingdom $1,110; West Germany $669. |
| Nonrefractory do | $13,775 | $15,957 | Japan $5,334; Italy $2,885; United States $2,682. |
| Cryolite, crude | 828 | 4,977 | Denmark 4,893; United States 84. |
| Diamond: | | | |
| Gem, not set or strung -- carats | 103,787 | 116,250 | Israel 48,006; Belgium-Luxembourg 38,718; Netherlands 7,324. |
| Industrial do | 865,735 | 887,024 | United States 783,631; Belgium-Luxembourg 43,703; United Kingdom 24,575. |
| Dust and powder do | 383,683 | 454,129 | United States 441,229; Ireland 7,100; Denmark 3,100. |
| Diatomite and other infusorial earth | 31,196 | 34,012 | All from United States. |
| Fertilizer materials: | | | |
| Nitrogenous | 62,299 | 59,195 | United States 47,663; Chile 7,016; Belgium-Luxembourg 2,485. |
| Phosphatic: | | | |
| Phosphate rock thousand tons | 2,729 | 3,286 | United States 3,279. |
| Other | 98,126 | 59,718 | United States 58,707; United Kingdom 502. |
| Potassic | 26,157 | 44,829 | United States 44,762. |
| Other, including mixed | 63,299 | 88,547 | United States 88,369. |
| Fluorspar | 65,236 | 153,816 | Mexico 91,542; United Kingdom 35,470; Spain 16,869. |
| Gypsum | 56,593 | 83,725 | Mexico 76,280; United States 6,612. |
| Iodine | 181 | 159 | Japan 151. |
| Lime | 26,017 | 14,740 | United States 14,703; France 37. |
| Magnesium: | | | |
| Dolomite, calcined | 1,585 | 1,328 | All from United States. |
| Dead burned or sintered | 50,747 | 53,708 | United States 39,732; France 7,402; Japan 4,449. |
| Other | 1,819 | 1,759 | United States 1,563; United Kingdom 195. |
| Mica, crude | 4,700 | 5,786 | United States 5,725. |
| Pigments, mineral, including processed iron oxides | 5,540 | 6,330 | United States 3,823; West Germany 1,668; Spain 560. |
| Precious and semiprecious stones, except diamond - value, thousands | $5,120 | $6,386 | United States $1,943; United Kingdom $908; West Germany $684. |
| Salt and brine | 928,876 | 830,179 | United States 518,198; Mexico 280,648; Bahamas 24,659. |
| Sodium carbonate (including sal soda) | 197,735 | 179,189 | United States 173,400; France 5,754. |
| Sodium and potassium compounds, n.e.s.: | | | |
| Caustic soda | 154,126 | 162,333 | United States 104,442; Netherlands 20,522; Belgium-Luxembourg 16,673. |
| Caustic potash, sodic and potassic peroxides | 1,644 | 1,740 | United States 1,550; Italy 92. |
| Sodium sulfate (Glauber's salt) | 24,458 | 27,038 | United States 12,863; Belgium-Luxembourg 11,605; United Kingdom 2,570. |
| Stone, sand and gravel: | | | |
| Stone: | | | |
| Dimension stone: | | | |
| Crude and partly worked | 24,476 | 32,955 | United States 18,651; Republic of South Africa 10,331; Italy 2,751. |
| Worked value, thousands | $2,809 | $2,735 | United States $1,850; Italy $708. |
| Limestone thousand tons | 1,645 | 2,124 | All from United States. |
| Pumice and lava | 15,339 | 17,179 | Greece 14,008; United States 2,863. |
| Quartz, silex and crystallized | 8 | 991 | All from United States. |
| Other, including crushed and broken | 62,515 | 56,225 | United States 55,125; Italy 680. |
| Sand and gravel: | | | |
| Silica sand thousand tons | 1,242 | 986 | Mainly from United States. |
| Other do | 969 | 1,031 | Do. |

2 Less than ½ unit.

# COMMODITY REVIEW

## METALS

**Aluminum.**—Production of primary aluminum metal during 1974, 1,007,000 tons, exceeded the production in 1973 by 7%. The surge in demand and consequent shortage experienced in 1973 carried over into the third quarter of 1974 so that in spite of a rapid softening of demand in the fourth quarter, the year as a whole yielded a near record production.

The alumina refinery of Aluminum Company of Canada Ltd. (Alcan), at Arvida, Quebec used bauxite from Guinea, Guyana, Surinam, Sierra Leone, and other countries to produce alumina for four Alcan smelters in Quebec at Isle-Maligne, Shawinigan, Beauharnois, and Arvida. During 1974 Canada imported about 1,980,000 tons of bauxite. Alcan also operated a smelter at Kitimat, British Columbia, supplied with alumina imported from Jamaica and Australia. Alcan's production of primary aluminum in 1974 was 874,000 tons.

Canadian Reynolds Metal Co. Ltd. operated a smelter at Baie Comeau, Quebec, supplied with alumina from the United States. Alumina imported from the United States totaled 174,800 tons in 1974.

Domestic primary aluminum consumption in Canada in 1974 was estimated to be 358,000 tons, an increase of 18% over 1973 consumption. Exports of aluminum ingot in 1974 reached a level of 682,000 tons, indicating a small increase over those of 1973. The United States received 55% of all aluminum exports; Japan and the United Kingdom received about 10% each.

Alcan announced a 10-year plan to expand ingot capacity by about 272,000 tons per year at a cost of $500 million to $600 million. Existing hydropower would supply half of this expansion. Modernization of other existing facilities to achieve increased efficiency would serve the other half. A 35,000-ton expansion of smelter capacity at Arvida was scheduled to be ready in 1975.

Aluminum Co. of America (Alcoa) suspended plans announced in 1973 to build a smelter in the Valleyfield, Quebec, area with a capacity of 60,000 tons per year. Canadian Reynolds Metal Co. Ltd. planned further expansion and improvement of its rolled aluminum products plant at Cape-de-la Madeleine, Quebec. Alcan and Péchiney Development, Ltd., agreed on a joint venture to develop a process for producing alumina from clays and shales, using a pilot plant near Marseilles, France.

**Columbium and Tantalum.**—Responding to strong demand in 1974, Canada's mine production of columbium concentrate (pyrochlore) grew from 1,441 tons in 1973 to 1,866 tons in 1974. The sole Canadian producer, the St. Lawrence Columbium and Metals Corp. near Oka, Quebec, exported much of its output for conversion to ferrocolumbium by foreign consumers. Some Canadian production was converted to ferrocolumbium by St. Lawrence Columbium, Masterloy Products Ltd., and Fundy Chemical International Ltd. The ore reserve at the Oka operation was enlarged during 1974 and was reported to be 25.6 million tons averaging 0.44% $Cb_2O_5$.

A possible second columbium producer, Niobec Inc., was formed in 1974 by Quebec Mining Exploration Co. (SOQUEM) and Copperfields Mining Corporation to begin production at the St. Honore, Quebec, columbium property owned 50% by SOQUEM, 25% by Copperfields, and 25% by Teck Corporation Ltd. Reserves were reported to be 40 million tons averaging 0.76% $Cb_2O_5$.

Tantalum Mining Corp. of Canada Ltd. (Tanco), produced approximately 195 tons of $Ta_2O_5$ in tantalite concentrate in 1974, a sharp increase from the reduced output of 1973. During 1974 Chemalloy Minerals Ltd., the controlling owner of Tanco, sold a 24.9% interest to Kawecki Berylco Industries, Inc.; Manitoba Development Corp., a government corporation, held a 25% interest. In February 1974, a sales contract was signed covering $18 million to $20 million in tantalum, cesium, and rubidium products over a 5-year period.

Tanco's tantalum reserves at Bernic Lake, Manitoba, were reported as 1,420,000 tons averaging 0.224% $Ta_2O_5$. Other adjoining reserves on the same group of properties contained 5 million tons containing 2.98% lithium oxide and 300,000 tons averaging 23.0% cesium oxide (pollucite).

**Copper.**—Production of recoverable copper by Canadian mines rose to a new

record of 842,400 tons in 1974, indicating a 2% increase over 1973 production despite a decline in output from the province with the largest production, British Columbia. Canada's copper production was valued at $1.4 billion, exceeding the value of any other solid mineral and surpassed in value only by Canadian petroleum production. Canada ranks third among world copper producing countries after the United States and Chile.

The supply of copper changed from scarcity to plenty midway through 1974. Prices on the London Metal Exchange (LME) peaked in April at about $1.50 per pound and dropped below $0.60 by yearend. Plans for expansion or increases in capacity were postponed not only because of slackening demand and falling prices but also due to uncertainty about new taxation measures introduced in some provinces.

British Columbia accounted for 35% of total mine production, followed by Ontario with 34%. Quebec contributed 17%, Manitoba 9%, and other Provinces and Territories 5% of the total.

Much of the copper production in Ontario and Manitoba is a coproduct from nickel mines. The International Nickel Co. of Canada Ltd. (INCO), delivered about 166,600 tons of refined copper from its refinery at Copper Cliff, Ontario, and operated 13 mines in Ontario and 3 in Manitoba. INCO reported proven ore reserves in Canada at yearend 1974 as 376 million tons of ore containing 6.1 million tons of nickel and 3.8 million tons of copper.

Falconbridge Nickel Mines Ltd. operated 9 nickel-copper mines in Ontario and Manitoba and its subsidiary Falconbridge Copper, Ltd., operated 6 copper-zinc or copper mines in Quebec, Ontario, and British Columbia. Total copper output by Falconbridge in 1974 was 69,500 tons of which about 25,500 was delivered by the nickel operations.

Falconbridge nickel ore reserves were reported to be 82 million tons of ore averaging 1.4% nickel and 0.68% copper at Sudbury, Ontario, and Manibridge, Manitoba. Falconbridge copper ore reserves were 2.2 million tons with a grade of 3.2% copper and 4.0% zinc in the Lake Dufault Division; 5.8 million tons at 2.35% copper in the Opemiska Division; and 2 million tons averaging 2.80% copper and 10.19% zinc in the Sturgeon Lake venture.

Sheritt Gordon Mines Ltd. operated the Lynn Lake mine (nickel-copper) and the Fox and Ruttan mines (copper), also in Manitoba, to produce 46,000 tons of copper in concentrates destined for smelting at Flin Flon, Manitoba, Noranda, Quebec, and Japan.

Noranda Mines Ltd., with its subsidiaries and associated companies, was the largest copper producer in Canada. Mines included in the Noranda group are those near Noranda (Horne, Geco, Normetal, Orchan, Mattagami Lake) in the Ontario-Quebec area; Gaspé mines in eastern Quebec, and several in British Columbia (Craigmont, Gilbraltar, Brenda, Bell Copper). Copper produced in concentrates from this group exceeded 205,000 tons. Copper production from the two Noranda smelters came from 983,000 tons of concentrates from 14 mines of the Noranda group and 929,300 tons of custom concentrates from 29 other Canadian mines for a total production of 307,500 tons of copper anodes. Canadian Copper Refineries Ltd. in Montreal, a 100% owned subsidiary, processed this Noranda copper anode production as well as the output of the Flin Flon smelter of Hudson Bay Mining & Smelting Co. Ltd. The total production of refined copper from Canadian Copper Refineries and from INCO in 1974 was 559,100 tons, an increase of 12% over that of 1973.

Texasgulf, Inc., operated its zinc-copper-silver mine near Timmins, Ontario, and produced 241,200 tons of copper concentrates as a coproduct with zinc, lead, and silver. Plans to construct a 130,000-ton-per-year copper smelter and to develop the deeper parts of the Kidd Creek mine which show an increased copper content, were developed and then suspended in 1974. After the Ontario Mining Tax Act was amended and the resulting regulations were published, these plans were reaffirmed early in 1975. The Canada Development Corp. (CDC), a crown corporation, acquired approximately 30% of Texasgulf shares late in 1973. At the end of 1974, ore reserves above the 2,800 level were estimated to be 85 million tons. Previous production has assayed 1.56% copper, 0.38% lead, and 9.66% zinc. Exploration by Texasgulf in Canada discovered a promising prospect in the Northwest Ter-

ritories assaying 4% copper, 4.8% zinc, and 1.0 ounce per ton silver, in addition to a possible porphyry copper deposit in north central British Columbia.

Hudson Bay Mining & Smelting operated a copper smelter as part of its metal complex at Flin Flon, Manitoba. The combined blister and anode copper production was about 49,000 tons. A new anode casting plant was put into operation in March and blister casting was discontinued. Anodes were shipped to Canadian Copper Refiners, (Noranda), for refining. Hudson Bay operated nine mines in the Flin Flon area producing 193,000 tons of copper concentrates (and about 64,000 tons of zinc and lead concentrates). The feed for the copper smelters was supplemented with 53,200 tons of residues and 84,300 tons of purchased copper concentrates. Ore reserves at the end of 1974 were reported at 16,300,000 tons—2.9% copper, 2.7% zinc, 0.03 ounce gold per ton and 0.5 ounce silver per ton.

In addition to the mines controlled by the larger copper producers many other mining companies operated to produce concentrates for Japan, the United States, and West Germany. Among the larger producers were the Buchans mine, operated by American Smelting & Refining Company (ASARCO) in Newfoundland; Caribou mines in New Brunswick operated by The Anaconda Company (Anaconda) which closed October 1, 1974; Campbell Chibougamau, Icon Sullivan, Louvem, and East Sullivan mines in Quebec; Pamour and Willroy mines in Ontario; Britannia Beach operated by Anaconda which closed November 1, 1974; Bethlehem, Similkameen, Texada, Utah and Western mines in British Columbia; the Whitehorse Copper mine in the Yukon and the Echo Bay and Terra Mining & Exploration Ltd. operations in the Northwest Territories.

**Gold.**—Canadian gold production declined for the 14th consecutive year to 1.72 million troy ounces in 1974, down from 1.93 million troy ounces in 1973. The value of gold production increased from $192 million in 1973 to $265 million in 1974 as a result of the sharp rise in the free market price of gold. The weighted average value of gold increased from Can$97.41 per troy ounce (US$97.32) in 1973 to Can$156.48 (US$160.86) in 1974. The average Royal Canadian Mint buying prices for gold were Can$38.86 in 1973 and Can$41.067 in 1974, but since all gold produced was sold on the open market, these prices did not apply, and no assistance was required under the Emergency Gold Mining Assistance Act. The act was scheduled to expire on June 30, 1976.

Lode gold mines accounted for about 73% of Canadian production and base metal mines about 27%. Placer mining accounted for only 0.2% of the total, mainly from British Columbia and the Territories.

Leading lode gold mines in Canada that accounted for most of the gold production except that produced as a by-product from copper, lead, or zinc mines, with output in troy ounces are as follows:

| Location and mine | 1973 | 1974 |
|---|---|---|
| Ontario: | | |
| Campbell Red Lake Mines Ltd | 196,190 | 197,369 |
| Dome Mines Ltd | 148,512 | 121,032 |
| Kerr Addison Mines Ltd | 127,650 | 108,820 |

NA Not available.
[1] Mill started December 1973.
[2] Mill started November 1974.
[3] Mill closed Sept. 30, 1974.

Exploration and development of mines in the Red Lake District of northwestern Ontario enlarged ore reserves at the Campbell Red Lake, Dickenson, Robin Red Lake, and Wilmar mines. As a result of a discovery at the Wilmar properties, a study was undertaken for reopening the Cochenour mill. Bulora Corp. Ltd. purchased the mine and mill of Madsen Red Lake Gold Mines Ltd. for $1.7 million.

In the Missanabie District of central Ontario, Nudulama Mines Ltd. controlled by The Coniagas Mines Ltd. planned to dewater its idle mines, and reported reserves of 525,000 tons containing 0.19 ounce of gold per ton. Rengold Mines Ltd. leased the former Renabie mines from Willroy Mines Ltd. and planned exploration and dewatering to be completed early in 1975.

Other development programs were planned at the Duport mine in the Kenora area for the Pursides Gold mines in the Wawa area and for Lakelyn Mines Ltd. at Lingman Lake in northwestern Ontario.

In the Malartic district of Quebec, Goldex Mines Ltd. completed developing the Dalton and Probe groups of claims with a 2,400-foot decline and planned to treat the ore at the Malartic Gold Fields mill. East Malartic Mines Ltd., an associate of Malartic Gold Fields (Quebec) Ltd., was deepening the Barnat shaft and increasing its mill capacity from 1,650 to 2,000 tons per day. Chibex Ltd. began operation of its new mill in the Chibougamau District in late 1974 aiming for a rate of 700 tons per day by January 1975.

In British Columbia, Northair Mines Ltd. developed the Warman and Manifold veins at Brandywine Falls and planned a milling operation of 300 tons per day to treat its ore reserve of 400,000 tons containing 1 ounce of gold per ton. Other exploration projects were undertaken by Carolin Mines Ltd. northeast of Hope and by Bralorne Resources Ltd., a former gold producer at Bralorne in the Bridge River area. In the Northwest Territories, Cominco Ltd. continued sinking a deep shaft to reach new ore reserves at the Con mine.

Although the rise in gold prices did not produce a surge of new gold prospecting, exploratory work was continued in many old gold districts seeking new reserves for future operations.

**Iron Ore, Pig Iron, Iron and Steel.**—Despite the economic downturn, the iron ore industry continued to produce at a high level in 1974, only 0.5% below the record output of 1973. Total shipments were 47.4 million tons of which 10.6 million went to Canadian consumers, 19.7 million to the United States, 11.8 million to Europe, 4.2 to Japan and 1.2 million to other destinations.

Quebec and the adjacent area of Labrador contained the mines accounting for the major share of Canadian iron ore production which amounted to 74%. Ontario's nine mines contributed 23% and British Columbia 3% of the total as indicated by the following tabulation:

| Location and mine | Material, percent iron | 1974 shipments (thousand wet metric tons) |
|---|---|---|
| Quebec and Labrador: | | |
| The Hilton Mines, Shawville | Pellets, 67. | 888 |
| Iron Ore Co. of Canada: | | |
| Schefferville (Quebec-Labrador) | Direct shipping, 54. | 6,548 |
| | Pellets, 64. | 7,560 |
| Carol Lake (Labrador) | Concentrate, 68. | 4,309 |
| | Pellets, 61. | 1,863 |
| Sept-Isles (from Schefferville) | Concentrate, 64. | 8,284 |
| Quebec Cartier Mining Co., Gagnon | Pellets, 64. | 5,738 |
| Wabush Mines, Pointe Noire (from Labrador) | Pig iron. | 552 |
| Quebec Iron & Titanium Corp., Sorel (from Lac Tio) | | |
| Ontario: | | |
| Adams Mine, Kirkland Lake | Pellets, 65. | 1,133 |
| Algoma Ore Div., Wawa | Siderite sinter, 48. | 2,078 |
| Caland Ore Co., Atikokan | Pellets, 64. | 996 |
| | Concentrate, 56. | 917 |
| Griffith Mine, Bruce Lake | Pellets, 67. | 1,577 |

The grade of crude ore in Canadian iron mines ranges from 19% iron at the Adams mine to 55% iron at Caland.

The Iron Ore Co. of Canada (IOC), managed by Hanna Mining Company, did not realize the full benefit of expansion plans completed in 1973 because of a labor shortage and mechanical problems. Its productive capacity was to be 33 million tons per year by 1976. Quebec Cartier Mining Co., a subsidiary of United States Steel Corporation, started to prepare the Mt. Wright open pit mine for a yearly production of 40 million tons of crude ore or 16 million tons of concentrate. A rail connection to Mt. Wright was completed in 1974, and the crushing and concentrating facilities were expected to be completed in 1975.

The Algoma Ore Division of The Algoma Steel Corp. Ltd. continued development work at the MacLleod mine to permit continued underground mining from the deeper levels of the mine for another 25 years. Algoma started receiving pellets from the Tilden mine in Michigan in December 1974. The Steel Company of Canada Ltd. (Stelco) also shared in production from the Tilden mine and announced that it would have a share of the production from two other U.S. projects, the Eveleth Taconite Project and the Hibbing Taconite Project, both in Minnesota. Dominion Foundries and Steel Ltd. (Dofasco) planned to continue drawing its ore supply from the Adams, Sherman, and Wabush mines in Ontario and Quebec.

Production of pig iron in 1974, 9.42 million tons, was 1% below 1973 production, but steel ingot production continued to grow, showing a 2% gain to reach a record 13.5 million tons. Exports of pig iron decreased in 1974 to about 520,000 tons. The major part of production was used to make steel (8.0 million tons) and a small part sold to foundries (0.9 million tons). Total crude steel production, including ingots, semimanufactures, and castings continued to grow but at a lesser rate than in 1973. Production in 1974, 13.5 million tons, was held back by shortages of raw materials and other constraining factors. Crude steel capacity was estimated to be 14.6 million tons in 1974, with some 2.0 million tons of capacity coming onstream during the year and 0.4 million tons of older open hearth capacity phased out. Domestic consumption, with strong demand, was supplied by a small excess of imports over exports in addition to domestic mill shipments.

Stelco was the leading Canadian producer with an output of 5.5 million tons of raw steel. Construction began on the new Lake Erie project near Nanticoke, Ontario. which was designed for an initial steelmaking capacity of 1.3 million tons per year and was scheduled to begin late in 1977. A 10-meter-hearth-diameter blast furnace will feed two 250-ton basic oxygen furnace vessels and an 80-inch hot-strip mill. The capital cost of the project was estimated at $430 million. Stelco also put a new electric furnace in operation at Contrecoeur, Quebec, and replaced electric furnaces at Edmonton, Alberta.

The Algoma Steel Corp. produced 2.5 million tons of raw steel in 1974. Construction continued on a new 4,500-ton-per-day blast furnace, as part of a rebuilding program, and this will increase capacity from 2.5 million to 3.2 million tons per year. Capital expenditures for new facilities in 1974 were about $139 million.

Dofasco produced a record 2.8 million tons of ingots and castings and spent $85 million on new capital manufacturing facilities. Projects underway included rebuilding a blast furnace, installation of a 5-stand 72 inch cold mill, and engineering for a new basic oxygen steel plant in Hamilton, Ontario.

Sydney Steel Corp. Ltd., Sydney, Nova Scotia, the only other integrated steelmaker had a capacity of 1 million tons per year. The installation of a continuous slab-caster was completed during 1974 as part of a modernization program begun in 1971. Of nine other steel plants mostly based on scrap, at least eight had expansion or modernization programs under construction in 1974. Total raw steel production was expected to expand by 6% in 1975.

**Lead.**—Canada did not use its full capacity for mine production of lead in 1974 and ranked only fourth in world production after the United States, the U.S.S.R., and Australia. Lead mine production in ores and concentrates dropped to 331,100 tons in 1974 from 387,800 tons in 1973. Output of primary refined metal decreased from 186,900 tons in 1973 to 125,200 tons in 1974. A strike at Cominco's Trail plant in British Colum-

bia from July 1 to October 31 cut refined metal production, and strikes or lockouts at the Cyprus Anvil, Brunswick, and Cominco mines limited mine production.

Yukon Territory was the leading producer among Provinces and Territories, providing 32% of the total. Other contributing areas were the Northwest Territories, 27%; British Columbia, 18%; New Brunswick, 15%; Newfoundland, 4%; Ontario, 3%; and three other Provinces, 1%.

The lead refining plant, at Trail, British Columbia, operated by Cominco produced 86,200 tons of lead, and the smelter at Belledune, New Brunswick, operated by Brunswick Mining and Smelting Corp. (64% owned by Noranda) produced 40,100 tons. Consumption of primary metal within Canada was estimated to be 75,000 tons in 1974.

Exports of refined metal decreased 37% to 71,700 tons, reflecting the loss of production by Cominco. Major markets were the United Kingdom and the United States. Exports of ores and concentrates maintained a level slightly above that of 1973, sending 194,100 tons of lead content abroad—58% to Japan, 13% to the United States, 10% to West Germany, and the balance to other European countries and Brazil. Imports of refined lead totaled 11,400 tons, which was larger than in previous years. Early in 1974 the U.S. International Trade Commission ruled against Canadian lead exporters in a dumping suit brought by The Bunker Hill Company against Canadian and Australian producers. The decision was appealed but a new hearing was not scheduled in 1974.

The two largest lead-producing mines in Canada, each with a production close to 90,000 tons of lead contained in concentrates, were the Pine Point mines of Cominco in the Northwest Territories and the Cyprus Anvil open pit operation at Faro in Yukon Territory. Other major lead producers were the Sullivan mine (Cominco) at Trail, British Columbia, with 1974 production estimated at 55,000 tons and the No. 12 and No. 6 mines of Brunswick Mining and Smelting Corp., New Brunswick, producing about 37,500 tons. Many of the large zinc mines in Ontario, Quebec, and Newfoundland produced lead concentrates as a substantial coproduct.

Feasibility studies were completed at the Polaris mine of Cominco on Little Cornwallis Island in the Northwest Territories and discussions were started with the Canadian Government concerning further development of the project. Ore reserves of 20 million tons were estimated to average more than 3% lead and 16% zinc. Exploration in the Yukon Territory continued with activity in the Vangorda Creek, Bonnet Plume, and Anvil Range areas.

**Molybdenum.**—Shipments of sulfides, ferromolybdenum, and oxide in Canada in 1974 were estimated to be 29.6 million pounds, slightly less than the 30.4 million pounds produced in 1973. The value of molybdenum production was estimated at $58.5 million. Domestic consumption was about 4.4 million pounds with the balance exported. Molybdenum demand exceeded supply with continued use in high-strength steel, especially pipeline material that can be welded under arctic conditions.

Production came from two sources mined primarily for molybdenum and from four copper mine producing molybdenum concentrate as a byproduct. The Endako mine of Placer Development Ltd. produced about 12 million pounds of recoverable molybdenum in concentrate and the Boss Mountain mine of Noranda produced about 1.8 million pounds after reopening early in 1974.

The byproduct producers were Brenda Mines Ltd. (Noranda) open pit copper-molybdenum operation at Peachland, British Columbia, 7.6 million pounds; Lornex Mining Corp. Ltd. (Rio Algom) open pit copper operation in the Highland Valley, British Columbia, 4.0 million pounds; Gibraltar Mines Ltd. (Placer Development) two open pits in the Cariboo District, British Columbia, 0.8 million pounds; and Gaspé Copper Mines, Ltd. (Noranda), with two mines near Gaspé, Quebec, 0.4 million pounds.

**Nickel.**—Production of nickel in Canada, the world's leading producer, was 262,200 tons in 1974 representing a 5% increase over 1973 production. Shipments exceeded production as producers reduced inventories to minimum working levels.

Nickel prices were increased three times during 1974 from a January price of $1.53 per pound for refined nickel to $2.01 at yearend.

INCO accounted for over 80% of the total nickel production with metal

deliveries of 549 million pounds. The high level of sales was the result of strong demand met by record production. INCO operated 12 mines in the Sudbury Basin of Ontario, 1 at Shebandowan, Ontario, and 3 mines in the Thompson area in Manitoba. Two smelters at Thompson and Sudbury and a nickel refinery at Copper Cliff were supplemented by refineries and rolling mills in other countries.

Falconbridge Nickel Mines Ltd., the second largest Canadian producer, delivered over 89 million pounds of nickel, excluding ferronickel, from its integrated complex near Falconbridge in the Sudbury area of Ontario and operated several other mines near Sudbury and one at Manibridge, Manitoba. Construction for the environmental improvement program continued, including work on a new sulfuric acid plant.

Sherritt Gordon Mines was the third nickel producer in Canada with a production of 26 million pounds including purchased ores and toll refining. The Lynn Lake mine was operated at 30% below its rated capacity, producing 6 million pounds of nickel and 3.2 million pounds of copper in concentrates. Sherritt Gordon's Fort Saskatchewan refinery was shutdown for 6 weeks because of a shortage of feed material; concentrates and matte from Australia were used to supplement domestic concentrates.

The Giant Mascot Mines Ltd. concentrator near Hope, British Columbia, was closed August 30, 1974, when ore reserves at the Giant Nickel mine were exhausted. Exploration on the Giant Nickel property is continuing. The Langmuir property of the Noranda group in northern Ontario produced concentrate containing 1.5 million pounds of nickel from ore that averaged 1.5% nickel.

**Silver.**—Mine production of silver dropped from the record rate of 47.5 million troy ounces in 1973 to 43.8 million troy ounces in 1974 valued at over $200 million. Canada retained its position as the leading silver-producing nation in the world with the U.S.S.R., Peru, Mexico, and the United States following closely, in that order.

Silver was produced in eight Provinces and two Territories with output and percentage as follows:

| Province | Thousand troy ounces | Percent of total |
|---|---|---|
| Ontario | 17,674 | 40.4 |
| British Columbia | 6,235 | 14.2 |
| Yukon Territory | 6,158 | 14.1 |
| New Brunswick | 4,382 | 10.0 |
| Northwest Territories | 4,252 | 9.7 |
| Quebec | 2,860 | 6.5 |
| Manitoba | 1,303 | 3.0 |
| Newfoundland | 647 | 1.5 |
| Saskatchewan | 227 | .5 |
| Nova Scotia | 27 | .1 |
| Total | 43,765 | 100.0 |

The largest producing mine was Ecstall Mining Ltd. at the Kidd Creek mine near Timmins, Ontario, recovering silver as a coproduct of copper, lead, and zinc concentrates. Other large producers were Brunswick Mining and Smelting Corp., Bathurst, New Brunswick; Mattabi Mines Ltd., Sturgeon Lake, Ontario; Cominco's Sullivan mine, Kimberley, British Columbia; United Keno Hill Mines Ltd., Elsa, Yukon; Echo Bay Mines Ltd., Port Radium, Northwest Territories; and Cyprus Anvil Mining Corp., Faro, Yukon. Each produced over 2.0 million ounces of silver. The major part of Canada's silver production was from zinc-lead or copper-lead-zinc ores but a few mines such as Echo Bay and United Keno Hill were primarily silver producers. Substantial contributions were made by nickel mines in the Sudbury District and by silver-cobalt mines in the Cobalt District of Ontario.

Silver refineries are operated by Canadian Copper Refiners (Noranda), Montreal East, Quebec, to recover silver from treatment of anode and blister copper; by Cominco, Trail, British Columbia, treating lead and zinc concentrates; and by the Royal Canadian Mint, Ottawa, Ontario, recovering silver from gold bullion. Refined metal production in 1974 included 19.4 million ounces from Canadian Copper Refiners and 6.6 million ounces from Cominco.

Exports of silver in ores and concentrates in 1974 totaled 19.4 million ounces valued at $62 million, with 56% going to the United States and 28% to Japan. Refined metal exports were 21.3 million ounces valued at $99.5 million with 97% going to the United States. Imports of silver were 28.7 million ounces valued at $122.7 million, 80% from the United States. The minting of Canadian Olympic coins containing 92.5% silver was started

in 1974; the issue will commemorate the Olympic Games to be held in Montreal in 1976. It was estimated that nearly 65 million ounces would be consumed to produce coins with a face value of $450 million. Estimated consumption of silver in Canada for all uses including coinage was 16,870,000 ounces in 1973 and 8,420,000 ounces in 1972.

**Uranium.**—Although renewed interest in uranium and increases in price stimulated exploration and plans for expansion, production in 1974, at 4,265 tons of $U_3O_8$, continued at about the same rate as in 1973.

The operating mines were the same as in 1973, Denison Mines Ltd. and Rio Algom Mines Ltd., both at Elliot Lake, Ontario and Eldorado Nuclear Ltd. at Uranium City, Saskatchewan. Denison started to expand its mill capacity from 4,000 to 6,400 tons of ore per day with completion expected in 1975. Rio Algom operated the Quirke mill at 4,000 tons per day and scheduled its expansion to 6,350 tons per day as well as planning to reopen the nearby Nordic mill with an eventual capacity of another 6,350 tons per day. Eldorado Nuclear operated at about one-half of capacity in 1974 but planned new mine development.

Gulf Minerals Canada Ltd. was preparing its open pit mine at Rabbit Lake, Saskatchewan, for operation in 1975. Agnew Lake Mines (Kerr Addison), Agnew Lake, Ontario, planned a pilot plant leaching operation for broken underground ore. Amok Ltd. announced its intention to develop its Cluff Lake, Saskatchewan, property to produce 1,800 tons per year of $U_3O_8$ by 1978.

Total production planned for 1975 was reported as 5,500 tons of $U_3O_8$ and by 1980 capacity was expected to reach 10,900 tons per year.

Canadian producers negotiated several export contracts during 1974 and in order to protect Canada's commitment to domestic nuclear power, the Canadian Government, late in 1974, announced safeguards to provide sufficient uranium for domestic use. Each producer was to be allocated a domestic reserve margin based on the ratio of its reserves to total Canadian reserves. Other restrictions on sales abroad were designed to protect Canadian technology and prevent use of material for nuclear explosives. Producers were thought to have almost 50% of their adjusted resources available for export or for expanded domestic needs after satisfying present commitments and legislated safeguard restrictions.[4]

**Zinc.**—Canada, the world's leading zinc producing country, mined 1.2 million tons of zinc in 1974, a 5% decrease from the record 1973 output. The value of zinc production, however, rose from $653 million in 1973 to $900 million in 1974; strong demand in the first half of 1974 maintained the favorable prices in effect at yearend 1973. Demand was sluggish in the fourth quarter and the LME price and parity differential dropped below the established producer prices.

Seven operating mines in Ontario produced about 422,000 tons of zinc in concentrates with the Ecstall Mine of Texasgulf mining the major portion. In the Northwest Territories, Pine Point Mines Ltd., continued its normal production of about 177,000 tons to give the Territories second rank among the Provinces and Territories. New Brunswick had three producing units with a total output of 159,000 tons. The Nigadoo River Mines Ltd. (Sullivan Group) resumed work late in the year after being shutdown since January 1972. Brunswick Mining and Smelting, despite interruptions due to labor problems, produced 121,000 tons of zinc in concentrate and Heath Steele Mines, produced 66,400 tons of concentrate containing an estimated 34,000 tons of zinc. Quebec reported seven zinc-producing mines for a total production of 125,000 tons. In the Yukon Territory, Cyprus Anvil Mining was the principal zinc producer with sales of 79,000 tons. Total production of Yukon Territory was 89,000 tons. British Columbia zinc production suffered from the strike at Cominco's Sullivan and H.B. mines. The output of the province dropped 39% to 83,000 tons. In Manitoba, Hudson Bay Mining & Smelting was the major producer refining 70,750 tons of zinc from its own 10 mines and from custom ores. Sherritt Gordon Mines, operated two mines, the Fox Lake and Ruttan, producing zinc concentrate for the Hudson Bay smelter and for export. The total output of the province was estimated to be 78,800 tons. Saskatchewan contains

[4] Department of Energy Mines and Resources, Canada. 1974 Assessment of Canada's Uranium Supply and Demand. August 1975, pp. 3–9.

part of the Hudson Bay properties and was credited with a production of 6,300 tons. In Newfoundland, the principal producer, the Buchans mine managed by ASARCO, produced an estimated 19,000 tons of zinc in concentrates, all for export.

One of the major new developments in Canada was the formation of Nanisivik Mines, to develop and mine a lead-zinc deposit on the northern end of Baffin Island in the Northwest Territories. Ownership is divided among Mineral Resources International Ltd. (in which Texasgulf has an interest), 59.5%; the Government of Canada, 18%; Metallgesellschaft A.G., 11.25%; and Billiton International Metals N.V., 11.25%. Ore reserves are estimated to be 6.9 million tons of ore containing 14% zinc, 2% lead, and 2 ounces per ton of silver.

Cominco participated in two possible new developments in the Northwest Territories. One was on the Bathurst Norsemines property near Bathurst Inlet where diamond drilling added substantially to the ore reserves, and the second was at the Polaris mine of Arvik Mines Ltd., on Little Cornwallis Island, where a feasibility study demonstrated that production would be economic under certain conditions.

Newfoundland Zinc Mines Ltd. (Teck Corporation 63%, Amax Inc. 37%) was planning to commence operations at the Daniels Harbor mine late in 1975 from ore reserves indicated to be 4.5 million tons averaging 8.8% zinc.

Exports of zinc in concentrates during 1974 increased by 4% over those of 1973 to 868,900 tons of zinc content. Exports of zinc metal as blocks, pigs, or slabs in 1974 were 295,400 tons, a 30% decrease from shipments in 1973, with 61% of the total destined for the United States.

Imports of zinc metal, unwrought, dropped from 18,500 tons in 1973 to 7,020 tons in 1974. Canadian consumption of slab zinc in 1974 was 169,000 tons, continuing the growth trend at a rate of 10% per year.

Canadian smelter production suffered a setback in 1974 caused by strikes at Cominco and at Canadian Electrolytic Zinc Ltd. (CEZ) a Noranda associate. The following table compares capacity with production:

| Company and location | Annual capacity (metric tons) | 1974 Production (metric tons) |
|---|---|---|
| Cominco Ltd., Trail, British Columbia | [1] 245,000 | 147,000 |
| Canadian Electrolytic Zinc Ltd., Valleyfield, Quebec | [2] 127,000 | 122,300 |
| Hudson Bay Mining & Smelting Co. Ltd., Flin Flon, Manitoba | 72,000 | 78,800 |
| Texasgulf Inc., Timmins, Ontario | [3] 109,000 | 97,900 |
| Total | 553,000 | 438,000 |

[1] Expansion to 272,000 tons by 1977.
[2] Expansion to 205,000 tons by 1975.
[3] Expansion to 136,000 tons by 1975.

## NONMETALS

**Asbestos.**—Canadian production of asbestos decreased 2.1% to a level of 1.7 million tons during 1974. Domestic values rose by about $77 million to $313.7 million an increase of almost 33% from the 1973 total. The strong increase in value despite a slightly declining production rate was attributed to firm market demand and a very tight supply situation. Asbestos was produced in four Provinces and the Yukon Territory. In Quebec, nine mines provided 85% of Canadian production. British Columbia and the Yukon each contributed 5% to the total with one mine operating in each region. The balance came from one mine in Newfoundland with 5% of the total and a single operation in Ontario. Canada remained the largest world producer of asbestos, providing 37% of the total world supply.

Exports of crude asbestos and milled fiber during 1974 totaled 1.6 million tons which was close to 94% of the total 1974 production. The value of export sales was about $339 million, reflecting very strong demand in world markets. Asbestos raw material was shipped to more than 70 countries throughout the world. Eleven countries accounted for 80% of the total shipments. The primary customers were the United States, 40%; West Germany and Japan, with 8% each; and the United Kingdom, 6%. Other customers in declining order of importance were

France, Spain, Belgium-Luxembourg, Australia, Brazil, Mexico, and Italy.

United Asbestos Inc. continued with development of its property near Matachewan, Ontario, to be in production by July 1975. Initial output was scheduled to be 35,000 tons per year, rising to full capacity of 100,000 tons per year by 1976. A serious setback to the industry was suffered when the Thetford, Quebec, mill of Asbestos Corp. Ltd. was destroyed by fire in December 1974. The low inventories of number 4, 5 and 6 fibers were aggravated by the resulting loss in production. Abitibi Asbestos Mining Co., Ltd., continued development of its prospect at Amos, Quebec. Proven ore reserves were estimated to be approximately 100 million tons assaying 4% fiber content. Product from this property could reach the market by 1978. Rio Algom Mines Ltd. stepped up evaluation and testing of a deposit on the property of the McAdam Mining Corp. Ltd. about 20 miles east of Chibougamau, Quebec. Estimated reserves exceed 186 million tons with a fiber content of over 3.5% asbestos.

**Potash.**—Production of potash in Canada during 1974 reached a record high of 5.5 million tons, an increase of 1.2 million tons or 24% when compared with 1973 production. The value of production in 1974 was approximately $306 million, an increase of $127 million, 72% over the 1973 total. All of the potash produced in Canada was mined and processed in the province of Saskatchewan.

The continuing requirement for additional food supplies throughout the world has increased demand for potash as a fertilizer with the result that the Canadian potash industry was operating at capacity wherever possible. The single curtailment of production in 1974 occurred in January when a serious plant fire forced Cominco to cease production for a period of 3 months. Inventories have declined from a 1974 high of 531,000 tons in January to a low of 106,000 tons in November. The latter figure represented only a 5-day production. Prices rose from a low of $11 per ton in 1969 to over $70 per ton in 1974. During 1974 the potash regulations (Saskatchewan, 1969) were raised five times to permit production at full capacity. On October 23 the Provincial authorities announced a new formula for calculation of tax on potash revenues. It was estimated that at a price of $60 per ton of $K_2O$ the new tax would yield the Provincial Government approximately $10 per ton of $K_2O$ equivalent. It was also announced that the Saskatchewan Government will assume full or majority ownership of all new potash mines in the Province.

Canada exported 95% of its potash production during 1974. The bulk went to the United States. Other customers included Japan, Belgium-Luxembourg, Brazil, India, South Korea, and the People's Republic of China.

The Potash Company of America (PCA) continued development drilling in New Brunswick following terms of an agreement signed in 1973 with the provincial government. Work on the property near Sussex, indicated continuation of a potash deposit according to PCA.

**Sulfur.**—Production of sulfur in Canada during 1974 totaled 8.0 million tons, virtually the same as 1973. Recovery of sulfur in the form of acid from smelter gases and pyrite remained fairly stable at about 760,000 tons. The balance of production was in the form of elemental sulfur generated in the refining of sour gas, petroleum, and other sources.

After a steady decline of prices from a high of $37 per ton in 1968 to a low of $5 per ton, f.o.b. Alberta plant, in 1973, tight supplies reversed the trend and prices rose to $30 per ton during 1974. Delays in bringing new worldwide capacity onstream, and problems with Canadian shipping were the immediate cause of short supplies.

Canada retained its position as the world's largest supplier of sulfur to international markets. During 1974 export sales increased 17% over those of 1973 to a record total in excess of 4.5 million tons. The United States imported over 1.2 million tons of Canadian sulfur during 1974, establishing a new record high. Offshore shipments also increased by 10% following a decline in 1973. During 1974 sulfur was exported to 29 countries of which 8 were responsible for 60% of the total. The United States was first, accounting for 27%, followed by Australia and Japan with 10% each. Italy received 8%, slightly more than the Republic of South Africa and New Zealand both of which accounted for 6%.

Elemental sulfur was produced at 45

plants with a combined yearly capacity of 9 million tons. One plant was located in Saskatchewan, 2 in British Columbia, and the remaining 42 in Alberta.

## MINERAL FUELS

**Coal.**—Canada's production of all types of coal during 1974, including bituminous, subbituminous, and lignite registered an increase for the fourth consecutive year. More than 21.0 million tons of clean coal were produced compared with approximately 20.5 million tons produced during 1973. This continued growth reflects a strong demand for coking coal from the western producing regions as well as utilization of steam coals from the prairie Provinces. The value of the 1974 production was approximately $270 million as compared with about $177 million in 1973. This increase of $93 million or 52% of the 1973 total can be attributed to some degree to increased production; however, prevailing high prices were the strong factor in overall gain. The bulk of metallurgical coal is exported to Japan. During 1974 exports totaled 11.9 million tons, a small increase from 1973 when 10.9 million tons were exported. Japan was the largest customer, receiving about 11 million tons or 92% of the total, followed by the United States, West Germany, and Denmark.

Canadian imports of coal during 1974 were virtually all from the United States. The total landed tonnage was over 12.3 million tons of which approximately 348,000 tons was anthracite and the balance bituminous. The bulk of the bituminous coal, 11.5 million tons, was consumed in Ontario. Most of this coal was metallurgical rank and was used to manufacture coke for consumption by the steel industry. A minor but significant portion of the coal was utilized in Ontario and Quebec for the production of electricity. The province of Quebec was the main consumer of anthracite coal, accounting for 278,000 tons or some 80% of the total. The principal use of anthracite coal in Canada is for specialized industrial applications.

Five Provinces produced coal during 1974. The largest tonnage was mined in Alberta with 8.9 million tons amounting to approximately 42% of the total Canadian output. Subbituminous coal accounted for 5.7 million tons, 64% of Provincial production, and was used exclusively for power generation. The remaining tonnage was composite medium and low-volatile bituminous coal which was shipped to Japan.

The second largest coal producing Province was British Columbia with 7.5 million tons, 36% of the national total. This coal was all low-volatile bituminous and was shipped to Japan. Saskatchewan was third, mining 3.4 million tons of lignite. All of this low-grade coal was used for power generation, principally in Saskatchewan with some tonnage shipped to Manitoba for its two powerstations. Fourth in the order of coal producing Provinces was Nova Scotia with 1.3 million tons or 6% of the national total. Nova Scotian coal falls in the rank of high-volatile bituminous and is used for both coking and thermal applications.

Continued expansion of the Canadian coal industry was the keynote through 1974 as production, exploration, and marketing efforts were increased. The major effort was in the western producing Provinces. The prairie Provinces were also active as they prepared to meet the needs of expanding energy requirements. Development of reserves in mainland Nova Scotia and Cape Breton Island was programed to increase future output.

The principal operating companies were in British Columbia; these were Kaiser Resources Ltd., with two producing mines in the Crows Nest Field and Fording Coal Ltd. with a surface operation in the Upper Elk Field. Kaiser Resources, which is 30.2% owned by Mitsubishi Corporation, operated a complex open pit and underground mining system which produced in excess of 4.4 million tons of clean coal during 1974. Most of the tonnage was shipped to Japan. In addition, during 1974 Kaiser Resources also shipped 28,000 tons to the Stelco, and 20,000 tons to Dofasco, both in Hamilton, Ontario, for evaluation as a domestic source of coking coal. The company has commenced a $3.5 million expansion program to develop a reserve of 1.5 million tons at its open pit mining operation.

Fording Coal, owned 60% by Canadian Pacific Investments and 40% by Cominco, shipped about 1.7 million tons during 1974 as compared with 2.0 million tons in 1973. The drop in production was the result of a 7-week strike by the mine workers. Virtually all of the coal was

consigned to Japanese steel makers. A trial shipment of 10,000 tons was shipped to The Algoma Steel Corp., Ltd.

Exploration for coal in British Columbia continued through 1974. Rio Tinto Canadian Exploration Ltd. (Riocanex), a subsidiary of Rio Algom Mines Ltd., continued work near the Montana border in the Flathead region. Other companies active in the area included Crows Nest Industries Ltd., Scurry-Rainbow Oil Ltd., and its partner Emkay Canada Natural Resources Ltd.

Coking coal is produced in Alberta by McIntyre Mines Ltd., Cardinal River Coals Ltd., Coleman Collieries, and the Canmore Mines Ltd. During 1974, McIntyre Mines produced approximately 1.4 million tons of clean coal from one underground and two open pit mines on the Smoky River property near Grande Cache, Alberta. The largest part of this production was shipped to Japan. Cardinal River Coals Ltd., owned jointly by Consolidation Coal Company of Canada and Luscar Ltd., produced 744,000 tons of coking coal at the Luscar colliery. All of this production was shipped to Japan. Expansion of production to 2.5 million tons per year beginning in 1975 has been announced. Coleman Collieries Ltd. operated two underground and one surface mine during 1974 producing a total of 794,000 tons of clean coal. About 90% of this output was exported to Japan. Preproduction stripping was carried out on the Tent Mountain property and initial mining operations are scheduled to commence during 1975. Canmore Mines Ltd. continued production during 1974 with a total of about 170,000 tons of which some 80% was shipped to Japan.

In the plains region of Alberta, mining of subbituminous coal was expanded to meet electrical demand. Manalta Coal Ltd. produced a total of 4.4 million tons of coal to supply the Calgary, Sundance, and Battle River powerstations during 1974. Forestburg Collieries Ltd. also produced about 544,000 tons of thermal coal which was utilized at the Battle River powerplant. Exploration continued in Alberta during 1974. McIntyre Mines Ltd. entered into an agreement with Meadowlark Farms, Inc., a subsidiary of Amax Coal Co., New York, for evaluation and development of the Copton property. Consolidation Coal Company of Canada completed studies on its Brazeau project near Nordegg. Consolidation Coal also announced production plans for 1.4 million tons of clean coking coal over a 15 year period at the Nordegg mine pending an operating permit from the Government of Alberta. During 1974, four mines in the Estevan-Bienfoit region produced about 3.4 million tons of lignite for thermal power generation. The Manitoba and Saskatchewan Coal Co. Ltd. contributed about 2 million tons from the Boundary Dam and M & S mines. The balance was mined by Manalta Coal Ltd. from its Utility Coals Ltd. mine and the Klimax operation.

In the east a total of 2 million tons was produced in the provinces of Nova Scotia and New Brunswick. In Nova Scotia the Cape Breton Development Corp. (DEVCO) of Sydney produced 1.6 million tons of coal at the Lingan and No. 26 mines. Expansion programs continued at both mines. It was anticipated that 1975 production will reach a level of 2.5 million to 3 million tons as a result of mine improvements. During 1974 DEVCO began construction of a new preparation plant at Grand Lake. This plant was designed specifically for production of low-sulfur coal and was scheduled to come on-stream in 1976.

Coal was mined in New Brunswick in the Minta-Chipman area by N.B. Coal Ltd. In 1974 six surface mines produced about 354,000 tons.

**Petroleum and Natural Gas.**—Production of crude oil in Canada during 1974 declined for the first time since 1958. The drop in production was attributed to newly established government regulations which reduced shipments of oil and gas to the United States. The value of crude oil, natural gas, and natural gas liquids, however, reached an alltime high of $4.9 billion, 60% higher than the record established in 1973. This sharp increase in revenue was the result of a rise in prices.

Average production of crude oil including synthetic oil and natural gas liquids totaled 1.9 million barrels per day during 1974, a drop of 5.5% from the record production level of 1973. Of the total annual crude oil and equivalent production, 99% was provided by the provinces of Alberta, Saskatchewan, and British Columbia.

Total demand for crude oil by Canadian refiners decreased slightly to 1.7 million barrels per day of which 900,000 barrels was supplied by Canadian sources. This represents an increase in demand for domestic crude oil of 9% over the 1973 requirements and was accounted for by shipments of approximately 86,000 barrels per day to refineries in Quebec and the Maritime Provinces. This unprecedented eastward movement was precipitated by a partial embargo on exports of crude oil to Canada, levied by Arab producing States. Use of imported oil by Canadian refiners during 1974 dropped to 760,000 barrels per day, a decrease of 11% from 1973.

The decline in use of imported crude oil was supplemented by increased shipment of domestic production made possible by curtailment of Canadian exports to the United States. Shipments to the United States were reduced by 220,000 barrels per day, a drop of 19% from the 1973 average. The refiners east of the Rocky Mountains received about 735,000 barrels per day, a loss of 159,000 barrels per day as compared with 1973 shipments. West of the Rockies refiners received 195,000 barrels per day, a decline of 62,000 barrels per day when compared with 1973 figures.

In summary, Canada remained a net exporter of crude oil and products in 1974, although at a somewhat reduced level from that of 1973. Annual exports exceeded imports by 105 million barrels or 287,000 barrels per day. By the end of 1974, Canada's crude oil refining capacity was in excess of 2 million barrels per day, an increase of about 167,000 barrels per day. This increase was due entirely to expansion of existing facilities as no new plants were constructed during the year. The petroleum refining industry totaled 40 refineries in 9 Provinces and 1 small operation in the Northwest Territories. Quebec was the largest producer with 32% of the total. Ontario was second with 26%, followed by Alberta and Nova Scotia each with 9%, British Columbia with 7%, New Brunswick 6%, and Newfoundland 6%. The balance came from Saskatchewan and Manitoba along with a nominal amount from the Northwest Territories.

Production of natural gas in Canada during 1974 declined to 8.4 billion cubic feet per day as compared with 8.5 billion cubic feet per day in 1973. Value of production was $692 million as compared with $455 million in 1973. This substantial increase in return was attributed to a near doubling of wellhead prices during the year. During 1974 export sales of natural gas to the United States declined to 2.48 billion cubic feet per day, a reduction of 343 million cubic feet per day from the 1973 level. The total amount exported was the maximum allowed by the National Energy Board less some cutbacks in deliveries by West Coast Transmission Company Ltd. due to production problems in several of the western fields. By yearend 1974 there were close to 19,000 proven wells with an estimated reserve total of 80 trillion cubic feet of marketable gas, located in 6 Provinces and the Northwest Territories.

Alberta Province was the largest producer, accounting for about 90% of the total. There were 209 gas processing plants in operation during 1974 of which 188 were located in Alberta. Saskatchewan had 9 plants, British Columbia 6, Ontario 5, and the Northwest Territories 1 plant. Natural gas pipelines totaled over 71,600 miles in 1974. This pipeline network provided linkage for gathering, transmission, and distribution to and from 10 Provinces and the Northwest Territories. The pipelines also service delivery at nine connecting points along the United States border, which serve as export terminals.

Exploratory and development drilling in Canada declined during 1974. Most of the drilling was conducted in the Western Provinces, particularly Alberta. No significant discoveries of oil or gas were realized. Exploration continued in the northern regions, both on the mainland and at offshore drilling stations. A new technique in the construction of manmade islands, composed either of gravel or ice, has extended the search seaward with considerable success. Drilling of the Mackenzie Delta continued through 1974. Since the inception of this program in 1965, three major gasfields and one oilfield have been discovered. One of these, the Taglu Field on Richards Island was initially discovered in 1971, with subsequent stepout drilling proving in over 3 trillion cubic feet of gas. Other important gas discoveries have been made at Mallik, Ya Ya, Reindeer, Titalik, Niglintgak, and Adgo with oil discoveries

reported at Ivik, Kugpik, and Kumac.

Potential gas reserves in the Canadian Arctic are estimated to be in excess of 300 trillion cubic feet. The cost of exploration, development, and transportation is very high; however, it is expected that increase in wellhead prices will prove an incentive for pipeline construction to eastern Canada and the United States market by 1980.

Exploratory offshore drilling on the Canadian east coast continued through 1974. Although the drilling results on the Scotian Shelf and Grand Banks were disappointing, industry interest was revived by significant discoveries on the Labrador Shelf by Gulf Oil Canada Ltd., about 200 miles north of St. Johns, Newfoundland. Two wells, the Bjarni H–81 and the Gudrid H–55 had test flow rates of 13 million and 20 million cubic feet daily, respectively. These wells were the first completed on a 30-million-acre block which will be further tested during 1975.

In addition to the traditional sources of mineral fuels, Canada also possesses a supplemental source in the form of the Athabasca tar sands. The first company to invest in this potential energy source was Great Canadian Oil Sands Ltd. (GCOS), controlled by Sun Oil Company. Commercial operations began in 1968 and the company operated at a loss until 1974 when a profit of $4 million was recorded. Output of synthetic crude oil during 1974 was at the rate of some 46,000 barrels per day, a drop of about 9% compared with that of 1973. The loss in production was attributed to mechanical difficulties, and future recovery is expected to reach official capacity of 65,000 barrels per day.

In addition to GCOS, three additional companies have been formed to further develop the potential of oil sands.

Syncrude Canada, Ltd., controlled by Imperial Oil Ltd., 30%; Atlantic Richfield Canada Ltd., 30%; Canada-Cities Service Ltd., 30%; and Gulf Oil Canada Ltd., 10%, has received approval to construct a plant which will yield 125,000 barrels per day. Estimated cost is $1 billion and production was scheduled to commence in 1977. Shell Canada Ltd., and Shell Explorer Ltd., controlled by Royal Dutch/Shell Group of Companies proposed a plant to produce 100,000 barrels per day commencing in 1980, reaching full-scale operation by 1982. The estimated cost of the project in terms of 1974 dollars was placed at $680 million. Petrofina Canada Ltd., controlled by Petrofina, S.A., Brussels, Belgium, also approached the Government of Alberta, seeking permission to build a plant to produce 122,000 barrels of synthetic oil per day and to be operational by 1982. Cost of the project is estimated to be $1.4 billion.

# The Mineral Industry of Chile

By George J. Coakley [1]

Chile ranked as the world's second largest producer of copper and iodine, third in molybdenum, and eighth in silver in 1974. Mineral industry exports, including iron ore and nitrates, accounted for 84% of all exports in 1974. Copper exports alone accounted for approximately 75% of the country's foreign exchange earnings. With identified copper reserves estimated at nearly 9 billion tons of ore containing up to 100 million tons of copper, the Chilean copper industry will continue to play an important role in the domestic and world economies for years to come. Production of nearly all mineral commodities increased during the year, while the output of some mineral fuels continued to decline. Chile showed an overall favorable mineral trade balance despite a drop in copper prices in the second half of 1974 and the purchase of over $300 million in crude petroleum imports.

In actions attempting to bolster the depressed world copper market, Chile as a member of the Conseil Intergouvernemental Des Pays Exportateurs De Cuivre (CIPEC) agreed to cut all copper exports by 10% effective December 1, 1974. To help this cutback Corporación del Cobre de Chile (CODELCO) announced a 6-month suspension of mining operations at Exótica at yearend.

In a major step towards encouraging a renewed foreign investment climate, the new Chilean Government proclaimed Foreign Investment Law (Decree Law 600) on July 11, 1974. The new law allows for negotiated contracts and guarantees foreign investors the right to repatriate the return of capital invested and profits obtained and that taxes as stated in the contracts will not be modified. In a second step to improve the investment climate, Chile settled all outstanding litigation and agreed to pay $384 million in compensation to the three major foreign copper companies whose mines were expropriated by the Chilean Government in 1971.

**Government Policies and Programs.**—In an effort to promote renewed foreign capital investment in Chile and to stimulate the growth of industries vital to economic and social development, the Government promulgated a new Foreign Investment Law, Decree Law 600, on July 11, 1974. This law permits foreign investment in new or existing companies with acquisition or investment in certain state-owned companies allowed until December 31, 1975. It guarantees the availability of foreign exchange, the right to remit an agreed-upon percentage of capital and profits, and the right to compensation in cases where the status of the foreign investor is changed by legislation or any other discriminatory circumstance. The Foreign Investment Committee established by the law is empowered to negotiate freely with each foreign investor, to reduce taxation if the rates affecting the foreign investor in Chile are higher than those internationally acceptable, and to authorize the import of capital goods partly or totally free of duties. Duration of normal contracts specified as up to 10 years, with special contracts of 20 or more years subject to the approval of the Committee. Taxes on natural resource investments as specified in a contract will not be modified during the life of the contract.[2]

CIPEC, comprised of Chile, Peru, Zaire and Zambia, was established in 1967 to

[1] Physical scientist, Division of Nonferrous Metals.

[2] Price Waterhouse & Co. Doing Business in Chile, Information Guide. January 1975, 68 pp.

coordinate the unified promotion of profitable copper production and marketing practices and policies. In 1974 the CIPEC countries accounted for approximately 31% of world mine production and 52% of world trade in refined copper of which Chile contributed 12% and 17%, respectively. Key actions made by CIPEC in 1974 to counteract the sharp fall in copper prices included discussions with the U.S. Government on the orderly disposal of the U.S. copper stockpile and negotiations with Japanese Government and copper industry officials which led to the suspension of reexports of excess Japanese copper back to the world market. In November the CIPEC ministers met in Paris and agreed, effective December 1, 1974, to cut back all copper exports by 10% in comparison with the levels achieved during the previous 6 months. This quota represented a total reduction in CIPEC country shipments of 17,500 tons of copper per month,[3] of which Chile's share should be 7,500 tons per month.

## PRODUCTION

Increased labor productivity and the stimulus provided by a realistic foreign exchange policy led to a marked increase in 1974 production in nearly all major mineral commodities except for the mineral fuels. In 1974 Chile ranked second in world production of copper, third in molybdenum and eighth in silver. Smelter and refinery outputs of copper increased 23% and 30% respectively. Total mine production of copper and iron ore increased 23% and 9%, respectively. Improved operation of Chile's three molybdenum plants yielded a 1974 output double that of 1973. Net crude fertilizer materials increased 7% as production of sodium nitrate and phosphatic guano increased 22% and 43%, respectively, while potassium nitrate decreased 51%. Iodine production rose slightly by 3%. Affected by diminishing economic reserves of petroleum and a shortage of production facilities, 1974 mineral fuels production levels decreased 5% in natural gas and 12% in petroleum. Coal production increased 7%.

[1] In addition to the commodities listed, lime, pyrites, and selenium are produced but available information is inadequate to make reliable estimates of output levels.

[2] Data given are the nonduplicative copper content of ores, concentrates, precipitates, metal, and other copper-bearing products measured at the least stage of processing reported in available sources.

[3] Figures presented are total blister and equivalent copper output including that blister subsequently refined in Chile and copper which is produced by electrowinning. Material produced for refining at Ventanas smelter is included.

[4] Figures presented are total refined output, distributed into two classes according to method of refining; output of Ventanas refinery is included.

[5] Excluding castings.

## TRADE

Copper export revenues were $1.57 billion for 1974, compared with $1 billion in 1973. This mineral commodity continued to contribute over 75% of Chile's foreign exchange earnings. While the average price received for Chilean export copper in 1974 was about 83 cents per pound, the sharp drop in London Metal Exchange (LME) copper quotations from a high of $1.52 in April to 53 cents at yearend represented a significant loss of potential revenue to the economy of Chile. CIPEC estimated the loss in export revenue to Chile at the rate of $20 million per year for each 1 cent reduction in price, for a total loss of over $1 billion in 1974.[4 5]

Major export shipments of copper in 1974 went to West Germany, Japan, the United States, the United Kingdom, and Italy. In addition significant amounts were also exported to the People's Republic of China (PRC), Canada, France, Brazil, and Argentina. Iron ore followed forest products as the third most important foreign exchange earner with 88% of the 1974 production exported for a value of $73 million. Next in trade importance was molybdenum with over 9,300 tons of exports worth an estimated $11 million. Chile earned approximately $67 million from nitrate and iodine exports, which represented 67% of sodium nitrate production, 74% of potassium nitrate production, and 114% of byproduct iodine production.

Exports of nitrate fertilizer commodities totaled 497,100 tons valued at $51,610,000, compared with 419,900 tons valued at $23,638,000 in 1973. Sodium nitrate exports went chiefly to Western Europe ($18 million), the United States ($13.8 million), and the PRC ($5.1 million). Shipments of potassium nitrate valued at $3.4 million went to the United States, and shipments valued at $1.3 million went to the PRC.

The country's balance of trade payments were seriously affected by increased petroleum prices and the necessity of importing 75% of 1974 requirements. Imports of 28.2 million barrels of crude petroleum cost $338 million, compared with 24.4 million barrels costing only $120 million in 1973.

Detailed trade data for 1973 and 1974 were not available at the time this chapter was written. The latest trade statistics available are those for 1972, and are contained in the 1973 Minerals Yearbook chapter.

## COMMODITY REVIEW

### METALS

**Copper.**—In its first full year of control, the new Chilean Military Government achieved a record copper production and promoted a renewed foreign investment climate. In addition to the new Decree Law 600, the Government settled all litigation and outstanding claims for compensation for the expropriation of privately owned mines in 1971. Cerro Corp. received an agreement for compensation of $41.9 million for its expropriated interests in Cia. Minera Andina, S.A. In July 1974, Chile agreed to pay The Anaconda Company $253 million, $65 million in cash and $188 million in promissory notes payable over 19 equal semiannual installments beginning in February 1975, for its interests in the Chuquicamata and El Salvador mines. In October 1974, Kennecott Copper Corp. received a net compensation for the takeover of its interests in Sociedad Minera El Teniente, S.A., of $68 million; $6.5 million was payable in cash and the remaining $61.5 million in 19 semiannual installments beginning in April 1975.

In December, Chile reimbursed the U.S. Overseas Private Investment Corp. $18.6 million for insurance payments paid to Anaconda for its expropriated interests in the Exótica mine, concluding all outstanding obligations on the part of the Government.

In conjunction with these actions the Foreign Investment Committee began soliciting bids for new foreign investment participation in the further exploration and development of the country's copper resources, which at yearend included eight known deposits with estimated combined

[4] U.S. Embassy, Santiago, Chile. State Department Airgram A-53, Mar. 31, 1975, 23 pp.
———. State Department Airgram A-107, June 25, 1975, 5 pp.
[5] Work cited in footnote 3.

ore reserves of 4 billion tons with a likely average grade of 0.8% copper. The committee is considering investment offers from over 12 companies with the cutoff date for bids on these deposits set at March 30, 1975. The four main properties being considered for development first include El Abra, with ore reserves reportedly estimated at 1 billion tons of 0.9% copper; Los Pelambres, with 430 million tons of 0.78% copper and 0.033% molybdenum; Andacollo, with a minimum estimated reserve of 100 million tons of 0.7% copper; and the Quebrada Blanca deposit. Other important deposits awaiting further exploration include Cerro Colorado, Mocho, Pampe Norte, El Salado, El Loicho, and Sierra Gorda.

Table 2 lists the main operating units responsible for the overall 23% increase in 1974 copper mine production. Cia. de Cobre Chuquicamata smelters and refineries produced 225,900 tons of electrolytic copper and 268,100 tons of blister copper, increases of 36% over the 166,100 tons of electrolytic and 38% over the 193,600 tons of blister copper produced in 1973. The purchase of new equipment and spare parts alleviated some of the problems encountered in 1973. Mine and mill operations were at near-capacity performance of 1,000 tons per day; however, a bottleneck at the smelter prevented attainment of its design capacity of 350,000 tons of copper per year. The smelter, which was designed for sea level, does not run efficiently at the mines 7,500-foot altitude. Plans underway to improve the present installation and to construct a new smelter would bring capacity up to 400,000 tons of copper.

In the interim, excess Chuquicamata concentrates are being treated in the Empresa Nacional de Minera (ENAMI) smelters at Ventanas and Paipote and at Cia. de Cobre El Salvador S.A.'s Potrerillos smelter. At the beginning of 1974 it was estimated that about 1.5 billion tons of proven ore grading 1.3% copper remained at Chuquicamata, with two to three times as much ore available at a 0.56% copper cutoff grade.

**Table 2.—Chile: Copper mine production, 1973–74**
(Metric tons, copper content)

| | 1973 | 1974 | Change, percent |
|---|---|---|---|
| CODELCO: | | | |
| Chuquicamata | 265,300 | 356,800 | +34 |
| Exótica | 31,800 | 32,200 | +1 |
| El Salvador | 84,000 | 80,000 | −5 |
| El Teniente | 178,100 | 225,500 | +27 |
| Andina | 56,100 | 68,400 | +22 |
| Total | 615,300 | 762,900 | +24 |
| Medium and small mines: | | | |
| Mantos Blancos | 28,900 | 32,200 | +11 |
| ENAMI | 73,300 | 71,200 | −3 |
| Disputada | 8,400 | 25,900 | +208 |
| Others | 9,500 | 9,900 | +4 |
| Total | 120,100 | 139,200 | +16 |
| Grand total | 735,400 | 902,100 | +23 |

Source: Corporación del Cobre. Departamento Estudios, Gerencia De Ventas Estadisticas: Producción y Exportacónes Chilenas, Año 1974.

Production at Exótica remained steady at 32,100 tons of electrolytic copper, representing only one-third of the 100,000-ton-per-year design capacity. Effective December 1, 1974, the Exótica mine was shutdown for a planned 6-month period to help meet the 10% reduction in copper exports agreed to by the CIPEC members. The high production costs at Exótica, estimated by a trade source at not less than 65 cents per pound, were also a factor in the closing.[6] Ore reserves at Exótica are estimated at 155 million tons of 1.35% copper. While the mine is closed, work will continue on the construction of a new solvent extraction plant to treat the complex oxide ore and to bring production up to original design levels.

El Salvador produced 63,257 tons of electrolytic copper at its Potrerillos refinery and 80,000 tons of blister copper; this was comparable to the 1973 electrolytic

[6] Work cited in second reference footnote 4.

output of 63,500 tons but a 5% decrease from 1973 blister production of 84,000 tons. The overall reduction in output is attributed to operations moving into a harder ore body than expected. Design capacity at El Salvador is 90,000 tons of copper per year. Ore reserves are estimated at 300 million tons of 1.25% copper.

Sociedad Minera El Teniente production of fire-refined copper at its Caletones refinery increased 61% to 85,200 tons, compared with 52,800 tons produced in 1973. An additional 87,800 tons of electrolytic copper was produced from El Teniente feed at the Ventanas refinery, an increase of 122% over 1973. Blister copper production from El Teniente concentrates increased 27% to 225,400 tons, compared with 177,900 tons in 1973. Output, however, was still only 84% of the rated capacity of 270,000 tons per year. The new reverberatory furnace came onstream in March 1974, eliminating some of the problems which held down blister copper output in 1973. Ore reserves at El Teniente, the world's largest underground copper mine, are estimated at 3.5 billion tons of 0.9% copper, including 350 million tons of 2.0% copper ore.[7]

Cia. Minera Andina, following the compensation agreement with Cerro Corp., continued to receive engineering consultation and technical services from Cerro. Production in 1974 of 68,400 tons indicated that the underground block-caving and concentration operations were working at full capacity. Ore reserves at Andina (Rio Blanco) are reported as 120 million tons of 1.6% copper.

ENAMI, the Government-controlled consortium of medium- and small-size mines, stopped marketing its copper through CODELCO in late 1974, and is now empowered to sell its output directly to consumers abroad. Development work on the $140 million open pit copper project at Andacollo continued during the year. Expansions were also underway to bring copper production at the Las Ventanas refinery up to 180,000 tons per year by 1976, with capacity eventually planned for 204,000 tons per year. Empresa Minera de Mantos Blancos, with ore reserves of 20 million tons of 1.6% copper, began trial underground mining operations and announced plans to invest $7 million to step up processing capacity by an additional 20 million tons of ore by 1984. Mantos Blancos increased production of fire refined copper 8% to 25,000 tons. Rebounding from the strike-troubled 1973 production year, Cia. Minera Disputada de las Condes S.A. (Disputada) produced a near-full-capacity 25,900 tons of blister copper in 1974. Ore reserves at the Disputada mines are estimated at 100 million tons of 1.4% copper.

Sociedad Minera Pudahuel Ltda., a medium-size copper complex near Santiago, announced plans to spend $40 million over the next 2 years to expand production of its Lo Aguirre copper deposits from 570 tons per day to 3,000 tons per day.

**Iron Ore.**—Production of iron ore totaled 10,292,000 tons, 10% greater than that in 1973. Chile ranked 14th in world iron ore production. Shipments of iron ore by Cia. de Acero del Pácifico, S.A. (CAP) exceeded 10 million tons for the first time. Increased shipments were reported from all mines; El Romeral accounted for the largest increase, 15%. Japan continued as the principal recipient with 83% of the total shipments, 6% more than in 1973. Shipments to the United States were 37% greater than in 1973, and deliveries to the Huachipato steel complex for domestic consumption were up 15% in 1974. Domestic and foreign shipments by mines are shown in table 3. CAP continued construction of a Japanese-financed iron ore pelletizing plant at Algarrobo. However the remainder of the Huasco Valley expansion project, including the development of a 3-million-ton-per-year iron ore mine at Bogueron Chanar and the expansion of port facilities at Guacolda, has been halted due to a lack of local currency financing. CAP is meanwhile conducting a feasibility study for a mining facility at the major Cerro Negro iron ore deposits in northern Chile.

[7] Sutulov, A. Copper Porphyries. The University of Utah Printing Services, Salt Lake City, Utah, 1974, p. 30.

Table 3.—Iron ore shipments by CAP in 1974
(Metric tons)

| Mine and product | Quantity |
|---|---|
| Romeral Division: | |
| Blast furnace ore to Japan | 1,410,911 |
| Blast furnace ore to Argentina | 47,531 |
| Blast furnace ore to CAP steel mill | 1,042,785 |
| Fines to Japan | 1,289,918 |
| Total | 3,791,145 |
| Santa Barbara-Santa Fe Division: | |
| Run-of-mine ore to Japan | 2,809,437 |
| Run-of-mine ore to Europe | 266,601 |
| Blast furnace ore to United States | 321,829 |
| Blast furnace ore to Argentina | 23,370 |
| Open hearth furnace ore to United States | 15,205 |
| Open hearth furnace ore to CAP steel mill | 35,784 |
| Total | 3,472,226 |
| Algarrobo Division: | |
| Blast furnace ore to Japan | 1,642,810 |
| Fines to Japan | 1,450,862 |
| Total | 3,093,672 |
| Total shipments by destination: | |
| Japan | 8,603,938 |
| United States | 337,034 |
| Europe | 266,602 |
| Argentina | 70,901 |
| CAP Huachipato steel mill | 1,078,569 |
| Total | 10,357,044 |

Source: Skillings' Mining Review. V. 64, No. 12, Mar. 22, 1975, p. 9. (Original data in long tons converted at a factor of 1 long ton equals 1.01605 metric tons.)

**Iron and Steel.**—Production of steel ingots totaled 635,300 tons, 17% more than in 1973. CAP, which accounts for about 94% of total output, operated at full capacity, producing 596,600 tons compared with 580,100 tons in 1973. Finished and semifinished steel mill products manufactured by CAP totaled 543,400 tons, 25% more than 435,000 tons produced in 1973. Total pig iron and cast iron production increased 16% in 1974 to 532,400 tons. Total domestic iron and steel shipments were 514,400 tons.

CAP plans to increase capacity at the Huachipato plant to 1 million tons following installation of continuous-casting equipment by late 1975 or early 1976.[8]

**Molybdenum.**—Chile attained third rank in the world in molybdenum production by more than doubling output to 9,757 tons of metal contained in 17,587 tons of concentrate. In addition, 1,460 tons of ferromolybdenum and 2,540 tons of molybdenum oxide were produced. Total production was recovered as a byproduct of copper operations at the Chuquicamata, El Salvador, and El Teniente plants. CODELCO continued plans to expand the Chuquicamata molybdenum plant and to increase production capacity to 13,600 tons per year. The expansion is scheduled for completion in late 1975 at a cost of $20 million and will also make Chile an important producer of rhenium. Chilean reserves of molybdenum contained in copper ores are estimated at over 2 million tons.

**Precious Metals.**—Gold production increased 21% to 118,829 troy ounces. Gold and silver ores accounted for 33% of the total gold output, and 67% was recovered as a byproduct of copper production. Production from copper ores increased 55% over that of 1973, more than offsetting a 28% decline in output from gold-silver ores.

Production of silver increased 32% to 6.65 million troy ounces, making Chile the world's eighth largest producer. Nearly 98% of the output was a byproduct of copper production. Lead-zinc ores and gold-silver ores each contributed about half of the remaining output.

## NONMETALS

**Cement.**—Chile is nearly self-sufficient in cement. Domestic production in 1974 increased over 3% to 1.43 million tons of portland cement. The scheduled opening of

[8] U.S. Embassy, Santiago, Chile. State Department Airgram A-41, Feb. 27, 1975, 10 pp.

Chile's fourth cement plant, INACESA, in early 1975 should allow Chile to become a modest exporter of cement to other Latin American countries within a year or two.

**Iodine.**—Production of iodine increased 3% in 1974 to 2,273 tons as Chile maintained its position as the world's second largest producer after Japan. Iodine was recovered as a byproduct of nitrates at three plants owned by Sociedad Quimica y Minera de Chile (SOQUIMICH).

**Nitrates.**—Nitrate production included 664,185 tons of sodium nitrate and 74,615 tons of potassium nitrate. Output of sodium nitrate was 22% greater than in 1973, but potassium nitrate production decreased 51%. Exports of sodium nitrate totaled 441,959 tons, compared with 349,608 tons in 1973. Of the total, 41% was shipped to Western Europe, 28% to the United States, and 11% to the PRC. Shipments of potassium nitrate totaled 55,177 tons in 1974; 48% went to the United States, 32% to the PRC, and 13% to Brazil. In late 1974 SOQUIMICH began plans for a $35 million expansion and modernization program. The expansion is expected to increase nitrate production to 850,000 tons in 1975 and to 950,000 by 1976, while iodine production is expected to increase about 14% to 2,600 tons per year. Construction of a new $10 million refinery for fine caliche is also included in the proposed expenditure.

## MINERAL FUELS

**Coal.**—Production of coal in 1974 totaled 1.52 million tons, a 7% increase over that of 1973. Receipts of metallurgical coal by CAP, which accounted for most of Chile's steel production, were 222,000 tons of domestic and 227,000 tons of imported coking coal, compared with 187,000 tons and 252,500 tons, respectively, in 1973. With lignite reserves estimated at 5 billion tons, Chile is watching the development of coal gasification technology very closely with the hope of exploiting this source of fossil fuel energy in the future.

**Petroleum and Natural Gas.**—Empresa Nacional del Petroleo (ENAP) completed 441 kilometers of reflectivity seismic exploration profiles in 1974, compared with 404 kilometers of reflectivity profiles in 1973. Drilling activity increased slightly. Sixty-seven holes with a cumulative length of 150,000 meters were drilled, compared with 65 holes and 136,216 meters in 1973. Magallanes Province accounted for 59 holes and 143,131 meters of the total length drilled; the remainder was in the south-central zone. The type of holes drilled and drilling results follow:

| Type of well | Number of completions | | | |
|---|---|---|---|---|
| | Petroleum | Gas | Dry | Total |
| 1973: | | | | |
| Exploration | 1 | 2 | 17 | 20 |
| Extension | -- | 1 | 3 | 4 |
| Development | 12 | 6 | 23 | 41 |
| Total | 13 | 9 | 43 | 65 |
| 1974: | | | | |
| Exploration | -- | 1 | 24 | 25 |
| Extension | -- | 1 | 5 | 6 |
| Development | 12 | 3 | 21 | 36 |
| Total | 12 | 5 | 50 | 67 |

Gross withdrawals of natural gas by ENAP totaled 248,687 million cubic feet, 5% less than in 1973. Mainland fields supplied 62% of the total, and Tierra del Fuego the remainder. Posesión Field (mainland) continued as the largest producing field with 35% of the total, followed by Daniel (mainland) with 12%, and by Tres Lagos and Cullen (both on Tierra del Fuego) with 10% and 9%, respectively. Of the total gas withdrawn, 49% was reinjected; 64% of the total withdrawn at Posesión was reinjected, 56% at Daniel, 67% at Cullen, and 89% at Calafate. A total of 127.5 billion cubic feet of natural gas was marketed or consumed by oil and gas production facilities. Production of natural gas liquids totaled 5 million barrels, 1% below that in 1973. Exports increased to 836,600 barrels from 337,100 barrels in 1973, and imports were 17,000 barrels compared with 434,200 barrels in 1973.

Reserves of natural gas in Chile are estimated at over 3.5 trillion cubic feet. ENAP is preparing plans for a liquefaction plant at Cabo Negro in Magallanes Province, near the gas deposits. Transportation facilities and regasifying installations in central and northern Chile, where the gas will be used, are also planned. At present, the lack of investment capital is delaying plans to establish an important petrochemical industry to further utilize the country's natural gas resources.

Crude petroleum production decreased 12% to 10,055,000 barrels, the lowest since

1961. Mainland fields across the Straits of Magellan produced 61% of the total production, and fields on Tierra del Fuego the remainder. All of the principal producing fields recorded decreased output for the year. Production by field for 1973 and 1974 was as follows:

| Location and field | Production (thousand 42-gallon barrels) | |
|---|---|---|
| | 1973 | 1974 |
| Mainland: | | |
| Daniel | 2,008 | 1,699 |
| Daniel Este | 1,656 | 1,529 |
| Posesión | 949 | 850 |
| Cañadón | 726 | 622 |
| Other | 1,313 | 1,390 |
| Total | 6,652 | 6,090 |
| Tierra del Fuego: | | |
| Calafate | 1,378 | 1,208 |
| Cullen | 1,012 | 812 |
| Tres Lagos | 844 | 728 |
| Other | 1,543 | 1,217 |
| Total | 4,777 | 3,965 |
| Grand total | 11,429 | 10,055 |

Source: Empresa Nacional del Petroleo, Chile. Boletin Estadistico, 4° Trimestre y Annual, v. 66, pp. 8, 42.

Imports of crude petroleum received at refineries totaled 28,209,000 barrels, 16% more than in 1973. Imports supplied 75% of the total petroleum refined in 1974, compared with 69% in 1973. Receipts of foreign crude petroleum comprised 92% of the total refined at the Concón refinery and 64% at the Concepción refinery. No imports were received at the Manantiales plant.

Refined petroleum production was 38,316,000 barrels compared with 35,238,000 barrels in 1973. The Concón refinery processed 16,122,000 barrels. Concepción 20,905,000 barrels, and the Manantiales gasoline plant 459,000 barrels, of which 318,000 barrels were credited to crude petroleum refining.

Chile's continued drop in crude oil production in 1974 was attributed to the exhaustion of deposits under exploitation and the lack of any major exploration effort. Production is expected to increase in 1976 with the delivery of drilling platforms to tap the 190 million barrels of proven reserves under the Straits of Magellan.

# The Mineral Industry of the People's Republic of China

By John E. Shelton [1]

Industrial growth in the People's Republic of China (PRC) has been variously estimated at 4.8% in 1974, down from the 10% annual rate of the last 3 years. Industrial production was reportedly on schedule for the fourth 5-year plan initiated in 1971.

Of major interest was the increasing output of crude petroleum by the PRC. Production of petroleum increased about 20% per year in the 1970's, reaching possibly 65 million tons in 1974. The three major fields, Taching, Takang, and Shengli, accounted for at least two-thirds of the output. Offshore exploration for oil was carried out in the Pohai Gulf and in the Yellow Sea near Shanghai.

Although fertilizer production increased considerably, the PRC was still dependent upon imports to fully meet requirements. To reduce the dependency on imports, the PRC has purchased ammonia or urea plants from various foreign companies.

The exchange of trade delegations continued and the PRC had trade agreements with 50 nations. Total foreign trade was more than $13 billion in 1974. Modern plants and technology for agriculture and industry were a significant part of the PRC's imports of about $7 billion. In addition to fertilizer plants, construction of petrochemical works, steel mills, and artificial fiber plants was acquired under contract. Modern mining machinery and technology for the drilling and recovery of oil were prominent acquisitions by the PRC. Imports of iron and steel were about 5 million tons of which Japan was the major source, exporting 2.9 million tons to the PRC.

Exports of $5 billion to $5.5 billion were predominantly industrial and mineral products. Exports of crude oil increased to 5 million to 5.5 million tons and became a significant source of export earnings. Japan was the major importer of crude oil as well as antimony, fluorspar, salt, and talc.

## PRODUCTION

The PRC is one of the world's leading producers and consumers of minerals, metals, and fuels. Little is known by the rest of the world about the PRC's mineral resources but assumptions and estimates made from historical data, occasional detailed reports, and international trade data indicate that production of some commodities is significant. Production of crude oil increased to 65 million tons in 1974. Steel production was estimated at 27 million tons. New blast furnaces were completed at the Anshan and Penchi iron and steel complexes. Output of chemical fertilizers was reported to be 15% higher in 1974 than in 1973. The PRC entered contracts with companies in Japan, Western Europe, and the United States for ammonia and urea plants which should increase production significantly over the next 2 or 3 years. Coal production was estimated at 450 million tons, up about 5%.

[1] Supervisory physical scientist, Division of Nonmetallic Minerals.

## Table 1.—People's Republic of China: Estimated production of mineral commodities

(Metric tons unless otherwise specified)

| Commodity [1] | | 1972 | 1973 | 1974 [p] |

[p] Preliminary. [r] Revised.

[1] In addition to the commodities listed for which quantitative estimates of output have been made, the People's Republic of China is known or is believed to have produced the following commodities for which no estimates, even of order of magnitude, have been prepared, owing to a paucity of general information upon which to base an estimate: Arsenic, chromite, nickel, titanium minerals, uranium, boron minerals, various clays (including kaolin), feldspar, lime, mica, various industrial and dimension stones, sand, gravel, and carbon black. Other unlisted commodities also may be produced.

[2] Mostly diasporic bauxite; data shown include only bauxite for aluminum manufacture; in addition 100,000 to 200,000 tons was believed to be produced each year for making refractories.

[3] In terms of equivalent 50% Fe ore.

[4] Officially reported.

[5] Data are for year ended June 30 of that stated.

## TRADE

The PRC's total foreign trade was estimated at almost $13 billion up from $9 billion in 1973. Exports were $5 billion to $5.5 billion up from $4 billion and imports were $7 billion up from $4.7 billion in 1973. About 58% of the total trade value was with market economy countries and 19% with developing countries. The largest trading partner was Japan with $3.3 billion or more than one-fourth of the trade. The United States was the next in trade with $1.0 billion followed by Hong Kong with $900 millon. Trade with centrally planned economy countries was up about 4% to $1.9 billion; Romania and the U.S.S.R. were leading countries. Total trade with developing countries was about $2.4 billion.

Imports by the PRC were again led by agricultural products; however, grain imports declined about 10% by weight. Tonnage of steel, iron ore, and pig iron imports increased. Japan exported more than 2.9 million tons of steel to the PRC. Fertilizer imports declined. In 1974, Japan exported 620,850 tons (nitrogen content), down from about 900,000 tons in 1973.

The rise in exports was led primarily by an increase in exports of crude oil to 5 million to 5.5 million tons in 1974 from 1 million to 1.5 million tons in 1973. Japan was the leading importer with about 4.4 million tons. Exports of barite, fluorspar, and talc and steatite were up in 1974, while exports of antimony and salt declined. Except for tin, Japan was the major importer of these minerals.

**Table 2.—People's Republic of China: Apparent exports of selected mineral commodities [1]**
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite and concentrate | r 72,945 | 99,913 | West Germany 39,240; Canada 38,655. |
| Oxide and hydroxide | 3,000 | 5,999 | All to Finland. |
| Antimony metal, unwrought | 150 | 250 | All to U.S.S.R. |
| Arsenic oxide and acids | 1,548 | 1,266 | All to Japan. |
| Copper metal including alloys, all forms | 152 | 100 | All to Italy. |
| Iron and steel metal: | | | |
| Pig iron, ferroalloys, and similar materials | 13 | -- | |
| Semimanufactures: | | | |
| Tubes, pipes, and fittings | r 609 | (2) | |
| Manganese ore and concentrate | r 44,359 | 47,750 | Mainly to Japan. |
| Mercury, 76-pound flasks | 1,450 | 1,973 | West Germany 1,073; France 609; Australia 290. |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Production of aluminum metal by the PRC was estimated at 200,000 tons in 1974. The major production of about 100,000 tons was at Fushun in Liaoning Province. An additional 20,000 to 30,000 tons was produced at Sanmen Gorge in Kansu with smaller quantities at Changling in Kirin, Wuhan in Hupeh, Hofei in Anhwei, and Nanning in Kwangsi. It is believed that plants of about a 40,000-ton capacity were under construction at Kweiyang in Kweichow Province and Sian in Shensi Province. Imports totaled about 100,000 tons of aluminum ingot.

The PRC has sizable resources of aluminum in offgrade diasporic material, aluminous shale, and bauxite. Reserves have been reported in Chekiang, Fukien, Honan, Hopeh, Kwangsi, Kweichow, Liaoning, Shantung, and Yunnan Provinces.

**Antimony.**—The PRC was a major world producer of antimony with an output of about 12,000 tons. In 1974, the United States imported 492 tons of antimony metal and 93 tons of antimony oxide from the PRC. Japan imported 1,994 tons of antimony ore and concentrate and 509 tons of metal from the PRC. Major world resources of antimony were in Hunan Province at Hsikwangshan mine near Hsin Hua.

**Bismuth.**—As a significant world producer, the PRC's output of bismuth was about 250 tons in 1974. Bismuth was recovered as a byproduct of tungsten and at nonferrous refining operations.

**Copper.**—Production of an estimated 150,000 tons of copper in the PRC was from several small mines. There also was a significant collection of scrap. Reported copper mines were the Tunghua in Kirin which produced 2,500 to 3,000 tons of copper, Hungtoushan and Huatung in Liaoning, Tungkuanshan in Anhwei, and the "No. 3 mine" in Yunnan. Production also was reported from the Tayeh, Hupeh, and Lanchow mines in Kansu. Extensive, low-grade porphyry copper deposits were reported several years ago, but there is no information that they have been developed. Copper was processed at a smelter and refinery at Shenyang in Liaoning Province and at a refinery at Shanghai. Smaller refineries are at Chungtiaoshan in Anhwei, Foochow in Fukien, Wuhan in Hupeh,

Chuchow in Hunan Kunming, Hochiochum and Wuwei in Kansu, Taiyuan in Shansi, and Chungking in Szechwan. A copper smelter in Fukien went onstream in 1972. Zambia agreed to ship 50,000 tons of copper to the PRC for a 4-year period beginning in 1972. Japan exported 32,700 tons to the PRC in 1974.

**Iron and Steel.**—Steel production was about 27 million tons in 1974. Increases in production at some operations may have been partially offset by problems at other complexes, such as the unknown extent of damage caused by the earthquake in Liaoning Province in February. It has been reported that steel production increased 3 million tons per year in the 1970–73 period.[2] It is estimated that more than 18 million tons was produced at major steel centers. Anshan Iron and Steel Company completed its 11th blast furnace and the Penchi Co. completed its 5th blast furnace.[3] The PRC has built many small and medium-sized plants, which now total more than four times the number in 1965. All provinces and autonomous regions except Tibet now have iron and steel enterprises. In 1974, about 11 million tons of scrap was collected throughout the PRC, of which about 5 million tons was new scrap.

Capacities of major Chinese steel plants are as follows:

| Plant | Province | Blast furnaces | Steel furnaces[1] | Steel capacity (metric tons per year) |
|---|---|---|---|---|
| Anshan | Liaoning | 11 | 25 OH | [2]7,000,000 |
| Wuhan | Hupeh | 8 | 6 OH | 2,500,000 |
| Taiyuan | Shansi | 5 | BOF and electric | 1,500,000 |
| Shanghai | Shanghai | 8 | Various | 3,000,000 |
| Peking | Peking | 3 | Oxygen converter | 1,500,000 |
| Penchi | Liaoning | 5 | OH and electric | [2]1,000,000 |
| Maanshan | Anhwei | 13 | OH and oxygen | 1,000,000 |
| Canton | Canton | 3 | OH and BOF | 1,000,000 |
| Paotou | Suiyüan | 1 | 2 OH and oxygen | 800,000 |
| Chungking | Szechwan | 3 | 2 OH | 800,000 |

[1] OH—open hearth furnace, BOF—Basic oxygen furnace.
[2] Capacities uncertain; estimates based on reported blast furnaces, increased use of scrap, and improved efficiencies.

The China National Technical Import Corp. and Nippon Steel Corporation concluded a 65,000-million-yen contract for facilities and equipment to construct a hot-strip mill and a silicon steel strip plant at Wuhan in Hupeh. When the plant is completed in 1977, it will have a capacity of 3 million tons of hot-rolled steel and 70,000 tons of silicon steel plate. The Federal Republic of Germany will build a cold-rolling mill at Wuhan with a capacity of 1 million tons of rolled steel. The contract valued at DM500 million will be completed in 1977.

The PRC imported more than 3 million tons of steel and steel products to meet its requirements. In addition, imports of pig iron and scrap combined were possibly 2 million tons. Japan exported more than 2.9 million tons to the PRC in 1974. Exports of steel scrap from the United States to the PRC were 189,000 tons valued at $12.4 million in 1974.

**Lead and Zinc.**—Production of lead and zinc was about 100,000 tons each in 1974. The largest mine was the Shin-kou-shan in Hunan. In Liaoning Province, the Hsiuyen mine and the Taoling mine produced lead and the Ching-ching mine produced lead and zinc. Other mines were in Anhwei, Fukien, Hunan, Kiangsi, Kwangtung, Kweichow, and Yunnan Provinces. A small mine and smelter were at Lienchen in Fukien. Other smelters were at Shenyang and Hulutao in Liaoning, at Sungpei in Hunan and at Shanghai. Other plants using scrap were mentioned at Wuhan, Canton, Changchun, and Kunming. The Imperial Smelting Process plant at Shaokuan in Kwangtung is believed to have a capacity of 35,000 tons of zinc and 18,000 tons of lead per year. There is no information that the smelter has been operated.

**Manganese.**—About 1 million tons of manganese ore was produced in the PRC. Major reserves are in Fukien, Hunan, Kiangsi, Kwangsi, Kwangtung, and Kweichow Provinces south of the Yangtze River. Manganese reserves also are found in Kansu and Liaoning Provinces.

[2] Federal Broadcast Informaton Service. V. 1, No. 208, Oct. 25, 1974, p. E6.
[3] Liaoning Provincial Service, Shenyang. Oct. 8, 1974.

**Mercury.**—The PRC continued to rank among the world's major mercury producers with an output of about 26,000, flasks in 1974. Production was mainly from Kweichow and Hunan Provinces with some from Kwangtung Province. Reserves are adequate to maintain the current rate of production. The PRC exported little mercury.

**Tin.**—Production of tin was estimated at 20,000 long tons. Output was primarily from Yunnan and Kwangsi Provinces. Ore from placer deposits in Kwangsi were the probable source of high-grade metal ingot, whereas the ore from lode deposits in Yunnan contain impurities that present refining problems. The PRC exported about 9,000 long tons of tin metal in 1974. Reported imports by France were 1,460 long tons; by the Netherlands, 1,460 long ton; by the Federal Republic of Germany, 610 long tons; and by the U.S.S.R., 500 long tons. Imports by the United States were 3,283 long tons, up from 1,727 long tons in 1973.

**Titanium.**—The PRC has adequate reserves of titanium ore to meet current needs. It is believed the PRC produced titanium dioxide, probably for use as white pigment for paint. There is no evidence of production of titanium metal.

**Tungsten.**—Output of tungsten was estimated at 17,000 tons of concentrates or 8,500 tons of tungsten metal in 1974. Several mines in Kiangsi Province produced 500 to 2,000 tons of wolframite concentrate. Scheelite was produced in Hunan Province. Reserves of tungsten, probably over 100 million tons, are in Hunan, Kiangsi, Kwangsi, and Kwangtung Provinces. Imports of tungsten concentrates by the U.S.S.R. from the PRC were about 3,650 tons in 1973 and about 3,000 tons in 1974. Imports of tungsten by the United States were 40.5 tons in 1973 and 172 tons in 1974. On the basis of imports reported by other countries through September, total exports by the PRC were estimated to be about 9,000 tons of tungsten concentrates in 1974.

**Uranium.**—Uranium ore was believed to have been produced at Chushan in Kiangsi Province and Weiyuan in Kwangtung Province. There is a gaseous diffusion plant in Lanchou in Kansu for use in nuclear testing. The PRC exploded a nuclear device of about 1 megaton (1 million tons of TNT) in the Løp Nor region on June 18, 1974. The previous test was that of a hydrogen bomb on June 27, 1973, in the same region.

## NONMETALS

**Asbestos.**—About 160,000 tons of chrysotile asbestos was produced in 1974, as the PRC continued to be among the top five world producers. The high-grade deposits at Shihmien in Szechwan Province accounted for most of the production of asbestos.

**Barite.**—The increase in demand for barite for the PRC's expanding petroleum industry resulted in an increase in the output of barite to about 180,000 tons. Japan imported 37,500 tons of barite and barium sulfate from the PRC in 1974 up from 30,000 tons in 1973.

**Boron.**—Deposits of boron-bearing minerals are known to occur in the Iksaydam area of Tsinghai Province. Data on production are not available; however, it is believed output exceeds demand. Japan imported 1,732 tons of sodium borate from the PRC in 1974.

**Cement.**—Production of cement in the PRC was estimated at 27 million tons in 1974 compared with 25 million tons in 1973. Several provinces reported increased production in 1974 and the PRC's small cement plants fulfilled the State plan 24 days early. Small plants numbering more than 2,400 accounted for about one-half of the total production. These small plants scattered throughout more than two-thirds of the counties in the PRC have helped in providing needed materials to build more water-control projects and improved farming conditions in the rural areas.[4] About one-third of the cement production was from about 60 plants with capacities between 100,000 and 1 million tons per year. Some of the larger known plants in the PRC are as follows:

| Plant | Province | Annual capacity (metric tons) |
|---|---|---|
| Hantan | Hopeh | 1,000,000 |
| Yao Hsien | Shensi | 1,000,000 |
| Huahsin | Hupeh | 1,000,000 |
| Kwangchow | Kwangtung | 700,000 |
| Yungteng | Kansu | 600,000 |
| Fushun | Liaoning | 550,000 |
| Chungking | Szechwan | 550,000 |
| Tangshan | Hopeh | 550,000 |

[4] New China News Agency, Peking. Jan. 20, 1975.

**Diamond.**—Diamonds were produced at the Changte mine in western Hunan Province. Kweichow and Shantung Provinces also were reported to have deposits; however, it is not known if diamonds have been produced. Synthetic diamond may have been produced at Tsingtao in Shantung Province.

**Fertilizer Materials**—Production of chemical fertilizer material increased about 15% in the PRC in 1974. Over 20 large- and medium-sized plants were built or expanded.[5] Small fertilizer plants provided 55% of the total synthetic ammonia output. Small- and medium-sized plants were built near agricultural centers to meet local needs. These plants use local charcoal or coal as raw material for nitrogenous fertilizer.

Large fertilizer plants are located at Nanking and Yangchow in Kiangsu, Taiyüan in Shansi, Chuchow and Liling in Hunan, Kunming in Yunnan, Hofei in Anhwei, Tsinan in Shantung, Lanchou in Kansu, and in Kirin Provinces. Large fertilizer plants are being constructed near petroleum refineries. Plants reportedly are under construction at Lunan in Shantung, Anyang in Honan, Changsha in Hunan, and Hsuanwei in Yunnan Provinces. The PRC has contracted with several foreign companies to build ammonia or urea plants[6] as follows:

| Company | Product | Number | Capacity (thousand metric tons) |
|---|---|---|---|
| Kellogg Continental | Urea | 8 | 480 |
| M. W. Kellogg | Ammonia | 8 | 330 |
| Dutch States Mines | Urea | 3 | 574 |
| Mitsui Toatsu | Ammonia | 1 | 330 |
| Do | Urea | 1 | 528 |
| Heurtz et Cie | Ammonia | 2 | 330 |
| Do | Urea | 1 | 574 |
| Toyo Engineering | Ammonia | 1 | 330 |
| Do | Urea | 1 | 528 |
| Do | Ammonia or urea | 1 | 330 or 528 |

The PRC ranks third as a world consumer of nitrogenous fertilizer. Although production increased and plants were expanded or built, the PRC still imported large quantities of fertilizer to meet its needs. Japanese exports were down considerably from 1973 but still totaled 456,200 tons of ammonium chloride (26% nitrogen), 340,700 tons of ammonium sulfate (21% nitrogen), and 957,100 tons of urea (45% nitrogen) or a combined total of 620,850 tons of nitrogen content. Total nitrogen content of Japanese exports to the PRC in 1973 was about 900,000 tons. Additional imports were from Kuwait, Venezolana de Nitrogen (NITROVEN), Greece and two large consortiums, NITREX A.G. and ANIC, S.p.A.

The output of pyrites was estimated at 2 million tons in 1974. The recovered sulfur was primarily used for manufacturing fertilizers.

Production of phosphate rock in 1974 was about 2.5 million tons. Output was primarily from the Chinghsiang mine in Hupeh Province with a capacity of 600,000 tons, Kaiyang mine in Kweichow, Paotou mine in Inner Mongolia, and the Tunghaihsien and Haichow mines in Kiangsu. Other phosphate production was from Anhwei, Hunan, Kansu, Kwangsi, and Szechwan Provinces. By August phosphate ore production in Hupeh was up 55% over the corresponding period in 1973. Phosphate fertilizer output from 58 plants in Hupeh was up 18% for the same period. It was reported that phosphate ore production from a number of large mines in Hunan was 10 times greater in 1974 compared with 1965.[7] Imports of phosphate rock was about 1 million tons, principally from Morocco and North Vietnam. About 5,000 tons of mixed phosphate and superphosphate fertilizers was imported from Japan. Canada exported diammonium phosphate to the PRC.

Canada entered into a contract with the PRC to export 150,000 tons of potash valued at $8 million in the first half of 1974. Exports from Canada were about 170,000 tons valued at $9 million compared with $2.5 million exported to the PRC in 1973. It is believed the PRC has significant potash deposits in the Tarim Basin in Sinkiang Uighur Autonomous Region and in the Tsaidam Basin in Tsinghai.

**Fluorspar.**—Production of fluorspar was about 270,000 tons in 1974. Fluorspar was produced in Chekiang, Fukien, Hopeh, Hunan, and Kwangsi Provinces. The PRC exported about 200,000 tons of fluorspar in 1974 of which Japan imported 180,000 tons. Other exports may have been to the Federal Republic of Germany, Poland, and the U.S.S.R. Fluorine was recovered as a sodium fluosilicate byproduct of the phosphate industry.

[6] U.S. China Business Review. May–June 1974, pp. 36–38.
[7] Hunan Provincial Service. Feb. 20, 1975.

**Quartz Crystal.**—The PRC produced both natural and synthetic quartz crystals for use in the electronic industry. Japan imported 22,600 tons of natural quartz from the PRC.

**Salt.**—The PRC was the second largest world producer of salt with an estimated production of 25 million tons per year. By September the PRC's 1974 plan for production was fulfilled with production up 40% over the same period in 1973.[8] The major source of salt was solar evaporation of sea water in Hainan, Hopeh, Kiangsu, Liaoning, and Shantung Provinces. Improvements and modernization of several salt fields were reported. Output was up at the three major salt fields, Tangku in Hopeh and Luta in Liaoning Provinces, and Chilantai in Ningsia Hui Autonomous Region. Tangku, the largest producer, reportedly surpassed its 1974 plan by mid-June. The Chilantai salt field is a 120-square-kilometer inland salt lake. Salt was also produced at Hanku in Hopeh, Hsiangli in Hunan, Yunchan in Kiangsi, Peimu, Lantzuken, Hsiniuchiao and Chisha in Kwangsi, and Chengkou, Shoukuang and Tsingtao in Shantung and in Singkiang Province. Bedded deposits are in Hunan, Kiangsi, and Yunnan Provinces.

Byproduct potassium and magnesium compounds were recovered at many of the salt fields. In Szechwan, potassium salts, bromine, iodine and boron were also recovered from brine. The largest operation, Tzukung, produced about one-half of Szechwan's output of 1 million tons of salt. Salt and byproducts were recovered from Iksaydam Lake in Tsinghai.

With salt production in the PRC exceeding internal demand for food and industrial uses, a large quantity was available for export. The principal market was Japan, which imported 815,000 tons from PRC in 1974.

**Steatite and Talc.**—The PRC recovers steatite and talc at Taling in Liaoning Province. Japan imported 135,000 tons of talc and 68,000 tons of steatite from the PRC in 1974.

**Vermiculite.**—Vermiculite was produced from more than 20 operations in Linshu County in Shantung Province. Heat-insulating boards, brick, and pipe were manufactured using vermiculite with a cement binder.

## MINERAL FUELS

**Coal.**—Output of coal in 1974 was up about 5% with a production of about 450 million tons. Goals for coal production in Shansi Province, the PRC's largest producer, were met more than 30 days early.[9] Other Provinces reporting advanced fulfillment of production goals were Fukien, Honan, Hopei, Kweichow, Shansi, and Shantung. Output in Heilungkiang was up 5% and in Kwangsi up 10%.

Small coal mines accounted for 28% of the PRC's coal production in 1973.[10] About 60 large coal mine complexes accounted for about two-thirds of the production.

The largest complexes, Fushun and Fuhsin in Liaoning, followed by Huainan in Anhwei and Kailan in Hopeh produced in the 20 million-ton range. Combines in the 10 million- to 20 million-ton range were Tatung in Shansi and Hokang in Chihsi in Heilungkiang Province. Seven other large coal combines with several mines each supplied over 10 million tons per year. In the 5 million- to 10 million-ton range were Pingtingshan in Honan, Fengfeng in Hopeh, Peking and Tzupo in Shantung, and Yangchuan in Shansi. About 50 additional combines produced from 1 million to 5 million tons. Of these the more imporant were Chiaotso (Honan), Shuangyashan (Heilungkiang), Huaipei (Anhwei), Penhsi and Peipiao (Liaoning), Tsaochuang (Shantung), Hopi and Ima (Honan), Chinghsing (Hopeh), Tungchuan (Shensi), Tunghua (Kirin), Luan (Shansi), Shihchuaishan (Ningsia), Meitien (Kwangtung), Pinghsiang (Kiangsi), Hsuchou (Kiangsu), and Hsishan (Shansi). In Ningsia, anthracite production capacity has been increased 30%.

The remaining one-third of the production is from small- and medium-sized local mines which produce 100 to 1,000 tons per day. Because of transportation problems these local mines are important in supplying provincial agricultural and small industries. With the development in the last few years of mines in Sinkiang and Tibet, there is now production in all Provinces. Many remote areas in the southwest have become self-sufficient in coal.

China continues exploration to develop new deposits and to expand the small- and medium-sized mines. New coal mines were opened in 1974 such as an anthracite pit at the Yungting coal mining center in

Fukien, a shaft mine with a 600,000-ton capacity at Peipiao in Liaoning, and a mine with a 570,000-ton capacity at Chihsing in Heilungkiang Province.

**Petroleum and Natural Gas.**—Petroleum production in the PRC in 1974 increased 20% [11] to about 65 million tons. At least two-thirds of this output was from the north and northeast provinces; at Taching oilfield in Heilungkiang, at Shengli in Shantung, at Takang in Tientsin and in Liaoning and Kirin Provinces. Other producing areas, most of them small, are located in Hupeh, at Karamai in Sinkiang, at Lenghu in the Tsaidam Basin of Tsinghai Province, Yumen in Kansu, and Szechwan and Shensi Provinces. A small amount of oil shale was produced in Kwangtung and Liaoning Provinces.

At the Taching oilfield, output of crude oil in 1974 was five times the 1965 production, and refinery capacity was double the startup capacity in 1966. The 1974 production of crude was 22% higher than in 1973. The 5-year plan for Taching was met in 4 years.[12] Completion of a 1,152-kilometer, large diameter pipeline from Taching to the port of Chinhuangtao in Hopei was reported.[13] Construction was started to extend the pipeline to Peking. Also, a parallel line terminating at Tiehling in Liaoning Province was completed. Production of crude oil at the Takang oilfield increased almost 25% in 1974 compared with that of 1973. It was reported that the area of the Takang field was 40 to 50 kilometers along the coast, 40 to 50 kilometers inland, and well out into Pohai Bay south of Tientsin.[14] A new refinery with a 2.5 million-ton-per year capacity was near completion at Takang in 1974. The new refinery will be in addition to the 3.5 million-ton refinery built in 1965. The capacity of the refinery at Shanghai was reported to be three times that in 1964. The capacity of the Fushun No. 1 refinery in Liaoning was increased by technical improvements and a new dock to berth 50,000-ton tankers was completed at Chanchiang harbor in Kwangtung Province.

Japan imported 4.4 million tons of crude oil from the PRC in 1974. About 1 million tons of oil was exported by the PRC to North Korea and to North Vietnam.

Production of natural gas was up about 25%. The principal natural gas-producing area was in Szechwan Province and some was produced in Liaoning Province.

# The Mineral Industry of Colombia

By Daniel C. Adkins [1]

Colombia's mineral industry exhibited mixed results during 1974. Production of most mineral commodities increased; however, petroleum production declined for the fourth consecutive year. Petroleum, refined products, natural gas, precious metals, lime, and coal continued to rank as the country's most valuable mineral products.

The following government actions directly affecting Colombia's mineral industry occurred during 1974: (1) The Ministry of Mines and Energy increased the price of new oil from $1.64 to $4 per barrel [2] in order to stimulate production and exploration; (2) on January 1, 1974, the Government reduced the export tax credit (CAT) from 15% of export value to levels ranging from 0.1% to 5.0% of export value; (3) the Ministry of Mines and Energy supervised the transfer of ownership of the largest precious metals mine from foreign to domestic investors; and (4) the Government implemented a modified form of the Andean Pact Foreign Investment Code. Exceptions to the Code were made for the extractive industry to allow a 19% per year rate of return on total direct investment. A further 19% per year recovery of capital can be made on all profits reinvested in mining ventures. Companies are also allowed a sales commission for minerals sold abroad. The Code also requires that 90% of the technical and administrative staff must be Colombian by the 9th year of operations. Previous Colombian laws are still in effect concerning concessions, service contracts, and depletion allowances.

During 1974, projects and plans were initiated to diversify and expand the mineral industries in order to achieve mineral and mineral-based product self-sufficiency by 1980. This self-sufficiency is a national goal of Colombian public and private industries. Implementation of this goal ranges from the establishment of a financial policy to attract domestic and foreign capital, to the expansion of government-owned refinery capacity. The petrochemical sector will depend upon private, foreign and domestic, as well as State capital to expand production of specific chemicals beyond domestic needs. The excess production will be used to create a balanced chemical trade within the Andean region by the early 1980's. Similar financial arrangements are anticipated in petroleum exploration and development. Iron and steel expansion will be met by domestic industry with Government financial aid. Other industries, it is hoped will expand through initiative of foreign investment. The investment required to develop these industries as planned was estimated to be around $1 billion for iron, steel, nickel; $1.5 billion for petroleum refining and petrochemicals; $2.3 billion for petroleum exploration and development; and $120 million for coal mining and beneficiating.

## PRODUCTION

Production of metallic minerals was varied. Increases were registered in gold and iron ore; however, the production of steel and other metals declined notably. Among the nonmetals, significant production increases occurred in gypsum, salt, sulfur, and limestone.

Crude oil output declined for the fourth consecutive year as private companies encountered inadequate stimulus for investment. Total production was down 9.1% to 60.9 million barrels and would have been lower except for the expenditures by Empresa Colombiana de Petróleos (ECOPETROL) to maintain production in its De Marcs Field. Present producing fields have a rate of decline of around 12% per year which can be reduced by infield drilling, workovers, and injection techniques. Of the other fossil fuels output of refined petroleum products, natural gas, and coal increased, while that of coke declined.

[1] In addition to the commodities listed, coal briquets are also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.
[2] May include gem stones other than emeralds.
[3] Exports.

## TRADE

Colombia ceased to be an exporter of crude petroleum in April 1974; however, exports of products, primarily residual fuel oil, remained constant. The value of petroleum exports more than doubled to $133.5 million. Increases in the world price of oil resulted in the largest national oil revenues at a time when Colombian oil production was declining. Product imports began in November 1974 with 259,000 barrels of gasoline. If current trends continue, Colombia will become a net importer by 1977.

Nonfuel mineral exports showed a decline partially as a result of revisions in the export tax credit system. The high value of emerald exports in 1973 and 1974, considering there was no emerald production, may have been related to tax credits for exports. The Bank of the Republic added gold purchases to its international reserves rather than utilizing these reserves in international sales. Much of the remaining mineral exports were composed of coal shipments to Venezuela and Brazil.

Nonfuel mineral imports, mainly phosphate rock, clays, and earths declined slightly to about $6 million.

Export value of minerals, in million U.S. dollars, were as follows:

| | 1972 | 1973 [r] | 1974 [e] |
|---|---|---|---|
| Emeralds | 46.1 | 75.0 | 25.0 |
| Gold | 2.5 | -- | -- |
| Platinum | 2.2 | 3.3 | 2.6 |
| Others | 1.1 | 2.7 | 4.7 |
| Crude oil | 30.8 | 25.4 | 4.5 |
| Refined products | 28.3 | 36.0 | 129.0 |
| Total | 111.0 | 142.4 | 165.8 |

[e] Estimated. [r] Revised.

## Table 3.—Colombia: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | | 1973 |
|---|---|---|
| **METALS** | | |
| Aluminum: | | |
| Bauxite and concentrate | | 3,658 |
| Oxide and hydroxide [1] | | 1,179 |
| Metal including alloys, all forms | | 13,927 |
| Antimony metal including alloys, all forms | | 21 |
| Arsenic anhydride and acid | | 129 |
| Bismuth metal including alloys, all forms | | 8 |
| Chromium: | | |
| Oxide and hydroxide | | 85 |
| Metal including alloys, all forms | | 8 |
| Cobalt oxide and hydroxide | | 7 |
| Copper metal including alloys, all forms | | 6,060 |
| Gold metal, worked or partly worked | value | $227 |
| Iron and steel: | | |
| Ore and concentrate | | 250 |
| Metal including alloys, all forms | | 19,780 |
| Semimanufactures | | 229,798 |
| Lead: | | |
| Oxides | | 1,956 |
| Metal including alloys, all forms | | 8,654 |
| Magnesium metal including alloys, all forms | | 43 |
| Manganese: | | |
| Ore and concentrate | | 958 |
| Oxides | | 1,466 |
| Mercury | 76-pound flasks | 894 |
| Nickel: | | |
| Unwrought | | 27 |
| Semimanufactures | | 268 |
| Platinum metal including alloys, all forms | value | $171 |
| Rare-earth oxides | | 2 |
| Selenium elemental | | 2 |
| Silver metal including alloys, all forms | thousand troy ounces | 3,685 |
| Tin metal including alloys, all forms | long tons | 335 |
| Titanium oxides | | 1,370 |
| Tungsten metal including alloys, all forms | | 4 |
| Vanadium oxide | | 21 |
| Zinc: | | |
| Oxide | | 704 |
| Metal including alloys, all forms | | 10,974 |
| Other: | | |
| Ore and concentrate, n.e.s | | 177 |
| Oxides, hydroxides, and peroxides of metals, n.e.s | | 47 |
| Metals including alloys, all forms, n.e.s | | 30 |
| **NONMETALS** | | |
| Abrasives, natural, n.e.s.: | | |
| Pumice, emery, natural corundum, etc | | 158 |
| Grinding and polishing wheels and stones | | 47 |
| Asbestos | | 19,656 |
| Barite and witherite | | 91 |
| Boron materials: | | |
| Crude and natural borates | | 1 |
| Oxide and acid | | 408 |
| Cement | | 677 |
| Chalk | | (2) |
| Clays and clay products (including all refractory brick): | | |
| Bentonite | | 3,217 |
| Kaolin | | 2,732 |
| Other | | 183 |
| Cryolite and chiolite | | (2) |
| Diamond, industrial | thousand carats | 80 |
| Diatomite and other infusorial earth | | 773 |
| Fertilizer materials, manufactured: | | |
| Nitrogenous | | 136,563 |
| Phosphatic | | 88,959 |
| Potassic | | 100,683 |
| Other | | 140,177 |
| Graphite, natural | | 40 |
| Gypsum and plasters | | 9,258 |
| Magnesite | | 134 |
| Mica, all forms | | 84 |
| Pigments, mineral, including processed iron oxides | | 995 |
| Precious and semiprecious stones, except diamond | kilograms | 111 |

See footnotes at end of table.

Table 3.—Colombia: Imports of mineral commodities—Continued
(Metric tons unless otherwise specified)

| Commodity | | 1973 |
|---|---|---|
| NONMETALS—Continued | | |
| Salt and brine | | 26 |
| Sodium and potassium compounds, n.e.s | | 4,962 |
| Stone, sand and gravel: | | |
| Dimension stone | | 271 |
| Dolomite, chiefly refractory grade | | 4,403 |
| Gravel and crushed rock | | 226 |
| Limestone (except dimension) | | (2) |
| Sand, excluding metal bearing | | 195 |
| Sulfur: | | |
| Elemental, all forms | | 15,044 |
| Sulfur dioxide | | 28 |
| Sulfuric acid and oleum | | 1,857 |
| Talc, steatite, soapstone, and pyrophyllite | | 1,070 |
| Other nonmetals, n.e.s.: | | |
| Crude, n.e.s | | 1,985 |
| Oxides and hydroxides of magnesium | | 263 |
| Bromine and iodine | | 17 |
| MINERAL FUELS AND RELATED MATERIALS | | |
| Asphalt and bitumen, natural | | 32 |
| Carbon black and gas carbon | | 712 |
| Coal, coke and peat | | 718 |
| Gas, hydrocarbon | | 580 |
| Hydrogen, helium and rare gases | | 39 |
| Petroleum: | | |
| Crude and partly refined | thousand 42-gallon barrels | (2) |
| Refinery products: | | |
| Gasoline (including naphtha) | do | 194 |
| Kerosine | do | (2) |
| Jet fuel | do | 40 |
| Distillate fuel oil | do | 16 |
| Residual fuel oil | do | 14 |
| Lubricants | do | 61 |
| Other: | | |
| Liquefied petroleum gas | do | 4 |
| Mineral jelly and wax | | 9 |
| Bitumen and other residues | do | 11 |
| Total | do | 349 |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | | 349 |

[1] Includes synthetic corundum.
[2] Less than ½ unit.

## COMMODITY REVIEW

### METALS

**Copper.**—The Government opened international bidding for the development of the Cerro Pantanos-Pedegorcito copper deposits in the Department of Antioquia. Reserves have been estimated at 635 million tons of 0.8% copper ore. More than 20 foreign companies have expressed interest in the deposits, although no contracts have been signed. The Government plans to form a joint-venture group comprised of the Instituto de Fomento Industrial (IFI), the Government development agency, and 49% foreign participation.

**Iron and Steel.**—Acerías Paz del Rio, S.A. (A.P.d.R.), Colombia's largest iron and steel manufacturer, was planning a major expansion of its Belencito plant, from 300,000 tons per year crude steel capacity to a 1-million-ton capacity by 1980. The goal is to make Colombia self-sufficient in raw materials and free from any need to import finished steel. Government financial assistance is expected and will be needed to raise the nearly $800 million for this investment.

Electric steel output declined to its lowest level since 1970 as a result of a shortage of steel scrap. Colombia's six minor steel plants are dependent upon scrap from A.P.d.R. and foreign sources to operate their electric furnaces. These plants operated at half their combined 200,000-ton-per-year capacity.

**Nickel.**—Negotiations progressed on the Cerro Matoso ferronickel project when Hanna Mining Company and the Chevron

Oil Co. reached an agreement with the Government on foreign exchange aspects. The U.S. companies have been examining the details of the Government's terms and assessing the implications of Colombia's latest mining tax legislation. Thus, the contractual problems are being resolved. Before development commences, financing and marketing studies must be completed. A pilot plant is being constructed by Hanna Mining Company and Bechtel Corp. Total estimated investment may be near $200 million and production is projected to commence in 1979.

The lateritic nickel deposit involved in the project contains reserves estimated at 35 million tons with a 1.5% to 2.6% nickel content and is located in the Department of Córdoba. Initial production is not expected to begin until 1979. Project operations will be handled jointly by Empressa Colombiana de Niquel Limitada (ECONIGUEL), a subsidiary of IFI, and Compañía de Niquel Colombiano, S.A., equally owned by Hanna Mining Company and Chevron Oil Co. Although each of the three participants must contribute one-third of the investment required for the project, IFI retains 50% voting power.

**Precious Metals.**—Gold production increased 23% over that of 1973 in response to a sharp worldwide increase in gold prices. As the largest gold producer in Latin America, Colombia produced 265,000 troy ounces in 1974, the best showing since 1966. A further stimulus to production was the Government's subsidy of awarding producers the difference between the Bank of the Republic price ($44.22 per troy ounce) and the international free market gold price which ranged from $197.50 to $117.00 per troy ounce in 1974. Many old mines have reopened, some of which had been closed for more than 20 years.

The controversy over International Mining Corporation's (IMC) gold-dredging operations was resolved by selling 100% ownership of Cia. Minera Chocó Pacífico, S.A. and 60% ownership (all mining assets) of Pato Consolidated Gold Dredging, Ltd. to a recently formed company owned by Colombian citizens. This company, Mineros Colombianos, paid $12 million and $16 million for the respective IMC companies. Another local company is seeking to acquire the IMC-owned Frontino Gold Mines, Ltd. IMC and subsidiary companies have been contracted to provide technical assistance and other services to the new owners. IMC companies traditionally dominated the precious metal industry, accounting for approximately 60% of the country's gold and silver production and about 40% of its platinum output.

**Uranium.**—A Colombian-owned company Minuranio has found uranium deposits in the California district of Santander Department. Three European companies, Urangesellschaft m.b.H. of West Germany, Ente Nazionale Idrocarburi (ENI) of Italy, and Total—Compagnie Minière et Nucléaire of France initiated exploration for uranium during 1974.

## NONMETALS

**Asbestos.**—Work continued on the Las Brisas asbestos project, which will be the only operating asbestos mine in the Andean chain when completed in 1976. The project is located in the Department of Antioquia and is designed to process over 50,000 tons of fiber per year. Proven reserves of 18.2 million tons contain 4.3% fiber with a high proportion of asbestos fiber in grades 4 and 5.

Mining and milling facilities are to be operated by Asbestos Colombianas, S.A., in which Eternit Colombiana owns 70% interest and other private Colombian investors hold the remaining share. During 1974 Eternit Colombiana, representing European and Colombian interest, bought the share previously held by Nicolet Industries Inc. of Ambler, Pa., for $1.8 million. Eternit is the largest user of asbestos in Colombia and made the purchase as part of a long-term plan to gain control of its sources of raw materials. Total investment is estimated to be about $11 million. Full production will meet the needs of the Colombian market and will make it also possible to export half of the production.

**Emerald.**—The Government emerald mines remained closed in an effort to halt violence in the mining area. There are plans to allow private enterprise to lease the area and produce gem emeralds under strict government control. A new bidding for operations of the emerald mines received no offers during 1974.

**Salt.**—Overestimation of domestic demand and inability to develop firm export markets has resulted in large stocks and unused desalination capacity.

## MINERAL FUELS

**Coal.**—The Colombian Government and Peabody Coal Co. of the United States concluded a $120 million agreement covering the development of the El Cerrejon coal deposits. Surveys of the deposits indicate measured reserves amounting to 90 million tons of coal, plus a further 110 million tons of indicated reserves. Strip mining methods will be economical for 10 years after which the remaining reserves would be recoverable by underground mining. Production is projected to commence in 1981 with initial output of 5 million tons per year.

The Cayman Corp. of California reportedly has expressed interest in developing coal reserves of 500 million tons at Carare in the North Santander region.

**Natural Gas.**—The Colombian division of Texas Petroleum Co. (TEXPET), a subsidiary of Texaco Inc., reported the evaluation of the Chuchupa gasfield in the Department of Guajira indicated total reserves of 3.9 trillion cubic feet with a production capacity of at least 500 million feet per day. The Chuchupa gasfield seems to be an extension of the onshore Ballena gas pool located in the vicinity of the coastal town of Riohacha. All other Colombian gas reserves total 1.7 trillion cubic feet in widely dispersed natural gasfields. The Government issued a decree under its emergency powers giving natural gas production the same legal structures as petroleum. TEXPET can now receive its share of sales 75% in dollars and 25% in pesos with no remittance restrictions.

ECOPETROL and TEXPET have developed tentative plans to utilize production from the Guajira gasfield for ammonia and possibly urea production. If the price of natural gas rises and both firms can find additional partners with greater experience in chemical operations, then two ammonia plants with a 100,000-ton capacity will be built.

**Table 4.—Colombia: Salient statistics of the petroleum and natural gas industry**

| | 1972 | 1973 | 1974 |
|---|---|---|---|
| Crude oil: | | | |
| Production ---- thousand 42-gallon barrels -- | 71,674 | 66,844 | 60,867 |
| Delivered to refineries ---- do ---- | 56,657 | 56,966 | 58,767 |
| Exported ---- do ---- | 14,924 | 9,452 | 9,480 |
| Natural gas: | | | |
| Production ---- million cubic feet -- | 115,622 | 113,229 | 116,634 |
| Consumption [1] ---- do ---- | 60,787 | 59,966 | 61,090 |
| Injected ---- do ---- | 30,474 | 30,058 | 31,238 |
| Flared ---- do ---- | 19,727 | 18,125 | 19,604 |
| Natural gas liquids: | | | |
| Production ---- thousand 42-gallon barrels -- | 2,962 | 2,932 | 3,324 |
| Delivered to refineries ---- do ---- | e 1,150 | 1,434 | 1,275 |
| Refinery products: | | | |
| Refinery output [2] ---- do ---- | 59,334 | 59,713 | 60,093 |
| Consumption [3] ---- do ---- | 38,972 | 42,743 | 51,889 |
| Exported ---- do ---- | 12,427 | 13,062 | 10,471 |

e Estimated.
[1] Includes oil company use for fuel.
[2] Includes refinery losses and refinery fuel, but not treatment of natural gas liquids.
[3] Excludes LPG, aviation fuel to international carriers, and bunker sales.

**Petroleum.**—Exploration decreased to 50.5 party-months of seismic work and some gravimeter and surface geology as compared with 73 party-months of all types of exploration during 1973. Most work was concentrated in Guajira, Magdalera, and Boyacá Departments.

The number of exploratory wells remained at 17 while the total footage drilled decreased from 209,703 in 1973 to 171,507 feet in 1974. The only exploratory well which produced oil in commercial quantities was drilled by the Cayman Corp. in the Ptumayo region. Three other exploratory wells were gas producers. The Colombian subsidiaries of Continental Oil Co., Gulf Oil Corp., and Sun Oil Co., suspended all exploration

activities in 1974 due to lack of economic incentives.

ECOPETROL has developed a 10-year plan to increase the country's crude reserves from the present level of 627 million barrels. The plan calls for drilling 800 wells at a cost of $2.3 billion with ECOPETROL furnishing 35% of the capital.

Colombian crude petroleum production was down 9.1% to 60.9 million barrels. Petróleos Colombo-Brasileros (COLBRAS) was the only company to show a production increase. The other producing fields had a production decline rate between 8% and 16% per year. Most companies were unwilling to undertake operations to counter the decline in production with the price of old oil limited to $1.64 per barrel by the Ministry of Mines and Energy.

Domestic consumption of refined products increased by 21% to 51.9 million barrels. The increase of jet fuel and gasoline was 19% to 2.1 million barrels and 9% to 23.0 million barrels, respectively. This resulted in minor imports of gasoline late in 1974. Current refining structure will not meet domestic gasoline needs until new projects come on-stream in 1977 or later. Three-quarters of Colombia's gasoline consumption is by highly utilized public transportation. Gasoline prices range from $0.11 to $0.16 per gallon because of government subsidies that may have reached $50 million for 1974.

Table 5.—Colombia: Summary data on companies producing and/or refining crude oil during 1974

| Company | Principal ownership or affiliation | Nationality of ownership | Crude oil production during 1974 (thousand 42-gallon barrels) | Refining capacity as of Dec. 31, 1974 (thousand 42-gallon barrels) daily) |
|---|---|---|---|---|
| Antex Oil and Gas Co., Inc.[1] | Petroquimica del Atlántico and U.S. citizens. | Colombian/United States | -- | 2 |
| Chevron Petroleum Co. of Colombia | Standard Oil Co. of California | United States | 5,982 | -- |
| Colombia-Cities Service Petroleum Corp. (COLCITCO).[2] | Cities Service Co., ECOPETROL, AMOCO, and ARCO. | Colombian/United States | 2,110 | -- |
| Colombia Petroleum Co. (COLPET)[3] | ECOPETROL and Texaco, Inc | do | 5,180 | 6 |
| Empresa Colombiana de Petróleos (ECOPEROL).[4] | Colombian Government | Colombian | 15,769 | 160 |
| International Petroleum Colombia, Ltd. (INTERCOL). | Exxon Corp | United States | 7,063 | 5 |
| Petróleos Colombo-Brasileros (COLBRAS). | Colombian citizens and Petrobras. | Colombian/Brazilian | 2,032 | -- |
| Petrólera del Rio[5] | Texaco, Inc., ECOPETROL and Cayman Corp. | Colombian/United States | 15,890 | 1 |
| Texas Petroleum Co., (TEXPET) | Texaco, Inc | United States | 7,364 | 2 |
| Total | | | [6] 61,390 | 176 |

[1] Production included with Colbras.
[2] Cities Service, Ecopetrol, Amoco, and Arco each own 25%.
[3] Texaco and Ecopetrol each own 50%; Texaco share will revert to Ecopetrol in July 1975.
[4] Includes previous Shell properties purchased in early 1974.
[5] Texaco owns 50% and Cayman and Ecopetrol own 25% each.
[6] Figure differs from that shown on table 1 because of source.

Early in 1974 the Ministry of Mines and Energy increased the price of new crude oil to $4 per barrel in order to stimulate both production and exploration. The previous price of all crude sold to refineries was fixed at $1.64 per barrel which resulted in an effective rate of $1.55 per barrel since 25% of each crude payment is in pesos at a fixed rate (Col$20=US$1.00). Exceptions in pricing are made to encourage continued production in marginal fields. Unfortunately, the increase in price was almost immediately outdated by precipitate increases in production and exploration costs and failed to have the desired effect. Colombia's petroleum sector faces grave financial problems with up to $100 million needed to subsidize 1975 transportation costs and even larger capital outlays for refinery expansion, production, and exploration.

Early in 1974, ECOPETROL purchased the 46,000-barrel-per-day Cartegena refinery owned by International Petroleum (Colombia) Ltd. (INTERCOL), a subsidiary of the Exxon Corporation. The total sale price was near $40 million to be payed over a 3-year period. Technipetrol S.p.A. received a $15 million contract to expand refinery capacity to 60,000 barrels per day by 1977. ECOPETROL has also contracted Technipetrol S.p.A. to increase gasoline yielded at the Barrancabermeja refinery 15,000 barrels per day. The expansion is estimated to cost about $130 million and should be completed by early 1978. ECOPETROL awarded a contract to Foster Wheeler Corporation for construction of a 75,000-barrel-per-day refinery in the Pacific port of Tumaco. Completion of the first stage (40,000 barrels per day) is tentatively scheduled for 1980 with final completion due in 1982. Total cost, including port facilities is near $200 million. With completion of the Tumaco refinery, ECOPETROL will own 95% of Colombia's refinery capacity and achieve a great coordination of crude and product supply.

A dramatic expansion of the plastics and synthetic fibers industry has resulted in an overall production increase of 55% in chemicals from 1970 to 1973. If the proposed goals for Colombia's petrochemical sector are realized, production in 1980 may be four times greater then the 1.2 million barrels of petrochemicals produced in 1974. One factor aiding chemical growth has been the creation of the Andean Common Market.

In 1974 two petrochemical projects were completed while four projects were under construction. The Niigata Engineering Co. completed a 15,000-ton-per-year detergent alkylates unit for a subsidiary of Standard Oil Co. of California in Barrancabermeja. Petroquimica Colombiana S.A. started operating a 30,000-ton-per-year polyvinyl chloride plant in Cartegena that was designed by Diamond Shamrock Oil Company Ltd. and constructed by Admicol S.A. (ADMI) for $2.5 million. Projects under construction and planned are designed to produce carbon black, ethylene, polyester resin, low-density polyethylene, polystyrene, and terephtalic acid.

# The Mineral Industry of Cyprus

By E. Shekarchi [1]

The political conflicts that erupted July 15, 1974, were followed within days by armed confrontations between Greek and Turkish Cypriot military units, and effectively destroyed the mineral industry for the remainder of the year. By the end of 1974, Cyprus had become a bizonal island with the southern section controlled by the Government of Cyprus and the northern section by the Federated Turkish Cypriot State (FTCS), an autonomous Turkish Cypriot administration sponsored by the Government of Turkey. One of the largest companies in the country, the U.S.-owned Cyprus Mines Corp. (CMC), was compelled to cease its copper-mining operation in July because the dividing line between the Greek and Turkish Cypriots bisected its property. Although CMC kept several hundred employees in the southern part of the island on the payroll until the end of the year, no satisfactory solution to the conflict seemed in sight for the foreseeable future, and the firm decided to write off its Cyprus assets at yearend.

The Geological Survey Department (GSD) continued survey work in all parts of the country until July 1974. However, after the internal conflict began, not only were GSD's activities limited to the southern section of Cyprus, but many field operations and much exploration work was considerably shortened. Cooperative programs with international organizations and various departments on the island were similarly curtailed.

The preliminary gross national product (GNP) for 1974, based on 1973 dollars, was estimated at $912 million,[2] a 3.5% decrease compared with the 1973 GNP. Per capita GNP decreased 20% in 1974 compared with that of 1973.

Historically, foreign investors in Cyprus had been dominantly from the United States and the United Kingdom. However, following the energy crisis of 1973, new investors from Greece and the Middle East became interested in establishing new industries or investing in established ventures. The fate of the new, as well as the old, investments was not clear by the end of the year.

## PRODUCTION

Overall mineral production in 1974 decreased approximately 25% from that of 1973. Based on preliminary information, commodity production in the southern sector of the island was not as severely curtailed by the political crisis as it was in the northern sector. Except for a few gypsum, clay, and crushed stone and gravel operations, most mining ceased in the northern part of Cyprus after July 15. Cyprus Island Div. (CID), a subsidiary of CMC, was the leading producer of copper until July, when operations were closed down.

---

[1] Physical scientist, Division of Ferrous Metals.

[2] Where necessary, values have been converted from Cyprus pounds (fC) to U.S. dollars at the rate of fC1=US$2.82.

Note: In October 1974, the FTCS adopted the Turkish currency as the official trade monetary unit in the northern sector of the country.

## Table 1.—Cyprus: Production of mineral commodities
(Metric tons unless otherwise specified)

[e] Estimate. [p] Preliminary. [r] Revised.

[1] In addition to the commodities listed, a variety of other crude construction materials are also produced, but information is inadequate to make reliable estimates of output levels.

[2] Includes the nonduplicative sum of copper content of ores, concentrates, cupreous pyrites, cement copper, and copper precipitates.

[3] Exports.

[4] Includes havara.

[5] Data excludes an amount reported on a volume basis only as follows: 1972—124,393 cubic meters; 1973—113,078 cubic meters; 1974—NA.

## TRADE

According to statistics published by the Ministry of Finance, December 1974, mineral exports totaled 422,481 tons, a decrease of 20.4% compared with the 1973 total. With world inflation and higher prices for all export commodities, the value of exports did not decrease significantly in 1974; the decrease was 0.75% compared with 1973 values. The most important mining products exported were, in order of value, cupreous concentrates, asbestos, iron pyrite, copper cement (precipitates), and chromium ore and concentrate.

## Table 2.—Cyprus: Exports and reexports of mineral commodities
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum, scrap | 162 | 159 | Italy 94; Spain 45. |

## COMMODITY REVIEW

### METALS

**Chromite.**—Hellenic Mining Co. Ltd. (HMC), the only chromite producer in Cyprus, produced about 33,700 tons of chromite in 1974, an increase of 11% compared with 1973 output. HMC managed some exploration work on the right flank of the Kannoures ore body during the year, but no significant finding was reported.

**Copper.**—Both the Skouriotissa and Lefka mines of CID operated at full capacities during the first 6 months of the year, although the grade of mined ore was low. Operation of both mines and the Xeros copper concentrator was completely halted for the second 6 months of the year.

Operations of the other copper-producing companies—HMC, Kampia Mines Ltd., and Cyprus Sulfur and Copper Co.—suffered the same fate as CID during the year. At yearend, the total copper export decreased 21% compared with that exported during 1973. West Germany was the main recipient of cupreous pyrite and copper cement, followed by the U.S.S.R. and Spain.

### NONMETALS

**Asbestos.**—Cyprus Asbestos Mines Ltd. continued its operation without interruption, despite civil disturbances during the

year. Production of asbestos, both long and short fiber, was reported as 31,456 tons, 1% lower than that of 1973. Approximately 36,000 tons of asbestos of both kinds was exported during 1974. Recipients of Cyprus asbestos were Denmark, 8,398 tons; the United Kingdom, 7,190 tons; West Germany, 5,722 tons and nine other nations receiving from 100 to 5,000 tons. Because of demand in the European market for the type of asbestos that Cyprus produces, the future of this commodity remained bright at yearend.

**Cement.**—According to the Cyprus Statistics and Research Department, cement production decreased to 343,798 tons in 1974 from a high of 456,851 tons in 1973. Cyprus Cement Co. Ltd. and Vassiliko Cement Works Ltd. were the main producers. It was reported that a small, cement-pipe manufacturing company was organized toward the end of the year. Although the Cyprus Government imported cement pipes for its own projects, part of the production of the new industry was slated for export to Middle Eastern countries.

**Clays.**—*Bentonite.*—Exports of bentonite decreased 22% in 1974 compared with 1973 data. Production for the year was minimal; consequently, most of the bentonite exported in 1974 was from material stockpiled in 1973. Production of other clays on the island also showed substantial decreases during the year.

**Mineral Pigments.**—Among the mineral pigments, umber export remained important, although 1974 exports were 15.9% below those of 1973. Foreign exchange earned from umber export was close to $1 million. The main recipients of Cyprus umber were the United States, 6,930 tons, followed by the United Kingdom, 2,184 tons, and seven other nations receiving from 60 to 356 tons. Estimated exports of yellow ocher were 600 tons in 1974.

**Pyrite.**—The decline of pyrite production, attributed to a lack of interest by the European market as well as low-grade ore, continued in 1974. Production of pyrite was about 304,318 tons, 35% below 1973 production. Both HMC and CMC contributed iron pyrite for export by limited production and from 1973 stocks. No new findings of iron pyrite were reported during the year.

## MINERAL FUELS

The Offshore Oil Exploration law, drafted as part of a Commonwealth Assistance Program of the United Kingdom, was sent to Parliament for ratification in the first quarter of 1974. The fate of this legislation was not known by the end of the year. No offshore drilling was reported during the year.

Cyprus Petroleum Refinery Ltd. (CPR) operated at near capacity during the year. CPR is owned by Shell Oil Co., 25.5%; British Petroleum Co. Ltd., 15%; Mobile Oil Corp., 34%; and the Cyprus Government, 15%. Most of the refinery output was consumed locally. In addition, the Cyprus Government imported 4,000 barrels of gasoline, 162,000 barrels of jet fuel and kerosine, and 723,000 barrels of residual fuel oil to meet the national demand.

Crude petroleum imports for the year amounted to 3.8 million barrels and came from Saudi Arabia, 1.7 million barrels; Iraq, 1.6 million barrels; Iran, 124,000 barrels; and others, 296,000 barrels.

# The Mineral Industry of Czechoslovakia

By Nikita Wells [1]

In 1974, Czechoslovakia's overall volume of industrial production increased 6.2% over that of 1973. The largest growths were achieved in the engineering industry (8.5%), the building materials industry (8.2%), and in nonferrous metallurgy (7.7%). The Czechoslovak steel industry was expanding and expected to keep increasing its output well into the future. However, it was 94% dependent upon imported iron ores most of which came from the U.S.S.R.

The Czechoslovak economy was making excessive demands upon its fuel and energy supply. In 1974 demands exceeded available supply from 300 to 600 megawatts during winter months. In the future, increasing power consumption is to be covered partly by imports of fuel and electricity and partly by increased production from domestic nuclear and hydrolectric powerplants. Natural gas, which is to be imported from the U.S.S.R. through the Orenburg gas pipeline in increasing quantities, is to play a more prominent role in the primary energy balance in the future.

Domestic production of crude oil, which has been declining in the past years, covers only 1% of Czechoslovakia's present consumption requirements. Almost all of the required crude is now imported from the U.S.S.R. but in the future Czechoslovakia is planning to obtain more oil from countries of the Middle East and Africa. This oil is to be delivered through the Adriatic pipeline directly to Bratislava.

## PRODUCTION

Increases in production were achieved in 1974 in nearly all branches of the mineral industry. The extraction and processing of ores increased 8.1%; nonferrous metallurgy 7.7% and ferrous metallurgy 5.1%. Production of crude steel increased 3.7%, bringing the total output to more than 13.6 million tons, while that of pig iron was 8.9 million tons, representing an increase of 4.3% over that of 1973. Production of aluminum increased by 4.6%.

In the nonmetallic sector, Czechoslovakia has been expanding its cement, kaolin, and magnesite capacities. A total of 8.97 million tons of cement was produced in 1974, a 7.0% increase over that of 1973. The production of kaolin increased 7.6% and that of magnesite 8.5% over output in 1973.

The chemical industry, however, experienced considerable setbacks due to equipment breakdowns and delays in startup of new facilities. Overall production showed a 6.5% increase over that of 1973 which was less than planned. The production of nitrogen fertilizers increased by 9.9% due to larger outputs at the Sola nad Vahom and Zaluzi plants.

In the mineral fuels sector the total production of all ranks of coal in 1974 increased 1.2 million tons [2] or 1%, reaching 110.7 million tons. The production of coal in the Czechoslovakian Soviet Socialist Republic (C.S.S.R.) has remained steady at this level for the last 5 years. Domestic production of petroleum, however, con-

[1] Physical scientist, International Data and Analysis.

[2] Metric tons, unless otherwise specified.

tinued to drop and showed a 13% decrease in 1974.

The production of electricity in 1974 reached a level of more than 56 billion kilowatt-hours or an increase of 4.8% over that of 1973. This increase came primarily from hydroelectric powerplants due to a favorable water supply and by the startup of some new facilities.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, arsenic, gold, feldspar, graphite, uranium, a variety of additional crude construction materials (such as other clays, stone, sand, and gravel) and additional petroleum products are also produced, but information is inadequate to make reliable estimates of output levels.

[2] This material, although reported as manganese ore, is believed to be manganiferous iron ore, with a manganese content of about 17%, and as such is not equivalent to materials reported elsewhere as manganese ore, which generally contain 25% or more Mn.

[3] Derived by subtracting reported metallurgical and gashouse coke from reported total coke output.

[4] Includes gas produced from coal mines; gross output of natural gas is not reported, but it is believed to exceed reported marketed output by only a relatively inconsequential amount.

[5] Data presented are for those products reported in official Czechoslovakian sources and in the Statistical Yearbook of the United Nations; no estimates have been included for other products or for refinery fuels and losses.

## TRADE

Czechoslovakia's total foreign trade registered a new record of 85.2 billion korunas [3] as compared with 71.1 billion korunas in 1973. The share of the centrally planned economy countries decreased from 69.4% in 1973 to 66.1% in 1974, while that of other countries increased from 30.6% in 1973 to 33.9% in 1974. The value of imports in 1974 increased by 22.8% and that of exports by 16.7% over those of 1973 and thus the negative trade balance, which was 483 million korunas in 1973, further worsened and increased to a record 2.8 billion korunas in 1974.[4]

Czechoslovakia's main trading partner was the U.S.S.R. with a total turnover of 24,255 million korunas; East Germany was second with a 9,739 million korunas turnover; Poland third with 7,299 million korunas; and West Germany was fourth with 5,518 million korunas. Total imports from U.S.S.R. in 1974 increased by 11% in value over that of 1973 and included 14,291,000 tons of petroleum, 2,747,000 tons of bituminous coal, 3,231 million cubic meters of natural gas, 11,825,000 tons of iron ore, and 798,000 tons of pig iron. Imports of nonferrous metals from the U.S.S.R. supplied the basic requirements of the Czechoslovak industry. In 1974, Czechoslovakia imported 97,632 tons of aluminum, 38,705 tons of copper, 25,028 tons of lead, 22,844 tons of zinc, and 1,695 tons of magnesium.

The major Czechoslovak exports in 1974 included 3.7 million tons of bituminous coal; 1.4 million tons of brown coal; 2.5 million tons of coke; 297,000 tons of kaolin; 400,000 tons of magnesite; and a large unreported amount of uranium exported exclusively to the U.S.S.R.

[3] Official exchange rate is US$1.00=5.50 korunas (Kcs) (January 1975).

## COMMODITY REVIEW

### METALS

**Aluminum.**—The production of aluminum in 1974 reached approximately 50,000 tons, showing an increase of 4.6% over that of 1973. Czechoslovakia imported 97,632 tons of aluminum from the U.S.S.R. in 1974 compared with 90,244 tons in 1973.

A new rolling mill for aluminum and aluminum alloys was put into operation on an experimental basis at Kovohute Bridlicna. The yearly foil output is to be 10,000 tons and the strip output, 26,000 tons.[5]

**Antimony.**—Czechoslovakia produced an estimated 1,400 tons of antimony which covered domestic demands. Existing facilities at Banska Dubrave, Pezinok, and Zlate

[5] Jedlicka Jaromir. A New Rolling and Heat-Treatment Works for Aluminum Strips and Foils. Neue Hütte (Leipzig), No. 8, August 1975, pp. 499–501.

Idce are to be further expanded. The reconstruction and modernization of the old metallurgical plant at Vajskove, where antimony is to be extracted from complex tetrahydride ores is still in progress.[6]

**Copper.**—In 1974, the approximate total consumption of copper was 51,200 tons, of which domestic production provided only 4,500 tons or 8.8%.[7] Copper ore production was 667,000 tons or 10,000 tons more than in 1973. By 1990, production of copper in concentrates is supposed to reach 8,600 tons. New beneficiation facilities will be built at Novoveska Huta, Slovinky, Fichtenbuhl, Zlate Hory, and Zlatno.[8]

**Iron Ore.**—During recent prospecting in Czechoslovakia no iron ore deposits of any significant size were discovered. Thus, Czechoslovak resources are now mostly limited to the deposits situated in the eastern part of the Slovak Ore Mountains (west of Kosice) where extraction will be concentrated in the future.[9]

In 1974, Czechoslovakian iron ore production provided only 6% of domestic needs. A total of 11,825,000 tons, or 85% of the iron ore imports, came from the U.S.S.R., mostly from the Krivoi Rog in the Ukraine. The rest of the ore was imported from India, Sweden, Brazil, and Algiers.[10]

An ore processing plant is being built in the Krivoi Rog region in order to improve the quality of the ore shipped. By 1980 this plant is expected to be fully operational and Czechoslovakia is to receive iron ore concentrates and pellets instead of crude ore and agglomerates. This should reduce the transportation costs, since a very large amount of rock is now included in the ore shipments.[11] The average iron content of the ore is reported to be only 58%.[12] Also the high silicon oxide content and the so-called acidity of this ore presently requires large quantities of coke and limestone in the smelting process. The future decrease in coke consumption per ton of steel produced will thus cut costs considerably.

The new Klement Gottwald plant at Kuncice (near Ostrava) is one of Czechoslovakia's largest industrial enterprises and, together with the East Slovak iron and steel works at Kosice, is to process most of the imported iron ore.

**Iron and Steel.**—The Czechoslovak steel industry is expanding on the basis of iron ore imported primarily from the U.S.S.R. and is expected to continue to expand for many years. Production of pig iron in 1974 increased by 364,000 tons (4.3%) and that of crude steel by 482,000 tons (3.7%) over 1973 production.

A major reconstruction and expansion is under way at the special steel plant located at Drin, a suburb of Kladno, Bohemia. Output of this plant is expected to triple by 1980. Here a 100-ton electric furnace, designed in the U.S.S.R., was under construction during 1974 in the newly erected electric steel plant which is part of the Poldi II metallurgical complex for the production of high-grade steel. This furnace is to be the largest in Czechoslovakia and is to go into operation at yearend 1975.[13] A second 100-ton furnace is also planned. This complex plans eventually to produce 420,000 tons per year of high-grade steel and has already cost an estimated 20 billion korunas, including reconstruction of the old works.[14]

A long range plan has been outlined for future additions to the new plant at Kladno. This is one of C.S.S.R.'s top priority projects. It is divided into four stages: A billet mill, a medium-light section mill, and the installation of two more 100-ton electric furnaces. Heavy metallurgical scrap iron, mainly supplied by other Czechoslovak plants, will be the basic material processed at the works. The startup of the billet mill is scheduled in 1977. The completion date of the whole project may run into 1990. After the construction is completed, the complex is supposed to produce 1.2 million tons of highgrade steel per year.[15]

A new iron foundry has been put into operation at the South Moravian fitting works in Hodonin. It has a capacity of 24,000 tons per year of castings and its total cost was 180 million korunas.

Czechoslovakia's pig iron and steel production by furnace type is listed in table 4.[16]

Table 4.—Czechoslovakia: Salient statistics on iron and steel production

| | 1972 | 1973 | 1974 |
|---|---|---|---|
| PIG IRON | | | |
| Number of blast furnaces | 16 | 16 | 16 |
| Production of pig iron and ferroalloys: | | | |
| Pig iron for steelmaking ---- thousand metric tons | 7,918 | 8,118 | 8,411 |
| Pig iron for foundry ---- do | 414 | 389 | 460 |
| Blast furnace ferroalloys ---- do | 28 | 27 | 34 |
| Electric furnace ferroalloys ---- do | 116 | 122 | 127 |
| Total ---- do | 8,476 | 8,656 | 9,032 |
| Materials consumed per ton of pig iron: | | | |
| Iron ore and manganese ore ---- kilograms | 330 | 361 | 369 |
| Sinter ---- do | 1,585 | 1,506 | 1,525 |
| Scrap ---- do | 23 | 24 | 19 |
| Coke ---- do | 566 | 540 | 541 |
| Limestone ---- do | 120 | 89 | 70 |
| CRUDE STEEL | | | |
| Production of crude steel: | | | |
| Open hearth ---- thousand metric tons | 8,502 | 8,727 | 8,998 |
| Bessemer ---- do | 217 | 216 | 208 |
| Electric furnace ---- do | 1,492 | 1,495 | 1,534 |
| Oxygen converter ---- do | 2,516 | 2,720 | 2,900 |
| Total ---- do | 12,727 | 13,158 | 13,640 |
| Materials consumed per ton of crude steel: | | | |
| Pig iron ---- kilograms | 702 | 702 | 708 |
| Scrap ---- do | 412 | 395 | 402 |

**Lead and Zinc.**—Lead-zinc ore production in 1974 was 552,000 tons (34,000 tons less than in 1973). This ore is presently mined at deep levels in the old mines of Pribram and also at the Kutna Hora and Banska Stiavnica deposits. At Pribram new developments are under way at the Kvetne, Radeticich, and Milinsku mines.

Lead production is expected to increase from 3,896 tons in 1974 to 5,700 tons in 1980 and is to be kept at this level through 1990. Zinc production in 1980 is to be 12,100 tons per year. However, zinc output will decrease in the near future due to depletion of some deposits.[17]

**Mercury.**—Mercury is extracted from vein deposits at Rudnany (Slovakia). The newly built plant processes ores at a rate of 40 tons per day. The concentrate contains 2% mercury. Czechoslovakia's mercury production in 1974 decreased by 15% compared with that of 1973.

**Nickel.**—Present Czechoslovak nickel demand is approximately 4,500 tons per year and is shortly expected to reach 5,000 tons. Nickel metal imports totaled 4,534 tons in 1974, of which 4,092 tons came from the U.S.S.R. and 397 tons from Cuba.

Czechoslovakia's nickel is produced at the Sered nickel plant from imported iron nickel ores. The plant's capacity has been reported to be 2,000 tons per year of refined nickel.

Nickel ores are planned to be extracted in Josove in East Slovakia from 1985 to 1990.

**Tin and Tungsten.**—Tin and tungsten are mined together in the Cinovec and Horni Slavkov Districts. The tin-tungsten ore output from deposits is presently believed to be less than 200,000 tons per year; however, future output is expected to increase.

**Uranium.**—Czechoslovakia has substantial uranium deposits; however, since the end of World War II this uranium has been exclusively exported to the U.S.S.R. and the mining of the Jahymov and Pribram deposits is on the decline. The Jahymov deposit is nearly depleted. A new uranium appraisal of the C.S.S.R. was made in 1973 and showed a number of promising areas in addition to the known deposits. Uranium ore has been found in the Moldanubikum area, southern Czechoslovak proterozoic, granite massif, and the permotriassic of southern Karpathia.[18]

The uranium industry is expected to expand the course of the sixth 5-year plan (1976–80). Considerable expansion is planned at Pribram, Nove Mesto, and

[17] Work cited in footnote 6.

[18] Sorf, Frantisek. Prognoza dalsiho rozvoje vyhledavani a tezby uranovych rud v CSSR (The Forecast of Further Development of Prospecting and Mining of Uranium Ore in CSSR). Rudy (Prague), No. 11, v. 23, 1975, pp. 337–338.

Bystrice pod Pernstejnem. Construction of housing is anticipated in the new uranium districts of North Bohemia at Ceska Lipa, Liberec, and Steaz pod Ralskem. In the areas of developed mines (Dolni Rozinka, Western Bohemia, Pribram), mining is being performed at greater depths and will gradually diminish only to be compensated for by the new developments in the North Bohemian area.[19]

Estimated reserves of uranium metal in Czechoslovakia are approximately 25,000 tons (29,480 tons of $(U_3O_8)$ and the estimated production capability is 250 tons per year of $U_3O_8$.[20] This, however, is only a very rough estimate. Data on Czechoslovakia's uranium reserves is practically nonexistent due to the high secrecy imposed on the uranium industry.

## NONMETALS

**Asbestos.**—Czechoslovak participation in the development of an asbestos complex at the Kiembaev deposit in the southern Urals, U.S.S.R., continued throughout 1974. Czechoslovakia will deliver automatic dump trucks as well as other engineering products to the U.S.S.R. in the period 1974–76 and will in return receive deliveries of asbestos between 1980 and 1991.[21]

In 1974, Czechoslovakia imported a total of 38,826 tons of asbestos, of which 28,488 tons came from the U.S.S.R.[22]

**Cement.**—Czechoslovakia hopes to achieve near self-sufficiency in cement as soon as its three new major cement plants come into full operation. It was reported, however, that construction of these plants is behind schedule. A cement plant with a capacity of 600,000 tons per year is being built near the Klement Gottwald Works at Kunice near Ostrava. Production is planned to start in the first quarter of 1975. The plant is to use the waste product from the Gottwald Works (65% limestone and 35% blast furnace slag).[23]

The Zahorie Lime Works and Cement Plant at Rohoznik in West Slovakia is expected to go into production in December 1975.[24] The Turna nad Badvou cement plant, with a capacity of 770,000 tons per year of cement, is to be the country's largest when it goes into full operation.

**Clays.**—*Kaolin.*—With the production of 484,000 tons in 1974, Czechoslovakia has become the sixth most important producer of kaolin in the world. The kaolin industry is maintaining a steady growth and, in addition to supplying all indigenous requirements, it exports 297,000 tons. In 1974, major exports were 88,000 tons to West Germany, 44,000 tons to Poland, 30,000 tons to Austria, 25,000 tons to Yugoslavia, and 10,000 tons to East Germany.[25]

The new flotation plant at Kaznejov near Plzen was completed in the last quarter of 1974 and now produces 200,000 tons of raw material for the paper and rubber industries. This plant is now the largest of its kind in Europe and the deposits of kaolin in the nearby quarry are reported sufficient to last 100 years.[26]

**Feldspar.**—Large deposits of feldspar were discovered near the village of Halamky, in the Jindrichuv Hradec area, where the reserves are estimated at a minimum of 60 million cubic meters. The Czechoslovak Ceramic Works is in the process of building a new modern plant at this location for feldspar extraction and plans trial operation at yearend 1975. Thus, under the sixth 5-year plan, Czechoslovakia will no longer have to import feldspar and even may be in a position to export it.[27]

**Fertilizer Materials.**—The production of nitrogen fertilizers in 1974 increased by 9.9% with the help of the urea facilities at Sala nad Vahom and Zaluzi. Sala nad Vahom is the principal nitrogen fertilizer complex in Czechoslovakia with a 432,000-ton-per-year ammonia production. Zaluzi is the second most important plant and hopes to achieve planned production of urea towards yearend 1975.

Once the plants, which are still under construction, go into operation, Czechoslovakia will become self-sufficient and even export nitrogen fertilizers (especially urea).

The production of the phosphatic fertilizers ($P_2O_5$ content) for 1974 was 336,000 tons, showing a slight decrease from that of 1973 and meeting only half of the nation's requirements.

**Magnesite.**—In 1974, magnesite production reached 634,000 tons. Total exports were reported as 400,000 tons, a 100% increase over those of 1973. Exports were

[26] Czechoslovak Heavy Industry (Prague), No. 7, July 1975, p. 27.
[27] Work cited in footnote 23.

93,000 tons to West Germany; 44,000 tons to East Germany; 72,000 tons to Hungary; 64,000 to Poland; and 37,000 to Romania.[28]

Czechoslovakia has spent 2.5 billion korunas in the development of the magnesite industry during the years 1956–75. It is expanding the capacity at Kosice, Podrecany, Lubenik, Burde-Poproci, and especially at the large Mikova mine near Jelsava.[29]

**Sulfur.**—Production of sulfur is far below demand and thus sulfur continued to be imported. In 1974, Czechoslovakia imported 196,000 tons of sulfur from Poland and 133,000 tons from the U.S.S.R.

Czechoslovakia produced 296,000 tons of pyrite, with a total sulfur content of 124,000 tons, showing an increase of only 1.6% over that of 1973.

The country is making an attempt to increase its sulfuric acid capacity in the forthcoming 5-year plan by the construction of two new sulfuric acid plants. The Neratovice plant (300,000-ton-per-year capacity) is presently under construction and is scheduled to go into operation in mid-1975. A contract for a new plant at Bratislava (330,000-ton-per-year capacity) was signed in November. Both plants are under contract with Polimex-Cekop Ltd., the Polish chemical engineering foreign trade organization.[30]

## MINERAL FUELS

Czechoslovakia's total primary energy consumption for 1974 was estimated at 105 million tons of standard coal equivalent as summarized in table 5. This represents an increase in total energy consumption of 2% over 1973 consumption. Coal now provides 73.0% of the total primary energy while oil represents 20.7%; natural gas 5.3%; hydroelectric power 0.4%; nuclear power 0.1%; and imported electric power 0.6%.

The share of the natural gas component in the total energy balance is expected to increase to 11% by 1980 and to 15% by 1990.[31] Deliveries of natural gas from the U.S.S.R. will continue to increase to meet Czechoslovak requirements in the future. Czechoslovakia is planning a transition from coal gas to natural gas in Slovakia by 1980, in Prague by 1990, and throughout Czechoslovakia by the year 2000.[32]

Table 5.—Czechoslovakia: Primary energy balance 1973–74
(Million tons of standard fuel equivalent) [1]

| Kind | Total primary energy | | Coal and coke | | Crude oil petroleum products | | Natural and associated gas | | Hydroelectric power | | Nuclear power | | Imported electric power | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1973 | 1974 | 1973 | 1974 | 1973 | 1974 | 1973 | 1974 | 1973 | 1974 | 1973 | 1974 | 1973 [2] | 1974 [2] |
| Production [3] | 79.1 | 79.6 | 76.9 | 77.6 | 0.3 | 0.2 | 1.4 | 1.3 | 0.4 | 0.4 | 0.1 | 0.1 | -- | -- |
| Exports | 6.1 | 6.4 | 5.9 | 6.2 | -- | -- | -- | -- | -- | -- | -- | -- | 0.2 | 0.2 |
| Imports | 29.9 | 31.8 | 5.3 | 5.2 | 20.8 | 21.5 | 3.1 | 4.3 | -- | -- | -- | -- | .7 | .8 |
| Apparent consumption | 102.9 | 105.0 | 76.3 | 76.6 | 21.1 | 21.7 | 4.5 | 5.6 | .4 | .4 | .1 | .1 | .5 | .6 |

[1] Conversion factors used are hard coal, 1.0; lignite and brown coal, 0.6; crude oil, 1.47; natural gas, 1.33; hydroelectric and nuclear power, 0.125.

[3] See production table.

Source: World Energy Supplies, Statistical Papers, Series J, No. 18, (United Nations) N.Y., 1975.

Nuclear power is to contribute an increasing share of the energy supply in the future. However, it still remains fairly insignificant compared with total energy production. Three nuclear powerplants are scheduled for full operation by 1980 with a total capacity of 2,600 megawatts.

**Coal.**—In 1974, production of coal and lignite reached 110.7 million tons, or 1.2 million tons (1%) higher than in 1973. Total coal production has been maintained between 109.5 million and 113.5 million tons for the past 5-years. Bituminous coal production for the same period remained

[28] Page 450 of work cited in footnote 10.

[31] Svet Hospodarstva, Aug. 13, 1974.
[32] Technicke Noviny, Jan. 29, 1974.

steady at approximately 28 million tons per year. The gross output of brown coal and lignite averaged at approximately 78 million and 3.7 million tons per year, respectively. The production of bituminous, brown coal, and lignite by major basins is shown in table 6.[33]

Table 6.—Czechoslovakia: Production of coal by major basins
(Thousand metric tons)

| Basin | 1972 | 1973 | 1974 |
|---|---|---|---|
| Bituminous coal: | | | |
| Ostrava-Karvina | 23,793 | 23,761 | 24,094 |
| Kladno | 2,346 | 2,302 | 2,272 |
| Plzen | 452 | 430 | 397 |
| Trutnov | 716 | 713 | 710 |
| Rosice | 515 | 463 | 418 |
| Total | 27,822 | 27,669 | 27,891 |
| Brown coal: | | | |
| North Bohemia | 58,297 | 56,389 | 57,078 |
| Sokolov | 19,748 | 18,116 | 18,190 |
| Handlova | 2,908 | 2,982 | 3,064 |
| Modry Kamen | 773 | 750 | 839 |
| Total | 81,726 | 78,237 | 79,171 |
| Lignite: | | | |
| Bohemian lignite mines | 195 | 41 | -- |
| South Moravian lignite mines | 1,967 | 2,000 | 2,064 |
| Novaky coal mines | 1,678 | 1,551 | 1,555 |
| Total | 3,840 | 3,592 | 3,619 |
| Grand total | 113,388 | 109,498 | 110,681 |

Czechoslovakia presently imports approximately 5 million tons of bituminous coal from Poland and the U.S.S.R. (2,421,000 and 2,747,000 tons in 1974, respectively). These figures are representative of the coal imports for the past 5 years. In turn, Czechoslovakia exported a total of 3,717,000 tons of bituminous coal; 1,391,000 tons of brown coal; and 2,519,000 tons of coke distributed as follows: [34]

| | Thousand tons | Percent |
|---|---|---|
| Bituminous coal: | | |
| Austria | 717 | 19 |
| Germany, East | 710 | 19 |
| Romania | 632 | 17 |
| Hungary | 576 | 15 |
| Other | 1,082 | 30 |
| Total | 3,717 | 100 |
| Brown coal: | | |
| Germany, West | 1,343 | 97 |
| Austria | 14 | 1 |
| Other | 34 | 2 |
| Total | 1,391 | 100 |
| Coke: | | |
| Germany, East | 801 | 32 |
| Romania | 472 | 19 |
| Hungary | 285 | 11 |
| Other | 961 | 38 |
| Total | 2,519 | 100 |

Czechoslovakia's hard-coal reserves are estimated at 11,600 million tons and the brown-coal reserves at 12,500 million tons (Dec. 31, 1966). Coking coal accounted for 10.5% of the aggregate reserves of the hard coals.[35]

According to Zemedelske Noviny[36] taking increased future demands into account, deposits of hard coal will be depleted in about 70 years, those of lignite in 30 years, and those of brown coal in 50 years. In the future, coal will become increasingly expensive due to the deteriorating conditions under which it will have to be mined both in the Ostrava hard-coal basin and in the North Bohemian brown-coal basin where surface mining at greater depths will require expensive machinery, the shifting of railroad tracks, roads, and even the development of entire towns. In order to alleviate the burden placed upon its own resources, Czechoslovakia plans to import additional coal in the future, probably from Poland.

Czechoslovakia's total consumption of bituminous and brown coal listed by consumer groups in 1973 and 1974 is presented in table 7.[37]

[33] Pages 276–277 of work cited in footnote 10.
[34] Page 449 of work cited in footnote 10.
[35] United Nations Report, E. AD (XI)/R.4, Add. 12, Jan. 30, 1974.
[36] Zemedelske Noviny. July 16, 1974.
[37] Page 268 of work cited in footnote 10.

Table 7.—Czechoslovakia: Consumption of coal by type of consumer
(Percent)

| Consumer | Bituminous coal | | Brown coal | |
|---|---|---|---|---|
| | 1973 | 1974 | 1973 | 1974 |
| Electric powerplants | 20.6 | 19.7 | 46.3 | 46.2 |
| Steam for heating and industrial use | 19.2 | 19.1 | 25.3 | 26.3 |
| Coke plants | 48.5 | 51.1 | -- | -- |
| Coal gas plants | -- | -- | 3.5 | 3.7 |
| Railroads | 2.6 | 2.0 | 1.4 | 1.3 |
| Households | 3.2 | 2.8 | 9.1 | 9.2 |
| Other | 5.9 | 5.3 | 14.4 | 13.3 |
| Total | 100.0 | 100.0 | 100.0 | 100.0 |

According to Czechoslovak sources total consumption of coal and lignite may reach 140 million tons by 1980. The increased requirement for solid fuels will place the greatest demand upon the North Bohemian brown-coal basin. Output from this basin is planned to increase steadily during the sixth 5-year plan. The demand on the Ostrava-Karvina coal, suitable for coking, is to exceed 18 million tons in all years of the coming 5-year plan. The production of coke is to exceed 11 million tons per year.[38]

The development of a new coal mine in the foothills of the Krkonose mountains in the area of the East Bohemian coal mines was started in 1974 and is to produce 500,000 tons of hard coal per year. The first stage of the mine is to go into operation in 1978. Final development is to be completed in 1985 at a total cost of 664 million korunas.[39]

**Natural Gas.**—Production of natural gas in 1974 was estimated at approximately 1 billion cubic meters. The delivery of natural gas from the U.S.S.R. in 1974 reached 3.2 billion cubic meters, 39% over the 2.3 billion cubic meters imported in 1973.[40] Future gas deliveries are planned on an increasing basis.

Work is continuing on the second branch of the transit gas pipeline "Transgaz" representing 1,000 kilometers of a new gas pipeline in Czechoslovakia. At present, Transgaz transfers 12.5 billion cubic meters of Soviet natural gas to Western Europe and is to transfer 16.5 billion cubic meters after completion of more compressor stations. Discussions have been conducted with the U.S.S.R. in order to raise the pipeline capacity to 37 billion cubic meters. Czechoslovakia is to receive 10% of the amount of gas that is transported through this pipeline as payment for its construction.[41]

An agreement was signed in June 1974 as to Czechoslovakia's participation in the capital investment and construction of the Orenburg gas pipeline which runs from Orenburg in the southern Urals to the western borders of the U.S.S.R., and which will be used to deliver natural gas to Eastern European countries. About 6,000 Czechoslovakian workers are to be employed in the completion of a 560 kilometer section of the pipeline equipped with 5 compressor stations which is to be operational by the first of October 1979.[42] In return for investment in this project Czechoslovakia will receive 2.8 billion cubic meters of natural gas per year for a period of 12 years.[43]

**Petroleum.**—Czechoslovakia produced 149,000 tons of crude oil in 1974, a 13% decrease compared with 1973 production. This production represents only 1% of the present domestic petroleum consumption. For 1974, total crude imports were 14,655,000 tons of which 14,291,000 tons came from the U.S.S.R.[44] This shows a total increase in imports of 3.4% compared with 1973 imports.

In order to increase processing of Soviet crude oil, construction has been accelerated at the Zaluzi petrochemical plant at Most and the Slovnaft chemical combine near Bratislava. Czechoslovakia presently has a total refining capacity of about 19 million tons per year of which the Slovnaft and

[43] Zemedelske Noviny (Prague), Sept. 25, 1975, p. 1.
[44] Page 445 of work cited in footnote 10.

Zaluzi plants are processing 9 million and 3 million tons per year respectively; they hope to reach 11 million and 5.5 million tons per year, respectively, by the end of the current 5-year plan. Slovnaft supplies about 50% of all propellants, lubricants, and heating oils for the national economy. However, certain construction delays have occurred at Slovnaft and the ethylene plant and the plants for production of ethyl oxide and glycols are behind schedule.[45]

The newly built refinery at Kralupy, located 20 kilometers from Prague, was scheduled to be completed by yearend 1974. The refinery will be using imported Soviet crude oil from the "Druzba" (Friendship) pipeline which links East European countries with the U.S.S.R. The refinery was to produce approximately 3 million tons of petroleum products per year and was to meet the demands of Prague and the surrounding district of Central Bohemia.

The fourth major refinery in Czechoslovakia is to be located between Ostrava and Opava in north Moravia. Construction was to begin in 1975. The capacity of this refinery was to be 3 million tons per year starting in 1978 and 6 million tons per year in 1980.

Czechoslovakia was to participate in the construction of the Adriatic pipeline which extends from the island of Krk, off the coast of Yugoslavia, through Hungary to Bratislava. Crude oil is to be delivered at Krk from Middle Eastern and African countries. By 1980, a total of 34 million tons of crude oil per year is expected to flow through the pipeline, 5 million tons of which is to be delivered to Czechoslovakia, which was to contribute approximately a total of $25 million plus technology and equipment to this project.

In February 1974, Czechoslovakia signed an agreement with Libya to receive between 500,000 to 1 million tons of crude oil per year for the next 10 years in exchange for Czechoslovak machinery and equipment. Similar agreements have been made in recent years with a number of countries in the Middle East and Africa (Egypt, Iraq, Iran, Algeria, Nigeria).

Nuclear Energy.—Czechoslovakia's first nuclear electric powerplant at Jaslovske Bohunice in Western Slovakia was put into operation in 1972, after being under construction for 10 years. This powerplant has a capacity of 840 megawatts and uses a heavy-water reactor where natural uranium is used as a fuel.[46]

Two more nuclear powerplants are to be put into operation in the sixth 5-year plan with the help of the U.S.S.R. Construction of the V–1 powerplant at Jaslovske Bohunice began in 1973 and continued into 1974. Installation of equipment is scheduled to begin in 1975 and initial startup was to be in 1977. Preparatory work began in 1974 on the V–2 powerplant at Dukovany. Both of these powerplants will use two of the Voronez type VVER–440 light-water reactors, each having a capacity of 440 megawatts, thereby providing each powerplant with a capacity of 880 megawatts. They are both to be put into operation gradually from 1977 to 1980 and are the first integrated type of nuclear powerplants which are being built by all the COMECON[47] countries in Europe.[48]

Plans are being made for the fourth Czechoslovak powerplant to be located at Mochovce in the Levice District. This plant will be designated V–3 and again was to use two VVER–440 reactors, giving a total capacity of 880 megawatts. The estimated cost of this plant is 5.5 billion korunas and startup of the two stages is set for 1981 and 1982.

An agreement has also been made with the U.S.S.R. for increasing the future total capacity of nuclear powerplants to 5,000 megawatts by the year 1985.[49]

# The Mineral Industry of Egypt

By Daniel C. Adkins [1]

Egypt's mineral activities were dominated by the petroleum and natural gas industry. The national budget allocated up to $245 million [2] for this industry, compared with $120 million for nonpetroleum mineral activities.[3] The Government-devised production-sharing system for oil exploration met with continued success. Concession areas were equivalent to 18% of total Egyptian land area by the end of 1974. Two new oilfields were brought into production, and two gasfields and their associated energy and petrochemical projects neared operation. It was planned to use the new oil and gas supplies for fertilizers, energy, petrochemicals, and the direct reduction of iron ore. Construction of the dual 42-inch crude oil pipeline from the Gulf of Suez to the Mediterranean Sea (SUMED) was well underway and received 70% of Egypt's oil budget.

## PRODUCTION

Crude oil production fell 8.6% to an annual average of 147,060 barrels per day even though the July and Ramadan oilfields were brought into production. The decline was attributed to a fall of reservoir pressure in the El Morgan Field in the Gulf of Suez and production setbacks due to the October 1973 war and resulting embargo. Israel continued producing about 90,000 barrels per day from occupied Egyptian oilfields on the Sinai Peninsula. Egypt's first gasfield, the Abu Madi in the Nile Delta north of Cairo, entered full production and piped over 100 million cubic feet per day of gas to industrial consumers in the Cairo area.

## TRADE

In early 1974, Egypt and the United States resumed diplomatic relations, which had been unilaterally severed by Egypt following the Arab-Israeli War of 1967. Although United States-Egyptian trade was not hampered during this period, closer diplomatic relations should open Egypt for more U.S. trade and investment.

Work started in April 1974 to reopen the Suez Canal, closed since 1967. By yearend, teams from the United States, the United Kingdom, France, Egypt, and the Soviet Union had cleared mines and other ordnance from the canal and surrounding areas. The Murphy Pacific Marine Salvage Co. of California was employed to remove the 10 wrecks that blocked the Suez Canal and completed its operation by yearend. The remaining work includes dredging and rebuilding canal support facilities.

The Egyptian Government plans to increase the capacity of the canal in two stages to accommodate 150,000- and then 250,000-deadweight-ton vessels. These plans would necessitate considerable financing and require up to 8 years for completion. The expansion project would allow the canal to increase its share of seaborne trade from an estimated 4% to 24% of total world seaborne trade.

## COMMODITY REVIEW

### METALS

**Aluminum.**—As construction of the Naj Hammadi aluminum smelter neared completion, plans were made to increase its capacity from 100,000 to 170,000 tons annually with further Soviet aid. Initial production of 100,000 tons per year may start in early 1975 if delays in construction of support facilities are overcome. Output will include cylinders, slabs, and wire rods, the majority of which will be exported. The smelter's electricity will be supplied by the Aswan High Dam.

**Copper.**—Negotiations between the Egyptian Metallurgical Industries Organization and the Zambian Government were initiated on the possibility of constructing a $50 million copper plant in Alexandria's "free zone." The plant would be able to produce 50,000 tons yearly of copper from ore shipped from Zambia.

**Gold.**—The Egyptian Geological Research Authority has begun studies to reopen the Eastern Desert gold mines in light of the increase in gold prices.

**Iron and Steel.**—In August 1974 the third blast furnace at the Hulwan iron and steel complex was inaugurated, raising Egyptian pig iron capacity from 300,000 to 900,000 tons per year. Corresponding steelmaking capacity was also installed, including oxygen steel converters, continuous-pouring units, a limestone unit, and an oxygen unit. Construction was initated on a fourth furnace that will bring the Hulwan iron and steel capacity to 1.5 million tons per year in 1976. The iron ore used has been from Aswan deposits and more recently from the higher quality Bahareza Oasis deposits in the Western Desert.

Egypt and Brazil are cooperating in iron ore ventures. The first step was construction of a $120 million iron ore pelletizing plant in Brazil using capital from Egypt's General Organization for Industrialization (GOFI), 70% and from Brazil's Companhia Vale do Rio Doce (CVRD), 30%. The plant will produce 4 million tons per year of iron pellets, 90% of which will be exported in Brazilian ore carriers to a new Egyptian sponge iron plant near Alexandria. This plant will be built by 1977 at a cost of $200 million, with the participation of Egypt, 50%; Japan, 25%; West Germany, 15%; and Brazil 10%. Natural gas from Egypt's Abu Qir gasfield will be piped 30 kilometers to provide reductant and fuel for the direct reduction of pellets. West Germany's Korf Industrie and Handel GmbH und Co. will provide the direct reduction technology for the plant. Japan's C. Itoh & Co. will handle organization and future exports to the Mediterranean area and Japan. International Engineering Co. of the United States will participate in technical studies. The plant is designed to produce 1.6 million tons per year of sponge iron and may be expanded to 5 million tons per year.

## NONMETALS

**Cement.**—The Egyptian National Building Material Co. has contracted with Marubeni Corp. and Kawasaki Heavy Industries Ltd. of Japan to construct a cement plant at Asnam. The plant may have a capacity of over 1 million tons per year and start production by 1978. The plant will utilize local limestone reserves totaling 200 million tons.

**Fertilizer and Materials.**—The Kuwait Fund for Arab Economic Development (KFAED) will lend Egypt $24 million of the $130 million needed to finance the second Talkha fertilizer plant, which is scheduled for completion in 1978. The 1,200-ton-per-day-capacity ammonia plant will use natural gas from the Abu Madi gasfield for feedstock. The first nitrogenous fertilizer plant at Talkha is expected to start production in 1975.

Egypt awarded an $80 million contract to Mannesmann-Export AG, and Friedrich Uhde, GmbH, of West Germany for construction of a urea fertilizer plant at Abu Qir near Alexandria by 1977. Natural gas from the Abu Qir offshore gasfield will be used in the production of 330,000 tons per year of ammonia, which will be utilized to produce 500,000 tons per year of urea fertilizers. Financing of nearly $300 million came from the West German Government and private industry.

*Phosphates.*—Egypt has considerable resources of phosphate rock, estimated to be around 1.4 billion tons. These resources are located near the Red Sea between Port Safaga and Kosseir (200 million tons), along the Nile River between Qina and Sebaia (200 million tons), and in the Western Desert on the Abu Tartur Plateau between the El Dakhla and El Kharga Oasis (1 billion tons).

Construction of the Hamrawayn phosphate complex near the Red Sea is progressing with Romanian participation. Upon completion in 1976, the complex will be able to produce 1,200,000 tons of crude phosphate per year.

## MINERAL FUELS

**Natural Gas.**—Estimated natural gas reserves totaled around 5 trillion cubic feet and were located in four dispersed areas: Abu Gharadiq (southwest of El Alamein), Abu Madi (northeast Nile Delta), Abu Qir (northeast of Alexandria offshore), and associated gas in the El Morgan Field (Gulf of Suez).

The Abu Gharadiq gasfield with reserves of 2.2 trillion cubic feet was being prepared for production in 1975. At that time 106 million cubic feet per day will be piped to the Hulwan industrial area.

Estimates of reserves of the Abu Madi field were doubled to 1.4 trillion cubic feet. The field started full production in October and has the capacity to send 106 million cubic feet per day to the Talkha nitrogenous fertilizer plant, an electric power station, and textile factories.

The offshore Abu Qir gasfield, with reserves of 1 trillion cubic feet, is expected to begin production in late 1975 at the rate of 106 million cubic feet per day. The KFAD has granted the Egyptian General Petroleum Corporation (EGPC) a loan of $14.5 million, which covers 45% of the project cost.

**Petroleum.**—*Exploration.*—During 1974, the production-sharing system devised by the EGPC met with continued success as 15 U.S. and European oil companies

acquired exploration rights for over 90,000 square kilometers in 17 concessions. The exploring companies are committed to bear all costs until a commercial oil discovery is made, when arrangements will be made for the foreign company to recover exploration and production costs. Offshore areas are subject to production-sharing contracts, and onshore acreage production will be a joint venture with EGPC. Contracts permit the operating company to use 40% of the production to recover costs, with the remaining 60% split from 85% to 70% and 15% to 30% between EGPC and the foreign company, respectively. The agreements also specify payment of signature and production bonuses. These contracts generally provide for 8-year exploration periods and 20 to 30 years of production thereafter. Among the 29 companies from 11 countries that have concessions in Egypt, the most involved are Phillips Petroleum Co., Exxon Corp., Continental Oil Co., Amoco International Oil Co., Shell Petroleum Co., Ltd., Agip, S.p.A. and Mobil Oil Corp.

## Table 4.—Egypt: Petroleum concession agreements with foreign companies signed during 1974

| Company and country | Location | Acreage (square kilometers) | Signature (s) and production (p) bonuses (million dollars) | Exploration commitments | Production sharing [1] |

[2] In this agreement, EGPC has abandoned its rights to the General Petroleum Company (GPC).
[3] Shell International Petroleum Co. Ltd., Netherlands; Erdölversorgungsgesellschaft, mbH, West Germany; British Petroleum Co., Ltd., United Kingdom.

These new concessions are part of an Egyptian Government program to increase oil production from the current 200,000 barrels to 1 million barrels per day by 1982. To reach this production goal, EGPC believes it will be necessary to attain certain levels of investment, exploratory drilling, and concession leasing. Of the estimated $800 million in investment needed for exploration, $500 million has already been committed by foreign oil companies. By the end of 1974, 37% of the planned exploration area covering 500,000 square kilometers was held in concessions. However, exploratory drilling will have to increase dramatically to achieve the goal of 400 wells by 1982.

Seismic activity increased in 1974 to 57.2 party-months covering 22,034 line-kilometers, of which 71% was offshore. Onshore seismic activity occured in the Western Desert and the Nile Delta, while offshore activity areas included the Suez Gulf and the Mediterranean Sea.

A total of 44 wells were drilled, of which 12 were exploratory. The Gulf of Suez Petroleum Co. (GUPCO), the joint operating company of Amoco Egypt Oil Co. and EGPC, discovered a new oilfield in September 1974, which was named Ramadan. GUPCO had discovered the July Field in the Gulf of Suez during 1973.

*Production.*—In the early months of

1974 production was depressed to 58,000 barrels per day as a result of the October 1973 conflict. However, by the end of 1974 the production rate had attained the prewar level of 192,000 barrels per day, resulting in a yearly average of 147,060 barrels per day. The newly discovered Ramadan Field started initial production in late 1974. The pay zone is 1,300 feet thick and contains 31.7° gravity crude oil. The July Field, discovered in 1973, was linked to El Morgan facilities and started production in April at 20,000 barrels per day. The July Field pay zone was reported to be 740 feet thick with reserves of 600 million barrels of 34° gravity oil having a 1% sulfur content. Egypt's largest oilfield, El Morgan, has had declining production for several years. Plans are being made to reverse this trend by a $40 million water injection program to start in early 1976. With the full implementation of the water injection program and the return of the Sinai oilfields, Egypt could realize a production level of 350,000 barrels per day by 1976.

*Pipelines.*—The operating and financing company of the Suez-to-Mediterranean pipeline changed its name to Arab Oil Pipeline Co., but kept the acronym SUMED to describe the pipeline. EGPC retains 50% ownership in the company, and Abu Dhabi, Kuwait, Qatar, and Saudi Arabia will share the remaining equity. Construction started on the pipeline, and one-third of the 42-inch pipes were delivered. In April 1974 Bechtel Corp. relinquished its building contract after a request for a 17% cost increase was turned down. Bechtel still retains a supervisory role. The SUMED pipeline will now be built by a consortium of Italian Government-controlled companies that includes SNAM Progetti, S.p.A., SAIPEM S.p.A. of Ente Nazionale Idrocarburi, and others. The pipeline may be completed during 1976 with a capacity of 1.6 million barrels per day.

The Government-owned Suez Oil Processing Co. won a $6.5 million contract to build a 168-mile gas pipeline from the Abu Gharadiq wells to the Hulwan industrial area. Another Government concern, the Petroleum Pipelines Co., received a $60 million contract to build a crude oil pipeline from the Ras Gharib Field on the Gulf of Suez to the refinery at Musturud. In late 1974 work began on an $11.5 million gas pipeline from the Abu Qir offshore gasfield to the al-Dakhilah industrial area west of Alexandria. The line is due to be completed during 1977 to provide for urea fertilizer plants and the direct reduction of iron ore.

*Refining.*—Just before the October 1973 war, Egypt had almost regained the refining capacity it held before the 1967 war. Current efforts are to regain the 180,000-barrel-per-day capacity by rebuilding refineries including the two Suez refineries damaged by the 1967 and 1973 wars.

Plans for a $400 million, 250,000-barrel-per-day export refinery to be built in the Alexandria free export zone were expanded to include petrochemicals. Feedstocks for the refinery would come from the SUMED pipeline. Feedstocks from this and other Egyptian refineries would supply petrochemical projects throughout Egypt. Some of these plans include the annual production of 6,000 tons of polyesters, 80,000 tons of dimethyl terephthalate, 80,000 tons of ethylene, 10,000 tons of butadiene, 45,000 tons of polyethylene, and 80,000 tons of vinylchlorides. Most of these projects are based in Alexandria to meet the needs of domestic and export markets.

# The Mineral Industry of Finland

By F. L. Klinger [1]

Output of the Finnish mineral industry in 1974 appeared to equal or exceed the 1973 level, despite declines in official indices of production in the mining and primary metals sectors. Production and apparent consumption of some key commodities, such as steel and cement, were at record levels.

Gross output from mines and quarries was up 9%. Development of new mines was continued near Kolari (iron ore) and at Mustavaara (iron ore and vanadium). The Metsämonttu mine, long a source of nonferrous and precious metals, was closed, as were the Kylmäkoski (copper) and Petolahti (copper and nickel) mines. Other copper-nickel deposits were being explored. In northeastern and east-central Finland, carbonatite complexes at Sokli and Siilinjärvi were being extensively drilled and tested as possible commercial sources of phosphate, rare-earth oxides, and columbium.

New plant developments included expansion of sulfuric acid plants at Kokkola and Harjavalta, construction of a second blast furnace and expansion of steelmaking facilities at Raahe, construction of a stainless steel works near Tornio, and expansion of the petroleum refinery at Porvoo. Finnish smelting technology for copper and nickel continued to be exported to many countries, including India, the Soviet Union, and Zaire in 1974.

The high cost of imported fuels, which greatly increased Finland's trade deficit in 1974, focused attention on alternative sources of energy such as the country's large resources of peat. A new trade agreement with the Soviet Union provided for a significant increase in imports of electric power as well as a continued supply of crude oil. Meanwhile, imports of natural gas by pipeline from the Soviet Union began in 1974, and construction of two nuclear powerplants was continued near Loviisa.

## PRODUCTION

Volume indices of production in the principal sectors of the mineral industry are shown in the following tabulation:

| Sector | (1970=100) | | |
|---|---|---|---|
| | 1972 [r] | 1973 [r] | 1974 |
| Mining and quarrying | 94 | 93 | 87 |
| Nonmetallic mineral processing | 115 | 124 | 132 |
| Primary metals industry | 115 | 134 | 130 |
| Chemical industry | 142 | 151 | 158 |
| Petroleum refining [1] | 102 | 111 | 107 |
| All industry | 114 | 121 | 123 |

[r] Revised.
[1] Including manufacture of rubber and plastics.

Source: Central Statistical Office of Finland (Helsinki). Tilastokatsauksia (Bulletin of Statistics), No. 2, 1975, pp. 8–9.

Published statistics on production of individual mines and quarries indicated that combined output of crude ore and waste rock in 1974 was about 9% more than in 1973, and that production of crude ore alone increased about 5%.[2] Most of the gains were registered in industrial minerals and stone, although there were substantial increases in output at some major mines producing copper, nickel, and other metals. Total output of iron ore was down, but production of pelletized by-product iron concentrates, from sulfide ores, increased. Production of pyrite concentrates continued to decline.

[2] Vuoriteollisuus-Bergshanteringen. V. 33, No. 1, 1975, pp. 48–49; v. 32, No. 1, 1974, pp. 38–39.

In the manufacturing sector, production of most metals increased, although output of pig iron, copper, cadmium, and cobalt was less than in 1973. Production of elemental sulfur declined by 20%, but output of cement and petroleum products increased.

Production of mineral commodities is detailed in table 1.

## TRADE

Exports of mineral commodities in 1974 were valued at about $450 million,[3] 35% more than in 1973. Metals (principally iron and steel, copper, nickel, and zinc) continued to account for more than two-thirds of the total value.

Imports of mineral commodities in 1974 were valued at about $2.5 billion, more than twice the value of imports in 1973. Liquid fuels accounted for nearly 50% of the total value, followed by iron and steel with 16%.

The net trade deficit attributable to mineral commodities in 1974 was approximately $2 billion, an increase of nearly threefold compared with the 1973 figure. The main cause of the deficit was the increasing cost of imported crude oil and petroleum products in 1974.

Finland's trade in mineral commodities in 1972 and 1973 is shown in tables 2 and 3.

[3] Where necessary, values have been converted from Finland marks (Fmk) to U.S. dollars at the rate of Fmk 3.816=US$1.00 for 1973 and Fmk 3.774=US$1.00 for 1974.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Finland continued to import all of its aluminum requirements. Imports of wrought and unwrought aluminum and alloys in 1974 totaled nearly 57,000 tons valued at $64 million. Compared with 1973, imports of semimanufactures rose 39% and imports of ingot rose 28%. Domestic consumption in the first half of 1974 was running 20% to 25% ahead of the 1973 level, and may have reached 11 kilograms per capita in 1974.[4] A new extrusion plant apparently began production in Finland in 1974; domestic production of extruded products and wire during the first 6 months of 1974 was at the rate of about 25,000 tons per year, 15% to 20% more than the rate in 1973.

**Chromium.**—Production and exports of chromite and ferrochromium increased significantly in 1974. Compared with 1973, output of crude ore at Kemi was up 9% to 410,000 tons, and output of concentrates was up 11% to 165,480 tons averaging 42% $Cr_2O_3$. Exports of chromite (partly as foundry sand averaging 46% $Cr_2O_3$) in 1974 rose to 83,942 tons valued at $3 million, nearly triple the quantity and value of exports in 1973.

Production of ferrochromium at Tornio was up 21%. Exports rose to 43,573 tons valued at $11.2 million, an increase of 13% in quantity and 80% in value compared with the 1973 figures.

Reserves of chromite ore were reported to be 33 million tons, averaging 27% $Cr_2O_3$ and a Cr:Fe ratio of 1.6:1.[5] The reserves are contained in eight ore bodies, of which the largest (Elijärvi) contained 14.5 million tons and is now being mined. All of the ore bodies are found along a continuous layer of chromite which ranges from a few centimeters to 2 meters in thickness. In 1977, mining will shift to the Viianlahti-Viianranta ore body nearby.

**Cobalt.**—Production and exports of cobalt metal in 1974 were less than in 1973. The reduced output appeared to be partly due to declining production of cobaltiferous pyrite at Outokumpu, and to a lower metal content of cobalt concentrates produced elsewhere such as at Luikonlahti. The

[4] Aluminium (Düsseldorf). V. 51, No. 1, January 1975, pp. 52–54.
[5] Outokumpu Oy (Helsinki). Outokumpu News, No. 2, 1975, p. 10.

reported output of cobalt concentrates in 1974 was up 25% compared with that of 1973, but the average cobalt content was only 0.5% compared with 0.07% in 1973. Exports of cobalt metal in 1974 totaled 807 tons valued at about $6.7 million.

**Copper and Nickel.**—Mine output of copper and nickel in 1974 was slightly less than in 1973, although more crude ore was mined in 1974. The average grade of copper concentrate was 21.3% Cu (21.9% in 1973), and the average grade of nickel concentrate was 4.9% Ni (4.7% in 1973). Ore containing copper and nickel was produced at five mines during 1974; the number was reduced to three by yearend as ore reserves were exhausted at the Kylmäkoski and Petolahti deposits. Ore containing only copper was produced at the Hammaslahti and Hällinmaki (Virtasalmi) mines. Most of the copper continued to be produced at the Outokumpu, Pyhäsalmi, Vihanti, and Luikonlahti mines, while the principal mine sources of nickel were the Vuonos and Kotalahti deposits. Two nickel-copper prospects were being explored in 1974, the Stormi deposit in Vammala parish, and the Pahtovuoma deposit in Kittilä parish.

Output of refined copper in 1974 was about 11% less than in 1973, while output of electrolytic nickel was 11% greater. Imports of concentrates for refining rose to new highs in 1974; imports of copper concentrate totaled 36,000 tons, while imports of nickel concentrate (mostly from Norway) were 12,600 tons. Exports of copper including alloys dropped by more than 30%, to 27,000 tons in 1974, while imports increased nearly 40% to about the same quantity. Trade in copper in 1974 was valued at about $65 million in both exports and imports, whereas a $35 million surplus had been realized in 1973. Exports of refined nickel in 1974 declined slightly to about 5,500 tons, but the total value (about $20 million) was 9% more than in 1973.

**Iron Ore.**—Development of the Rautavaara underground iron mine in Lapland was continued by Rautaruukki Oy. Production of concentrate was expected to begin in the fall of 1975, at the rate of 500,000 tons per year. All of the concentrate will be shipped to blast furnaces at Raahe.

The Mustavaara vanadium mine, now under construction, was expected to supply about 200,000 tons of pelletized iron ore per year to Raahe, beginning in 1976.

Production of iron concentrates in 1974 included 569,000 tons produced by Rautaruukki Oy., from the Otanmäki and Raajärvi mines, and 368,000 tons of iron oxide residues obtained from processing of pyrite and pyrrhotite by Outokumpu Oy. at Kokkola. Average iron content of all concentrates produced in 1974 was 65.5%.

Imports of iron ore in 1974 totaled 1,133,000 tons, about 20% more than in 1973. Value of imports was approximately $20 million.

**Iron and Steel.**—Production of iron and steel continued at near-capacity levels in 1974. Output of raw steel set a new record. Net imports of steel semimanufactures increased to nearly 400,000 tons, and apparent consumption was about 1.5 million tons, 8% more than in 1973. Strong domestic demand arose from relatively high levels of activity in the shipbuilding, engineering, and construction industries. Exports included 170,000 tons of pig iron and 451,000 tons of steel semimanufactures, principally ingots and other crude forms. Exports of iron and steel in 1974 were valued at $142 million, while imports were valued at $408 million.

Rautaruukki Oy., at Raahe, produced 56% of Finland's output of pig iron in 1974, and 49% of the raw steel. The rest was produced by the Ovako group in plants at Imatra, Koverhar, and Turku. Rautaruukki's mill at Hämeenlinna accounted for all production of cold-rolled products (234,000 tons) in 1974, and the company was planning to double the plant's production capacity. Rautaruukki continued construction of a new blast furnace, an oxygen plant, a plate mill, and extensions to the steel mill and the continuous-casting plant in 1974. The company's production capacity for raw steel will be 1.7 million tons annually by the end of 1976, about twice the 1974 production.

Outokumpu Oy. was planning to build a plant for production of stainless steel. The plant will be located in north Finland, near the company's ferrochromium works, and will have a production capacity of 50,000 tons of stainless steel per year. Construction was expected to be completed by the end of 1976. Domestic demand for

stainless steel in 1976 was estimated by the company at 30,000 tons.[6]

In November 1974, agreements between Finland and countries of the European Coal and Steel Community were ratified.[7] The agreements apparently concerned conformity of pricing and freight costs, and were to become effective January 1, 1975. A similar agreement was made between Finland and Sweden.

**Lead and Zinc.**—Mine production of zinc in 1974 was about 4% more than in 1973. Output of concentrates was up 7%, but the average zinc content dropped to 51.7% (53.1% in 1973). Imports of zinc concentrate rose by 111% to 112,000 tons in 1974, and output of slab zinc was up 14% compared with that of 1973. Exports of metal remained at the 69,000-ton level in 1974, but total value increased about 50% to $53 million. Apparent consumption of zinc and alloys in 1974 rose to 24,000 tons.

Most of the mine lead produced in 1974 came from the Vihanti mine, which is primarily a producer of copper, zinc, and sulfur concentrates. Most of the lead concentrate was exported.

The Metsämonttu mine in southwestern Finland, a long-time source of copper, lead, zinc, gold, and silver, was closed in 1974 owing to exhaustion of ore reserves.

Imports of lead and lead alloys in 1974 totaled 14,600 tons valued at more than $9 million.

**Titanium.**—Finland's production of ilmenite continued to come solely from the Otanmäki mine as a byproduct of iron ore concentration. The ilmenite was processed by Kemira Oy. (formerly Rikkihappo Oy.) at Mantyluoto to make titanium dioxide and pigment. The plant has a production capacity of 80,000 tons of titanium dioxide per year and uses the sulfate process.

Exports in 1974 included 41,516 tons of titanium white valued at nearly $41 million, and 1,800 tons of titanium dioxide. Imports of 17,560 tons of ilmenite concentrate were reported in 1974, compared with 2,100 tons in 1973.

**Vanadium.**—Construction of the Mustavaara iron-vanadium mine in Taivalkoski parish was continued by Rautaruukki Oy. About 70,000 tons of rock were excavated in 1974. The open pit mine is expected to provide about 3,000 tons of vanadium pentoxide and 200,000 tons of pelletized iron concentrate per year after production begins in 1976.

A record output of vanadium pentoxide was realized at the Otanmäki mine in 1974. Exports during the year totaled 2,681 tons valued at $9.5 million. Ore reserves at Otanmäki were reportedly sufficient for at least another 20 years of operations.[8]

## NONMETALS

**Asbestos.**—Production and exports of asbestos continued to decline in 1974. The Paakkila mine, owned by Paraisten Kalkkivuori Oy., produced 188,000 tons of crude ore in 1974; this yielded 8,550 tons of usable ore and 5,593 tons of anthophyllite asbestos. Exports in 1974 totaled 4,867 tons valued at $625,000; imports totaled 6,172 tons valued at $1.4 million.

**Cement and Other Construction Materials.**—The construction industry was busy in 1974. More buildings were completed than in any previous year. Compared with 1973, the volume of industrial buildings completed was up 32% and the number of residential completions was up about 17%. Construction activity was expected to slacken in 1975, but abolition of the investment tax at the beginning of 1975 may stimulate construction of several projects that had been deferred.

A record tonnage of cement was produced in 1974. Exports declined to 66,000 tons, 62% less than the quantity exported in 1973. Imports of cement totaled 85,000 tons, slightly less than in 1973. Output of bricks and window glass, while not at record levels, was appreciably higher than in 1973. Kemira Oy. reportedly produces about 600,000 tons per year of byproduct gypsum[9] from the manufacture of phosphoric acid. The company was building a plant at its Uusikaupunki works to process some of the gypsum into 7-centimeter blocks at the rate of 35,000 tons per year. Markets for most of this material have not yet been developed since imports of gypsum in 1974 totaled nearly 185,000 tons and exports were negligible.

**Fertilizer Materials.**—With rising prices of phosphate rock and the prospect of imports of apatite from the Soviet Union being discontinued by 1980,[10] exploration

[6] Metal Bulletin Monthly. May 1975, p. 63.
[7] Rautaruukki Oy. Annual Report for 1974. P. 3.
[8] Page 8 of work cited in footnote 7.
[9] Metal Bulletin Monthly. December 1974, p. 43.
[10] Industrial Minerals (London). No. 87, December 1974, p. 43.

and beneficiation testing of phosphate deposits in central and northern Finland was continued in 1974. In both areas, phosphate is found in carbonatite complexes. At the Sokli deposit in the Savukoski area of Lapland, drilling by Rautaruukki Oy. by yearend had proved the existence of 100 million tons of material containing 6% to 9% $P_2O_5$, along with unspecified quantities of columbium and rare-earth oxides. Work was begun on development of a suitable concentration process, and deeper drilling was planned. In the Siilinjärvi area of east-central Finland, subsidiaries of Kemira Oy. were reported to have outlined deposits of fluorapatite in an area 15 kilometers long and 100 to 600 meters wide. The deposits apparently contain an average of about 10% apatite. The fluorapatite was reported to contain 40% $P_2O_5$, 56% CaO, 1.2% SrO, and 0.4% rare-earth oxides. Kemira Oy. planned to mine 100,000 tons of the material for pilot plant tests. If results are favorable, mining could begin by 1978.

Production of manufactured fertilizers set a new record in 1974. Imports of crude phosphate (570,000 tons) and potassium salts (286,000 tons) in 1974 were valued at $38 million.

**Pyrite and Sulfur.**—A drop of about 9% in mine output of pyrite and pyrrhotite in 1974 was accompanied by a decline of nearly 19% in production of elemental sulfur, compared with 1973. Exports of sulfur in 1974 declined about 35% to 20,200 tons, and imports increased to 36,500 tons.

Output of sulfuric acid in 1974 was the second highest on record. Exports (57,200 tons) were less than in 1972 or 1973, probably because of increased domestic demand.

A large increase in production capacity for sulfuric acid was planned by Kemira Oy. The company's plant at Kokkola was being expanded in 1974 to a capacity of 900,000 tons per year (present capacity, 540,000 tons), and capacity at Harjavalta was being raised to 420,000 tons per year (present capacity, 250,000 tons). Much of the increase in capacity was to be installed by mid-1975. At both localities manufacture of acid is based on smelter gases obtained from Outokumpu Oy.

## MINERAL FUELS

**Coal and Coke.**—Imports of solid fuels in 1974 included 3.93 million tons of coal and 979,000 tons of coke, having an aggregate value of $181 million. Compared with 1973, the quantities of coal and coke were up 32% and 17%, respectively, and the aggregate value more than doubled.

Consumption of coal and coke in Finland in 1973 and 1974 was as follows, in thousand metric tons:

| Consuming sector | 1973 | 1974 |
|---|---|---|
| Coal: | | |
| Electric power generation | 1,658 | 1,785 |
| Paper and woodworking industry | 623 | 578 |
| Other industries | 560 | 545 |
| Gas and coke manufacturing | 84 | -- |
| Space heating | 198 | 135 |
| Locomotive fuel | 20 | 14 |
| Total | 3,143 | 3,057 |
| Coke: | | |
| Metal reduction | 835 | 888 |
| Other | 25 | 15 |
| Total | 860 | 903 |

Source: Ministry of Commerce and Industry, through U.S. Embassy, Helsinki (State Department Airgram A-109, June 4, 1975).

**Natural Gas.**—Imports of natural gas through the Imatra-Kouvola segment of the pipeline from the Soviet Union began in January 1974. By yearend a total of 412 million cubic meters had been received, valued at approximately $27 million. Deliveries of natural gas to Finnish consumers are scheduled to increase to 1 billion cubic meters in 1975, and to 1.4 billion cubic meters in 1979.

**Peat.**—With the high cost of imported fuels, Finnish resources of peat were receiving increased attention as a national energy source. It was possible that about 10% of domestic energy requirements could be supplied by peat by 1980. In 1972, peat accounted for less than 1% of the country's energy needs.

**Petroleum.**—Imports of crude oil (including topped crude) in 1974 totaled 9.47 million tons valued at $824 million. The Soviet Union continued to be the major supplier with 63% of the total. The total quantity of crude oil imported in 1974

was slightly less than in 1973, but the total value was nearly three times greater. With net imports of 4.2 million tons of petroleum products adding another $374 million, the cost of petroleum fuels reached $1.2 billion in 1974 and accounted for a rising share of Finland's deficit in international trade.

A 5-year trade agreement between Finland and the Soviet Union was signed in September 1974. Under the agreement, Finland's import quota for crude oil in 1976–80 is 6.5 million tons per year, and the annual quota for imports of fuel oils will be 2.3 million to 3.5 million tons per year.

Total crude oil throughput in the country's two refineries in 1974 was 9.3 million tons, of which two-thirds was processed at Porvoo and the remainder at Naantali. Both refineries are owned and operated by Neste Oy. The company was increasing refining capacity at Porvoo by 5 million tons per year; this project was scheduled for completion by yearend 1975, at which time the combined refining capacity of the two plants will be between 14 million and 15 million tons per year.

Consumption of refined products in Finland was less than in 1973, due mainly to a relatively mild winter. The increased output of hydroelectric power during the year was estimated by Neste Oy. to have reduced the need for imported energy by about 500,000 tons of oil equivalent.

Inland consumption of petroleum products in 1973 and 1974 was as follows, in thousand tons:

| Refinery product | 1973 | 1974 |
|---|---|---|
| Aviation fuel | 157 | 172 |
| Gasoline | 1,244 | 1,180 |
| Kerosine | 28 | 15 |
| Gas and diesel oil | 4,577 | 4,045 |
| Residual fuel oil | 5,704 | 4,552 |
| Other | 804 | 723 |
| Total | 12,509 | 10,687 |

Source: Organization for Economic Cooperation and Development (OECD), Paris. Provisional Oil Statistics by Quarters. 4th Quarter 1974, 1975, pp. 16–21.

**Electric Energy.**—Production of electric power in 1974 was 17% more than in 1973. Total output was 29 billion kilowatt-hours, of which hydroelectric plants supplied 42%.

Under an energy agreement negotiated in 1974, the Soviet Union would guarantee delivery of electric power to Finland of up to 4 billion kilowatt-hours per year by 1980, and up to 8 billion kilowatt-hours per year after 1985.

Construction of the two 440-megawatt nuclear powerplants near Loviisa was continued in 1974. The plants were scheduled to begin service in 1976 and 1978. At the same locality, construction of two more powerplants of the same type was planned for completion by 1983.

# The Mineral Industry of France

By E. Shekarchi [1]

Despite soaring inflation, rising unemployment, bankruptcies, and a severe petroleum shortage, the French mineral industry continued to gain on West Germany, and was an economic pace setter in 1974. Instrumental in achieving this remarkable growth was the number of foreign manufacturing plants lured to France by lenient governmental policies toward foreign companies. The French economy grew at a 4.5% rate during the year, with unparalled increases in crude steel and aluminum production of 5%, compared with that of 1973, and a decrease of 4.6% in oil products consumption. The gross national product (GNP) at 1974 prices was $287.7 billion [2] compared with $248.6 billion in 1973. Estimated per capita GNP was $5,500 in 1974 compared with $4,800 in 1973.

The Government of France in 1974 made a series of policy decisions in an effort to improve the status of mineral supplies in France. The decisions reflected the results of interministerial studies which indicated that the mineral supply of France could become critical under one or another set of eventualities. Price changes and other developments in 1973 and 1974 finally overcame years of opposition, mainly from the Ministry of France, and allowed the French Government to build a national minerals stockpile. The new policy was to establish a stock of minerals equivalent to 2 months' average imports for each category of raw or processed minerals. An appropriation of approximately $23 million was approved for 1975 purchases. It was expected that this amount would be doubled in 1976 and remain at that level for 4 years. Stockpile purchases were to be made by the Groupement d'Importation et de Repartition des Métaux (GIRM), a private consortium of copper importers which was to broaden its activities under Government supervision and receive fees for services rendered. The stockpile of materials was to be maintained at Government expense and was to be disposed of only under authorization by the Government of France. According to Ministry of Industry officials, the Government was not to attempt to use the stockpile material to intervene in the market place.

Under another decision the Government would appropriate $10 million in 1975 and $25 million annually thereafter to stimulate mineral prospecting in France and to revise the mining code so as to improve the economic conditions for mineral exploitation.

A new office created in the Ministry of Industry and Scientific Research to promote recycling of metals was expected to help alleviate France's dependence on imports. To this end, a recycling program was under study and was to be presented to parliament in 1975.

Finally, since 65% of French mineral imports originate in developing countries, the Council of Ministry emphasized the necessity for continuous good relations with these nations and sought areas of cooperation in geological research, manpower training, and eventually exploitation of mineral deposits.

In March 1974, 3 months after being linked to Electricité de France, France's power system, the first neutron breeder reactor, Phénix, attained its maximum output. By the end of 1974, it produced more than 1 billion kilowatt hours. France thus confirmed her place as the world

[1] Physical scientist, Division of Ferrous Metals.
[2] Where necessary, values have been converted from French francs (F) to U.S. dollars at the rate of F4.4=US$1.00.

leader in a technique that made it possible to use nuclear fuels with an efficiency 100 times greater than conventional reactors. The success of the Phénix could be regarded as a success for Europe. France, in cooperation with Italy and West Germany, was drawing plans for commercial fast-neutron reactors of 1.2 million kilowatts, to be installed in Savoie. The construction was scheduled for early 1975.

After experiencing a period of relative stagnation in the early 1960's, the French merchant marine fleet entered a period of expansion, with its tonnage growing at an average annual rate of 10%. It was expected to double again between 1974 and 1980. This doubling of tonnage was also accompanied by far reaching changes. For example the average age of ships fell from 9½ years in 1966 to 7 years in 1974, and the number of ships dropped from 640 to 480 in the same period.

Société Nationale des Poudres et Explosifs (SNPE), a company founded in 1971, decentralized its organizational framework into four operational departments: Powders and explosives, chemicals, engineering, and rocket propulsion. SNPE had a considerable industrial potential with eight plants which manufactured a widely diversified range of products and was particularly well equipped with research centers.

To strengthen the chemical industry, several ownership changes took place during 1974. Plans called for Rhône-Poulenc S.A., Péchiney Ugine Kuhlmann (PUK), and Société Chimique des Charbonnages (Cdf-Chimie) to realign ownership in some jointly held subsidiaries. In one change, PUK's chemical division, Produits Chimiques Ugine Kuhlmann (PCUK), relinquished its 50% share of acrylonitrile products to Cdf-Chimie, which became 100% owner. PCUK retained ownership of a 45,000-ton-per-year plant at Yvours. In other deals, PCUK gained full ownership of a plastics maker, which was jointly owned with Rhône-Poulenc obtained PCUK's interest and full ownership in three downstream plastic makers. In another action Entreprise Minière et Chimique (EMC) and Cdf-Chimie were to join in building a vinyl chloride monomer and polyvinyl chloride (PVC) complex in the Alsace region. Also EMC was to buy 50% of the PVC plant that Cdf-Chimie was to bring onstream at Mazingarhe at yearend 1975. Both companies also planned to construct a 10,000-ton-per-year benzyl chloride unit and coordinate ammonium and phosphate output.

The Délégation à l'Aménagement du Territoire et à l'Action Régionale (DATAR), celebrated its tenth anniversary in 1974. DATAR acts as a special adviser to the Prime Minister and as a coordinator of ministerial policies in the provinces. In drafting the fifth plan DATAR invited France's local authorities to participate and have an active voice in implementing it. The Government was also elaborating on its foreign investment policy. Foreign investment was welcomed as long as it produced jobs, brought in technologic know-how, and was not solely financial. If investors set up new industries in areas chosen by DATAR, they benefited, particularly foreign investors, with special premiums up to 25%. DATAR opened up branch offices in many major cities of industrialized nations, to inform investors of local attractions as well as investment opportunities in France.

French chemical processing companies and metal companies took an active role in combating pollution, in response to French Government demands in 1974. A draft agreement was negotiated between the French Government and PUK, which required the company to spend about $240 million for pollution control at its plants, during the next 5 years. PUK, France's largest private company, was to spend about $26 million in remodeling the Lannemezan aluminum plant alone by 1976.

The Bureau de Recherches Géologiques et Minières (BRGM), a combined industrial, commercial, and government organization, was granted a permit by the Ministry of Industry to prospect for copper, zinc, silver, and allied metals at Couesnou. Also, the Ministry extended BRGM's permit for prospecting at Saint-Salvy and authorized development work on behalf of Société Minière et Métallurgique de Peñarroya S.A. BRGM was budgeted about 50% by the Government, 48% by private companies for which BRGM performed all aspects of mining and geological work at home and abroad, and 2% from BRGM's investments as a company. In addition to immediate financing for France's long anticipated stock-

piling program, the Government was to double the current budget of BRGM to accelerate geological research and resource inventories within the country and overseas territories.

## PRODUCTION AND TRADE

Table 1 gives the production of primary minerals and processed metals and nonmetals.

Details of foreign trade including total tonnage by commodities are given in tables 2 and 3.

**Table 1.—France: Production of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 p |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite, gross weight ---- thousand tons | r 3,402 | 3,299 | 2,938 |
| Alumina ---- do | 1,274 | 1,268 | 1,280 |
| Metal: | | | |
| Primary ---- do | 394 | 359 | 393 |
| Secondary ---- do | 112 | 124 | 125 |
| Antimony, smelter production | 2,090 | 2,355 | 3,117 |
| Arsenic, white | 6,932 | r e 7,000 | e 7,000 |
| Bismuth: | | | |
| Ore and concentrate, metal content ---- kilograms | 80,000 | e 70,000 | e 70,000 |
| Metal ---- do | 67,000 | 57,000 | 57,000 |
| Cadmium metal | 572 | 606 | 644 |
| Cobalt metal | r 700 | 835 | 885 |
| Copper: | | | |
| Mine output, metal content | 472 | 414 | 392 |
| Metal: | | | |
| Blister (secondary) | 8,340 | 8,784 | 9,298 |
| Refined [1] | 15,600 | 21,600 | 22,558 |

| Semimanufactures | 121,444 | 135,805 | United States 10,097. |
| Antimony metal including scrap | 112 | 217 | Italy 82. |
| Arsenic (anhydride) | 8,887 | 9,543 | United Kingdom 908. |
| Beryllium value, thousands[2] | r $96 | $173 | United States $138. |
| Bismuth, all forms | 243 | 229 | Italy 162; Belgium-Luxembourg 34. |
| Cadmium | 135 | 132 | Belgium-Luxembourg 55; West Germany 51. |
| Chromium: | | | |
| Chromite | 325 | 207 | NA. |
| Oxide and hydroxide | 217 | 58 | NA. |
| Metal | 458 | 440 | United States 145; West Germany 131; Italy 57. |
| Cobalt | 465 | 456 | United States 68; Austria 55; West Germany 50. |
| Columbium (niobium), all forms value, thousands[2] | r $14 | $3 | NA. |
| Copper: | | | |
| Matte | 358 | 1,112 | Belgium-Luxembourg 256; West Germany 229; United Kingdom 228. |
| Metal and alloys: | | | |
| Scrap | 57,863 | 75,171 | West Germany 25,693; Belgium-Luxembourg 25,350; Italy 16,614. |
| Blister and other unrefined | 6,334 | 6,835 | Mainly to Belgium-Luxembourg. |
| Refined | 3,805 | 8,603 | West Germany 3,071; Netherlands 1,753; Italy 1,458. |
| Semimanufactures | 72,528 | 83,770 | West Germany 33,134; Netherlands 12,286; United States 8,998. |
| Gallium[3] value, thousands[2] | $1,276 | $1,931 | Switzerland $1,878. |
| Gold: | | | |
| Ashes and sweepings kilograms | 773 | 147 | Switzerland 108. |
| Metal: | | | |
| For domestic use thousand troy ounces | 297 | 487 | New Caledonia 161; Netherlands 75. |
| Temporary imports do | 4,006 | 3,858 | Switzerland 1,726; Dubai 860. |
| Iron and steel: | | | |
| Iron ore thousand tons | 19,072 | 19,454 | Belgium-Luxembourg 15,889; West Germany 3,565. |
| Pyrite cinder do | 120 | 109 | Mainly to Belgium-Luxembourg. |
| Metal: | | | |
| Scrap do | 3,081 | 2,788 | Italy 2,187; Belgium-Luxembourg 317. |
| Pig iron including spiegeleisen[4] do | 111 | 187 | Belgium-Luxembourg 68; Italy 60; West Germany 41. |
| Ferroalloys do | 451 | 575 | United States 170; West Germany 144; Italy 101. |
| Shot and powder do | 27 | 28 | West Germany 12; Italy 6. |
| Steel: | | | |
| Primary forms including coil do | 974 | 914 | Italy 295; Belgium-Luxembourg 222; West Germany 142. |
| Semimanufactures: | | | |
| Bars, rods, wire rods and sections do | 2,935 | 3,009 | West Germany 602; United States 472; Belgium-Luxembourg 309. |
| Plates, sheets, universals do | 3,067 | 3,012 | West Germany 781; United States 345; Italy 324. |
| Hoop and strip do | 381 | 486 | West Germany 144; Belgium-Luxembourg 86; Italy 83. |
| Rails and accessories do | 258 | 185 | Italy 48; Egypt 25. |
| Wire do | r 116 | 141 | West Germany 36; United States 26; Belgium-Luxembourg 16. |
| Tubes, pipes, fittings do | 892 | 1,056 | U.S.S.R. 252; Netherlands 137. |
| Castings and forgings, rough do | 31 | 49 | Belgium-Luxembourg 18; United States 17; West Germany 6. |

See footnotes at end of table.

## Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Lead: | | | |
| Ore | 95 | 105 | NA. |
| Oxides | 12,332 | 15,938 | Italy 5,568; Netherlands 3,430; U.S.S.R. 1,500. |
| Metal including alloys: | | | |
| Scrap | 14,140 | 18,503 | Italy 7,526; West Germany 6,420; Netherlands 3,958. |
| Unwrought | 19,222 | 24,833 | West Germany 7,376; Greece 4,656; Belgium-Luxembourg 3,978. |
| Semimanufactures | r 4,420 | 2,494 | Italy 326; Belgium-Luxembourg 284. |
| Magnesium metal including alloys, all forms | 3,560 | 4,278 | West Germany 3,395. |
| Manganese: | | | |
| Ore | 3,827 | 9,923 | Spain 5,795; Greece 2,000. |
| Oxide | 121 | 708 | Ivory Coast 311. |
| Metal including alloys, all forms | 5,023 | 6,558 | Italy 1,501; West Germany 1,350; Sweden 1,301. |
| Mercury 76-pound flasks | 290 | 145 | NA. |
| Molybdenum: | | | |
| Ore | 6 | 11 | NA. |
| Oxide | 33 | 117 | Belgium-Luxembourg 74; Netherlands 24. |
| Metal, all forms | 80 | 97 | Netherlands 47; West Germany 26; Italy 10. |
| Nickel: | | | |
| Matte, speiss, etc | 325 | 554 | Czechoslovakia 430. |
| Oxides | 257 | 606 | Italy 163; United States 126; Belgium-Luxembourg 61. |
| Metal including alloys: | | | |
| Scrap | 2,508 | 2,278 | West Germany 848; Netherlands 410; United Kingdom 325. |
| Ingots | 5,767 | 3,824 | West Germany 1,383; Sweden 390; Yugoslavia 388. |
| Semimanufactures, including anodes | 3,572 | 3,997 | Spain 1,291; West Germany 556. |
| Platinum and platinum-group metals, including alloys thousand troy ounces | r 380 | 63 | West Germany 21; Netherlands 16; Spain 11. |
| Selenium | 11 | 8 | NA. |
| Silver: | | | |
| Metal including alloys thousand troy ounces | 11,722 | 21,594 | Spain 6,219; Sweden 4,285; West Germany 2,478. |
| Ashes and sweepings do | r 2,614 | 94 | Mainly to United Kingdom. |
| Tantalum, all forms value, thousands [2] | $161 | $144 | United States $81. |
| Thorium oxide | 11 | 44 | United Kingdom 18; Japan 11, Belgium-Luxembourg 9. |
| Tin: | | | |
| Ore long tons | 443 | 413 | All to Spain. |
| Oxide do | 40 | 41 | West Germany 38. |
| Metal including alloys: | | | |
| Scrap do | 41 | 70 | West Germany 28. |
| Ingots do | 282 | 242 | Italy 107; Switzerland 33. |
| Semimanufactures do | 156 | 212 | Belgium-Luxembourg 24. |
| Titanium: | | | |
| Ore | 336 | 222 | NA. |
| Oxide | 20,895 | 21,161 | United States 5,376. |
| Metal, all forms | 400 | 364 | United Kingdom 120; Italy 88; West Germany 53. |
| Tungsten: | | | |
| Ore | 1,402 | 1,260 | West Germany 1,050; United States 209. |
| Trioxide | 89 | 66 | Austria 31; West Germany 24; Yugoslavia 6. |
| Metal, all forms | 237 | 333 | West Germany 95; Japan 52. |
| Zinc: | | | |
| Ore | 2,687 | 9,045 | Italy 6,318; Belgium-Luxembourg 1,457; West Germany 1,270. |
| Matte | 241 | 40 | NA. |
| Oxide | 80 | 20,363 | United States 4,070; Belgium-Luxembourg 3,786; Netherlands 3,722. |
| Metal including alloys: | | | |
| Scrap | 1,698 | 2,294 | Italy 1,551; West Germany 346; Belgium-Luxembourg 316. |
| Dust (blue powder) | 2,848 | 4,043 | Norway 2,226; Belgium-Luxembourg 485; Spain 451. |
| Slab and ingot | 48,160 | 40,030 | United States 12,919; West Germany 5,532; Switzerland 4,150. |
| Semimanufactures | 17,712 | 24,583 | West Germany 10,488; Belgium-Luxembourg 7,584. |

See footnotes at end of table.

## Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Zirconium: | | | |
| Ore | 81 | 563 | Italy 438. |
| Oxide | 77 | [3] 144 | Netherlands 46; Spain 36; West Germany 22. |
| Metal including nuclear grade | 146 | 169 | Sweden 64; United States 54. |
| Other: | | | |
| Ore and concentrate | 1,290 | 118 | NA. |
| Ash and residues from nonferrous metals: | | | |
| Aluminum | 6,608 | 7,106 | Italy 4,896; West Germany 1,267; Belgium-Luxembourg 921. |
| Copper | 3,013 | 12,339 | Belgium-Luxembourg 10,206; West Germany 1,361. |
| Lead | 8,070 | 8,596 | Belgium-Luxembourg 8,349. |
| Nickel | 589 | 468 | Netherlands 120; Belgium-Luxembourg 85; Italy 65. |
| Zinc | 7,107 | 14,507 | Belgium-Luxembourg 7,394; West Germany 3,311; Netherlands 1,549. |
| Other | 36,181 | 25,088 | Sweden 14,210; Belgium-Luxembourg 6,066; West Germany 4,116. |
| Ashes, sweepings and other residues of platinum, silver, and other precious metals | 115 | 5 | United Kingdom 3. |
| Slag and ash, n.e.s | 37,337 | 37,129 | Belgium-Luxembourg 15,759; Ivory Coast 14,855. |
| Metal including alloys, all forms [5] | r 607 | 344 | West Germany 99; Yugoslavia 83; Belgium-Luxembourg 51. |
| NONMETALS | | | |
| Abrasives, natural: | | | |
| Pumice, emery and other | 642 | 689 | Algeria 246. |
| Dust and powder of precious and semiprecious stones value thousands [2] | $293 | $463 | Spain $271; Switzerland $116. |
| Grinding and polishing wheels | 2,933 | 3,586 | West Germany 631; Belgium-Luxembourg 488; Italy 386. |
| Asbestos, crude | 5,715 | 2,694 | West Germany 1,929. |
| Barite, including witherite | 26,421 | 16,649 | Belgium-Luxembourg 3,601; Italy 2,202; Gabon 1,890. |
| Borates, natural | 476 | 2,852 | West Germany 2,311. |
| Cement thousand tons | 1,890 | 2,429 | Ivory Coast 510; West Germany 320; United States 300. |
| Chalk | 397,826 | 454,952 | West Germany 200,364; Belgium-Luxembourg 77,996; Netherlands 50,772. |
| Clays and clay products (including all refractory brick): | | | |
| Crude: | | | |
| Kaolin | 103,362 | 91,781 | West Germany 56,410; Italy 18,438. |
| Bentonite | 2,416 | 1,937 | NA. |
| Refractory | 362,174 | 403 | NA. |
| Other | 134,655 | 507,362 | Italy 269,800; West Germany 109,602; Belgium-Luxembourg 44,509. |
| Products: Refractory (including nonclay bricks) | 403,354 | 473,093 | West Germany 181,276; Belgium-Luxembourg 91,914. |
| Corundum: | | | |
| Natural including emery (included in abrasives above) | 279 | 412 | Algeria 246. |
| Artificial | 15,456 | 19,465 | Belgium-Luxembourg 2,853; Italy 2,697; Austria 2,659. |
| Cryolite and chiolite, natural | 95 | 24 | NA. |
| Diamond: | | | |
| Industrial excluding powder value, thousands [2] | $2,351 | $1,361 | Ireland $487; Belgium-Luxembourg $287; Spain $132. |
| Gem, unset do | r $10,764 | $13,753 | Switzerland $6,246; Netherlands $2,731 United States $2,184. |
| Diatomite | 17,016 | 16,297 | West Germany 8,783; Italy 1,548. |
| Feldspar | 37,597 | 43,104 | Belgium Luxembourg 19,934; Spain 8,408; West Germany 6,934. |
| Fertilizer materials: | | | |
| Crude: | | | |
| Nitrogenous (natural sodium nitrates) | 1,011 | 5 | NA. |
| Phosphate rock | 3,494 | 2,406 | NA. |
| Potassic salts | 36,778 | 32,566 | Belgium-Luxembourg 25,719; Netherlands 4,353. |
| Organic | 23,954 | 24,194 | Switzerland 16,019; West Germany 2,421. |

See footnotes at end of table.

## Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Fertilizer materials—Continued | | | |
| Manufactured: | | | |
| Nitrogenous - thousand tons | 546 | 540 | Belgium-Luxembourg 99; Morocco 72; Egypt 60. |
| Phosphatic: | | | |
| Basic slag do | 318 | 239 | Switzerland 113; Austria 71; Italy 46. |
| Other do | 43 | 68 | Bulgaria 11; Poland 11; United Kingdom 10. |
| Potassic do | 678 | 700 | Belgium-Luxembourg 255; Italy 114. |
| Ammonia, anhydrous | 135 | 176 | West Germany 96; Spain 28. |
| Flint (pebbles) | 109,767 | 820,552 | West Germany 733,130. |
| Fluorspar | 75,163 | 122,828 | West Germany 85,205; Italy 16,286. |
| Graphite | 2,132 | 1,606 | Spain 535; Belgium-Luxembourg 231. |
| Gypsum and anhydrite, including plasters thousand tons | 1,192 | 1,243 | Belgium-Luxembourg 438; Denmark 150; Norway 148. |
| Iodine | 42 | 11 | NA. |
| Lime | 375,997 | 371,958 | West Germany 161,460; Belgium-Luxembourg 157,916. |
| Magnesite, including calcined | 373 | 719 | NA. |
| Mica | 1,395 | 1,861 | West Germany 715; United Kingdom 622; Belgium-Luxembourg 220. |
| Pigments, mineral, including iron oxide | 2,948 | 2,323 | NA. |
| Pozzolan, santorin, etc | 3,185 | 20,170 | Ivory Coast 16,957. |
| Precious and semiprecious stones, except diamond[6] value, thousands[2] | r $16,816 | $19,751 | Switzerland $11,715. |
| Pyrite, gross weight | NA | 1,626 | NA. |
| Salt | 103,788 | 158,755 | West Germany 96,658; Belgium-Luxembourg 22,202; Spain 16,660. |
| Sodium and potassium compounds, n.e.s.: | | | |
| Caustic soda | 317,058 | 503,778 | Guinea 94,754; United States 80,518; Australia 78,485. |
| Stone, sand and gravel:[7] | | | |
| Building stone: | | | |
| Crude and partly worked, n.e.s | 93,618 | 99,792 | Belgium-Luxembourg 55,855; West Germany 16,615; Switzerland 14,360. |
| Worked: | | | |
| Slate, including crude | 28,903 | 39,057 | Netherlands 17,873; Belgium-Luxembourg 15,196. |
| Not specified | 14,583 | 13,891 | Belgium-Luxembourg 6,130; West Germany 5,285. |
| Dolomite, chiefly refractory grade | 79,893 | 88,937 | Belgium-Luxembourg 33,716; West Germany 16,993; Liberia 16,386. |
| Gravel and crushed stone thousand tons | 12,305 | 13,747 | West Germany 10,708; Switzerland 1,913. |
| Limestone (except dimension) | 165,222 | 247,143 | West Germany 100,286; Belgium-Luxembourg 86,706; Switzerland 59,323. |
| Quartz and quartzite | 3,678 | 5,374 | Belgium-Luxembourg 3,989. |
| Sand, excluding metal bearing thousand tons | 8,825 | 4,275 | West Germany 2,372; Sweden 1,126. |
| Sulfur, elemental do | 1,004 | 870 | United Kingdom 435; Netherlands 112. |
| Talc and steatite | 57,455 | 68,688 | West Germany 18,014; United Kingdom 13,761. |
| Other nonmetals, n.e.s.: | | | |
| Crude | 225,987 | 269,971 | Switzerland 211,023. |
| Slag, dross and similar waste not metal bearing, from iron and steel manufacture thousand tons | 1,331 | 1,340 | West Germany 900; Netherlands 211. |
| Oxides and hydroxides of magnesium, strontium, and barium | 6,509 | 5,871 | West Germany 1,175. |
| Fluorine | 230 | 21 | NA. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 7,467 | 7,077 | NA. |
| Carbon black | 32,954 | 43,732 | Italy 11,903; Spain 9,572; West Germany 6,236. |
| Coal and briquets: | | | |
| Bituminous | 940,749 | 951,554 | West Germany 603,027; Belgium-Luxembourg 217,834. |
| Briquets of bituminous coal | 127,563 | 80,106 | United Kingdom 64,341; Italy 9,033. |
| Lignite | 24,137 | 29,112 | Mainly to Spain. |
| Coke | 577,335 | 918,862 | Belgium-Luxembourg 398,192; West Germany 176,587. |

See footnotes at end of table.

## Table 2.—France: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS—Continued | | | |
| Gas, natural ____ million cubic feet | r 352,655 | 3,553 | Switzerland 2,474. |
| Hydrogen, helium, and rare gasses | 651 | 841 | Switzerland 402. |
| Peat, including briquets | 3,047 | 956 | NA. |
| Petroleum refinery products: | | | |
| Gasoline thousand 42-gallon barrels | r 22,687 | 6,100 | United Kingdom 1,469; Switzerland 1,385; Netherlands 1,381. |
| Kerosine and jet fuel ____ do | 5,776 | 5,692 | Switzerland 2,797; West Germany 1,576. |
| Distillate fuel oil ____ do | 32,357 | 32,540 | Switzerland 15,097; West Germany 9,754. |
| Residual fuel oil ____ do | 20,005 | 24,428 | West Germany 5,392; United Kingdom 3,391; Belgium-Luxembourg 3,277. |
| Lubricants ____ do | 3,838 | 2,778 | United Kingdom 570; Belgium-Luxembourg 463; Netherlands 326. |
| Other: | | | |
| Liquefied petroleum gas do | 6,030 | 7,373 | Spain 3,118; Portugal 1,289. |
| Bitumen, petroleum coke, and other residues ____ do | 2,417 | 2,375 | West Germany 1,306; Switzerland 581. |
| Chemical derivatives of coal, petroleum, or gas | 104,031 | 103,914 | West Germany 37,474. |

r Revised. NA Not available.
[1] Excludes artificial corundum.
[2] Based on exchange rates of 5.0443 francs per U.S. dollar in 1972 and 4.4540 francs per U.S. dollar in 1973.
[3] Includes indium and thallium.
[4] Including cast iron and shot, grit, powder and sponge of iron and steel.
[5] Alkali, alkaline earth and rare-earth metals except sodium.
[6] Including synthetic and reconstituted stone, but not including diamond.
[7] Not including slate, flint, or industrial limestone.

## Table 3.—France: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite | 517,905 | 587,765 | Australia 304,574; Greece 135,903; Guinea 77,702. |
| Oxide and hydroxide [1] | 9,756 | 20,583 | West Germany 14,261; United States 2,410. |
| Metal including alloys: | | | |
| Scrap | 23,089 | 30,600 | Belgium-Luxembourg 10,071; West Germany 8,695; Netherlands 3,317. |
| Unwrought | 194,126 | 229,743 | Greece 45,700; West Germany 33,983; Netherlands 31,743. |
| Semimanufactures | 109,932 | 136,112 | West Germany 60,097; Belgium-Luxembourg 36,516; Italy 13,731. |
| Antimony: | | | |
| Ore and concentrate | 4,643 | 6,286 | Thailand 2,076; Bolivia 1,068; Morocco 797. |
| Metal, all forms | 1,119 | 2,269 | People's Republic of China 860; Belgium-Luxembourg 821; Italy 289. |
| Arsenic, anhydride and acid | -- | 5 | NA. |
| Beryllium, metal, all forms value, thousands [2] | r $224 | $391 | United States $254; West Germany $97. |
| Bismuth | 1,209 | 1,146 | Bolivia 406; Peru 231; Belgium-Luxembourg 212. |
| Cadmium | 569 | 613 | Belgium-Luxembourg 204; Japan 154; Zaire 108. |
| Chromium: | | | |
| Ore | 276,393 | 330,802 | Madagascar 117,600; U.S.S.R. 92,347; United States 56,180. |
| Oxide and hydroxide | 3,189 | 2,937 | West Germany 1,421; United Kingdom 669; U.S.S.R. 396. |
| Metal, all forms | 90 | 83 | United Kingdom 48; United States 21. |

See footnotes at end of table.

## Table 3.—France: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Cobalt: | | | |
| Ore | 7,815 | 8,499 | All from Morocco. |
| Oxide and hydroxide | 269 | 253 | All from Belgium-Luxembourg. |
| Metal, all forms | r 409 | 568 | Zaire 335; Belgium-Luxembourg 75; United States 75. |
| Columbium: | | | |
| Ore (including tantalum ore) [3] | 619 | 814 | Canada 731. |
| Metal, all forms value, thousands [2] | r $136 | $122 | United States $76. |
| Copper: | | | |
| Ore and concentrate | 4,346 | 2,958 | Mainly from Mauritania. |
| Matte | 3,580 | 1,970 | United Kingdom 1,502; West Germany 245. |
| Metal including alloys: | | | |
| Scrap | 13,279 | 13,208 | Belgium-Luxembourg 3,776; West Germany 2,243; Netherlands 1,651. |

| Liquefied petroleum gas do ---- | 9,795 | 2,911 | U.S.S.R. 1,107; Spain 384; Italy 290. |
| Vaseline, waxes, petroleum coke, bitumen, mixtures of bitumen, etc - do ---- | r 1,847 | 3,315 | United States 2,210; West Germany 418. |
| Mineral tar and crude chemicals derived from coal, petroleum, or gas -------- | 320,227 | 265,449 | United States 94,539; West Germany 52,518; Belgium-Luxembourg 50,302. |

r Revised. NA Not available.
1 Excludes artificial corundum.
2 Based on exchange rates of 5.0443 francs per U.S. dollar in 1972 and 4.4540 francs per U.S. dollar in 1973.
3 Includes vanadium.
4 Includes cast iron and sponge, powder, etc., of iron and steel.
5 Including wire rod.
6 Less than ½ unit.
7 Includes oxides of germanium.
8 Including synthetic and reconstituted stone, but not including diamond.
9 Excludes flint and industrial limestone.

## COMMODITY REVIEW

### METALS

**Bauxite.**—Production of bauxite decreased 11% and alumina increased slightly in 1974, compared with that of 1973. Combined primary and secondary aluminum production increased 7% in 1974 compared with that of 1973.

PUK, a leading aluminum producer in France, continued construction of a pilot plant at l'Estaque in the Rhône Delta, which was to cost about $8 million and was expected to be in full operation by 1976. The plant was to employ PUK's new $H^+$ process using sulfuric acid to break down the aluminum silicate found in most ordinary clays and shales. The impure aluminum sulfate produced will be converted to aluminum chloride by the addition of hydrochloric acid, and the final alumina product obtained by a recrystallization process. PUK officials counted on the process to free the aluminum industry from dependence on bauxite and perhaps to partially reorient alumina production toward utilization of shales and clays. PUK reported that, depending on the alumina content of clay, 60 to 100

tons of clay would be required to produce 20 tons of alumina.

**Gold.**—Gold production decreased 44% in 1974, compared with 1973 output. High gold prices prompted reexamination of a gold deposit near Limoges in central France. Also a consortium was formed by France's Société Minière et Métallurgique de Peñarroya S.A. and BRGM each with a 37.5% share, and Belgium's Compagnie Royale Asturienne des Mines S.A., with 25% share to examine and evaluate some of the promising French deposits. In 1974 the consortium evaluated the Bornieux area and reported 400,000 troy ounces of gold that can be extracted economically.

**Iron Ore.**—Iron ore production increased slightly in 1974 compared with the 1973 output. In the Lorraine Basin, which contributed 92% of the iron ore produced in the country, two ore types were identified, calcareous ore with 750 million tons of reserves and siliceous ore with 750 million tons. The West Basin and the Pyrénées Basin provided the remainder. The output of each basin from 1972 to 1974 in thousand tons follows:

| | Lorraine Basin | West Basin | Pyrénées Basin | Total |
|---|---|---|---|---|
| 1972 | 52,085 | 2,065 | 96 | 54,246 |
| 1973 | 51,958 | 2,178 | 92 | [1]54,228 |
| 1974 | 51,991 | 2,178 | 91 | 54,260 |

[1] Data do not agree with that shown on table 1 because of difference in source.

Source: Chambre Syndicale des Mines de Fer de France, Rapport d'Activité, 1974, p. 13.

**Iron and Steel.**—French crude steel production in 1974 increased 7% above that produced in 1973 to 27 million tons. This constituted 17.3% of the European Communities (EC) total production as compared with a 16.9% share of 1973. French iron and steel industry officials believed that a 929 million ton production could be reached by yearend in the absence of technical incidents, strikes, or an economic downturn.

Progress during the course of the year at Solmer's various installations resulted in a total output of 820,000 tons and began to alter the traditional regional distribution of French iron and steel production. Eastern France, whose share of production was declining, remained the chief producing region with 52.7% of domestic production. The north, in spite of the increased capacities at complexes in Dunkirk and Mardyck, was barely holding on to its own share of production with 33.4%. Other regions, particularly the south gained rapidly in the productive share, garnering 12.9% in 1974, an increase of 35.4% over the 1973 level. Steel production by the various processes in 1973 and 1974, showing the trend toward more oxygen process, was as follows in thousand tons:

| Process | 1973 | Percent | 1974 | Percent |
|---|---|---|---|---|
| Thomas | 6,158 | 24.4 | 5,188 | 19.2 |
| Pure oxygen | 13,143 | 52.0 | 15,793 | 58.5 |
| Martin | 3,273 | 13.0 | 2,927 | 10.8 |
| Electric | 2,685 | 10.6 | 3,110 | 11.5 |
| Other | 5 | -- | 5 | -- |
| Total | 25,264 | 100.0 | 27,023 | 100.0 |

Specialty steel production increased 6.6%, from 2.89 million tons in 1973 to 3.08 million tons in 1974. This category of steel continued to represent 11.4% of total French steel production. Total rolled steel production amounted to 20.9 million tons in 1974 compared with 19.5 million tons in 1973. Due to the opening of new installations in Mardyck, Seremange, and Basse-Indre, production of tinplate, black iron, and tinned sheet increased 16.5% in 1974. Production of galvanized sheet held steady at 813,000 tons but production of other coated sheets decreased 17.5% to 137,000 tons in 1974 compared with 1973 production.

The number of people employed by firms in the French iron and steel industry increased by 4%, from 151,514 to 157,629. Geographically those employed in the north of France increased 4.2% in 1974 compared with the 1973 level. Following the completion of the Solmer and Ugine Aciéries plants in Fos-sur-Mer, employment in south-central France increased 17.3%. In the east, there was some reduction in employment. Expressed in terms of man-hours per ton of raw steel produced, productivity increased from 11.08 in 1973 to 10.82 in 1974. The improvement would have been greater had it not been for the fact that more workers were employed at Solmer during the plant startup period than were necessary for production. This plant aside, French productivity increased 3% in 1974.

In 1974 total investment in the steel industry declined 24.3% compared with the 1973 investment level. Of the investment which did take place, nearly 60% was in Solmer and Union Sidérurgique du Nord de la France (USINOR). The investment downturn was partially due to a malaise in general activity during the last half of 1974. Also, the year marked the completion of the USINOR plant extension in Dunkirk and the completion of the first phase of Solmer's complex in Fos-sur-Mer. Other investments made in 1974 involved converting to more efficient steelmaking methods, particularly conversion to the pure oxygen processes. Modernization was to continue in 1975 with the installation of an Linz-Donawitz (LD) converter at Mondeville to replace the old Thomas and Martin steelworks. Ministeelworks, employing electric processes, were constructed in Porcheville and Toulon, and an electric furnace was modernized by the Société des Hauts Fourneaux de la Chiers. Four other electric ministeelworks were scheduled to go into operation in 1975.

French steel exports made a strong showing in 1974, registering a solid 18.3% increase compared with the 1973 level. A number of factors contributed to French export strength in 1974: New units went into production; domestic demand did not increase from that of 1973; world prices were higher than those in the EC; and several French steel firms made considerable investments in marketing operations abroad and thus were in a position to maximize sales in the newly enlarged EC and in countries where free exchange agreements were reached.

French sales to countries outside EC increased by nearly a million tons. In the case of sales to the United States, exports increased from 987,000 tons in 1973 to 1.26 million in 1974, an increase of 27%.

Overall French imports of steel declined only 1.4% in 1974, from 7.8 to 7.7 million tons. Of interest was the much sharper decline in imports from outside of the European Iron and Steel Community. Such imports decreased 16.3%, dropping to 548,000 tons in 1974 from 655,000 tons in 1973. Steel imports from the United States decreased from 30,200 tons in 1973 to 8,800 tons in 1974. The most notable slump was in regular steel ingot.

Not included in overall French steel import-export figures were those for ferrous scrap. French imports from the United States dropped from 27,800 tons to 11,800 in 1974. Overall French imports declined as scrap needs were increasingly met from domestic sources.

**Lead-Zinc.**—Construction of the electrolytic zinc plant at Auby in the northern part of France continued in 1974. The Auby zinc plant, with an 80,000-ton capacity, was to replace the conventional zinc plant of the Compagnie Royale Asturienne des Mines in the early part of 1975 and was to cost about $40 million. Feed for the plant was to come primarily from Canada and Sweden in the form of lead-zinc concentrates.

Production of primary and secondary refined lead decreased 16% in 1974 compared with that of 1973. An increase of 7% was reported in zinc slab production in 1974 over that of 1973.

The prospecting work of Royale Asturienne des Mines continued in the Chenelette permit and Cenadere permit of the Upper Pyrénées. However, no results were available by the end of 1974.

**Titanium.**—Information on titanium activities in France is somewhat limited. However, Thann et Mulhouse was building more capacity at its sulfate-process pigment plant at Le Havre in 1974. Additions of 22,000 tons per year in 1975 and 13,000 in 1977 were to bring total plant capacity to 100,000 tons per year.

## NONMETALS

**Barite.**—The combined exploration efforts of Société des Mines de Garrot Chaillac (SMGC) and BRGM resulted in evaluation of an important barite deposit in 1974. The deposit known as Rossignol situated about 50 kilometers south-southwest of Chateauroux, in Indre Département, overlaid gneissic rock of the Massif Central with an average barite thickness of 12 meters. The barite-bearing horizon spread over 190,000 square meters and was estimated to contain about 8 million tons of crude barite ore, with 4 million tons of recoverable ore. The deposit would be amenable to open pit mining.

Production was scheduled to start in mid-1975, at a rate of 100,000 tons of concentrate per year. Part of the recovery was to be by gravity methods, (about 20,000 tons), while the remaining was slated for flotation techniques. All of the

production management was to be by SMGC according to the agreement.

Barite production decreased 5% in 1974 compared with the 1973 output. Part of the new production from Rossignol was to be for export to EC markets.

**Borax.**—Borax Français, a wholly-owned subsidiary of Rio Tinto Zinc Borax increased the capacity of its boric acid plant at Conde-Kerque by 25,000 tons per year in 1974. More expansion was underway for 1975 and when completed in 1976 the boric acid plant was to produce 50,000 tons per year.

**Fluorspar.**—PUK and Société Denain-Anzen Minéraux (DAM) remained the most important producers and consumers of fluorspar during 1974. Total production of fluorspar from both companies and 10 smaller companies amounted to 610,000 tons, an 7% increase compared with 1973 production.

Construction of a high-purity hydrofluoric acid plant by Rhône-Poulenc S.A. continued at Salindres. Production at the Salindres plant, with 1,000 tons annual capacity was slated to begin in mid-1976. Dong Trieu Société Française Immobiliére et Miniére S.A. obtained an exploration permit for a 20-square-kilometer area in central France to search for fluorspar and related mineral during 1974.

**Potash.**—Pollution of the Rhine River remained a serious problem for local communities bordering the river and the countries through which it flows. In 1974 a ministerial conference was held, following earlier meetings in La Havre and Bonn to seek solutions. Switzerland was the first to construct four waste-treatment plants and to make plans for others in an attempt to drastically cut water pollution in the Rhine by 1982. Although these measures rendered the Rhine cleaner at its upper reaches, Dutch communities, which relied on the Rhine River for their drinking water, had little relief, since, as soon as the river left Switzerland, it entered the heavily polluting area of France—the Alsace region. One company alone, Mines Dominales de Potasse d'Alsace (MDPA), discharged 18,000 tons per day of potash effluent into the river. By the time the Rhine reached the sea it contained 85 tons of mercury, 1,000 tons of arsenic, 200 tons of cadmium, 1,500 tons of lead, and 30,000 tons of hydrochloric acid per year.

Various solutions were being considered; transfer of the salt by pipe for discharge into the North Sea, or sale of salt for snow cleaning and stockpiling. However, by yearend no clear decision was made.

**Pyrite**— Exploration efforts of the Société des Mines et des Produits Chimiques de Salsique (SMPCS) continued during the year in the Saint-Bel area. The company's production of pyrite was halted in 1973 because of ore depletion and high costs of processing the lower grade deposits.

**Sulfur.**—Société Nationale des Pétroles d'Aquitaine (SNPA) remained the main sulfur producer in France in 1974. With production from its natural gas deposits at Laçq, in the southwest of France, output was 1.84 million tons, slightly below the previous year; however, production of about 70,000 tons from other sources was sufficient to meet domestic demand as well as to supply the export market.

## MINERAL FUELS

The French Government set up a special committee to determine whether the 1928 law giving the provinces power to regulate the French oil market should be revised. The Finance Ministry was also examining whether any changes should be made in the tax treatment of oil companies and the special tax levy introduced in 1973. Parliament was expected to assume a stronger hand in operations of the French oil industry in the future.

Annual reports released by French oil companies in 1974 indicated that the industry invested $2.7 billion in 1974 compared to the $1.8 billion in 1973. Spending in the refinery sector rose from $30 million in 1973 to $34 million in 1974, in storage and distribution, spending rose from $30 million to $39 million, and foreign investment jumped from $73 million to $1.5 billion. Commenting on the Government's objective of reducing French oil consumption to 96 million tons in 1985 or 40% of total energy consumption compared with 65% in 1974, the oil industry expressed doubts as to whether these goals could be met if economic growth was kept at the planned annual rate of 5%. They felt, that even with achievement of the maximum objectives of the Government, oil and gas would still account for 55% of French energy consumption by 1985, excluding the needs of the chemical industry.

The Government, in order to reduce energy consumption in 1974, cut use in public departments by 20%, and raised the prices of oil products, gas, and electricity by an average of 5%. In order to help the petrochemical manufacturers, the French Government kept costs as low as possible, by waiving all internal taxation on feedstock, including all petroleum and natural gas products.

**Coal.**—The French Government worked out a wide-ranging plan designed to reduce the country's dependence on foreign sources of energy. The plan called for an additional 46 million to 50 million tons of domestic coal production between 1975 and 1985. The goal was set at 21 million additional tons instead of the 14 million ton target set previously. Central to the plan were the Lorraine coalfields where the output of 9.5 million tons of 1974 was to be increased to 10 million per year until 1985. Production in the Nord/Pas-de-Calais Basin was to be increased to 5 million tons in 1985. Although the new plan was approved, the miners' trade unions called for revised production figures. The union labeled the plan inadequate, not in keeping with EC energy policy, and irresponsible in view of France's energy situation in general.

In addition to France's well-known coalfields of Nord/Pas-de-Calais, Lorraine, and Centre-Midi, other deposits existed in France, which were not deemed profitable prior to the 1973 general change in market conditions. Foremost of the untapped reserves was in the Jurassic formation at Lons-Saulnier where 200 million tons of coking coal was measured. Other important deposits were at Decize with about a 45-million-ton reserve, and at Bas-Dauphine and Bert-Montcourbroux with total reserves of 40 million tons.

The state-owned Charbonnages de France (CDF) joined a number of French steel companies in announcing plans to spend $40 million for the purchase of majority holdings in an unidentified West Virginia coal mine in the United States. About $20 million of the investment was to be used in renovating the mine. It was understood that, if the plan becomes a reality, France would import about 2 million tons per year from this mine.

Compared with 1973, coal production declined 2.8 million tons or 9.7% in 1974 while coke production increased 3.4%. Stocks of coal were unchanged, whereas stocks of lignite were reduced by 100,000 tons at yearend 1974. Production data on the major producing area are shown in table 4.

**Table 4.—France: Salient statistics of the coal and lignite industry**
(Thousand metric tons unless otherwise specified)

| | 1973 | 1974 |
|---|---|---|
| **COAL (ANTHRACITE AND BITUMINOUS)** | | |
| Production: | | |
| Nord/Pas-de-Calais | 10,404 | 9,011 |

**Coke.**—Total coke production increased 3.4% between 1973 and 1974. However output by collieries only decreased about 14% in 1974 compared with 1973 production. Among the producing coal basins, only Aquitaine of Centre-Midi showed a slight production increase. Colliery production of coke and semicoke in the four basins, in thousand tons, for the years 1972–74 follow:

| | 1972 | 1973 | 1974 |
|---|---|---|---|
| Nord/Pas-de-Calais | 3,823 | 4,245 | 3,632 |
| Lorraine | 2,356 | 2,515 | 2,159 |
| Aquitaine | 376 | 353 | 358 |
| Loire | 252 | 224 | 132 |
| Total | 6,807 | 7,337 | 6,281 |

**Natural Gas.**—The natural gas industry continued to expand its share of the energy market during 1974, although at a somewhat reduced rate. During the year natural gas accounted for 9.2% of total French energy consumption, an increase of 8.8% over the 1973 level. French energy planners were confident that natural gas can continue to expand its share of the market and were looking toward its supplying approximately 13% of total French energy consumption in 1985. This expansion required increasing quantities of imports as domestic production had already leveled off at about 7.5 billion cubic meters.

Imports of natural gas from the Netherlands and Algeria increased in 1974, to 9.9 billion cubic meters, compared with 8.3

billion cubic meters in 1973. French companies continued negotiations for future gas supplies from the Soviet Union, Algeria, Norway, and from Iran where the French discovered large reserves.

**Petroleum.**—At yearend 1974, oil had retreated to its 1972 position in French energy consumption, accounting for 64% of total consumption as opposed to almost 67% in 1973. During the year, the French Government worked to establish a comprehensive energy policy designed to maintain the ground thus won and limit the future growth of oil consumption. Also, the Government was banking on an ambitious nuclear development program to bring French oil consumption down to approximately 40% of total energy consumption by the mid-1980's. In these circumstances, the country's refining and sales network entered into a period of relative stability or even stagnation.

French domestic oil production continued its fall, dropping 13% to only 1.08 million tons, or less than 1% of the national consumption. Crude oil imports totaled 129.8 million tons, or a drop of 3.3% below 1973, in reaction to higher prices, consumption reduction measures, and two successive mild winters. Middle Eastern and North African exporters supplied 87% of the country's requirements, with Saudi Arabia alone accounting for 32%. The full breakdown of crude imports by source in million tons follow:

| | 1973 | 1974 |
|---|---|---|
| Saudi Arabia | 20.17 | 41.4 |
| Iraq | 18.68 | 16.8 |
| Abu Dhabi and Oman | 15.87 | 14.9 |
| Kuwait | 15.48 | 12.4 |
| Nigeria | 12.59 | 10.5 |
| Algeria | 11.10 | 8.9 |
| Iran | 10.82 | 8.8 |
| Libya | 6.49 | 8.7 |
| U.S.S.R | 8.36 | .2 |
| Qatar | 3.41 | 3.5 |
| Venezuela | 1.80 | 1.5 |
| Gabon | 1.41 | 2.1 |
| Zaire | .95 | 1.5 |
| Others | 12.00 | 8.6 |
| Total | 134.13 | 129.8 |

Source: Comité Professionnel du Pétrole (Paris), 1974, p. 58.

Petroleum product imports dropped 6% during 1974, to 6.9 million tons, compared with 1973 imports. Import licenses for petroleum products, which were due to expire at the end of 1974, were extended with only minor modification by 1 year in view of the uncertain market situation.

Consumption of major oil products and natural gas in thousand tons in 1973–74 follow:

| Product | 1973 | 1974 |
|---|---|---|
| Regular gasoline | 3,532 | NA |
| Premium gasoline | 15,772 | 15,182 |
| Aviation gasoline | 48 | 38 |
| Jet fuel | 1,812 | 1,829 |
| Special gasoline | 78 | 71 |
| White spirit | 155 | 141 |
| Kerosine | 44 | 36 |
| Gas oil | 6,533 | 6,771 |
| Fuel oil, domestic | 37,217 | 31,541 |
| Light fuel oil | 2,023 | 1,602 |
| Heavy fuel oil | 34,134 | 34,528 |
| Lubricants | 1,051 | 1,009 |
| Liquefied petroleum gas | 2,696 | 2,666 |
| Bitumen | 3,395 | 3,154 |
| Paraffin wax | 66 | 68 |
| Petroleum coke | 395 | 431 |
| Incandescible gas | 215 | 174 |
| Petroleum fuel stocks | 3,831 | NA |
| Natural gas (billion cubic meters) | 15.4 | 17.4 |

NA Not available.

Source: Comité Professionnel du Pétrole (Paris), 1974, p. 174.

Total refinery production in 1974 decreased to 120.1 million tons compared with the 1973 level a drop of 4.6%. There were 128.1 million tons of crude treated, and in the process 8 million tons of crude were lost. Refinery capacity increased by 10% during the year, due to the completion of the new refinery of Compagnie Française des Pétroles (CFP) at Dunkirk capacity 6 million tons per year and the doubling of capacity at Shell's Petite-Couronne refinery to 18.8 million tons per year. Total refinery capacity of 169 million tons per year was expected to remain generally stable over the coming years as changed consumption patterns caused the shelving of all new refinery expansion projects. Thus, emphasis was switched from increased production capacity to increased efficiency yields at existing refineries and to the renewal of cracking units.

Details on production, trade, and consumption of major products, in thousand tons were as follow:

| Product | Refinery production | Domestic consumption | Exports | Imports |
|---|---|---|---|---|
| Gasoline | 16,791 | 15,182 | 1,807 | 276 |
| Aviation gas | 45 | 38 | -- | 25 |
| Jet fuel | 3,241 | 1,829 | 612 | 16 |
| Liquefied petroleum gas | 2,959 | 2,666 | 662 | 221 |
| Diesel oil | 13,666 | 6,771 | 3,812 | 1,842 |
| Heating oil | 29,956 | 31,541 | 14 | 103 |
| Light fraction and chemical feedstock | 6,305 | 5,447 | 646 | 883 |
| Lube oil | 1,302 | 1,009 | 457 | 102 |
| Asphalt | 3,715 | 3,154 | 486 | 4 |

French refinery capacity in million tons for the years 1965, 1973, and 1974, as well as location and ownership, follow:

| Location and refinery | 1965 | 1973 | 1974 |

Stocks increased markedly in 1974. Storage capacity increased by 3.2 million cubic meters to 65.4 million. Over 1 million cubic meters of the new capacity was attributed to the completion of the new Dunkirk refinery. In addition, storage capacity was increased by the creation of a new tank farm at Graveline of 540,000 cubic meters, and the addition of 900,000 cubic meters of capacity to the underground storage area of Manosque. Work also coninued on an underground heated storage depot of 3-million-cubic-meter capacity which was being built at Georgenville for industrial fuel oil. At the end of 1974, actual stocks on hand totaled 11 million tons of crude and 19.1 million tons of refinery products.

France's 1974 petroleum product imports of 6.9 million tons were predominantly from Italy, 1.4 million tons; West Germany, 1.2 million; the Soviet Union, 0.9 million; and the Netherlands, 0.7 million. The major markets for French petroleum product exports continued to be Switzerland and West Germany, which took 3 million tons each. Other significant export markets were the United States, 1 million tons; the Netherlands, 0.84 million; Belgium and Luxembourg, 0.8 million; and Spain 0.4 million.

*Consumption.*—Civilian crude oil consumption decreased 6% in 1974, to 105 million tons, compared with 1973 consumption. The major savings were undoubtedly due to the mild winter weather plus the short term consumption-depressing effect of higher prices. Although French Government policy encouraged economy in energy use during the year, the only significant and authoritative measure to that end, a domestic fuel rationing program, was not instituted until autumn of 1974. The Government was to develop a more comprehensive petroleum savings program for 1975 and perhaps for the next decade. Accordingly, a goal was to be set up for petroleum consumption in 1985, of 100 million tons per year, as opposed to 110 million tons in 1973.

*Exploration.*—Exploration continued at a low rate. Only nine exploratory and three development wells were drilled in 1974. New offshore exploration, particularly in the approaches to the English Channel, was held up during the year largely because of a demarcation dispute with the United Kingdom.

Departments of Finistère, Morbihan, Loire Atlantique, Vendée, Charente-Maritime, and Gironde were to offer permits for offshore oil and gas searches on France's Atlantic coast in 1975. Exclusive search permits were sought by CPF, British Petroleum, and Esso representatives. However, by the end of 1974 no conclusive contracts were reported.

A demarcation of the Franco-Spanish offshore boundaries in the Bay of Biscay area was agreed on in the early part of 1974 and was sent to both countries for ratification. According to this agreement proceeds and development costs of any mineral discoveries in the agreed area were to be shared jointly. At yearend 1974 discussion on the establishment of a median line along the Mediterranean coast of both countries continued.

*Transportation.*—There were no significant changes in inland transport facilities in France during the year. Construction of a port for supertankers continued at Cap Antifer near Le Havre and was scheduled for completion in 1978. Pipeline and other transport volumes were down, comensurate with the dropoff in refining and consumption. Nine major oil tankers were added to the French-flag fleet in 1974, for a total of 89 ships at the end of the year.

# The Mineral Industry of Gabon

By Janice L. W. Jolly [1]

The mineral industry of Gabon continued to show substantial improvement as crude petroleum (up 33.6%), uranium (up 15.6%), and manganese (up 9.7%) all showed production increases for 1974. Gabon was the fourth largest oil producer in Africa, following Nigeria, Libya, and Algeria.[2] After surpassing the 10-million-ton production level, Gabon became eligible for full membership in the Organization of Petroleum Exporting Countries (OPEC), in which it has held associate membership since November 1973. Gabon's earnings from the petroleum industry was estimated at $880 million [3] in 1974, compared with around $83 million in 1973. The rise in oil revenues brought Gabon's 1974 gross domestic product (GDP) to an unprecedented level of an estimated $1.3 billion for a country of 950,000 inhabitants. The growth in oil revenues was the result not only of increased production and higher oil prices, but also of increased oil royalties, corporate tax rates, and increased state acquisition of shares in oil companies. Because of the increase in oil revenues, the national budget for 1974, (originally set at $200 million), was increased to about $375 million, equally divided between development and administrative expenses. The new budget adopted for 1975 was balanced at $620 million; over 70% of it was earmarked for development projects. Adopted September 18, 1974, the budget included $9.6 million for the Trans-Gabon Railroad, which remained the Nation's foremost development project. Completion was scheduled for 1981.

The first section of the Trans-Gabon Railroad, costing more than $200 million, will link Owendo with Booué, a distance of about 206 miles. The second section will extend 233 miles from Booué to Franceville. On December 18, 1974, the French aid for both sections was raised to more than $46.7 million.[4] Others providing loans and credits for the building of the railroad were the following: Fonds Européen de Développement (FED), $8.6 million; African Development Bank (ADB), $6.2 million; French Aid Organization (FAO), $14.6 million; Italy, $11.2 million; Canada, $14.2 million; Federal Republic of Germany, $8.3 million; Japan, $10 million; Zaire $6.7 million; Algeria, about $1 million; Agency for International Development (AID), $5 million; Export-Import Bank (EXIM), $20 million; and Republic of South Africa, $17 million. The second section was expected to cost about $209 million, most of which was expected to be paid by the Gabon Government.[5]

The Government budgeted $2.2 million for a study of the mineral port at Santa Clara. Work on the port was planned to proceed in time for completion along with the Booué-Franceville leg of the Trans-Gabon Railroad so that it could be used to transport manganese. An asphalt plant was under construction in Port Gentil at a cost of $2.9 million. It was expected to begin production in February 1975 at the rate of 10,000 tons per year. A second refinery was started at Port Gentil in December 1973, costing around $26.7 mil-

[5] Marches Tropicaux et Méditerranéens (Paris). Fed Financing for Trans-Gabon. June 7, 1974, p. 1605.

lion. The extension of the Port Gentil oil refinery, when completed, will increase refinery capacity from 1.2 million to 2.5 million tons.

Petroleum companies operating in Gabon agreed to reinvest 5% of their profits in Gabon in diversified projects chosen jointly by the Government and the petroleum companies. This 5% represented about $44 million in 1974, and was expected to rise to $60 million by 1975.[6] Eight important industrial projects were to be financed mostly through the investment funds of the petroleum companies and were to be managed by the new Ministry of Industrial Participation. These included an ammonia plant, representing a $26 million investment, to be completed in Port Gentil by Essence et Lubrificiant de France of Gabon (Elf-Gabon), and a U.S. firm, and a methanol plant, also a $25 million investment to be set up at Port Gentil by the Pierrefitte-Auby firm.

A ferromanganese plant near Franceville, under study by the Japanese firm Okura Trading Co., was in advanced stages. Société Gabonaise des Ferroalliages (SOGAFERRO) was to be formed with a capital of $4.2 million. Three participants were to be Gabon Government (10%), Compagnie Minières de l'Ogooué, S.A. (COMILOG) (15%), and Okura Trading Co. (25%), and the remaining 50% was to be distributed among Union Carbide Corp. (U.S.), Elkem–Spigerverket (Norway), Sadacem, Applications de la Chimie de l'Electricité et des Metaux S.A. (Belgium), and Tassara (Italy). The project would be operational in 1979 with plans to produce 135,000 tons per year of ferromanganese and silicomanganese alloys.[7]

Following the policy of joint participation when a new company is established the Gabonese receive 10% of the stock free with the option of increasing their participation up to 60% by purchasing additional stock at a price agreed upon. The company headquarters must be located in Gabon, and a Gabonese must be its director.[8] During 1974, the Government purchased or announced the following participation: Shell Oil Co. of Gabon (Shell-Gabon) (10%), Elf-Gabon (12%), Société des Mines de Fer de Mékambo (SOMIFER) (56%), Compagnie des Mines d' Uranium de Franceville (COMUF) (25%), Société Gabonaise de Raffinage (SOGARA) (30%), COMILOG (10%), National Petroleum Products Distribution Corp., (PIZO) (51%), Société des Ciments d'Owendo (51%), Société Gabonaise d'Entreposage de Produits Petroliers (25%), and the Société Gabonaise de Marbrerie et Matériaux (SOGAMAR) (54.4%).

The Bank of Gabon and Luxembourg, with headquarters in Libreville, was inaugurated in August 1974. The bank is 30% subscribed by Gabonese nationals, and 70% by a group associated with the International Company of Banks of Luxembourg. On November 19, 1974, the 10th year for the Customs and Economic Union of Central Africa (UDEAC) was celebrated at a meeting in Yaounde, Cameroon. Cameroon, Gabon, the Central African Republic, Congo, and Equatorial Guinea are members. Five projects were approved including the creation of a regional development bank with head offices in Brazzaville, Congo. The regional bank is planned as a community organization for the financing of economic and social development.[9]

The Petit Poubara hydroelectric dam was under construction by a French group, and another dam at Grand Poubara was being planned. The French Electric Co. was designing the plant for Grand Poubara dam, and plans were to be submitted to the Government at yearend 1976.[10]

The French Bureau de Recherches Géologique et Minières (BRGM) increased activities in Gabon on the following projects: (1) With COMILOG and Elf-Gabon, the continued study of copper, zinc, and gold samples in the Ndjolé region; (2) with COMILOG, gold prospecting in the Etéké region where a Gabonese state company was already working a deposit of placer gold; (3) with COMILOG, continuation of copper and nickel prospecting in the Franceville region, so far not encouraging; and (4) with COMILOG, Elf-Gabon, and the Aquitaine Oil Co. of Canada Ltd., a research program on mineral deposits at

Kroussou in Central Gabon. Other recent exploration included exploration for diamond at Mamfe, quartz crystals in the Batoure and Betare-Oya regions, and copper indications at Poli, Marova and Bibemi. Geological prospecting continued in cooperation with the United Nations Development Program (UNDP) in the Koula-moutou-Franceville region of southeastern Gabon and in the Woleu-Ntem region of northern Gabon. Results of this survey were soon to be available. The Gabon Government, in association with the United Nations, was also carrying on its own exploration to the west of Mouila in southwest Gabon. The State reportedly has invested $312,500, and the UNDP has put $437,500 into this effort.[11] Airborne geophysical prospecting was also being carried out with the assistance of the Canadian Government together with detailed mapping over an area covering 105,750 square miles.

## PRODUCTION AND TRADE

Crude petroleum production was 73,548,000 barrels (approximately 10.2 million tons) in 1974, representing an increase of 33.6% over 1973, and was expected to continue to rise. Oil prices doubled in late October 1973, and again in January 1974, reaching $13.03 per barrel for Mandji quality and $13.80 for Gamba quality. Gross gas production was estimated at 19 billion cubic feet in 1974. The SOGARA refinery at Port Gentil used nearly 8 million barrels (about 1.1 million tons) of crude oil in 1974, and reportedly[12] earned $72 million compared with $32.9 million in 1973 for production of petroleum products. Refinery production was expected to double in 1976 when the second refinery under construction would be completed. The United States, for the first time,[13] imported 3.4 million barrels of crude from Gabon in 1974.

Uranium production, valued at approximately $11.6 million in 1974, increased by about 25% to 1,772 tons of 43.60% contained metal from the 1,412 tons of equivalent material produced in 1973. The sale price of uranium from Gabon was sharply increased in April 1974, and has since been the subject of talks with France. An agreement was signed in May 1974 with the French, increasing the price about five times. Discussions between France and Gabon on uranium matters were expected to reopen in January 1975.

In 1974, Gabon produced 2.1 million tons of metallurgical- and battery-grade manganese, compared with 1.9 million tons in 1973. Production was expected to stay at this level until 1980, when the Trans-Gabon Railroad was planned for completion. More than half of the U.S. imports of manganese was supplied by Gabon and Brazil, with Australia a significant third. Prices for ore, alloy, and manganese metal continued to rise in 1974.

Cement produced by the Cimenterie d'Owendo in 1974 was insufficient for local consumption and a scarcity occurred in June and July. Cimenterie d'Owendo, which utilizes imported clinker, more than doubled production after 1970; from 22,695 tons to 42,526 tons in 1971 and 52,285 tons in 1972. By 1974, 80,000 tons of cement were being produced. An extension to the factory was being planned.

Gold production was down by 35% in 1974 compared with 1973.

## COMMODITY REVIEW

### METALS

**Copper.**—Indications of copper occur in the Makokou-Booué area, but investigations have not shown the mineralization to be extensive. Surveys have been made by BRGM west of the Ogooué River, southeast of Etéké, where the geology is presumed similar to that of the Zaire Copperbelt, but no discoveries have been made of commercial importance. Copper indications at Poli that may extend to Maroua and Bibemi were being investigated.

**Gold.**—The State gold authority, Gabonese Mining Exploration and Exploitation Co. (SOGAREM), was continuing its exploration for new deposits to supplement the present workings at Etéké, Lastoursville, Makokou, and Ndjolé. The BRGM has concessions for prospecting between Ndjolé and Lambaréné, and at Etéké.

**Iron Ore.**—The State renounced its plan to acquire 60% of the multinational corporation SOMIFER, reducing its holdings to 56%,[14] and was reportedly favorable to reassigning its interests to new stockholders and to reducing its capital interest eventually to 35%. SOMIFER was expected to begin construction of 19 miles of road to link Massah village on the Makokou-Mékambo road to Belinga, finishing by August 1975. A group of Bethlehem Steel Co. technicians was to arrive in 1975 to begin testing. The tests, which will be carried out over a 2-year period, will determine the exact extent and percentage of impurities in the ore. An analytical laboratory will be installed at Makokou and a liaison office in Libreville.

Iron ore resources in Gabon are estimated[15] to be 1,216 million tons of Precambrian "Lake Superior" type deposits of hematite and accessory goethite and magnetite. Of the eight main deposits, Belinga, Batoala, and Boka-Boka are often described as the Mékambo group. The Mékambo group has a total of 877 million tons estimated reserves, of which the Belinga deposit is the largest. Located on the left bank of the Ivindo River, Belinga has reserves estimated at 566 million tons with 65% Fe, 2.2% $SiO_2$, and 0.12% P. The Minkébé deposit, located northeast of Belinga, has reserves estimated at 60 million tons of 64% Fe, 3% $SiO_2$, and 0.11% P. The Mébaga deposit, located in the northwest section of Mitzic District has resources in the neighborhood of 15 million tons of potential ore with 60% Fe and 4% $SiO_2$. The N'Gama deposit, also in the Mitzic District, contains about 50 million tons of ore with 47% Fe and 22% $SiO_2$. Mela, in the Kango District of western Gabon averages 46% Fe, 30% $SiO_2$, and has resources of 100 million tons. The Tchibanga-Moutéli deposit is located in southwestern Gabon near Tchibanga, and is only 25 miles from the coast. It is a massif of ferruginous quartzites with irregular occurring zones of hematite enrichment and resources estimated at 114 million tons of potential ore with 43% Fe, 27% $SiO_2$, and 0.18% P. Other known iron deposits include the subeconomic iron (120 million tons, 33% $Fe_2O_3$) in the Kribi region, and 450,000 tons of ilmenite at Kribi-Longji and Douala-Souellaba.

**Manganese.**—Gabon was the third largest producer of manganese in the world in 1974; production from the COMILOG mine at Moanda reached 2.1 million tons. Pending completion of the Trans-Gabon Railroad, production was expected to reach 4 million tons per year. Reserves were estimated to be 210 million tons of salable product grading 48% manganese dioxide. COMILOG was owned by the Government (10%), United States Steel Corp. (44.10%), the French BRGM (19.8%), Compagnie de Mokta (17.10%), and the Société Auxiliare du Manganese de Franceville (9%).[16]

**Uranium.**—Negotiations were held during March 1974 between Gabon, Niger, and France regarding the price of uranium, the revenue earned by these States from uranium exploitation and effects derived from this revenue. The sale price was increased, and an agreement was signed in May 1974 between France and Gabon that permitted the French Commissariat à l'Energie Atomique (CEA) to pay market prices for uranium but included

[14] Informations D'Outre Mer (Paris). Belinga Iron Project Underway. Jan. 22, 1975, p. 9.
[15] Survey of World Iron Resources. Gabon. United Nations (New York), 1970, p. 77.
[16] Industries et Travaux D'Outre-Mer (Paris). Le Manganese, Exploitation et Marché Mondial. (Manganese, Exploitation and World Market.) V. 22, No. 249, April 1974, p. 710.

a lump sum payment by France to Gabon to offset loss of earnings resulting from the preferential sale of uranium to France.

The Government purchased 25% of COMUF; the remainder is owned by Compagnie de Mokta, the French CEA, and Société Minière Péchiney-Mokta.

Gabon's uranium reserves are estimated at 20,600 tons of metal. The ore is among the purest known and has a content between 8.8 and 11 pounds of metal per ton (0.4% to 0.5%). The discovery in September 1972 of a natural atomic pile excited the curiosity of scientists, and in 1974 was the subject of a research bulletin by the CEA,[17] which included papers by several authors. Prospecting was on the increase; COMUF and the CEA pursued a large-scale prospecting program in the southeast near Franceville, in the east near Okondja, and on the coast near Coco Beach, where core reportedly will be taken from as deep as 3,281 feet below ground level. C. Itoh & Co., Ltd. (Japan) joined Dowa Mining Co., Ltd. and Okura Trading Co., Ltd. in prospecting in mid-western Gabon.[18]

## NONMETALS

**Cement.**—In 1974, Gabon suffered a shortage of cement, prompting a renewal of plans for building a cement factory using the high-grade calcium deposits occurring on the Isle of Coniquet in the Gabon estuary. A capacity of 200,000 tons of cement per year was visualized. The Government increased its participation in the Société des Ciments d'Owendo to 51% during 1974.

**Fertilizer Materials.**—*Phosphate.*—A discovery of submarine Neogene phosphatic deposits was made in 1971 and 1972 during dredging along the Continental Plateau. Both phosphate-covered pebbles and fluorapatite coproliths were described in a 1973 report[19] as situated between depths of 262 and 328 feet. Economic evaluation of deposits was not possible.

**Stone.**—*Marble and Granite.*—A cutting and finishing factory for marble and granite quarried in south Gabon was established in 1973. In 1974, the Gabon Government acquired a $1.6 million interest in SOGAMAR. Marble for the factory was derived from the 10-million-ton estimated reserve located at Tchibanga.

## MINERAL FUELS

**Natural Gas.**—Reserves were estimated at 6.5 trillion feet of natural gas. Natural gas production in 1973 was up about 16.6% over that of 1972, and in 1974 increased 35.7%. Cumulative gas production in 1974 was 224.5 billion cubic feet[20] for 10 producing African States, and 19 billion cubic feet for Gabon. A factory for the industrial use of natural gas was also planned.

**Petroleum.**—Requirements for a company seeking oil in Gabon were listed as follows:[21] A local company must be formed of which the Government will take 12% participation, with possible subsequent purchasing to 60%. Corporate income tax rate is 55% with allowances that can bring the rate down. In 1974, Gabon agreed to modify Elf-Gabon's tax basis so that the Government received 55% of profits on the posted price of $7 per barrel of crude oil. However, the 15% discount, which had been allowed to cover cost of shipping to the port of embarkation, was cut back to 5%. Royalties due the Government are based on the price of crude and are 12.5% on 95% of f.o.b. price. New producing companies must make available 25% of their production for sale to the National Oil Refinery at Port Gentil, and up to 25% of local crude production must be transported by Gabonese flag vessels.

Total proved oil reserves were 1.25 billion barrels. A total of 137 wells were flowing, with a total cumulative production to November 1, 1974, of 308,253,657 barrels.[22] The largest producers were the Gamba (since 1963) with 98.6 million barrels, Anquille Marine (since 1962) with 57 million barrels, and Ivinga (since 1967) with 40.6 million barrels. Production from the Lucina, Barbier, Girelle,

[22] Work cited in footnote 20.

Merous, and Mandaros finds began in 1974. Barbier was linked up to a 20-inch pipeline already taking production from Grondin and Torpille (started in 1972) to the Cap Lopez export terminal. Grondin (started in 1973) was expected to increase production in early 1975, and was reportedly producing 70,000 barrels per day in 1974. The Shell-Lucina discovery tested 2,300 barrels per day in 1972; the oil is 37° API, low-sulfur, medium-pour point. Development of the Breme Field was underway, and Ocean Oil and Gas Co. was expected to put its Doree well into production at 1,000 barrels per day in early 1975. Elf-Gabon had three drilling rigs operating on the Barbier Marine, Breme Marine, and Grondin Madroo Marine structures. Two offshore drills were operating on the Sette Cama lease for Shell-Gabon. Shell had a number of permits expiring at yearend 1974, and spent some $15 million on offshore work. Six million dollars was spent on drilling a dry well from the drillship *Sedco 445* in 2,150 feet of water. Shell was also operating another drillship. Elf-Gabon reportedly spent on estimated $25 million on exploration, double the 1973 estimate.

In 1975, prospecting was expected to be done mainly on land in Ogooué where four Cie. Générale de Géophysique (CGG) teams were to carry out seismic studies. Other companies holding exploration permits, in partnerships with one or more of those listed, included Gulf Oil Company of Gabon, Mitsubishi of Japan, Gabon Petroleum Corp., Ashland Petroleum Company, Gabon Corp., Valmar Construction Corp., Mesa Oil Co., Texaco of Gabon, Chevron Oil Co., Tennessee Oil and Gas Co. Inc. (Tenneco), Continental Oil Co., Ocean Drilling and Exploration Co. (ODECO), Ocean Oil and Gas Co., Oceanic Exploration Co., Canadian Bonanza Ltd., Diamond Shamrock Oil Company Ltd., Grace Petroleum Co., and Exxon Corporation.

Oil production necessitated the building of a terminal at Cap Lopez where tanks were installed with a storage capacity of 1.3 million barrels; three more 310,559-barrel tanks were to be setup. A new loading dock that will take 250,000-ton supertankers was planned for yearend 1975. Cap Lopez was expected to be the biggest oil storage facility in Gabon, backed up by Gamba and Batanga terminals to the south. Gabon was also starting tanker operations. Elf-Gabon's 140,000-deadweight ton crude carrier *N'Tchingue,* launched in Sweden in September 1974, was under Gabonese flag.

Export of refined products from the 17,400-barrel-per-day SOGARA refinery was being planned as production was expected to be doubled by 1976. PIZO (after the Bakota word for energy), a national company for the distribution of petroleum products, was established with the Government owning 51% and the remainder divided between Shell, Elf, and AGIP S.p.A. It was to begin operations in 1975. The company was established to enable Gabon to comply with OPEC policies and control the distribution as well as the exploitation of its oil. Other private distribution companies, notably Texaco and Mobil, will continue to operate in Gabon.[23] The Government expressed interest in increasing participation in Elf-Gabon to 25%, and talks on the matter were to be held in 1975.

# The Mineral Industry of East Germany

By Joseph B. Huvos [1]

East Germany's mineral industry is closely linked to that of East Europe and the Soviet Union. The centrally controlled economy of East Germany is based on mutually coordinated production schedules, and plan targets are predetermined by the 1971–75 national plan for economic development. By world standards East Germany had no significant mineral resources besides lignite and potash, for which the country was the world's first and third largest producer, respectively. Much of the remainder of the country's mineral requirements had to be imported.

Compared with 1973 production, pig iron has increased 78,000 tons; crude steel 274,000 tons; nitrogen fertilizer, 49,000 tons; and potash, 309,000 tons. Natural gas output increased 48.1 billion cubic feet, and electric power 3,372 million kilowatthours. There were also increases in the output of phosphatic fertilizers, manufactured gas, oil refinery products, and petrochemicals.

Beside gains in mineral production as reported in the official press, there have been also reports of failures to reach planned goals and to eliminate shortages in the supply of energy and materials. This focused attention on more intense campaigns for saving materials and energy.

As in the past, expansion of the mineral industry was achieved mainly through increased use of capital. Though East Germany's industry is better developed than that of most countries in East Europe, plant and equipment was often not up to date and failed to match efficiencies achieved in West Germany.

There are about 195,000 persons employed in the fuel industry including mining; about 345,000 in the chemical industry including petroleum; and about 124,000 in the metallurgical industry. There was also a constant shortage of labor in the country, and some industrial projects were built with the help of "guest" workers from neighboring East European countries.

While trade unions in Western countries are mainly wage-bargaining organizations, East German unions, similar to those in other East European countries have as a purpose to promote labor productivity and achievement of plan targets. Average monthly earnings of East German workers and employees in industry were about 870 marks [2] in 1974, or an increase of 2.7% over that of 1973.

As East German territory has been already well explored for mineral resources, prospecting was centered mainly on further delineation of lignite deposits for new mines and on development of existing oil and gas resources.

In 1974, a number of mines and plants were commissioned. New large scale lignite units that became operational during the year, were at the opencast lignite mines of Nochten, Welzow-Süd and Profen-Süd.

In the electric power generating industry two 440-megawatt nuclear-powered generating units went onstream at the Bruno Leuschner plant and two conventional 210-megawatt units were commissioned at the Boxberg powerplant.

In the iron and steel industry, new surface treatment plants for strip and profiles were commissioned at the steel strip combine in Eisenhüttenstadt. At Nachterstedt a continuous casting unit for aluminum strip was commissioned.

In the fertilizer materials industry, new capacities went onstream producing ammonia and urea at the Piesteritz nitrogen works.

---

[1] Foreign mineral specialist, Division of Coal.

[2] Values have not been converted from East Germany currency units (marks) to U.S. dollars owing to fluctuating exchange rates. The official East German exchange rate not recognized by the International Monetary Fund was 2.30 marks = US$1.00.

## PRODUCTION

Mineral production statistics were not officially reported for a number of commodities. Therefore, many of the data in table 1 were estimated.

Reportedly 58 mineral products were produced in the country. A comparison of actual production increases with planned increases for the few mineral products for which 1974 plan figures were published [3] follows: Potash production increased 12.1% (planned increase 12.1%); nitrogen fertilizer, 11.9% (planned 14.6%); manufactured gas, 1.8% (planned 3.9%); natural gas, 19.6% (planned 19.1%); petroleum products, 6.7% (planned 12.2%), and cement 5.8% (planned 8.8%).

Besides a reported 7.4% increase in the volume of industrial production, there remained several problems hampering output and productivity, such as chronic shortages of energy softened only during the year by favorable weather conditions; shortages of spare parts; and shortages of railroad cars and trucks.

| Total [4] | do | 97,206 | 105,578 | [e] 112,600 |

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, magnesium, peat and a variety of crude nonmetallic construction materials (clays and stone) are produced, but output is not reported, and available general information is inadequate to permit formulation of reliable estimates of output levels.

[2] Source indicates that data include "roasted ore"; presumably roasted pyrite.

[3] Gross production of natural gas is not reported, but presumably it is only slightly greater than reported marketed gas.

[4] Total of reported figures only; no estimates have been made for unreported products and/or refinery fuel and losses.

## TRADE

In 1973, reference year for this chapter's trade tables, East Germany's exports of all goods amounted to 26.2 billion marks, an increase of 2.3 billion compared with that of 1972; imports were 27.3 billion, an increase of 4.4 billion over those of 1972. In 1972, the value of mineral related commodity exports comprised 22.4% of all exports, an increase of 1.3%; mineral imports comprised 31.7% of all commodities imported, a decrease of 2.1% compared with that of 1972. In 1973, East Germany's principal trading partners, in order of importance of trade volume, with respective values of exports and imports in billion marks shown in parentheses, were as follows: the U.S.S.R. (9.9; 8.6), Czechoslovakia 2.6; 2.4), Poland (2.6; 2.2), West Germany (1.8; 2.3), and Hungary (1.2; 1.6). The value of total East German commodity trade with various groups of countries in 1971, 1972, and 1973 was as follows:

| Countries | Value (billion mark) | | |
|---|---|---|---|
| | 1971 | 1972 | 1973 |
| COMECON[1] | 28.4 | 31.7 | 35.3 |
| Other East European | 1.8 | 1.5 | 1.5 |
| Total East European and U.S.S.R | 30.2 | 33.2 | 36.8 |
| All other developed countries | 9.9 | 12.0 | 14.9 |
| All other developing countries | 1.7 | 1.5 | 1.8 |
| Total all other developed and developing countries | 11.6 | 13.5 | 16.7 |
| Grand total | 41.8 | 46.7 | 53.5 |

[1] COMECON (CMEA)—Council for Mutual Economic Assistance comprising the following countries: Bulgaria, Cuba, Czechoslovakia, East Germany, Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

In 1973 East Germany traded with 49 countries. More than two-thirds of its trade, however, was with East Europe and the U.S.S.R. The share of East German trade with these countries decreased from 71.1% in 1972 to 68.8% in 1973. East Germany's major trading partners are the COMECON countries. Trade with these countries decreased from 67.9% of total trade in 1972 to 66.0% in 1973. Quantitatively there was no significant change in the pattern of East Germany's mineral trade in 1973 compared with that in 1972. Exports of mineral commodities were small. Only exports of potash and fuel briquets were significant. There was a decrease in East Germany's exports of petroleum products, potassium, salt, gypsum, and kaolin.

The most important categories of mineral commodity imports were those of crude oil and petroleum products, manufactured and natural gas, bituminous coal, coke, phosphate rock, apatite concentrate, asbestos, mica, alumina, carbon black, nitrogenous fertilizers, phosphatic fertilizers, iron ore, ferroalloys, raw steel and semiproducts, bauxite, aluminum semimanufactures, graphite, and kaolin. The most important suppliers were the U.S.S.R. and the East European countries.

## Table 2.—East Germany: Exports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 [1] | 1973 [2] | Principal destinations, 1973 |

## COMMODITY REVIEW

### METALS

East Germany's metals industries are based mainly on imported raw materials, since East Germany has only very limited domestic metal resources of its own. In 1974 East Germany imported most of its iron ore and nonferrous metals and all of its bauxite and alumina requirements.

**Aluminum.**—East Germany operated two reduction plants with a total probable capacity of 90,000 tons per year. Although no exact production figures were available, the output of primary metal was estimated at 70,000 tons in 1974, the same as that in 1973. At present most of East Germany's primary aluminum comes from the Bitterfeld electrochemical combine, estimated to have a capacity of about 65,000 tons per year; and from the Lauta aluminum works with 25,000 tons per year. In 1974 East Germany also imported 109,900 tons of aluminum from the U.S.S.R. and an estimated 29,000 tons of semiproducts.

The estimated aluminum supply position in 1974 was as follows, in thousand tons:

| | |
|---|---|
| Production of primary aluminum | 70,000 |
| Imports | 110,000 |
| Exports | -- |
| Apparent consumption | 180,000 |

East Germany's only alumina plant is also located at VEB Chemiewerke Lauta. The plant produced an estimated 47,267 tons in 1974, unchanged compared with that of 1973. The plant used bauxite imported mainly from Hungary (179,000 tons) and from Yugoslavia (62,075 tons) in 1973. Some of the bauxite imported from Hungary may have been reexported to the U.S.S.R. To complement the alumina produced domestically, East Germany imported significant quantities in 1973: (84,467 tons) of which Hungary provided 21,281 tons. The Lauta aluminum works was modernized and plans have been made to raise alumina and ingot capacity by 140% and 265%, respectively.

Building of a larger processing plant has started at the Nachterstedt light metal works for the production of ultra-thin aluminum sheets. The 120-million-mark project was built in cooperation with the U.S.S.R. and other East European countries. The cold-rolling equipment will be supplied by the Ernst Thaelmann heavy machinery construction combine in Magdeburg.

Production started at a second section of the reduction plant of the Bitterfeld chemical combine. Forty-eight reduction cells are onstream and the plant is said to have reached its planned capacity.[4]

**Cadmium.**—In 1974 East Germany's estimated cadmium output was 18 tons, an increase of 12.5% over that of 1973. The cadmium is recovered mainly as a byproduct from the smelting of zinc and other nonferrous metals at the Wilhelm Pieck combine in Eisleben and the Elektro works in Weida, Thuringia.

**Copper.**—In 1974 East German secondary copper production was estimated to be 46,000 tons, an increase of 9.5% over that of 1973. No primary copper was produced as the Manfeld-Eisleben-Hettstedt (Anhalt) copper deposits were virtually exhausted and the mines were closed. A new deposit was being developed simultaneously at an adjacent location at Sängerhausen.

Work continued on modernizing East Germany's copper smelters at Eisleben and Helbra (August-Bebel-Hütte). Natural gas was introduced in the copper smelting plants in 1974.

In 1974 East German copper consumption was an estimated 95,000 tons. To satisfy demand, East Germany had to import half of this quantity in the form of blister and the other half as refined metal. No official data have been published about East German copper imports, but in the past most copper was known to have been imported from the U.S.S.R.

**Iron and Steel.**—With a production of 6.2 million tons of crude steel in 1974, East Germany contributed 0.8% to world steel production. Output of pig iron increased by 78,000 tons over that of 1973; steel increased by 274,000 tons; semimanufactures (rolled products, forgings, and pressings) increased by 124,000 tons. Production did not satisfy demand, therefore large quantities had to be imported, much of it from the U.S.S.R.

In 1973, East Germany's imports included 813,000 tons of pig iron, 474,700 tons of shapes, 638,900 tons of rods, 226,700 tons of hot-rolled strip, 60,400 tons of fine sheet, 552,300 tons of heavy sheet, 70,600 tons of cold-rolled strip, and 298,100 tons of pipes. Another factor that helped

[4] Könan, B. Elektrolyse II im CKB (Electrolytic Plant in the Chemical Combine Bitterfeld. Freiheit (Halle, East Germany), v. 30, No. 7, Jan. 8, 1975, p. 2.

to boost imports was the depletion of East Germany's iron ore resources. In 1974 no production of iron ore was reported and it may be assumed that the mines were closed down. In 1973 iron ore imports amounted to 1.8 million tons, of which 1.5 million tons came from the U.S.S.R. Much importance was given by East Germany authorities to scrap recovery. In 1974, 70% of East German steel production was based on recycled scrap.[5]

Plans for expanding East Germany's steel industry by 1975 included a new 3.5-million-ton-per-year sinter plant; conversion to natural gas at the open-hearth furnaces of the Riesa, Gröditz, and Brandenburg steelworks; reconstruction and expansion of the rolling mills as Riesa, Hennigsdorf Maxhütte; conversion of the Maxhütte Bessemer plant to a basic oxygen operation; completion of a 1-million-ton-per-year cold-sheet rolling mill; startup of a new 10,000-ton-per-year wire mill in Freital; a 20,000-ton-per-year railroad tire plant in Grödlitz; and a 650,000- to 700,000-ton-per-year bar mill in Hennigsdorf and Brandenburg, respectively; and finally the reconstruction of a tube mill at Riesa.[6]

**Lead and Zinc.**—Estimated output of primary lead and zinc was 4,000 and 5,000 tons, respectively. Depletion of deposits made East Germany increasingly dependent on secondary and imported metal. Secondary lead and zinc output was unchanged at 20,000 and 18,000 tons, respectively, in 1974; estimated consumption of lead and zinc was 100,000 and 80,000 tons, respectively.

**Nickel.**—After modernization of East Germany's nickel industry in 1974, production was 1,300 tons, an increase of 8.3% over that of 1973. All production has been centralized to the Aue (St. Egidien) nickel plant. The smelter slag byproduct is used for mineral wool.

**Silver.**—In 1974 estimated silver output further decreased 25% from that in 1973, to reach 3 million ounces. This was caused by the dwindling of domestic nonferrous metals resources which contain gold and silver that are recovered as byproducts. The metals are produced at the Wilhelm Pieck nonferrous combine in Mansfield and Eisleben, and at the Halsbrücke plant of the Freiberg metallurgical combine.

**Tin.**—East Germany's estimated mine and refined tin output in 1974 was 1,000 and 1,200 long tons, respectively, unchanged as compared with production. Improvement in the process and plant allowed maintenance of present production levels while using lower grade domestic ores. Ore from the Harz Mountains is subjected to flotation and pyrometallurgical concentration at the Albert Funk combine in Freiberg.

## NONMETALS

Production of nonmetallic mineral commodities did not change much during the year except for a few commodities which showed moderate increases. Among these were cement and nitrogenous and postassic fertilizers. The resource position varied from adequacy for some nonmetals, to apparent shortages of others such as asbestos, phosphatic raw materials, graphite, mica, pyrites, and sulfuric acid.

**Barite.**—Domestic barite output was adequate, leaving about one-third of production for export. Estimated barite output in 1974 was unchanged at 31,000 tons. East Germany's barite is processed at the Lengenfeld fluorite and barite plant which is located in the south of the country.

**Bromine.**—A new 910-ton-per-year bromine plant went onstream during 1974. Bromine is a byproduct of the refining of potash.

**Cement.**—Cement output was 10.1 million tons, an increase of 5.8% compared with that in 1973. Several cement plant construction projects were in progress during the year. Construction of the second production line at the Deuna Cement Works will be completed in 1975. After the commissioning of all four production lines, total capacity will reach 2.5 million tons per year.[7] The capacity of the Karsdorf Cement Works will be also increased. At present it produces 4.3 million tons, or 40% of East Germany's total output. With East German assistance, construction continued on a 1,000-ton-per-day cement plant at Hama, Syria, 210 kilometers north of Damascus.

**Chalk.**—In 1974 estimated chalk production was 48,000 tons, an increase of 6.7% over that of 1973. East Germany has Europe's largest chalk deposits which are lo-

[5] Neues Deutschland (East Berlin). Dec. 12, 1974, p. 3.
[6] Graf G. Entwicklung der Metallurgie der DDR (Development of the German Democratic Republic's Metallurgy). Neue Hütte (Leipzig), v. 18, No. 11, November 1973, p. 643.
[7] Neues Deutschland (East Berlin). Dec. 7, 1974, p. 3.

cated on Rügen Island near Sassnitz. The opencast Wittenfeld mine, and the Klementevitz processing plant are operated by the Rügen chalkworks belonging to the Dessau cement combine. Plans are to raise production progressively 160% by 1980. About 25% of current output is exported.

**Clays.**—At the Grimmen light-aggregate plant for ceramic purposes, 1,620 cubic meters of clay were produced daily.

**Fertilizer Materials.**—Estimated fertilizer production contained 3.7 million tons of nutrients,[8] an increase of 10.8% over that of 1973. Nitrogen fertilizers constituted 12.3%, phosphorus fertilizers 11.0%, and potassium fertilizers, 76.7% of total production.

There was no significant change in the exports of fertilizer materials. Potash exports were 1.8 million tons in 1973, virtually unchanged compared with those in 1972. There were no significant exports of nitrogenous or phosphatic materials.

*Nitrogen.*—Nitrogen production was 460,000 tons, 49,000 tons more than in 1973. Of this an estimated 38.7% was ammonium sulfate, 43.5% was calcium ammonium sulfate, and the rest urea with other complex nitrogen fertilizers. In 1973 total imports of nitrogen fertilizers were 237,100 tons of active substance. Most of East German fertilizer nitrogen production is centered around Leipzig in the south of the country, with one important plant located at Schwedt on the Polish border. Older nitrogen plants were located near Leuna because of the lignite deposits in that area. In 1973 the country's nitrogen fertilizer production, by type, with quantities produced in thousand tons, and producing plants, in parentheses were as follows: Ammonia (619; Leuna, Schwedt); ammonium nitrate (259; Schwedt, Wolfen, Bitterfeld, Piesteritz); ammonium sulfate (150; Leuna); potassium nitrate (11; Sonderhausen, Wolfen); urea (45; Leuna); calcium cyanamide (17; Piesteritz, Zschopau); and complex fertilizer (225; Piesteritz).

Two urea plants with a combined capacity of 738,000 tons are scheduled to enter production at Piesteritz in 1975. Urea capacity is also to be expanded with the construction of three other plants having a total capacity of 480,000 tons of nitrogen. Western technology will be used, but the plants will be built with COMECON and Czechoslovak assistance. All three units will be commissioned in 1975 or thereafter.

East Germany also assisted the U.S.S.R. in the construction of an ammonia plant at Kingisepp. In return for technical aid, East Germany will receive part of the plant's production.

*Phosphate.*—East Germany has virtually no indigenous phosphatic raw materials and imports most of its needs. In 1973 the U.S.S.R. supplied 431,000 tons; Morocco, 111,000 tons; and Tunisia, 54,000 tons. The country also imported 46,500 tons of phosphatic fertilizer products.

Total production of phosphatic fertilizer was an estimated 410,000 tons of active substance ($P_2O_5$) in 1974, an increase of 1.7% over that of 1973. Of the phosphatic fertilizer produced, 51% was superphosphate; 28.8% calcined phosphate; 3.4% Thomas slag; and 16.8% was of unspecified type. Estimated capacity for producing phosphoric acid in 1974 was 40,000 tons per year.

*Potassium.*—In 1974 East Germany overtook West Germany in the production of potash and became the world's third largest producer of this commodity, following the U.S.S.R. and Canada in that order. Potash output reached 2.9 million tons, an increase of 12.1% over that of 1973.

Increased potassium fertilizer output was obtained entirely through the commissioning of new facilities at the Zielitz potassium combine, replacing the old Strassfurt mine which had been shut down. The country's potash reserves are estimated at 13 billion tons.[9] The production plan target for 1975 was 3.2 million tons of $K_2O$ equivalent. East Germany was a major exporter of potassic fertilizer with exports equivalent to 1.8 million tons of $K_2O$ in 1973, virtually unchanged compared with that in 1972. Some of the more important recipients of East German potassic fertilizer exports in 1973, in tons of $K_2O$ equivalent, were Czechoslovakia (446,300); United Kingdom (150,963); Hungary (126,200); Austria (66,522); and Brazil (43,558). There were 647 accidents with the loss of one or more workdays, corresponding to 0.11 accident per 10,000 hours worked in the potash industry in 1973. Total work force of the potash industry was estimated at 33,900 in 1974.

**Gypsum.**—Estimated marketable calcined production, 289,320 tons, was unchanged

[8] The active ingredients (nitrogen, phosphates, and potash) are expressed as N, $P_2O_5$ and $K_2O$, respectively.

[9] Industria Mineraria (Milano). V. 24, No. 3, March 1973, p. 153.

in 1974 compared with that in 1973. The country's demand was 400,000 tons because of increased use in cement and plasterboard. Gypsum production is expected to double by 1980.[10]

**Sulfuric Acid.**—Production decreased by 53,000 tons in 1974, to 1,005,000 tons, compared with that in 1973. A new 200,000-ton-per-year brimstone based sulfuric acid plant was commissioned near Gera in 1974.

## MINERAL FUELS

East Germany's primary energy production from fossil fuels, hydroelectric power, and nuclear energy rose from 84.5 million tons of standard fuel equivalent in 1973 to an estimated 86.2 million tons in 1974. The estimated output of crude oil was unchanged at 346,000 tons and that of natural gas increased from 7.0 billion to 8.3 billion cubic meters. The share of these two fuels in East Germany's primary energy supply increased from 25.7% to about 27.9% during the 1973–74 period. In 1974, East Germany produced an estimated 246.8 million tons of coal and lignite. The share of coal (bituminous coal and lignite) in the primary energy supply declined from 73.9% in 1973 to 71.8% in 1974. While the production of natural gas increased significantly, the output of crude oil was unchanged and that of coal declined slightly. The share of coal in the energy balance will decline while production is unchanged, but it will remain the major source of energy consumed in East Germany well into the 21st century. The share of liquid and gaseous hydrocarbons will gain steadily in importance.

In 1974 the country produced 80.3 terawatt hours of electricity, 4.4% more than in 1973. Thermal powerplants generated 71.2 terawatt-hours (88.7%) of electricity, hydroelectric powerplants about 1.3 terawatt-hours (1.6%), and nuclear powerplants, including all other types of energy sources 7.8 terawatt-hours (9.7%). Installed capacity of power-generating plants in the country at yearend totaled 15,800 megawatts. In 1974 East German industry consumed about 58,000 million kilowatt-hours, 74.4% of the electrical energy produced, and about 2.1 billion cubic meters of manufactured gas, or 43% of the gas manufactured in the country. The plan target for electric energy production for 1975 was 88 billion to 90 billion kilowatt-hours.

There is no plan for increasing the country's lignite production during the next 10 years, but efforts were made to raise production of crude oil and that of natural gas. Primary fuel exports consisted mainly of some fuel briquets and petroleum products. In 1974 as in previous years, the U.S.S.R. was the country's major supplier of crude oil and more recently of natural gas, with deliveries of about 14 million tons and 2.8 billion cubic meters, respectively.

Total primary energy balances for East Germany in 1973 and 1974 are shown in table 4.

[10] Meissner, M. (Importance of the gypsum industry for East Germany's building industry.) Baustoffindustrie (Leipzig), February 1975, No. 1, p. 4.

**Table 4.—East Germany: Primary energy balance for 1973 and 1974[1]**
(Million tons standard fuel equivalent)

| Year | Total primary energy | Coal (lignite, brown, bituminous) and coke | Crude oil and petroleum products | Natural and associated gas | Hydroelectric and nuclear electricity |
|---|---|---|---|---|---|
| 1973: | | | | | |
| Production | 84.493 | 74.600 | 0.450 | 9.242 | 0.201 |
| Imports | 33.339 | 11.220 | 20.859 | 1.052 | .208 |
| Exports | 3.812 | 1.511 | 2.237 | .013 | .051 |
| Apparent consumption | 114.020 | 84.309 | 19.072 | 10.281 | .358 |
| 1974: | | | | | |
| Production | 86.157 | 74.450 | .450 | 11.056 | .201 |
| Imports | 36.204 | 11.220 | 22.100 | 2.664 | .220 |
| Exports | 5.082 | 1.500 | 3.500 | .012 | .070 |
| Apparent consumption | 117.279 | 84.170 | 19.050 | 13.708 | .351 |

[1] Production data for 1973 and 1974 were taken from the Statistical Yearbook of the D.D.R. (East Berlin); Satistische Praxis (Berlin) and other sources.

**Coal and Lignite.**—Lignite output was about 246.2 million tons, unchanged in 1974 compared with that of 1973. As in previous years, East Germany was the world's leading producer followed by the U.S.S.R. West Germany, and Czechoslovakia, in that order. The country's lignite reserves were estimated at 20 billion tons.[11]

Efforts in the lignite mining industry were directed at concentrating mining into larger and more efficient units. Negotiations were underway between East and West Germany for the mining of an estimated 15 million tons of lignite located in the Helmstedt-Harbke area on the common border of the two countries.

**Natural Gas.**—Natural gas production reached an estimated 8.3 billion cubic meters, an increase of 1.3 billion cubic meters compared with 1973 production. The country also produced 4.9 billion cubic meters of manufactured gas, about 100 million more than in 1973. Imports of Soviet natural gas were less than 3 billion cubic meters in 1974.

Development work at the Salzwedel gasfields continued, with further substantial growth of natural gas production to be expected. East Germany's gasfields are located on its common border with West Germany. Recently West Germany has shown interest in developing these resources on its side of the common border.

In 1974, the country had 17 gas and coking plants feeding into the national gas network. Manufactured gas is distributed by a 4,000-kilometer-pipeline network having total capacity of 7 billion cubic meters per year. The network includes the underground gas storage facilities at Ketzin. Natural gas was distributed by a 700-kilometer, pipeline system with an 8-billion-cubic-meter-per-year capacity and consisting of a 750 and a 900-millimeter-in-diameter pipeline. An underground storage facility at Bernburg is part of this system. Imported natural gas is served by a 400-kilometer long and 900-millimeter-in-diameter pipeline.

**Petroleum.**—Estimated crude oil production was 2.5 million barrels in 1974, unchanged compared with that in 1973. Domestic production provided only 2.2% of the country's crude oil requirements, while the rest had to be imported.

The Friendship pipeline which extends from the U.S.S.R. to East Germany carries Soviet oil to East Germany's Schwedt petrochemical combine which is 27 kilometers from the Polish border. In 1974 East Germany's crude oil pipeline network exceeded 1,000 kilometers in length. This pipeline system connects Schwedt and the terminal of the Friendship pipeline with the North Sea port of Rostock where most of the overseas oil shipments arrive; it also connects Berlin and the major petrochemical centers of the country such as Leuna, Böhlen, and Zeitz. There is also a 130-kilometer pipeline to Zaluzi, Czechoslovakia.

East Germany has refining plants at Schwedt, Leuna, Böhlen, and Lützgendorf. The country's total refining capacity of 12 million tons per year in 1973, is to be increased to 20 million tons by 1975, requiring an increase of 67%.

Intensive development continued also in the petrochemical industry. The Schwedt petrochemical combine, which includes the Schwedt oil refinery in 1974 had a throughput of about 8 million tons per year which is to be raised by 1975 to 8.4 million tons. The Otto Grotewohl petrochemical plant in Böhlen which is also part of the Schwedt petrochemical combine performs low temperature lignite distillation for recovering low temperature tar, a petrochemical feedstock. At yearend 1974 an olefin complex located in Böhlen was subjected to test runs. The complex will produce a total of 300,000 tons of ethylene, propylene, and butadiene which will replace the low-temperature tar used. About 60% of the olefin production is sent to Czechoslovakia by pipeline. The Zeitz hydration plant which is also part of the Schwedt petrochemical combine produced lubricating oils, fats, and bitumen. The Leuna petrochemical combine supplied 10% of the country's chemical products which included mainly light distillate fuel oils, plastics, and synthetic fibers. East Germany also contributed help for construction of the Novoplozk high-density polyethylene plant in the U.S.S.R.

**Nuclear Power.**—In 1974 East Germany had two operating nuclear powerplants. The first is the Rheinsberg 70-megawatt nuclear powerplant commissioned in 1966. The other is the Bruno Leuschner Nord-Greifswald nuclear powerplant that had been under construction since 1967 and has two operating 440-megawatt units commissioned during the year—one unit under full power and the second unit under test runs. East Germany's third nuclear powerplant to be erected at Magdeburg was in the planning stage. All nuclear powerplants were built with the help of the U.S.S.R.

# The Mineral Industry of the Federal Republic of Germany

By D. H. Desy [1]

The general economy entered into a decline in 1974, particularly during the second half of the year. The gross national product (GNP) in terms of 1962 prices showed an increase of 0.4% for 1974 but had declined in the second half of the year. Inflation was held to 7%, low in comparison with other industrialized nations, while unemployment rose to 2.6% from 1.3% in 1973.

In December, the Government and the Bundesbank took steps to stimulate the economy, including an investment bonus plan, additional Federal expenditures of $700 million and a general relaxation of the tight money policy.

The GNP in 1974 was $413.1 billion compared with $343.4 billion in 1973, at current prices. This was equivalent to a per capita GNP of $6,658 in 1974 and $5,529 in 1973. Total exports amounted to $95.6 billion in 1974 as compared with $66.1 billion in 1973, and exports to the United States were $7.2 billion in 1974 and $5.6 billion in 1973.

Total imports in 1974 and 1973 were $74.6 billion and $53.9 billion, respectively, while imports from the United States were $5.8 billion in 1974 and $4.5 billion in 1973.

Employment and turnover figures for the mineral industry are shown in table 1. Average employment in the mineral industry was 812,000 in 1974, 2.8% below the 836,000 of 1973. Total turnover was 42% above that in 1973.

[1] Physical scientist, Division of Ferrous Metals.

## PRODUCTION AND TRADE

The index of industrial production (1970=100) for 1974 was 111.4, down 2% from 113.1 in 1973. In the mineral industry, iron and steel production showed the greatest gain, while mining, petroleum, and stone and sand all registered declines.

| Industry sector | Index of production (1970=100) | | Change (percent) |
|---|---|---|---|
| | 1973 | 1974 [p] | |
| Mining | 91.8 | 90.7 | −1 |
| Coal | 86.0 | 84.5 | −2 |
| Metal ores: | | | |
| Iron | 94.5 | 82.3 | −13 |
| Nonferrous | 97.0 | 90.9 | −6 |
| Potash and salt | 99.4 | 102.8 | +3 |
| Crude oil and natural gas | 132.8 | 135.5 | +2 |
| Iron and steel | 111.8 | 120.7 | +8 |
| Nonferrous metals | 117.4 | 118.5 | +1 |
| Petroleum, refined | 110.5 | 101.8 | −8 |
| Stone and sand | 110.9 | 100.2 | −10 |

## Table 3.—Federal Republic of Germany: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Other nonmetals, n.e.s.—Continued | | | |
| Slag, dross, and similar waste, not metal bearing: | | | |
| From iron and steel manufacture thousand tons | 1,087 | 1,612 | Netherlands 1,566. |
| Slag and ash, n.e.s do | 401 | 559 | Netherlands 474. |
| Oxides and hydroxides of strontium and barium | 3,611 | 4,013 | France 1,548; United States 1,157; Belgium-Luxembourg 676. |
| Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s | r 99,644 | 113,594 | Mainly to Netherlands. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 994 | 1,713 | Switzerland 850; Netherlands 337; Austria 131. |
| Carbon black | 76,951 | 89,260 | France 11,504; Belgium-Luxembourg 11,018; Austria 10,677. |
| Coal and briquets: | | | |
| Anthracite and bituminous thousand tons | 13,043 | 13,856 | France 5,936; Belgium-Luxembourg 3,326; Italy 2,817. |
| Briquets of anthracite and bituminous coal do | 206 | 216 | United Kingdom 89; Austria 65; Belgium-Luxembourg 28. |
| Lignite and lignite briquets do | 639 | 601 | France 237; Austria 159; Belgium-Luxembourg 74. |
| Coke and semicoke do | r 9,055 | 10,262 | Belgium-Luxembourg 3,477; France 3,137. |
| Gas, natural do | 301 | 272 | Switzerland 115; Netherlands 56; Denmark 29. |
| Helium and other rare gases | r 15,018 | 17,437 | Mainly to France. |
| Peat and briquets thousand tons | 299 | 313 | Netherlands 162; Switzerland 50; France 40. |
| Petroleum refinery products: | | | |
| Gasoline, motor spirit thousand 42-gallon barrels | 7,155 | 9,478 | Switzerland 3,924; Austria 2,131; Poland 832. |
| Kerosine, white spirit do | 8,556 | 9,657 | Ship stores 8,114. |
| Distillate fuel oil do | 15,077 | 16,516 | Switzerland 7,729; Poland 2,609; ship stores 2,240. |
| Residual fuel oil do | 24,802 | 26,180 | Ship stores 11,049; Austria 4,321; Belgium-Luxembourg 2,621. |
| Lubricants do | 2,696 | 2,592 | Belgium-Luxembourg 502; Sweden 404; United Kingdom 298. |
| Mineral jelly and wax do | 904 | 1,077 | Italy 112; Netherlands 95; Denmark 94. |
| Other do | 16,786 | 17,325 | Netherlands 4,913; France 4,881; Austria 1,490. |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons | 224 | 221 | Netherlands 98; France 54; Switzerland 13. |

r Revised. NA Not available.
1 Less than ½ unit.

## Table 4.—Federal Republic of Germany: Imports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite thousand tons | 2,330 | 2,749 | Australia 1,613; Yugoslavia 348; Sierra Leone 303. |
| Alumina | 310,612 | 374,161 | Italy 48,406; France 20,127; Guinea 18,709. |
| Aluminum hydroxide | 1,475 | 2,596 | United States 1,654; United Kingdom 349; France 272. |
| Metal including alloys: | | | |
| Scrap | 85,956 | 86,440 | Austria 22,842; Netherlands 14,038; United States 11,459. |
| Unwrought | 224,826 | 392,986 | Norway 147,628; Netherlands 48,040; France 40,540. |
| Semimanufactures | 143,793 | 162,272 | Belgium-Luxembourg 48,426; France 44,322; Netherlands 38,354. |

See footnotes at end of table.

**Table 4.—Federal Republic of Germany: Imports of mineral commodities—Continued**
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Antimony: | | | |
| Ore and concentrate | 3,326 | 3,012 | Turkey 1,200; Bolivia 1,051; Thailand 392. |
| Metal including alloys, all forms | 1,363 | 1,377 | Belgium-Luxembourg 743; People's Republic of China 346. |
| Arsenic hydroxide | 762 | 751 | France 585; Belgium-Luxembourg 105. |
| Beryllium metal including alloys, all forms ---- kilograms | 304 | 2,966 | France 2,412; United States 479. |
| Bismuth metal including alloys, all forms | r 283 | 215 | Japan 71; United Kingdom 61. |
| Cadmium metal including alloys, all forms | 1,260 | 1,249 | Belgium-Luxembourg 446; Japan 318; U.S.S.R. 202. |
| Chromium: | | | |
| Chromite | 372,045 | 508,692 | Republic of South Africa 177,030; U.S.S.R. 168,076; Mozambique 80,422. |
| Oxide and hydroxide | 2,954 | 2,556 | Netherlands 431; Yugoslavia 276; Italy 262. |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Production of primary aluminum in 1974 amounted to 689,000 tons, up 29% over production in 1973. Production of secondary aluminum remained essentially unchanged at 327,000 tons. Imports of unwrought aluminum decreased by about 16%, while exports increased by 64.5%. Apparent consumption was up 1.8%. The aluminum balance for 1974 compared with 1973 is given in the following tabulation, in thousand tons:

| | 1973 | 1974 [e] | Change (percent) |
|---|---|---|---|
| Production: | | | |
| Primary metal | 532.7 | 689 | +29.2 |
| Secondary metal [1] | 331.0 | 327 | −1 |
| Total | 863.7 | 1,016 | +17.7 |
| Imports, unwrought aluminum | +407.0 | +343 | −15.7 |
| Exports, unwrought aluminum | −106.4 | −175 | +64.5 |
| Stock changes | +8.4 | +6 | -- |
| Apparent consumption | 1,139.0 | 1,160 | +1.8 |

[e] Estimated.
[1] Excluding ingots made on toll or by other arrangements from scrap of the first processing stage.

Heavy international demand for aluminum in 1973 continued into 1974 and resulted in a depletion of stocks. Consequently, the German aluminum industry was able to operate at near capacity in spite of the general economic slowdown.

Production of semiproducts rose 6% to 820,000 tons in 1974. Exports of semiproducts increased by 41% to 152,000 tons, accounting for most of the production increase.

The foundry sector was affected by the recession in the automobile industry, and production of castings decreased by almost 6% in comparison with 1973 production.

As a result of an antipollution suit, Reynolds Aluminium Hamburg GmbH was ordered to restrict its production to two-thirds of its 100,000-ton capacity until late 1975.

**Copper.**—Mine production of copper (recoverable copper content) in 1974 was 1,734 tons, up 20.8% from 1973 production. Smelter production was 258,611 tons, a decrease of 18% from that of 1973, and production of refined copper increased 4.2% over 1973 production to 423,600 tons. Consumption of refined copper declined slightly from 1973 consumption to a total of 723,800 tons.

**Iron Ore.**—Production of iron ore and concentrate, after showing an increase in 1973, resumed the downward trend of previous years and decreased 12.4% to 4.4 million tons in 1974. Iron content, which averaged 32%, was equivalent to 1.4 million tons.

In terms of iron content, domestic ore supplied about 4% of the iron ore requirements for pig iron production in 1974, the balance being supplied by imported ore. Iron ore imports in 1974 totaled 57.7 million tons. The three principal suppliers of iron ore to West Germany were Brazil, with 12.0 million tons, Sweden with 10.6 million tons, and Liberia with 9.7 million tons.

**Iron and Steel.**—Pig iron production, including blast furnace ferroalloys, achieved a record high of 40.2 million tons in 1974, 9.2% above 1973 production. Production of both raw and finished steel also attained record highs in 1974. Raw steel production was 53.2 million tons, 7.5% above the previous high of last year, while finished steel production was 39.6 million tons, up 7.9% from 1973. West Germany continued as the largest steel producer in the European Communities (EC) with 34% of the total as compared with 33% in 1973. West Germany's share of world raw steel production in 1974 increased slightly to 7.5% from 7% last year. West German steel plants were operating at 88% of capacity in 1974 as compared with 84% of in 1973. The high level of production was sustained mainly through exports, which increased by 28% over that of 1973. About

37% of finished steel production was exported compared with 29% in 1973. Domestic shipments increased by about 1% in spite of a drop of 3% in domestic consumption, due mainly to decreased imports of steel. Wages and salaries increased 12%, which, combined with a slight increase in the average number of employees, raised wage and salary cost to the industry by 15%.

Of the steel produced, 68.8% came from the basic oxygen process, 17.4% from the open-hearth process, 10.8% from the electric furnace process, and 3.0% from the basic Bessemer (Thomas) process.

The total new ferrous scrap supply amounted to 28.2 million tons. Consumption was 20.9 million tons in the iron and steel industry and 4.6 million tons in the foundry industry, for a total of 25.5 million tons. Imports of ferrous scrap amounted to 1.8 million tons of which about 95% came from the EC; exports were 2.5 million tons of which about 94% was destined for EC countries.

Most West German steel producers increased their output in 1974. The leader, August Thyssen–Hütte AG (ATH) in the Ruhr area, advanced from sixth to fifth place in the list of the world's largest steel producers. ATH, which remained the second largest steel producer in the EC, after the British Steel Corp., increased its raw steel production by 9% to 17.1 million tons. The EC Commission approved the progressive acquisition of 25% of the capital of Société Lorraine et Méridionale de Laminage Continu (SOLMER), the French steel concern at Fos-sur-Mer, near Marseilles. The combined West German-Netherlands company, ESTEL N.V. Hoesch-Hoogovens, formed in 1972, produced 12.2 million tons of raw steel in 1974, about half of which was produced by the German branch, Hoesch Hüttenwerke AG. The Netherlands branch, Koninklijke Netherlandsche Hoogovens en Staalfrabrieken, N.V. (KNHS), located at IJmuiden, is planning to increase its proportion of the group's raw steel production. Its location on the coast is favorable for the use of seaborne ore and coal. The Government-owned Stahlwerke Peine-Salzgitter AG in Lower Saxony produced 5.5 million tons of raw steel, 6% above 1973 production.

The Ruhr firm of Mannesmann AG, most of whose output is in the form of pipe, produced 5.1 million tons in 1974, up 11% from 1973. Fried. Krupp Hüttenwerke AG, also located in the Ruhr Valley, increased its production by 5% to 4.5 million tons of steel in 1974. The company's capacity is being expanded to 7 million tons per year. A new, large blast furnace is being built at Krupp's Rheinhausen plant. The furnace, scheduled to begin production in 1976, will have a hearth diameter of 11.5 meters, a usable volume of 2,355 cubic meters and an annual capacity of 1.8 million tons. It is the first of three large blast furnaces planned by the firm. In July, the Government of Iran acquired a 25.04% interest in this subsidiary of Fried. Krupp GmbH. Klöckner-Werke AG increased its raw steel ouptut by 15% to 3.6 million tons, but experienced production difficulties with its large blast furnace and slab caster at the Bremen plant. Output of the firm was therefore well below capacity.

Other large steel producers in West Germany were Stahlwerke Röchling-Burbach GmbH, which had a 13% increase in raw steel production to 3.4 million tons, and Dillinger Hüttenwerke AG, which had a 14% production increase to 2.4 million tons. Both firms are located in the Saarland. Dillinger Hüttenwerke began operation of a new blast furnace, having a hearth diameter of 10 meters and a volume of 1,790 cubic meters. The furnace is equipped with two hot-blast stoves and has a capacity of 2,800 to 3,000 tons per day, which could be raised to 4,500 to 5,000 tons per day with the addition of a third stove.

The merchant pig iron producer, Duisburger Kupferhütte, recently began operation of a new blast furnace with a hearth diameter of 5.5 meters and a volume of 660 cubic meters, replacing an older furnace. Two forthcoming mergers in the West German specialty steel industry will concentrate production in two major groups. ATH will take over Edelstahlwerk Witten A.G., Witten/Ruhr, and Fried. Krupp Hüttenwerke will acquire Stahlwerke Südwestfalen AG, Hüttental-Geisweid. When these mergers, which are awaiting approval by the EC authorities, are complete, the two groups will control about 80% of West German specialty steel production.

The basic agreement for the construction of a direct-reduction steelworks in Kursk, U.S.S.R. by the West German

firms of Salzgitter AG, Korf-Stahl AG, and Fried. Krupp Hüttenwerke was signed in March 1974. The first stage of the project will involve construction of an iron-oxide pellet plant with a capacity of 3.5 million to 4 million tons per year, a direct-reduction plant having a capacity of about 2.5 million tons per year, an electric furnace shop and continuous casting facilities, and a rolling mill. Negotiations on the second phase are to take place in 1976. There is provision for long-term deliveries of prereduced pellets and semifinished steel to West Germany.

Foreign trade in iron and steel for principal categories, in million tons, was as follows:

| | 1973 | 1974 p |
|---|---|---|
| Exports: | | |
| Ferrous scrap | 2.3 | 2.5 |
| Pig iron and ferroalloys | 1.2 | 1.4 |
| Semifinished steel, including coils | 2.6 | 2.6 |
| Finished rolled and forged steel | 13.3 | 17.6 |
| Imports: | | |
| Ferrous scrap | 1.5 | 1.8 |
| Pig iron and ferroalloys | .4 | .3 |
| Semifinished steel, including coils | 2.3 | 2.0 |
| Finished rolled and forged steel | 7.8 | 6.2 |

p Preliminary.

Iron and steel trade with the United States, in thousand tons, was as follows:

| | 1973 | 1974 p |
|---|---|---|
| Exports to United States: | | |
| Pig iron, ferroalloys, scrap | 3 | 5 |
| Ingots and semifinished steel | -- | 4 |
| Coils | 313 | 235 |
| Finished hot-rolled and forged steel | 1,615 | 1,646 |
| Imports from United States: | | |
| Pig iron, ferroalloys, scrap | 17 | 8 |
| Ingots and semifinished steel | 41 | 11 |
| Coils | 22 | .5 |
| Finished hot-rolled and forged steel | 27 | 13 |

p Preliminary.

[1] Data may not add to totals shown because of independent rounding.

**Lead and Zinc.**—Mine output of lead (lead content of ore) in 1974 was 30,500 tons, down 12.5% from 1973 production. Mine production of zinc (zinc content of ore) was 116,000 tons, 5.6% below that of the previous year. Smelter production of lead consisted of 116,000 tons of primary and 205,000 tons of secondary lead for a total of 321,000 tons, which was 5.9% above the 1973 total of 303,000 tons. Production of slab zinc amounted to 400,000 tons compared with 395,000 tons in 1973, an increase of 1.3%.

**Uranium.**—West Germany now has 11 nuclear power stations in commission, with a total capacity of over 3,200 megawatts. There are also 13 other nuclear power stations under construction or on order. By 1980, nuclear power generating capacity should approximate 20,000 megawatts and should provide about 25% of all power needs.

In July the first 1,200-megawatt section of the Biblis nuclear power station near Worms in the Upper Rhineland went into operation. In August another smaller reactor at Niederaibach, Bavaria, was shutdown because performance had not measured up to expectations.

The two leading West German utilities, Rheinisch-Westfälisches Elektrizitätswerk AG (RWE) and Energie Versorgung Schwaben (EVS) have placed orders for 250,000 to 300,000 separative work units of enriched uranium from the Eurodif gaseous diffusion plant when it comes onstream in 1981. Eurodif is a joint project of France, Italy, Spain, and Belgium with a planned annual output of 9 million separative work units.

## NONMETALS

**Cement.**—Reduction in building activity led to a 13.8% decline in production of hydraulic cement to 36 million tons in 1974 from 41.0 million tons in 1973. Per capita consumption fell from 640 to 551 kilograms. Despite an increase in exports by 570,000 tons, a decline in domestic sales resulted in an overall reduction in sales of 14.3%.

Although 21 kilns were taken out of production during the year, the addition of 6 new gas- or oil-fired kilns by the industry resulted in an increase in capacity of 2 million tons, for a total capacity of 47 million tons.

**Fertilizers.**—The potash industry of West Germany is dominated by two producers, Kali und Salz AG with 90% of the output and Kali-Chemie AG with the remaining 10%. Production and sales of potash continued to grow gradually in 1974. The production of marketable potash exceeded 2.6 million tons $K_2O$ content, an increase of 3% over that of 1973. Available production capacity was utilized at an average rate of 88% as compared with 85% in 1973. Potassium chloride (muriate of potash) containing a minimum of 60% $K_2O$ accounted for 57% of total potash production. Potassium chloride with a $K_2O$ content between 50% and 59% represented 17% of the total output, and that with a $K_2O$ content less than 50% accounted for 13% of the total. The remaining 13% of output consisted of potassium sulfate or potassium magnesium sulfate.

Exports of potash accounted for 48% of the industry's production amounting to 1.3 million tons, or 4% above that of 1973. Western Europe continued to take the bulk of the exports, while exports to the United States reached 23,000 tons, up 28% from that of 1973. Exports also went to Eastern Europe, Brazil, Japan, and the Republic of South Africa.

Imports of potash remained insignificant, because of West Germany's large domestic resources.

Potash consumption from domestic production reached 1.4 million tons of $K_2O$ in 1974, about 50,000 tons more than in 1973. More than 90% of this consumption was used as fertilizers, with the remainder being consumed in chemical and related industries.

**Fluorspar.**—Fluorspar production in 1974 declined by 10.9% to 82,000 tons from 92,000 tons in 1973. Imports of fluorspar increased 37% to 285,000 tons in 1974. Spain and Italy remained the major suppliers with 56,000 and 28,000 tons, respectively.

**Sulfur.**—Recovery of sulfur from raw, sour natural gas from the deep wells in Lower Saxony has brought about a considerable increase in West German sulfur production in recent years. Production of sulfur increased 25% to 416,000 tons in 1974 from 333,000 tons in 1973, and 219,000 tons in 1972. It is expected that production of sulfur from this source will continue to increase in the next few years.

Imports of sulfur (including sublimed, precipitated, and colloidal sulfur) decreased 3.8% to 472,065 tons in 1974, whereas exports increased sharply by 103% to 144,282 tons.

The first of two 245,000-ton-per-year sulfur recovery plants at Grossenkneten, Lower Saxony, began operation at the end of 1973, and a second unit was scheduled to go onstream at the end of 1974. Both plants are operated by Gewerkschaft Brigitta und Elwerath Betriebsführungsgesellschaft GmbH, 66.6% owned by Gewerkschaft Brigitta and 33.3% by Mobil AG.

The 130,000-ton-per-year spent acid regeneration plant designed and constructed by Lurgi for Badische Anilin und Soda Fabrik AG (BASF) is now operational. This is the first such facility to be operated by BASF.

Farbwerk Hoechst AG is converting its sulfuric acid plant at Frankfurt-Hoechst from a pyrite to an elemental sulfur operation. One unit will be converted to use elemental sulfur and its capacity will be raised from 210,000 to 340,000 tons per year; a second pyrite-based unit with a capacity of 130,000 tons per year will be shutdown.

## MINERAL FUELS

As a result of the oil crisis of 1973–74, and the resultant changes in world energy markets, the West German Government, in October 1974, issued a revision of its energy policy, originally issued in September 1973. The projected annual growth rate of energy demand up to 1985 was revised downward from 4.3% to 3.2%. In terms of standard coal equivalents (SCE) the projection for 1980 was reduced by 7% from 510 million to 475 million tons, and for 1985, it was reduced by 9% from 610 million to 555 million tons. The new estimates were based on the assumptions of a lower economic growth rate and a more rational utilization of energy resources. Most of the reductions in projected energy demand were made in petroleum consumption, and greater emphasis was placed on coal and natural gas, while lignite and nuclear energy remained essentially constant as shown in the following tabulation:

| | Percent of total energy requirements | | | |
|---|---|---|---|---|
| | 1980 | | 1985 | |
| | 1973 program | 1974 revised program | 1973 program | 1974 revised program |
| Petroleum | 54 | 47 | 54 | 44 |
| Coal | 11 | 17 | 8 | 14 |
| Lignite | 8 | 7 | 6 | 7 |
| Natural gas | 16 | 18 | 15 | 18 |
| Nuclear | 9 | 9 | 15 | 15 |
| Other | 2 | 2 | 2 | 2 |
| Total | 100 | 100 | 100 | 100 |

When the program was announced, the West German Government stated that it went beyond a pure probability estimate and that it represented an orientation aid for the energy policy of the Government and for decisions by industry.

The percentage of energy requirements supplied by various sources in 1973 and 1974 was as follows:

| Energy source | Percentage of total primary energy consumption | |
|---|---|---|
| | 1973 | 1974 |
| Anthracite and bituminous coal | 22.2 | 22.6 |
| Lignite and brown coal | 8.7 | 9.6 |
| Petroleum | 55.2 | 51.5 |
| Natural gas | 10.2 | 12.7 |
| Hydroelectric power | 2.2 | 2.0 |
| Nuclear energy | 1.0 | 1.1 |
| Firewood, peat and other | .5 | .5 |
| Total | 100.0 | 100.0 |

Source: Statistik der Kohlenwirtschaft e.V. Der Kohlenbergbau in der Energiewirtschaft der Bundesrepublik im Jahre 1974. Essen, 1975, p. 103.

Total domestic energy consumption fell by 3.1% during the year, from 378.6 SCE in 1973 to 367 SCE in 1974. The two principal factors contributing to this decline were the general recession in the economy and a sharp drop in the consumption of petroleum.

**Coal and Lignite.**—Coal production (anthracite and bituminous) declined by 2.5% to 94.9 million tons in 1974, continuing the downward trend begun in 1964. Coal mine employment also decreased, falling to 202.8 million persons, or 3.6% below that of 1973. Output per man-shift fell by 2.1% to 3,275 kilograms.

Under the new energy program, production of coal is to be maintained at 94 million tons per year up to 1980, as compared with the goal in the 1973 program of 83 million tons in 1978. Sales are expected to account for less than 90 million tons per year; the balance of production is to go into a reserve provided for possible future energy shortages. A reserve of 10 million tons, to be financed from public funds, will be established.

Stocks of coal declined from 19 million tons in September 1973 to 4.8 million tons at the end of September 1974. These stocks were used to supply the energy needs of the EC as well as West Germany during the oil crisis. Under the revised program, sales of coal to the electric power industry are to be set at an average of 33 million tons annually, as compared with the 1973 plan, which provided for 30 million tons annually.

Requirements for coking coal for the steel industry are estimated to be 25 million tons to 1980, of which 22 million tons will be supplied by domestic production and 3 million tons will be imported. Importation of coking coal has heretofore been prohibited. Subsidies will continue on domestic coking coal.

Imports of coal during 1974 totaled 5.8 million tons, a decrease of 1.2 million tons or 16.9% less than the 7.0 million tons imported during 1973. Imports of coal from other EC nations during 1974 were less than half of those of 1973, falling from 3.1 million to 1.5 million tons. Poland remained the major source of imported coal, increasing the amount supplied in 1974 by 7.8% to 1.9 million tons, or 33.1% of the total imported during 1974. The United States was the second largest supplier of coal to West Germany, shipping 1.4 million tons, or 24.5% of total imports, and 7.6% over the amount shipped in 1973.

Coke imports totaled 1.3 million tons in 1974, slightly more than in 1973.

Coal exports during 1974 were 17.4 million tons, an increase of 3.6 million tons, or 25.9% above 1973 exports. Exports to EC countries increased 19.9% to 15.9 million tons in 1974, compared with 13.3 million tons in 1973. Most of the coal exported, 91.4%, went to other EC nations.

Exports of coke in 1974 totaled 13.1 million tons, an increase of 2.8 million tons, or 27.5% more than the 10.3 million

tons exported during 1973. The principal market for coke exports was the other EC nations, which received 63.1% of the total in 1974, compared with 71.2% in 1973.

The firm of Ruhrkohle AG (RAG), which was formed in 1968 through the consolidation of 26 coal mining companies, made much progress in recovering from the poor financial condition it had been in since its founding. The firm, which produces three-fourths of West Germany's coal, lost about $570 million between 1968 and 1973 but sustained no further losses in 1974. The improved financial condition of RAG was brought about primarily as a result of the better competitive position of West German coal resulting from the international energy crisis together with a strong worldwide demand for metallurgical coal.

RAG has also constructed a coal gasification and liquefaction research center in the Ruhr area and is planning to join Gulf Energy and Mineral Corp. in a coal oil pilot project in the State of Washington. The company has also acquired Appalachian Resources Co. of Oak Hill, West Virginia, which operates five coal mines in West Virginia and Kentucky. The latter is expected to export about 500,000 tons of coal to West Germany in 1975.

Production of lignite in West Germany in 1974 amounted to 126 million tons, 6% above 1973 production. The firm of Rheinische Braunkohlenwerke AG (Rheinbraun) of Cologne produced 86.5% of this total, or 109 million tons. In 1974 about 67,000 million kilowatt-hours of electricty were generated from Rheinbraun lignite, 10.5% more than in 1973. Lignite briquet production fell to approximately 6.3 million tons, a decrease of 2.5% over 1973. In 1974, lignite accounted for 21% of primary energy production and 37% of all public electricity generation. It is planned to increase lignite-fired power station capacity from the present 11,800 megawatts to 14,000 megawatts by 1976. New open pit mines are planned, and extensive research is being conducted on production of gas from lignite.

Imports of lignite increased to 1.3 million tons in 1974 from 1.2 million tons in 1973.

**Petroleum and Natural Gas.**—As a result of depletion of domestic deposits, crude oil production continued to decline, decreasing 6% below the 1973 amount to 6.2 million tons. Refining capacity increased from 139.5 million to 147 million tons per year, but utilization of capacity fell from 83.4% to 72.9% in 1974. Refinery throughput decreased by 8% from 116.5 million tons in 1973 to 107.3 million tons in 1974.

Domestic consumption of petroleum products decreased 10.5% to 120.4 million tons from 134.6 million tons in 1973. Crude oil imports decreased 7.2% from 110.5 million tons in 1973 to 102.5 million tons in 1974. Saudi Arabia was the largest supplier with 24.4%, followed by Libya with 16.3% and Iran with 13.0%. Of the total, 56.0% originated in the Middle East, 39.0% in Africa, 3.0% in the U.S.S.R., and 2.0% in Latin America. The distribution of imports of crude oil by country of origin, in thousand tons follow:

| Country | 1973 | 1974 |
|---|---|---|
| Saudi Arabia | 25,283 | 25,080 |
| Libya | 25,649 | 16,719 |
| Iran | 14,122 | 13,352 |

At the end of the year, stocks of crude oil were 10.1 million tons, 29.4% above those of 1973; stocks of gasoline, 2.2 million tons; stocks of middle distillates, 11.2 million tons; and stocks of heavy fuel oil 3.6 million tons. West German refinery output of finished products was for 1973-74 in thousand tons follow:

| | 1973 | 1974 |
|---|---|---|
| Refinery, heating, and town gas | 4,488 | 4,096 |
| Ethylene, propylene, butadiene, butylene | 1,444 | 1,700 |
| Other LPG | 1,890 | 1,737 |
| Motor gasoline (including aviation) | 14,582 | 13,581 |
| Naphtha and spirit | 5,641 | 5,605 |
| Kerosine and jet fuel | 1,250 | 1,094 |
| Diesel oil | 10,717 | 9,756 |
| Fuel oil, light [1] | 32,386 | 29,621 |

| Total | 115,162 | 105,909 |

[1] Includes refineries' own consumption.

Plans for the merger of West Germany's two largest oil firms continued with the offer of Vereinigte Elektrizitäts und Bergwerks AG (Veba) to exchange shares of Veba stock for the 48.7% of publicly held stock in Gelsenberg AG. The West German Government holds 40% of Veba stock and a 51.3% interest in Gelsenberg. The combined company will be the largest in West Germany. Formation of the company was an important part of the West German energy program and is designed to create a company better able to compete internationally as well as in the home market in which non-German interests have an estimated 75% share.

The West German oil exploration firm, Deutsche Erdölversorgungsgesellschaft mbH (Deminex), had participation and exploration agreements covering 270,000 square kilometers, of which about 40% was offshore. The area included exploration projects in the British section of the North Sea, the Gulf of Suez, the coast of Trinidad and Tobago, and off the coasts of Guyana, Nigeria, Burma, and Indonesia. Most of the projects are in the form of consortia with international partners. A total of 20 exploration wells have been drilled with the greatest number off the coast of Nigeria. Gas has been discovered off the coasts of Nigeria and Trinidad and Tobago but has not yet been proved to be present in commercial amounts.

Deutsche Shell A.G. acquired three concessions off the west coast of Portugal in a joint effort with a Portuguese firm, and also acquired exploration concessions from the Government of Yemen in the Red Sea. Activity was resumed in the German area of the North Sea with the sinking of two new wells, one of which yielded natural gas but which has not yet been determined to be commercial.

Onshore drilling activities were expanded during the year, and a total of 160,000 meters were drilled, yielding new natural gas finds. A new natural gas region near Uelzen, Lower Saxony, will be exploited in 1975–76 with an annual production of 800 million cubic meters. A pipeline network will be built to supply the Hanover-Brunswick area with natural gas from Uelzen.

A new refinery is under construction by Mobil at Wilhelmshaven, which will come onstream in 1975 with a capacity of 160,000 barrels per day.

Approval was given for expansion of the Elf Mineralöl GmbH's refinery at Speyer, Rhineland-Palatinate, and Fina-Total's refinery at Duisberg. Veba officially postponed construction of their new refinery at Orsoy, North Rhine-Westphalia, and Shell postponed its refinery expansion at Ingolstadt, Bavaria.

Production of natural gas increased 5.8% from 18.9 billion cubic meters in 1973 to 20.0 billion cubic meters in 1974. The principal source of the increased domestic gas output continued to be the Schlochteren Field in the Ems estuary. West German gas production from this source amounted to 4,100 million cubic meters, or 36% more than in 1973. In 1974, natural gas consumption increased to 40,800 million cubic meters, of which 20,500 million cubic meters were imported from the Netherlands and the Soviet Union. Future supplies of natural gas are projected from the Norwegian Ekofisk Field in the North Sea through a pipeline to Emden and from

Iran via a pipeline through the Soviet Union. In August 1974, another contract was concluded with the Soviet Union providing for the delivery of an additional 2.5 billion cubic meters annually to be delivered to West Germany by 1980.

Negotiations with Algeria for liquefied natural gas to be supplied beginning in 1978 were temporarily discontinued. Ruhrgas AG completed a 300-mile section of a natural gas pipeline between Aachen near the Netherlands border and Rheinfelden near the northern border of Switzerland.

In addition to renewed drilling activity in the North Sea area, exploratory drilling in Miesbach, Bavaria, and Velpke/Asse, Lower Saxony, has been initiated.

**Table 11.—Federal Republic of Germany: Petroleum and natural gas production by area**

| Area | 1973 | 1974 |
|---|---|---|
| | Petroleum (thousand tons) | |
| Schleswig-Holstein | 653 | 548 |

# The Mineral Industry of Ghana

By Janice L. W. Jolly [1]

The 1974 mineral output of Ghana consisted primarily of bauxite, gold, diamond, manganese, cement, and salt, and refined petroleum. Although the world diamond market took a downturn, Ghana's diamond production increased over that of 1973 mainly because of increased production by independent licensed diggers. Overall gold production was down by 22%, but the high price of gold on the free market allowed continued mine expansion aimed at increasing lower grade ore tonnage. Manganese production also dropped by 21% in 1974 as compared with 1973. The Nsuta manganese mine, at one time considered one of the largest manganese mines in the world, was reported as having only a short life left. Ghana joined the International Bauxite Association (IBA) and participated in the higher bauxite levies that were setup by the IBA in 1974.

The cumulative trade surplus during the first 6 months of 1974 fell by 73% compared with that during the same period in 1973. By December 1974, the balance of payments reportedly showed a deficit of $19.4 million.[2] Reported causes for the deficit were: A sharp reduction in world prices for some of Ghana's principal export items such as timber; a quadrupling of imported crude oil prices; and inflated prices for imported fertilizers and capital equipment. Oil imports accounted for about one-third of Ghana's import bill. To combat excessive imports, subsidies were removed from certain food items once considered essential but now considered as foreign food. Increases in wages and government salaries occurred simultaneously to counter inflation. All unutilized import licenses were cut in half for the last half of 1974, which was looked upon as a step to conserve foreign exchange.

Increased attention was given to further geological surveys and the exploitation of Ghana's mineral wealth such as the Kibi and Nyinahin bauxite deposits. A new fund, under the control of the Commissioner for Land and Minerals Resources, was set up in 1974 for mineral exploration and development. The fund is to be financed out of a levy on gold exports imposed on mining companies, including the state-owned Gold Mining Corporation (GMC). In the year 1973/74, exports of gold attracted a special levy. Each exporter of gold, for the first 100,000 troy ounces, was exempt from the levy, but for every ounce beyond this, a levy of $2.78 was charged.[3] Record setting revenues were derived from mineral duties, royalty payments, and levies and taxes from gold mining ventures in 1974.

The 1974–75 budget was presented on August 23, 1974, and was aimed at an expenditure of $481.9 million. Most items were increased. Development projects were allocated $214 million. Several sources of revenue were being increased including income tax. GMC was allotted $1.22 million in the 1974–75 budget for importing new equipment and exploratory activities.

The United States agreed to a long-term $19 million loan to finance the cost of machinery, equipment, and other priority items for various development projects. The loan is to be repaid in 40 years, including a 10-year moratorium. Interest is 3% for 30 years and 2% during the 10-year moratorium period. The International Development Association (IDA)

[1] Physical scientist, Division of Ferrous Metals.
[2] Where necessary, values have been converted from the Ghana new cedi (N¢) to U.S. dollars at the rate of N¢1.00=US$0.87.
[3] Barclays International Review (London). Ghana. October 1973, p. 21.

issued a credit of $10.4 million towards a total $44.7 million needed for water supply projects around the Accra-Tema metropolitan area. The United Nations Development Program (UNDP) and the Ghana Government were to undertake a $3.5 million water supply and environmental health project to solve rural water and sanitation problems. Ghana also signed the first of four agreements with the UNDP under which the UNDP will assist the GMC in the exploration of new gold deposits. Investment in the program amounts to $3.9 million.[4] The UNDP will also undertake geological investigation of known gold-bearing areas in the Western Region located north of Prestea.

A fertilizer plant, estimated to cost about $870,000 was planned for either Tema or Takoradi. It would be a joint venture of the Ministry of Agriculture, the National Investment Bank, the Agricultural Development Bank, and a foreign company. Initially it will be fed with imported raw materials until the extent of the phosphatic deposits located near the Ghana-Togo border has been determined.[5]

Canada was reportedly investing $3 million in a hydraulic project as a joint venture with Ghana. Canadian consultants were conducting feasibility studies for construction of a dam at Kpong, about 10 miles downstream from the Akosombo dam, and were expected to complete the study in December 1974. The Volta River Authority also intends to reactivate the Bui Dam project. Estimated construction costs for Kpong and Bui are $89.3 million and $146.1 million, respectively. Installed capacity at Kpong is expected to be 200 megawatts, and at Bui, 300 megawatts, and would satisfy Ghana's electrical needs through 1995. The capacity of the Akosombo plant is 912 megawatts of electricity.

Bulgaria is to provide doctors and geologists to work in Ghana under an agreement for scientific, technical, and cultural cooperation in irrigation, geological survey, animal husbandry, and construction of an Olympic sports complex. Other possible joint projects with Bulgaria included the production of caustic soda and fertilizers. Poland and Ghana also signed a new trade agreement, superseding the 1967 agreement. Agricultural items, manganese, bauxite and alumina, and diamonds will be exported to Poland. The German Democratic Republic was expected to increase trade with Ghana. They hoped to import crops worth an estimated $5 million in 1974. Romania also has a bilateral trade agreement with Ghana. The second economic and trade exhibition of the People's Republic of China (PRC) was held in Ghana. The first was held in 1961.

The steelworks division of Ghana Industrial Holding Corp. at Tema was to start large-scale production of spare parts for various types of vehicles and agricultural machinery. The Government has allotted about $2 million for expansion of the foundry to carry out the project. Rehabilitation of the plant and the foundry would help the division to produce about 30,000 tons of steel rods in an effort to meet the local demand.

## PRODUCTION AND TRADE

Mineral commodity production, excluding petroleum refinery products, was valued at an estimated $255 million in 1974 compared with an estimated $182 million in 1973. In 1974, 2.6 million carats of diamonds were produced, up 10.8% over 1973 production. Ghana Consolidated Diamonds Ltd. (GCDL), produced 2.4 million carats, or 93.6% of the total. Independent African miners produced 164,000 carats, up 215% from the 52,000 carats officially recorded in 1973. Ghana exports diamonds to the United Kingdom, the Netherlands, and Belgium-Luxembourg. The total gold produced for the first 6 months of 1974 was 316,923 troy ounces, and overall production for the year was down compared with that of 1973. The United States is Ghana's leading supplier of lube oils, and the U.S.S.R. and Nigeria have been chief sources of crude oil for the past few years. The Tema refinery has a 25,000-barrel-per-day capacity and is owned and operated by the Ghanaian Italian Petroleum Co. Ltd. (GHAIP). In March 1974, the sales tax on gasoline, fuel oil, diesel, and marine oil was abolished in an effort to minimize the effect of price increases. Aluminum ingots and billets produced by the Volta Aluminium Co. Ltd. (Valco) smelter at Tema were exported mainly to the United Kingdom and the United States.

## COMMODITY REVIEW

### METALS

**Aluminum.**—A small semifabricating plant, Ghana Aluminium Products Ltd., located at Tema is owned 60% by Alcan Aluminium Ltd. of Canada and 40% by the Ghana Government. It is a sheet-rolling mill with corrugating equipment and a 9,000-ton-per-year capacity of sheet and strip, including corrugated roofing sheet. Ghana Pioneer Aluminium Co., Tema, produces hollowware and other fabricated products.

The Valco smelter started production in November 1966 and has a capacity of 150,000 tons. Valco obtains alumina outside Ghana at present, but under the terms of the 1961 Master Agreement, Valco is allowed to use imported alumina up to 1977, after which mild penalties may be applied if local bauxite is not utilized.[6] Kaiser Aluminum and Chemical Corp. of the United States, which owns 90% of Valco, planned a $60 million expansion to the smelter, raising the capacity to 192,000 tons. The contract was awarded to Kaiser Engineers. Valco was awarded the Overseas Private Investment Corp. (OPIC) Development Award in 1974 for its contribution and continued maintenance of services to Ghana since the company's beginning. Valco provides jobs for more than 2,000 Ghanaians.

A 10-man engineering team, lead by Mitsubishi Chemical Industries Ltd. of Japan, was undertaking a feasibility study to construct an aluminum smelter in the Volta River region. The planned smelter would be contingent on the possibility of developing sufficient new power sources, and the feasibility of mining the Kibi deposits.

The Ghana Government concluded an agreement on October 29, 1974, with the British Aluminium Co., Ltd. (BAC) under which a new company, owned 55% by the Government and called Ghana Bauxite Co. Ltd. (GBC), was formed. GBC will take over BAC operations at Ghana's only operating bauxite mine near Awaso. The mine has estimated reserves of 18 million tons of 50% and 14 million tons of 55% $Al_2O_3$.

The bauxite deposits of Kibi, with reserves of 88 million tons and a potential for 150 million tons with an average 45% bauxite and 2.95% silica, were still being investigated. The Bauxite Alumina Study Co. Ltd. (Bascol), was expected to finish the bauxite reserve evaluation in July 1975. An estimated $240 million is needed for development, including construction of railway lines and provision of water and electricity for the project. An annual production of 600,000 tons of alumina is planned when the project starts operation. Valco holds 50% and Ardeco (a consortium owned 70% by Japan's five primary aluminum producers and 30% by the Ghana Government) holds a 20% share of Bascol. The remaining 30% interest in Bascol dropped by Reynolds Metals Company in 1972 had reportedly not been taken up.[7] Bauxite deposits also occur at Nyinahin, where an estimated 200 million tons are proven with 50% bauxite and 3.1% silica with a further potential for 450 million tons.

**Gold.**—Gold from the Gold Coast was first recorded in 1471 when Portuguese traded gold dust at the mouth of the Pra River. Most of the ancient mining in Ghana was alluvial, but most modern mining is in lode deposits. Operating mines are located in the Ashanti region near Obuasi and Konongo, and in the Western region at Tarkwa, Prestea, Bogoso and Bibiani. Several smaller locations in various parts of Ghana[8] are no longer operated. Approximately 75% of the gold is presently extracted from gold-bearing quartz veins 20% from auriferous conglomerates, and 5% from alluvial gold deposits. The lode mines are of two types: (1) Quartz reefs (like the Ashanti Goldfields mine) occurring in steeply dipping Precambrian greenstones (Birrimian Series) and (2) the banket reefs (like the Tarkwa mines) occurring in an arenaceous rock (Tarkwaian Series) also of Precambrian age. The banket mines of Tarkwa are located mostly along the east limb of a geosyncline that trends about 150 miles northeast from the coast at Axim to Konongo. With the recent acquisition of 55% of the Ashanti Goldfields, all princi-

[6] Engineering and Mining Journal. Mining Activity Digest. Ghana. V. 1, No. 5, Oct. 7, 1974, p. 8.
[7] American Metal Market (New York). Japanese Study Ghana Smelter Plan. V. 81, No. 99, May 21, 1974, p. 8.
[8] Occurrences of Economic Minerals in Ghana. Geological Survey of Ghana, Accra, Ghana, Bull. No. 28, pp. 21–42, 1962.

pal gold-mining companies were controlled by the GMC.

With the average price of gold ranging between $195 and $116 per troy ounce on the London Metal Exchange in 1974, the Ghana Government earned record revenues and profits from its joint venture with Ashanti Goldfields. In the first 6 months of 1974, the Ghana Government earned more than $24 million with $4.8 million from dividends for its 55% share and over $19.6 million in mineral duties, royalties, levies, and taxes.[9]

Ashanti Goldfields reserves on June 30, 1973 were reported at 5.2 million tons with an average gold content of 0.69 troy ounces per ton. The Ashanti ore body is an irregular system of quartz veins with lenticular reefs in graphitic phyllite. The ore is either fine-grained free gold or associated with pyrite and arsenopyrite. The mine has seven shafts and had an operation depth of 3,609 feet in 1973. The cutoff grade was 8.5 grams per ton. An expansion program to include larger tonnages of lower grade ore was being continued in 1974. Tarkwa Goldfields mines reserves were reported at 475,000 tons averaging 0.37 troy ounces of gold per ton.

GMC was rehabilitating its mines at Tarkwa and Prestea in 1973 under a 4-year development program, including prospecting for new reserves. The Government allotted $1.2 million in the 1974–75 budget for exploration and equipment. GMC was to order two gold dredges incorporating the latest techniques for dredging both gold and diamonds in gravels for use in the Dunkwa area. Under a $3.9 million gold exploration program, the UNDP will investigate the region north of Prestea in western Ghana.

**Iron.**—In the past few years, there has been a renewed interest in the iron ore deposits of northern Ghana (discovered in 1928) and western Ghana (discovered in 1963). Feasibility studies were being done in the Opon-Mansi area by the West German company Friedr. Krupp Hüttenwerke AG. They will form a joint mining venture with the Ghana National Investment Bank if the deposits prove viable to mine. A six-man Bulgarian economic delegation will also evaluate iron ore at Shieni and Opon Mansi as part of the technical and scientific cooperation program to be undertaken in 1974–75. Establishment of an iron and steel complex in conjunction with development of Opon Mansi was also being considered.

The Shieni deposits near Yendi in the Northern Region consist of siliceous hematite covering about 32 square miles. Reserves are estimated at 270 million tons with iron content varying from about 29% to 53%. Silica is about 30%, sulfur 0.018%, and phosphorus 0.04%. The ores are reportedly amenable to gravity concentration to obtain an average 56.7% iron.[10] The Western Region deposits are lateritic and are estimated at 150 million tons with a potential for 205 million tons, are 10 to 90 feet thick, and cover the tops of hills in the Opon-Mansi area. Iron content is estimated at 41%, silica at 3%, alumina at 14%, and phosphate at 0.9%. A third deposit of titaniferous magnetite occurring at Pudo in the Upper Region is estimated at 4.5 million tons.

**Manganese.**—The Ghana Government assumed control of the Nsuta mine in a settlement reached with Union Carbide. The mine reportedly has only a short life left.

## NONMETALS

**Clays.**—A $35,000 brick factory at Asokwa was opened late in 1973 as an example of self-help from local materials by local labor giving employment to inhabitants of the surrounding area.

**Diamond.**—The two principal diamond mining areas, Birim River Basin (Eastern Region) and Bonsa River near Tarkwa (Western Region) have averaged a production of 2.7 million carats per year since 1960. Production has never again reached the peak production years of 3.2 million carats achieved through 1962, the last year of a free diamond market in Ghana. Since 1967, an average of 2.5 million carats have been produced. Although diamond production in 1974 increased over that of 1973, it still remained within the average of the past 7 years. The increase over 1973 was mainly due to a 215% increase in diamonds recovered by independent African miners, representing a difference between the 2 years of 112,000 carats. This may be an indication that steps taken towards containing smuggling have been somewhat successful.

[9] Barclays International Review (London). Ghana. July 1974, p. 17.
[10] Page 43 of work cited in footnote 8.

Cayco (Ghana) Ltd., GCDL, Dunkwa Goldfields, and about 60 licensed individual diggers were mining diamonds in 1974. Dunkwa Goldfields, principally a gold mining concern, obtains gem quality stones (2 to 4 carats) during dredging on the Jimi River in the Ashanti region. Gem-quality stones are also found in the Bonsa Valley, but are usually too small for commercial purposes. About 90% of the diamonds mined in Ghana are industrial grade. GCDL, in which the Government holds a controlling (55%) interest produced 93.6% of the total diamonds mined. The plant capacity will handle 2.5 million carats per year. Amalgamated Diamond Corporation ceased production late in 1973; and Cayco (Ghana) Ltd. production has decreased significantly since 1968. The company reportedly may soon be liquidated. Both concessions are located in the Birim Basin. A New York company, First International Natura Corp., with substantial American backing was negotiating for mining rights in a 24.56-square-mile area near the confluence of the Birim and Pra Rivers. The Government will take 55% of the project. Preliminary prospecting was completed.

The Diamond Marketing Corp. (DMC) grades, values, and processes diamonds as well as buys all those won locally. All companies except GCDL sell directly to DMC, and GCDL sells through DMC. Under a marketing arrangement started in 1968, licensed dealers must bid on "reserved prices" set by GCDL and the DMC. DMC sells diamonds abroad with assistance of Consolidated African Selection Trust Limited (CAST) in London.[11] CAST owns 45% of GCDL.

**Limestone and Granite.**—Chinese experts surveyed the Nauli limestone deposits, where there is an estimated 400 million tons of limestone in addition to 1,000 million tons in the Tano River Basin. The Nauli deposits may prove uneconomical to mine as they are covered by a thick overburden and are interbedded with sulfur-rich clays. Other deposits are located in Bonga-Da in the Upper Region and Buipe in the Northern Region. Reserves at Bonga-Da are estimated at 15 million tons of first quality limestone and 20 million tons of dolomitic limestone. The Buipe deposit contains an estimated 20 million tons first quality limestone, underlain by 100 million tons of dolomitic limestone. Both Bonga-Da and Buipe are at ground level.

The most important quarry for building stone is in the Shai Mountains where granite is mined. Another large quarry was opened at Takoradi for the construction of a naval base.[12]

## MINERAL FUELS

**Petroleum.**—In 1973, several groups including the Ashland Oil Co., Texaco Ghana Petroleum Co., Ltd., and Oceanic/West Coast Petroleum Co. relinquished a total of about 5,000 square miles of concession areas, mostly offshore. Mesa Petroleum Ltd. completed the onshore seismic survey started in 1972 and found noncommercial oil shows from Dzita 1 well in Block 24 in the Keta area onshore in May 1973. The well was abandoned on October 13, 1973, at 13,448 feet in the Devonian Takoradi Formation. Mesa Petroleum Ltd. includes Volta Petroleum Co. Ltd. and Kewanee Overseas Oil Co. Ltd. In April 1974, Mayflower Petroleum Corp. (United States) sold a 5% interest in the Keta concession to Mesa, Diamond Shamrock Oil Company Limited, and Hamilton Brothers Oil and Gas Ltd. in exchange for a commitment to drill two wells; and a 8% interest in the Keta concession to Hamilton for expenditures necessary to meet the original $6 million commitment. The three partners will have earned an additional 15.5% working interest in the area when all work requirements are completed. Zapata Exploration Co. operator for the Mobil Exploration Ghana, Ltd., group, established the noncommercial potential of the offshore Cape Three Points 1 well in Block 4 that was started in November 1973. The well was drilled to 13,823 feet,[13] in fulfillment of an agreement with Mobil, Zapata, and Phillips Petroleum Co. Both Zapata and Phillips were assigned interest (30% and 50%, respectively) in Mobil's offshore blocks 3, 3A, 4, and 5. More drilling was awaiting availability of another drill rig as the drillship *Glomar V* was under a one-well contract.

A consortium consisting of Amoco Ghana Exploration Co., Signal Oil and Gas Co., and Occidental Petroleum Corp. continued

[12] Industries et Travaux D'Outre-Mer (Paris). Ghana. No. 249. (22d year). April 1974, p. 733.
[13] World Oil. Ghana. V. 179, No. 3, Aug. 15, 1974, p. 61.

prospecting in the Saltpond area. Shell Oil Co., which obtained concessions in the Volta Basin was soon to start exploration. Oil and gas exploration was among investments planned by the development group Durum Securities Corp. of New York and Sumitomo Shoji Kaisha, Ltd. (Japan). Fidesco (West Africa) Ltd., a new Ghanaian company, will cary out projects funded by the above consortium.

A new petroleum law was enacted in April 1974 that will allow all oil products distribution and storage facilities to be nationalized at will with compensation.

# The Mineral Industry of Greece

By Scott F. Sibley [1]

The economy of Greece reflected the strains of relatively high oil prices and political unrest in 1974. Economic stagnation, inflation, and balance of payment problems also contributed to the unfavorable economic situation. Real gross national product, for example, declined 2% from that of 1973, and prices climbed 13.5% compared with those of 1972.

The Consumer Price Index in 1974 exceeded that of 1973 by 27%, and the National Statistical Service wholesale price index increased 37% from 1973 to 1974. These increases were greater than those of 1973. Net private and official capital inflow increased slightly during the year. A major element of the capital account was $305 million borrowed by the Bank of Greece from foreign banks and the International Monetary Fund Oil Facility. Official assets in gold and convertible currencies declined by $112 million, and total postwar foreign indebtedness as of December 31, 1974, was estimated at $4.2 billion, 25% above the December 1973 level. The Greek Government's credit policy was designed to stimulate investment in manufacturing and exports and to aid the construction sector. However, improvements in this area were offset by Greece's perennial trade deficit, which was aggravated by relatively high petroleum prices and defense spending.

The Greek Government pursued a policy of closer relations with the European Communities (EC) during the year, and the Government expected that full integration with the EC might be achieved well in advance of the planned 1984 target date. On December 2, the Greek–EC Association Council held its first meeting since 1967, officially ending the freeze that had existed in Greek–EC relations.

Greece's new Mining Code included lignite, natural gas, sources of geothermal energy, and organic fertilizers as minerals for which the State alone has exploration and development rights. Gold and platinum were removed from this classification. In addition, acquisition of mineral research rights (directly or indirectly) or concessions, or the purchase of mineral property and shares by aliens, required prior approval of the Minister of Industry.

## PRODUCTION

Significant production gains in the Greek mineral industry were recorded in the following commodities: Lead mine output (24%); manganese crude ore (26%); nickel mine output (9%); zinc mine output (26%); barite crude ore (23%); bentonite (crude) (33%); magnesite (crude) (36%); magnesite (dead-burned) (40%); sulfur content of pyrite (16%); and pyrite (16%).

Table 1.—Greece: Production of mineral commodities—Continued
(Metric tons unless otherwise specified)

| Commodity [1] | | 1972 | 1973 | 1974 [p] |
|---|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS—Continued | | | | |
| Petroleum refinery products—Continued | | | | |
| Residual fuel oil | thousand 42-gallon barrels | 17,922 | 34,865 | 35,178 |
| Lubricants | do | 105 | 518 | 539 |
| Other | do | 4,431 | 6,510 | 9,250 |
| Refinery fuel and losses | do | 2,223 | 10,072 | 2,345 |
| Total | do | 48,809 | 86,730 | 79,207 |

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, other types of crude construction materials such as clays, sand, gravel, and stone are produced, but output is unreported and available information is inadequate to make reliable estimates of output levels. Cobalt is also produced, but output is included with nickel.
[2] Black sheet, galvanized sheet, and reinforcing bars only.
[3] Includes antimonial lead and hard lead.
[4] Nickel plus cobalt contained.

## TRADE

Preliminary Bank of Greece data indicated that during January to November 1974 total exports increased 42.5%. Imports amounted to $4,144 during the same period, about 15% over those of this period in 1974. Higher petroleum prices were largely responsible for this increase. Invisible receipts were up 8.4%, with a 48.6% increase in shipping remittances. Emigrant remittances and tourist income declined 16% and 16.9%, respectively.

The current accounts deficit totaled $1,175 million, about 2% higher than for January–November 1973. Net capital inflow increased 13.9% to $1,136 million. This was largely attributed to the borrowing of $298 million, which included $43 million of Greece's $124 million International Monetary Fund Oil Facility credit.

The recent trends in mineral trade and total commodity trade may be observed from the following tabulation:

| | Value (million dollars) | |
|---|---|---|
| | Mineral commodity trade | Total commodity trade |
| Exports: | | |
| 1971 | 150.6 | 662.5 |
| 1972 | 193.1 | 870.9 |
| 1973 | 504.4 | 1,454.1 |
| Imports: | | |
| 1971 | 330.5 | 2,098.1 |
| 1972 | 449.3 | 2,345.8 |
| 1973 | 791.1 | 3,473.1 |

In 1973 principal increases in exports of selected mineral commodities (compared with those of 1972) occurred in crude nonmetallic materials (41%); petroleum and petroleum products (1760%); manufactured fertilizer (137%); iron and steel (184%); and nonferrous metallics (28%). However, these increases were more than offset by increases in imports of metallic ore and scrap (104%); petroleum (88%); solid fuels (41%); iron and steel (69%); and nonferrous metallics (74%).

The mineral commodity trade deficit increased from $256.2 million in 1972 to $286.8 million in 1973, a 12% increase, whereas the total commodity trade deficit increased from $1,475 million in 1972 to $2,019 million in 1973, a 37% increase.

## Table 2.—Greece: Exports of mineral commodities

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| **METALS** | | | |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Production of alumina and aluminum was 494,000 tons and 148,000 tons, respectively, during the year. The refining of large amounts of bauxite ore in Greece considerably improved Greece's foreign exchange earnings from exports of the refined metal. This totaled about $100 million in 1974 for both alumina and aluminum exports.

The Mining Company of Greece, established jointly by the Bodossakis Group and Aluminium de Grèce S.A. (ADG), planned a significant exploration project which was to be funded by loans totaling $200,000 to $300,000 from the French company Péchiney Ugine Kuhlmann (PUK). ADG also planned an aluminum smelter expansion costing $8.2 million and already had underway an $8.2 million investment program to control air pollution and to improve general plant production facilities at Distomon. Included in the air pollution program was the collection of electrolysis emissions at the plant and alumina dust at the shiploading ports. In March, an agreement was reached between the Government of Greece and representatives of Péchiney on electric power rates. An agreement for a 30% increase in the contractual price of electricity sold to ADG by the Public Power Corporation (PPC) was reached.

Negotiations between the Greek Government and Aluminum Company of America (Alcoa) were deadlocked at yearend over the proposed $350 million aluminum complex to be built at Megara. The principal obstacle again was the price of electricity to be supplied by the PPC. The Greek Government appeared to be moving at yearend toward an accommodation, but no breakthrough had been announced and the PPC remained adamant on the issue of power cost.

Officials of Voxitai Elikonos S.A., were considering the construction of an alumina plant in which the National Bank of Greece and PPC would participate. Mention was also made of possible cooperation with the Soviet Union. The Voxitai Elikonos bauxite concession reportedly contained between 210 and 313 grams of gallium per ton of ore.

In February, Eleusis Bauxite Mines, Inc., of the Skalistiri Mining Group began operating a bauxite dressing plant at Loutsa, Eleusis, for the exploitation of large but low-grade bauxite deposits with a silica content over 5%. The plant's output of 250,000 tons per year of dressed ore was scheduled for export to eastern and western European countries. In addition, Eleusis Bauxite constructed a bauxite sorting and classifying plant at Agia Marina in Stylis, near Lamia, to process material from its Oiti Mountain ore deposits.

Bauxites Parnasse Mining Co., the leading producer of bauxite in Greece, planned to raise production from 2 million to 3 million tons of bauxite per year. Investment plans were aimed at increasing the company's export potential between 1975 and 1980. The plans included a 35-ton-per-hour bauxite washing facility located at Viniani, Fokis; a $1.0 to $1.5 million private access road between Itea and Viniani; installation of a third shiploading bridge at Itea; and an industrial plant for processing bauxite. The latter would involve production of alumina, with Bauxites Parnasse in partnership with a foreign firm. As part of the overall plan, Bauxites Parnasse, in cooperation with the Chase Manhattan Bank and the United States companies, National Steel Corp. and Southwire Corp., planned to establish a 600,000-ton-per-year alumina plant, with provision for doubling capacity at a later date. The plant would be located in the Parnassos area. Although 60% of the investment was to come from foreign sources, Bauxites Parnasse was to hold a 51% equity position.

The annual bauxite export quota was raised from 1,860,000 tons in 1973 to 3,085,000 tons in 1974. For 1975, the quota was fixed at 3,155,000 tons. Exports were to go to EC and Western European countries. Actual total exports of bauxite in 1973 were 1,369,364 tons, valued at $11.2 million. According to Bank of Greece data, exports of alumina and aluminum for the period January to October 1974 amounted to $84 million compared with $58.8 million during a similar period of 1973.

**Copper.**—The Hellenic Chemical Products and Fertilizers Co. Ltd. (HCPF), of the Bodossakis Group, which owned the mixed sulfides mines at Kassandra, northwest of Ierissos Bay, Chalkidiki, completed

work in the mines which would enable extraction of recently discovered cupreous (2% Cu) ore. The company expected to extract 30,000 tons of chalcopyrite ore in 1974 and use it to begin feeding its new 300,000-ton-per-year flotation plant built in the area. HCPF also owned chalcopyrite deposits (3% Cu) at Ermioni, Peloponnisos. Construction work on HCPF's 60,000-ton-per-year chalcopyrite ore concentration plant near Ermioni continued during the year and was scheduled for completion in 1975. Also, exploitation of the Skouries copper mines on the Chalkidiki Peninsula reportedly was under consideration. Another location to be developed was the sulfide ore deposit at Mavri Petra. At Olympias, an ore concentration plant was to be built, and improvements were to be made to mine approach facilities and to mining equipment. Investments totaling $15 million were to be made by HCPF.

Exploration for copper and other metals in Greece was continuing at yearend. During 1974, PUK explored in Northern Greece in the Kilkis area for copper, lead, and zinc, while Bethlehem Steel Corporation explored, mainly in the Kastoria, Florina, and border areas, for the same metals plus nickel and chromium.

**Gold and Silver.**—The Olympias ore of HCPF reportedly was rich in gold and silver, but no percentages were available. HCPF conducted feasibility studies for establishing a sulfuric acid plant, lead and zinc metallurgical operations, and facilities to separate the precious metal content of the ores.

The Canadian Masivor Corporation, in cooperation with the Greek company Greek Gold Mines, was to invest $600,000 in developing gold mines in the area of Servia, Kozani. A local corporation, valued at $170,000, was established for this purpose. The Bodossakis Group and PUK were also exploring for gold in Macedonia. In addition, the Greek Government reportedly had reserved the Aggitou River area in Macedonia for public use in exploring and developing gold deposits.

**Iron and Steel.**—Consumption of steel in Greece was about 1.2 million tons, down about 40% from that of 1973, and consumption was to remain about the same for 1975. A shortage of scrap imports was a major problem throughout 1974.

Greek shipowner Aristomenis Karageorgis planned to establish a 500,000-ton-per-year capacity steel mill in Peloponnisos. An investment of $335 million would be made, and the plans included provision for expansion of capacity to 2 million tons. The electric arc furnaces of the proposed plant would be fed with imported ferrous metal agglomerate and scrap iron. Initial production was projected to be 200,000 tons of steel pipe (over 10 centimeters in diameter) and 300,000 tons of steel sheet, shipbuilding plate, and other steel products. All products except shipbuilding plate and products necessary to meet local shortfalls would be exported. The 100% Greek-owned project would be completed within 30 months after the Government of Greece and Karageorgis reach agreement.

The No. 1 blast furnace of Halyvourgiki S.A. was shut down for relining on February 24. A total of 2,503,000 tons of iron had been produced since the furnace was first lit in June 1963. For the second campaign of the furnace, the hearth diameter was to be increased to 7 meters, which was expected to give a 15% increase in production. The furnace also was to be relined with carbon brick and other materials that were used in the first campaign.

Greek shipbuilding continued to thrive during the year, with vessels totaling about 3.5 million tons scheduled to be commissioned. The tonnage scheduled for delivery in 1975 exceeded 5 million tons. About 63% of the 24 million tons of new ships ordered by Greek-owned concerns were scheduled to be delivered during 1976 and 1977. The expansion was partly due to an increase in the number of supertankers being built as a result of the energy crisis.

The Greek Government approved a $135 million appropriation for the establishment of a ship-repairing and shipbuilding facility at Messinia in Pylos Province. The new shipyard was to have the capacity to repair or build ships of up to 500,000 deadweight tons. Included in the new unit were: (1) facilities for unballasting and mooring ships; (2) a permanent dry dock for building tankers; (3) a floating dock; and (4) three slips for building ships up to 60,000 tons. Ownership would be by a joint stock company set up by A. Karageorgis. The capital of this company was to total $14 million plus a loan of $121 million from the United States.

In May, an agreement reportedly was reached for a $15 million expansion of the

Bodossakis iron pyrites and ferrous sulfide mining complex located in Chalkidiki. The expansion was to take place over a 3-year period.

**Manganese.**—At its manganese mines near Drama, Financial Mining and Industrial Shipping Corporation (FIMISCO) of the Skalistiri Group planned to complete by yearend a plant for grinding and packing battery-grade manganese dioxide. FIMISCO raised production of dressed manganese from 6,222 tons in 1973 to 7,920 tons in 1974.

The Greek Government signed an agreement with two Japanese companies approving the establishment of a Greek company that would produce electrolytic manganese dioxide. The two companies were Tekkosha Co., Ltd., and Mitsubishi Corporation. The new $6 million company, called Greece Tekkosha, was to receive 65% of its financing from Mitsubishi. A 12,000-ton-per-year plant was to be established at Salonika, and products were to be exported to various European countries beginning in 1975.

**Nickel.**—Mine production of nickel totaled 28,522 tons in 1974. Exports of ferronickel containing 35% nickel, through midyear 1974, were valued at $30,004,000, the best since 1970 (neglecting inflation), when $24,240,000 worth of ferronickel was exported in the same period. During 1974, officials of Société Minière et Métallurgique de Larymna S.A. (LARCO) indicated that production orders would exceed production capacity and that stocks would have to be used to meet demand requirements.

A plan by LARCO to construct a 7-mile-long conveyor belt to transport ore from the mines at Euboea to shiploading facilities at Politika was abandoned. Instead, a 12-kilometer tarred road was built connecting the facilities. In addition, LARCO conducted exploration surveys for the development of newly acquired laterite mines at Vryssakia, which were expected to yield 200,000 tons of ore in 1974. The company also purchased new equipment for use at its underground mine at Agios Ioannis in Larymna in order to reduce mining costs and manpower.

Nickel-bearing iron ores reportedly were located in the Lokris Larymna area and central Euboea. Verified reserves as of September were put at 10 million tons, with indications of the existence of many times that quantity.

## NONMETALS

**Cement.**—A total of $233 million was under investment in September, which would eventually increase production of cement to 13.5 million tons per year. One private developer received Government of Greece approval to construct a 500,000-ton-per-year cement plant on the island of Crete. However, the issuing by the Government of new licenses for cement plant construction on Crete was temporarily suspended during the year. The ruling caused General Cement Co. Ltd. (AGET), Titan Cement Co., and Chalkis Cement Co. S.A., to cancel plans to jointly build a 600,000-ton-per-year plant on Crete. As a result of completion of a third 1-million-ton-per-year cement production unit at Mikro Vathy, Avlis, Chalkis Cement raised its annual production capacity to 1.7 million tons in 1974. Completion of a fourth unit of equal size was scheduled for late 1975 and would raise annual cement production capacity to 2.7 million tons. In March, the company began operation of its bag-loading system, with a loading capacity of 5,000 sacks per hour.

The Greek Concrete Co., which produced and distributed ready-mixed concrete, inaugurated operation of its concrete producing plant at Thessaloniki in February. At this time, the company also announced plans to invest $13.3 million in 16 new plants, 240 mixing trucks, and 40 mixed concrete pumping vehicles. The total production capacity of the 16 units was to be 6,000 cubic meters per day of ready-mixed concrete.

AGET was forced to delay plans to build a 1.3-million-ton, $50 million cement plant at Methana in Eastern Peloponnisos, on the Sardonic Gulf. The plant was scheduled to be operational in 1976. However, at its existing Methana facility, AGET was to install $4 million worth of Fuller Co. (U.S.) equipment. This included two Traylor finish grinding systems, each employing a 15- by 45-foot, 6,000-horsepower ball mill, all of which would bring production up to 4,000 tons per day of clinker.

In January, the 6,500-deadweight-ton bulk cement carrier *Theseus* was launched at the Japanese shipyards of Ishikawajima

Harima in Fukuoka, Japan, and was scheduled for delivery at midyear. Halyps Cement Co. S.A., was to complete it Skaramanga plant by yearend 1974. Capacity was to be increased from 460,000 to 1 million tons.

An application to build a cement plant at Aitoloakarnania was submitted to the Ministry of Industry. An investment of $15 million was to be made in a plant designed to produce 900,000 tons of cement per year, all for export. It was expected that approval would be granted, subject to strict adherence to government regulations. These included: (1) proper distance from archaeological sites, developed areas, and tourist installations; and (2) antipollution precautions. In another action, the Greek Government approved the import of $22 million in foreign funds by A. Karageorgis to invest in enlarging to 1,000,000 tons per year the capacity of the proposed new cement works to be constructed at Messinia, South Peloponnisos. The approval was received under privileges accorded by Law 2687. The Ministry of Commerce reportedly approved total exports of 1.2 million tons of cement for the year.

**Clays and Other Nonmetals.**—Silver and Baryte Ores Mining Co. S.A., of the Eliopoulos Group continued work on a $7 million investment project aimed at improving and increasing its bentonite, kaolin, perlite, and barite facilities on Milos Island by 1975. As part of the project, the following were completed: A 220,000-ton-per-year bentonite drying plant; a second jetty for loading ships, with a 700-ton-per-hour capacity; and a 25,000-ton-per-year kaolin pulverizer. The company expected to complete its new 300,000-ton-per-year capacity perlite processing plant by yearend.

**Fertilizers and Chemicals.**—HCPF expanded its Piraeous plant facilities during 1974. New additional capacity per day was to be: (1) single superphosphate fertilizers, 550 tons; (2) ammonium superphosphate fertilizers, 760 tons; (3) compound fertilizers, 150 tons; and (4) mixed fertilizers, 300 tons.

Oronzio de Nora–Impianti Electrochimici S.p.A., of Milan, Italy, was to build a new electrochlorination plant for HCPF at Piraeus. The contract reportedly covers engineering and supply of the complete plant, which was to be equipped with de Nora Seaclor, S.p.A. electrolyzers and use seawater as raw material. De Nora was also to supply the electrolyzers, a complete electrical conversion unit, and some ancillary equipment.

**Magnesite.**—Exports of magnesite earned $35.9 million in foreign exchange in 1973. FIMISCO of the Skalistiri Group obtained government approval in June to invest $14.5 million over a 5-year period for: (1) the purchase of heavy earth-moving and drilling equipment; (2) the expansion and improvement of the company's magnesite dressing plants, refractory brick plants, and dead burning installations; and (3) the erection of a flotation, calcination, and briqueting installation to exploit low-grade magnesite and wastes from which 50,000 tons per year of dead-burned magnesite would be produced.

Macedonian Magnesite Mining, Industrial, and Shipping Corporation of the Skalistiri Group was to bring its first rotary kiln at Mantoudi, Euboea, on-stream by yearend. The unit had a 50,000-ton-per-year capacity. Total production capacity of the Skalistiri Group in dead-burned magnesite was to be 330,000 tons per year by 1975.

Magnesite Mining Industrial and Commercial S.A. carried out exploration and development studies in the North Euboea area. Construction was to start in May 1975 on an ore dressing plant to process 87,500 tons per year of concentrate. Moreover, a 35,000-ton-per-year French rotary kiln was to be built for dead-burned magnesite production, starting in July 1975, and to be completed by the summer of 1976. In addition, the company was to buy $1.7 million worth of U.S. mining equipment. The Export-Import Bank was to provide $510,000 credit to help finance 30% of total equipment costs.

**Pumice.**—In April Hiotopoulos S.A. began operations at a $1.7 million pumice stone processing plant at Corinth. The unit was the first of its kind in Greece and was to process pumice stone for industrial purposes, mainly for export. The company reportedly hoped to earn $1.5 million annually from its exports.

In order to complete installation of mechanical equipment for processing pumice stone at its Gyali, Dodecanese quarries, Lava S.A. borrowed $200,000 from the Compañia Maritima Volcan of Panama.

**Silica.**—The principal glass manufacturer in Greece was HCPF, which produced con-

tainers at its Drapezona plant near Athens. Virtually all of the industrial silica sand was imported, with Belgium supplying about 60,000 tons per year and the Netherlands 10,000 tons per year.

## MINERAL FUELS

**Geothermal.**—Early in 1974, the PPC signed a contract with the Greek-French firm Hydrotechniki S.A.—Foramines S.A. to drill four 7-inch diameter boreholes to a depth of 1,000 meters each on the island of Milos. Drilling was expected to begin in April 1975 and be completed within 3 months. Officials hoped that the drilling would reveal a geothermal steamfield large enough to produce 50 megawatts of electric power. Other islands where geothermal sites existed and some exploration took place were Nisyros, Methana, Kamena Vourla, and Ikaria. Under the New Mining Code, geothermal energy resources are classified as mineral resources and as such only the State may prospect for them and exploit them.

**Peat and Lignite.**—Six new lignite burning units of 300 megawatts each were scheduled to be completed by 1983. One was to be installed at Megalopolis in Peloponnisos and the other five at the Kardia mines of Ptolemais in Northern Greece. PPC mines lignite for firing its thermal powerstations at Aliveri (40% lignite fired), and Ptolemais and Megalopolis (both 100% lignite fired). Reserves found at Aliveri in 1973 totaled 1.5 million tons of lignite, which PPC planned to start developing in 1975 and deplete within 2 or 3 years. At Megalopolis, the Horemi opencast mine (400 million tons proven reserves) was expected to be completed by May 1975. This was to feed the local thermoelectric, 300 megawatt unit at a rate of 4.5 million tons of lignite per year. The addition of a fourth unit for Megalopolis was being considered. Greek officials anticipated that development of indigenous lignite and peat reserves might increase their share of electric power generation from 35% in 1973 to 68% by 1985.

In Ptolemais, the Kardia A′ and B′ lignite-fired units were to be completed by April 1975 and were temporarily to be fed with lignite from the Main Field and Kardian mines until the South Field is developed. Development of the South Field reportedly was delayed because of protracted negotiations between the PPC and foreign manufacturers on the financial terms connected with the supply of equipment.

The PPC also planned exploitation of rich lignite deposits near the communities of Agios Loukos and Gavalas. The area of the deposits totaled 1.23 million square meters and much of it was expected to be strip mined.

A Greek Government official in September signed the Market Control Regulation which readjusted the price of lignite on the basis of thermal yield. This was the first price change since 1957. The low price previously allowed had caused a serious decline in mining operations.

Controversy continued over exploitation of the Philippi peat deposits. However, at least one delivery took place during the year as part of the Greek-Soviet agreement signed in 1973 to develop the deposits. In October, the Soviet freighter *Saliany* arrived at the port of Kavala with equipment that ENERGO-MACHEXPORT, the Soviet technical organization, was to use to construct the thermoelectric unit in the Philippi plain. Local villagers of the Pangaion area continued their opposition. Reportedly, no real progress was made during 1974 on the $89 million Philippi project, which was to include the construction of a 375-megawatt peat-burning powerstation. The Soviet organization had already been paid $17 million by the Greek Government as down payment and installment money for the supply of equipment.

**Petroleum and Natural Gas.**—The Greek Government made plans for revision of its regulations governing oil exploration and exploitation contracts. The revision reportedly would have included the provision that contracts would be awarded on the basis of international tenders at predesignated areas. About 50 applications for contracts were pending before the Government at yearend, and 30 of these were submitted in the first half of 1974. At least 15 firms were active in exploration during the year. These included: (1) Oceanic Exploration Co. of Denver in cooperation with three other companies, which were exploring an 8,509-square-kilometer tract offshore in the Thracean Sea; (2) An-Car Oil Co., Inc., of Boston, with 5,000 square kilometers offshore and onshore at Killini and on the islands of Cephalonia and Zantes; these exploration areas were in

addition to 6,500 square kilometers offshore and onshore in northeast and northwest Peloponnisos; and (3) the Anschutz Overseas Corp. of Denver, with 5,600 square kilometers onshore and offshore in the Thessaloniki Basin and Sigiticos Gulf, plus other tracts. Oceanic's fourth well, "Prinos 1", was completed in February when oil was struck at 8,500 feet. The oil flowed at a stabilized rate of 2,948 barrels per day through a ¾-inch choke. A second confirmation well was drilled and flowed at a rate of 8,000 barrels per day.

Brown and Root Co. of Houston, Tex., reportedly signed a turnkey contract with Oceanic for the engineering required for development of Oceanic's discoveries. Five platforms were to be built over a 2½-year period in the first phase at a cost of $100 million to $150 million. Production was expected to reach 50,000 barrels of oil, 1,000 tons of solid sulfur, 10,000 barrels of liquefied natural gas, and 10 million cubic feet of natural gas. If this production is achieved, it would cover about 25% of Greece's 1974 annual requirements of crude oil and all its sulfur requirements. In its second phase, Oceanic operations included exploitation of the Kavala gas find and further development of the Prinos deposit. At yearend, further negotiations between Oceanic and the Greek Government were about to take place.

In April, Serres Shipping, Inc. obtained search rights for natural gas in the areas of Pulos, Navarino, and Messinia Nomos. At about the same time, the Canadian Calvin Exploration and Development Company obtained governmental approval to conduct a 6-month geological and geophysical survey to spot oil-bearing areas in Greece. Offshore research by the company was to be carried out in the northern and southern part of the Aegean Sea and the Gulf of Corinth, and results of the survey were to be made available to private companies as well as to the Government. The first part of the program, in the northern part of the Aegean Sea, was to be completed in July.

Motor Oil Hellas was expected to complete expansion of its Agioi Theodori, export-oriented refinery by early 1975, when its capacity would be raised 1.8 million tons to about 7 million tons of refined oil. A fifth refinery with a capacity of 6 million tons per year was to be built by Hellenic Refineries Stran S.A. The project was to be located at Pachi, 26 miles west of Athens. Reportedly, harbor works, near the proposed refinery, for berthing of tankers of up to 600,000 deadweight tons were already at an advanced stage. The harbor works were estimated to cost about $25 million. Nevertheless, the new administration reversed decisions that had been made for land sale and expropriation at the site. Thus, at yearend prospects for the construction of this refinery were not favorable.

Greece's total refining capacity was reported as 19,700,000 tons, distributed among four refineries.

**Uranium and Nuclear Energy.**—Uranium exploration in the Xanthi area was temporarily suspended early in 1974, pending arrangements for more extensive drilling and testing. Samples tested reportedly registered 10 counts per second versus the 40 to 50 counts per second considered exploitable by U.S. standards.

The PPC took the first steps for the installation of a nuclear reactor generating station, which the PPC hoped to have in operation by 1983. Senior company executives were to visit the United States in order to negotiate for the supply of requisite quantities of uranium. Work on the site, yet to be selected, was to begin in 1977. Lavrion reportedly was the location of choice.

According to PPC officials, by the year 1984 local sources of energy will generate 65% of all electric energy in Greece. If Greece's first 600-megawatt nuclear reactor is operational by that time, oil reportedly will account for only 23% of all power generated.

The connection of the Greek electric power grid with Albanian production facilities was completed during the year. Initially, the 20-megawatt operaton was to be one way, to Greece, on the basis of a bilateral clearing-account trade agreement. It was anticipated that in the future the hookup would operate both ways.

**Other.**—*Solar and Wind Energy.*—The small island of Doroussa, in the Saronikos Gulf, was selected as the site on which to establish the Greek Center for Oceanological Research, which was to include the important section of Solartechnical Oceanology. Also, 34 nations decided to found the International Center for Solar and Wind Technological Research in Greece, also to be located on Doroussa. As a first step toward implementation of new plans in this area, members of the National Committee on Solar and Wind Energy were appointed by the Greek Government.

# The Mineral Industry of Hungary

By Joseph B. Huvos [1]

Hungary's mineral industry, like that of the other East European countries, is closely linked to that of the U.S.S.R. Its centrally planned economy is based on mutually coordinated production schedules, and planned targets are predetermined by the 1971–75 national plan for economic development. Hungary had no internationally significant mineral resources besides bauxite, the production of which amounted to 3.9% of the world total in 1974. Mineral fuels, iron, steel, and manganese were next in importance although their output was not significant by world standards. Most of the country's minerals and mineral product requirements such as fuels, metals, and nonmetallic minerals were imported.

Compared with 1973, pig iron output increased by 275,000 metric tons; crude steel by 139,000; finished rolled ferrous metals by 111,000; bauxite by 151,000; alumina by 38,000; and cement by 32,000. Natural gas production increased by 9.6 billion cubic feet and electric power output by 1,300 million kilowatt-hours. There were also increases in the output of aluminum metal, phosphatic fertilizers, and petroleum products.

Besides gains in mineral production as reported in the official press, there have also been reports of failures to reach planned goals in some areas of the mineral industry and failures to eliminate occasional material shortages. Expansion in the mineral industry was achieved by greater expenditure of capital and improved productivity.

There were about 78,000 blue-collar workers and about 10,000 university graduate engineers and technicians in the country's metallurgical industry. The mining industry employed over 130,000 including over 12,000 university graduate engineers and technicians, the chemical industry including petrochemicals employed almost 110,000 with nearly 13,000 university graduate engineers and technicians, and the electric power industry employed about 38,000 including 4,700 engineers and technicians.

To ease the shortage of labor, many employees were permitted to hold more than one job, and about 25,000 retired persons were allowed to supplement their income by returning to active employment.

Worknorms used in all branches of Hungary's industry required that a minimum output be achieved within a predetermined period of time. As in other countries having a centrally planned economy, Hungary's unions are not wage-bargaining organizations, but they actively promote production increases, improved productivity, and fulfillment of planned quotas. Monthly earnings of Hungarian workers and employees in industry averaged 2,693 forints,[2] 7.1% more than that of 1973.

Exploration and prospecting focused on coal, bauxite, and liquid hydrocarbons, and to a limited degree on nonmetallic minerals. While industrial investments were 9% higher than those of 1973, the value of unfinished projects at yearend 1974 exceeded 100 billion forints. In the mining industry, the value of new projects built was 5.1 billion forints, that of the metallurgical industry was 3.2 billion forints, that of the chemical industry including

[1] Foreign mineral specialist, Division of Coal.

[2] Values have not been converted from Hungarian currency units, forints (fts), to U.S. dollars owing to the wide variation between the official exchange rate and the value actually used for transactions. To convert forints into dollars, these rates may be used: The official exchange rate used for statistical purposes in 1974 was fts 9.15 = US$1.00; the tourist rate was fts 20.43 = US$1.00; and the rate used by Hungarian companies with the National Bank of Hungary was fts 43.2 = US$1.00.

petrochemicals was 7.3 billion forints, and that of the electric power industry was 6.3 billion forints.

In 1974, a number of plants and mines started operation. In the iron and steel industry a new rolling mill was started at the Lenin metallurgical works in Diósygör; in the mining industry a new dolomite mine started production at Alsótelkes, Borsod County; in the electric power sector a 100-megawatt gas turbine and a 730-megawatt thermal powerplant went online. Construction of some other major mining and industrial facilities continued during the year, including the Algyö natural gas processing plant, the U.S.S.R.-Lenin City gas pipeline, development of the Rákhegy II bauxite and Visonta lignite mine, the olefin plant at the Tisza chemical combine, the Pét nitrogen fertilizer plant, and the Bélapátfalva and Hejöcsaba cement plants. While construction of some plants was ahead of schedule, that of some others was behind planned targets in 1974.[3] The construction of some major projects begun in 1974 included site preparation work for a 11-million-ton-per-year oxygen converter steelplant at the Dunaújváros steel combine to become operational by 1977–78, and a rod and wire mill at the Ozd metallurgical plant.

In 1974, there were 9,314 accidents in the country's mining industry, 235 fewer than those in 1973; of this total, 37 were fatal, 8 fewer than in 1973. The metallurgical industry had 4,944 accidents in 1974, 339 fewer than in 1973, with 28 fatal accidents, 10 fewer than in 1973.

Of a total of about 9.6 billion tons of mineral products shipped in 1974, about 45% went by rail and 55% by road.

## PRODUCTION

Mineral production statistics were not officially reported for a number of commodities. Therefore, many of the data in the production table were estimated, and present at best an order of magnitude.

As reported, 68 minerals and mineral related products were produced in the country. Compared with 1973, industrial production in Hungary grew 8.2%, and production of most mineral commodities increased and reached planned targets in spite of shortages of some petrochemical feedstocks and steel semiproducts.[4] Growth of the mining industry was approximately 1.9%, somewhat short of its 2% target. Production of coal decreased 3.8%; that of nitrogenous fertilizer 3.1%.

Hungary's mineral production was mainly in Transdanubia, where all bauxite and most of the manganese ore, bituminous and brown coal, and almost half the oil was produced. The great plains region produced the remaining half of the crude oil and most of the natural gas. The northern mountainous provinces produced the rest of the coal, lignite, iron ore, nonferrous metals, and nonmetallic minerals of the country.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, diatomite, gypsum, and other crude construction materials, such as common clay, as well as natural gas liquids are produced but available information is inadequate to make reliable estimates of output levels.
[2] Ore contains 18% to 26% manganese.
[3] Excludes refinery fuel and losses.

## TRADE

International trade has a high priority in Hungary's mineral economy. As in all other countries which have centrally planned economies, the country's trade is outlined in the national 5-year plan and is conducted by state enterprises directed by the Ministry of Foreign Trade. Foreign trade reflects national goals and priorities, and there is an implied commitment to achieve a favorable trade balance. Hungary's foreign trade continued to be oriented towards importing much needed fuels, minerals, and production equipment, while exports consisted mainly of industrial and agricultural products.

The value of Hungary's total trade turnover (exports plus imports) expanded 23.5%, from 79.3 billion forints in 1973 to 97.9 billion forints in 1974. Exports from Hungary were valued at 46.9 billion forints, 11.7% more than in 1973. The value of imports amounted to 51.0 billion forints, an increase of 36.7% over that of 1973. Hungary's trade with market economy countries in 1974 amounted in aggregate to 37.3 billion forints; trade with countries which had centrally planned economies totaled 60.6 billion forints.

The value of total commodity trade with various groups of countries in 1970 and 1972–74 follows, in billion forints:

| | 1970 | 1972 | 1973 | 1974 | Percent of increase 1973–74 |
|---|---|---|---|---|---|
| Countries with ruble accounts | 34.8 | 44.4 | 47.6 | 52.7 | 10.7 |
| Countries with dollar and other accounts | 21.7 | 25.0 | 31.7 | 45.2 | 42.6 |
| Total all countries | 56.5 | 69.4 | 79.3 | 97.9 | 23.5 |

As officially reported, Hungary traded with 73 countries in 1974. Almost two-thirds of the foreign trade was with countries which had centrally planned economies, with the U.S.S.R. having the largest share of the total. Compared with 1973, trade with some individual countries increased in 1974, in billion forints as follows: U.S.S.R. 26.7 to 29.5, East Germany 7.9 to 9.6, Czechoslovakia 6.8 to 8.1, West Germany 5.8 to 7.7, Poland 4.4 to 5.1, Italy 3.9 to 4.2, and Austria 2.6 to 4.2.

There was no significant change in Hungary's mineral trade patterns in 1974 compared with those of 1973. Mineral exports were insignificant, as in previous years. Fuels, metals, and minerals were not exported in important quantities except for bauxite, alumina, aluminum and aluminum products, and also some steel semimanufactures. Industrial products, machinery, pharmaceutical, and agricultural products made up the balance.

The most important categories of mineral commodity imports in 1974 were bituminous and anthracite coal, coke, crude

oil and petroleum products, natural gas, iron ore, pig iron, steel and steel semimanufactures, aluminum ingots, aluminum semimanufactures, nonferrous metals, and nonferrous metal products.

There was an increase in imports of crude oil from 6.6 million tons in 1973 to 6.8 million tons in 1974, fuel oil from 121,000 tons to 132,000 tons, and rolled steel from 644,000 tons to 734,000 tons. There was a decrease in imports of metallurgical coke from 1.13 million tons to 1.11 million tons and nitrogenous fertilizer from 459,000 tons to 415,000 tons.

**Table 2.—Hungary: Exports of mineral commodities**
(Metric tons unless otherwise specified)

| Commodity | 1972 [1] | 1973 [2] | Principal destinations, 1973 |
|---|---|---|---|
| METALS | | | |

## COMMODITY REVIEW

### METALS

In general, development of ferrous and nonferrous industries reached goals foreseen by the 1974 annual plan; growth was the largest in the aluminum and iron and steel industries.

Of all metals or metallic ores needed by Hungary, only bauxite was in plentiful supply domestically. Almost all other mineral-related products had to be imported and included chromite, copper, iron ore, pig iron, steel including semimanufactures, lead, magnesium, molybdenum, nickel, tin, tungsten, and zinc.

**Aluminum.**—Hungary's three reduction plants, Ajka, Inota, and Tatabáya, had a total capacity of about 90,000 tons in 1974. Primary metal production was 69,043 tons, an increase of 1.7% over that of 1973. According to a long-range agreement with the U.S.S.R. concluded in 1962, Hungary imported substantial amounts of primary aluminum metal from the Volgograd reduction plant in the U.S.S.R., supplied

with Hungarian alumina. A similar agreement was concluded also with Poland.

Hungarian exports of aluminum ingots to 24 different countries in 1974 totaled 54,727 tons, 31,529 tons less than in 1973; this included 19,030 tons to European seaports, 6,254 tons to Austria, 4,738 tons to Finland, 4,310 tons to the People's Republic of China, 3,924 tons to Brazil, 3,800 tons to Poland, and 3,267 tons to Turkey. Aluminum products exported totaled 28,330 tons, including 9,661 tons to Romania, 5,349 tons to East Germany, 2,492 tons to Czechoslovakia, 1,467 tons to Bulgaria, and 1,217 tons to Finland.

In 1974, Hungary's aluminum supply position was as follows, in thousand tons:

| | |
|---|---|
| Production of primary aluminum | 69.0 |
| Production of secondary aluminum [e] | 14.0 |
| Imports (metal including products) | 144.9 |
| Exports (metal including products) | 88.1 |
| Apparent consumption | 139.8 |

[e] Estimate.

Hungary operated three alumina plants, Ajka, Almásfüzitö, and Mosonmagyaróvár, with a total capacity of about 700,000 tons per year. Production was 693,000 tons in 1974, an increase of 5.8% over that of 1973. Exports of alumina amounted to 626,292 tons in 1974, an increase of 27,988 tons over that of 1973, and included 331,646 tons to the U.S.S.R., 152,400 tons to Poland, 96,415 tons to Austria, 23,440 tons to East Germany, 11,926 tons to Czechoslovakia, 5,216 tons to Romania, and 5,000 tons to the Netherlands.

Hungary operated five bauxite mines in Transdanubia northwest of Lake Balaton, located at Kislöd, Halimba, Nyirád-Darvastó, Gánt, and Kincsesbánya. Output of bauxite was 2.75 million tons, an increase of 5.8% over that of 1973, and amounting to about 3.6% of total world production. Increased production resulted mainly from commissioning of the new Halimba mine still under development. Exports of bauxite, the only nonferrous metal ore exported in significant quantities by Hungary in 1974, amounted to 559,000 tons, 100,000 tons less than that of 1973, and included 265,766 tons to Czechoslovakia, 179,973 tons to East Germany, and 113,284 tons to Poland.

Hungary's total bauxite reserves were estimated at 150 million tons in 1972; this included 76 million tons of minable reserves, a decrease of about 25% for the 1969–72 period.[5] The quality of Hungarian bauxite continued to deteriorate.

Hungary's aluminum industry is operated by the Hungarian aluminum industry trust (MAT). The trust covers all activities in the field of exploration and mining of bauxite, the production of alumina, primary metal, and semifinished and finished products. Three companies are involved in bauxite mining; of these the bauxite exploration company performs the drilling for exploration of bauxite and for ground water control, and the Fehér County bauxite mining company and the Bakony bauxite mining company do the mining, with one-third of the total mined by the former, and two-thirds by the latter.[6] Alumina is produced by the Ajka and the Almásfüzitö alumina enterprises; reduction of alumina to aluminum takes place at the Ajka, Inota, and Tatabánya plants; design and construction of new plants is performed by the designing institute of the Hungarian aluminum corporation (ALUTERV).

New plant construction was planned at the Almásfüzitö alumina plant to increase capacity from 285,000 tons to 325,000 tons per year. The $17 million expansion project is scheduled to become operational by 1977.

Hungary gave assistance to several countries for the construction of aluminum industry projects. A 200,000-ton-per-year alumina plant built with Hungarian assistance was commissioned at Korba, India, in 1974. In addition to designing the plant, Hungary also gave assistance in construction and startup. At the 300,000-ton-per-year Obrovac alumina plant under construction in Yugoslavia, plant design and much of the equipment was provided by Hungary; Hungary also trained the plants' employees. In the Malagasy Republic, Hungarian aluminum industry experts made a feasibility study for an alumina plant to be supplied with bauxite from nearby deposits. In Greece, Hungary made a feasibility study for a 600,000-ton-per-year alumina plant for the Bauxite Parnasse Mining Co.

Hungary processed much of its aluminum domestically. Production of semiproducts amounted to about 140,000 tons in

[5] Bányászat (Budapest). V. 107, No. 9, September 1974, p. 617, and other sources.

[6] Bányászat (Budapest). Bemutatjuk a Bakonyi Bauxitbánya Vállalatot (The Bakony Bauxite Mining Company). V. 107, No. 11, November 1974, pp. 753–761.

1974, an increase of 10,550 tons over that of 1973; endproducts totaled about 115,000 tons, an increase of 5,500 tons. Expansion of Hungary's aluminum processing industry continued with the appropriation of $49 million for the expansion of the Székesfehérvár lightmetal works.

**Copper.**—In addition to 8,000 tons of copper concentrate containing 1,200 tons of copper produced at the Gyöngyösoroszi mine in 1974 and processed at the Metallochemia Co. smelter in Nagytétény-Diósd, Hungary produced about 14,000 tons of refined copper at the Csepel metal works, 17.6% less than in 1973. Imports totaled 42,633 tons of copper including semiproducts, and 8,746 tons of castings, fittings, and scrap materials in 1974; 33,128 tons of copper were from the U.S.S.R.

**Iron Ore.**—Hungary's only iron ore mine located at Rudabánya, in north Hungary, produced 545,000 tons of iron ore in 1974, 136,000 tons less than that of 1973. Iron content of the ore was 23.5%, and the ore supplied 11.7% of Hungary's iron ore requirements. Hungary imported 4.1 million tons of iron ore, including 3,973,000 tons from the U.S.S.R. and 101,000 tons from India.

At the beginning of 1974, the measured, indicated, and inferred reserves of iron ore in place (categories $A+B+C_1$) totaled 31.6 million tons, and averaged 24.4% Fe; speculative reserves in place (category $C_2$) totaled 14.7 million tons.[7]

**Iron and Steel.**—Ferrous metallurgy remained the most important branch of Hungary's metals industry in 1974. Crude steel production was 3.5 million tons, an increase of 139,000 tons over that of 1973. Pig iron production was 2.4 million tons, an increase of 275,000 tons over that of 1973. Among steel semimanufactures, rolled products totaled 2.4 million tons, an increase of 4.9% over that of 1973. A range of rolled semimanufactures was imported totaling 734,000 tons, while exports for the same period amounted to 607,000 tons.

Among the most important projects that went onstream in the iron and steel industry in 1974, were the steel mill at the Lenin metallurgical works located at Diósgyör in north Hungary. The $45 million, 400,000-ton-per-year plant was equipped with machinery from the East German Ernst Thälmann heavy equipment construction combine. Process control equipment was supplied by the U.S.S.R. and Czechoslovakia, and the furnaces by Austria and France. The plant will have 1,200 employees.[8]

Large-scale reconstruction of the Ozd metallurgical works was started in 1974, it will cost $100 million and take 3 years; a 110-ton converter is to be started in 1975. Total capacity of the plant reportedly will be 1.1 million tons per year of steel to be raised later to 1.4 million tons. A wirebar mill, also under construction, reportedly will start production in 1975.

Long-range reconstruction plans have been prepared for the Csepel metal works near Budapest; the cost is to be $100 million every year for 10 years. Ultimately, the plant is to employ 33,000 persons.

Site preparation has started at a new steel plant in Dunaújváros which will include 1.1-million-ton-per-year basic oxygen steel converters. An oxygen plant is to be commissioned in 1976, and one of two converters will start operating in 1977, the other in 1978.

**Lead and Zinc.**—Output of lead-zinc ore was 163,000 tons in 1974 at Gyöngyösoroszi in north Hungary. The ore contained an estimated 1,600 tons of recoverable lead and 3,000 tons of recoverable zinc. Of the zinc concentrates produced, 4,200 tons were exported to Poland and 2,621 tons to Belgium. The 2,000 tons of lead concentrate produced were processed domestically at the Metallochemia plant in Nagytétény. Hungary imported 11,101 tons of lead and 6,952 tons of zinc from the U.S.S.R. in 1974.

Refined lead output was 13,500 tons, an increase of 5,500 tons compared with that of 1973, and secondary zinc output was 1,000 tons.

**Manganese Ore.**—Manganese ore output totaled an estimated 125,000 tons, 11,000 tons less than that of 1973. Production of manganese ore has declined since 1965, when 213,000 tons was produced. At the beginning of 1974, measured, indicated, and inferred reserves of manganese ore in place (categories $A+B+C^1$), amounted to 43.1 million tons, and speculative reserves in place (category $C_2$) amounted to 36.5 million tons. Average composition of ores was 21.6% Mn and 9.2% Fe. About one

[7] Horváth, J. A. Hazai Nyersvasgyártás Ercbázisa (Hungarian Iron Ores). Kohászat (Budapest). V. 108. No. 2, February 1975, p. 57.

[8] Figyelö (Budapest). Nemesacél Diósgyörböl (Alloy Steel from Diósgyor). V. 19, No. 14, Apr. 2, 1975.

tenth of the ore was oxide containing 26.1% Mn and nine tenths was carbonaceous with 18.7% Mn.[9] Hungary's manganese mines are at Urkút and Csárdahegy, not far from the Halimba bauxite mines, north of Lake Balaton. Hungary imported 14,614 tons of manganese ore from the U.S.S.R.; 11,997 tons of ore were exported to Czechoslovakia and 3,176 tons to West Germany in 1974.

Hungary also imported 13,306 tons of 75% to 80% ferromanganese in 1974, including 19,367 tons from the U.S.S.R. and 14,096 tons from Norway.

## NONMETALS

As in previous years, Hungary was self-sufficient only in the following nonmetallic minerals: Lime, bentonite, perlite, diatomite, sand, and gravel. Most of the nonmetallic minerals used in the country had to be imported, and included asbestos, barite, cryolite, fluorspar, graphite, magnesite, mica, phosphates, salt, soda ash, sulfur, and pyrites.

**Cement.**—Hungary's four operating cement plants produced 3.4 million tons in 1974, or 0.9% more than that of 1973. Work continued on construction of the Hejöcsaba and Bélapátfalva cement plants. The $230 million, 1.5 million-ton-per-year Hejöcsaba plant was to start operating by yearend 1974, but test runs will begin only in 1975, and full capacity is to be reached in 1978. Technology was by the West German firm Polysius A.G., and the equipment was built in Czechoslovakia. New limestone and clay reserves near the plantsite are sufficient to maintain planned production levels for 50 years. The old 430,000-ton-per-year Hejöcsaba cement plant was closed in 1974. Hungary imported 974,000 tons of cement in 1974, including 680,000 tons from the U.S.S.R.; 85,000 tons from Romania, 82,000 tons from Czechoslovakia, 78,000 tons from Austria, and 39,000 tons from East Germany.

**Clay.**—Clay production in 1974 was unchanged compared with that of 1973. A new ceramic-quality clay was discovered and a mine was established at Füzérradvány in 1974.

**Corundum.**—Hungary produced artificial corundum by the fusion of domestic bauxite in electric arc furnaces. The artificial corundum plant was located at Mosonmagyaróvár; it supplied Hungary's domestic abrasives industry. Exports included 9,703 tons of abrasives shipped to Romania and 6,483 tons to Bulgaria in 1974.

**Fertilizer Materials.**—Fertilizer material production totaled almost 3 million tons containing 595,000 tons of nutrient,[10] an increase of 1,000 tons of nutrient compared with that of 1973. Of the fertilizer produced in 1974, 65.7% was nitrogen and 34.3% was phosphorus fertilizer. There was no significant change in the trade patterns for fertilizer materials, and substantial quantities had to be imported to satisfy demand. Imports of nitrogenous fertilizer totaled 415,000 tons, a decrease of 9.6% compared with that of 1973. Of total imports of 990,949 tons of potassic fertilizer (in terms of 40% $K_2O$) in 1974, 566,765 tons came from the U.S.S.R., 385,679 tons from East Germany, and 38,505 tons from West Germany.

*Phosphate.*—Hungary has no phosphatic raw materials of its own; the country imported a total of 978,433 tons of phosphatic fertilizer materials (in terms of 18% $P_2O_5$) in 1974, an increase of 42.6% over that of 1973. Imports included 242,175 tons from Yugoslavia, 156,836 tons from Austria, and 140,901 tons from the U.S.S.R. Hungary imported 603,296 tons of phosphate rock and concentrates in 1974, 15.5% more than that of 1972; the U.S.S.R. supplied 453,174 tons, Algeria supplied 102,629 tons, and Morocco 47,493 tons.

In 1975, there were plans to increase superphosphate production at the Tisza chemical combine by 80,000 tons with the present equipment. Hungary and Morocco signed a long-term contract; Morocco will supply Hungary with 135,000 tons of crude phosphate rock and 20,000 tons of superphosphate in 1975, and 230,000 tons of crude phosphate rock and 20,000 tons of superphosphate each year thereafter. An agreement was signed between the U.S.S.R. and Hungary for Hungarian participation in the development of the Kingisepp phosphorite deposits in the U.S.S.R. Hungary is to supply machinery and goods in exchange for deliveries by the U.S.S.R. of complex phosphatic fertilizer over a period of 10 years.

*Potash.*—Hungary imported all of its potash requirements totaling 990,949 tons (in terms of 40% $K_2O$) in 1974, 15.7% more than that of 1973; the U.S.S.R. supplied

[9] Kohászat (Budapest). V. 18, No. 2, February 1975, p. 60.

[10] The active ingredients nitrogen, and phosphorus are expressed as N, and $P_2O_5$, respectively.

566,765 tons, East Germany supplied 385,679 tons, and West Germany supplied 38,505 tons.

*Nitrogen.*—Nitrogen production, in terms of 20.5% nutrient content, was 1,908,000 tons, a decrease of 3.1% compared with that of 1973. Hungary imported 415,222 tons of nitrogen fertilizers in 1974, of which 169,722 tons came from the U.S.S.R., 149,620 tons from Czechoslovakia, and 86,530 tons from Austria.

Hungary's nitrogen industry is divided into four industrial organizations which include the Pét nitrogen works (PNM), the Borsod chemical industry combine (BKV), the Tisza-Region chemical combine (TVK), and the Tisza-Region chemical works (TVM).

Construction continued on several nitrogen industry projects in 1974. Commissioning of the 1,000-ton-per-day, $440 million Pét ammonia plant is to take place early in 1975, jointly with that of a 600-ton-per-day carbamide plant, which uses Belgian technology and equipment. Nitric acid and ammonium nitrite capacities were also scheduled for commissioning in 1975 at the PNM.

A 15-year contract for cooperation in the field of phosphatic fertilizers was signed by both Hungary and Yugoslavia. According to the contract Hungary extends a credit of $15 million to Yugoslavia for developing the Prahovo fertilizer plant of the Bor Mining and Smelting Enterprise. Hungary will receive phosphatic fertilizers for a period of 15 years in exchange for providing equipment for nitrogen fertilizer production. Hungary gave technical assistance to Poland for building a mixed fertilizer plant based on Hungarian technology and engineering.

**Lime.**—Production of lime was 636,000 tons in 1974, a decrease of 4.9% compared with that of 1973. The Budapest-based Chemimas Co. designed and built a new type of lime kiln which was exported to East Germany, Czechoslovakia, and several West European countries in 1974.

**Stone.**—*Dolomite.*—A new dolomite mine has been developed at Alsótelkes in Borsod County by the State Ore and Mineral Mining Co., with estimated reserves of 8 million tons. Production of the mine will be absorbed by the metallurgical and chemical industry of Borsod County.

**Sulfur and Sulfuric Acid.**—The country produced an estimated 9,500 tons of by-product sulfur in 1974, 9.9% more than that of 1973. Imports amounting to 183,478 tons came in 1973 mainly from Poland (108,248 tons) and the U.S.S.R. (75,198 tons). Sulfuric acid production was 657,000 tons in 1974, an increase of 1.4% over that of 1973. The country's sulfuric acid was produced mainly from imported native sulfur.

## MINERAL FUELS

Hungary's primary energy production from fossil fuels, fuelwood, and hydroelectric power increased from 20.3 million tons of standard fuel equivalent in 1973 to 20.8 million tons in 1974. The output of crude oil increased from 1,989,000 tons to 1,997,000 tons, and that of natural gas from 170.3 billion cubic feet to 179.9 billion cubic feet. The share of these two fuels in the country's energy supply decreased from 56.4% to 55.5% during the 1973–74 period. In 1974, Hungary produced 25.8 million tons of coal and lignite. The share of coal (bituminous coal, brown coal, and lignite) in the country's primary energy supply increased from 40.4% in 1973 to 41.1% in 1974. During the next 5 years no change is planned for the output of coal, a substantial increase is planned for that of lignite, a moderate increase is planned for that of natural gas, and no change is planned for that of crude oil. Because of increasing imports of natural gas and crude oil, the share of coal will decline somewhat in the energy balance, but it will still remain the country's major source of energy.

Among Hungary's fuel and energy resources of lesser importance to the energy economy in 1974 were fuelwood and hydroelectric power. Nuclear power was still in the development stage with construction continuing on the Soviet-assisted Paks nuclear powerplant. The first 440-megawatt unit is scheduled for completion in 1980 and the second in 1981, and further expansion with 1,000-megawatt Leningrad-type units to 4,000 megawatts' capacity is planned for 1990.

As in previous years, the country supplied most of its own fuelwood amounting to about 400,000 tons of standard fuel equivalent in 1974, or 1.2% of the country's energy supply. No fuelwood imports were reported in 1974.

Hungary's hydroelectric generating plants, located on the Tisza River, had about 20,000 kilowatts total capacity. Construction of a 120-megawatt hydroelectric powerplant to be located in the Dömös-

Visegrád area on the Danube River was under consideration.

In 1974, Hungary produced 18.9 billion kilowatt-hours of electricity, 7.4% more than that of 1973. Thermal powerplants generated 18.8 billion kilowatt-hours (99.5%) and hydroelectric powerplants generated 100 million kilowatt-hours (0.5%). Installed capacity of electric powerplants at yearend was about 3.6 million kilowatts; about 432 grams of standard fuel were used per kilowatt-hour generated in 1974. In 1974, industry consumed 39.9% of all coal produced, about 50% of all crude oil, about 95% of all natural gas, and about 69.2% of all electrical energy.

Hungary's primary energy balances for 1973 and 1974 are shown in table 4.

**Table 4.—Hungary: Primary energy balance for 1973 and 1974**
(Million tons standard fuel equivalent)

| Year | Total primary energy | Coal (lignite, brown, bituminous and coke) | Crude oil and petroleum products | Natural and associated gas | Fuelwood | Hydroelectric and other power |
|---|---|---|---|---|---|---|
| 1973: | | | | | | |
| Production | 20.3 | 10.9 | 2.6 | 6.4 | 0.4 | -- |
| Imports | 11.2 | 1.5 | 8.7 | .3 | -- | 0.8 |
| Exports | .8 | -- | .7 | -- | -- | .1 |
| Apparent consumption | 30.7 | 12.4 | 10.6 | 6.7 | .4 | .7 |
| 1974: | | | | | | |
| Production | 20.8 | 11.0 | 2.6 | 6.8 | .4 | -- |
| Imports | 12.5 | 2.4 | 8.9 | .3 | -- | .9 |
| Exports | .7 | -- | .5 | -- | -- | .2 |
| Apparent consumption | 32.6 | 13.4 | 11.0 | 7.1 | .4 | .7 |

[1] Production and trade data for 1973 were from monthly statistical publications, Central Statistics Office (Budapest), 1975, No. 6. Statistical Yearbook 1973, 563 pp., Foreign Trade Yearbook 1974, 465 pp., and other Hungarian sources.

**Coal.**—In 1974, Hungary's 60 underground and 5 open cast mines produced a total of 25.8 million tons of coal, 3.8% less than that of 1973. Of all coal mined in 1974, 3.2 million tons was bituminous coal, a decrease of 5.9% compared with that of 1973; brown coal was 15.3 million tons, a decrease of 1.2%; and lignite 7.3 million tons, a decrease of 8.1%. The target for 1975 is a total coal production of 26.6 million tons.

Of 27.8 million tons of coal available to the economy in 1974, powerplants consumed 16.4 million tons, industry consumed 5.8 million tons, railroads consumed 1.0 million tons, and the remaining 4.6 million tons was consumed by the household sector of the economy.

In July 1974, the coal mining industry employed, about 85,000 persons, 5.3% fewer than those in 1973. In 1973, there were 8,038 accidents in the coal mining industry, 412 less than in 1972; of this total 37 were fatal, 9 more than in 1972. Of 7,160 employees at the Oroszlány coal mines, typical of Hungary's coal industry, 613 were professionals, 337 were office workers, and 5,680 were blue-collar workers. Production at Oroszlány was 2.64 million tons of raw coal in 1974.

There were 25% fewer underground mines and output per mine was 15% more in 1974 than at the beginning of the fourth 5-year plan in 1971. About 44% of coal production and 70% of loading in the mines was mechanized; mechanization of drifting was not satifactory.[11] There was a series of equipment failures at the Visonta lignite mines in 1974, brought about by floods and rain, that caused a 50% drop in coal production and failure to reach production targets for 1974.[12]

In 1974, the average heating value of all coal mined in Hungary was 2,978 kilocalories per kilogram, 0.5% higher than that of 1973; that of lignite was about 1,700 kilocalories per kilogram; that of brown coal ranged from 2,300 to 4,500 kilocalories per kilogram; and that of bituminous coal averaged 4,400 kilocalories per kilogram.

Of Hungary's total geological coal reserves of 5.8 billion tons in 1973, about 5 billion were considered minable. Of this 435 million tons was bituminous coal in south Hungary, near Pécs; 582 million tons was brown coal in Transdanubia; 431 mil-

[11] Bányászat (Budapest). V. 108, No. 7, July 1975, p. 484.
[12] Népszabadság (Budapest). Nov. 7, 1974, p. 8.

lion tons was brown coal in north Hungary; and 3.5 billion tons was lignite, in both north and west Hungary.[13] Hungary had to supplement coal production by imports amounting to 1,430,000 tons of bituminous coal and anthracite in 1974, 2.8% less than that of 1973; of this Czechoslovakia supplied 570,000 tons, Poland 540,000 tons, and the U.S.S.R. 319,000 tons.

Coke production was about 1,081,000 tons; of this 639,000 tons were oven coke, and about 442,000 tons were gas coke. Coke imports amounted to 1.2 million tons; of this 659,000 tons were from the U.S.S.R.; 284,000 tons from Czechoslovakia, and 257,000 tons from Poland. Fuel briquetes totaling 518,363 tons came from East Germany.

There were some organizational changes in Hungary's coal industry in 1974. The United Hungarian Coal Mining Trust was replaced by the Hungarian Coal Mining Trust. This organization, the largest industrial unit in Hungary, includes nine individual coal mining companies which are the Mecsek, Dorog, Tatabánya, Oroszlány, Közép-Dunántúl, Nógrád, Borsod, Várpalota, and Mátraalja.

Hungary's presently producing coal mines reportedly will be depleted in 1990, when five new underground mines and one opencast mine will start production. The new mines will be located in the Oroszlány, Dorog, Tatabánya, and Borsod coalfields. The opencast mine will be at Bükkábrány, where several hundred million tons of lignite with an average heating value of about 1,650 kilocalories per kilogram have been found. The mine is to produce 20 million to 22 million tons of coal per year for 30 to 35 years and is to supply a 2,000-megawatt minemouth powerplant.

Coal exploration was centered around the Tatabánya coal basin, particularly in the areas of Csordakút, Nagyegyháza, and Mány. Near Csordakút, development of a new mine was begun. Exploration for lignite was centered near the Szombathely area in west Hungary, near the common border of Hungary with Austria.

It was reported that Hungary bought a complete coking plant from India for supplying the Danube steelworks with metallurgical coke.[14]

**Natural Gas.**—During 1974, Hungary produced 180 billion cubic feet of marketable natural gas from 72 gasfields, an increase of 5.7% over that of 1973. In addition, the country produced manufactured gas totaling about 25 billion cubic feet, prepared from coal or hydrocarbons in gasplants at Budapest, Pécs, Baja, Györ, Sopron, Szombathely, and Dunaújváros. As in the past, imports of natural gas from Romania remained around the 7-billion-cubic-foot-per-year level. Construction of the U.S.S.R.-Lenin City natural gas pipeline entered its last phase; the pipeline is to carry 1.2 billion cubic meters of natural gas from the U.S.S.R. to Hungary in 1975, and 4 billion cubic meters in 1980. Capacity of the pipeline is 10 billion cubic meters of gas per year. Hungary's estimated recoverable natural gas reserves at yearend amounted to 45 billion cubic meters.[15] This includes 3.1 million tons of liquid natural gas, 3.5 million tons of stabilized gasoline, 400,000 tons of isopentane, and 800,000 tons of other liquid hydrocarbons contained in the gas.

Exploration for oil and natural gas was performed mainly by 13 seismic groups. About 5% of all natural gas produced in the country in 1974, was associated gas.[16]

Work continued on construction of the natural gas processing plant at the Algyö gasfields. The first stage of the plant is to start production in 1975; yearly output will include 170,000 tons of liquid natural gas, 200,000 tons of gasoline, and 20,000 tons of isopentane. Design and engineering is by the Kiev-based designing institute of the Soviet gas industry.

Seven underground gas storage facilities are to enter service between 1976 and 1980, for a total hourly capacity of 440,000 cubic meters. There is to be one each at Szeged and Kardoskút, two at Hajduszoboszló, and three at Pusztaszederics.

**Petroleum.**—Total production of crude oil in 1974 amounted to 1,997,000 tons, an increase of 0.4% over that of 1973. Of crude oil imports totaling 6,817,000 tons in 1974, 262,000 tons more than that of 1973, the U.S.S.R. supplied 6,126,000 tons, Iraq 583,000 tons, Albania 55,000 tons, and Egypt 53,000 tons. Imports of petroleum products totaled 1,042,545 tons, including 836,527 tons from the U.S.S.R., 44,464 tons from Romania, 39,946 tons from Austria, and 20,216 tons from Kuwait.

In 1974, the Algyö oilfield supplied more

[13] Bányászat (Budapest). V. 107, No. 8, August 1974, p. 587.
[14] Glückauf (Frankfurt). V. 111, No. 4, April 1975 p. 140.
[15] Koolaj és Foldgáz (Budapest). V. 7, No. 11, November 1974, p. 333.
[16] Koolaj és Foldgáz (Budapest). V. 8, No. 4, April 1975, p. 100.

than half of the country's crude oil production; the remainder came from 20 smaller oilfields. There were about 900 oilwells in 1974, producing oil from estimated reserves of about 19 million tons.[17] Conditions for producing crude oil were difficult. Water in quantities up to 12 times that of the oil produced had to be injected into the formations at the Nagylengyel oilfields; 54% of the wells had to be pumped, and average production per day was 2.2 tons, per well; when gas injection was used, production was lower.[18] At present it is not expected that the country's crude oil production can be further significantly increased.

Oil drilling was 279,300 meters in 1974, 17.8% more than that of 1973. The cost of drilling was about $250 per meter, and an average of 22.5 drilling rigs were in operation during 1974. Cost of exploration reportedly totaled about $8.82 per ton of crude oil produced.

Hungary's total refining capacity was 10 million tons in 1974; of this 7 million tons were at the Danube oil refinery, 2 million tons at the Komárom oil refinery, 700,000 tons at the Zala oil refinery, and 300,000 tons at the Nyirbogdány oil refinery. Additional refining capacity was under construction at the Tisza chemical works and at the Danube oil refinery, and reconstruction of the Komárom oil refinery was scheduled for 1975. Hungary's catalytic reforming capacity was 1 million tons.

Crude oil from the U.S.S.R. came by the Friendship I and II pipelines. The Friendship I stretches from Sahy in Czechoslovakia to Százhalombatta in Hungary and carries 4.5 million tons per year. The Friendship II stretches from Uzhorod in the U.S.S.R. to Százhalombatta via Leninváros in Hungary, and has a 10-million-ton-per-year capacity. Other pipelines interconnect the oilfields of Transdanubia, the Szeged area, and the Százhalombatta refinery.

Construction has started on the Adria pipeline which will carry Midwestern and African crude oil from the Adriatic sea to Yugoslavia, Hungary, and Czechoslavakia by 1977. One terminal of the pipeline is on the Adriatic Island of Krk where construction of a harbor for supertankers has already started. The main 40-inch-diameter line is to extend from the terminal to Sisak in Yugoslavia, where 28-inch lines branch out to other Yugoslavian refineries, and to Hungary, which the pipeline enters at Csurgó. In Hungary the line extends to Százhalombatta which is to receive 5 million tons of crude oil per year. The remaining 5 million tons of crude oil carried by the line are to be pumped each year to Czechoslovakia by using the older Friendship I pipeline extending from Százhalombatta to Sahy. Both Hungary and Czechoslovakia are to contribute $25 million to Yugoslavia for the construction of the Yugoslavian section of the pipeline, but sections of the pipeline across each country are to be built by the respective country itself.

In the petrochemical industry, construction of the $30-million petrochemical combine in Lenin City, near Tiszalök, was almost completed and trial runs started at yearend 1974. Some of the ethylene produced in this plant will be pumped by a 330-kilometer pipeline to the chemical combine in Kalush, the U.S.S.R., and some of it will be piped to the Borsod chemical combine in Hungary. The Borsod chemical combine, near Kazincbarcika, the construction of which continued in 1974, will produce 150,000 tons of polyvinylchloride, 110,000 tons of chlorine, and 125,000 tons of caustic soda. The vinylchloride plant will be supplied by the English subsidiary of the Badger Co., the polymer plant by the Japanese Sin Etsu Co., and the alkalichloride electrolysis plant by the Italian De Nora Co.

**Nuclear Energy.**—In 1974, work continued on the construction of Hungary's first nuclear powerplant on the west bank of the Danube River, 120 kilometers south of Budapest at Paks. About $50 million have been spent preparing the plantsite. Engineering, construction, and most of the equipment will come from the U.S.S.R. The first of four 440-megawatt Novovoronesh-type reactor blocs is scheduled to start operating in January 1980, the second in 1981, the third in 1983, and the fourth in 1984, with the 4,000-megawatt level reached by 1990, using 1,000-megawatt Leningrad-type units.

Hungary's uranium mining continued in the Pécsszöllös area with the opening of a new seam at the No. 4 mine of the Mecsek ore mining enterprise. Temperatures as high as 117° F made use of air conditioning at the mine necessary.

# The Mineral Industry of India

By Louis J. Sousa [1]

The performance of India's mineral industry showed little improvement during 1974 as gains in the production of coal, petroleum, natural gas, copper, zinc, phosphate rock, fertilizers, and limestone were offset by declines in the output of iron and manganese ores, pig iron and steel, bauxite, aluminum, and cement.

The increase in coal production was probably one of the most significant improvements. Coking coal shortages early in the year were largely responsible for the decline in steel mill capacity utilization and hence steel production. Electric power cutbacks, caused at least partially by inadequate coal supplies, tended to inhibit output of all industrial activities most notably large power using or dependent industries such as aluminum, steel, and underground coal mining. As the coal supply position improved during the year, both steel production and electric power generation advanced. Overall coal production increased 7% over that of 1973 to 86.3 million tons.

Production of the other major fossil fuels also improved slightly. Gross natural gas production was up 14%, while production of both crude and refined petroleum products increased 1%. Additionally, increased offshore exploration efforts proved the existence of substantial high-quality commercially exploitable petroleum reserves off India's west coast in the Bombay High area.

The performance of India's ferrous metal industries, though down somewhat from that of 1973, nonetheless showed a gradual improvement through the latter half of the year. Iron ore and manganese ore production were both down 1%. Steel ingot production dropped 13% to 6 million tons. The output of the country's electric arc furnace "mini" mills was exceptionally low as production reached only 25% of capacity.

India's production of bauxite and aluminum was particularly affected by the electric power shortages with respective declines of 14% to 16% registered, while output of India's other major nonferrous metals, copper, lead, and zinc, all showed dramatic improvements over that of 1973. On a metal content basis, production of copper and lead ores were both up 38%, while zinc ore output increased 26%.

The performance of India's principal nonmetallic mineral commodities was mixed. Cement production declined 5% while limestone output increased a percentage point. Although phosphate rock production more than tripled during the year, output totaled less than half a million tons.

Indian fertilizer production improved slightly, but output of 1.1 million tons (nitrogen and phosphorus pentoxide content) was far below total capacity and estimated demand. Rather than continue to meet domestic demand through the purchase of increasingly expensive petroleum-based fertilizer imports, India placed more emphasis on developing fertilizer plants using coal as a feedstock, a fuel in which its reserves are abundant.

The performance of all of India's mineral industries was largely affected by conditions in two vital components of the country's industrial infrastructure—the electric power industry and the rail transport industry. Although total electricity generated increased in 1974 to 63.4 billion kilowatt-hours, per capita consumption was among the world's lowest at 113 kilowatt-hours, less than one-tenth the world aver-

[1] Economist, Division of Ferrous Metals.

age. Light monsoons caused shortages in hydroelectric power output while poor quality and irregular supplies of coal contributed to thermal stations operating at only 40% of capacity. Additionally, large power consumers frequently had portions of their supply diverted to agricultural operations.

Overall rail traffic (measured by the number of cars loaded) improved 1% over that of 1973. Significantly, the number of railcars carrying coal or coke increased 7% over that of 1973 and accounted for about one-third of total rail traffic. The improvement in coal transport was an important factor in getting maximum utilization of the increased coal supplies.

India's foreign trade in mineral commodities was disappointing in 1974. Iron ore exports, the principal mineral export, changed little from that of 1973, while value of imports of crude oil, refined petroleum products, and manufactured fertilizers increased substantially over that of 1973. The effects of these imports on the country's trade balance was slightly mitigated, however, by such agreements as deferred payment plans and barter arrangements. Through belt-tightening measures, India managed to greatly reduce its volume of imports of these materials during the last few months of the year.

The Government of India continued to increase its involvement in the ownership and operation of the country's mineral industries during the year. The Government acquired 74% ownership in Exxon Corp.'s Indian operations and conducted negotiations aimed at securing similar agreements with the two remaining foreign-based private oil companies in the country. The Government also moved to gain greater control over the export of mica by forming the Mica Trading Corp. of India. Additionally, there were reports that the Government's Minerals and Metals Trading Corporation (MMTC) was considering "canalizing" exports of Goan iron ore. Iron ore exported from Goa is sold under agreements negotiated by private businessmen. If the MMTC moves to canalize Goan exports, the terms of sales agreements would become subject to government approval and control.

In summary the Indian mineral industry showed neither a definite positive improvement nor negative decline during 1974. However, when viewed in the context of rampant inflation, massive food shortages, and the high unemployment which the country experienced, the fact that the mineral industry was able to hold steady may itself have been a sign of underlying strength. At yearend, however, it was questionable as to how long the situation in the minerals industry could remain stable in the face of such potentially destabilizing conditions.

## PRODUCTION

With the exception of aluminum, cement, and some ferrous group minerals, production of practically all principal mineral commodities in India increased during 1974 over that of 1973. In the ferrous group iron ore output dropped 1% to 35,306,000 tons while pig iron production declined to 6,627,000 tons. Production of ingot steel also declined during the year to 5,986,000 tons, a drop of 13% from that of 1973. Manganese ore production fell for the third straight year to 1,474,000 tons. One bright spot among the ferrous metals was chromite production which increased 36% to 393,718 tons.

Table 1.—India: Production of mineral commodities—Continued
(Metric tons unless otherwise specified)

| Commodity [1] | | 1972 | 1973 | 1974 [p] |
|---|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS—Continued | | | | |
| Petroleum—Continued | | | | |
| Refinery products—Continued | | | | |
| Other [e] | thousand 42-gallon barrels | [r] 29,341 | 16,747 | 23,610 |
| Refinery fuel and losses | do | [r] 5,965 | 9,711 | 7,173 |
| Total | do | 143,322 | 149,616 | 148,245 |

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, India also produces bromine, other clays (bentonite, fuller's earth, and common clay), other varieties of gem stones (aquamarine, ruby and spinel), uranium and natural graphite, but production data are not available.
[2] Apparently, production of industrial beryl has been terminated in India, with remaining output being confined to insignificant unreported quantities produced as a byproduct of mica production and relatively inconsequential output of gem quality material. No beryl has been reported among exports from India since 1967.
[3] In 1972, 341,000 metric tons of "nonsalable" crude kaolin was processed to provide 117,000 metric tons of "processed" kaolin produced; comparable nonsalable crude clay figures are not available for 1973 and 1974.
[4] Nitrogen content of ammonium sulfate, nitrophosphate and urea.
[5] $P_2O_5$ content of superphosphates only.
[6] Includes reinjected.
[7] Details on refinery production by product type are not available; estimates supplied are based on available information on refinery facilities. Data on refinery fuel and losses and on total refinery throughput are reported.

Of the nonferrous metals, the output of copper, lead, and zinc advanced while aluminum and bauxite production declined. Copper mine production climbed 38% to 20,100 tons of metal contained in ore while refined copper metal output decreased 2% to 11,782 tons. Mine production of lead ore increased to 9,147 tons of contained lead, while production of refined lead also increased to 3,986 tons. Zinc ore and metal both showed healthy production increases over those of 1973 with mine output climbing 26% to 19,257 tons of contained zinc and slab zinc production increasing 69% to 21,105 tons. Due principally to massive electric power cutbacks, aluminum output was the major disappointment among the nonferrous metals declining 16% to 128,913 tons. This in turn affected the demand for and mining of bauxite which fell 14% to 1,113,000 tons.

The largest percentage increase in mineral production over that of 1973 occurred in phosphate rock output which more than tripled to 433,545 tons. Of the other major nonmetals produced in India, limestone production increased 1% to 25,607,000 tons, crude mica production decreased 4% to 18,232 tons, while cement production fell slightly to 14,265,000 tons, a 5% drop from that of 1973.

In the fossil fuels group, coal, petroleum, and natural gas production all advanced over that of 1973. Coal and lignite output increased 7% to 86.3 million tons, gross natural gas production climbed 14% to 67,716 million cubic feet, and production of crude petroleum increased 1% to 55.7 million barrels. Output of refined petroleum products (excluding refinery fuel and losses) also advanced a percentage point to 141.1 million barrels.

## TRADE

Based on a conversion rate of 8 rupees per dollar, the total value of India's exports was $3.8 billion.[2] Of the total, India's mineral industries accounted for $618 million, or about 16%. The two largest export categories were metallic ores and scrap, and nonmetallic mineral manufactures. A total of $214 million was earned from exports of metallic ores and scrap during the year. This included $171 million earned from the export of 21.9 million tons of iron ore and concentrate, and $7.7 million for 1,036,075 tons of manganese concentrate. Approximately $161 million was earned from the export of nonmetallic mineral manufactures during 1974. This included the export of diamonds worth $118 million.

The total value of imports was $5.2 bil-

[2] Where necessary, values have been converted from India rupee (Rs) to U.S. dollars at the rate of Rs8=US$1.00.

lion during 1974. Imports of mineral industry materials and goods amounted to $2.7 billion, or about 52% of total imports. The high cost of petroleum was the largest factor in India's trade deficit with imported crude oil totaling $1.2 billion, and petroleum products costing $272 million. Payments for petroleum represented about 28% of total imports. Other large import costs resulted from the purchase of iron and steel valued at $474 million, manufactured fertilizers valued at $343 million, and nonferrous metals valued at $223 million.

## COMMODITY REVIEW

### METALS

**Aluminum and Bauxite.**—Production of bauxite was significantly lower in 1974 than in either 1973 or 1972. Total mine output reached 1,113,000 tons, 14% below the 1973 level. The reduced production reflected the diminished demand for bauxite brought about by operating problems at domestic aluminum smelters. While bauxite production was off for the year, there were reports of the discovery in Orissa of significant ore reserves. Although surveys suggested the possibility of up to 1.05 billion tons of ore, only 77.4 million tons were classified as proven reserves.

Domestic production of aluminum declined for the second straight year to 128,900 tons, a drop of 16% compared with that of 1973. Most of the decline was caused by an exceptionally poor year at India's largest aluminum smelter, the Hindustan Aluminium Corp. Ltd.'s Renusagar plant. Located in Uttar Pradesh, the smelter accounts for almost half of the country's aluminum capacity. The State Electricity Board stopped supplying power to the smelter in January and did not resume its normal delivery schedule until much later in the year.

Electric power shortages failed to dampen the ambitious expansion plans of India's aluminum industry. At the beginning of the year, existing installed capacity was 195,000 tons per year. To that total the public sector's Bharat Aluminium Co.'s Korba smelter was scheduled to add 25,000 tons of capacity in December. The firm, India's first public venture in aluminum smelting, plans to bring an additional 75,000 tons capacity onstream before completion of the plant. Other plans call for the construction of a 30,000-ton-per-year smelter in Orissa and expansion of capacity at three existing smelters, adding 65,000 tons per year capacity. At yearend the status of a second public sector smelter to be located in Ratnagiri, Maharashtra, was indefinite. Moving the site of the proposed smelter to Gujarat State, was under consideration.

**Copper.**—One of the largest measurable improvements in the Indian mineral industries in 1974 came in copper mine production where ore output increased 38% to 20,100 tons, metal content. Although this amount was insufficient to meet the country's total requirements, the figure indicated that some of the developmental projects undertaken over the past few years were beginning to come onstream. India's copper industry began receiving increased interest from government planners a few years ago when higher prices for copper imports began to add to trade deficits. With large reserves and a growing demand for the metal, policy shifted towards providing for increased self-sufficiency. The 1974 cop-

per mine performance was solid evidence that this policy shift had begun to materialize.

Of the four major copper districts in the country, historically the biggest producer has been the Singbhum Belt in Bihar State. Development and expansion work continued on various projects within the State during the year. The Rakha copper project, undertaken with Canadian assistance, was funded for $53.3 million. Completion of the first of the two phases planned for the project will boost copper ore production by 300,000 tons per year. Eventual plans call for the construction of a 20,000-ton-per-year smelter to be built at the site. Reserves in the area have been estimated as high as 85 million tons of ore containing 1.3% copper. The Mosaboni group of mines was also under development during 1974. Over $53 million was allocated to developing these mines. When completed, they should add between 4,000 and 5,000 tons of ore per day to the country's copper supply. Also in Bihar, it was reported that the concentrator capacity at the Ghatsila complex was being increased.

In the Rajasthan producing district, development work at the Chandmari mine continued. It was reported that planned production from the mine upon completion would be 150,000 tons of ore per year. Production began at the Khetri smelter, India's largest copper smelter, late in the year. The plant, established with French collaboration, has a planned capacity of 31,000 tons of copper per year. Preliminary estimates indicated that copper production at the smelter would increase from 2,400 tons in Indian fiscal year 1974/75 (April 1, 1974 to March 31, 1975), to 8,000 tons the following year. Full capacity utilization was planned by 1979.

In Madhya Pradesh State, development of the Malanjkhand deposits continued to be studied. The deposits, estimated to run as high as 70 million tons of 1.3% copper, will be developed with assistance from the U.S.S.R. Plans call for production of 1 million tons of ore per year by 1978. Development costs for the mine and concentrator were expected to run to $32.9 million.

The Karnataka Copper Consortium was organized during 1974 to develop copper mining and concentrating facilities at Kalyadi and Thinthani in Karnataka State. The consortium consists of the Chitradurga Company, Hatti Gold Mines Ltd., and Mysore Minerals Co. Up to 13 million tons of ore reserves were believed to be located between the two sites. Scheduled completion date for development work was planned for late 1975. Between 15,000 and 18,000 tons per year of concentrate are eventually planned to be produced from the deposits.

**Gold.**—Production of gold at the government-subsidized Bharat Gold Mines Ltd. was 57,905 troy ounces during fiscal year 1973–74, while output at the Hatti Gold Mines in Karnataka was 45,013 troy ounces of gold from 225,000 tons of ore during the same period.

**Ilmenite, Rutile, Rare Earths, Monazite, Zircon.**—Definitive production data for monazite, rutile, and zircon were not available because the Government withheld the information under provisions of its Atomic Energy Act and as a separate security measure concealed ilmenite output. However, India's production of these commodities has never taken full advantage of the large reserves which the country possesses. During the year indications were that this underutilization of resources may be about to change, as many plans were released showing intent to increase capacity for mining, processing, and pigment manufacturing operations associated with these commodities.

An Australian firm was reportedly conducting feasibility studies for a large scale deep mining operation of ilmenite deposits in the coastal areas of Quilon and Alleppey in Kerala State. Kerala Minerals and Metals Ltd. planned to expand its capacity to produce processed ilmenite ore from 20,000 tons to 230,000 tons per year.

The mineral sand separation plant operated by Indian Rare Earths Ltd. at Manavalakurichi reportedly was to be expanded to treat 500 tons of raw sand per day and produce 65,000 tons of ilmenite per year, while the company's separation plant at Chavara was to expand its capacity to 130,000 tons per year.

In attempting to reduce its $3 million per year import bill for titanium dioxide pigments, an item which could be manufactured at home using domestic ilmenite reserves, India announced approval of plans to construct a 50,000-ton-per-year chloride-processing titanium pigment facility at Quilon. Additionally, it was reported that India signed letters of intent with

three companies for other similar plants. Although the ultimate outcome of these plans and proposals remained uncertain, they were evidence of an increased attempt to make better utilization of valuable resources.

**Iron Ore.**—Iron ore output recorded a 1% decline from that of 1973 with production reaching 35.3 million tons. In other developments it was reported that the 140-million-ton ore deposit discovered in Tiruvannamalai, Tamil Nadu, graded about 35% to 40% iron. A feasibility study will be conducted on upgrading the ore to a concentrate containing 63% iron.

During the year work continued on planning and developing numerous new iron mines throughout the country. Shortly after it was announced that Japan would shelve its plans to develop the Kudremukh deposits located in southwestern India, Iran signed an agreement with India to extend $300 million in credit to revive the project. Present plans call for the low-grade ore to be converted to slurry at the mine site and pumped 50 kilometers to the port of Mangalore where it will be converted to beneficiated pellets and shipped to Iran. An ultimate production of 5 million tons per year was envisaged. It was also announced that Mysore Minerals Co. was granted a lease to develop the 125-million-ton ore reserve located at the Supa Dam site in Karnataka State. Meanwhile, work on two other important projects did not proceed as rapidly as previously expected. Work on Deposit No. 5 at Bailadilla in Madhya Pradesh, already 2 years behind schedule, may be delayed another 2 years. Delays in the delivery of mining machinery for the project have been substantial. Work at another major mining project at Donimalai also proceeded slowly during the year and the most optimistic reports suggested that production will commence no earlier than late 1976.

In addition to mine development projects, two new iron ore pellet plants to be built by Chowgule & Co. Pvt. Ltd. were reported to have been approved for construction during the year. One plant, with a 2-million-ton-per-year capacity, was planned to be built near Mormugao Harbor in Goa while the second plant with a 6-million-ton-per-year capacity will be built further south near Kudremukh

Progress was made on expanding harbors of the two port cities of Mormugao and Visakhapatnam during the year to accommodate greater tonnages of iron ore for export. Scheduled for completion in 1976, were the unloading, storage, and loading facilities under construction at Mormugao which would handle 14 million tons per year. A new mechanical ore handling plant with four piers for unloading ore bearing river barges was also under construction. The conveyor system which will receive ore from the barges will be automated and capable of simultaneously moving three grades of ore to the storage yard where seven stackers will be employed. Adjacent to the ore storage yard, two ship loaders will be installed for loading ore carriers at the rate of 4,000 tons of ore per hour each. Upon completion a 100,000-ton ship will be able to be loaded in 2 days.

Work also continued on the projected 12-million-ton-per-year Visakhaptnam Harbor project. Although originally scheduled for completion in May 1974, the project was uncompleted at yearend. Carriers of 200,000 deadweight tons will eventually load at the port.

There were several notable developments pertaining to Indian iron ore exports during 1974. Chowgule & Co. Pvt. Ltd. entered into a contract with United States Steel Corp. to sell 1 million tons of iron ore during a 4-year period beginning in October 1974. India's state-owned MMTC signed contracts to supply steel companies in Belgium, France, West Germany, and the United Kingdom with 1.5 million tons in 1974–75 and 2 million tons in 1975–76. With its principal customer, Japan, MMTC was able to renegotiate price increases ranging from $2.25 to $3 per ton under existing contracts. Goan exporters learned during the year that MMTC was considering "canalizing" Goan ore exports in the same manner that iron ore exports from the rest of the country are. This would mean that the private Goan exporters could no longer negotiate contracts or set prices; rather, this would be done through a central export agency.

**Iron and Steel.**—The overall performance of India's iron and steel industry was down somewhat from that of 1973, but the production decline was not spread evenly throughout the year. Coking coal shortages seriously disrupted steel production in the early part of the year and forced the closing of most production facilities at the Jamshedpur steel mill for

the first time in 67 years. Once coal deliveries improved, however, production picked up dramatically and during the second half of the year iron and steel were produced at record rates.

Total pig iron production declined to 6,627,000 tons and output of ingot steel dropped 13% to 5,986,000 tons. Of the total ingot production, the major integrated steel mills accounted for an estimated 4,900,000 tons while electric arc furnaces at "mini" mills contributed an estimated 700,000 tons of carbon steel to the total. Alloy steel production of about 400,000 tons provided the balance. Steel imports in all forms totaled slightly less than 1 million tons. Perhaps the brightest spot in the ferrous metals picture was an 11% increase in ferroalloy production to 193,000 tons.

Of the five integrated steel mills, Tata Iron & Steel Co. Ltd. (TISCO) in the private sector continued to be one of the country's most efficient steel producers despite an eastern region power shortage that lowered output at the mill to 75% of capacity during the early months of the year. The power shortage precipitated a request to the Government to allow importation of equipment necessary to increase the mill's captive generating capacity by 70% to 85 megawatts. Also during the year, a Government Steering Committee was considering whether or not to implement a report from Japan's Nippon Steel Corp. recommending the expansion of the mill's ingot steelmaking capacity from 1.5 million tons to 5.5 million tons.[3]

During 1974 an extensive rehabilitation program continued at the antiquated Indian Iron & Steel Co. Ltd. (IISCO) mill at Burnpur. A partial restoration of the plant's coke oven batteries during the year helped raise finished steel production slightly to about 400,000 tons. It was estimated that the coke batteries would be back to full performance by late 1975.

Although expanded to a capacity of 1.8 million tons of ingot steel, Hindustan Steel Ltd.'s (HSL) Rourkela plant failed to break the 1-million-ton mark producing only an estimated 800,000 tons of finished steel. An abundance of fines in the ore, the high ash content of coking coal, and electric power shortages contributed to the plant's poor performance during 1974.

HSL's Bhilai steel mill, India's most consistent public sector steel producer, accounted for approximately 40% of the country's salable steel production during 1974. Due to its consistent performance, it has been proposed to expand the mill's capacity from 2.5 million to 4 million tons of ingot steel per year. Principal additions provided for in the expansion plans include the installation of three Linz-Donawitz (LD) converters (125-ton-per-heat capacity), four continuous casting machines, two sinter machines, and the construction of an additional coke oven battery. Progress was also made during the year on expanding and mechanizing the iron ore mines which supply Bhilai.

Both supply and operating problems continued to plague HSL's Durgapur plant during 1974. Poor maintenance was reportedly responsible for expansion equipment being used in substitution for the plant's original equipment. Although the plant was able to increase its output of salable steel almost 40% to 520,000 tons, production was below the rated capacity of 1.6 million tons of ingot steel.

Crude steel production was formally inaugurated at the giant public sector Bokaro Steel complex early in the year. The event marked the culmination of 10 years of planning and construction that had gone into the erection of what will eventually be India's largest steel mill. Ingots produced at Bokaro were shipped to the TISCO mill at Jamshedpur and the Bhilai mill for further processing until Bokaro's own hot-rolling mills can be utilized. The mill has been planned for an ultimate capacity of up to 10 million tons of steel ingot.

During the year, India's electric furnace carbon steel industry drastically curtailed its previously rapid rate of growth. This industry added about 700,000 tons to the country's steel supply during the year, down from 1 million tons produced in 1973. Only 25% of the total rated capacity of approximately 2.8 million tons per year was utilized. Unlike India's integrated iron and steel producers which are predominantly nationalized, the country's electric furnace carbon steel producers are largely private concerns. When a heavy excise tax on scrap was combined with electric power shortages, a number of furnaces were forced to cut production or shutdown entirely.

The alloy and specialty steels industry increased production to an estimated 400,000 ingot tons during 1974. Power short-

[3] The Hindu (India) Survey of Indian Industry 1974, Section II. May 1975, p. 33.

ages, particularly in the northern producing regions, prevented the additional production of an estimated 50,000 tons. Government plans call for a large and rapid increase in the capacity of this segment of the iron and steel industry because it has been particularly vulnerable to imports.

Due to the relative scarcity of the investment capital required for construction of integrated iron and steel mills, electric arc furnaces and minimills continued to occupy important positions in future development planning. Correspondingly, since the country has only minor scrap iron supplies but large iron ore reserves, interest in direct-reduction sponge iron technology as a means of providing raw material inputs to these furnaces was high. It was reported during the year that the state-owned Gujarat Industrial Investment Corp. Ltd. was planning to establish a sponge iron plant with an annual capacity of 180,000 tons per year using gaseous reduction techniques. Gas was to be obtained from the Ramol oilfield in Gujarat and iron ore from either Karnataka or Goa.

It was announced that India developed plans to export steel valued up to $125 million to Middle Eastern countries during Indian fiscal year 1974–75. If implemented, this would almost double steel exports recorded during 1973.

**Lead and Zinc.**—Mine production of zinc ores and concentrates increased 26% to 19,257 tons of contained zinc in 1974. Slab zinc output of 21,105 tons was a 69% increase over that of 1973. Lead mine production climbed to 9,147 tons of contained lead, while refined lead production increased 51% to 3,986 tons.

New deposits of both commodities were located during the year. A deposit of lead ore totaling 4 million tons was confirmed in the Gurubhatra area near Sikkim and Bhutan. Also, an estimated 1-million-ton deposit of complex copper-lead-zinc ore was reportedly located in the Sirohi district of Rajasthan.

Work proceeded on expanding both zinc ore and metal production at Hindustan Zinc Ltd.'s (HZL) Zawar-Dabari complex. Zinc ore production would be increased an estimated 2,000 tons per day when the Balaria zinc mine project near Zawar is commissioned in 1976. Ore would be concentrated at the mine site and the concentrate shipped 25 miles to HZL's Dabari smelter near Udaipur. In preparation for handling the increased supply of concentrate, the smelter was expanded to a capacity of 30,000 tons during the year when a $2 million furnace was installed. Slab zinc capacity will be expanded by 30,000 tons per year when the Vizakhapatnam smelter, authorized by the Government during the year, comes onstream. It was reported that the first phase of reconstruction at HZL's lead smelter at Tundoo in Bihar was near completion. When completed, the smelter will have a capacity of 3,600 tons per year. An eventual total capacity of 6,000 tons is planned.

**Manganese.**—In 1974 manganese ore production was 1,474,000 tons valued at $10.1 million. The country's ferromanganese industry reportedly suffered acute shortage of carbon electrode paste which in turn hindered production.

It was announced that the Steel and Mines Ministry planned to progressively reduce manganese ore exports in order to conserve ores to meet growing demand within the country. During Indian fiscal year 1974–1975, exports of ores containing 35% to 45% manganese were to be held to 60% of their 1971–72 level.

**Nickel.**—India's first nickel plant was approved by the Government during the year. The plant, to be built at Sukinda, Orissa State, would have an annual capacity of 4,800 tons of electrolytic nickel when it comes onstream in 1978. Proven reserves of 10.6 million tons of 1.2% nickel ore located nearby will provide feed for the plant. Up to 200 tons of byproduct cobalt will also be recovered annually.

**Silver.**—The Indian Government legalized silver exports for the first time since 1968 in order to reduce its availability for smuggling.

**Thorium.**—The Orissa State Government was reported to have acquired 200 hectares of land for a thorium plant to be operated by Indian Rare Earths Ltd.

**Vanadium.**—The Steel Authority of India was evaluating a proposal to establish ferrovanadium production facilities in Orissa.

## NONMETALS

**Fertilizer Materials.**—Although capacity at Indian fertilizer plants was expanded to 3.2 million tons per year with the commissioning of new plants at Kalol and Tuticorin, capacity utilization was estimated to have been only 60%. Nutrient content of fertilizer production was about 964,000

tons while estimated total demand for fertilizers was 3.6 million tons. The resultant gap between domestic supply and demand was met by purchasing increasingly expensive imports and lowering agricultural production goals. Causes of production shortfalls were attributed largely to electric power cutbacks and labor disputes. Particularly hard hit was The Fertilizer Corporation of India Ltd.'s ammonia-urea complex at Durgapur where power restrictions threatened to close the plant.

In efforts to close the domestic supply-demand gap for fertilizers, progress and plans on constructing several new plants continued. Increased emphasis was placed on adopting coal-based fertilizer technology at new plants. In addition to the increased capacity resulting from the opening of plants at Kalol and Tuticorin, work commenced on expanding capacity at the Fertilizers & Chemicals Travancore Ltd. (FACT) plant at Ambalamedu. Construction at another new plant site located in Paradeep was also initiated. Other locations reportedly approved for new plants during the year included Sindri, Bhatinda, Panipat, and Kakinada. In addition to these projects, work was either under way or under evaluation on up to 12 other fertilizer plants.

Three projects receiving special attention from the Government included coal-based fertilizer plants at Talcher (Orissa), Ramagundam (Andhra-Pradesh), and Korba (Madhya Pradesh). The Talcher and Ramagundam plants were scheduled for commissioning in January 1976 while the Korba plant may not come onstream until late 1979. Although capital costs for coal-based fertilizer plants have exceeded those for plants based on fuel oil or naphtha feedstocks by as much as 40%, the coal technology installations became increasingly tenable as costs for the more traditional feedstocks rapidly escalated. India's abundant coal reserves made the new technology even more appealing. Interest was particularly high in the Ramagundam plant which will be the largest of its kind in the world. Approximately 1 million tons of coal will be consumed in producing 550,000 tons of urea per year. Pulverized coal will be gasified using the Kopper Totzek process. The raw gas will then be purified by use of the Rectisol process and converted to $CO_2$ gas. The Montecatini process will be used for ammonia synthesis and urea manufacture.[4] The Government was hopeful that experience gained from the new plants would prove valuable in setting up other coal-based fertilizer plants.

Imports of manufactured fertilizers reached 2.5 million tons during the year. Of the total, about 750,000 tons came from centrally controlled economy countries. Due to rapidly rising import prices and the Government's practice of absorbing 50% of the purchase cost in subsidizing domestic consumers, reports indicated that the Government might have to cut back its level of imports. Meanwhile, prices for domestic nitrogen, held down by government controls, were not yielding a return sufficient to attract needed investment capital. This forced the Government to increase domestic nitrogen prices between 75% and 90% in June. When the Government stiffly boosted the price of gasoline to curb demand so feedstock would be diverted to Naphtha production, the increased naphtha output was not absorbed by domestic fertilizer plants and was subsequently made available for export.

**Mica.**—Crude production of mica was 18,342 tons valued at $2.7 million during 1974. Exports of all mica products totaled 35,549 tons.

During the year, the Mica Trading Corp. of India (a subsidiary of MMTC) became the chief marketing agent for the country's mica industry. The new company has the responsibility for negotiating export contracts. The company also plans to discourage the export of relatively low value processed mica. Instead, exports of higher value products such as fabricated mica, reconstituted mica, and mica powder will be encouraged.

**Phosphate Rock.**—India's 1974 phosphate rock production was 433,500 tons valued at $4.3 million. During the year, the Government established a committee to study the techno-economic aspects of further developing the Jhamarkota phosphate rock deposits in Rajathan. Reserves measuring 35 million tons have been proven in the area.

## MINERAL FUELS

**Coal and Lignite.**—When the price of petroleum quadrupled, relatively coal-rich petroleum-poor India was forced into completely revising its national energy policies

[4] The New Sketch (India). V. 35, No. 14, Jan. 13, 1975, p 36.

and priorities. Accompanying these policy changes was a reorganization of the entire domestic coal industry bringing practically all mines under public ownership. During 1974 changed energy policies and a reorganized industry began to manifest themselves in positive terms as coal production increased 7% to 86.3 million tons. The industry also began taking some of the difficult steps necessary to deal with both short- and long-run obstructions to increased coal supplies.

During the year, a central planning organization was established within the Coal Mines Authority Limited (CMAL) to undertake development planning, design, and research. The organization, called the Central Mine Planning and Development Institute (CMPDI), undertook 24 feasibility project reports, 22 of which were approved for implementation. Included was a large project, prepared with Soviet assistance, which envisaged 13 open pit mines with an ultimate production capacity of 76 million tons per year in the Singrauli coalfield. Two large underground projects under study in the Raniganj Field called for an ultimate production of 10 million tons per year. Other studies, conducted with KOPEX (Overseas Mining Corporation of Poland), were aimed at reconstructing and reorganizing the vastly inefficient Jharia coking coalfields. All plans under consideration called for an increased amount of the total coal supply to come from more efficient open pit mines.

In addition to plans and feasibility studies aimed principally at opening up new coal mines, numerous other steps were taken during the year to boost productivity at existing mines above 0.6 tons per manshift. This low productivity figure comes from the fact that scarcely a dozen of India's coal mines are mechanized. Hence, a large effort was devoted to speeding mechanization of the mines. The Mining and Allied Machinery Corp. of India, a government undertaking, received orders worth $12.5 million for sophisticated equipment to modernize Indian coal mines. Coal mining equipment companies in Poland, the U.S.S.R., and the United Kingdom received orders for plants and equipment. In an attempt to strengthen a weak coal exploration program, CMAL reported that it would more than triple its number of drilling rigs from 17 to 54 by May 1975. To help accommodate the disruption that will occur when the influx of heavy machinery begins to impact on the coal mines, four training institutes were opened throughout the country to teach skills necessary to maintain and operate the equipment.

In addition to steps taken to increase coal supply through opening up new mechanized mines, Bharat Coking Coal Ltd. also considered methods of obtaining additional coking coal from existing mines through such methods as deepening mine shafts and increased pillar robbing.

During the year attempts were made to reinforce the coal industry's supporting explosives, electric power, and transportation services. Proposals were made to start new explosives factories at Ramagundam and Bhandara. The Damodar Valley Corp., the chief electric power supplier to the Bengal-Bihar coalfields, made plans to substantially increase its thermal generating capacity at Durgapur, Chandrapura, and Bokaro by 1979.

One of the largest impediments to increased coal supplies in the past was the tieup of coal-carrying rail cars at a large number of small inefficient railheads. This problem was at least partly rectified in 1974 as nationalization of the mines enabled CMAL to consolidate and reduce the number of railheads, thereby simplifying the coal collecting and loading situation. Efforts also were made to boost the amount of coal moved by ship to southern consuming districts. The Haldia port with mechanical facilities for handling up to 3.5 million tons of coal was to have been commissioned in 1974. New vessels were ordered for coastal coal trade in efforts to bring the gross registered tonnage of coastal vessels to a capacity sufficient to carry up to 5 million or 6 million tons of coal per year. Finally, the CMPDI was studying the possibilities of a slurry pipeline to transport coal from Kedla and the proposed Bamgarh washeries to Bokaro Steel.

Possibly the largest most complex problem area in the Indian coal industry showed virtually no improvement over the previous year's performance, as 43% capacity utilization equaled that of 1973. Total capacity of India's coal washeries was 26 million tons, sufficient to meet its present demands for washed coal. However, equipment problems kept most of the country's 14 washeries operating at less than one-half capacity. Plans revealed during

the year to build four new washeries in Sudamdih, Monidih, Ramgarh, and Kedla should help increase India's supply of washed coal over the long run.

**Petroleum and Natural Gas.**—During the year, increased costs for imported crude oil and refinery construction resulted in a slight shifting of the Government's interest from building expensive new refinery capacity to increased attention to developing a more self-reliant position in crude petroleum production.

*Government Actions.*—Numerous actions were taken by the Government in furthering its involvement in the domestic petroleum industry during 1974. In March, the Government acquired 74% ownership of Exxon's India operations. The remaining 26% interest will be purchased by the Government in 1981. Upon finalization of the sale, the company was renamed Hindustan Petroleum Corp. The Minister for Petroleum and Chemicals said that similar agreements with the country's two other foreign-based private oil companies, Caltex Oil Refining (India) Ltd. and Burmah-Shell Refineries Ltd., would be concluded as soon as possible. It was reported that the Government of India may seek full ownerhip in the Indian operations of these companies.

In other actions, the Government introduced a tax on indigenous crude oil production. Revenues from the tax were to be disbursed by the newly created Oil Industry Development Board. Reportedly most of the money would initially be used to help defer costs of offshore oil exploration.

*Exploration, Drilling and Crude Oil Production.*—Highly dependent on Middle Eastern imports for much of its crude petroleum requirements when large price increases were announced in 1973, India was forced into searching for new domestic fields. During 1974 the country's efforts to increase its self-sufficiency in crude oil began to pay off with the discovery of apparently large commercially exploitable deposits in the Gulf of Cambay off India's west coast in an area known as Bombay High. The Bombay High drilling was part of a large exploratory scheme in promising oil-bearing areas located both on- and offshore. Data collected from three wells drilled during the year indicated the presence of up to 1 billion barrels of high-quality crude oil. The Government was considering plans for drilling up to 200 production wells, each capable of producing over 2,000 barrels of crude oil per day. In addition to the Government's drilling in the Bombay High, two U.S. companies contracted to conduct offshore oil prospecting activities in the Gulf of Kutch and the Bay of Bengal. Although results of offshore drilling were encouraging, the country was having difficulties in obtaining the production rigs necessary to exploit the newly discovered fields. Once this problem is solved, the Government will have to face the expensive proposition of transporting crude oil to onshore refineries.

In addition to its ambitious offshore exploration program, India also attempted to intensify its onshore oil prospecting efforts. Both Oil India Ltd. and the Indian Oil and Natural Gas Commission (IONGC) increased their deep well exploration operations in the northeast provinces of Assam and Tripura. The IONGC also was reportedly drilling in 12 different sites throughout Gujarat. Other new exploratory wells were either being planned or drilled in the previously nonproducing states of Kashmir, Himachal Pradesh, and Rajasthan.

In efforts to increase its self-sufficiency with respect to exploration and development of domestic petroleum deposits, IONGC was developing a program to stimulate and encourage indigenous manufacture of different types of drilling rigs.

Crude petroleum production increased 1% over that of 1973 to 55.7 million barrels. Gross production of natural gas also improved over that of 1973 to a total of 67,716 million cubic feet, a 14% increase.

*Refining.*—Efforts to increase India's total refinery capacity slowed during the year as total utilization reached about 75% of capacity. Plans to build a 90,000-barrel-per-day refinery in Goa were reportedly canceled while no further work was done at a refinery construction site in Bongaigaon. High construction costs caused a reexamination of plans to build a 120,000-barrel-per-day refinery at Mathura. Meanwhile, work progressed on a new refinery at Haldia to a point where trial runs were made.

*Imports.*—India's crude oil imports totaled 103 million barrels during 1974, approximately two-thirds of the country's total crude requirements. Although exact figures were not available, Iran was believed to be the largest crude supplier. Saudi Arabia and Iraq were other principal

sources of crude imports. Imports of refined petroleum products amounted to 21 million barrels.

India's dependency on imports combined with large price increases resulted in yet another large outflow of the country's limited foreign exchange. Imported oil bills escalated from 13% of export earnings in 1972 to an estimated 40% in 1974. This led India into entering barter agreements, deferred payment plans with reduced interest rates, and joint ventures in order to lessen the impact of increased oil prices on the country's foreign exchange accounts. The largest contract of this type was made with Iran. Terms of the contract call for India to pay $3.50 per barrel cash for its Iranian oil purchases with an additional payment of $6.50 per barrel due at the end of 5 years at a 2½% interest rate, an effective 25% savings on current market prices.

India also planned or contributed to numerous joint ventures aimed at finding or developing oil deposits in foreign countries during the year. India shared production of certain Persian Gulf oilfields with Iran and entered exploration agreements with Libya, Iraq, and Romania.

# The Mineral Industry of Indonesia

By Walter Pajalich [1]

Indonesian mineral policy rests upon the principle that minerals are the property of Indonesian people. With this orientation, a balance has been sought between the working environment necessary to attract foreign investment at the desired level and at the same time maximize Indonesian control and income from mining operations.

Mineral Law No. 11 on the Basic Provisions of Mining, passed in 1967, reopened Indonesia to large-scale foreign investment. Agreements executed under this law expanded the Nation's earnings from mineral resources and set the pattern of cooperation with foreign investors. Individual mining companies were given rights to explore and exploit specific minerals within defined areas. The contracts defined the companies' obligations and privileges throughout the survey, exploration, and production stages in such matters as relinquishment, employment and training of nationals, tax obligations or privileges and transfer of funds.

However, contracts concluded since 1967 have progressively broadened the benefits to Indonesia and narrowed the privileges of foreign firms. Provisions of the latest contracts provide for the offer of share participation to Indonesians and commit contractors to obtain their supplies from domestic sources to the greatest possible extent, provide amenities for the communities in which they operate, and maximize employment and training for Indonesian citizens. Processes underway to alter the provisions of the Contracts of Work may be why no new contracts have been signed. It is reported that there are 22 pending applications.

A change in the organizational form of existing State mining enterprises is in progress which would give them fuller control of their own budgets and authority to take part in joint ventures. The new energy policy calls for development of alternate forms of energy with emphasis on reviving the use of the country's vast coal resources in place of oil in order to maximize oil exports. There is also a growing interest in the generation of power from geothermal energy, hydroelectric plants, and nuclear reactors.

New financial wealth has given Indonesia better bargaining position with foreign investors. This is not only true with new incoming investors but the feeling is that old Contracts of Work could be renegotiated.

Indonesia has been successful, after several years of negotiation, in obtaining an agreement for building the enormous Asahan hydroelectric and aluminum smelting project in Central Sumatra. Their bargaining leverage was strong enough to give the Japanese a 30-year license before the project is nationalized.

The January 1974 riots stimulated a series of policy announcements that will effect foreign participation in Indonesia's mineral development. These announcements indicated that the Government of Indonesia is prepared to accept some reduction in volume of foreign investment if needed, in order to better direct the remainder toward national objectives. The decisions of general application would require 51% Indonesian participation in any venture involving foreign direct investment. Implementaton of this provision in the mineral field would involve participation of the State mineral enterprises.

The new policy has encouraged the Department of Mines to try various programs to build up Indonesian-owned mining enterprises. One of the ways the Department

[1] Mining engineer, Division of Nonmetallic Minerals

hopes to achieve this is by limiting foreign participating interest only to those mineral activities where the foreign investors' financial, technical, and marketing resources are clearly needed. No further Contracts of Work will be granted to foreign companies for coal, tin, lateritic nickel, bauxite, iron sands, alluvial nonmetallic minerals, or manganese mining in Java, Madura or Bali. At the same time the Department is encouraging Indonesian miners with direct and indirect assistance. In connection with this, foreign investors will be excluded from projects capitalized at less than $5 million and from projects smaller than $10 million on Java and Bali.

## PRODUCTION

Production of the major mineral commodities—oil, copper, iron sands, and tin—increased substantially. Increases in crude oil production were primarily due to expansion of exploration and development programs by foreign contractors. World demand and increases in prices made oil the most important item in the economy of Indonesia. Of the nonfuel minerals, the most dramatic increase was in the production of copper concentrates, which increased about 41% over the 1973 production. This was followed by iron sands with an increase in production of 23%, tin metal 3%, bauxite 5%, and nickel 1%.

e Estimate. p Preliminary. r Revised. NA Not available.
[1] In addition to the commodities listed, a variety of crude construction materials (such as clays, stone, sand, and gravel) are also produced, but available information is inadequate to make reliable estimates of output levels.
[2] Officially reported Indonesian statistics representing government output; private production by small unorganized producers may be as much as 30,000 troy ounces per year. Some gold recovered from copper concentrate.
[3] Includes a small amount of cobalt which is not recovered separately.
[4] Some silver recovered from copper concentrate.
[5] The limestone figure is understated by the considerable amounts of limestone produced by enterprises under local jurisdictions for building materials, for crushed rock to be used as aggregate, and to burn for lime.
[6] Sulfur produced by other than Frasch process.

## TRADE

Mineral commodity exports during 1974 accounted for more than half of the value of total export trade. Crude oil and refined products were the most significant mineral exports. The high world oil prices increased export earnings from this mineral fuel about 70%. Export earnings from tin and copper concentrate increased 49% combined, nickel ore 21%, and bauxite 3%.

Japan continued as a major customer for mineral exports and was a major supplier of mineral commodities to Indonesia. The main mineral imports were cement, manufactured fertilizers, and iron and steel products.

**Table 2.—Indonesia: Exports of mineral commodities**

[2] Includes artificial graphite.
[3] Includes peat.
[4] Included in coal.

## COMMODITY REVIEW

### METALS

**Aluminum.**—The State-owned mining enterprise, P.N. Aneka Tambang, is the only company mining bauxite in Indonesia. The ore from the Kijang mine on Bintan Island in the Riau Archipelago is exported to Japan. Ore shipped contains 52% to 53% $Al_2O_3$ and about 10% moisture. A contract signed late in 1973 between the Indonesian Government and Japanese aluminum companies, Sumitomo Chemical Co., Ltd., Nippon Light Metal Co., Ltd., and Showa Denko K.K., calls for an increase in bauxite shipped to Japan from the current 1.1 million to 1.3 million tons per year. The new contract calls for shipments through 1983 instead of the originally planned 1978 expiration. Reserves of higher grade ore are limited and the company has been exploring and developing reserves of lower grade ore. A study for the construction of an alumina plant, in partnership with a group of Japanese aluminum producers, has been going on since 1972. The project would involve an investment of $200 million to $300 million and the plant would have an annual capacity of about 350,000 to 400,000 tons of alumina. Reportedly this alumina would be smelted in the Asahan complex when completed.

P.T. Alcoa Minerals of Indonesia (ALCOMIN) a wholly-owned subsidiary of the Aluminum Company of America (Alcoa), has confirmed bauxite reserves in Western Kalimantan large enough to support an alumina plant. The original 525 million hectare ALCOMIN contract area has been reduced to 1.3 million hectares. The ALCOMIN project is expected to process over 2 million tons of bauxite per year to produce 800,000 tons of alumina.

It appears that an argeement has been reached between the Japanese aluminum partners and the Indonesian Government regarding the Asahan River hydroelectric and aluminum refinery. The hydroelectric plant will have an initial capacity of 430,000 kilowatts and will be able to operate at a capacity of up to 644,000 kilowatts. The aluminum refinery, with a yearly output capacity of 225,000 tons, will be built in Kualatajun, 120 kilometers from the powerplant. It will be built in three stages each with a 75,000-ton output capacity. Production from the first stage is expected by 1982 and will be raised to 225,000 tons by 1984. Production may eventually be raised to 360,000 tons. Including construction cost of the powerplant, the entire cost of construction is estimated at $830 million. Preconstruction negotiation in the last part of the year should pave the way for signing of the formal contract between the two parties sometime in 1975.

**Copper.**—The third aerial tramline from Freeport Indonesia Incorporated's Ertsberg copper ore body to the 7,000-ton-per-day flotation mill was put in operation. Two of the three trams are used for ore and the third for personnel. With the new tram and improved crushing and flotation, the operation reached the designed capacity of 250,000 tons of concentrate per year. Japan was the principal consumer of Freeport's copper concentrate. Small amounts were shipped to West Germany.

P. N. Aneka Tambang was doing exploratory drilling for porphyry copper at Gunung Gebe (near Bogor), and geologic investigation in South Sumatra and West Kalimanta.

P.T. Tropic Endeavour Indonesia, a subsidiary of the Australian firm Endeavour Oil Company N.L., formed a partnership with P.T. Kennecott Indonesia to do geologic exploration for copper in Endeavour's Sulawesi Block 2 contracted area of exploration.

**Gold and Silver.**—The Indonesian Ministry of Mines announced that a group of foreign companies, one British and four Australian, applied to enter into joint ventures with Indonesian companies to explore for gold. The best exploration prospects were said to be in south Sumatra, West Java, and the central part of west Irian.

The only gold and silver production in Indonesia came from Aneka Tambang's two underground operations—Cikotok and Cipicung. Favorable gold prices have prolonged the life of these operations.

**Iron and Steel.**—The iron and steel industry in Indonesia was made up of small mills with a capacity range from 5,000 to 25,000 tons of product per year. The raw material, mostly local or imported scrap or ingot, was melted in 5- to 10-ton electric arc furnaces and cast into billet size ingots. These were processed into reinforc-

ing bars, strip, pipe, nail wire, and galvanized sheets. Domestic production of steel was capable of meeting 40% of domestic demand. Indonesia has no significant amount of high-grade iron ore or metallurgical coke for the establishment of a basic iron and steel industry.

With the proximity of Indonesia to the abundant supply of Australian iron ore and metallurgical coke, national policy was aimed at developing a basic iron and steel industry with imported raw materials.

The Gutehoffnungshütte Aktienverein unit of the West Germany company Ferrostahl AG planned to commence work on a DM300 million steel works in Indonesia. The proposal called for a 500,000-ton-per-year plant to be constructed 80 miles from Jakarta. Production was scheduled to commence in 2 years with an anticipated capacity of 1.2 million tons per year in 3 years. The steelworks will be managed by a joint group, 20% of which is owned by the West German firm and 80% by P. T. Krakatau Steel Co. of Indonesia a subsidiary of the State-owned enterprise Pertamina.

Nippon Steel Corporation and four other steelmakers and four trading firms have come to an agreement with Krakatau Steel to jointly establish a reversing mill with an annual production capacity of 300,000 tons of cold-rolled sheet. The location of the mill will be in the Meraku area of western Java. A joint firm set up by the Japanese and Indonesian partners will operate the mill after it is completed in 1977. Construction will begin when the Indonesian Government approves the project. The reversing mill has been under consideration for several years because the four galvanizing sheet producers in the country have had to import cold-rolled sheet from Japan. The reversing mill will enable Indonesia to use hot-rolled sheet in coil which is more reasonable in price than cold-rolled sheet. Eventually the mill is to be taken over by the proposed integrated steel mill project in western Java.

A pending agreement between the Japanese firm of Toshin Steel Co., Ltd., and an Indonesian company would establish a joint venture for a mill to produce bar steel with an initial capacity of 5,000 tons per month. The Japanese would supply 55% of the $6 million capital, and the Indonesian company would provide the remaining funds. The agreement also calls for a 50-ton open hearth furnace. Steel scrap for the open hearth would be imported from Australia by a subsidiary firm of Budi Darma.

Hojalata y Lámina, S.A. announced the sale of its patented HyL process to P. T. Krakatau Steel Co. A steel producing facility is expected to be erected near Jakarta and to be completed by 1976.

Aneka Tambang continues to mine titaniferous iron beach sands along the south coast of Central Java. The 10-year sale contract, with Nippon Kokan K.K., was in its 4th year. Production has not yet reached the planned 300,000 tons per year. Several direct reduction processes were under consideration by Aneka Tambang for these iron sand deposits.

**Manganese.**—All of the manganese production came from many small-government sponsored mines in Jogjakarta, west Java. Hand-sorting methods were used to separate manganese ore from the laterite in which it occurs. Of the many mines only two were in production. The West Java Mining Company in Bandung coordinated some of the sales and purchasing activities. Most of the 11,000 to 12,000 tons of yearly production went to Japan. A new prospect in northern Maluke was being considered for development.

**Nickel.**—Aneka Tambang was the only producer of nickel ores in Indonesia. The Pomalaa mine is located on South Sulawesi, near Kendari. Aneka Tambang's program included the production of ferronickel using the lower grade Pomella ores. Construction of a $32 million Japanese financed ferronickel plant was started, and production was expected sometime in 1976. The plant will produce 20,000 tons of ferronickel per year. Aneka Tambang was exploring other low-grade nickel deposits in Southeast Kalimantan.

P.T. International Nickel Indonesia (PT INCO), a subsidiary of the International Nickel Co. of Canada (INCO) with six Japanese partners, has initiated construction of mining and processing facilities to produce 75% nickel matte from the lateritic ores in its contract area near Soroako, Central Sulawesi. The output of the plant was committed to three of the Japanese partners for 15 years. Improvement of the pyrometallurgical process, to which the ores have been submitted, has permitted an upward revision of output projections from 30 to 35 million pounds of nickel content

annually. PT INCO employed more than 1,000 persons, almost all of them Indonesian citizens. This figure should peak at 1,300 in 1975 and stabilize at 1,100 when the plant is in production. PT INCO investment projections for phase one of the project were revised to $169 million from the original $135 million figure. The company was considering the possibility of expanding production of the second phase to a level of 90 million to 100 million pounds nickel content annually. Also hydroelectric potential was being considered as the project's energy source instead of petroleum. PT INCO held 18% of its original 6.6 million hectare contract area and was continuing its systematic exploration program on the remaining property.

About 700 miles to the northeast of Sulawesi, near Bird's Head of Irian Jaya, on Gag Island, P.T. Pacific Nikkel Indonesia has completed initial exploration and feasibility studies of its nickel-bearing laterite project. P.T. Pacific Nikkel (a consortium of United States Steel Corp., Internatio-Müller N.V., Koninklijke Nederlandsche Hoogovens en Stalfabrieken, N.V., Newmont Mining Corp., and Sheritt Gordon Mines Ltd.) has spent over $30 million since 1968 in developing this deposit. The refinery was expected to produce 100 million pounds of metallic nickel and a small amount of cobalt annually. The cost of the project was estimated at $700 million. Engineering, design, and procurement activities have been brought to the point where infrastructure and facility construction can readily be undertaken. The pace of the project has been slowed down because of high fuel prices, supply problems and finances needed for the project. However, construction on the site preparation continues. The Indonesian Government may decide to take an equity position in the venture, a development which would help resolve the complex financial problems inherent in a project of this magnitude.

Japanese ferronickel producers have agreed to increase the price they pay for nickel ore exported by Aneka Tambang from its deposit on Sulawesi Island. The price increase was 9.92 cents per kilogram of contained nickel in the ore. The grade of the ore under contract was 2.7% nickel. Actual shipments averaged about 2.4% nickel.

**Tin.**—The State-owned P.N. Tambang Timah was the only company that could market and produce metallic tin in the country. Three other companies have been permitted to obtain rights to explore and develop mineral resources on the basis of Contract of Work agreements. Of the three, P.T. Koba Tin is the only one which has started mining.

Most of the Indonesian tin was sold to Europe with small amounts going to Japan and the United States. Domestic consumption was less than 3%.

To provide a steady income, two-thirds of Timah production was marketed under long-term contracts and the remainder was sold on an individual basis for the best price. The company had 47 dredges. There were 34 bucket dredges ranging in size from 5 cubic feet to 18 cubic feet. The largest bucket, *Banka I,* is 18 cubic feet. The remaining 13 dredges were cutter suction dredges.

Timah has decided to proceed with the design and construction of *Banka II* which will supplant *Banka I* as the flagship of Indonesia's tin-dredging fleet. It was scheduled for operation in 1977. W. Payne & Son, the British consulting firm, was designing the dredge. This same firm designed the *Banka I* dredge.

*Banka II* will be able to dredge to a depth of 50 meters below the waterline, with buckets of 22-cubic-foot (625-liter) capacity. Based on a 600-hour working month and dredging at 75% capacity, the *Banka II* will have an approximate throughput of 575,000 cubic yards per month (about 6.9 million cubic yards per year). Although no cost figures have been made public of the anticipated cost of *Banka II,* it was expected to cost more than 2.8 million pounds sterling. The cost of the new dredge is expected to be financed completely by Timah.

Timah's 5-year exploratory program was successful. Sufficient ore reserves were found to extend the life of Timah's operation for an additional 20 to 30 years. Some of these reserves lie in water more than 60 meters deep. Timah's Peltin tin smelter at Mentok, Banka Island, which has never exceeded 65% of its designed annual capacity of 25,000 long tons, was being expanded. The new facilities will use conventional reverberatory stationary furnaces of Danish design. With the additional facilities, the smelter's capacity will be 28,000 long tons of tin per year by 1975.

P.T. Broken Hill Pty. Indonesia in their

Contract of Work in 1971 agreed to explore and evaluate the underground tin mine of Kelapa Kampit. Kelapa Kampit was flooded in 1942 during the Japanese occupation of Indonesia. Before it was flooded, it produced 2,000 tons of concentrates per year. Under the present program the mine was dewatered and part of the underground workings were rehabilitated. A sufficient number of workings have been started to feed a 100-ton-per-day pilot plant. Mining and bulk sampling for testing was scheduled for 1975.

## NONMETALS

**Cement.**—Because of the rapidly rising demand for cement, Kaiser Cement & Gypsum Corp. and its Indonesian affiliate, Cibinong Cement Co., were planning to expand their partially completed cement plant near Bogor in West Java to about 1 million tons per year. Completion of the plant was scheduled for 1977. The initial phase of the plant, under construction since 1973, was expected to be completed in the second half of 1975. The estimated cost of the first phase of the plant was $41 million. Kaiser Cement owns 51% of Cibinong Cement. International Finance Corp., P.T. Semen Gresik of Indonesia, Bamerical International Finance Corp. (a subsidiary of Bank America Corp.), and Private Investment Co. of Asia (PICA) are the other shareholders of Cibinong Cement.

There were three plants in production: Gresik at Surabaya; Padang in Central Sumatra; and Tonasa in South Sulawesi. Gresik was preparing to double its yearly capacity from 500,000 to 1 million tons within the next few years; Padang, from 220,000 tons to 330,000 tons by 1975; and Tonasa from 120,000 tons to 500,000 tons by 1978.

**Diamond.**—Almost all Indonesian diamonds were mined in Kalimantan from alluvium by individuals who used mainly hand-panning methods. They sold through unofficial channels to foreign buyers.

Aneka Tambang has been exploring the alluvial deposits at Talang Intam Cempaka Putih, South Kalimantan. Results during the past 5 years have not been favorable. Consideration was being given to ending this program.

The only foreign private venture in diamond mining, P.T. Asia Tigor, with a contract area in South Kalimantan, has reported no activity since signature of its contract in 1971.

**Fertilizers.**—The State-owned enterprise P.N. Pupuk Sriwidjaja (Pusri), producing triple superphosphate at Palembang, Southern Sumatra, has contracted with M. W. Kellogg Overseas Corp. to build a 1,000-ton-per-day urea plant. Contracts for fertilizer plant construction with Kellogg now total $150 million. M. W. Kellogg has already completed 660-tons-per-day ammonia and 1,150-tons-per-day urea facilities for Pusri.

**Other Nonmetallic Minerals.**—Other industrial minerals were chiefly mined on a small scale by small private or mixed enterprises for domestic use.

State-owned enterprises have a legal monopoly in the production of iodine and in the quarrying of marble. P.T. Kimia Farma, under Health Department authority, extracted small amounts of iodine from brines in Java, solely for the domestic market. Kimia Farma was reported to have submitted an application to the Capital Investment Coordinating Board to launch a joint venture with Japanese partners Mitsui & Co. and Ise Chemical Industries Co., Ltd. in the manufacture and marketing of iodine and derivatives. P. T. Marmer, under the Department of Industry, has been operating marble quarries in Kediri, East Java.

Phosphates were found in limestone caves in Java, and occurrences were recently reported in Kalimantan. The volcanos of Indonesia were the source of sulfur production averaging about 2,000 tons per year from small, scattered deposits. Volcanic trass was mined on a small scale in Java. Clay and kaolin occur on the tin islands and mainly supply the domestic ceramic industry. Kaolin production has averaged 26,000 tons per year. About 6,000 tons were exported. Timah was considering new ventures involving exploitation of kaolin for export and of clay for the domestic ceramics industry. Numerous small private mines on the tin-producing islands and on Java near Jakarta and Surabaya have produced about 55,000 tons per year of quartz sands for the domestic glass industry.

## MINERAL FUELS

**Coal.**—The 2-year agreement between N.V. Shell Mijnbouw of the Royal Dutch/

Shell group and the Indonesian Government's State coal mining enterprise P.N. Batubara signed in November 1973, called for $1 million per year for coal exploration in a 71,000-square-kilometer area in Ombilin coalfield in West Sumatra. Drilling which started in July was suspended in December because of near surface gas pocket blowouts. During this period 250 exploratory holes were drilled, some to a depth of 450 feet. Drilling of additional 500 to 600 holes was expected to be resumed in the first part of 1975 after installation of blowout arrestors. The exploration agreement called for relinquishment of 75% of the area by June 1, 1975, and an additional 15% by June 1981. Results have been encouraging enough for Shell to indicate that the deposit is large enough to sustain an operation of 25 million tons of coal per year. Shell was negotiating a profit-sharing contract for the development of the deposit.

Mining of Ombilin coal has been going on for over 50 years. Lack of markets and inaccessibility has limited production. The railroad that connects Ombilin and the western Sumatra seacoast port of Palembang is a narrow gauge cog railroad incapable of transporting any substantial tonnage of coal to markets. Upgrading this railroad has been deemed too costly and a slurry pipeline to the coast was under consideration.

Indonesia's second 5-year plan (1974–79) was to increase coal production and to encourage its substitution for domestic uses in place of higher priced oil and gas. Production for domestic uses will remain the responsibility of Batubara while two foreign-owned companies now active in coal exploration, Rio Tinto-Bethlehem and Shell, will develop large-scale operations for export.

**Petroleum.**—Indonesia was the tenth largest crude oil producer among the market economy countries of the world. Its low-sulfur crude was in demand by two major industrial nations, Japan and the United States. Four percent of U.S. oil imports were from Indonesia. The oil policies of Indonesia influenced the development of oil industries in other Southeastern Asian countries as a result of the success of the Production Sharing Contracts pioneered by Pertamina, the State-owned oil company.

Petroleum exploration and development expenditures were increased from about $78 million in 1969 to an estimated $546 million in 1974. This high level of expenditure was expected to continue to increase and will undoubtedly result in additional discoveries, rivaling those already discovered. Indonesia exported 71% of its crude production to Japan, 22% to the United States, 5% to Trinidad, and 2% to other countries.

U.S. interests played a very important role in the development of Indonesia's petroleum sector. There were 25 U.S. oil companies in Indonesia. Of these companies, Caltex Petroleum Corp. accounted for over 70% of Indonesia's crude oil production.

Over 30 companies have signed agreements with Pertamina for exploration and production operations. Three Contracts of Work were signed prior to 1967 and 53 Production Sharing Contracts have been signed since then.

Indonesia's Production Sharing Contracts were an innovation in contractual relationships between a foreign company and a State enterprise. Under the contractual agreement Pertamina was to be capable of phased assumption of responsibility of management of the foreign oil company operations. Pertamina and the contracting companies shared the problems and benefits of their activities.

The Production Sharing Contract was working well in Indonesia and the principles of the agreement were being adopted by other countries in the world especially those in Southeast Asia.

The petroleum sector contributed about 7% to Indonesia's gross national product and accounted for about half of its gross export earnings and a very substantial part of its total investment expenditures. As a result of increasing production, rising prices, and modification of Work and Production Sharing Contracts, the Government's gross foreign exchange from oil exports are expected to increase more than 200%. The net foreign exchange earnings should increase about 375%.

Foreign oil contractors spent about $550 million in 1974 on oil exploration and production. It was estimated that the oil industry will spend $55 billion in Asia between 1975–85 compared with $23 billion in the Middle East. Pertamina's budget for 1974–75 was estimated at $1.7 billion. During the past year over 200 exploratory wells were completed. This was about 23% more

than in the previous year. Footage drilled increased 34%. Extension and development drilling was completed on 449 wells. Pertamina reported 50 oil and gas discoveries giving a 25% success ratio. Of the various discoveries, 28 were oil, 19 were gas, and 3 were oil and gas discoveries. Indonesian oil reserves were estimated to be about 12 billion to 15 billion barrels.

The high success ratio, the workability of the Production Sharing Contract, the low sulfur content of the crude, increasing energy demand, and high oil and gas prices will keep the foreign oil company interests high in Indonesia. Although millions of square miles of onshore and offshore areas, representing about 90% of the oil-prospecting area, have been allocated to various companies, only about 10% of the area has been explored. Of the total 5.1 million square kilometers of the prospecting area about 1.7 million square kilometers (33%) is located onshore and 3.4 million square kilometers (67%) is offshore.

Pertamina has signed a Production Sharing Contract with Sun Oil Company (Sunoco) for a 16,360-square-kilometer area in the northwestern part of Irian Jaya just north of Bintuni Bay. The contract called for Sunoco to relinquish approximately two-thirds of the area over the first 10 years and make an $11 million exploration expenditure over an 8-year period. The contract also called for a 65% Pertamina, and 35% Sunoco oil production split of up to 75,000 barrels per day. After Sunoco's production exceeds 75,000 barrels per day, they have agreed to invest in a refinery or a petrochemical plant. The agreement offers a 10% participation on a cost basis to Pertamina or an Indonesian party recommended by Pertamina. This made the 52d Production Sharing Contract that Pertamina has signed.

The 53d Production Sharing Contract was signed with Katy Industries, Inc. (KII), covering 6 million acres in Southeast Kalimanta. Katy Industries, Inc., announced that Union Oil, which will be the operator, acquired 80% of the company. This new contract has much more favorable terms for Pertamina than previous agreements. Pertamina was to receive a $10 million bonus for data and their signature, basic 70% to 30% production split in favor of Pertamina, up to 80% to 20% split when production exceeds 300,000 barrels per day, and relinquishment of almost 80% of the area at the end of 10 years.

Phillips Petroleum Co. discovered a new oil well which produced 12,000 barrels of crude per day in the Berau Gulf, West Irian. Pertamina and the Continental Oil Co. group discovered an offshore oil and gas deposit in 267 feet of water and 220 miles east of Natuma Islands in the South China Sea. The well named Trubuk 2 produced 24 million cubic feet of gas and 4,320 barrels of oil per day. Atlantic Richfield Co., operator for a group of American companies, in association with Pertamina, announced the discovery of an oil and gas find 100 miles northwest of the Ardjuna Field and 70 miles northwest of Jakarta offshore in the Java Sea. The oil zone is between 3,200 and 3,600 feet in depth. From one zone gas flowed at rates from 8.2 million to 11.6 million cubic feet per day. Below the 3,600-foot level two other intervals produced oil and gas at lower flow rates.

Union Oil Company of California, in association with Pertamina, discovered a new oilfield and gasfield 7 miles off the coast of Balikpapan, East Kalimantan. Oil flow was about 7,700 barrels per day and gas was about 21 million cubic feet per day.

Asian American Exploration Refining Association (Asamera) announced that a well drilled in the east flank of its new Tualang oilfield in Northern Sumatra has resulted in a new field discovery. The well showed four producing zones.

Japanese Petroleum Exploration Co., Ltd. (JAPEX), and Total Indonesie announced a new gas discovery in the Mahakam area offshore east of Kalimantan. The exploratory well, Tambora No. 1, tested 21 million cubic feet of gas per day. The flow came from two separate zones below 2,700 meters.

A liquefied natural gas (LNG) plant was planned to use the oil and gas from the Arjuna oilfield. The plant's production capacity was expected to be 25,000 barrels per day. The natural gas from the field also was planned to be used as fuel for the 2-million-ton direct reduction steelmaking facility at Cilegon. The 24-inch pipeline from the oilfield to Cilegon will cover a distance of 220 kilometers and will cost about $200 million. A Japanese consortium headed by Nippon Steel Corporation has reportedly signed the contract to construct the pipeline. Now under construction, the

pipeline was scheduled for completion by the end of 1976.

Pertamina was planning to set up petrochemical facilities in Plaju and Sungaigerong. The products will be synthetic fibers and other materials for making textiles. The anticipated cost of the plant was $500 million. Construction will be undertaken by the Commonwealth Oil and Refining Company of Puerto Rico.

# The Mineral Industry of Iran

By Bernadette Michalski [1]

The fourfold increase in petroleum prices that evolved in late 1973 had an overwhelming impact on the Iranian economy in 1974, the first full year of the $11.88 and $11.64 per barrel posted prices for Iranian crude. Government revenues realized from the production and sale of hydrocarbons leaped to $18 billion [2] in the Iranian year 1353 (March 1974 to March 1975) as compared with revenues exceeding $4 billion in the previous 12-month period.

With additional revenues in the form of petrodollars at its disposal, the Government of Iran undertook a revision of the Iranian Fifth National Development Plan covering the period from March 1973 to March 1978. The revised plan provides a firm financial basis for industrial diversification by allotting $70 billion for development, a figure nearly double the original allotment. Under the revised plan, nearly $12 billion was allocated for the petroleum and natural gas industries; $6 billion for metal refining and petrochemicals industries; and $1 billion for mining industries, particularly development of the Sar Cheshmeh copper deposit and the Gol-e Gowar iron ore deposit. Mineral supporting industries such as transportation and power generation were allotted $7 billion for road, rail, and port expansion and $4.6 billion for construction of power generation and distribution facilities.

During the year, the Government of Iran entered into massive purchasing contracts with France, the United Kingdom, and Italy. The combined contracts approached $8 billion in value. The largest transaction, valued at $5 billion, was concluded with France and included the purchase and installation of five nuclear powerplants, construction of a steel plant, and construction of petroleum and natural gas pipelines.

Additional petrodollars were channeled to Western Europe by Iran's purchase of approximately one-quarter interest in a major steel firm, the Friedrich Krupp Hüettenwerke AG (West Germany). Throughout 1974, Iran continued to exert its influence as a member of the Organization of Petroleum Exporting Countries (OPEC) for additional petroleum price increases to sustain its ambitious investment and development program.

## PRODUCTION

According to the National Iranian Oil Co. Ltd. (NIOC), crude petroleum production was valued at an estimated $26 billion dollars. Although petroleum operations dominated Iran's mineral industry, the Nation produced a variety of minerals as indicated in table 1. The significant increases reported in the production of most metal and construction materials were the result of continued government efforts to encourage development of a diversified economy. Aluminum production is based on reduction of imported alumina. Other primary metal production was derived from indigenous ores in 1974.

[1] Mineral specialist, Division of Petroleum and Natural Gas.

[2] Where necessary, values have been converted from Iranian Rials (Rls) to U.S. dollars at the rate of Rls67.50=US$1.00.

## Table 1.—Iran: Production of mineral commodities

(Metric tons unless otherwise specified)

| Commodity [1] | 1972 [2] | 1973 [2] | 1974 p [2] |
|---|---|---|---|
| **METALS** | | | |

e Estimate. p Preliminary. r Revised. NA Not available.
[1] In addition to the commodities listed, other types of crude construction materials (such as common clays, sand, and gravel, and other varieties of stone) are also produced, but output is unreported and available information is inadequate to make reliable estimates of output levels.
[2] Data presented are for Iranian calendar years beginning March 21 of the year stated, except for figures on natural gas, natural gas liquids, and petroleum, which are for regular calendar years.
[3] As reported in Iranian sources; apparently includes secondary copper.
[4] Excludes petroleum produced but reinjected into fields.

## TRADE

Export receipts and import payments for the Iranian year 1353 (March 1974 to March 1975) resulted in a record surplus of $8.2 billion. Petroleum exports accounted for more than 90% of total receipts. Iran ranked second among the leading world petroleum exporting countries. Crude oil exports averaged 5.37 million barrels per day in calendar 1974, a slight increase from the 5.28 million barrels per day in calendar 1973. The per barrel posted price for Iranian light crude (34° API gravity) was $11.875 from January to November and was reduced to $11.475 on November 1 to yearend. The posted price for Iranian heavy crude (31° API gravity) was $11.635 from January to November and was reduced to $11.235 on November 1 to yearend.

## COMMODITY REVIEW

### METALS

**Aluminum.**—The Arak smelter Iran's sole aluminum producing facility, operated at full capacity yielding about 49,000 tons of aluminum ingot in 1974. The smelter is owned by the Iranian Aluminium Co. (IRALCO). The Iranian Government holds 82.5% interest in IRALCO with Reynolds International, Inc. (United States) holding 12.5% interest and the Pakistani Government holding the remaining 5% interest.

The Arak smelter is now under an expansion program designed to raise capacity to 120,000 tons by 1976. Raw material for the smelter is imported alumina from Australia. Any additional expansion of aluminum smelter capacity in Iran is related to expansion of Australian alumina plant capacity. As of yearend, several investment ventures in Australian bauxite-alumina operations have been stalemated because of Australian foreign investment regulations requiring that a percentage of new foreign investments be deposited in no-interest-bearing accounts in the Central Bank of Australia.

**Chromite.**—Chromite production reached 175,000 tons containing an average of 48% $Cr_2O_3$. Three chromite deposits are believed to be currently under exploitation: Cheshmeh Bid, Khajeh Jamali, and Neyriz. Iran's chromite reserves are reported at 7 million tons averaging from 35% to 50% $Cr_2O_3$.

**Copper.**—Development of the Sar Cheshmeh deposit continued, and by yearend, overburden stripping had commenced. An estimated total of 40 million tons of overburden is scheduled for removal by 1976, followed by ore extraction at the rate of 42,000 tons per day yielding an estimated 145,000 tons of metal per year. The Ministry of Industry and Mines reported that the original reserve of 400 million tons of ore averaging 1.2% copper content is conservative, and Sar Cheshmeh ore reserves are now estimated to be near 800 million tons. Once production from this deposit is realized, Iran will reverse its position from net copper importer to major copper exporter.

Development work continued on the Qaleh Zari deposit where reserves reportedly total 2 million tons of ore containing 3% to 4% copper. Mine and concentrator operation is scheduled for early 1976 and to attain the full designed yearly capacity of 5,000 tons of copper in concentrate by yearend.

**Iron Ore.**—Approximately 1 million tons of iron ore is mined yearly from the Bafg deposit in central Iran for use in the Aryamehr iron and steel complex. Development of a second major iron ore deposit came closer to reality with the announcement that a $110 million contract was awarded by the National Iranian Steel Industries Corp. (NISIC) to Gränges International Mining Co. (Sweden) for mine and concentrator operation at the Ghol-e Gowar deposit. Mine production is scheduled for 1978 at a yearly rate of 5 million tons of ore that will yield 3 million tons of concentrate suitable for direct reduction.

In addition to defining and developing domestic iron ore reserves, NISIC entered a preliminary agreement with the Indian Government involving the investment of $350 million petrodollars in the development of the Kudremukh iron ore deposit in India. Reserve estimates for the deposit range from 600 million to 3 billion tons of ore containing 35% to 39% Fe. Development plans include mining 20 million tons of ore per year, which will be concentrated at the mine to 66%–67% Fe content. The concentrate will be hydraulically transported a distance of 38 miles to the expanded port of Mangalore, India for shipment to Iran. Mine development and port expansion activities should be completed in 1978.

At yearend NISIC entered into a $100 million contract with Lurgi-Chemie and Hüttentechnic GmbH (West Germany) for construction of a 5-million-ton-per-year-capacity pelletizing plant at Ahwaz by 1977.

**Iron and Steel.**—The Aryamehr iron and steel complex at Isfahan accounted for virtually all of Iran's crude steel output. During the year, an agreement was signed with the U.S.S.R. for the eventual expansion of the complex from the present 750,000-ton-per-year capacity to 8 million tons. The expansion program was scheduled to increase yearly capacity to 1.9 million tons by 1978, to 4.0 million tons by 1981, and finally to 8 million tons by 1986.

With the exception of the Aryamehr complex, future steel production will be

derived from sponge iron produced by direct reduction of iron ore. Iron and steel complexes utilizing direct reduction methods are scheduled for Ahwaz, Bandar Abbas, Bushire-Kangan, and Isfahan. Yearly crude steel capacity based on direct reduction processes is scheduled to reach 9 million tons by 1980.

During 1974, a feasibility study was completed by Italy's Finsider for a 2-million to 3-million-ton-per-year capacity direct reduction plant at Bandar Abbas. A study for a million-ton-capacity direct reduction plant at Isfahan was near completion by British Steel Corp., and a feasibility study for a 2.5-million-ton-capacity plant at Bushire was launched by a West German consortium. Contracts for construction of direct reduction plants with a total 2.2-million-ton-per-year capacity were awarded in 1973.

The Iranian Government had not only taken major steps in developing a national steel industry significant by world standards, but also acquired equity interest in a leading West German steel firm. In mid-1974, the Iranian Government announced the purchase of 25.04% interest in Friedrich Krupp Hüettenwerke A.G.

**Lead and Zinc.**—Mine and concentrator expansion programs were underway during the year to support development of a domestic lead and zinc smelting industry by 1980. At least 15 mining companies are involved in production of lead-zinc ores. The largest group is Société Industrielle et Minière de l'Iran (SIMIRAN). The group's Angouran deposit contains reserves estimated at 7 million tons of ore averaging 21% Zn and 6% Pb. The mine is operated by Cherkate Sahami Calcimin for SIMIRAN. Ore production from open pit and underground workings at Angouran yielded approximately 50,000 tons of concentrate. A flotation plant of 1,000-ton-per-day capacity was under construction in 1974 with completion scheduled for 1975. This facility should double the capacity of concentrate production. Feasibility studies for construction of a 70,000-ton-per-year-capacity zinc smelter and a 20,000-ton-per-year-capacity lead smelter were underway. Another major deposit owned by SIMIRAN is located at Khusk. This deposit, containing a reserve estimated at 3 million tons, is operated by the Bafg Mining Co. Ore production approached 100,000 tons in 1974. The bulk of Iran's lead concentrate production and all of the zinc concentrate production continued to be exported; however, exports should be appreciably reduced by 1980 when proposed lead and zinc smelters are commissioned.

## NONMETALS

**Cement.**—Construction activity continued to place heavy demands on the nation's cement manufacturing industries. To meet these demands, expansion programs were underway at all existing plants and at least nine additional cement plants were in various stages of planning and construction. The 4,000-ton-per-day-capacity Abyek plant entered production in April. Additional capacity installed at the Kermanshah, Fars, Esfahan, and Mashad plants was available throughout the year making possible a 43% increase in cement production as compared with the 1973 production record. Cement imports for 1974 were estimated at 700,000 tons.

**Fertilizer Materials.**—During 1974 the Chemical Fertilizer Distribution Co. reported Iran's chemical fertilizer consumption at 650,000 tons of both domestically produced and imported fertilizers. This represented an increase of 35% over the 1973 consumption level. Much of Iran's chemical fertilizer needs are satisfied by products of the chemical complexes at Shahpur and at Shiraz. A partial list of product output from these complexes was reported for 1974 as follows, in tons:

| Shahpur | | Shiraz | |
|---|---|---|---|
| Ammonia | 170,000 | Ammonium nitrate | 30,000 |
| Ammonium phosphate | 170,000 | Nitric acid | 4,000 |
| Urea | 150,000 | Urea | 52,000 |
| Diammonium phosphate | 170,000 | Mixed fertilizer | 50,000 |

The National Petrochemical Co. of Iran (NPCI) announced its intention to double the capacity at the Shahpur complex by 1977. Expansion plans for the Shiraz complex were well underway in 1974 with the contract for construction of a 1,200-ton-per-day-capacity ammonia plant awarded to Humphreys & Glasgow Ltd. (United Kingdom) and a 1,500-ton-per-day urea plant contract awarded to Heurtey Ltd.

**Sulfur.**—The bulk of sulfur production is obtained through byproduct recovery operations at the Shahpur and Kharg chemical plants. Sulfur recovery capacity at Shahpur

was reported at 251,000 tons. Sulfur recovery capacity at the Kharg chemical plant was reported at 230,000 tons.

## MINERAL FUELS

**Carbon Black.**—The NPCI, in partnership with Cabot Corp. (United States), opened a 16,000-ton-per-year carbon black plant at Ahwaz in November. Plant production is to serve the Iranian market.

**Natural Gas.**—According to the National Iranian Gas Co. (NIGC), proven natural gas reserves exceed 500 trillion cubic feet affording Iran the second largest known gas reserves in the world. During 1974, discovery of a second large gas deposit in the Kangan region was announced by the European Group of Oil Cos. (EGOCO), a European consortium in joint venture with NIOC. Official reserve figures were not reported for the Kangan region.

Gross production of natural gas reached 1.77 trillion cubic feet in 1974, the bulk of which was derived from the former consortium agreement area in southern Iran where NIOC reported gross production at 1.64 trillion cubic feet for the year. Nearly a trillion cubic feet of gas was flared during the year; however, flared gas expressed as a percentage of total gas production was reduced to 56% in 1974 as compared with 59% in 1973. To take full advantage of abundant natural gas reserves, Iran will expand its natural gas based chemical industry, increase exports of natural gas in both gaseous and liquid forms, utilize gas in secondary recovery operations at the Khuzestan oilfields, and utilize gas in direct reduction of iron ore.

Two liquefied natural gas (LNG) projects are planned. The Kangan Liquefied Gas Co. (Kalingas) continued construction of a liquefaction plant at Dayyer, just west of Kangan. The plant will process 1.6 billion cubic feet of gas daily and should be completed by 1976. At yearend a letter of intent was signed by NIGC and an American-Belgian consortium for the construction of liquefaction facilities capable of processing 2 billion to 3 billion cubic feet of natural gas per day. Initial cost of the project including liquefaction plant, terminal facilities, and the purchase of 34 LNG tankers is estimated at $5.9 billion.

During 1974, 321 billion cubic meters of natural gas was transported to the U.S.S.R. via the Iranian Gas Trunkline (IGAT) connecting the southern gasfields with the U.S.S.R. at Astara. Negotiations continued on an agreement whereby Iran would supply an additional 475 billion cubic meters of natural gas per year to the Soviet border. Under a transit agreement, the U.S.S.R. would deliver the gas to the West German border. Germany would purchase 50% of the delivered gas; France and Austria would purchase the remainder.

**Natural Gas Liquids.**—Natural gas liquids (NGL) are extracted from associated gas produced from the Marun, Agha-Jari, and Ahwaz Fields. The feed gas and extracted NGL is reported as follows for 1974:

| Field | Feed gas (billion cubic feet) | NGL (thousand barrels) |
|---|---|---|
| Marun | 304 | 9,006 |
| Agha-Jari | 168 | 5,497 |
| Ahwaz | 104 | 1,979 |

**Nuclear Energy.**—During 1974, Iran established an Atomic Energy Agency to develop Iran's nuclear power program. Near yearend, an agreement was signed with France for the purchase of five nuclear reactors of a total capacity of 5,000 megawatts per year. At least two plants of 900-megawatt capacity each are to be built by Société Franco-Américaine de Constructions Atomiques (Framatome), a subsidiary of Creusot-Loire. Construction was to commence in 1975 with completion scheduled for 1982 and 1983.

**Petroleum.**—Exploration and development activities continued at an accelerated pace. Total footage drilled was 1,065,200 for 99 well completions as compared with 868,265 feet drilled for 73 well completions in 1973. Twenty-seven exploratory wells with a total footage of 241,200 were drilled in 1974 yielding four oil discovery wells and four gas discovery wells.

Iran revised its petroleum production goal from 8.6 million barrels per day in 1977 to 7.2 million barrels per day in 1978. A contributing reason for the downward revision is the tieup of drilling equipment and expertise in the vast gas injection program to be launched in 1975 in the southwestern oilfields. Petroleum production for 1974 exceeded a per day average of 6 million barrels representing

a production increase averaging 160,000 barrels per day as compared with that of 1973. Iran remained the second largest crude petroleum producer in the Middle East and the fourth largest producer in the world.

The bulk of Iran's petroleum production, or more than 5.5 million barrels per day, was recovered in southwestern Iran from onshore operations conducted by the Oil Service Co. of Iran (OSCO) under contract to NIOC. Twenty fields are connected to the OSOC production system. The largest of these fields is Marun, which yielded a yearly average of 1,050,000 barrels per day for 1974 and produced at the rate of 1,135,000 barrels per day at yearend. Production from Agha-Jari, the second largest field, continued to decline averaging 990,000 barrels per day in 1974 as compared with 1,025,000 barrels per day in 1973. Production from Gachsaran averaged 920,000 barrels per day in 1974. The Ahwaz-Asmari Field averaged 875,000 barrels daily for 1974; however, by mid-1975 the field was expected to yield well over 1 million barrels per day.

At yearend, NIOC announced that in 1975 a $500 million secondary recovery project would be launched. This project calls for the injection of 13 billion cubic feet of gas per day into six southwestern oilfields including the Gachsaran and Agha-Jari Fields. The project will hopefully boost recovery to 40% of the oil in place rather than the 20% to 30% recovery anticipated from primary depletion.

During 1974 four companies, each including a 50% equity held by NIOC, produced crude oil from offshore wells. The largest producer among these was the Lavan Petroleum Company (LAPCO), which produced an average of 195,000 barrels per day from its Sassan Field in the Persian Gulf, an increase of 6% over that of 1973. LAPCO development plans include production from the Bahram Field (formerly "W" structure) at 60,000 barrels per day by 1977.

The Iran Pan American Oil Co. (IPAC) produced a total average of more than 132,000 barrels per day from its Darius, Cyrus, and Fereidoon Fields. The Fereidoon Field, which entered production in August 1974, averaged 30,000 barrels per day for the last quarter. IPAC anticipates the production rate from Fereidoon at 150,000 barrels per day by 1976 with completion of a 47 development well schedule. IPAC's fourth field, the Ardeshir, should enter production in 1975 reaching productive capacity of 200,000 barrels per day by 1977 after completion of 90 development wells.

The Société Irano-Italiane des Pétroles (SIRIP) produced an average of 76,000 barrels per day in 1974. The Nowruz Field produced 34,000 barrels per day followed by the Hendijan Field at 22,000 barrels per day and the Bahregansar at 20,000 barrels per day. SIRIP's onshore discovery at Shurom has been confirmed as a commercial field.

Iranian Marine International Oil Co. (IMINOCO) produced an average in excess of 58,300 barrels per day. The Rakhsh Field supplied an average of 33,300 barrels per day, and the Rostam Field yielded an average 25,000 barrels per day.

Other companies that include NIOC 50% equity participation are the Iran Nippon Petroleum Co. (INPECO); Phillips Petroleum Co. Iran, operator with Cities Service Oil Co. and Continental Oil Co. (FILIRAN formerly CONIRAN); and Hormuz Petroleum Co. (HOPECO). Exploration and drilling activities continued in concession areas held by these groups, but no production was reported. The Bushire Petroleum Co. (BUSHCO), a joint equity holding by Amerada Hess Corp. and NIOC, was dissolved at yearend abandoning its 1,200-square-mile offshore concession near the city of Bushire.

Iran exported most of its onshore crude production and all the crude production from offshore fields. Exports for 1974 averaged 5.37 million barrels per day or nearly 90% of total production. The remaining crude output, more than 630,000 barrels per day, was refined in Iran. The Abadan refinery, Iran's largest, recorded a throughput average of 446,000 barrels per day in 1974. More than half of the refinery's output was exported. Expansion plans increasing Abadan capacity to 1.5 million barrels per day have been announced. The additional capacity at Abadan is designed to service export markets. Studies continued on the proposed construction of several 500,000-barrel-per-day-capacity export-oriented refineries. As many as five such refineries are under consideration as joint venture operations between NIOC and Japanese, U.S., and West German investors.

# The Mineral Industry of Iraq

By John L. Albright [1]

The petroleum industry continued as the most important mineral industry in Iraq, and the Government's oil revenues soared to an estimated $6.5 billion [2] in 1974, compared with the previous year's $1.4 billion. Crude oil was produced by the Basrah Petroleum Co. Ltd. (BPC), the Iraqi Company for Oil Operations (ICOO), and the Iraq National Oil Company (INOC). During 1974 petroleum producing, refining, and exporting facilities were being enlarged and new industries, that would utilize petroleum and natural gas as fuel or feedstocks were being planned. Several foreign information sources estimated Iraq's proved crude oil reserves at 35 billion barrels, but Iraqi officials believed that proved reserves totaled 75 billion barrels, and that probable reserves may exceed 100 billion barrels. Reserves of natural gas were estimated to be about 27.5 trillion cubic feet.

A number of mineral industry projects were approved during the year, including the establishment of a petroleum technological institute in Al Basrah, construction of a large crude oil storage terminal at the port of Fao, and expansion of the sulfur-exporting terminal at Umm Qasr. Iraq also issued contracts to several French firms to construct a $700 million petrochemical complex near Al Basrah, which will produce ethylene, polyethylene, and polyvinyl chloride. Iraqi National Minerals Co. (INMC) signed a $550,000 contract with a Czechoslovakian firm to conduct a gravimetric survey of 45,000 square kilometers of the western desert areas, and Poland received a $9 million contract to establish a network of geodesic centers in Iraq.

In December, the Revolutionary Command Council reorganized several government ministries. The Ministry of Oil and Minerals was changed to the Ministry of Oil, and a new Ministry of Industry and Minerals was formed.

The Ministry of Transport invited bids to convert the Baghdad-Al Ma'qil railroad (near the port of Umm Qasr) from meter- to standard-gage track and approved the project to connect the line to the northern Baghdād-Al Mawsil railroad. Discussions were held with Syria on the project of extending the Syrian Ladhiqiyah-Qamishli railroad into Iraq. The project would connect Ladhiqiyah, on the Mediterranean Sea with Umm Qasr, on the Persian Gulf, stimulating trade between Iraq and Syria. In 1974, Iraq held discussions with Turkey concerning an international railroad between the two countries. The two governments agreed to study the feasibility of constructing a railroad link which would connect the Iraqi rail system with Iskenderun, Turkey, on the Mediterranean Sea.

## PRODUCTION

Crude oil production in 1974 totaled 720.7 million barrels (an average daily rate of 1.97 million barrels), down 19.9 million barrels or 2.7% from 1973. Iraq was the fourth largest oil producer in the Middle East and accounted for about 8.5% of the crude oil produced in the Middle East in 1974. The country planned to increase its oil output capacity to 3.5 million barrels per day in 1975 and to 6 million

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.
[1] In addition to the commodities listed, juss (an impure sandy gypsum), lime, and a variety of crude construction materials (clays, stone, sand, and gravel) are produced, but output is not reported quantitatively, and available information is inadequate to make reliable estimates of output levels.

## TRADE

Iraq and Italy negotiated important trade agreements in 1974. Italian firms will assist Iraq in numerous projects including the construction of an electric powerplant, a petrochemical complex, and a steel mill, and Iraq will export large quantities of petroleum to Italy. Iraq resumed diplomatic relations with West Germany, which were broken off in 1965, and reestablished diplomatic relations with the United Kingdom, which were broken off in 1971.

In 1974, Iraq negotiated a trade agreement with Japan to supply 670 million barrels of crude oil and approximately 525 million barrels of refined petroleum products to Japan over a 10-year period. Japan agreed to loan Iraq about $1 billion to be used in various development projects.[4] Spain signed agreements with Iraq for supplies of crude oil totaling 186 million barrels between 1974 and 1979, and Spain agreed to install some 30 agricultural, engineering, and industrial projects in Iraq.

Iraq also signed a protocol with Syria for the establishment of a free trade zone on the Mediterranean coast. Yugoslavia will participate in development projects in Iraq valued up to $3 billion under an economic agreement signed during the year.

INOC's crude oil export pipeline (formerly owned by the Iraq Petroleum Co.) to Mediterranean tanker terminals and refineries in Lebanon and Syria operated at reduced rates in 1974, brought about by reduced demand by European consumers and by competition from lower priced oils available on the Persian Gulf. Crude oil pumped to Bāniyās totaled 183.4 million barrels averaging 502,568 barrels per day (off 18,525 barrels per day from 1973). Crude oil pumped to Tripoli totaled 123.0 million barrels averaging 336,873 barrels per day (down 130,556 barrels per day from 1973).

## COMMODITY REVIEW

### METALS

**Aluminum.**—Iraq issued a $130 million contract to a French firm for the construction of an aluminum smelter rated at 30,000 tons per year at An Nasiriyah, 340 kilometers south of Baghdad. The plant is expected to begin production in 1977.

**Iron and Steel.**—Société Générale de Sidérurgie was formed to manage Iraq's iron and steel industry, and Creusot-Loire Entreprises of France began construction of the iron and steel manufacturing complex at Khor al-Zubair, near Umm Qasr in southern Iraq. In 1974, Iraq awarded a $120 million contract to the same firm to build a sponge iron plant at Khor al-Zubair with an annual output capacity of 1.2 million tons of sponge iron. Both plants were scheduled for completion in 1977.

### NONMETALS

**Cement.**—Construction activities continued on cement plants at Al Fallujah, Al Kufah, and Umm Qasr. The Al Fallujah project was expected to begin production in August 1975 at an initial yearly rate of 240,000 tons of cement, the Al Kufah plant was scheduled to start cement production in October 1974 at the yearly rate of 200,000 tons, and during 1974 the Umm Qasr plant began output of cement at the initial rate of 255,000 tons per year.

Contracts were issued during the year to foreign firms for the construction of three additional cement plants. A firm from the U.S.S.R. will build a 500,000-ton-per-year plant valued at $40.5 million at Al-Samawah in southern Iraq, and a French firm will build a cement plant of the same capacity at Hammam al 'Alil in the north.[5] A Danish company received a contract valued at $255 million to build a 2-million-ton-per-year plant near Al Kufah.[6]

**Lime.**—A project was under way in mid-year to double the size of the small Hammam al 'Alil lime plant. It will cost about $1 million and will raise the plant's capacity to 60,000 tons of lime per year.

**Sulfur.**—INMC awarded a contract to Chemical Construction (GB) Ltd. for the engineering and construction of a 50-ton-per-day sulfuric acid plant at Mishraq in north Iraq.[7]

### MINERAL FUELS

**Natural Gas.**—Iraq developed plans to establish industries which would utilize large quantities of natural gas. The Ministry of Industry and Minerals invited international firms to submit bids for contracts to build a petrochemical complex at Az Zubayr in southern Iraq which will utilize about 120 million cubic feet per day of natural gas to produce about 120,000 tons per year of plastic ethylene derivatives. INOC also invited international bids for the construction of a large natural gas liquids plant to produce liquefied petroleum gas (LPG) from natural gas at the rate of approximately 3.8 million tons per year. The LPG plant is one of a number of industrial projects to be financed by the $1 billion loan from Japan.

**Petroleum.**—In 1974, oil exploration surveys were conducted mainly by the INOC, but several firms also carried out surveys in the country. An East German company signed a contract to carry out a seismic survey in central Iraq near An Narjaf and Karbala, and Indian teams conducted seismic surveys in southern Iraq. The Romanian company, Geomin, carried out seismic surveys in central Iraq, Machinoexport of the Soviet Union signed a $3.4 million contract for further seismic work northeast of Baghdad, and drilling in northern Iraq by Technoexport Stroy of Bulgaria resulted in an oil discovery near the Syrian border. In June, INOC discontinued negotiations with about 40 oil companies for service contracts to develop large blocks of land that had been advertised in July 1973. INOC signed a contract with the U.S.S.R. for the preparation of the third development stage of the North Rumaila oilfield, which will raise the field's annual output capacity to 313 million barrels from about 45 million barrels.

INOC increased its drilling activities in 1974 when 105,184 meters were drilled (development wells 89,776 meters, evaluation wells 7,242 meters, and exploration

wells 8,166 meters), nearly double the 53,855 meters drilled in 1973. Elf-Iraq, a subsidiary of the French company Essence et Lubrifiant de France—Entreprise de Récherches et d'Activités Pétrolières, discovered oil southeast of the Abu Ghurāb oilfield, and INOC reported two oil discoveries, one west of Ain Zalah oilfield and one east of Baghdad.

A Czechoslovakian firm completed construction of the 70,000-barrel-per-day petroleum refinery near Al Basrah, and the INOC placed it on-stream in 1974. The Iraquis then approved a project to double the throughput capacity of the new plant. An agreement was reached between Iraq and Somalia for the establishment of a jointly-owned petroleum refinery in Somalia. The small 10,000-barrel-per-day plant will process Iraqi crude oil. Iraq agreed to train the Somalian refinery staff and to assist them in marketing the plant's output.

Iraq was concerned with four pipeline projects in 1974. Construction of the Kirkuk to Dörtyol, Turkey, crude oil pipeline was delayed [8] and rescheduled for early 1975. The total length of the international pipeline was reset at 981 kilometers (640 kilometers in Turkey and the remainder in Iraq) from the previously estimated length of 1,005 kilometers.[9] The U.S.S.R. signed a $37 million contract with Iraq for the construction of a 600-kilometer, 20-centimeter petroleum refined products pipeline to connect Iraq's Baghdad and Al Basrah refineries.[10] Scheduled for completion in 1976, the line will have a throughput capacity of 30,000 barrels per day of petroleum products. In 1974, Iraq began construction of parallel pipelines between Al Hadithah and Rumaila. Each line will be 665 kilometers long. One line will be used to transport crude oil between the two points, and the other line will transport natural gas.

In an effort to significantly enlarge its fleet of oil tankers, the Iraq Oil Tankers Co. (IOTC) placed orders with foreign shipyards for the construction of nine ships with an aggregate tonnage of nearly 1.3 million deadweight tons. Four 154,000 deadweight-ton tankers were ordered from a Swedish shipyard, with deliveries scheduled for 1976 and 1977; and five oil tankers (one 144,000 deadweight ton and four 125,000 deadweight-ton tankers) were ordered from two Japanese shipyards, with deliveries scheduled during the next 3 years. The board of directors of the INOC approved the participation of the IOTC in the Organization of Arab Petroleum Exporting Countries' project, Arab Company for Shipbuilding and Repair, to construct a dry dock in Bahrain to service tankers engaged in international oil trade. The project was also backed by Bahrain, Kuwait, Libya, and Saudi Arabia; Iraq's investment amounted to $12.7 million.

# The Mineral Industry of Ireland

By J. M. West [1]

Throughout 1974 the problems of high inflation rates and unemployment continued to affect the Irish mineral industry and the general Irish economy. The gross national product (GNP) declined slightly, while consumer prices increased 20%. High costs of raw materials and fuel contributed to poor economic performance. The rate of investment in industry increased only 0.5% in real terms. Unemployment was expected to continue at about 9% in 1975, and the economic forecast was for continued generally depressed conditions but with substantial wage increases for industrial workers resulting from a new National Wage Agreement in the first half of 1975.

Offshore petroleum exploration was considered a promising area of economic activity, and in 1975 the Government was expected to announce terms for licensing offshore oil development. A $12 million service base for offshore drilling equipment was planned in the Aghada area of Cork's lower harbor. Planning was also in progress for a government-sponsored $72 million ammonia and urea plant at Marina Point in the River Lee estuary, Cork. The Energy Supply Board continued plans for a nuclear reactor generating plant in the Wexford area and prepared plans for a $164 million gas-fired generating plant in County Cork, which would utilize natural gas discovered 30 miles offshore.

Negotiations continued between the Irish Government and Tara Mines Ltd., a subsidiary of the Canadian-based Tara Exploration and Development Co. Ltd., over terms and extent of state control of the Navan zinc-lead mine development. The deposits were believed to be the largest in Europe, and a large sum had already been spent by Tara on preparation for mining under the assumption that a mining license would be issued without dispute. Negotiations were deadlocked at yearend, and delays until late 1975 or mid-1976 were expected in reaching production.

## PRODUCTION

Production of copper concentrates and mercury decreased during 1974, and outputs of lead and zinc concentrates were reduced by declining grades and mill throughputs. Cement production increased despite fuel limitations for cementmaking. Production of refined petroleum products was higher than in 1973. A significant increase occurred in fertilizer production utilizing imported phosphates and sulfur. Less iron and steel were produced in 1974.

[1] Physical scientist, Division of Nonferrous Metals.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, substantial quantities of stone, sand, and gravel are produced by local authorities for purposes such as maintenance of roads, but statistics on such output are not reported and available general information is inadequate to make reliable estimates of output levels.

[2] Excludes output by local authorities.

[3] Figures given as reported in source; includes granite, marble, silica rock, sand, calcspar, fire clay, and shale and clays for cement production, but excludes output of these materials by local authorities.

[4] Includes production by farmers and by Bord Na Mona.

[5] Includes milled peat used in the production of peat briquets listed previously in this table.

## TRADE

Values for metal ores and scrap exports increased more than 50% in 1974, owing chiefly to higher prices. Copper concentrate exports declined. Exports of petroleum products declined, but imports of crude and refined petroleum increased significantly. Imports of sulfur increased 45% to 86,000 tons in the first 10 months of 1974. Steel scrap imports declined 48% in the same period, to 216,000 tons. Generally, in 1974 values of crude fertilizer and other nonmetallic mineral imports more than doubled, value of imported fuels about tripled, and value of imported metal ores and scrap increased about 50%.

## COMMODITY REVIEW

### METALS

**Copper, Lead, Zinc, Mercury, and Silver.**—Copper, mercury, lead, and zinc production were all lower but silver production was higher than in 1973. According to the 1974 Annual Report of Northgate Exploration Ltd., production at the Tynagh lead-zinc mine was below that forecast because of a shortage of minable ore and lower ore grades. Reserves were expected to be adequate for 6 years of operation but

at lower grades than those in 1974. The company's Gortdrum copper mine continued to operate satisfactorily, but reserves were expected to be exhausted by the second half of 1975. Northgate held a 10% share in Tara Exploration and Development Co., Ltd., which was developing the Navan lead-zinc deposit. Prolonged negotiations were completed in February 1975, and production was scheduled to begin in late 1975 at Navan. The new mine is planned for a mining rate of 2.5 million tons of ore yearly, which will result in output of about 470,000 tons of concentrate per year. At the mine, a 1,120-foot shaft was nearing completion and another shaft was begun. Access will also be through an incline for motorized equipment. Major shareholders in the Navan project, in addition to Northgate, were Cominco Ltd. and Noranda Mines Ltd.

Avoca Mines (Canada) Ltd. increased the copper ore milling rate at its property in County Wicklow. After averaging 2,660 tons per day in the first quarter of 1974, the rate was expected to reach 4,000 tons per day by December. Iron pyrite concentrate was roasted, and the product was exported to the United Kingdom.

## NONMETALS

**Cement.**—Cement Ltd. announced plans to expand capacity at its Platin cement plant to 1 million tons per year with the addition of a 0.6-million-ton-per-year dry process kiln. Its older wet process plant at nearby Drogheda was to be closed when the new capacity is on-stream in 1977.

## MINERAL FUELS

Crude petroleum imports increased an estimated 11% and petroleum product imports declined 8% in 1974. During the first 10 months, 2.26 million tons of crude petroleum valued at $168.8 million[2] was imported for refining. In the same period, 2.62 million tons of products valued at $240.4 million was imported; over half of these imports comprised residual fuel oils. Exports of petroleum products were down an estimated 12% in 1974, and in the first 10 months were valued at $21.8 million. New energy saving measures were put into effect in December, including increased gasoline taxes (up 30%), a 50-mile-per-hour nationwide speed limit, and a possible permanent daylight saving time.

Exports of coke and peat products rose an estimated 23% and 6%, respectively, in 1974, while coal exports declined 66%. Sod and milled peat continued to be produced mainly by Bord Na Mona and were used chiefly for generation of electricity.

During the first 10 months of 1974, 48,857 tons of natural gas valued at $4.2 million was imported. The amount was 66% less than in the comparable period of 1973.

Late in the year a second offshore oil discovery was announced. The discovery in the Marathon Petroleum Ireland Ltd. concession area about 50 miles south of Cork City was approximately 10 miles southeast of a first discovery made early in 1974. The second drill hole produced at a rate of 1,500 barrels per day, compared with 780 barrels per day at the first hole. Further testing was postponed until the spring. On November 4, the Minister for Industry and Commerce announced the general Irish Government policy toward licensing of offshore oil operations. Among the provisions of the policy were the right of state participation as an essential feature of each new offshore petroleum license; the state "interests" will consist of three basic elements—taxation of profits, royalties on petroleom produced and the option of state participation. Irish participation other than the option of state participation will not be a condition for licenses granted to foreign companies.

[2] Where necessary, values have been converted from the Irish pound (£) to U.S. dollars at the rate of £1 = US$2.35.

# The Mineral Industry of Israel

By Michael J. Potter [1]

The economy of Israel continued to go through a period of high uncertainty, as the Government attempted to restrain the continuing boom without causing a recession. In 1974, Israel's gross national product (GNP) increased by 7% in real terms despite increasingly restrictive government policies.

The Government announced a series of austerity measures in late 1974 designed to deter inflationary pressures and safeguard foreign exchange reserves. On November 10, 1974, the Israeli pound (I£) was devalued from I£4.2 to I£6.00 per U.S. dollar (the last previous devaluation was in August 1971).[2]

Israel is not rich in mineral resources and its mining industry is modest in comparison with other industrial sectors. Nevertheless, Israel's mining industry plays an important role in the fast-growing chemical industry. In 1974, mineral production was influenced by sharp fluctuations in world demand for minerals. While mineral exports grew faster than total industrial exports, mineral output decelerated. Extraction of phosphate, potash, and bromine was very profitable; however, copper production resulted in serious financial losses because of the collapse in world copper prices.[3]

## PRODUCTION

According to the available information, elemental bromine, flint clay, crude and beneficiated phosphate rock, gypsum, lime, hydraulic cement, marine salt, and glass sand increased in tonnage output compared with 1973. Decreases were noted in kaolin, copper and nitrogenous fertilizers. The Government of Israel considers much of the data on the petroleum industry as classified.[4]

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] In addition to the commodities listed, Israel reportedly has the capacity to produce 71 metric tons of $U_3O_8$ per year, but official data are not reported and available information is inadequate to make reliable estimates of output levels.

## TRADE

The balance of payments, Israel's basic economic problem, ran a deficit of almost $800 million in 1974. The current account deficit on goods and services reached $3.4 billion, a 31% increase over 1973. The major causes of these developments were operating the Israeli economy on a quasi-war footing since October 1973 and the expenditure of $1.7 billion for defense imports, both direct and indirect, in 1974. Other contributing factors were the increases in international prices for petroleum, food, and raw materials.[5]

Exports and imports of mineral commodities for the years 1972 and 1973 are shown in tables 2 and 3. Detailed trade data for 1974 were not available. It should be noted that the totals provided for 1973 on the two tables may be incomplete. Because of the October 1973 war, mineral production was affected substantially. Exports of copper cement, crude phosphate rock, and crude and partly refined petroleum decreased 29%, 40% and 31%, respectively compared with 1973. Some exports which showed gains were polished diamonds, 6%, and manufactured phosphates, 37%. Precious and semiprecious stones (except diamond) increased 26% in value. Imports of many mineral commodities were down in 1973 compared with 1972.

| NONMETALS | | | |
| Abrasives, natural, n.e.s., grinding and polishing wheels and stones value | $26,000 | $58,000 | Turkey $38,000; Canada $11,000; United States $6,000. |
| Barite and witherite | 304 | 225 | Republic of South Africa 214. |

See footnotes at end of table.

## Table 2.—Israel: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 [1] | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Bromine [5] | 917 | 1,290 | United States 386; Argentina 235; Switzerland 88. |
| Chalk | -- | 13 | All to Cyprus. |
| Clays and clay products (including all refractory brick): | | | |
| Crude clays, n.e.s | 7,550 | 2,113 | Greece 982; Taiwan 565; Austria 563. |
| Products: | | | |
| Refractory (including nonclay bricks) | 1,185 | 2,283 | West Germany 1,168; Greece 707; Iran 269. |
| Nonrefractory value | $2,000 | $14,000 | Singapore $7,000; United States $3,000; Ivory Coast $2,000. |
| Diamond, gem, not set or strung thousand carats | 2,532 | 2,676 | United States 843; Hong Kong 384; Japan 278. |
| Diatomite and other infusorial earth | -- | 2 | All to Republic of South Africa. |
| Fertilizer materials: | | | |
| Crude, phosphatic | 503,162 | 303,442 | Italy 90,060; Belgium 68,322; Romania 66,004. |
| Manufactured: | | | |
| Nitrogenous | 5 | -- | |
| Phosphatic | 177,985 | 243,581 | Yugoslavia 81,184; Austria 41,477; Taiwan 30,994. |
| Potassic value | $164,000 | $136,000 | Thailand $74,000; Cyprus $62,000. |
| Other, including mixed | 799,536 | 774,480 | France 157,349; United Kingdom 93,764; Italy 90,719. |
| Ammonia | 33 | 28 | Switzerland 18; Philippines 10. |
| Gypsum and plasters | 47 | (6) | NA. |
| Lime | -- | 82 | All to Ethiopia. |
| Magnesite | 66 | 1,948 | All to Austria. |
| Pigments, mineral, natural, crude | 4 | -- | |
| Precious and semiprecious stones, except diamond value, thousands | $3,354 | $4,220 | United States $1,139; United Kingdom $879; West Germany $764. |
| Salt (including brine) | 436 | 111 | Singapore 103. |
| Stone, dimension: | | | |
| Crude and partly worked value | -- | $21,000 | West Germany $20,000. |
| Worked | 55 | 7 | All to United States. |
| Sulfur: | | | |
| Elemental, all forms | 24 | 40 | Taiwan 35; Philippines 5. |
| Sulfuric acid | 89 | 92 | Ethiopia 55; Zambia 37. |
| Other nonmetals, n.e.s.: | | | |
| Crude | -- | 174 | All to West Germany. |
| Slag and ash | 103 | 230 | All to Spain. |
| Bromine, chlorine, fluorine and iodine | 6,324 | 5,532 | United Kingdom 1,750; Netherlands 988; West Germany 683. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 15 | 239 | Cyprus 230; Singapore 9. |
| Carbon black | 6,868 | 4,889 | Thailand 2,027; Turkey 1,790; Malaysia 379. |
| Hydrogen, helium and rare gases | 15 | 3 | All to Iran. |
| Petroleum: [e] [7] | | | |
| Crude and partly refined thousand 42-gallon barrels | 38,441 | 26,470 | NA. |
| Refinery products: | | | |
| Gasoline do | 994 | 890 | NA. |
| Kerosine do | 272 | 298 | |
| Jet fuel do | 380 | 410 | |
| Distillate fuel oil do | 1,559 | 1,615 | |
| Residual fuel oil do | 2,134 | 2,222 | |
| Other do | 639 | 780 | |
| Total do | 5,978 | 6,215 | |

[e] Estimate. NA Not available.

[1] Totals provided for 1973 may be incomplete. The figures presented, unless otherwise specified are the sum of listed detail for all countries for which a quantity figure is provided in official Israeli trade returns; additional quantities may have been exported to other countries for which only a value figure is provided. In some cases, where it is clear that the bulk of the quantity exported was shipped to a country for which no quantity figure was provided, the value figure for the total has been provided in a footnote, together with the corresponding value for the quantity reported for 1972.

[2] Quantity not reported; value of 1973 exports—$925,000 compared with $855,000 in 1972.

[3] May include some manufactured articles.

[4] Quantity not reported; value of 1973 exports—$9,900 compared with $36,000 in 1972.

[5] Elemental bromine is included (inseparable) with chlorine, fluorine and iodine, and is reported in this grouping under other nonmetals in this table.

[6] Less than ½ unit.

[e] Estimate. r Revised.

[1] Totals provided for 1973 may be incomplete. The figures presented, unless otherwise specified, are the sum of listed detail for all countries for which a quantity figure is provided in official Israeli trade returns; additional quantities may have been imported from countries for which only a value figure is provided. In some cases, where it is clear that the bulk of the quantity imported was shipped from a country for which no quantity figure was provided, the value figure for the total has been provided in a footnote, together with the corresponding value for the quantity reported in 1972.

[2] Quantity not reported. Value of 1973 imports—$16,000 compared with $15,000 in 1972.

[3] Partial figure. Quantity of puddled bars and pilings not available. Value of 1973 imports of these items—$182,000 compared with $556,000 in 1972 when 1,500 tons were imported.

[4] Partial figure. Quantity of couplings for rubber pressure pipes not available. Value of 1973 imports of these items—$66,000 compared with $104,000 in 1972 when 7 tons were imported.

[5] Partial figures. Quantity of lead foil, tubes, blanks and accessories of lead not available. Value of 1973 imports of these items—$18,000 compared with $19,000 in 1972.

[6] Partial figure. Quantity of unwrought magnesium, waste and scrap not available. Value of 1973 imports of these items—$6,000 compared with $19,000 in 1972 when 20 tons were imported.

[7] Quantity not reported. Value of 1973 imports—$219,000 compared with $100,000 in 1972.

[8] Quantity not reported. Value of 1973 imports—$13,000 compared with $12,000 in 1972.

[9] Quantity not reported. Value of 1973 imports—$18,000 compared with $36,000 in 1972.

[10] Partial figures. Quantity of unwrought tin, n.e.s. and wrought bars, and angles not available. Value of 1973 imports of these items—$351,000 compared with $328,000 in 1972.

[11] Partial figures. Quantity of wrought bars, and angles not available. Value of 1973 imports of items—$91,000 compared with $160,000 in 1972.

[12] Quantity not reported. Value of 1973 imports—$34,000 compared with $1,000 in 1972.

[13] Quantity not reported. Value of 1973 imports—$89,000 compared with $326,000 in 1972.

[14] Quantity not reported. Value of 1973 imports—$49,000 compared with $148,000 in 1972.

[15] Quantity not reported. Value of 1973 imports—$12,000 compared with $24,000 in 1972.

[16] Quantity not reported. Value of 1973 imports—$2,000 compared with $158,000 in 1972.

[17] Quantity not reported. Value of 1973 imports—$22,000 compared with $17,000 in 1972.

[18] Quantity not reported. Value of 1973 imports—$33,000 compared with $14,000 in 1972.

[19] Quantity not reported. Value of 1973 imports—$18,000 compared with $21,000 in 1972.

[20] Quantity not reported. Value of 1973 imports—$2,000 compared with $35,000 in 1972.

[21] Partial figure.

[22] Quantity not reported. Value of 1973 imports—$22,000 compared with $157,000 in 1972.

[23] Quantity not reported. Value of 1973 imports—$459,000 compared with $228,000 in 1972.

## COMMODITY REVIEW

### METALS

**Copper.**—Copper cement exports from the Timna Copper Mines Ltd. increased 32% in calendar year 1973, to $14.7 million. The dampening effect of the October 1973 Arab-Israeli war and the post-war, and steeply rising plant operational costs were offset by increases in world copper prices. Production during the fiscal year ending March 31, 1974, declined by 14% to around 10,200 tons. The Timna 2 underground mine is said to have reserves for the next 15 years. Investment plans were being considered for a new surface mine and an installation for the manufacture of copper compounds. In June, 1974, Timna Copper Mines became a subsidiary of Israel Chemicals Ltd.[6]

**Magnesium.**—During the fiscal year ending March 31, 1974, the Dead Sea Periclase Co. Ltd. plant produced 15,000 tons of magnesium oxide and 27,000 tons of hydrochloric acid. All of the magnesium oxide output, valued at $1 million, was exported. The hydrochloric acid byproduct was shipped to the adjacent Arad Chemical Industries Ltd.'s phosphoric acid plant. During the fiscal year ending in 1975, the plant hopes to reach 60% of its design capacity. This would mean a production of 35,000 tons of magnesium oxide, valued at $3.5 million and 65,000 tons of hydrochloric acid. During the fiscal year ending in 1977, it is expected that plant capacity will reach 100%. Looking even farther ahead, and in view of sharp increases in world prices, plans are to more than double the annual capacity. This would mean an increase in output from 55,000 tons, to 120,000 tons in 3-years time.[7]

### NONMETALS

**Asbestos.**—An industrial complex containing four factories is being setup in the Negev town of Dimona at a cost of $15.5 million. Production items of the Tel Aviv Chemical and Asbestos plant will include asbestos brake linings, fibre, and discs.[8]

**Bromine.**—As a result of the October war, there was a decline of 8% in bromine production to 13,000 tons in the fiscal year ending March 31, 1974.[9] However, production for the calendar year 1974 rose to 18,000 tons.[10] Most of the bromine was exported. Plans call for an increase in production capacity to 50,000 tons per year by yearend 1978. Approximately $3.3 million was to have been invested in 1974 in the expansion program. A sister company of Dead Sea Bromine Works Ltd., Bromine Compounds Ltd., manufactures bromine derivatives for agricultural use. Within the next 2 years the plant will be moved, and a new $18-million plant will result in a substantial increase in production capacity.[11]

**Cement.**—Some 350,000 tons of cement was imported in 1974 to supplement domestic requirements. Nesher Cement Co., Ltd., presently the sole cement manufacturer in Israel, operates three plants. Plans are underway to construct a fourth cement plant at Beit Guvrin. Production at the new plant is scheduled for 1980.[12]

**Diamond.**—Overseas sales in 1974 were valued at $562.2 million. This was slightly more than exports in 1973, when volume was the industry's largest to date. Exports to the United States were $138.7 million, compared with $131.7 million in 1973. Net exports to Hong Kong amounted to $85.1 million, an increase of 19% over 1973. Other major importers of polished gem diamonds from Israel included, in descending order: Switzerland, the Netherlands, Belgium, Japan, West Germany, the United Kingdom, France, Canada, Singapore, Australia, and Italy.[13]

**Fertilizer Materials.**—Phosphate production at the two locations, Oron and Little Crater, amounted to 721,000 tons in fiscal year 1973–74 (ending March 31, 1974). This represented a decline of 9% in production, but an increase of 64% in export earnings compared with the previous years. Approximately 80% of the phosphate production, valued at $11.8 million, was exported.

A $7 million investment was to be made in 1974 in the development of the

recently discovered phosphate field at Nahal Zin (18 miles from Oron) and in the laying of an Oron-Nahal Zin railway line. Israel's phosphate reserves were estimated at 270 million tons.[14]

Start-up difficulties continued at the Arad Chemical Industries phosphoric acid plant in the Negev. Production was 8,600 tons during fiscal year 1973–74 (ending March 31, 1974), or 5% of planned output.[15]

Potash production at the Dead Sea works in Sodom is to be increased by 50%, to about 1.5 million tons per year, at a cost of $20 million. Plans at Haifa Chemical are to double potassium nitrate output from 100,000 tons per year, currently, to 220,000 tons by 1976. The company also has slated a new 30,000-ton-per-year dicalcium phosphate facility for next year.[16]

## MINERAL FUELS

**Petroleum.**—Drilling for oil was carried out by "Lapidoth" Israel Oil Prospectors, Inc. at Nir-Am, with plans to reach a depth of 2,200 meters. Drilling at Ramallah was discontinued at 4,500 meters because of a shortage of deep drilling equipment. Negotiations continued for drilling in the Dead Sea area, offshore Ashkelon, and in the Negev.

The Israel Oil Institute decided to undertake an experimental project for storing 30,000 tons of oil underground in the central part of the country. If the experiment is successful, storage could be carried out on a large scale at various places.

A long-term loan of $70 million over 10 years was obtained for expanding oil refining capacity. Present refining capacity is 10 million tons; 6.5 million in Haifa and 3.5 million in Ashdod. Plans call for adding another 3.5 million tons in Haifa.[17]

During 1974, the Eilat-Ashkelon pipeline carried 25.5 million tons of crude oil, compared with 23.4 million tons in 1973.[18]

# The Mineral Industry of Italy

By Andrew Kuklis [1]

Rising disposable income due to increased wages and transfer payments generated a high level of economic activity in Italy during most of 1974. The nation's gross national product (GNP) increased to $81.2 billion,[2] or 3% above that of 1973. Government programs intended to control inflation and to arrest the mounting deficit in balance of payments resulted in a decline in production and consumption of goods during the fourth quarter.

Italy's trade deficit in 1974 increased dramatically and totaled $10.7 billion compared with $5.6 billion in 1973. The Nation's trade balance is vulnerable to increases in costs of raw materials, especially hydrocarbons, which account for about two-thirds of total imports.

The value of Italy's imports totaled $40.9 billion compared with $28.0 billion in 1973. Exports increased to $30.2 billion in 1974. Most of the increase was due to inflation. Despite rising prices, depreciation of the floating lira kept Italian manufactured products competitive on the world market.

Exports of chemical products, valued at $3.2 billion in 1974 more than doubled those reported for 1973. Higher exports of plastics, synthetic resins, chemical fertilizers, paints, varnishes, and pharmaceutical products accounted for the increase. Despite higher exports, the nation's chemical trade deficit totaled over $400 million for 1974 but was one-half that reported in 1973.

Foreign investments in Italy totaled $54 million in 1974, an increase of about 40% compared with those of 1973. The European Investment Bank granted a $40 million loan to Italy to finance energy projects and expand the petrochemical industry. Ente Nazionale Idrocarburi (ENI) assigned the funds to 3 major projects, namely: Development of the Molossa oilfield and gasfield, $19 million; construction of a 210-mile pipeline in the Calabria, Puglie, and Basilicata Provinces, $11 million; and expansion and modernization of the Gela petrochemical complex, $10 million.

## PRODUCTION

The overall index of production for the mining industry in 1974 showed an increase of 2% compared with 1973 figures. Lower production was reported for all commodities in the mineral fuels sector except carbon black and coke. In metal mining, all metallic minerals declined except cadmium, copper, and iron ore. Higher output was reported for barite, bentonite, feldspar, potassium salts, fluorspar, talc, and rock salt.

Employment in the mining sector rose for the second consecutive year in part due to the expanding controls of the mineral industries by Ente Gestione Aziende Minerarie S.p.A. (EGAM), a government agency.

Performance of the different sectors in the mining industry are shown in the following tabulation:

| Sector | Index 1970 = 100 | |
|---|---|---|
| | 1973 | 1974 |
| Metallic minerals | 83.6 | 85.7 |
| Nonmetallic minerals | 116.9 | 114.6 |
| Solids, liquids and gas fuels | 121.2 | 124.5 |
| Total mining | 100.3 | 102.4 |

[1] Physical scientist, Division of Ferrous Metals.

[2] Where necessary, values have been converted from Italian lira (Lit) to U.S. dollars at a rate of Lit625=U.S.$1.00.

1 Excludes pelletized iron oxide derived from pyrite.
2 Limestone used for lime, artificial cement, and construction.

## TRADE

Mineral commodities significantly increased their share of the total value of Italy's foreign trade in 1974. Both, exports and imports increased in value, the former by 58% the latter by 63% compared with 1973. Large increases in imports were reported for crude oil, iron ore, bauxite, and coal. They collectively accounted for over 90% of the value of Italian mineral commodities imports. A gain of over $2.0 billion in exports of mineral commodities resulted from higher shipments of petroleum products, building stone, and finished steel products.

Mineral commodity trade in 1972 and 1973, and the principal items constituting Italy's mineral commodity trade, are shown in tables 2 and 3.

Table 2.—Italy: Exports of mineral commodities
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |

| Chalk | 962 | 1,174 | NA. |

See footnotes at end of table.

## Table 2.—Italy: Exports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Clays and clay products (including all refractory brick): | | | |
| Crude n.e.s.: | | | |
| Bentonite | 12,947 | 15,767 | Libya 4,180. |
| Kaolin | r 1,660 | 2,572 | NA. |
| Other | 37,746 | 11,089 | NA. |
| Products: | | | |
| Refractory (including nonclay bricks) | 57,224 | 81,139 | West Germany 11,280; Argentina 6,485. |
| Nonrefractory—thousand tons | 1,122 | 1,210 | France 305; West Germany 248. |
| Cryolite and chiolite | -- | 11 | NA. |
| Diamond: | | | |
| Gem, not set or strung value, thousands | $35 | $80 | NA. |
| Industrial do | r $78 | $98 | NA. |
| Diatomite and other infusorial earth | 1,760 | 1,396 | NA. |
| Feldspar | r 30,936 | 33,092 | West Germany 13,628. |
| Fertilizer materials: | | | |
| Crude | 3,169 | 6,205 | Mainly to France. |
| Manufactured: | | | |
| Nitrogenous—thousand tons | 1,196 | 1,040 | Turkey 322; People's Republic of China 304. |
| Phosphatic do | 3 | 19 | NA. |
| Potassic do | 13 | 26 | Algeria 9; Greece 7; Tunisia 4. |
| Other do | 245 | 199 | Turkey 51; France 46; Zambia 31. |
| Ammonia | r 11,632 | 17,350 | Greece 10,642; U.S.S.R. 1,950. |
| Fluorspar | 67,060 | 91,047 | United States 65,976; West Germany 6,542. |
| Graphite, natural | 1,497 | 2,295 | France 1,724. |
| Gypsum and plasters | 18,365 | 20,798 | NA. |
| Lime | 90,800 | 88,696 | Libya 46,917; Switzerland 35,759. |
| Lithium ore | 38 | -- | |
| Magnesite | r 96 | 435 | NA. |
| Mica: | | | |
| Crude, including splittings and waste | 305 | 206 | NA. |
| Worked, including agglomerated splittings | 53 | 70 | NA. |
| Pigments, mineral, including processed iron oxides | 1,219 | 1,839 | NA. |
| Precious and semiprecious stones, except diamond: | | | |
| Natural value, thousands | $222 | $34 | NA. |
| Manufactured kilograms | 347 | 275 | NA. |
| Pyrite (gross weight) | 11,438 | 6,901 | NA. |
| Salt, all forms | 261,301 | 97,643 | Portugal 13,530. |
| Sodium and potassium compounds: | | | |
| Caustic soda | 341,483 | 361,479 | Yugoslavia 70,003; U.S.S.R. 44,730 Arab Republic of Egypt 34,922. |
| Caustic potash | 852 | 1,354 | NA. |
| Stone, sand and gravel: | | | |
| Dimension stone: | | | |
| Crude and partly worked: | | | |
| Calcareous | 281,010 | 282,590 | West Germany 37,532; France 34,274; Libya 24,422. |
| Slate | 2,902 | 3,422 | NA. |
| Other | 61,989 | 66,977 | Switzerland 12,952; West Germany 11,817; France 6,497. |
| Worked, all forms | 745,812 | 839,801 | West Germany 448.722; France 138,944; United States 92,647. |
| Dolomite, all grades | 23,955 | 25,436 | Switzerland 6,770; Argentina 3,214. |
| Gravel and crushed rock | r 507,532 | 592,576 | West Germany 143,052; Libya 91,294; Switzerland 61,847. |
| Limestone (except dimension) | 256 | 382 | NA. |
| Quartz and quartzite: | | | |
| Piezoelectric crystal kilograms | 11 | -- | |
| Other | 34,371 | 26,460 | NA. |
| Sand, excluding metal bearing | 694,608 | 697,259 | Mainly to Switzerland. |
| Sulfur: | | | |
| Elemental, all forms | 4,557 | 4,570 | NA. |
| Sulfur dioxide | r 31 | 39 | NA. |
| Sulfuric acid | 307 | 10,188 | NA. |
| Talc, steatite, and soapstone | 59,635 | 49,082 | West Germany 17,255; United Kingdom 6,780; United States 5,622. |
| Other: | | | |
| Slag, dross and similar waste, not metal bearing | 213,042 | 223,167 | Yugoslavia 151,347. |

See footnotes at end of table.

## Table 2.—Italy: Exports of mineral commodities—Continued
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal destinations, 1973 |
|---|---|---|---|
| NONMETALS—Continued | | | |
| Other—Continued | | | |
| Oxides, hydroxides, and peroxides of magnesium, strontium, and barium | r 1,937 | 1,592 | West Germany 378. |
| Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s | 60,247 | 82,103 | France 35,293; West Germany 13,269. |
| MINERAL FUELS AND RELATED MATERIALS | | | |
| Asphalt and bitumen, natural | 927 | 1,033 | NA. |
| Carbon black and gas carbon | 37,797 | 48,143 | Turkey 10,801; Austria 9,768; Yugoslavia 6,691. |
| Coal, all grades, including briquets | 2,030 | 3,077 | NA. |
| Coke and semicoke | r 526,512 | 612,997 | Romania 147,188; Algeria 146,534. |
| Peat | 83 | 82 | NA. |
| Petroleum refinery products: | | | |
| Gasoline thousand 42-gallon barrels | 49,800 | 50,142 | United Kingdom 9,775; Netherlands 6,768; France 6,739. |
| Kerosine do | r 22,560 | 25,304 | Netherlands 3,112; Greece 2,966. |
| Distillate fuel oil do | 63,574 | 72,989 | Netherlands 14,234; West Germany 12,801; France 11,675. |
| Residual fuel oil do | 102,677 | 93,606 | United States 33,620. |
| Lubricants do | 1,758 | 1,677 | Switzerland 342; United Kingdom 144. |
| Other: | | | |
| Liquefied petroleum gas do | r 3,691 | 4,424 | Spain 632; Arab Republic of Egypt 575; Algeria 488. |
| Mineral jelly and wax do | 9 | 12 | NA. |
| Bitumen and other residues do | 1,051 | 1,358 | Austria 652; Libya 278; Yugoslavia 180. |
| Bituminous mixtures, n.e.s. do | 139 | 177 | Libya 107; Yugoslavia 15. |
| Petroleum coke and pitch coke do | 329 | 290 | Switzerland 127; France 86; Greece 48. |
| Total do | r 245,088 | 249,979 | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | 46,885 | 33,173 | United States 18,355; Yugoslavia 6,594. |

r Revised. NA Not available.
1 Less than ½ unit.

## Table 3.—Italy: Imports of mineral commodities
(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS | | | |
| Aluminum: | | | |
| Bauxite | 676,158 | 815,876 | Australia 454,266; Yugoslavia 219,365. |
| Ash and residue containing aluminum | 35,636 | 41,191 | Austria 20,092; France 5,140; West Germany 4,833. |
| Oxide and hydroxide | 189,205 | 188,857 | France 119,657; Greece 26,437; Yugoslavia 22,621. |
| Metals including alloys: | | | |
| Scrap | 59,605 | 63,256 | France 12,817; Austria 12,032; West Germany 11,297. |
| Unwrought | 173,277 | 185,558 | France 43,129; Norway 35,584; Greece 34,273. |
| Semimanufactures | 34,647 | 46,746 | West Germany 17,507; France 11,054; Belgium-Luxembourg 5,648. |
| Antimony: | | | |
| Ore and concentrate | 1,464 | 2,705 | Canada 1,442; Thailand 629; Bolivia 292. |
| Metal including alloys, all forms | 200 | 172 | NA. |
| Arsenic trioxide, pentoxide, and acids | 1,925 | 1,082 | NA. |

See footnotes at end of table.

## Table 3.—Italy: Imports of mineral commodities—Continued

(Metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | Principal sources, 1973 |
|---|---|---|---|
| METALS—Continued | | | |
| Beryllium metal including alloys, all forms ____ kilograms __ | 3,936 | 8,300 | NA. |
| Bismuth metal including alloys, all forms ____ | 195 | 185 | France 141. |
| Cadmium ____ | 33 | 96 | NA. |
| Chromium: | | | |
| Chromite ____ | 193,611 | 188,070 | Albania 67,208; U.S.S.R. 53,835; Turkey 37,908. |
| Oxide and hydroxide ____ | 1,900 | 1,528 | West Germany 1,117; United States 151. |
| Metal including alloys, all forms __ | 209 | 296 | West Germany 151; France 49. |
| Cobalt: | | | |
| Oxide and hydroxide ____ | 230 | 301 | Belgium-Luxembourg 270. |
| Metal including alloys, all forms __ | r 354 | 401 | Belgium-Luxembourg 261; United Kingdom 59. |
| Columbium and tantalum: | | | |
| Ore and concentrate ____ | 110 | 171 | West Germany 80. |
| Metal, all forms, including waste and scrap ____ | 9 | 412 | NA. |
| Copper: | | | |
| Matte ____ | 728 | -- | |
| Ash and residue containing copper | 424 | 1,338 | NA. |
| Copper sulfate ____ | 5,233 | 6,555 | Yugoslavia 4,848; France 865. |
| Metal including alloys: | | | |
| Scrap ____ | 48,819 | 57,013 | France 17,028; West Germany 14,705; United States 10,052. |
| Unwrought ____ | 315,759 | 295,826 | Zambia 70,835; Zaire 61,983; Chile 46,826. |
| Semimanufactures ____ | 17,510 | 27,756 | West Germany 11,036; Belgium-Luxembourg 5,063 France 4,438. |
| Gallium, indium, and thallium kilograms __ | 355 | 900 | NA. |
| Germanium ____ do ____ | 7,332 | 4,100 | Belgium-Luxembourg 3,500. |
| Iron and steel: | | | |
| Ore and concentrate thousand tons __ | 13,308 | 14,194 | Liberia 3,764; Canada 1,943; Brazil 1,933. |
| Roasted pyrites ____ do ____ | -- | 2 | NA. |
| Metal: | | | |
| Scrap ____ do ____ | 5,679 | 5,605 | France 2,123; West Germany 1,868; U.S.S.R. 526. |
| Pig iron, including cast iron and spiegeleisen ____ do ____ | r 1,176 | 1,017 | West Germany 250; U.S.S.R. 227; Yugoslavia 128. |
| Sponge iron, powder and shot ____ do ____ | 16 | 17 | Sweden 8; France 6. |
| Ferroalloys: | | | |
| Ferromanganese __ do ____ | 88 | 121 | France 69; Belgium-Luxembourg 12. |
| Other ____ do ____ | 101 | 122 | France 26; Norway 19; Yugoslavia 14. |
| Steel, primary forms _ do ____ | 2,572 | 2,157 | West Germany 458; Belgium-Luxembourg 275; France 270. |
| Semimanufactures: | | | |
| Bars, rods, angles, shapes, and sections ____ do ____ | 501 | 723 | West Germany 184; France 165; Belgium-Luxembourg 137. |
| Universals, plates, and sheets ____ do ____ | 1,247 | 1,576 | France 348; West Germany 279; Belgium-Luxembourg 248. |
| Hoop and strip __ do ____ | 160 | 228 | France 73; West Germany 47; Belgium-Luxembourg 29. |
| Rails and accessories do ____ | 109 | 133 | West Germany 50; France 49; Belgium-Luxembourg 16. |
| Wire ____ do ____ | 45 | 61 | Belgium-Luxembourg 25; France 11; Yugoslavia 6. |
| Tubes, pipes, and fittings ____ do____ | 163 | 274 | West Germany 93; France 69. |
| Castings and forgings do ____ | 27 | 27 | West Germany 12; France 8. |
| Total ____ do ____ | 2,252 | 3,022 | |
| Lead: | | | |
| Ore and concentrate ____ | 24,699 | 38,478 | Greece 14,702; Canada 14,355; Poland 9,395. |
| Ash and residue containing lead __ | 17,932 | 3,645 | Yugoslavia 1,818. |
| Oxide ____ | 6,108 | 19,646 | Mexico 10,269; France 5,530; West Germany 1,555. |

## COMMODITY REVIEW

### METALS

**Aluminum.**—Production of primary aluminum increased by 28,046 tons in 1974 and was more than 15% higher than that of 1973. Most of the output came from smelters of Società Alluminio e Metalli S.p.A. (Alumetal) at Bolzano, Mori, and Fusina operated by Ente Partecipazioni e Finanziamento Industria Manifatturiera S.p.A. (EFIM). Other producers of primary aluminum were Società Alluminio Veneto per Azioni S.p.A. (SAVA) at Fusina and Porto Marghera, and Alcan Alluminio Italiano, a Canadian subsidiary, at Borgo Franco.

Domestic production of bauxite declined 37% from that of 1973. The decline was due to reduced production from residual vein deposits at the S. Giovanni Rotondo mine in Sardinia. Italy's lower production was balanced by an increase in imports in 1974, principally from Australia, Yugoslavia, Guinea, and Sierra Leone. Azienda Minerali Metallici Italiane S.p.A. (AMMI) conducted research on extensive leucite deposits in Sardinia as a substitute for bauxite.

Consumption of aluminum increased to over 450,000 tons in 1974. The demand for aluminum increased because of improvement in economic conditions during most of 1974. The transportation industry consumed 29%; construction, furniture, and appliance industries, 30%; packing and electrical industries, 19%; and the remaining 22% tons was for other sectors of the economy. Italy's primary aluminum industry ranked sixth in volume among West European countries. The industry produced about 6% of the total primary aluminum production in the world.

Government participation in the aluminum metal industry coupled with several expansion projects was expected to increase production to 300,000 tons per year. EFIM acquired 50% interest in an aluminum smelter, extrusion plant, and an aluminum rolling mill from SAVA.

**Antimony.**—Output of antimony ore decreased by 130 tons in 1974 and was 10% lower than that of 1973. Lower production

was due to a decrease in the grade of ore at the Tafone mine near Grosseto. Domestic and imported stibnite ores were processed to regulus at the AMMI operated smelter near Manciano.

**Copper.**—Output of copper concentrate totaled 1,073 tons of contained metal, an increase of 25% from that of 1973. Increased mine production at the Torrento Otro mine near Vercelli and at the Funtana Ramirosa mine near Gadoni accounted for the higher copper output.

Italy's increasing requirement for copper metal was balanced by imports from Zambia, Zaire, and Chile. The three countries supplied over 60% of total imports.

Italrame S.p.A. was building a 100,000 tons copper rod manufacturing facility near Avellino. The $16 million investment, a joint venture of three companies namely, Società Metallurgica Italiana S.p.A. (SMI), Industriale Pirelli S.p.A., and Trafileria Laminati di Metali S.p.A. SMI, a state-controlled metals fabricating agency, will manage the company and supply copper rods to other wire plants operated by the partnership.

To assure an adequate supply of copper metal for Italy's industrial complexes, EGAM was negotiating joint venture investment type agreements in exploration and development of copper resources with underdeveloped countries.

The construction of a copper refinery and smelter based on concentrate imported from Canada and Australia announced in 1971 remained in the negotiating stages.

**Iron and Steel.**—The Italian iron and steel industry is the third largest among the countries in the European Coal and Steel Community (ECSC) and the fourth largest in Western Europe. Output of raw steel in 1974 was significantly higher than in 1973 and accounted for nearly 18% of ECSC steel production. Linz-Donawitz (LD) converters were the main source of steel (10.4 million tons), while electric furnaces yielded 9.9 million tons. Open-hearth furnaces produced about 3.5 million tons.

At yearend, steel production capacity was reported at 30.4 million tons, an increase of nearly 3 million tons over that of 1973. The iron and steel industry operated at about 78% of its theoretical capacity. Salient statistics on Italian steel production for 1974 are shown in table 4.

Steel consumption totaled about 22.8 million tons, approximately that reported in 1973. Continued strong steel consumption reflected a rise in consumer durables, residential and commercial construction, shipbuilding, and manufacture of trucks and buses.

Per capita steel consumption in Italy was 416 kilograms in 1974 compared with 385 kilograms in 1973 and an average of 535 kilograms for European Communities (EC) countries.

r Revised.
[1] Rolled-steel structurals; plates, sheets, tin plates, wire rods, rails, etc.
[2] Including forged steel castings and other finished products, excluding welded tubes.

Source: Associaziono Nazionale Industrie Siderurgiche (ASSIDER).

Italy was both an exporter and importer of steel. The 1974 steel imports were 6.2 million tons while exports totaled 6.3 million tons. As in past years, importation of steel came principally from EC countries. Italian steel exports, however, tend to be heavily biased toward finished products such as steel pipes with a far higher added value than semifinished products which form the bulk of the imports. In terms of value, exports exceeded imports by $34.8 million.

Italian steel consumption was expected to reach about 30 million tons annually by 1980. Società Finanziaria Siderurgica S.p.A. (Finsider) anticipates that domestic steel capacity must expand to an estimated 36 million tons annually during the period. To utilize this mill capacity, the steel industry envisages the need to construct steel plants in foreign countries having large deposits of iron ore. These overseas plants would produce steel ingots, blooms, and slabs for export to Italy for finishing into various steel products.

Improvement of port facilities continued at the Taranto steel complex. The Port of Taranto authority was constructing a large pier and a breakwater to provide space for the increase in volume in water transportation. An estimated $50 million was authorized for the project.

Expansion of the Taranto steel works was continued during 1974. The $2 billion project began in 1970 and was expected to be completed in 1975. The complex was designed to produce at a rate of 10 million tons per year. It encompasses an area of over 2,500 acres, containing 160 miles of railroad trackage, 42 miles of street and about 35 miles of conveyor belting. A work force totaling some 19,000 employees is utilized to operate the steel complex.

At yearend, a second of two twin-strand, continuous slab casting machines was installed at a plant within the Taranto steel complex. A number of innovations were incorporated in the machines, including ladle turrets with independent movable swivel arms of 500–ton load capacity, insertion of a dummy bar from top of the mold, adjustable mold, cooling grids below the molds for high casting speeds, and an adjustable spray cooling system. The machines were designed and manufactured by Schloeman-Siemag of West Germany, and installation and plant construction were conducted in cooperation with Innocenti-Santenstacchio, S.p.A., an Italian firm. Also, a fifth blast furnace and a third continuous casting process were in operation at yearend.

Finsider announced an agreement to supply 2.5 million tons of 56-inch-diameter welded steel pipe to the U.S.S.R. in exchange for iron ore, coal, and other undisclosed raw minerals. The value of the pipe was reported at $1.5 billion and its delivery scheduled over a 5-year period at a rate of 500,000 tons per year. The pipe will be manufactured to withstand high pressure and for service in arctic areas of subzero temperatures. The Taranto pipe mill produced 866,000 tons of line pipe in 1974.

Two 250-ton converters were installed at the Altie Fornie e Acciaierie Riunite Ilva e Cornigliano S.p.A. near Genoa to replace existing open-hearth furnaces. The converters, employing a steel-making process developed by Maxhütte of West Germany, will be installed by the developing company and United States Steel Corp. Raw steel capacity at the facility was unchanged and remained at 2.3 million tons per year. The company installed computer quality control on its tin plate production line. The unit will automatically detect and correct defects in tin plate. At yearend, the installation of a continuous casting process was underway.

Dalmine S.p.A. steelworks in Taranto continued construction of an electric furnace having a continuous steel pouring unit. The steel making section is modular in design, hence easily expanded. The company plans to construct two additional modules costing $26 million which will produce 200,000 tons of steel annually.

Dalmine initiated production of line pipe employing the Fretz-Moon solder process. The plant was designed to produce 400,000 tons of line pipe per year.

*Iron Ore.*—Domestic output of iron ore rose 26% above that mined in 1973. Italy's iron ore comes from the Elba mines operated by Italsider S.p.A. The grade of the iron ore mined was 44% iron, same as in 1973.

The Nation imports most of its iron ore requirements. In 1974, 18.1 million tons were received from Liberia, Brazil, Canada, Australia, and three other countries; Liberia supplied over 42% of the imports.

*Pig Iron.*—Production of pig iron increased from 10.0 million to 11.7 million tons in 1974, an increase of over 15%. Blast furnaces were the principal sources of pig iron accounting for 11.6 million tons; the remaining 0.1 million tons came from electric furnaces. Italsider remained the largest producer of pig iron in Italy, accounting for over 90% of output. Imports of pig iron from four countries totaled over 1 million tons with West Germany supplying over 38% of the total. The industry's pig iron to steel ratio was 49.1% compared with 47.8% in 1973.

*Iron and Steel Scrap.*—Consumption of iron and steel scrap in steelmaking totaled 14.5 million tons in 1974, or about 13% more than that of 1973. Approximately 33% of the scrap originated within the steel industry, 24% was derived from home markets, and the remaining 43% came from foreign countries. Iron and steel scrap was imported principally from France and West Germany.

Iron and steel scrap consumption and distribution, by source, for the last 2 years was as follows in thousand tons:

| | 1973 | 1974 |
|---|---|---|
| Source: | | |
| Own arising | 4,240 | 4,858 |
| Home supplies | 3,400 | 3,349 |
| Imports: | | |
| From ECSC countries | 3,755 | 4,836 |
| From other countries | 1,717 | 1,438 |
| Yearend stocks | 1,351 | 1,200 |

*Special Steels.*—Production of all types of special steels totaled 3.2 million tons in 1974 and was more than 18% lower than in 1973. The nation's output of carbon and alloy steel in the last 2 years was as follows in thousand tons:

| | 1973 | 1974 |
|---|---|---|
| High carbon steel: | | |
| Structural | 1,424 | 1,492 |
| Tool | 1 | 6 |
| Total | 1,425 | 1,498 |
| Alloy steel: | | |
| Structural | 2,073 | 1,290 |
| Tool | 18 | 16 |
| Bearing | 90 | 57 |
| Stainless | 297 | 322 |
| High speed | 2 | 2 |
| Others | 2 | 2 |
| Total | 2,482 | 1,689 |
| Grand total | 3,907 | 3,187 |

**Lead and Zinc.**—Output of lead concentrate decreased 3,546 tons in 1974 and was 14% lower than in 1973. Production of concentrate assaying 52% zinc metal approximated that produced in 1973. Low-grade zinc material assaying 7% metallic zinc declined 2% compared with 1973 figures. Declining output of these metals was apparently due to increased labor costs, decreasing grade of ore mined, and removal of protective tariffs. The province of Cagliari, Sardinia, was the source of virtually all lead and zinc ore mined in Italy.

Italy imports about 75% of its lead requirements and in 1974 three countries supplied most of the shipments. However, domestic production of zinc accounted for about 87% of the Nation's demand. Imports from Canada, Mexico, and Peru supplied most of the remainder.

**Magnesium.**—La Compagnia Generale del Magnesio S.p.A. (COGEMA) completed construction of a magnesium extraction plant near Melilli, Sicily. The capacity of the facility was reported at 60,000 tons per year. The magnesium, obtained from sea water, will be utilized in the manufacture of refractories and for other chemical products.

**Manganese.**—Italy was the only country within the EC to mine manganese ore exceeding 20% in grade. Output, however, dropped to 14,008 tons in 1974 from 25,529 tons mined in 1973. Manganese ore was mined at the Gambatesa facility near Varese Ligure. In 1974, the Nation imported 308,072 tons of manganese compared with 282,057 tons in 1973. The Republic of South Africa, Gabon, and Brazil supplied most of imports. An extensive exploration program in the vicinity of the Gambatesa mine over the past few years failed to increase manganese reserves.

**Mercury.**—Production of mercury metal declined by 6,759 flasks in 1974 and was nearly 21% lower than that in 1973. A decline in the world price and demand affected production rates at the nation's mercury mines. The average content of

the ore was 47% mercury, the same as that mined in 1973.

Despite lower output, Italy ranked second to Spain among world producers of mercury. Early in the year, EGAM obtained ownership of the mercury-producing mines and plants operated by Società Monte Amiata S.p.A. and Stabilimenta Mineraria del Siele S.p.A. For the past several years, production costs reportedly exceeded income from mercury sales at the two facilities necessitating a change in operating structure within the industry.

A decline in ore reserves and increasingly higher labor costs have made Italian mercury production uncompetitive on world markets. To arrest increasing unemployment in the area, the Italian Government was expected to continue operation of the mines and processing facilities of both companies. The 1974 employment at five operations totaled 1,013 workers. The Bagnore and Mt. Labbro mines were closed early in 1975 and were expected to remain on maintenance and/or development status during most of the year.

Italian exports of mercury decreased by 1,200 flasks, 17% lower than that of 1973. West Germany and India remained the leading importing countries At yearend, mercury stocks totaled about 105,000 flasks, or equivalent to about 3 years of production at the 1973 rate.

**Titanium.**—In February, Montedison was permitted by authorities of the Port of Livorno to resume ocean dumping of effluent from its Scarlino sulfate-process pigment plant for a 6-month trial period. The company also continued construction of a 30,000-ton-per year chloride-process plant at Cretone.

**Uranium.**—Azienda Generale Italiani Petroli S.p.A. (AGIP) plans to develop the Novazza uranium deposit near Valgoglio. Land was purchased and construction of a mining and milling facility having a capacity of approximately 250,000 pounds of uranium oxide annually was underway. Total minable uranium ore reserves were estimated in excess of 3.1 million pounds of recoverable uranium oxide.

A new deposit of uranium ore was reportedly discovered in the Lazio region containing an estimated 10,000 tons of uranium oxide. Development of the deposit was scheduled in the early 1980's.

To meet increasing demand for uranium oxide, AGIP negotiated numerous joint venture uranium exploration investments in four countries, namely the United States, Australia, Canada, and Nigeria. A joint venture exploration project in Nigeria resulted in discovery of a large uranium deposit containing an estimated 40,000 tons of recovered uranium oxide. The deposit was being developed by the Somair Mining Co.

The projected increase in future requirements for nuclear fuel has led the Comitato Nazionale per l'Energie Nucleare (CNEN) to resume uranium exploration. However, CNEN was expected to transfer the responsibility for uranium exploration to ENI during the year.

## NONMETALS

**Asbestos.**—Output of asbestos approximated that produced in 1973. Most of Italy's asbestos came from the San Vittore open pit mine operated by Società Amiantifera di Balangero S.p.A. near Turin. Italy exported 66,784 tons of short fiber asbestos and asbestos powder. West Germany and France received over 65% of total exports. Other countries receiving Italian asbestos were Libya, the Netherlands, Poland, and Spain. The Nation also is a large importer of asbestos. The Republic of South Africa and Canada accounted for over 80% of the import shipments.

**Barite.**—Output of ground barite increased by 12,040 tons in 1974 and was over 7% higher than in 1973. An increase in exports and domestic requirements by the chemical industry accounted for the higher output. Italy exported 17,370 tons in 1974 compared with 6,670 tons shipped in 1973.

**Cement.**—Cement output totaled 36.3 million tons, a slight decline from that of 1973. Reduced demand for cement in commercial and industrial construction was reflected in the lower production for 1974. Italy's cement industry continued to rank second to West Germany among West European countries. The industry comprises 120 plants, of which one-half are in northern Italy.

Cementerie Calabro Lucane S.p.A. commenced operations at its modernized plant near Castrovillari. Expenditures totaling nearly $1 million were for automated control system, portable crushing plants, and conveyor equipment. Limestone rock is

mined and crushed at two quarries and delivered to the cement plant by way of a conveyor system for a distance of over 6 miles. Vionini S.p.A. authorized expenditures of $8.5 million for a cement plant near Gonisa. A work force of 380 persons would be employed to produce 1 million tons of cement annually.

**Clays.**—*Bentonite.*—Production of bentonite totaled 344,604 tons, or 11% higher than that of 1973. Società Mineraria Isole Pontine S.p.A. (SAMIP) continued exploration and development of a large bentonite deposit estimated at 10 million tons near Isili, Sardinia. Italy exported 22,503 tons of bentonite, most was shipped to Libya.

**Feldspar.**—Output of feldspar increased significantly. Higher production was due to increased demand for the material by the ceramic industry and for export markets. The Giustino mine operated by Società Maffai Feldspato S.p.A. remained the largest producer of feldspar during 1974. Società Esercizo Cave Feldspato S.p.A. mined feldspar from the Tremenico pegmatite deposite south of Legnone. Italy exported about 14% of its output in 1974 compared with 17% in 1973.

**Fluorspar.**—Output of fluorspar increased by 13,843 tons and was 6% higher than in 1973. Italy's fluorspar industry was dominated by two companies, namely Montedison and Società Mineraria Silius S.p.A. The fluorspar mines in Sardinia accounted for more than 60% of the Nation's output, although mines in northern Italy near Trento also were important producers.

The nation's fluorspar industry is dependent on foreign markets for about 30% of its sales. The United States and West Germany were the destinations of most of the 1974 exports.

Ente Mineraria Sarda (EMS) continued a 3-year exploration program costing $2 million on a large concession in the Sarrabus-Sorrei and Sarcidano areas. The newly constructed fluorspar facility of Mineraria Silius near Assemeni, Sardinia, completed its first full year of operation. The rise in the Nation's fluorspar output was apparently due to additional production at the Assemeni plant.

**Phosphates.**—Fosfitalia S.p.A. continued construction of a plant to produce phosphoric acid and a range of phosphate compounds at Monfalcone, near Trieste. The facility, costing $5 million, will have a designed capacity of 250,000 tons annually. Sulfuric acid production for captive use will be included as part of the overall project.

Italy depends heavily on importation of phosphates for its requirements. In 1974 imports totaled nearly 2 million tons, of which Morocco accounted for about 50% of the shipments.

**Potassium Salts.**—Production of potassium salts totaled over 2.0 million tons, 14% higher than in 1973. Output came from mines operated by Montedison and AMMI near Palo, Racalmuto, Pasquasia, and Corvillo, Sicily. Montedison also operated a processing facility near Campofranco, Sicily. Virtually all the potassium ore production was processed into chemical fertilizers. The increase in output was attributed to higher worldwide prices and an increase in demand for potash fertilizers, especially in the export market. Expenditures for expansion of existing mining and processing facilities in Sicily were authorized by EGAM. Also, the Government agency reportedly developed a process to recover carnallite as a byproduct in the production of magnesium.

**Pyrite.**—Italy produced almost 1.2 million tons of pyrite ore in 1974, or approximately the same as in 1973. The Boccheggiano mine in Tuscany Province operated by EGAM was scheduled to close at year-end because of exhaustion of ore reserves.

Montedison's Scarlino plant continued processing pyrite concentrate to iron pellets and sulfur. Pollution problems had caused a decline in production in 1973, but installation of new equipment and a change in processing technology returned operations to normal.

Italy continued to rank second to Spain among Western European countries in the production of pyrite. Although output was over a million tons, the nation imported 222,779 tons compared with 300,837 tons in 1973. The U.S.S.R. was the principal supplier of pyrite.

EGAM authorized over $30 million to develop a large pyrite deposit in the Campiano area, Tuscany Province. The deposit contains an estimated 30 million tons of pyrite at a depth ranging from 1,500 to 3,000 feet. An 18-foot-wide tunnel will be driven into the deposit and the ore will be truck hauled to the surface plant. The mine will produce at an annual rate in excess of 1 million tons of pyrite

from which 500,000 tons of iron pellets and 1 million tons of sulfuric acid will be manufactured.

**Salt.**—The 1974 output of rock salt totaled over 4 million tons, an increase of 8% compared with that of 1973. Sicilian plants produced about one-third of the Nation's output. The increase in production was reportedly due to growing requirements of the chemical industry. About 71,000 tons was exported to Western European countries, principally to Portugal.

Società Industria del Salgemma S.p.A. planned to spend $10.5 million on expansion of its rock salt processing and mining facility near Petralia, Sicily. At completion of the project, employment was expected to increase to 650 workers from the 430 currently employed.

**Stone.**—*Marble.*—Production of block marble (white and colored) increased by 26,000 tons in 1974 and was more than 2% higher than that of 1973. An increase in Italy's building construction and higher exports accounted for the rise in marble output.

More than 80 types and/or grades of marble was produced in Italy, mostly from Tuscany, but also included numerous other varieties of metamorphic rock quarried in many parts of the country.

Exports of marble in blocks, slabs, and finished pieces rose more than 7% compared with that of 1973.

EGAM purchased a significant marble mining concession in the Alpine area from Montedison. Marmifera Irpina S.p.A. commenced operations of a marble processing plant costing $1.7 million near Polito Ultra. Estraba S.p.A. exported $370,000 worth of Roman travertine marble for building facades and interior purposes to the United States.

**Sulfur.**—Output of sulfur ores declined significantly from that produced in 1973. Most of the sulfur production came from the strip mining project near Pomezia. Sulfur ore also was mined at 12 small mines in Sicily.

Despite lower output, Sicily's mine production costs remain high, hence prices are not competitive with those of foreign sulfur. For example, sulfur produced in Sicily costs about $120 per ton compared with an international price of $52 per ton. The average grade of sulfur ore was 21% compared with 22% for ore mined in 1973.

Imports of sulfur increased to 765,304 tons from the 408,066 tons received in 1973. Two countries, Canada and Poland, supplied about 80% of the imports.

The decision to close 7 of 12 mines in Sicily was postponed by Ente Minerario Siciliano (EMS) because of depressed economic conditions in the Nation.

## MINERAL FUELS

Consumption of fuels in Italy was estimated at 120.8 million tons of crude oil equivalent.[3] Since the output of coal, crude oil, and natural gas remains small, imports of solid and liquid fuels were a significant part of the Nation's energy supply. Domestic resources provided an estimated 19% of the energy consumed while the remainder came from imports. Table 5 shows the share of different sources of energy in tons of crude oil equivalent.

**Coal.**—Coal output at the Seruci mine in Sardinia dropped to 3,681 tons or 26% below 1973 figures. However, because of sharp increases in crude oil costs, the Government was studying the feasibility of reopening the sulcis coal mines.

Italy's coal deposits, in the Sulcis Basin of Sardinia, are very low in thermal quality and high in sulfur and ash content. Because of these deleterious elements, the use of sulcis coal hinders the operation of electric power producing complexes and adds to operating costs. In the early 1950's, the coal mining industry provided employment for nearly 9,000 workers. The 1974 employment was reported at about 500 maintenance workers.

Coal continued to rank high on the list of Italian imports of mineral commodities. In 1974, nearly 12 million tons of coal was imported of which 25% came from the United States. Coking coal accounted for about 95% of coal imports, the remaining 5% was steam coal, anthracite, gas coal, and other solid fuels. Italy's imports from Australia were expected to increase substantially in the future because of long-range supply contracts.

EFIM invested $86 million in a joint venture with the South Cape Corp. of South Africa to develop and operate two coal mines near Ellisras and Davel, Republic of South Africa. EFIM will construct a pipeline and a terminal at Richards Bay on the Natal Coast, Republic of South Africa, the former for transportation purposes and the latter to load coal onto ocean-going boats for shipment to Italy.

[1] Bunkers not included.

Source: Italian Ministry of Industry and Commerce.

*Lignite.*—Lignite mining was related to activity at the pithead thermoelectric plants in the principal domestic lignite coalfields of Valdarno and Pietrafitta. Output of lignite decreased 9% from that produced in 1973. Reserves at known lignite deposits in Italy were reportedly estimated at 40 million tons.

The Mecure mine in the Province of Potenza was shutdown in 1973 because the lignite deposit in the area was exhausted. Electric power production continued to increase at plants utilizing fuel oil.

**Coke.**—The 1974 output of coke increased to 8.6 million tons from 7.7 million tons produced in 1973. Metallurgical coke accounted for all of the output. Italy's entire output of coke was produced from imported coking coal, principally from the United States, West Germany, the U.S.S.R., and Poland.

**Electric Energy.**—Production of electricity continued to increase in 1974 with thermal plants supplying more than 70% of total production. Ente Nazional Energia Electrica (ENEL) plans to increase domestic electrical generating capacity by 23.6 megawatts by 1980, of which new thermoelectric plants would supply 12.8 megawatts; hydroelectric plants, 5.0 megawatts; nuclear plants, 4.9 megawatts; and gas turbine generating plants, the remainder.

Construction was initiated on a thermoelectric power facility at Torvaldaliga by ENEL. The plant will consist of four generators, each producing 3.5 megawatts of electricity.

**Nuclear Energy.**—ENEL planned large expenditures in nuclear powerplant construction to meet future energy requirements of the Nation. At yearend, three nuclear powerplants were in operation with an installed capacity of 577 megawatts. A fourth nuclear facility was under construction at Caorso. It will employ the enriched uranium-boiling water principle to generate 850 megawatts of electricity. Completion was scheduled for the last quarter of 1975. Construction of a fifth nuclear facility employing a Cireno prototype reactor was scheduled to begin at midyear 1975. The plant, located near Latina, will be built by CNEN and ENEL. Completion of these two plants was expected to temporarily ameliorate the Nation's enery situation.

**Natural Gas.**—Production of natural gas in 1974 was nearly 15.3 billion cubic meters, approximately that recovered in 1973. Output came from the Po Valley gasfields, offshore Ravenna, Ferrara gasfields, and gasfields in southern Italy. Offshore gasfields accounted for about one-half of Italy's 1974 natural gas production.

Natural gas was reportedly discovered about 13 miles offshore from Rimini in the Adriatic Sea by a consortium of companies that include AGIP, Montedison, and Texaco. Two test wells were completed on the Anemone structure and drilling of another was underway at yearend. The wells were spaced over 1 mile apart.

The 1974 natural gas discoveries added an estimated 19.5 billion cubic meters (565,000 million cubic feet) to Italian gas reserves, exceeding the amount consumed in 1974. Domestic reserves are estimated to total 220 billion cubic meters compared with 213 billion reported in 1973.

At midyear, ENI announced new price schedules on natural gas consumed for industrial purposes. From the previous flat rate of 2.3 cents per cubic meter, the new price will range from 4.2 cents to 4.6 cents per cubic meter, depending on the amount consumed. The new price schedule was expected to return nearly $300 million annually to ENI. In the past year, the agency reported record deficits because of increased costs of imports. The substantial increase in earnings will allow ENI to conduct an intensive exploration and development program in Italy for new hydrocarbon resources.

At midyear, Exxon Libya Co. discontinued delivery of liquefied natural gas (LNG) from its Marsa el Brega plant in Libya to the regassification plant at Panagaglia because of a disagreement over delivery price with ENI. The Libyan Government increased taxes on exported natural gas and when passed on to ENI the price tripled. ENI declined to consider a price revision because the 1965 agreement did not provide for increase in price due to higher taxes. Operations at the regassification plant were discontinued thus depriving Italy of about 12% of its natural gas requirements.

Italy consumed about 19.7 billion cubic meters of natural gas in 1974. Consumption continued to exceed domestic production. Italy imported about 4.4 billion cubic meters of natural gas, principally from Libya LNG was regassified at the Società Nationale Metanodotti Progetti (SNAM) plant at Panagaglia and transferred to the Italian distribution system. At yearend, some natural gas was received via pipeline from the Groningen gasfield in the Netherlands and the Tyumen gasfield in Siberia. Industrial users accounted for 71% of the natural gas market. Other major consumers were residential and commercial establishments, 24%; electric power generating facilities, 4%; and other uses, 1% (table 6).

**Table 6.—Natural gas production and consumption**
(Thousand cubic meters)

| Year | Production | Consumption | | | | | |
|---|---|---|---|---|---|---|---|
| | | Industrial | Domestic and heating | Electric power generation | Trans-portation | Mining | Total |
| 1955 | 3,615,824 | 2,591,706 | 310,221 | 503,053 | 199,875 | 13,027 | 3,617,882 |

**Petroleum.**—Domestic output of petroleum decreased 77,000 tons in 1974 and was 7% below that of 1973. The reduced output resulted from lower production rates at the Ragusa and Gela oilfields as well as the difficulty of marketing the output at the Gela refinery because of its high-sulfur content.

Production of crude oil has been declining since 1970 because of depletion of resources in the Ragusa and Gela oilfields, the principal source of Italy's petroleum output. However, discovery of crude oil in the Po Valley Basin was expected to arrest the Nation's declining production.

Petroleum product prices were increased on three occasions between September 1973 and July 1974, reflecting the rising cost of crude oil. The retail price of gasoline increased to 48 cents per liter, an increase of 85%. However, prices for gas oil and fuel oil increased less dramatically.

The Nation is heavily dependent on importation of crude oil. Imports in 1974 totaled 118.5 million tons, 8% lower than those of 1973. The Middle East countries supplied 82.8 million tons; African countries, 31.4 million tons; east Mediterranean countries, 11.8 million tons; the U.S.S.R., 3.6 million tons; and other countries, 0.7 million tons.

*Pipelines.*—At yearend, Italy's pipeline network totaled 10,991 kilometers, an increase of over 1% over that of 1973. More than 510 kilometers of pipeline were in process of construction during 1974.

On June 8, 1974, two pipelines linking the Groningen gasfield (the Netherlands) and the Tyumen gasfield (Siberia) with the Italian natural gas distribution system were officially placed into operation. In 1972, ENI contracted to purchase 6 billion cubic meters annually of natural gas from N.V. Nederlandse Aardolie Maatschappij, the Netherlands natural gas producer, and 6 billion cubic meters annually from the U.S.S.R. The length of the two pipelines totaled 1,590 kilometers, of which, 816 kilometers came from the Netherlands and 774 kilometers from the Czechoslovak border. Approximately 5,000 men, working for about 22 million hours over a 2-year period, were employed in construction of the pipelines. Total costs of the two pipeline projects was estimated at $786 million.

At yearend, a 16-kilometer section of a pipeline was completed in the Messina Straight between Calabria and Sicily. The section is part of a 2,414-kilometer pipeline under construction to deliver 11.7 billion cubic meters of natural gas over a 25-year period from the Hassi R'Mel gasfield in Algeria to Italy. Sales and construction agreements were negotiated last year between ENI and Société Nationale pour la Recherche, la Production, le Transport, la Transformation et la Commercialisation des Hydrocarbures (SONATRACH), an Algerian State Agency. Construction of the pipeline was an outstanding accomplishment for ENI engineers because of the development and successful application of new deep-water technology and a historical first at depths of over 300 meters of water.

Terminale GNL Monfalcone, S.p.A., a consortium of Italian, West German, Austrian, and Swiss natural gas distribution agencies, was formed to construct and operate a LNG regassification terminal near Trieste and a 442 kilometers pipeline distribution network. LNG will be obtained from Algeria and delivered to the terminal by liquid methane tankers thence regassified and transmitted by pipeline to Karlsruhe, West Germany, and other marketing areas in Austria, Southern Germany, and western Switzerland. The pipeline transmission capacity was reported at about 6 billion cubic meters annually. ENI will represent Italian interests in the venture.

*Refining.*—Oil throughput at Italian refineries decreased about 7%. The decrease was due to lower domestic demand and lower exports. Total crude runs to stills in refineries totaled 122.4 million tons compared with 131.7 in 1973. Petroleum products produced at refineries are tabulated in table 7. Domestic markets consumed about 74% of the processed crude oil. Consumption of petroleum products decreased 5% compared with 1973 figures. Fuel oil accounted for over 42% of total production, followed by motor oil, 24%; gasoline, 12%; and miscellaneous purposes, 22%.

Mobil Oil Italiana S.p.A. (MOI) acquired a 25% interest in the Bertonico refinery owned by Sarni S.p.A. The $30 million investment in refining capacity will provide MOI with petroleum products for the company's northern Italian marketing area. Previously, MOI had obtained petroleum products from the Gulf Italiana S.p.A. refinery under a long-range products exchange agreement.

At yearend 1974, there were 36 refineries

in operation with a total installed annual capacity of 200 million tons (table 8). The Nation's petroleum industry was operating at 61% of its theoretical capacity. Expansion projects underway and/or authorized were expected to increase capacity to 250 million tons by 1980. Italy ranked first among the nations in the EC and third in the world in crude oil refinery capacity. The current refinery capacity exceeds the Nation's domestic consumption of petroleum products by a factor of two.

**Table 7.—Petroleum refinery production**
(Metric tons)

| Year | Crude oil and residues processed | Main products obtained | | | | | |
|---|---|---|---|---|---|---|---|
| | | Gasoline | Jet fuel | Kerosine | Gas oil | Fuel oil | Lubricating oils |

Construction was continued on two refinery complexes with a combined annual capacity of 22 million tons, one at Porto Gruaro, and the other at Melilli. The Porto Gruaro facility, jointly owned by Azienda Nazionale Idrogenazione Combustibili (ANIC) and ENI, will be supplied with crude oil by pipeline from Triest and the finish product returned to the area via another pipeline for marketing purposes. When completed, the Melilli facility, jointly owned by a group of private investors and ENI, will be Italy's largest refinery. About 80% of its output was scheduled for export markets, principally the United States.

*Exploration.*—Exploration for hydrocarbons was intensified in Italy during 1974. The major part of this exploratory activity was in offshore areas where numerous geophysical anomalies remain untested.

Deep exploratory drilling in onshore areas discovered hydrocarbon liquids and gas in the pre-Alpine zone in the Po Valley Basin.

ENI discovered the Molassa oilfield and gasfield near Bergamo, Northern Italy, in the Po Valley Basin. The discovery well, Molossa No. 1, tested 1,800 barrels of oil and 16 million cubic feet of natural gas per day through a 3/8-inch choke. The well was drilled to a depth of 5,300 meters into a pay zone consisting of limestone and dolomite estimated to be over 600 meters thick. The oil, analyzed 35° API and contained very little sulfur. A separation plant was under construction at midyear. The plant will produce 2.5 million tons of oil and 3 billion cubic meters of natural gas annually. At yearend, three producing wells were drilled into the oilfield and gasfield and drilling of two additional wells was underway. The Molossa oilfield and gasfield was the largest discovery of hydrocarbons on record in Italy. The field is situated in a highly industrialized area and in proximity to refineries. Geological evaluation of the discovery and test well indicated a potential hydrocarbon reserve containing 40 million tons of petroleum and 50 million cubic meters of natural gas. Anticipated natural gas production was expected to equal that imported from Libya.

The Po Valley Basin is underlain by geological strata and structure favorable for oil and gas resources. Intensive exploratory drilling now in progress was expected to result in discovery and production of sufficient hydrocarbons to meet most of Italy's requirements in the future. These favorable structural and stratigraphic anomalies were defined by a geophysical survey conducted over the area for the past 2 years. ENI was test drilling an extension of the structure near Turbigo, west of Milan.

A consortium of foreign and Italian exploration companies namely ENI, British Petroleum Italiana S.p.A., and Elf Aquitane Oil Co., reportedly discovered oil in the Adriatic Sea about 24 kilometers from the port city of Vasto. Two holes drilled in 80 meters of water showed good quality oil. Further test drilling and geological studies were underway to assess the significance of the discovery and its commercial potential.

Elf Italiana S.p.A., a French-Italian joint venture, discovered oil in a well drilled at Fermo, near Ancona. A second well was drilled to confirm the oilfield discovery. The crude oil was analyzed to contain high sulfur and approximately 17° to 21° API. Yield of the oilfield was estimated at 2.5 million tons per year.

# The Mineral Industry of Japan

By K. P. Wang [1]

The Japanese claim that during the first full year (fiscal 1974)[2] since the shift from cheap and abundant oil to an expensive and limited supply, the Japanese economic slowdown has been excessive, recording a minus growth rate; unemployment and bankruptcies have been rampant; and consumer buying power has dwindled under the influence of extremely high inflation.[3] The country's oil and gas import bill had increased from less than $7 billion in 1973 to nearly $22 billion in 1974. The end of the economic downturn was not yet in sight at yearend.

Japan's 1974 gross national product (GNP) was estimated at about Y131.7 trillion.[4] At current yen prices, the growth rate was 18.6%; this compares with 26% in 1973 and generally 10% to 15% during 1966–71. In terms of constant 1970 prices, the annual GNP increase in yen value was closer to 9% for 1972, 10% for 1973, and minus 1.7% for 1974. In the first quarter of 1975 which corresponds to the last quarter of fiscal 1974, industrial output was drastically cut and numerous expansion plans were curtailed or delayed. The yen rallied in the spring but moved back up to about Y300=US$1.00 for the rest of 1974.

Japan's mineral industries, based predominantly and increasingly upon the processing of imported raw materials and domestic and foreign secondary materials, were severely affected in 1974 by the oil crisis and ensuing worldwide recession. Most industries moved back expansion plans, moved ahead furnace and equipment repair schedules, shutdown the least efficient facilities either temporarily or permanently, negotiated for reduced ore deliveries and the least amount of price increases, and had to deal with slumping sales, excessive inventories, and labor difficulties. The degree of disruption varied with individual mineral industries. The financially strong steel industry stood up well under the economic strain, although much surplus capacity could not be utilized. Increased foreign demand for steel products compensated for slumping domestic sales. Imported coal and iron ore prices soared, but prices for finished steel also rose significantly. The copper industry was hard hit by a rising inflow of ore supplies coupled with cutbacks in operations and a drastic reduction in demand for copper products. At the same time copper prices declined sharply during the year. The lead-zinc industries owned mainly by the same firms that produce copper suffered nearly the same fate. The aluminum industry had problems of similar magnitude but was less vulnerable because of its many international ties. Domestic construction was down, saved somewhat by a public works program. Generally, the metal industries produced close to the 1973 levels but with more idle capacity, whereas production in the cement industry declined moderately. The petroleum refining industry continued to expand, although the quantity processed was slightly reduced. The high petroleum prices did not greatly affect refining operations. Oddly, the Japanese market was flooded with surplus byproduct elemental sulfur recovered from oil refining. Japanese fertilizers were still in great demand, but costs and prices were much higher than usual. Production in the domestic coal industry continued to decline, with imported coal taking up the slack. Nuclear powerplants encountered severe difficulties during 1974.

During 1974, the Ministry of International Trade and Industry (MITI) looked

[1] Supervisory physical scientist, Division of Nonmetallic Minerals.

[2] The Japanese fiscal year is from April to March.

[3] Focus Japan (Tokyo). An Economic Outlook: What Now? V. 2, No. 3, March 1975, pp. 2–4.

[4] Weighted average exchange rate for 1974 of Japan Yen (Y) was about Y291.7=US$1.00.

into the matter of raw material stockpiling.[5] On the advice of a study committee on the stockpiling of nonferrous metals, MITI requested for fiscal year 1975 budgetary appropriations totaling Y44,100 million (about $147 million) to begin stockpiling emergency supplies of copper, nickel, chromium, and tungsten. Other nonferrous metals to be studied in the future were zinc, cobalt, molybdenum, antimony, and tin. A MITI-controlled Japan Metal Mining Public Corporation would be formed to supervise stockpiling arrangements and issue bonds. MITI was also seeking a commitment from the Japan Export-Import Bank to make available Y70,000 million (about $233 million) at 7.5% interest which private companies may borrow to finance up to 70% of the cost of ore imported to produce primary metals for the stockpiling project. MITI further requested a small budget (about $420,000) to establish subcommittees to study iron ore, copper, bauxite, chromium, tin, and coking coal.

On December 4, the Foreign Ministry established an International Resources Problems Research Council to investigate energy and Middle East oil. The Japanese were moving ahead on their program to build up facilities to store a 90-day supply of liquid fuels. Oil stockpiling had taken priority over metal stockpiling for the time being, for lack of adequate funds and the fact that the nonferrous metal industries had accummulated very large inventories because of the recession. The Government had no money to buy these surpluses for stockpiling, but gave the copper industry about $100 million for "relief" instead. In October 1974, a public corporation controlled by the Forestry Agency began with a $1 million budget to stockpile plywood and lumber.

The long-standing Japanese Government program to encourage mineral exploration at home and abroad is evidenced by the activities of the Metal Mining Agency of Japan.[6] In 1974, three measures were taken to expand the Agency's overseas exploration activities: (1) Increase overall exploration funds abroad; (2) provide subsidies to Japanese mining companies to facilitate international joint projects; and (3) increase government subsidies for detailed geological exploration projects from 60% to 66.6%. The Agency has a Mineral Resources Center to maintain mineral surveillance abroad and dispatch survey missions. It has a program to make basic geological surveys and promote mineral resources development in developing countries. A special financing system was introduced for uranium and other minerals in foreign countries on a "repay if successful" basis. A "geological survey vessel" was completed in late 1974 for exploring offshore and deep-sea mineral deposits. The Agency's activities have recently been broadened to cover prevention of pollution. Agencies like the Japan Export-Import Bank and the Overseas Economic Cooperation Fund continued to finance many kinds of mineral projects, including mining, beneficiation, smelting, refining, and mineral transport. Not to be overlooked are the Agency's domestic activities like regional geological surveys, detailed exploration, and revolving funds for exploration in Japan. The Government continued to work closely both at home and abroad with private Japanese mining companies, who constitute the backbone of the total effort to secure and process mineral raw materials worldwide. The Metal Mining Agency had eight regional offices abroad as of year-end 1974.

Japan's 1975 energy conservation program was aimed at cutting oil imports by about 3%, following a 2.6% active cut in oil consumption during 1974 over that in 1973. The goal was to economize on the use of oil and electricity without seriously hampering industrial activities. The industrial sector will be subjected to an energy control campaign; the Government sector will aim at a 13% reduction in energy use; and the nonindustrial sector will be urged to save 10%. Japan's industries were seriously investigating and introducing energy-saving processes and equipment, closing down or writing off less efficient mines and plants in the process. The Government was also focusing on energy and resource problems through the establishment of a totally new Resources and Energy Agency under MITI.

Early in 1975, the Industrial Technology Council, an advisory body to MITI, called for a series of urgent measures to cope with future energy problems. A recommended

[6] Metal Mining Agency of Japan (Tokyo). Report for 1974. Pp. 1-27.

energy-saving program would cover (1) more efficient use of heat energy by industry; (2) greater efficiency in manufacturing processes; (3) greater use of waste heat; (4) recycling of scrap (for example, scrap aluminum can be recycled at some 4% of the energy required for new production); and (5) greater systemization of energy use in general such as regional heating and cooling and nuclear-powered total energy systems for industrial complexes.

## PRODUCTION

Japan's mineral and metal production showed slight increases in aluminum and copper, little change in lead and zinc, slight declines in steel and refined oil, and moderate decreases in cement and coal. Having achieved substantial industrial gains in the last decade, Japan's days of continued sharp growth in mineral and metal output have apparently come to a temporary halt, primarily as a result of the energy crisis.

During the last few months of 1974, industrial production declined sharply across the board, on account of overall sluggish domestic and foreign demand for Japan's mineral and metal products. Cutbacks in steel, cement, and oil refining were moderate; however, the gap between capacity and production widened as additional facilities continued to come onstream. In contrast, cutbacks in nonferrous metals were rather severe, with contemplated reductions of up to 40% during the first half of 1975. These adverse developments were not different from elsewhere, except temporary setbacks by Japan's custom-smelting type of mineral industries were more severe than those by other countries with mineral economies more dependent upon indigenous raw materials.

Despite these trends, Japan held its own as a prominent world producer of mineral products. Its 1974 rankings for certain major minerals were as follows: Pyrite and slab zinc (1st); chemical fertilizers (2d); cement, refined copper, steel, aluminum, and refined oil (3d); coke (4th); and refined lead (5th).

e Estimate. p Preliminary. r Revised. NA Not available.

[1] Revised to none.

[2] Includes (but not limited to) ferromolybdenum, ferrotungsten, ferrovanadium, and silicochromium.

[3] Includes aplite as follows in thousand tons: 1972—455; 1973—497; 1974—490, and saba as follows in thousand tons: 1972—1; 1973—NA; 1974—NA.

[4] Nitrogen content of fertilizer for year ended June 30 of that stated.

[5] Includes a small amount of byproduct sulfur recovered from sulfide ores as well as sulfur content of sulfur ores.

[6] Includes a small amount of natural coke.

[7] Includes output from gas mines and coal mines.

## TRADE

Japan's overall trade in 1974 totaled about Y34,274.3 billion (rough conversion, Y291.7=US$1.00); exports totaled Y16,207.9 billion and imports, Y18,076.4 billion. Mineral and related products were an important part of the total. Mineral exports during the year comprised about 25% of all exports, and mineral imports about 55% of all imports. The leading mineral export was iron and steel, accounting for nearly four-fifths of the value of all mineral exports and one-fifth of total commodity exports. Steel exports in 1974 approximated Y3,148.9 billion or on the order of US$10.8 billion.

The most important minerals imported in 1974 were as follows, with rounded values in billions of yen: crude oil, 5,504; iron ore, 606; coal and coke, 845; nonferrous metal ores, 795 (477 for copper); nonferrous metals, 590 (205 for copper); refined petroleum, 657; natural gas, 250; and nonmetallics, 378.

Details on mineral exports and imports are given in the following tabulations in billion yen:

| Exports [1] | 1973 | 1974 |
|---|---|---|
| METALS | | |
| Iron and steel | 1,441.5 | 3,148.9 |
| Iron and steel scrap | 5.5 | 12.6 |
| Nonferrous metals: | | |
| Copper | 41.2 | 208.8 |
| Aluminum | 11.8 | 28.3 |
| Zinc | 10.3 | 43.5 |
| Other | 20.6 | 52.2 |
| NONMETALS | | |
| Inorganic chemicals | 33.9 | 129.6 |
| Cement | 4.8 | 23.2 |
| Chemical fertilizers | 65.5 | 137.5 |
| Nonmetallic manufactures | 150.0 | 177.7 |
| MINERAL FUELS AND RELATED MATERIALS | | |
| Petroleum products | 19.0 | 62.1 |
| Other | 6.1 | 12.2 |
| Total: | | |
| Mineral commodities | 1,810.2 | 4,036.6 |
| All commodities | 10,026.5 | 16,207.9 |

[1] Weighted average for 1974 was about Y291.7=US$1.00. The exchange rate was about 300 to 1 during January, February, and most of second half 1974; but it was 270 to 1 in March and moving up slowly to 300 to 1 in the next few months.

| Imports [1] | 1973 | 1974 |
|---|---|---|
| METALS | | |
| Iron and steel: | | |
| Iron ore | 450.3 | 605.9 |
| Scrap | 104.7 | 148.3 |
| Metal | 65.1 | 116.8 |
| Nonferrous metals: | | |
| Ores and concentrates: | | |
| Copper | 320.3 | 477.3 |
| Lead | 15.0 | 21.4 |
| Zinc | 47.5 | 76.8 |
| Nickel | 46.1 | 68.3 |
| Bauxite | 17.1 | 22.5 |
| Manganese | 25.3 | 44.4 |
| Other | 40.0 | 58.8 |
| Scrap | 29.9 | 25.7 |
| Metal: | | |
| Copper | 184.9 | 205.2 |
| Silver and platinum group | 98.8 | 131.1 |
| Aluminum | 75.6 | 119.4 |

| Nickel | 17.0 | 24.5 |
| Other | 31.1 | 39.0 |
| NONMETALS | | |
| Inorganic chemicals | 31.4 | 50.6 |
| Salt | 17.7 | 27.0 |
| Phosphate rock | 20.0 | 63.8 |
| Manufactured fertilizers (mainly potassic) | 21.5 | 41.1 |
| Other crude fertilizers and minerals | 54.9 | 63.8 |
| Nonmetallic manufactures | 160.2 | 131.4 |
| MINERAL FUELS AND RELATED MATERIALS | | |
| Coal and coke | 368.9 | 844.9 |
| Petroleum: | | |
| Crude | 1,633.0 | 5,503.9 |
| Refinery products | 197.6 | 656.5 |
| Natural gas | 66.6 | 249.8 |
| Total: | | |
| Mineral commodities | 4,185.4 | 9,888.6 |
| All commodities | 10,404.4 | 18,076.4 |

[1] Weighted average for 1974 was about Y291.7=US$1.00. The exchange rate was about 300 to 1 during January, February, and most of second half 1974; but it was 270 to 1 in March and moving up slowly to 300 to 1 in the next few months.

## Table 2.—Japan: Exports of mineral commodities [1]

(Thousand metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 | Principal destinations, 1973 |
|---|---|---|---|---|
| METALS | | | | |
| Aluminum: | | | | |
| Bauxite and concentrate -- tons -- | 7,905 | 316 | 146 | Mainly to Republic of Korea. |
| Oxide (alumina) and hydroxide -- | 220 | 183 | 79 | U.S.S.R. 50; United States 50; Republic of Korea 35. |
| Fused alumina ---------- tons -- | 5,223 | 6,431 | 6,054 | Republic of Korea 2,777; Taiwan 2,615; Australia 244. |
| Metal including alloys, all forms -- | 45 | 34 | 69 | Republic of Korea 6; United States 6; Indonesia 4. |
| Arsenic trioxide, pentoxide, acids ---------- tons -- | 128 | 47 | 20 | Mainly to Republic of Korea. |
| Beryllium metal including alloys, all forms ---------- kilograms -- | 228 | 28 | (2) | All to Hong Kong. |
| Bismuth metal including alloys, all forms ---------- tons -- | 613 | 531 | 507 | Netherlands 319; United States 113; United Kingdom 85. |
| Cadmium metal including alloys, all forms ---------- do ---- | 1,018 | 1,513 | 1,606 | Netherlands 1,091; Belgium-Luxembourg 154; France 106. |
| Chromium: | | | | |
| Chromite ---------- do ---- | -- | 71 | 244 | All to Thailand. |
| Oxide and hydroxide----- do ---- | 2,405 | 1,661 | 1,361 | United States 692; Republic of Korea 583; Taiwan 319. |

See footnotes at end of table.

## Table 2.—Japan: Exports of mineral commodities [1]—Continued

(Thousand metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 | Principal destinations, 1973 |
|---|---|---|---|---|
| METALS—Continued | | | | |
| Cobalt oxide and hydroxide -- tons -- | 5 | 16 | 12 | Republic of Korea 10; North Vietnam 4; Taiwan 1. |
| Columbium and tantalum, tantalum metal, including alloys, all forms ---------- kilograms -- | 2,321 | 545 | 25,298 | People's Republic of China 300; West Germany 113; United States 66. |
| Copper: | | | | |
| Ore and concentrate ----- tons -- | 4,550 | -- | 2,299 | |
| Copper sulfate ---------- do ---- | 1,754 | 268 | 379 | Republic of Korea 64; Taiwan 60; Malaysia 51. |
| Metal including alloys, all forms -- | 86 | 80 | 344 | United States 19; Taiwan 18; Hong Kong 11. |
| Iron and steel: | | | | |
| Ore and concentrate ------ tons -- | 210 | 2 | -- | All to Indonesia. |
| Metal: | | | | |
| Scrap ---------- do ---- | 221,588 | 208,381 | 301,163 | Republic of Korea 154,365; Taiwan 50,052; Thailand 3,513. |
| Pig iron, including cast iron ---------- do ---- | 381,744 | 108,183 | 72,070 | People's Republic of China 62,689; Taiwan 25,290; Republic of Korea 17,283. |
| Sponge iron, powder, shot ---------- do ---- | 8,038 | 7,009 | 9,079 | Australia 5,107; Republic of Korea 783; United Kingdom 695. |
| Spiegeleisen ---------- | -- | -- | (3) | |
| Ferroalloys: | | | | |
| Ferromanganese --------- | 50 | 26 | 54 | United States 17; Iran 5; Singapore 1. |
| Other ---------- | 56 | 24 | 123 | United States 14; Singapore 2; Australia 2. |
| Steel, primary forms -------- | 1,789 | 5,233 | 7,595 | Republic of Korea 1,205; Argentina 891; United States 618. |
| Semimanufactures: | | | | |
| Bars, rods, angles, shapes, sections ------- | 3,132 | 3,636 | 7,068 | United States 885; People's Republic of China 282; U.S.S.R. 263. |
| Universals, plates, sheets: | | | | |
| Universals, plates, sheets, uncoated --- | 9,665 | 9,274 | 9,640 | United States 1,438; People's Republic of China 767; Taiwan 559. |
| Tinned plates and sheets ---------- | 832 | 888 | 1,049 | United States 244; Taiwan 80; U.S.S.R. 70. |
| Other coated plates and sheets --------- | 1,476 | 1,548 | 1,562 | United States 568; West Germany 78; Iran 74. |
| Hoop and strip ---------- | 557 | 670 | 734 | Indonesia 78; United States 48; Canada 46. |
| Rails and accessories ---- | 37 | 73 | 114 | Taiwan 34; Republic of Korea 14; Australia 10. |
| Wire ---------- | 463 | 419 | 511 | United States 190; Thailand 28; Indonesia 24. |
| Tubes, pipes, fittings ---- | 2,911 | 2,980 | 3,856 | United States 727; People's Republic of China 300; Saudi Arabia 229. |
| Castings and forgings, rough ---------- | 16 | 12 | 13 | United States 8; Republic of South Africa 2. |
| Lead: | | | | |
| Ore and concentrate ----- tons -- | 1,466 | -- | 7,405 | |
| Oxides ---------- do ---- | r 64 | 195 | 66 | Mainly to Taiwan. |
| Metal including alloys, all forms ---------- | 6 | 5 | 35 | India 3; Republic of Korea 1; Taiwan 1. |
| Magnesium metal including alloys, all forms ---------- tons -- | 89 | 117 | 1,461 | Republic of Korea 72; Taiwan 21; Malaysia 21. |

See footnotes at end of table.

| METALS—Continued | | | | |
| Metals including alloys, all forms: | | | | |
| Phosphorus and other metalloids ---------- tons -- | 113 | 368 | 502 | United States 249; Taiwan 65; Republic of Korea 38. |
| Alkali, alkaline-earth, rare-earth metals ---------- do ---- | 47 | 120 | 119 | Taiwan 61; West Germany 20; Italy 14. |
| Pyrophoric alloys -------- do ---- | 106 | 110 | 125 | Singapore 27; Hong Kong 22; France 16. |
| Base metals including alloys, all forms, n.e.s -------- do ---- | 8,800 | 8,000 | 7,464 | United States 1,934; West Germany 1,481; United Kingdom 1,027. |
| NONMETALS | | | | |
| Abrasives, natural, n.e.s.: | | | | |
| Emery ---------- do ---- | 1,180 | 1,491 | 931 | Taiwan 987; Republic of Korea 221; Hong Kong 139. |
| Natural abrasives, n.e.s -- do ---- | 366 | 703 | 363 | Republic of Korea 243; Taiwan 194; People's Republic of China 157. |
| Dust and powder of precious and semiprecious stones thousand carats -- | 8,871 | 1,112 | 1,387 | Mainly to United States. |
| Grinding and polishing wheels and stones ---------- tons -- | 2,962 | 3,554 | 3,111 | Thailand 562; United States 449; Singapore 260. |
| Asbestos ---------- do ---- | 758 | 257 | 180 | Philippines 90; Indonesia 40; Saudi Arabia 33. |
| Barite and witherite -------- do ---- | 390 | 100 | -- | All to Republic of Korea. |
| Boron materials: | | | | |
| Crude natural borates --- do ---- | -- | 150 | 1,207 | All to Taiwan. |
| Oxide and acid ---------- do ---- | 107 | 121 | 1,155 | Taiwan 66; Bangladesh 19; Republic of Korea 12. |
| Cement ---------- | 1,544 | 857 | 2,302 | Singapore 367; Indonesia 176; Hong Kong 82. |
| Chalk ---------- tons -- | 3,675 | 949 | 36 | Hong Kong 500; Singapore 235; Taiwan 115. |
| Clays and clay products (including all refractory brick): | | | | |
| Crude clays, n.e.s -------- do ---- | 54,027 | 62,451 | 56,733 | Philippines 15,465; Taiwan 14,138; United Kingdom 5,188. |
| Products: | | | | |
| Refractory (including nonclay brick) ---- do ---- | 113,818 | 92,244 | 125,901 | Brazil 17,874; Republic of Korea 16,803; India 9,524. |
| Nonrefractory [4] ------ do ---- | 71,976 | 54,592 | 47,814 | United States 19,677; Australia 8,382; Hong Kong 6,278. |
| Cryolite and chiolite ---------- do ---- | 2 | 18 | 11 | Mainly to Taiwan. |
| Diamond: | | | | |
| Gem, not set or strung - carats -- | 5,590 | 8,785 | 7,460 | Hong Kong 5,860; Belgium-Luxembourg 2,325; Italy 370. |
| Industrial ---- thousand carats -- | 103 | 93 | 11 | United States 34; Taiwan 28; United Kingdom 21. |
| Diatomite and other infusorial earth ---------- tons -- | 1,414 | 1,294 | 981 | Taiwan 220; Republic of Korea 193; Republic of South Africa 174. |
| Feldspar and fluorspar: | | | | |
| Feldspar ---------- do ---- | 3,191 | 5,438 | 7,409 | Taiwan 3,532; Malaysia 900; Philippines 623. |
| Fluorspar, leucite, nepheline, nepheline syenite ------- do ---- | 19 | 18,043 | 61 | Mainly to U.S.S.R. |
| Fertilizer materials: | | | | |
| Crude ---------- do ---- | 36 | 2,930 | -- | All to Republic of Korea. |
| Manufactured: | | | | |
| Nitrogenous [5] ---------- | 4,048 | 3,454 | 3,005 | India 465; Indonesia 325; Philippines 267. |
| Phosphatic ---------- | 87 | 37 | 24 | Fiji 8; Sri Lanka 6; Indonesia 5. |

See footnotes at end of table.

## Table 2.—Japan: Exports of mineral commodities [1]—Continued

(Thousand metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 | Principal destinations, 1973 |
|---|---|---|---|---|
| NONMETALS—Continued | | | | |
| Fertilizer materials—Continued | | | | |
| Manufactured—Continued | | | | |
| Potassic | 6 | 2 | (6) | Mainly to Republic of Korea. |
| Other, including mixed | 228 | 166 | 74 | Thailand 113; Sri Lanka 13; Nepal 11. |
| Ammonia tons | 99,438 | 119,919 | 144,738 | Philippines 88,140; Republic of Korea 31,091; Hong Kong 371. |
| Graphite, natural do | 420 | 440 | 418 | Taiwan 132; Pakistan 123; Indonesia 70. |
| Gypsum and plasters do | 2,537 | 2,546 | 2,843 | Taiwan 1,012; Republic of Korea 565; Hong Kong 390. |
| Iodine do | 6,551 | 6,265 | 6,717 | United States 2,628; United Kingdom 783; France 718. |
| Kyanite and related materials do | 5,204 | 10,676 | 20,768 | Taiwan 6,838; Republic of Korea 2,791; Thailand 270. |
| Lime do | 7,164 | 23,317 | 31,484 | Mainly to Bismarck Archipelago. |
| Magnesite do | 68 | 100 | 1,134 | Republic of Korea 50; Taiwan 50. |
| Mica do | 390 | 171 | 257 | Republic of Korea 68; Taiwan 47; Thailand 29. |
| Pigments, mineral, iron oxides, processed do | 2,088 | 5,248 | 12,342 | Taiwan 1,954; United States 1,078; Australia 574. |
| Precious and semiprecious stones, except diamond: | | | | |
| Natural thousand carats | 230,511 | 222,873 | 325,231 | Republic of Korea 155,246; West Germany 26,166; United States 19,950. |
| Manufactured do | 44,550 | 72,742 | 112,917 | United States 21,774; Republic of Korea 17,560; Netherlands 16,650. |
| Pyrite (gross weight) tons | -- | 3,209 | -- | All to Republic of Korea. |
| Salt and brine do | 311 | 533 | 1,120 | Bismarck Archipelago 225; United States 116; Mauritius 90. |
| Sodium and potassium compounds, n.e.s.: | | | | |
| Caustic soda | 186 | 185 | 331 | Mainly to Australia. |
| Caustic potash, sodic and potassic peroxides | 5 | 3 | 4 | People's Republic of China 1. |
| Stone, sand and gravel: | | | | |
| Dimension stone tons | 826 | 1,714 | 1,529 | North Korea 1,220; Republic of Korea 169; Australia 102. |
| Dolomite, chiefly refractory grade do | 3,772 | 3,193 | 6,025 | Mainly to Philippines. |
| Gravel and crushed rock do | 4,357 | 1,922 | 1,199 | Singapore 407; Thailand 400; Puerto Rico 201. |
| Limestone (except dimension) | 881 | 1,442 | 1,469 | Mainly to Australia. |
| Quartz and quartzite tons | 160 | 256 | 1,165 | Taiwan 150; Thailand 80; West Germany 20. |
| Sand, excluding metal-bearing do | 3,499 | 3,452 | 1,575 | Taiwan 1,270; Republic of Korea 898; Hong Kong 444. |
| Sulfur: | | | | |
| Elemental: | | | | |
| Other than colloidal do | 47,318 | 45,051 | 62,986 | Mainly to Republic of Korea. |
| Colloidal do | 571 | 2,421 | 114 | Mainly to Thailand. |
| Sulfur dioxide do | 387 | 180 | 181 | Mainly to Australia. |
| Sulfuric acid do | 462 | 176 | 289 | Republic of Korea 75; Philippines 33; Hong Kong 24. |
| Talc and steatite do | 765 | 829 | 746 | Singapore 500; Taiwan 140; Indonesia 49. |

See footnotes at end of table.

## Table 2.—Japan: Exports of mineral commodities [1]—Continued

(Thousand metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 | Principal destinations, 1973 |
|---|---|---|---|---|
| NONMETALS—Continued | | | | |
| Other nonmetals, n.e.s.: | | | | |
| Crude | 5 | 5 | 7 | Republic of Korea 1; Taiwan 1; Philippines 1. |
| Slag, dross, similar waste, not metal bearing | 20 | 25 | 39 | Mainly to Republic of Korea. |
| Oxides, hydroxides, peroxides of magnesium, strontium, barium (including magnesia clinker) | 87 | 94 | 82 | Australia 23; United States 18; Venezuela 8. |
| Fluorine and bromine ---------- kilograms | 2,500 | 1,175 | 8,090 | Mainly to Taiwan. |
| MINERAL FUELS AND RELATED MATERIALS | | | | |
| Asphalt and bitumen, natural - tons | 6 | -- | 11 | |
| Carbon black and gas carbon: | | | | |
| Carbon black | 28 | 16 | 14 | Thailand 3; Singapore 2; Taiwan 2. |
| Gas carbon ---------- kilograms | 3 | -- | 2,551 | |
| Coal, all grades, including briquets | 9 | 24 | 132 | Republic of Korea 17; Taiwan 3; Thailand 3. |
| Coke and semicoke | 394 | 564 | 656 | Peru 165; Venezuela 160; Taiwan 93. |
| Gas, manufactured only ----- tons | 301 | 1 | (7) | All to Indonesia. |
| Hydrogen and rare gases (helium, neon, argon, krypton, xenon) ---------- do | 278 | 563 | 442 | Republic of Korea 159; Philippines 68; Iran 57. |
| Peat, including peat briquets and litter ---------- do | 20 | -- | -- | |
| Petroleum: | | | | |
| Crude and partly refined thousand 42-gallon barrels | 7,610 | 258 | 16 | Mainly to Philippines. |
| Refinery products: | | | | |
| Nonbunker: | | | | |
| Gasoline ---------- do | 349 | 576 | 26 | United States 338; Thailand 130; Guam 41. |
| Kerosine and jet fuel ---------- do | 3,107 | 2,398 | 1,062 | Mainly to United States. |
| Distillate fuel oil - do | 519 | 945 | 495 | United States 468; Hong Kong 394; Mexico 77. |
| Residual fuel oil - do | 189 | 1,496 | 12,574 | Republic of Korea 519; Hong Kong 426; Singapore 286. |
| Lubricants ------ do | 3,188 | 2,229 | 4,496 | Republic of Korea 849; Taiwan 343; Indonesia 206. |
| Other: | | | | |
| Liquefied petroleum gas ------- do | 527 | 336 | 85 | Taiwan 235; Hong Kong 98; Australia 2. |
| Naphtha ---- do | 479 | 647 | 1,162 | United States 494; United Kingdom 148; New Zealand 4. |
| Mineral jelly and wax ------- do | 329 | 410 | 315 | United States 112; Republic of Korea 56; Australia 30. |
| Bitumen ----- do | 211 | 128 | 245 | Republic of Korea 42; Burma 34; Indonesia 31. |
| Unspecified -- do | 129 | 229 | 248 | Italy 62; West Germany 57; Republic of Korea 48. |
| Bunker: [8] | | | | |
| Kerosine and jet fuel ---------- do | 10,217 | 13,137 | NA | NA. |
| Distillate fuel oil ---------- do | 9,525 | 10,216 | NA | NA. |
| Residual fuel oil - do | 94,458 | 111,270 | NA | NA. |
| Other ---------- do | 314 | 428 | NA | NA. |

See footnotes at end of table.

## Table 2.—Japan: Exports of mineral commodities [1]—Continued
(Thousand metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 | Principal destinations, 1973 |
|---|---|---|---|---|
| MINERAL FUELS AND RELATED MATERIALS—Continued | | | | |
| Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals | 34 | 31 | 51 | Republic of Korea 22; Philippines 1; Bangladesh 1. |

r Revised. NA Not available.
[1] Excludes exports under Japanese-United States Mutual Defense Agreement or for account of U.S. military forces.
[2] Reported in value only: 1974, $3,894.
[3] Reported in value only: 1974, $3,922.
[4] Excludes mosaic tile valued at (thousand yen): 1972, 20,666,571; 1973, 26,471,496; 1974, 25,684,534.
[5] Includes exports of following amounts of urea containing more than 45% nitrogen: 1972, 2,511,128 tons; 1973, 2,454,739 tons; 1974, 2,249,275 tons.
[6] Less than ½ unit.
[7] Reported in value only: 1974, $2,393.
[8] Source: Ministry of International Trade and Industry (Tokyo, Japan), Yearbook of Petroleum Statistics 1972 and 1973.

## Table 3.—Japan: Imports of mineral commodities [1]
(Thousand metric tons unless otherwise specified)

| Commodity | 1972 | 1973 | 1974 | Principal sources, 1973 |
|---|---|---|---|---|
| METALS | | | | |
| Aluminum: | | | | |
| Bauxite and concentrate | 4,997 | 5,615 | 5,311 | Australia 3,457; Indonesia 1,137; Malaysia 931. |
| Oxide and hydroxide | 548 | 452 | 647 | Mainly from Australia. |
| Fused aluminum (artificial corundum) tons | 201 | 565 | 2,615 | United Kingdom 323; West Germany 115; United States 85. |
| Metal including alloys: | | | | |
| Scrap | 37 | 48 | 25 | United States 32; South Vietnam 5; Canada 3. |
| Unwrought | 325 | 476 | 479 | Canada 80; Bahrain 77; New Zealand 77. |
| Semimanufactures | 8 | 28 | 44 | United States 12; Romania 3; Republic of Korea 2. |
| Antimony: | | | | |
| Ore and concentrate tons | 13,312 | 13,959 | 10,857 | Bolivia 7,345; People's Republic of China 3,014; Thailand 1,526. |
| Metal including alloys, all forms do | 262 | 1,248 | 589 | Mainly from People's Republic of China. |
| Arsenic: | | | | |
| Natural sulfides do | 2 | 5 | 40 | All from People's Republic of China. |
| Trioxide, pentoxide, acids do | 1,442 | 1,971 | 1,082 | People's Republic of China 1,266; France 533; United States 59. |
| Beryllium metal including alloys, all forms kilograms | 9,084 | 8,696 | 3,139 | Mainly from United States. |
| Bismuth metal including alloys, all forms tons | 1 | 2 | 5 | Mainly from United Kingdom. |
| Cadmium metal including alloys, all forms kilograms | 4 | 3,984 | 9,118 | Mainly from North Korea. |

See footnotes at end of table.

r Revised.
[1] Excludes imports under Japanese-United States Mutual Defense Agreement or for account of U.S. military forces.
[2] Includes zinc sulfate.
[3] Includes ferruginous manganese and manganese dioxide.
[4] Partial figure; value of reported quantity is $77,096. An addition unreported quantity valued at $747 was also imported.
[5] Includes lithium hydroxide, beryllium oxide, mercury oxide, antimony trioxide, cuprous oxide and oxides, hydroxides, and peroxides, n.e.s., and silicon dioxides.
[6] Includes phosphorus, boron, and arsenic.
[7] Includes lithium, sodium, alkali-metals, n.e.s., and alkaline-earth metals.

## COMMODITY REVIEW

### METALS

**Aluminum.**—Japan's primary aluminum production increased another 2.0% in 1974, reaching 1,118,374 tons (excluding 5,630 tons of superpure aluminum), according to the Japan Light Metal Association. In addition, 517,334 tons of secondary aluminum and alloy ingots was produced. Although Japan's production was far below that of the United States, it closely followed that of the Soviet Union and was ahead of Canadian production. Nonetheless, output near yearend declined slightly and most aluminum producers in Japan were revaluating their plans, particularly Mitsubishi Chemical Co. which was scheduling a cut of 40% early in 1975. Because of sluggish demand, Japan's aluminum stocks at yearend 1974 were about 242,000 tons compared with 66,000 tons in 1973.

Japan's internationally oriented aluminum industry has many commercial and investment ties with major foreign companies. Because of these specific relationships, large quantities of alumina were imported and sizable tonnages of aluminum were imported. During 1974 imports of alumina to produce aluminum were 633,325 tons (all from Australia), and imports of aluminum ingot were 384,819 tons (headed by New Zealand, 21%; Bahrain, 19%; Canada, 17%; and the United States, 13%). Imports of alloyed aluminum ingot were 94,088 tons (headed by the U.S.S.R., 44% and the United States, 13%). Japan has no bauxite, hence all needs must be met by imports. During 1974, approximately 5.3 million tons of bauxite were imported compared with 5.6 million tons in 1973. In 1974, Australia supplied about three-fifths, Indonesia one-fourth, and Malaysia, just under one-sixth.

Australia has become the principal raw material base for Japan's aluminum industry and its position is improving. During 1974, Japan imported about 3.2 million tons of bauxite from Australia. Nearly two-thirds of this came from the Weipa area, produced and sold by a consortium headed by Comalco Ltd. (Australia), and shipped mainly to Sumitomo Chemical Co., Ltd., and Showa Denko K.K., shareholders of Comalco. Weipa had labor troubles during the middle of the year. Bauxite from Darling Range, owned by Alcoa of Australia Ltd., was shipped mainly to Nippon Light Metal Company, Ltd. (NLM). Bauxite from Gove, owned by the Nabalco Pty., Ltd., formerly went only to Mitsui Aluminum Co., Ltd., on a 20-year, 10-million ton (total) contract. In August 1974 another contract was concluded regarding the Gove area to supply Nippon Light Metal with 4.3 million tons in 12 years, and Showa Denko and Sumitomo Chemical each with 1 million tons in 10 years. Alumina from Pinjarra (also owned by Alcoa), amounting to more than 600,000 tons in 1974, went mostly to Mitsubishi Chemical Co.; this project is in the process of substantial expansion and will also supply large tonnages to Amax Aluminum Co., Inc.

Japan has acquired about 2 million tons of bauxite yearly from Bintan, Indonesia, and Johore, Malaysia, in recent years, with the three older companies—NLM, Sumitomo Chemical, and Showa Denko—importing the bulk. Whereas reserves of high-grade bauxite from Malaysia may run out in 5 to 10 years, a new large deposit has been found on Enam Island, Indonesia, where other commercial deposits might also be found. An agreement was finally reached at yearend between five Japanese aluminum companies and the Indonesian Government on the Asahan power-aluminum project to be built at a cost of $830 million. The plan is to produce 75,000 tons of aluminum by 1982; 225,000 tons by 1984; and 360,000 tons at some later date, using Indonesian bauxite.[7] Early in 1975, an agreement was finally reached between five Japanese aluminum companies and Companhia Vale do Rio Doce of Brazil to build a 1.3-million-ton alumina plant and a 640,000-ton aluminum reduction plant in Bira De Conde in Pará State and a 1.85-million-kilowatt hydropower plant in Tucurui on the banks of Tocantins River. This $3 billion project will probably be completed in the early 1980's.[8]

In August Japanese firms were expected to agree to 20% capital participation in the "Venalum" project (down from 80% because of Venezuela's increased oil dollars), together with the Guyana District Development Corp. of Venezuela. The plan is to produce 70,000 tons aluminum annually by 1977 and 280,000 tons by 1979; eventually a total of 160,000 tons will be exported to Showa Denko, Kobe Steel Ltd., Mitsubishi Chemical, and Sumitomo Chemical. In June the Aluminum Resources Development Corp (ARDECO) of Japan, Kaiser Aluminum & Chemical Corporation, and the Government of Ghana agreed to set up a joint venture to produce alumina from local bauxite (600,000 tons of alumina annually) and also 100,000 tons per year of aluminum from reduction plants to be completed in the Tema District by about 1980, if feasibility studies prove successful; the Ghanians will build a 200,000-kilowatt powerplant for this purpose.

Mitsui Mining & Smelting Co., Ltd., together with sister Mitsui companies have reached an agreement with local authorities to consider building a 600,000-ton alumina plant on Rennel Island, Solomon Islands.[9] Bauxite reserves are 30 to 60 million tons. This ore with various impurities will be treated by Mitsui's new technology (not Bayer Process) which raises alumina recovery to 95% and cuts down soda and fuel oil consumption by 50% and 30%, respectively. If a feasibility study proves successful, completion of plant construction should be in 4 years. Aluminium Company of Canada Ltd. (Alcan), and its subsidiary NLM made plans to establish a joint venture to make alumina for conversion into 100,000 tons of aluminum at Alcan's smelter at Kitimat, British Columbia. The Japanese joint venture Bluff Works in New Zealand moved ahead on its plan to expand aluminum capacity to 150,000 tons by mid-1976.

Japan has a sophisticated Bayer processing and aluminum reduction industry, although the high cost of power and energy

[7] Japan Metal Bulletin (Tokyo). Oct. 19, 1974, p. 4 and other pages.
[8] Japan Metal Bulletin (Tokyo). Mar. 25, 1975, pp. 4–5.
[9] Japan Chemical Week (Tokyo). Mar. 6, 1975, p. 1.

is a built-in handicap. Data on raw materials and power consumption reveal Japan's relative competence in production of light metals. During April 1973 to March 1974, 2.19 tons of bauxite, 99 kilograms of caustic soda, and 118 liters of heavy oil were consumed per ton of alumina. For the same period and for each ton of aluminum, consumption of raw materials was as follows, in kilograms: alumina, 1,931; cryolite, 6; recovered cryolite, 22; aluminum fluoride, 36; anodes 537; calcined coke 408; pitch 158; and cathode carbon 8. Power for electrolysis stood at 15,151 kilowatts per ton of aluminum, and power for other than electrolysis, 1,122 kilowatts.[10]

Overall, Japan's alumina production declined from 1,987,144 tons in 1973 to 1,800,859 tons in 1974, with the difference made up by imports from Australia. NLM's output declined from 768,859 tons in 1973 to 666,215 tons; Sumitomo Chemical's output dropped from 567,582 tons in 1973 to 489,185 tons. Showa Denko showed a nominal drop from 469,794 tons in 1973 to 460,254 tons and Mitsui Aluminum showed a nominal gain from 180,909 tons in 1973 to 184,605 tons.[11]

As for performance by individual companies in primary aluminum production, NLM produced 313,237 tons in 1974 as compared with 320,909 tons in 1973; Showa Denko showed a gain to 209,690 tons from 198,755 tons; Sumitomo Chemical produced 273,994 tons as compared with 274,145 tons in 1973; Mitsubishi Chemical showed a gain to 244,552 tons from 224,915 tons; and Mitsui Aluminum's output dropped to 76,901 tons from 78,041 tons.

NLM produced much below its full capacity of 386,000 tons (130,000 tons at the Tomakomai plant; 111,000 tons at the old Kambara plant; and presumably 145,000 tons at the Niigata plant). A 144-cell, 44,000-ton-per-year new potline at Niigata was completed late in the year, but startup might be delayed until September 1975. The idea behind building a joint venture smelter in Kitimat, Canada, was simply to save on energy expense.

Sumitomo Chemical worked its Toyama Works (182,000-tons-per-year capacity) at nearly full scale but scrapped the small and old Kikumoto reduction plant in August, except for the "superpurity aluminum" lines rated at 8,300 tons. The Kikumoto 800,000-tons-per-year alumina plant, however, was kept intact and running. A new 50,000-tons-per-year reduction works at Toyo in Ehime was virtually completed at yearend, with another 50,000-ton-per-year capacity to be added a year later. To take advantage of tax breaks, Toyo is under a wholly–owned subsidiary, Sumitomo Aluminum Smelting Co., Ltd.

Near yearend, Showa Denko discontinued operation of 150 cells (15% of its total of 985 cells) at three of its aluminum smelters, namely Chiba, Kitakata, and Omachi. Chiba has 160,000-tons-per-year of Showa's total 275,000-tons-per-year capacity. Plans to add 50,000-tons-per-year capacity at Chiba have been dropped indefinitely, possibly in favor of building plants abroad. Showa Denko had a good financial year. However, this was mainly attributed to nonaluminum product lines, such as fertilizers, ferrochrome, electrodes, and metals and carbons needed by the iron and steel industry.

Mitsubishi Chemical, which relies on Australia for all its alumina needs, completed its Sakaide Works early in 1975 to make its 190,000-ton-per-year capacity the largest in Japan. The last installment at Sakaide was 128 cells aggregating 50,000-tons-per-year and will be in full-scale operation in July 1975. Meanwhile, the whole works was scheduled to produce at roughly half capacity for the first half of 1975. Mitsubishi's other reduction works, Naoetsu which may be rated at about 150,000-tons-per-year, was worked nearly full scale during 1974 but with periodic repairs moved up so as to cut down only slightly on production.

Mitsui Aluminum moved cautiously toward its goal to produce 400,000-tons-per-year (200,000-tons-per-year already installed) of alumina and correspondingly 162,000-tons-per-year (118,500-tons-per-year already installed) of aluminum. Mitsui Alumina Co., Ltd. a subsidiary, began expansion work at the Wakamatsu Alumina Works with target completion date early in 1976 at a cost of Y17 trillion (including Y2.5 trillion for pollution control equipment). At the Omuta (or Miike) reduction works, 128 cells aggregating 43,500

[10] Japan Metal Bulletin (Tokyo). May 27, 1974, p. 7.
[11] Japan Metal Journal (Tokyo). Feb. 17, 1975, p. 8.

tons were completed at yearend to add to the 75,000-tons-per-year previously installed. The last 43,000-ton-per-year capacity is also targeted for 1976.

**Chromium.**—Japan was involved in all phases of chrome operations. Domestic output of low-grade chromite continued to correspond to a fraction of imports. Ferrochrome production in fiscal 1973–74 totaled 495,000 tons, as compared with 360,000 tons a year earlier. Japan's exports of ferrochrome were 57,578 tons, including 31,359 tons to the United States; imports of ferrochrome were 38,815 tons, predominantly from the Republic of South Africa. All Japanese ferrochrome producers were interested in smelting overseas. Japan also produced 2,146 tons of metallic chromium in 1974. The Tekkosha Co., Ltd. was the main producer and the Chuo Denki Kogyo company was the second producer. Tekkosha's Yamagata plant now rated at 200-tons-per-month was due to be expanded 25% in 1975.

Meanwhile, 1,154,911 tons of high-grade ores were imported in 1974, specifically 423,738 tons from the Republic of South Africa, 310,888 tons from India, 127,033 tons from the Philippines, and 122,650 tons from the U.S.S.R. Japan's five leading ferrochrome producers (Showa Denko, Japan Metals & Chemicals Co., Ltd., Nippon Denko Co., Ltd., Nippon Kohan K.K., and Awamura Metal Industry Co.) took 49% ownership of a joint project with the Brazilian firm Cia. de Ferro Ligas da Bahia S.A. to mine a 100-million-ton ore reserve in Bahia, Brazil. The plan was to produce 100,000 to 200,000 tons of chromite per year initially and 35,000 to 70,000 tons of ferrochrome eventually.

**Copper.**—At yearend 1974, Japan's modern copper smelting industry was in financial difficulty because of over capacity, a sharp decline in copper prices after a steep rise early in the year, radical increases in energy and labor costs, and general lowering of domestic consumption. Plants could not be operated at full capacity or had to be shut down, ore supply contracts had to be renegotiated in terms of both tonnage and price, and inventories accumulated and tied up working capital. The Government's proposed long-term program to stockpile copper and other minerals did not get underway, because of more urgent matters brought about by the overall economic slump. Exports were scaled down on account of criticism overseas that Japanese copper sales were disturbing the world market. Copper producers were asking for Y90 trillion of relief funds from MITI and the Ministry of Finance, but were granted only about one-third of this amount. December production dropped below 80,000 tons for refined primary copper, the first time since April 1974.

Overall, production of primary electrolytic copper at just under a million tons represented a new record and a gain of 5% over 1973 production. The refined metal was extracted from approximately 3,123,600 tons of imported copper concentrate plus about 400,000 tons of domestic concentrate. In 1974 Japan also imported 62,174 tons of blister copper (mainly from Chile, Australia, and the Republic of South Africa); 230,182 tons of refined copper (three-fifths from Zambia and 18% from Chile); and about 46,000 tons of copper and copper alloy scrap (two-thirds from the United States). Although based mainly upon foreign raw materials, Japan's copper refining capacity at yearend 1974 was probably close to 1.2 million tons per annum. Japan retires inefficient facilities as new ones are built so that reported capacities automatically exclude obsolescent facilities.

Nippon Mining far outdistanced Mitsubishi Metal Corporation as Japan's leading refined copper producer during April–September 1974. In this period, production by company was as follows in tons: Nippon Mining, 141,066; Mitsubishi Metal, 106,128; Sumitomo Metal Mining Co. Ltd., 79,066; Mitsui Mining and Smelting, 63,770; Dowa Mining Company Ltd., 61,307; Furukawa Mining Co., Ltd., 36,926; and Toho Zinc Co., Ltd., 6,757. Japan's worsening economic slump in the last quarter of 1974 caused strikes at various copper facilities such as Mitsubishi Metal's Naoshima smelter and Shimokawa mine, Mitsui's Takehara and Tamano smelters, Sumitomo's Sazare mine, and Dowa Mining's Kosaka smelter. Near yearend 1974, Nippon Mining and Mitsubishi Metal worked out arrangements with labor unions to lay off a total of about 4,500 workers at up to 90% pay and to immediately recall these workers when markets recover. The Japanese smelters were also seeking to raise toll charges from about

US$0.08 to US$0.14 per pound to US$0.20 to US$0.23. Capacity details on Japan's copper companies and facilities as of yearend 1973 are shown in the 1973 edition of this chapter.

Near yearend MITI's recommendation to copper producers was an overall production cut of about 20% and the nonferrous industry's hope was a substantial government loan along with a 15% to 30% cut in raw materials from foreign suppliers. Nippon Mining temporarily suspended operations of the No. 1, 10,000-ton-per-month flash smelter at Saganoseki on December 19 while continuing to run the No. 2 flash smelter of the same size and the 7,000-ton-per-month flash smelter at Hitachi; the corresponding refineries were also scheduled to be "compressed." Mitsubishi Metal did not start up its completed 4,000-ton-per-month continuous copper smelter until August; subsequently, a decision was made to temporarily cut down monthly output to the 1,500-ton to 1,600-ton level. The Dowa Mining Company permanently closed down the marginal 1,000-ton-per-month smelter at Okayama and was planning to cut down output at another 3,800-ton-per-month smelter. Consideration was given to reducing Omahama smelter's output by 3,000-tons-per-month at yearend 1974. Furukawa Mining Co. decided to close down the 3,500-ton-per-month Ashio smelter for 10 days beginning December 28.

Operated by the same companies that own the large and modern smelters, Japan's domestic copper mining industry contributed about one-tenth of the primary copper raw material supply required by smelters in 1974. However, production declined 10% below the 1973 level of about 91,000 tons of mine copper. Despite important new findings of the famous, complex black metal or "kuroku" ores, output in 1973-74 was much below the 120,000 tons produced annually a few years back. The trend towards shutting down old mines continued, with various new "kuroku" mines not fully developed taking their place. Nippon Mining's Namariyama mine was readied for production. With additional reserves available from a new ore body, capacity of Mitsubishi Metal's Shimokawa mine was increased to above 10,000 tons of mine copper annually. Mitsubishi Metal brought another "kuroku" mine into full-scale production, namely, Matsuki in Akita Prefecture. It was designed to produce about 5,000 tons of copper per year from 3.7% copper ores (plus 2.8% combined lead-zinc). Dowa Mining's Fukazawa mine, also in Akita, was proving up much more reserves than first thought. Early in 1974, known reserves were about 6 million tons of ore grading 14.7% zinc, 3.0% lead, and 1.1% copper. The eventual target was to produce 240,000 tons of ore annually. During 1974, the Japanese Government announced that in regional drilling of the Hokuroku Kita area, Aomori Prefecture, two intersecting high-grade zones of mineralization were discovered near Lake Towada at a depth of about 1,250 feet. One zone is 16 feet wide analyzing 2.2% copper, 3.0% lead, and 6.2% zinc, and the other is nearly 7 feet wide analyzing 4.8% copper, 2.0% lead, and 3.5% zinc.

Japan was building up to an annual supply of more than a million tons of imported copper-in-concentrate by the latter part of the 1970's. Thereafter, growth in imports of concentrate probably will slow down, because of saturation of domestic smelters and the trend towards constructing smelters abroad and obtaining more copper in form. The Japanese had already signed long-term contracts with Peru and Zambia for substantial imports of blister copper. In 1974, Japanese smelters were jointly investigating erection of an 80,000-ton-per-year copper smelter in the Philippines by the late 1970's, whereby only 10,000 tons would be kept for local consumption and most of the rest exported to Japan. Mitsui Mining and Smelting installed a Mitsui Segregation Process [12] pilot plant for copper oxide ores at the Katanga mine, southern Peru, for subsequent development into a full-scale operation. Mitsubishi Metal started to negotiate with various foreign companies to "export techniques" related to its continuous copper smelting process called "MI process," with a view towards establishing new smelters.

Japan's imports of copper concentrates in 1974 (usually 24% to 29% Cu) showed a 5% increase over the 2.97 million tons imported a year earlier. Canada maintained

[12] Salt and coke added to finely ground 5% Cu oxide copper ores and heated to 650° C to form copper chloride which is reduced to native copper by the coke. Subsequent flotation makes a 53% to 58% copper concentrate.

its position as principal supplier of mine copper to Japan, supplying 1.13 million tons of concentrates in 1974. The Philippines improved its relative position, furnishing 886,000 tons as compared with 763,000 tons in 1973. The Japanese also imported about 381,000 tons of copper concentrates from Bougainville in 1974; 188,000 tons from Australia; 184,000 tons from Chile; 162,000 tons from Indonesia (Freeport Mineral Co.'s Ertzberg mine); and 88,000 tons from Zaire (mainly from the Musosi mine) among the leading suppliers. Since most of the copper mines in these countries were established mainly to supply the Japanese market, the companies involved were anxious to increase sales whereas Japanese smelters, because of the economic slump in Japan, wanted to temporarily reduce supplies. Thus, a great deal of renegotiation of long-term contracts took place in 1974.

At yearend 1974 Japanese copper smelters were paving the road for an international copper conference in London, at which time suppliers again would be asked to cut their copper concentrate shipments to Japan on a temporary basis in view of the large buildup of Japanese inventories. Previously, the Intergovernmental Council of Copper Exporting Countries (CIPEC) had already agreed in principal to reduce overall world shipments to Japan by 10%. By mutual agreement, receipts by Japan from the Bougainville copper mines in Papua New Guinea and Sherritt Gordon mines and Granduc mines in Canada were scheduled to be cut by 15%, 40%, and 50%, respectively. Nippon Mining also asked two British Columbia producers—Gibralter mines and Craigmont mines—to reduce shipments by 15% in December 1974 and in January 1975. In the Philippines, Japan's Mitsubishi Metal, Mitsui Mining and Smelting, and Nippon Mining proposed cuts of 30%, 30%, and 40%, respectively, to Atlas Consolidated Mining and Development Corp., Marinduque Mining & Industrial Corp. and Marcopper Mining Corp. near yearend 1974. No doubt these cuts would be restored once the world economic crisis is over the hump and Japanese smelters can operate normally once more. Indonesia's Ertzberg mine presented no particular problems regarding shipments to Japan, because development and production were behind schedule.

Meanwhile, Japanese nonferrous companies continued to look worldwide for additional copper supplies. Agreement was reached in March between Sumitomo Metal, Dowa Mining, and Mt. Isa of Australia for a joint venture in Papua New Guinea to possibly develop a 400-million-ton, 0.45% copper ore deposit. Another agreement was signed in May between Nippon Mining and Petromin of Saudi Arabia to prospect for high-grade nonferrous resources in the northwestern Nugra District. Mitsubishi Metal was helping to boost production at the Gun Powder mine in Queensland, Australia, from 8,000 to 14,000 tons of mine copper yearly. Marubeni Corp. decided to participate in a joint venture with the French for prospecting copper deposits in the Moba District of Zaire. The Government of Chile asked the Japanese to jointly look into various deposits, including El Abla where 700 million tons of ore have been reported. Rio Branco of Chile, already a large supplier to Japan, asked Japanese firms (Sumitomo Metal, Nippon Mining, and Mitsubishi Metal) for loans to raise production by 40% so that the Japanese would be supplied with 70,000 tons of mine copper annually by 1977. Nippon Mining was also looking into the Cerro Colorado deposit (100 miles east of Iquique) in Chile where estimated reserves are 100 million tons of 1.2% copper ore. In October, nine Japanese firms signed a joint contract with Southern Peru Copper Corp., and advanced $23 million for future deliveries (1977-91) of 30,000 tons of mine copper per year from the Cuajone area. Thus one-fourth of the total output of the Peruvian company would be exported to Japan.

Mitsui Mining and Smelting expected to import several thousand tons of "segregation process" mine copper annually from the Katanga mine in Peru and was prospecting in promising nearby areas as well. The Japanese were in an international consortium called Cobre Panama, S.A., trying to sign an exploration contract with the Panamanian Government to examine a large porphyry copper deposit in the Petaquilla District. The 30,000-ton-per-year Mamut copper mine in Sabah, Malaysia, developed solely to supply the Japanese smelters, was nearing completion at yearend.

**Iron and Steel.**—Despite the energy crisis, sharp inflation, and overall industrial slowdown, Japan's steel production of 117.1 million tons in 1974 was only 1.8% lower than the previous year. Domestic consumption was radically down, but this was somewhat compensated by stronger foreign demand. As the newer and larger furnaces came into production, older and smaller ones were temporarily or permanently shut down.

Japan strengthened its position as the world's third largest steel producer following the Soviet Union and the United States with 136.0 million tons and 132.0 million tons, respectively. Japan continued to be the world's foremost steel exporter, with a record 33.1 million tons during 1974. Raw material imports were also important by world standards, specifically 142 million tons of iron ore, 6.2 million tons of coking coals (by steel industry only), 3.5 million tons of steel scrap, and 1.2 million tons of pig iron. Value of steel exports greatly exceeded imports of raw materials for steelmaking, with the favorable trade balance amounting to approximately $1.5 billion in 1974, excluding liquid fuels.

Japan had 6 of the 10 largest blast furnaces in the world late in 1974, and about 13 of the first 20 blast furnaces. The other four large blasts furnaces were located in France (Usinor No. 4), the Netherlands (Hoogovens No. 7), (Italy–Stell No. 5), and West Germany (August Thyssen No. 1). The present Japanese world leader is Nippon Kokan's Fukuyama No. 5 capable of producing more than 11,000 tons of pig iron per day. In comparison, the largest Soviet furnace is rated at 3,200 cubic meters and the largest U.S. furnace at less than 2,500 cubic meters. Apparently, no new Japanese blast furnaces were brought in during 1974. As of yearend 1974, Japan's 10 largest blast furnaces follow:

| Company and blast furnace | Cubic meters | Startup date |
|---|---|---|
| Nippon Kokan's Fukuyama Works No. 5 | 4,617 | November 1973. |
| Kawasaki Steel's Mizushima Works No. 4 | 4,323 | April 1973. |
| Nippon Kokan's Fukuyama Works No. 4 | 4,197 | April 1971. |
| Nippon Steel's Oita Works No. 1 | 4,158 | April 1972. |
| Sumitomo's Kashima Works No. 2 | 4,080 | March 1973. |
| Nippon Steel's Kimitsu Works No. 3 | 4,063 | September 1971. |
| Kobe Steel's Kagogawa Works No. 2 | 3,850 | January 1973. |
| Nippon Steel Yawata Works Tobata No. 4 | 3,799 | June 1972. |
| Kawasaki Steel's Mizushima Works No. 3 | 3,367 | October 1970. |
| Sumitomo's Kashima Works No. 1 | 3,159 | January 1971. |

Four Japanese steel companies were among the world's top 10 in 1974, headed by Nippon Steel Corporation with output of about 38.5 million tons. This compares with the 30.8 million tons produced by the United States Steel Corp.; the 20.2 million tons by the Bethlehem Steel Corp.; and the 19.3 million tons by the British Steel Corp., the next three ranking steel firms. August Thyssen with 16.7 million tons was fifth, followed by Japan's Nippon Kokan with 16.2 million tons; Kawasaki Steel Corp. with 14.9 million tons; and Sumitomo Metal Industries, Ltd., with 14.6 million tons. Italy's Finsider Enterprises with 13.6 million tons and the Netherlands-West German joint venture ESTEL with 12.0 million tons rounded out the first 10 companies.[13]

As of yearend 1974 Japan had three steel bases with an annual steel capacity of 10 million to 15 million tons—Nippon Kokan's Fukuyama Works, Nippon Steel's Yawata Works (Tobbata is a subsection), and Kawasaki Steel's Mizushima Works, in that order. There were three other slightly smaller bases — Sumitomo's Wakayama Works, Sumitomo's Kashima Works, and Nippon Steel's Kimitsu Works. Japan's planners felt that the existing national steel capacity of approximately 140 million tons will not be adequate in a few years time. Accordingly, MITI at yearend 1974 approved total steel equipment investments of more than 1 trillion yen for fiscal year 1975, up 30% over those of fiscal year

[13] Japan Metal Bulletin (Tokyo). Mar. 13, 1975, p. 4.

1974.[14] Major construction projects to be completed within 2 years include Kawasaki Steel's Chiba Works No. 6 blast furnace (4,500 cubic meters), Sumitomo's Kashima Works No. 3 blast furnace (5,000 cubic meters), Nippon Steel's Oita Works No. 2 blast furnace (5,000 cubic meters), Nippon Steel's Kimitsu Works No. 4 blast furnace (4,500 cubic meters), and Kobe Steel's Kakogawa Works' No. 3 blast furnace (4,500 cubic meters).

In conjunction with producing a reported 117.1 million tons of crude steel in calendar 1974, Japan also produced 90.4 million tons of pig iron, 91.0 million tons of hot-rolled ordinary steel, and 9.3 million tons of hot-rolled special steel. The high ratio of pig to steel shows the importance of iron ore and large blast furnaces to the industry. Breakdown of Japan's crude steel output in 1974 was as follows, in million tons: Basic oxygen furnaces—94.7; electric furnaces—20.9; and open-hearth furnaces—1.5.

The energy crisis has motivated Japan to further improve steel technology. All major companies have initiated programs to conserve energy. Conversion from open-hearth to basic-oxygen furnaces and greater efficiency in coking coal usage have already meant substantial savings. The new directions include recovery of energy from red coke, greater use of waste gas from hot stoves, and applying top pressures in blast furnaces. Research is also being done on hot briqueted coal, formed coke, and non-fired agglomerate ore. Nippon Steel has led the way in the use of noncoking coal to cut down consumption of hard coking coal.[15] A briquet production facility for this purpose has already been installed at the Yawata Works and a second facility is planned. Plans for utilization of nuclear energy in steelmaking moved ahead towards development of a pilot plant after 1979.[16] The initial objective was to build a multi-purpose, high-temperature, gas-cooled experimental reactor. The Japanese steel companies have also made significant progress in continuous-casting technology and marine engineering. In mid-1974, Nippon Steel decided to begin construction of a 150,000-ton direct-reduction iron plant at the Hirohata Works that could utilize liquefied natural gas (LNG), heavy oil, or coal gas as the reducing agent.

The importance of exports to Japan's steel industry is such that up to one-third of the steel products output in recent years have been exported. The 33.1 million metric tons exported in 1974 was a new record, up 30% in quantity and 102% in value over 1973 quantity and value. Asia stood first on the list of destinations in 1974, but the United States was still by far the most important single recipient country, with exports totaling 6.5 million tons. Next came the People's Republic of China (PRC), with Japanese steel exports at 2.9 million tons. Regionally, Asia accounted for 14.2 million tons in 1974; North America, 7.4 million tons; Europe, 4.5 million tons; and South America, 4.4 million tons. The most important steel products exported were wide hoops, cold-rolled steel, plates, angles, bars, and wire rod, in that order.

Japan's many large integrated steel bases depend upon a steady, long-term supply of high-grade foreign raw materials and this has made the country the world's number one iron ore importer and a leading iron shipper. During 1974, Japan imported 142 million tons of iron ore, as compared with 135 million tons in 1973. The pattern of imports by country show that nearly half came from Australia, one-sixth from Brazil, one-eight from India, and about one-tenth from Peru and Chile combined. Iron ore requirements by major steel producers during 1974 show Nippon Steel at more than 55 million tons; Nippon Kokan, Kawasaki Steel, and Sumitomo Metal at 18 million to 22 million tons each; and Kobe Steel at just over 10 million tons.

Japan has had no difficulty acquiring adequate quantities of iron ore because of its long-term direct and indirect efforts in promoting iron ore production and transportation worldwide. Imports have been limited by what Japan can consume and stockpile at a given time and place. However, economic, political, and technological factors at home and abroad greatly affect the sources of supply, delivery schedules, prices, freight rates, and the nature of the iron and other raw materials imported. The overall impact of the world energy and economic crisis of 1974 has simply been

[14] Japan Metal Bulletin (Tokyo). Feb. 15, 1975, p. 5.
[15] Nippon Steel News (Tokyo). Nippon Steel Corp., No. 57, January 1975, p. 2.
[16] Nippon Steel News (Tokyo). Nippon Steel Corp., No. 49, May 1974, pp. 1–2.

much higher unit c.i.f. landed prices, with iron ore increasing by nearly one-third and coal roughly doubling. However, unit steel price for exports rose about 55% during the year, thus compensating for the expensive raw materials. At yearend 1974, stocks of both iron ore and coal were equivalent to more than a 1.3-month requirement. These stocks were much higher than usual and Japanese steelmakers were predicting an oversupply situation for raw materials during most of 1975.

Australian iron ore prices were renegotiated several times during 1974. In September, a 22% f.o.b. price increase to about US$12.30 per ton was agreed upon, covering the period September 1974 to March 1975. For contracts to be reviewed after March 1975, another 7.5% price increase would be allowed. Shipping costs have vacillated greatly in the past, and this means that Japan's iron costs from Australia, the leading supplier, will be $120 million to $200 million higher in the coming year than in 1974. India, an example of a medium-size supplier, furnishes Japan with nearly 10 million tons of iron ore per year, and the latest f.o.b. price of "base grade" iron ore ranged from about US$13.05 to US$14.15.

Japanese steelmakers consume sizable tonnages of iron and steel scrap, although proportionally not as much as U.S. steelmakers because of the preponderance of integrated blast furnace-converter operations. The Japanese Iron and Steel Federation reported that 46.1 million tons were consumed in 1974 as compared with 48.6 million tons in 1973. Recirculated plant scrap from domestic operations is the principal constituent; however, imports have been important from time to time. During 1974 steel scrap imports by Japan totaled 3.5 million tons as compared with 5.4 million tons in 1973. Price and availability of scrap greatly affect the use of foreign scrap.

During 1974, Japanese steelmakers consumed about 57 million tons of imported coking coal and 9 million tons of domestic weakly caking coal. The United States and Australia continued to be the Japan's principal coal suppliers, with U.S. coal commanding higher prices because of superior quality. For further discussion of this subject, see section under Coal.

Japan has been increasingly involved in iron and steel projects abroad because of interest in raw materials, proficiency in steel technology, desire to extend technical and financial assistance, and business and shipping advantages. For example, Nippon Steel was involved in a joint 10-million-ton steel venture with Broken Hill Pty. and Jones & Laughlin Steel Corp. to build an integrated plant somewhere in Western Australia. The Pohang Iron & Steel Co., Ltd. of the Republic of Korea (South) asked the Japanese Government in mid-1974 to help plan a third expansion program to raise crude steel output from the present 1,200,000 tons annually (second stage of 2,600,000 tons already decided upon) to 8,500,000 tons. The Brazilians and Japanese are in a joint venture to build a 12-million-ton steel center in the Itaqui area in conjunction with a program to deliver iron ore to Japan. Another 6-million-ton project was being implemented in the Tubarão area of Brazil. The Japanese have been asked to look into a 4-million-ton integrated steel plant at San Nicolas Port and a 1.2-million-ton direct reduction plant south of Tahara City, both in Peru. A 3.5-million-ton direct reduction plant will be built in Al Jubayl, Saudi Arabia, in cooperation with Marcona Corp. A 3-million-ton steel plant was scheduled to be built eventually on the Coast of Saldanha Bay, the Republic of South Africa. The Japanese were also either already involved or bidding for additional projects in Australia (Kwinana), Egypt (Alexandria), Mexico (Las Truchas), Venezuela, Iran, Nigeria, the Philippines (Luzon), Indonesia (Merak), India, and recently even in British Columbia, Canada.

**Lead and Zinc.**—Japan has been a much more significant world producer of zinc than of lead, both in terms of domestic mine production and refined metal output, the latter being based primarily on imported raw materials. Local zinc-lead ores contain more zinc than lead. Imports of zinc concentrate have also been much larger than imports of lead concentrate. Nonetheless, the country's indigenous output of both metals constituted on the order of one-fourth to one-third of the total supply of primary raw materials during 1972–74, indicating that Japan is of some consequence as a mine zinc and lead producer by international standards. In slab zinc output, Japan ranked first in the world since 1972, surpassing the U.S.S.R., the

United States, and Canada by sizable tonnages. Within a few years, the country's annual zinc metal production should top the 1-million-ton plateau.

Meanwhile, Japan's zinc-lead industry was encountering financial difficulties, especially during the latter part of the year, mainly on account of slackening domestic demand and impending further cuts by major consumers such as galvanizers. The zinc smelters had already reduced output by 10% to 20% in December, and proposed cuts for January 1975 would be 25% to 40% of designed capacity. Corresponding figures for lead smelters were 10% to 12% in December and 20% to 38% in January. On an annual basis the business slump was not so obvious, since production of both metals were at about the same levels as in 1973. Also, as of April 1974, Japan's zinc smelting capacity was 908,000 tons per year and rate of operation was 96%; and lead smelting capacity was 258,000 tons and rate of operation was 90%.

Earlier in the year, while the domestic market sagged, export orders bolstered Japan's zinc and lead smelters. Zinc orders from the United States, which accounted for nearly half of the approximately 116,000 tons exported, all but stopped in January 1975. Lead exports amounted to about 33,000 tons (about 10,000 tons to Canada, 7,000 tons to the U.S.S.R., and 4,000 tons to the United Kingdom). Mitsubishi Metal was temporarily staving off production cuts by shipping pig lead to its affiliate Cominco Ltd., of Canada; stocks, however, rose to unmanageable levels by yearend. Lead smelters were hoping that shipments to the U.S.S.R. would pickup.

Whereas metal sales slumped, and this led to worldwide renegotiations on raw material supply, zinc smelters still had to have enough ore for smelting. Strangely, there was some apprehension at yearend about having enough concentrates to smelt in the coming year. The Australians notified the Japanese that they intended to cut supplies by 20% to 30% beginning January 1975, so as to save more for their own domestic industries. Some Japanese facilities are custom or toll smelters, and supply and demand imbalances are part of the smelter business.

Domestic mines were not significantly affected by the economy and world situation. At Japan's premium zinc mine—Kamioka in Gifu Prefecture owned by Mitsui Mining and Smelting—rich ore beds containing 11% zinc were recently encountered in the lower portions of the Mozumi pit. The new find should add much to the approximately 12 million tons of 7.7% zinc ore already delineated at Mozumi, where daily output will soon be pushed up to 2,000 tons of ore or about 150 tons of mine zinc. Dowa Mining was in the process of expanding the new Fukazawa "black ore" mine near Odate from 11,000 to 20,000 tons of mine-run ore per month (about 12% Zn). Nippon Mining's Shakanai "black ore" mine produced about 400,000 tons of complex metal ores in 1974, containing about 15,000 tons of zinc. Development continued at Nippon Mining's Namariyama mine and prospects known as Toyoha (Hokkaido) and Nakanogewa. Mitsubishi Metal was building up the Matsuki mine in Akita Prefecture to produce annually several thousand tons each of copper and zinc.

Japan has been producing between 240,000 and 295,000 tons of mine zinc annually (or 450,000 to 550,000 tons of zinc concentrates) during most of the last decade, which represented about 5% of the world's output. A steady decline has taken place since the peak in 1971, with production in 1974 about 9% lower than the approximately 264,000 tons produced in 1973. Some older mines have been shutdown, and many of the "black ore" mines have not yet been fully developed. Further declines in Japan's mine zinc production are not anticipated.

Imports of zinc concentrate rose slightly from 1,205,405 tons in 1973 to 1,215,879 tons in 1974. Converting at about 54% zinc in concentrates, Japan's imports in each of these 2 years was about 650,000 tons of contained zinc. In 1974, Canada supplied about 31% of Japan's zinc concentrate imports and was followed by Peru with 26% and Australia with 19%; the Republic of Korea, the United States, North Korea, Mexico, Bolivia, and Honduras furnished a large part of the remainder. Unlike imports of iron ore and copper, most of the zinc concentrate obtained abroad was from established producers rather than from new mines developed for the Japanese market.

Japan was becoming increasingly involved in foreign mine projects. For exam-

ple, at the Huanzala mine in Peru, Mitsui Mining and Smelting's subsidiary Hachinoe Smelting was instrumental in raising the mine's yearly output to 30,000 tons of mine zinc and 10,000 tons of mine lead through an advance of funds amounting to over $3 million for mill expansion. Toho Zinc with a Canadian partner started on the second stage of prospecting at the Minorsa lead-zinc mine in Guatemala. Mitsubishi Metal was moving ahead on a scheme with American and Canadian partners to explore and develop various deposits in Yukon Territory, especially the MacMillan region. The Dowa Mining agreed to extend to the New Jersey Zinc Co. (subsidiary of Getty Oil Co.) a $3.5 million loan for the development of the Huari Huari "high-silver" zinc mine in central Bolivia, with a view towards obtaining 50,000 tons of zinc concentrate annually beginning mid-1976. Sumitomo, Mitsubishi, Mitsui, and Dowa agreed to take a combined 10% equity in a $250 million zinc project in east Tennessee (on the Cumberland River) with New Jersey Zinc Co. in return for as much as 40% of the future output of 160,000 tons per year. Investigation of oxide zinc ores in Australia and Iran continued. Agreement was reached between Toho Zinc and Eiho Trading Co., Ltd., of the Republic of Korea to build an $80 million, 80,000-ton-per year zinc smelter in the Onsan area north of Pusan for startup by 1979. Toho will supply half the primary zinc raw material, and part of the output will be sold elsewhere in the Far East.

Japan's mine output of lead also declined in line with reduced zinc output and despite the partial development of the "black ores." Production was about 15% lower than the 52,889 tons of mine lead reportedly produced in 1973. This compares with imports of lead concentrates[17] of 198,948 tons in 1972, 242,753 tons in 1973, and 217,568 tons in 1974. Two-thirds of the above concentrates came from Canada, and the rest mainly from Peru, Australia, and the Republic of Korea.

Mitsui Mining and Smelting, the largest metallic zinc producer in the world, has four smelters: Kamioka rated at 5,300 tons-per-month; Miike at 11,400-tons-per-month; Hikoshima at 7,000-tons-per-month and Hachinohe which belongs to a subsidiary of Mitsui at 6,300-tons-per-month. Thus, the total for the company is 30,000-tons-per-month. The plan was to cut down production by about 30% during the spring quarter of 1975. At Kamioka, zinc operations will be totally suspended for the last 3 weeks of February 1975 because of the short supply of power during the dry seasons. At Miike, the relatively small electrolytic zinc plant was scrapped at yearend and one-fourth of the 32 vertical retorts will be shut down. On the other hand, Kamioka's lead refining capacity was scheduled to be raised to 2,250-tons-per-month, so that 450-tons-per-month of crude bullion need no longer be sent to the company's Takehara lead refinery. Construction began on a fluosolids zinc roster at Kamoika and a zinc oxide plant at Miike.[18] The concept would be to temporarily cut output up to 30% across the board for the other facilities. The Hachinohe (or Hachinoe) Imperial Smelting Process (ISP) plant is rated at about 37,000 tons of lead and 78,000 tons of zinc yearly.

Because of "cadmium-pollution" difficulties, the working capacity of Annaka, formerly Japan's largest zinc smelter, has been cut down to 11,600-tons-per-month by MITI. Meanwhile, capacity of the Iijima electrolytic smelter of Akita Zinc Co. (subsidiary of Dowa Mining) was doubled to 13,000-tons-per-month by August with production rate near the turn of the year at about 11,000 tons. Earlier in the year Dowa mining started to build a 2,000-ton-per-month lead smelter and a 2,500-ton-per-month lead refinery at Kosaka, Akita Prefecture. Mitsubishi Metal was considering at yearend to cut output at the 7,500-ton-per-month Akita zinc smelter by up to 25%; meanwhile its subsidiary Mitsubishi Cominco Co. practically decided upon a 50% cut for its 3,000-ton-per-month lead smelter at Naoshima. Nippon Mining with some 10,000-tons-per-month zinc capacity and 3,000-tons-per-month lead capacity at its Saganoseki refinery was talking about raising cuts from 20% to 40%, and Sumitomo Metal with some 4,600-tons-per-month zinc capacity was considering raising cuts from 15% to 25%. Sumiko I.S.P., Sumitomo's subsidiary with a plant at Harima, was producing about 4,500-tons-per-month of distilled zinc and 1,500-tons-per-

[17] Japanese lead concentrates are 53% to 58% lead, whereas imported concentrates are generally better than 60% lead.

[18] Japan Metal Bulletin (Tokyo). Nov. 2, 1974, p. 4.

month of lead near yearend. Toho Zinc was planning to raise cuts from 12% to 20% at its 6,000-ton-per-month Chigirishima lead refinery.

**Magnesium.**—Japan's primary magnesium production, furnished entirely by Furukawa Magnesium Co., Ltd. and Ube Industries, Ltd., was only 8,923 tons, down about 21% as compared with production in 1973 and in 1972. Secondary magnesium production increased from 8,107 tons in 1973 to 10,877 tons in 1974, reflecting the higher level of titanium production which recycles most of the magnesium. Imports of magnesium and alloy ingots rose to 13,426 tons (1974 exports 1,461 tons), more than doubling the 1973 tonnage. Overall magnesium consumption in 1974 was about 24,700 tons, including 11,200 tons in titanium and zirconium smelting, 5,400 tons for light-metal rolling, 3,400 tons for aluminum alloys, and 1,272 tons for nodular cast iron.[19]

In April, Showa Denko decided to launch magnesium production with its own technology at the Chichibu Works. The process is claimed to be pollution-free, dry, and completely automated, requiring only 40 workers for producing 10,000-tons-per-year. A 200-ton-per-year pilot plant was being constructed, and this will be scaled up to 2,000 tons in 1975 before building a full-scale, 10,000-ton-per-year plant.[20]

**Manganese.**—Although Japan produces several hundred thousand tons of low-grade manganese annually, virtually all requirements for high-grade manganese ores have been met by imports. In 1974, imports of high-grade manganese ore amounted to 1.876 million tons (1.786 million tons in 1973), with Australia and the Republic of South Africa each supplying about 35% and Gabon 7%. Groote Eylandt Mining Co., Pty., Ltd., and Longreach Manganese Pty., Ltd., in Australia; South African Manganese Ltd. in Cape Province; and Compagnie Minière de l'Ogooue of Gabon were the main suppliers. Groote Eylandt was closed most of November because of a strike, and the Australians were pressing for a 50% hike in prices to $58 per ton f.o.b. The South Africans were considering asking for a 20% price increase, and Gabon was uncertain about deliveries in 1975. About 2.0 million tons of ferruginous manganese ore, used for charging directly into blast furnaces, was also imported in 1974; the supply came mainly from the Republic of South Africa (50%) and India (41%). The Indians were planning cutbacks in shipments to Japan. Meanwhile, Japanese ferromanganese producers decided to extend a $12 million loan to develop the Tambas manganese mine in Haute Volta for eventual annual shipments of 275,000 to 450,000 tons to Japan.[21]

During 1971–74 Japan produced 500,000 to 700,000 tons of ferromanganese per year, mostly high-carbon type, and 300,000 to 400,000 tons of silicomanganese per year. Exports are far less important than previously. During 1974, 54,265 tons of ferromanganese and 36,002 tons of silicomanganese were exported. In recent years production has been mainly geared to the expanding needs of the Japanese steel industry. Japan Metals & Chemicals Co., Nippon Denko, Nippon Kokan K.K., Chuo Denko Kogyo, Kobe Steel, Ltd., and Mizushima Ferroalloy Co., Ltd. were the principal ferromanganese producers.

Japan ranked second to the United States as a producer of electrolytic manganese and manganese dioxide. Respective annual capacities total just over 14,000 and 40,000 tons. Output in 1974 was 8,659 tons of electrolytic manganese and 44,790 tons of manganese dioxide, as compared with 10,080 tons and 37,501 tons, respectively, in 1973. During the year, Tekkosha Co. produced most of the electrolytic manganese and more than half of the manganese dioxide. The second and much smaller producer of electrolytic manganese was Chuo Denko Kogyo. Mitsui Mining and Smelting produced about two-fifths of the manganese dioxide and Daiichi Carbon the rest. Virtually all the manganese oxide was exported (35,527 tons in 1974 to many different countries), and this explains why Tekkosha and Mitsui Mining and Smelting were looking for plant sites abroad. Tekkosha was on schedule with a 12,000-ton-per-year manganese dioxide project, jointly with Mitsubishi Corporation which has 35% minority interest, in Saronikos (Greece) for startup in the spring of 1975. Mitsui Mining and Smelting was building a similar-size manganese dioxide plant at

[21] Japan Metal Bulletin (Tokyo). Feb. 1, 1975, p. 4.

Cork, Ireland, for completion by the summer of 1975. Tekkosha and Nihon Kagaku Sangyo Co., Ltd. were moving ahead on plans to produce refined manganese dioxide ($Mn_3O_4$) for use as raw material to make high-purity ferrite.

**Molybdenum.**—Japan imported 17,111 tons of roasted molybdenum concentrates in 1974—9,216 tons from the United States, 5,727 tons from Canada, 2,019 tons from Chile, and 149 tons from other countries. In addition, 667 tons of unroasted concentrates were imported. In 1973, total imports were only 16,613 tons. Indigenous ore production has always been nominal and Japan decided to abolish the tariff on imports. Japan also imports much ferromolybdenum—2,292 tons in 1973 and 2,172 tons in 1974—to supplement the 2,000 to 3,000 tons of ferromolybdenum produced annually in recent years. During 1974, Japan produced 341 tons of molybdenum powder and imported 80 tons, down respectively 30% and 59% from 1973 figures.

The American Metal Climax Co. (AMAX), by far the principal individual supplier, formed a joint venture (34% AMAX) with 10 Japanese ferroalloy producers by the name of Japan Molybdenum Co. to build a 9,000-ton-per-year molybdenum trioxide plant, hoping to produce more than half of Japan's need for molybdenum trioxide. However, because of the recession, the plan was not yet implemented by yearend. AMAX has a subsidiary (AMAX Japan Co., Ltd.) to handle all of Japan's import business originating from AMAX enterprises including U.S. molybdenum materials, copper from various sources, Australian iron ore, and large quantities of nonferrous ores.

**Nickel.**—For lack of indigenous resources, Japan imports all of its nickel needs. During 1974, 16,298 metric tons of nickel metal (4,756 tons from the U.S.S.R., 3,641 tons from Canada, 3,380 tons from the Republic of South Africa, and 2,402 tons from Norway); 4.218 million tons (3,539 million in 1973) of 1.8% to 2.5% nickel ore (3,363 million from New Caledonia and 0.793 million from Indonesia); 39,780 tons (30,391 tons in 1973) of nickel matte and speiss (17,493 tons from Australia, 17,076 tons from Canada and 5,211 tons from New Caledonia); and 18,001 tons of ferronickel (9,897 tons from Canada) were imported. From these raw materials, Japan produced 20,992 tons of nickel and 73,727 tons of nickel contained in ferronickel in 1974. Japan also imported 2,581 tons of semifabricated nickel and alloy products and 366 tons of nickel alloy ingots. Production of nickel metal dropped 3%, and ferronickel output went up 28%. Japan has a 13% tariff on imported nickel ingots, but ores are not subject to tariff.

Although ferronickel production rose sharply, sales increased only 6% over those of 1973 and, as in the past, went predominantly to the special steel sector. Pacific Metals Co. Ltd., Nippon Yakin Kogyo Co., Ltd., Nippon Mining Co., Sumitomo Metal Mining Co. and Shimura Kako Co., Ltd. were the five companies (with six plants) producing ferronickel in Japan during 1974 and their combined annual capacity totaled about 100,000 tons of nickel in ferronickel. Exports of ferronickel were only 2,274 tons in 1974.

Measured in quantity of contained nickel, ferronickel supply is usually 2 to 3 times as important as nickel metal. However, nickel as metal is used in much more diversified areas. MITI estimates for fiscal year 1974 consumption was 10,700 tons in steel manufacture, 8,400 tons in plating, 2,700 tons in brass products, 1,800 tons in electric machines and appliances, 1,400 tons in coinage and nonferrous alloys, and 2,700 in miscellaneous consumption. Stocks at yearend were about 11,000 tons. As of 1974, Japan possessed two nickel refineries totaling about 21,000 tons in capacity—Sumitomo Metal Mining's Niihama plant and Shimura Kako's Tokyo plant–and two nickel oxide plants—Tokyo Nickel Co. Ltd.'s Matzusaka plant and Nippon Nickel Co.'s Tsuruga plant. Early in 1974 Nippon Nickel announced plans to build a nickel plant of 3,000- to 5,000-ton-per-year capacity at its Tsuruga site. Nippon Mining was also considering producing 3,000 tons of nickel and 1,000 tons of cobalt annually at its Hitachi copper smelter by 1975 to process Australian sulfides. Shimura Kako's plans to raise capacity of its Tokyo plant from 600 to 1,000 tons monthly, and Sumitomo Metal Mining's plans to scale up its Niihama plant from 1,500 to 2,000 tons of nickel per month by adopting the fire-refining process, had not yet materialized at yearend. Meanwhile, Sumitomo was seri-

ously considering closing down its Shisakajima smelter (near Niihama) and using imported Australian matte entirely. In 1974, Australia (mainly Western Mining Corporation, Ltd.) supplied Sumitomo with about 14,000 tons of contained nickel—half in ore and half in matte.

Japanese imports of lateritic nickel ore from New Caledonia increased about 23.5% during 1974 over those of 1973. However, Japanese ferroalloy producers were negotiating early in 1975 to cutback ore imports from this source 40% to 2 million tons in fiscal year 1975, because of their proposed 35% reduction of future output. Meanwhile, in September 1974, a 10-year basic agreement with Rio Tuba Nickel Mining Co. of the Philippines was signed by Pacific Metals Co. to import up to 500,000 tons of ore annually beginning in 1976 from its mine on Palawan Island. To accommodate this development, Pacific Metals was planning to raise its annual ferronickel capacity from 32,000 (nickel content) to 50,000 tons.

Another project in the Philippines which will sell to the Japanese is Marinduque's enterprise on Nonoc Island, Suragao. The refinery is designed to process 3.85 million tons of ore annually into 68.4 million pounds of pure nickel plus mixed sulfide concentrates containing about 6.6 million pounds of nickel and 3.3 million pounds of cobalt. Sumitomo Metal Mining has been building a refinery unit at Niihama to convert the concentrate into the two metals and will receive Nonoc ore under a 7-year contract. It also holds a long-term contract to market 6.7 to 13.4 million pounds of nickel powder or briquets within Japan each year. This Philippine plant went onstream in December 1974.

Japanese nickel interests in Indonesia were in more than one area of activity. The 1974 and earlier relationship consisted mainly of imports of nickeliferous ores from Sulawesi (Celebes); subsequently, Japanese ferroalloy producers requested that Indonesia's ore supply to Japan be cut down to about 700,000 tons in fiscal year 1975. Furthermore, International Nickel Co.'s subsidiary at Soroako, also on Sulawesi, was expected to put a plant onstream by mid-1976. To begin with, this plant was to produce 35 million pounds of nickel per year, in 75% grade nickel matte, and eventually a 90-million-pound-per-year production was planned. Under a 15-year contract, the entire output of nickel matte will go to Japan for processing.

**Tin.**—Japan's 1974 tin consumption was second only to that of the United States and ahead of the Soviet Union. As in other industrialized countries, by far the most important areas of tin use have been in tinplating and soldering. Japan's own production of mine tin was disappearing, with imminent closure of the only two mines—Akenobe and Ikuno—both belonging to Mitsubishi Metal Corp. which also owns the country's small and only tin smelter at Ikuno. Over 95% of the tin is imported as refined tin. Malaysia provided 19,255 metric tons (1 metric ton equals 0.9842 long tons) out of a total of 31,163 tons of refined tin imported by Japan in 1974; Thailand, 4,674 tons; Indonesia, 5,924 tons; and the potentially important PRC, 830 tons. In 1973, overall imports were 35,816 metric tons. Japan produced 99 tons of tin in November 1974 and 115 tons in December.

**Titanium.**—Demand for Japanese sponge titanium has taken a sharp upturn for more than a year, mainly because of remodeling of petrochemical and caustic soda plants for pollution control purposes, for use as condensors in electric powerplants, and for equipment used in desalting plants. This explains why production went up sharply again in 1974, despite a government cut in electric power supply in the first half of the year. During the second half of 1974, monthly sponge output was more than 800 tons. With consumption controls on oil and power removed, the Japanese titanium industry was hopeful that the 1975 output would reach 10,000 tons. Exports (mainly to the United States) increased from 2,264 tons in 1973 to 2,892 tons in 1974 with overseas demand brisk all year long. With production much higher than the 2,100 tons in 1973 and exports rising 45% to reach 736 tons in 1974, the titanium fabrication business also improved. Japanese titanium producers had a price problem during 1974, with costs up sharply and consumers reluctant to agree to higher prices.

Japan's well established titanium and titania industries have no operational difficulties when demand is strong. In sponge titanium, Osaka Titanium Co. and Toho Titanium Co., Ltd. each has a monthly

capacity of 450 tons, and New Metals Industries Co. (subsidiary of Nippon Soda Co., Ltd.) has another 180-ton capacity.[22] Fabricators were Kobe Steel Ltd., Nippon Mining Co., Nippon Stainless Steel Co., and Furukawa Metal Co.

Japan has also been prominent as a world producer and exporter of titania and synthetic rutile, using about 0.5 million tons of ilmenite yearly as raw material. However, the titania industry was hit hard by sluggish domestic and foreign demand in 1974 which caused curtailment of production by 50% since November. Built-up inventories had reached 25,000 tons by late January 1975. There were six titania producers capable of producing together about 180,000 tons of titania yearly. The group was headed by Ishihara Sangyo Kaisha, Ltd., and Sakai Chemical Industry Co. Ltd. Ishihara had plans to expand titania capacity by 3,000 tons monthly (chlorine process) with a proposed startup by 1975. In addition, the company also has a 40,000-ton-per-year synthetic rutile plant at Yokkaichi, using ilmenite as raw material, and has contracts to ship most of its output to the United States. Ishihara together with C. Itoh & Co., Ltd. have signed contracts to participate in a joint venture in Brazil[23] to produce titania and intermediate material from ilmenite and anatase. Sakai Chemical in joint venture with Toyo Soda decided to construct a 32,000-ton titania facility at Nanyo (Yamaguchi Prefecture), also using the Kerr-McGee chlorine process. Mitsubishi Metal Corporation after succeeding in upgrading ilmenite to synthetic rutile was negotiating with a U.S. ilmenite producer to manufacture 5,000 to 6,000 tons per year of synthetic rutile in the United States. Mitsubishi also has an understanding to sell the synthetic rutile it produces within Japan to the Sakai joint venture now taking shape.

**Tungsten.**—Japan produced only 940 tons (898 tons in 1972) of tungsten-in-con centrates in 1973 and slightly less in 1974. Imports measured in gross weight of concentrates totaled 3,818 tons in 1974 and 4,563 tons in 1973. Awamura Metal Industry Co. continued to be the only important domestic ore producer. The Republic of Korea furnished 1,161 tons of the 1974 tungsten concentrate imports; Portugal, 499 tons; Thailand, 494 tons; Canada, 386 tons; Australia, 274 tons; Peru, 484 tons; and the PRC, 288 tons. Hoping for stabilized imports of Chinese tungsten, a mission was sent there to negotiate for 800 tons annually on a long-term basis.

Awamura was the sole Japanese ferrotungsten producer. Production in 1973 was only 934 tons, which turned out to be 158 tons higher than in 1974. Imports in 1974 were only 231 tons (194 from Portugal), but the figure for 1973 was 598 tons. The three producers of powdered tungsten were Japan New Metals, Nakahara Construction, and Japan Heavy Metals. Their combined output in 1973 was 2,020 tons, 300 to 400 tons higher than in 1974. In addition, 285 tons of tungsten powder were imported in 1974, mainly from the United States, West Germany, and France. Overall demand for tungsten was slightly weaker. Roughly 40% of the 1974 tungsten supply went to steelmaking, 35% to electronics (wire rod and sheet), and 30% to tungsten carbide tools.

**Uranium.**—Japan's ambitious plans to diversify its energy sources away from imported oil to atomic power have hit serious setbacks.[24] Of Japan's eight nuclear reactors, which have a total power-generative capacity of nearly 4 million kilowatts, only two were functioning properly near yearend and six had to be halted for prolonged tests and repairs. Additional projected power projects could very well be delayed and some might be even abandoned. The previously set MITI long-term goal of developing as much as 60 million kilowatts of total nuclear generating capacity by 1985 may have to be cut in half. Safe disposal of radioactive waste, sharp rises in raw materials and atomic power equipment, finding new sites for plants, and cracks and flaws in steam generator tubes and fuel rod cases, plus public indignation and concern, have compounded the difficulties. Environmentalists were threatening to block the start of four new reactors, with a combined capacity of 2.7 million kilowatts, scheduled to go into operation during the first half of 1975.

Before the recent serious turn of events, the Japanese had been investigating all

[22] Plant sites are: Osaka Titanium—Amagasaki in Kyogo; Toho Titanium—Chigasaki in Kanagawa; and New Metals—Nihongi in Niigata.

[23] Japan Chemical Week (Tokyo). Nov. 29, 1973, p. 5.

[24] Far Eastern Economic Review (Hong Kong). Turning Off Nuclear Power. Apr. 11, 1975, pp. 33–34.

kinds of reactors, materials, advanced methods, and international arrangements to achieve their long-term objectives. The 1973 edition of the Minerals Yearbook reviewed some of these developments. U.S. technology related to a high-temperature, gas-cooled reactor was being introduced. The Japanese who already used pressurized light-water and boiling-water reactors were investigating the heavy-water reactor that burns natural uranium rather than enriched uranium used by light-water reactors. They also studied fast-breeder reactors and were investing heavily in the gas-centrifuge method related to "second generation enrichment." Meanwhile, the Japanese continued to look for participation in an additional gas diffusion plant under multinational auspices, which is the standard approach for "first generation" separation of uranium. They considered working with the United States, France, and Australia. Steps were taken to obtain enriched uranium on a long-term basis from the United States but there was a temporary suspension of contract signing by the U.S. Atomic Energy Commission in July, similar negotiations had also taken place with France and the U.S.S.R. A conference was scheduled to be held with Australia to discuss a possible joint project to produce enriched uranium in Australia. Japan was also hoping to produce some enriched uranium itself by 1985.

Japan continued to strengthen its nuclear raw material supply position. Annual requirements for enriched uranium may reach 3,000 tons by 1975 and 2 or 3 times this amount a decade later. Japan also has long-term contracts to obtain large tonnages of uranium oxide from abroad. A contract was pending between Denison Mines, Ltd. (Canada), and Tokyo Electric Power Inc. (Japan) for about 1,800 tons of $U_3O_8$ during 1983–99. Definite agreements have been made with the Rio Tinto Zinc Corp. Ltd. for Canadian and Australian supplies and with the Kerr-McGee Corp. for U.S. supplies. A joint venture was established with the Acuta Mining Co. of Nigeria to obtain 43.3% of the projected yearly output of 2,600 tons of uranium oxide (beginning in 1977 and extending 15 years). Japanese, United States, and Canadian firms were starting a joint uranium exploration venture called Mississippi Uranium Co. to develop Canadian uranium for the Japanese market. Four Japanese companies have joined hands with Cleveland-Cliffs Iron Co. to explore and develop ores from Wyoming. Mitsubishi interests were working with the U.S. firm Minerals Recovery Corp. to explore for uranium in Happy Canyon, Utah.

**Other Metals.**—During 1974 Japan produced nearly 35 tons (about 1.2 million troy ounces) of gold and 999 tons (about 32 million ounces) of silver. Output of gold derived mainly from smelting of imported nonferrous ores was roughly one-tenth higher than in 1973 and imports of gold dropped 30% to 607 tons. Output of silver was nearly the same (only one-third from domestic ores in recent years) as in 1973, whereas imports of silver declined 12% to 900 tons. Platinum imports at 27 tons was 11% lower, and palladium imports at 21 tons was 6 tons lower. Domestic production of platinum and palladium has been nominal. Thus, Japan has had to import most of these noble metals in one form or another.

Japan and the United States are the world's two leading producers of cadmium, a byproduct of zinc smelting. Both metals are produced by the same companies. Japanese output in 1974 of 3,077 tons, 3% down from that of 1973, was nearly identical with U.S. production. However, Japanese cadmium consumption declined sharply by 45% to 927 tons, whereas exports gained only slightly (1,606 tons in 1974 and 1,513 tons in 1973). The three principal markets were batteries, pigment for cosmetic manufacture, and stabilizer for polyvinyl chloride. The cadmium-poisoning pollution scare prompted the Japanese Mining Industry Association to consider a sales-promotion campaign for this metal.

Japan produces only a small quantity of antimony ore and imports the metal in various forms. However, it does produce antimony metal and antimony oxide as follows: 2,783 and 4,492 tons, respectively, in 1973 and 2,166 and 4,418 tons, respectively, in 1974. During 1974, Japan imported 10,857 tons of antimony ore and concentrate (about 50% to 60% grade), including 6,216 tons from Bolivia, 1,974 tons from the PRC, and 907 tons from Thailand. Antimony metal was also imported in 1974, 509 out of a total of 589 tons coming from the PRC. Hibino Metal Industries and Nihon Mining and Concen-

trating Co., Ltd. were the main ingot producers, and these two along with Sumitomo Metal Mining controlled the bulk of Japan's antimony trioxide output. Hibino Metal Industries remained active in securing antimony materials from the PRC, and it also exported flotation equipment and technology to Pan Pacific Developer Inc. of Sarawak, Malaysia, in the hope of obtaining about 1,000 tons of antimony ore annually. Most of Japanese antimony trioxide goes into flame-proofing and secondarily, glassmaking and plastics.

According to MITI, Japanese output of primary and secondary mercury declined from 136 metric tons (1 metric ton equals about 29 flasks) in 1973 to 55 tons in 1974, along with an import drop from 582 to 265 tons. The consumption decline of 20% to 456 tons in 1974 was attributed mainly to reduced use of mercury in making caustic soda (a shift from mercury to diaphram cells) where consumption was down from 350 tons in 1973 to only 213 tons in 1974. Exports also dropped, from 67 tons in 1973 to 33 tons in 1974.

Japan was also an important world producer of other byproduct metals like bismuth, selenium, and tellurium.[25] Bismuth production and consumption showed slight declines, but selenium and tellurium made gains. Production was mainly by the half-dozen ranking nonferrous metal companies. Bismuth output was close to 800 tons, whereas consumption was less than half of this amount, with three-fourths going into metallurgical additives, ferrite, and alloys. Selenium production moved up 5.8% to 363 tons, and consumption increased 3.6% to 199 tons. The three leading domestic selenium markets were glass, rectifiers, and pigments. Because of the brisk overseas demand for selenium, Nippon Mining was expected to double capacity to match Mitsubishi Metal Corporation's existing capacity. These two companies and Mitsui Mining and Smelting provided nearly all of Japan's 1974 output of 25.9 tons of tellurium.

Japan also produced many other metals, usually of high purity and generally in quantities prominent by world standards. Average monthly output for some of these during 1974 was as follows, in tons: Germanium, 1.5; germanium oxide, 1.2; lanthanum oxide, 11; hyperpure silicon, 19; tantalum, 4; and zirconium, about 10. Most production figures are much lower than capacity figures because of the worldwide economic recession.

## NONMETALS

**Cement.**—Japan's cement output was down about 7% from the 78 million tons produced in 1973, the first decline in many years. Domestic sales of 70 million tons in 1974, showed a decline of 9.4% that could be attributed to the recession. Exports remained nominal. Japan ranked with the United States as the largest cement producer in the world, after the U.S.S.R. Japan's construction activities slowed down somewhat but were hardly at a standstill, and the overall situation improved in the second half of the year.

Ube Industries, claims to have the world's foremost cement kiln at Isa, Yamaguchi Prefecture, rated at over 2 million tons. Early in 1974, Kawasaki Heavy Industry Ltd. received an order for an 8,500-ton-per-day plant equipped with Kawasaki's "KSV" suspension preheater. Presumably, this will be installed at Ube. Together with the company's third cement factory at Kanda, Ube Industries was capable of producing about 11.5 million tons of cement annually at yearend 1974. Kawasaki's "RSP" (reinforced suspension preheater) system has been installed at Onoda Cement Co. Ltd.'s Ofunato cement plant in the form of a 3,000-ton-per-day and a 5,500-ton-per-day kiln. Among other new facilities recently installed were the Chichibu Cement Co. Ltd.'s 2-million-ton wet-process unit at Kumagaya (Saitama Prefecture); Nihon Cement Co. Ltd.'s 1.2-million-ton kiln at Kamiiso (Hokkaido); Sumitomo Cement Co. Ltd.'s 1.2-million-ton plant at Ako Nakamizu (Hyogo Prefecture); and Denki Kagaku Kogyo K.K.'s 900,000-ton kiln at Omi (Niigata Prefecture). Thus, Japan has some of the world's largest and newest cement facilities.

**Fertilizer Materials.**—Japan's chemical fertilizer industry, second largest in the world, had a complicated and uncertain year. Production did not change much,

[25] Page 1 of work cited in footnote 19.

exports were down slightly, raw material and power costs soared, and export prices doubled although they were still below international levels. Because of price and delivery schedule differences, the fertilizer talks with the PRC were temporarily suspended in June. Subsequently, however, two half-year fertilizer accords were signed with the PRC.

Japan's fertilizer industry has long been highly export-oriented. During 1974, production and exports (in parentheses) of various chemical fertilizers were as follows, in thousand tons: Ammonium sulfate, 2,078 (713); urea, 3,416 (2,249); ammonium chloride, 959 (558); calcium superphosphate, 798 (small); fused magnesium phosphate, 527 (small); and complex fertilizers, 4,106 (small). Total value of all fertilizer exports in 1974 was Y137.5 billion (about $470 million). Approximately three-fourths of the export value consisted of urea, and the PRC took about two-thirds of the exports. Aside from conventional fertilizers, Japan also exported small quantities of anhydrous ammonia, mainly to the United States, Costa Rica, and the Republic of Korea and aqueous ammonia to the Philippines. The PRC took 43% of Japan's urea exports, 82% of the ammonium chloride, and 48% of the ammonium sulfate during 1974.

In contrast to adequate supplies of nitrogen (from the air) and sulfur, Japan continued to be almost totally dependent upon foreign sources for phosphate rock and potash. During 1974, Japan imported 3,844,959 tons of phosphate rock, including 2,162,028 tons from the United States and 659,505 tons from Morocco. Annual potash needs have been about 1.2 million tons in recent years, almost half from Canada, 15% to 20% from the U.S.S.R., 10% to 15% from the United States, and 10% each from Israel and West Germany.

**Fluorspar.**—Japan's output of fluorspar remained nominal compared with overall supply. Consumption based overwhelmingly on imports surpassed the ½-million-ton mark for the 6th year in a row. About two-thirds of the fluorspar went into steel smelting, and most of the rest went into aluminum reduction and manufacture of chemicals. Fluorspar has been particularly essential in oxygen converter steel smelting as a fluxing material to remove impurities. However, Japanese steelmakers have been successful in cutting down fluorspar consumption through substitution, mixing, use of synthetic fluxes, and improving smelting efficiency. In aluminum reduction, there has been increasing recycling of fluorine chemicals and materials. In chemicals, more synthetic cryolite and fluorides are recovered to satisfy pollution control standards. In fact, Japan produced about 35,000 tons of synthetic cryolite in fiscal year 1973–74 and sold most of this abroad. The trend was subsequently reversed with most of the synthetic cryolite reused domestically and only 3,723 tons exported in 1974.

Japan's producers of hydrofluoric acid from imported fluorite include Morita Kakagu Kogyo Co., Ltd., Hashimoto Chemical Industries Co., Ltd., Nippon Light Metal Co., Tohoku Hiryo K.K., and Asahi Glass Co., Ltd.

Japan's 1974 imports of fluorspar totaled 541,304 tons, including 188,393 tons from Thailand; 179,485 tons from the PRC; 126,943 tons from the Republic of South Africa; 24,277 tons from Kenya; and 10,413 tons from the Republic of Korea. The 1974 total was about 33,000 tons lower than the 1973 figure and 51,000 tons higher than the 1972 figure. Only a small part of Thai shipments to Japan was acid-grade flotation fluorspar concentrates. Chinese fluorspar was mainly of metallurgical grade. Kenya fluorspar was preferred over Chinese fluorspar because prices are lower and sizes are more even. Mexico was expected to become a significant supplier of aluminum fluoride to Japan as soon as a plant producing this is completed at Torreon. Meanwhile, because of inventories and various other reasons, Japanese steelmakers were considering importation of only 200,000 tons of metallurgical fluorspar in fiscal year 1975 and were cutting back imports from Thailand to 100,000 tons. The Thais were most unhappy about this, since they had hoped to sell 200,000 tons. The Chinese quota for steel use was 50,000 tons and the Kenya quota 40,000 tons. Apparently, the Japanese would like to buy more material from the Fluorspar Co. of Kenya if able to reduce purchases from other countries.

**Salt.**—Japan's salt production of 1.15 million tons in 1974 compares with imports of approximately 7.75 million tons. Domestic output has been declining, whereas imports have been increasing slightly.

Breakdown of 1974 imports shows 3.61 million tons from Australia, 3.32 million tons from Mexico, and 0.81 million tons from the PRC, the three major suppliers. All three have gotten price boosts of more than $1.00 per ton f.o.b.

Mexico's largest salt-producing firm, Exportadora de Sal, S.A. (ESSA) operated the Guerrero Negro salt complex in Baja, California, and is a joint venture of Mitsubishi Corp. (75%) and the Mexican Government (25%). Producing about 5 million tons annually, Guerrero Negro has furnished Japan with more than 2.8 million tons annually during the last 3 years. ESSA wants a 3- to 5-year contract in 1975 to ship 3.3 to 3.37 million tons yearly to Japan in 50,000- ot 120,000-deadweight ton ships. The export price was boosted from $3.56 per ton to $4.98 per ton f.o.b. in June.

With the exception of the leading producer Texada Mines Ltd., Australia's "solar" salt industry centered in Western Australia has been developed primarily for the Japanese market. Two fairly large producers supplied most of the salt to Japan: Dampier Salt Ltd. with an annual capacity about 2 million tons and annual shipments to Japan of about 1.3 million tons and Leslie Salt Co. with an annual capacity of 1.2 million tons to be expanded to 3 million tons. Western Australia already can produce about 6 million tons of salt, with more than half going to Japan. Recent contracts with the PRC show that yearly shipments to Japan will be reduced somewhat because of quality and price considerations.

Salt is needed in Japan mainly by the chlor-alkali industry, headed by Hokkaido Soda Co., Ltd., Nippon Soda Co., Ltd., Sumitomo Chemical Co., Ltd., Toyo Soda Manufacturing Co., Ltd., Tokuyama Soda Co., Ltd., Central Glass Co., Kanto Denka Kogyo Co., Ltd., Okayama Chemical Co., Ltd., Nippon Carbide Industries Co., Ltd., Tekkosha Co., and Ryo-Nichi Co. In 1974, Japan produced 3.16 million tons of caustic soda, 1.33 million tons of soda ash, and 2.77 million tons of chlorine gas. Growth in demand for these products has been estimated at 5% to 8% annually. Difficulty in finding plant sites prompted four Japanese firms to join with Comalco Ltd. to start building a 500,000-ton-per-year caustic soda plant in Pilbara, Australia. New soda plants in Japan are mostly diaphragm type, and most mercury plants were being modernized. Inventories of salt were building up to a million tons and caustic soda output was intermittently curtailed near year-end because of the sluggish demand for polyvinyl chloride.

**Sulfur.**—Japan's production of elemental sulfur from indigenous ores amounts to only 5% to 10% of the overall supply. However, sulfur recovered from petroleum refining increased sharply until 1973. Byproduct output of sulfur reportedly totaled 721,648 tons, showing no great change as compared with 1973 output. Production figures of sulfur by specific Japanese oil refineries during 1974 were listed in Japan Chemical Week.[26]

Idemitsu Kosan Co., Ltd., with four refineries and Toa Nenryo Kogyo K.K. with three refineries accounted for some 20% of the Japanese total. Ten refineries recovered more than 30,000 tons of sulfur each in 1974, headed by the Okinawa refinery of Okinawa Sekiyu, the Chiba refinery of Idemitsu Kosan, the Mizushima refinery of General Sekiyu, the Kawasaki refinery of Maruzen Oil Co., Ltd., the Nigushi refinery of Koa Oil Co., Ltd., and the Hyogo refinery of Toa Nenryo.

Actual production of elemental sulfur was much lower than capacity, which may be about 4,500 tons per day. Byproduct sulfur output was higher in the first half than the second half of the year because of some curtailment in crude oil refining. Some surplus sulfur was shipped to the Republic of Korea, Indonesia, and Singapore. However, most sulfur was consumed in Japan, in production of synthetic fibers, carbon disulfide, and Japanese rinsan which together accounted for three-quarters of the 1974 total; paper and pulp ranked next using 10% to 15% of the 1974 total.

Japan has no resource problem with regard to the sulfur needed for making sulfuric acid, because it has long been one of the world's leading producers of pyrite. The country also has many cupriferous, zinc, and complex metal mines with sulfide ores. In addition, Japan imports large tonnages of sulfur contained in nonferrous sulfides as well as the sulfur contained in crude oil. Japan has built up an annual capacity of about 9 million tons of 100% sulfuric

[26] Japan Chemical Week (Tokyo). Apr. 17, 1975, p. 7.

acid.[27] Japan's large nonferrous metal mining companies and smelters were very prominent in sulfuric acid production, along with chemical and petroleum refining firms. An excessive supply of sulfuric acid was building up early in 1975, and various nonferrous companies were considering cutbacks in metal output to counteract this dilemma.

## MINERAL FUELS

**Coal.**—Japan's domestic coal production continued to decline. The approximately 20.4 million tons of coal produced in 1974 was only about two-fifths the output a decade ago, and compared with 1972 figures, the decline was more than 8 million tons. The downward trend was expected to continue and could eventually approach the 10-million-ton-per-year level. Efforts were being made by the Japanese Government to prevent coal production from dropping below the 15- to 20-million-ton-per-year level. The recent energy crunch accentuated the need for preserving the internal coal production capability, particularly in the face of substantial price increases for foreign coal.

The Japanese Government was considering taking over long-term debts of coal enterprises providing no-interest loans or outright grants to high-efficiency mines, permitting higher coal prices, and giving subsidies for mine modernization and safety. The Government may also help mining companies obtain operating funds, urge large-scale users to buy more domestic coal and provide assistance with regard to mine shutdowns, welfare of discharged workers, and establishment of new industries in coal districts. Unfortunately, the program was slowed down by the economic recession.

Virtually, all coal produced in Japan during 1974 was bituminous coal. About half the coal was "ordinary" or steam-raising coal, and the other half was "raw material" or coking coal plus a little gas coal. Japan's preponderently weakly caking coal generally must be blended with high-grade imported coal for smelting use. Hokkaido, the big island to the north, and Kyushu, to the south of the main island of Honshu, provided the bulk of the Japan's coal output, with Hokkaido half as important as Kyushu. Almost all Japanese coal comes from large mines, with the Miike mine in Kyushu heading the list.

Japan's 1974 energy balance showed that approximately 68% of the energy consumed was derived from imported crude oil, 6% from imported refined petroleum, 3% from imported liquefied petroleum gas and LNG, 11% from imported coal, 3% from domestic coal, 6% from indigenous hydropower, and 2% from other lesser sources. Coal consumed in electric power generation was only about 19 million tons in 1974.

The role of coal in steelmaking was much more important than energy. In fact, approximately 66 million tons of coal—nearly 57 million tons of foreign coal and 9 million tons of domestic coal—were consumed by the steel industry in 1974. Most of the Australian and Canadian coals which were generally medium quality were used as such. In contrast, the exceptionally high-quality U.S. coking coals were blended with weakly caking indigenous coals for quality-improvement purposes. During 1974, Japan's total coal imports were 64.16 million tons and the United States, Australia, and Canada furnished 57.99 million. Specifically, the U.S. share was 25.42 million (16.5 million in 1973); Australia's share, 22.87 million (24.9 million in 1973); and Canada's share, 9.70 million (10.4 million in 1973). Japan's coal import bill was Y844.6 billion in 1974 (Y369 billion in 1973), remembering that the average exchange rate was about Y291 to the dollar (compared with Y265 in 1973).

MITI made plans to dispatch various missions to Oceanian, South and North American, and African countries in 1975 to study development of overseas resources of ordinary coal, so that Japanese coking coal supplies for steelmaking will be adequate for the next 5 to 10 years. Coal-fueled powerplants were gaining in importance after the oil crisis, and domestic production of such coal probably will continue to decline, leaving a shortage of 10 to 20 million tons annually after 1980. Use of more "formed coal" by the steel industry in the future also became a reason for requiring more ordinary coal.

Deliveries of steelmaking coal to Japan showed a 6-million-ton increase in 1974, although consumption went up only about 2 million tons. There probably was "hedge" buying because of the high price increase for coal. Whereas oil prices stabilized and

[27] Japan Chemical Week (Tokyo). July 18, 1974, pp. 1, 5. (This source mentions many of the new sulfuric acid plants.)

were slightly lower in some cases, coal prices were still spiraling. U.S. Itman and Beatrice coals were close to $27 per ton f.o.b. in January and $55 in December. Some spot purchases of the best low-volatile coals went up to as high as $130. At year-end, U.S. suppliers were trying to sell low-volatile coal at $90 per ton and medium-volatile coal at $70, which the Japanese thought exhorbitant. Anyhow, negotiations on prices and tonnages were taking place with established U.S. suppliers. Whereas the price of U.S. coals roughly doubled, freight rates to Japan for 50,000-tons vessels from Hampton Roads, Va., were $17 to $22 per ton up to July, generally $12 to $15 late in 1974, $8 to $9 early in 1975, and less than $6 in May 1975.

Although price increases played an important role in relationships with new coal suppliers in the United States and other countries, other factors were also significant. Japan frequently helps to develop coal mines which in turn depend primarily on the Japanese market. Agreements and negotiations were often long-term in nature dealing with matters like loans, investments, advance of funds, technical and equipment help, and delivery tonnages and schedules, along with prices. Japan's steel industry, unlike most other mineral and metal industries, did not and probably will not greatly reduce production as a result of the recession. Thus, its coal acquisitions from abroad did not change much in tonnage and the Japanese were not negotiating for cutbacks in 1974 but rather for better adherence to schedules regarding development and deliveries.

Near the end of 1974 Japanese steelmakers signed a basic agreement with Thiess Peabody Mitsui Pty., Ltd. (TPM), of Australia to import three brands of Nebo coals from Queensland totaling 75 million tons to be shipped at 5 million tons per year beginning in 1979. The Japanese will extend credit amounting to 210 million Australian dollars ($A) to TPM to build railways for coal transport.[28] Headed by Nippon Steel Corporation they also were negotiating a 15-year, 4.5-million-ton-per-year contract with a consortium comprised of Western Mining Corp. and others to import Hail Creek coal from Queensland beginning in 1978. For this development, the Japanese were prepared to make a $A60 million loan.

Nippon Kokan and other Japanese companies will participate in a joint venture with Kaiser Resources Corp. to develop the Hosmer Wheeler coal mine near Sparwood in British Columbia, Canada, by hydraulic mining techniques. Terms and delivery schedules will be determined at a later date after feasibility studies.[29] Kaiser was already committed to ship 4.5 million tons of Balmer coal to Japan annually. The Japanese have already signed other long-term contracts, such as the one with Gregg River Resources Corp. Ltd. to obtain Canadian coal. The Japanese were having price troubles with Fording River Corp., Ltd. of Canada. The Canadians want to push the price up $20 per ton to $52 in fiscal 1975, whereas the Japanese felt that $43 should be the maximum price.

Nippon Steel and others signed a 15-year, 3-million-ton-per-year contract with U.S. Pipe & Foundry Co. (potential producer) to import Blue Creek coal from Alabama beginning in 1978. In this case the Japanese have extended a $40 million loan to aid development. Sumitomo Metal Industries concluded a 13-year contract with Cerro Company to import 1 million tons of low-volatile coal from Pennsylvania beginning in 1975 and agreed to extend a $35 million loan for repayment in 10 years. The Japanese also have other important contracts in Australia, Africa, and the U.S.S.R. (South Yakutsk, Siberia) to obtain coking coals. With all these projects, the Japanese do not expect a coking coal shortage after 1978.

**Petroleum.**—The Japanese call 1974 the year of the "oil shock." The oil import bill went up from Y1,831 billion (about $6.4 billion) in 1973 to Y6,160 billion (about $21.1 billion) in 1974, the latter representing nearly one-third the value of Japan's total imports. Early in 1974 the Government was enforcing a state of emergency with 10% cutbacks in oil and power consumption. It was reported that "neon lights went out, offices switched off heaters, and factories slowed down operations."[30] Consumer and wholesale prices

[28] Japan Metal Bulletin (Tokyo). Feb. 6, 1975, p. 1.
[29] Japan Metal Bulletin (Tokyo). Feb. 27, 1975, p. 1.
[30] Japan External Trade Organization (Tokyo). The Oil Crisis: A Year Later the Pain Lingers on. Focus Japan. V. 2, No. 1, January 1975, pp. 2–3.

went up roughly 20% and 30%, respectively, during the year. Price freezes were not fully lifted until the end of August. Oil reserves fell early in 1974 but were slowly replenished by September. However, overall oil imports were down only 3%, dropping to 1.76 billion barrels (including 1.64 billion of crude) in 1974. With domestic crude production of little consequence, refined production also declined approximately 3% to 1.49 billion barrels. During 1974, only 250,000 barrels per day of refinery capacity was added. The oil industry could not pass on the sharply increased costs and had to make financial plans for raising funds to build up a larger national stockpile.

At yearend, the Japanese Government planned to introduce a bill promoting the "rationalized" use of energy and had already established an organization to encourage public savings of energy. Both government and industry favor reinforcing future oil stockpiling possibly to a 90-day supply level. MITI stated that the Y1,500 billion needed for stockpiling should be totally borne by industry, whereas industry claimed that cost estimates are grossly underestimated and there is no way to fund the project without financial assistance. The Government wanted to reorganize independent firms into a giant "Japanese oil major" for competitive advantages, but industry feels that this does not necessarily make for better efficiency. Another goal, fostering independent oil development, was also bogged down at yearend, with the Government apparently eager to expand its role, whereas industry only desired government funds.

Early in 1975, the MITI view prevailed when it was decided that the Japanese Petroleum Development Corporation Law would be recommended for revision to enable the wholly government-owned Japan Petroleum Development Corporation to promote reorganization of the oil-developing industry and to encourage development of oil resources and stability of oil imports.[31] The draft revision would let the Corporation buy prospecting and mining rights from foreign countries, because oil-producing nations often show preference for government-to-government dealings. However, the rights of the Corporation would later be transferred to private companies. The revision would also grant authority to invest in companies specializing in government-to-government-based oil imports and extend credits to state-owned firms in oil-producing countries in exchange for oil imports. Japanese authorities hope also to broaden their economic, social, and cultural cooperation with oil-producing nations while obtaining oil supplies.

Japan's new energy conservation program envisages savings of 150,000 barrels of oil per day during 1975. The oil consumption curb, which went into effect on January 1, 1975, is expected to reduce the nation's crude oil imports by about 3%.[32] Domestic consumption of refined oil products declined 2.6% compared with that of 1973, dropping to 1.42 billion barrels in 1974; it took an oil crisis to reverse the trend of increased petroleum consumption. The timid conservation program being implemented had been designed to economize the use of oil and electricity without excessively suppressing industrial activities. Savings in energy consumption does not mean cuts in oil imports because of commitments to suppliers and efforts to build up stockpiles. The industrial sector will be subjected to an energy control campaign, the Government sector will aim at a 13% reduction, and the nonindustrial sector is requested to save 10%.

Although most of the sharp crude oil price rises took place late in 1973, additional increases were registered in 1974. Quoted below are representative import prices for crude oil to Japan in 1974, in terms of U.S. dollars per barrel, f.o.b. source.

[31] Japan External Trade Organization (Tokyo). Turning Point for Oil Development. Focus Japan. V. 2, No. 2, February 1975, pp. 2–3.

| Arabian heavy | 8.50 | 10.27 |

Within Japan, oil product prices did not follow the same as those for crude because of demand-supply relationships and controls. Price trends are shown as follows, in yen per kiloliter:[33]

| Product | January 1974 | December 1974 |
|---|---|---|
| Motor gasoline: | | |
| Premium | 31,500 | 56,000 |
| Regular | 26,700 | 48,200 |
| Naphtha | 12,200 | 26,800 |
| Jet fuel | 13,000 | 27,500 |
| Kerosine: | | |
| Industrial | 16,900 | 33,500 |
| Home heating | 12,900 | 25,700 |
| Gas oil | 16,400 | 28,000 |
| Fuel oil A | 16,400 | 28,100 |
| Fuel oil B | 11,200 | 19,500 |
| Fuel oil C (varies with sulfur content) | 11,800 | 20,600 |
| Crude oil cost, c.i.f. | 8,840 | 22,168 |

The Japanese oil industry incurred large debts in 1974 for various reasons. The sharp price increases depressed consumption. The shipper's usance period was generally shortened from 60 to 30 days after loading date as recorded on the bill of lading. Interest rates on "dollar loans" went up to 12% per annum for covering the 4-month period after customs clearance. The "yen loans" period has been cut from 60 to 20 days so that the oil industry often has to resort to other funds with interest higher than the 9.5% per annum for "yen loans." Japanese refiners' average financial burden due to interest payment used to be about Y250 per kiloliter of product refined, but this had gone up to Y1,250. Futhermore, fluctuation in foreign exchange also poses a serious problem to the Japanese oil industry.

As of December 31, 1974, Japan had 48 refineries owned by 32 companies, with a total atmospheric distillation capacity of 5,660,360 barrels per day (bpd). Corresponding downstream capacities were as follows: Vacuum distillation, 1,628,200 bpd; catalytic cracking, 327,100 bpd; catalytic reforming, 566,300 bpd; middle distillates hydrodesulfurization, 1,122,300 bpd; fuel oil desulfurization, 963,500 bpd; hydrocracking, 12,500 bpd; lube oil solvent extraction, 60,160 bpd; lube oil solvent deasphalting, 49,100 bpd; lube oil solvent dewaxing, 58,070 bpd; sulfur recovery 5,035 tons per day; and liquefied petroleum gas (LPG) recovery, 22,527 tons per day.[34] There were 35 vacuum distillation units, 39 catalytic reforming units, and 19 catalytic cracking units. As of yearend, Japan also had 1,733,000 bpd of additional refining capacity under construction or in the planning stage.

[33] Yen exchange was about Y285=US$1.00 in 1973 and Y292=US$1.00 in 1974. One kiloliter equals 6.29 barrels.

Japan's crude output continued to decline, dropping from 5.14 million barrels in 1973 to 4.94 million barrels in 1974. The indigenous quantities represented only about one-third of 1% of the overall supply. The country's natural gas position is only slightly better, and plans were being made to import increasing quantities of LNG. While stressing Japanese-controlled oil exploration and production abroad, MITI and private companies were accelerating the program to develop the offshore areas adjacent to Honshu Island. For fiscal 1975, MITI has set aside Y518 million for general oil and gas surveys and Y680 million for natural gas subsidies.[35] Loans totaling Y3.5 billion will also be extended by the Japan Development Bank for new oil projects on the Continental Shelf. Emphasis will be placed on development of oil and gas resources off the coast of Aga in Niigata Prefecture and natural gas off Fukushima Prefecture. Exploration off Aga was being done by a subsidiary of Japan Petroleum Development Corp. together with Idemitsu Exploration Co., Ltd. A drilling platform was built in August, with the hope of commencing production of 200 kiloliters (1,260 barrels) of oil and 1,600 cubic meters of natural gas by yearend 1975, from an oil reserve of possibly 8 million kiloliters (50 million barrels). In Fukushima Prefecture, Teikoku Oil Company, Ltd. and the Exxon group of the United States were jointly engaged in shallow sea exploration off the Joban coast.

[35] Japan Chemical Week. (Tokyo). Jan. 30, 1975, p. 2.

Of seven wells drilled by yearend 1974, five have hit natural gas deposits; the feeling was that Joban was more promising than Aga in terms of natural gas. Some preliminary exploration for natural gas in the waters west of Okinawa was planned to be started in fiscal 1975.

During 1974, Japan obtained 27% of its crude oil from Saudi Arabia, 25% from Iran, 11% from the United Arab Emirates, 10% from Kuwait, 14% from Indonesia, 3.2% from Brunei, 1.8% from Nigeria, 1.6% from the PRC, and 1.4% from Libya. Thus, 77.1% of the total imports (or about 1.36 billion barrels) came from the Middle East, 17.2% from Southeast Asia, 3.5% from Africa, and 2.2% from other countries. Most countries held to the 1973 levels and percentages. However, Iran's share in 1973 was 34% and Saudi Arabia's share was 23%. The PRC was hardly a factor in 1973 but according to contracts made with Japan could furnish 3% of the total or possibly 60 million barrels in 1975. Japan's overall crude oil imports in 1975 were not expected to be much different from those in 1974. At yearend, there was little concern over the adequacy of oil supplies. Also, import prices weakened somewhat.

Direct purchasing of "participation crude" from the Middle East and Africa became more of a factor. For example, the Abu Dhabi Government offered to sell to independent Japanese oil refineries 20,000 barrels of crude oil per day on a direct-deal basis at a price some US$0.50 per barrel lower than the prevailing price; reportedly, the import usance period also prolonged from 30 to 60 days.[36] Iran, Lybia, and Algeria have also cut their crude prices through similar means, although not as much. Slightly lower oil consumption around the world prompted such sales promotion efforts.

In August 1974, the Kuwaiti Government requested participation in the Japanese-owned Arabian Oil Co., Ltd. in the Kuwait-Saudi Arabia Neutral Zone, and Japan accepted this request agreeing that 60% of the Kuwait's share of the output would go to the Kuwaiti Government. However, the Arabian Oil Co. has the right to buy back the oil at 94.8% of the posted price. Arrangements with Saudi Arabia, which also owns part of the operations, have not been clarified. Arabia Oil Co. remained as Japan's only overseas oil-producing firm, supplying around 10% of Japan's needs.

Soviet efforts to interest Japan in participating in the Tyumen oil project fell through late in the year because of increasingly difficult terms. A Soviet-Japanese-United States joint arrangement to prospect for gas in northern Yakutsk, mainly involving the Tokyo Gas Co., Ltd. and the El Paso Natural Gas Co. and a $3.5 billion foreign loan, remained most hopeful. Japan and the Soviet Union did sign a basic agreement on January 28, 1975, whereby $100 million worth of credits will be extended to the U.S.S.R. for the exploration of oil and gas resources on the Continental Shelf of the Far Eastern Soviet island of Sakhalin. If the Sakhalin project is successful, Japan will receive half of the oil output (8.4% discount) for 10 years and mutually agreeable quantities of natural gas to be determined later.[37]

Natural gas and other projects were assuming greater importance. Alaska was already an important source. Japan entered into an agreement with the United States and Indonesia to build LNG plants in North Sumatra and East Kalimantan, whereby Japan would receive 7.5 million tons of LNG annually and the United States would also receive large amounts beginning in 1977. C. Itoh began near yearend to study the possibility of obtaining natural gas from Abu Dhabi. Kyodo Oil Co. and Maruzen Oil Co., Ltd., reached an agreement with the Kuwaiti Government to import 240,000 tons of LPG annually under the "direct deal" formula. The PRC was planning to build large-scale LNG plants in the Takang oilfield and the Szechuan gasfields for exports to Japan.

MITI indicates that about 30 Japanese oil and trading companies have so far submitted their plans for construction of refineries abroad with a combined capacity of almost 5 million barrels per day.[38] Many of these companies are involved in the acquisition of crude oil and construction of other chemical and fertilizer facilities as well. Because of economic difficulties, plans were temporarily shelved late in the year

[36] Page 2 of work cited in footnote 9.
[37] Pages 6–8 of work cited in footnote 34.
[38] Japan Petroleum Weekly (Tokyo). Jan. 13, 1975, p. 8.

on building proposed petrochemical plants in Thailand and South Korea, although one such project was still being considered in Spain. MITI's yearend list of proposed refining construction projects abroad was as follows (figures in parentheses indicate refining capacities after expansion):

| Country | Japanese companies | Quantity (thousand barrels per day) | |
|---|---|---|---|
| Saudi Arabia | Mitsubishi Corporation, Mitsui & Co., C. Itoh, Marubeni, Nichimen, Arabian Oil Co., Maruzen Oil, Mitsubishi Oil—six projects. | 1,300 | (1,950) |
| Abu Dhabi | Mitsui & Co., Maruzen Oil, Daikyo Oil, Nippon Mining, Marubeni—three projects. | 600 | (750) |
| Iran | Mitsubishi Corporation, Mitsui & Co., C. Itoh, Sumitomo Shoji, Nissho-Iwai, Nichimen, Mitsubishi Oil, Idemitsu Kosan, Maruzen Oil, Showa Oil, Kyushu Oil, Kaikyo Oil, Teijin—one joint project. | 500 | |
| Iraq | C. Itoh, Toyo Menka, Mitsubishi Corporation, Marubeni, Sumitomo Shoji, Daikyo Oil, Mitsubishi Oil—one joint project. | 300 | |
| Indonesia | Sumitomo Shoji, Nissho-Iwai, Maruzen Oil, Daikyo Oil, Mitsubishi Oil—two projects. | 250 | (450) |

# The Mineral Industry of Kenya, Tanzania, and Uganda

By Avery H. Reed [1] and Robert G. Clarke [2]

## KENYA [3]

The mineral industry of Kenya operated at record levels in 1974. Output increased 10% above the 1973 record, to 3.7 million tons valued at $36 million. New annual records were set for the production of carbon dioxide, cement, feldspar, gem stones, lead, magnetite, stone, and vermiculite.

Principal exports were cement and sodium compounds. Leading imports were crude petroleum, iron and steel products, and coal.

## COMMODITY REVIEW

**Metals.**—*Gold.*—Production of gold was 235 ounces valued at $30,800.

*Iron Ore.*—Output of magnetite expanded 60%, to a record 19,780 tons.

*Lead.*—Output of lead from the Kinagoni mine was 20 tons.

*Silver.*—Production of silver was 19,800 ounces.

**Nonmetals.**—*Barite.*—Output of barite declined 51% below the 1973 record, to 442 tons.

*Cement.*—Cement production increased 11% to 878,000 tons and was 9% above the 1971 record. Total cement output, 1955–74, was 9,275,000 tons valued at $185,500,000.

*Clays.*—Output of shale for cement and clay products decreased 7% and was 11% below the 1971 record. Kaolin production was 907 tons.

*Diatomite.*—Production of diatomite was 1,657 tons valued at $111,000.

*Feldspar.*—Feldspar production was a record 2,842 tons, 7% above the 1971 record.

*Fluorspar.*—Fluorspar Co. of Kenya mined 30,000 tons of fluorspar at the Kerio Valley mine in the Rift Valley. The spar was exported to Japan. Total output, 1968–74, was 76,620 tons valued at $837,300.

*Gem Stones.*—Kenya has become recognized as a favorable place to collect gem stones. Output was a record $227,000. Collectibles were garnet, ruby, sapphire, and tourmaline.

*Gypsum.*—Output of gypsum for cement increased 11% to 100,000 tons, and was 9% above the 1971 record.

*Lime.*—Production of lime decreased 1%. Total lime output, 1941–74, was 607,600 tons valued at $9,889,000.

*Magnesite.*—Production of magnesite was 2,000 tons.

*Salt.*—Output of salt from Lake Magadi increased 15% to 66,256 tons valued at $785,000. Total salt production, 1939–74, was 920,600 tons valued at $21,210,000.

*Soda.*—Production of soda from Lake Magadi declined 20% to 168,500 tons. Total output, 1936–75, was 3,987,000 tons valued at $112,800,000. Reserves of soda are more than 100 million tons.

*Stone.*—Crushed limestone output increased 13% to 2.2 million tons, 11% above the 1971 record. Most of the stone was used in cement manufacture. Total production of crushed stone, 1948–74, was 16,600,000 tons valued at $5,587,000.

*Vermiculite.*—Output of vermiculite was a record 1,683 tons valued at $96,610.

*Wollastonite.*—Production of wollastonite was 100 tons valued at $2,800.

**Mineral Fuels.**—*Petroleum.*—Petroleum has not been discovered in Kenya. The oil refinery at Mombasa operated on imported crude oil.

Nineteen petroleum companies which were exploring for oil in Kenya have completed extensive geophysical examinations. They are Adobe Oil Co., Anschutz Corp., BP-Shell Petroleum Development Company of Kenya Ltd., Burmah Oil Development Inc., Canadian Export Gas and Oil Ltd., Canadian Homestead Oils Ltd., Canadian Superior Gas and Oil Co. Ltd., Chevron Oil Company of Kenya, Cities Service Company, Louisiana Land & Exploration Co., Oceanic Exploration Co., Petrola Co., Polar Bear International Petroleums, Sun Oil Co., Texas Pacific Co., Inc., Total Co., Union Texas Petroleum., Wainoco Inc., and Whitestone Corp.

The Kenyan Government informed all of these companies of its option to acquire 50% of the equity in any of these companies.

| Mineral jelly and wax | do | 45 | 11 |
| Other | do | 29 | 24 |
| Mineral tar and other coal-, petroleum-, or gas-derived chemicals | 42-gallon barrels | 9 | 112 |

r Revised.
[1] Includes transfers from Uganda and Tanzania.
[2] One-hundred tons credited to Uganda were removed from Kenya leaving a negative balance.
[3] Includes gypsum, plasters, limestone flux and similar stone used for the manufacture of lime or cement.
[4] Fifty-five tons credited to Uganda were removed from Kenya leaving a negative balance.

## TANZANIA [4]

The production of diamond continued to dominate the mineral industry of Tanzania, accounting for over 90% of the total value of mineral exports.[5]

To help develop the Tanzania mining industry, the Government of Canada donated $1.5 million through the Canadian International Development Agency.[6] The grant, to be administered by the agency, provides for senior Canadian mining officials to fill top posts in the recently organized Tanzania State Mining Corp. while candidates from Tanzania are trained in Canada for the next 5 years to fill the posts. In addition, the grant will enable further assistance for mineral exploration in Tanzania by providing three diamond-drilling rigs and three master drillers who will train Tanzanian personnel.

e Estimate. p Preliminary. r Revised.
1 Estimates based on reported total diamond output and best available information on ratio of gem to industrial stones in total output.
2 Exports, including transfers to Kenya and Uganda.
3 Less than ½ unit.

The State Mining Corporation, as a result of exploratory work in 1973, installed a pilot plant for processing beach sands at Silversands, just outside Dar es Salaam.[7] The plant is intended to process extensive ilmenite, rutile, and zircon-bearing sands along the Tanzanian coast. Teams of People's Republic of China (PRC) geologists arrived in Tanzania in the latter part of 1974 to conduct field studies for the State Mining Corporation which may lead to the development of an industry to utilize the coal and iron deposits in southern Tanzania.[8] If feasible, the project would be financed initially through a $75 million loan agreement made between the PRC and Tanzanian Governments in 1974.

A consortium of Japanese companies and Tanzanian interests planned to exploit the natural soda ash deposits of Lake Natron.[9] The Japanese companies include Japan's five major Solvay soda-ash producers, Asahi Glass Co., Ltd., Central Glass Co., Ltd., Toyo Soda Manufacturing Co., Ltd., and Tokuyama Soda Co., Ltd., and the large trading concern, Toyo Menka Kaisha, Ltd. Expansion of the soda-ash industry in Japan has been deterred because Japan has to import nearly all of its salt requirements. The Lake Natron operation would ease the problem for the Japanese producers.

## PRODUCTION AND TRADE

Available data on mineral production and trade are shown in tables 4-6.

## COMMODITY REVIEW

**Metals.**—*Gold and Silver.*—Production of gold increased and byproduct silver decreased. Exploration programs by a team from the U.S.S.R. continued at sites in the Mpanda, Chunya, and Songea areas. A preliminary development program for the Songea area was indicated to be by placer mining methods. The current price of gold is sufficiently high to justify reviewing gold mining operations which previously were too high in cost and were abandoned.

*Iron Ore.*—A team of geologists from the PRC conducted a feasibility study of known iron and coal deposits in southern Tanzania starting in late 1974.[10] The project would be financed initially through a $75 million loan agreement in 1974 between the PRC and Tanzanian Governments and would

[10] Work cited in footnote 8.

include mine development, access railroad facilities, a coking plant, and an iron ore reduction plant.

**Nonmetals.**—*Cement.*—Production by the Tanzanian Portland Co. Ltd. at its Wazo Hill plant near Dar es Salaam was near capacity. The State Mining Corp. proposed a new cement plant to be built near the northern seaport of Tanga for which preliminary plans included a financing package. International sources were solicited for the project.

*Gem Stones.*—After diamond, exports of all other gem stones, as a group, ranked second in value in 1974. The gem minerals exported included amethyst, beryl, chrysoprase, opal, gem-corundum, garnet and rhodolite, ruby, sapphire, tourmaline, zircon, and gem zoisite (tanzanite).
