The libraries provide public access to a wide range of material, including online exhibits, digitized collections, archival finding aids, our catalog, online articles, and a growing range of materials in many media.

When possible, we provide rights information in catalog records, finding aids, and other metadata that accompanies collections or items. However, it is always the user's obligation to evaluate copyright and rights issues in light of their own use.

~~Report on~~ Sources of underground water at Marinette, Wis.

In response ~~at~~ to the request of Mr. Higley I made a brief investigation of the sources of underground water in the vicinity of the plant of the Ansul Chemical Co. at Marinette, Wis.

I found that the plant is at present supplied by two wells, *680 and 450 feet deep* each six inches diameter in the rock. Both draw on a sandy limestone bed at the depth of about 430 feet. As the two wells are only a few feet apart only one can be pumped at a time.

The following projects may be suggested for increasing the amount of water:

(1) Installation of an air lift of approved design.
(in existing wells)

(2) Shooting one or both ~~of the~~ wells.

(3) Deepening of one of the wells to "granite."

(4) Drilling a new well of larger diameter.

(5) Removal of the plant to a place underlain by gravel where shallow wells of large capacity could be

secured:

(6) *cooling of present supply by artesian means*

(1) From data ^{available} ~~supplied~~ the writer concluded that the present ^{capacity of} well is good for about two gallons per minute per foot of

draw down. For 300 g.p.m. this would mean lowering the water

draw down. For 300 g.p.m. this would mean lowering the water

150 feet which is not prohibitive, ^{such a low capacity} but would be nearly out of the

~~question if 600 g.p.m. were sought for.~~ It is the opinion of the

writer that sufficient submergence could not be obtained ^{any} for ~~the~~

^{the} latter yield and that the diameter of the deeper of the two

wells, reduced as it is to 5 inches by the liner, is too small.

for much over 150 g.p.m.

(2) The yield of many wells has been increased by shooting

them but on the other hand other wells, such as that at the pulp

plant in Peshtigo, have been entirely ruined by this process.

The writer advises against shooting because so little is known

of the formations penetrated by the wells that there is no

data by which to place the shots. If shooting failed it would

undoubtedly cause both wells to cave in such a manner that they

could never be used again.

(3) The shallower of the two wells might be deepened to the

"granite" or pre-Cambrian rocks but inasmuch as the formations cave

badly and the hole is only 6 inches at the surface this proceeding ^{will}

would appear to be uneconomical unless investigation shows that no
liner will be necessary in this well in which case air lifts
might be placed in both wells.

(4) Drilling a new well of not less than eight inch

diameter at the bottom appears to the writer to be the best

chance for ^{improving} ~~improving~~ the ^{underground} water supply. In order to insure this

diameter ^{at the bottom} the well should be started with not less than 10 inch

pipe and preferably with 12 inch. ^{especially if a deep well pump is to be used.} If possible this well should

be drilled on a ^{production} guarantee basis although that will cost more than

simply drilling a hole. It is ^{suggested} ~~recommended~~ that this well ^{might}

be located several hundred feet north of the present wells

so as to minimize the interference due to the eastward flow

of the ^{underground} waters. It is also suggested that this

well and the old ^{wells} be equipped with air lifts so that

there would always be one well in reserve. Said air lifts

should discharge into a cistern from which water would be drawn

by the present centrifugal pump. It is possible, however, that

a deep well pump would be cheaper as it would discharge the

water just where needed. Unfortunately there is ~~no~~ available

information on ~~the yield~~ of the city well, which appears to have

been the only well ^{in the city} to reach the deeper strata. ^{which has ever been tested for yield.} According to the

man at the water works this well was abandoned on account of the

amount of iron in the water ^{at} not because of the small yield.

which has ever been tested for yield. then being simply used for the natural flow.

From experience elsewhere the writer thinks that there is little

Conclusion

On the whole the writer feels that a better air lift combined with deepening of one of the wells might be sufficient ^{for the present unit}. ~~At any rate it is certain that more water can be obtained whether 600 gpm can be obtained from ~~ground~~ or wells is decidedly uncertain and it is possible that artificial cooling of river water during the summer months would prove cheaper. It is suggested that bids be asked on a complete installation on a guaranteed basis, thus placing the risk on the contractor.~~

undoubtedly at least 10 degrees too low. The water from the deep sand-
stones is undoubtedly warmer than from the level at which water is now
obtained but it has a temperature of less than 51 degrees the temper-
ature should not exceed 54 degrees.

(2) Removal of the plant to a location where shallow waters from inex-
haustive wells and at low temperature could be obtained is a last resource.
In order to pick such a locality a special study of the geology ^{is necessary,}
followed by
taking of an option on a suitable tract with privilege of putting down a

test well. Some tract should be large enough to
secure a permanent supply for even in dry years.

on the suggestion of artificial cooling of present supply. over
(2) The water does not feel comfortable to part
in the case of ~~ground~~ wells. Overhead water can be removed to other
and present drainage to ~~ground~~ wells. Another possibility

doubt but that ~~considerable~~ ^{some} water could be obtained from the lower sandstones.

The following data is all that could be obtained on the deep wells in and near Marinette. The successful well at The Peshigo Paper and Pulp Co. in

Peshigo is encouraging but the deep dry hole across the river shows that

there are unknown ~~factors~~ ^{as yet some} in the underlying rocks which make the finding

of water in large quantity more or less ~~of a gamble~~ ^{uncertain}. Further investigation

should be made ^{at Peshigo} of ~~this~~ ^{the city} well. ^{To see if it could now be tested} The temperatures ascribed to the water are

unquestionably at least 10 degrees too low. The water from the deep sand-

stones is undoubtedly warmer than from the level at which water is now

obtained but if that has a temperature of less than 51 degrees ^{at Peshigo} the temper-

ature should not exceed 54 degrees.

(5) Removal of the plant to a location where shallow waters from inexpensive wells and at low temperature could be obtained is a last resource.

In order to pick such a locality a special study of the geology ^{is necessary,} ~~and the~~ followed by taking of an option on a suitable tract with privilege of putting down a

test well. Such tract should be large enough to secure a permanent supply ~~from~~ even in dry years.

^{and prevent damage by neighboring wells} ^{another possibility}
in the ^{shore of Green Bay} ^{where cold water can be secured at depth.}
(6) The water does not feel competent to pass ^{on} the suggestion of artificial cooling of present supply. over

Deep wells in Marinette.

Old Stephenson well on Riverside st.

Data from Vaughan, Ann. Rept., Michigan Geol. Survey for 1903, pp. 121-131.

states that the well was drilled in 1895-6. The first water was struck at 405 and main supply was obtained from a crevice

at 410-414. The original head was 15 feet above the ground and the

temperature of the water was variously stated as 55.5 and 50.5 deg. F.

It is apparent that the former figure was a typographical error.

The well is cased to 415 feet and plugged at 457. There was no increase

in head below that depth. It is interesting to note that the present temperature

of the water is the same as stated above. There are also deep wells at

the hotel, at Oakwood Beach $3\frac{1}{2}$ miles (water 53 degrees) south of the city, at the Stephenson old oil test 2 miles south of Stephensons with water at 51.8 degrees,

and 3 miles to the west of the city, at the A. C. Merriman residence, at

the Marinette waterworks, and apparently at a number of places in Menomonee.

Unfortunately no data could be secured as to the yield of these wells on

pumping as they were apparently simply drilled for the natural flow.

Proposals, specifications, and contract for the water supply ^{for} the Ansul
Chemical Co., Marinette, Wisconsin

Location

The Ansul Chemical Co. Plant is situated on the low ground southwest of
Menomonee River in NWSW Sec. 5, T. 30 R. 24 E. ^{If a well is drilled it} ~~The well~~ is to be located
~~at a point~~ either alongside the present wells or at a point several hundred
feet to the north.

Definitions  and conditions.

The Ansul Chemical Co shall be ^{or} ~~herin~~ referred to as the Owner and the person,
firm, or corporation that is to furnish the materials, apparatus, appliances,
and ~~labor~~ work herein called for is herein referred to as the Contractor.

II Before submitting a tender the Contractor shall visit the premises and
make a thorough and careful examination to familiarize himself with all
conditions existing, and in awarding the contract it will ~~be~~ assumed that
such examination has been made.

The work must ~~be~~ commenced within such time from the date of the
execution of the contract as shall be agreed upon with the Owner in writing
and shall be prosecuted uninterruptedly with sufficient force to ~~induce~~ the
speedy completion of the contract.

The Contractor shall not be entitled to any claim for damages, for

any hinderance or delay from any source or cause whatsoever in the progress of the work or any portion thereof, but such hindrance will entitle the Contractor to such extension of time for completing the contract as may be determined by the Owner provided that notice be given in writing at the time of such hindrance or the cause of detention.

The Contractor must sustain all losses and damages arising from the action of the elements, flood waters, or the nature of the work to be done under these specifications and he will be held responsible for any and all material or work to the full amount of the payments made thereon and he will be required to make good at his own cost any injury or damage which said materials or work may sustain from any source or cause whatsoever before the final acceptance thereof.

The Contractor shall indemnify and save harmless the said Owner or its officers or agents from any and all claims for remuneration or indemnity for or on account of any injury or damage to person or property received or sustained by any person or persons, firm, or corporation by or from the said Contractor or by or in consequence of any materials used in or upon the said work, or by or on account of any improper material or workmanship used or employed in the construction, or by or on account of any accident or any ~~any~~ or omission of the said Contractor or his agents or servants or employees, and so much of the money that is due or to become

due the at pt of better interm... 3

Contractor under his contract as shall be considered necessary by the Owner may be retained by the Owner until such suits or claims for damages shall have been finally determined and settled.

Defective materials may be condemned by the Owner and when so condemned shall be destroyed or removed and shall not be used by the Contractor on any part of the work. In case of failure to remove or destroy such condemned materials, after written notice has been served by the Owner, within the time specified in said notice, the Owner may cause the said condemned materials to be destroyed or removed and acceptable materials substituted therefore. The cost of such substituted material and the cost of removing or destroying said condemned materials, shall be deducted from any amount due to to become due to the Contractor.

The Contractor shall strictly observe and comply with any and all Ordinances of the city of Marinette and statutes of the State of Wisconsin and shall obtain any and all permits, inspections, and otherwise which shall be required.

In case a well is drilled the contractor shall preserve full records of the material encountered together with samples of the cuttings from every five (5) feet of the depth. Samples are to be kept in bags furnished by the owner.

The contractor guarantees, without reservations or understandings not expressly mentioned in these specifications, that he will install equipment to supply the Ansul Chemical Co. with six hundred (600) gallons per minute

Record must also be furnished of the diameter of the hole. Length and size of all pipe, depth of water-bearing

over

formation and all other information called for by the
Owner

Contract

Contractor under his contract as shall be considered necessary by the

Owner may be retained by the Owner until such suits or claims for damages

shall have been finally determined and settled.

Defective materials may be condemned by the Owner and when so condemned

shall be destroyed or removed and shall not be used by the Contractor on

any part of the work. In case of failure to remove or destroy such con-

demned materials, after written notice has been served by the Owner, within

the time specified in said notice, the Owner may cause the said condemned

materials to be destroyed or removed and acceptable materials substituted

therefore. The cost of such substituted material and the cost of removing

or destroying said condemned materials, shall be deducted from any amount

due to become due to the Contractor.

The Contractor shall strictly observe and comply with any and all

Ordinances of the city of Marinette and a statutes of the State of Wisconsin

and shall obtain any and all permits, inspections, and otherwise which

shall be required. In case a well is drilled the Contractor shall furnish

samples of the cuttings from every five (5) feet of

depth to be kept in a safe place for the use of the Owner.

The contractor guarantees, without reservations or understandings not

expressly mentioned in these specifications, that he will install equipment

to supply the Anaxi Chemical Co. with six hundred (600) gallons per minute

Handwritten notes on the left margin, including "2) feet of", "the Owner", "furnished", "the Contractor", "of the date", "samples", "of all", "specifications".

Owner

of water which has at no time of the year a temperature of over ^{fifty five} (55) degrees

Fahrenheit. No restriction is made on quality or source of water.

well casing.
all pipe used in the well shall be genuine wrought iron.
 Information for bidders

The following information is offered to bidders as the best that is available to the Owner who does not guarantee its accuracy.

The depth to rock at the plant of the Owner is approximately 38 feet.

The nature of the drift or surface formation is not known but it is believed

that it is not water-bearing. The bed rock is limestone which is in many

places is broken by fissures. The top 10 feet of the rock is much broken

and may contain water although it is thought from wells in Menomonee that

warm water from the river may be thus obtained. There are now two six inch

wells on the premises. The deeper one is 680 feet deep and is lined to a

depth of 400 feet with 5 inch pipe. There is a lost string of tools in the

bottom. The other well is unlined and is about 450 feet in depth. Both

wells flow and either one will deliver water to the amount of about 2 gallons

per minute per foot of draw down. The temperature of the water which comes

from a depth of about 430 feet is approximately 50 degrees. There is a

200 foot dry hole ~~just~~ a few rods north of these wells. A well at the

Sawyer-Goodman mill southeast of the Ansul plant was nearly dry at 250

feet on June 11, 1926.

There are a number of deep flowing wells in and near the city but no
 information ^{is available} as to the quantity of water that ^{can} be pumped from them. Temperature of the water ~~is~~ ^{from} the shallower flows at 400 to 450 feet is from

49 to 51 degrees F. The Oakwood Beach well is reported to show 53 deg. F.

The following log of the ~~old city~~ well at the Marinette ^{waterworks} gives an idea of the geology of the deeper formations.

0-69 Sand and gravel
 69-100 Limestone, yellow Galena-Black River
 100-125 Limestone, blue sandy
 125-145 Dolomite, white, and blue, sandy
 145-160 Limestone, gray to white, crystalline, sandy Total Galena-Black
 160-175 Lower Magnesian-limestone, gray, sandy River 91 ft.
 175-190 Limestone, gray
 190-215 Limestone white, and yellow, , some shale, and sand.
 215-225 Limestone, gray and yellow, some floating sand
 225-245 Limestone, yellow and gray
 245-260 Sandstone, white, very limy, apparently no water
 260-275 Limestone, brown, sandy
 275-290 Shale, blue, limy
 290-325 Limestone, gray, much pyrite
 325-365 Sandstone, white, limy, little water
 365-400 Limestone, white to yellow, sandy
 400-420 Limestone, white, with some dark red shale and sandy limestone
 4 Total Lower Magnesian 260 ft.
 420-460 Jordan-sandstone, white, somewhat limy, source of flowing wells
 at Ansul plant, Stephenson house, etc.
 460-560 Trempealeau-Sandstone, fine grained, very limy, gray to white
 ranging below to sandy limestone.
 560-580 Mazomanie-sandstone, white
 580-600 Sandstone, gray
 600-660 Sandstone, pure white
 660-700 Sandstone, green, apparently little water to this depth
 Dresbach Total Mazomanie 140 ft.
 700-760 Dresbach-sandstone, white
 760-775 Sandstone, red
 775-795 Sandstone, white with pebbles of red quartzite
 Total Dresbach 95 ft.
 795-978 Pre-Cambrian-quartzite, red, some water at 860.
 PreCambrian penetrated 83 ft.

Note: caves may be expected to a depth of not less than 400 feet.

Here add specifications for pumping equipment
